		28/02/2024 16:04	28/02/2024 16:04	Outbound Phone Call	BHMW-PH-01-EOG February Telephone Calls	Beehive Multi-Well Drilling EP Outgoing call.	Call receiver informed that they had received the information from EOG and believed that the information provided to them was too long in format and didn't address the key points succinctly. Receiver wanted it noted that they are opposed to the project and they would prefer for the drilling and blasting to not go ahead. They informed that the fishing industry in the area would be negatively affected by operational activities due to its proximity to the coastline (referenced times of low fishing productivity in the gulf from earthquakes in Indonesia). The receiver noted that she did not think her saying no to the project was going to stop any approvals from going ahead.	N/A

Focus on top end coastal Traditional Owner groups in NT and crossing over in WA. Received a number of consultation communications from various Traditional Owner groups for a variety of offshore projects - including the Beehive project. They requested a status update on the project. They would like to be directly contacted regarding the project, and have made a request for the most recent project communications to be sent to them.	Provided a brief project update from geotech to current beehive multi-well projects, including providing the status of the approvals/submissions to NOPSEMA. Took down the Organisations contact details to include in Consultation Manager for future distributions. Provided information that EOG is a foreign company, and a request will be made for the team who look after the email distributions to send the requested information via email.
		28/05/2024 1:28	28/05/2024 1:28	Outbound Email	BHMW-TEACA-01 XEN	EOG request to consult with the TEACA about the beehive project.	EOG request to consult with the TEACA about the beehive project - template letter adapted for new RP.	N/A.
		28/05/2024 8:30	28/05/2024 8:30	Outbound Post / Letter	BHMW-TEACA-02 XEN	EOG sent a request to consult letter attached with the Beehive February 2024 flyer to update the corporation with the Beehive project.	EOG sent a request to consult letter attached with the Beehive February 2024 flyer to update the corporation with the Beehive project - template letter adapted for new RP.	N/A.
		3/06/2024 6:03	3/06/2024 6:03	Inbound Email	BHMW-TEACA-03 XEN	Refer to the EOG's email sent on the 28 May 2024 to the organisation and have attached correspondence regarding the same project.	The attached letter informs EOG Resources Australia that TEACA is recognised as a relevant party for the Beehive Project stages: Geotechnical Assessment, Exploration Drilling, and Multi-Well Drilling, under the Offshore Petroleum and Greenhouse Gas Storage Regulations. TEACA, a First Nations organisation, represents various coastal territories in the Northern Territory, comprising senior leaders from representative organisations. They aim to facilitate culturally appropriate consultation with Indigenous stakeholders, emphasising in-person engagement. TEACA's expertise in cultural heritage and regulatory compliance aids proponents in satisfying legal requirements. They propose a meeting in Darwin to discuss the project further.	***NOTE: Response in progress with EOG at time of submission.***
Top End Aboriginal Corporation Croker Island	Prescribed body corporate (PBC) nominated by Croker Island (DCD1998/001) to represent them and manage their native title rights and interests once a determination that native title exists has been made. Once the court determines that the corporation is to be the PBC, it is entered onto the National Native Title Register as a registered native title body corporate (ss 193(2)(e) and 253 NTA). Croker Island (DCD1998/001) are Determined Native Title Holders with communal, group or individual rights and interests in relation to land and waters, possessed under traditional law and custom, by which these people have a connection with their respective areas recognised under Australian law (s 223 NTA). Contact is through the Northern Land Council.	22/02/2024 0:37	22/02/2024 4:41	Outbound Email	BHMW-EM-01-EOG Beehive EP 2 Request to Consult	Template email sent to all relevant persons with a listed email address to commence consultation for Beehive Multi-Well Drilling. Includes Beehive February 2024 Flyer as an attachment.	Request to consult with you regarding the Beehive project located in the Joseph Bonaparte Gulf in Western Australia. Note previous consultation efforts regarding Beehive Geotechnical Assessment and Beehive-1 Exploration Drilling, including associated activity timings. Invitation to engage on Beehive Multi-Well Drilling of up to three exploratory wells to take place between January 2025 and December 2029. Although the Multi-Well Drilling Program covers up to three wells, at this time EOG plans to drill one single exploration well at Beehive, which could be drilled under either of the EP for Beehive-1 Exploration Drilling or Beehive Multi-Well Drilling. Fisheries Compensation Protocol - Summary

Fisheries Compensation Protocol - Summary

EOG Resources - Beehive Exploration

EOG Resources Australia Block WA-488 Pty Ltd ('EOG') is the titleholder of exploration permit WA-488-P (the 'Permit') and proposes to drill the Beehive-1 exploration well and conduct a related pre-drill geotechnical assessment (together the 'Activities') within Commonwealth waters approximately 80 kilometres off the Western Australian coastline, located in the Joseph Bonaparte Gulf. More details about these Activities can be found on EOG's website set out below.

Introduction

Offshore petroleum titleholders and licenced commercial fishers have mutual access rights and use of marine commons. With such rights comes the obligation to carry out activities safely and without interference with each other. EOG is committed to minimising impacts to commercial fishers from its offshore activities.

EOG has developed a Fisheries Compensation Protocol ('the Protocol'), summarised here, that outlines EOG's approach to minimising impacts to commercial fishers. The Protocol has been developed in line with Australian offshore industry best practice guidance (NERA, 2021). EOG's aim is to consult with commercial fishers in an open, transparent and respectful manner in order to promote safety and understand and minimise environmental and economic impacts.

Safety

EOG is focused on operating safely, which sometimes requires restricting access to defined areas while an activity is underway. EOG acknowledges that this may temporarily interfere with commercial fishing operations.

Environmental protection

All offshore petroleum activities must prepare Environment Plans (EP) that outline the potential impacts and risks to the environment, including risks to socio-economic factors such as commercial fishing. The EPs must be assessed and accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) before any activities can commence. The EP must propose control measures to reduce impacts and risk to be 'as low as reasonably practicable' (ALARP) and acceptable.

The Protocol is one such control measure in the unlikely event where impacts to the commercial fishing industry cannot be avoided or minimised and where the impacts may cause an economic loss.

Consultation

EOG works to identify commercial fishers potentially impacted by its Activities. EOG seeks to consult with commercial fishers in an open, transparent and respectful manner to 1) inform the environmental assessment process, and 2) seek to minimise potential disturbance to fishing grounds.

EOG is also making efforts to determine whether fishers wish to be consulted directly or via their representative association, where one exists.

Where a commercial fisher or fishing association believes they could be impacted by EOG's Activities and informs EOG as such, EOG will endeavour to provide activity-specific information as requested by the commercial fisher and/or association, discuss the issues and work to avoid or minimise impacts.

Economic loss

EOG is committed to the principle that a commercial fisher should not suffer an economic loss as a direct result of EOG Activities. Losses may be incurred for one of the following reasons:

- Fishing not undertaken - due to the need to avoid fishing in an EOG activity area and not being able to fish elsewhere;
- Displacement from fishing – due to the displacement from the EOG activity at the time of the activity resulting in reduced catch from fishing in a new area and/or increased running costs;
- Fishing gear loss or damage – loss of or damage to fishing gear as a result of accidental and uninsured physical contact with EOG vessels or in-water equipment.

Claims procedure

EOG works to provide a fair, simple and transparent process for a commercial fisher to claim compensation, where the commercial fisher has consulted with EOG in good faith ahead of project activities and provided that the fisher has taken steps to avoid impacts and mitigate any economic losses to their business as a result of the EOG Activities.

Claim procedure

A full copy of the Fisheries Compensation Protocol is available upon written request and provides simple claim forms for each type of loss (as listed above). Claims must be made within three months of the claimed event and must be supported by historical and current catch and effort evidence.

Before approving a claim, EOG may request to meet with the commercial fisher or their representative to seek further details. EOG will use best endeavours to approve claims within 60 days of receiving a claim.

Resolving disagreements

The Protocol outlines a process for managing disagreements regarding a claim, including appointing an independent mediator (paid by EOG) to facilitate both parties reaching an agreement.

Feedback

EOG encourages you to ask questions or provide feedback. Please use the following contact details to do so:

EPBC Act Protected Matters Search Tool (PMST) Results

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 05-Apr-2024

Impacts EMBA

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	23
Listed Migratory Species:	39

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	60
Whales and Other Cetaceans:	15
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	2
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	13
Key Ecological Features (Marine):	1
Biologically Important Areas:	3
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Carbonate bank and terrace system of the Sahul Shelf	North-west

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence

Scientific Name	Behaviour	Presence
Marine Turtles		
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 05-Apr-2024

Flaring EMBA

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	23
Listed Migratory Species:	39

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	67
Whales and Other Cetaceans:	15
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	2
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	16
Key Ecological Features (Marine):	1
Biologically Important Areas:	4
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Carbonate bank and terrace system of the Sahul Shelf	North-west

Biologically Important Areas

[Resource Information]

Scientific Name	Behaviour	Presence
Marine Turtles		
Chelonia mydas		
Green Turtle [1765]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Seabirds		
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

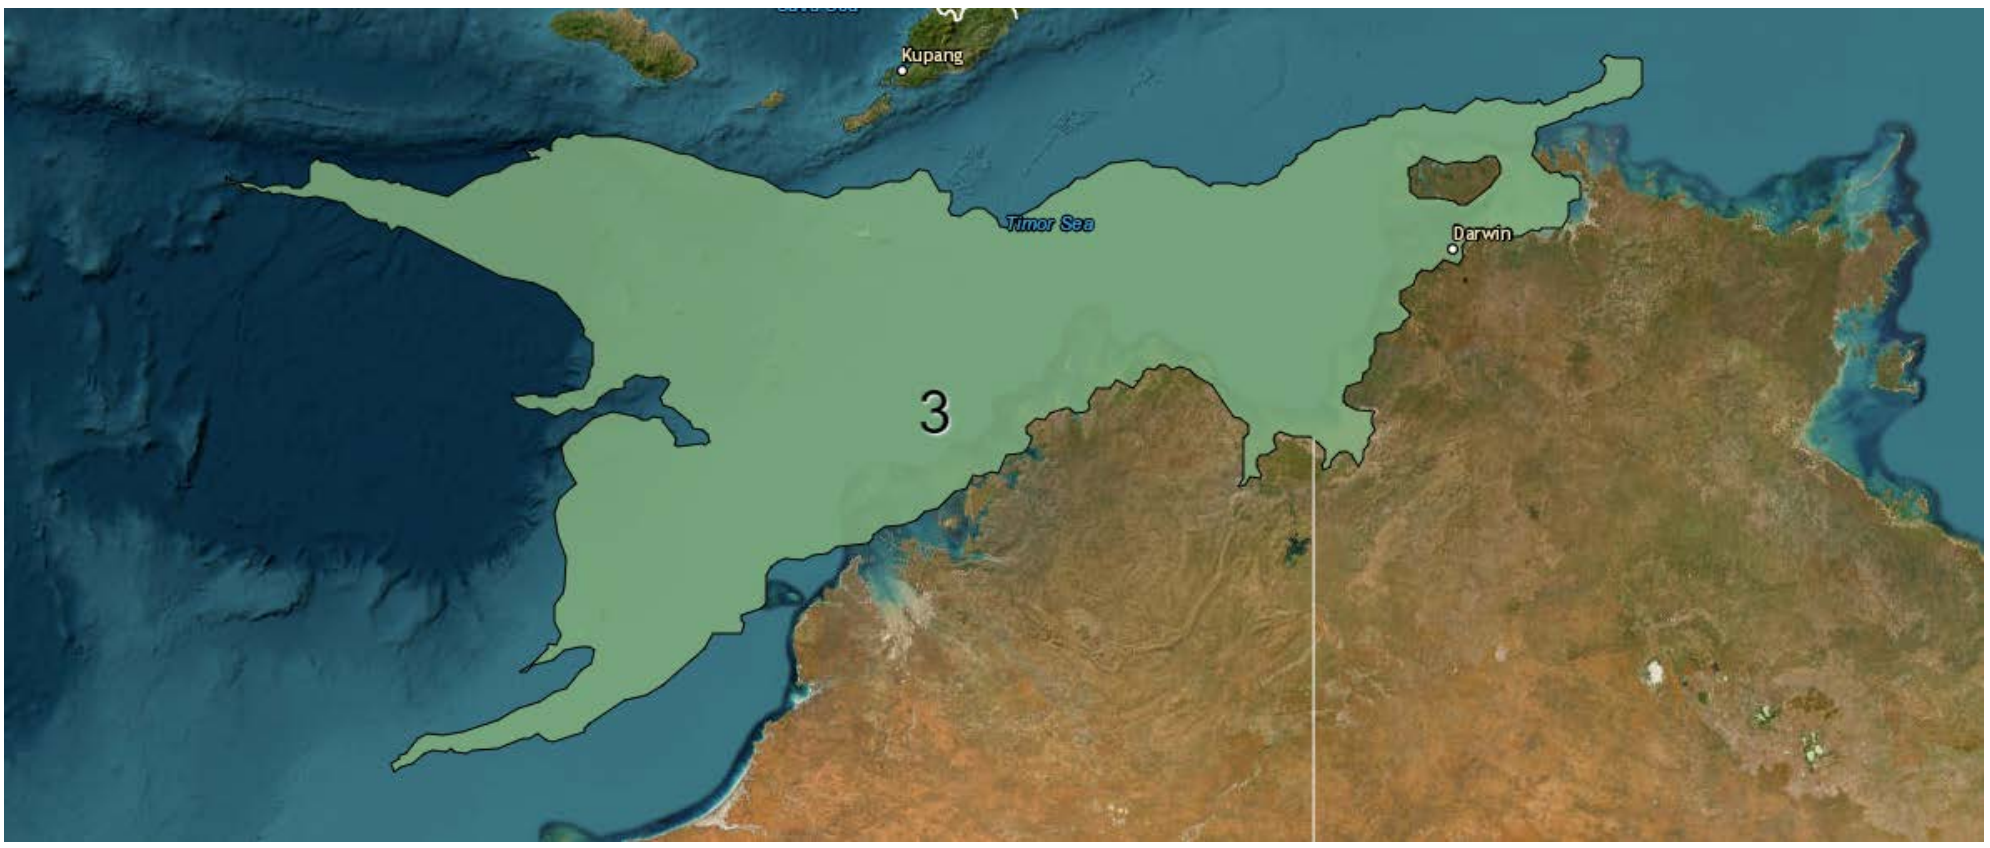
EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 05-Apr-2024

Ecological Spill EMBA



Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	2
Wetlands of International Importance (Ramsar	4
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	11
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	84
Listed Migratory Species:	85

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	86
Commonwealth Heritage Places:	11
Listed Marine Species:	142
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	1
Australian Marine Parks:	20
Habitat Critical to the Survival of Marine Turtles:	5

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	35
Regional Forest Agreements:	None
Nationally Important Wetlands:	15
EPBC Act Referrals:	204
Key Ecological Features (Marine):	11
Biologically Important Areas:	69
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Epthianura crocea tunneyi Alligator Rivers Yellow Chat, Yellow Chat (Alligator Rivers) [67089]	Endangered	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat known to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii smithii Partridge Pigeon (eastern) [64441]	Vulnerable	Species or species habitat known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Endangered	Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Melanodryas cucullata melvillensis Tiwi Islands Hooded Robin, Hooded Robin (Tiwi Islands) [67092]	Critically Endangered	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Papasula abbotti		
Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis		
Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus		
Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda westralis		
Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
Pluvialis squatarola		
Grey Plover [865]	Vulnerable	Roosting known to occur within area
Rostratula australis		
Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tyto novaehollandiae kimberli		
Masked Owl (northern) [26048]	Vulnerable	Species or species habitat known to occur within area
Tyto novaehollandiae melvillensis		
Tiwi Masked Owl, Tiwi Islands Masked Owl [26049]	Endangered	Species or species habitat known to occur within area
Xenus cinereus		
Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
FROG		

Scientific Name	Threatened Category	Presence Text
Uperoleia daviesae		
Howard River Toadlet, Davies's Toadlet [85375]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Antechinus bellus		
Fawn Antechinus [344]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Conilurus penicillatus		
Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus		
Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Isoodon auratus auratus		
Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas		
Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Mesembriomys gouldii gouldii		
Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mesembriomys gouldii melvillensis		
Black-footed Tree-rat (Melville Island) [87619]	Vulnerable	Species or species habitat known to occur within area
Petrogale concinna canescens		
Nabarlek (Top End) [87606]	Endangered	Species or species habitat likely to occur within area
Petrogale concinna concinna		
Nabarlek (Victoria River District) [87605]	Critically Endangered	Species or species habitat likely to occur within area
Petrogale concinna monastria		
Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Phascogale pirata		
Northern Brush-tailed Phascogale [82954]	Vulnerable	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis		
Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus		
Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Sminthopsis butleri		
Butler's Dunnart [302]	Vulnerable	Species or species habitat known to occur within area
Trichosurus vulpecula arnhemensis		
Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat known to occur within area
Xeromys myoides		
Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Atalaya brevialata		
[86125]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Burmannia championii listed as Burmannia sp. Bathurst Island (R.Fensham 1021) [93461]	Endangered (listed as Burmannia sp. Bathurst Island	Species or species habitat likely to occur within area
Elaeocarpus miegei [65147]	Endangered	Species or species habitat known to occur within area
Hoya australis subsp. oramicola a vine [55436]	Vulnerable	Species or species habitat known to occur within area
Mitrella tiwiensis a vine [82029]	Vulnerable	Species or species habitat likely to occur within area
Stylidium ensatum a triggerplant [86366]	Endangered	Species or species habitat known to occur within area
Tarennoidea wallichii [65173]	Endangered	Species or species habitat known to occur within area
Typhonium jonesii a herb [62412]	Endangered	Species or species habitat known to occur within area
Typhonium mirabile a herb [79227]	Endangered	Species or species habitat known to occur within area
Typhonium taylorii listed as Typhonium taylori [93459]	Endangered	Species or species habitat likely to occur within area
Xylopia monosperma a shrub [82030]	Endangered	Species or species habitat known to occur within area
REPTILE		
Acanthophis hawkei Plains Death Adder [83821]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding known to occur within area
Lucasium occultum Yellow-snouted Gecko, Yellow-snouted Ground Gecko [82993]	Endangered	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Tiliqua scincoides intermedia Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat known to occur within area
Varanus mertensi Mertens' Water Monitor, Mertens's Water Monitor [1568]	Endangered	Species or species habitat known to occur within area
Varanus mitchelli Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Breeding known to occur within area
Glyphis glyphis Speartooth Shark [82453]	Critically Endangered	Species or species habitat known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica		
Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		

Scientific Name	Threatened Category	Presence Text
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area
Charadrius dubius Little Ringed Plover [896]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting known to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa incana Wandering Tattler [831]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous minutus Black Noddy [824]		Breeding known to occur within area
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Charadrius dubius Little Ringed Plover [896]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting known to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area overfly marine area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Roosting known to occur within area overfly marine area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa incana as Heteroscelus incanus Wandering Tattler [831]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
[Tringa stagnatilis](#) Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
[Xenus cinereus](#) Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area overfly marine area
Fish		
[Bhanotia fasciolata](#) Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
[Campichthys tricarinatus](#) Three-keel Pipefish [66192]		Species or species habitat may occur within area
[Choeroichthys brachysoma](#) Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
[Choeroichthys suillus](#) Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
[Corythoichthys amplexus](#) Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
[Corythoichthys flavofasciatus](#) Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
[Corythoichthys haematopterus](#) Reef-top Pipefish [66201]		Species or species habitat may occur within area
[Corythoichthys intestinalis](#) Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
[Corythoichthys schultzi](#) Schultz's Pipefish [66205]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Festucalex cinctus Girdled Pipefish [66214]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys parvicarinatus Short-keel Pipefish, Short-keeled Pipefish [66230]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Solegnathus hardwickii](#) Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
[Solegnathus lettiensis](#) Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
[Solenostomus cyanopterus](#) Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
[Syngnathoides biaculeatus](#) Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
[Trachyrhamphus bicoarctatus](#) Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
[Trachyrhamphus longirostris](#) Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
[Dugong dugon](#) Dugong [28]		Breeding known to occur within area
Reptile		
[Aipysurus apraefrontalis](#) Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus duboisii](#) Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
[Aipysurus foliosquama](#) Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
[Aipysurus fuscus](#) Dusky Sea Snake [1119]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Emydocephalus annulatus Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis atriceps Black-headed Sea Snake [1101]		Species or species habitat may occur within area
Hydrophis coggeri Cogger's Sea Snake [25925]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis hardwickii as Lapemis hardwickii Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
Hydrophis inornatus Plain Sea Snake [1107]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis pacificus Pacific Sea Snake, Large-headed Sea Snake [1112]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Hydrophis zweiffei as Enhydrina schistosa Australian Beaked Sea Snake [93514]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Parahydrophis mertoni Arafura Smooth Sea Snake, Northern Mangrove Sea Snake [1090]		Species or species habitat may occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str.		
Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris		
Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	North-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Carbonate bank and terrace system of the Sahul Shelf	North-west
Carbonate bank and terrace system of the Van Diemen Rise	North
Continental Slope Demersal Fish Communities	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west
Pinnacles of the Bonaparte Basin	North
Pinnacles of the Bonaparte Basin	North-west
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west
Shelf break and slope of the Arafura Shelf	North

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur

Scientific Name	Behaviour	Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat - unknown behaviour	Likely to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Calving	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging	Known to occur
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Likely to occur
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Internesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Mating	Likely to occur
Chelonia mydas Green Turtle [1765]	Nesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Likely to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Internesting	Likely to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Likely to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur

Scientific Name	Behaviour	Presence
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Thalasseus bergii Crested Tern [83000]	Breeding (high	Known to occur

Scientific Name	Behaviour numbers)	Presence
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

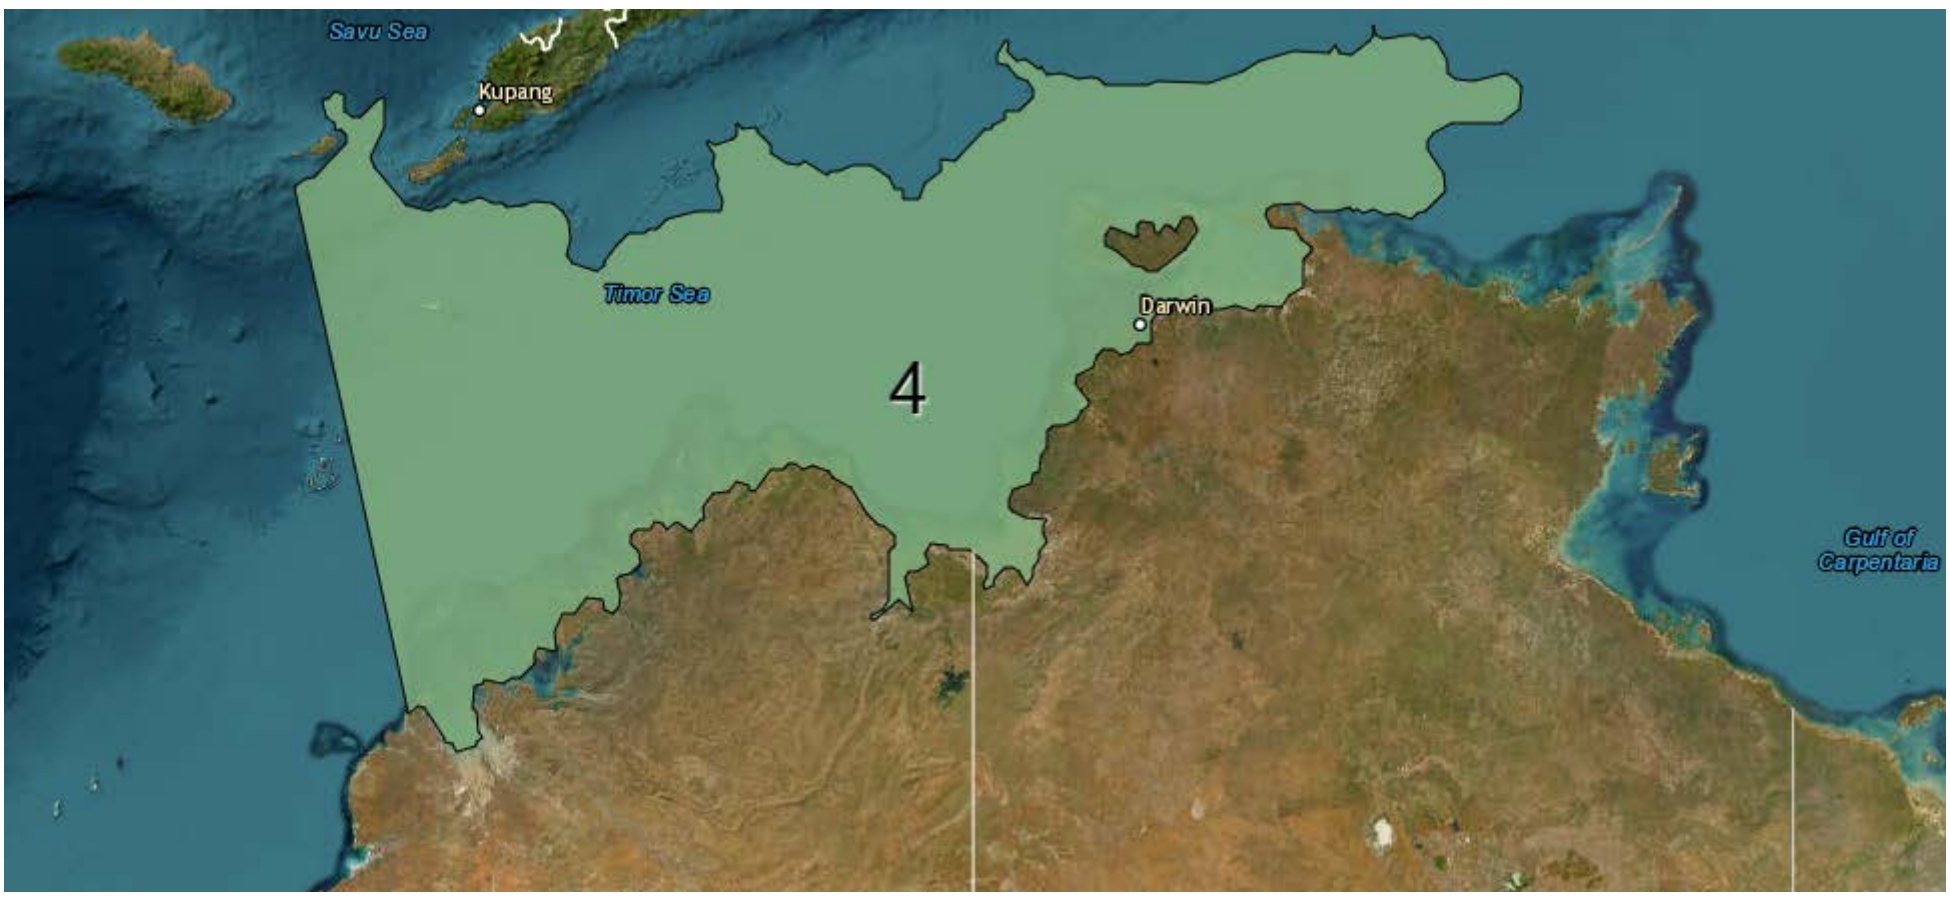
EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 05-Apr-2024

Socio-economic EMBA - eastern half



Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	2
Wetlands of International Importance (Ramsar	4
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	9
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	87
Listed Migratory Species:	85

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	89
Commonwealth Heritage Places:	10
Listed Marine Species:	141
Whales and Other Cetaceans:	27
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	1
Australian Marine Parks:	18
Habitat Critical to the Survival of Marine Turtles:	5

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	42
Regional Forest Agreements:	None
Nationally Important Wetlands:	17
EPBC Act Referrals:	232
Key Ecological Features (Marine):	10
Biologically Important Areas:	83
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties		[Resource Information]
Name	State	Legal Status
Kakadu National Park	NT	Declared property

National Heritage Places		[Resource Information]
Name	State	Legal Status
Natural		
Kakadu National Park	NT	Listed place
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands)	[Resource Information]
Ramsar Site Name	Proximity
Ashmore reef national nature reserve	Within Ramsar site
Cobourg peninsula	Within Ramsar site
Kakadu national park	Within Ramsar site
Ord river floodplain	Within Ramsar site

Commonwealth Marine Area	[Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Epthianura crocea tunneyi Alligator Rivers Yellow Chat, Yellow Chat (Alligator Rivers) [67089]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat known to occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat known to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii smithii Partridge Pigeon (eastern) [64441]	Vulnerable	Species or species habitat known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Endangered	Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Malurus coronatus coronatus Purple-crowned Fairy-wren (western) [64442]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Melanodryas cucullata melvillensis Tiwi Islands Hooded Robin, Hooded Robin (Tiwi Islands) [67092]	Critically Endangered	Species or species habitat known to occur within area
Mirafra javanica melvillensis Horsfield's Bushlark (Tiwi Islands) [81011]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat known to occur within area
Tyto novaehollandiae melvillensis Tiwi Masked Owl, Tiwi Islands Masked Owl [26049]	Endangered	Species or species habitat known to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
FISH		
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
FROG		
Uperoleia daviesae Howard River Toadlet, Davies's Toadlet [85375]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Antechinus bellus Fawn Antechinus [344]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Macrotis lagotis		
Greater Bilby [282]	Vulnerable	Species or species habitat likely to occur within area
Mesembriomys gouldii gouldii		
Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat known to occur within area
Mesembriomys gouldii melvillensis		
Black-footed Tree-rat (Melville Island) [87619]	Vulnerable	Species or species habitat known to occur within area
Petrogale concinna canescens		
Nabarlek (Top End) [87606]	Endangered	Species or species habitat likely to occur within area
Petrogale concinna concinna		
Nabarlek (Victoria River District) [87605]	Critically Endangered	Species or species habitat likely to occur within area
Petrogale concinna monastria		
Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Phascogale pirata		
Northern Brush-tailed Phascogale [82954]	Vulnerable	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis		
Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus		
Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Sminthopsis butleri		
Butler's Dunnart [302]	Vulnerable	Species or species habitat known to occur within area
Trichosurus vulpecula arnhemensis		
Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Atalaya brevialata [86125]	Critically Endangered	Species or species habitat known to occur within area
Burmannia championii listed as Burmannia sp. Bathurst Island (R.Fensham 1021) [93461]	Endangered (listed as Burmannia sp. Bathurst Island	Species or species habitat likely to occur within area
Elaeocarpus miegei [65147]	Endangered	Species or species habitat known to occur within area
Hoya australis subsp. oramicola a vine [55436]	Vulnerable	Species or species habitat known to occur within area
Mitrella tiwiensis a vine [82029]	Vulnerable	Species or species habitat likely to occur within area
Stylidium ensatum a triggerplant [86366]	Endangered	Species or species habitat known to occur within area
Tarennoidea wallichii [65173]	Endangered	Species or species habitat known to occur within area
Typhonium jonesii a herb [62412]	Endangered	Species or species habitat known to occur within area
Typhonium mirabile a herb [79227]	Endangered	Species or species habitat known to occur within area
Typhonium taylorii listed as Typhonium taylori [93459]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Xylopia monosperma a shrub [82030]	Endangered	Species or species habitat known to occur within area
REPTILE		
Acanthophis hawkei Plains Death Adder [83821]	Vulnerable	Species or species habitat known to occur within area
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Cryptoblepharus gurrmul Arafura Snake-eyed Skink [83106]	Endangered	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding known to occur within area
Lucasium occultum Yellow-snouted Gecko, Yellow-snouted Ground Gecko [82993]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Tiliqua scincoides intermedia		
Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat known to occur within area
Varanus mertensi		
Mertens' Water Monitor, Mertens's Water Monitor [1568]	Endangered	Species or species habitat known to occur within area
Varanus mitchelli		
Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Breeding known to occur within area
Glyphis glyphis		
Speartooth Shark [82453]	Critically Endangered	Species or species habitat known to occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area

Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area
Charadrius dubius Little Ringed Plover [896]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting known to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa incana Wandering Tattler [831]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous minutus Black Noddy [824]		Breeding known to occur within area
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius dubius Little Ringed Plover [896]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area overfly marine area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Roosting known to occur within area overfly marine area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa incana as Heteroscelus incanus Wandering Tattler [831]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area overfly marine area
Fish		
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Festucalex cinctus Girdled Pipefish [66214]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys parvicarinatus Short-keel Pipefish, Short-keeled Pipefish [66230]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Micrognathus micronotopterus](#) Tidepool Pipefish [66255]		Species or species habitat may occur within area
[Solegnathus hardwickii](#) Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
[Solegnathus lettiensis](#) Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
[Solenostomus cyanopterus](#) Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
[Syngnathoides biaculeatus](#) Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
[Trachyrhamphus bicoarctatus](#) Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
[Trachyrhamphus longirostris](#) Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
[Dugong dugon](#) Dugong [28]		Breeding known to occur within area
Reptile		
[Aipysurus apraefrontalis](#) Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus duboisii](#) Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
[Aipysurus foliosquama](#) Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus fuscus Dusky Sea Snake [1119]		Species or species habitat known to occur within area
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Emydocephalus annulatus Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis atriceps Black-headed Sea Snake [1101]		Species or species habitat may occur within area
Hydrophis coggeri Cogger's Sea Snake [25925]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis hardwickii as Lapemis hardwickii Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
Hydrophis inornatus Plain Sea Snake [1107]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis pacificus Pacific Sea Snake, Large-headed Sea Snake [1112]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Hydrophis zweiffei as Enhydrina schistosa Australian Beaked Sea Snake [93514]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Parahydrophis mertoni Arafura Smooth Sea Snake, Northern Mangrove Sea Snake [1090]		Species or species habitat may occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Migration route known to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Delphinus delphis](#) Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
[Feresa attenuata](#) Pygmy Killer Whale [61]		Species or species habitat may occur within area
[Globicephala macrorhynchus](#) Short-finned Pilot Whale [62]		Species or species habitat may occur within area
[Grampus griseus](#) Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
[Kogia breviceps](#) Pygmy Sperm Whale [57]		Species or species habitat may occur within area
[Kogia sima](#) Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
[Lagenodelphis hosei](#) Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
[Megaptera novaeangliae](#) Humpback Whale [38]		Breeding known to occur within area
[Mesoplodon densirostris](#) Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area

Current Scientific Name	Status	Type of Presence
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	North-west
Carbonate bank and terrace system of the Sahul Shelf	North-west
Carbonate bank and terrace system of the Van Diemen Rise	North
Continental Slope Demersal Fish Communities	North-west
Pinnacles of the Bonaparte Basin	North
Pinnacles of the Bonaparte Basin	North-west
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west
Shelf break and slope of the Arafura Shelf	North
Tributary Canyons of the Arafura Depression	North

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding likely	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur

Scientific Name	Behaviour	Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging likely	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding likely	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat	Known to occur

Scientific Name	Behaviour	Presence
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat - unknown behaviour	Likely to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Calving	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging likely	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Migration likely	Known to occur
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Likely to occur
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Mating	Likely to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Likely to occur
Dermochelys coriacea Leatherback Turtle [1768]	Internesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Likely to occur

Scientific Name	Behaviour	Presence
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Internesting	Likely to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Likely to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Juvenile	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur

Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia
-Department of Land and Resource Management, Northern Territory

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 05-Apr-2024

Socio-economic EMBA - western half

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	9
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	57
Listed Migratory Species:	78

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	2
Listed Marine Species:	130
Whales and Other Cetaceans:	32
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	11
Habitat Critical to the Survival of Marine Turtles:	4

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	5
Regional Forest Agreements:	None
Nationally Important Wetlands:	1
EPBC Act Referrals:	150
Key Ecological Features (Marine):	6
Biologically Important Areas:	38
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Natural		
The West Kimberley	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		

Scientific Name	Threatened Category	Presence Text
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat may occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Endangered	Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat may occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Species or species habitat known to occur within area
FISH		
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat may occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat may occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat may occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat likely to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Eretmochelys imbricata](#) Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
[Lepidochelys olivacea](#) Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
[Natator depressus](#) Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
[Tiliqua scincoides intermedia](#) Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat known to occur within area
[Varanus mertensi](#) Mertens' Water Monitor, Mertens's Water Monitor [1568]	Endangered	Species or species habitat may occur within area
[Varanus mitchelli](#) Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat may occur within area
SHARK		
[Carcharias taurus (west coast population)](#) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat likely to occur within area
[Carcharodon carcharias](#) White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
[Glyphis garricki](#) Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
[Pristis clavata](#) Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
[Pristis pristis](#) Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis as Balaena glacialis australis		
Southern Right Whale [40]	Endangered	Species or species habitat may occur within area
Isurus oxyrinchus		
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus		
Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Megaptera novaeangliae		
Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi		
Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris		
Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica		
Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat may occur within area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris alba Sanderling [875]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Calidris ruficollis Red-necked Stint [860]		Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chalcites osculans as Chrysococcyx osculans		
Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus		
Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat known to occur within area
Charadrius ruficapillus		
Red-capped Plover [881]		Species or species habitat known to occur within area overfly marine area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae		
Silver Gull [82326]		Breeding known to occur within area
Fregata andrewsi		
Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
Glareola maldivarum		
Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster		
White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius phaeopus Whimbrel [849]		Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Species or species habitat known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Species or species habitat known to occur within area overfly marine area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Species or species habitat known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Fish		
[Acentronura larsonae](#) Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
[Bhanotia fasciolata](#) Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
[Bulbonaricus brauni](#) Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
[Campichthys tricarinatus](#) Three-keel Pipefish [66192]		Species or species habitat may occur within area
[Choeroichthys brachysoma](#) Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
[Choeroichthys latispinosus](#) Muiron Island Pipefish [66196]		Species or species habitat may occur within area
[Choeroichthys suillus](#) Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
[Corythoichthys amplexus](#) Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
[Corythoichthys flavofasciatus](#) Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
[Corythoichthys intestinalis](#) Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
[Corythoichthys schultzi](#) Schultz's Pipefish [66205]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Phoxocampus belcheri](#) Black Rock Pipefish [66719]		Species or species habitat may occur within area
[Solegnathus hardwickii](#) Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
[Solegnathus lettiensis](#) Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
[Solenostomus cyanopterus](#) Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
[Syngnathoides biaculeatus](#) Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
[Trachyrhamphus bicoarctatus](#) Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
[Trachyrhamphus longirostris](#) Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
[Dugong dugon](#) Dugong [28]		Foraging, feeding or related behaviour likely to occur within area
Reptile		
[Aipysurus apraefrontalis](#) Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus duboisii](#) Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
[Aipysurus foliosquama](#) Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus fuscus Dusky Sea Snake [1119]		Species or species habitat known to occur within area
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Emydocephalus annulatus Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis coggeri Cogger's Sea Snake [25925]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis hardwickii as Lapemis hardwickii Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis platura as Pelamis platurus		
Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii		
Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata		
Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni		
Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks	[Resource Information]
Park Name	Zone & IUCN Categories
Kimberley	Habitat Protection Zone (IUCN IV)
Argo-Rowley Terrace	Multiple Use Zone (IUCN VI)
Argo-Rowley Terrace	Multiple Use Zone (IUCN VI)
Eighty Mile Beach	Multiple Use Zone (IUCN VI)
Kimberley	Multiple Use Zone (IUCN VI)
Montebello	Multiple Use Zone (IUCN VI)
Argo-Rowley Terrace	National Park Zone (IUCN II)
Christmas Island	National Park Zone (IUCN II)
Kimberley	National Park Zone (IUCN II)
Mermaid Reef	National Park Zone (IUCN II)
Argo-Rowley Terrace	Special Purpose Zone (Trawl) (IUCN VI)

Habitat Critical to the Survival of Marine Turtles		[Resource Information]
Scientific Name	Behaviour	Presence
Aug - Sep		
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur

Scientific Name	Behaviour	Presence
Dec - Jan		
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
May - Jul		
Lepidochelys olivacea Olive Ridley Turtle [1767]	Nesting	Known to occur
Nov - May		
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Continental Slope Demersal Fish Communities	North-west
Glomar Shoals	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]	Foraging likely	Known to occur
Sousa chinensis		
Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Tursiops aduncus		
Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging likely	Known to occur
Tursiops aduncus		
Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Migration likely	Known to occur
Dugong		
Dugong dugon		
Dugong [28]	Foraging	Likely to occur
Marine Turtles

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

11 Description of the Existing Environment of the Spill EMBA

In accordance with OPGGS(E) Regulation 21(2), the 'environment that may be affected' (EMBA) by the activity is described in this section, together with its values and sensitivities. While each hazard associated with the activity has its own unique EMBA, the largest one has been chosen for this chapter so as to describe all possible values and sensitivities, which is a surface release of crude oil from a loss of well control (LoWC). Spill modelling of this event used the NOPSEMA Bulletin #1 Oil Spill Modelling (NOPSEMA, 2019) hydrocarbon contact values of four oil phases (surface, dissolved, entrained and accumulated shoreline) that pose differing environmental risks to define the outer extent of the EMBA (see Table 5.1 in Section 5.1.2 of Chapter 5).

The low contact values used to inform the extent of the spill EMBA are useful for establishing scientific monitoring parameters and identifying potential socio-economic impacts (the socio-economic EMBA); however, they may not be at concentrations that are ecologically significant (NOPSEMA, 2019). Therefore, in addition to the socio-economic EMBA, an ecological EMBA has also been derived from the stochastic spill modelling using hydrocarbon thresholds that are identified by NOPSEMA Bulletin #1 (NOPSEMA, 2019) (see Table 5.1 in Section 5.1.2 of Chapter 5) as having the potential to cause impacts to ecological receptors. This is simply referred to as the 'spill EMBA' or interchangeably throughout this appendix as the 'EMBA' (Figure 11.1).

This spill EMBA has been established through hydrocarbon spill modelling (see Section 8.6 for MDO and Section 8.7 for crude oil). The EMBA is generated from stochastic modelling and therefore does not represent the possible outcome from a single spill scenario. The spill EMBA represents the compilation of possible outcomes and encompasses the area predicted to be affected from 100 simulations of the scenario per season (summer, winter, transition). Because of this, the spill EMBA is very large, covering areas that may not be affected by any single spill event.

The modelling also reports hydrocarbon contact for a given grid cell even if hydrocarbon concentrations reach this very low threshold for only one time step (2 hours) within the entire duration of the model run (6 hours for MDO and 77 days for crude oil). Because of this, the spill EMBA from a single spill event would be considerably smaller than the spill EMBA presented for the loss of MDO or a LoWC (which is an amalgamation of 100 simulations). Additionally, the spill EMBA does not consider mitigation measures that would be applied in the event of an MDO spill or LoWC, which would act the reduce the extent of the EMBA.

The 'environment' described in this EP is as per the definition in the OPGGS(E) regulations:

- Ecosystems and their constituent parts, including people and communities;
- Natural and physical resources;
- The qualities and characteristics of locations, places and areas;
- The heritage value of places; and
- The social, economic and cultural features of these matters.

The maps within this appendix contain the following note regarding the spill EMBA:

'The EMBA illustrated in this map represents the combined modelling results of 100 individual hydrocarbon spill simulations for each of three metocean seasons (summer, winter and transition), resulting in 300 spill simulations. Each individual spill simulates a loss of well control that releases 786,858 m^3 of crude oil over 77 days. Each spill simulation occurs is subject to various winds and ocean currents. The 300 individual spill simulations are then combined to identify the largest envelope in which a single spill could occur at any time. The EMBA is not representative of a single spill; an individual spill would affect a significantly smaller area. The modelled EMBA is based on the lowest reportable hydrocarbon thresholds.'

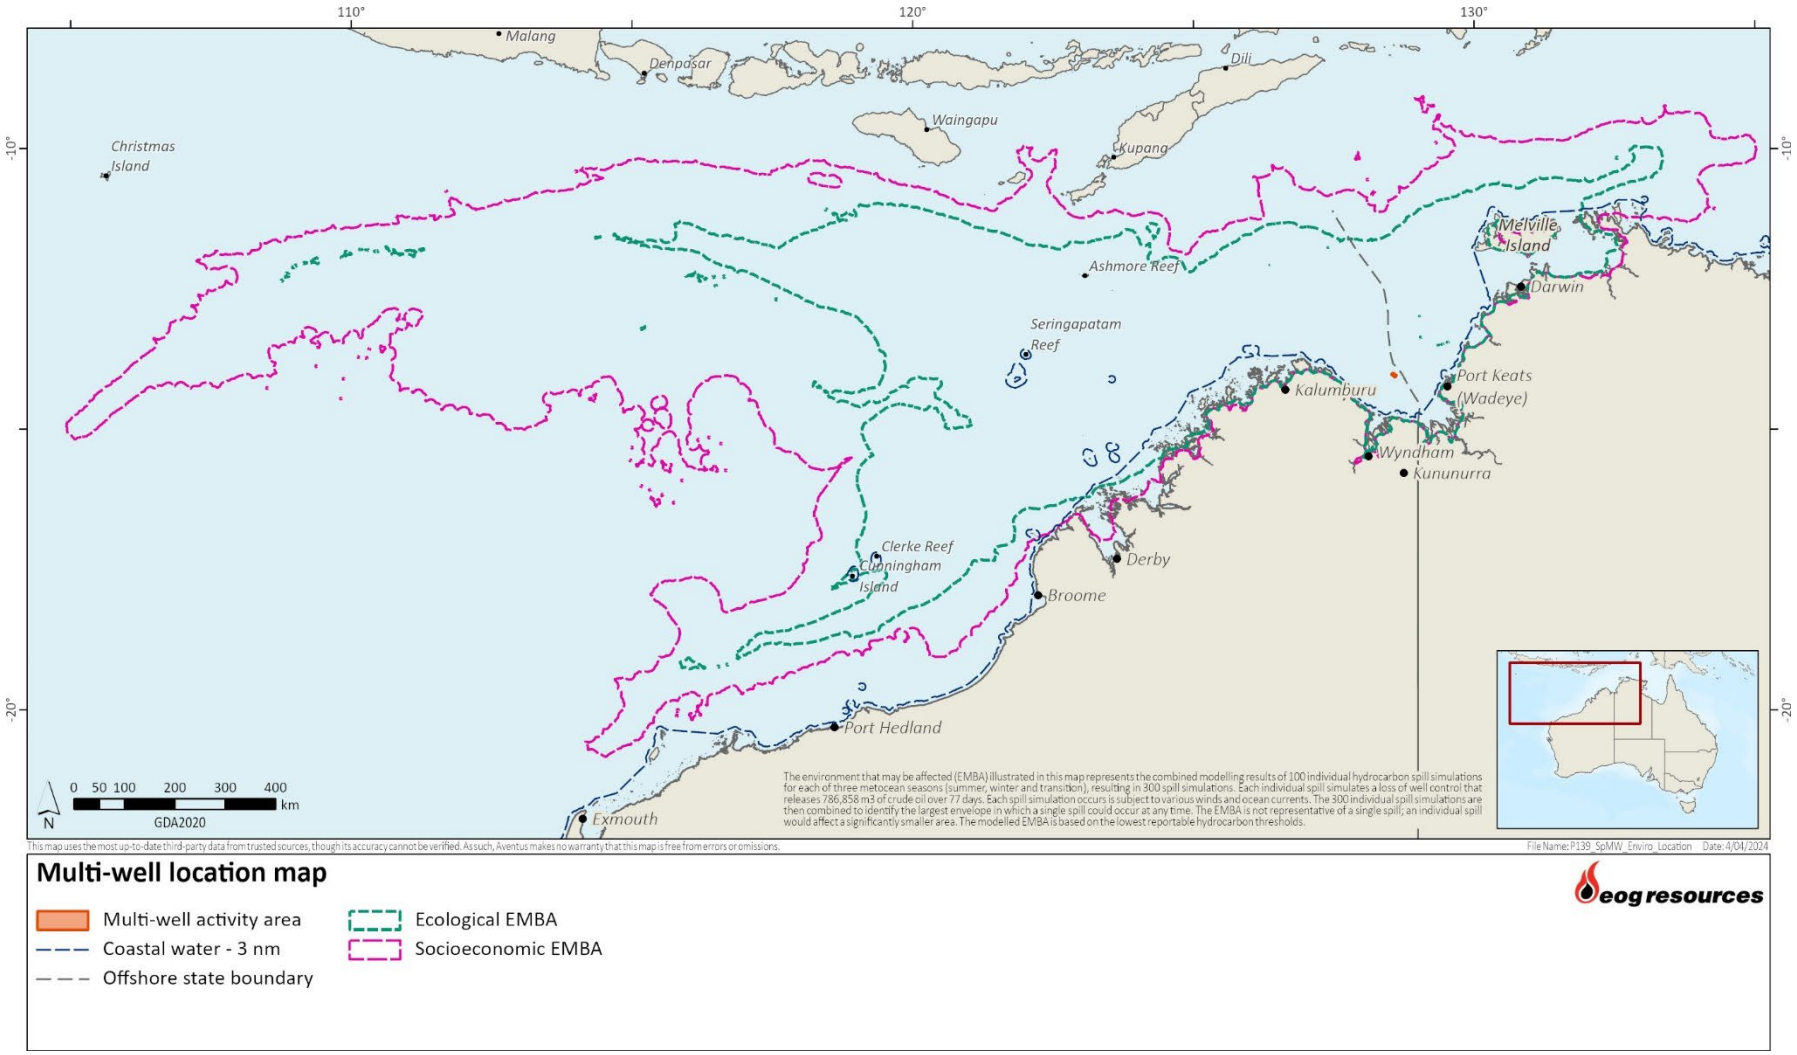

Figure 11.1 The LoWC spill EMBA

The key sources of information used in developing this chapter include the:

- EPBC Act Protected Matters Search Tool (PMST) database (DCCEEW, 2024a), conducted for the socio-economic and the ecological portion of the spill EMBA in on the 5th of April 2024 (**Appendix 10**);
    - The PMST search results of the socio-economic spill EMBA are split into 'east' and 'west' in **Appendix 10** because the PMST search does not allow for a search as large as the entire socio-economic spill EMBA.
    - The results of the PMST report have been screened against GIS data sets and current literature to remove any MNES identified in the PMST report that are outside the area of interest.
- Species Profile and Threats (SPRAT) Database (DCCEEW, 2024b);
- The Northwest Marine Bioregional Plan Bioregional Profile (DEWHA, 2008b);
- Marine bioregional plan for the North Marine Region (DSEWPC, 2012);
- National Conservation Values Atlas (NCVA) (DCCEEW, 2024c);
- Shoreline Ecological Assessments (Aerial & Ground Surveys) (PTTEP, 2009);
- Species recovery plans, conservation advice and scientific publications; and
- Seabed Habitats and Hazards of the JBG and Timor Sea, Northern Australia (Przeslawski *et al.,* 2011).

The relevant values and sensitivities considered in this chapter are inclusive of but not limited to the matters protected under Part 3 of the EPBC Act.

11.1 Regional Context

The spill EMBA occurs within both the NWMR and the NMR. The marine bioregional plans for the NWMR (DEWHA, 2008b) and NMR (DSEWPC, 2012) have been used in conjunction with other relevant management plans, reports, and published papers to inform the description of the existing environment.

11.1.1 Northwest Marine Region

The NWMR comprises Commonwealth waters from the Western Australia-Northern Territory (WA-NT) border to Kalbarri, south of Shark Bay, WA (DEWHA, 2008b).

The NWMR is characterised by the large area of continental shelf and continental slope, highly variable tidal regions and very high cyclone incidence (DEWHA, 2008b).

The NWMR is characterised by a wide continental shelf with water depths generally less than 70 metres, complex geomorphology with features including shelves, shoals, banks and terraces and valleys, currents driven largely by strong winds and tides and complex weather and a tropical monsoonal climate (DEWHA, 2008b).

11.1.2 North Marine Region

The NMR comprises Commonwealth waters from west Cape York Peninsula to the WA-NT border. The marine environment of the NMR is known for its high diversity of tropical species but relatively low endemism, in contrast to other bioregions. This region is highly influenced by tidal flows and less by ocean currents. The region is dominated by monsoonal climatic patterns characterised by a pronounced wet season and a generally dry season. Tropical cyclones are a dominant feature in the wet season (DEWHA 2008b).

11.1.3 Provincial Bioregions

Based on the Integrated Marine and Coastal Regionalisation of Australia (IMCRA) Version 4.0, the spill EMBA is situated within the Northern Shelf Province, Northwest Shelf Transition, Northwest Shelf Province, Timor Province and the Northwest Transition bioregions. The socio-economic EMBA intersects all the above bioregions as well as the Northwest Province, Christmas Island Province and the Timor Transition bioregions, which is illustrated in Figure 11.2**.**

Northwest Shelf Transition

The Northwest Shelf transition is a provincial bioregion situated within the NWMR and NMR extending from the Tiwi Islands in the NT to Cape Leveque in WA, covering an area of 305,463 km^2. The Indonesian Throughflow is the dominant oceanographic feature and dominates the majority of the water column. The strength of the Throughflow and its influence in the bioregion varies seasonally in association with the North-west Monsoon (DEWHA, 2008b).

The vast majority of the bioregion is located on the continental shelf with water depths generally in the range 10 to 100 m. The provincial bioregion has a complex seafloor topography with a diversity of features including submerged terraces, carbonate banks, pinnacles, reefs and sand banks. The carbonate banks and pinnacles of the Joseph Bonaparte Gulf are distinctly different in morphology and character to other parts of the region and are considered to support a high diversity of marine species (DEWHA, 2008b).

The biological communities of the North-west Shelf Transition are typical of Indo-west Pacific tropical flora and fauna and occur across a range of soft-bottom and harder substrate habitats. The inshore waters off the Kimberley are where the Western Australian population of humpback whales mate and

calve. The bioregion is important for commercial fisheries and supports both defence activities and the petroleum industry (DEWHA, 2008b).

Northwest Shelf Province

This provincial bioregion is located primarily on the continental shelf between Northwest Cape and Cape Bougainville. It varies in width from about 50 km at Exmouth Gulf to more than 250 km off Cape Leveque. Approximately half of the bioregion has water depths of only 50 to 100 m. The bioregion is a dynamic oceanographic environment, influenced by strong tides, cyclonic storms, long-period swells and internal tides. Its waters derive from the Indonesian Throughflow, are warm and oligotrophic, and circulate throughout the bioregion via branches of the South Equatorial and Eastern Gyral Currents (DEWHA, 2008b).

Fish communities are diverse and both benthic and pelagic fish communities appear to be closely associated with different depth ranges. Humpback whales migrate through the bioregion and Exmouth Gulf is an important resting area, particularly for mothers and calves on their southern migration. A number of important seabird breeding sites are located in the bioregion (but adjacent to Commonwealth waters), including Eighty Mile Beach, the Lacepede Islands (an Important Bird Area (IBA)), and Montebello and Barrow islands. The bioregion is important for the petroleum industry and the location of commercial fishing operations. The nationally significant ports of Dampier and Port Hedland operate in this bioregion (DEWHA, 2008b).

Northwest Transition

The Northwest Transition is a provincial bioregion located off the shelf between the Dampier Archipelago and Lacepede Islands covering a total area of 184 424 km2. The area includes shelf break and continental slope and the majority of the Argo Abyssal Plain included in the NWMR. Key topographic features include the Mermaid, Clerke and Imperieuse Reefs, all of which are marine reserves and together constitute the Rowley Shoals.

Surface circulation of Indonesian Throughflow waters occurs both via direct southward movement of the Throughflow itself, and recirculation of Throughflow waters via the South Equatorial Current. Cyclone incidence is high in this bioregion during summer months (DEWHA, 2008b).

Little is known about benthic biological communities in the deeper parts of the provincial bioregion, although high levels of species diversity and endemism have been identified among demersal fish communities on the continental slope. The Rowley Shoals are biodiversity hotspots in the bioregion and the steep change in slope around them attracts a range of pelagic migratory species including billfish, sharks, tuna and cetaceans. Commercial fishers operate within the bioregion and it may increase in importance for the petroleum industry in the future (DEWHA, 2008b).

Northwest Province

The Northwest Province is located on the continental shelf between Northwest Cape and Cape Bougainville, with half the bioregion located in water depths of 50 m to 100 m. It varies in width from approximately 50 km at Exmouth Gulf to more than 250 km off Cape Leveque in the Kimberley. The bioregion is a dynamic oceanographic environment, influenced by strong tides, cyclonic storms, long-period swells and internal tides. Waters derive from the Indonesian Throughflow, are warm and oligotrophic, and circulate throughout the bioregion via branches of the South Equatorial and Eastern Gyral Currents (DEWHA, 2008b).

Christmas Island Province

This provincial bioregion surrounds Christmas Island and covers a total area of 277,180 km^2. It contains the fourth largest abyssal plain/deep ocean floor area and smallest area of slope of all the bioregions (DEH, 2005). Water depths range from 0 m to 6,545 m and support a suite of marine species typical of

Indian Ocean tropical reefs. The recorded marine species diversity includes 88 coral species and over 600 fish species, including the whale shark and several other shark species, as well as hybrid fish. Green turtles and hawksbill turtles are found in offshore waters of the bioregion (DNP, 2014).

Northern Shelf Province

The Northern Shelf Province extends over the continental shelf from the eastern shore of Melville Island to West Cape York and is the largest of all the shelf provincial bioregions in the Region. It comprises the Gulf of Carpentaria in the east and the south-western Arafura Sea in the west, a covering a total area of 556,350 km^2. The provincial bioregion is characterised by relatively featureless sandy and muddy continental shelf and basin, turbid coastal waters, and submerged patch or barrier reefs around 30 m to 50 m water depth. Offshore features of the Arafura Shelf include canyons, terraces and the Arafura Sill (DEWHA, 2008b).

Of all the provincial bioregions of the Region, the Northern Shelf Province is the best sampled for demersal fish and invertebrates. Most data are associated with scientific studies and sampling of prawns and fish trawling. Localised upwellings offshore, around islands and offshore reefs, are also known to be hotspots for marine biodiversity in the provincial bioregion (DEWHA, 2008b).

Timor Province

This provincial bioregion covers almost 15% of the NWMR predominantly covering the continental slope and abyss between Broome and Cape Bougainville in WA. Water depth ranges from about 200 m near the shelf break to 5,920 m over the Argo Abyssal Plain. In addition to the Argo Abyssal Plain, the major geomorphic features are the Scott Plateau, the Ashmore Terrace, part of the Rowley Terrace and the Bowers Canyon. Important features of the bioregion include Ashmore Reef, Cartier Island, Seringapatam Reef and Scott Reef (DEWHA, 2008b).

The bioregion is dominated by warm, oligotrophic waters of the Indonesian Throughflow. In this bioregion the thermocline in the water column is pronounced and associated with the generation of internal tides. The variety of geomorphic features in the Timor Province, coupled with the variation in bathymetry, results in several distinct habitats and biological communities. The reefs and islands of the bioregion are regarded as particular hotspots for biodiversity. A high level of endemicity exists in demersal fish communities of the continental slope in the Timor Province and two distinct communities have been identified associated with the upper slope and mid slope (DEWHA, 2008b).

The bioregion supports commercial fisheries, and the petroleum industry (DEWHA, 2008b).

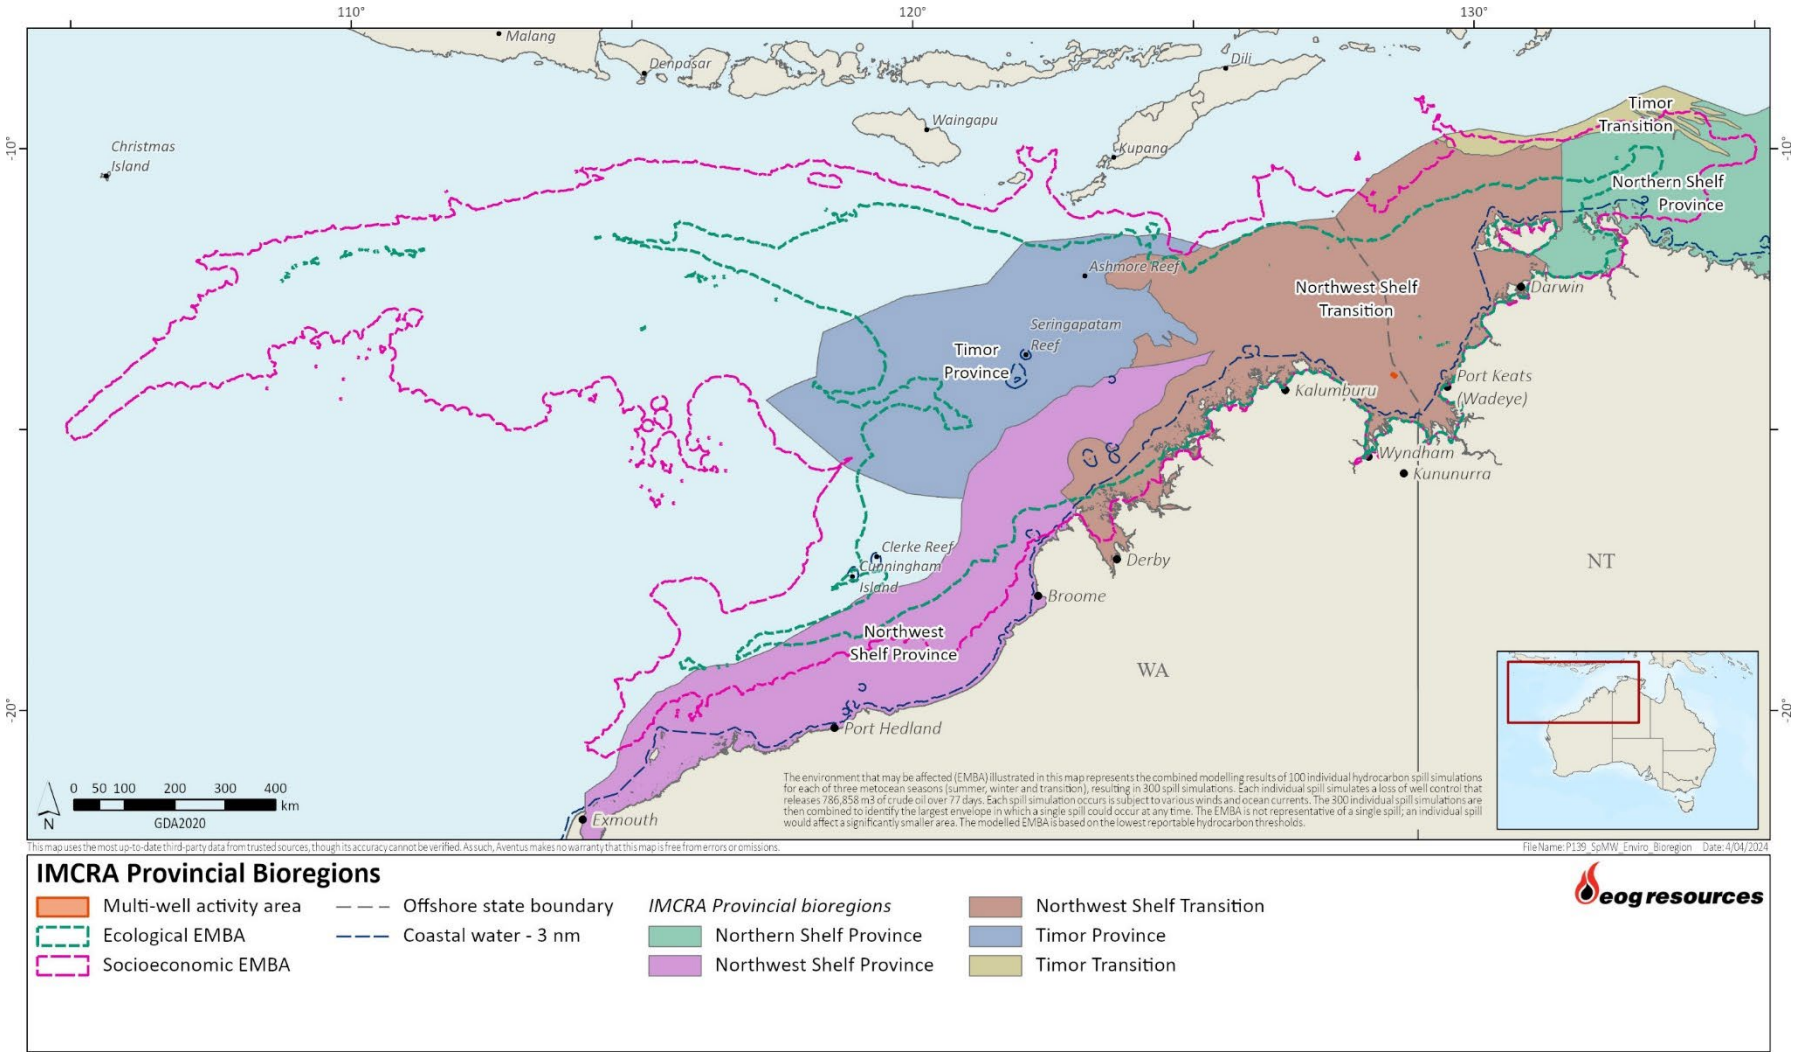

Figure 11.2 Provincial bioregions intersected by the spill EMBA

11.1.4 Mesoscale Bioregions

The following mesoscale bioregions are intersected by the spill EMBA and are presented in Figure 11.3:

- Anson Beagle;
- Arafura;
- Bonaparte Gulf;
- Cambridge-Bonaparte;
- Canning;
- Cobourg;
- Kimberley;
- King Sound;
- NorthWest Shelf;
- Oceanic Shoals;
- Tiwi; and
- Van Diemen's Gulf.

The socio-economic spill EMBA intersects all the above listed mesoscale bioregions, as well as Pilbara (offshore).

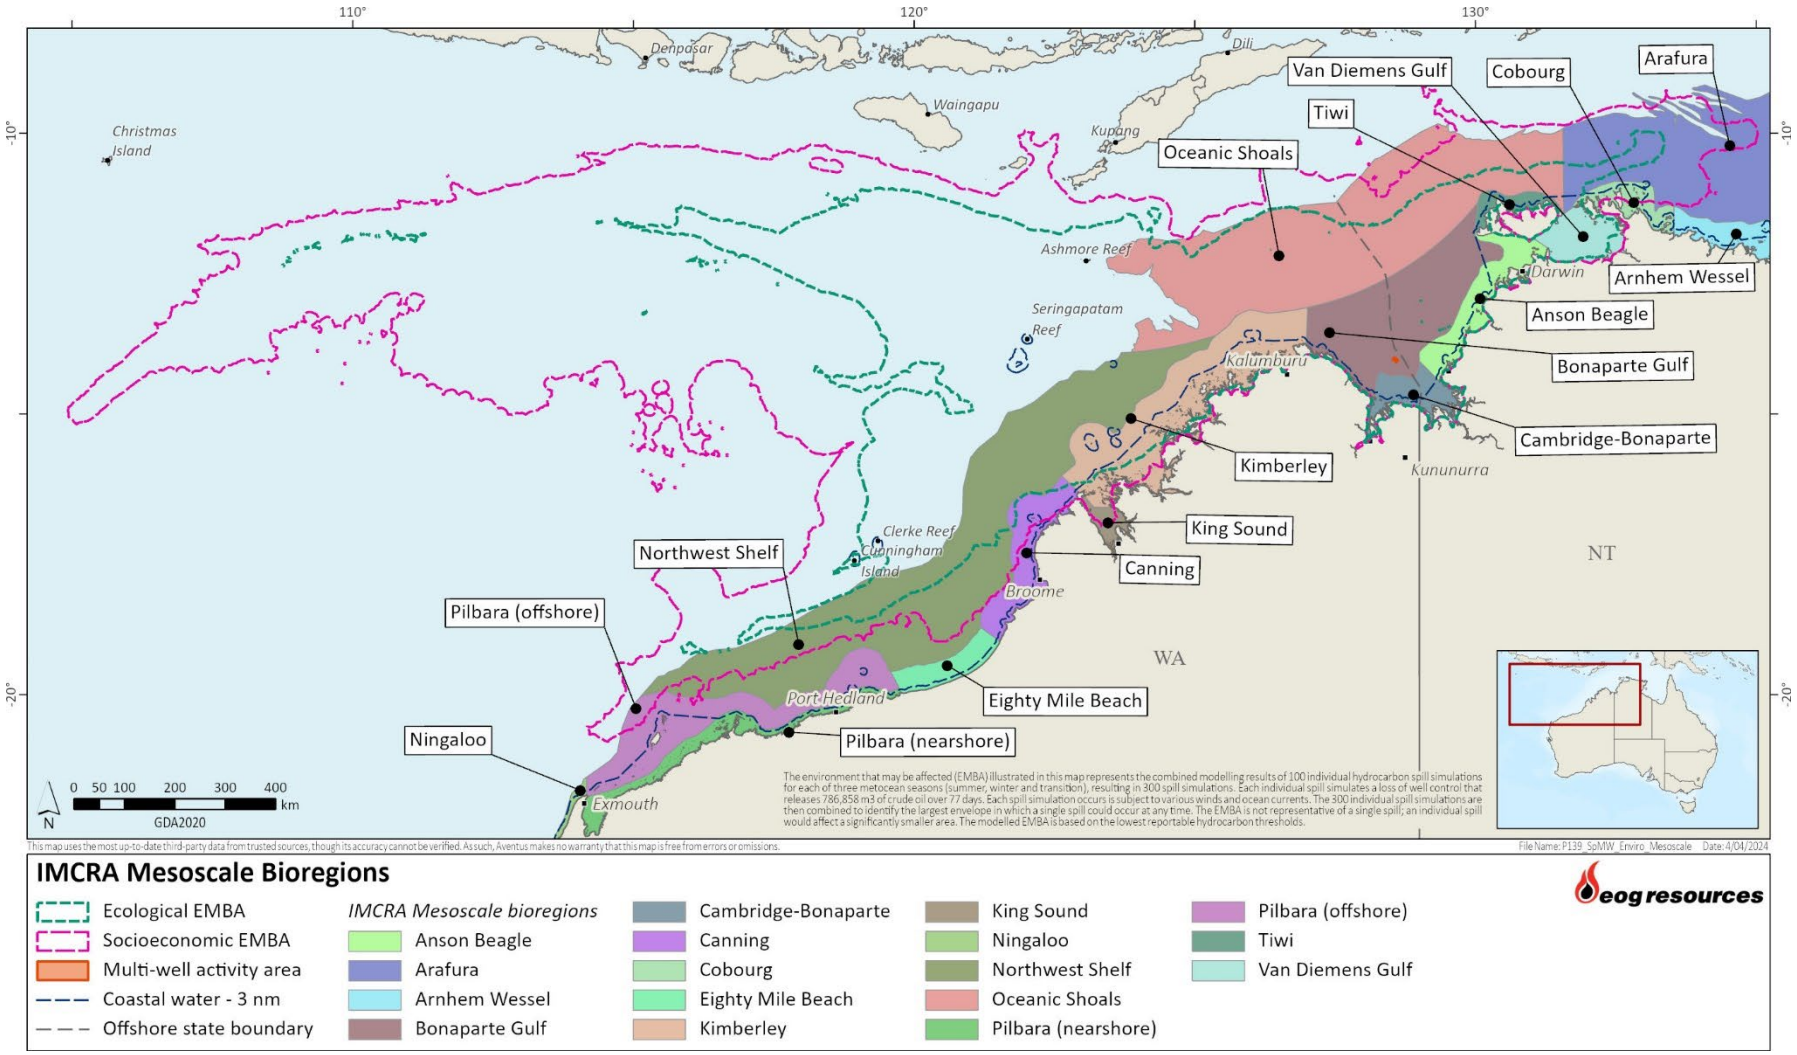

Figure 11.3 Mesoscale bioregions intersected by the spill EMBA

11.1.5 Climate

The northwest of Australia has a tropical climate with hot and humid summers and warm winters. There are two distinct seasons known as the northwest monsoon, which occurs from late October to mid-March ('wet season'); and the southeast monsoon, which occurs from May to mid-October ('dry season').

Air Temperature

Mean air temperatures range from a minimum of 11°C in winter to a maximum of 36°C in summer (Condie *et al.,* 2006). During summer, hot and dry wind from the north-east, which comes from the desert, can become really intense, with air temperatures reaching above 40°C.

Rainfall

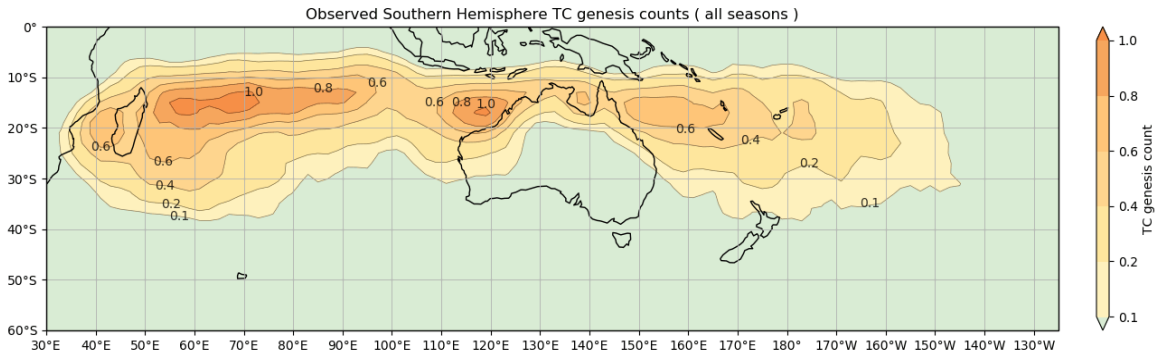
Regular and high rainfall is a characteristic of the northwest monsoon, mainly over coastal areas and during tropical cyclones. This is caused by large amounts of moisture being gathered as the monsoon crosses the sea from the Asian high-pressure belt on its way to the intertropical convergence zone, which drifts southward close to, or over, northern Australia. On the contrary, the southeast monsoon originates from the southern hemisphere high-pressure belt and is relatively dry and cool (DSEWPC, 2012). Low rainfall and humidity are associated with the southeast monsoon.

Historical rainfall data in the region shows the highest mean monthly rainfall occurs from January to March (BoM, 2024b).

Cyclones

Cyclones are common in the region resulting in severe storms with gale force winds and a rapid rise in water levels. The cyclone season typically occurs between November and April (BoM, 2024c). Cyclones result in severe storms with gale force winds and a rapid rise in water levels. Cyclones in the Australian region are influenced by several factors, and in particular variations in the El Niño –Southern Oscillation, generally more tropical cyclones occur across the coast during La Niña years than during El Niño years. On average about eleven cyclones form in the Australian region (90-160° E) each cyclone season (BoM, 2024c).

The average number of tropical cyclones through the Australian region and surrounding waters in El Niño, La Niña, neutral years and using all years of data is presented in Figure 11.4. The data is based on a 48-year period from the 1969/70 to 2017/18 tropical cyclone season.



Source: BoM (2022)

Figure 11.4 Average number of tropical cyclones in Australia from 1969 to 2018

Wind

Winds typically vary seasonally, with a tendency for south-westerly winds during September–March and south-easterly from May–July (Condie *et al.,* 2006). Transitional wind periods, during which either pattern may predominate, can be experienced in April–May and September of each year. September–March winds are more variable and are driven by high pressure cells that pass from west to east over the Australian continent. During May–July the relative position of the high-pressure cells moves further north, leading to prevailing easterly winds blowing from the mainland (Pearce *et al.,* 2003).

Seasonally averaged winds in the NWMR at 10 m above sea level during January, March, May, July, September and November are presented in Figure 11.5.

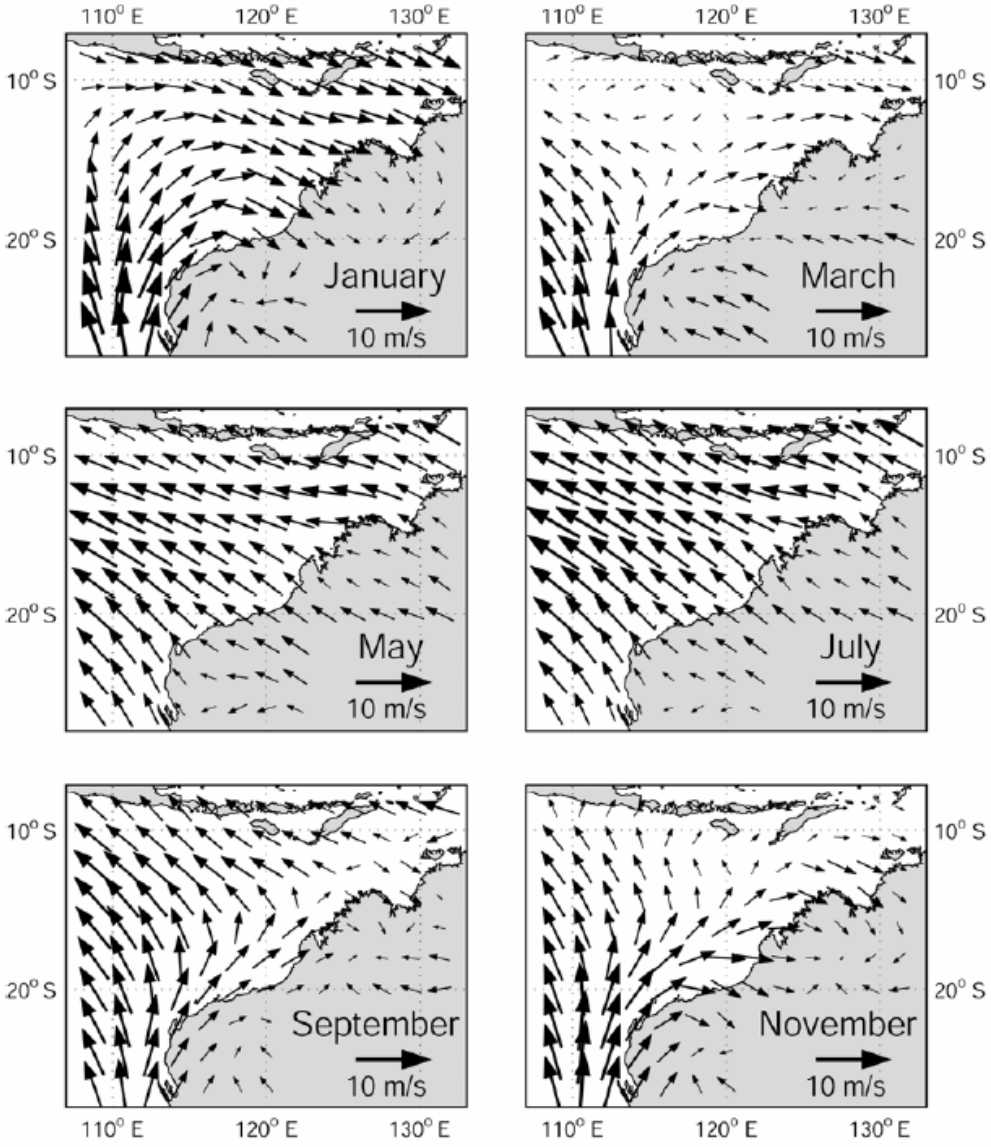


Figure 11.5 Seasonally averaged winds in the Northwest Marine Region

11.1.6 Oceanography

The oceanography of the spill EMBA is described within this section.

