[Video Instructions for Navigating Environment Plan]

Executive Summary

The Regia Marine Seismic Survey (**Regia MSS**) Environment Plan (**EP**) is a detailed document that explains how the environmental management approach taken by CGG Geophysical Services Pty Ltd (**CGG**) complies with the prevailing regulatory requirements. The regulations allow the National Offshore Petroleum Safety and Environmental Management Authority (**NOPSEMA**) to permit the Regia MSS. CGG is seeking such permission to carry out the activity as specified in this document and its appendices.

CGG propose to undertake a three-dimensional (**3D**) marine seismic survey in the Otway Basin, in Commonwealth waters offshore from Victoria. The activity aims to gather data on the structure and composition of geological formations for the purpose of identifying petroleum resources.

The EP has been uniquely structured to address feedback related to the digestion of large and complicated environmental approval documents presented by titleholders. Further, the content is slightly more educational than a typical EP because many of the consultations revealed a need to fully describe the regulatory requirements, share NOPSEMA guidance, and explain environmental management concepts such as reducing impacts and risks to as low as reasonably practicable (**ALARP**) and to an acceptable level.

By having a concise EP document and extended, comprehensive appendices, CGG aims to simplify the assessment processes for NOPSEMA, the public, and relevant persons. For NOPSEMA, areas of contention or focus are more easily accessible through the shorter, separate appendices, rather than reviewing a long singular document. For the public, this format is easier to digest, encouraging more readers, inviting more public comment, and potentially helping to identify more relevant persons. For relevant persons identified in preparation of this Environment Plan, the parts of the EP addressing their functions, interests or activities and subsequent objections, feedback and claims are located more quickly and easily through the specific appendices.

A significant feature of the preparation of this EP was the consultation process initiated by CGG on February 4, 2023. This process involved engaging with over 900 community members, relevant persons, environmental experts, government agencies, and regulatory bodies. The objective was to incorporate diverse perspectives and concerns into the plan, ensuring that the design of the survey and the mitigation of its adverse effects are well-informed and community inclusive. A public comment period on this EP received 14,879 submissions. Within those submission there were 653 unique submission and 905 specific claims considered as inputs into the environmental management planning process.

The EP has two parts. The first part discusses the specific criteria that must be met to gain acceptance from NOPSEMA. It focuses on demonstrating that the criteria for acceptance have been met. The second part of the EP covers the content requirements specified in the Regulations. These are the component parts of an environmental impact and risk assessment, and it covers aspects such as marine wildlife protection, pollution control, sound reduction, and emergency response protocols. The second part also explains how CGG will ensure the effective implementation of the EP. This includes regular environmental audits, feedback mechanisms, and adaptive management practices to address any deviations from the predicted levels of impact and risk.

Overall, the Regia MSS EP represents a contemporary, proactive, and inclusive approach to environmental management. It showcases CGG's commitment to sustainability, community engagement, and adherence to stringent environmental standards, setting a comprehensive framework for conducting environmentally responsible marine surveys.

Document Structure and Map

This document has been structured to show the evolution of the content over time, in consultation with relevant persons and the broader community. The structure shown in Figure F1-1 is hyperlinked and bookmarked so it can be accessed to easily navigate the EP. Video instructions are available to further assist readers in navigating the EP and can be found here.

Regia MSS Environment Plan

Document Map and Outline of the Environmental Assessment Process

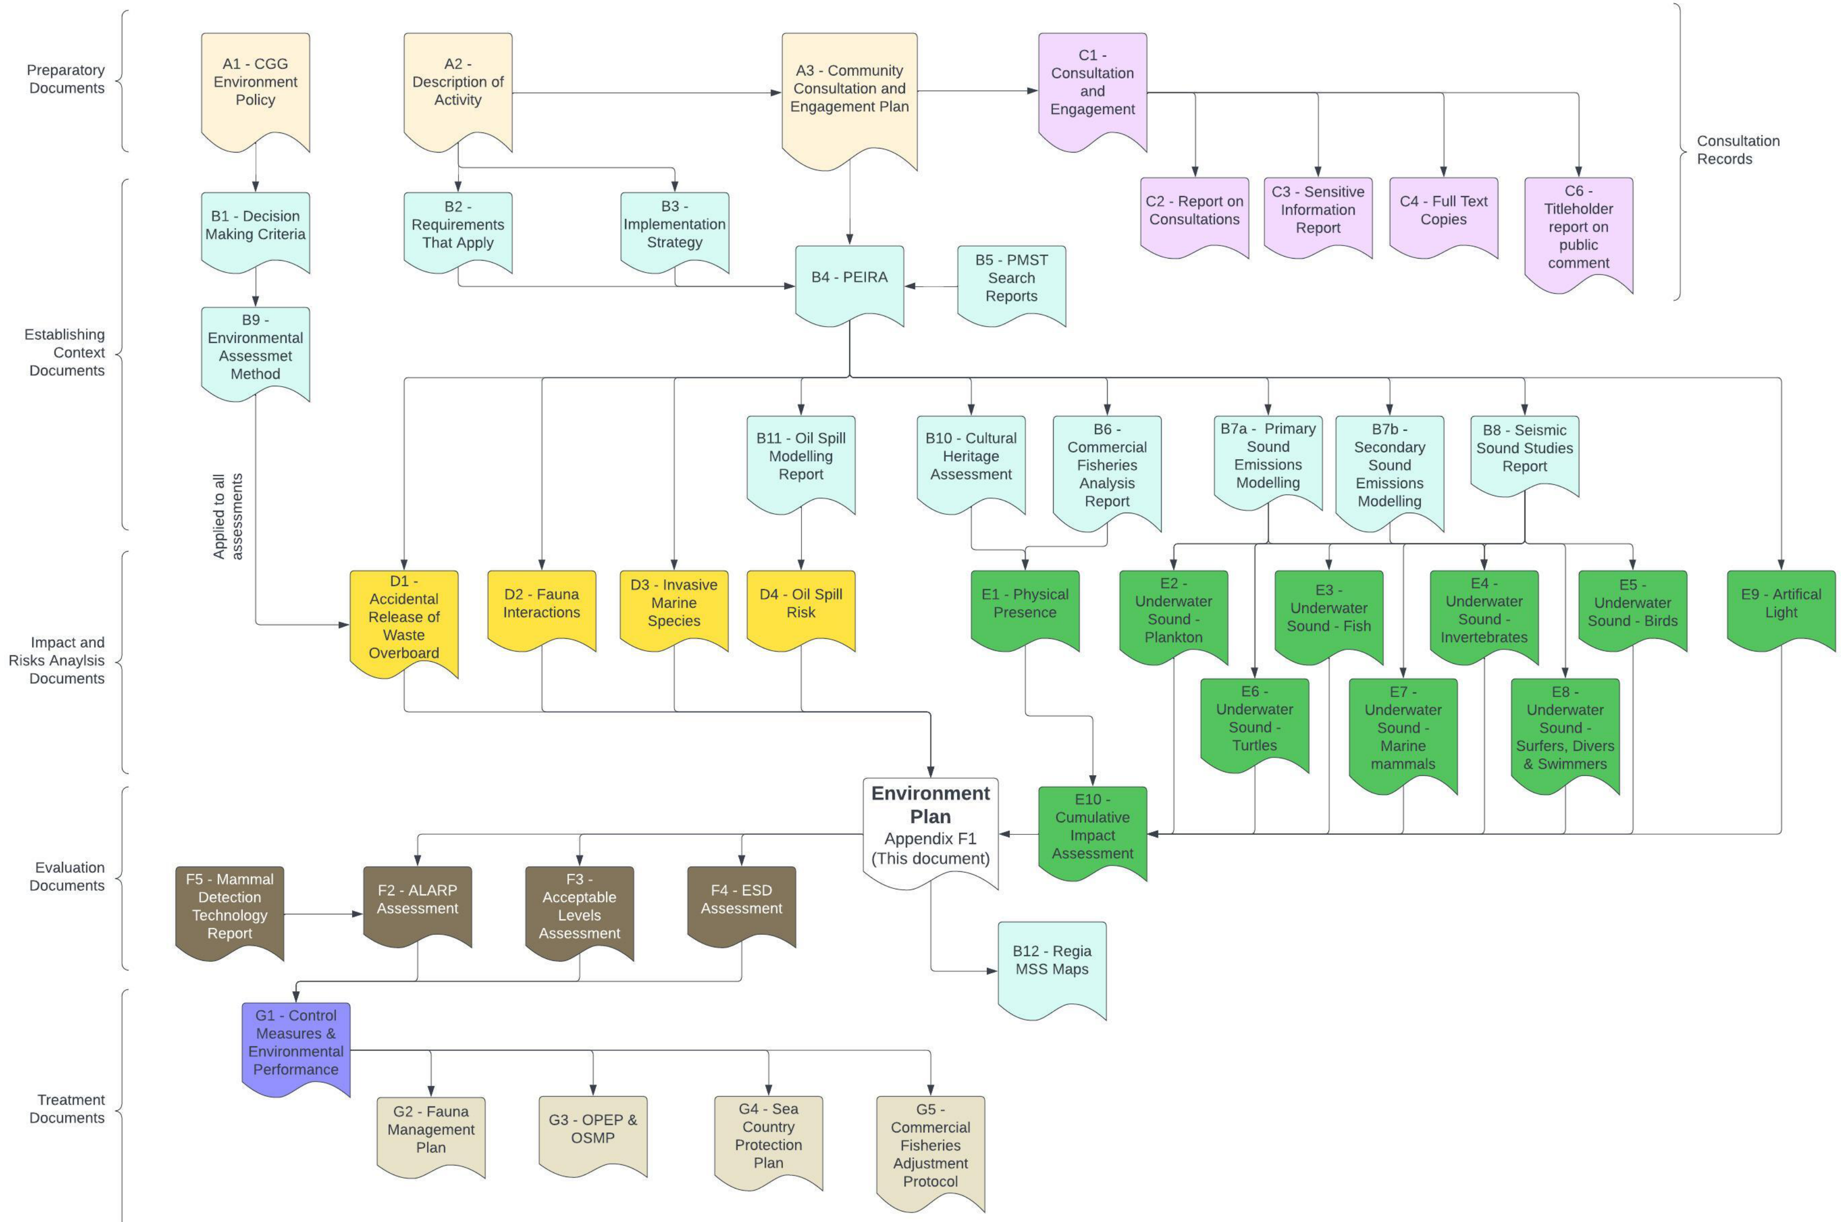

Figure F1-1 - Regia MSS Environment Plan Document Map

Table of Contents

1 Introduction

Welcome to the Regia Marine Seismic Survey (**Regia MSS**) Environment Plan (**EP**). This document is made to adhere to the guidelines and regulations set forth for environment management in the *Offshore Petroleum and Greenhouse Gas Storage (*Environment*) Regulations 2023* (**the Regulations**). To enhance clarity and understanding this EP is divided into two distinct parts.

1.1 Part 1: Criteria for Acceptance of an Environment Plan

The first part is dedicated to addressing the criteria for acceptance of an EP. This section of the EP explicitly seeks to address the NOPSEMA Decision-Making Guideline (N-04750-GL1721). This part underscores the critical nature of these criteria as the backbone of regulatory assessment, ensuring that environmental impacts and risks are not merely identified but also rigorously mitigated and managed in accordance with the highest standards of environmental protection and sustainability.

The narrative within this part respects the separate yet interdependent roles of the titleholder and the regulator. It is incumbent upon the titleholder to demonstrate, with exacting precision and thorough documentation, the compliance of their EP (and ultimately the petroleum activity) with each specified criterion. This demonstration must encompass detailed evidence and a robust justification of the strategies employed, adhering to the principle that the burden of proof lies squarely with the titleholder.

In contrast, the regulator's role is executed through a lens of critical evaluation and verification. The regulator will rigorously test the titleholder's assertions, ensuring that the EP not only meets the letter of the law but also embodies the spirit of environmental stewardship and responsibility. This process is fundamental in maintaining the integrity of the regulatory framework, ensuring that compliance is not a mere formality but a substantive demonstration of environmental stewardship.

1.2 Part 2: Contents of Environment Plan

The second part is dedicated to meet the content requirements of an EP as stipulated by Regulations 20 to 24. This part is significant because it lays out the foundational aspects of the EP, ensuring that all activities are systematically assessed and managed in accordance with recognised standards. In this case, ISO AS/NZS 31000 is adapted into the environmental assessment process contained in Appendix B9.

In this section of the document, we delve into each regulation in detail, starting with the overarching purpose of the EP, the environmental assessment process, and the implementation strategy. We also cover the crucial aspects of documenting the titleholder's details and additional information necessary for a comprehensive EP.

Significantly, throughout this part, there are references to numerous documents that substantiate our claims of meeting each regulation's specific requirements in detail. These documents were published on the Regia MSS Consultation Hub and have been available for comment from the public, in some cases for more than 8 months. These documents provide additional depth and context to this EP, showcasing the comprehensive approach to environmental stewardship and compliance. By doing so, we ensure that every aspect of this EP is not only in line with the regulatory framework but is also supported by relevant and authoritative documentation.

This structured approach is aligned with the 'plan – do – check – act' cycle of systematic environmental management, emphasising our commitment to a holistic and sustainable approach to environmental stewardship. It enables readers to grasp the intricate components of the EP, ensuring clarity and a focused understanding of each aspect's relevance and interconnectivity.

1.3 Why This Two-Part Structure is Necessary

This structure acknowledges that there has been an environmental assessment process undertaken by CGG Geophysical Services Pty Ltd (**CGG**), over several months, with numerous studies, reports, and analysis' which supported that process. The compilation of these studies into one document becomes unmanageable for the public to digest, particularly in a 30-day public comment period. Therefore, this EP functions in the same way as an environmental impact statement would and provides information about the environmental assessment process undertaken, with signposts to further information relevant to a reader's interests.

Further, the rationale for splitting the EP into these two parts with a series of supporting appendices enhances:

- **Clarity and Focus**: By separating the content requirements from the acceptance criteria, we enable readers to concentrate on specific aspects of the EP without being overwhelmed by its entirety.
- **Plainness**: This division allows for a more structured and systematic approach to understanding the EP. Each part addresses distinct yet interrelated components, making the information more digestible and accessible.
- **Targeted Implementation**: The split facilitates a targeted approach towards both the creation and review of the EP. Readers can align their efforts more effectively by understanding the nuances of what the plan entails and how it is evaluated.
- **Compliance and Beyond**: While compliance with regulations is paramount, this structure also underscores our commitment to going beyond mere compliance. It demonstrates our dedication to environmental excellence and sustainable practices.

The structure of the EP is such that maps are used sparingly in the text only where they contribute to the logical flow of information. The full collection of supporting maps can be found in Appendix B12 and we advise readers to open the EP twice so that maps may be sighted as and when your own logical flow desires a spatial representation of what is being described.

In conclusion, this two-part structure of the EP is not just a compliance-driven choice but a strategic approach to ensure that our environmental planning is both comprehensive and easily understandable. It reflects our commitment to transparency, excellence in environmental management, and our unwavering dedication to a sustainable future.

2 Purpose of the Environment Plan

CGG propose to undertake a three-dimensional (**3D**) marine seismic survey in the Otway Basin, in Commonwealth waters offshore from Victoria. Hereafter, this activity will be referred to as the Regia MSS. The Regia MSS provided for in this EP is proposed to be carried out within the Operation Area defined in Appendix A2 and shown in Figure F1-2. This EP allows for the activity to be undertaken during a near 5-year period, between 1 April 2024 (subject to acceptance of this EP by NOPSEMA) and 31 December 2028.

This EP has been prepared to ensure the Regia MSS is planned and undertaken in accordance with CGG's Health, Safety and Environment Policy (HSE Policy), which can be found at Appendix A1. The EP has also been prepared to comply with the requirements of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (**OPGGS Act**) and the Regulations.

2.1 Purpose and Objectives

In accordance with the requirements of the Regulations, the purpose of this EP is to demonstrate that the Regia MSS will be caried out in a manner:

- consistent with the principles of ecologically sustainable development set out in Section 3A of the EPBC Act; and
- by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable; and
- by which the environmental impacts and risks of the activity will be of an acceptable level.

This includes assessing the environmental impacts and risks to the environmental values and sensitivities within the receiving environment, including people and communities, and the social, economic, and cultural features of that environment.

Preparation of this EP has resulted in the adoption of controls measures and operational procedures to be implemented to reduce the potential adverse environmental impacts and risks associated with the Regia MSS to ALARP and to acceptable levels.

Environmental performance is covered in this EP to ensure that the control measures adopted in this EP are effective throughout the duration of the EP. The objective of the proposed activity is to provide a 3D data coverage and improved subsurface imaging within the Otway Basin. The new 3D data will provide an improved understanding of the subsurface, which to-date has been limited to 2D data coverage. Ultimately the new data will provide improved confidence in mapping major geological structures aiding in the identification and de-risking of petroleum prospectively across the active source area (**ASA**).

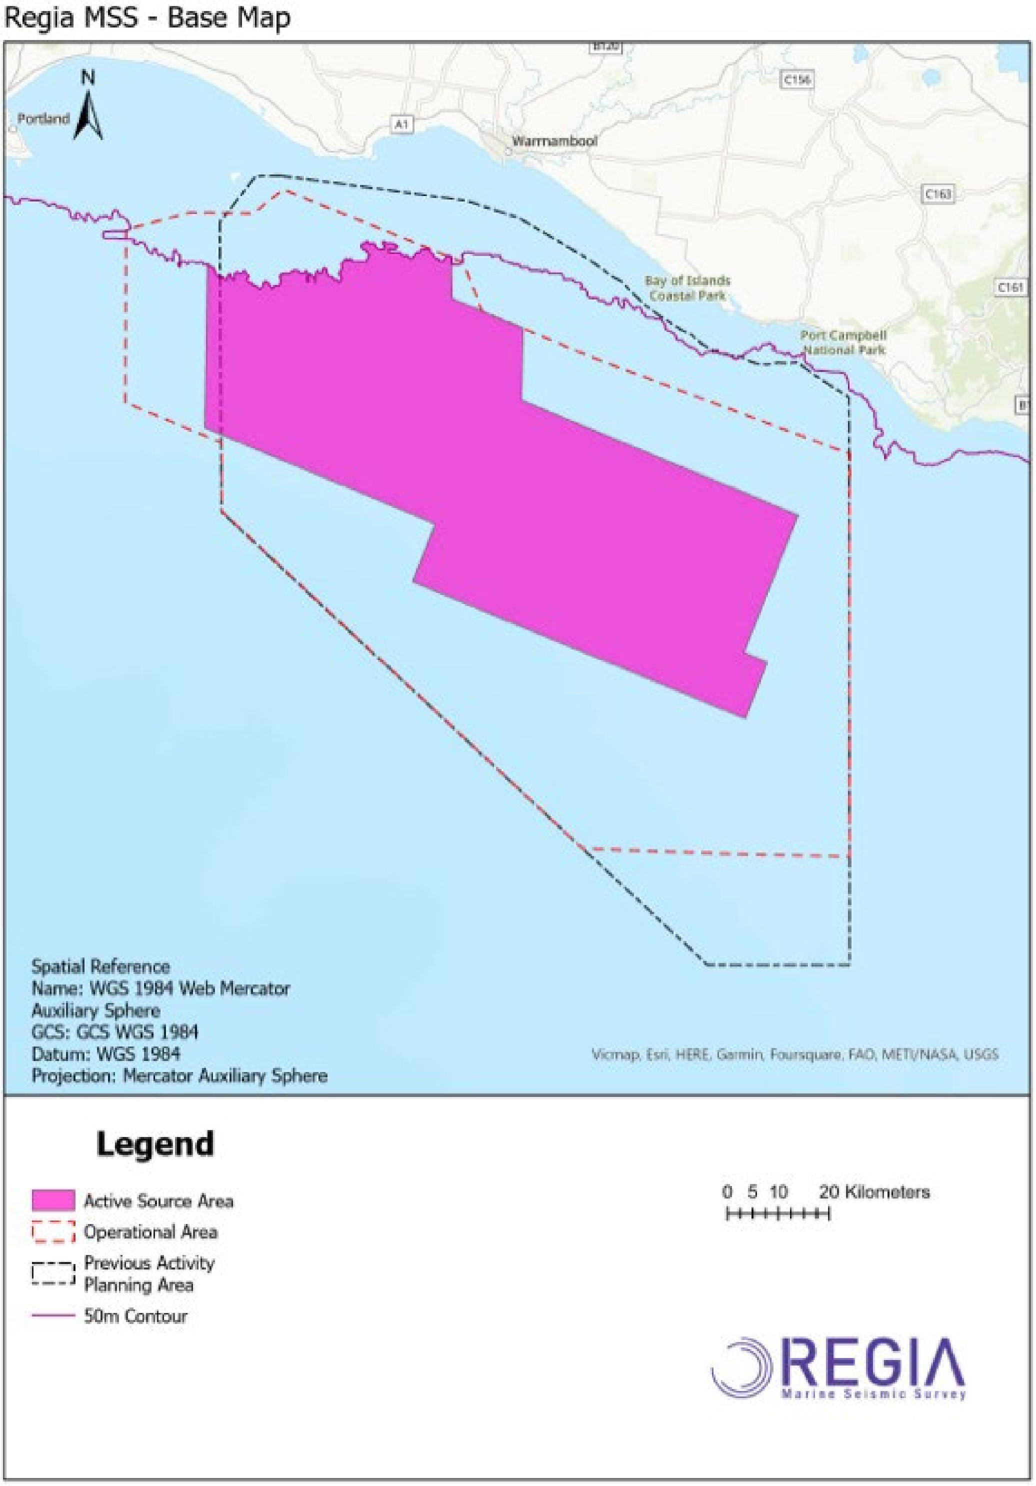

Figure F1-2 - Base Map: Proposed Operational Area and Active Source Area (MAP-REG-EPM-040)

2.2 Scope of the Environment Plan

The scope of this EP addresses the petroleum activity – a marine seismic survey - and associated activities as described in Appendix A2. Of relevance, the scope of this EP covers 3D seismic data acquisition and associated line turns, run-ins, run-outs, seismic testing, and support activities within the defined Operational Area (**OA**). The petroleum activity is defined as commencing at the point when the seismic vessel is within the defined OA and the source is deployed, until the seismic source has been retrieved and the seismic vessel departed from the OA, following completion of the survey. The scope of this EP does not include the periods when the seismic vessel or support vessels are not within the OA, such as during maintenance activities outside of the OA, port calls, crew changes, inclement weather avoidance, or vessel mobilisation/demobilisation to/from the OA. During these periods the project vessels are deemed to be operating under the Commonwealth Navigation Act 2012 and are not managed within this EP.

2.3 Structure and Organisation of the Environment Plan

This EP has been developed in accordance with the environmental assessment process detailed in Appendix B9 and in parallel to the consultation process detailed in Appendix A3, which was adapted as per Appendix C1. For readers wishing to appreciate the entire EP, the document map in Figure F1-1 shows the links between appendices and the flow in which they were prepared. If reading this EP in full, CGG recommends reading within the workflows shown by the arrows. Each document that supports this EP was prepared and published at the appropriate step (See Appendix C1, Table C1-6).

Reference to Regulations and Sections within those Regulations are for the *Offshore Petroleum and Greenhouse Gas Storage* (Environment) *Regulations* 2023, unless otherwise stated.

Regia MSS EP Part 1: Criteria for Acceptance of an Environment Plan

3 Objectives and Scope

Part 1 of the EP is a comprehensive justification for why CGG believes that NOPSEMA can be reasonably satisfied that the Regia MSS EP meets the criteria for acceptance set out in Section 34. This part is an evaluation of whether reasonable person charged with assessing the EP should be reasonably satisfied that each of the criteria in Section 34 have been met.

A key feature of this part is the discussion on the application of the term 'reasonably satisfied' in the context of NOPSEMA's decision-making process. This consideration reveals the balance between objective assessment and subjective judgment, demonstrating how CGG has applied discretion in its environmental assessment process, considering the unique environmental, social, and economic contexts of the Regia MSS. Furthermore, this part provides insights into how CGG interpreted and adhered to these criteria to achieve regulatory compliance because it has been written as part of the evaluation step in the environmental assessment process.

Throughout this part, the public and relevant persons will gain a clearer understanding of the regulatory landscape, the role of discretion in environmental assessments, and the responsibilities of titleholders in aligning their operations with these regulatory standards.

4 Public Comment

NOPSEMA invited comments on the Regia MSS EP at midnight on 25 January 2024 for a period of thirty days. 14,848 comments were received from a single petition email with embedded unique claims from submitters. A further 51 submissions were received through the NOPSEMA portal. Once the public comment period closed, NOPSEMA gave CGG a copy of the comments as per Section 30(2). CGG has considered each of the submissions made and, where appropriate, made modifications to the EP.

CGG has given NOPSEMA a written statement responding in general terms to the comments and indicated where any modifications to the EP were made in response to the comments. This written statement has been given to NOPSEMA separately to the EP to facilitate publication under Section 30(5).

The written statement is extensive, reflecting the large number of comments received. Therefore, CGG has prepared Appendix C6 as a summary of the full written statement for inclusion in the EP so that inputs from the public comment process can be shown to have directly contributed to the EP. Further, each relevant Appendix of this EP has been reviewed considering the comments and a new section added to show how relevant comments have been incorporated into the EP. Table F1-2 shows how the Matters raised during public comment have been incorporated into the EP in this document.

Whilst this additional work is not explicitly requirement of the Regulations, CGG believes it demonstrates our commitment to transparency and inclusivity. It also aims to assist NOPSEMA because all comments received must be considered (Section 30(6)) in deciding whether to accept the EP under Section 33.

Table F1-2 - List of changes arising from public comment matters

Matter	Matter ID	Changes made arising from public comment
Matter: Impacts to dive-based fisheries	F17	CGG has considered this claim and, based on the updated secondary sound modelling, has updated EP Appendix E8 (Impact Assessment – Underwater Sound: Surfers, Divers and Swimmers), Appendix A2 (Description of the Activity) and M#01: Activity limitation, to reflect that the sound source will not be discharged at full power from areas which have been predicted to result in an exceedance of the safety criterion human health safety criterion for recreational divers, surfers and swimmers along the coastline. CGG has also made updates to modelling in Appendices (E1, E2, E3, E4, E5, E6, E7, F1 F3, G1 and G2).
Matter: Impacts to juvenile seals	M30	Updates have been made to EP Appendix E7 Section 6.4, Section 8), and EP F1 (Environmental Plan)
Matter: Displacement of Deen Maar and Portland seal colonies	M31	CGG has made updates to EP Appendix E 7 Sections 4.1, 6.4, 7, and 8., and EP Appendix F1 (Environmental Plan).
Matter: Operational Buffer around Deen Maar	M32	CGG has made updates to EP Appendix E7 Sections 6.4, 7 and 8, and EP Appendix F1 (Environmental Plan).
Matter: Insufficient mitigation measures for seals and sea lions	M33	CGG has made updates to EP Appendix E7 Sections 6.4, 7 and 8 EP Appendix F1 (Environmental Plan).
Matter: Geographic range and all species need to be defined and considered	I16	CGG has considered these claims and has rerun the PMST reports to ensure that all information on the likely/known presence of relevant species within the area, as well as information on their protection status, Biologically Important Areas (BIAs) and behaviours is up to date. The updated PMST reports are provided in full in EP Appendix B5.
Matter: Lack of detail on EPBC-listed species and enforceable measures	I17	CGG has considered these claims and has rerun the PMST reports to ensure that all information on the likely/known presence of relevant species within the area, as well as information on their protection status, Biologically Important Areas (BIAs) and behaviours is up to date. The updated PMST reports are provided in full in EP Appendix B5.

5 Overview of the Criteria for Acceptance

Section 34, as interpreted in NOPSEMA's Decision-Making Guidelines, represents a comprehensive set of criteria that are vital to the environmental management and regulatory compliance of offshore petroleum activities. This section forms the bedrock upon which NOPSEMA assesses whether the environmental impacts and risks of a proposed activity are permissible and in line with both the Regulations and the broader principles of Ecologically Sustainable Development (**ESD**).

In Section 33, the standard of 'reasonably satisfied' that the criteria for acceptance have been met ensures that NOPSEMA's decisions are based on substantial evidence, comprehensive risk assessments, and a rigorous evaluation process. The decisions must also align with the principles of ESD, which are an object of the Regulations.

The application of 'reasonably satisfied' in regulatory practice is also informed by the precautionary principle, which posits that a lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation when there are threats of serious or irreversible damage. This principle, which is a key component of ESD, influences the standard of proof by mandating a cautious approach when potential risks to the environment are not fully understood.

The standard of being 'reasonably satisfied' represents a specialised threshold of belief, shaped by legal precedents and the principles of ESD, which guides NOPSEMA's acceptance of EPs. It necessitates a high degree of confidence in the environmental management and risk mitigation measures outlined in the EP, ensuring that the activities it covers will not result in unacceptable environmental harm.

The criteria for acceptance of an EP are essential for several reasons:

- **Standardisation:** They provide a standardised framework for environmental assessment, ensuring that all titleholders adhere to a consistent set of expectations.
- **Protection:** These criteria are designed to protect the marine environment by ensuring that activities do not proceed unless their impacts and risks are reduced to ALARP and to an acceptable level.
- **Transparency:** They create transparency in decision-making processes, offering a clear basis for NOPSEMA's evaluations and decisions.
- **Accountability:** Titleholders are held accountable for the environmental impacts and risks of their activities, where the burden of proof is place on the titleholder with clear requirements for documentation and evidence.
- **Continuous Improvement:** The criteria encourage continual improvement in environmental performance by requiring that impacts and risks are managed and reassessed over time.

Titleholders and NOPSEMA utilise the criteria for acceptance of an EP differently. CGG has used these criteria as a guideline to prepare this EP and prepare to carry out the activity. The criteria informed the environmental assessments, the selection of control measures, and the development of environmental management strategies. CGG has the duty to demonstrate compliance with these criteria in their EP submissions.

For the regulatory body, these criteria form the basis for assessing and accepting an EP. NOPSEMA assesses the adequacy of the titleholder's environmental impact and risk assessments, the effectiveness of their environmental management strategies, and the overall suitability of the EP for the proposed activity.

The application of the criteria for acceptance within the EP assessment process is a nuanced exercise that extends beyond a mere tick-box approach. While Section 34 provides criteria against which an EP must be assessed, the language used within the regulatory framework inherently allows for a certain degree of discretion in decision-making.

Within the parameters of the legislation, NOPSEMA's decision-making process is guided by principles of administrative decision-making that permit a holistic and flexible approach to assessing, and accepting, an EP. The term 'reasonably satisfied' suggests that NOPSEMA must consider the entirety of the situation, including the environmental setting, the predicted impacts and risks, and the mitigation, monitoring, and management measures proposed by CGG. It acknowledges that environmental assessments are complex and multifaceted, often requiring judgment calls based on professional expertise, scientific evidence, and best practice standards in environmental management. This subjective aspect of Section 34 is critical for several reasons:

- **Contextual Evaluation:** It allows consideration of specific contexts of each proposed activity, recognising that environmental settings vary and that a one-size-fits-all approach may not be appropriate for all cases.
- **Adaptive Management:** Discretion in decision-making supports adaptive management practices. As new information becomes available or as situations evolve, assessment can adjust, accordingly, ensuring that EP decisions remain relevant and effective.
- **Quality of Judgement:** The discretionary language ensures that decision-making is not just about compliance but also about the quality of judgment and reasoning behind how environmental impacts and risks are proposed to be managed.
- **Community Confidence:** By moving away from a rigid checklist, NOPSEMA and titleholders can address relevant person concerns more effectively, ensuring that decisions are made with an understanding of the complexities involved and the potential for varying interpretations of risk and impact.
- **Continual Improvement:** Decision-making discretion facilitates continual improvement, as titleholders are encouraged to not only meet minimum standards but to also strive for best practice in environmental management, reflecting an ongoing commitment to reducing environmental impacts and risks.

The importance of regulatory criteria like Section 34 lies not only in their role as standards but also in their function as tools for informed, flexible, and adaptive decision-making. This approach is integral to the environmental assessment process, allowing for a balance between the predictability necessary for business operations and the flexibility needed to manage diverse environmental scenarios.

6 Detailed Assessment of Each Criterion

There follows a discussion of the facts and reasons that support CGG's belief that each criterion for acceptance of the EP has been met.

6.1 The EP is appropriate for the nature and scale of the activity.

The EP is appropriate to the nature and scale of the activity because it demonstrates a comprehensive understanding of the proposed activity (Appendix A2) and its environmental context. This understanding is evident in Appendices B5, B6, B8 and in the descriptions of the existing environment relevant to each environmental aspect, in the detailed analysis for each environmental aspect arising from the activity (Appendices D1 – D4 and E1 – E9), and in the proposed management of environmental impacts and risks associated with the activity (Appendix G1 – G5).

In the impact and risk analysis carried out, CGG has ensured that the relevant values and sensitivities of the existing environment have been described, using relevant references and information sources. These descriptions have included the social, economic, and cultural features of ecosystems and their constituent parts, the physical resources, qualities and characteristics of locations, places and areas, and the heritage values of places. In doing so it is evident that matters protected under Part 3 of the EPBC Act are adequately described utilising relevant information, including information available on the DCCEEW website such as plans of management, threat abatement plans, threatened species recovery plans and marine bioregional plans.

Therefore, the EP contains a level of rigor, effort, content, and detail that aligns and exceeds the complexity and scale of the proposed operations. It provides robust supporting predictions, analyses, and conclusions about environmental impacts and risks, ensuring that all aspects of the activity's interaction with the environment are thoroughly evaluated and addressed. Each assessment of impacts and risks was scaled commensurate with the magnitude of effect/consequence. This is evidenced in the screening of lower order (negligible) impacts and risks performed in the PEIRA (Appendix B4) and the series of additional studies (e.g. sound modelling report (Appendix B7a and B7b), detection technologies report (Appendix F5) etc.) undertaken for higher order, or more uncertain impacts and risks.

The legislative and other requirements were at forefront of the environmental assessment process and have been considered at every step in that process. This is evidenced in the EP in Appendix B2 which considered the legislative and other requirements in the context of the activity. This is further proven in each environmental analysis (Appendices D1 – D4 and E1 – E9) when the environmental aspects of the activity were the context of considering relevant legislative and other requirements.

The EP has also been scaled in response to feedback from relevant persons as evidenced by additional studies, for example, the additional assessments undertaken of key environmental values and sensitivities in Appendix F3, and dedicated studies relevant to the principles of ESD (Appendix F4), and the reduction of risks to ALARP (Appendix F2).

Furthermore, the EP outlines clear and effective control measures tailored to mitigate identified risks and impacts, indicating that the EP is not only reactive but also proactive in its approach to environmental management. The methodologies and strategies employed in the EP for monitoring, mitigating, and managing environmental impacts are consistent with the latest industry standards and best practices, demonstrating a commitment to environmental stewardship.

In summary, the EP's content reflects a deep level of understanding and response to the environmental impacts and risks arising from the activity, with the control measures employed being suitably scaled and detailed for the nature of the operations.

6.2 The EP demonstrates that the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable.

The EP demonstrates that the environmental impacts and risks of the activity will be reduced to ALARP because it meticulously evaluates all reasonably conceivable control measures, particularly for higher order impacts and risks, and clearly shows the exploration of alternative, additional, or improved control measures (Appendix F2). It details how the assessment of impacts and risks has directly informed the selection of suitable control measures aimed at diminishing either or both effect/consequence or uncertainty/likelihood of the environmental impacts and risks of the activity.

Moreover, the EP provides comprehensive details of each control measure to substantiate their effectiveness in mitigating impacts and/or risks throughout the duration of the EP. Each control measure is evaluated against criteria of functionality, availability, reliability, survivability, independence, and compatibility with other measures, ensuring a multi-faceted approach to risk management, as evidenced in Appendix G1.

Furthermore, the management and mitigation measures delineated within the Regia MSS EP are not arbitrary but are founded on well-established environmental management principles and industry best practice. These measures have been tested and validated in similar contexts (i.e. in other seismic survey EPs), providing a level of confidence in the accuracy of the predictions and confidence in the effectiveness of control measures. Scalability in the adaptive response actions reinforce the robustness of the environmental assessment, as evidenced in Appendix G2.

In terms of economic considerations, Appendix F2 provides a methodical semi-quantitative evaluation process that weighs the environmental benefits of mitigation and management measures against their implementation costs. The methodology for this evaluation is systematic, thoroughly applied, defensible, and reproducible, providing a transparent and rational basis for the design of the activity and the selection of control measures.

Finally, the EP reflects a consultative approach, incorporating and evaluating information gathered from relevant person consultations and public comment. This is evidenced in Appendix G1 where each control measure has been evaluated considering the subject-centred groups it reduced exposure to, and whether an environmental performance standard was adopted because of the consultations, or not. This ensures that the EP is not only comprehensive but also considerate of the insights and concerns of all relevant persons.

6.3 The EP demonstrates that the environmental impacts and risks of the activity will be of an acceptable level.

Multiple methods have been used to demonstrate that the environmental impacts and risks of the Regia MSS will be of an acceptable level. These are:

1. Comparison of predicted levels of impact and risk to pre-defined acceptable levels.
2. Further assessment of key environmental values and sensitivities.
3. Compliance with the EPBC Act.
4. A search for unacceptable environmental impacts.
5. Consideration of predictive uncertainty.

The subsequent subsections explain why these separate demonstrations provide confidence in the environmental assessment process and the outcome of that process.

6.3.1 Comparisons of acceptable levels of impact and risk to predicted levels.

The EP demonstrates that the environmental impacts and risks of the activity will be of an acceptable level because CGG defined acceptable levels within a reasonable context that includes internal and external factors, legislative requirements, and industry standards. These acceptable levels of environmental impact and risk are specifically tailored to be appropriate and relevant to the environmental components of the Otway marine estate that may be affected by the activity. The public and relevant persons were given the opportunity to influence the defined acceptable levels.

Additionally, the EP establishes that the acceptable levels are attainable by comparing them to the predicted levels of impact and risk. This comparison is grounded in a methodical approach, ensuring that the process is systematic, thoroughly applied, defensible, and reproducible. The content of Appendices D1 – D4 and E1 – E10 reflect careful consideration of the activity-specific decision-making criteria established for the activity and principles of ESD.

6.3.2 Further assessment of key environmental values and sensitivities

In Appendix F3 we present analysis that reveals the relative impacts of seismic survey activities on key values and sensitivities within the Otway marine environment. These key matters were selected either because of the consultations or because the species has an elevated level of protection under the EPBC Act. The key values and sensitivities further assessed were, in no order:

- **Southern Right Whales** (e.g. Event ID's 653, 3237, 3384, 3697, 3678, Person ID 1163[1])
- **Blue Whales** (e.g. Event ID's 3697, 653, 2901, 3384, and Org 181)
- **Southern Rock Lobster** (e.g. Event ID's ID 2774, 3228, 653, 1742, 2886, 1529, 4107, 1815)
- **Giant Crab** (e.g. Event ID's 653, 1742, 1892)
- **Glass Eels** (e.g. Event ID's 3697, 3237, 3678)
- **Gould's Squid** (e.g. Event ID's 3237, 4107)
- **Pale Octopus** (Octopus pallidus) (Public Comment Matter F11, F12)
- **Blacklip Abalone** (Haliotus rubra) (Event ID's 906, 908, 948, 1742, 2078, 2093, 2095, Public Comment Matter F1, F12, F16, F17)
- **Pink Snapper** (Chrysophrys auratus) (Public Comment Matter F11, F12, F19)
- **King George Whiting** (Sillaginoides punctatus) (Event ID 4355, 4433, Public Comment Matter F12, F14, F19
- **Plankton Communities** (e.g. Event ID's 3697, 3182, 3237, 3384)
- **Commercial Fish Spawning Patterns** (e.g. Event ID's 1529, 2774, 2886)

In each case the assessment focused on the cause-effect pathway of most concern – elevated levels of sound. These assessments systematically evaluate the effects of seismic acoustic disturbances in comparison to other environmental threats and pressures. Our findings suggest that the acoustic signals associated with short-term seismic surveys exhibit minimal and non-significant impacts at population levels when compared to the baseline variability induced by larger-scale environmental processes.

The research included a comprehensive review of the existing peer reviewed literature, grey literature, and feedback from relevant persons. Through this integrative approach, we concluded (in general

[1] See Appendix C3 for sensitive information regarding cultural significant of Koontapool.

terms) that the minor and temporary impacts to populations brought by seismic surveys are often indistinguishable from the pre-existing effects attributed to other large-scale oceanic pressures, such as those from commercial shipping, climatic events, recreational and commercial fishing, and human marine activities.

It was critical to contextualise the scale and duration of impacts associated with seismic activities within the broader scope of anthropogenic and natural influences on marine ecosystems. The discourse within the scientific community predominantly centres on the repercussions of large-scale changes driven by global phenomena — such as climate change, ocean acidification, and overfishing — which are identified as principal factors contributing to irreversible shifts in population dynamics and key ecosystem functions.

Our analysis posits that while the Regia MSS will contribute to the cumulative effects to and within marine environments, the magnitude of their contribution relative to other sources remains immeasurably low. The temporal and spatial extent of seismic-induced disturbances are bounded and often rapidly attenuated, eliminating the likelihood of significant impacts, and ensuring that the formal precautionary trigger of serious or irreversible environmental harm is not met.

6.3.3 Compliance with the EPBC Act

The primary environmental legislation within Australia is the *Environmental Protection and Biodiversity Conservation Act* 2002 (**EPBC Act**). NOPSEMA's authorisation processes have a Part 10 approval applied to offshore petroleum activities as per the NOPSEMA EPBC Act Program. This program ensures that impacts on matters protected under Part 3 of the EPBC Act are not unacceptable.

Matters protected by the EPBC Act that have been considered in this EP include:

- World Heritage properties (see Section 6.6).
- National heritage values of declared National Heritage Places.
- Wetlands of international importance.
- Listed threatened species and ecological communities.
- Listed migratory species.
- Commonwealth marine environment.

Each impact and risk analyses has considered these matters and provides evidence that the proposed activity is not in conflict with any recovery plans or threat abatement plans for listed threatened species or ecological communities. It respects the management plans in place for Commonwealth reserves, such as Australian Marine Parks, and upholds the Australian IUCN Reserve Management Principles. It shows that the activity will not have unacceptable impacts on the values of these protected areas.

Moreover, the EP content confirms that the proposed activity does not contravene any management plans for World Heritage properties, National Heritage places, or Ramsar wetlands. In the absence of specific management plans, the EP shows that all reasonable steps have been taken to ensure consistency with the Australian World Heritage Management Principles, National Heritage Management Principles, Australia Ramsar Management Principles, and Commonwealth Heritage Management Principles.

The EP also demonstrates due regard for relevant policy documents, guidance, bioregional plans, wildlife conservation plans, management plans, gazettal instruments under the EPBC Act, conservation advices', marine bioregional plans, and other pertinent information, including spatial data, available on the DCCEEW website.

6.3.4 Search for potential unacceptable impacts

Conducting a search for potential unacceptable impacts within an ecosystem and considering these in the context of the Regia MSS facilitates the identification and prediction of potential negative effects the activity may have on the environment. If the analyses of each impact and risk arising from the activity is a 'bottom up' approach to assessing impacts, the search for unacceptable impacts is a 'top down' approach because it starts by looking at the highest levels of ecosystem health – biological diversity and ecosystem integrity.

This method of demonstrating levels of impact from the Regia MSS provides a useful alternative perspective on the nature and scale of impacts that complements the detailed analyses of the cause effect pathways arising from the activity. By thoroughly searching for and addressing unacceptable impacts, the environmental assessment process supports a demonstration that the impacts of an activity can be managed to a level that is not detrimental to the maintenance of biological diversity and ecosystem integrity, in other words, will be of an acceptable level.

6.3.5 Consideration of predictive uncertainty

Uncertainty of the extent, severity, and duration of environmental impacts has been systematically considered each phase of the assessment process. In instances where uncertainties exist, the EP does not shy away from acknowledging these gaps in knowledge. Instead, it approaches them with a structured plan to manage and, if necessary, mitigate such uncertainties. This proactive stance not only reflects a commitment to environmental stewardship but also aligns with a precautionary approach to environmental management – a key aspect in the face of scientific uncertainty. Evidence of considering predictive uncertainty is most relevantly presented in each of the impact assessments (Appendices E1 – E9)

Additionally, the EP incorporates and appropriately addresses the information provided during relevant person consultations, ensuring that the views and knowledge of others contributed to the establishment of acceptable levels of impact and risk. This thorough incorporation of diverse inputs and robust evaluation mechanisms provides evidence that all impacts and risks, particularly to protected matters, will be managed to acceptable levels.

6.4 The EP provides for appropriate environmental performance.

Appendix G1 provides for appropriate environmental performance outcomes (**EPO**s), environmental performance standards (**EPS**s), and measurement criteria because there are clear, unambiguous EPOs that are intrinsically linked to acceptable levels of environmental impact and risk (see Annex 3, Appendix G1). The full list of EPO's can be found in Part 2, Section 7.5.

The EPOs are comprehensive, apply to multiple impacts and risks, and ensure that all identified environmental aspects, as well as the cumulative effects on all values and sensitivities that may be affected by the activity, are addressed. The EPOs set within the EP not only reflect achievable levels of environmental performance by CGG, but also adhere to the relevant requirements of the NOPSEMA EPBC Act Program, establishing a standard for management that is both ambitious and attainable. The associated EPSs are directly connected to the control measures and provide clear statements of performance that are not open to misinterpretation.

Furthermore, the EP includes explicit and detailed measurement criteria that can demonstrate whether the desired environmental performance has been achieved. These criteria are designed to confirm that all impacts and risks are maintained at acceptable levels and reduced to ALARP. The EP ensures that the EPOs and EPSs can be easily monitored for compliance, facilitating straightforward oversight and enforcement.

Compliance with established environmental performance standards is a non-negotiable aspect of the Regia MSS EP. The document details rigorous monitoring and enforcement mechanisms that not only track adherence to these standards but also outline clear measures for addressing any deviations. Such a systematic approach to compliance underscores the scientific integrity of the environmental assessments.

Lastly, the EP guarantees that the EPOs, EPSs, and measurement criteria are interlinked and mutually reinforcing, which is crucial for confirming that the predicted level of impact and risk will not exceed the defined acceptable levels. The integration of these components within the EP ensures a cohesive and effective approach to managing environmental performance throughout the duration of the activity.

6.5 The EP includes an appropriate implementation strategy.

The EP includes an appropriate implementation strategy for the Regia MSS because it is grounded in a standardised methodology that CGG has developed and refined over years of successful operations in Australia, as stated in Appendix B3. This implementation strategy is designed to fulfill the specific requirements of Section 22(1), which demands a comprehensive approach to environmental performance management throughout the lifecycle of the activity.

Appendix B3 showcases that for the duration of the Regia MSS, CGG has established specific measures and arrangements to ensure that all environmental impacts and risks are continually identified and reduced to ALARP. Appendix G1 details control measures that are not only effective in mitigating environmental impacts and risks to ALARP and acceptable levels but also demonstrates that the EPOs and EPSs outlined within the EP are capable of consistently being met.

Moreover, the EP includes management systems to effectively implement control measures identified in the impact and risk analyses. These systems are designed to ensure that the implementation of control measures is monitored rigorously, thereby continuously reducing environmental impacts and risks to ALARP over time. The implementation strategy also emphasises the importance of ongoing consultation, both prior to and during the seismic survey, and incorporates a process for monitoring, auditing, and reporting environmental performance relative to the activities conducted under the EP.

An integral component of the Regia MSS EP is its adaptive management framework outlined in the environmental management system (described in Appendix B3). This approach is responsive to new data and changing environmental conditions, allowing for the modification of strategies and actions in an evidence-based manner. This ensures that the environmental management strategies are not static but evolve in line with the best available scientific information.

Additionally, Appendix B3 describes arrangements that are in place to respond to and monitor impacts of oil pollution emergencies, thereby ensuring preparedness for potential environmental incidents. Training protocols to ensure that all employees and contractors have the appropriate competencies are also described.

The EP also reflects a commitment to continuous improvement, considering lessons learned from previous activities and inspection recommendations. This iterative learning approach ensures that the implementation strategy remains dynamic and responsive to changing circumstances and emerging best practices.

In summary, the EP's implementation strategy is appropriate for the Regia MSS due to its systematic, evidence-based approach to environmental management, which aligns with regulatory requirements and reflects CGG's operational experience and commitment to environmental stewardship.

6.6 The activity is not being undertaken in a declared World Heritage property.

The Regia MSS is not planned to occur within the boundaries of any World Heritage Property. This has been confirmed through careful planning and consultation with spatial data and environmental sensitivity maps. The survey's location has been chosen to avoid any overlap with areas designated under the World Heritage Convention, ensuring that there is no direct or indirect impact on the Outstanding Universal Value of any World Heritage site.

6.7 The EP demonstrates that consultation have been carried out and the measures adopted because of the consultations are appropriate.

The EP for the Regia MSS demonstrates compliance with the consultation requirements set out in Section 25 because it includes a thorough consultation process which ensured the effective capture and incorporation of input from all relevant persons.

Moreover, the consultative process described in the EP is indicative of a thorough and inclusive approach to consultation. By ensuring that the views and inputs from a broad spectrum of relevant persons and the public have been actively sought and considered, the assessment reinforces its comprehensive nature and the quality of the resultant environmental planning.

Evidence that the consultation has been carried out in accordance with Section 25 can be found in the Appendices C1 – C4 (noting Appendices C3 and C4 are the sensitive information part of the EP). The activities undertaken in preparation of the EP demonstrate that:

- The consultation process is clearly detailed, ensuring broad and inclusive identification of all ascertainable relevant persons, and published at the commencement of EP preparation.
- The nature of the activity, the description of the environment, and the potential impacts and risks have been thoroughly considered when determining the relevance of the activity to relevant persons.
- Appendix C1 and C2 demonstrate that effective consultation has taken place, providing sufficient information and a reasonable period for relevant persons to respond, thereby facilitating a genuine two-way dialogue.
- The consultation methods employed by CGG were designed to be accessible, providing depth and quality of information with the least burden on relevant persons, offering ample opportunity for response, and genuinely considering relevant person views before final decisions are made.
- Feedback obtained through the consultation process is integrated into the EP, effectively informing the identification of environmental values and sensitivities, and contributing to the assurance that impacts and risks are reduced to ALARP and acceptable levels.
- The EP contains a detailed report and full text copies of all the consultation that includes prescriptive elements as per Section 24(b), providing NOPSEMA with sufficient information to objectively determine that the titleholder’s duty to consult has been adequately discharged.

In summary, these elements collectively illustrate that the EP's consultation process has been conducted with due diligence, ensuring comprehensive relevant person engagement and integration of feedback into the environmental planning process.

CGG's consultation methodology could identify each relevant person by capturing sufficiently broad people and information. Once relevant persons were identified, they were invited to tailored consultation and provided with sufficient information and a reasonable period to consult. This documented process helped CGG to inform the description of the environment and mitigate potential adverse effects of the activity, which is demonstrated throughout Appendix C1, throughout this document, and other supporting documents.

A public comment period occurred and previously identified relevant persons made submissions. These submissions were treated as relevant person correspondence. Any previous and new objections and claims were (re)assessed and CGG provided a response to the relevant person. Changes have been made throughout the EP because of the public comment submission. These changes can be seen at the commencement of each Appendix (where relevant). Further information on the public comment process can be found in Appendix C6 and in the separate Titleholders Report on Public Comment (which is not part of the EP).

6.8 The EP complies with the Act and the Regulations.

To meet the criteria of Section 34(h), the EP has demonstrated that the environmental assessment process carried out has resulted in a proposed activity that is consistent with the objectives of the Environment Regulations, including the principles of ESD (see Appendix F4).

The EP contains sufficient information to address each of the content requirements of sections 20-24 with enough clarity, consistency, and detail commensurate with the nature and scale of the activity. This case has been put forward in the Appendices and has been summarised in this document, particularly in Part 2, Sections 6.1 and 6.3.

The EP acknowledges and commits to the requirements of the OPGGS Act to maintain equipment and property brought into the title area and to remove it when no longer in use.

The EP acknowledges and commits to the requirements of the Regulations to notify reportable incidents and the start and end of an activity.

The EP is developed in a manner that is not inconsistent with the statutory and regulatory requirements, as evidenced by the inclusion of all necessary and relevant information pertaining to the activity and its environmental impacts and risks. This is shown further in Part 2 of this EP.

Regia MSS EP Part 2: Contents of Environment Plan

7 Environmental Assessment

On 4 March 2023, CGG published the proposed environmental assessment method. Appendix B9 provides a comprehensive methodology for assessing environmental impacts and risks associated with offshore petroleum activities like the Regia MSS. It outlines a transparent, consultative approach that incorporates best practices in environmental management, complying with relevant legislation. Key elements include the application of the ISO 31000:2009 Risk Management Framework, relevant person communication and consultation, and detailed impact and risk assessment processes.

The methodology emphasises systematic, evidence-based evaluation of environmental aspects and integrates feedback from relevant persons and communities to inform the EP preparation. This document is pivotal in ensuring that environmental impacts and risks are identified, analysed, and managed effectively, aligning with regulatory requirements and stakeholder expectations.

7.1 Description of the Activity

The activity is a marine seismic survey, focusing on acquiring 3D geophysical data in the Otway Basin, an area with a history of hydrocarbon production. Key elements of the activity include the establishment of Environmental and Activity Planning Areas, stringent adherence to environmental laws, and detailed operational plans. The location of the activity is shown in Figure 1 (MAP-REG-EPM-040) and the coordinates of the active source area polygon are in Table F1-3.

Table F1-3 - Active Source Area Coordinates

Line	Single line joining Point 1 to Point 12 following the 50m bathymetry contour.	

Appendix A2 presents a comprehensive description of the Regia MSS. This document outlines operational and design envelopes, detailing the timing, location, and nature of the activities. The activity encompasses various aspects such as seismic surveying, streamer and sail line operations, sound source specifications, and support activities, all described with relevant environmental parameters. This comprehensive activity description ensures transparency and rigor in assessing environmental impacts and risks, fulfilling the requirements of Section 21(1).

The activity description does not yet contain a description of the final acquisition area. This is partly due to the unavailability of information within which to finalise the geophysical objectives of the survey. As soon as this information is known an acquisition area will be set which is the full fold area that CGG will seek to acquire. Once set, the area may narrow further the project progresses towards operations and during the activity based on weather and other event that cause a prioritisation of acquisition areas. The absence of a defined acquisition area does not invalidate CGG seeking permission for the Regia MSS because:

- Other activity limitations are in place to constrain the activity.
- A spatial limitation for discharge of the sound source exists – the active source area.
- The impact and risk assessment have been completed on a larger area than the future acquisition area – either the original activity planning area or the active source area (plus justified buffers for each impact and risk).
- CGG have committed to implementing an acquisition area as soon as practicable which will be smaller than the active source area.

It is important to note that Appendix A2 serves as the foundational document for ensuring compliance with Sections 17, 18, and 19. It is the definitive guide for the Regia MSS and should be referred to as the primary source of information. In the event of any discrepancies or contradictions between Appendix A2 and other parts of the EP or its appendices, it is to be noted that such inconsistencies are unintentional. In such cases, Appendix A2 prevails and should be considered the authoritative source for compliance and operational guidance. This approach guarantees consistency and clarity in aligning our activities with the regulatory requirements.

7.1.1 Evolution of the Activity Design

CGG undertook a highly consultative approach to the activity design. It involved publishing early versions of the Description of Activity and refining the areas of geological interest based on relevant person input. CGG published updated versions of Appendix A2 throughout the consultation process, with the earliest version being available on the Consultation Hub since 4 February 2022. There is a revision history included in the document which shows the additions made to the document throughout the environmental assessment and consultation processes.

The evolution of the activity included:

- Initially establishing an activity planning area of 7,755 km^2 abutting the State waters boundary with a 155 km environment planning area shown in Figure F1-3 (MAP-REG-EPM-080).
- An initial preference for a summer acquisition window due to:
    - Better weather which would have meant a shorter survey due to less vessel downtime which reduces physical presence impacts and reduced the overall cost of the survey.

- The initial overlap of the activity planning area including overlap with the (then) Southern Right Whale (SRW) reproductive BIA meaning their absence was required to complete the survey[2].

Following initial community information sessions three overriding themes of concerns relevant to the adverse effects of the activity led to the first set of modifications to the proposed activity. The first theme related to the concerns the local communities had for commercial fishing activities which were understood to focus on shallower waters (Feedback 166, 232). The second theme related to the increased levels of biodiversity found in the region in summer months and the importance of the upwelling events to ecological integrity (Feedback 203). The third theme related to effects from elevated levels of sound to SRW (Feedback 74, 48, 160, 164, 231) (), the Australian fur seal breeding colony at Lady Percy Julia Island / Deen Maar (Feedback 97, 222), () and Pygmy Blue Whales (Feedback 48, 160, 231) ().

[2] Note that the Commonwealth government Conservation Management Plan for SRW was under review during the preparation of the EP and the SRW BIA changed twice on the National Conservation Atlas which contributed to the evolution of the activity design.

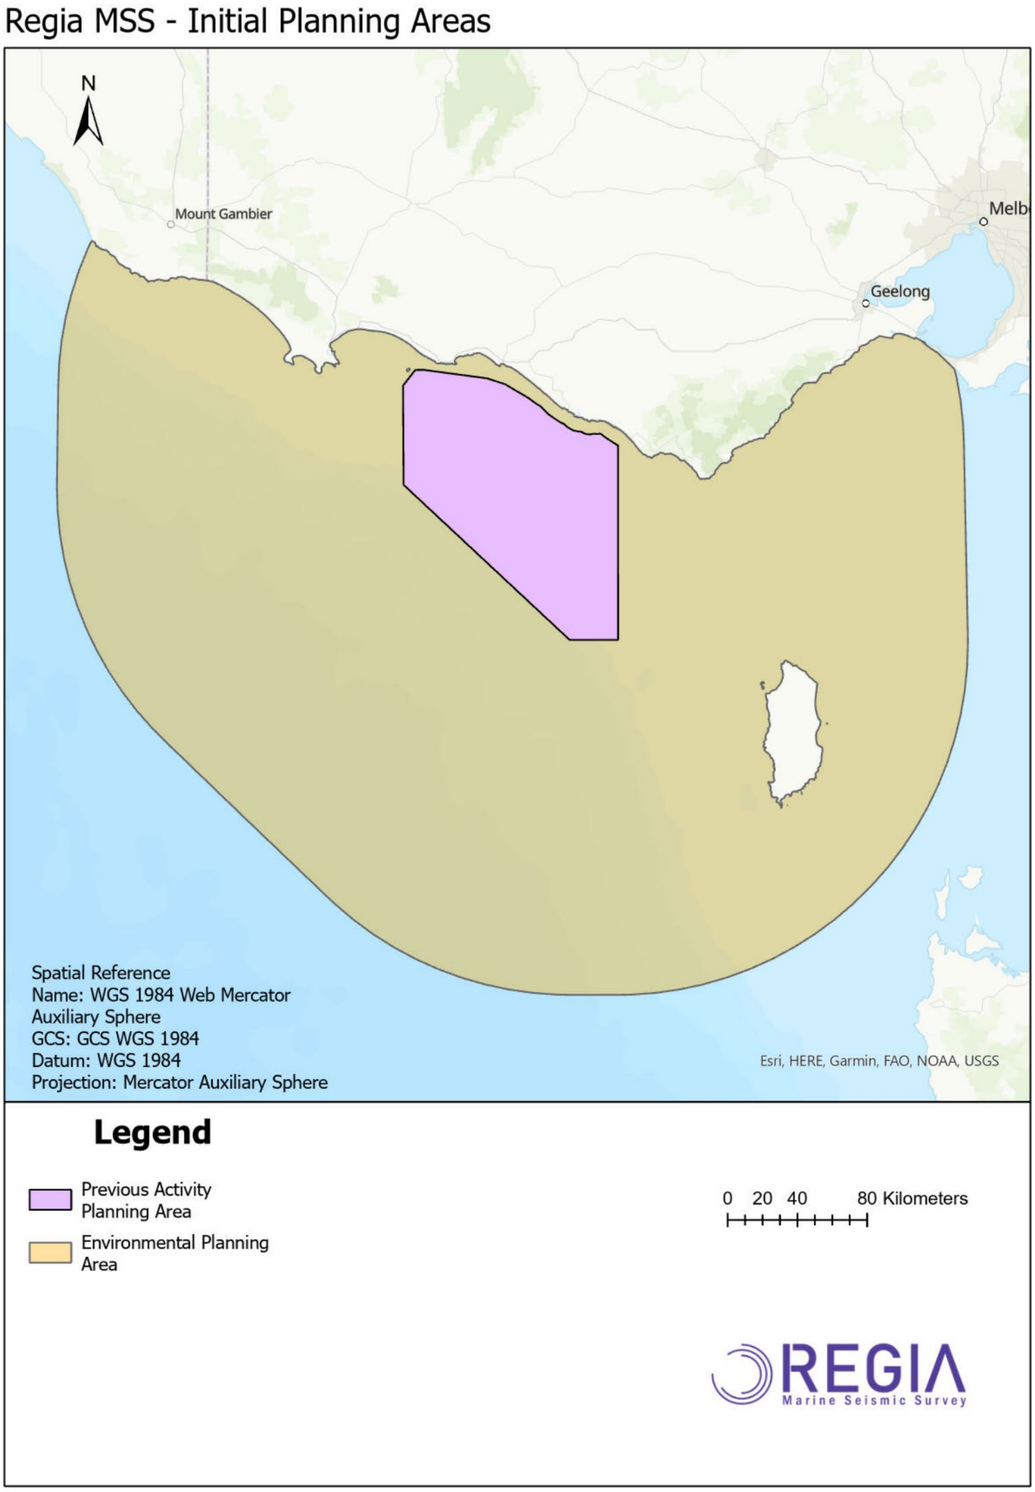

Figure F1-3 - Initial Planning Areas (MAP-REG-EPM-080)

In parallel with the initial community sessions, CGG commissioned initial sound propagation modelling to provide an initial understanding of the effect distances to key locations along the coast and effect distances for relevant grouping of environmental receptors. The initial modelling report can be found at Appendix B7a. After receipt of the initial modelling report, feedback from the community sessions, and correspondence from relevant persons the following changes to the proposed activity were made:

- A spatial activity limitation to exclude waters shallower than 30 m. This was primarily due to concerns for effects on abalone from abalone divers.
- A 10.3 km buffer placed around Lady Percy Julia Island / Deen Maar which is the behavioural effect distance for pinnipeds derived from the modelling report. Note: This buffer has been updated to reflect that the sound source will not be activated within 17 km of Lady Percy Julia Island / Deen Maar. A 10.3km buffer from Deen Maar was initially applied to reduce risks and impacts to Australian Fur Seals. This effect distance for pinnipeds was based on the initial modelling conducted for the activity (see Appendix B7a). The commissioning of subsequent modelling (see Appendix B7b Sound Emissions Secondary Modelling Report) has provided further insights relevant to the management of this species. Now, 11.8 km is the furthest distance to behavioural disturbance sound effect criteria for pinnipeds (seals), the increased protections afforded through the 17 km buffer are considered highly conservative to minimise disturbance of breeding seals. *[Paragraph updated in response to Matters M30, M31, M32, M33 and F17]*.
- A change in timing preference to avoid the peak levels of biodiversity expected in the summer months (January/February/March).

With the change in timing for the activity to prefer either an April – June, or September – November window further community sessions were held to communicate the change and further raise awareness about the proposed activity. Relevant person consultation continued throughout 2023 and lead to the following second set of modifications to the activity:

- Consultation with conservation groups and relevant persons revealed that the change in timing of the survey did not adequately address concerns associated with effects to zooplankton, particularly during upwelling events and the values associated with Key Ecological Features (**KEF**s) in the region. This resulted in an activity limitation of no acquisition within 500 m of the Bonney Upwelling KEF, nor the West Tasmanian Canyons KEF.
- Consultation with the Gunditj Mirring Traditional Owners Aboriginal Corporation indicated that *Deen Maar* was a site of cultural importance. CGG noted the 10.3 km buffer already in place and received no confirmation whether this distance was sufficient to manage effects on cultural values. Following this feedback, and further desktop research on cultural values (Appendix B10), CGG committed to no vessels traversing between Deen Maar and the mainland. The buffer around Deen Maar is now 17 km due to the exclusion of acquisition in water shallower than 50 m. *[Paragraph updated in response to F17]*.
- Consultation with Parks Victoria resulted in an activity limitation with no operational activity with 5 km of the Twelve Apostles State Marine Park (Feedback 259).
- Consultation with the Abalone Council of Australia resulted in an activity limitation extending the bathymetry contour activity limitation from no shallower than 30 m to no shallower than 50 m (Feedback 262).
- Consultation with a commercial fisher (Feedback 245) led to an activity limitation to exclude acquisition from fishing blocks G12, G13, H13, and H14, plus a 700 m buffer to protect the target species of the fisher.

The publication of draft impact and risk analyses occurred in September 2023 and there was further feedback provided by relevant persons that led to the following changes to the activity:

- Consultation with commercial fishers, and commercial fishing associations, revealed concerns about the overlap with productive trawl fishing areas in water depths of 200 m to 400 m resulting in an activity limitation of no acquisition deeper than the 200 m bathymetry contour.
- Consultation with a local dive shop/school revealed concerns about sound effect threshold exceedance for divers at known popular dive sites. This has resulted in an activity limitation to ensure that the effect levels to humans are not exceeded at those sites. This feedback also led to an agreement to implement a simultaneous operation (**SIMOPS**) plan for divers in the region.

As a result of consultation with local commercial divers, secondary sound propagation modelling was undertaken [Event ID 3367 & Feedback ID 253]. Popular and frequent dive sites were identified by relevant persons and used as 'receiver' locations in the secondary modelling report to understand offset distances that may be required to protect divers and inform the SIMOPS plan. The secondary modelling also addressed the constraint of the sound source activation to water depths of no shallower than 50 m. Results from this work showed that:

- Offset would be required in the northwest corner of the future acquisition area (Site 1).
- Behavioural sound effect criteria for pinnipeds are now reached at a maximum of 11.8 km (previously 10.3 km) from the sound source. As the survey area is a minimum of 17km from the closest haul out site (Deen Maar), behavioural impacts to pinnipeds at this location are no longer predicted. [Paragraph updated in response to Matter F17].

As foreshadowed to relevant persons during the consultation, the description of activity has been progressively narrowed over time as geological objectives were refined and relevant person feedback was addressed. In total the active source area has been reduced to 39% of the activity planning area and can only narrow further from the current design.

As described in Section 4 above (Public Comment), further changes to the activity design were made because of public comment. Changes to the EP because of this process are described in the Regia MSS: Public Comment Titleholder Report. Each relevant Appendix of this EP has been reviewed considering the comments and a new section added to show how relevant comments have been incorporated into the EP.

7.2 Description of the Environment

For the purposes of the EP summary requirements of Section 35(7) a description of the receiving environment is provided in this document whereas the full descriptions of the environment as required by Section 21(2), and any relevant values and sensitivities as required by Section 21(3), are found in each specific impact and risk analysis for reasons explained in Part 2, Section 7.2.3.

7.2.1 Description of the Receiving Environment

The marine environment off the Otway Coast in Victoria, Australia, presents a remarkable instance of ecological complexity and diversity, encompassing a broad spectrum of biological, physical, and socio-cultural components.

7.2.1.1 Ecosystems and Constituent Parts, Including Human Communities:

The Otway marine ecosystem is characterised by its biodiversity. This region is a habitat for a multitude of species, ranging from microorganisms to larger marine mammals like whales and dolphins. The intricate food webs within this ecosystem are a focus of extensive research, emphasising the interdependence of species. The role of keystone species, such as certain fish and crustaceans, is critical in maintaining the ecological balance. Human communities along the Otway Coast are deeply intertwined with this marine ecosystem. Their livelihoods, predominantly fishing and tourism, are directly linked to the health of the marine environment. There is a growing body of literature exploring the socio-economic dependence of these communities on the marine ecosystem, highlighting the need for sustainable management practices.

7.2.1.2 Natural and Physical Resources:

The Otway region's marine environment encompasses a variety of natural resources, including significant fish stocks and unique benthic habitats, particularly in nearshore waters. This area has high water quality, influencing the health of the marine biota. Geological features such as underwater cliffs, canyons, and sandy substrates contribute to the area's biodiversity by providing habitats and influencing oceanographic processes. The dynamic nature of these physical features, under the influence of both natural and anthropogenic factors, is a subject of ongoing study.

7.2.1.3 Qualities and Characteristics of Locations, Places, and Areas:

The Otway marine environment is distinguished by its unique marine landscapes, which include diverse sponge fields. These areas are not only ecologically important but also contribute to the aesthetic and intrinsic value of the marine landscape. Some locations within this marine environment are recognised as biodiversity hotspots, critical for the conservation of endemic and endangered species.

7.2.1.4 Heritage Value of Places:

The Otway coast holds significant cultural and historical value. Indigenous communities have longstanding connections with this region, with coastal areas often holding traditional and spiritual significance. The presence of historic shipwrecks adds another layer to the region's heritage, making it a site of archaeological and historical interest. Marine Protected Areas within this region not only serve to conserve biodiversity but also help in preserving these cultural and historical values.

7.2.1.5 Social, Economic, and Cultural Features:

The economic framework of the local communities is intrinsically linked to the marine environment. The fishing industry, alongside emerging sectors like marine aquaculture, plays a significant role in the local economy. Petroleum development, including over 80 seismic surveys since the 1960's, has been ever present since the 1990's. The cultural aspect of the marine environment is equally significant. Traditional knowledge and practices related to marine resources are an integral part of the local culture, especially among First Nations groups. Furthermore, the region is a hub for environmental education and research, contributing significantly to our understanding of marine ecosystems and their sustainable management.

In conclusion, the marine environment off the Otway Coast of Victoria, Australia, is a multifaceted ecosystem with significant biological diversity, physical resources, cultural heritage, and socio-economic importance. The interplay of these elements underlines the need for an integrated approach to conservation and management, ensuring the sustainability of both the natural ecosystem and the human communities that depend on it.

7.2.2 Evolution of the Description of the Existing Environment

The description of the existing environment started with establishing an environment planning area (**EPA**) which was derived from the likely largest area of effect from any environmental aspect of a seismic survey – in this case an oil spill. The EPA represents a 150km buffer around the Activity Planning Area, plus a 5km buffer to include coastal sensitivities. The 150km distance was selected as it is conservatively the farthest an oil spill could reach in the unlikely event of an accidental release of marine diesel.

This area was shown on the interactive map on the Consultation Hub and visitors to the site were able to share information on the environmental values and sensitivities they had in the area. There were several environmental values and sensitivities highlighted on the interactive map which can be found in Appendix C2 and remain online. 78 map comments were received in total with the following examples of the community sharing their environmental values and sensitivities:

- One comment identified Logans Beach as south-east Australia's only established SRW nursery.
- Two comments identified Fairy Penguin colonies at coastal locations that the community valued.
- One comment highlighted the cultural values of Sacred Birthing Grounds for the Southern Right Whales and "stood in solidarity with Gunditjmara Traditional Owners of this precious Sea Country."
- One comment identified "The Bonney Upwelling is vital to the survival of local marine species."

These map comments have each been considered in the impact and risk analyses and the environmental assessment process overall. Comments were taken at face value and lead to an increased weighting on environmental protections for the identified environmental components.

In parallel to receiving comments through the website the Preliminary Environmental Impact and Risk Assessment (**PEIRA**) (Appendix B4) identified the basis of the spatial extent of each environmental aspect of the activity. These distances were subsequently used to complete multiple queries of the Protected Matters Search Tool and other databases of environmental values and sensitivities. The PMST reports completed to inform the PEIRA (Appendix B4) and the subsequent analyses (Appendices D1 – D4 and E1 – E10) can be found in Appendix B5. These search reports were run again prior to resubmission to ensure any changes to species or listings were identified to control for passage of time [In response to Matters: I16 and I17]. These searches will be re-run prior to the activity commencing, and at least once a year, to help determine any changes to environmental knowledge underpinning this EP.

7.2.3 Description of the Existing Environment

The approach adopted for this EP was to integrate the Description of Environment within each impact and risk analyses. This represents a departure from traditional EP presentation methods of a single large chapter describing every receptor within the largest affected area without the context of cause effect pathways or subsequent protection of the described environmental values and sensitivities. Therefore, content that satisfies the requirements of Section 21(2) and Section 21(3) can be found in the impact and risk analyses in Appendices D1 to D4 and E1 to E10.

The benefits of this approach are various, especially for relevant persons:

- **Enhanced Specificity and Relevance:** By embedding the environmental description within each impact and risk analysis, readers gain a more detailed and specific understanding of how the activity may affect the environment. This contextualises the environmental effects, making them more relatable and understandable.
- **Improved Relevant Person Consultation:** This approach makes it easier for a relevant person to self-identify and for CGG to communicate how effects may manifest (i.e. through an identified cause-effect pathway). As a result, consultation becomes more targeted and meaningful, fostering better communication and collaboration.
- **Dynamic Assessments:** Traditional methods often present a static view of the environment. In contrast, this integrated approach allows for a dynamic assessment, reflecting changes in

environmental conditions or activity profiles over time. It was easier for relevant persons to see their input and will be easier for CGG to manage and communicate change over time.

- **Streamlined Documentation:** Instead of navigating through a separate chapter for environmental descriptions, relevant persons can directly access information within each impact and risk analysis. This makes the EP more user-friendly and accessible.
- **Comprehensive Environmental Understanding:** Integrating the environmental description within each assessment ensures that all environmental aspects are considered in relation to specific aspects of the activity, leading to a more accurate environmental understanding where only things affected are analysed.

In summary, this approach enhanced the clarity, relevance, and efficacy of the environmental assessment process, benefiting both the environment and relevant persons involved.

7.3 Requirements that Apply to the Activity

Appendix B2 is a comprehensive compilation of legislative and regulatory requirements relevant to the environmental management of the Regia MSS. It encompasses international conventions, Commonwealth and state legislation, policy statements, and international and industry standards. The document includes a detailed list of these requirements, their relevance to the Regia MSS, and outlines how the proposed activity will adhere to these requirements, demonstrating compliance and a commitment to best practice environmental management. The document is structured to be updated regularly, ensuring the activity remains within the current legal framework.

Appendix B2 was first published during the establishing context step of the environmental assessment process. Publishing the requirements that apply to the environmental management of the activity early in the consultation process is important because it:

- Enhances transparency about the regulatory framework guiding the project.
- Allows the public and relevant persons to understand the compliance landscape and evaluate the activity against these criteria.
- Facilitates informed feedback and meaningful discussion during the consultation.
- Demonstrates the project's commitment to regulatory adherence and best practices.
- Enables early identification and resolution of potential compliance issues.

In preparing Appendices D1-D4 and E1-E9, CGG considered these identified requirements that apply to the activity and has listed all those that were relevant to each cause effect pathway as evidenced in the Annexes of each chapter. So, the legislative and other requirements were used in the environmental impact and risk analyses and references to relevant laws, regulations, conventions, and EBPC Act guidance documents are made throughout these analyses to tie the whole assessment process together and demonstrate how each of these requirements will be met as required by Section 21(4)(b).

CGG believe that the content in each impact and risk analysis, along with Appendix B2, demonstrates our ability to properly identify and meet the requirements because it comprehensively lists relevant legislative and regulatory requirements and:

- Describes the applicability of each requirement to the activity in detail.
- Outlines specific strategies and measures in place to ensure compliance.
- Is constructed with due diligence to reflect the latest legal standards.
- Has been peer-reviewed by legal experts to ensure accuracy.

- Provides a clear, auditable trail of how operational procedures align with regulatory obligations.

7.4 Evaluation of Environmental Impacts and Risks

This section of the EP is dedicated to detailing the compliance with Section 21(5) and Section 21(6), a central part of our environmental management process. Section 21(5) mandates the inclusion of specific content within an EP that details and evaluates all environmental impacts and risks associated with the activity. This section underpins informed decision-making for the protection of the marine environment.

Our approach to section 21(5) is rooted in best-practice methodologies and is aligned with both regulatory requirements and relevant persons expectations. It is an iterative process in theory which can be challenging to deliver in practice. For the Regia MSS EP a decision was taken early in the assessment process to publish all the documents prepared as soon as the drafts were ready. Comments were invited during consultations and the content was used in raising awareness about the environmental aspects of the activity. Relevant persons were furnished with the information in the following incremental and iterative way.

1. Initially CGG commissioned Klarite, an environmental services company with expertise in offshore energy approvals, to prepare the PEIRA (Appendix B4). This document was published in March 2023.
2. Specific study reports to provide detailed identification of the extent, severity, and duration of impacts and risks were commissioned from other expert consultants such as:
   - Millodon Consulting – Commercial fishing history in the area (Appendix B6).
   - JASCO Applied Sciences – Sound Propagation Modelling (Appendix B7a & B7b)
   - S2 Services – Seismic Sound Studies Report (Appendix B8).
3. Drafts of the full impact and risk assessments were prepared by a combination of expert consultants and published as soon as they were complete (Appendices D1 – D4 and E1 to E10). Note that Appendix E10 – Cumulative Impact Assessment was prepared in response to requests from relevant persons and will be published alongside submission of the EP for public comment.

7.4.1 Details of the environmental impacts and risks of the activity

The regulatory requirement to ‘detail’ impacts and risks is interpreted in NOPSEMA guidance (N-04750-GN1344) to mean both the identification and analysis of impacts and risks. The identification of environmental impacts and risks was completed in the PEIRA. Subsequently, CGG commissioned dedicated analyses to cover each environmental impact and risk. Both these steps are described in more detail below and the full reports are appended to this EP.

7.4.1.1 Preliminary Environmental Impact and Risk Assessment

The PEIRA (Appendix B4) was the first document published about environmental impacts and risks from the Regia MSS. The PEIRA was published to provide initial information to relevant persons during the consultation process. Publishing the PEIRA allowed relevant persons to understand the cause effect pathways created by the Regia MSS and hence, be able to identify how they may be affected, or where to ask for more information.

The PEIRA identified the following planned environmental aspects that can lead to environmental impacts from the activity.

- Artificial light
- Physical presence
- Underwater sound
- Atmospheric emissions
- Planned discharges.

The PEIRA also identified the following unplanned environmental aspects that can lead to environmental risks from the activity.

- Accidental release of fuel
- Accidental release of materials or waste overboard
- Introduction of marine pest species
- Collisions with marine fauna

Benthic disturbance was considered in the PEIRA, and it was concluded that if there is no anchoring during the activity there is no pathway for the activity to result in changes to benthic habitats.

Having identified relevant environmental aspects of the activity and providing an initial estimate of the likely extent and duration of the aspect, the PEIRA performed a screening of these aspects with components of the environment because not all environmental aspects interact with an identified component part of the environment. A table from the PEIRA is replicated below at Table F1-4. With these steps complete, there were now justified boundaries established to be able to undertake the full impact and risk analyses.

Table F1-4 - Screening of Environmental Aspects against the Components of the Environment

		Environmental Aspects								
		Artificial Light	Physical Presence	Underwater Sound	Atmospheric Emissions	Planned Discharges	Accidental Release of Fuel	Accidental Release of Materials or Waste Overboard	Introduction of marine pest species	Collisions with marine fauna
Environment Component										
Physical Environment	Air Quality				✓					
	Ambient Light	✓								
	Ambient Sound			✓						
	Climate				✓					
	Sediment Quality						✓			
	Water Quality					✓	✓	✓		
	Benthic Assemblages			✓			✓	✓	✓	
	Coastal Habitats and Communities				✓		✓			

Environment Component		Artificial Light	Physical Presence	Underwater Sound	Atmospheric Emissions	Planned Discharges	Accidental Release of Fuel	Accidental Release of Materials or Waste Overboard	Introduction of marine pest species	Collisions with marine fauna
		Environmental Aspects

	Recreational Fishing		✓				✓		✓	

The PEIRA also completed the impact assessment requirements for this EP when initial assessment indicated that the levels of impact (the combination of effect and uncertainty) were negligible and low resulting in a preliminary outcome that no further assessment was required. Justification for not carrying through these impacts is provided in the PEIRA.

Similarly, the PEIRA also completed risk assessments required for this EP when initial assessment indicated the level of risk (the combination of probability and consequence) were rare and negligible resulting in a preliminary outcome that no further assessment was required. Justification for not carrying through these risks is provided in the PEIRA.

[3] Ecological environment includes the presence of a listed threatened species or listed threatened ecological community, the presence of a listed migratory species, any values and sensitivities that exist in, or in relation to, part or all a Commonwealth marine area, or Commonwealth land.

[4] Marine Protected Areas includes the National Heritage values of a National Heritage place and the ecological character of a declared Ramsar wetland. The activity is not being undertaken in any part of a declared World Heritage property.

The PEIRA concluded that the identified environmental impacts (Table F1-5) and identified environmental risks (Table F1-6) will be carried through to the full assessment and will be refined based on further assessment and consultation.

Table F1-5 - Planned environmental aspects requiring full assessment (PEIRA - Appendix B4)

Environmental Aspect	Environmental Impact	Preliminary Outcome
Artificial Light	Change in ambient light	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
Underwater Sound	Change in ambient sound	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
	Change in hearing capacity	Quantitative assessment
	Change in physical condition	Quantitative assessment
Physical Presence	Change in functions, interests, or activities	Quantitative assessment

Table F1-6 - Unplanned environmental aspects requiring full assessment (PEIRA - Appendix B4)

Environmental Aspect	Environmental Risk	Preliminary Outcome
Accidental Release of Fuel	Change in water quality	Low
	Change in sediment quality	Low
	Change in ecosystem dynamics	Low
	Change in physical condition	Low
	Change in fauna behaviour	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Introduction Of Marine Pest Species	Change in ecosystem dynamics	Moderate
	Change to functions, interests, or activities	Moderate
Accidental Release of Materials or Waste Overboard	Change in physical condition	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Collisions With Marine Fauna	Change in physical condition	Moderate

The following recommendations were made for CGG to consider, each of which was accepted:

1. Commission independent underwater sound modelling to understand the effect thresholds and distances for specific receptors within the Environment Planning Area.
2. Split the full assessment of underwater sound into two components for impulsive and continuous sound sources.
3. Review the NERA Reference Case 2018:1003 Consequence analysis of an accidental release of diesel and regionally relevant spill models from similar worst-case events to determine the applicability of the NERA Reference Case and, subsequently, the need for activity specific spill modelling.

Having identified the environmental impacts and risks that require full assessment, CGG commissioned various consultants to undertake the environmental assessments. The analyses in Appendices D1 to D4 and E1 to E10 were completed between April 2023 and July 2023. Each was published and relevant persons informed through a project update. The project updates included an explicit invitation for relevant persons, and other readers, to provide input into the assessment process. A copy of this invitation can be found in Annex 1. There now follows a summary of each environmental aspect analysed.

7.4.1.2 Planned discharges (PEIRA)

Impacts from planned discharges from project vessels was assessed as negligible within the PEIRA and, with the legislative requirements in Australia met, would be adequately managed by CGG's marine assurance system. There is no discernible difference between the planned discharges of CGG's project vessels and the hundreds of other vessels that utilise this area all year round, all of which must comply with stringent international conventions and Australian maritime laws, including Marine Orders.

7.4.1.3 Atmospheric emissions (PEIRA)

Impacts from atmospheric emissions from project vessels was assessed as negligible within the PEIRA and, with the legislative requirements in Australia met, would be adequately managed by CGG's marine assurance system. Like planned discharges, there is no discernible difference between the atmospheric emissions of CGG's project vessels and the hundreds of other vessels that utilise this area all year around.

7.4.1.4 Physical presence (Appendix E1)

Appendix E1 details the impacts from the physical presence of vessels and towed equipment and their potential interference with people and communities who use, or have a connection to, the marine environment. It includes consideration of human environmental components such as commercial fishing, indigenous culture, and marine industries, and outlines the predicted level of impact the Regia MSS may have.

The physical presence of the project vessels became a key focus area for CGG based on relevant persons consultations, summarised as follows:

- Commercial fishers identified that interference with their activities would have a detrimental effect of their business and financial interests and a comprehensive adjustment protocol will be adopted for the survey, as per industry standards.
- Conservation managers highlighted the values of marine parks (both State and Commonwealth), and appropriate buffers were established around those parks that were to the satisfaction of those agencies.
- We are aware that there are cultural values held by Traditional Owners in the area that project vessels may interfere with, and a Sea Country Protection Program is in place to provide the opportunity for Traditional Owners to co-design and co-implement a program of work to protect these values.

More information on the consultations with these groups, and others, can be found in Appendix C1.

The best measures for minimising interference with other marine users are to adapt the activity design to cater for reasonable requests for avoidance. CGG notes that some level of interference is permitted by Section 280 of the OPGGS Act. However, there is a limitation in this clause that the interference must not be to a greater extent than is necessary for the reasonable exercise of the rights and performance of CGG's duties. This facilitates a mutual marine use policy whereby other marine users and CGG must compromise on use of the marine environment.

After extensive re-design of the survey, following feedback from relevant persons (mostly commercial fishers), the activity was limited to within the 50m and 200m bathymetry contours and the active source area has shrunk to 39% of the original activity planning area (from 7,755 km^2 to 3,041 km^2). The depth limitations significantly reduce the overlap with productive fishing grounds.

Overall, the document concludes that the impacts from the physical presence of the survey equipment are considered minor, temporary, and largely avoidable with planned mitigation measures. These include on-water communications, optimised vessel usage, and compensation processes for any potential financial loss to marine users, ensuring that environmental management measures are in line with legislative and industry standards.

7.4.1.5 Underwater sound (Appendices E2 – E8)

CGG commissioned independent studies on the effects of seismic survey sound emissions on the environment prior to completing the analysis found in Appendices E2 to E8. These studies were critical in recognition that underwater sound assessments are historically one of the higher order impacts for seismic survey environment plans.

The first study used to inform the analysis were a numerical modelling report to establish the most appropriate sound exposure thresholds and effect level distances. This study focused on a highly prospective area that was critical to meeting the geological objectives of the study. The second study was a similar modelling report that examined new survey plans in response to relevant persons consultation. In particular, the new modelling tested the effect on reducing the size of the active source area and also limited the depth of the survey to no shallower than 50 m. The modelling was undertaken for sail lines as shallow as 49 m (MSL) so the output can be viewed as representing a small level of precaution to the environmental impact analyses.

The third study was a literature review of relevant peer reviewed papers in relation to the effects of sound on various environmental components. Both studies were published as soon as CGG received them, and they were used to support the provision of sufficient information to relevant persons.

The subsequent series of impact analyses of elevated levels of sound found that there were no major or catastrophic levels of effect identified to any environmental component. The effects to different species ranged from no effect, through to some effect levels that were ranked as moderate, meaning additional management and mitigation measures are required to ensure impacts are of an acceptable level.

The most important findings about predicted effects within these reports are that with the management and mitigation measures adopted by CGG:

- There may be permanent sub-lethal effects to some Southern Rock Lobsters within 711 m of the sound source that may increase affected individuals' exposure to predation, however this increased exposure to predation is insignificant in the context of a population resilient to a minimum ~30% reduction in adult lobsters every year (this statement is further examined and justified in Appendix E10 and Appendix F3).
- There may be permanent mortal injury to zooplankton within 220 m of the sound source, but this is considered insignificant in the context of total population levels of zooplankton, very high levels of naturally occurring mortality, and the avoidance of major upwelling locations where there may be higher densities or abundance (this statement is extensively examined and justified in Appendix F3).

The analyses also considered the uncertainty in the predictions of impact and found that after the application of quantitative modelling from an independent expert there was generally low levels of uncertainty in the predictions of impact. However, the following findings arose where the level of uncertainty was rated as medium, meaning there are still gaps or uncertainties:

- There was a range of literature considered in the analysis of effects to zooplankton and relevant person concern about the effect criteria used not being the most conservative.
- There is a paucity of data and information on the effects on the early life-cycle stages of species associated with the upwelling events in the region.
- There is a paucity of data and information on indirect impacts if disturbance to either Southern Right Whales and Pygmy Blue Whales occurred and an absence of long-term monitoring data of the effects of seismic given the recovery of the species in the presence of frequent seismic surveys, and other anthropogenic sound generating activities, in the region.

The impacts associated with elevated levels of sound were also some of the most frequently raised concerns of relevant persons about the adverse effects of the activity. Given these findings, CGG undertook additional assessment to put the effects of seismic surveys in context with other pressures on these species. These studies can be found in Appendix F3.

7.4.1.6 Artificial light (Appendix E9)

Appendix E9 details the regulations and management plans in place to mitigate the impact of artificial light emissions from marine vessels on wildlife, including marine turtles, seabirds, and migratory shorebirds. Compliance with the Navigation Act 2012 and associated Marine Order 30 ensures that navigation lighting on vessels meets international standards for preventing collisions at sea. The National Light Pollution Guidelines for Wildlife mandate best practice lighting design to minimise light pollution and require environmental impact assessments for artificial light that could affect wildlife. These guidelines ensure that light emissions do not disrupt wildlife within important habitats and allow for critical behaviours such as foraging, reproduction, and dispersal.

For seabirds, the Wildlife Conservation Plan for Seabirds addresses the management of light pollution effects on breeding and roosting areas, with a focus on preventing disruption to seabird activities. The Vessel Lighting Management Plan is highlighted as a key measure to keep light emissions at levels that do not disturb seabird habitats, ensuring that seabird populations are not adversely affected by artificial light from vessels.

Regarding migratory shorebirds, the document cites the Wildlife Conservation Plan for Migratory Shorebirds and the EPBC Act Policy Statement 3.21. These guidelines require that development processes consider areas important to migratory shorebirds and provide strategies to avoid significant impacts on these species. The Vessel Lighting Management Plan is implemented to ensure that light emissions do not lead to a substantial reduction in migratory shorebird numbers.

The overall impact of light emissions is rated as low concern because the project vessels will be indistinguishable from any other vessels in the area. The comprehensive assessments and mitigations, which include controlled light levels and management plans ensuring that light does not disrupt or displace wildlife from important habitats or affect their critical behaviours is over and above the standards for any other transient vessels in the area with similar levels of impact.

7.4.1.7 Accidental release of materials or waste overboard (Appendix D1)

Appendix D1 addresses the potential environmental impacts associated with the accidental release of materials or waste overboard, evaluating the risks and management measures in line with the principles of ESD and the EPBC Act Management Plans and Recovery Plans. The EP predicts that the potential for injury or mortality to marine fauna due to entanglement or ingestion of marine debris is low, with a consequence that may occur to an individual but is unlikely to affect species populations or ecosystems. This assessment considers Annex V of the International Convention for the Prevention of Pollution from Ships (MARPOL), which has prohibited the discharge of plastic into the sea since 1988 and all types of garbage since 2013.

The risk of an accidental release of materials or waste is considered unlikely and, if it were to occur, it would be a one-off event with minimal impact. All vessels used for the Regia MSS will comply with the MARPOL requirements, ensuring no solid waste discharge to the marine environment. Additional waste management measures, such as the use of covered containers to prevent windblown waste, further mitigate the potential for waste loss overboard.

In terms of the functions, interests, or activities of other users, the risk as minor, with a low likelihood of occurrence and an overall medium risk level. Control measures such as the CGG Marine Assurance System and specific waste management requirements will be adopted to ensure no waste material is disposed of overboard, with all vessels required to have a Garbage Management Plan. In the event of an accidental release of materials or waste, procedures are in place for the immediate retrieval of materials and notification of relevant authorities.

The EP asserts that the predicted level of impact from an accidental release of materials or waste remains below the defined acceptable level, affirming that the risks to biological, ecological, economic, and cultural features are temporary, reversible, and of low intensity. It emphasises that all reasonably practicable measures have been adopted to reduce environmental impacts and risks, ensuring that the implementation strategy will effectively manage any potential risk.

Additionally, the EP incorporates feedback from the consultation process to address the concerns of relevant persons. For example, assurances have been made that activities at sea will not increase rubbish washing up onshore, addressing the concerns of local tourism operators and environmental groups. The EP also details that the views of the public have been considered in the impact and risk assessment, with no public comments received in relation to an accidental release of materials or waste to date.

Overall, Appendix D1 demonstrates a comprehensive approach to managing the risks associated with the release of materials or waste overboard, aligning with regulatory requirements and demonstrating a commitment to environmental protection and sustainable practices.

7.4.1.8 Collisions with marine fauna (Appendix D2)

Appendix D2 details the risk analysis for potential collisions with marine fauna due to survey operations. It sought expert feedback to refine these assessments, emphasising accuracy, environmental values, scientific literature, legislation, and additional mitigation measures. The risk of collisions or entrapments with marine animals is considered in the context of legal requirements and operational measures, with details on specific marine species expected to be found in the area.

Management strategies are in place to mitigate this risk. Measures include design modifications to equipment (adoption of turtle guards), regulated vessel speeds, the presence of marine fauna observers, and adherence to Policy Statement 2.1. The document asserts that the predicted impacts from vessel operations are unlikely and restricted to individual animals. There is no affect to populations or the overall health of the marine ecosystem.

The risk of collision with marine fauna is low. Crews keep a lookout for marine fauna, and the vessel operates at a slow speed to give animals time to move away. When the sound source is active it is more likely that marine fauna will navigate away from the sound rather than toward it. However, once the source passes, animals will be free to move back into the habitat that they departed from. [Paragraph updated in response to Matter I05]. The Regia MSS has been designed to avoid known areas of high animal concentrations, especially during sensitive times such as migration or breeding seasons.

7.4.1.9 Introduction of marine pest species (Appendix D3)

Appendix D3 provides a detailed analysis of the potential introduction of marine pest species associated with seismic survey activities. It delves into the various ways marine pests might be introduced, notably focusing on vessels used in the Regia Marine Seismic Survey. The introduction risk is attributed to factors such as the discharge of ballast water containing foreign species and the translocation of species through biofouling on vessel hulls or in-water equipment like source arrays and streamers. The document further explores the duration and extent of this risk, indicating that the potential for introducing marine pests exists within the Activity Planning Area over a period of 90 days while activities are undertaken.

Additionally, the assessment touches on the legislative and other requirements governing marine pests, with an appendix detailing these legalities and compliance strategies. A notable inclusion is the PEIRA, which establishes a cause-effect pathway for the potential introduction of marine pests because of the survey activities.

Conclusively, the document rates the risk of introducing marine pest species due to these activities as medium. This rating underscores the importance of vigilance and the implementation of effective measures to mitigate this environmental concern, highlighting the need for a careful balance between operational objectives and ecological conservation. The IMS risk assessment procedure adopted by CGG is a comprehensive approach to meeting and exceeding the requirements of the Biosecurity Act 2015 which is consistent with industry best practice.

7.4.1.10 Accidental release of fuel (Appendix D4)

Appendix D4 provides a comprehensive risk assessment concerning the potential loss of containment and subsequent oil spill scenarios associated with the seismic survey operations. Contained within this document is a detailed summary that includes an analysis of the aspects and mechanisms of potential loss of containment, the extent and duration of such events, and the relevant legislative requirements that govern the survey's operations. A cause-effect pathway is delineated, clarifying how an incident might unfold and the potential consequences thereof.

Crucially, the document assesses the existing environment where the Regia MSS is to be conducted, anticipating the consequences on various environmental receptors including water and sediment quality, benthic assemblages, coastal habitats and communities, plankton, invertebrates, fish populations, birds, marine reptiles, and marine mammals. Additionally, it considers the effects on coastal developments, Indigenous culture, commercial fisheries, the seaweed industry, and other marine industries.

The risk assessment predicts the levels of risk to these environmental receptors, establishing criteria for sensitivity and has predicted level of risk to be medium. This is mainly due to the rare likelihood of a spill event occurring based on the absence of any reported collision of a seismic vessel leading to an oil spill in Australia. This is further supported by the adoption of the vessel bunkering procedure, the marine assurance system, and the comprehensive oil pollution emergency plan (OPEP) and operational and scientific monitoring program (OSMP) as means for reducing the consequences of a spill.

7.4.1.11 Summary of impact and risk analysis

The environmental impact and risk analysis were structured to systematically capture this part of the environmental assessment process for the environmental aspects of the activity identified by the PEIRA. The structure included:

- An outline of the aspect being assessed.
- A description of how the aspect occurs and its extent and duration.

- The legislative and other requirements that apply.
- A cause-effect pathway analysis.
- An overview of the existing environment that may be affected by the activity.
- Predicted levels of impact and a comparison with defined acceptable levels.
- Identification of mitigation and management measures.
- Document control information and references.
- Appendices with detailed legislative and other requirements.

These elements collectively form a thorough environmental assessment, providing a clear pathway from the Description of Activity (Appendix A2) through to the environmental performance required of CGG (Appendix G1). They are sufficient because they:

- **Follow a Recognised Framework:** The analysis utilise a methodology aligned with international standards and regulatory frameworks, ensuring robustness and completeness.
- **Are Comprehensive:** CGG have addressed all relevant environmental aspects and their potential impacts or risks, from minor to significant.
- **Incorporate Best Available Information:** Used the latest and most relevant scientific data and relevant person input for assessments.
- **Ensures Transparency:** Clearly documents all steps, from scoping to conclusion, allowing for relevant person review and verification.
- **Define Mitigation Measures:** The documents each proposes effective mitigation and management measures for identified impacts or risks.
- **Meet Legal Requirements:** Aligns with legislative and regulatory obligations, ensuring compliance.
- **Facilitate Decision Making:** Provides a clear basis for informed decision making by CGG, regulators, and other stakeholders.

Each analysis has been publicly available since September 2023. Whilst there have been general comments raised about the analyses, there have been no direct comments received related to the matters upon which CGG invited feedback with the exceptions discussed below.

During consultation there was some criticism that the environmental assessments were inadequate because they did not consider cumulative effect properly and bifurcated the aspects of the activity rather than consider them holistically (Event ID 3697). CGG considered that cumulative impacts were properly considered because the existing environment step in each analysis was carried out considering the existing and future pressures on the environment. However, CGG also recognised it was opaque how current and reasonably foreseeable activities had been considered. This lead CGG to work with other titleholders known to be proposing petroleum activities in the region to prepare a Cumulative Impact Assessment which was published on submission for public comment (Appendix E10).

CGG also received criticism about the bifurcation of the assessment by considering each environmental aspect in isolation. CGG acknowledges that the process and format of the assessments lead to relevant persons who had concerns about specific receptors (Event ID 3697) would not be able to get a holistic picture of the effects on that receptor easily. This lead CGG to complete additional evaluation of higher order environmental values and sensitivities so that effects could be considered more holistically (Appendix F3). Similarly, relevant persons looking for holistic assessments of the activity's consistency with the principles of ESD (Event ID 3697) would have an equally troubling time given this assessment was done against each environmental aspect. This lead

CGG to commission a separate evaluative document looking at the consistency of the decision-making process used in preparation of the EP with the principles of ESD (Appendix F4).

7.4.2 Evaluation of all the environmental impacts and risks

There are three main stages of the evaluation that occurred in sequence during the consultation process. The first stage of the evaluation of all environmental impacts and risks started with CGG publishing its Decision-Making Criteria (Appendix B1). The purpose of the Decision-Making Criteria provides the defined acceptable levels against which the (future) predictions of impact and risk will be compared. In the format shown in Table F1-7, they are used in the structured process of evaluating each environmental aspect.

The criteria, or justifiable variations on them, have been used by CGG in recently accepted EP's (Gippsland MSS) and in other current EP's (Sauropod MSS). They are like the criteria applied in most EP's accepted by NOPSEMA and were assessed to be appropriate in the context of the Regia MSS. The Regia MSS Decision-Making Criteria document was hosted on the Regia MSS Consultation Hub for 61 days between 1 May 2023 and 30 June 2023, during the 'analysis' phase of the environmental assessment and prior to the evaluation phase. This was done to ensure that relevant persons had the opportunity to comment on them prior to CGG applying the criteria in the impact and risk analyses.

Relevant persons were invited to comment on the appropriateness of the criteria and had an opportunity to influence CGG's application of the criteria to the environmental assessment process (Appendix B9). Awareness was raised about this opportunity and the importance of inputting at webinars, in 1-on-1 meetings, community meetings, and on social media (Appendix C1 & C2). Despite this, no comments were received through the Consultation Hub, nor in any subsequent meetings.

The second phase of the evaluation of all environmental impacts and risks was to use the decision-making criteria in the draft impact and risk analyses. Each of the fourteen analyses dutifully carried out this process and each presents a comparison of the predicted levels of risk against the defined acceptable levels. In doing so, CGG has complied with the expectations of NOPSEMA's Decision-Making Guidelines (N-04750-GL1721).

Table F1-7 - Defined Acceptable Levels of Impact and Risk

Category	**Defined Acceptable Level for the Regia MSS Impacts and Risks**
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.
	The impact and risk assessments are based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.
Economic	Affected persons will not be worse off because of the activity.
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.

Category	Defined Acceptable Level for the Regia MSS Impacts and Risks
	Environmental impacts and risks are consistent with the CGG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.
	The views of the public have been considered in the impact and risk assessment.

The analyses must be appropriate to the nature and scale of the activity (Section 21(5)(b)) and the analysis completed in Appendices D1 – D4 and E1 – E10 are appropriate because they are:

- **Comprehensive:** They cover all environmental aspects, and all environmental components including air, water, land, flora, fauna, and human health including the social, economic, and cultural features of these.
- **Systematic:** They follow a structured methodology to identified environmental impacts and risks.
- **Transparent:** Clearly document the assessment process and findings for relevant person review and they have been publicly available for months prior to submission.
- **Precautionary:** Each analysis applies caution in uncertainty, preferring preventative measures and properly applying the hierarchy of controls concept.
- **Adaptable:** The analysis will be maintained in a 'live' status throughout the duration of the EP so to enable the incorporation of new data and adjust management and mitigation measures as needed.
- **Properly scaled:** There has been greater effort applied to analysis of impacts and risks with lower predictive confidence and higher effect/consequence meaning the EP has prioritised actions based on the severity of impacts and risks.
- **Sustainability Focus:** Each analysis shows that actions meet current needs without compromising future generations.
- **Legally Sound:** Comply with relevant laws and regulations.
- **Ethical:** Address the social and cultural impacts on local communities.

The analyses completed have credibility because they incorporated peer-reviewed scientific literature, utilised high-quality and verifiable data, employed rigorous and established scientific methodologies, ensured the reproducibility of results, and maintained transparency regarding methods and data sources used. It also exercises objectivity, avoiding any conflicts of interest by using qualified external experts, and follows international standards for environmental impact assessments. Comprehensive documentation throughout the assessment process further underpins its scientific integrity.

The conclusion from the four risk analyses (Table F1-8) and ten impact analyses (Table F1-9) provided a series of ratings in accordance with the environmental assessment process (Appendix B9).

Table F1-8 - Summary of Risk Assessment Outcomes of the Environmental Assessment Process

Appendix Ref	Predicted level of Consequence	Likelihood	Predicted level of Risk
D1 – Accidental Release of Waste Overboard	Minor	Unlikely	Medium
D2 – Fauna Interactions	Major	Rare	Medium
D3 – Invasive Marine Species	Major	Rare	Low
D4 – Oil Spill Risk	Moderate	Rare	Medium

Table F1-9 -Summary of Impact Assessment Outcomes of the Environmental Assessment Process

Appendix Ref.	Predicted level of Effect	Uncertainty	Predicted level of Impact
E1 – Physical Presence	Moderate	Low	Medium
E2 – Underwater Sound - Plankton	Minor	Low	Low
E3 – Underwater Sound – Fish	Minor	Medium	Medium
E4 – Underwater Sound – Invertebrates	Minor	Medium	Medium
E5 – Underwater Sound – Birds	Minor	Medium	Medium
E6 – Underwater Sound – Turtles	Minor	Low	Low
E7 – Underwater Sound – Marine Mammals	Moderate	High	High
E8 – Underwater Sound – Surfers, Divers, & Swimmers	Negligible	Low	Low
E9 – Artificial Light	Minor	Low	Low

The third and final stage of evaluating all environmental impacts and risks is to consider them holistically from the activity. To achieve this CGG, decided to wait to commence these assessments until it believed all relevant persons had received sufficient information and a reasonable period to share their assessments of how their functions, interests, and activities may be affected by the Regia MSS. This allowed for relevant persons to input into the evaluation step with information, feedback, objections, and claims. CGG was subsequently able to make properly informed decisions. CGG notes that many titleholders use the UKOOA Risk Decision Framework and in this framework each impact and risk would have been assessed using decision context 'C', the most inclusive of societal values.

So, following the commencement of inviting objections and claims from relevant persons CGG began the evaluation steps of the environmental management process (Appendix B9). To reiterate, the evaluation of all the environmental impacts and risks is considered in the CGG environmental assessment process to be a holistic assessment about whether the collective set of all the impacts or all the risks have been managed to below an acceptable level and reduced to ALARP.

The evaluation documents originally intend to be completed by CGG were:

- Appendix F1 – An assessment whether the EP meets each criterion for acceptance (this document).
- Appendix F2 – A more detailed assessment of whether the activity can be carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable.
- Appendix F3 – A more detailed assessment of whether the activity can be carried out in a manner by which the environmental impacts and risks of the activity will be of an acceptable level.

As per the earlier commentary, an additional evaluative document was added to the decision-making part of the process because of the consultations:

- Appendix F4 – A more detailed assessment of whether the activity can be carried out in a manner consistent with the principles of ecologically sustainable development set out in section 3A of the EPBC Act.

These documents are appended as part of the EP and make the demonstrations required by Section 34, which is discussed in detail in Part 1 of this EP.

7.4.3 Details of the control measures

Sections 21(5)(c) requires the EP to include details of the control measures that will be used to reduce the impacts and risks of the activity to as low as reasonably practicable and an acceptable level. The control measures adopted for the Regia MSS to achieve this are listed below and the full details are presented in Appendix G1.

1. **M#02: Consultation Management System (CMS):** CMS organizes efficient consultation processes throughout the activity lifecycle, including identifying, engaging, and responding to relevant persons.
    - **Activity Communications Plan:** Part of CMS, CLP informs relevant persons and communities about activity progress, with the Environment Advisor ensuring communication adherence.
    - **Fisheries Liaison Officer (FLO):** A CGG representative that can discuss the status of the Regia MSS operations with fishers and assists with Adjustment Protocol claims.
2. **M#03: Fauna Management System:** Focuses on protecting marine fauna, especially Southern Right Whales and Blue Whales, during Regia MSS through various surveillance and impact minimisation methods.
    - **Fauna Management Plan (FMP):** The FMP offers guidance for on-water actions and shoreside support to protect marine fauna, ensuring compliance with EPO's.
    - **Fauna Detectors:** The system employs Marine Fauna Observers, Passive Acoustic Monitoring Operators, and Acoustic Detection Monitoring Operators on multiple platforms in multiply locations for identifying and minimising impacts on marine fauna.
    - **Fixed Buoy Acoustic Detection:** Fixed buoys, equipped for real-time whale detection, are tested for reliability in detecting low-frequency whales.
    - **Aerial Surveillance:** Complements other methods for detecting whales, focusing on movements of Southern Right Whales and Blue Whales in specific areas.
    - **Expert Panel:** Independent experts in whale species assist CGG in dynamic survey situations to achieve EPO's, with details in the FMP.
3. **M#04: Marine Assurance System:** Ensures compliance with maritime regulations and includes vessel contractor assessments and biofouling controls to meet EP requirements.
    - **Project Vessels and Gear:** Includes various vessels equipped with environmental protection gear and procedures, ensuring navigational safety and environmental compliance.
    - **IMS Risk Assessment Procedure:** Assesses vessels and equipment for environmental risks in line with international and national standards.

- **Vessel Bunkering Procedure:** Ensures best practices and standards in bunkering operations at sea.

4. **M#05: Sail Line Plan:** Procedural control for contractor activities, including technical and spatial data to comply with CGG specifications and activity limitations (M#01).
5. **M#06: Sea Country Protection Program (SCPP):** Aims to identify and protect cultural heritage values, inviting co-design and co-implementation by First Nations peoples.
6. **M#07: Adjustment Protocol for Commercial Marine Users:** Manages unavoidable interference with fishing activities, outlining principles for negotiation and response.
7. **M#08: Oil Pollution Emergency Plans:** Comprehensive plans for addressing oil spill incidents, aligning with national preparedness and response systems.
8. **M#09: Acquire Seismic on Paper (ASOP):** A pre-operational workshop for CGG, its contractors, and technical staff to collaborate to identify risks and improvements.
9. **M#10: Company Site Representatives:** CGG assigns onboard representatives for Quality Control, Health and Safety, and Environmental Advice, ensuring compliance with EP and the survey contract.

7.5 Environmental Performance Outcomes and Standards

Appendix G1 details the control measures and environmental performance required for the Regia MSS to reduce environmental impacts and risks to ALARP and acceptable levels. It includes consultation outcomes and was updated throughout the consultation process. A significant update was undertaken after most objections and claims had been received to show the measures adopted because of the consultations. Appendix G1 was published when the EP was submitted for public comment on the Consultation Hub. Prior to public comments the initial set of management and mitigation measures were published in the impact and risk analysis documents.

Appendix G1 sets out management and mitigation measures which should be interpreted as self-imposed conditions or limitation of acceptance. These are framed as environmental performance required of the activity. An EPO is a measurable level of performance required for the management of environmental aspects of the activity to ensure that environmental impacts and risks of the activity will be of an acceptable level. The EPOs for the Regia MSS, informed by the defined acceptable levels, and against which the performance of CGG in protecting the environment is to be measured, are:

EPO 1. To ensure effective communication and engagement with relevant persons and local communities throughout the activity's lifecycle, fostering transparency, understanding, and responsiveness to their needs and concerns.

EPO 2. No death or injury to fauna, including listed threatened or migratory species, from the activity.

EPO 3. Sound emissions in BIAs will be managed such that any whale, including blue whales, continue to utilise the area without injury, and is not displaced from a foraging area.

EPO 4. Biologically important behaviours within a BIA or outside a BIA can continue while the activity is being undertaken.

EPO 5. No introduction of a known or potential invasive marine species.

EPO 6. To guarantee that all contracted vessels strictly adhere to international and national maritime regulations, including MARPOL, COLREGS, and specific Marine Orders.

EPO 7. To ensure that the seismic acquisition activity adheres to the specified boundaries and technical requirements outlined in the sail line plan, minimizing the impact on the environment.

EPO 8. To establish and maintain a framework for Sea Country protection that manages the interaction of the activity with First Nations cultural values and sensitivities.

EPO 9. Interference with other marine users is of no greater extent than is necessary for the exercise of right conferred by the titles granted.

EPO 10. To establish and maintain an effective Oil Pollution Emergency Plan (OPEP) that ensures swift and efficient response to oil spill incidents, minimizing environmental harm, protecting sensitive ecosystems, and safeguarding human health and safety.

EPO 11. To align all staff and contractors involved in the activity to ensure environmental protections implemented in this EP can and will be met.

The full list of EPSs for the control measures listed in Section 7.4.3 are provided in Appendix G1 along with detailed measurement criteria that CGG will use to determine whether each environmental performance outcome and environmental performance standard is being met.

8 Implementation Strategy for Environment Plan

Appendix B3 details CGG's approach for environmental management of the Regia MSS in accordance with Section 22. Appendix B3 was published as part of the 'establishing the context' step in the assessment process. Publishing this document early in the assessment process was essential as it provided the community with a clear understanding of the company's management systems in practice, especially in relation to each sub-clause of Section 22.

8.1 Environmental Management System

Appendix B3 contains a description of the Environmental Management System (EMS) designed to ensure that CGG's activities, specifically for the Regia MSS, are conducted in an environmentally responsible manner. That includes specific measures to be used to ensure that, for the duration of the activity:

- the environmental impacts and risks of the activity continue to be identified and reduced to a level that is as low as reasonably practicable.
- control measures in Section 7.4.3 (and Appendix G1) are effective in reducing the environmental impacts and risks of the activity to as low as reasonably practicable and an acceptable level.
- environmental performance outcomes and environmental performance standards in the environment plan are being met.

The EMS encompasses a structured framework for managing environmental responsibilities, facilitating compliance with legal and other requirements, and achieving continuous improvement in environmental performance. The system includes mechanisms for identifying environmental aspects and impacts, setting objectives and targets, and monitoring and reviewing performance to mitigate environmental risks effectively.

8.2 Roles and Responsibilities

Appendix B3 establishes a clear chain of command, setting out the roles and responsibilities of employees and contractors in relation to the implementation, management, and review of the EP. There are also specific measures to ensure that each employee or contractor working on, or in connection with, the activity is aware of the employee's or contractor's responsibilities in relation to the EP, including during emergencies or potential emergencies, and has the appropriate competencies and training.

Key roles include the Environmental Manager, who ensures compliance with environmental standards; the Operations Manager, responsible for daily activity management; and the HSE Advisor, who advises on health, safety, and environmental matters. During the survey, the Survey Manager and Party Chief play crucial roles in implementing the EMS on-the-water, with specific duties in overseeing operational adherence to environmental protocols and immediate response actions.

8.3 Monitoring and Reporting Requirements

Appendix B3 provides for meeting the requirements of Section 22(5) and is sufficient because CGG's approach to environmental performance management hinges on several key elements:

- **Comprehensive Monitoring and Recording:** CGG's strategy likely includes rigorous monitoring and recording practices that capture a wide range of environmental data. This continuous collection of information is vital to understand the real-time impact of activities and to ensure environmental performance outcomes and standards are met.

- **Regular Audits:** Periodic audits provide an additional layer of scrutiny, helping to identify any discrepancies between the planned environmental management practices and those carried out. Audits are a cornerstone of any robust environmental management system, enabling the detection of potential non-conformances before they escalate.
- **Management of Non-conformance:** When non-conformances are identified, CGG's strategy probably defines clear processes for addressing them. This includes corrective actions to mitigate any environmental impact and preventive measures to ensure the same issues do not recur.
- **Review and Continuous Improvement:** The strategy must include regular reviews of environmental performance against the outcomes and standards set in the environment plan. These reviews feed into a cycle of continuous improvement, ensuring that the strategy evolves and adapts to new information or changes in the operational environment.
- **Alignment with Regulations and Standards:** CGG's implementation strategy is designed to align with relevant environmental regulations and industry standards, providing a framework that supports compliance and environmental protection.
- **Relevant Person Involvement:** By incorporating feedback into monitoring and review processes, CGG ensures that the strategy is responsive to the concerns of all relevant interested persons, which is critical for maintaining social license to operate.
- **Transparency:** Adequate reporting mechanisms likely ensure transparency in CGG's operations, which is essential for building trust with regulators, relevant persons, and the public.

These elements collectively ensure that CGG's implementation strategy for environmental performance is proactive, responsive, and in line with best practices, thereby meeting the intended outcomes and standards in the environment plan.

Similarly, the sufficiency of CGG's monitoring and maintaining quantitative records of emissions and discharges as part of an environmental management system lies in its ability to:

- **Ensure Accountability:** Quantitative records provide concrete evidence of performance against environmental standards. This data is essential for verifying compliance and demonstrating accountability in environmental management.
- **Enable Impact Assessment:** The records allow for an accurate assessment of the actual versus predicted environmental impacts. This is crucial in determining whether the environmental performance outcomes and standards in the environment plan are being met.
- **Facilitate Decision Making:** Quantitative data on emissions and discharges support informed decision-making. It enables the identification of trends, potential areas of improvement, and the effectiveness of mitigation measures.
- **Support Transparency:** Detailed records of emissions and discharges contribute to transparency, enabling relevant interested persons to assess the environmental performance of the operations themselves.
- **Comply with Regulatory Requirements:** Regulators require precise records to ensure that operations are within the allowed environmental limits. Such records are often a regulatory requirement, and their sufficiency ensures legal compliance.
- **Aid Continuous Improvement:** Quantitative records are a benchmark for continuous improvement. By analysing the data, the company can identify opportunities for reducing its environmental footprint and enhancing its environmental performance.

Monitoring and record-keeping of emissions and discharges are foundational to a robust environmental management system, ensuring environmental performance outcomes and standards are being met efficiently and effectively.

Appendix B3 states when CGG will report to NOPSEMA in relation to its environmental performance for the activity and the interval between reports is not more than 12 months.

8.4 Emergency Response Planning and Testing

The OPEP is mentioned in Appendix B3 but is provided in its complete form in Appendix G3. The arrangements for responding to and monitoring environmental pollution as outlined in the OPEP & OSMP document demonstrate adequacy by establishing comprehensive, systematic processes for handling potential oil and chemical spill emergencies. The document details initial response actions, specific notification procedures, and the roles and responsibilities of key personnel in addressing spills. Moreover, it integrates the Operational and Scientific Monitoring Plans, which are designed to effectively manage and mitigate oil pollution incidents and ensure compliance with regulatory obligations.

The plans include a tiered response protocol that scales according to the severity of the spill, leveraging resources from the National Plan for Maritime Environmental Emergencies to maximise response capabilities. The OPEP has been shared with the Victorian and Tasmanian Control Agencies during the consultation process and feedback from those groups has been incorporated. The OPEP was published on the Consultation Hub for transparency and comment.

There are provisions in Appendix B3 for the testing of oil pollution emergency response arrangement and they are appropriate because they:

- Align with industry best practices and standards.
- Are designed to realistically simulate operational conditions.
- Are regularly reviewed and updated based on operational feedback and incidents.
- Ensure that all equipment and response protocols are effective and can be reliably deployed in actual events.
- Examine the effectiveness of response arrangements against the objectives of testing.
- Include mechanisms to address any recommendations arising from tests.

8.5 Ongoing Consultation

The arrangements for ongoing consultation as detailed Appendix B3 are appropriate due to the structured and inclusive approach they adopt. These arrangements are designed to comply with Section 22(15) which stipulates that the implementation strategy must include ongoing consultation with relevant authorities and other relevant interested persons or organisations.

The key reasons for the appropriateness of these provisions show:

- **Inclusive Engagement:** By committing to consult with relevant authorities of the Commonwealth, State, or Territory, as well as other interested persons or organisations, the strategy ensures that all relevant interested persons with a potential interest are considered.
- **Continuity of Consultation:** The provisions for ongoing consultation beyond the initial acceptance phase, during the planning, and throughout the execution of the activity, ensures that relevant interested persons are engaged and informed at all stages of the project. This

continuous engagement allows for adaptive management in response to concerns and evolving project dynamics.

And in relation to emergency conditions because:

- **Real-time Identification of High Priority Areas:** The strategy involves identifying high priority protection areas within the Environment that May Be Affected (EMBA) in real-time, which allows for immediate attention to sensitive areas and the ability to quickly adapt strategies in response to emerging issues.
- **Monitoring Methodologies:** Specifying monitoring methodologies within the Operational and Scientific Monitoring Program (OSMP) provides transparency about how environmental monitoring will be conducted, enabling stakeholders to understand and trust the monitoring process.
- **Situational Awareness:** The strategy is designed to provide situational awareness, assisting in the planning and execution of emergency responses, which minimises environmental harm and aids in recovery efforts.
- **Recovery Assessments:** By providing for both short-term and long-term environmental damage and recovery assessments, the strategy demonstrates a commitment to understanding and mitigating the full spectrum of potential environmental impacts.

Overall, the ongoing consultation provisions reflect a commitment to transparent, inclusive, and adaptive environmental management, which is critical to maintain trust and to safeguard the environmental integrity of the project.

9 Details of Titleholder and Nominated Liaison

As required by Section 23, the details for the titleholder are:

- CGG Services (Australia) Pty Ltd
- Level 1, 1 Ord Street, West Perth WA 6005
- Telephone: +61 8 9214 6200
- ACN: 081 777 755

And the details for the CCG's nominated liaison for the activity are:

- Paul Rheinberg
- Level 1, 1 Ord Street, West Perth WA 6005
- Telephone: +61 8 9214 6200
- contact@regiamss.com.au

If there is a change in the titleholder, the titleholder's nominated liaison person or a change in the contact details for the titleholder or liaison person, CGG will notify NOPSEMA and provide the updated details (as described in Appendix B3).

10 Other Information in the Environment Plan

10.1 CGG Corporate Environmental Policy

Section 24(a) requires that the EP must contain a statement of CGG's corporate environmental policy. CGG has two policies that are relevant to this section which are listed below and can be found at Appendix A1:

- Environmental, Social & Governance Policy
- Health, Safety & Environment Policy

These documents were considered as foundational to the Regia MSS EP and to the consultation process. Therefore, CGG published these policies on the Regia Consultation Hub at the commencement of the consultation process so that community members and relevant persons had line of sight to the policies that governed CGG's employees, contractors, and site visitors.

10.2 Consultation Report

Section 25(g) has two requirements for titleholders, that Division 2.2A consultation is complete prior to completeness check and that appropriate measures are adopted considering those consultations. The Act and Regulations do not define what constitutes consultation for the purposes of Division 2.2A and subsequently 25(g) and in this absence, CGG fulfilled consultation obligations subjectively based on the circumstances and characteristics of the relevant persons affected.

Beginning on 4 February 2023, CGG commenced consultation in preparation of the Regia MSS Environment Plan. The overarching goal of consultation was to identify as many relevant persons as possible and provide them with sufficient information to help inform the protection of the environment. The consultation process was designed in the context of the objects of the Environment Regulations and is consistent with the principles of ESD, reduces environmental impacts risks to ALARP and an acceptable level. Full details of how CGG aligned consultation with the principles of ESD can be found in Appendix F4.

Very broadly, the consultation process involved the following steps:

1. Identifying the legislative and regulatory requirements.
2. Incorporating other guidelines and resources into the planning stage.
3. Creating a community consultation and engagement plan.
4. Identifying *each*[5] relevant person through a broad capture of people and information.
5. Providing identified relevant persons with sufficient information to make an informed decision on the potential impacts of Regia MSS on their functions, interests and activities.
6. Allowing a reasonable period for consultation.
7. Giving relevant persons appropriate feedback.
8. Assessing the merit of any objections, claims or feedback relevant persons had, and where appropriate incorporating this into the EP.
9. Keeping confidential records of all communications with relevant persons.
10. Having appropriate ongoing consultation procedures in place in the implementation strategy.

[5] The requirement that the titleholder "must consult with each" relevant person is a requirement to consult with each and every relevant person. The text of reg 11A, including the multiple references made to "each relevant person" make that requirement clear." Tipakalippa v National Offshore Petroleum Safety and Environmental Management Authority (No 2) [2022] FCA 1121 at [81]. Although CGG recognises some RP's may remain unidentified for reasons discussed in Appendix C1, the methodology employed was reasonably capable of discharging this obligation.

The complete details of these steps are expanded on in Appendix C1 (Consultation Chapter) and full supporting documentation can be found in Appendices C2, C3, and C4.

In January 2024, CGG completed consultation in the preparation of the Environment Plan. The valuable information provided by relevant persons was consolidated and reviewed to ensure it was accurately reflected and accommodated for in the EP before submission to NOPSEMA for public comment.

CGG will continue to communicate throughout completeness check and public comment. Once the Environment Plan is accepted, the appropriate ongoing consultation procedures outlined in Appendix B3 will ensure relevant persons remain up to date and informed throughout the life of the project.

In accordance with Section 24(b), this EP contains a report on all consultations between CGG and any relevant person. Table F1-10 shows concordance with the section requirement and the location of the contents in this EP.

Table F1-10 - Concordance table of content meeting the requirements of Section 24(b)

Regulatory Requirements	Location in the EP
A summary of each response made by a relevant person.	**Appendix C2** This document is structured in two parts. The first part is organised by each person consulted, either as an individaul, or as a representative of an organisation. The second part is organised by each organisation or authority consulted. Each consultation was given a unique identifying 'Event ID' which is listed in Appendix C2. The details of each Event have been reported and the summary can be found in the furthest right column of the report, under each persons or organisation.
An assessment of the merits of any objection or claim about the adverse impact of each activity to which the environment plan relates.	**Appendix C2** Each objection or claim raised by a relevant person was logged in the Consultation Management System. The system requires that an assessment of the merits of each objection or claim is made. This enabled reporting against indivduals that raised the objection or claim, as well as reporting in a consolidated list of objections and claims. Appendix C2 presents both reports; by person or organisation, and in a consolidated format.
A statement of the titleholder's response, or proposed response, if any, to each objection or claim	**Appendix C2** For each objection and claim entered into the Consultation Management System, CGG was required to make a statement of response. This included the consideration of adopting measures because of the consultations (meaning because of the objection or claim.
A copy of the full text of any response by a relevant person.	**Appendix C4** The full text copies of each Event sent by CGG to relevant persons are included for context as well as the full text copies of any response by a relevant person. This attachment is structured as a repeat of Appendix C2, only with the inclusion of the full text copies of every Event.

Regulatory Requirements	Location in the EP
Consultation materials	**Appendix C2** This details the materials used during consultations to provide sufficient information to relevant persons. CGG prepared summary documents that it believed would be useful and on request from relevant persons. Documents requested were also published on the Consultation Hub. This appendix also includes all evidence of awareness raising activities through traditional and social media.

The consultation report is supplemented by Appendix C3 which is a sensitive part of the EP and must not be published. Appendix C4 is similarly a sensitive part of the EP and must not be published.

10.3 Details of all Reportable Incidents

A 'reportable incident' is defined as an incident related to the activity that has caused or has the potential to cause moderate to significant environmental damage. As required by Section 24(c), the following information details the scenarios that could meet this definition during the Regia MSS:

Table F1-11 - Details of reportable incidents

Scenario	Details of reportable incidents
Impact on marine fauna	Any incident leading to the disturbance of a blue whale from its foraging area or injury to a southern right whale or blue whale due to the acoustic output will be considered a reportable incident.
Exceedence of permitted sound levels	When undertaking the activity, CGG will be verifying the sound levels emitted. Exceedence of the levels that have been predicted may give rise to unacceptable impacts on protected species. As such any exceedances of permitted sound levels may lead to a reportable incident
Seabed disturbances	The activity does not include anchoring and has eliminated the assessment of physical disturbances to the seabed on that basis. Therefore any anchoring, or other distrubance to the seabed could significantly alter benthic habitats will be subject to reporting.
Oil spills	Accidental releases of hazardous substances or marine diesel from survey vessels will be reportable.
Effects on protected areas	The activity does not overlap any protected areas. Therefore, any activities inadvertently impacting marine protected areas or sensitive ecological zones will be promptly reported.
Unplanned interference with fishing and navigation	There may be some interference with fishing and navigation on the water, however, with the control measures in place interference should be avoidable. Therefore, if there are any unplanned interferences that materially disrupt local fishing or navigation, they will be reported in accordance with Section 24(c).
Boundary violations	Conducting activities outside of permitted zones, impacting unassessed environments, is reportable. Strict navigational controls and continuous tracking of survey vessels will prevent such incidents.

In accordance with Section 24(c) and detailed within the Implementation Strategy document, CGG Services (Australia) Pty Ltd is obliged to notify the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) of any recordable and reportable incidents. Recordable incidents are those that breach an Environmental Performance Outcome (EPO), or Environmental Performance Standard (EPS) set in the EP that are not reportable incidents, while reportable incidents are those that have caused or have the potential to cause moderate to significant environmental damage.

When such incidents occur, they are to be reported by the Client Site Representative to the relevant government agency within the specified timeframe. Following the notification of an incident, an investigation is conducted, and the findings are communicated to all pertinent personnel. Documentation of both recordable and reportable incidents is managed by the CGG Technical Operations Manager and includes details of the incident, immediate actions taken, and corrective actions implemented to prevent recurrence. This process ensures that all incidents are appropriately logged and reviewed, with a view to continuous improvement. The specific requirements for the reporting and recording of incidents are outlined in Table 1 of Appendix B3.

11 EP Summary

This document functions as the EP Summary required by Section 35(7). Table F1-12 is a concordance table with the requirements of this section and this document.

Table F1-12 - EP Summary Concordance Table

Section 35(7)	EP Summary Content Location
The location of the activity.	Part 1, Section 7.1
A description of the receiving environment.	Part 1, Section 7.2.1
A description of the activity.	Part 1, Section 7.1
Details of environmental impacts and risks of the activity.	Part 1, Section 7.4.1
A summary of the control measures for the activity.	Part 1, Section 7.4.3
A summary of the arrangements for ongoing monitoring of the titleholder's environmental performance.	Part 1, Section 8.3
A summary of the response arrangements in the oil pollution emergency plan.	Part 1, Section 8.4
Details of consultation already undertaken, and plans for ongoing consultation.	Part 1, Section 10.2, and Section 8.5
Details of the titleholder's nominated liaison for the activity.	Part 1, Section 0

12 Revision History

Version	Date of Revision	Author/Reviewer	Summary of Changes
0.0	12 December 2023	MS/SR/LB/AE	Document drafted.
0.1	22 December 2023	LT/PR	Review by CGG
1	4 January 2024	MS	Updated and reviewed, published for public comment.
2	9 June 2024	AH/CT/MS	Updated following public comment. Incorporated passage of time amendments.

Annex 1

Copy of invitation to readers of the draft environmental assessments

Dear Reader,

The Regia MSS Environment team is seeking your insights, experience, and expertise as we look to refine the impact assessments for the Regia MSS Environment Plan. These documents are the result of careful research, analysis, and the dedicated pursuit of informed decision-making. Any environmental assessment process is improved by thoughtful critique, suggestions, and feedback to ensure these assessments are as comprehensive, robust, and accurate as possible.

Your unique perspectives and areas of expertise could shed light on facets that we might have overlooked or underestimated. Whether it's a detail that seems off, an argument that could be further strengthened, or an area that needs more clarity, we want to hear from you. No point is too small, and no comment is insignificant. Each one will contribute significantly to the improvement of these assessments.

This document has been prepared as a draft for consultation. It forms the basis of the Environment Plan that will be submitted to NOPSEMA. It will be amended based on feedback received and any subsequent research required.

An intended purpose if the document is to provide detail on an environmental aspect to assist in the provision of sufficient information for relevant persons during the consultation process. The Regia MSS team is specifically looking for the following types of feedback:

- *The accuracy of the described environment that may be affected.*
- *Any omissions of environmental values and sensitivities relevant to the environmental aspect.*
- *Any errors or omissions of scientific/peer reviewed literature that should be considered.*
- *Any errors or omissions of relevant legislation or documents of standing that should be considered.*
- *Any further mitigation or management measures that should be considered.*

For relevant persons, we are also seeking objections or claims about the impact or risk described may affect you. To assist us resolving any objections or claims you may have, we ask that your feedback includes a short preamble about your functions, interests, or activities and a clear statement about how the proposed activity/aspect may affect you.

This document should be read in the context of the Description of Activity and the Preliminary Environmental Impact and Risk Assessment available in the document library on the Regia MSS website (www.regiamss.com.au) which constitute initial information for individuals or organisations to determine whether they are a relevant person.

MS Word versions of the document are available for relevant persons on request. A summary of this information is available on request. Should you wish to discuss the content with a member of the Regia MSS Environment Team please submit a request to contact@regiamss.com.au. Feedback should be emailed to this address.

Thank you in advance for your time and attention. We look forward to receiving your insightful feedback, and we are excited about the improvements in environmental outcomes we can bring to these assessments together.

Regards,

Regia MSS Environment Team

Care+Protect
WHAT MATTERS

ENVIRONMENTAL, SOCIAL & GOVERNANCE (ESG) POLICY

Purpose

We believe that the health of the environment and climate as well as operating in a socially and ethical responsible way are moral obligations and critical to the continued and improved well-being of people and communities globally, as well as the sustainability of the company. Therefore, all of us at CGG have a duty to do our part in making continued significant progress in these areas.

Scope

This policy applies to CGG in all its operations as well as contractors and site visitors within CGG's prevailing influence.

Responsibility

As one of our values, responsibility is in the core of everything we do. CGG is committed managing the potentially negative impacts of its operations, mitigating and minimizing them as far as possible, while acting as a positive influence on our stakeholders:

- We act responsibly and ethically and abide by all applicable laws and regulations, providing our employees and contractors with guidance and support to enable compliance.
- We will always have a precautionary approach towards challenges, taking the time to assess risks and manage the potential impacts of our operations.
- We use our prevailing influence with service providers and suppliers to support the continuous improvement of their ESG performance.

Environment

We are committed to measure and reduce our carbon footprint across all levels of our value chain:

- We report environmental data across our operations, measuring and monitoring the Carbon Footprint.
- We are committed to reaching carbon neutrality by 2050 in scopes 1 & 2 of the Greenhouse Gas Protocol.
- We aim to improve the Power Usage Efficiency (PUE) of our data centers.
- We commit to increase the low-carbon content of our energy supply mix.
- We encourage and support local internal initiatives supporting our 2030-2050 carbon neutrality ambitions.
- We work with our Supply Chain to improve their ESG performance.
- We develop and offer products & services enabling environmentally sustainable activities.

Social

Our key aim is to be an exemplary company for all our stakeholders:

- We strengthen our work environment and our culture around diversity and inclusion.
- We ensure our work environment enables the engagement and development of our employees and attracts the best talents.
- We act as a positive influence for our employees, suppliers, and communities.
- We maintain a robust HSE-Operating Management System which is built around and complies with recognized International and Industry standards and supports our ESG commitments.

Governance

Our aim is to set the highest standards of governance which shall guide our operations and ensure the highest level of compliance & ethics are applied in the way we conduct our business.

Sophie ZURQUIYAH
Chief Executive Officer

Date: June 2022 - **Review Period:** 24 months

Care+Protect
WHAT MATTERS

HSE POLICY

Purpose

This policy broadly outlines our commitments to Health, Safety, Environment (HSE) . Our corporate policies, governance, and values as a whole act to drive and assure that CGG remains a healthy, safe, and environmentally conscious company that can sustain the needs of its present demands without compromising needs of the future generations.

HSE principles are integrated into our risk management, business planning and processes. We believe that all incidents are preventable and strive for zero harm to our people, the environment and the communities in which we operate.

Scope

This policy applies to all employees, contractors and site visitors within CGG.

Compliance

We recognize all International Labor Organization conventions and laws and comply with all national and industry HSE regulations.

We contribute to advancing industry standards and seek to establish and apply best practice.

Our HSE Principles

CGG provides a healthy, safe, inclusive and environmentally conscious workplace whilst promoting awareness of workplace hazards.

We protect our employees, contractors and assets from criminal, hostile and malicious acts.

We monitor the health of our employees and promote wellbeing.

We are committed to promoting a working environment that is free from illicit substances and tobacco use.

We apply eco-design principles and mitigation to prevent and remediate harmful effects on the environment.

We respect and promote human rights and maintain mutually beneficial relationships with local communities.

Leadership, Commitment & Responsibilities

The commitment and cooperation of all employees and contractors is essential, including the right and obligation to stop work and intervene.

Willful breach of CGG's 'Rules to Live By' will not be tolerated.

Line management are responsible for implementing this policy, setting relevant HSE objectives and ensuring resources are in place to achieve them.

The HSE OMS

Our Health, Safety, Security, Environment Operating Management System (HSE-OMS) provides a framework for company-wide integrated approach to Risk and Opportunity Management.

Our HSE-OMS is built around and complies with recognized International and Industry standards.

Stakeholders

CGG selects partners and contractors who acknowledge and comply with our HSE Principles whilst supporting them in fulfilling those responsibilities.

We openly engage and dialogue on HSE with our main stakeholders and publicly disclose our performance

Sophie ZURQUIYAH
Chief Executive Officer

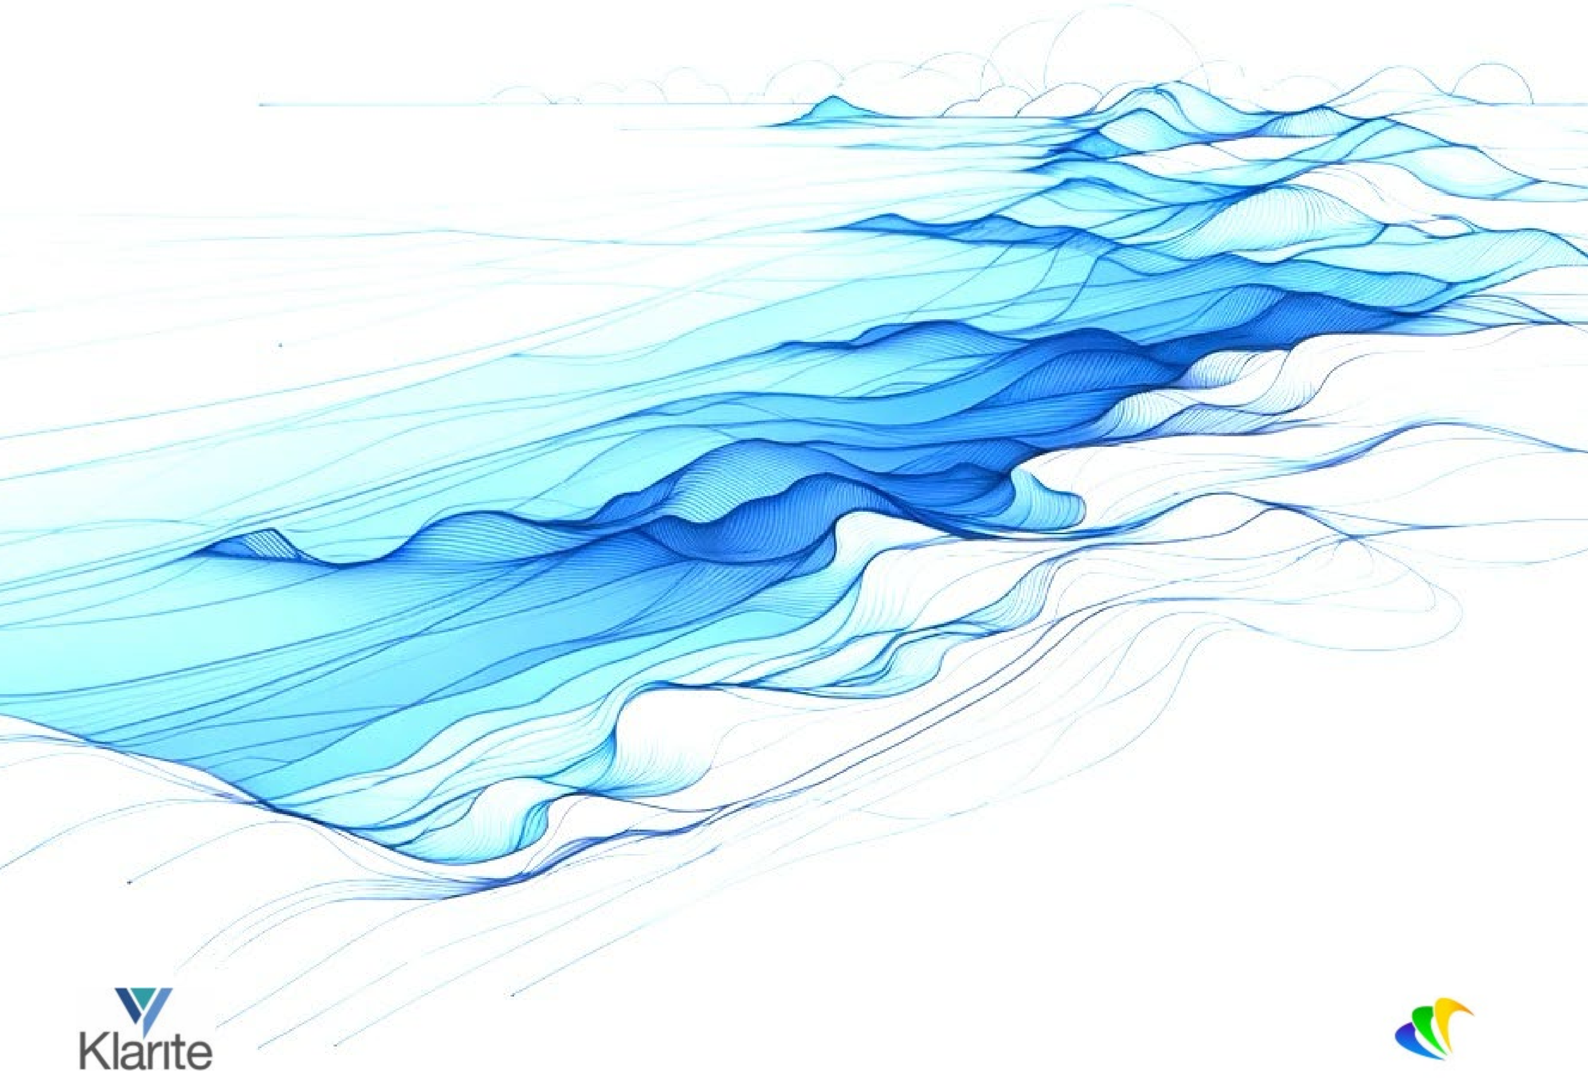
REGIA
Marine Seismic Survey

Description of Activity

Appendix A2: REG-EP-002-A2

Rev 4

May 2024



Klarite

Table of Contents

1 Introduction

This Description of Activity has been prepared by CGG Services (Australia) Pty Ltd (**CGG**) in its environmental management of the Regia Marine Seismic Survey (**Regia MSS**). This is the content of the Environment Plan (**EP**) that will be submitted to meet the requirements of Section 21(1) of the *Offshore Petroleum and Greenhouse Gas Storage (*Environment*) Regulations* 2023 (the Regulations).

1.1 Purpose

The purpose of this document is to provide a comprehensive description of the activity including the following:

a) the location or locations of the activity.
b) general details of the construction and layout of any facility.
c) an outline of the operational details of the activity and proposed timetables.
d) any additional information relevant to consideration of environmental impacts and risks of the activity.

1.2 Overview

To commence the preparation of the EP for the Regia MSS an Environmental Planning Area was established to frame the initial studies and community consultation effort. Within that area an Activity Planning Area was established to frame the maximum geographical limits of the activity. The Environmental Planning Area and Activity Planning Area are shown in Figure A2-1. The Activity Planning Area coordinates are recorded in Table A2-1 and Figure A2-2.

The Environmental Planning Area was set at 155 km around the Activity Planning Area. This distance has been selected using professional judgement and a review of previous oil spill risk assessments for similar activities in the region (Appendix B11). Further justifying the distance, the NERA Reference Case: Consequences analysis of an accidental release of diesel (NERA 2018) found that diesel spills under 700m^3 were reliably predicted to disperse within this distance.

1.3 Environmental Regulations and Guidelines

The primary legislation governing the Regia MSS is the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (the Act) and the Regulations. There are numerous additional laws, regulations, and guidelines that apply requirements to the Regia MSS activity. These can be found in Appendix B2 and their relevance to each environmental aspect is considered in each assessment (Appendices D1- D4 and E1 – E10). Any legislative requirements discussed in this document if they are relevant to the management of environmental impacts and risks.

The following terms are used in this document and are defined in the Regulations:

> A **petroleum activity** or **activity** means operation or works in an offshore area undertaken for the purpose of: (a) exercising a right conferred on a petroleum titleholder under the Act by a petroleum title; or (b) discharging an obligation imposed on a petroleum titleholder under the Act or a legislative instrument under the Act.

2 Assessment Input

2.1 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table A2-2 shows how this feedback has been incorporated into the environmental assessments.

Table A2-2 - Relevant person input into the preparation of the EP

Objections and Claims	Feedback ID	Measure adopted because of consultation
A yacht race is held every Saturday. A different yacht race occurs every Easter. Course may be up to 4nm offshore.	3	Notification to vessel contractor of race occurrence and location. Note: no overlap with race expected.
Email received detailing the negative impact on marine life and climate.	166	CGG agreed to implement the following measures: Exclusion zones for shallower waters with higher biodiversity - adopted 50 m and shallower activity exclusion zone. Activity timing - avoid peak biodiversity in summer months (Jan/Feb/Mar) - adopted.
Email received containing queries demanding for a plan to monitor and reduce the risks and effects of seismic testing on marine species.	199	CGG agreed to implement various activity limitations captured in Section 4.
Received levels of sound at coastal areas must be below 145 dB re 1 μ Pa	231	CGG have agree to limit the activity in this way and commissioned a second sound propagation modelling report to confirm the distances. Note: a simultaneous operation plan is still required with divers in the area.
Issues with seismic on the local fishing stock and does not believe that retirement of quota was a fair means of compensation.	245	No vessel movements with 700 m of fishing blocks G12, G13, H13, and H14.
Concerned about the impact of the project on the Twelve Apostles Marine Park.	237, 259	No vessel movements within 5 km of the Twelve Apostles State Marine Park.
Submission requesting preference for survey to start in shallower area and work towards deeper, outer continental shelf areas.	848	CGG agreed to acquisition lines acquired working from shallow lines to deep lines if the survey period is during the April to June period. Reversely, if the survey period is between September to November, the acquisition plan will be to acquire deep lines to shallow lines.

2.1 Public Comment

Table A2-3 shows how the Matters raised during public comment have been incorporated into the EP in this document.

Table A2-3 - List of changes arising from public comment matters

Matter	Matter ID	Changes made arising from public comment
Matter: Impacts to dive-based fisheries	F17	CGG has considered this claim and, based on the updated secondary sound modelling, has updated EP Appendix E8 (Impact Assessment – Underwater Sound: Surfers, Divers and Swimmers), Appendix A2 (Description of the Activity) and M#01: Activity limitation, to reflect that the sound source will not be discharged at full power from areas which have been predicted to result in an exceedance of the safety criterion human health safety criterion for recreational divers, surfers and swimmers along the coastline. CGG has also made updates to modelling in Appendices (E1, E2, E3, E4, E5, E6, E7, F1 F3, and G1.).

3 Description of Activity

3.1 Purpose and Need

The Otway Basin has been producing hydrocarbons since the 1990's and has seen the discovery of several gas fields. Since that time, seismic acquisition and processing technologies have advanced dramatically. The Regia MSS aims to survey areas where 3D geophysical data has not been acquired previously or applying new technologies to overlapping areas of existing 3D data, to improve our understanding of the geophysics of the area. Exploration for new gas reserves has been identified by the Labour Government's Future Gas Strategy[1] as necessary to meet predicted gas supply shortfalls and the Otway basin is explicitly mentioned as a possible source of additional domestic supply.

3.2 Project Design, Location and Timing

Two envelopes define the limits of the activity. A design envelope, which is the broadest timing and location of the activity, and an operating envelope which narrows the timing and location of activities. These envelopes changed during the environmental assessment. The nature of any change and the reasons for it were communicated through the online Regia MSS Consultation Hub and through consultation, where relevant.

3.2.1 Design Envelope

The activity commences in two stages: operations and acquisition. The seismic and support vessels will conduct a few days of operational movements to deploy and test the equipment. This may occur within the operational area or adjacent to it. Operations start when the vessels enter the operational area and end when the vessels leave the operational area. Acquisition starts when the sound source is discharged at full power for the first time and ends when the sound source is discharged at full power for the final time. The following parameters set the timings within the design envelope:

Table A2-4 - Design envelope parameters

Parameter	Details
Earliest start date (operations)	00:01 AEST on 1 April 2024
Earliest start date (acquisition)	00:01 AEST on 5 April 2024
Latest finish date (acquisition)	23:59 AEST on 20 October 2028
Latest finish date (operations)	23:59 AEST on 31 October 2028
Night-time operations	Yes

[1] https://www.industry.gov.au/sites/default/files/2024-05/future-gas-strategy.pdf

3.2.2 Operating Envelope

Acquisition may occur 24 hours a day over consecutive days, or at unspecified intervals due to time for equipment deployment, weather delays, fauna instigated shutdowns, contractor downtime, line turns, and equipment retrieval. The following parameters set the operating envelope:

Table A2-5 - Operating envelope parameters

Parameter	Details
Maximum days (operations)	90 continuous days
Maximum days (acquisition)	60 days
Maximum sail line distance	1,700 km

3.3 Outline of the Operational Details of the Activity

The activity is the acquisition of geophysical data (a seismic survey) and any other activities (support activities) required to support acquisition, carried out within the operational area prior to and after acquisition.

3.4 Location of Activities

There are several progressively smaller areas within the **Activity Planning Area** that govern the various component parts of the activity, these are describe below and shown in Figure A2-3igure A2-4:

- **Operational Area**: an area within the Activity Planning Area in which survey vessel activities other than actively operating the seismic source will be conducted, such as line turns, equipment maintenance and deployment/recovery, crew change and resupply.
- **Active Source Area**: an area within the Operational Area in which the sound source is active. This area is used to complete data acquisition along sail lines. Line runouts and run-ins occur within this area. There may also be occasional source testing at, or below, full capacity.
- **Survey Acquisition Area**: the primary target area for the survey and the area in which seismic data will be recorded.

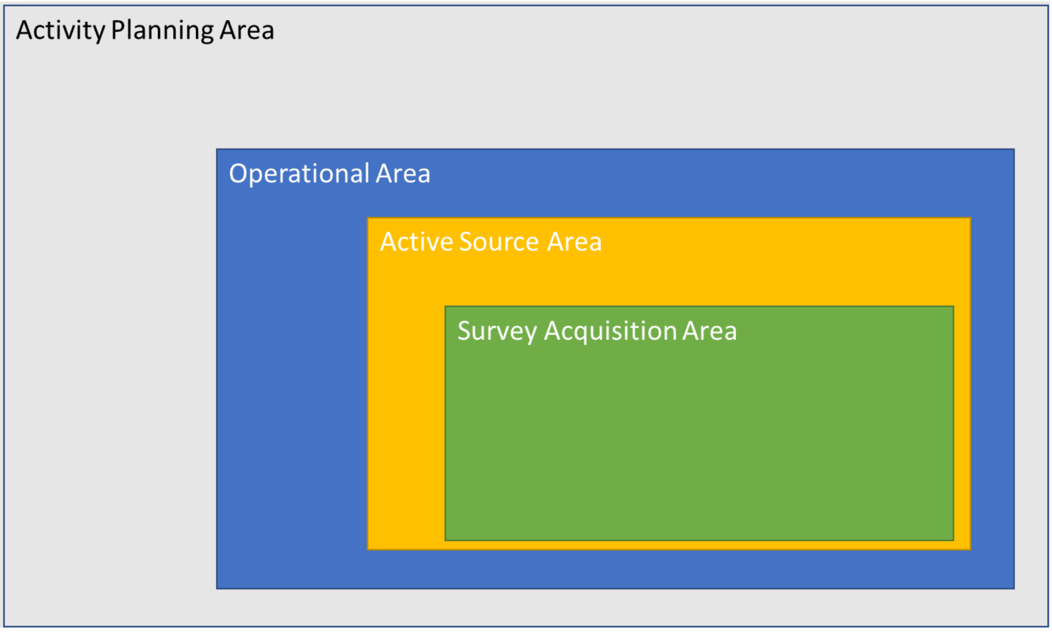

Figure A2-3 - Relevant Activity Areas

3.4.1 Operational Area

The operational area for the Regia MSS has been refined through consultation and throughout the environmental assessment process. In May 2023, it was decided that the operational area needed to extend westward to meet geophysical objectives of acquiring full data up to the boundary of petroleum title Vic/P79. This required an extension to the operational area beyond the activity planning area. This change was communicated at community sessions throughout May and in the May newsletter. The final coordinates for the operational area are shown in Table A2-6able A2-4 and Figure A2-4ure A2-5.

3.4.2 Active Source Area

The active source area for the Regia MSS has been reduced through consultation and thorough environmental assessment. Like the operational area, in May 2023, it was decided that the active source area needed to extend westward to meet geophysical objectives. This required an extension to the active source area up to the western edge of the activity planning area. This change was communicated at community sessions throughout May and in the May newsletter. The final coordinates for the operational area are shown in Table A2-7able A2-5 and Figure A2-5 A2-6.

3.4.3 Survey Acquisition Area

The survey acquisition area is yet to be defined though it will be fully within the active source area.

Figure A2-4 - Operational Area Coordinates

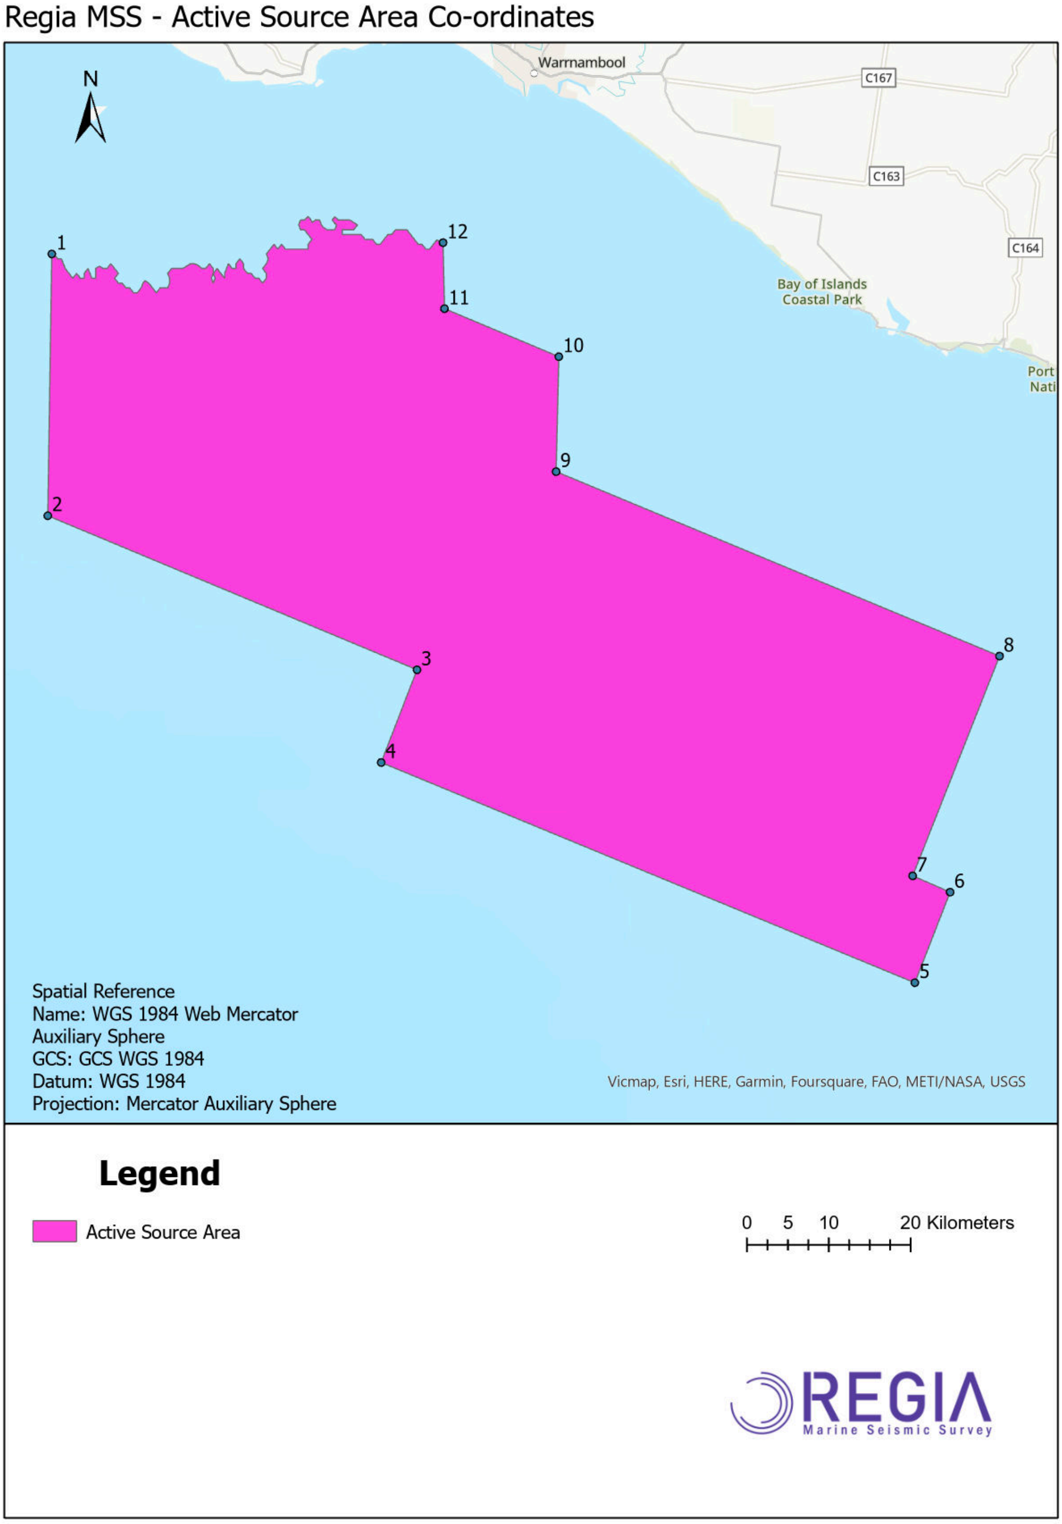

Figure A2-5 - Active Source Area Coordinates

3.5 Seismic Survey

Seismic surveying is a widely used exploration method to define and analyse subsurface geological structures in the marine environment. Seismic surveying uses a technique that directs acoustic energy into subsurface geological structures from equipment deployed from a specifically design survey vessel. This activity is called a marine seismic survey (MSS) and includes the towing of a sound source and multiple streamers along sail lines, day, and night.

3.5.1 Streamers and Sail Lines

The survey vessel will tow streamers back and forth through a (currently undefined) acquisition area along a series of sail lines within the Activity Planning Area. The streamers contain sound sensors that detect the pressure and velocity of sound levels reflected from the geophysical structures being targeted. TableA2- 8able A2-6 provides relevant environmental management details about the streamers and sail lines. The survey may be carried out in sections and the sail lines can be acquired in any order allowing flexibility for the activities to adapt to environmental features and occurrences such as marine mammal observations.

TableA2- 8: Environmentally Relevant Details for Streamers and Sail Lines

Parameter	Details	Environmentally relevant information
Maximum number of streamers	14	Using more streamers lessens the acquisition time. The highest number of streamers will be used that meet geophysical objectives of the survey and vessel recording capability.
Maximum length	8,100 m	The streamers will trail behind the survey vessel and present a hazard to navigation and marine fauna.
Maximum depth below sea surface	25 m	
Average and maximum streamer horizontal separation	100 m (average) 200 m (maximum)	Separation distance will be maximised whilst meeting survey objectives and vessel capability to lower the acquisition time. Streamer fanning will be used to increase the swath width at the end of the streamer array to minimise the need for in-fill lines.
Streamer type	Solid or gel core	The streamers are made of a solid core construction, with either a solid foam core or a solid gel core used for internal ballast.
Maximum number of sail lines in the racetrack survey design	Unknown	Number of sail lines will be minimised to reduce acquisition time.
Likely sail line orientation	North-west to South-east	Decreases acquisition time and decreases sound levels received at mainland Victoria due to increased sound profile forward and aft of the sound source.
Minimum line separations	500 m	Separation distance will be maximised whilst still meeting geophysical objectives.

3.5.2 Sound Source

The survey vessel will acquire the seismic data by towing three acoustic source arrays with three sources per array operating alternatively, one array discharging as the others recompress. Details about the sound source that are relevant to environmental management are provided in Table A2-9. These details provide the basis upon which predictions of sound levels and attenuation in the marine environment can be made.

Table A2-9: Environmentally relevant details of the sound source

Parameter	Details	Environmentally relevant information
Number of source arrays	Three	
Maximum tow depth	8 m	
Frequency range	0-200 Hz	
Low-power mode	50 cui	Used during line turns to minimise impacts. Used to transit between survey lines anywhere in the Operational Area. Used to manage impacts to flocks of foraging seabirds observed within 500 m of the survey vessel.
Maximum total volume	2,820 cui	Minimised to achieve survey objectives.
Maximum operating pressure	2000 psi	Minimised to achieve survey objectives.
Shot point interval	12.5m	Minimised to achieve survey objectives.
Towing speed	3-6 knots	

The sound source will be towed along a series of adjacent and parallel sail lines in a 'racetrack' like pattern. At the end of the first line, the vessel will turn in a wide arc to position itself for another parallel line in the opposite direction, offset by several kilometres from the previous line. The vessel will then turn again to position itself to return in the original direction along a third parallel line, offset from the first line. This pattern is repeated in the survey acquisition area until the required coverage is completed.

To obtain full coverage of the eventual acquisition area the seismic source must remain at full power for at least half a streamer length prior to the vessel turn. This 'run out' of the acquisition area occurs each time the vessel ends an acquisition sequence and occurs entirely within an active source area. Once outside the active source area, the source is turned to low-power mode to complete the turn. Then, during the 'run in' to the acquisition area, soft-start procedures are implemented for a minimum of 30 minutes, which begins with the operation of the single smallest air chamber in the array and then the gradual ramp-up to include additional air chambers until the source is at full power for the commencement of full power acquisition at the acquisition area boundary.

The source may be operated for short durations elsewhere in the operational area for maintenance and testing. These activities are infrequent and typically involve intermittent discharge of individual air chambers.

3.6 Support Activities

Support activities include:

- Survey vessel when the sound source is not active.
- Support vessel operations for safety, resupply, staff transfers, and maritime observations.
- Aviation operations for staff transfers and resupply.

In the unlikely event of an emergency additional vessels and aircraft may be deployed to assist the response efforts.

3.6.1 Vessels

The survey will be conducted using a purpose-built seismic survey vessel. Its purpose is to tow the sound source and streamers along the sail lines. The survey vessel will have a small on-board workboat, which may be launched to assist with equipment deployment and retrieval, or to carry out streamer maintenance activities. The survey vessel will also have a fast rescue craft (FRC) on-board. Environmentally relevant details of the survey vessel are included in Table A2-10.

Table A2-10: Environmentally Relevant Details of the Survey Vessel

Parameter	Details	Environmentally relevant information
Vessel length	90 – 130 m	Potential for interference with other marine users, inform expected sound source.
Total crew accommodation	70 people	Accommodating crew results in the discharge of sewage, greywater, reverse osmosis brine from water treatment, and food wastes.
Vessel class	1A1	This class has two fully independent propulsion systems providing redundancy in the event of loss of steerage.
Endurance at sea	32 days	Refuelling, crew transfers, bulk transfers of chemicals, waste, and supplies will occur during the activity.
Largest fuel tank size	257.4 m^3	Results in a worse-case credible oil spill risk in event of a vessel collision.
Dynamic positioning	No	Informs expected level and sound source of continuous sound from vessels.
Propulsion and power	Main engines, generators, and bow thrusters.	Results in discharges of cooling water and bilge water.
Vessel lighting – navigation	Minimum for safe navigation.	Mandatory indication of the 'restricted ability to manoeuvre.'
Vessel lighting – safe work	Minimum for safe work.	The working deck areas will be lit as required to provide for safe work.

At least two (2), and no more than three (3) support vessels, comprising a 'supply vessel' and at least one or two smaller 'escort vessel(s)', will accompany the survey vessel to provide logistical, safety and equipment management duties. At least one vessel will be rigged and capable of towing the survey vessel in the case of an emergency. The support vessels will mobilise to and from the mainland to undertake re-supply, refuelling and other support functions for the activity.

The support vessels may be required to leave the operational area to respond to unplanned events such as retrieval of accidentally over boarded floating objects, or communicating with a third-party vessel, or for other logistical and safety reasons. The support vessels transit between the port and the activity approximately once every two weeks.

In addition, there will be one (1) spotter vessel as part of the marine spread dedicated to marine fauna observation. It will be used near the survey vessel and tasked as required by the prevailing circumstances to improve marine fauna detection capabilities.

3.6.2 Aircraft

Aircraft maybe used for crew changes, critical equipment supply, surveillance and emergency response uses. Aircraft includes helicopters, fixed wing planes, and drones. Helicopter operations occur as needed which is approximately once every 3-4 weeks.

4 Additional information relevant to consideration of environmental impacts and risks of the activity

Following consultation with relevant persons, and completion of the environmental assessments, the following activity limitations have been adopted. These activity limitations have been referred to throughout the impact and risk analyses and are collectively referred to as M#01 – Activity Limitations.

Activity Limitations Relevant to Species Protection

1) No discharge of the sound source in the Southern Right Whale reproduction biologically important area (**BIA**) at any time.
2) No discharge of the sound source within 15 km of the Southern Right Whale reproduction BIA or Habitat Critical to Survival (**HCTS**) while Southern Right Whales are present in the BIA and HCTS.[2]
3) Only discharge the sound source in the Pygmy Blue Whale foraging BIA when low numbers of Pygmy Blue Whales and other foraging whales are in the BIA off Otway.[3]
4) No discharge of the sound source within 17 km of Lady Percy Julia Island / Deen Maar. [4, 5] [Sentence updated in response to Matter F17].
5) Data acquisition will follow a 130-degree orientation.[6]
6) The MSS acquisition lines will be acquired working from:
   - Shallow lines to deep lines if the survey period is during the April to June period.[7]
   - Deep lines to shallow lines if the survey period is between September to November.[8]

Activity Limitations Relevant to Protected Areas

7) No discharge of the sound source within a Key Ecological Feature.[9]
8) No vessel movements within 5 km of the Twelve Apostles State Marine Park. [10]

[2] 15 km is based on 14.2 km is the furthest distance to sound effect criteria for Southern Right Whales from the secondary sound propagation modelling report (Appendix B7b).
[3] Specific criteria for 'low numbers' can be found in Appendix G2.
[4] 17 km is based on the furthest distance from the Active Source Area to Deen Maar. It also covers relevant effects to other values such as pinnipeds and divers.
[5] Adoption of the 50 m depth limitation results in no discharge of the sound source within ~17 km of Deen Maar.
[6] This aligns with the modelled approach to minimize environmental impact to zooplankton.
[7] Measure adopted on request from relevant person to minimise interference with Southern Bluefin Tuna (Event ID 4370).
[8] Measure designed to mitigate interactions with Blue Whales who might traverse the intended MSS area as they move towards their summer feeding grounds recognising historical feeding patterns and timing.
[9] Two KEFs were identified within the Environment Planning Area, the Bonney Upwelling KEF, and the West Tasmanian Canyons KEF.
[10] 5 km is based on a reasonable buffer to reduce IMS risks to the park values following consultation with Parks Victoria.

Activity Limitations Relevant to Cultural Sensitivities

9) Project vessels will not traverse between Lady Percy Julia Island / Deen Maar and the mainland.
10) No vessel movements within 5 km of the Twelve Apostles State Marine Park. [11]

Activity Limitations Relevant to Marine User Interactions

11) No vessel movement within 4 nautical miles of the coast, except in case of emergency. [12]
12) No vessel movements with 700 m of fishing blocks G12, G13, H13, and H14.[13]
13) No discharge of the sound source at full power;
    - in water depths of less than 50 m.
    - from locations which result in an exceed of the safety criteria for recreational divers and swimmers along the coastline. [Sentence has been updated in response to Matter F17].
14) Received levels of sound at coastal areas must be below 145 dB re 1 μPa.
15) No discharge of the sound source at full power in water depths of greater than 200 m.
16) Minimise vessel movements in water depths of greater than 200 m to avoid trawling activities.

Activity Limitations Relevant to Compliance

17) No anchoring permitted within the operational area.
18) No discharge of the sound source outside of the active source area except for when during line turns or if transiting between sail lines anywhere in the operational area when the sound source will be at low power.[14]
19) No discharge of the sound source in January, February, or March.
20) Seismic and support vessels will operate at no more than 5 knots during acquisition.

Activity Limitations Relevant to Cumulative Impacts

21) The industry standard control of 40 km separation distance between operating seismic sources will be applied.
22) CGG and TGS have agreed not to acquire their surveys simultaneously.

[11] 5 km is based on a reasonable buffer to reduce effects on Sea Country values of the park.
[12] This limitation ensures no overlap with local yacht races (Feedback 3).
[13] 700m is based on the no effect distance for invertebrates, the target species of the fisher in these blocks.
[14] As requested by the Director of National Parks (Feedback 231).

5 Document Control

Table A2-11 - Revision history

Version	Date of Revision	Author/Reviewer	Summary of Changes
0.0	24 March 2023	MS	Initial version taken from Activity Overview flyer which was published 1.2.23.
0.1	29 March 2023	LT/PR	Review by CGG
0.2	30 March 2023	MS	Updated following CGG review
1.0	31 March 2023	MS	Published on Regia MSS Consultation Hub website
1.1	30 June 2023	MS	Updated following consultation to include commitments for activity limitations (not published).
1.2	14 September 2023	MS	Updated following completion of impact and risk assessments to add further activity limitations. Also added the proposed active source area and operational area (not published).
1.3	26 September 2023	PR/LT	CGG Review.
2.0	30 September 2023	MS	Published on Regia MSS website.
2.1	31 October 2023	MS	Updates to include refined activity limitations following consultation.
3.0	29 December 2023	MS	Reviewed following updates to Appendices D1 – D4 and E1 – E10. Preparation for submission to NOPSEMA for public comment.
4.0	11 May 2024	MS	Additional activity limitations added because of passage of time, new literature, public comments, and revision of the EP. Also added spotter vessel to marine spread.

Community Consultation and Engagement Plan

January 2023

Contents

Definitions and Abbreviations

Term	Definition
Activities	In reference to consultation with a relevant person, activities are a thing a person or group does/is already doing.
ALARP	As Low As Reasonable Practicable
CCEP	Community Consultation and Engagement Plan
EIA	Environmental Impact Assessment
EMBA	Environment that May Be Affected
EP	Environment Plan
ERA	Environmental Risk Assessment
Function	In reference to consultation with a relevant person, functions are a role that is performed or something to be exercised.
Interests	In reference to consultation with a relevant person, interests are any interest above that of the public.
MSS	Marine Seismic Survey
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
OPEP	Oil Pollution Emergency Plan
OPGGS Act	Offshore Petroleum and Greenhouse Gas Storage Act 2006
OSMP	Operational and Scientific Monitoring Plan
Petroleum activity	means operations or works in an offshore area undertaken for the purpose of exercising a right conferred on a petroleum titleholder under the OPGGS Act by a petroleum title
Relevant person	A person specified under Division 2.2A of the Regulations
The Regulations	Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023
Work Program	CGG's activities proposed to be carried out to meet our corporate objectives

Introduction

CGG is seeking to gather geological information about potential hydrocarbon deposits in the Otway basin in the Commonwealth offshore area. CGG has started the design of a marine seismic survey (MSS) to be called the Regia Marine Seismic Survey (Regia MSS). As part of operating in Australia, CGG recognises the need to introduce ourselves to local communities, build relationships and earn our social licence to operate. We are also required to undertake consultation in preparation of environmental approvals called an Environment Plan (EP). This Community Consultation and Engagement Plan (CCEP) is a key pillar for CGG in describing how we will undertake our consultation activities in Australia.

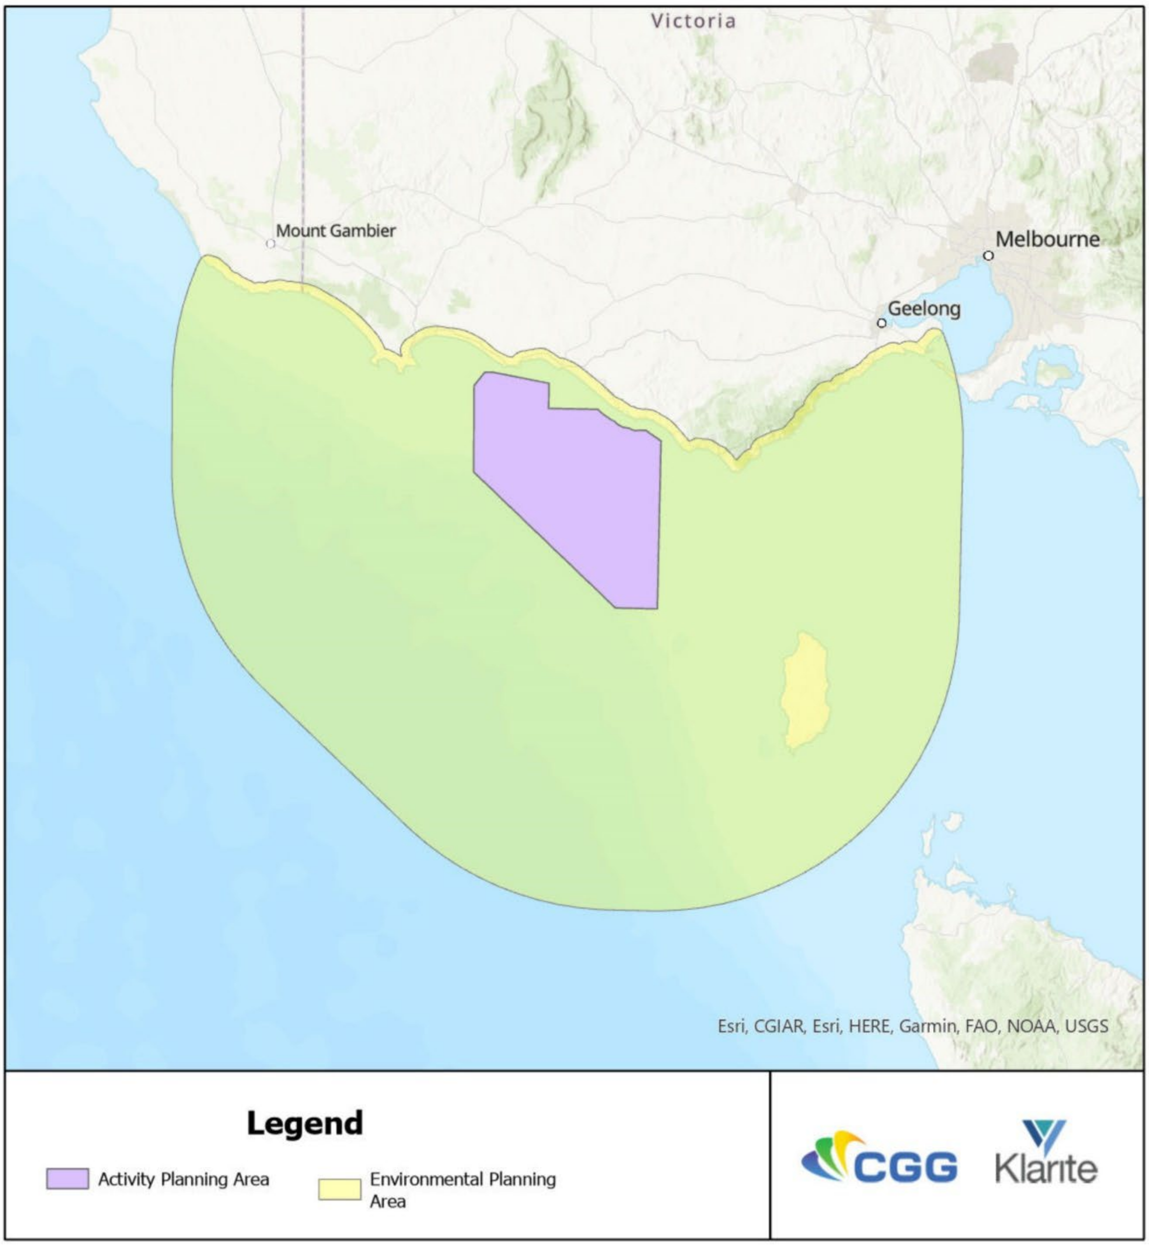

Figure A3-1 – Current boundaries of the Regia MSS

Scope

This document covers community consultation and engagement in the broadest meaning of those terms. It does not cover elected officials. The scope of the CCEP is to describe the process CGG will use to progress and document consultation and engagement activities in relation to the Regia MSS Environment Plan (EP).

This document is prepared as part of the EP and will be submitted to NOPSEMA for assessment. It is published at the commencement of the preparation of the EP to share our community consultation and engagement activities and support effective consultation.

Aim and Objectives

The aim of CGG's consultation efforts is to ensure that the activity is planned and executed in a way that respects the rights, interests and concerns of all relevant persons and that it is socially and environmentally responsible.

The objectives of CGG's consultation efforts are to:

- Identify all relevant persons who may be affected by the activity.
- Assist in providing sufficient information and time to allow relevant people to make an informed assessment of the potential consequences on their functions, interests and activities.
- Gather knowledge about the environmental values, sensitivities and social and cultural features of the areas in which we intend to operate.
- Elicit feedback from the community and address any objections and claims of relevant persons that may arise.
- Establish information flows between CGG and relevant persons.
- Help identify, and consider, important environmental characteristics or mitigation opportunities presented by relevant persons.
- Ensure that the magnitude and significance of impacts have been properly assessed.

Outcomes

There are three target outcomes for the community consultation and engagement activities.

1. Improved predictive quality of environmental impact and risk assessments.
2. Earn and maintain social licence to operate in Australia.
3. Perform the consultations as required by local Australian environmental law in a timely manner.

Background and Context

Legislation and Other Requirements

The *Offshore Petroleum and Greenhouse Gas Storage Act 2006*(OPGGS Act) and the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (the Regulations) are the prevailing legislation that govern how CGG is required to engage in offshore petroleum activities. There is a requirement for CGG to have an Environment Plan (EP) accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

The Regulations mandate a consultation process that CGG must carry out in preparation of an EP. In December 2022, the Federal Court of Australia considered the consultation parts of the Regulations in a landmark judgement[1]. The findings of the Federal Court have been incorporated into this CCEP. Other guidelines considered in the preparation of this CCEP are included in the References.

Acceptable Levels of Environmental Impact and Risk

Section 280 of the OPGGS Act requires that a titleholder must carry on its activities in a manner that does not interfere with navigation, fishing, conservation of the resources of the sea and seabed, exploration for, recovery of or conveyance of a mineral, construction or operation of a pipeline, offshore infrastructure activities, or the enjoyment of native title rights and interests, or other lawful activities to a greater extent than is necessary for the reasonable exercise of the rights and performance of the duties of the titleholder. One of the objectives of the Regulations is that petroleum activities must be carried out in a manner by which the environmental impacts and risks will be of an acceptable level. Importantly, these clauses implement Australian government policy about mutual marine use and a policy that recognises the offshore petroleum industry is not a no impact industry.

This plan uses these clauses to govern our public engagement and relevant persons consultation processes including consultation activities and decision making. Acceptable levels of environmental impact and risk are context specific, so they are established in the preparation of each individual Environment Plan. However, generally, the following levels of environmental impact and risk are of an acceptable level.

- No person, organisation, or authority is worse-off because of offshore petroleum activities.
- Environmental impacts that are short-term, temporary, and recoverable.
- Environmental risks have consequences that are preventable and effectively managed.

These general statements will be refined through the planning process to become defined acceptable levels of environmental impact and risk that will be activity-specific and developed during consultation in the preparation of the Environment Plan.

Engagement and Consultation Principles

This document is prepared in accordance with ISO 31001, which stipulates consultation as integral to all stages of risk management. When we engage with external authorities, organisations, or persons the following principles guide our work. We recognise that effective consultation requires the fostering of relationships, a clear and co-designed process and the identification of substantive issues. The following principles apply to these three preconditions for effective consultation and in all our activities.

1. Open: Being honest, open and direct in our engagement with relevant persons.
2. Inclusive: Hearing people and listening to understand. We want to be easy to talk to.

[1] Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193

3. Collaborative: Encourage people to be part of the engagement and work towards minimising impacts on each other.
4. Respectful: Valuing the knowledge and experience of people. Grateful for people's time and input.
5. Meaningful: Ensuring that our communication can be reciprocal, timely and empowering.

Relevant Persons Identification

Identification of potentially affected communities is the critical first step in being able to successfully manage and address the concerns and issues of groups, organizations, or individuals who may be affected by or impact the Work Program. The community can be disaggregated in many ways and a person can reveal themselves within the community differently. CGG is proactive in its identification activities, which are undertaken when we commence the preparation of the EP. Identification activities are ongoing while we prepare the EP, and when it is in-force, with increased efforts in preparation of an EP.

Categorising the people within the community is a useful way to group and plan engagement activities that are fit-for-purpose for those groups. The legislation uses four main categories: the public, authorities, organisations and persons. The Regulations create a distinction between the public and *relevant persons* (authorities, organizations and persons) who are mandatory consultees in the preparation of each EP. CGG will adopt these categories for its activities.

Consultation with the Public

CGG will facilitate two streams of activities. One stream of activities relates to public engagement and the other relates to consultation with relevant persons. Both streams commence with the publication of a dedicated activity-specific website. Comments raised through the website will be taken to be submitted by members of the public. The website will go live on 1 February 2023 and end when the EP is no longer in force. After 5 months, on 30 June 2023, both streams will pause while the EP is prepared for submission to NOPSEMA.

Running these two streams of consultation supports the broadest search for relevant persons, who are a subset of the public. It also allows support to non-relevant persons, or persons who opt out of the formal consultation process, to engage with our activities in a way that works for them. The two streams of relevant persons consultation and public engagement are shown in Figure A3-2 below.

An activity specific website will be a central repository of information about the activity which will allow the public to raise concerns, share location-based information, and provide feedback to CGG regardless of whether they meet the definition of being a relevant person. This includes the provision of initial information to the public sufficient to allow a person to self-identify as a relevant person. Persons who contribute to the preparation of the EP through the website will be providing information directly into the EIA and ERA processes that are being carried out in parallel to the engagement activities. Commenting through the website does not qualify as a relevant person and they will be encouraged to undertake a consultation survey to determine if they are a relevant person.

The public is a broader group of people than those who can be identified as relevant persons. Without proactive action from CGG, the first time the public are made aware of the activity in the EP is too late for relevant persons to self-identify as someone who may be affected by our activities. Therefore, CGG will publish notices in print media, social media, in local radio adverts, and online to:

- Notify the public of the commencement of the preparation of an EP.
- Encourage relevant persons to self-identify to be consulted with.
- Notify the public of the commencement of the consultation process.
- Encourage people concerned to visit the website.

In addition to CGG's public engagement activities the Regulations provide a mechanism for the public to make comment on each EP for seismic activity. This mechanism allows the public to comment directly to the regulator with their views about the proposed activity. The public comment period occurs upon submission of the EP.

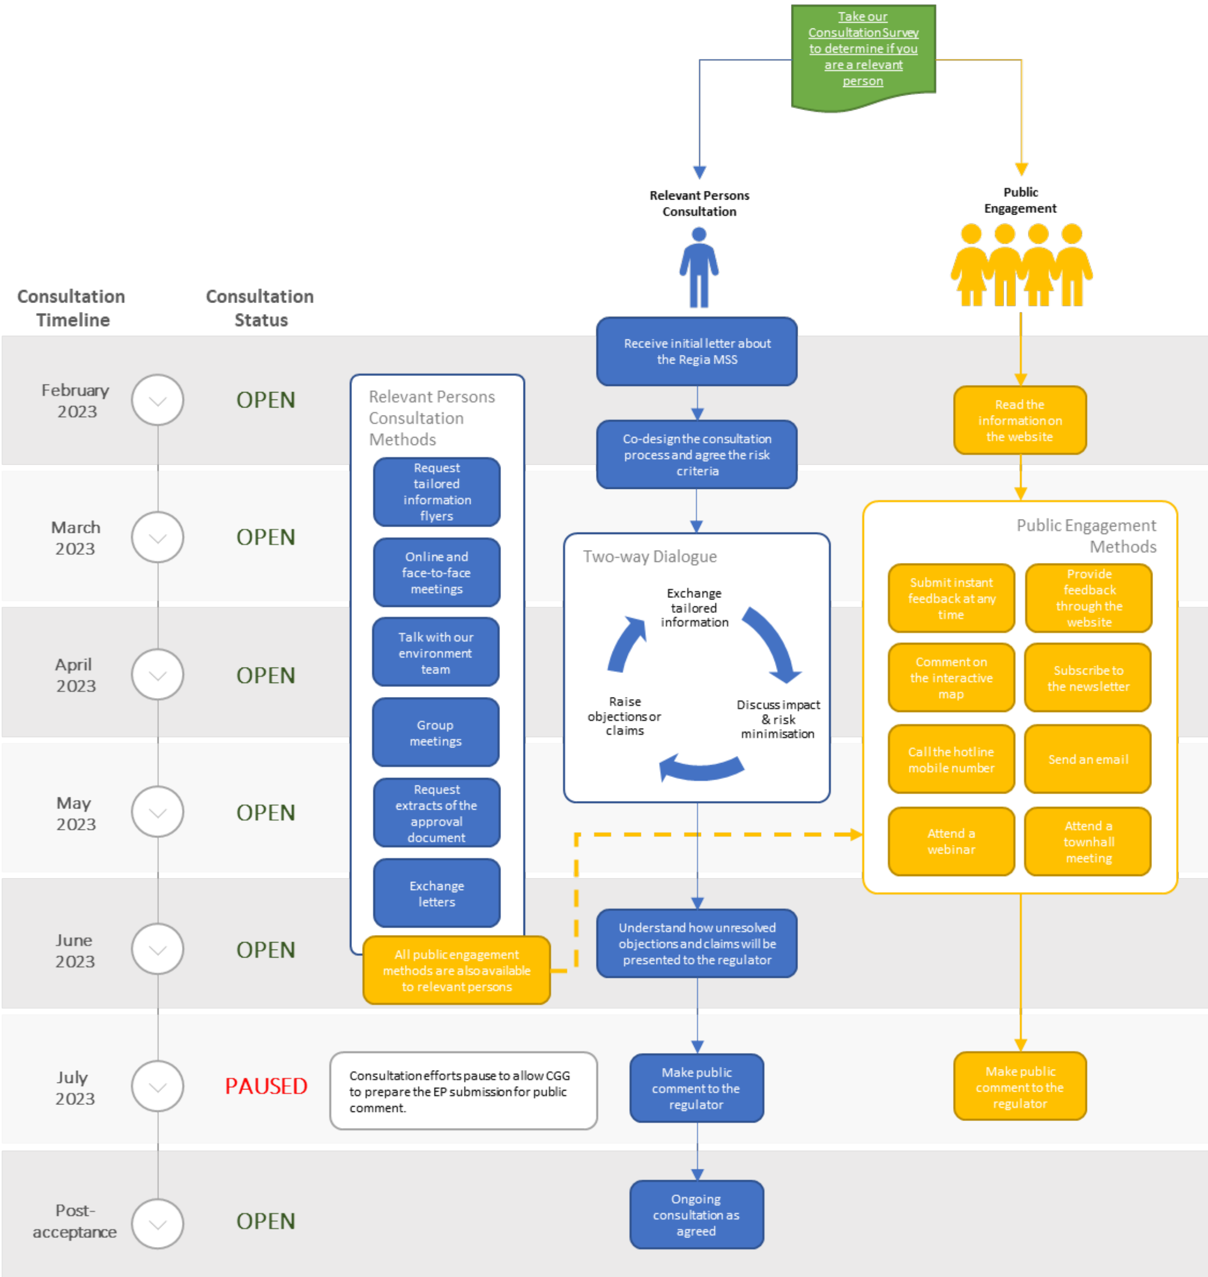

Figure A3-2 - Regia MSS Consultation Activities

Relevant Persons: Authorities, Organisations and Persons

The steps above will not be solely relied upon to identify all relevant persons. CGG will be proactive in pursuing relevant persons and providing the opportunity for each of them to be consulted as per the regulated process. To discharge our legislated obligation, CGG must tell the authority, person, or organisation that they have been identified as a relevant person and that the subsequent consultation effort is being undertaken as per the prescribed process and we are obligated to expressly advise them of titleholder obligations for consultation.