Currents

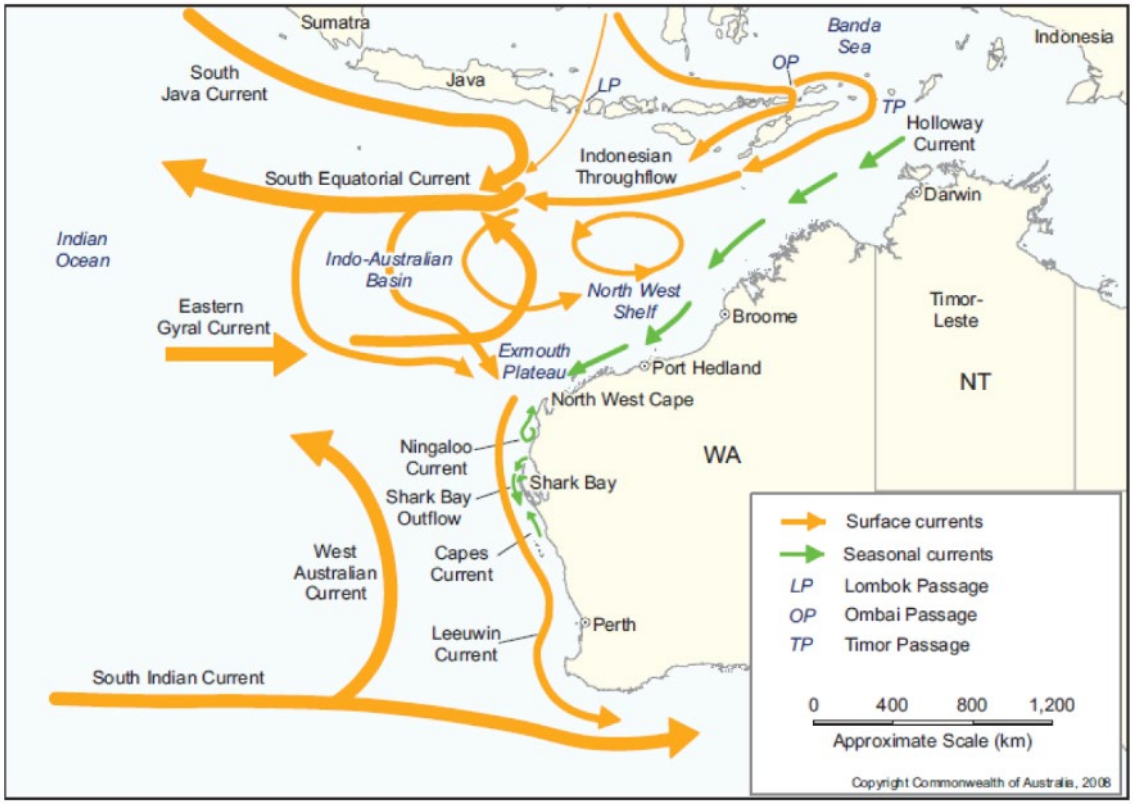
Broad-scale ocean circulation of the North Australian Shelf is dominated by the Indonesian Throughflow current system. The NWMR is influenced by a complex system of ocean currents that vary between seasons and years, which generally result in warm, nutrient-poor and low salinity surface waters (DEWHA, 2008b). Two ocean and coastal surface currents in the WA region are significant in shaping marine environmental conditions and climate. Forming on the NWS, the Leeuwin Current exerts a major influence on the distribution of marine life and WA's weather. The Indonesian Throughflow is a system of currents that carries water westward from the Pacific to the Indian Ocean through the deep passages and straits of the Indonesian Archipelago where warm, equatorial waters flow from one ocean to another, that influence the character of the Leeuwin Current (CSIRO, 2022).

During the wet season (December to March), monsoon winds push some of the waters of the Indonesian Throughflow eastwards, extending as far as the Gulf of Carpentaria. At the end of the Northwest monsoon (March-April), the pressure gradient is released, which releases a south-westerly flow of water across the shelf during autumn and winter, known as the Holloway Current (DEWHA, 2008b).

Currents in the NMR are driven largely by strong winds and tides, with only minor influences from oceanographic currents such as the Indonesian Throughflow and the South Equatorial Current. The net tidal flows that occur over time drive longer-term transport patterns through the region. The movement of tidal waters across the northern Australian marine environment is complex due to the barrier of islands and submerged reefs in the Torres Strait that hinder tidal energy entering from the Coral Sea (DSEWPC, 2012).

Surface currents that have some minor influence in the NMR include the Indonesian Throughflow and the South Equatorial Current. The Indonesian Throughflow brings warm water of lower salinity from the tropical western Pacific Ocean between the Indonesian islands to the Indo-Australian basin in the north-west of the region. The influence of the South Equatorial Current in the region is marginal, although the strength of its influence varies with the season (DSEWPC, 2012).

Figure 11.6 illustrates the major ocean currents in north-western Australian waters.



Source: DEWHA, 2008b

Figure 11.6 Ocean currents along the Northwest Australian continental shelf

Tides

The tides of the region are mixed and predominantly semi-diurnal (two high tides and two low tides per day), with well-developed spring to neap tidal variation (DEWHA, 2008b). The Kimberley region within the NWMR has some of the largest tides in Australia, along a coastline adjoining an open ocean. Tides increase in amplitude from with an increase in amplitude from south to north, which corresponds with the increasing width of the shelf (Holloway, 1983).

Tides and winds strongly influence water flow in the coastal zone and over the inner to mid-shelf, whereas flows over the outer-shelf, slope, rise and deeper waters are influenced by large scale regional circulation (DEWHA, 2008b).

Tides are semi-diurnal (two high tides and two low tides each day) and generally quite large; up to 10 m during spring tide and less than 3 m in the neap tides for the Kimberley region (DEWHA, 2008b). Water flows in the deeper waters are influenced more by large scale regional water circulation than tides and winds that influence the coastal regions. Tides contribute to the vertical mixing of surface water layers and sediments, but this is more evident in shallow waters than deep waters (DEWHA, 2008b).

The JBG is subject to semi-diurnal tides with two high and low tides per day, and has the largest tidal energy observed anywhere in the world (>7 m) (Rothlisberg *et al.,* 2005). Within the Bonaparte Gulf (situated in the Northwest Shelf Transition provincial bioregion), tides range from 2-3 m offshore (microtidal) rising to 3-4 m inshore (mesotidal).

Waves

In the JBG, the Southern Ocean swell is higher in winter than in summer as a result of northerly migration of swell-generating storms. The wave period and significant wave height generated by this swell is highly dependent on the exact location within the basin. For example, the JBG is protected from the Southern Ocean swell; therefore, swells affecting the area are limited to those generated by cyclones or prolonged storm winds (Maxwell *et al.,* 2004). The region is considered a moderate-energy environment except when influenced by tropical cyclones which generate short-term but major fluctuations in sea levels. Swells generated may have periods of 6-18 seconds and wave heights of 0.5-9 m and are dependent on the size, intensity, speed and relative location of the cyclone.

One of the most unique features of the NWMR is the occurrence of internal waves. Internal waves are dynamic, episodic events, which are strongly influenced by topography and generated by internal tides (DEWHA, 2008b). Internal tides occur at the thermocline, where the warm, low salinity waters of the Indonesian Throughflow overlay colder, more saline, deeper ocean waters. Internal tides are large in scale, frequently occurring across an ocean basin and forced by the gravitational pull of the moon and sun. An internal tide can rise and fall at a different rate to the surface tide but are typically occur semi-diurnal (twice daily) (Holloway *et al.,* 1997) and may travel either towards the shore, or away from the shore across the shelf and out into deeper water (DEWHA, 2008b).

Water Quality

The Indonesian Throughflow brings in oligotrophic waters (low in nutrients) from the western Pacific Ocean through to the Indian Ocean (DEWHA, 2008b). Exceptions in the region occur in the event of local or regional upwelling activity at the shelf break, where deeper, cooler nutrient-rich water is brought to the surface (DEWHA, 2008b). These upwelling activities include, but are not limited to, internal wave and tide regimes, horizontal shear due to strong tidal currents and tropical cyclones. However, understanding of the nature and spatial distribution of biological productivity in the region is limited (DEWHA, 2008b).

Major inputs of fine silt sediments from the Ord, Victoria and Keep River systems occur during the wet season, creating vast areas of high turbidity, particularly in the southern part of the Gulf. The sediments are deposited to form sand bars and mud flats which are themselves the source of high turbidity throughout the year as sediments are resuspended by tidal movements. Though there is only limited marine and nearshore water quality data available, as there are no major developments or population centres near the multi-well location, the potential for existing pollution is limited.

A study conducted by Holloway et al in 1985 into the mechanisms of nitrogen supply in the NWS indicated the NWMR is an oligotrophic (low in nutrients) environment. Nutrient enrichment of the shelf occurs through river runoff, tidal mixing, internal tides, low frequency circulation, upwelling, and tropical cyclones that induce oceanic mixing and further upwelling (Holloway *et al.,* 1985).

Ambient Ocean Sound

Physical and biological processes contribute to natural background sound. Physical processes include that of wind, waves, rain and earthquakes, whilst biological noise sources include vocalisations of marine mammals and other marine species.

Wind is a major contributor to noise between 100 Hz and 30 kHz and can reach 85-95 dB re 1µPa^2/Hz under extreme conditions (WDCS, 2004). Rain may produce short periods of high underwater sound with a flat frequency spectra to levels of 80 dB re 1µPa^2/Hz and magnitude 4 earthquakes have been reported to have spectral levels reaching 119 dB re 1µPa^2/Hz at frequency ranges of 5-15 Hz.

Turnpenny and Nedwell (1994) found that in sensitive species such as the cod, continuous ambient sound alone resulted in auditory masking, and that sound had to be 20 dB above ambient sound to be audible. A comparison of biological and anthropological sounds in the marine environment is provided in Table 5.5 of Section 5.2.2 of Chapter 5.

11.1.7 Physical Environment

The physical environment of the spill EMBA is described in this section.

Bathymetry

Water depths in the NWMR range from 0 to 5,980 m. The NWMR is relatively shallow, with greater than 40% of the total area in water depths of less than 200 m and greater than 50% in depths of less than 500 m (Baker *et al.,* 2008). Water depths in the spill EMBA range from 6,000 m (offshore) to <10 m (inshore).

Bathymetry in parts of the south of the JBG is strongly influenced by the strong tidal movement and channels of the Ord, Keep, Victoria and Fitzmaurice rivers. A series of extensive sandbars, known as the King Shoals and Medusa Banks, have been generated in the southwest by the strong outflows of sediment-laden water from the Cambridge Gulf. Similar sandbars can be found in the southeast of the JBG. Bathymetry of the spill EMBA is presented in Figure 11.7.

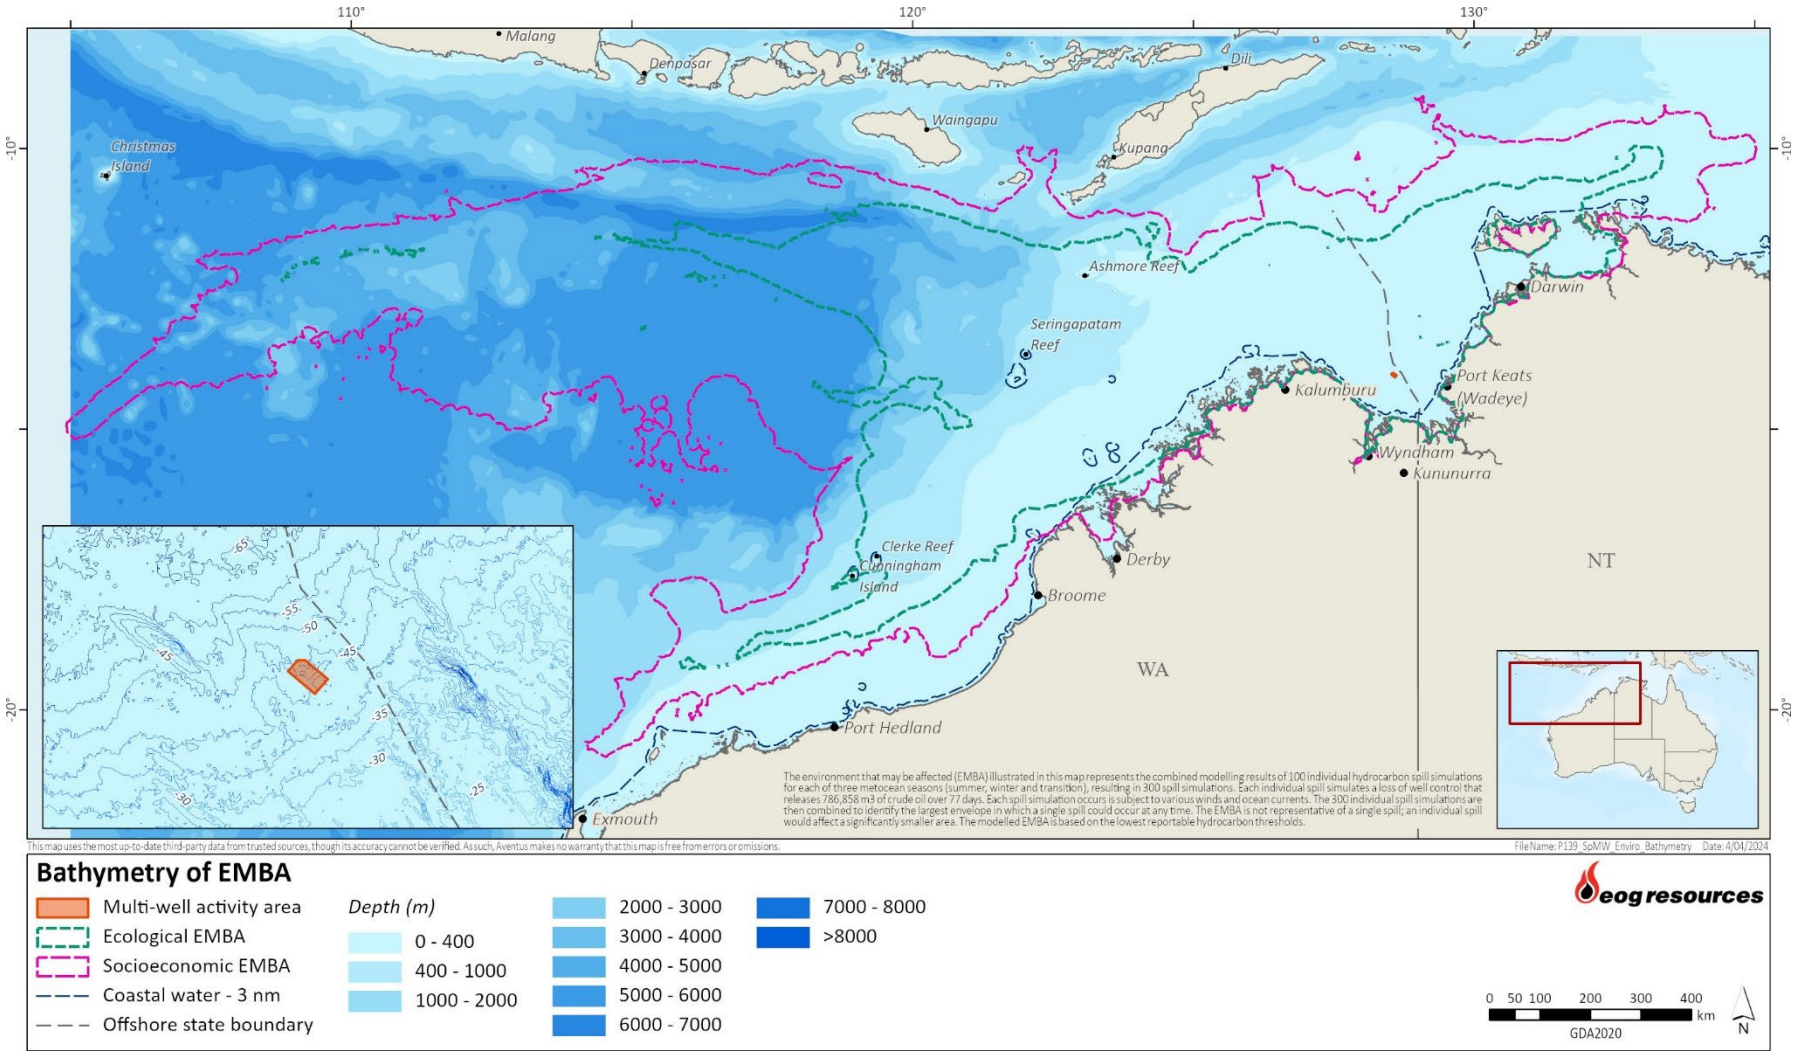


Figure 11.7 Bathymetry of the spill EMBA

Geomorphology

The seafloor of the NWMR comprises an extensive area of continental shelf, slope, rise and abyssal plain/deep ocean floor. Most of the region consists of continental slope (61%) or continental shelf (28%) and a range of features such as canyons, plateau, terraces, ridges, reefs, banks and shoals. Over half of the total area of banks and shoals in Australian marine jurisdiction occurs in the NWMR, including 39% of terraces and 56% of deeps, holes and valleys (DSEWPC, 2012).

Sediment texture and composition displays a zoning with depth, and sand and gravel dominatethe shelf area whilst mud dominates the lower slope and abyssal plain/deep ocean floor.

Calcium carbonate concentrations throughout the region are generally highest along the shelf to the shelf edge and are associated with reefs (Baker *et al.,* 2008).

Ten key geomorphic features have been identified in the JBG (Przeslawski *et al.,* 2011). The inner gulf comprises mostly shelf with sand banks and valleys. The outer gulf and Timor Sea mostly comprise of basin with banks/shoals, terraces and pinnacles separated by deep hole/valley features and escarpment.

The benthic environment of the JBG is linked to its geomorphic features, with the majority of the area characterised by infaunal plains, with some localised reefs and outcrops supporting sponge gardens. Seabed morphology in parts of the JBG is influenced by the strong tidal movement and channels of the Ord, Keep, Victoria and Fitzmaurice rivers. A series of extensive sandbars, known as the King Shoals and Medusa Banks (approximately 70 km and 65 km south respectively of the multi-well location), have been generated by the strong outflows of sediment-laden water from Cambridge Gulf. Similar sandbars can be found in the south-east of the JBG. The multi-well location is located entirely within the ‘shelf’ geomorphic feature, which is typically characterised by extensive sediment plains and high sediment deposition from the coastal rivers to the south (Figure 11.8).

The NMR seafloor comprises a wide continental shelf with water depths generally less than 70 m although water depths range from approximately 10 m to a maximum known depth of 357 m (DSEWPC, 2012). It contains the Van Diemen Rise, characterised by complex geomorphology with features including shelves, shoals, banks, terraces and valleys like the Malita Shelf Valley, which provides a significant connection between the Joseph Bonaparte Gulf and the Timor Trough. In addition, numerous limestone pinnacles up to tens of kilometres in length and width, lie within the Bonaparte Basin (DSEWPC, 2012).

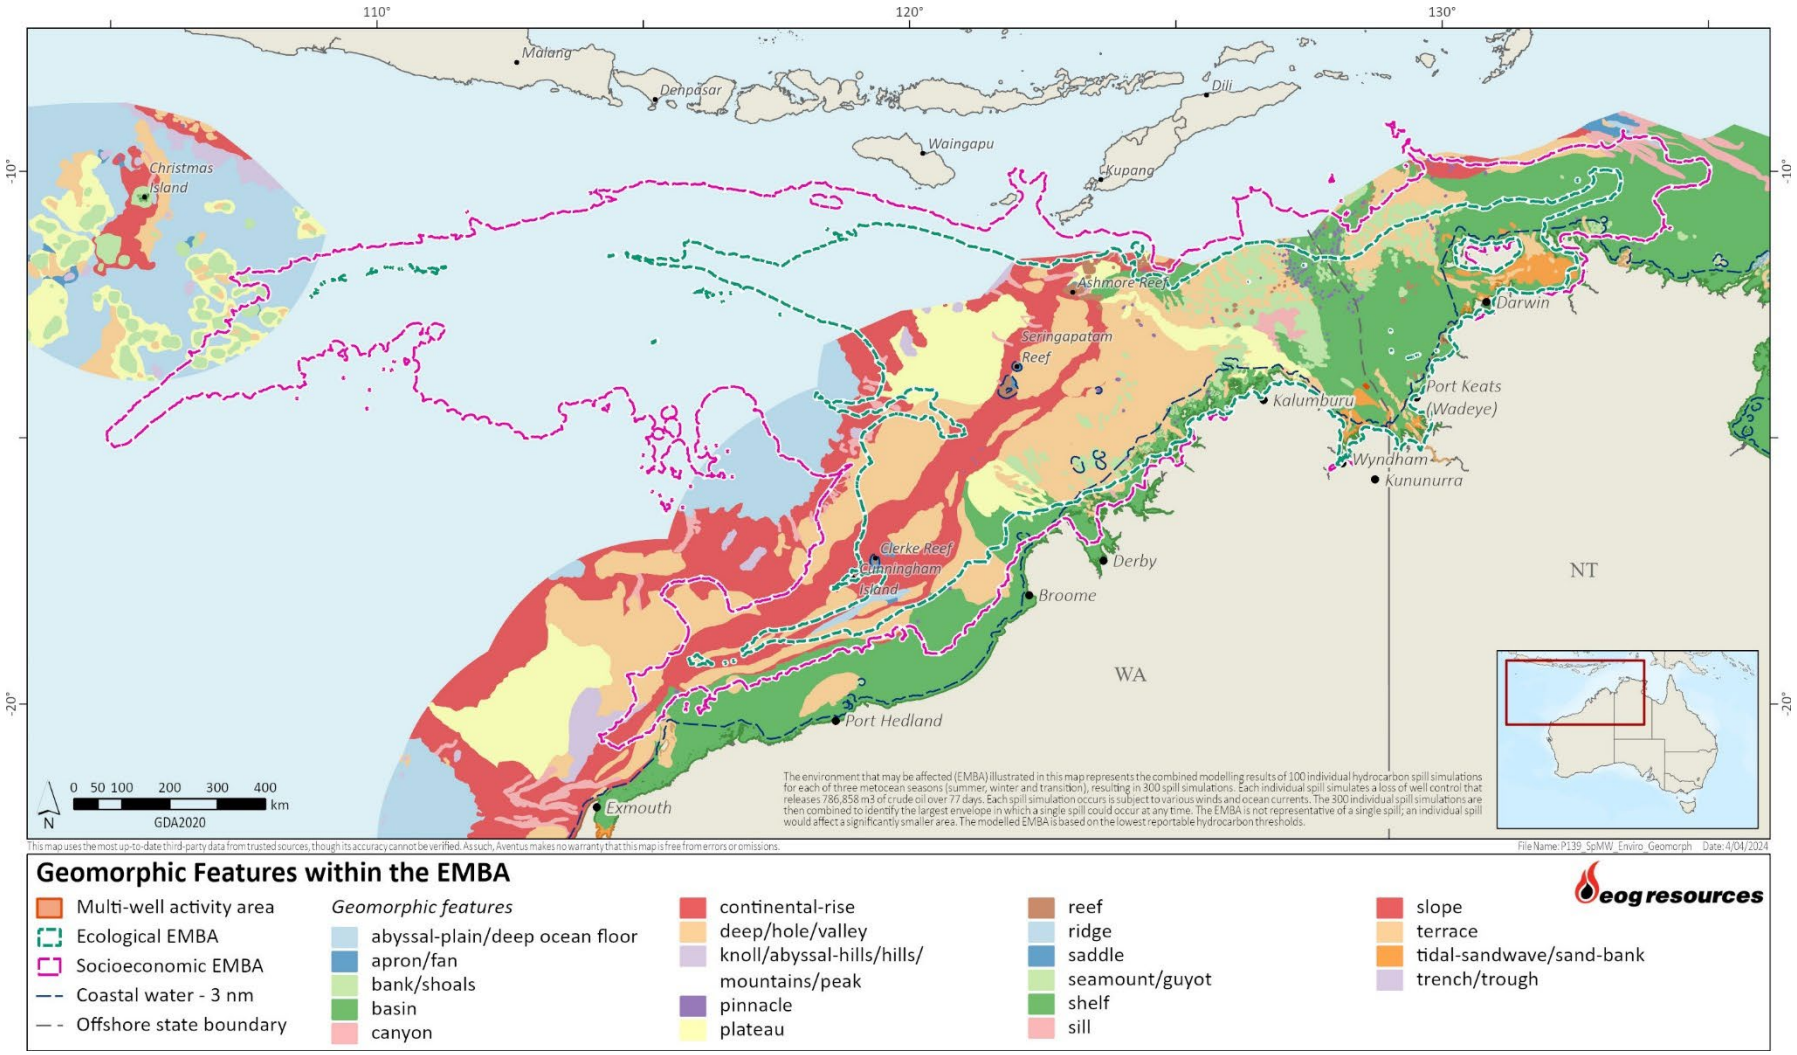

Figure 11.8 Geomorphic features of the spill EMBA

Sedimentology

The sedimentology of the NWMR is varied due to the diversity of physical features from coral reefs to major canyons that act as conduits for sediment and nutrient transport (DSEWPC, 2012). The region is made up of a tropical carbonate shelf dominated by sand and gravel to 15° latitude, while the outer shelf/ slope zone is dominated by mud (Baker *et al.,* 2008). It has a relatively homogenous rise and abyssal plain/ deep ocean floor that is dominated by non-carbonate mud because it occurs below the carbonate compensation depth (Baker *et al.,* 2008).

Major contributors to sediment mobilisation in the NWMR include storm events, tropical cyclones; internal tides; and ocean currents, including the Leeuwin current (Baker *et al.,* 2008). Sediments of the middle shelf region are predominantly influenced by tidal processes, including internal tides (Baker *et al.,* 2008).

Sedimentology in the NMR is also varied, with physical features including shallow canyons, which mainly consist of calcium carbonate, based sediments, as well as limestone pinnacles and reefs (DEWHA, 2008b).

The continental shelf in the JBG is the widest in Australia, extending up to 400 km from the shore. The sedimentology of the JBG is unique, with most of the inner shelf being characterised by relatively flat expanses of soft sediment seabed with localised rocky outcrops, gravel deposits and sands banks. The soft sediments in the region typically consist of sandy and muddy substrate, occasionally made up of patches of coarser sediments (Baker *et al*., 2008). The inner shelf section of the JBG receives significant loads of sediments from several large rivers including the Daly and Victoria rivers (Przeslawski *et al*., 2011).

The distribution of seabed sediments in the JBG, and in particular within the Sahul Shelf, reflects the present-day oceanographic condition and displays a distinct seaward fining pattern (Lees 1992, in Baker *et al*., 2008). Sediment sampling undertaken by ERM) in 2010 and 2011 (within WA-6-R and NT/RL1, more than 100 km north of the multi-well location location) confirms that the area is mainly dominated by sand, with similar proportions of smaller gravel, silt and clay (ERM, 2011).The top layer of sediment in the JBG from ~3 km to 35 km offshore is expected to be greater than 1 m in depth and consists of sand and gravel with variable proportions of clay. This material is primarily alluvium, derived from sedimentary sandstones and basal conglomerate. Sonar images indicate some minor paleochannels in this area containing mega-ripple or sand waves. These sediments are generally unconsolidated coarse sand, fine gravel interspersed with areas of flat and featureless seabed containing very soft to firm gravelly clays (Woodside, 2004).

The main drainage channels for the Victoria River System occur from approximately 35 km to 58 km offshore. This area is dynamic as currents and tidal influence are constantly changing the seabed features in the area. Due to the dynamic nature of the channels, the thickness of the top layer of sediment is expected to be variable. A top layer greater than one metre in depth and consisting of sands and gravels with variable proportions of clay is expected from 59 km to 65 km offshore, with some minor paleochannels occurring. The influence of alluvial inputs diminishes from around 60 km offshore to the Blacktip Wellhead Platform (WHP), which is located approximately 20 km northwest of the multi-well location. This top layer increases to greater than two metres in depth from 66 km offshore and the sediments range from loose silty/clayey sands from 66 km to 75 km and very soft clayey silt and silty clay from 75 km offshore to the Blacktip WHP location (Woodside, 2004). Again, the seabed alternates between flat and featureless seabed containing very soft to firm silty clay and an area of hummocky seabed containing mega-ripple or sand waves, though the seabed is generally flat to gently sloping from about 66 km offshore to the Blacktip WHP location (Woodside, 2004).

11.2 Coastal Environments

The physical coastal environment described in this section is defined by the potential extent of dispersion of low threshold entrained hydrocarbons predicted under the LoWC spill scenario (i.e., the socio-economic EMBA), as illustrated in Figure 11.1.

Shoreline habitats are defined as those habitats that are adjacent to the water along the mainland and islands that occur above the Lowest Astronomical Tide (LAT), and most often in the intertidal zone. Table 11.1 provides a description of the shoreline types according to shoreline receptors (areas defined in this EP to inform oil spill response planning purposes and are referred to as 'sectors') that are intersected by the socio-economic EMBA. Descriptions of the shoreline habitats for each sector are derived from the Australian Coastal Geomorphology Smartline database.

In general, these coastlines and islands (excluding Darwin) are very remote and sparsely populated. Levels of human development and disturbance are correspondingly low around most of the coast (Chatto and Parks, 2006).

Maps of the coastal habitats of the shoreline sectors intersected by the spill EMBA are provided in Figure 11.9 to Figure 11.23. These maps note the maximum probability of shoreline loading from a LoWC.

The following section broadly categorises shoreline habitats as the following biological communities that were identified to occur within the socio-economic EMBA: sandy beaches, rocky shorelines, tidal flats, mangroves and islands.

11.2.1 Sandy Beaches

Sandy beaches are the dominant shoreline type on the eastern coast of the JBG with only occasional rocky headlands and river estuaries leading to the ocean. These environments are remote and have had limited anthropogenic presence (Christiansen *et al.,* 2010). The beaches provide roosting and nesting habitat for sand nesting birds and turtles, such as plovers and flatback turtles, respectively.

For the purposes of this description, sandy beaches include areas of mixed sandy shore/mixed sandy sediments on bedrock, sand beach/alluvium/shore/dune/foredunes (Table 11.1).

Sandy beaches provide habitat to a variety of burrowing invertebrates and subsequently provide foraging grounds for shorebirds (Garnet and Crowley, 2000). The number of species and densities of benthic macroinvertebrates that occur in the sand are typically inversely correlated with sediment grain-size and exposure to wave action, and positively correlated with sedimentary organic content and the amount of detached and attached macrophytes (Wildsmith *et al.,* 2005). However, the distributions of these fauna among habitats will also reflect differences in the suite of environmental variables that characterize those habitats (Wildsmith *et al.,* 2005).

Sandy beaches are found scattered throughout the coastline of northwest WA and the NT with large areas on the western side of the Dampier Archipelago, north and south of Broome (approximately 140 km in length) (Figure 11.10), Derby-West Kimberley (10.6 km) (Figure 11.11), Mitchell River (23.9 km) (Figure 11.12), Wyndham-East Kimberley sector (150 km) (Figure 11.13), Ashmore Reef/Cartier Island (14.5 km) (Figure 11.14), Scott Reef/Browse Island (~2 km) (Figure 11.15), north of Cox-Finniss (25.8 km) (Figure 11.19) and Litchfield (4.8 km) (Figure 11.20).

11.2.2 Rocky Shorelines

Rocky shores can include pebbles/cobbles, boulders and rocky limestone cliffs (often at the landward edge of reef platforms). Rocky outcrops typically consist of hard bedrock, but some of the coastline has characteristic limestone karsted cliffs with an undercut notch. Rocky shorelines can vary from habitats where there is bedrock protruding from soft sediments to cliff like structures that form

headlands. Rocky shorelines are an important foraging area for seabirds and habitat for invertebrates found in the intertidal splash zone (Morton and Britton cited in Jones, 2004). For the purposes of this description, rocky shorelines include areas of hard bedrock/cliff (> 5 m)/hard rocky shore, rocky shore and soft bedrock (Table 11.1).

Rocky shorelines are the dominant shoreline type on the western coast of the JBG that is intersected by the socio-economic EMBA. Hard bedrock shorelines are also found in all of the shoreline sectors except for Ashmore Reef/Cartier Island (Figure 11.14), Scott Reef/Browse Island (Figure 11.15) and Victoria-Daly (Figure 11.16). The longest length of coastline consisting of hard bedrock cliffs and shore are found in the following shoreline sectors: Derby-West Kimberley (2,261 km) (Figure 11.11) and Mitchell River (3,837 km) (Figure 11.12).

While there are some stretches of sandy beaches on the west coast of the JBG, they are confined to the sheltered bays and inlets. The exposed rocky shores would be exposed to wave action from the surrounding gulfs and as such are likely to provide habitat for intertidal algae and shell species.

11.2.3 Tidal Flats

Tidal flats (also referred to as mudflats) are comprised of layers of fine mud due to the ongoing deposition of estuarine silts, which combines with deposition of fine sands by tidal movements. For the purposes of this description, tidal flats include areas of tidal flats (sand, mud, sediments)/mangroves, marshy sediment flats/marshy saline sediment flats, saline mudflats and muddy sediments /alluvium/sediment flats (Table 11.1).

These areas provide important habitat for mud and sand-dwelling invertebrates such as crabs, prawns, shells and worms and sheltered habitat for larval and juvenile fishes. Due to the diversity of infauna, they are also an important foraging habitat for various shorebird species including egrets, plovers and oystercatchers.

the spill EMBA intersects tidal flats (sand, mud, sediment) which are found in all of the shoreline sectors except for Ashmore Reef/Cartier Island (Figure 11.14) and Scott Reef/Browse Island (Figure 11.15). The longest length of coastline consisting of tidal flats are found in the following shoreline sectors: Derby-West Kimberley (100 km) (Figure 11.11), Mitchell River (55 km) (Figure 11.12), and Wyndham-East Kimberley (1,062 km) (Figure 11.13).

Tidal sediments flats (inferred from mangroves) are predominantly found in the NT from the Victoria-Daly coastline extending up to and including West Arnhem (Figure 11.16 to Figure 11.22).

Marshy sediment flats including marshy saline sediment flats are commonly found along the Cox-Finniss sector (Figure 11.19) toward and including the West Arnhem sector (NT) (Figure 11.22).

11.2.4 Mangroves

Mangroves commonly occur in sheltered coastal areas in tropical and sub-tropical latitudes (Kathiresan and Bingham, 2001). Mangroves are found wherever suitable conditions are present including wave-dominated settings of deltas, beach/dune coasts, limestone barrier islands and ria/archipelago shores (Semeniuk, 1993). For the purposes of this description, mangroves include areas of tidal flats (sand, mud, sediments)/mangroves and marshy sediment flats/marshy saline sediment flats (Table 11.1).

Mangroves are important primary producers and have a number of ecological and economic values, including reducing coastal erosion and providing habitat for a variety of epibenthic, infaunal and meiofaunal invertebrates (Kathiresan and Bingham, 2001). Crustaceans known to inhabit the mud in mangrove systems include fiddler crabs, mud crabs, shrimps and barnacles, while water channels of the system support various finfish. Mangroves and their associated invertebrate-rich mudflats are also

an important habitat for migratory shorebirds from the northern hemisphere, as well as some avifauna that are restricted to mangroves as their sole habitat (Garnet and Crowley, 2000).

Mangrove habitat intersected by the socio-economic EMBA typically occur along the banks of the major rivers and estuarine environments of the southern JBG including at Quoin Island (126 km southeast of the multi-well location) and Clump Island (133 km southeast) and along the southern coastline of Dorcherty Island (95 km east), including the Tiwi Islands and Vernon Islands (located 345 km in the most north-easterly extent of the spill EMBA) (see Figure 11.23).

Shoreline ecological aerial and ground surveys were conducted from Darwin in the NT to Broome in WA in response to the Montara oil spill during 2009 (Pearce & Duke, 2013). A distance of approximately 5,100 km of shoreline was surveyed, analysed and mapped to quantitatively characterise coastal ecological features. Mangroves were found to grow along 63% of the surveyed shoreline and salt marshes occurred over 24% of the shoreline.

11.2.5 Islands

Several rocky and sandy islands are located within the socio-economic EMBA that provide intertidal and shoreline habitats for a variety of marine fauna and ecological communities, including many small islands along the north Kimberley coast, Browse Island, including sand islands at Ashmore Reef and Cartier Island (as described in Sections 11.3.1 and 11.4.7), the Tiwi Islands (including Melville and Bathurst Islands (Figure 11.23) and Vernon Islands, as described in Sections 11.3.1). For the purposes of this description, islands include reef/coral outer with sandy shore (Table 11.1).

Table 11.1 Description of shoreline receptors by type in the spill EMBA

EMBA shoreline sector	Description of shoreline by type

Scott Reef/Browse Island									X			X			
Ashmore Reef/Cartier Island									X			X			

Key:

X = shoreline type present.

Unclassified is defined as the 13,045 km of shoreline of the EMBA that has no known coastal geomorphological classification.

Source: Australian Coastal Geomorphology Smartline. Note GoogleEarth Pro imagery was used in the absence of GIS data for unclassified areas.

Note: a detailed list of receptors mapped against the Western Australia Marine Oil Pollution Risk Assessment (WAMOPRA) sectors is presented in table E.2 in appendix E of the OPEP.

Shoreline Receptor Map
- Scott Reef and Browse Island

- Ecological EMBA
- Socioeconomic EMBA
- Coastal water - 3 nm
- Sectors

The environment that may be affected (EMBA) illustrated in this map represents the combined modelling results of 100 individual hydrocarbon spill simulations for each of three metocean seasons (summer, winter and transition), resulting in 300 spill simulations. Each individual spill simulates a loss of well control that releases 786,858 m3 of crude oil over 77 days. Each spill simulation occurs is subject to various winds and ocean currents. The 300 individual spill simulations are then combined to identify the largest envelope in which a single spill could occur at any time. The EMBA is not representative of a single spill; an individual spill would affect a significantly smaller area. The modelled EMBA is based on the lowest reportable hydrocarbon thresholds.

11.3 Biological Environment

The sources listed at the start of this chapter have been used in the preparation of this section. Additionally, BIAs are identified for those species that may occur in the spill EMBA. BIAs are spatially defined areas, defined by the DCCEEW based on expert scientific knowledge, where aggregations of individuals of a species are known, or likely, to display biologically important behaviour such as breeding, foraging, resting or migration (DCCEEW, 2024a). The BIAs do not represent a species' full distribution range.

11.3.1 Benthic Assemblages

The benthic environment of the JBG is linked to its geomorphic features, with the majority of the area characterised by infaunal plains, with some localised reefs and outcrops supporting sponge gardens. Przeslawski et al (2011) provides an overview of the benthic environment associated with the different geomorphic features within the EMBA (see Figure 11.8), which are outlined below.

- Slope – the majority of the Northwest marine bioregion consists of either continental slope or continental shelf. Biological productivity is reliant upon seasonal changes in the strength of surface and subsurface currents.

- Shelf – sediment plains that are swept by strong tidal currents and are subject to large influxes of suspended sediment and freshwater, particularly during the wet season. Support diverse infaunal communities that play a key ecological role by contributing to nutrient cycling and sediment turnover (bioturbation) at the local scale. Low abundance of crustaceans, echinoderms and sessile epifauna are expected.

- Banks/shoals - elevated features with a relatively high proportion of hard substrate that support patches of moderately dense octocoral and sponge gardens which in turn provide habitat for other epifauna and cryptofauna. Banks support high numbers of epifaunal species. Infaunal species richness is moderately high in bank sediments. Very few macroalgae (including Halimeda) or reef-forming hard corals were recorded. Carbonate banks and shoals occur predominantly in the JBG (Baker *et al.,* 2008), with the Glomar Shoals and Rowley Shoals situated within the NWS region. Many shoals identified within the socio-economic EMBA are also found offshore in the NT region including the Timor Sea (see Table 11.2 and Figure 11.24).

- Basin - low-relief expanses of unconsolidated sediment, and the available biological data suggests that these habitats are dominated by infauna with limited epifauna.

- Canyons – the canyons on the slope of the Argo Abyssal Plain and Scott Plateau and to the north of Scott Reef (in the NWMR) are a unique seafloor feature associated with small periodic upwellings that enhance biological productivity and aggregations of marine life (DEWHA, 2008b). The tributary canyons of the Arafura Depression located in the NMR are a key ecological feature (KEF) known to support both benthic and pelagic habitats including a diverse range of invertebrates (e.g., sponges, corals, sea anemones, tunicates, worms, crustaceans, brittle stars and feather stars).

- Cliffs and coral reefs - within the EMBA, offshore coral reefs include Ashmore reef and Hibernia Reef, Cartier Island, Browse Island, the Vernon Islands, with many other islands in coastal waters supporting fringing coral reefs. Submerged cliffs and coral reefs of the Kimberley and atolls and reefs on the edge of the continental shelf support a high diversity of benthic filter-feeders and producers.

- Deep/hole/valley - dominated by flat soft sediment expanses. Support low-moderate numbers of epifaunal species and include many debris-swept channels, which in places expose small patches of underlying rock that support moderate densities of sessile animals.
- Tidal-sandwave/sand bank – high disturbance, soft substrate, limited biota.
- Pinnacles – limestone pinnacles of the of the Bonaparte Depression are thought to be associated with enhance local biological productivity due to the movement of water around these features to facilitate mixing of nutrients and sediments. Associated communities include sessile benthic invertebrates including hard and soft corals and sponges (DEWHA, 2008b).

Infaunal communities

The offshore marine environment off WA (from Busselton) to the Northern Territory (NT) border is dominated by soft sediment seabeds; sandy and muddy substrates, occasionally interspersed with hard substrates covered with sand veneers, and rarely, exposed hard substrate. In shallow waters, non-coral benthic invertebrates may form part of the mosaic of benthic organisms found on hard substrates, alongside macrophytes and coral colonies. As light reduces with water depth, non-coral benthic invertebrates are the dominant community, albeit at low densities.

Infauna are animals that inhabit sandy or muddy surface layers of the ocean floor these may include deposit feeders, filter-feeders, grazers and predators. The distribution of infauna and benthic invertebrate species is influenced by many physical parameters (e.g., water temperature, dissolved oxygen, pH, salinity) and biological (e.g., primary productivity, acclimatisation) factors.

Within the EMBA deep offshore areas such as the Northwest Transition support infauna such as sediment burrowing polychaetes and isopods.

Crustaceans

See EP Chapter 5 Section 5.4.1. Crustaceans are found throughout the EMBA primarily in the inner shelf (30 m to 60 m water depth) and the continental slope (between 200 m to 1000 m) of the NWS region, although little is known about the benthic environment in the latter (DWHA, 2008b).

Molluscs

See EP Chapter 5 Section 5.4.1. Molluscs are also found in the mid shelf (60 m to 100 m water depth) of the NWS region which includes the Glomar Shoals. Distinct assemblages of molluscs are also found in depths between 100 m to 200 m and 200 m to 500 m with no overlap. Areas of the continental slope, offshore from North West Cape to the southern boundary of the NWMR Region of 200 m to 4,000 m contain molluscs and large isopods that feed on particulate organic matter (DEWHA, 2008b).

Reefs, Shoals and Banks

Coral reefs are habitats with high diversity of corals, associated fish and other species of both commercial and conservation importance. The spill EMBA overlaps with areas of coral reef habitats. The closest identified coral reef habitat is located within the Joseph Bonaparte Gulf AMP (JBG AMP). Emu Reefs (located 92 km northeast of the multi-well location) was recently surveyed by traditional owners of the Thamarrur region in partnership with the Australian Institute of Marine Science (AIMS), Eni Australia and Parks Australia. The survey deployed Baited Remote Underwater Video Systems (BRUVS) and captured a diversity of fish, sharks and crabs as well as the protected and culturally significant eyebrow wedgefish (*Rhynchobatus palpebratus*) (Parks Australia, 2021). Emu Reef is protected from recreational fishermen by a fish protection area (NT Government, 2016).

Oceanic shoals and banks are abrupt geological features that rise from the deep continental shelf to within 15-20 m of the sea surface, with many occurring within the spill EMBA. These unique habitats contain submerged reefs that support a very high diversity of coral reef ecosystems (Heyward *et al.,* 2017). It is likely that the open oceanic environment that the northwest banks and shoals are situated in contributes to their high species diversity and abundance as their exposure to oceanic influences may enhance productivity and in turn the diversity of species inhabiting them (Parks Australia, 2021). There are several identified shoals and banks in the western extent of the socio-economic EMBA including Holothuria Banks, Tait Bank, Penguin Shoal and Bassett-Smith Shoal (RPS, 2021).

Though there is a paucity of information relevant to these specific features, studies of similar shoals not located in the spill EMBA have found a high diversity of free-living corals, sponges, gorgonian soft corals, hard corals, rhodoliths, tropical fish, rays and sharks (Heyward *et al.,* 2017; Moore *et al.,* 2017; Heyward *et al.,* 2010). It is expected that the shoals and banks located in the spill EMBA may include a similar assemblage of species.

In total there are approximately 306 shoals that are known to occur within or in close proximity to the socio-economic EMBA; of these 53 are named and 242 are unnamed. Table 11.2 lists the shoals present within the EMBA and location by depth below sea surface. The vast majority of the identified shoals are located in water depths greater than 10 m. Many of these shoals are marked on marine charts and are popular areas for recreational fishing, however given the paucity of information, only publicly accessible information in relation to features is included in Table 11.2.

Identified banks, reefs, and shoals in the spill EMBA are presented in Figure 11.24.

Table 11.2 Shoals present within the spill EMBA

Name	Area of coverage ($km^{2)}$	Minimum depth below water (m)	Maximum depth below water (m)	Key features
Abbott Shoal	3.4	10	24	-
Afghan Shoal	59.8	6	35	-
Ann Shoals	8.8	4	25	-
Barbara Shoal	9.5	4	22	-
Barcoo Shoal	8.0	3	50	-
Barracouta Shoal	9.0	19	139	Supports reef building corals, seagrass and algae, particularly the calcareous green algae *Halimeda* spp (Heyward *et.al.*, 2010).
Bassett-Smith Shoal	6.8	13	97	-
Beagle Shoals	7.9	3	24	-
Big Bank Shoals	96.0	1	303	Submerged carbonate banks in the Timor Sea, which rise up from depths of 200 to 300 metres to within 20 m to 30 m below sea level. Supports 3 distinct ecosystems: algae-dominated by *Halimeda*, coral and filter feeding ecosystems.
Bill Shoal	1.0	9	15	-

Name	Area of coverage ($km^{2)}$	Minimum depth below water (m)	Maximum depth below water (m)	Key features
Britomart Shoal	1.4	9	36	-
Calder Shoal	80.4	20	73	-
Cootamundra Shoal	84.4	15	98	Ancient coral reefs consisting of flat-topped banks of fossil coral platforms.
Deep Shoal 1	2.0	25	63	-
Deep Shoal 2	2.6	115	120	-
Echuca Shoal	12.3	19	104	Predominantly an extensive claystone; organic-rich, oil-prone marine shale.
Eugene McDermott Shoal	4.8	19	101	Coral shoal
Evans Shoal	49.7	15	69	-
Fantome Shoal	3.6	13	297	-
Fitzpatrick Shoal	12.4	9	38	-
Giles Shoal	8.3	2	22	-
Goeree Shoal	2.1	23	83	According to a seabed biodiversity survey done in 2016 by the Australian Institute of Marine science for PTTEP, Goeree Shoal contained 161 species and 2,527 individuals (Heyward *et.al*, 2017). Multiple species of emperor fish were present as well as large groups of fish from the genus *Cirrhilabrus*. Wrasses, lyretail and two-spot red snapper were also present. Overall, fish communities appeared relatively stable in terms of richness and abundance. Goeree Shoal also displayed unique patterns of hard coral, sponge and *Halimeda*, algae was the most abundant benthic group, the results of the survey indicated that Goeree shoals support diverse benthic communities as well as benthic primary producers and many species typical of tropical coral reef ecosystems (Heyward *et.al*, 2017).
Hancox Shoal	14.4	5	28	-
Heywood Shoal	23.3	18	95	A report written by Moore et al. (2017) explores the biodiversity of submerged oceanic shoals in north

Name	Area of coverage ($km^{2)}$	Minimum depth below water (m)	Maximum depth below water (m)	Key features
				WA. Heywood Shoal is described as being oval is shape and comprising primarily of rubble (51.2%), sand (23.3%) and calcareous coral (22.3%) substrates. Whilst 58.5% of Heywood Shoal's epibenthic cover was reported as being bare, hard coral was the most dominant epibenthic species (17.9%). Encrusting organisms, macroalgae, filter feeders and soft coral accounted for the remaining 23.6%. Heywood Shoal was noted as having distinctive fish communities, with over 200 species recorded.
Howland Shoals	0.4	3	12	-
Jabiru Shoals	21.7	13	261	-
Jones Shoal	1.8	10	28	-
Karmt Shoal	263.5	2	316	-
Lowry Shoal	3.0	10	23	-

Margaret Shoal	11.4	1	17	-
Marie Shoal	8.9	11	63	-
Marsh Shoal	2.8	7	19	-
Mataram Shoal	21.9	3	45	-
Mermaid Shoal	326.1	30	17	-
Money Shoal	20.1	0	65	-
Moss Shoal	4.0	11	72	-
Newby Shoal	4.8	19	74	-
Ommaney Shoals	6.5	6	24	-
Parry Shoal	62.8	13	80	-
Pee Shoal	3.3	10	332	-
Penguin Shoal	17.3	4	49	-
Rainbow Shoals	0.7	9	30	-
Renard Shoals	5.4	5	22	-
Shepparton Shoal	41.6	19	57	-
Skottowe Shoal	9.9	12	27	-
Taiyun Shoal	17.2	3	30	-
Tassie Shoal	8.1	12	78	-

Name	Area of coverage ($km^{2)}$	Minimum depth below water (m)	Maximum depth below water (m)	Key features
Van Cloon Shoal	37.7	16	62	-
Vee Shoal	3.2	12	171	-
Victoria Shoal	9.3	2	13	-
Vulcan Shoal	11.5	17	133	Supports reef building corals, seagrass and algae, particularly the calcareous green algae *Halimeda* spp (Heyward *et.al.,* 2010). Contains an extensive field of the seagrass *Thallasodendron ciliatum*.
Wells Shoal	6.3	7	25	-

Source: High-resolution depth model for Northern Australia – 30m (Geoscience Australia), except for a small area in the vicinity of Clerke/Mermaid/Imperieuse reef which is standard ausbath 2009 v4 (~250m resolution). Australian Stratigraphic Units Database (accessed May 2022). Note the absence of information regarding key features is marked as "-".

A description of the most well-known reefs, shoals, and islands within the socio-economic EMBA is provided here.

Scott and Seringapatam Reefs

The Scott and Seringapatam reefs are regionally significant due to its high representation of species not found in coastal waters off WA and unusual nature of its fauna that has affinities with the oceanic reef habitats of the Indo-West Pacific as well as the reefs of the Indonesian region. Scott Reef is important for its contribution to understanding long-term geomorphological and reef formation processes and past environments (Gilmour and Smith, 2013).

Scott Reef is the largest of the oceanic reef systems off WA and comprises two major formations: North Reef and South Reef, separated by a channel 2 km wide and between 400 and 700 m deep. North Reef is an annular reef enclosing a shallow lagoon (as is Seringapatam) and South Reef is a crescent-shaped reef with a deeper and more extensive lagoon environment.

Scott Reef is the region's best-understood reef from the point of view of resident communities and how they function and change. The most comprehensive datasets come from a long-term monitoring program run by AIMS has provided the most comprehensive dataset of the reef's resident communities. A diverse assemblage of hard coral species has been recorded from the shallow and deep-water environments at Scott Reef, with 306 species from 60 genera and 14 families (Gilmour *et al,* 2012). Two hundred and ninety-five species have been recorded from shallow-water environments (<30 m) and 51 species from deep water habitats (>30 m). Community composition in the deep-water lagoon at South Reef is markedly different to the shallow-water habitats at Scott Reef. The shallow-water coral communities comprise typical reef front, lagoon and reef-flat assemblages, while the deepwater communities are dominated by extensive areas of foliaceous *Agariciidae, Pectinidae, Poritidae and Montipora* species, and fragile branching and plating Acropora species.

Compared with other offshore reefs in the region, Scott Reef appears to have a comparable diversity of hard corals. A shallow-water survey (0 - 20 m) of Ashmore, Scott and Seringapatam reefs and Mermaid Reef (Rowley Shoals) in 2006 recorded 211 species of corals at Mermaid Reef, 159 species at Seringapatam, 255 species at Ashmore Reef, and 201 and 224 species at North and South (Scott) reefs respectively (WAM, 2009). All coral taxa were predominantly widespread Indo-Pacific species that have clear affinities with the coral assemblages of Ashmore Reef and the Indonesian provinces to the north.

Ashmore Reef

Ashmore Reef is a commonwealth marine park (see Section 11.4.1). The marine fauna at Ashmore Reef has the highest diversity of the reefs on the North-West Shelf, with the mollusc fauna being substantially more diverse here (433 species) than either Scott and Seringapatam Reefs (279 species) or Rowley Shoals (DAWE, 2013). Ninety-nine species of decapod crustaceans have been recorded at Ashmore Reef compared with 56 for Scott and Seringapatam Reefs) and 178 echinoderms species have been recorded (compared with 119 species for Scott and Seringapatam and 90 species for Rowley Shoals). A total of 560 fish species have also been recorded at the reef, with the most species-rich fish families being the Gobiidae (small to mid-sized gobies, 66 species), Pomacentridae (small and brightly coloured damselfish and anemonefish, 66 species), Labridae (wrasse, 54 species) and Apogonidae (36 species) (DSEWPC, 2013).

Fringing Reefs

Fringing reefs exist on almost all the shores of all islands off the Kimberley coast between the Bonaparte Archipelago Islands and Buccaneer Archipelago Islands, and they also occur on the mainland shores of Cape Londonderry, Cape Voltaire, One Arm Point and Yampi Sound (all of which are within the spill EMBA) (Wilson, 2013). This stretch of coast is over 600 km long.

Within the Kimberley region, it is likely fringing reefs are developed by rocky shores that are exposed to the prevailing westerly ocean swell (Wilson, 2013). Many Kimberley fringing reefs are limestone wedges built by coral and crustose algal communities. The assemblages of coral reef within the Bonaparte Archipelago intertidal regionnotes that the intertidal zone of the Bonaparte Archipelago is a hub of diverse corals (Richards *et al*., 2015). In total, 225 species of hard coral were identified, with the species richness likely to represent the species found on fringing reefs within other areas of the Kimberley region. *Glomar Shoals*

The Glomar Shoals are defined as a KEF for their high productivity and aggregations of marine life. Further information on the Glomar Shoals is provided in Section 11.4.7**.**

Rowley Shoals

The Rowley Shoals is defined as a KEF or its enhanced productivity and high species richness, that apply to both benthic and pelagic habitats within the feature. Further information on the Rowley Shoals is provided in Section 11.4.7.

King Shoals

King Shoals is located within the North Kimberley Marine Park (WA) and is protected by a Sanctuary Zone. The King Shoals sanctuary zone includes some of the only mapped tidal sand waves and banks in the Kimberley, as well as containing a KEF (Carbonate bank and terrace system of the Sahul Shelf). Carbonate banks are significant due to their known potential to support high levels of biodiversity of reef fish, sponges, corals, and filter feeders. The banks are likely to be foraging areas for the flatback turtle and are known to provide protection to the threatened species green sawfish and freshwater sawfish (Department of Parks and Wildlife, 2016).

Cartier Island

Cartier Island is a commonwealth marine park (see Section 11.4.1) consisting of an un-vegetated sand cay surrounded by mature reef flats; it sits at the centre of a reef platform that rises steeply from the seabed. The island is composed of coarse sand and is stabilised by patches of beach rock around its perimeter. The effects of wind, tides and rain periodically expose and remove areas of shifting sandbanks. The island supports large populations of nesting marine turtles and seabirds/shorebirds. The crested tern (Thalasseus bergii) is known to breed on the island, with most other species occurring as occasional visitors or vagrants (Clarke *et al*., 2017).

Cartier Island is located about 55 km southeast of the Ashmore Island complex and in the absence of specific information regarding species assemblages, is likely to host a similar assemblage of fish species to Ashmore Reef given their close proximity.

Browse Island

Browse Island is an isolated sandy cay surrounded by an intertidal reef platform and shallow fringing reef located 536 km northeast from the multi-well location. This reef rises from a depth of 200 m and is a flat-topped, oval-shaped platform reef with a diameter of 2.2 km at its widest point. The benthic habitats and biotic assemblages are characteristic of coral platform reefs throughout the Indo-West region (Inpex, 2010). Intertidal habitats around Browse Island include a sandy beach (known for green turtle nesting (DCCEEW, 2024a) rocky beach, a lagoon supporting macroalgae and coral such as Acropora species and Porites species, a reef platform supporting sparse algal turf, and the reef crest (supporting hard corals such as Goniastrae spp and a high diversity of molluscs). The reef platform is barren in many places, and seagrasses are not present (Inpex, 2010).

Adele Island

Adele Island is a hook shaped island off the central Kimberley coast, located around 97 km north-northwest from Cape Leveque and 600 km from the multi-well location. The island measures 2.9 km by 1.6 km with an area of 2.17 km^2. Its surrounding sand banks sit atop a shallow-water limestone platform, surrounded by an extensive reef system.

Adele Island is an important site for breeding seabirds with several Japan-Australia Migratory Birds Agreement (JAMBA), China-Australia Migratory Birds Agreement (CAMBA) and Republic of Korea Migratory Birds Agreement (ROKAMBA) listed species breeding there, with rookeries of cormorants, Australian pelicans, lesser frigate birds (2,000-5,700 breeding pairs), brown booby (1,500-8,500 breeding pairs), red-footed booby and masked booby (DSEWPC, 2008; Kimberley Coast, 2013).

Cunningham Island

Cunningham Island is an unvegetated sand cay surrounded by a small lagoon which lies near the northern extent of Imperieuse Reef. The island is situated 1,100 km from multi-well location and its shoreline is dominated by white sandy shores and low-lying beach rock. There is limited data on the benthic assemblages supported by the island.

Bedwell Island

Bedwell Island a small sandy cay inside Clerke Reef situated 1,048 km from multi-well location. The island is home to one of only two colonies of red-tailed tropicbirds in WA. The tropicbirds nest on the island, along with wedge-tailed shearwaters, white-bellied sea-eagles, various terns, eastern reef-egrets and even a pair of white-tailed tropicbirds.

Lacepede Island

The Lacepede Islands situated 752 km from the multi-well location provide critical nesting and internesting habitat for green turtles and are the site of the largest green turtle rookery in Western Australia. The Commonwealth waters surrounding the islands are important for migrating marine turtles as they move between nesting and feeding sites in this bioregion and beyond. The Lacepede Islands also support some of the largest brown booby colonies in Western Australia. Other seabirds also breed in the area, including lesser frigatebirds, bridled terns, roseate terns and common noddies. The surrounding waters are likely to provide food for seabird species (DEWHA, 2008b).

Tiwi Islands

Located 20 km north of Darwin, the Tiwi Islands are made up of two main islands namely Melville Island (Australia's second largest island) and Bathurst Island (Department of Natural Resources, Environment, the Arts and Sport, 2009) The coasts of the Tiwi Islands support important nesting sites for marine turtles, internationally significant seabird rookeries, and some major aggregations of migratory shorebirds (Department of Natural Resources, Environment, the Arts and Sport, 2009).

Vernon Islands

The Vernon islands are located in the Clarence Strait in the NT, between the Australian mainland at Gunn Point and Melville Island's southernmost point, Cape Gambier (Tiwi Land Council, 2013). There are three major islands making up the Vernon Islands group; north-west Vernon Island, south-west Vernon Island and east Vernon Island, including a large reef and numerous lesser reefs and sand islands (Tiwi Land Council, 2013). The Vernon Islands are rich in mangrove forests, reef systems, rocky shelves and stacks, and seagrass and algal beds (Tiwi Land Council, 2013). The islands are an important coral reef locality, and there is a small number of naturally occurring deep holes (up to 20 m deep) which support coral communities with high species diversity (Tiwi Land Council, 2013). The waters surrounding the Vernon Islands support populations of dugong and turtles (Tiwi Land Council, 2013).

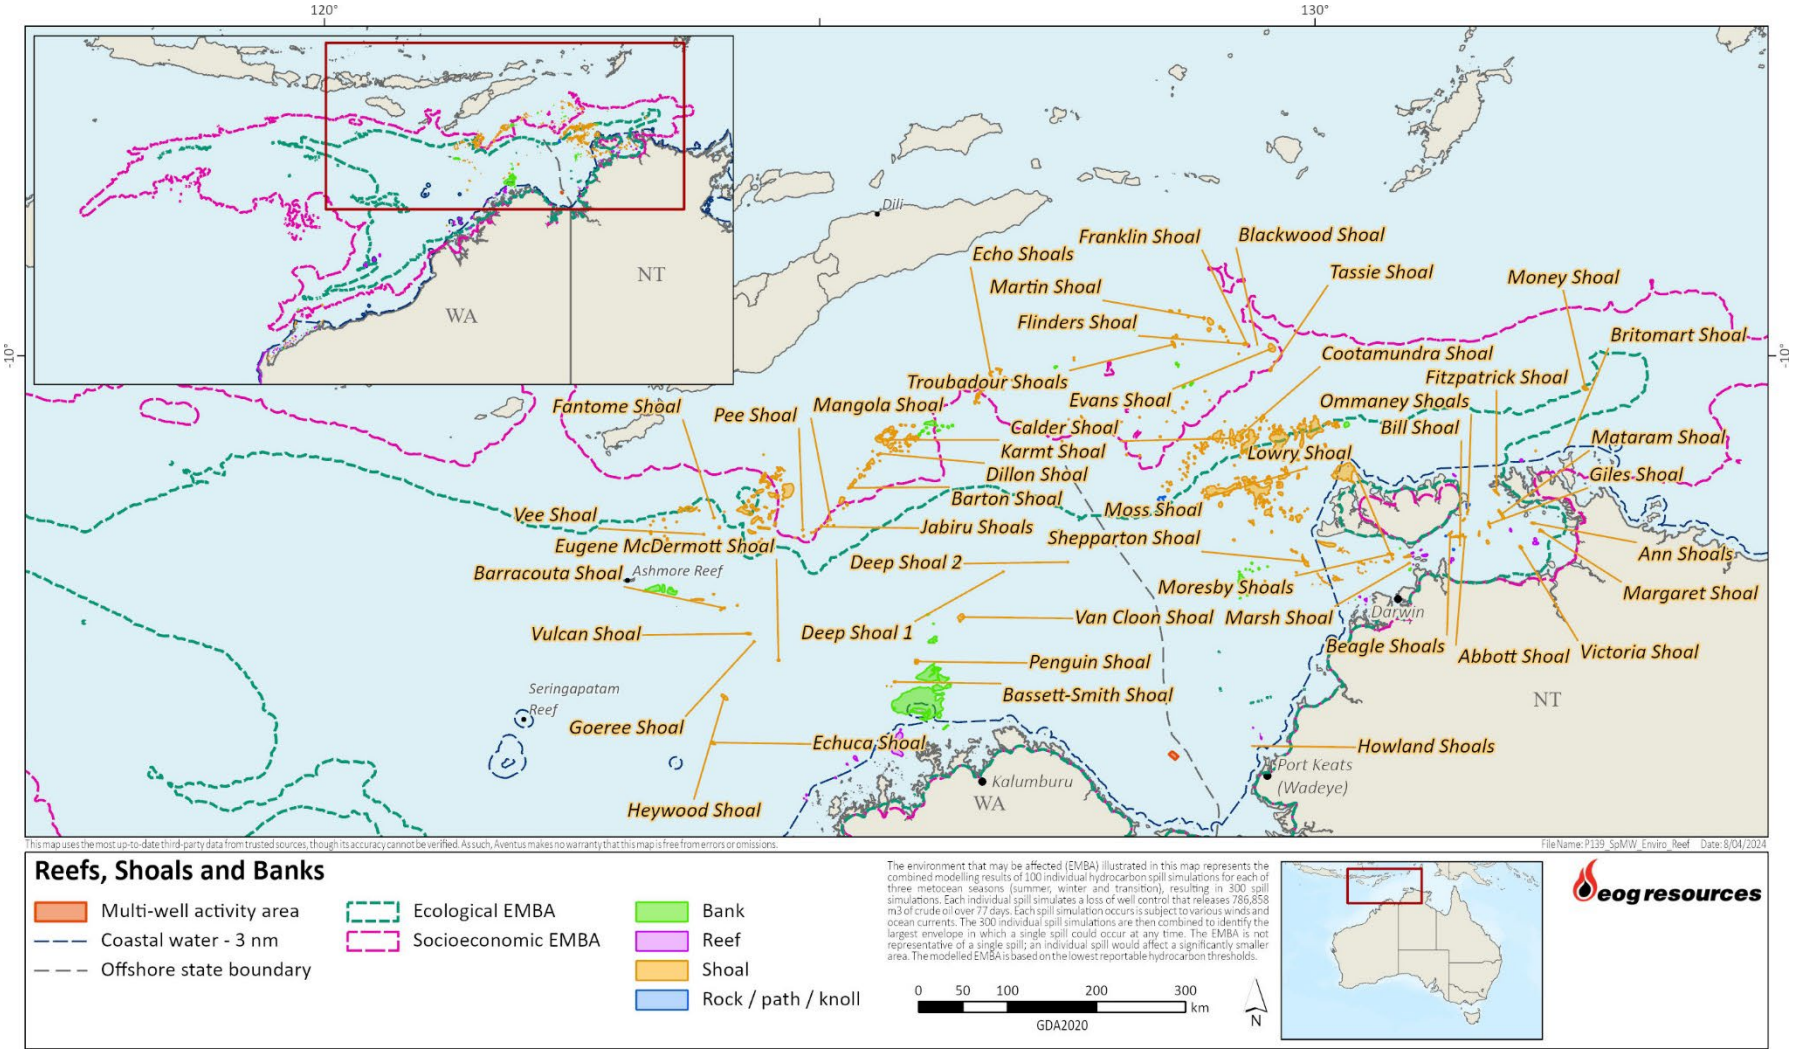

Figure 11.24 Reefs, shoals and banks overlapped by the spill EMBA

11.3.2 Marine Flora

Marine flora is generally limited to mangroves and seagrass beds and macroalgae, which is generally confined to shallow, nearshore waters.

Mangroves

Mangroves provide nutrient to surrounding waters and are also important habitat and nursery areas for fish and invertebrates. The north Kimberley region contains some of the most species rich systems of mangroves in the world (DPaW, 2016). The mangroves and estuarine habitats of the north Kimberley support a range of threatened, protected and culturally important species including estuarine crocodiles, turtles, dolphins, sawfish, mud crabs, fish and specialist mangrove birds (DPaW, 2016).

In the JBG, mangroves occur in river estuaries. The mangroves surrounding the Ord River are notable in terms of their structural complexity and diversity. Fourteen species of mangroves have been identified within the Ord River alone (Pedretti & Paling, 2001). This diverse area is known to support significant habitats for saltwater crocodiles, migratory birds and supports populations of the commercially exploited species of red-legged banana prawn (*Penaeus indicus*) (Kenyon *et al*., 2004).

Seagrass Beds and Macroalgae

Seagrass beds and macroalgae communities are the primary food source for many marine species and provide important habitats and nursery grounds (Heck *et al*., 2003; Wilson *et al*., 2010). Within the north Kimberley marine region, seagrass and macroalgae communities are an important source of primary productivity. They provide vital habitat for juvenile fish, turtles and dugongs and can be found around Cape Londonderry (176 km northwest from the multi-well location), is within the spill EMBA (DPAW, 2016).

11.3.3 Plankton

Plankton is a key component in oceanic food chains and comprises two elements; phytoplankton and zooplankton, as described in Section 5.4.3 of Chapter 5 of the EP.

11.3.4 Finfish, Sharks, and Rays

There are 60 fish species listed under the EPBC Act with potential to occur in the spill EMBA (DCCEEW, 2024a). This includes ten species listed as threatened, eleven species listed as migratory and a further 44 listed marine species, all of which are Sygnathiformes (seahorses, pipefishes and their relatives) (Table 11.3).

The likely temporal presence and absence of these fish species in the EMBA is illustrated in Figure 5.13 in Section 5.4.4 of Chapter 5 of The EP. Species listed as threatened or migratory are described in this section. BIAs for fish species that overlap the EMBA are presented in Table 11.4.

Table 11.3 EPBC Act-listed finfish, sharks and rays that may occur in the spill EMBA

Definitions

EPBC Act	Description
Listed threatened species	A native species listed in Section 178 of the *EPBC Act* as either extinct, extinct in the wild, critically endangered, endangered, and vulnerable or conservation dependent.
Listed migratory species	A native species that from time to time is included in the appendices to the Bonn Convention and the annexes of JAMBA, CAMBA and ROKAMBA, as listed in Section 209 of the *EPBC Act*.
Listed marine species	As listed in Section 248 of the *EPBC Act*.

Key

Table 11.4 BIAs of fish species within the spill EMBA

Species	BIA	Location within the EMBA
Dwarf sawfish	Nursing and pupping	Fitzroy River Mouth, May & Robinson River - tidal tributaries. King Sound (Inshore waters).
	Foraging	Camden Sound - eastern shore.
Largetooth sawfish *(Freshwater sawfish)*	Foraging and nursing	King Sound - tidal tributaries King Sound (Inshore waters).
Green sawfish	Foraging	Camden Sound. Cape Leveque.
	Nursing and pupping	Cape Leveque.
Whale shark	Foraging	Northward from Ningaloo (outside of the EMBA) along 200 m isobath, extending offshore off the Kimberley coastline (within the EMBA).

Note: Biologically important areas have not yet been identified for seahorse or pipefish species in the North-west Marine Region as stated in the Species group report card– bony fishes (Supporting the marine bioregional plan for the North-west Marine Region (Commonwealth of Australia, 2012) accessed via DCCEEW (February 2022).

Grey nurse shark (west coast population) (EPBC Act: Vulnerable)

The grey nurse shark (*Carcharias taurus*) has a broad inshore distribution, primarily in sub-tropical to cool temperate waters (Last and Stevens, 2009). The west coast population of grey nurse shark are predominantly found in the south-west coastal waters of WA (DCCEEW, 2024b) and has been recorded as far north as the Northwest Shelf (NWS) (DoE, 2014b).

Grey nurse sharks are often observed hovering motionless just above the seabed, in or near deep sandy-bottomed gutters or rocky caves, and in the vicinity of inshore rocky reefs and islands (Pollard *et al*., 1996). The species has been recorded at varying depths but generally found between 15–40 m (DoE 2014b).

Grey nurse sharks have also been recorded in the surf zone, around coral reefs, and to depths of around 200 m on the continental shelf. They generally occur either alone or in small to medium sized groups, usually of fewer than 20 sharks (Pollard *et al*., 1996). Grey nurse sharks that are observed alone are thought to be moving between aggregation sites (DCCEEW, 2024b). Grey nurse sharks are often observed aggregating around inshore rocky reefs or islands (DoE, 2014b). At these locations, grey nurse sharks are typically found near the seabed (at depths of 10 m to 40 m) in deep sandy or gravel filled gutters, or in rocky caves (DoE, 2014b). There are no known aggregation sites critical to the grey nurse shark in WA waters (DoE, 2014b).

There are no biologically important aggregation, breeding or foraging areas intersected by the spill EMBA; however, it is likely that individuals may transit through the spill EMBA.

Great white shark (EPBC Act: Vulnerable, Listed migratory)

The great white shark (*Carcharodon carcharias*) is widely distributed and located throughout temperate and sub-tropical waters with their known range in Australian waters including all coastal areas except the NT (DCCEEW, 2024b). Studies of the great white shark indicates that they appear to be largely transient, with a few longer-term residents; however, individuals are known to return to feeding grounds on a seasonal basis (Klimey and Anderson, 1996). Observations of

adult white sharks are more frequent around fur-seal and sea lion colonies whilst juveniles are known to congregate in certain key areas.

There are no biologically important aggregation, breeding or foraging areas intersected by the spill EMBA; however, it is likely that individuals may transit through the spill EMBA.

Shortfin mako shark (EPBC Act: Listed migratory)

The shortfin mako (*Isurus oxyrinchus*) is a pelagic species with a circumglobal, wide ranging oceanic distribution in tropical and temperate seas (Mollet *et al.,* 2000). It is widespread in Australian waters, recorded in offshore waters all around the continent's coastline with exception of the Arafura Sea, the Gulf of Carpentaria and Torres Strait (DCCEEW, 2024b). Shortfin makos are also highly migratory and travel large distances (DCCEEW, 2024b).

Due to their widespread distribution in Australian waters, their presence in the spill EMBA is likely to be limited to transiting individuals.

Longfin mako shark (EPBC Act: Listed migratory)

The longfin mako is widely distributed; however, it is rarely encountered and can be found along the WA coastline as a far south as Geraldton (Last and Stevens, 2009). There is limited research into the species within Australian waters; however, Sepulveda et al (2004) recorded southern Californian juveniles favoured surface waters, while larger adults were frequently observed at depths of up to 250 m. Whilst assumed to be a deep-dwelling shark, sightings on the ocean surface, and the species' diet, suggest a greater depth range (Reardon *et al*., 2006).

Though there is limited information about the longfin mako, their presence in the spill EMBA is likely to be limited to transiting individuals.

Whale shark (EPBC Act: Vulnerable, listed migratory)

The whale shark (*Rhincodon typus*) is a filter-feeding shark and is the largest known species of fish in the world (DCCEEW, 2024b). It is considered to be an oceanic and coastal species, commonly seen far offshore but also closer inshore near coral atolls (DCCEEW, 2024b). Whale sharks generally prefer tropical to warm temperate waters where surface sea temperature ranges from 21° to 25 °C (DCCEEW, 2024b).

In Australian waters the whale shark is commonly seen in waters off northern WA, NT and Queensland with only very occasional sightings off Victoria and South Australia (Last and Stevens, 2009). The movements of whale sharks are not well documented; however, they are known to seasonally aggregate (March and April) in shallow tropical waters off the North West Cape in WA (DCCEEW, 2024b).

Whale sharks may occur within the spill EMBA. A foraging BIA is intersected by the socio-economic EMBA (see Table 11.4 and Figure 11.25) and hence, individuals may forage in the far western extent of the EMBA.