Identification of relevant persons

CGG uses the following methods to find authorities, organisations and persons who may be affected by our activities.

1. **Contact government agencies and organizations:** Relevant government agencies may have information about individuals and organizations that may be affected by the activity.
2. **Consult with local community groups:** Reach out to local community groups, such as those focused on environmental conservation or fishing, as they may have members whose interests or activities could be affected by the activity.
3. **Consult with local Indigenous groups:** Indigenous groups may have specific cultural or spiritual interests and activities that could be affected by the activity, it's important to consult with them and ensure their rights and beliefs are respected.
4. **Conduct online research:** We will search for news articles or press releases about similar activities in the area and identify individuals or organizations that were mentioned.
5. **Advertise in Local Newspapers and on Local Radio stations:** Advertising in local newspapers or on local radio stations to notify the public about the planned activity and ask for any persons with specific interests or activities that may be affected by the activity to come forward.
6. **Contact industry associations:** We will reach out to industry associations related to fishing, shipping and oil and gas exploration in the area, as they may have members whose interests or activities could be affected by the activity.
7. **Contact local businesses:** We will reach out to local businesses, such as tour operators or accommodation providers, as they may have customers whose interests or activities could be affected by the activity.
8. **Contact local educational institutions:** We will reach out to local educational institutions, such as universities or research centres, as they may have researchers or students whose interests or activities could be affected by the activity.
9. **Use social media:** We will use social media to find relevant persons by searching for hashtags or keywords related to the activity, following local organizations or groups in the area and reaching out to people who have commented on or shared posts about similar activities.
10. **Conduct a survey:** We will conduct a survey to reach out to a wide range of people and gather information about their interests and activities that may be affected by the activity.
11. **Attend local community events:** We will search for local community events that may be appropriate for CGG to participate in and engage with aggregations of people, some of whom may be affected by the activity.

In addition to the above methods, we have an online survey available for anyone to determine if they are entitled to consultation with us as a relevant person or if they should engage with us as a member of the public. The survey will remain live throughout the preparation of the EP, the public comment period and throughout NOPSEMA's assessment.

Authorities

Authorities are relevant to each of CGG activities within its Work Program. Each Department or Agency has been identified through online searches, expert advice, review of legislation and review of previous EPs adjacent to the title. Some authorities have published specific guidelines on how they wish to be consulted as relevant persons under the Regulations. These have been hyperlinked in the lists below.

Australian Commonwealth Agencies

NOPSEMA Guideline GL1887 identifies the following government agencies as relevant persons as they have responsibilities within the Commonwealth marine area.

- Australian Fisheries Management Authority (AFMA)
- Australian Maritime Safety Authority (AMSA)
- Department of Agriculture, Fisheries and Forestry (DAFF)
  - Fisheries
  - Biosecurity (vessels)
  - Biosecurity (marine pests)
- Department of Climate Change, Energy, the Environment and Water (DEECCW)
  - Australian Antarctic Division (AAD)
  - Underwater Cultural Heritage
  - Sea Dumping
- Department of Defence (DoD)
  - Australian Hydrographic Office (AHO)
- Department of Foreign Affairs and Trade (DFAT)[2]
- Director of National Parks (DNP)

The full list[3] of Commonwealth agencies will be reviewed to find additional Commonwealth agencies. The following agencies were identified as relevant persons:

- Australian Communications and Media Authority (ACMA)
- Commonwealth Fisheries Association (CFA)
- National Native Title Tribunal (NNTT)
- Maritime Border Command (MBC)

Victorian Government Agencies

The full list[4] of Victorian agencies will be reviewed to find relevant persons. The following agencies will be contacted to determine whether they are relevant persons.

- Victorian Fisheries Authority
- Heritage Council Victoria
- Heritage Victoria
- Department of Energy, Environment and Climate Action
- Department of Health
- Department of Jobs, Skills, Industry and Regions
- Department of Transport and Planning
- Business Victoria
- Energy Victoria
- Environment Protection Authority
- Local Government Victoria
- Parks Victoria
- Ports Victoria
- Victorian Aboriginal Heritage Council

People and Organisations

The Regulations specify that relevant persons include people or organizations whose functions, interests and activities may be affected by the petroleum activity. The Federal Court of Australia helped to define these terms in the appeal decision of Tipakalippa v National Offshore Petroleum Safety and Environmental Management Authority (No 2) [2022] FCA 1121.

[2] Not a relevant person as the proposed activity does not cross into or impact on waters outside of Australia's maritime jurisdiction.
[3] Full list of Commonwealth agencies can be found here https://www.directory.gov.au/departments-and-agencies
[4] Full list of Victorian agencies can be found here https://www.vic.gov.au/victorian-government-organisations

CGG has grouped people and organisations into subject-centred categories because this allows for tailoring identification, communication and engagement strategies to each category. An additional benefit is that the search for one member of a group can often lead to the discovery of additional members of that group. The following subject-centred groups have been identified in the preparation of this plan. A person could be associated with more than one of these groups while it is more likely that an organisation will associate with just one.

Subject-centred Groupings

Commerce	Tourism operators	Traditional Owners	Port users
Petroleum titleholders	Commercial fishers	Recreational fishers	Native title land councils
Conservation groups	Fishing associations	Commercial shipping	Local councils
Educational bodies	Other marine users	Ports and harbours	Heritage groups

The search for persons or organizations who are relevant persons starts as a global public search because the definitions of functions, interests and activities are not geographically constrained. However, certain groups, such as other marine users, are likely to be proximate to the activity.

We assume that there will be more relevant persons proximate to the activity and therefore consultation efforts will be greater in these locales. However, the subject-centred approach allows identification of relevant persons to be tailored within that group allowing global searches to be carried out where this is more likely to reveal relevant persons.

Identification of relevant persons by subject-centred groups

The identification of persons or organizations within the subject-centred groups will be tailored and will evolve as engagement within these groups is carried out. In all cases each person contacted will be asked to support in the identification of relevant persons and encouraged to share information about the petroleum activity and how to contact us.

Information about each of these subject-centred groups that supports the identification of relevant persons can be found in materials published by the DCCEEW under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) including:

- **Plans of Management:** including for World and National Heritage places, Ramsar wetlands, Australian marine parks, Commonwealth reserves and Commonwealth Heritage places.
- **Recovery Plans:** for listed threatened species and ecological communities.
- **Policy Statements:** including significance impact guidelines and industry specific guidelines.
- **Other material:** including management principles, online databases, factsheets and other publications.

Tourism operators

To identify tourism operators the following searches will be performed:

- Online searches for marine tours and recreational experiences such as marine mammal observations, diving and thrill-seeking experiences.
- Request to Tourism Australia and Tourism Victoria to query any databases of local businesses along the coastline within the socio-economic risk EMBA.
- Enquiry with local Chambers of Commerce to identify marine based tourism operators in the region.
- Search for upcoming marine-based community or sporting events.

Traditional Owners

To identify Traditional Owners the following searches will be performed:

- Visit the local government authority websites (the shire or municipal council) who often include an acknowledgement of the local traditional owners.

- State and territory government websites also include information about traditional owners in their jurisdictions, especially in the context of information about local offices.
- Search online for states' and territories' Aboriginal and Torres Strait Islander consultative bodies, which themselves might offer advice.
- Contact land councils representing the local Aboriginal or Torres Strait Islander communities.
- Online searches for Native Title groups and corporations on the Prescribed Bodies Corporate website.
- Register searches on the National Native Title Tribunal website.
- Geospatial searches by completing the forms here on the National Native Title Tribunal website.

Note that any person with Native Title claims of any standing will be categorised as a relevant person.

Port users

To identify port users the following searches will be performed:

- Contact made with relevant harbourmaster to enquire about frequent users.
- Online searches for businesses located at wharves in regional ports.

Petroleum titleholders

To identify petroleum titleholders the following searches will be performed:

- Use the NEATS database to find titles and titleholders within the EMBA.
- Use the NOPSEMA EP database to find other titleholders with activities.
- Subscribe to the NOPSEMA EP submissions pages for all activities in Victoria.

Commercial fishers

To identify commercial fishers the following searches will be performed:

- https://www.fish.wa.gov.au/Sustainability-and-Environment/Fisheries-Science/Stock-assessment-and-data-analysis/Pages/Making-a-data-request.aspxRequest data from the Victorian Fisheries Authority to understand historical fishing activity within the EMBA.
- Visit local ports to find local fishers who operate in the area.

Recreational fishers

To identify recreational fishers the following searches will be performed.

- Engagement with recreational fishing associations to use newsletters/circulars or websites.
- Request contact details for license holders.
- Request to engage with advisory bodies or reference groups to establish the best approach to identify relevant persons.

Native title land councils

To identify native title land councils the following searches will be performed:

- Seek contact details of land councils from the National Native Title Council.

Conservation groups

To identify conservation groups the following searches will be performed:

- Review of previously submitted EPs on the NOPSEMA website.
- Online searches for conservation groups with interests in similar activities.
- Online searches for new articles and current campaigns related to similar activities.

Fishing associations

To identify fishing associations the following tasks and searches will be performed:

- Identify the target species within the EMBA through online research.
- Ask the peak fishing association to identify other species-specific associations.
- Request contact details for license holders.

Other marine users

To identify other marine users the following searches will be performed:

- Online searches for groups who use or have a connection to the marine environment. This search will focus on marine users proximate to the EMBA.

Commercial shipping

To identify commercial shipping entities the following searches will be performed:

- Contact made with relevant harbourmasters and shipping agents to enquire about frequent users.
- Online searches for businesses located at wharves in regional ports.

Local councils

To identify local councils, shires and cities, the following searches will be performed:

- Search the Victorian Electoral Commission database for councils, shires and cities proximate to the activity.

Educational bodies

To identify educational and research bodies the following searches will be performed:

- Contact the Department of Education to identify relevant institutions and research programs.
- Contact the universities to identify any relevant research programs.

Note: for this category the exposure thresholds for monitoring of potential impacts of the activity will be used rather than the socio-economic thresholds because this is more relevant to the likely activities of research institutions.

Commerce

To identify commercial entities the following searches will be performed:

- Contact the local Chamber of Commerce to identify local marine-based businesses.
- Online searches for news articles or press releases about marine-based businesses in the area.

Ports and harbours

To identify ports and harbours (including boat ramps) the following searches will be performed:

- Review of automatic information system (AIS) data of vessel activities along the coast to establish frequented ports.
- Review the Victorian boat ramp database.
- Contact local councils, cities and shires for listing of local boat ramps and users.

Heritage groups

To identify heritage groups the following searches will be performed:

- Contact Victorian heritage organisations to identify other relevant persons.
- Query the Australian Heritage Database.
- Query the Australasian Underwater Cultural Heritage Database.

Each of the relevant persons identification searches will be re-run at least quarterly while the EP is in-force and at least once a month before the activity commences.

The Consultation Framework

A framework of consultation stages will be implemented, within which there is flexibility to tailor the consultation to subject-centred groups and individual needs. This includes the provision of initial information to the public sufficient to allow a person to self-identify as a relevant person. The early engagement of relevant persons will provide the clarity of the consultation process required to underpin effective consultation. Further, early engagements with relevant persons enable discussions about the expectations a relevant person may have about the type and level of detail of information required through the process. The framework has been designed to align with ISO 31001 in that it should be iterative throughout its numerous stages as per Table A3-2.

This consultation framework covers both public engagement and consultation with relevant persons. The timeframes show when certain information is intended to be made available to the public. Consultation with relevant persons will occur within the overall timeframe, subject to any variations required after co-design of the consultation process.

Table A3-1 - Consultation framework and schedule

Stage	Purpose	Information to Publish	~Timing
0	To prepare the engagement and consultation activities		7 months pre-submission
1	To introduce the activity and this consultation plan and seek input into the co-design of the consultation processes.	- Community Consultation and Engagement Plan - Description of Activity - EIA and ERA processes and assessment criteria	5 months pre-submission
2	To provide the environmental context to the activities and information to relevant persons and the public.	- Legislative Requirements - Implementation Strategy - Preliminary EIA	4 months pre-submission
3	To provide the environmental analysis undertaken to predict the levels of impact and risk that the environment is exposed to.	- Predicted levels of impact - Predicted levels of risk - Independent reports (e.g., noise modelling, oil spill modelling)	3 months pre-submission
4	To provide the evaluation of and control measures adopted for the environmental impacts and risks including how relevant persons' feedback has been incorporated.	- Full EIA - Full ERA - Treatment and Management Plans (e.g., OPEP, OSMP)	2 months pre-submission
5	To provide an opportunity for relevant persons to raise objections or claims about any adverse impact on their functions, interests and activities.	- Notice of the consultation process complete and ongoing	1 month pre-submission
6	To complete the consultation records for first submission of the EP.		0 months pre-submission
7	To provide updates during the assessment process including the feedback provided by NOPSEMA and the way in which the titleholder is addressing the matters raised	- NOPSEMA letters to the titleholder - Latest versions of the submitted/resubmitted EP	During the assessment process
8	To provide updates on the activity and the monitoring of environmental impacts and risks	- Activity commencement and cessation notifications - Ongoing notifications to commercial fishers and other marine users - Environmental incident reports (recordable and reportable incidents)	Prior to and during the activity

Undertaking a petroleum activity is a complex task that requires extensive planning, integration of many component parts and detailed risk management. To deliver the activity successfully an integrated schedule governs the timing of all activities including the preparation of EP's and the conduct of the consultation required. This framework caters for some flexibility in the community engagement and consultation activities. This is recognised in the first stage of the framework, which encourages relevant persons to influence the design of the subsequent processes and activities. This framework acknowledges that consultation activities cannot be 'one-size-fits-all' and there is an obligation to adapt our consultation activities to what we hear from the community and relevant persons.

However, like all businesses, we must operate within a schedule. Therefore, each stage of the framework has an indicative timeframe of one month for each of the stages to occur. This equates to a 5-month consultation process run in parallel with the preparation of the EP. This timeframe is considered reasonable given that at each stage within the framework the public and relevant persons, will be able to have full access to the documents that underpin the environmental assessments as they are prepared. As will be shown later in this plan, the community will be able to make comment on those documents and engage in the process to the extent that they want to, either as a relevant person or as a member of the public.

Reasonable Period for the Consultation

CGG is required to provide a 'reasonable period' to relevant persons once they have received 'sufficient information' to make an informed assessment of the potential consequences of the activity on their functions, interests and activities. Whilst the framework is adaptable to what we hear from relevant persons the minimum definition of a 'reasonable period' will be:

- At least 5-months from the notice of commencement of the consultation process.
- At least 30-days following the provision of sufficient information to the relevant person.

Sufficient Information

Information provided must be sufficient to allow an informed assessment of the possible consequences of the activity on the functions, interests, or activities of the relevant person. What constitutes sufficient information as part of a consultation process will differ depending on the relevant person(s). The information provided to relevant persons will consider:

- the functions, interests, or activities of the relevant person.
- the environmental impacts and risks that may affect them.
- the degree to which a relevant person is affected.

The overarching consultation framework and its schedule will remain as the base case for the consultation effort. However, the specific processes applied to relevant persons will need to be defined in collaboration with those persons for the EP. The type, format and level of detail of information necessary is likely to vary for different relevant persons depending on the above factors. However, CGG recognises that for some relevant persons there may never be enough information for them to assess how they may be affected (i.e., in the case of a general objection to the activity). Therefore, the framework has been designed in such a way that the entire contents of the EP will be made available for the public (and therefore to all relevant persons) for a minimum of 30 days prior to first submission of the EP. This design implies that sufficient information is, at least, the full EP contents that will be put before the regulator upon which they will decide whether to accept or refuse to accept the EP.

Notwithstanding the above commitment to publish the full draft EP prior to submission, CGG will undertake the consultation processes and activities without relying on this measure as the way sufficient information will be provided to relevant persons. We recognise that generic information flyers, targeted electronic mailouts and links to a webpage will not be considered sufficient. We will endeavour to tailor the information we provide in a convenient and digestible format that respects the needs and activities of each relevant person. The exact method of communicating sufficient information cannot be determined without talking to relevant persons. However, CGG has a variety of communication methods available to use such as in-person meetings, phone calls, email, letters, social media, public meetings and newsletters.

Engagement and Consultation Activities

Best practice consultation includes an element of co-design of consultation processes. This means that detailed planning in advance of talking to relevant persons is somewhat limited as the needs of the relevant person would not have been taken into consideration. However, this does not remove the need for a preferred consultation and engagement plan to be developed. Rather, it means that the engagement and consultation activities need to be adapted in response to circumstances.

Consultation Methodology

Once a relevant person is identified, consultation will be undertaken in line with the International Association for Public Participation IAP2 spectrum (IAP2 Spectrum), which is considered best practice for stakeholder engagement. Table A3-3 shows how the IAP2 Spectrum aligns with our consultation efforts on specific goals. It links the communication channels available to CGG to the IAP2 Spectrum and assesses the effectiveness of consultation methods. The assessment of effectiveness of a communication channel included consideration of the following:

- Accessibility to the channel.
- Accessibility of information.
- Depth and quality of information able to be communicated.
- Least burden on the person.
- Opportunity to respond to the information.
- Ability to show genuine consideration of the views prior to a decision.

Table A3-2 – Consultation goals, channels and assessment of effectiveness

Relevant IAP2 Spectrum element	Consultation goal	Consultation channels	Assessment of effectiveness
Inform	To provide balanced and objective information to assist persons in understanding the problems, alternatives and/or solutions. To seek and further understand the environmental values and sensitivities in the EMBA.	Activity specific website. Activity information flyers. Print media notices. Mandated public comment process.	The methods adopted cover a wide range of persons and provide specific information about the CGG activity and its environmental impacts and risks. As an exploration EP, the full EP is available for public exhibition prior to submission to NOPSEMA for assessment, which provides the opportunity for the public to provide feedback directly to NOPSEMA.
Consult	To obtain specific feedback on analysis, alternatives and/or decisions from potentially relevant persons.	Exchange of letters/emails. Informal discussions. Activity update flyers.	Adapting consultation processes so that they are fit-for-purpose and tailored to the relevant person and/or provided updates to specific information as the activity definition is developed.

Relevant IAP2 Spectrum element	Consultation goal	Consultation channels	Assessment of effectiveness
Involve	To work directly with relevant persons throughout the process to ensure that their functions, interests and activities are consistently understood, considered and addressed.	Phone calls. Online meetings. Face-to-face meetings.	The methods adopted in this category are targeted and support the provision of detailed and tailored information to allow informed assessment of the possible consequences of the CGG activity on the relevant persons' specific functions, interests or activities and building of one-on-one relationships.
Collaborate	To partner with the public in each aspect of our decision making including the development of alternatives and the identification of the preferred solutions.	Dual consultation process for the public and relevant persons. Participatory decision making.	The dual consultation processes allow anyone to engage as they prefer to. Both processes will directly influence the design of the activity, its environmental management measures and the decision about whether the activity is environmentally acceptable.
Empower	To provide the opportunity to co-design the consultation process and directly influence the final design of the activity.	Final decisions are placed in the hands of an independent regulator.	CGG will accept the decision of NOPSEMA about whether it has done enough to demonstrate that the requirements of the Regulations have been met.

Consultation with Relevant Persons Process Flowchart

Relevant persons may reveal themselves at any time in the preparation of an EP, during the activity, or after the activity is finished. As a result, the flowchart in Appendix A governs how each relevant persons will be treated irrespective of the stage within the framework.

Consultation Activities and Tasks

The following tables identify all the activities and the tasks that will be carried out in preparation of an EP and provides guidance for how these activities should be completed. The Regulations require that all consultation activities are specific to the EP.

The consultation and engagement activities that CGG is prepared to undertake are listed below and are expanded on in the following tables. This CCEP must be adaptable to the needs of relevant persons therefore not all activities listed below will take place, rather this is a list of activities that CGG is prepared to undertake should the need be identified. The 'triggers' in each of the corresponding tables provide guidance to when the activity and tasks may be implemented. Other circumstances may trigger the activity. If the consultation activity will occur the trigger is captured as '*Upon the decision to seek environmental approvals for a petroleum activity in Australian Commonwealth waters*.'

- Establish an activity-specific online presence (Table A3-4)
- Public notices in print and social media and on radio (Table A3-5)
- Publication of information flyers (Table A3-6)
- Written correspondence (Table A3-7)
- Phone calls (Table A3-8)
- Online meetings (Table A3-9)
- Face-to-face meetings (Table A3-10)
- Group meetings (Table A3-11)
- Webinars (Table A3-12)
- Establish a consultation reference group (Table A3-13)
- Community meetings (Table A3-14)
- Public notices at prominent locations (Table A3-15)
- CGG activity news subscription service (Table A3-16)
- Maintain a telephone hotline service (Table A3-17)

In addition to these measures the website will have a link to provide instant feedback in a prominent location for anyone to provide feedback directly to our environment team.

Table A3-3 - Establish an activity-specific online presence

Consultation Activity	Establish an activity-specific online presence					
Purpose	The purpose of this activity is to establish a central place for all activity specific information that needs to be easily accessible to as many people as possible at any time during the consultation process and during the activity. The website will function as the single source of truth for information provided to the community and be a place for the community to provide feedback. Social media activity sites will act to direct traffic to the website.					
Triggers	Upon the decision to seek environmental approvals for a petroleum activity in Australian Commonwealth waters.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
0	Build an activity-specific webpage and social media activity pages.	N/A	All	Minimum of 7 months prior to EP submission	Surrender of title	Once
1	Publish the details of the proposed activity and the consultation process going forward	Authorities, Organizations and People	All	Minimum of 6 months prior to EP submission	Surrender of title	Year-round
2	Interactive map: Create a place for people to provide location-based feedback on the proposed activity	Authorities, Organizations and People	All	Minimum of 5 months prior to EP submission	Acceptance of the EP	Year-round
2	Issues comment board: create a page for anyone to raise specific concerns and comment on them	Authorities, Organizations and People	All	Minimum of 5 months prior to EP submission	End of the activity	Year-round
2	Community survey: seeking information on the environment that may be affected	Authorities, Organizations and People	All	Minimum of 5 months prior to EP submission	End of stage 4	Once
4	Community survey: provide a form for people to raise objections and claims	Authorities, Organizations and People	All	Minimum of 3 months prior to EP submission	End of stage 4	Once

Table A3-4 - Public notices in print and social media and on radio

Consultation Activity	Public notices in print and social media and on radio					
Purpose	The purpose of these activities is to increase awareness of the petroleum activity and direct interested persons to the website. Notices are to be placed in local, regional and other relevant print media. Notices and updates are also printed on social media platforms LinkedIn and Facebook. Subject-centered groups may have their own newsletters or print communication methods that should be used, if possible, to communicate within those groups.					
Triggers	Upon the decision to seek environmental approvals for a petroleum activity in Australian Commonwealth waters. Upon significant changes to the petroleum activity.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
1	Notices in local papers, on social media platforms (LinkedIn, Facebook, Instagram) and on local radio (3RPC Community Radio, ABC Local Radio 3SWR) notifying of the activity, the consultation process and the way to "self-identify".	Persons	All	Start of phase 1	End of phase 5	Monthly
1	Notices in regional papers (Portland Observer, Geelong Advertiser, Warrnambool Standard) notifying of the activity, the consultation process and the way to "self-identify".	Persons, Organizations	Marine Users	Start of phase 1	End of phase 5	Monthly
1	Notice in national papers (The Australian, The Age) notifying of the activity, the consultation process and the way to "self-identify".	Persons, Organizations	All	Start of phase 1	-	Once
5	Notices in local, regional and national newspapers and on social media inviting objections or claims on the proposed activity and its environmental management.	All	All	Start of phase 4	-	Once
8	Notices in local, regional and national newspapers and social media informing the outcome of the NOPSEMA assessment and, if accepted, inviting self-identification as a relevant person at any time.	All	All	Upon final decision by NOPSEMA	-	Once

Table A3-5 – Information flyers

Consultation Activity	Information flyers					
Purpose	Short summary flyers containing activity specific context about the petroleum activity, its environmental aspects and its potential environmental impacts and risks will be produced for distribution alongside other consultation activities and tasks. They will be accessible through the website and appended to correspondence as necessary. If a relevant person requests more information, or the information in a different form, subject-specific flyers will be created to further tailor the information to the subject-centered group. For example, if fishers request information about impacts on their target species a tailored flyer will be produced.					
Triggers	Upon completion of EP content Upon request through consultation					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
0	Flyer: Description of activity, consultation framework, and risk framework	All	All	Start of phase 1	-	Once
1	Flyers: Environmental aspects	All	All	Start of phase 1	-	Once
Any	Prepare flyers as per requests for information from relevant persons	Organizations, Persons	Marine Users	Start of phase 1	End of the activity	On request

Table A3-6 – Written correspondence

Consultation Activity	Written correspondence					
Purpose	To provide formal consultation between the titleholder and a relevant person. Written correspondence is useful to initiate consultation with authorities and organizations					
Triggers	Upon identification of a relevant person					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
1	Communicate with all identified authorities and organizations to commence the consultation process. Focus of the letter/email is to notify the commencement of the preparation of the EP and invite co-design of the consultation process.	Authorities, Organizations	Petroleum titleholders, educational bodies, fishing associations, local councils, ports and harbors, heritage groups, native title land councils and Traditional Owners.	Start of Stage 1	-	Once
1	Communicate with all identified fishers to commence the consultation process. Focus of the letter/email is to notify the commencement of the preparation of the EP and invite co-design of the consultation process.	Persons	Fishers	Start of Stage 1	-	Once
All	Continue the consultation processes as agreed.	All	All	-	-	Once
2	Request input on the environmental values and sensitivities within the EMBA through the interactive map on the website.	All	All	Start of Stage 2	-	Once
5	Written notice that the draft EP is available online and request any residual objections or claims that haven't been addressed by the consultation process to date.	All	All	Start of stage 5	Start of Stage 6	Once

Table A3-7 – Phone calls

Consultation Activity	Phone calls					
Purpose	To supplement written correspondence to assist in delivering the message effectively and build relationships with the receiver. Cold calls are not part of this activity and are not supported as an effective method of commencing consultation.					
Triggers	After written correspondence has been sent. To arrange other consultation activities.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
1-5, 7 & 8	Call relevant persons to confirm receipt of correspondence and offer the opportunity to ask any questions.	All	All	One week after correspondence sent	-	Once

Table A3-8 – One-on-one online meetings

Consultation Activity	One-on-one online meetings					
Purpose	As many of the decision makers for CGG are not in Victoria online meetings with relevant persons are the preferred method of meeting with relevant persons. With attendees' permission they can be transcribed for ease of record keeping. It is likely that meetings will follow some form of written correspondence. Like all meetings, the agenda and frequency of meetings will be specific to the needs of the relevant person.					
Triggers	Upon request from a relevant person. To assist in delving deeper into the substantive issues of a relevant person. To resolve objections or claims that cannot be easily managed.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
2-5, 7 & 8	Online meetings to be held, if triggered, with a clear agenda communicated and agreed beforehand.	All	All	As needed	-	On requests or as agreed

Table A3-9 – Face-to-face in person meetings

Consultation Activity	Face-to-face in person meetings					
Purpose	Face-to-face meetings are the preferred means of building relationships with relevant persons.					
Triggers	Relevant person requests a face-to-face meeting During CGG staff visits to Victoria. If other consultation activities have failed to resolve substantive issues					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Completion Date	Start Date	Frequency
2-5, 7 & 8	Face-to-face meetings to be held, if triggered, with a clear agenda communicated and agreed beforehand.	All	All	As needed	-	On requests or as agreed

Table A3-10 – In person group meetings

Consultation Activity	In person group meetings					
Purpose	In person group meetings can be useful to communicate the same messages and content to multiple relevant persons at the same time and allow for deeper debate on the substantive issues that affect the whole group. A group meeting might be effective if there are multiple representatives of a relevant organization where it is more efficient to meeting collectively rather than with each representative individually.					
Triggers	On request from an organization. On request from more than 10 relevant persons in the same subject-centered group.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
2—5, 7 & 8	Organize a meeting at a convenient location for relevant persons.	All	All	As needed	-	On request or as agreed.

Table A3-11 – Webinars

Consultation Activity	Webinars					
Purpose	Hosted periodically online, these open briefings are available to anyone who registers to attend i.e., the public and relevant persons. The purpose is to communicate the consultation process, provide instruction on how to determine if you are a relevant person, seek input and local knowledge and build trust in the community.					
Triggers	Upon the decision to seek environmental approvals for a petroleum activity in Australian Commonwealth waters.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
2-5, 7 & 8	Host an online webinar specific to the activity that anyone can register to attend.	All (and the public)	All	-	-	Monthly

Table A3-12 – Establish a consultation reference group

Consultation Activity	Establish a consultation reference group					
Purpose	A consultation reference group is designed to provide CGG with input into decision making within the consultation framework, the consultation methodology and the consultation processes. It is designed as a consultative group across the activities within the Work Program. It would meet regularly throughout the Work Program to provide feedback to CGG on its consultation efforts and how they can be improved.					
Triggers	If the co-design consultation processes reveal themselves to be ineffective. If there are trade-offs between relevant persons that may need community input to resolve.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
2	Offer relevant persons who are directly affected by the activities the opportunity to be part of a consultation reference group.	Authorities, Organizations	Commercial Fishers, Native Title Land Councils, Local Councils, Conservation Groups, fishing associations and Traditional Owners	As needed	-	As defined by the group

Table A3-13 – Community briefings

Consultation Activity	Community briefings					
Purpose	These are open forums held at relevant locations proximate to the location of the activity to engage the local communities in the Work Program. They are designed to facilitate relationship building with the public and relevant persons within those locales.					
Triggers	If the environmental assessment identifies significant impacts or risks that cannot be avoided.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
3, 4, or 5	Undertake a roadshow of community briefings at strategic locations with appointments for anyone to come and meet the CGG team and discuss their concerns.	Persons	Recreational fishers, Traditional Owners, Port users, other marine users.	As needed	-	Once in the Work Program

Table A3-14 – Public notices at prominent locations

Consultation Activity	Public notices at prominent locations					
Purpose	These notices can be targeted to relevant subject-centered groups in places they may receive other notices or messages.					
Triggers	If other activities have identified relevant persons but their identity cannot be shared, for example, if fishing records show activity but because of confidentiality either the exact location fished, or the fisher, cannot be identified through other means. If other activities have identified that relevant persons may have been inadvertently missed. If this activity is requested by associations or other relevant persons.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
1 & 4	Public notices to be placed on the notice boards at local post offices, boat ramps, public houses and local councils about the stage of consultation we are at.	Persons	Traditional owners (fishers), commercial fishers, recreational fishers, tourism operators and other marine users.	Start of the stage	-	Once per stage
8	Public notices to be placed at locations defined as useful by relevant persons.	Persons	Traditional owners (fishers), commercial fishers, recreational fishers, tourism operators and other marine users.	Start of the stage	-	Once

Table A3-15 – CGG activity news subscription service

Consultation Activity	CGG activity news subscription service					
Purpose	Any person will be able to subscribe to a newsletter that will outline the latest information on CGG's full Work Program including the status of the activities and the status of the EP.					
Triggers	Upon the decision to seek environmental approvals for a petroleum activity in Australian Commonwealth waters.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
All	Short 2-page max newsletters will update all subscribers about the status of the Work Program, the activities and the approvals.	All	All	Start of stage 1	End of activity	Monthly

Table A3-16 – Maintain a telephone hotline service.

Consultation Activity	Maintain a telephone hotline service					
Purpose	Any person will be able to contact this service to find out about the activity from a member of the EP development team who is familiar with the activity and environmental management requirements.					
Triggers	Upon the decision to seek environmental approvals for a petroleum activity in Australian Commonwealth waters.					
Implementation						
Framework Stage	Task	Relevant Person Category	Target Group(s)	Start Date	Completion Date	Frequency
All	Maintain a telephone hotline service.	All	All	Start of phase 1	End of the activity	Ongoing

Coordination of Activities

All consultation and engagement activities will be coordinated by the CGG Consultation Team, who are also responsible for updating this plan and communicating the change to internal stakeholders and, where relevant, external audiences.

Assessment of Merit of Objections or Claims

Feedback of any type will be welcomed throughout the consultation process. If received through our public engagement activities, it will be documented in the website management system and is considered in the preparation of the EP. If feedback is received through our relevant persons consultation activities, it will be recorded in our consultation management system and forms part of the EP.

Listening to feedback and attempting to understand the substantive issues is the first step in mitigating them. The process in Appendix A will be applied to assess the merit of objections and claims received from relevant persons. It is preferred that this process take place in meetings rather than through written correspondence, though this may not always be possible.

An assessment of merit of each objection or claim will be carried out by CGG with external experts as needed. A relevant person's objection or claim has higher merit when one or more of the following criteria is met:

- The objection or claim is relevant to environmental management of the activity.
- The objection or claim is relevant to the persons functions, interests, and activities.
- The objection or claim can be resolved through the adoption of additional control measures, an activity design variation/limitation, or through changes to the implementation strategy for the EP.

An objection or claim may be resolved by providing more information and/or adopting one of the three main types of 'measures' which can be adopted because of the consultations:

1. Control measures (with associated environmental performance outcomes and standards)
2. Activity design variations/limitations applied within the activity description.
3. Inclusions within the Implementation Strategy of the EP.

Despite our best efforts to resolve all objections and claims we understand that relevant persons may not agree with our treatment of their objection or claim. In such circumstances the consultation processes can continue provided that the relevant person has received a response about our assessment of their objections and claims and is aware how our respective views will be presented to NOPSEMA.

Ongoing Consultation

Section 22(15) of the Regulations requires ongoing consultation to be incorporated into the Implementation Strategy of the EP. This CCEP will form part of the Implementation Strategy of the EP. CGG will continue to search for relevant persons before, during and after all our activities up until the EP has ended or expired. CGG will continue the discourse with relevant persons and organisations after this time to maintain relationships for future activities. In addition, CGG will keep relevant persons up to date with the status of the title by sending periodic public notifications and correspondence to all relevant persons who have not explicitly requested that communications cease.

CGG acknowledges that relevant persons may have decided not to engage in the consultation processes but may reconsider that decision at any time. As such, CGG will continue to provide notifications to relevant persons if they haven't specifically requested to be excluded from the consultation processes. CGG will apply the same consultation processes that applied in preparation of the EP for the duration of the activity.

Post-EP acceptance, key milestones that will trigger further consultation with relevant persons include:

- Availability of the accepted EP on the NOPSEMA website.
- Notification prior to activity commencement (the notification period varies from one day to five weeks pre-activity depending on the relevant person).
- Completion of activity (between one and 10 days, depending on the relevant person).
- Any reportable incidents.
- If there is a change to the CGG activity scope that would affect the relevant person in a new or different manner to that which has been discussed.

Communication of changes

CGG acknowledges that changes to activities based on knowledge underpinning the environmental impact and risk assessments occur from time to time. In the event of such a change that affects a relevant person's functions, interests, or activities, CGG will complete an assessment that includes provision of information to affected relevant persons in respect of the change and consideration of their feedback.

As required by the Regulations, CGG shall assess the merits of any new claims or objections made by a relevant person because of the change that may have an adverse impact on their functions, interests, or activities. If the claim has merit, where appropriate, CGG will modify the management of the activity.

CGG will seek to finalise its determination of the merits of any claim or objection received before the activity starts, and if after commencement, within 1 week of receipt and undertake any resulting management of change actions as soon as practicable, but preferably within that timeframe. The assessment of merit and any resulting management of change actions will be shared with the concerned relevant persons. For objections and claims that do not require a change in management of the activity, CGG will respond to relevant persons providing reasoning and supporting information (as relevant) to support CGG's conclusions. This may include an outline of the options/controls explored to mitigate the degree to which the person may be affected and/or a demonstration that the impact or risk in question has been reduced to ALARP and acceptable levels.

Any claims or objections raised by relevant persons after submission of the EP will be assessed for merit and a response provided. If a change to the CGG activity or controls adopted during the CGG activities occurs because of relevant persons consultation, the change will be managed in accordance with the processes outlined in the EP.

Monitoring

Effectiveness of Consultation

It is CGG's intention to consult effectively in preparation of the EP, during the activity and throughout the tenure of the title. The effectiveness of our consultation will be determined in the following ways:

- **Responsiveness**: We will have effectively consulted when we have reached out to relevant persons, listened to their concerns and taken appropriate actions to address those concerns.
- **Two-way communication**: Consultation is an ongoing process of two-way communication, not just providing information. Effective consultation is when we have actively listened to the views and concerns of relevant persons and taken them into account in our decision making.
- **Inclusion**: We will have effectively consulted when we can show we have reached out to a diverse range of people, including those who may be particularly affected by the activity.
- **Timing**: We have effectively consulted when we have reached out to relevant persons early in the planning process, throughout the preparation of the EP and throughout the duration of the activity.
- **Transparency**: We have effectively consulted when we can show we have provided relevant persons with accurate and transparent information about the activity and have been open and honest in our communication.
- **Feedback**: We have effectively consulted when we have received feedback from relevant persons and have taken appropriate actions to address their concerns.
- **Compliance**: We have effectively consulted when we have followed all relevant laws and regulations related to consultation, such as ensuring that the rights of all persons are respected.

Records Management

Engagement and consultation activities with relevant persons will be logged by the person who carried out the activity in the consultation management system.

Key Performance Indicators

The following key performance indicators will be monitored to judge the effectiveness of this CCEP, the consultation processes and the consultation activities.

1. Numbers of relevant persons start high and begin to lower indicating that our identification processes are working.
2. Relevant persons are responded to within 24 hours, acknowledging receipt of a correspondence.
3. Relevant persons have a considered response from CGG within 14 days of receiving correspondence.
4. Website visits on issues decline as control measures are adopted and the activity design changed in response to relevant person concerns.
5. The EP is submitted to NOPSEMA with no outstanding issues from relevant persons.

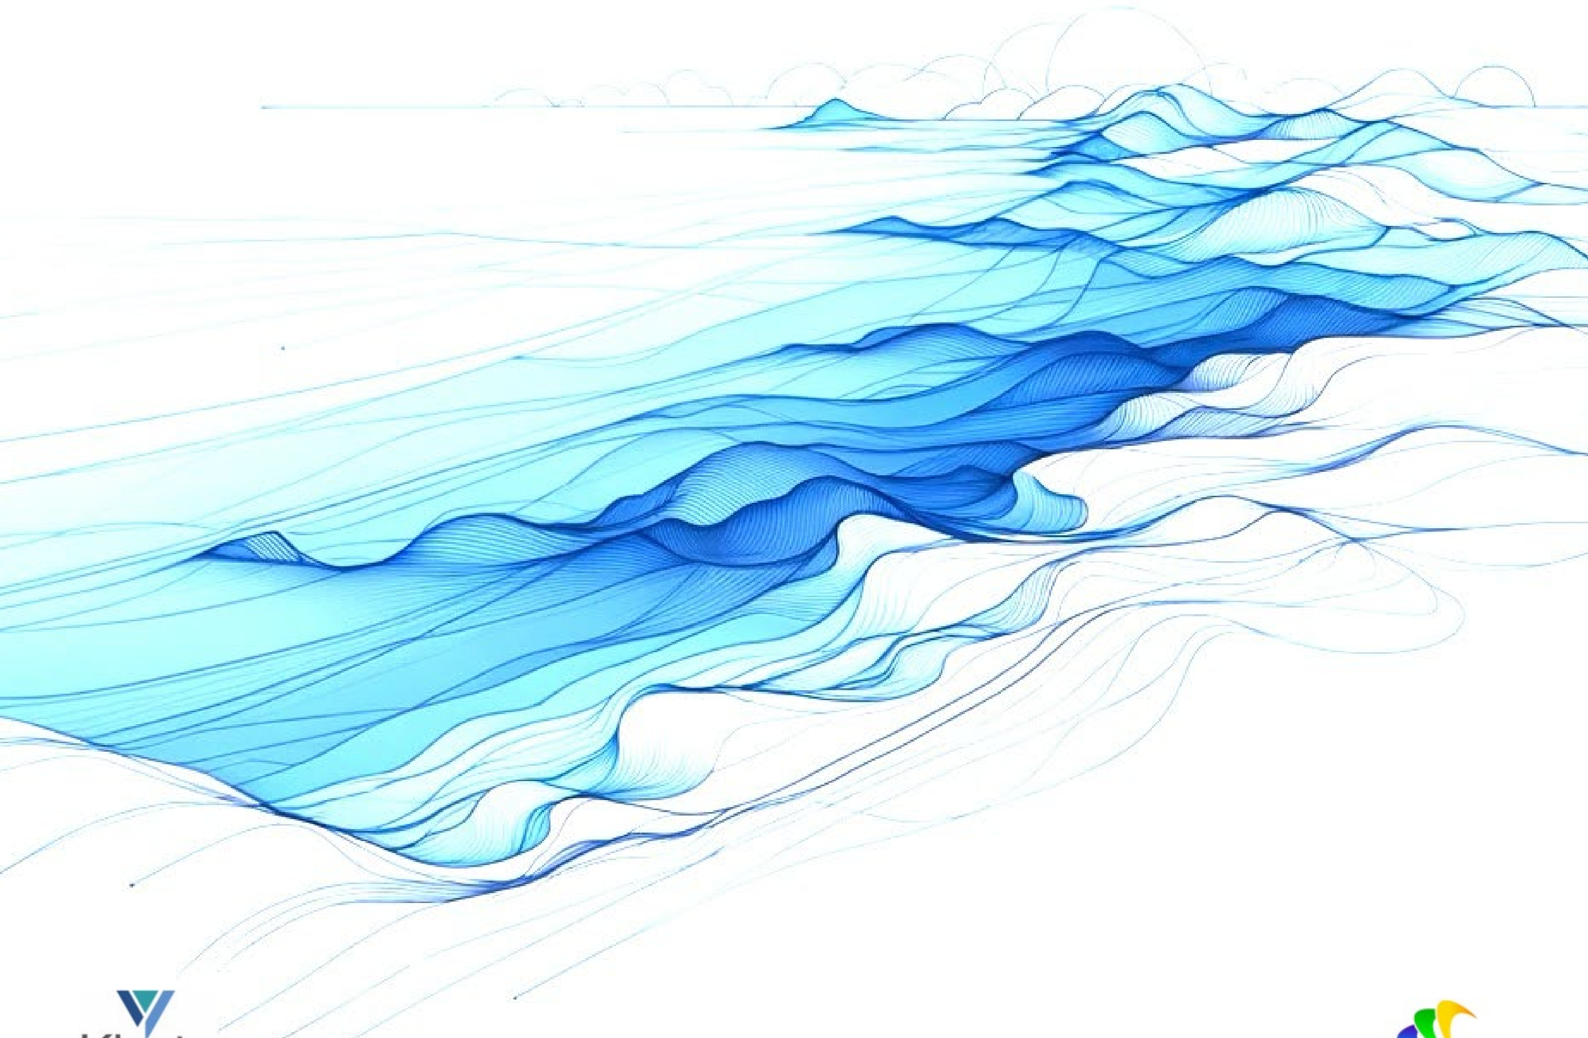
Decision-Making Criteria in the Environmental Assessment Process

Appendix B1: REG-EP-004-B1

Rev 2

January 2024



Klarite

Table of Contents

1 Introduction and Purpose

This Decision-Making Criteria (**DMC**) document has been prepared to support CGG Services (Australia) Pty Ltd (**CGG**) in its environmental management of the Regia Marine Seismic Survey (**Regia MSS**). The DMC follows a standardised methodology for identifying environmental impacts and risks from offshore petroleum activities and determining their relative significance.

This document aims to:

- Communicate the basis for the decision-making criteria that CGG will apply in its environmental assessment of the Regia MSS.
- Explain the process for determining how the activity is to be managed to ensure these decision-making criteria will be met throughout the duration of the activity.
- Determine how the principles of ecologically sustainable development (**ESD**) as set out in section 3A of the Environment Protection and Biodiversity Conservation Act (**EPBC Act**) will be integrated into the impact and risk assessment process and management of the activity.
- Propose acceptable levels of environmental impact and risk to support consultation with relevant persons.
- Introduce the concept of managing environmental impacts and risks to As Low As Reasonably Practicable (**ALARP**).

This document will be updated over time because of the consultations and throughout the environmental assessments.

2 Aspect Specific Relevant Person Objections and Claims

These DMC were published in May for a period of 60 days and relevant persons, and the community, were invited to provide input into their quality and form. The consultation sought involve people who may be affected by the activity to improve the predictive quality of the assessments.

No feedback on the DMC document or the criteria themselves was received despite promotion of the importance of these documents at community information sessions, webinars, and during consultation activities (See Appendix C1). The lack of comment has not been used to assume relevant persons tacitly agree with these criteria. Notwithstanding, the criteria were derived from industry standards and from previously accepted Environment Plan thus giving them sufficient credibility to be used for this activity.

3 Legislation

3.1.1 Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023

The objectives of the *Offshore Petroleum and Greenhouse Gas (*Environment*) Regulations 2023* (**the Regulations**) are to ensure that any petroleum activity carried out in an offshore area is carried out in a manner consistent with the principles of ecologically sustainable development as set out in section 3A of the EPBC Act. Additionally, these activities must be carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable, while also ensuring that any environmental impacts and risks are of an acceptable level.

These objectives are critical to the protection of the marine environment and marine ecosystems from potential pollution, degradation, and other negative impacts associated with offshore petroleum activities. The principles of ecologically sustainable development promote the responsible use of natural resources and emphasize the need to consider the long-term impacts of human activities on the environment.

Reducing the environmental impacts and risks associated with offshore petroleum activities to as low as reasonably practicable is an important aspect of responsible and sustainable business practices in the offshore petroleum industry. This involves identifying potential environmental impacts and risks associated with an activity, implementing measures to minimize those impacts and risks, and continually monitoring and evaluating the effectiveness of those measures.

Ensuring that residual environmental impacts and risks are of an acceptable level is also critical to protecting the marine environment and marine ecosystems. This involves defining acceptable levels, such as effect level thresholds for specific receptors and ensuring that the environmental impacts and risks associated with an activity do not exceed those levels/thresholds.

3.1.2 Section 3A of the EPBC Act

The principles of ecologically sustainable development (ESD) in Section 3A of the EPBC Act refer to a set of guidelines aimed at promoting responsible environmental stewardship and sustainable use of natural resources. Table 1 describes the six principles of ESD outlined in the EPBC Act and explains how they will be met by the environmental impact and risk assessment process for the Regia MSS.

By adhering to these principles, decision-makers can promote sustainable development practices that consider both environmental and economic factors, ensure the conservation of biodiversity and ecological integrity, and engage with affected communities in transparent decision-making processes. These principles are critical to promoting a sustainable future that balances economic development with the protection and preservation of the environment.

Table B1-1 - Application of the Principles of ESD to the Environmental Impact and Risk Assessment Process

Principle of ESD	Application to the Environmental Impact and Risk Assessment Process
Integration Principle: Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social, and equitable considerations.	This principle is addressed by defining acceptable levels of impact and risk for biological, ecological, social and economic features of the environment which are compared against the predicted levels of impact and risk. This principle is inherently met through the environmental impact and risk assessment as it requires consideration of long-term and short-term economic, environmental, social, and equitable considerations based on: Consultation with relevant persons. Environmental requirements including legislation, conservation advice, recovery plans and management plans.
Precautionary principle: If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.	The precautionary principle will be applied in the presence of scientific uncertainty for all levels of impacts and risks, not just those of serious or irreversible environmental damage. At the conclusion of each impact and risk assessment a level of predictive uncertainty is assigned. If there is residual uncertainty this will be assessed, and measures implemented to either remove the uncertainty or apply the precautionary principle. Activities where environmental damage is temporary / reversible, small scale, and/or low intensity is deemed to be of an acceptable level.
Intergenerational principle: That the present generation should ensure that the health, diversity, and productivity of the	The acceptable level of impact and risk will be set to ensure impacts and risks do not result in serious or irreversible environmental damage, thus ensuring the health, diversity

Principle of ESD	Application to the Environmental Impact and Risk Assessment Process
environment is maintained or enhanced for the benefit of future generations.	and productivity of the environment is maintained or enhanced for the benefit of future generations.
Biodiversity principle: The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making.	The EP must demonstrate the activity is not inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological communities, or a management plan for an Australian Marine Park or Ramsar Wetland. This means that the acceptable level of impact and risk will be consistent with these plans which aim to ensure biological diversity and ecological integrity is maintained.
Valuation principle: Improved valuation, pricing and incentive mechanisms should be promoted.	The application of measures provides for CCG as the titleholder, to bear the cost of environmental management for the activity to ensure that the environmental impacts and risks are reduced to ALARP and are of an acceptable level. The ALARP assessment inherently balances the economic cost against environmental benefit.
Transparency principle: Decision-making should be transparent and involve the participation of potentially affected communities and stakeholders.	By publishing this document as part of our consultation activities we aim to meet this principle. This document will be used throughout our consultation effort and is available in the Regia MSS Consultation Hub (www.regiamss.com.au).

4 Decision-Making Criteria in the Environmental Assessment Process

Assessing environmental impacts and risks involves comparing the predicted levels of impact and risk against the pre-defined acceptable levels for each environmental impact and risk. This comparison is done considering typical (best practice) measures. If the predicted level of impact or risk is greater than the defined acceptable level, further measures or changes to the activity are required to ensure the environmental impact or risk can be managed to the defined acceptable level.

Once the defined acceptable level is met, an evaluation is done to identify if there are additional measures that would further reduce the environmental impact or risk to ALARP. The evaluation relies on demonstrating that further potential measures would require a disproportionate level of cost/effort to reduce the level of impact or risk. If this cannot be demonstrated, then the measure is required to be adopted.

The process for applying measures to meet the acceptable level and to be ALARP is shown in Figure B1-1.

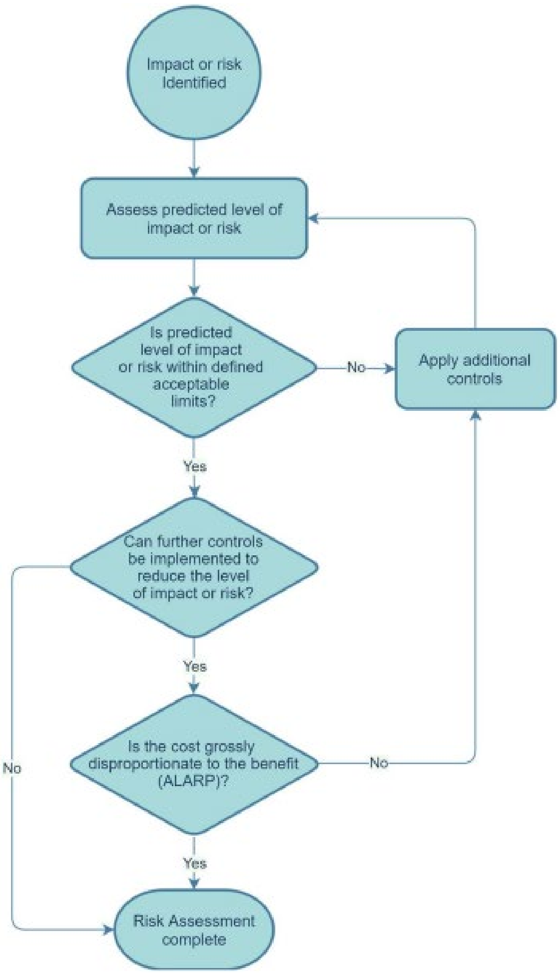


Figure B1-1 - Process for Applying Measures to Meet the Acceptable Level and ALARP

5 Defining Acceptable Levels of Impact and Risk

An 'acceptable level' is the specified amount of environmental impact and risk that an activity may have, which is consistent with all relevant principles and does not compromise the protection objectives of the environment.

To define the acceptable level for each impact and risk there are five areas of context to be considered:

1. **Principles of ESD:** Activities are to be carried out in a manner consistent with the ESD principles set out in Section 3A of the EPBC Act.
2. **Environmental context:** Consideration of the biological, ecological, economic, and cultural features relevant to the activity.
3. **Legislative context:** Management of the activity is consistent with legislation and other requirements including relevant policy documents, guidance, bioregional plans, wildlife conservation plans, management plans, gazettal instruments under the EPBC Act, conservation advice, and marine bioregional plans.
4. **Company (Internal) Context:** Management of the activity is consistent with the CGG impact and risk assessment process and implementation strategy.
5. **External Context:** Relevant persons' objections or claims have been assessed, responded to and controls adopted for objections and claims which have merit.

Based on these contexts, the statements in Table B1-2 have been proposed by CGG as being the defined acceptable levels of impact and risk for the Regia MSS.

Table B1-2 - Defined Acceptable Levels of Impact and Risk

Category	Defined Acceptable Level for the Regia MSS Impacts and Risks
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.
	The impact and risk assessments are based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.
Economic	Affected persons will not be worse off because of the activity.
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.
	Environmental impacts and risks are consistent with the CGG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.
	The views of the public have been considered in the impact and risk assessment.

A tabulated process will be followed for each impact and risk assessment. Each impact and risk assessment applies a standard method of comparing the predicted level of impact and risk against the defined acceptable level. Where there is uncertainty in the prediction that results in the possibility for unacceptable impacts the uncertainty will be identified and managed.

6 Demonstrating ALARP

As detailed in Figure 1, environmental impacts and risks are reduced to ALARP after the defined acceptable level of impact or risk has been reached. Further consideration of measures is undertaken and CGG demonstrates impacts and risks are reduced to ALARP when the cost and effort required to further reduce risk is grossly disproportionate to the benefit gained. Part of this demonstration includes a systematic process of considering alternative, additional or improved control measures and performance standards. Justification for control measures or improved performance standards that have been rejected is also provided.

This consideration of control measures to reduce impacts and risks will be made after the environmental assessments have been completed.

7 Document Control

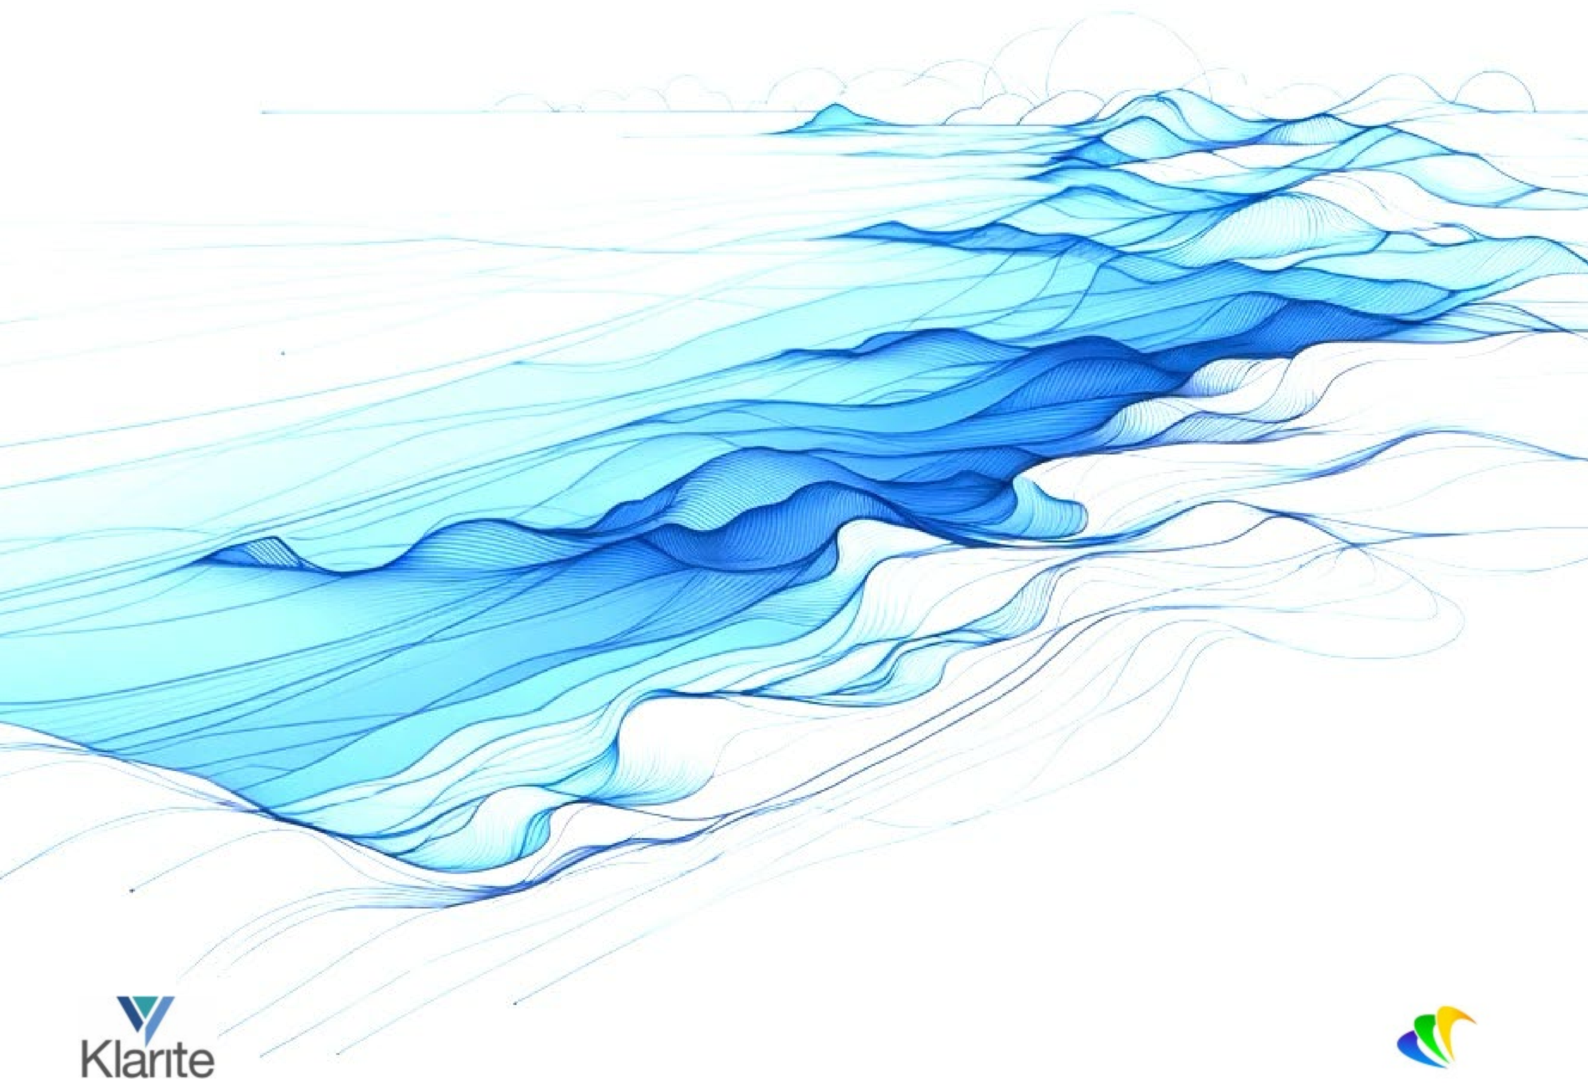
REGIA
Marine Seismic Survey

Legislation and Other Requirements Relevant to the Environmental Management of the Activity

Appendix B2: REG-EP-005-B2

Rev 2

January 2023



Klarite

Table of Contents

1 Introduction

This document outlines the legislation and other requirements that have been identified and considered relevant to the environmental management to the Regia Marine Seismic Survey (Regia MSS) and provides an overview of the regulatory framework in which the proposed activity must operate.

The impact and risk analysis documents (Appendix D1 to D4 and E1 to E10) demonstrate how the requirements identified as relevant to the Regia MSS will be met throughout the activity.

This document will be updated over time to reflect changes to the regulatory framework, including the introduction of new and updates to existing legislation and other requirements. These changes will be reviewed against the impact and risk analysis documents (Appendix D1 to D4 and E1 to E10) and where appropriate these documents will be updated to include details about how the new or updated legislation and other requirements will be met throughout the activity. A register is provided at the end of the document to record changes to the document.

1.1 Background

The legislation that governs offshore activities in Australian waters are designed to ensure the protection and preservation of the marine environment and the sustainability of its resources.

The process used to identify legislation and other requirements that apply to the environmental management of the proposed activity involved a comprehensive review of legislation, policies, guidelines, and advice at the Commonwealth and State (Victorian and Tasmanian) levels. This was initially done in March 2023 based on the Activity Planning Area which was within Commonwealth waters and the Environmental Planning Area which is within Commonwealth, Victorian and Tasmanian (King Island) waters. Since then, the Operational Area has been defined and supersedes the Activity Planning Area. The Operational Area, like the Activity Planning Area, is totally within Commonwealth waters. A review of this document was undertaken in January 2024 to identify any new or changes to legislation and other requirements applicable to the Operational Area.

Environment Plans previously submitted and accepted by NOPSEMA were used to validate the process.

1.2 Purpose

This document aims to provide a comprehensive overview of the legislation and other requirements that currently apply to environmental management of the proposed activity. Were legislation and other requirements were identified to be relevant to the Regia MSS the impact and risk analysis documents (Appendix D1 to D4 and E1 to E10) demonstrate how they will be met throughout the activity.

By complying with all applicable legislation and other requirements and updating this document as needed, the proposed activity can be carried out in an environmentally responsible and sustainable manner.

The following concepts have been identified in the NOPSEMA guidelines and form the structure of this document:

- Compliance with legislation and other requirements.
- Best practice environmental management.
- Application of the precautionary principle.
- Adaptive management approach.
- Relevant person consultation.
- Monitoring and reporting.

1.3 EBPC Act Streamlining

In 2014, the Commonwealth government amended the *Environmental Protection and Biodiversity Conservation* (EPBC) *Act* to streamline environmental approvals for offshore petroleum activities under the *Offshore Petroleum and Greenhouse Gas Storage* (OPGGS) *Act*. This amendment allows for the OPGGS (Environment) Regulations to be used as the primary mechanism for environmental assessment and approval under the EPBC Act for offshore petroleum activities. As a result, NOPSEMA is now responsible for assessing the environmental impact of proposed offshore petroleum activities and ensuring compliance with the EPBC Act and associated policies, guidelines, and advices.

In conducting their assessment, NOPSEMA is required to have regard to a range of documents under the EPBC Act, including threatened species and ecological communities' lists, conservation advices, recovery plans, conservation agreements, and management plans (Available on the Department of Climate Change, Energy, the Environment and Water (DCCEEW)). This requirement ensures that the potential impacts of the proposed activity on the environment are assessed and managed in accordance with the regulatory framework for environmental protection in Australian waters.

- Threatened species and ecological communities' lists: These are lists of species and ecological communities that are listed as threatened under the EPBC Act 1999. The list is maintained under the EPBC Regulations 2000. These lists are used to identify and manage potential impacts of the proposed activity on these species and communities.
- Conservation advice: These documents provide information about the ecology and conservation status of listed threatened species and ecological communities. They are issued under the EPBC Act 1999 and provide guidance on the management of potential impacts of the proposed activity on these species and communities.
- Recovery plans: These plans set out the actions necessary to recover listed threatened species and ecological communities. Recovery plans are prepared under the EPBC Act 1999 and provide guidance on how the potential impacts of the proposed activity on these species and communities can be managed.
- Conservation agreements: These are voluntary agreements between the Commonwealth government and landholders or other stakeholders for the conservation and management of threatened species and ecological communities. Conservation agreements are made under the EPBC Act 1999 and the EPBC Regulations 2000. Conservation agreements can provide additional guidance on the management of potential impacts of the proposed activity on these species and communities.
- Management plans: These are plans that set out the objectives and actions for the management of protected areas, such as National Parks or Marine Parks. Management plans are made under various pieces of legislation, including the EPBC Act 1999, the National Parks and Wildlife Conservation Act 1975, and the Environment Protection and Biodiversity Conservation Regulations 2000. Management plans can provide guidance on how the potential impacts of the proposed activity on these areas can be managed.

In summary, each type of EPBC Act document provides guidance on how to manage potential impacts of the proposed activity on the environment. They help to ensure that the proposed activity is carried out in a way that is consistent with the regulatory framework for environmental protection in Australian waters, as set out in various pieces of legislation and other requirements.

2 Compliance with Legislation and Other Requirements

The proposed activity must comply with all relevant legislation and other requirements. The legislative and other requirements relevant to the environmental management of the proposed activity have been identified and are described in Annex 1 of this document.

The proposed activity will be designed to comply with these legislative and requirements. Any changes to the proposed activity that may impact compliance with these legislative and other requirements will be assessed and managed through the Management of Change Process described in the Implementation Strategy (Appendix B3).

3 Principles of Ecologically Sustainable Development

We have completed a dedicated assessment of the Regia MSS EP preparation process for consistency with the principles of ecologically sustainable development. This can be found in Appendix F4.

4 Relevant Person Consultation

Relevant persons consultation with relevant authorities is an important part of the management of the proposed activity in accordance with the applicable legislation. The consultation with the relevant authorities ensures the proper application of legislative and other requirements that apply to the environmental management of the activity. Details of the consultation with relevant authorities can be found in Relevant Person Consultation (Appendix C1 to C5).

5 Legislative and Other Requirements Identified and Considered

5.1 International Conventions

Table B2-1 - International Conventions

Instrument	**Relevant to Regia MSS (Yes/No)**	**Description of Relevance to Environmental Management of the Activity**
Agreement on the Conservation of Albatrosses and Petrels (ACAP)	Yes	ACAP is a multilateral agreement which seeks to conserve listed albatrosses, petrels and shearwaters by coordinating international activity to mitigate known threats to their populations. Albatrosses, petrels and shearwaters are protected under the Environment Protection and Biodiversity Conservation Act 1999.
China-Australia Migratory Bird Agreement (CAMBA)	Yes	This agreements provides for the protection and conservation of migratory birds and their important habitats, protection from take or trade except under limited circumstances, the exchange of information, and building cooperative relationships. Birds listed in the annex of this agreement are required to be listed as migratory species under the Environment Protection and Biodiversity Conservation Act 1999.
Convention on Biological Diversity (CBD)	Yes	The CBD aims to conserve biodiversity, sustainably use its components, and share the benefits from the use of genetic resources. Seismic surveys may impact marine biodiversity through noise pollution or other means, so it is important to consider the potential impacts on biodiversity during the survey. In Australia, the CBD has been given effect by the Environment Protection and Biodiversity Conservation Act 1999.
Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR)	No	The goal of this convention is to preserve marine life and environmental integrity in and near Antarctica. It was established in large part to concerns that an increase in krill catches in the Southern Ocean could have a serious impact on populations of other marine life which are dependent upon krill for food.
Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention)	Yes	The Conn Convention aims to conserve terrestrial, aquatic and avian migratory species throughout their range. Marine seismic surveys may impact migratory species such as whales or dolphins, so it is important to consider potential impacts during the survey. In Australia, the CMS has been given effect by the Environment Protection and Biodiversity Conservation Act 1999.
Convention on the International Regulations for Preventing Collisions at Sea (COLREG)	Yes	COLREG establishes the navigation rules to be followed by ships and other vessels at sea to prevent collisions between two or more vessels. Seismic surveys may involve the use of vessels that must comply with the safety standards set out in this convention. In Australia, COLREG is implemented through the Navigation Act 2012.
International Convention on Civil Liability for Oil Pollution Damage (CLC)	Yes	The CLC aims to ensure that victims of oil pollution are compensated for the damage caused. Seismic surveys may involve the use of vessels that carry oil or other pollutants, so it is important to consider the potential for oil spills during the survey. In Australia, the CLC is implemented through the Protection of the Sea (Civil Liability for Bunker Oil Pollution Damage) Act 2008.
International Convention on the Control of Harmful Anti-fouling Systems on Ships (AFS)	Yes	The AFS convention aims to prohibit the use of harmful anti-fouling systems on ships, which can release toxic substances into the marine environment. Seismic surveys may involve the use of vessels that must comply with the regulations of this convention. In Australia, the convention is implemented through the Protection of the Sea (Harmful Anti-fouling Systems) Act 2006.

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
International Convention on Load Lines (LL)	Yes	The convention pertains specifically to a ship's load line (also referred to as the "waterline"), a marking of the highest point on a ship's hull that can safely meet the surface of the water; a ship that is loaded to the point where its load line is underwater and no longer visible has exceeded its draft and is in danger because its capacity has been exceeded. In Australia, this requirement is implemented through the Navigation Act 2012.
International Convention for the Control and Management of Ships' Ballast Water and Sediments	Yes	The convention is a 2004 international maritime treaty which requires signatory flag states to ensure that ships flagged by them comply with standards and procedures for the management and control of ships' ballast water and sediments. In Australia, the convention is implemented through the Biosecurity Act 2015 and associated regulations.
International Convention on Oil Pollution Preparedness, Response and Co-operation (OPRC)	Yes	The OPRC convention aims to establish an international framework for preparedness and response to marine oil pollution incidents. Seismic surveys may increase the risk of oil spills due to the use of vessels carrying fuel or other pollutants, so it is important to have a plan in place to respond to any potential spills. In Australia, the convention is implemented through the Protection of the Sea (Prevention of Pollution from Ships) Act 1983.
International Convention for the Prevention of Pollution from Ships (MARPOL)	Yes	This convention regulates the discharge of pollutants from ships into the sea, including discharges of oil, chemicals, sewage and garbage. Marine seismic surveys may involve the use of vessels that must comply with the regulations of this convention. In Australia, the convention is implemented through the Protection of the Sea (Prevention of Pollution from Ships) Act 1983.
International Convention for the Safety of Life at Sea (SOLAS)	Yes	SOLAS establishes minimum safety standards for ships, including requirements for equipment, construction, and operation. Seismic surveys may involve the use of vessels that must comply with the safety standards set out in this convention. In Australia, SOLAS is implemented through the Navigation Act 2012.
International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW)	Yes	STCW sets the standards of competence and certification for seafarers internationally. Seismic surveys may involve the use of vessels that must comply with the training and certification standards set out in this convention. In Australia, STCW is implemented through the Navigation Act 2012.
Japan-Australia Migratory Bird Agreement (JAMBA)	Yes	This agreement provides for the protection and conservation of migratory birds and their important habitats, protection from take or trade except under limited circumstances, the exchange of information, and building cooperative relationships. Birds listed in the annex of this agreement are required to be listed as migratory species under the Environment Protection and Biodiversity Conservation Act 1999.
Minamata Convention on Mercury	No	The Minamata Convention on Mercury is an international treaty that seeks to protect human health and the environment from anthropogenic (caused by humans) emissions and releases of mercury and mercury compounds. No mercury emissions are predicted associated with the seismic survey.
Montreal Protocol on Substances that Deplete the Ozone Layer (the Montreal Protocol)	Yes	This protocol controls the production and import of chemicals that deplete the ozone layer. In Australia, the protocol is implemented through the Ozone Protection and Synthetic Greenhouse Gas Management Act 1989.

Instrument	**Relevant to Regia MSS (Yes/No)**	**Description of Relevance to Environmental Management of the Activity**
Ramsar Convention on Wetlands (Ramsar Convention)	Yes	The Ramsar Convention encourages the designation of sites containing representative, rare or unique wetlands, or wetlands that are important for conserving biological diversity. Once designated, these sites are added to the Convention's List of Wetlands of International Importance and become known as Ramsar sites. Wetlands of International Importance are managed under the Environment Protection and Biodiversity Conservation Act 1999.
Republic of Korea-Australia Migratory Bird Agreement (CAMBA)	Yes	This agreements provides for the protection and conservation of migratory birds and their important habitats, protection from take or trade except under limited circumstances, the exchange of information, and building cooperative relationships. Birds listed in the annex of this agreement are required to be listed as migratory species under the Environment Protection and Biodiversity Conservation Act 1999.
United Nations Convention on the Law of the Sea (UNCLOS)	Yes	UNCLOS provides the legal framework for all activities in the ocean, including marine seismic surveys. The convention establishes the rights and responsibilities of states in their use of the world's oceans, establishing guidelines for businesses and governments to operate within maritime boundaries. In Australia, UNCLOS has been given effect by the Seas and Submerged Lands Act 1973.
UNESCO 2001 Convention for the Protection of the Underwater Cultural Heritage (UNESCO 20021 Convention)	Yes	The Convention aims to protect underwater cultural heritage to assist countries in managing and preserving their unique underwater cultural heritage. The Convention defines underwater cultural heritage as all traces of human existence having cultural, historical or archaeological character which have been partially or totally underwater, periodically or continuously for at least 100 years. It does not include installations still in operation such as submarine cables or piers, jetties and wharves that have been utilised with the last 100 years., In this convention has been given effect by the Underwater Cultural Heritage Act 2018.

5.2 Legislative Requirements

5.2.1 Commonwealth

Table B2-2 - Commonwealth Legislation

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Aboriginal and Torres Strait Islander Heritage Protection Act 1984	Yes	The act provides for the protection and conservation of Aboriginal and Torres Strait Islander heritage in Commonwealth waters, including those that may be impacted by seismic surveys.
Australian Maritime Safety Authority Act 1990	Yes	The act establishes the Australian Maritime Safety Authority (AMSA), which is responsible for ensuring the safety of vessels and seafarers, including those associated with seismic surveys.
Antarctic Treaty (Environment Protection) Act 1980	Yes	The act provides for the protection and conservation of the Antarctic environment, including those that may be impacted by seismic surveys.
Biosecurity Act 2015 (Biosecurity Act)	Yes	The act provides a framework for managing biosecurity risks associated with the import and export of goods and vessels, which may be associated with seismic surveys.
Biosecurity Regulations 2016	Yes	The regulations provide additional guidance on the management of biosecurity risks associated with the import and export of goods and vessels, which may be associated with seismic surveys.
Biosecurity Amendment (Biofouling Management) Regulations 2021	Yes	The regulations require operators of all vessels, including those associated with seismic surveys, to provide information on biofouling management practices prior to arriving in Australia.
Climate Change Act 2022	Yes	This Act sets out Australia's greenhouse gas emissions reduction targets. The Minister must prepare an annual climate change statement. The Climate Change Authority is to give the Minister advice that relates to the preparation of an annual climate change statement.
Environmental Protection and Biodiversity Conservation Act 1999 (EPBC Act)	Yes	The act regulates activities that may have a significant impact on the environment, including seismic surveys, and requires that these activities are assessed and approved before they can be carried out.
EPBC Act Regulations 2000	Yes	The regulations provide additional guidance on the assessment and approval process for activities that may have a significant impact on the environment, including seismic surveys. They also provide distances and actions to be taken when interacting with cetaceans for vessels and aircraft, which may be associated with seismic surveys.
Environment Protection (Sea Dumping Act) 1981	No	The act regulates the dumping of waste at sea, which will not occur for the Regia MSS.
Fisheries Management Act 1991	Yes	The Fisheries Management Act 1991 establishes the legislative framework for the sustainable use and conservation of fisheries resources, and for the management of fishing activities by commercial, recreational, and Indigenous fishers. The act provides for the setting of total allowable catches, fishing

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
		quotas, and other management measures, as well as the regulation of fishing gear, fishing methods, and fishing licenses.
Fisheries Management Regulations 2009	Yes	The Fisheries Management Regulations 2009 provide more detailed regulations for the implementation of the Fisheries Management Act 1991, including provisions for monitoring, compliance, and enforcement of fisheries management measures. The regulations set out requirements for the reporting of fishing activities, the monitoring of fishing vessels, and the handling of fish and other seafood products.
Hazardous Waste (Regulation of Exports and Imports) Act 1989	No	The act regulates the import and export of hazardous waste, which will not occur for the Regia MSS.
Marine Order 21 (Safety and Emergency Arrangements)	Yes	The marine order provides guidance on the safety and emergency arrangements for vessels, which may be associated with seismic surveys.
Marine Orders Part 27 (Safety of Navigation and Radio Equipment)	Yes	The marine order provides guidance on the safety of navigation and radio equipment for vessels, which may be associated with seismic surveys.
Marine Order 30 (Prevention of Collisions)	Yes	The marine order provides guidance on the prevention of collisions between vessels, including those associated with seismic surveys.
Marine Order 31 SOLAS and non-SOLAS certification	Yes	The marine order provides guidance on the survey, certification and maintenance of certificates for regulated Australian vessels and certification of foreign vessels, which may be associated with seismic surveys.
Marine Order 70 (Seafarer Certification)	Yes	The marine order provides guidance on the certification of seafarers, including those associated with seismic surveys.
Marine Order 71 (Masters and Deck Officers)	Yes	The marine order provides guidance on the certification and training of masters and deck officers for vessels, including those associated with seismic surveys.
Marine Order 72 (Engineer Officers)	Yes	The marine order provides guidance on the certification and training of engineer officers for vessels, including those associated with seismic surveys.
Marine Order 91 - Marine pollution prevention - oil	Yes	Marine Order 91 sets out the requirements for the prevention of marine pollution by oil from ships in Australian waters. The order establishes procedures for reporting, investigating, and responding to pollution incidents, as well as measures for the clean-up and disposal of spilled pollutants. It also sets out the requirements for pollution emergency plans, contingency planning, and pollution response equipment and training.
Marine Order 93 - Marine pollution prevention - noxious liquid substances	Yes	Marine Order 93 sets out the requirements for the prevention of marine pollution from liquids and chemicals in Australian waters, including measures to prevent spills, leaks, and discharges of noxious liquids from ships. The order establishes procedures for reporting, investigating, and responding to noxious liquid pollution incidents, as well as measures for the clean-up and disposal of spilled noxious liquids. It also sets out the requirements for noxious liquids pollution emergency plans, contingency planning, and pollution response equipment and training.

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Marine order 94—Marine pollution prevention – packaged harmful substances	Yes	Marine Order 94 sets out the requirements for the prevention of marine pollution from packaged harmful substances in Australian waters, including management of harmful substances in packaged form, washing substances overboard and notifying and reporting an incident.
Marine Order 95 - Marine pollution prevention - garbage	Yes	Marine Order 95 sets out the requirements for the prevention of marine pollution from garbage in Australian waters, including measures to prevent the discharge of garbage from ships. The order establishes procedures for the storage, processing, and disposal of garbage, as well as the requirements for garbage management plans and records.
Marine Order 96 - Marine pollution prevention - sewage	Yes	Marine Order 96 sets out the requirements for the prevention of marine pollution from sewage in Australian waters, including measures to prevent the discharge of untreated sewage from ships. The order establishes requirements for the design and operation of sewage treatment systems on board ships, as well as the requirements for sewage management plans and records.
Marine Order 97 - Marine pollution prevention - air	Yes	Marine Order 97 sets out the requirements for the prevention of air pollution from ships in Australian waters, including measures to reduce emissions of pollutants from ships' engines and boilers. The order establishes requirements for the use of low-sulphur fuels and the installation of emission control systems on board ships.
Marine Order 98 - Marine pollution prevention - antifouling systems	Yes	Marine Order 98 sets out the requirements for the use of antifouling solutions on ships in Australian waters. The order establishes restrictions on the use of certain types of antifouling coatings, as well as requirements for the management of hull cleaning and maintenance.
National Environmental Protection Measures (Implementation) Act 1998	No	The act provides a framework for the implementation of national environmental protection measures, which were not identified to be relevant to the Regia MSS.
National Greenhouse and Energy Reporting Act (NGER Act)	No	The Act establishes a national framework for reporting and disseminating information about greenhouse gas emissions, energy production, and energy consumption. The Act applies to facilities that meet certain thresholds for greenhouse gas emissions, energy production, and energy consumption, including some offshore petroleum facilities. The Regia MSS will not trigger the reporting requirements of the Act.
Native Title Act 1993	Yes	The main objects of this Act are: to provide for the recognition and protection of native title; and to establish ways in which future dealings affecting native title may proceed and to set standards for those dealings; and to establish a mechanism for determining claims to native title; and to provide for, or permit, the validation of past acts, and intermediate period acts, invalidated because of the existence of native title. Native title may be associated with seismic surveys.
Navigation Act 2012	Yes	The act regulates the safety and navigation of vessels, which may be associated with seismic surveys.

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Offshore Petroleum and Greenhouse Gas Storage Act 2006 (OPGGS Act)	Yes	The act provides a regulatory framework for offshore petroleum and greenhouse gas storage activities, which includes seismic surveys.
Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023	Yes	The regulations provide additional guidance on the environmental impact assessment process for offshore petroleum and greenhouse gas storage activities, including seismic surveys. The Regia MSS will not occur in Victorian State waters.
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989	Yes	The act regulates the import, export, manufacture, and use of ozone-depleting substances (ODSs) and synthetic greenhouse gases (SGGs) in Australia. The act establishes a framework for the phase-out of ODSs and the reduction of SGG emissions, in order to protect the ozone layer and mitigate climate change. The act provides for the licensing of persons involved in the handling of ODSs and SGGs, as well as the regulation of equipment containing these substances. It also establishes penalties for non-compliance with the regulations under the act.
Protection of the Sea (Civil Liability for Bunker Oil Pollution Damage) Act 2008	Yes	The Protection of the Sea (Civil Liability for Bunker Oil Pollution Damage) Act 2008 is a Commonwealth legislation that provides for civil liability and compensation for damages caused by oil spills from ships' bunkers in Australian waters. The act establishes a regime for the liability of the shipowner and the right to compensation of the affected parties, including the cost of clean-up and restoration of the environment. The act also provides for the limitation of liability of the shipowner in certain circumstances.
Protection of the Sea (Prevention of Pollution from Ships) Act 1983	Yes	The act regulates the prevention of pollution from ships, which may be associated with the transportation of personnel and equipment during seismic surveys.
Protection of the Sea (Harmful Antifouling Systems) Act 2006	Yes	The act regulates the use of antifouling systems, which may be used on vessels associated with seismic surveys.
Underwater Cultural Heritage Act 2019	Yes	The act provides for the protection of underwater cultural heritage, which may be affected by the activities associated with seismic surveys.

5.2.2 Victorian Legislation

Table B2-3 - Victorian Legislation

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Aboriginal Heritage Act 2006	Yes	This Act provides for the protection of Aboriginal cultural heritage in Victoria, including Aboriginal cultural heritage that may be affected by the operation of seismic surveys.
Aboriginal Heritage Regulations 2018	Yes	The Regulations give effect to the Aboriginal Heritage Act. The Regulations prescribe standards, set out the circumstances in which a Cultural Heritage Management Plans should be prepared, including where Aboriginal cultural heritage may be affected by the operation of seismic surveys.
Climate Change Act 2017	Yes	This Act provides Victoria with the legislative foundation to manage climate change risks, maximise the opportunities that arise from decisive action, and drive transition to a climate-resilient community and economy with net-zero emissions by 2050.
Emergency Management Act 2013	Yes	This act provides for the management of emergencies, including natural disasters and other incidents that threaten public safety, health or welfare. It establishes a framework for emergency management at the federal, state and local levels, and sets out the roles and responsibilities of emergency management agencies.
Environment Protection Act 2017	Yes	The act regulates the prevention and management of pollution and waste, including those generated by seismic surveys, and provides for the protection of the environment and human health.
Flora and Fauna Guarantee Act 1988 (FFG Act)	Yes	The act provides for the conservation of flora and fauna, including marine species that may be affected by the operation of seismic surveys.
Heritage Act 1995	Yes	This act provides for the protection and conservation of historic places, objects, shipwrecks and archaeological sites in state areas and waters, including those that may be affected by the operation of seismic surveys.
Marine and Coastal Act 2018	Yes	The act provides a framework for the management of marine and coastal environments in Victoria, including the assessment and management of environmental impacts of activities such as seismic surveys.
Marine (Drug, Alcohol and Pollution) Act 1988	Yes	This act regulates the use of drugs and alcohol by seafarers and provides measures for preventing marine pollution. It aims to promote safety and protect the marine environment from the harmful effects of pollution caused by ships.
Marine Safety Act 2010	Yes	This act provides for safe marine operations in Victoria State waters, including imposing safety duties on owners, managers and designers of vessels, marine infrastructure and marine safety equipment; marine safety workers, masters and passengers on vessels; regulation and management of vessel use and navigation in Victorian State waters.
National Parks Act 1975	Yes	This act establishes a framework for the protection and management of national parks in Australia. It provides for the conservation of natural and cultural resources, the provision of recreational opportunities, and the management of park use.
Offshore Petroleum and Greenhouse Gas Storage Act 2010	No	The act applies to petroleum operations within three nautical miles of the Victorian coast and address licensing, health, safety, environmental and royalty issues for offshore petroleum exploration and development operations.

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Pollution of Waters by Oil and Noxious Substances Act 1986 (POWBONS)	Yes	This act provides measures for preventing, controlling and cleaning up pollution caused by oil and other noxious substances in Australian waters. It aims to reduce the risk of damage to the environment and protect public health and safety.
Seafood Safety Act 2003	Yes	This act regulates the production, processing, and sale of seafood in Victoria, Australia. It sets standards for food safety and ensures that seafood products are safe for human consumption.
Wildlife Act 1975	Yes	This act provides for the conservation and management of wildlife in Victoria, Australia. It regulates the hunting and trapping of wildlife, establishes protected areas for wildlife, and provides for the protection of threatened and endangered species.
Wildlife (Marine Mammals) Regulations 2009	Yes	The regulations provide guidance on the management and protection of marine mammals, which may be affected by the underwater noise generated by seismic surveys.

5.2.3 Tasmanian Legislation

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Aboriginal Heritage Act 1975	Yes	The act is the primary legislation for the protection of Aboriginal cultural heritage in Tasmania,
Environmental Management and Pollution Control Act 1994	Yes	The act regulates the management and control of pollution, including those generated by seismic surveys, and provides for the protection and conservation of the environment and human health in Tasmania.
Historic Cultural Heritage Act 1995	Yes	The act was developed to ensure the historic places that are of importance to the whole of Tasmania are recognised, protected, and managed effectively as part of the Resource Management and Planning System, including the assessment and management of environmental impacts of activities such as seismic surveys.
Living Marine Resources Management Act 1995	Yes	The act regulates the management and conservation of living marine resources in Tasmania, including the assessment and management of environmental impacts of activities such as seismic surveys.
Marine Farming Planning Act 1995	Yes	The act provides a framework for the planning, management, and development of marine farming activities in Tasmania, including the assessment and management of environmental impacts of activities such as seismic surveys.
Marine Farming Planning Regulations 2016	Yes	The regulations provide detailed guidance on the management and regulation of marine farming activities in Tasmania, including the assessment and management of environmental impacts of activities such as seismic surveys.
Marine-related Incidents (MARPOL Implementation) Act 2020	Yes	This act deals specifically with discharges of oil and other pollutants from ships, including those associated with seismic surveys.
Marine and Safety Authority Act 1997	Yes	The act provides for the safety of vessels and seafarers in Tasmania, including those associated with seismic surveys.
National Parks and Reserves Management Act 2002	Yes	The act provides for the management of parks and reserves based on management objectives of each class of reserve, declaration and management of Marine Protected Areas (marine reserves), including those that may be impacted by seismic surveys.

5.3 Other Requirements

5.3.1 Policy Statements

Table B2-4 - Policy Statement

Instrument	**Relevant to Regia MSS (Yes/No)**	**Description of Relevance to Environmental Management of the Activity**
Australian Ballast Water Management Requirements	Yes	The requirements provide guidance on how vessel operators should manage ballast water when operating within Australian seas to comply with the Biosecurity Act 2015, including those conducting a marine seismic survey. They align to the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004.
Australia Biofouling Management Requirements	Yes	The requirements set out vessel operator obligations for the management of biofouling when operating vessels under biosecurity control within Australian territorial seas, including those conducting a marine seismic survey.
Australian National Guidelines for Whale and Dolphin Watching 2017	No	The guidelines provide guidance on the responsible watching of whales and dolphins. Applicable requirements relevant to seismic surveys are applied via the Environment Protection and Biodiversity Conservation Regulations 2000 Part 8.
EPBC Act Policy Statement 1.1 – Significant Impact Guidelines – Matters of National Environmental Significance	Yes	The policy statement provides guidance on the assessment and management of activities that may have a significant impact on matters of national environmental significance, including marine habitats and species.
EPBC Act Policy Statement 2.1 - Interaction between offshore seismic activities and whales (2008)	Yes	The policy statement provides guidance on how to minimise the impact of seismic surveys on whale populations, which may be affected by underwater noise and disturbance caused by these activities.
EPBC Act Policy Statement 3.21 - Industry Guidelines for avoiding, assessing and mitigating impacts on EPBC Act listed migratory shorebird species	Yes	The policy statement provides guidance on how to minimise the impact of seismic surveys on migratory shorebirds, which may be affected by the disturbance caused by these activities.
Guidelines for the Control and Management of Ships' Biofouling to Minimize the Transfer of Invasive Aquatic Species (Biofouling Guidelines)	Yes	Provide a globally consistent approach to the management of biofouling, which may be associated with seismic surveys.
Marine Pest Plan 2018–2023: National Strategic Plan for Marine Pest Biosecurity	Yes	The plan outlines a coordinated approach to building Australia's capabilities to manage the threat of marine pests over the next five years. It represents agreed priorities and actions of governments, marine industries, and other stakeholders to achieve a common purpose: to manage the risks posed by marine pests and

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
		minimise their potential harm to marine industries, communities and the environment, which may be associated with seismic surveys.
National Biofouling Management Guidance for the Petroleum Production and Exploration Industry 2009	Yes	The guidance provides a framework for managing the biofouling of vessels, which may be associated with seismic surveys.
National Light Pollution Guidelines for Wildlife 2023	Yes	The guidelines provide guidance on the management of light pollution, which may affect marine species, including those affected by seismic surveys.
National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna	Yes	The strategy provides guidance on reducing the risk of vessel strikes on cetaceans and other marine megafauna, which may be affected by the operation of vessels associated with seismic surveys.
Threat Abatement Plan for the Impacts of Marine Debris on Vertebrate Wildlife of Australia’s Coasts and Ocean	Yes	The plan provides national guidance on action to prevent and mitigate the impacts of harmful marine debris on vertebrate marine life, which may be affected by the operation of vessels associated with seismic surveys.
Victorian Coastal Council Strategic Plan	Yes	The strategic plan provides guidance on the management of coastal environments in Victoria, including the management of environmental impacts of activities such as seismic surveys.
Victorian Coastal Strategy	Yes	The strategy provides a framework for the management of the Victorian coast, including the protection and conservation of marine environments that may be impacted by seismic surveys.
Victorian Marine and Coastal Discovery Centre Guidelines	Yes	The guidelines provide guidance on the responsible interaction with marine environments, including the operation of vessels associated with seismic surveys.
Victorian Marine and Coastal Policy 2020	Yes	The policy provides guidance on the sustainable use and management of marine and coastal environments in Victoria, including the management of environmental impacts of activities such as seismic surveys.
Victorian Marine Mammal Emergency Response Plan	Yes	The emergency response plan provides guidance on the response to marine mammal strandings and incidents, which may be associated with the operation of vessels associated with seismic surveys.
Victorian Marine National Parks and Sanctuaries Management Plan	Yes	The management plan provides guidance on the management of marine national parks and sanctuaries in Victoria, including the protection and conservation of marine environments that may be impacted by seismic surveys.
Victorian Marine Pest Management Strategy	Yes	The strategy provides guidance on the management of marine pests, which may be associated with the operation of vessels associated with seismic surveys.
Marine and Coastal Policy 2020	Yes	The policy provides guidance on the sustainable use and management of marine and coastal environments in Tasmania, including the assessment and management of environmental impacts of activities such as seismic surveys.
Tasmanian Marine Bioregional Plan	Yes	The plan provides guidance on the management and conservation of marine ecosystems and species in Tasmania, including those that may be impacted by seismic surveys.

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
Tasmanian Marine Wildlife Code of Practice	Yes	The code provides guidance on the responsible interaction with marine wildlife, including the operation of vessels associated with seismic surveys.

5.3.2 Management Plans

Management Plans have been identified and described in the impact and risk analysis documents (Appendix D1 to D4 and E1 to E10) which also demonstrate how the requirements relevant to the Regia MSS will be met.

5.3.3 Species Recovery Plans

Species Recovery Plans have been identified and described in the impact and risk analysis documents (Appendix D1 to D4 and E1 to E10) which also demonstrate how the requirements relevant to the Regia MSS will be met.

5.3.4 Conservation Advice

Conservation Advice have been identified and described in the impact and risk analysis documents (Appendix D1 to D4 and E1 to E10) which also demonstrate how the requirements relevant to the Regia MSS will be met.

5.3.5 International and Industry Standards

Table B2-5 - International and Industry Standards

Instrument	Relevant to Regia MSS (Yes/No)	Description of Relevance to Environmental Management of the Activity
AS/NZS 4360:2004 Risk Management	Yes	The standard provides guidance on the management of risk associated with the activities associated with seismic surveys.
AS/NZS ISO HB 203:2012 Managing Environment Related Risk	Yes	The handbook provides guidance on managing environment-related risks associated with activities, including seismic surveys.
AS/NZS ISO 31000:2018 Risk Management	Yes	The standard provides guidance on the management of risk associated with the activities associated with seismic surveys.
International Association of Geophysical Contractors (IAGC) Environment Manual for Worldwide Geophysical Operations (2013)	Yes	Provides guidance on the management of risk associated with the activities associated with seismic surveys.
Recommended monitoring and mitigation measures for cetaceans during marine seismic survey geophysical operations (2017)	Yes	Provides recommendations on applying mitigation measures for cetaceans during seismic surveys.
Technical Guidance for Assessing the Effects of Anthropogenic Hearing (NOAA 2018)	Yes	The guidance provides guidance on assessing the effects of anthropogenic hearing on marine mammals, which may be affected by the underwater noise generated by seismic surveys.

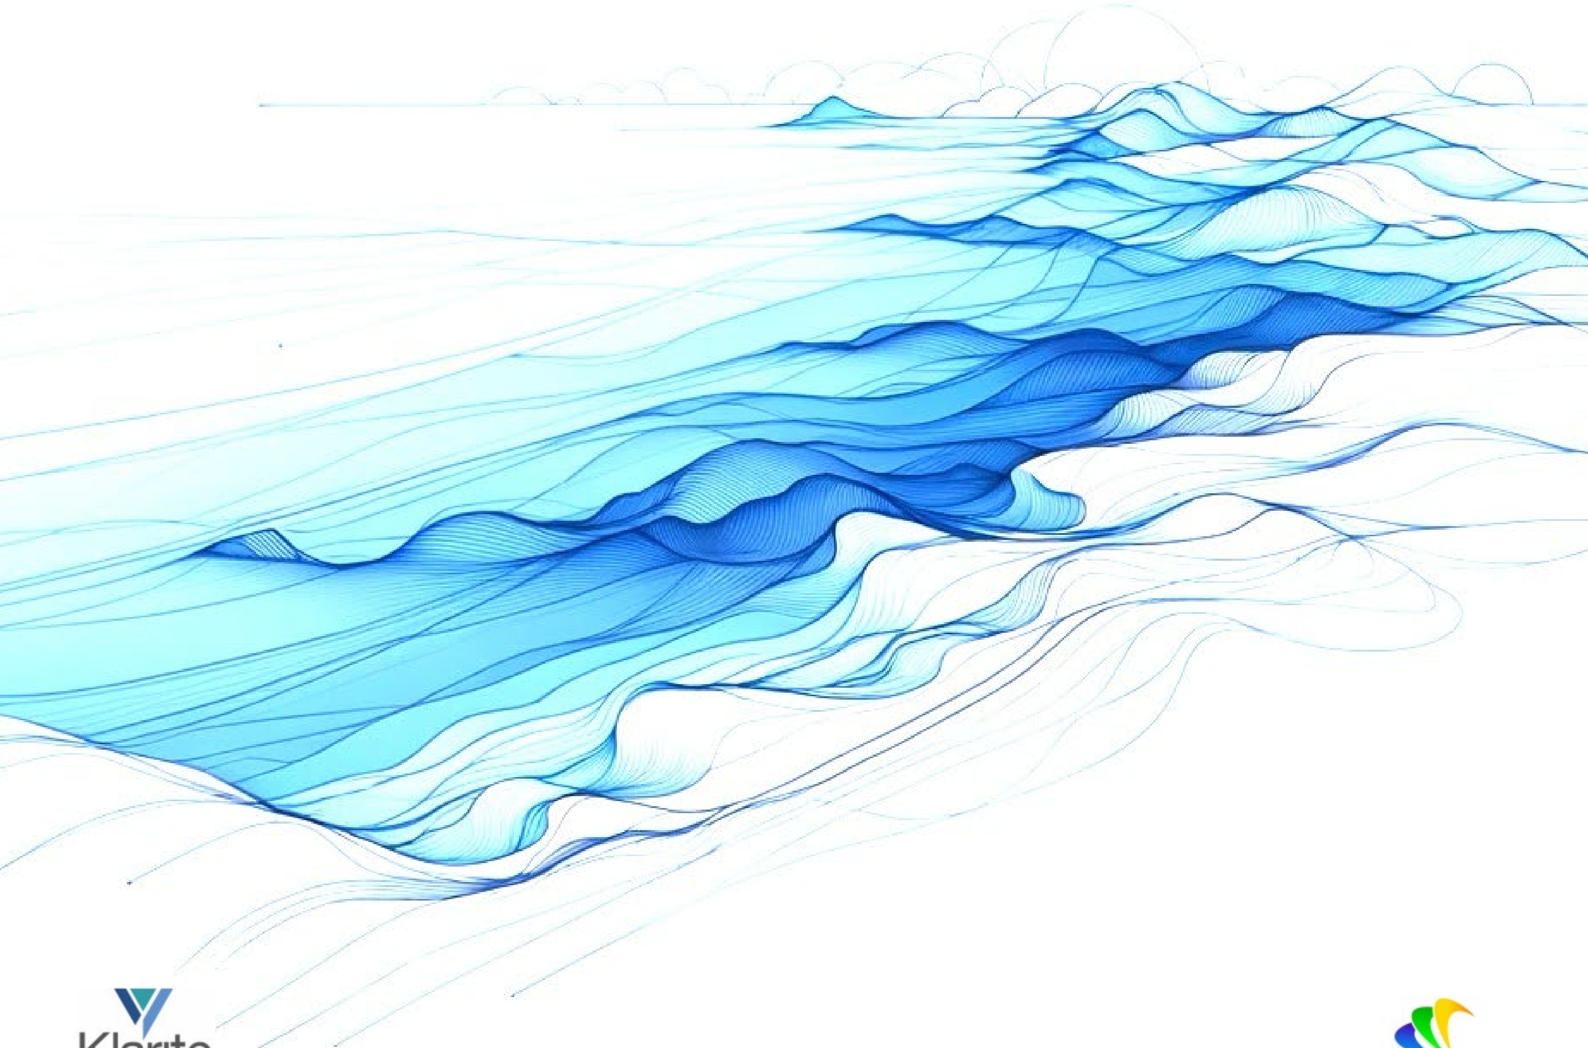
REGIA
Marine Seismic Survey

Implementation Strategy

Appendix B3: REG-EP-006-B3

Rev 3

May 2024



Klarite

Table of Contents

1 Introduction

This document has been prepared to support CGG Services (Australia) Pty Ltd (**CGG**) in its environmental management of the Regia Marine Seismic Survey (**Regia MSS**). The Implementation Strategy follows a standardised methodology for monitoring and managing environmental performance of offshore petroleum activities and has been developed by CGG over many years of successfully operating in Australia without major incidents.

2 Purpose

This document aims to communicate the basis for environmental performance monitoring and management before, during and after the proposed Regia MSS. It is structured to align with the prescribed content of an implementation strategy as per Section 22 of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (**the Regulations**).

3 Section 22(1): Implementation Strategy

This implementation strategy has been developed to comply with the requirements of Section 22(1) of the Regulations and describes the specific measures and arrangements that will be implemented for the duration of the activity to ensure that:

- All environmental impacts and risks of the activity will be continually identified and reduced to a level that is as low as reasonably practicable (**ALARP**).
- Management and mitigation measures detailed in the EP are effective in reducing the environmental impacts and risks of the activity to ALARP and acceptable levels.
- Environmental performance outcomes and standards set out in the environment plan (**EP**) are met.
- Arrangements are in place to respond to, and monitor impacts of, oil pollution emergencies.
- Consultation is maintained throughout the activity as appropriate.

The implementation strategy outlines a systematic approach that describes:

- The management systems by which the management and mitigation measures identified in the impact and risk assessment will be implemented.
- The implementation of management and mitigation measures will be monitored to ensure environmental risks continue to be managed to ALARP.
- The ongoing consultation process prior to and during the activity.
- Monitoring, auditing, and reporting of environmental performance for activities carried out under the EP.
- Arrangements in place to respond to, and monitor impacts of, oil pollution emergencies.

The implementation strategy for this EP has considered lessons learnt from the implementation of previous campaigns and inspection recommendations.

4 Section 22(2): Environmental Management System

The Regia MSS will be conducted under the framework of the CGG Environment Policy (Appendix A1), CGG Environmental Management Procedure, CGG Health, Safety, Environment and Social Responsibility Operating Management System (**HSE-OMS**) and the survey and support vessel's HSE Management System.

The activity will also operate under an activity specific HSE Plan that CGG, and the vessel operators will develop together. The HSE Plan is a tailored document that ensures CGG's environmental management standards and intended environmental performance outcomes are achieved at an operational level throughout the activity. The HSE Plan identifies and enables the selected seismic and support vessels contractor's own procedures to be utilised where appropriate, for example, for specific vessel operational control measures. At all times, however, the seismic and vessel contractors will be required as a minimum to comply with all relevant requirements of CGG's HSE policies and standards. As described in CGG Environment Management Procedure, the HSE Plan will incorporate regulatory and EP requirements including procedures for the following:

- Emergency response.
- Waste management.
- Hazardous materials and handling.
- Fuel/oil spills.
- Bunkering.
- Light.

The seismic and vessel contractor's HSE documentation will be reviewed for compliance with the relevant requirements described in this EP prior to the commencement of the activity. In the event of a gap between the existing plans and procedures and the requirements of this EP, a bridging document will be developed to ensure all control measures are adequately covered in the implementation of the EP and the hierarchy of control established.

4.1 Management of Change Process

The primary purpose of managing change is to reevaluate the predicted levels of environmental impacts and risks and perform an updated assessment of whether the decision-making criteria are still met. This is the assessment of whether a change can be managed such that the activity continues to manage environmental impacts and risks to as low as reasonably practicable and to an acceptable level.

The following activities will trigger a management of change (**MoC**) process:

- A new scope (e.g., timing, location, or changes to operational details such as vessel type, equipment, processes, or procedures), which has the potential to impact on the environment not assessed for environmental impact previously or authorised in existing management plans and procedures.
- Change to the existing activity, scope, equipment, process, or procedures, which have the potential to impact on the environment or interface with an environmental receptor (responsibility of the CGG Technical Operations Manager).
- Changes in the external environment managed and monitored by the CGG Technical Operations Manager.
- Provision of new information that differs to that included in this EP, such as:
    - Potential changes in scientific knowledge regarding impacts and risks from seismic activities
    - New environmental sensitivities within or adjacent to the survey area

- Issue of new regulatory requirements (e.g., Australian Marine Parks (**AMP**) Management Plans).
- Identification of Key Ecological Features (**KEF**s), threatened or migratory species or critical habitats or biologically important areas (**BIA**s) not identified in the EP.
- Identification of new stakeholder objections or claims that are assessed to have merit.

- Non-conformances (audits, inspections, etc.) which identify management and mitigation measures may no longer manage environmental impact/risk to ALARP or acceptable criteria. Non-conformances are monitored by the Environmental Officer.
- Incidents which identify new or increased impacts and risks arising from activities not previously identified in the accepted EP. Incidents are monitored by the Environmental Officer.

Any change relevant to environmental management of the activity shall be directed to the CGG Technical Operations Manager and Environment Officer for initial assessment. The change shall be assessed for environmental impact/risk in accordance with the CGG Risk Management and MoC Process and any implications determined for the environment and associated regulatory document revisions.

Additional management and mitigation measures identified as part of the MoC that avoid, minimise, limit, or mitigate environmental impacts and risks will be captured in the relevant documents and the change to those documents recorded. Changes to any management and mitigation measure being relied on for the management of environmental impacts and risks will require a reassessment of whether the impact or risk being considered remains of an acceptable level and reduced to ALARP. The appropriateness of the environmental performance outcomes (**EPO**s) and environmental performance standards (**EPS**s) set for the activity will also be reassessed. For changes identified in the impact and risk assessment process, if relevant persons' interests, activities, or functions are affected by the change, they will be advised, and feedback invited on the proposed change.

Any new information, changes or updates considered via the MoC process will also be considered against Section 39 of the Regulations, to determine if resubmission of the EP to NOPSEMA is required. Consideration of the triggers for resubmission will occur after the MoC has been completed and will either result in a major revision (meaning a resubmission to NOPSEMA is required) or a minor revision.

Major revisions to the Environment Plan can arise from many circumstances including but not limited to:

- Before commencement of a new activity.
- Before the commencement of any significant modification or new stage of the activity that is not provided for in the accepted ep.
- Before or, as soon as practicable after the occurrence of any significant new or significant increase in environmental impact or risk, including a series of new or increased impacts or risks.
- If there is a change in titleholder that will result in a change in the way the environmental impacts and risks of an activity are managed.
- If the updated predictions of environmental impacts or risks exceed or may exceed the defined acceptable levels of impacts or risks in the in-force environment plan.
- If the assumptions made in the in-force environment plan about the predicted levels of environmental impacts or risks or defined acceptable levels are proven incorrect/inaccurate.
- In the event of legislative change driven by new case law.
- Requirements relevant to the activity or environmental feature being considered.

Minor revisions to the Environment Plan are likely to include:

- Administrative changes that are identified during operation of the Environment Plan (e.g. document references, contact details, etc.)

- A review of the activity/change and the environmental impacts and risks of the activity/change does not trigger a requirement for revision under the Regulations (Section 39 and Section 40).
- An improvement to a level of environmental performance.

Where amendments are made to the accepted EP/OPEP via the CGG MoC process, revisions made will be justified, tracked and a comprehensive record of the revision kept for each change. This includes all risk assessments associated with MoC activities.

4.2 Management of Knowledge Process

Copies of the following documents will be always available to all staff and contractors on each vessel.

- CGG HSE Plan.
- Environmental Conformance Register.
- Emergency Response Procedures.
- HSE Management Procedures.
- Hazard Management Procedures.
- SOPEP and OPEP.
- The EP.

4.2.1 Pre-survey Knowledge Assessment

At least eight weeks prior to the survey commencement, the CGG Technical Project Manager shall undertake pre-survey knowledge assessment that will review and consider the following as a minimum:

- Community and relevant person notification requirements.
- New issues or concerns raised by relevant persons.
- Changes to relevant legislation or regulatory guidelines.
- Existing information in relation to any component of the receiving environment (including BIAs, AMPs).
- Search the NOPSEMA website and consult with any new titleholders to determine the presence of other seismic operations overlapping the proposed activity.
- Changes to commercial fishery licence areas, fishery status, current fishing effort and licence holders overlapping the Regia MSS Environment Planning Area based on:
  - Status reports and available data sources such as FRDC, IMAS for fisheries and aquatic resources.
  - Information provided directly by fishers, VFA, and AFMA through the relevant person consultation process.
  - Fishing locations.
  - Spawning information relevant to key indicator species.
- Newly available scientific literature.
- New acoustic source technology and justification for or against its implementation.
- Confirmation of emergency (oil spill) contacts.

If new information regarding the receiving environment relevant to the activity is present, then a management of change assessment will be carried out.

4.3 Management of Communications Process

Any modification to the assumptions or basis of the EP that arise because of the implementation of the Environmental Management System will be communicated using the Chain of Command. This includes timely notification of any modifications to the EP because of managing change, knowledge, or adverse weather.

The seismic and vessel contractors will be responsible for keeping its workforce informed about environmental issues. The Party Chief acts as a focal point for personnel to raise environmental issues, and consults/involves all personnel in the following:

- Issues associated with the implementation of the EP.
- Any proposed changes to equipment, systems, or methods of operation of plant, where these may have environmental implications.
- Any proposals associated with continuous improvement of environmental protection, including the setting of environmental objectives and training schemes.
- Regular HSE meetings will be held on the seismic vessel. The issues discussed and actions taken will be recorded. The minutes of each meeting, including action items from the meetings, will be made available to all personnel.

Other forms of internal communication include toolbox meetings, which occur before every critical or unfamiliar job. This meeting includes all personnel involved in the task and will include aspects such as spill prevention requirements, etc.

The Report on Consultations (Appendix C1 and C2) documents all commitments made to relevant persons in relation to notifications about the activity and the progress of the survey.

4.4 Management of Adverse Weather Process

It is the duty of the Vessel Master to act as the focal point for all actions and communications with regards to any emergency, including response to adverse weather or sea state, to safeguard his vessel, all personnel on board and environment.

During adverse weather the Survey and Support Vessel Masters are responsible for:

- Ensuring the safety of all personnel on board.
- Monitoring all available weather forecasts and predictions.
- Initiating the vessel safety management system, vessel HSE procedures and/or vessel ERP.
- Keeping the Party Chief and CGG Site Representative fully informed of the prevailing situation and intended action to be taken.
- Assessing and maintaining security, watertight integrity and stability of vessel.
- Proceeding to identified shelter location(s) as appropriate.
- Other appropriate responsibilities shall be taken into consideration as dictated by the situation.

In addition to in-vessel VHF Marine Radio Weather Services, daily weather forecasting from a designated weather forecast will be provided (if available) to monitor weather within the Operational Area over the duration of the survey.

Should poor/bad weather be imminent/encountered, the Vessel Master shall implement weather monitoring to assess conditions on site. The amount of monitoring and subsequent action would be dependent on the severity of the bad weather front and resulting actions will comply with the seismic contractor's procedure for Severe Weather Monitoring.

The CGG Technical Operations Manager shall ensure adequate weather forecasting is available at an increased frequency as the severity escalates.

4.5 Contractor and Supplier Management Process

Seismic and vessel contractors considered for the Regia MSS will be assessed against, and meet the following criteria:

- Compliance with all statutory requirements.
- Have an acceptable HSEQ performance record in undertaking seismic activities.
- Provide evidence of resources and competency in the services to be provided.
- Services, procedures, and vessel hardware comply with the requirements of this EP.
- Any equipment to be used in the provision of survey services meets regulatory requirements, is fit-for-purpose and has all equipment, testing and verification certificates.
- Specific requirements, which need to be assessed at tender evaluation stage include the acoustic source is confirmed to be 2,820 in^3 or less.
- Specific requirements, which need to be assessed at tender evaluation stage include a preference to select vessels:
    - Whereby refuelling at sea is not required.
    - That are double bottomed.
    - That have double walled fuel tanks.
- Specific requirements that need to be assessed prior to vessel mobilisation include all vessels transiting to the Otway must be assessed for biofouling risk and have the relevant biosecurity clearance.

Prior to the survey, CGG will undertake an audit/inspection of each vessel as detailed in Section 4.7.

4.6 Chain of Command

A clear chain of command for the shore-based and vessel-based roles relating to the Regia MSS is provided in Figure B3-1. Upon contract award, and during evaluation of the contractor's management system, specific on-board positions will be identified who are responsible for specific management and mitigation measure implementation.

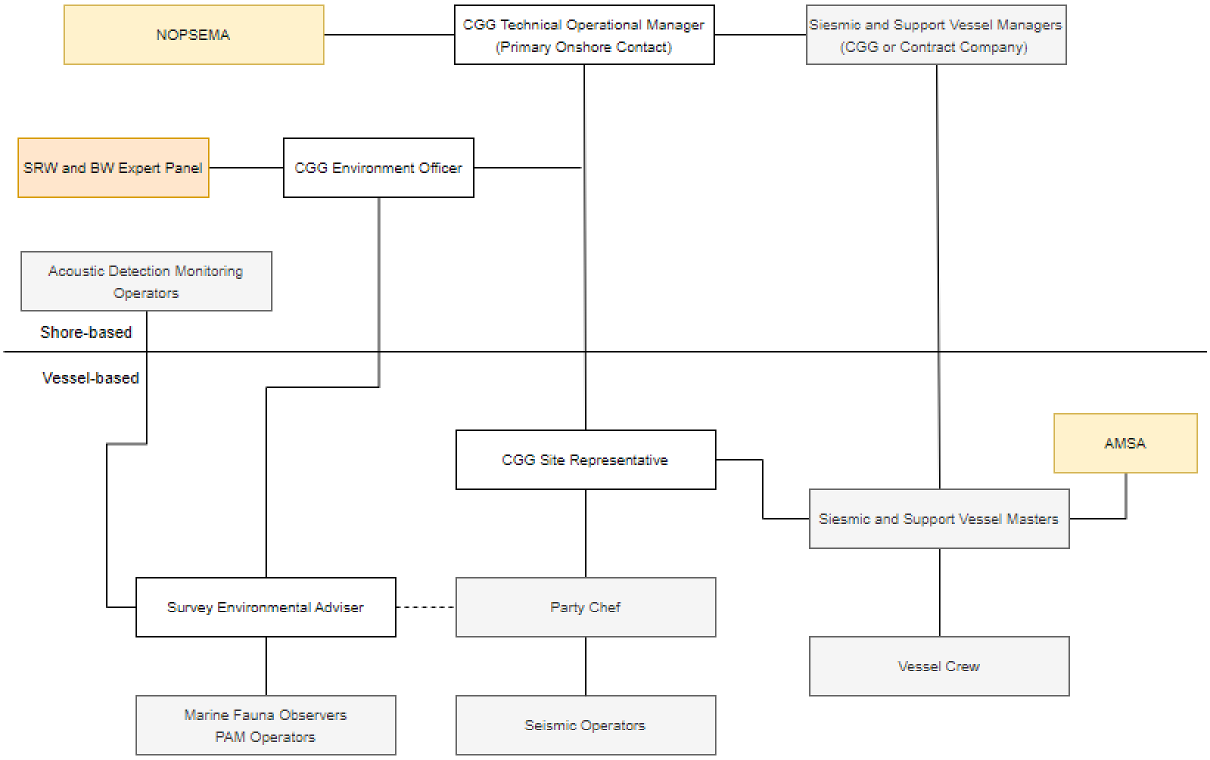


Figure B3-1 – Regia MSS Organisation Structure

4.7 Roles and Responsibilities

The roles and responsibilities for personnel involved in this activity in relation to implementation, management, and review of this EP, including during emergencies or potential emergencies are described in Table B3-1. Emergencies or potential emergencies are defined in this section to be any breach, or potential breach of a requirement of the EP as well as the responsibilities in emergency response. Roles and responsibilities as they relate specifically to oil spill response are detailed in the Oil Pollution Emergency Plan (**OPEP**) which is available in Appendix G3.

Table B3-1 - Regia MSS Roles and Responsibilities

Role	Responsibilities in relation to the implementation, management, and review of the EP	Responsibilities during emergencies or potential emergencies
CGG Technical Operations Manager (Primary Shore-based Contact)	Ensure the activity is undertaken as per the performance outcomes of the EP. Provide sufficient resources to implement management and mitigation measures to achieve the performance outcomes of the EP. At least eight weeks prior to the survey commencement undertake a pre-survey edge assessment as per Section 4.2. With the support of the CGG Environment Officer, ensure that ongoing monitoring for potential changes that may have a bearing on the EP are undertaken. Liaise with regulatory authorities as required. Review results of conformance audits conducted during the program and make recommendations where required. Ensure that the activity specific induction is completed by all project personnel. Initiate the end of activity review with the seismic contractor and document lessons learnt.	Commit resources to facilitate an emergency response strategy in the event of an incident. Manage the CGG emergency response strategy in the event of an incident. Notify NOPSEMA of any spills in Commonwealth waters. Ensure environmental incident reporting meets regulatory requirements. Ensure that all incidents are reported in accordance with Section 22(7).

Role	Responsibilities in relation to the implementation, management, and review of the EP	Responsibilities during emergencies or potential emergencies
CGG Environment Officer	Provide support to the CGG Technical Operations Manager to ensure the activity is undertaken as per the performance outcomes of the EP. Review the seismic and vessel contractor's HSE documentation for compliance with the relevant requirements described in this EP prior to the commencement of the activity. Ensure that ongoing monitoring for potential changes that may have a bearing on the EP are undertaken. Review the EP as necessary and manage change in accordance with the MoC process. Develop the Environmental Conformance Register for the activity, detailing the environmental commitments, performance outcomes and standards and measurement criteria in the EP. Monitor, maintain and advise the CGG Technical Operations Manager of the status of the Corrective Action Register. Coordinate the Expert Panel as part of the Fauna Management Plan. Provided support and advice to the offshore SEA. Liaise with regulatory authorities as required. Monitor and close out corrective actions raised from environmental inspections/audits or incidents. Review results of conformance audits conducted during the program and make recommendations where required. Ensure that the activity specific induction covers the requirements in the EP including the Fauna Management Plan. Prepare the EP Performance/Compliance Report and submit to NOPSEMA.	Manage any oil spill monitoring requirements as per the OSMP. Identify high priority protection areas.

<table>
<tr><th>Role</th><th>Responsibilities in relation to the implementation, management, and review of the EP</th><th>Responsibilities during emergencies or potential emergencies</th></tr>
<tr><td>Seismic and Support Vessel Managers (CGG or Contractor Company)</td><td>Responsible for the overall HSE performance of the vessel against the legislative requirements and any additional commitment made in the EP.
Ensure vessel conformance with all company standards, policies and procedures and the EP.
Participate in audits.
Ensure that all relevant QHSE documentation is in place for the vessel, according to the company’s QHSE Management System requirements.
If contractor’s HSE documentation is not compliant with the relevant requirements described in this EP develop a bridging document to ensure all management and mitigation controls are covered.</td><td>Ensuring major incidents (Lost Time Injury and/or Hi-Potential or above) are thoroughly investigated, root cause analyses performed, corrective actions completed, logged and closed out.
Timely communication of emergencies or potential emergencies within the Chain of Command.</td></tr>
<tr><td>CGG Site Representative (Primary Vessel-based Contact)</td><td>Facilitate clear communications between the CGG Technical Operations Manager, Party Chief and Vessel Masters.
Ensure all personnel have received the activity specific inductions.
Ensure day-to-day activities are monitored for conformance against this EP and the outcomes are reported to the CGG Technical Operations Manager
Monitor and report on the conformance of all EP commitments through observations and assessments of performance against the measurement criteria.
Assist with review, investigation and reporting of all environmental incidents and ensure they are reported to the CGG Technical Operations Manager. Ensure appropriate levels of incident investigation are undertaken and corrective actions from incidents are tracked to completion on behalf of CGG.
Ensure incidents are fully investigated and corrective actions monitored to close-out.
Ensure data and records are collected for the Post-survey Environmental Performance Report (PEPR).
Assist the CGG Technical Operations Manager in the preparation of the PEPR.
Liaise with the CGG Technical Operations Manager in the event of a change in the activity and updates the EP in accordance with the requirements of the Regulations.
Perform MMO duties when the dedicated MMO is unable to, such as during short break periods.</td><td>Immediately alert the CGG Technical Operations Manager of any changes in operations, which could impact negatively on environmental performance or for changes in operation, which alter the environmental risk profile of the activity.
Immediately notify the CGG Technical Operations Manager of any incidents/activities arising from seismic operations that are likely to have a negative impact on the performance outcomes detailed in this EP.
Collate information for monthly recordable incident report and providing information to the CGG Technical Operations Manager.</td></tr>
</table>

Role	Responsibilities in relation to the implementation, management, and review of the EP	Responsibilities during emergencies or potential emergencies
Party Chief	Ensure safe execution of all operations carried out by the seismic crew aboard the survey vessel. Ensure the seismic operations are conducted in accordance with this EP. Ensure that the documents specified in the management of knowledge are available aboard. Ensure the control measures adopted within this EP relating to operation of the seismic source are implemented to minimise potential environmental impacts resulting from seismic acquisition (e.g., pre-watch, soft-start procedures, stop-work procedures) Ensure equipment used on site is inspected before use and as required during survey. With assistance from others, inspect and maintain equipment, including environmental equipment. Maintain all statutory test and inspection documentation for the marine equipment. Provide a daily log of activities and environmental incidents to the CGG Site Representative. Ensure compliance with all aspects of HSE reporting and for investigations of all incidents and near misses.	Immediately notify the CGG Site Representative of any incidents/activities arising from seismic operations that are likely to have a negative impact on the performance outcomes detailed in this EP.

Role	Responsibilities in relation to the implementation, management, and review of the EP	Responsibilities during emergencies or potential emergencies
Survey Environmental Advisor (SEA)	Coordinate the implementation of the Fauna Management Plan offshore and provide advice to the Party Chief on actions to be taken. Provide support to the CGG Site Representative to ensure all offshore personnel have receive the activity specific induction. Monitor the implementation of the environmental performance standards on the survey and support vessels. Ensure environmental inspections/audits are undertaken as per Section 6. Assist with review, investigation and reporting of environmental incidents. Assist in preparation of external regulatory reports required for the survey, in line with environmental approval requirements and the CGG HSE incident reporting procedures. Prepare a report of the overall environmental performance upon completion of the survey, including the results of audits and any incidents, and forward to the Environmental Officer. Collate data for the EP Performance/Compliance Report	
Seismic and Support Masters	Responsible for the overall HSE performance of the vessel against the legislative requirements and any applicable controls in the EP. Ensure the safe execution of all operations of the vessel. Ensure vessel audits, inspections, emergency drills, training, HSE and inductions are undertaken. Ensure maintenance of equipment and records meet legislative requirements. Support the CGG Site Representative in ensuring that all relevant HSE documents are understood and adhered to. Establish and maintain radio contact with other vessels in the Operational Area and adjacent waters.	Notify AMSA, CGG Site Representative and Vessel Manager in the event of a notifiable oil spill. Implement the vessel's SOPEP and OPEP procedures in the event of an oil spill, including first response to an incident using the resources immediately available to the vessel. Immediately notify the CGG Site Representative of any incidents/activities arising from vessel operations that are likely to have a negative impact on the performance outcomes detailed in this EP.

Role	Responsibilities in relation to the implementation, management, and review of the EP	Responsibilities during emergencies or potential emergencies
Seismic Operators **Vessel Crew**	Conduct activities in a professional and safe manner with attention to good housekeeping procedures and work practices. Undertake Regia MSS induction. Immediately report any incidents to the Survey Vessel Master or Party Chief. Encourage improvement in environmental performance wherever possible. Report any marine fauna sightings to the SEA.	
Marine Fauna Observers (MMO) **PAM Operators** **Acoustic Detection Monitoring Operators**	As per Fauna Management Plan.	NA
SRW and BW Expert Panel	As per Fauna Management Plan.	NA

4.8 Emergency Response

CGG's emergency preparedness and response arrangements will be included within the Project HSE Plan. In addition, the seismic and support vessels will be expected to have a vessel-specific Emergency Response Plan (**ERP**) and SOPEP. These documents will be reviewed by CGG to ensure they meet the requirements for emergency and oil spill response specified within this EP. As the Regia MSS is vessel-based, it is considered appropriate that operational response to an emergency would be handled by CGG using their existing emergency response procedures and the vessel-specific ERP and SOPEP. The ERP, SOPEP and OPEP will be tested prior to the commencement of the survey as detailed in Section 10.1.

CGG reviews specific activities, equipment, and workplaces to identify possible emergency situations that may arise. CGG would ensure that any subcontracted vessel operator has established systems to ensure emergency plans are developed, implemented, and maintained and that these plans address those incidents that are reasonably foreseeable. Information that is considered when identifying potential emergency situations include the following:

- Results of hazard identification and impact/risk assessments.
- Legal requirements.
- Previous incident (including accident) and emergency experience.
- Emergency situations known to have occurred in similar organisations.
- Information related to accident and/or incident investigations posted on the websites of regulators or emergency response agencies.
- The Project HSE Plan contains instructions for vessel emergency, medical emergency, search and rescue, reportable incidents, incident notification and contact information to ensure that:

- All potential emergencies are identified.
- Emergency response plans are documented, accessible and clearly communicated.
- Roles and responsibilities are clearly defined.
- Adequate equipment, facilities and trained personnel are available to respond to emergency situations to mitigate adverse consequences.
- Inspection and testing of critical emergency equipment is performed.
- Emergency drills and exercises are conducted to assess emergency response capacity and capabilities.
- Lessons learned are communicated to the appropriate people.

5 Section 22(4): Awareness of EP Responsibilities

5.1 Activity Specific Inductions

All personnel involved with the Regia MSS will be given an activity-specific environmental induction prior to commencing work. This induction will cover environmental responsibilities relevant to the duties and responsibilities of the roles including:

- Environmental sensitivities and conservation values in the EP Area.
- Environmental impacts and risks associated with the activity.
- Waste management and chemical management procedures (including the vessel Garbage Management Plan).
- Emergency response and spill management procedures outlined in the OPEP and vessel SOPEP.
- Procedures for marine fauna interactions as per the Fauna Management Plan.
- Roles and environmental responsibilities of key personnel on board the survey and support vessels.
- The importance of following procedures and using company processes (JSAs etc.) to identify environmental risks and mitigation measures.
- Environmental performance outcomes, standards, and measurement criteria to be complied with under the EP.
- Procedures for reporting environmental hazards, incidents, near misses and opportunities for improvement.
- Opportunities for employee communication and participation.
- Relevant plans and procedures (CGG, seismic and support vessel contractor owned), including where they can be obtained on board the vessels.

A record of the induction will be retained by CGG's Technical Operations Manager with the endorsement of personnel who attended. All personnel are required to sign an attendance sheet to confirm their participation in and understanding of the induction. If a contractor is used, they will conduct their own company and vessel-specific inductions independently and in addition to the activity-specific HSE induction.

5.2 Competency and Ongoing Awareness

It is ultimately CGG's responsibility to ensure all employees and contractors comply with the requirements of the CGG corporate HSE Policy and that the personnel are suitably trained and competent in their respective roles.

CGG will ensure the marine crew are trained and competent to undertake their respective activities on board the vessel. All marine personnel will be qualified in accordance with the International Convention on Standards of Training Certification and Watch Keeping for Seafarers (STCW95).

CGG will ensure marine fauna observers (**MFO**s), passive acoustic monitoring (**PAM**) operators and acoustic detection monitoring (**ADM**) operators are trained and competent as per the Fauna Management Plan.

The following activities will serve to reinforce and maintain ongoing environmental awareness of vessel personnel for the Regia MSS. Records will be produced for each of these meetings:

- Project kick-off meeting: Held at the start of the activity and reviews the contractual and HSE specifications for the activity, the scope of work, vessel specific HSE plans, environmental outcomes, performance standards and measurement criteria within this EP.

- Daily progress meetings (on board): Review all survey operations and incidents of the previous day, actions are recorded within the daily progress report.
- Toolbox meetings: Attended by all personnel involved in a specific operation (i.e. operations involving major hazards and/or involving more than one person). This meeting reviews the activity and reinforces the adoption of control measures within this EP to prevent adverse environmental and safety impacts. Recorded within the daily progress report.

All personnel will be encouraged to communicate any concerns, suggest improvements to the control measures implemented for any task or operation during the activity and comment on any proposed changes to equipment, systems, or methods of operation of equipment, where these may have HSE implications. Opportunities for personnel (including management, relevant contractors and MMOs) to participate in improving the management of environmental risks during the activity include:

- At the time of the induction.
- During daily toolbox and pre-start meetings at the commencement of each shift and prior to commencing a new task (e.g. recovery of streamer).
- Identification of hazards based on incident and near miss reporting.
- Providing suggestions for improvements to the CGG Site Representative at any time.

CGG crew and contractors (including all vessel personnel) will be provided information on employee communication and participation during the project environmental induction prior to commencing the activity.

6 Section 22(5): Managing Environmental Performance

6.1 Monitoring of Environmental Performance

CGG will monitor the performance of the management and mitigation controls during the activity in line with the HSE Plan and CGG Environment Management document. Environmental performance during the survey will be reviewed to ensure that:

- EPOs and EPSs are being met, reviewed and where necessary amended (to continue to reduce the environmental impacts and risks of the activity to ALARP).
- Potential non-conformances and opportunities for continuous improvement are identified and corrective actions implemented.
- All environmental monitoring requirements have been met before completing the activity.

6.2 Recording of Environmental Performance

CGG will develop and maintain an electronic Environmental Conformance Register for the activity, which details the environmental management and mitigation controls, performance outcomes and standards and measurement criteria in the EP. The Environmental Conformance Register is an audit tool to be used before and during the activity to demonstrate conformance of the activity with the EP.

A summary of the environmental management and mitigation controls, performance outcomes and standards and measurement criteria in the EP will be distributed aboard the survey and support vessels, and implementation of the environmental performance standards will be monitored by the Survey Environmental Advisor.

6.3 Audits and Inspections

Post acceptance of the EP, conformance will be monitored on an at least quarterly basis by the CGG Site Representative, or delegate, via audits and inspections, as well as through the commitments under the Management of Risk, Management of Change, and Management of Knowledge parts of this Implementation Strategy.

Prior to the survey, CGG will undertake a vessel audit/inspection to:

- Confirm that the vessel management systems are consistent with the management and mitigation controls detailed in the in-force EP.
- Review of the risk of IMS, potentially including an inspection to confirm that the vessel does not pose an unacceptable risk of IMS.
- Audit the on-board spill response capability against the vessels SOPEP or equivalent and relevant management and mitigation controls in this EP, to verify spill preparedness.
- Ensure that the relevant documents that support implementation of the management and mitigation controls in the EP are accessible and have been communicated to the contractor and vessel crew.

During the activity, conformance will be monitored on an at least fortnightly basis by the CGG Site Representative, or delegate, via audits and inspections during the activity. Conformance auditing or inspection while the EP is in-force will be based on the Environmental Conformance Register and will target the following:

- Conformance with regulatory requirements detailed in the accepted EP.
- Management strategies and procedures to ensure EPOs and EPSs are being implemented, monitored, measured, and evaluated.
- Emissions and discharges are being monitored, measured, and documented.

6.4 Review of Environmental Performance

The following arrangements will be established to review the environmental performance of the activity:

- Inspections of the vessels will be carried out before and during the survey to ensure that procedures and equipment for managing routine discharges and emissions are in place to enable conformance with the EP.
- The performance of key equipment as described in this EP (i.e., oil-in-water separator) will be checked to ensure ongoing reduction of risks and impacts to ALARP, and any potential issues (i.e. observations of poor operating condition/performance or non-conformances) are continually monitored and raised as soon as practicable.
- Records of inspections against EP requirements are documented in the Environmental Conformance Register.

6.5 Management of Non-Conformance

Non-conformances and opportunities for improvement will be identified and corrective actions will be tracked to completion utilising Environment Conformance Register. Corrective actions will specify the remedial action required to fix the breach and prevent its reoccurrence and is delegated to the person deemed most appropriate to fulfil the action. Where more immediacy is required, non-compliances will be communicated to relevant personnel immediately and responded to as soon as possible. CGG will carry forward any areas of non-conformance identified during its previous activities for consideration in future seismic activities to assist with continuous improvement in environmental management.

Non-conformances may necessitate a management of change and/or a management of knowledge process to be implemented.

An end of activity review will be jointly conducted by CGG and the seismic contractor during a post-survey meeting. The purpose of this meeting is to enable the review of management and mitigation strategies implemented during the activity. It includes reviews of performance, incident investigations, audits and field activity to identify actions for future seismic surveys, which can be implemented on a continuous improvement basis. The end of survey HSE Review will include a 'Lessons Learnt' section to facilitate incorporation of any recommended improvement actions in future seismic activities.

7 Section 22(6): Monitoring of Emissions and Discharges

7.1 Monitoring Emissions and Discharges

In accordance with the Regulations the titleholder shall record emissions and discharges for the duration of the activity. Discharges associated with a survey will be limited to those allowed for under maritime law. Therefore, all discharges will be recorded and controlled in accordance with maritime monitoring and recording requirements. Any non-compliance with discharge requirements will be included in the monthly recordable incident report to NOPSEMA.

8 Section 22(7): Environmental Performance Reporting

8.1 Regulatory Reporting

CGG will submit an environmental performance report to NOPSEMA within three months of survey completion. CGG will publish the same environmental performance report at the same time as submission to NOPSEMA on the Regia MSS Consultation Hub.

8.2 Notifications and Reporting

Under Sections 24(c) and 47 of the Regulations, CGG is required to notify NOPSEMA of any recordable (an incident arising from the activity that breaches an EPO or EPS in the EP that applies to the activity that is not a reportable incident) and reportable (an incident arising from the activity that has caused, or has the potential to cause, moderate to significant environmental damage) incident within a specified timeframe. Environmental incidents will be reported to the relevant government agency by the CGG Site Representative. The requirements for reporting and recording incidents are outlined in Table B3-2.

Following any recordable or reportable incident, CGG will undertake an incident investigation and this information will be communicated to all relevant personnel. All recordable and reportable incidents will be documented by the CGG Technical Operations Manager and will include details of the event, immediate action taken to control the situation, and corrective actions to prevent re-occurrence. The CGG Technical Operations Manager and CGG Site Representative will follow up actions taken to ensure that the corrective actions have been taken to close it out. When planning future activities, CGG will review the reportable and recordable incidents that have occurred previously to incorporate any lessons learned as part of CGG's continual improvement process.

Table B3-2 - Notification Requirements

Requirement	Timing	Contact
Recordable Incidents		
As a minimum, the written monthly recordable incident report must include a description of: All recordable incidents which occurred during the calendar month All material facts and circumstances concerning the incidents that the operator knows or can reasonably find out. Any actions taken to avoid or mitigate any adverse environmental impacts of the incident. Corrective actions that have been taken, or may be taken, to prevent a repeat of similar incidents occurring.	As soon as possible but before the fifteenth day of the following calendar month.	NOPSEMA - submissions@nopsema.gov.au
Verbal Notifications		

<table>
<tr><th>Requirement</th><th>Timing</th><th>Contact</th></tr>
<tr><td>Vessel-sourced spill in Commonwealth waters.</td><td>Within one hour</td><td>JRCC Australia:
Phone: +61 2 6230 6811 or 1800 641 792
Facsimile: +61 02 6230 6868</td></tr>
<tr><td>Reportable incidents include, but are not limited to, those that have been identified through the risk assessment process as having an inherent impact consequence of ‘significant’, ‘major’ or ‘critical’, or at a minimum, the following incidents:
A level 2 spill incident
Vessel strike / entrapment or entanglement with listed marine fauna.
IMS Introduction.
The notification must contain:
All material facts and circumstances concerning the incident.
Any action taken to avoid or mitigate the adverse environmental impact of the incident.
The corrective action that has been taken or is proposed to be taken to stop, control or remedy the reportable incident.
This must be followed by a written record of notification ASAP after notification. This written notification must also be supplied to the NOPTA and DEECA (Vic) for Commonwealth water incidents.</td><td>Within two hours</td><td>Verbal:
NOPSEMA – Phone 1300 674 472
DEECA (Vic) – 0419 597 010

Email: EPBC.Permits@environment.gov.au</td></tr>
<tr><td colspan="3">Written Incident Reports</td></tr>
<tr><td>Verbal notification of a reportable incident to NOPSEMA (Commonwealth waters) must be followed by a written report. As a minimum, the written incident report will include:</td><td>Within three days of notification of</td><td>NOPSEMA - submissions@nopsema.gov.au
NOPTA – reporting@nopta.gov.au</td></tr>
</table>

Requirement	Timing	Contact
The incident and all material facts and circumstances concerning the incident. Actions taken to avoid or mitigate any adverse environmental impacts. The corrective actions that have been taken, or may be taken, to prevent a recurrence of the incident. The action that has been taken or is proposed to be taken to prevent a similar incident occurring in the future.	incident (NOPSEMA) Within seven days after submission to NOPSEMA (NOPTA).	
Vessel strike with cetacean is reported to the DCCEEW.	Within 72 hours of incident	Upload information to: https://data.marinemammals.gov.au/report/shipstrike
Heritage Notifications		
Heritage Victoria must be notified in accordance with s80 of the Heritage Act 2017 (Vic) or under Underwater Cultural Heritage Act 2018 (Cth). A further notification must be given to the Minister as per s40 of the Underwater Cultural Heritage Act 2018 (Cth).	As soon as practicable.	Email: heritage.victoria@delwp.vic.gov.au Phone 03 7022 6390

8.3 External Routine Notification and Reporting Requirements

Review of statutory and stakeholder requirements with respect to routine external notification and reporting is provided in Table B3-3. These actions are the responsibility of the CGG Technical Operations Manager (or delegate).

Table B3-3 - External Routine Notification and Reporting Requirements

Requirement	Timing	Contact
Routine Performance Reporting		
The Regulations - Section 51: Submit an EP Performance/Compliance Report to NOPSEMA. This reports compliance against each of the EPOs and EPSs as outlined in this EP.	Within three months of survey completion.	NOPSEMA - submissions@nopsema.gov.au
Report on the conduct of the survey with any whale sightings. Sightings and survey information is to be recorded within the 'Cetacean Sightings Application' (CSA) software. Upon completion of the survey the information entered into the CSA is to be exported as a text file.	Within two months of activity completion.	Upload information to: https://data.marinemammals.gov.au/csa Text file sent to: sightingsdata@aad.gov.au
EP Accepted and Activity Update		
Notification to all relevant stakeholders advising of EP acceptance and provide an update on survey commencement.	Within ten days of the date the EP has been accepted.	All relevant stakeholders listed in the Consultation Log.
Notification of the establishment of the claims process, the survey timing, and the Adjustment Area	No less than 28 days before activity commencement.	Relevant commercial fishing licence holders and respective peak commercial fishing industry bodies.

Requirement	Timing	Contact
Provision of OPEP to DTP and AMSA following EP acceptance and prior to survey commencement.	Prior to survey commencement.	Contact details listed in Consultation Log.
Survey Commencement		
Notify AHO for Notice to Mariners.	At least four weeks prior to commencement.	AHO - datacentre@hydro.gov.au
Notify NOPSEMA of survey commencement.	At least ten days prior to commencement.	NOPSEMA - submissions@nopsema.gov.au
Notify AMSA for Auscoast Warnings This notification will include when operations start and end, name, callsign and maritime mobile service identity (MMSI), satellite communications details (including inmarsat-c and satellite telephone numbers), area of operation, requested clearance from other vessels and any other information that may contribute to safety at sea.	At least 24-48 hours prior to survey commencement.	JRCC - rccaus@amsa.gov.au Ph: 1800 641 792 or +61 2 6230 6811
Survey Cessation		
Notify AMSA to cease Auscoast Warnings	Upon vessel demobilisation.	JRCC - rccaus@amsa.gov.au Ph: 1800 641 792 or +61 2 6230 6811
Notify NOPSEMA with survey completion date	Within ten days of survey completion.	NOPSEMA - submissions@nopsema.gov.au
End of EP		
Notification of EP completion to NOPSEMA.	End of EP operation.	NOPSEMA - submissions@nopsema.gov.au

9 Sections 22(8), 22(9), & 22(11): Oil Pollution Emergency Plan

9.1 Oil Pollution Emergency Plan

The Oil Pollution Emergency Plan (**OPEP**) is available in Appendix G3.

The OPEP consists of the following:

- Survey / support vessel(s) SOPEPs[1]
- CGG Regia MSS OPEP[2]

These response arrangements are consistent with, and supported by, the:

- National Plan for Maritime Environmental Emergencies (NATPLAN): Australian Maritime Safety Authority (**AMSA**) – has jurisdiction and is the Control Agency for vessel spills, which affect Commonwealth waters.
- State Hazard Plan for Maritime Environmental Emergencies (State Hazard Plan): The Victorian Department of Transport and Planning (**DTP**) is the Control Agency for marine oil spills in Victorian state waters.

The seismic and support vessels (if ≥400 gross tonnes) must have IMO compliant SOPEP, prepared in accordance with IMO guidelines for the development of shipboard oil pollution emergency plans (resolution MEPC.54 (32) as amended by resolution MEPC.86 (44)), include oil spill response arrangements and provisions for testing the SOPEP (oil pollution emergency drills).

CGG will ensure that support vessels under 400 gross tonnes (that are not obligated legislatively to have a SOPEP), do have vessel-specific spill response plans (to an equivalent standard) that cover spill response arrangements. The SOPEP is designed to ensure a rapid and appropriate response to any oil spill and provide practical information required to undertake a rapid, effective response, and reporting procedures in the event of a spill.

[1] Required for vessels ≥400 gross tonnes involved in the survey or equivalent for lesser tonnage vessels that manage the environmental impacts of a spill and vessel-based operational monitoring (agreement OPRC 90)

[2] This document supports the individual vessel-based SOPEPs by detailing the interaction between contractor-related spill response plans and CGG response arrangements.

10 Section 22(12), 22(13) & 22(14): Testing of the Response Arrangements in the Oil Pollution Emergency Plan

10.1 OPEP Testing

The OPEP will be tested:

- Prior to the survey commencing.
- Following any significant amendment of the response arrangements.
- When a new seismic vessel is engaged for the activity.
- Not later than 12 months after the most recent test.

Vessel-based SOPEP tests are undertaken by vessels routinely as per MARPOL Annex I (Section 15) requirements, and drill outcomes reviewed as part of the ongoing monitoring and improvement of emergency response control measures.

A desktop drill of the Regia MSS OPEP, including the vessel SOPEP, will be conducted to assess the effectiveness of the response arrangements. Specifically, the drill will be completed at least 8 weeks prior to carrying out the activity and will test the following:

- Roles and responsibilities of those involved in oil spill response are clear and understood.
- Communication sequence from the vessel master to vessel-contractor onshore management and the Control Agency, including notification of the AMSA JRCC is adequate, current and includes all relevant details.
- Communication between the CGG offshore representative and CGG Technical Project Manager and subsequent notification authorities is adequate and timely.
- Ensures Type 1 operational monitoring such as spill surveillance and tracking is appropriate, understood and practised.
- Equipment and procedures intended for source control on-board the vessels are available for use as outlined in the vessel SOPEP.

The outcomes of the drill will be documented, reviewed and improvements identified (as needed). Should any inadequacies, altered contractual arrangements or improvements to arrangements be identified via testing, these corrective actions will be registered as a non-conformance and the EP/OPEP will be amended for these items via a Management of Change process.

11 Section 22(10): Operational and Scientific Monitoring Program

11.1 Operational and Scientific Monitoring Program

The Regia MSS Operational and Scientific Monitoring Program (OSMP) is available in Appendix G3. The OSMP has the following objectives:

- Identify high priority protection areas within the Environmental Planning Area.
- Specify monitoring methodologies.
- Detail the process CGG will follow to determine the monitoring studies that will be implemented in order to:
    - Provide situational awareness and assist in planning and execution of spill response to minimise environmental harm.
    - Provide for short-term and long-term environmental damage and recovery assessments.

12 Section 22(15): Ongoing Consultation

12.1 Ongoing Consultation

As per the Community Consultation and Engagement Plan, community engagement and relevant persons consultation will be ongoing post-acceptance, as well as during the planning and conduct of the activity.

CGG will continue its practice of hosting an online webinar every month the Environment Plan is in-force. During the consultation in preparation of the Environment Plan CGG has encouraged relevant persons to register for this webinar. Registration for the webinars will remain open while the Environment Plan is in-force. Members of the public may also register for the webinar series. All previous webinars will be accessible on the Regia MSS Consultation Hub and on YouTube. Similarly, there will be a monthly newsletter every month the EP is in-force.

CGG will also communicate to each relevant person by sending notifications at the following key milestones or events:

- At each NOPSEMA decision.
- If the EP is accepted.
- 8 weeks prior to survey commencement.
- Immediately upon completion of the activity.
- In the event of a significant incident (e.g. large fuel spill).
- If the seismic vessel is required to depart the Operational Area to avoid adverse weather (notification will be communicated by the AMSA Joint Rescue Coordination Centre as a navigational safety warning).
- If there is a change to the MSS activity scope that may affect the stakeholder interests, activities or functions.
- If a new or significant increase in potential impact or risk is identified that (after identification of additional control measures to manage those impacts or risks) may affect the relevant persons functions, interests, and activities.

All notifications will include the relevant details of the activity including the activity title, location and contact details.

As a result of providing activity status updates publicly, or because of a change in a person's functions, interests, and activities, CGG acknowledges that new relevant persons may reveal themselves at any time while the EP is in-force. The processes provided in the Community Engagement and Consultation Plan will be implemented if a new relevant person is found.

Similarly, a relevant person may be the source of new information that has resulted in a change to their functions, interests, and activities. This may in turn result in a modified or new objection or claim relevant to the activity. CGG shall assess the merits of any modified or new objections or claims in the same way as outlined in the Community Engagement and Consultation Plan. If the claim has merit, where appropriate, CGG may modify the management of the activity as soon as possible. A management of change process would assess the modification to the management of the activity.

CGG will endeavour to respond to the modified or new objection or claim received while the Environment Plan is in-force within one week of receipt of the new information and the modified or new objection or claim. CGG will undertake any resulting management of change actions as soon as practicable, but preferably within the same time. For objections and claims that do not necessitate a change to the management of the activity nor the Environment Plan, CGG will respond to the relevant person providing reasoning and supporting information (as relevant) to support CGG's conclusions within a month of receiving the new information.

13 Section 22(16): Compliance with the Act, the regulations, and all other environmental legislation

13.1 Record Management

In accordance with Section 52, CGG will store and maintain documents or records relevant to the EP implementation for a period of five years in a way that makes retrieval reasonably practicable.

14 Document Control

Table B3-4 - Revision history

Version	Date of Revision	Author/Reviewer	Summary of Changes
0.0	10 March 2023	MS	Initial version
0.1	19 March 2023	SJ	Peer review

Regia MSS: Preliminary Environmental Impact and Risk Assessment

March 2023

Klarite

Contents

Disclaimer

Introduction

This preliminary environmental impact and risk assessment (PEIRA) has been prepared by Klarite to support CGG Services (Australia) Pty Ltd (CGG) in its environmental management of the Regia Marine Seismic Survey (Regia MSS).

Klarite is an independent professional services firm specialising in environmental management of offshore energy developments. Established in 2017, Klarite has performed environmental impact and risk assessment throughout the offshore marine area in Australia and has years of experience in the offshore regulatory framework.

The PEIRA follows a standardised methodology for identifying environmental impacts and risks from offshore petroleum activities and determining their relative significance.

Purpose

The purpose of this PEIRA is to:

- Identify key environmental values and sensitivities (which include social, economic, and cultural features).
- Perform an initial evaluation of the environmental impacts and risks associated with the Regia MSS to support consultation efforts.

The findings of this assessment will be used to inform project design and decision making, and to identify any necessary mitigation measures and management strategies. The PEIRA will also provide a basis for further study, including the potential for baseline characterisation studies, and investigation as required. This document serves as a starting point for a full environmental assessment, which will be required before the activity can progress through the approvals process.

Environmental Planning Area Description

To commence the PEIRA an Environmental Planning Area was established to frame the initial studies and community consultation effort. Within that area an Activity Planning Area was established to frame the maximum geographical limits of the activity. The Environmental Planning Area and Activity Planning Area are shown in Figure B4-1.

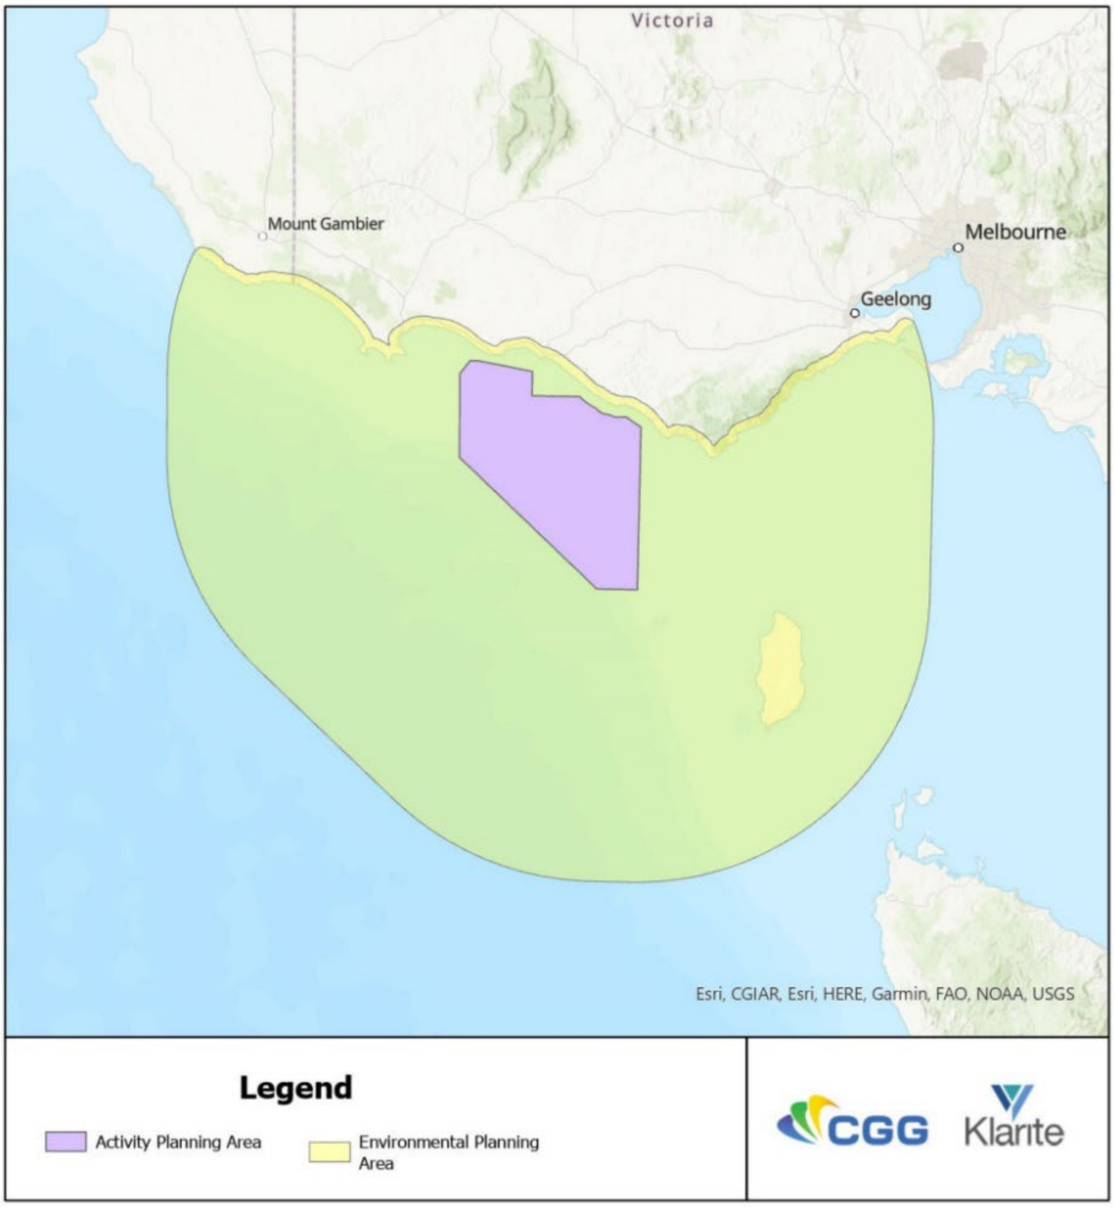

Figure B4-1: Regia MSS Environmental Planning Area and Activity Planning Area

The Environmental Planning Area has been set at 155 km around the Activity Planning Area. This distance has been selected using professional judgement and a review of previous impact and risk assessments for similar activities in the region. Further justifying the distance, the NERA Reference Case: Consequences analysis of an accidental release of diesel (NERA 2018) found that diesel spills under 700m^3 were reliably predicted to disperse within this distance. The Environmental Planning Area will be validated or modified based on recommended within this PEIRA.

Scope of Assessment

This scope of this PEIRA covers the Environmental Planning Area, which includes the Activity Planning Area and the surrounding area that may be affected by the activity. The PEIRA aims to identify and evaluate the impacts and risks of the activity on the:

- physical and biological environment, including air quality, water quality, sediment quality, climate, marine life, and marine habitats; and
- human environment, including marine industries, cultural and indigenous values, recreational activities, tourism, coastal developments, and marine protected areas.

Environmental Regulations and Guidelines

The primary legislation governing the Regia MSS is the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (the Act) and the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (the Regulations).

There are numerous additional laws, regulations, and guidelines that apply requirements to the Regia MSS activity. These are the subject of a separate study being completed by CGG and are only discussed here if they are relevant to the management of environmental impacts and risks.

The following terms are used in this PEIRA and are defined in the Regulations:

A petroleum activity or activity means operation or works in an offshore area undertaken for the purpose of: (a) exercising a right conferred on a petroleum titleholder under the Act by a petroleum title; or (b) discharging an obligation imposed on a petroleum titleholder under the Act or a legislative instrument under the Act.

An environmental impact is a change, whether adverse or beneficial, that wholly or partially results from an activity.

The following terms are used in this PEIRA and are defined in various relevant environmental management standards and guidelines:

An environmental aspect is an element of an activity that can interact with the environment.

An environmental risk is the probability and consequence of an unwanted accident.

Methodology

The environmental assessment methodology used in the PEIRA has been developed based on widely adopted best practice and industry standards, primarily AS/NZS ISO 31000:2018: Risk Management – Principles and Guidelines. There are two parts of the methodology, one for environmental impacts and one for environmental risks. Both parts of the assessment are underpinned by a clear description of the activity, data collected in preparation of this document, and the identification of environmental aspects arising from the Regia MSS.

Project Description

Klarite was provided a description of the activity which is available on the Regia MSS Consultation Hub (www.regiamss.com.au).

Data Collection

A review of relevant literature and data sources was undertaken to gather information on the Environmental Planning Area and the baseline environmental conditions. No field surveys were undertaken to collect data given that the marine environment in the Otway region is relatively well understood and the preliminary nature of this PEIRA.

Community consultation for the project has commenced and will provide a valuable source of information on environmental values and sensitivities, as well as the concerns and perspectives of interested parties, including local communities and regulatory agencies. This PEIRA will be published to help inform the community of the environmental aspects of the activity so that their views can be properly reflected in the full environmental assessment.

Information sources accessed to inform this PEIRA are detailed in Table B4-1able B4-1.

Table B4-1: Information Sources Accessed to Inform PEIRA

Impact Assessment Techniques

The impact assessment for the PEIRA consists of a desktop study conducted to evaluate the environmental impacts of the activity on the Environmental Planning Area, based on the data collected during the data collection phase. Professional judgement and good practice have been relied on to complete the PEIRA and recommendations for further studies including modelling, have been made where necessary to support the full environment assessment.

Risk Assessment Techniques

The risk assessment for the PEIRA consists of a desktop study conducted to identify the hazards associated with the activity and analyse the probability and consequence of each hazard to determine the risks associated with the activity. The results of the probability and consequence analysis will be used to characterise the overall risk associated with the activity, and to prioritise mitigation measures and management strategies. Professional judgement and good practice have been relied on to complete the PEIRA and recommendations for further studies, including modelling, have been made where necessary to support the full environmental assessment.

Assessment of Potential Significance

Assessment of potential significance is a key outcome of the PEIRA. It provides context for any additional baseline studies and guides the full environmental impact and risk assessment. Under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act), an action (*activity*) will require approval from the Environment Minister if the action has, will have, or is likely to have, a significant impact on a matter of national environmental significance. A 'significant impact' is an impact which is important, notable, or of consequence, having regard to its context or intensity. Whether or not an action is likely to have a significant impact depends upon the sensitivity, value, and quality of the environment, which is impacted, and upon the intensity, duration, magnitude, and geographic extent of the impacts (DAWE 2013).

Treatment of Environmental Impacts and Risks

Throughout the PEIRA (and the subsequent full assessment) there will be mitigation and management measures that will be implemented preparing for, and during, the activity. There are five types of mitigation and management measures as shown below. Where a mitigation or management measure is identified for the Regia MSS from this PEIRA they will be shown within the text to emphasise their importance for environmental management.

Activity Limitation

A measure that constrains, limits or otherwise restricts the activity such that impacts and risks can be avoided, or lessened to at or below acceptable levels.

Control Measure

A system, an item of equipment, a person or a procedure that is used as the basis for management of environmental impacts and risks.

Legislative Requirement

A requirement of law, regulation, or guideline that applies to the activity and is relevant to the environmental management of the activity.

Environmental Performance Standard

A statement of performance required of a control measure

Management System Element

A responsibility, practice, process or resource used to manage an environmental aspect of the activity, including monitoring and review of environmental performance.

Environmental Aspects

Cause Effect Pathways

A cause-effect pathway refers to the chain of events that connects a specific cause to an effect. In the context of environmental impacts and risk assessments, cause-effect pathways describe the relationships between environmental aspects and the impacts or consequences they could have on the environment.

A cause-effect pathway typically starts with the identification of a potential hazard, such as the physical presence of a seismic survey vessel, and then examines the potential pathways by which that hazard could result in an impact, such as the release of pollutants into the water affecting water quality or the generation of underwater sound at levels that can cause harm to marine life.

The identification of cause-effect pathways is an important step in the assessment process, as it allows for a systematic evaluation of the environmental impacts and risks of a proposed activity. It also provides a basis for developing mitigation and management strategies.

Identification

To understand the magnitude, extent and duration of an environmental impact or risk the pathway of each environmental aspect needs to be identified. The following list describes the environmental aspects identified from the Regia MSS activities to date that can lead to environmental impacts.

- Artificial light – the presence of vessels undertaking night-time operations will result in artificial light discharge into the marine environment.
- Physical presence – the presence of components of the activity, such as the physical presence of vessels operating in marine waters may interfere with other marine users.
- Underwater sound – components of the activity will generate impulsive sound and other components will generate continuous sound. Both could affect ecological, economic, or social receptors.
- Atmospheric emissions – vessels used on the activity will generate atmospheric emissions, which could affect ambient physical conditions and ecological receptors.
- Planned discharges – the activity will likely result in planned liquid discharge pathways, such as those typically generated by vessels.

The following list describes the environmental aspects identified in the Regia MSS to date that may lead to environmental risks.

- Accidental release of fuel – whilst undertaking the activity, unplanned events may occur which result in a discharge of marine diesel.
- Accidental release of materials or waste overboard – whilst undertaking the activity, unplanned release of waste, or equipment may occur.
- Introduction of marine pest species – vessels that transit between ports may temporarily harbour invasive marine species that have could be introduced or even establish in foreign places.
- Collisions with marine fauna – vessels have limited manoeuvrability at stages during the activity and may be unable to avoid collisions with marine fauna.

Typical environmental aspects from offshore petroleum activities that were considered and determined to not be relevant to this assessment are listed below.

- Benthic disturbance – there is no pathway for the activity to result in changes to physical receptors, for example disturbance to the seabed, as there will be no anchoring as part of the activity.

Activity Limitation
No anchoring permitted within the activity planning area.

Extent and Duration

Each environmental aspect has a related spatial extent within the Environmental Planning Area. The Regulations require that the Environment Plan must describe the existing environment that may be affected by the activity. Therefore, this PEIRA seeks to identify the appropriate extent and duration of each environmental aspect so that the search for environmental values and sensitivities can be specific to the environmental aspect. Table B4-22B4-2 identifies and justifies the extent and duration of each environmental aspect for the Regia MSS.

Table B4-22: Extent and Duration of Regia MSS Environmental Aspects

Environmental Aspect	Extent	Duration	Justification
Artificial light	Activity Planning Area +20 km	90 days	The National Light Pollution Guidelines (CoA 2020) detail that where there is important habitat for

Environmental Aspect	Extent	Duration	Justification
			listed species that are known to be affected by artificial light within 20 km of a project, species specific impacts should be considered through an Environmental Impact Assessment process. The measurable change in light from ambient conditions is likely to occur at <20 km from the source; but due to difficulties with calculating light intensity in biologically relevant measurements, the distance in CoA (2020) has been used. Once the vessels leave the Activity Planning Area this aspect ceases.
Physical presence	Activity Planning Area	90 days	There will be no activities beyond the Activity Planning Area which will be narrowed to the Operational Area later in the assessment process. The larger area has been used for this PEIRA.
Underwater sound	Underwater sound area	90 days	This is an additional area that varies depending on how sound is received by the receptor. This area will be predicted through qualitative underwater sound modelling.
Atmospheric emissions	Activity Planning Area	90 days	There will be no activities beyond the Activity Planning Area which will be narrowed to the Operational Area later in the assessment process. The larger area has been used for this PEIRA.
Planned discharges	Activity Planning Area	90 days survey duration +1 day	When the survey ends the planned discharges associated with the activity end. Planned discharges are such that after a 24-hour period any impacts would be indistinguishable from other marine activities in the area.
Accidental release of fuel	Environment Planning Area	90 days survey duration +7 days	When the survey ends this aspect ends. If there were an accidental release of fuel the consequences of the release would not be detectable a further 7 days post-incident due to the rapid evaporation and dispersion of the fuel.
Accidental release of materials or waste overboard	Environment Planning Area	90 days	Any buoyant waste released overboard is likely to wash up on shorelines hence why the larger Environment Planning Area has been used. Once the activity ends this aspect is no longer relevant.

Environmental Aspect	Extent	Duration	Justification
Introduction of marine pest species	Activity Planning Area	90 days	The vessel will not be conducting petroleum activities beyond the Activity Planning Area, which will be narrowed to the Operational Area later. Once the activity ends this aspect is no longer relevant.
Collision with marine fauna	Activity Planning Area	90 days survey duration	The vessel will not be conducting petroleum activities beyond the Activity Planning Area, which will be narrowed to the Operational Area later. Once the activity ends this aspect is no longer relevant.

Screening

Not all environmental aspects interact with the identified component parts of the environment. For example, water quality will not be affected by artificial light. Table B4-33B4-3 shows the interactions between each environmental aspects and identified components of the environment. Additional component parts of the environmental may be identified through the consultation process. These will be considered in the full assessment.

Table B4-33: Screening of Environmental Aspects against the Components of the Environment

Baseline Environmental Conditions

The baseline environmental conditions identified below are used as a reference point to evaluate the impacts and risks of the Regia MSS. The baseline conditions are also used to determine the significance of the impacts and risks identified in the PEIRA and to identify any necessary mitigation measures and management strategies.

Summary

The marine environment of the offshore Otway Basin, Victoria, Australia, is a diverse and dynamic ecosystem that supports a range of important physical, ecological, and human activities. The Environmental Planning Area encompasses a wide range of habitats, including open ocean, coastal waters, rocky shores, sandy beaches, seagrass beds, and kelp forests. These habitats support a variety of marine species, including fish, crustaceans, molluscs, birds, marine reptiles, marine mammals, and seaweeds. The marine environment also supports a range of human activities, including but not limited to fishing, diving, shipping, and recreation.

Water quality in the Environmental Planning Area is generally good, with relatively low levels of pollutants and relatively high levels of dissolved oxygen. The area is also relatively protected from human impacts, with few major industries or coastal developments in the immediate vicinity. However, the Environmental Planning Area is subject to some environmental stressors, including nutrient runoff, sedimentation, and marine debris.

Physical Environment

The physical environment refers to the non-living natural elements of an ecosystem, including air, water, soil, minerals, and energy from the sun. These elements interact with each other and with living organisms to form a complex system that supports and sustains life.

The physical environment plays a crucial role in shaping the biotic components of an ecosystem, influencing the distribution and diversity of plants, animals, and microorganisms. For example, the availability of water, light, and nutrients determines the types of vegetation that can grow in a particular area, while topography and geology shape the physical structure of the landscape, providing habitats and resources for various species.

Understanding the physical environment is essential for comprehending the functioning of an ecosystem and for developing sustainable management practices that preserve and enhance the ecological, economic, and social values of the environment. The following components of the physical environment are considered in this PEIRA and will be carried through to the full assessments.

- Air Quality
- Ambient Light
- Ambient Sound
- Climate
- Sediment Quality
- Water Quality

Ecological Environment

The ecological environment refers to the living components of an ecosystem, including plants, animals, and microorganisms, as well as their interactions with each other and with the non-living elements of the environment. These interactions form the food webs and nutrient cycles that sustain life and maintain the stability and resilience of the ecosystem.

The ecological environment is shaped by the physical environment, as well as by historical events, such as natural disasters, evolution, and human activities. Biodiversity, or the variety of species and their interactions, is a key feature of the ecological environment, providing the essential functions and services that support human well-being, such as food, medicine, and recreation.

Understanding the ecological environment is important for conserving and restoring biodiversity, preserving the integrity and functioning of ecosystems, and supporting the livelihoods and well-being of people and communities. It involves monitoring and assessing changes in species composition, populations, and interactions, as well as evaluating the impacts of human activities, such as habitat destruction, pollution, and introduction of non-native species, on the ecological environment. The following components of the ecological environment are considered in this PEIRA and will be carried through to the full assessments.

- Benthic Assemblages
- Coast Habitats and Communities
- Plankton
- Invertebrates
- Fish
- Birds
- Marine Reptiles
- Marine Mammals

These components of the ecological environment may include the following matters that must be considered in the full assessments:

- the presence of a listed threatened species or listed threatened ecological community.
- the presence of a listed migratory species.
- any values and sensitivities that exist in, or in relation to, part or all of:
    - a Commonwealth marine area; or
    - Commonwealth land.

Human Environment

The human environment refers to the relationships between people and the environment, including the physical, psychological, social, economic and cultural elements that shape human well-being. It encompasses the communities, economies, and cultures that depend on the environment for their livelihoods, health, and well-being.

In the context of marine areas, the human environment includes coastal developments, fishing and aquaculture industries, tourism and traditional owners who have a close connection to the sea and its resources. The relationship between traditional owners and the sea often involves a deep cultural, spiritual, and economic connection, and they have a unique knowledge and understanding of the marine environment that has been passed down through generations.

Understanding the human environment is critical for developing effective and equitable environmental management strategies that balance the needs of people with the conservation of the environment. It involves considering the social, economic, and cultural values and impacts of environmental change, and engaging with the various stakeholders, including traditional owners, to ensure that their perspectives and needs are incorporated into decision-making processes. The following components of the human environment are considered in this PEIRA and will be carried through to the full assessments.

- Coastal Development
- Commercial Fishing and Aquaculture
- Diving
- Indigenous Culture
- Marine Industries
- Marine Protected Areas
- Marine Tourism
- Recreational Activities

In this list Marine Protected Areas may include the following matters that must be considered in the full assessments:

- the National Heritage values of a National Heritage place.
- the ecological character of a declared Ramsar wetland.

Noting that there is no proposed activity, or part of the activity, being undertaken in any part of a declared World Heritage property.

Environmental Impacts

Environmental impacts are identified and evaluated based on the cause effect pathways that arise from the activity. This PEIRA provides a first pass at evaluating the significance of the environmental impacts to:

- Support community consultation.
- Direct further assessment towards areas of higher impact.
- Inform decision making during the activity design.
- Justify if no further assessment is required for negligible effects.

The evaluation step at this preliminary stage involves using professional judgement to compare the estimated environmental impacts to internal assessment criteria, determining the overall significance of the impacts, and deciding on actions for further assessment.

This impact assessment is designed to facilitate consultation with the community, including government agencies, community groups, and other relevant organisations about the nature and scale of environmental impacts from the activity. This PEIRA will be published, with a summary, on the Regia MSS Consultation Hub (www.regiamss.com.au) and used in consultation with the community.

Environmental Impact Evaluation

At the preliminary stage, environmental impacts are a combination of a subjectively estimated level of effect combined with a subjectively estimated level of uncertainty. The impact assessment methodology is explained in the Environmental Assessment Framework document available on the Regia MSS Consultation Hub. The outcomes of the evaluation are presented in Table B4-4 4B4-4.

Impacts Not Further Assessed

The PEIRA identified four environmental aspects where the environmental impact to some environment components were ranked as having a negligible level of effect. Each identified environmental aspect will be carried through to the full assessment, however, the environment component where the impact was ranked as negligible will not be carried through to the full impact assessment for that environmental aspect. Justification for this decision is provided in the sections below.

Artificial Light

Marine Mammals: Change in fauna behaviour

Artificial light has not been reported to cause a significant behavioural disturbance to marine mammals, despite their often-higher activity levels at night. Results from a previous independent review and assessment of the sensitivity of marine mammals to mining and exploration activities in the Great Australian Bight Marine Park indicate that the consequence of light pollution impacts to marine mammals were insignificant (defined as occasional short-term attraction and/or disruption to marine mammals) (Pidcock, Burton and Lunney, 2003). Therefore, impacts to marine mammals from light emissions are not predicted and have not been evaluated further.

Coastal Development: Change to functions, interests, and activities

The coastline is sparsely populated with no cities (i.e. >100,000 people congregated around an urban centre) located on the coastline. The largest town that may be able to see the mandatory minimum navigational light is Warrnambool at the northwest of the Activity Planning Area. There is a shipping channel through the Activity Planning Area and artificial light produced by the survey at night-time will be no different to artificial light from other marine users navigating at night. Therefore, impacts to coastal developments from light emissions are not predicted and have not been evaluated further.

Atmospheric Emissions

Ecological environment: Change to local air quality, change in climate, change in ecosystem dynamics

Atmospheric emissions have the potential to result in a change in air quality. As a result of a change in ambient air quality, a change in physical condition may occur to benthic assemblages, plankton, invertebrates, fish, marine reptiles, marine mammals and coastal habitats and communities.

Control Measure
Implement the CGG marine assurance system to ensure compliance of contract vessels with MARPOL, COLREGS, and Marine Orders 21, 30, 31, 59 70,71,72, 91, 95, 96, 97, 98.

The use of fuel to power vessel engines, generators and mobile and fixed plant will result in emissions of greenhouse gases (GHG) such as carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O), along with non-GHG such as sulphur oxides (SO_X) and nitrous oxides (NO_X).

A change in air quality has the potential to result in a change in physical condition. The activity is of a short duration and will only involve up to three vessels. It is a once-off activity. Based on a 2018 seismic survey in Bass Strait, approximately 50 tonnes of fuel were used per day by the vessel spread. This results in the daily emissions of approximately:

- 1.2 tonnes of nitrogen dioxide (NO_X)
- 0.04 tonnes of sulphur dioxide (SO_X)
- 110 tonnes of carbon dioxide (CO_2)

Based on a 90-day survey, it could be expected that 4,500 tonnes of fuel would be used, resulting in similar daily emissions of NO_X, SO_X and CO_2.

Potential receptors above the sea surface within the Environmental Planning Area that may be exposed to reduced air quality include seabirds and marine megafauna that surface for air (e.g., marine mammals and marine turtles). Emissions will be small in quantity and will dissipate quickly into the surrounding atmosphere, therefore any localised reduction in air quality is not expected to result in any measurable effect.

While these emissions add to the GHG load in the atmosphere, which adds to global warming potential, they are relatively small on a state, national and global scale, representing an insignificant contribution to overall GHG emissions. Emissions will be small in quantity and short-term. The emissions from up to three vessels for 90 days will not significantly contribute to climate change.

Therefore, impacts to ecological components of the environment from atmospheric emissions are not predicted and have not been evaluated further.

Table B4-4 4: Preliminary Environmental Impact Evaluation

Environment Component	Environmental Aspect	Environmental Impact	Effect	Uncertainty	Preliminary Outcome
Air Quality	Atmospheric Emissions	Change to local air quality	Negligible	Low	No further assessment
Ambient Light	Artificial Light	Change in ambient light	Minor	Low	Qualitative assessment

Marine Tourism	Physical Presence	Change in functions, interests, or activities	Minor	Moderate	Qualitative assessment
Recreational Fishing	Physical Presence	Change in functions, interests, or activities	Minor	Low	Qualitative assessment

Planned Discharges

Ecological Environment: Change to water quality, change in fauna behaviour and change in physical condition

Vessel discharges have the potential to result in a change in water quality. As a result of a change in ambient water quality, further impacts may occur to marine fauna, including:

- a change in fauna behaviour
- injury/mortality to fauna

Discharges of organic matter, such as those present in sewage, greywater or food waste can lead to an increase in scavenging behaviour in fauna. Discharges will be localised and temporary as they will be quickly broken down by microbial action and dispersed by wave action and local ocean currents. Sewage solids will be broken down during treatment before being discharged, which will aid the decomposition process. Likewise, under MARPOL, food scraps are required to be macerated to a size small enough to pass through a 25 mm mesh before being discharged.

Control Measure
Implement the CGG marine assurance system to ensure compliance of contract vessels with MARPOL, COLREGS, and Marine Orders 21, 30, 31, 59 70,71,72, 91, 95, 96, 97, 98.

Plankton have a patchy distribution linked to localised and seasonal productivity that produces sporadic bursts in populations (DEWHA 2007). A change in water quality associated with discharges of sewage, greywater or food waste is unlikely to lead to a significant change in plankton distribution at a measurable level and will not result in a change in the viability of the population or ecosystem.

Marine fauna likely to be present within the upper water column are expected to be highly mobile and therefore able to avoid any localised change in ambient water quality. Species with limited mobility (i.e., plankton, fish embryo and larvae) are extremely unlikely to be impacted by any effects of temporary and localised increases in turbidity and low toxicity due to rapid dilution. No significant impacts are expected to plankton species, or on higher trophic levels reliant on plankton abundance.

Levels of contaminants within deck washdown, rainwater and deck drainage are likely to be insignificant. OSPAR (2014) indicates that the predicted no effect concentration (PNEC) for marine organisms exposed to dispersed oil is 70.5 ppb. Due to wave action and ocean currents any low-level contaminants will be quickly diluted and dispersed with no or negligible environmental impact. Shell (2009) conducted modelling that showed discharges of hydrocarbon and other chemical concentrations will be rapidly diluted and expected to be below PNEC within a relatively short time and will meet UNEP (1999) standards within 70m of their discharge.

Bilge water will be treated prior to discharge via an oily water separator with a maximum concentration of 15 ppm oil-in-water being achieved prior to discharge and therefore will have negligible impacts on water quality and hence plankton and marine fauna.

A change in water quality because of routine vessel discharges is unlikely to cause a change in behaviour or a change in physical condition of plankton and marine fauna at a measurable level and will not result in a change in the viability of the population or ecosystem. Therefore, impacts from planned vessel discharges on marine fauna are not predicted and have not been evaluated further.

Underwater Sound

Invertebrates: Change in hearing capacity

Invertebrates detect sound by sensing either the 'particle motion' (Przeslawski et al. 2016a;b; Carroll et al. 2017), through external and/or internal physiological structures such as hairs, statocysts and muscles; or the 'pressure' component (or both) of a sound field in the marine environment. Invertebrate statocysts are the mechanosensory organ equivalent to the inner ear of humans and are responsible for the detection of gravity, position and movement (Day et al. 2020). Because they lack gas-filled bladders, marine invertebrates are unable to detect the pressure changes associated with sound waves (Carroll et al. 2017; Parry & Gason 2006). As no functional cause-effect relationship has been established for a change in hearing, permanent and/or temporary threshold shifts in invertebrates are not predicted and have not been evaluated further. Impacts to statocysts, a balance sensory receptor present in some aquatic invertebrates, are evaluated under 'Fauna injury/mortality'.

Birds: Change in fauna behaviour, hearing capacity and physical condition

Impulsive and continuous underwater sound emissions have the potential to result in a change in ambient sound. As a result of a change in ambient sound, further impacts may occur to birds, including a change in fauna behaviour, hearing capacity and physical condition.

There are no thresholds for underwater sound impacts to seabirds. As such, no modelling can be conducted. The threshold for physiological damage on the auditory system for seabirds is unknown, however most seabirds are generally shallow divers and utilise surface waters where the acoustic signals 'destructively interfere' with the sea surface, resulting in much lower sound exposure compared with deeper waters (Marine Technology Directorate, 1996: cited in SCAR, 2002) and the time of exposure underwater is short.

If individual birds or flocks are present in the Environmental Planning Area during acquisition, vessel movement is expected to temporarily deter them from foraging in the immediate vicinity of the vessel. The uncertainty of underwater sound impacting individuals or a population of any given species during plunge/dive feeding is extremely low. While resting/rafting on the water surface, there is limited potential for seabirds to be affected by the seismic sound due to the limited transmission of sound between the air-water interface. If there is an effect, it is likely to be a startle response, resulting in the bird flying away. Seabirds feed on multiple prey species and have widespread foraging areas. While displacement of some prey species may result in the displacement of these birds, this impact is localised, temporary and recoverable in any one location. Given their widespread foraging areas (ACAP 2018) and the small area possibly affected by prey displacement, seabirds are not expected to be impacted by reduced net foraging opportunities.

Impacts to shorebird species are not predicted from the activity, given their prey is concentrated within the intertidal zone along the coastline. The little penguin is capable of diving to 72 m but typically dives to 10-20 m. The species is known to generally forage within 20 km of their nesting site during the non-breeding season and 15 km of their nest during the breeding season (October to December) (Australian Wildlife, 2014). The little penguin has a foraging BIA (10 km buffer) around Christmas Island (off the northeast coast of King Island), which is a breeding colony. The Regia Activity Planning Area is more than 25 km from the little penguin BIA. On this basis, encounter rates with little penguin in the Activity Planning Area is considered unlikely. It is inferred that penguins have relatively poor hearing thresholds in the lower frequencies, which is where marine seismic surveys have the most energy (McCauley, 1994). However, Pichegru et al (2017) identified that African penguins switched foraging direction and distance in response to seismic activity but that the response was short-term. As seabirds spend very little time underwater, and shorebirds including the little penguin are located outside of the Activity Planning Area, impacts to birds from underwater sound emissions are not predicted and will not be evaluated further.

Marine Reptiles: Change in hearing capacity; change in physical condition

Underwater sound emissions have the potential to result in a change in ambient sound. As a result of a change in ambient sound, further impacts may occur to marine reptiles, including change in physical condition. The Sound Exposure Guidelines for Fishes and Sea Turtles Guidelines (Popper et al. 2014) details that there is no direct evidence of mortality or potential mortal injury to marine turtles from shipping and continuous sounds. As no functional cause-effect relationship has been established, no change in physical condition is predicted from continuous underwater sound. Studies to date on marine turtles have not identified a change in physical condition as an impact from seismic sound (Nelms 2016, McCauley et al. 2000, Popper et al. 2014). As no functional cause-effect relationship has been established, changes to the physical condition of turtles from seismic sound will not be evaluated further.

Risk Assessment

Environmental risks are identified and evaluated based on the cause effect pathways that arise from the activity. This PEIRA provides a first pass at evaluating the significance of the environmental risk to:

- Support community consultation.
- Direct further assessment towards areas of higher risk.
- Inform decision making during the activity design.
- Justify if no further assessment is required for negligible effects.

The evaluation step at this preliminary stage involves using professional judgement to compare the estimated environmental risks to our corporate criteria, determining the overall significance of the risks, and deciding on actions for further assessment.

This risk assessment is designed to facilitate consultation with the community, including government agencies, community groups, and other relevant organizations about the nature and scale of environmental risks from the activity. This PEIRA will be published, with a summary, on the Regia MSS Consultation Hub (www.regiamss.com.au) and used in consultation with relevant persons.

Environmental Risk Evaluation

At the preliminary stage, environmental risks are assessed on the basis of a combination of an estimated likelihood combined with a subjectively estimated level of consequence. The risk assessment methodology is explained in the Environmental Assessment Framework document available on the activity website. The outcomes of the evaluation are presented in Table B4-55B4-5.

Risks Not Further Assessed

The PEIRA has one environmental aspect where the environmental risks to some environment components are ranked as having a negligible level of effect. Each environmental aspect will be carried through to the full assessment, however, the environment component where the risk is ranked as negligible will not be carried through to the full impact assessment for that environmental aspect. Justification for this decision is provided in the sections below.

Accidental Release of Materials or Waste Overboard

Water Quality: Change in water quality

> **Legislative Requirement**
>
> Marine Order 95: that vessels must have a garbage management plan, placards and maintain a garbage record book. Waste with potential to be windblown shall be stored in covered containers

Loss of materials or waste overboard has the potential to change water quality relied on by marine fauna through ingestion or entanglement. Marine turtles and seabirds are particularly at risk from entanglement. Marine turtles may mistake plastics for food; once ingested, plastics can damage internal tissues and inhibit physiological processes, which can both potentially result in fauna fatality. Floating, non-biodegradable marine debris has been highlighted as a threat to marine turtles, whales, whale sharks, albatrosses and giant petrels in relevant recovery plans and approved conservation advice for those species. Marine debris causing entanglement and ingestion was recognised in 2003 as a key threatening process for marine vertebrates under the EPBC Act leading to the development of the Threat Abatement Plan for the Impacts of Marine Debris on the Vertebrate Wildlife of Australia Coasts and Oceans (DoEE 2018). The recovery plans and approved conservation advice, as well as the threat abatement plan, have specified several recovery actions to help combat this threat. Of relevance to this activity there is a legislative requirement that prevents this type of marine pollution. Marine Order 95 stipulates that vessels must have a garbage management plan, placards and maintain a garbage record book. Waste with potential to be windblown shall be stored in covered containers to minimise the risk of loss to the marine environment. Marine Order 95 gives effect under Australian law to MARPOL Annex VI.

Benthic assemblages: Change in habitat

Loss of equipment or waste has the potential to cause localised seabed disturbance with potential damage to benthic habitats. Given the size of equipment used for a survey, only a relatively small area of the seabed would be disturbed, a maximum of 0.001km^2 based on loss of a streamer that settled on the seabed, though this is unlikely as the streamers will have recovery units. There are no risks to biodiversity or ecosystem function and integrity from any waste that could be lost overboard. Lasting impacts are not predicted as the small area would quickly recover. The consequence to benthic assemblages is ranked as negligible and has not been evaluated further.

Control Measure
Streamers will have recovery units fitted to prevent benthic disturbance in the event of loss.