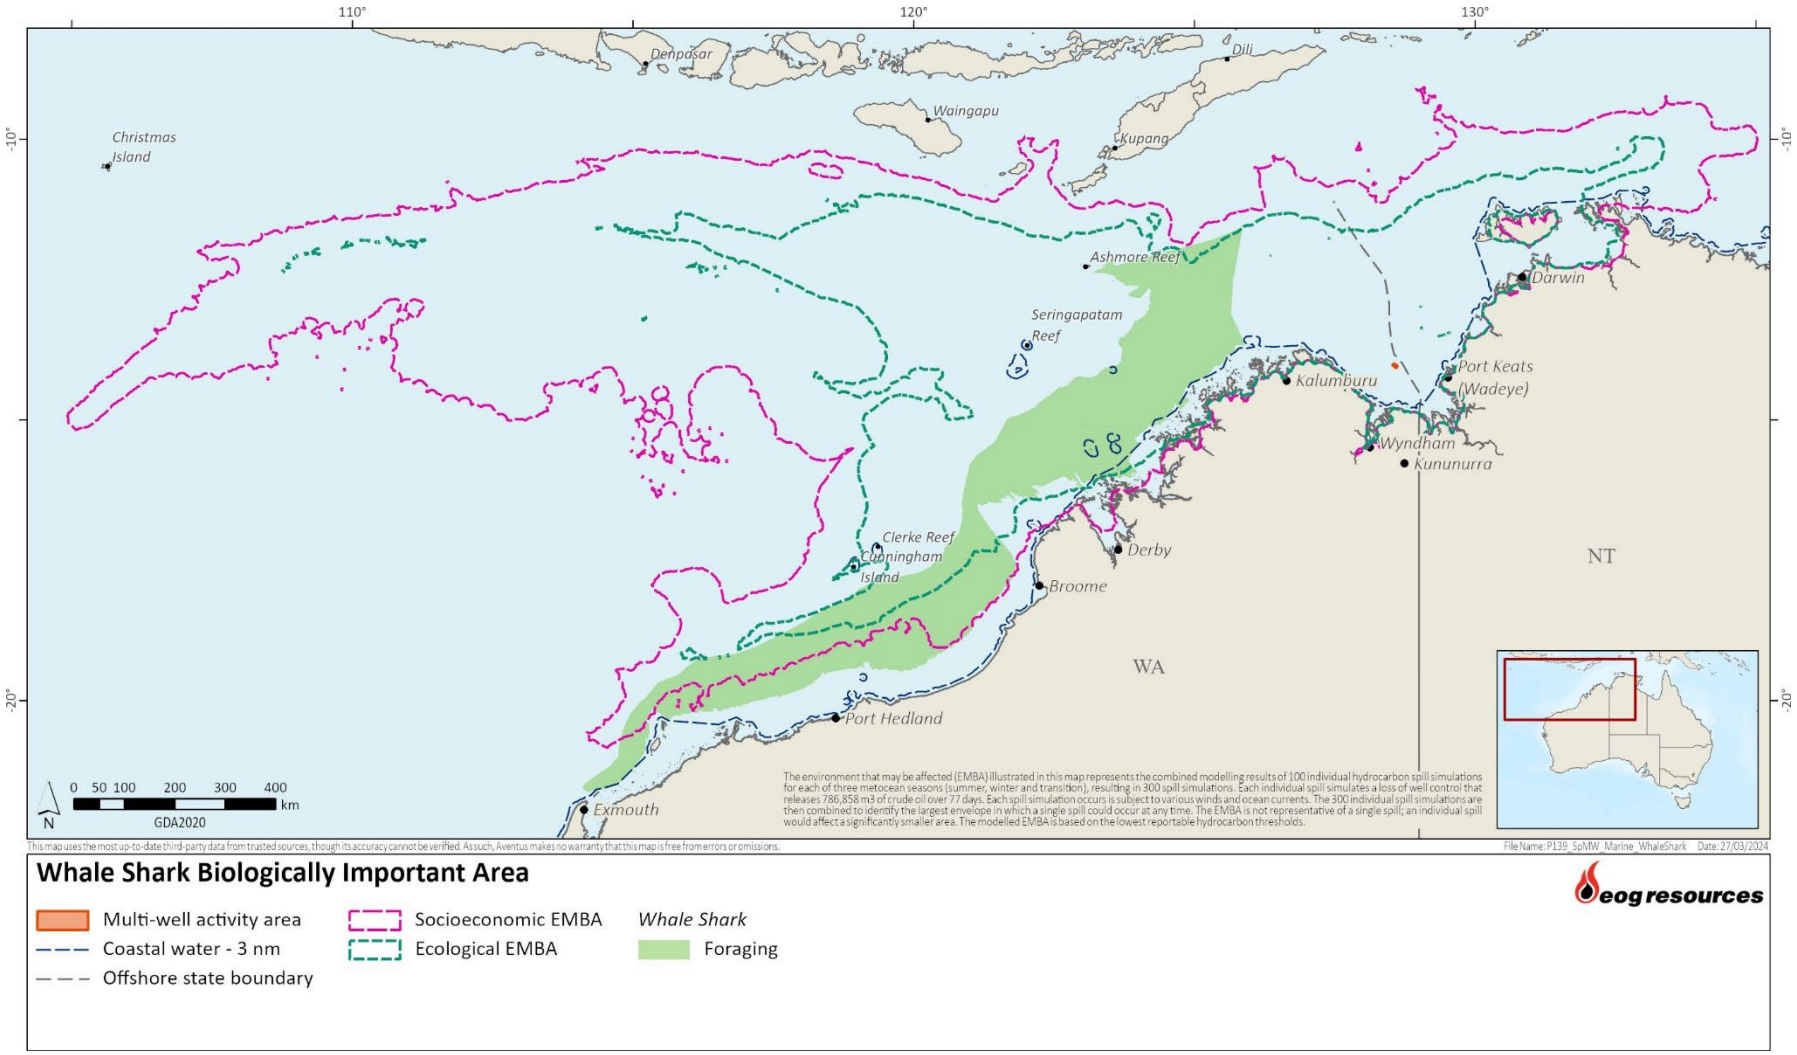

Figure 11.25 Whale shark BIA intersected by the spill EMBA

Northern river shark (EPBC Act: Endangered)

The northern river shark (*Glyphis garricki*) is an elasmobranch capable of living and moving between freshwater and seawater. The species utilises rivers, tidal sections of large tropical estuarine systems, macro tidal embayments, inshore and offshore marine habitats. The species is listed as endangered under the EPBC Act, based partly on its limited geographic distribution (TSSC, 2014a). Within Australia, the northern river shark is known to occur in WA and the NT, occupying both marine and freshwater environments including the JBG, Daly River, Adelaide River and the South and East Alligator Rivers (TSSC, 2014a) (Figure 11.26). Whilst northern river sharks have been observed well offshore, the extent to which this occurs is unknown (TSSC, 2014a). Individuals may be present within the nearshore areas of the spill EMBA.

Speartooth shark (EPBC Act: Listed Critically Endangered)

Speartooth sharks (*Glyphis glyphis*) occur in geographically distinct locations across northern Australia in the NT including Queensland, having been recorded in tidal rivers and estuaries with turbid waters, fine muddy substrates and temperatures ranging from 27°C to 33°C (DoE, 2014c). In the NT, they are found in the Van Diemen Gulf drainage, including the Adelaide River, South, East and West Alligator rivers and Murganella creek (DoE, 2014c). Due to their similarity to bull sharks, it is thought that adult speartooth sharks may live outside of rivers in the coastal marine environment (DoE 2014c). Given the species preference for estuarine and coastal waters, the speartooth shark may be present in the socioeconomic EMBA along the NT coastline. Given the absence of BIAs for this species, significant numbers are not expected to be impacted.

Blind Gudgeon (EPBC Act: Listed vulnerable)

The blind gudgeon is a small fish known to occur on the Cape Range Peninsula in the arid NW of WA (Humphreys and Feinberg, 1995) and at Barrow Island, to the northeast of the Cape Range Peninsula, off the WA coastline (Humphreys ,1999). The species is known only from the underground waters which lie beneath the narrow coastal plain of the Cape Range Peninsula in WA (Allen, 1982; Humphreys and Blyth, 1994) in water temperatures ranging from 27°C to 30°C in May and Aug (Mees, 1962).

Although the PMST report identifies this species or its habitat may be present within the EMBA, the closest area of presence is 33 km southeast from the southern extent of the socioeconomic EMBA. Therefore, given the location preference and there are no BIAs for this species, the blind gudgeon is not expected to occur within the spill EMBA.

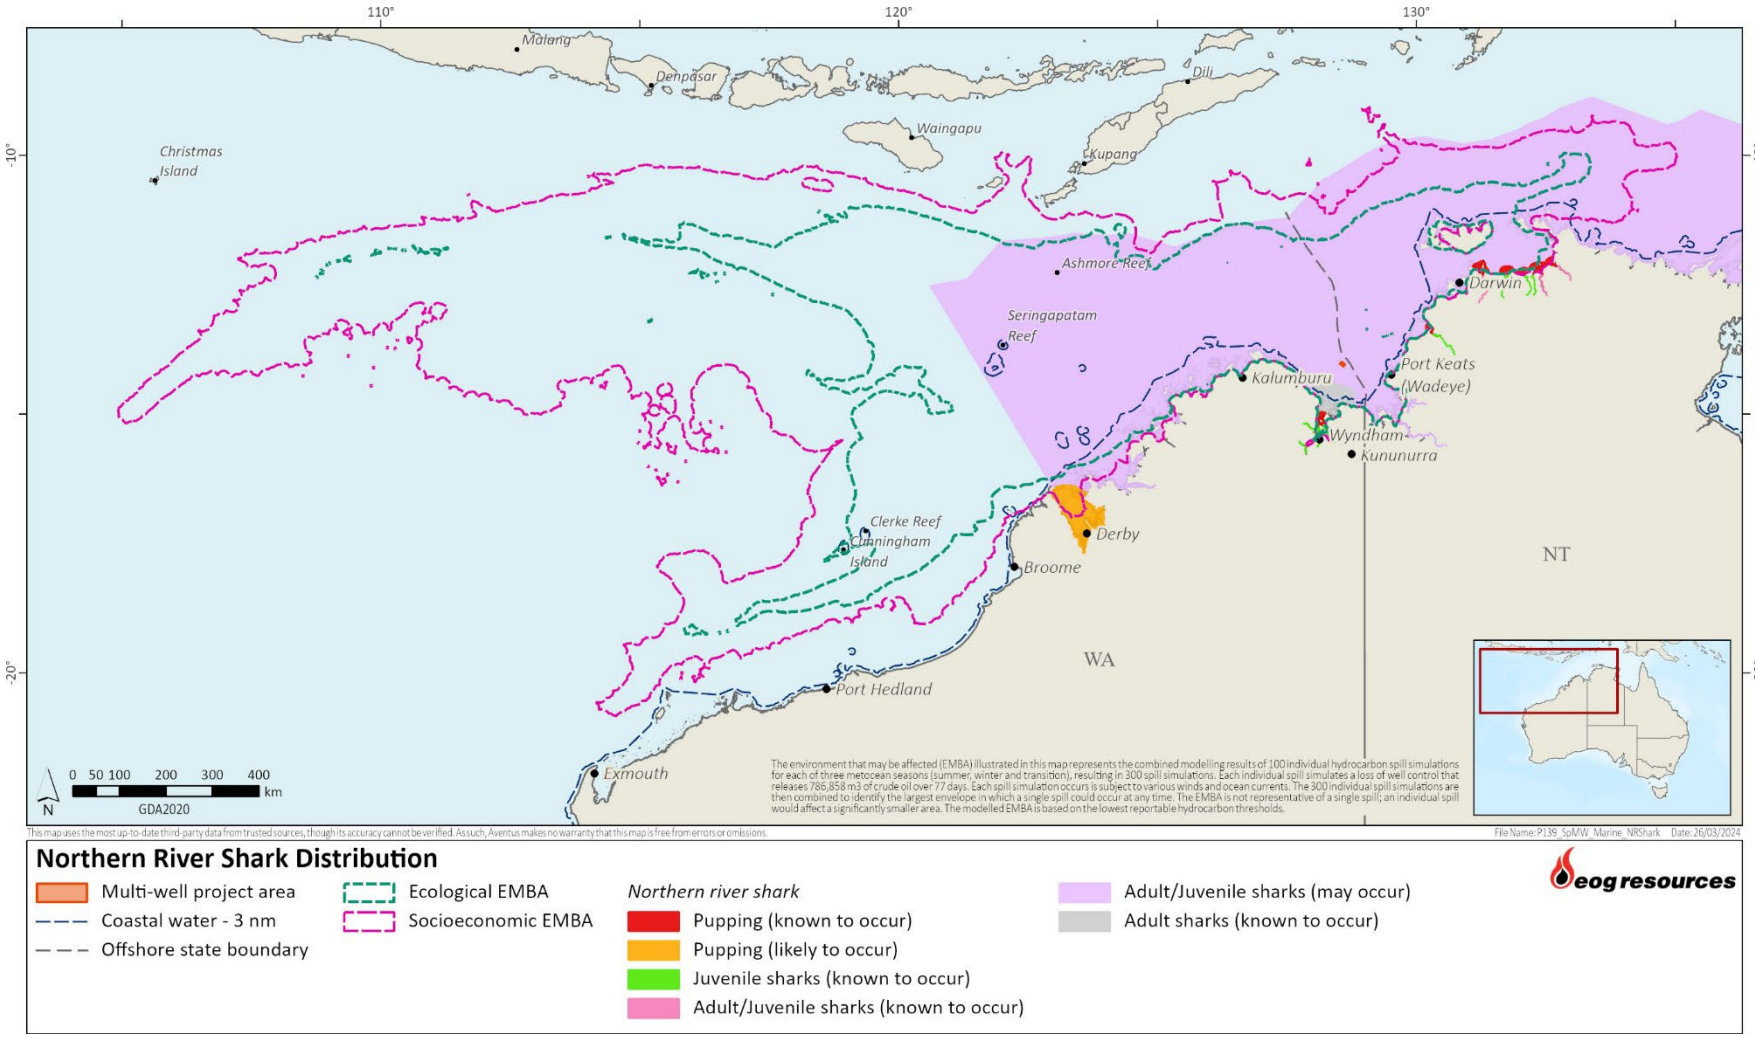

Figure 11.26 Northern river shark presence in the spill EMBA

Reef manta ray (EPBC Act: Listed migratory)

The reef manta ray (*Manta alfredi*) has a circum-global range in tropical and sub-tropical waters with sightings between waters off Perth, all along the northern coastline of Australia to the waters off the Solitary Islands, NSW (Marshall *et al*., 2011a). While this species tends to inhabit nearshore environments, it is known to occurs in waters as deep as 300 m and has been sighted around offshore coral reefs, rocky reefs and seamounts (Marshall *et al*., 2011a). In addition, it makes seasonal migrations of several hundred kilometres (Marshall *et al*., 2011a).

Despite there being no known aggregation sites within close proximity to the EMBA, reef manta rays may be present in the EMBA as transiting individuals.

Giant manta ray (EPBC Act: Listed migratory)

The giant manta ray (*Manta birostris*) has a widespread distribution along the coast of Australia and is known to seasonally migrate between aggregation sites (Marshall *et al*., 2011b). The giant manta ray is commonly sighted along productive coastlines with regular upwelling, oceanic island groups and particularly offshore pinnacles and seamounts (Marshall *et al*., 2011b).

This species has also been recorded within the Oceanic Shoals Marine Park, which is located within the EMBA (Nichol *et al*., 2013). Despite there being no known aggregation sites within close proximity to the activity area, giant manta rays may be present in the EMBA as transiting individuals.

Narrow sawfish (EPBC Act: Listed migratory)

The narrow sawfish lives in coastal and estuarine habitats across northern Australia and is generally restricted to shallow waters (less than 40 m) (D'Anastasi *et al*., 2013). The species is known to occur in the Gulf of Carpentaria but its distribution and migration is largely unknown. The narrow sawfish has the potential to occur within the spill EMBA because it has been caught as bycatch by the NPF in these areas (Tonks *et al*., 2008).

Dwarf sawfish (EPBC Act: Vulnerable, Listed migratory)

The dwarf sawfish (*Pristis clavata*) usually inhabits shallow (2–3 m deep) coastal waters and estuarine habitats. Its distribution is considered to extend north from Cairns around the Cape York Peninsula in Queensland, across northern Australian waters to the Pilbara coast in WA (DCCEEW, 2024b). The dwarf sawfish uses its rostrum to stun schooling fish by sideswiping or threshing while swimming through a school. The main prey species is popeye mullet (*Rhinomugil nasutus*). The main threats to dwarf sawfish are habitat loss and entanglement in fishing nets.

Adult dwarf sawfish are known to occur in the nearshore areas of the spill EMBA (Figure 11.27). The EMBA overlaps with foraging, nursing and pupping BIAs in Camden Sound (eastern shore), and some sections of the Fitzroy River Mouth, May & Robinson River tidal tributaries and inshore waters of King Sound respectively (see Table 11.4 and Figure 11.27).

Largetooth sawfish (EPBC Act: Vulnerable, Listed migratory)

Largetooth sawfish (*Pristis pristis*) also known as the freshwater sawfish, utilise both freshwater (juvenile) and marine (adult) environments during the different stages of its lifecycle (TSSC, 2014b). Within Australia, largetooth sawfish have been recorded in numerous drainage systems across northern WA, NT and northern Queensland (TSSC, 2014b). Growing up to 7 m in length, the largetooth sawfish feeds on fishes and benthic invertebrates. The saw is used to stun schooling fish, such as mullet, and for extracting molluscs and small crustaceans from the benthic sediment. Nursing areas for the species include Eighty Mile Beach, Roebuck Bay and King Sound (which is also a known foraging area).

The spill EMBA overlaps areas where adult largetooth sawfish are known to occur. BIAs that overlap the EMBA are shown in Table 11.4 and Figure 11.28.

Green sawfish (EPBC Act: Vulnerable, Listed migratory)

The green sawfish (*Pristis zijsron*) occurs in both inshore and offshore marine coastal waters of northern Australia. Green sawfish have been recorded in very shallow water (less than one metre) to offshore trawl grounds in over 70 m of water (Stevens *et al.,* 2005). Despite being found in deep water, evidence suggests that the range of green sawfish is mostly restricted to the inshore coastal fringe, with a strong association with mangroves and adjacent mudflats (Stevens e*t al.,* 2008). Its current known distribution stretches from Broome, WA around northern Australia and down the east coast as far as Jervis Bay, NSW (DCCEEW, 2024b).

The main threats to green sawfish are habitat loss and entanglement in fishing nets. The EMBA overlaps areas where both adult and juvenile sawfish are known to occur and is adjacent to the inner waters of the southern JBG where pupping of this species is likely to occur (Figure 11.29). It has also been caught as bycatch from the NPF in the area overlapped by the activity area and spill EMBA and therefore is likely to be present in both (Tonks *et al*., 2008). BIAs for this species that overlap the EMBA are listed in Table 11.4.

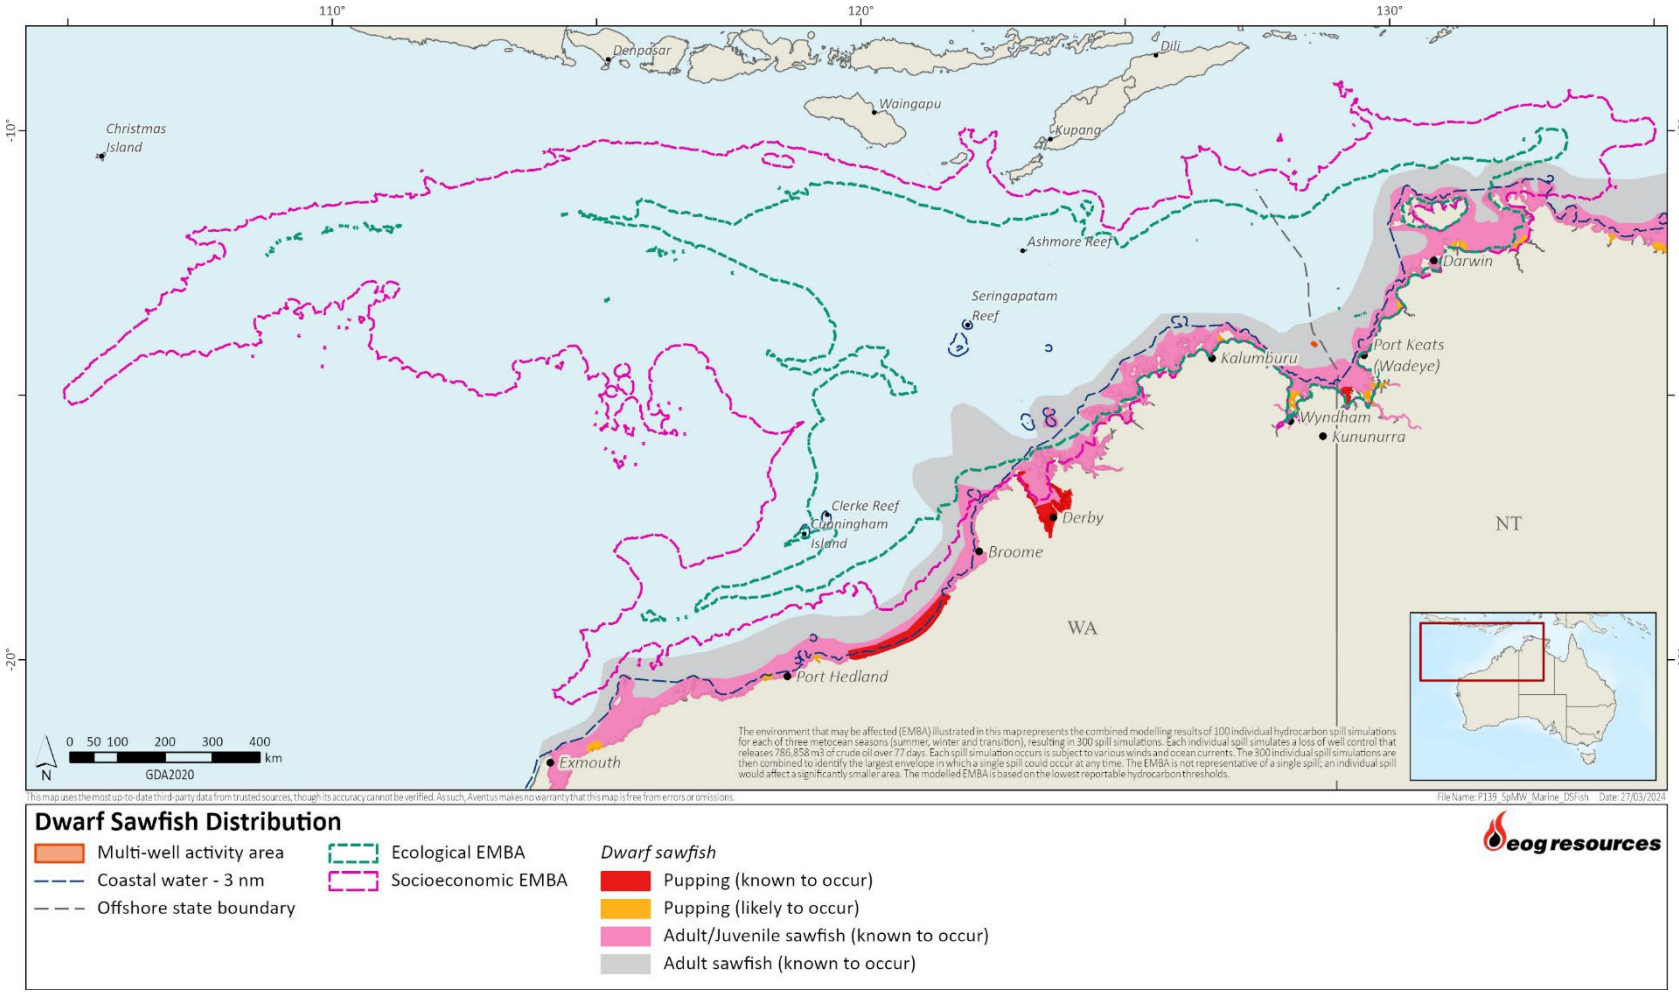

Figure 11.27 Dwarf sawfish presence in the spill EMBA

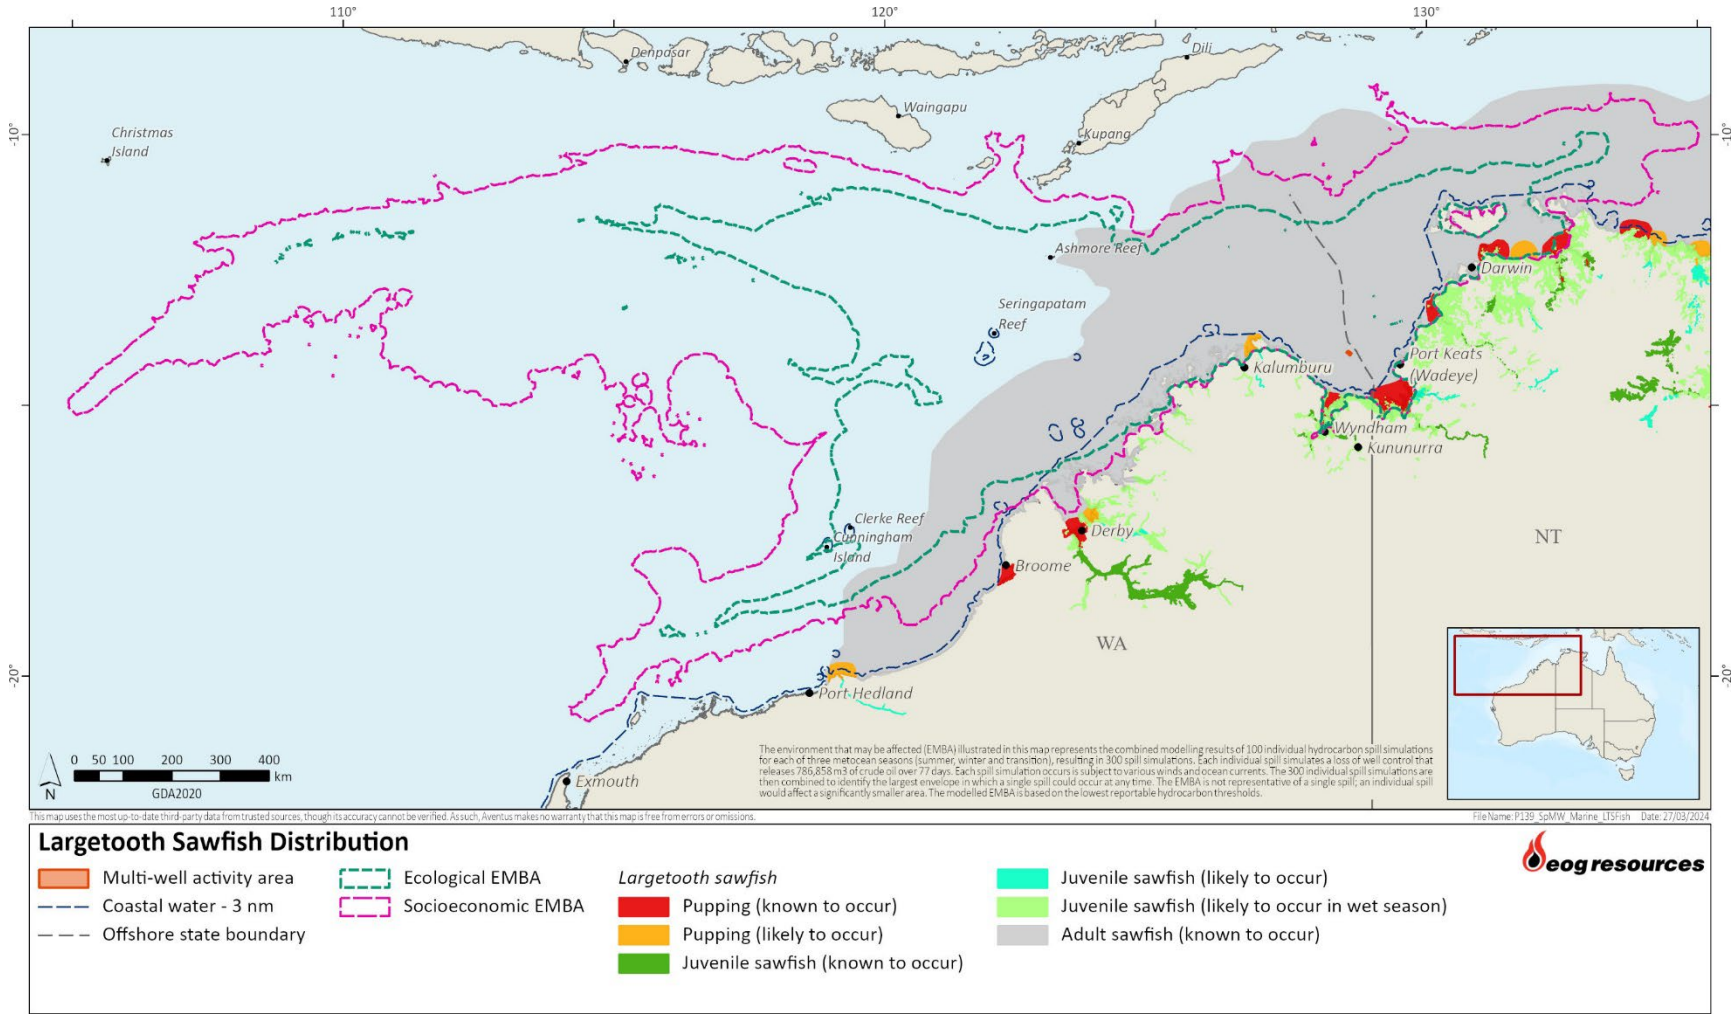

Figure 11.28 Largetooth sawfish presence in the spill EMBA

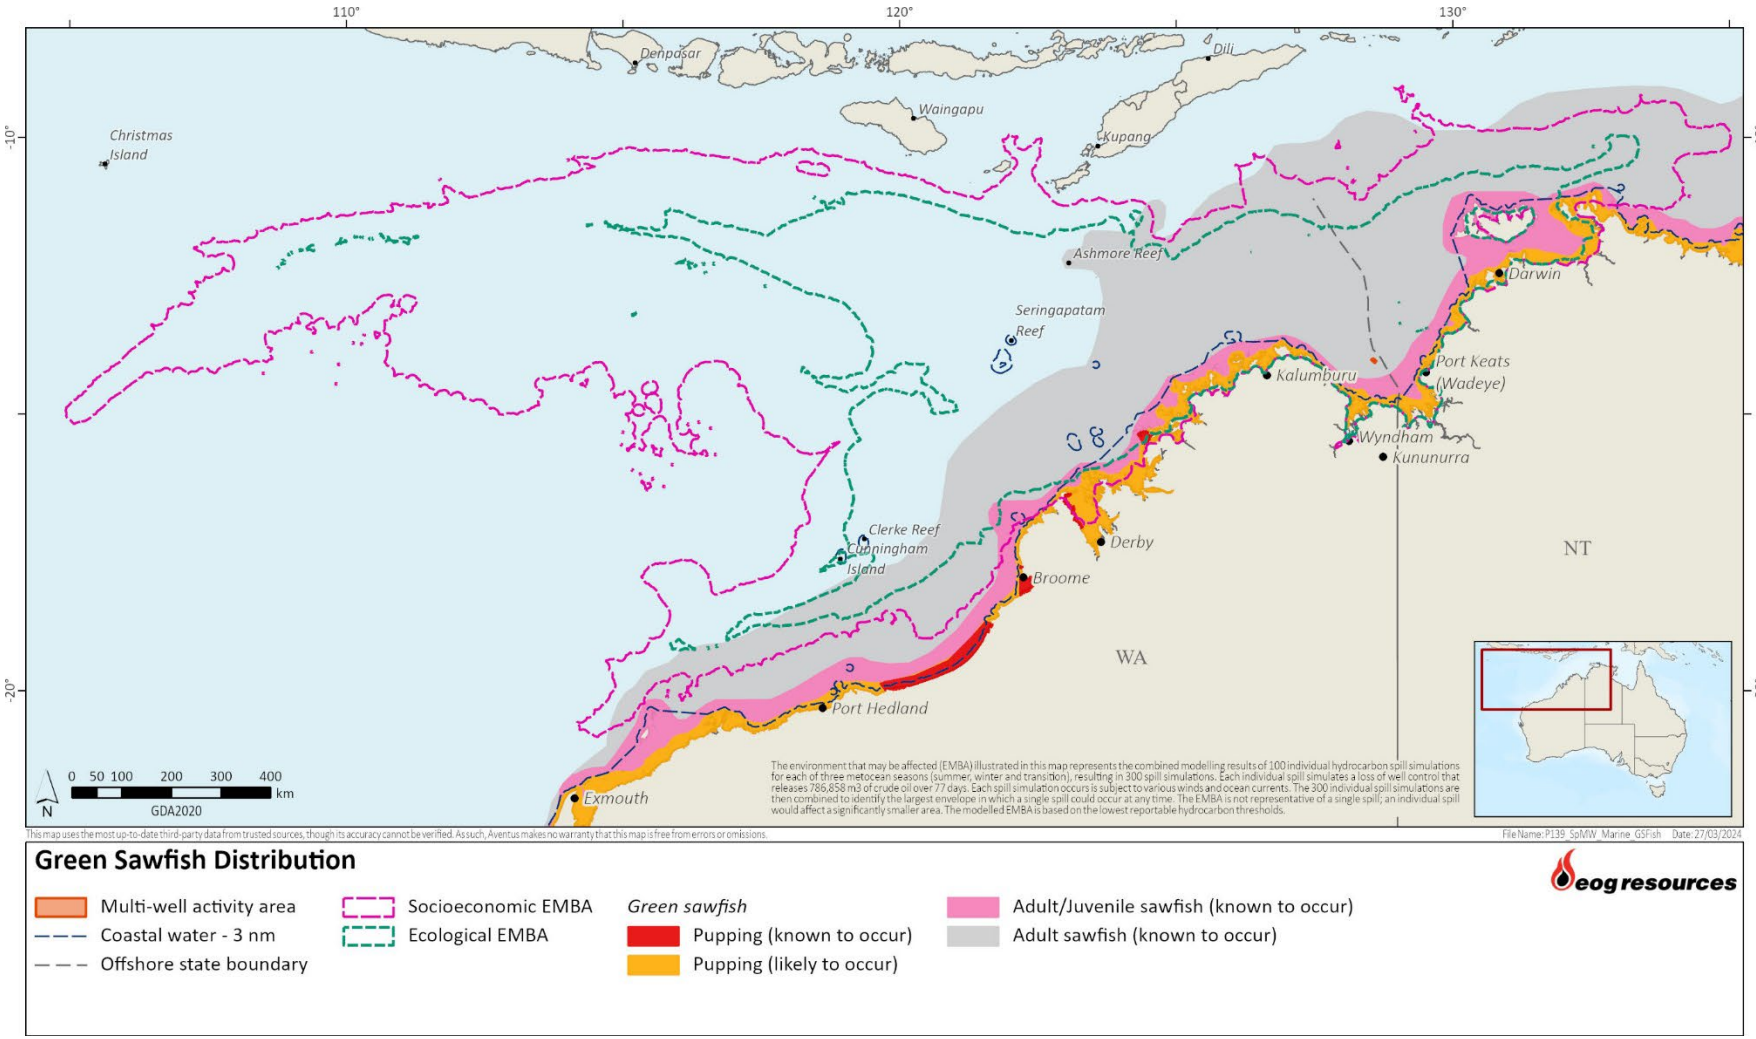

Figure 11.29 Green sawfish presence in the spill EMBA

Scalloped hammerhead (EPBC Act: Conservation Dependent)

The scalloped hammerhead (*Sphyrna lewini*) is a relatively large, fusiform-bodied, moderately slender shark. has a circum-global distribution in tropical and sub-tropical waters. This species has a strong genetic population structuring across ocean basins as it rarely ventures into or across deep ocean waters, but ranges quite widely over shallow coastal shelf waters. Within Australian waters the scalloped hammerhead extends from New South Wales (around Wollongong, where it is less abundant), around the north of the continent and then south into Western Australia to approximately Geographe Bay, though it is rarely recorded south of the Houtman Abrolhos Islands (TSSC, 2018a). It is currently under threatened listing assessment (current status is Conservation Dependent) which was due 30 April 2022, but has not been updated since.

As per the PMST report, breeding of the scallop hammerhead is known to occur in the EMBA.

Southern Bluefin Tuna (EPBC Act: Conservation Dependent)

This species is described in Chapter 5 of the EP.

As per the PMST report, breeding of the southern bluefin tuna is known to occur in the EMBA.

Sygnathids (EPBC Act: Listed marine species, FFG Act: Not listed)

Thirty-five (35) of the 47 marine ray-finned fish species identified in the EPBC Act PMST (74%) are sygnathiformes, which includes seahorses, seadragon, pipehorse and pipefish. The majority of these fish species are associated with seagrass meadows, macroalgal seabed habitats, reefs and sponge gardens located in shallow, inshore waters (e.g., protected coastal bays, harbours and jetties) less than 50 m deep. They are sometimes recorded in deeper offshore waters, where they depend on the protection of sponges and rafts of floating seaweed such as *Sargassum*. It is likely that sygnathid species will occur in the deeper waters of the spill EMBA.

The PMST species profile and threats profiles indicate that the sygnathiforme species listed in the spill EMBA are widely distributed throughout northern and north-western Australian waters. The diverse range of ecological niches afforded by reef sites would be expected to provide suitable habitat for these listed species.

11.3.5 Marine Mammals

The PMST indicates that 15 whale species and 17 dolphin species may occur within or migrate through the spill EMBA (DCCEEW, 2024a). These species are presented in Table 11.5 and a description focused on threatened species follows.

The likely temporal presence and absence of cetaceans in the EMBA is illustrated in Figure 5.18 in Section 5.4.5 of Chapter 5.

The species listed as threatened or migratory are described in this section. BIAs for marine mammals that overlap the EMBA are presented in Table 11.6.

	Breeding	Ashmore Reef – west.
	Calving	Ashmore Reef – west.
	Nursing	Ashmore Reef – west.

Pygmy blue whale (EPBC Act: Endangered, Listed migratory)

Pygmy blue whales are described in Section 5.4.5 of Chapter 5.

The EMBA is considered within the 'likely' distribution of the species and therefore pygmy blue whales may be present in the region during the southern migration period (September to December) (DoE, 2015b).

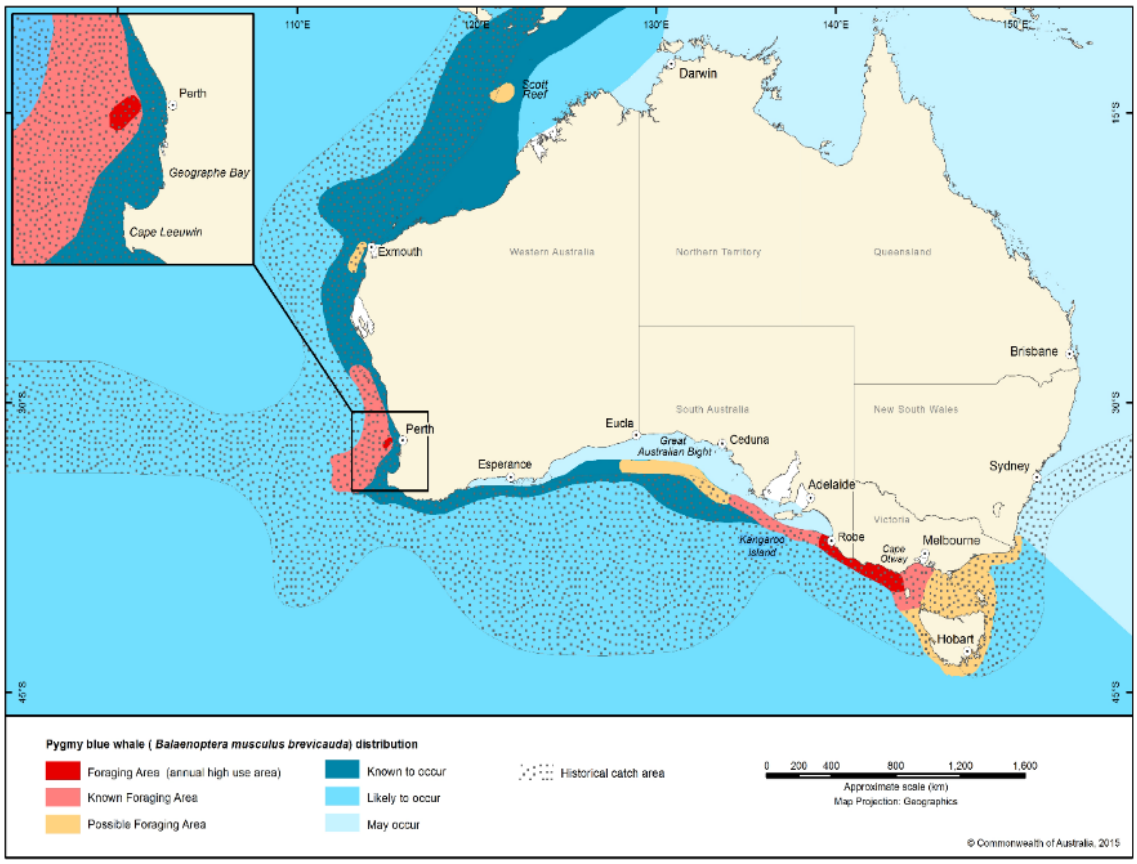
There is a foraging, migration and distribution BIA located off the Northwest Shelf is and Scott Reef (within the EMBA) is considered to be a 'possible' foraging area (see Table 11.6 and Figure 11.30).

Southern right whale (EPBC Act: Endangered, Listed migratory)

The southern right whale (*Eubalaena australis*) is present in the southern hemisphere between approximately 30° and 60°S. The species feeds in the Southern Ocean in summer, moving close to the Australian shore in winter.

In Australian waters, the southern right whales distribution range from Perth, along the southern coastline, to Sydney. Sightings have been recorded as far north as Exmouth although these are rare (Bannister *et al*., 1996). BIAs including calving and aggregation areas are recorded for this species along the southern coastline of Australia (DCCEEW, 2024a).

There are no established or emerging coastal aggregation areas, nor breeding or calving BIAs for the southern right whale in the spill EMBA. Given the preference for the southern coastline of Australia, it is unlikely that southern right whales will be present the spill EMBA.



Source: DoE (2015a)

Figure 11.30 Pygmy blue whale BIAs

Humpback whale (EPBC Act: Listed migratory)

Humpback whales are described in Section 5.4.5 of Chapter 5 and their distribution is illustrated in Figure 11.31.

Humpback whales travel northbound from Northwest Cape, along the continental shelf and pass the west of the Muiron, Barrow and Montebello Islands (within the EMBA), peaking in late July (Jenner *et al*., 2001). Southbound migrations are more diffuse and irregular with no obvious peak. The southerly migration extends parallel to the coast on the 20 – 30 m depth contour from Lacepede Islands (north of Broome) (Jenner *et al.* 2001, DEWHA, 2008b). An increase in southerly migrating individuals may be observed between the North West Cape and the Montebello Islands around November (Jenner *et al*., 2001).

In the NWMR, humpback whales are known to have breeding and foraging grounds between Broome and the northern end of Camden Sound, with the highest concentrations occurring between June and September (DEWHA, 2008b). Camden Sound appears to be the northern most limit for the majority of the west coast whales (Figure 11.32) (Jenner *et al*., 2001). Although, the breeding and calving BIA for humpbacks off the west Kimberley coastline extends as far as Bigge Island (offshore from Mitchell Plateau) located within the spill EMBA.

Given the activity timing is outside of the humpback whale period of peak presence in north western Australia (June – September), it is unlikely that the whales are present in significant numbers within the EMBA.

The humpback whale migration (north and south) BIA is located in the EMBA. Other BIAs for this species that overlap the EMBA are presented in Table 11.6 and Figure 11.33.

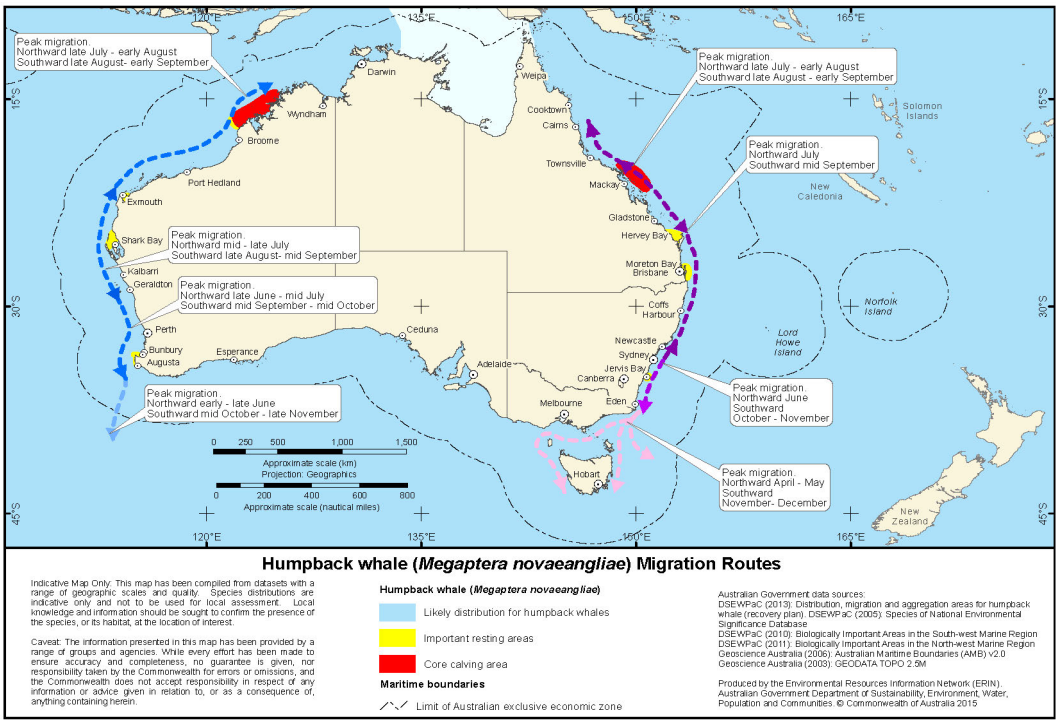
Figure 11.31 Distribution of the humpback whale around Australia



Source: TSSC (2015a).

Figure 11.32 Migration routes of humpback whales around Australia

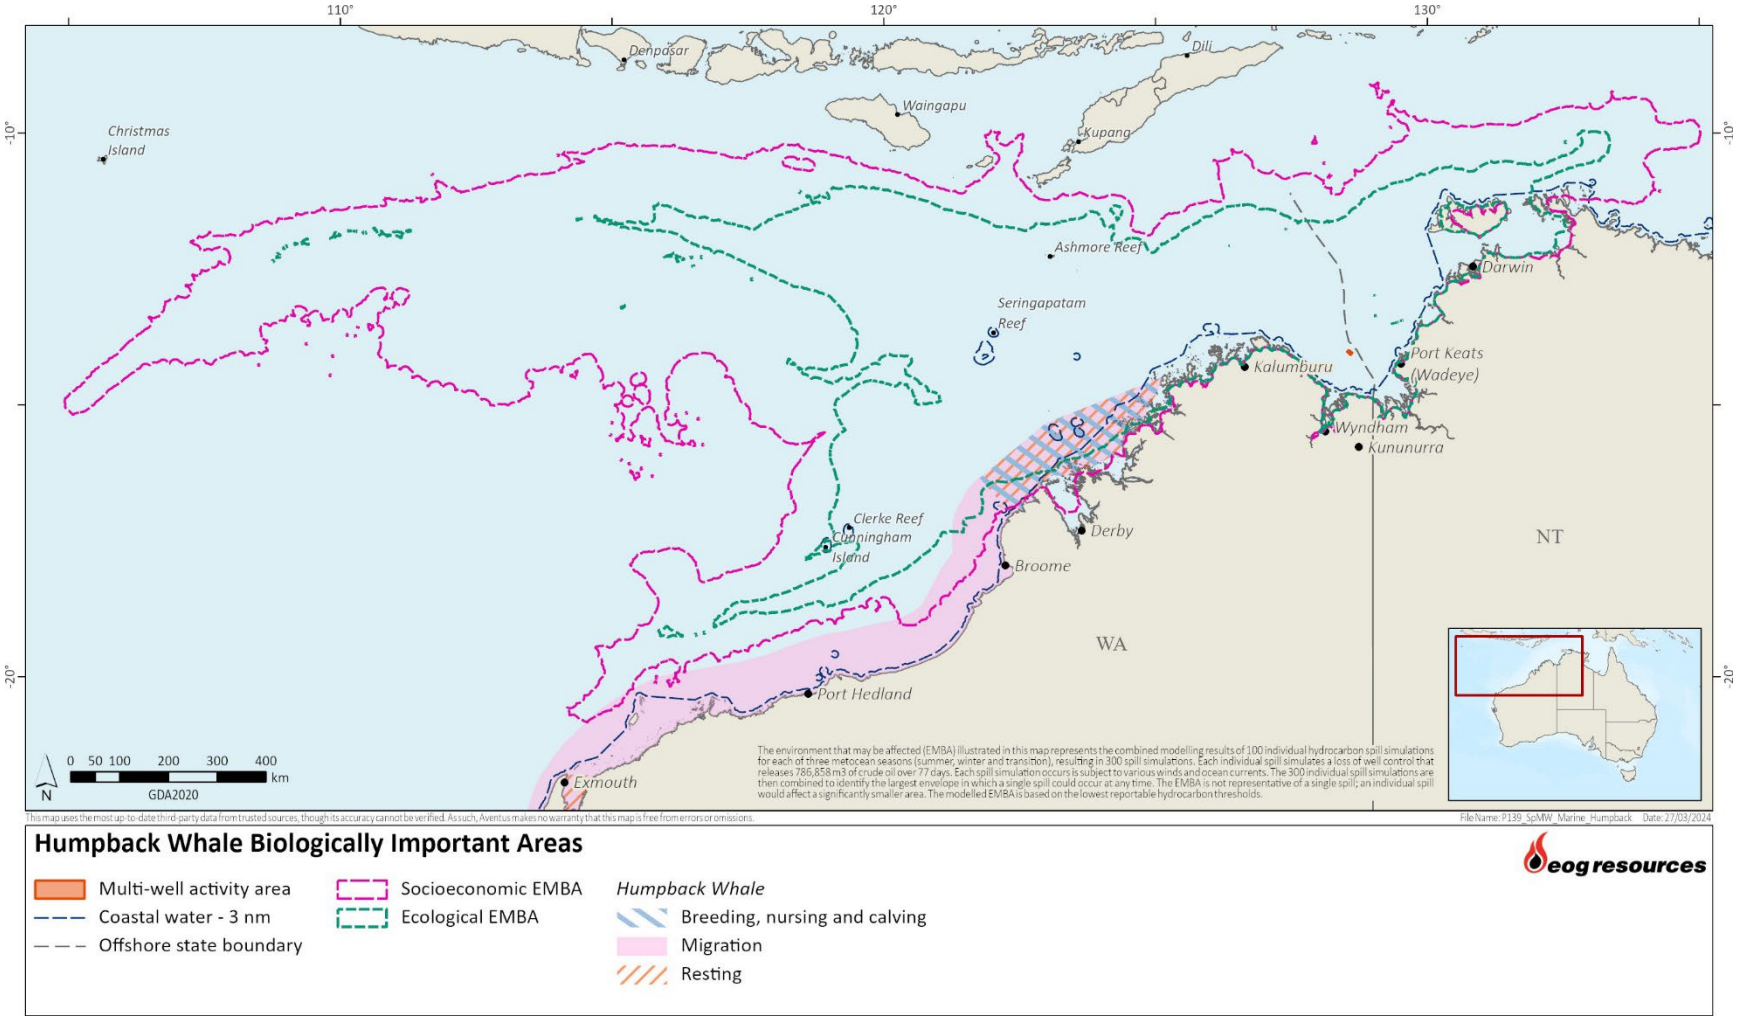


Figure 11.33 Humpback whale BIA in the spill EMBA

Sei whale (EPBC Act: Vulnerable, Listed migratory)

Sei whales are described in Section 5.4.5 of Chapter 5.

Based upon the species preference for deep offshore waters, the wide-ranging nature of this species, and the small number of sei whale sightings in Australia, the presence of the species within the EMBA is likely to be low.

Fin whale (EPBC Act: Vulnerable, Listed migratory)

Fin whales are described in Section 5.4.5 of Chapter 5.

Based on the fin whale preference for deep offshore waters and the minimal sightings in the coastal waters of the EMBA, the presence of this species in the spill EMBA is considered to be limited.

Sperm whale (EPBC Act: Vulnerable, listed migratory)

Sperm whales (*Physeter macrocephalus*) are the largest of the toothed whales and are generally found in pods of up to 50 individuals (DCCEEW, 2024b). Sperm whales have a global distribution. They generally inhabit deeper oceanic waters with a water depth of 600 m or more and are uncommon in waters less than 300 m (DoEE 2019a).

The PMST indicates that the species is known to occur within the EMBA. No BIAs for the species are recorded in the spill EMBA.

It is possible that sperm whales may transit through the spill EMBA, but they are not expected to be present in significant numbers.

Bryde's whale (EPBC Act: Listed migratory)

Bryde's whales are described in Section 5.4.5 of Chapter 5.

The PMST indicates that the species may occur within the EMBA. However, there are no feeding or breeding BIAs within the EMBA.

Killer whale (EPBC Act: Listed migratory)

Killer whales are described in Section 5.4.5 of Chapter 5.

Sightings of killer whale around the Australian coast are typically recorded along the continental slope and shelf, and predominantly in the vicinity of seal colonies, which are not known to exist in the region (DEWHA 2008b). No areas of significance and no determined migration routes have been identified for this species within waters off WA (DoEE, 2019a).

The EMBA is unlikely to represent important habitat for this species. Therefore, killer whales are unlikely to be present in the EMBA.

Indo-Pacific humpback dolphin (EPBC Act: Listed migratory)

Australian humpback dolphins (*Sousa sahulensis*) are found primarily in coastal waters and feed mainly on fish associated with coastal-estuarine waters (DCCEEW, 2024b). In Queensland and the NT, Australian humpback dolphins are mainly found in water less than 20 km from the nearest river mouth, and in water less than 15–20 m deep (DCCEEW, 2024b). They are generally found in river mouths, mangroves, seagrass beds, tidal channels and inshore reefs. They are known to have resident groups that forage, feed, breed and calve in state and territory waters. Calves may be born throughout the year, but peaks in summer and spring have been reported.

Humpback dolphin foraging BIAs are located along the Kimberley coastline, including breeding, and calving. A breeding BIA for the species are also located in Darwin Harbour (approximately 275 km north-east of the activity area). Foraging BIAs are also located in Van Diemen Gulf and Port Essington (Cobourg Peninsula) (see Table 11.6 and Figure 11.34).

The PMST indicates that the species is known to occur within the EMBA. The coastal area of the socio-economic EMBA overlaps the significant habitat BIA for this species located in the north Kimberley coastline and NT coastline are outlined in Table 11.6 and Figure 11.34. Therefore, the species is likely to be present in the spill EMBA.

Australian snubfin dolphin (EPBC Act: Listed migratory)

The Australian snubfin dolphins (*Orcaella brevirostris*) is described in Section 5.4.5 of the EP.

The PMST indicates that the species is known to occur within the EMBA. The EMBA overlaps with the resting, calving, breeding and foraging BIA as outlined in Table 11.6 and Figure 11.35.

Spotted bottlenose dolphin (EPBC Act: Listed marine)

The spotted bottlenose dolphin (*tursiops aduncus)* resembles common bottlenose dolphins (*T. truncatus)* in their general colour pattern. They have a dark grey dorsal cape, with a paler grey dorsal overlay extending onto the flanks, and an off-white ventral area (DCCEEW, 2024b). This species has been confirmed to occur in estuarine and coastal waters of eastern, western and northern Australia. They are restricted to inshore areas such as bays and estuaries, nearshore waters, open coast environments, and shallow offshore waters including coastal areas around oceanic islands. The spill EMBA overlaps breeding, calving and foraging BIAs for the spotted bottlenose dolphin which can be seen in Figure 11.36

The spotted bottlenose dolphin is likely to be present in the spill EMBA.

Indian ocean bottlenose dolphin (Arafura/Timor Sea populations) (EPBC Act: listed migratory)

The Indian Ocean bottlenose dolphin (*Tursiops aduncus Arafura/Timor Sea populations)* is described in Section 5.4.5 of Chapter 5.

Dugong (EPBC Act: Listed marine, migratory)

Dugongs are described in Section 5.4.5 of Chapter 5.

Dugongs have been reported to occur along the coastline from Cape Hay to Pearce Point with the main populations concentrated around Dorcherty Island (Woodside, 2004), approximately 92 km east of the activity area. The closest dugong foraging BIA is located south of Ashmore Reef, with additional foraging BIA on the Kimberley coastline off the Dampier Archipelago (within the spill EMBA) (see Table 11.6). Ashmore Reef supports a population of less than 50 individuals that are genetically distinct from other Australian populations. The reef provides breeding and feeding habitats, with seagrass beds of the reef flats and lagoon their preferred food source. Breeding occurs year round at Ashmore Reef (DoEE, 2019a). An additional three BIAs for this species overlaps with the EMBA (see Table 11.6 and Figure 11.37).

Dugongs have high cultural value to Indigenous coastal communities. The coastal waters of northwest Australia, encompassing the Kimberley and Pilbara regions (within the EMBA) down to Shark Bay (outside of the EMBA), are home to one of the largest remaining dugong populations in the world (Bayliss & Hutton, 2017; Lincoln *et al.,* 2021). To date there have been limited human-induced threats to dugongs in the Kimberley, making the area an important global stronghold for the species (Bayliss & Hutton, 2017).

Dugongs live and move between the traditional Sea Country and Native Title determination areas of numerous Indigenous communities along the length of the Kimberley coastline. Within the Kimberley region it is known that there is a deep ancient and contemporary Indigenous knowledge surrounding dugongs relating to people, culture, livelihoods, and spiritual belief (Lincoln *et al.,* 2021). This knowledge ties into sustainable harvest, local abundance, ecology, biology, diet, and movement of this species (Lincoln *et al.,* 2021). The Balanggarra Healthy Country Plan (HCP), Wunambal Gaambera HCP, Dambimangari HCP and the Mayala Country Plan all discuss the historical and cultural

significance of the dugong, particularly as a food and trade source (Balanggarra Aboriginal Corporation/KLC, 2011; Wunambal Gaambera Aboriginal Corporation, 2010; Dambimangari Aboriginal Corporation, 2012; Mayala Inninalang Aboriginal Corporation, 2019).

Therefore, dugongs are likely to be present in the nearshore areas of the spill EMBA within the Kimberely and Pilbara regions.

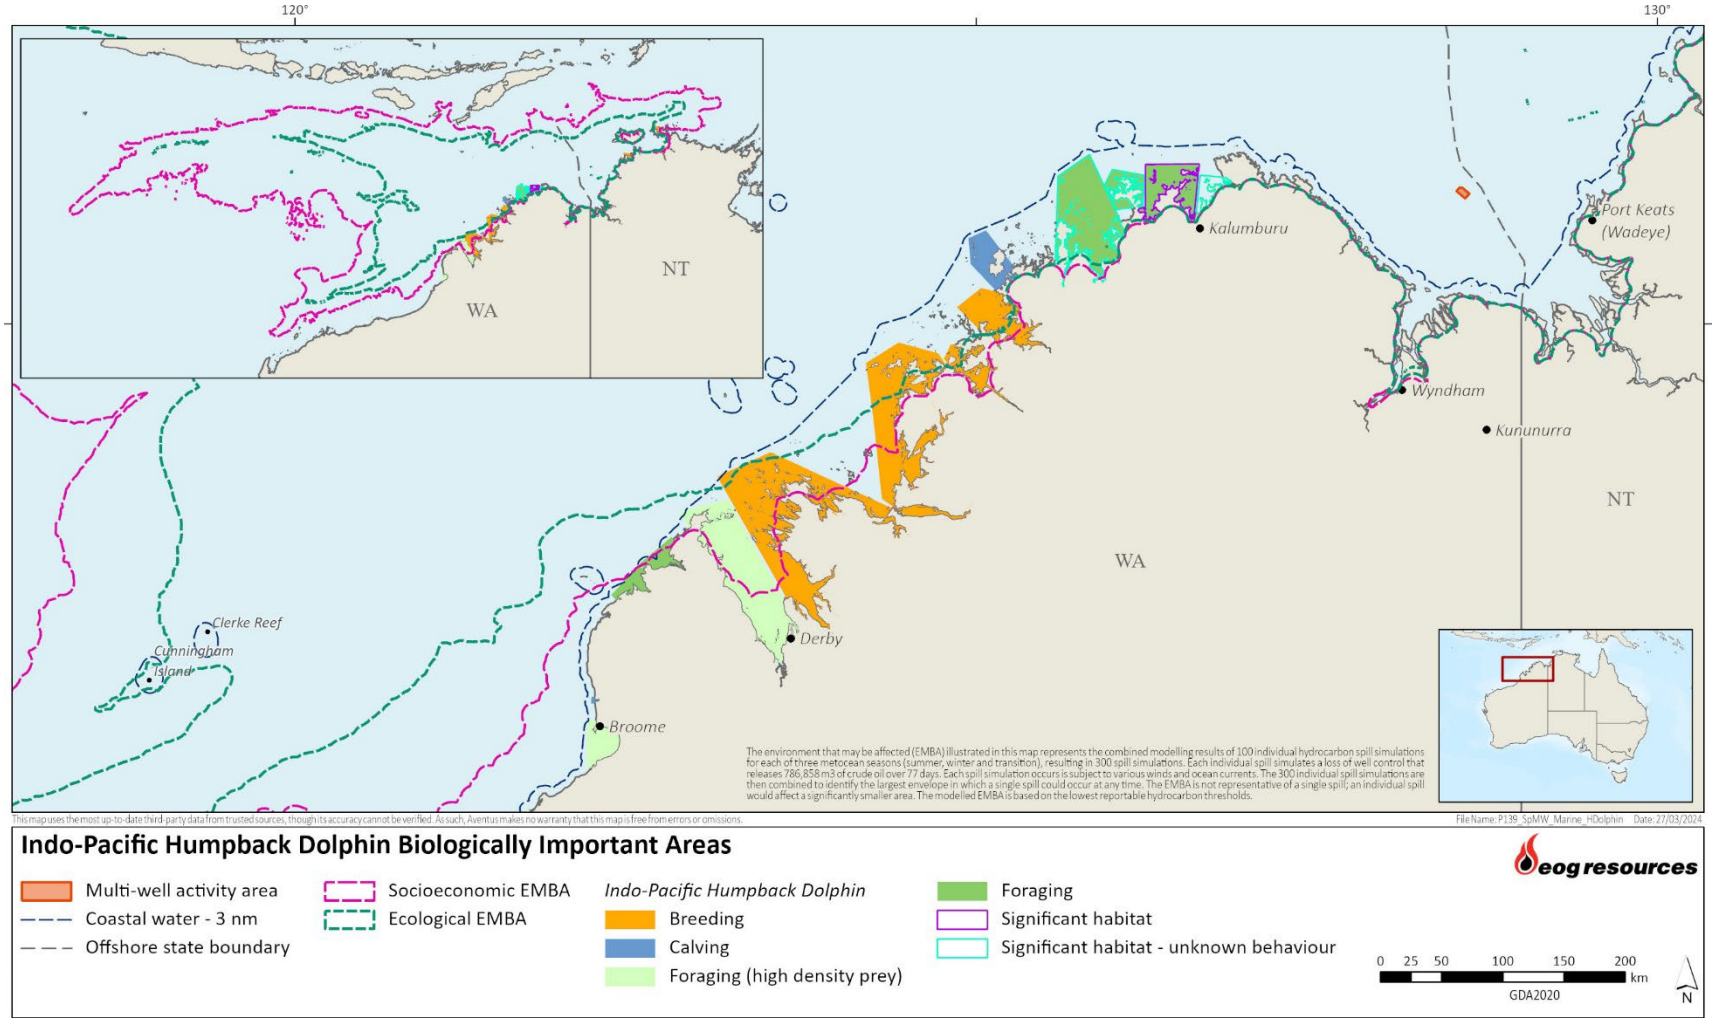

Figure 11.34 Australian humpback dolphin BIA in the spill EMBA

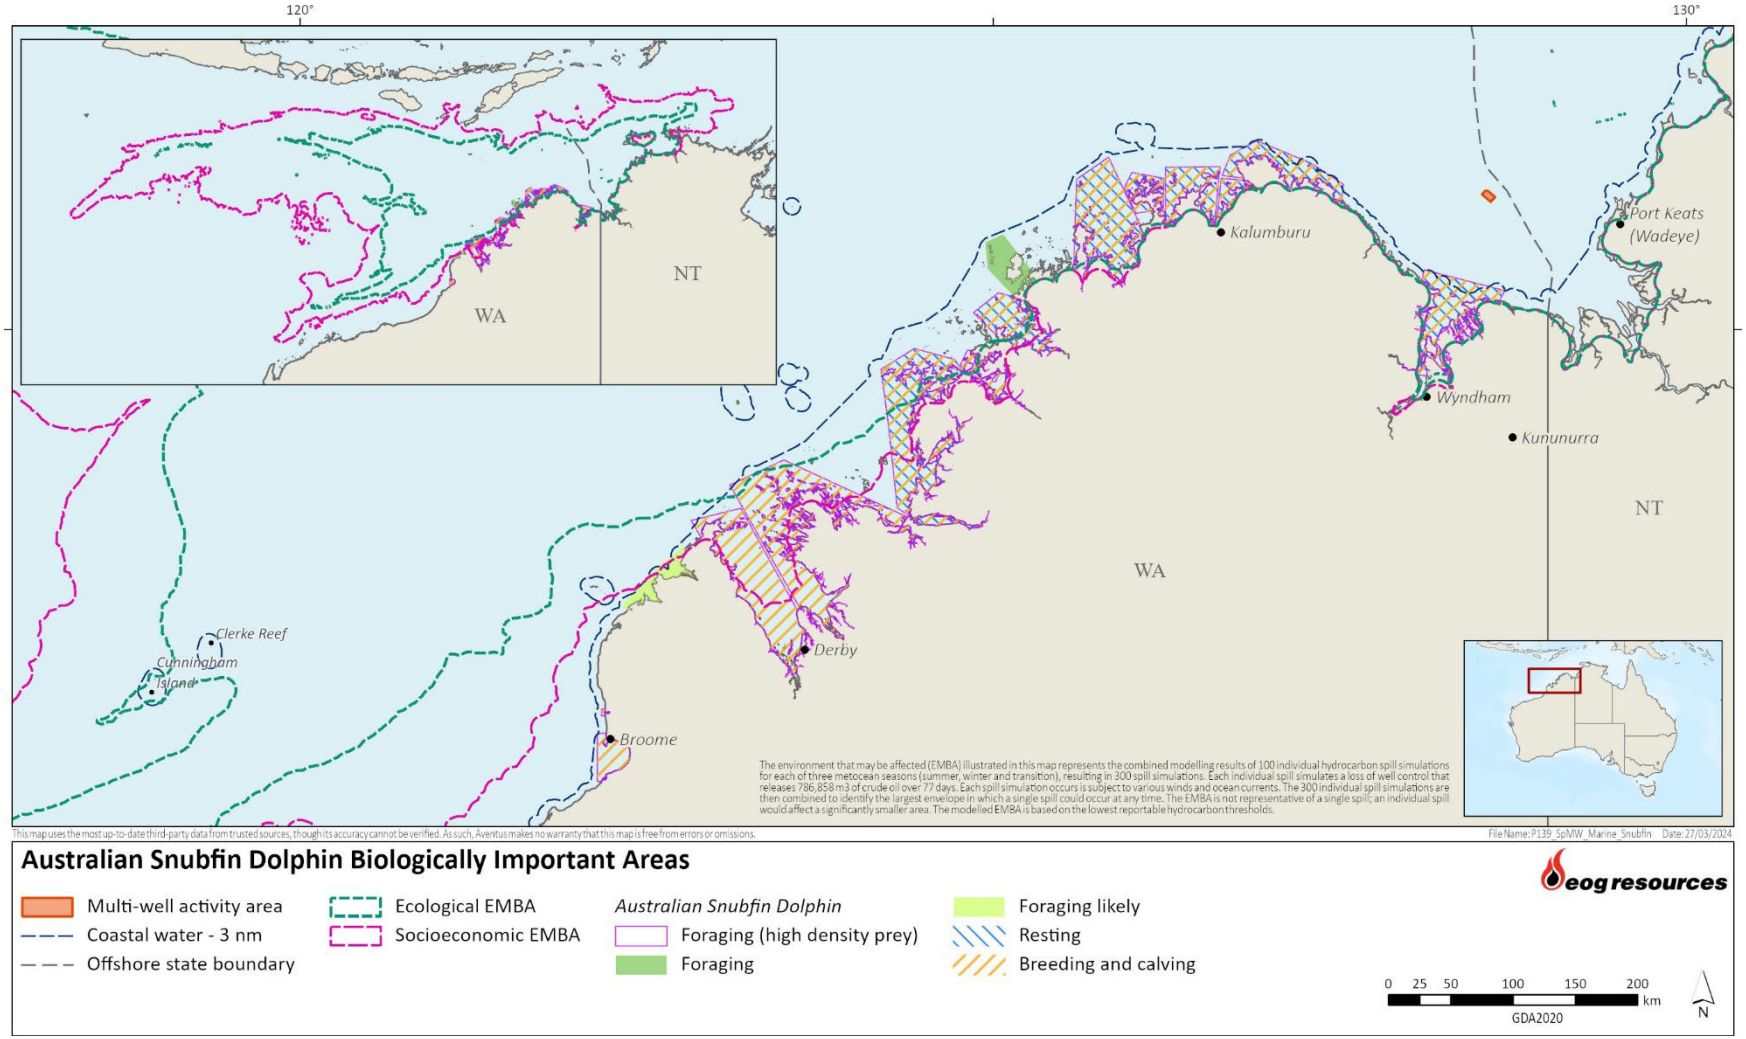

Figure 11.35 Australian snubfin dolphin BIA in the spill EMBA

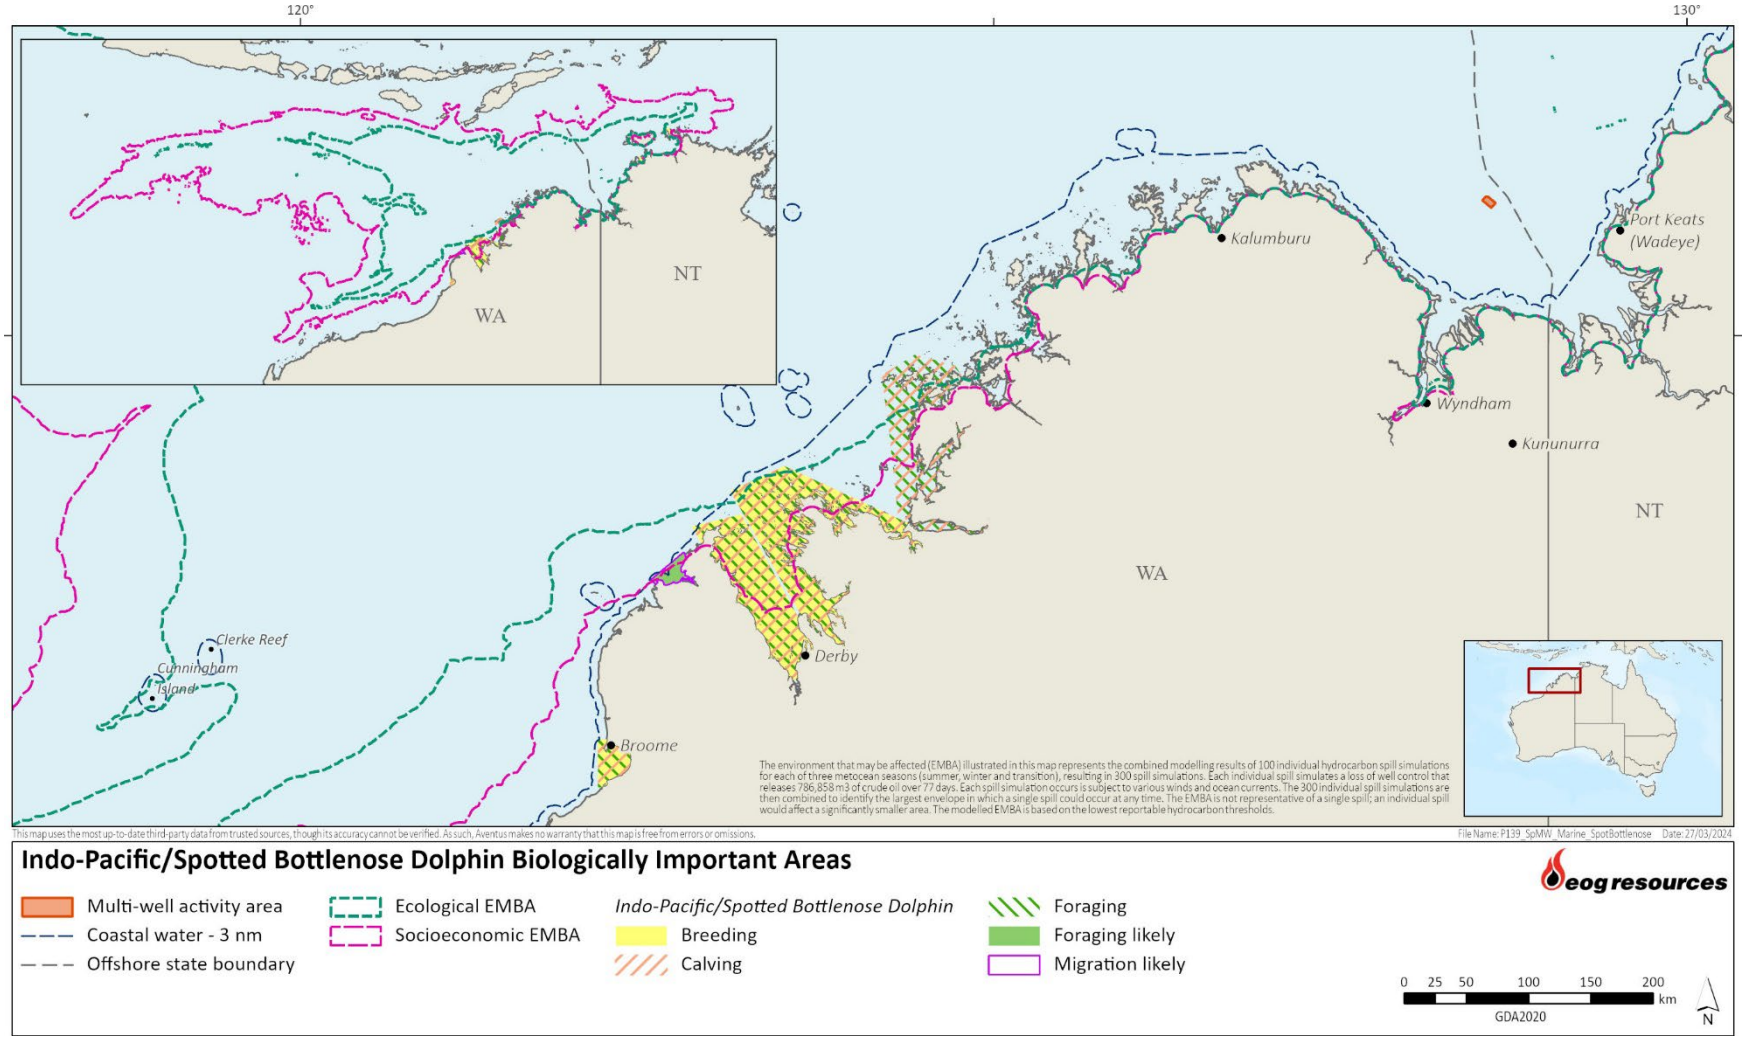

Figure 11.36 Spotted bottlenose dolphin BIA in the spill EMBA

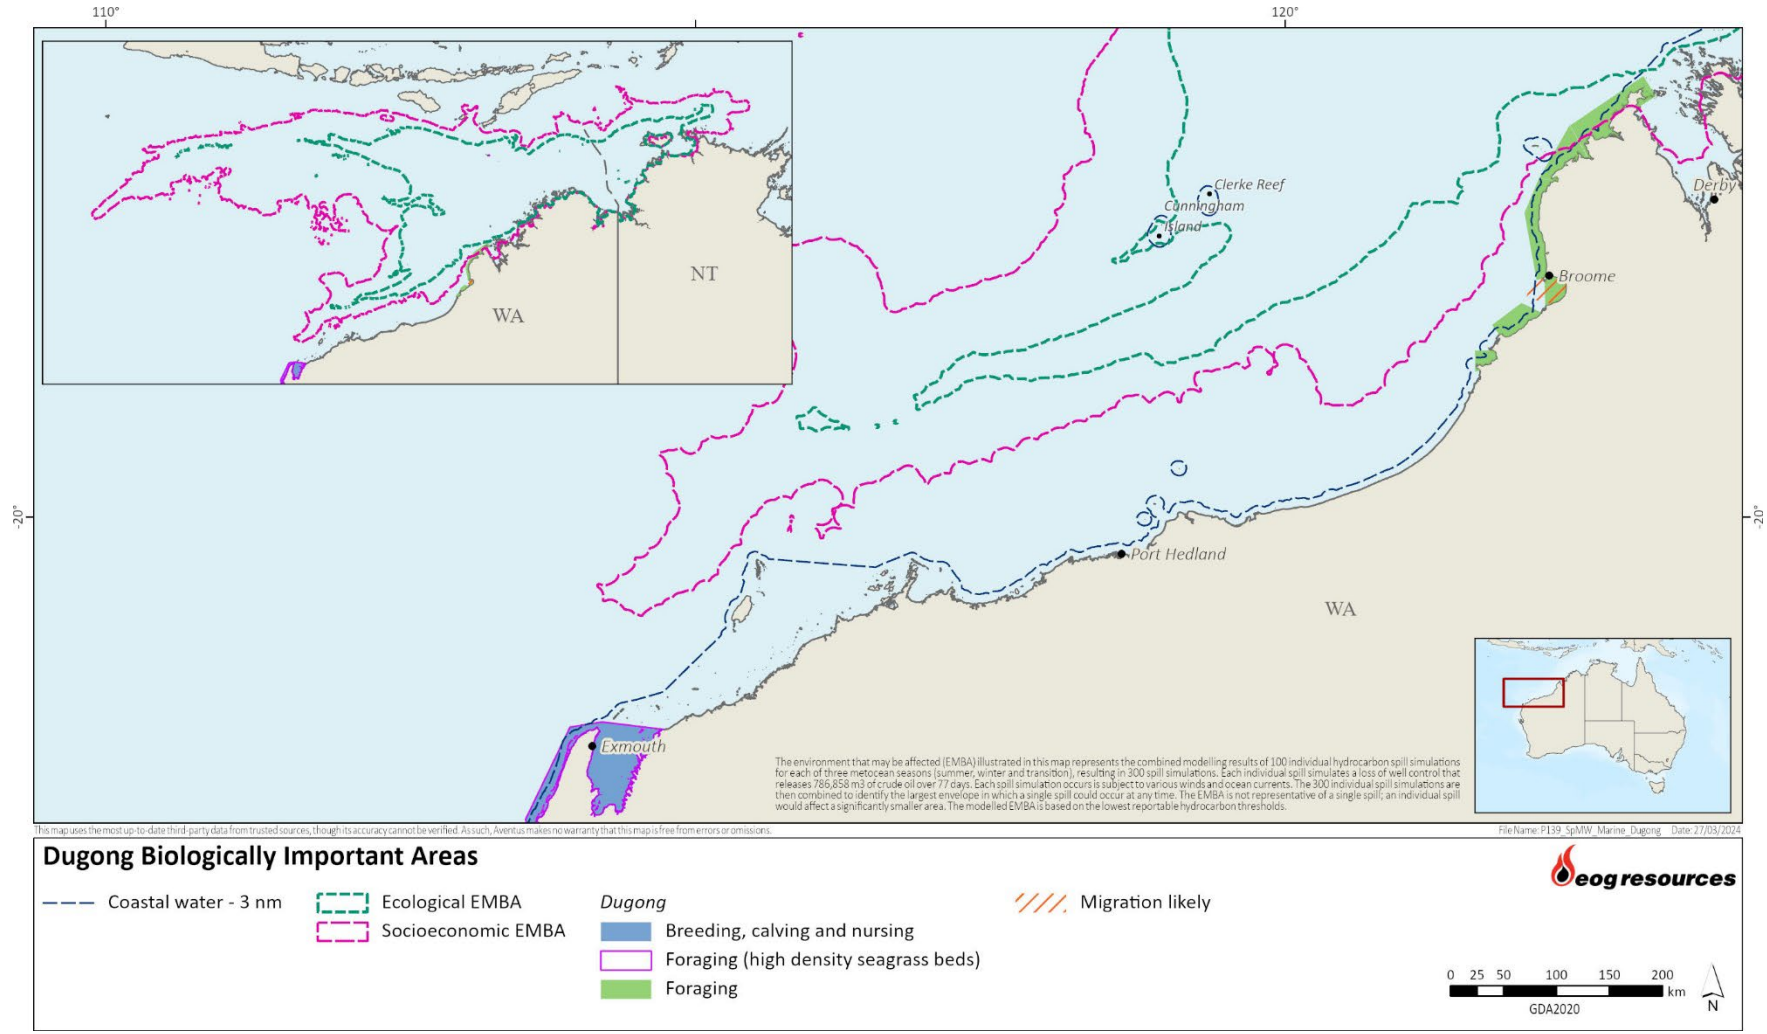

Figure 11.37 Dugong BIA in the spill EMBA

11.3.6 Reptiles

Six species of marine turtle are listed under the EPBC Protected Matters Search Tool (PMST) as potentially occurring in the spill EMBA, as listed in Table 11.7 (DCCEEW, 2024a). Three of the turtle species are listed as endangered, with the other three listed as vulnerable.