Table B4-55 – Preliminary environmental risk evaluation

Environment Component	Environmental Aspect	Environmental Risk	Probability	Consequence	Preliminary Outcome
Water Quality	Accidental Release of Fuel	Change in water quality	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change in water quality	Rare	Negligible	Low (Negligible)
Sediment Quality	Accidental Release of Fuel	Change in sediment quality	Rare	Moderate	Low
Benthic Assemblages	Accidental Release of Fuel	Change in ecosystem dynamics	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change in habitat	Rare	Negligible	Low (Negligible)
	Introduction Of Marine Pest Species	Change in ecosystem dynamics	Rare	Severe	Moderate
Plankton	Accidental Release of Fuel	Change in physical condition	Rare	Moderate	Low
Invertebrates	Accidental Release of Fuel	Change in fauna behaviour	Rare	Moderate	Low
		Change in physical condition	Rare	Moderate	Low
	Introduction Of Marine Pest Species	Change in ecosystem dynamics	Rare	Severe	Moderate
Fish	Accidental Release of Fuel	Change in fauna behaviour	Rare	Moderate	Low
		Change in physical condition	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change in physical condition	Rare	Minor	Low
	Collisions With Marine Fauna	Change in physical condition	Rare	Moderate	Low
Birds	Accidental Release of Fuel	Change in fauna behaviour	Rare	Moderate	Low
		Change in physical condition	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change in physical condition	Rare	Minor	Low
Marine Reptiles	Accidental Release of Fuel	Change in physical condition	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change in physical condition	Rare	Minor	Low
	Collisions With Marine Fauna	Change in physical condition	Rare	Moderate	Low
Marine Reptiles	Accidental Release of Fuel	Change in fauna behaviour	Rare	Moderate	Low
	Collisions With Marine Fauna	Change in physical condition	Rare	Moderate	Low
Marine Mammals	Accidental Release of Fuel	Change in fauna behaviour	Rare	Moderate	Low
		Change in physical condition	Rare	Moderate	Low

Environment Component	Environmental Aspect	Environmental Risk	Probability	Consequence	Preliminary Outcome
	Accidental Release of Materials or Waste Overboard	Change in physical condition	Rare	Minor	Low
	Collisions With Marine Fauna	Change in physical condition	Rare	Major	Moderate
Coastal Habitats and Communities	Accidental Release of Fuel	Change in ecosystem dynamics	Rare	Moderate	Low
Commercial Fishing	Accidental Release of Fuel	Change to functions, interests, or activities	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change to functions, interests, or activities	Rare	Minor	Low
	Introduction Of Marine Pest Species	Change to functions, interests, or activities	Rare	Severe	Moderate
Shipping Activity	Accidental Release of Fuel	Change to functions, interests, or activities	Rare	Moderate	Low
Traditional Owners	Accidental Release of Fuel	Change to functions, interests, or activities	Rare	Moderate	Low
		Change in aesthetic value	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change to functions, interests, or activities	Rare	Minor	Low
Coastal Development	Accidental Release of Fuel	Change to functions, interests, or activities	Rare	Moderate	Low
	Accidental Release of Materials or Waste Overboard	Change to functions, interests, or activities	Rare	Moderate	Low
Marine Protected Areas	Accidental Release of Fuel	Change in aesthetic value	Rare	Moderate	Low
	Accidental Release of Materials Or Waste Overboard	Change in aesthetic value	Rare	Minor	Low

Mitigation and Management

This PEIRA considers the residual environmental impacts and risks that occur with the application of legislative requirements as a minimum. Further, industry standards will be applied during the design of the activity, many of which aim to avoid or minimise environmental impacts and risks. Mitigation measures are adopted within the design and implementation of the activity to further reduce environmental impacts and risks. They are typically specific to the environmental setting of the activity may be informed through consultation and may not be defined until the final details of the activity are known.

Mitigation Measures

In determining the mitigation measures included at any stage of the activity, a hierarchy of controls system will be implemented. This is a widely accepted system to classify mitigation measures and promote adoption of the most effective mitigation measures first. The hierarchy, in order of decreasing effectiveness is:

- Elimination/avoidance
- Substitution
- Engineering
- Administrative/ procedural
- Offsetting

In an environmental context, procedural mitigation measures can include further studies which improve the accuracy of predicted impacts and risks, validate assumptions, establish baselines, monitor impacts, or reduce scientific uncertainty.

Management Plans

In the context of this PEIRA, management plans refer to the strategies, procedures, and measures that are put in place to minimise the environmental impacts and risks associated with the activity. They outline how the impacts or risks will be monitored, managed, and mitigated over the course of the activity. Management plans may include measures such as mitigation measures, monitoring programs, emergency response plans, and contingency plans. They aim to ensure that the proposed activity is carried out in an environmentally responsible and sustainable manner. The following management plans are either mandatory or should be considered by CGG based on this PEIRA:

- Oil Pollution Emergency Plan (mandatory)
- Operational & Scientific Monitoring Program (mandatory)
- Marine Mammal Adaptive Management Plan
- On-water Interactions Management Plan

Conclusion and Recommendations

The following identified environmental impacts and risks will be carried through to the full assessment stage and will be refined based on further assessment and consultation.

Environmental Aspect	Environmental Impact	Preliminary Outcome
Artificial Light	Change in ambient light	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
Underwater Sound	Change in ambient sound	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
	Change in hearing capacity	Quantitative assessment
	Change in physical condition	Quantitative assessment
Physical Presence	Change in functions, interests, or activities	Quantitative assessment

Environmental Aspect	Environmental Risk	Preliminary Outcome
Accidental Release of Fuel	Change in water quality	Low
	Change in sediment quality	Low
	Change in ecosystem dynamics	Low
	Change in physical condition	Low
	Change in fauna behaviour	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Introduction Of Marine Pest Species	Change in ecosystem dynamics	Moderate
	Change to functions, interests, or activities	Moderate
Accidental Release of Materials or Waste Overboard	Change in physical condition	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Collisions With Marine Fauna	Change in physical condition	Moderate

The following recommendations are made for CGG to consider:

1. Commission independent underwater sound modelling to understand the effect thresholds and distances for specific receptors within the Environment Planning Area.
2. Split the full assessment of underwater sound into two components for impulsive and continuous sound sources.
3. Review the NERA Reference Case 2018:1003 Consequence analysis of an accidental release of diesel and regionally relevant spill models from similar worst-case events to determine the applicability of the NERA Reference Case and, subsequently, the need for activity specific spill modelling.

This PIERA has not identified any management plans required to be implemented at this stage of the assessment, noting that many environmental impacts and risks have been carried through for full assessment, which is more likely to result in management plan requirements.

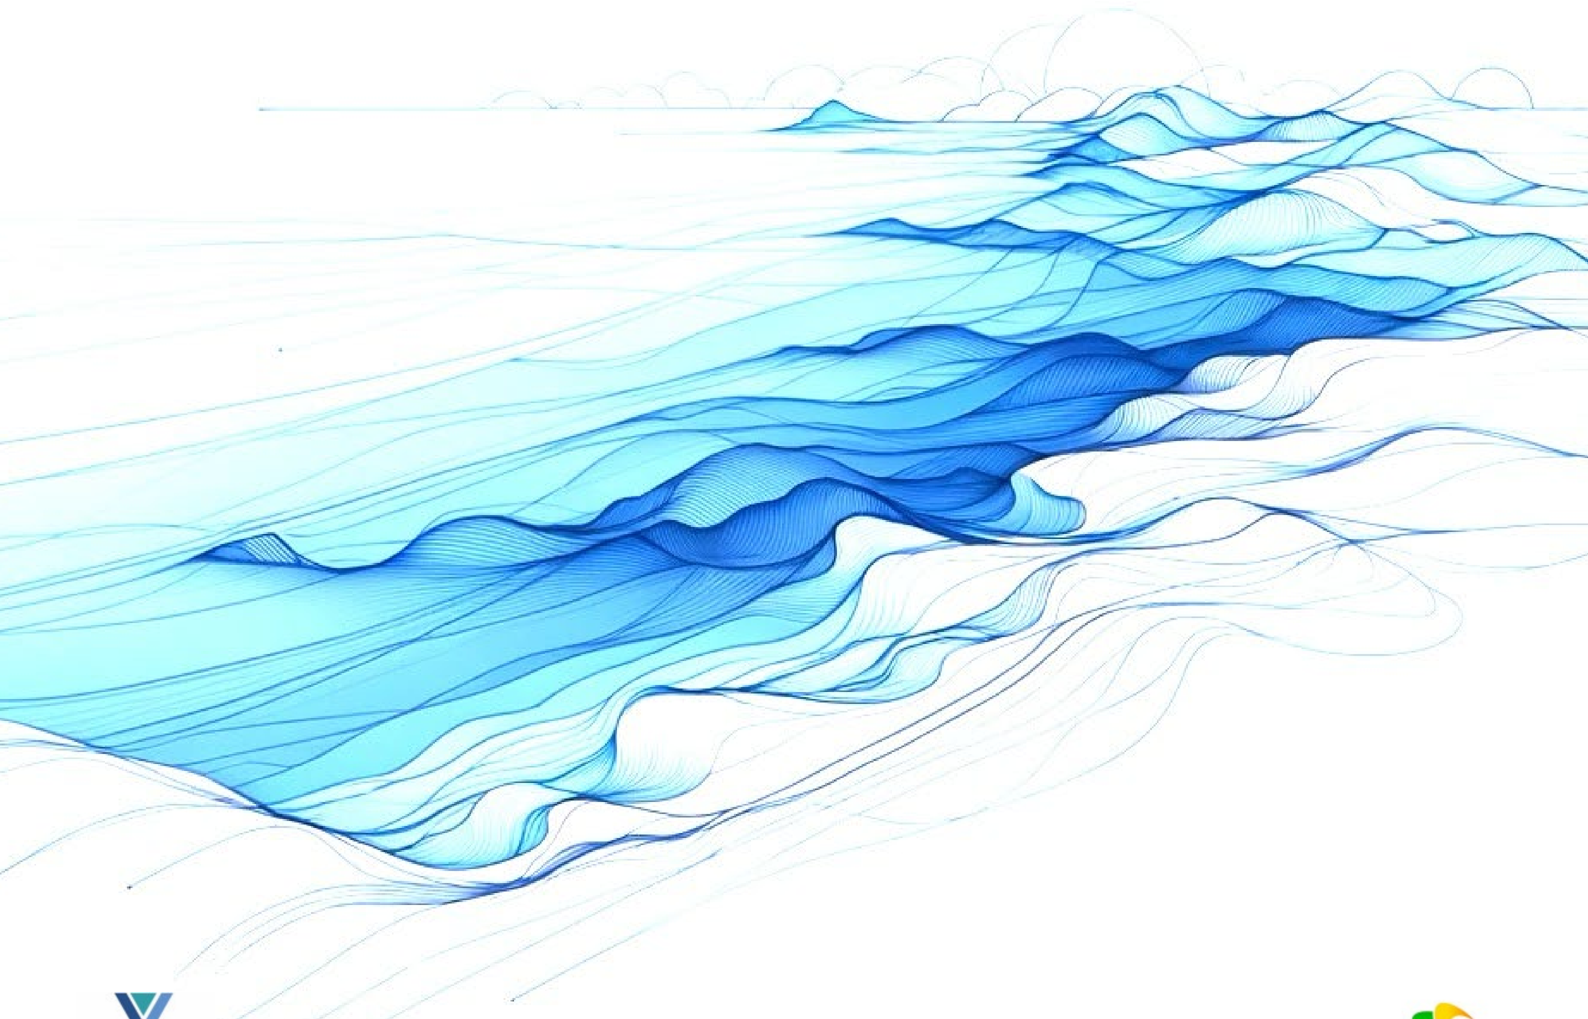
Rev 2

May 2024



Klarite

1 Introduction

This document includes the Protected Matter Search Tool outputs relevant to various planning areas associated with the Regia MSS. The PMST search tool was initially used to search for environmental values and sensitivities within the Environment Planning Area, with refined searches complete for different aspects buffered around the Activity Planning Area, as defined by the Preliminary Environmental Impact and Risk Assessment (PEIRA).

The searches were performed again prior to Rev 2 submission because the active source area was established as an area narrower than the activity planning area. The passage of time also meant that changes may have occurred in the intervening period between PMST searches.

The searches were then conducted again prior to resubmission (Rev 2) to ensure any changes to species or listings were identified to control for passage of time and in response to Matters: I16 and I17.

This document presents the raw output from the PMST search tool and was used to update the environmental assessment in this Environment Plan. There are eight searches presented in total, of which seven were completed on 23 April 2024 and the eighth on 1 May 2024.

1. Active Source Area.
2. Light Environment that May Be Affected.
3. Operational Area.
4. Underwater Sound for Birds – 50 km.
5. Underwater Sound for Fish – 8 km.
6. Underwater Sound for LF Cetaceans – 44 km.
7. Underwater Sound for Turtle – 6 km.
8. Environment Planning Area

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

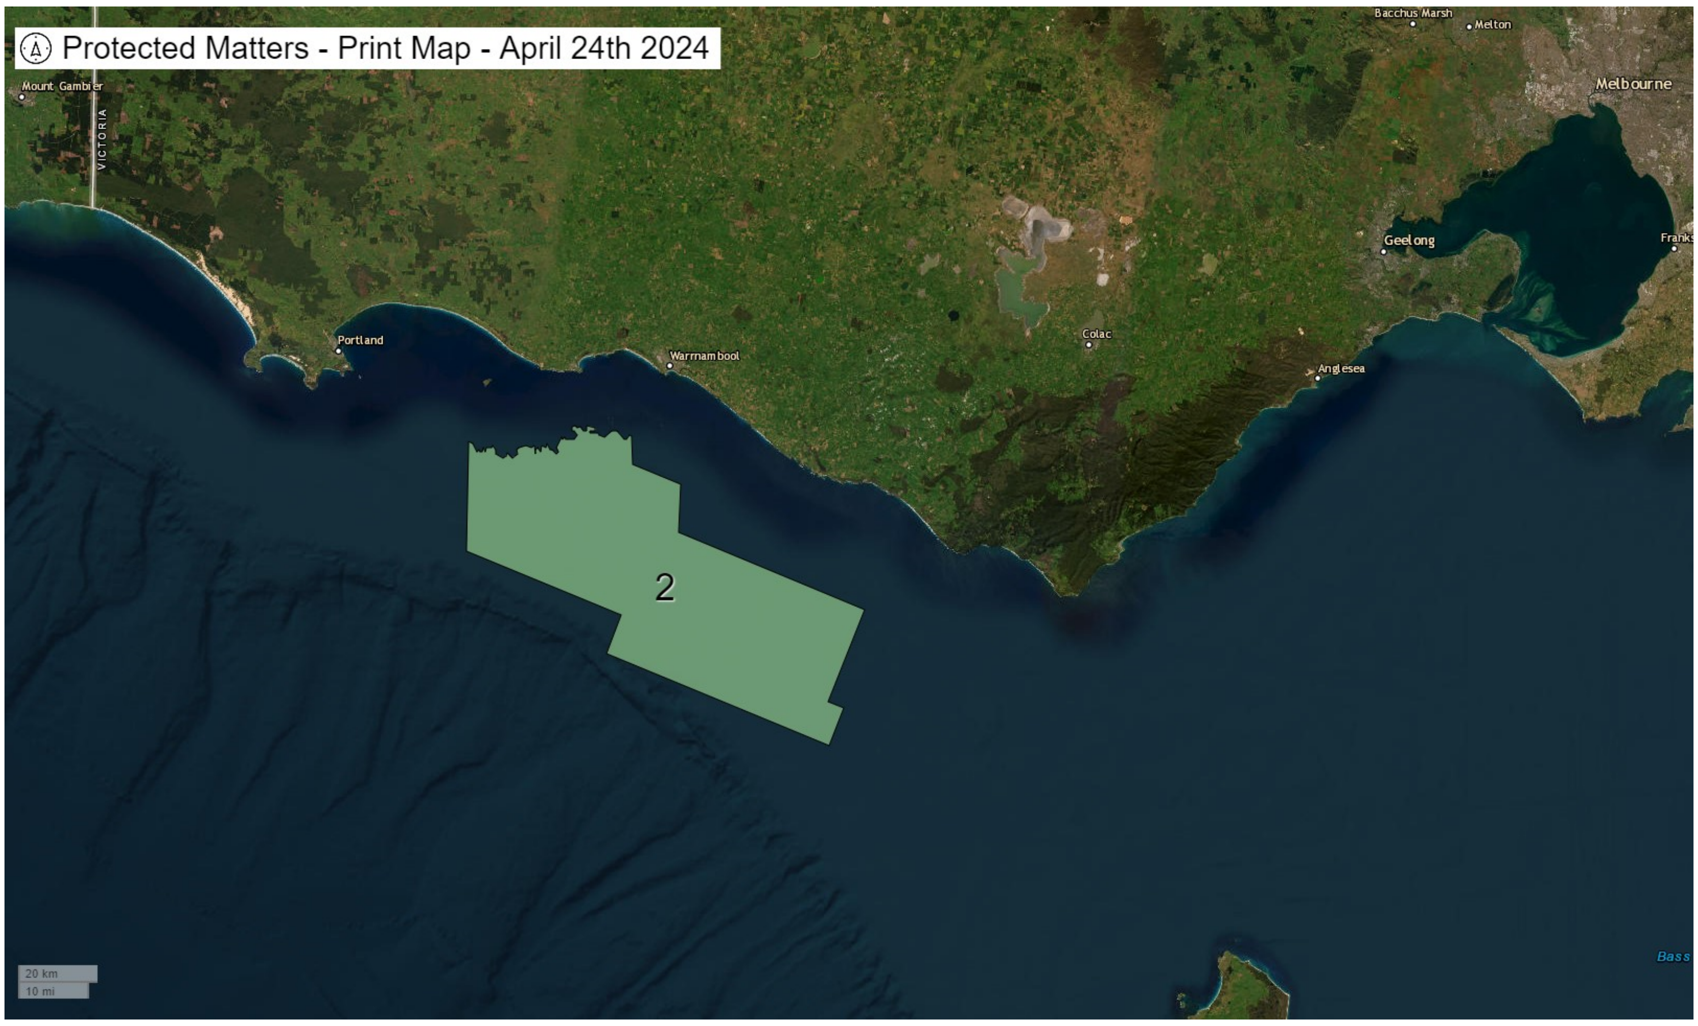

Figure 1: PMST Search Area - Active Source Area

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	41
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	62
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	32
Key Ecological Features (Marine):	2
Biologically Important Areas:	19
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
FISH		
Hoplostethus atlanticus		
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat may occur within area
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Neophoca cinerea		
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
REPTILE		

Scientific Name	Threatened Category	Presence Text
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato		
Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus		
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes		
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea		
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis		
Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata		
Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Migratory Wetlands Species

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Fish		
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus poecilolaemus		
Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri		
Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus		
Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area
Neophoca cinerea		
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata		
Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region

Name	Region
Bonney Coast Upwelling	South-east
West Tasmania Canyons	South-east

Biologically Important Areas

[Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur

Scientific Name	Behaviour	Presence
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

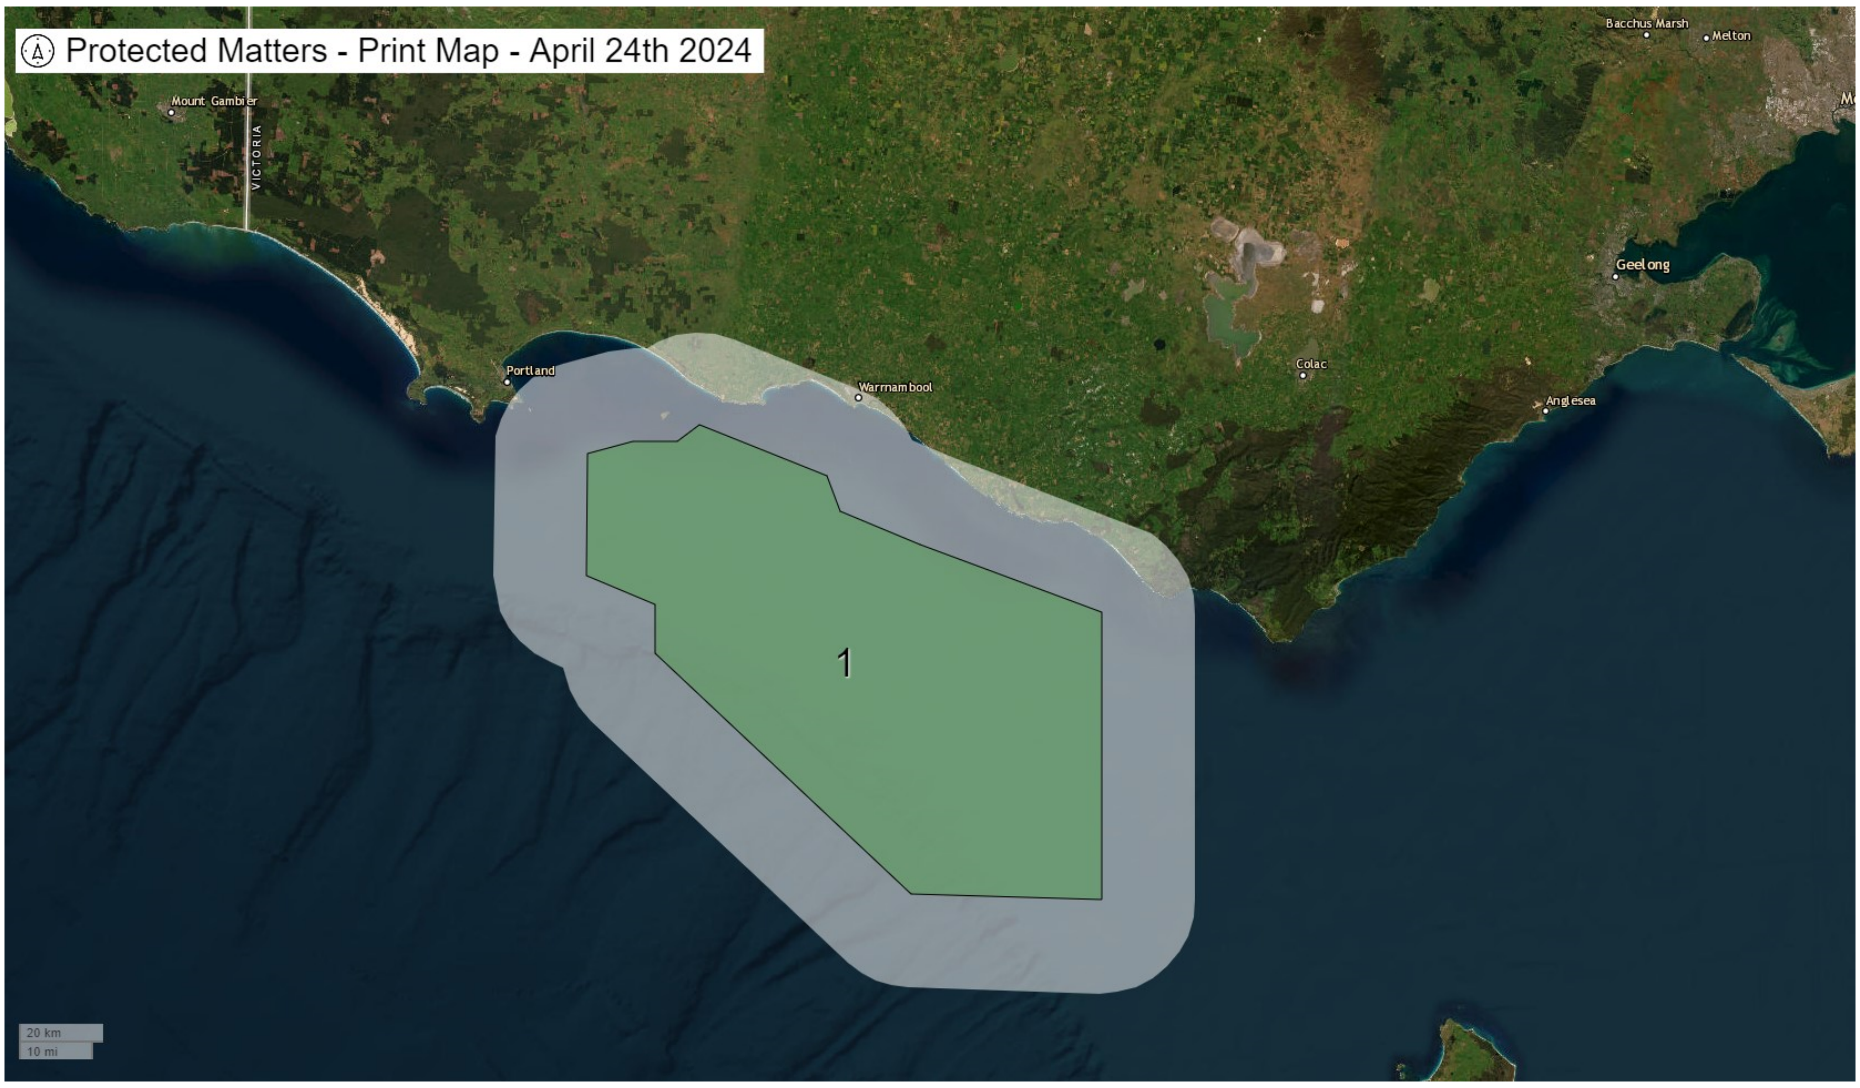

Figure 1: PMST Search Area - Light Environment that May Be Affected (Operational Area + 20km Buffer)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	6
Listed Threatened Species:	99
Listed Migratory Species:	66

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	1
Commonwealth Heritage Places:	None
Listed Marine Species:	108
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	19
Regional Forest Agreements:	1
Nationally Important Wetlands:	4
EPBC Act Referrals:	77
Key Ecological Features (Marine):	2
Biologically Important Areas:	22
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status	Buffer Status
Historic			
Great Ocean Road and Scenic Environs	VIC	Listed place	In buffer area only

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name	Buffer Status
Commonwealth Marine Areas (EPBC Act)	In feature area
Commonwealth Marine Areas (EPBC Act)	In feature area

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area	In buffer area only
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area	In feature area
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area	In buffer area only
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community may occur within area	In buffer area only
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area	In buffer area only
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area	In buffer area only

Listed Threatened Species			[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Anthochaera phrygia			
Regent Honeyeater [82338]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Ardenna grisea			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Arenaria interpres			
Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Botaurus poiciloptilus			
Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area	In buffer area only
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris canutus			
Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Callocephalon fimbriatum			
Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Charadrius leschenaultii			
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus			
Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Climacteris picumnus victoriae			
Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area	In buffer area only
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area	In feature area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area	In buffer area only
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area	In feature area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In buffer area only
CRUSTACEAN			
Euastacus bispinosus Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat likely to occur within area	In buffer area only
FISH			
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Nannoperca obscura Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area	In feature area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
FROG			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Litoria raniformis Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
INSECT			
Synemon plana Golden Sun Moth [25234]	Vulnerable	Species or species habitat may occur within area	In buffer area only
MAMMAL			
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Dasyurus maculatus maculatus (SE mainland population) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area	In buffer area only
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area	In buffer area only
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area	In buffer area only
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Pseudomys shortridgei Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat known to occur within area	In buffer area only
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area	In buffer area only
PLANT			
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Caladenia hastata Melblom's Spider-orchid [16118]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Ixodia achillaeoides subsp. arenicola Sand Ixodia, Ixodia [21474]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum diversiflorum Gorae Leek-orchid [13210]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum litorale listed as Prasophyllum littorale Coastal Leek Orchid [55234]	Critically Endangered	Species or species habitat likely to occur within area	In buffer area only
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area	In buffer area only
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area	In buffer area only
Thelymitra matthewsii Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
REPTILE			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area	In feature area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area	In buffer area only
SHARK			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area	In feature area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area	In feature area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area	In buffer area only
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area	In buffer area only
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Migratory Marine Species			
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area	In feature area
Eubalaena australis as Balaena glacialis australis			
Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isurus oxyrinchus			
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area	In feature area
Lagenorhynchus obscurus			
Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lamna nasus			
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area	In feature area
Megaptera novaeangliae			
Humpback Whale [38]		Species or species habitat likely to occur within area	In feature area
Orcinus orca			
Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus			
Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Migratory Terrestrial Species			
Hirundapus caudacutus			
White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Monarcha melanopsis			
Black-faced Monarch [609]		Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Motacilla flava			
Yellow Wagtail [644]		Species or species habitat may occur within area	In buffer area only
Myiagra cyanoleuca			
Satin Flycatcher [612]		Breeding known to occur within area	In buffer area only
Rhipidura rufifrons			
Rufous Fantail [592]		Species or species habitat known to occur within area	In buffer area only
Migratory Wetlands Species			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Arenaria interpres			
Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris alba			
Sanderling [875]		Roosting known to occur within area	In buffer area only
Calidris canutus			
Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Calidris melanotos			
Pectoral Sandpiper [858]		Species or species habitat known to occur within area	In feature area
Calidris ruficollis			
Red-necked Stint [860]		Roosting known to occur within area	In buffer area only
Charadrius bicinctus			
Double-banded Plover [895]		Roosting known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area	In buffer area only
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area	In buffer area only
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area	In buffer area only
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area	In buffer area only
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area	In buffer area only
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area	In buffer area only
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area	In buffer area only
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In buffer area only
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area	In buffer area only

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status
Defence		
Defence - WARRNAMBOOL TRAINING DEPOT [21111]	VIC	In buffer area only

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area	In buffer area only
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area	In buffer area only
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area	In buffer area only
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris alba Sanderling [875]		Roosting known to occur within area	In buffer area only
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area	In feature area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area	In buffer area only
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area	In buffer area only
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area	In buffer area only
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area	In buffer area only
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area	In buffer area only
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area	In buffer area only
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area	In buffer area only
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area	In buffer area only
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area	In buffer area only
Morus capensis Cape Gannet [59569]		Breeding known to occur within area	In buffer area only
Morus serrator Australasian Gannet [1020]		Breeding known to occur within area	In buffer area only
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area	In buffer area only
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area	In buffer area only
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In feature area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area	In buffer area only
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area	In buffer area only
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pandion haliaetus			
Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Pelecanoides urinatrix			
Common Diving-Petrel [1018]		Breeding known to occur within area	In buffer area only
Phalacrocorax fuscescens			
Black-faced Cormorant [59660]		Breeding known to occur within area	In buffer area only
Phoebetria fusca			
Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pluvialis fulva			
Pacific Golden Plover [25545]		Roosting known to occur within area	In buffer area only
Pterodroma mollis			
Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Recurvirostra novaehollandiae			
Red-necked Avocet [871]		Roosting known to occur within area overfly marine area	In buffer area only
Rhipidura rufifrons			
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Rostratula australis as Rostratula benghalensis (sensu lato)			
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Stercorarius antarcticus as Catharacta skua			
Brown Skua [85039]		Species or species habitat may occur within area	In feature area
Sterna striata			
White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area	In buffer area only
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalasseus bergii as Sterna bergii			
Greater Crested Tern [83000]		Breeding known to occur within area	In buffer area only
Thinornis cucullatus as Thinornis rubricollis			
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis			
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Tringa brevipes as Heteroscelus brevipes			
Grey-tailed Tattler [851]		Roosting known to occur within area	In buffer area only
Tringa glareola			
Wood Sandpiper [829]		Roosting known to occur within area overfly marine area	In buffer area only
Tringa nebularia			
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Tringa stagnatilis			
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area	In buffer area only
Fish			
Heraldia nocturna			
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area	In feature area
Hippocampus abdominalis			
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area	In feature area
Hippocampus breviceps			
Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area	In feature area
Histiogamphelus briggsii			
Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area	In feature area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area	In feature area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area	In feature area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area	In feature area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area	In feature area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area	In feature area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area	In feature area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area	In feature area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area	In feature area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area	In feature area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area	In feature area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area	In feature area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area	In feature area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area	In feature area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area	In feature area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area	In feature area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area	In feature area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area	In feature area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area	In feature area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area	In feature area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area	In feature area
Mammal			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area	In feature area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area	In feature area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Reptile			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area	In feature area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence	Buffer Status
Mammal			
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area	In feature area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area	In feature area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area	In feature area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area	In feature area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area	In feature area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area	In feature area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area	In feature area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area	In feature area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area	In feature area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area	In feature area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area	In feature area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area	In feature area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area	In feature area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area	In feature area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area	In feature area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area	In feature area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area	In feature area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region	Buffer Status
Bonney Coast Upwelling	South-east	In feature area
West Tasmania Canyons	South-east	In feature area

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence	Buffer Status
Seabirds			
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur	In buffer area only
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur	In feature area
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur	In feature area
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur	In feature area
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur	In feature area
Morus serrator Australasian Gannet [1020]	Aggregation	Known to occur	In buffer area only
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur	In feature area
Pelecanoides urinatrix Common Diving-petrel [1018]	Breeding	Known to occur	In buffer area only
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur	In feature area

Scientific Name	Behaviour	Presence	Buffer Status
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur	In feature area
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur	In feature area
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur	In feature area
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur	In feature area
Sharks			
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur	In feature area
Whales			
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur	In feature area

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

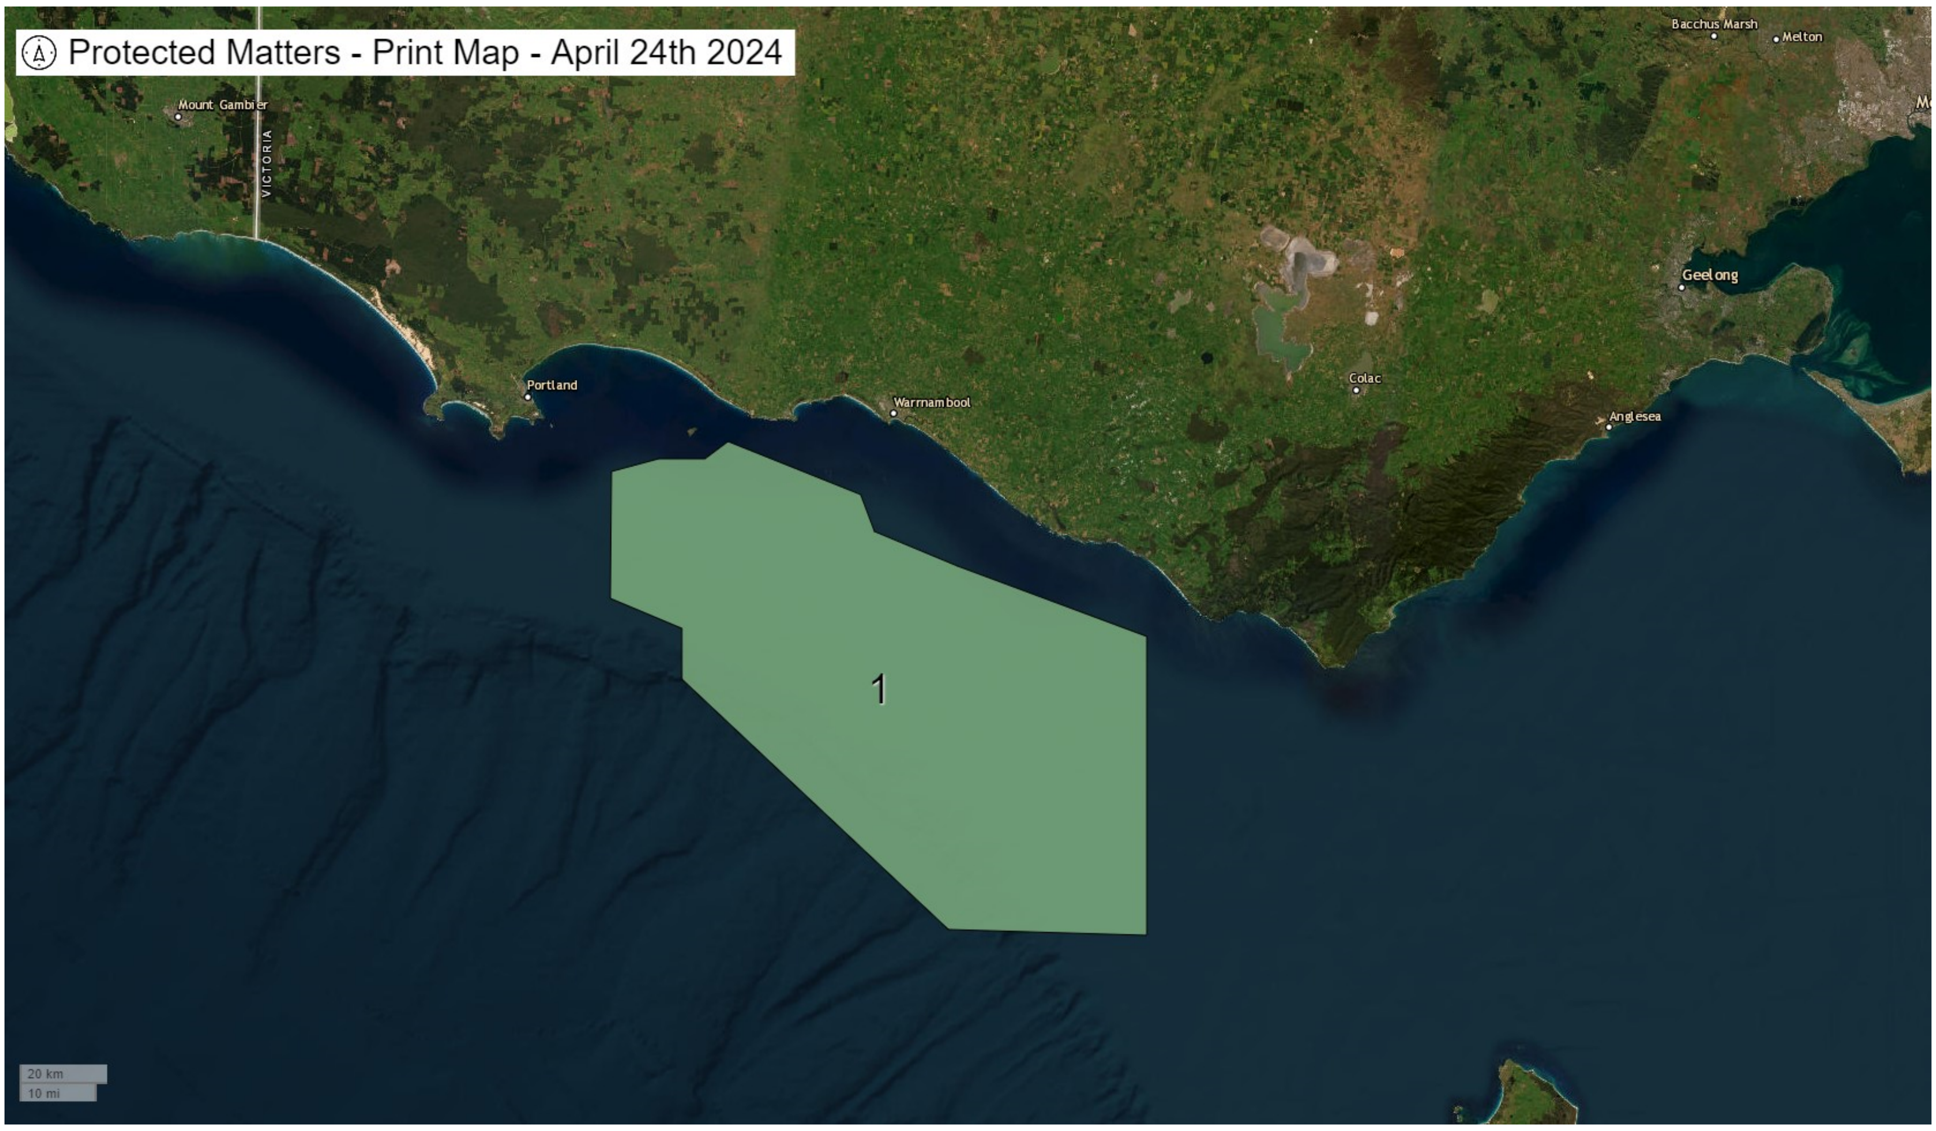

Figure 1: PMST Search Area - Operational Area

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	42
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	63
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	40
Key Ecological Features (Marine):	2
Biologically Important Areas:	19
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat may occur within area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Neophoca cinerea		
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
REPTILE		
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato		
Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus		
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes		
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus		
Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Bonney Coast Upwelling	South-east
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		

Scientific Name	Behaviour	Presence
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur

Scientific Name	Behaviour	Presence
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

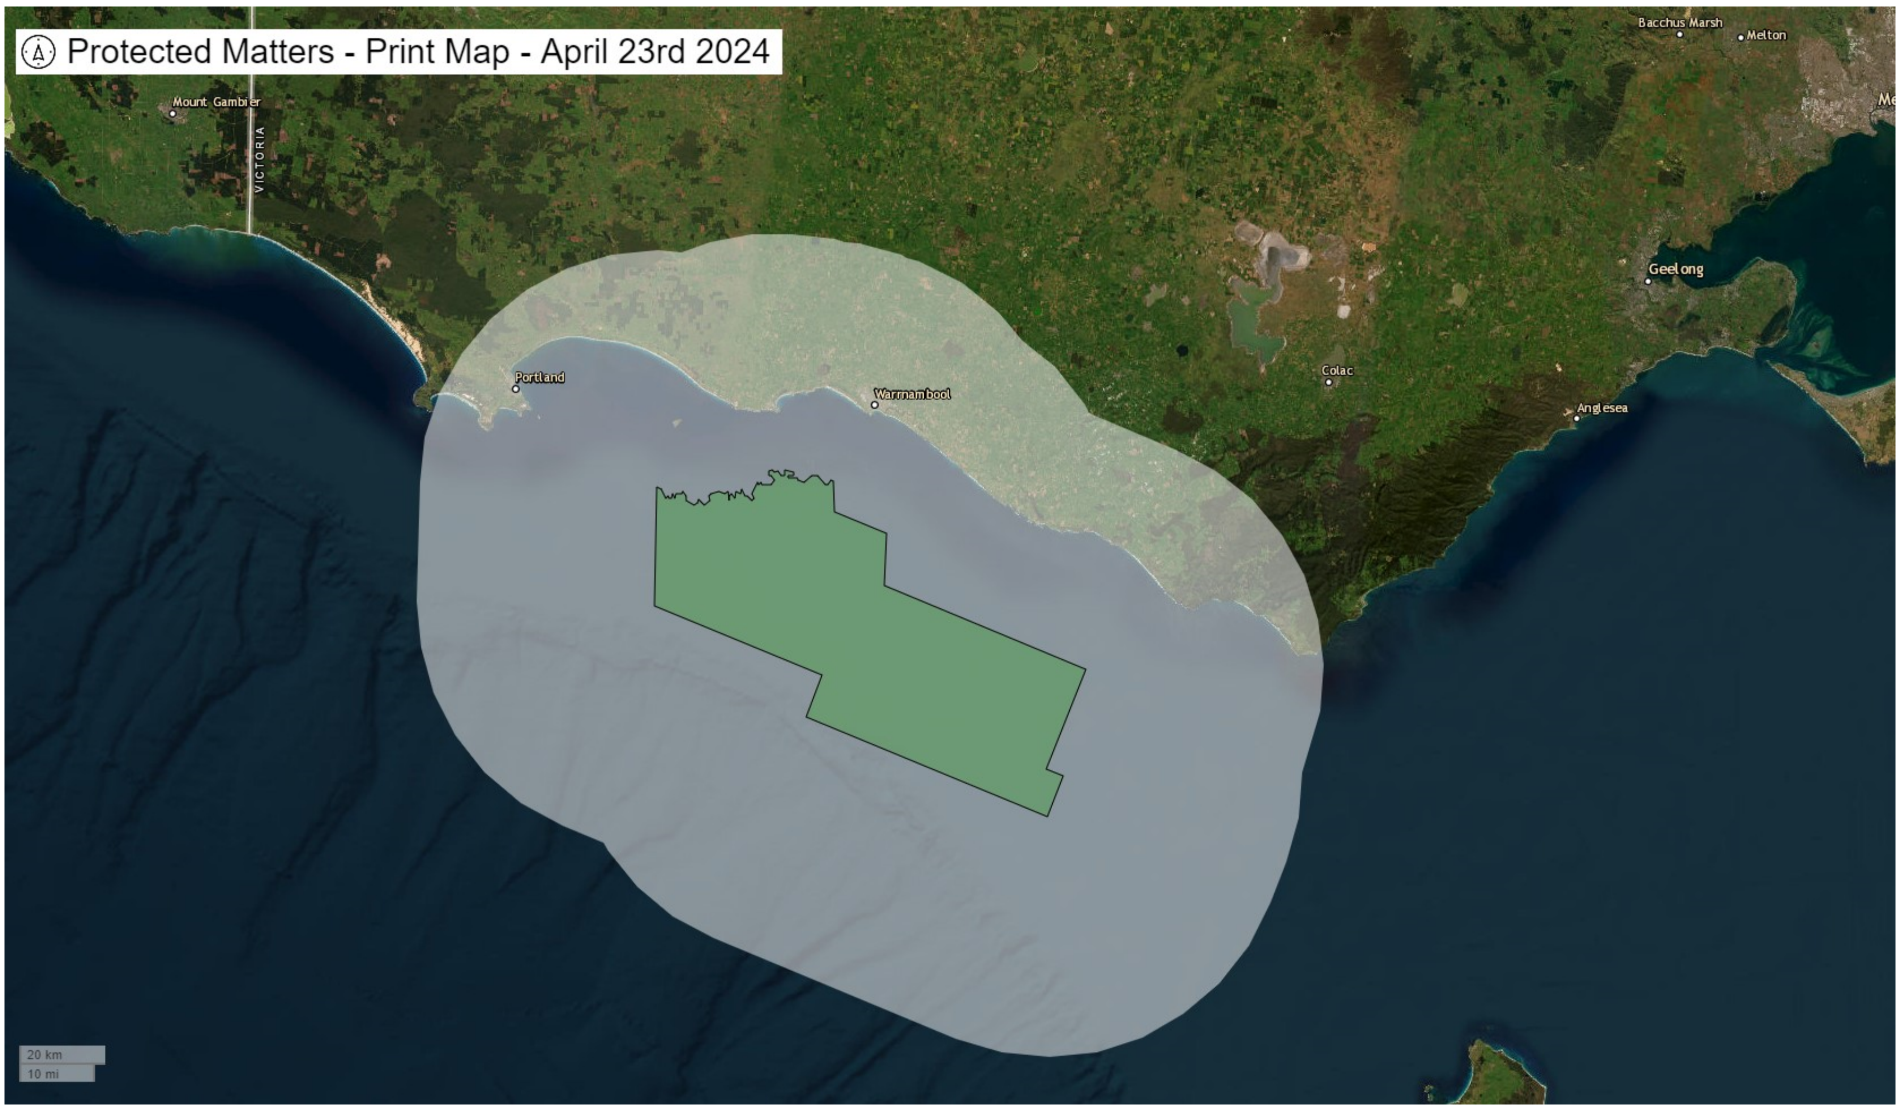

Figure 1: PMST Search Area - Underwater Sound for Birds (Active Source Area + 50km Buffer)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	3
Wetlands of International Importance (Ramsar	2
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	9
Listed Threatened Species:	115
Listed Migratory Species:	66

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	20
Commonwealth Heritage Places:	None
Listed Marine Species:	110
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	67
Regional Forest Agreements:	1
Nationally Important Wetlands:	8
EPBC Act Referrals:	97
Key Ecological Features (Marine):	2
Biologically Important Areas:	22
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status	Buffer Status
Budj Bim Cultural Landscape	VIC	Declared property	In buffer area only

National Heritage Places [Resource Information]

Name	State	Legal Status	Buffer Status
Historic			
Great Ocean Road and Scenic Environs	VIC	Listed place	In buffer area only
Indigenous			
Budj Bim National Heritage Landscape - Mt Eccles Lake Condah Area	VIC	Listed place	In buffer area only
Budj Bim National Heritage Landscape - Tyrendarra Area	VIC	Listed place	In buffer area only

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity	Buffer Status
Glenelg estuary and discovery bay wetlands	Within 10km of Ramsar site	In buffer area only
Western district lakes	10 - 20km upstream from Ramsar site	In buffer area only

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name	Buffer Status
Commonwealth Marine Areas (EPBC Act)	In feature area
Commonwealth Marine Areas (EPBC Act)	In feature area

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area	In buffer area only

Community Name	Threatened Category	Presence Text	Buffer Status
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area	In buffer area only
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area	In buffer area only
Karst springs and associated alkaline fens of the Naracoorte Coastal Plain Bioregion	Endangered	Community may occur within area	In buffer area only
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community may occur within area	In buffer area only
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area	In buffer area only
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area	In buffer area only
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area	In buffer area only
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area	In buffer area only

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Anthochaera phrygia			
Regent Honeyeater [82338]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Aphelocephala leucopsis			
Southern Whiteface [529]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Ardenna grisea			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Arenaria interpres			
Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Botaurus poiciloptilus			
Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Calyptorhynchus banksii graptogyne South-eastern Red-tailed Black-Cockatoo [25982]	Endangered	Species or species habitat known to occur within area	In buffer area only
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area	In feature area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area	In feature area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area	In buffer area only
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa nebularia			
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In buffer area only
CRUSTACEAN			
Euastacus bispinosus			
Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat known to occur within area	In buffer area only
FISH			
Hoplostethus atlanticus			
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Nannoperca obscura			
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prototroctes maraena			
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area	In feature area
Seriolella brama			
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
Thunnus maccoyii			
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
FROG			
Litoria raniformis			
Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
INSECT			
Synemon plana			
Golden Sun Moth [25234]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
MAMMAL			
Antechinus minimus maritimus			
Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Balaenoptera borealis			
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus			
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus			
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Dasyurus maculatus maculatus (SE mainland population)			
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area	In buffer area only
Eubalaena australis			
Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isoodon obesulus obesulus			
Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area	In buffer area only
Mastacomys fuscus mordicus			
Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area	In buffer area only
Miniopterus orianae bassanii			
Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area	In buffer area only
Neophoca cinerea			
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Petauroides volans			
Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area	In buffer area only
Petaurus australis australis			
Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area	In buffer area only
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Pseudomys shortridgei Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat known to occur within area	In buffer area only
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area	In buffer area only
PLANT			
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Astelia australiana Tall Astelia [10851]	Vulnerable	Translocated population known to occur within area	In buffer area only
Caladenia calcicola Limestone Spider-orchid [10065]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Caladenia hastata Melblom's Spider-orchid [16118]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Caladenia ornata Ornate Pink Fingers [76213]	Vulnerable	Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Cassinia rugata Wrinkled Cassinia, Wrinkled Dollybush [21885]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Dianella amoena Matted Flax-lily [64886]	Endangered	Species or species habitat known to occur within area	In buffer area only
Dipodium campanulatum Bell Flower Hyacinth Orchid [55051]	Endangered	Species or species habitat may occur within area	In buffer area only
Dodonaea procumbens Trailing Hop-bush [12149]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Ixodia achillaeoides subsp. arenicola Sand Ixodia, Ixodia [21474]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lachnagrostis adamsonii Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area	In buffer area only
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pimelea spinescens subsp. spinescens Plains Rice-flower, Spiny Rice-flower, Prickly Pimelea [21980]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Poa sallacustris Salt-lake Tussock-grass [24424]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Prasophyllum diversiflorum Gorae Leek-orchid [13210]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum litorale listed as Prasophyllum littorale Coastal Leek Orchid [55234]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area	In buffer area only
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Rutidosis leptorhynchoides Button Wrinklewort [67251]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Senecio psilocarpus			
Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Thelymitra epipactoides			
Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area	In buffer area only
Thelymitra matthewsii			
Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thelymitra orientalis			
Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Xerochrysum palustre			
Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
REPTILE			
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Delma impar			
Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In feature area
Lissolepis coventryi			
Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area	In buffer area only
SHARK			
Carcharodon carcharias			
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Centrophorus uyato			
Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Galeorhinus galeus			
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area	In feature area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Ardenna carneipes			
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area	In feature area
Ardenna grisea			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Ardenna tenuirostris			
Short-tailed Shearwater [82652]		Breeding known to occur within area	In buffer area only
Diomedea antipodensis			
Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora			
Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans			
Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi			
Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Macronectes giganteus			
Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli			
Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Phoebetria fusca			
Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Sternula albifrons			
Little Tern [82849]		Breeding known to occur within area	In buffer area only
Thalassarche bulleri			
Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri			
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta			
Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma			
Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida			
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris			
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Migratory Marine Species			
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In feature area
Eubalaena australis as Balaena glacialis australis			
Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isurus oxyrinchus			
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area	In feature area
Lagenorhynchus obscurus			
Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lamna nasus			
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area	In feature area
Megaptera novaeangliae			
Humpback Whale [38]		Species or species habitat known to occur within area	In feature area
Orcinus orca			
Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus			
Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Migratory Terrestrial Species			
Hirundapus caudacutus			
White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Monarcha melanopsis			
Black-faced Monarch [609]		Species or species habitat may occur within area	In buffer area only
Motacilla flava			
Yellow Wagtail [644]		Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area	In buffer area only
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area	In buffer area only
Migratory Wetlands Species			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris alba Sanderling [875]		Roosting known to occur within area	In buffer area only
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area	In feature area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area	In buffer area only
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area	In buffer area only
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area	In buffer area only
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area	In buffer area only
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area	In buffer area only
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area	In buffer area only
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area	In buffer area only
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area	In buffer area only
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area	In buffer area only
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa nebularia			
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In buffer area only
Tringa stagnatilis			
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area	In buffer area only

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status
Defence

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Anseranas semipalmata			
Magpie Goose [978]		Species or species habitat may occur within area overfly marine area	In buffer area only
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Ardenna carneipes as Puffinus carneipes			
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area	In feature area
Ardenna grisea as Puffinus griseus			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Ardenna tenuirostris as Puffinus tenuirostris			
Short-tailed Shearwater [82652]		Breeding known to occur within area	In buffer area only
Arenaria interpres			
Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Bubulcus ibis as Ardea ibis			
Cattle Egret [66521]		Breeding likely to occur within area overfly marine area	In buffer area only
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris alba Sanderling [875]		Roosting known to occur within area	In buffer area only
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area	In feature area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area	In buffer area only
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area	In buffer area only
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area	In buffer area only
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area	In buffer area only
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area	In buffer area only
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area	In buffer area only
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area	In buffer area only
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area	In buffer area only
Morus capensis Cape Gannet [59569]		Breeding known to occur within area	In buffer area only
Morus serrator Australasian Gannet [1020]		Breeding known to occur within area	In buffer area only
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area	In buffer area only
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area	In buffer area only
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area	In buffer area only
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area	In feature area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Pelecanoides urinatrix Common Diving-Petrel [1018]		Breeding known to occur within area	In buffer area only
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area	In buffer area only
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pterodroma mollis			
Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Recurvirostra novaehollandiae			
Red-necked Avocet [871]		Roosting known to occur within area overfly marine area	In buffer area only
Rhipidura rufifrons			
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Rostratula australis as Rostratula benghalensis (sensu lato)			
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Stercorarius antarcticus as Catharacta skua			
Brown Skua [85039]		Species or species habitat may occur within area	In feature area
Sterna striata			
White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Sternula albifrons as Sterna albifrons			
Little Tern [82849]		Breeding known to occur within area	In buffer area only
Thalassarche bulleri			
Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei as Thalassarche sp. nov.			
Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri			
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area	In buffer area only
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area	In buffer area only
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area	In buffer area only
Fish			
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area	In feature area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area	In feature area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area	In feature area
Hippocampus minotaur Bullneck Seahorse [66705]		Species or species habitat may occur within area	In buffer area only
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area	In feature area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area	In feature area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area	In feature area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area	In buffer area only
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area	In feature area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area	In feature area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area	In feature area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area	In feature area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area	In feature area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area	In feature area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area	In feature area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area	In feature area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area	In feature area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area	In feature area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area	In feature area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area	In feature area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area	In feature area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area	In feature area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area	In feature area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area	In feature area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area	In feature area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area	In feature area
Mammal			
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area	In feature area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Reptile			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In feature area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence	Buffer Status
Mammal			
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area	In feature area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area	In feature area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area	In feature area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area	In feature area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area	In feature area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area	In feature area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area	In feature area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area	In feature area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area	In feature area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area	In feature area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area	In feature area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area	In feature area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area	In feature area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area	In feature area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area	In feature area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area	In feature area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region	Buffer Status
Bonney Coast Upwelling	South-east	In feature area
West Tasmania Canyons	South-east	In feature area

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence	Buffer Status
Seabirds			
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur	In buffer area only
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur	In feature area
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur	In feature area
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur	In feature area

Scientific Name	Behaviour	Presence	Buffer Status
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur	In feature area
Morus serrator Australasian Gannet [1020]	Aggregation	Known to occur	In buffer area only
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur	In feature area
Pelecanoides urinatrix Common Diving-petrel [1018]	Breeding	Known to occur	In buffer area only
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur	In feature area
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur	In feature area
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur	In feature area
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur	In feature area
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur	In feature area
Sharks			
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur	In feature area

Scientific Name	Behaviour	Presence	Buffer Status
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur	In feature area
Whales			
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur	In feature area

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

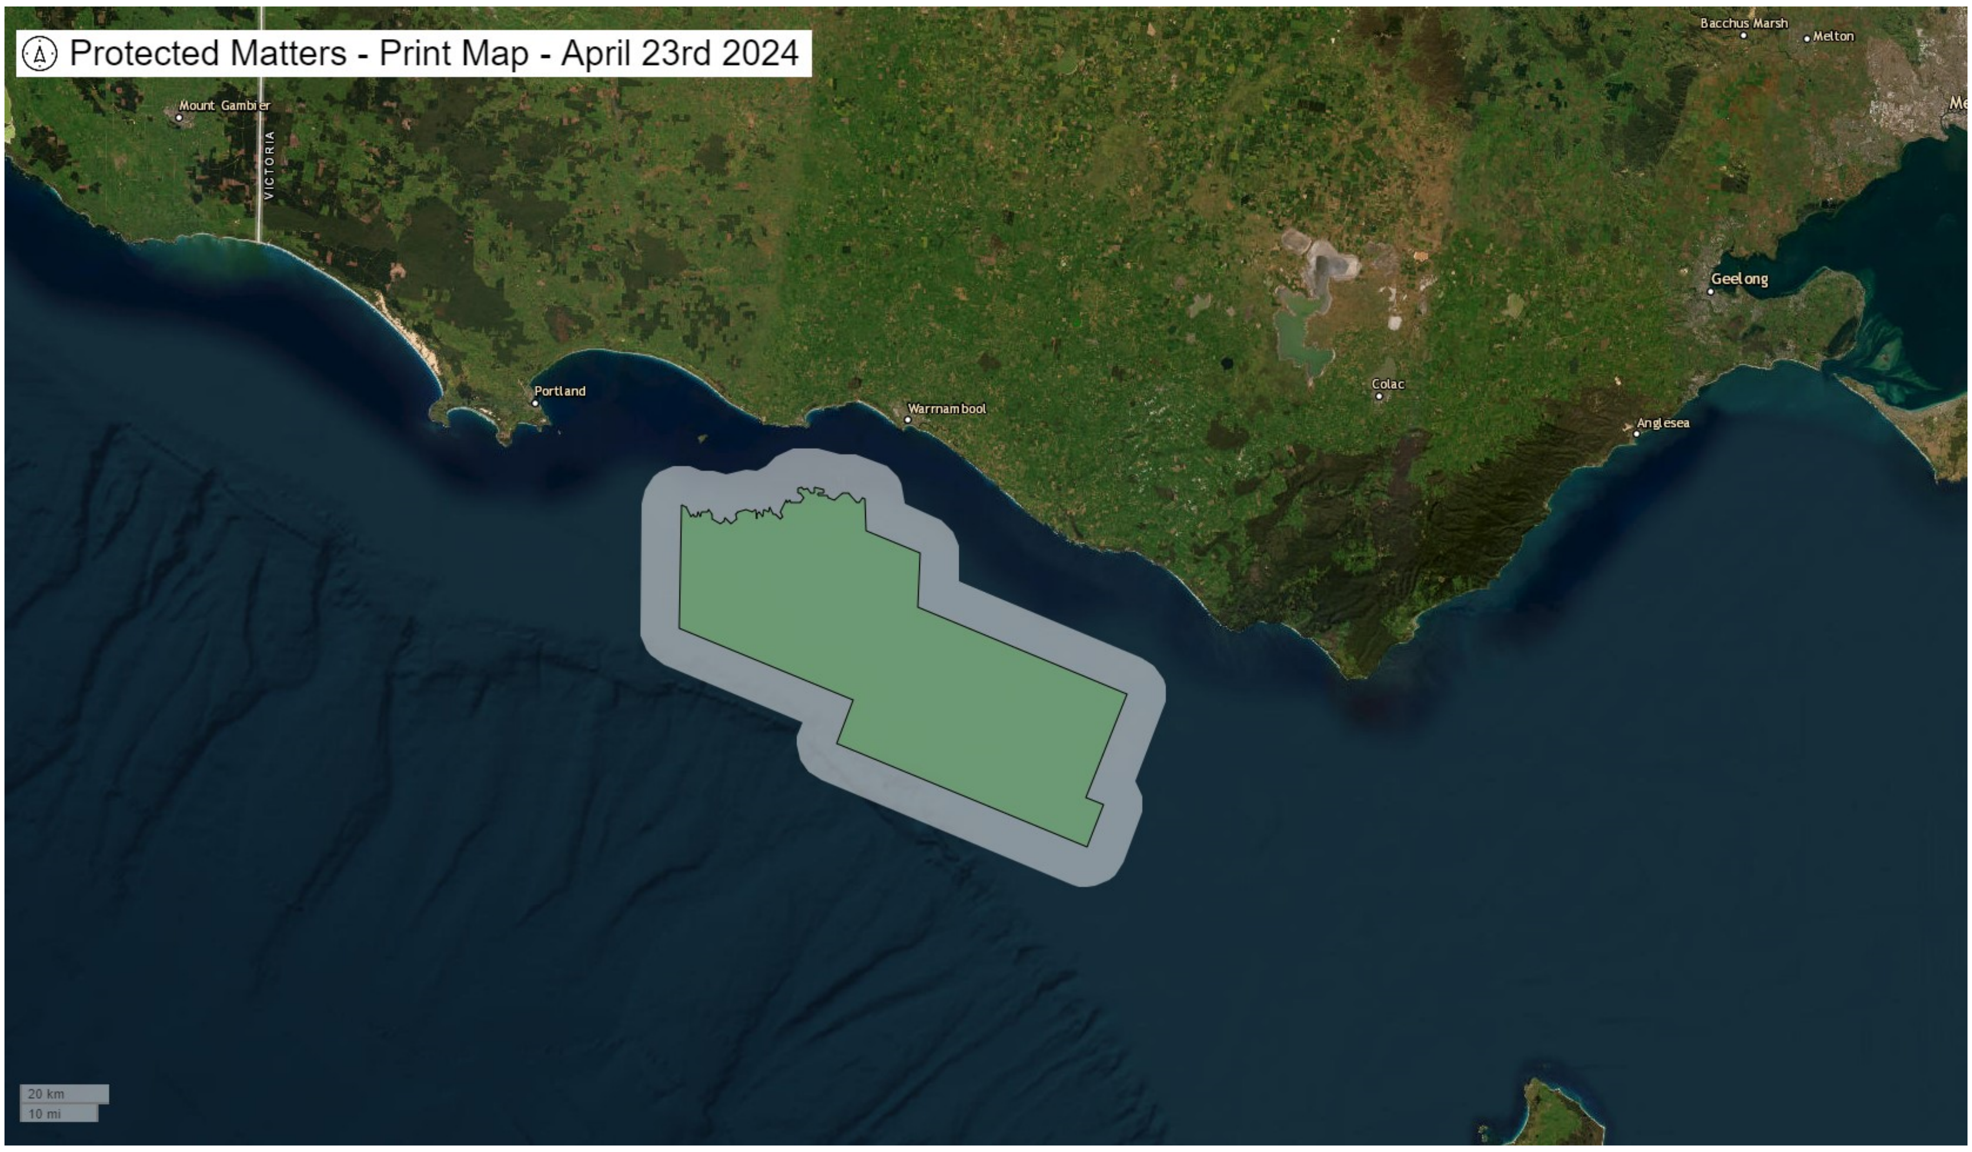

Figure 1: PMST Search Area - Underwater Sound for Fish (Active Source Area + 8km Buffer)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	44
Listed Migratory Species:	43

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	68
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	37
Key Ecological Features (Marine):	2
Biologically Important Areas:	19
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name	Buffer Status
Commonwealth Marine Areas (EPBC Act)	In feature area
Commonwealth Marine Areas (EPBC Act)	In feature area

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area	In buffer area only

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area	In feature area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area	In feature area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche impavida			
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris			
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini			
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi			
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Thinornis cucullatus cucullatus			
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
FISH			
Hoplostethus atlanticus			
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Prototroctes maraena			
Australian Grayling [26179]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Seriolella brama			
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
Thunnus maccoyii			
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
MAMMAL			
Balaenoptera borealis			
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
REPTILE			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area	In feature area
SHARK			
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area	In feature area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area	In buffer area only
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Migratory Marine Species			
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area	In feature area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area	In feature area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Migratory Wetlands Species			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area	In feature area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Numenius madagascariensis			
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pandion haliaetus			
Osprey [952]		Species or species habitat known to occur within area	In buffer area only

Other Matters Protected by the EPBC Act

Listed Marine Species			[Resource Information]
Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Ardenna carneipes as Puffinus carneipes			
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Ardenna grisea as Puffinus griseus			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris canutus			
Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area	In feature area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Numenius madagascariensis			
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur			
Fairy Prion [1066]		Species or species habitat known to occur within area	In feature area
Pandion haliaetus			
Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Phoebetria fusca			
Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pterodroma mollis			
Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Stercorarius antarcticus as Catharacta skua			
Brown Skua [85039]		Species or species habitat may occur within area	In feature area
Sterna striata			
White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Sternula albifrons as Sterna albifrons			
Little Tern [82849]		Species or species habitat may occur within area	In buffer area only
Thalassarche bulleri			
Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei as Thalassarche sp. nov.			
Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri			
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat likely to occur within area overfly marine area	In buffer area only
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat likely to occur within area overfly marine area	In buffer area only
Fish			
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area	In feature area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area	In feature area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area	In feature area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area	In feature area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area	In feature area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area	In feature area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area	In feature area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area	In feature area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area	In feature area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area	In feature area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area	In feature area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area	In feature area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area	In feature area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area	In feature area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area	In feature area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area	In feature area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area	In feature area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area	In feature area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area	In feature area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area	In feature area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area	In feature area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area	In feature area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area	In feature area
Mammal			
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area	In feature area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area	In feature area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Reptile			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area	In feature area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence	Buffer Status
Mammal			
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area	In feature area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area	In feature area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area	In feature area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area	In feature area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area	In feature area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area	In feature area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area	In feature area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area	In feature area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area	In feature area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area	In feature area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area	In feature area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area	In feature area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area	In feature area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area	In feature area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area	In feature area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area	In feature area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area	In feature area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region	Buffer Status
Bonney Coast Upwelling	South-east	In feature area
West Tasmania Canyons	South-east	In feature area

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence	Buffer Status
Seabirds			
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur	In feature area
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur	In feature area
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur	In feature area
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur	In feature area
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur	In feature area
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur	In feature area

Scientific Name	Behaviour	Presence	Buffer Status
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur	In feature area
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur	In feature area
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur	In feature area
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur	In feature area
Sharks			
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur	In feature area
Whales			
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur	In feature area

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

- -Office of Environment and Heritage, New South Wales
- -Department of Environment and Primary Industries, Victoria

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

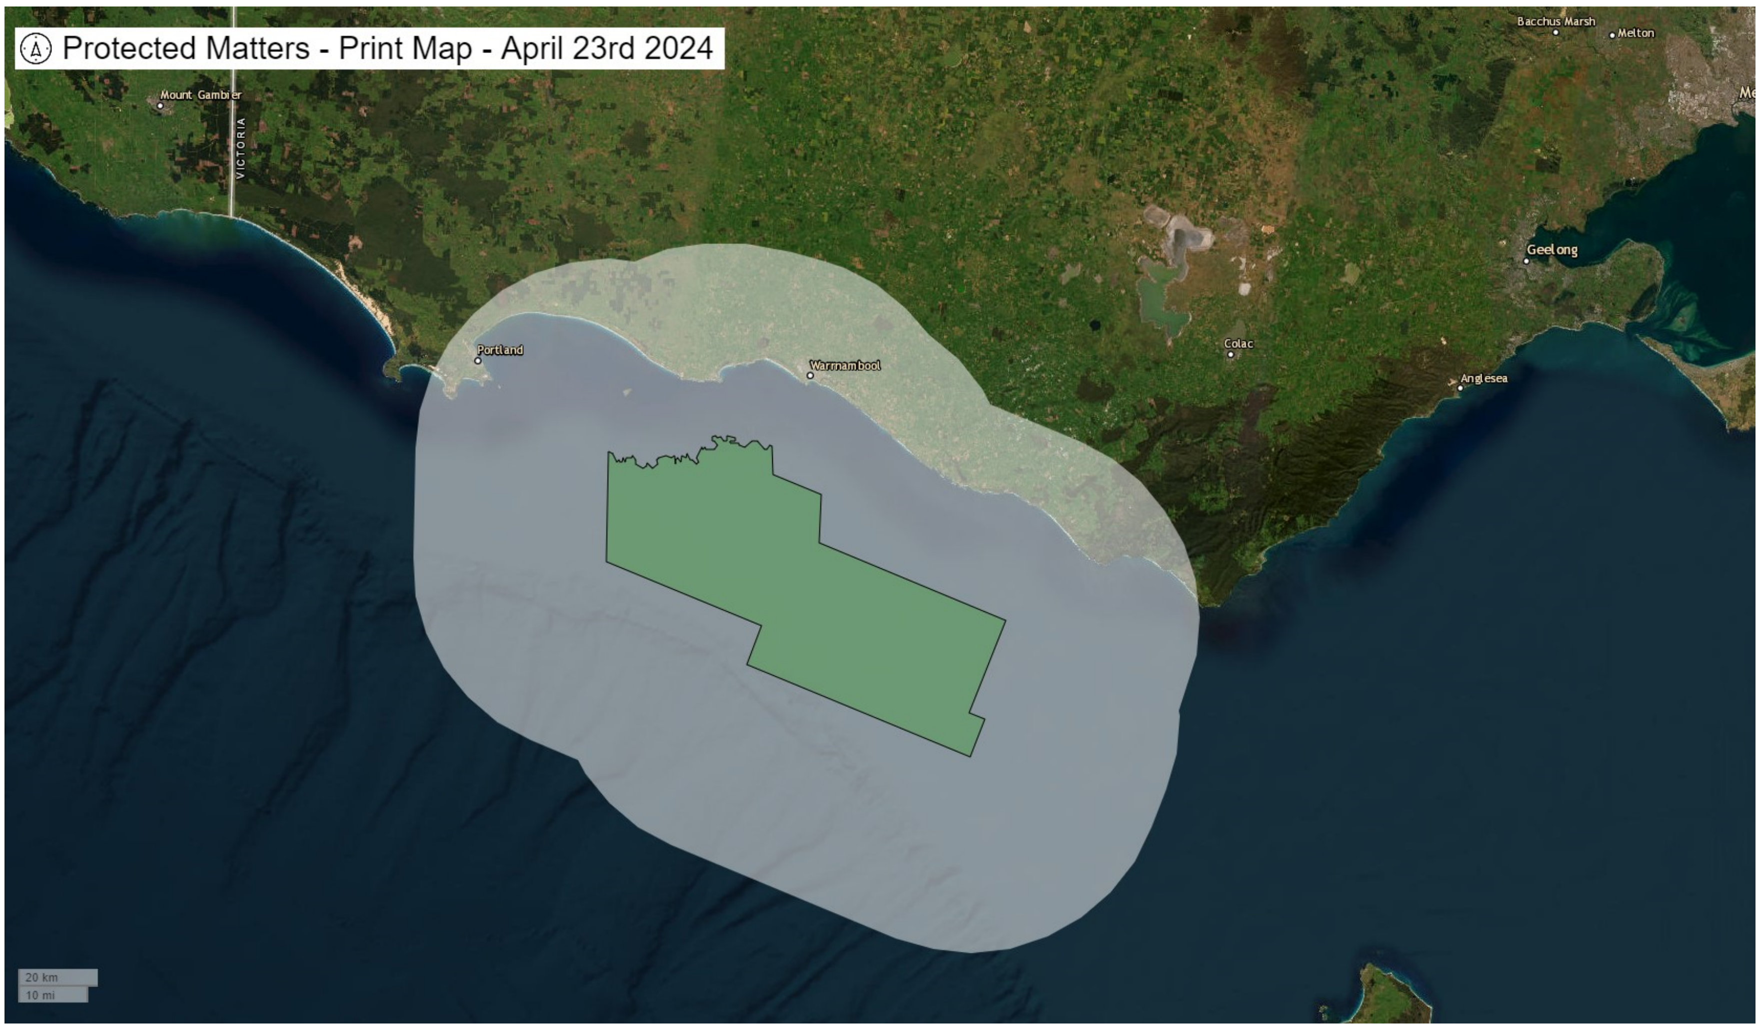

Figure 1: PMST Search Area - Underwater Sound for LF Cetaceans (Active Source Area + 44km Buffer)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	3
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	9
Listed Threatened Species:	109
Listed Migratory Species:	66

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	19
Commonwealth Heritage Places:	None
Listed Marine Species:	110
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	58
Regional Forest Agreements:	1
Nationally Important Wetlands:	5
EPBC Act Referrals:	92
Key Ecological Features (Marine):	2
Biologically Important Areas:	22
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status	Buffer Status
Budj Bim Cultural Landscape	VIC	Declared property	In buffer area only

National Heritage Places [Resource Information]

Name	State	Legal Status	Buffer Status
Historic			
Great Ocean Road and Scenic Environs	VIC	Listed place	In buffer area only
Indigenous			
Budj Bim National Heritage Landscape - Mt Eccles Lake Condah Area	VIC	Listed place	In buffer area only
Budj Bim National Heritage Landscape - Tyrendarra Area	VIC	Listed place	In buffer area only

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name	Buffer Status
Commonwealth Marine Areas (EPBC Act)	In feature area
Commonwealth Marine Areas (EPBC Act)	In feature area

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area	In buffer area only
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area	In buffer area only
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area	In buffer area only
Karst springs and associated alkaline fens of the Naracoorte Coastal Plain	Endangered	Community may occur within area	In buffer area only

Community Name	Threatened Category	Presence Text	Buffer Status
Bioregion			
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community may occur within area	In buffer area only
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area	In buffer area only
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area	In buffer area only
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area	In buffer area only
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area	In buffer area only

Listed Threatened Species

[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Aphelocephala leucopsis Southern Whiteface [529]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area	In buffer area only
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area	In buffer area only
Calyptorhynchus banksii graptogyne South-eastern Red-tailed Black-Cockatoo [25982]	Endangered	Species or species habitat known to occur within area	In buffer area only
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area	In buffer area only
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area	In feature area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area	In feature area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area	In buffer area only
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area	In feature area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In buffer area only
CRUSTACEAN			

Scientific Name	Threatened Category	Presence Text	Buffer Status
Euastacus bispinosus Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat known to occur within area	In buffer area only
FISH			
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Nannoperca obscura Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area	In feature area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
FROG			
Litoria raniformis Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
INSECT			
Synemon plana Golden Sun Moth [25234]	Vulnerable	Species or species habitat may occur within area	In buffer area only
MAMMAL			
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Balaenoptera musculus			
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus			
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Dasyurus maculatus maculatus (SE mainland population)			
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area	In buffer area only
Eubalaena australis			
Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isoodon obesulus obesulus			
Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area	In buffer area only
Mastacomys fuscus mordicus			
Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area	In buffer area only
Miniopterus orianae bassanii			
Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area	In buffer area only
Neophoca cinerea			
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Petauroides volans			
Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area	In buffer area only
Petaurus australis australis			
Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Potorous tridactylus trisulcatus			
Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area	In buffer area only
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Pseudomys shortridgei Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat known to occur within area	In buffer area only
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area	In buffer area only
PLANT			
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Caladenia hastata Melblom's Spider-orchid [16118]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Caladenia ornata Ornate Pink Fingers [76213]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Dianella amoena Matted Flax-lily [64886]	Endangered	Species or species habitat known to occur within area	In buffer area only
Dipodium campanulatum Bell Flower Hyacinth Orchid [55051]	Endangered	Species or species habitat may occur within area	In buffer area only
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Glycine latrobeana			
Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Haloragis exalata subsp. exalata			
Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Ixodia achillaeoides subsp. arenicola			
Sand Ixodia, Ixodia [21474]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Lachnagrostis adamsonii			
Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area	In buffer area only
Lepidium aschersonii			
Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Lepidium hyssopifolium			
Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum diversiflorum			
Gorae Leek-orchid [13210]	Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum litorale listed as Prasophyllum littorale			
Coastal Leek Orchid [55234]	Critically Endangered	Species or species habitat known to occur within area	In buffer area only
Prasophyllum spicatum			
Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Prasophyllum suaveolens			
Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area	In buffer area only
Pterostylis chlorogramma			
Green-striped Greenhood [56510]	Vulnerable	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Rutidosis leptorhynchoides Button Wrinklewort [67251]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area	In buffer area only
Thelymitra matthewsii Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
REPTILE			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Delma impar			
Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In feature area
Lissolepis coventryi			
Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area	In buffer area only
SHARK			
Carcharodon carcharias			
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Centrophorus uyato			
Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Galeorhinus galeus			
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area	In feature area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Ardenna carneipes			
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area	In feature area
Ardenna grisea			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Ardenna tenuirostris			
Short-tailed Shearwater [82652]		Breeding known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area	In buffer area only
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Migratory Marine Species			
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Balaenoptera physalus			
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caperea marginata			
Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Carcharodon carcharias			
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In feature area
Eubalaena australis as Balaena glacialis australis			
Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isurus oxyrinchus			
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area	In feature area
Lagenorhynchus obscurus			
Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lamna nasus			
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area	In feature area
Megaptera novaeangliae			
Humpback Whale [38]		Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Migratory Terrestrial Species			
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area	In buffer area only
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area	In buffer area only
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area	In buffer area only
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area	In buffer area only
Migratory Wetlands Species			
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris alba Sanderling [875]		Roosting known to occur within area	In buffer area only
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area	In feature area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area	In buffer area only
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area	In buffer area only
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area	In buffer area only
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area	In buffer area only
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area	In buffer area only
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pandion haliaetus			
Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Pluvialis fulva			
Pacific Golden Plover [25545]		Roosting known to occur within area	In buffer area only
Thalasseus bergii			
Greater Crested Tern [83000]		Breeding known to occur within area	In buffer area only
Tringa brevipes			
Grey-tailed Tattler [851]		Roosting known to occur within area	In buffer area only
Tringa glareola			
Wood Sandpiper [829]		Roosting known to occur within area	In buffer area only
Tringa nebularia			
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area	In buffer area only
Tringa stagnatilis			
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area	In buffer area only

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status
Defence		
Defence - Training Depot, Darts RD 3305 Portland [21019]	VIC	In buffer area only
Defence - Training Depot, Darts RD 3305 Portland [21010]	VIC	In buffer area only

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat known to occur within area	In feature area
Anseranas semipalmata			
Magpie Goose [978]		Species or species habitat may occur within area overfly marine area	In buffer area only
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Ardenna carneipes as Puffinus carneipes			
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area	In feature area
Ardenna grisea as Puffinus griseus			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area	In buffer area only
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area	In buffer area only
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Breeding likely to occur within area overfly marine area	In buffer area only
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area	In feature area
Calidris alba Sanderling [875]		Roosting known to occur within area	In buffer area only
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area	In feature area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area	In buffer area only
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Charadrius leschenaultii			
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Charadrius mongolus			
Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area	In buffer area only
Charadrius ruficapillus			
Red-capped Plover [881]		Roosting known to occur within area overfly marine area	In buffer area only
Chroicocephalus novaehollandiae as Larus novaehollandiae			
Silver Gull [82326]		Breeding known to occur within area	In buffer area only
Diomedea antipodensis			
Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora			
Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans			
Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi			
Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Eudyptula minor			
Little Penguin [1085]		Breeding known to occur within area	In buffer area only
Gallinago hardwickii			
Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Gallinago megala			
Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area	In buffer area only
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area	In buffer area only
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area	In buffer area only
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area	In buffer area only
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area	In buffer area only
Morus capensis Cape Gannet [59569]		Breeding known to occur within area	In buffer area only
Morus serrator Australasian Gannet [1020]		Breeding known to occur within area	In buffer area only
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area	In buffer area only
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area	In buffer area only
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area	In buffer area only
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area	In buffer area only
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area	In buffer area only
Pelecanoides urinatrix Common Diving-Petrel [1018]		Breeding known to occur within area	In buffer area only
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area	In buffer area only
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area	In buffer area only
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area	In buffer area only
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area	In feature area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area	In buffer area only
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalasseus bergii as Sterna bergii			
Greater Crested Tern [83000]		Breeding known to occur within area	In buffer area only
Thinornis cucullatus as Thinornis rubricollis			
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area	In buffer area only
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis			
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area	In buffer area only
Tringa brevipes as Heteroscelus brevipes			
Grey-tailed Tattler [851]		Roosting known to occur within area	In buffer area only
Tringa glareola			
Wood Sandpiper [829]		Roosting known to occur within area overfly marine area	In buffer area only
Tringa nebularia			
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area	In buffer area only
Tringa stagnatilis			
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area	In buffer area only
Fish			
Heraldia nocturna			
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area	In feature area
Hippocampus abdominalis			
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area	In feature area
Hippocampus breviceps			
Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area	In feature area
Hippocampus minotaur			
Bullneck Seahorse [66705]		Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area	In feature area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area	In feature area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area	In feature area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area	In feature area
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area	In buffer area only
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area	In feature area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area	In feature area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area	In feature area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area	In feature area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area	In feature area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area	In feature area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area	In feature area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area	In feature area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area	In feature area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area	In feature area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area	In feature area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area	In feature area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area	In feature area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area	In feature area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area	In feature area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area	In feature area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area	In feature area
Mammal			
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area	In feature area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area	In feature area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Reptile			
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area	In feature area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence	Buffer Status
Mammal			
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area	In feature area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area	In feature area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area	In feature area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area	In feature area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area	In feature area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area	In feature area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area	In feature area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area	In feature area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area	In feature area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area	In feature area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area	In feature area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area	In feature area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area	In feature area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area	In feature area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area	In feature area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area	In feature area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area	In feature area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region	Buffer Status
Bonney Coast Upwelling	South-east	In feature area
West Tasmania Canyons	South-east	In feature area

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence	Buffer Status
Seabirds			
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur	In buffer area only
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur	In feature area
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur	In feature area
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur	In feature area
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur	In feature area
Morus serrator Australasian Gannet [1020]	Aggregation	Known to occur	In buffer area only
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur	In feature area
Pelecanoides urinatrix Common Diving-petrel [1018]	Breeding	Known to occur	In buffer area only

Scientific Name	Behaviour	Presence	Buffer Status
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur	In feature area
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur	In feature area
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur	In feature area
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur	In feature area
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur	In feature area
Sharks			
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur	In feature area
Whales			
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur	In feature area

Scientific Name	Behaviour	Presence	Buffer Status

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Apr-2024

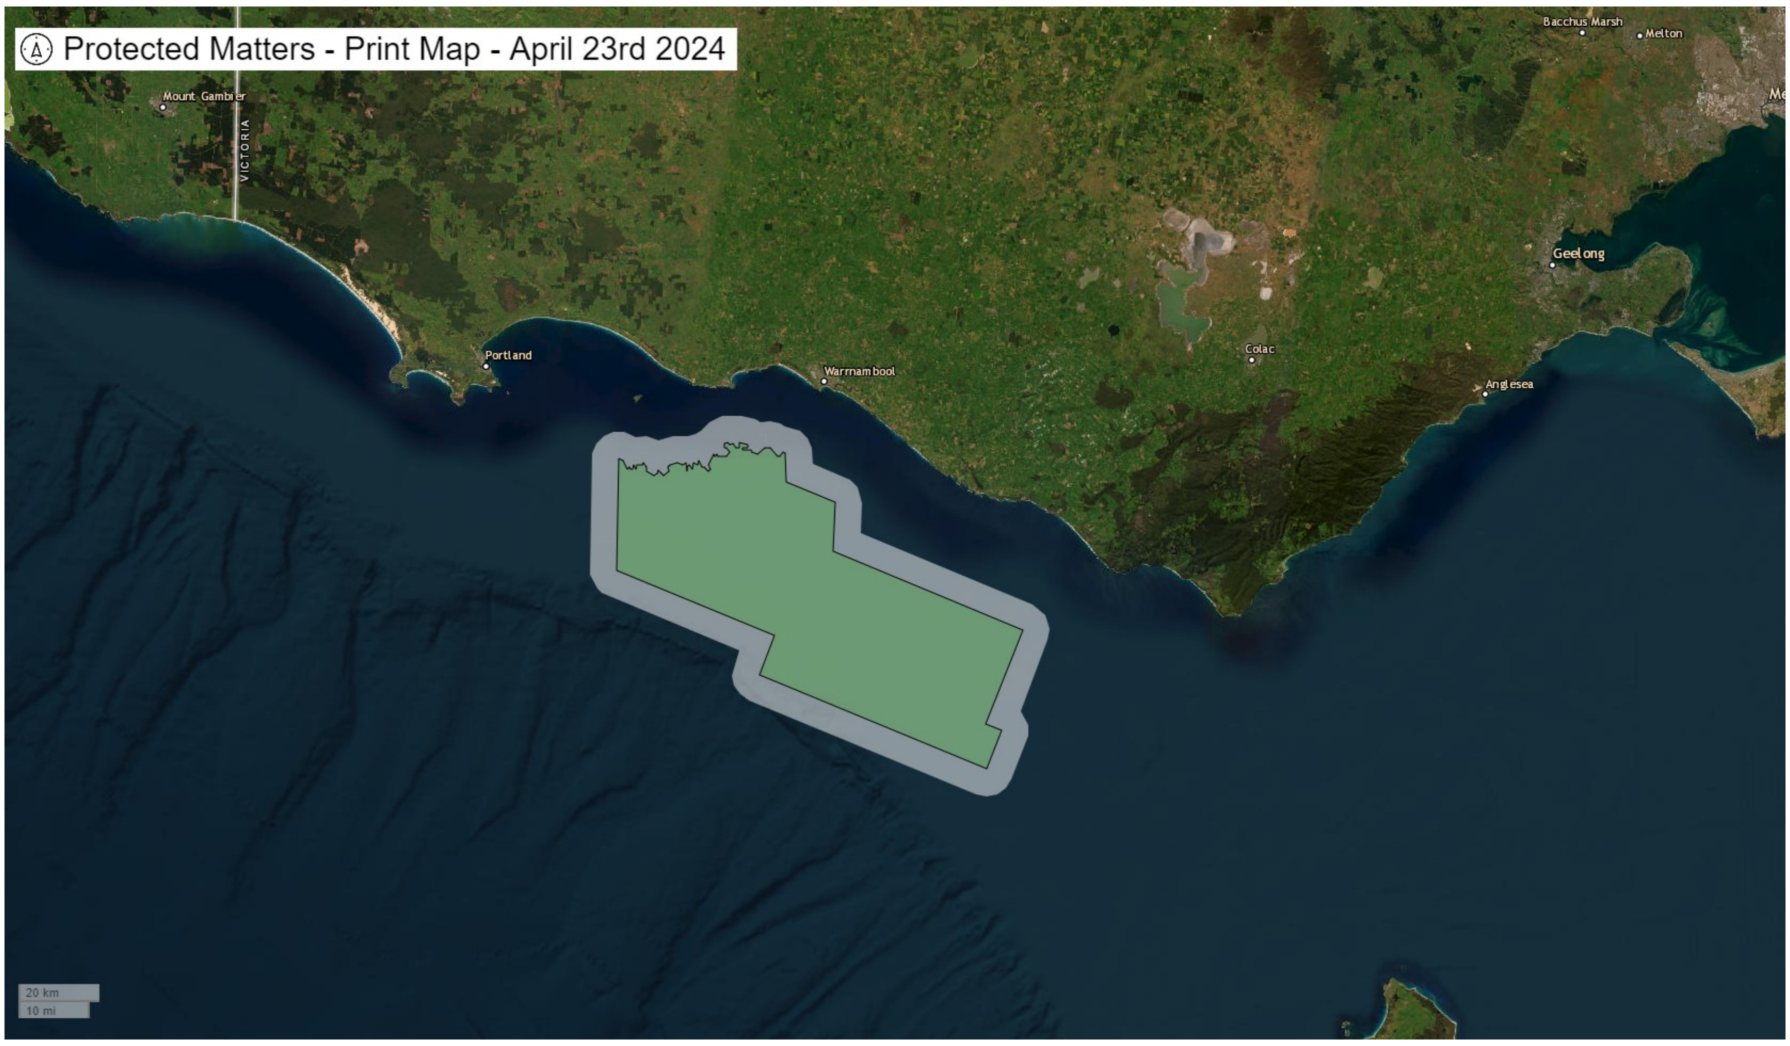

Figure 1: PMST Search Area - Underwater Sound for Turtles (Active Source Area + 6km Buffer)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	42
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	63
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	36
Key Ecological Features (Marine):	2
Biologically Important Areas:	19
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name	Buffer Status
Commonwealth Marine Areas (EPBC Act)	In feature area
Commonwealth Marine Areas (EPBC Act)	In feature area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat may occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area	In feature area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche salvini			
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi			
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
FISH			
Hoplostethus atlanticus			
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Prototroctes maraena			
Australian Grayling [26179]	Vulnerable	Species or species habitat may occur within area	In feature area
Seriolella brama			
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
Thunnus maccoyii			
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area	In feature area
MAMMAL			
Balaenoptera borealis			
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus			
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus			
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Eubalaena australis			
Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Neophoca cinerea			
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
REPTILE			
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area	In feature area
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area	In feature area
SHARK			
Carcharodon carcharias			
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Centrophorus uyato			
Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area	In feature area
Galeorhinus galeus			
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area	In feature area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Ardenna carneipes			
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Ardenna grisea			
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Migratory Marine Species			
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area	In feature area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area	In feature area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area	In feature area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area	In feature area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Physeter macrocephalus			
Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Migratory Wetlands Species			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris canutus			
Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calidris melanotos			
Pectoral Sandpiper [858]		Species or species habitat may occur within area	In feature area
Numenius madagascariensis			
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area

Other Matters Protected by the EPBC Act

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area	In feature area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area	In feature area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area	In feature area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area	In feature area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area	In feature area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area	In feature area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area	In buffer area only
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat may occur within area	In feature area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area	In feature area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area	In feature area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area	In feature area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area	In feature area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Fish			
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area	In feature area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area	In feature area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area	In feature area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area	In feature area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area	In feature area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area	In feature area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area	In feature area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area	In feature area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area	In feature area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area	In feature area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area	In feature area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area	In feature area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area	In feature area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area	In feature area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area	In feature area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area	In feature area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area	In feature area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area	In feature area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area	In feature area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area	In feature area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Vanacampus margaritifer			
Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area	In feature area
Vanacampus phillipi			
Port Phillip Pipefish [66284]		Species or species habitat may occur within area	In feature area
Vanacampus poecilolaemus			
Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area	In feature area
Mammal			
Arctocephalus forsteri			
Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area	In feature area
Arctocephalus pusillus			
Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area	In feature area
Neophoca cinerea			
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area	In feature area
Reptile			
Caretta caretta			
Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area	In feature area
Chelonia mydas			
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area	In feature area
Dermochelys coriacea			
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area	In feature area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence	Buffer Status
Mammal			
Balaenoptera acutorostrata			
Minke Whale [33]		Species or species habitat may occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area	In feature area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area	In feature area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area	In feature area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area	In feature area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area	In feature area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area	In feature area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area	In feature area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area	In feature area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area	In feature area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area	In feature area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area	In feature area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area	In feature area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area	In feature area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area	In feature area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area	In feature area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area	In feature area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area	In feature area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area	In feature area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area	In feature area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area	In feature area

Current Scientific Name	Status	Type of Presence	Buffer Status
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area	In feature area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area	In feature area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area	In feature area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area	In feature area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area	In feature area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area	In feature area

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region	Buffer Status
Bonney Coast Upwelling	South-east	In feature area
West Tasmania Canyons	South-east	In feature area

Biologically Important Areas

[Resource Information]

Scientific Name	Behaviour	Presence	Buffer Status
Seabirds			
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur	In feature area
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur	In feature area
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur	In feature area
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur	In feature area
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur	In feature area
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur	In feature area

Scientific Name	Behaviour	Presence	Buffer Status
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur	In feature area
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur	In feature area
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur	In feature area
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur	In feature area
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur	In feature area
Sharks			
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur	In feature area
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur	In feature area
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur	In feature area
Whales			
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present	In feature area
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur	In feature area

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 01-May-2024

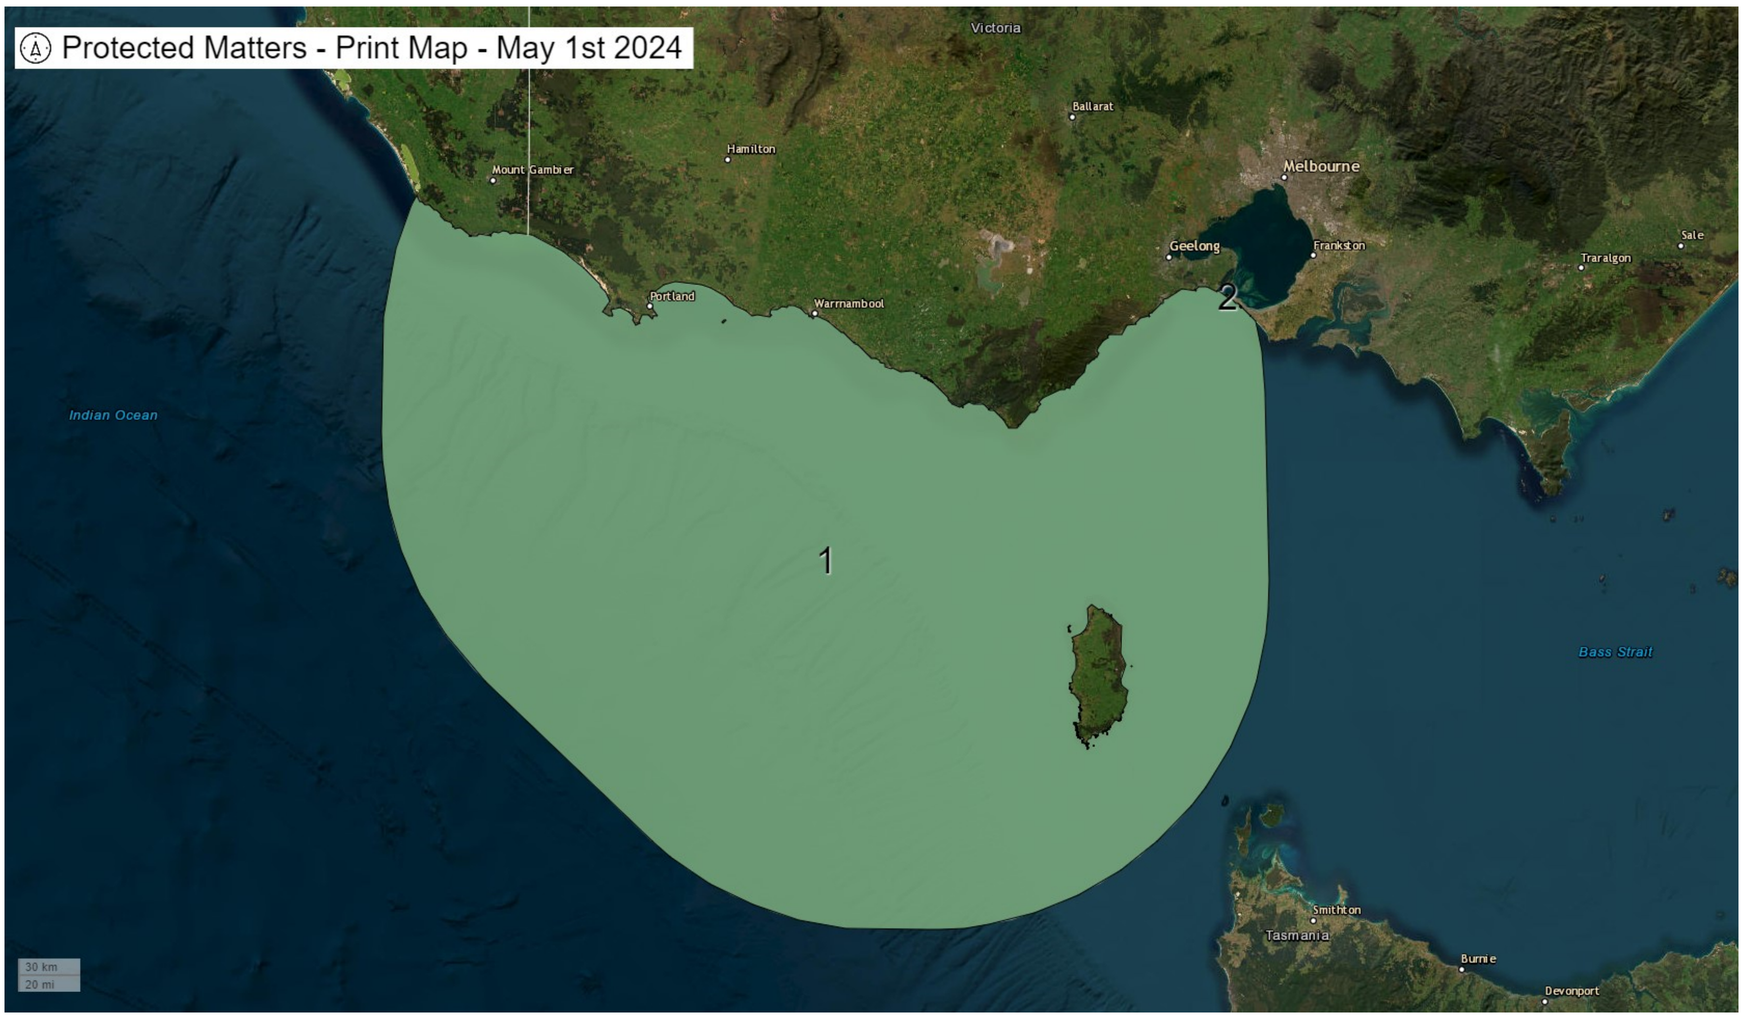

Figure 1: PMST Search Area - Environmental Planning Area

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	2
Wetlands of International Importance (Ramsar	4
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	11
Listed Threatened Species:	135
Listed Migratory Species:	72

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	30
Commonwealth Heritage Places:	3
Listed Marine Species:	117
Whales and Other Cetaceans:	31
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	5
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	101
Regional Forest Agreements:	2
Nationally Important Wetlands:	18
EPBC Act Referrals:	156
Key Ecological Features (Marine):	2
Biologically Important Areas:	29
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place
Point Nepean Defence Sites and Quarantine Station Area	VIC	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Glenelg estuary and discovery bay wetlands	Within Ramsar site
Lavinia	Within Ramsar site
Piccaninnie ponds karst wetlands	Within Ramsar site
Port phillip bay (western shoreline) and bellarine peninsula	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area

Community Name	Threatened Category	Presence Text
Karst springs and associated alkaline fens of the Naracoorte Coastal Plain Bioregion	Endangered	Community likely to occur within area
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community likely to occur within area
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
Tasmanian Forests and Woodlands dominated by black gum or Brookers gum (Eucalyptus ovata / E. brookeriana)	Critically Endangered	Community likely to occur within area
Tasmanian white gum (Eucalyptus viminalis) wet forest	Critically Endangered	Community may occur within area
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area

Listed Threatened Species

[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Acanthiza pusilla magnirostris		
King Island Brown Thornbill, Brown Thornbill (King Island) [91709]	Endangered	Species or species habitat known to occur within area
Acanthornis magna greeniana		
King Island Scrubtit, Scrubtit (King Island) [82329]	Critically Endangered	Species or species habitat known to occur within area
Anthochaera phrygia		
Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour likely to occur within area
Aphelocephala leucopsis		
Southern Whiteface [529]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Aquila audax fleayi Tasmanian Wedge-tailed Eagle, Wedge-tailed Eagle (Tasmanian) [64435]	Endangered	Species or species habitat may occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Calyptorhynchus banksii graptogyne South-eastern Red-tailed Black-Cockatoo [25982]	Endangered	Species or species habitat known to occur within area
Ceyx azureus diemenensis Tasmanian Azure Kingfisher [25977]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Fregetta grallaria grallaria White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Platycercus caledonicus brownii Green Rosella (King Island) [67041]	Vulnerable	Species or species habitat known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Strepera fuliginosa colei Black Currawong (King Island) [67113]	Vulnerable	Breeding likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Xenus cinereus		
Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area
CRUSTACEAN		
Euastacus bispinosus		
Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat known to occur within area
FISH		
Galaxiella pusilla		
Eastern Dwarf Galaxias, Dwarf Galaxias [56790]	Endangered	Species or species habitat may occur within area
Hoplostethus atlanticus		
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Nannoperca obscura		
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area
Nannoperca variegata		
Variegated Pygmy Perch, Ewens Pygmy Perch, Golden Pygmy Perch [26178]	Vulnerable	Species or species habitat known to occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Rexea solandri (eastern Australian population)		
Eastern Gemfish [76339]	Conservation Dependent	Species or species habitat may occur within area
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis		
Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
INSECT		

Scientific Name	Threatened Category	Presence Text
Synemon plana Golden Sun Moth [25234]	Vulnerable	Species or species habitat may occur within area
MAMMAL		
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dasyurus maculatus maculatus (SE mainland population) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Petauroides volans Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pseudomys shortridgei Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat known to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat likely to occur within area
Astelia australiana Tall Astelia [10851]	Vulnerable	Species or species habitat may occur within area
Caladenia calcicola Limestone Spider-orchid [10065]	Vulnerable	Species or species habitat likely to occur within area
Caladenia colorata Coloured Spider-orchid, Small Western Spider-orchid, Painted Spider-orchid [54999]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Caladenia hastata Melblom's Spider-orchid [16118]	Endangered	Species or species habitat likely to occur within area
Caladenia ornata Ornate Pink Fingers [76213]	Vulnerable	Species or species habitat likely to occur within area
Caladenia tensa Greencomb Spider-orchid, Rigid Spider-orchid [24390]	Endangered	Species or species habitat may occur within area
Dodonaea procumbens Trailing Hop-bush [12149]	Vulnerable	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Euphrasia collina subsp. muelleri Purple Eyebright, Mueller's Eyebright [16151]	Endangered	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Grevillea infecunda Anglesea Grevillea [22026]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Hiya distans listed as Hypolepis distans Scrambling Ground-fern [92548]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Ixodia achillaeoides subsp. arenicola		
Sand Ixodia, Ixodia [21474]	Vulnerable	Species or species habitat known to occur within area
Lachnagrostis adamsonii		
Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area
Leiocarpa gatesii		
Wrinkled Buttons [76212]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii		
Spiny Peppercress [10976]	Vulnerable	Species or species habitat known to occur within area
Lepidium hyssopifolium		
Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area
Leucochrysum albicans subsp. tricolor		
Hoary Sunray, Grassland Paper-daisy [89104]	Endangered	Species or species habitat may occur within area
Pimelea spinescens subsp. spinescens		
Plains Rice-flower, Spiny Rice-flower, Prickly Pimelea [21980]	Critically Endangered	Species or species habitat likely to occur within area
Pomaderris halmaturina subsp. halmaturina		
Kangaroo Island Pomaderris [21964]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum diversiflorum		
Gorae Leek-orchid [13210]	Endangered	Species or species habitat likely to occur within area
Prasophyllum frenchii		
Maroon Leek-orchid, Slaty Leek-orchid, Stout Leek-orchid, French's Leek-orchid, Swamp Leek-orchid [9704]	Endangered	Species or species habitat known to occur within area
Prasophyllum litorale listed as Prasophyllum littorale		
Coastal Leek Orchid [55234]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat known to occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Rutidosis leptorhynchoides Button Wrinklewort [67251]	Endangered	Species or species habitat may occur within area
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat likely to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Taraxacum cygnorum Coast Dandelion, Native Dandelion [2508]	Vulnerable	Species or species habitat may occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
Thelymitra matthewsii Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra orientalis		
Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre		
Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar		
Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Lissolepis coventryi		
Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato		
Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus		
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eubalaena australis as Balaena glacialis australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus		
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus		
Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus		
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae		
Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus		
White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Monarcha melanopsis		
Black-faced Monarch [609]		Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus		
Common Noddy [825]		Species or species habitat likely to occur within area
Anseranas semipalmata		
Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes		
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area
Ardenna grisea as Puffinus griseus		
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris		
Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres		
Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis		
Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chroicocephalus novaehollandiae as Larus novaehollandiae		
Silver Gull [82326]		Breeding known to occur within area
Diomedea antipodensis		
Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora		
Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans		
Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi		
Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor		
Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii		
Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala		
Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura		
Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster		
White-bellied Sea-Eagle [943]		Breeding known to occur within area
Halobaena caerulea		
Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat known to occur within area overfly marine area
Morus capensis Cape Gannet [59569]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Morus serrator Australasian Gannet [1020]		Breeding known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Pelecanoides urinatrix Common Diving-Petrel [1018]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Phalacrocorax fuscescens		
Black-faced Cormorant [59660]		Breeding known to occur within area
Phalaropus lobatus		
Red-necked Phalarope [838]		Roosting known to occur within area
Phoebetria fusca		
Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva		
Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola		
Grey Plover [865]	Vulnerable	Roosting known to occur within area overfly marine area
Pterodroma mollis		
Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Recurvirostra novaehollandiae		
Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua		
Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata		
White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Thalasseus bergii as Sterna bergii		
Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis		
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes		
Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola		
Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis		
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Xenus cinereus		
Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area overfly marine area
Fish		
Heraldia nocturna		
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis		
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps		
Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus minotaur Bullneck Seahorse [66705]		Species or species habitat may occur within area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys mollisoni Mollison's Pipefish [66260]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		

Current Scientific Name	Status	Type of Presence
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tasmacetus shepherdi Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Bonney Coast Upwelling	South-east
West Tasmania Canyons	South-east

Biologically Important Areas

[Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Eudyptula minor Little Penguin [1085]	Breeding	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging	Known to occur
Morus serrator Australasian Gannet [1020]	Aggregation	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Pelecanoides urinatrix Common Diving-petrel [1018]	Breeding	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Breeding	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur

Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

Acknowledgements

Klarite would like to acknowledge the contributions of co-authors in this report, Millodon Consulting and s2 Services. Klarite also wishes to acknowledge that this report would not have been possible without the data provided by the Victorian Fisheries Authority and the Australian Fisheries Management Authority. We have made every attempt to faithfully represent the data we requested and were provided, respectful of the confidentiality requirements placed on the data.

Introduction

This review of commercial fisheries has been prepared for CGG Services (Australia) Pty Ltd (CGG) to identify Commonwealth and State (Victorian, Tasmanian, and South Australian) fisheries that have authority to fish within the Regia Marine Seismic Survey (Regia MSS) Activity Planning Area and/or Environmental Planning Area (Figure 1).

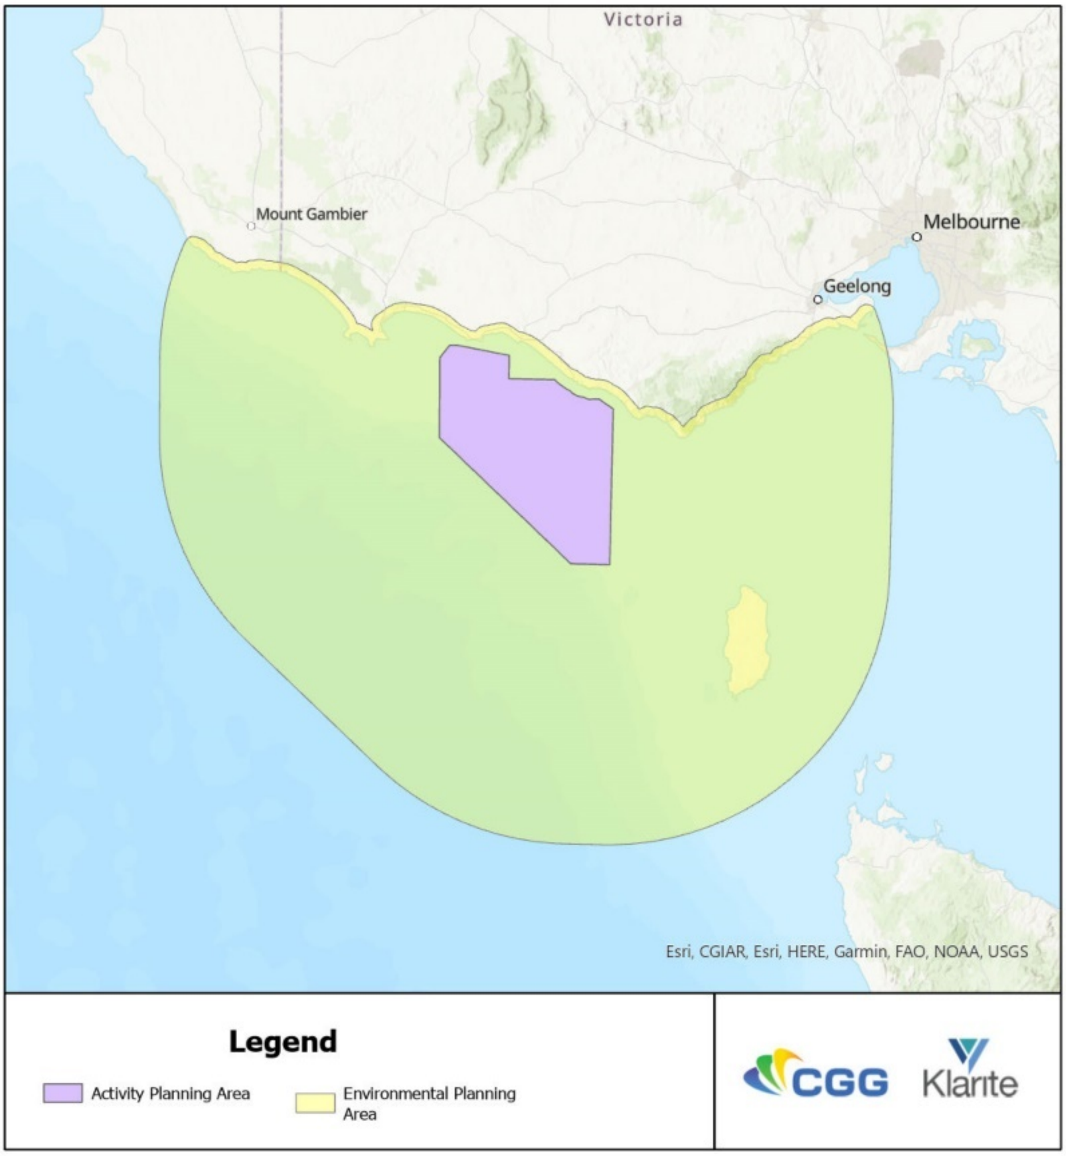

Figure 1: Regia Marine Seismic Survey Activity Planning Area and Environmental Planning Area

Commonwealth Fisheries

Commonwealth fisheries are managed by the Australian Fisheries Management Authority (AFMA) under the *Fisheries Management Act 1991* (Cth). AFMA jurisdiction covers the area of ocean from the coastline (under State-Commonwealth Offshore Constitutional Settlement Arrangements [OCS]) or from 3 nm from the coast out to the 200 nm limit (the Australian Fishing Zone (AFZ)). OCS arrangements are joint management arrangements of marine living resources that are found in waters subject to both Commonwealth and State control. Such arrangements provide for the management of the resources by the Commonwealth or respective State from the shoreline out to 200nm. Commonwealth commercial fisheries with authority to fish within the Activity Planning Area and Environmental Planning Area are:

- Bass Strait Central Zone Scallop Fishery (Bass Strait CZSF)
- Eastern Tuna and Billfish Fishery (ETBF)
- Skipjack Tuna Fishery (Eastern)
- Small Pelagic Fishery (SPF)
- Southern Bluefin Tuna Fishery (SBTF)
- Southern and Eastern Scalefish and Shark Fishery (SESSF)
- Southern Squid Jig Fishery
- Western Tuna and Billfish Fishery (ETBF)

Information relating to the target species, fishing locations, landed catch, value and other relevant aspects of each fishery is included in the following sections. Maps of relative fishing intensity for 2010 – 2020 and the Activity Planning Area and Environmental Planning Area are also provided.

The maps show the maximum area fished and the fishing intensity for each fishery. Fishing intensity (in kilograms of catch per square kilometre) is classified in shades of red, orange, and green to show high, medium, and low intensity classes, respectively. The data attributes include the class, the range of values in the class and the unit of measure. The maximum area fished shows the area fished by all fishers aggregated by 1-degree (111 km × 111 km) grid cells. The data provided by AFMA has been filtered to exclude catch from analysis areas where fewer than 5 boats operated during a given year.

Data sources are from the Commonwealth Fishery Status Report 2022 (Patterson et al. 2022) and AFMA website (AFMA 2023).

Table 1 provides a summary of the Commonwealth fisheries with fishing intensity within the Activity Planning and Environmental Planning Areas.

Table 1: Summary of Commonwealth Fisheries with Fishing Intensity within the Activity Planning and Environmental Planning Areas

Fishery	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area	Note
Bass Strait Central Zone Scallop Fishery	No	Yes	The Activity Planning Area and Environmental Planning Area overlap the fishery maximum fished area but this is due to the size of the grids used for reporting as there have been no active scallop beds within the area of overlap. The Environmental Planning Area overlaps where there has been fishing intensity during 2010 – 2020.
Eastern Tuna and Billfish Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the fishery maximum fished area. The Activity Planning Area and Environmental Planning Area do not overlap where there has been fishing intensity during 2010 – 2020.
Skipjack Tuna Fishery (Eastern)	No	No	Not currently active. There has been no catch effort in the fishery since the 2008 - 2009 season.
Small Pelagic Fishery (Western sub-area)	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the fishery maximum fished area. The Activity Planning Area and Environmental Planning Area do not overlap where there has been fishing intensity during 2009 – 2020.
Southern Bluefin Tuna Fishery (SBTF)	No	No	The Activity Planning Area and Environmental Planning Area do not overlap the fishery maximum fished area or were there has been fishing intensity during 2010 – 2020. Between May and October Southern Bluefin Tuna may migrate through the Activity Planning and Environmental Planning Areas.

Fishery	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area	Note
Southern and Eastern Scalefish and Shark Fishery (SESSF) Shark Gillnet and Hook Sector	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the Shark Hook Sub-Sector fishery maximum fished area. The Environmental Planning Area overlaps the Shark Hook Sub-Sector where there has been fishing intensity during 2010 – 2020. The Activity Planning Area and Environmental Planning Area overlap the Shark Net Sub-Sector maximum fished area and where there has been fishing intensity during 2010 – 2020.
Southern and Eastern Scalefish and Shark Fishery (SESSF) Commonwealth Trawl Sector and Scalefish Hook Sector	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the Commonwealth Trawl Sub-sector maximum fished area and where there has been fishing intensity (otter trawl only not Danish seine) during 2010 – 2020. The Activity Planning Area and Environmental Planning Area overlap the Scalefish Hook Sector maximum fished area and where there has been fishing intensity during 2010 – 2020.
Southern Squid Jig Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the Southern Squid Jig Fishery and Southern and Eastern Scalefish and Shark Fishery Commonwealth Trawl Sector Squid maximum fished area and where there has been fishing intensity during 2010 – 2020.
Western Tuna and Billfish Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the Western Tuna and Billfish Fishery maximum fished area. The Activity Planning Area and Environmental Planning Area do not overlap where there has been fishing intensity during 2010 – 2020.

Bass Strait Central Zone Scallop Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Bass Strait Central Zone Scallop Fishery	Scallops	Fishery operates in the Bass Strait between the Victorian and Tasmanian and starts at 20 nm from their respective coastlines. Commercial scallops in the Bass Strait Central Zone Scallop Fishery are mainly found at depths of 35 - 100 m and are caught using a steel dredge that is towed by the vessel along muddy to coarse sand substrates. Fishing effort is concentrated around King and Flinders Islands which are outside of the Regia Activity Planning Area. Currently there are 10 active boats using towed dredges. Fishing season is 1 April to 31 December. Actual catch in 2021 was 2,344 tonnes. The major landing ports are Beauty Point, Devonport, and Stanley (Tasmania); Apollo Bay, Lakes Entrance, Melbourne, Port Welshpool, Queenscliff and San Remo (Victoria) Total fishery value in 2021 was A$4.7 million. In the 2021 fishing season there were 10 active vessels. The Activity Planning Area and Environmental Planning Area overlap the fishery maximum fished area, though fishing intensity from 2010 – 2020 has been to the east of the Activity Planning Area within the Environmental Planning Area (Figure 2). The area of overlap with the Activity Planning Area is due to the size of the grids used for reporting as there have been no active scallop beds within the area of overlap. Historical and current scallop beds are to the east and north of King Island outside of the Activity Planning Area (Koopman and Knuckey 2023). Fishing mortality: not subject to overfishing. Biomass: Not over fished.	No	Yes

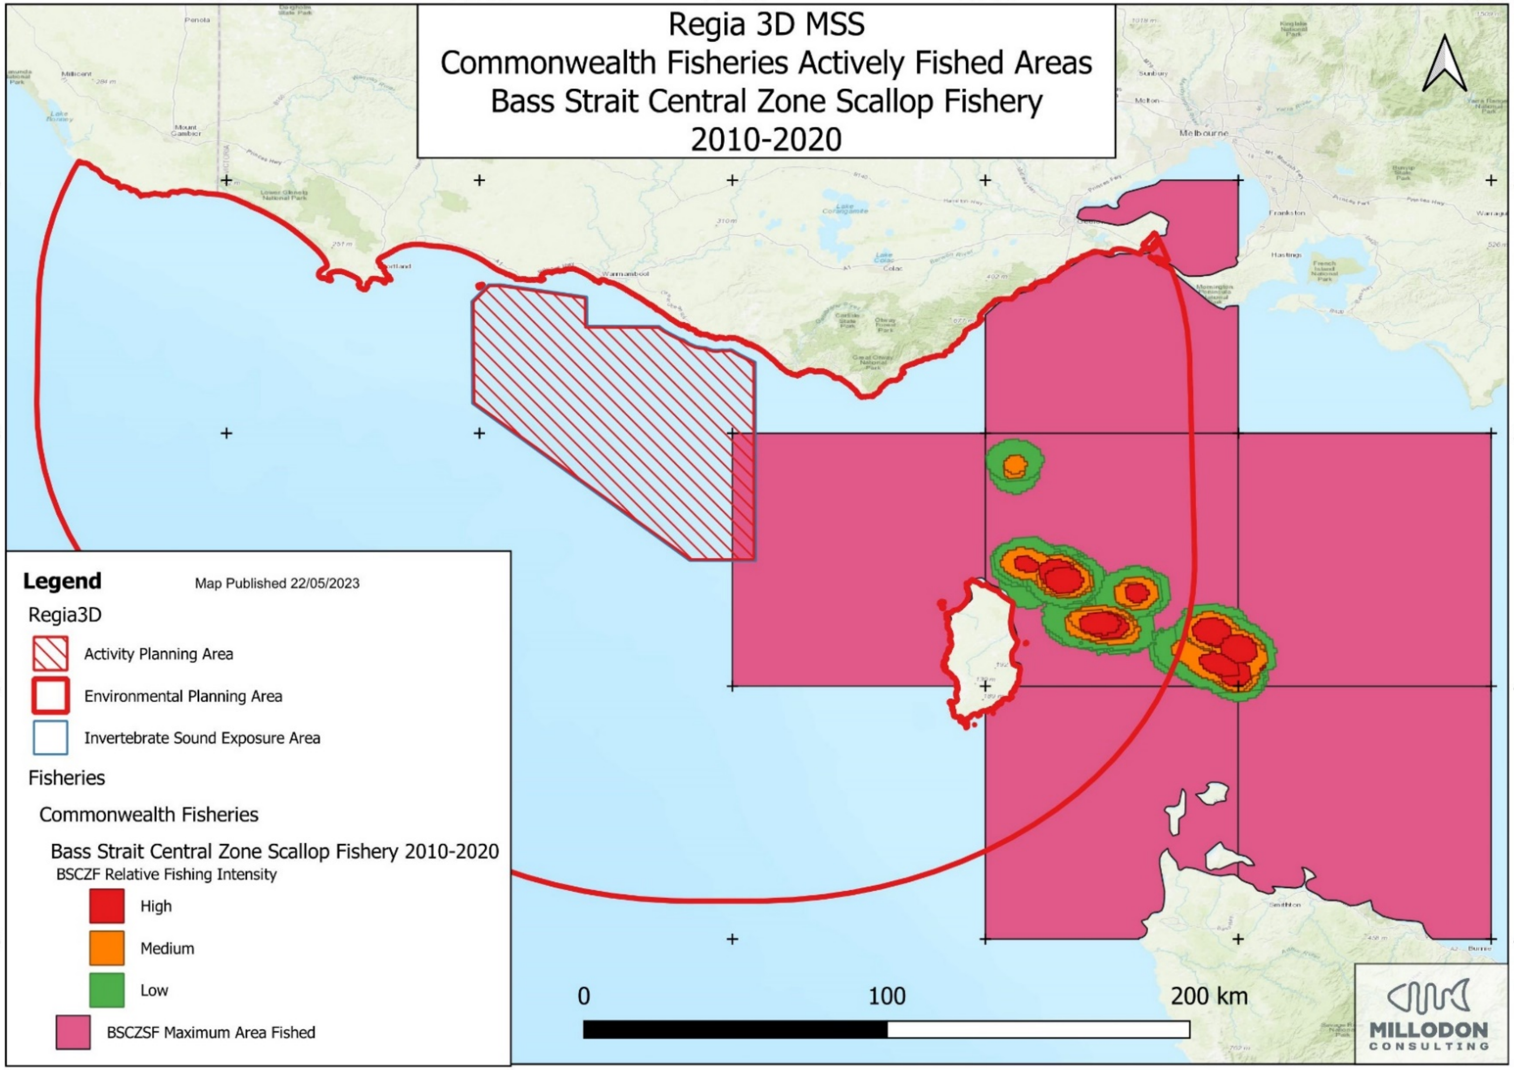

Figure 2: Bass Strait Central Zone Scallop Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

Eastern Tuna and Billfish Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Eastern Tuna and Billfish Fishery	Albacore tuna Bigeye tuna Yellowfin tuna Swordfish Striped marlin	A longline and minor line fishery that operates in water depths > 200 m from Cape York to Victoria. Fishery effort is typically concentrated along the NSW coast and southern Queensland coast (Figure 3). No Victorian ports are used. In 2017 there was some fishing effort in Victoria at low levels. The number of active vessels has decreased within the fishery from around 152 in 1999 to 35 in 2021. Actual catch in the 2021 season was 5,148 tonnes. Total fishery value in 2021 was A$35.6 million. The Activity Planning Area and Environmental Planning Area overlap the fishery maximum fished area, though fishing intensity from 2010 – 2020 has been along the NSW coast and southern Queensland coast (Figure 3). Fishing mortality: not subject to overfishing. Biomass: Over fished – striped marlin. All other species not overfished.	Yes	Yes

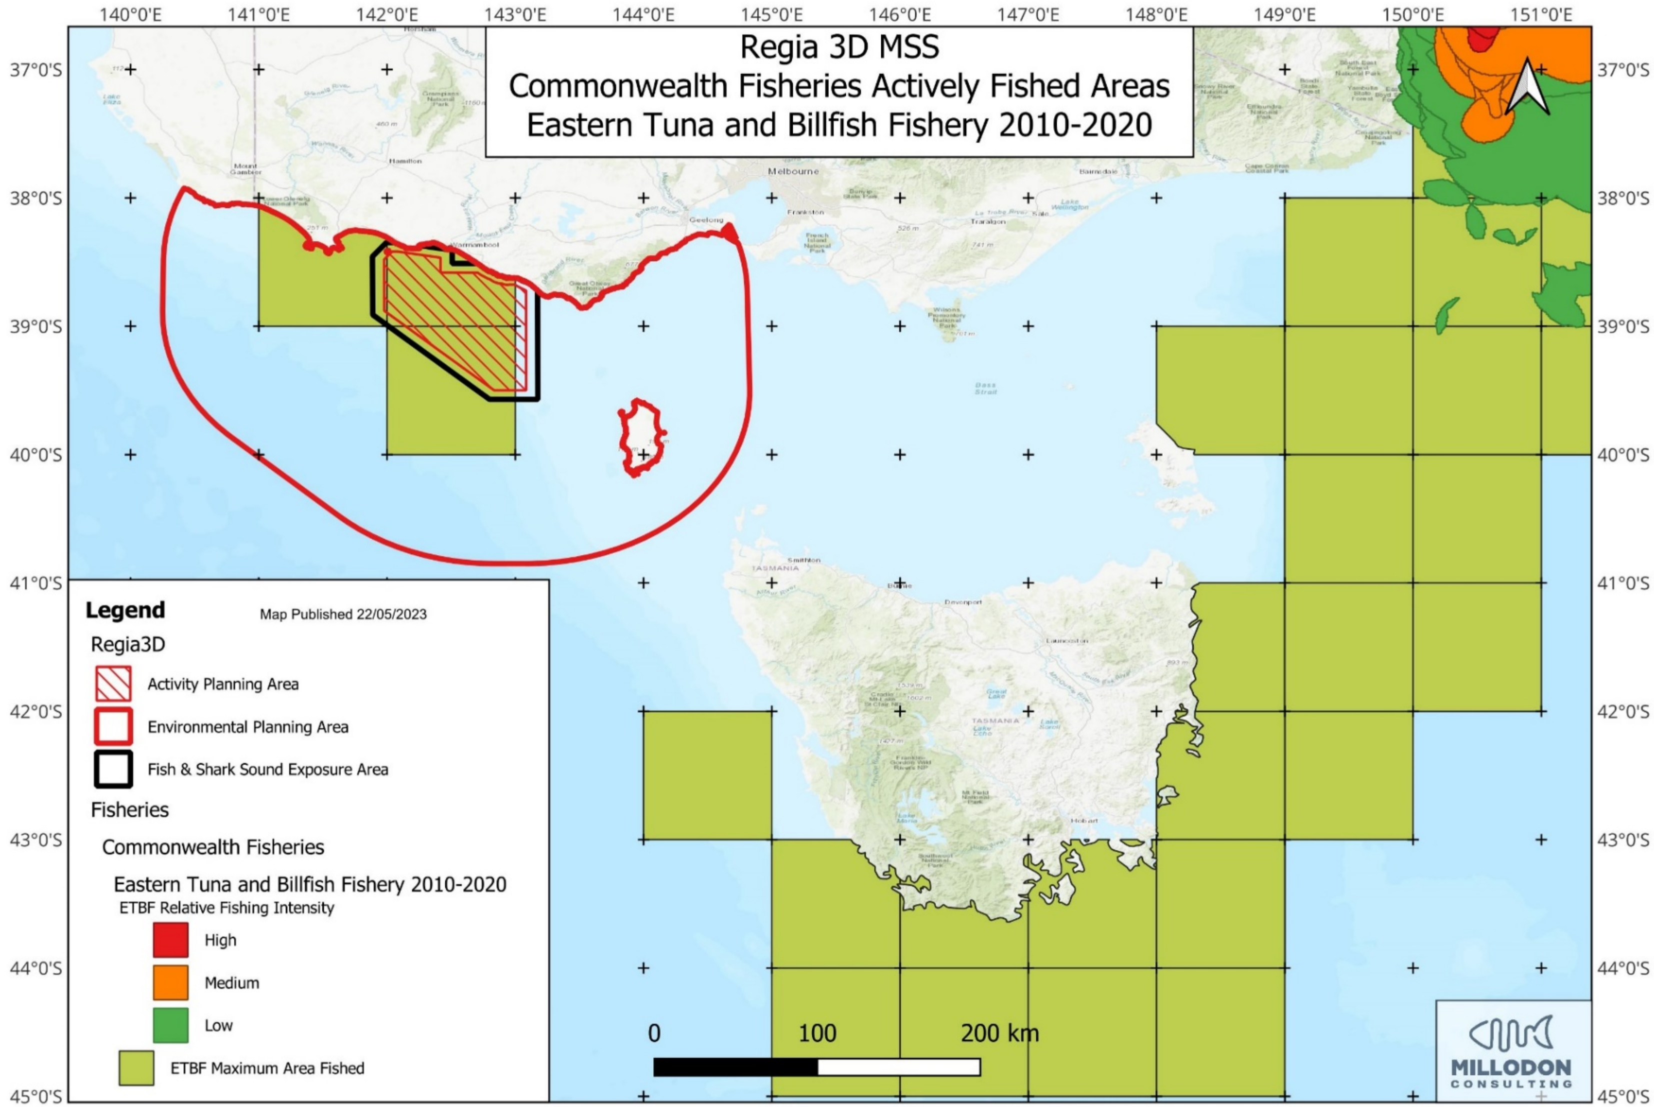

Figure 3: Eastern Tuna and Billfish Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

Small Pelagic Fishery (Western sub-area)

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Small Pelagic Fishery (Western sub-area)	Australian sardine Blue mackerel Jack mackerel Redbait	The Small Pelagic Fishery extends from the southern Queensland to southern Western Australia. Fishers use midwater trawls and purse seine nets. Geelong is a major landing port. Total retained catch of the four target species was 18,878 tonnes in the 2021-22 season. Fishery effort generally concentrated in the near-shore Great Australian Bight to the west and south of Port Lincoln. The Environmental Planning Area and a small part of the Activity Planning Area overlap the fishery maximum fished area. There has been no ABARES classified fishing intensity from 2009 – 2020 in the Activity Planning Area or Environmental Planning Area (Figure 4). Fishing mortality: not subject to overfishing. Biomass: Not over fished.	Yes	Yes

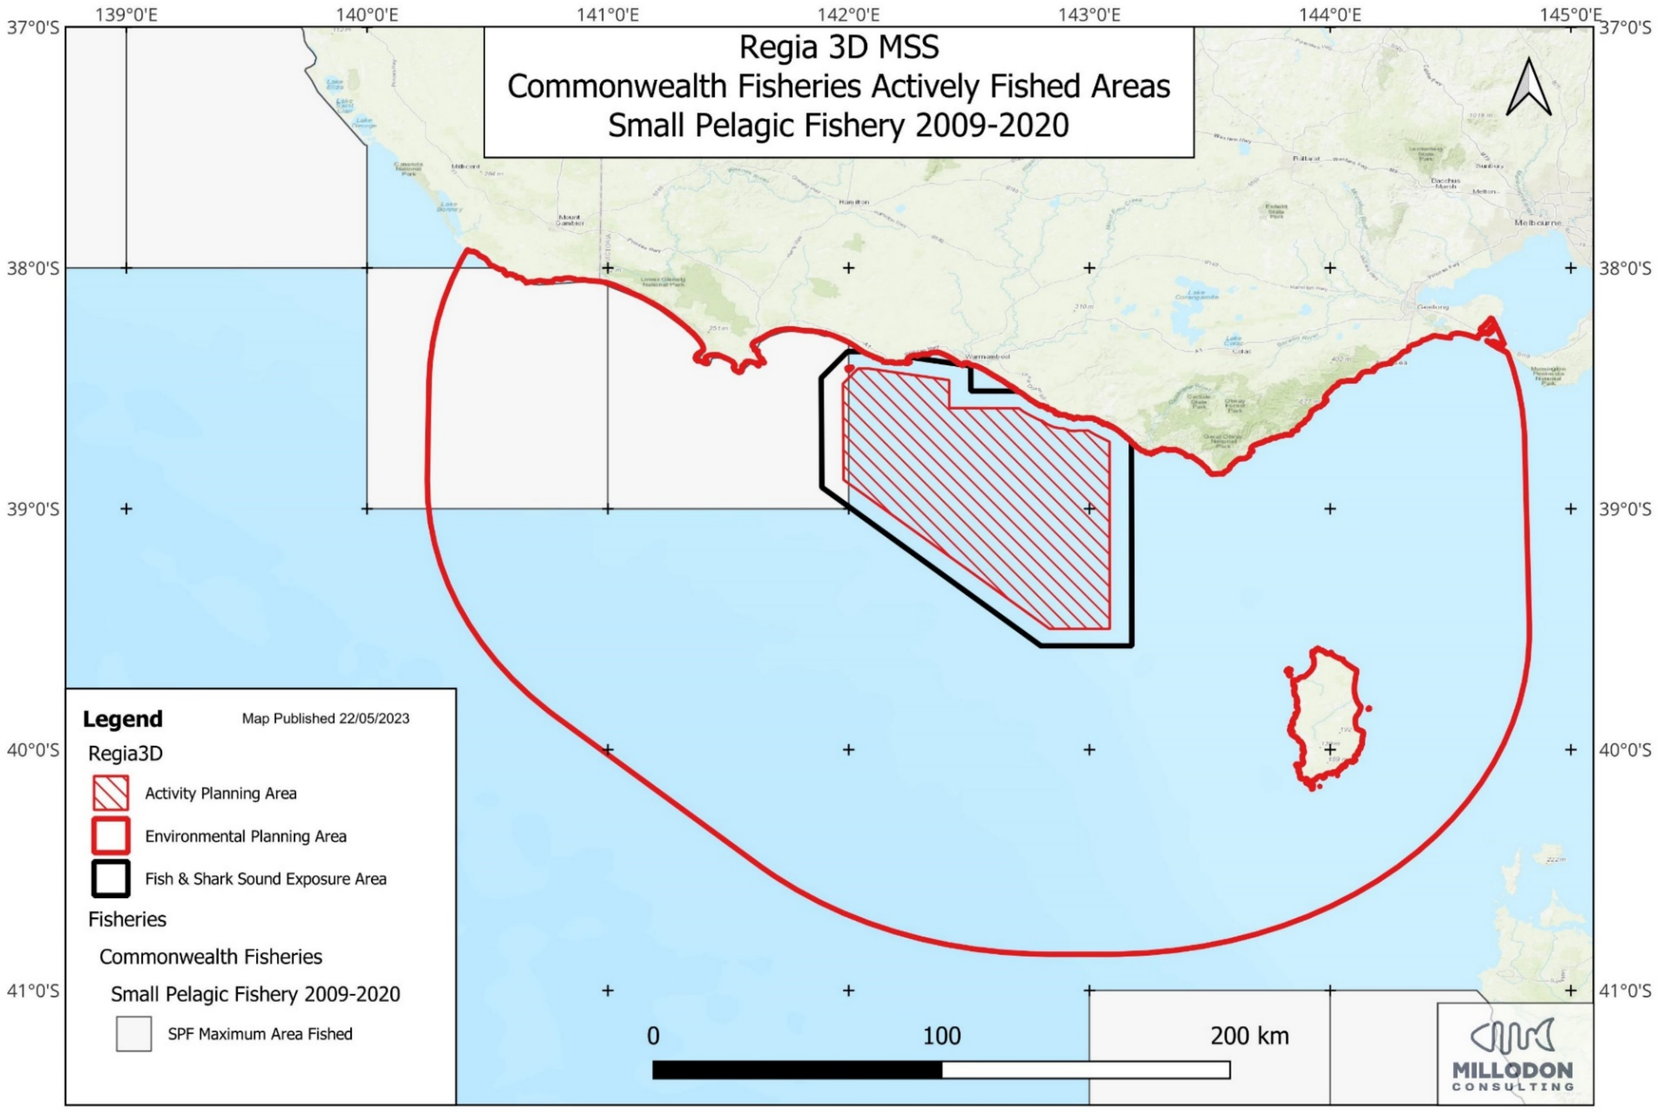

Figure 4: Small Pelagic Fishery (Western sub-area) Fishing Effort within the Activity Planning Area and Environmental Planning Area

Southern Bluefin Tuna Fishery (SBTF)

Fishery	**Target species**	**Description**	**Fishing activity within the Activity Planning Area**	**Fishing Activity within the Environmental Planning Area**
Southern Bluefin Tuna Fishery (SBTF)	Southern bluefin tuna	The SBTF covers the entire sea area around Australia, out to 200 nm from the coast. Southern bluefin tuna are also commonly caught off the NSW coastline. In this area, fishers catch these fish using the longline fishing method. A pelagic longline and purse seine fishery that was worth $41.39 million in 2020-21 (actual catch was 5,646 tonnes). The fishery operates year-round. Fishery effort is generally concentrated in the Great Australian Bight and off the southern NSW coast. The Activity Planning Area and Environmental Planning Area do not overlap the fishery maximum fished area or where there has been classified fishing intensity from 2010 – 2020 (Figure 5). Between May and October, when the waters off NSW and Victoria are cooler, Southern Bluefin Tuna may migrate through the Activity Planning and Environmental Planning Areas. Fishing mortality: not subject to overfishing. Biomass: Not over fished.	No	No

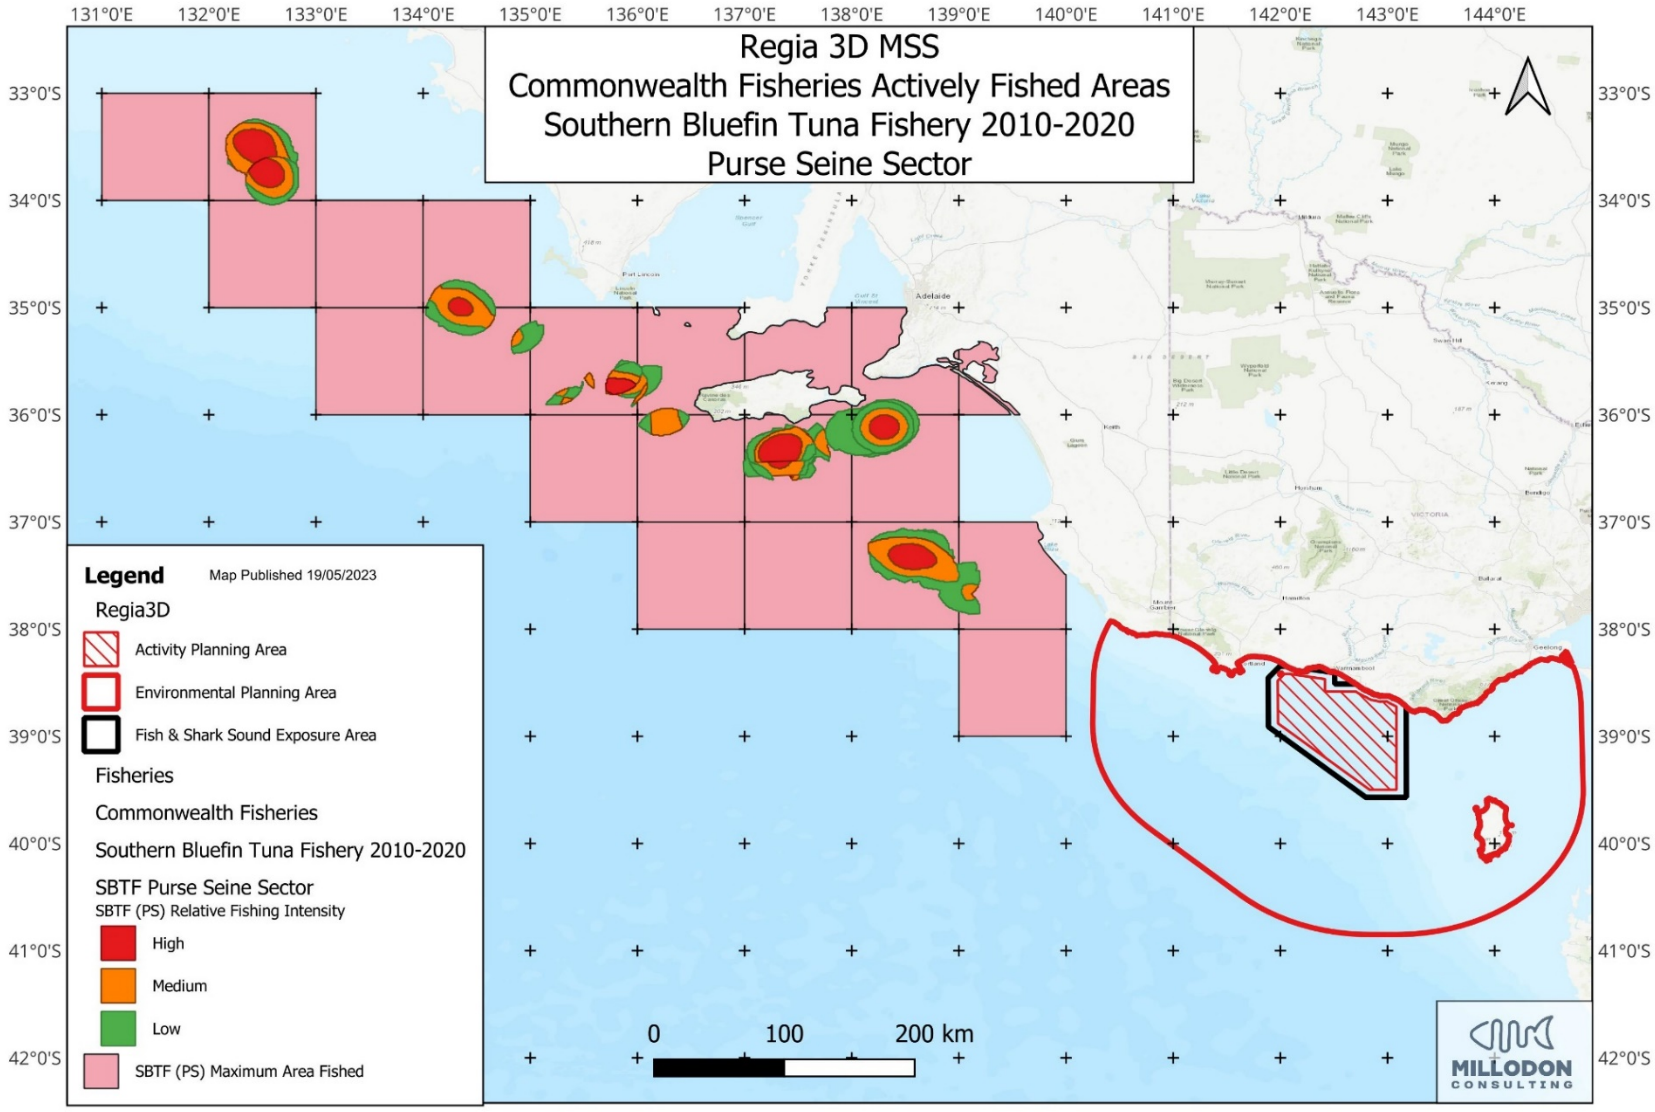

Figure 5: Southern Bluefin Tuna Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

Southern and Eastern Scalefish and Shark Fishery (SESSF) - Shark Gillnet and Hook Sector

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Southern and Eastern Scalefish and Shark Fishery (SESSF) Shark Gillnet and Hook Sector	Elephantfish Gummy shark Sawsharks School shark	The Southern and Eastern Scalefish and Shark Fishery (SESSF) stretches south from Fraser Island in southern Queensland, around Tasmania, to Cape Leeuwin in southern Western Australia. The shark gillnet and shark hook sectors (SGSHS) are part of the Gillnet, Hook and Trap Sector (GHTS) of the Southern and Eastern Scalefish and Shark Fishery (SESSF). The SGSHS uses demersal gillnet and demersal longline to target gummy shark. Sawsharks and elephantfish are caught as by-products of fishing for gummy sharks. Most fishing in the sector using nets occurs in Bass Strait targeting elephantfish, gummy shark, sawsharks and school shark. Fishing is generally concentrated east of King Island. Most fishing using hooks occurs off South Australia (Figure 7). The Activity Planning Area and Environmental Planning Area overlap the Shark Hook Sub-Sector maximum fished area but there has only been classified fishing intensity from 2010 – 2020 in the Environmental Planning Area (Figure 6). The Activity Planning Area and Environmental Planning Area overlap the Shark Net Sub-Sector maximum fished area and where there has been fishing intensity from 2010 – 2020 (Figure 7). Total retained catch of the target species was 2,150 tonnes in the 2021-22 season. No value is provided for 2021-22 season. In 2020-21, the fishery value was A$28.84 million. In the 2021-2022 fishing season there were 27 active gillnet vessels and 40 active hook vessels. Fishing mortality: school shark is uncertain. Biomass: school shark is over fished.	Yes	Yes

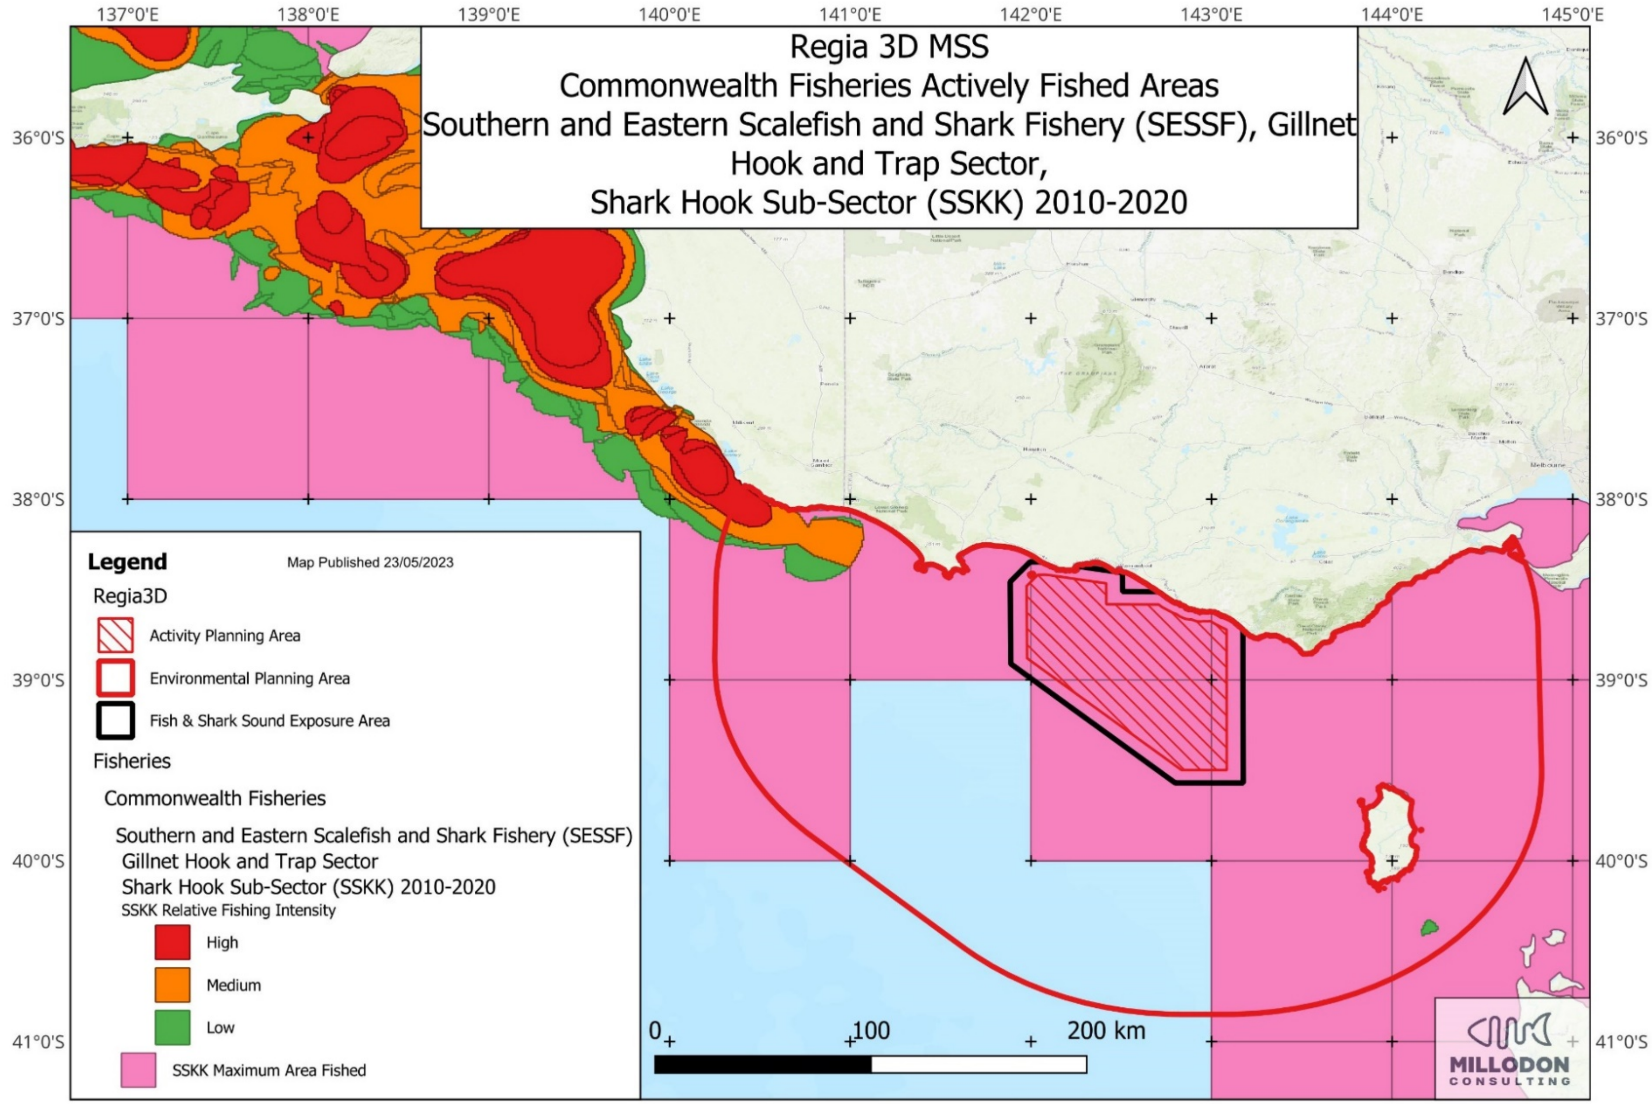

Figure 6: Southern and Eastern Scalefish and Shark Fishery Shark Hook Sub-Sector Fishing Effort within the Activity Planning Area and Environmental Planning Area

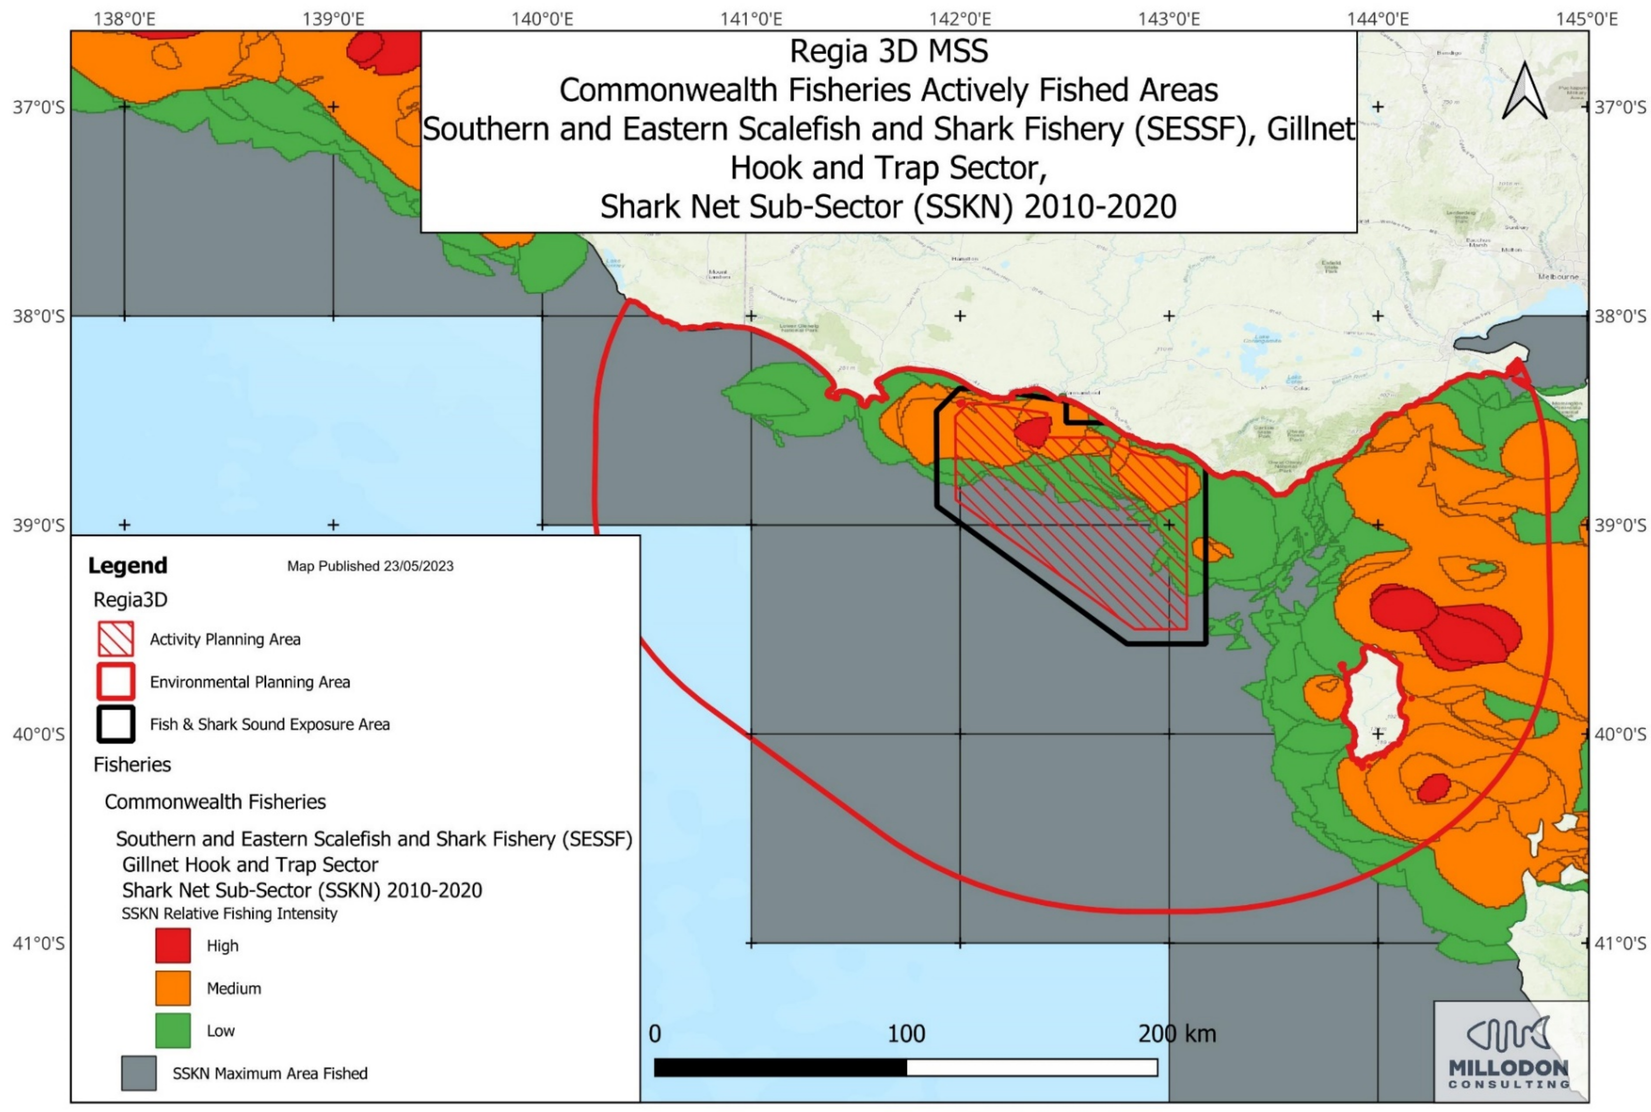

Figure 7: Southern and Eastern Scalefish and Shark Fishery Shark Net Sub-Sector Fishing Effort within the Activity Planning Area and Environmental Planning Area

Southern and Eastern Scalefish and Shark Fishery (SESSF) - Commonwealth Trawl Sector and Scalefish Hook Sector

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Southern and Eastern Scalefish and Shark Fishery (SESSF) Commonwealth Trawl Sector Scalefish Hook Sector	Blue-eye trevalla Blue grenadier Eastern school whiting Orange roughy Pink ling Ribaldo Tiger flathead	The Commonwealth Trawl Sector of the SESSF extends south from Barrenjoey Point in northern New South Wales to east of Kangaroo Island off South Australia. The Commonwealth Trawl Sector is a multispecies fisheries, targeting a variety of fish and shark species. The Commonwealth Trawl Sector and Scalefish Hook Sector are reported together as they share many target species. A multi-sector, multi-species fishery that uses a range of gear year-round targeting fish and shark species. Fishing is generally concentrated along the 200 m bathymetric contour. The Commonwealth Trawl Sector predominantly uses demersal otter trawl and Danish-seine fishing methods. The Scalefish Hook Sector uses a variety of longline and dropline hook fishing methods, some of which are automated. The Activity Planning Area and Environmental Planning Area overlap the Commonwealth Trawl Sub-sector maximum fished area and where there has been fishing intensity from 2010 – 2020 (Figure 8). Though the Activity Planning Area and Environmental Planning Area overlap the Danish Seine Sub-sector maximum fished area but not where there has been ABARES classified fishing intensity from 2010 – 2020 in either area (Figure 9). The Activity Planning Area and Environmental Planning Area overlap the Scalefish Hook Sector maximum fished area and where there has been low fishing intensity from 2010 – 2020 (Figure 10). In the 2021 – 2022 season there where 32 trawl, 19 Danish-seine and 21 scalefish hook vessels operating. Total retained catch of the target species was 19,501 tonnes in the 2021-22 season. No value is provided for 2021-22 season. In 2020-21, the fishery value was A$64 million. Fishing mortality: some species subject to overfishing. Biomass: some species over fished.	Yes	Yes

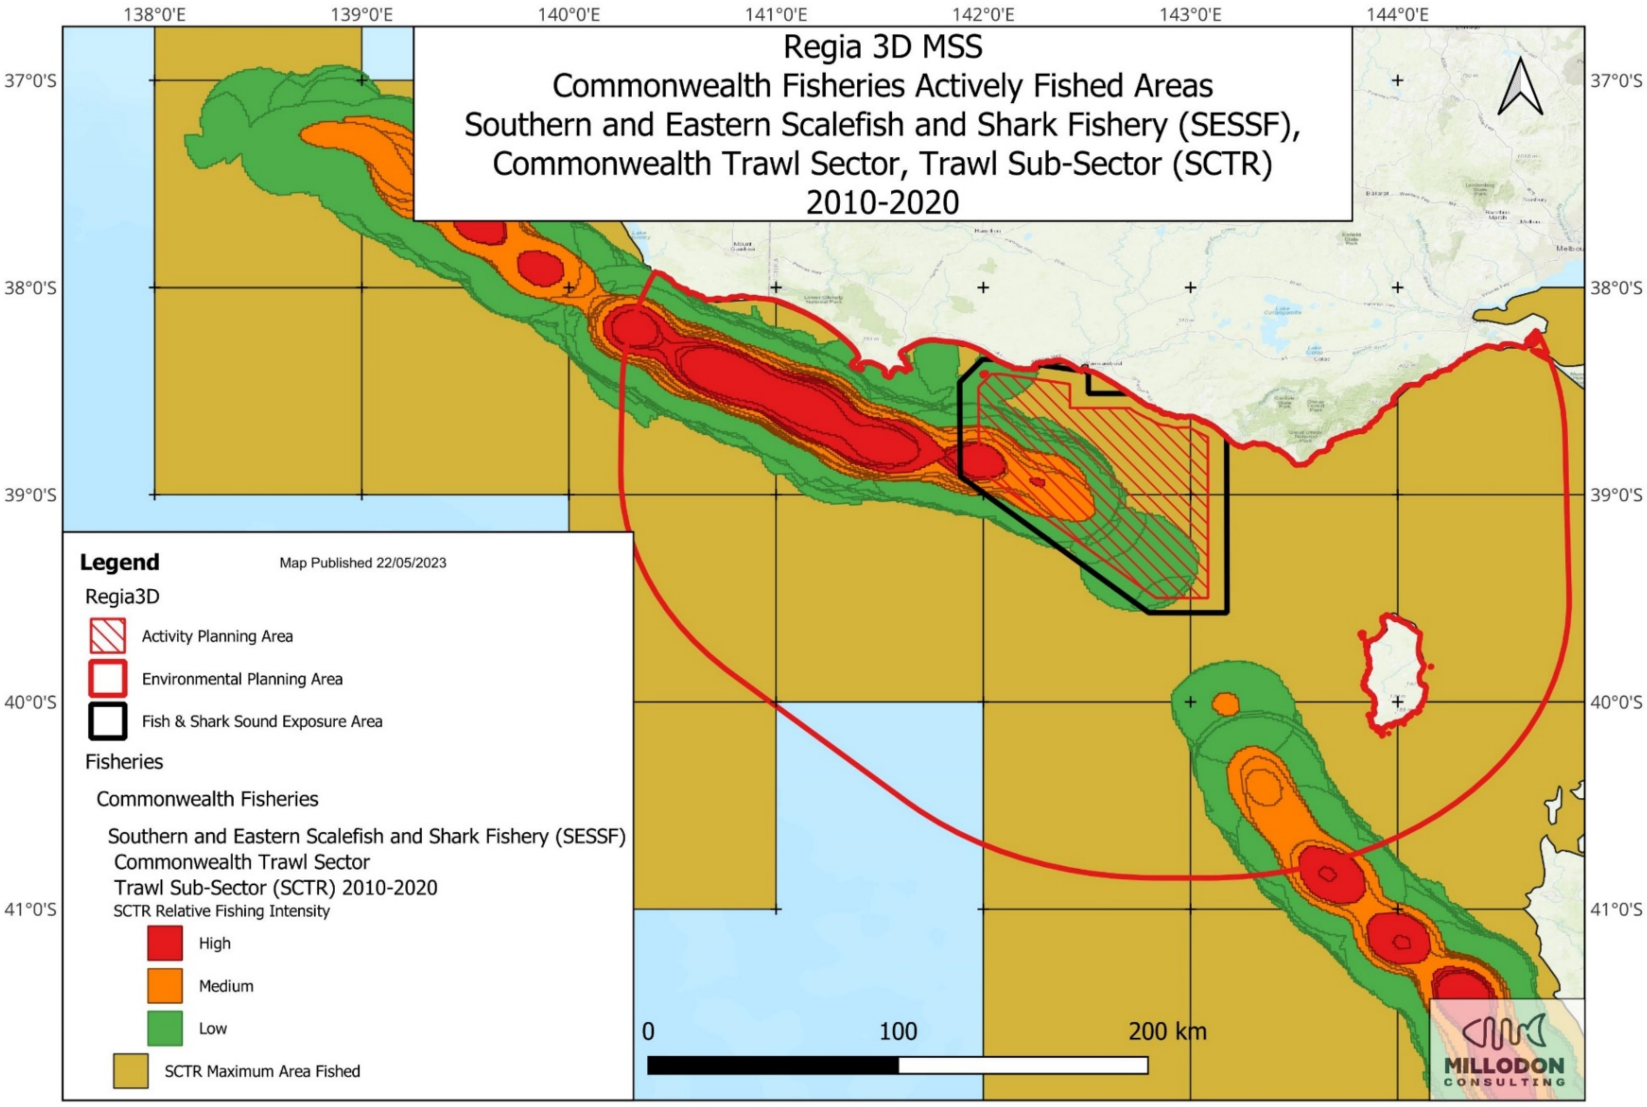

Figure 8: Southern and Eastern Scalefish and Shark Fishery Commonwealth Trawl Sub-Sector Fishing Effort within the Activity Planning Area and Environmental Planning Area

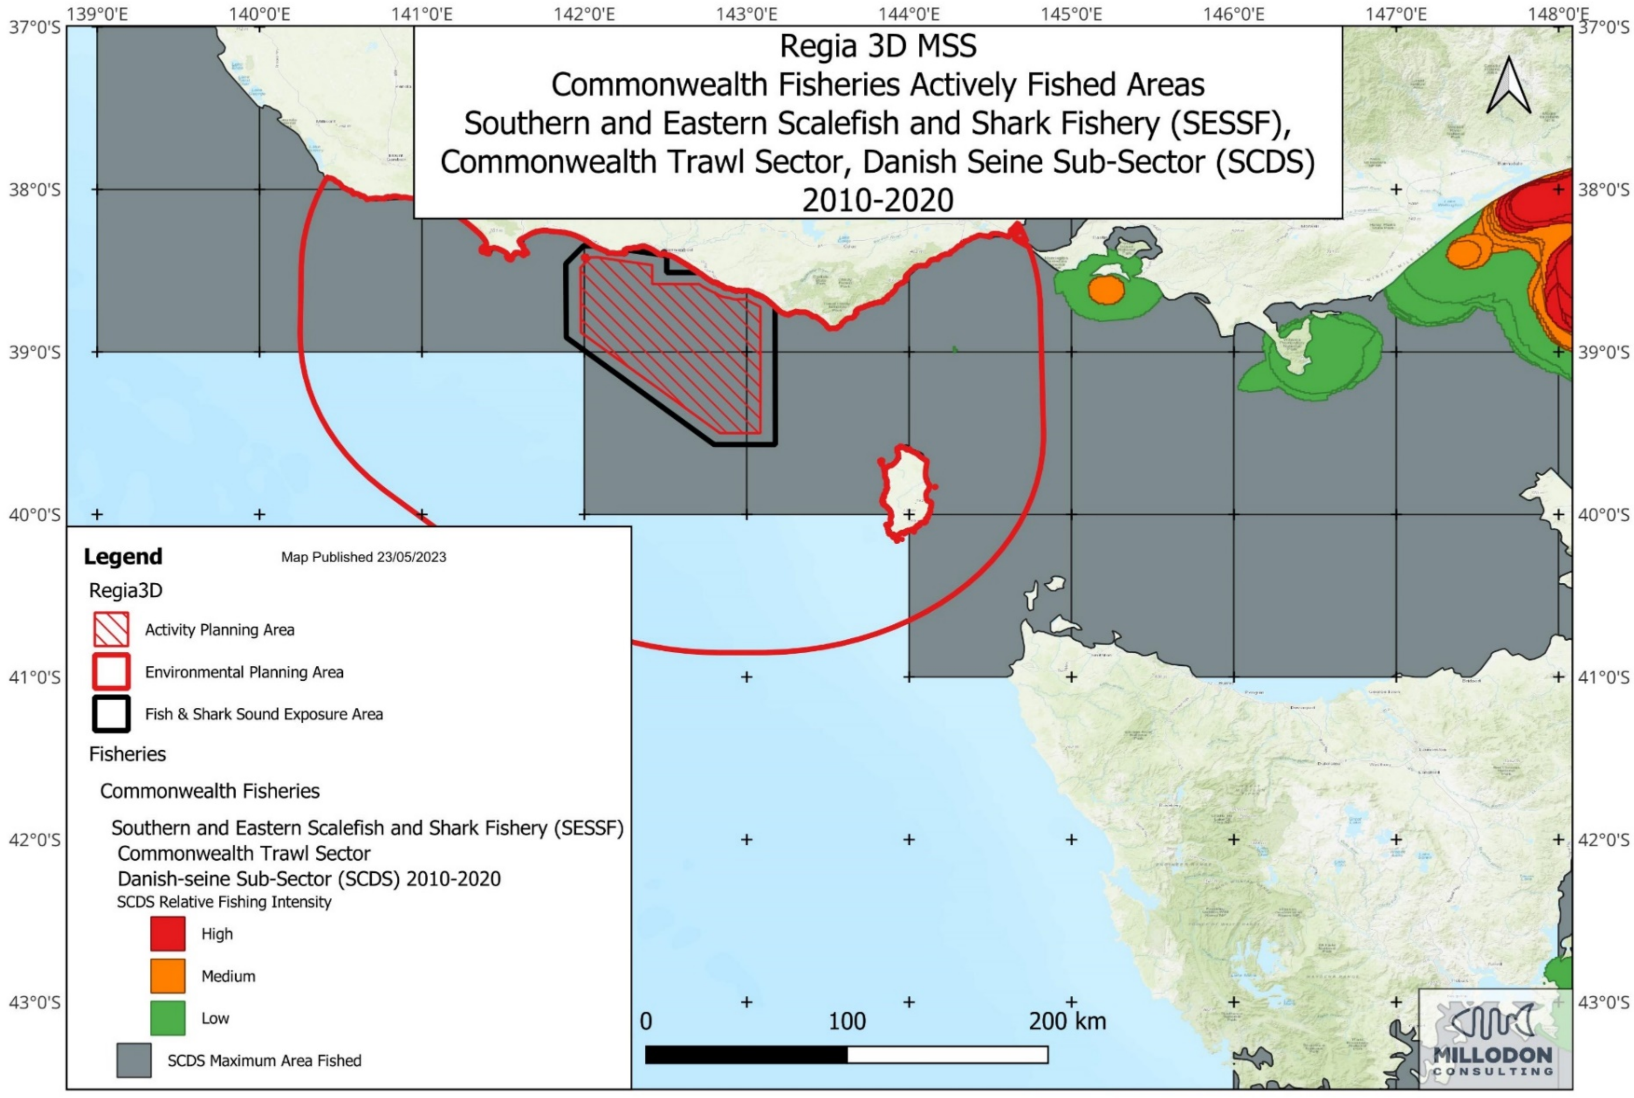

Figure 9: Southern and Eastern Scalefish and Shark Fishery Danish Seine Sub-Sector Fishing Effort within the Activity Planning Area and Environmental Planning Area

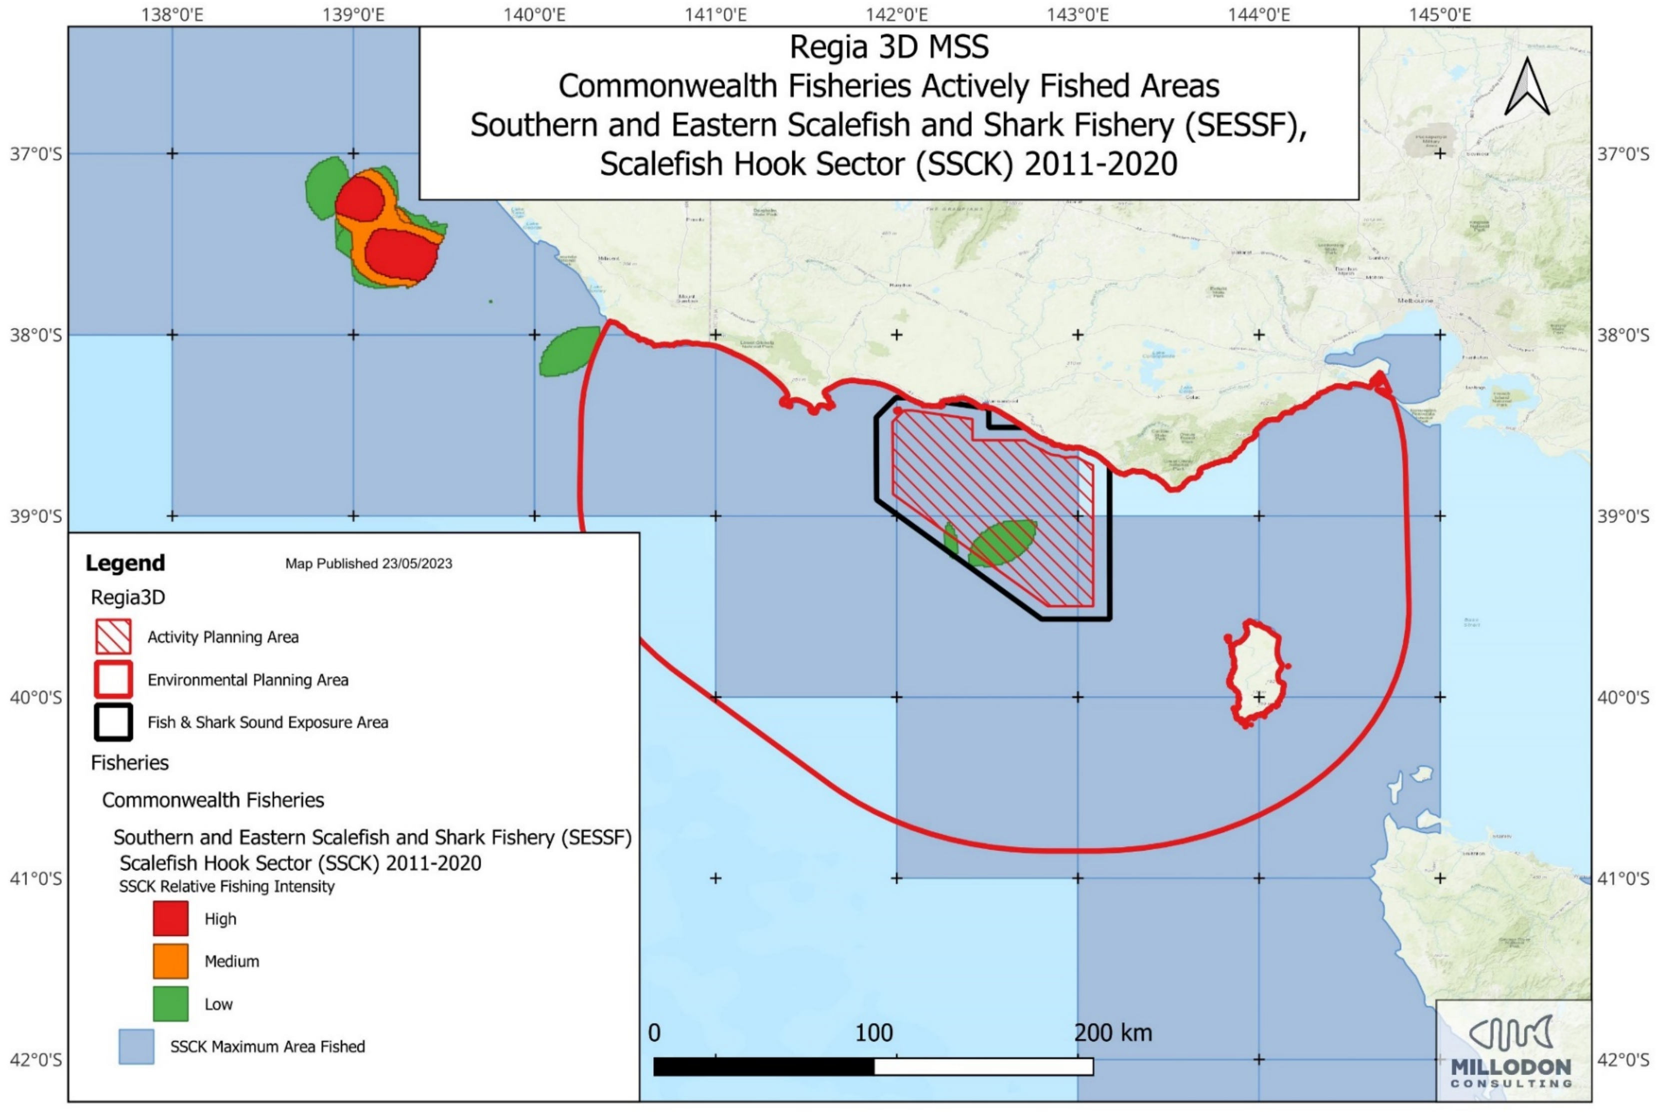

Figure 10: Southern and Eastern Scalefish and Shark Fishery Scalefish Hook Sector Fishing Effort within the Activity Planning Area and Environmental Planning Area

Southern Squid Jig Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Southern Squid Jig Fishery	Gould's squid (arrow squid)	A single species fishery that operates year-round. Portland and Queenscliff are the major Victorian landing ports. Jigging typically occurs midwater at depths between 50 and 100 m at night using large lights that illuminate the waters around a boat. The Commonwealth Trawl Fishery also catches Gould' squid. The Activity Planning Area and Environmental Planning Area overlap the Southern Squid Jig Fishery maximum fished area and where there has been fishing effort from 2010 – 2020 (shown as relative fishing intensity on Figure 11). The Activity Planning Area and Environmental Planning Area overlap the Southern and Eastern Scalefish and Shark Fishery Commonwealth Trawl Sector Squid maximum fished area and where there has been classified fishing intensity from 2010 – 2020 (Figure 12). In 2021, the actual catch of 939 tonnes was worth A$3.30 million. In 2021 there were eight active vessels in the fishery with the landing ports being Triabunna (Tasmania); Queenscliff and Apollo Bay (Victoria). Fishing mortality: not subject to overfishing. Biomass: Not over fished.	Yes	Yes

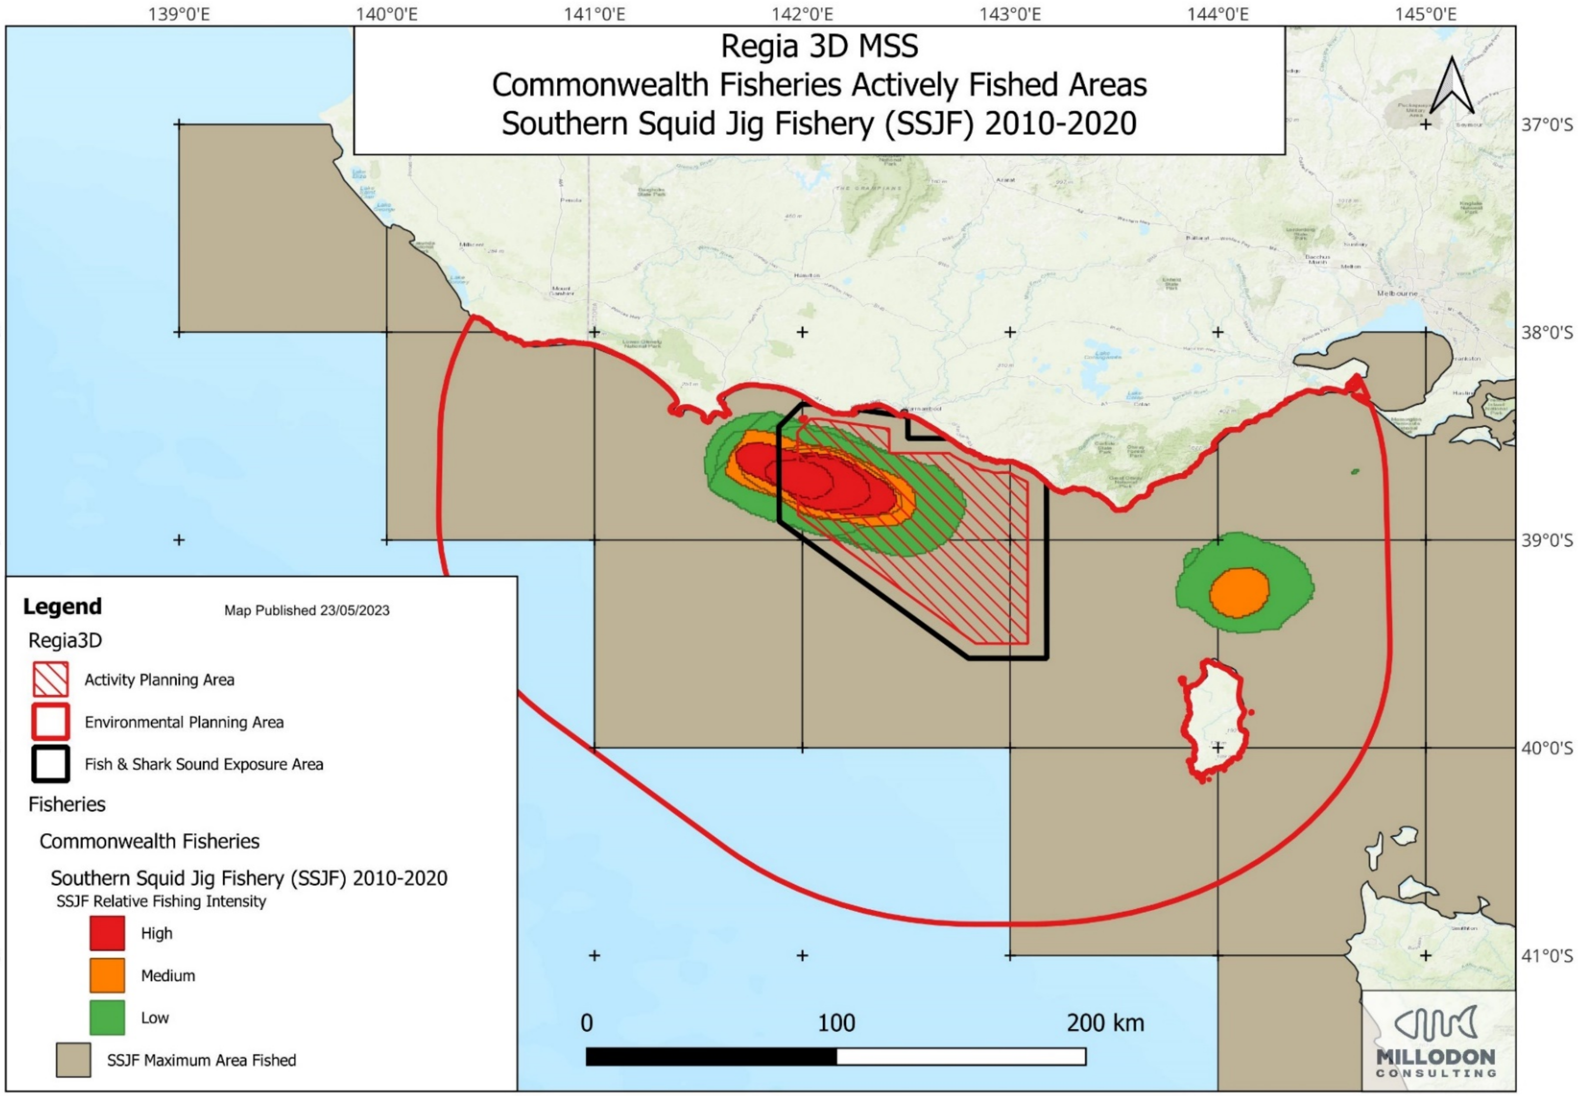

Figure 11: Southern Squid Jig Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

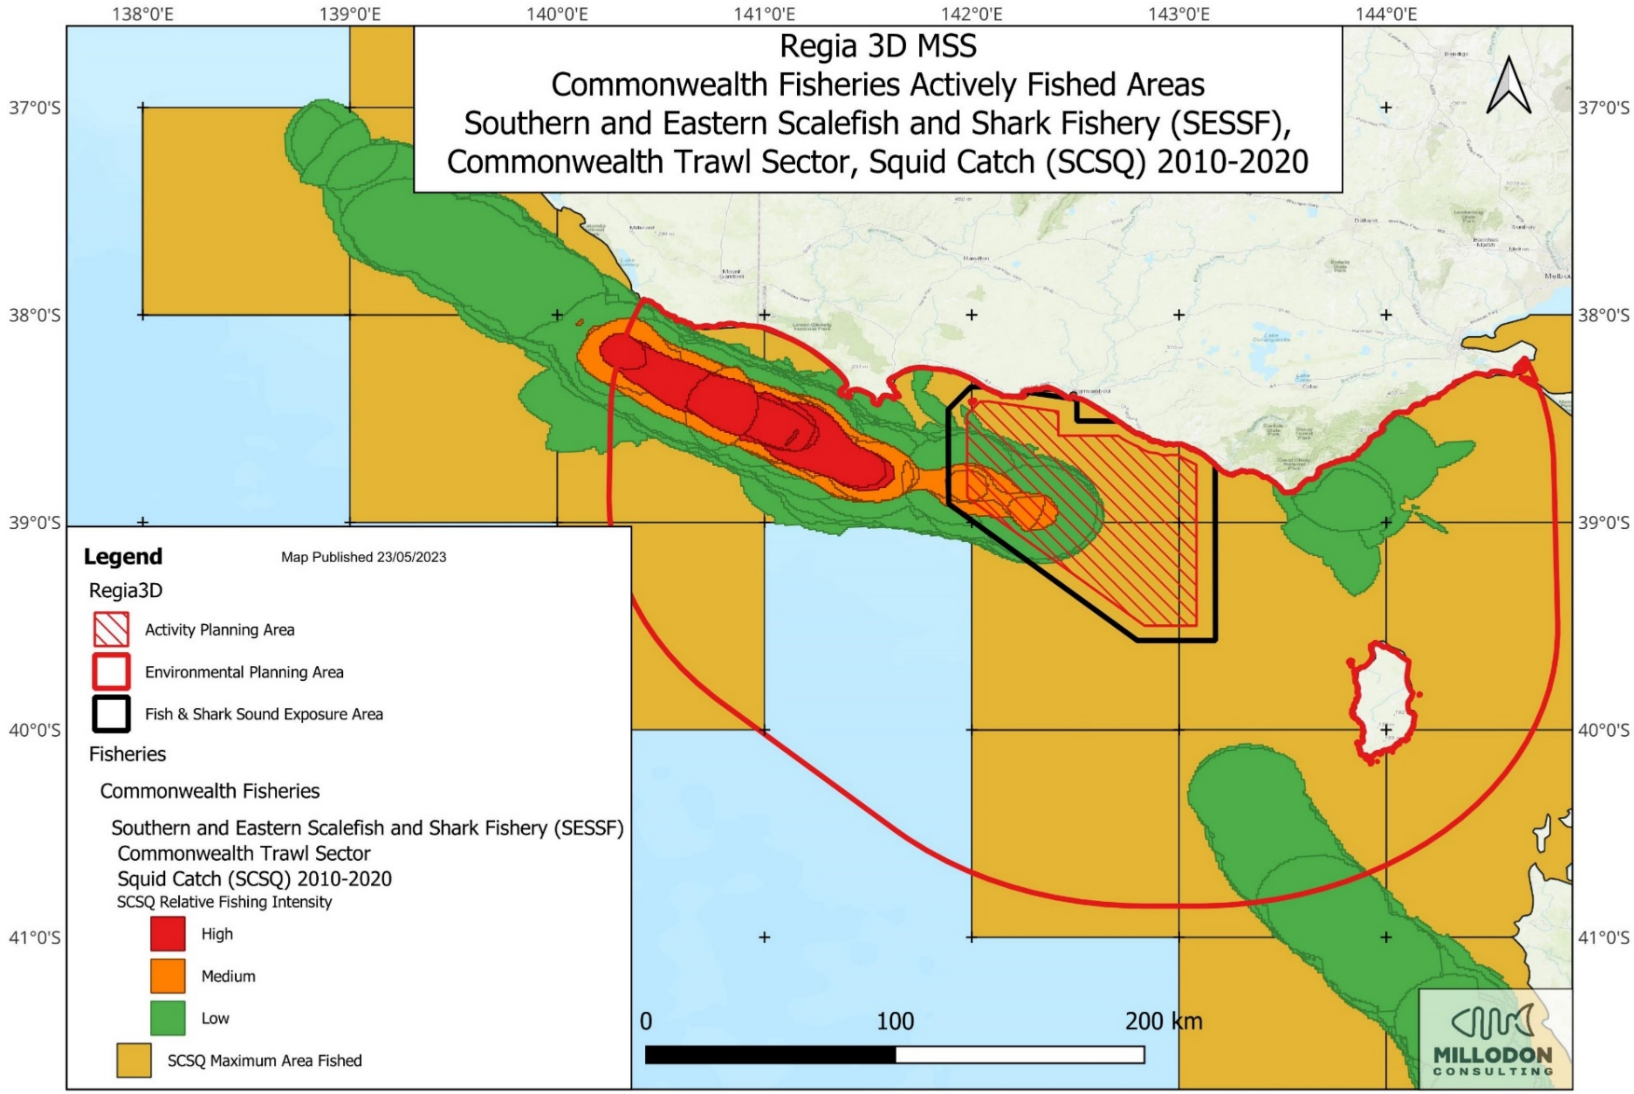

Figure 12: Southern and Eastern Scalefish and Shark Fishery Commonwealth Trawl Sector Squid Fishing Effort within the Activity Planning Area and Environmental Planning Area

Western Tuna and Billfish Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Western Tuna and Billfish Fishery	Albacore tuna Bigeye tuna Yellowfin tuna Broadbill swordfish Striped marlin	The Western Tuna and Billfish Fishery (WTBF) operates in Australia's Exclusive Economic Zone and high seas of the Indian Ocean. In recent years, fishing effort has concentrated off south-west Western Australia, with occasional activity off South Australia. The main fishing gear in the WTBF is pelagic longline, with low levels of minor-line fishing. The Activity Planning Area and Environmental Planning Area overlap the Western Tuna and Billfish Fishery maximum fished area but not where there has been classified fishing intensity from 2010 – 2020 (Figure 12). No Victorian ports are used. Actual catch in the 2021 season was 252 tonnes with the fishery value confidential due to only two active vessels. Fishing mortality: all except swordfish subject to overfishing. Biomass: Over fished – striped marlin. All other species not overfished.	Yes	Yes

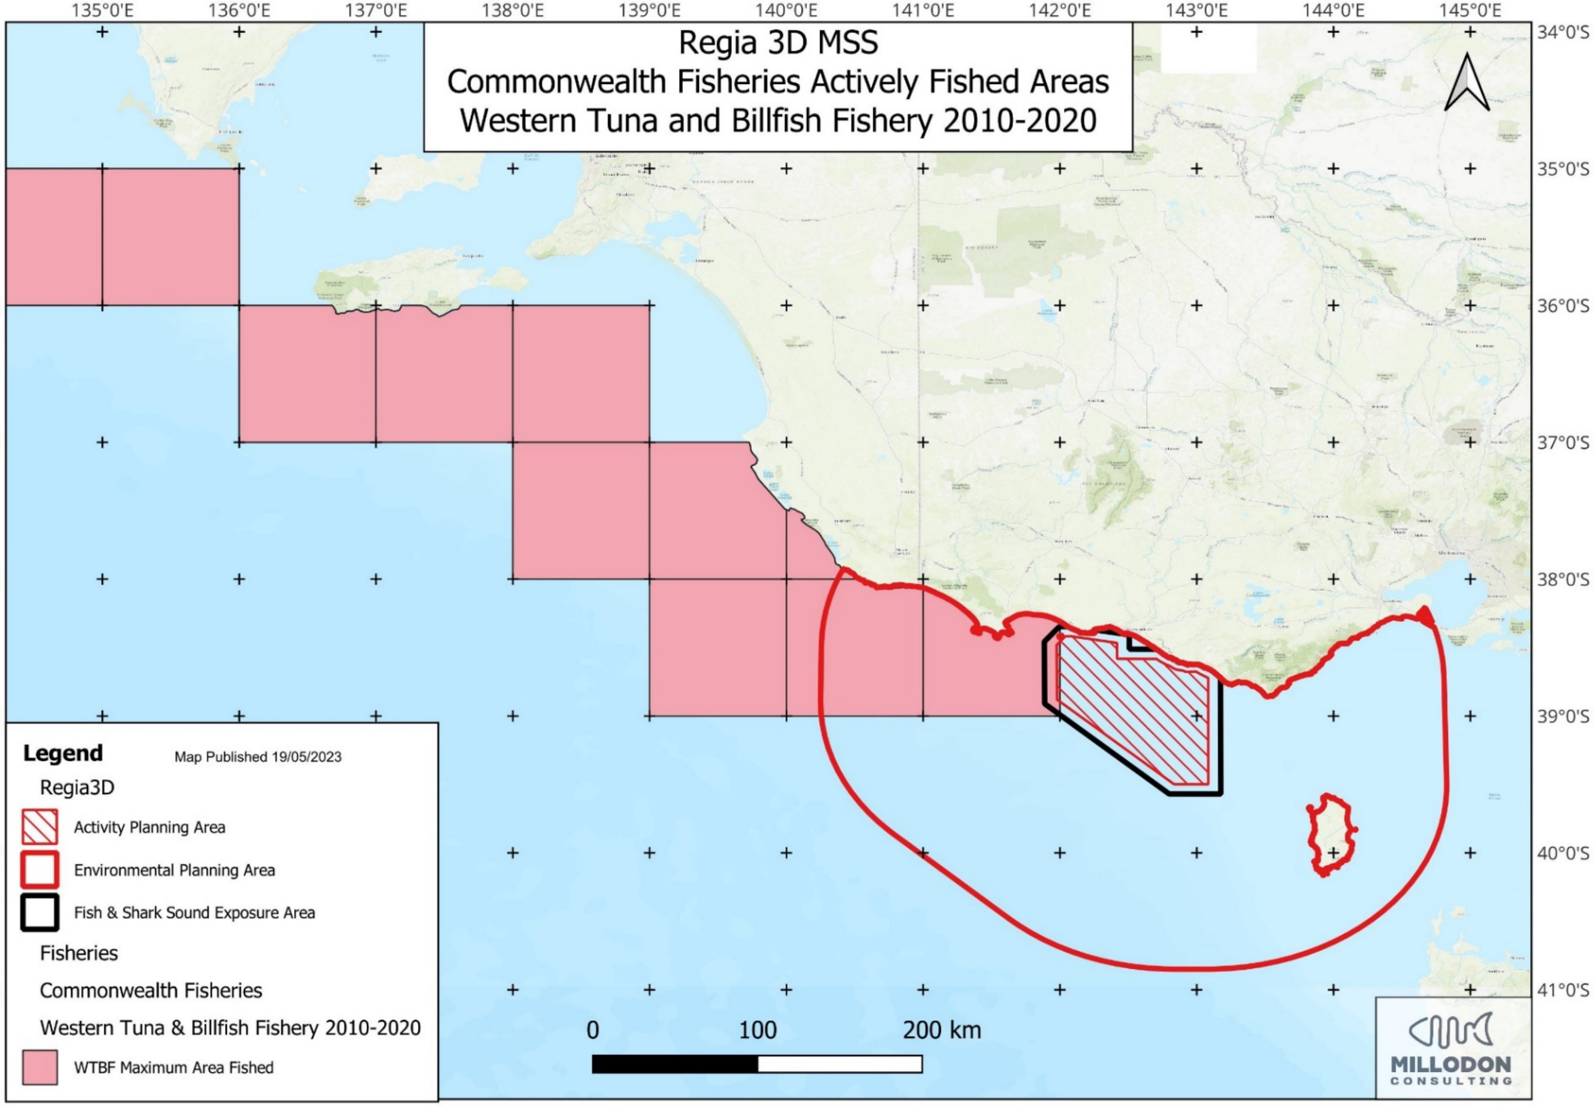

Figure 13: Western tuna and Billfish Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

Victorian Fisheries

Victorian fisheries are managed by the Victorian Fisheries Authority (VFA) under the *Fisheries Act 1995* (Cth). VFA has regulatory responsibility for the management of fisheries in Victorian State Waters out to 3 nm and Commonwealth waters where the VFA manage fisheries on behalf of the Commonwealth under the Offshore Constitutional Settlement (OCS) arrangements. OCS arrangements are joint management arrangements of particular marine living resources that are found in waters subject to both Commonwealth and State control. Such arrangements allow for the management of the resources by State authorities, even in waters outside the State 3 nm territorial sea boundary. In Victoria, such arrangements are in place out to 20 nm for key species such as scallop and rock lobster.