Species of marine turtles listed in Table 11.7 occur in and nest on the sandy beaches of WA, all of which are likely to be present within the spill EMBA. Details on these species are provided in this section. Ecological stages and temporal occupation of the turtle species is presented in Figure 5.20 in Section 5.4.6 of Chapter 5.

BIAs and habitat critical for turtle species that overlap the spill EMBA are presented in Table 11.8. Additionally, 26 species of seasnake were identified as potentially occurring in the spill EMBA (two of which are listed as critically endangered). Two species of crocodile and two species of terrestrial reptiles that are known to occur in coastal or semi-coastal habitats are also listed in Table 11.7.

Sea turtles are culturally important to First Nation groups, particularly to those groups who exist along the northern coast of Australia where sea turtles are abundant and were traditionally used as a food source and for other cultural purposes. The Balanggarra HCP, Wunambal Gaambera HCP, Dambimangari HCP and the Mayala Country Plan all discuss the current and historical cultural significance of sea turtles, particularly the green turtle as it is the most common turtle within the region. The green and hawksbill turtles are hunted for their meat that is shared amongst the community; however, the hawksbill turtle is poisonous if it is not prepared correctly in the traditional way. The flatback turtle is occasionally hunted for its meat, but more often for its eggs which are found on the mainland and inshore islands.

Turtle eggs can be used as drink (raw) or cooked as food (Balanggarra Aboriginal Corporation/KLC, 2011; Wunambal Gaambera Aboriginal Corporation, 2010; Dambimangari Aboriginal Corporation, 2012; Mayala Inninalang Aboriginal Corporation, 2019). Where water was not available, people were able to survive for a few days by obtaining moisture from sea turtle eggs (Vigilante *et al*., 2013). One of the earliest recorded encounters of Aboriginal people harvesting turtle eggs was recorded in 1819 on Lacrosse Island (WA) (within the EMBA) (Vigilante *et al*., 2013).

Loggerhead turtle (EPBC Act: Endangered, listed migratory)

Loggerhead turtles are described in Section 5.4.6 of Chapter 5.

Loggerhead turtles are known to forage around the pinnacles of the Bonaparte Basin and the carbonate bank and terrace system of the Sahul Shelf KEFs. Two foraging BIAs for the loggerhead turtle overlap with the socio-economic EMBA (see Table 11.8 and Figure 11.38). No habitat critical to the survival of this species overlaps the spill EMBA, with the nearest area being close to the far western extent of the socio-economic EMBA near waters surrounding Exmouth (Figure 11.38).

Habitat critical to the survival of a species is defined in Section 5.4.6 of the EP.

Green turtle (EPBC Act: Vulnerable, listed migratory)

Green turtles are described in Section 5.4.6 of Chapter 5.

Nesting on the Scott Reef-Sandy Islet and Browse Island has been observed all year round with peaks between December and January (DoEE, 2017c). Satellite tracking studies have shown that green turtles migrate between breeding beaches and feeding grounds off the northwest coast (DoE, 2017c). However, during the internesting periods green turtles are known to remain within 10 km of nesting beaches (DoE, 2017c). The foraging, nesting and interesting BIAs and habitat critical to the survival of green turtles that overlap the EMBA are presented in Table 11.8.

The NCVA identifies that the EMBA overlaps the foraging BIA for this species (Figure 11.39). As such, green turtles are likely to occur in the EMBA. The closest nesting and interesting BIAs are also intersected by the EMBA (Table 11.8 and Figure 11.39). The EMBA overlaps areas of habitat critical to the survival of the green turtle around Cobourg Peninsula and Croker Island in the NT, the coastal areas of Kalumburu, Ashmore Reef, Scott Reef, Lacepede Islands and reaches the edge of critical habitat in the Montebello Islands Conservation Park (see Figure 11.39). Habitat critical to the survival of green turtles occurs at Ashmore Reef all year (peaking in January-February) and Scott Reef and Browse Island (November to March) (DoEE, 2022).

Leatherback turtle (EPBC Act; Endangered, listed migratory)

Leatherback turtles are described in Section 5.4.6 of Chapter 5.

No major nesting has been recorded in Australia, with isolated nesting recorded in Queensland and the NT (DSEWPC, 2012). Nesting occurs on tropical beaches and subtropical beaches (Marquez 1990), but no major centres of nesting activity have been recorded in Australia. The species is understood to migrate from Australian waters to breed at larger rookeries in neighbouring countries such as Indonesia, Papua New Guinea and Solomon Islands between December and January (DoE, 2008). The closest confirmed inter-nesting site for the leatherback turtle is at Cobourg Peninsula (DCCEEW, 2024b) located in the eastern extent of the EMBA (Table 11.8 and Figure 11.40). The spill EMBA overlaps with habitat critical to the survival of the leatherback turtle, within the waters surrounding the Garig Gunak Barlu National Park. Habitat critical is present between December and January (DoEE, 2017). The socio-economic spill EMBA extends into habitat critical to the survival of this species around Croker Island and Garig Gunak Barlu National Park, NT (see Figure 11.40).

Flatback turtle (EPBC Act: Vulnerable, listed migratory)

The flatback turtle (*Natador depressus*) is only found in Australian waters and some nearby waters in Indonesia and Papua New Guinea. It is commonly found in the NWMR and NMR, nesting in northern Australia and foraging in the region.

Breeding occurs all year round; however, in northern Australia most nesting occurs between June and August (DCCEEW, 2024b). Flatback turtle nesting is widespread across the islands and mainland beaches east of Dampier Peninsula in winter, with Cape Domett (within the spill EMBA) reported to support the highest density (Whiting *et al*., 2008). Flatback turtles nest at Cape Domett throughout the year. The Recovery Plan for Marine Turtles in Australia 2017 -2027 (DoEE, 2017c) notes that the peak nesting period at Cape Domett is July to September. The Cape Domett nesting population appears to be one of the largest known nesting populations of this species, with an estimated yearly population in the order of several thousand turtles (Whiting *et al*., 2008).

The 60 km inter-nesting buffer for flatback turtles in the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017) is based primarily on the movements of tagged inter-nesting flatback turtles along the Northwest Shelf reported by Whittock et al (2016), which found that flatback turtles may demonstrate inter-nesting displacement distances up to 62 km from nesting beaches. However, these movements were confined to longshore movements in nearshore coastal waters or travel between island rookeries and the adjacent mainland (Whittock *et al*., 2016). There is no evidence to date to indicate flatback turtles swim out into deep offshore waters during the inter-nesting period. Flatback turtle hatchlings do not have an offshore pelagic phase. Instead, hatchlings grow to maturity in shallow coastal waters thought to be close to their natal beaches (DoEE, 2017c). Flatback turtle hatchlings do not undertake oceanic migrations like the juveniles of other turtle species do, but spend their juvenile life phase within continental shelf waters. The EMBA intersects an inter-nesting BIA, as illustrated in Figure 11.41 and outlined in Table 11.8.

Adult flatback turtles are primarily carnivorous, feeding on soft-bodied invertebrates. Juveniles eat gastropod molluscs, squid, siphonophores, and limited data indicate that cuttlefish, hydroids, soft corals, crinoids, molluscs and jellyfish are also eaten (DCCEEW, 2024b). The species has been recorded foraging in depths less than 10 m to over 40 m on the carbonate bank and terrace system of the Sahul Shelf KEF and around the pinnacles of the Bonaparte Basin KEF. The EMBA intersects a foraging BIA located in the Bonaparte Basin, as illustrated in Figure 11.41 and outlined in Table 11.8**.**

The NCVA identifies the area out to 60 km offshore from Cape Domett and Lacrosse Island in the Cambridge Gulf as a inter-nesting BIA for flatback turtles, which is intersected by the EMBA. Hence, it is likely that flatback turtles will be present in the EMBA. The habitat critical is defined as year-round peaking in July to September (DoEE, 2017). The spill EMBA overlaps habitat critical to the survival of the flatback turtle within the waters surrounding the Tiwi Islands, Kakadu National Park and Darwin (all year-round) as well as waters adjacent to Wyndham and Lacepede Islands (defined as critical from October to March) (see Figure 11.41).

Olive Ridley turtle (EPBC Act: Endangered, listed migratory)

The olive ridley turtle (*Lepidochelys olivacea*) has a worldwide tropical and sub-tropical distribution and is known to occur in both WA and the NT (DoEE 2017c). While nesting has been recorded in WA, it is far more common in the NT (DSEWPC, 2012).

Although olive ridley turtles nest all year round, nesting activity peaks around April to November, with the majority of nesting occurring from the Arnhem Land coast (including Bathurst Island, within the EMBA) to the northwest coast of Cape York Peninsula (Qld) (outside of the EMBA) (DSEWPC, 2012). After nesting, Olive Ridley turtles are known to migrate up to 1,050 km to various foraging areas (DCCEEW, 2024b), including the pinnacles of the Bonaparte Basin and the carbonate bank and terrace system of the Sahul Shelf KEF (DSEWPC, 2012).

The EMBA overlaps with the inter-nesting BIA of the olive ridley turtle located between Fog Bay and the Cox Peninsula (NT) (see Table 11.8 and Figure 11.42).

The olive ridley turtle is known to primarily forage in soft-bottom habitats ranging in depths from 6 – 35 m, though they are also known to forage in pelagic waters (DEWHA 2008b). Adult turtles forage for crabs, shrimp, tunicates, jellyfish, salps and algae in depths ranging from several metres to over 100 m (DCCEEW, 2024b). The NCVA identifies that EMBA overlaps with the foraging BIA for this species as outlined in Table 11.8 and Figure 11.42. The spill EMBA overlaps habitat critical to the survival of olive ridley turtle, within waters surrounding the Tiwi Islands and Kakadu National Park, and the west of the Garig Gunak Barlu National Park as well as waters surrounding Augustus Island and Dampier peninsula. Habitat critical is present year-round (DoEE, 2017). The spill EMBA overlaps the entirety of the waters surrounding Garig Gunak Barlu National Park in the NT, as well as Croker Island and multiple islands to the east and southeast of Croker Island (see Figure 11.42).

Hawksbill turtle (EPBC Act: Vulnerable, listed migratory)

Hawksbill turtles (*Eretmochelys imbricate*) are found in tropical, sub-tropical and temperate waters in all the oceans of the world (DoEE, 2017c). The hawksbill turtle is commonly found in the NWMR and NMR, nesting extensively along the coasts and foraging in the region.

As a juvenile, the hawksbill turtle feeds on plankton in the open ocean and then feeds on sponges, hydroids, cephalopods, gastropods, jellyfish, seagrass and algae as an adult (DCCEEW, 2024b). The species is also highly migratory, moving up to 2,400 km between foraging and breeding areas (DSEWPC, 2012). Due to genetic variability, Australia's population is considered to comprise of two distinct stocks; one in WA and the other in the northeast of Australia (DSEWPC, 2012). These distinct populations are also known to have significantly different breeding seasons.

Hawksbill turtles forage in waters ranging from 1.5 m to 84 m deep, and Fossette et al (2021) report that 17% of satellite tagged turtles (total n=42) foraged in waters greater than 20 m. Fossette et al (2021) reported less than a quarter of foraging area overlapped with designated foraging BIAs for hawksbill turtles (within the spill EMBA) and/or Commonwealth and State-managed protected areas.

The northeast sub-population breeds throughout the year with a peak nesting period during July to October (DSEWPC, 2012), while in the WA population breeding peaks around October to January.

The EMBA overlaps with foraging, nesting and inter-nesting BIAs for this species (see Table 11.8 and Figure 11.43. The ecological spill EMBA does not overlap with any habitat critical to the survival of the hawksbill turtle. The socio-economic EMBA overlaps habitat critical to the survival of this species on New Year Island, NT and approaches the edge of the Montebello Islands Conservation Park (see Figure 11.43).

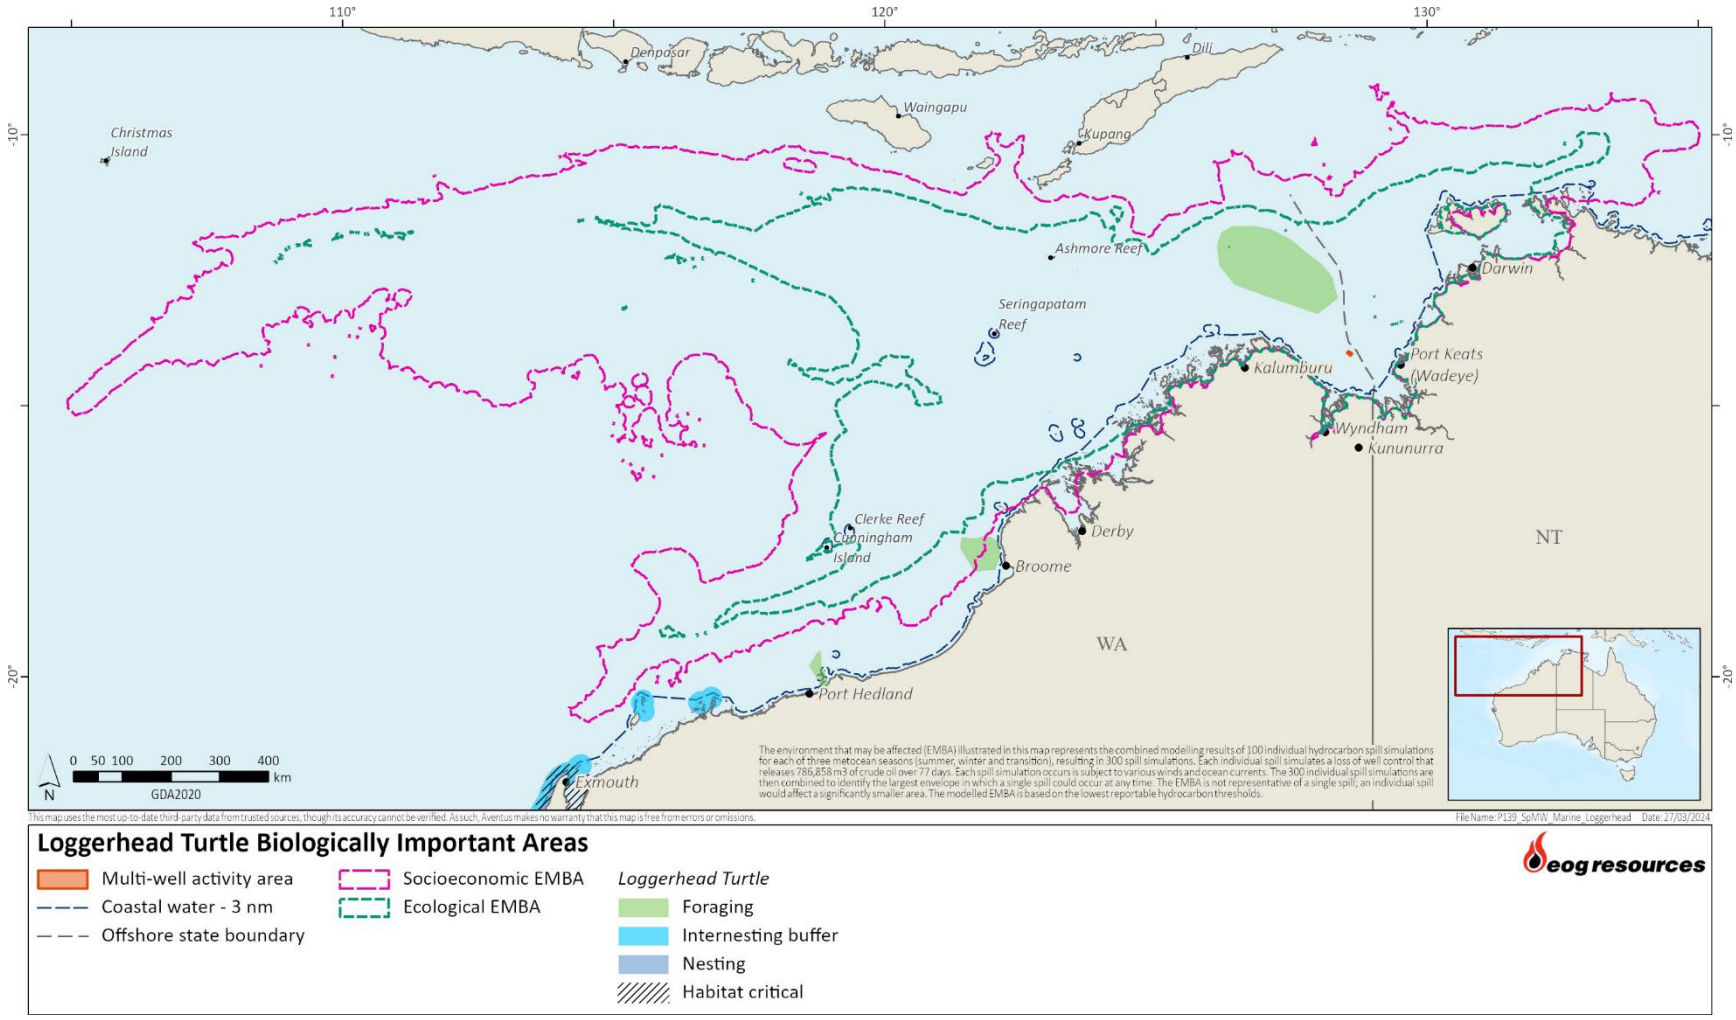

Figure 11.38 Loggerhead turtle BIA and habitat critical in the spill EMBA

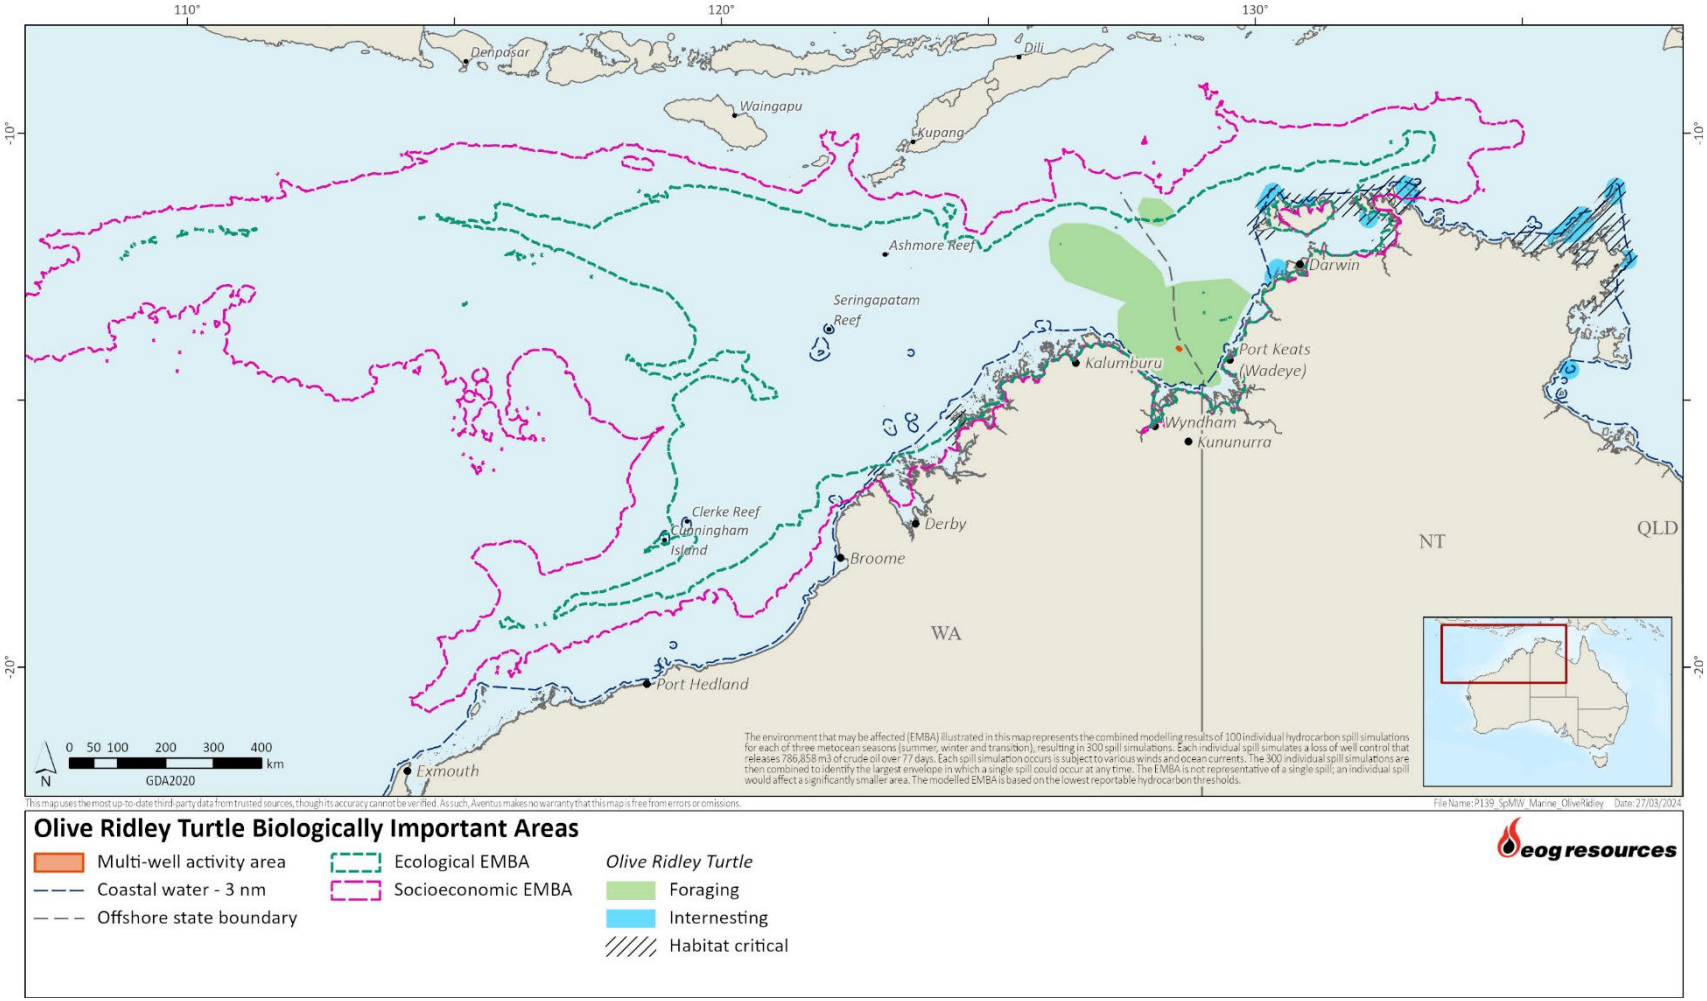

Figure 11.42 Olive Ridley turtle BIA and habitat critical in the spill EMBA

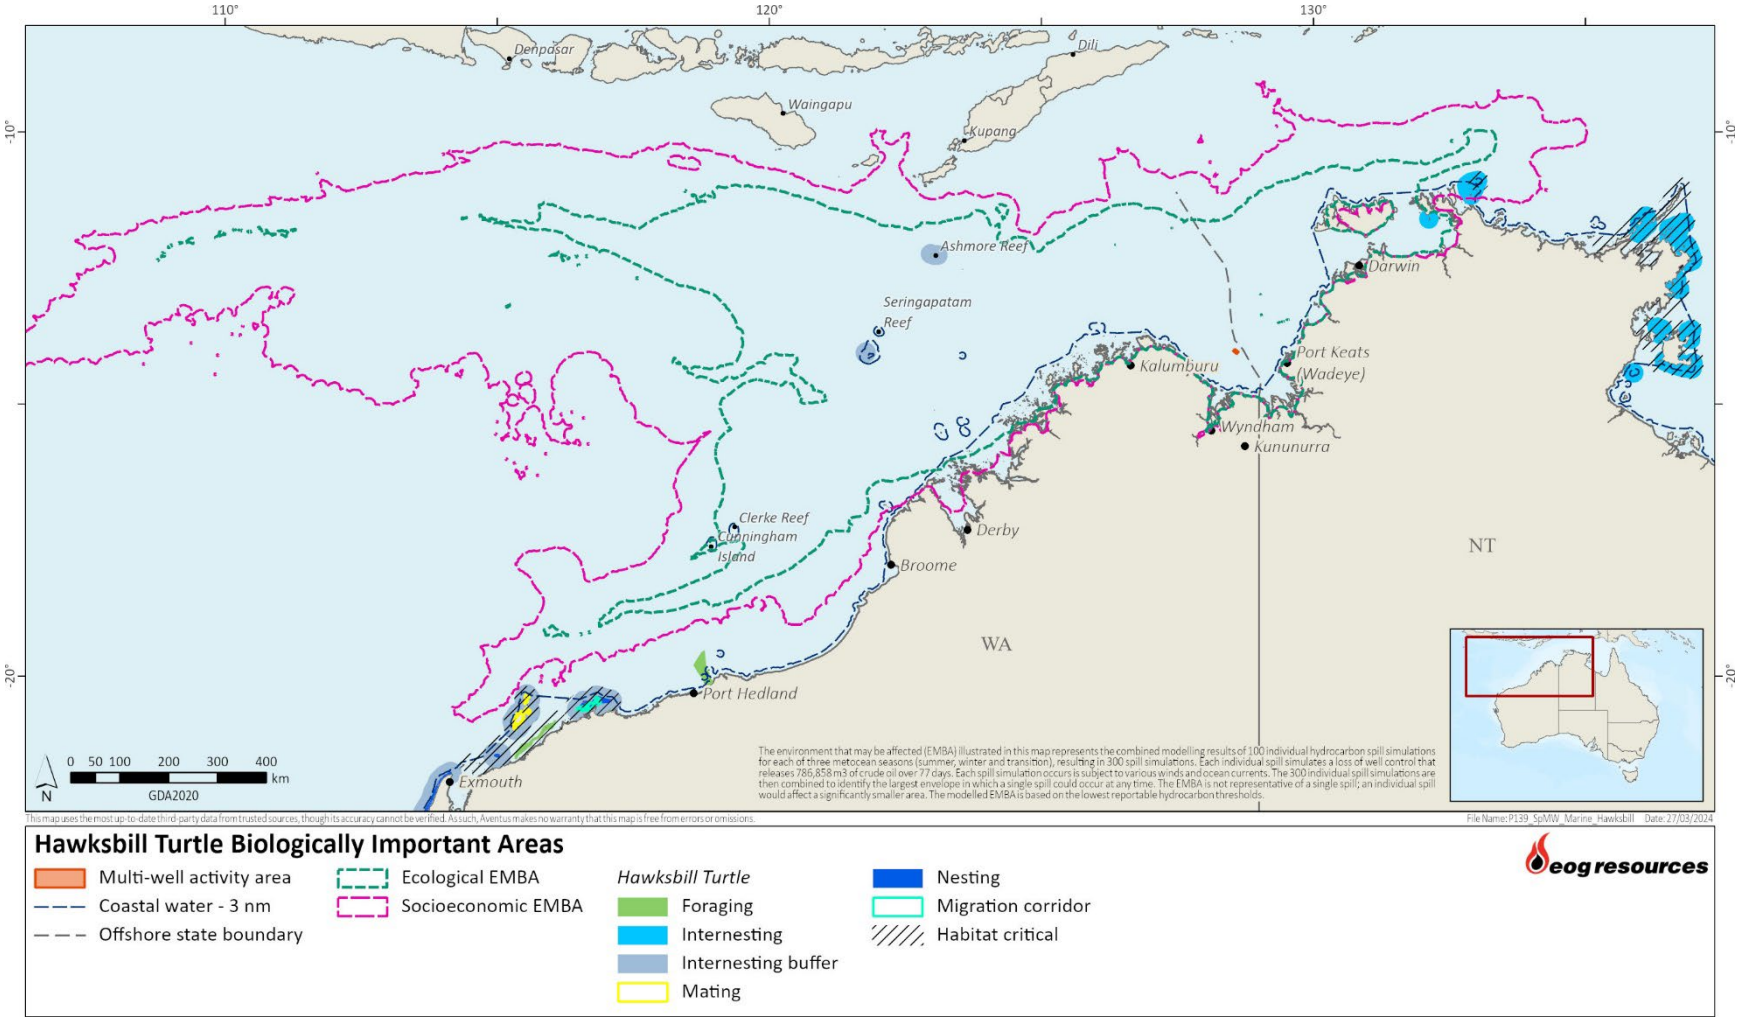

Figure 11.43 Hawksbill turtle BIA and habitat critical in the spill EMBA

Short-nosed seasnake (EPBC Act: Critically Endangered)

The short-nosed seasnake (*Aipysurus apraefrontalis*) is endemic to WA and occurs throughout the Northwest Shelf and eastern Indian Ocean. This fully aquatic species can grow up to 90 cm in length and prefers shallow coastal reef habitats.

Given the shallow water distribution of the species it is unlikely the species will occur within the activity area, however the species and species habitat may occur in the spill EMBA. Cartier Island and Ashmore Reef are internationally significant sites for their abundance and diversity of seasnakes, both of which are located outside the EMBA.

Leaf-scaled seasnake (EPBC Act: Critically Endangered)

The only known populations of the leaf-scaled seasnake (*Aipysurus foliosquama*) species inhabit the shallow reef habitats of the Sahul Shelf and Ashmore Reef (Minton and Heatwole, 1975), which are both located outside the activity area and EMBA.

Given the shallow water distribution, it is unlikely the species will occur within the activity area, but the species and species habitat is known to occur in the EMBA.

Saltwater crocodile (EPBC Act: Listed migratory)

The saltwater crocodile (*Crocodylus porosus*) is distributed from King Sound, WA throughout coastal NT to Rockhampton in Queensland, where it can be found in coastal waters, estuaries, lakes, inland swamps and marshes up to 150 km inland from the coast (DCCEEW, 2024b).

Preferred nesting habitat of the saltwater crocodile includes elevated, isolated freshwater swamps that do not experience the influence of tidal movements. Floating rafts of vegetation also provide important nesting habitat. In the NT, most nest sites are found on the north-west banks of rivers (DCCEEW, 2024b). The species nest during the wet season with peak nesting during January and February. Whilst sightings of saltwater crocodiles far out to sea have been recorded, it is more likely to be encountered in the coastal areas of the socio-economic EMBA than in the activity area.

Arafura snake-eyed skink (EPBC Act: Endangered)

The Arafura snake-eyed skink (*Cryptoblepharus gurrmul*) is a small, slender, relatively long-limbed, shallow-headed species of snake-eyed skink. The Arafura snake-eyed skink is endemic to the NT, where it is found only on three islands: North Goulburn Island (36 km^2), and two small (about 2 km^2) islands, New Year Island and Oxley Island, north-east of Croker Island (DEPWS, 2021b). Some individuals, when trapped on rocks, surrounded by water, will escape by swimming rapidly to a nearby rock or shore.

The Arafura snake-eyed skink is an agile and fast-moving terrestrial species, and are found in littoral habitats, including beach sands, rocks and coral rubble, on the three islands (DEPWS, 2021b). They forage amongst rocks in the intertidal zone, and retreat to fringing vegetation when confronted by an incoming tide. They feed on both terrestrial and small marine invertebrates, such as amphipods and polychaete worms (DEPWS, 2021b).

Threats to the Arafura Snake-eyed Skink are poorly understood due to insufficient information on the ecology of the species. Nonetheless, its highly restricted distribution presents a substantial risk. The coastline habitat of these islands may be exposed to periodic storm surges associated with cyclones and will be reduced in size with any rise in sea level: the highest points on Oxley and New Year Islands are about 12 m above sea level, but most of each island is <5 m above sea level (DEPWS, 2021b). The socio-economic EMBA intersects with the littoral zones of the three islands where the Arafura snake-eyed skink lives and forages.

Northern blue-tongued skink (EPBC Act: Endangered)

The northern blue-tongued skink (*Tiliqua scincoides intermedia*) became threatened in December 2023. The northern blue-tongue skink is a large, robust, short-limbed lizard that can reach up to 37 cm. the species is widely distributed in northern parts of Australia ranging from Eighty Mile Beach in WA to the Cloncurry area in western Queensland. The northern blue-tongue skink occurs in a wide variety of ecosystems from dissected sandstone plateaus and gorges, limestone ranges, granite, basalt and dolerite hills, glacial shale undulations, sand plains, sandy waterways, swamps, cracking clay floodplains and coastal flats. The species feeds on diverse diet of plants, insects, and other invertebrates (DCCEEW, 2023d).

Considering the northern blue-tongued skink is terrestrial, it is unlikely thy will be encountered within the EMBA, however, suitable habitat such as floodplains and coastal flats will be intercepted by the spill EMBA.

Water monitors (EPBC Act: Endangered and Critically Endangered)

Two species of water monitors were detected by the PMST, the Mertens' water monitor (*Varanus mertensi*) and the Mitchell's water monitor (*Varanus mitchelli*). Both species became threatened in December 2023 as Endangered and Critically Endangered respectively. The Mertens' water monitor is relatively large, robust lizard reaching up to 1.5 m in length (DCCEEW, 2023f), on the contrary the Mitchell's water monitor is a mere 70 cm length (DCCEEW, 2023e). Both species have a patchy distribution across tropical northern Australia, from the west Kimberley across the Top End of the Northern Territory. The Mertens' water monitors distribution extends further into QLD. Both species of water monitors feed on freshwater crabs, fish, insects, amphipods, insects and frogs (DCCEEW. 2023e, 2023f).

Mertens' water monitor is a highly aquatic lizard that rarely ventures more than 5–10 m from the edge of (fresh) water sources. Suitable habitat includes perennial and semi-permanent pools in upper catchment areas, including springs, seeps, swamps, creeks and gorges, the margins of permanent streams, rivers and lakes in lower catchment areas, gloodplain billabongs, lagoons, swamps and soaks, perennial waterholes in woodlands, and man-made irrigation channels and the margins of dams (DCCEEW, 2023f). The Mitchell's water monitor inhabits freshwater and saline wetlands that range from seasonal gorges in upper catchments to large rivers and coastal floodplains. It is recorded from rivers, creeks, riffle zones, gorges, springs, lagoons, swamps, mangroves, and foreshores (DCCEEW, 2023e).

Due to habitat preferences, it is unlikely that the Mertens' water monitor will be encountered in the EMBA. However, the Mitchell's water monitor may be present.

Plains death adder (EPBC Act: Vulnerable)

The plains death adder (*Acanthophis hawkei)* is a relatively short (70 cm long on average) stout snake with a triangular head and narrow neck. They have a disconnected and poorly defined distribution in the NT and western Queensland (DEPWS, 2021a). In NT, the species occurs on cracking soil floodplains of the Adelaide, Mary and Alligator Rivers. It is more widely distributed on the cracking black soils of the Barkly Tableland on the NT/QLD border and the Mitchell Grass Downs of western QLD. The plains death adder is highly venomous and feeds on frogs, reptiles, rodents and other small to medium sized mammals (DEPWS, 2021a).

The primary threat to the plains death adder is the advance of cane toads in the NT. Death adders are naive to toads and their toxins, but because of their specialised ambush foraging tactics they successfully attract and catch toads. As a consequence, plains death adders die in large numbers when toads arrive in an area (DEPWS, 2021a). Due to the habitat preferences of the plains death adder being

cracked floodplain soils, it may occur within coastal areas of the spill EMBA where they intersect with floodplains that connect to the ocean.

11.3.7 Avifauna

There are 84 bird species (32 seabirds and 52 shorebirds) listed under the EPBC Act with potential to occur in the spill EMBA (DCCEEW, 2024a).

The majority of these are listed as migratory and marine species, with four listed as critically endangered, 12 as endangered and 11 as vulnerable. The PMST results also includes terrestrial species of birds that are protected under the EPBC Act. Any terrestrial bird species detected by the PMST search that do not occur or migrate through coastal areas are not presented in Table 11.9 or discussed further. The bird species listed as both threatened and are marine or coastal, (Table 11.9) or with a BIA intersected by the EMBA (see Table 11.10) are described in this section.

Figure 5.25 in Section 5.4.7 of Chapter 5 illustrates the likely temporal presence and absence and ecological stages of these bird species in the activity area and EMBA.

Many of the birds listed in Table 11.9 are listed in the following international conventions that aim to protect the birds themselves and their habitat:

- Republic of Korea Migratory Birds Agreement 2006 (ROKAMBA);
- Agreement between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment 1986 (CAMBA);
- Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention) 1979;
- Agreement between the Government of Australia and the Government of Japan for the Protection of Migratory Birds and Birds in Danger of Extinction and their Environment 1974 (JAMBA); and
- Convention on Wetlands of International Important especially as Waterfowl Habitat 1971 ('Ramsar Convention', see also Section 11.4.5).

Table 11.10 BIAs of bird species within the EMBA

Species	BIA	Location within the EMBA
Wedge-tailed shearwater	Breeding	Kimberley coastline and islands including Ashmore Reef.
Lesser frigatebird	Breeding	Kimberley coastline and islands including Ashmore Reef.
Greater frigatebird	Breeding	Kimberley and Ashmore Reef.
White-tailed tropicbird	Breeding	Kimberley coastline and islands including Ashmore Reef.
Roseate tern	Breeding	Kimberley coastline and islands including Ashmore Reef.
Little tern	Breeding and resting	Kimberley coastline and islands including Ashmore Reef.
Crested tern	Breeding (in high numbers)	No. 2 Sandy Island (Cobourg Peninsula). Seagull Island, off NW of Cape Van Diemen, Melville Island
Lesser crested tern	Breeding	Kimberley coastline and islands including Ashmore Reef.
Bridled tern	Breeding (in high numbers)	No. 2 Sandy Island (Cobourg Peninsula).
Brown booby	Breeding	Kimberley and northern Pilbara coasts and islands also Ashmore Reef.
Red-footed booby	Breeding	Northwest Kimberley and Ashmore reef.

Seabirds

Wedge-tailed shearwater (EPBC Act: Listed Migratory)

The wedge-tailed shearwater (*Ardenna pacifica*) is a medium-sized seabird and inhabits oceanic waters off WA except when roosting in colonies. Foraging at sea, the species feeds mostly on fish, cephalopods, insects, jellyfish and prawns. Ashmore Reef has been identified as an important area for this species (DEWHA, 2008b).

According to the National Conservation Values Atlas (NCVA) (DCCEEW, 2024a) the nearest BIA (Ashmore Reef) is greater than 500 km northwest of the activity area. It is likely that the species will be present in the spill EMBA (see Table 11.10 and Figure 11.44).

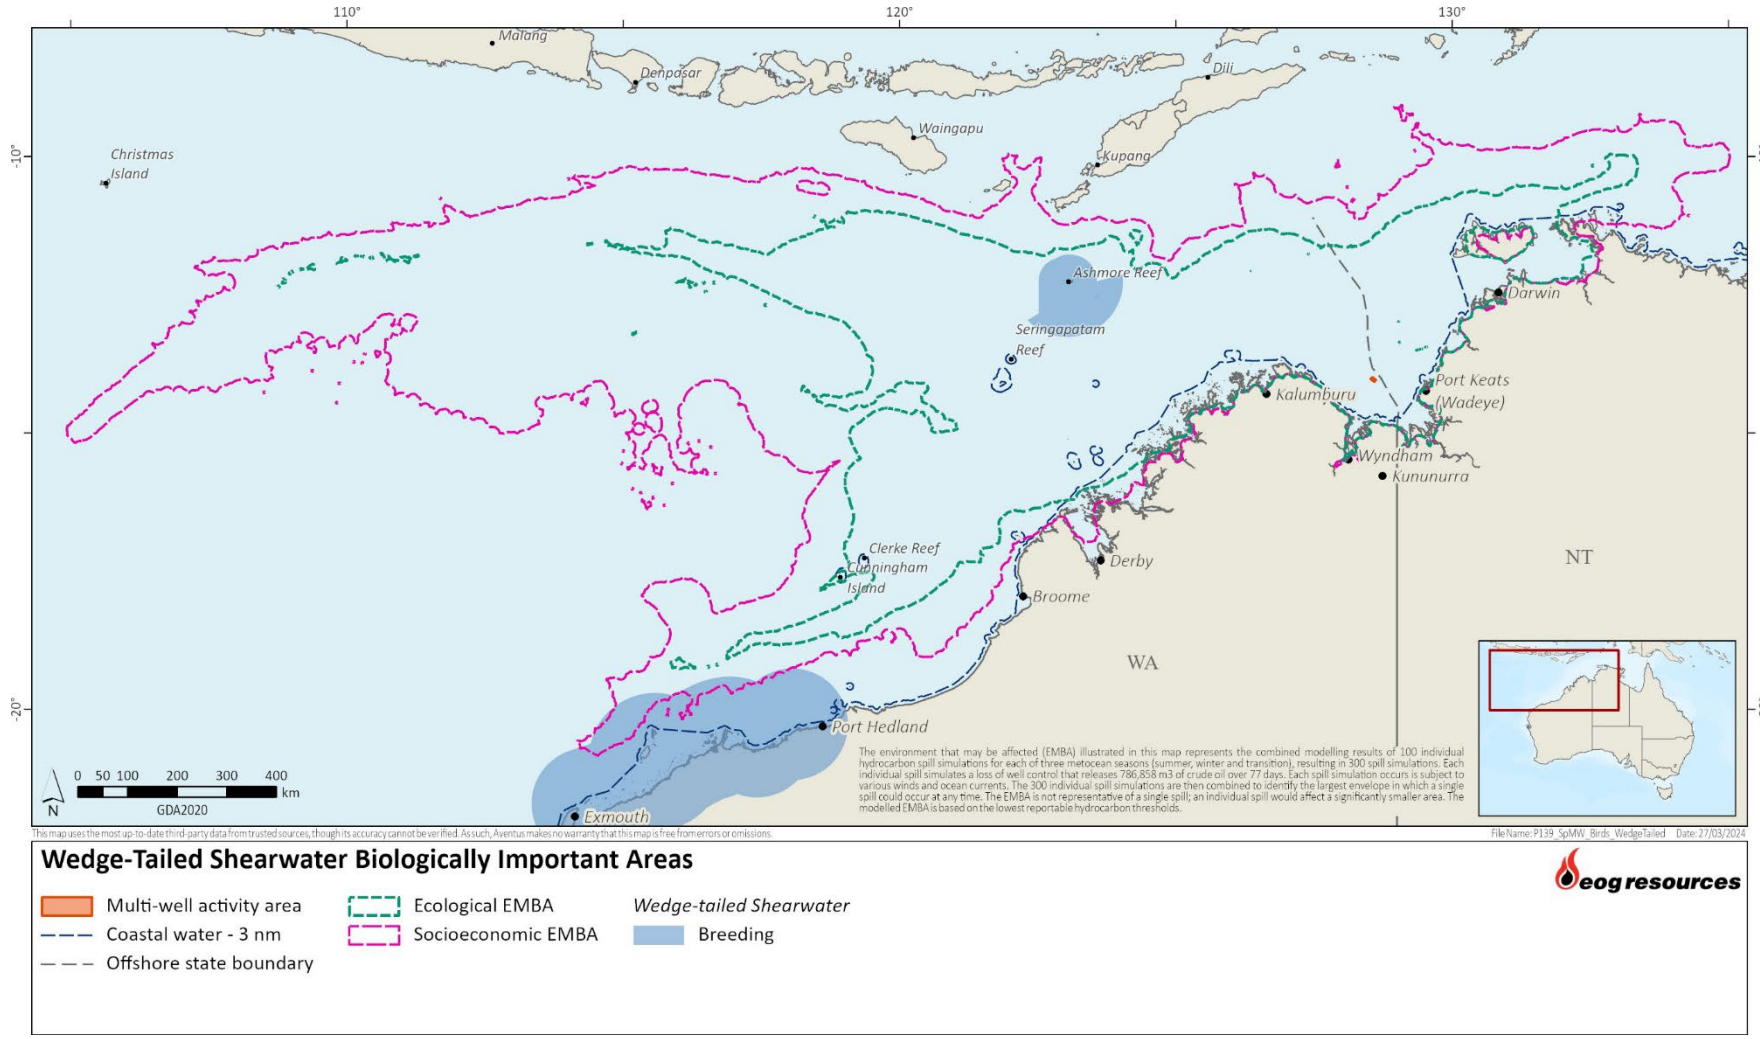

Figure 11.44 Wedge-tailed shearwater BIA in the spill EMBA

Christmas Island Frigatebird (EPBC Act: Endangered, Listed Migratory)

The Christmas Island frigatebird (*Fregata andrewsi*) is a very large seabird that primarily forages in the ocean for food, scooping marine organisms such as fish and squid (DCCEEW, 2024a). Christmas Island is the only place in the world where the Christmas Island frigatebird breeds and nests in the forest canopy (DCCEEW, 2024a).

Given the distance to breeding and nesting sites, it is unlikely that this species will be present in the activity or spill EMBA.

Southern giant petrel (EPBC Act: Endangered, Listed Migratory)

The southern giant petrel (*Macronectes giganteus*) is the largest of the petrels. They are a highly migratory bird and widespread throughout the Southern Ocean (DCCEEW, 2024a). This species occurs from Antarctic to subtropical waters and breeds on the Antarctic continent, peninsular and islands and on subantarctic islands and South America. Breeding occurs annually between August and March (DCCEEW, 2024a).

All waters within Australian jurisdiction can be considered foraging habitat, however the most critical foraging habitat is considered to be those waters south of 25 degrees where most species spend the majority of their foraging time. The southern giant petrel is an opportunistic scavenger and predator that scavenge on penguin carcasses and feed on seals and carrions. It also eats a wide variety of seabirds, penguin chicks, crustacean, kelp, fish, jellyfish and rabbits.

Given there are no breeding BIA for this species in the activity area and their preference to forage in southern waters off Australia, it is highly unlikely that the southern giant petrel will be present in the spill EMBA.

Roseate tern (EPBC Act: Listed Migratory)

The roseate tern (*Sterna dougallii*) occurs throughout various coastal habitats including beaches, reefs and sandy/coral islands. It is a specialist forager for small pelagic fish (DCCEEW, 2024b). The terns prefer nesting sites adjacent to clear shallow hunting areas. Nests are generally a bare scrape in sand, shingle or coral rubble. The species breeds in large mixed-species colonies from April to June, with breeding populations located around Ashmore Reef, Cartier Island and Scott Reef (located in the EMBA) (DEWHA, 2008b). Little information is available about migratory movements or timing through the northwest of Australia.

A breeding BIA for the species is intersected by the EMBA at coastal islands off the north Kimberley coast (Table 11.10 and Figure 11.45). Foraging, feeding or related behaviours are likely to occur within the offshore and coastal areas of the EMBA (Table 11.10).

Little tern (EPBC Act: Listed Migratory)

The little tern (*Sternula albifrons*) is a small and slender tern that is found throughout the coast from Broome extending to the NT. Breeding sites are widely distributed across the northwest of WA, with breeding occurring in late April-July and September to early January. There is a lack of information about their migration however however recorded numbers of the species are lowest in the dry season. The EMBA overlaps breeding and resting BIAs for this species along the Kimberley coast and islands including Ashmore Reef (see Table 11.10 and Figure 11.46).

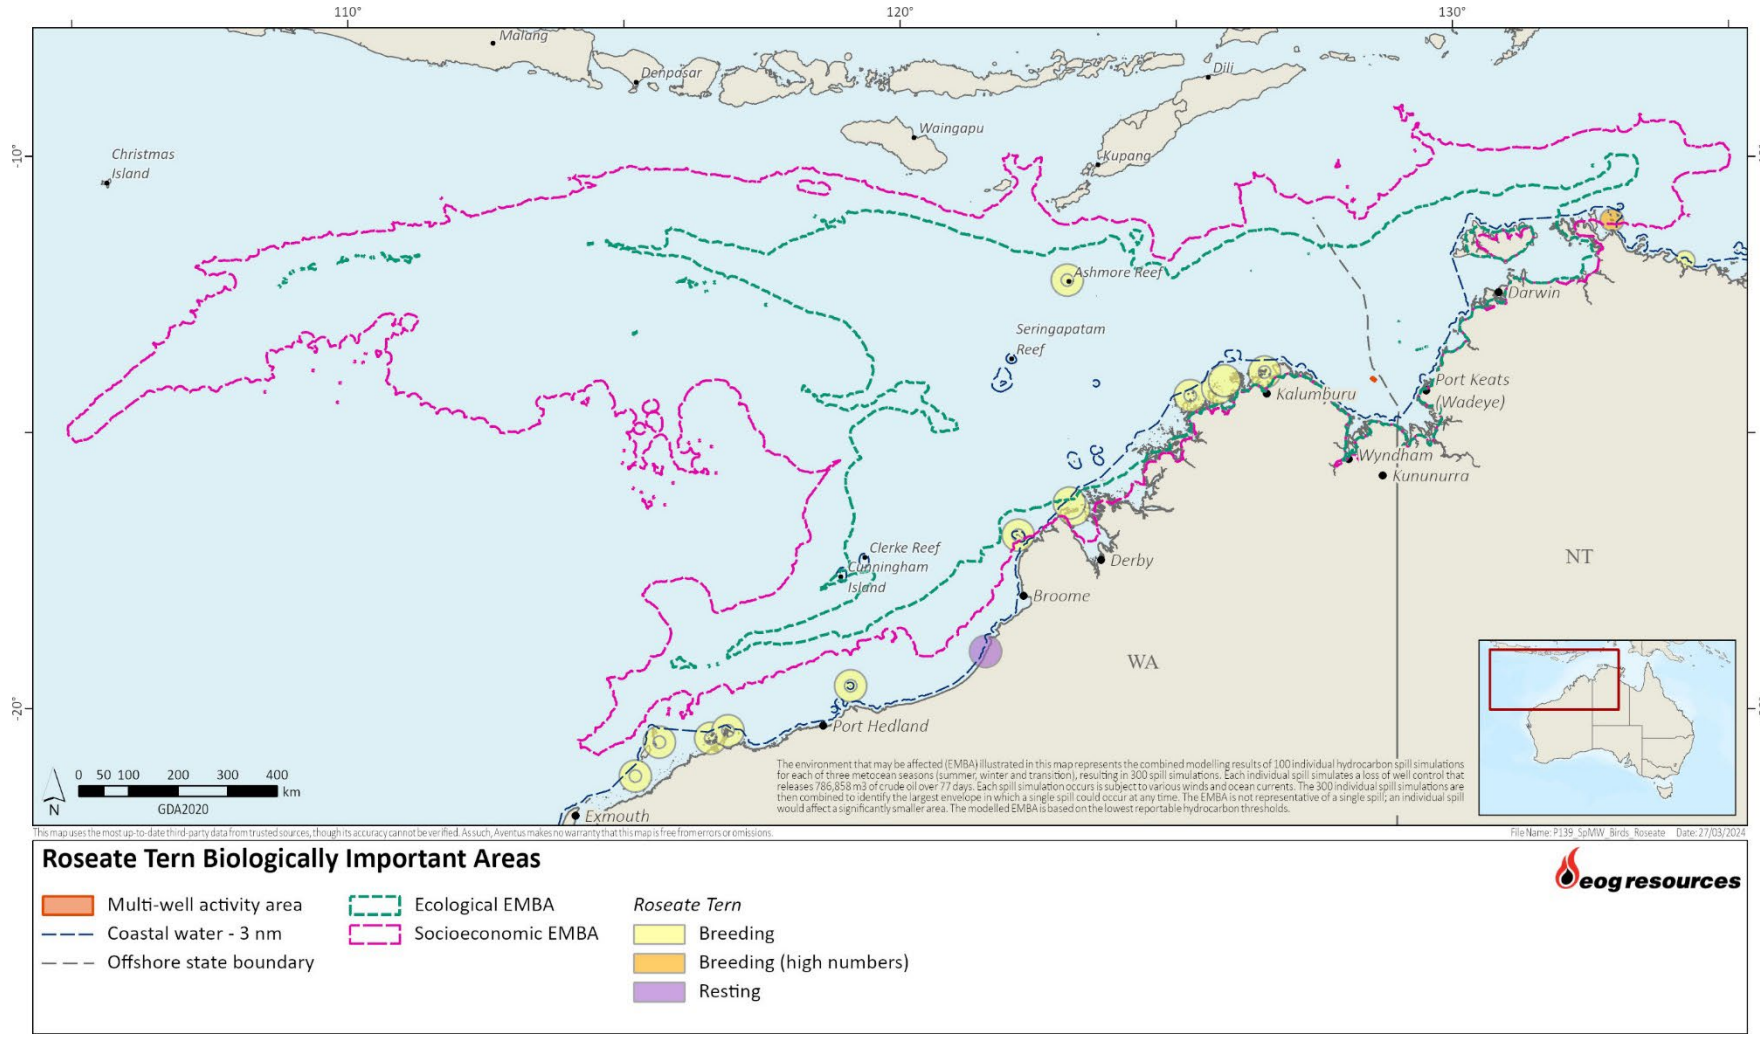

Figure 11.45 Roseate tern BIA in the spill EMBA

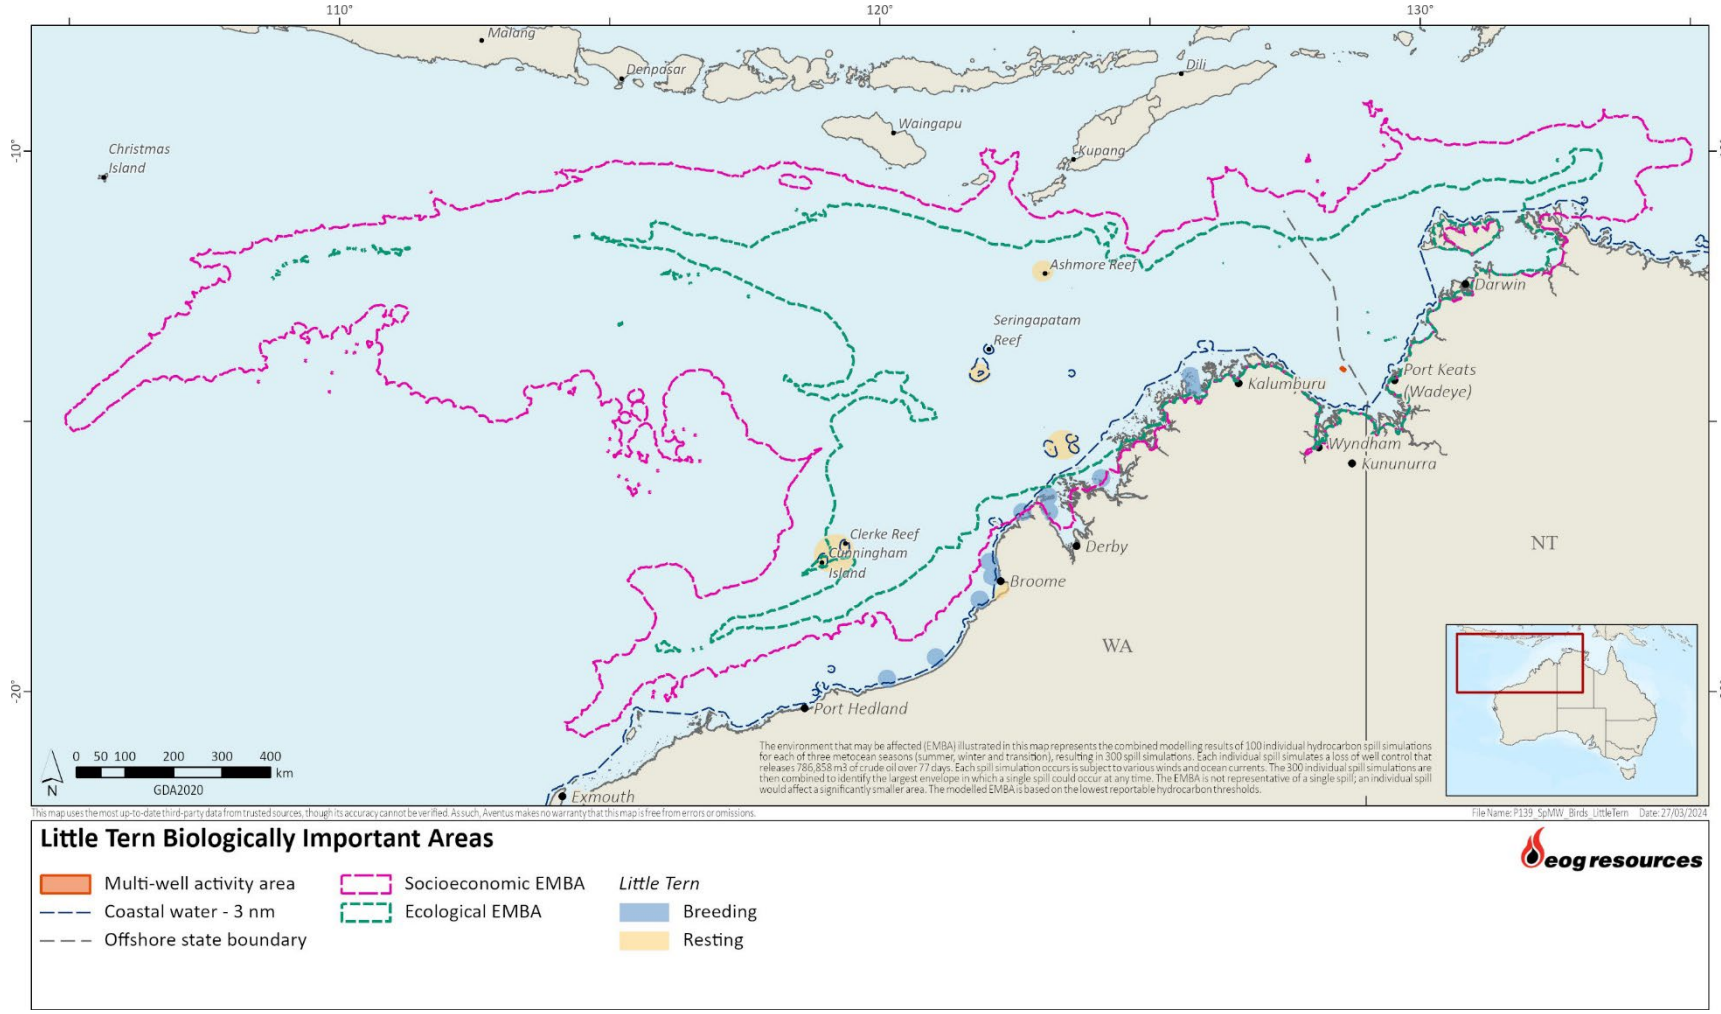

Figure 11.46 Little tern BIA in the spill EMBA

Lesser frigatebird (EPBC Act: Listed Migratory)

Lesser frigatebirds (*Fregata ariel*) are usually observed in tropical waters around the coast of northern WA, NT, Queensland and NSW (DSEWPC, 2012). They are often found foraging far offshore, especially during the non-breeding season where some large movements have been recorded (DSEWPC, 2012). During the breeding season (March - September), the lesser frigatebird's range remains close to the breeding colonies (DSEWPC, 2012).

Within the NWMR, the lesser frigatebird is known to breed on Adele, Bedout and West Lacepede islands, Ashmore Reef and Cartier Islands (DEWHA, 2008b). Breeding occurs between March and September along the Kimberley and Pilbara coasts and islands (DCCEEW, 2024b). The EMBA overlaps the Kimberley and Pilbara coasts and islands (including Ashmore Reef) breeding BIA for this species as presented in Table 11.10 and Figure 11.47.

Greater frigatebird (EPBC Act: Listed Migratory)

The greater frigatebird (*Fregata minor*) has a global distribution range throughout the world's tropical seas. Greater frigatebirds undertake regular migrations across their range. Breeding occurs from May to June and August, with the closest breeding colonies identified on Ashmore Reef and Adele Island (DCCEEW, 2024b). The greater frigatebird forages in pelagic waters within 80 km of the breeding colony or roosting areas (ALA, 2022).

Greater frigatebrids commonly eat fish species such as flying fish and squid. Prey is snatched while in flight, either from just below the surface or from the air, in the case of flying fish flushed from the water. The EMBA overlaps with the Kimberley and Ashmore Reef breeding BIAs for this species (Table 11.10 and Figure 11.48).

Lesser crested tern (EPBC Act: Listed Migratory)

The lesser crested tern (*Thalasseus bengalensis*) is described in Chapter 5 of the EP.

The EMBA overlaps with the Kimberley coast and islands including Ashmore Reef breeding BIAs for this species (Table 11.10 and Figure 11.49).

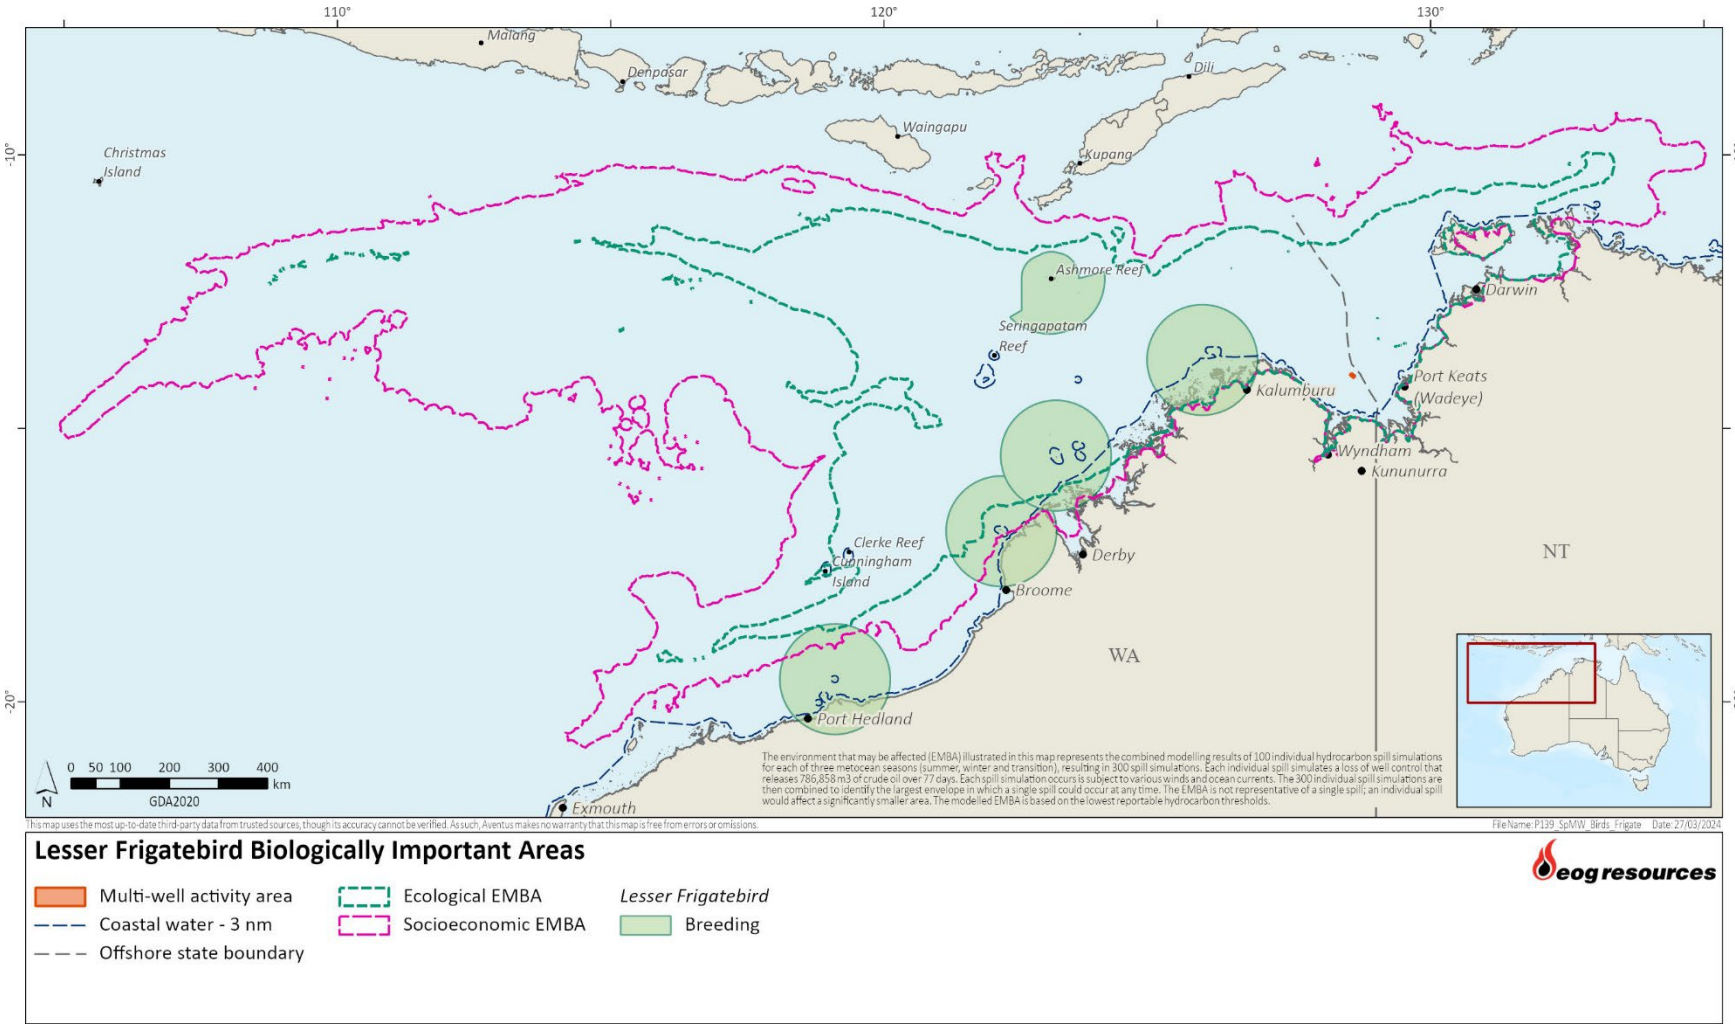

Figure 11.47 Lesser frigatebird BIA in the spill EMBA

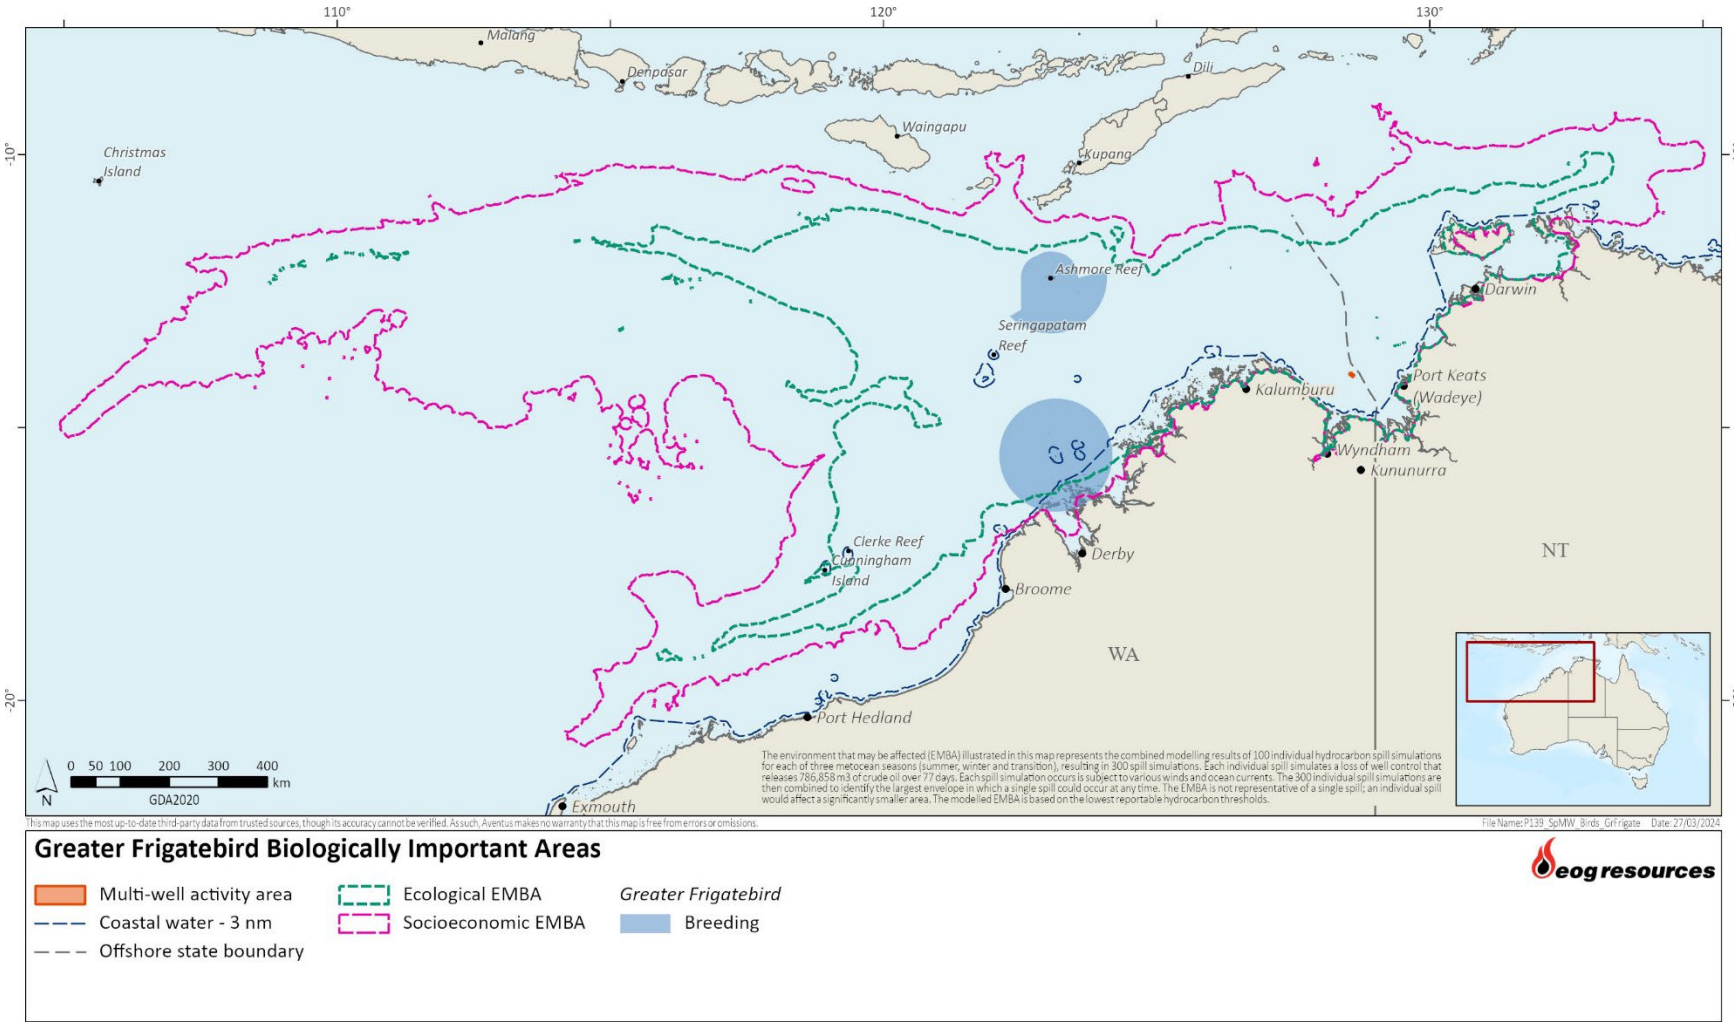

Figure 11.48 Greater frigatebird BIA in the spill EMBA

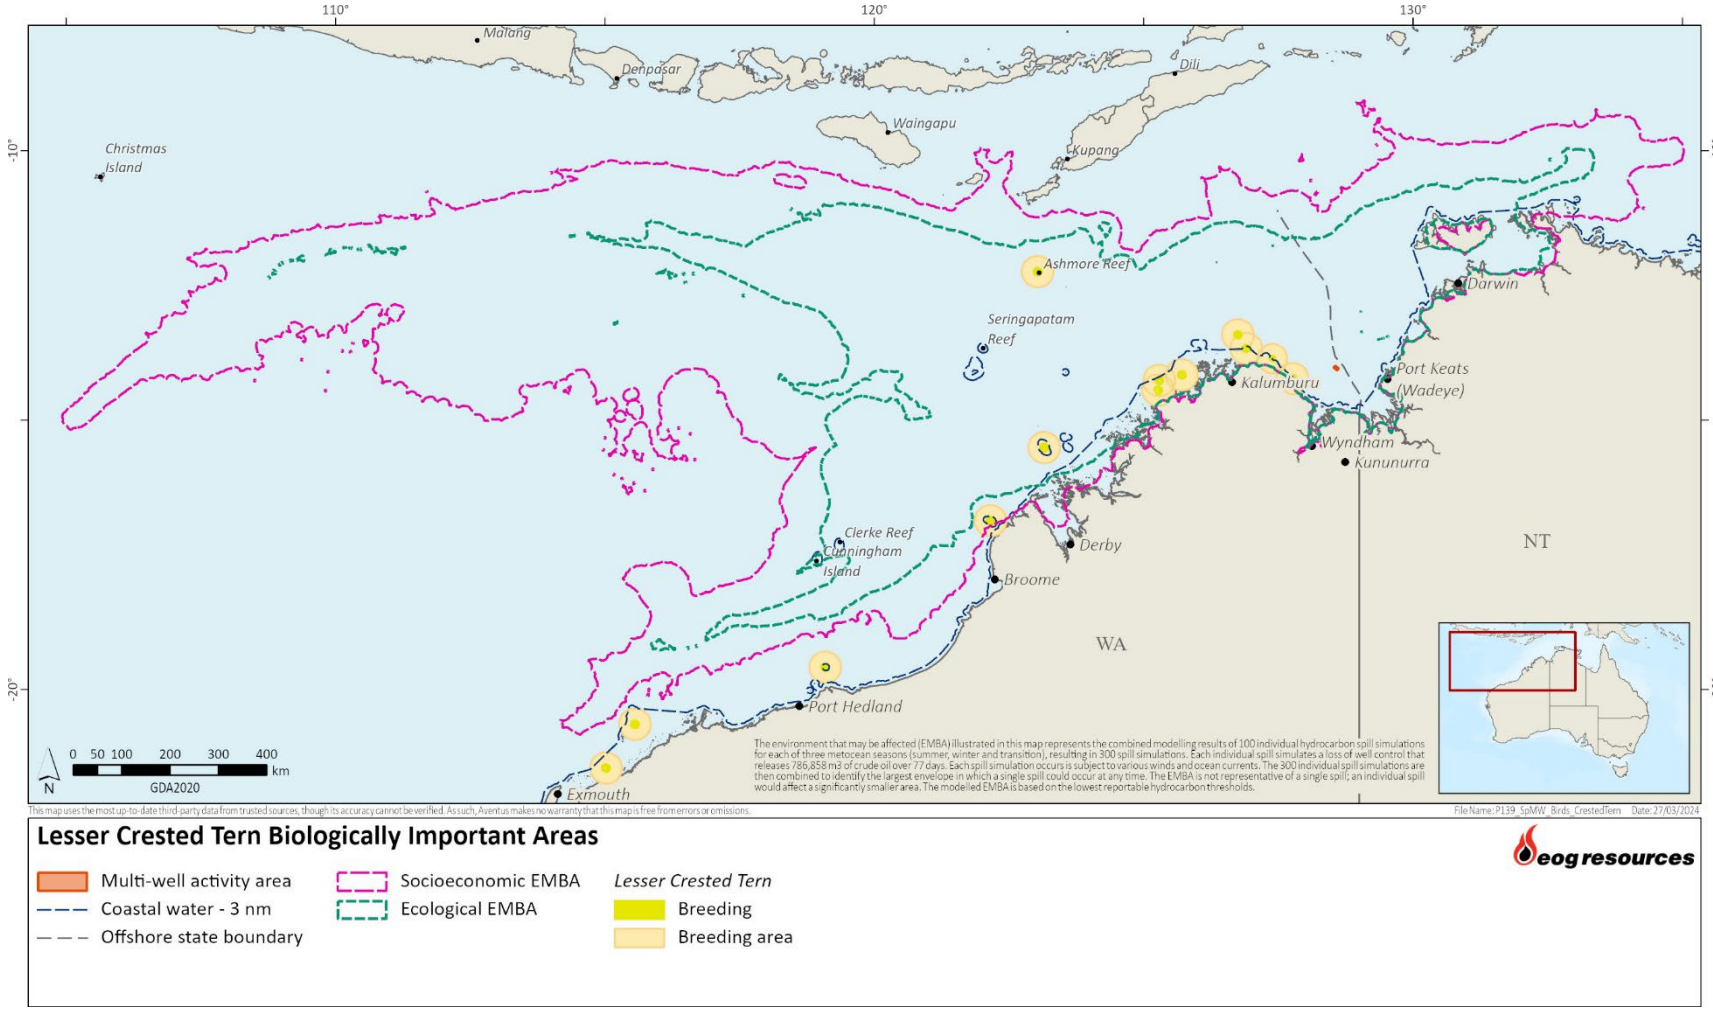

Figure 11.49 Lesser crested tern BIA in the spill EMBA

Crested tern (EPBC Act: Listed Migratory)

The crested tern (*Thalasseus bergii*) inhabits tropical and subtropical coastlines and forages in the shallow waters of lagoons, coral reefs, bay, harbours, inlets and estuaries; along sandy, rocky, coral or muddy shores; on rocky outcrops in open sea; in mangrove swamps; and in offshore and pelagic waters (Higgins and Davies, 1996). The crested tern usually feeds from the surface of the sea to less than 1 m water depth. Its diet consists predominantly of pelagic fish, although it will also feed on crustaceans, insects and hatchling turtles, opportunistically (Birdlife, 2020). The crested tern shows a preference for nesting on offshore islands, low-lying coral reefs, low-lying coral reefs, sandy or rocky coastal islets, coastal spits and lagoon mudflats (Birdlife, 2020). According to the NCVA, breeding is known to occur on Seagull Island, off NW of Cape Van Diemen on Melville Island and on the Coburg Peninsula (Table 11.10 and Figure 11.50).