Victorian commercial fisheries with jurisdictions to fish within the Activity Planning Area and Environmental Planning Area are:

- Abalone Fishery
- Bays and Inlet Fisheries
- Eel Fishery
- Giant Crab Fishery
- Multi-species Ocean Fisheries
- Octopus Fishery
- Pipi Fishery
- Rock Lobster Fishery
- Scallop (Ocean) Fishery
- Wrasse (Ocean) Fishery

No areas where aquaculture or seaweed harvesting occurs where identified within the Activity Planning Area and Environmental Planning Area.

Information relating to the target species, fishing locations, landed catch, value and other relevant aspects of each fishery is included in the following sections. Maps are also provided showing where catch and effort has been reported in a VFA grid between 2011 – 2022 in relation to the Activity Planning Area and Environmental Planning Area.

Data sources are from the Victorian Fisheries Authority Commercial Fish Production Information Bulletin July 2021 to June 2022 (VFA 2022) and VFA website (VFA 2023).

Table 2 provides a summary of the Victorian fisheries with catch and effort within the Activity Planning and Environmental Planning Areas.

Table 2: Summary of Victorian Fisheries with Fishing Catch and Effort within the Activity Planning and Environmental Planning Areas

Fishery	**Fishing activity within the Activity Planning Area**	**Fishing Activity within the Environmental Planning Area**	**Note**
Abalone Fishery	No	Yes	The Activity Planning Area does not overlap the fishery while the Environmental Planning Area overlaps the Western and Central zones of the fishery.
Bays and Inlet Fisheries	No	No	The fishery is not within the Activity Planning Area or Environmental Planning Area.
Eel Fishery	No	No	As the Activity Planning Area or Environmental Planning Area does not overlap with coastal river basins there is no overlap with this fishery. The Activity Planning Area or Environmental Planning Area may overlap where glass eels migrate.
Giant Crab Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Giant Crab Fishery.
Multispecies Ocean Fisheries – Ocean General	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Ocean General Fishery.
Octopus Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Octopus Fishery.
Pipi Fishery	No	Yes	The Environmental Planning Area overlaps the actively fished areas of the Discovery Bay zones of the Pipi Fishery.
Rock Lobster Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Rock Lobster Fishery.
Scallop Fishery	No	No	The Scallop Fishery does not operate within the Activity Planning Area or Environmental Planning Area.
Wrasse (Ocean) Fishery	Yes	Yes	The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Wrasse (Ocean) Fishery.

Abalone Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Abalone Fishery	Blacklip abalone Greenlip abalone	The Abalone Fishery is one of Victoria's most valuable commercial fisheries. It operates along most of the Victorian shoreline, generally to 30 m depth where abalone are harvested by divers. Fishing is only allowed between sunrise and sunset. Abalone catch effort data was not provided by VFA due to confidentiality requirements but based on water depths, the Activity Planning Area does not overlap the fishery, while the Environmental Planning Area overlaps the Western and Central zones of the fishery. As of June 2022, there were 14 licences in the Western Zone and 33 in the Central Zone. Total allowable commercial catch limits of blacklip abalone for the Western Zone are considerably less than the Central Zone (2021-22 season: 66 tonnes compared with 251.2 tonnes, respectively). Greenlip abalone total allowable commercial catch limits are considerably lower than for blacklip abalone with 1.6 tonnes for the Western Zone and 3.46 tonnes for the Central Zone.	No	Yes

Bays and Inlet Fisheries

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Bays and Inlet Fisheries	Multi-species	Multi-species, multi gear fishery utilising octopus pot, bay fish trap, commercial hoop net, seine net, mesh net, fishing line (including a longline), mussel rake underwater breathing apparatus and a hand operated bait pump. The larger bay and inlet fisheries include Western Port, Port Phillip Bay, Corner Inlet/Nooramunga and the Gippsland Lakes. These areas are not within the Activity Planning Area or Environmental Planning Area.	No	No

Eel Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Eel Fishery	Short-finned eel Long-finned eel	Eel are harvested in Victorian coastal river basins south of the Great Dividing Range. Short-finned eels are found across the State, while long-finned eels are only found in eastern Victoria. Both species spend the majority of their life cycle in fresh water or estuaries but travel to the ocean to spawn once before dying. Spawning is thought to occur in the vicinity of the Coral Sea, although no precise spawning location for either species has been identified. Eggs are thought to be pelagic and hatch after about two days. Larvae are transported southwards along the east coast of Australia where they metamorphose into glass eels and swim into coastal bays and estuaries. Most short-finned glass eels migrate in the winter and spring, while long-finned glass eels migrate during summer and autumn. Commercial fishers are only permitted to use fyke nets to take eels and the number, dimensions, and mesh size of fyke nets is prescribed by regulation. As the Activity Planning Area or Environmental Planning Area does not overlap with coastal river basins there is no overlap with this fishery. However, the Activity Planning Area or Environmental Planning Area may overlap where glass eels migrate.	No	No

Giant Crab Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Giant Crab Fishery	Giant crab	Giant crabs are fished commercially in western Victoria. The fishery is a small quota managed fishery that is closely linked with the Rock Lobster Fishery. The majority of vessels are used primarily for rock lobster fishing with giant crab taken as by-product. However, a small number of fishers target giant crabs and processors who specialise in exporting giant crab have developed technologies to store and transport live crabs to international markets. The boundaries of the fishery mimic those of the Rock Lobster Fishery, however the fishery is based in the Western Zone. Giant crabs inhabit the continental slope at approximately 200 metres depth and are most abundant along the narrow band of the shelf edge. Closed seasons are: • Male: 15 September to 15 November to protect males during moult. • Female: 1 June to 15 November to protect females while breeding and in berry (with eggs attached). Total landed catch in 2015-16 was 10 tonnes. Data since then is not available due to insufficient data to report because there are less than five licence holders (policy requirement to protect commercial confidentiality of data). The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Giant Crab Fishery (Figure 14). Data from VFA for the last 5 years (2018 - 2022 shows the number of days fished in a block for that period (Figure 14). Fishing intensity is concentrated along the edge of the shelf with a maximum of 78 days fished in Activity and Environment Planning Area.	Yes	Yes

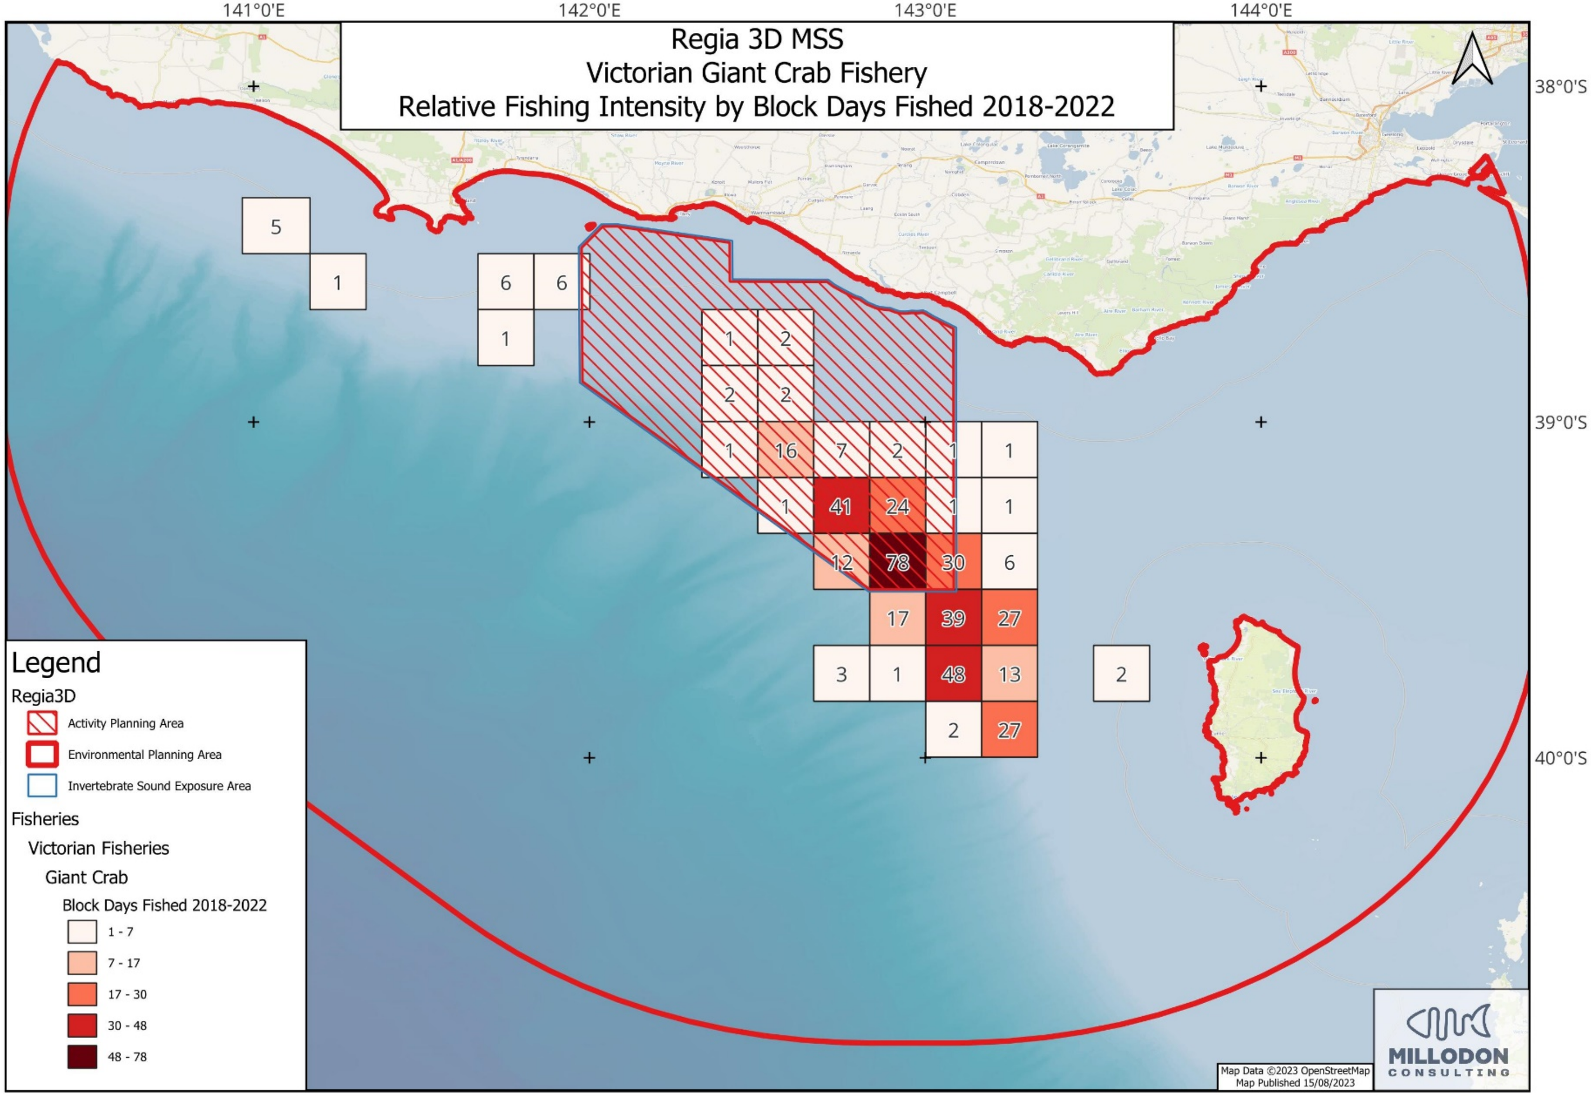

Figure 14: Giant Crab Fishery Relative Fishing Intensity within the Activity Planning Area and Environmental Planning Area

Multispecies Ocean Fisheries

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Multispecies Ocean Fisheries – Ocean General	Gummy shark School shark Australian salmon Snapper Small flathead bycatch	The wrasse, inshore trawl, southern rock lobster and giant crab fisheries are able to catch gummy shark and school sharks as part of their fishery. Snapper is caught using lines, nets and haul seine. Over 90% of the catch is from Port Phillip Bay, and around 5% from coastal waters. In 2020/21, 45 tonnes were landed but a value could not be provided as there is insufficient data to report because there are less than five licence holders (policy requirement to protect commercial confidentiality of data). The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Ocean General Fishery (Figure 15). Data from VFA for the last 5 years (2018 - 2022 shows the number of days fished in a block for that period (Figure 15). Fishing intensity is concentration nearshore with a maximum of 79 days fished in Activity Planning Area and 363 days in the Environment Planning Area.	Yes	Yes

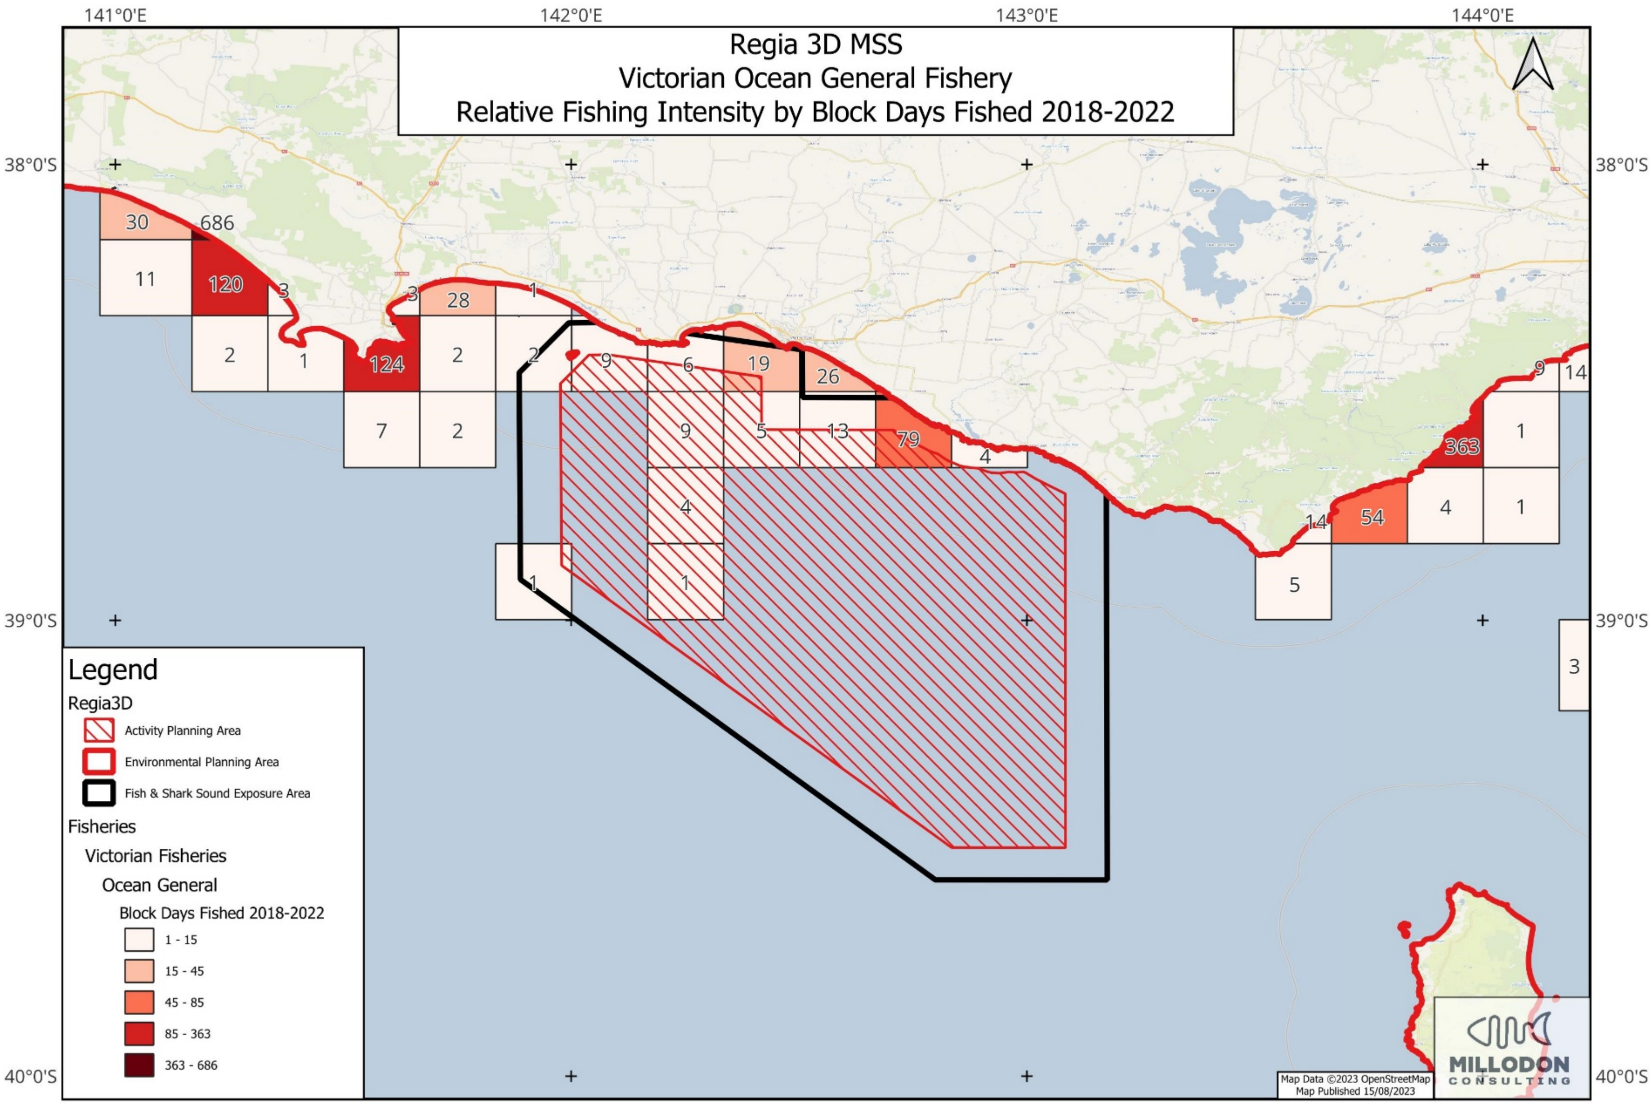

Figure 15: Ocean General Relative Fishing Intensity within the Activity Planning Area and Environmental Planning Area

Octopus Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Octopus Fishery	Pale octopus Maori octopus Gloomy octopus	Victoria's new Octopus (Eastern Zone) Fishery harvests mainly pale octopus in East Gippsland using purpose-built unbaited traps which minimise bycatch. The fishery may also catch Maori octopus and gloomy octopus. The fishery commenced on 1 August 2020. Three zones have been established for the management to commercial octopus fishing in Victoria: Eastern, Central and Western. Octopus Fishery Access Licences authorise commercial take of octopus from the Eastern Octopus Zone. Octopus fishing in the central and western octopus zones is less established and is being managed by the VFA through exploratory, temporary permits. The Activity Planning Area is within the Western Octopus Zone and the Environmental Planning Area is within the Western and Central Octopus Zones. The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Octopus Fishery (Figure 16). Data from VFA for the last 5 years (2018 - 2022 shows the number of days fished in a block for that period (Figure 16). Fishing intensity is concentration west of the Activity Planning Area with a maximum of 1 day fished in Activity Planning Area and 15 days in the Environment Planning Area.	Yes	Yes

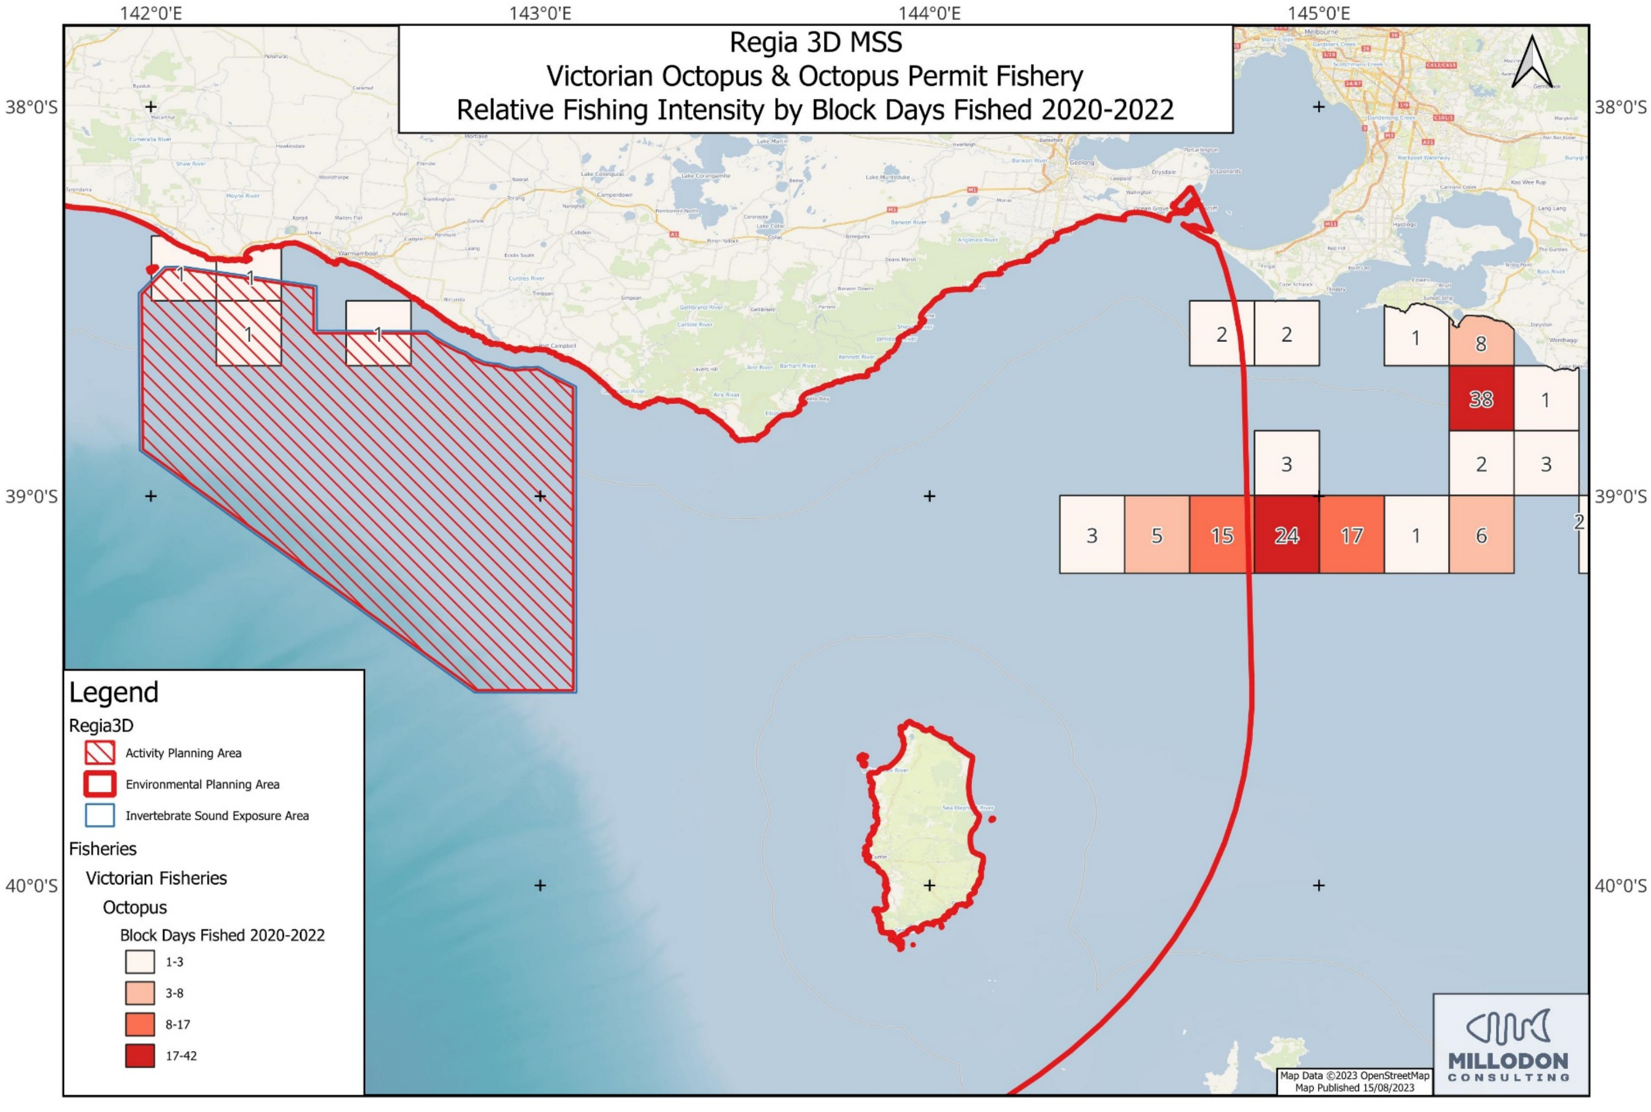

Figure 16: Octopus Fishery Relative Fishing Intensity within the Activity Planning Area and Environmental Planning Area

Pipi Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Pipi Fishery	Pipi	The new Victorian Pipi Fishery commenced on 1 April 2020. Pipi Fishery Access Licences have been issued for the Discovery Bay and Venus Bay commercial management zones. The Total Allowable Catch for the 2020/2021 season has been set at 10 tonne in Discovery Bay Western Zone, 40 tonne in Discovery Bay Eastern Zone and 2 tonne in the Venus Bay Commercial Zone. The Activity Planning Area does not overlap the area actively fished by the Pipi Fishery (Figure 17). The Environmental Planning Area overlaps the Discovery Bay zones (Figure 17).	No	Yes

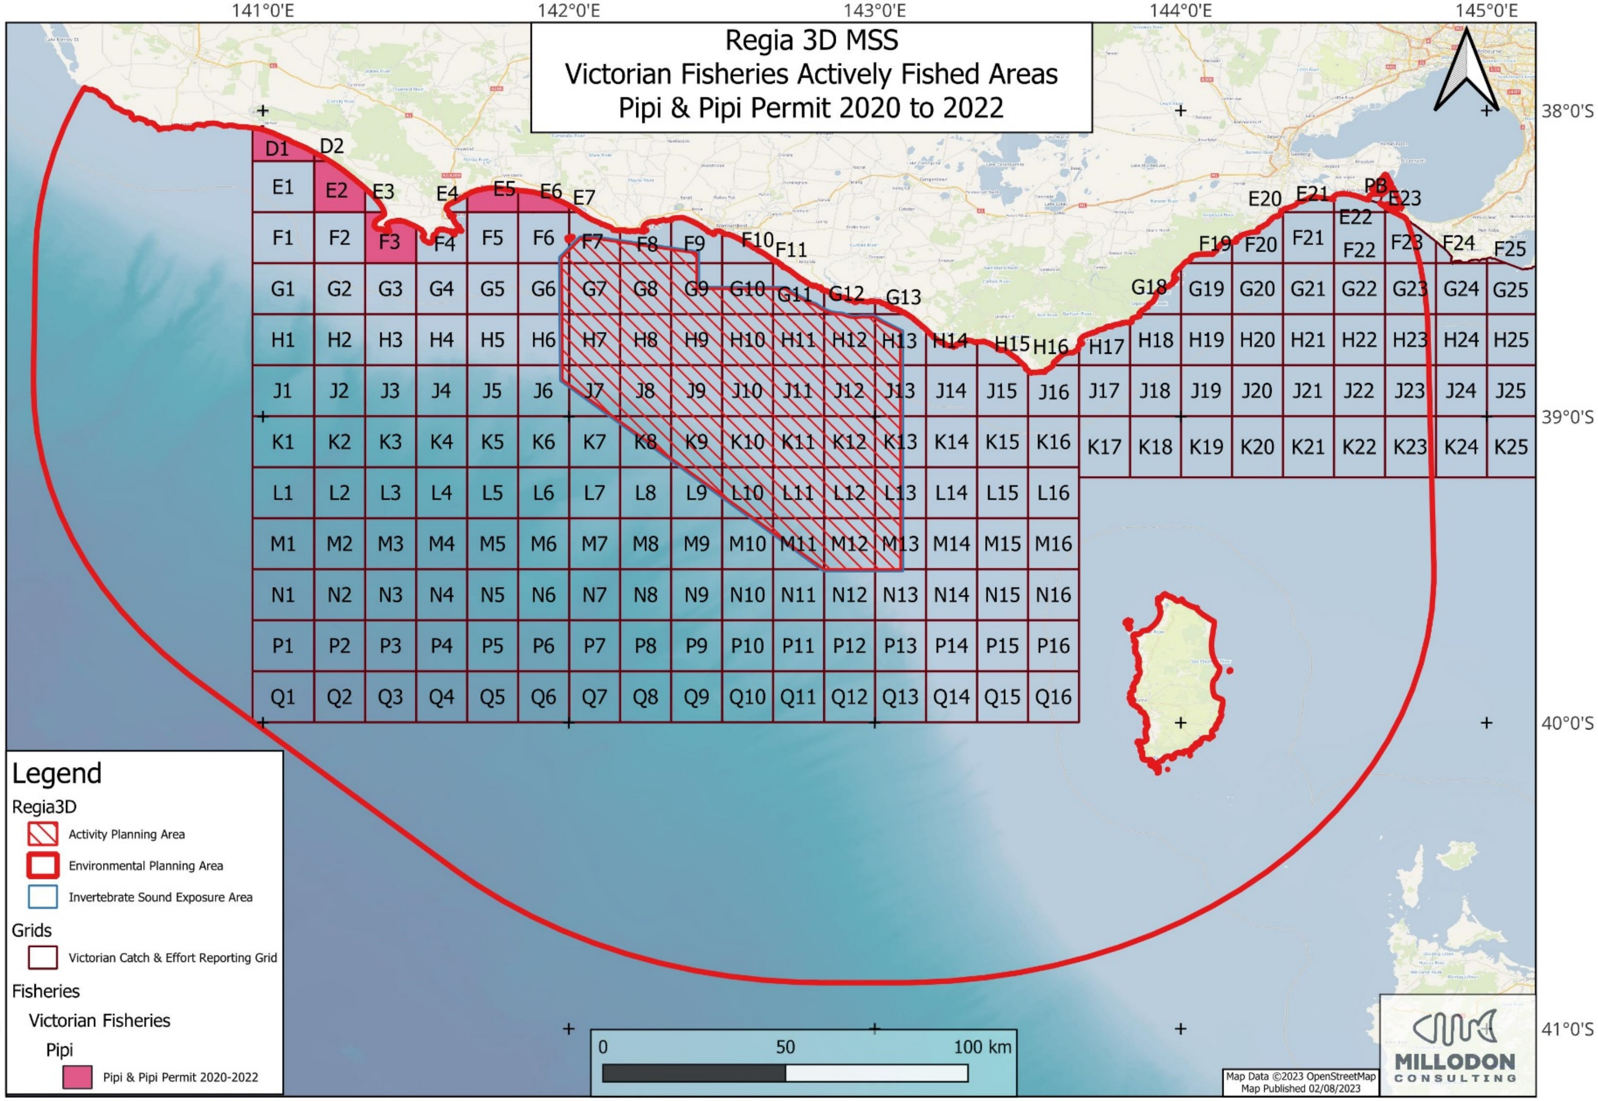

Figure 17: Pipi Fishery Permit Areas within the Activity Planning Area and Environmental Planning Area

Rock Lobster Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Rock Lobster Fishery	Southern rock lobster	The Rock Lobster Fishery is Victoria's most valuable fishery value of A$13.6 million in 2020/21 and is based on the southern rock lobster. The fishery is divided into two separately managed zones: the Eastern Zone and the Western Zone. Southern rock lobsters are found to depths of 150 m, with most of the catch coming from inshore waters less than 100 m deep. Fishing for rock lobsters is prohibited during closed seasons. • The closed season for female rock lobsters is from 1 June to 15 November and is designed to protect females in berry (with eggs attached) during the spawning period. • The closed season for male rock lobsters is from 15 September to 15 November and is designed to protect males during the moulting period when soft shells increase their vulnerability. The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Rock Lobster Fishery (Figure 18). Since 2009/10, annual quotas for the western zone that overlaps the Activity Planning Area have been set at between 230 and 260 tonnes and have been fully caught each year. In the western zone, most catch is landed through Portland, Port Fairy, Warrnambool, Port Campbell, and Apollo Bay. Data from VFA for the last 5 years (2018 - 2022 shows the number of days fished in a block for that period (Figure 18). Fishing intensity is concentration near with a maximum of 642 day fished in Activity Planning Area and 18.13 days in the Environment Planning Area.	Yes	Yes

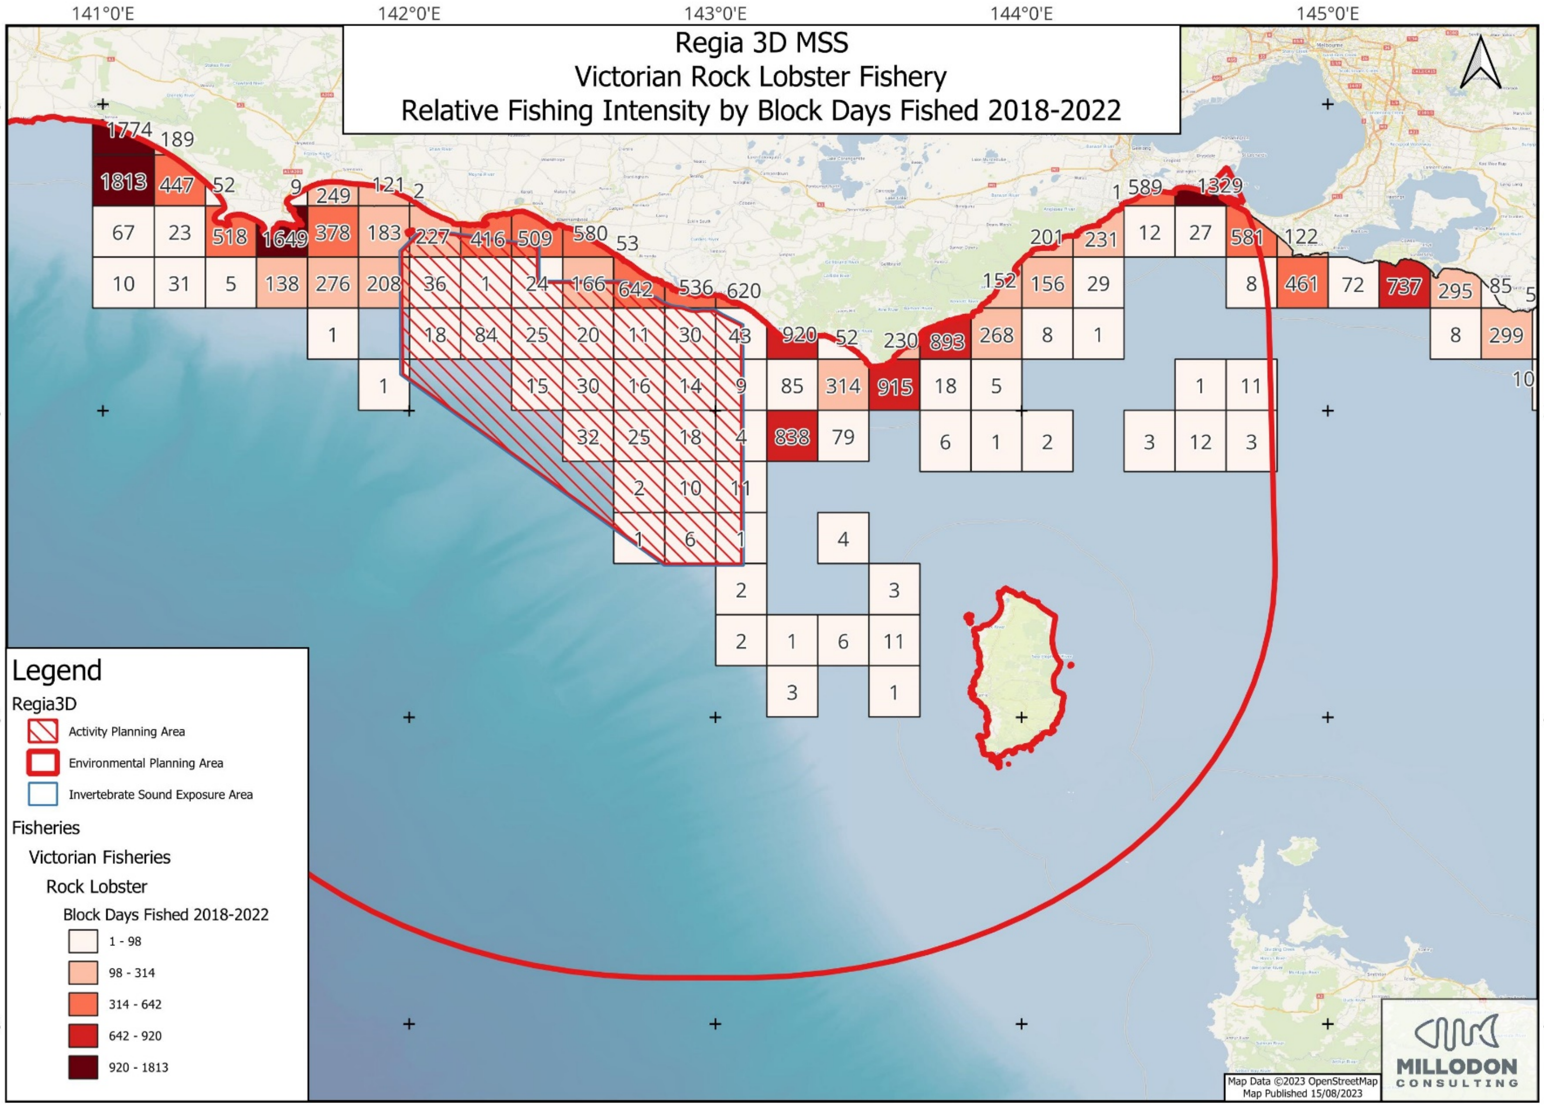

Figure 18: Rock Lobster Relative Fishing Intensity within the Activity Planning Area and Environmental Planning Area

Scallop Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Scallop Fishery	Scallops	The Scallop Fishery is within the waters of the Victorian zone extend out to 20 nm from the high tide water mark but exclude the bays and inlets along the coast where commercial fishing for scallops is prohibited. The Scallop Fishery does not operate within the Activity Planning Area or Environmental Planning Area (Figure 19).	No	No

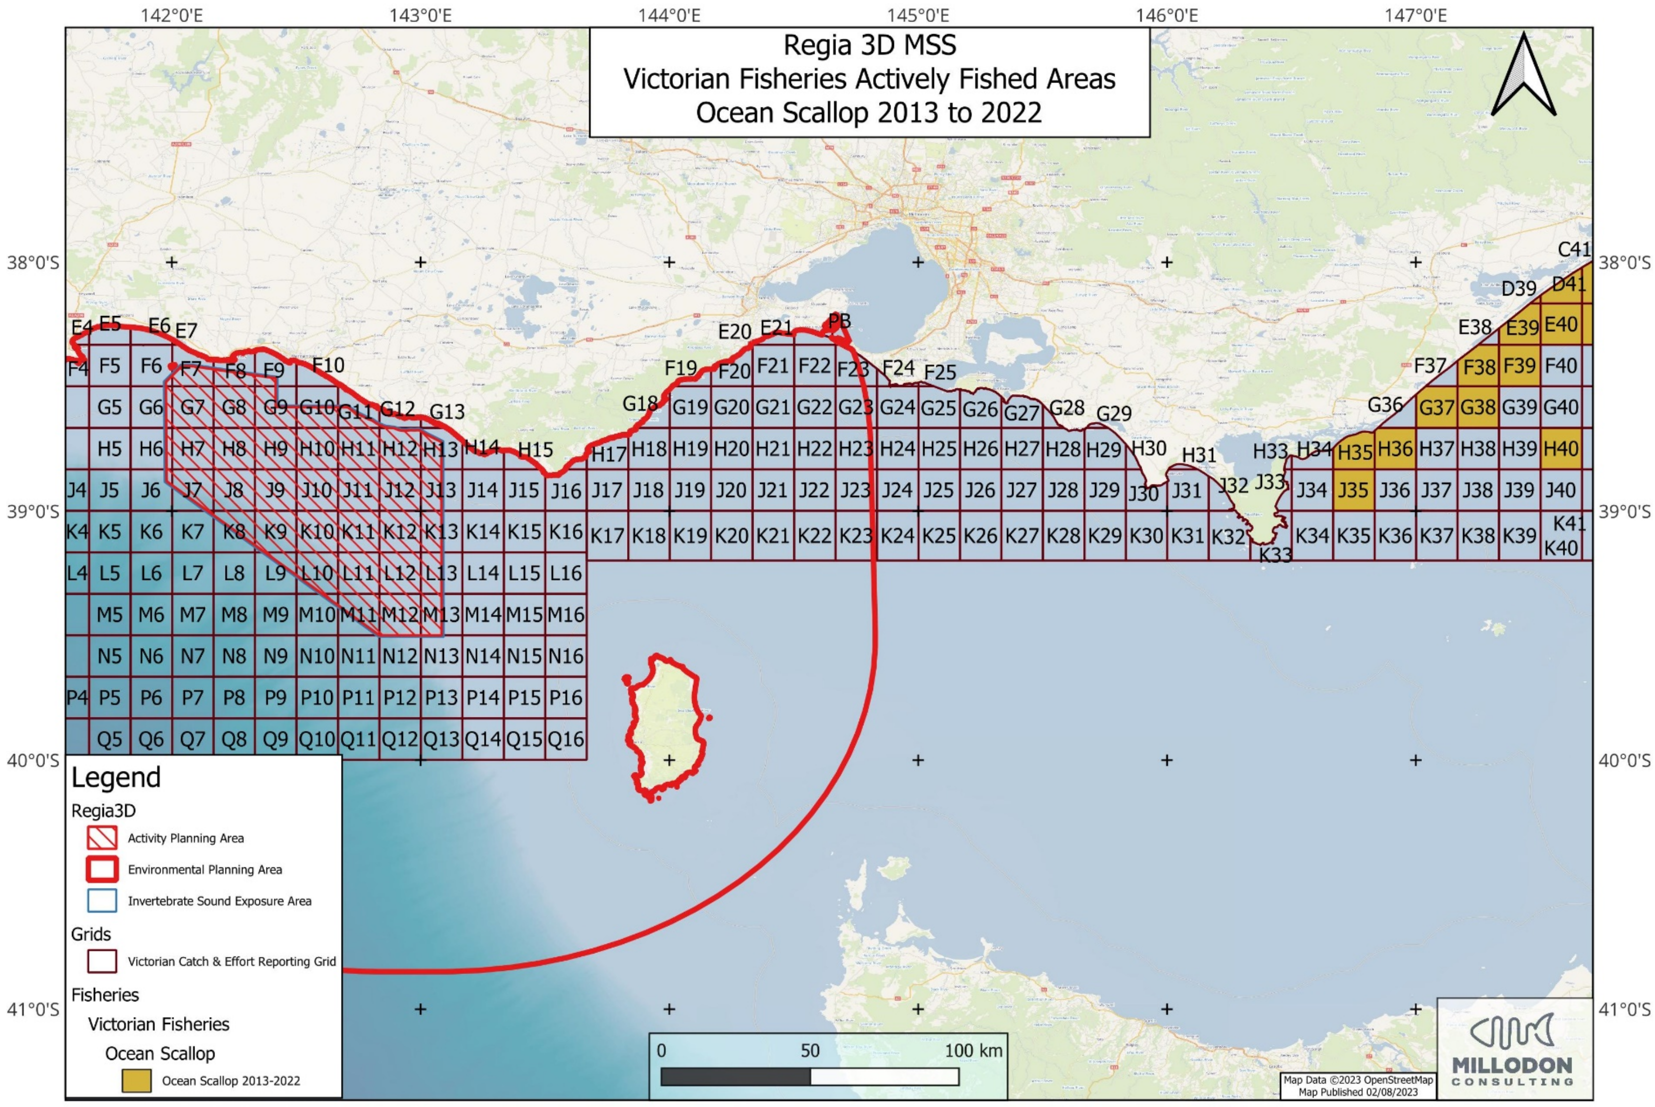

Figure 19: Scallop Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

Wrasse (Ocean) Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Wrasse (Ocean) Fishery	Wrasse	The fishery extends along the entire length of the Victorian coastline and out to 20 nm offshore, except for marine reserves. Fishers mostly use hook and line. Limited entry fishery with 23 licences at June 2022. Total annual catch in 2021/22 was 21 tonnes. Most wrasse is harvested by hook and line, although commercial rock lobster fishers who also hold a commercial wrasse licences can keep those fish that they catch in their rock lobster pots. Wrasse inhabit depths up to 160 m, whereas fishers mostly operate in depths shallower than 30 m to reduce their losses due to barotrauma, where the swim bladder expands and damages the fish as it is hauled to the surface. The Activity Planning Area and Environmental Planning Area overlap the area actively fished by the Wrasse (Ocean) Fishery (Figure 20). Data from VFA for 2011 - 2022 shows the maximum number of vessels in grids within the Activity Planning Area was three, with a maximum fishing days of 106.	Yes	Yes

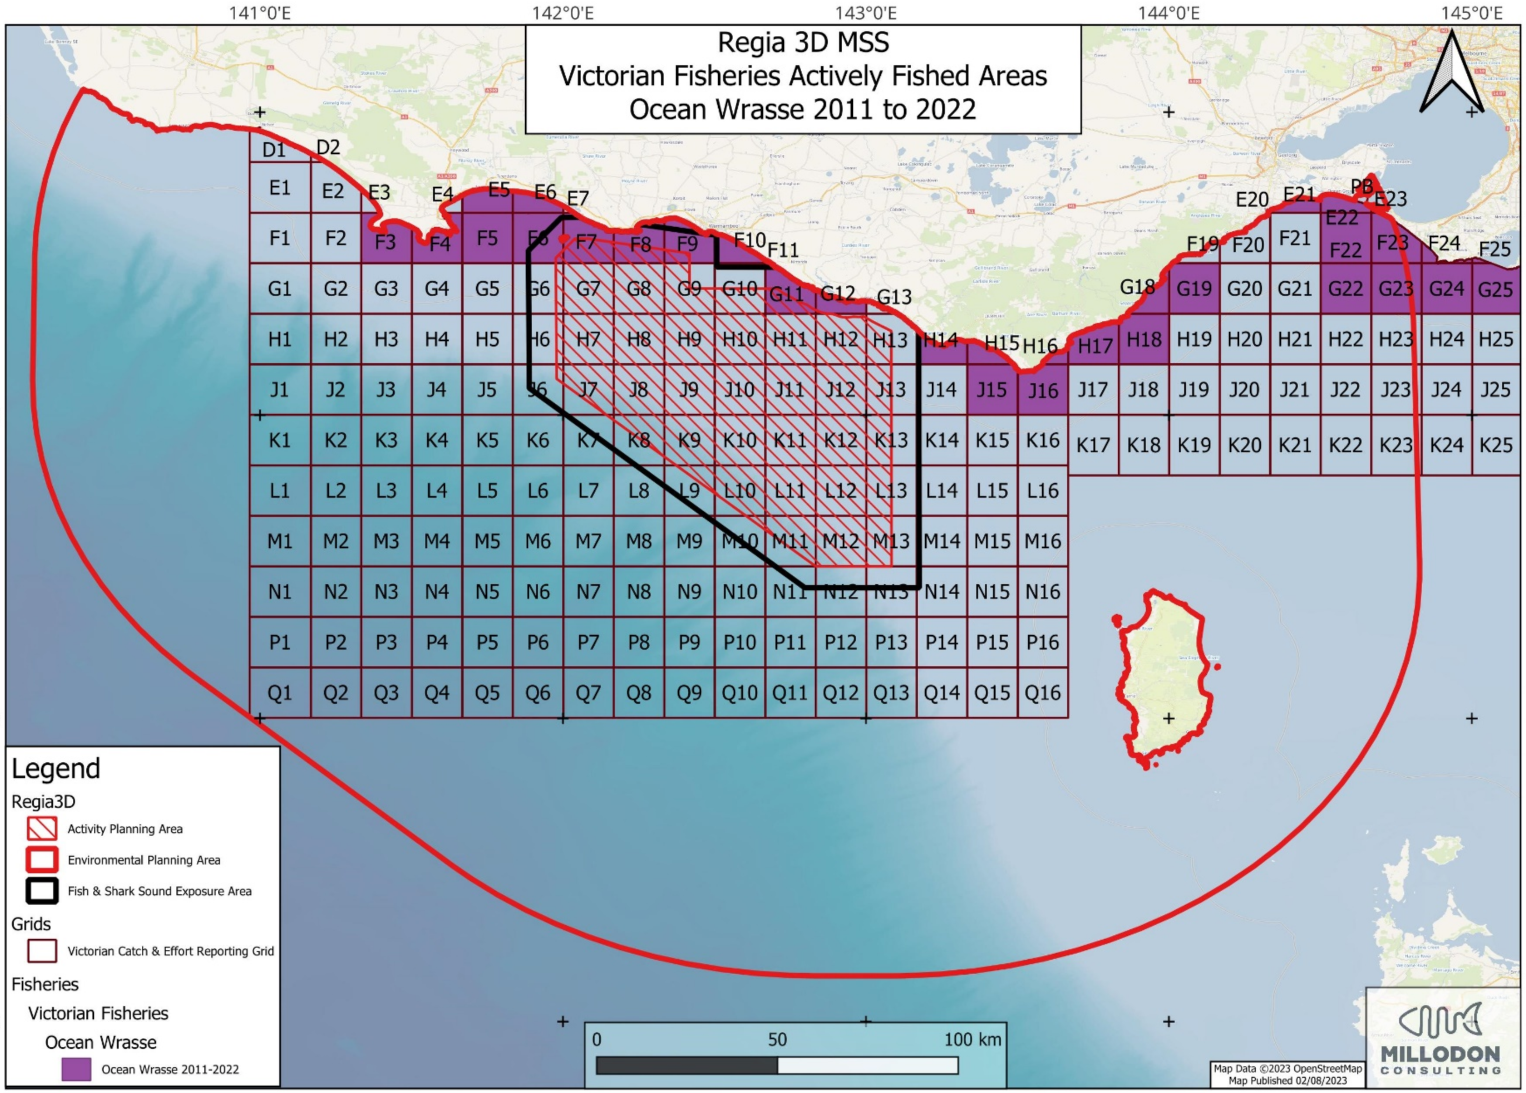

Figure 20: Wrasse (Ocean) Fishery Fishing Effort within the Activity Planning Area and Environmental Planning Area

Tasmanian Fisheries

The Department of Natural Resources and Environment Tasmania (DNRET) manages Tasmania's commercial fisheries under the *Living Marine Resources Management Act 1995*.

All fisheries except for the Giant Crab Fishery and the Rock Lobster Fishery operate within Tasmanian waters. The Giant Crab Fishery and the Rock Lobster Fishery also operate in Commonwealth waters under an Offshore Constitutional Settlement (OCS) between the Australian Government and the Government of Tasmania.

Via stakeholder consultation with DNRET it was confirmed that no Tasmanian fisheries overlap the Activity Planning Area and that the following fisheries may fish within the Environmental Planning Area around King Island.

- Abalone Fishery
- Giant Crab Fishery
- Octopus Fishery
- Rock Lobster Fishery

Information relating to the target species, fishing locations, landed catch, value and other relevant aspects of each fishery is included in the following sections. Data sources are from the Fishing Tasmania (2023) and UTAS (2023) unless noted.

Abalone Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Abalone Fishery	Blacklip abalone Greenlip abalone	The Tasmanian wild abalone industry operates within Tasmanian coastal waters (Figure 21) and is a major contributor to the Tasmanian economy. It is the largest wild abalone fishery in the world, providing around 25% of the annual harvest. Abalone are hand-captured by divers in depths between 5-30 m. Blacklip abalone are collected on rocky substrate around the Tasmanian shoreline and are the main focus of the fishery. Greenlip abalone are distributed along the north coast and around the Bass Strait islands and usually account for around 5% of the total wild harvest. In 2020/21, the gross value of production of the fishery was around $50 million from a total catch of approximately 1,000 tonnes. The Activity Planning Area does not overlap the area actively fished by the Abalone Fishery, while the Environmental Planning Area overlaps the fishery area around King Island (Figure 21).	No	Yes

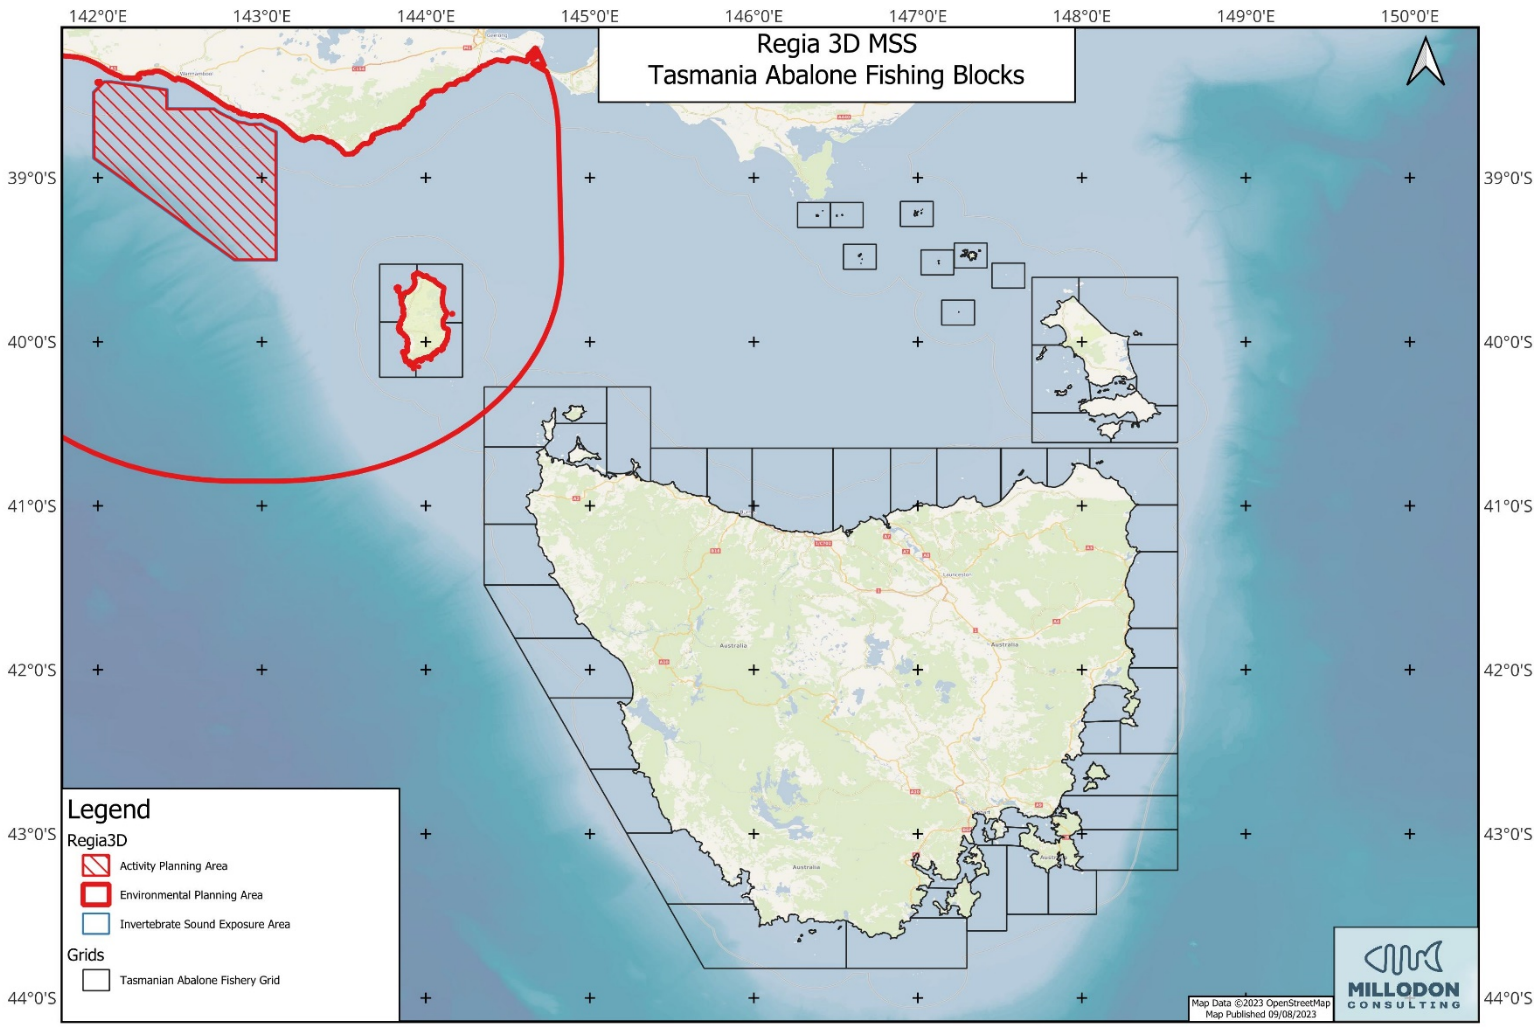

Figure 21: Tasmania Abalone Fishing Block Map

Giant Crab Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Giant Crab Fishery	Giant crab	The Giant Crab Fishery is a comparatively small fishery with the annual harvest set at 20.7 tonnes but with a high landed value of around $2 million. The fishery is managed by Tasmania under an Offshore Constitutional Settlement (OCS) between the Australian Government and the Government of Tasmania despite the majority of catch taken in Commonwealth waters. The Giant Crab Fishery has the following closures: • Females - from 15 November in a year to 31 May the following year inclusive. The Activity Planning Area does not overlap the Giant Crab Fishery, while the Environmental Planning Area overlaps the fishery area around King Island (Figure 22).	No	Yes

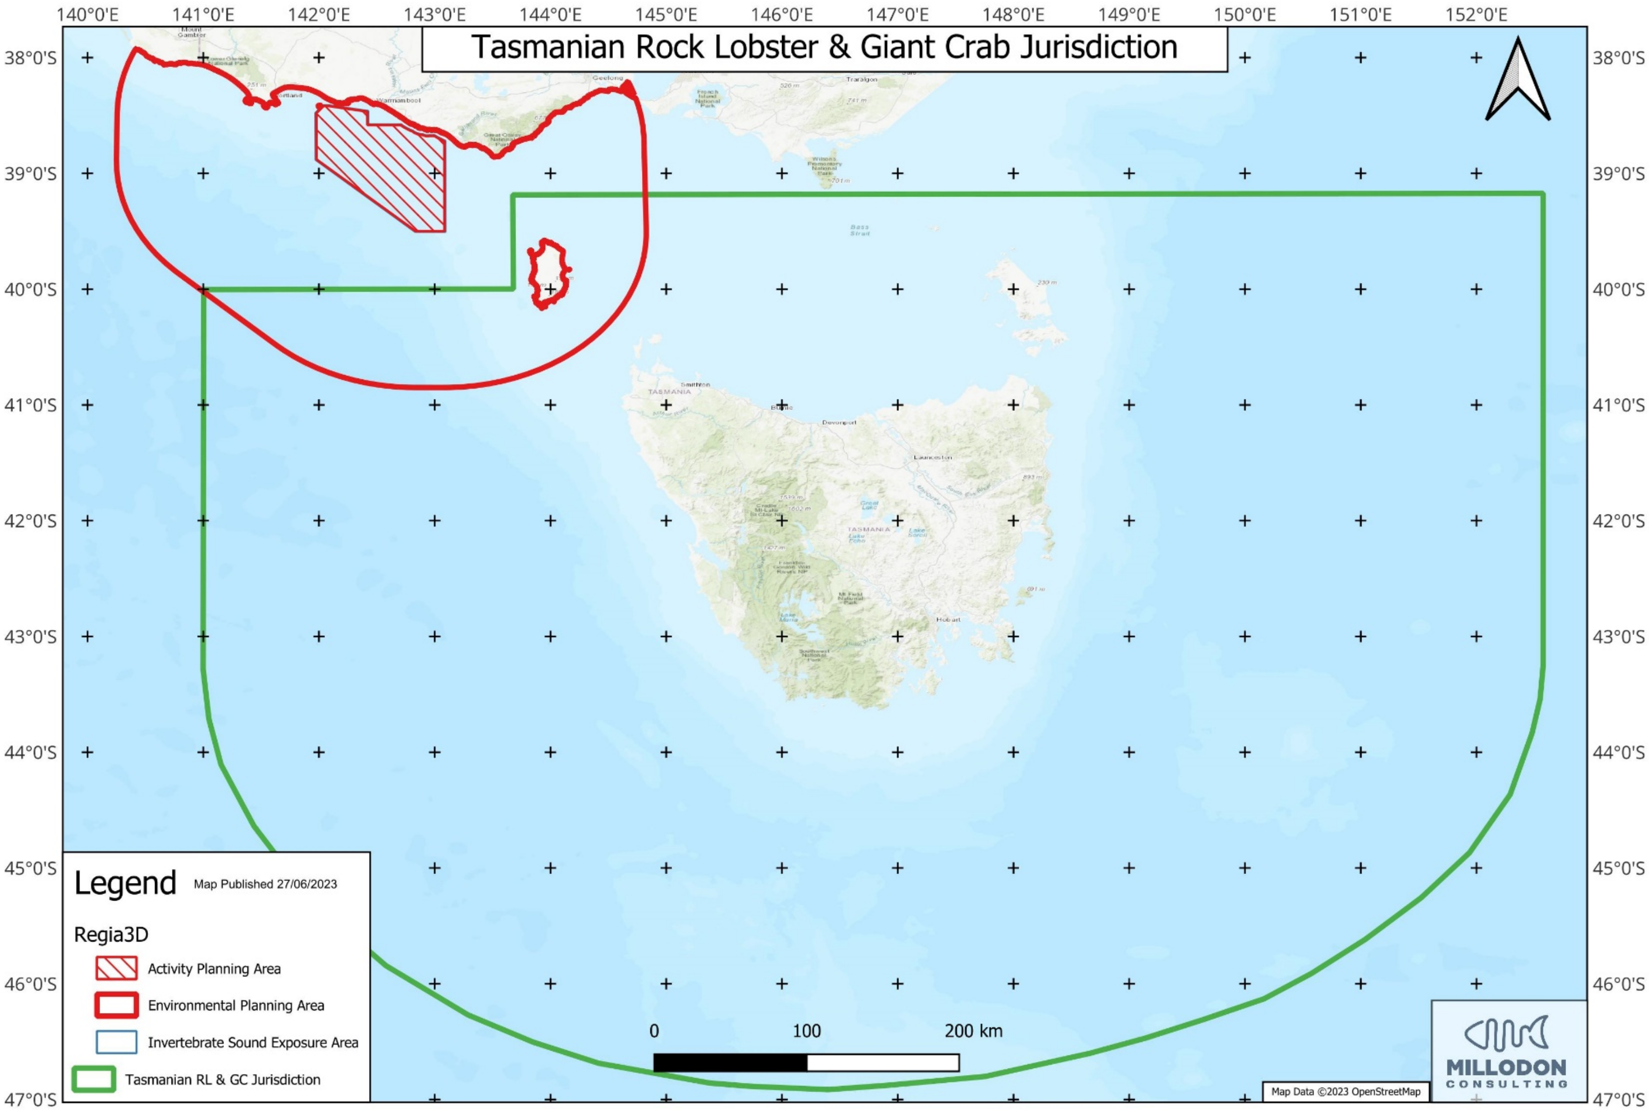

Figure 22: Tasmanian Giant Crab Fishery and Rock Lobster Fishery Jurisdiction

Octopus Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Octopus Fishery	Pale octopus Gloomy octopus Maori octopus	Information in this section is from Fraser et. al (2022). Octopus are caught commercially in Tasmanian waters across multiple fisheries using a range of gear types. Most catch comes from a targeted unbaited trap fishery for pale octopus in northern Tasmania, primarily Bass Strait, by fishers operating under the fishing licence (octopus). Holders of the fishing licence (octopus) also retain low quantities of Māori octopus as by-product and take occasional landings of gloomy octopus in years when the fishery extends towards eastern Bass Strait. The Scalefish and Rock Lobster fisheries take octopus as by-product. The total catch of pale octopus in 2020/21 was 154 t, representing the highest recorded catch. These catches are well above the average of 100 t observed over the last decade. Almost all the catch in 2020/21 (72%) occurred in only three fishing blocks – two east of King Island and one inshore adjacent to Stanley. Two licences have been issued for the operation of two vessels. The Activity Planning Area does not overlap the Octopus Fishery, while the Environmental Planning Area overlaps the fishery area on the west side of King Island (Figure 23).	No	Yes

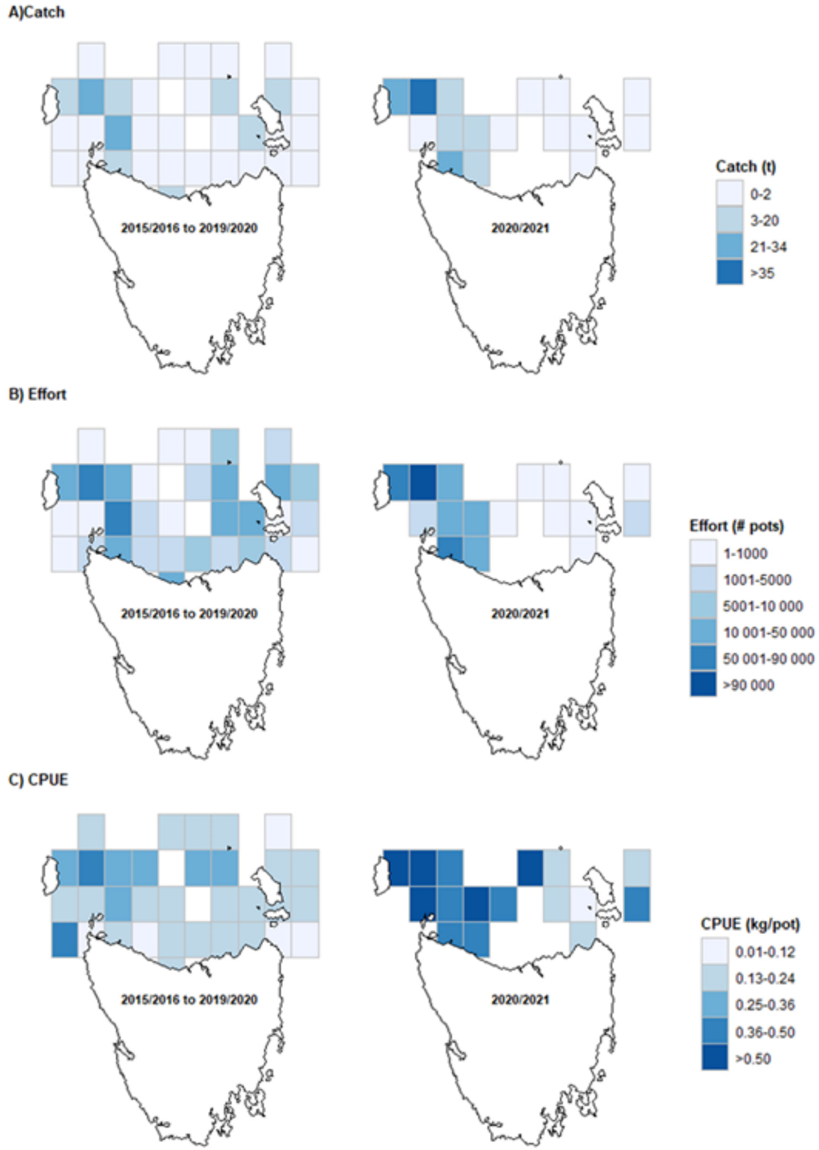

Figure 23: Pale Octopus Catch, effort (pot lifts) and nominal CPUE averaged over the last 5 years (left) and for 2020/21 (right) (Fraser et. al 2022)

Rock Lobster Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Rock Lobster Fishery	Southern rock lobster	The Rock Lobster Fishery primarily targets southern rock lobster, and small amounts of eastern rock lobster (less than 1% of the fishery). The commercial fishery currently catches just over 1,000 tonnes per annum with a landed value of about $90 million. Commercial fishers use baited pots to harvest lobster all around Tasmania, including in waters surrounding major islands. The fishery takes place in Tasmanian and Commonwealth waters (Figure 24). The Rock Lobster Fishery has the following season closures: • Males: 1 October to 15 November for all state waters (except for September closed region which is outside of Environmental Planning Area) to protect males during moulting period. • Females: 1 May to 15 November to protect females in berry (with eggs attached). The Activity Planning Area is not overlapped by the Tasmanian Rock Lobster Fishery, while the Environmental Planning Area overlaps the fishery area around King Island (Figure 24).	No	Yes

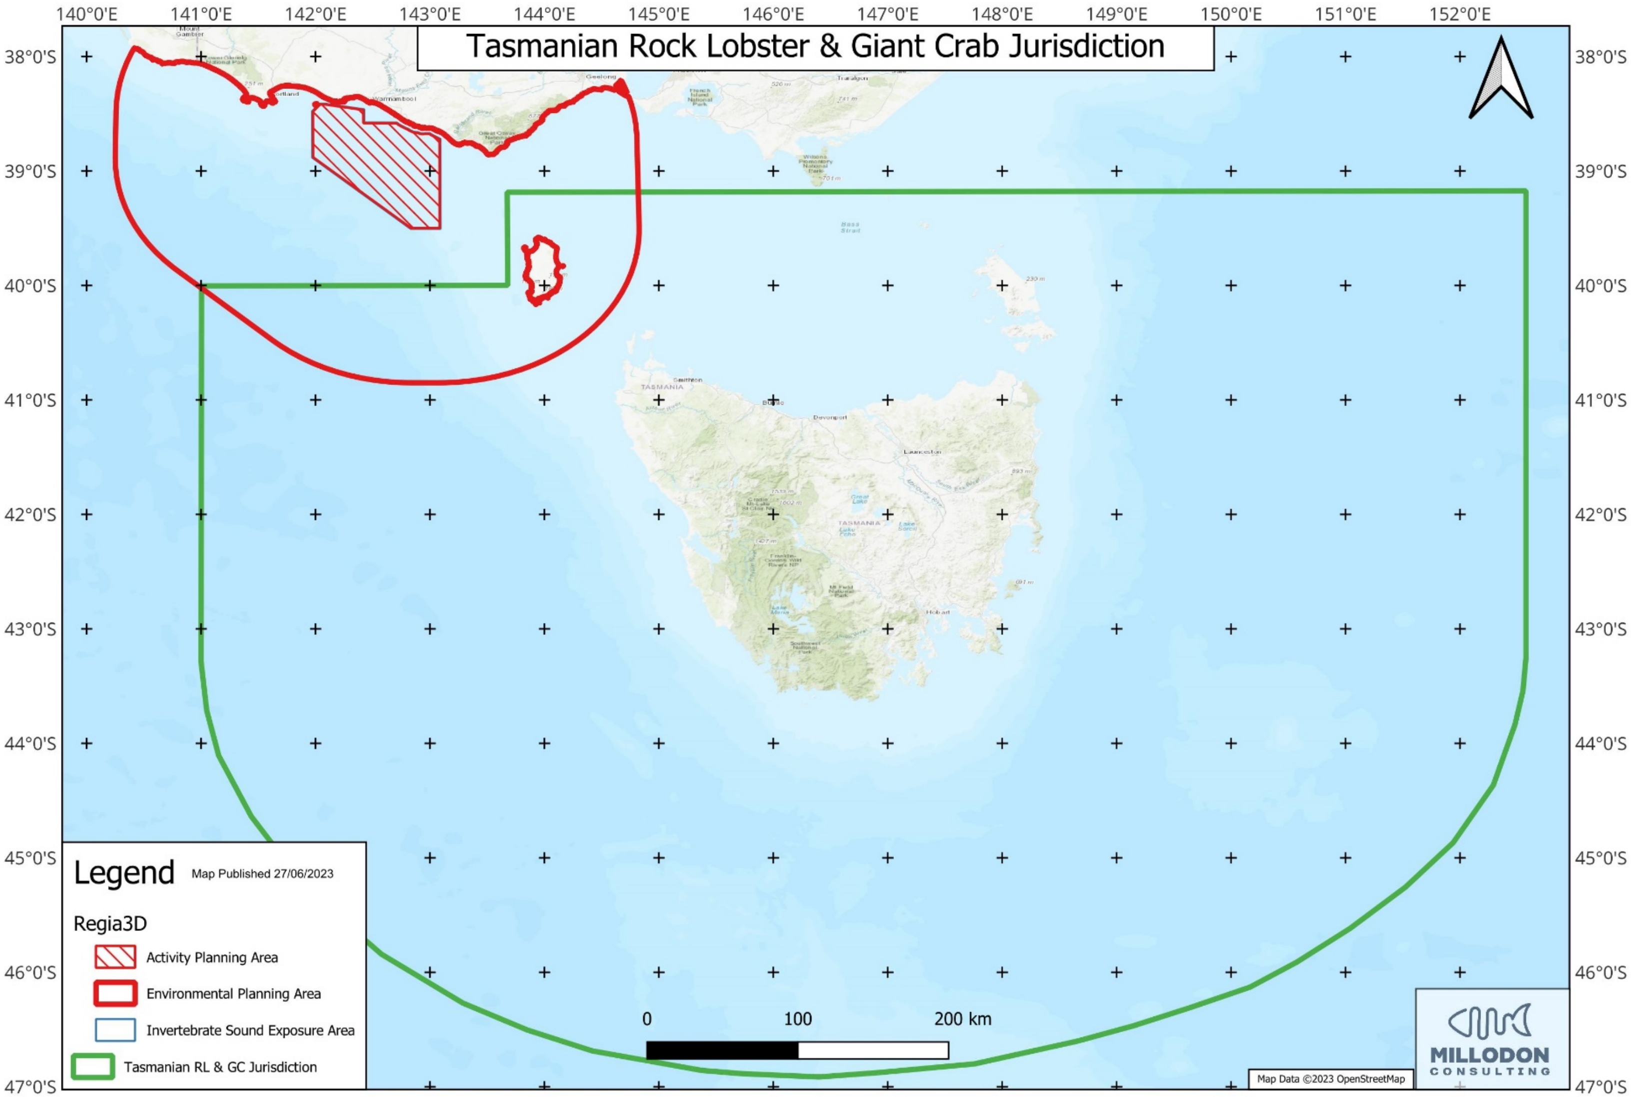

Figure 24: Tasmanian Giant Crab Fishery and Rock Lobster Fishery Jurisdiction

South Australian Fisheries

The *Fisheries Management Act 2007* and its regulations provide the legislative framework, objectives and guiding principles for the management of fisheries in South Australia. Management rules for commercial fisheries are provided in fisheries regulations under the Act.

The Department of Primary Industries and Regions (DPIR) is responsible for the ecologically sustainable development of South Australia's aquatic resources and the administration of the *Fisheries Management Act 2007*.

The Activity Planning Area does not overlap any South Australian Fisheries (Figure 25).

Data from DPIR identified that the Environmental Planning Area overlaps fishing blocks 56 and 58 in the Southern Zone of South Australia's Marine Fishing Areas (MFA) grid (Figure 25) where the following fisheries are active:

- Abalone Fishery
- Charter Boat Fishery
- Giant Crab Fishery
- Marine Scalefish Fishery
- Rock Lobster Fishery

Information relating to the target species, fishing locations, landed catch, value and other relevant aspects of each fishery is included in the following sections. Data sources are from DPIR fishing data from 2012 to 2022 for fishing blocks 56 and 58, which the Environmental Planning Area overlaps, and DPIR (2023), unless noted.

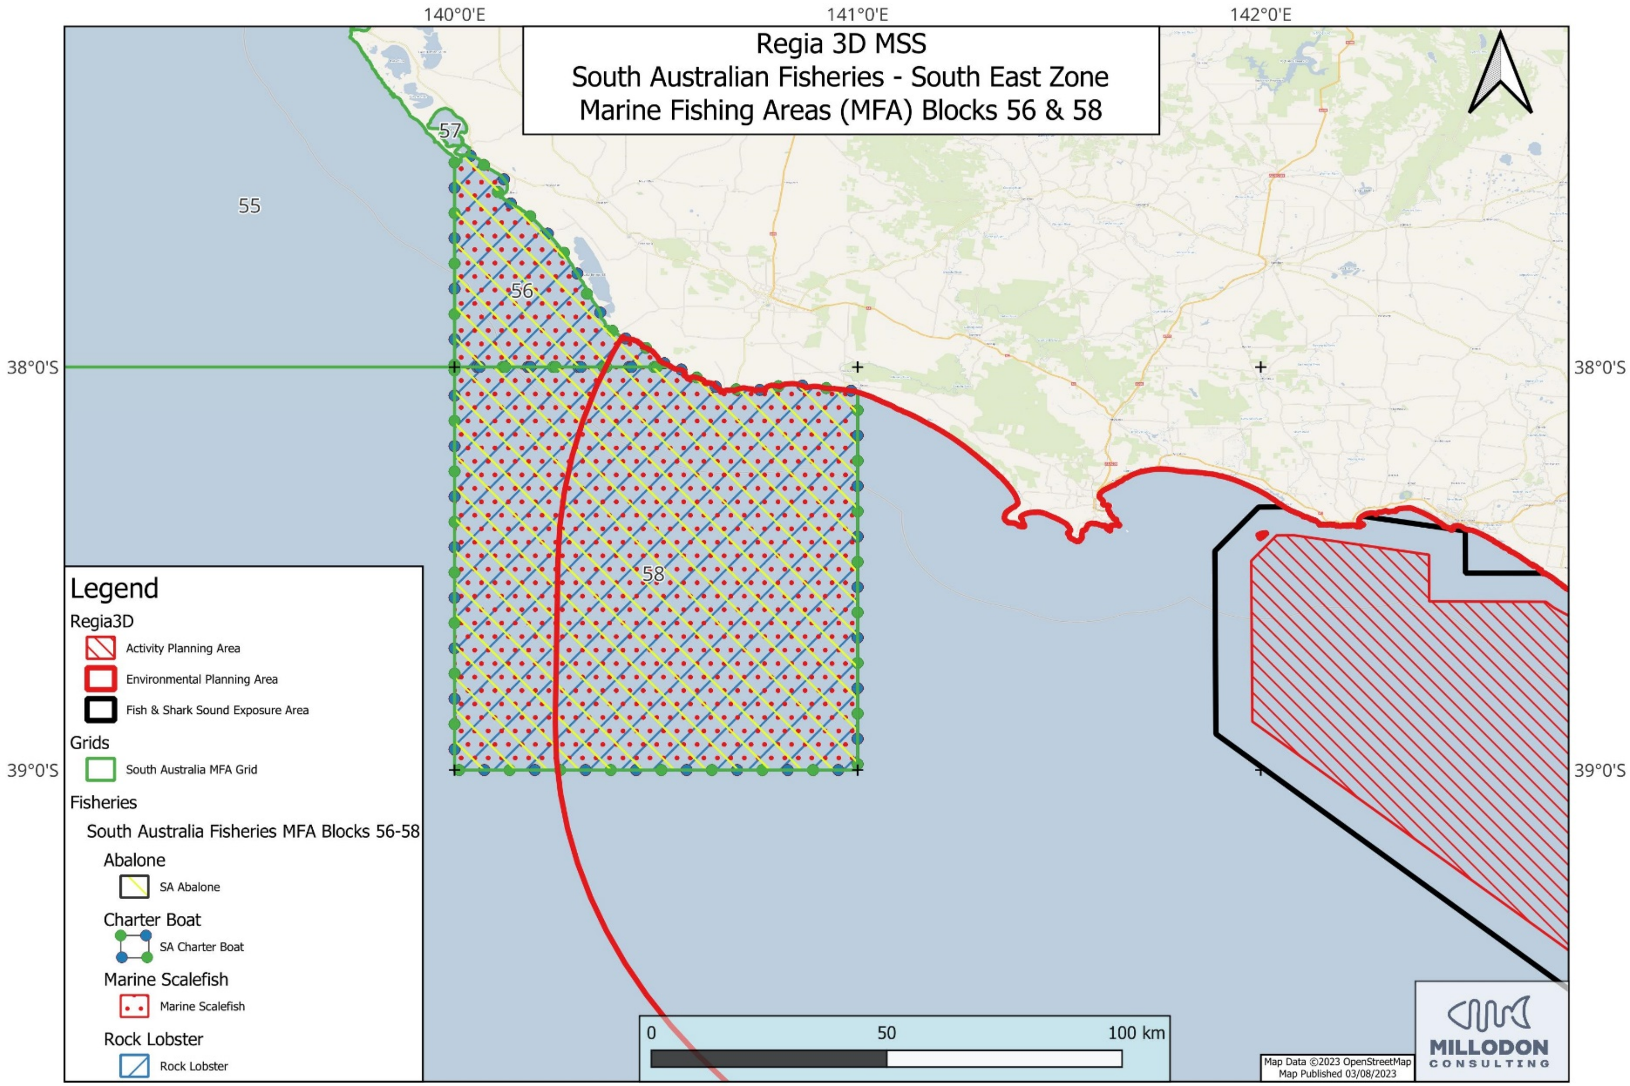

Figure 25: South Australian Fisheries within the Environmental Planning Area

Abalone Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Abalone Fishery	Blacklip abalone Greenlip abalone	The South Australian commercial abalone fishery takes greenlip and blacklip abalone that inhabit subtidal reefs out to approximately 30 m. Commercial abalone divers mostly operate from large, trailered boats. Divers use surface supplied air from the boat and may use motorised cages to mitigate physical interactions with white sharks. The Activity Planning Area does not overlap the fishery. The Environmental Planning Area overlaps the Southern Zone of the fishery where there have been six active licences from 2021 to 2022. Hours dived range from 921 to 1496 per year with annual catch between 101,133 to 153,491 kg.	No	Yes

Charter Boat Fishing

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Charter Boat Fishery	Various	The Charter Boat Fishery is a limited entry fishery with 82 licence holders of which 47 were active in 2020/2021. Fishing in inshore regions where water depths are < 50 m is the most frequent activity. Peak periods are between December and April (summer) and October. Seventy-eight species of fish, shark, mollusc, cephalopods, and crustacean are targeted with King George whiting, snapper and Bight redfish recording the highest catches. The above information is from Durante et al. (2022). The Activity Planning Area does not overlap the fishery. The Environmental Planning Area overlaps the fishery where there have been six active licences in 2019/20 but typically five or less than five licenses from 2012 to 2022.	No	Yes

Giant Crab Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Giant Crab Fishery	Giant crab	Information from in this section is from McLeay (2022). Giant Crab (*Pseudocarcinus gigas*), also known as king crab, is endemic to southern Australian waters and distributed from southern Western Australia to central New South Wales. While they occur at depths ranging from 20 to 600 m, the highest population densities are found at the edge of the continental shelf at depths of approximately 140 to 270 m. Fishers use a maximum of 100 steel-framed pots that must comply with pot dimension specifications. Commercial access to the giant crab resource is limited to licence holders in the Miscellaneous Fishery and Rock Lobster Fishery. Total allowable catch in the fishery is 22.1 t per year, consisting of 13.4 t in the Northern Zone and 8.7 t in the Southern Zone, with total catch ranging from 15.4 t in 2020/21 to 18.4 t in 2017/218. The giant crab fishing season is between 1 October 31 May, with the fishing season in the Southern Zone between 1 October and 30 April, and in the Northern Zone between 1 November and 31 May. The Activity Planning Area does not overlap the fishery. The Environmental Planning Area overlaps the southern zone of the fishery. DPIR could not provide data specific for the area overlapping the Environmental Planning Area as all data for the Giant Crab Fishery is confidential.	No	Yes

Marine Scalefish Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Marine Scalefish Fishery	King George Whiting Southern Garfish Southern Calamari	The Marine Scalefish Fishery is a multi-species and multi-gear fishery. Commercial fishing can be undertaken for more than 60 species of scalefish using a range of gear types. The Sardine Fishery is a part of the Marine Scalefish Fishery The Marine Scalefish Fishery operates in all coastal waters of South Australia between the Western Australian and Victorian border. For some species the Offshore Constitutional Settlement extends the fishery area out 200 nm to the Australian Exclusive Economic Zone miles. The fishing area includes gulfs, bays and estuaries, excluding the Coorong. The main species taken are: • King George Whiting • Southern Garfish • Southern Calamari. Those 4 species make up: • 60% of the total fishery production weight • 70% of the total fishery value. Not all species taken by this fishery are scalefish. Other species include squid, worms, and sharks. In 2020 there were >300 licences in the fishery. Total annual catches of primary species decline from 2,089 t in 2001 to 807 t in 2020. The Activity Planning Area does not overlap the fishery. The Environmental Planning Area overlaps the fishery where there have been 15 active licences in 2012/13 to less than 5 in 2021/22.	No	Yes

Rock Lobster Fishery

Fishery	Target species	Description	Fishing activity within the Activity Planning Area	Fishing Activity within the Environmental Planning Area
Rock Lobster Fishery	Rock lobster	The Rock Lobster Fishery is based on the capture of southern rock lobster (*Jasus edwardsii*). Other species are permitted to be landed and sold, including giant crab and octopus. Rock lobsters are commercially harvested with pots that are set overnight. Rock lobster licence holders may also harvest marine scalefish as endorsed on their licence. The Activity Planning Area does not overlap the fishery. The Environmental Planning Area is within the fishery Southern Zone which is closed from 31 May to 1 October. The total reported 2020 logbook catch was 1,275.5 t (99% of TACC). The annual catch within the Planning Area ranged from 331 t to 420 t from 2012 to 2022. During this period licence holders ranged from 43 to 71.	No	Yes

Cover Sheet for Technical Reports

Documents

- **Appendix B7a** - Modelling Report on Sound Emissions: Regia Marine Seismic Survey by JASCO Applied Sciences
- **Appendix B7b** - Regia Marine Seismic Survey: Acoustic and Animat Modelling for Assessing Marine Fauna Sound Exposures (Document 03301, Version 2.0)

Purpose

This cover sheet accompanies two comprehensive reports detailing the acoustic modelling associated with the planned Regia Marine Seismic Survey (Regia MSS). These reports have been prepared to assess the potential impacts of sound emissions on marine life, with a focus on marine mammals, fish, sea turtles, benthic invertebrates, and humans.

Appendix B7a

Client: CGG Date: 29 May 2023 Status: Approved for Use

Authors: JASCO Applied Sciences

Summary: This report was the initial modelling requested by CGG to provide a detail prediction of the expected sound emissions from the Regia MSS. It includes modelling results, sound level contour maps, and comprehensive assessments of potential exposure for marine wildlife, including behavioural and physiological impacts.

Appendix B7b

Client: CGG Date: 5 June 2024 Status: Approved for Use

Authors: JASCO Applied Sciences

Summary: This report presents an expanded acoustic modelling study aimed at understanding and predicting the sound exposures to various marine fauna from additional areas of geophysical interest. The report was commissioned in response to consultation with local divers who wanted to understand the sound exposure regime at popular recreational and commercial dive sites. The updated modelling also accounted for changes in activity design up to the point it was commissioned. These include the increased minimum depth (to 50m) and the addition of the western edge of the survey to the permit boundary of petroleum title Vic/P79.

Intended Use

The information contained within these reports is critical for regulatory submission. It is intended to aid in the decision-making process regarding the permitting of the Regia MSS.

Access and Use Restrictions

The contents of these reports are relevant within the specific context described and should be considered alongside all accompanying information. Any use of this data in public or regulatory documents must clearly cite these reports, which should be made available to recipients in their entirety and unedited form.

Distribution

When finalised these reports are distributed to relevant stakeholders through the Regia MSS Consultation Hub found at www.regiamss.com.au.

Regia Marine Seismic Survey

Acoustic and Animat Modelling for Assessing Marine Fauna Sound Exposures

Initial Acquisition Area

Executive Summary

JASCO Applied Sciences (JASCO) performed a numerical modelling study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic impacts on key regional receptors including marine mammals, fish, turtles, benthic invertebrates, sponges, coral, plankton and divers. The modelling considered a seismic source in triple configuration with a 2820 in^3 total volume, towed at a 7 m depth behind a single vessel, with a 12.5 m impulse interval (inter-pulse interval) and a 37.5 m crossline array separation.

JASCO's specialised airgun array source model was used to predict the acoustic signature of the seismic source and complementary underwater acoustic propagation models were used in conjunction with the modelled array signatures to estimate sound levels over a large area around the sources. Single-impulse sound fields were predicted at 11 sites over the proposed survey line plans, with water depths ranging from 40 to 174 m. Accumulated sound exposure fields were predicted for three representative scenarios for likely survey operations over 24 h. Three animal movement modelling scenarios, to address different line acquisition plans, for likely survey operations over 24 hours were modelled.

The modelling methodology considered source directivity and range-dependent environmental properties likely to be encountered within the proposed survey area. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria. A conservative sound speed profile that would be most supportive of sound propagation conditions for the period of the survey was defined and applied to all modelled sites.

SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 hours, based on the assumption that a receiver (e.g., an animal) is consistently exposed to such noise levels at a fixed position. More realistically, marine animals would not stay in the same location for 24 hours (especially in the absence of location-specific habitat) but rather a shorter period, depending on the animal's behaviour and the source's proximity and movements. Therefore, a reported radius for the SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS)) if it remained at that location for 24 hours.

A more realistic representation of the potential exposures for foraging pygmy blue whales in the foraging Biologically Important Area (BIA) and both migrating and aggregating southern right whales within the known core range area and aggregation BIA was undertaken using animal movement modelling ('animat modelling'). Simulations with animats (i.e., simulated animals) restricted to the BIA provide an understanding of how animats will be exposed given the location and environment-specific context in which they are most likely to occur. Scenarios in which the pygmy blue and southern right whales are seeded in an unrestricted manner allow for the calculation of exposure range across the entire project area. These ranges may then be interpreted to determine BIA action zones for different project options and scenarios. The unrestricted seeding approach is informative in cases where there is very little or no overlap between the BIA and the planned active source area. While acoustic modelling inherently assumes static animals, the JASCO Animal Simulation Model Including Noise Exposure (JASMINE) combines modelled sound fields with realistic animal movements to predict how animals might be impacted through sound exposure. The exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters. JASMINE provides a framework for understanding and predicting sound exposure for species of interest and for calculating ranges to relevant regulatory thresholds. The distribution of distances to the source of simulated animals ('animats') predicted to be exposed to sound levels above relevant thresholds was used to calculate the horizontal distance that includes 95% of the animat distances that exceeded a given effect threshold ($ER_{95\%}$). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed the threshold criteria. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which the animats are exposed to the sound field over time, both vertically and horizontally. The probability that an animat within the $ER_{95\%}$ was exposed above threshold was also computed (P_{exp}) to provide additional context. Due to insufficient density data availability, the modelling results are not related to real-world density estimates for pygmy blue and southern right whales.

The acoustic analysis considered the distances away from the seismic source at which several effects criteria or relevant sound levels were reached. The results are summarised below considering all the representative single-impulse sites and all accumulated SEL scenarios for both acoustic modelling results and pygmy blue whale and southern right whale animat $ER_{95\%}$ results and probabilities.

Marine Mammals – Acoustic Results

- The maximum distance where the NOAA marine mammal behavioural response criterion of 160 dB re 1 µPa (SPL) for impulsive noise could be exceeded varied between 2.95 and 10.3 km for the 2820 in^3 seismic source, depending on modelled site.
- The results for marine mammal injury considered the criteria from Southall et al. (2019). These criteria contain two metrics (PK and SEL_{24h}), both required for the assessment of marine mammal PTS and TTS. The longest distance associated with either metric is required to be applied for assessment; Table 1 summarises the maximum distances, along with the relevant metric.
- The distance to PTS and TTS was always farthest in the broadside direction, distances are shown in Table 1.

Table 1. Summary of maximum (R_{max}) horizontal distances (in km) from all modelled sites and scenarios to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals showing the relevant metric. Maximum extents are in the broadside direction of the 2820 in^3 seismic source.

Hearing group	Maximum modelled distance to effect threshold (R_{max})						
	Behavioural response[1]	Scenario A		Scenario B		Scenario C	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	10.3 (SPL)	34.0 (SEL_{24h})	4.89 (SEL_{24h})	14.8 (SEL_{24h})	1.65 (SEL_{24h})	43.5 (SEL_{24h})	1.90 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.74 (PK)	0.43 (PK)	0.74 (PK)	0.43 (PK)	0.65 (PK)	0.33 (PK)
Otariid Pinnipeds		0.05 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Animal Movement Modelling

- The exposure ranges predicted using animat modelling are significantly more realistic, due to the incorporation of species-specific realistic movements, rather than conservative approach of calculating ranges using the maximum-over-depth sound fields and receivers which are stationary for 24 hours. This is because the exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters.

- Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criteria, are typically comparable to the predicted acoustic ranges. Exposure ranges are generally slightly lower than the R_{max} acoustic ranges, which is the case for this study.
- All scenarios resulted in exposures above the behavioural response threshold NOAA (2019). Of these, the maximum $ER_{95\%}$ to the marine mammal behavioural response threshold NOAA (2019) was 8.43 km, with a probability of exposure of 85%. These results are summarised in Table 2.
- Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because of the shorter time ('dwell time') to accumulate sound energy of the moving animats. There were exposures above threshold for all considered scenarios and species. The maximum $ER_{95\%}$ to TTS and PTS thresholds (Southall et al. 2019) were 13.2 and 1.50 km, respectively, with probabilities of exposure of 58 and 50%.

Table 2. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales Maximum Exposure ranges show $ER_{95\%}$ (km) first and probability of exposure of animats travelling within the $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL24h)[3]	PTS (SEL24h)[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	8.09 (86%)	13.2 (58%)	1.40 (51%)
	B	6.82 (93%)	6.05 (60%)	0.53 (50%)
	C	6.77 (92%)	7.60 (60%)	0.34 (47%)
Southern right whale	A	8.43 (85%)	11.6 (60%)	1.50 (50%)
	B	6.81 (92%)	6.04 (52%)	0.54 (49%)
	C	7.58 (85%)	6.71 (37%)	0.25 (37%)

1 LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)
2 SPL (L_p; dB re 1 µPa)
3 Southall et al. (2019) criteria for marine fauna.
4 NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

Sea Turtles

- The PK sea turtle injury criteria of 232 dB re 1 µPa for PTS and 226 dB re 1 µPa for TTS from Finneran et al. (2017) was not exceeded at a distance longer than 20 m from the acoustic centre of the source.
- The maximum distance to the SEL_{24h} metrics of 204 dB re 1 µPa^{2}s for PTS and 189 dB re 1 µPa^{2}s for TTS (summarised in Table 3) for all scenarios was 0.07 km for PTS onset and 3.43 km for TTS onset for the 2820 in^3 seismic source (Finneran et al. 2017). As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that sea turtles travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- Table 3 summarises the distances to where the criterion for behavioural response of turtles to 166 dB re 1 µPa (SPL) and the 175 dB re 1 µPa (SPL) threshold for behavioural disturbance (McCauley et al. 2000) could be exceeded.

Table 3. Summary of horizontal distances (in km) to turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group	Maximum modelled distance to effect threshold (R_{max})							
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	5.97 (SPL)	2.55 (SPL)	3.43 (SEL_{24h})	0.07 (SEL_{24h})	1.14 (SEL_{24h})	0.07 (SEL_{24h})	0.82 (SEL_{24h})	0.06 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance to the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 μPa^{2}s was reached between 0.05 and 0.06 km for all scenarios was. PTS and PK thresholds were not resolved withing the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- The maximum distance where the OCW-weighted penguin behavioural response threshold of 120 dB re 1 μPa (SPL) for impulsive noise could be exceeded varied between 9.08 and 52.1 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 4 summarises distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric. Seafloor sound levels were assessed at a set of representative depths related to the planned acquisition lines ranging from 40 to 170 m.

Table 4. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single impulse and 24 hour sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Recoverable injury	SEL_{24h}	0.07
	TTS	SEL_{24h}	7.86
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Recoverable injury	PK	0.22
	TTS	SEL_{24h}	7.86
Fish eggs, and larvae (relevant to plankton)	Injury	PK	0.22

Benthic invertebrates, Sponges, and Coral

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 µPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 295 and 711 m for the 2820 in^3 source.
- Bivalves: The distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was determined for comparing to results presented in Day et al. (2016a). This particle acceleration was reached at a range of 52 m for depth 40 m, 4 m for a depth of 50 m, and was not reached at any greater depth.
- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for sponges and corals (Heyward et al. 2018); the threshold was reached at a range of 2 m for depth 40 m and was not reached at any greater depth.

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 µPa (SPL; LP) derived from (Parvin 2005) was considered for people swimming and diving. At the closest separation between considered modelled sites and receiver locations a sound level of 153.1 dB re 1 µPa (SPL; LP) was predicted at Little River and Taylors Beach. It is important to review the provided contour maps to contextualise levels at coast areas to understand where the human health assessment level may be reached.

1. Introduction

JASCO Applied Sciences (JASCO) performed a numerical estimation study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic effect on receptors including marine mammals, fish, sea turtles, benthic invertebrates, plankton, sponges, corals and divers.

This study considered a 2820 in^3 seismic source array. JASCO's specialised Airgun Array Source Model (AASM) was used to predict acoustic signatures and spectra (see Section 4.2). AASM accounts for individual airgun volumes, airgun bubble interactions, and array geometry to yield accurate source predictions.

Complementary underwater acoustic propagation models were used in conjunction with the array signature and spectra to estimate sound levels considering site-specific environmental influences. Single-impulse sound fields were predicted at eleven unique geographic locations linked to the considered survey line plans and three representative scenarios for accumulated SEL modelling were considered. Accumulated sound exposure fields were predicted for each representative scenario for likely survey operations over 24 hours (see Section 2).

The modelling methodology considered source directivity and range-dependent environmental properties. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-pk}}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria.

The planned seismic acquisition area overlaps the pygmy blue whale foraging BIA as well as the aggregation BIA and known core range area for southern right whales. The acoustic modelling results were also used in conjunction with animal movement modelling ('animat modelling') simulations to predict the distance at which feeding pygmy blue whales (*Balaenoptera musculus brevicauda*), aggregating and migrating southern right whales (*Eubalaena australis*) are expected to be exposed above threshold criteria for PTS, TTS, and behavioural response. Estimates of sound exposure distribution were determined by moving large numbers of simulated animals (animats) through a modelled time-evolving sound field, computed using acoustic models. This approach provides the most realistic prediction of the maximum expected SPL and SEL_{24h} for comparison against the relevant thresholds.

Section 3 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 4 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the seismic source and all environmental parameters the propagation models require. Section 4 also describes the methodology used in the animal movement and exposure modelling simulations. Section 5 presents the results, which are then discussed and summarised in Section 6.

2. Modelling Scenarios

Three nominal acquisition scenarios were considered for both acoustic propagation modelling and animal movement modelling. Acoustic modelling consisted of both source and propagation modelling and was conducted at eleven individual single-impulse sites for SEL and SPL while water column PK was assessed at six sites. The locations of the modelled sites are provided in Table 6 and the acquisition lines for the scenarios are shown in Figure 1. This study considered a 2820 in^3 seismic source towed in a triple array configuration at a speed of 4.5 knots with an impulse interval (inter-pulse interval) of 12.5 m and a crossline array separation of 37.5 m. The acoustic propagation modelling utilised the sound speed profile for December, as this month will likely result in favourable propagation conditions within potential acquisition time window for the proposed survey.

The single impulse sites and the accumulated SEL scenarios were determined based on proposed survey line plans with lines orientated at 113/293°. The single impulse sites and accumulated SEL scenarios were chosen to be representative of the range of water depths and the potential sound propagation characteristics of the considered line plans. Near-field sea-floor PK and PK-PK sound levels were assessed considering eleven water depths chosen to represent the depth range encompassed by the considered line plans. Particle motion modelling was also performed at these representative water depths.

The three scenarios account total number of impulses and acquisition time as shown in Table 5. The total assessment period for accumulated sound exposure level was 24 h and during line turns, the seismic source was not operating for modelling purposes. The time surveying and time on turns combine to a total 24 h period.

All animat simulations were run in two configurations: one with animats restricted to the BIA, and another with unrestricted animat seeding.

Table 5. Key parameters of the two accumulated sound exposure level (SEL) scenarios.

Scenario	Array	Impulse interval (m)	Tow direction (°)	Total impulses	Acquisition period (h)
A				8768	13.15
B	Triple 2820 in^3 seismic source	12.5	113/293	11306	16.96
C				11277	16.91

† FWRAM modelling conducted at these sites.

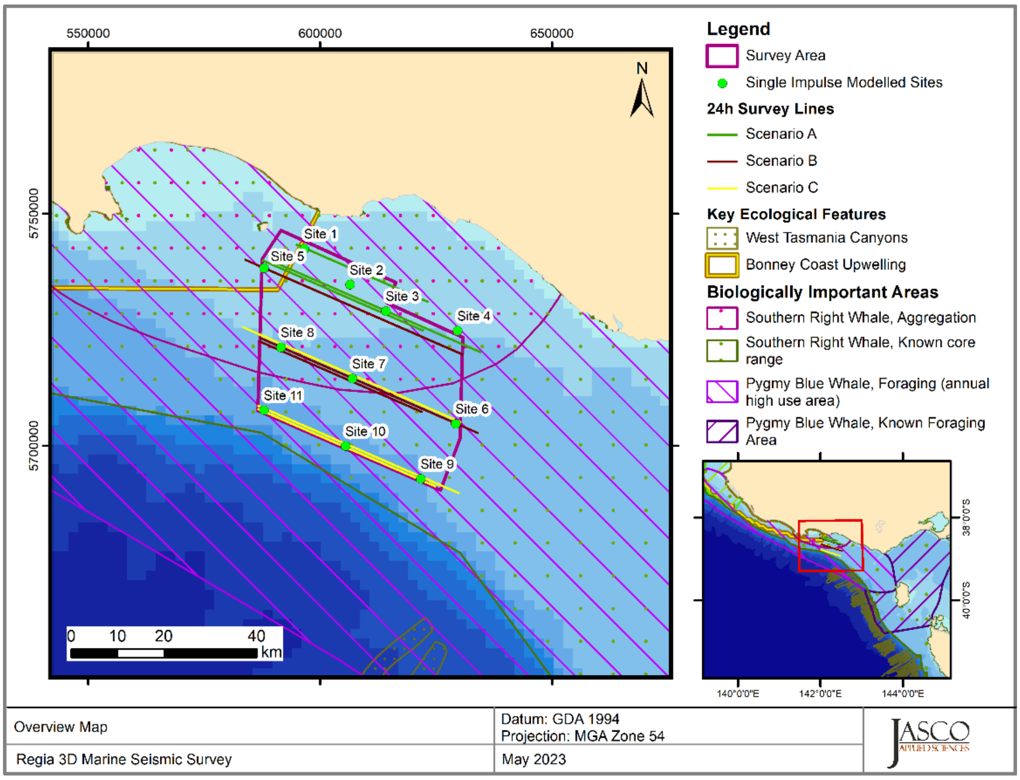

Figure 1. Overview of the modelled sites, acquisition lines, and features for the Regia Marine Seismic Survey.

Animal Movement modelling simulations were run for pygmy blue whales and southern right whales considering the three nominal acquisition scenarios. In general, animats are randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2) within the species preferred depth range. During the simulation, if an animat's movement takes itself outside of its preferred depth range, it will begin to make movements (while still following the parameters within its species behaviour file) back towards its preferred depth range. For all simulations, animats were seeded at a nominal horizontal sampling density of 4 animats/km^2. Each of the animat simulations were run for a representative 24 h duration.

Figure 2 shows an overview of the animat modelling simulation extents, along with the animat seeding areas for each scenario.

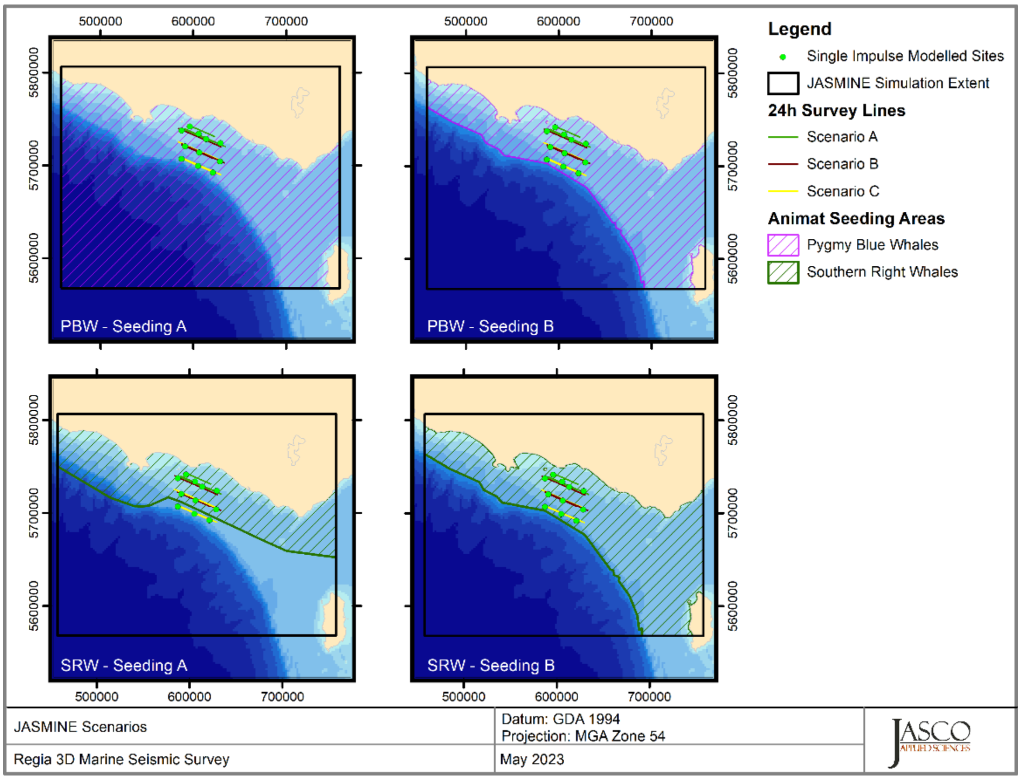

Figure 2. Overview Map of the considered scenarios for animal movement modelling.

2.1. Sensitive receivers

The Regia MSS lies within a foraging BIA for pygmy blue whales and an aggregation BIA for southern right whales. In addition, there are several swimming, diving and surfing beach that are within proximity of the survey. Lady Julia Percy Island, is also an important sensitive location, the closest modelled sites to the edge of the island are Site 1 and Site 5, at respective distances of about 9.3 and 8.4 km. The received acoustic levels at several receiver locations have been calculated and are presented below in Section 5.2.1.4. The receiver locations have been labelled 1–8 and are summarised in Table 7.

Table 7. Location details for the sensitive receiver sites.

Receiver ID	Sensitive receiver location	Receptors	Latitude (S)	Longitude (E)	MGA[1] Zone 54	
					X (m)	Y (m)
1	Lady Julia Percy Island	Seals, White Sharks	38° 25' 27.17"	142° 0' 35.78"	588158	5746633
2	Southern Right Whale Migration and Resting BIA	Southern Right Whales	38° 33' 42.51"	142° 43' 43.45"	650618	5730432
3	Discovery Bay	Human Swimmers	38° 22' 32.87"	141° 21' 27.02"	531227	5752428

3. Noise Effect Criteria

The perceived loudness of sound, especially impulsive sound such as that from seismic airguns, is not generally proportional to the instantaneous acoustic pressure. Rather, perceived loudness depends on the pulse rise-time and duration, and the frequency content. Several sound level metrics, such as PK, SPL, and SEL, are commonly used to evaluate sound and its effects on marine life (Appendix A). The period of accumulation associated with SEL is defined, with this report referencing either a “per pulse” assessment or over 24 h. The acoustic metrics in this report reflect the updated ISO standard for acoustic terminology, ISO/DIS 18405:2017 (2017).

Whether acoustic exposure levels might injure or disturb marine mammals is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that have investigated the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

The following noise criteria and sound levels for this study were chosen because they include standard thresholds, thresholds suggested by the best available science, and sound levels presented in literature for species with no suggested thresholds (Sections 3.1–3.5 and Appendix A):

1. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from (Southall et al. 2019) for the onset of Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) in marine mammals.
2. Marine mammal behavioural threshold based on the current US National Oceanic and Atmospheric Administration (NOAA 2019) criterion for marine mammals of 160 dB re 1 µPa (SPL; L_p) for impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs and larvae (including plankton) (Popper et al. 2014).
4. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in turtles.
5. Sea turtle behavioural response threshold of 166 dB re 1 µPa (SPL; L_p), (McCauley et al. 2000) as cited in the Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017), along with a sound level associated with behavioural disturbance 175 dB re 1 µPa (SPL; L_p) (McCauley et al. 2000)
6. Diving birds (penguins):
   - Thresholds for otariid pinnipeds are used as a proxy (Section 3.4): Peak pressure levels (PK; L_{pk}) and frequency–weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Southall et al. (2019) for the onset of PTS and TTS in otariids.
   - Behavioural response to impulsive sound of 120 dB re 1 µPa (SPL; L_p) for diving birds based on information from Sørensen et al. (2020).
7. Peak-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$) and particle acceleration (ms^{-2}) at the seafloor to help assess effects of noise on crustaceans through comparing to results in Day et al. (2016a), Day et al. (2019), Day et al. (2016b), Day et al. (2017) and Payne et al. (2008).
8. A sound level of 226 dB re 1 µPa (PK; L_{pk}) reported for comparing to Heyward et al. (2018) for sponges and corals.
9. An SPL human health assessment threshold of 145 dB re 1 µPa (SPL; L_p) for sound exposure to people swimming and diving derived from Parvin (2005), and considering Ainslie (2008).

Additionally, to assess the size of the low-power zone required under the Australian Environment Protection and Biodiversity Conservation (EPBC) Act Policy Statement 2.1, Department of the

Environment, Water, Heritage and the Arts (DEWHA 2008), the distance to an unweighted per-pulse SEL of 160 dB re 1 µPa²·s (L_E) is reported.

The following subsections (Sections 3.1–3.5, along with Appendix A.4 and A.5), expand on the thresholds, guidelines and sound levels for marine mammals, fish, fish eggs, fish larvae, sea turtles, and benthic invertebrates.

3.1. Marine Mammals

There are two categories of auditory threshold shifts or hearing loss: permanent threshold shift (PTS), a physical injury to an animal's hearing organs; and Temporary Threshold Shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued.

To help assess the potential for the possible injury and hearing sensitivity changes in marine mammals, this report applies the criteria recommended by Southall et al. (2019), considering both PTS and TTS. These criteria, along with the applied behavioural criteria (NOAA 2019), are summarised in Table 8, with descriptions included in Appendix A.4.1 (auditory impairment) and Appendix A.4.2 (behavioural response), with frequency weighting explained in Appendix A.5. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

Table 8. Unweighted sound pressure level (SPL), 24-hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds for acoustic effects on marine mammals.

Hearing group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS onset thresholds[1] (received level)		TTS onset thresholds[1] (received level)	
	SPL (L_p; dB re 1 µPa)	Weighted SEL (L_E; dB re 1 µPa² s)	PK (L_{pk}; dB re 1 µPa)	Weighted SEL (L_E; dB re 1 µPa² s)	PK (L_{pk}; dB re 1 µPa)
Low-frequency cetaceans (baleen whales)	160	183	219	168	213
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)		185	230	170	224
Very-high-frequency cetaceans (*Kogia*, cephalorhynchid, and *L. australis*)		155	202	140	196
Pinnipeds[2] (Australian sea lion, Australian fur seal, New Zealand fur seal)		203	232	188	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.
[2] Listed as pinnipeds but equivalent to other marine carnivores in water in the Southall et al. (2019) criteria. Also equivalent to Otariid pindipeds listed in NMFS (2018).
L_p denotes sound pressure level period and has a reference value of 1 µPa.
$L_{pk, flat}$ peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24-hour period and has a reference value of 1 µPa²s.

3.2. Fish, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and turtles, work begun by a panel convened by NOAA two years earlier. The resulting guidelines included specific thresholds for different levels of effects and for different groups of species (Popper et al. 2014). These guidelines defined quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death.
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma.
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges, these effects are not addressed in this report and are included in Table 9 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Turtles, fish eggs, and fish larvae are considered separately. Table 9 lists relevant effects thresholds from Popper et al. (2014).

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long-lasting exposures, it is required to define a time. Popper et al. (2014) recommend applying a standard period, where this is either defined as a justified fixed period or the duration of the activity; however, Popper et al. (2014) also included caveats about how long the fish will be exposed because they can move (or remain in location) and so can the source. Popper et al. (2014) summarises that in all TTS studies considered, fish that showed TTS recovered to normal hearing levels within 18–24 hours. Due to this, a period of accumulation of 24 hours has been applied in this study for SEL, which is similar to that applied for marine mammals in NMFS (2016, 2018).

In the discussion of the criteria, Popper et al. (2014) discuss the complications in determining a relevant period of mobile seismic surveys, as the received levels at the fish change between impulses because the source is moving, and that in reality a revised guideline based on the closest PK or the per-pulse SEL might be more useful than one based on accumulated SEL. This is because exposures at the closest point of approach (CPA) are the primary exposures contributing to a receiver's accumulated level (Gedamke et al. 2011). Additionally, several important factors determine the likelihood and duration a receiver is expected to be in close proximity to a sound source (i.e., overlap in space and time between the source and receiver). For example, accumulation time for fast moving (relative to the receiver) mobile sources is driven primarily by the characteristics of the source (i.e., speed, duty cycle; NMFS 2016, 2018).

As discussed in Popper (2018), many fish species move around, some over large distances. The author suggests that it is reasonable to think that if the sound of a seismic source becomes too loud, the fish will move away from the source because they are able to determine the direction of a sound source. If the fish moves away, the amount of energy to which it is exposed is likely to be one or a few seismic pulses, and these would not likely be loud enough to result in any effect because the fish would move away at a much lower level signal than could cause harm. Data on TTS for fish are very limited, with the only study that examined recovery from seismic impulses being Popper et al. (2005). Popper (2018) states that if this study had been conducted on wild, free-swimming fish instead of caged ones, there would have been no effect whatsoever because they were likely to have moved away from the source as it approached them, as would happen with normally free-moving demersal and pelagic fish species associated with a 3-D seismic survey in northern Australian waters, extrapolating from the Bethany 3-D assessed in Popper (2018).

Therefore, the time over which energy should be accumulated in each individual fish in the survey area should be limited to the time over which fish receives the maximum exposure, and 24 h is likely too long a period for calculating the accumulation of energy in determining potential harm (e.g., damage or TTS) (Popper 2018). Even if fish do show some TTS, recovery will start as soon as the most intense sounds end, and recovery is likely to even occur, to a limited degree, between seismic pulses. Based on very limited data, recovery within 24 h (or less) is very likely. If TTS does occur, the duration of exposure to the most intense sounds that could result in TTS will be over just a few hours. Thus, energy accumulating over longer periods than a few hours is probably inappropriate (Popper 2018).

Table 9. Criteria for seismic noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	>219 dB SEL_{24h} or >213 dB PK	>216 dB SEL_{24h} or >213 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	186 dB SEL_{24h}	(N) Low (I) Low (F) Moderate	(N) High (I) High (F) Moderate
Fish eggs and fish larvae (relevant to plankton)	>210 dB SEL_{24h} or >207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low

Peak sound level (PK) dB re 1 μPa; SEL_{24h} dB re 1μPa^2·s. All criteria are presented as sound pressure, even for fish Without swim bladders, since no data for particle motion exist. Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

3.3. Sea Turtles

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles).

Finneran et al. (2017) presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

McCauley et al. (2000) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 μPa (SPL), the sea turtles increased their swimming activity, and above 175 dB re 1 μPa they began to behave erratically, which was interpreted as an agitated state. The

Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017) acknowledges the 166 dB re 1 µPa SPL reported (McCauley et al. 2000) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1 µPa level from McCauley et al. (2000) is recommended as a criterion for behavioural disturbance. These thresholds are shown in Table 10.

Table 10. Acoustic effects of impulsive noise on sea turtles: Unweighted sound pressure level (SPL), 24 hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds

Effect type	Criterion	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	PK (L_{pk}; dB re 1 µPa)
Behavioural response	McCauley et al. (2000)	166	NA	
Behavioural disturbance		175		
PTS onset thresholds[1] (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds[1] (received level)			189	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.
L_p denotes sound pressure level period and has a reference value of 1 µPa.
$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa²s.

3.4. Diving Birds

There are no regulatory thresholds with regard to onset of hearing impairment for penguins, any other bird species, or phylogenetically or anatomically related species. The only scientifically robust thresholds in this context exist for marine mammals. To allow for assessing the noise–induced impact risk of impulsive airgun signals on penguins, the least sensitive marine mammal hearing group, other carnivores in water (OCW), from Southall et al. (2019), is recommended as a proxy. This hearing group has been selected due to similar hearing sensitivity in the frequency band of underwater hearing for diving birds and otariid pinnipeds, which are included in the group. This provides a conservative approach, as otariids are considered more sensitive to underwater sound at higher frequencies than penguins.

There are also no regulatory thresholds or criteria established to assess potential behavioural responses by penguins or flying seabirds to underwater noise. To allow for assessing the potential for such impacts, an onset criterion for behavioural responses of penguins and flying seabirds of 120 dB re 1 µPa (SPL) for impulsive sources was chosen based on information from Sørensen et al. (2020). They exposed gentoo penguins (*Pygoscelis papua*) in a controlled exposure experiment to underwater noise bursts (impulsive signals) and demonstrated that the animals show a graded reaction depending on received sound levels. For consistency with the approach to assess PTS and TTS, the behavioural response threshold is applied as OCW weighted.

3.5. Invertebrates

3.5.1. Benthic Invertebrates (Crustaceans and Bivalves)

Research is ongoing into the relationship between sound and its effects on crustaceans, including the relevant metrics for both effect and impact. Available literature suggests particle motion, rather than sound pressure, is a more important factor for crustacean and bivalve hearing. Water depth and seismic source size are related to the particle motion levels at the seafloor, with larger arrays and shallower water being related to higher particle motion levels, more likely relevant to effects on crustaceans and bivalves.

At the seafloor interface, crustaceans and bivalves are subject to particle motion stimuli from several acoustic or acoustically induced waves. These include the particle motion associated with an impinging sound pressure wave in the water column (the incident, reflected, and transmitted portions), substrate acoustic waves, and interface waves of the Scholte type. However, it is unclear which aspect(s) of these waves is/are most relevant to the animals, either when they normally sense the environment or their physiological responses to loud sounds so there is not enough information to establish similar criteria and thresholds as done for marine mammals and fish. Including recent research, such as Day et al. (2016b), current literature does not clearly define an appropriate metric or identify relevant levels (pressure or particle motion) for an assessment. This includes the consideration of what particle motion levels lead to a behavioural response, or mortality. Therefore, at this stage, we cannot propose authoritative thresholds to inform the impact assessment. However, levels can be determined for pressure metrics presented in literature to assist the assessment.

The pressure and acceleration examples provided in Day et al. (2016a) (Figures 11 and 12) indicate that the acceleration and pressure signals occurred simultaneously, which was interpreted as an indication that the waterborne sounds were responsible for the accelerations measured by the geophones. For clarity, it is important to distinguish that the acceleration from waterborne sound energy is *not* ground roll, which Day et al. (2016a) correctly define as the sound that propagates along the interface at a speed lower than the shear wave speed of the sediment. However, the report subsequently uses ground roll for all further discussions of particle acceleration. While Day et al. (2016a) discuss that they chose the simplest measure of ground roll, it should have been referring to as ‘the acceleration from waterborne sound energy’, or ‘waterborne acceleration’ for short.

For crustaceans, a PK-PK sound level of 202 dB re 1 µPa (Payne et al. 2008) is considered to be associated with no effect, and therefore applied in the assessment. Additionally for context related to different levels of potential impairment, the PK-PK sound levels determined for crustaceans in Day et al. (2016b), 209–212 dB re 1 µPa and 213 dB re 1 µPa from Day et al. (2019), are also included.

For bivalves, PK-PK sound levels of 212, and 213 are presented to allow comparison to the maximum sound levels measured in Day et al. (2016a) and Day et al. (2017) for scallops and pearl shell oyster.

Literature does not present a sound level associated with no impact, and as particle motion is the more relevant metric, particle acceleration from the seismic source has been presented for comparing the results in Table 7 of Day et al. (2016a). The maximum particle acceleration assessed for scallops was 37.57 ms^{-2}.

3.5.2. Plankton

To assess effects on plankton, there are only a few studies to base threshold criteria on. Popper et al. (2014) cites many of the references and studies on potential impacts of noise emissions on fish eggs and larvae prior to 2014. Results presented in Day et al. (2016b) for embryonic lobsters and Fields et al. (2019) for copepods align with those presented in Popper et al. (2014), which is that mortality and sub-lethal injury are limited to within tens of metres of seismic sources. Additionally, the Popper et al. (2014) criteria (Table 9), are extrapolated from simulated pile driving signals which have a more rapid rise time and greater potential for trauma than pulses from a seismic source.

Other research, such as McCauley et al. (2017), has indicated the potential for effects at longer range and at levels of 178 dB PK-PK, however, Fields et al. (2019) noted that it was difficult to reconcile the high mortality reported by McCauley et al. (2017) with the low mortalities reported in the greater previous body of earlier research and their experiment. They recommended further research into whether it is the sound pulse itself (i.e., the energy, peak pressures, or particle acceleration), the (turbulent) fluid flow occurring more slowly (i.e., not related to the sound pulse), or other effects such as the bubble cloud that which might cause higher mortality near the seismic source.

4. Methods

4.1. Parameter Overview

The specifications of the seismic sources and the environmental parameters used in the propagation models are described in additional detail in Appendix D. A single sound speed profile for December was considered in this modelling study (Appendix D.3.2). This was identified as the seasonal period that would provide the farthest propagation by comparing model predictions for a subset of months identified when the survey could be in operation.

The modelled sites in spanned water depths of 40–174 m. In shallower waters, less than 150 m, seabed geologic profile was characterised as a layered limestone, variable cemented with a thin lay of overlying sand for water depth less than 50 m. For sites in deeper water, greater than 150 m, the seabed geologic profile was characterised as a thick package of unconsolidated sediments. Three geological profiles were defined to represent the different geo-acoustic properties across the area encompassed by the considered line plans, and are representative of the different zones within the entire Survey Area (Appendix D.3.3).

4.2. Acoustic Source Model

The pressure signature of the individual airguns and the composite decidecade-band point-source equivalent directional levels (i.e., source levels) of the 2820 in^3 seismic source were modelled with JASCO's Airgun Array Source Model (AASM). Although AASM accounts for notional pressure signatures of each seismic source with respect to the effects of surface-reflected signals on bubble oscillations and inter-bubble interactions, the surface-reflected signal (known as surface ghost) is not included in the far-field source signatures. The acoustic propagation models account for those surface reflections, which are a property of the propagating medium rather than the source.

AASM considers:

- Array layout.
- Volume, tow depth, and firing pressure of each airgun.
- Interactions between different airguns in the array.

All seismic sources considered were modelled over AASMs full frequency range, up to 25 kHz. Appendix B.1 details this model.

4.3. Sound Propagation Models

Three sound propagation models were used to predict the acoustic field around the seismic source:

- Combined range-dependent parabolic equation and Gaussian beam acoustic ray-trace model (MONM-BELLHOP, 10 Hz to 25 kHz).
- Full Waveform Range-dependent Acoustic Model (FWRAM, 10 to 1024 Hz).
- Wavenumber integration model (VSTACK, 10 to 1024 Hz).

The models were used in combination to characterise the acoustic fields at short and long ranges in terms of SEL, SPL, PK, and PK-PK. Appendix C details each model. MONM-BELLHOP was used to calculate SEL of a 360° area around each source location. FWRAM was used to model synthetic seismic pulses and to generate a generalised range-dependent SEL to SPL conversion function for the considered modelled sites. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM-BELLHOP to estimate SPL values. FWRAM was also used to calculate water column PK and PK-PK levels.

VSTACK was used to calculate near field PK and PK-PK levels along 4 transects at the seafloor along the endfire and broadside directions considering a set of 11 unique water depths at 40, 50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m. This model was also used to model the peak particle acceleration magnitude considering the same 11 unique water depths. For modelled sites where the seabed is likely to be composed of outcropping limestone (Appendix D.3.3), an additional correction factor was applied to predictions to better estimate loss characteristics of the seabed (see Appendix C.3.2).

4.4. Geometry and Modelled Regions

To predict sound levels with MONM-BELLHOP was used to calculate propagation losses up to distances of 100 km from the source, with a horizontal separation of 20 m between receiver points along all modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta$ = 2.5° for a total of N = 144 radial planes. Receiver depths were chosen to span the entire water column over the modelled area, from 2 m to a maximum of 2700 m, with step sizes that increased with depth. To supplement the MONM results, high-frequency results for propagation loss were modelled using BELLHOP for frequencies from 1.25 to 25 kHz. The MONM and Bellhop results were combined to produce results for the full frequency range of interest.

FWRAM was run to 100 km along four radials (fore and aft endfire, and port and starboard broadside) for computational efficiency. This was done to compute SEL-to-SPL conversions (Appendix D.2) and also to quantify water column PK and PK-PK. The horizontal range step begins at 20 m and increases with range from the source.

The maximum modelled range for VSTACK was 1000 m, and a variable receiver range increment that increased away from the source was used, which increased from 10 to 25 m. The final tabulated distances were obtained through interpolating predicted received levels. Received levels were computed for receivers at 5 and 50 cm above the seafloor to assist in the assessment on invertebrates and fish respectively.

4.5. Accumulated SEL

New sound energy is introduced into an environment with each pulse from the seismic source. While some impact criteria are based on the per-pulse energy released, others, such as the marine mammal and fish SEL criteria (Section 3), account for the total acoustic energy marine fauna is subjected to over a specified duration, defined in this report as 24 h. An accurate assessment of the accumulated sound energy depends not only on the parameters of each seismic impulse but also on the number of impulses delivered in a duration and the relative positions of the impulses.

When there are many seismic impulses, it becomes computationally prohibitive to perform sound propagation modelling for every single event. The distance between the consecutive seismic impulses is small enough, such that the environmental parameters that influence sound propagation are virtually the same for many impulse points. The acoustic fields can, therefore, be modelled for a subset of seismic pulses and estimated at several adjacent ones. After sound fields from representative impulse locations are calculated, they are adjusted to account for the source position for nearby impulses.

Although estimating the cumulative sound field with the described approach is not as precise as modelling sound propagation at every impulse location, small-scale, site-specific sound propagation features tend to blur and become less relevant when sound fields from adjacent impulses are summed. Larger scale sound propagation features, primarily dependent on water depth, dominate the cumulative field. The accuracy of the present method acceptably reflects those large-scale features, thus providing a meaningful estimate of a wide area SEL field in a computationally feasible framework.

To produce the map of accumulated received sound level distributions and calculate distances to specified sound level thresholds, the maximum-over-depth were calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth and seafloor sound levels for each impulse were then resampled (by linear triangulation) to produce a regular Cartesian grid. The sound field grids from all impulses were summed (see Equation A-5) to produce the cumulative sound field grid with cell sizes of 20 m. The contours and threshold ranges were calculated from these flat Cartesian projections of the modelled acoustic fields.

The unweighted (fish) and frequency-weighted SEL_{24h} results were rendered as contour maps, including contours that focus on the relevant criteria-based thresholds. Only contours at ranges larger than the nearfield of the seismic source were rendered.

4.6. Animal Movement and Exposure Modelling

4.6.1. Methodology

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was used to predict the exposure of animats to sound arising from the seismic activity. JASMINE integrates the predicted sound field with biologically meaningful movement rules for each marine mammal species (pygmy blue whales and southern right whales for the current analysis) that results in an exposure history for each animat in the model. An overview of the exposure modelling process using JASMINE is shown in Figure 4.

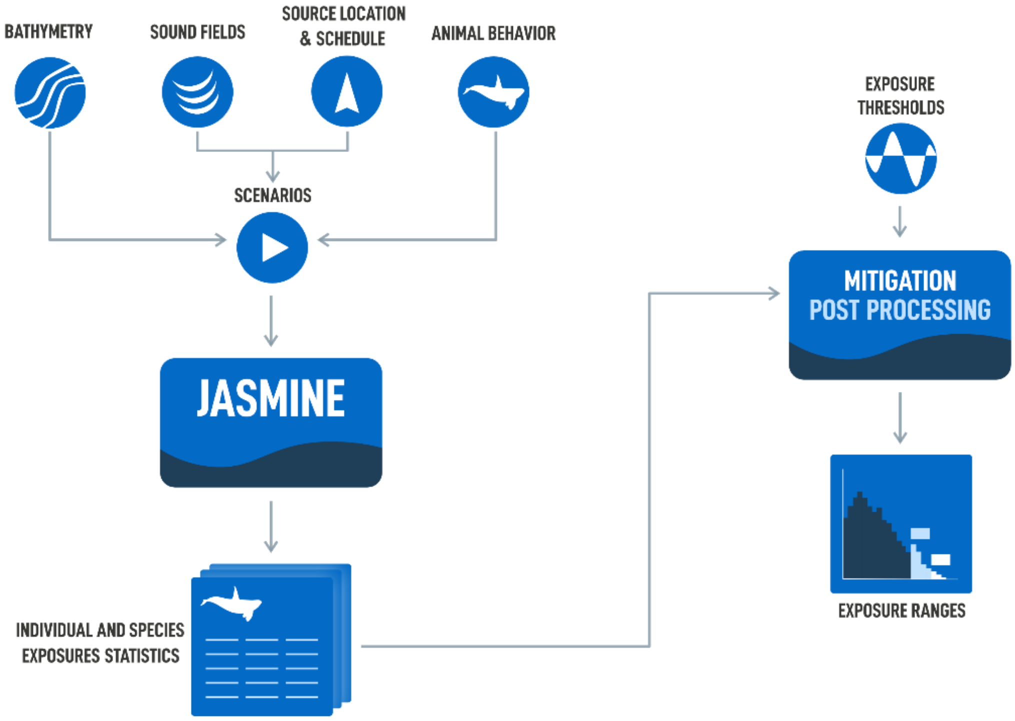

Figure 4. Exposure modelling process overview.

In JASMINE, the sound received by the animats is determined by the proposed seismic operations. As illustrated in Figure 5, animats are programmed to behave like the marine animals that may be present in an area. The parameters used for forecasting realistic behaviours (e.g., diving and foraging depth, swim speed, surface times) are determined and interpreted from marine mammal studies (e.g., tagging studies) where available, or reasonably extrapolated from related or comparable species. For cumulative metrics, an individual animats sound exposure levels are summed over a 24 h duration to determine its total received energy, and then compared to the relevant threshold criteria. For single-exposure metrics, the maximum exposure is evaluated against threshold criteria for each 24 h period. For additional information on JASMINE, see Appendix D.4.

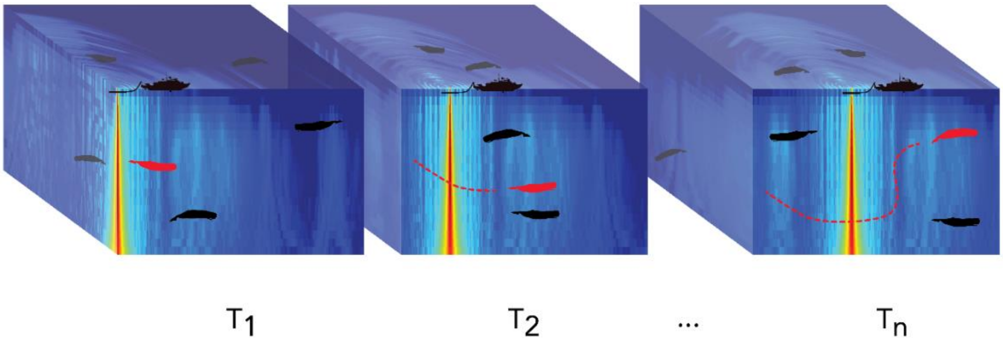

Figure 5. Depiction of animats in a moving sound field. Example animat (red) shown moving with each time step (T_n). The acoustic exposure of each animat is determined by where it is in the sound field, and its exposure history is accumulated as the simulation steps through time.

The exposure criteria for impulsive sounds (described in Section 3) were used to determine the number of animats that exceeded thresholds. To generate statistically reliable probability density functions, model simulations were run with animat sampling densities of 4 animats/km^2. The modelling results are not related to real-world density estimates for pygmy blue whales and southern right whales within BIAs or known core range area, as the number of animals potentially exposed is not calculated. To evaluate PTS, TTS and behavioural response, exposure results were obtained using detailed behavioural information for pygmy blue whales and southern right whales (described in Sections 4.6.3.1 and 4.6.3.2). Figure 2 illustrates the differences between the corresponding seeding areas.

The seismic source was modelled as a vessel towing an airgun array at a speed of 4.5 knots, with an impulse interval of 12.5 m. The simulated source tracks followed a racetrack configuration with acquisition not occurring on turns. At the time and location of each seismic pulse, the modelled source location with the closest distance was selected for exposure modelling. The track lines along with the acoustic modelling locations are shown in Figure 1.

Figure 6 shows an example animat track (generated for information purposes only and not related to the results presented in this report) with associated received levels from a stationary point source. The top panel displays the animat track relative to the point source, and the bottom panel displays the accumulation of SEL_{24h} for TTS and PTS criteria. At approximately 50 seconds, the animat is exposed so that the TTS threshold is exceeded, and at approximately 700 seconds the animat is exposed so that the PTS threshold is exceeded.

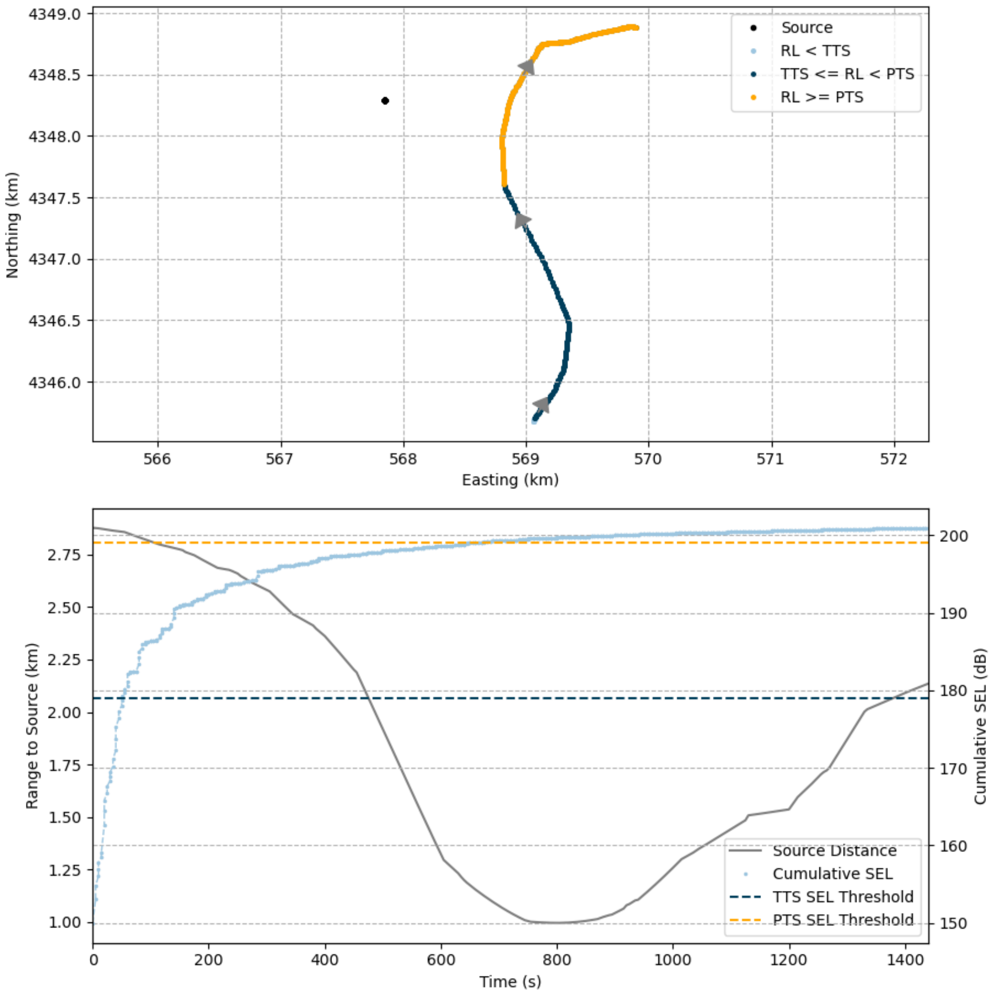

Figure 6. Animat track from an example simulation showing northward movement over a 1400 s duration. The upper panel shows a plan view of both a stationary point source and a foraging animat. Animat steps are coloured to indicate whether the accumulated sound energy at that point has exceeded either TTS or PTS threshold criteria. The lower panel shows horizontal distance in kilometres to the source (grey line; left y-axis) and cumulative 24-h SEL ($L_{E,24h}$, dB re 1 µPa²·s; right y-axis) as a function of time. Note that this example does not use data from the current study.

4.6.2. Exposure–based Radial Distance Estimation

The results from the animal movement and exposure modelling provided a way to estimate radial distances to effect thresholds. The distance to the closest point of approach (CPA) for each of the animats was recorded. The $ER_{95\%}$ (95% Exposure Range) is the horizontal distance that includes 95% of the animat CPAs that exceeded a given effect threshold (see Section 3). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed threshold criteria. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which animats sample the sound field over time, both vertically and horizontally. The sound field varies as a function of range, depth, and azimuth based on a variety of factors such as bathymetry, sound speed profile, and geoacoustic parameters. The way the animats sample the sound field depends upon species-typical swimming and diving characteristics (e.g., swim speed, dive depth, surface intervals, and reversals). Furthermore, even within a particular species definition, these characteristics vary with behavioral state (e.g., feeding, migrating). As this results in some animats not exceeding threshold criteria even within the $ER_{95\%}$, the probability that an animat within that distance was exposed above threshold within the $ER_{95\%}$ was also computed (P_{exp}) to provide additional context.

Acoustic ranges are reported for both $R_{95\%}$ and R_{max}, however, exposure ranges are reported for $ER_{95\%}$ only since, statistically, ER_{max} is not defined. JASMINE is a Monte Carlo simulation, and the results are probabilistic in nature. This is in contrast with acoustic modelling, where there is a specific maximum isopleth range for a given source/environment setup.

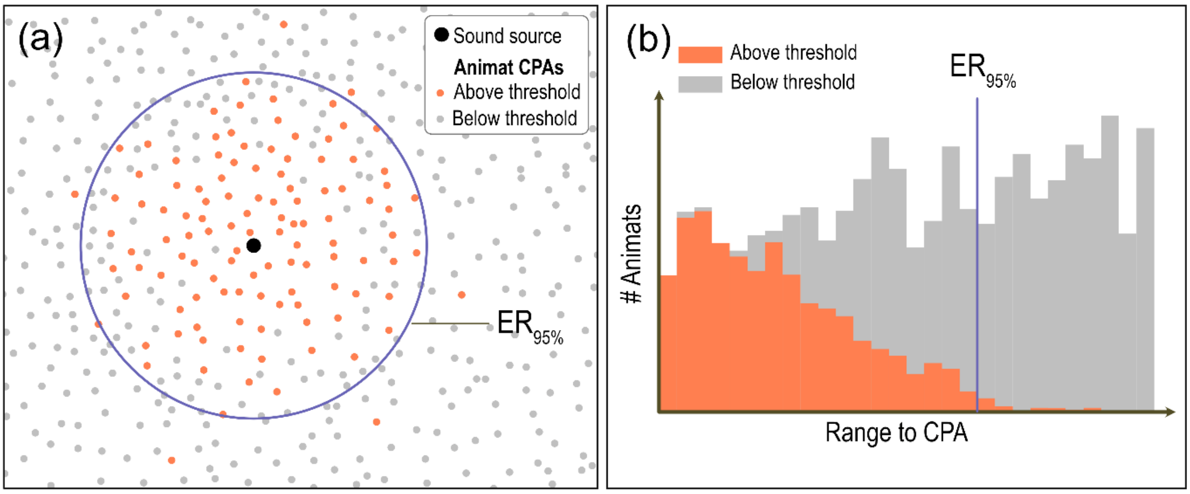

Figure 7. Example distribution of animat closest points of approach (CPAs). Panel (a) shows the horizontal distribution of animats near a sound source. Panel (b) shows the distribution of distances to animat CPAs. The 95% exposure range ($ER_{95\%}$) is indicated in both panels.

4.6.3. Species Specific Behaviour Profile Parameterisation

4.6.3.1. Pygmy Blue Whale Behaviour Profile

The project area overlaps with a known foraging BIA for pygmy blue whales (DoE (AU) 2015-2025). Therefore, only foraging behaviours were considered in the species profile.

Data on fine-scale foraging behaviour are not currently available for pygmy blue whales. Therefore, data from multi-sensor tags deployed on blue whales from the North Pacific were used to inform the feeding behaviours. Irvine et al. (2019) used intermediate-duration archival tags (SPLASH MK10) attached to eight blue whales off the coast of California and was able to determine two feeding modes based on depth: shallow and deep. These two feeding behaviours differed further between males and females, with females generally diving deeper than males during both shallow and deep feeding. In order to account for these differences, female and male pygmy blue whales were modelled separately, with values derived from Irvine et al. (2019). The remaining parameters for feeding behaviour were primarily sourced from Goldbogen et al. (2011), who deployed 25 multi-sensor suction cup tags (DTAGs) on blue whales off the coast of California. The exceptions were the values for travel speed, which was derived from satellite tags deployed on pygmy blue whales off southern Australia (Möller et al. 2020), and surface interval, which was derived from a satellite tag deployed on a pygmy blue whale off western Australia (Davenport et al. 2022).

4.6.3.2. Southern Right Whale Behaviour Profile

The project area is located in the known core range for southern right whales, and overlaps with a coastal aggregation BIA for this species. In aggregation areas, southern right whales concentrate from days to weeks before continuing to migrate along the coast (DCCEEW 2022). Animals of all demographics use these areas, including mothers with new calves. As such, two behavioural profiles were considered for southern right whales: migrating and aggregating.

The end of the year corresponds closest to the end of their calving/breeding season and the start of their migration (McCauley 2021). At this time, most pregnant females will likely have given birth, and sightings of mother/calf pairs have been documented in this area (Stamation et al. 2020). The behaviour of southern right whale mother/calf pairs can be dramatically different from other demographics, particularly in regards to the amount of time spent resting at the surface (Cusano et al. 2019, Nielsen et al. 2019). Therefore, separate behavioural profiles were modelled for mother/calf pairs and for all other demographics, resulting in four behavioural profiles for southern right whales: mother/calf migrating, mother/calf aggregating, non-mother/calf migrating, and non-mother/calf aggregating.

The behaviour of migrating southern right whales was modelled to reflect animats transiting through the known core range area on a 293º track to correspond with the tow direction. This reflects the animals migrating along the southern coast of Australia in a westerly or counter-clockwise direction (Burnell et al. 2001). Fine-scale behavioural data on southern right whales are limited, however migrating travel speed was derived from satellite-tagged southern right whales (Mackay et al. 2020). The remaining parameters used for the migrating species profiles were primarily sourced from multi-sensor tags (DTAGs and/or TDRs) deployed on North Atlantic right whales (Baumgartner and Mate 2003) (Dombroski et al. 2021).

Reproductive BIAs for southern right whales act as aggregation areas for mothers with new calves and for other demographics between additional known habitats. For the aggregating behavioural profiles, behaviours reflect those observed in North Atlantic right whales on calving grounds due to limited data on southern right whales: resting, travelling, and surface active. Additionally, the mother/calf profile includes nursing behaviour. The parameters used for the aggregating species profiles were again primarily sourced from North Atlantic right whales with the exception of behavioural probabilities, which were available from studies of southern right whales in South America (Thomas et al. 1984 and Lundquist et al. 2008).

5. Results

5.1. Acoustic Source Levels and Directivity

AASM (Section 4.2) was used to predict the horizontal and vertical overpressure signatures and corresponding power spectrum levels for the seismic sources, with results provided in Appendix B.3 along with the horizontal directivity plots for the selected source.

Table 11 shows the PK and per-pulse SEL source levels in the horizontal-plane broadside (perpendicular to the tow direction), endfire (along the tow direction), and vertical directions for the modelled array signature (2820 in^3 source). The vertical source level that accounts for the “surface ghost” (the out of phase reflected pulse from the water surface) is also presented to make it easier to compare the output of other seismic source models.

Figure B-2 in Appendix B.3 shows the broadside, endfire, and vertical overpressure signature and corresponding power spectrum levels for the source. The signature consists of a strong primary peak, related to the initial release of high-pressure air, followed by a series of pulses associated with bubble oscillations. Most energy was produced at frequencies below 500 Hz. Frequency-dependent peaks and nulls in the spectrum result from interference among airguns in the source and correspond with the volumes and relative locations of the airguns to each other.

Table 11. Far-field source level specifications for 2820 in^3 source, for 7 m tow depth. Source levels are for a point-like acoustic source with equivalent far-field acoustic output in the specified direction. Sound level metrics are per-pulse and unweighted.

Direction	Peak source pressure level ($L_{S,pk}$; dB re 1 µPa m)	Per-pulse source SEL ($L_{S,E}$; dB 1 µPa^{2}m^{2}s)	
		10–2000 Hz	2000–25000 Hz
Broadside	248.6	224.2	185.8
Endfire	244.7	222.7	186.3
Vertical	254.8	227.8	194.0
Vertical (surface affected source level)	254.8	230.5	196.9

5.2. Per-pulse Sound Fields

This section presents the per-pulse sound fields in terms of maximum-over-depth SPL, SEL, PK, and seafloor PK and PK-PK. The different metrics are presented for the following reasons:

- SPL sound fields were used to determine the distances to marine mammal and turtle behavioural thresholds (see Sections 3.1 and 3.3).
- Per-pulse SEL sound fields are used as inputs into the 24 h SEL scenario and to provide context for the range to 160 dB re 1 µPa^2·s, relevant for the EPBC Act Policy Statement 2.1 (DEWHA 2008).
- PK metrics within the water column are relevant to thresholds and guidelines for marine mammals, sea turtles, fish, fish eggs and larvae (as well as plankton; Sections 3.1–3.3).
- PK metrics at the seafloor are relevant to guidelines for fish, fish eggs and larvae (Section 3.3) and the sound level for no effect on corals and sponges.

- PK-PK metrics at the seafloor are relevant to sound levels used in the assessment of effect on benthic invertebrates (Section 3.5.1).

The maximum and 95% distances to per-pulse SEL and SPL metrics are presented in Tables 12–13. The SPL sound fields, and distances to relevant isopleths can be visualised on the contour maps presented in Figures 8–18. The SPL sound fields are also presented as vertical slices for selected azimuths along the endfire and broadside directions out to 50 km, with the airgun array in the centre (Figures 19–23).

Maximum distances to maximum-over-depth water column PK thresholds were calculated for five modelled single impulse sites, Sites 2, 3, 5, 8, and ,10, this was done at the sites where FWRAM was applied to calculate the SEL-SPL conversion (Appendix C.2 and D.2), and presented in Table 15. Seafloor sound levels were assessed considering eleven different representative water depths (40, 50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m). Tables 16 and 17 present the PK and PK-PK result Particle motion was also calculated considering these water depths, results are presented in Table 18.

5.2.1. Tabulated Results

5.2.1.1. Entire Water Column

Table 12. *Sites 1-11, 2820 in^3 source*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) from the seismic source to modelled maximum-over-depth and maximum-over-tow direction unweighted per-pulse sound exposure level (SEL) isopleths from the modelled single impulse sites, with water depth indicated. The results presented are the maximum ranges from the set of modelled tow directions for each site, as described in Table 6.

A dash indicates the threshold is not reached within the limits of the modelling resolution (20 m).

5.2.1.2. Seafloor

Ranges presented for seafloor receptors are provided in Tables 16 and 17 for receiver depths of 50 and 5 cm above the seafloor. As an example, the seafloor PK results in Table 16 differ from the maximum-over-depth modelled results presented in Table 15. This is because the model used for the water column results, calculated using FWRAM do not represent the maximum sound levels at the seafloor close to the array. FWRAM is based on a wide-angle parabolic equation (PE) algorithm which is valid to only approximately 70° down angle from the horizontal, and while it provides accurate predictions in the horizontal direction, it cannot predict sound levels directly under the array. VSTACK was used to determine the levels at the seafloor directly under the array and is valid in the very nearfield directly under the source.

Table 16. *2820 in³ source*: Maximum (R_{max}) horizontal distances (in m) from the seismic source to modelled seafloor (receiver located 50 cm above seafloor) peak pressure level thresholds (PK) at eleven representative water depths.

Hearing group/animal type	PK threshold (L_{pk}; dB re 1 µPa)	Water Depth										
		40 m	50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)										
Sound levels for sponges and corals[1]	226	2	*	*	*	*	*	*	*	*	*	*
Fish: No swim bladder (also applied to sharks)	213	102	110	74	73	73	70	67	56	46	9	*

5.2.1.3. Particle Motion Metrics

The modelling considered receivers positioned at 5 cm off the seafloor. The maximum distance in metres to a peak particle acceleration magnitude of 37.57 ms^{-2} are presented in Table 18. The ranges for the particle acceleration threshold for invertebrates defined by Day et al. (2016a).

Table 18. Maximum (R_{max}) horizontal distances (in m) from the 2820 in^3 to particle motion threshold: Peak acceleration magnitude level (m/s^2) threshold for benthic invertebrates 5 cm above the seafloor, with water depth indicated. Results included in relation to benthic invertebrates (Section 3.5.1).

Hearing group/animal type	Peak Acceleration Magnitude (m/s^2)	Water Depth										
		40 m	50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)										
Benthic invertebrates	37.57	52	4	*	*	*	*	*	*	*	*	*

An asterisk indicates that the sound level was not reached.

5.2.1.4. Sound Levels at Sensitive Receivers

The received per-pulse SPL sound levels at the sensitive receiver sites identified in Section 2.1 are provided in Table 19. For each receiver location, the maximum level from all modelled sites is shown below. The distance between the receiver and the modelled site that produced the maximum level are also shown.

Table 19. Maximum-over-depth received sound levels (SPL) at the sensitive receivers outlined in Section 2.1 along with the distance between the receiver and associated modelled site.

Receiver ID	Sensitive receiver	SPL (L_p; dB re 1 µPa)	Distance between receiver location and modelled site (km)	Associated Modelled Site
1	Lady Julia Percy Island	153.4	9.35	1
2	Southern Right Whales Migration and resting BIA	133.9	44.5	2
3	Discovery Bay	113.2	72.1	11

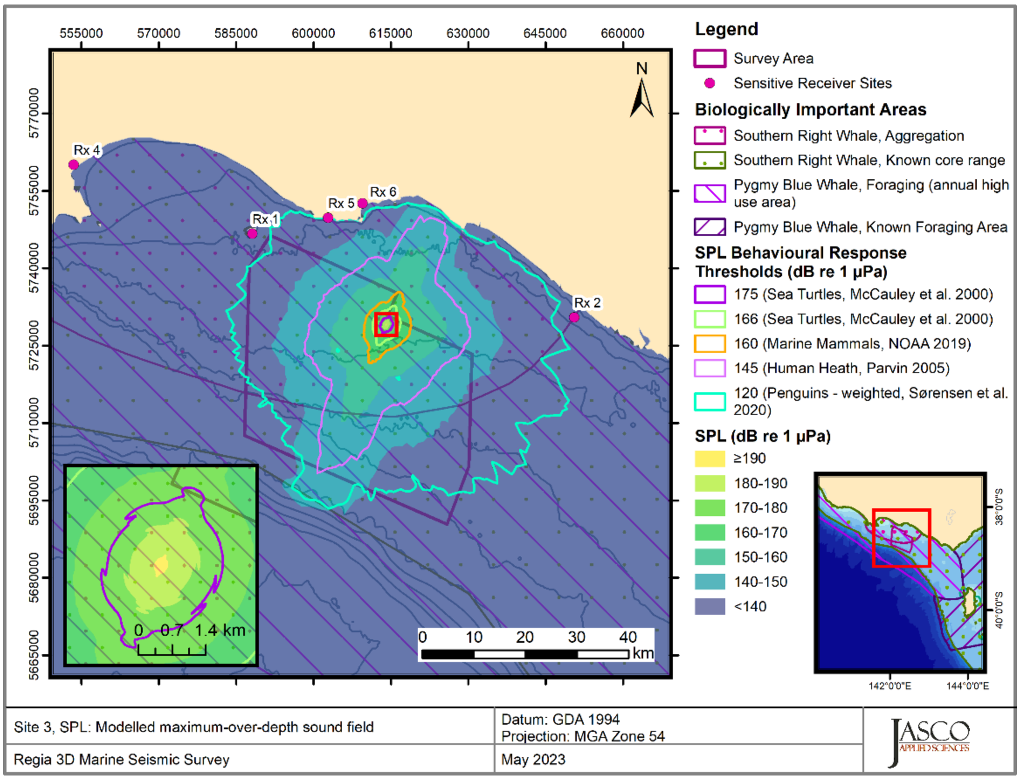

Figure 10. *Site 3, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

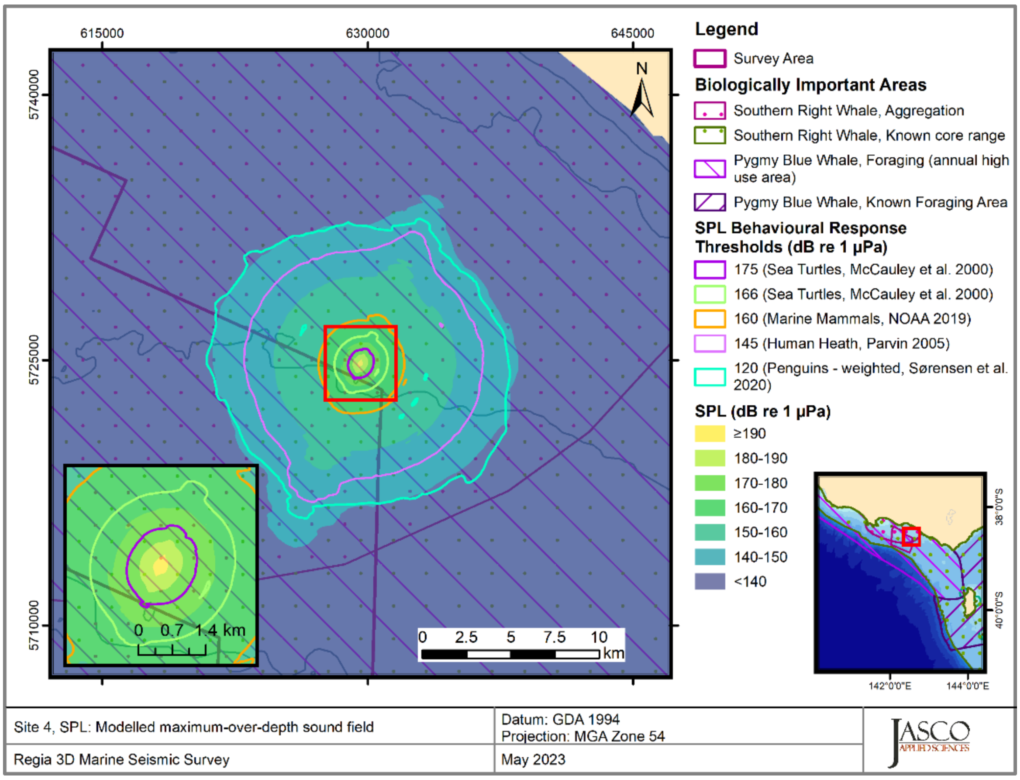

Figure 11. *Site 4, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

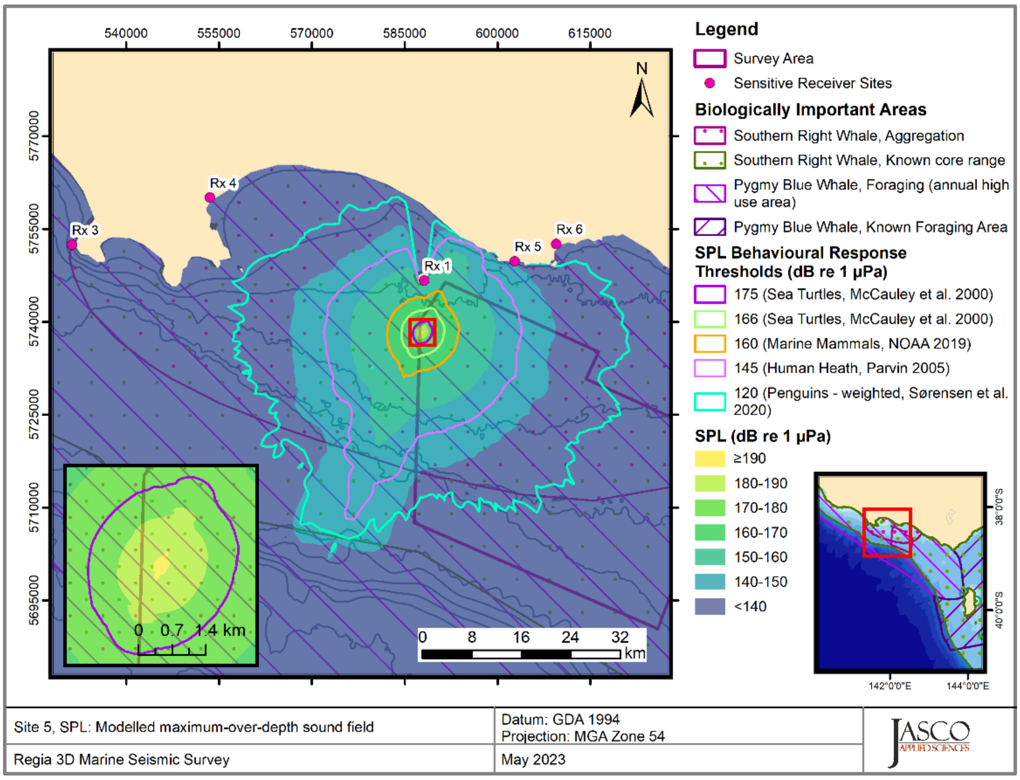

Figure 12. *Site 5, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

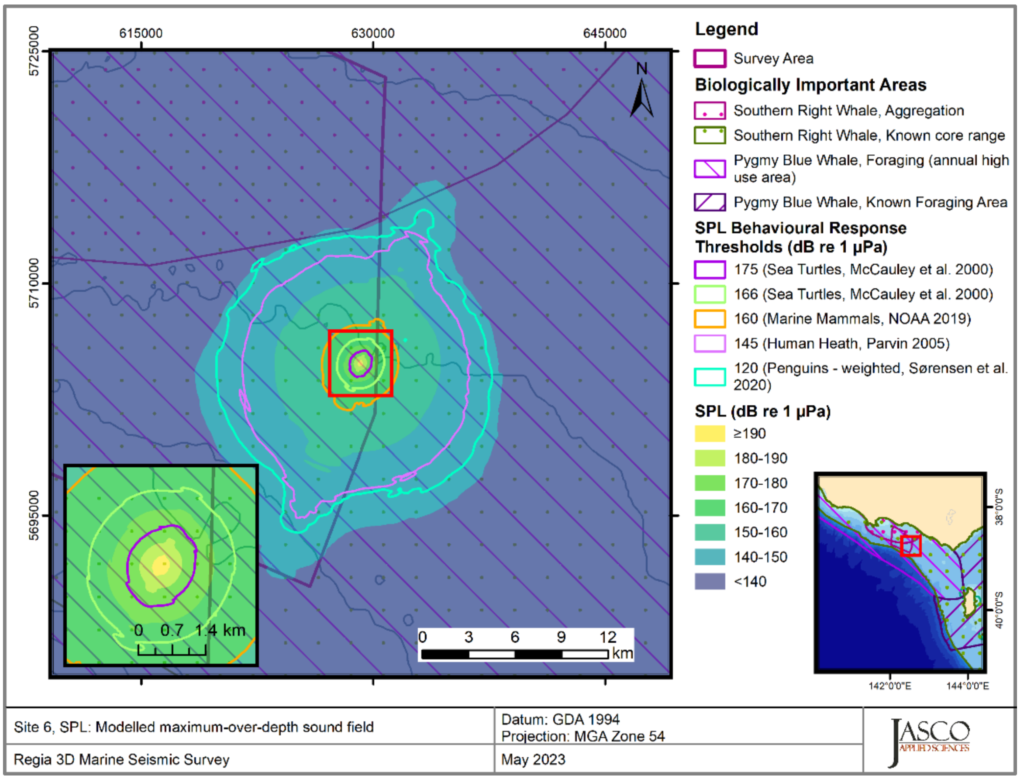

Figure 13. *Site 6, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

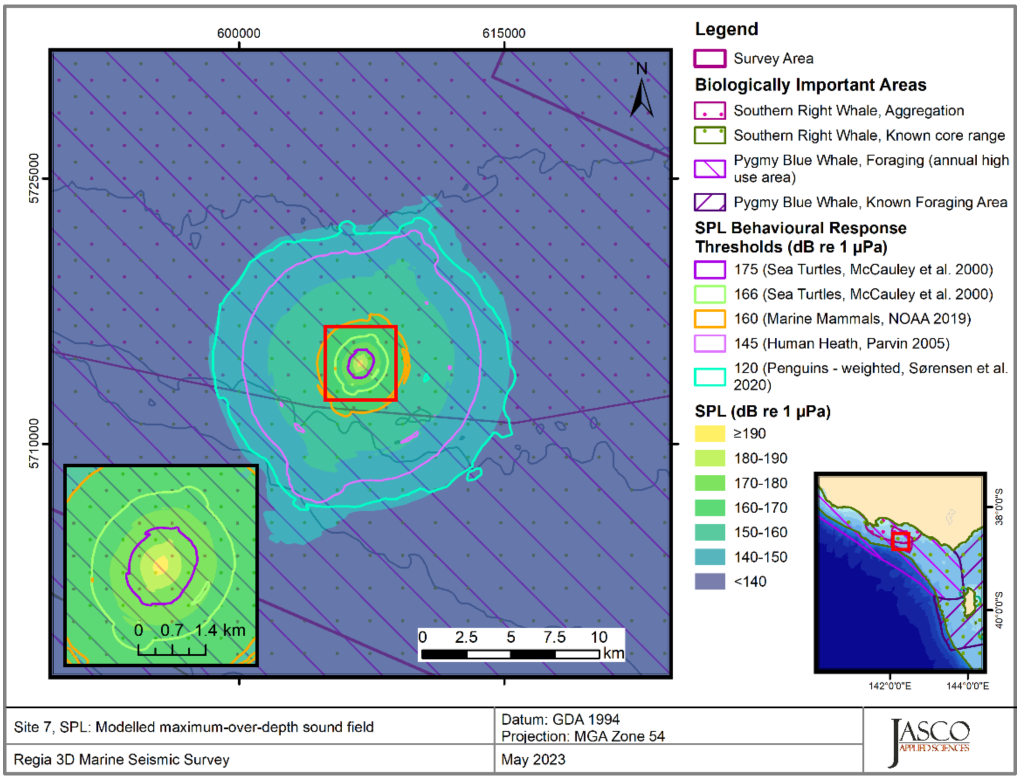

Figure 14. *Site 7, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

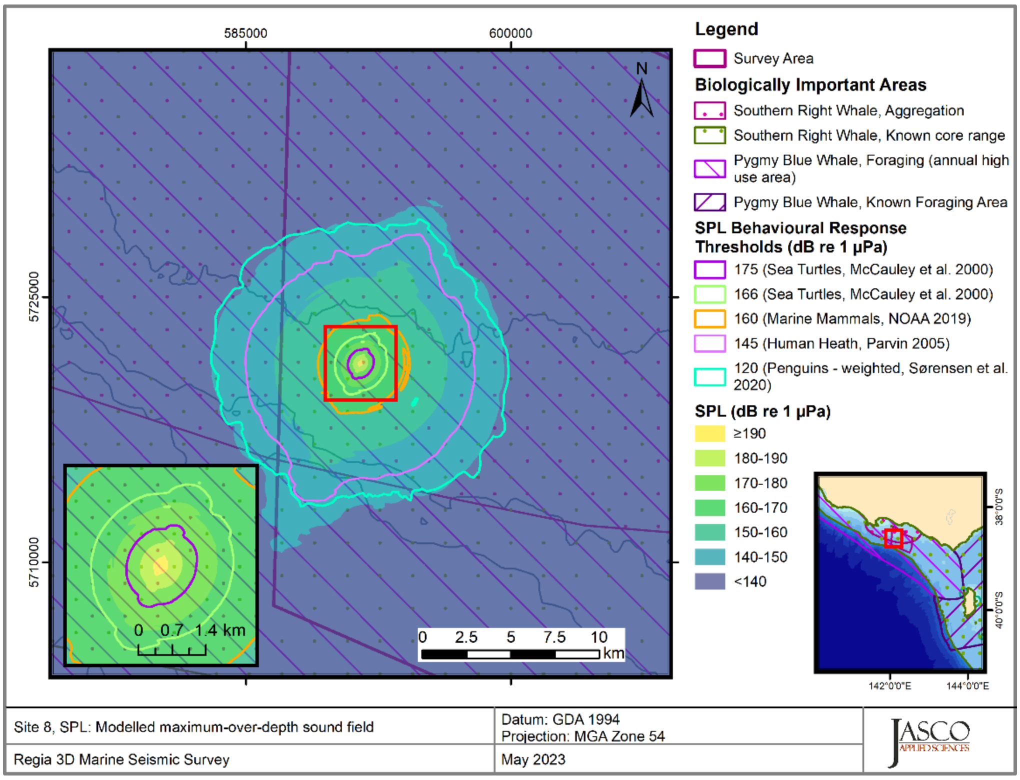

Figure 15. *Site 8, SPL, 2820 in^3 source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

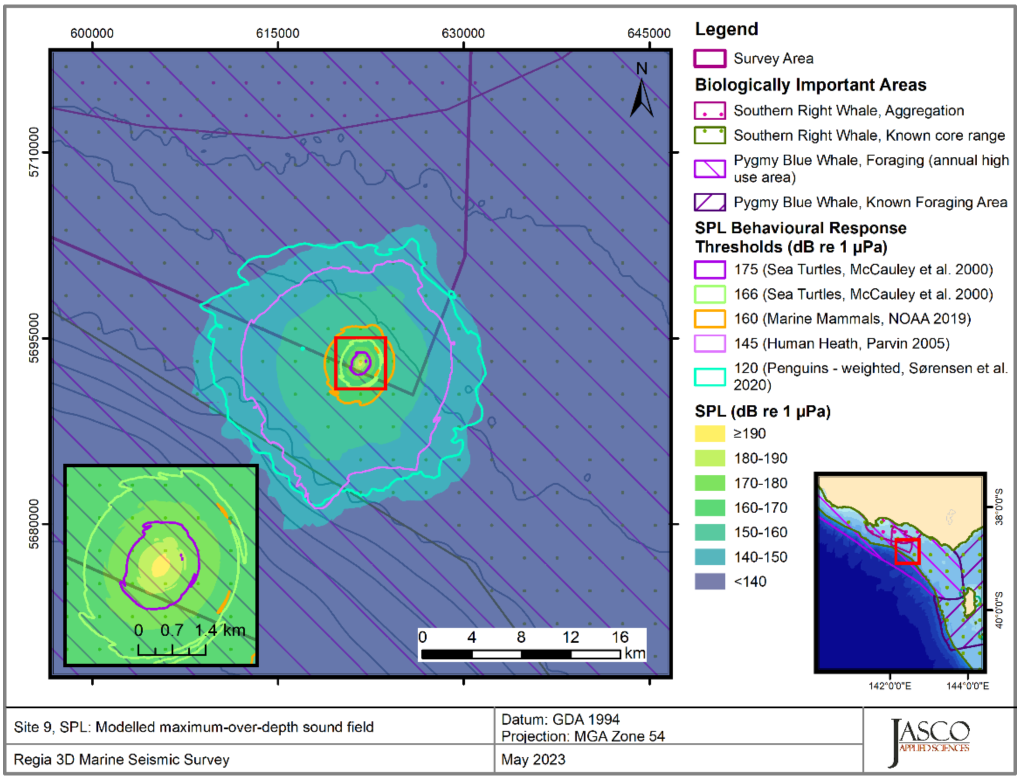

Figure 16. *Site 9, SPL, 2820 in^3 source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

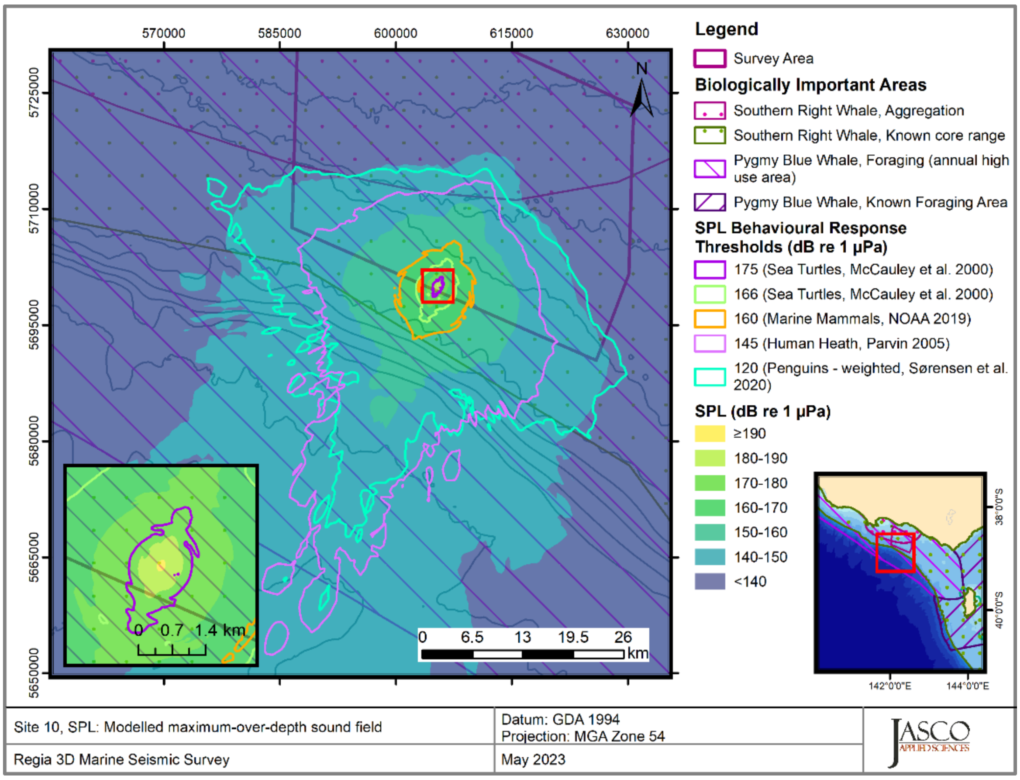

Figure 17. *Site 10, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

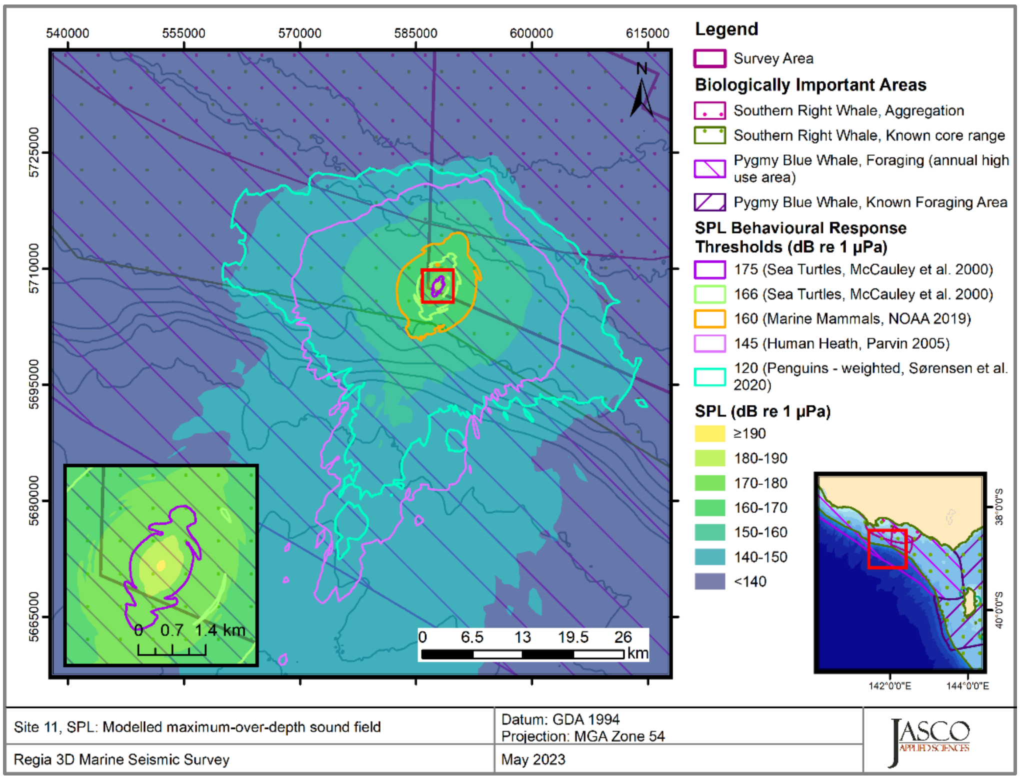

Figure 18. *Site 11, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

5.2.2.2. Vertical Slices of Modelled Sound Fields

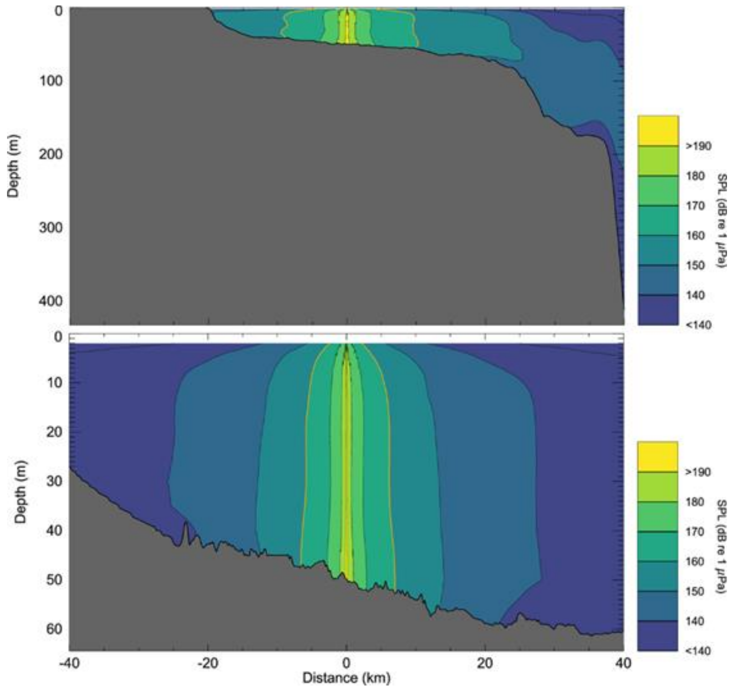

Figure 19. *Site 2, SPL, 2820 in*[3] *source, tow azimuth 113*°: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

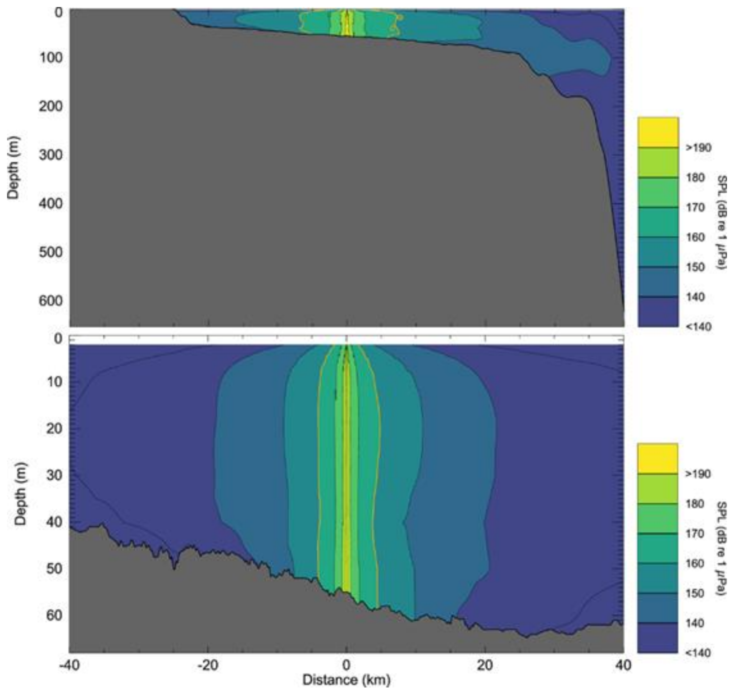

Figure 20. *Site 3, SPL, 2820 in*[3] *source, tow azimuth 113*°: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

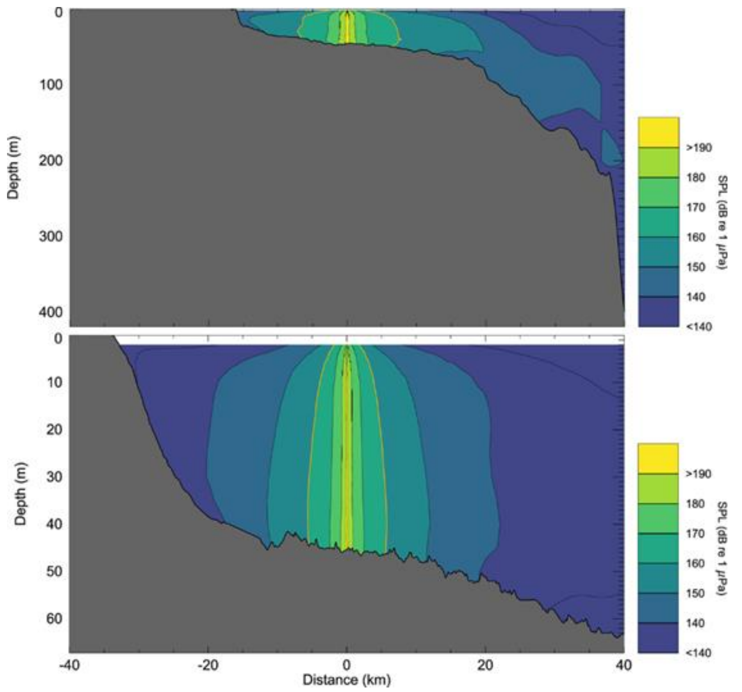

Figure 21. *Site 5, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

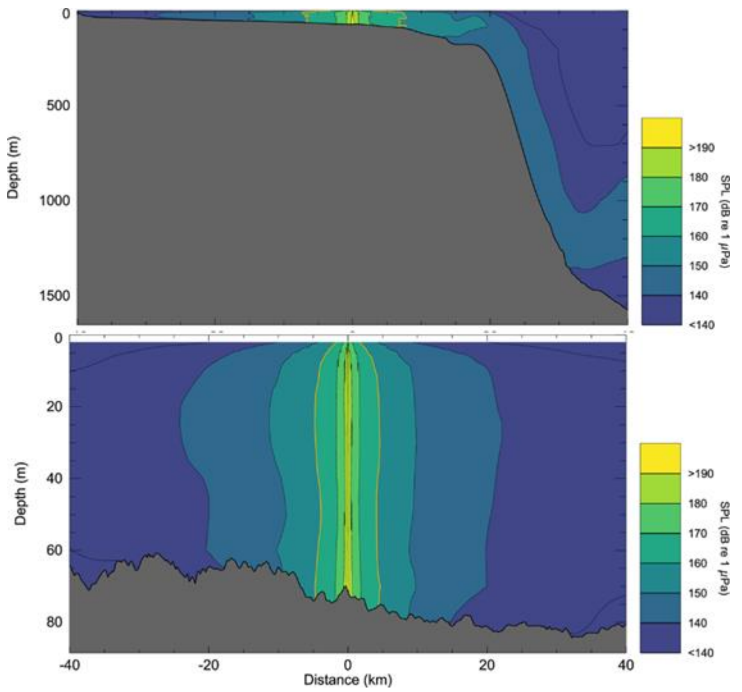

Figure 22. *Site 7, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

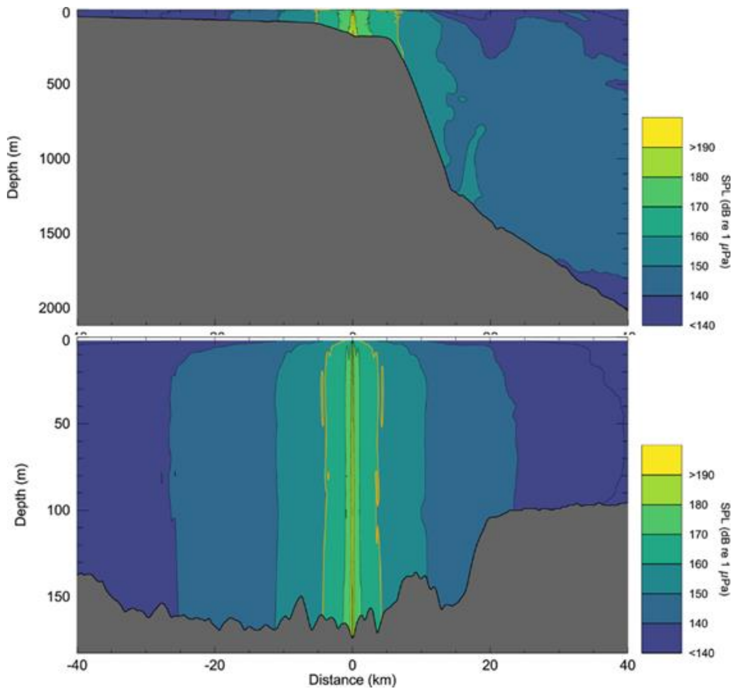

Figure 23. *Site 10, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

5.3. Multiple Source Fields

This section presents the sound fields in terms of SEL accumulated over 24 h for the modelled scenarios (Section 2). Frequency-weighted SEL_{24h} sound fields were used to estimate the maximum horizontal distances (R_{max}) to marine mammal and sea turtle PTS and TTS thresholds (listed in Table 20), and to estimate maximum distance and the area for injury and TTS guidelines for fish (Table 21).