Bridled tern (EPBC Act: Listed Migratory)

The bridled tern (*Onychoprion anaethetus*) is found throughout tropical and sub-tropical regions of Australia (DCCEEW, 2024b). The species is most common on offshore islands as opposed to coastal areas and forages singly or in small flocks, primarily on fish by swooping on schools and dipping only the head in the water (as opposed to plunge diving) (DCCEEW, 2024b). Breeding populations exist at Ashmore Reef and Cartier Island (DEWHA, 2008b). Birds return to breeding colonies at various island locations throughout northern WA between late September and mid-October and leave from early May to mid-September. The EMBA overlaps with a breeding BIA for this species (see Table 11.10 and Figure 11.51).

Australian lesser noddy (EPBC Act: Vulnerable)

The Australian lesser noddy (*Anous tenuirostris melanops*) is endemic to Australia and nests on the Abrolhos Islands, Ashmore Reef and various other islands throughout tropical and sub-tropical northwest Australia (DCCEEW, 2024b). They may forage out to sea or close inshore to breeding islands, including outside fringing reefs, feeding on small squid and fish (DoEH, 2005). They roost mainly in mangroves, and sometimes rest on the beaches (DoEH, 2005). The Australian lesser noddy may occur within the coastal areas of the EMBA.

Abbott's booby (EPBC Act: Endangered)

Abbott's booby (*Papasula abbotti*) spend much of their time at sea, but need to come ashore to breed (DCCEEW, 2024b). It is currently known to only breed on Christmas Island (outside the EMBA) during the months of March to October, with peak nesting May-July (DCCEEW, 2024b). The species nests in tall rainforest trees, laying a single egg clutch (DAWE, 2021b). Birds are known to travel up to 400 km from nesting locations to forage for fish and squid (DCCEEW, 2024b). The species may occur in the EMBA.

Brown booby (EPBC Act: Listed Migratory)

The brown booby (*Sula leucogaster*) is the smallest of the booby family. The species feeds either individually or in flocks, around inshore waters and use both marine and terrestrial habitats. They forage by either plunge diving or by snatching prey from the surface. The EMBA overlaps with the Kimberley and northern Pilbara coasts and islands also Ashmore Reef breeding BIAs for this species (see Table 11.10 and Figure 11.52).

Red-footed booby (EPBC Act: Listed Migratory)

The red-footed booby (*Sula sula*) is a slender bird with conspicuous red feet. Its distribution is confined to tropical waters between 30°N and 30°S in the Indian Ocean. In WA a small breeding population has been recorded on Ashmore Reef (DEWHA, 2008b). It mostly feeds on fish, especially flying fish, including cephalopods, by plunge diving in groups to shallow depths

(DCCEEW, 2024b). The EMBA overlaps with the northwest Kimberley and Ashmore Reef breeding BIAs for this species (see Table 11.10 and Figure 11.53).

White tailed tropicbird (EPBC Act: Listed Migratory)

The white-tailed tropicbird (*Phaethon lepturus*) is a pelagic species that rarely comes ashore, except to breed. The species breeds on islands throughout the tropics of the northern Indian Ocean, including Ashmore Reef and Rowley Shoals off the northern coast of WA (Johnstone and Storr, 1998; Marchant and Higgins, 1993).

The white-tailed tropicbird is a rather scarce breeding species at Ashmore Reef, and it is estimated that up to two pairs nest within the reserve each year (Clarke, 2010). Breeding has been recorded from May through to October, with birds dispersing away from the breeding colonies outside the breeding season.

The species forages in warm waters and over long distances, moving up to 1,500 km from breeding sites when not breeding (DSEWPC, 2012) and up to 89 km from the nest site when breeding. It feeds on fish and cephalopods by plunge-diving (Marchant and Higgins 1993).

The closest breeding BIA for the white-tailed tropicbird within the EMBA is at Ashmore Reef (Table 11.10 and Figure 11.54).

Red tailed tropicbird (EPBC Act: Endangered, Marine and Migratory)

This species is described in Chapter 5 Section 5.4.7.

The closest BIA for this species (according to the NCVA) is a breeding/foraging BIA located 900 km east of the EMBA, near the Great Barrier Reef region.

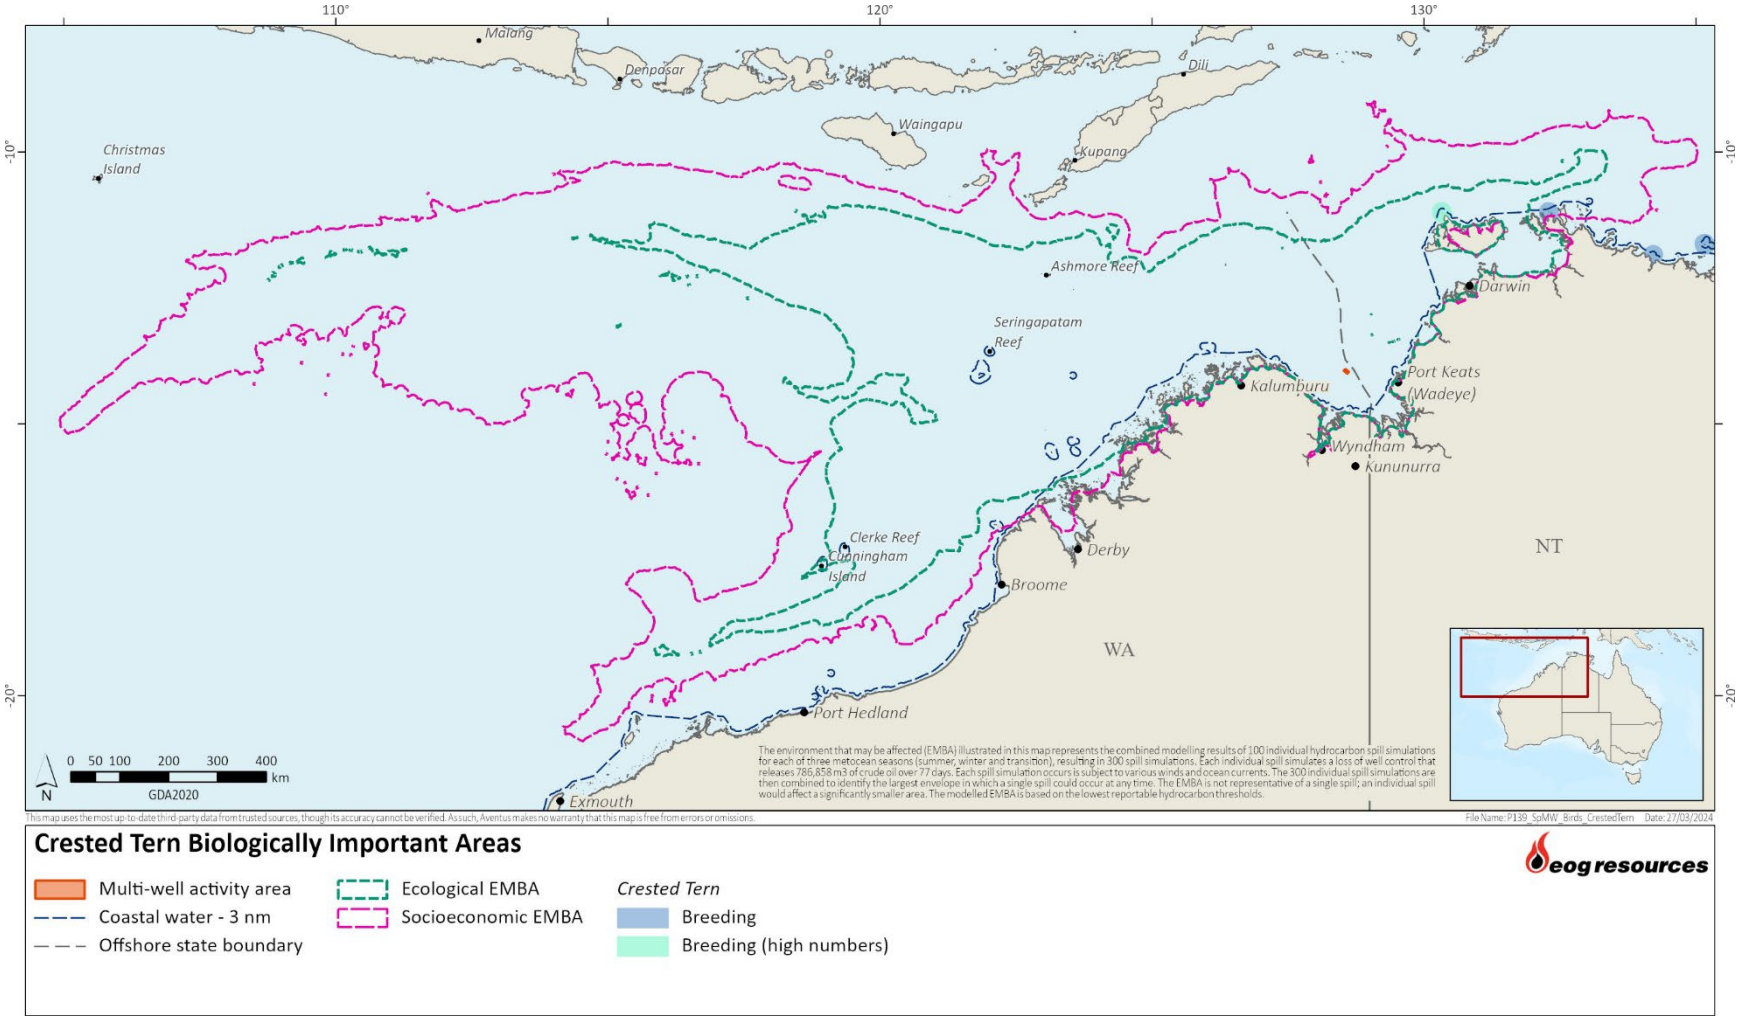

Figure 11.50 Crested tern BIA in the spill EMBA

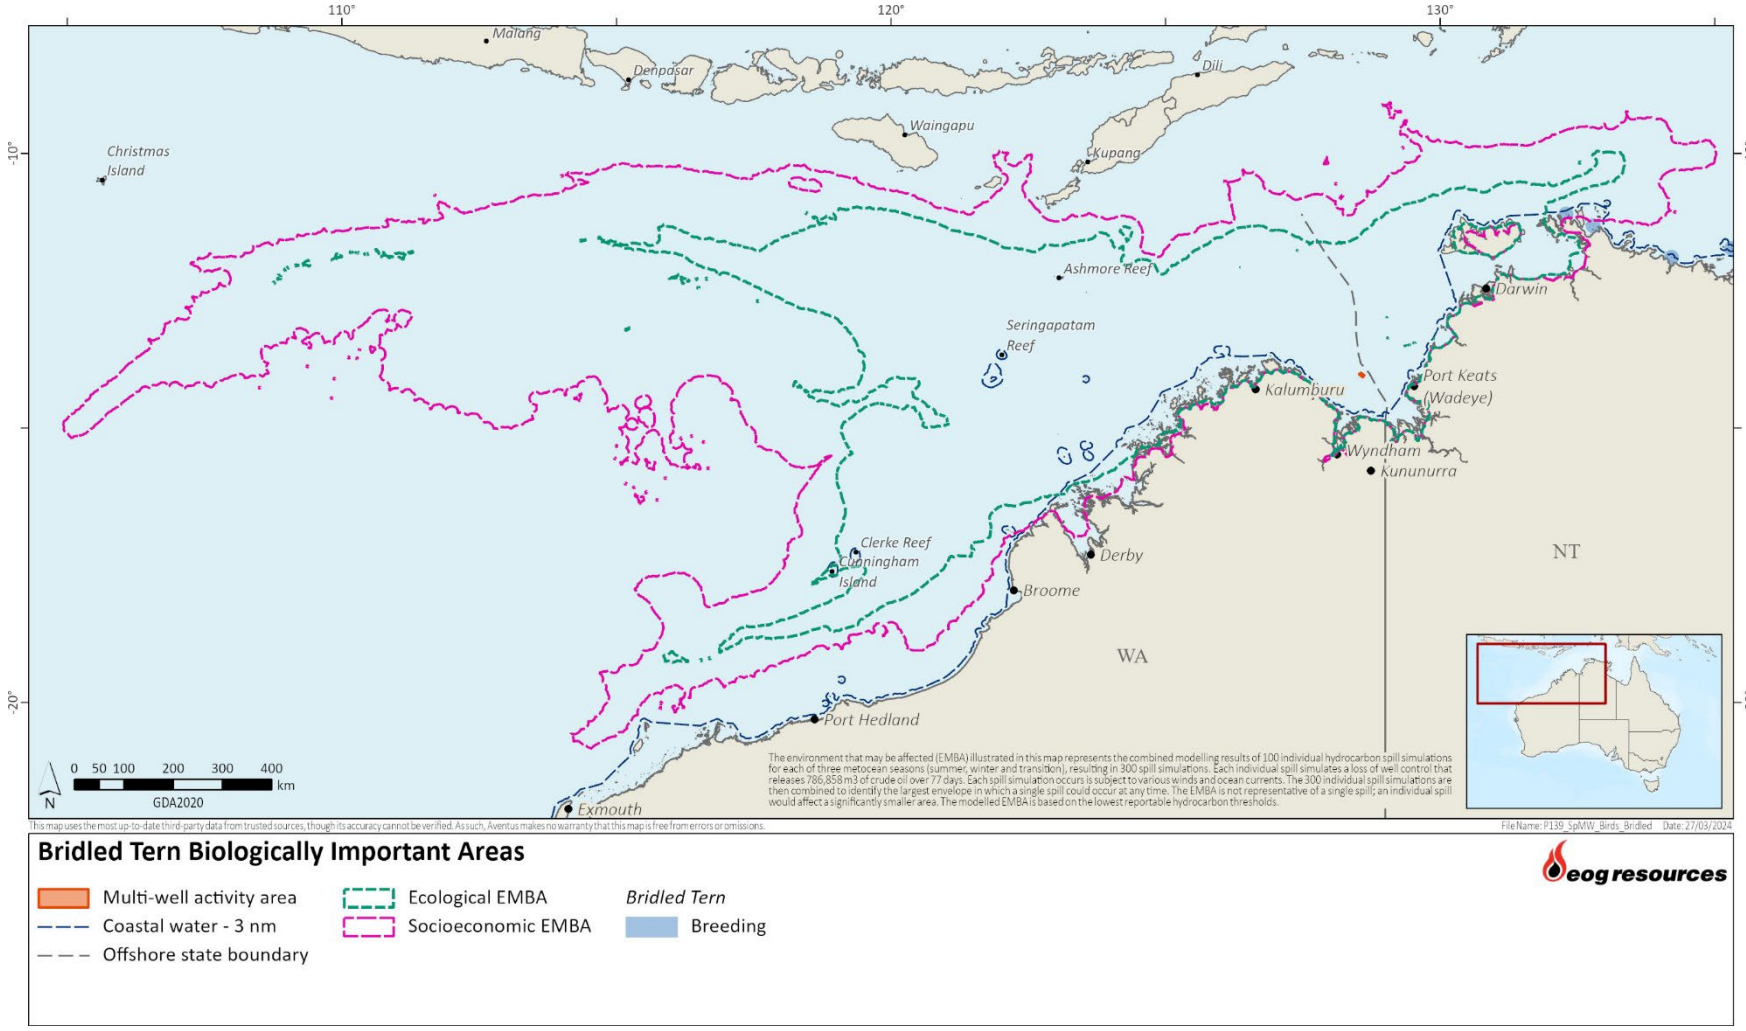

Figure 11.51 Bridled tern BIA in the spill EMBA

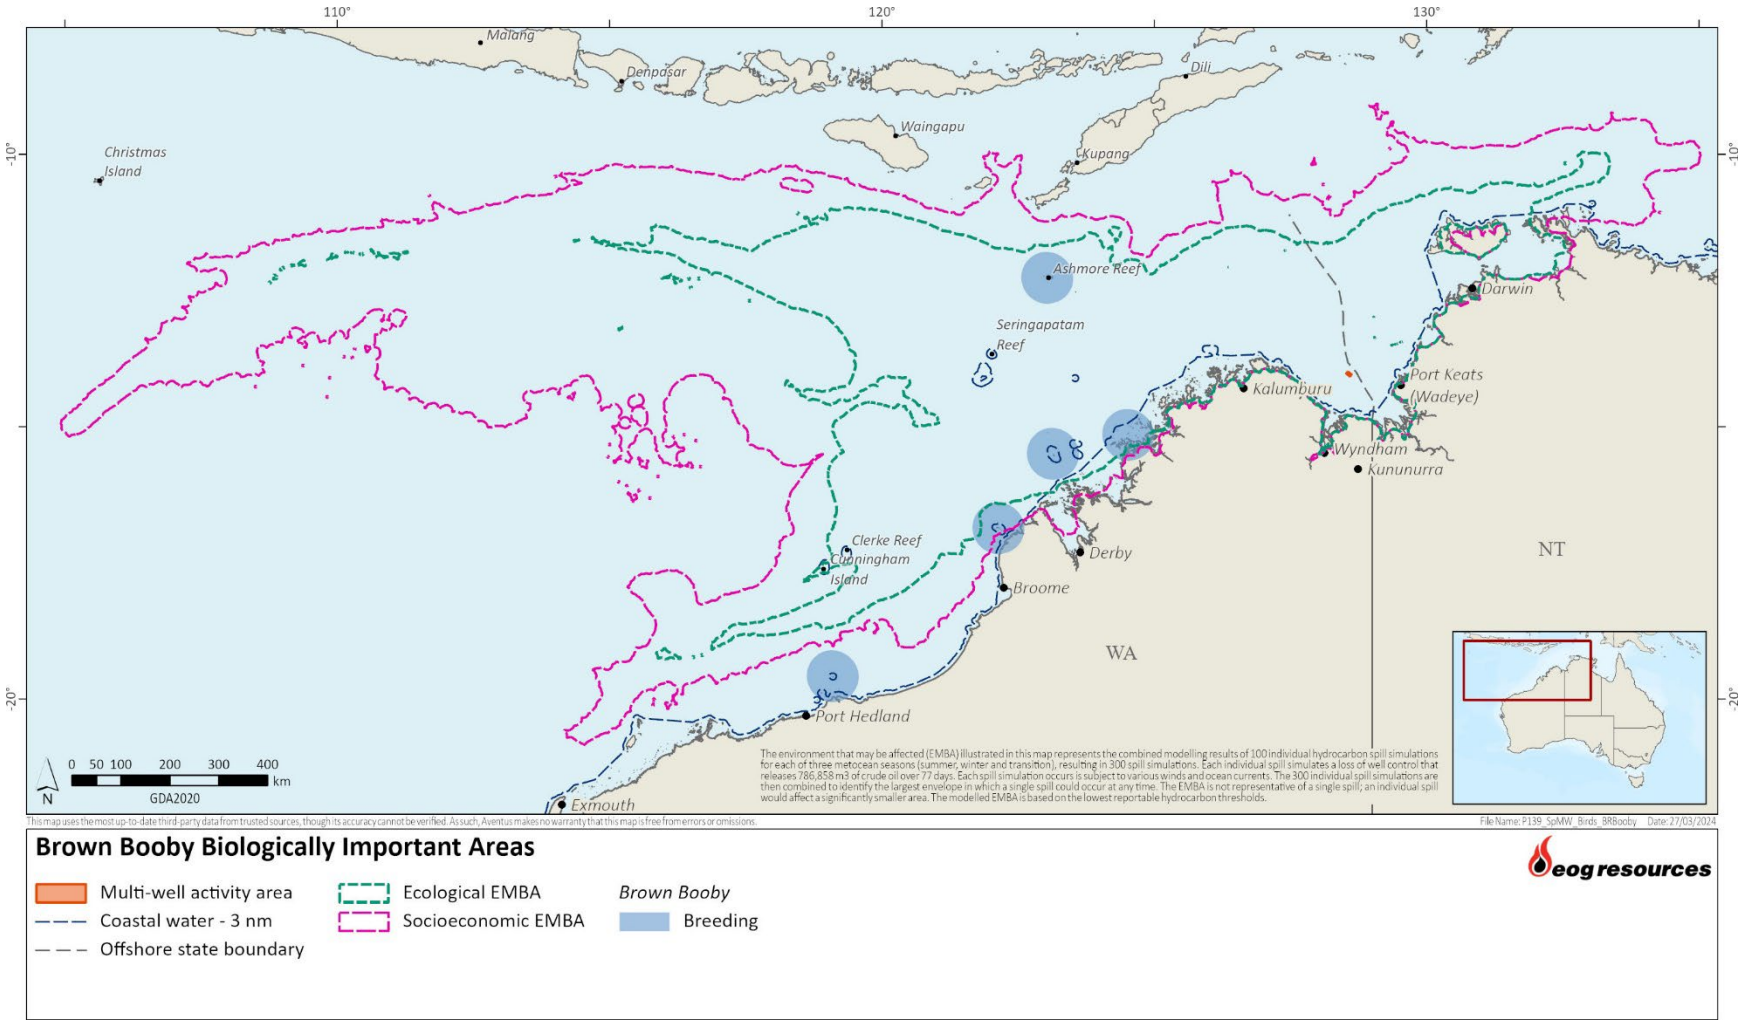

Figure 11.52 Brown booby BIA in the spill EMBA

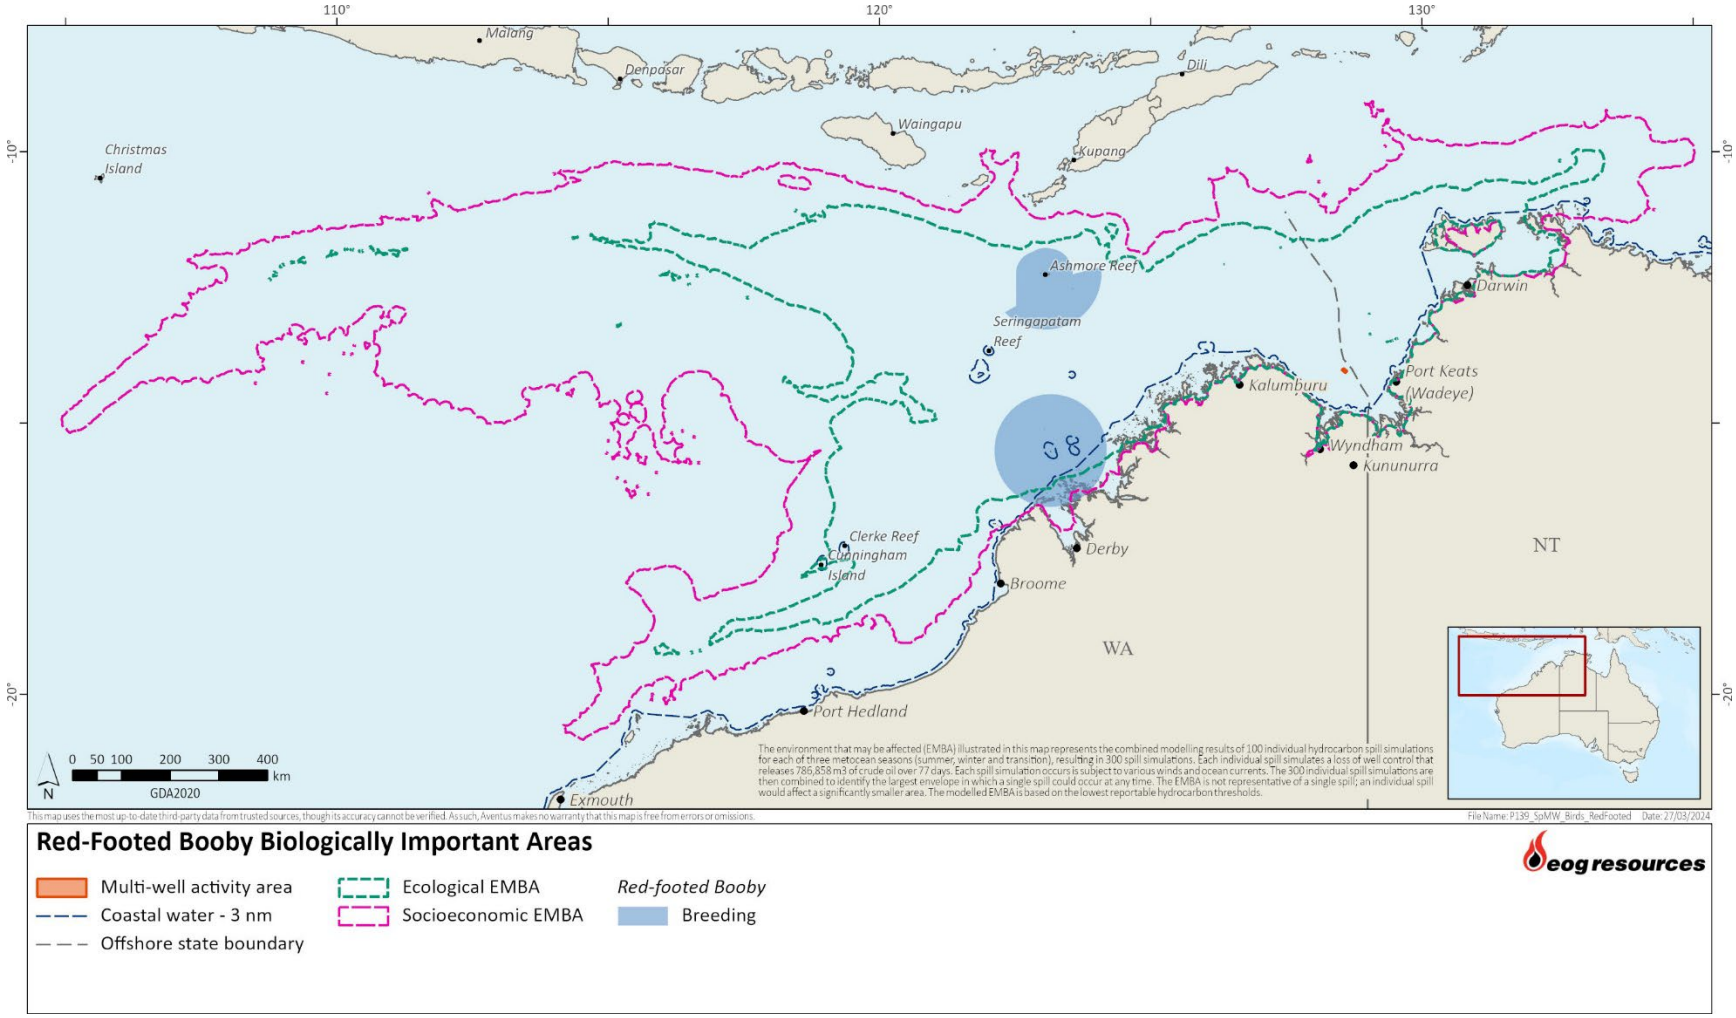

Figure 11.53 Red-footed booby BIA in the spill EMBA

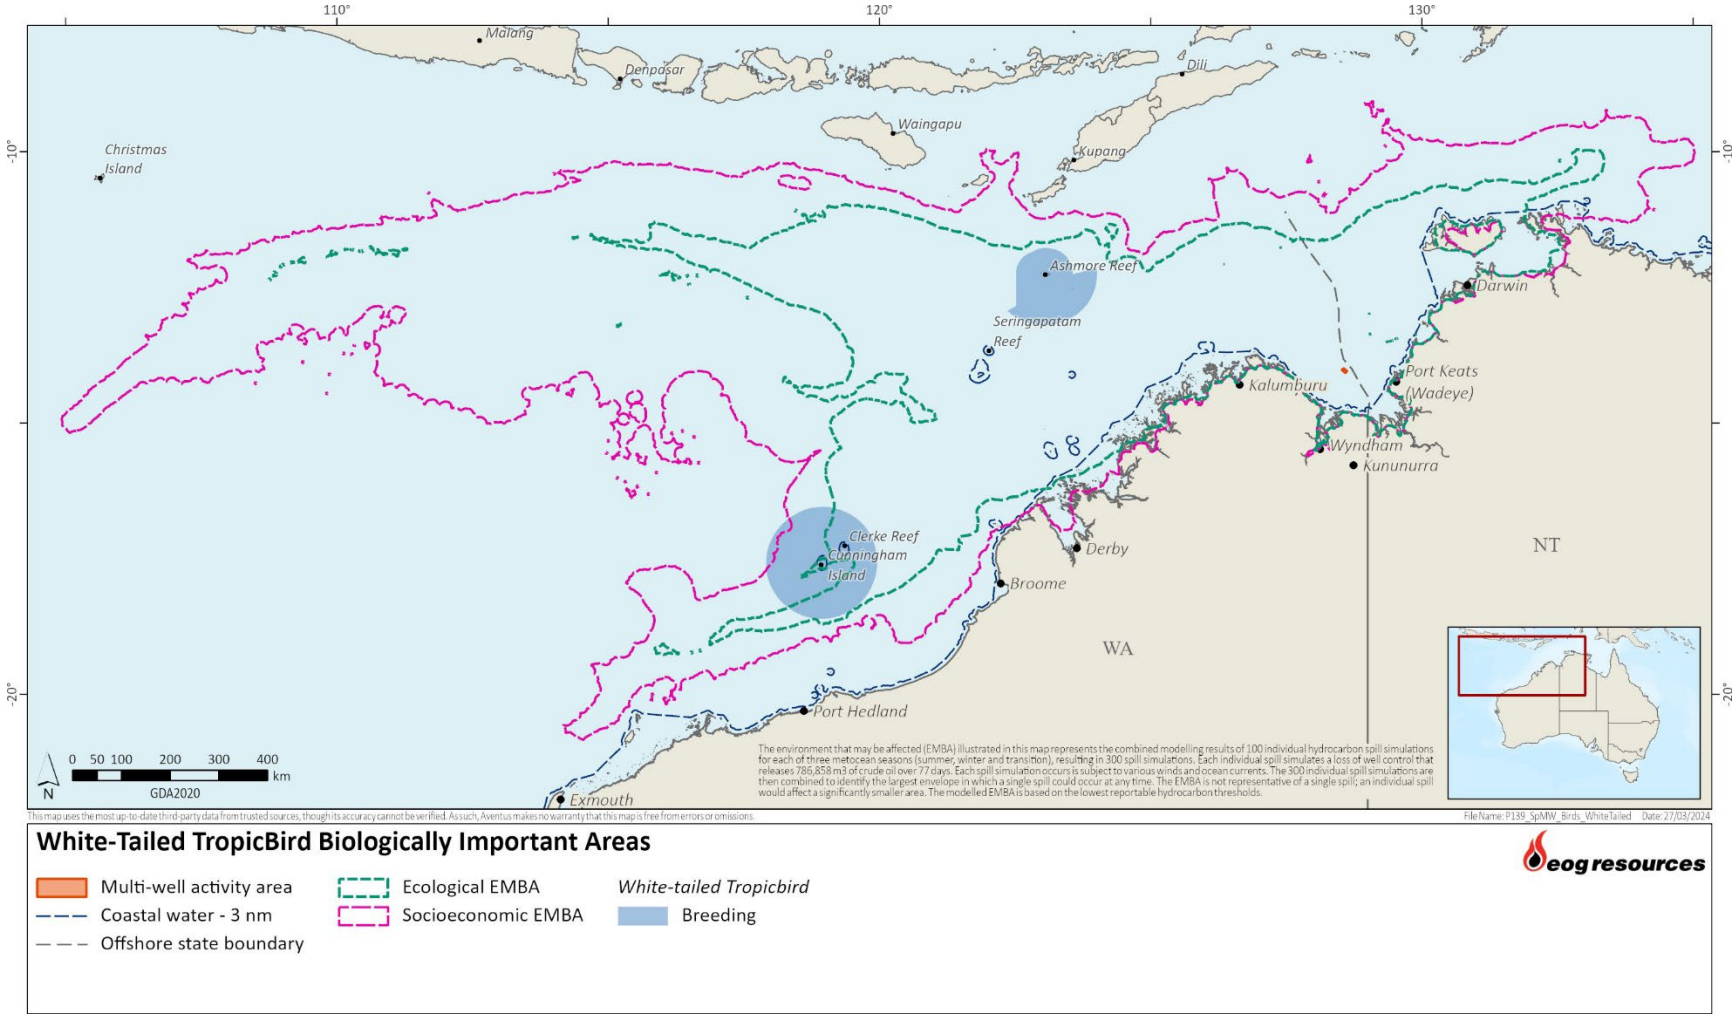

Figure 11.54 White tailed tropicbird BIA in the spill EMBA

Christmas Island white-tailed tropicbird (EPBC Act: Listed Endangered)

The Christmas Island white-tailed tropicbird (*Phaethon lepturus fulvus*) is endemic to Christmas Island, which is its only known breeding site (DoE, 2014d). It leaves the island to forage in the warm waters of the Indian Ocean (DoE, 2014d) mainly feeding on fish and cephlapods. The white-tailed tropicbird roosts at sea; only incubating or brooding adults remain on nests on the island at night (Stokes, 1988).

The National Conservation Values Atlas (DCCEEW, 2024c) does not identify any BIAs for this species within the activity area nor ecological EMBA.

Indian yellow-nosed albatross (EPBC Act: Listed vulnerable)

The Indian yellow-nosed albatross (Thalassarche carteri) is a is a marine bird, located in subtropical and warmer subantarctic waters (Marchant and Higgins, 1993). Foraging BIAs are located throughout the offshore waters of the south-west marine region, north to Shark Bay and extending east into Bass Strait. Although the PMST report identifies this species or its habitat may be present within the EMBA, the closest likely habitat is just south of Barrow Island (outside of the EMBA). There are no BIAs intersected by the spill EMBA; however, it is likely that individuals may transit through the EMBA.

Australian fairy tern (EPBC Act: Vulnerable)

This subspecies of the fairy tern (*Sternula nereis nereis*) is listed as vulnerable as there are less than 5,000 mature individuals remaining and the total population has undergone a substantial decline of approximately 24% (TSSC, 2011). The Australian fairy tern occurs along the coasts of NSW, Victoria, Tasmania, SA and WA in a variety of habitats including offshore, estuarine or lake islands, wetlands, beaches and spits (TSSC, 2011). They are suspected to migrate with southern WA and Tasmania due to their low records during winter months. Within northern WA, SA and Victoria they are more sedentary. Some of the main threats to the subspecies include predation from mammals, human disturbance and high salinity levels within their foraging waters.

The spill EMBA reaches a small area of their distribution (surrounding waters of Barrow Island and coastal waters of Karratha) (DCCEEW, 2024b).

Shorebirds

Ruddy turnstone (EPBC Act: Vulnerable, Migratory and Marine)

The ruddy turnstone (*Arenaria interpres*) became listed as vulnerable in January 2024. They are a stocky, medium-sized wader, with short orange-red legs. During the austral summer non-breeding season, the ruddy turnstone is widespread within Australia. In north Australia, they are known to occur in a wide variety of habitats and may prefer wide mudflats. The species has a preference for areas containing rotting seaweed where they can rummage for maggots, larvae, and other invertebrates. The species has occasionally been recorded chasing small crabs and using their beak to probe crab holes (DCCEEW, 2024j).

The species may be present within the coastal areas of the spill EMBA.

Curlew sandpiper (EPBC Act: Critically Endangered, Listed Migratory)

In Australia, the curlew sandpiper (*Calidris ferruginea*) occurs around the coasts and is also quite widespread inland, though in smaller numbers (DCCEEW, 2024b). They are rarely recorded in the northwest Kimberley, around Wyndham and Lake Argyle (DCCEEW, 2024b).

This species is unlikely to be present in the activity area due to its location offshore but given that the EMBA is adjacent to (without intersecting) critical habitat for this species (e.g., wetlands), it is

possible that this species would be present in the coastal sections of the EMBA during the summer months.

Sharp-tailed sandpiper (EPBC Act: Critically Endangered, Listed Migratory)

This species is described in Chapter 5 section 5.4.7. There are no BIAs (as defined by the NCVA) that exist within the EMBA.

Terek sandpiper (EPBC Act: Vulnerable, Marine and Migratory)

The terek sandpiper (*Xenus cinereus*) was listed as vulnerable in January 2024. The species has a distinctive long, upcurved bill and weights around 95 g. In Australia, the terek sandpiper has a primarily coastal distribution. The species is more widespread and common in northern and eastern Australia than southern Australia. In the NT, widespread records of the bird occur from Darwin, north to Melville Island, and east to the western section of the Gulf of Carpentaria, around Gove Peninsula, Groote Eylandt, Sir Edward Pellew Island, and the mouth of the McArthur River. Terek sandpipers are typically found in tropical mangrove-lined estuaries and mudflats and feed on crustaceans and insects (DCCEEW, 2024n).

The terek sandpiper may be present within the coastal areas of the EMBA, particularly within the NT.

Lesser sand plover (EPBC Act: Endangered, Listed Migratory)

The lesser sand plover (*Charadrius mongolus*) spends non-breeding periods in Australia. The species is widespread in coastal regions and has been recorded in all states within Australia but mainly occurs in northern and eastern Australia (DCCEEW, 2024b).

The species feeds mostly on extensive, freshly-exposed areas of intertidal sandflats and mudflats in estuaries or beaches, or in shallow ponds in saltworks (DCCEEW, 2024b). They also occasionally forage on coral reefs and on sandy or muddy river margins (DCCEEW, 2024b). The lesser sand plover roost near foraging areas, on beaches, banks and spits, banks of sand and shells, and occasionally on rocky spits, isles, or reefs (DCCEEW, 2024b).

This species is not predicted to occur in the activity area due to its distance from shore but may occur within the coastal areas of the EMBA and in the Cambridge Gulf.

Common greenshank (EPBC Act: Endangered, Listed Migratory and Marine)

The common green shank was listed as endangered in January 2024. The species is a large and heavily built wader with a long and slightly upturned bill. The common greenshank is widespread in coastal regions, occurs in all types of wetlands, and has one of the widest distributions of any shorebird in Australia. The species is known to occur fragmentedly along the WA and NT coast. The common greenshank forages at the edge of wetlands, in soft mud on mudflats, in channels, or within shallows around the edge of waterbodies. Their consists of insects and their larvae, crustaceans, annelids, molluscs, amphibians.

It is possible that the common greenshank will be encountered within the coastal regions of the EMBA.

Asian dowitcher (EPBC Act: Vulnerable, Migratory and Marine)

The Asian dowitcher (Limnodromus semipalmatus) become listed as vulnerable in January 2024. They are a large, distinctive shorebird with a long neck, long legs, and a long, straight, snipe-like bill. Within Australia, this species is only a regular visitor to coastal areas between Broome and Port Hedland. Elsewhere, the species occurrence is sporadic and rare. The species feeds in inter-tidal mudflats on small fish and insect larvae as well as molluscs (DCCEEW, 2024k).

Due to the species limited known range within coastal WA, it is unlikely that the Asian dowitcher will be present within the EMBA.

Eastern curlew (EPBC Act: Critically Endangered, Listed Migratory)

The eastern curlew (*Numenius madagascariensis*) has a primarily coastal distribution within Australia (DoE, 2015c). It does not breed in Australia and is found foraging on soft sheltered intertidal sandflats or mudflats, open and without vegetation or covered with seagrass, often near mangroves, on saltflats and in saltmarsh, rockpools and among rubble on coral reefs, and on ocean beaches near the tideline (DoE, 2015c).

Given that the EMBA is adjacent to (without overlapping) critical habitat for this species (e.g., wetlands), it is possible that this species occurs in the EMBA during the summer.

Black-tailed godwit (EPBC Act: Endangered, Marine and Migratory)

The black-tailed godwit (*Limosa limosa*) was listed as endangered in January 2024. Black-tailed godwits are 40–44 cm long, have a wingspan between 63–75 cm, and weigh between 200–300 g. During the austral summer non-breeding season, black-tailed godwits are found in all states and territories of Australia predominately in coastal regions. The largest populations are found on the north coast between Darwin, NT and Weipa, QLD. Feeding habitat includes areas of mud or soft, wet sand within sandflats, intertidal mudflats, saltmarshes, and the beaches of oceanic coastlines, bays, and estuaries. Their diet consists mainly of insects, crustaceans, molluscs, worms, larvae, spiders, fish eggs, frog eggs and tadpoles, which they probe from soft mud or shallow water (DCCEEW, 2024l).

This species may be present within the coastal regions of the EMBA, particularly within the NT.

Nunivak bar-tailed godwit (EPBC Act: Vulnerable)

The Nunivak bar-tailed godwit (*Limosa lapponica baueri*) is a large wader recorded in coastal areas of all states and territories of Australia (DCCEEW, 2024b). The species is found in coastal habitats such as large intertidal sand and mudflats, banks, estuaries, harbours, bays and coastal lagoons where it forages when the tide is out (DAWE, 2021b). Their diet consists of worms, molluscs, crustaceans, insects and some plant material (DCCEEW, 2024b). This species breeds in the northern hemisphere and migrates south for the winter, arriving in northwest Australia from August and departs before the end of April (DCCEEW, 2024b).

This species is not predicted to occur in the activity area due to its offshore location but may be present in the coastal sections of the EMBA between August and April.

Northern Siberian bar-tailed godwit (EPBC Act: Critically Endangered)

The northern Siberian bar-tailed godwit (*Limosa lapponica menzbieri*) is a large migratory shorebird (TSSC, 2016b). The northern Siberian bar-tailed godwit spends non-breeding periods in Australia and is found in all Australian states and territories (TSSC, 2016b). Populations have been recorded in northern Australia, from Darwin east to the Gulf of Carpentaria. The species forages near the edge of water or in shallow water, mainly on muddy coastlines, estuaries, inlets and mangroves feeding on worms, molluscs, crustacean, insects and plant material (TSSC, 2016b).

It is unlikely that this species would be present in the activity area due to its offshore location but this species may be present within the coastal sections of the EMBA.

Great knot (EPBC Act: Critically Endangered, Listed Migratory)

The great knot (*Calidris tenuirostris*) has been recorded around the entire Australian coast and spends non-breeding periods in Australia (DCCEEW, 2024b). The greatest numbers of this species are found in northern Australia, and most commonly on the coast of the Pilbara and Kimberley,

from the Dampier Archipelago to the NT border, and in the NT from Darwin and Melville Island, through Arnhem Land to the southeast Gulf of Carpentaria (DCCEEW, 2024b). This species typically prefers sheltered coastal habitats with large intertidal mudflats or sandflats (DCCEEW, 2024b). The great knot feeds on snails, worms and crustaceans, and forages on intertidal mudflats, estuaries, and in mangroves.

This species is not predicted to be encountered in the activity area due to its habitat preferences, although it is expected in parts of the coastal areas of the EMBA where its preferred habitat is available.

Red knot (EPBC Act: Endangered, Listed Migratory)

The red knot (*Calidris canutus*) is common in all the main suitable habitats around the coast of Australia (DCCEEW, 2024b), and very large numbers are regularly recorded in northwest Australia, with Eighty Mile Beach and Roebuck Bay being particular strongholds (both outside the EMBA). In WA, it is widespread on the coast from Ningaloo Reef and Barrow Island to the southwest Kimberley coastline. In the NT it is mainly recorded in Darwin.

The red knot is not predicted to occur within the activity area due to its habitat preferences but is likely to be present in parts of the coastal areas of the EMBA.

Alligator Rivers yellow chat (EPBC Act: Endangered)

The alligator rivers yellow chat (*Epthianura crocea tunneyi*) is a small bird that has been recorded from a several sites in the NT on the floodplains of the Adelaide, Mary, Wildman, South Alligator and East Alligator rivers (Garnett *et al.,* 2011). Most records are from within Kakadu National Park, however the relative importance of the different floodplains is unknown (Garnett *et al*., 2011). Occasional records elsewhere, mostly from between Darwin to Oenpelli, are probably dispersive individuals. The subspecies is presumed to be a single a contiguous population (Garnett et al., 2011).

The species is restricted to alluvial coastal and subcoastal grassy floodplains, primarily near floodplain depressions and channels, typically sparsely vegetated and feed mainly on insects (Armstrong, 2004). Given the habitat preference of the alligator rivers yellow chat, the species may be present in the coastal section of the NT. There are no known BIAs intersected by the EMBA.

Australian painted snipe (EPBC Act: Endangered)

The Australian painted snipe (*Rostratula australis*) is a wader and is found in wetlands throughout all Australian states and territories (DCCEEW, 2024b). The species generally inhabits freshwater wetlands, although can inhabit brackish water, saltmarshes and claypans (DCCEEW, 2024b). It feeds on vegetation, seeds, insects, worms, molluscs, crustaceans and other invertebrates (DCCEEW, 2024b). The Australian painted-snipe is not predicted to occur within the activity area, but is likely to be present in the EMBA.

Red goshawk (EPBC Act: Vulnerable)

The red goshawk is a large, swift and powerful rufous-brown hawk found in patchy, but widespread areas across coastal and sub-coastal regions of northern and eastern Australia. Historically it occurred from the north-east tip of New South Wales, across Queensland and the Northern Territory, to the north of WA (Marchant and Higgins, 1993). The species is thought to consist of two subpopulations, one on the Tiwi Islands containing approximately 200 adults, and a mainland population containing approximately 1200 adults (Garnett *et al.,* 2011). The red goshawk may transient through the coastal areas of northern WA and the NT within the EMBA. However, there are no BIAs for this species that overlap the EMBA.

Greater sand plover (EPBC Act: Vulnerable, Listed Migratory)

The greater sand plover (*Charadrius leschenaultia*) occurs in coastal areas throughout Australia with the greatest populations between the NW Cape and Roebuck Bay (DCCEEW, 2024b) (both outside the EMBA). The plover spends almost all its time in coastal habitats. Their diet consists mainly of molluscs, worms, crustaceans and insects (DCCEEW, 2024b). The species breeds in the northern hemisphere and migrates south for the boreal winter (DCCEEW, 2024b). The greater sand plover is one of the first migratory waders to return to northwest Australia, usually arriving in late July and departing in mid to late April (DCCEEW, 2024b).

The species is not predicted to occur in the activity area due to its habitat preferences, but may occur within the coastal areas of the EMBA from July to April.

Grey plover (EPBC Act: Vulnerable, Marine and Migratory)

The grey plover (*Pluvialis squatarola*) was listed as vulnerable in January of 2024. Grey plovers are medium-sized, long-legged plovers with a large head and large, dark eyes. During the austral summer non-breeding season, the grey plover is a regular migrant to Australia but is primarily found along the west and south coasts. Western Australian sites support about 38% of the Australian population. In the Northern Territory, small numbers of grey plovers are regularly recorded in the Top End. The species feeds on marine polychaete worms, molluscs, and crustaceans in mostly in mud or soft, wet sand of sandflats, intertidal mudflats, saltmarshes, and the beaches of oceanic coastlines, bays, and estuaries.

It is possible that the grey plover will be encountered in coastal regions of the EMBA, particularly in NT.

11.3.8 Marine Pests

It is widely recognised that marine pests can become invasive and cause significant impacts on economic, ecological, social and cultural values of marine environments. Impacts can include the introduction of new diseases, altering ecosystem processes and reducing biodiversity, causing major economic loss and disrupting human activities (Brusati and Grosholz, 2007).

The Marine Pests Interactive Map (DAFF, 2021) indicates that the major port likely to be used to support the activity (e.g., Darwin) is not known to harbour any marine pests. However, DAFF (2021) notes that the following species are listed to keep watch for in the Port of Darwin due to their high potential for accidental introduction:

- Asian green mussel (*Perna viridis*) – typically inhabits soft sediment bottoms from the low tide mark to shallow waters up to 42 m deep. Juveniles are bright green than turn brown in adults.
- American slipper limpet (*Crepidula fornicate*) – competes with native species for food and space and may alter sediment characteristics by removing suspended sediments from the water column. Its likely habitat includes mud, rocks and sand within shores and shall waters.
- Black striped false mussel (*Mytilopsis sallei*) – affects the productivity of commercial fisheries and aquaculture by competing with native species for food and space. The species usually inhabits shallow waters up to a few metres deep.
- Charru mussel (*Mytella charruana*) – successful invasive species globally due to its great dispersal ability and tolerance for a wide variety of habitats. Typically found on rocky or hard substrates in shallow waters

11.4 Conservation Values and Sensitivities

The conservation values and sensitivities within the EMBA are described in this section, with Table 11.11 providing an outline of the conservation categories described.

Table 11.11 Conservation values in the EMBA

Category	Conservation classification	Section
MNES under the EPBC Act	Australian Marine Parks (AMP)	Section 11.4.1
	World Heritage-listed properties	Section 11.4.2
	National Heritage-listed places	Section 11.4.3
	Wetlands of international importance	Section 11.4.5
	Nationally threatened species and threatened ecological communities	Throughout Section 11.3 and Section 11.4.6
	Migratory species	Throughout Section 11.3
	Great Barrier Reef Marine Park	Not applicable.
	Nuclear actions	Not applicable.
	A water resource, in relation to coal seam gas development and large coal mining development	Not applicable.
Other areas of national importance	Commonwealth heritage-listed places	Section 11.1.1
	Key Ecological Features (KEF)	Section 11.4.7
	Nationally important wetlands (NIW)	Section 11.4.8
State protected areas	State/territory protected areas	Section 11.4.9

11.4.1 Australian Marine Parks

Australian Marine Parks as proclaimed under the EPBC Act (in 2007 and 2013) are located in Commonwealth waters that start at the outer edge of state and territory waters, generally 3 nm (approximately 5.5 km) from the shore, and extend to the outer boundary of Australia's EEZ, 200 nautical miles (approximately 370 km) from the shore (DNP, 2018).

The AMP Network includes six marine regions being the Coral Sea, South-west, Temperate East, South-east, North and Northwest. The marine park networks applicable to the activity area and spill EMBA are the Northwest Marine Parks Network aligned with the NWMR; and North Parks Marine Network aligned to the NMR. Management plans have been developed and approved for each of these regions including zoning and related rules for managing activities in the marine park to ensure protection of marine habitats and species:

- North Marine Parks Network Management Plan 2018 (DNP, 2018a); and.
- Northwest Marine Parks Network Management Plan 2018 (DNP, 2018b).

The nearest AMPs to the multi-well location is the JBG AMP (located 30 km east) and the Kimberley AMP (located 235 km), described herein. AMPs in the EMBA and their zoning (IUCN classification as defined in Table 11.12) are listed in Table 11.13. AMPs within the EMBA are shown in Figure 11.55.

Table 11.12 Definition of AMP zones

Special Purpose Zone (IUCN category VI)—managed to allow specific activities though special purpose management arrangements while conserving ecosystems, habitats and native species. The zone allows orprohibits specific activities.
Multiple Use Zone (IUCN category VI)—managed to allow ecologically sustainable use while conserving ecosystems, habitats and native species. The zone allows for a range of sustainable uses, including commercial fishing and mining where they are consistent with park values.
Habitat Protection Zone (IUCN category IV)—managed to allow activities that do not harm or cause destruction to seafloor habitats, while conserving ecosystems, habitats and native species in as natural astate as possible.
Recreational Use Zone (IUCN category IV)—managed to allow recreational use, while conserving ecosystems, habitats and native species in as natural a state as possible. The zone allows for recreationalfishing, but not commercial fishing.
National Park Zone (IUCN category II)—managed to protect and conserve ecosystems, habitats and native species in as natural a state as possible. The zone only allows non-extractive activities unless authorised for research and monitoring.
Sanctuary Zone (IUCN category Ia)—managed to conserve ecosystems, habitats and native species in as natural and undisturbed a state as possible. The zone allows only authorised scientific research and monitoring.

Table 11.13 Australian Marine Parks in the spill EMBA

AMP	Distance and direction to multi-well location	Zone or IUCN Classification	Presence	
			Ecological EMBA	Socio-economic EMBA
North Marine Region (NMR)				
Oceanic Shoals	151 km north	Multiple Use Zone (IUCN VI)	Yes	Yes
Arafura	555 km north northeast	Multiple Use Zone (IUCN VI)	Yes	Yes
		Special Purpose Zone (Trawl) (IUCN VI)	-	Yes

AMP	Distance and direction to multi-well location	Zone or IUCN Classification	Presence	
			Ecological EMBA	Socio-economic EMBA
Arnhem	613 km northeast	Special Purpose Zone (Trawl) (IUCN VI)	-	Yes
Northwest Marine Region (NWMR)				
Argo-Rowley Terrace	885 km west	National Park Zone (IUCN II)	Yes	Yes
		Multiple Use Zone (IUCN VI)	Yes	Yes
		Special Purpose Zone (Trawl) (IUCN VI)	Yes	Yes
Ashmore Reef	602 km northwest	Recreational Use Zone (IUCN IV)	Yes	Yes
		Sanctuary Zone (IUCN 1a)	Yes	Yes
Cartier Island	555 km west	Sanctuary Zone (IUCN 1a)	Yes	Yes
Joseph Bonaparte Gulf	30 km east	Multiple Use Zone (IUCN VI)	Yes	Yes
		Special Purpose Zone (IUCN VI)	Yes	Yes
Kimberley	235 km west	Multiple Use Zone (IUCN VI)	Yes	Yes
		National Park Zone (IUCN II)	Yes	Yes
		Habitat Protection Zone (ICUN IV)	Yes	Yes
Mermaid Reef	1003 km south southwest	National Park Zone (IUCN II)	Yes	Yes
Montebello	1491 km south southwest	Multiple Use Zone (IUCN VI)	-	Yes

Note: Although Oceanic Shoals AMP is part of the North Marine Region, it also overlaps the NWMR, where the EMBA extends.

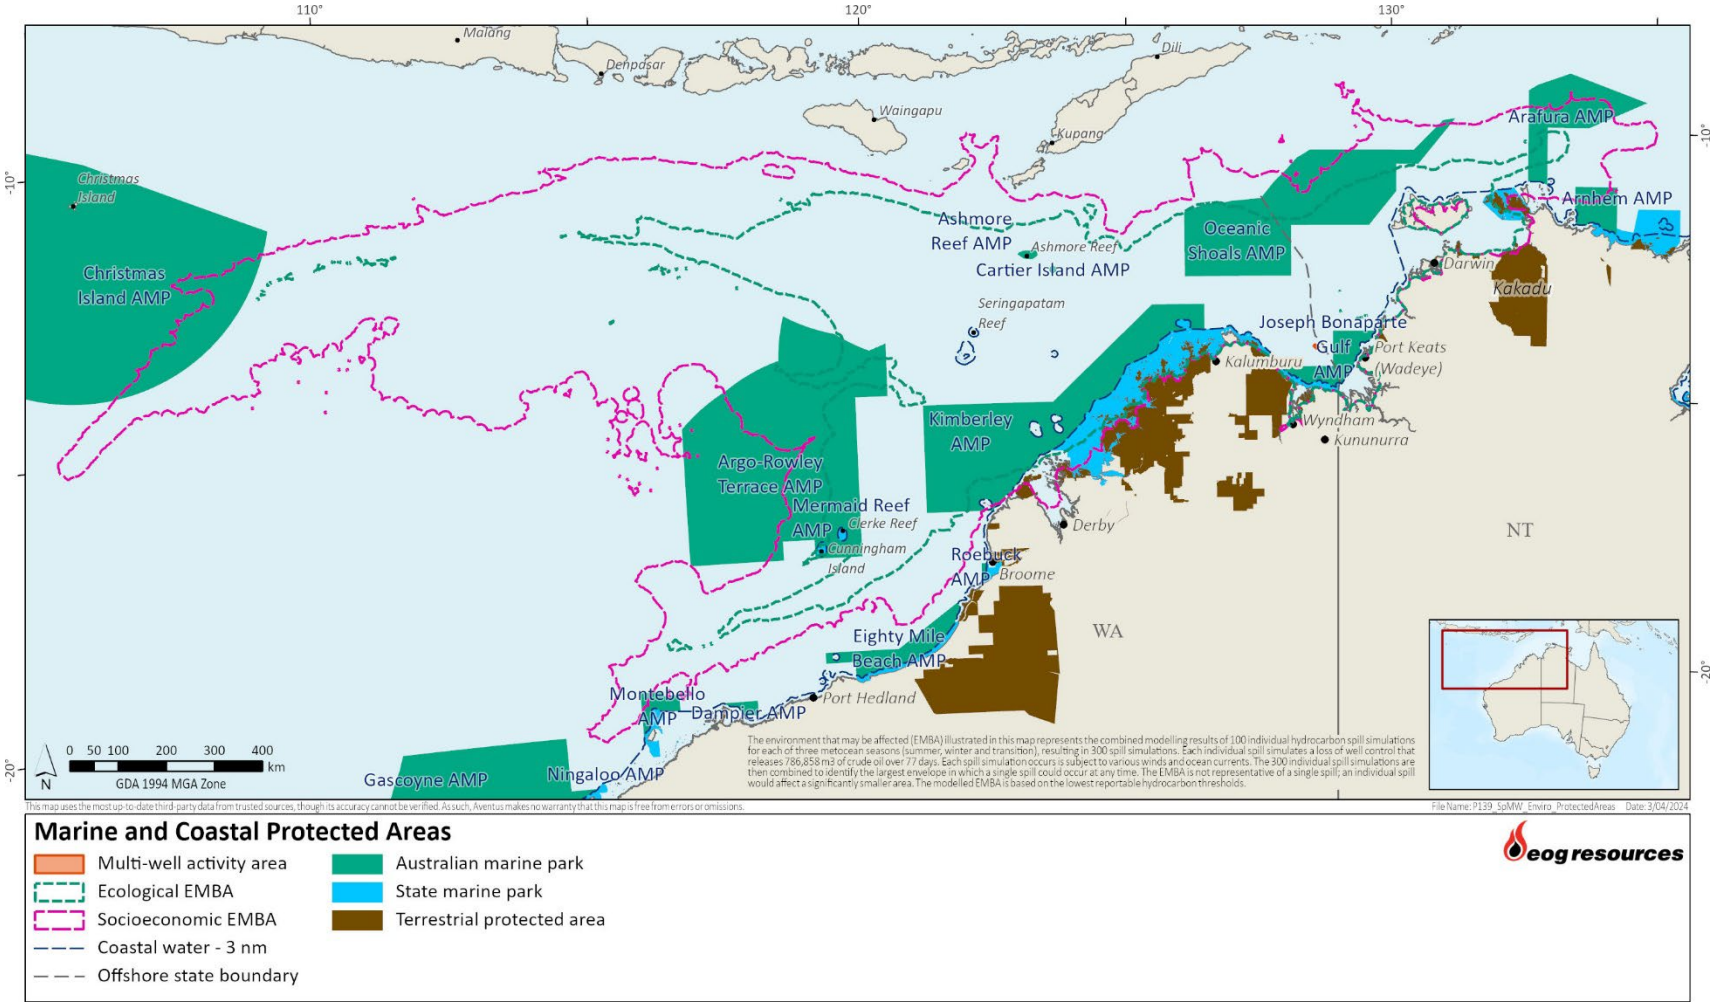

Figure 11.55 Protected areas in the spill EMBA

Oceanic Shoals AMP

The Oceanic Shoals AMP is located west of the Tiwi Islands, approximately 155 km north-west of Darwin, Northern Territory and 305 km north of Wyndham, Western Australia. It extends to the limit of Australia's Exclusive Economic Zone (EEZ). The Oceanic Shoals AMP covers an area of 71,743 km² and water depths from less than 15 m to 500 m and is the largest marine park in the North Marine Parks Network.

The Oceanic Shoals AMP is characterised by:

- Examples of ecosystems representative of the Northwest Shelf Transition. The pinnacles, carbonate banks and shoals within the AMP are sites of enhanced biological productivity.
- Four KEFs (refer to Section 11.4.7), namely:
  - Carbonate bank and terrace systems of the Van Diemen Rise;
  - Carbonate bank and terrace system of the Sahul Shelf;
  - Pinnacles of the Bonaparte Basin; and
  - Shelf break and slope of the Arafura Shelf.
- Foraging and internesting BIA for marine turtles (Section 11.3.6).
- Sea country within the marine park is valued for Indigenous cultural identity, health and wellbeing.
- Commercial fishing and mining are important activities in the AMP.

Arafura AMP

The Arafura AMP covers an area of 22,924 km^2 with depths from less than 15 m to 500 m. It is located approximately 256 km northeast of Darwin. The marine park extends from NT waters to the limit of Australia's EEZ. The Arafura Marine Park is significant because it contains habitats, species and ecological communities associated with the Northern Shelf Province and Timor Transition. It contains one KEF known as the tributary canyons of the Arafura Depression, an area that contains canyons that are approximately 80 to 100 km long and 20 km wide with sediments including sand, mud and rock. The canyons channel deep ocean waters, enhancing productivity and supporting large predatory fish, whale sharks, sawfish and marine turtles, deep sea sponges, and barnacles (DNP, 2018a).

In addition, it is in close proximity to important wetland systems including the Cobourg Peninsula Ramsar site, and provides important foraging habitat for seabirds (DNP, 2018a). Biologically important areas within the marine park include inter-nesting habitat for marine turtles and important foraging and breeding habitat for seabirds. According to the North Marine Parks Network Management Plan 2018, there are no international, Commonwealth or national heritage listings apply to the marine park No international, Commonwealth or national heritage listings apply to the marine park Commercial fishing, tourism, and recreation, including fishing occur in the marine park (DNP, 2018a).

Arnhem AMP

The Arnhem AMP located 60 km southeast of the Arafura Marine Park, is extends from NT waters surrounding the Goulburn Islands, to the waters north of Maningrida. The marine park covers an area of 7,125 km² and water depth ranges from less than 15 m to 70 m. The marine park is significant because it contains habitats, species and ecological communities associated with the Northern Shelf Province. It includes dynamic habitats due to gently sloping shelf topped with a number of pinnacles, at depths ranging from 5 m to 30 m. It is nearby important wetland systems

including the Blyth-Cadell Floodplain and Boucaut Bay Nationally Important Wetland (outside of the EMBA, 667 km east of the activity area) and provides important foraging habitat for seabirds (DNP, 2018a).

Internal currents in the region drive a net clockwise movement of nutrient-rich coastal water contributing to high biological diversity. Tidal eddies induce localised upwellings and hotspots of productivity that correspond with aggregations of marine life within the marine park. No international, Commonwealth or national heritage listings apply to the marine park. Commercial fishing, tourism, and recreation, including fishing also occur in the marine park (DNP, 2018a).

Argo-Rowley Terrace AMP

The Argo-Rowley AMP covers an area of 146,003 km^2 and water depths between 220 m and 600 m. It is the largest in the Northwest Network, and is adjacent to the Mermaid Reef Marine Park and the WA Rowley Shoals Marine Park. It includes the deeper waters of the region and a range of seafloor features such as canyons on the slope between the Argo Abyssal Plain, Rowley Terrace and Scott Plateau. These are believed to be up to 50 million years old and are associated with small, periodic upwellings that results in localised higher levels of biological productivity (DNP, 2018b).

The Argo-Rowley Marine Park is significant because it contains habitats, species and ecological communities associated with the Northwest Transition and Timor Province. It includes two KEFs:

- Canyons linking the Argo Abyssal Plain with the Scott Plateau and Mermaid Reef; and
- Commonwealth waters surrounding Rowley Shoals.

This AMP supports a range of species including species listed as threatened, migratory, marine or cetacean under the EPBC Act. BIAs within the Marine Park include resting and breeding habitat for seabirds and a migratory pathway for the pygmy blue whale (DNP, 2018b). Commercial fishing and mining are important activities in the marine park (DNP, 2018b).

Ashmore Reef AMP

The Ashmore Reef AMP is in the Australian External Territory (AET) of Ashmore and Cartier Islands, approximately 630 km north of Broome, WA. It covers 583 km², with depths less than 15 m to 500 m. The Ashmore Reef AMP is comprised of three small islands, lagoons, sand flats, reef flats with a high diversity of hard and soft corals and sponges, and large seagrass meadows. The AMP is a Sanctuary Zone with a small Recreational Use Zone allowing access to the most westerly island.

The Ashmore Reef AMP is characterised by:

- The presence of around 100,000 seabirds than come to breed each year, including greater crested terns, white-tailed tropicbirds and greater frigatebirds, and tens of thousands of migratory shorebirds that forage in the surrounding waters, such as curlew sandpipers, bar-tailed godwits and great knots. It is also a breeding site for green turtles.
- Sea country within the AMP is valued for Indigenous cultural identity, health and wellbeing.
- Tourism, recreation and scientific research are important activities in the Marine Park.
- Two KEFs, namely:
    - The continental slope demersal fish communities KEF; and
    - The Ashmore Reef and Cartier Island and surrounding Commonwealth waters KEF.
- The presence of the Ashmore Reef National Nature Reserve Ramsar site.

Further information on KEFs and Ramsar sites is provided in Section 11.4.7 and Section 11.4.5 respectively.

Cartier Island AMP

The Cartier Island AMP lies in the Timor Sea within the AET of Ashmore and Cartier Islands, approximately 600 km north of Broome, WA. It covers 172 km², with water depths from less than 15 m to 500 m. The south-flowing Leeuwin Current originates in this region, and transports marine life southwards.

The entire Carter Island AMP is characterised by:

- Important habitat for seasnakes, turtles, whale sharks, corals, sea fans and sponges. This marine park and the nearby Ashmore Reef AMP are marine biodiversity hotspots, supporting a rich diversity of species and high numbers of individuals.
- Sea country within the marine park is valued for Indigenous cultural identity, health and wellbeing.
- Scientific research is an important activity in the AMP.
- Two KEFs, namely:
    - The continental slope demersal fish communities KEF, characterised by high levels of endemic fish; and
    - The Ashmore Reef and Cartier Island and surrounding Commonwealth waters KEF characterised by enhanced primarily productivity and aggregations of marine life.

Joseph Bonaparte Gulf AMP

The JBG AMP covers an area of 8,597 km^2 and water depths within the AMP range from less than 15 m to 75 m (Galaiduk *et al*., 2018). The JBG AMP is significant because it contains habitats, species and ecological communities associated with the Northwest Shelf Transition provincial bioregion and the Oceanic Shoals meso-scale bioregion (Galaiduk *et al*., 2018). The AMP contains a number of prominent shallow seafloor features including an emergent reef system, shoals and sand banks (Galaiduk *et al*., 2018). It also includes one key ecological feature, the Carbonate Bank and Terrace System of the Sahul Shelf, which is valued as a unique seafloor feature with ecological properties of regional significance (Galaiduk, *et al*., 2018). The Miriuwung, Gajerrong, Doolboong, Wardenybeng and Gija and Balangarra people have responsibilities for sea country in this AMP (DNP, 2018a).

Ranger led marine ecological surveys were conducted at the Joseph Bonaparte Gulf Marine Park (JBGMP) in 2021 and 2022. Results of the survey were released in 2023 (Udyawer et al., 2023). Overall, the surveys conducted at Emu Reefs, Emu Break and Howland Shoal highlighted the rich and diverse fish fauna within the JBGMP. The project established a baseline dataset of at least 59 species recorded within the JBGMP, including 10 species with threatened status (according to the IUCN). The BRUVs biodiversity data corroborates previous information from fisheries assessments on the common occurrence of Emperor and Snapper species (*Lutjanus spp. and Lethrinus spp.)*. The sightings of a large number of threatened species which include reef sharks, rays and wedgefish within the region highlights the healthy ecosystem within the Marine Park (Udyawer et al., 2023).

Kimberley AMP

The Kimberley AMP is located approximately 100 km north of Broome, WA and the central part of the Kimberley AMP is adjacent to the WA Camden Sound State Marine Park. It covers 74,469 km^2, with depths from less than 15 m to 800 m.

The Kimberley AMP is characterised by:

- High numbers of marine mammals such as dolphins, whales and dugong. The humpback whale breeds and calves in the Kimberley AMP annually after undertaking an extensive migration from Antarctica. Three dolphin species (Australian snubfin dolphin, Australian humpback dolphin and spotted bottlenose dolphin) use the Kimberley AMP to forage within and travel to coastal waters to calve and raise their young in inshore, protected waters.
- Important foraging rounds for seabirds and shorebirds known to breed on Adele Island (outside of the EMBA), including critically endangered eastern curlews and curlew sandpipers.
- Sea country within the AMP is valued for Indigenous cultural identity, health and wellbeing.
- Tourism, commercial fishing, mining, recreation (including fishing) and traditional use are important activities in the AMP.

There are no KEFs within the Kimberley AMP.

Mermaid Reef AMP

The Mermaid Reef AMP adjacent to the Argo–Rowley Terrace Marine Park, is located 280 km northwest of Broome and approximately 13 km from the Rowley Shoals Marine Park which falls under WA state jurisdiction. The Mermaid Reef Marine Park covers an area of 540 km² and water depths from less than 15 m to 500 m (DNP, 2018b).

It is significant because it contains habitats, species and ecological communities associated with the Northwest Transition. It includes the Mermaid Reef and Commonwealth waters surrounding Rowley Shoals KEF, and is one of three reefs forming the Rowley Shoals. The other two are Clerke Reef and Imperieuse Reef, to the southwest of the marine park, which are included in the WA Rowley Shoals Marine Park (DNP, 2018b).

Ecosystems of the Marine Park are associated with emergent reef flat, deep reef flat, lagoon, and submerged sand habitats. The marine park supports a range of species, including species listed as threatened, migratory, marine or cetacean under the EPBC Act. Biologically important areas within the marine park include breeding habitat for seabirds and a migratory pathway for the pygmy blue whale. Important activities in the marine park include marine tourism, recreation, and scientific research (DNP, 2018b).

Montebello AMP

The Montebello AMP covers an area of 3,413 km² and water depths from less than 15 m to 150 m. It is significant because it contains habitats, species and ecological communities associated with the Northwest Shelf Province. It includes one KEF: the ancient coastline at the 125-m depth contour. When tides are low, two coral reefs called Tryal Rocks emerge above the water (DNP, 2018b)

The marine park supports a range of species including species listed as threatened, migratory, marine or cetacean under the EPBC Act. BIAs within the marine park include breeding habitat for seabirds, internesting, foraging, mating, and nesting habitat for four species of marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks (DNP, 2018b). Tourism, commercial fishing, mining and recreation are important activities in this AMP (DNP, 2018b).

AMP Pressures

Section 2.4 of the North Marine Parks Network Management Plan 2018 (DNP, 2018a) and Section 2.4 of the North-west Marine Parks Network Management Plan 2018 (DNP, 2018b) identify pressures relevant to the marine park networks. Pressures are defined as human-driven processes, events and activities that may detrimentally affect the values of the reserves network. Table 11.14 summarises the pressures and sources of pressure on the conservation values of the of the NMR and NWMR Reserves Network.

Table 11.14 Summary of environmental pressures in the NWMR and NMR

Pressure	Description
Climate change	Climate change impacts on marine environments are complex and interrelated and may include changes in sea temperature, sea level, ocean acidification, sea currents, increased storm frequency and intensity and species range extension or local extinction. Examples of features and species vulnerable to climate change impacts include submerged coral reefs, sawfish, sharks, dolphins, seabirds and marine turtles.
Changes in hydrology	Coastal developments and agriculture have the potential to discharge increased sediment loads and pollutants to rivers, estuaries and nearshore coastal environments. This can result in increased turbidity and siltation, which in turn impacts species that spawn or inhabit coastal, nearshore or offshore waters. Habitats and species vulnerable to changes in hydrology include seagrass meadows, reefs, sawfish, shark and dugong.
Extraction of living resources	Sustainable fishing as well as illegal or unregulated fishing can modify natural populations and disproportionately target select valuable species. Species vulnerable to extraction include shark, sawfish, turtles, sea snakes, fish and dugong.
Habitat modification	Offshore infrastructure developments can impact habitat within marine parks through physical disturbance and indirectly through the physical presence of infrastructure. Benthic habitats may be impacted by direct discharges to the seabed resulting in smothering or a reduction in the quantity of light reaching the seabed. Habitats and species vulnerable to habitat modification include reefs, shoals and pinnacle habitats, turtles, fish, sea snakes, dolphins and dugong.
Human presence	Wildlife watching, camping, boating, diving and snorkelling are drawcard activities for people to the region and have the potential to impact natural wildlife behaviour or result in damage to fragile marine environments. Habitats and species vulnerable to these impacts include reefs, turtles and seabirds.
Invasive species	Accidental introduction and establishment of invasive species can have potentially debilitating impacts on island, reef or shallow-water marine ecosystems. Direct impacts from predation or damage to important habitat and indirect impacts from competition for food resources can affect native populations. Habitats and species vulnerable to invasive species include reefs, turtles, seabirds and saltwater crocodiles.
Marine pollution	Land-based and marine activities that result in pollution have the potential to impact marine park values. Discharges of emissions including light, marine debris, noise, oil and chemicals can be detrimental to marine life and cause contamination of ecosystems and entanglement of marine fauna. Habitats and species vulnerable to marine pollution include islands, reefs, shallow-water habitats, dolphins, whales, turtles, sawfish, sharks and seabirds.

11.4.2 World Heritage-Listed Properties

World Heritage-Listed properties are examples of sites that represent the best examples of the world's cultural and heritage values, of which Australia has 19 properties (DCCEEW, 2024e). In Australia, these properties are protected under Chapter 5, Part 15 of the EPBC Act.

The spill EMBA overlaps with the coastal areas of Kakadu National Park as well as Djidbordu (Barron Island) and Gardangarl (Field Island). This World Heritage-listed property is described below and illustrated in Figure 11.56.

Kakadu National Park

Kakadu's natural formations and wildlife habitats are one of the primary contributors to its listing as a UNESCO world heritage site. Over 100 reptiles inhabit the park, the saltwater crocodile being the most renowned (Kakadu Tourism, 2024). Kakadu also has its own flatback turtle population that nest on Field Island (within the spill EMBA) and a few beaches near West Alligator Head. Green turtles (*Chelonia mydas*) are seen swimming around the Kakadu coastline. The hawksbill turtle (*Eretmochelys imbricata*) feed in Kakadu, however, they do not nest in the area. There are very few reliable sightings of loggerhead turtles (*Caretta caretta*) in Kakadu as the water is not deep enough for their preferred habitat. The olive ridley turtle (*Lepidochelys olivacea*) has few remaining nesting sites in the world and there is one unconfirmed record of a nest in Kakadu (O'Dea, 2014).

Other threatened marine species that reside in the park include the Indo-Pacific humpback dolphin (*Sousa chinensis*), snubfin dolphin (*Orcaella heinsohni*), dugong (*Dugong dugon*), largetooth sawfish (*Pristis pristis*), dwarf sawfish (*Dwarf sawfish*), northern river shark (*Glyphis garricki*), and the speartooth shark (*Glyphis glyphis*) (O'Dea, 2014).