The SEL_{24h} sound fields are presented as contour maps in Figures 24–26. These figures present the unweighted SEL_{24h} in 10 dB steps, as well as the isopleths corresponding to thresholds or guidelines that are large enough to be resolved on a map.

5.3.1. Tabulated Results

Table 20. Maximum-over-depth distances (in km) to frequency-weighted 24 h sound exposure level (SEL_{24h}) based permanent threshold shift (PTS) and temporary threshold shift (TTS) for marine mammals Southall et al. (2019) and sea turtles (Finneran et al. 2017) using the 2820 in^3 seismic source for all scenarios. Maximum extents are in the broadside direction.

Hearing group	Threshold for SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	Scenario A		Scenario B		Scenario C

5.3.2. Sound Level Contour Maps

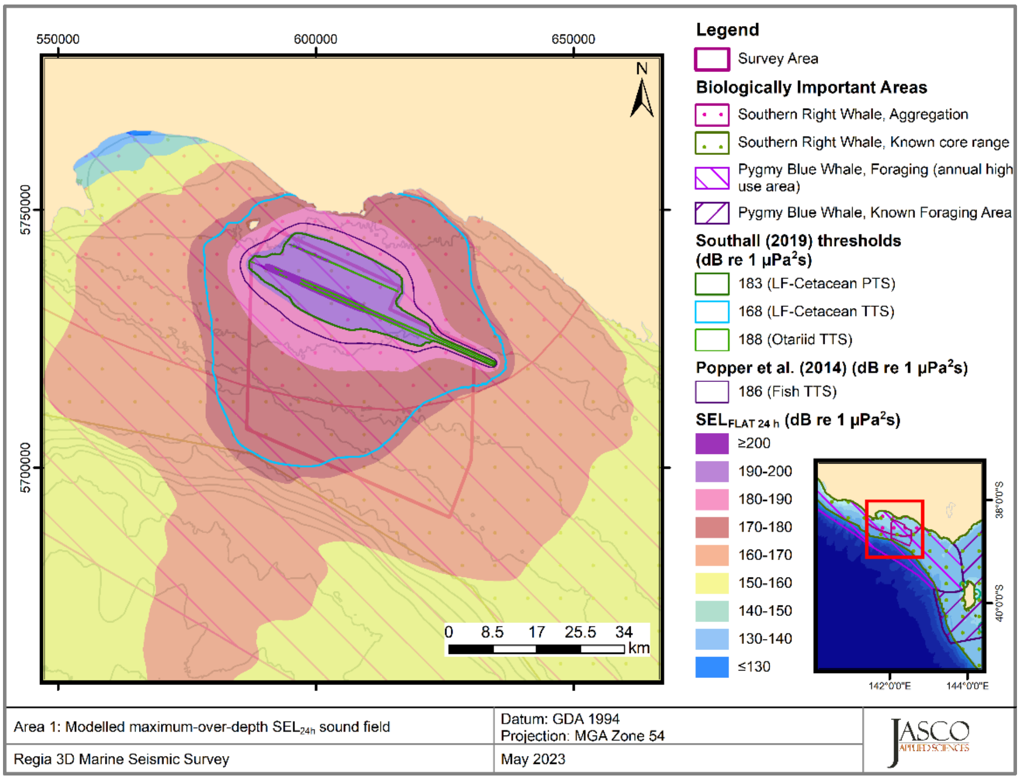

Figure 24. *Scenario A*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

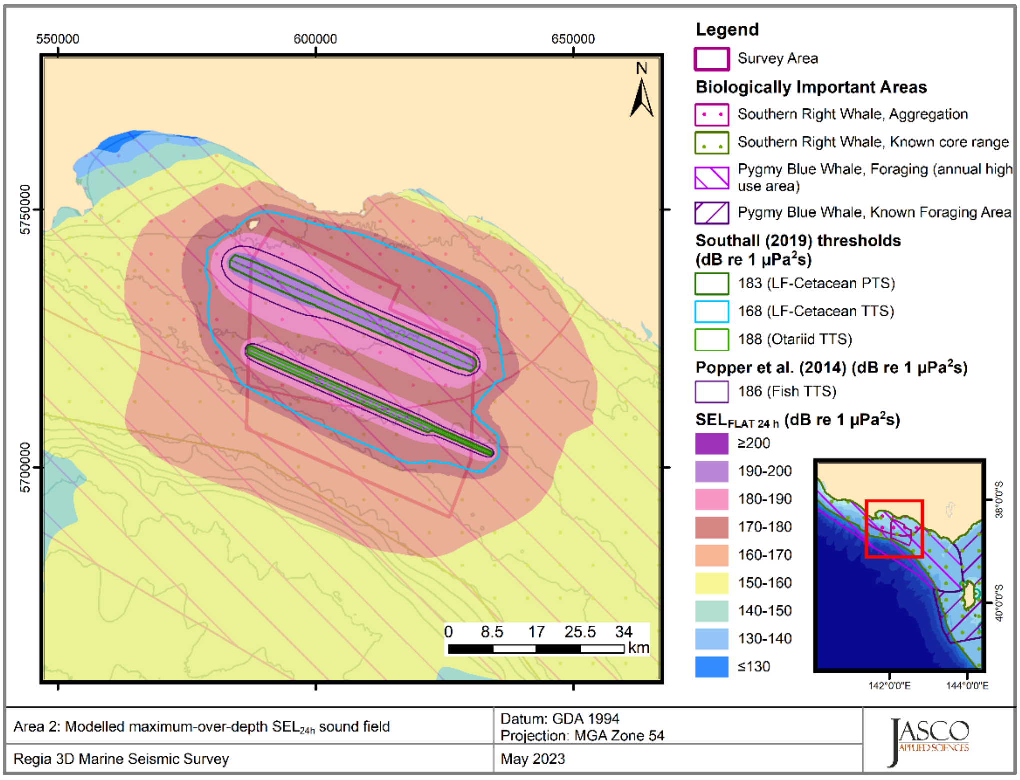

Figure 25. *Scenario B*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

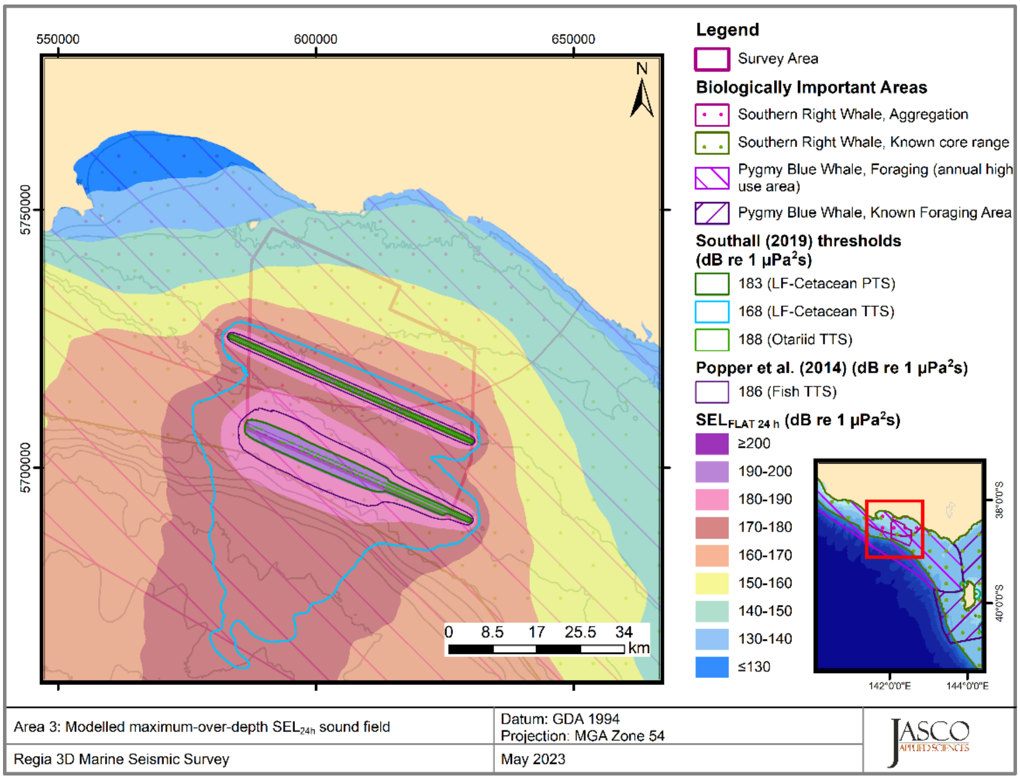

Figure 26. *Scenario C*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

5.4. Animal Movement Exposure Ranges

A summary of radial distances to exposure thresholds for pygmy blue whales and southern right whales, along with probability of exposure for each modelled scenario (Section 2) are included below. Tables 22 and 23 show results for scenarios with pygmy blue whale animats unrestricted (Seeding A) and restricted to the shelf (Seeding B), respectively, whilst Tables 24 and 25 show results for scenarios with southern right whale animats restricted to the extended aggregation BIA (Seeding A) and known core range area (Seeding B), respectively. Results include $ER_{95\%}$ exposure ranges calculated for the 160 dB behavioural response threshold and SEL_{24h} thresholds for both TTS and PTS, and the probability of an animat being exposed above the threshold within the $ER_{95\%}$.

Exposure ranges for TTS and PTS PK thresholds were not included in the exposure analysis since acoustic modelling predicted no PTS PK exceedance and ranges of less than 150 m for TTS PK (see Table 15). For the per-pulse PK metric, the exceedance distances are small and close enough to the source such that only minor differences are expected between acoustic and animat exposure predictions.

Sections 5.4.1 and 5.4.2 includes histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenario A, with results in Tables 22 to 25. Additional histograms for the remaining scenarios can be found in Appendix F.

Table 22. Summary of animat simulation results for pygmy blue whales with animats not restricted to the BIA (Seeding A). The 95th percentile exposures ranges ($ER_{95\%}$) in km and probability of animats being exposed above threshold within the $ER_{95\%}$ (P_{exp} (%)) are provided.

6. Discussion and Summary

The modelling study predicted underwater sound levels associated with the planned Regia MSS. The underwater sound field from a 2820 in^3 seismic source was modelled (Appendix B.2). An analysis of seasonal sound speed profiles and associated sensitivity comparison indicated that December was likely to be the month most conductive to sound propagation. Only a subset of months when the survey could occur were consisted in the comparison. As such December was selected to ensure a conservative estimation of distances to received sound level thresholds over the potential survey periods (Appendix D.3.2). Modelling also accounted for site-specific bathymetric variations (Appendix D.3.1) and local geoacoustic properties (Appendix D.3.3).

Most acoustic energy from a seismic source is output at lower frequencies, in the tens to hundreds of hertz. The modelled array had a pronounced broadside directivity for decidecade bands between ~100 to 400 Hz (Appendix B.3), which caused a noticeable axial bulge in the modelled acoustic footprints. The overall broadband (10–25000 Hz) unweighted per-pulse SEL and peak pressure source levels of the seismic source operating at 7 m depth are detailed in Table 11.

6.1. Per-Pulse Sound Fields

The per-pulse modelled sites span water depths from about depths of 40–174 m across three different geological regions. The bathymetry within the vicinity of the survey varied between approximately 20–150 m; however, along a south-westward transect the environment generally transitions from shallower water of the Otway Shelf to the significantly deeper waters of the continental slope and abyssal plane (>1000 m). The frequency content of the seismic sources coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters. The maximum-over-depth sound footprint maps and vertical slice plots (Sections 5.2.2.1 and 5.2.2.2) assist in demonstrating the influence of the bathymetry and seabed composition on the sound field.

For the sites modelled in shallow water, less than 50 m depth, where the seabed was modelled as a sand layer underlain by variably cemented limestone (calcarenite). Literature suggests that this layer likely begins to thin as water depths increase in an offshore direction, and for water depths greater than 50 m it was considered absent with only the variably cemented calcarenite present at the seafloor interface. Modelled sites located in environments where the seabed was modelled as bare calcarenite generally displayed higher rates of loss at distance away from the source as compared to sites where a layer of sand overlies calcarenite.

The presence of unconsolidated coarse sand overlying semi-cemented calcarenite led to a more reflective seabed and likely led to large isopleths for low level thresholds, particularly in the offshore direction. This is most evident for the marine mammal behavioural threshold of 160 dB re 1 µPa (SPL) for impulsive sound sources. However, the distribution of sand layer is not well known and if the thickness of the sand layer is not as uniform as modelled then this variability could potentially lead to smaller radii.

The array directionality and frequency content coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters for all modelled sites. This is particularly evident for modelled Sites 9, 10 and 11 which are situated along the continental shelf break and continental slope. For source locations close to the continental shelf break modelling indicates that significant amounts energy reflected from the seabed slope can be trapped in the deep sound channel and propagate for large distances within the ocean interior. This phenomenon is evident in the slice plots showing the sound field in the broadside direction, where greater ranges to all isopleths are predicted to occur in the downward sloping offshore direction. The vertical slice plots in Section 5.2.2.2 assist in demonstrating the influence of the sloping bathymetry on the sound field.

6.2. Multiple Pulse Sound Fields

The accumulated SEL over 24 hours of seismic source operation was modelled considering three acoustic scenarios and three animal movement modelling scenarios, each with a realistic acquisition pattern based on provided survey designs. The modelling predicted the accumulation of sound energy, considering the change in location and the azimuth of the source at each pulse point, which was used to assess possible injury in marine mammals and the SEL_{24h} based fish criteria. The results were presented as maps of the accumulated exposure levels and tabulated values of ranges to threshold levels and exposure areas for the given effects criteria (Section 3).

The footprints and range maxima for all accumulated SEL thresholds are influenced by the seabed compositions along acquisition lines. The discussion above regarding ranges to isopleths also applies to the accumulated SEL calculations. The farthest ranges to thresholds for PTS and TTS were driven by the source orientation and bathymetry, particularly in the broadside and offshore directions.

6.3. Acoustic Results Summary

This section presents summary of the distances to the noise effect criteria applied in this study (Section 3) as relevant to the impact assessment. The effect criteria for impairment of marine mammals, fish and sea turtles use dual metrics (PK and SEL_{24h}), and the longest distance associated with either metric is required to be applied, and thus is presented in this summary.

The SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 h based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. Where the corresponding SEL_{24h} radii are larger than those for peak pressure criteria, they often represent an unlikely worst-case scenario. More realistically, marine mammals, fish, and sea turtles would not remain in the same location for 24 hours, but rather a shorter period, depending upon their behaviour, the proximity and movements of the source. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained in that location for 24 h. A more realistic representation of the potential exposures was undertaken using animal movement modelling (‘animat modelling’), with the results summarised separately below.

A summary of predicted distances to criteria from acoustic modelling are presented below.

Marine Mammals

Table 26 summarises the distances to criteria for marine mammals, note that these distances are primarily associated with the broadside aspect of the array. Results for PK are presented in Table 15, while SEL_{24h} results are in Table 20.

Table 26. Summary of maximum (R_{max}) horizontal distances (in km) from modelled sites or scenarios to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. Maximum extents are in the broadside direction of the 2820 in^3 seismic source.

Hearing group	Maximum modelled distance to effect threshold (R_{max})						
	Behavioural response[1]	Scenario A		Scenario B		Scenario C	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	10.3 (SPL)	34.0 (SEL_{24h})	4.89 (SEL_{24h})	14.8 (SEL_{24h})	1.65 (SEL_{24h})	43.5 (SEL_{24h})	1.90 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.74 (PK)	0.43 (PK)	0.74 (PK)	0.43 (PK)	0.65 (PK)	0.33 (PK)
Otariid Pinnipeds		0.05 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Sea Turtles

Table 27 summarises the distances to criteria for sea turtles, with the results for behavioural thresholds presented in Table 3 while SEL_{24h} results are in Table 20.

Table 27. Summary of horizontal distances (in km) to turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group	Maximum modelled distance to effect threshold (R_{max})							
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	5.97 (SPL)	2.55 (SPL)	3.43 (SEL_{24h})	0.07 (SEL_{24h})	1.14 (SEL_{24h})	0.07 (SEL_{24h})	0.82 (SEL_{24h})	0.06 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance to the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 µPa^{2}s was reached between 0.05 and 0.06 km for all scenarios was. PTS and PK thresholds were not resolved withing the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.

- The maximum distance where the OCW-weighted penguin behavioural response threshold of 120 dB re 1 µPa (SPL) for impulsive noise could be exceeded varied between 9.08 and 52.1 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
    - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
    - Fish with a swim bladder that do not use it for hearing,
    - Fish that use their swim bladders for hearing,
    - Fish eggs and fish larvae.
- Table 28 summarises distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric. Results for PK are presented in Tables 15 whilst SEL_{24h} results are in Tables 21.

Table 28. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single impulse and 24 hour sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Recoverable injury	SEL_{24h}	0.07
	TTS	SEL_{24h}	7.86
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Recoverable injury	PK	0.22
	TTS	SEL_{24h}	7.86
Fish eggs, and larvae (relevant to plankton)	Injury	PK	0.22

Benthic invertebrates, Sponges, and Coral

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 µPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 295 and 711 m for the 2820 in^3 source.
- Bivalves: The distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was determined for comparing to results presented in Day et al. (2016a). This particle acceleration was reached at a range of 52 m for depth 40 m, 4 m for a depth of 50 m, and was not reached at any greater depth.
- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for

sponges and corals (Heyward et al. 2018); the threshold was reached at a range of 2 m for depth 40 m and was not reached at any greater depth.

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 µPa (SPL; L_P) derived from (Parvin 2005) was considered for people swimming and diving. At the closest separation between considered modelled sites and receiver locations a sound level of 153.1 dB re 1 µPa (SPL; L_P) was predicted at Little River and Taylors Beach. It is important to review the provided contour maps to contextualise levels at coast areas to understand where the human health assessment level may be reached.

6.4. Animal Movement Modelling

The estimated sound fields produced by source and propagation models for the planned Regia MSS were incorporated into an animat sound exposure model for pygmy blue whales to estimate the radial distance within which 95% of the exposure exceedances occur ($ER_{95\%}$), along with the probability that an animat with the closest point of approach within that distance would be exposed above the relevant threshold (P_{exp}).

For the exposure analysis, all three acquisition scenarios were run with different animat seeding approaches. Survey lines from all nominal acquisition scenarios overlap with the foraging BIA for pygmy blue whales. Survey lines from Scenario A fully and from Scenarios B and C partially overlap with the aggregation BIA for southern right whales.

Sections 6.4.1 and 6.4.2 summarise the PTS, TTS, and behavioural exposure range results, with the tabulated results presented in Tables 22 to 25. Table 29 summarises the maximum exposure range results for pygmy blue whales and southern right whales across the different species profiles considered. Figure 39 summarises results for each modelled scenario and species profile, with pygmy blue and southern right whales considered.

Table 29. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales Maximum Exposure ranges show $ER_{95\%}$ (km) first and probability of exposure of animats travelling within the $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL24h)[3]	PTS (SEL24h)[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	8.09 (86%)	13.2 (58%)	1.40 (51%)
	B	6.82 (93%)	6.05 (60%)	0.53 (50%)
	C	6.77 (92%)	7.60 (60%)	0.34 (47%)
Southern right whale	A	8.43 (85%)	11.6 (60%)	1.50 (50%)
	B	6.81 (92%)	6.04 (52%)	0.54 (49%)
	C	7.58 (85%)	6.71 (37%)	0.25 (37%)

1 LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)
2 SPL (L_p; dB re 1 µPa)
3 Southall et al. (2019) criteria for marine fauna.
4 NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

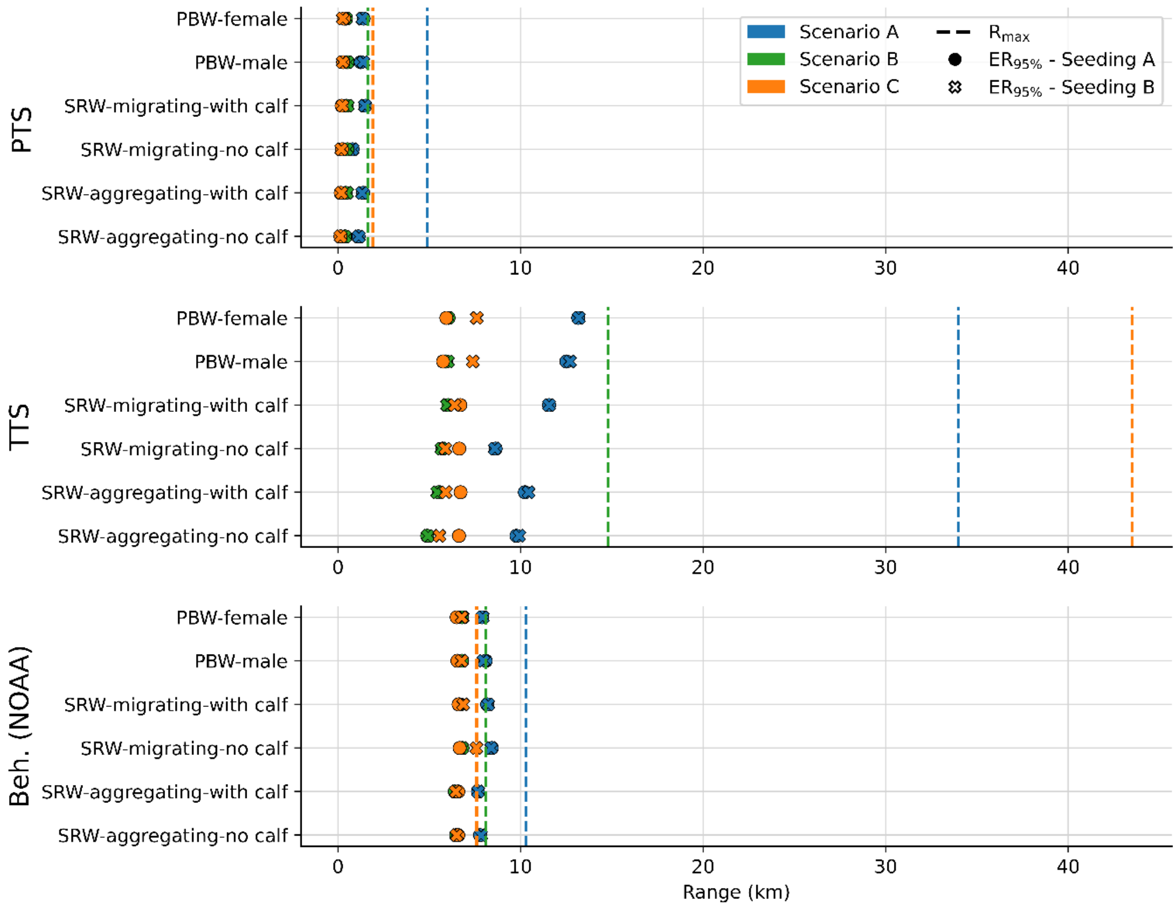

Figure 39. Acoustic (R_{max}) and exposure ranges ($ER_{95\%}$) for TTS/PTS and the behavioural thresholds (NOAA), shown for each species. Colour represents the acoustic modelled scenario. Seeding A and B refer to the different seeding areas for pygmy blue whales and southern right whales, presented in Figure 2.

6.4.1. PTS and TTS

Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because of the generally shorter time ('dwell time') to accumulate sound energy of the moving animats. In this study, PTS and TTS exposure ranges were substantially shorter than acoustic ranges to threshold, as shown in Figure 39.

All considered scenarios resulted in exposures above the PTS and TTS thresholds, and therefore exposure ranges.

The maximum $ER_{95\%}$ for pygmy blue whale scenarios was 13.2 and 1.4 km for TTS and PTS, respectively. The probability of exposure within $ER_{95\%}$ varied between 47 and 68%. For southern right whales, the maximum $ER_{95\%}$ for TTS and PTS were 11.6 and 1.5 km, respectively, with probability of exposure varying between 36 and 80%. The range of probabilities indicates that some, but not all, animats exposed within the 95th percentile range were exposed above threshold. This is because animats can move in and out of the modelling range as well as their vertical position in the water column, thus potentially limiting the length of time they are within the exposure radius. For example, an animat might approach within the predicted exposure range but if they are traveling more quickly on average than other animats, they may not accumulate as much exposure, or they may be spending more time at depths with quieter sound levels.

For this reason, female pygmy blue whale scenarios resulted in slightly larger exposure ranges than the corresponding male pygmy blue whale scenarios. Based on the vertical distribution of the sound field (see Section 5.2.2.2), female pygmy blue whale animats accumulate more exposures than the males since females generally dive deeper than males (Section 4.6.3.1) and therefore spend more time at depths with higher sound levels.

Exposure ranges are, on average, slightly longer for TTS and PTS for unrestricted vs restricted pygmy blue whale scenarios because unrestricted animats have more opportunities to be seeded in deeper water and further away from the sources, whereas restricted animats have more opportunities to be exposed to sound fields closer to the sources and for a longer time, which effectively lengthens their dwell time. This becomes apparent for the nominal acquisition lines of Scenario C, which are located close to the edge of the shelf. Any restricted foraging pygmy blue whale animats travelling close the survey lines and close to the border of Seeding Area B are forced to stay within the bounds, whereas unrestricted animats can move in and out of the modelling range.

Exposure ranges are, on average, slightly longer for TTS and PTS for mother and calf pair versus no calf southern right whale scenarios as well. This is primarily due to the inclusion of nursing behaviour, where animals spend time stationary at the surface (Thomas et al. 1984), and the long duration of resting periods with slow travel speeds for mother/calf pairs (Hain et al. 2013). As a result, they accumulate more sound energy and are exposed for a longer time.

The animat modelling was included in the scope of work to provide context to possible exposures to pygmy blue and southern right whales over an entire day. The distances to isopleths associated with the effect thresholds for PTS and TTS are more realistic than those from the static sound fields as they consider potential animal movements passing through the operational region.

6.4.2. Behavioural Effects

Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criteria, are typically comparable to the predicted acoustic ranges. Maximum acoustic ranges (e.g., R_{max}) are conservatively calculated using the maximum-over-depth sound fields and assuming static receivers, while exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving parameters, so exposure ranges are generally slightly lower than the R_{max} acoustic ranges. In this case, exposure ranges were slightly shorter than acoustic ranges to threshold for most modelled scenarios.

Overall, ranges were longest for Scenario C. For all considered pygmy blue whale scenarios, the $ER_{95\%}$ to behavioural threshold ranged from 6.50–8.09 km for pygmy blue whales, with P_{exp} varying between 87 and 93%. For southern right whales, the $ER_{95\%}$ to behavioural threshold ranged from 6.39-8.43 km, with P_{exp} varying between 81 and 92%.

Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 80000-3 (2017).

1/3-octave

One third of an octave. *Note*: A one-third octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

1/3-octave-band

Frequency band whose bandwidth is one one-third octave. *Note*: The bandwidth of a one-third octave-band increases with increasing centre frequency.

A-weighting

Frequency-selective weighting for human hearing in air that is derived from the inverse of the idealized 40-phon equal loudness hearing function across frequencies.

absorption

The reduction of acoustic pressure amplitude due to acoustic particle motion energy converting to heat in the propagation medium.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

auditory frequency weighting

The process of applying an auditory frequency weighting function. In human audiometry, C-weighting is the most commonly used function, an example for marine mammals are the auditory frequency weighting functions published by Southall et al. (2007).

auditory frequency weighting function

Frequency weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity. Example hearing groups are low-, mid-, and high-frequency cetaceans, phocid and otariid pinnipeds.

azimuth

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also called bearing.

bandwidth

The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI S1.13-2005 (R2010)).

bar

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to 10^5 Pa or 10^{11} μPa.

boxcar averaging

A signal smoothing technique that returns the averages of consecutive segments of a specified width.

broadband level

The total level measured over a specified frequency range.

broadside direction

Perpendicular to the travel direction of a source. Compare with endfire direction.

cetacean

Any animal in the order Cetacea. These are aquatic species and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called primary wave or P-wave.

conductivity-temperature-depth (CTD)

Measurement data of the ocean's conductivity, temperature, and depth; used to compute sound speed and salinity.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006).

decidecade

One tenth of a decade. *Note*: An alternative name for decidecade (symbol ddec) is "one-tenth decade". A decidecade is approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct) and for this reason is sometimes referred to as a "one-third octave".

decidecade band

Frequency band whose bandwidth is one decidecade. *Note*: The bandwidth of a decidecade band increases with increasing centre frequency.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Unit: dB.

duty cycle

The time when sound is periodically recorded by an acoustic recording system.

endfire direction

Parallel to the travel direction of a source. Also see **broadside direction**.

energy source level

A property of a sound source obtained by adding to the sound exposure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2 m^2 s$.

energy spectral density source level

A property of a sound source obtained by adding to the energy spectral density level of the sound pressure measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2 m^2 s/Hz$.

ensonified

Exposed to sound.

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

Fourier transform (or Fourier synthesis)

A mathematical technique which, although it has varied applications, is referenced in the context of this report as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as fast Fourier transform (FFT).

flat weighting

Term indicating that no frequency weighting function is applied. Synonymous with unweighted.

frequency

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: f. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function. For sound of a given frequency, the frequency weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency weighting function*: compensatory frequency weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency weighting function*: frequency weighting function describing the sensitivity of an acoustic acquisition system, typically consisting of a hydrophone, one or more amplifiers, and an analogue to digital converter.

geoacoustic

Relating to the acoustic properties of the seabed.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For example, the second harmonic of a sound has a frequency that is double the fundamental frequency of the sound.

hearing group

Category of animal species when classified according to their hearing sensitivity and to the susceptibility to sound. Examples for marine mammals include very low-frequency (VLF) cetaceans, low-frequency (LF) cetaceans, mid-frequency (MF) cetaceans, high-frequency (HF) cetaceans, very high-frequency (VHF) cetaceans, otariid pinnipeds in water (OPW), phocid pinnipeds in water (PPW), sirenians (SI), other marine carnivores in air (OCA), and other marine carnivores in water (OCW) (NMFS 2018, Southall et al. 2019). See **auditory frequency weighting functions**, which are often applied to these groups. Examples for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual for specified background noise during a specific percentage of experimental trials.

hertz (Hz)

A unit of frequency defined as one cycle per second.

high-frequency (HF) cetacean

See **hearing group**.

intermittent sound

A sound whose level abruptly drops below the background noise level several times during an observation period.

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 second), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Examples of impulsive sound sources include explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some quantity.

knot

One nautical mile per hour. Symbol: kn.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. Examples include sound pressure level, sound exposure level, and peak sound pressure level. For example, a value of sound exposure level with reference to 1 μPa^2 s can be written in the form x dB re 1 μPa^2 s.

low-frequency (LF) cetacean

See **hearing group**.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetacean

See **hearing group**.

M-weighting

See **auditory frequency weighting function** (as proposed by Southall et al. 2007).

mysticete

A suborder of cetaceans that use baleen plates to filter food from water. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. A non-impulsive sound is not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

otariid

A common term used to describe members of the Otariidae, eared seals, commonly called sea lions and fur seals. Otariids are adapted to a semi-aquatic life; they use their large fore flippers for propulsion. Their ears distinguish them from phocids. Otariids are one of the three main groups in the superfamily Pinnipedia; the other two groups are phocids and walrus.

otariid pinnipeds in water (OPW)

See **hearing group**.

other marine carnivores in air (OCA)

See **hearing group**.

other marine carnivores in water (OCW)

See **hearing group**.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of back-scattered sound, simplifying the computation of propagation loss. The effect of back-scattered sound is negligible for most ocean-acoustic propagation problems.

peak sound pressure level (zero-to-peak sound pressure level)

The level ($L_{p,pk}$ or L_{pk}) of the squared maximum magnitude of the sound pressure (p^2_{pk}). Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 µPa^2.

$$L_{p,\mathrm{pk}} := 10 \log_{10}\left(p^2_{\mathrm{pk}}/p_0^2\right) \mathrm{dB} \ = 20 \log_{10}\left(p_{\mathrm{pk}}/p_0\right) \mathrm{dB}$$

The frequency band and time window should be specified. Abbreviation: PK or L_{pk}.

peak-to-peak sound pressure

The difference between the maximum and minimum sound pressure over a specified frequency band and time window. Unit: pascal (Pa).

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

phocid

A common term used to describe all members of the family Phocidae. These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves. Phocids are one of the three main groups in the superfamily Pinnipedia; the other two groups are otariids and walrus.

phocid pinnipeds in water (PPW)

See **hearing group**.

pinniped

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source

A source that radiates sound as if from a single point.

pressure, acoustic

The deviation from the ambient pressure caused by a sound wave. Also called sound pressure. Unit: pascal (Pa).

pressure, hydrostatic

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, PL(x) = SL − L(x). Also see **transmission loss**.

received level

The level measured (or that would be measured) at a defined location. The type of level should be specified.

reference values

standard underwater references values used for calculating sound **levels**, e.g., the reference value for expressing sound pressure level in decibels is 1 μPa.

Quantity	Reference value
Sound pressure	1 μPa
Sound exposure	1 μPa^2 s
Sound particle displacement	1 pm
Sound particle velocity	1 nm/s
Sound particle acceleration	1 $\mu m/s^2$

rms

abbreviation for root-mean-square.

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium.

sound exposure

Time integral of squared sound pressure over a stated time interval. The time interval can be a specified time duration (e.g., 24 hours) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: Pa^2 s.

sound exposure level

The level (L_E) of the sound exposure (E). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 µPa^2 s.

$$L_E := 10\log_{10}(E/E_0)\,\mathrm{dB} \;= 20\log_{10}\left(E^{1/2}/E_0^{1/2}\right)\,\mathrm{dB}$$

The frequency band and integration time should be specified. Abbreviation: SEL.

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum. Unit: Pa^2 s/Hz.

sound field

Region containing sound waves.

sound intensity

Product of the sound pressure and the sound particle velocity. The magnitude of the sound intensity is the sound energy flowing through a unit area perpendicular to the direction of propagation per unit time.

sound particle acceleration

The rate of change of sound particle velocity. Unit: metre per second squared (m/s^2). Symbol: *a*.

sound particle motion

smallest volume of a medium that represents its mean physical properties.

sound particle displacement

Displacement of a material element caused by the action of sound, where a material element is the smallest element of the medium that represents the medium’s mean density.

sound particle velocity

The velocity of a particle in a material moving back and forth in the direction of the pressure wave. Unit: metre per second (m/s). Symbol: *v*.

sound pressure

The contribution to total pressure caused by the action of sound.

sound pressure level (rms sound pressure level)

The level ($L_{p,\text{rms}}$) of the time-mean-square sound pressure (p^2_{rms}). Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa^2.

$$L_{p,\text{rms}} := 10 \log_{10}(p^2_{\text{rms}}/p_0^2)\ \text{dB} \ = 20 \log_{10}(p_{\text{rms}}/p_0)\ \text{dB}$$

The frequency band and averaging time should be specified. Abbreviation: SPL or Lrms.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

soundscape

The characterization of the ambient sound in terms of its spatial, temporal, and frequency attributes, and the types of sources contributing to the sound field.

source level (SL)

A property of a sound source obtained by adding to the sound pressure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^{2}m^2.

spectrum

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

surface duct

The upper portion of a water column within which the sound speed profile gradient causes sound to refract upward and therefore reflect off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity. TTS can be caused by noise exposure.

thermocline

The depth interval near the ocean surface that experiences temperature gradients due to warming or cooling by heat conduction from the atmosphere and by warming from solar heating.

transmission loss (TL)

The difference between a specified level at one location and that at a different location, TL(x1,x2) = L(x1) − L(x2). Also see **propagation loss**.

unweighted

Term indicating that no frequency weighting function is applied. Synonymous with flat weighting.

very high-frequency (VHF) cetacean

See **hearing group**.

very low-frequency (VLF) cetacean

See **hearing group**.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol: λ.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 μPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow the American National Standard Institute and International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI R2013), but these standards are not always consistent.

The zero-to-peak sound pressure, or peak sound pressure (PK or $L_{p,pk}$; dB re 1 μPa), is the decibel level of the maximum instantaneous acoustic pressure in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$L_{p,\mathrm{pk}} = 10\log_{10}\frac{\max|p^2(t)|}{p_0^2} = 20\log_{10}\frac{\max|p(t)|}{p_0} \tag{A-1}$$

PK is often included as a criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of an acoustic event, it is generally a poor indicator of perceived loudness.

The peak-to-peak sound pressure (PK-PK or $L_{p,pk\text{-}pk}$; dB re 1 μPa) is the difference between the maximum and minimum instantaneous sound pressure, possibly filtered in a stated frequency band, attained by an impulsive sound, $p(t)$:

$$L_{p,\mathrm{pk\text{-}pk}} = 10\log_{10}\frac{[\max(p(t)) - \min(p(t))]^2}{p_0^2} \tag{A-2}$$

The sound pressure level (SPL or L_p; dB re 1 μPa) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T g(t)\,p^2(t)\,dt\Big/p_0^2\right) \tag{A-3}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function. For short acoustic events, such as sonar pulses and marine mammal vocalizations, it is important to choose an appropriate time window that matches the duration of the signal. For in-air studies, when evaluating the perceived loudness of sounds with rapid amplitude variations in time, the time weighting function $g(t)$ is often set to a decaying exponential function that emphasizes more recent pressure signals. This function mimics the leaky integration nature of mammalian hearing. For example, human-based fast time-weighted SPL ($L_{p,fast}$) applies an exponential function with time constant 125 ms. A related simpler approach used in underwater acoustics sets $g(t)$ to a boxcar (unity amplitude) function of width 125 ms; the results can be referred to as $L_{p,boxcar\ 125ms}$. Another approach, historically used to evaluate SPL of impulsive signals underwater, defines $g(t)$ as a boxcar function with edges set to the times corresponding to 5% and 95% of the cumulative square pressure function encompassing the duration of an impulsive acoustic event. This calculation is applied individually to each impulse signal, and the results are referred to as 90% SPL ($L_{p,90\%}$).

The sound exposure level (SEL or L_E; dB re 1 µPa²·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10\log_{10}\left(\int_T p^2(t)\,dt \Big/ T_0 p_0^2\right) \quad \text{(A-4)}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \quad \text{(A-5)}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LF,24h}$; see Appendix A.5) or auditory-weighted SPL ($L_{p,ht}$). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Particle Acceleration and Velocity Metrics

Since sound is a mechanical wave, it can also be measured in terms of the vibratory motion of fluid particles. Particle motion can be measured in terms of three different (but related) quantities: displacement, velocity, or acceleration. Acoustic particle velocity is the time derivative of particle displacement, and likewise acceleration is the time derivative of velocity. For the present study, acoustic particle motion has been reported in terms of acceleration and velocity.

The particle velocity (v) is the physical speed of a particle in a material moving back and forth in the direction of the pressure wave. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium:

$$v = -\int \nabla p(t)dt/\rho_0 \quad \text{(A-6)}$$

The particle acceleration (a) is the rate of change of the velocity with respect to time, and it can be obtained from equation A-6 as:

$$a = \frac{dv}{dt} = -\frac{\nabla p(t)}{\rho_0} \quad \text{(A-7)}$$

Unlike sound pressure, particle motion is a vector quantity, meaning that it has both magnitude and direction: at any given point in space, acoustic particle motion has three different time-varying components (x, y, and z). Given the particle velocity in the x, y, and z, directions, v_x, v_y, and v_z, the particle velocity magnitude $|v|$ is computed per the Pythagorean equation:

$$|v| = \sqrt{v_x + v_y + v_z} \quad \text{(A-8)}$$

The magnitude of particle acceleration is calculated similarly from the particle acceleration in the *x*, *y*, and *z* directions.

A.3. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. They are approximately one third of an octave (base 2) wide and are therefore often referred to as 1/3-octave-bands. Each octave represents a doubling in sound frequency. The centre frequency of the ith band, $f_{\mathrm{c}}(i)$, is defined as:

$$f_{\mathrm{c}}(i) = 10^{\frac{i}{10}}\,\mathrm{kHz} \tag{A-9}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{\mathrm{lo},i} = 10^{\frac{-1}{20}} f_{\mathrm{c}}(i) \quad \text{and} \quad f_{\mathrm{hi},i} = 10^{\frac{1}{20}} f_{\mathrm{c}}(i) \tag{A-10}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 7 (f_c (7) = 5 Hz) to band 44 ($f_{\mathrm{c}}(44)$ = 25 kHz).

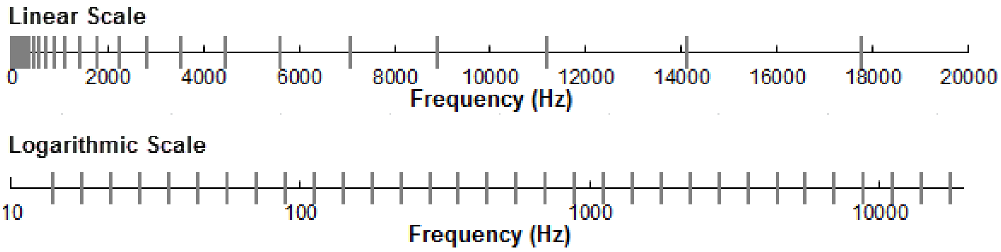

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{\mathrm{lo},i}$ and $f_{\mathrm{hi},i}$:

$$L_{p,i} = 10\log_{10} \int_{f_{\mathrm{lo},i}}^{f_{\mathrm{hi},i}} S(f)\,df \tag{A-11}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10\log_{10} \sum_i 10^{\frac{L_{p,i}}{10}} \tag{A-12}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

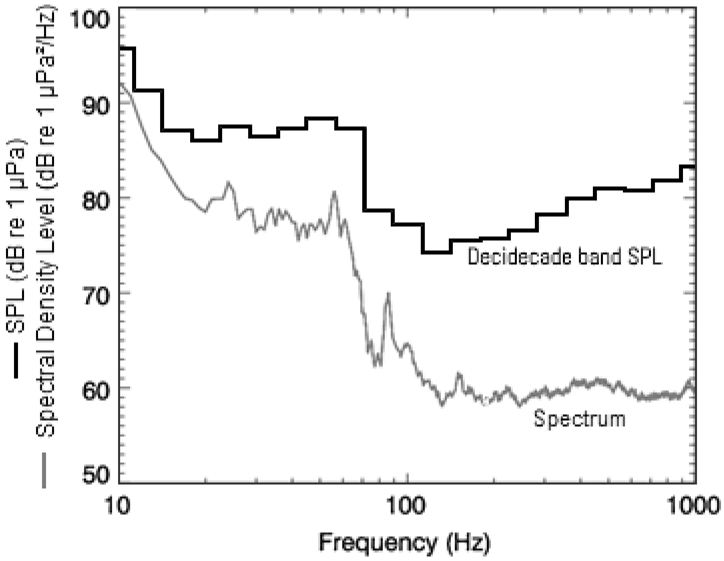

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.

A.4. Marine Mammal Impact Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggested that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for both injury and disturbance. The following sections summarize the recent development of thresholds; however, this field remains an active research topic.

A.4.1. Injury

In recognition of shortcomings of the SPL-only based injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual acoustic injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas the SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for human; Appendix A.5). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower injury values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 μPa^2·s. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 μPa^2·s.

As of present, an optimal approach is not apparent. There is consensus in the research community that an SEL-based method is preferable either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018; with the criteria defined in NMFS (2018). The latest criteria are from Southall et al. (2019) which is applied in this report.

A.4.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1 μPa SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). The HESS team recognised that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above a SPL of 140 dB re 1 μPa. Southall et al. (2007) found varying responses for most marine mammals between a SPL of 140 and 180 dB re 1 μPa, consistent with the HESS (1999) report, but lack of convergence in the data prevented them from suggesting explicit step functions.

A.5. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.5.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^2\right]^a\left[1+(f/f_{hi})^2\right]^b}\right)\right] \tag{A-13}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values. Table A-1 lists the frequency-weighting parameters for each hearing group. Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	f_{lo} (Hz)	f_{hi} (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very-high-frequency cetaceans (true porpoises, *Kogia*, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Other marine carnivores in water (Australian sea lion, Australian fur seal, New Zealand fur seal, Penguins)	2.0	2	940	25,000	0.64

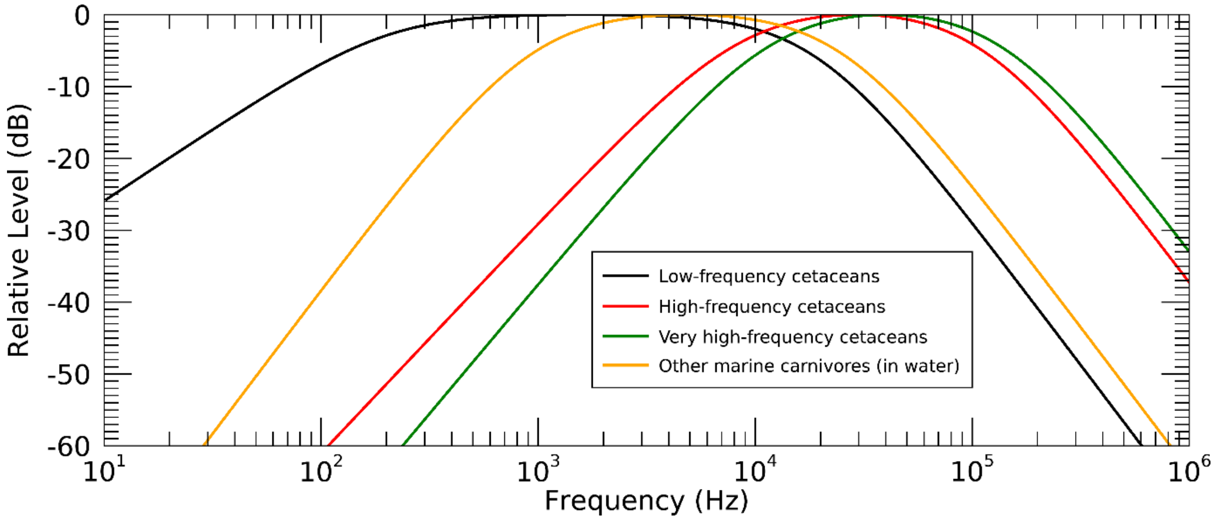

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

Appendix B. Acoustic Source Model

B.1. Airgun Array Source Model

The source levels and directivity of the seismic source were predicted with JASCO's Airgun Array Source Model (AASM). AASM includes low- and high-frequency modules for predicting different components of the seismic source spectrum. The low-frequency module is based on the physics of oscillation and radiation of airgun bubbles, as originally described by Ziolkowski (1970), that solves the set of parallel differential equations that govern bubble oscillations. Physical effects accounted for in the simulation include pressure interactions between airguns, port throttling, bubble damping, and generator-injector (GI) gun behaviour discussed by Dragoset (1984), Laws et al. (1990), and Landrø (1992). A global optimisation algorithm tunes free parameters in the model to a large library of airgun source signatures.

While airgun signatures are highly repeatable at the low frequencies, which are used for seismic imaging, their sound emissions have a large random component at higher frequencies that cannot be predicted using a deterministic model. Therefore, AASM uses a stochastic simulation to predict the high-frequency (800−25,000 Hz) sound emissions of individual airguns, using a data-driven multiple-regression model. The multiple-regression model is based on a statistical analysis of a large collection of high quality seismic source signature data recently obtained from the Joint Industry Program (JIP) on Sound and Marine Life (Mattsson and Jenkerson 2008). The stochastic model uses a Monte-Carlo simulation to simulate the random component of the high-frequency spectrum of each airgun in an array. The mean high-frequency spectra from the stochastic model augment the low-frequency signatures from the physical model, allowing AASM to predict airgun source levels at frequencies up to 25,000 Hz.

AASM produces a set of "notional" signatures for each array element based on:

- Array layout
- Volume, tow depth, and firing pressure of each airgun
- Interactions between different airguns in the array

These notional signatures are the pressure waveforms of the individual airguns at a standard reference distance of 1 m; they account for the interactions with the other airguns in the array. The signatures are summed with the appropriate phase delays to obtain the far-field source signature of the entire array in all directions. This far-field array signature is filtered into decidecade-bands to compute the source levels of the array as a function of frequency band and azimuthal angle in the horizontal plane (at the source depth), after which it is considered a directional point source in the far field.

A seismic array consists of many sources and the point source assumption is invalid in the near field where the array elements add incoherently. The maximum extent of the near field of an array (R_{nf}) is:

$$R_{\mathrm{nf}} < \frac{l^2}{4\lambda} \tag{B-1}$$

where λ is the sound wavelength and l is the longest dimension of the array (Lurton 2002, §5.2.4). For example, a seismic source length of l = 21 m yields a near-field range of 147 m at 2 kHz and 7 m at 100 Hz. Beyond this R_{nf} range, the array is assumed to radiate like a directional point source and is treated as such for propagation modelling.

The interactions between individual elements of the array create directionality in the overall acoustic emission. Generally, this directionality is prominent mainly at frequencies in the mid-range between tens of hertz to several hundred hertz. At lower frequencies, with acoustic wavelengths much larger than the inter-airgun separation distances, the directionality is small. At higher frequencies, the pattern of lobes is too finely spaced to be resolved and the effective directivity is less.

B.2. Seismic Source

The layout of the 2820 in^3 seismic sources used for modelling in this study is provided in Figure B-1. Details of the airgun parameters are provided in Table B-1.

For the modelled array, the layout is presented in a nominal cartesian coordinate system. In this coordinate system the direction of vessel travel determines the relative position of the array elements as plotted and tabulated. The layout used for acoustic modelling was produced by transforming the coordinates of client supplied layouts such that the resultant layouts correspond to a vessel travel direction along the positive X-axis and the array is centred on the X-Y origin. When used with an acoustic model the positive X-axis in this nominal coordinate system aligns with the vessel tow direction or survey line azimuth.

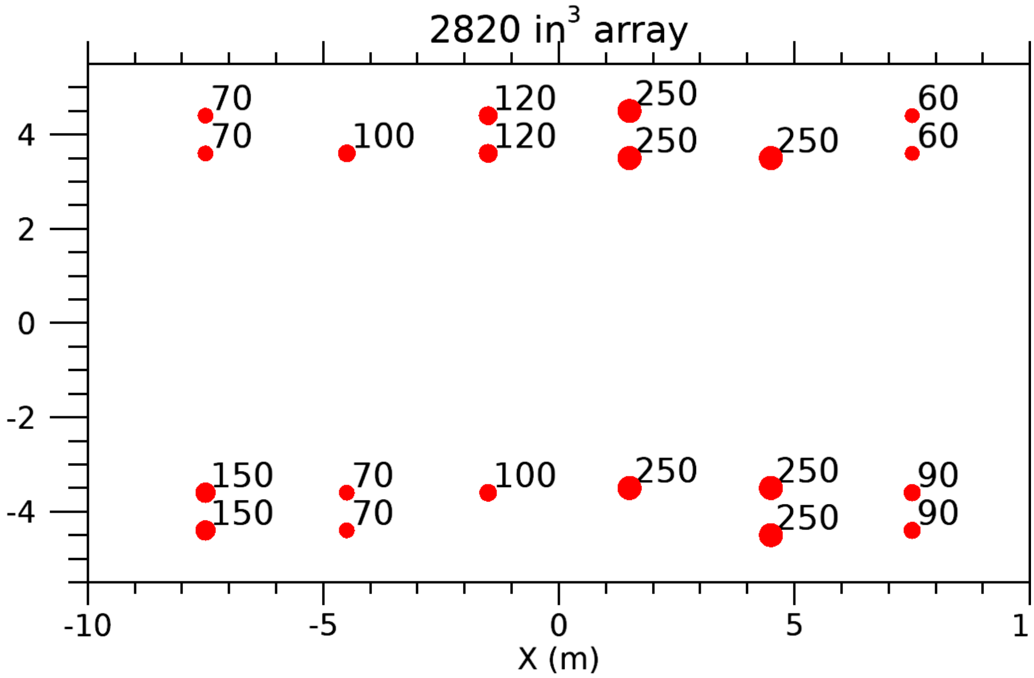

Figure B-1. Layout of the modelled 2820 in^3 seismic source where the plotted layout is such that the array is centred on the origin and vessel travel direction is in the positive x-direction. Tow depth was 7 m. The labels indicate the firing volume (in cubic inches) for each airgun. Also see Table B-1.

Table B-1. Layout of the modelled 2820 in^3 seismic source. Tow depth was 7 m. Firing pressure for all guns was 2000 psi. Greyed out values indicate spares. Also see Figure B-1.

String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)	String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)
1	1	7.5	-4.4	7	90	2	13	7.5	3.6	7	60
	2	7.5	-3.6	7	90		14	7.5	4.4	7	60
	3	4.5	-4.5	7	250		15	4.5	3.5	7	250
	4	4.5	-3.5	7	250		16	4.5	4.5	7	220
	5	1.5	-4.5	7	250		17	1.5	3.5	7	250
	6	1.5	-3.5	7	250		18	1.5	4.5	7	250
	7	-1.5	-4.4	7	100		19	-1.5	3.6	7	120
	8	-1.5	-3.6	7	100		20	-1.5	4.4	7	120
	9	-4.5	-4.4	7	70		21	-4.5	3.6	7	100
	10	-4.5	-3.6	7	70		22	-4.5	4.4	7	100
	11	-7.5	-4.4	7	150		23	-7.5	3.6	7	70
	12	-7.5	-3.6	7	150		24	-7.5	4.4	7	70

B.3. Array Source Levels and Directivity

Figure B-2 shows the broadside (perpendicular to the tow direction), endfire (parallel to the tow direction) and vertical overpressure signature and corresponding power spectrum levels for the 2820 in^3 seismic source (Appendix B.2). Horizontal decidecade-band source levels are shown as a function of band centre frequency and azimuth in Figure B-3.

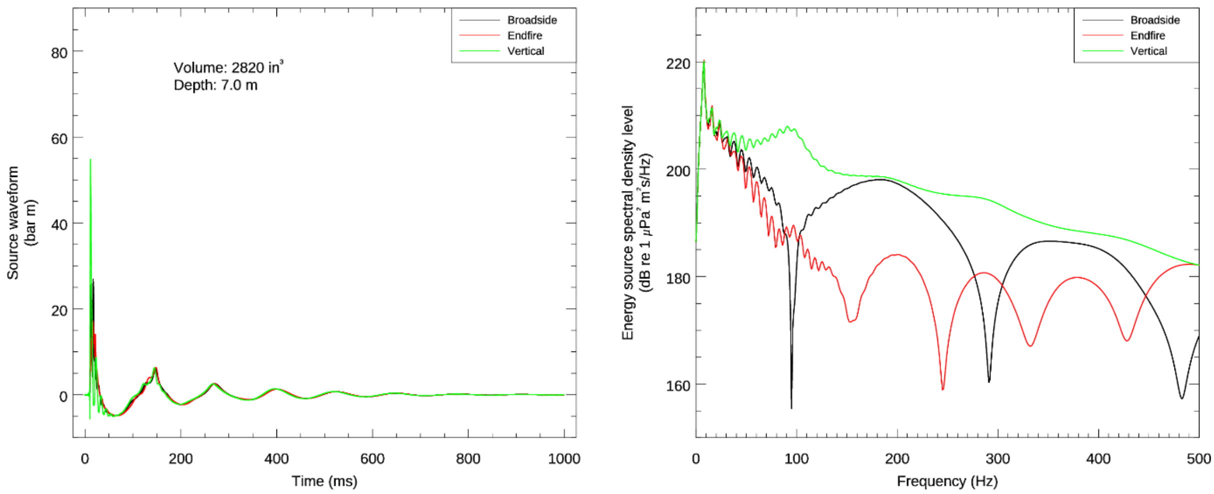

Figure B-2. Predicted source level details for the 2820 in^3 seismic source with a 7 m tow depth. (Left) the overpressure signature and (right) the power spectrum for in-plane horizontal (broadside), perpendicular (endfire), and vertical directions (no surface ghost).

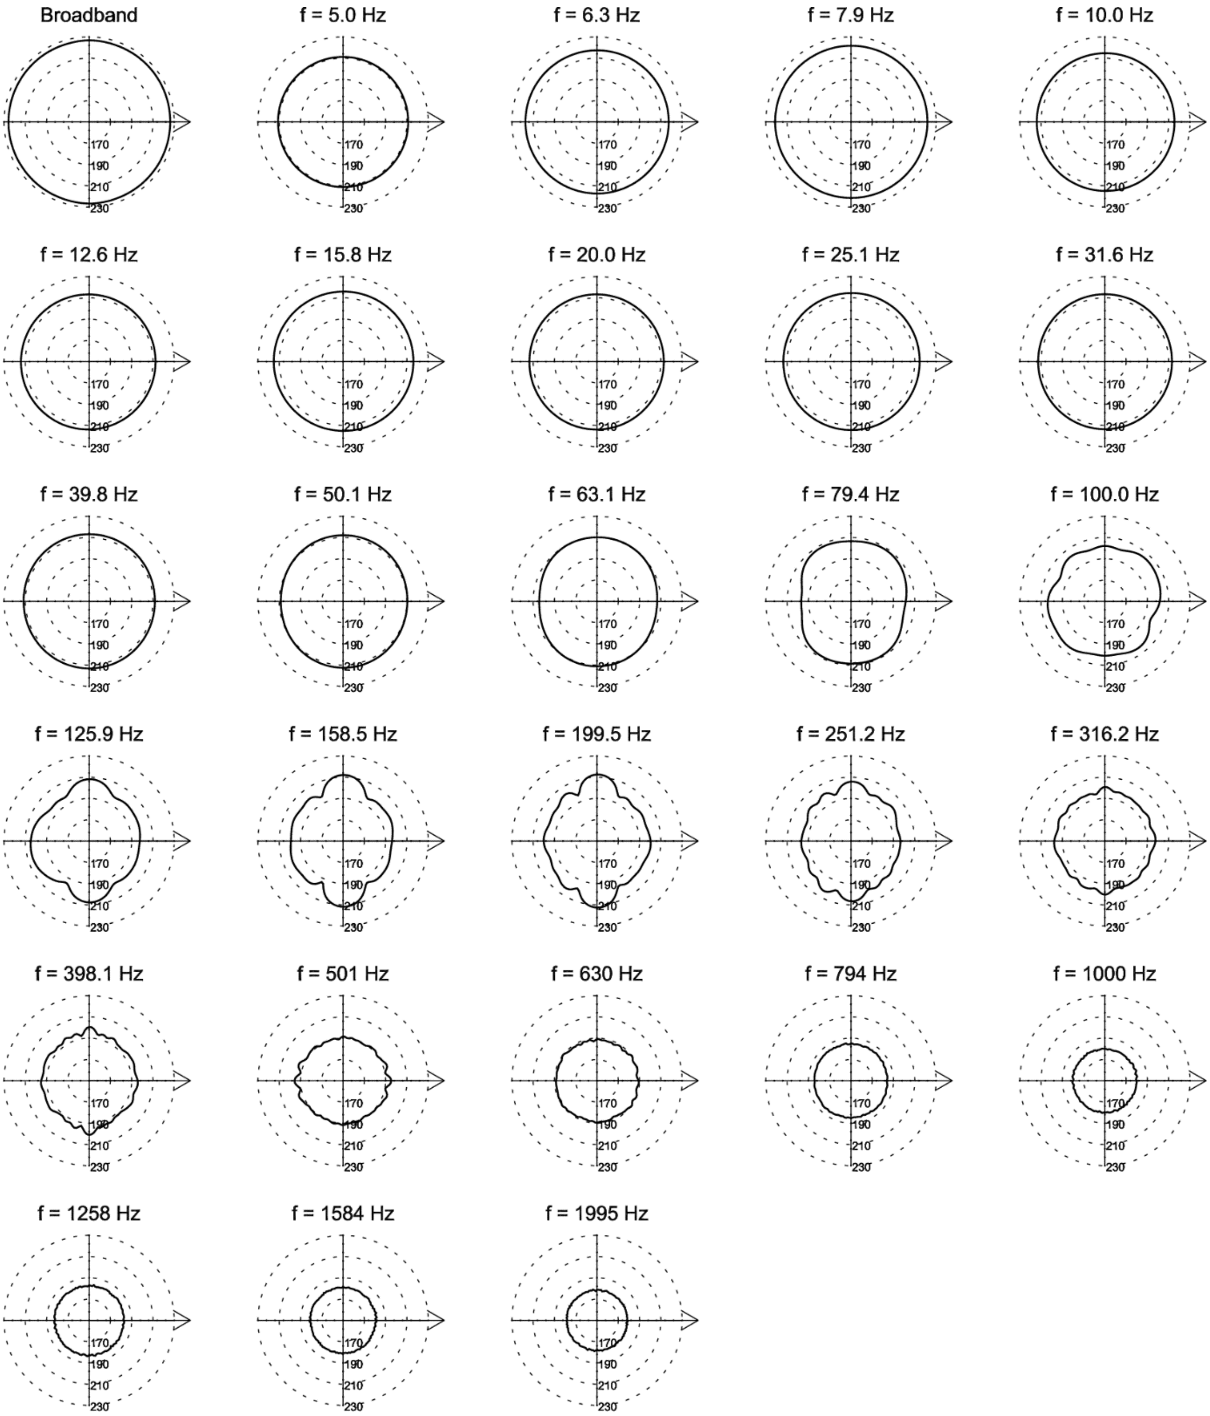

Figure B-3. Directionality of the predicted horizontal source levels for the 2820 in^3 seismic source, 5 Hz to 2 kHz. Source levels (in dB re 1 µPa^2·s m^2) are shown as a function of azimuth for the centre frequencies of the decidecade bands modelled; frequencies are shown above the plots. The perpendicular direction to the frame is to the right. Tow depth was 7 m (see Table B-1).

Appendix C. Sound Propagation Models

C.1. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). Compared to VSTACK, MONM less accurately predicts steep-angle propagation for environments with higher shear speed but is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 5 Hz to 1 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies >1 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

This version of MONM accounts for sound attenuation due to energy absorption through ion relaxation and viscosity of water in addition to acoustic attenuation due to reflection at the medium boundaries and internal layers (Fisher and Simmons 1977). The former type of sound attenuation is significant for frequencies higher than 5 kHz and cannot be neglected without noticeably affecting the model results.

MONM computes acoustic fields in three dimensions by modelling transmission loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure C-1).

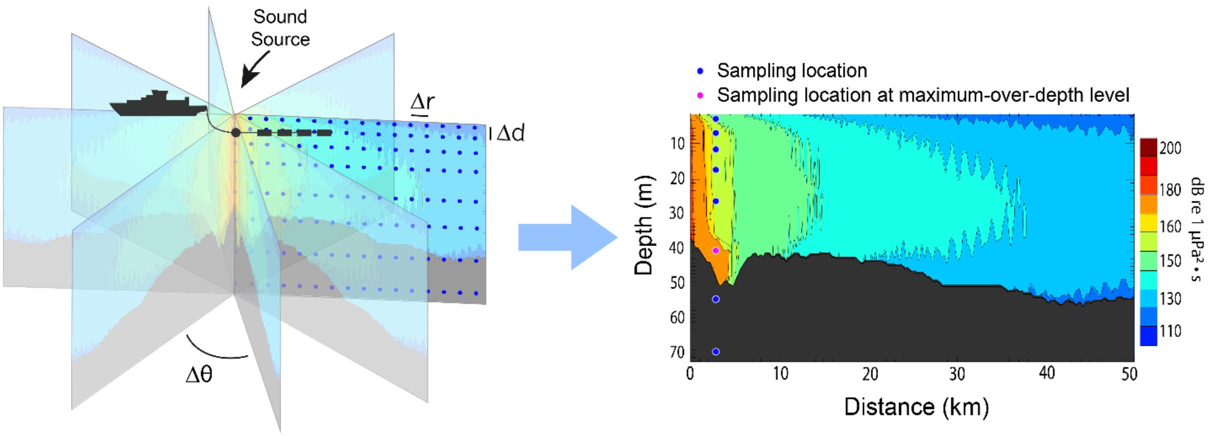

Figure C-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic transmission loss at the centre frequencies of decidecade bands. Sufficiently many decidecade bands, starting at 5 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the transmission loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade band received per-pulse SEL are computed by subtracting the band transmission loss values from the directional source level in that frequency band. Composite broadband received per-pulse SEL are then computed by summing the received decidecade band levels.

The received per-pulse SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. The maximum received per-pulse SEL at many sampling depths are taken over all samples within the water column, i.e., the maximum-over-depth received per-pulse SEL. These maximum-over-depth per-pulse SEL are presented as contours around the source.

C.2. Full Waveform Range-dependent Acoustic Model: FWRAM

For impulsive sounds from the seismic source, time-domain representations of the pressure waves generated in the water are required to calculate SPL and PK. Furthermore, the seismic source must be represented as a distributed source to accurately characterise vertical directivity effects in the near-field zone. For this study, synthetic pressure waveforms were computed using FWRAM, which is a time-domain acoustic model based on the same wide-angle parabolic equation (PE) algorithm as MONM. FWRAM computes synthetic pressure waveforms versus range and depth for range-varying marine acoustic environments, and it takes the same environmental inputs as MONM (bathymetry, water sound speed profile, and seafloor geoacoustic profile). Unlike MONM, FWRAM computes pressure waveforms via Fourier synthesis of the modelled acoustic transfer function in closely spaced frequency bands. FWRAM employs the array starter method to accurately model sound propagation from a spatially distributed source (MacGillivray and Chapman 2012).

Besides providing direct calculations of the PK and SPL, the synthetic waveforms from FWRAM can also be used to convert the SEL values from MONM to SPL.

C.3. Wavenumber Integration Model

Sound pressure levels near the seismic source were modelled using JASCO's VSTACK wavenumber integration model. VSTACK computes synthetic pressure waveforms versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. The output of the model can be post-processed to yield estimates of the SEL, SPL, and PK.

VSTACK accurately predicts steep-angle propagation in the proximity of the source, but it is computationally slow at predicting sound pressures at large distances due to the need for smaller wavenumber steps with increasing distance. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. VSTACK is thus best suited to modelling the sound field near the source.

C.3.1. Particle Motion

VSTACK was also used to compute estimates of particle acceleration and velocity at four sites for the 2820 in^3 seismic source. Particle motion waveforms were modelled, and pulse metrics were computed from the time-domain traces. VSTACK uses the wavenumber integration approach to solve the exact acoustic wave equation for arbitrarily layered range-independent acoustic environments.

The VSTACK model setup for the particle velocity scenarios was identical to that for the peak pressure scenarios (Section 5.2.1.2) in terms of source treatment, frequency range and environmental model. The particle acceleration and velocity waveforms were computed to a maximum distance of 1000 m in the broadside and endfire directions from the centre of the airgun array for a receiver 5 cm above the seafloor.

As discussed above in Appendix A.2, particle velocity (v) is the physical speed of a particle in a material. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium. Since the wavenumber integration kernel is a product of analytic expressions in terms of range and depth, VSTACK computes particle velocity by computing the spatial gradient of the pressure field analytically in the frequency domain. Fourier synthesis is applied to compute time series synthetic pressure and/or velocity waveforms at depth and range receivers by convolving the source waveforms with the impulse response of the waveguide. Particle velocity metrics at each receiver location were calculated from the modelled particle motion along three perpendicular axes (horizontal and along the source-receiver path, horizontal and perpendicular to the source-receiver path, and vertical).

The particle velocity results were converted to acceleration by time differentiation. The peak particle acceleration and velocity were calculated from the maximum of the predicted acceleration and velocity magnitude, defined as “peak magnitude”.

C.3.2. Limestone Seabed Propagation Loss

For all modelled sites, an additional broadband correction was applied to the propagation loss results from MONM to better account for the additional propagation loss associated with a calcarenite/limestone seabed. The differences between the broadband per-pulse SEL from MONM and VSTACK were extracted at the same modelled ranges and depths for corresponded range independent environments. The 90th percentile of the resultant dB differences in range bins were selected to generate a correction function for representative sites to be modelled. The conversion functions were applied after to the summed decidecade band levels from MONM, but before gridding, and radii calculations for each modelled site in each modelled scenario considered.

Appendix D. Methods and Parameters

D.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure D-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure D-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure D-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

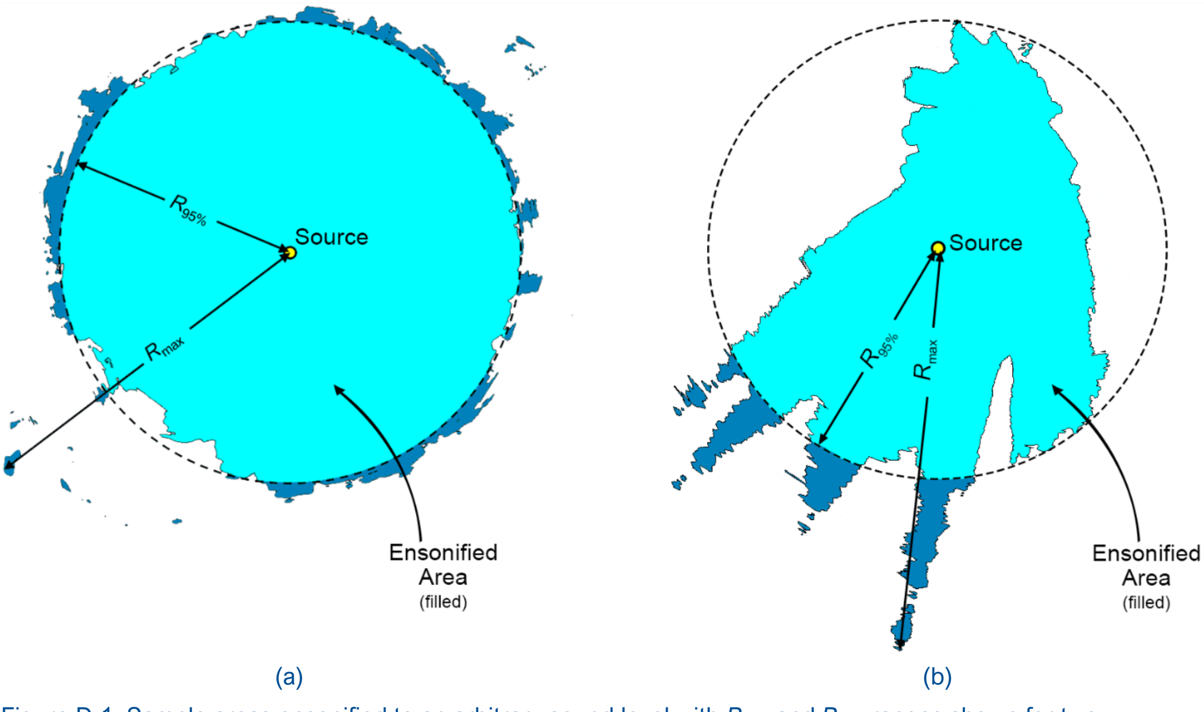

Figure D-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

D.2. Estimating SPL from Modelled SEL Results

The per-pulse SEL of sound pulses is an energy-like metric related to the dose of sound received over a pulse's entire duration. The pulse SPL on the other hand, is related to its intensity over a specified time interval. Seismic pulses typically lengthen in duration as they propagate away from their source, due to seafloor and surface reflections, and other waveguide dispersion effects. The changes in pulse length, and therefore the time window considered, affect the numeric relationship between SPL and SEL. This study has applied a fixed window duration to calculate SPL (T_{fix} = 125 ms; see Appendix A.1), as implemented in Martin et al. (2017b). Full-waveform modelling was used to estimate SPL, but this type of modelling is computationally intensive, and can be prohibitively time consuming when run at high spatial resolution over large areas.

For the current study, FWRAM (Appendix C.2) was used to model synthetic seismic pulses over the frequency range 5–1024 Hz. This was performed along all broadside and endfire radials at five sites. FWRAM uses Fourier synthesis to recreate the signal in the time domain so that both the SEL and SPL from the source can be calculated. The differences between the SEL and SPL were extracted for all ranges and depths that corresponded to those generated from the high spatial-resolution results from MONM. A 125 ms fixed time window positioned to maximize the SPL over the pulse duration was applied. The resulting SEL-to-SPL offsets were averaged in 0.02 km range bins along each modelled radial and depth, and the 90th percentile was selected at each range to generate a generalised range-dependent conversion function for each site. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM to model SPL values. Figures D-2 to D-6 show the conversion offsets for Sites 2, 3, 5, 8, and 10 with the 2820 in^3 array; the spatial variation is caused by changes in the received airgun pulse as it propagates from the source. The conversion to SPL from SEL was conducted considering the water depth and seabed geology at a given modelled site.

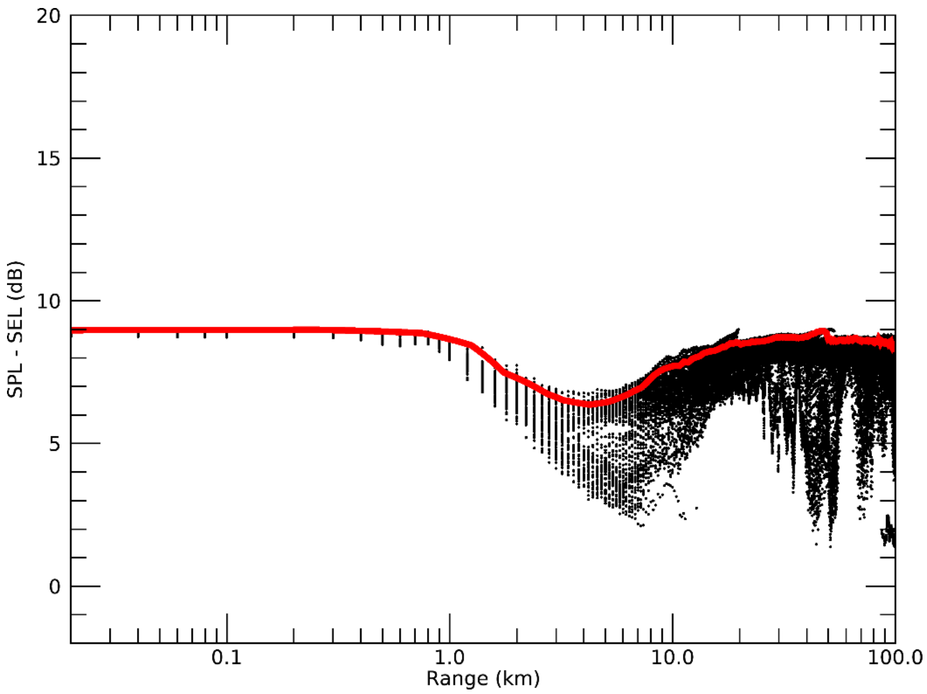

Figure D-2. *Site 2 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

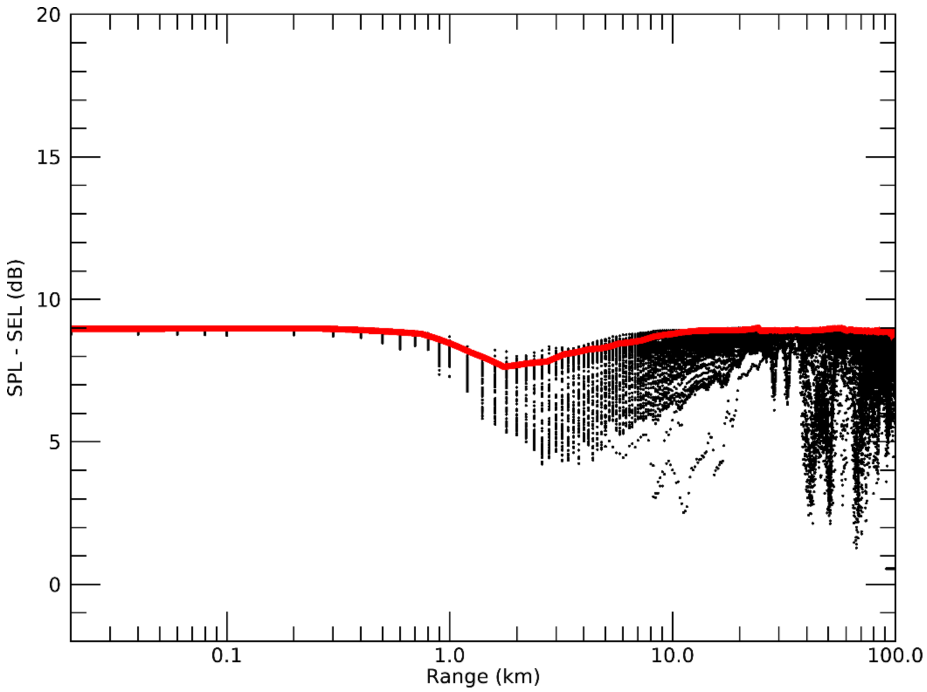

Figure D-3. *Site 3 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

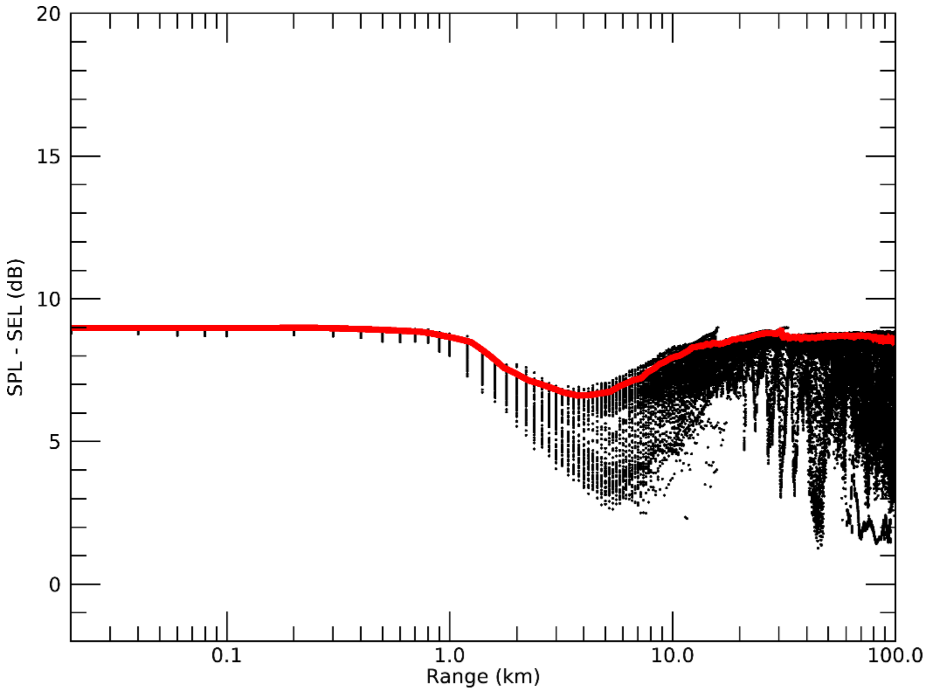

Figure D-4. *Site 5 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

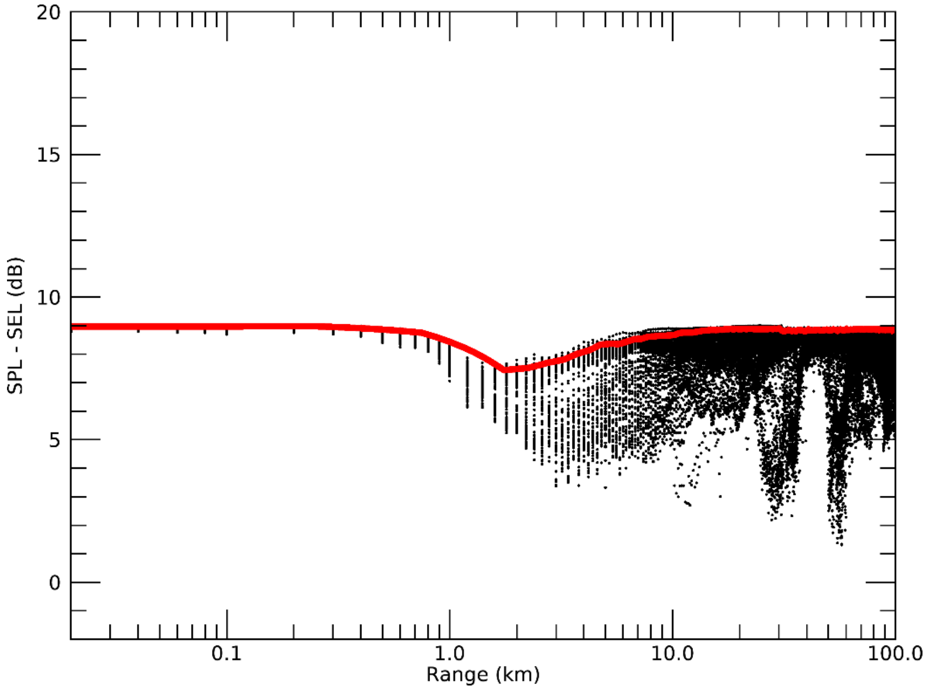

Figure D-5. *Site 8 tow direction 113*°: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

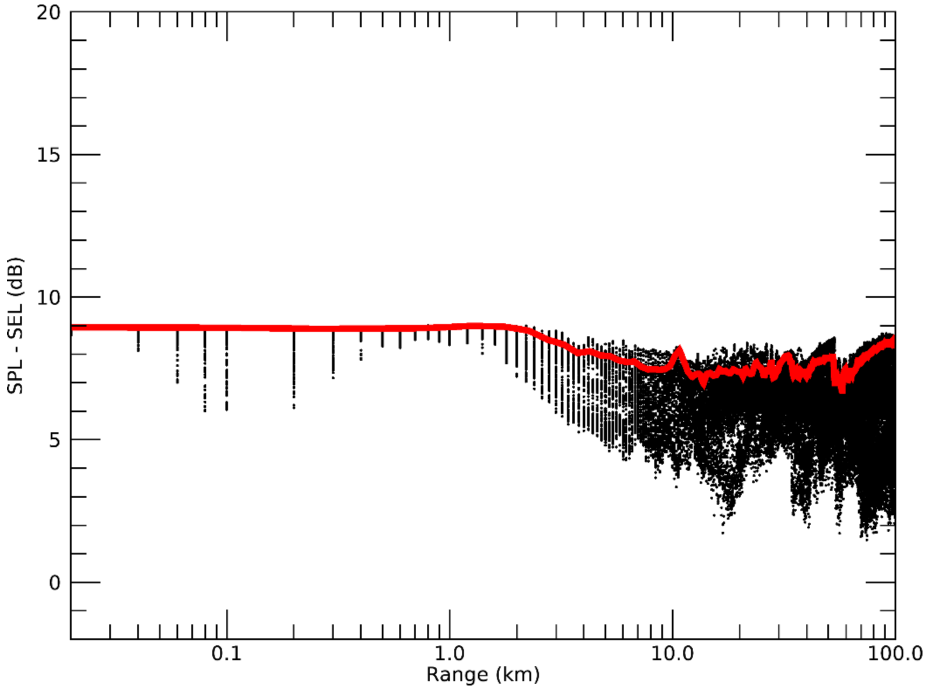

Figure D-6. *Site 10 tow direction 113*°: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

D.3. Environmental Parameters

D.3.1. Bathymetry

Water depths throughout the modelled area were extracted from Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data was extracted and re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 200 × 200 m to generate the bathymetry in Figure D-7.

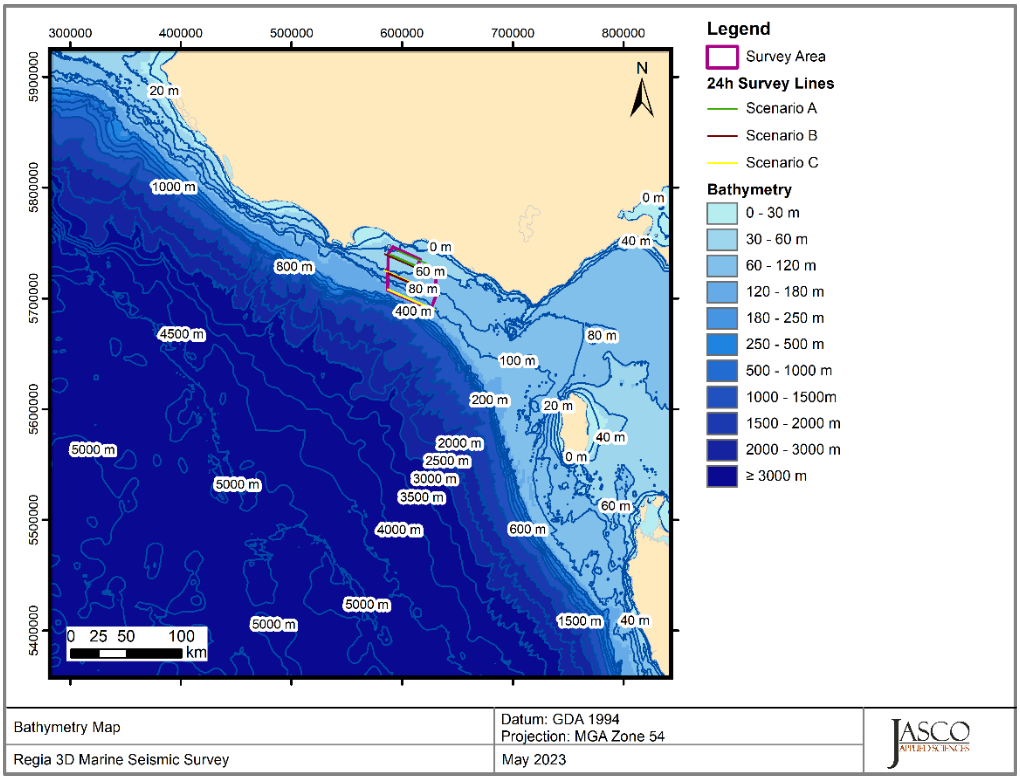

Figure D-7. Bathymetry map of the modelling area for the Regia Marine Seismic Survey.

D.3.2. Sound Speed Profile

The sound speed profiles for the modelled sites were derived from temperature and salinity profiles from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the US Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles within a 100 km box radius encompassing all modelled sites. The December sound speed profile is expected to be most favourable to longer-range sound propagation during the proposed survey time frame due its upward refracting profile. As such, December was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure D-8 shows the resulting profile used as input to the sound propagation modelling.

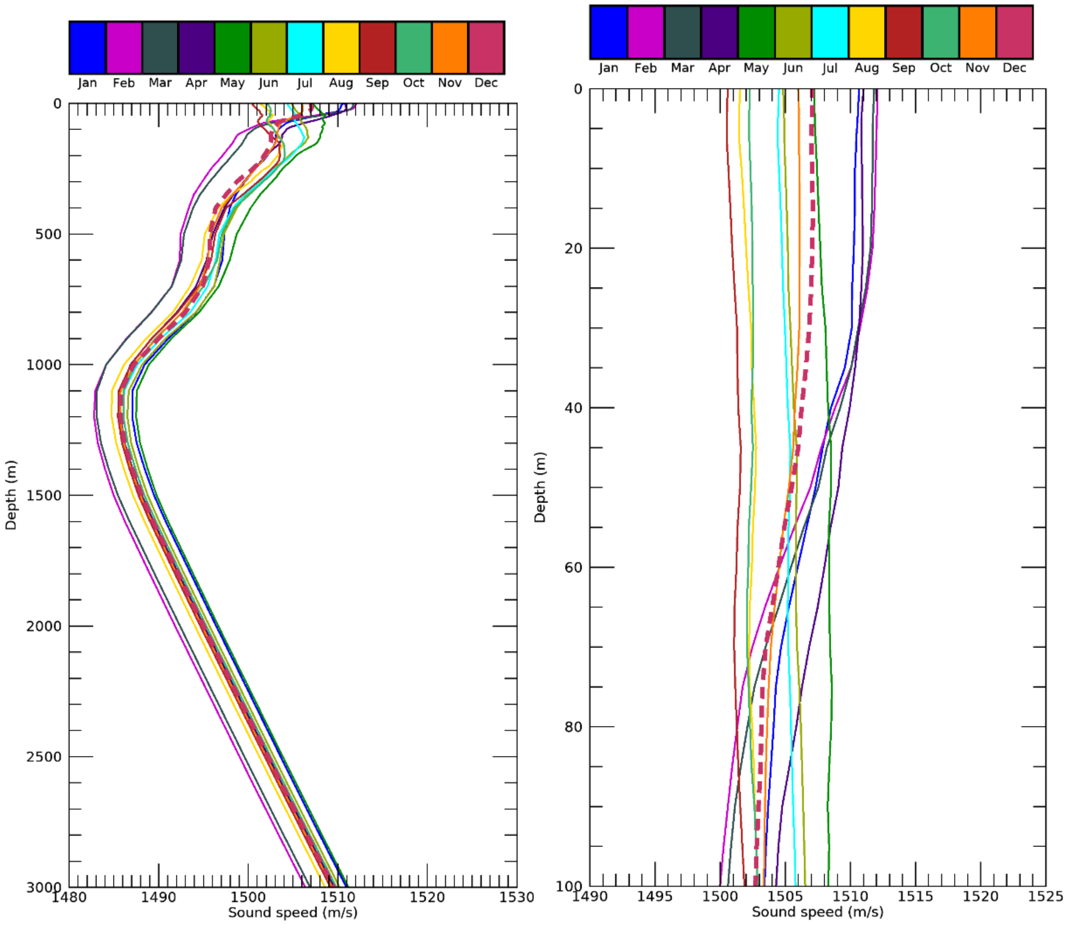

Figure D-8. The sound speed profile (December) used for all modelling, showing the entire water column (left) and the top 100 m within the profile (right). Profiles are calculated from temperature and salinity profiles from GDEM V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

D.3.3. Geoacoustics

The geoacoustic parameters used for modelling have been sourced from previous public reports completed by Jasco for modelling projects in the surrounding area. Similar to previous modelling studies in the region (Wood and McPherson 2018, Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), several seabed types were considered for modelling. These seabed profiles are indicative of a benthic environment located on the continental shelf and upper slope and are consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010) within the Otway region.

For the sites modelled in shallow water (less than 50 m depth) the seabed was modelled as a sand layer underlain by variably cemented calcarenite. Literature and public reports suggest that this layer likely begins to thin as water depths increase in an offshore direction (Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), and for water depths greater than 50 m it was considered absent with only the variably calcarenite present at the seafloor interface. These two seabed profiles are consistent with profiles described in association with measurement data (McCauley et al. 2016), and other modelling studies in the region (AIMS 2018).

Sites located above the calcarenite seabed generally displayed higher rates of loss (Duncan et al. 2009) at distance away from the source as compared to sites where a layer of sand overlies calcarenite and as such additional modelling was conducted to account for the propagation loss associated with a limestone seabed and additional modelled was conducted to account for the loss associated with exposed calcarenite (see Appendix C.3.2). For sites located in water along the shelf, geoacoustic parameters considered for modelling are provided in Tables D-1 and D-2

Table D-1. Geoacoustic profile used in the acoustic propagation models less than 50 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-5	Fine Carbonate Sand	2.1	1634-1803	0.09-0.73		
5-25		2.2	2000-2120	0.30-0.34		
25-45		2.3	2120-2240	0.34-0.38		
45-65	Increasingly cemented calcarenite	2.4	2240-2360	0.38-0.42	315	3.65
65-85		2.5	2360-2480	0.42-0.46		
85-105		2.6	2480-2600	0.46-0.50		
>105	Well-cemented calcarenite	2.7	2600	0.50		

Table D-2. Geoacoustic profile used in the acoustic propagation models for between 50 m and 150 m water depth.Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-1	Well-cemented carbonate caprock	2.7	2600	0.5		
1-20		2.2	2000-2120	0.30-0.34		
20-40		2.3	2120-2240	0.34-0.38		
40-60	Increasingly cemented calcarenite	2.4	2240-2360	0.38-0.42	500	0.4
60-80		2.5	2360-2480	0.42-0.46		
80-10		2.6	2480-2600	0.46-0.50		
>100	Well-cemented calcarenite	2.7	2600	0.50		

For sites located along the shelf break/upper continental slope, the geoacoustic parameters used for modelling was derived from sedimentary grain size measurements from the Australian Government's Marine Sediments (MARS) database (Heap 2009). On average, the surficial grain size indicates silty carbonate sand is present. Information on the deeper geological structure was sparse, as such the seabed was assumed to consist of a thick package of unconsolidated sediments. However, this is consistent with the "shaved shelf" model of the discussed in James and Bone 2010, where sediments are transported and deposited from the shelf onto the slope. Representative grain sizes and porosity were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models. Table D-3 lists the geoacoustic parameters used for modelling for sites in water depths greater than 150 m.

Table D-3. Geoacoustic profile used in the acoustic propagation models for all modelled sites greater than 150 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–10	Silty carbonate sand to semi-cemented carbonate	1.88	1605–1700	0.35–0.70	255	3.65
10–20		1.88–1.89	1700–1755	0.70–0.85		
20–50		1.89–1.90	1755–1850	0.85–1.15		
50–100		1.90–1.92	1850–1950	1.15–1.35		
100–200		1.92–1.96	1950–2100	1.35–1.60		
200–500		1.96–2.05	2100–2355	1.60–1.95		
>500		2.05	2355	1.95		

D.4. Animal Movement and Exposure Modelling

Animal movement and exposure modelling considers the movement of both sound sources and animals over time. Acoustic source and propagation modelling are used to generate 3-D sound fields that vary as a function of distance to source, depth, and azimuth. Sound sources are modelled at representative sites and the resulting sound fields are assigned to source locations using the minimum Euclidean distance. The sound received by an animal at any given time depends on its location relative to the source. Because the true locations of the animals within the sound fields are unknown, realistic animal movements are simulated using repeated random sampling of various behavioural parameters. The Monte Carlo method of simulating many animals within the operations area is used to estimate the sound exposure history of the population of simulated animals (animats).

Monte Carlo methods provide a heuristic approach for determining the probability distribution function (PDF) of complex situations, such as animals moving in a sound field. The probability of an events occurrence is determined by the frequency with which it occurs in the simulation. The greater the number of random samples, in this case the more simulated animats, the better the approximation of the PDF. Animats are randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2). Higher densities provide a finer PDF estimate resolution but require more computational resources. To ensure good representation of the PDF, the animat density is set as high as practical allowing for computation time. The animat density is much higher than the real-world density to ensure good representation of the PDF. The resulting PDF is scaled using the real-world density.

Several models for marine mammal movement have been developed (Ellison et al. 1987, Frankel et al. 2002, Houser 2006). These models use an underlying Markov chain to transition from one state to another based on probabilities determined from measured swimming behaviour. The parameters may represent simple states, such as the speed or heading of the animal, or complex states, such as likelihood of participating in foraging, play, rest, or travel. Attractions and aversions to variables like anthropogenic sounds and different depth ranges can be included in the models.

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was based on the open-source marine mammal movement and behaviour model (3MB, Houser 2006) and used to predict the exposure of animats to sound arising from the anthropogenic activities. Animats are programmed to behave like the species likely to be present in the survey area. The parameters used for forecasting realistic behaviours (e.g., diving, foraging, aversion, surface times, etc.) are determined and interpreted from marine species studies (e.g., tagging studies) where available, or reasonably extrapolated from related species. An individual animats modelled sound exposure levels are summed over the total simulation duration to determine its total received energy, and then compared to the assumed threshold criteria.

JASMINE uses the same animal movement algorithms as 3MB (Houser, 2006), but has been extended to be directly compatible with JASCO's Marine Operations Noise Model (MONM) and Full Waveform Range-dependent Acoustic Model (FRAWM) acoustic field predictions, for inclusion of source tracks, and importantly for animats to change behavioural states based on time and space dependent modelled variables such as received levels for aversion behaviour, although aversion was not considered in this study.

D.4.1. Animal Movement Parameters

JASMINE uses previously measured behaviour to forecast behaviour in new situations and locations. The parameters used for forecasting realistic behaviour are determined (and interpreted) from marine species studies (e.g., tagging studies). Each parameter in the model is described as a probability distribution. When limited or no information is available for a species parameter, a Gaussian or uniform distribution may be chosen for that parameter. For the Gaussian distribution, the user determines the mean and standard deviation of the distribution from which parameter values are drawn. For the uniform distribution, the user determines the maximum and minimum distribution from which parameter values are drawn. When detailed information about the movement and behaviour of a species are available, a user-created distribution vector, including cumulative transition probabilities, may be used (referred to here as a vector model; Houser 2006). Different sets of parameters can be defined for different behaviour states. The probability of an animat starting out in or transitioning into a given behaviour state can in turn be defined in terms of the animats current behavioural state, depth, and the time of day. In addition, each travel parameter and behavioural state has a termination function that governs how long the parameter value or overall behavioural state persists in simulation.

The parameters used in JASMINE describe animal movement in both the vertical and horizontal planes. The parameters relating to travel in these two planes are briefly described below.

Travel sub-models

- **Direction**– determines an animats choice of direction in the horizontal plane. Sub-models are available for determining the heading of animats, allowing for movement to range from strongly biased to undirected. A random walk model can be used for behaviours with no directional preference, such as feeding and playing. In a random walk, all bearings are equally likely at each parameter transition time step. A correlated random walk can be used to smooth the changes in bearing by using the current heading as the mean of the distribution from which to draw the next heading. An additional variant of the correlated random walk is available that includes a directional bias for use in situations where animals have a preferred absolute direction, such as migration. A user-defined vector of directional probabilities can also be input to control animat heading. For more detailed discussion of these parameters, see Houser (2006) and Houser and Cross (1999).
- **Travel rate**–defines an animats rate of travel in the horizontal plane. When combined with vertical speed and dive depth, the dive profile of the animat is produced.

Dive sub-models

- **Ascent rate**–defines an animats rate of travel in the vertical plane during the ascent portion of a dive.
- **Descent rate**–defines an animats rate of travel in the vertical plane during the descent portion of a dive.
- **Depth**–defines an animats maximum dive depth.
- **Reversals**–determines whether multiple vertical excursions occur once an animat reaches the maximum dive depth. This behaviour is used to emulate the foraging behaviour of some marine mammal species at depth. Reversal-specific ascent and descent rates may be specified.
- **Surface interval**–determines the duration an animat spends at, or near, the surface before diving again.

D.4.2. Exposure Integration Time

The interval over which acoustic exposure (L_E) should be integrated and maximal exposure (L_p) determined is not well defined. Both Southall et al. (2007) and the NMFS (2018) recommend a 24 h baseline accumulation period, but state that there may be situations where this is not appropriate (e.g., a high-level source and confined population). Resetting the integration after 24 h can lead to overestimating the number of individual animals exposed because individuals can be counted multiple times during an operation. The type of animal movement engine used in this study simulates realistic movement using swimming behaviour collected over relatively short periods (hours to days) and does not include large-scale movement such as migratory circulation patterns. For this study, a representative 24-hour period was simulated.

Ideally, a simulation area is large enough to encompass the entire range of a population so that any animal that could approach the source during an operation is included. However, there are limits to the simulation area, and computational overhead increases with area. For practical reasons, the simulation area is limited. In the simulation, every animat that reaches a border is replaced by another animat entering at the opposing border—e.g., an animat crossing the northern border of the simulation is replaced by one entering the southern border at the same longitude. When this action places the animat in an inappropriate water depth, the animat is randomly placed on the map at a depth suited to its species definition. The exposures of all animats (including those leaving the simulation and those entering) are kept for analysis. This approach maintains a consistent animat density and allows for longer integration periods with finite simulation areas.

D.4.3. Seeding Density and Scaling

Seeding density refers to the spatial sample rate, in units of animats/km^2, used in the simulation. It is not related to the real-world animal density, but rather is a model parameter that controls how samples are drawn from the model space. The minimum required seeding density for any given project depends on several factors such as bathymetry, source characteristics, and the behavioural profile of the animats, with the main constraint being computation time and resources. Seeding density is adjusted as needed based on model conditions specific to a project or project area.

In the present study, the exposure criteria for impulsive sounds were used to determine the number of animats exceeding exposure thresholds. To generate statistically reliable probability density functions, all simulations were seeded with an animat density of 4 animat/km^2 over the entire simulation area. The modelling results are not related to real-world animal densities and the number of real-world animals potentially exposed was not calculated.

Appendix E. Model Validation Information

Predictions from JASCO's Airgun Array Source Model (AASM) and propagation models (MONM, FWRAM and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Artic, Canadian and southern United States waters, Greenland, Russia and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities which have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016).

Appendix F. Supplemental Results

Histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenarios B and C are shown in Figures 1 to 24.

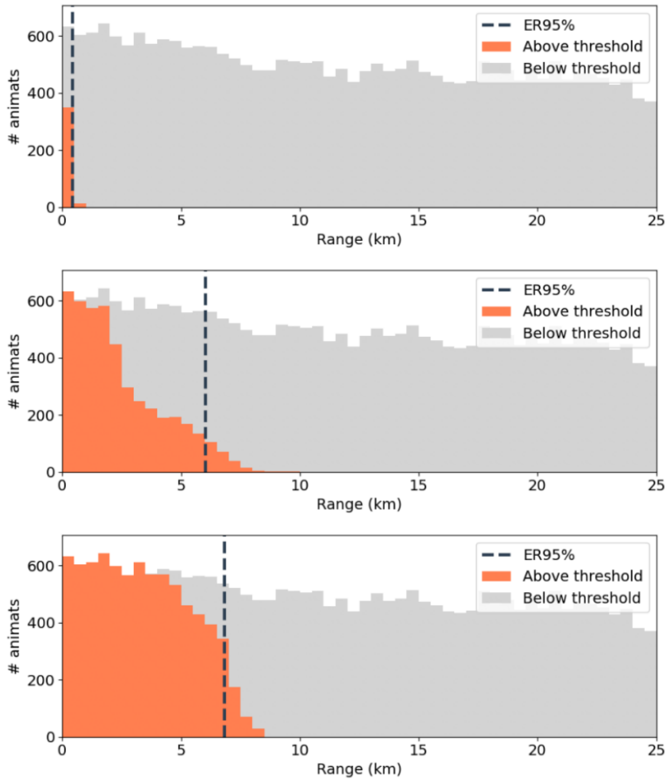

Figure F-1. *Scenario B, female pygmy blue whale animats, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

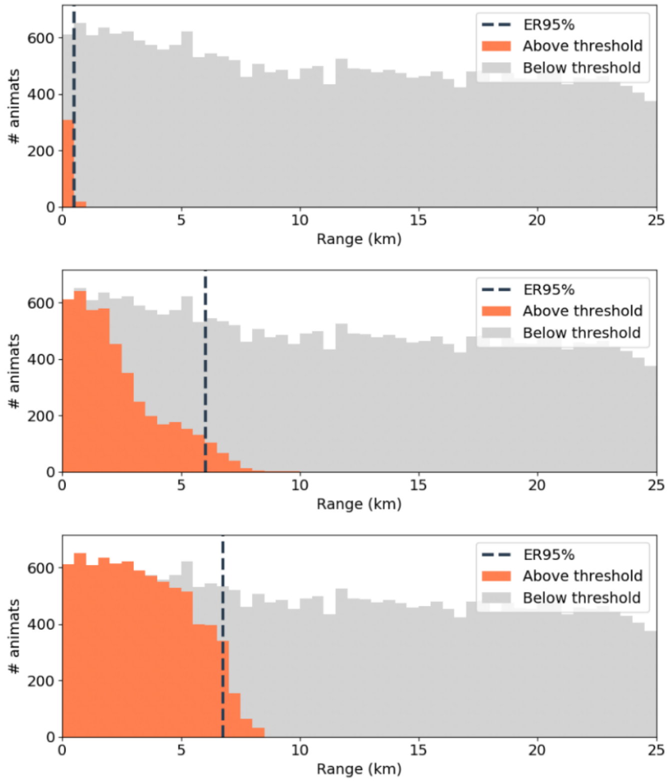

Figure F-2. *Scenario B, male pygmy blue whale animats, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

Executive Summary

JASCO Applied Sciences (JASCO) performed a numerical modelling study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic impacts on key regional receptors including marine mammals, fish, turtles, benthic invertebrates, plankton and recreational divers and swimmers. The modelling considered a seismic source in triple configuration with a 2820 in^3 total volume, towed at a 7 m depth behind a single vessel, with a 12.5 m impulse interval (inter-pulse interval) and a 37.5 m crossline array separation.

JASCO's specialised airgun array source model was used to predict the acoustic signature of the seismic source and complementary underwater acoustic propagation models were used in conjunction with the modelled array signatures to estimate sound levels over a large area around the sources. Single-impulse sound fields were predicted at 15 sites over the proposed survey line plans. Accumulated sound exposure fields for a 24-hour period were predicted for four representative survey operation scenarios. Four animal movement modelling scenarios, to address the four different survey operations, were also modelled.

The modelling methodology considered source directivity and range-dependent environmental properties likely to be encountered within the proposed survey area. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-pk}}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria. A conservative sound speed profile that would be most supportive of sound propagation conditions for the period of the survey was defined and applied to all modelled sites.

SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels over 24 hours, based on the assumption that a receiver (e.g., an animal) is consistently exposed to such noise levels at a fixed position. More realistically, marine animals would not stay in the same location for 24 hours (especially in the absence of location-specific habitat) but rather a shorter period, depending on the animal's behaviour and the source's proximity and movements. Therefore, a reported radius for the SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS)) if it remained at that location for 24 hours.

A more realistic representation of the potential exposures for pygmy blue whales and southern right whales within the modelling area was undertaken using animal movement modelling ('animat modelling'). While acoustic modelling inherently assumes static animals, the JASCO Animal Simulation Model Including Noise Exposure (JASMINE) combines modelled sound fields with realistic animal movements to predict how animals might be impacted through sound exposure. Calculated exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters.

The distribution of distances of animats predicted to be exposed to sound levels above relevant thresholds was used to calculate 95th percentile exposure ranges ($ER_{95\%}$). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed the threshold criterion. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which the animats are exposed to the sound field over time, both vertically and horizontally. The probability that an animat within the $ER_{95\%}$ was exposed above the threshold criterion was also computed (P_{exp}) to provide additional context.

The acoustic analysis considered the distances away from the seismic source at which several effects criteria or relevant sound levels were reached. The results are summarised below considering all the representative single-impulse modelling sites and all accumulated SEL scenarios for both acoustic modelling results and pygmy blue whale and southern right whale animat $ER_{95\%}$ results and probabilities.

Marine Mammals – Acoustic Results

- The maximum distance where the NOAA marine mammal behavioural response criterion of 160 dB re 1 µPa^2 (SPL) for impulsive noise could be exceeded varied between 2.91 and 11.8 km from the 2820 in^3 seismic source, depending on modelled site.
- The results for marine mammal injury considered the criteria from Southall et al. (2019). These criteria contain two metrics (PK and SEL_{24h}), both required for the assessment of marine mammal PTS and TTS. The longest distance associated with either metric is required to be applied for assessment; Table 1 summarises the maximum distances, along with the relevant metric.

Table 1. Summary of maximum (R_{max}) horizontal distances (in km) from all modelled sites and scenarios to behavioural response thresholds, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals showing the relevant metric.

Hearing group	Maximum modelled distance to effect threshold (R_{max})								
	Behavioural response[1]	Scenario A		Scenario B		Scenario C		Scenario D	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	11.8 (SPL)	41.9 (SEL_{24h})	5.07 (SEL_{24h})	35.4 (SEL_{24h})	4.55 (SEL_{24h})	20.5 (SEL_{24h})	2.43 (SEL_{24h})	28.6 (SEL_{24h})	1.00 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.03 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.82 (PK)	0.41 (PK)	0.82 (PK)	0.41 (PK)	0.79 (PK)	0.39 (PK)	0.71 (PK)	0.37 (PK)
Otariid Pinnipeds		0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.05 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Animal Movement Modelling

The exposure ranges predicted using animat modelling are more realistic, due to the incorporation of species-specific realistic movements, rather than a conservative approach of calculating ranges using the maximum-over-depth sound fields and receivers which are stationary for 24 hours. In particular, the exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters.

Animal movement modelling ('animat modelling') focussed on feeding pygmy blue whales, migrating southern right whales, and reproducing southern right whales. Animat simulations were run with unrestricted animat seeding, and, if applicable, with seeding restricted to relevant BIAs (southern right whales were restricted to their reproduction BIA and pygmy blue whales were restricted to their foraging BIA). Southern right whales were not additionally restricted to the southern right whale migration BIA as this BIA completely encompassed the modelling area. Pygmy blue whales were additionally restricted to be on the shelf.

- Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criterion, are typically comparable to the predicted acoustic ranges. Apart from reproducing southern right whales restricted to their reproduction BIA, all scenarios resulted in exposures above the behavioural response threshold (NOAA (2019)). Of these, the maximum $ER_{95\%}$ to the marine mammal behavioural response threshold was 9.83 km, with an associated probability of exposure of 76%. These results are summarised in Table 2.

- Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because the moving animats have a shorter time ('dwell time') to accumulate sound energy. There were exposures above PTS and TTS threshold for all considered scenarios and species, except for southern right whales when they were restricted to their respective reproductive BIA. The maximum $ER_{95\%}$ to PTS and TTS thresholds (Southall et al. 2019) were 1.98 and 22.5 km, respectively, with probabilities of exposure of 58% and 56%.

Table 2. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales. Maximum exposure ranges show $ER_{95\%}$ (km) first and associated probability of exposure of animats travelling within the maximum $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL_{24h})[3]	PTS (SEL_{24h})[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	9.83 (76%)	22.5 (56%)	1.98 (58%)
	B	9.54 (77%)	18.9 (57%)	1.73 (50%)
	C	8.38 (45%)	10.8 (35%)	0.83 (36%)
	D	6.69 (63%)	8.85 (59%)	0.37 (59%)
Southern right whale	A	9.51 (83%)	14.2 (1%)	1.40 (52%)
	B	8.97 (73%)	11.3 (64%)	1.22 (44%)
	C	7.39 (47%)	7.10 (35%)	0.69 (26%)
	D	6.84 (63%)	6.23 (58%)	0.24 (51%)

1 LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)
2 SPL (L_p; dB re 1 µPa²)
3 Southall et al. (2019) criteria for marine fauna.
4 NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

Sea Turtles

- The PK sea turtle injury criteria of 232 dB re 1 µPa for PTS and 226 dB re 1 µPa for TTS from Finneran et al. (2017) were exceeded at a distance up to 40 m and 80 m from the acoustic centre of the source, respectively.
- The maximum distance to the SEL_{24h} metrics of 204 dB re 1 µPa²s for PTS and 189 dB re 1 µPa²s for TTS (summarised in Table 3) for all scenarios was 0.07 km for PTS onset and 3.35 km for TTS onset for the 2820 in³ seismic source (Finneran et al. 2017). As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that sea turtles travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- Table 3 summarises the distances to where the criterion for behavioural response of turtles to 166 dB re 1 µPa² (SPL) and the 175 dB re 1 µPa² (SPL) threshold for behavioural disturbance (McCauley et al. 2000) could be exceeded.

Table 3. Summary of maximum horizontal distances (in km) from the sound source within which the turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS), are exceeded.

Hearing group	Maximum modelled distance to effect threshold (R_{max})									
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C		Scenario D	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	6.30 (SPL)	2.62 (SPL)	3.35 (SEL_{24h})	0.07 (SEL_{24h})	3.20 (SEL_{24h})	0.07 (SEL_{24h})	1.67 (SEL_{24h})	0.07 (SEL_{24h})	0.60 (SEL_{24h})	0.07 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance within which the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 μPa^{2}s was reached was 0.06 km for all scenarios. PTS and PK thresholds were not resolved within the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- The maximum distance within which the OCW-weighted penguin behavioural response threshold of 120 dB re 1 μPa^2 (SPL) for impulsive noise could be exceeded varied between 10.4 and 77.0 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
    - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
    - Fish with a swim bladder that do not use it for hearing,
    - Fish that use their swim bladders for hearing,
    - Fish eggs and fish larvae.
- Table 4 summarises maximum distances within which effect criteria for fish, fish eggs, and fish larvae were exceeded along with the relevant metric. Received sound levels at the seafloor were assessed at a set of representative depths related to the planned acquisition lines ranging from 40 to 170 m.

Table 4. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single-impulse and 24 hour sound exposure level (SEL_{24h}) criteria.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Mortality and Potential Mortal Injury	PK	0.11
	Recoverable injury	PK	0.11
	TTS	SEL_{24h}	8.35
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Mortality and Potential Mortal Injury	PK	0.21
	Recoverable injury	PK	0.23
	TTS	SEL_{24h}	8.35
Fish eggs, and larvae (relevant to plankton)	Mortality and Potential Mortal Injury	PK	0.23

Benthic invertebrates

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 μPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 322 and 715 m for the 2820 in^3 source.
- Bivalves: For comparison to relevant criteria in Day et al. (2016a), the distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was calculated. This particle acceleration was reached at a range of 4 m for a water depth of 50 m, and was not reached at any greater water depth.
- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 μPa PK for sponges and corals (Heyward et al. 2018); the threshold was not reached in water depths greater than 50 m.

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 μPa^2 (SPL; L_P) derived from (Parvin 2005) was considered for recreational swimmers and divers. This criterion was considered for all single-impulse modelled sites and cumulative scenarios, and specifically at 14 coastal sensitive receiver locations. The human health assessment threshold was predicted to be exceeded at Deen Maar (Lady Julia Percy Island), Middle Island, Port Fairy Lighthouse, Killarney Beach and Merri Sanctuary. Maximum received sound levels varied between154.8–150.6 dB re 1 μPa^2 (SPL; L_P) at predicted at Deen Maar and Killarney Beach respectively.

1. Introduction

JASCO Applied Sciences (JASCO) performed a numerical estimation study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic effect on receptors including marine mammals, fish, sea turtles, benthic invertebrates, plankton, and divers.

This study considered a 2820 in^3 seismic source array. JASCO's specialised Airgun Array Source Model (AASM) was used to predict acoustic signatures and spectra (see Section 3.2). AASM accounts for individual airgun volumes, airgun bubble interactions, and array geometry to yield accurate source predictions.

Complementary underwater acoustic propagation models were used in conjunction with the array signature and spectra to estimate sound levels considering site-specific environmental influences. Single-impulse sound fields were predicted at 15 unique geographic locations linked to the considered survey line plans and four representative scenarios for accumulated SEL modelling were considered. Accumulated sound exposure fields were predicted for each representative scenario for likely survey operations over 24 hours (see Section 0).

The modelling methodology considered source directivity and range-dependent environmental properties. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-pk}}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria.

The planned seismic acquisition area overlaps the pygmy blue whale (*Balaenoptera musculus brevicauda*) foraging BIA and the migration BIA for southern right whales (*Eubalaena australis*). The southern right whale reproduction BIA lies inshore of the proposed survey lines. The acoustic modelling results were used in conjunction with animal movement modelling ('animat modelling') simulations to predict the distance at which feeding pygmy blue whales, migrating and reproducing southern right whales are expected to be exposed above threshold criteria for PTS, TTS, and behavioural response. Estimates of sound exposure distribution were determined by moving large numbers of simulated animals (animats) through a modelled time-evolving sound field, computed using acoustic models. This approach provides the most realistic prediction of the maximum expected SPL and SEL_{24h} for comparison against the relevant thresholds.

Section 2 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 3 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the seismic source and all environmental parameters the propagation models require. Section 3 also describes the methodology used in the animal movement and exposure modelling simulations. Section 4 presents the results, which are then discussed and summarised in Section 5.

1.1. Iterative Approach

This report, labelled version 2.0, presents a second iteration of modelling undertaken to assess the risks and impacts of underwater noise for the proposed Regia MSS. This second iteration incorporates additional modelled sites and updated survey line plans. The updated survey line plans focused on moving the survey to deeper water depths and increasing the separation from Deen Maar. The acoustic modelling considers an increased number of single-impulse modelling sites to enhance the resolution of predictions at sensitive receiver locations. The labelling of sites and scenarios are similar to the original version 1.0 report. However, identically labelled sites and scenarios are not necessarily equivalent, any comparisons should be done with the careful consideration and attention to detail.

1.2. Modelling Scenarios

Four nominal 24-hour acquisition scenarios were considered for both acoustic modelling and animal movement modelling. Acoustic modelling consisted of both source and propagation modelling and was conducted at 15 individual single-impulse sites for SEL and SPL while water column PK was assessed at eight sites. The locations of the modelled sites are provided in Table 6 and the acquisition lines for the scenarios are shown in Figure 1. The current iteration of the proposed line plan for the survey has included a provision to not survey over bathymetry less than 50 m. The modelling conducted herein was based on a line plan which had some lines extending over bathymetry that was marginally less than 50 m. For the purposes of acoustic and animal movement modelling very little difference is expected if the modelled lines were terminated at the 50 m bathymetric contour. The sites in Table 6 are representative of the geographic and bathymetric extents of the survey.

This study considered a 2820 in^3 seismic source towed in a triple array configuration at a speed of 4.5 knots with an impulse interval (inter-pulse interval) of 12.5 m and a crossline array separation of 37.5 m. The acoustic propagation modelling utilised the sound speed profile for June, as this month is likely to be the most supportive of sound propagation conditions across all months.

The single-impulse sites and the accumulated SEL scenarios were determined based on proposed survey line plans with lines orientated at 113/293°. The single-impulse sites and accumulated SEL scenarios were chosen to be representative of the range of water depths and the potential sound propagation characteristics of the considered line plans. Near-field sea-floor PK and PK-PK sound levels were assessed considering 10 water depths chosen to represent the depth range encompassed by the considered line plans (50 – 170 m). Particle motion modelling was also performed for these representative water depths.

Table 5 summarises the total number of impulses and the period of acquisition within each of the four 24-hour scenarios. The total assessment period for accumulated sound exposure level was 24 h and during line turns, the seismic source was not operating for modelling purposes. The time surveying and time on turns combine to a total 24 h period.

Table 5. Key parameters of the four accumulated sound exposure level (SEL) scenarios.

Scenario	Array	Impulse interval (m)	Tow direction (°)	Total impulses	Acquisition period (h)
A	Triple 2820 in^3 seismic source	12.5	113/293	8000	11.9
B				8116	12.46
C				13508	20.26
D				13248	20.16

Table 6. Location details for the single-impulse modelled sites. Each site was modelled for both tow directions applicable to the modelling of the scenarios of 24 hour operation.

Site	Scenario(s)	Tow directions (°)	Latitude (°S)	Longitude (°E)	MGA[1] Zone 54		Water depth (m)

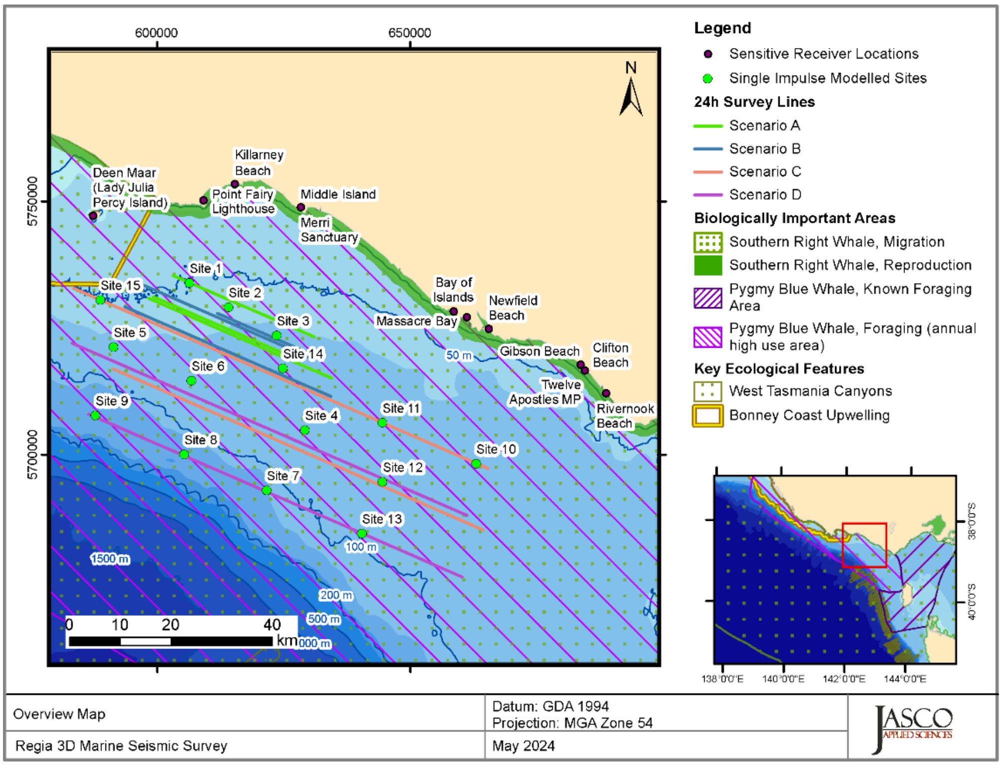

Figure 1. Overview of the single-impulse modelled sites, acquisition lines in the modelled scenarios, and features relevant to the Regia Marine Seismic Survey.

Animal movement modelling ('animat modelling') was undertaken considering the four nominal 24-hour nominal acquisition scenarios and focussed on feeding pygmy blue whales, migrating southern right whales, and reproducing southern right whales.

In unrestricted scenarios, animats were randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2) within the species preferred depth range. During the simulation, if an animat's movement takes it outside of its preferred depth range, it will begin to make movements (while still following the parameters within its species behaviour file) back towards its preferred depth range.

Animat simulations were also run with seeding restricted to relevant BIAs (southern right whales were restricted to their reproduction BIA and pygmy blue whales were restricted to their foraging BIA). Southern right whales were not additionally restricted to the southern right whale migration BIA as this BIA completely encompassed the modelling area. Pygmy blue whales were additionally restricted to be on the shelf.

Animats were seeded at a nominal horizontal sampling density of 4 animats/km^2 for all simulations, except those in which southern right whale animats were restricted to their reproduction BIA, in which case the density was increased to 6 animats/km^2 to account for the relatively small area. Each of the animat simulations were run for a representative 24 h duration.

Figure 2 shows the spatial extent of animat seeding for the four modelled scenarios.

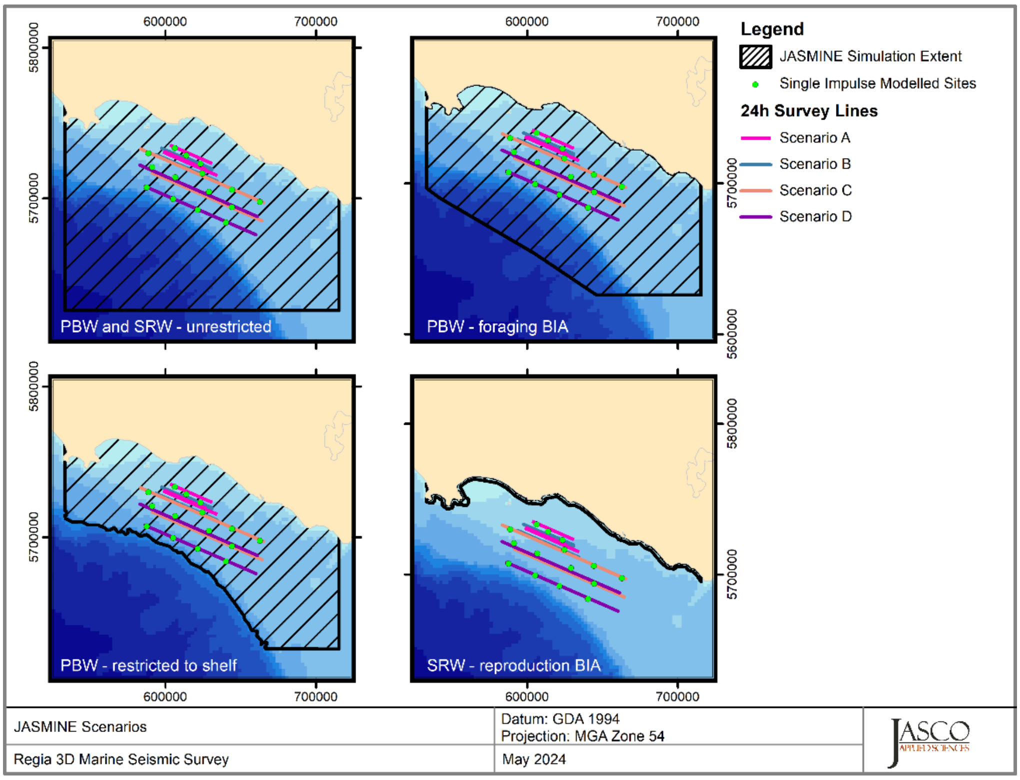

Figure 2. Overview maps of the seeding areas and restrictions for animal movement modelling.

1.3. Sensitive receivers

The Regia MSS lies within a foraging BIA for pygmy blue whales and the migration BIA for southern right whales. In addition, there are several swimming, diving and surfing beaches that are within proximity of the survey area. Deen Maar (Lady Julia Percy Island) is also an important sensitive location. The modelled received sound levels at 14 specific receiver locations have been calculated and are presented in Section 4.2.1.4. The sensitive receiver locations have been labelled 1–14 and are summarised in Table 7 along with the nature of the receptor(s) present at each location.

Table 7. Location details for the sensitive receiver sites.

Receiver ID	Sensitive receiver location	Receptors	Latitude (S)	Longitude (E)	MGA[1] Zone 54	
					X (m)	Y (m)
1	Deen Maar (Lady Julia Percy Island)	No Specific Receptors	38° 25' 37.22"	142° 00' 20.52"	587784	5746327

2. Noise Effect Criteria

The perceived loudness of sound, especially impulsive sound such as that from seismic airguns, is not generally proportional to the instantaneous acoustic pressure. Rather, perceived loudness depends on the pulse rise-time and duration, and the frequency content. Several sound level metrics, such as PK, SPL, and SEL, are commonly used to evaluate sound and its effects on marine life (Appendix A). The period of accumulation associated with SEL is defined, with this report referencing either a "per pulse" assessment or over 24 h. The acoustic metrics in this report reflect the updated ISO standard for acoustic terminology, ISO/DIS 18405:2017 (2017).

Whether acoustic exposure levels might injure or disturb marine mammals is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that have investigated the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

The following noise criteria and sound levels for this study were chosen because they include standard thresholds, thresholds suggested by the best available science, and sound levels presented in literature for species with no suggested thresholds (Sections 2.1–2.5 and Appendix A):

1. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from (Southall et al. 2019) for the onset of Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) in marine mammals.
2. Marine mammal behavioural threshold based on the current US National Oceanic and Atmospheric Administration (NOAA 2019) criterion for marine mammals of 160 dB re 1 µPa^2 (SPL; L_p) for impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs and larvae (including plankton) (Popper et al. 2014).
4. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in turtles.
5. Sea turtle behavioural response threshold of 166 dB re 1 µPa^2 (SPL; L_p), (McCauley et al. 2000) as cited in the Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017), along with a sound level associated with behavioural disturbance 175 dB re 1 µPa^2 (SPL; L_p) (McCauley et al. 2000)
6. Diving birds (penguins):
   - Thresholds for otariid pinnipeds are used as a proxy (Section 2.4): Peak pressure levels (PK; L_{pk}) and frequency–weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Southall et al. (2019) for the onset of PTS and TTS in otariids.
   - Behavioural response to impulsive sound of 120 dB re 1 µPa^2 (SPL; L_p) for diving birds based on information from Sørensen et al. (2020).
7. Peak-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$) and particle acceleration (ms^{-2}) at the seafloor to help assess effects of noise on crustaceans through comparing to results in Day et al. (2016a), Day et al. (2019), Day et al. (2016b), Day et al. (2017) and Payne et al. (2008).
8. A sound level of 226 dB re 1 µPa (PK; L_{pk}) for comparison to Heyward et al. (2018) for sponges and corals.
9. An SPL human health assessment threshold of 145 dB re 1 µPa^2 (SPL; L_p) for sound exposure to people swimming and diving derived from Parvin (2005), and considering Ainslie (2008).

Additionally, to assess the size of the low-power zone required under the Australian Environment Protection and Biodiversity Conservation (EPBC) Act Policy Statement 2.1, Department of the

Environment, Water, Heritage and the Arts (DEWHA 2008), the distance to an unweighted per-pulse SEL of 160 dB re 1 µPa^2·s (L_E) is reported.

The following subsections (Sections 2.1–2.5, along with Appendix A.4 and A.5), expand on the thresholds, guidelines and sound levels for marine mammals, fish, fish eggs, fish larvae, sea turtles, and benthic invertebrates.

2.1. Marine Mammals

There are two categories of auditory threshold shifts or hearing loss: permanent threshold shift (PTS), a physical injury to an animal's hearing organs; and Temporary Threshold Shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued.

To help assess the potential for the possible injury and hearing sensitivity changes in marine mammals, this report applies the criteria recommended by Southall et al. (2019), considering both PTS and TTS. These criteria, along with the applied behavioural criterion (NOAA 2019), are summarised in Table 8, with descriptions included in Appendix A.4.1 (auditory impairment) and Appendix A.4.2 (behavioural response), with frequency weighting explained in Appendix A.5. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

Table 8. Unweighted sound pressure level (SPL), 24-hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds for acoustic effects on marine mammals.

Hearing group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS onset thresholds[1] (received level)		TTS onset thresholds[1] (received level)	
	SPL (L_p; dB re 1 µPa^2)	Weighted SEL (L_E; dB re 1 µPa^2 s)	PK (L_{pk}; dB re 1 µPa)	Weighted SEL (L_E; dB re 1 µPa^2 s)	PK (L_{pk}; dB re 1 µPa)
Low-frequency cetaceans (baleen whales)	160	183	219	168	213
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)		185	230	170	224
Very-high-frequency cetaceans (*Kogia*, cephalorhynchid, and *L. australis*)		155	202	140	196
Pinnipeds[2] (Australian sea lion, Australian fur seal, New Zealand fur seal)		203	232	188	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.
[2] Listed as pinnipeds but equivalent to other marine carnivores in water in the Southall et al. (2019) criteria. Also equivalent to Otariid pindipeds listed in NMFS (2018).
L_p denotes sound pressure level and has a reference value of 1 µPa^2.
$L_{pk, flat}$ peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24-hour period and has a reference value of 1 µPa^{2}s.

2.2. Fish, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and turtles, work begun by a panel convened by NOAA two years earlier. The resulting guidelines included specific thresholds for different levels of effects and for different groups of species (Popper et al. 2014). These guidelines defined quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death.
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma.
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges, these effects are not addressed in this report and are included in Table 9 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Turtles, fish eggs, and fish larvae are considered separately. Table 9 lists relevant effects thresholds from Popper et al. (2014).

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long-lasting exposures, it is required to define a time. Popper et al. (2014) recommend applying a standard period, where this is either defined as a justified fixed period or the duration of the activity; however, Popper et al. (2014) also included caveats about how long the fish will be exposed because they can move (or remain in location) and so can the source. Popper et al. (2014) summarises that in all TTS studies considered, fish that showed TTS recovered to normal hearing levels within 18–24 hours. Due to this, a period of accumulation of 24 hours has been applied in this study for SEL, which is similar to that applied for marine mammals in NMFS (2016, 2018).

In the discussion of the criteria, Popper et al. (2014) discuss the complications in determining a relevant period of mobile seismic surveys, as the received levels at the fish change between impulses because the source is moving, and that in reality a revised guideline based on the closest PK or the per-pulse SEL might be more useful than one based on accumulated SEL. This is because exposures at the closest point of approach (CPA) are the primary exposures contributing to a receiver's accumulated level (Gedamke et al. 2011). Additionally, several important factors determine the likelihood and duration a receiver is expected to be in close proximity to a sound source (i.e., overlap in space and time between the source and receiver). For example, accumulation time for fast moving (relative to the receiver) mobile sources is driven primarily by the characteristics of the source (i.e., speed, duty cycle; NMFS 2016, 2018).

As discussed in Popper (2018), many fish species move around, some over large distances. The author suggests that it is reasonable to think that if the sound of a seismic source becomes too loud, the fish will move away from the source because they are able to determine the direction of a sound source. If the fish moves away, the amount of energy to which it is exposed is likely to be one or a few seismic pulses, and these would not likely be loud enough to result in any effect because the fish would move away at a much lower level signal than could cause harm. Data on TTS for fish are very limited, with the only study that examined recovery from seismic impulses being Popper et al. (2005). Popper (2018) states that if this study had been conducted on wild, free-swimming fish instead of caged ones, there would have been no effect whatsoever because they were likely to have moved away from the source as it approached them, as would happen with normally free-moving demersal and pelagic fish species associated with a 3-D seismic survey in northern Australian waters, extrapolating from the Bethany 3-D assessed in Popper (2018).

Therefore, the time over which energy should be accumulated in each individual fish in the survey area should be limited to the time over which fish receives the maximum exposure, and 24 h is likely too long a period for calculating the accumulation of energy in determining potential harm (e.g., damage or TTS) (Popper 2018). Even if fish do show some TTS, recovery will start as soon as the most intense sounds end, and recovery is likely to even occur, to a limited degree, between seismic pulses. Based on very limited data, recovery within 24 h (or less) is very likely. If TTS does occur, the duration of exposure to the most intense sounds that could result in TTS will be over just a few hours. Thus, energy accumulating over longer periods than a few hours is probably inappropriate (Popper 2018).

Table 9. Criteria for seismic noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	>219 dB SEL_{24h} or >213 dB PK	>216 dB SEL_{24h} or >213 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	186 dB SEL_{24h}	(N) Low (I) Low (F) Moderate	(N) High (I) High (F) Moderate
Fish eggs and fish larvae (relevant to plankton)	>210 dB SEL_{24h} or >207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low

Peak sound level (PK) dB re 1 µPa; SEL_{24h} dB re 1µPa^2·s. All criteria are presented as sound pressure, even for fish Without swim bladders, since no data for particle motion exist. Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

2.3. Sea Turtles

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles).

Finneran et al. (2017) presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

McCauley et al. (2000) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 µPa^2 (SPL), the sea turtles increased their swimming activity, and above 175 dB re 1 µPa^2 they began to behave erratically, which was interpreted as an agitated state. The

Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017) acknowledges the 166 dB re 1 µPa² SPL reported (McCauley et al. 2000) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1 µPa² level from McCauley et al. (2000) is recommended as a criterion for behavioural disturbance. These thresholds are shown in Table 10.

Table 10. Acoustic effects of impulsive noise on sea turtles: Unweighted sound pressure level (SPL), 24 hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds

Effect type	Criterion	SPL (L_p; dB re 1 µPa²)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	PK (L_{pk}; dB re 1 µPa)
Behavioural response	McCauley et al. (2000)	166	NA	
Behavioural disturbance		175		
PTS onset thresholds[1] (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds[1] (received level)			189	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.
L_p denotes sound pressure level and has a reference value of 1 µPa².
$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa²s.

2.4. Diving Birds

There are no regulatory thresholds with regard to onset of hearing impairment for penguins, any other bird species, or phylogenetically or anatomically related species. The only scientifically robust thresholds in this context exist for marine mammals. To allow for assessing the noise–induced impact risk of impulsive airgun signals on penguins, the least sensitive marine mammal hearing group, other carnivores in water (OCW), from Southall et al. (2019), is recommended as a proxy. This hearing group has been selected due to similar hearing sensitivity in the frequency band of underwater hearing for diving birds and otariid pinnipeds, which are included in the group. This provides a conservative approach, as otariids are considered more sensitive to underwater sound at higher frequencies than penguins.

There are also no regulatory thresholds or criteria established to assess potential behavioural responses by penguins or flying seabirds to underwater noise. To allow for assessing the potential for such impacts, an onset criterion for behavioural responses of penguins and flying seabirds of 120 dB re 1 µPa² (SPL) for impulsive sources was chosen based on information from Sørensen et al. (2020). They exposed gentoo penguins (*Pygoscelis papua*) in a controlled exposure experiment to underwater noise bursts (impulsive signals) and demonstrated that the animals show a graded reaction depending on received sound levels. For consistency with the approach to assess PTS and TTS, the behavioural response threshold is applied as OCW weighted.

2.5. Invertebrates

2.5.1. Benthic Invertebrates

Research is ongoing into the relationship between sound and its effects on crustaceans, including the relevant metrics for both effect and impact. Available literature suggests particle motion, rather than sound pressure, is a more important factor for crustacean and bivalve hearing. Water depth and seismic source size are related to the particle motion levels at the seafloor, with larger arrays and shallower water being related to higher particle motion levels, more likely relevant to effects on crustaceans and bivalves.

At the seafloor interface, crustaceans and bivalves are subject to particle motion stimuli from several acoustic or acoustically induced waves. These include the particle motion associated with an impinging sound pressure wave in the water column (the incident, reflected, and transmitted portions), substrate acoustic waves, and interface waves of the Scholte type. However, it is unclear which aspect(s) of these waves is/are most relevant to the animals, either when they normally sense the environment or their physiological responses to loud sounds so there is not enough information to establish similar criteria and thresholds as done for marine mammals and fish. Including recent research, such as Day et al. (2016b), current literature does not clearly define an appropriate metric or identify relevant levels (pressure or particle motion) for an assessment. This includes the consideration of what particle motion levels lead to a behavioural response, or mortality. Therefore, at this stage, we cannot propose authoritative thresholds to inform the impact assessment. However, levels can be determined for pressure metrics presented in literature to assist the assessment.

The pressure and acceleration examples provided in Day et al. (2016a) (Figures 11 and 12) indicate that the acceleration and pressure signals occurred simultaneously, which was interpreted as an indication that the waterborne sounds were responsible for the accelerations measured by the geophones. For clarity, it is important to distinguish that the acceleration from waterborne sound energy is *not* ground roll, which Day et al. (2016a) correctly define as the sound that propagates along the interface at a speed lower than the shear wave speed of the sediment. However, the report subsequently uses ground roll for all further discussions of particle acceleration. While Day et al. (2016a) discuss that they chose the simplest measure of ground roll, it should have been referring to as ‘the acceleration from waterborne sound energy’, or ‘waterborne acceleration’ for short.

For crustaceans, a PK-PK sound level of 202 dB re 1 µPa (Payne et al. 2008) is considered to be associated with no effect, and therefore applied in the assessment. Additionally for context related to different levels of potential impairment, the PK-PK sound levels determined for crustaceans in Day et al. (2016b), 209–212 dB re 1 µPa and 213 dB re 1 µPa from Day et al. (2019), are also included.

For bivalves, PK-PK sound levels of 212 and 213 dB re 1 µPa are presented to allow comparison to the maximum sound levels measured in Day et al. (2016a) and Day et al. (2017) for scallops and pearl shell oyster.

A sound level of 226 dB re 1 µPa (PK; L_{pk}) has been considered for comparison to Heyward et al. (2018) for sponges and corals.

Particle acceleration from the seismic source has been presented to allow for comparison with the results in Table 7 of Day et al. (2016a). The maximum particle acceleration assessed by Day et al. (2016a) for scallops was 37.57 ms^{-2}.

2.5.2. Plankton

To assess effects on plankton, there are only a few studies to base threshold criteria on. Popper et al. (2014) cites many of the references and studies on potential impacts of noise emissions on fish eggs and larvae prior to 2014. Results presented in Day et al. (2016b) for embryonic lobsters and Fields et al. (2019) for copepods align with those presented in Popper et al. (2014), which is that mortality and sub-lethal injury are limited to within tens of metres of seismic sources. Additionally, the Popper et al. (2014) criteria (Table 9), are extrapolated from simulated pile driving signals which have a more rapid rise time and greater potential for trauma than pulses from a seismic source.

Other research, such as McCauley et al. (2017), has indicated the potential for effects at longer range and at levels of 178 dB PK-PK, however, Fields et al. (2019) noted that it was difficult to reconcile the high mortality reported by McCauley et al. (2017) with the low mortalities reported in the greater previous body of earlier research and their experiment. They recommended further research into whether it is the sound pulse itself (i.e., the energy, peak pressures, or particle acceleration), the (turbulent) fluid flow occurring more slowly (i.e., not related to the sound pulse), or other effects such as the bubble cloud that which might cause higher mortality near the seismic source.

2.6. Human Health Assessment Threshold

Underwater, the human ear is about 20 dB less sensitive than it is in air at low frequencies (20 Hz), increasing to 40 dB at mid–frequencies (less than 1 kHz), and increasing to 70–80 dB less sensitive at higher frequencies (Parvin 1998). Divers who wear neoprene hoods have even higher hearing thresholds (lower sensitivity) above 500 Hz because the hood material absorbs high–frequency sounds (Sims et al. 1999). Exposure studies related to divers have typically focused on military sonar exposure, with little information on seismic surveys, and as such care is required when considering thresholds for recreational divers and swimmers, particularly for impulsive sounds such as seismic surveys (Ainslie 2008).

The auditory threshold of hearing under water was lowest at 1 kHz (70 dB re 1 µPa SPL) and increased for lower and higher frequencies to around 120 dB re 1 µPa at 20 Hz and at 20 kHz (Parvin 1998). Fothergill et al. (2000) and Fothergill et al. (2001) conducted controlled acoustic exposure experiments on military divers under fully controlled conditions at a US Ocean Simulation Facility and an US Open water test facility; in all tests, the diver were covered with soft or hard shell dive suits and their position and distance relative to sound source, signal characteristics and received levels were controlled and documented (Pestorius et al. 2009). A total of 89 male Navy divers were exposed to pure tone signals and sweeps between 160–320 Hz at SPLs up to 160 dB re 1 µPa. The divers were exposed to these sounds over 100 seconds at depths from 10 to 40 metres. The divers rated the sounds on a severity scale. For frequencies between 100 and 500 Hz, at a received SPL of 130 dB re 1 µPa, divers and swimmers detected body vibration. None of the divers tested rated levels of 140 dB re 1 µPa as “very severe”; however, at 157 dB re 1 µPa, sound was rated as “very severe” 19 per cent of the time. No physiological damage was observed at the highest levels tested: 160 dB re 1 µPa (Fothergill et al. 2001). In a subsequent study, recreational divers were exposed to tonal signals or 30 Hz–sweeps at frequencies between 100 and 500 Hz at received levels of 130–157 dB re 1 µPa (Pestorius et al. 2009). Each exposure lasted for seven seconds. Nine female and 17 male scuba divers were tested, all wearing full body neoprene wetsuits. Diver aversion and perception of body vibration were used as test parameters. The results showed no sex–specific differences. The results differed as a function of frequency – while test results showed a strong overall variation between subjects, signals at 100 Hz elicited the strongest aversion in all tests and even at 148 dB a few diver ratings indicated extreme aversion. Due to this and the strong variation between test subjects, the following exposure limit for both military and recreational divers was suggested as a conservative measure: For frequencies between 100 and 500 Hz, the maximum SPL should be 145 dB re 1 µPa over a maximum continuous exposure of 100 seconds or with a maximum duty cycle of 20 per cent and a maximum daily cumulative total of three hours. The trading relation between the maximum SPL and duration was 4 dB per doubling of duration (e.g. 141 dB SPL for a 200 second exposure) (Pestorius et al. 2009).

Considering only frequencies between 100 and 500 Hz, Parvin (2005) suggested 145 dB re 1 µPa as a safety criterion for recreational divers and swimmers. Piling impulses are broadband sources, and therefore, to be precautionary, the 145 dB re 1 µPa SPL suggested by Fothergill et al. (2001) and Parvin (2005) has been applied in this study as a broadband SPL and as a human health assessment threshold for recreational divers and swimmers. This does not imply that this level is associated with the onset of injury.

3. Methods

3.1. Parameter Overview

The specifications of the seismic sources and the environmental parameters used in the propagation models are described in additional detail in Appendix D. A single sound speed profile for June was considered in this modelling study (Appendix D.3.2). This was identified as the month that would likely provide the farthest propagation by comparing the sound speed profile across all months.

The modelled single-impulse sites spanned water depths of 49–174 m. Three geological profiles were defined to represent the different geo-acoustic properties across the area encompassed by the considered line plans, and are representative of the different zones within the entire Survey Area (Appendix D.3.3). In water depths less than 120 m, the seabed geological profile was characterised as layered limestone, variably cemented. In the shallowest modelled water depths, less than 65 m and within 20 km of the coast, the geological profile also included a thin layer of overlying sand. For sites in deeper water, greater than 120 m, the seabed geologic profile was characterised as a thick package of unconsolidated sediments.

3.2. Acoustic Source Model

The pressure signature of the individual airguns and the composite decidecade-band point-source equivalent directional levels (i.e., source levels) of the 2820 in^3 seismic source were modelled with JASCO's Airgun Array Source Model (AASM). Although AASM accounts for notional pressure signatures of each seismic source with respect to the effects of surface-reflected signals on bubble oscillations and inter-bubble interactions, the surface-reflected signal (known as surface ghost) is not included in the far-field source signatures. The acoustic propagation models account for those surface reflections, which are a property of the propagating medium rather than the source.

AASM considers:

- Array layout.
- Volume, tow depth, and firing pressure of each airgun.
- Interactions between different airguns in the array.

All seismic sources considered were modelled over AASMs full frequency range, up to 25 kHz. Appendix B.1 details this model.

3.3. Sound Propagation Models

Three sound propagation models were used to predict the acoustic field around the seismic source:

- Combined range-dependent parabolic equation and Gaussian beam acoustic ray-trace model (MONM-BELLHOP, 10 Hz to 25 kHz).
- Full Waveform Range-dependent Acoustic Model (FWRAM, 10 to 1024 Hz).
- Wavenumber integration model (VSTACK, 10 to 1024 Hz).

The models were used in combination to characterise the acoustic fields at short and long ranges in terms of SEL, SPL, PK, and PK-PK. Appendix C details each model. MONM-BELLHOP was used to calculate SEL of a 360° area around each source location. FWRAM was used to model synthetic seismic pulses and to generate a generalised range-dependent SEL to SPL conversion function for a sub-set of the considered modelled sites. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM-BELLHOP to estimate SPL values. FWRAM was also used to calculate water column PK and PK-PK levels.

VSTACK was used to calculate near field PK and PK-PK levels along 4 transects at the seafloor along the endfire and broadside directions considering a set of 11 unique water depths at 40, 50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m. This model was also used to model the peak particle acceleration magnitude considering the same 11 unique water depths. For modelled sites where the seabed is likely to be composed of outcropping limestone (Appendix D.3.3), an additional correction factor was applied to predictions to better estimate loss characteristics of the seabed (see Appendix C.3.2).

3.4. Geometry and Modelled Regions

To predict sound levels with MONM-BELLHOP was used to calculate propagation losses up to distances of 100 km from the source, with a horizontal separation of 20 m between receiver points along all modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta$ = 2.5° for a total of N = 144 radial planes. Receiver depths were chosen to span the entire water column over the modelled area, from 2 m to a maximum of 2700 m, with step sizes that increased with depth. To supplement the MONM results, high-frequency results for propagation loss were modelled using BELLHOP for frequencies from 1.25 to 25 kHz. The MONM and Bellhop results were combined to produce results for the full frequency range of interest.

FWRAM was run to 100 km along four radials (fore and aft endfire, and port and starboard broadside) for computational efficiency. This was done to compute SEL-to-SPL conversions (Appendix D.2) and also to quantify water column PK and PK-PK. The horizontal range step begins at 20 m and increases with range from the source.

The maximum modelled range for VSTACK was 1000 m, and a variable receiver range increment that increased away from the source was used, which increased from 10 to 25 m. The final tabulated distances were obtained through interpolating predicted received levels. Received levels were computed for receivers at 5 and 50 cm above the seafloor to assist in the assessment on invertebrates and fish respectively.

3.5. Accumulated SEL

New sound energy is introduced into an environment with each pulse from the seismic source. While some impact criteria are based on the per-pulse energy released, others, such as the marine mammal and fish SEL criteria (Section 2), account for the total acoustic energy marine fauna is subjected to over a specified duration, defined in this report as 24 h. An accurate assessment of the accumulated sound energy depends not only on the parameters of each seismic impulse but also on the number of impulses delivered in a duration and the relative positions of the impulses.

When there are many seismic impulses, it becomes computationally prohibitive to perform sound propagation modelling for every single event. The distance between the consecutive seismic impulses is small enough, such that the environmental parameters that influence sound propagation are virtually the same for many impulse points. The acoustic fields can, therefore, be modelled for a subset of seismic pulses and estimated at several adjacent ones. After sound fields from representative impulse locations are calculated, they are adjusted to account for the source position for nearby impulses.

Although estimating the cumulative sound field with the described approach is not as precise as modelling sound propagation at every impulse location, small-scale, site-specific sound propagation features tend to blur and become less relevant when sound fields from adjacent impulses are summed. Larger scale sound propagation features, primarily dependent on water depth, dominate the cumulative field. The accuracy of the present method acceptably reflects those large-scale features, thus providing a meaningful estimate of a wide area SEL field in a computationally feasible framework.

To produce the map of accumulated received sound level distributions and calculate distances to specified sound level thresholds, the maximum-over-depth were calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth sound levels for each impulse were then resampled (by linear triangulation) to produce a regular Cartesian grid. The sound field grids from all impulses were summed (see Equation A-5) to produce the cumulative sound field grid with cell sizes of 20 m. The contours and threshold ranges were calculated from these flat Cartesian projections of the modelled acoustic fields.

The unweighted (fish) and frequency-weighted SEL_{24h} results were rendered as contour maps, including contours that focus on the relevant criteria-based thresholds. Only contours at ranges larger than the nearfield of the seismic source were rendered.

3.6. Per-pulse Levels at Receivers

The received acoustic levels at 14 sensitive receiver locations have been calculated; sensitive receiver locations are summarised in Table 7. To determine whether per-pulse levels at these receivers exceed relevant thresholds, modelling was undertaken to estimate the sound level at a given receiver from any shot within the survey.

The method utilised to calculate per-pulse levels at receivers is similar to the method described in Section 3.5 to calculate accumulated received levels. The per-pulse sound fields modelled for the fifteen single-impulse modelled sites were translated to each impulse location on the survey lines based on the closest, most appropriate single-impulse modelled site. For computational efficiency purposes, every 50th impulse was considered in this method. Modelling every shot on the survey lines would be computationally prohibitive.

After translation the maximum-over-depth received level at a given location was extracted. In such a fashion, a sequence of received levels at a given location can be tabulated for impulses in the survey. In order to obtain per-pulse received levels, the received levels were not summed for this analysis, unlike the calculation for accumulated received levels (Section 3.5).

3.7. Animal Movement and Exposure Modelling

3.7.1. Methodology

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was used to predict the exposure of animats to sound arising from the seismic activity. JASMINE integrates the predicted sound field with biologically meaningful movement rules for each marine mammal species (pygmy blue whales and southern right whales for the current analysis) that results in an exposure history for each animat in the model. An overview of the exposure modelling process using JASMINE is shown in Figure 4.

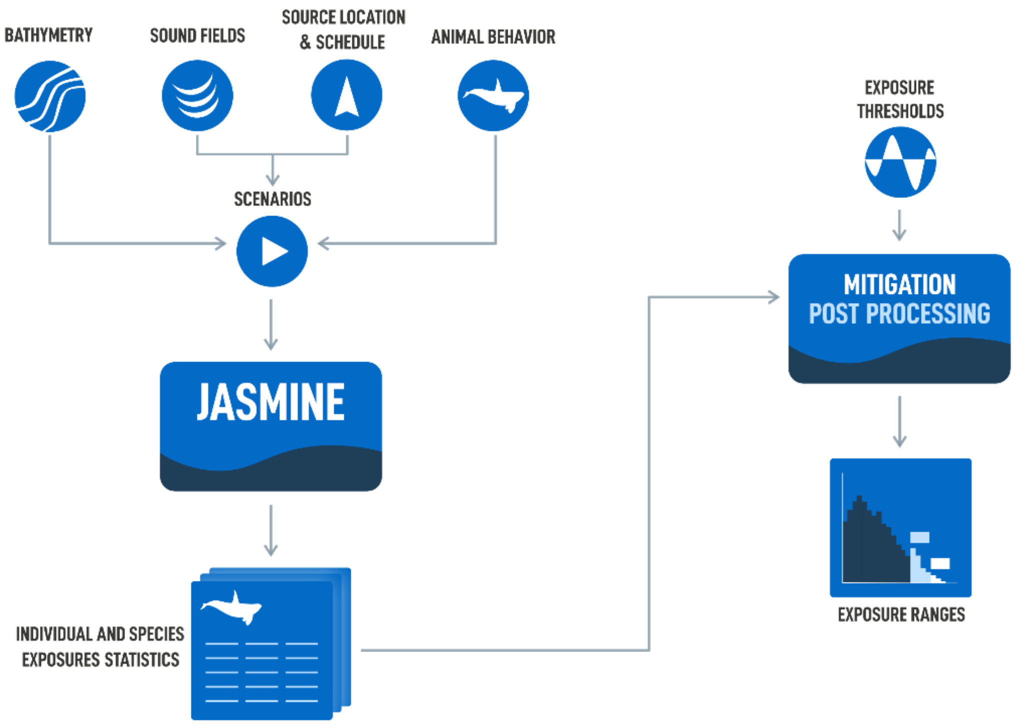

Figure 4. Exposure modelling process overview.

In JASMINE, the sound received by the animats is determined by the proposed seismic operations. As illustrated in Figure 5, animats are programmed to behave like the marine animals that may be present in the modelling area. The parameters used for forecasting realistic behaviours (e.g., diving and foraging depth, swim speed, surface times) are determined and interpreted from marine mammal studies (e.g., tagging studies) where available, or reasonably extrapolated from related or comparable species. For the assessment of cumulative criteria, an individual animats sound exposure levels are summed over a 24 h duration to determine its total received energy, and then compared to the relevant threshold criteria. For single-exposure metrics, the maximum exposure is evaluated against threshold criteria for each 24 h period. For additional information on JASMINE, see Appendix D.4.

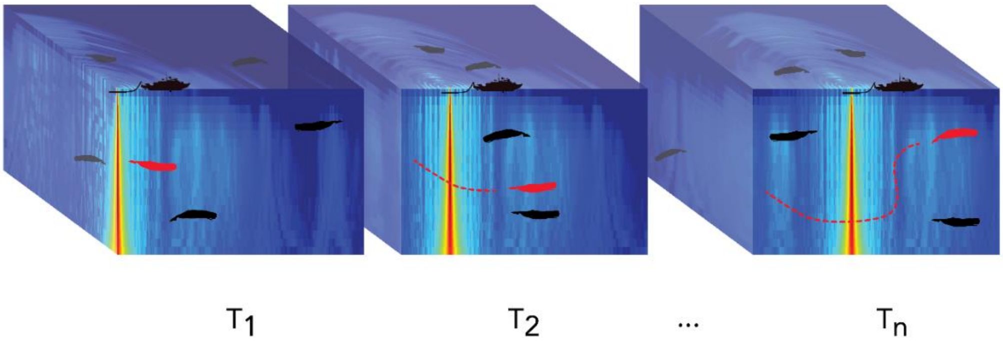

Figure 5. Depiction of animats in a moving sound field. Example animat (red) shown moving with each time step (T_n). The acoustic exposure of each animat is determined by where it is in the sound field, and its exposure history is accumulated as the simulation steps through time.

The exposure criteria for impulsive sounds (described in Section 2) were used to determine the number of animats that exceeded thresholds. To generate statistically reliable probability density functions, model simulations were run with animat sampling densities of 4 animats/km^2, except those in which southern right whale animats were restricted to their reproduction BIA, in which case the density was increased to 6 animats/km^2 to account for the relatively small area. The modelling results are not related to real-world density estimates for pygmy blue whales and southern right whales within BIAs or the wider area, as animal density in the area is unknown. To evaluate PTS, TTS and behavioural response, exposure results were obtained using detailed behavioural information for pygmy blue whales and southern right whales (described in Sections 3.7.3.1 and 3.7.3.2).

The seismic source was modelled as a vessel towing an airgun array at a speed of 4.5 knots, with an impulse interval of 12.5 m. The simulated source tracks followed a racetrack configuration with acquisition not occurring on turns. At the time and location of each seismic pulse, the modelled source location with the closest distance was selected for exposure modelling. The track lines along with the acoustic modelling locations are shown in Figure 1.

Figure 6 shows an example animat track (generated for information purposes only and not related to the results presented in this report) with associated received levels from a stationary point source. The top panel displays the animat track relative to the point source, and the bottom panel displays the accumulation of SEL_{24h} for TTS and PTS criteria. At approximately 50 seconds, the animat is exposed so that the TTS threshold is exceeded, and at approximately 700 seconds the animat is exposed so that the PTS threshold is exceeded.

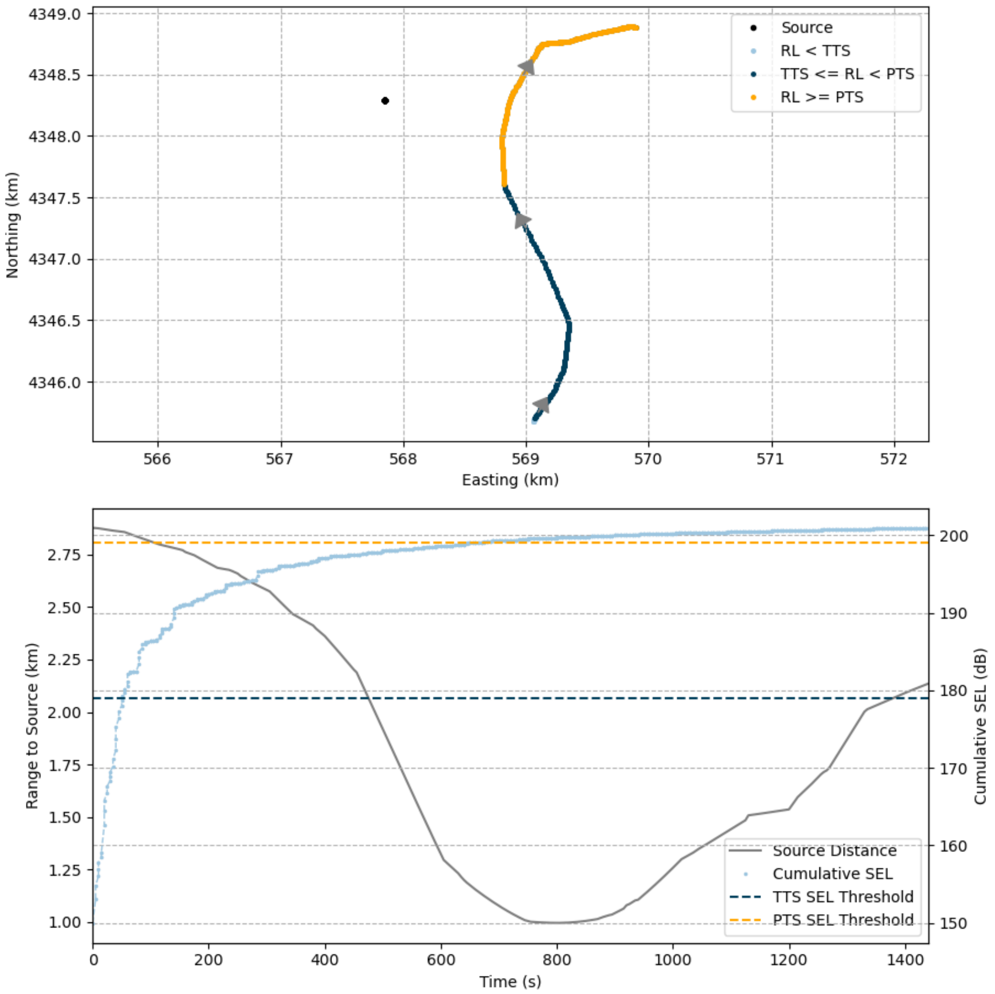

Figure 6. Animat track from an example simulation showing northward movement over a 1400 s duration. The upper panel shows a plan view of both a stationary point source and a foraging animat. Animat steps are coloured to indicate whether the accumulated sound energy at that point has exceeded either TTS or PTS threshold criteria. The lower panel shows horizontal distance in kilometres to the source (grey line; left y-axis) and cumulative 24-h SEL ($L_{E,24h}$, dB re 1 µPa²·s; right y-axis) as a function of time. Note that this example does not use data from the current study.

3.7.2. Exposure–based Radial Distance Estimation

The results from the animal movement and exposure modelling provided a way to estimate radial distances to effect thresholds. The distance to the closest point of approach (CPA) for each of the animats was recorded. The $ER_{95\%}$ (95% Exposure Range) is the horizontal distance that includes 95% of the animat CPAs that exceeded a given effect threshold (see Section 2). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed threshold criteria. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which animats sample the sound field over time, both vertically and horizontally. The sound field varies as a function of range, depth, and azimuth based on a variety of factors such as bathymetry, sound speed profile, and geoacoustic parameters. The way the animats sample the sound field depends upon species-typical swimming and diving characteristics (e.g., swim speed, dive depth, surface intervals, and reversals). Furthermore, even within a particular species definition, these characteristics vary with behavioral state (e.g., feeding, migrating). As this results in some animats not exceeding threshold criteria even within the $ER_{95\%}$, the probability that an animat within that distance was exposed above threshold within the $ER_{95\%}$ was also computed (P_{exp}) to provide additional context.

Acoustic ranges are reported for both $R_{95\%}$ and R_{max}, however, exposure ranges are reported for $ER_{95\%}$ only since, statistically, ER_{max} is not defined. JASMINE is a Monte Carlo simulation, and the results are probabilistic in nature. This is in contrast with acoustic modelling, where there is a specific maximum isopleth range for a given source/environment setup.

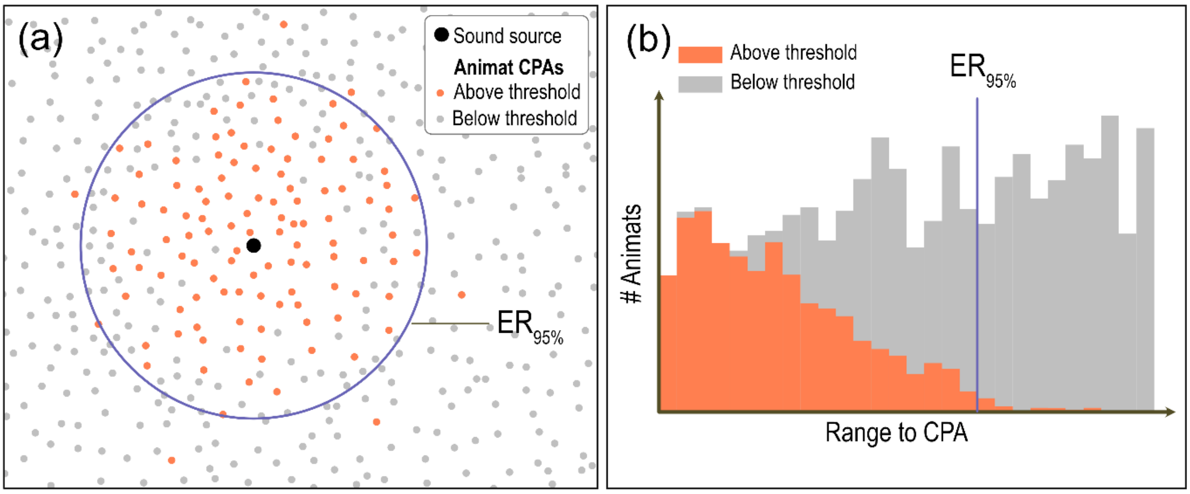

Figure 7. Example distribution of animat closest points of approach (CPAs). Panel (a) shows the horizontal distribution of animats near a sound source. Panel (b) shows the distribution of distances to animat CPAs. The 95% exposure range ($ER_{95\%}$) is indicated in both panels.

3.7.3. Species Specific Behaviour Profile Parameterisation

3.7.3.1. Pygmy Blue Whale Behaviour Profile

The project area overlaps with a known foraging BIA for pygmy blue whales (DoE (AU) 2015-2025). Therefore, only foraging behaviours were considered in the species profile.

Data on fine-scale foraging behaviour are not currently available for pygmy blue whales. Therefore, data from multi-sensor tags deployed on blue whales from the North Pacific were used to inform the feeding behaviours. Irvine et al. (2019) used intermediate-duration archival tags (SPLASH MK10) attached to eight blue whales off the coast of California and was able to determine two feeding modes based on depth: shallow and deep. These two feeding behaviours differed further between males and females, with females generally diving deeper than males during both shallow and deep feeding. In order to account for these differences, female and male pygmy blue whales were modelled separately, with values derived from Irvine et al. (2019). Most remaining parameters for feeding behaviour were sourced from Goldbogen et al. (2011), who deployed 25 multi-sensor suction cup tags (DTAGs) on blue whales off the coast of California. Finally, travel speed was derived from satellite tags deployed on pygmy blue whales off southern Australia (Möller et al. 2020), and surface interval was derived from a satellite tag deployed on a pygmy blue whale off western Australia (Davenport et al. 2022).

3.7.3.2. Southern Right Whale Behaviour Profile

The project area is located in the migration BIA for southern right whales, and the reproduction BIA for this species lies inshore of the proposed survey lines. Animals of all demographics use these areas, including mothers with new calves. The behaviour of southern right whale mother/calf pairs can be dramatically different from other demographics, particularly in regards to the amount of time spent resting at the surface (Cusano et al. 2019, Nielsen et al. 2019). Therefore, separate behavioural profiles were modelled for mother/calf pairs and for all other demographics. Accordingly, a total of four behavioural profiles were considered for southern right whales: migrating mother with calf, migrating adult with no calf, reproducing adult with calf, reproducing adult with no calf. Migration profiles are applicable to the migration BIA, and reproducing profiles are applicable to the reproduction BIA.

The behaviour of migrating southern right whales was modelled to reflect animats transiting through the migration BIA on a 293º track to correspond with the tow direction. This reflects the animals migrating along the southern coast of Australia in a westerly or counter-clockwise direction (Burnell et al. 2001). Fine-scale behavioural data on southern right whales are limited, however migrating travel speed was derived from satellite-tagged southern right whales (Mackay et al. 2020). The remaining parameters used for the migrating species profiles were primarily sourced from multi-sensor tags (DTAGs and/or TDRs) deployed on North Atlantic right whales (Baumgartner and Mate 2003) (Dombroski et al. 2021).

Reproductive BIAs for southern right whales act as aggregation areas for mothers with new calves and for other demographics. For the reproducing behavioural profiles, behaviours reflect those observed in North Atlantic right whales on calving grounds due to limited data availability for southern right whales. Behavioural states comprise resting, travelling, and surface active. Additionally, the mother/calf profile includes nursing behaviour. The parameters used for the reproducing species profiles were again primarily sourced from North Atlantic right whales with the exception of behavioural probabilities, which were available from studies of southern right whales in South America (Thomas et al. 1984 and Lundquist et al. 2008).

4. Results

4.1. Acoustic Source Levels and Directivity

AASM (Section 3.2) was used to predict the horizontal and vertical overpressure signatures and corresponding power spectrum levels for the seismic sources, with results provided in Appendix B.3 along with the horizontal directivity plots for the selected source.

Table 11 shows the PK and per-pulse SEL source levels in the horizontal-plane broadside (perpendicular to the tow direction), endfire (along the tow direction), and vertical directions for the modelled array signature (2820 in^3 source). The vertical source level that accounts for the "surface ghost" (the out of phase reflected pulse from the water surface) is also presented to make it easier to compare the output of other seismic source models.

Figure B-2 in Appendix B.3 shows the broadside, endfire, and vertical overpressure signature and corresponding power spectrum levels for the source. The signature consists of a strong primary peak, related to the initial release of high-pressure air, followed by a series of pulses associated with bubble oscillations. Most energy was produced at frequencies below 500 Hz. Frequency-dependent peaks and nulls in the spectrum result from interference among airguns in the source and correspond with the volumes and relative locations of the airguns to each other.

Table 11. Far-field source level specifications for 2820 in^3 source, for 7 m tow depth. Source levels are for a point-like acoustic source with equivalent far-field acoustic output in the specified direction. Sound level metrics are per-pulse and unweighted.

Direction	Peak source pressure level ($L_{S,pk}$; dB re 1 µPa m)	Per-pulse source SEL ($L_{S,E}$; dB 1 µPa²m²s)	
		10–2000 Hz	2000–25000 Hz
Broadside	249.0	224.3	185.8
Endfire	244.9	222.6	186.4
Vertical	255.1	228.0	194.0
Vertical (surface affected source level)	255.1	230.8	197.0

4.2. Per-pulse Sound Fields

This section presents the per-pulse sound fields in terms of maximum-over-depth SPL, SEL, PK, and seafloor PK and PK-PK. The different metrics are presented for the following reasons:

- SPL sound fields were used to determine the distances to marine mammal and turtle behavioural thresholds (see Sections 2.1 and 2.3).
- Received per-pulse SPL at the considered receiver locations are presented in Table 19, as well as maps showing which impulses result in levels above the human health assessment threshold (Figure 38).
- Per-pulse SEL sound fields are used as inputs into the 24 h SEL scenario and to provide context for the range to 160 dB re 1 µPa²·s, relevant for the EPBC Act Policy Statement 2.1 (DEWHA 2008).
- PK metrics within the water column are relevant to thresholds and guidelines for marine mammals, sea turtles, fish, fish eggs and larvae (as well as plankton; Sections 2.1–2.3).

- PK metrics at the seafloor are relevant to guidelines for fish, fish eggs and larvae (Section 2.3) and the sound level for no effect on corals and sponges.
- PK-PK metrics at the seafloor are relevant to sound levels used in the assessment of effect on benthic invertebrates (Section 2.5.1).

The maximum and 95% distances to per-pulse SEL and SPL metrics are presented in Tables 12–13. The SPL sound fields, and distances to relevant isopleths can be visualised on the contour maps presented in Figures 8–22. Where indicated in the table captions, distances to maximum and 95% distance were calculated considering both survey directions (tow directions); the largest resultant distances were reported. The SPL sound fields are also presented as vertical slices for selected azimuths along the endfire and broadside directions out to 50 km, with the airgun array in the centre (Figures 23–27).

Maximum horizontal distances to maximum-over-depth water column PK thresholds were calculated for eight modelled single-impulse sites, Sites 1, 2, 5, 8, 10, 12, 14 and 15. This metric was calculated for the sites where FWRAM was applied to enable the SEL to SPL conversion (Appendix C.2 and D.2). PK results are presented in Table 15.

Seafloor sound levels were assessed considering ten different representative water depths (50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m). Tables 16 and 17 present the PK and PK-PK results. Particle motion was also calculated considering these water depths, results are presented in Table 18.

Table 19 provides a summary of whether or not the 145 dB re 1 µPa SPL human health assessment threshold was exceeded at each of the 14 sensitive receiver sites identified in Section 1.3 from any impulse location on the survey lines. Figures 38 to 43 indicate which modelled impulses on the seismic survey lines result in these exceedances.

4.2.1. Tabulated Results

4.2.1.1. Entire Water Column

Table 12. *Sites 1-15, 2820 in^3 source*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to modelled maximum-over-depth unweighted per-pulse sound exposure level (SEL) isopleths from the modelled single-impulse sites. Water depth at each site is indicated. The results presented are the maxima considering either of the two tow directions modelled for each site.

Per-pulse SEL (L_E; dB re 1 µPa²·s)	Site 1 (49.1 m)		Site 2 (54.8 m)		Site 3 (63.9 m)		Site 4 (81.0 m)		Site 5 (61.9 m)		Site 6 (71.1 m)		Site 7 (124.9 m)		Site 8 (173.6 m)		Site 9 (166.5 m)		Site 10 (67.4 m)		Site 11 (72.0 m)		Site 12 (84.0 m)		Site 13 (99.0 m)		Site 14 (69.2 m)		Site 15 (51.6 m)

[1] Mortality and potential mortal injury, and recoverable injury threshold
[2] Mortality and potential mortal injury threshold
A dash indicates the threshold is not reached within the limits of the modelling resolution (20 m).

4.2.1.2. Seafloor

Ranges presented for seafloor receptors are provided in Tables 16 and 17 for receiver depths of 50 and 5 cm above the seafloor. The seafloor PK results in Table 16 differ from the maximum-over-depth modelled results presented in Table 15. This is because the model used for the water column results, calculated using FWRAM do not represent the maximum sound levels at the seafloor close to the array. FWRAM is based on a wide-angle parabolic equation (PE) algorithm which is valid to only approximately 70° down angle from the horizontal, and while it provides accurate predictions in the horizontal direction, it cannot predict sound levels directly under the array. VSTACK was used to determine the levels at the seafloor directly under the array and is valid in the very nearfield directly under the source.

Table 16. *2820 in³ source*: Maximum (R_{max}) horizontal distances (in m) from the seismic source to modelled seafloor (receiver located 50 cm above seafloor) peak pressure level thresholds (PK) at ten representative water depths.

Hearing group/animal type	PK threshold (L_{pk}; dB re 1 µPa)	Water Depth									
		50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)									
Sound levels for sponges and corals[1]	226	*	*	*	*	*	*	*	*	*	*
Fish: No swim bladder (also applied to sharks)	213	113	78	74	72	69	66	56	49	16	*

4.2.1.3. Particle Motion Metrics

Particle motion was modelled at a depth of 5 cm above the seafloor for an associated assessment for invertebrates. The maximum distances in metres to a peak particle acceleration magnitude of 37.57 ms^{-2} are presented in Table 18 for ten considered water depths. This particle acceleration threshold was assessed for invertebrates by Day et al. (2016a).

Table 18. 2820 *in*^{3} *source*: Maximum (R_{max}) horizontal distances (in m) from the 2820 in^3 to particle motion level: Peak acceleration magnitude level (m/s^2), 5 cm above the seafloor. Results included in relation to benthic invertebrates (Section 2.5.1).

Hearing group/animal type	Peak Acceleration Magnitude (m/s^2)	Water Depth									
		50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)									
Benthic invertebrates	37.57	4	*	*	*	*	*	*	*	*	*

An asterisk indicates that the particle motion level was not reached.

4.2.1.4. Sound Levels at Sensitive Receiver Locations

Table 19 provides a summary of whether or not the 145 dB re 1 µPa SPL human health assessment threshold was exceeded at each of the 14 sensitive receiver sites identified in Section 1.3 from any impulse location on the survey lines.

Table 19. Exceedances of the human health assessment threshold (145 dB re 1 µPa) at each the sensitive receivers outlined in Section 1.3.

Receiver ID	Sensitive receiver	Exceedance of 145 dB re 1 µPa SPL human health assessment threshold?	Minimum Received Level (dB re 1 µPa)†	Maximum Received Level (dB re 1 µPa
1	Deen Maar (Lady Julia Percy Island)	Yes	145.0	154.8
2	Middle Island	Yes	145.0	151.8
3	Apollo Marine Park	No	*	*
4	Portland	No	*	*
5	Port Fairy Lighthouse	Yes	145.6	154.6
6	Killarney Beach	Yes	145.0	150.6
7	Merri Sanctuary	Yes	145.0	151.8
8	Rivernook Beach	No	*	*
9	Clifton Beach	No	*	*
10	Gibson Beach	No	*	*
11	Newfield Beach	No	*	*
12	Bay of Islands	No	*	*
13	Massacre Bay	No	*	*
14	Twelve Apostles MP	No	*	*

†Minimum received level above the stated threshold or criteria.
An asterisk indicates that the level did not exceed the stated threshold or criteria.

4.2.2. Sound Field Maps and Graphs

The SPL sound fields, and distances to relevant isopleths can be visualised for the 113° tow direction on the contour maps presented in Figures 8–22. Equivalent maps for the 293° tow direction are included in Appendix F.

The SPL sound fields are also presented as vertical slices for selected azimuths along the endfire and broadside directions out to 50 km, with the airgun array in the centre (Figures 23–27).

Section 4.2.2.3 includes maps showing which modelled impulses on the seismic survey lines result in exceedances of the human health assessment threshold for the sensitive receptor locations outlined in Section 1.3.