Several shorebirds including the eastern curlew (*Numenius madagascariensis*), Asian dowitcher (*limnodromus semipalmatus*), great knot (*Calidris tenuirostris*), red knot (*Calidris canutus*), bar-tailed godwit (*Limosa lapponica*), lesser sand-plover (*Charadrius mongolus)*, greater sand-plover (*Charadrius leschenaultii leschenaultia*) and the curlew sandpiper (*Calidris ferruginea*) feed on the well protected coast of Kakadu's mainland and Field and Barren islands (within the EMBA) (O'Dea, 2014). The Australian painted snipe (*Rostratula australis*) has only been recorded once within the park.

Kakadu National Park is also a recognised as a RAMSAR wetland and is described in Section 11.4.5.

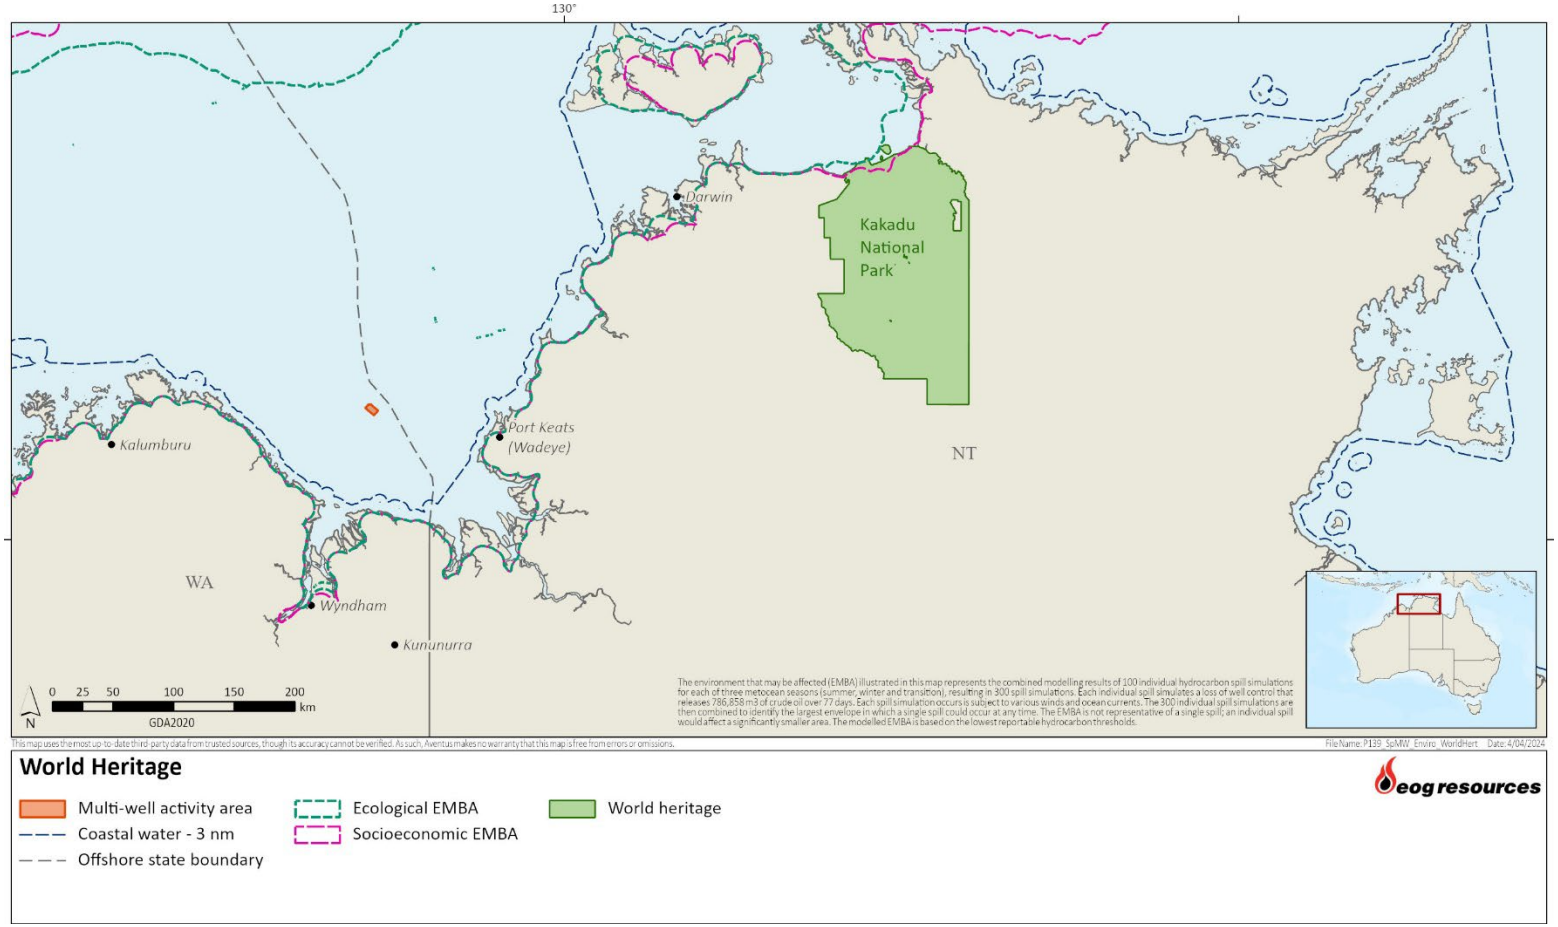

Figure 11.56 World heritage-listed Properties in the spill EMBA

11.4.3 Commonwealth Heritage-Listed Properties

Commonwealth Heritage Listed places are Indigenous, historic, and natural heritage places owned or controlled by the Australian Government. These include places connected to defence, maritime safety, communications, customs, and other government activities that also reflect Australia's development as a nation (DCCEEW, 2024h).

Several Commonwealth Heritage Listed properties were detected by the PMST (see Figure 11.57). Only properties that are marine/coastal and classed as 'natural' are discussed in this section.

Mermaid Reef – Rowley Shoals

Mermaid Reef is an AMP and described in section 11.4.1, Mermaid Reef - Rowley Sholas is also a KEF which is described in section 11.4.7.

Ashmore Reef Nature Reserve

Ashmore Reef is an AMP and NIW and described in section 11.4.1, 11.4.8 and Section 11.3.1.

Scott reef and surrounds

Scott Reef is described in in section 11.3.1.

Yampi Defence Area

Yampi Defence Area located on Koolan Island, WA displays a complex mosaic of landforms in the transition from the sandstone plateaux of the north-west Kimberley, to the broad plains and pindan scrub of the south-west Kimberley (DCCEEW, 2024h).The diversity of landforms results in a high concentration of small refugial habitats supporting regionally rich vertebrate as well as supporting several fauna and flora species that are listed as specially protected, threatened or having priority status in WA.

Bradshaw Defence Area

Bounded by the Fitzmaurice and Victoria Rivers on the shores of the JBG, Bradshaw Defence Field Training Area comprises a vast and rugged habitat endowed with a diverse array of plants and animals (DCCEEW, 2024h). Bradshaw has an unusually rich vertebrate fauna, second only to Kakadu National Park a total of 377 vertebrate species are known to occur within the place, comprising 22 frog, 77 reptile, 212 bird, 50 mammal species and 26 fish species.

11.4.4 National Heritage-Listed Properties

The National Heritage List is Australia's list of natural, historic and Indigenous places of outstanding significance to the nation (DCCEEW, 2024f). These places are protected under Chapter 5, Part 15 of the EPBC Act.

The socio-economic EMBA intersects the West Kimberley National Heritage Place and Kakadu National Park (which is described in section 11.4.2) as illustrated in Figure 11.57. This West Kimberley National Heritage Place is described below.

West Kimberley National Heritage Place

The West Kimberley was included on the National Heritage List in 2011 and has numerous values which contribute to the significance of the property, including indigenous, historic, aesthetic, cultural and natural heritage values (DCCEEW, 2024f). The West Kimberley National Heritage place covers a vast area that is characterised by a diversity of landscapes and biological richness found in its cliffs, headlands, sandy beaches, rivers, waterfalls and islands.

The values most relevant to the marine environment is Roebuck Bay as a migratory hub for shorebirds (Roebuck Bay does not fall within the EMBA).

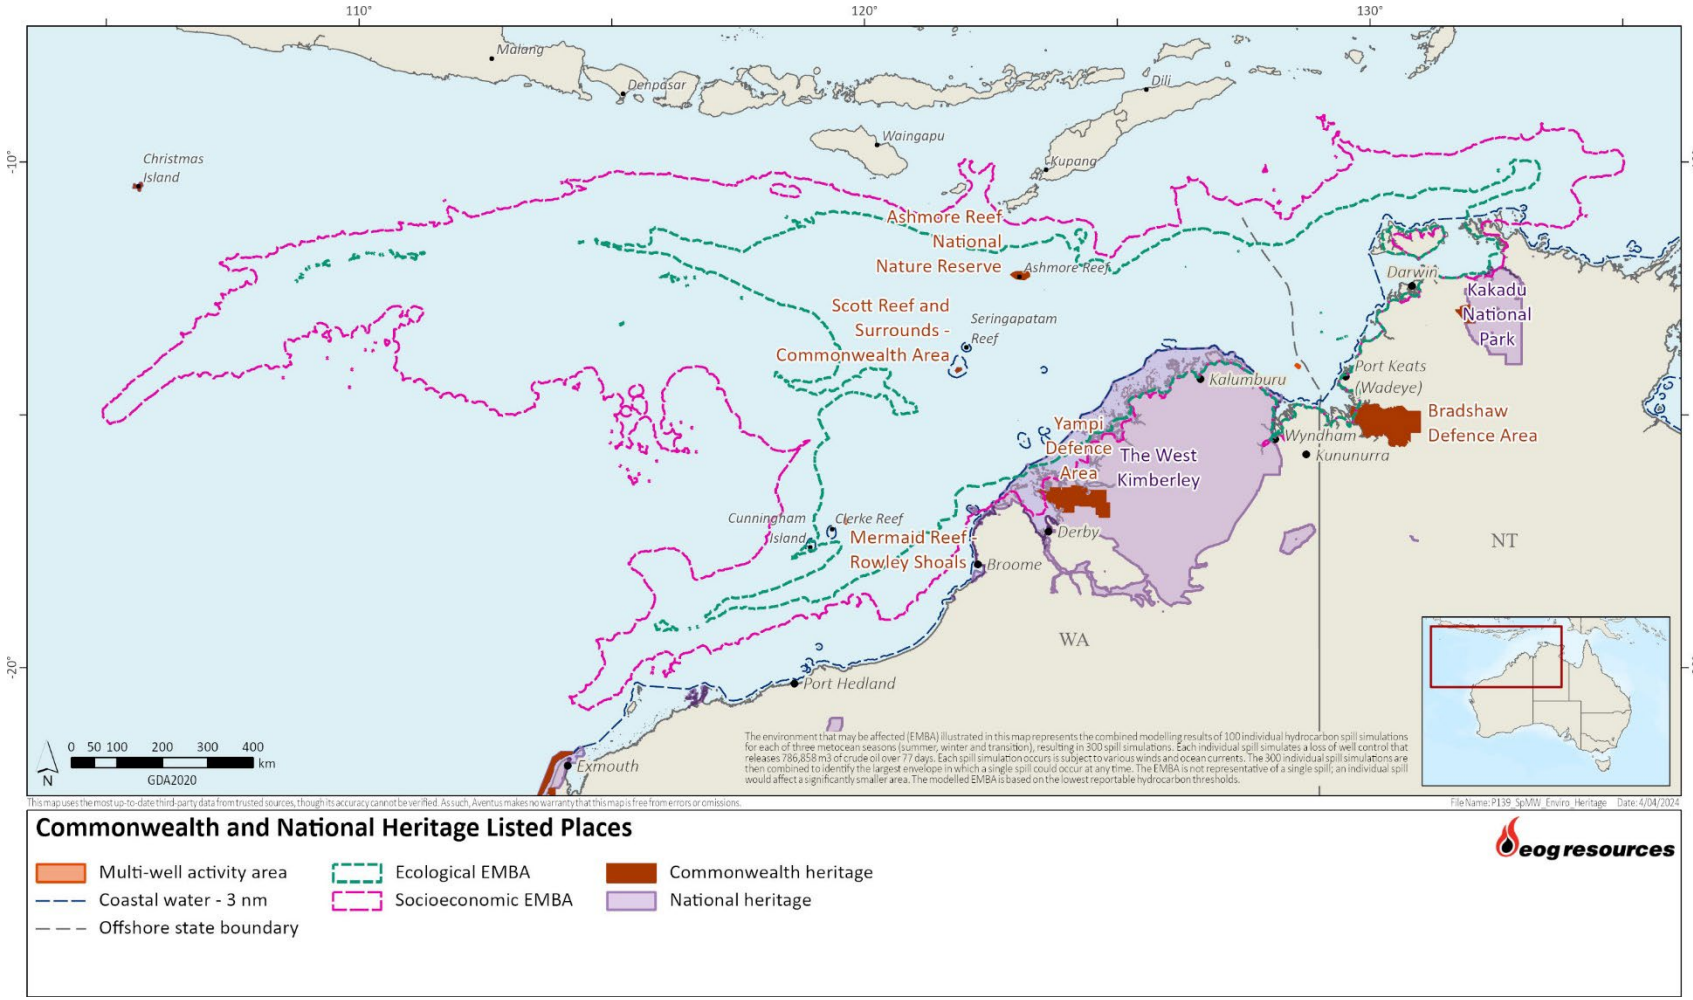

Figure 11.57 National Heritage and Commonwealth Heritage-listed Places in the spill EMBA

11.4.5 Wetlands of International Importance

Australia has 66 wetlands of international importance ('Ramsar wetlands') that cover more than 8.3 million hectares (as of September 2021) (DCCEEW, 2024g). Ramsar wetlands are those that are representative, rare or unique wetlands, or are important for conserving biological diversity, and are included on the List of Wetlands of International Importance developed under the Ramsar Convention. These wetlands are protected under Chapter 5, Part 15 of the EPBC Act.

There are four Ramsar-listed wetlands intersected by the EMBA (Figure 11.58), described here.

Ord River Floodplain

The Ord River Floodplain Ramsar site is a floodplain and estuarine wetland system located 87 km south of multi-well location. North of the lagoons, the site includes the Ord River Estuary leading into the Cambridge Gulf while the northeast end of the site heads around the coast to include a series of extensive intertidal creeks and flats known as the False Mouths of the Ord. The upstream portion of the floodplain and river tends to be freshwater and becomes more saline as the river approaches the Cambridge Gulf and falls under tidal influence (DCCEEW, 2024g).

Mangroves are the most common vegetation in the site, extending from the False Mouths of the Ord to the upstream sections of the estuary. The mangroves form narrow fringes along the intertidal areas, with saltmarsh on higher ground. The intertidal mangroves support many species of birds and bats and are a breeding area for banana prawns (DCCEEW, 2024g).

Over 200 species of birds have been recorded within the site including waterfowl, migratory shorebirds, mangrove birds and terrestrial species. The site supports the nationally threatened Australian painted snipe. The wetlands are habitat for many fish species that require migration between marine and more freshwater environments during their life, including the nationally threatened species largetooth sawfish, green sawfish and northern river shark. Reptiles that use the site include the freshwater crocodile and saltwater crocodile (DCCEEW, 2024g).

The Ord River Floodplain Ramsar site lies within the boundaries of six Indigenous language groups: Miriuwung, Gajerrong, Dulbung, Guluwaring, Djangade and Biambarr. The site contains Indigenous burial sites, artefact scatters, quarries, paintings and ceremonial sites (DCCEEW, 2024g). The Ord River Nature Reserve is gazetted for the conservation of flora and fauna. The Lower Ord River and the False Mouths of the Ord are popular destinations for locals and visitors for recreational fishing, crabbing and boating (DCCEEW, 2024g).

The *Ord River and Parry Lagoons nature reserves management plan 77 2012* (DEC 2012) is the approved management plan for the Ord River Floodplain Ramsar Site.

Ashmore Reef National Nature Reserve

The Ashmore Reef National Nature Ramsar site (Ashmore Reef Ramsar site) is located in the Indian Ocean approximately 840 km west of Darwin, 610 km north of Broome and 602 km northwest of multi-well location.

There are a number of other coral atolls and reefs within the Timor Province including Cartier Island, Seringapatam Reef and Scott Reef. These contain some of the same types of wetlands and habitats as Ashmore Reef Ramsar site, notably coral reefs, intertidal sand flats and sub-tidal beds (Hale and Butcher, 2013). However, Ashmore is the largest of the atolls in the region and has been managed for the purposes of conservation for three decades. Each of the wetland types present at Ashmore Reef Ramsar site is in near natural condition, with low densities of coral predators and disease (Hale and Butcher, 2013). The Ashmore Reef Ramsar site also has the highest seagrass cover in the bioregion (Hale and Butcher, 2013). In addition, the three islands at Ashmore Reef

Ramsar site (West, Middle and East) represent the only vegetated islands within the Timor Province bioregion (DEWHA 2008a). Thus, by definition the site contains bioregionally unique examples of wetland type E (sand, shingle or pebble shores) (Hale and Butcher, 2013).

Cobourg Peninsula

The Cobourg Peninsula Ramsar site is located approximately 163 km northeast of Darwin and 458 km northeast of multi-well location .

This Ramsar site occupies the entire peninsula and several nearby islands including the Sir George Hope Islands group, Sandy Island, Allaru Island, High Black Rock and Burford Island (BMT WBM, 2011) with the offshore islands (Figure 11.22). consisting of sandy shores, and the latter consisting of rocky shores; and tidal flats (sand, mud, sediment) and mangroves respectively. The Cobourg Peninsula Ramsar site is composed of a diversity of coastal and inland wetland types. Wetland types present include intertidal forested wetlands and salt flats, seasonal freshwater marshes and permanent freshwater pools. Using the Ramsar typology, there are ten coastal types and ten inland types within the site.

Cobourg Peninsula supports populations of threatened species including support for key life-cycle functions such as marine turtle breeding, waterbird breeding fish nursery and spawning habitats. The critical component of the site is the diversity and connectivity of a wide range of wetland habitat types, and is supported by populations of waterbirds, terrestrial ecosystems and freshwater fish and invertebrates (BMT WBM, 2011). Recent or continuing threats that are notable in the context of the site that may affect future ecological character include invasive species, climate change, tourism, marine debris, and resource extraction.

Kakadu National Park

The Kakadu National Park Ramsar site is located approximately 200 km east of Darwin and 422 km northeast of multi-well location. This Ramsar site is mainly an inland wetland ranging from intertidal forested wetlands and mudflats to seasonal freshwater marshes and permanent freshwater pools (BMT WBM, 2010). The socio-economic EMBA only intersects the coastal section of the Kakadu Park Ramsar site. The shoreline in this area consists of tidal flats (sand, mud, and sediment) and mangrove habitat.

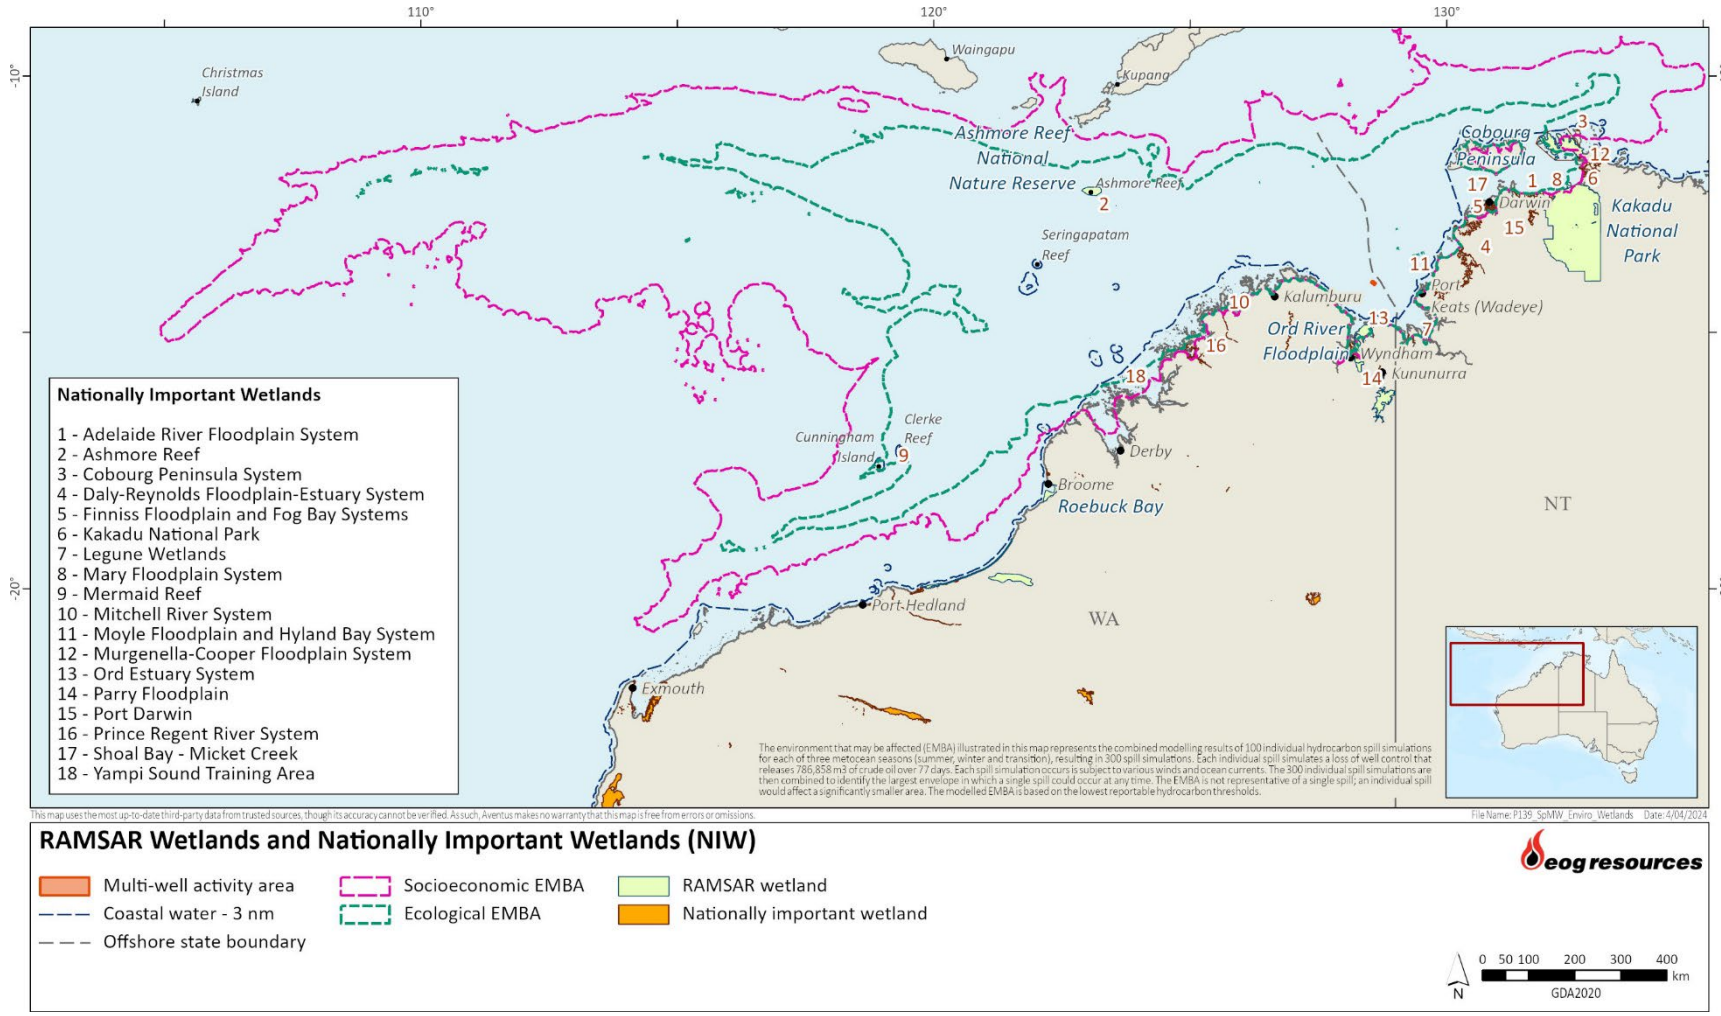

Figure 11.58 Wetlands of international importance and NIWs in the spill EMBA

11.4.6 Threatened Ecological Communities

The Australian Government is responsible for identifying and protecting MNES through the EPBC Act. Threatened Ecological Communities (TECs) are a MNES under the EPBC Act. TECs provide wildlife corridors and/or habitat refuges for many plant and animal species, and listing a TEC provides a form of landscape or systems-level conservation (including threatened species).

One TEC is identified in the spill EMBA, which is described below.

Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula

The vine thickets of the Dampier Peninsula are a very distinctive type of rainforest in the Kimberley region. This TEC is located about 641 km southwest of multi-well location.

This type of vine thicket is confined to the Peninsula between Broome and Derby, along with the coastal dune formations on which it occurs. Vine thickets occur as discrete areas of dense vegetation and can occur as a stand of a few trees or as larger patches. The 90 known occurrences vary in size from about 0.3 ha up to 507 ha, with a mean size of about 33 ha. They can occur as clumps or narrow linear stands (Black *et al*., 2010). The vine thicket community contains many plants with fleshy fruits that provide important food sources for fauna such as agile wallabies, bats, bower-birds and fruit-doves. They are also an important traditional resource for Indigenous people.

11.4.7 Key Ecological Features

KEFs are components of the marine ecosystem that are considered to be important for biodiversity or ecosystem function and integrity of the Commonwealth Marine Area.

There are several KEFs in the spill EMBA, which are illustrated in Figure 11.59 and described herein.

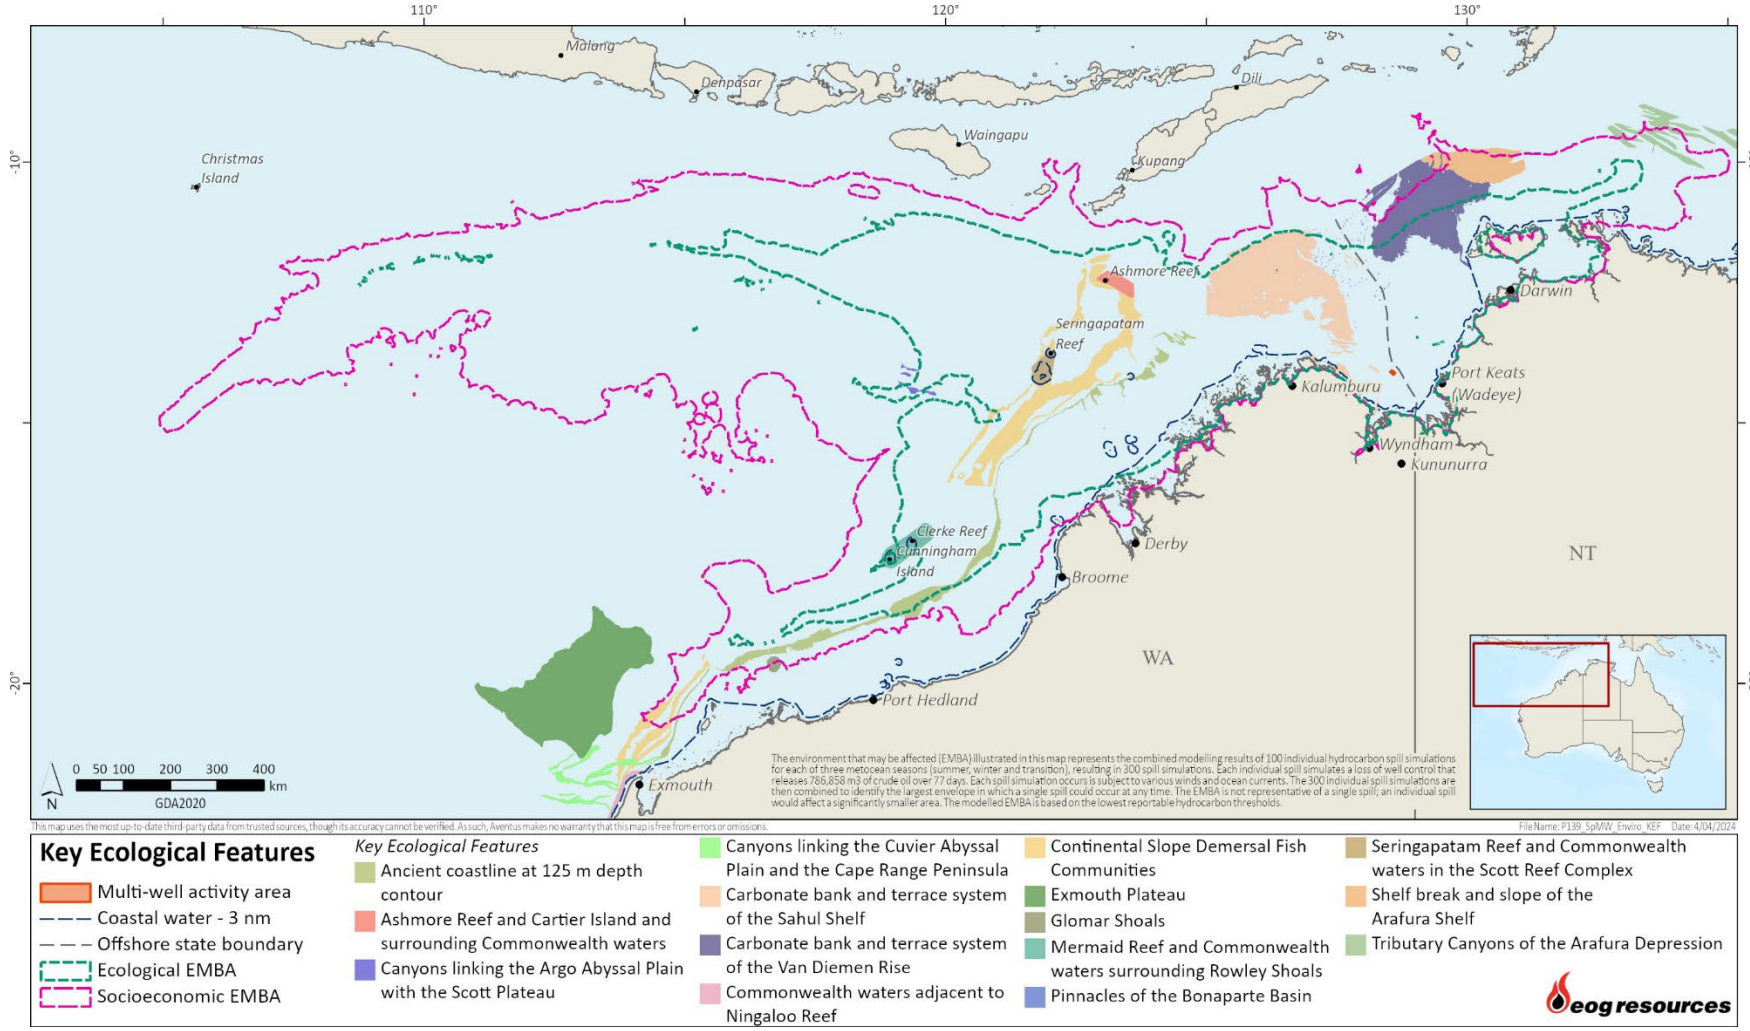

Figure 11.59 KEFs in the spill EMBA

Carbonate bank and terrace system of the Sahul Shelf

The carbonate bank and terrace system of the Sahul Shelf KEF is located in the western JBG and to the north of Cape Bougainville and Cape Londonderry. It is located 21 km west of multi-well location at its closest point.

The carbonate banks and terrace system of the Sahul Shelf is defined as a KEF for its role in enhancing biodiversity and local productivity relative to its surrounds as it is a unique seafloor feature supporting relatively high species diversity, making it regionally significant.

The KEF provides areas of hard substrate in an otherwise soft sediment environment, which is important for sessile species. Banks rise from depths of approximately 80 m to within 30 m of the surface. Banks that rise to within 45 m water depth support more biodiversity, such as communities of sessile benthic invertebrates including hard and soft corals, sponges, whips, fans and bryozoans (Brewer *et al*., 2007; Nichol *et al*., 2013). Brewer et al (2007) also noted that banks within the KEF support aggregations of demersal fish species such as snappers, emperors and groupers.

The banks are recognised as a biodiversity hotspot for sponges with more species and different communities than the surrounding seafloor (DCCEEW, 2024b). The KEF is also known as a foraging area for flatback, olive ridley and loggerhead turtles (DSEWPC, 2012).

Threats to the KEF include changes in sea temperature and ocean acidification, both resulting from climate change, as well as extraction of living sources from illegal, unreported and unregulated fishing (Brewer *et al*., 2007; Nichol *et al*., 2013).

Pinnacles of the Bonaparte Basin

The limestone pinnacles of the Bonaparte Basin lie on the mid-outer shelf in the western JBG. It is located 116 km northwest of multi-well location at its closest point. The pinnacles are defined as a KEF because they are a unique seafloor feature with ecological properties of regional significance.

The pinnacles provide areas of hard substrate in an otherwise soft sediment environment and are therefore important for sessile species. Pinnacles typically rise steeply from depths of about 80 m and emerge to within 30 m of the water surface, allowing light dependent organisms to thrive. Pinnacles that rise to within at least 45 m of the water surface support more biodiversity. Communities include sessile benthic invertebrates including hard and soft corals, sponges, whips, fans, bryozoans and aggregations of demersal fish species such as snappers, emperors and groupers (Brewer *et al*., 2007; Nichol *et al*., 2013). The pinnacles are also recognised as a biodiversity hotspot for sponges as they are home to more sponge species and different communities than the surrounding seafloor.

Carbonate bank and terrace system of Van Diemen Rise

The carbonate bank and terrace system of the Van Diemen Rise KEF is located on the north-eastern side of the JBG and partially overlaps with the north-east of the EMBA. It is located 229 km north of multi-well location at its closest point.

The KEF is considered important for its role in enhancing biodiversity and local productivity relative to its surrounds and for supporting relatively high species diversity. The KEF covers an area of 31,278 km^2.

The KEF is characterised by banks, ridges and terraces with relatively high proportions of hard substrate (DCCEEW, 2024b). Channel systems between the banks range from approximately 60–150 m to 10–40 m in depth (Anderson *et al.,* 2011) and supports sponge and octocoral gardens by providing epifauna habitat in an otherwise flat environment (Przeslawski *et al*., 2011). Whilst reef-

forming corals are rare throughout the JBG, some locally dense hard corals were found on the banks of the Van Diemen rise during marine surveys in 2009 and 2010 (Przeslawski *et al*., 2011).

A study of the sponge diversity and ecology of the Van Diemen Rise identified the region as a sponge biodiversity hotspot (Przeslawski *et al*., 2014). Sponges were collected with a benthic sled from five geomorphic features (banks, terrace, ridge, plain and valley), resulting in the identification of 283 species. The study found that sponge diversity was generally highest further offshore and on raised geomorphic features, particularly banks. Pelagic fish such as mackerel, red snapper and a distinct gene pool of goldband snapper are found in the Van Diemen Rise (Blaber *et al*., 2005; Salini *et al*., 2006). Olive ridley turtles, seasnakes and sharks have also been reported to occur in the area (DCCEEW, 2024b).

Ancient Coastline at 125 m depth contour

The ancient coastline at 125 m depth contour KEF comprises a series of several steps and terraces that form an escarpment along north-west WA centred around the 125 m isobath, although this feature is not continuous. It is located 410 km west of multi-well location at its closest point.

The KEF is an important divide between carbonate, cemented sands and the fine, less cemented slope materials found offshore. It is valued as a unique seabed feature with ecological properties of regional significance. Hard substrate areas of the ancient coastline are thought to provide biologically important habitat in an area predominantly made up of soft sediment (DCCEEW, 2024b).

Continental slope demersal fish communities

The continental slope demersal fish communities KEF is considered important due to its high levels of endemism (DEWHA 2008b). It is located 528 km west of multi-well location at its closest point.

The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the Northwest Province is high compared to elsewhere along the continental slope (DEWHA 2008b). The KEF supports two distinct demersal community types (biomes) associated with the upper slope (water depth of 225–500 m) and the mid-slope (750–1,000 m) (DCCEEW, 2024b). Although poorly known, demersal-slope communities are thought to rely on bacteria and detritus-based systems comprised of infauna and epifauna, which in turn become prey for a range of teleost fish, molluscs and crustaceans (Brewer *et al*., 2007). Higher-order consumers may include carnivorous fish, deep water sharks, large squid and toothed whales (Brewer *et al*., 2007).

Glomar Shoals

The Glomar Shoals are a submerged littoral feature located approximately 150 km north of Dampier on the Rowley shelf at water depths of 33 m to 77 m (Falkner *et al.,* 2009). The shoals are defined as a KEF primarily due to their high productivity and aggregations of marine life.

The shoals consist of a high percentage of marine-derived sediments with high carbonate content and gravels of weathered coralline algae and shells (McLoughlin and Young, 1985). The area's higher concentrations of coarse material in comparison to surrounding areas are indicative of a high-energy environment subject to strong sea-floor currents (Falkner *et al.,* 2009).

While the biodiversity associated with the Glomar Shoals has not been studied, the shoals are known to be an important area for a number of commercial and recreational fish species such as rankin cod, brown striped snapper, red emperor, crimson snapper, bream and yellow-spotted triggerfish (Falkner *et al.,* 2009; Fletcher and Santoro, 2009). These species have recorded high catch rates associated with the Glomar Shoals, indicating that the shoals are likely to be an area of high productivity.

Mermaid Reef and Commonwealth waters including Rowley Shoals

The Mermaid Reef and Commonwealth waters surrounding Rowley Shoals is defined as a KEF for its enhanced productivity and high species richness and benthic and pelagic habitats within the feature. The Rowley Shoals are a collection of three atoll reefs, Clerke, Imperieuse and Mermaid, which are located about 300 km northwest of Broome. This KEF encompasses Mermaid Reef Commonwealth Marine Reserve as well as waters from 3 nm out to 6 nm surrounding Clerke and Imperieuse reefs (DCCEEW, 2024a). Mermaid Reef lies 29 km north of Clerke and Imperieuse reefs and is totally submerged at high tide. Mermaid Reef falls under Commonwealth jurisdiction. Clerke and Imperieuse reefs constitute the Rowley Shoals Marine Park, which falls under WA Government jurisdiction (DCCEEW, 2024a).

Mermaid Reef and Commonwealth waters surrounding Rowley Shoals are regionally important in supporting high species richness, higher productivity and aggregations of marine life associated with the adjoining reefs themselves (Done *et al.,* 1994). The reefs provide a distinctive biophysical environment in the region as there are few offshore reefs in the northwest. They have steep and distinct reef slopes and associated fish communities. In evolutionary terms, the reefs may play a role in supplying coral and fish larvae to reefs further south via the southward flowing Indonesian Throughflow. Both coral communities and fish assemblages differ from similar habitats in eastern Australia (Done *et al.,* 1994).

Ashmore Reef and Cartier Island and surrounding Commonwealth waters

The Ashmore Reef and Cartier Island and surrounding Commonwealth waters KEF is regarded as a biodiversity hotspot which supports a diverse array of pelagic and benthic marine species. It is located 557 km northwest of multi-well location. The KEF is considered important due to its aggregations of marine life and enhanced primarily productivity in an otherwise low-nutrient environment.

Ashmore Reef and Cartier Island are situated on the shallow upper slope of the Sahul Shelf, north of Scott and Seringapatam reefs. They form part of a series of submerged reef platforms along the outer edge of the continental slope of the NWMR. Localised upwelling and turbulent mixing in the surrounding Commonwealth waters provide nutrients to support the reef structure and ecology (DEWHA 2008b).

Ashmore Reef and Cartier Island and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of birds and other marine life, including an unusually high diversity of sea snakes, a genetically distinct breeding population of green turtles and foraging grounds for green, loggerhead and hawksbill turtles (Limpus, 2008). The reef system is an important staging post for seabirds and migratory shorebirds and the area is home to some of the most important seabird colonies in the NWMR (Milton, 2005). Ashmore Reef supports the highest number of coral species of any reef off the WA coast.

Canyons linking the Argo Abyssal Plain with the Scott Plateau

The canyons linking the Argo Abyssal Plain with the Scott Plateau is defined as a KEF for their high productivity and aggregations of marine life (DCCEEW, 2024a). These values apply to both the benthic and pelagic habitats within the feature.

The spatial boundary of this KEF includes three canyons, adjacent to the south-west corner of Scott Plateau. The canyons cut deeply into the south-west margin of the Scott Plateau at an approximate depth of 2,000 m to 3,000 m, and act as conduits for transport of sediments to depths of more than 5,500 m on the Argo Abyssal Plain. The water masses at these depths are deep Indian Ocean water on the Scott Plateau and Antarctic bottom water on the Argo Abyssal Plain. Both water masses are cold, dense and nutrient-rich (DCCEEW, 2024a).

Seringapatam Reef and Commonwealth waters in the Scott Reef complex

The Seringapatam reef and Commonwealth waters in the Scott reef complex are defined as a KEF as they support diverse aggregations of marine life, have high primary productivity relative to other parts of the region, are relatively pristine and have high species richness, which apply to both the benthic and pelagic habitats within the feature (DCCEEW, 2024a).

Scott and Seringapatam reefs are part of a series of submerged reef platforms that rise steeply from the sea floor between the 300–700 m contours on the northwest continental slope and lie in the Timor Province (Falkner *et al.,* 2009). Scott and Seringapatam reefs provide an important biophysical environment in the region as one of few offshore reefs in the northwest. The spatial boundary of this KEF includes both reefs plus the adjacent apron/fan features, and the canyon approximately 10 km to the west of Scott Reef. The southern edge of the KEF is defined by the state water boundary around Scott Reef (DCCEEW, 2024a).

As two of the few offshore reefs in the north-west, they provide an important biophysical environment in the region (DCCEEW, 2024a). The coral communities at Scott and Seringapatam reefs play a key role in maintaining the species richness and subsequent aggregations of marine life. Scott and Seringapatam reefs and the waters surrounding them attract aggregations of marine life including humpback whales and other cetacean species, whale sharks and several species of sea snake. Two species of marine turtle nest and forage during the summer months, and this KEF also provides foraging areas for various seabird species (DCCEEW, 2024a).

Shelf break and slope of the Arafura Shelf

The shelf break and slope of the Arafura Shelf is located north of the Tiwi Islands, near the edge of the Australian EEZ. It is defined as a KEF for its ecological significance associated with productivity emanating from the slope and forms part of a unique biogeographic province (Last *et al.,* 2005). The spatial boundary of this KEF includes the area of slope north of the Van Diemen Rise, an adjacent area of shelf, extending south to the terrace edge of the Van Diemen Rise in the western part and bounded by the 100 m depth contour in the east. At the eastern end, the area of shelf included extends to approximately the eastern extent of the slope. The slope and shelf areas contain pinnacles and reefs (DCCEEW, 2024a).

Phytoplankton and invertebrates have been sampled in the area (Hallegraeff and Jeffrey 1984; Wilson, 2005), and primary production of phytoplankton is thought to form the basis for offshore food webs (DEWHA, 2007). Fish communities that occur in this key ecological feature represent the break between the Timor Province provincial bioregion and the Timor Transition provincial bioregion (Last *et al*., 2005). Records show at least 284 demersal fish species are found in the area (Last *et al.,* 2005), including commercially fished red snapper species. The area is also likely to support whale sharks, sharks and marine turtles (DEWHA, 2007).

Tributary canyons of the Arafura Depression

The Tributary canyons of the Arafura Depression are defined as a KEF for their high productivity and high levels of biodiversity and endemism, in both the benthic and pelagic habitats within this feature (DCCEEW, 2024a).

Nearly all the canyons in the NMR are located within this KEF in which endemic benthic species are thought to occur (Wilson, 2005). Primary productivity in this feature is likely to be associated with movements of water through the canyons and surface water circulation driven by seasonal north-west monsoon winds.

Biological diversity and ecosystem processes in the area are influenced by the state of the canyon habitats. The steep topography of the canyons, their diverse current regimes, nutrient enrichment

and entrapment, detritus funnelling and diverse substrate types form widely divergent ecosystems (McClain and Barry 2010; Vetter, 1994; Vinogradova, 1959), coupled with the regional setting and geological origins of the area, strongly influence species biodiversity (Kloser *et al.,* 2010).

At least 245 macroscopic species, including a diverse variety of invertebrates (e.g. sponges, corals, sea anemones, tunicates, worms, crustaceans, brittle stars, feather stars) and six small fish species have previously been sampled (Wilson, 2005). It is estimated that a further 500 species could be identified from post-survey analysis of grab and dredge samples (Wilson, 2005). Marine turtles, likely to be olive ridleys, have been reported to feed in the vicinity of the canyons (Whiting *et al.,* 2007).

11.4.8 Nationally Important Wetlands

NIWs are considered significant for a variety of reasons, including their importance for maintaining ecological and hydrological roles in wetland systems, providing important habitat for animals at a vulnerable or particular stage in their life cycle, supporting 1% or more of the national population of any native plant or animal taxa or for its outstanding historical or cultural significance (DCCEEW, 2024i).

There are 18 NIWs that are intersected by the EMBA, as illustrated in Figure 11.58 and described in Table 11.15. Information provided in Table 11.15 is sourced from DAWE's online Directory of Important Wetlands (DCCEEW, 2024i). Noting there are NIWs shown in Figure 11.58 that are in close proximity and/or outside of the EMBA, these are not discussed further in this section.

Table 11.15 Nationally important wetlands in the spill EMBA

Name	Distance from multi-well location	Description
WA		
Ord Estuary	88 km south	The Ord River system is a floodplain and estuarine wetland system consisting of broad floodplains known to periodically flood and dry out; and permanent waterholes (known as the Parry Lagoons) (DCCEEW, 2024i). The wetlands are a habitat for many diadromous fish species (that migrate between salt water and freshwater environments), including nationally threatened species such as freshwater sawfish, green sawfish and the northern river shark. Freshwater and saltwater crocodiles are also known to use the wetland (DCCEEW, 2024i).
Mitchell River System	317 km southwest	The Mitchell River system consists of a relatively small river system and estuary, with an of escarpment of vertical multi-stage waterfalls (e.g., Mitchell Falls). Tributaries of the system are Camp Creek (off Mitchell Plateau), Youngs Creek and Leichardt Creek. The creeks and upper reaches of Mitchell River are seasonal; the entrenched lower reaches are permanent or near-permanent; twice-daily tides occur in the estuary. At least 10 species of freshwater fish are known to inhabit the waters of the Mitchell River. Seven waterbird species have been recorded in the system (DCCEEW, 2024i).
Parry Floodplain	133 km south	The Parry floodplain is a good example of a tropical floodplain with permanent billabongs, seasonal marshes and wooded swamp (one of the few such floodplains of substantial area in WA). The site comprises the lower reaches and floodplain of Parry Creek including Parry Lagoons and numerous other lagoons, billabongs including claypans. The floodplain is 5 km southwest of the Ord River and

Name	Distance from multi-well location	Description
		adjoins tidal wetlands of the Ord estuary system in the north. Surface water flows in the floodplain from upper Parry Creek, originating 25 km south of the site in disturbed (fire and grazing) catchment, and from several short creeks; and occasionally from the Ord River. Seventy-seven waterbird species (including 24 shorebirds and four terns) are recorded in this system (one of the highest totals in the Kimberley); with 22 listed under treaties. Both freshwater crocodile and saltwater crocodile occur in the permanent billabongs (DCCEEW, 2024i).
Prince Regent River System	393 km southwest	The Prince Regent River System is a tropical estuary and river system incised in a plateau. There are nine major tributaries to this river, originating 11 km to 32 km from their junctions with the river (e.g., Youwanjela Creek from north-east, Cascade Creek from south southwest). The water catchments are relatively undisturbed and the only known habitat of two freshwater fishes; habitat to 15 waterbird species and an important breeding and non-breeding area for saltwater crocodile (DCCEEW, 2024i). The area is nominated as an IBA (Birdlife International, 2022)
Yampi Sound Training Area	576 km southwest	The Yampi Sound Training Area contains large areas of coastline. The central and southwestern region is flat, consisting of the low lying flood plains of the Robinson River and its tributaries. The average annual rainfall in the training area is approximately 1,000 mm, which falls almost entirely during the summer wet season from November to April. During this time numerous permanent and semi-permanent pools along both major and minor watercourses are maintained. The Robinson River is tidal, with extensive tidal flats bordering King Sound. Tides are up to 11 m (DCCEEW, 2024i). Threatened species such as the Little Tern, Gouldian Finch and Western Partridge Pigeon have been recorded in the area (DCCEEW, 2024i).
Mermaid Reef	1,020 km southwest	Mermaid reef is the most north-easterly atoll of the Rowley Shoals, which comprises three distinct reef systems arising from depths of between 300 and 700 m along the edge of the continental shelf. The reef experiences a semi-diurnal tidal cycle with a spring range of about 4.5m (DCCEEW, 2024i). Fauna surveys indicate the reef has a rich and diverse fauna which is regionally important, which includes some endemics and species not occurring elsewhere in Western Australia (Berry ,1986; Done *et. al.,* 1994). In addition to the diverse range of coral species, other benthic groups include sponges, bryozoans, ascidians (sea squirts) polychaetes, molluscs, echinoderms, crustaceans and cnidarians (jellyfish) (DCCEEW, 2024i).
Ashmore Reef	621 km northwest	Ashmore Reef is described in Section 11.3.1 and 11.4.1. Ashmore Reef is one of only three emergent oceanic reefs in the north eastern Indian Ocean, and the only one having vegetated islands (DCCEEW, 2024i). Some 95 species of bird have been recorded from the reef and its adjacent waters. Forty-three of these species are listed on the Japan-Australia and China-Australia Migratory Birds Agreements. The islets are an important staging point for wading birds migrating between Australia and the northern hemisphere. The islands are major seabird nesting sites with 20 breeding species

Name	Distance from multi-well location	Description
		recorded to date. The total bird population has been estimated to exceed 100,000 during the peak breeding season (DCCEEW, 2024i).
NT		
Legune (JBG) Wetlands	128 km southeast	The Legune wetlands are floodplain including meso and microscale pools and channels. The Legune Homestead Swamps are regionally significant Eleocharis-dominated wetland supporting significant waterbird numbers in the dry season, and breeding magpie geese in the wet season. The Osmans Lake System is the main area of open shallow wetland in the Keep River drainage. In combination the swamps and lake systems provide a good diversity of wetland habitat in a relatively small area. Forty-seven species of waterbirds have been recorded in the wetlands, 14 of them listed under treaties (JAMBA/CAMBA) (DCCEEW, 2024i). The wetlands are also nominated as an IBA (Birdlife International, 2022)
Moyle Floodplain and Hyland Bay System	119 km east	Located in the Bonaparte Gulf Basin, the Moyle Floodplain and Hyland Bay System is classed as a megascale irregular floodplain with mesoscale sinuous channel and several mesoscale sumplands. Water supply to the floodplain is from surface inflow from creeks originating 10 km to 22 km southwest and southeast, with surface inflow to the east and north from the Moyle River. Forty-seven bird species known to occur on floodplain and adjacent coast, with 26 listed under treaties (JAMBA, CAMBA, BONN). The floodplain is a significant breeding area for magpie geese, with especially large breeding populations in drier years. The mudflats of Hyland Bay support relatively high numbers of migrant shorebirds. There are at least two significant waterbird breeding rookeries in the area which include darter and cormorant species (BirdLife, 2022; Whitehead *et al.,* 1992) and the area is nominated as an IBA. The tidal estuary and creeks support a particularly high density of Saltwater Crocodiles, that also breed on the floodplain channel (DCCEEW, 2024i).
Daly-Reynolds Floodplain Estuary System	187 km northeast	One of the largest floodplains in the NT with the largest catchment of any major freshwater floodplain system. Water supply to the floodplain esturary is primarily from the Daly River, originating 275-300 km east north-east to south-south-east (catchment area of 49 000 km^2), and the Reynolds River, originating 60 km south-east (catchment area of 10 000 km^2); with substantial inflow from from Hermit-Door Creek system, Kilfoyle, Lookout, Woomeroo and unnamed Creeks. More than 80 fauna species, with at least 30 species listed under treaties (JAMBA/CAMBA), are known to occur within the site and is an IBA (Birdlife International, 2022). The system supports a large number of magpie geese. Reptiles (frogs, freshwater turtles) are known to occur in areas of the system, which also acts as an important breeding area for saltwater crocodile (in swamps and billabongs) and habitat for freshwater crocodiles (further upstream) (DCCEEW, 2024i).
Finniss Floodplain and Fog Bay Systems	205 km northeast	A megascale irregular floodplain, with a network of microscale irregular creeks and a series of mesoscale (almost closed loop) irregular channels, also several microscale irregular estuaries and a macroscale embayment (mudflats part, up to 1.5 km wide). Surface

Name	Distance from multi-well location	Description
		water inflow is mainly from the Finniss river originating 50 km southeast (catchment area exceeds 110 000 ha), and several creeks. This system supports a major breeding area for magpie geese, at times a significant dry season refuge area for waterbirds (whistling-ducks); a major migration stop-over area for shorebirds; and a major breeding area for saltwater crocodile (DCCEEW, 2024i). The site is nominated as an IBA (Birdlife International, 2022).
Port Darwin	291 km northeast	A shallow branching embayment supporting one of the largest discrete areas of mangrove swamp in the NT. The wetland acts as a major nursery area for estuarine and offshore fish and crustaceans in the Beagle Gulf area. At least 48 bird species occur, 25 listed under treaties (JAMBA, CAMBA, BONN); including four cormorants, nine herons and allies, three rails, 23 shorebirds and six gulls and terns. Dolphins and turtles are commonly observed (DCCEEW, 2024i).
Adelaide River Floodplain System	350 km northeast	A major floodplain-tidal wetland system typical of the Top End region, consisting of the largest blocks of mangrove associated with a floodplain, a tightly meandering major tidal river, and several marginal lakes and swamps including the largest floodplain lake (Lake Finniss), and near-permanent marsh (Fogg Dam, Melacca Swamp), considered a rare wetland type in NT. Records indicate there are 88 waterbird species, 43 of them listed under treaties (JAMBA/CAMBA). Saltwater crocodiles, freshwater crocodiles, freshwater turtles, water python, snakes, frogs and numerous fish species are associated with the floodplain, fringing billabongs and swamps. Dolphins and dugongs occur in the lower part of the estuary (DCCEEW, 2024i). The area is nominated as an IBA (Birdlife International, 2022).
Shoal Bay - Micket Creek	312 km northeast	The Shoal Bay – Micket creek is a spring fed coastal freshwater floodplain consisting of wetland marshes, mangrove woodlands, beaches, mudflats, creeks and estuaries. The wetland area stretches from Lee Point, which is outside Defence property, around the coast to Gunn Point. Micket Creek is a tidal estuary flowing into Shoal Bay. King creek, other smaller creeks, and water from Noogoo Swamp flow into Shoal Bay. The Micket Creek area is a significant bird habitat with over 200 species of birds recorded and is an IBA (Birdlide International, 2022). It is also a dry season refuge for waterfowl and birds of prey. High numbers of migratory shorebirds regularly use the areas' mudflats with counts of more than 15,000 waders. The estuary creeks provide a significant nursery for Barramundi. Twenty-five migratory birds listed on international agreements with Japan and China (JAMBA/CAMBA) have been recorded from intertidal feeding sites, saline flats and local sewage ponds. The most common of these birds are the greenshank, sharp-tailed sandpiper, bar-tailed godwit, black-tailed godwit, great knot, large sand plover and red-necked stint. The area is also notable for the nationally endangered little tern (DCCEEW, 2024i).
Mary Floodplain System	362 km northeast	A major floodplain-tidal wetland system typical of the Top End region, however unusual due to a lack of coherent river channel or major river estuary. The Mary Floodplain adjoins the Adelaide River Floodplain System located in the northwest. The site includes some of

Name	Distance from multi-well location	Description
		the largest areas of wooded swamp (apart from Arafura Swamp) in the NT and featuring a complex network of channels and billabongs. At least 75 bird species have been recorded, 33 listed under treaties (JAMBA, CAMBA, BONN. The site is one of the two to three most important breeding areas for magpie goose in part due to an abundance of nesting sites and feeding habitat (DCCEEW, 2024i).
Kakadu National Park	415 km northeast	Kakadu National Park is a Ramsar site of contiguous wetlands comprising the catchments of two large river systems, the East and South Alligator rivers, seasonal creeks and the lower reaches of the East Alligator River. It also includes the Magela Creek floodplain, the lower South Alligator floodplain, the entire West Alligator River system and nearly all the Wildman River system. During the dry season water contracts into lagoons and billabongs and up to two million waterbirds frequent the floodplains. At least 53 species of waterbirds use the Ramsar site including large concentrations of magpie geese and wandering whistling-duck. These and many other species breed in the wetlands but most species are dry season migrants (DCCEEW, 2024i). Both freshwater and saltwater crocodiles are known to breed within the Ramsar site. Fifty-nine fish species are known from the wetland, including eight with narrowly restricted ranges (DCCEEW, 2024i).
Murgenella-Cooper Floodplain System	487 km northeast	A good example of a floodplain-tidal wetland system of the Top End region, with relatively low volume of freshwater inflow. Surface water flows into the system mainly from Cooper Creek, originating 70 km east south-east (catchment area of 165 000 ha), and several unnamed creeks including minor creeks. At least 71 bird species have been recorded in the area, 26 on treaties (JAMBA, CAMBA, BONN). Magpie geese breed extensively on both Murgenella and Cooper Floodplains. Although, the Murgenella floodplain is not known as a breeding area for saltwater crocodile, Cooper creek swamps are thought to have high numbers (DCCEEW, 2024i).
Cobourg Peninsula System	453 km northeast	The Coburg Peninsula system is a good example of mangrove swamp occurring around tidal channels and islands not associated with substantial riverine inflow. It is has one of the largest discrete blocks of mangroves in the NT. Most of the site's wetlands are tidal, with numerous creeks flowing into the tidal areas. 58 species of bird species have been recorded, at least 21 listed under treaties (JAMBA/CAMBA); includes four darters and cormorants, 12 herons and allies (e.g., eastern reef egret), 23 shorebirds (e.g., eastern curlew) and six gulls and terns. Saltwater crocodile are present in the tidal areas (e.g., south ends of Port Bremer and Raffles Bay) but densities are relatively low. At least 13 frog species occur on the peninsula. Marine turtles (green and hawksbill turtles) occur at most of the islands and headlands, with all species known to breed in the NT. Dugong occur in the Minimini channels and widely in adjacent shallow seas, with high densities in some northern embayments (DCCEEW, 2024i).

11.4.9 State/Territory Protected Areas

There are several WA and NT managed marine protected areas intersected by the EMBA, (see Figure 11.55) and described in Table 11.16.

Table 11.16 Marine protected areas in the spill EMBA

Name	Distance from multi-well location	Description
WA		
North Kimberley Marine Park	66 km south	The North Kimberley Marine Park is the largest state marine park in WA, covering an area of approximately 18,450 km^2. The park is located in state waters and extends from York Sound to Cape Londonderry, to the JBG and up to the WA/NT border (DPW, 2016). The park is managed under a joint management plan between the Department of Parks and Wildlife (DPW) and the Uunguu, Balangarra, Miriuwung Gajerrong and Wilinggin traditional owners (DPW, 2016). The coastline of this marine park (from west coast of Cambridge Gulf) is a National Heritage Place (Indigenous). The North Kimberley Marine Park covers a large variety of marine habitats including sub-tidal and inter-tidal (fringing) coral reefs, seagrass, mangroves and macroalgal communities. More than 1,000 islands and associated intertidal and subtidal habitats are contained within its boundaries. Seagrass beds found around Cape Londonderry (162 km west of the activity area) provide foraging areas for dugong and marine turtles (DPW, 2016). The marine park surrounds thousands of islands with diverse and rich habitats. Marine turtle nesting sites and breeding sites for seabirds and migratory shorebirds have been identified within the marine park, and fringing reefs line the shores of almost all of the islands (DPAW, 2016). Fringing reefs occur along sectors of the mainland coast (Elsie Island to Cape Talbot, Cape Bougainville) (Christiansen *et al*., 2010). The productive deep waters that surround the islands and open sea reefs provide foraging habitat for marine mammals and pelagic fish, such as mackerel (DPW, 2016). The complex coastline of the mainland also creates a variety of habitats and communities, including important areas for dugongs, Australian snubfin dolphins and Australian humpback dolphins (DPW, 2016). Hotspots for dugongs occur to the northeast of Bigge Island to the Maret and Montalivet Islands and around the Anjo Peninsula in Vansittart and Napier Broome Bays (DPW, 2016). The MP is a globally significant area for sawfish, with finfish targeted by commercial and recreational fishermen (DPW, 2016). The marine park also contains many places of cultural and spiritual importance to traditional owners (DPW, 2016). Environmentally significant areas with the marine park include: • King Shoals Sanctuary Zone – supports a wide diversity of organisms including corals and other reef dwelling species. The area is likely to be foraging grounds for flatback turtles and sawfish. King Shoals falls within the critical habitat zone for flatback turtles (all year) (DoEE, 2017).

Name	Distance from multi-well location	Description
		• Cape Domett Special Purpose Zone – is a globally significant nesting area for flatback turtles, and the surrounding waters provide habitat for sawfish, Australian snubfin dolphins and include mangroves. Cape Domett is nominated as a critical habitat for the flatback turtle (all year, peaking July to September) (DoEE, 2017). Social values (recreation, tourism and community values) within the park include nature-based, cultural and recreational activities and tourism experiences. Tourism is a significant industry for the Kimberley, estimated to directly employ 2,500 people (DPW, 2016). The expedition cruise boat industry operates in the dry season (April to October) between Broome and Wyndham/Darwin (estimated to be valued at $63 million). Visitors also access the coast by road with more than 1,000 visitors (2016) to the coast near Kalumburu each year (DPW, 2016).
Malaya Marine Park	586 km southwest	The Mayala Marine Park is located in the west Kimberley region of WA, within the Mayala people's Native Title determination area. The park has remained a place of exceptional value for the Mayala people for tens of thousands of years. The Mayala Marine Park makes up 315,000 hectares of the Kimberley marine reserves (DBCA, 2022a). The marine park is managed under the Mayala Marine Park joint management plan, which was released in July of 2022. The plan represents the joint management of the park between the Mayala Traditional Owners and the DBCA and their shared vision to preserve the natural, recreational, commercial, cultural and heritage values of the park for future generations (DBCA, 2022a). The Mayala Marine Park is home to an array of biocultural and ecological values and features including coral and reef communities, mangroves, seagrass and macroalgae communities, high water and sediment quality, geomorphology (including beaches), subtidal filter feeding communities, intertidal sand and mudflat communities, turtles (all six species described in this EP), fish, sharks and rays, dugongs, whales and dolphins, saltwater crocodiles, sea and shore birds and invertebrates. The majority of the listed values are known to be in good or undisturbed condition or are assumed to be, with management strategies highlighting the need for further research, monitoring and reporting (DBCA, 2022a).
Bardi Jawi Gaarra Marine Park	626 km southwest	The Bardi Jawi Gaarra Marine Park is located in the west Kimberley region of WA within the Bardi and Jawi Native Title determination area. The park has remained a place of exceptional value for the Bardi and Jawi people for tens of thousands of years. The Bardi Jawi Gaarra Marine Park makes up 204,000 ha of the Kimberley marine reserves (DBCA, 2022b). The marine park is managed under the Bardi Jawi Gaarra Marine Park joint management plan, which was released in July 2022. The plan represents the joint management of the park between the Bardi and Jawi Traditional Owners and the DBCA and their shared vision to preserve the natural, recreational, commercial, cultural and heritage values of the park for future generations (DBCA, 2022b).

Name	Distance from multi-well location	Description
		The Bardi Jawi Gaarra Marine Park is home to an array of biocultural and ecological values and features including coral and reef communities, mangroves, creeks and saltmarsh communities, seagrass and macroalgae communities, high water and sediment quality, geomorphology (including beaches), subtidal filter feeding communities, intertidal sand and mudflat communities and freshwater soaks, turtles (all six species described in this EP), fish, sharks and rays, dugongs, whales and dolphins, saltwater crocodiles, sea and shore birds and invertebrates. The majority of the listed values are known to be in good or undisturbed condition or are assumed to be, with management strategies highlighting the need for further research, monitoring and reporting (DBCA, 2022b)
Lalang-gaddam Marine Park	397 km southwest	The Lalang-gaddam Marine Park has been formed from the amalgamation of four marine parks: the Lalang-garram/Camden Sound Marine Park, the Lalang-garram/Horizontal Falls Marine Park, the North Lalang-garram Marine Park and the Maiyalam Marine Park (DBCA, 2022c). This Marine Park is located in the Kimberley region of WA and covers approximately 1,308,500 ha within the Dambimangari Native Title determination area adjacent to the Shire of Derby-West Kimberley and the Shire of Wyndham East Kimberley. For tens of thousands of years, Dambeemangarddee people have depended on and looked after their traditional land and Sea Country and the area remains one of the last relatively undamaged coastal areas left in the world (DBCA, 2022c). The marine park is managed under the Lalang-gaddam Marine Park Joint Management Plan which was released in July 2022. The plan represents the joint management of the park between the Dambeemangarddee Traditional Owners with input from stakeholders and the DBCA and their shared vision to preserve the natural, recreational, commercial, cultural and heritage values of the park for future generations (DBCA, 2022c). The Lalang-gaddam Marine Park is home to an array of biocultural and ecological values and features including coral and reef communities, mangroves and saltmarsh communities, seagrass and macroalgae communities, high water and sediment quality, geomorphology, subtidal filter feeding communities, intertidal sand and mudflat communities, turtles (all six species described in this EP), fish, sharks and rays, dugongs, whales and dolphins, saltwater crocodiles, sea and shore birds and invertebrates. The majority of the listed values are known to be in good or undisturbed condition or are assumed to be, with management strategies highlighting the need for further research, monitoring and reporting (DBCA, 2022c).
Rowley Shoals Marine Park	1,040 km southwest	The Rowley Shoals Marine Park is a WA managed marine park adjacent to Mermaid Reef, Commonwealth managed Marine Park . The Rowley Shoals Marine Park protect a chain of three coral atolls at the edge of Australia's continental shelf. The atolls have shallow lagoons inhabited by diverse corals and abundant marine life. Each cover around 80km-

Name	Distance from multi-well location	Description
		90km, rising with near-vertical sides from very deep water. At low tide the water becomes ponded within the reef walls, and gushes over the edge like waterfalls. At high tide, the reefs disappear beneath the sea, with only the sandy islands of Clerke and Imperieuse visible (DBCA, 2017). Corals form a spectacular chain of reef systems, each covering about 80km2. Shallow lagoons within the reefs provide sheltered waters that are inhabited by diverse and abundant tropical marine life. Further offshore, the seafloor slopes away to the abyssal plain, some 6000m below. Undersea canyons slice the slope: these features are commonly associated with diverse communities of deep-water corals and sponges and create localised upwellings that aggregate pelagic species like tunas and billfish (DBCA, 2017).
Montebello Islands Marine Park	1,493 km southwest	Refer to previous information provided in Section 11.4.1.
Ord River Nature Reserve (R 31967)	85 km southwest	Section 11.4.5 describes the Ord River in the context of its Ramsar listing. The following description has been extracted from the Ord River and Parry Lagoons Nature Reserves Management Plan 77 2012 (DEC, 2012). The Ord River Nature Reserve covers an area of 79,842 ha and is comprised of the False Mouths of the Ord, featuring vast areas of mudflats, mangrove communities and a maze of tidal creeks (DEC, 2012). Of the 18 species of mangrove found in WA, 16 have been recorded within the reserve. The wetland areas of the reserve regularly support more than 20,000 waterbirds at a time and provides important breeding habitat for 16 species of wetland dependent birds as well as supporting mangrove dependent bird species. Lands within the reserve are also considered important habitat and breeding sites for the saltwater crocodile (DEC, 2012). The nature reserve also includes nurseries, foraging and breeding areas for at least 50 species of fish and supports the migratory route between marine and freshwater habitats for 15 species of fish (DEC, 2012). Ord River Nature Reserve also holds significant heritage and cultural values to First Nations people and the wider community as well as recreational value.
NT		
Garig Gunak Barlu National Park	456 km northeast	Garig Gunak Barlu National Park is a protected area on the Cobourg Peninsula and some adjoining waters approximately 216 km northeast of Darwin. It covers an area of 4,500 km^2 and is one of only two areas in the NT which contains adjoining land and marine parks. The national park includes the entire Cobourg Peninsula, the surrounding waters of the Arafura Sea and Van Diemen Gulf, including some of the neighbouring islands (e.g., Burford Island) (NT Government, 2020b).

Name	Distance from multi-well location	Description
		The protected area was established by joining the former Gurig National Park and the Cobourg Marine Park. Garig Gunak Barlu is Aboriginal owned land, jointly managed by a Board consisting of Iwaidja speaking peoples of the Cobourg Peninsula and NT Government representatives (NT Government, 2020b). The Park consists of sandy beaches, dunes and associated coastal grasslands, mangroves, rainforest patches, swamps, lagoons, coral reefs, sea grass meadows and rich marine life. The park supports rare species such as dugong and marine turtles as listed under the EPBC Act (Table 11.5). In addition, the park is home to the largest wild herd of Banteng (Indonesian cattle) which are an endangered species in their native habitat park (NT Government, 2020b).
Charles Darwin National Park	301 km northeast	Charles Darwin National Park is located in proximity to Darwin. The Park comprises of extensive littoral and estuarine vegetation communities, a large portion which are undisturbed mangrove forests with expansive mudflats. The intertidal mudflats are rich in birdlife, many protected under international agreements and are listed as a NIW. The park also supports 21 reptile, 17 mammal and 9 amphibian species (DEPWS, n.d.). Several aboriginal shell middens and a number of World War II bunkers of cultural and historic significance are located in the park (DEPWS, nd).
Casuarina Coastal Reserve	302 km northeast	Casuarina Coastal Reserve is a protected area in the northern area of Darwin. It offers 8 km of unspoilt beaches and is fringed by cliffs and casuarina trees. Wading and migratory birds together with nesting turtles occur at this location (NT Government, 2022). This is a significant area for the Larrakia people. Darriba Nunggalinya (Old Man Rock) can be seen at low tide. In addition, heritage ruins from World War II are scattered through the reserve (NT Government, 2022).
Vernon Islands Conservation Reserve	338 km northeast	The Vernon Islands are located in the Clarence Strait between the mainland and Melville Island. There are three major islands in the group plus a large reef, numerous lesser reefs and sand islands. The islands are generally fringed with mangroves and surrounded by mudflats and rocks/reef at low tide (TLC, 2013). The natural values of the islands include extensive and species rich mangrove forests, rich coral reef system, rocky shelves and stacks and seagrass and algal beds. The waters surrounding the Vernon Islands support dugong and turtles (TLC, 2013). Recreational values relate to fishing and boating which shipwrecks in the area popular for divers (TLC, 2013).

11.5 Cultural Heritage Values and Sensitivities

Cultural heritage includes both tangible and intangible values, and the definition of cultural heritage has evolved in recent decades as non-tangible cultural heritage continues to develop. Non-tangible cultural heritage includes oral traditions, performing arts, social practices, rituals, festive events, knowledge, and practices concerning nature and the universe or the knowledge and skills to produce traditional crafts (UNESCO, 2022). Tangible cultural heritage includes artefacts, monuments, a group of buildings and sites and museums that have a diversity of values including symbolic, historic, artistic, aesthetic, ethnological or anthropological, scientific, and social significance. Cultural heritage also captures natural heritage such as culturally significant landscapes (UNESCO, 2009).

Underwater cultural heritage is defined in Section 5.6.1 of the EP.

During the relevant persons consultation process for the Beehive-1 EP, EOG consulted with the NT Department of Territory Families, Housing & Communities (TFHC) heritage branch in an effort obtain cultural heritage data specific to the spill EMBA. The TFHC were unable to provide specific cultural heritage data relating to the spill EMBA due to its size and because many sites are unlocated. Given the spill EMBA is exactly the same for this EP, this comment relating to cultural heritage values within the spill EMBA remains applicable.

This section describes the cultural heritage values of the spill EMBA (which includes the coastline up to the high-water mark).

Table 11.17 outlines the cultural heritage sites identified by the WA inHerit cultural heritage database (Government of Western Australia, 2021) and the NT Heritage Register (NT Heritage Council, 2023) within the spill EMBA moving from east to west.

Table 11.17 Cultural heritage sites within the spill EMBA

Site No.	Site name	Local Government Area	Description
NT			
-	Hope Inlet Archaeological Sites, Shoal Bay	Litchfield	The Hope Inlet Archaeological Sites are an exceptional group of over 200 sites that represent a period of Aboriginal coastal occupation from 2,500 years ago to 500 years ago. During this period the inhabitants built many large mounds of shell and earth, the largest of which rises seven metres above the surrounding landscape. These sites are the remains of subsistence and ceremonial activities, which include shellfish gathering, fishing, hunting, stone artefact manufacture, large gatherings of people and the use of ochre. Hearth stones, charcoal, and faunal remains indicate that a variety of resources such as fish, shellfish, crabs, kangaroos, possums, snakes, and birds were cooked in these shell and earth mounds.
WA			
9609	Seaplane Bay	Wyndham-East Kimberley	Seaplane Bay is the location where two German aviators were forced to land due to a fuel shortage on a journey from Timor to Darwin in 1932. The pair were found 38 days after the landing by an Aboriginal from Drysdale River Mission. Seaplane Bay is situated near Cape Bernier, called Quourmayer by the Aboriginal meaning "two fella German".

9613	Koolama Bay	Wyndham-East Kimberley	Koolama Bay is named after the Koolama 1 state passenger ship that was bombed by the Japanese 25-40 miles off the coast near Cape Rulhieres in 1942. The vessel was abandoned by 160 passengers and crew at Koolama Bay. 93 men walked overland to Drysdale River Mission, and the women and children were taken to safety by Captain Crave of the MV Kimberley.
18783	B24 Liberator Submerged Aircraft Crash Site	Wyndham-East Kimberley	Located in Vansittart Bay (off Truscott Airbase) in crocodile infested waters the B24 Liberator Submerged Aircraft Crash Site is a submerged World War II aircraft crash site. The plane is broken into three main sections and is believed to be in a pristine condition. Nothing besides the easily accessible human remains were recovered at the time of the accident, and there has been none of the customary scavenging by treasure hunters, suggesting the site holds a high level of integrity and authenticity.
9621	Swift Bay	Wyndham-East Kimberley	Swift Bay is the landing site of 56 Chinese refugees on 31 December 1992 in an Indonesian boat. The first two refugees walked into King Edward River Station the 16th of January 1992. This began what was probably the biggest search and rescue operation Australia has ever seen. By the 25th of January 55 of the refugees had been found, and the search was then scaled down. "Mrs Lucky" was found, thin and weak, dragging himself along a path on his knees on the same day having walked in excess of 200 kilometres.
9558	Careening Bay & Boab Tree	Wyndham-East Kimberley	Philip Parker King staggered the ship *His Majesty's Cutter (HMC) Mermaid* on the beach in Careening Bay in 1820, whilst on one of its journeys to complete Matthew Flinders' task of mapping Australia. The crew inscribed the date and name of the ship on a large boab tree which is situated approximately 60 metres from the high-water mark. Parker King and his crew camped here for 17 days to repair the ship.
4155	Camden Harbour	Wyndham-East Kimberley	Camden Harbour is known for the rise and fall of early settlement between 1864-1865. In 1864 a group of interested settlers from the east of Australia formed the Camden Harbour Pastoral Association. They arrived in December with a small amount of breeding stock, ample provisions, and farming equipment. The first settlers faced horrendous conditions. The second ship arrived with a load of settlers and supplies on Christmas Day 1864. The settlement limped on, continuing to face many difficulties. Problems, including insects, heat, humidity, tropical ulcers, sharks, and crocodiles made life difficult for the people and the stock. The settlers did not have any knowledge of local food sources and their relations with the local Aboriginals was not cordial. All the people of Camden Harbour had withdrawn from the settlement by October 1865. In the ten months of the Association, nine people died. Six of which are buried on Sheep Island. A quarter of all stock brought to Camden harbour had also died.
26353	Dampier Coast - Broome Sandstone	Broome	The Broome Sandstone is exposed discontinuously for over at least 100 km of coastline from Gulbunwilla on Roebuck Bay east of Broome north to Minarriny (Coloumb Point), and possibly as far north as Cape Leveque. At most places

	Dinosaur Footprints		where this rock formation has been uncovered, whether by gradual erosion or the pounding of cyclonic seas, dinosaur footprints have been found. At least 21 different types of footprints are recognised, making this the most diverse collections of dinosaurian trace fossils in the world. Over 70 discrete track sites have been identified. The tracks are also linked to the Dreamtime stories of the indigenous people along the Dampier Peninsula coastline.

Source: Government of Western Australia, 2021 & NT Heritage Council, 2023

11.5.1 Aboriginal Heritage Sites

Indigenous Australian people have a strong continuing connection with the area that extends back some 50,000 years. The existence of any unknown Aboriginal sites or artefacts of significance within the offshore waters of northern Australia is considered highly unlikely.

The Kimberley coastline between King Sound and the western shoreline of Cambridge Gulf (including State waters) is listed as a National Heritage Place ('The West Kimberley') (DCCEEW, 2024f). The area contains dramatic and relatively undisturbed landscapes that have great biological richness and provide important geological and fossil evidence of Australian history. The indigenous values of the West Kimberley National Heritage Place are not definitively mapped. Indigenous people are the primary source of information on the value of their heritage in this region (DCCEEW, 2024f).