4.2.2.1. Sound Level Contour Maps

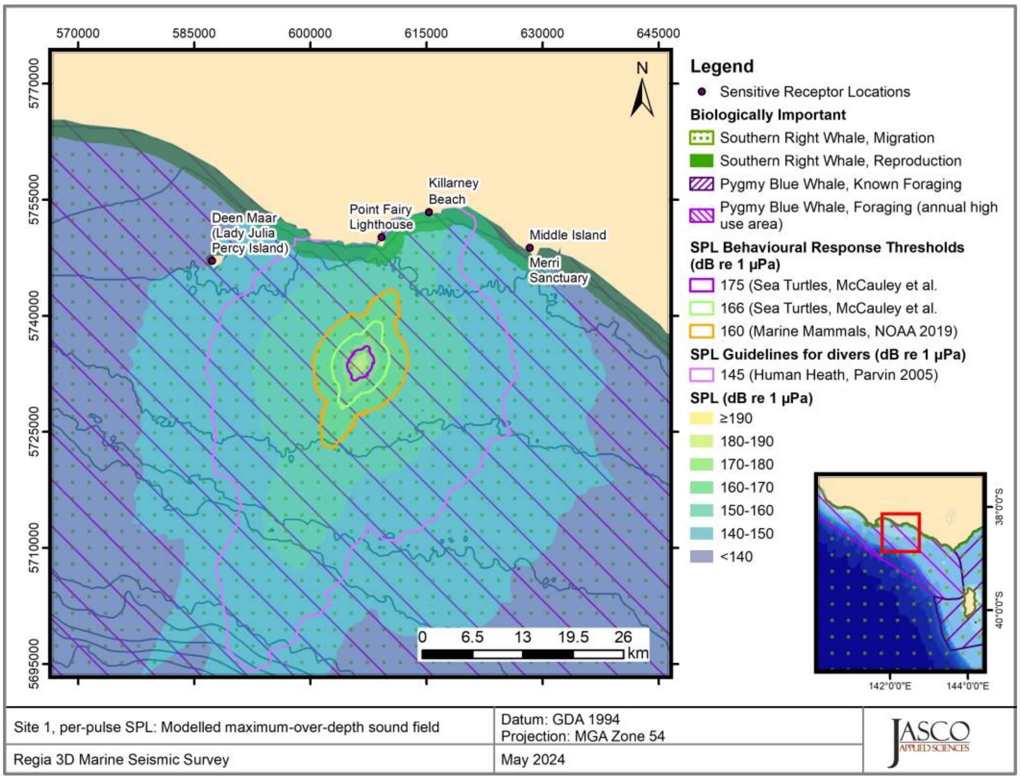

Figure 8. *Site 1, SPL, 2820 in³ source, tow direction 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

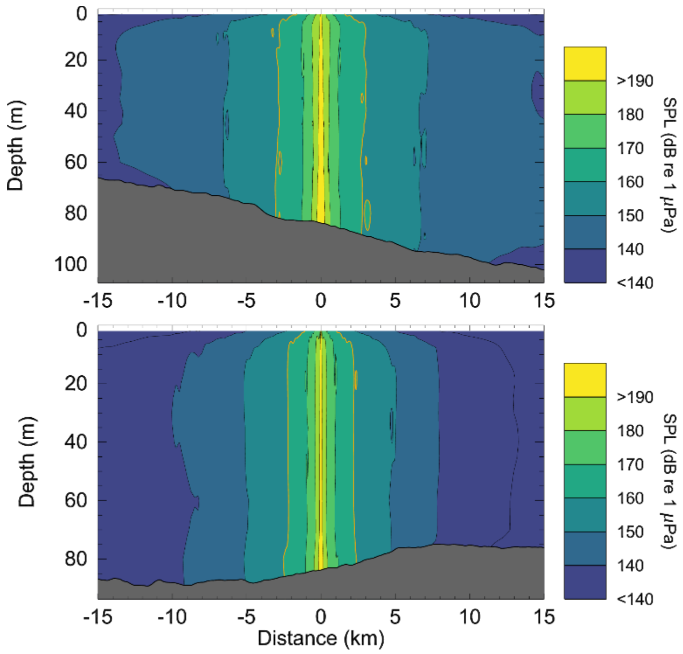

Figure 34. *Site 12, SPL, 2820 in³ source, tow direction 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow direction for broadside, and the tow direction for the endfire slice.

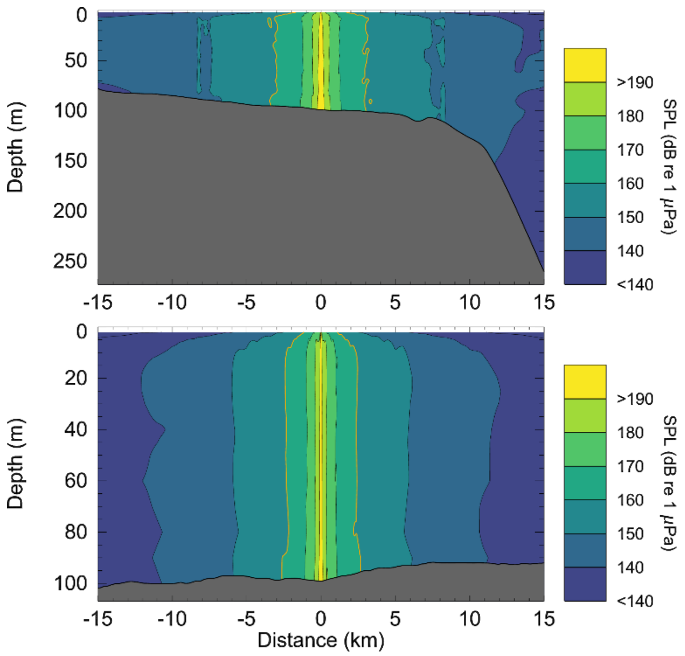

Figure 35. *Site 13, SPL, 2820 in³ source, tow direction 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow direction for broadside, and the tow direction for the endfire slice.

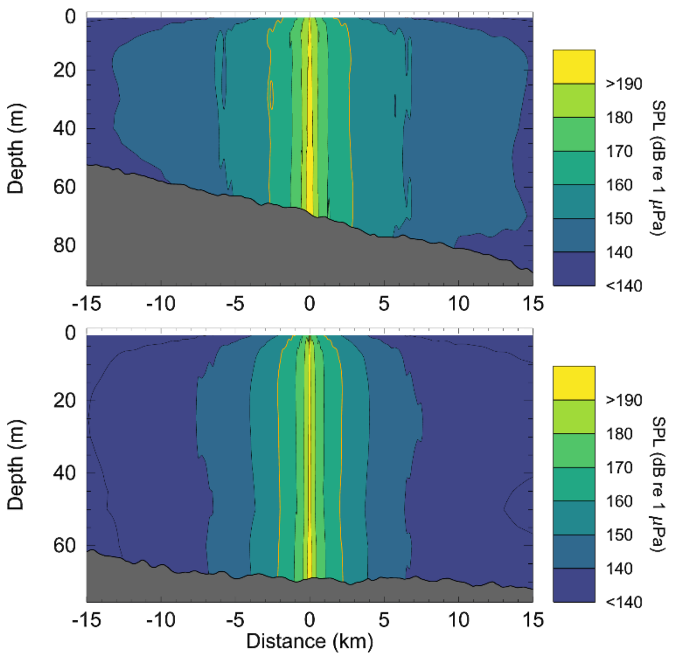

Figure 36. *Site 14, SPL, 2820 in³ source, tow direction 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow direction for broadside, and the tow direction for the endfire slice.

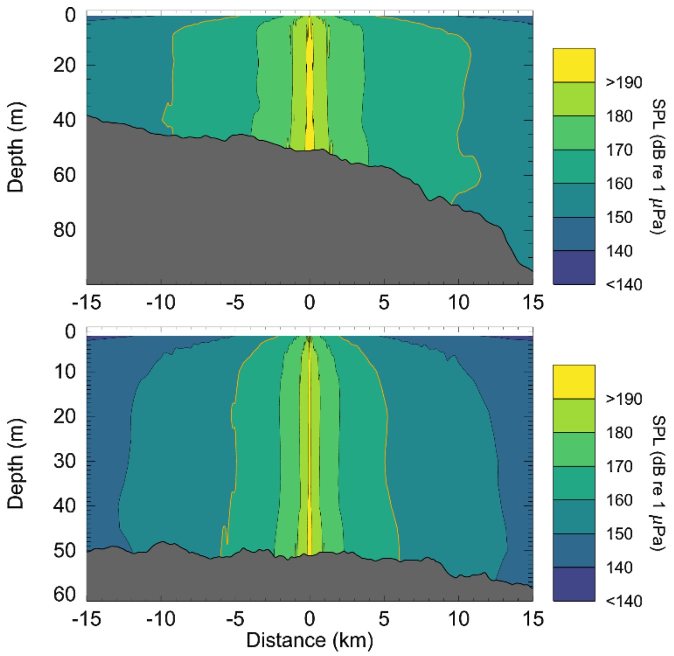

Figure 37. *Site 15, SPL, 2820 in³ source, tow direction 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow direction for broadside, and the tow direction for the endfire slice.

4.2.2.3. Sensitive Receiver Maps

Figure 38 indicates which modelled impulses on the seismic survey lines result in an exceedance in the human health assessment threshold for any of the 14 sensitive receiver locations outlined in Section 1.3.

Figures 39 – 43 indicate which modelled impulses result in an exceedance in the human health assessment threshold for specific sensitive receiver locations. Maps for all other specific sensitive receiver locations where exceedances did not occur are included in Appendix G.

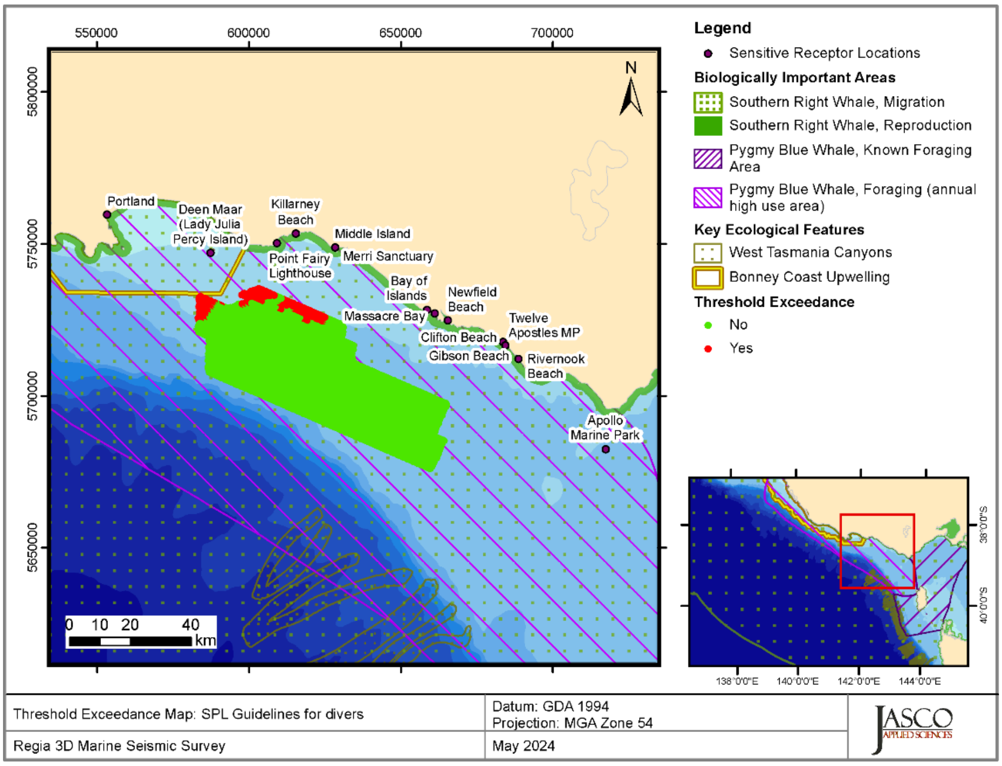

Figure 38. *SPL, 2820 in³ source,* seismic single-impulse locations where the human health assessment threshold at any sensitive receivers is exceeded.

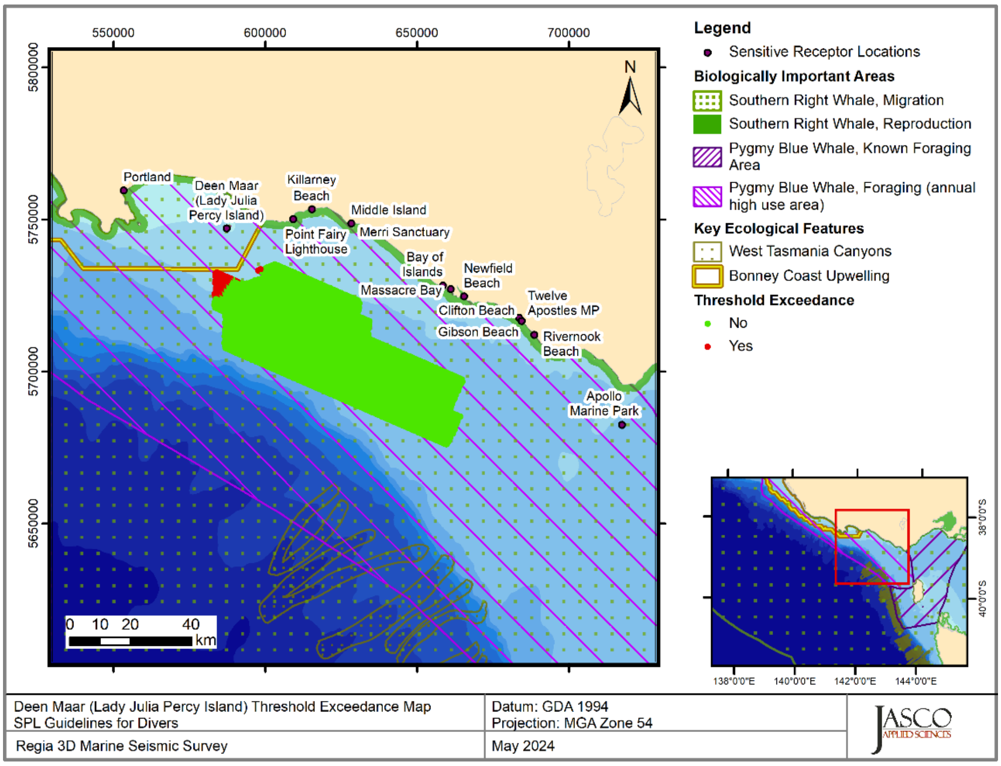

Figure 39. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Deen Maar (Lady Julia Percy Island) is exceeded.

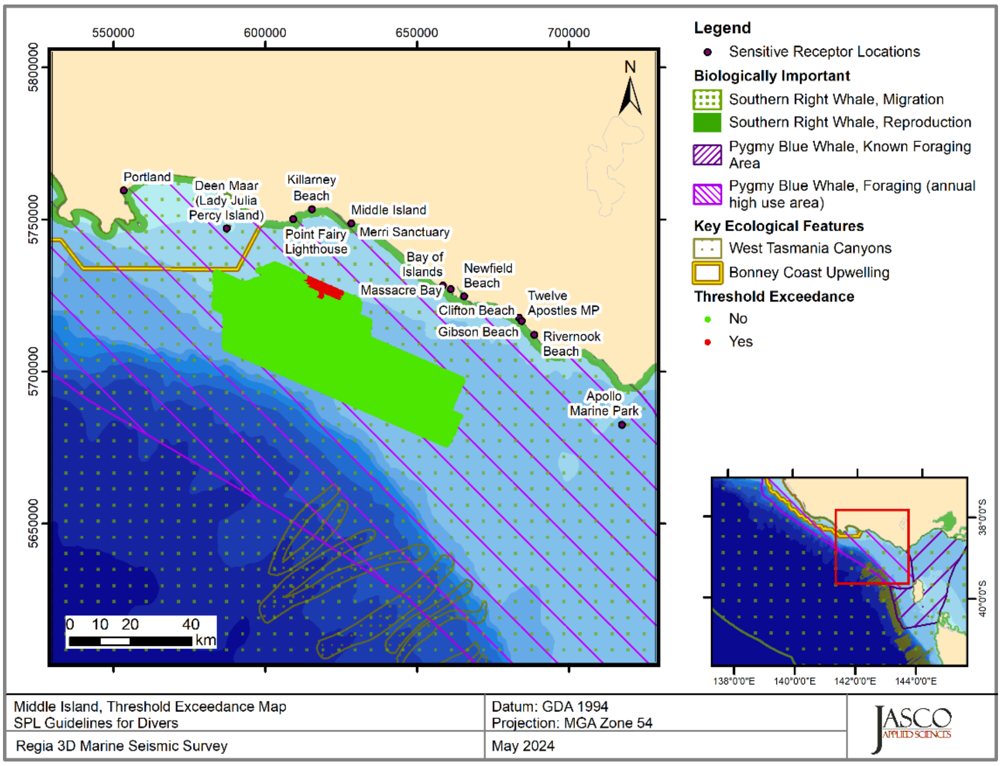

Figure 40. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Middle Island is exceeded.

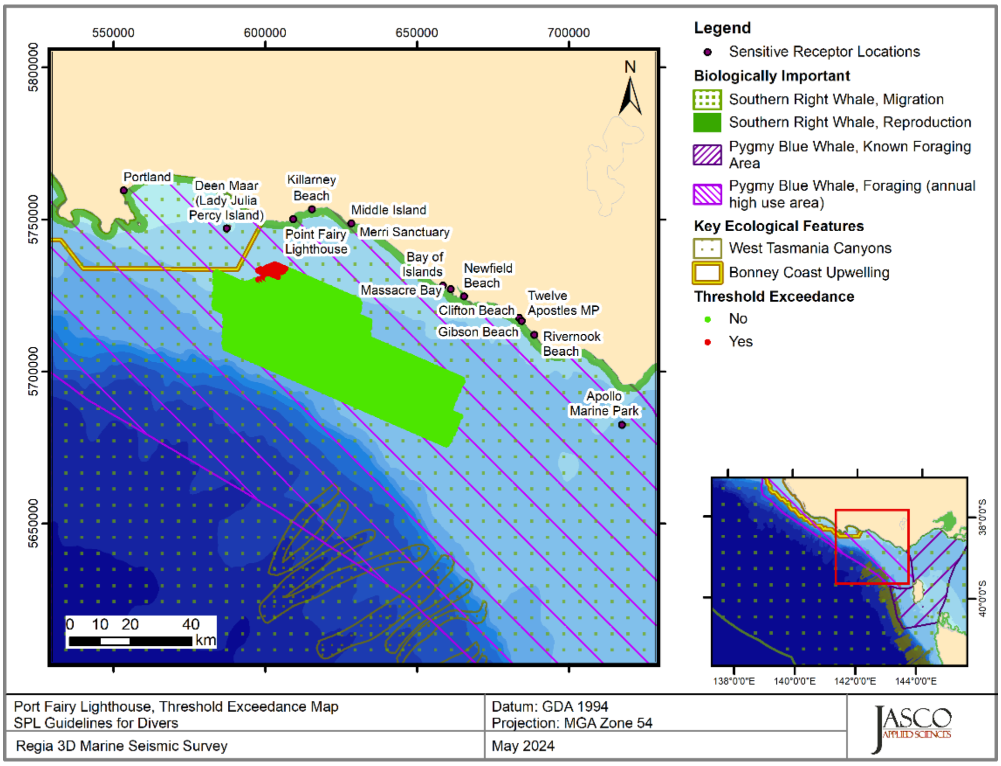

Figure 41. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Port Fairy Lighthouse is exceeded.

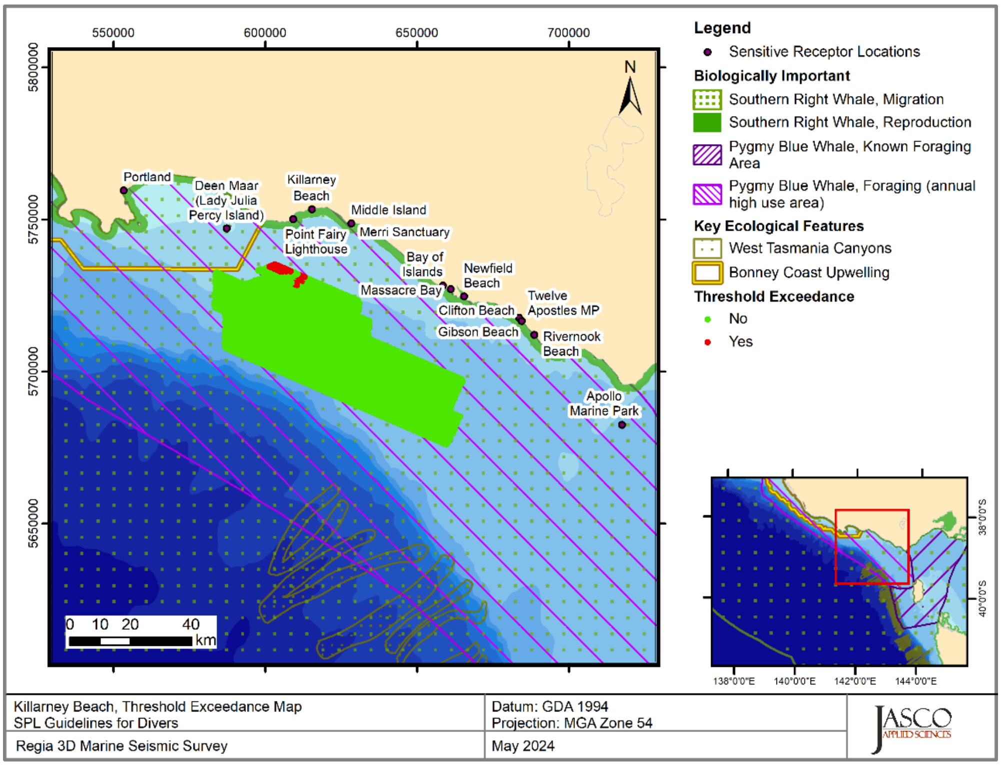

Figure 42. *SPL, 2820 in^3 source,* seismic impulse locations where the human health assessment threshold at Killarney Beach is exceeded.

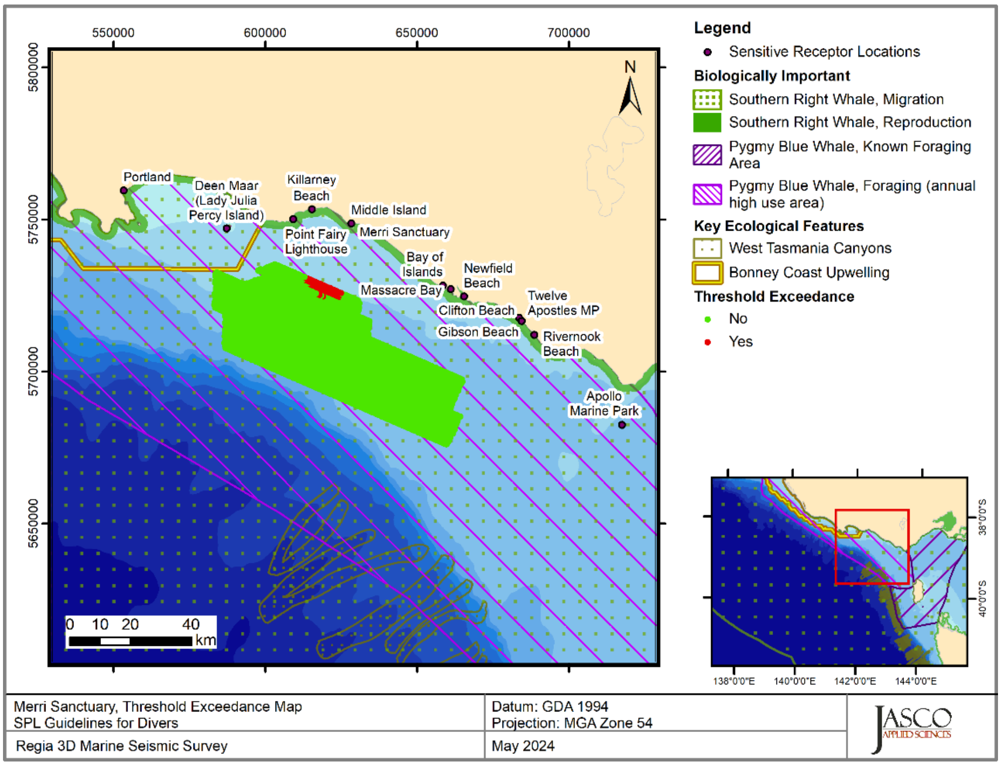

Figure 43. *SPL, 2820 in^3 source,* seismic impulse locations where the human health assessment threshold at Merri Sanctuary is exceeded.

4.3. Multiple Source Fields

This section presents the sound fields in terms of SEL accumulated over 24 h for the modelled scenarios (Section 0). Frequency-weighted SEL_{24h} sound fields were used to estimate the maximum horizontal distances (R_{max}) to marine mammal and sea turtle PTS and TTS thresholds (listed in Table 20), and to estimate maximum distance and the area for injury and TTS guidelines for fish (Table 21).

The SEL_{24h} sound fields are presented as contour maps in Figures 44–46. These figures present the unweighted SEL_{24h} in 10 dB steps, as well as the isopleths corresponding to thresholds or guidelines that are large enough to be resolved on a map.

4.3.1. Tabulated Results

Table 20. Maximum-over-depth horizontal distances (R_{max}, in km) to frequency-weighted 24 h sound exposure level (SEL_{24h}) marine mammal and turtle thresholds, and the corresponding area ensonified above the respective threshold (in km^2). Thresholds provided are based on permanent threshold shift (PTS) and temporary threshold shift (TTS) for marine mammals (Southall et al. 2019) and sea turtles (Finneran et al. 2017).

Hearing group	Threshold for SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	Scenario A		Scenario B		Scenario C		Scenario D

4.3.2. Sound Level Contour Maps

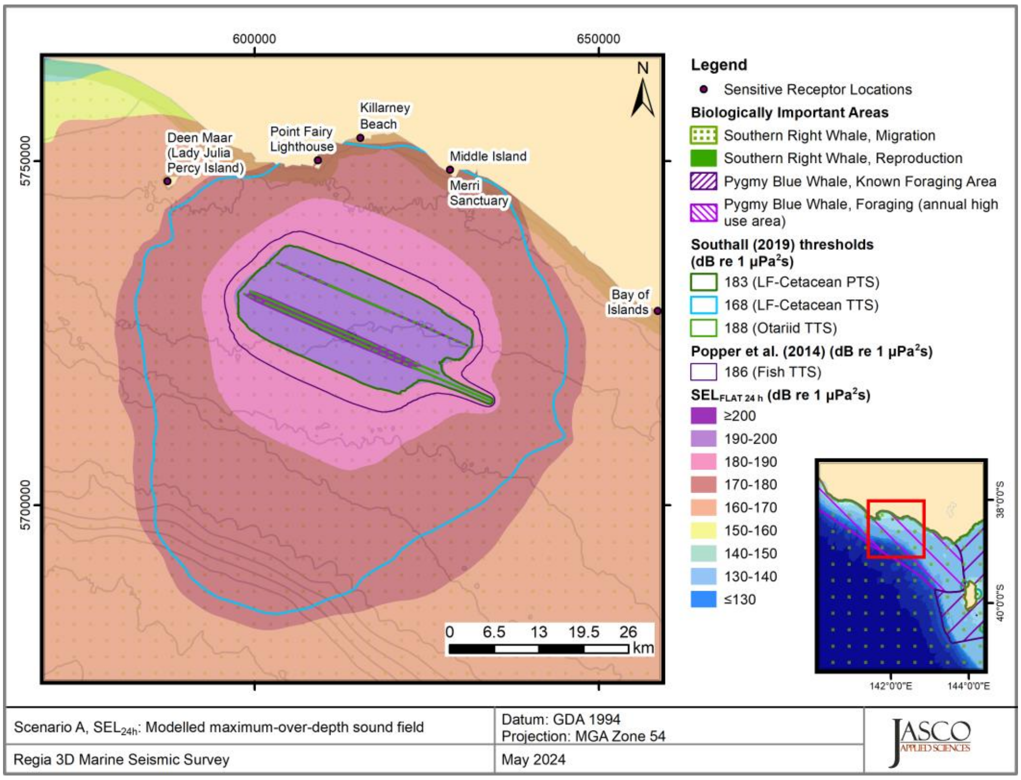

Figure 44. *Scenario A*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

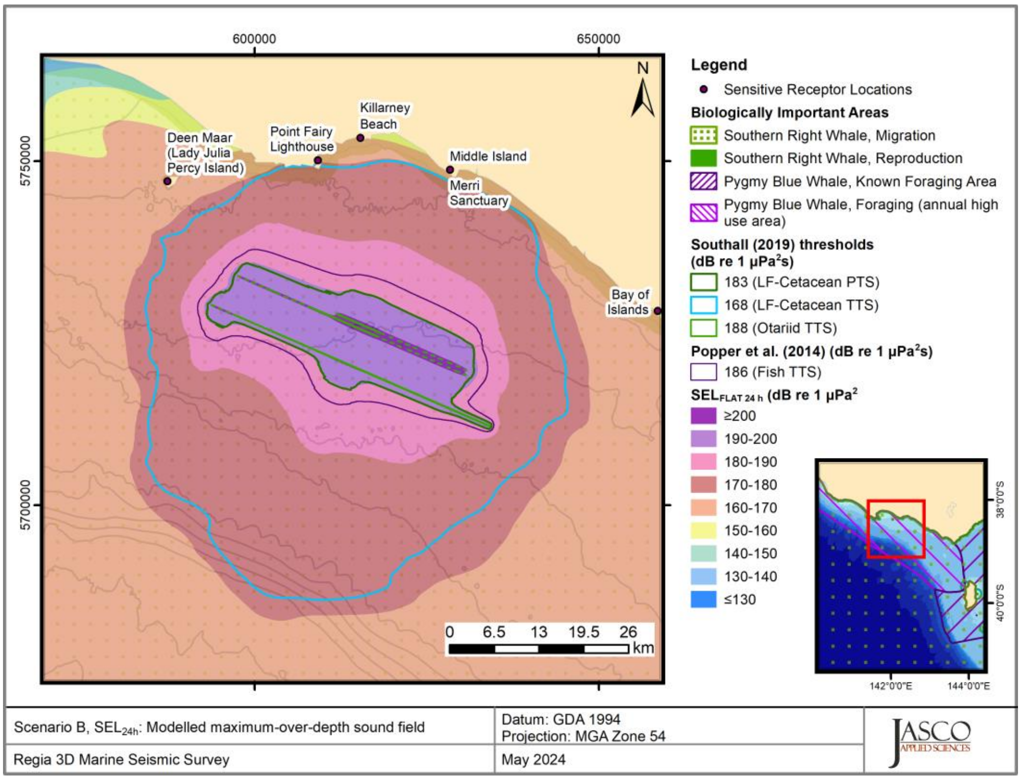

Figure 45*. Scenario B*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

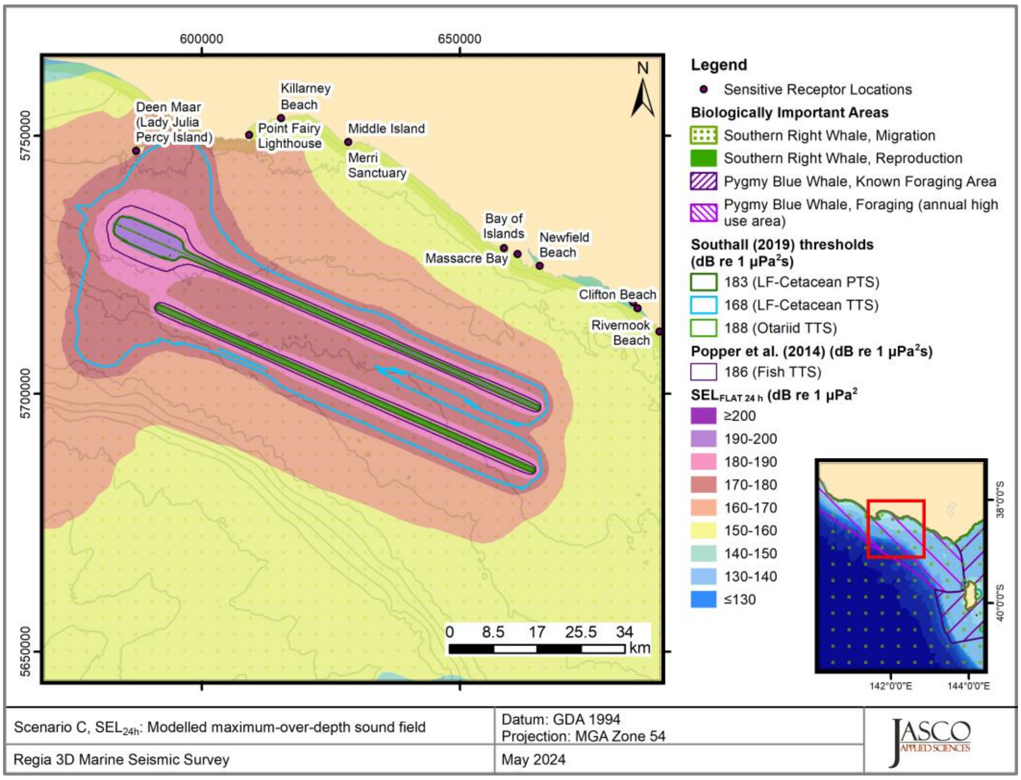

Figure 46*. Scenario C*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

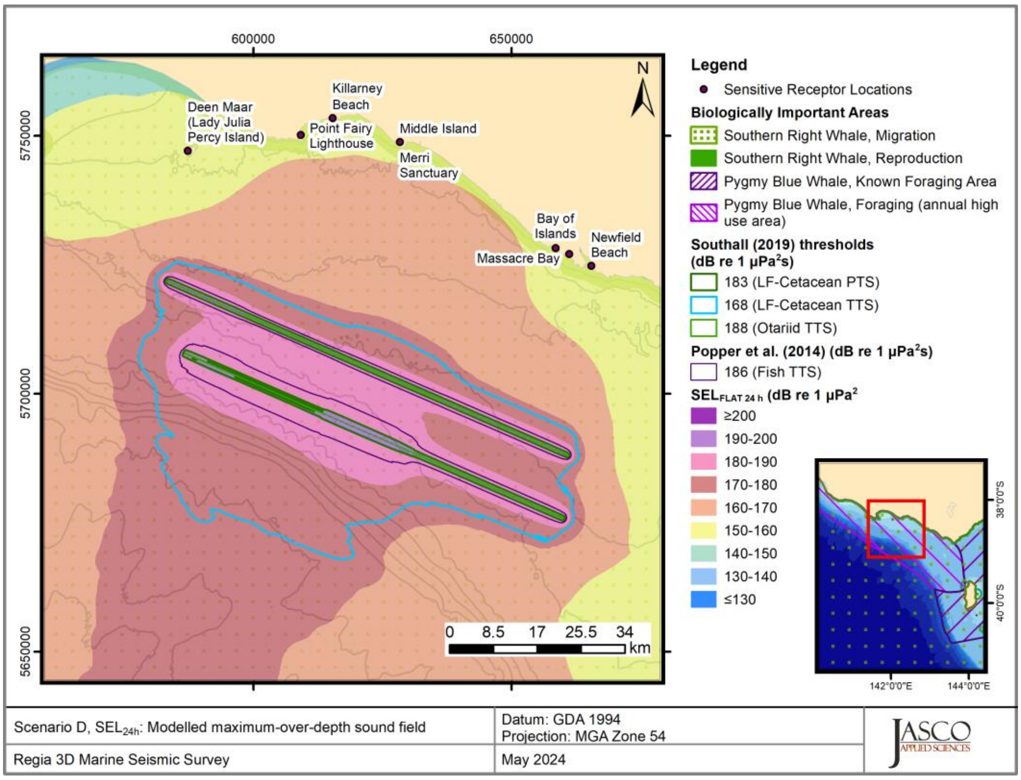

Figure 47. *Scenario D*, sound level contour map of unweighted maximum-over-depth SEL24h results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

4.4. Animal Movement Exposure Ranges

A summary of radial distances to exposure thresholds for pygmy blue whales and southern right whales, along with probability of exposure for each modelled scenario (Section 0), are included below. Table 22 shows results for scenarios with pygmy blue whale animats with unrestricted seeding, seeding restricted to their foraging BIA, and seeding restricted to the shelf. Tables 23 and 24 show results for scenarios with southern right whale animats within their migration BIA (which is equivalent to unrestricted seeding) and within their reproduction BIA (both unrestricted and restricted seeding), respectively. Reproducing southern right whales restricted to the reproduction BIA were not exposed above any of the three thresholds (PTS, TTS or behavioural response), except in scenario A where SRWs (without a calf) restricted to the reproduction BIA were exposed within 14.2 km with a probability of exposure of 1%. Results include $ER_{95\%}$ exposure ranges calculated for the 160 dB behavioural response threshold and SEL_{24h} thresholds for both TTS and PTS, and the probability of an animat being exposed above the threshold within the $ER_{95\%}$.

Exposure ranges for TTS and PTS PK thresholds were not included in the exposure analysis since acoustic modelling predicted the PK exceedance distances are small and close to the source (see Table 15) such that only minor differences are expected between acoustic and animat exposure predictions.

Sections 4.4.1 and 4.4.2 include histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenario A. Additional histograms for the remaining scenarios can be found in Appendix F.

Table 22. Summary of animat simulation results for pygmy blue whales. The 95th percentile exposures ranges ($ER_{95\%}$) in km and probability of animats being exposed above threshold within the $ER_{95\%}$ (P_{exp} (%)) are provided.

5. Discussion and Summary

The modelling study predicted underwater sound levels associated with the planned Regia MSS. The underwater sound field from a 2820 in^3 seismic source was modelled (Appendix B.2). An analysis of seasonal sound speed profiles and associated sensitivity comparison indicated that June was likely to be the month most conductive to sound propagation, and hence was selected to ensure a conservative estimation of distances to received sound level (Appendix D.3.2). Modelling also accounted for site-specific bathymetric variations (Appendix D.3.1) and local geoacoustic properties (Appendix D.3.3).

Most acoustic energy from a seismic source is output at lower frequencies, in the tens to hundreds of hertz. The modelled array had a pronounced broadside directivity for decidecade bands between ~100 to 400 Hz (Appendix B.3), which caused a noticeable axial bulge in the modelled acoustic footprints. The overall broadband (10–25000 Hz) unweighted per-pulse SEL and peak pressure source levels of the seismic source operating at 7 m depth are detailed in Table 11.

5.1. Per-Pulse Sound Fields

The single-impulse modelled sites span water depths of 49–174 m across three different geological regions. The bathymetry within the vicinity of the survey varied between approximately 20–150 m; however, along a south-westward transect the environment generally transitions from shallower water of the Otway Shelf to the significantly deeper waters of the continental slope and abyssal plane (>1000 m). The frequency content of the seismic sources coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters. The maximum-over-depth sound footprint maps and vertical slice plots (Sections 4.2.2.1 and 4.2.2.2) assist in demonstrating the influence of the bathymetry and seabed composition on the sound field.

The geological profile for single-impulse modelled sites in water depths less than 65 m, consisted of a sand layer underlain by variably cemented limestone (calcarenite). Literature suggests that the sand layer likely begins to thin as water depths increase in an offshore direction, and for water depths greater than 65 m it was considered absent with only the variably cemented calcarenite present at the seafloor interface. Modelled sites located in environments where the seabed was modelled as bare calcarenite generally displayed higher rates of loss with distance away from the source as compared to sites where a layer of sand overlies calcarenite.

The presence of unconsolidated coarse sand overlying semi-cemented calcarenite led to a more reflective seabed which is associated with large isopleths for low level thresholds. This is most evident for the marine mammal behavioural threshold of 160 dB re 1 µPa^2 (SPL) for impulsive sound sources. However, the distribution of a sand layer is not well known and if the thickness of the sand layer is not as uniform as modelled then this variability could potentially lead to smaller radii. It is possible to model a transitioning seabed type, where the sand layer mentioned above thins with distance; however, sufficient information was not available to make that discrimination to develop reliable model inputs.

The array directionality and frequency content coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters for all modelled sites. This is particularly evident for modelled Sites 8 and 9 which are situated along the continental shelf break and continental slope. For source locations close to the continental shelf break modelling indicates that significant amounts of energy reflected from the seabed slope can be trapped in the deep sound channel and propagate for large distances within the ocean interior. This phenomenon is evident in the slice plots showing the sound field in the broadside direction, where greater ranges to all isopleths are predicted to occur in the downward sloping offshore direction. The vertical slice plots in Section 4.2.2.2 assist in demonstrating the influence of the sloping bathymetry on the sound field.

5.2. Multiple Pulse Sound Fields

The accumulated SEL over 24 hours of survey operation was modelled considering four acoustic scenarios and four animal movement modelling scenarios, each with a realistic acquisition pattern based on provided survey designs. The modelling predicted the accumulation of sound energy, considering the change in location and the tow direction of the source at each pulse point, which was used to assess possible injury in marine mammals and the SEL_{24h} based fish criteria. The results were presented as maps of the accumulated exposure levels and tabulated values of ranges to threshold levels and exposure areas for the given effects criteria (Section 2).

The footprints and range maxima for all accumulated SEL thresholds are influenced by the seabed compositions along acquisition lines. The discussion above regarding ranges to isopleths also applies to the accumulated SEL calculations. The farthest ranges to thresholds for PTS and TTS were driven by the source orientation and bathymetry, particularly in the broadside and offshore directions.

5.3. Acoustic Results Summary

This section presents a summary of the distances to the noise effect criteria applied in this study (Section 2) as relevant to the impact assessment. The effect criteria for impairment of marine mammals, fish and sea turtles use dual metrics (PK and SEL_{24h}), and the longest distance associated with either metric is required to be applied, and thus is presented in this summary.

The SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 h based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. Where the corresponding SEL_{24h} radii are larger than those for peak pressure criteria, they often represent an unlikely worst-case scenario. More realistically, marine mammals, fish, and sea turtles would not remain in the same location for 24 hours, but rather a shorter period, depending upon their behaviour, the proximity and movements of the source. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained in that location for 24 h. A more realistic representation of the potential exposures was undertaken using animal movement modelling (‘animat modelling’), with the results summarised separately below.

A summary of predicted distances to criteria from acoustic modelling are presented below.

Marine Mammals

Table 25 summarises the distances to where effect criteria for marine mammals are no longer exceeded. Full results for PK levels were presented in Table 15, while SEL_{24h} results were presented in Table 20.

Table 25. Summary of maximum (R_{max}) horizontal distances (in km) from modelled sites or scenarios to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. Maximum extents are in the broadside direction of the 2820 in^3 seismic source.

	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C		Scenario D	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	6.30 (SPL)	2.62 (SPL)	3.35 (SEL_{24h})	0.07 (SEL_{24h})	3.20 (SEL_{24h})	0.07 (SEL_{24h})	1.67 (SEL_{24h})	0.07 (SEL_{24h})	0.60 (SEL_{24h})	0.07 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance to where the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 µPa^{2}s was no longer exceeded was 0.06 km for scenarios A–C and 0.05 km for scenario D. PTS and PK thresholds were not resolved within the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.

- The maximum distance where the OCW-weighted penguin behavioural response threshold of 120 dB re 1 μPa^2 (SPL) for impulsive noise could be exceeded varied between 10.4 and 77.0 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 27 summarises distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric. Results for PK are presented in Tables 15 whilst SEL_{24h} results are in Tables 21.

Table 27. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single impulse and 24 hr sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Mortality and Potential Mortal Injury	PK	0.11
	Recoverable injury	PK	0.11
	TTS	SEL_{24h}	8.35
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Mortality and Potential Mortal Injury	PK	0.21
	Recoverable injury	PK	0.23
	TTS	SEL_{24h}	8.35
Fish eggs, and larvae (relevant to plankton)	Mortality and Potential Mortal Injury	PK	0.23

Benthic invertebrates

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 μPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 322 and 715 m for the 2820 in^3 source.
- Bivalves: The distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was determined for comparing to results presented in Day et al. (2016a). This particle acceleration was

reached at a range of 4 m for a water depth of 50 m, and was not reached at any greater water depth.

- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for sponges and corals (Heyward et al. 2018); the threshold was not reached in water depths greater than 50

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 µPa^2 (SPL; L_P) derived from (Parvin 2005) was considered for recreational swimmers and divers. This criterion was considered for all single-impulse modelled sites and cumulative scenarios, and specifically at 14 coastal sensitive receiver locations. The human health assessment threshold was predicted to be exceeded at Deen Maar (Lady Julia Percy Island), Middle Island, Port Fairy Lighthouse, Killarney Beach and Merri Sanctuary. It is important to review the provided contour maps (Section 4.2.2.1) and sensitive receiver maps (Section 4.2.2.3, Appendix G) to contextualise levels at coastal areas and understand which portions of the survey may result in the human health assessment level being exceeded.

5.4. Animal Movement Modelling

The estimated sound fields produced by source and propagation models for the planned Regia MSS were incorporated into animat sound exposure models for pygmy blue whales and southern right whales to estimate the radial distances within which 95% of exposure exceedances occur ($ER_{95\%}$), along with the probability that an animat with the closest point of approach within that distance would be exposed above the relevant threshold (P_{exp}).

For the exposure analysis, all four acquisition scenarios were run with multiple animat seeding approaches (see Figure 2). Survey lines from all nominal acquisition scenarios overlap with the foraging BIA for pygmy blue whales and migrating BIA for southern right whales. The reproduction BIA for southern right whales lies inshore of the nominal acquisition scenarios.

Sections 5.4.1 and 5.4.2 summarise the PTS, TTS, and behavioural exposure range results, with all tabulated results presented in Tables 22 to 24. Table 28 summarises the maximum exposure range results for pygmy blue whales and southern right whales across the different species profiles and seeding regimes considered. Figure 59 summarises results for each modelled scenario, species profile and seeding regime. Reproducing southern right whales restricted to the reproduction BIA were not exposed above any of the three considered thresholds (PTS, TTS or behavioural response).

Table 28. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales Maximum exposure ranges show $ER_{95\%}$ (km) first and associated probability of exposure of animats travelling within maximum $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL_{24h})[3]	PTS (SEL_{24h})[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	9.83 (76%)	22.5 (56%)	1.98 (58%)
	B	9.54 (77%)	18.9 (57%)	1.73 (50%)
	C	8.38 (45%)	10.8 (35%)	0.83 (36%)
	D	6.69 (63%)	8.85 (59%)	0.37 (59%)
Southern right whale	A	9.51 (83%)	14.2 (1%)	1.40 (52%)
	B	8.97 (73%)	11.3 (64%)	1.22 (44%)
	C	7.39 (47%)	7.10 (35%)	0.69 (26%)
	D	6.84 (63%)	6.23 (58%)	0.24 (51%)

1 LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)
2 SPL (L_p; dB re 1 µPa^2)
3 Southall et al. (2019) criteria for marine fauna.
4 NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

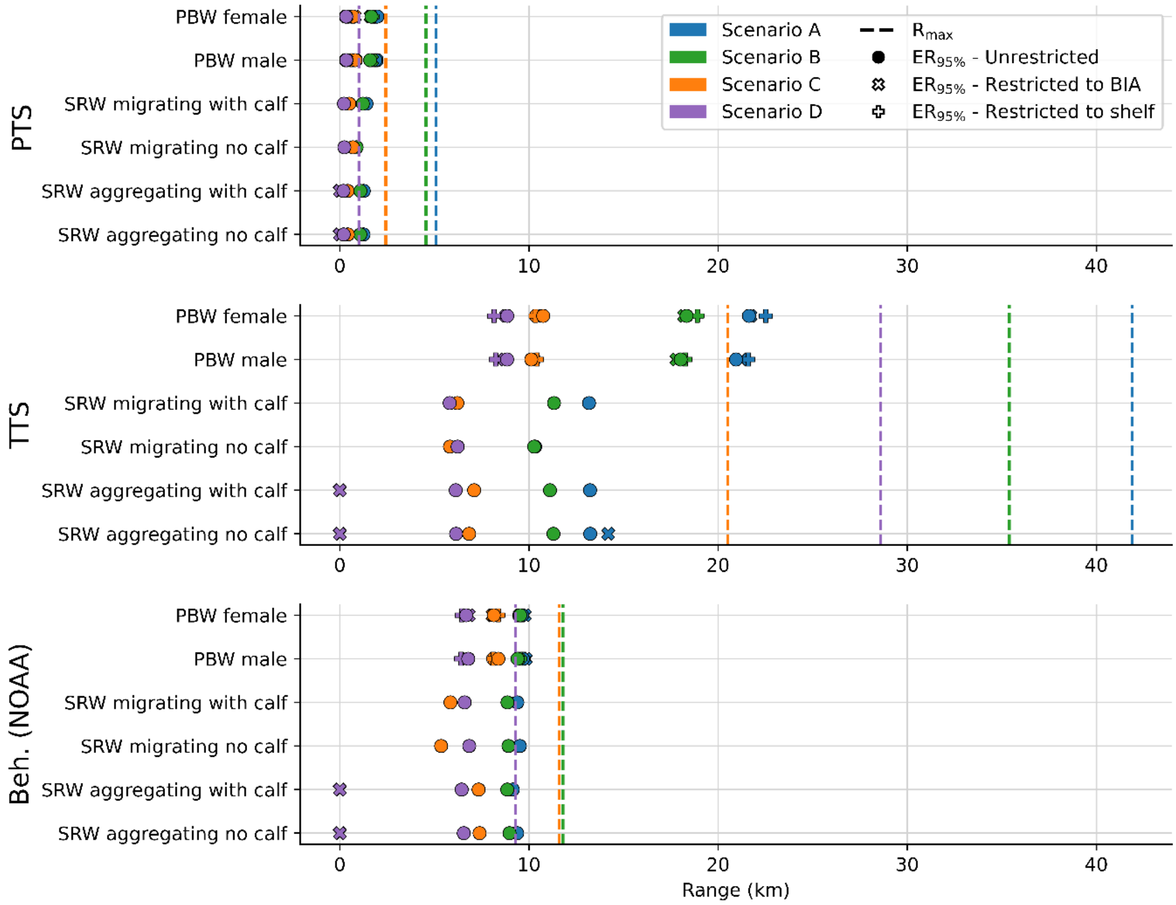

Figure 59. Acoustic (R_{max}) and exposure ranges ($ER_{95\%}$) for PTS, TTS and the behavioural thresholds, shown for each species. Colour represents the acoustic modelled scenario. The "restricted to BIA" sub-set refers to the pygmy blue whale foraging BIA and southern right whale reproduction BIA for pygmy blue whales and southern right whales respectively, presented in Figure 2. The "restricted to shelf" sub-set refers to pygmy blue whales, presented in Figure 2.

5.4.1. PTS and TTS

Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because of the generally shorter time ('dwell time') for moving animats to accumulate sound energy. In this study, PTS and TTS exposure ranges were substantially shorter than acoustic ranges to threshold, as shown in Figure 59.

All considered scenarios resulted in exposures above the PTS and TTS thresholds with the exception of scenarios B, C and D for reproducing southern right whales restricted to the reproduction BIA.

The maximum $ER_{95\%}$ for pygmy blue whale scenarios was 22.5 and 1.98 km for TTS and PTS, respectively. The associated probability of exposure above threshold within these $ER_{95\%}$ was 56% and 58%, respectively. For southern right whales, the maximum $ER_{95\%}$ for TTS and PTS were 14.2 and 1.40 km, respectively, with associated probabilities of exposure above threshold of 1% and 52%. The fact that some, but not all, animats that travelled within the 95th percentile range were exposed above threshold is because animats alter their horizontal position in the modelling area as well as their vertical position in the water column, thus potentially limiting the length of time they are within ensonified areas. For example, an animat might travel within the predicted exposure range but if they are traveling more quickly on average than other animats, they may not accumulate as much exposure, or they may be spending more time at depths with quieter sound levels.

Female pygmy blue whale scenarios did not result in significantly or consistently different exposure ranges than the corresponding male pygmy blue whale scenarios. Based on the vertical distribution of the sound field (see Section 4.2.2.2), the sound fields are relatively constant with depth, and hence female pygmy blue whale animats accumulated similar exposure as the males even though females generally dive deeper than males (Section 3.7.3.1).

Exposure ranges are not significantly affected by seeding restrictions for pygmy blue whales. This is due to the survey being located within the boundaries of the restricted scenarios (pygmy blue whales foraging BIA and restricted to the shelf). Exposure ranges from the seismic survey were generally comparable or less than the distance to the edge of the restrictions, therefore restricted scenarios resulted in similar exposure ranges as unrestricted scenarios.

No southern right whales restricted to the reproduction BIA were exposed above PTS, TTS or behavioural threshold, except for limited exposures above TTS in scenario A. The SRW reproduction BIA is both narrow and close to shore, and in comparison with the modelled acoustic ranges, relatively little sound energy reaches the BIA. Sufficient sound energy from scenario A reaches the SRW reproduction BIA to result in TTS exposures, however, very few animats were exposed above this threshold (1% probability of exposure above the TTS criterion, Table 24).

The animat modelling was included in the scope of work to provide context to possible exposures to pygmy blue and southern right whales over an entire day. The distances to isopleths associated with the effect thresholds for PTS and TTS are more realistic than those from the static sound fields as they consider potential animal movements passing through the operational region.

5.4.2. Behavioural Effects

Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criteria, are typically comparable to the predicted acoustic ranges. Maximum acoustic ranges (e.g., R_{max}) are conservatively calculated using the maximum-over-depth sound fields and assuming static receivers, while exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving parameters, so exposure ranges are generally slightly lower than the R_{max} acoustic ranges. In this case, exposure ranges were slightly shorter than acoustic ranges to threshold for most modelled scenarios (Figure 59).

Overall, ranges were longest for Scenario A. For all considered pygmy blue whale scenarios, the $ER_{95\%}$ to behavioural threshold ranged from 6.40 to 9.83 km for pygmy blue whales, with associated P_{exp} of 66 and 76%. For southern right whales, the $ER_{95\%}$ to behavioural threshold ranged from 5.35 to 9.51 km, with associated P_{exp} of 57 and 83%, notwithstanding reproducing southern right whales restricted to the reproduction BIA which were not exposed above the behavioural response threshold.

Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 80000-3 (2017).

1/3-octave

One third of an octave. *Note*: A one-third octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

1/3-octave-band

Frequency band whose bandwidth is one one-third octave. *Note*: The bandwidth of a one-third octave-band increases with increasing centre frequency.

A-weighting

Frequency-selective weighting for human hearing in air that is derived from the inverse of the idealized 40-phon equal loudness hearing function across frequencies.

absorption

The reduction of acoustic pressure amplitude due to acoustic particle motion energy converting to heat in the propagation medium.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

auditory frequency weighting

The process of applying an auditory frequency weighting function. In human audiometry, C-weighting is the most commonly used function, an example for marine mammals are the auditory frequency weighting functions published by Southall et al. (2007).

auditory frequency weighting function

Frequency weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity. Example hearing groups are low-, mid-, and high-frequency cetaceans, phocid and otariid pinnipeds.

azimuth

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also called bearing.

bandwidth

The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI S1.13-2005 (R2010)).

bar

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to 10^5 Pa or 10^{11} µPa.

boxcar averaging

A signal smoothing technique that returns the averages of consecutive segments of a specified width.

broadband level

The total level measured over a specified frequency range.

broadside direction

Perpendicular to the travel direction of a source. Compare with endfire direction.

cetacean

Any animal in the order Cetacea. These are aquatic species and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called primary wave or P-wave.

conductivity-temperature-depth (CTD)

Measurement data of the ocean's conductivity, temperature, and depth; used to compute sound speed and salinity.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006).

decidecade

One tenth of a decade. *Note*: An alternative name for decidecade (symbol ddec) is "one-tenth decade". A decidecade is approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct) and for this reason is sometimes referred to as a "one-third octave".

decidecade band

Frequency band whose bandwidth is one decidecade. *Note*: The bandwidth of a decidecade band increases with increasing centre frequency.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Unit: dB.

duty cycle

The time when sound is periodically recorded by an acoustic recording system.

endfire direction

Parallel to the travel direction of a source. Also see **broadside direction**.

energy source level

A property of a sound source obtained by adding to the sound exposure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2 m^2 s$.

energy spectral density source level

A property of a sound source obtained by adding to the energy spectral density level of the sound pressure measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2 m^2 s/Hz$.

ensonified

Exposed to sound.

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

Fourier transform (or Fourier synthesis)

A mathematical technique which, although it has varied applications, is referenced in the context of this report as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as fast Fourier transform (FFT).

flat weighting

Term indicating that no frequency weighting function is applied. Synonymous with unweighted.

frequency

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: f. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function. For sound of a given frequency, the frequency weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency weighting function*: compensatory frequency weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency weighting function*: frequency weighting function describing the sensitivity of an acoustic acquisition system, typically consisting of a hydrophone, one or more amplifiers, and an analogue to digital converter.

geoacoustic

Relating to the acoustic properties of the seabed.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For example, the second harmonic of a sound has a frequency that is double the fundamental frequency of the sound.

hearing group

Category of animal species when classified according to their hearing sensitivity and to the susceptibility to sound. Examples for marine mammals include very low-frequency (VLF) cetaceans, low-frequency (LF) cetaceans, mid-frequency (MF) cetaceans, high-frequency (HF) cetaceans, very high-frequency (VHF) cetaceans, otariid pinnipeds in water (OPW), phocid pinnipeds in water (PPW), sirenians (SI), other marine carnivores in air (OCA), and other marine carnivores in water (OCW) (NMFS 2018, Southall et al. 2019). See **auditory frequency weighting functions**, which are often applied to these groups. Examples for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual for specified background noise during a specific percentage of experimental trials.

hertz (Hz)

A unit of frequency defined as one cycle per second.

high-frequency (HF) cetacean

See **hearing group**.

intermittent sound

A sound whose level abruptly drops below the background noise level several times during an observation period.

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 second), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Examples of impulsive sound sources include explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some quantity.

knot

One nautical mile per hour. Symbol: kn.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. Examples include sound pressure level, sound exposure level, and peak sound pressure level. For example, a value of sound exposure level with reference to 1 μPa^2 s can be written in the form x dB re 1 μPa^2 s.

low-frequency (LF) cetacean

See **hearing group**.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetacean

See **hearing group**.

M-weighting

See **auditory frequency weighting function** (as proposed by Southall et al. 2007).

mysticete

A suborder of cetaceans that use baleen plates to filter food from water. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. A non-impulsive sound is not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

otariid

A common term used to describe members of the Otariidae, eared seals, commonly called sea lions and fur seals. Otariids are adapted to a semi-aquatic life; they use their large fore flippers for propulsion. Their ears distinguish them from phocids. Otariids are one of the three main groups in the superfamily Pinnipedia; the other two groups are phocids and walrus.

otariid pinnipeds in water (OPW)

See **hearing group**.

other marine carnivores in air (OCA)

See **hearing group**.

other marine carnivores in water (OCW)

See **hearing group**.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of back-scattered sound, simplifying the computation of propagation loss. The effect of back-scattered sound is negligible for most ocean-acoustic propagation problems.

particle acceleration, particle displacement, particle motion, particle velocity

See sound particle acceleration, sound particle displacement, sound particle motion, and sound particle velocity.

peak sound pressure level (zero-to-peak sound pressure level)

The level ($L_{p,pk}$ or L_{pk}) of the squared maximum magnitude of the sound pressure (p_{pk}^2). Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa².

$$L_{p,\mathrm{pk}} := 10 \log_{10}\left(p_{\mathrm{pk}}^2 / p_0^2\right) \mathrm{dB} \; = 20 \log_{10}\left(p_{\mathrm{pk}} / p_0\right) \mathrm{dB}$$

The frequency band and time window should be specified. Abbreviation: PK or L_{pk}.

peak-to-peak sound pressure

The difference between the maximum and minimum sound pressure over a specified frequency band and time window. Unit: pascal (Pa).

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

phocid

A common term used to describe all members of the family Phocidae. These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves. Phocids are one of the three main groups in the superfamily Pinnipedia; the other two groups are otariids and walrus.

phocid pinnipeds in water (PPW)

See **hearing group**.

pinniped

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source

A source that radiates sound as if from a single point.

pressure, acoustic

The deviation from the ambient pressure caused by a sound wave. Also called sound pressure.
Unit: pascal (Pa).

pressure, hydrostatic

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, PL(x) = SL − L(x). Also see **transmission loss**.

received level

The level measured (or that would be measured) at a defined location. The type of level should be specified.

reference values

standard underwater references values used for calculating sound **levels**, e.g., the reference value for expressing sound pressure level in decibels is 1 µPa.

Quantity	Reference value
Sound pressure	1 µPa
Sound exposure	1 μPa^2 s
Sound particle displacement	1 pm
Sound particle velocity	1 nm/s
Sound particle acceleration	1 $\mu m/s^2$

rms

abbreviation for root-mean-square.

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium.

sound exposure

Time integral of squared sound pressure over a stated time interval. The time interval can be a specified time duration (e.g., 24 hours) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: Pa^2 s.

sound exposure level

The level (L_E) of the sound exposure (E). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 µPa^2 s.

$$L_E := 10 \log_{10}(E/E_0)\,\text{dB} \; = 20 \log_{10}\left(E^{1/2}/E_0^{1/2}\right)\,\text{dB}$$

The frequency band and integration time should be specified. Abbreviation: SEL.

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum. Unit: Pa^2 s/Hz.

sound field

Region containing sound waves.

sound intensity

Product of the sound pressure and the sound particle velocity. The magnitude of the sound intensity is the sound energy flowing through a unit area perpendicular to the direction of propagation per unit time.

sound particle acceleration

The rate of change of sound particle velocity. Unit: metre per second squared (m/s^2). Symbol: *a*.

sound particle motion

smallest volume of a medium that represents its mean physical properties.

sound particle displacement

Displacement of a material element caused by the action of sound, where a material element is the smallest element of the medium that represents the medium's mean density.

sound particle velocity

The velocity of a particle in a material moving back and forth in the direction of the pressure wave. Unit: metre per second (m/s). Symbol: *v*.

sound pressure

The contribution to total pressure caused by the action of sound.

sound pressure level (rms sound pressure level)

The level ($L_{p,\mathrm{rms}}$) of the time-mean-square sound pressure (p_{rms}^2). Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa².

$$L_{p,\mathrm{rms}} := 10\log_{10}(p_{\mathrm{rms}}^2/p_0^2)\ \mathrm{dB}\ = 20\log_{10}(p_{\mathrm{rms}}/p_0)\ \mathrm{dB}$$

The frequency band and averaging time should be specified. Abbreviation: SPL or Lrms.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

soundscape

The characterization of the ambient sound in terms of its spatial, temporal, and frequency attributes, and the types of sources contributing to the sound field.

source level (SL)

A property of a sound source obtained by adding to the sound pressure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa²m².

spectrum

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

surface duct

The upper portion of a water column within which the sound speed profile gradient causes sound to refract upward and therefore reflect off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity. TTS can be caused by noise exposure.

thermocline

The depth interval near the ocean surface that experiences temperature gradients due to warming or cooling by heat conduction from the atmosphere and by warming from solar heating.

transmission loss (TL)

The difference between a specified level at one location and that at a different location, TL(x1,x2) = L(x1) − L(x2). Also see **propagation loss**.

unweighted

Term indicating that no frequency weighting function is applied. Synonymous with flat weighting.

very high-frequency (VHF) cetacean

See **hearing group**.

very low-frequency (VLF) cetacean

See **hearing group**.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol: λ.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 μPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow the American National Standard Institute and International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI R2013), but these standards are not always consistent.

The zero-to-peak sound pressure, or peak sound pressure (PK or $L_{p,pk}$; dB re 1 μPa), is the decibel level of the maximum instantaneous acoustic pressure in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$L_{p,\mathrm{pk}} = 10\log_{10}\frac{\max|p^2(t)|}{p_0^2} = 20\log_{10}\frac{\max|p(t)|}{p_0} \tag{A-1}$$

PK is often included as a criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of an acoustic event, it is generally a poor indicator of perceived loudness.

The peak-to-peak sound pressure (PK-PK or $L_{p,pk\text{-}pk}$; dB re 1 μPa) is the difference between the maximum and minimum instantaneous sound pressure, possibly filtered in a stated frequency band, attained by an impulsive sound, $p(t)$:

$$L_{p,\mathrm{pk\text{-}pk}} = 10\log_{10}\frac{[\max(p(t)) - \min(p(t))]^2}{p_0^2} \tag{A-2}$$

The sound pressure level (SPL or L_p; dB re 1 μPa^2) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T g(t)\,p^2(t)\,dt \Big/ p_0^2\right) \tag{A-3}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function. For short acoustic events, such as sonar pulses and marine mammal vocalizations, it is important to choose an appropriate time window that matches the duration of the signal. For in-air studies, when evaluating the perceived loudness of sounds with rapid amplitude variations in time, the time weighting function $g(t)$ is often set to a decaying exponential function that emphasizes more recent pressure signals. This function mimics the leaky integration nature of mammalian hearing. For example, human-based fast time-weighted SPL ($L_{p,fast}$) applies an exponential function with time constant 125 ms. A related simpler approach used in underwater acoustics sets $g(t)$ to a boxcar (unity amplitude) function of width 125 ms; the results can be referred to as $L_{p,boxcar\ 125ms}$. Another approach, historically used to evaluate SPL of impulsive signals underwater, defines $g(t)$ as a boxcar function with edges set to the times corresponding to 5% and 95% of the cumulative square pressure function encompassing the duration of an impulsive acoustic event. This calculation is applied individually to each impulse signal, and the results are referred to as 90% SPL ($L_{p,90\%}$).

The sound exposure level (SEL or L_E; dB re 1 µPa²·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10\log_{10}\left(\int_T p^2(t)\,dt \Big/ T_0 p_0^2\right) \quad \text{(A-4)}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \quad \text{(A-5)}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LF,24h}$; see Appendix A.5) or auditory-weighted SPL ($L_{p,ht}$). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Particle Acceleration and Velocity Metrics

Since sound is a mechanical wave, it can also be measured in terms of the vibratory motion of fluid particles. Particle motion can be measured in terms of three different (but related) quantities: displacement, velocity, or acceleration. Acoustic particle velocity is the time derivative of particle displacement, and likewise acceleration is the time derivative of velocity. For the present study, acoustic particle motion has been reported in terms of acceleration and velocity.

The particle velocity (v) is the physical speed of a particle in a material moving back and forth in the direction of the pressure wave. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium:

$$v = -\int \nabla p(t)dt/\rho_0 \quad \text{(A-6)}$$

The particle acceleration (a) is the rate of change of the velocity with respect to time, and it can be obtained from equation A-6 as:

$$a = \frac{dv}{dt} = -\frac{\nabla p(t)}{\rho_0} \quad \text{(A-7)}$$

Unlike sound pressure, particle motion is a vector quantity, meaning that it has both magnitude and direction: at any given point in space, acoustic particle motion has three different time-varying components (x, y, and z). Given the particle velocity in the x, y, and z, directions, v_x, v_y, and v_z, the particle velocity magnitude $|v|$ is computed per the Pythagorean equation:

$$|v| = \sqrt{v_x + v_y + v_z} \quad \text{(A-8)}$$

The magnitude of particle acceleration is calculated similarly from the particle acceleration in the *x*, *y*, and *z* directions.

A.3. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. They are approximately one third of an octave (base 2) wide and are therefore often referred to as 1/3-octave-bands. Each octave represents a doubling in sound frequency. The centre frequency of the ith band, $f_c(i)$, is defined as:

$$f_c(i) = 10^{\frac{i}{10}}\ \text{kHz} \tag{A-9}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i) \tag{A-10}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 7 (f_c (7) = 5 Hz) to band 44 ($f_c(44)$ = 25 kHz).

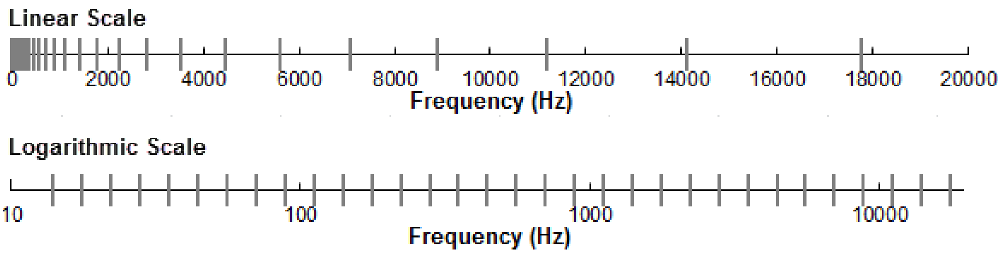

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{lo,i}$ and $f_{hi,i}$:

$$L_{p,i} = 10 \log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f)\, df \tag{A-11}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_{i} 10^{\frac{L_{p,i}}{10}} \tag{A-12}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

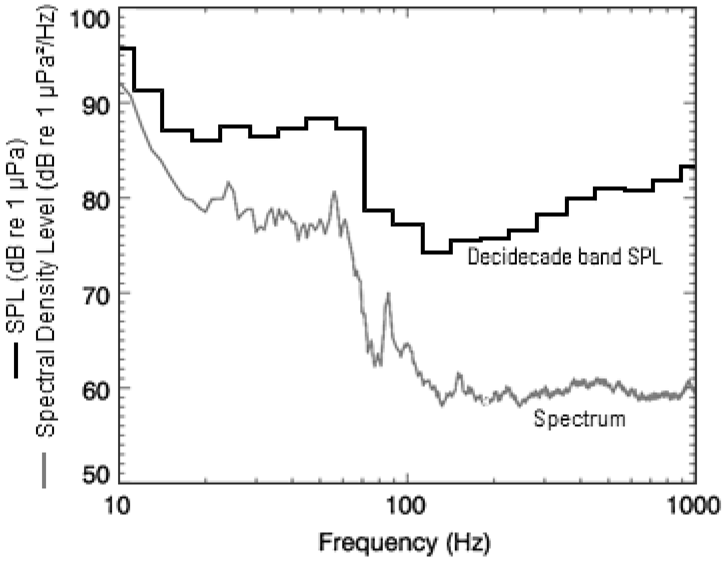

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.

A.4. Marine Mammal Impact Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggested that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for both injury and disturbance. The following sections summarize the recent development of thresholds; however, this field remains an active research topic.

A.4.1. Injury

In recognition of shortcomings of the SPL-only based injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual acoustic injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas the SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for human; Appendix A.5). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower injury values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 μPa^2·s. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 μPa^2·s.

As of present, an optimal approach is not apparent. There is consensus in the research community that an SEL-based method is preferable either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018; with the criteria defined in NMFS (2018). The latest criteria are from Southall et al. (2019) which is applied in this report.

A.4.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1 μPa^2 SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). The HESS team recognised that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above a SPL of 140 dB re 1 μPa^2. Southall et al. (2007) found varying responses for most marine mammals between a SPL of 140 and 180 dB re 1 μPa^2, consistent with the HESS (1999) report, but lack of convergence in the data prevented them from suggesting explicit step functions.

A.5. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.5.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^2\right]^a\left[1+(f/f_{hi})^2\right]^b}\right)\right] \tag{A-13}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values. Table A-1 lists the frequency-weighting parameters for each hearing group. Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	f_{lo} (Hz)	f_{hi} (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very-high-frequency cetaceans (true porpoises, *Kogia*, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Other marine carnivores in water (Australian sea lion, Australian fur seal, New Zealand fur seal, Penguins)	2.0	2	940	25,000	0.64

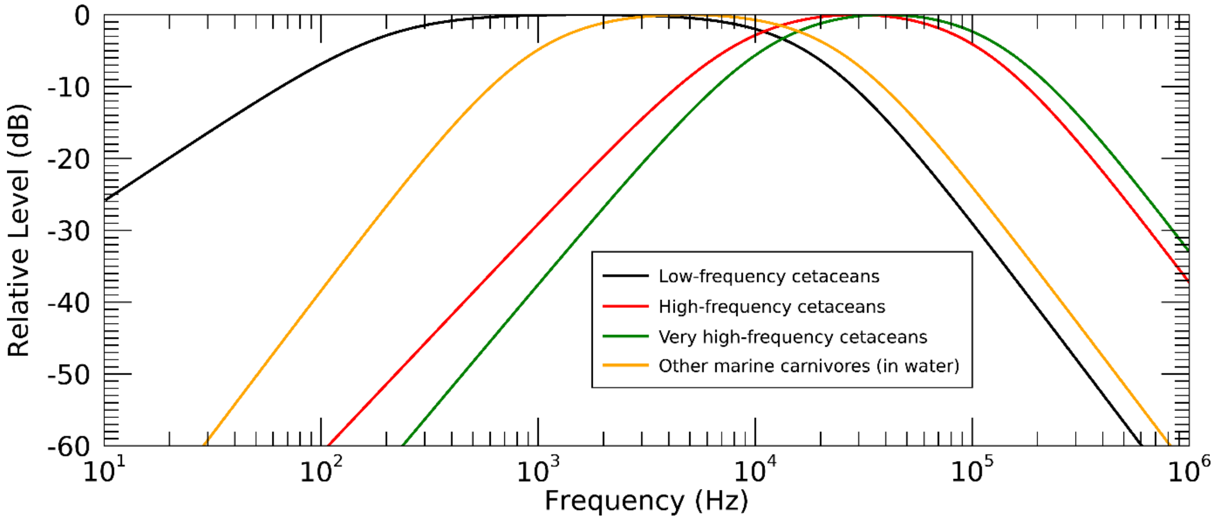

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

Appendix B. Acoustic Source Model

B.1. Airgun Array Source Model

The source levels and directivity of the seismic source were predicted with JASCO's Airgun Array Source Model (AASM). AASM includes low- and high-frequency modules for predicting different components of the seismic source spectrum. The low-frequency module is based on the physics of oscillation and radiation of airgun bubbles, as originally described by Ziolkowski (1970), that solves the set of parallel differential equations that govern bubble oscillations. Physical effects accounted for in the simulation include pressure interactions between airguns, port throttling, bubble damping, and generator-injector (GI) gun behaviour discussed by Dragoset (1984), Laws et al. (1990), and Landrø (1992). A global optimisation algorithm tunes free parameters in the model to a large library of airgun source signatures.

While airgun signatures are highly repeatable at the low frequencies, which are used for seismic imaging, their sound emissions have a large random component at higher frequencies that cannot be predicted using a deterministic model. Therefore, AASM uses a stochastic simulation to predict the high-frequency (800−25,000 Hz) sound emissions of individual airguns, using a data-driven multiple-regression model. The multiple-regression model is based on a statistical analysis of a large collection of high quality seismic source signature data recently obtained from the Joint Industry Program (JIP) on Sound and Marine Life (Mattsson and Jenkerson 2008). The stochastic model uses a Monte-Carlo simulation to simulate the random component of the high-frequency spectrum of each airgun in an array. The mean high-frequency spectra from the stochastic model augment the low-frequency signatures from the physical model, allowing AASM to predict airgun source levels at frequencies up to 25,000 Hz.

AASM produces a set of "notional" signatures for each array element based on:

- Array layout
- Volume, tow depth, and firing pressure of each airgun
- Interactions between different airguns in the array

These notional signatures are the pressure waveforms of the individual airguns at a standard reference distance of 1 m; they account for the interactions with the other airguns in the array. The signatures are summed with the appropriate phase delays to obtain the far-field source signature of the entire array in all directions. This far-field array signature is filtered into decidecade-bands to compute the source levels of the array as a function of frequency band and azimuthal angle in the horizontal plane (at the source depth), after which it is considered a directional point source in the far field.

A seismic array consists of many sources and the point source assumption is invalid in the near field where the array elements add incoherently. The maximum extent of the near field of an array (R_{nf}) is:

$$R_{\mathrm{nf}} < \frac{l^2}{4\lambda} \tag{B-1}$$

where λ is the sound wavelength and l is the longest dimension of the array (Lurton 2002, §5.2.4). For example, a seismic source length of l = 21 m yields a near-field range of 147 m at 2 kHz and 7 m at 100 Hz. Beyond this R_{nf} range, the array is assumed to radiate like a directional point source and is treated as such for propagation modelling.

The interactions between individual elements of the array create directionality in the overall acoustic emission. Generally, this directionality is prominent mainly at frequencies in the mid-range between tens of hertz to several hundred hertz. At lower frequencies, with acoustic wavelengths much larger than the inter-airgun separation distances, the directionality is small. At higher frequencies, the pattern of lobes is too finely spaced to be resolved and the effective directivity is less.

B.2. Seismic Source

The layout of the 2820 in^3 seismic sources used for modelling in this study is provided in Figure B-1. Details of the airgun parameters are provided in Table B-1.

For the modelled array, the layout is presented in a nominal cartesian coordinate system. In this coordinate system the direction of vessel travel determines the relative position of the array elements as plotted and tabulated. The layout used for acoustic modelling was produced by transforming the coordinates of client supplied layouts such that the resultant layouts correspond to a vessel travel direction along the positive X-axis and the array is centred on the X-Y origin. When used with an acoustic model the positive X-axis in this nominal coordinate system aligns with the vessel tow direction or survey line azimuth.

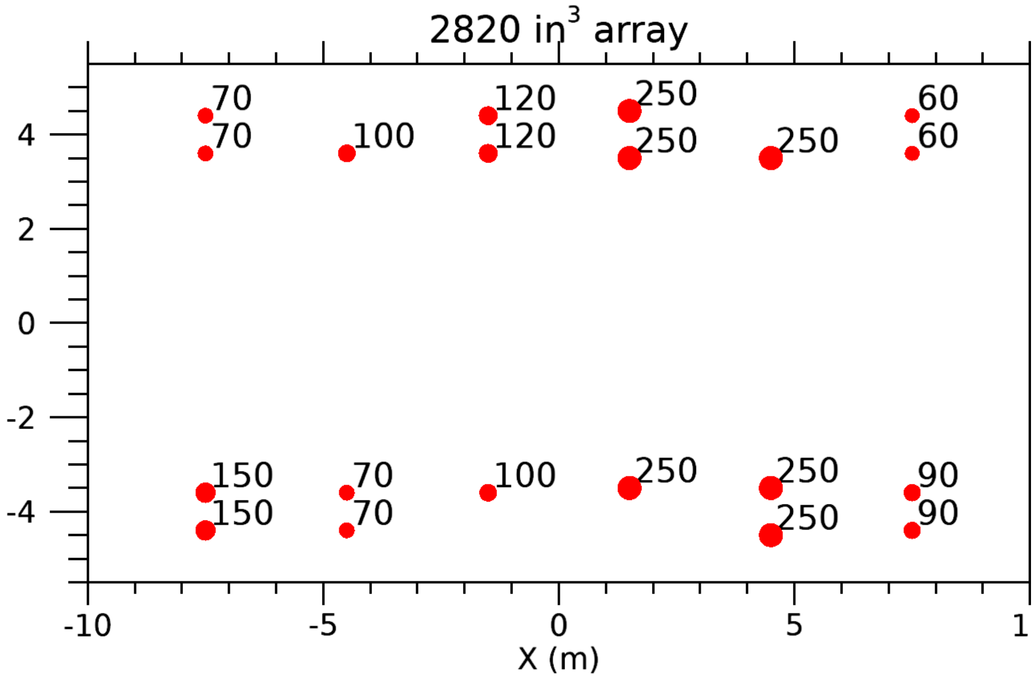

Figure B-1. Layout of the modelled 2820 in^3 seismic source where the plotted layout is such that the array is centred on the origin and vessel travel direction is in the positive x-direction. Tow depth was 7 m. The labels indicate the firing volume (in cubic inches) for each airgun. Also see Table B-1.

Table B-1. Layout of the modelled 2820 in^3 seismic source. Tow depth was 7 m. Firing pressure for all guns was 2000 psi. Greyed out values indicate spares. Also see Figure B-1.

String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)	String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)
1	1	7.5	-4.4	7	90	2	13	7.5	3.6	7	60
	2	7.5	-3.6	7	90		14	7.5	4.4	7	60
	3	4.5	-4.5	7	250		15	4.5	3.5	7	250
	4	4.5	-3.5	7	250		16	4.5	4.5	7	220
	5	1.5	-4.5	7	250		17	1.5	3.5	7	250

	12	-7.5	-3.6	7	150		24	-7.5	4.4	7	70

B.3. Array Source Levels and Directivity

Figure B-2 shows the broadside (perpendicular to the tow direction), endfire (parallel to the tow direction) and vertical overpressure signature and corresponding power spectrum levels for the 2820 in^3 seismic source (Appendix B.2). Horizontal decidecade-band source levels are shown as a function of band centre frequency and azimuth in Figure B-3.

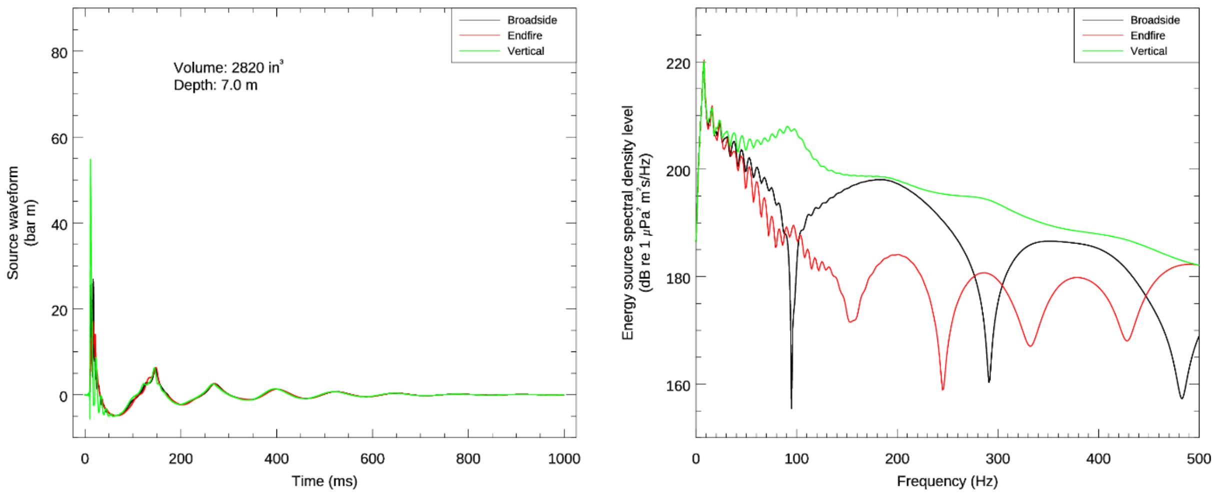

Figure B-2. Predicted source level details for the 2820 in^3 seismic source with a 7 m tow depth. (Left) the overpressure signature and (right) the power spectrum for in-plane horizontal (broadside), perpendicular (endfire), and vertical directions (no surface ghost).

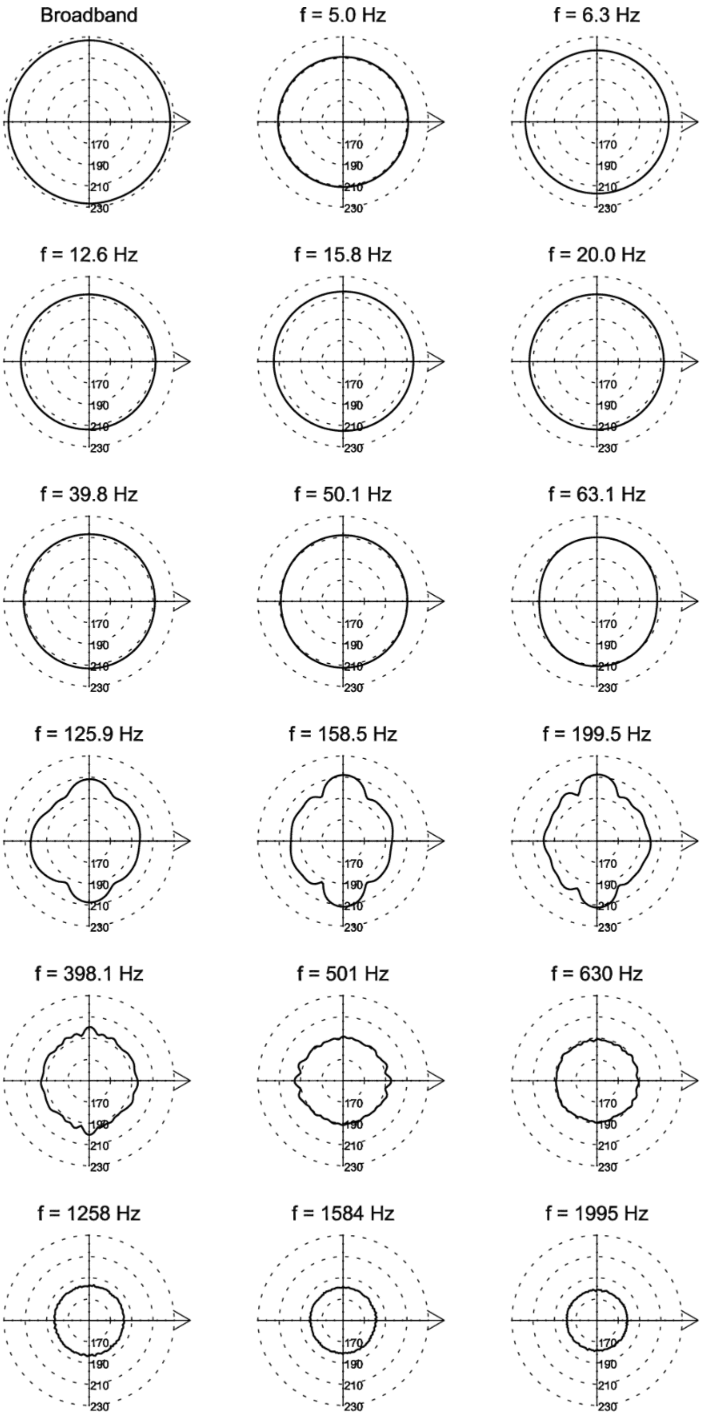

Figure B-3. Directionality of the predicted horizontal source levels for the 2820 in^3 seismic source, 5 Hz to 2 kHz. Source levels (in dB re 1 µPa^2·s m^2) are shown as a function of azimuth for the centre frequencies of the decidecade bands modelled; frequencies are shown above the plots. The perpendicular direction to the frame is to the right. Tow depth was 7 m (see Table B-1).

Appendix C. Sound Propagation Models

C.1. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). Compared to VSTACK, MONM less accurately predicts steep-angle propagation for environments with higher shear speed but is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 5 Hz to 1 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies >1 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

This version of MONM accounts for sound attenuation due to energy absorption through ion relaxation and viscosity of water in addition to acoustic attenuation due to reflection at the medium boundaries and internal layers (Fisher and Simmons 1977). The former type of sound attenuation is significant for frequencies higher than 5 kHz and cannot be neglected without noticeably affecting the model results.

MONM computes acoustic fields in three dimensions by modelling transmission loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure C-1).

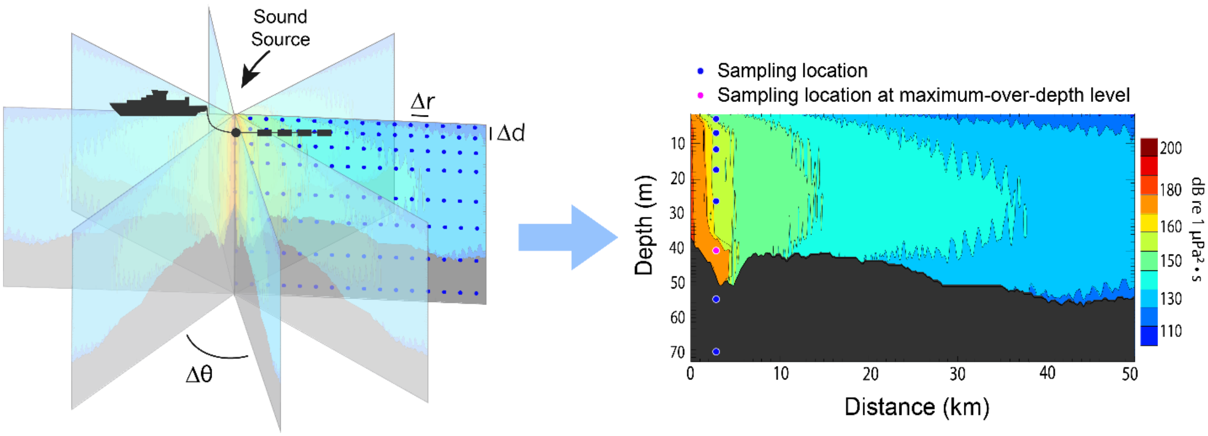

Figure C-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic transmission loss at the centre frequencies of decidecade bands. Sufficiently many decidecade bands, starting at 5 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the transmission loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade band received per-pulse SEL are computed by subtracting the band transmission loss values from the directional source level in that frequency band. Composite broadband received per-pulse SEL are then computed by summing the received decidecade band levels.

The received per-pulse SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. The maximum received per-pulse SEL at many sampling depths are taken over all samples within the water column, i.e., the maximum-over-depth received per-pulse SEL. These maximum-over-depth per-pulse SEL are presented as contours around the source.

C.2. Full Waveform Range-dependent Acoustic Model: FWRAM

For impulsive sounds from the seismic source, time-domain representations of the pressure waves generated in the water are required to calculate SPL and PK. Furthermore, the seismic source must be represented as a distributed source to accurately characterise vertical directivity effects in the near-field zone. For this study, synthetic pressure waveforms were computed using FWRAM, which is a time-domain acoustic model based on the same wide-angle parabolic equation (PE) algorithm as MONM. FWRAM computes synthetic pressure waveforms versus range and depth for range-varying marine acoustic environments, and it takes the same environmental inputs as MONM (bathymetry, water sound speed profile, and seafloor geoacoustic profile). Unlike MONM, FWRAM computes pressure waveforms via Fourier synthesis of the modelled acoustic transfer function in closely spaced frequency bands. FWRAM employs the array starter method to accurately model sound propagation from a spatially distributed source (MacGillivray and Chapman 2012).

Besides providing direct calculations of the PK and SPL, the synthetic waveforms from FWRAM can also be used to convert the SEL values from MONM to SPL.

C.3. Wavenumber Integration Model

Sound pressure levels near the seismic source were modelled using JASCO's VSTACK wavenumber integration model. VSTACK computes synthetic pressure waveforms versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. The output of the model can be post-processed to yield estimates of the SEL, SPL, and PK.

VSTACK accurately predicts steep-angle propagation in the proximity of the source, but it is computationally slow at predicting sound pressures at large distances due to the need for smaller wavenumber steps with increasing distance. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. VSTACK is thus best suited to modelling the sound field near the source.

C.3.1. Particle Motion

VSTACK was also used to compute estimates of particle acceleration and velocity at four sites for the 2820 in^3 seismic source. Particle motion waveforms were modelled, and pulse metrics were computed from the time-domain traces. VSTACK uses the wavenumber integration approach to solve the exact acoustic wave equation for arbitrarily layered range-independent acoustic environments.

The VSTACK model setup for the particle velocity scenarios was identical to that for the peak pressure scenarios (Section 4.2.1.2) in terms of source treatment, frequency range and environmental model. The particle acceleration and velocity waveforms were computed to a maximum distance of 1000 m in the broadside and endfire directions from the centre of the airgun array for a receiver 5 cm above the seafloor.

As discussed above in Appendix A.2, particle velocity (v) is the physical speed of a particle in a material. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium. Since the wavenumber integration kernel is a product of analytic expressions in terms of range and depth, VSTACK computes particle velocity by computing the spatial gradient of the pressure field analytically in the frequency domain. Fourier synthesis is applied to compute time series synthetic pressure and/or velocity waveforms at depth and range receivers by convolving the source waveforms with the impulse response of the waveguide. Particle velocity metrics at each receiver location were calculated from the modelled particle motion along three perpendicular axes (horizontal and along the source-receiver path, horizontal and perpendicular to the source-receiver path, and vertical).

The particle velocity results were converted to acceleration by time differentiation. The peak particle acceleration and velocity were calculated from the maximum of the predicted acceleration and velocity magnitude, defined as "peak magnitude".

C.3.2. Limestone Seabed Propagation Loss

For all modelled sites, an additional broadband correction was applied to the propagation loss results from MONM to better account for the additional propagation loss associated with a calcarenite/limestone seabed. The differences between the broadband per-pulse SEL from MONM and VSTACK were extracted at the same modelled ranges and depths for corresponded range independent environments. The 90th percentile of the resultant dB differences in range bins were selected to generate a correction function for representative sites to be modelled. The conversion functions were applied after to the summed decidecade band levels from MONM, but before gridding, and radii calculations for each modelled site in each modelled scenario considered.

Appendix D. Methods and Parameters

D.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure D-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure D-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure D-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

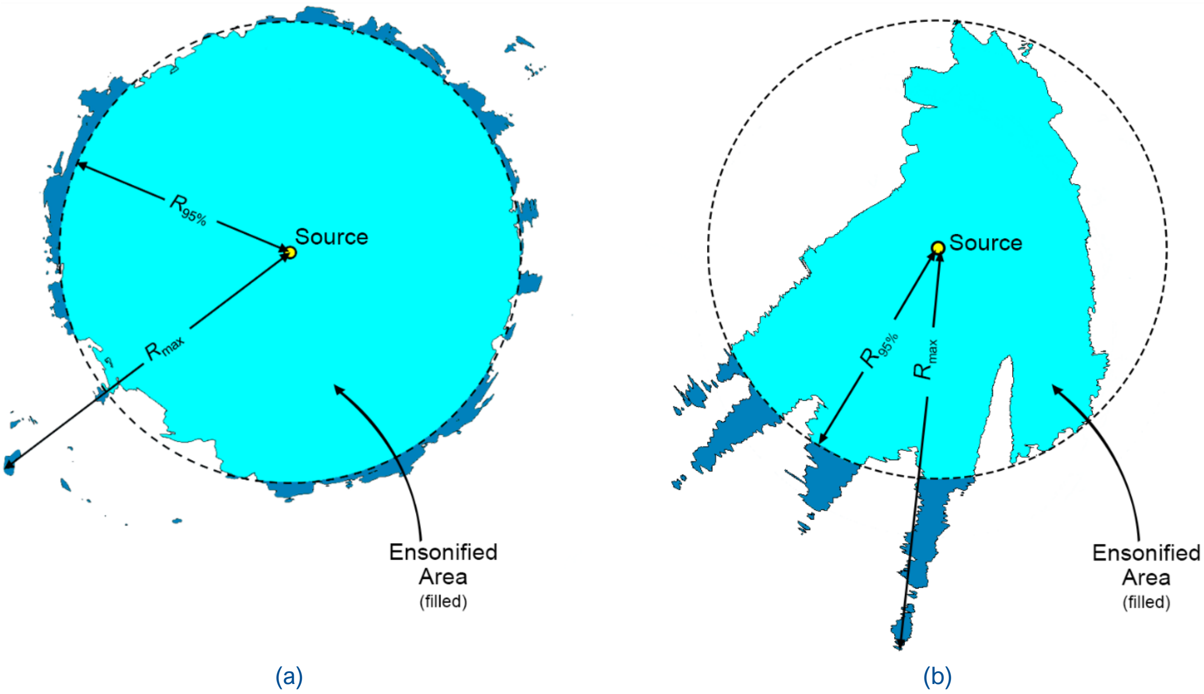

Figure D-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

D.2. Estimating SPL from Modelled SEL Results

The per-pulse SEL of sound pulses is an energy-like metric related to the dose of sound received over a pulse's entire duration. The pulse SPL on the other hand, is related to its intensity over a specified time interval. Seismic pulses typically lengthen in duration as they propagate away from their source, due to seafloor and surface reflections, and other waveguide dispersion effects. The changes in pulse length, and therefore the time window considered, affect the numeric relationship between SPL and SEL. This study has applied a fixed window duration to calculate SPL (T_{fix} = 125 ms; see Appendix A.1), as implemented in Martin et al. (2017b). Full-waveform modelling was used to estimate SPL, but this type of modelling is computationally intensive, and can be prohibitively time consuming when run at high spatial resolution over large areas.

For the current study, FWRAM (Appendix C.2) was used to model synthetic seismic pulses over the frequency range 5–1024 Hz. This was performed along all broadside and endfire radials at five sites. FWRAM uses Fourier synthesis to recreate the signal in the time domain so that both the SEL and SPL from the source can be calculated. The differences between the SEL and SPL were extracted for all ranges and depths that corresponded to those generated from the high spatial-resolution results from MONM. A 125 ms fixed time window positioned to maximize the SPL over the pulse duration was applied. The resulting SEL-to-SPL offsets were averaged in 0.02 km range bins along each modelled radial and depth, and the 90th percentile was selected at each range to generate a generalised range-dependent conversion function for each site. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM to model SPL values. Figures D-2 to D-6 show the conversion offsets for Sites 2, 3, 5, 8, and 10 with the 2820 in^3 array; the spatial variation is caused by changes in the received airgun pulse as it propagates from the source. The conversion to SPL from SEL was conducted considering the water depth and seabed geology at a given modelled site.

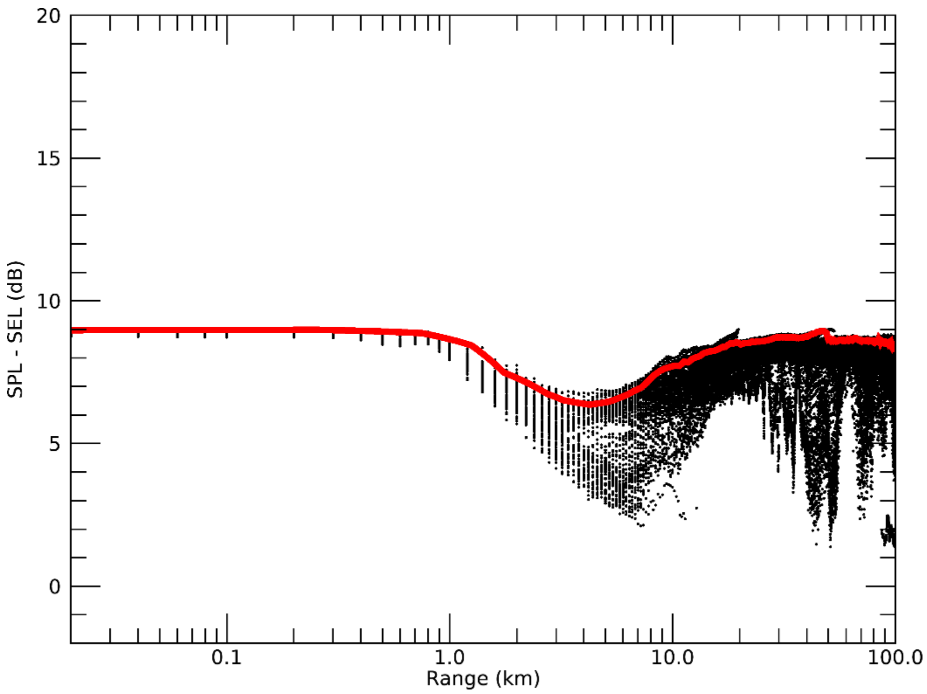

Figure D-2. *Site 2 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

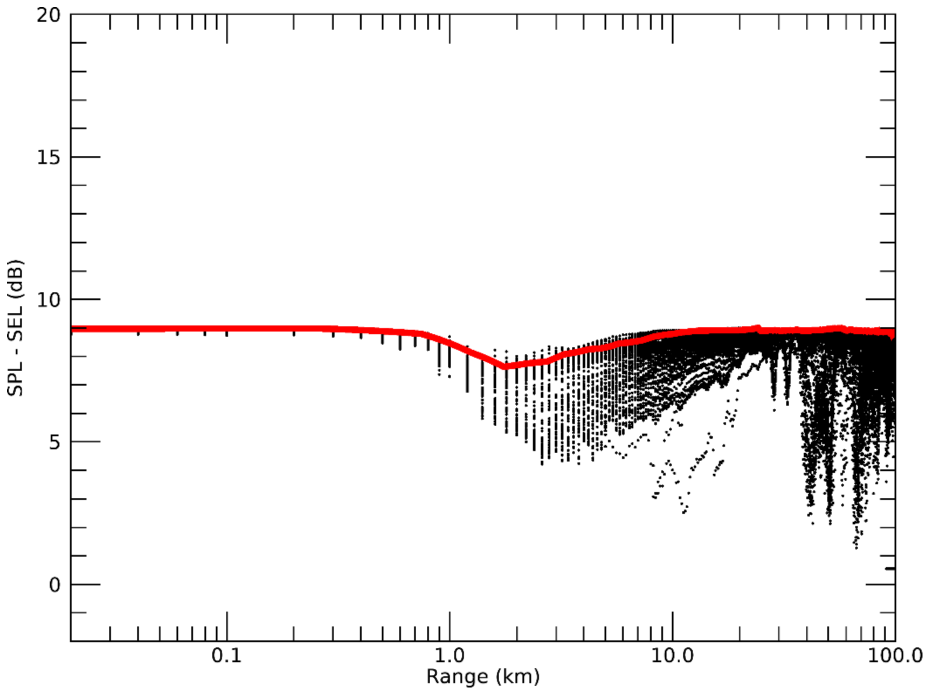

Figure D-3. *Site 3 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

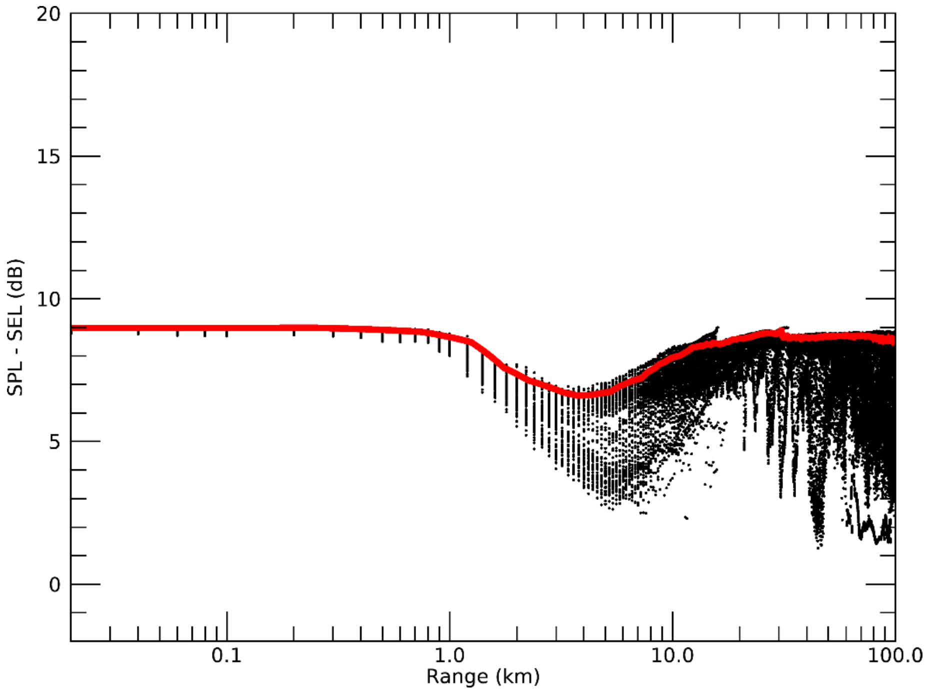

Figure D-4. *Site 5 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

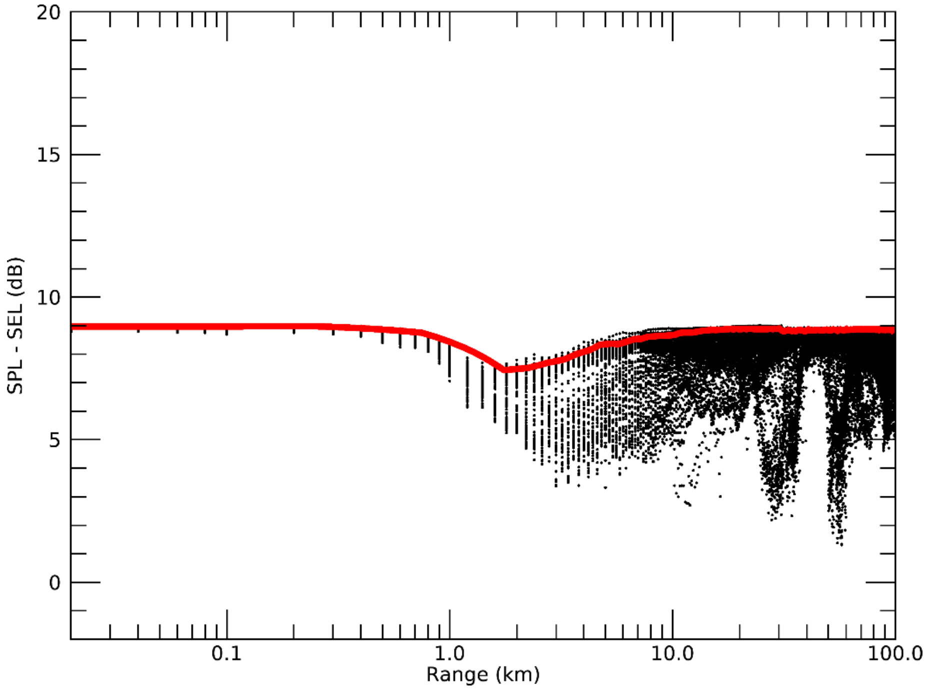

Figure D-5. *Site 8 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

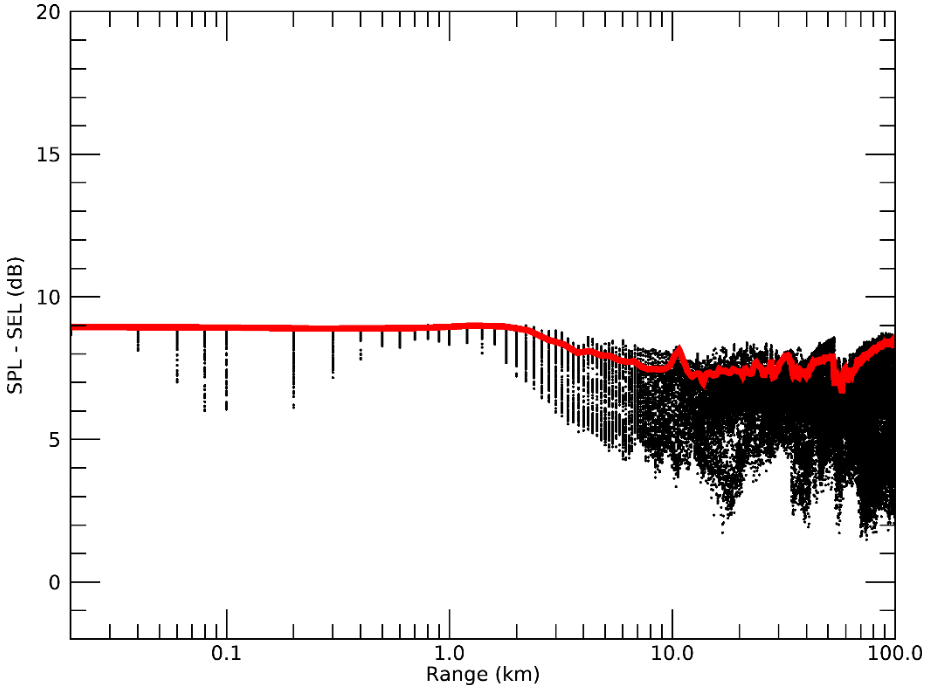

Figure D-6. *Site 10 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

D.3. Environmental Parameters

D.3.1. Bathymetry

Water depths throughout the modelled area were extracted from Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data was extracted and re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 200 × 200 m to generate the bathymetry in Figure D-7.

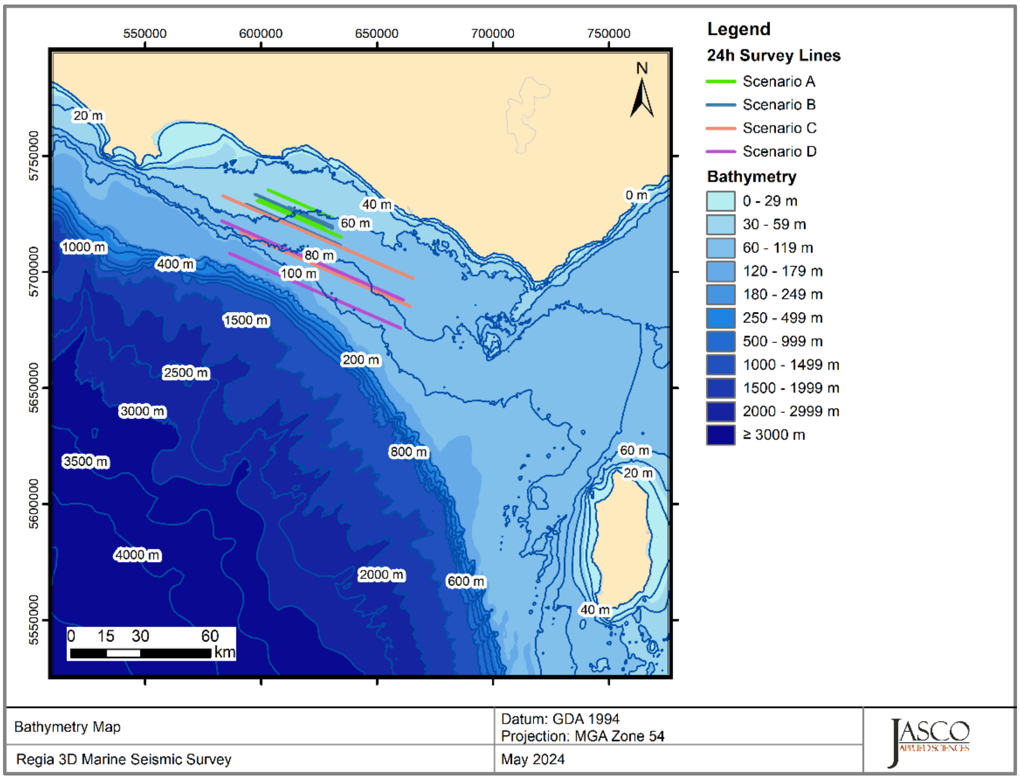

Figure D-7. Bathymetry map of the modelling area for the Regia Marine Seismic Survey.

D.3.2. Sound Speed Profile

The sound speed profiles for the modelled sites were derived from temperature and salinity profiles from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the US Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles within a 100 km box radius encompassing all modelled sites. The June sound speed profile is expected to be most favourable to longer-range sound propagation due its upward refracting profile. As such, June was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure D-8 shows the resulting profile used as input to the sound propagation modelling.

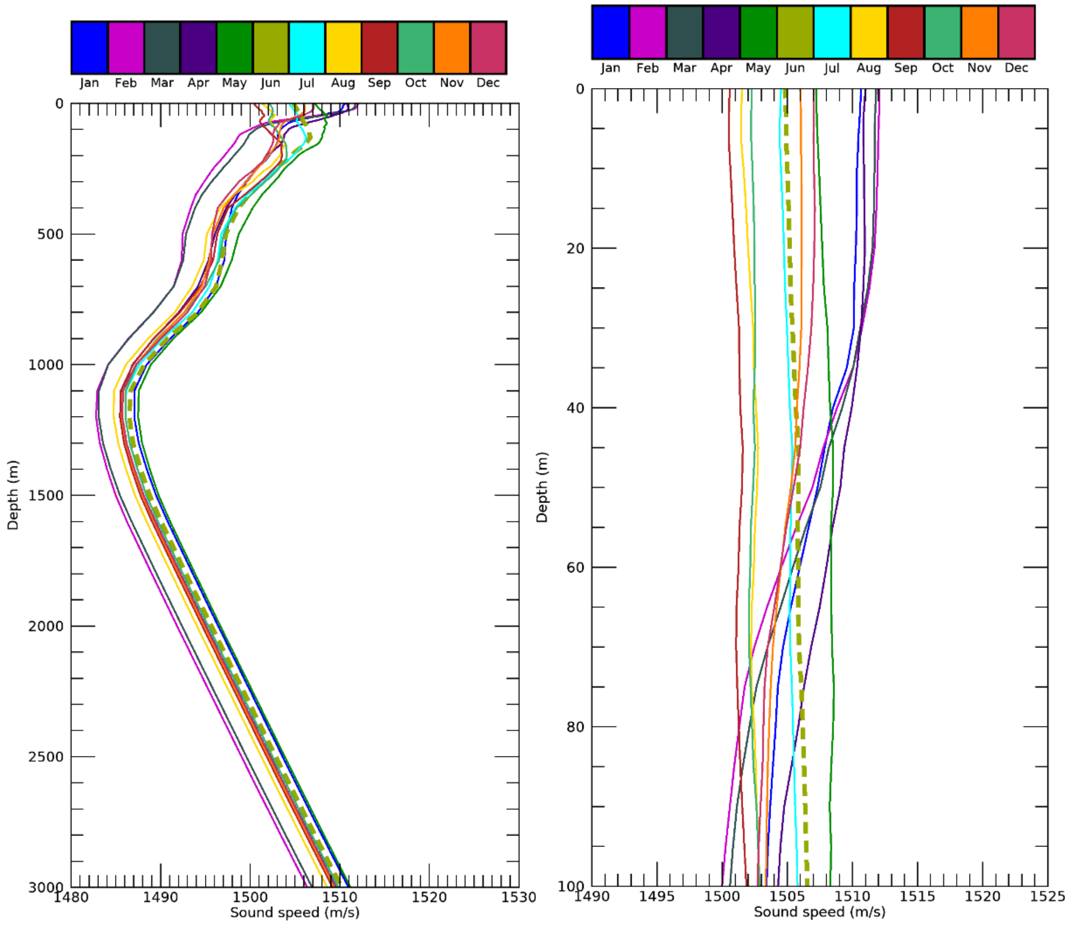

Figure D-8. The sound speed profile (June) used for all modelling, showing the entire water column (left) and the top 100 m within the profile (right). Profiles are calculated from temperature and salinity profiles from GDEM V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

D.3.3. Geoacoustics

The geoacoustic parameters used for modelling have been sourced from previous public reports completed by JASCO for modelling projects in the surrounding area. Similar to previous modelling studies in the region (Wood and McPherson 2018, Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), several seabed types were considered for modelling. These seabed profiles are indicative of a benthic environment located on the continental shelf and upper slope and are consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010) within the Otway region.

For the sites modelled in shallow water (less than 65 m depth) the seabed was modelled as a sand layer underlain by variably cemented calcarenite. Literature and public reports suggest that this layer likely begins to thin as water depths increase in an offshore direction (Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), and for water depths greater than 65 m it was considered absent with only the variably cemented calcarenite present at the seafloor interface. These two seabed profiles are consistent with profiles described in association with measurement data (McCauley et al. 2016), and other modelling studies in the region (AIMS 2018).

Sites located above the calcarenite seabed generally displayed higher rates of loss at distance away from the source as compared to sites where a layer of sand overlies calcarenite (Duncan et al. 2009) and as such precises modelled was conducted to account for the loss associated with exposed calcarenite (see Appendix C.3.2). For sites located in water along the shelf, geoacoustic parameters considered for modelling are provided in Tables D-1 and D-2

Table D-1. Geoacoustic profile used in the acoustic propagation models for sites in less than 65 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-5	Fine Carbonate Sand	2.1	1634-1803	0.09-0.73	315	3.65
5-25	Increasingly cemented calcarenite	2.2	2000-2120	0.30-0.34		
25-45		2.3	2120-2240	0.34-0.38		
45-65		2.4	2240-2360	0.38-0.42		
65-85		2.5	2360-2480	0.42-0.46		
85-105		2.6	2480-2600	0.46-0.50		
>105	Well-cemented calcarenite	2.7	2600	0.50		

Table D-2. Geoacoustic profile used in the acoustic propagation models for between 65 m and 120 m water depth.Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-1	Well-cemented carbonate caprock	2.7	2600	0.5	500	0.4
1-20	Increasingly cemented calcarenite	2.2	2000-2120	0.30-0.34		
20-40		2.3	2120-2240	0.34-0.38		
40-60		2.4	2240-2360	0.38-0.42		
60-80		2.5	2360-2480	0.42-0.46		
80-10		2.6	2480-2600	0.46-0.50		
>100	Well-cemented calcarenite	2.7	2600	0.50		

For sites located along the shelf break/upper continental slope, the geoacoustic parameters used for modelling was derived from sedimentary grain size measurements from the Australian Government's Marine Sediments (MARS) database (Heap 2009). On average, the surficial grain size indicates silty carbonate sand is present. Information on the deeper geological structure was sparse, as such the seabed was assumed to consist of a thick package of unconsolidated sediments. However, this is consistent with the "shaved shelf" model of the discussed in James and Bone 2010, where sediments are transported and deposited from the shelf onto the slope. Representative grain sizes and porosity were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models. Table D-3 lists the geoacoustic parameters used for modelling for sites in water depths greater than 120 m.

Table D-3. Geoacoustic profile used in the acoustic propagation models for all modelled sites greater than 120 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–10	Silty carbonate sand to semi-cemented carbonate	1.88	1605–1700	0.35–0.70	255	3.65
10–20		1.88–1.89	1700–1755	0.70–0.85		
20–50		1.89–1.90	1755–1850	0.85–1.15		
50–100		1.90–1.92	1850–1950	1.15–1.35		
100–200		1.92–1.96	1950–2100	1.35–1.60		
200–500		1.96–2.05	2100–2355	1.60–1.95		
>500		2.05	2355	1.95		

D.4. Animal Movement and Exposure Modelling

Animal movement and exposure modelling considers the movement of both sound sources and animals over time. Acoustic source and propagation modelling are used to generate 3-D sound fields that vary as a function of distance to source, depth, and azimuth. Sound sources are modelled at representative sites and the resulting sound fields are assigned to source locations using the minimum Euclidean distance. The sound received by an animal at any given time depends on its location relative to the source. Because the true locations of the animals within the sound fields are unknown, realistic animal movements are simulated using repeated random sampling of various behavioural parameters. The Monte Carlo method of simulating many animals within the operations area is used to estimate the sound exposure history of the population of simulated animals (animats).

Monte Carlo methods provide a heuristic approach for determining the probability distribution function (PDF) of complex situations, such as animals moving in a sound field. The probability of an events occurrence is determined by the frequency with which it occurs in the simulation. The greater the number of random samples, in this case the more simulated animats, the better the approximation of the PDF. Animats are randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2). Higher densities provide a finer PDF estimate resolution but require more computational resources. To ensure good representation of the PDF, the animat density is set as high as practical allowing for computation time. The animat density is typically much higher than the real-world density to ensure good representation of the PDF. The resulting PDF can be scaled using real-world animal density when this information is available.

Several models for marine mammal movement have been developed (Ellison et al. 1987, Frankel et al. 2002, Houser 2006). These models use an underlying Markov chain to transition from one state to another based on probabilities determined from measured swimming behaviour. The parameters may represent simple states, such as the speed or heading of the animal, or complex states, such as likelihood of participating in foraging, play, rest, or travel. Attractions and aversions to variables like anthropogenic sounds and different depth ranges can be included in the models.

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was based on the open-source marine mammal movement and behaviour model (3MB, Houser 2006) and used to predict the exposure of animats to sound arising from the anthropogenic activities. Animats are programmed to behave like the species likely to be present in the survey area. The parameters used for forecasting realistic behaviours (e.g., diving, foraging, aversion, surface times, etc.) are determined and interpreted from marine species studies (e.g., tagging studies) where available, or reasonably extrapolated from related species. An individual animats modelled sound exposure levels are summed over the total simulation duration to determine its total received energy, and then compared to the assumed threshold criteria.

JASMINE uses the same animal movement algorithms as 3MB (Houser, 2006), but has been extended to be directly compatible with JASCO's Marine Operations Noise Model (MONM) and Full Waveform Range-dependent Acoustic Model (FRAWM) acoustic field predictions, for inclusion of source tracks, and importantly for animats to change behavioural states based on time and space dependent modelled variables such as received levels for aversion behaviour, although aversion was not considered in this study.

D.4.1. Animal Movement Parameters

JASMINE uses previously measured behaviour to forecast behaviour in new situations and locations. The parameters used for forecasting realistic behaviour are determined (and interpreted) from marine species studies (e.g., tagging studies). Each parameter in the model is described as a probability distribution. When limited or no information is available for a species parameter, a Gaussian or uniform distribution may be chosen for that parameter. For the Gaussian distribution, the user determines the mean and standard deviation of the distribution from which parameter values are drawn. For the uniform distribution, the user determines the maximum and minimum distribution from which parameter values are drawn. When detailed information about the movement and behaviour of a species are available, a user-created distribution vector, including cumulative transition probabilities, may be used (referred to here as a vector model; Houser 2006). Different sets of parameters can be defined for different behaviour states. The probability of an animat starting out in or transitioning into a given behaviour state can in turn be defined in terms of the animats current behavioural state, depth, and the time of day. In addition, each travel parameter and behavioural state has a termination function that governs how long the parameter value or overall behavioural state persists in simulation.

The parameters used in JASMINE describe animal movement in both the vertical and horizontal planes. The parameters relating to travel in these two planes are briefly described below.

Travel sub-models

- **Direction**– determines an animats choice of direction in the horizontal plane. Sub-models are available for determining the heading of animats, allowing for movement to range from strongly biased to undirected. A random walk model can be used for behaviours with no directional preference, such as feeding and playing. In a random walk, all bearings are equally likely at each parameter transition time step. A correlated random walk can be used to smooth the changes in bearing by using the current heading as the mean of the distribution from which to draw the next heading. An additional variant of the correlated random walk is available that includes a directional bias for use in situations where animals have a preferred absolute direction, such as migration. A user-defined vector of directional probabilities can also be input to control animat heading. For more detailed discussion of these parameters, see Houser (2006) and Houser and Cross (1999).
- **Travel rate**–defines an animats rate of travel in the horizontal plane. When combined with vertical speed and dive depth, the dive profile of the animat is produced.

Dive sub-models

- **Ascent rate**–defines an animats rate of travel in the vertical plane during the ascent portion of a dive.
- **Descent rate**–defines an animats rate of travel in the vertical plane during the descent portion of a dive.
- **Depth**–defines an animats maximum dive depth.
- **Reversals**–determines whether multiple vertical excursions occur once an animat reaches the maximum dive depth. This behaviour is used to emulate the foraging behaviour of some marine mammal species at depth. Reversal-specific ascent and descent rates may be specified.
- **Surface interval**–determines the duration an animat spends at, or near, the surface before diving again.

D.4.2. Exposure Integration Time

The interval over which acoustic exposure (L_E) should be integrated and maximal exposure (L_p) determined is not well defined. Both Southall et al. (2007) and the NMFS (2018) recommend a 24 h baseline accumulation period, but state that there may be situations where this is not appropriate (e.g., a high-level source and confined population). Resetting the integration after 24 h can lead to overestimating the number of individual animals exposed because individuals can be counted multiple times during an operation. The type of animal movement engine used in this study simulates realistic movement using swimming behaviour collected over relatively short periods (hours to days) and does not include large-scale movement such as migratory circulation patterns. For this study, a representative 24-hour period was simulated.

Ideally, a simulation area is large enough to encompass the entire range of a population so that any animal that could approach the source during an operation is included. However, there are limits to the simulation area, and computational overhead increases with area. For practical reasons, the simulation area is limited. In the simulation, every animat that reaches a border is replaced by another animat entering at the opposing border—e.g., an animat crossing the northern border of the simulation is replaced by one entering the southern border at the same longitude. When this action places the animat in an inappropriate water depth, the animat is randomly placed on the map at a depth suited to its species definition. The exposures of all animats (including those leaving the simulation and those entering) are kept for analysis. This approach maintains a consistent animat density and allows for longer integration periods with finite simulation areas.

D.4.3. Seeding Density and Scaling

Seeding density refers to the spatial sample rate, in units of animats/km^2, used in the simulation. It is not related to the real-world animal density, but rather is a model parameter that controls how samples are drawn from the model space. The minimum required seeding density for any given project depends on several factors such as bathymetry, source characteristics, and the behavioural profile of the animats, with the main constraint being computation time and resources. Seeding density is adjusted as needed based on model conditions specific to a project or project area.

In the present study, the exposure criteria for impulsive sounds were used to determine the number of animats exceeding exposure thresholds. To generate statistically reliable probability density functions, all simulations were seeded with an animat density of 4 animat/km^2 over the entire simulation area, except those in which southern right whale animats were restricted to their reproduction BIA, in which case the density was increased to 6 animats/km^2 to account for the relatively small area. The modelling results are not related to real-world animal densities as animal density in the area is unknown.

Appendix E. Model Validation Information

Predictions from JASCO's Airgun Array Source Model (AASM) and propagation models (MONM, FWRAM and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Artic, Canadian and southern United States waters, Greenland, Russia and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities which have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016).

Appendix F. Supplemental Modelling Results

The SPL sound fields, and distances to relevant isopleths, can be visualised for the 293° tow direction on the contour maps presented below. Equivalent maps for the 113° tow direction are included in Section 4.2.2.1.

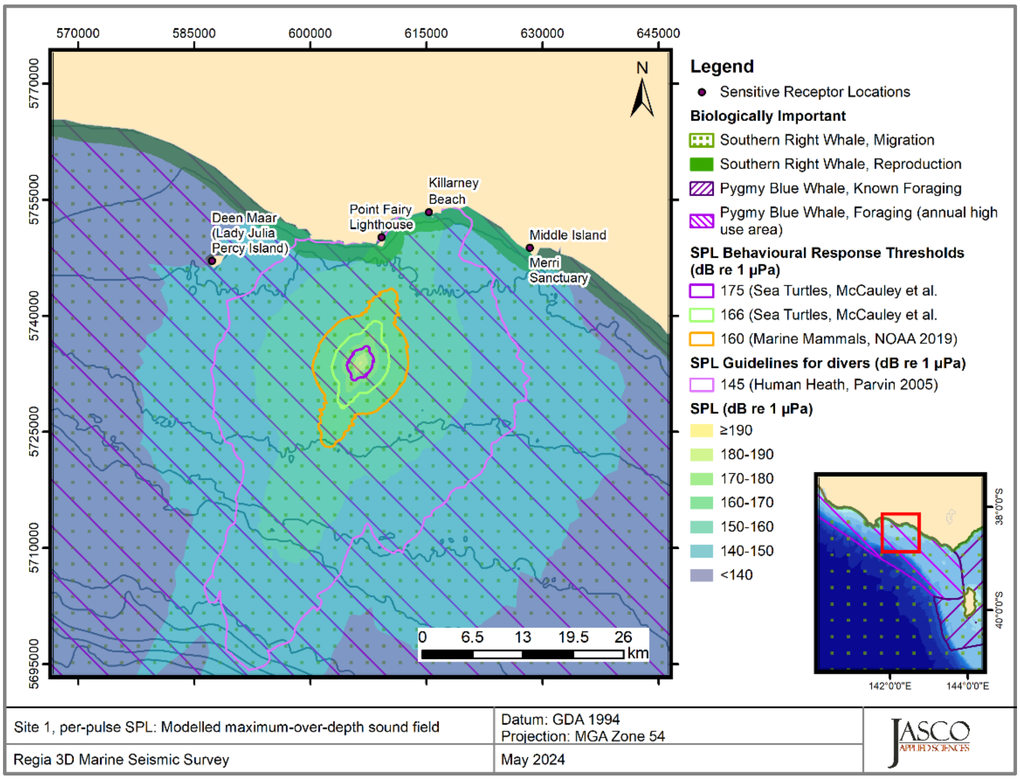

Figure F-1. *Site 1, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

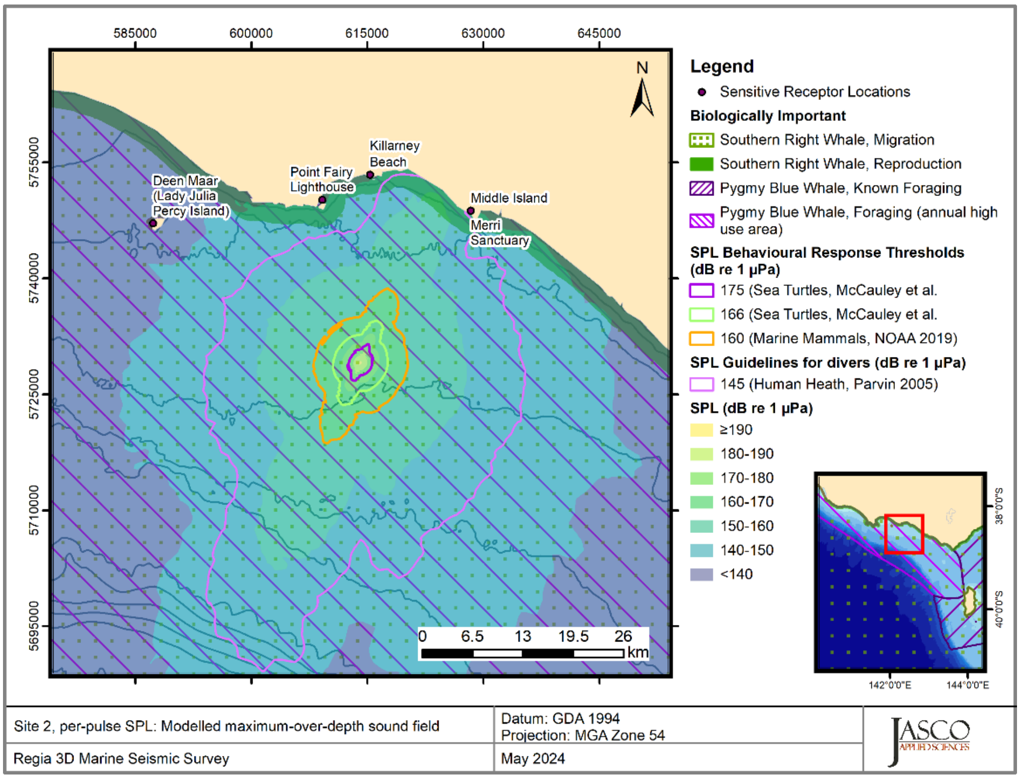

Figure F-2. *Site 2, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

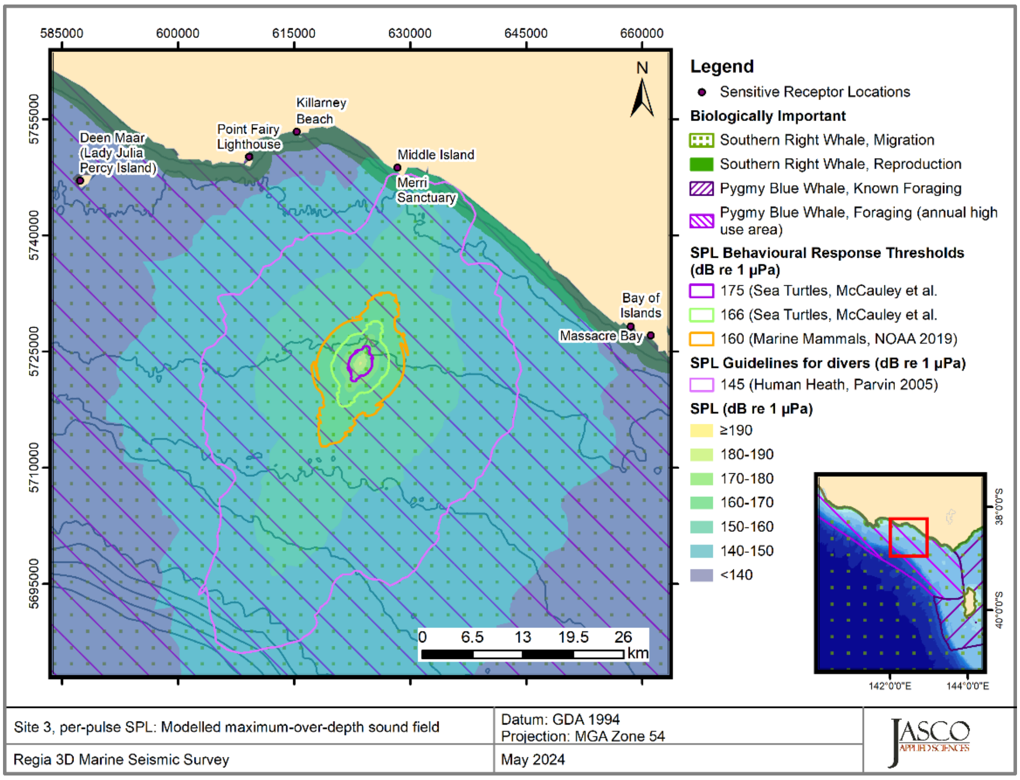

Figure F-3. *Site 3, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

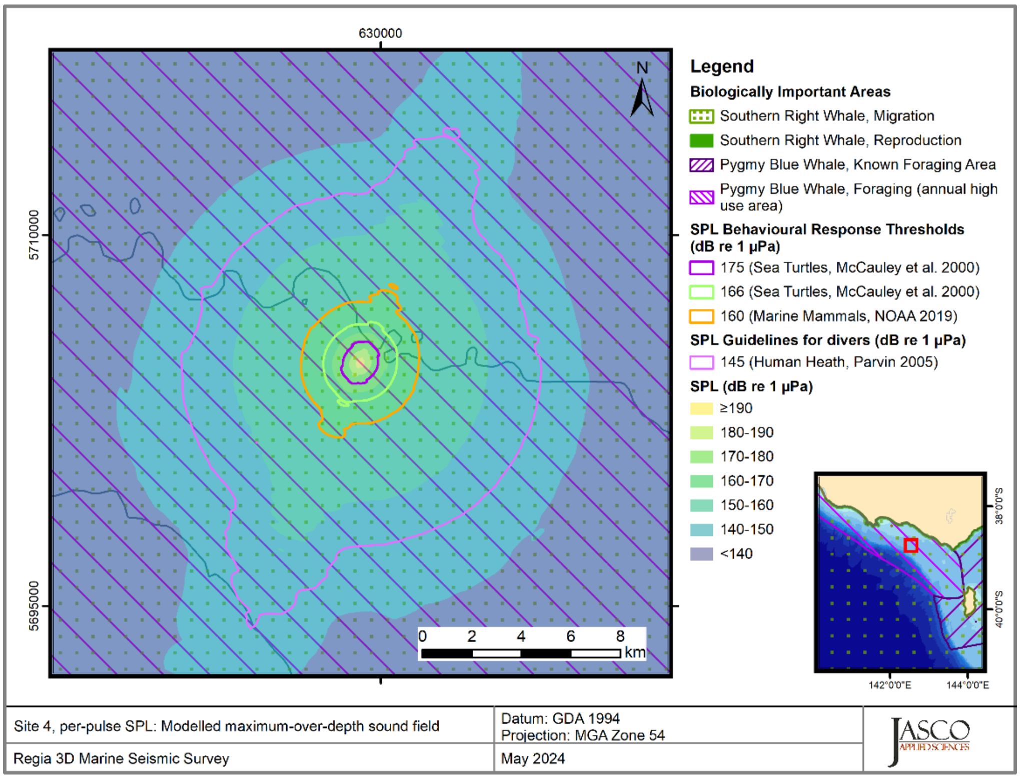

Figure F-4. *Site 4, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

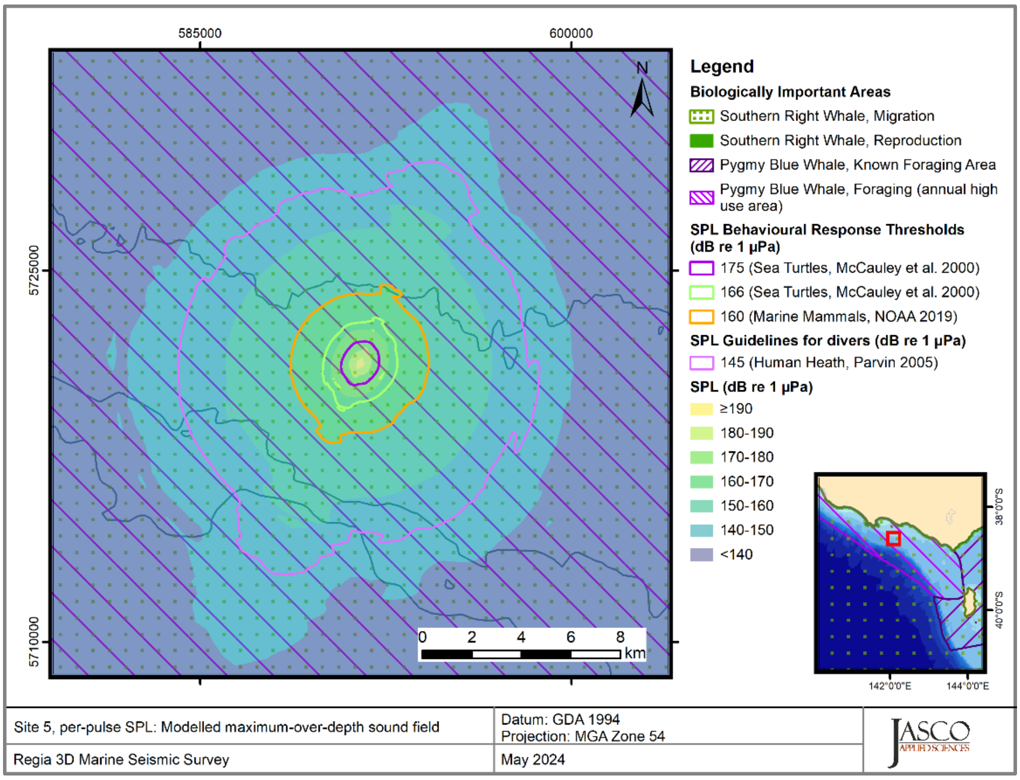

Figure F-5. *Site 5, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

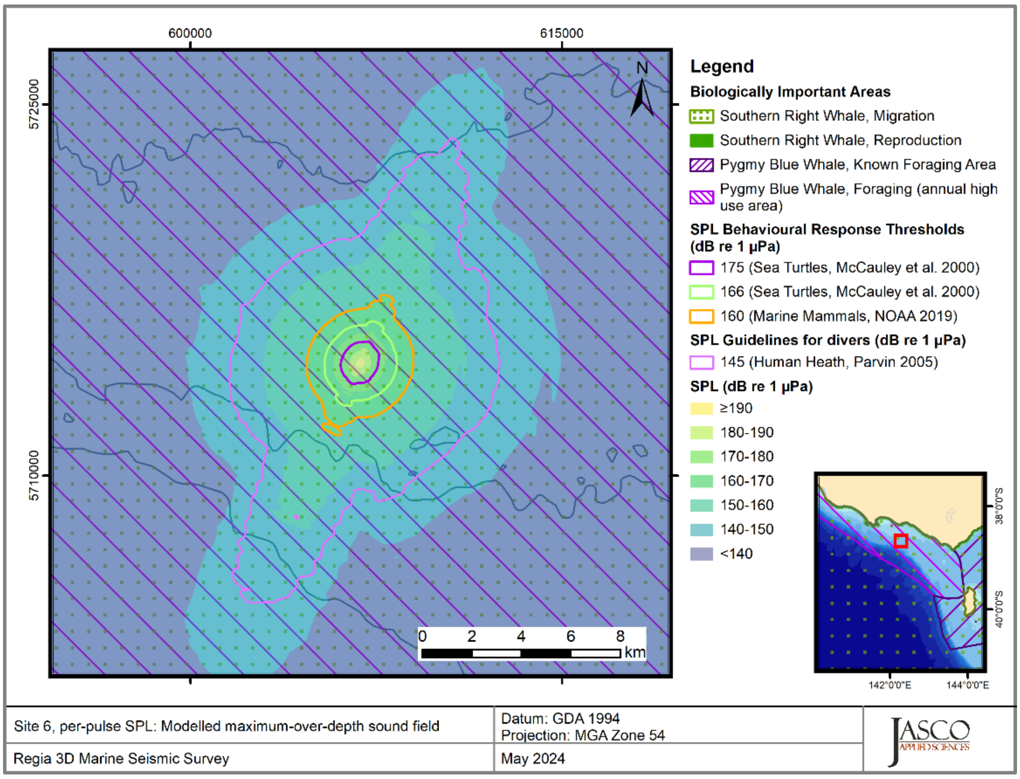

Figure F-6. *Site 6, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

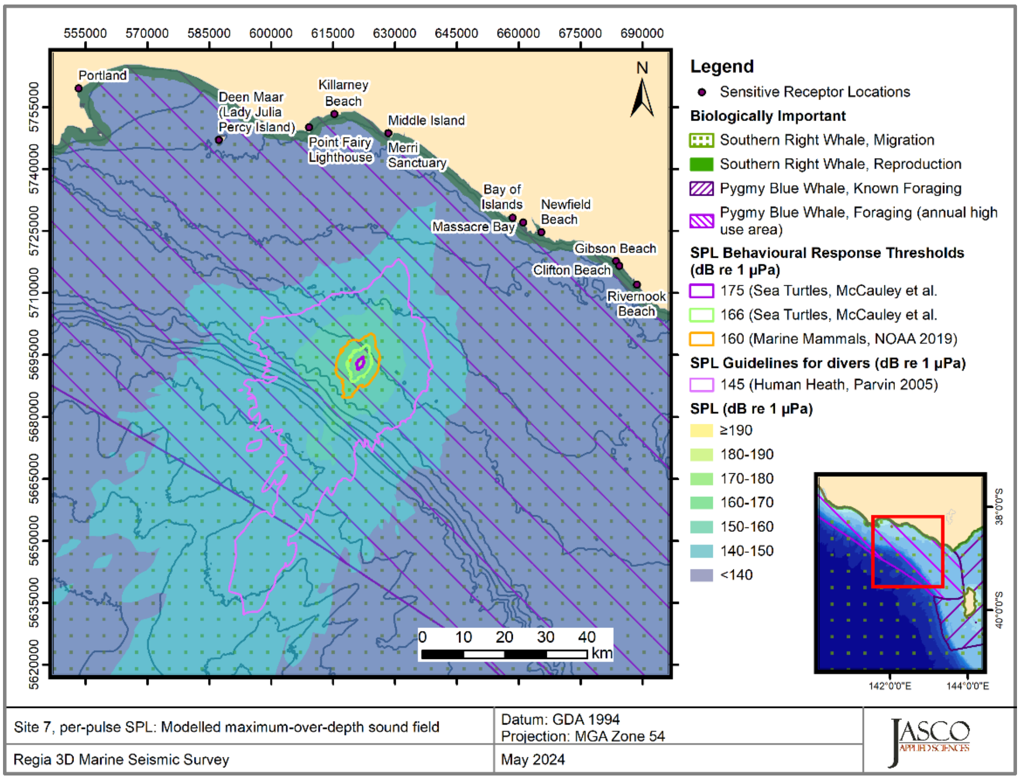

Figure F-7. *Site 7, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

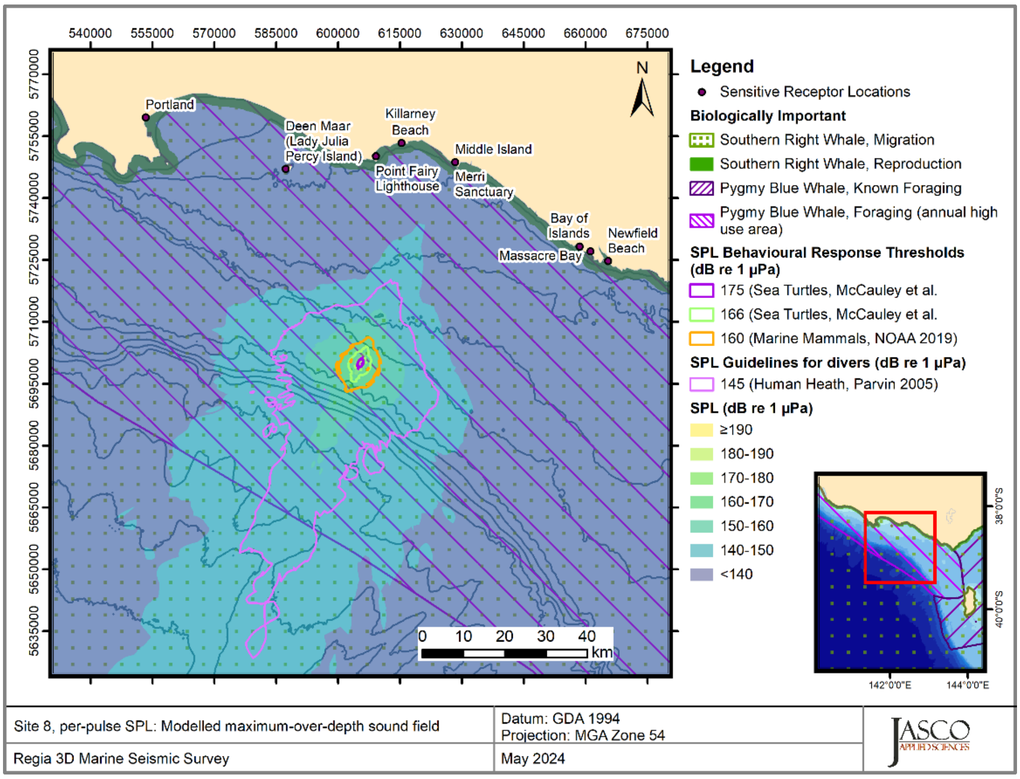

Figure F-8. *Site 8, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

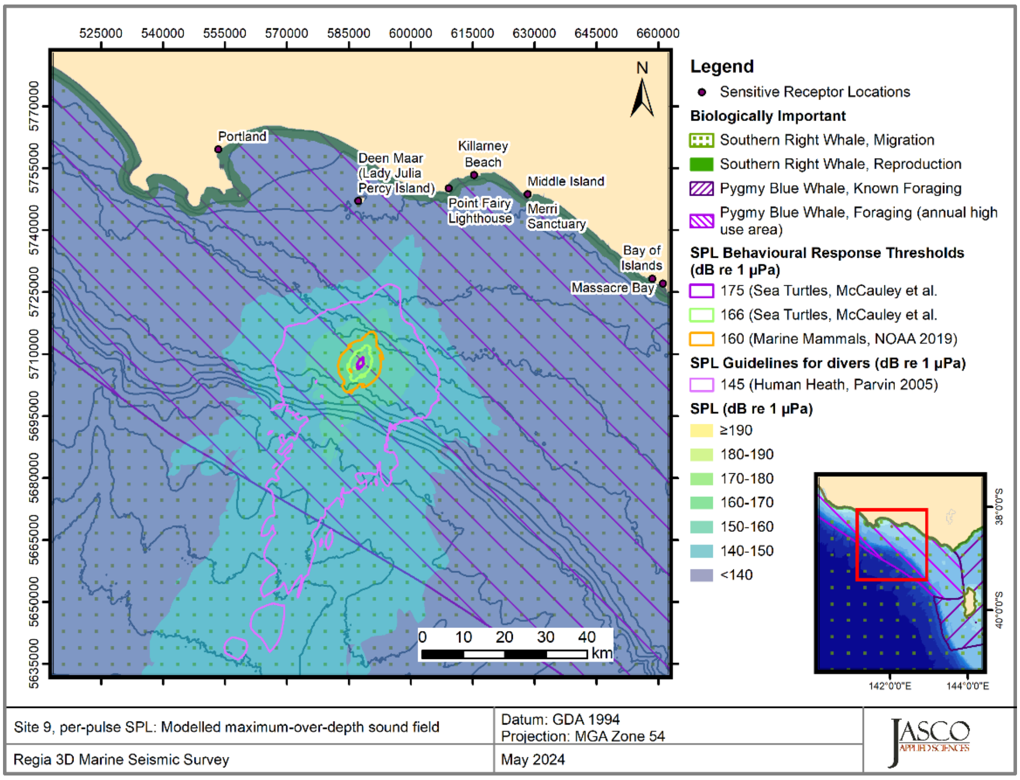

Figure F-9. *Site 9, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

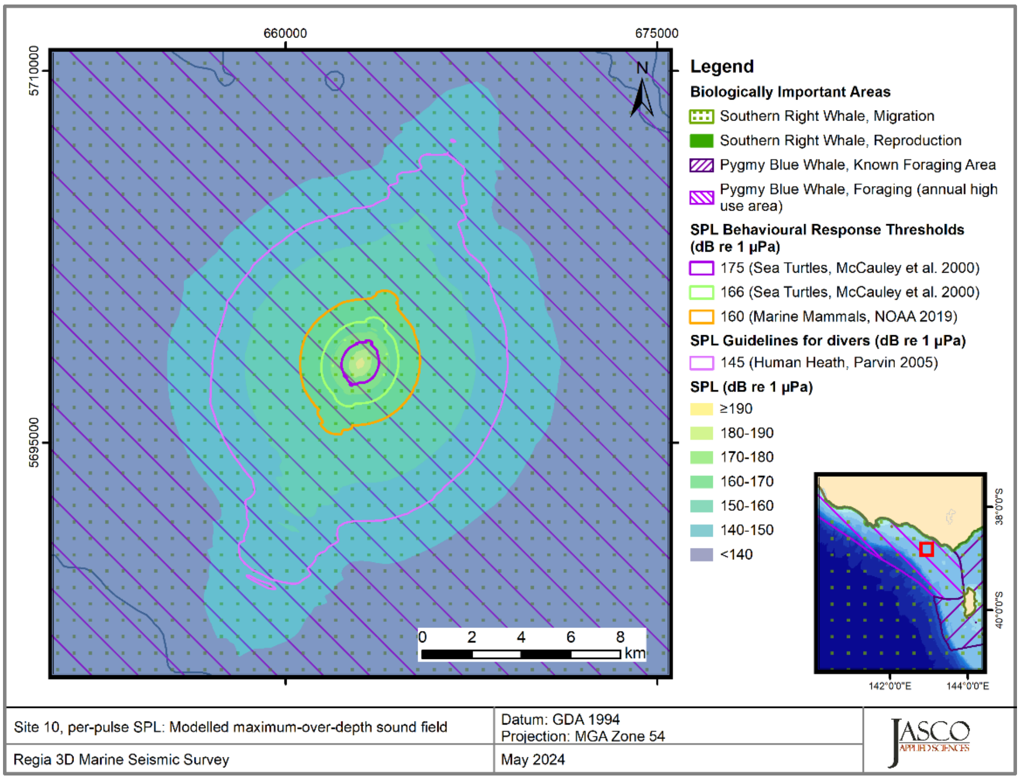

Figure F-10. *Site 10, SPL, 2820 in³ source, tow direction 293*°: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

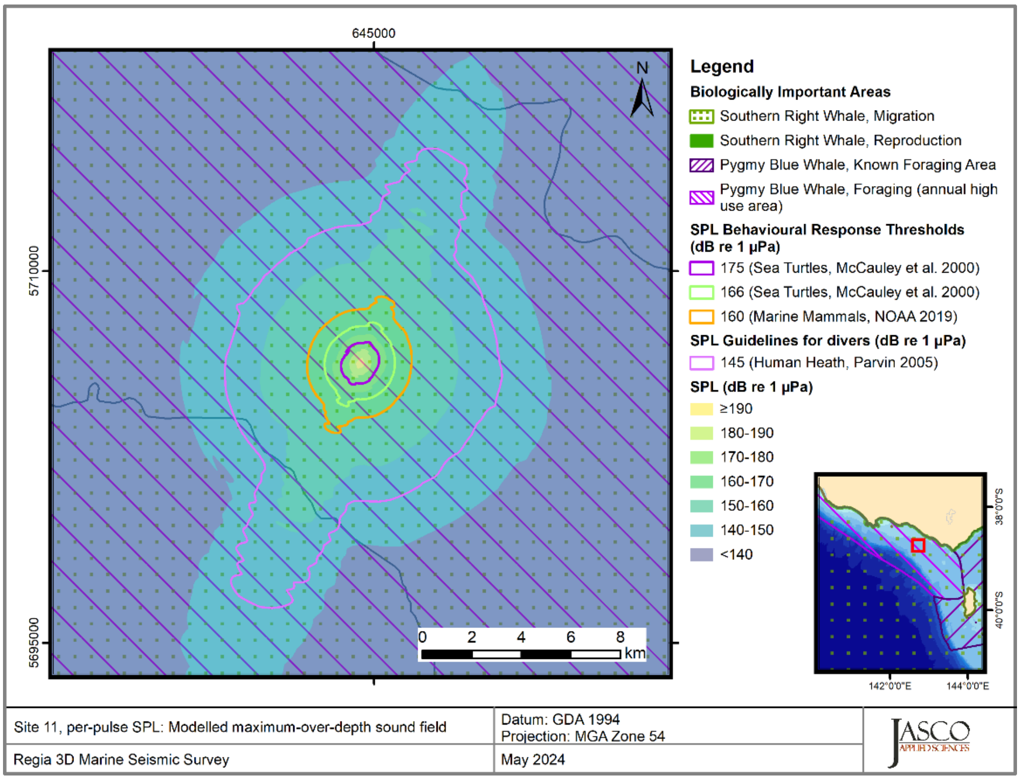

Figure F-11. *Site 11, SPL, 2820 in³ source, tow direction 293*°: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

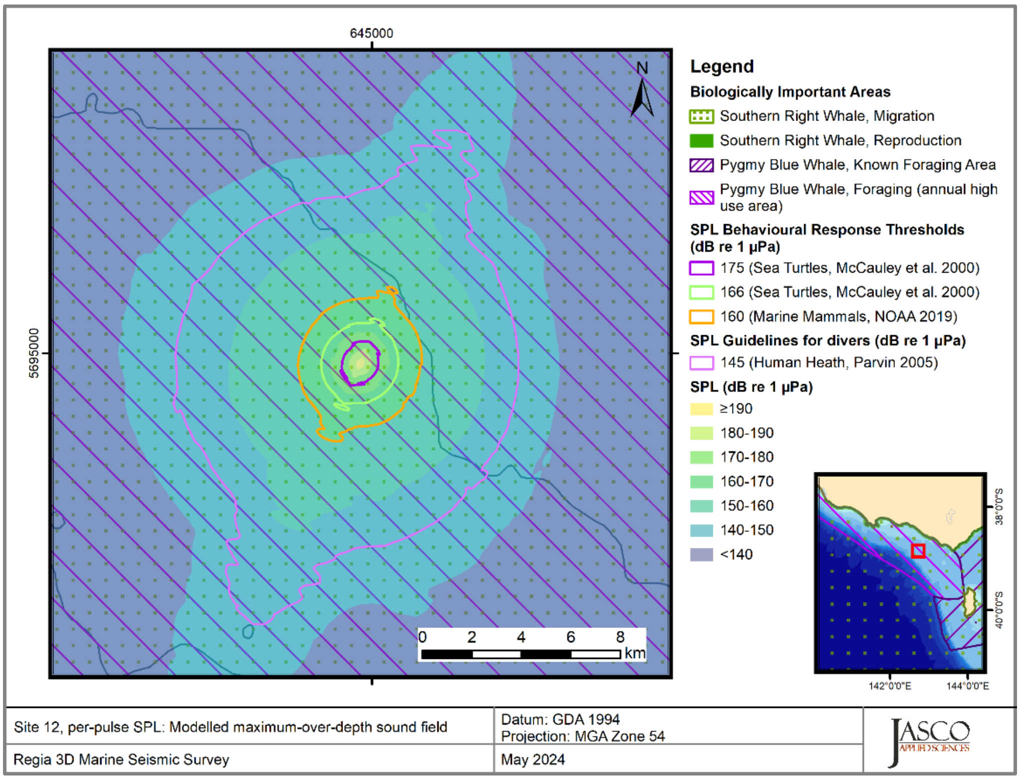

Figure F-12. *Site 12, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

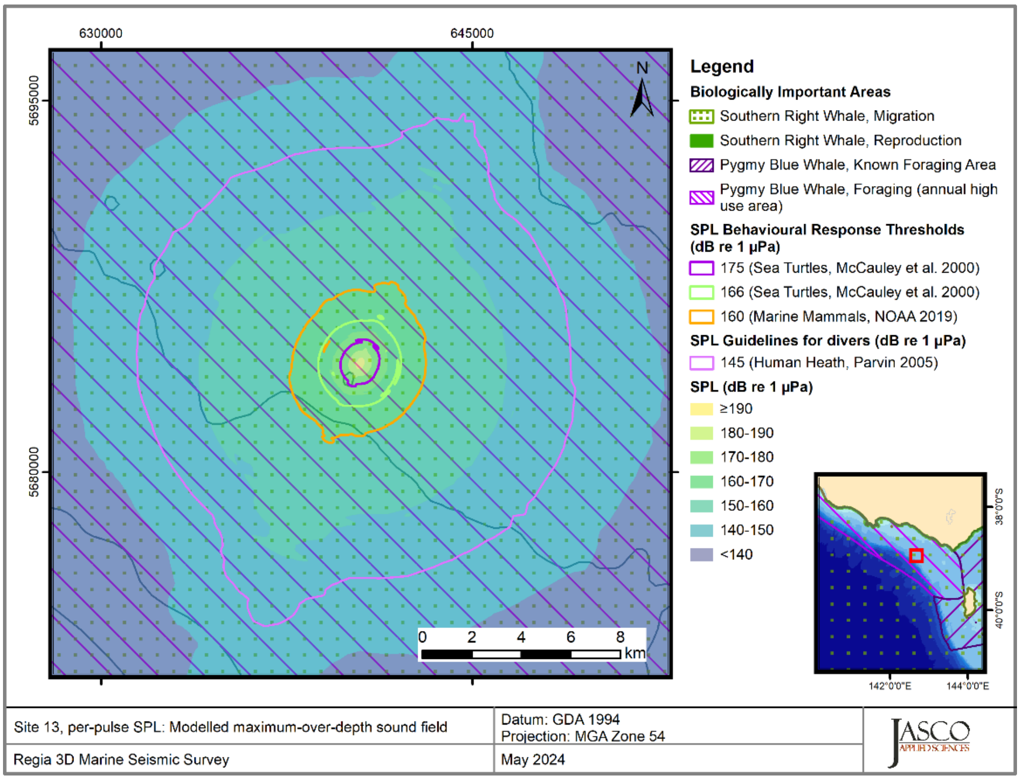

Figure F-13. *Site 13, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

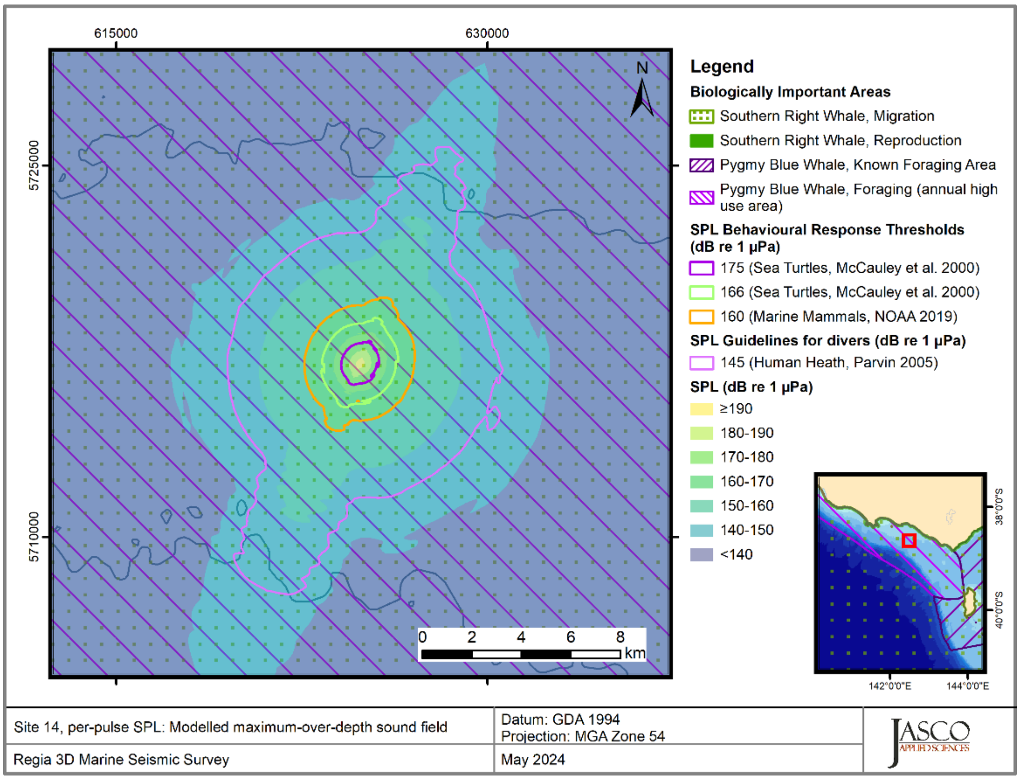

Figure F-14. *Site 14, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

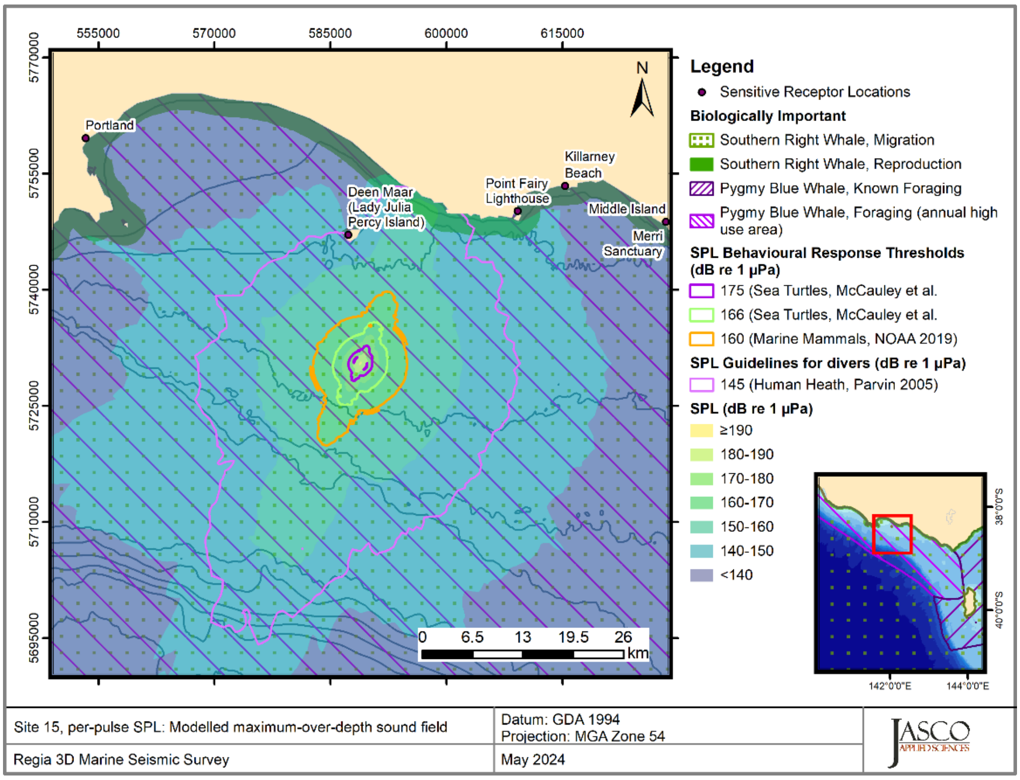

Figure F-15. *Site 15, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

Appendix G. Sensitive Receiver Maps

Maps showing which impulses result in levels above the human health assessment threshold. Each map shows which impulse if any result in an exceedance in the human health assessment threshold at the location listed in the figure caption.

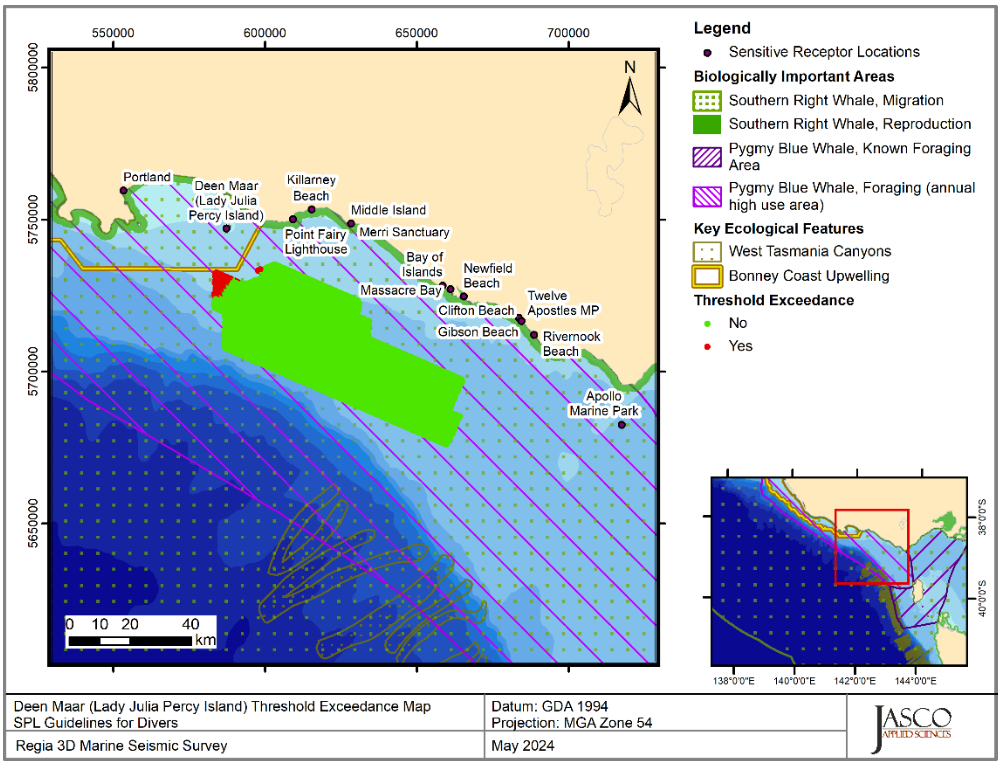

Figure G-1. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Deen Maar (Lady Julia Percy Island) is exceeded.

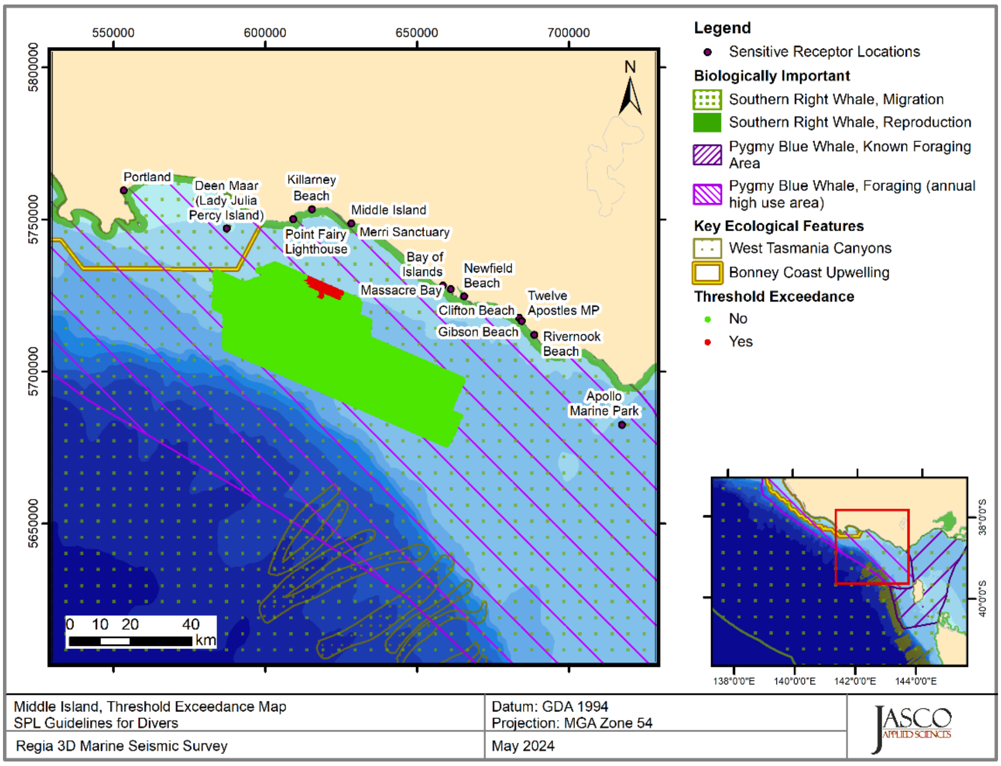

Figure G-2. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Middle Island is exceeded.

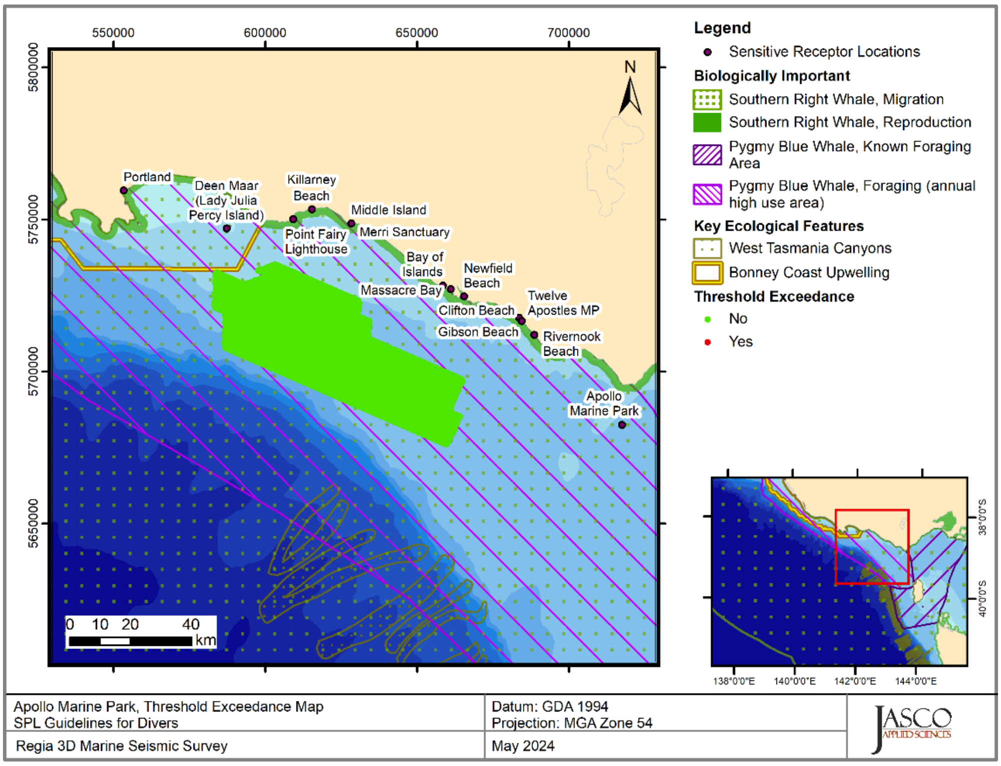

Figure G-3. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Apollo Marine Park is exceeded.

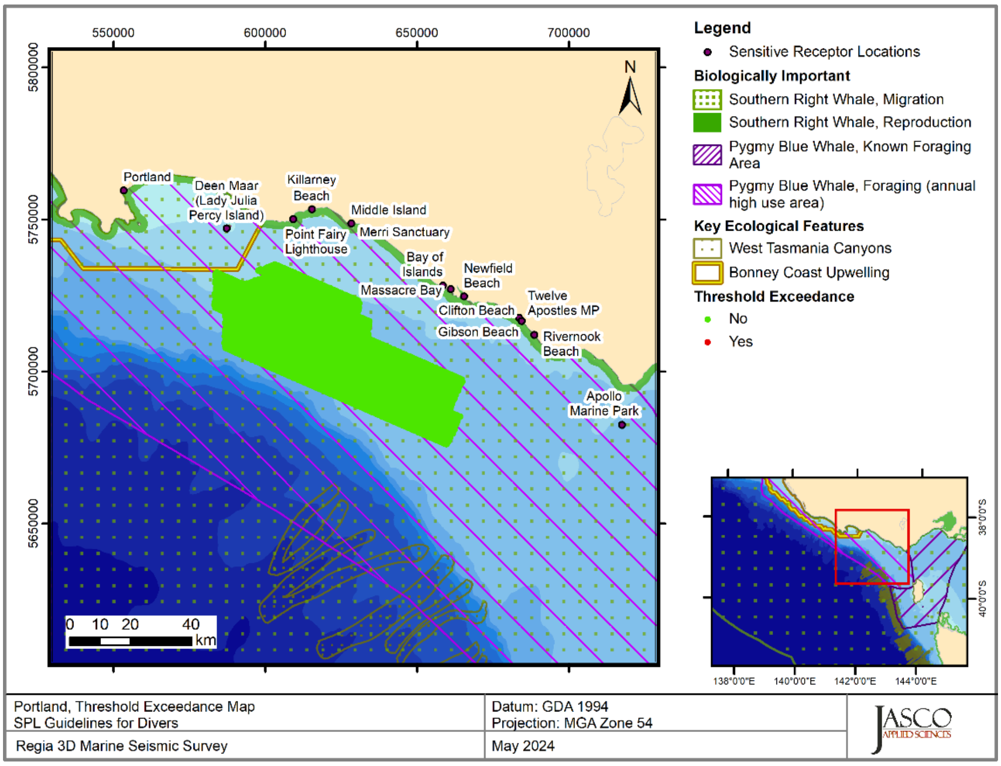

Figure G-4. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Portland is exceeded.

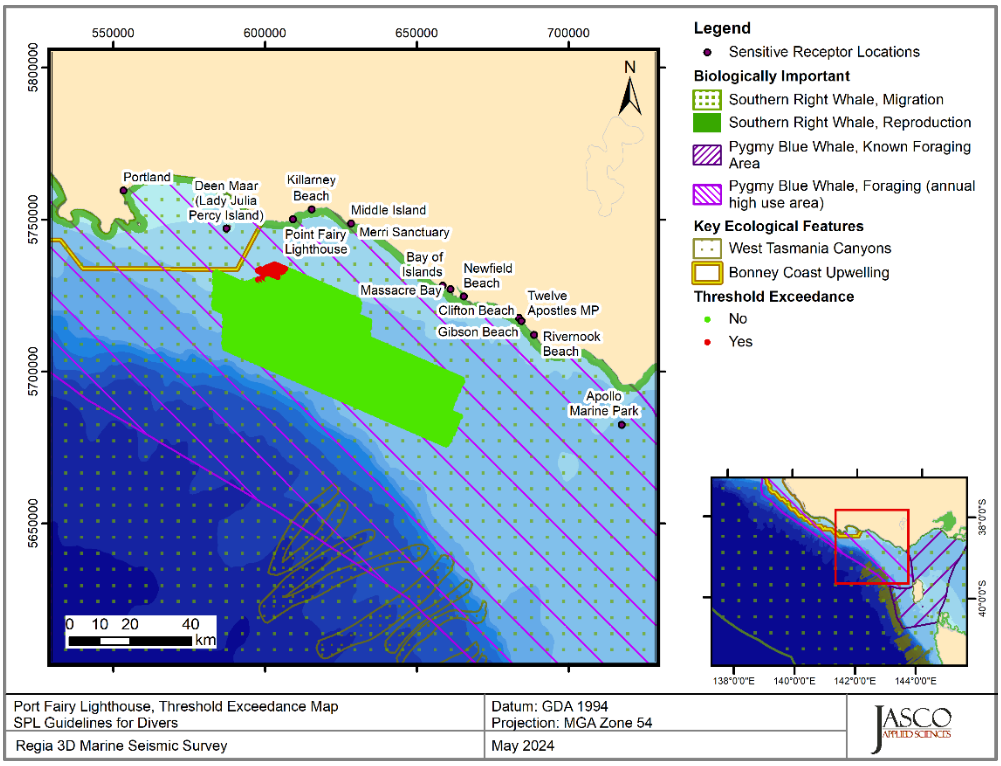

Figure G-5. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Port Fairy Lighthouse is exceeded.

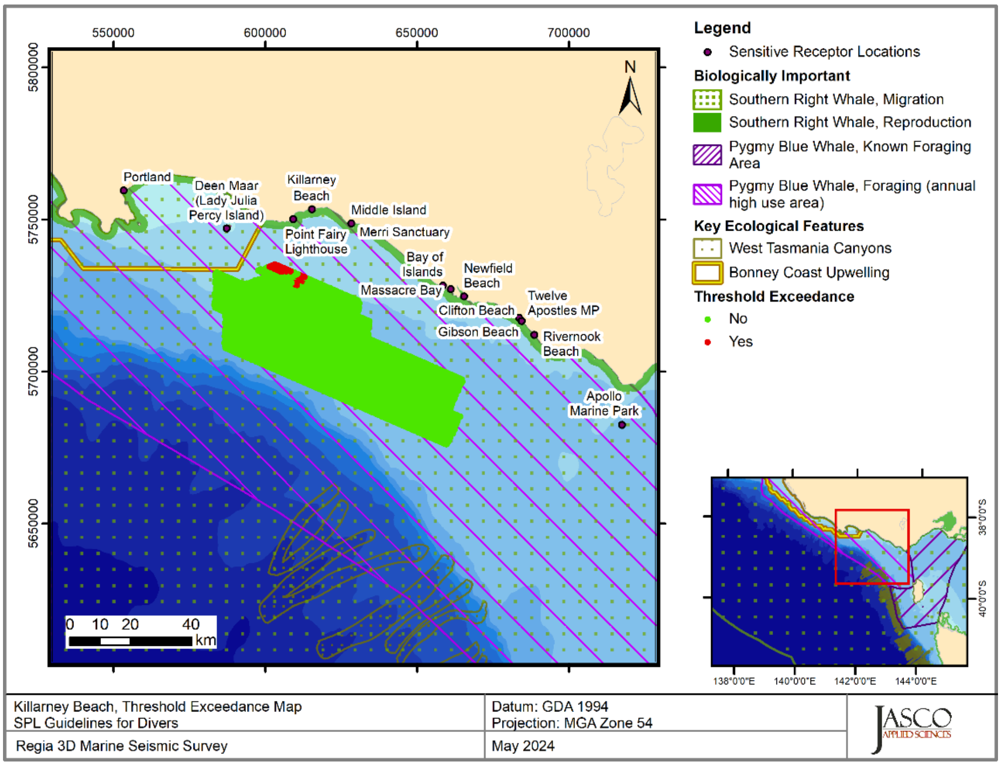

Figure G-6. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Killarney Beach is exceeded.

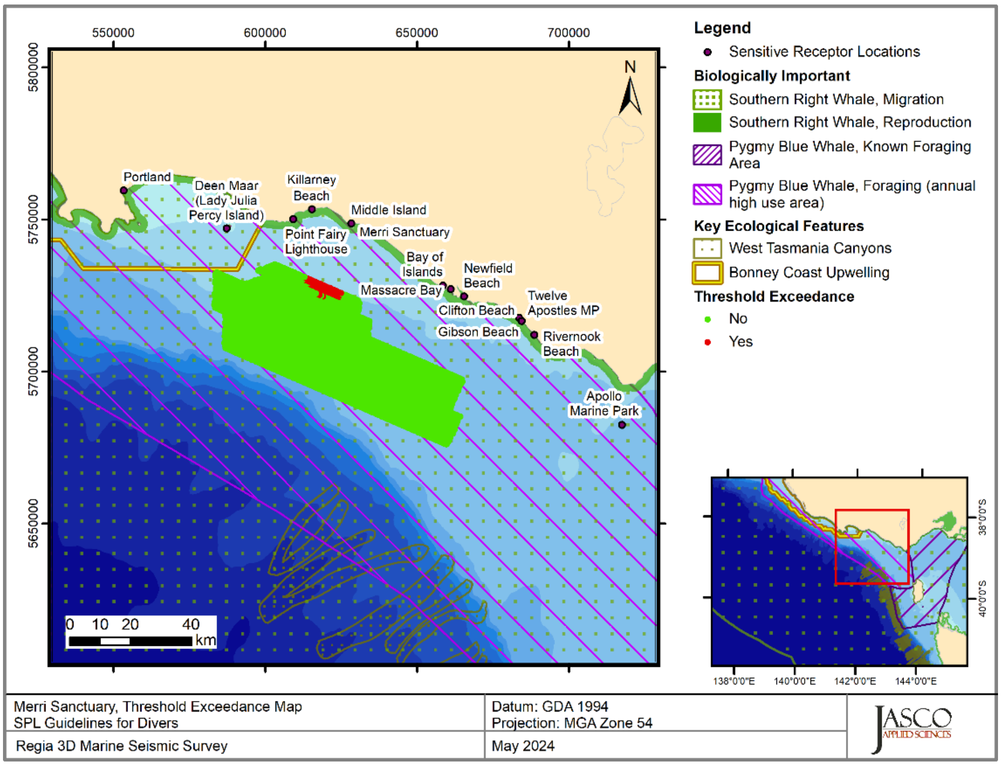

Figure G-7. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Merri Sanctuary is exceeded.

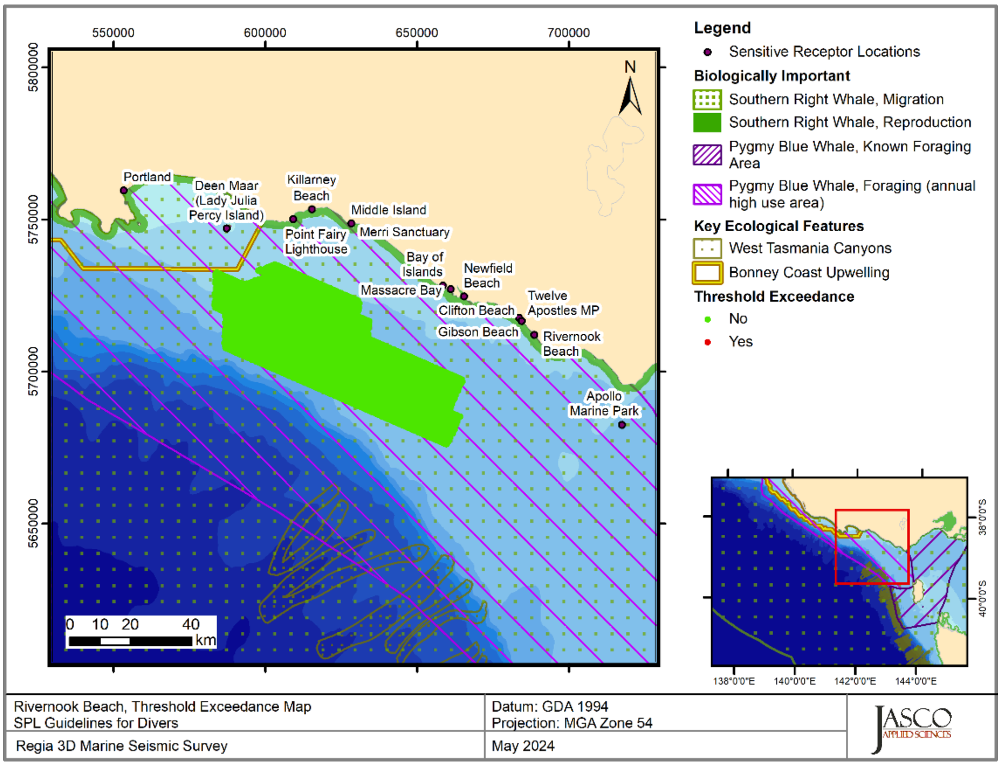

Figure G-8. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Rivernook Beach is exceeded.

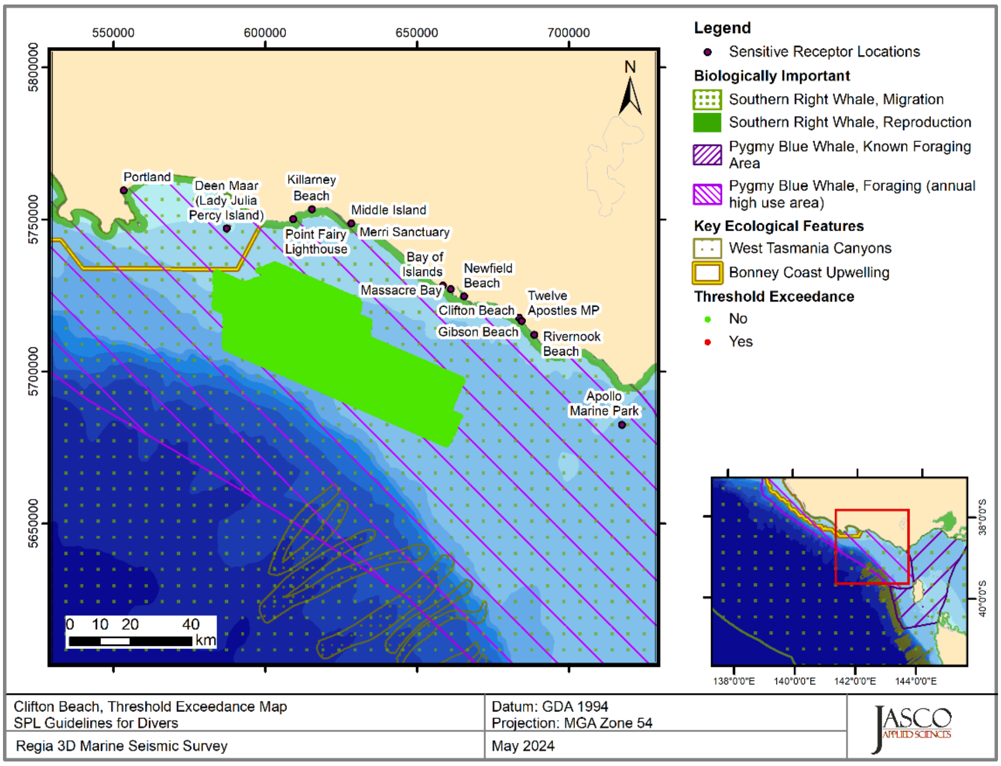

Figure G-9. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Clifton Beach is exceeded.

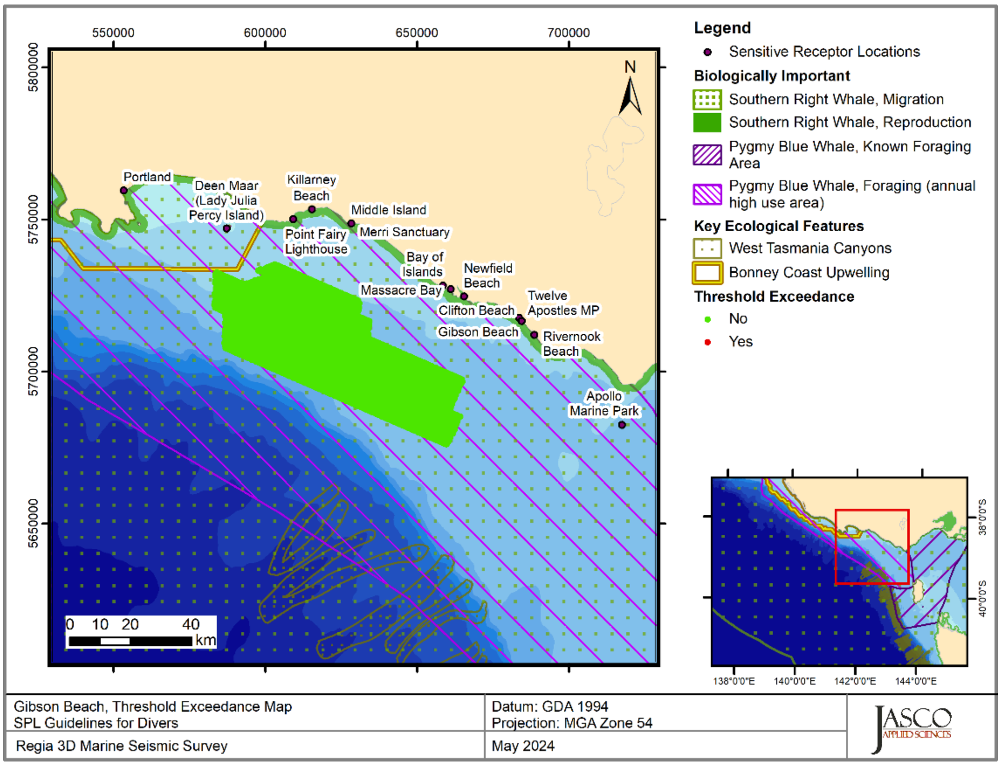

Figure G-10. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Gibson Beach is exceeded.

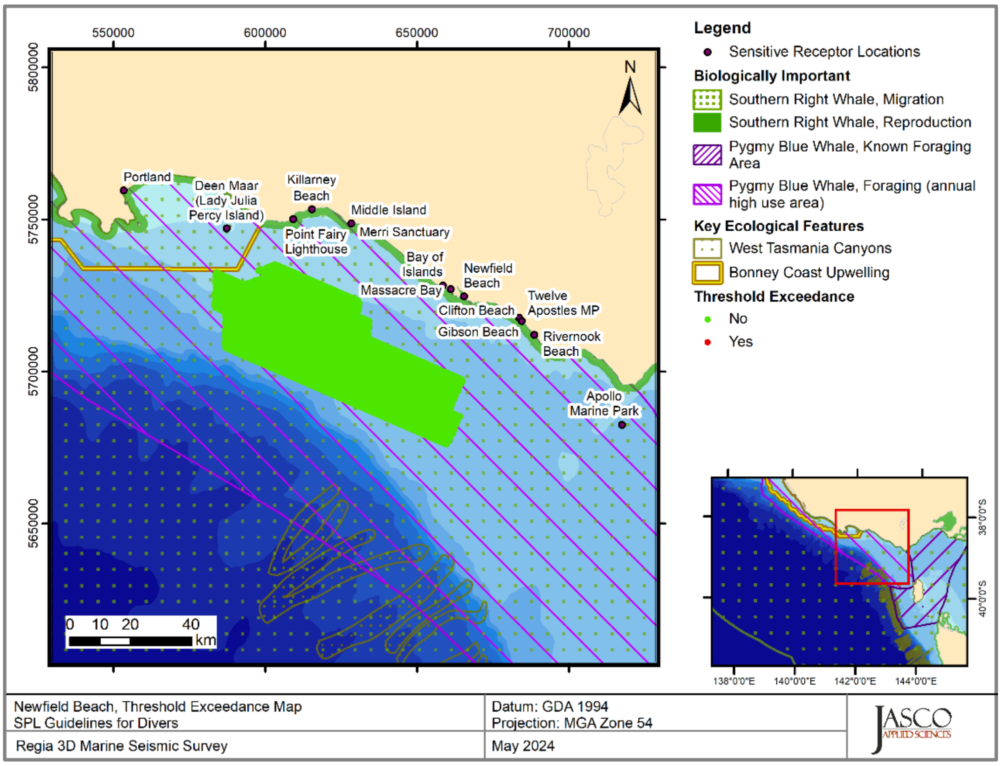

Figure G-11. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Newfield Beach is exceeded.

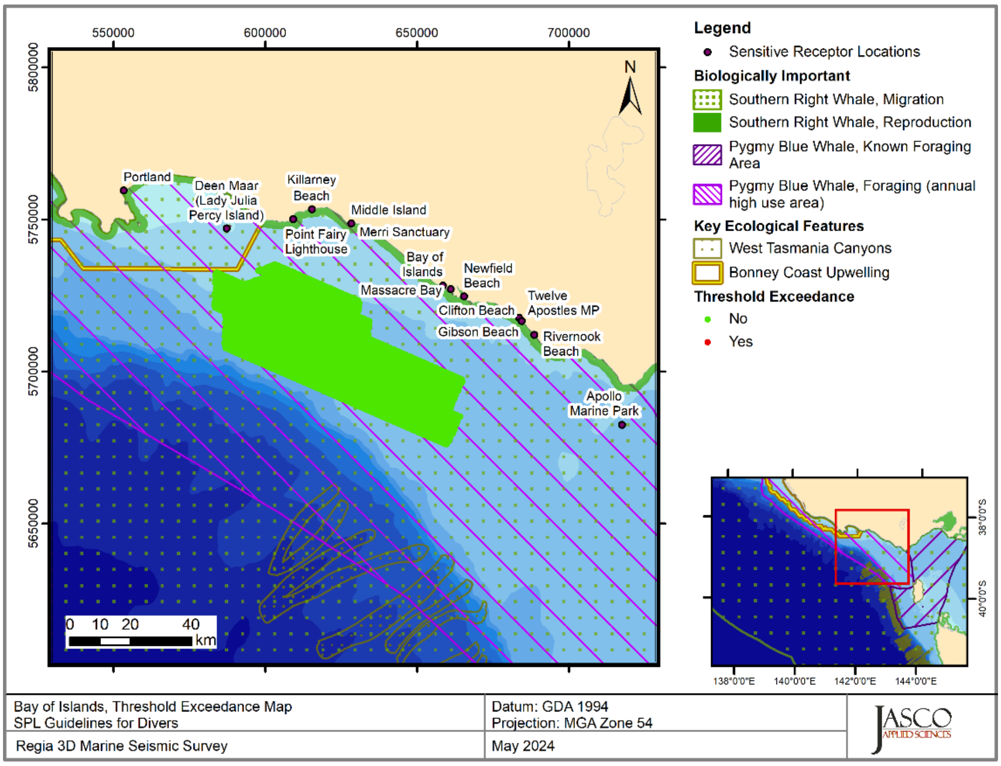

Figure G-12. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Bay of Islands is exceeded.

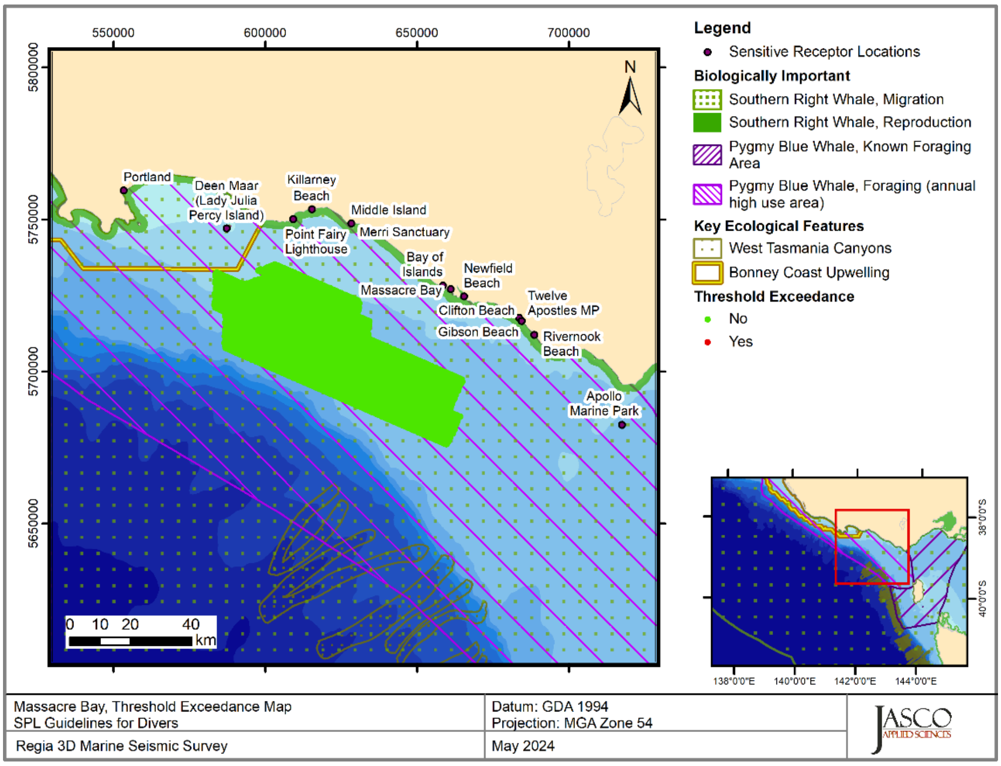

Figure G-13. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Massacre Bay is exceeded.

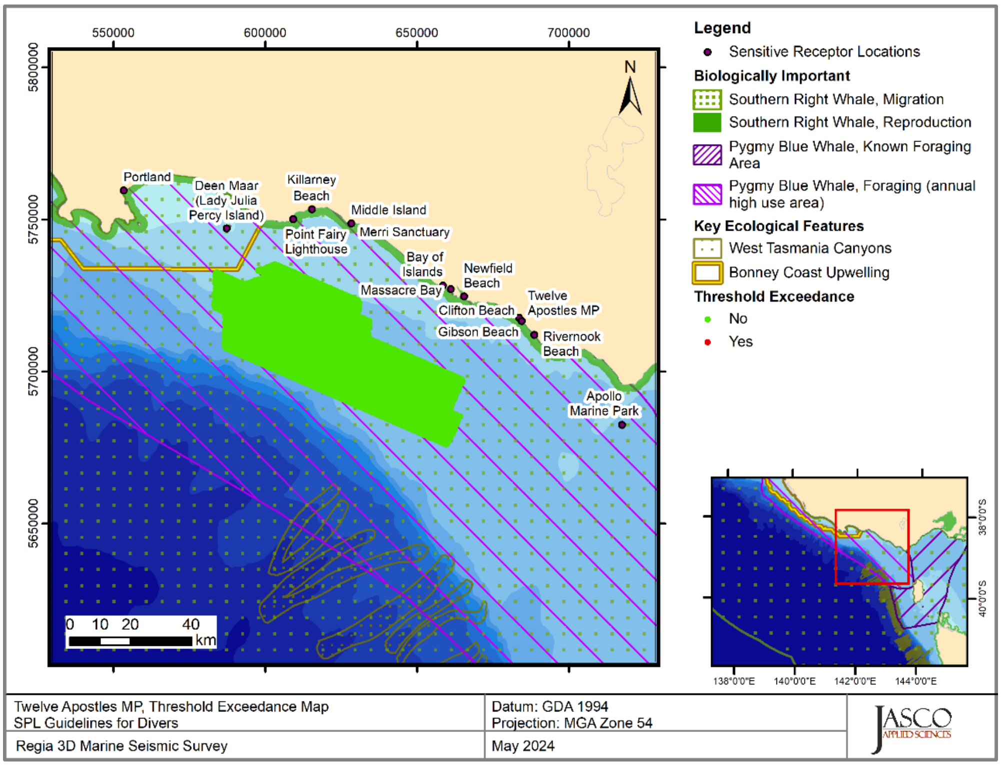

Figure G-14. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Twelve Apostles MP is exceeded.

Appendix H. Supplemental Animal Movement Modelling Results

Histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenarios B, C and D are shown in Figures F-1 to F-30.

H.1. Scenario B

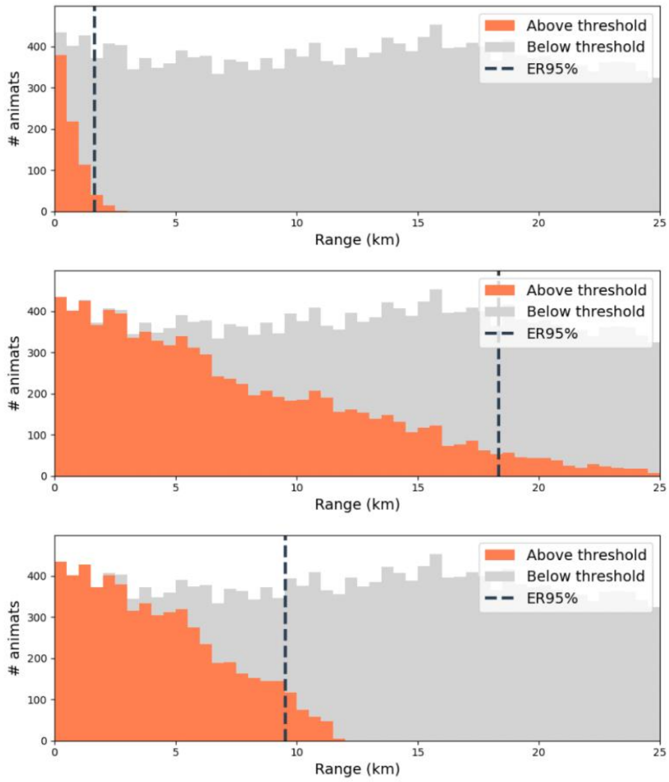

Figure H-1. *Scenario B, female pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

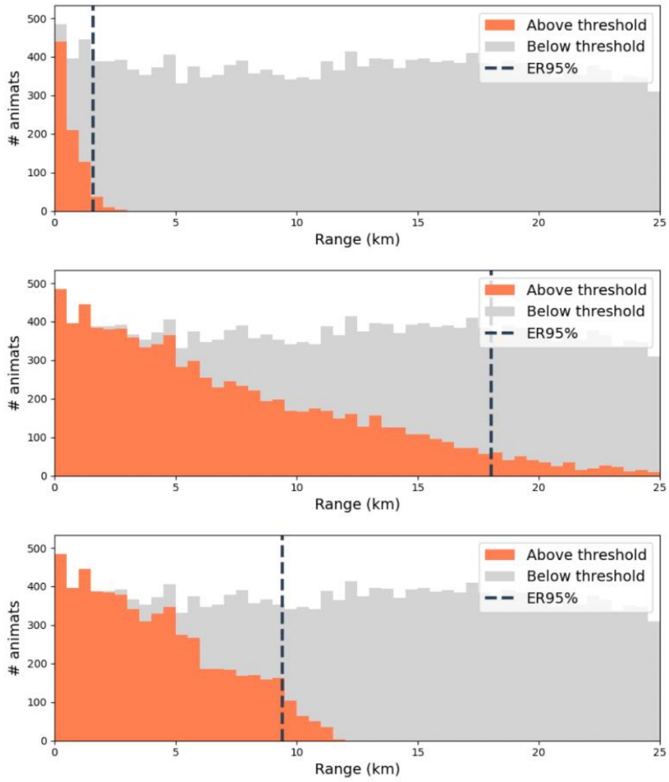

Figure H-2. *Scenario B, male pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

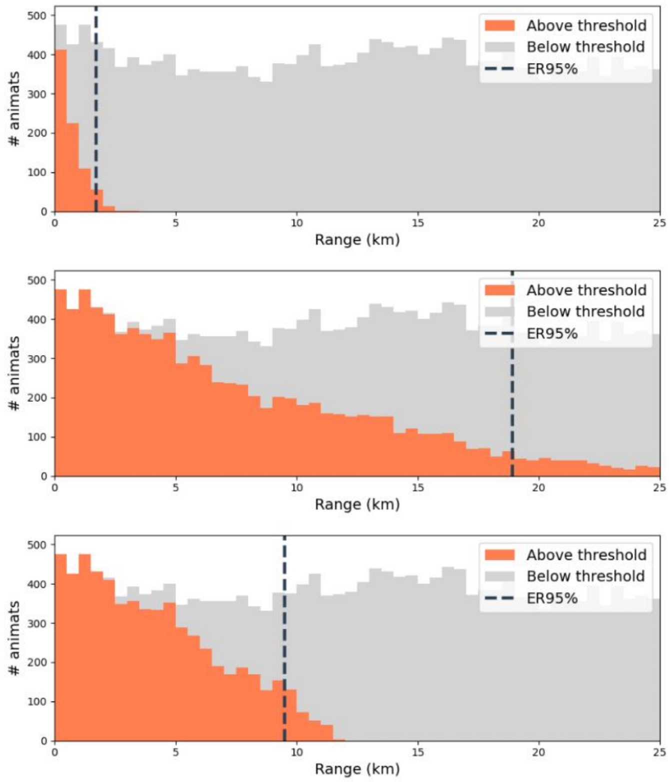

Figure H-3. *Scenario B, female pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

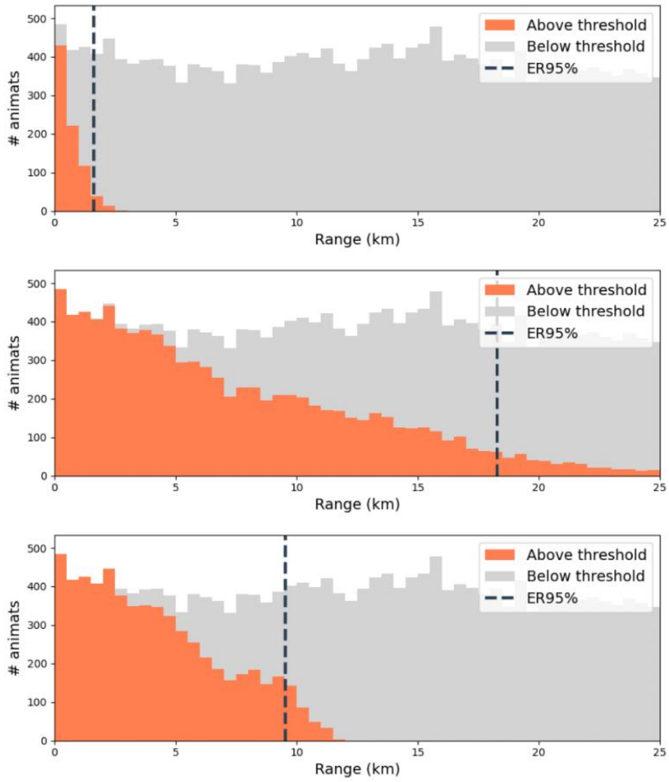

Figure H-4. *Scenario B, male pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

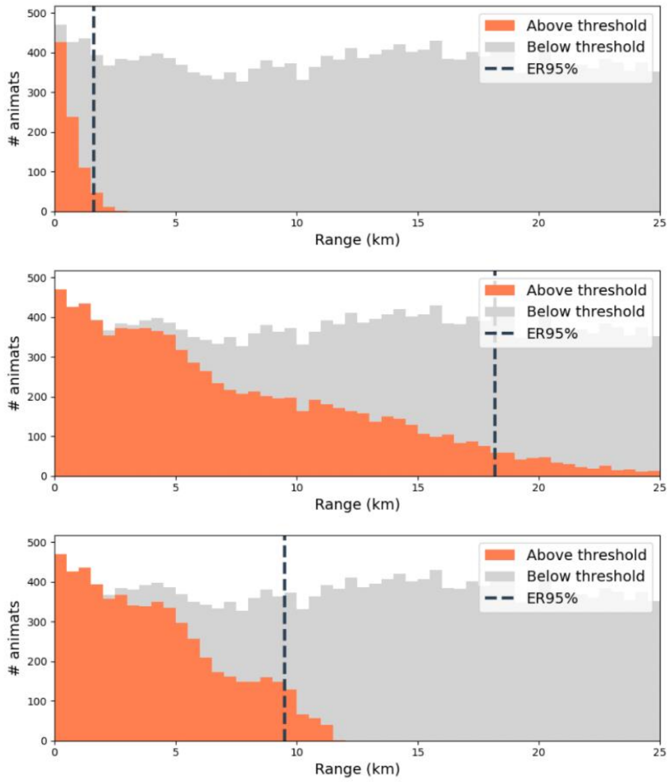

Figure H-5. *Scenario B, female pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

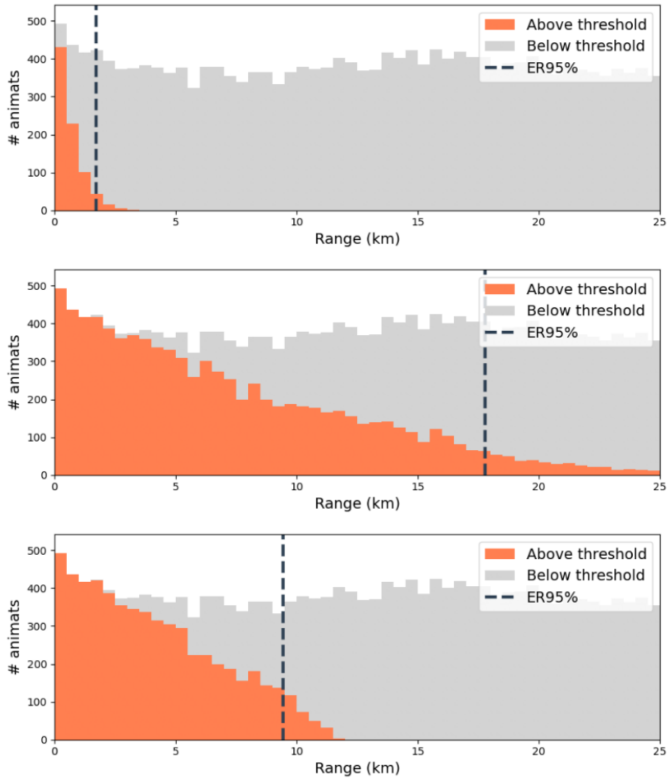

Figure H-6. *Scenario B, male pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

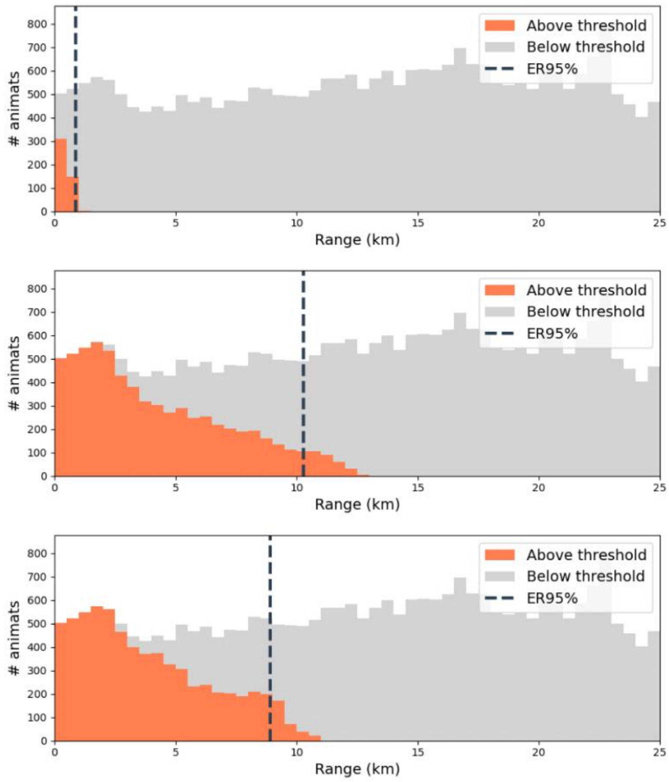

Figure H-7. *Scenario B, migrating southern right whale animats, no calf, unrestricted:* CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

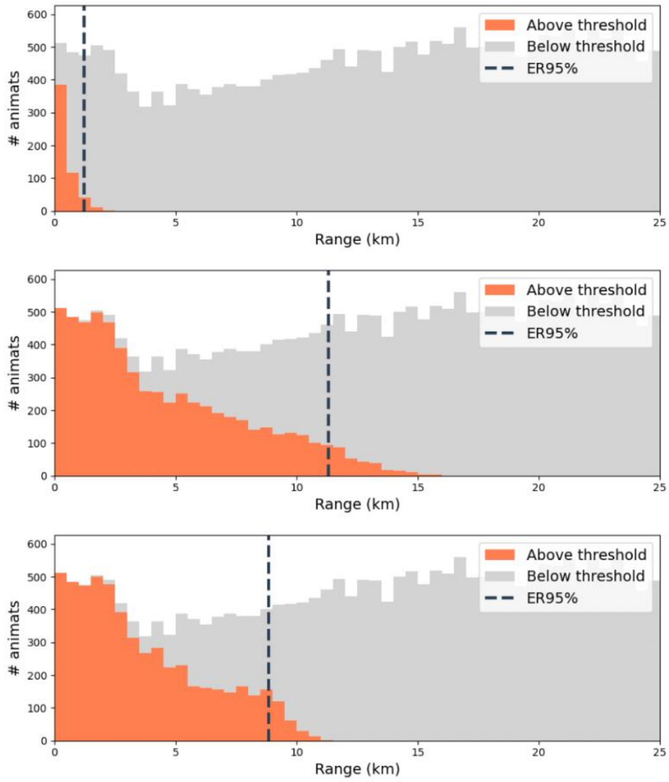

Figure H-8. *Scenario B, migrating southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

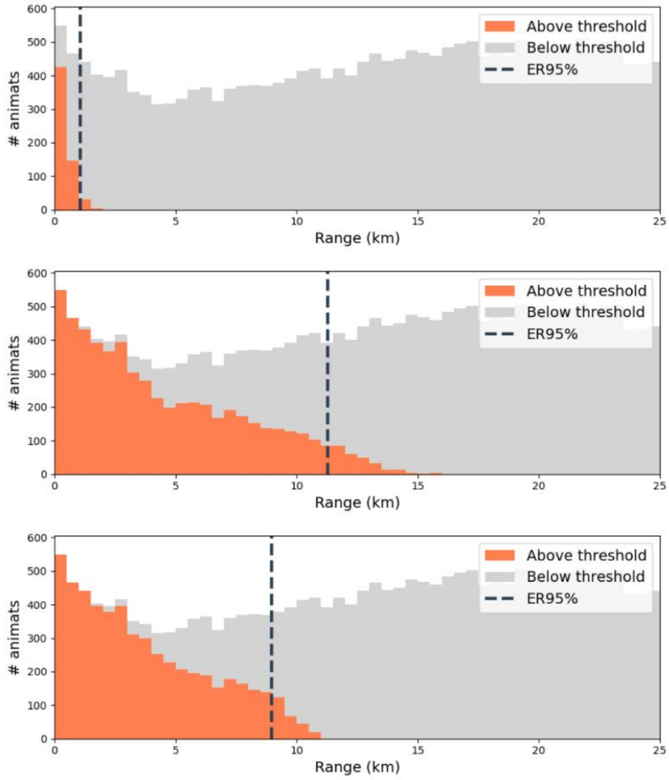

Figure H-9. *Scenario B, reproducing southern right whale animats, no calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

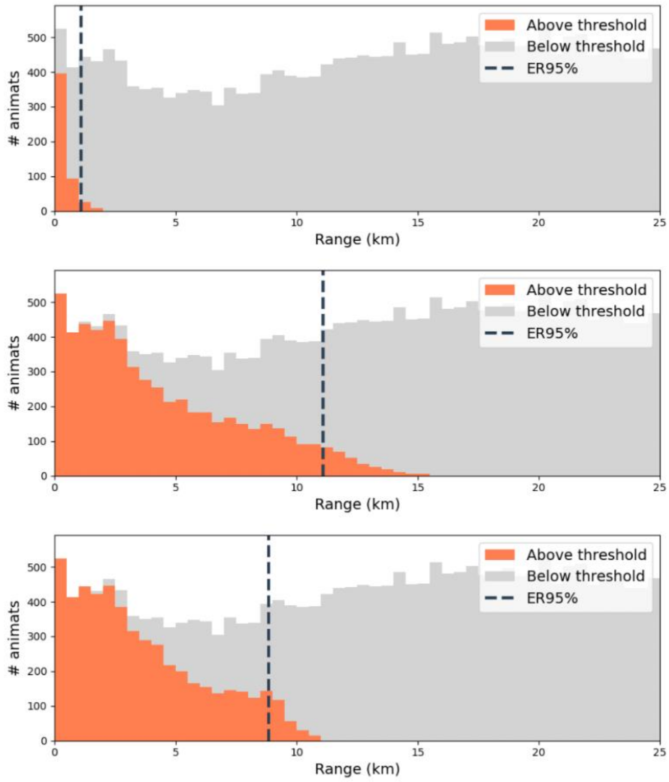

Figure H-10. *Scenario B, reproducing southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

H.2. Scenario C

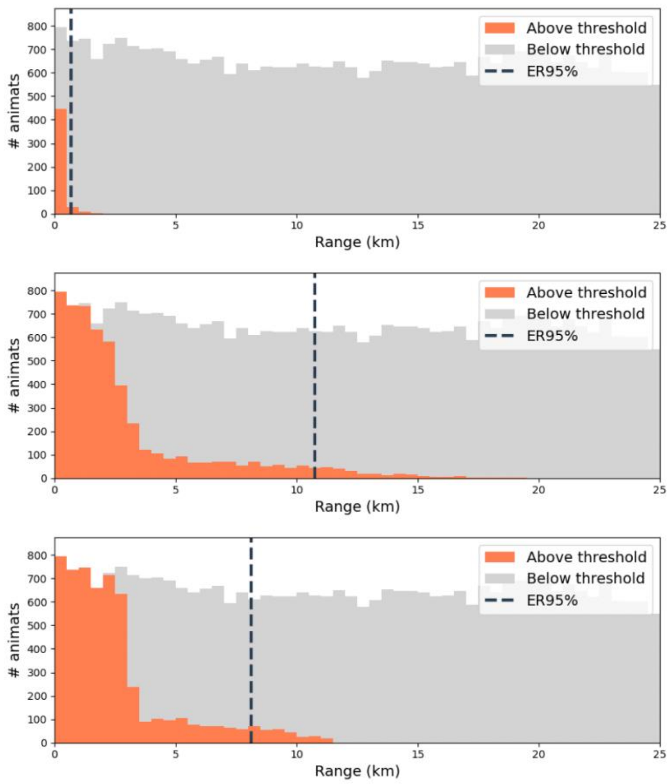

Figure H-11. *Scenario C, female pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

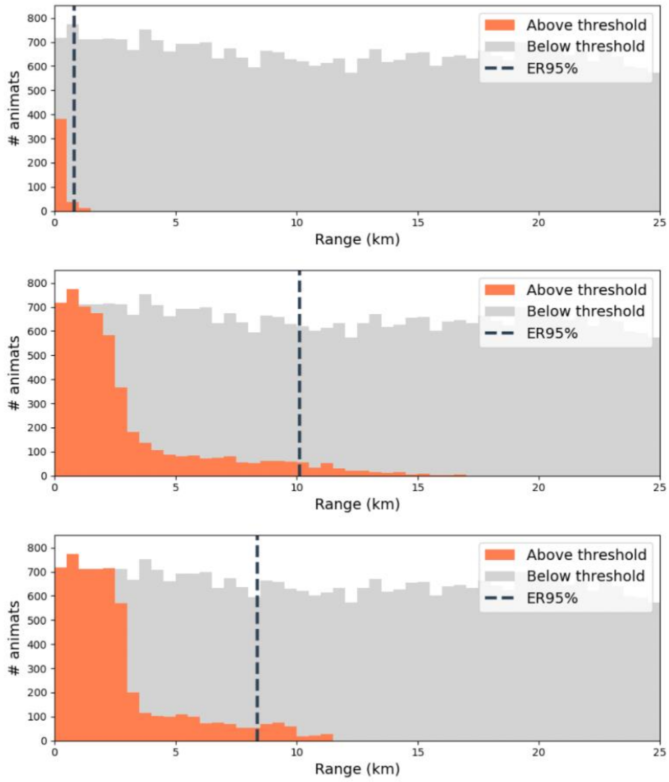

Figure H-12. *Scenario C, male pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

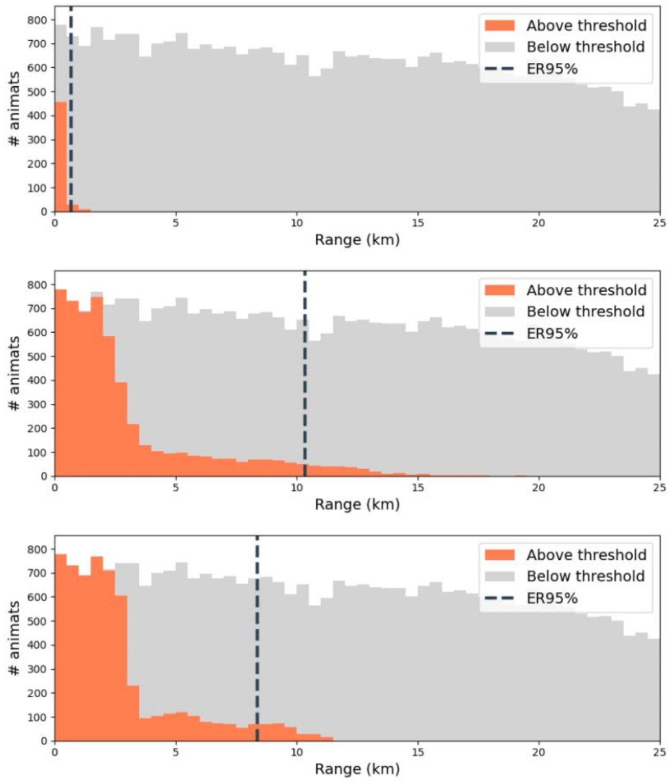

Figure H-13. *Scenario C, female pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

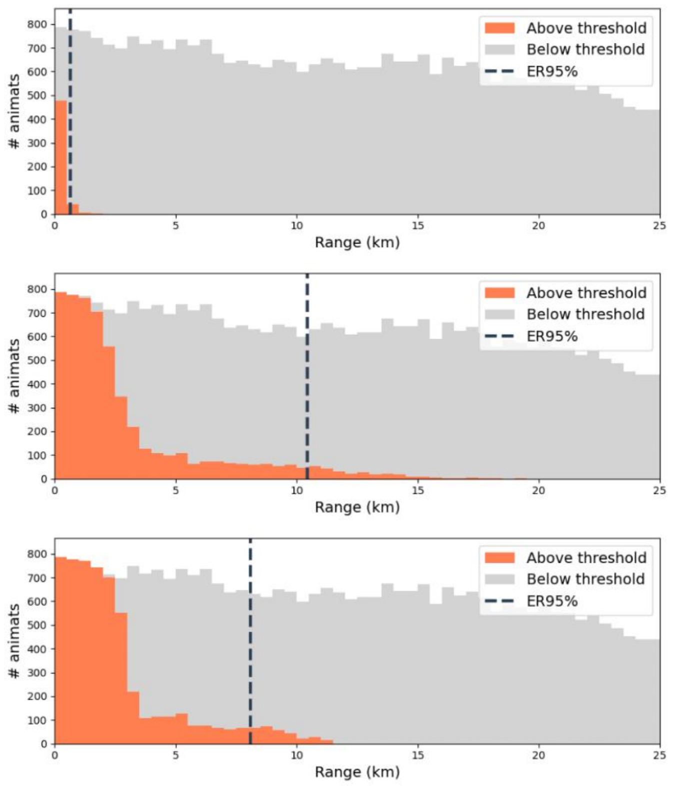

Figure H-14. *Scenario C, male pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

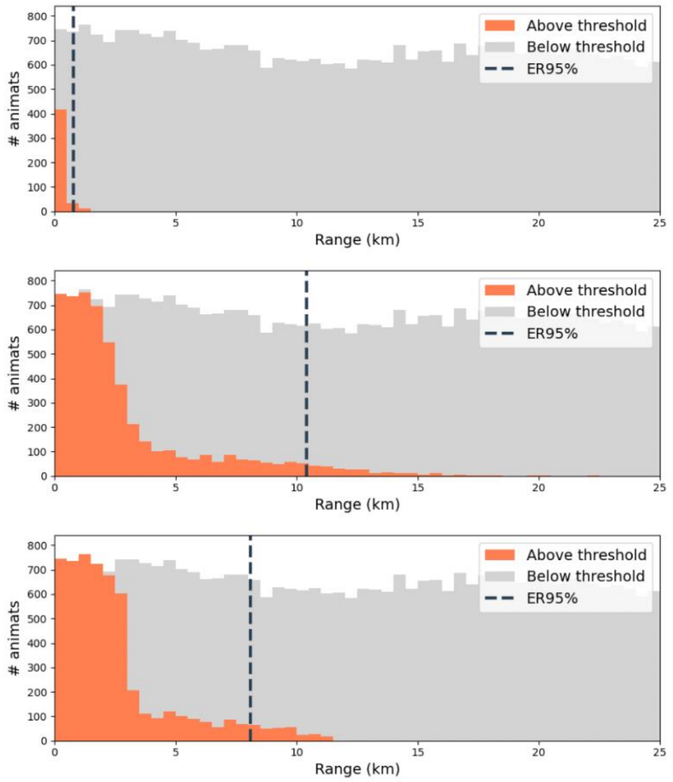

Figure H-15. *Scenario C, female pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

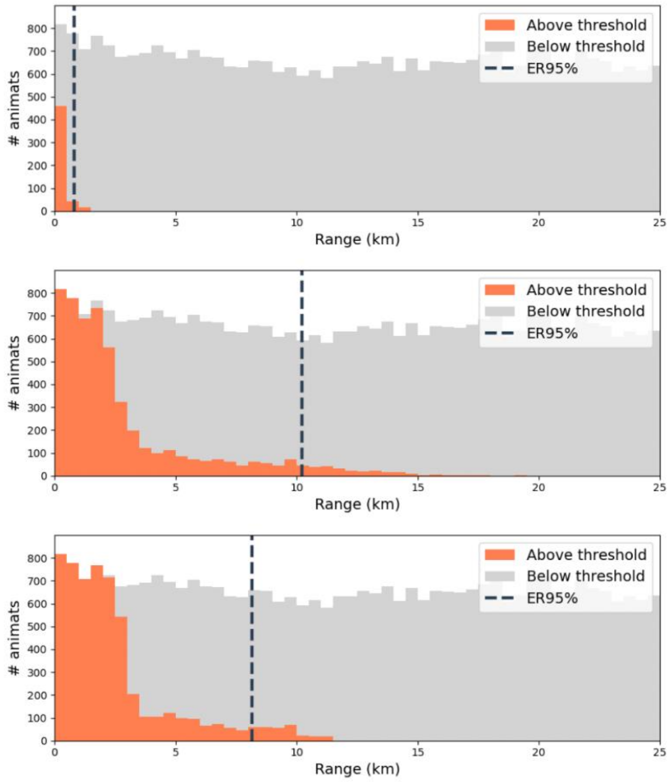

Figure H-16. *Scenario C, male pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

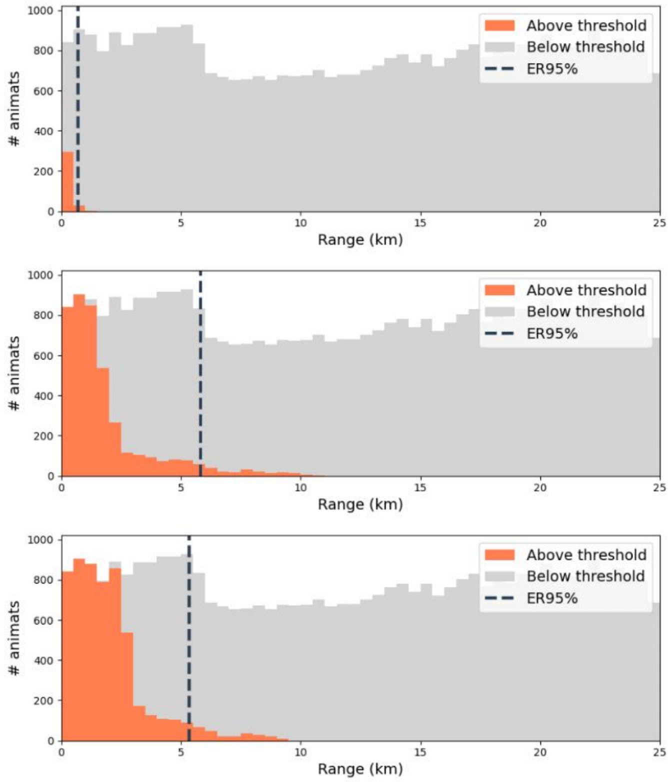

Figure H-17. *Scenario C, migrating southern right whale animats, no calf, unrestricted:* CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

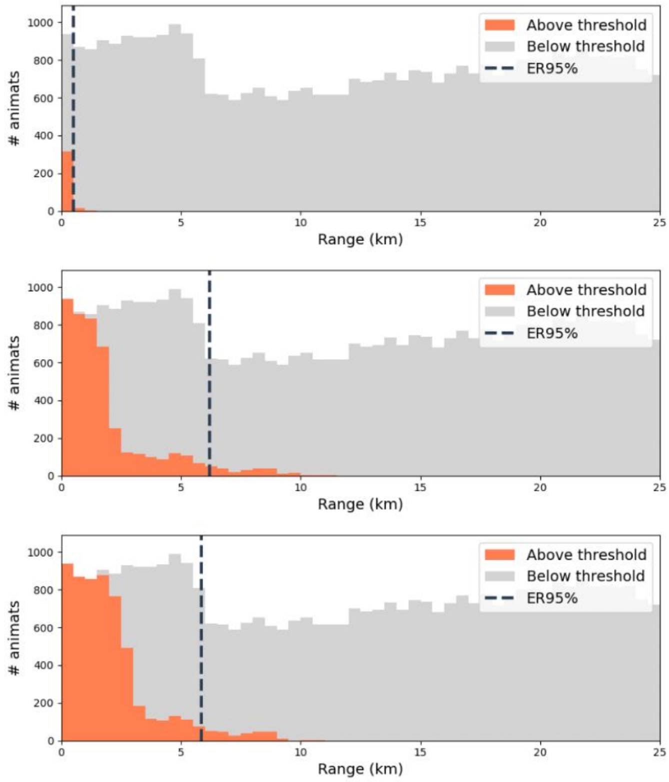

Figure H-18. *Scenario C, migrating southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

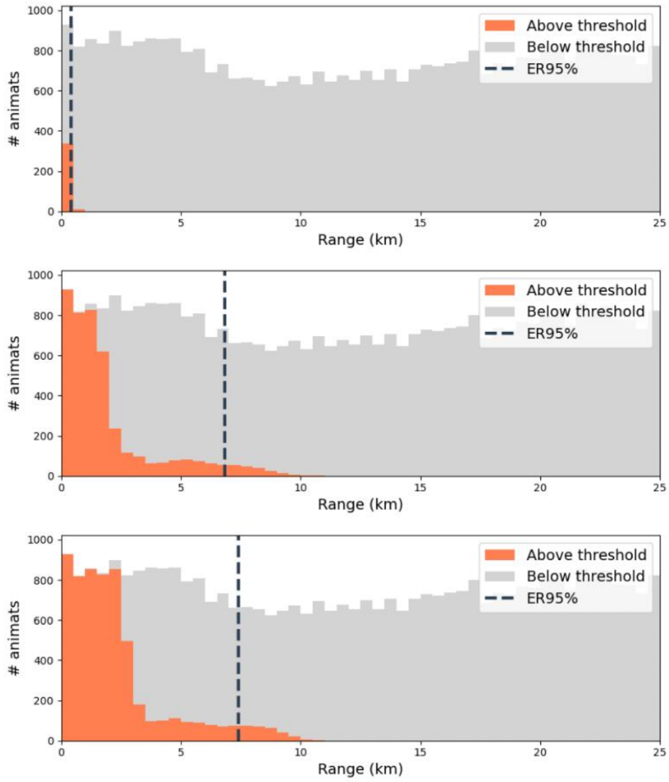

Figure H-19. *Scenario C, reproducing southern right whale animats, no calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

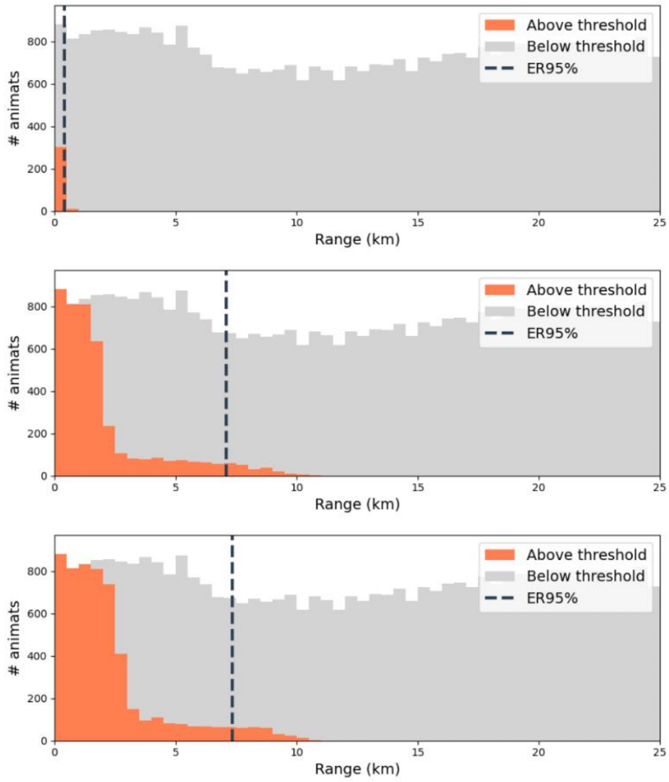

Figure H-20. *Scenario C, reproducing southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

H.3. Scenario D

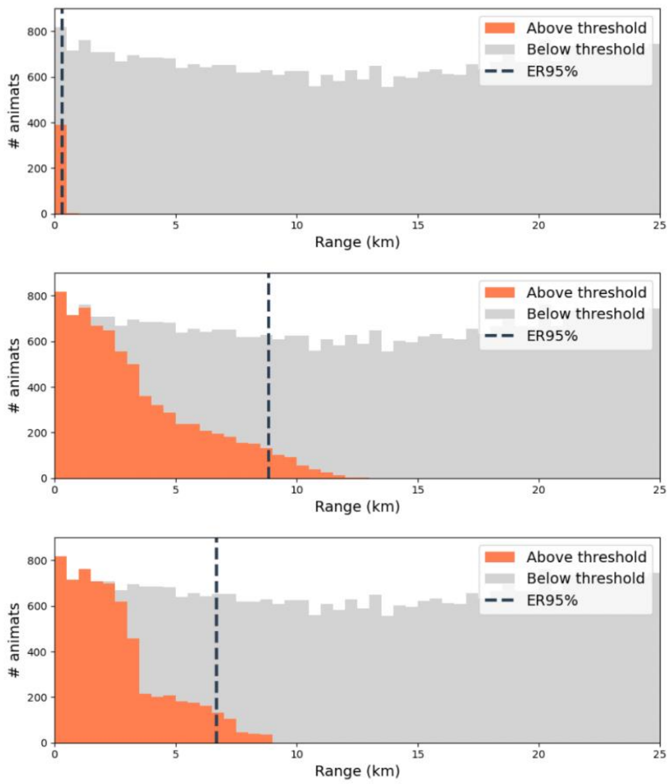

Figure H-21. *Scenario D, female pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

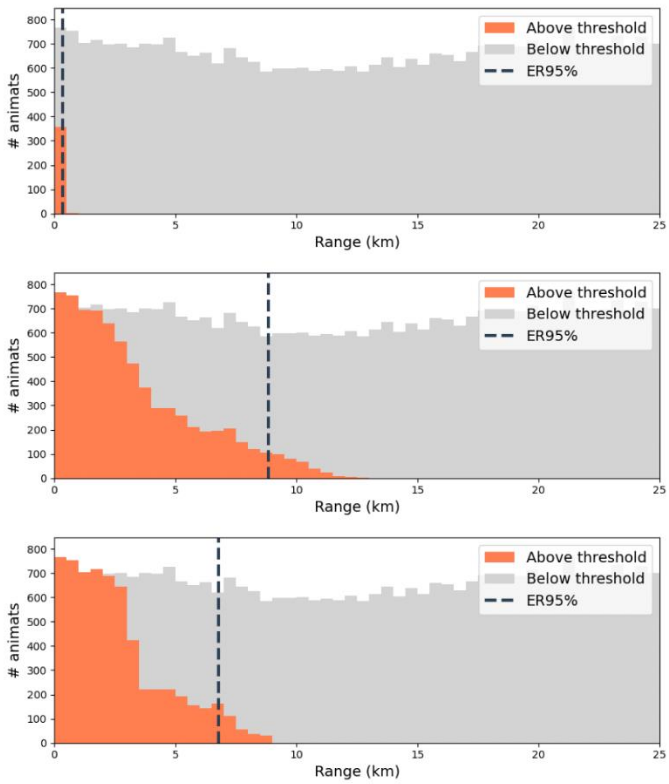

Figure H-22. *Scenario D, male pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

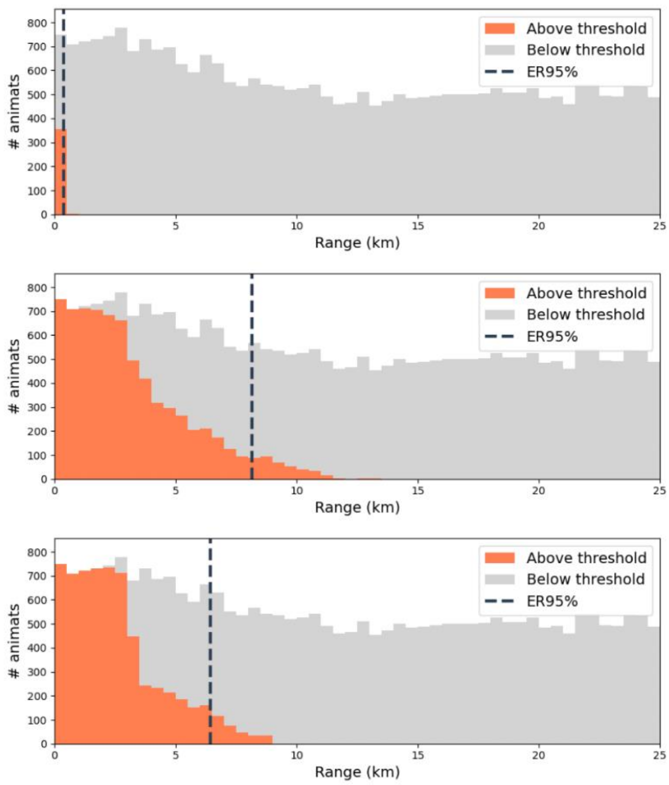

Figure H-23. *Scenario D, female pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

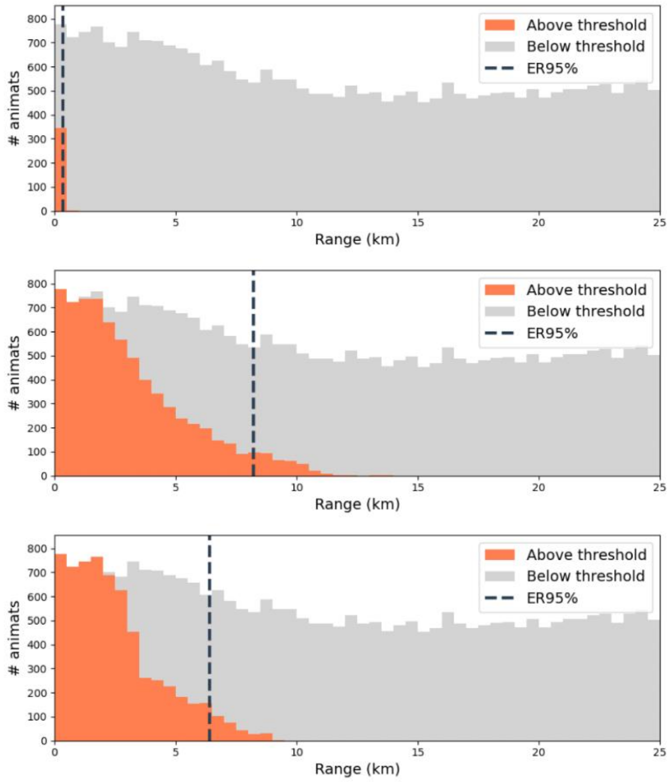

Figure H-24. *Scenario D, male pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

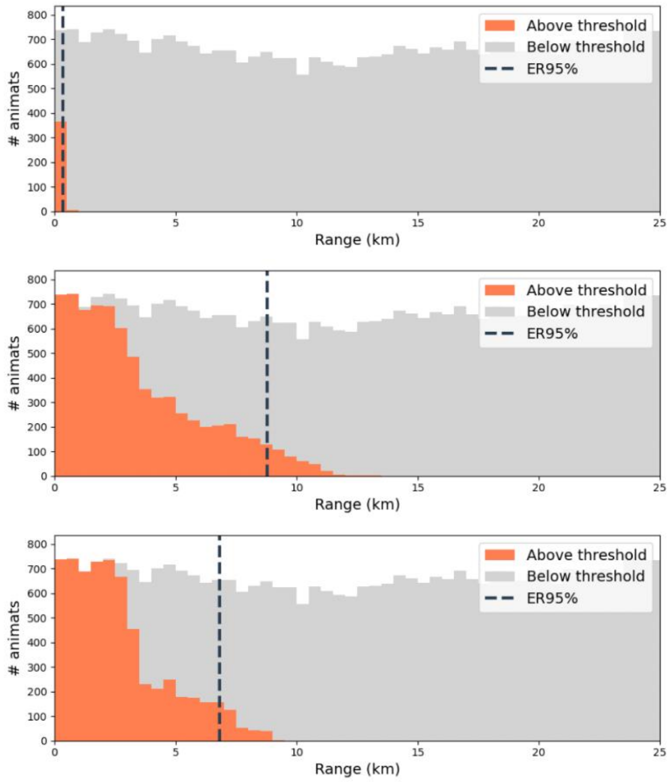

Figure H-25. *Scenario D, female pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

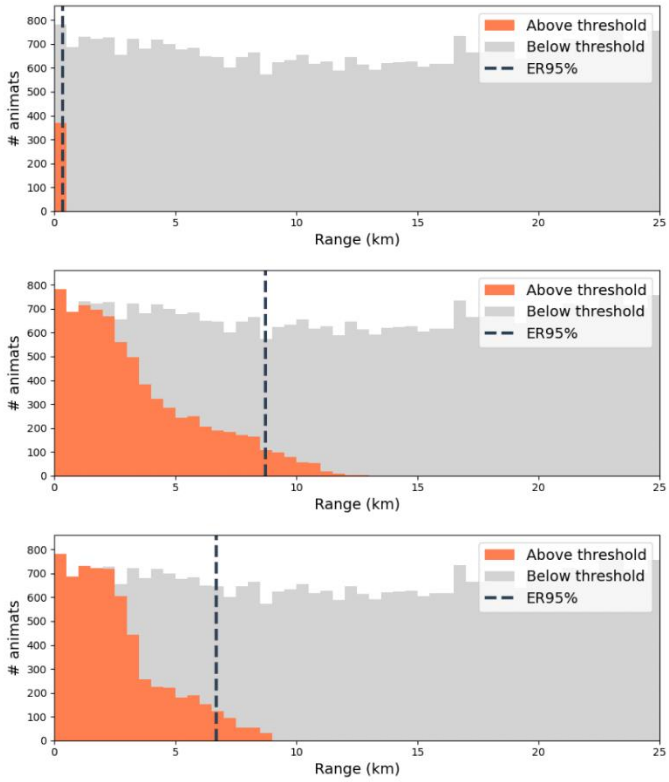

Figure H-26. *Scenario D, male pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

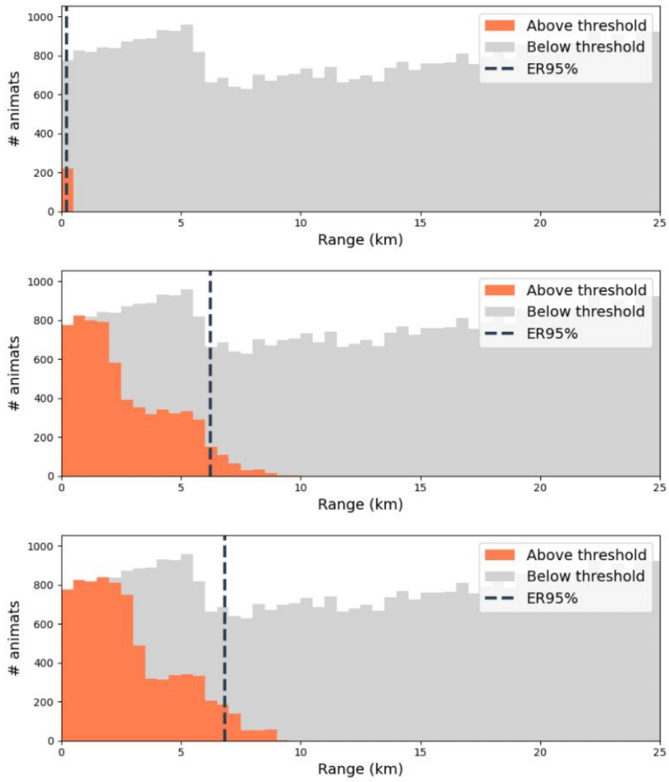

Figure H-27. *Scenario D, migrating southern right whale animats, no calf, unrestricted:* CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

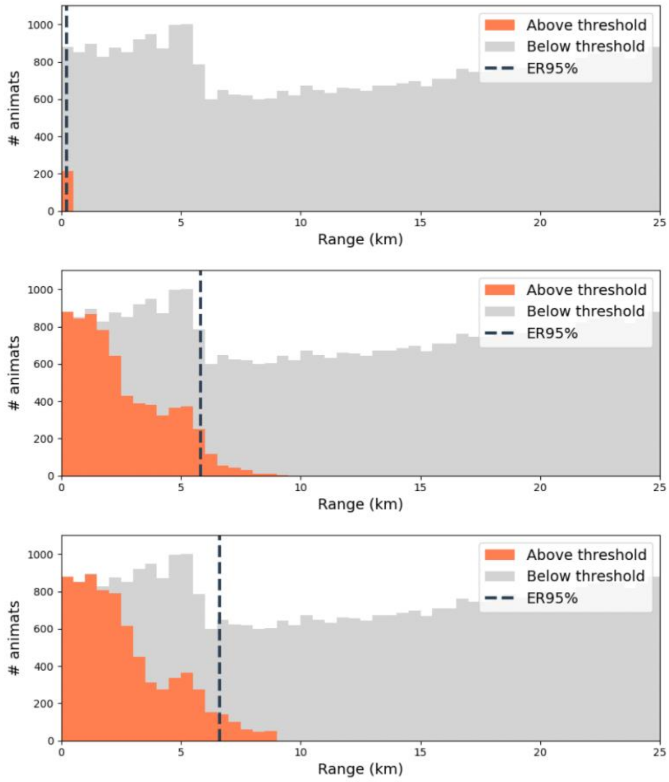

Figure H-28. *Scenario D, migrating southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

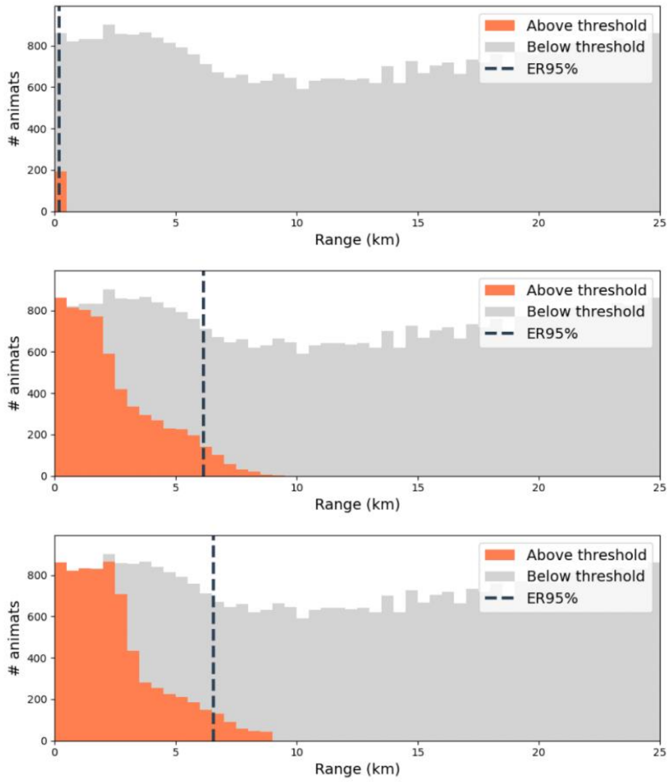

Figure H-29. *Scenario D, reproducing southern right whale animats, no calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

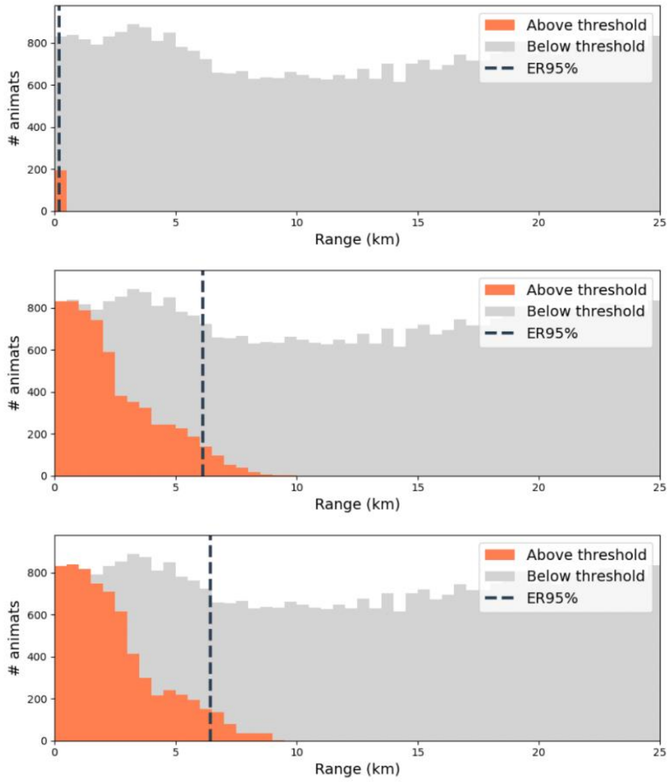

Figure H-30. *Scenario D, reproducing southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

Table of Contents

1 Introduction

Marine fauna use sound in a variety of functions, including social interactions, foraging, orientation, and responding to predators. The type and scale of effect of seismic sound emissions on receptors depends on several factors including the level of exposure, the physical environment, the location of the receptor in relation to the seismic source, how long the receptor is exposed to the sound, the exposure history, how often the sound repeats (repetition period) and the ambient sound level.

This document provides a summary of the available information that will be used to inform the acoustic impact assessment for the Regia Marine Seismic Survey (Regia MSS).

1.1 Overview of Seismic Acoustic Emissions

When underwater objects vibrate, they create sound-pressure waves that alternately compress and decompress the water molecules as the sound wave travels through the sea. Sound waves radiate in all directions away from the source like ripples on the surface of a pond. The compressions and decompressions associated with sound waves are detected as changes in pressure by the receiver.

Sound moves at a faster speed in water than in air because the mechanical properties of water differ from air. The reference level used in air (20µPa @ 1m) was selected to match human hearing sensitivity. A different reference level is used for underwater sound (1µPa @ 1m). Because of these differences in reference standards, noise levels cited in air do not equal underwater levels.

The energy, or intensity (loudness) of a sound is measured on the decibel (dB) scale. It takes about 61.5 times more energy to transmit a sound through air than through water. Because of this energy difference, there is a 61.5 dB difference between sounds transmitted through air and water, such that a sound intensity of 120 dB in water would be equivalent to an intensity of about 60 dB in air (Webb 2023).

Impulsive underwater acoustic emissions will result from the seismic source releasing compressed air (seismic pulse) that creates a sound wave that is directed downwards into the seabed.

Underwater acoustic emissions from a seismic source are characterised by high energy pulses of low frequency sound. The frequency of the sound produced from each seismic pulse is primarily less than 2 kHz, with the highest levels at frequencies in the range of 10-500 Hz (McCauley 1994).

The rate of sound attenuation from the seismic source is dependent on local sound propagation characteristics, including seawater temperature and salinity profiles, water depth, bathymetry and the geoacoustic properties of the seabed (McCauley 1994). While the seismic pulses are directed downwards, horizontal propagation may be detected over long distances due to the high intensity and low frequency properties of the sound.

Sound travels as a wave with the amplitude of the wave related to the amount of acoustic energy it carries. Figure B8-1-1igure B8-11 shows a representative sound wave and the sound metrics used in this studies summary. Table B8-1-1le B8-12 provides definitions of the sound metrics and other sound related terms used in this studies summary.

The particle motion component of sound is also relevant to the assessment of potential impacts to marine fauna. Acoustic particle motion refers to the physical motion caused by a sound wave within the water, seafloor or other medium. Unlike pressure, particle motion is directional in nature, although the actual to-and-fro particle displacements that constitute sound are extremely small, in the order of nanometres (Popper & Hawkins 2018). Particle motion can be described in terms of particle displacement (m), velocity (m/s), or acceleration (m/s-2) (Popper et al. 2014; Carroll et al. 2017). Alternatively, it is sometimes expressed in dB with respect to a reference value of displacement (dB re 1 pm), velocity (dB re 1 nm/s) or acceleration (dB re 1 µm/s^2) (Nedelec et al. 2016).

Particle motion is important because marine invertebrates and most fishes are primarily sensitive to particle motion rather than sound pressure and, therefore, particle motion is the most relevant metric for perceiving underwater sound by invertebrates and most fish species (Popper & Hawkins 2019). It is of less importance to marine mammals as evolution of the mammalian ear operating in air has led to a greater dependence on pressure for hearing sound (Finneran et al. 2002). There is currently limited information available to quantify the particle motion sensitivity of fishes and invertebrates. It is complex and challenging to directly measure particle motion compared to sound pressure, hence most research is presented in the context of sound pressure or exposure levels instead of particle motion (Carroll et al. 2017; Popper & Hawkins 2018).

It should be noted that particle motion is most relevant close to the source where it is the dominant component of a sound wave (i.e., in the near field), while pressure will dominate a sound wave propagating over distance (i.e., in the far field) (Radford et al. 2012; Morley et al. 2014; Nedelec et al. 2016; Popper & Hawkins 2018). Sound pressure levels received at increasing distance from a source do not, therefore, provide a reliable representation of particle motion. Organisms that are sensitive only to particle motion have typically been found to be sensitive only at close range where these particle motions are greatest (Popper et al. 2014; Edmonds et al. 2016; Popper & Hawkins 2018).

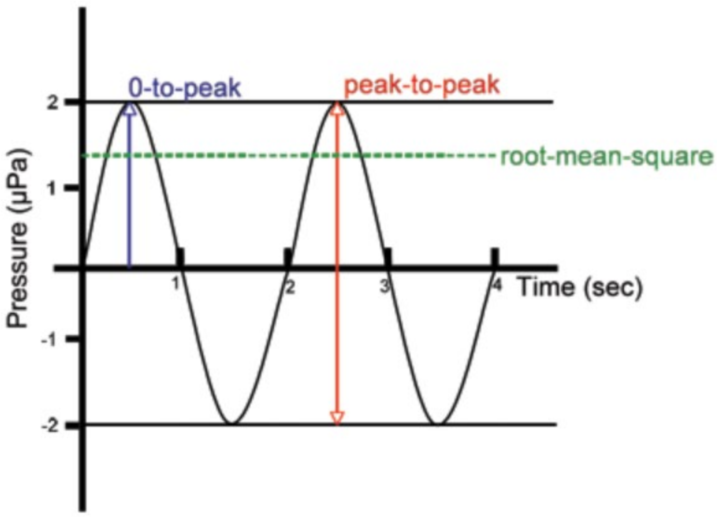

Figure B8-1-1: Simplified Sound Wave and Sound Pressure Metrics (DOSITS 2023)

Table B8-1-1: Underwater Sound Terminology

Term	Definition
0-to-peak or Peak sound pressure level (PK)	The peak pressure, also called the 0-to-peak pressure, is the range in pressure between zero and the greatest pressure of the signal. It is represented by PK and the unit dB re 1 µPa and summarised as dB PK.
Peak-to-peak sound pressure level (PK-PK)	The peak-to-peak pressure is the range in pressure between the most negative pressure and the most positive pressure of the signal. It is represented by PK-PK and the unit dB re 1 µPa or dB re 1 µPa2m2 and summarised as dB PK-PK.
Permanent threshold shift (PTS)	Permanent loss of hearing sensitivity at certain frequencies caused by excessive sound exposure.
Received sound level	The sound level measured at a receiver.

Term	Definition
Root mean square sound pressure level (RMS)	The root-mean-square pressure is the square root of the average of the square of the pressure of the sound signal over a given duration. It is represented by sound pressure level (SPL) and the unit dB re 1 µPa and summarised as dB SPL.
Sound exposure level (SEL)	A measure of the sound energy that considers both received level and duration of exposure. SEL is specified in terms of either single pulse (SEL) or a defined accumulation period (SEL_{cum}). For this assessment 24 hrs is used for the accumulation period and is shown as SEL24h. Units are dB re 1 µPa2 s or dB re 1 µPa2m2s.
Source sound level	The sound pressure level or sound exposure level measured 1 metre from a theoretical point source that radiates the same total sound power as the actual source.
Temporary threshold shift (TTS)	Temporary loss of hearing sensitivity at certain frequencies caused by excessive sound exposure.

2 Assessment Input

2.1 Public Comment

The completed EP was published for public comment on the NOPSEMA website on 25 Jan 2024 for a 30-day period, closing 26 February 2024. Table B8-2-2 shows how this feedback has been incorporated into the environmental assessments.

Table B8-2-2 - Public comment input into the preparation of the EP

Matter: Research on impacts of anthropogenic noise on marine mammals.	M11	CGG has considered these claims and has updated the EP Seismic Studies Report (Appendix B8) Section 8.

3 Zooplankton including Fish and Invertebrate Eggs and Larvae

This section summarises the published studies in relation to seismic acoustic emission studies on plankton and fish and invertebrate eggs and larvae. Plankton is a collective term for all marine organisms that are unable to swim against a current. This group is diverse and includes phytoplankton (plants) and zooplankton (animals), as well as fish and invertebrate eggs and larvae.

Some zooplankton can sense pressure changes to some degree. Swim bladders may also develop during the larval stages of some fish species, rendering larvae susceptible to pressure-related injuries such as barotrauma (Popper et al. 2014). Data on the effects of sound upon eggs and larvae containing gas bubbles is, therefore, largely focused on barotrauma rather than actual hearing. Very few publications have considered the effects of particle motion or vibration on plankton (Popper et al. 2014).

Few studies have found significant negative impacts on zooplankton, fish eggs, larvae, or fry, and most have reported that impacts occur within a few metres or tens of metres from the source (Kostyuchenko 1973; Dalen & Knutsen 1987; Holliday et al. 1987; Kosheleva 1992; as cited in Parry et al. 2002; Pearson et al. 1994; Turnpenny & Nedwell 1994; Booman et al. 1996; Payne et al. 2004; Payne et al. 2009). These studies included exposures to sound pressures up to approximately 242 dB SPL.

Larval stages of fish are often perceived to be more sensitive to stressors than adult stages, but exposure to seismic sound does not appear to result in any differences in larval mortality or abundance for fishes, crabs, or scallops (Carroll et al. 2017).

Kostyuchenko (1973) found up to a 17% increase in mortality of fish eggs of various species exposed to a seismic source, but no effect beyond 10 m. Kosheleva (1992; as cited in Turnpenny & Nedwell 1994) also reported that eggs and larvae died within 1 m of a seismic source producing sound pressures of 220-240 dB SPL, but no injuries were reported at greater distances. Dalen and Knutsen (1987) exposed eggs, larvae and post-larval stages of cod exposed to seismic source elements with source levels of 222 – 231 dB SPL at 1 m. At ranges of 1 – 10 m from the source, some specimens indicated temporarily impaired balance following exposure but with rapid recovery. Mortality was only observed in just one of the three exposure experiments, with 90% mortality when exposed at 2 m from the seismic source, but no significant impacts at 6 m from the seismic source. Overall, there was no significant change in the survival of eggs.

Holliday et al. (1987) obtained mixed results during studies undertaken over a two-year period, with eggs and larvae exposed to sound pressures of 221 – 235 dB SPL at 1.5 m from a seismic source. Either no significant impact was observed or a 9% reduction in the survival of eggs. Pearson et al. (1994) reported no effects to crab larvae exposed to sound pressures up to 231 dB SPL at 1 m from a seismic source. Booman et al. (1996) exposed fish eggs and larvae to sound pressures of 220 – 242 dB SPL. High rates of mortality were observed at distances of 1.4 m from the seismic source, but low or no mortality rates at distances of 5 m.

In a review of the above studies, Payne et al. (2004) noted that injury and mortality to eggs and larvae is likely to be limited to within 5 m of the seismic source. Payne et al. (2009) found no statistical differences between controls and exposed larvae following exposure to mean sound pressure levels of 205 dB PK-PK, positioned 0.5 m from the seismic source element.

Parry et al. (2002) undertook studies on the effects of a marine seismic survey on scallop fisheries in Bass Strait, including on larvae. This study was undertaken in December 2001 and February 2002 during a 3D marine seismic survey undertaken by Esso Australia in the Gippsland Basin, which used a 3,542 m^3 source towed 6 m below the sea surface. Plankton samples (impact and duplicate) were collected from five sites located 500 m apart in water depths of 55 m in a Before-After-Control-Impact (BACI) experimental study. The study results found few bivalve larvae in the live plankton samples and there was no significant difference in the number of bivalve larvae found in samples collected before and after passage of the seismic vessel (the same was true for all planktonic taxa). Parry et al. (2002) postulated that invertebrates that do not contain gas spaces (like swim bladders in fish) appear to be very resilient to seismic pulses. The research also notes that while the study does not exclude the possibility that some changes to planktonic communities resulted from the seismic survey, the failure to detect any impacts occurred because impacts were small. Parry et al. (2002) also indicated there is no evidence of mortality-associated population effects such as reduced abundance in plankton a few hours after exposure.

Pearson et al. (1994) exposed crab larvae to single pulses from a seismic source array (840 m^3) with a measured sound pressure level of 231 PK-PK at 1 m. For immediate and long-term survival and time to moult, this study did not reveal any statistically significant differences between the exposed and unexposed larvae, even those exposed within 1 m of the seismic source.

Impacts to scallop larvae have been identified following intense and lengthy periods of exposure to low-frequency sound. Tank experiments by Aguilar de Soto et al. (2013) showed evidence of morphological abnormalities in early-stage scallop larvae from simulated seismic signals for a 6,920 in^3 seismic source. However, the lengthy exposure period of 3 second pulse intervals for an exposure duration of 90 hours and at 1 m distance from sound source is not realistic of an actual survey. Christian et al. (2003) found major developmental differences between control and treatment groups of snow crab eggs exposed to a peak pressure level of 216 dB SPL every 10 seconds for 33 minutes. Again, the exposure to a constant peak pressure level for a prolonged period is not realistic of an actual survey where the source is moving and so does not remain in one place.

Hawkins (2014) used continuous sonar to record zooplankton layers, comprising copepods, cladocerans, decapod larvae, gastropod larvae, and bivalve larvae, exposed to playback of pile driving sound (pile driving sound typically has a more rapid rise time, more frequent strike rates and therefore a greater sound exposure regime than a seismic survey). Zooplankton layers responded to sound by showing a 'dent' in the top of the layer at the onset of the sound sequence, although the change in depth often did not persist for the whole duration of the sound exposure and zooplankton distribution quickly returned to normal.

Day et al. (2016a) found no effects on the mortality, abnormality, competency, or energy content of lobster larvae after exposure of early embryonic stages to seismic exposure. In this study, egg-bearing female southern rock lobsters (*Jasus edwardsii*) were exposed to signals from three air gun configurations, all of which exceeded sound exposure levels (SEL) of 185 dB re 1 $\mu Pa^2 \cdot s$ (209-212 dB PK-PK). Lobsters were maintained until their eggs hatched and the larvae were then counted for fecundity, assessed for abnormal morphology using measurements of larval length and width, tested for larval competency using an established activity test and measured for energy content. Overall, there were no differences in the quantity or quality of hatched larvae, indicating that the condition and development of spiny lobster embryos were not adversely affected by air gun exposure. Day et al. (2016a) detailed that the results suggest that embryonic spiny lobster are resilient to air gun signals and highlight the caution necessary in extrapolating results from the laboratory to real world scenarios or across life history stages.

Based on the studies discussed above, physical impacts to planktonic organisms have typically been found to be limited to within approximately 10 m of the seismic source. Using this 10 m impact range, a study by McCauley (1994) calculated the impact in a seismic survey area, assuming plankton mortality of 100% within 10 m of a seismic source. This suggested that the total mortality due to seismic testing would impact less than 1% of plankton in the survey area. DNV Energy (2007) and Hawkins & Popper (2012) conducted comprehensive reviews of a number of scientific studies, including those by Kostyuchenko (1973), Dalen & Knutsen (1987), Booman et al. (1996) and Saetre & Ona (1996); the effects of seismic activities on eggs and larvae were predicted to result in average and worst-case mortality rates of 0.0012% and 0.45% per day respectively, which were not deemed significant when compared to a natural mortality rate of 5-15% per day, as applicable to most species during early life stages. Natural mortality rates in larvae can be much higher than this—exceeding 50% per day in some species and commonly exceeding 10% per day (Tang et al. 2014). For example, in a review of mortality estimates (Houde & Zastrow 1993), the mean mortality rate for marine fish larvae was M = 0.24, a rate equivalent to a loss of 21.3% per day.

In 2014, noise effect criteria for fish eggs and larvae were established by the American National Standards Institute (ANSI) accredited report of sound exposure guidelines for fishes and sea turtles (Popper et al. 2014). The criteria from Popper et al. (2014) are from an offshore pile driving study by Bolle et al. (2012) that indicated no damage was caused by simulated repeated pile driving (100 strikes at 100 m) of 210 dB SEL_{cum}. Popper et al. (2014) also detailed that other studies suggest that eggs and larvae in proximity (<5 m) to a seismic source are likely to suffer mortality and tissue damage (Kostyuchenko 1973; Booman et al. 1996). Sætre and Ona (1996) concluded that mortality rates caused by exposure to seismic source sounds are so low compared to natural mortality that the impact from seismic surveys must be regarded as insignificant.

However, a study by McCauley et al. (2017) received notable attention for suggesting the potential for zooplankton mortality to increase two- to three-fold out to 1.2 km from a single seismic source element, with an estimated decline in zooplankton abundance of up to 64% and a "hole" in the zooplankton backscatter observed via acoustic detection methods. The 1.2 km range corresponded with pressure levels of 178 dB PK-PK (McCauley et al. 2017). However, the extent of such impacts is inconsistent with previously and subsequently documented effects to plankton.

The findings of this study have been questioned by several reviews (Richardson et al. 2017; IAGC 2017; Fields et al. 2019) particularly in relation to:

- There was no evidence of attenuation of impacts with distance from the source with no consistent decline in the proportion of zooplankton that were killed with increasing distance from the source.
- Sonar backscatter data indicated an immediate decline in zooplankton abundance (the "hole" in the data). However, if the zooplankton had been killed, they would not have sunk from the surface layers of the water column immediately, suggesting that some zooplankton may have moved, or they may have simply reorientated themselves to the sonar in response to the seismic pulses, which raises questions over the occurrence, magnitude, and extent of mortal impacts.
- The study was based on a relatively small number of tow samples on two separate days. On the second day, even before the use of the seismic source element, the zooplankton net tow abundance counts were significantly lower than the first day and, therefore, it is difficult to draw reliable conclusions from these data. On the second day almost all values at 80 m range presented greater plankton abundance from exposed samples and lower abundance of control samples, indicative of a potential flaw in the sampling scheme and analysis protocol.

The McCauley et al. (2017) study was undertaken in early March 2015, using two replicated experiments in Storm Bay in southeast Tasmania. It involved the deployment of acoustic noise loggers to measure air gun signals and used an acoustic source volume of 150 in^3 and operating pressure of 2,000 psi. The study measured zooplankton abundance and the proportion of the population that was dead at three distances from the acoustic source - 0, 200 and 800 m. The experiment estimated the proportion of the zooplankton that was dead, both before and after exposure to acoustic source sound, using net samples to measure zooplankton abundance, and bioacoustics to identify the distribution of zooplankton. In this study, copepods dominated the mesozooplankton (0.2-20 mm), and impacts were not assessed on microzooplankton (0.02-0.2 mm) or macrozooplankton (>20 mm). There was movement of water through the experimental area, which made interpreting their results more difficult (Richardson et al. 2017).

The results of the experiment found that zooplankton exposure to acoustic sources increased the mortality rate from a natural level of 19% per day to 45% per day (on the day of exposure), with this mortality rate observed out to 1.2 km. This is more than two orders of magnitude greater than the 10 m previously assumed (McCauley et al. 2017). These results escalated the concerns that some stakeholders had about the effects of marine seismic surveys on plankton, particularly fishers and conservation groups.

This study postulates that the external sensory hairs that zooplankton possess may be extremely sensitive and in response to seismic sound, may 'shake' to the point where damage could accrue to sensory hairs or tissue. Importantly, the study notes that for anthropogenic sources to have significant impacts to plankton at an ecological scale, the spatial or temporal scale of the impact (i.e., the seismic survey) must also be large when compared to the impacted ecosystem.

In response to this research, the Australian Petroleum Production and Exploration Association (APPEA) commissioned the Commonwealth Scientific and Industrial Research Organisation (CSIRO) to assess the potential local and regional impacts on zooplankton of a typical marine seismic survey. A large-scale marine seismic survey conducted on the North West Shelf of Australia was modelled in a hydrodynamic model using the McCauley et al. (2017) results, as reported in Richardson et al. (2017). The modelled survey parameters include a survey area of 2,900 km^2, 60 survey lines, waters 300 - 800 m deep, an acoustic source of 3,000-3,200 m^3 and operating pressure of 2,000 psi. This paper reports that impact is recorded within the survey area and within 15 km of it, but that these impacts are not discernible at the bioregional scale and barely discernible within 150 km of the survey area. Zooplankton populations recovered quickly after seismic exposure due to their fast growth rates and due to the dispersal and mixing of zooplankton from both inside and outside of the impacted region. The modelling undertaken by Richardson et al. (2017) found that while there was a maximum decline of 22% in zooplankton populations in the survey and a 14% decline within 15 km of the survey area, it took only three days following the completion of the survey for zooplankton biomass to recover to pre-seismic survey levels within the survey area and within an area of 15 km around the survey area. The study notes that because zooplankton growth rates are slower in colder regions (e.g., Bass Strait), the recovery rate of zooplankton populations following exposure to a seismic survey is likely to be slower in colder waters. It is important to note that Fields et al. (2019) and IAGC (2017) noted that the findings of McCauley et al. (2017) (which were used in Richardson et al. 2017) may provide an overly conservative estimate of the potential effects of seismic pulses to zooplankton.

Independently of the APPEA/CSIRO study, the International Association of Geophysical Contractors (IAGC) conducted its own review of the McCauley et al. (2017) study. This review came to the following conclusion: "*While we found the study interesting, we are also troubled by the small sample sizes, the large day-to-day variability in both the baseline and experimental data, and the large number of speculative conclusions that appear inconsistent with the data collected over a two-day period. Both statistically and methodologically, this project falls short of what would be needed to provide a convincing case for adverse effects from geophysical survey operations*." (IAGC 2017).

An assessment of zooplankton was undertaken to determine pre- and post-seismic survey abundance of zooplankton at sites within CarbonNet's Pelican Marine Seismic Survey area in the Gippsland Basin and at reference sites during January and February 2018. Pre-seismic survey plankton samples collected were dominated by copepods, cladocerans and salps while post-seismic survey plankton samples were dominated by the dinoflagellate *Noctiluca scintillans*. Other groups present included siphonophores, fish larvae, fish eggs, polychaetes, ghost shrimps and cnidarians. There was variance between and within assessments, with samples exhibiting levels of diversity and abundance typical of healthy temperate coastal waters. Neither lobster nor scallop larvae were present in any of the samples assessed (CarbonNet 2018).

A study by Fields et al. (2019) exposed the copepod (*Calanus finmarchicus*) to seismic pulses at various distances up to 25 m from a seismic source. The source levels produced were estimated to be 221 dB SEL comparable to the far-field source levels associated with some commercial scale seismic surveys. The study observed an increase in immediate mortality rates of up to 30% of copepods in samples compared to controls at distances of 5 m or less from the seismic source. Mortality one week after exposure was significantly higher by 9% relative to controls in the copepods placed 10 m from the seismic source. Fields et al. (2019) also reported that no sublethal effects occurred at any distance greater than 5 m from the seismic source. The findings of the study are consistent with numerous other field studies, as referenced previously, indicating that the potential effects of seismic pulses to zooplankton are limited to within approximately 10 m from the seismic source. Fields et al. (2019) detailed that it is difficult to reconcile the high mortality reported by McCauley et al. (2017) with the low mortalities reported in the body of earlier studies and in the experiment they undertook. Fields et al. (2019) details that it is possible that their results can be attributed to *C. finmarchicus* having a high tolerance to air gun impulses and that other species would be more sensitive. Other possible causes for the high mortality observed by McCauley et al. (2017) could be bubbles because of cavitation or small-scale shear produced by the sampling boat, unrelated to the air gun impulses.

Day et al. (2021, 2022) undertook a study to determine whether early development and recruitment of southern rock lobsters puerulus and juveniles might be affected by exposure to seismic sound by assessing mortality rates following exposure; impairment of the righting reflex, and development through assessment of progression through the moult cycle. This study also undertook to respond to the finding by McCauley et al. (2017) of increased mortality in zooplankton following exposure to air gun signals that suggests that planktonic, early life stages of marine invertebrates may be more vulnerable than adults or developing embryos. Outcomes of this study are detailed in the section below on crustaceans.

Vereide et al. (2023) conducted a field experiment to assess mortality and naupliar body length of the calanoid copepod (*Acartia tonsa*) when exposed to an air gun array discharge. The air gun array treatment consisted of two 40 in^3 air guns fired at a pressure of 110 bar every 10 seconds for three hours. The air gun array was towed at 2 knots at a depth of 3–4 m along an oval transect (3 nm in total) by the research vessel *H.U. Sverdrup II*. The vessel sailed between 50 m and 1,220 m from the line holding the bags. During the boat control treatment, *H.U. Sverdrup II* followed the same transect without discharging the air guns. The boat control treatment was included to control for the sound generated by the vessel itself.

The sound exposure level (SEL) was 152 dB re 1 μPa^2 s furthest away and 183 dB re 1 μPa^2 s at the closest distance. Nauplii were placed in plastic bags and attached to a line at a depth of 6 m. For each treatment, three bags of nauplii were exposed to one of three treatments for 2.5-hours: Air gun array discharge, a boat control, or a silent control. After exposure, nauplii were kept in filtered seawater in the laboratory without food. The immediate mortality was significantly higher in the air gun array treatment than in the silent and boat control treatments. On average, 13.5 ± 3.8% of the nauplii in the air gun array exposed treatment died immediately after exposure, compared to 3.4 ± 1.3% in the silent control and 2.6 ± 1.7% (mean ± SD) in the boat control. There was a significant difference in delayed mortality between the treatments. On days 1 and 2 after exposure, nearly all of the nauplii from the control groups were alive, while 27.0 ± 14.2% and 14.8 ± 14.2% of the air gun array exposed nauplii had died in the aliquots from day 1 and day 2, respectively. Mortality started occurring from day 3 (5.7 ± 10.1%, boat control) and 4 (9.4 ± 14.4%, silent control) in the control treatments but with lower mortality than in the air gun array exposed treatment (day 3, 47.5 ± 19.2% dead nauplii). In the aliquots from days 5 and 6 after the treatments, almost all of the air gun array exposed nauplii were dead, in contrast to the control groups, in which the proportion of dead nauplii was 49.2 ± 12.0% on day 5, and 72.6 ± 21.8% day 6 in the silent control and 4.0 ± 10.1% on day 5 and 48.4 ± 17.9% on day 6 in the boat control.

There was a significant interaction between treatment and time (days) on the body length (µm) of the nauplii, with lower growth from day 1–4 in the air gun array exposed treatment than in the control treatments. On day 1 after treatment, the average body length was 125 ± 10 µm. After four days, the average body length in the air gun array exposed nauplii was 128 ± 7 µm, which differed from the silent control (144 ± 8 µm) and the boat control (146 ± 7 µm). Over the first four days after exposure, the growth rates were 1.7 (4.1% in total), 5.4 (12.5%), and 6.1 per day (18.7%) in the air gun array exposed, silent control, and boat control, respectively. Naupliar development stages (NI–NIV) were positively correlated with body length (µm). In all treatments, >50% of the nauplii reached stage NII one day after exposure. By day 4, 43 ± 26.9% of the air gun array exposed nauplii were still in NI, compared with 11 ± 12.7% in the silent control and 1 ± 3.6% in the boat control. Only four individuals reached stage NIV: 3 in the silent control and 1 in the boat control.

Immediate mortality in the air gun array exposed nauplii was approximately 14% compared to less than 4% in the silent and boat control. Similarly, there was higher mortality in the air gun array exposed nauplii up to six days after exposure compared to the control treatments. Nearly all of the air gun exposed nauplii were dead after four days, while >50% of the nauplii in the control treatments were alive at six days post-exposure. There was an interaction between treatment and time on naupliar body length, indicating lower growth in the nauplii exposed to the air gun discharge. These experiments indicate that the output of two small air guns affected mortality and growth of the naupliar stages of *Acartia tonsa* in close vicinity to the array.

Vereide et al. (2023) concluded:

- The results of this study suggest that air gun array discharges affected the growth and mortality of *Acartia tonsa* in early naupliar stages. However, the degree of impact is likely to be stage- and species-specific and may be difficult to separate from background mortality.

- The results observed are consistent with many previous studies that show small effects of air gun discharges on zooplankton mortality. For example, no effects were detected in bivalve larvae sampled 2 km away from the source after exposure to air gun discharges (Parry et al. 2002) or in adult scallops sampled up to 1 km from the source shortly after exposure (Harrington et al. 2010). Similarly, Fields et al. (2019) reported that the mortality of the copepod *Calanus finmarchicus* adults to a two air gun array discharge increased (<5%) compared to that of the control groups, but only at <10 m from the air guns and no effects at distances from 10 to 50 m.

- There were notable differences in these results from previous studies. For example, in contrast to Fields et al. (2019), this study found significantly higher mortality in the exposed animals compared to the controls at distances of 50–~1,200 m. Although the sound exposure levels were higher in Fields et al. (2019) than those in this study, the animals in this study were exposed to multiple air gun discharges that resulted in a cumulative exposure that lasted much longer. The cumulative exposure of multiple blasts coupled with the younger stage used in this study may help to explain the higher mortality.

- Despite the higher mortality, the immediate mortality observed in this study is much lower than the 50% mortality in zooplankton at >1 km from the source (McCauley et al. 2017). Even though the absolute immediate mortality was lower than that reported by McCauley et al. (2017), the relative increase in mortality compared to the controls was somewhat greater in this study (greater than three-fold increase) than in McCauley et al. (2017) (two-to three-fold increase). However, in McCauley et al. (2017), the mortality in the controls was ~20% compared to less than 4% in this study.

- In this study, the mortality rate in nauplii directly after exposure was lower than the natural mortality rates observed in *Acartia* nauplii (up to 0.35 per day), although this is dependent on temperature, season, and region (Elliott & Tang 2011). This indicates that the population-level effect of air gun exposure might not be detectable from the background mortality.

- The air gun array exposed nauplii grew less and developed slower over four days than the boat and silent control groups. The slower development in the air gun array treatment nauplii was correlated with decreased growth. The progression through developmental stages and increase in body length observed in the control groups in our study is more similar to the development of naturally observed in *Acartia tonsa* nauplii cultured in 10–15° C water than is the development in the air gun array exposed nauplii. Slowed or arrested development at naupliar stages can reduce fitness or cause death. Thus, mortality could be affected long after seismic exposure. The population-level effects that this might have are uncertain.

4 Invertebrates

Research is ongoing into the relationship between sound and potential effects on benthic invertebrates, including the relevant metrics for both effect and impact. Marine invertebrates lack a gas-filled bladder and are unable to detect the pressure component of sound waves (Parry & Gason 2006; Carroll et al. 2017) or "hear" sound in the way that mammals and fish can. Instead, invertebrates detect sound by sensing the particle motion component of sound in water and seabed sediments through physiological structures such as sensory hairs, statocysts and muscles, and therefore detect sound at close range (McCauley 1994; Parry & Gason 2006; André et al. 2016: Roberts et al. 2016: Edmonds et al. 2016: Carroll et al. 2017: Popper & Hawkins 2018). Statocysts, found in a wide range of invertebrates, are utilised by animals to maintain their orientation, direct their movements through the water and may play a key role in controlling the behaviour responses of invertebrates to a wide range of stimuli. Although directly sensitive to particle motion and not to sound pressure, most available research on seismic impacts to invertebrates characterises received sound levels in terms of the sound pressure. Therefore, available literature suggests particle motion, rather than sound pressure, is a more important factor for benthic invertebrates such as crustacean and molluscs.

A range of physiological responses have been identified in some studies; however, the received sound levels are typically at levels that would be received within tens or a few hundred metres from the sound source or have been from repeated exposure at the same sound levels, which is not typical of an actual seismic survey (Carroll et al. 2017; Edmonds et al. 2016; Salgado Kent et al. 2016; Webster et al. 2018).

The most recent critical review of the potential impacts of marine seismic surveys on fish and invertebrates by Carroll et al. (2017) summarised the impacts of seismic sound emissions on marine invertebrates based on a literature review of 70 studies, which comprised a total of 68 species of fish and 35 species of invertebrates, including several studies that were not differentiated. Carroll et al. (2017) concluded that:

> *"Our review has identified scientific evidence for high-intensity and low-frequency sound-induced physical trauma and other negative effects on some fish and invertebrates; however, the sound exposure scenarios in some cases are not realistic to those encountered by marine organisms during routine seismic operations. Indeed, there has been no evidence of reduced catch or abundance following seismic activities for invertebrates, and there is conflicting evidence for fish with catch observed to increase, decrease or remain the same."*

4.1 Crustaceans

Specific studies examining the effect of seismic survey signals on crustaceans, including larval stages, are relatively rare, though recent Australian studies (e.g., Day et al. 2016b; Przeslawski et al. 2016b; Carroll et al. 2017; Day et al. 2019; Day et al. 2021, 2022), have aimed to narrow the knowledge gap. These are being supplemented by global research, including ongoing projects such as Canadian Healthy Oceans Network Project 2.1.4 (Anthropogenic Noise in The Ocean Soundscape: Effects on Fishes and Invertebrates).

To understand interactions between marine seismic surveys and marine invertebrates, the Commonwealth Government's Fisheries Research Development Corporation (FRDC), Origin Energy Ltd and the CarbonNet Project contributed funding to a research program assessing the impact of marine seismic surveys on southern rock lobsters and commercial scallops. This program study was undertaken by researchers from the Institute for Marine and Antarctic Studies (IMAS) at the University of Tasmania (Day et al. 2016b).

The research program involved exposure of cohorts of southern rock lobsters to multiple seismic acoustic source pulses at two sites (sandy substrate and limestone rock platform), both in 10–12 m water depths off the southern Tasmanian coast. The exposed lobsters were captive and control lobsters (no exposure) were also examined during subsequent analyses undertaken at 0-, 14-, and

120 -days post-exposure. Exposure experiments were undertaken in July 2013 (45 in^3 acoustic source, 2,000 psi), July 2014 (150 in^3 acoustic source, 1,300 psi and 2,000 psi) and February 2015 (150 in^3 acoustic source, 2,000 psi). The acoustic source was towed at approximately 5 m depth from 1 km away and at a speed of approximately 5.5–7.4 km/hr with a shot interval of 11.6 seconds. The seismic source circled near the lobster pots. The maximum calculated exposures were 212 dB re 1 μPa PK-PK, a per-pulse SEL of 190 dB re 1 $μPa^2$.s, an accumulated SEL of 199 dB re 1 $μPa^2$.s and maximum peak magnitude of ground acceleration of 68 ms^{-2}, though Day et al. (2016b) note this was an outlier.

Conclusions from the study are:

- Exposure to seismic sound did not result in any mortality from any of the experiments comprising this study.
- There was no difference in fecundity between control and exposed lobsters.
- The ability of exposed lobsters, and one cohort of control lobsters, to right themselves, a complex reflex, was compromised in the long-term (120 days post-exposure) in three of the four experiments. This response was linked to damage to sensory hairs of the statocyst, the primary mechano-sensory and balance organ in lobsters.
- Tail extension, a simple behavioural reflex response, showed reduction in exposed lobsters in one of the four experiments. The authors noted it is unclear how significant this finding is, as the warm summer water conditions during this experiment may have been a contributing factor.
- Haemolymph (blood) biochemistry showed little effects on metabolic and respiratory stress, or vitality following exposure.
- Haemocyte count (indicative of immune response function) in exposed lobsters showed a long-term decline to 120 days post-exposure. However, haemocyte counts subsequently recovered to double the number of haemocytes in control lobsters at 365 days post-exposure, which may indicate a possible immune response to pathogens.
- Seismic exposure did not cause any mass mortality. Not considering when both the control and exposed groups suffered mass mortality, the experimental mortality rates at 120 days' post-seismic acoustic source exposure were between 9.4% and 20%. These fall towards the low end of what might be expected from natural mortality rates. Even the highest levels of mortality recorded, 17.5% and 20% suffered by 4-pass treatments from the 2014 and 2015 experiments, were assessed by the authors to be modest compared to naturally occurring mortality rates.

Overall, no direct lethal effects to adult lobsters were observed and impacts were limited to statocyst condition, behavioural reflexes, and immune response functions in adult lobsters. Day et al. (2016b) note that these could have some effect on longer-term survivability.

Subsequent to the Day et al. (2016b) study, Day et al. (2020) undertook additional work to determine whether southern rock lobsters with pre-existing damage to their mechanosensory statocyst organs as a result of exposure to anthropogenic sound, incur further damage from exposure to marine seismic surveys. For this study, southern rock lobsters collected from a site subject to high levels of anthropogenic noise (a high shipping traffic lane used by cargo vessels and cruise ships, as well as pumping stations) were exposed to an equivalent seismic air gun signal regime as the Day et al. (2016b) study of lobsters, which was from an area of minimal anthropogenic sound ('noise-naïve' lobsters). Following exposure, both control and exposed treatments were found to have damage to the statocyst equivalent to that of noise-naïve lobsters following seismic exposure, leading to the conclusion that the damage was both pre-existing and not exacerbated by seismic exposure. Additional to the lack of further damage following marine seismic survey exposure, no disruption to the righting reflex was observed, demonstrating the lobster's ability to cope with or adapt to the mechanosensory damage (Day et al. 2020).

The lobsters from the high shipping site showed a pre-existing level of statocyst damage equivalent to that of lobsters exposed to the seismic signals. These lobsters also demonstrated a resilience to further damage, with exposure to seismic sound not increasing the level of cell loss in the statocyst hairs (Day et al. 2020). There were also no significant differences in the time taken to right themselves (from 'belly up' to 'belly down') between the control and exposed lobsters from the shipping site, though righting time was slower and more variable than the lobsters at the control site.

Day et al. (2021, 2022) undertook a study to determine whether early development and recruitment of southern rock lobsters puerulus and juveniles might be affected by exposure to seismic sound by assessing mortality rates following exposure; impairment of the righting reflex, and development through assessment of progression through the moult cycle. This study also undertook to respond to the finding by McCauley et al. (2017) of increased mortality in zooplankton following exposure to air gun signals that suggests that planktonic, early life stages of marine invertebrates may be more vulnerable than adults or developing embryos.

The Day et al. (2021, 2022) study involved exposing puerulus and juvenile southern rock lobsters within oyster baskets on the seabed to a full-scale array (three 2,820 in^3 seismic sources at 2,000 psi at a depth of 8 m) during a commercial seismic survey in 51-58 m of water. Day et al. (2021, 2022) identified that:

- Exposure did not result in any elevated mortality for puerulus or juveniles and thus, seismic surveys are unlikely to produce significantly increased mortality in puerulus and juvenile southern rock lobsters.
- An impact to righting reflex occurred in the immediate vicinity (directly below the sound source) for puerulus and out to at least 500 m for juvenile southern rock lobsters. However, juveniles exposed at 500 m recovered after the first moult, indicating that the impact range extended to at least 500 m from the source, the maximum range tested in the study. The results from the combined puerulus and juvenile treatments indicated that puerulus and juveniles below the sound source did not show the capacity for recovery whereas juvenile lobsters at 500 m from the source recovered from impairment after the first moult, providing evidence of a range threshold for recovery.
- The intermoult period was significantly increased in juvenile lobsters directly below the sound source and appeared to be increased in puerulus, though the latter could not be statistically analysed.
- Juveniles at 500 m showed a moderate, non-significant increase in moult duration.
- Increased intermoult duration suggested impacted development and potentially slowed growth, though the proximate cause was not identified.

In another study focusing on southern rock lobster, Fitzgibbon et al. (2017) examined the impact of seismic acoustic exposure on the haemolymph physiology and nutritional condition of this species and found no effect of seismic exposure on 24 haemolymph biochemical parameters, hepatopancreas index or survival. However, this study did report evidence of:

- A chronic negative impact on immune competency for up to 120 days post-exposure.
- A potential immune response to infection after 365 days post-exposure.
- Chronic impairment of nutritional condition 120 days post-exposure.

These authors concluded that the biochemical hematological homeostasis of rock lobster is reasonably resilient to seismic acoustic signals; however, exposure may negatively influence the rock lobster's nutritional condition and immunological capacity. The impact of these results at an ecological level is not known.

Payne et al. (2007) conducted a pilot study of the effects of exposure to seismic sound on various health endpoints of the American lobster *(Homarus americanus*). Adult lobsters were exposed either 20 to 200 times to 202 dB re 1µPa PK-PK or 50 times to 227 dB re 1µPa PK-PK, and then monitored for changes to survival, food consumption, turnover rate, serum protein, enzyme and calcium levels. Lobsters were exposed to seismic pulses at very close range to the source (~2 m). The SEL that the lobsters were exposed to was not described in the report but can be estimated to be up to 207 dB re 1 μPa^2.s. Observations were made over a period of a few days to several months and found that:

- Results indicated no effects on delayed mortality or damage to the mechanosensory systems associated with animal equilibrium and posture (as assessed by turnover rate).
- There was a decrease in the levels of serum protein, enzymes, and calcium in the haemolymph of animals exposed to seismic sound. Statistically significant differences were noted in serum protein at 12 days post-exposure, serum enzymes at five days post-exposure, and serum calcium at 12 days post-exposure. Serum enzymes are valuable in detecting major organ damage whereby enzymes leak into the blood upon cellular rupture. Within this study two enzymes, aspartate transaminase and creatine kinase, were not elevated in seismic-exposed animals, reflecting the absence of major cellular rupture or necrosis being affected by seismic sound, including high exposure conditions. Similar results were obtained in studies with snow crabs (Christian et al. 2003). However, there was evidence of decreased serum enzymes in some trials, indicating the possibility of haemodilution or uptake of excess water by the animals. A similar decrease in serum protein and calcium was noted in some trials indicating a potential for disturbance to osmoregulation (i.e., the process by which the body regulates the osmotic pressure of any organisms' fluids to keep the homeostasis of the organisms' water level constant). Altogether, the results suggest a potential for osmo-regulatory disturbance in lobsters exposed to seismic sound. This study did not provide evidence for delayed mortality in lobsters several months after exposure, with some observations extending to nine months.
- During the histological analysis conducted four months post-exposure, no structural differences in hepatopancreatic tissues were noted, which would denote cell or tissue rupture, necrosis, or inflammation. There was also no evidence of tissue necrosis or inflammation in the ovaries. However, histology identified elevated deposits of carbohydrates, thought to be glycogen, in the hepatopancreas of seismic-exposed animals. Such abnormal accumulations are believed to be due to disturbance in cellular processes connected with synthesis and secretion; however, the report concludes that further research is required to assess whether this observation is due to organ stress. These studies are noted as being exploratory in nature, with the authors cautioning against over-interpretation.

In 2018, the CarbonNet Project undertook the Pelican 3D marine seismic survey in waters 15 m to 35 m deep located between 1 km and 13 km from the Gippsland shoreline in Victoria. Underwater sound and its potential impact on the marine environment was a key issue raised by stakeholders, particularly the commercial fishing industry. In response, and among other actions, CarbonNet undertook southern rock lobster surveys before and after the marine seismic survey to ascertain whether any differences in abundance could be attributed to the marine seismic survey. The design of the survey was overseen by an independent advisory panel to provide advice on the survey methodology and interpretation of the survey results and its implications.

Ten sites (in areas of reef) were monitored, including six sites within the survey acquisition area and four reference sites located more than 15 km to the northeast. At all sites, more southern rock lobster were retrieved during the post-survey assessment (four months after the survey), with 81 individuals trapped during the pre-survey assessment compared to 122 trapped post-survey. This increase in numbers post-survey was most likely due to seasonal effects rather than any impact of the survey (CarbonNet 2018). These results indicate no effect of the marine seismic survey on lobster abundance.

Morris et al. (2018) and Cote et al. (2020) undertook field studies in from 2015 – 2017 into the effects of marine seismic surveys on the behaviour of the snow crab (*Chionoecetes opilio*) on the shelf and slope habitats of Atlantic Canada using a BACI study design to assess the behavioural responses of snow crab to seismic exposure. A 4,880 in^3 seismic source operated at 2,000 psi, 9 m depth and fired at a frequency of 10 seconds (approximately 25 m apart). Animal movements were tracked using an acoustic positioning array consisting of 50 acoustic receivers. The study concluded that while effects of seismic exposure on snow crab movement could not be ruled out completely, effects were at most quite small relative to natural variation. In contrast, snow crab exhibited much clearer responses to handling, temperature, and time of day. Overall, the results suggested that seismic effects, specific to the behaviour of adult male snow crab, were at most subtle and are not likely to be a prominent threat to the fishery.

A pilot study on snow crabs (*C. opilio*) (Christian et al. 2003, 2004) exposed captive adult males, egg-carrying females, and fertilised eggs to variable SPLs (191–221 dB re 1 µPa PK) and SELs (<130–187 dB re 1 $\mu Pa^2.s$) under controlled field experimental conditions. The crabs were exposed to 200 discharges over 33 minutes and found that:

- Neither acute nor chronic (12 weeks post-exposure) mortality was observed for the adult crabs.
- There was a significant difference in the development rate noted between the exposed and unexposed fertilised eggs/embryos in this study with the egg mass exposed to seismic energy demonstrating a higher proportion of less-developed eggs than the unexposed mass. However, this experiment was performed on eggs stripped from a single berried female and cultured in a laboratory for six weeks prior to exposure and 18 weeks following exposure.
- Stress indicators in the haemolymph of adult males were monitored immediately after exposure of the animals to seismic survey sound (Christian et al. 2003, 2004) and at various intervals after exposure. No significant acute or chronic differences between exposed and unexposed animals in terms of the stress indicators (e.g., proteins, enzymes, cell type count) were observed.

Christian et al. (2003) also investigated the behavioural effects of exposure to seismic survey sound on snow crabs. Caged animals on the ocean bottom at a depth of 50 m were monitored with a remote video camera during exposure to seismic sound and did not exhibit any overt startle response during the exposure period. Eight animals were equipped with ultrasonic tags, released, and monitored for multiple days prior to exposure and after exposure. None of the tagged animals left the immediate area after exposure to the seismic survey sound. Five animals were captured in the snow crab commercial fishery the following year, one at the release location, one 35 km from the release location, and three at intermediate distances from the release location.

In 2003, a collaborative study was conducted in the southern Gulf of St. Lawrence, Canada, to investigate the effects of exposure to sound from a commercial seismic survey on egg-bearing female snow crabs (DFO 2004). Caged animals were placed on the ocean bottom at a location within the survey area and at a location outside of the survey area. The maximum received SPL was ~195 dB re 1 µPa PK. The crabs were exposed for 132 hours of the survey, equivalent to thousands of seismic shots of varying received SPLs. The animals were retrieved and transferred to laboratories for analyses. Neither acute nor chronic lethal or sub-lethal injury to the female crabs or crab embryos was indicated. DFO (2004) reported that some exposed individuals had short-term soiling of gills, antennules and statocysts, bruising of the hepatopancreas and ovary, and detached outer membranes of oocytes. However, they were found to be completely cleaned of sediment when sampled five months later and any differences could not be conclusively linked to exposure to seismic survey sound.

In a field study, Pearson et al. (1994) exposed Stage II larvae of the Dungeness crab (*Cancer magister*) to single discharges from a seven-source air gun array and compared their mortality and development rates with those of unexposed larvae. For immediate and long-term survival and time to moult, this study did not reveal any statistically significant differences between the exposed and unexposed larvae, even those exposed within 1 m of the seismic source (with a mean peak pressure as high as 231 dB re 1 µPa).

4.2 Molluscs

Molluscs include benthic invertebrates such as marine bivalves (e.g., scallops, oysters, mussels and clams), gastropods (e.g. sea snails/trochus, sea slugs and nudibranchs) and cephalopods (e.g. octopi and squid). Like crustaceans, the mechanism of impacts for molluscs are unlikely to be from sound pressure, but rather from particle motion. The physiology and sensory structures of different marine bivalves and gastropods is similar and so results of studies on the effects of seismic sound are broadly representative for species other than those studied.

Wardle et al. (2001) monitored molluscs and echinoderms on a shallow water reef exposed to seismic sound with peak SPLs of 218, 210 and 195 dB re 1 µPa at distances of 5 m, 16 m and 109 m respectively. Video observations made over two weeks indicated that the sound did not result in invertebrates moving away from the reef and there was little effect on their day-to-day behaviour.

Kosheleva (1992; as cited in Parry & Gason 2006) identified no detectable effects to marine bivalves and gastropods (mussels and periwinkles) after exposure to a single seismic source element of source level 233 dB re 1µPa at 0.5 m or greater from the source. Conversely, Matishov (1992; as cited in Parry & Gason 2006) reported a single scallop shell splitting in a sample of three scallops, but this was located 2 m beneath a seismic source and therefore exposed to maximum sources levels.

Recent Australian studies (Harrington et al. 2010; Przeslawski et al. 2016a, 2016b, 2018; Day et al. 2016b, 2017) have focussed on commercial scallops (*Pecten fumatus*).

Harrington et al. (2010) conducted a BACI study of the short-term effects of seismic surveying on adult commercial scallops within the Bass Strait Central Zone Scallop Fishery between February and June 2010. The study aimed to determine the survival and health of adult scallops within impacted (directly below seismic survey transects), semi-impacted (within the seismic survey transect grid) and control (outside of the seismic survey transect grid) strata two months after seismic surveying. A before-seismic impact scallop dredge survey was conducted in February 2010 at both impact and control sites. In total, 45 sample dredge tows were conducted, with 15 sample tows being completed within each survey stratum. Between February 2010 and April 2010, the seismic survey vessel *M/V Aquila Explorer* completed 8,000 line kilometres of 2D seismic transects within eastern Bass Strait, including areas within the Bass Strait Central Zone Scallop Fishery with high densities of adult scallops. The seismic source, 4,130 in^3 with an operating pressure of 2,000 psi was towed at a depth of ~6 m, with seismic discharges occurring at intervals of approximately every five seconds. The after seismic impact scallop dredge survey was conducted on the 2nd and 3rd June 2010, approximately eight weeks after the seismic survey had been completed within the vicinity of the dredge survey location.
Data on the abundance of live and dead scallops within the impacted and control sites were examined to assess whether any changes were evident and whether they may be attributable to effects of the seismic survey. Animals collected in surveys were separated into one of four shell categories; live scallops, clappers (very new dead scallops with two shell halves still joined together),

new dead shell and old dead shell. Sub-lethal impacts were investigated by examining changes in roe and meat condition within each of the areas sampled.

No change in the abundance of live scallops (or related change in dead scallop categories) or macroscopic gonad and meat condition was detected after seismic surveying within either the control, impacted or semi-impacted strata. There was also no observable change in the size frequency distribution of scallops in the impacted and semi-impacted strata following seismic surveying. The conclusion was that no short-term (<2 months) impacts on the survival or health of adult commercial scallops (*Pecten fumatus*) were detected following the seismic survey.

Przeslawski et al. (2016a, 2016b, 2018) examined the short-term impacts on scallops and other marine invertebrates from a 2,530 in^3 seismic array and found no evidence of mortality or change in condition following exposure to a seismic survey. Analysis of images and samples revealed some site-specific differences in scallop abundance, size, condition, and assemblages, but these were not related to seismic operations.

From 2013-2015, a long-term study evaluated the acoustic impacts from seismic exposure on scallops in Australia (Day et al. 2016b, 2017). The experimental field research maintained the scallops in mesh enclosures while a vessel with the acoustic source passed close to the animals. Day et al. (2016b, 2017) exposed scallops to maximum received sound exposures of up to 213 dB re 1μPa PK-PK, 181 to 188 dB re 1 μPa^2.s per-pulse SEL, and SEL_{cum} of 188 to 198 dB re 1μPa^2.s. The study also predicted ground acceleration of up to 37.57 m/s^2.

Day et al. (2016b, 2017) concluded that exposures did not result in any immediate mass mortalities; however, repeated exposures, not representative of typical survey conditions, resulted in a chronic increase in mortality over timeframes of approximately four months post-exposure, though not beyond naturally occurring rates of mortality. Separate experiments undertaken in 2013 and 2014 yielded mortalities of 3.6-3.8% in control scallops (no seismic exposure), 9.4-11.3% mortality in scallops exposed to a single pass of the seismic source, 11.3-16.1% mortality in scallops exposed to two passes of the seismic source, and 14.8-17.5% mortality in scallops exposed to four passes of the seismic source. The mortality rates were at the low end of the range of naturally occurring mortality rates documented in the wild, which range from 11-51% with a six year mean of 38% (Day et al. 2017). A third experiment in 2015 resulted in 100% mortality to both control scallops and exposed scallops, and accordingly was attributed to other causes and not to seismic exposure (Day et al. 2016b, 2017).

Sub-lethal effects to exposed scallops were also observed by Day et al. (2016b, 2017) indicating a compromised capacity for homeostasis and potential immunodeficiency over acute (hours to days) and chronic (months) timescales post exposure. Exposures did not elicit energetically expensive behaviours (i.e., extensive swimming or long periods of valve closure), but scallops showed significant changes in behavioural patterns during exposure, through a reduction in classic behaviours and demonstration of a non-classic "flinch" response to seismic signals. Furthermore, following exposure scallops showed an increase in recessing into sediment following exposure (Day et al. 2017).

Though Day et al. (2016b) recorded increased mortality with repeated exposure to a seismic source, it has not been established as to whether this was due to exposure to the seismic source or other mechanism related to the study design (Przeslawski et al. 2016). Using a precautionary approach, if the increased mortality was due to exposure to the seismic source, then the increased mortality identified translates to an annual increase of between 9.4% and 20%. These fall towards the low end of what might be expected when compared with natural mortality rates in wild scallop populations, which range from 11-51% with a six year mean of 38% (Day et al. 2016b).

Scallops exposed to repeated seismic sound suffered physiological damage with no signs of recovery over the four month period, suggesting potentially reduced tolerance to subsequent stressors. In addition, changes in behaviour and reflexes during and following seismic exposure were observed. However, Day et al. (2016a, 2016b) cautioned that it was unclear from the study whether the observed physiological (and behavioural) impairments would result in mortality beyond the timeframes considered in their study.

Przeslawski et al. (2018) concluded that there was no evidence of increased scallop mortality, or effects on scallop shell size, adductor muscle diameter, gonad size, or gonad stage due to the seismic sound from an actual seismic survey. The authors concluded that the study provided no clear evidence of adverse effects on scallops, fish, or commercial catch rates due to the 2015 seismic survey undertaken in the Gippsland Basin. Przeslawski et al. (2018) further concluded that the study provided a robust and evidence-based assessment of the potential effects of a seismic survey on some fish and scallops.

Studies by Mooney et al. (2010) showed squid use their statocysts to detect low frequency, particle motion stimuli with a frequency response similar to the accelerometer ears of most elasmobranch and teleost fishes. Evoked potential response characteristics also parallel those found in many fish species that lack auditory specializations.

Laboratory studies that exposed two species of squid to seismic sound showed that *Alloteuthis sublata* was tolerant to a sound level up to 260 dB re 1 µPa (SPL) and *Loglio vulgaris* was fatally injured at levels of 246 – 252 dB re 1 µPa (SPL) within 3 – 11 minutes of exposure (Norris & Mohl 1983). However, received sound levels from a typical seismic survey do not reach these levels.

Fewtrell & McCauley (2012) assessed the effects of air gun noise on caged squid (*Sepioteuthis australis*). No sub-lethal injury or mortality as a result of exposures in this study was observed. Several squid showed alarm responses to the start-up of an air gun by firing their ink sacs and/or jetting away from the source, but this was not observed for similar or greater levels if the signal was ramped up. General habituation was observed with a decrease in alarm responses with subsequent exposures. During the trial the squid showed avoidance to the air gun by keeping close to the water surface at the end of the cage furthest from the air gun (within the sound shadow). Fewtrell & McCauley (2012) suggested a threshold of 166 dB re 1 µPa (SPL) would give an indication of the extent of disruption of a seismic survey by significant alteration in swimming patterns. They found that in one trial, where the received level of the first airgun impulse was 162 dB re 1 µPa^2·s, the squid inked. This response was not observed again within this trial; however, the authors stated that it was unknown if this was due to depleted ink reserves or habituation. In two other trials, the initial received levels were lower (132 and 146 dB re 1 µPa^2·s per–pulse SEL), and although the cumulative received levels did exceed 162 dB re 1 µPa2 s, no inking behaviour was observed. The authors hypothesised that the results also suggest that a gradual increase in received levels and prior exposure to air gun impulses decreases the severity of the alarm responses in this species. This aligns with findings of general habituation in response to predators in squid (Long et al. 1989). Recent work (Jones et al. 2020) supports these findings as well, indicating potential rapid, short–term habituation by squid to impulsive noise, however, similar response rates were seen 24-hours later, which indicated that squid might re–sensitise to the noise.

The results presented in by Fewtrell and McCauley (2012) were stated by the authors to be preliminary, and while they stated that while it is possible that noise levels greater than 147 dB re 1 µPa^2·s are required to induce avoidance behaviour, the level associated with inking, of 162 dB re 1 µPa^2·s per–pulse SEL, has been considered as a startle response level for squid. In the absence of additional studies and thresholds this level may be considered for other cephalopods; however, it may be limited when applied to other species.

André et al. (2011) exposed cephalopods (squid, cuttlefish, and octopus) to low-frequency sounds, 50–400 Hz sinusoidal wave sweeps with 100% duty cycle and one second sweep period for two hours in either a 2 L fiberglass reinforced plastic tank or a 200 L glass-walled tank, filled with natural seawater. The sweep was produced and amplified through an in-air loudspeaker, with measured received SPL of 157 ± 5 dB 1 µPa, with peak levels at 175 dB re 1 µPa. Following exposure, the individuals were decapitated at different intervals, ranging from immediately afterward to 12, 24, 48, 72, and 96 hours after exposure, respectively. All exposed individuals from presented the same lesions and the same incremental effects over time. The most pronounced lesions were visible in specimens observed 96 hours after sound exposure. In these individuals, the sensory epithelium was severely damaged, with very few hair cells remaining; most of the hair cells had been extruded. The epithelium only presented supporting cells, creating a holed mosaic, where residual hair cells showed either very few bent, flaccid, or fused kinocilia, or none at all. André et al. (2011) detailed that the lesions described in the study were new to cephalopod pathology and that their presence in all the noise-exposed individuals (versus their absence in controls) and their clear progression over time are consistent with the effects observed in other species that have been exposed to much higher intensities of sound.

Mooney et al. (2016) detailed that squid responded to sounds from 80 to 1,000 Hz, with response rates diminishing at the higher and lower ends of this frequency range. Animals responded to the lowest sound levels in the 200-400 Hz range. These results demonstrate that squid can exhibit a range of behavioural responses to sound include fleeing, startle, and protean behaviours, all of which are associated with predator evasion. Response types were frequency and sound level dependent, reflecting a relative loudness concept to sound perception in squid.

Solé et al. (2017) conducted offshore noise controlled exposure experiments on common cuttlefish (*Sepia officinalis*), at three different depths and distances from the source and particle motion and sound pressure measurements were performed at each location. Scanning electron microscopy revealed injuries in statocysts, which severity was quantified and found to be proportional to the distance to the transducer. These findings are the first evidence of cephalopods sensitivity to anthropogenic noise sources in their natural habitat. From the measured received power spectrum of the sweep, it was possible to determine that the animals were exposed at levels ranging from 139 to 142dB re 1μPa^2 and from 139 to 141 dB re 1μPa^2, at 1/3 octave bands centred at 315 Hz and 400 Hz, respectively. These results could therefore be considered a coherent threshold estimation of noise levels that can trigger acoustic trauma in cephalopods.

Dead beached squids have been documented in the vicinity of seismic surveys (Guerra et al. 2004) and from a seismic survey vessel (Leite et al. 2016).

Guerra et al. (2004) detailed that five giant squids were stranded between the end of September and the middle of October and four giant squid were found floating or stranded along the Asturian coast during a single week in September 2003. Guerra et al. (2004) examined seven of the nine animals, and did not find an obvious cause of death in any of these giant squid; however, internal examinations showed that two of the squids suffered extensive damage to internal muscle fibres, stomachs and digestive tracts were mangled. Some of the squids had also suffered severe damage to their statocysts that would have effectively disorientated them. Coincidentally, at the time of both mass strandings, vessels had been conducting seismic geophysical surveys in the vicinity, using ten compressed air guns that produced sound waves of low frequency (below 100 Hz) and high intensity (source level of 240 dB re 1 μPa at 1m per air gun) (Guerra et al. 2011).

Leite et al. (2016) reported that a squid, ~2 m long and identified as *Architeuthis dux,* was sighted as dead from a seismic survey vessel that had been operating in the area using a 5,085 in^3 seismic source with an operating pressure of 2,000 psi. Leite et al. (2016) detailed that while there is no definite proof to link the death of this specimen to the seismic activity, its occurrence in an area of active surveys is suggestive of a possible link.

Given the similarities in physiology between squid and octopus, octopus are not thought to be at risk of physical injury even if individuals are exposed to several passes as noted by Fewtrell and McCauley (2012). There is limited information on the hearing sensitivity of octopus to sound stimuli. Kaifu (2008) studied *Octopus ocellatus* and concluded that the statocyst was responsible for the observed responses kinetic sound energy (particle motion). It is unknown how octopuses will respond behaviourally, but since they are benthic and territorial it is thought more likely that they will retreat into their lair as they normally do to perceived threats. They may also freeze and camouflage themselves if out in the open. Octopus are not expected to move very far from their territory and therefore will not be exposed to repeat close passes in short period of time since subsequent survey lines are about 4 km apart. If they remain in the same area they may be exposed to sounds shown to elicit strong responses two to three times throughout the survey period and these events will be several days apart allowing the individual animals to recover.

4.3 Corals

A literature review by Dr Mardi Hastings stated that the primary mechanisms for injury of hermatypic corals from seismic sound emissions are: (1) breaking of the external coral skeleton which could also damage the polyp tissue, and (2) rupture or tearing of polyp tissues inside the corallites (Hastings 2008).

Although injury to corals is theoretically possible as described by Hastings (2008), studies on the actual impacts were limited prior to the Maxima 3D and Gigas 2D studies at Scott Reef (see below). A survey of coral reefs in Brunei that were subjected to seismic noise did not detect any damage to hard or soft corals, sponges, or other sessile benthic organisms (IEC 2003).

The most relevant data currently available are results from exposure studies that Woodside conducted during the Maxima 3D and Gigas 2D Pilot Ocean Bottom Cable (OBC) marine seismic surveys at Scott Reef offshore northern Western Australia.

In the Maxima 3D experiments corals in and around the lagoon were exposed to seismic signals (both experimental seismic lines and a full seismic survey) using a 2,055 in^3 source over a 59-day period. The experimental lines passed directly over the coral communities (source at 7 m depth, corals at ~60 m depth) whereas the full seismic survey passed within tens to hundreds of metres (horizontal offset). The maximum estimated received seismic signal levels at coral impact sites were 226–232 dB PK-PK, 214–220 dB SPL, 197–203 dB SEL, and a maximum cumulative SEL of 197–203 dB (Salgado Kent et al. 2016).

For plate corals, *Lobophytum* spp., and various soft corals including *Sarcophytum* spp., the proportion of dead and bare coral cover and the percent cover of red algae were documented, and no detectable effect was found from one or multiple passes of the seismic source (Battershill et al. 2008). Further, there was no evidence of coral breakage, no signs of physiological impairment in the corals (polyp withdrawal or reduction in soft coral rigidity) and no long-term change in coral community structure related to the experimental or full seismic survey activities (Battershill et al. 2008).

The Gigas 2D Pilot OBC coral monitoring study (SKM 2008) examined the potential for physical damage to a range of shallow water corals in North Scott Reef lagoon from seismic source emissions. This study used several sub-lethal indicators of stress and mortality (partial and whole colony mortality) to determine the effects of seismic source emissions on corals. The conclusion from this study was that emissions from the seismic source did not cause significant injury, tissue damage, sublethal stress or mortality to coral colonies, even when colonies were within a few metres of the seismic source (SKM 2008). This survey had a measured at source SEL of 206 dB (McCauley 2008).

Heyward et al. (2018) reviewed the research undertaken at Scott Reef and the analyses detected no effect of seismic activity measured as coral mortality, skeletal damage, or visible signs of stress immediately after and up to four months following the 3D marine seismic survey. Maximum received levels were 226 dB PK.

5 Fishes

Although hearing ranges and sensitivities vary substantially between species (e.g., Ladich & Fay 2013), all fish species tested to date can detect sound and vibration to some degree (Dale et al. 2015). Fish produce sounds in a wide range of context such as feeding, mating or fighting, and as a result anything that inhibits the detection of these sounds can have a negative effect on their fitness and survival (Popper & Hawkins 2019). The majority of fish species detect sounds from <50 Hz up to 500-1500 Hz (Popper & Hawkins 2019). A smaller number of species can detect sounds over 3 kHz, while very few species can detect ultrasound over 100 kHz (Ladich & Fay 2013). The critical issue for understanding whether an anthropogenic sound will affect the hearing of a fish is whether it is within the hearing frequency range of the fish and loud enough to be detectable above background ambient noise.

The hearing sensitivity of fish varies depending upon the auditory structures in the inner ear (otoliths surrounded by an epithelium of hair cells) and, if present, the swim bladder (Finneran & Hastings 2000; Nedwell et al. 2004). Otoliths are sensitive only to particle motion, while the swim bladder may provide an indirect route for sound pressure to reach the inner ear. The other main mechano-reception system in fish is the lateral line system, which runs along the side of the body and is more pronounced in some groups of fish than others. The lateral line system responds to particle motion produced in the near-field of a sound source, as well as to tiny water currents set up by the motions of the fish (Nedwell et al. 2004); therefore, all fish are sensitive to the particle motion component of sound at close range from a sound source. Particle motion is the most relevant metric for perceiving underwater sound for most species, but with the exception of a few species (Popper & Fay 2011; Popper et al. 2014), there is an almost complete lack of relevant data on particle motion sensitivity in fish (Popper & Hawkins 2018). Some more specialised fish with a swim bladder that they use for hearing are sensitive to sound pressure and are capable of detecting less intense noise and a wider range of frequencies, compared to less-specialised groups of fish (Popper et al. 2014; Carroll et al. 2017; Hawkins & Popper 2017). The susceptibility of fish to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Inter-specific variations in hearing range and sensitivity result from the different adaptations in these systems for perceiving sound pressure and particle motion information (Popper & Fay 2011).

Based on their morphology, Popper et al. (2014) classified fishes into three categories comprising:

- Fishes with swim bladders whose hearing does not directly involve the swim bladder or other gas volumes.
- Fishes whose hearing does directly involve a swim bladder or other gas volume.
- Fishes without a swim bladder that can sink and settle on the substrate when inactive.

The Popper et al. (2014) classifications can be assigned to the following families or species of commercial fish species, common in Australian waters:

- Fishes with swim bladders or other gas volumes, but whose hearing does not directly involve the swim bladder, e.g., snappers, emperors, groupers and rock cods (lutjanids and lethrinids such as *Pristipomoides* spp., *Lethrinus* spp., *Lutjanus* spp., and Family Serranidae), and some species of tuna (*Thunnus* sp.) (Tavolga & Wodinsky 1963; Higgs et al. 2006; Braun & Grande 2008; Engineering-Environmental Management, Inc. 2008; United States Department of the Navy 2008; Caiger et al. 2012; Bertrand & Josse 2000; Song et al. 2006).
- Fishes whose hearing does directly involve a swim bladder or other gas volume e.g., Family Clupeidae (herrings, sardines, pilchards, and shads) and some Haemulidae (grunters and sweetlips) (Nedwell et al. 2004; Braun & Grande 2008; Popper et al. 2014).

- Fishes without a swim bladder (e.g., mackerel, *Scomberomorus* spp., some species of tuna, *Thunnus* sp. and sharks) (Casper et al. 2012; Popper et al. 2014; Carroll et al. 2017).

Underwater noise levels significantly higher than ambient levels can have a negative impact on fishes, ranging from physical injury or mortality to temporary effects on hearing and behavioural disturbance effects.

The effects of underwater sound on fishes within the vicinity of a seismic sound source array will vary depending on the size, age, sex, and condition of the receptor among other physiological aspects, and the topography of the benthos, water depth, sound intensity and sound duration. The effect of noise on a receptor may be either physiological (e.g., injury or mortality) or behavioural, as described in the following sub-sections.

Mortality/Potential Mortal Injury

It is noted that while thresholds for fish mortality have been included for consideration in this assessment based on the Popper et al. (2014) guidelines, no studies to date have demonstrated direct mortality of free-swimming adult fish in response to seismic source emissions, even when at close proximity (within 1 7 m) (DFO 2004; Boeger et al. 2006; Popper et al. 2016; Carroll et al. 2017).

Although some fish deaths have been reported during cage experiments, these were more likely caused by experimental artefacts of handling fish or confinement stress (Hassel et al. 2004). For free swimming fishes that can move away from seismic sources as they approach, the potential for lethal physical damage from air gun emissions is even further nullified. However, reef or bottom-dwelling fishes that show greater site attachment may be less inclined to flee from a seismic sound source and experience greater effects.

Despite mortality being a theoretical possibility for fish exposed to seismic source emissions, Popper et al. (2014) did not reference an actual occurrence of this effect. At the time of developing the guidelines, no quantified data on injury and mortality from seismic sources on fishes had been reviewed by the Working Group. Therefore, the Popper et al. (2014) exposure guidelines for mortality/potential mortal injury and recoverable injury for fishes exposed to seismic source emissions are based solely on data from pile driving conducted on predominantly temperate, freshwater fish species. Although seismic surveys and pile driving both produce impulsive sound, their sound characteristics are markedly different; pile driving impulses result in a more rapid rise time in sound pressure than seismic pulses and it is this rapid rise time that has the greatest potential for trauma (Caltrans 2001, 2004; Hastings & Popper 2005; Popper et al. 2006). Also, pile driving sound effects are usually more significant due to the fact that they usually involves a static source and static receivers (e.g., site-attached fishes).

Environmental Resources Management Australia (ERM) undertook a detailed literature review of potential fish mortality and physical injury because of exposure to seismic sources (ERM 2017). Of the 28 studies reviewed, only three observed direct mortality and in each case, mortalities occurred to caged fish at very close proximity to the seismic source (<2 m), which is not representative of real-life exposures from seismic surveys because fish are free-swimming and are not likely to be exposed at such close range. The received sound levels that resulted in mortality ranged from 220 to 241 dB re 1 μPa PK; however, other studies reported no mortality or injury at levels as high as 246 dB re 1 μPa PK. Therefore, the sound exposure criteria proposed by Popper et al. (2014) for mortality and mortal injury are highly conservative.

Other than physiological stress responses or hearing loss, no other physical damage to adult fish or invertebrates have been directly attributed to exposure to seismic source emissions, even at close proximity (NSW DPI 2014). It should be noted that some reports of physical damage arise from studies undertaken using explosions and other high-pressure sound waves, and not from seismic source emissions that generate lower maximum pressures and pressure change (Popper & Hastings 2009).

There is some evidence that bony fishes can regenerate the sensory cells in their hearing system to a fully functional state within weeks after a detrimental exposure. The processes involved in the recovery are not fully understood, and there is conflicting evidence from sound exposure studies, such as McCauley et al. (2003). These findings could also suggest that the process of sensory hair cell death and regeneration is species-specific.

Recovery processes take a few days to a few weeks (Scholik & Yan 2001; Mackenzie & Raible 2012), and the time course for recovering from hearing loss likely depends on the species, its normal hearing sensitivity, the sound exposure intensity and duration, and the amount of sensory epithelial damage (Smith & Monroe 2016). Noise-induced PTS has not been reported for fishes yet, which may be explained by their apparent ability to regenerate hair cells.

Injurious effects caused by rapid pressure changes within the body are called 'barotrauma' (Stephenson et al. 2010; Halvorsen et al. 2011, 2012b). The range of barotrauma effects in fishes mostly depends on the temporal pattern of the pressure changes and the physiological state of the exposed fishes (Stephenson et al. 2010; Halvorsen et al. 2012a, 2012b); they range in severity from damage with full recovery to lethal injury (McKinstry et al. 2007).

Casper et al. (2012) showed that fishes can recover from less severe injuries under laboratory conditions, suggesting that minor injuries do not inevitably lead to mortality. Nevertheless, in open waters, they have the potential to reduce the animal's fitness to the extent that its ability to find food decreases and its risk of being predated increases (Halvorsen et al. 2011, 2012b).

Mortality is either a direct effect of barotrauma (in the case of severe injury) or indirect if an animal is moderately injured. Data on sound-induced mortality in fishes are scarce and mainly related to underwater explosions (see review by Popper & Hastings 2009). Caltrans (2001) documented fish mortality near underwater pile driving. There is no evidence for fish mortality caused by exposure to other sound sources such seismic source emissions, dredging, or vessel noise (Normandeau Associates, Inc. 2012).

Temporary Threshold Shift

The following is sourced from Popper et al. (2014):

> *"Temporary threshold shift (TTS) is a temporary reduction in hearing sensitivity caused by exposure to intense sound. TTS has been demonstrated in some fishes, and its extent is of variable duration and magnitude. TTS results from temporary changes in sensory hair cells of the inner ear and/or damage to auditory nerves innervating the ear (Smith et al. 2006; Liberman 2015). However, sensory hair cells are constantly added in fishes (e.g., Corwin 1981, 1983; Popper and Hoxter 1984; Lombarte and Popper 1994) and also replaced when damaged (Lombarte et al. 1993; Smith et al. 2006; Schuck and Smith 2009), unlike in the auditory receptors of mammals. When sound-induced hair cell death occurs in fishes, its effects may be mitigated over time by the addition of new hair cells (Smith et al. 2006, 2011; Smith 2012, 2015).*
>
> *After termination of a sound that causes TTS, normal hearing ability returns over a period that is variable, depending on many factors, including the intensity and duration of sound exposure (e.g., Popper and Clarke 1976; Scholik and Yan 2001, 2002a, b; Amoser and Ladich 2003; Smith et al. 2004a, b, 2006, 2011; Popper et al. 2005, 2007). While experiencing TTS, fishes may have a decrease in fitness in terms of communication, detecting predators or prey, and/or assessing their environment."*

McCauley et al. (2003) demonstrated that exposure to repeated emissions of a single air gun (source level of 222.6 dB re 1µPa PK-PK) from 5 to 15 m at the closest approach caused extensive damage to the sensory hair cells in the inner ear of caged pink snapper (*Pagrus auratus*). Although no mortality was observed, the damage was severe with no evidence of repair or replacement of damaged sensory cells up to 58 days post-exposure. However, the study did not investigate the effects on fish hearing. The study acknowledged that the fish were caged and therefore not able to swim away from sound source, and that the monitoring video suggested the fish would have fled the sound source if possible. The authors of the study also acknowledged that the impact of exposure on ultimate survival of the fish was not clear.

As part of Woodside's Maxima 3D marine seismic survey, an extensive field study was undertaken at Scott Reef. A component of this study investigated the potential physical, physiological, and behavioural noise-induced effects on fish assemblages. The results showed statistically more damage to the hearing in blue-stripe sea perch (*Lutjanus kasmira*) exposed to the seismic impulses than in control fishes. However, the damage found in these fishes was marginal, and—assuming a direct relationship between hair cell density and hearing capability—a negligible effect on the fishes' hearing capability. The damage was monitored through time out to 58 days post seismic exposure and did not increase significantly through time, with almost zero damage detected by 58 days (McCauley 2008).

A study of auditory sensitivity in four species of tropical reef fishes following exposure to emissions from the 2,055 in^3 array showed that none of the four species, including the pinecone soldierfish (a species with expected to have good hearing sensitivity) experienced any hearing sensitivity loss (i.e. TTS) following exposure to SEL_{cum} up to 190 dB re 1 µPa^2·s (Hastings et al. 2008; Hastings & Miksis-Olds 2012). No detectable gross physiological damage was found in individuals from any of the seven species (McCauley & Kent 2012). The results of the hearing tests are consistent with the sound exposure guidelines proposed in Popper et al. (2014), which indicated that TTS may occur at SEL_{cum} levels >186 dB re 1 µPa^2·s while other studies (Popper & Hastings 2009; Song et al. 2008) indicate that TTS may occur at levels as high as SPL 205-210 dB re 1µPa (PK).

Behavioural Effects

The sound-related factors influencing behavioural reactions in fishes can include its frequency content, intensity above background noise and temporal sound characteristics. If exposed to the same stimulus over a prolonged period, an initial behavioural reaction might fade as the fishes habituate to the sound. Behavioural reactions that are usually observed in fishes in response to sound are dispersion, directed movements away from the sound source (leaving the area of the noise source, aggregation and descending closer to the bottom), startle response (fast start escapes, C-start response) at sound onset (Wardle et al. 2001; Slotte et al. 2004). Effects can be acute (such as acoustic masking), or chronic (including altered distribution), lasting from the immediate duration of sound exposure to several days or weeks if fishes are displaced from their preferred areas during a survey (Engås et al. 1996; Slotte et al. 2004; Løkkeborg et al. 2012; Streever et al. 2016).

The onset level of behavioural responses in fishes varies greatly between and within species, including between fishes of different ages and sizes, the behavioural and social context, and the motivation of the fishes. Existing data on behavioural responses do not provide a clear dose-response relationship and, consequently, it is currently impossible to determine single value thresholds for the onset of behavioural reactions. Instead, broad response and effect categories such as those proposed by Popper et al. (2014) seem most reasonable and may guide regulatory decisions in this context.

Strong 'startle' responses have been observed in some fish species at received sound levels of 200-205 dB re 1 µPa, indicating that sounds at or above this level may cause more severe behavioural reaction such as avoidance. Sound levels of this intensity are likely to occur 100 to 300 m from an acoustic array. Based on this, an approximate range of 200 m was estimated as the minimum distance at which fishes may start avoiding the approaching seismic source (McCauley 1994). Wardle et al. (2001) documented that schooling reef fishes swam past a seismic source array at received levels that would be received at about 20 m below a survey array consisting of 30 air guns.

Pearson et al. (1992) showed that that exposure to air gun sound can cause changes in schooling patterns and distribution. Løkkeborg et al. (2012) found changes in catch rates of fish species in Norwegian waters, indicating that these species all responded to seismic sound emissions. However, they also showed that gillnet catches were doubled for some fish species during seismic surveying and only longline catch rates fell slightly. Except for one species, they did not find any changes in abundance or displacement from fishing grounds. Hawkins et al. (2014) used synthetic impulsive signals in a behavioural response study; they documented that sprat and mackerel reacted to the impulsive sound exposure generally by dispersal and depth changes (which would make it difficult to detect the true scope of effects in a study relying on fisheries technology).

Some other studies looking at the behavioural response of sound pressure-sensitive Gadidae and Clupeidae species, such as whiting, Atlantic cod and herring, have reported changes in vertical position in the water column, potential avoidance responses and short-term changes in distribution. Chapman & Hawkins (1969) observed that the depth distribution of free-ranging whiting changed in response to an intermittently discharging stationary seismic source, which resulted in fish being exposed to an estimated SPL of 178 dB re 1 μPa. The fish school responded to the sound by shifting downward, forming a more compact layer at greater depth although temporary habituation was observed after one hour of continual sound exposure (Chapman & Hawkins, 1969).

Hawkins et al. (2014) exposed free-swimming sprat (a sound pressure-sensitive Clupeidae species with a swim bladder connected to the inner ear) and Atlantic mackerel (a particle motion detecting species without a swim bladder) to playback of impulsive sound. Sprat schools were more likely to disperse laterally in response to received sound levels of approximately 135 dB re 1 $\mu Pa^2.s$ SEL. Mackerel schools were more likely to alter their depth in the water column in response to approximately 142 dB re 1 $\mu Pa^2.s$ SEL. Hawkins et al. (2014) note how the two different species seemed to respond to the sound playback at similar sound levels despite the differences in sound sensitivity of the two species, but suggested that mackerel were simply more "flighty" than sprat and therefore more likely to react. The tests were also undertaken using low sound level playback in very close proximity to the schools of fish and it is not clear how relevant the sound pressure and sound exposure levels are in relation to mackerel given that their response was likely driven by particle motion. The study location, a very small, enclosed, quiet, coastal sea lough, where fish were not accustomed to heavy disturbance from shipping and other intense sound sources is also very different from an open ocean location.

Slotte et al. (2004) monitored the effects of a 3,090 in^3 seismic array on migrating herring (Clupeidae) and whiting (Gadidae), mapping their distribution and abundance in relation to the seismic survey lines. There was no significant evidence of immediate, near-field scaring reactions on the horizontal scale in response to acquiring survey lines, but there was some evidence that fish changed position in the water column, moving closer to the seabed. Some short-term changes in distribution were observed but weren't statistically significant; fish consistently remained within the immediate vicinity of the survey area, but in a limited number of measurements there was an indication that fish abundance was lower near to the survey area and increased with distance out to a maximum range of 37 km. However, results were inconsistent and clear trends were not observed in all cases. Slotte et al. (2004) concluded that it was not possible to determine how much abundance and distribution were attributed to the seismic survey or to the natural migration patterns and food availability of the fish, or other natural factors. Herring and whiting were found to be abundant in the survey area again after a pause in seismic acquisition and monitoring of fishes for three to four days, indicating that if any displacement did occur as a result of seismic sound exposure, the displacement was temporary (i.e. less than 3-4 days) (Slotte et al. 2004).

In similar studies, Engås et al. (1996) and Engås & Løkkeborg (2002) reported on the effects of seismic surveys on Atlantic cod and haddock (Gadidae) and found that the abundance of fish were lower in the survey area compared with areas outside of the survey area, which the authors hypothesize may be the result of an avoidance response. Some differences in abundance were still detectable within the survey area five days after the survey was completed (Engås et al. 1996; Engås & Løkkeborg 2002).

Santulli et al. (1999) exposed caged European sea bass (a demersal species) to a 2,500 in^3 seismic source. Limited response was observed at 2.5 km distance, a startle response was observed when the array was at a distance of approximately 800 m, but after passing within 180 m, fish behaviour appeared to return to normal within one hour. Increased biochemical stress levels were measured in some fish following exposure, returning to normal levels within 72 hours of exposure. It is noted that exposures of fish in the wild would likely result in avoidance of high sound levels prior to the seismic source approaching to as close a range and to as high sound levels as the captive fish in the experiment were exposed to.

The behavioural observations of free-swimming fishes in Woodside's Maxima 3D survey at Scott Reef (Miller & Cripps 2013) show that seismic source emissions did not cause lethal or sub-lethal effects on fish near the operating array. At close range, the vessel approach caused fishes to cease their behaviours and move towards the seabed, but the effect was short-lived, and fishes began to feed and behave normally again within 20 minutes after the passage of the seismic survey vessel. Caged fishes displayed startle responses too infrequently to analyse. However, agitation levels increased with increasing received sound exposure level for the three holocentrid species (squirrelfishes and soldierfishes, suborder Holocentroidei) but were not detectable for the blue-stripe sea perch. Sonar observations of free-swimming fishes indicated that individual animals tended to move towards the seabed on approach of the operating seismic source, consistently out to 400 m either side of the survey test line. Schools of fishes moved towards the seabed within 200 m of the survey test line in response to the passage of the operating seismic source and stayed significantly closer to the seabed up to 63 minutes post-exposure. The vocal behaviour of fishes was unaffected from the seismic activity; fish choruses remained unchanged with regards to timing and chorus level (at daily, lunar and seasonal scales); these findings suggest that in the long-term the survey had little effect on the fish that produced the choruses. Underwater visual censuses (UVC) revealed that diversity and abundance of both Pomacentridae (damselfishes and clownfishes) and non-Pomacentridae fish species (inhabtiting shallow-slope regions) showed no significant changes after the seismic survey compared to the long-term temporal trend before the survey. Analysis of recordings from baited remote underwater video stations showed no detectable effects of the seismic survey on the diversity and abundance of deeper water fish communities at the spatial and temporal scales examined. Also, there were no signs of loss of individuals or of systematic re-distribution of individuals and species at any of the time scales examined.

The findings from the research at Scott Reef support those by Wardle et al. (2001), who exposed free ranging fishes inhabiting an inshore reef to sounds from a seismic source (maximum received levels of 195-218 dB re 1 µPa PK). The study found that fishes exhibited a startle response to all received levels, but no avoidance behaviours were observed, they showed no signs of moving away from the reef and exposure to the seismic noise did not interrupt a diurnal rhythm of fishes gathering at dusk. Slight changes were recorded to the long-term day-to-night movements of two tagged pollack (*Pollachius sp.*), particularly when positioned within 10 m of their normal living positions. However, the seismic sound had little effect on the day-to-day behaviour of the resident fishes and invertebrates.

Behavioural observations of two tropical snapper species and another coral reef fish species, spadefish, in field enclosures before, during and after exposure to seismic sound showed that repeated exposure resulted in increasingly less obvious startle responses (Boeger et al. 2006). This is consistent with the potential habituation suggested by McCauley et al. (2000) and by Fewtrell and McCauley (2012).

McCauley & Salgado Kent (2007) observed the behaviour of goldband snapper in fish traps in the Timor Sea using cameras placed inside the fish traps. A seismic vessel towed two 3,090 in^3 seismic sources. Maximum signals reached at the closest trap to each seismic pass-by were 200, 202 and 212 dB re 1 µPa PK-PK (equivalent to approximately 194, 196 and 206 dB re 1 µPa PK). No dramatic behavioural responses of fish to the passing seismic source were observed. Fish generally displayed increased activity immediately after entering a trap presumably as they searched for a way out, with this activity reducing with time. Fish that had been in a trap for some time showed increased activity levels as the operating seismic source approached but were 'quiet' when the array passed at the point of closest approach.

Fewtrell & McCauley (2012) showed that fishes tended to remain lower in the water column and/or swim faster and form tighter schools during periods of close air-gun emissions. Fish populations can be potentially impacted if behavioural responses result in deflection from migration paths, feeding grounds or disturbance of spawning, thereby affecting recruitment of fish stocks.

Paxton et al. (2017) observed temperate reef fishes, including snapper and grouper species, in 33 m water depths located 7.9 km from a seismic survey line using video recordings. The authors observed fish abundance and habitat use during the evening hours for three days prior to a seismic survey and then during the evening of the day when seismic activity occurred. The authors attempted to measure sound at two other reefs in closer proximity to the survey, but the hydrophones malfunctioned. No video recordings were made at the other reefs where hydrophone measurements were attempted. No hydrophone measurements were made at the reef where video recordings took place, but maximum sound levels were estimated to be more than 170 dB re 1 µPa SPL. Despite no clear visual evidence of behavioural responses in fishes during the seismic survey, the authors noted a 78% decline in abundance in the evening following the survey. No further recordings were made to assess when fish abundance returned to pre-exposure levels or how far they may have moved. Therefore, with limited data, it is not clear from this study if reduced abundance is attributed to the seismic sound or other natural factors such as tidal influence or food availability. However, the study may indicate a possible avoidance response and temporary change in local abundance and distribution.

Bruce et al. (2018) tagged tiger flathead, which were monitored during a seismic survey undertaken in Australian waters. Minor behavioural effects were observed in exposed tiger flathead, which increased their swimming speed during the seismic survey and changed daily movement patterns after the survey but showed no significant displacement. Overall, there was little evidence for consistent behavioural responses (Bruce et al. 2018).

Davidsen et al. (2019) investigated the effects of seismic sound exposure on the physiology and behaviour of captive Atlantic cod (*Gadus morhua*) and saithe (*Pollachius virens*), both species from the Family Gadidae with a swim bladder directly involved in sound detection. Experimental sound exposures were 18-60 dB above ambient. The cod exhibited reduced heart rate in response to the particle motion component of the sound from the air gun, indicative of an initial flight response. No behavioural startle response to the air gun was observed despite some observed changes in swimming depth and position, and the fish seemed to habituate both physiologically and behaviourally with repeated exposure. The authors concluded that sound exposures induced over the three day study period appear unlikely to be associated with long-term alterations in physiology or behaviour.

Hubert et al. (2020) also exposed captive Atlantic cod to one hour of playback of seismic air gun sound pulses with a 10 second shot point interval. Results indicated no strong overall pattern of change in swimming patterns or immediate, short-term behaviours during the exposure, compared to baseline periods without playback. However, several individuals changed their time spent in several behavioural states during the one-hour sound exposure, which may be indicative of changes in energy expenditure.

van der Knaap (2021) investigated the effect of a 3.5-day, full-scale, seismic survey exposure on the movement behaviour of free-swimming Atlantic cod, using acoustic telemetry. The closest point of approach to the tagging location was 2.25 km. The study found that during the experimental survey, cod did not leave the detection area more than expected from baseline data. However, cod left more quickly than expected, from two days to two weeks after the seismic survey. Furthermore, behavioural analyses indicated that during the exposure cod decreased their activity, with time spent being locally active (moving over small distances, showing high body acceleration) becoming shorter, and time spent being inactive (moving over small distances, having low body acceleration) becoming longer. Additionally, diurnal activity cycles were disrupted with lower locally active peaks at dusk and dawn–periods when cod is known to actively feed.

Meekan et al. (2021) undertook a large-scale experiment that quantified the impacts of exposure of an assemblage of tropical demersal emperors (Family Lutjanidae), snappers (Family Lethrinidae) and groupers (Family Epinephelidae) targeted by commercial fisheries to a commercial-scale seismic source on the North West Shelf off Western Australia. Dominant species included spangled emperor (*Lethrinus punctulatus*), red emperor (*Lutjanus sebae*), and brownstripe snapper (*L. vitta*). A combination of Baited Remote Underwater Video Systems (BRUVS) and acoustic tagging methods were used to measure the behaviours and movements of fishes at high, medium, and low exposure sites, as well as at control sites. The high, medium, and low exposure sites were located at horizontal distances from the path of the seismic source of approximately 0 300 m, 2 10 km and 11 km respectively. The maximum modelled SEL values received at the high, medium, and low exposure sites were in the order of 180 – 200 dB re 1 µPa^{2}·s, 130 – 160 dB re 1 µPa^{2}·s and 115 – 125 dB re 1 µPa^{2}·s respectively. There were no short-term (days) or long-term (months) effects of exposure on the composition, abundance, size structure, behaviour, or movement of fishes at any exposure sites. The authors suggest that it is a reasonable assumption that the behavioural responses of demersal fishes to the bait cue provided by the BRUVS are a realistic proxy of the likely response of the same species to baited hooks or traps used by the commercial fisheries that target them. The acoustic tags and telemetry found little evidence that fish were displaced by the exposure to the seismic source. Movements of tagged fish occurred over a limited area focused on two or three acoustic receivers, and there was no evidence for the departure of tagged fish after exposure. These multiple lines of evidence suggest that seismic surveys have little impact on the behaviours of demersal fishes in this environment.

A recent study examined behavioural responses in spawning Atlantic cod in Norway (McQueen et al. 2022, 2023). Atlantic cod (*Gadus morhua*) may be especially vulnerable to sound disturbance during spawning, as it is a soniferous fish species, with acoustic communication playing an important role in the cod mating system, and a low frequency hearing range (10 – 650 Hz). During the spawning period, male cod produce low frequency grunts (~50 Hz) that have been associated with aggressive and courtship behaviours. Low frequency noise associated with ship traffic has been found to reduce the effective communication range of spawning cod (Stanley et al. 2017; as cited in McQueen et al. 2023), and low frequency anthropogenic noise can elicit stress responses in cod resulting in reduced egg production and fertilization rates (Sierra-Flores et al. 2015). Additionally, cod tend to demonstrate high site fidelity to spawning areas. There have been reports that free-ranging cod move away from an area in immediate or delayed response to seismic surveys (Engås et al. 1996; van der Knaap et al. 2021).

To investigate whether airgun sound causes cod to leave their spawning grounds, McQueen et al. (2022, 2023) deployed acoustic telemetry arrays were on two cod spawning grounds: a test and a reference site. From 2019 to 2021, 136 mature cod from the test site and 45 from the reference site were tagged with acoustic transmitters. Intermittent seismic shooting of two 40 cui airguns for one week during the spawning periods of 2020–2021 resulted in fluctuating SELs at the test site, comparable to a full-scale industrial survey 5–>40 km away. Residency and survival of tagged cod were analysed with capture–mark–recapture models fitted to the detection and recapture data. Departure rate of the mature cod varied between spawning seasons but was similar between the test and reference sites. Cod demonstrated only weak responses to the disturbance from repeated three hour treatment periods over five days, swimming on average slightly deeper during seismic exposure compared to silent control periods. This response varied between individuals. Longer-term effects of seismic exposure on swimming depth were not detected. No changes in swimming acceleration, displacement, or area use occurred. Neither survival nor departure significantly differed between seismic exposure and baseline periods. The results indicated that exposure to airguns at received SEL of up to ~145 dB re 1 µPa^{2} s, comparable to a seismic survey occurring several kilometres away, did not displace tagged cod from spawning grounds. These results suggest that relatively distant seismic surveys do not substantially alter cod behaviour during the spawning period at received sound exposure levels varying between 115 and 145 dB re 1 µPa^{2} s over a five day period (McQueen et al., 2022, 2023).

The following conclusions are made regarding behavioural effects to fish from seismic airguns, based on the literature above:

- Different fish may exhibit different behavioural responses when exposed to seismic survey noise, depending on their activities, motivation and the context in which they receive sound.
- Fish may change position in the water column (i.e., move closer to the seabed) as a response to becoming aware of approaching seismic sound (e.g., Pearson et al. 1992; McCauley et al. 2000, 2003; Slotte et al. 2004; Fewtrell & McCauley 2012; Miller & Cripps 2013; Davidsen et al. 2019).
- Exposure to higher sound levels at close range to a seismic source may begin to result in more noticeable startle or alarm responses, such as changes in school structure, increased swimming speed and avoidance of the sound source (e.g., Simmonds & MacLennan 2005; McCauley et al. 2000, 2003; Fewtrell & McCauley 2012; Popper et al. 2014; Carroll et al. 2017).
- Many exposure experiments are undertaken using a single airgun and it is not clear how transferrable the behaviours and received SPL/SEL levels are to a full commercial-sized seismic array, particularly if observed behaviours are in response to particle motion close to the sound source rather than to sound pressure.
- There is some evidence that fish may also tolerate gradual increases in sound levels and habituate to repeated sound exposures (Chapman & Hawkins 1969; McCauley et al. 2000; Boeger et al. 2006; Fewtrell & McCauley 2012; Peña et al. 2013; Davidsen et al. 2019).
- Many studies indicate that fishes resume normal behaviour shortly after cessation of the acoustic disturbance (within minutes / less than an hour), with no evidence of long-term changes (e.g., Wardle et al. 2001; Pearson et al. 1992; Santulli et al. 1999; McCauley et al. 2000, 2003; Fewtrell & McCauley 2012; Miller & Cripps 2013; Davidsen et al. 2019).
- Meekan et al. (2021) found no short-term (days) or longer-term (months) effects of seismic sound exposure on the behaviour and movement of tropical demersal snapper, emperor and grouper species on the North West Shelf.
- There is some evidence that changes in distribution may persist for longer than the initial change in behaviour, i.e. position in the water column, schooling behaviours and swim speeds may return to normal relatively quickly (within minutes or hours), but their distribution may not return to normal for hours or days. Potential changes in distribution of fish has been observed in some studies for approximately five days following sound exposure, although such changes are limited to studies that focused primarily on migrating sound pressure-sensitive types of fish with a swim bladder-ear connection (e.g. Clupeidae, Gadidae). These studies also acknowledge that it is difficult to attribute these changes in distribution directly to the seismic survey or to natural migration patterns, food availability or other natural factors (Slotte et al. 2004; Engås et al. 1996; Engås & Løkkeborg 2002). However, it is possible that changes to the behaviour and distribution of some sound-sensitive prey species (e.g. herring, sardines) may have some indirect influence on the distribution of larger predatory fishes during the days following exposure and disturbance.
- Small changes in behaviour or disruption to diurnal activities of pressure-sensitive species of fish (Gadidae) with a swim bladder-ear connection may indicate that activities such as feeding and energy expenditure can be affected if exposed long-term (Davidsen et al. 2019; Hubert et al. 2020; van der Knaap 2021), although these species of fish may also habituate to the sound with repeated exposure (Davidsen et al. 2019).

Given the limited convergence in results from the available studies, the subjective nature of many assessments and the context under which fish received sound, the Popper et al. (2014) ANSI-Accredited Standards Committee Sound Exposure Guidelines for Fishes and Turtles determined that it is not possible to define exact sound level thresholds for changes in fish behaviours. Instead, Popper et al. (2014) applies relative risk criteria. The criteria reflect the potential for substantial changes in behaviour for a large proportion of the animals exposed to a sound, which may alter distribution, and moving from preferred sites for feeding and reproduction. The criteria do not include effects on single animals or small changes in behaviour such as a startle response or minor movements. As such, Popper et al. (2014) indicate that fish without a swim bladder or with no connection between the swim bladder and the inner ear may experience substantial changes in behaviour within tens or hundreds of metres of a seismic source. These peer-reviewed and accredited sound exposure criteria are reflected in this risk assessment. It is acknowledged that some fishes with swim bladders may show varying levels of awareness of sound pressure at greater distances from the seismic source, but it is important to recognise changes in behaviour that may be of ecological significance from those that aren't.

Acoustic Masking

Masking impairs an animal's hearing impairment with respect to the relevant biological sounds normally detected within the environment and can have long lasting effects on survival, reproduction, and population dynamics of fishes. The consequences of masking for fishes; however, have not been sufficiently examined to allow a thorough assessment of effects caused in the context of this survey. Popper et al. (2014) surmised that "*It is likely that increments in background sound within the hearing bandwidth of fishes and sea turtles may render the weakest sounds undetectable, render some sounds less detectable, and reduce the distance at which sound sources can be detected. Energetic and informational masking may increase as sound levels increase, so that the higher the sound level of the masker, the greater the masking*." If impulsive sounds are generated repeatedly by many sources over a wide geographic area there is a possibility that the separate sounds might merge and that the overall background noise be raised (Nieukirk et al. 2004). However, acoustic masking only occurs while the interfering sound is present, and therefore, masking resulting from a single pulse of sound (such as seismic source impulses) or widely separated pulses would be infrequent and not likely affect an individual's overall fitness and survival.

5.1 Sharks

Myrberg (2001) stated that sharks differ from bony fishes in that they have no accessory organs of hearing such as a swim bladder and therefore are unlikely to respond to acoustical pressure. The study also suggested that the lateral line system does not respond to normal acoustical stimuli and is unable to detect sound-induced water displacements beyond a few body lengths, even with large sound intensities (Myrberg 2001).

Chapuis et al. (2019) detailed that the auditory apparatus of sharks comprises the paired inner ears that, as in all fishes, detect the particle motion component of a sound. However, unlike most bony fishes, cartilaginous fishes do not possess a swim bladder, which responds to the pressure component of a sound, and therefore are thought to only be sensitive to particle motion. Though Lobel (2009) noted that at very loud levels, an elasmobranch is able to discriminate between sounds based upon the phased difference between particle motion and acoustic pressure (Lobel 2009).

Two sensory maculae, the sacculus and the macula neglecta, have been shown to be responsive to particle motion detection in the inner ear of cartilaginous fishes which are known to be sensitive to low frequency sounds up to 1.5 kHz, peaking between 200 and 600 Hz, depending on the species (Chapuis et al. 2019). This range overlaps with seismic pulses which are primarily less than 2 kHz, with the highest levels at frequencies in the range of 10-500 Hz (McCauley 1994).

There is some indication that a sudden onset of sound can also cause a startle response in sharks (Myrberg et al. 1978). Klimley and Myrberg (1979) established that an individual shark will suddenly turn and withdraw from a sound source of high intensity (more than 20 dB re 1 μPa above broadband ambient SPL) when approaching within 10 m of the sound source.

Research by Bruce et al. (2018), which tagged two shark species and monitored their movements in response to a seismic survey in Australian waters noted that both control sharks and exposed sharks moved freely in and out of the study area which did not indicate any changes in behaviour or distribution as a result of seismic sound exposure.

A study by Chapuis et al. (2019) used a baited underwater camera rig to record the behavioural responses of eight species of sharks (seven reef and coastal shark species and the white shark) to the playback of two distinct sound stimuli in the wild: an orca call sequence and an artificially generated sound. The aim of the study was to look at sound-induced behavioural changes in sharks to potentially identify acoustic repellent devices. When sounds were playing, reef and coastal sharks were less numerous in the area, were responsible for fewer interactions with the baited test rigs, and displayed less 'inquisitive' behaviour, compared to during silent control trials. White sharks spent less time around the baited camera rig when the artificial sound was presented but showed no significant difference in behaviour in response to orca calls.

It is noted that there has been reported cased of sharks biting the seismic streamers, such as during seismic surveys conducted by the survey vessel *Pacific Titan* in New Zealand waters.

6 Marine Turtles

Morphological studies of green turtles (*Chelonia mydas*) and loggerhead turtles (*Caretta caretta*) (Ridgway et al. 1969; Wever 1978; Lenhardt et al. 1985) found that the turtle ear is similar to other reptile ears but has adaptations for underwater listening. In-air electrophysiological and behavioural studies on green and loggerhead turtles found their hearing frequency range is approximately 50-2,000 Hz, with highest sensitivity to sounds between 200 and 400 Hz (Ridgway et al. 1969; Bartol et al. 1999; Ketten & Bartol 2005; Bartol & Ketten 2006; Yudhana et al. 2010; Piniak et al. 2011; Lavender et al. 2012, 2014).

Underwater audiograms are only available for three species, all of whom have poor hearing sensitivity. Two of these species, the red-eared slider (*Trachemys scripta elegans*, freshwater, semi-aquatic) (Christensen-Dalsgaard et al. 2012) and the loggerhead turtle (Martin et al. 2012), demonstrated highest sensitivity at around 500 Hz (Willis 2016). Piniak et al. (2016) found that green turtles have maximum underwater sensitivity between 200 and 400 Hz. Very little research has been performed on the hearing capabilities of hawksbill turtles (*Eretmochelys imbricata*). Yudhana et al. (2010) measured auditory brainstem responses from two hawksbill turtles in Malaysia and found that peak frequency sensitivity occurred at 457 Hz in one turtle and at 508 Hz in the other.

There is no robust information on the susceptibility of marine turtles to noise-induced effects. Most studies researching the effect of seismic noise on marine turtles focused on behavioural responses, as physiological impacts are more difficult to observe in living animals. Turtles avoid low-frequency sounds (Lenhardt 1994) and sounds from an air gun (O'Hara & Wilcox 1990), but these reports did not note received sound levels. Moein et al. (1995) found that penned loggerhead turtles initially reacted to an air gun but then showed little or no response to the sound (i.e., habituated to it). Caged green and loggerhead turtles increased their swimming activity in response to an approaching air gun when the received SPL was above 166 dB re 1 μPa, and they behaved erratically when the received SPL was approximately 175 dB re 1 μPa (McCauley et al. 2000).

The 166 dB re 1 μPa level has been used as the threshold level for a behavioural response to marine turtles by NMFS and applied in the Arctic Programmatic Environmental Impact Statement (PEIS) (NSF 2011) and the Recovery Plan for Marine Turtles in Australia (DoEE 2017). The 175 dB re 1 μPa level from McCauley et al. (2000) is recommended as the threshold for behavioural disturbance. Sound levels defined by Popper et al. (2014) show that animals are very likely to exhibit a behavioural response when they are near an air gun (tens of metres), a moderate response if they encounter the source at intermediate ranges (hundreds of metres), and a low response if they are far (thousands of metres) from the air gun.

Mortality and potential mortality injury (PMI) impacts have not been reported to have occurred in turtles as a result of noise emissions during seismic surveys. Popper et al. (2014) suggested injury to turtles could occur for sound exposures above 207 dB re 1 μPa (PK) or above 210 dB re 1 uPa^2·s (SEL_{24h}). However, Finneran et al. (2017) presented revised thresholds for turtle injury and hearing impairment from impulsive noise, considering both PK and frequency weighted SEL, suggesting that PTS may occur in response to received levels of 204 dB re 1 uPa^2·s (SEL_{24h}) or 232 dB re 1 μPa (PK) and TTS may occur in response to received levels of 189 dB re 1 uPa^2·s (SEL_{24h}) or 226 dB re 1 μPa (PK).

7 Birds

There is very little known about the effects of intense underwater sound (i.e. seismic surveys) on marine birds. However, impacts have not been observed during previous seismic surveys (Turnpenny and Nedwell, 1994), and it is generally thought that noise produced from activities associated with seismic surveys may impact only those species of birds that spend large quantities of time underwater, either swimming or plunge diving while foraging for food, for example penguins.

Pichegru et al. (2017) investigated the behavioural response of endangered African penguins (*Spheniscus demersus*) before, during and after a seismic survey conducted within 100 km of their breeding colony in South Africa, using a multi-year GPS tracking dataset.

Penguins foraging within 100 km of the active seismic operations showed a change of foraging direction during seismic periods, increasing their distance between their feeding area and the location of the seismic vessel. The avoidance behaviour by penguins observed in this study may be explained by either a direct disturbance from the noise generated by the operation or a change in fish distribution during that period (possibly as a result of seismic activities). Small-scale acoustic fish surveys assessing distribution and abundance of small pelagic fish in Algoa Bay around both penguin colonies did not show a significant change in distribution and/or abundance of small pelagic fish in the region in March 2013 compared to a few months prior to or after the seismic operations. Therefore, African penguins likely relocated away from their traditional feeding zone to avoid the disturbance generated by the noise of the seismic vessels, rather than to follow their prey.

The African penguins quickly reverted to normal foraging behaviour after cessation of seismic activities during this study, which suggest a relatively short-term influence of seismic activity on these birds' behaviour and/or that of their prey. Most bird and many fish species have the capacity to regenerate lost or damaged sensory cells of the ear, although the researchers could not rule out potential longer-terms impacts on the penguins hearing ability.

Stemp (1985; as cited in LGL 2012) conducted observations on the effects of seismic exploration on seabirds and did not observe any negative effects.

Lacroix et al. (2003) assessed the effect of near shore seismic surveys on the foraging behaviour of moulting long-tailed ducks in the Beaufort Sea, Alaska. Long-tailed ducks are not capable of flying during the moult and to compensate for the nutritionally costly moult process they increase their foraging. Lacroix et al. (2003) found that the abundance and distribution of ducks, in both the seismic and control areas, changed similarly following the start of the seismic operations suggesting other influencing factors such as wind were more important for duck distribution than seismic activities, and that seismic activities did not significantly change the diving intensity of ducks. Overall Lacroix et al. (2003) concluded that there was no evidence to suggest any displacement away from seismic operations.

In a controlled exposure experiment, Sørensen et al. (2020) exposed captive Gentoo Penguins (*Pygoscelis papua*) to impulsive signals, and most animals showed strong aversive reactions at received levels above 120 dB re 1μPa (SPL). While the experiment made efforts to reduce some of the limitations of captive experiments, the study is still difficult to reconcile exposures to sudden sound stimuli at close range (metres) in the absence of natural ocean background noise with a real-life exposure.

8 Marine Mammals

The potential impacts of anthropogenic noise on marine mammals have been the subject of considerable research (see reviews by Nowacek et al. 2007; Southall et al. 2007; Weilgart 2007; Wright et al. 2007; Southall et al. 2019; Southall et al. 2021).

Kavanagh et al. (2019) modelled over 8,000 hours of cetacean survey data across diverse offshore region of the Northeast Atlantic to investigate the effect of seismic surveys on baleen and toothed whales. They found a significant effect of seismic activity across multiple species and habitats, with an 88% (82–92%) decrease in sightings of baleen whales, and a 53% (41–63%) decrease in sightings of toothed whales during active seismic surveys when compared to control surveys. Significantly fewer sightings of toothed whales also occurred during active versus inactive air gun periods of seismic surveys, although some species-specific response to noise was observed.

Southall et al. (2007), Finneran & Jenkins (2012), Wood et al. (2012), Finneran (2015) and more recently NMFS (2018) and Southall et al. (2019, 2021), reviewed available literature to determine noise exposure criteria, based on the onset levels of non-recoverable PTS and TTS in cetaceans. The NMFS (2018) criteria incorporate the best available science to inform assessment of PTS and TTS. However, a lack of a quality low-frequency (LF) cetacean audiograms has made it difficult to precisely determine hearing sensitivity, and the criteria for LF cetaceans are likely precautionary.

Hearing Sensitivity

Current data and predictions show that marine mammal species differ in their hearing capabilities, absolute hearing sensitivity and frequency band of hearing (Richardson et al. 1995; Wartzok & Ketten 1999; Southall et al. 2007). While hearing measurements are available for a small number of species based on captive animal studies, direct measurements of many odontocetes and all mysticetes do not exist. As a result, hearing ranges for many odontocetes are grouped with similar species, and predictions for mysticetes are based on other methods, such as anatomical studies and modelling (Houser et al. 2001; Parks et al. 2007; Tubelli et al. 2012; Cranford & Krysl 2015), vocalizations (see reviews in Richardson et al. 1995; Wartzok & Ketten 1999; Au & Hastings 2008), taxonomy, and behavioural responses to sound (Dahlheim & Ljungblad 1990)

To better reflect the auditory similarities between phylogenetically closely related species, but also significant differences between species groups among the marine mammals, Southall et al. (2007) defined five groups of marine mammals, based on phylogenetic relationships and a combination of auditory, physiological, and behavioural characteristics, where known. A revised set of marine mammal hearing groups and associated frequency-weighting functions were proposed by Finneran (2016) and these groups were adopted in technical guidance (NMFS 2018) as a useful approach in developing auditory weighting functions and deriving noise exposure criteria for marine mammals. In 2019, Southall et al. reviewed these marine mammal hearing groups and modified them based on phylogenetic relationships and a comprehensive review of studies on hearing, auditory anatomy, and sound production (Southall et al. 2019). This review resulted in eight discrete hearing groups as detailed in Table B8-8-1.

Frequency weighting

Different animals are sensitive to different sound frequencies, which are measured in Hertz (Hz) and kiloHertz (kHz). Therefore, if an animal is sensitive to a particular frequency range, a sound in that frequency range will seem louder to that animal than to a different animal that is less sensitive to those frequencies. For example, some large baleen whales are sensitive to very low frequency sounds (7 Hz to 35 kHz), while toothed whales and dolphin species are considered more sensitive to mid-high frequency sounds (150 Hz to 160 kHz) with their peak hearing frequency somewhere between these frequency ranges (NMFS 2018). Therefore, how loud a sound will be perceived will differ between species.

As the hearing of different species of marine fauna is frequency dependent, rather than express received sound pressures in terms of their levels over a broad bandwidth, levels can be weighted by the frequency response of hearing for the animal. This approach has been widely used for examining exposure of humans to sound (Popper et al. 2014). Southall et al. (2007) developed M frequency weighting functions (M-weightings) for five functional hearing groups of marine mammals, with this method designed specifically to represent the broader bandwidth at which auditory effects (TTS and/or PTS) might occur for higher exposures. Southall et al. (2019) expanded on this approach to provide M-weighting functions for eight marine mammal hearing groups, including LF cetaceans, HF cetaceans, VHF cetaceans, sirenians, phocid carnivores and other marine carnivores (refer Table B8-8-1able B8-71).

Table B8-8-1: Marine Mammal Hearing Groups

Group	Genera or species included
Low-frequency (LF) cetaceans	The LF cetacean group contains all of the mysticetes: Balaenidae (*Balaena* spp. and *Eubalaena*, Neobalenidae (*Caperea*), Eschrichtiidae (*Eschrichtius*), and Balaenopteridae (*Balaenoptera* spp. and *Megaptera*).
High frequency (HF) cetaceans	The HF cetacean group contains most delphinid species (e.g., bottlenose dolphin, common dolphin, and pilot whale), beaked whales, sperm whales and killer whales.
Very high frequency (VHF) cetaceans	The VHF cetacean group comprises the true porpoises, most river dolphin species, pygmy/dwarf sperm whales, as well as number of oceanic dolphins (Commerson's, Chilean, Heaviside's, Hector's, Hourglass, and Peale's dolphins).
Sirenian (SI)	The SI group includes the manatees and dugongs.
Phocid Carnivores in Air (PCA) and Water (PCW)	This group contains all the true seals, including harbour, grey, and freshwater seals; elephant and monk seals; and both Antarctic and Arctic ice seals.
Other Marine Carnivores in Air (OCA) and Water (OCW)	This group contains all non-phocid marine carnivores, including the otariid seals (sea lions and fur seals), walruses, sea otters, and polar bears.

Behavioural Effects

Differences between species, individuals, exposure situational context, the temporal and spatial scales over which they occur, and the potential interacting effects of multiple stressors can lead to inherent variability in the behavioural response of marine mammals to sound exposure (Southall et al. 2021).

Southall et al. (2007) presented a severity-index ranking the intensity of behavioural responses that was later amended by Ellison et al. (2012), Miller et al. (2012), and Sivle et al. (2015) and has recently been updated by Southall et al. (2021) based primarily on studies of free-ranging mammals.

The NMFS currently uses a step function with a 50% probability of inducing behavioural responses at an SPL of 160 dB re 1 µPa to assess behavioural impact. This threshold value was derived from the HESS (1999) report, which, in turn, was based on the responses of migrating mysticete whales to seismic sounds (Malme et al. 1983, 1984). The HESS team recognized that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above an SPL of

140 dB re 1 µPa. An extensive review of behavioural responses to sound was undertaken by Southall et al. (2007), which found varying responses for most marine mammals between an SPL of 140 and 180 dB re 1 µPa, consistent with the HESS (1999) report.

In 2012, Wood et al. (2012) proposed a graded probability of response for impulsive sounds using a frequency weighted SPL metric (Table B8-8-2able B8-72). They designated behavioural response categories for sensitive species (such as harbour porpoises, *Phocoena phocoena*, and beaked whales) and for migrating mysticetes.

Table B8-8-2: Graded Probability of Response for Impulsive Sounds

Marine Mammal Group	Probability of response to frequency -weighted SPL (dB re 1 µPa)			
	120	**140**	**160**	**180**
Sensitive species	50%	90%		
Other species		10%	50%	90%

McCauley et al. (2000) monitored the effects of seismic survey sounds on humpback whales in the Exmouth Gulf region of Western Australia. They documented rapid swimming on the surface, breaching and localised avoidance behaviour by migrating whales during the seismic operation, indicating that the 'risk factor' associated with the marine seismic survey was confined to a comparatively short period and small range displacement. During their migration and breeding season, humpback whales rarely display deep dives. This tendency to stay close to the surface has been interpreted as actively utilising the 'sound shadow' (Lloyd's Mirror effect) near the surface; irrespective of the motivation for this behaviour, it reduces the risk for noise-induced effects unless at very short range from a large seismic source array.

A comparison of behavioural observations of humpback whale behaviour during seismic surveys shows the variability and context dependence of these responses (Richardson et al. 1995). McCauley et al. 2000) estimated that humpback whales would avoid seismic surveys in key habitat (such as breeding, resting, or feeding areas) at distances between 7 and 12 km, whereas migrating individuals generally showed an avoidance range of around 3 km. Some males have even been recorded approaching seismic survey vessels to within 1 to 2 km (McCauley et al. 2000). It is considered that avoidance behaviour represents a temporary and minor effect, unless avoidance results in displacement of whales from breeding, resting, or feeding areas.

The BRAHSS (Behavioural Response of Australian Humpback whales to Seismic Surveys) project conducted studies at Peregian Beach in Queensland, and off Dongara in Western Australia, to better understand the behavioural responses of humpback whales to noise from the operation of seismic air gun arrays (20 in^3 and 140 in^3 arrays) (Cato et al. 2013). Results from the experiments are published in Dunlop et al. (2015, 2016, 2017a, b). The BRAHSS Project found:

- Humpback whale groups responded by decreasing both dive time and speed of southwards movement though the response magnitude was not found to be related to the proximity of the source vessel, the received level of the air gun, the tow path direction, or the exposure time within the during phase. There was no evidence of orientation of the groups towards, or away from, the source vessel in the during phase. Interestingly, this behavioural response was found in the control trials as well as the active trials suggesting a response to the source vessel.
- No abnormal behaviours were recorded during the trials. However, in response to the active seismic array and the controls, the whales displayed changes in behaviour. Changes in respiration rate were of a similar magnitude to changes in baseline groups being joined by other animals suggesting any change group energetics was within their behavioural repertoire. However, the reduced progression southwards in response to the active

treatments, for some cohorts, was below typical migratory speeds. This response was more likely to occur within 4 km from the array at received levels over 135 dB re 1 μPa^2.s

- Humpback whales were more likely to avoid the air gun arrays (but not the controls) within 3 km of the source at levels over 140 re. 1 μPa^2 s, meaning that both the proximity and the received level were important factors and the relationship between dose (received level) and response is not a simple one.

The results of the BRAHSS study are consistent with previous studies with humpback whales in different behavioural contexts. Feeding humpback whales, for example, responded at ranges up to 3 km from the source, at levels of 150-169 dB re 1 μPa (Malme et al. 1985). Resting female humpback whales with calves displayed avoidance reactions at 140 dB re 1 μPa, though other cohorts reacted at higher levels (157-164 dB re 1 μPa - McCauley et al. 2000).

Blackwell et al. (2015) found evidence for two behavioural thresholds in migrating bowhead whales responding to seismic operations in the Beaufort Sea. A moderate cessation or modification of vocal behaviour (interpreted as compensation behaviour) was found at received SEL over a 10 minute period of 94 dB re 1μPa^2·s (increase of calling rates) and 127 dB re 1μPa^2·s (decrease in calling rates). At received levels of >160 dB re 1μPa^2·s; however, whales were completely silent. Robertson et al. (2013) detected changes in surfacing, respiration, and diving behaviour of bowhead whales in response to seismic survey activity but did not provide any qualitative information on the received levels. Castellote et al. (2010) documented avoidance behaviour in fin whales in response to seismic survey activity in the Mediterranean Sea lasting over 10 days.

Observations of sperm whale behaviour during seismic surveys provided conflicting results: Stone (2003) identified that while sperm whales were frequently (visually) detected during seismic surveys, these animals did not show any observable behavioural reactions. Jochens et al. (2008) found sperm whales tolerant of seismic activity; however, a decrease in foraging activity was observed for a small number of animals but no horizontal avoidance was measured. In a tagging study, Jochens and Biggs (2003) found that sperm whales did not show any behavioural reaction (horizontal avoidance of the seismic vessel, change in feeding rates) at maximum received levels of 148 dB re 1μPa.

In the Gulf of Mexico, sperm whales were equipped with multisensory tags to investigate their behaviour in response to seismic surveys. The animals did not show any statistically significant changes in horizontal movement, diving and echolocation behaviour at received levels of approximately 118–131 dB re 1μPa^2·s ($SEL_{M\text{-weighted}}$) (Miller et al. 2009).

The hearing of dolphins (HF cetaceans) is less sensitive in the low frequency range of air gun impulses (<500 Hz) and seismic operators sometimes report dolphins and other small toothed whales near operating seismic source arrays. However, there is a component of seismic pulses in the higher spectrum and in general most toothed whales do show some limited avoidance of operating seismic vessels. Goold (1996) studied the effects of seismic surveys common dolphins (*Delphinus delphis*) in the Irish Sea. The results indicated that there was a local displacement of dolphins around the seismic operation. This observation is consistent with visual data compiled by Stone (2003) from marine mammal surveys in the North Sea that shows small toothed whale species tend to move away from operating compressed air seismic sources. In a review of behavioural effects of seismic surveys on marine mammals in UK waters, Stone and Tasker (2006) reported that small odontocetes (dolphins, HF cetaceans and porpoises, VHF cetaceans) showed the strongest avoidance response to the seismic survey activity, were seen less often during periods of seismic acquisition, remaining further from the air guns and showing altered behaviour (e.g., less bow-riding, orienting away from the survey vessel, faster swimming). The same study documented that killer whales also showed some localised avoidance to seismic surveys.

A reduction in feeding activity in response to seismic survey activity has been documented for harbour porpoises at estimated received SEL of 150 – 165 dB re 1μPa^2·s (Pirotta et al. 2014). Due to the permanently high energy demands of harbour porpoises (Wisniewska et al. 2016) a prolonged cessation of feeding can have significant effects on the fitness of affected animals.

Gotz et al. (2009) reported that controlled exposure experiments with small acoustic sources (215 - 224 dB re 1μPa) were carried out over one hour to individual harbour seals (*Phoca vitulina*) and grey seals (*Halichoerus grypus*), and in seven out of eight trials with harbour seals, the animals exhibited strong avoidance reactions.

Two harbour seals equipped with heart rate tags showed immediate, but short-term, startle responses to the initial acoustic source pulses. The behaviour of all harbour seals seemed to return to normal soon after the end of each trial, even in areas where disturbance occurred on several consecutive days. Only one harbour seal showed no detectable response to the acoustic sources and approached the acoustic source to within 300 m, and seals remaining in the water returned to pre-trial behaviours within two hours of the end of the experiment (Gotz et al. 2009). General avoidance behaviour of other Northern Hemisphere seal species was exhibited at exposure levels above 170 dB re 1μPa.