A search of the WA Department of Aboriginal Affairs' Aboriginal Heritage Inquiry System (AHIS) indicates there are approximately 473 registered Aboriginal sites within the spill EMBA. The majority of the registered sites are located along the coastline between the Derby-West Kimberley, Mitchell River and Wyndham-East Kimberley shoreline sectors which are considered to be remote unpopulated areas in northern WA (see Figure 11.9). Figure 11.60 displays the sites identified by the AHIS that are intersected by the spill EMBA.

During the relevant persons consultation process for the Beehive-1 EP, EOG made an application to the Aboriginal Areas Protection Authority (AAPA) for an abstract of records under regulation 7 of the *Northern Territory Aboriginal Sacred Sites Regulations 2004* (NT) (the Regulations). The returned abstract advised that for the application area:

i. *there are registered sacred sites located on the spill EMBA;*

ii. *there are recorded sacred sites located on the spill EMBA;*

iii. *there are restricted work areas in the spill EMBA which are provided for in a previously issued Authority Certificate.*

The information relating to i, ii and iii is restricted and confidential in nature and is excluded from information published for public exhibition but has been submitted to NOPSEMA as sensitive information. It is an offence under s38 of the *Sacred Sites* Act to permit access to, or furnish a document produced for a purpose of the Act without the written permission of the Authority. Given the spill EMBA is exactly the same for this EP, this information regarding Aboriginal heritage sites within the spill EMBA remains appliable.

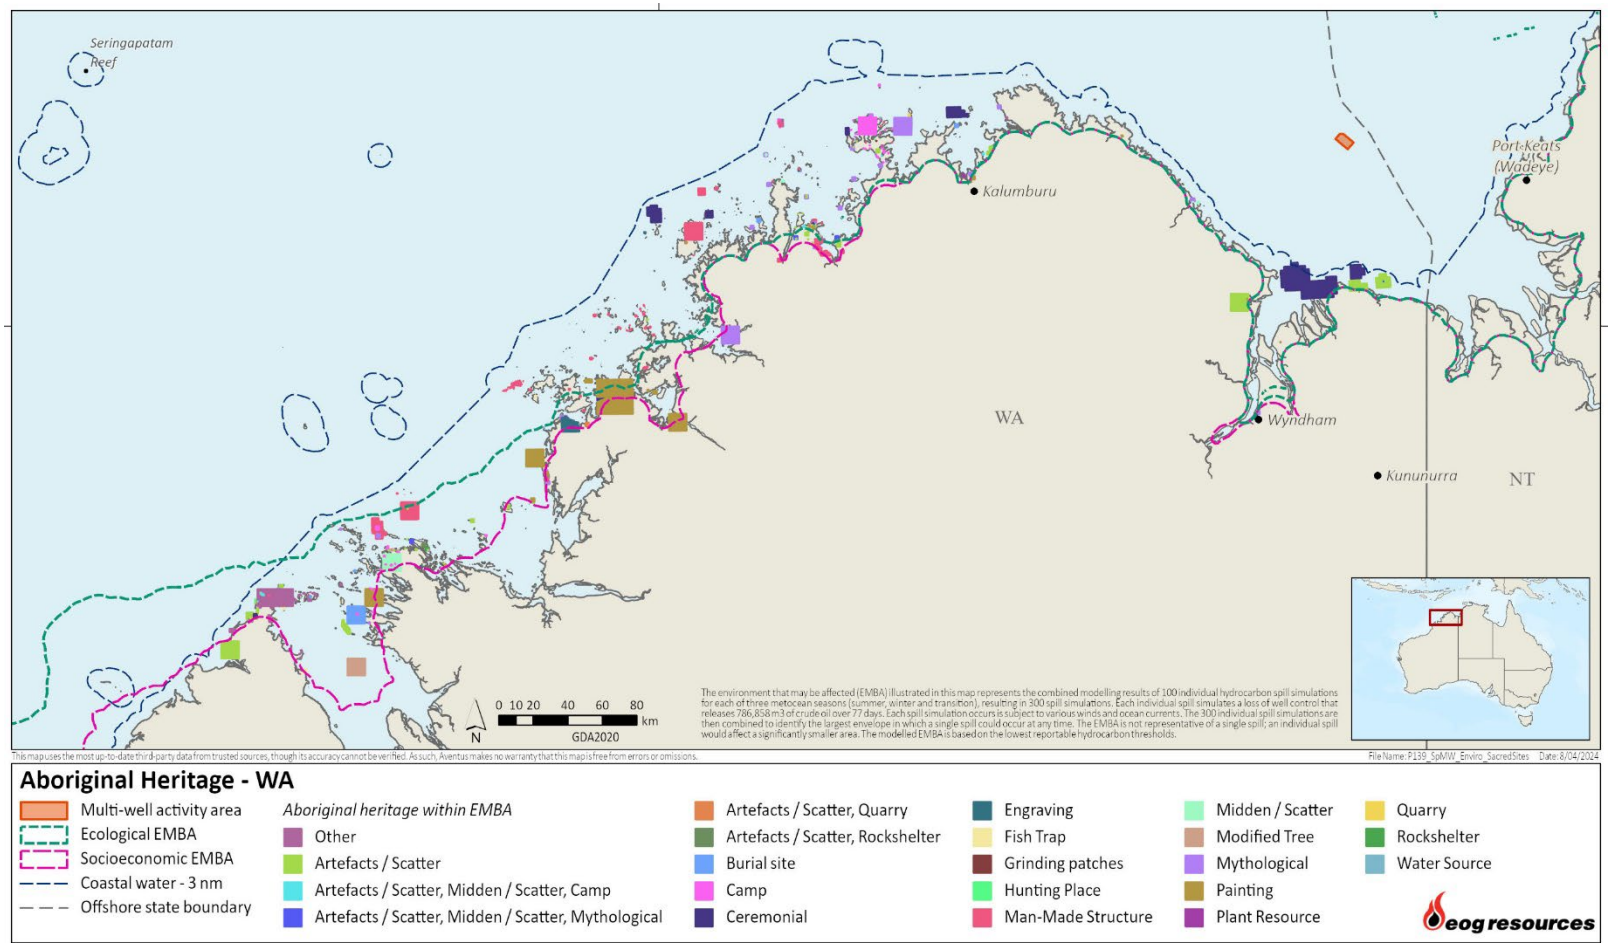

Figure 11.60 Registered Aboriginal heritage sites within the spill EMBA

11.5.2 Information from Consultation

This section draws on information derived from the relevant persons consultation process undertaken for the Beehive-1 EP. Given the multi-well activity area encompasses the Beehive-1 location, the information gathered regarding cultural heritage values remains applicable to this activity.

Consultation specifically undertaken during the development of the Beehive-1 EP included several in-person information sessions, as listed in Table 4.6 of the EP. These meetings identified a number of particular values and sensitivities, and concerns relevant to this EP.

The Broome meeting (7 June 2023) identified that:

- Introduced species pest management (particularly example of cane toads) is an issue of importance.
- Turtle and dugong are migratory species and important cultural animals to manage in the project area.

The Ardyaloon meeting (8 June 2023) did not identify any concerns with this activity but did identify concerns related to offshore oil and gas in general, including:

- Hunting resources – Could an event impact freshwater hunting resources - “this is our food bowl”. This includes sea country - fishing and dugong and turtle (including cultural significance of the resources).

The Kalumburu meeting (13 June 2023) identified:

- Important fishing areas for oysters, scallops, fish, crabs and sting rays.
- That marine life needs to be protected, particularly turtles, whales and mangroves.
- There are important cultural heritage resources in the area, including rock art, marine resources and camping locations along the shore.
- That EOG should ensure that there are no negative impacts on tourism.
- The Aboriginal Sea Company requested information on the processes of reporting:
    - Accidental waste discharges.
    - Damage to sea life on the sea floor, such as, giant clam and any other protected or endangered species.

During the relevant persons consultation for the Beehive-1 EP, a Tiwi Islands Land Council anthropologist confirmed that due to the location of the proposed activity, there will be no cultural impacts to the Tiwi Islands. Given the multi-well location encompasses the Beehive-1 location, this comment referring to cultural heritage impacts at the Tiwi Islands remains applicable.

EOG has sent project information to all other relevant persons and invited comments, including Native Title determination group representatives, Aboriginal land councils and other Aboriginal relevant persons intersected by the spill EMBA. To date, no information from these groups regarding their cultural values and sensitivities have been obtained.

11.5.3 Healthy Country Plans

The spill EMBA has the potential to encounter areas containing important cultural features to First Nations people. The information presented here is based on information obtained during the consultation process undertaken for the Beehive-1 EP, and desktop research only, primarily Healthy Country Plans (HCPs). Where HCPs are unavailable, other online sources and publications have been

interrogated to gain an understanding of applicable marine values. Note that some areas lack publicly available and documented localised knowledge of the areas, and therefore, data was not able to be obtained via desktop research. Table 11.18 details the marine values for each of the relevant groups (based on Native Title determination areas) within the spill EMBA moving from east to west. Given the spill EMBA is exactly the same as the one in the Beehive-1 EP, this section remains applicable.

Table 11.18 Marine values of coastal First Nation groups within the EMBA

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
NT			
1. Croker Island (see Figure 11.61)	Yuwurruma members of the Mandilarri-Ildugij, Mangalara, Murran, Gadura-Minaga, and Ngaynjaharr clans	Native Title Report 2000: Chapter 3: Native title and sea rights. Cobourg Marine Park Plan of Management (2011)	Due to the absence of a HCP for Croker Island, information from the Native Title Report 2000 (Chapter 3) has been used to describe the marine values applicable to the determination area. The report quotes Mary Yamirr, one of the main Indigenous witnesses in the hearing of the Croker Island case 'As far as my eyes can carry me' was her answer under cross-examination to the question of the extent of her traditional Sea Country. The quote holds significant influence as it exemplifies the gap between Indigenous and non-Indigenous understandings of the coastal seas. However, the report does not detail specific marine values relating to Croker Island. The Cobourg Marine Park Plan of Management (2011), which is adjacent to Croker Island, provides the following information regarding marine values within the region that are important to the traditional owners of Cobourg Peninsula. Managing for Aboriginal values: • Cobourg Aboriginal people have responsibility and obligation to care for sea country. • Managing and maintaining sacred sites and sites of cultural significance through ceremony and ritual. • Passing on indigenous knowledge of the marine environment, rehouses and traditional management. • Desire to develop a secure economic base from the sustainable use of the Marine Park. • Hunt, use marine resources and conduct customary management practices in the park. • Concerns: marine debris, by-catch.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			Traditional resource use and cultural significance: • Section 122 of the *Territory Parks and Wildlife Conservation Act* provides for traditional use of land and water by Aboriginal people that have traditional rights. • Section 53 of the *NT Fisheries Act* reaffirms the rights of Aboriginal people to continue to use the resources of an area of land or water in the traditional manner in which they have done so historically. • Traditional owners live on Croker Island • Dugongs, turtle, crabs, fish and shellfish are important part of Cobourg Aboriginal people's diets. • Dugongs and turtles have spiritual, ritual and mythological significance. • Sacred sites and sites of significance – dreaming tracks and sacred sites in and under the sea. • Concerns: much traditional management knowledge in not written and may be lost with the passing of Elders.
2. Larrakia (see Figure 11.62)	Larrakia people	Larrika nation annual report (2022-2023)	Due to the absence of a HCP for the Larrakia region, the Larrika nation annual report (2022-2023) has been used to describe applicable marine values. The Larrakia people are the traditional owners of the Darwin region. Despite Larrakia's native title rights being rejected in 2006, they have a dedicated land and sea ranger program. According to the Larrika nation annual report (2022-2023), the Larrika rangers were involved in monthly shorebird counts, daily turtle nesting surveys during peak nesting season, the annual dolphin survey of Shoal Bay and Darwin Harbour and the annual helicopter survey of Darwin Harbour for shore birds, marine megafauna, and crocodiles. A total of 67 days were spent undertaking marine based activities and 1,287 kg of marine debris was cleaned up (Larrakia Nation Aboriginal Corporation, 2023).
3. Legune (see Figure 11.63)	Gajerrong-Wadanybang, Gajerrong-Gurrbjim	N/A	No information is publicly available.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
	and Gajerrong-Djarrajarrany groups		
4. Spirit Hills (see Figure 11.64)	Miriuwung-Nyawam Nyawam, Miriuwung-Bindjen, Gajerrong-Gurrbijim, Gajerrong-Djarradjarrany , Gajerrong-Djandumi and the Gajerrong-Wadanybang groups	N/A	No information is publicly available.
WA			
5. Miriuwung-Gajerrong (see Figure 11.65 & Figure 11.66)	Miriuwung, Gajerrong, Doolboong, Wardenybeng and Gija groups	Miriuwung-Gajerrong Cultural Planning Framework (Hill *et al*., 2008) Ecological Character Description of the Ord River Floodplain Ramsar Site (Hale, 2008) Allocating for the Future of the Lower Ord River: Balancing Ecological, Social, Cultural, and Consumptive Water Requirement (Storey and Trayler 2006)	There is no HCP plan specific to the Miriuwung-Gajerrong region. However, the publications outlined in the previous column have provided some detail regarding marine values within the region. The planning framework (Hill *et al*., 2008) mentions fish, turtle, crab, crocodile and barramundi being of importance as well as dreaming stories surrounding saltwater. The Ord River is a major feature within the determination area that connects to the sea. Hale et al (2008) lists the Aboriginal sites that hold great cultural significance to local indigenous people within the site, including: • Burial sites. • Artefact scatters. • Mythological sites. • Quarries. • Paintings. • Ceremonial sites. Storey and Trayler (2006) discuss the past sociocultural values of the Ord River including: • Provided food, particularly waterbirds, such as jabiru, pelican, flying fox, white crane, 'black divers', magpie goose, burdekin duck, black swan, and 'black and yellow ducks' (presumed to be whistling duck).

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			• Freshwater turtles and freshwater crocodiles were collected from waterholes. • Fishing. • House Roof Hill, Bolgumirri and Adolphus Island, and Burrunungun are dreaming locations. • Wetland-dependent animals that appeared in stories; for example, brolgas (Gurrandalang), jabiru (Dariimbagang), and white crane (Djalarrang); and • The Kununurra diversion dam was built on an important cultural site known as Darram (Bandicoot Bar). In Aboriginal mythology, the rocky pool was formed by women, who, in the Dreamtime, attempted to trap barramundi with rolls of spinifex. Storey and Trayler (2006) also discuss the present socio-cultural values of the Ord River including: • Gather vegetable foods and hunt animals. • Use the riverbanks for hunting goannas, turtles, and wallabies, and fish the spillway of the Kununurra diversion dam and other parts of the river. • Cultural activities occur in close association with the river, which remains central to their society and worldview, in much the same way as the adjacent Fitzroy River does to the people associated with it.
6. Balanggarra (see Figure 11.67, Figure 11.68 & Figure 11.69)	Balanggarra	Balanggarra HCP 2012-2022 (BAC/KLC, 2011)	The Balanggarra HCP (BAC/KLC, 2011) provides the following information, relating to marine values. The nine most important things to the Balanggarra community are: 1. Balanggarra law and culture. 2. Our Gra (Country). 3. Cultural sites (rock art sites, burial sites, heritage places). 4. Right way fire. 5. Native animals. 6. Bush tucker and medicine plants. 7. Freshwater (places and freshwater fish) 8. Saltwater fish. 9. Migratory saltwater animals (turtle, dugong, whales, dolphins).

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			Marine species mentioned in the HCP (target 8: saltwater fish & seafood and target 9: migratory saltwater animals): • Green turtle (most popular turtle species hunted for flesh). • Hawksbill turtle (poisonous to consume). • Flatback turtle (eggs are harvested). • Dugong. • Saltwater crocodiles. • Whale. • Snubfin dolphin. • Mullet. • Silver bream. • Coral trout. • Stingrays. • Oysters. • Cockle shells. • Baler shells. • Turtle eggs. Other species listed in the HCP (Matters of National Significance): • Common noddy. • Fork-tailed swift. • Great egret. • Cattle egret. • Streaked shearwater. • Little tern. • Brown booby. • White-bellied sea-eagle. • Blue whale. • Humpback whale. • Killer whale. • Bryde's whale. • Irriwaddy dolphin. • Indo-pacific humpback dolphin. • Spotted bottlenose dolphin. • Whale shark.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			• Loggerhead turtle. • Olive Ridley turtle. • Leatherback turtle. Geomorphic habitats mapped in the HCP: • Channel. • Flood-and ebb-tide delta. • Intertidal flats. • Mangrove. • Rocky reef. • Saltmarsh/sandflat. • Tidal sand banks. Main threats: • Lack of traditional owner consultation. • Lack of infrastructure to access country. • Climate change. • Weeds. • Cane toads. • Lack of land and sea management capacity. • Unmanaged wildfires. • Large, introduced animals. • Uncontrolled visitor access.
7. Uunguu (see Figure 11.70 & Figure 11.71)	Wanjina Wunggurr Community	Wunambal Gaambera HCP (Wunambal Gaambera Aboriginal Corporation, 2010)	The Wunambal Gaambera HCP (Wunambal Gaambera Aboriginal Corporation, 2010) provides the following information, relating to marine values. The ten most important things for looking after Uunguu are: 1. Wanjina Wunggurr Law – our culture. 2. Right way fire. 3. Aamba (kangaroos and wallabies) and other meat foods. 4. Wulo (rainforest). 5. Yawal (waterholes). 6. Bush plants. 7. Rock art. 8. Cultural places on islands. 9. Fish and other seafoods.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			10. Mangguru (marine turtles) and balguja (dugong). Saltwater resources of Wunambal Gaambera Country: • Mangrove snapper. • Barramundi. • Bream. • Mud-crab. • Mangrove worms. • Oysters. • Periwinkles. • Saltwater crocodile. • Stingrays. • Blue-bone groper. • Saddletail snapper. • Queenfish. • Potato cod. • Reefs. • Seagrass. Target 10: Mangguru (marine turtles) and balguja (dugong): • Dugong. • Green turtle (hunted the most for food). • Hawksbill turtle (poisonous). • Turtle eggs (consumption). • Sand goanna. • Whale. • Dolphin. • Snub-fin dolphin. • Birds. Appendix 3: Nested targets – cultural significance or cultural resource: • North-western Western Australia coral beds. • Northern river shark. • Speartooth shark.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			• Sandy beaches. • Reefs. • Mangrove species and communities. • Sharks. • Stingrays. • Blue-spotted stingray. • Mud-crab. • Clams. • White lips (*Plectorphynchus sp*). • Mangrove worms. • Oyster. • Barramundi. • Mangrove snapper. • Periwinkles. • White-bellied sea-eagle. • Blue-bone groper. • Rock cod. • Queenfish. • Trepang. • Green turtle. • Hawksbill turtle. • Flatback turtle. • Loggerhead turtle. • Leatherback turtle. • Olive Ridley turtle. • Dugong. • Seagrass. • Reefs. • Common dolphin. • Indo-pacific humpback dolphin. • Striped dolphin. • Spinner dolphin. • Snub-fin dolphin.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			The main threats: • Loss of traditional knowledge. • Not being secure on country. • Bauxite mining. • Climate change. • Wrong way fire. • Visitors not being respectful. • Lack of land and sea management capacity. • Weeds. • Feral animals. • Commercial fishing.
8. Dambimangari (see Figure 11.72)	Wanjina Wunggurr Community	Dambimangari Healthy Country Plan 2012-2022 (Dambimangari Aboriginal Corporation, 2012)	The Dambimangari HCP (Dambimangari Aboriginal Corporation, 2012) provides the following information, relating to marine values. Nine most important things to focus on: 1. Cultural sites ○ Rock art sites. ○ Stone arrangements. ○ Burial sites. ○ Important camping sites where old people rested while travelling through saltwater country. 2. Reefs, beaches & islands 3. Saltwater fish ○ Rock-cod. ○ Baler shell. ○ Mangrove Jack. ○ Mullet. ○ Barramundi. ○ Bluebone. ○ Spanish flag. ○ Oysters. 4. Turtle & dugong ○ Green turtle (meat). ○ Hawksbill turtle (mainly shell for ornaments/artefacts).

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			○ Loggerhead turtle. ○ Flatback turtle (meat but mainly eggs). 5. Whales & dolphins ○ Humpback whales (stories of creation). ○ Common dolphin. ○ Humpback dolphin. ○ Snubnose dolphin. 6. Rivers, waterholes, waterfalls & wetlands (freshwater systems). 7. Culturally important native animals. 8. Bush fruits & medicine plants. 9. Right-way fire. Main threats: • Lack of culturally appropriate consultation with Traditional Owners. • Climate change. • Lack of Land and Sea Management capacity. • Visitors not being respectful. • Wrong-way fire (unmanaged). • Landowners prohibiting Traditional Owner access. • Lack of infrastructure to access country. • Mining/Industrial development. • Cane toads. • Weeds. • Gas/oil drilling. • Feral animals (cattle/pigs).
9. Mayala (see Figure 11.73 & Figure 11.74)	Kudumili, Galawa, Ngalgarrgard, Jabadayim, and Ulgirr/Oolgir	Mayala Country Plan 2019-2029 (Mayala Inninalang Aboriginal Corporation, 2019)	Cultural land and seascapes include: ○ Islands • Long yam. ○ Reefs. ○ Saltwater. • Food ▪ Saltwater fish. ▪ Mangrove jack. ▪ Golden lined spinefoot.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			▪ Spinefoot. ▪ Surgeonfish. ▪ Spanish Flag. ▪ Cod. ▪ Turtles – green turtles. ▪ Turtle eggs – green turtles and flatback turtles. ▪ Dugong. ▪ Crabs. ▪ Oysters. ▪ Trumpet shell. ▪ Baler shell. • Cultural. ▪ Humpback whales. ▪ Whale sharks. ○ Loo (tidal streams or currents). ○ Wetlands & Springs. ○ Cultural & historical sites. • Graveyard within Strickland Bay. ○ Seasonal camping areas. • Brue Reef. • Irvine/Bathurst Island. • Mermaid Island . • Herbert Islands Group. • Silica Beach. ○ Language. ○ Medicine. • Glycine spp. • Buchanania obovate. • Mimosops elengi. • Ficus virens. • Cyperus bulbosus. • Mangrove tree. • Paperbark. • Pandanus.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			• Big yam. ○ Food. • Figs • Oysters. • Trochus. • Clam shell. • Pearl shell – significant cultural species. • Fishes. • Turtle. • Octopus. • Blue crab. • Monsoonal vine thicket. • Acacia spp. Main threats: ○ Loss of connection to country. ○ Unmanaged tourism. ○ Illegal fishing. ○ Overfishing. ○ Introduced species. ○ Climate change. ○ Wrong-way fire. ○ Pollution. ○ Safety. ○ No-go zones.
10. Bardi and Jawi (see Figure 11.75)	Bardi and Jawi People	Bardi Jawi indigenous protected area management plan 2013-2023 (KLC/Bardi Jawi Niimidiman Aboriginal Corporation, 2013)	The seven identified targets are: 1. Marnany (Fringing Reefs). 2. Aarli (Fish). 3. Odorr (Dugong) and Goorlil (Turtle). 4. Significant sites. 5. Language, law and culture. 6. Traditional Oola (Water) places. 7. Indigenous plant resources.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			1. Target: marnany (fringing reefs): • Aarli (fish) species. • Abalone. • Banyjarr (clam shell). • Alngir (trochus). • Goowarn (pearl shell). • Oysters. • Dugong. Target: aarli (fish): • Goolan (small bluebone). • Barrambarr (large bluebone). • Jirral and Yawilil (trevally, numerous species). • Joordoo (mullet). • Joorloo (spanish flag). • Barrbal (yellow-lined spinefoot). • Maarrarn (mangrove jack). • Biindarral (coral trout). • Biidib (rock cod). • Birrinyan (queenfish). • Gambarl (surgeon fish). • Gooloorrganjoon (mackerel). • Barnamb (stingray). • Ngarrangg (mud crab). Target: goorlil (turtle) & odorr (dugong): • Green turtle (hunted for food). • Odorr (dugong). Target: significant sites: • Many significant sites associated with law are interconnected through songlines and stories that refer to mythological beings and places far afield. • Some sites are only for men while others belong to women who, traditionally, would meet to pass on knowledge and gather food.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			Target: Language, law and culture: • Law ceremonies are held and run by the Majamajin (law bosses). • Ceremonies take place in some significant sites, respected by Bardi Jawi people for that purpose. • In Bardi Jawi law, Balil (young boys) are initiated according to the ceremony Arnkooy. • Some parts of Bardi Jawi Law are kept secret but others are public ceremonies, in which women and families play a major part. • Bardi and Jawi language reflects a deep understanding of the land and sea, the plants and animals. • Bardi Jawi people have an obligation to respect Jawal (law teacher) and Alood (in-law) relationships, and other customs that are still largely followed. • Old people are much respected and many Traditional Owners try to make sure their old people receive fish, turtle, dugong or other favourite foods from country when they have been caught or collected. Habitat types: • Vine thicket. • Seagrass meadows. • Sandy flats. • Beaches. • Mangroves. • Fringing reefs. • Islands. Threats • Climate change. • Bushfire. • Mining. • Marine pests. • Visitors to country. • Weeds. • Lack of control over marine resource. • People not living on country.

Determination name	Affiliated language groups	Relevant HCP/publication	Marine values
			• Lack of transmission of knowledge. • People not looking after country. • Pearling leases and land-based infrastructure.
11. Warrwa Mawadjala Gadjidgar (see Figure 11.76)	Warrwa Mawadjala Gadjidgar people	N/A	No information is publicly available.
12. Bindunbur (see Figure 11.77)	Jabirr Jabirr/Ngumbarl, Nyul Nyul and Nimanburr people	N/A	No information is publicly available.

Marine Species

Table 11.19 summarises the marine species that hold significance to the coastal First Nation groups within the EMBA based on the information presented in Table 11.18. This shows that the marine species identified as being important across the majority of groups (according to publicly available data) include dugong, dolphins, whales, turtles, assorted fish species and molluscs. All of these provide sustenance and are embedded in their lifestyle and culture. Section 11.3.5 discusses the presence of the dugong within the spill EMBA as well as the cultural significance. Section 11.3.6 discusses the presence of marine turtles within the spill EMBA as well as the cultural significance. Threatened fish species within the spill EMBA are listed and described in Section 11.3.4 and molluscs are described in Section 11.3.1. Traditional fishing is also described in Section 11.5.6.

Intangible Values

Table 11.20 summarises the intangible values that hold significance to the coastal First Nation groups within the EMBA based on the information presented in Table 11.18. Intangible cultural heritage is defined in Section 11.5. Sea Country (described in Section 11.5.5) is a value uniformly recognised across all First Nation groups that exist within the coastal region of the EMBA.

Tangible Values

Table 11.21 summarises the tangible values that hold significance to the coastal First Nation groups within the EMBA based on the information presented in Table 11.18. Tangible cultural heritage is defined in Section 11.5. Paintings/rock art is the most commonly listed tangible value across the First Nation groups within the spill EMBA (according to publicly available data). Section 11.5.7 also discusses Aboriginal rock art within the spill EMBA.

Geomorphic Features/Habitat

Table 11.22 summarises the geomorphic features/habitat that hold significance to the coastal First Nation groups within the EMBA based on the information presented in Table 11.18.

Geomorphic features and habitat hold intrinsic value to the coastal First Nation groups within the EMBA. Habitats signify the health of Country, provide food and resources and represent changes in landscape in dreaming and creation stories. Geomorphology of the spill EMBA is described in Section 11.1.7 and mapped in Figure 11.8. Coastal environments of the spill EMBA are described in section 11.2 and Table 11.1 and mapped in Figure 11.9 - Figure 11.23. Reef/rocky reef/fringing reef are the most commonly listed feature (according to publicly available data). Reefs within the EMBA are described in Section 11.3.1.

Table 11.22 Geomorphic features/habitat that hold significance to the coastal First Nation groups within the EMBA

	Geomorphic features/habitat

Threats

Table 11.23 summarises the major threats that are marine in nature that hold significance to the coastal First Nation groups within the spill EMBA based on the information presented in Table 11.18. An extensive list of threats is listed in Table 11.18. The following threats in relation to the activity have been addressed in the impact and risk assessment in Sections 7 and 8 of the EP.

- Climate change: Section 7.4 of the EP discusses the routine atmospheric emissions that will occur during the activity and evaluates the impacts.
- Pollution: Sections 7.6 – 7.11 of the EP discuss the discharges of drill cuttings and muds, discharges of cement and routine vessel discharges associated with the activity, and evaluates the impacts. Section 8.1 of the EP discusses the risks associated with accidental release of waste overboard and evaluates the potential impacts. Section 8.6 of the EP discusses the risks associated with MDO release and evaluates the potential impacts. Section 8.7 of the EP discusses the risks associated with a LoWC and major oil spill and evaluates the potential impacts. Chapter 9 of the EP evaluates the potential impacts associated with hydrocarbon spill response activities.
- Marine Pests: Section 8.3 discusses the risk of introducing and establishing invasive marine species and evaluates the potential impacts.
- Oil drilling: The entire impact assessment chapter (Chapter 7) and risk assessment chapters (Chapter 8 & 9) evaluate all the impacts (planned activities) and risks (unplanned events) associated with exploration drilling for the proposed multi-well. The EIA & ERA conclude that all residual impacts are negligible, and all residual risks range from negligible to medium (once all controls have been adopted).

11.5.4 Native Title

Native Title is the recognition that Aboriginal and Torres Strait Islander people have rights and interests to land and waters, according to their traditional law and customs as set out in the Australian Law (KLC, 2022).

A determination of Native Title is a decision on whether Native Title exists in relation to a particular area of land, or waters and a Native Title claim is an area that is undergoing assessment for determination. Table 11.24 describes the Native Title determination areas within the spill EMBA (moving from east to west) using search records from the National Native Title Tribunal (NNTT) Register. There are currently no Native Title claims present within the spill EMBA.

Table 11.24 Native Title Determination areas within the spill EMBA (east to west)

Native Title Determination area	Distance from multi-well location	Description	Type of exposure to spill EMBA	Earliest time to contact and/or probability of exposure (reported by WAMOPRA DoT cells and RPS OSTM)
Croker Island (Figure 11.61)	523 km northeast	Represented by the Top End (Default prescribed bodies corporate (PBC/CLA) Aboriginal Corporation registered Native Title body corporate (RNTBC). The determination area includes the sea and seabed surrounding Croker Island, Templer Island, Valencia Island, Darch Island, Grant Island, Lawson Island, Oxley Island and Mc Cluer Island. Native Title was determined in 1998 and is held by the Yuwurruma members of the Mandilarri-Ildugij, Mangalara, Murran, Gadura-Minaga, and Ngaynjaharr clans.	Entrained oil	*Minjilang* Entrained: Summer – 8% (low) Winter – N/A Transitional – N/A *Oxley Island* Entrained: Summer – 8% (low) Winter – N/A Transitional – N/A *Lawson Island* Entrained: Summer – 6% (low) Winter -N/A Transitional – N/A *Grant Island* Entrained: Summer – 4% (low) Winter – N/A Transitional – N/A *McCluer Island*

				Entrained: Summer – 7% (low) Winter – N/A Transitional – N/A
Larrakia (Part A - consolidated proceeding) (Figure 11.62)	296 km southwest	Represented by the Northern Territory Aboriginal/ Torres Strait Islander (A/TSI) body area. The determination area includes waters near and surrounding Darwin Port including the Darwin waterfront and Darwin municipality. In 2006 the court made the decision that Native Title does not exist within this area on the basis that the current laws and customs were not 'traditional' as required under the Native Title Act. This is the second claim within the Darwin region to be denied a Native Title determination. This hearing was consolidated with other claims within the area seeking Native Title determinations.	Primarily dissolved oil, with small levels of entrained, surface oil and shoreline oil.	*Darwin* Dissolved: Summer – 12% (low), 5% (moderate), 1% (high) Winter – N/A Transitional – 1% (low) Entrained: Summer – 28% (low), 22% (high) Winter –1% (low), 1% (high) Transitional – N/A Surface: Summer – 78 days Winter – N/A Transitional – N/A Shoreline: Summer – 48 days (low) 51 days (moderate) Winter – N/A Transitional – N/A
Legune Pastoral Lease	114 km southeast	Represented by the Top End (Default PBC/CLA) Aboriginal Corporation RNTBC. The determination area is in the NT near	Surface oil and shoreline oil.	*Turtle Point* Surface:

Spirit Hills Pastoral Lease No.2 (Figure 11.64)	99 km southeast	Represented by Top End (Default PBC/CLA) Aboriginal Corporation RNTBC. The western boundary of the determination area is on the WA/NT border and includes the land and waters associated with six estates or pastoral leases on the NT mainland. Native Title was determined in 2011 and is held by the Miriuwung-Nyawam Nyawam, Miriuwung-Bindjen, Gajerrong-Gurrbijim, Gajerrong-Djarradjarrany , Gajerrong-Djandumi and the Gajerrong-Wadanybang groups.	Primarily shoreline and surface oil and small amounts of dissolved oil.	*Turtle Point* <u>Surface:</u> Summer -23 days (low) Winter – 14 days (low) Transitional – 29 days (low) <u>Shoreline:</u> Summer – 18 days (low), 24 days (moderate) Winter – 13 days (low), 14 days (moderate) Transitional – 22 days (low), 24 days (moderate)
Miriuwung Gajerrong (WA and #4) (Figure 11.65 and Figure 11.66)	WA - 77 km south #4 - 84 km south	Both areas are represented by the Miriuwung and Gajerrong Aboriginal Corporation (MG Corporation). The determination areas extend to intertidal areas and sea country intersected by the EMBA in the Cambridge Gulf and eastern Kimberley region. Native Title was determined in 2003 for the WA section as is and is held by the members of the Miriuwung (including Yirralalem, Ngamoowalem, Wiram, Yardanggarlm, Nganalam and Mandangala), Gajerrong, Doolboong, Wardenybeng and Gija and, in respect to Boorroongoong (Lacrosse Island), also Balangarra.	The intertidal areas of both determination areas are exposed primarily to dissolved oil, shoreline and surface oil, with	*East Cape Domett – WA- NT Border (C)* <u>Shoreline:</u> Summer – 16 days (low), 17 days (moderate), 42 days (high) Winter – 15 days (low), 26 days (moderate), 90 days (high) Transitional – 11 days (low), 12 days (moderate), 51 days (high)

		Sir Frederick Island. Native Title was determined in 2018 and is held by descendants (including such people descended by adoption and are accepted in accordance with traditional law and custom) of the following persons Kudumili, Galawa, Ngalgarrgard, Jabadayim, and Ulgirr/Oolgir.		Winter – 10% (low), 2% (high) Transitional – 18% (low), 9% (high)_ Dissolved: Summer – 3% (low) Winter – 2% (low), 1% (moderate) Transitional – 4% (low), 1% (moderate)
Mayala #2 (Figure 11.74)	587 km southwest	Represented by the Mayala Inninalang Aboriginal Corporation. The native title exists in parts of the determination area on two islands (Area 1 and Area 2) east of Arbidej Island and one island (Area 3) northeast of Umida island. Native Title was determined in 2019, The Mayala Inninalang Aboriginal Corporation ICN 9067 hold the determined native title in trust for the native title holders pursuant to section 56(2)(b) of the Native Title Act 1993 (Cth).	Entrained oil.	*Brue Reef* Entrained: Summer – 9% (low), 9% (high) Winter – 10% (low), 2% (high) Transitional – 18% (low), 9% (high)_
Bardi and Jawi (Figure 11.75)	626 km southwest	Represented by the Bardi and Jawi Niimidiman Aboriginal Corporation RNTBC. The determination area includes the waters from Pender Bay, Thomas Bay, Curlew Bay, Cygnet Bay and Goodenough Bay. Native Title was determined in 2019 and is held by the Bardi and Jawi People.	Entrained oil	*Broome* Entrained oil: Summer – 2% (low) Winter –1% (low) Transitional – 7% (low)
Warrwa Mawadjala Gadjidgar (Figure 11.76)	609 km southwest	Represented by the Kimberley A/TSI. The determination area includes the land and sea surrounding the Port of Derby and encompasses both branches of Doctors Creek. Native Title was determined in 2020 and is held by the Warrwa Mawadjala Gadjidgar people.	Entrained oil	*Derby – West Kimberley* Entrained: Summer – 8% (low) Winter – 5% (low) Transitional – 13% (low), 1% (high)

Native Title Determination area	Distance from multi-well location	Description	Type of exposure to spill EMBA	Earliest time to contact and/or probability of exposure (reported by WAMOPRA DoT cells and RPS OSTM)
Bindunbur (Figure 11.77)	622 km southwest	Represented by the Gogolanyngor Aboriginal Corporation, Nimanburr Aboriginal Corporation and Nyul Nyul PBC Aboriginal Corporation. Coastal parts of determination area within the spill EMBA include Lacepede Islands and its surrounding waters offshore and Goodenough Bay on the Dampier Peninsula. Native Title was determined in 2018 and is held by the Jabirr Jabirr/Ngumbarl, Nyul Nyul and Nimanburr people.	Primarily entrained oil. Small amount of shoreline oil on Lacepede Islands	*Broome* Entrained oil: Summer – 2% (low) Winter –1% (low) Transitional – 7% (low) *Lacepede Islands* Shoreline: Summer – 17 days (low), 19 days (moderate), 50 days (high) Winter – N/A Transitional – 73 days (low) Entrained: Summer – 1% (low) Winter –N/A Transitional – 2% (low)

Note: Native Title determination areas that are situated in coastal regions will be primarily exposed to shoreline levels of exposure.

11.5.5 Sea Country

Sea Country refers to the areas of the sea that First Nations groups are particularly affiliated with through their traditional lore and customs (DNP, 2018a). Traditional owners have managed and used sea country within the region for tens of thousands of years, in some cases since before rising sea levels created these marine environments. They use and actively manage the coastal and marine environments of the region as a resource and to maintain cultural identity, health, and wellbeing. Fishing, hunting and the maintenance of culture and heritage through ritual, stories and traditional knowledge continue as important uses of nearshore and adjacent areas. Smyth and Isherwood (2016) describe Sea Country as all estuaries, beaches, bays, and marine areas collectively, within a traditional estate. Sea country contains evidence of the ancient mystical events by which all geographic features, animals, plants, and people were created. Sea Country contains sacred sites and contains tracks (or song lines) along which mythological beings travelled during the creation period (Smyth and Isherwood, 2016).

The sea, like the land, is integral to the identity of First Nation groups. Connection to sea country is accompanied by a complexity of cultural rights and responsibilities. Formal recognition of Sea Country rights lags considerably compared to land rights; this could be for a range of reasons including conflicting perspectives and opinions on traditional custodianship of land and how far it extends (Smyth and Isherwood, 2016). First Nations people continue to assert inherited rights and responsibilities over sea country within the region. It is recognised that spiritual corridors extend from terrestrial areas into nearshore and offshore waters, a number of marine animals are totems for Indigenous people, and that song lines pass through marine parks (DNP, 2018b).

The spill EMBA has the potential to encounter areas of Sea Country. EOG has sent project information to relevant persons and invited comments, including Native Title determination group representatives, Aboriginal land councils and other Aboriginal relevant persons intersected by the spill EMBA. The BAC expressed concerns to EOG regarding their Sea Country being within the spill EMBA, noting that important cultural sites exist within the spill EMBA (although did not specify where) and a number of tourism activities are present. The BAC also expressed interest in co-managing risks to the Kimberley coast.

11.5.6 Traditional Aboriginal Fishing

Traditional Aboriginal fishing in NT waters predominately occurs within inshore tidal waters. Approximately 85% of the NT's intertidal zone is recognised as Aboriginal land under the *Aboriginal Land Rights (Northern Territory) Act 1976*.

From a cultural perspective, fishing for food and traditional purpose is central to the health and wellbeing of Aboriginal communities across the NT (NT Government, 2019).

Nearly all of the effort of Indigenous sectors is concentrated in coastal waters (DPIR, 2019). Hand lines are the most common traditional fishing method used by Indigenous fishers, with most of this effort (93%) concentrated onshore (i.e., from beaches rivers, or lakes) (NT Government, 2019). Less than 2% of the fish caught by Indigenous fishers are released, as fishing is undertaken as a subsistence activity (DPIR, 2019).

Around 10% of all fishing by Indigenous fishers in the NT involve the use of some form of net (DPIR, 2019). Sharks are taken in significant quantities by Indigenous fishers, with the vast majority from shore (DPIR, 2019). Most (85%) of the mud crabs harvested by Indigenous fishers are taken by hand or with spears. These two collection methods account for around 50% of all fishing events by Indigenous fishers in the NT (DPIR, 2019).

Hunting, subsistence fishing and shell collecting are recognised as occurring in the Kimberley region (DNP 2018a; DPaW 2016b, Smyth 2007). The land and sea country of the Balanggarra people extends from Napier-Broome Bay to Cambridge Gulf and Wyndham in the JBG, inshore from where the multi-well activity is proposed. In the past, the Balanggarra people speared fish along the rocky shoreline and in shallow waters. Saltwater fish, turtles, dugong, mud crabs and cockles continue to be important food sources for the Balanggarra people today (DPaW, 2016b). The Miriuwung Gajerrong land and sea country extends from the Cambridge Gulf to the NT. In the past, the Miriuwung Gajerrong people would hunt, fish and gather bush tucker in tidal areas such as mangroves, with fishing and hunting still practiced today (DPaW, 2016b).

11.5.7 Aboriginal Rock Art

The National Museum of Australia (2022) defines Aboriginal rock art as the oldest surviving human art form and is an integral part of First Nations life and customs, dating back to the earliest times of human settlement on the continent. Research indicates that there are more than 100,000 significant rock sites within Australia, over 5,000 of which are found in Kakadu National Park (The National Museum of Australia, 2022). The coastline of this park is located in the western portion of the spill EMBA.

EOG's consultation with the BAC for the Beehive-1 EP, indicates that rock art may be present within coastal areas of the spill EMBA within the Balangarra Native Title determination area(s). Rock art was also mentioned during the relevant persons consultation process at a community meeting in June 2023 in Kalumburu (for the Beehive-1 EP). The exact locations of the rock art have not been made available to EOG, however, Figure 11.60 does contain spatially defined areas labelled 'painting' that intersect with the spill EMBA. Given the multi-well location encompasses the Beehive-1 location and the spill EMBA is exactly the same, this comment remains applicable.

11.5.8 Maritime Archaeological Heritage

Historic shipwrecks are recognised and protected under the *Underwater Cultural Heritage Act* 2018, which aims to protect historic wrecks and associated relics. Under the Act, all wrecks more than 75 years old are protected, together with their associated relics regardless of whether their actual locations are known.

There are 178 shipwrecks identified within the spill EMBA; 106 located off the WA coast and 72 located off the NT coast. The locations of these shipwrecks are illustrated in Figure 11.78.

The spill EMBA intersects with the following shipwreck protection zones:

- *SS Florence D* (1942) located Northwest of Bathurst Island; and
- *I-124* (Japanese Submarine) (1942) located south of Yinanapi Point, Bathurst Island.

Shipwreck protection zones can be in place for conservation, management, or public safety reasons.

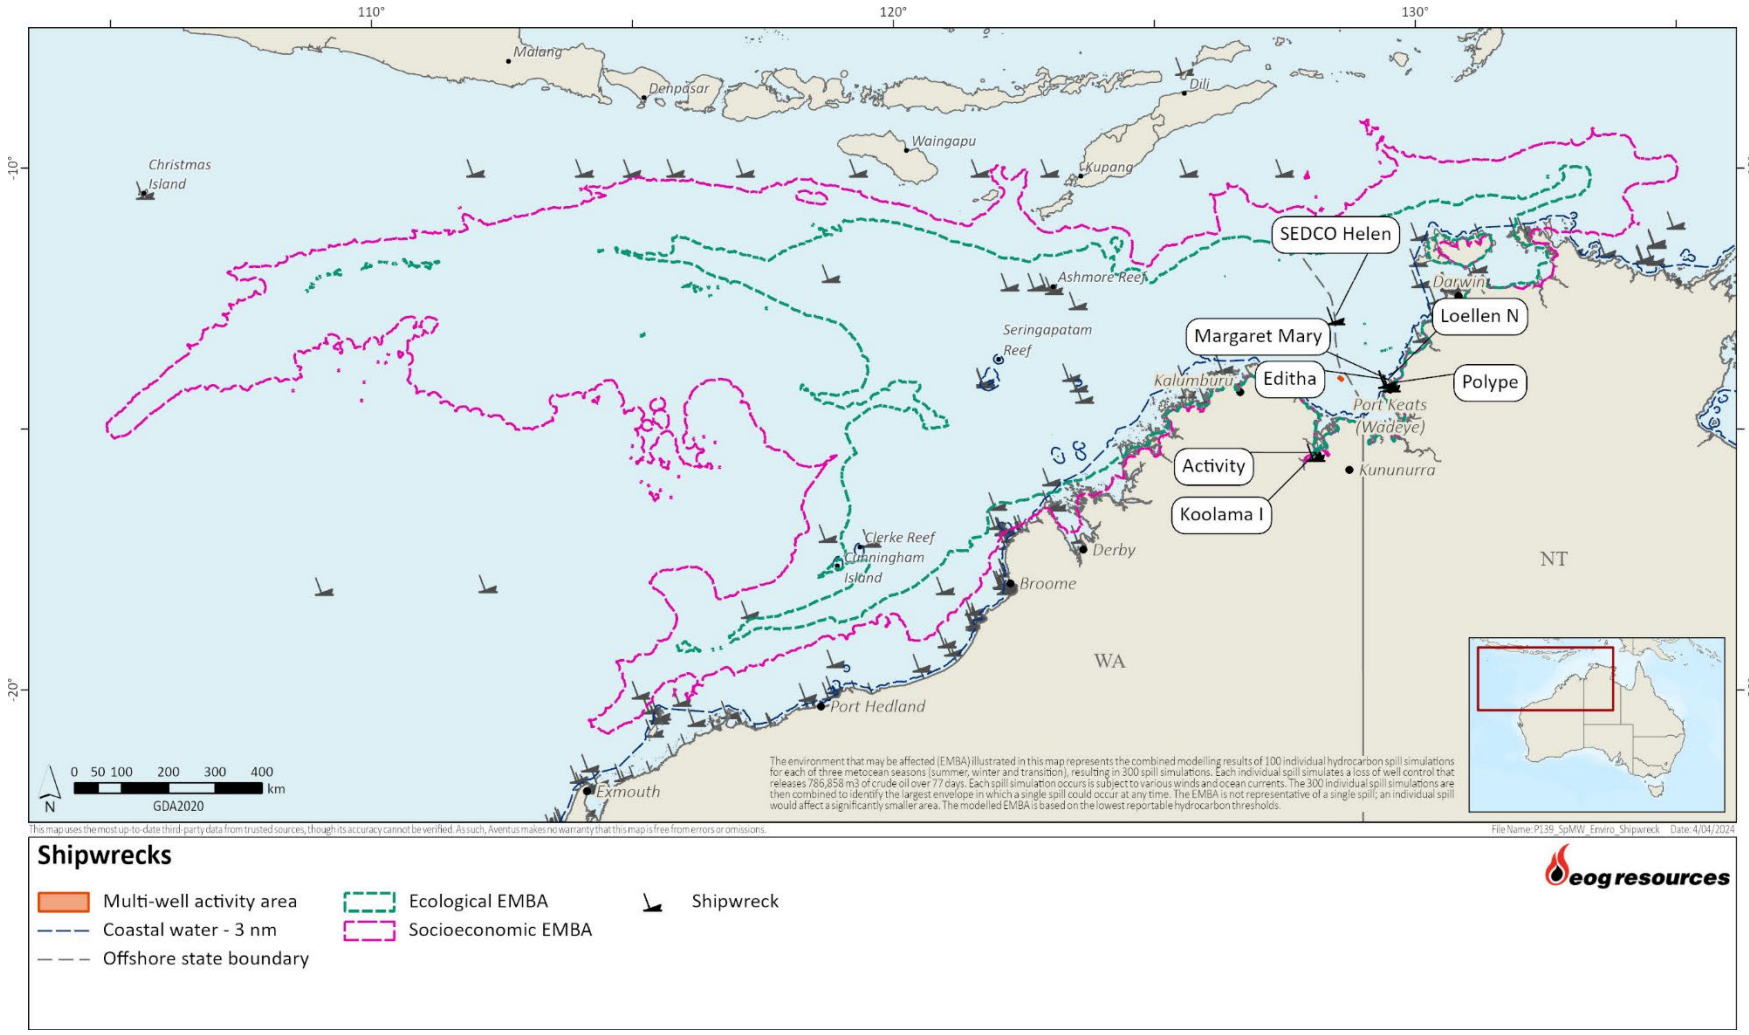

Figure 11.78 Shipwrecks in the spill EMBA

11.6 Socio-economic environment

This section describes the social and economic environment of the EMBA.

11.6.1 Commercial Fishing

Several Commonwealth, WA and NT commercial fisheries are licensed to operate in the EMBA. These are described in the following sections.

Commonwealth-managed Fisheries

Commonwealth fisheries are managed by AFMA under the *Fisheries Management Act 1991* (Cth). Their jurisdiction covers the area of ocean from 3 nm from the coast out to the 200 nm limit (the extent of the Australian Fishing Zone [AFZ]). Commonwealth commercial fisheries with jurisdictions to fish the spill EMBA are the:

- Northern Prawn Fishery (NPF).
- North West Slope Trawl Fishery;
- Southern Bluefin Tuna (SBT) Fishery;
- Western Tuna and Billfish Fishery;
- Western Deepwater Trawl Fishery; and
- Western Skipjack Fishery.

Of these fisheries, only the NPF and the North West Slope Trawl Fishery have evidence of recent (within the last three years) fishing activity in the EMBA. The NPF is discussed in detail in Section 5.71 of Chapter 5 of the EP.

Although there is no current fishing effort nor previous active fishing for the Southern Bluefin Tuna Fishery off WA, the EMBA does overlap a known spawning ground for this species (see Figure 11.81). Table 11.25 summarises the key facts and figures of the relevant fisheries.

Table 11.25 Commonwealth-managed commercial fisheries with jurisdictions to fish in the EMBA

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
NPF (Figure 11.79)	Redleg banana prawn (*Fenneropenaeus indicus),* white banana prawn (*F. merguiensis*), brown tiger prawn (*Penaeus esculentus*), grooved tiger prawn (*P. semisulcatus*), blue endeavour prawn (*Metapenaeus endeavouri*) and red endeavour prawn (*M. ensis*)	Yes – Areas include JBG (low-medium fishing intensity), south-west of Darwin (low to medium intensity), north of Melville Island (low to high intensity) extending to Cobourg Peninsula (low to medium intensity). The EMBA overlaps 17.53% of the total fishery.	The NPF operates in two seasons; • First – beginning in April for a duration of 6-12 weeks during which time banana prawns are mainly caught. • Second (August – November), when tiger prawns are predominately caught.	Otter trawl is the primary fishing method. In 2021, there were 52 fishing permits and 54 active vessels.	Catch data and economic value available for the last five years: • 2022 – 5,325 tonnes valued at $91.7 million. • 2021 – 5,390 tonnes valued at $76.6 million. • 2020 – 4,767 tonnes valued at 84.9 million. • 2019 – 8,581 tonnes valued at $117.1 million. • 2018 – 6,778 tonnes valued at $98.2 million.
North West Slope Trawl Fishery (Figure 11.80)	Australian scampi (*Metanephrops australiensis*) smaller quantities of velvet scampi (*M. velutinus*) and Boschma's scampi (*M. boschmai*) are also harvested. Mixed deep-water snappers are also a component of the catch.	Yes - Low to high intensity fishing area northeast of Clerke Reef; including a small area southwest of Cunningham Island. The EMBA overlaps 18.02% of the total fishery.	All year round.	Deepwater demersal trawling. Fishing occurs on the continental slope in water depths greater than 200 m. There were six fishing permits and four active vessels in the 2020-21 fishing season, a drop from seven permits and six vessels in the 2019-2020 fishing season.	Catch data available for the following years (economic value confidential): • 2021-22 – 85.8 tonnes. • 2020-21 – 86.9 tonnes. • 2019-20 – 111.5 tonnes. • 2018-19 – 67.4 tonnes. • 2017-18 – 79.8 tonnes.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Southern Bluefin Tuna Fishery (Figure 11.81)	Southern bluefin tuna (*Thunnus maccoyii*).	No - There has been no active fishing in WA in recent years as fishing efforts are concentrated off the south eastern coast of New South Wales, eastern Victoria, Tasmania and SA (Butler *et al.,* 2023). However, the EMBA extends to the potential spawning grounds of the target species in the northwest of WA between September and March, and larvae are seasonally abundant in surface waters during these months.	12-month season begins 1st December.	Purse seine catch in the GAB for transfer to aquaculture farms off Port Lincoln in South Australia (five to eight vessels consistently fish this area). Port Lincoln is the primary landing port. On the east coast, pelagic longline fishing is the key fishing method. 27 active vessels in the last fishing season (2020-2021).	There is no recent fishing effort in the EMBA. Catch data and economic value available for the following years: • 2022 – 5,972 tonnes worth 35.45 million. • 2021 – 5,646 tonnes worth $35.49 million. • 2019-20 – 5,429 tonnes worth $41.27 million. • 2018-19 – 6,074 tonnes worth $43.41 million. • 2017-18 – 6,159 tonnes worth $39.73 million.

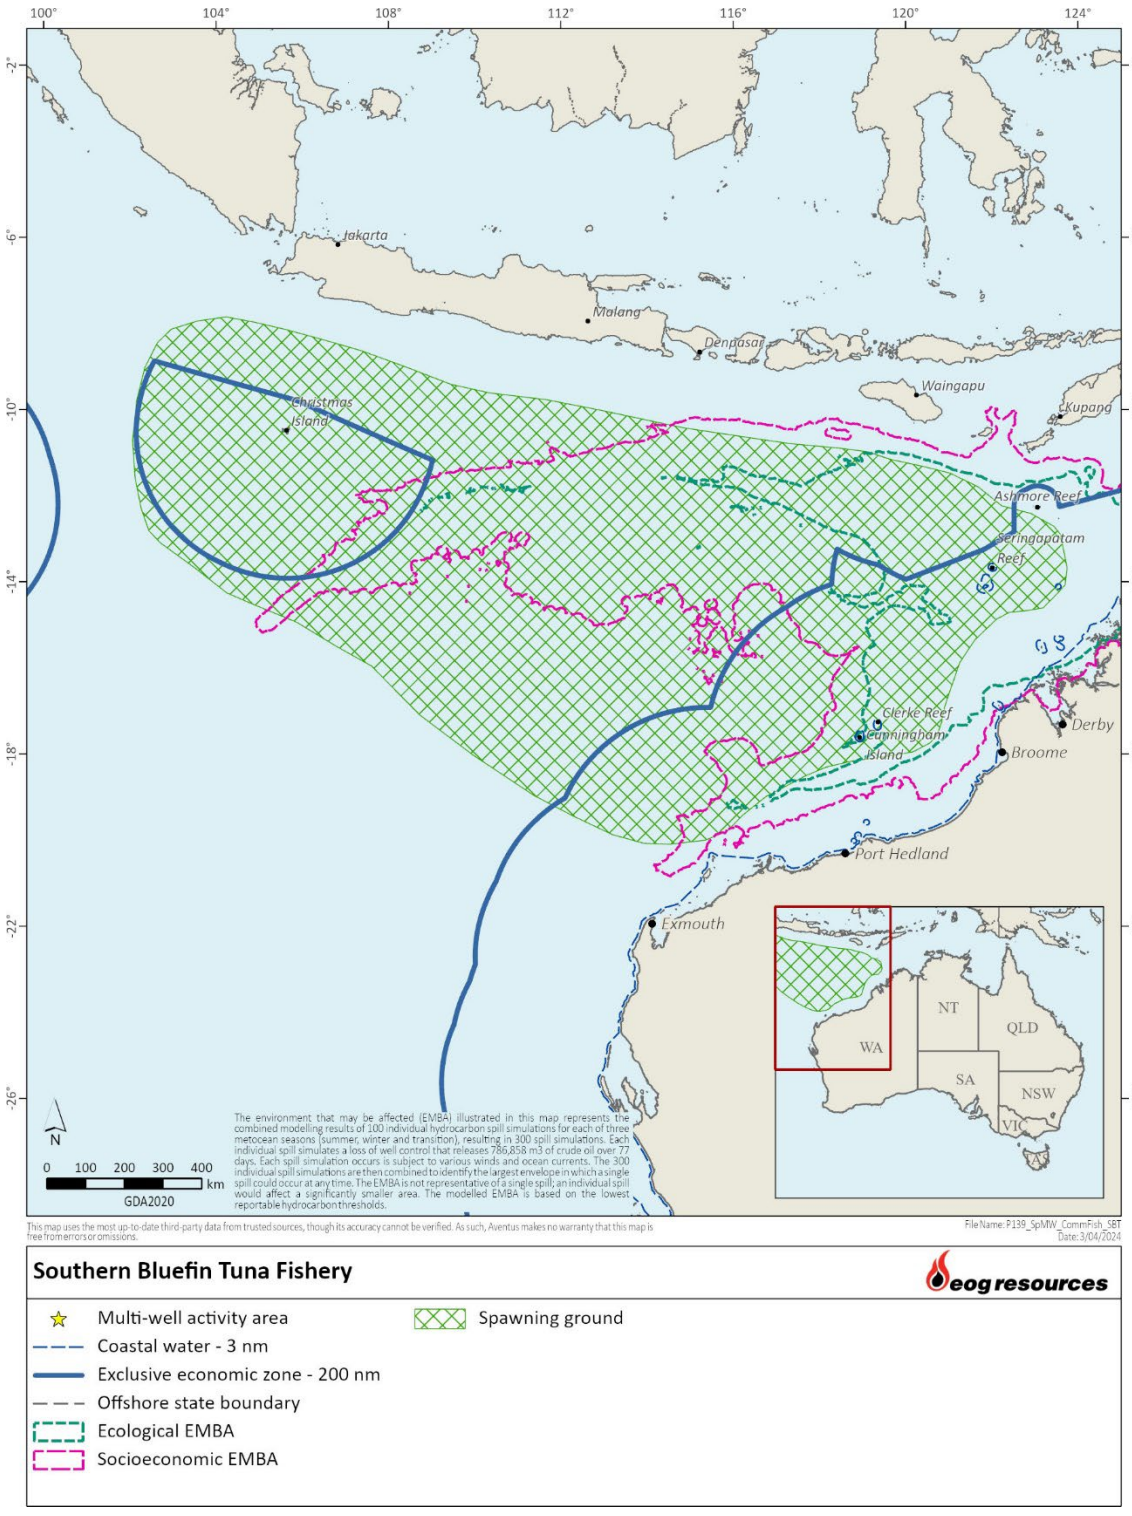

Figure 11.81 Southern Bluefin Tuna spawning grounds overlapped by the spill EMBA

Western Australian-managed Fisheries

Western Australian-managed commercial fisheries that are authorised to harvest in the waters of the spill EMBA include the following (noting that not all actively fish):

- Mackerel Managed Fisheries (MMF);
- Northern Demersal Scalefish Managed Fishery;
- Pearl Oyster Managed Fishery;
- Abalone Managed Fishery;
- Kimberley Crab Managed Fishery (North Coast Crab Fishery);
- Kimberly Prawn Managed Fishery;
- Kimberley Gillnet and Barramundi Managed Fishery;
- Broome Prawn Managed Fishery;
- Nickol Bay Prawn Managed Fishery;
- Onslow Prawn Managed Fishery;
- Specimen Shell Fishery;
- Marine Aquarium Fish Managed Fishery (MAFMF);
- Pilbara Demersal Scalefish Fishery;
- Pilbara Crab Managed Fishery (PCMF); and
- West Coast Deep Sea Crustacean Managed Fishery.

Through the consultation process for the Beehive-1 EP with the WA DPIRD, EOG identified the MMF, the Northern Demersal Scalefish Managed Fishery, Kimberley Crab Managed Fishery, Kimberley Prawn Managed Fishery and the Kimberley Gillnet and Barramundi Fishery as the key fisheries that actively fish in the EMBA. Given the spill EMBA is exactly the same for this EP, the comments relating to active fisheries within the EMBA remains applicable.

Table 11.26 presents information for these fisheries (noting that catch data for 2023 is not yet publicly available).

Table 11.26 WA-managed commercial fisheries with jurisdictions to fish within the spill EMBA

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Northern Demersal Scalefish Managed Fishery (Figure 11.82)	Targets predominately goldband snapper (*Pristipomoides multidens*), crimson snapper, red emperor (*Lutjanus sebae*) bluespotted emperor (*Lethrinus punctulatus*), saddletail snapper (*L. malabaricus*), rankin cod (*Epinephelus multinotatus*), brownstripe snapper (*L. vitta*), rosy threadfin bream (*Nemipterus furcosus*) and spangled emperor (*Lethrinus nebulosus*).	The EMBA intersects both the Pilbara zone (30.50% overlap, Figure 11.94) and Kimberely zone (2.72% overlap, Figure 11.82) of this fishery.	Assumed to be year-round.	Although permitted to use handlines, droplines and traplines, since 2002 the fishery has been essentially trap based. Eight vessels actively fished in 2022, employing at least 27 people.	Catch data available for the last five years: • 2022 – 1,458 t. • 2021 – 1,544 t. • 2020 – 1,419 t. • 2019 – 1,507 t. • 2018 – 1,297 t. Majority of catch (1,235 t) was landed in Zone B in the 2022 season.
Mackerel Managed Fishery (Area 1 and 2) (Figure 11.83)	Spanish mackerel (*Scomberomorus commerson*) and grey mackerel (*Scomberomorus semifasciatus*).	The EMBA intersects 44.48% of this fishery, particularly, fishing Area 1 (Kimberley) and Area 2 (Pilbara) (Figure 11.83)	Fishing is primarily from May – November in 2019. In the Pilbara sector, approximately 65% of effort has historically occurred from July to August.	A total of 13 vessels operated during 2022 across the fishery, employing 30-40 people. In 2014, only three vessels operated in the Kimberley region. Trolling and handline are the only allowable fishing methods.	Catch data available for the last five years: • 2022 – 212 t. • 2021 – 248 t. • 2020 – 299 t. • 2019 – 291 t. • 2018 – 213 t.
Kimberley Crab Managed Fishery (KCMF) (Figure 11.84)	Green mud crabs (*Scylla serrata*) and brown mud crabs (*Scylla olivacea*).	The EMBA intersects 2.17% of this fishery, particularly, fishing Area 1 (permitted areas of fishing) (Figure 11.84)	Generally, March to November with June to September being the most productive months.	Crab traps are the primary fishing method. In 2022, two people were employed as skippers and crew on vessels fishing for mud crab in the KCMF.	Catch data available for the last five years: • 2022 – 2.4 t. • 2021 – 0.8 t. • 2020 – 1.5 t. • 2019 – 7.4 t. • 2018 – 3.2 t.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Kimberley Prawn Managed Fishery (Figure 11.85)	Banana prawns (*Fenneropenaeus indicus* and *F. merguiensis*) are the primary target species though brown tiger prawns (*Penaeus esculentus*) and blue endeavour prawns (*Metapenaeus endeavouri*) are taken as bycatch.	The EMBA intersects the trawled areas and trawl closure areas nearshore and inshore as shown in Figure 11.85. The EMBA intersects 8.82% of the fishery.	There are two fishing periods for the season (April to mid-June, then from August to the end of November) with around 81% of the total landings taken in the first fishing period.	Otter board trawl system is the primary fishing method.	Catch data available for the last five years: • 2022 – 238.5 t. • 2021 - 203.9 t. • 2020 – 253.4 t. • 2019 – 100 t. • 2018 – 333 t.
Kimberley Gillnet and Barramundi Fishery (Figure 11.86)	Barramundi (*Lates calcarifer*), king threadfin (*Polydactylus macrochir*) and blue threadfin (*Eleutheronema tetradactylum*) are the primary target species.	The EMBA primarily intersects the fishery in areas where the fishery is closed from 1st November to 31st January and 1st December to 31st January inclusive (Figure 11.86). The EMBA intersects 0.85% of the fishery.	Year round, though predominantly occurs from April to September.	Fishing is restricted to state waters. Three vessels were active during the 2022 season, employing approximately six people.	Catch data available for the last five years: • 2022 – 64.5 t. • 2021 – 100 t. • 2020 – 44.6 t. • 2019 – 73.4 t. • 2018 – 91.8 t.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Pearl Oyster Managed Fishery (Figure 11.87)	Silver lipped pearl oyster (*Pinctada maxima*).	The EMBA intersects Zone 1, Zone 2 and Zone 3 including the Kimberley development zone of the fishery (Figure 11.87Figure 11.87).	Most vessels operate between March and June each year.	Quota-based diver fishery operating in shallow coastal waters. The number of active vessels in 2022 was six. Most vessels operate with 10 – 14 crew. Personnel employed in the pearling industry and current full-time is estimated to be around 300.	Catch data available for the last five years: • 2022 - 756,531 shells. • 2021 – 590,064 shells. • 2020 – 455,980 shells. • 2019 – 611,816 shells. • 2018 – 614,002 shells.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Abalone Managed Fishery (Figure 11.88)	Roe's abalone (*Haliotis roei*).	Yes	Between 1 October to 15 May the following year.	Abalone diving generally occurs close to the shoreline (generally no greater than 30 m depth) using hookah gear (breathing air supplied via hose connected to an air compressor on the vessel). Commercial divers do not use SCUBA gear.	Catch data available for the last five years: • 2022 – 28.9 t. • 2021 – 39 t. • 2020 – 18.2 t. • 2019 – 47 t. • 2018 – 48 t. Area 8 of this fishery (where the spill EMBA intersects) has been closed since the 2011/12 season due to catastrophic mortality following the 2011 marine heatwave. With no evidence of natural recovery, a restocking project has been successful on a trial-scale, but it has yet to be implemented on a commercial scale.
Marine Aquarium Fish Managed Fishery (Figure 11.89)	Multispecies including Syngnathids, invertebrates, hard coral, soft coral, living rock and sand, sponges and seagrasses.	Likely	Assumed year-round.	13 licences were active during the 2021 season.	Catch data available for the last five years: • 2022 – 19,710 individuals • 2021 – 13,362 individuals • 2020 – 28,165 individuals • 2019 – 11,925 individuals • 2018 – 27,327 individuals

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Broome Prawn Managed Fishery (Figure 11.90)	Western king prawn (*Melicertus latisulcatus*)	The socio-economic EMBA intersects a known fishing area off Broome.	Assumed to follow that of the Kimberley Prawn Managed Fishery	Demersal trawl.	Between 2015-2021, there was trial fishing only with landings <1 tonne each year. No fishing effort occurred in 2022 as no boats undertook trial fishing activities.
Nickol Bay Managed Prawn Fishery (Figure 11.91)	Banana prawns (*Fenneropenaeus indicus* and *F. merguiensis*) are the primary target species though brown tiger prawns (*Penaeus esculentus*) and blue endeavour prawns (*Metapenaeus endeavouri*) are taken as bycatch.	Yes –within the fishery extent, however it does not intersect the fishery trawled area nor the size management fish ground (Figure 11.91).	Assumed to follow that of the Kimberley Prawn Managed Fishery.	Demersal trawl.	Catch data available for the last five years: • 2022 – 51 t • 2021 - 123.4 t • 2020 – 202.4 t • 2019 – 254 t. • 2018 – 81 t.
Onslow Managed Prawn Fishery (Figure 11.92)	Banana prawns (*Fenneropenaeus indicus* and *F. merguiensis*) are the primary target species though brown tiger prawns (*Penaeus esculentus*) and blue endeavour prawns (*Metapenaeus endeavouri*) are taken as bycatch.	Yes – within the fishery extent, however it does not intersect the fishery trawled area nor the size management fish ground (Figure 11.92Figure 11.92).	Assumed to follow that of the Kimberley Prawn Managed Fishery.	Demersal trawl. One boat fished during the 2022 season.	Catch data available for the last five years: • 2022 – confidential. • 2021 - Undisclosed (less than the target catch range) • 2020 – Undisclosed (less than the target catch range) • 2019 – 50 t. • 2018 – 60 t.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Specimen Shell Fishery (Figure 11.93)	In the past 5 years, more than 438 separate species of molluscs have been collected, with an average of more than 200 species per year.	Low fishing intensity.	Year-round.	Hand collection.	Catch data available for the last five years: • 2022 - 5,074 shells. • 2021 – 5,443 shells. • 2020 – 6,152 shells. • 2019 – 7,232 shells. • 2018 – 7,628 shells.
Pilbara Demersal Scalefish Managed Fishery (Figure 11.94)	Goldband snapper (*Pristipomoides multidens*), blue spotted emperor (*Lethrinus punctulatus*), red emperor (*Lutjanus sebae*), saddletail snapper (*L. malabaricus*), crimson snapper (*L. erythropterus*) and rosy threadfin bream (*Nemipterus furcosus*).	Yes – the southwestern extent of the EMBA intersects the Pilbara offshore closed waters (trawl) (Zone 1 and Area 6) and Pilbara trawl (Zone 1 and Zone 2) and trap fishing (Figure 11.94).	Year-round.	Hand line, drop line and fish traps are permitted. At least 34 people (e.g., 2-4 crew per vessel) were directly employed in the PDSF in 2022.	Catch data available for the last five years: • 2022 – 2,485 t. • 2021 - 2,714 t. • 2020 – 2,854 t. • 2019 – 2,980 t. • 2018 – 2,651 t.
Pilbara Crab Managed Fishery (PCMF) (Figure 11.95)	Blue swimmer crabs (*Portunus pelagicus*)	Yes - the southwestern extent of the EMBA intersects the permitted area of the fishery (Figure 11.95).	Fishers generally operate from March to November with May to September being the most productive months.	Crab trap and drop nets are used to harvest crabs. During 2022, two people were employed as skippers and crew on vessels fishing for blue swimmer crabs along the Pilbara coast.	Catch data available for the last five years: • 2022 – 11.2 t. • 2021 – 8.9 t. • 2020 – 0.6 t. • 2019 – 19 t. • 2018 – 35 t.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
West Coast Deep Sea Crustacean Managed Fishery (Figure 11.96)	Crystal crab (*Chaceon albus*), Snow crab (*Chaceon albus*), spiny crab (*Hypothalassia acerba*) and giant crab (*Pseudocarcinus gigas*).	Yes –within the fishery extent and closed waters of the fishery, however fishing effort is concentrated in areas south of Exmouth (outside of EMBA) (Figure 11.96).	Typically, from January to June with greater intensity in January/February.	Baited pots or traps in a long line formation in the shelf edge waters (>150 m).	Catch data available for the last five years: • 2022 – 123.2 t. • 2021 – 154.5 t. • 2020 – 153 t. • 2019 – 153 t. • 2018 – 154 t.

Northern Territory-managed Fisheries

NT-managed commercial fisheries (under the jurisdiction of the NT DITT) that are authorised to fish the waters of the spill EMBA include the following (noting that not all actively fish in the spill EMBA):

- Spanish Mackerel Fishery;
- Barramundi Fishery;
- Bait Net Fishery;
- Coastal Net Fishery;
- Coastal Line fishery;
- Trepang Fishery;
- Aquaculture (pearl oyster and barramundi farming);
- Aquarium Fishery;
- Mollusc Fishery;
- Mud Crab Fishery;
- Pearl Oyster Fishery;
- Small Pelagic Developmental Fishery;
- Fishing Tour Operator Fishery;
- Timor Reef Fishery;
- Offshore Net and Line Fishery; and
- Demersal Fishery.

A review of data from the NT DITT website and consultation undertaken for the Beehive-1 EP with DITT, identified the Demersal Fishery, Timor Reef Fishery, Spanish Mackerel Fishery and Offshore Net and Line Fishery as have recently fished in the EMBA. Given the spill EMBA is exactly the same for this EP, the comments relating to active fisheries within the EMBA remains applicable.

Table 11.27 presents the available information for these fisheries.

Table 11.27 NT-managed commercial fisheries with jurisdictions to fish within the spill EMBA

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Demersal Fishery (Figure 11.97)	Primarily targets red snapper (*Lutjanus erythropterus*), goldband snapper (*Pristipomoides multidens*) and saddletail snapper (*L. malabaricus*).	Yes – the EMBA intersects the line and fish trap permitted areas and Zone A and Zone B (line and fish trap, finfish trawl gear permitted) (Figure 11.97). The EMBA overlaps with 10.09% of the fishery.	Assumed year-round.	Fishing method is through the use of vertical lines, drop lines, finfish long-lines, baited fish traps and semi-demersal trawl nets in two multi-gear areas. There are 16 licences currently issued in the Demersal Fishery and 7 boats nominated for fishing.	Catch data for the 2022 calendar year revealed a catch of 3,530 t valued at $19.7 million. In 2020, 3,492 t (including 2,522 t of red snapper and 218 t of goldband snapper) was caught. No data found for 2018 and 2019. In 2017, 3,387 t (including 505 t of red snapper and 341 t of goldband snapper) was caught, with an estimated value of $17.9 million. In 2016, 3,463 t (including 2,510 t of red snapper and 318 t of goldband snapper) was caught. In 2015, 3,107 t (including 2,299 t of red snapper and 279 t of goldband snapper) was caught.
Spanish Mackerel Fishery (Figure 11.98)	Primarily targets Spanish mackerel (*Scomberomorus commerson*).	Yes – northeastern extent of EMBA intersects the fishery (Figure 11.98). The EMBA overlaps with 13.76% of the fishery.	Assumed year-round.	The primary fishing method used by all sectors is trolling, where baited hooks or lures are towed behind a boat moving at 3–6 knots near reefs, headlands and shoals. In 2021 there were 15 licences in the fishery, all of which were allocated.	Catch data available: • 2022 – 269.5 t valued at $5.5 million. • 2019/20 – 357 t. • 2018/19 – 408 t. • 2017/18 – 372 t. • 2016/17 – 411 t.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Offshore Net and Line Fishery (Figure 11.99)	Blacktip shark (*Carcharhinus limbatus*), spot tail shark (*Carcharhinus sorrah*) and grey mackerel (*Scomberomorus semifasciatus*).	Yes – northeastern extent of EMBA intersects the fishery (Figure 11.99). The EMBA overlaps with 13.76% of the fishery.	Assumed year-round.	Demersal or pelagic longlines or pelagic net gear is permitted.	Catch data available (for combination of grey mackerel, combined black tip shark, spot tail shark only): • 2022 – 455.1 t valued at $6.2 million • 2018/2019 – 553 t • 2017/2018 – 461 t • 2016/2017 – 486 t • 2015/2016 – 424 t
Timor Reef Fishery (see Figure 11.97 *(as per Demersal Fishery)*	Goldband snapper (*Pristipomoides multidens*).	Yes. The EMBA overlaps with 10.09% of the fishery.	There is no closed season for the Timor Reef Fishery, but normally, it is most productive between October and May.	Operates in remote offshore waters in the Timor Sea in a defined area approximately 370 km northwest of Darwin. Methods include vertical lines, drop line, long lines and fish baited traps	Catch data available: • 2022 – 585.6 t valued at $5.4 million • 2019 – 246 t • 2018 – 349 t • 2017 – 329 t • 2016 – 280 t
Bait Net Fishery	Bait fish.	Possibly.	Assumed year-round	Fishing allowed from the high-water mark to the 3 nm seaward of the low-water mark, excluding Darwin Harbour and Shoal Bay. Methods include bait net, cast net or scoop net. In 2021, the fishery was restricted to two licences, both were allocated.	No data available.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Coastal Net Fishery (Figure 11.100)	Mullet (*Mugil* spp)	Yes – fishery operates inshore, extending from the high-water mark out to 3 nm.	Assumed year-round.	Fishery is divided into 3 regions: Darwin – from Cape Hotham to Native Point and Cape Ford to Cape Dooley, between Cape Arnhem and Cape Wilberforce; and from Bing Bong Creek and Pelican Spit. Only netting is permitted. In 2021, fishery was restricted to five licences, all of which were allocated.	Catch data for the 2022 calendar year revealed a catch of 2.65 t valued at $13,411.
Coastal Line Fishery	Black jewfish (*Protonibea diacanthus*).	Possibly.	Possibly all year-round.	Extends 15 nm from the low water mark and covers the entire NT coastline. The majority of fishing effort is focused around rocky reefs within 150 km of Darwin. Mainly hook and line gear is used.	Catch data available: • 2022 - 132.7 t valued at $2.3 million • 2019 – 141 t • 2018 – 120 t • 2017 – 173 t • 2016 – 155 t
Barramundi Fishery	Primarily barramundi (*Lates calcarifer*) and king threadfin (*Polydactylus macrochir*).	Possibly.	Annual commercial fishing runs from 1st February to 30 September.	Operate in tidal mud flats and inside a restricted number of rivers using gillnets. As of 2016, there were 14 licences and approximately 10 boats.	Catch data available: • 2022 – 312.1 t valued at $5.7 million • 2019 – 276 t • 2018 – 277 t • 2017 – 392 t • 2016 – 305 t

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Trepang Fishery (Figure 11.101)	Sandfish (*Holothuria scabra*)	Yes - fishery area extends from the NT high-water mark out to 3 nm (see Figure 11.101).	All year-round, though harvesting occurs on neap tides during the dry season (May to October).	Method is by hand either on foot or by diving, usually on neap tides during the dry season when the water is clearer. In 2021, there were 6 licences in the fishery, with only one or two boats active over the past few years.	Catch data available: • 2022 – 42.9 t valued at $708, 543 • 2019/2020 – 32 t • 2018/2019 – 48 t • 2017/2018 – 56 t • 2016/2017 – 94 t • 2015/2016 – 36 t

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Aquaculture	Pearl oyster (*Pinctada maxima*) culture and Barramundi farming (*Lates calcarifer*) including sea cucumber (trepang), giant clams and freshwater plants.	Possibly.	Assumed all year-round.	A large number of pearl oysters for seeding is obtained from wild stocks and supplemented by hatchery-produced oysters with major hatcheries operating at Broome and the Dampier Peninsular (Gaughan & Santoro, 2021). Wild shell collection occurs in shallow coastal waters. All the leases are within 35 m diving depth. Pearl farm sites are located mainly along the Kimberley coast, particularly in the Buccaneer Archipelago, in Roebuck Bay and at the Montebello Islands. Developing marine aquaculture initiatives in the Kimberley region include farming barramundi in the Kimberley Aquaculture Development Zone located in Cone Bay, situated approximately 200 km north-east of Broome (Gaughan & Santoro, 2021). Another focus is the Broome Tropical Aquaculture Park where a commercial pearl oyster hatchery is located along with the Kimberley Training Institute aquaculture facility (Gaughan & Santoro, 2021).	No data available.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Aquarium Fishery (Figure 11.102).	Freshwater and marine species including fish, plants and invertebrates.	Yes - fishery extends from the NT inland estuarine and marine waters out to the outer boundary of the Australian Fishing Zone (excluding Aboriginal sacred sites and other closed areas) (see Figure 11.102).	All year-round.	Methods of collection are by hand or small scoop nets. In 2016, there were 11 licences with only 3 boats active.	Catch data for the 2022 calendar year revealed a catch of 19.1 t valued at $2.2 million.
Mollusc Fishery	Molluscs and shellfish (excluding pearl oysters or cephalopods such as squid, octopus, cuttlefish and nautilus).	Possibly.	Assumed all year-round.	Operates in intertidal waters from the high-water mark out to the low water mark. Molluscs are collected by hand. There is only one commercial licence allocated.	No data available.
Mud Crab Fishery (Figure 11.103)	Giant mud crab (*Scylla serrata*).	Yes – fishery extends mainly around coastal areas and tidal waters (excluding Aboriginal sacred sites and other closed areas or closed waters) (see Figure 11.103).	All year-round, except during the wet season (November to April).	Crab fishing is generally confined to coastal mudflats and estuaries. commercial crabbing is banned from Darwin, most creeks adjoining Shoal Bay and waterways of Kakadu National Park. Method of catch via dinghies using rigid metal crab pots. Crabs are transported live to Darwin. In 2021, there were 49 licences for crab fishing, each licence is allowed 60 pots.	Catch data for the 2022 calendar year revealed a catch of 342.5 t valued at $8.1 million.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Pearl Oyster Fishery (Figure 11.104)	Pearl Oyster (*Pinctada maxima*).	Most likely – fishing operates from the high-water mark to the outer boundary of the Australian fishing zone, 200 nautical miles offshore. (Figure 11.104)	All year-round.	Pearl oysters are collected by hand. There are currently 5 licences in the fishery.	A total of 138,000 oysters can be collected by hand only each year.
Small Pelagic Developmental Fishery	Blacktip sharks (*Carcharhinus tilstoni*, *C. limbatus* and *C. sorrah*).	Possibly.	Assumed all year-round	Method is pelagic long lines or pelagic nets. There are currently three active licences.	In 2017, a commercial catch of 0.1 tonnes was reported.
Aboriginal Coastal Licence	Does not specify.	Possibly.	Assumed all year-round	If you're an Aboriginal person living full time in an Aboriginal community and have the agreement and support of your community, you can apply for this licence. With this licence you can catch and sell fish to people such as community members, visitors, community shops or fish wholesalers using the following methods: • Vertical line. • Troll line. • Cast net. • Scoop net. • 100m net with mesh size of 65mm or less. • Hand spear.	Catch data for the 2022 calendar year revealed a catch of 3,328 kg valued at $20,080.