Monitoring studies (Harris et al. 2001) undertaken on the behaviour of phocid seals (more sensitive to sound than otariid pinnipeds) during a nearshore seismic program in Alaska observed that:

- During daylight hours seals were seen at nearly identical rates during periods where there were no air guns firing, one air gun firing and the full array operational.
- Seals tended to be further away during full array seismic. Swimming away was more common during full array operation than no air gun periods, but relative behaviours (looked, approached, swam parallel to boat's track, dive or swam away when full array was firing) did not differ significantly among the distance categories.
- Approximately 79% of seal sightings were within 250 m of the seismic vessel. There was partial avoidance of the zone less than 150 m from the vessel during full array seismic, but seals did not move much beyond 250 m at any time.
- Received levels of noise pulses from the full array were ≥180 dB SPL out to a radius of 1 km. Despite this, many seals showed little or no obvious avoidance and no obvious tendency to avoid diving.

Physiological Effects

A study on the physiological response of Arctic Narwhals to anthropogenic noise found individuals had marked cardiovascular, respiratory and locomotor reactions in response to seismic pulses. Noise exposed Narwhals experienced a 2-2.2-fold increase in the energetic cost of diving, whilst paradoxically heart rate reduced (bradycardia). Williams et. al. 2022 compared these results to studies on trained harbour porpoises (Phocoena phocoena, Elmegaard et al., 2021) and a closely related species, the Beluga Whale (Delphinapterus leucas, Lyamin et al., 2011). In the harbour porpoise study, the cetaceans initially had intensified levels of bradycardia, however this response diminished as they habituated to the noise. In the Beluga Whale study, the continued noise exposure resulted in eventual bradycardia. These studies are impacted by variation in environmental conditions and type of fear stimuli (Williams et. al. 2022). [Paragraph has been added in response to Matter M11].

Acoustic Masking

Masking is the process by which the threshold of hearing for one sound is raised by the presence of another (masking) sound (Erbe & Farmer 1998; Erbe 2008; Erbe et al. 2016). This describes the reduction in audibility for one sound (termed 'signal') caused by the simultaneous presence of another sound (termed 'noise'). For this to occur, the sound must be loud enough, have similar frequency content to the signal, and must happen at the same time. Masking depends on the spectral and temporal characteristics of signal and noise and is reduced if the signal and noise are separated in time, frequency, or direction (space); it can occur if the noise happens shortly before or after the signal (forward and backward masking). The zone of masking can maximally be as large as the zone of audibility, as a faint noise might mask a faint signal. The masking effect can be reduced or remedied by various active or passive mechanisms for masking-release, such as spatial or temporal release from masking, the Lombard effect, or co-modulation masking release.

Auditory masking can lead to disruption of a behaviour, lack of appropriate behavioural reactions, increased vulnerability to predators, reduced access to prey, reduced communication, changes in vocal behaviour, disruption of spawning activities, and stress. The biological significance of acoustic masking is directly linked to the duration of the masking sound. While masking can be detrimental to the fitness, reproduction, and survival of individuals, it ends immediately after the masking sound ceases. Both anthropogenic and natural marine sound can affect hearing and partially or completely reduce an individual's ability to effectively communicate; detect important predator, prey, and/or conspecific signals; and detect important environmental features associated with spatial orientation (Clark et al. 2009). This is true for all marine fauna; however, masking is most frequently associated with marine mammals. Masking in fishes has not been studied in detail.

Masking reduces the communication space of marine mammals (Clark et al. 2009; Hatch et al. 2012). A calculation of reductions in communication range can be a useful proxy for impact. So far, a direct assessment and quantification of masking effects in wild animals has proven impossible (Tougaard et al. 2015). It depends on the positions of the signalling and the receiving animal relative to the sound source and to each other. In humpback whales (*Megaptera novaeangliae*), tonal and grunting sounds acting as contact calls between a mother and its calf were recorded at comparatively low levels (Videsen et al. 2017). While there is controversy about the validity of conclusions, such low levels would create a small communication space (<100 m) which, in turn, would be sensitive to increases in ambient noise.

Most studies related to masking effects in marine mammals have investigated the auditory parameters that are most relevant in this context, such as auditory sensitivity, frequency-tuning (critical bandwidth and critical ratio), auditory integration time, and critical interval. Erbe et al. (2016) reviewed the current knowledge on masking in marine mammals, summarising data on marine mammal hearing as they relate to masking and discussing masking release processes of receivers. The variability seen in auditory sensitivity (see Hearing sensitivity) indicates the variability seen with respect to auditory masking.

Temporary Threshold Shift and Permanent Threshold Shift

In marine mammals, the onset level and growth of TTS is frequency specific, depends on the temporal pattern, duty cycle, and the hearing test frequency of the fatiguing stimuli. Exposure to intense impulse noise might be more hazardous to hearing than non-impulsive noise, and there is a positive relationship between exposure duration and the amount of TTS induced. TTS can accumulate across multiple exposures, but the resulting TTS will be less than the TTS from a single, continuous exposure with the same total sound exposure level. Sounds generated by seismic sources, pile driving and mid-frequency sonars have directly been tested and proven to cause noise-induced threshold shifts in marine mammals at high received levels. Finneran (2015) reviewed the current state of knowledge on TTS and PTS. TTS typically decreases in marine mammals relative to the logarithm of the increasing recovery time. However, there is considerable individual difference in all TTS-related parameters between subjects and species tested so far.

PTS is considered injurious in marine mammals, but there are no published data on the sound levels that cause PTS in marine mammals. Hence, PTS effects in marine mammals should be viewed as theoretical, as they have never actually been demonstrated in either captive or wild animals. Regeneration of sensory cells, as known to occur in fishes, has not been documented for any marine or terrestrial mammal. Onset levels of PTS onset are typically extrapolated from TTS onset levels and assumed growth functions (Southall et al. 2007). The NMFS (2018) criteria incorporate the best available science to estimate PTS onset in marine mammals from sound energy (SEL_{24h}), or very loud, instantaneous peak sound pressure levels. Criteria are given separately for each cetacean functional hearing group and discriminate between impulsive and non-impulsive sounds. Southall et al. (2019) undertook a comprehensive review of all available data on direct measures of hearing auditory anatomy, and emitted sound characteristics for all marine mammal species. The quantitative process undertaken resulted in exposure criteria, in many respects identical to those derived by Finneran (2016) and adopted by the NMFS (2016, 2018); however, the Southall et al. (2019) exposure criteria (Table B8-8-3able B8-73) appear in a peer-reviewed publication and include marine mammal species for all noise exposures, both under water and in air for amphibious species.

Table B8-8-3: TTS- and PTS-onset Thresholds for Marine Mammals Exposed to Impulsive Noise

Marine mammal hearing group	TTS onset: SEL (weighted)	TTS onset: Peak SPL (unweighted)	PTS onset: SEL (weighted)	PTS onset: Peak SPL (unweighted)
LF	168	213	183	219
HF	170	224	185	230
VHF	140	196	155	202
SI	175	220	190	226
PCW	170	212	185	218
OCW	188	226	203	232
PCA	123	138	138	144
OCA	146	161	161	167

The role of the temporal pattern of sound on TTS in marine mammals has been studied in MF and HF cetaceans (Mooney et al. 2009; Finneran et al. 2010; Kastelein et al. 2014; Kastelein et al. 2015). The results of these studies show that TTS can accumulate across multiple exposures, but the resulting TTS will be less than the TTS from a single, continuous exposure with the same total SEL.

Only a few studies have investigated TTS in marine mammals in response to exposure to impulsive sounds such as seismic impulses. Lucke et al. (2009) tested the effect of a single seismic source on a male harbour porpoise. They documented onset of TTS at received (unweighted) SEL of 164 dB re 1 $\mu Pa^2 \cdot s$. This equates to a (HF) weighted SEL_{24h} of 140 dB re 1 $\mu Pa^2 \cdot s$ (NOAA 2016). The main energy of the fatiguing stimulus (seismic pulse) was centred below 500 Hz, but a substantial amount of energy was also present at higher frequencies. Kastelein et al. (1997) tested the auditory tolerance of a harbour porpoise to playbacks of broadband pile driving sounds. After one hour of exposure an unweighted SEL 146 dB re 1 $\mu Pa^2 \cdot s$ and a SEL_{24h} of 180 dB re 1 $\mu Pa^2 \cdot s$, a TTS of 2.3 dB and 3.6 dB occurred at 4 kHz and 8 kHz, respectively. The average weighted SEL_{24h} from these exposures was 144 dB re 1 μPa²·s.

In a study using playbacks of pile driving sounds, Kastelein et al. (2013) exposed harbour porpoises to a maximum single-strike unweighted broadband SEL of 145 dB re 1 μPa²s and a cumulative SEL_{24h} of up to 187 dB re 1 μPa²·s. TTS increased from 0 dB after 15 minutes exposure to 5 dB after 360 minutes exposure. Based on their results, they calculated an onset of TTS for this type of sound at a SEL_{24h} of approximately 175 dB re 1 μPa²·s. Kastelein et al. (2017) exposed a harbour porpoise to 10 and 20 consecutive seismic impulses at received SEL_{24h} of 188-191 dB re 1 μPa²·s with a mean shot intervals of around 17 seconds. TTS of ~4.4 dB was measured at 4 kHz.

Finneran et al. (2015) tested the exposed three bottlenose dolphins to 10 impulses produced by a seismic source. The highest exposures were conducted at peak sound pressure levels (PK) of 210 dB re 1 μPa, peak-peak sound pressure levels (PK-PK) of 212 dB re 1 μPa, and cumulative (unweighted) SEL_{24h} of 195 dB re 1 μPa²·s. This exposure induced 9 dB TTS in one animal at 8 kHz.

9 Commercial Fishing Catch and Abundance Effect Studies

Some effort to relate fishing catch data to marine seismic survey effects has been undertaken, but to date none of the Australian efforts to relate catch data with marine seismic surveys have yielded significant results. Elsewhere, the potential effects of seismic operations on fish distribution, local abundance or catch have been examined for some teleost species with varying results (Carroll et al. 2017).

A range of behavioural responses have been observed in wild fish in the presence of anthropogenic sound. Studies suggest that fish will generally move away from a loud sound source to minimise their exposure, but this response may depend upon the animal's motivational state. Anthropogenic sound (including marine seismic surveys) has been shown to cause changes in schooling patterns and distribution (Engås et al. 1996; Engås and Lokkeborg 2002; Slotte et al. 2004; Lokkeborg et al. 2012; Popper at al. 2014; Streever et al. 2016) potentially altering the catchability of commercially valuable species or recreationally targeted species.

The following studies have relevance to commercial fish and invertebrate species with respect to their catchability:

- The effects of a marine seismic survey on demersal long-line and trawl catch rates of Atlantic cod (*Gadus morhua*) and haddock (*Melanogrammus aeglefinus*) in Norway after a marine seismic survey were shown to fall by 45% and 70% respectively five days after survey completion (Engås et al., 1996). Based upon this decline Engås et al. (1996) hypothesised a reduction in catch rates due to fish avoidance behaviour, but this was not quantified. Similar reductions in catch rates (52% decrease in catch per unit effort (CPUE)) relative to controls) has been observed in the hook-and-line fishery for rockfish during controlled discharges of a single air gun (Skalaski et al. 1992). The authors suggest that the CPUE decline may not be dispersal but a decreased responsiveness to baited hooks from alarm response behaviour. A companion behavioural study showed the alarm and startle responses were not sustained following the removal of the sound source (Pearson et al. 1992; Skalski et al. 1992) suggested fishing effects may be transitory, primarily occurring during the sound exposure.
- Lokkeborg et al. (2012) observed, following air gun exposure, gillnet catches increased substantially for redfish (*Sebates norvegicus*) and Greenland halibut (*Reinharditius hippoglossoides*) by 86% and 132% respectively compared with pre-shooting levels, while longline catches of Greenland halibut and haddock decreased by 16% and 25% respectively compared with pre-survey catch. These contradictory results were explained by greater swimming activity versus lowered food search behaviour in fish when exposed to air-gun emissions. Changes in catch rates of all species studied, including saithe and ling, found all species responded to air-gun sounds. Except for saithe (a pelagic hearing sensitive fish), acoustic mapping of fish abundance did not suggest displacement from fishing grounds.
- Sonar observations by Peña et al. (2013) observing real-time behaviours of Atlantic herring (*Clupea harengus* - a clupeid species with good hearing capability) schools exposed to an acoustic source approaching from 27 km to 2 km over a two hour period found no changes in school size, swimming speed or direction. The lack of response was interpreted as a combination of a strong motivation for feeding, a lack of suddenness of the air gun stimulus and an increased tolerance to seismic shooting.
- Catch studies undertaken as part of a marine seismic survey in the Gippsland Basin found no clear evidence of adverse effects on scallops, fish or commercial catch rates (Przeslawski et al. 2016a; Bruce et al. 2018) The study followed 15 species caught by Danish

seine and demersal gillnet and identified in the six months which followed the survey, six species showed increased catch. For Danish seine this included tiger flathead, goatfish and elephantfish. For demersal gillnet this included boarfish, broadnose shark and school shark. Three species showed decreased catch caught via Danish seine – gummy shark, red gurnard, sawshark. No change was observed in the remainder of species. No change to gummy shark catch was observed for demersal gillnet capture techniques. These results support previous studies in which the effects of seismic surveys on catch seem transitory and vary among species and gear types.

In October 2020, the FRDC released preliminary results of a Multiple BACI experiment that they funded to investigate the effects of a 3D marine seismic survey in eastern Bass Strait on Danish Seine catch rates (Fishwell Consulting 2020). The key targets for the Danish Seine fishery in the areas of the marine seismic survey are flathead (*Platycephalus* sp.) and whiting (*Sillago* sp.). The October 2020 report (Fishwell Consulting 2020) provided preliminary results of three phases of the four phase study and found that overall, the BACI analyses provide robust evidence for a negative impact of seismic acquisition on whiting catch rates in the Danish Seine Fishery up to ~100 days following the survey and on flathead rates up to ~200 days. Relative catch indices for both species in the years preceding the marine seismic survey were highly variable (temporally and spatially), and that relative catch index is a measure of catch per effort, not an absolute measure of abundance. As the relative catch indices for both species in the years preceding the marine seismic survey were highly variable it is difficult to determine the effect of the survey.

Specific studies examining the effect of seismic survey signals on invertebrate catch data are rare but include:

- Carroll et al. (2017) undertook a critical review of the potential impacts of marine seismic surveys on fishes and invertebrates. Carroll et al (2017) found no significant differences in any of the studies reviewed in catch rates from the potential effects of seismic signals (Christian et al. 2003; Parry & Gason 2006; Przeslawski et al. 2016a).

- Christian et al. (2003) investigated the behavioural effects of exposure to seismic survey sound on snow crabs. Caged animals on the ocean bottom at a depth of 50 m were monitored with a remote video camera during exposure to seismic sound and did not exhibit any overt startle response during the exposure period. Eight animals were equipped with ultrasonic tags, released, and monitored for multiple days prior to exposure and after exposure. None of the tagged animals left the immediate area after exposure to the seismic survey sound. Five animals were captured in the snow crab commercial fishery the following year, one at the release location, one 35 km from the release location, and three at intermediate distances from the release location.

- Parry & Gason (2006) undertook a statistical analysis of CPUE data collected over nearly 30 years in the Victorian southern rock lobster (SRL) fishery (in southwest Victoria) that showed no influence of historical 2D and 3D marine seismic survey activity. Analyses looked at short-term (weekly) and long-term variations (up to seven years) in CPUE to determine whether changes were correlated with the marine seismic survey. The surveys occurred in water depths ranging from 10 m to 150 m. The study included surveys occurring during the SRL spawning period as well as during the lobster fishing. This study found no evidence that catch rates were affected in the weeks or years following the surveys; however, Day et al. (2016a) suggest that catch rates would have had to decrease by around 50% for this study to detect a result.

- A study undertaken by the CSIRO and Geoscience Australia (Thomson et al. 2014) examined fisheries catches (10 species of interest) and catch rates for potential effects from 183 seismic surveys undertaken in the Gippsland Basin (Bass Strait). The authors found that there were no clear or consistent relationships between seismic surveys and subsequent fisheries catch rates in their study. However, they cautioned that the results did not imply that such impacts do not exist, but that data was lacking. In terms of duration since a seismic survey occurred, significant positive and negative effects were found but could not be distinguished from inter-annual changes in stock size or availability to fishing gear resulting from other dynamics (Thomson et al., 2014).

- Przeslawski et al. (2016a) monitored scallop populations and fish behaviour before, during, and/or after an April 2015 seismic survey in the Gippsland Basin, commercial scallops (*Pecten fumatus*) and doughboy scallops (*Mimachlamys asperrima*) were assessed using dredged samples and underwater imagery from an Autonomous Underwater Vehicle (AUV) before and two and ten months after completion of the seismic survey. The study provided no clear evidence of adverse effects on scallops or commercial catch rates due to the 2015 seismic survey undertaken in the Gippsland Basin. It was noted that there were limitations with some of the analyses (e.g., large variance in scallop catch).
- Haddon (2017) further investigated the effect of the 2015 seismic survey in the Gippsland Basin on deepwater flathead catches and concluded that the significant drop in CPUE was very likely negatively influenced by the seismic survey. However, Haddon (2017) went on to add that the seismic survey did not appear to have had a lasting impact on deepwater flathead CPUE, which returned to typical values in the first month following the seismic survey.
- Morris et al. (2018) investigated the effects of 2D seismic acquisition on the snow crab fishery along the continental slope in Canada in a BACI study over a period of two years. Crabs were exposed to received levels of 187 dB re 1μPa^2 s (single shot) and 200 dB re 1μPa^2 s (cumulative over 24-hours). There was no negative effects on the catch rates in the shorter term (days) or longer term (weeks), and the authors concluded that seismic effects on snow crab harvest (if they do exist) would be smaller than changes related to natural spatial and temporal variation.
- In a further study, Morris et al. (2020) conducted a field experiment applying a series of comparisons conducted within a BACI study design to investigate the effect of prolonged industrial 3D seismic exposure on the catch rates of snow crab over nine weeks in 2017 and five weeks in 2018. Changes in catch rates at 3D seismic surveying sites were inconsistent across years, with reduced catches in 2017 and increased catches in 2018. Catch rates were similar at experimental and control sites within two weeks after exposure, and the potential effect of seismic surveying was not measured at a distance of 30 km. The large variation in catch rates across small temporal and spatial scales coupled with the absence of notable mechanistic responses of snow crab in past studies to seismic in associated snow crab movement behaviour, gene expression and physiology, the authors concluded that the observed differences owing to seismic surveying in this study design are likely a result of stochastic processes external to their manipulation.

10 Scuba Divers and Snorkelers

Scuba divers and snorkelers exposed to high levels of underwater sound can suffer from dizziness, hearing damage or other injuries to other sensitive (mainly air-filled) organs, depending on the frequency and intensity of the sound. The human auditory system is significantly less sensitive underwater than in air and is further degraded if diving equipment obstructs the ears or face (e.g., diving with a hood or full facemask).

Underwater, the human ear is about 20 dB less sensitive than it is in air at low frequencies (20 Hz), increasing to 40 dB at mid-frequencies (less than 1 kHz), and increasing to 70–80 dB less sensitive at higher frequencies (Parvin 1998). Divers who wear neoprene hoods have even higher hearing thresholds (lower sensitivity) above 500 Hz because the hood material absorbs high-frequency sounds (Sims et al. 1999). Exposure studies related to divers have typically focused on military sonar exposure, with little information on seismic survey operations, and as such care is required when considering thresholds for non-military divers, particularly for impulsive sounds such as seismic source impulses (Ainslie 2008).

Underwater auditory threshold curves indicate that the human auditory system is most sensitive to waterborne sound at frequencies between 400 Hz to 1 kHz (Parvin et al. 1994) and these frequencies have the greatest potential for damage. The auditory threshold of hearing under-water was lowest at 1 kHz (70 dB re 1 μPa SPL) and increased for lower and higher frequencies to around 120 dB re 1 μPa at 20 Hz (Parvin 1998).

Within the literature there is some variation in acceptable SPLs for divers (Ainslie 2008).

Fothergill et al. (2000) and Fothergill et al. (2001) conducted controlled acoustic exposure experiments on military divers under fully controlled conditions at a US Ocean Simulation Facility and an US Open water test facility. In all tests, the divers were covered with soft or hard shell dive suits and their position and distance relative to sound source, signal characteristics and received levels were controlled and documented (Pestorius et al. 2009). A total of 89 male Navy divers were exposed to pure tone signals and sweeps between 160-320 Hz at SPLs up to 160 dB re 1 μPa. The divers were exposed to these sounds over 100 seconds at depths from 10 to 40 m. The divers rated the sounds on a severity scale. For frequencies between 100 and 500 Hz, at a received SPL of 130 dB re 1 μPa, divers and swimmers detected body vibration. None of the divers tested rated levels of 140 dB re 1 μPa as “very severe”; however, at 157 dB re 1 μPa, sound was rated as “very severe” 19% of the time. No physiological damage was observed at the highest levels tested: 160 dB re 1 μPa (Fothergill et al. 2001).

In a subsequent study, recreational divers were exposed to tonal signals or 30 Hz sweeps at frequencies between 100 and 500 Hz at received levels of 130-157 dB re 1 μPa (Pestorius et al. 2009). Each exposure lasted for seven seconds. Nine female and 17 male scuba divers were tested, all wearing full body neoprene wetsuits. Diver aversion and perception of body vibration were used as test parameters. The results showed no sex-specific differences. The results differed as a function of frequency – while test results showed a strong overall variation between subjects, signals at 100 Hz elicited the strongest aversion in all tests and even at 148 dB a few diver ratings indicated extreme aversion. Due to this and the strong variation between test subjects, the following exposure limit for both military and recreational divers was suggested as a conservative measure: For frequencies between 100 and 500 Hz, the maximum SPL should be 145 dB re 1 μPa over a maximum continuous exposure of 100 seconds or with a maximum duty cycle of 20% and a maximum daily cumulative total of three hours. The trading relation between the maximum SPL and duration was 4 dB per doubling of duration (e.g., 141 dB SPL for a 200 second exposure) (Pestorius et al. 2009).

In alignment with these studies, and considering only frequencies between 100 and 500 Hz, Parvin (2005) suggested 145 dB re 1 μPa as a safety criterion for recreational divers and swimmers. This does not imply that this level is associated with the onset of injury not been established due to ethical research protocols. Parvin (2005) reported vibration in forearms and thighs at 180 dB re 1 μPa but no physical injury.

Guidance issued by the Diving Medical Advisory Committee (DMAC 2020) suggests that adverse effects to divers may be experienced at distances of up to 27 km from the seismic source, which is a considerably greater distance than has previously been recognised. However, the basis for this conclusion is not provided.

11 Acronyms and Abbreviations

BRUVS	Baited remote underwater video stations
dB	Decibels
FRDC	Fisheries Research Development Corporation
HF cetaceans	High-frequency cetaceans
hr	Hour
Hz	Hertz
IMAS	Institute for Marine and Antarctic Studies
In3	Cubic inch
kHz	KiloHertz
km	Kilometre
LF cetaceans	Low-frequency cetaceans
m	Metre
m3	Cubic metre
MSS	Marine Seismic Survey
nm	Nautical mile
OCA	Other Marine Carnivores in Air
OCW	Other Marine Carnivores in Water
PCA	Phocid Carnivores in Air
PCW	Phocid Carnivores in Water
PK	Peak sound pressure level
PK-PK	Peak-to-peak sound pressure level
PSI	Pound per square in
PTS	Permanent threshold shift
RMS	Root mean square
sec	Second
SEL	Sound exposure level
SPL	Sound pressure level
μPa	Micropascal
TTS	Temporary threshold shift
VHF cetaceans	Very-high-frequency cetaceans

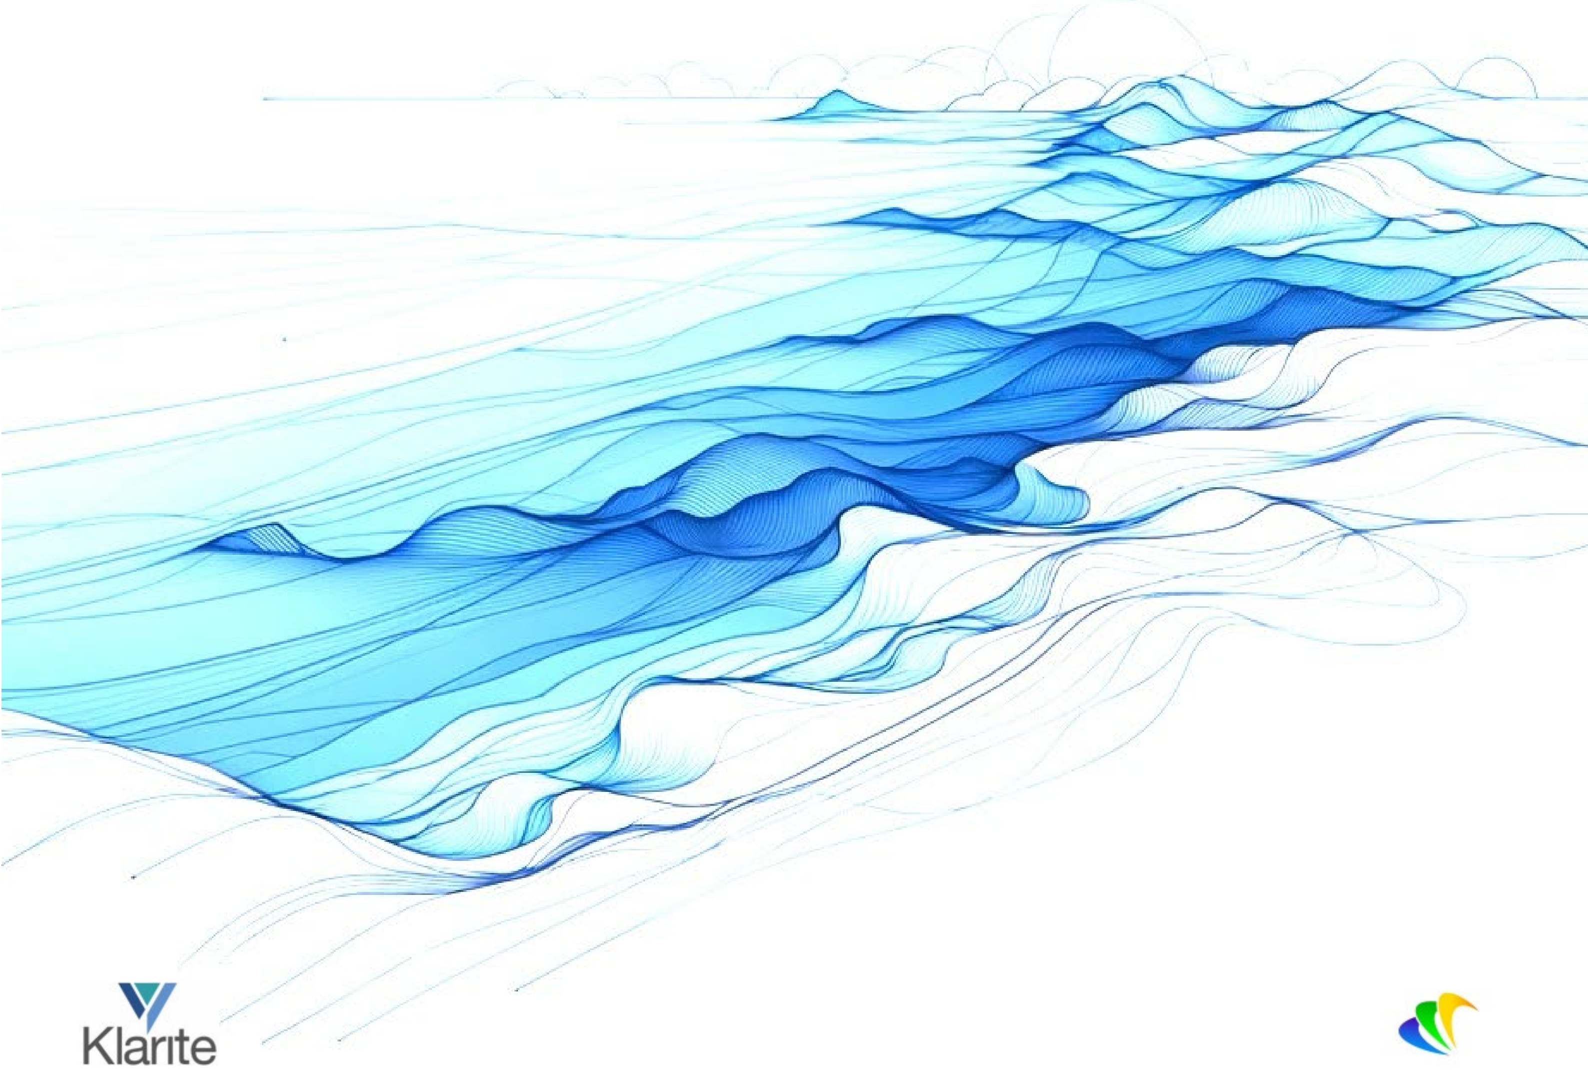
Environmental Assessment Methodology

Appendix B9: REG-EP-041-B9

Rev 1

January 2024



Klarite

Table of Contents

1 Introduction

This document has been prepared by CGG Services (Australia) Pty Ltd (**CGG**) as part of its environmental management of the Regia 3D Marine Seismic Survey (**Regia MSS**). The methodology provides a transparent and consultative approach and incorporates best practices in environmental management. The method is designed to facilitate the identification and management of potential impacts and risks associated with an offshore petroleum activity, ensuring compliance with relevant legislation and other requirements, while minimising the potential for adverse environmental, social, economic, and cultural impacts.

1.1 Purpose

This document provides the methodology for the assessment of environmental impacts and risks for offshore petroleum activities under the *Offshore Petroleum and Greenhouse Gas Storage (*Environment*) Regulations 2023* (**the Regulations**) administered by the National Offshore Petroleum Safety and Environmental Management Authority (**NOPSEMA**). The environmental impact and risk assessment method is a comprehensive process that evaluates the potential environmental impacts and risks associated with offshore petroleum activities, including seismic exploration.

The purpose of this document is to communicate how environmental impacts and risks will be assessed before the environmental assessments are started. This is intended to allow relevant persons an opportunity to influence the environmental assessment process and to support consultation with relevant persons.

1.2 Overview

CGG's impact and risk management method is based on the principles, framework and processes defined by the International Standards Organization (**ISO**) 31000:2009 Risk Management – Principles and Guidelines (Figure B9-1 & Figure B9-2). The following sections describe the steps in the risk management method, including the legislative framework, approach taken to identify and evaluate potential impacts and risks associated with the activity and how mitigation and management measures (treatments) will be assessed to ensure those adopted will reduce the impacts and risks to as low as reasonably practical (**ALARP**) and to an acceptable level.

The environmental impact and risk assessment method is a systematic, evidence-based approach to evaluate and interpret the impacts and risks associated with the Regia MSS activity. Each environmental aspect arising from the activity will be assessed to identify the environmental impacts and risks associated with the Regia MSS. Each assessment will use the following steps:

- Establish the context of the assessments.
- Identify and screen of affected receptors using the cause effect pathways for receptors within an area defined as relevant for each aspect.
- Describe the environmental values and sensitivities that may be affected by that environmental aspect.
- Predict the level of impact for each environmental aspect planned to occur or predict the level of risk for each environmental aspect actively prevented from occurring.
- Evaluate the predicted level of environmental impact or risk arising from the environmental aspect.
- Compare the predicted level of impact or risk to the acceptable level.
- Identify mitigation and management measures to lower levels of impact and risk.

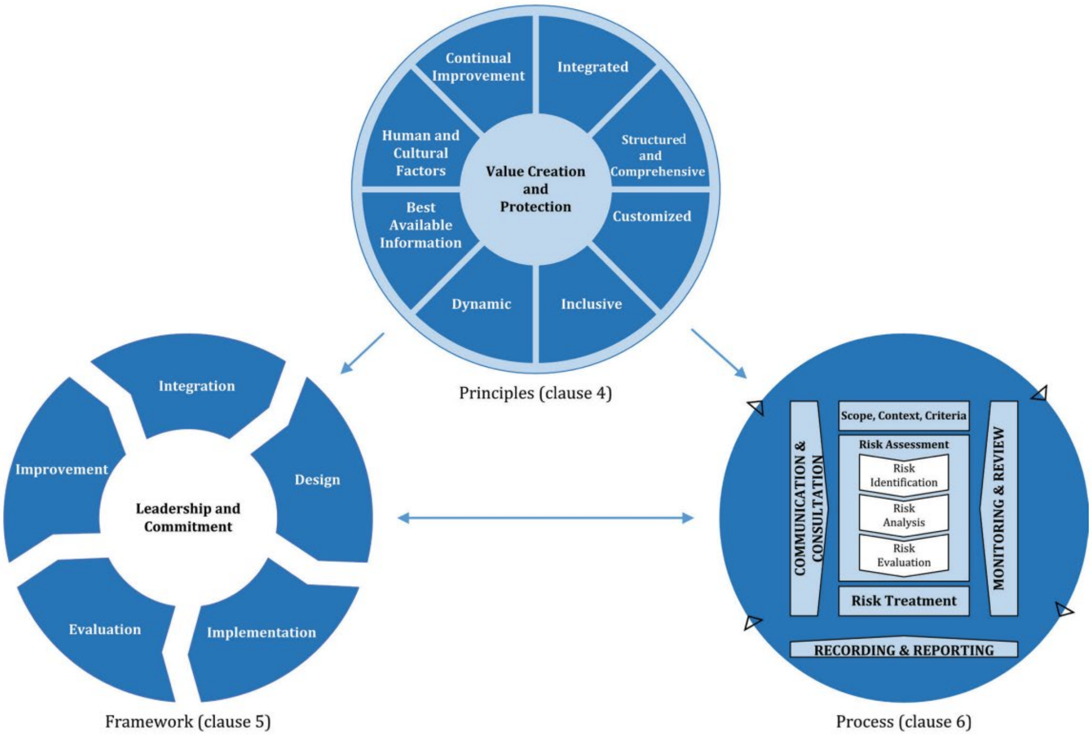


Figure B9-1 - ISO 31000 Risk Management Framework

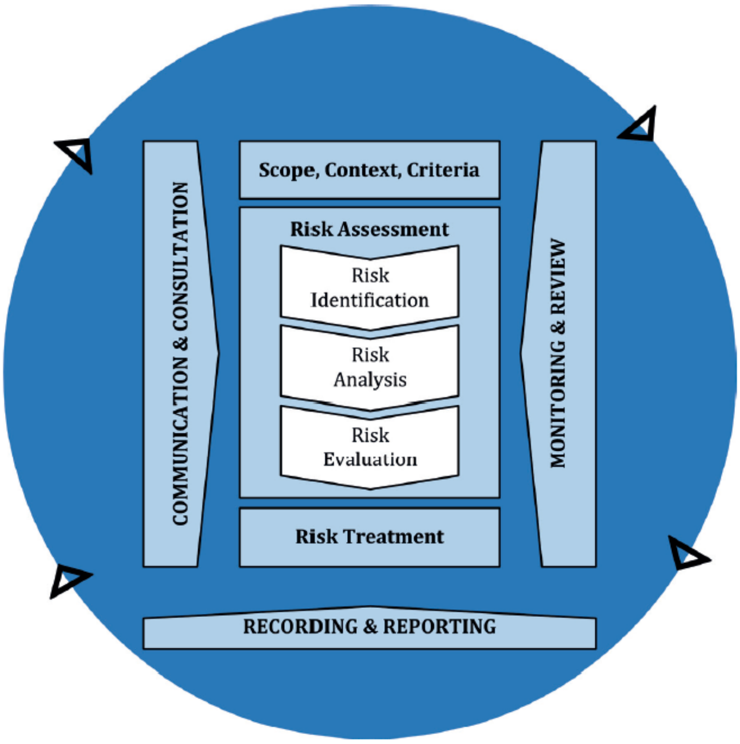

Figure B9-2 - ISO 31000 Risk Management Process

2 Communication and Consultation

Communication and consultation with internal and external stakeholders take place during all stages of the impact and risk assessment. The ISO 31000:2009 standard requires effective stakeholder communication and consultation to ensure that those accountable for implementing the impact and risk assessment process (namely, CGG and any appointed contractors), and stakeholders understand the basis on which decisions are made, and the reasons why particular actions are required. This is also consistent with NOPSEMA's guidance.

The OPGGS Act and the Regulations are guiding principles that underpin the process of external stakeholder communication and consultation in the development of an Environment Plan (EP). NOPSEMA's Consultation In The Course of Preparing an Environment Plan Guideline (N-04750-GL2086) outlines how the regulations relate to EPs and its recommendations have been followed herein.

CGG has commenced consulting with relevant persons who may be affected by the activity as per our Community Engagement and Consultation Plan available on the Regia MSS Consultation Hub (www.regiamss.com.au). This document explains how we will find relevant persons and consult with them to understand and mitigate any concerns and issues they may have. Input from relevant persons and the community will help to inform the preparation of the EP and the design and execution of the Regia MSS. Measures adopted because of the consultations will be captured in each assessment.

3 Context, Scope & Criteria

3.1 Context

The purpose of establishing the context in the assessment process is to define the external and internal parameters to be considered when assessing and treating environmental impacts and risks. The context is also used to define the acceptable levels of environmental impact and risk. This requires assessment of the external and internal environments in which CGG seeks to achieve its objectives.

The primary context of the assessment is the Description of Activity (Appendix A2). In addition, CGG commissioned an independent Preliminary Environmental Impact and Risk Assessment (**PEIRA**) to provide preliminary information on the potential impacts and risks to support consultations with relevant persons. The PEIRA also provides context to the subsequent impact and risk assessments.

The internal context relates to CGG's culture, processes, structure, and strategy, and includes anything within the organisation that can influence the way in which environmental impacts and risks are managed. CGG's commitment to minimising environmental harm and to operating and maintaining a safe and healthy work environment for its employees, contractors and project partners is reflected in its corporate HSE Policy (Appendix A1) and the Implementation Strategy (Appendix B3).

3.2 Scope

Each environmental assessment will start with identification of how the environmental aspect under assessment arises from the activity. Then, the extent and duration of the environmental aspect will be justified. Next there is a demonstration of how the legislative and other requirements that are relevant to that environmental aspect are to be met. There will follow an analysis of the relevant environmental aspect to make a prediction of the levels of each impact, or each risk, arising from that aspect. Then, once consultation has sufficiently progressed, an evaluation of the relevant impacts or risks will be performed. The subsequent collective treatment of environmental impacts and risks and setting of environmental performance is performed collectively to ensure any trade-offs or unintended consequences are understood.

3.3 Criteria

CGG has published its Decision-Making Criteria for the Regia MSS environmental impact and risk assessments in a separate document on the Regia MSS Consultation Hub. This is so that identified relevant persons, and unidentified relevant persons in the community, can understand and comment on the quality of the criteria. This document will be adapted over time to reflect relevant person feedback and information discovered through the impact and risk assessment process.

4 Impact Assessment

Each impact assessment is framed by the environmental aspect that causes it. This method is preferred as community concerns are usually aligned with the thing that causes harm rather than the specific effect it may have.

4.1 Identification of Impacts

Information used in identifying the environmental impacts associated with the activity has been obtained from the following sources:

- CGG's description of the activity.
- Professional experience of vessel activities/operations during seismic surveys.
- Previous EPs for seismic surveys.
- Literature review of the environmental values and sensitivity of the receiving environment with respect to species' presence, "biological calendars", habitat distribution and location of environmentally sensitive areas (breeding, migration, resting areas).
- Identification of environmental features within and adjacent to the Environment Planning Area.
- Feedback from stakeholders (onshore and marine) to understand socio-economic activities that may be affected by the proposed activity.

The PEIRA identified and screened impacts. Table B9-1able B9-1 shows the aspects that are planned to occur and the environmental impacts that require full assessment. Aspects that through the PIERA were identified as having a negligible impact are described and evaluated in the PIERA.

Table B9-1 - Environmental aspects identified for full assessment (Klarite, 2023)

Environmental Aspect	Environmental Impact	Preliminary Outcome
Artificial Light	Change in ambient light	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
Underwater Sound	Change in ambient sound	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
	Change in hearing capacity	Quantitative assessment
	Change in physical condition	Quantitative assessment
Physical Presence	Change in functions, interests, or activities	Quantitative assessment

4.2 Analysis of Impacts

Impact analysis and impact evaluation are two terms that are often used interchangeably, but they have different meanings and purposes in the context of environmental management. Impact analysis refers to the process of identifying, assessing, and predicting the environmental, social, and economic impacts of a proposed activity.

Impact evaluation refers to the process of comparing the predicted levels of environmental, social, and economic impacts of an activity to the defined acceptable levels of impact. Impact evaluation involves collecting and analysing data on the acceptable outcomes and effects of the activity, comparing those outcomes to the predicted impacts, and identifying the factors that contributed to any differences or discrepancies.

Each impact arises from a planned aspect of the activity. Each impact will be analysed by predicting the level of effect as per Table B9-2able B9-2, which includes consideration of the impact's extent, duration, and timing, and the receptors vulnerability, sensitivity, and recoverability from the effect. The predicted levels of impact are made with legislative and other requirements applied.

Then, each impact will be assigned a level of uncertainty associated with those effects as per Table B9-3able B9-3. It is important to note that uncertainty is not the same as risk or likelihood. Uncertainty refers to the degree of knowledge or confidence in the data or models used, while risk or likelihood refers to the probability of an event occurring and the potential consequences of that event.

Table B9-2 – Environmental impact assessment effect levels

Effect Level	**Definition**
Negligible	The impact is expected to have little or no effect on the environment or the affected species, populations, or ecosystems. The impact may be within the natural variation or background levels, or the system may have the capacity to absorb or recover from the impact without significant harm.
Minor	The impact is expected to have some effect on the environment or the affected species, populations, or ecosystems, but the effect is not considered significant or long-lasting. The impact may be localized or temporary, and the system may have the capacity to recover from the impact over time.
Moderate	The impact is expected to have a noticeable and potentially significant effect on the environment or the affected species, populations, or ecosystems. The impact may be more widespread or persistent than a minor effect, and the system may require longer periods of time or additional management measures to recover from the impact.
Major	The impact is expected to have a significant and potentially irreversible effect on the environment or the affected species, populations, or ecosystems. The impact may result in the loss or degradation of critical habitats, the decline or loss of species or populations, or the disruption of ecosystem functions or services. The system may require extensive management measures to recover from the impact, and the recovery may be incomplete or may take many years.
Catastrophic	The impact is expected to have a severe and potentially irreversible effect on the environment or the affected species, populations, or ecosystems. The impact may result in the loss of entire ecosystems or the collapse of ecological processes, with significant consequences for human health, safety, or well-being. The system may require extensive and long-term management measures to recover from the impact, and the recovery may be uncertain or impossible to achieve.

Table B9-3 - Environmental impact assessment uncertainty levels

Uncertainty Level	Definition
Very low	This level of uncertainty indicates that there is an extremely high degree of knowledge, understanding, or confidence in the data, models, or assumptions used in the analysis. This level of uncertainty is typically associated with very well-established scientific principles or data that have been extensively tested, validated, and replicated.
Low	There is a high degree of knowledge, understanding, or confidence in the data, models, or assumptions used in the analysis. This level of uncertainty is typically associated with well-established scientific principles or data that have been extensively tested and validated.
Medium	Some knowledge, understanding, or confidence in the data, models, or assumptions used in the analysis, but there are still gaps or uncertainties that need to be addressed. This level of uncertainty may require further research or data collection to reduce uncertainty.
High	Limited knowledge, understanding, or confidence in the data, models, or assumptions used in the analysis. This level of uncertainty may indicate a lack of data, or a poor understanding of the system being studied. At this level there is scientific uncertainty, and the precautionary principle must be applied.
Unknown	Insufficient knowledge, understanding, or data available to decide the level of uncertainty. This level of uncertainty may be associated with new or emerging scientific principles, or areas where data are scarce or difficult to obtain. The unknown uncertainty level may also be used when there are conflicting scientific opinions or when the scientific community is divided on a particular issue. At this level there is scientific uncertainty, and the precautionary principle must be applied.

4.3 Evaluation of Impacts

Impact evaluation is the process of comparing the results of the analysis against predefined criteria or standards to determine the significance of the impact and the need for treatment. After each impact has been assigned a level of effect and uncertainty, and a prediction of residual impact made, each impact will be compared to the pre-defined acceptable levels of impact. ISO 31000 recommends using a matrix to evaluate and communicate the results of analysis. The impact evaluation matrix in Table B9-4able B9-4 will be used to understand impact trade-offs, develop treatment strategies, and communicate the results of impact assessments to stakeholders.

The outcome of the impact evaluation is that either the environmental impacts are of an acceptable level, or they are not. If they are not, further mitigation and management measures must be applied to manage the impact to a lower level either by lowering the effect of the aspect or by lowering the levels of uncertainty in the prediction of impact.

Each impact assessment will end with a summary demonstrating that the environmental impacts that arise from the environmental aspect under consideration are of an acceptable level. The criteria for the acceptable level demonstration are in the Decision-Making Criteria.

Table B9-4 - Environmental impact evaluation matrix

	Effect				
Uncertainty	Negligible	Minor	Moderate	Major	Catastrophic
Very low					
Low					
Medium					
High					
Unknown					

Term	**Definition**
Low	Acceptable. The predicted levels of impact are beneath levels of perception and/or within normal bounds of variation. Good industry practice (including legislation and standards) has been applied and therefore these impacts are of an acceptable level without further reduction measures being required.
Medium	Acceptable. The predicted levels of impact are clearly below the pre-defined acceptable levels of impact and the mitigation and management measures in place provide sufficient confidence in the predicted effect levels.
High	Objectionable. The predicted levels of impact are close or like the pre-defined acceptable levels and/or there is enough uncertainty to apply the precautionary principle.
Very High	Unacceptable. The activity requires re-design and/or postponement or cancellation. Further studies may be required to lessen the uncertainty or reclassify the effect level. There are no additional mitigation and management measures that lower the effect.

5 Risk Assessment

Each risk assessment is framed by the environmental aspect that causes it. This method is preferred as community concerns are usually aligned with the thing that causes harm rather than the specific effect it may have.

5.1 Risk Identification

Information used in identifying the environmental risks associated with the activity has been obtained from the following sources:

- CGG's description of the activity.
- Professional experience of vessel activities/operations during seismic surveys.
- Previous EPs for seismic surveys.
- Literature review of the environmental values and sensitivity of the receiving environment with respect to species' presence, "biological calendars", habitat distribution and location of environmentally sensitive areas (breeding, migration, resting areas).
- Identification of environmental features within and adjacent to the Environment Planning Area.
- Feedback from stakeholders (onshore and marine) to understand socio-economic activities that may be affected by the proposed activity.

The PEIRA identified and screened impacts. Table B9-5able B9-5 shows the unplanned aspects and the environmental risks arising from them that require full assessment. Aspects that through the PIERA were identified as having a negligible risk are described and evaluated in the PIERA.

Table B9-5 - Environmental risk identified for full assessment (Klarite, 2023)

Environmental Aspect	Environmental Risk	Preliminary Outcome
Accidental Release of Fuel	Change in water quality	Low
	Change in sediment quality	Low
	Change in ecosystem dynamics	Low
	Change in physical condition	Low
	Change in fauna behaviour	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Introduction Of Marine Pest Species	Change in ecosystem dynamics	Moderate
	Change to functions, interests, or activities	Moderate
Accidental Release of Materials or Waste Overboard	Change in physical condition	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Collisions With Marine Fauna	Change in physical condition	Moderate

5.2 Analysis of Risks

The environmental risks were identified by the PEIRA. Each risk arises from an unplanned aspect of the activity. Each risk will be analysed by first predicting the level of consequence should the event occur, as per Table B9-6, which includes consideration of the consequence's extent, duration, and timing, and the receptor's vulnerability, sensitivity, and recoverability from the consequence. The predicted levels of risk are made with legislative and other requirements applied.

Then, each risk will be assigned a level of likelihood associated with those consequences, as per Table B9-7able B9-7. Likelihood refers to the probability or frequency of an event or hazard occurring that could result in harm or damage. Likelihood will be analysed based on the available data, experience, and expert judgment. Depending on the significance of the consequence, further qualitative or quantitative assessments will be undertaken. Likelihood is a measure of the frequency or probability of an event occurring. The likelihood of an event or hazard occurring can be influenced by a range of factors, including the nature of the hazard, the conditions under which the activity takes place, and the effectiveness of mitigation and management measures.

Table B9-6 - Environmental risk assessment levels of consequence

Consequence	Definition
Negligible	Potential harm is minor, and it may be limited to minor injuries or damage to property that can be easily repaired or replaced. The impact may be temporary or localized, and the consequences may be reversible or easily mitigated.
Minor	Potential harm is moderate, and it may result in injuries or damage to property that require some level of repair or replacement. The consequences may be more widespread or longer lasting than a negligible consequence, and the consequences may require some level of mitigation or remediation.
Moderate	This level of consequence indicates that the potential harm is significant, and it may result in injuries or damage to property that require extensive repairs or replacement. The consequence may be more widespread or longer lasting than a minor consequence, and the consequences may require significant mitigation or remediation efforts.
Major	Potential harm is severe, and it may result in injuries or damage to property that are catastrophic or irreparable. The consequences may result in significant environmental, social, or economic harm, and the consequences may require extensive and long-term mitigation or remediation efforts.
Catastrophic	Potential harm is extremely severe, and it may result in loss of life, extensive environmental damage, or long-term social or economic harm. The consequence may be irreversible or impossible to mitigate, and the consequences may have significant consequences on human health, safety, and well-being.

Table B9-7 - Environmental risk assessment likelihood levels

Likelihood	Definition
Rare	The event is expected to occur only in exceptional circumstances, or it may have never occurred before in similar circumstances. This level of likelihood implies that the event is highly unlikely to occur, with a probability of less than 1%.
Unlikely	The event is possible but not expected to occur under normal circumstances. This level of likelihood implies that the event is not likely to occur, with a probability of between 1% and 10%.
Possible	The event could occur under certain conditions, or it may have occurred before in similar circumstances. This level of likelihood implies that the event is moderately likely to occur, with a probability of between 10% and 50%.
Likely	The event is expected to occur under normal circumstances, or it may have a high likelihood of occurring based on experience or data. This level of likelihood implies that the event is highly likely to occur, with a probability of between 50% and 90%.
Almost Certain	The event is expected to occur in most circumstances, or it may be virtually certain to occur based on experience or data. This level of likelihood implies that the event is almost certain to occur, with a probability of greater than 90%.

5.3 Evaluation of Risks

Risk evaluation is the process of comparing the results of the analysis against predefined criteria or standards to determine the significance of the risk and the need for treatment. After each risk has been assigned a level of consequence and likelihood, and a prediction of residual risk made, all risks will be compared to the pre-defined acceptable levels of risk. ISO 31000 recommends using a matrix to evaluate and communicate the results of the assessments. The risk matrix in Table B9-8able B9-8 will be used to prioritize risks, develop risk treatment strategies, and communicate the results of risk analysis to stakeholders.

The outcome of the risk evaluation is that either the environmental risks are of an acceptable level, or they are not. If they are not, further mitigation and management measures must be applied to manage the risk to a lower level either by lowering the likelihood of the event occurring or by improving levels of preparedness and lowering the level of consequence.

Each risk assessment will end with a summary demonstrating that each of the environmental risks that arise from the environmental aspect under consideration are of an acceptable level. The criteria for the acceptable level demonstration are in the Decision-Making Criteria.

Table B9-8 - Environmental risk evaluation matrix

	Consequence				
Likelihood	Negligible	Minor	Moderate	Major	Catastrophic
Rare					
Unlikely					
Possible					
Likely					
Almost Certain					

Term	**Definition**
Low	Acceptable. The predicted levels of risk are beneath levels of perception. Good industry practice (including legislation and standards) has been applied and therefore these risks are of an acceptable level without further reduction measures being required.
Medium	Acceptable. The predicted levels of risk are clearly below the pre-defined acceptable levels of risk and the mitigation and management measures in place provide reliable prevention to have confidence in the predicted likelihood levels.
High	Objectionable. The predicted levels of risk are close to or like the pre-defined acceptable levels of risk and/or the mitigation and management measures in place to prevent and respond to the event have lower levels of effectiveness such that others may disagree to the acceptability of the risk.
Very High	Unacceptable. The activity requires re-design and/or postponement or cancellation. Further studies may be required to lessen the uncertainty or reclassify the effect level. There are no additional mitigation and management measures that lower the effect.

6 Treatment of Environmental Impacts and Risks

The treatment of the environmental impacts and risks is through the adoption of mitigation and management measures that reduce the levels of impact or risk to ALARP and will be of an acceptable level. To demonstrate that the levels of each environmental impact and risk are ALARP the following steps are taken:

1. Determination of residual impact and risk with legislative and other requirements applied.
2. Identification of feasible (additional, alternative, and improved) mitigation and management measures.
3. Identification of the cost (in terms of money, time, and trouble) required to implement any feasible mitigation and management measure. Costs are qualitatively assessed by multi-disciplinary teams as either:
4. High – Very significant cost associated with the implementation of this measure and the cost may be prohibitive or not warranted based on the potential benefit gained. The level of cost is likely to compromise the objectives and viability of the project.
5. Medium – Significant cost associated with implementation of this measure, however it is not considered prohibitive, when compared to the potential risk reduction benefit.
6. Low – No significant cost associated with implementation of this measure.
7. Prediction of the environmental benefit gained by adopting the mitigation and management measure usually expressed in terms of the effectiveness of the measure (See Hierarchy of Measures below) or expressed as a change to the evaluation ranking in the impact/risk matrices.
8. Undertake a Cost Benefit Analysis of the proportionality between the cost and environmental benefit of each mitigation and management.
9. Justifying the adoption or rejection of each mitigation and management measure.
10. Setting the environmental performance required of any adopted mitigation and management measure.

6.1 Mitigation and management measures

Throughout the assessment there will be mitigation and management measures that will be implemented preparing for, and during, the activity. There are five types of mitigation and management measures as shown in Figure B9-3igure B9-3. Where a mitigation or management measure is identified in an assessment it will be shown within the text to emphasise their importance for environmental management.

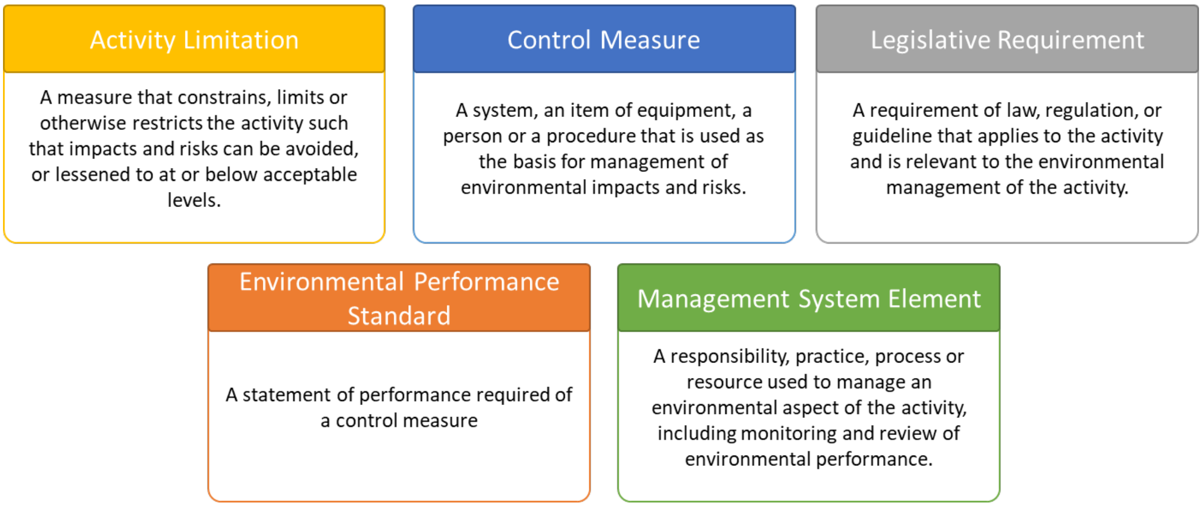

Figure B9-3 - Types of mitigation and management measures

6.2 Hierarchy of Controls

The hierarchy of controls (mitigation and management measures) is a philosophy used in occupational health and safety management to minimize or eliminate workplace hazards. It can be easily adapted to environmental management. Applying the hierarchy of controls involves a systematic approach to controlling hazards by implementing a series of control measures, with each measure building on the previous one in terms of effectiveness. The five levels of the hierarchy of controls, in order of effectiveness, are:

1. Avoidance: The most effective control measure is to avoid or eliminate the aspect completely. This involves removing the aspect from the activity, so that receptors are no longer exposed.
2. Substitution: If elimination is not feasible, the next best control measure is substitution. This involves replacing the cause of one aspect with another, less hazardous one.
3. Engineering control measures: If substitution is not feasible, the next best control measure is an engineering control measure. This involves modifying the activity or process or equipment to reduce exposure.
4. Administrative measures: If engineering control measures are not feasible, the next best measure is an administrative measure. This involves changing practices, policies, or procedures to reduce exposure.
5. Protective measures: The least effective control measure is protective measures. This involves implementing management plans to monitor and adapt to circumstances with protective measures, monitoring equipment, or devices to reduce exposure levels. Protective measures are the last line of defence and should only be used when other control measures are not feasible.

In summary, the hierarchy of controls philosophy emphasizes the importance of using the most effective measures first, with less effective measures used only when more effective measures are not feasible.

6.3 Environmental Performance

Environmental performance outcomes, standards, and measurement criteria for each aspect of the activity that has the potential to cause environmental impacts or risks are developed as part of the assessment process. Environmental performance will be measured and reported against these environmental performance outcomes standards and measurement criteria, as part of CGG's Implementation Strategy to ensure that impacts and risks are managed to the acceptable and are ALARP throughout the activity.

6.3.1 Environmental Performance Outcomes

An environmental performance outcome is a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level.

6.3.2 Environmental Performance Standards

An environmental performance standard is a statement of the performance required of a control measure. The effectiveness of control measures will be assessed as part of the treatment of environmental impacts and risks. The effectiveness of control measures can be evaluated based on several key attributes, including functionality, availability, reliability, survivability, and independence, which are explained further in Table B9-9able B9-9.

Determination of effectiveness is made by qualified experts based on professional judgement, considering the attributes in Table B9-9able B9-9. In summary, evaluating the effectiveness of control measures based on these attributes can help ensure that control measures are effective in addressing environmental aspects, and minimizing or eliminating associated impacts and risks.

Table B9-9 - Effectiveness attributes of control measures

Control Measure Attribute	Description
Functionality	The functionality of a control measure refers to its ability to perform its intended function effectively. This includes the ability of the control measure to address the aspect, the ease of use, and any limitations or drawbacks associated with the control measure.
Availability	The availability of a control measure refers to its accessibility and readiness when needed. This includes the availability of the control measure at the appropriate time and place, as well as any limitations or challenges associated with accessing the control measure.
Reliability	The reliability of a control measure refers to its ability to perform its intended function consistently and accurately over time. This includes the control measure's ability to operate without failure, the consistency of performance, and the predictability of outcomes.
Survivability	The survivability of a control measure refers to its ability to withstand adverse conditions or events and continue to function effectively. This includes the control measure's ability to operate under extreme conditions, to withstand physical or environmental damage, and to continue to perform its intended function despite disruptions or failures.
Independence	The independence of a control measure refers to its ability to operate independently of other control measures and to avoid any potential conflicts of interest or biases. This includes the control measure's ability to operate without being influenced by external factors, and its ability to remain objective and impartial in evaluating and addressing the hazard.
Compatibility	Evaluates the integration of control measures with each other and the overall operations, ensuring harmonious functionality without compromising the effectiveness of other measures.

7 Monitoring and Review

Ongoing monitoring and review are essential to ensuring the environmental impact and risk assessments remain relevant over time. The Implementation Strategy describes the specific measures and arrangements that will be implemented for the duration of the activity to ensure that:

- Environmental impacts and risks of the activity will be continually identified and reduced to ALARP.
- Mitigation and management measures detailed in the EP are effective in reducing the environmental impacts and risks of the activity to ALARP and acceptable levels.
- Environmental performance outcomes and standards set out in the EP are met.
- Arrangements are in place to respond to, and monitor impacts of, oil pollution emergencies.
- Consultation is maintained throughout the activity as appropriate.

The Implementation Strategy outlines a systematic approach that describes:

- The management systems by which the mitigation and management measures identified in the impact and risk assessment will be implemented.
- The implementation of mitigation and management measures will be monitored to ensure environmental impacts and risks continue to be managed to ALARP.
- The ongoing consultation process prior to and during the activity.
- Monitoring, auditing, and reporting of environmental performance for activities carried out under the EP.
- Arrangements in place to respond to, and monitor consequences of, oil pollution emergencies.

The Implementation Strategy considered lessons learnt from the implementation of previous campaigns and inspection recommendations.

8 Recording and Reporting

In accordance with Section 27 of the OPGGS(E) Regulations, CGG will store and maintain documents or records relevant to the EP implementation for a period of five years in a way that makes retrieval reasonably practicable.

In accordance with Sections 26, 26A, 26B and 26C of OPGGS(E) Regulations, CGG will report all recordable and reportable incidents as defined in the Implementation Strategy.

9 Terms and Definitions

Table B9-10 - Terms and Definitions Relevant to Impact and Risk Assessment

Term	Definition
Acceptable level	The specified amount of environmental impact and risk that an activity may have, which is tolerable, is consistent with all relevant principles, and does not compromise the management/conservation/protection objectives of the environment.
Activity	Refers to a 'petroleum activity' as defined under the OPGGS(E) Regulations as: petroleum activity means operations or works in an offshore area undertaken for the purpose of exercising a right conferred on a petroleum titleholder under the Act by a petroleum title or discharging an obligation imposed on a petroleum titleholder by the Act or a legislative instrument under the Act.
As low as reasonably practicable (ALARP)	The ALARP principle refers to reducing impacts and risks to a level that is `as low as reasonably practicable'. In practice, this means that the titleholder has to show through reasoned and supported arguments that there are no other practicable options that could reasonably be adopted to reduce impacts and risks further, i.e. to demonstrate that the cost involved in reducing the impact or risk further would be grossly disproportionate to the benefit gained.
Consequence	The consequence of an impact or risk is the potential outcome of the event on affected receptors (values and sensitivities) and can be positive, neutral or negative.
Control measure	A system, an item of equipment, a person or a procedure, that is used as a basis for managing environmental impacts and risks.
Emergency condition	An unplanned event that has the potential to cause significant environmental damage or harm to matters of national environmental significance (MNES). An environmental emergency condition may, or may not, correspond with a safety incident considered to be a Major Accident Event (MAE).
Environment **(Values and Sensitivities)**	Defined under the OPGGS(E) Regulations as: • ecosystems and their constituent parts, including people and communities. • natural and physical resources; • the qualities and characteristics of locations, places and areas; and • the heritage value of places; and includes the social, economic and cultural features of the matters mentioned above.
Environmental aspect	Element of an activity that interacts or can interact with the environment. Environmental aspects can have a direct impact on the environment, contribute only partially or indirectly to a larger environmental change, or create a risk to one or more environmental receptors. Aspects can be planned (inherent part of the activity i.e., light) or unplanned (not part of the activity i.e., spill).
Environmental impact	A change to the environment, whether adverse or beneficial, that wholly or partly results from an activity.
Environmental Performance	The performance of a titleholder in relation to the Environmental Performance Outcomes (EPO) and Environmental Performance Standards (EPS) in an Environment Plan.
Environmental performance outcome (EPO)	A measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level.
Environmental performance standard (EPS)	A statement of the performance required of a control measure.
Environmental risk	A change, which could occur to one or more environmental receptors, that is caused either wholly or partly by one or more environmental aspects associated with an activity. Environmental risks have a degree of likelihood and are not certain to occur.
Inherent impact and risk	The level of impact or risk with 'legislative and other requirement' controls in place, before the application of additional control measures.

Term	Definition
Likelihood	The likelihood is the chance (or probability) of the consequence occurring, and only applies to risks.
Measurement criteria	A clear and objective way to evaluate environmental performance. Environmental performance outcomes and environmental performance standards must have appropriate measurement criteria, which define how environmental performance will be measured and determine whether the outcomes and standards have been met during the activity.
Residual impact and risk	The impact or risk remaining after additional control measures have been applied (i.e., after treatment of inherent impacts and risks)
Receptors	Features of the environment that may be affected by impacts and risks.

Draft version 01	SD/KJF	31/01/2023

Executive summary

Biosis Pty Ltd was commissioned by Conoco Phillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait.

The purpose of this report is to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area in order to provide the project a grounding in Aboriginal cultural heritage. This short report will describe the known cultural environment, include a brief ethnohistory and history, and detail results of register searches.
The study area includes the proposed permit areas (the location of the exploration zone(s)), where seabed surveys and drilling exploration may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island.

The study area consists of a large geographical area noted as the 'Investigation Area for the Identification of Values and Sensitivities' which is based on stochastic modelling of oil spills, generating a statistical area where impacts may occur under many eventualities. This modelling predicts potential oil spill outcomes over many different variables to generate an investigation area for potential impacts.

Due to the significant size of the study area, it is broken into three areas for discussion in parts of this report and for the Communication Plan (CP), this includes:

1. Primary Stakeholder area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines
2. Secondary Stakeholder area – the wider area affected by the modelling of oil spills
3. Primary Stakeholder area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and LDADs. Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

In light of a review of Aboriginal places within the study area, there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

Within Tasmania and the Bass Strait Islands, there are no recent published figures of sites located on the coastal margins. Access to this data is restricted, and permission will need to be sought by the Aboriginal Heritage Council to access the Aboriginal Heritage Register via Aboriginal Heritage Tasmania. However, from the assessment of available regional data, Aboriginal heritage should be expected in any area of low-lying coastal areas, shelter sites, and sources of food, water and raw materials. These coastal margins contain all Tasmanian Aboriginal site types. It is also known on the West Coast of Tasmania, that a number of rock art sites are located on the coast, many either close or in tidal margins (Dix pers. obs.). Large midden sites are also located very close to the waters edge, as well as some stone quarry sites within tidal margins (Dix pers .obs.).

1 Introduction

1.1 Acknowledgement

Biosis acknowledges that the authors of this assessment identify as non-Aboriginal Australians living on Bunurong and Wurundjeri Countries. We acknowledge that they interpret, present and understand the past through their own cultural lens. In writing this report about Aboriginal living culture including their cultural heritage and the events following the commencement of colonisation, we pay our respects to Elders past, present and emerging and recognise that Country is unceded.

The authors acknowledge the inherent racism, cultural ignorance and political agendas imbedded within ethnographic sources at the time of, and following, colonisation.

Traditional Owners are the owners of all Traditional knowledge. Traditional knowledge and cultural values remain the intellectual property of the Traditional Owners and the interpretation and understanding of cultural values must be undertaken in genuine consultation with Aboriginal people.

1.2 Scope of works

Biosis Pty Ltd was commissioned by Conoco Phillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait.

It must be emphasised, that this report is not intended to meet the requirements of a formal assessment under First Peoples – State Relations, Heritage Victoria, Aboriginal Heritage Tasmania or Heritage Tasmania guidelines.

The purpose of this report is to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area in order to provide the project a grounding in Aboriginal cultural heritage. This short report will describe the known cultural environment, include a brief ethnohistory and history, and detail results of register searches.

1.3 Study area

The extent of the study area is shown in Figure 1.

The study area includes the proposed permit areas (the location of the exploration zone(s)), where seabed surveys and drilling exploration may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island.

The study area consists of a large geographical area noted as the 'Investigation Area for the Identification of Values and Sensitivities' which is based on stochastic modelling of oil spills, generating a statistical area where impacts may occur under many eventualities. This modelling predicts potential oil spill outcomes over many different variables to generate an investigation area for potential impacts.

Due to the significant size of the study area, it is broken into three areas for discussion in parts of this report and for the Communication Plan (CP), this includes:

4. Primary Stakeholder area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines
5. Secondary Stakeholder area – the wider area affected by the modelling of oil spills

6. Primary Stakeholder area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands

1.4 Heritage Advisor/Authorship

Emily Ward BArch

Emily has recently started her career in the Heritage Industry by initially interning at Biosis from August 2022 to September 2022, to her current role as a Graduate Heritage Consultant. Within her internship, Emily learnt and completed many techniques and processes such as aiding in background research to Cultural Heritage Management Plans, illustrating stratigraphic contexts and subsurface field testing. Emily also gained experience in field photography, rock art and heritage building surveys. Emily has been a part of several projects since she was an intern, gaining knowledge of several systems, such as HERMES and ACHRIS.

Emily completed her Bachelor of Archaeology at LaTrobe University at the end of 2022 and will start further study in 2024.

Erica Walther BArch(Hons)

Erica (B Arch Hons (2007)) is an Archaeologist and Heritage Advisor, with over 15 years' experience as a heritage consultant. Erica is the Technical Director for heritage in Victoria and specialises in project management, community liaison and the resolution of complex cultural heritage issues in varying situations. Erica provides specialist cultural heritage legislative advice and completes technical reports to meet the requirements of heritage legislation. Erica has broad experience completing various heritage assessments, including over 60 Cultural Heritage Management Plans (CHMPs). Erica carries out cultural heritage inductions, salvages, and other compliance requirements for completed CHMPs. Erica has also completed Due Diligence Assessments, Heritage Impact Assessments, "Consents to Disturb" and other permit applications, conservation management plans, and heritage reports. Erica has also assisted on a wide variety of other heritage projects, including as an expert witness and with planning and overlay applications, strategic advice, and continues to work towards completing projects to best practice standards.

Erica is a full member of the Australian Association of Consulting Archaeologists and is a listed heritage advisor under the *Aboriginal Heritage Act 2006*.

Dr Samuel Dix BA(Hons), PhD, MCIfA

Samuel has worked in archaeology and heritage management since 2007. Samuel has undertaken numerous archaeological projects around Australia and has worked in consulting, government, teaching and museums in Victoria, Tasmania, Northern Territory, Western Australia, the United Kindom, Middle East, and South Africa. Samuel completed his Bacheor of Arts with First Class Honours where his thesis focussed on hand stencil rock art. After a break from university to undertake consulting, government and teaching based archaeological work, Samuel returned to complete his PhD at Griffith University where he was the recipient of the Australian Research Council Laureate Scholarship in 2016. His thesis explored contact archaeology in Arnhem Land, and how people reacted to change through what was depicted in rock art.

Samuel is a registered heritage advisor under the Victorian *Aboriginal Heritage Act 2006.*

1.5 Stakeholders

It is not within the remit of this report to undertake consultation with Traditional Owner groups, industry bodies or other stakeholders. No consultation was undertaken. Stakeholder engagement is considered in the Communication Plan (CP). In Victoria, Traditional Owner groups are represented by the relevant Registered Aboriginal Party (RAP). There are five RAPs registered in the study area, including the Gunditjmara, Eastern Maar, Wadawurrung, Bunurong, and Gunaikurnai.

In Tasmania, the Traditional Owner group is referred to collectively as the Palawa, and are not represented by a representative or governing body.

2 Background review

2.1 Geology and geomorphology

The Bass Strait is the stretch between the south of the Australian mainland and north of the Tasmanian state. The Bass Strait formed during the last glacial period, also known as the Last Ice Age, which occurred between 110,000 and 12,000 years ago (Williams et al. 2018, p. 149). During this time, the Earth's climate was much cooler and global sea levels were much lower due to the large amount of water that was locked up in glaciers and ice sheets.

As the climate began to warm and the glaciers began to melt, sea levels began to rise. This process caused the land bridge that connected Tasmania to mainland Australia to be gradually flooded eventually forming the Bass Strait as we know it today.

This gradual flooding is therefore known to have occurred within the period of human occupation in southeastern Australia – the diaspora of people from Victoria to Tasmania occurred prior to the total flooding of the strait, across a land bridge for which archaeological evidence may be buried deep below the ocean (Lourandos 1997, p. 244). Evidence for this indicates people crossed the land bridge from Victoria to Tasmania at 35,000 years ago (Lourandos 1997, p. 254). In addition, dreaming stories of both Victorian and Tasmanian Aboriginal communities further reinforce the memories and songlines relating to the flooding and connection to Sea Country of coastal communities (Nunn & Reid 2016).

2.1.1 Bass Strait, Islands and the land bridge

The Bass Strait is bordered on the west by King Island and the King Island Rise and on the east by Flinders Island and the Bassian Rise, with an approximated depth of between 60 and 80 metres (Harris & Heap 2009, Robinson 1974). The predominant deposits within the Bass Strait consist of Tertiary sediments overlaid on early Cretaceous deposits. The sediments in the early Cretaceous period contained combinations of shale, siltstone, sandstone, while a variety of marl, mudstone, limestone and shale can be seen in the later deposits (Robinson 1974).

Phillip Island's geomorphology is centred around Quaternary limestone dunes with higher-level shore platforms that were formed by Quaternary sea levels (Birch 2003). French Island is boarded by sandy sheets, similar to Western Port Sunkland. Port Phillip Bay is the lowest part of the Sunklands and is currently flooded due to Quaternary sea-level fluctuations in the Last Glacial Maximum (Birch 2003, p. 556). Also during this period the Yarra River water levels had risen and spilled over the coastal plain, forming what is now known as the Bass Strait (Birch 2003, p. 556).

2.1.2 The Victorian Coast

The coastal plains of southwest Victoria are made up of both Tertiary and Quaternary marine and nonmarine sediments, formed on calcareous sands and sandy limestones, overlaid with dune ridges and beaches that were formed during the last 800 000 years. The dune ridges closer to the coast are younger than those further inland and are comprised of calcareous sands. Caves are common in ridges of the limestone sands (Birch 2003, p. 545).

The coastline of western Victoria is seen to have several layers of sedimentary deposits, as evident in the cliffs often found, containing stratigraphic sections of basalt, limestone and clay (Birch 2003, p. 555).

The geomorphic evolution of southeast coastal plains of Victoria is varied, with Tertiary overlaying early Cretaceous sediments on the Otway coast as well as Quaternary sand and limestone dunes in Mornington

Peninsula and Phillip Island (Birch 2003, pp. 547,556). The coast of East Gippsland is covered extensively in coastal dunes, with intermittent pockets of Pleistocene deposits. Parabolic dunes formed from Pleistocene and Holocene age deposits are also located in this area (Birch 2003, p. 557).

2.1.3 The Tasmanian Coast

The Tasmanian coast consists of varying deposits making up its rugged nature. Geological formations include Dolerite, Sandstone, Mudstone, Granite, Limestone, and other Volcanic rocks. These varying geologies are reflected in high cliffs and outcrops, dune-backed beaches, sea stacks and arches. The Tasmanian geological makeup is complex and varies. Along the coastal regions detailed in the study area, these consist of Devonian granites, Tertiary Basalt, Neoproterozoic dolomite, Cambrian bonitite, Cambrian Sediment, and Mesoproterozoic quartzite (MRT: 2022).

Tasmania is known to have been one of the few areas in the southern hemisphere that was glaciated during the Pleistocene (MRT 2002). This generally occurred in higher regions of the state and influenced many of the earlier Pleistocene sites recorded in Tasmania (MRT 2022).

2.1.4 Archaeology of the Sea Floor

Archaeology of the sea floor is an emerging aspect of archaeological science. Throughout the world, archaeological investigations have shown that there is evidence for human occupation to be recovered below current sea levels. Investigations in the Sunda Shelf, Southeast Asia demonstrates the impact of sea level rise at approximately 12,000 years ago, with the investigation of settlements, fish traps, and other structures. Other investigations have occurred in India (Kumar et al. 2021), and the Black Sea (Ryan et al. 1996), investigating more recent sea level change, around 7,500 years ago. In the UK and US, the offshore wind industry is required to complete offshore archaeological investigations including desk-based studies and field survey.

In comparison, Bass Strait is comparable to the vanished landscape of Doggerland that was submerged similarly in rising sea levels during the Mesolithic Period. Like the Bassian Plain, Doggerland formed a land bridge between the United Kingdom and Europe. Works by marine archaeologists have found that many artefacts and environmental sediments still remain form this now vanished ancient landscape (Gaffney et al. 2007). It is even suggested by Weninger et al (2008) that this was caused by a catastrophic flood. However, such ideas are not believed in the example of Bass Strait, and that this was a more gradual separation (see Davidson and Roberts 2008:20)

In Victoria, limited investigations have been completed, however the use of LiDAR and shoreline mapping has occurred. In particular, Gunditjmara have worked with Extent Heritage in partnership with Wessex University in determining the location of prior shorelines with the use of remote sensing. Should archaeological evidence survive, it is likely that the previous shorelines would provide the most likely locations for this. Physical investigations are likely to be difficult, complex, and costly.

Following deposition, archaeological evidence of human occupation along the Bass Strait has flooded. Since flooding, sedimentation has also occurred, capping any archaeological evidence deep below the current sea floor. The depth of sedimentation varies throughout the strait, however combined with deep waters (400 to 5,500 metres) and harsh conditions, exploration of sea floor archaeology utilising physical methods in this area is currently unlikely.

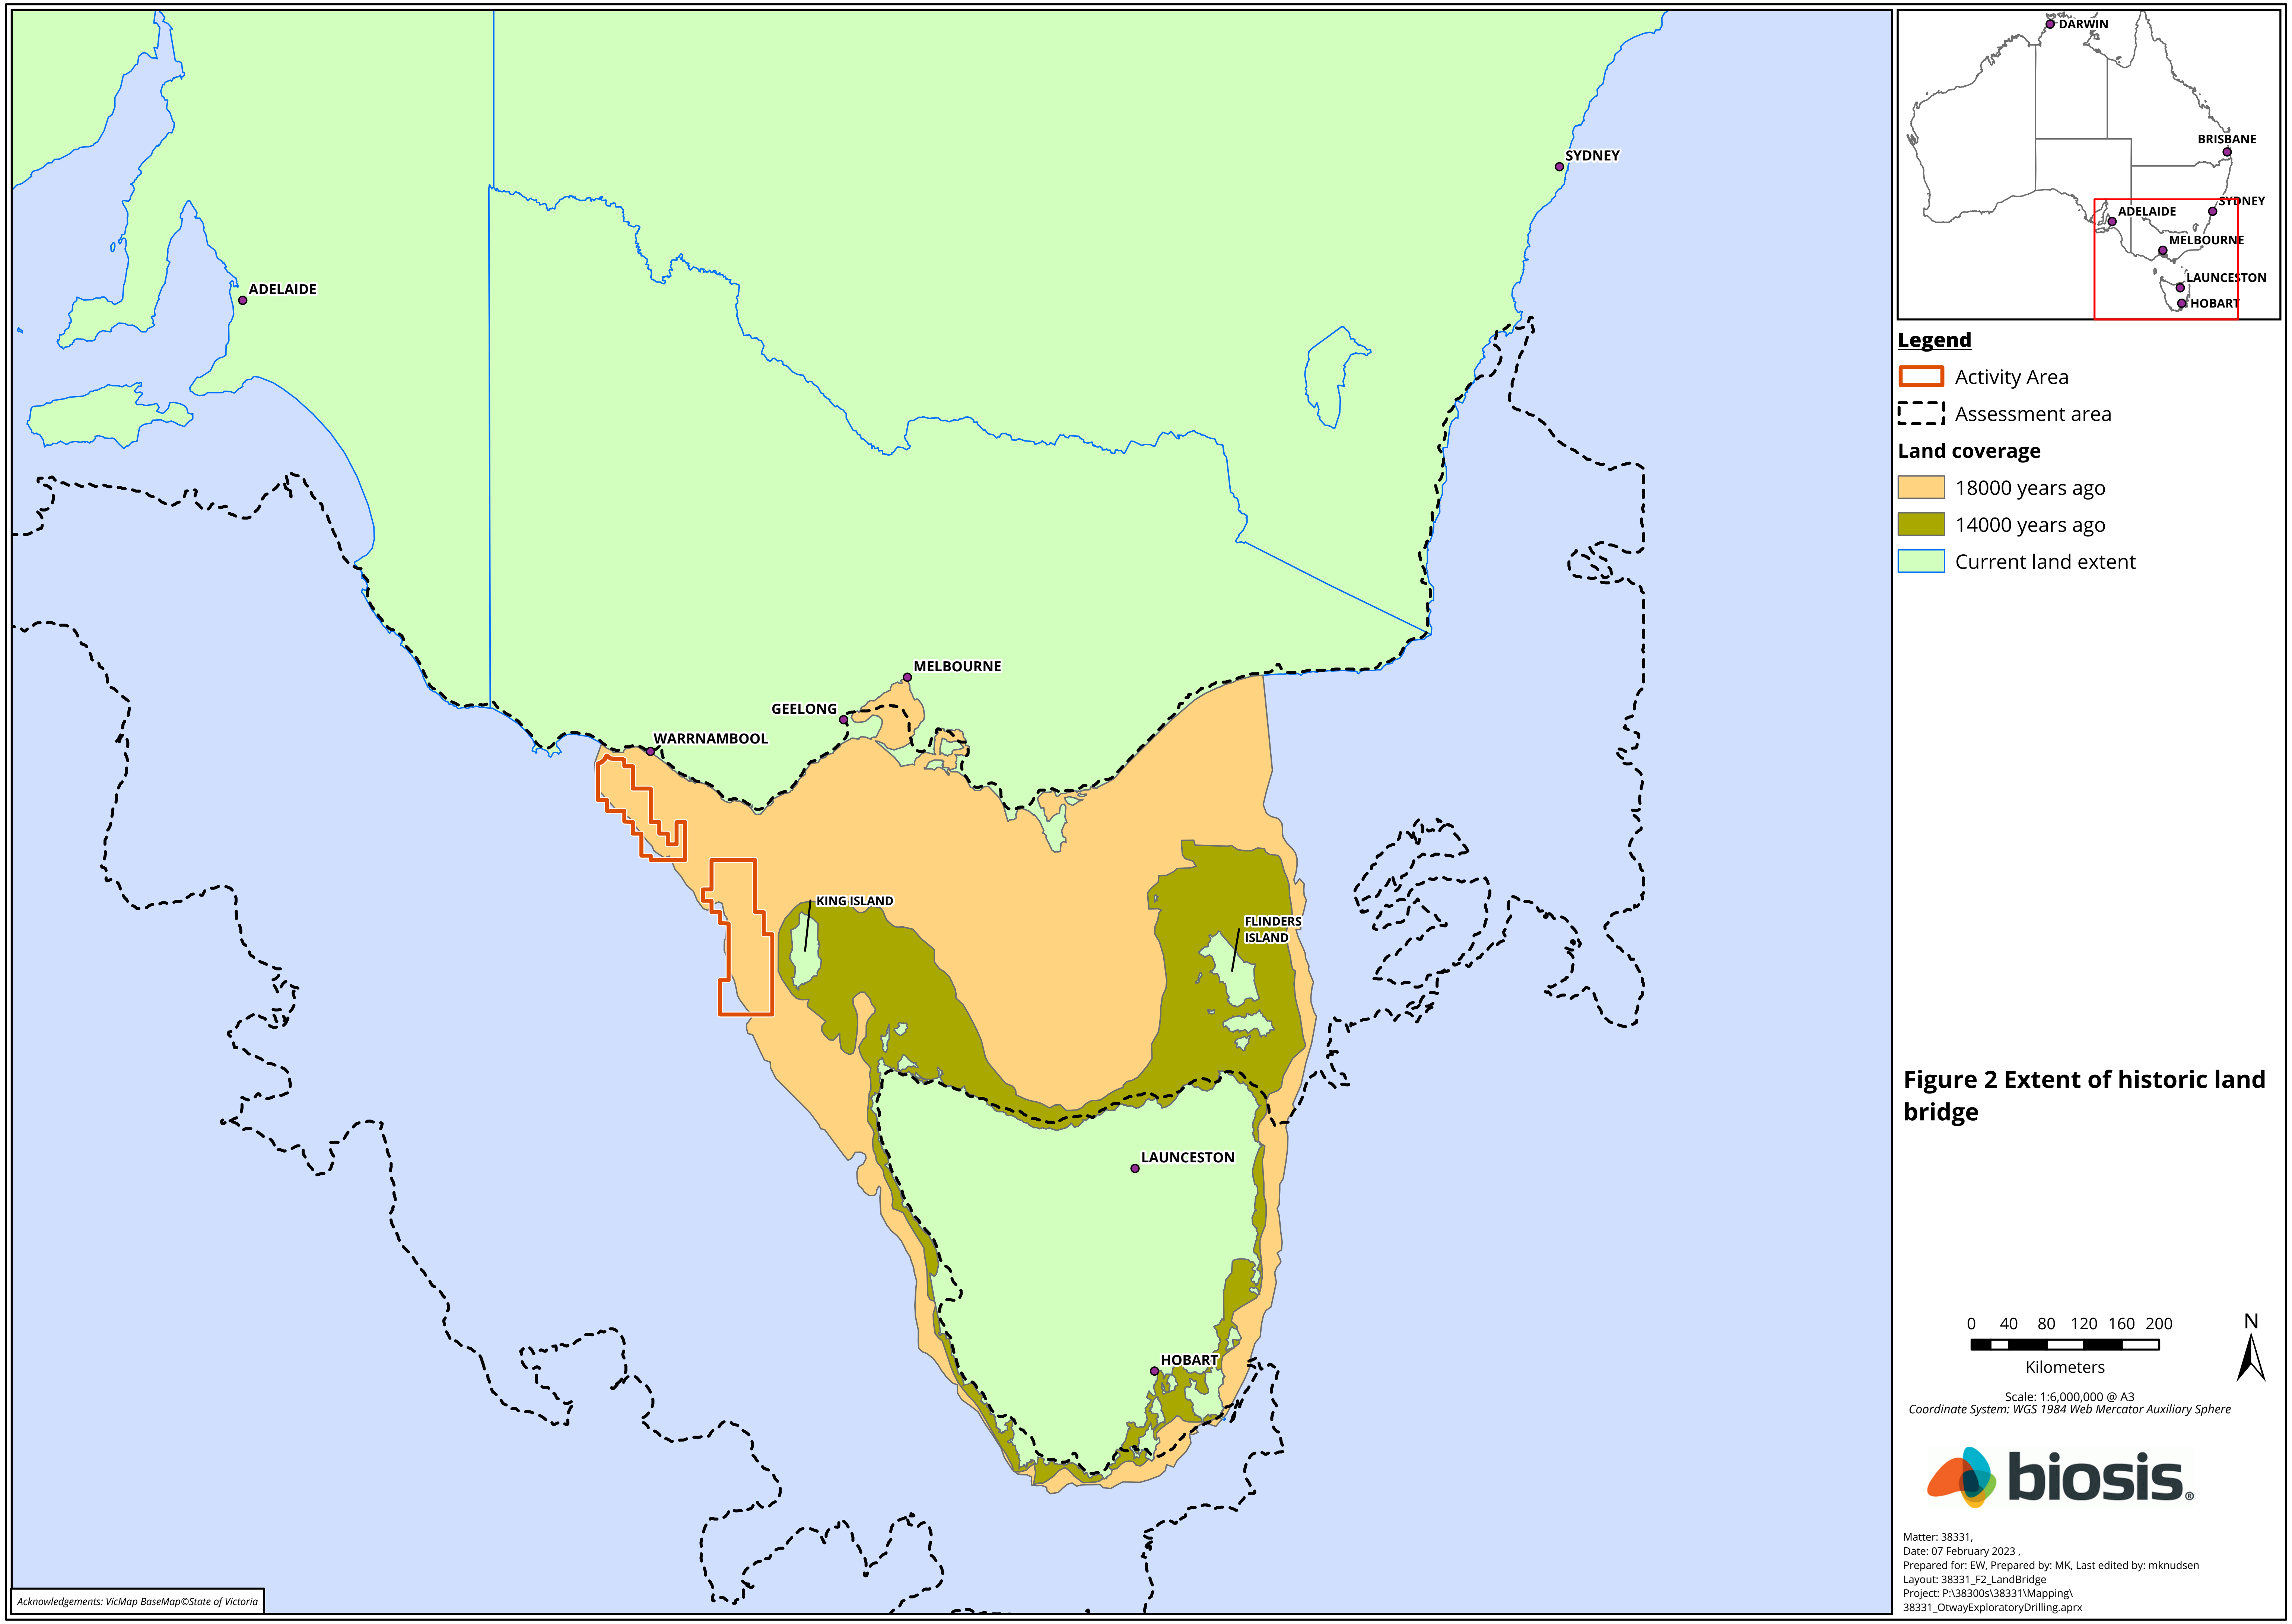

Figure 2 Extent of historic land bridge

2.2 Land use history

Permanent European colonisation of Victoria and Tasmania occurred first in Tasmania, in 1803, and Victoria in 1835. Earlier exploration and transitory, temporary or failed settlements occurred in the two states. Early settlements in Tasmania were penal, with free settlement commencing following. The Gold Rush in Victoria in the 1850s resulted in the rapid expansion of population and the establishment of towns throughout the state. Agriculture and Industry heavily influenced the growth of the population of Tasmania.

Settlement, population growth and utilisation of land for agricultural purposes has resulted in the spread of disease, displacement, and violence to Indigenous communities, leading to a significant decline in population and disruption to traditional cultural practice. Aboriginal people were subject to forced displacement and assimilation, including the forced removal of Aboriginal children, from the 1800s up until the 1970s. Overall the impact of colonisation on Aboriginal people has been devastating.

In regard to the remains of physical cultural heritage (such as sites and places), the practice of archaeology has increased the knowledge of Aboriginal occupation of the land in the past. The potential for archaeology to shed light on Aboriginal connections to Country has been realised with increasing frequency due to relatively recent legislative requirements.. Archaeology is, however, a finite resource which has also been impacted by the effects of population growth, construction, land clearance, resource extraction, and climate change. Self-determination for Aboriginal people in regard to ownership of cultural heritage and knowledge has resulted in increased investigations led by Aboriginal people supported by technical experts, following research pathways set by the communities themselves.

Archaeological sites are located throughout the land and adjacent seascape and consist of the physical remains of the way people used the land in the past. Places may reflect resource extraction (such as scarred trees, stone quarries); be evidence of settlement (such as stone huts), manufacture (stone artefact scatters) and cultural practices (such as painting, etchings, and stone arrangements); food consumption (shell middens, earth mounds and hearths); and ritual practice (such as burials). Other cultural values can take the form of intangible places or be recorded in historic (ethnographic) references.

Whilst long-lasting, archaeological sites are heavily affected, and frequently destroyed, by the effects of modern, and past, impacts. Land clearance and increasingly intense bushfires result in the removal of old growth trees, including those showing cultural scarring, and also increases the effects of erosion. Ploughing for agricultural practices displace artefact scatters and deflate earth mounds. Coastal erosion, coastal change and increased storm surges destroys shell middens and artefact scatters located in coastal and offshore landforms. The practice of archaeology itself is destructive and results in the loss of archaeological places. Alteration of the natural environment also affects intangible values, affecting connections between the Dreamtime and the landscape, for example, by interrupting songlines. As Aboriginal people have strong connections to Country, effects on the natural environment, the land, sea, and animals, also have strong effects on Aboriginal people.

2.3 Aboriginal heritage – registered archaeological places in the study area

A search of the Victorian Aboriginal Heritage Register (VAHR) was undertaken by Emily Ward, Biosis Pty Ltd on the 21 of December 2022 utilising access number 11456. The search area was set by the study area and consists of the entire Victorian coastline.

The search identified 5636 recorded Aboriginal places within the study area (Table 1).

The dominant Aboriginal place types in the study area are shell middens (n=2639, 46.82%), artefact scatters (n=2210, 39.21%) and low density artefact distribution also known as LDADs (n=321, 5.70%). Other place types include earth features (n=181, 3.21%), object collections (n=160, 2.84%), Aboriginal Ancestral Remains (Burial) (n=51, 0.90%), scarred trees (n=42, 0.75%), stone features (n-12, 0.21%), quarries (n=9, 0.16%), Aboriginal historical places (n=8, 0.14%), Aboriginal Ancestral Remains Reinterments (n=2, 0.04%) and rock art (n=1, 0.012%).

Object Collections represent places that have been removed from the context in which they were originally recorded. More specifically, they represent the location of stored artefacts (i.e. heritage consultancies, museums, private collections) or places where artefacts have been repatriated; therefore, Object Collections are not necessarily representative of the archaeological character of the region

Due to most of the search area being coastal, the dominance of shell middens in the study area is not surprising. Middens represent the repeated consumption of coastal resources (predominantly shells of rocky or sandy shore types, such as mussel, pipi, oyster, turban) and consist of the discarded shell. Other objects may be discarded within the midden, such as bones (seal and bird are common), and artefacts. The shells and other items were discarded in discrete areas over time, some middens are small consisting of a smaller number of meals or individuals, others are larger, indicating multiple meals, some revisited over many hundreds, or thousands, of years (Frankel 2017, p.38).

> *'Archaeological evidence from Victoria indicates that occupation of coastal areas is as old as the present coastline – about 6000 years. Most coastal occupation sites in Victoria, however, are 4000 years old or younger' (National Oceans Office, 2002:80)*

Within the study area the Traditional Owner group with the most registered Aboriginal places is Bunurong with 1486 place registrations, with 26.37% of the total registered sites in the study area. This is then followed by Gunditjmara with 853 registered sites (15.77%), then Eastern Maar with 853 registered sites (15.13%), Wadawurrung with 798 registered sites (14.16%), Gunaikurnai with 700 registered sites (12.42%) and the area of overlap of Gunditjmara and Eastern Maar has 88 registered sites (1.56). The area within the study area that has no registered RAP group has a total of 822 registered sites (14.16%). The specifics of each group are discussed below.

The areas of Bellarine Peninsula, Mornington Peninsula and French Island and Wilson's Promontory have been searched specifically on the Victorian Aboriginal Heritage Register (VAHR) as they are distinctive landforms on the coastline of Victoria and hold distinct cultural patterning, regarding both tangible and intangible cultural heritage values. These three areas contribute 1775 of the registered sites (31.5%), out of the 5636 total registered sites in the study area; The Bellarine Peninsula has 578 registered sites, Mornington Peninsula and French Island have 813 registered sites and Wilson's Promontory has 384 registered sites.

Table 1 – Aboriginal places within the study area (Victoria)

Aboriginal Place Type	Total number of sites	Percentage of sites
Aboriginal Ancestral Remains (Burial)	51	0.90%
Aboriginal Ancestral Remains (Reinternment)	2	0.04%
Aboriginal Historical Place	8	0.14%
Artefact Scatter	2210	39.21%
Earth Feature	181	3.21%
LDAD	321	5.70%
Object Collection	160	2.84%
Quarry	9	0.16%
Rock Art	1	0.012%
Scarred Tree	42	0.75%
Shell Midden	2639	46.82%
Stone Feature	12	0.21%
Total	5636	100%

2.3.1 Primary Stakeholder Area - Gunditjmara Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 889 recorded Aboriginal places within the Gunditjmara RAP area. The dominant Aboriginal place types in the study area are artefact scatters (47.36%), shell middens (38.81%) and LDADs (6.3%).

Artefact scatters have been registered throughout the search area, with notable clusters of artefact scatters south of Portland, around Point Danger. Low Density Artefact Distributions (LDADs) consisting of fewer artefacts less densely present than artefact scatters, are most often found further inland, compared to artefact scatters and shell middens which are located close to the shoreline. This suggests concentration of activity close to the coast, and increased transitory movement to and from the coast, as material is being discarded when people are moving across the landscape.

Other registered place types include earth features (6.3%), object collection (0.56%), Aboriginal historic places (0.34%), Aboriginal Ancestral Remains Burial (0.11%), quarry (0.11%) and scarred trees (0.11%) There are no registered sites in the western most area of the Gunditj Mara RAP group, within the study area. This area is along the southern most point of the Fitzroy River and west of Narrawong.

2.3.2 Primary Stakeholder Area - Eastern Maar Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 853 recorded Aboriginal places within the Eastern Maar RAP area. The dominant Aboriginal place types in the study area are shell middens (53.81%), artefact scatters (34.11%) and earth features (5.39%)

Shell midden sites on in coastal landforms have been frequently registered. The artefact scatters with the study area tend to follow natural paths inland. This suggests movement to and from the coast, with people utilising land resources. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016).

Other registered place types include LDADs (3.99%), object collection (1.52%), Aboriginal Ancestral Remains Burial (0.94%), quarry (0.12%) and stone features (0.12%)

2.3.3 Primary Stakeholder Area – Shared Gunditjmara and Eastern Maar Aboriginal places

In this area, the two RAP groups overlap. The search of the Victorian Aboriginal Heritage Register (VAHR) identified 88 recorded Aboriginal places within the shared Gunditjmara and Eastern Maar RAP area. The dominant Aboriginal place types in the study area are shell middens (52.27%) artefact scatters (34.09%) and stone features (7.95%).

Majority of the artefact scatters and shell midden sites with the study area are located between the coast and Eumerella River. This suggests the use of both fresh and sea water sources for material and resources. Shell midden sites can be found along the coastline while the artefact scatters tend to be closer to fresh water sources. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016).

Other registered place types include earth features (4.55%) and Aboriginal historic places (1.14%).

2.3.4 Secondary Stakeholder Area - Wadawurrung Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 798 recorded Aboriginal places within the Wadawurrung RAP area. The predominate Aboriginal place types in the study area are artefact scatters (46.12%), shell middens (33.83%) and LDADs (9.27%).

Within the study area, artefact scatters tend to follow freshwater sources inland and cluster around headlands (such as the Queenscliff and the Indented Heads area). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea. LDADs are most often found further inland, compared to shell middens which are located closer to the shoreline. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape

Other registered place types include object collection (5.64%), earth features (2.88%), scarred trees (0.88%), Aboriginal Ancestral Remains Burial (0.75%) Aboriginal historic places (0.25%), stone features (0.25%) and quarry (0.13%)

Bellarine Aboriginal Places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 578 recorded Aboriginal places within the Bellarine Peninsula. The predominate Aboriginal place types found on the Bellarine Peninsula are artefacts scatters (48.44%), shell middens (29.41%) and LDADs (10.03%).

Within the study area, artefact scatters tend to follow freshwater sources inland and cluster around headlands (such as Queenscliff and Barwon Heads). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea. LDADs are most often found further inland, compared to shell middens which are located closer to the shoreline. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape

Other site types include object collection (6.75%), earth features (3.29%), Aboriginal Ancestral Remains Burial (0.87%), scarred trees (0.69%), Aboriginal historical places (0.35%) and stone features (0.17%).

2.3.5 Secondary Stakeholder Area - Bunurong Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 1486 recorded Aboriginal places within the Bunurong RAP area. The predominate Aboriginal place types in the study area are shell middens (45.56%), artefact scatters (38.36%) and LDADs (8.28%).

Within the study area, artefact scatters on French Island and Phillip Island are found further inland, compared to shell middens. Some of the shell middens within the study area can be found in clusters around headlands (such as the Portsea and Sorrento area). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea.

Other registered place types include object collection (5.79%), earth features (1.28%), scarred trees (0.20%), Aboriginal Ancestral Remains Burial (0.20%), quarry (0.13%). Aboriginal historic place (0.07%), rock art (0.07%) and stone features (0.07%)

Mornington Peninsula and French Island Aboriginal Places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 813 recorded Aboriginal places within the Mornington Peninsula and French Island area. The dominant Aboriginal place types in the study area are shell middens (50.43%), artefact scatters (31.12%) and LDADs (11.69%).

Along the coast of the Mornington Peninsula there is a significant increase in shell midden sites from Sorrento to Cape Schanck. This could indicate targeted gathering of resources specific to this area and purposeful occupation of the coastline. From Cape Schanck, moving east, there is a noticeable decrease in the number of registered sites along the coast. Shell middens can be found along the coast, either along the shore or along creeks close to the coast (such as Merricks Creek). Artefact scatters can be found intermittently along the coast but can also be seen following water sources inland. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources and coastal sites as occupation sites and opportunities for variety in resource gathering. LDADs are an inland site type within the locality. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape.

There are 50 registered sites on French Island. Only 9 of these sites are located along its coast, the other 41 are inland sites, with the majority of the sites being artefact scatters. The inland artefact scatters are located along paths of water, suggesting targeted use of the landscape (land use patterning).

Other registered place types include object collection (4.31%), earth features (1.72%), scarred trees (0.37%), Aboriginal historic places (0.12%), quarry (0.12%) and rock art (0.12%).

2.3.6 Secondary Stakeholder Area - Gunaikurnai Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 700 recorded Aboriginal places within the Gunaikurnai RAP area. The predominate Aboriginal place types in the study area are shell middens (46.29%), artefact scatters (43.14%) and scarred trees (4.29%).

Clusters of artefact scatter sites can be found on the eastern coast of the Corner Inlet Marine and Coastal Park. These artefact scatters ten to follow sources of freshwater inland. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea.

Other registered place types include LDADs (2.14%), Aboriginal Ancestral Remains Burial (2.14%), earth features (1%), object collection (0.57%), Aboriginal Ancestral Remains Reinternment (0.14%), Aboriginal historic places (0.14%) and stone features (0.14%).

Wilson's Promontory Aboriginal Places

The Traditional Owners of Wilson's Promontory come from two recognised RAP groups: Bunurong and Gunaikurnai.

The search of the Victorian Aboriginal Heritage Register (VAHR) identified recorded 384 Aboriginal places within the Wilson's Promontory area. The predominate Aboriginal place types in the study area are shell middens (72.40%), artefact scatters (21.61%) and earth features (2.08%)

Clusters of shell midden sites can be found both inland and around the coast of Wilson's Promontory. A large shell midden cluster can be found along the western coast of the Promontory with a total of 163 shell midden registered sites. Another two clusters have been recorded around the opening of Wilson's Promontory, with a total of 18 registered sites between them. All 18 shell midden sites are in close proximity to either the coast or moving water. Majority of the artefact scatter register sites recorded at Wilson's Promontory follow water sources inland. The strategic locations of both shell midden and artefact scatter sites demonstrate land use patterning.

Other registered place types include LDADs (1.56%), Aboriginal Ancestral Remains Burial (1.3%), object collection (0.52%), Aboriginal Ancestral Remains Reinternment (0.26%) and scarred trees (0.26%)

2.4 Aboriginal heritage – archaeological places in Tasmania

2.4.1 Primary Stakeholder Area – Bass Strait Island Aboriginal places

Mackay (1946) was the first to identify archaeological evidence of past Aboriginal use of the Bass Strait Islands in the 1930s (see also Sim 1991:6). Earlier thoughts were that these were stone artefacts left behind when the Tasmanians were moved to Flinders Island by George Augustus Robinson in the 1830s. It was not until Rhys Jones' work in the 1960s that attention to the Bass Strait islands was made. Sandra Bowdler (1979) excavated at Cave Bay Cave on Hunter Island that provided the first evidence of Pleistocene occupation, dating from 23,000 years. At this time, this was the oldest recorded date of Aboriginal occupation in Tasmania. This was also archaeological proof of the Bassian Land Bridge that once connected Tasmania to Mainland Australia (Sim 1991).

Further work was carried out on Flinders Island and several other smaller islands in Bass Strait showed signs of earlier occupation, including stone artefacts, middens and burials. It was believed at the time that the absence of middens on some islands, but the presence of stone artefacts meant that the midden sites were once closer to the original pre-Ice Age coast, which is now under water (Orchiston and Glenie 1978). The first middens excavated in Bass Strait was by Orchistone (Orchiston and Glenie 1978, Orchiston 1979a, 1979b, 1984), however, the full details of the report have not been published. Sim (1991:12) recorded a number of middens on Flinders Island in 1989 and noted that many of the remaining midden sites were found where the sea floor drops away abruptly, further suggesting that many of the midden sites were possibly found on ground level now under water due to rising waters after the Ice Age. Sim (1991) argued that the Bass Strait islands were abandoned before the last remnants of the Bassian Plain land bridge between Mainland Australia and Tasmania disappeared. Davidson and Roberts (2008:20) state:

> *For a while, perhaps, it was possible to use watercraft to maintain contact with families and friends on the other side but eventually this became more difficult. Boats sank sometimes, or storms and rough seas would have made the crossing perilous. When the sea barrier became too wide, those left on the Tasmanian side turned their backs and never saw their friends and families again. It proved to be a monumental turning point, leading to an independent evolution in their technology, economy, society and culture. They were alone for five hundred generations, knowing no other people in the world, living with the knowledge and beliefs derived from those they had known before the sea surrounded them. They remained isolated from the rest of*

humanity until that same sea brought the first Europeans in the late seventeenth and early eighteenth centuries

Brown (1990) conducted excavations on Flinders Island that again proved the antiquity of the Bass Strait Islands, where sporadic occupation from 20,000 years to 8,500 years was found at Mannalargenna Cave on Prime Seal Island. Again, it was hypothesised that the islands were abandoned after 8,500 years due to the rising sea levels (see Sim 1991:11). Early thoughts at the time state that water craft between the islands would have been possible, and the sea level rise was gradual and would have been shallower. However, with the rise of waters, also meant that the distance between land masses increased, therefore making travel much harder and dangerous. It is thus why many believe that the islands were abandoned around 6,000 years ago when the seas reached their current levels (Sim 1991:12).

The flooding of the Bassian Plain meant that the people who chose to remain in Tasmania would soon be Isolated for generations. Jones (1977) states '… no other human society, which survived until modern times, had been isolated so completely and for so long'.

2.4.2 Secondary Area – Tasmanian coastal Aboriginal places

Archaeological evidence of occupation in Tasmania range between 34,000 – 40,000 BP. The most accurate date for occupation is from the Parmerpar Rockshelter close to Cradle Mountain that was excavated by archaeologist Richard Cosgrove (Mulvaney and Kamminga 1999:189). This was a time when Tasmania was still a part of the landmass of Australia before it was disconnected with the flooding of the Bassian Plain after the last Ice Age. Further excavations of Kutukina Cave (formally Frasier Cave) in southwest Tasmania established Pleistocene settlement of Tasmania with radio carbon dates ranging from 15,000 to 20,000 years BP (Kiernan 1983; Mulvaney and Kamminga 1999:182).

By the end of the last Ice Age (12,000 BP) the rising temperatures and subsequent rising sea levels flooded the Bassian Plain and separated Tasmania from the mainland of Australia (Kee 1987:12; Taylor 2003). The formation of what is now known at the Bass Strait ultimately led to the isolation of the Tasmanians from their groups on the mainland of Australia. The resulting 10,000 years of isolation crafted a unique culture and economy that was independent from any mainland Australia influence (Mulvaney and Kamminga 1999:339). A series of environmental and climatic changes started to occur in Tasmania as a result of this separation with a reduction in rainfall, lower than normal temperatures, some reduction in the seeding of vegetation, as well as the formation of sand dune systems that were to become a prime area for the discovery of Aboriginal remains. Kee (1987:14) stated that these dunes formulated a new abundance of resources available to the Tasmanian's, which is reflected in much of the early archaeology of this period. These climatic changes started to stabilise around 6,000 years ago. This has been noted by radiocarbon dating at Carlton Bluff, where dates ranged from 8,000 to 6,000 BP (Dix 2015:147-148; Key 1987:12 Neil 1981; Reber1965), and therefore the range of sites found on the coast are more than likely representative of this 6,000 year figure.

Regionally, sites vary in Tasmania. As such, the state has been divided into three geographic regions. Various studies were conducted in the 1980s and 1990s to understand these regional differences in sites, and to understand more broadly Tasmanian Aboriginal archaeology (Brown 1991; Cane 1980; Cosgrove 1985; 1990; Gaughwin 1985: 52; Jones 1965; 1966; 1967; Key 1991; Lourandos 1968; 1970; 1977; MacFarlane 1993; Stockton 1977a, 1977b; 1982). Many of these were published as part of the Parks and Wildlife section of the Tasmanian government. More recent and accurate data is available at Aboriginal Heritage Tasmania, however prior approval from the Aboriginal Heritage Council will be required to access this data.

- East/South East Tasmania
  - Middens formulate 90% of all site types on the east coat with a range of shell from turbo, oyster, limpet, abalone and mussel. Brown (1991:46) determined that turbo middens dominated areas behind rock platforms where oysters were mostly predominant behind sandy beaches, where shell fish consumption generally took place within the immediate proximity of where it was procured from;
  - 50m within the coastline appears to be the limit of the majority of the larger sites in the area;
  - Sites are generally situated on well drained more inland areas;
  - That 81% of sites recorded contained some level of stone artefacts, and generally consist of hornfels, cert, quartzite and chalcedony flakes.
  - Stone artefact scatters were generally located on flat or gently inclined landscapes where they were close to a water source;
  - The underlying geology of the inland area suggests that areas where the underlying rock was sandstone was more favourable over those areas that contain dolerite;
  - Sandstone rock shelters located close to water often contain signs of occupation.
  - Rock art can occasionally be found on sandstone rock shelters, and is generally executed in ochre.
- Archaeological Sites – North/ North East Tasmania
  - Sites generally occur on high energy coastlines;
  - Approximately 78% of sites occur within 50m from a water source;
  - Sand dune areas most commonly have sites located on them;
  - The main stone typology noted in these assemblages include hornfels, chert, and quartz.
  - Rock art can be found pecked in stone on coastal margins
- Archaeological sites North West/ West/ South West
  - Majority of sites can be found on sand dunes close to rock platforms;
  - Middens are generally smaller and lower on sandy shores.
  - Middens are generally absent along rocky granite shorelines.
  - Site types include artefact scatters, isolated artefacts, stone and ochre quarry sites and rock shelters.

- The main stone types used in the area include spongolite, quartzite, quartz, silcrete and hornfels.
- Artefact scatters and isolated artefacts are generally located on the forest plain.
- Stone artefacts will be varies in material type, which reflects the opportunistic nature of collecting material.
- Areas within 500m of major water courses and creeks will generally contain Aboriginal sites.
- Sites that contain stone artefacts made from spongolite artefacts will no predate 2,500BP.
- Generally, sites are 70 to 100 artefacts per km^2. Densities are approximately 1.7 artefacts per site in places away from major rivers and quarry sites, whereas there will be approximately 6.5 artefacts per site in areas close to these resources.
- Sites will generally be located near the transition of inland heath plains and forest margins.
- Large artefact scatters will be located close to major creeks or rivers especially where flat grounds are associated with the area;
- Hut depression occur on coastal margins, generally close to food sources
- Rock art is found on coastal margins, and is generally pecked or engraved on large sandstone faces, or where creeks exit to the sea.

2.5 Archaeological summary

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and LDADs. Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

In light of a review of Aboriginal places within the study area, there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

Within Tasmania and the Bass Strait Islands, there are no recent published figures of sites located on the coastal margins. Access to this data is restricted, and permission will need to be sought by the Aboriginal Heritage Council to access the Aboriginal Heritage Register via Aboriginal Heritage Tasmania. However, from the assessment of available regional data, Aboriginal heritage should be expected in any area of low-lying coastal areas, shelter sites, and sources of food, water and raw materials. These coastal margins contain all Tasmanian Aboriginal site types. It is also known on the West Coast of Tasmania, that a number of rock art sites are located on the coast, many either close or in tidal margins (Dix pers. obs.). Large midden sites are also located very close to the waters edge, as well as some stone quarry sites within tidal margins (Dix pers .obs.).

2.6 Traditional Owner groups and ethnohistory

For the purposes of this assessment, information about Aboriginal Victorian pre and post contact history has been sourced from nineteenth and twentieth century primary and secondary ethnographic/historical records.

2.6.1 Primary Stakeholder Area - Gunditjmara

The Gunditjmara RAP group covers the area boarding the South Australia border with Victoria and the Southern Grampians. This area includes Harrow and Horsham, south to Dunkeld and MacArthur, and southwest to Portland and Cape Nelson. The Gunditjmara RAP area also includes many state and national parks such as Discovery Coastal Park, Mount Richmond National Park, Cape Nelson State Park and the Grampians National Park.

The area between the Shaw and Eumerella Rivers in the south-west to Lake Linlithgow in the north and Yambuk in the south, are shared by both the Gunditjmara RAP and the Eastern Maar RAP groups.

There are many landscapes within Gunditjmara Country – Nyamat Mirring (Sea Country), Tungatt Mirring (Stone Country), Bocara Mirring (River Country) and Woorrowarook Mirring (Forest Country) (Glenelg-Hopkins Regional Catchment Strategy 2023).

It can be noted that the Gunditj Mara view water as part of their traditional lands and should be recognised and protected as such (Clark 1990, RNTBC 2023)

Evidence of Gunditj Mara knowledge of water is found in the eel trapping and the redirecting of waterways at Lake Condah and in the larger Budj Bim National Heritage Landscape. The Budj Bim National Heritage Landscape had been managed by Traditional Owners to form waterways and channels to bring eels down from Darlots Creek into Lake Condah for fishing and resource gathering (Department of Climate Change, Energy, the Environment and Water 2021). This practice can be dated to approximately 6600 years old, with one of five of the eel trap systems around the lake's edge being carbon dated. The relocating and breeding of eels became a sustainable husbandry practice that sustained the Gunditj Mara through every season, providing food stuffs and sources of trade. There are plans currently being made with VicWater and Wannon Water to reestablish traditional eel farming in the Budj Bim area (VicWater 2022)Another plan devised to aid in the management of Indigenous water landscapes is the Sea Country IPA Program. The Sea Country IPA (Indigenous Protected Areas) Program was developed at the beginning of 2021 to aid in the conservation and protection of Indigenous marine and coastal environments. The IPA program covers the Gunditj Mara area from the Convincing Ground to the Yambuk Lakes and provides further protection of the Budj Bim landscape as well as opportunities for Indigenous employment, documentation of traditional knowledge and sea management (DCCEEW n.d.)

The Lake Condah mission was opened in 1867 in response to the displaced Gunditj Mara after the Eumerella wars (Budj Bim Cultural Landscape 2023). The Eumerella wars lasted over 20 years, beginning in the mid 1830's to the 1860's, starting over disagreements in ownership of land in southwest Victoria. The Dhauwurd wurrung people (apart of Eastern Maar country) refused to settle at the mission in Framlingham, so the Lake Condah mission was established, where they farmed and learnt to read and write English. The mission was strategically position to both house eel trapping facilities and have a view of the Budj Bim Reserve. In 1918, the mission was formally closed, and some of the Gunditj Mara were moved to other missions, such as the Lake Tyers Mission, while others refused to leave country. In 1987, the land on which the mission was situated on was given back to the Gunditj Mara (Budj Bim Cultural Landscape 2023).

Gunditj Mara hold strong cultural connections to sea country (Nyamat Mirring), and Nyamat Mirring features heavily in the Dreaming and creation stories of the Gunditj Mara. The Gunditj Mara believe that after the initial eruption of the creator spirit, Budj Bim, out of a volcano, the spirits movement throughout the landscape created the surrounding landscapes and their features. The lava flow from this eruption caused the creation of the wetlands found within the Gunditj Mara landscape. In the traditional funeral rites of the Gunditj Mara people, bodies are bundled in grass and laid into the ground with their heads pointing towards Deen Maar (Lady Julia Percy Island). This is due to Deen Maar having a cave called Tarn Wirrung, which is thought to be the beginning of the passage towards the afterlife. Once the bodies were buried, if grass grew at the mouth of the cave, it was thought that the spirit had made it to the island, and into the realm of the clouds

Deen Maar (Lady Julia Percy Island) is the point where two creator deities, Punjil and Pallian left this earth. Pallian was the creator deity of the sea and fish and the governor of the oceans (after William Thomas, Letters from Victorian Pioneers, in National Oceans Office 2003:12). This island holds and creation story holds significance for both the Gunditj Mara and Eastern Maar.

Significant locations of conflict are also located on the coast, including the massacre of Gunditj Mara at Convincing Ground, east of Portland. The Convincing Ground Massacre occurred at Allestree, approximately 10km from Portland, where Kilcarer Gundidj, Gundtij Mara people were killed by whalers over a disagreement about the ownership of a beached whale(VHR n.d.). The suggested dates for this massacre are between 1833 and 1834, with an unknown number of Indigenous peoples being killed(VHR n.d.).

2.6.2 Primary Stakeholder Area - Eastern Maar

The Eastern Maar RAP group covers the area including Port Fairy and Warrnambool, down to Apollo Bay, east to Lorne and northwest towards Ararat. The RAP area of Eastern Maar also extends 100 meters off the coast and therefore encompasses the Twelve Apostles.

Eastern Maar is an umbrella term, used to describe a large area of land containing many, smaller traditional owner groups, such as Maar, Eastern Gunditgimara, Tjap Wurrung, Peek Whurrong, Kirraw Whurrung, Kuurn Kopan Noot. Yarro waetch and many others.(Eastern Maar Aboriginal Corporation 2020)

In 1865 the first Aboriginal mission was formed in the Western District at Framlingham in Girai wurrung country, north-east of Warrnambool. Aside from the Dhauwurd wurrung clans who moved to the Lake Condah mission in the 1860s, other Indigenous people were removed to the Framlingham Aboriginal Mission, which was gazetted as a “temporary reservation for the use of Aborigines” (Barwick 1979: 4).In this mission the Eastern Maar people continued both cultural and spiritual traditional practices. In 1867 and 1899 the mission was meant to close down, and the Eastern Maar people were expected to move into the Lake Condah mission. Again, in 1916, the Eastern Maar people were expected to move into missions within Gippsland Victoria. All three times, the people refused to move and were successful in staying on country. During the 1970’s, Eastern Maar were granted ownership of the land, including 586 acres of the original mission(Lawler, Oataway, & Berelov 2016).

Eastern Maar’s connection to water relies heavily in the marine resources, abundant around the area. Fishing practices are still used today with the fishing and collection of eels, perch, blackfish, yabbies, abalone, cockles and crayfish (Eastern Maar Aboriginal Corporation 2015, pp. 9). The techniques used in eeling have been passed down for generations, meaning the practices used today are techniques and skills traditional owners were using to eat and to trade (Eastern Maar Aboriginal Corporation 2015, pp. 9). Shell middens are an important archaeological site to the Eastern Maar, where they take time to teach others about the importance of culture and preservation and management of sea resources (Eastern Maar Aboriginal Corporation 2015, pp. 9).

> *When Maar citizens visit places with archaeological sites, we take time to teach our young ones about what they mean in terms of our history and culture. For example, our ancestors left many ancient middens along the coast which continue to tell a story about our Country - how the coastline and estuaries fluctuated, how and when our ancestors used the resources along the coast, what was harvested from out in the open ocean, how climatic conditions changed over time, where the meeting places were and ceremonies took place. This type of cultural*

learning helps develop empathy for Country; a deeper understanding on a societal scale of what Country means to us as a nation. We always pay our respects…(Eastern Maar Aboriginal Corporation 2015, pp. 9)

Through Country, Eastern Maar People connect with their ancestors who are associated with different water systems within the landscape (Eastern Maar Aboriginal Corporation 2015, pp. 9):

> *We believe that the spirits of our dead reside in our waterways and water bodies, and that they use animate and inanimate objects to move through Country. The signs they reveal to us are an important part of the interaction with our Ancestors – engaging, guiding, informing and warning us. When our citizens die, they are often buried with their bodies facing towards Deen Maar (Island). A story associated with Deen Maar Island is that the spirits go first to Deen Maar and then up to the stars, as Bunjil had done. A star falling or lights flying through the sky is a sign that the spirit is going over.*
>
> *Sea Country Maar citizens have always had a close connection with the sea and its resources, which were central to our culture, economy and survival. The ocean nourished our Ancestors and we still rely on it for our survival. Abundant middens along the coastline tell a rich story of our past. The coastline is home to sites that are important for our Dreaming - Three Sisters Rocks and Deen Maar (Lady Julia Percy Island) where our Ancestors leave the earth. Our connection with our Sea Country extends well beyond the current shoreline to the edge of the continental shelf. While this area is under the sea today, we occupied it for thousands of years and rising sea levels have not washed away the history, physical evidence or our connection.*(Eastern Maar Aboriginal Corporation 2015, pp. 13)

2.6.3 Secondary Stakeholder Area - Wadawurrung

Aboriginal groups mapped natural features as boundaries for their ranges, estates and economic territories. The Wadawurrung held land along the coast from Painkalac Creek at Aireys Inlet, east into Port Phillip Bay and to the Werribee River and to the north as far as Mt Emu and Fiery Creeks (Clark 1990).

Little is known about the Wadawurrung and their social organisation as they were one of the first Aboriginal groups within the region to be affected by European settlement in the area (Clark 1990). However, the Wadawurrung RAP organisation has traced its people's lineage to that of the seven families of John Robinson who was born in 1846 and passed in 1919 (WTOAC 2019).

During the summertime months, Wadawurrung along with Djab wurrung, Dhauwurd wurrung and girai wurrung language groups gathered at Mirraewuae swamp for ceremony and hunting. In early autumn the *Wada wurrung* would meet with Girai wurrung at Lake Bolac with local Djab wurrung named groups to take advantage of the migratory eels. The Wadawurrung participated in trade meetings at Terang, trading axe's and adhesive gum.

The coastal Wadawurrung first came into contact with settlers around the early 1800s when John Murray and William Flinders surveyed part of Indented Head. By the end of 1836 sheep runs were endemic around Geelong for an approximate 40.2 kilometre radius. The following year, settlers began to spread westward towards the Colac district.

An important figure in the history of Wadawurrung country was an escaped convict named William Buckley. The Wadawurrung balug first encountered Europeans in 1832 when William Buckley, escaped from the failed Sorrento settlement in 1803. Buckley was adopted by the Wadawurrung balug and spent the next 32 years with them; taking part in their customs, learning the language as well as hunting gathering techniques (Clark 1990). Buckley's story was recorded by John Morgan in 1852. From Buckley's accounts it was recorded that the Wadawurrung balug would catch eels at Lake Modewarre and would spend time on the hunting ground of the neighbouring Bengalat bulluck. According to Buckley the clan was at odds with the Bun wurrung, Woi wurrung and Daung wurrung clans (Clark 1990).

2.6.4 Secondary Stakeholder Area - Bunurong

The land encompassing the eastern side of the study area, as mapped by Clark (Clark 1990), is held by the Boon Wurrung language group, commonly associated with the Bunurong people. Boon Wurrung land occupied the coastal area from the Werribee River to Anderson Inlet, Phillip Island and probably beyond to Wilsons Promontory(Horton & Morris 1983, pp. 44). The Bunurong RAP group covers the Mornington Peninsula (such as Rosebud and Frankston), Western Port (French Island, Phillip Island and San Remo) and the eastern most part of South Gippsland (Warragul down to Leongatha)(BLCAC 2023).

The Bunurong group is loosely divided into smaller clan or family groups, named for the area they associated with (Gaughwin & Sullivan 1984, pp. 85). Barwick (1984, pp. 117–118) identified six clans: the *Burinyung-balluk* from Point Nepean and Cape Schanck, the *Mayone-bulluk* associated with the Carrum swamp, Cranbourne and the northern part of the Mornington Peninsula, the *Ngaruk-willam* associated with the Brighton area and Mordialloc, the *Yallock-bulluk* (most relevant to the study area) associated with the eastern side of Bass River and Tooradin, the *Yallukit-willam* associated with the area now called St Kilda and a broader region from the Werribee River to Mordialloc, the *Yowengherra* occupying the Tarwin River area. Thomas distinguished between the Bunurong people from Port Phillip and those of Western Port, though he rarely had contact with the Bunurong people on the eastern side of Western Port Bay (Sullivan 1981, pp. 16–19, Clark 1990). The Yallock-Bulluk Bunurong group are the most likely to have lived and associated with San Remo and Phillip Island area. The moiety of the Yallock-Bulluk named group is Bunjil, commonly associated with the Phillip Island area.

People were likely to have moved between the interior in winter and the coast in the summer. Movement was made up of many small distances (c. 10 km per day) punctuated by camps of one to three nights and occasionally longer stays of eight to ten days (Sullivan 1981). Social activity involving neighbouring named or socio-dialectical groups was usually held in warmer periods, held at the intersection of group boundary's and arranged by a person assigned of the responsibility of travelling between groups to organise the time, place, and events of the meeting.

An important figure in the history of Bunuroung country was an Indigenous man named Derrimut. Derrimut was the *arweet* the *Yalukit Willam* group at the time of European settlement of the region (Clark 1990, pp. 368–369). His name, Derrimut (derrimart/derremot), is believed to mean 'to hunt' or 'to pursue' in the language of the *Yalukit Willam* (Clark 2005, p. 1), Derrimut was a prominent figure in both the Indigenous and European histories of early Melbourne, and historical and contemporary views of his status vary. William Buckley, an escaped convict who lived with the Wadawurrung people of the Geelong region, considered him a 'traitor' who should be speared for divulging impending attacks to European colonists (Clark 2005, pp. 109). Clark (2005) considers Derrimut a "culture-broker" who sought to navigate the newly imposed political context of colonial Victoria by forging relationships with prominent early European Melbournians including John Pascoe Fawkner and William Thomas, who held Derrimut in high regard (Clark 2005, pp. 111). In 1849, Derrimut and other members of the *Yalukit-Willam* agitated for the establishment of the Mordialloc Reserve, and when it was later divided for sale in 1863, Derrimut used his European connections to angrily protest its sale (Clark 2005, pp. 116).

Bunurongs use of water-based resources is evident in the quantity of shell midden sites found along the coastline. Within the study area and the bounds of the Bunurong RAP group, there are a total of 677 registered shell midden sites, within two hundred meters of the shoreline. This suggests knowledgeable exploitation of marine resources as practiced techniques and an understanding of the ocean would be needed to accumulate the amount of shell middens listed on Bunurong country.

2.6.5 Secondary Stakeholder Area - Gunaikurnai

The Gunaikurnai RAP group covers most of the Gippsland Area, spanning from Warragul and Noojee, down to Port Albert and Port Welshpool, eastward towards Bairnsdale, Lakes Entrance and Marlo, and north towards Omeo and Hotham Heights

The Gunaikurnai believe in strong connections between land (Wurruk), water (Yarnda) and air (Watpootjan) and how these connections support living things. The Gunaikurnai see no separation of land and water, combining the two to represent whole country and therefore, demonstrate the same levels of importance to both land and sea. Due to this definition of country, both land and ocean receive the same amount of protection and management(GLWAC 2023a).

Throughout Gunaikurnai country, there are multiple sites that detail indigenous relation to country and resource exploitation. One site that displays local resource exploitation is the recently excavated cave near Mitchell River, Raymond Creek 2 Rock Shelter, that provides evidence of using mussel shell tools and localised resource gathered through fishing(Monash University & GLWAC 2019).

The Buchan Caves Reserve is an example of the spiritual and physical relation to country that the Gunaikurnai people share. At this site in Eastern Victoria there are registered indigenous burials located in and around the cave system, creating a spiritual space within the landscape. In conjunction to the sacred burials, the site was already known to be a great place of connection as it played an integral role in the migrating patterns of the Gunaikurnai travelling through the mountains(GLWAC 2023b).

The area surrounding Buchan Caves Reserve is also considered special to country, with several other caves being recognized as having cultural meaning One such cave is Cloggs Cave, located southeast of Buchan Caves Reserve, having an undisturbed cultural sequence, that could prove indigenous settlement in the Late Holocene and holds evidence of megafauna that challenge the idea of megafaunal extinction being caused by the LGM(GLWAC 2023a, David et al. 2021, GLWAC 2023b)

2.6.6 Primary Stakeholder Area – Palawa (Tasmania)

According to Jones (1974), Tasmanian Aboriginal society consisted of three social units: hearth group, the band and the Tribe. The hearth group was described as being the family unit, and consisted of a man, woman, their children, aged relatives, and ranged from 2-8 people (Jones 1974: Plomley 1983).

> *There were nine individuals in this family, and clearly they represented a hearth group, because Peron visited their campsite with its single hut. The group comprised an older man and wife, a younger man and wife, and five children, one a daughter (Oure-Oure) of the older man and wife, and the other four the children of the younger man and wife. (Plomley 1983:168).*

The band was more similar to a social unit, comprising of a number of hearth groups, and this was defined by land owned and the boundaries within this territory being lined with defined geographic boundaries (Jones 1974:324-325). Brown (1986:21) further notes that the band was generally led by an older man who had a reputation as a successful hunter and fighter. Brown (1986:21) also believes that the band was exogamous, with the wife generally moving to her husband's band and hearth group. Each of these bands were then further associated with a 'political' unit, as termed by Jones (1974:328-329) as a tribe. Jones (1974:328-329) describes:

> *…that agglomeration of bands which lived in contiguous regions, spoke the same language or dialect, shared the same cultural traits, usually intermarried, had a similar pattern of seasonal movement, habitually met together for economic and other reasons, the pattern of whose peaceful relations were within the agglomeration and of whose enmities and military adventures were directed outside it. Such a tribe had a territory, consisting of the sum of the land owned by its constituent bands … The borders of a territory ranged from a sharp well defined line associated with a prominent geographic feature to a broad transition zone.*

Ryan (2012:14) hypothesises that the population of Tasmania was associated with a broad network of nine Tribes, each consisting of six to 15 bands. Ryan (2012:14) estimates that at by the time of European colonisation, the population of each tribe was around 350 and 800 people, where the overall population of Tasmania is estimated at being 3000-8000 people.

Coastal sites generally consist of midden sites, however, significant stone quarries, rock art, and former hut depressions and camp site can still be located. These sites show a seasonal exploitation of the coastal areas (Brown 1991; Jones 1977). The recording of bark canoes by early explorers shows that the Tasmanians did have a rich maritime tradition, however, many of these were used to access smaller off shore islands, not the larger islands of Bass Strait, or to the main land of Australia (Jones 1977).

With the removal of the Tasmanians to Flinders Island, population decreases, and associations with different geographical areas of Tasmania were lost. When the Tasmanian's returned to the mainland to Oyster Cove, many of these survivors were not allowed back into their traditional areas where they were born, or where their family had resided for generations.

2.7 Conclusion

Aboriginal communities in Victoria and Tasmania continue to be present and vibrant, and maintain strong connections to their traditional lands, waters, and their cultures. Each group is distinct and hold different systems of belief, connection, ceremony, language and lore and cultural practice. Each group hold traditional ecological knowledge of plants, animals and land management passed down through generations.

Aboriginal communities continue to practice traditional hunting, fishing, and gathering, and have a deep understanding of the environment around them. They also have a spiritual connection to the land and sea. Aboriginal people and representative bodies in Victoria and Tasmania have become more active in conservation, land and heritage management, working to protect and restore their traditional lands and waters, and to ensure that their cultural heritage is respected and protected.

> *Coastal environments in south-eastern Australia are rich in cultural sites. These include archaeological sites, such as shell middens and stone quarries, as well as "natural" sites, such as headlands, river mouths, reefs and islands. These sites have continuing cultural meaning because of their connection with Creation Stories, Dreaming Tracks, ceremonial places, camping places and massacre sites. Many of these places are listed on the Register of the National Estate, others are recorded in State-based heritage registers, while many others are known only to Indigenous people themselves and are not formally recorded…*
>
> *Protecting this cultural heritage is a major concern for Indigenous people. (National Oceans Office 2002:4).*

This Cultural Heritage Desktop Assessment explores the cultural heritage background for the region, provides a summary of available information in order to provide the project with a grounding in the cultural heritage of Aboriginal people in the study area.

4 Glossary of Terms

The glossary provides definitions of various archaeological and heritage related terms.

Heritage place: A place that has aesthetic, historic, scientific or social values for past, present or future generations – ' ...this definition encompasses all cultural places with any potential present or future value as defined above' (Pearson & Sullivan, 1995, p. 7).

Aboriginal place: Aboriginal place is defined under Section 5 of the *Aboriginal Heritage Act* 2006 as follows:

5 What is an Aboriginal place?

(1) For the purposes of this Act, an Aboriginal place is an area in Victoria or the coastal waters of Victoria that is of cultural heritage significance to the Aboriginal people of Victoria.

(2) For the purposes of subsection (1), *area* includes any one or more of the following—

(a) an area of land;

(b) an expanse of water;

(c) a natural feature, formation or landscape;

(d) an archaeological place, feature or deposit;

(e) the area immediately surrounding anything referred to in paragraphs (c) and (d), to the extent that it cannot be separated from the thing without diminishing or destroying the cultural heritage significance attached to the thing by Aboriginal people;

(f) land set aside for the purpose of enabling Aboriginal human remains to be re-interred or otherwise deposited on a permanent basis;

(g) a building or structure.

Alluvial terrace: a platform created from deposits of alluvial material along river banks.

Angular fragment: a piece of stone that is blocky or angular, not flake-like.

Archaeology: the study of the remains of past human activity.

Artefact scatter: a surface scatter of cultural material. Aboriginal artefact scatters are defined as being the occurrence of five or more items of cultural material within an area of about 100 square metres. Artefact scatters are often the only physical remains of places where people have lived camped, prepared and eaten meals and worked.

Backed piece: a flake or blade that has been abruptly retouched along one or more margins opposite an acute (sharp) edge. Backed pieces include backed blades and geometric microliths. They are thought to have been hafted onto wooden handles to produce composite cutting tools. Backed pieces are a feature of the 'Australian small tool tradition', dating from between 5,000 and 1,000 BP in southern Australia (Holdaway & Stern, 2004).

Blade: a flake at least twice as long as it is wide.

Burial place: usually a sub-surface pit containing human remains and sometimes associated artefacts.

Contact place: see 'Aboriginal historical archaeological place'.

Core: an artefact from which flakes have been detached using a hammerstone. Core types include single platform, multi-platform and bipolar forms.

Cortex: original or natural (unflaked) surface of a stone.

Cortical: refers to the cortex.

Flake: a stone piece removed from a core by percussion (striking it) or pressure. It is identified by the presence of a striking platform and bulb of percussion, not usually found on a naturally shattered stone.

Flaked piece: a piece of stone with definite flake surfaces, which cannot be classified as a flake or core.

Formal tool: an artefact that has been shaped by flaking, including retouch, or grinding to a predetermined form for use as a tool. Formal tools include scrapers, backed pieces and axes.

Geocentric Datum of Australia 1994 (GDA94): a system of latitudes and longitudes, or east and north coordinates, centred at the centre of the earth's mass. GDA94 is compatible with modern positioning techniques such as the Global Positioning System (GPS). It supersedes older coordinate systems (AGD66, AGD84). GDA94 is based on a global framework, the IERS Terrestrial Reference Frame (ITRF), but is fixed to a number of reference points in Australia. GDA94 is the Victorian Government Standard and spatial coordinates for excavations, transects and places in CHMP documents.

Geometric microlith: a small tool that has been fashioned from breaking apart a microblade. The piece is then retouched or backed and a small tool formed.

Grindstones: upper (handstone) and lower (basal) stones used to grind plants for food and medicine and/or ochre for painting. A handstone sometimes doubles as a hammerstone and/or anvil.

Hearth: usually a sub-surface feature found eroding from a river or creek bank or a sand dune - it indicates a place where Aboriginal people cooked food. The remains of a hearth are usually identifiable by the presence of charcoal and sometimes clay balls (like brick fragments) and hearth stones. Remains of burnt bone or shell are sometimes preserved within a hearth.

Isolated artefact: the occurrence of less than five items of cultural material within an area of about 100 square metres. It/they can be evidence of a short-lived (or one-off) activity location, the result of an artefact being lost or discarded during travel, or evidence of an artefact scatter that is otherwise obscured by poor ground visibility.

Manuport: foreign fragment**,** chunk or lump of stone that shows no clear signs of flaking but is out of geological context and must have been transported to the place by people.

Map Grid of Australia (MGA): The official coordinate projection for use with the Geocentric Datum of Australia 1994 (GDA94).

Mound: these places, often appearing as raised areas of darker soil, are found most commonly in the volcanic plains of western Victoria or on higher ground near bodies of water. The majority were probably formed by a slow build-up of debris resulting from earth-oven cooking; although some may have been formed by the collapse of sod or turf structures.

Percussion: the act of hitting a core with a hammerstone to strike off flakes.

Platform preparation: removal of small flake scars on the dorsal edge of a flake, opposite the bulb of percussion. These overhang removal scars are produced to prevent a platform from shattering.

Pre-contact: before contact with non-Aboriginal people.

Post-contact: after contact with non-Aboriginal people.

Quarry (stone/ochre source): a place where stone or ochre is exposed and has been extracted by Aboriginal people. The rock types most commonly quarried for artefact manufacture in Victoria include silcrete, quartz, quartzite, chert and fine-grained volcanics such as greenstone.

Rejuvenation flake: a flake that has been knapped from a core solely for the purpose of preparing a new platform and making it easier to get flakes off a core, as it reduces the angle between platform and core surface.

Retouch: a flake, flaked piece or core with intentional secondary flaking along one or more edges.

Rock art: 'paintings, engravings and shallow relief work on natural rock surfaces' (Rosenfeld, 1988, p. 1). Paintings were often produced by mineral pigments, such as ochre, combined with clay and usually mixed with water to form a paste or liquid that was applied to an unprepared rock surface. Rock engravings were made by incising, pounding, pecking or chiselling a design into a rock surface. Rare examples of carved trees occasionally survive.

Rock shelter: may contain the physical remains of camping places where people prepared meals, flaked stone, etc. They are often classed as a different type of place due to their fixed boundaries and greater likelihood of containing sub-surface deposits. Rock shelters may also contain rock art.

Scarred tree: scars on trees may be the result of removal of strips of bark by Aboriginal people e.g. for the manufacture of utensils, canoes or for shelter; or resulting from small notches chopped into the bark to provide hand and toe holds for hunting possums and koalas. Some scars may be the result of non-Aboriginal activity, such as surveyors' marks.

Scraper: a flake, flaked piece or core with systematic retouch on one or more margins.

Shell midden: a surface scatter and/or deposit comprised mainly of shell, sometimes containing stone artefacts, charcoal, bone and manuports. These place types are normally found in association with coastlines, rivers, creeks and swamps – wherever coastal, riverine or estuarine shellfish resources were accessed and exploited.

Significance: the importance of a heritage place or place for aesthetic, historic, scientific or social values for past, present or future generations.

Striking platform: the surface of a core, which is struck by a hammerstone to remove flakes.

Structures (Aboriginal): can refer to a number of different place types, grouped here only because of their relative rarity and their status as built structures. Most structures tend to be made of locally available rock, such as rock arrangements (ceremonial and domestic), fishtraps, dams and cairns, or of earth, such as mounds or some fishtraps.

Stratified deposit: material that has been laid down, over time, in distinguishable layers.

Transect: A fixed path along which one records archaeological remains.

Utilised artefact: a flake, flaked piece or core that has irregular small flake scarring along one or more margins that does not represent platform preparation.

Review of Oil Spill Modelling for the Regia 3D MSS

December 2023

S2 Services ENVIRONMENTAL CONSULTING

Table of Contents

1. Introduction

This technical review of oil spill modelling has been prepared to support CGG Services (Australia) Pty Ltd (CGG) in its impact and risk assessment process for the for the Regia Marine Seismic Survey (Regia MSS).

The Regia MSS Preliminary Environmental Impact and Risk Assessment (PIERA) used an Environmental Planning Area set at 155 km around the Activity Planning Area. This distance was selected using professional judgement and a review of previous impact and risk assessments for similar activities in the region. Further justifying the distance, the NERA Reference Case: Consequences analysis of an accidental release of diesel (NERA 2018) found that diesel spills under 700m^3 were reliably predicted to disperse within 150 km.

The PIERA recommended that following be undertaken: Review the NERA Reference Case 2018:1003 Consequence analysis of an accidental release of diesel and regionally relevant spill models from similar worst-case events to determine the applicability of the NERA Reference Case and, subsequently, the need for activity specific spill modelling. This report actions this recommendation to determine if the Environmental Planning Area is appropriate to approximate the spatial extent and variability of the receiving environment's contact with oil and subsequently inform risk evaluation and planning for oil spill response and monitoring, for the oil spill risk associated with the Regia MSS.

The initial spill modelling review was undertaken in April 2023 and updated in December 2023 prior to submission of the Regia MSS EP to NOPSEMA to consider any new oil spill modelling undertaken within the Otway Basin relevant to the review.

2. Review Recommendations

The following recommendations are made to CGG from this review:

- Basing the spill volume on the vessel's largest fuel tank is appropriate for the risk assessment.
- The NERA Reference Case distance of 150 km is appropriate for defining the furthest an oil spill could reach for spills up to 250 m^3 diesel spill that may occur within the Regia MSS Activity Planning Area.
- The Environmental Planning Area is appropriate for:
    - Estimating the spatial extent of oil exposure at the low thresholds (NOPSEMA 2019) for a 250 m^3 diesel spill within the Regia MSS Activity Planning Area.
    - Predicting oil exposure at King Island from a 250 m^3 diesel spill within the Regia MSS Activity Planning Area.
    - Predicting no oil exposure at the Tasmanian coast from a 250 m^3 diesel spill within the Regia MSS Activity Planning Area.
- CGG should keep the largest tank volume for vessels below 250 m^3.
- Once the seismic survey vessel and type of support vessels are contracted, undertake a review of the largest fuel tank volume. If the largest fuel tank volume is greater than 250 m^3 this oil spill modelling review should be redone to determine if the Environmental Planning Area is still appropriate. If it is not a management of change should be undertaken as per CGG's Implementation Strategy for the Regia MSS.

- If the Regia MSS Activity Planning Area changes, this oil spill modelling review should be redone to determine if the Environmental Planning Area is still appropriate. If it is not a management of change should be undertaken as per CGG's Implementation Strategy for the Regia MSS.

3. Regia MSS Spill Risk

The Regia MSS PIERA identified that whilst undertaking the activity, unplanned events may occur which result in a discharge of marine diesel. The Regia MSS Description of the Activity details that the worse-case credible oil spill risk of a vessel collision could result in the loss of diesel fuel from the vessels largest fuel tank. This assumption aligns with AMSA's National Plan Technical Guidelines for Preparing Contingency Plans for Marine and Coastal Facilities (AMSA 2015) that recommend that the indicative maximum credible spill volume for a vessel collision is the volume of the largest fuel tank.

The Regia MSS Description of the Activity details that the survey will be conducted using a purpose-built seismic survey vessel supported by up to three support vessels. CGG provided information on the proposed seismic survey vessel and type of support vessels that are likely to be used for the Regia MSS and it was identified that the largest fuel tank was 257.4 m^3.

4. Review Process

The review process focussed on oil spill modelling that is publicly available that met the following requirements:

- Surface release of marine diesel oil.
- Modelling thresholds align with those in the NOPSEMA Oil Spill Modelling Environment Bulletin April 2019.
- Modelling was used in an environment plan available on the NOSPEMA website.
- Modelled location is within the Regia MSS Activity Planning Area or > 20 km of the Regia MSS Activity Planning Area where the metocean conditions would be similar.

5. Review

The oil spill modelling that met the criteria in Section B11-4 are detailed in Table B11-51-. Marine diesel oil spill volumes ranged from 200 m^3 to 375 m^3 with all models using a release rate over 6 hours.

Distances to the modelling thresholds ranged considerable with the furthest distances typically to the east of the spill release location. This aligns with the major ocean currents in South-eastern Australia where the Leeuwin current from Western Australia flows south-east across the Great Australian Bight and reaches the west coast of Tasmania as the Zeehan Current (CoA 2015a).

Larger volumes modelled typically resulted in greater distances with entrained hydrocarbons travelling the furthest.

The NERA Reference Case (NERA 2018) detailed that, except for one outlier, there was no surface impact above thresholds beyond 150 km from the source of the spill for spills up to 700 m^3. This does not align with the modelling reviewed for which surface oil travelled between 10 to 300 km for spill volumes up to 373 m^3. Though it is noted that the moderate threshold for surface oil (NOPSEMA 2019) was used in the NERA Reference Case which would result in a smaller distance.

The NERA Reference Case (NERA 2018) also used 500 ppb for water column consequences of hydrocarbon release which does not align with NOPSEMA (2019) for which the low thresholds of 10 ppb for dissolved and entrained hydrocarbons are recommended for determining the spatial extent that may be exposed to a measurable level of hydrocarbons.

Only one spill volume of 250 m^3 was modelled (RPS 2019a) at the Annie-1 well location in 70 m water depth and 15 km from the Victorian coastline. The outputs from this modelling are relevant to the Regia MSS Activity Planning Area nearshore component and would be valid to estimate the distance to surface, dissolved and entrained low thresholds and oil contact to the mainland coast. The distances to these thresholds are within the Environmental Planning Area except for:

- The surface oil distance to the east of the oil spill modelling location was 193 km which is greater than the 150 km used for the Environmental Planning Area. However, the modelling used a threshold value of 0.1 g/m^2 which is lower than the current modelling threshold of 1 g/m^2 (NOSPEMA 2019) Based on a lower threshold was used and that the modelling at Minerva for Woodside (~ 10 km east of the Annie location) in a similar water depth (60 m) and distance to the Victorian coast (9 km) had a furthest distance of 75 km to the east for the low threshold surface oil, the 150 km used for the Environmental Planning Area in the nearshore Regia MSS Activity Planning Area would be appropriate.
- The moderate threshold for entrained oil was used for the modelling. This threshold is appropriate for informing the risk evaluation, but NOPSEMA (2019) recommend that the low threshold be used to define the area that may be exposed to oil above background levels. The moderate threshold was reached at a maximum distance of 60 km so even if this distance was double it would still be within the 150 km used for the Environmental Planning Area.

However, as the Regia MSS Activity Planning Area extends out ~ 120 km from the Victorian mainland and ~100 km from King Island the Annie-1 location may not accurately predict oil exposure to King Island or Tasmania.

Based on the following modelling that was undertaken closer to King Island and the Tasmanian mainland than the Regia MSS Activity Planning Area, the Regia MSS Activity Planning Area is appropriate for predicting low shoreline exposure to King Island and no shoreline exposure to the Tasmanian mainland from a 250 m^3 diesel spill over 6 hours:

- The ConocoPhillips Australia SH1 Pty Ltd modelling at Permit T/49P, 70 km west of King Island and 50 km south of Cape Otway, for a 350 m^3 diesel spill over 6 hours predicted no shoreline oil exposure for the Tasmanian mainland and a maximum probability of shoreline accumulation at the low threshold of 3%.
- The Beach Energy (Operations) Limited modelling at the Thylacine field located 70 km south of Port Campbell and 90 km northwest of King Island, for a 200 m^3 diesel spill over 6 hours predicted no shoreline oil exposure for the Tasmanian mainland and a maximum probability of shoreline accumulation at the low threshold of 2%.

- The Beach Energy (Operations) Limited modelling at the Thylacine field located 70 km south of Port Campbell and 90 km northwest of King Island, for a 300 m^3 diesel spill over 6 hours predicted no shoreline oil exposure for the Tasmanian mainland and a maximum probability of shoreline accumulation at the low threshold of 4%.

Table B11-t5-1: Oil Spill Modelling Outcomes

Company	EP	EP Status	Modelling Site	Approximate Modelling Location	Diesel Spill Volume	Water depth	Approximate Distance to Low Threshold

2 Public Comment

The following feedback was received during the public comment period starting 25 January 2024 which ran for 30-days. Table B12-2 21 shows how this feedback has been incorporated into the environmental assessments.

Table B12-2-1: Public comment input into the preparation of the EP

Matter	Matter ID	Changes made arising from public comment
Matter: Unacceptable impacts and risks to Marine Parks and protected areas	E01	CGG has considered these claims and has updated figures in Appendix B12 to include distances from operational and activity action zone areas to marine parks, reserves, and KEFs thereby providing further context of separation distances; and has calculated the percentage overlap of the Regia Operational Area with Bonney Coast Upwelling KEF.
Matter: Acknowledgement of breeding colonies	B02	The noise EMBA has been added to Figure MAP-REG-EPM-064 to show that the declared Little penguin BIAs occur outside of the noise EMBA.
Matter: Surveying previously surveyed areas is unnecessary	I24	CGG has considered these claims and is satisfied that the concerns raised have been adequately addressed in the EP, for the reasons outlined above but has undertaken to update EP Appendix B12 (Regia MSS Maps), namely Figures MAP-REG-EPM-052 (2D NOPIMS) and MAP-REG-EPM-053 (3D Surveys) to show the overlap of the operational and activity action zone and previous survey data in response to these claims.

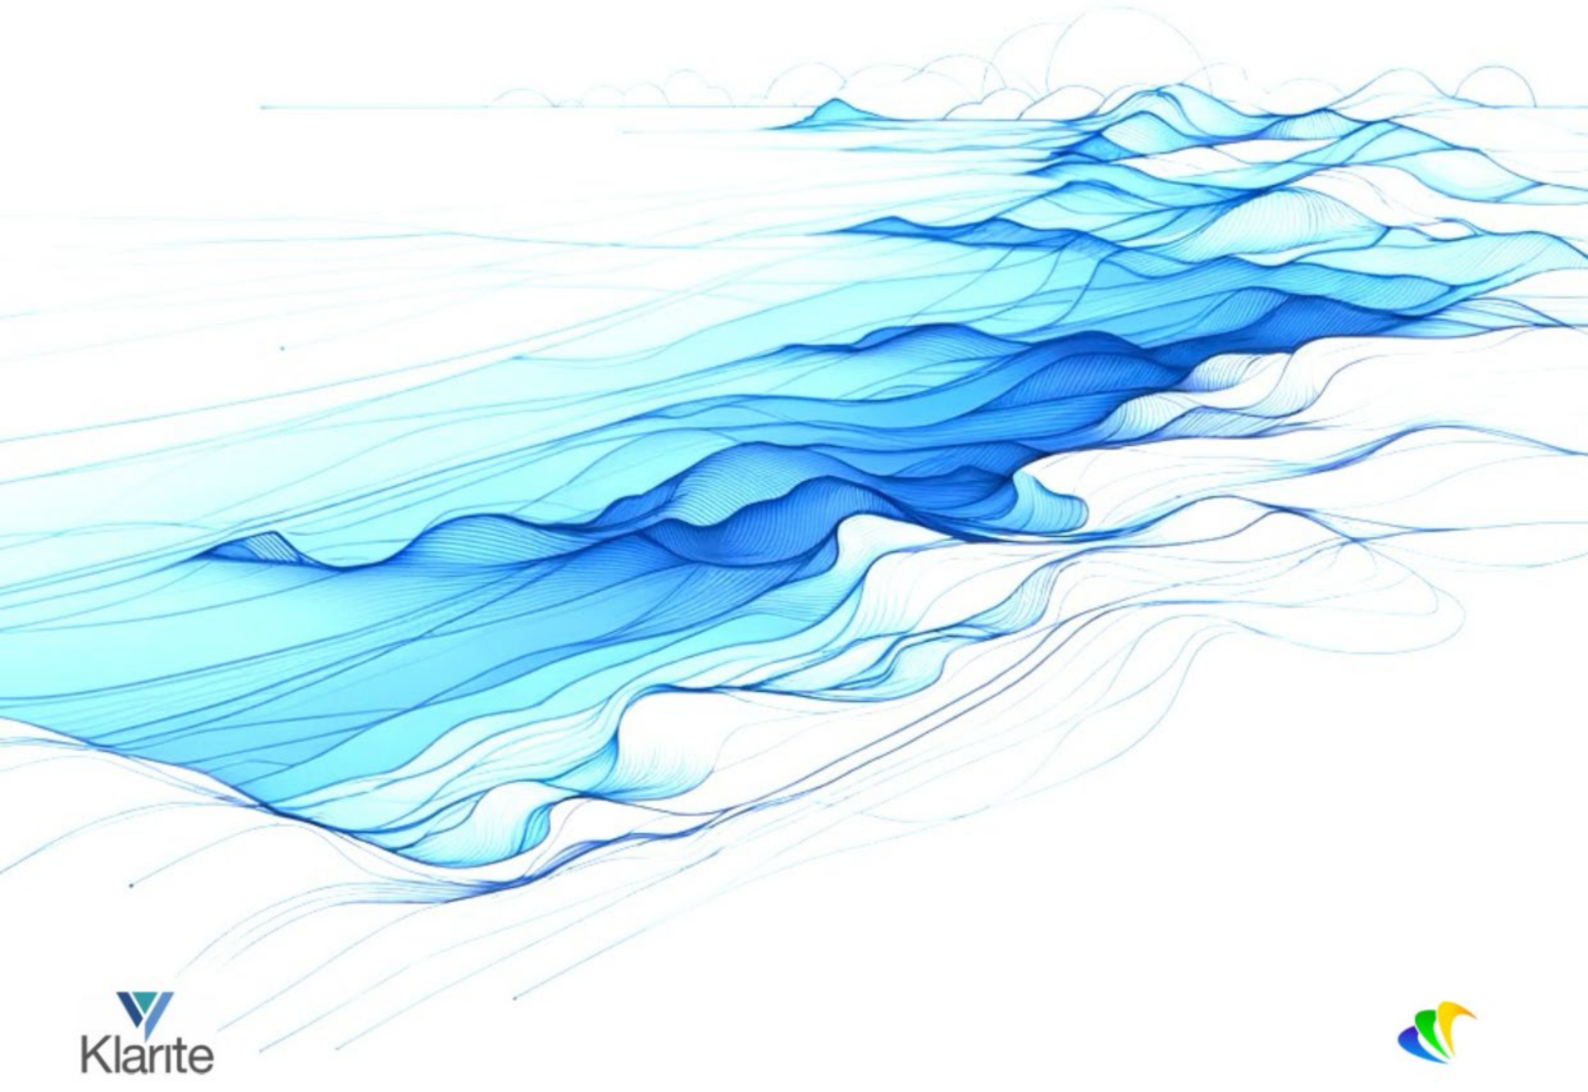
Consultation and Engagement

Appendix C1: REG-EP-012-C1

Rev 2

May 2024



Klarite

Table of Contents

1 Introduction

Pursuant to Part 4 Division 3 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (**the Regulations**) and considering recent case law, CGG Geophysical Services Pty Ltd (**CGG**) has performed consultations as required. This appendix aims to document how CGG undertook the consultation process, managed risks to as low as reasonably practicable and an acceptable level, and appropriately responded to, incorporated, and adopted measures based on relevant persons objections, claims, and other feedback.

By capturing sufficiently broad people and information through desktop research, community outreach events, and various targeted media and advertising techniques, CGG were able to identify relevant persons, provide them with sufficient information on the possible consequences of the activity on their functions, interests, or activities, allow a reasonable period for consultation, respond appropriately, and document details of such process.

This chapter will outline the guidelines set out by NOPSEMA, legislation and case law and demonstrate CGG has capably satisfied these requirements. The following appendices should be read in conjunction with the consultation chapter.

Appendix C2: Consultation Report

Section 24(b) requires an environment plan contains a report on all consultations under Section 25 of any relevant person by the titleholder. This report must include the following:

- A summary of each response; and
- An assessment of the merits of objections and claims regarding adverse impacts of activities proposed; and
- A statement of CGG's response as titleholder where they were given.
- This appendix is sorted separately by organisations and persons, so each specific case by case response by the titleholder and the relevant person can be assessed on their merits and easily referred to.

Appendix C3: Sensitive Information Part (16(b)(iv))

To comply with sub-section 26(8) of the Regulations, the full text of all responses by relevant individuals engaged under Section 25 and any other sensitive information (if applicable) must be included in a sensitive information report.

This report satisfies the remainder of section 24 and sub-section 26(8) by containing full text responses by relevant persons and any additional sensitive information. This report will not be published.

Appendix C4: Full Text copies

Full text copies of consultations with relevant persons. This information will not be publicly available.

Appendix C5: Consultation Materials

CGG have a further appendix which highlights the other efforts and methods used to find every possible relevant person in the community and raise awareness of the ability to self-identify through several mediums, such as the Regia website.

Appendix C6: Public Comment Report

CGG received nearly 15,000 submissions through public comment. This document provides a summary of the process used to ensure all submissions have been considered in the EP.

2 Background

CGG are required by legislation to prepare an Environment Plan (**EP**) to carry out the Regia Marine Seismic Survey (**Regia MSS**). This EP must then be accepted by the National Offshore Petroleum Safety and Environmental Management Authority (**NOPSEMA**). A key part of this EP is the consultation and co-design process, that must be carried out in preparation for the EP. CGG adhered to an iterative consultation process that was developed with consideration and in accordance with legislation, case law and NOPSEMA guidelines.

The foundations of this consultation process included:

- Maximising the broad capture of relevant persons through appropriate, targeted and subject-specific advertisement; and
- Allowing multiple channels for relevant persons to self-identify; and
- Encouraging relevant persons to share activity details with others; and
- Gathering knowledge about specific environmental, cultural, and societal values; and
- Providing concise yet sufficient information allowing relevant persons to make informed decisions; and
- Communicating with relevant persons through their preferred medium and in appropriate language through established information channels; and
- Allowing appropriate timeframes and encouraging feedback and queries; and
- Incorporating relevant persons input into the EP where appropriate; and
- Ensuring all relevant persons are aware of the consultation period and process, and affording the opportunity to participate in preparation and co-design of the EP.

The following principles outlined in Table C1-1 from the former Ministerial Council on Mineral and Petroleum Resources were also pillars of CGG's communication and consultation procedures.

Table C1-1 - Principles of Consultation

Principle	CGG's approach
Communication	Undertook effective two-way engagement to encourage feedback on relevant, accurate information provided.
Transparency	Transparency was fundamental in the consultation process and continues to be so. All feedback was addressed, and comments posted on the Regia website were responded to, and EP documents uploaded into the public document library hosted on the activity website.
Collaboration	Relevant persons were heard and collaborated with, which helped to adapt approaches and outcomes based on merit. The collaborative approach resulted in outcomes beneficial to both relevant persons and the titleholder.
Inclusiveness	All identified relevant persons were involved in the consultation process. This will last throughout the life of the Regia MSS through CGG's implementation and ongoing consultation strategies.
Integrity	The process fostered respect through freedom of information on the Regia website and trust through tailored two-way communication.

2.1 Legislation and Requirements

The following legislation was strictly adhered to during the consultation process:

- *Offshore Petroleum and Greenhouse Gas Storage Act 2006*
- *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009/2023*
- *Environmental Protection and Biodiversity Conservation Act 1999*

The following NOPSEMA guidelines were also considered and complied with:

- NOPSEMA Guideline GL2086 – Consultation in the course of preparing an environment plan – May 2023
- NOPSEMA Guidance Note GN1847 – Responding to public comment on environment plans – July 2022
- NOPSEMA Guidance Note GN1344 – Environment plan content requirements – December 2022
- NOPSEMA Guideline GL1721 – Environment Plan Decision Making Guideline – December 2022
- NOPSEMA Guidance Note GN1488 – Oil pollution risk management – July 2021
- NOPSEMA Guidance Note GN1785 – Petroleum activities and Australian Marine Parks – June 2020
- NOPSEMA Guideline GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023
- NOPSEMA Brochure – Consultation on offshore petroleum environmental plans – May 2023
- NOPSEMA Policy PL2098 – Engaging gender-restricted information Draft Policy – May 2023
- NOPSEMA Policy PL1347 – Environment Plan Assessment Policy – December 2022
- Recent case law developments also moulded CGG's consultation process:
- *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193
- *Cooper v National Offshore Petroleum Safety and Environmental Management Authority* (No 2) [2023] FCA 1158

Other resources and guidelines used:

- *NOPSEMA* Guidance framework: Supporting cooperative coexistence of seismic surveys and commercial fisheries in Australia's Commonwealth marine area.
- Victorian Aboriginal Heritage Council: Registered Aboriginal Parties (RAPs) - Fact Sheet.
- Victorian Aboriginal Heritage Council: Victorian Aboriginal Heritage Council - Fact Sheet.

2.2 CGG Consultation Principles

During the consultation process there was significant clarification about the consultation requirements that apply to preparing an EP arising from case law. As this clarification was delivered over time, CGG decided to create consultation principles that supported communicating the purpose of consultation with relevant persons. These principles were:

1. **Co-design:** Incorporating a co-design principle into the consultation process emphasises collaboration and mutual agreement on how consultations are conducted. This principle is

essential when relevant persons may have their preferred engagement processes that may or may not align with the regulatory requirements of the Regulations. By adopting a co-design approach, CGG aimed to ensure that all parties had a say in shaping the consultation methodology, fostering a sense of ownership and acceptance among all relevant persons.

2. **Voluntary Participation:** Ensuring that participation in the consultation process is voluntary respects the autonomy of all relevant persons. This principle recognises that while input and engagement are highly valued, mandating participation could lead to procedural compliance rather than genuine dialogue. Voluntary participation encourages more meaningful and constructive contributions from those who choose to engage, ensuring that any feedback is driven by a genuine interest in the outcomes of the project rather than compulsion.
3. **Not Seeking Consent:** By not seeking explicit consent through the consultation process, CGG acknowledges that the purpose of consultation is to inform, discuss, and consider the perspectives and feedback of relevant persons, not to obtain approval. This approach aligns with the regulatory framework under which CGG operates, where the final decision-making authority rests with regulatory bodies like NOPSEMA, not with the relevant persons, nor the public. This distinction helps maintain clarity in the roles and responsibilities within the consultation process.
4. **Regulatory Permission for Impacts:** The principle that regulations allow NOPSEMA to permit impacts underscores the structured regulatory environment within which environmental impacts are assessed and managed. It highlights that while relevant person input is crucial and valued, there are established legal and scientific frameworks in place to evaluate and mitigate environmental impacts. This ensures that decisions are made based on comprehensive environmental assessments and best practice standards, balancing economic, cultural, and social factors. CGG often encountered a misconception that 'no impact' was the requisite standard that had to be met.
5. **Absence of Requirement for Universal Participation:** Acknowledging that not every relevant person must participate in the consultation process recognises the practical limitations of engagement and avoids the logistical and procedural complexities that attempting to achieve full participation would entail. It ensures that the process remains efficient and manageable while still being inclusive and comprehensive. This principle also respects the diversity of interest and the varying degrees of impact on different relevant persons, allowing for a focus on those most affected or most knowledgeable without diluting the quality of engagement with mandatory universal participation.
6. **Multidimensional Nature of Relevant Persons:** CGG decided it was important to acknowledge the multidimensional nature of relevant persons and not to assume the primary reason for contacting a relevant person was the exclusive reason they were a relevant person. For instance, a commercial fishers may also be a recreational diver and have different pathways to being affected. This approach ensures a comprehensive understanding of how the Regia MSS affects all aspects of relevant persons lives, fostering more meaningful engagement and building trust. This holistic view not only enhances stakeholder participation but also ensures that strategic decisions are informed by a broad spectrum of perspectives, leading to more equitable and sustainable outcomes.

These principles were frequently referred to during the community consultation forums and subsequent consultations with relevant persons.

3 Consultation Methodology

CGG proposed a process that allowed relevant persons to co-design both the development of the consultation process and the preparation of the EP. This process was designed with the context of the objects of the Regulations.

As stated by Justice Lee in *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 at [141], these objects are "best achieved by a consulting process that is practicable but is sufficiently broad so as to collect available input into the possible risks and environmental impacts of the activity and ways of reducing those risks and impacts and managing them to an acceptable level." CGG adapted this statement to include the following:

1. Broad capture of all relevant persons.
2. Develop knowledge of and describe relevant values and sensitivities of the environment that may be affected.
3. Provide sufficient information.
4. Create two-way channels for communication from relevant persons.
5. Allow a reasonable period for relevant persons assessment and feedback.
6. Respond to each claim or objection where appropriate.
7. Continue ongoing consultation throughout the life of the project.

This approach was underpinned by and upholds the principles of the International Association for Public Participation spectrum (IAP2 spectrum), which helped to achieve the goals set out by the NOPSEMA guidelines and legislation. The project-specific Regia website not only helped with community engagement and co-design of consultation, but further aligned goals and outcomes between CGG's consultation methodology and the IAP2 spectrum.

The decision-making criteria was captured in a document (Decision Making Criteria in the Environmental Assessment Process – March 2023). This document was uploaded in to the 'Establishing Context' section of the activity webpages' document library. It was also featured on the landing page, with a feedback function that facilitated public discourse regarding the decision-making criteria.

The Environmental Planning Area (EPA) was established to frame the initial studies and community consultation effort. Set at 155 km around the Activity Planning Area, this distance has been selected using professional judgement and a review of previous impact and risk assessments for similar activities in the region. Further justification for this distance can be found in Appendix B11.

CGG identified several subject-centred groups in its planning process and the consultation methodology was tailored to the cultural, social, and economic features of these people and communities. The discussion in the subsequent sections of this document apply to all subject-centred groups. Through the consultation process two subject-centred groups (Commercial Fishers and First Nations Australians) warranted elevated tailoring of the consultation method. Therefore, demonstrations of compliant consultation with these groups have been provided in Annex 1 – Commercial Fishers and Annex 2 – First Nations Australians.

3.1 Relevant Person Identification

Titleholders are required to identify and consult with each authority, person or organisation who fits the definition of a relevant persons pursuant to Section 25 of the Regulations. This section clearly demonstrates who is a relevant person, and the rationale used to determine that status. Key factors considered by CGG in this process included the nature of the activity, the environment in which it is being undertaken and the impacts and risks associated with it.

3.1.1 Broad Capture of People and Information

Identifying relevant persons is essential in designing a consultation method that is inclusive, effective, and legally compliant. It promotes fairness, transparency, and accountability in decision-making processes and can lead to more successful outcomes and reduced risks for all parties involved. CGG's process for relevant persons identification provided for the broad capture of relevant persons such that each relevant person who can be identified, was identified (GN1344: Section 12.3; GL2086: Section 6). CGG also understands that despite our best endeavours, there may still be some unidentified relevant persons. Despite this, the methodology used by CGG was capable of identifying each relevant person.

By categorising people within the community, engagement was tailored to specific subject-centred groups. The legislation provides guidelines to this effect using four categories: the public, authorities, organisations, and persons. For the purposes of Part 4 Division 3, there is a clear, explicit difference between the public and *relevant persons* (organisations, authorities, and persons) who unlike the public, are mandatory consultees in preparation of the EP.

CGG has identified and evaluated all potential environmental impacts and risks based on the information and relevant persons identified. If new information or relevant persons are identified, CGG has appropriate change management procedures in place, which are outlined in our ongoing consultation strategy (See Appendix B3).

3.1.2 Opportunity to Self-Identify

To combat the challenges faced by a requirement to identify every relevant person, CGG launched the Regia website, which created two channels of communication with the public and with relevant persons. This website, advertised at community events, and via print (both link and QR code), social, radio and television media, helped reach and locate interested members of the public and provided a simple survey to determine if a person was relevant for Section 25. This survey helped self-identification as it enabled individuals to provide their functions, interests, and activities, or request more information to determine if they were relevant. In total, the website reached over 3700 unique users, with over 12,200 total visits, 852 document downloads, and the consultation survey was taken 121 times, identifying 108 relevant persons.

To facilitate use of the Regia MSS website, 13 social media boosted adverts were run, the audience being 18-65+ within the Environment Planning Area (**EPA**) and matching potentially affected interests. The adverts encouraged people to visit the Regia MSS website to self-identify, access or request information and submit comments. These advertisements were through Facebook (META), LinkedIn and Instagram, with an estimated target audience of 270,300-318,000. A full report detailing Thruplay, Reach and Impressions is available in Appendix C5. A total of 10 advertisements were run through traditional media, with a QR code and written website link, and 13 through social media, which were also used to publicise community information sessions.

3.1.3 Raising Awareness

CGG published a total of 299 notices in local and national print media, social media, and local radio and television interviews to:

- Provide sufficient information to allow individuals to make informed decisions on potential impacts on their functions, interests, or activities.
- Facilitate information and consultation requests.

- Promote self-identification through the Regia website.
- Notify the public of commencement of the EP and consultation process.
- Advertise information sessions.
- Access recordings of previous webinars.
- Allow individuals to sign up for newsletters and webinars.
- List 'Frequently asked questions' and, as engagement progressed, thematic 'What we've heard so far' feedback, with assessment of merit and measures adopted.
- Publish summaries, implementation strategies and risk assessments.
- Allow individuals to make both public (interactive map) and private instant feedback.

The notices were placed in media where the audience were potentially relevant to the activity, such as located in the EPA and a First Nations newspaper. In addition, the initial community sessions were run jointly with another titleholder who also had a proposal in the Otway, they placed 4 print adverts and 142 radio spots within the EPA to advertise these sessions.

All identified relevant persons were contacted via email and/or phone or post and informed of their rights and the role they play as a relevant person. Each person was also asked what their preferred line of communication was and how they would like to co-design the consultation in a way which best suits their interests, availability, and needs. A full record of these communications can be found in Appendix C2 and C3, but some of the techniques employed by CGG included:

- 11 Community information sessions.
- 6 online webinars, which were recorded and uploaded to the activity website.
- 10 Campaign email project newsletters.
- 23 Letters via postal service.
- 121 Consultation surveys.
- Feedback surveys.
- 7 Instant feedback.
- 11 Commercial fisher engagement surveys.
- 17 Webinar series registrations.
- 38 Newsletter registrations.
- 78 Interactive map comments.
- 13 Boosted social media targeted adverts.
- 25 Face-to-face meetings.
- 19 Virtual meetings.
- 10 print advertisements.
- 272 radio adverts over 6 local stations and their websites.
- 9 Tailored information summaries.
- Commercial fisher group meetings.
- 1 ENGO group meeting.

- Local radio and television interviews/comments.

In addition to this, the project-specific website, which can be accessed at www.regiamss.com.au, was designed to create an open-book space where people can publicly or privately raise concerns, share and/or access information and stay informed. On the website, the consultation survey empowered CGG and the public to determine the best way for them to engage with the Regia project and if they are a relevant person for the purposes of Section 25 of the Regulations. The Regia website goes beyond industry standards for consultations, and assisted CGG in locating a further 118 relevant persons through self-identification on the website.

In a bid to mitigate consultation fatigue, initial community information events were held in conjunction with another proponent who was also promoting an offshore activity in the Otway. Following these events, CGG received feedback from some attendees that this was confusing and requested Regia MSS only events (Event ID806 & ID919). CGG worked with these groups and held the standalone events (Event ID's 4112, 1731), working with them to ensure the location and date was suitable, and advertising via email notice (ID987 & ID1020) and in the local newsletter a community member suggested during the first community event (ID762 & ID1199).

During these information events, individuals were informed of the ways they could participate and the classification of a Relevant Person. They were encouraged to self-identify by contacting the Regia team via one of the points of communication, and to forward information to any potentially relevant person they may know.

In three of the community events (Event ID1481, ID1731 & ID4112) an attendee requested that a vote be taken on who opposes the project, at all events the majority were against the activity. The Regia Environment Manager re-iterated that a 'for and against' vote is not part of the community or relevant person engagement, however he would record this in the consultation. This was reiterated to individuals who were unable to attend the event and subsequently emailed in a 'no vote'.

In total there were 37 in-person engagements with the Regia Environmental Manager in the south-west region, this included visiting wharfs and local fishing businesses to raise awareness of the activity.

3.1.4 Tailored Engagement Methods

CGG employed a range of communication techniques which were tailored based on different audiences, preferred mediums, and technological availability. Consultation consisted of two-way dialogue, where relevant persons were given sufficient information through a medium of their choice, allowing them to make an informed decision on the potential consequences of the Regia MSS on their functions, activities, or interests. These mediums included emails, phone calls, face-to-face meetings, tailored presentations, webinars, and website interactions. An outline of the engagement methods used by CGG is in Table C1-7 in Annex 3.

3.1.5 Reasonable Period of Raising Awareness

To promote best practice, CGG took a broad interpretation of the reasonable period required in sub-section 25(3) to mean not only a reasonable period with sufficient information but a reasonable period of raising awareness as well. CGG commenced consultation on 03 February 2023, over 330 days before first submission to NOPSEMA, this is considered a reasonable period of raising awareness.

3.1.6 Statutory categories

Section 25(1) demonstrates that a relevant person can fall into any one of these categories:

(a) each Department or agency of the Commonwealth to which the activities to be carried out under the environment plan, or the revision of the environment plan, may be relevant;

(b) each Department or agency of a State or the Northern Territory to which the activities to be carried out under the environment plan, or the revision of the environment plan, may be relevant;

(c) the Department of the responsible State Minister, or the responsible Northern Territory Minister;

(d) a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the environment plan, or the revision of the environment plan;

(e) any other person or organisation that the titleholder considers relevant.

3.1.7 Section 25(1)(a), (b) and (c)

Identifying relevant persons under these categories is simple as they are all government agencies and statutory authorities that have functions, interests, or activities within the EPA. The exhaustive list of these relevant persons and a summary of communications can be found in Appendix C2.

3.1.8 Section 25(1)(e)

Nobody was identified under this section as all identified relevant persons fit into 25(1)(a)-(d). This is because CGG has treated everyone engaged as a relevant person and only people who positively opted out of consultation have not been subject to the full methodology.

3.1.9 Section 25(1)(d)

The factors in Section 3.1 helped determine which individuals, authorities and persons had functions, interests or activities that may be affected. The terms "functions", "activities" and "interest" are defined below in Table C1-3 as per the Regulations, Federal Court and NOPSEMA guidelines. CGG contacted persons whose functions, interests or activities could not be easily ascertained and validated any assumptions about whether they may be affected by the Regia MSS.

Table C1-2 - Functions, activities, and interests

Term	Definition
Functions	Refers to "a power or duty to do something"
Activities	To be read broadly and is broader than the definition of 'activity' in section 4 of the Environment Regulations and is likely directed to what the relevant person is already doing.
Interests	To be construed as conforming with the accepted concept of "interest" in other areas of public administrative law. Includes "any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relations to reputation"

Contrary to section 25(1)(a), (b) and c, the list of relevant persons here was and is non-exhaustive, as it can change as the project develops, but the Regulations and NOPSEMA understand and cater for this. Over 260 people were identified as relevant persons for the purposes of this regulation. Every single one of these individuals was engaged in two-way dialogue through their preferred medium, whether it be email or an in person, face-to-face meeting. See Appendix C2 for a summary of these consultations and Appendix C4 for full text responses.

3.1.9.1 Subject-centred groups

CGG used subject-centred groups and tailored consultation strategies to identify relevant persons and subsequently engage with them in a way that was appropriate to their cultural, social, and economic needs. Table C1-3 outlines the strategies used.

Table C1-3 - Subject-centered groups

Subject-centred group	**Tailored identification strategies**	**Relevant persons identified**
Commerce	Contacted the local Chamber of Commerce to identify relevant businesses. Online searches conducted for news articles or press releases about marine-based businesses in the area.	7
Commercial Fishers	Requested data from the Victorian Fisheries Authority to understand historical fishing activity within the EPA, this was used to inform Commercial Fisheries Analysis Report. Visited local ports and found local fishers who operated. Contacted industry related organisations. Undertook fee-for-service arrangements with Fishing Associations.	17 (fee for service arrangements with 4 associations to engage on their members behalf).
Commercial Shipping	Contacted relevant harbourmasters and shipping agents and enquired about frequent users. Performed online searches for business located at wharves in regional ports.	2
Conservation Groups	Previously submitted EP's on the NOPSEMA website were reviewed and relevant conservation groups compiled. Online searches performed for conservation groups with interests in similar activities. Online searches performed for articles and current campaigns related to similar activities.	14
Educational Bodies	Exposure thresholds for monitoring potential impacts of the activity were used as this is more relevant to research institutions. Contacted the Department of Education and identified relevant institutions and research programs. Contacted the universities and identified relevant research programs.	5
Fishing Associations	Research allowed the target species within the EPA to be identified (see Appendix B6). The peak fishing associations were also able to identify other species-specific associations. Contact details of license holders were requested from AFMA.	10
Government Agency	Previous databases perused. Desktop research conducted.	13
Heritage Groups	Contacted Victorian heritage organisations to identify other relevant persons. Accessed the Australian Heritage Database to compile potential relevant persons. Queried the Australasian Underwater Cultural Heritage Database.	6
Interested member of the public	List compiled through project awareness raising, including local adverts (print, social, media, TV adverts), and community information sessions	174

Subject-centred group	Tailored identification strategies	Relevant persons identified
Local councils	Searched the Victorian Electoral Commission database and found relevant councils, shires and cities close to the activity.	7
First Nations Australians inc. Native title land councils	Contact details of land councils were sourced from the National Native Title Council which will be expanded on below.	19
Petroleum title holders	Utilised the NEATS database to find titles and titleholders within the EPA. Used the NOPSEMA EP database to find other titleholders with activities in the area. Subscribed to NOPSEMA EP submissions pages for all activities in Victoria.	2
Other marine and Port users	Relevant harbourmaster's contacted to enquire about frequent users Online searches conducted for business located at wharves in regional ports. Performed online searches for groups who use or have a connection to the marine environment, the searches were heavily focused on those users proximate to the EPA.	59
Ports and harbours	Automatic information system data of vessel activities along the coast was reviewed and frequented ports were established. Reviewed the Victorian boat ramp database which helped to identify ramps within the EPA. Contacted local councils, cities and shires for local boat ramp listings and users.	2
Recreational fishers	Engaged with recreational fishing associations and used newsletters/circulars and websites to spread information about the activity and identify relevant persons. Requested contact details for license holders. Engaged with advisory bodies and reference groups to establish the best approach to identify relevant persons.	16
Tourism operators	Online searches for marine tours and recreational experiences such as marine mammal observations, diving and outdoor extreme sports. Enquired with Chambers of commerce, local and regional tourism centres to help identify marine based tourism operators in the EPA region. Online and in person searches for marine-based community or sporting events.	7

3.1.10 Relevant Persons Identified

In the process of consultation, 1126 individuals and organisations were contacted during the preparation of this EP. Of these points of contact, 140 individual relevant persons and 177 relevant organisations were identified, full details of these persons can be found in Appendix C3. Following 11 months of consultation and research, CGG has discharged its duty by providing all identified relevant persons with sufficient information and a reasonable period to engage in the co-design of both the consultation process and the environmental plan.

3.2 Give Sufficient Information

Under sub section 25(2) of the OPGGE(S)R, titleholders must give relevant persons with sufficient information to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, activities, and interests.

As a minimum, all relevant persons were given initial information including:

- An activity description summary.
- A map indicating the activity planning area and environmental planning area.
- An overview of the consultation process proposed by CGG.

The initial information pack was specifically designed to provide sufficient information for readers to understand if they may be affected, and if they wanted to participate in the consultation process. In giving this information CGG informed each relevant person of their rights in the consultation process and that they could request information provided be kept confidential.

When it became available the Preliminary Environmental Impact and Risk Assessment (PEIRA) was used to provide further information in a digestible shortened format. CGG were able to empower relevant persons to make informed decisions and engage in the construction of positive outcomes by:

- Tailoring information, responses, and communication mediums to relevant persons; and
- Providing further information when requested to ensure relevant persons understanding and comprehension; and
- Published Decision Making Criteria: and
- Offering summaries or further explanation if required; and
- Producing receptor and industry specific reports and summaries; and
- Directed relevant persons to the NOPSEMA guidelines; and
- Published all relevant information on the Regia MSS website document library; and
- Community information sessions; and
- Webinars; and
- Group and individual meetings.

A detailed list of information requests and how they were addressed is captured in Appendix C2 and Appendix C4.

Project newsletters were utilised as a tool to capture important information, within a single correspondence to limit consultation fatigue, and to provide information on changes made throughout the consultation process. The newsletters provided information such as when the team would be in the area and inviting meeting requests, how to refer a potentially relevant person, changes to timings, how to request information is kept sensitive, distribute the NOPSEMA community consultation brochure, and to inform of, and request feedback on, measures implemented through the engagement process. Project newsletters were sent to all organisations and people in the database (both relevant and non-relevant) and uploaded to the project website. Located on the project website was also a link to provide details to sign up for the newsletter.

3.2.1 Information Formatting

The original provision of information was broad, simplistic, and easily accessible to the public to engage and capture the maximum possible number of relevant persons. Once these groups and individuals had been identified, they were consulted regarding which communication channel they prefer, the detail of information they require and helped build the framework for ongoing consultation with CGG.

Rather than using a one size fits all approach, CGG understands that different people digest and respond to information differently. Information was uniquely tailored to different requirements through multiple techniques, some of these include:

- **Changing the format of information flow depending on the person's needs:** For example, some First Nations groups (Event ID 1891) required in person, face-to-face meetings, whereas some groups preferred online (Event ID 2937).
- **Changing the content and complexity of the information based on a person's needs:** Rather than overwhelming people with information, CGG provided concise, to the point information and evidence surrounding the function, interest or activity that was being affected by the Regia MSS. Information was broken down into themes, topics and receptors, to mitigate concerns of information being inaccessible. For example, the environmental impact and risk assessments were both published online, in chapters, relating to their specific receptors. This allowed information relating to a specific concern to be easily accessed and reviewed. These chapters were also released with cover letters requesting feedback, directing the reader to context documents, relevant studies, and offering a summary and/or to discuss further with a member of the Regia team.
- **Subject-specific information summaries:** Flyers were produced to complement the consultation process and assist in capturing a broad group of relevant persons. These flyers were unique to the subject-centred groups previously discussed, to facilitate the understanding of risks and response from interested persons.
- **Regia website:** The project-specific Regia website allowed all members of the public and persons with interest to access every piece of information they would need to make informed decisions and objections, or request information in a form and delivery method appropriate to their needs. There are multiple industry-exceeding features of this website which include:
- **An interactive map for the Regia MSS:** This map included a boundary of the EPA and invited members of the public to place a 'marker' and share feedback for the activity. There were also instructions indicating that leaving a marker is a contribution as a member of the public and not as a relevant person pursuant to the Regulations. These instructions also provided an email, phone number, and a link to the consultation survey should someone believe they were a relevant person and mandatory consultee. Where questions were asked, they were responded to in a thread, so answers were available for public viewing.
- **Consultation survey:** This key feature provided members of the public a non-confrontational, simplistic way to check if they were a relevant person under the Regulations.

Through the design and nature of this publicly available information, interested parties were able to access the exact information they required to make informed decisions, without needing to request it, however, were afforded the opportunity to request the information in a format suitable to their specific needs. The information available on the Regia website is detailed in Table C1-7 in Annex 4.

A total of 40 relevant documents (and a further five TBC post-submission) are published and publicly available for review and comment on the Regia website. The full list of documents available on the Regia website can be found in Annex 4 along with the original publication dates. This transparency employed by CGG promoted trust within the community and far exceeds the level of sufficient information required to make an informed decision.

3.2.2 Further Information

In addition to the efforts put into tailoring the delivery and content of information to the relevant persons requirements, CGG invited relevant persons to request further information, in their preferred form, and engage in two-way consultation. Where requested, further relevant information was provided and relevant persons were referred to the Regia website, if necessary, which is supported in the full text responses annexed in Appendix C3.

3.2.3 Iterative Process for Reaching Sufficient Information

CGG has adopted an iterative and collaborative approach to provide relevant persons with sufficient information to allow an informed assessment of any possible effects of the activity on their functions, interests, or activities. When a relevant person requested further information, CGG promptly provided it. The iterative nature of the consultation process is best demonstrated where there were multiple occasions of information, questions, and feedback exchange between CGG and relevant persons.

3.2.4 Community sessions

The community sessions were not only incredibly valuable in identifying relevant persons, but they provided an open format to provide and receive information. A total of 11 community sessions were held at strategic locations based on the EPA. Information exchange at, and following, these events allowed engagement to be co-designed. Initially, in a bid to mitigate consultation fatigue, events were held with another titleholder who had a proposal in the area. When requests were made to hold standalone events, in requested areas, these were organised (Event ID's 1005, 806).

The sessions were advertised in 9 local print newspapers, 3 targeted social media adverts and 272 radio adverts over 6 local stations and their websites. In addition, the collaborating titleholder placed 4 print adverts and 142 radio spots within the EPA to advertise these sessions.

3.3 Reasonable Period with Sufficient Information

Pursuant to sub-section 25(3) of the Regulations, relevant persons must be afforded a reasonable period for consultation. NOPSEMA guidelines reiterate that for consultation to be genuine and meaningful, relevant persons must be given a reasonable period with sufficient information to allow them to make an informed assessment of the possible consequences of the activity on their functions, interests, or activities (GL2086: Section 9).

CGG understood that a reasonable period is contextually different for different groups and subsequently applied different interpretations of the term 'reasonable period' to different subject-centred groups and relevant persons. The provision of a reasonable period is therefore closely linked to the iterative nature of consultation and can change on a case-by-case basis. It is also inappropriate to assimilate the term reasonable period with a strict time frame as both relevant persons and a titleholder could misuse this interpretation against the spirit of consultation and the regulations. Subsequently and as an example, CGG considered multiple attempts to engage and the provision of subsequent information and project updates as a reasonable period.

CGG also considered the subjective context affecting a relevant person's communication important to determining what a reasonable period might be. For example, due to the professional nature of a government agency, an initial email and a 30-day minimum period may constitute a reasonable period. By comparison, a First Nations organisation may have technological or cultural barriers preventing the application of an email and 30-day minimum being appropriate. Full details of these communications, efforts and timeframes can be found in Appendix C2 and C4.