Fishery	Target species	Fishing activity in the EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
Fishing Tour Operator Fishery	Target fish include barramundi, golden snapper, stripey snapper, saddletail snapper and grass emperor.	Possibly - fishery operates in non-tidal and tidal waters from the NT boundary to the outer limit of the Australian Fishing Zone generally in areas that are accessible to the general public.	Assumed all year-round	Primary method is hook and line. Commercial fishing tour operators (FTOs) are managed by the NT Government and operate under specific licence conditions including reporting of catch and effort statistics.	No data available.

Indonesian Commercial and Subsistence Fishing

Indonesian fishers have sailed to and actively fished Australia's northern waters, particularly in and around the shallow lagoons of Scott Reef, primarily targeting trepang (sea cucumber), shark fin and other marine resources such as trochus shells. They also catch fish largely for subsistence purposes although the average fish catch per lete-lete (traditional Indonesian fishing vessel) in 2008 increased to commercial volumes. Although deeper waters are more plentiful in trepang, deep diving is generally not undertaken by the fishers due to the MoU stipulation on the exclusive use of traditional equipment only (Woodside, 2011).

Within the northwest extent of the spill EMBA, there is a defined area where a Memorandum of Understanding (MoU) between the Government of Australian and the Government of the Republic of Indonesia Relating to Cooperating in Fisheries (1992) exists to allow Indonesian fishers (using traditional fishing methods) to operate in the Australian waters of the Timor Sea (Figure 11.105). The MoU is officially known as the Australia-Indonesia Memorandum of Understanding regarding the Operations of Indonesian Traditional Fishermen in Areas of the Australian Fishing Zone and Continental Shelf – 1974 (DCCEEW, 2024a).

The MoU agreement provides the framework for fisheries and marine cooperation between Australia and Indonesia, and facilitates information exchange on research, management and technological developments, complementary management of shared stocks, training and technical exchanges, aquaculture development, trade promotion and cooperation to deter illegal fishing (DCCEEW, 2024a).

Cooperation under the MoU takes place under the auspices of the Working Group on Marine Affairs and Fisheries. Established in 2001, the Working Group on Marine Affairs and Fisheries is the primary bilateral forum to enhance collaboration across the spectrum of marine and fisheries issues relevant to the areas of the Arafura and Timor seas. The Working Group brings together the fisheries, environment and scientific research portfolios and agencies from both countries (DCCEEW, 2024a).

As part of negotiations to delineate seabed boundaries, Australia and Indonesia entered into the MoU which recognises the rights of access for traditional Indonesian fishers in shared waters to the north of Australia. This access was granted in recognition of the long history of traditional Indonesian fishing in the area. The MoU provides Australia with a tool to manage access to its waters while for Indonesia, it enables Indonesian traditional fishers to continue their customary practices and target species such as trepang, trochus, abalone and sponges. Guidelines under the MoU were agreed in 1989 in order to clarify access boundaries for traditional fishers and take into account the declaration of the 200 nm fishing zones (DCCEEW, 2024a).

Figure 11.105 Australia-Indonesia MoU Box

11.6.2 Recreational Fishing

Within the North Coast Bioregion, there is a distinct seasonal peak of recreational fishing during winter (Gaughan and Santoro, 2018). Offshore islands, coral reefs and the continental shelf provide species of major recreational interest, including tropical snapper, cods, coral and coronation trout, sharks, trevally, tuskfish, tunas, mackerels and billfish (Gaughan and Santoro, 2018).

Recreational fishing activities are primarily based out of Darwin. Given the long distance of the activity area from the mainland and key population areas, recreational fishing activities in much of the EMBA are not predicted. However, given the broad extent of the EMBA across northern Australia, it is likely that some recreational fishing does occur.

RecFish West and the AFANT have not raised any issues regarding recreational fishing for this project.

11.6.3 Coastal Settlements

The coastline adjacent to the spill EMBA is sparsely populated, with the townships of Broome (WA) (800 km southwest), Derby (WA) (637 km southwest), Wyndham, WA (162 km south), Wadeye, NT (99 km east) and the city of Darwin (297 km northeast of multi-well location) being the largest city within the EMBA.

Darwin is the capital of the NT and has a population of 139,902 (ABS, 2021). Of the people employed in Darwin, 65.7% work fulltime (ABS, 2021). The state government administration, hospitals and defence are the largest employment sectors, accounting for 17.6% of the workforce (ABS, 2021).

The population of Wadeye is 1,924, with Aboriginal and/or Torres Strait Islander people making up 85.8% of the population (ABS, 2021). Of the employed people in Wadeye, the education and local government administration sectors are the largest employment sectors, accounting for 21.4% of the workforce (ABS, 2021).

The population of Wyndham is 941 with Aboriginal and/or Torres Strait Islander people making up 56.6% of the population (ABS, 2021). Of the employed people in Wyndham, the social services and education are the largest employment sectors, accounting for 20.9% of the workforce (ABS, 2021).

The population of Broome is 16,959, with Aboriginal and/or Torres Strait Islander people making up 28.6% of the population (ABS, 2021). Of the employed people in Broome, hospitals, accommodation, and primary education, are the largest employment sectors, accounting for 14.8% of the workforce (ABS, 2021).

The population of Derby is 3,222 people, with Aboriginal and/or Torres Strait Islander people making up 41.5% of the population (ABS, 2021). Of the employed people in Derby, hospitals, correctional and detention and secondary education sectors are the largest employment sectors, which account for 24.4% of the workforce (ABS,2021).

Apart from Kalumbaru (205 km east of the multi-well location , inland of the coast) is located on the western side of Cape Londonberry (179 km northwest of the multi-well location) there are no coastal settlements on the western coast of the JBG until Cambridge Gulf where the Oombulgurri community is located, approximately 138 km south of the multi-well location . The towns of Wyndham (as described above) and Kununurra (190 km south from multi-well location) are also located in the Cambridge Gulf.

The population of Kununurra is 5,494 people, with Aboriginal and/or Torres Strait Islander people making up 24.9% of the population (ABS, 2021). Of the employed people in Kununurra, hospitals, secondary education and other social assistance services are the largest employment sectors, which account for 14.2% of the workforce (ABS, 2021).

The population of the Tiwi Islands is 2,348 people, with Aboriginal and/or Torres Strait Islander people making up 86.5% of the population (ABS, 2021). Of the employed people in the Tiwi Islands, local government, primary and secondary education are the largest employment sectors, accounting for 34.6% of the workforce (ABS, 2021).

11.6.4 Tourism

The JBG and adjacent lands are remote with very little infrastructure (such as roads, airports, accommodation) and therefore has not been developed for tourism. For up to five months of the year, access to the JBG region is restricted to boat or helicopter due to wet season rains, and road access to areas of Aboriginal freehold land requires prior permission from the Northern Land Council (NLC) (Woodside, 2004).

Expedition cruise boats operate in the North Kimberley Marine Park in the dry season (April to October), between Broome and Wyndham or Darwin, and offer multi-day tours (DPW, 2016b). Vessels range from small fishing and sightseeing tour boats to large luxury cruise ships carrying up to 100 passengers (DPW, 2016b). Access to the coast is possible although only by using a four-wheel drive. Scenic flights and fishing expeditions operate in connection with coastal accommodation or cruise boats as well as from Broome, Derby and Kununurra (DPW, 2016b).

Charter fishing and tourism activities operate from Darwin and the Kimberley and target areas of high scenic value and/or offshore coral reef areas (Woodside, 2004). These attributes are sparse in the JBG, and therefore, given the isolated nature of the area, the likelihood of charter fishing and tourism is also anticipated to be low (Woodside, 2004) though restricted to are located within a few kilometres from the coast, and mainly in estuarine waters. Charter boats operating out of Darwin and Broome/Derby may occasionally visit or pass through the JBG.

Tourism accommodation and operations in the Kimberley include Berkeley River Lodge, Faraway Bay Lodge, Honeymoon Bay and Kimberley Coastal Camp. All camps close during October and reopen during March following the wet season.

Swimming tends to be limited to guided excursions to freshwater pools and waterfalls on land, given the presence of saltwater crocodiles and other dangerous fauna in northern WA and NT. Known dive sites in the wider Kimberley region are near Broome, the Lacepede Islands and the Rowley Shoals.

11.6.5 Offshore Energy Exploration and Production

The Bonaparte Basin is an established hydrocarbon province with a number of commercial operations. The closest operation is the Blacktip Gas Field, located in adjacent permit WA-33-L and operated by ENI Australia (Figure 11.106). The Blacktip Gas Field consists of an unmanned wellhead platform, two producing wells, flowlines and a subsea gas export pipeline (GEP) that runs from the platform to shore near Wadeye, NT. The Blacktip GEP is located 10 km northeast of multi-well location. Vessels servicing the Blacktip platform pass through the EMBA (see Section 5.6.7 of Chapter 5).

The Bonaparte Basin contains several oil and natural gas fields, amounting to 18% of Australia's known reserves of natural gas. The basin had produced 11 GL of oil to end-2000 but only 0.11 BCM of gas. Remaining known reserves are 33.42 GL of oil and 668.55 BCM of gas (Geoscience Australia, 2022).

There are numerous petroleum exploration and production permits located within the spill EMBA, operated by companies including ENI Australia, Woodside Energy Limited, Melbana Energy, Neptune Energy Bonaparte Pty Ltd, Santos Ltd, BP Developments Australia Pty Ltd, Chevron Australia Pty Ltd and Kufpec. Petroleum activities include production from platforms, FPSOs, export pipelines and exploration (seismic surveys and drilling), with most concentrated in the southern-most extent of the spill EMBA, as shown in Figure 11.106.

11.6.6 Commercial Shipping

Commercial shipping in the activity area is outlined in Section 5.7.7 of Chapter 5. Shipping traffic in the spill EMBA is relatively low given the large extent of the EMBA, with major shipping lanes concentrated in and out of Darwin Port and the North West Shelf, as illustrated in Figure 11.107.

11.6.7 Submarine Cables

Submarine telecommunication cables provide telephone and internet connections across the world; they are laid on the ocean floor and are often thousands of kilometers in length.

The western-most extent of the EMBA overlaps the Australia- Singapore cable and the Indigo-West cable (Figure 11.108).

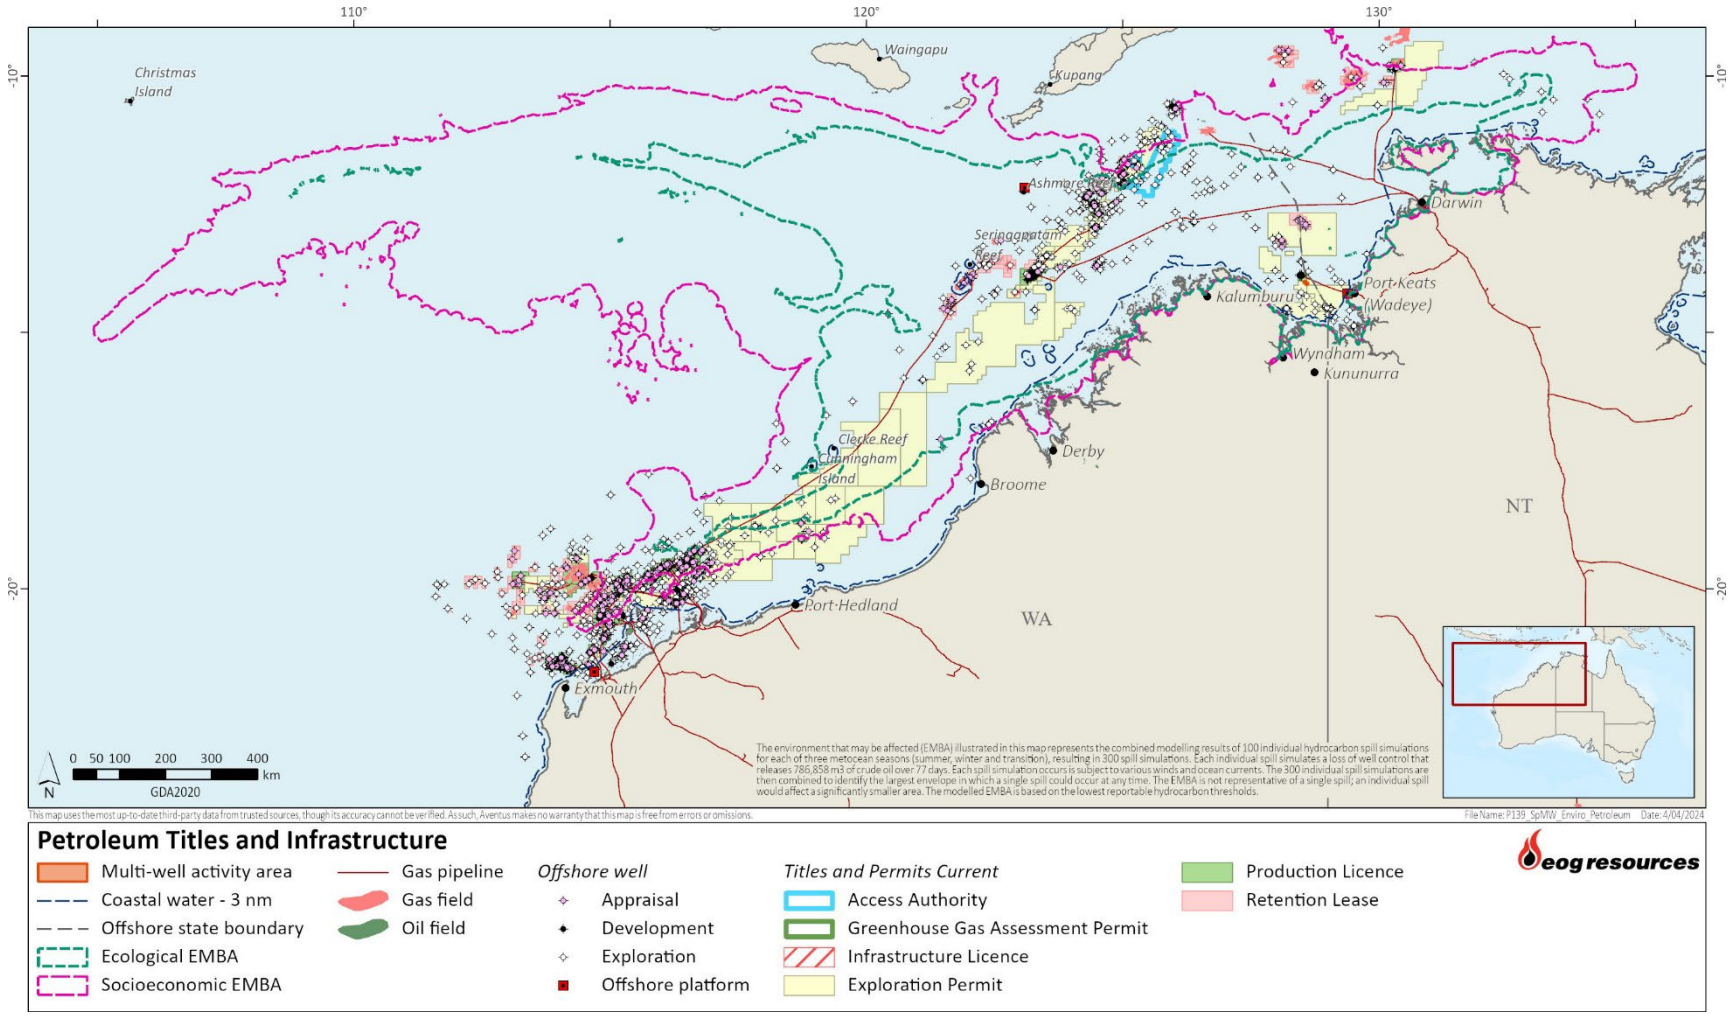

Figure 11.106 Petroleum titles and infrastructure in the spill EMBA

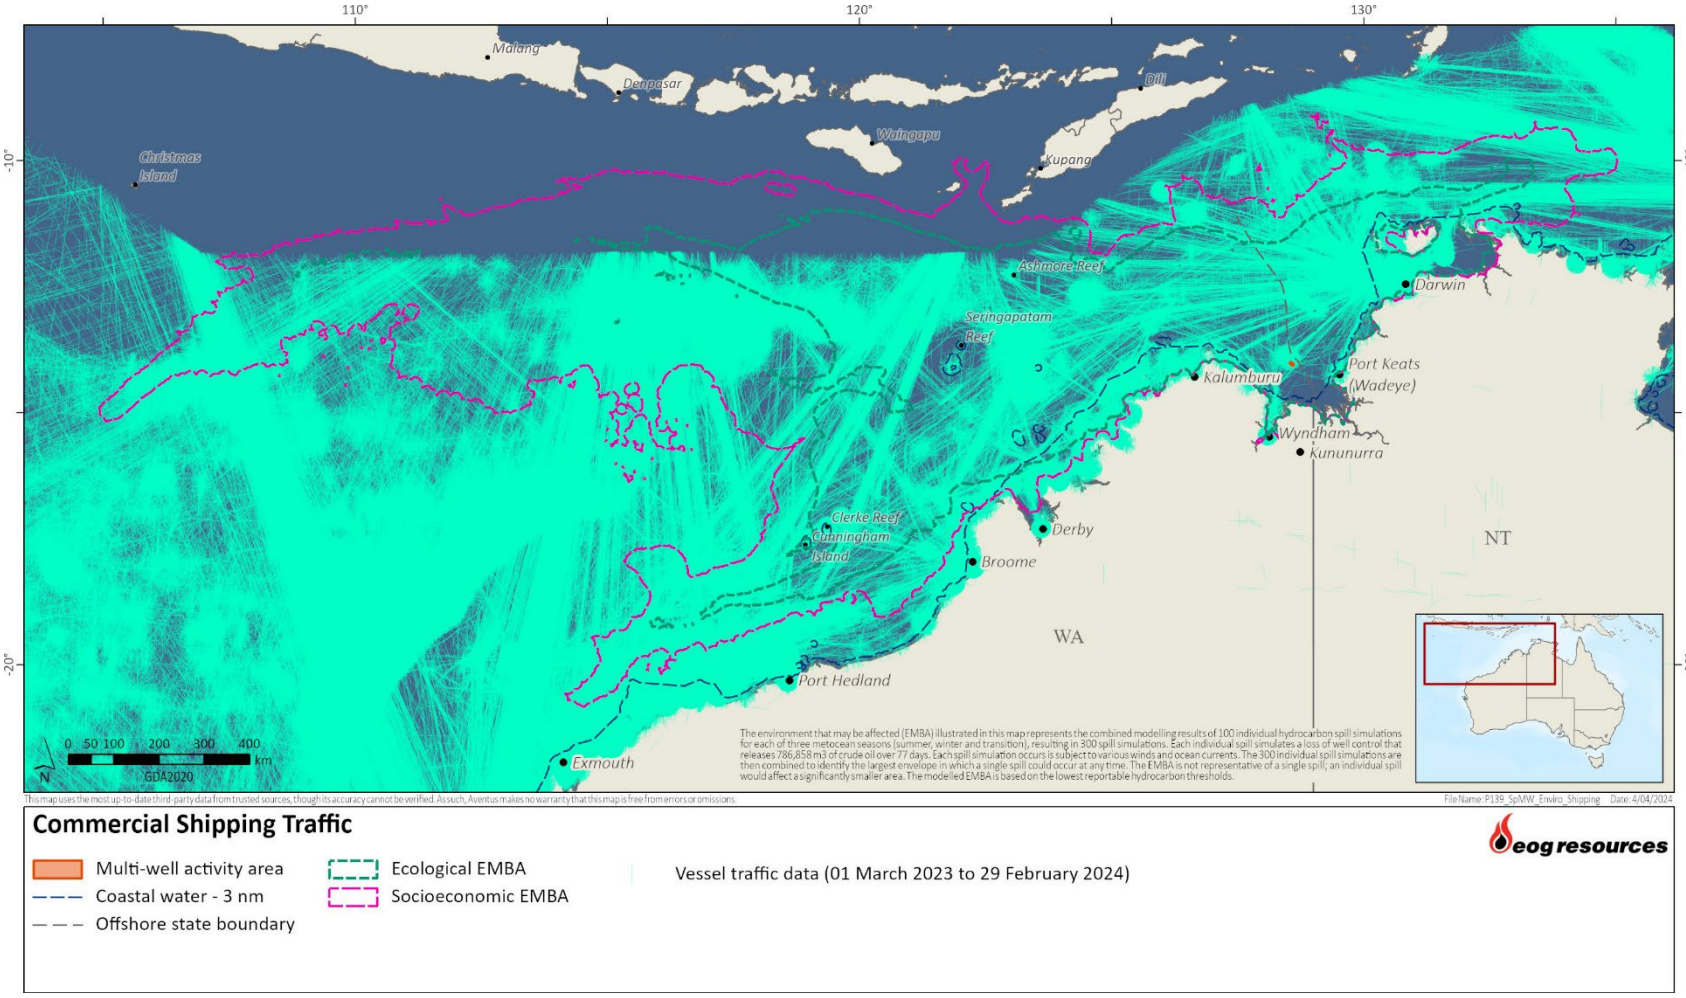

Figure 11.107 Commercial shipping in the spill EMBA

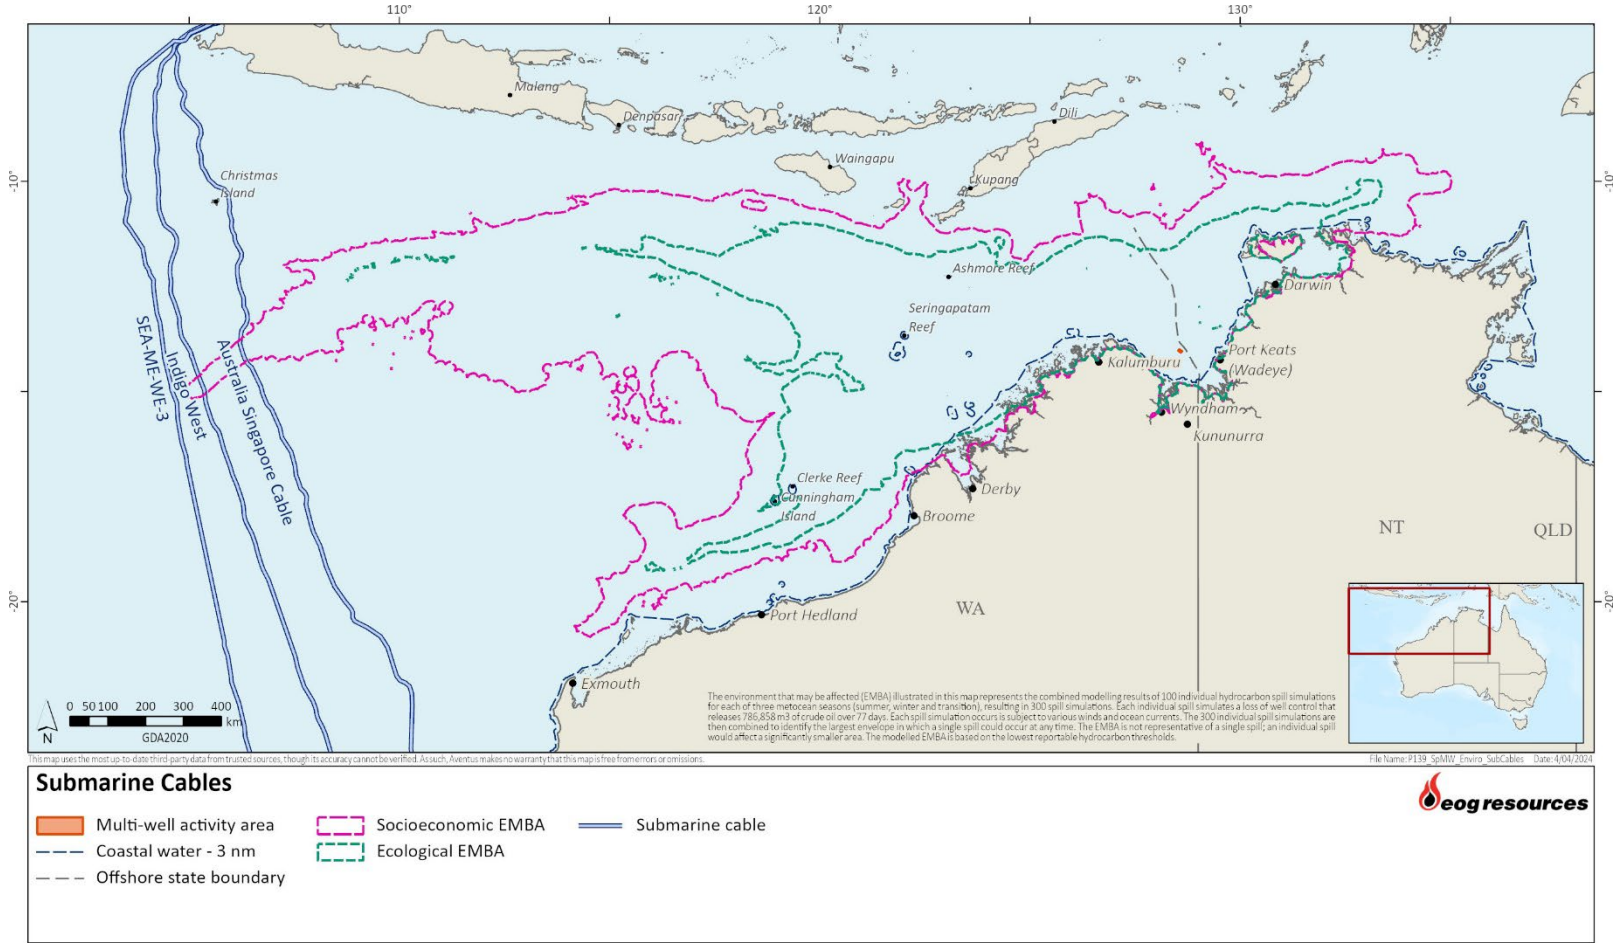

Figure 11.108 Submarine cables in the spill EMBA

11.6.8 Defence Activities

The spill EMBA is overlapped by a defence training area, which is a maritime military zone administered by the Australian Defence Force (Figure 11.109). This is an area where exercises such as operational flying training or live weapon firing may occur. Training areas along the coastline of the spill EMBA include the Yampi Sound Training Area, Bradshaw Field Training Area and Kangaroo Flats Training Area (Figure 11.109).

Australian Border Force and Australian Defence Force vessels undertake civil and maritime surveillance within the region with the primary purpose of monitoring the passage of illegal entry vessels and illegal fishing activity within these areas. The area is a known area for travel between Indonesia and Australia for refugees seeking asylum in Australia.

The spill EMBA overlaps the exercise and training areas that comprise the North Australian Exercise Area (NAXA), a maritime military zone administered by the Australian Defence Force, as well as restricted airspace used for operations including live weapons and missile firings. The NAXA location of the KAKADU training exercise that operates biennially. The exercise involves numerous naval ships from various countries participating in the waters off Darwin and Northern Australia. Exercise KAKADU is Australia's premier international maritime exercise bringing together multiple navy and air forces from the Asian, Pacific and Indian Ocean regions to test integration and war fighting abilities.

During Exercise KAKADU, access may be restricted to all vessels and aircraft. Avoidance of the area during exercises is requested by Defence.

There is also an Air-to-Air Refuelling (AAR) and Airborne Early Warning and Control (AEW&C) airspaces that overlap the activity area and EMBA.

The spill EMBA (but not the activity area) overlaps an area with potential for unexploded ordnance (UXO), illustrated in Figure 11.110.

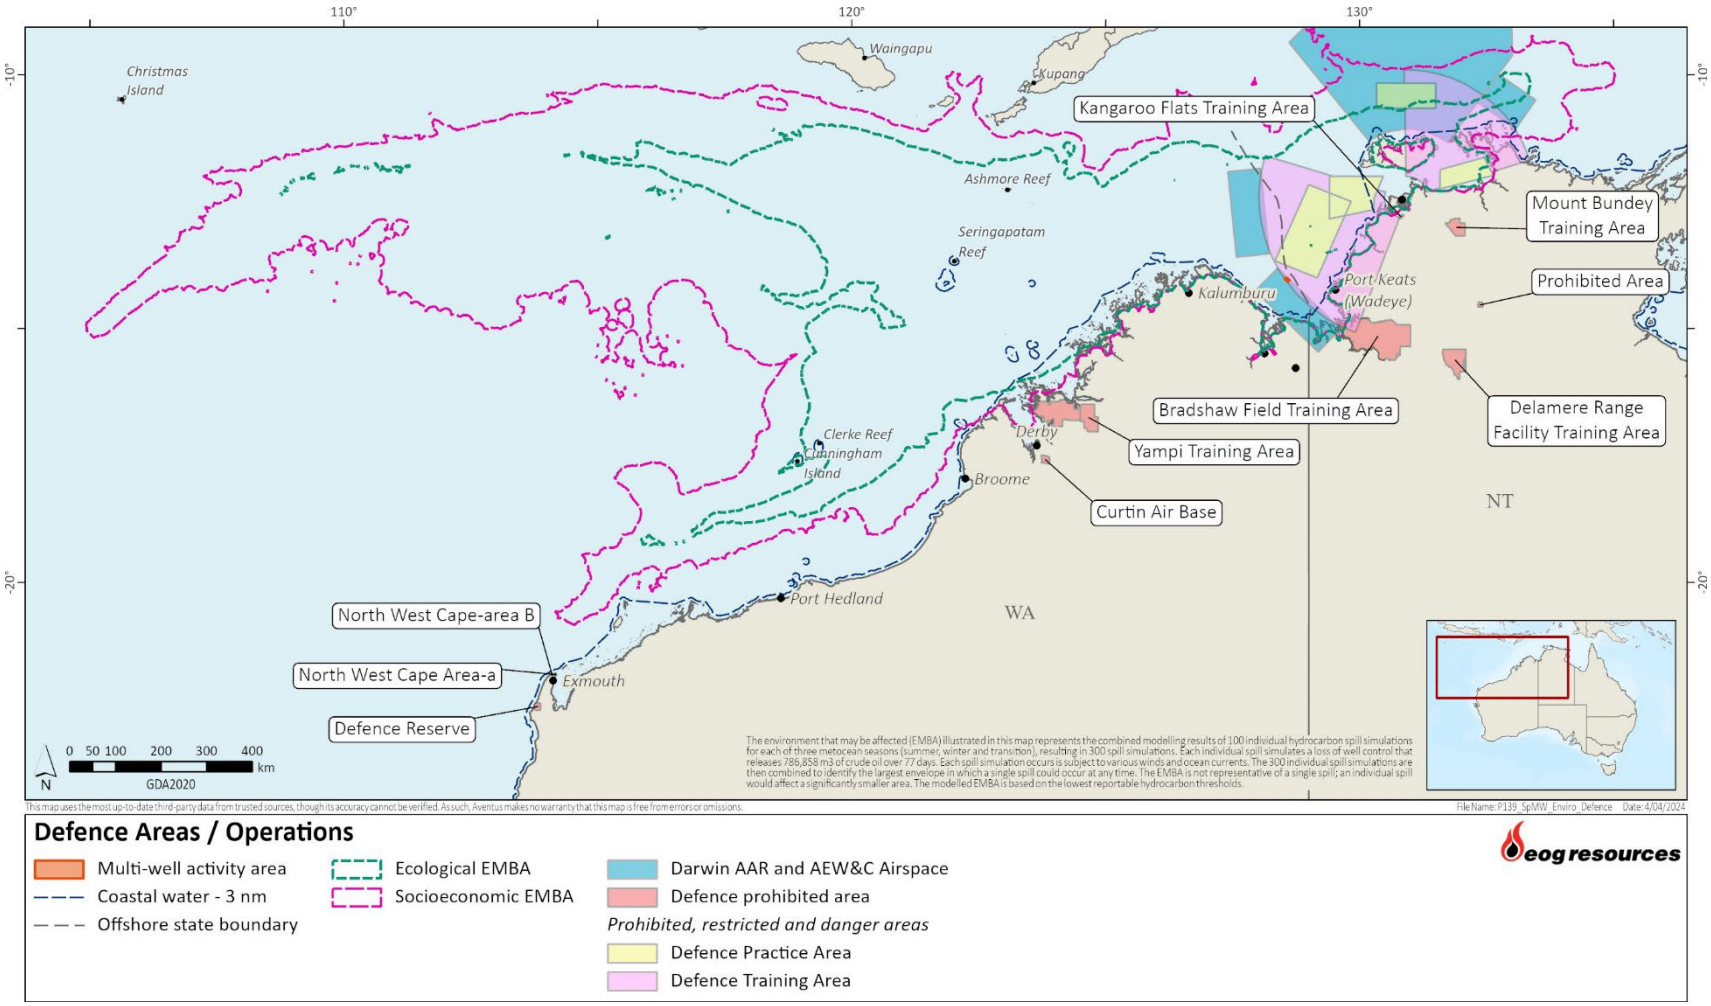

Figure 11.109 Defence exercise and training areas overlapped by the spill EMBA

BEEHIVE Project
Western Australia
First Nations Tangible Underwater Cultural Heritage
Due Diligence Assessment

FINAL

This Due Diligence Assessment (DDA) provides advice on the potential impacts to tangible underwater cultural heritage (UCH) arising from the activities related to an exploration well, BEEHIVE-1, in Bonaparte Gulf, Western Australia.

The purpose of this DDA is to assess tangible heritage risk and advise if a full data review and assessment is required.

This DDA only address tangible Aboriginal underwater cultural heritage expressed as …*traces of human existence* … as defined in the Commonwealth *Underwater Cultural Heritage Act 2018*.[1] In the context of this assessment tangible UCH refers to archaeological sites that have become inundated during sea level rise in the late Pleistocene.

Intangible First Nations UCH is not addressed in this due diligence assessment. Intangible refers to oral histories, songlines, dreaming narratives, and other forms of cultural memories associated with landforms that are now submerged.

Maritime Heritage in the form of shipwrecks has also not been assessed in this DDA.

This DDA has been prepared from the following documentation provided by the client:

- EOG Resources and EGS Group, February 2023; *Beehive-1 Wellsite Clearance Letter for Drilling Hazards Assessment*. Report Number: RT-PRO-108-2021035 Revision 2.0
- Fugro, December 2022; *Geophysical Site Investigation – Beehive Pre-Drill Survey. Bonaparte Basin: Volume 2 – Interpretation (Survey Results) Report*. 206084-1-052-REP-006 1. Includes Appendices C and D as well as Charts and Drawings.
- EOG Resources and EGS Group, November 2021; *Beehive Regional Shallow Hazards Assessment*.

[1] Underwater Cultural Heritage Act 2018 Part 1, Division 2, Section 15

Location of proposed seabed works

EOG Resources is proposing to undertake drill exploration of BEEHIVE-1 in 2024. The proposed wellsite location is at:

WELL BEEHIVE-1	GDA2020		WGS84 UTM 52 South	
	Longitude	***Latitude***	***Easting***	***Northing***
	128°34'18.51"E	14°03'23.74"S	453770.24	8445972.64

It is understood that this location is located 250 m southeast of that shown in Figure 3.

It is understood that 2 other locations, WHP -1 and WHP-2, within the BEEHIVE-1 site boundary are nominal locations for future work.

Proposed seabed disturbance

The planned operation is to spud an exploration well from the three-legged jack up rig Valaris–107. The spuds can penetrate up to 10 m into a sandy/silty seabed. The planned drill hole has a diameter of 36".

BEEHIVE-1 surrounding area

The BEEHIVE-1 well is located within Joseph Bonaparte Gulf in water depths of 45.6 m below sea level, and ~80 km from the present coastline. The Joseph Bonaparte Gulf (including the Cambridge Gulf) is a large embayment, approximately 300 km east-west and 120 km north-south with regional Northwest Shelf located to the northeast. Several large rivers including the Durack, Pentecost, and Ord rivers drain into Cambridge Gulf, while the Victoria and Fitzmaurice rivers drain into the Joseph Bonaparte Gulf. Sediments within the Gulf are terrigenous inshore and grading to carbonates offshore.

Local sea level curve

A locally derived sea level curve spanning the last 80,000 years shows the relative and changing position of BEEHIVE -1 wellsite to the ancient shorelines. Around the time of first Human arrival around 65,000 years ago sea level was approximately 80 m lower than present and BEEHIVE -1 wellsite located around 85 km inland of the ancient coastline. BEEHIVE -1 wellsite became a coastal environment for a period between 60,000 and 50,000 yeas BP and gradually becoming situated further inland as sea level continued to fall until the peak of the last glacial maximum (LGM) around 18,000 years BP. At this time the BEEHIVE -1 wellsite was situated 450 km from open marine coastal environments, however it was proximal to (approx. 100 km) a large lacustrine system that likely formed within the Bonaparte basin fed by river systems that drained the hinterland catchments. The termination of the LGM saw rapid sea level rise with the BEEHIVE-1 site becoming inundated at around 13,500 years BP.

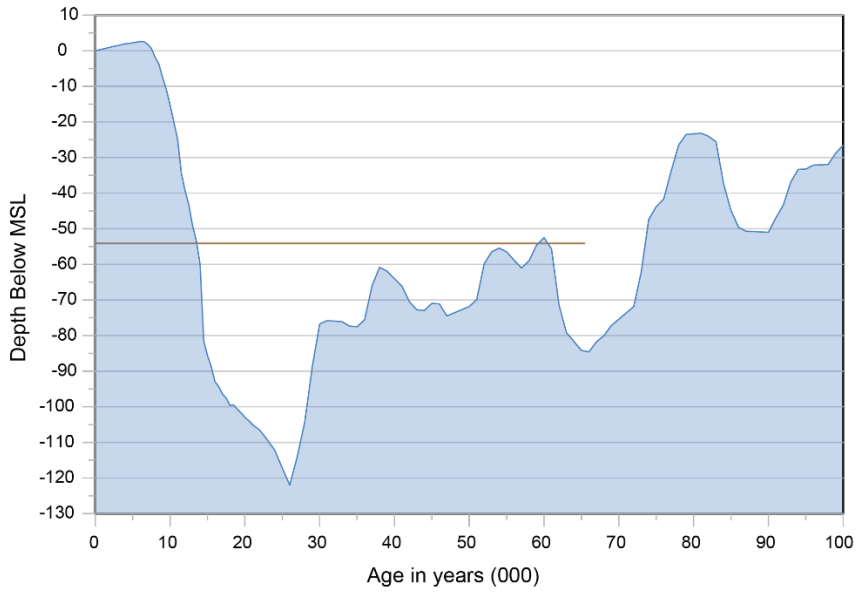

Figure 1: Sea level curve with the brown line showing the elevation of the antecedent Pleistocene land surface at BEEHIVE-1 well site compared to the palaeosea level record, the length of the line representing the duration of occupation.

Regional landscape reconstructions

Despite terrigenous sedimentation along the inner gulf during the mid to late Holocene, regional scale bathymetry still provides some evidence of the preinundaiton landscapes and associated palaeoenvironments. The inner margin of the Joseph Bonaparte Gulf is characterised by a relatively flat and seaward sloping terrain. Remnant palaeochannels can be seen incising the shelf, the most prominent being the palaeoVictoria river system which passes about 30 km to the east of BEEHIVE-1. Smaller palaeochannels are intermittently exposed at the seabed likely representing the palaeoKeep/Sandy river systems which appear to flow in the direction of the BEEHIVE-1 well site. Palaeodrainage channels appear to become less prominent at sea floor depths > 40 m, the likely result of channels becoming less entrenched and/or becoming buried by marine sediments.

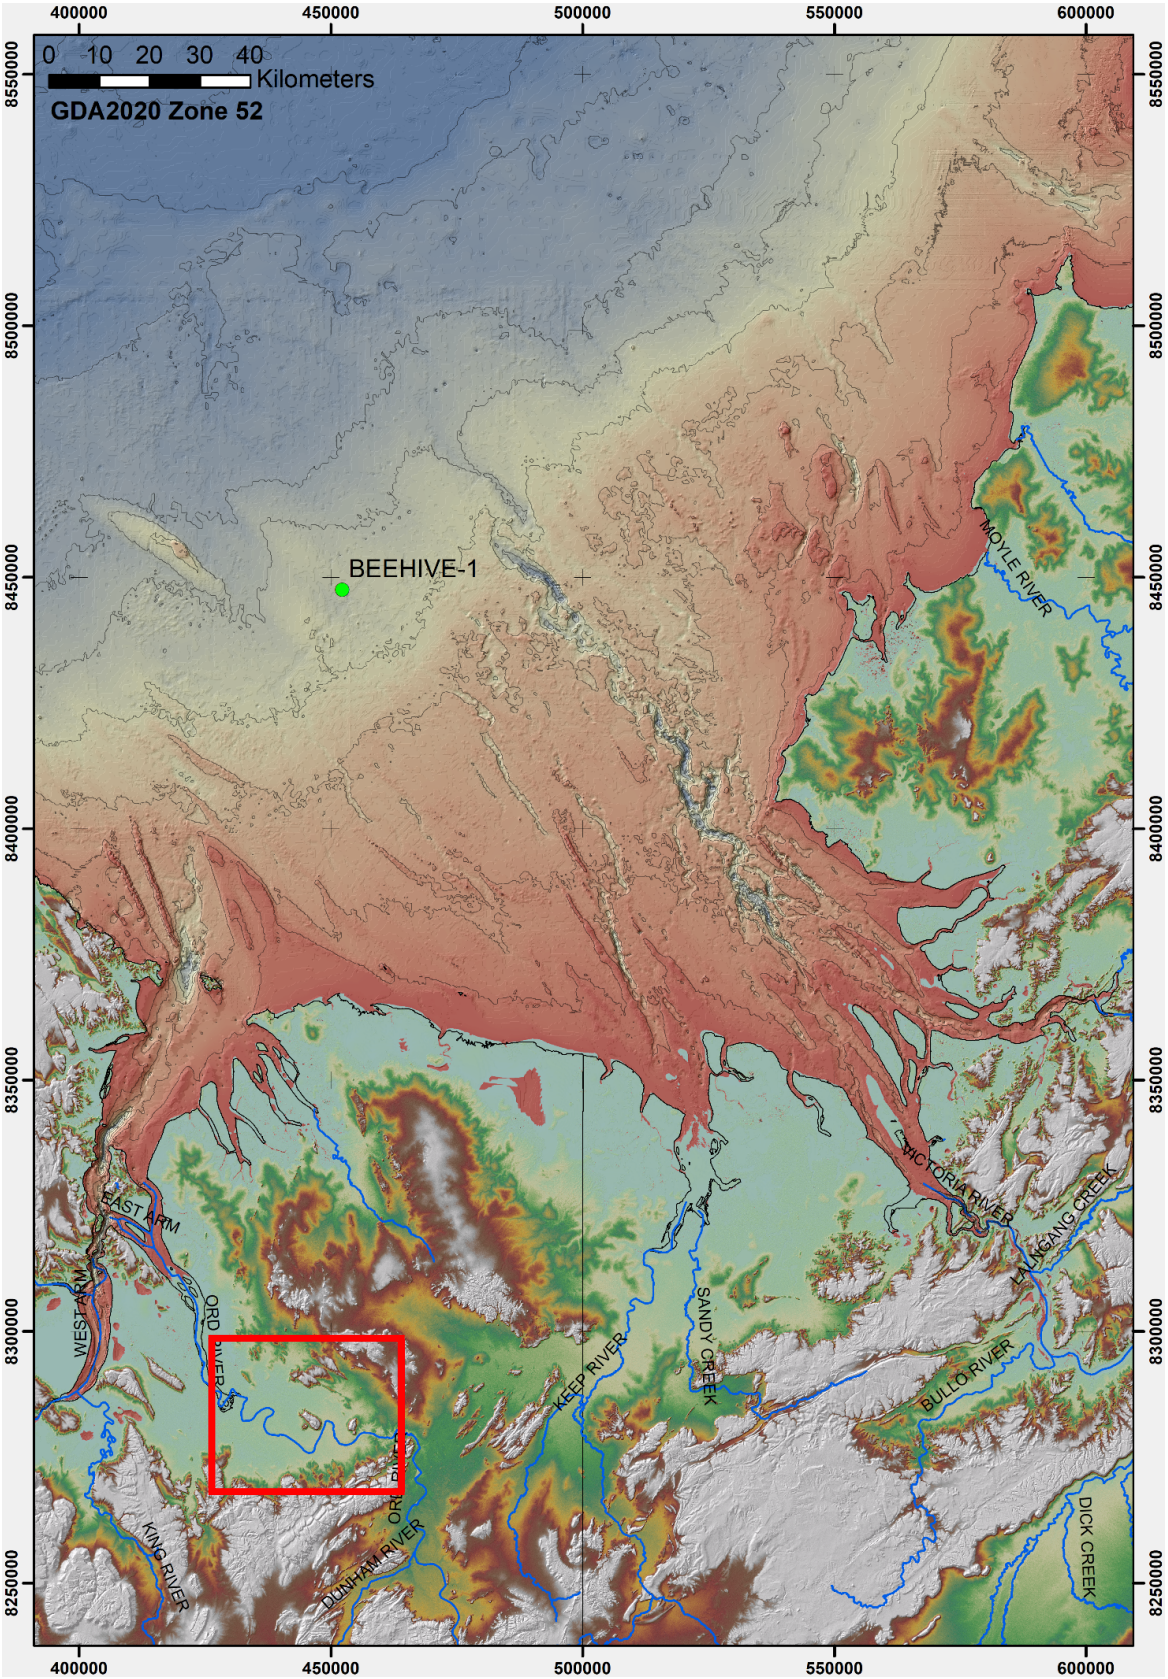

Figure 2: Terrestrial and submerged landscapes of the Joseph Bonaparte Gulf. Depth contours representing 10 m intervals. Red box shows location of figure 5.

Local Geomorphology

The antecedent Pleistocene landscapes around the BEEHIVE-1 well site have been buried by Recent marine sedimentation. A large low relief sand body is situated to the immediate north and east of BEEHIVE-1 at a depth of -44 to -45 m below mean sea level (bmsl) with what appears to be sand wave forming to the west. An interpretation of the subbottom survey data suggest the swales between sand waves may represent outcropping preinundation land surface at the seabed (at depths of -48 to -49 m bms) though no distinctive landforms are evident.

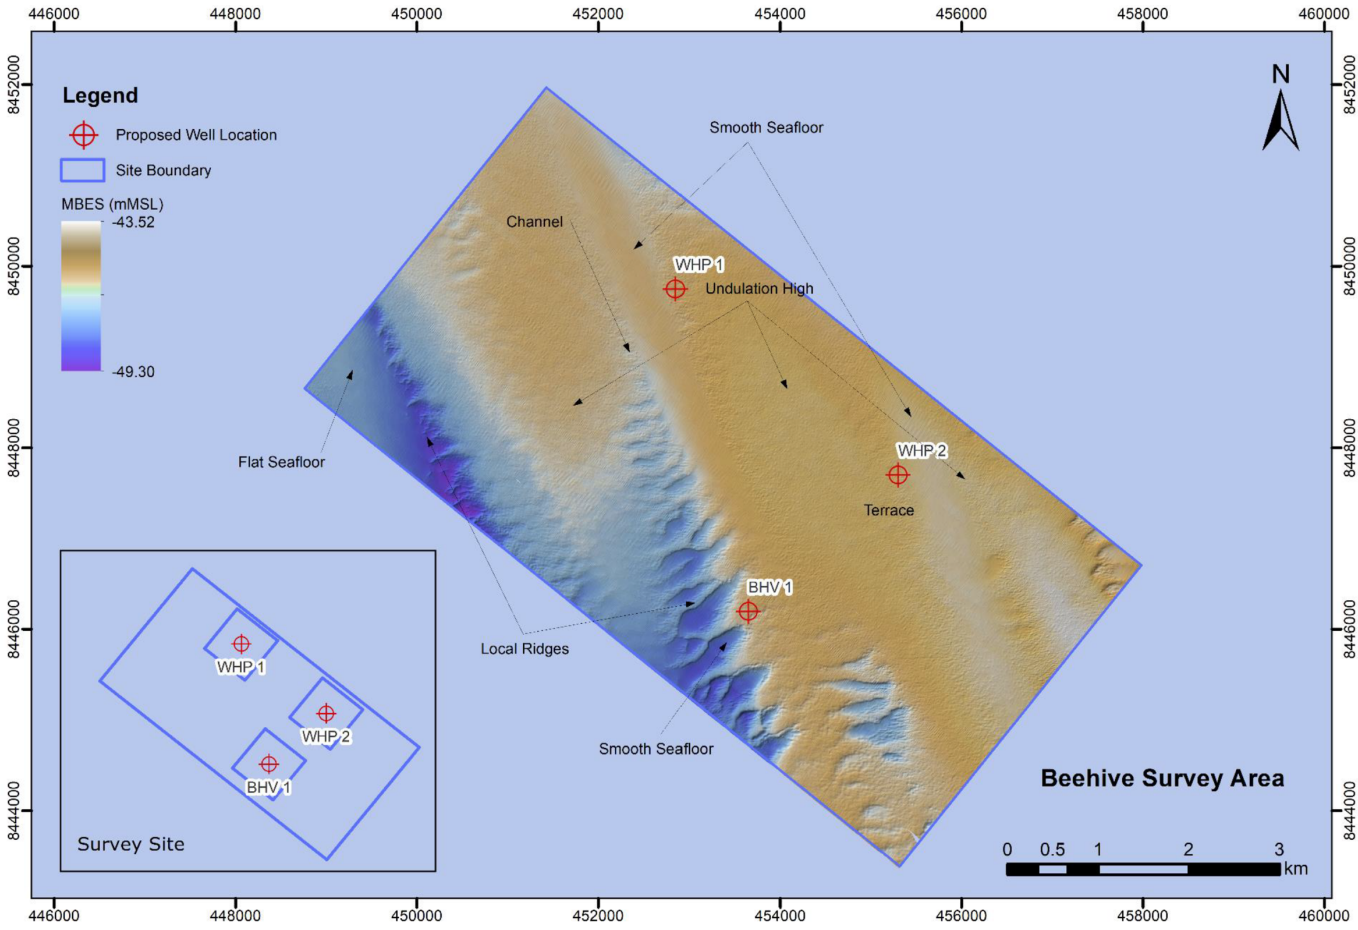

Figure 3 Bathymetric Image of the Beehive General Survey Area [Image from 206084-1-052-REP-006 1 | Volume 2 – Interpretation (Survey Results) Report Page 34 of 99]. Note the proposed location of the exploration well is 250 m SE of that depicted in the figure.

Local palaeolandscapes and environments

An isopach map showing the thickness of overlying Recent marine sediments (up to 5 m around the BEEHIVE -1 well site) to seismic reflector R1 (understood to represent the antecedent Pleistocene land surface), explains the lack of expression of submerged terrestrial landforms at the sea floor. Furthermore, the fact that there are no prominent positive relief features present within the study area suggests that the palaeolandscape was subdued and likely dominated by negative relief features. This interpretation is supported by analysis of shallow seismic datasets which has revealed an extensive network of palaeochannels which have incised the Pleistocene land surface.

This evidence of palaeochannels along with (1) a very low topographic relief and shallow seaward slope of the underlying Pleistocene land surface, (2) the vast inland catchments and large palaeodrainage system evident along the inner shelf, suggest this region was situated within a large regional scale floodplain characterised by a fluvial meander belt (the zone within which a meandering stream periodically shifts its channel and typically ranges from 15 to 18 times the width of the channel) complex, with channels, scroll bars, cut banks, oxbow lakes, and terraces at the local level. These types of sedimentary environments are highly dynamic on geomorphic timescales with meanders typically migrating downstream.

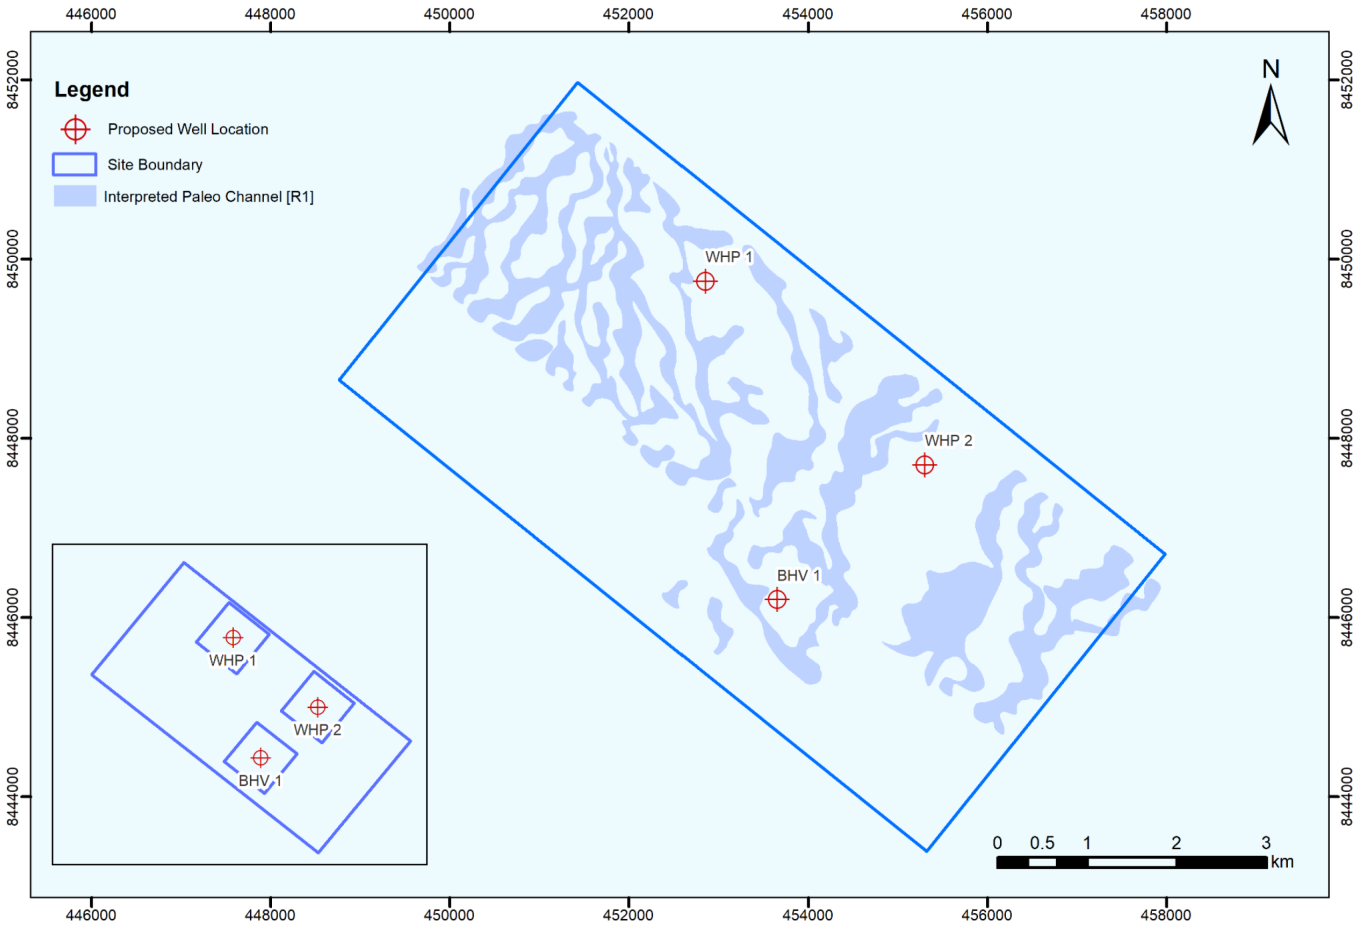

Figure 4: Interpreted Paleo Channel margins representing the reflector 1 boundary [From 206084-1-052-REP-006 1 | Volume 2 – Interpretation (Survey Results) Report Page 63 of 99.

Terrestrial Analogue of the BEEHIVE-1 Meander System

A terrestrial landform analogue to the interpreted BEEHIVE -1 meander belt complex can be found in the lower reaches of the Ord River system, which is located approximately 170 km south of the BEEHIVE-1 well site. A 5 m Lidar product shows the location of the main river channel which drains through the lower Ord River catchment and onto the flat coastal plain. As the land surface slope decreases the river begins to meander with evidence of an active meander bends with advancing scroll bars and eroding cut banks. There is also evidence of older abandoned channels forming oxbow lakes. The down channel migration of fluvial meanders means that most of the river terraces/flood plains within the meaner belt will eventually erode at the cut bank and become redeposited along the downstream scroll bar, resulting in a relatively young land surface. As a result of this particular geomorphic system,

archaeological material situated within a meaner belt should equally be relatively young. The Department of Planning, Land and Heritage (DPLH) archaeological site database identified a total of 8 archaeological sites along a 20 km section of the Ord River meander belt. All sites are registered as artifact scatters and would be considered to have a very low site density.

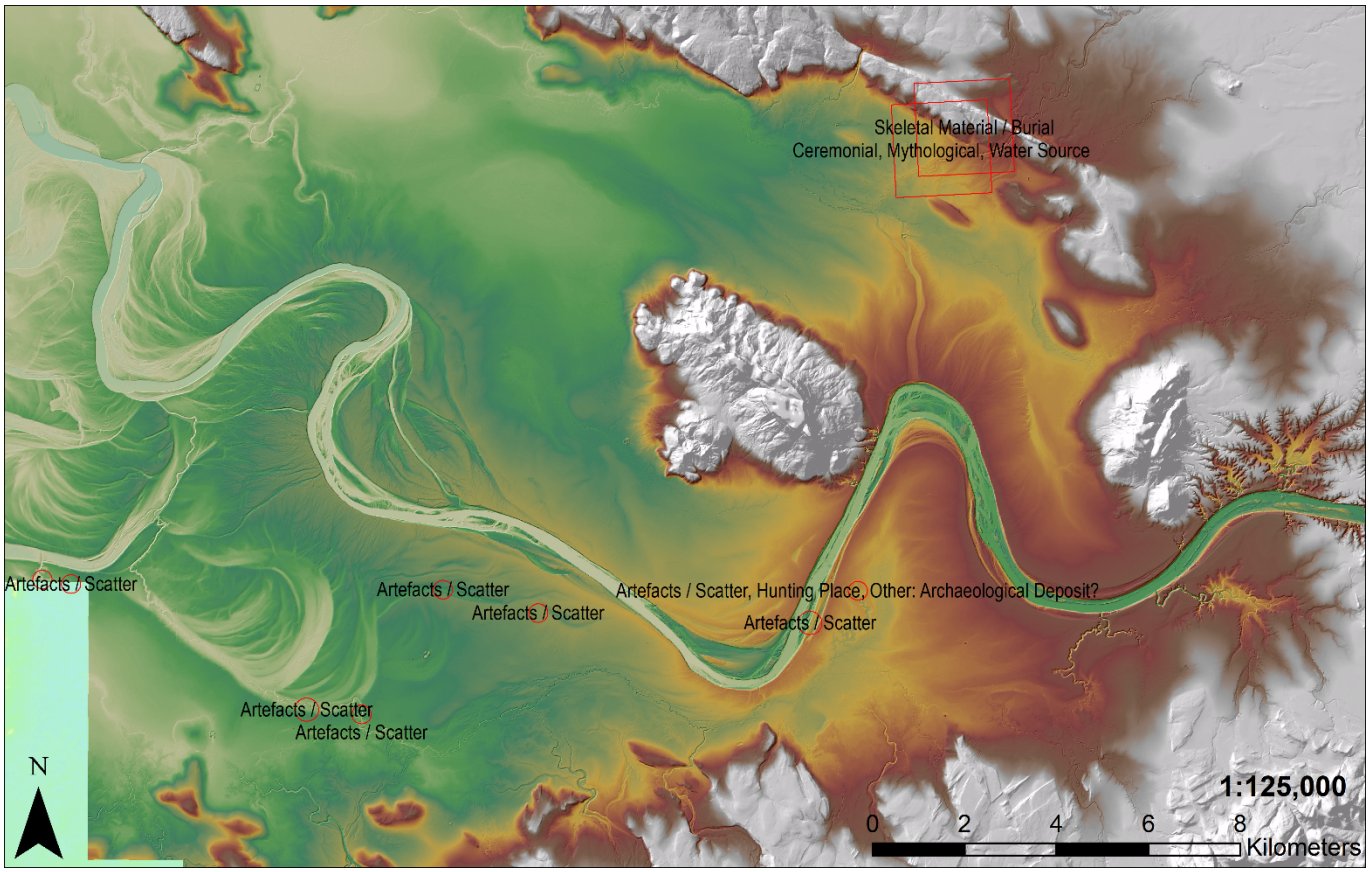

Figure 5: DEM showing the lower reaches of the Ord River system before draining into East Arm of the Cambridge Gulf.

Potential of archaeological sites at the Beehive -1 well site

Given that the BEEHIVE-1 well site is located within an interpreted meander belt, which has likely been an active fluvial system across the period of occupation, would suggest that the natural down-stream migration of these meanders would have resulted in multiple phases of erosion and deposition (recycling) of the fluvial flood plain. This would mean that archaeological material periodically deposited within a meander belt system would eventually erode and transported downstream, or on the case of larger lithics simply deposited at the foot of the cut bank and buried by the advancing scroll bar. This type of fluvial process might explain the very low density of archaeological sites within the lower reaches of the Ord River and if used as an analogue for the BEEHIVE-1 meander belt, it would equally suggest a very low density of archaeological sites having formed around the BEEHIVE-1 development area.

Due to the exposed nature of the BEEHIVE-1 wellsite, during the process of inundation wave and tidal energy may have further mobilised the lithic artefacts that comprised the more 'recent' sites either dispersing or concentrating them depending on their exposure, rate of burial and micro-geomorphological context. As such it is possible that some sites may have undergone relatively low levels of disturbance as has been demonstrated at the Dampier

Archipelago (Murujuga) thereby retaining a relatively high level of archaeological integrity.[2] However, for the majority of exposed sites composed of artefact scatters it can be expected that they have been dispersed or dissipated and for the most part from have moved from an archaeological context towards a geomorphological/sedimentological context. This would reduce but not eliminate the archaeological/scientific values associated with these artefacts. Note that the inherent cultural heritage values of the artefacts themselves as may be identified and expressed by the relevant First Nations stakeholder would not be diminished.

Potential impact

The three spuds and the drill hole will penetrate the recent Holocene sediments and impact the former Late Pleistocene surfaces. Each point of contact will impact an area of between 0.5 to 1 m^2. There is a remote likelihood that the spuds or drill will intersect a lithic artefact. Only the drill would destroy such an artefact while the spuds will dislocate it or modify it. Even with the remote likelihood that an artefact may be impacted such an impact will not appreciably alter the existing archaeological integrity of any site present and as such will not affect its archaeological/scientific cultural heritage values.

Potential mitigation

The relocation of the drilling site within the site boundary as shown in Figures 3 and 4 will not alter the risk of impact.

Any form of retrieval of seabed material from the potential impact areas for the purposes of recovering artefacts will likely cause the same or greater disturbance than the proposed works.

It is believed that any further remote sensing or geotechnical investigation will not alter the assessment of the identified landform and archaeological potential presented in this report.

Compliance with the *Underwater Cultural Heritage Act 2018*.

Ship and aircraft wrecks over 75 years old are automatically protected in Commonwealth waters. All other forms of underwater cultural heritage including First Nations submerged terrestrial sites can be protected by the Minister however they have to have been found before they can be declared protected.

Though it has been assessed that there is a remote likelihood that the undertaking of the proposed works would lead to the discovery of any form of underwater cultural heritage it is noted that under Section 40 of the Act a person who finds … *an article of underwater cultural heritage*… which … *appears to be of an archaeological character*… is legally obligated to report the find to the Minister.

Compliance with Relevant Guidelines

On 31st March the Department of Climate Change, Energy the Environment and Water issued draft *Guidelines for working in the near and offshore environment to protect Underwater Cultural Heritage*. This document is currently exposed for public comment.[3]

---

[2] **Benjamin, J., O'Leary, M., McDonald, J., Wiseman, C., McCarthy, J., Beckett, E., Morrison, P., Stankiewicz, F., Leach, J., Hacker, J. and Baggaley, P., 2020**. Aboriginal artefacts on the continental shelf reveal ancient drowned cultural landscapes in northwest Australia. *PloS one*, *15*(7), p.e0233912.
[3] **DCCEEW, March 2023,** Draft guidelines to protect underwater cultural heritage https://consult.dcceew.gov.au/draft-guidelines-to-protect-uc-heritage

The purpose of the document is to provide guidance to proponents proposing to undertake activities in Australian waters.

The Guidelines propose a range of cultural heritage assessment and mitigation actions in response to seabed development. The commencement of this process is the undertaking of a UCH desktop assessment.[4] The draft Guidelines state the UCH desktop assessment :

> ***…*** *outlines the initial assessment of known protected UCH and potential unlocated UCH within the project area and proposes a forward work program for the detailed assessment of UCH in the project area and potential impacts as a result of the proposed work. A forward work program may not be necessary if a negligible risk of impact to UCH is assessed. A UCH desktop assessment should always be prepared by a qualified maritime archaeologist should appropriate experience.*

Elsewhere in the draft Guidelines this is referred to as a 'due diligence desktop assessment'.[5]

This document complies with the above described desktop assessment process and furthermore includes the review of remote sensing data and has assessed the risk of impact to be remote which is comparable to 'negligible'.

Note that the draft Guidelines are more focused on maritime heritage, such as shipwrecks, than First Nations UCH. The Commonwealth is currently preparing Technical guidance notes specific to the investigation and assessment of First Nations UCH.

Conclusion

The proposed works as presented in this short letter report will have a remote likelihood of impacting First Nations tangible UCH. The level of analysis undertaken in this short letter report is sufficient to make the aforementioned statement with confidence. A more detailed UCH impact assessment is not required.

It is advised that an Unexpected Finds Protocol be prepared and implemented in the event that that seabed material is bought aboard the jack up barge during the works.

TERMS AND ABBREVIATIONS

°	Degrees
‘	Minutes
“	Seconds
µm	Micrometre (unit of length; 1 µm = 0.001 mm)
Actionable oil	Oil which is thick enough for the effective use of mitigation strategies
AIS	Automatic identification system
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ASTM	American Society for Testing and Materials
Aventus	Aventus Consulting Pty Ltd
bbl	Barrel (unit of volume; 1 bbl = 0.159 m3)
bbl/d	Barrels per day
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
°C	degree Celsius (unit of temperature)
CFSR	Climate Forecast System Reanalysis
cm	Centimetre (unit of length)
cP	Centipoise (unit of dynamic viscosity)
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
EOG	EOG Resources, Inc.
EP	Environment Plan
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors

g/m2	Grams per square meter (unit of surface area density)
GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IBRA	Interim Biogeographic Regionalisation for Australia
IMCRA	Integrated Marine and Coastal Regionalisation of Australia
IOA	Index of Agreement
ITOPF	International Tanker Owners Pollution Federation Limited
KEF	Key Ecological Feature
km	Kilometre (unit of length)
km^2	Square Kilometres (unit of area)
Knots	unit of speed (1 knot = 0.514 m/s)
LOWC	Loss of well control
m	Meter (unit of length)
m3	Cubic meter (unit of volume)
m/s	Meter per Second (unit of speed)
MAE	Mean Absolute Error
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park
MP	Marine Park

NP	National Park
NR	Nature Reserve
O	Observed variable
Oi	Observed surface elevation
OPEP	Oil Pollution Emergency Plan
P	Model-predicted variable
Pi	Model predicted surface elevation
PAH	Polynuclear Aromatic Hydrocarbons
PDSA	Pre-drilling seabed assessment

Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
ppb	Parts per billion (concentration)
psu	Practical salinity nits
RSB	Reefs, Shoals and Banks
scf	Standard cubic feet (defined as one cubic foot of gas at 15.56 °C and at normal sea level air pressure)
Shoreline contact	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
Single Oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
SRTM	Shuttle Radar Topography Mission
Stochastic oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the environment that maybe affected (EMBA) and indicates which locations are more likely to be affected (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be affected in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment
TOPEX/Poseidon	A joint satellite mission between NASA and CNES to map ocean surface topography using an array of satellites equipped with detailed altimeters
USA	United States of America
US CG	United States Coast Guard
US EPA	United States Environmental Protection Agency
World Ocean Atlas	A collection of objectively analysed, quality controlled physicochemical parameters (e.g. temperature, salinity, oxygen, phosphate, silicate, and nitrate) based on profile data from the World Ocean Database (NCEI, 2021) established by NOAA’s National Centers for Environmental Information (NCEI)
WGS 1984	World Geodetic System 1984 (WGS84); reference coordinate system
Xmodel	Model predicted surface elevation

Xobs	Observed surface elevation

EXECUTIVE SUMMARY

Background

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to undertake the Beehive-1 drilling campaign within permit area WA-488-P located in the Bonaparte Basin in the Joseph Bonaparte Gulf, Western Australia.

Aventus Consulting Pty Ltd (Aventus) has been contracted by EOG to prepare the Environment Plan (EP) and Oil Pollution Emergency Plan (OPEP) for the planned activity.

To inform the potential environmental impact and risk assessments for the proposed drilling campaign, Aventus commissioned RPS to undertake a detailed crude oil spill modelling study assessing the following hypothetical scenario:

- **Scenario**: A 786,858 m^3 (or 4,949,338 bbl) surface release of crude oil over 77 days to represent a loss of well control (LOWC).

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area that may be affected in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbon may influence.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a ten-year CFSR wind and HYCOM current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 spill simulations initiated at random start times, using the same release information (spill volume, duration and composition of the oil). This ensured that each simulation was subject to different wind and current conditions and, in turn, movement and weathering of the oil for an annual based assessment.

The SIMAP system, the methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-13 "Standard Practice for Development and Use of Oil Spill Models".

Oil Properties

An analogue crude oil was used to represent the LOWC scenario. The analogue crude oil was carefully selected based on EOG recommendations to represent the crude oil likely to be found within permit area WA-488-P. The crude oil has an API of 42.3 and a density of 813.9 kg/m^3 (at 15ºC) with a viscosity value (3.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The crude is a mixture of volatile (79%) and persistent hydrocarbons (21%). In favourable evaporation conditions, about 24.2% of the oil mass should evaporate within the first 12 hours (BP < 180 °C); a further 20.8% should evaporate within the first 24 hours (180°C < BP < 160°C); and a further 33.9% should evaporate over several days (160°C < BP < 380°C). Approximately 21.0% of the oil is shown to be persistent.

Results

Scenario: LOWC – 786,858 m^3 Surface release of Crude Oil over 77 Days

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure levels was 1,517 km (winter), 153 km (summer) and 61 km (winter) respectively.

- Of all the receptors considered in the assessment, the Joseph Bonaparte Gulf AMP was the only receptor predicted to be exposed to floating oil above the low, moderate and high thresholds during all seasonal conditions.

- The probability of accumulation to any shoreline at, or above, the low threshold (10-100 g/m^2) was 100% for all seasons and the minimum time before shoreline accumulation at, or above, the low threshold ranged between 10.29 days (transitional) to 11.58 days (summer).

- The maximum volume ashore for a single spill trajectory ranged between 406.9 m^3 (winter) and 704.67 m^3 (summer) and maximum length of shoreline contacted at the low threshold was 201 km for winter and 224 km for summer and transitional. The predicted shoreline length above the high (≥1,000 g/m^2) shoreline threshold decreased to a maximum of 16 km, 9 km and 8 km during summer, winter and transitional months respectively.

- In the surface (0-10 m) depth layer, low, moderate and high exposure to dissolved hydrocarbons was recorded for a range of receptors. The highest dissolved hydrocarbon concentrations were predicted for the Joseph Bonaparte Gulf AMP and the carbonate bank and terrace system of the Sahul Shelf KEF, followed by the North Kimberley MP and Kimberley AMP during all seasonal conditions. In addition, the nearshore waters of the Thamarrurr, Wyndham-East Kimberley, Dorcherty Island, Clump Island Quoin Island, Daly, Victoria Daly shorelines and Ord River floodplain (Ramsar) were some of the receptors with the highest entrained hydrocarbons concentrations for all seasonal conditions.

- In the surface (0-10 m) depth layer, low, moderate and high exposure to dissolved hydrocarbons was recorded for a range of receptors. The highest dissolved hydrocarbon concentrations were predicted for the Joseph Bonaparte Gulf AMP and the carbonate bank and terrace system of the Sahul Shelf KEF, followed by the North Kimberley MP and Kimberley AMP during all seasonal conditions. In addition, the nearshore waters of the Thamarrurr, Wyndham-East Kimberley, Dorcherty Island, Clump Island Quoin Island, Daly, Victoria Daly shorelines and Ord River floodplain (Ramsar) were some of the receptors with the highest entrained hydrocarbons concentrations for all seasonal conditions.

1 INTRODUCTION

1.1 Background

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to undertake a drilling campaign within permit area WA-488-P located in the Bonaparte Basin in the Joseph Bonaparte Gulf, Western Australia.

Aventus Consulting Pty Ltd (Aventus) has been contracted by EOG to prepare the Environment Plan (EP) and Oil Pollution Emergency Plan (OPEP) for the planned activity.

To inform the potential environmental impact and risk assessments for the proposed drilling campaign, Aventus commissioned RPS to undertake a detailed oil spill modelling study assessing the following hypothetical scenario:

- **Scenario**: A 786,858 m3 (or 4,949,338bbl) surface release of crude oil over 77 days to represent a loss of well control (LOWC).

Table 1.1 presents the Beehive-1 exploration well location used for Scenario 1. Figure 1.1 illustrates the exploration well location.

The potential risk of exposure to the surrounding waters and contact to shorelines was assessed for three distinct seasons defined by prevailing wind conditions.

i. summer (October to February),

ii. the transitional periods (March and September), and

iii. winter (April to August).

This approach assists with identifying the environmental values and sensitivities that would be at risk of exposure on a seasonal basis, given the dominant winds and water currents vary significantly among the seasons.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area that may be affected in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbon may influence.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein uses modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

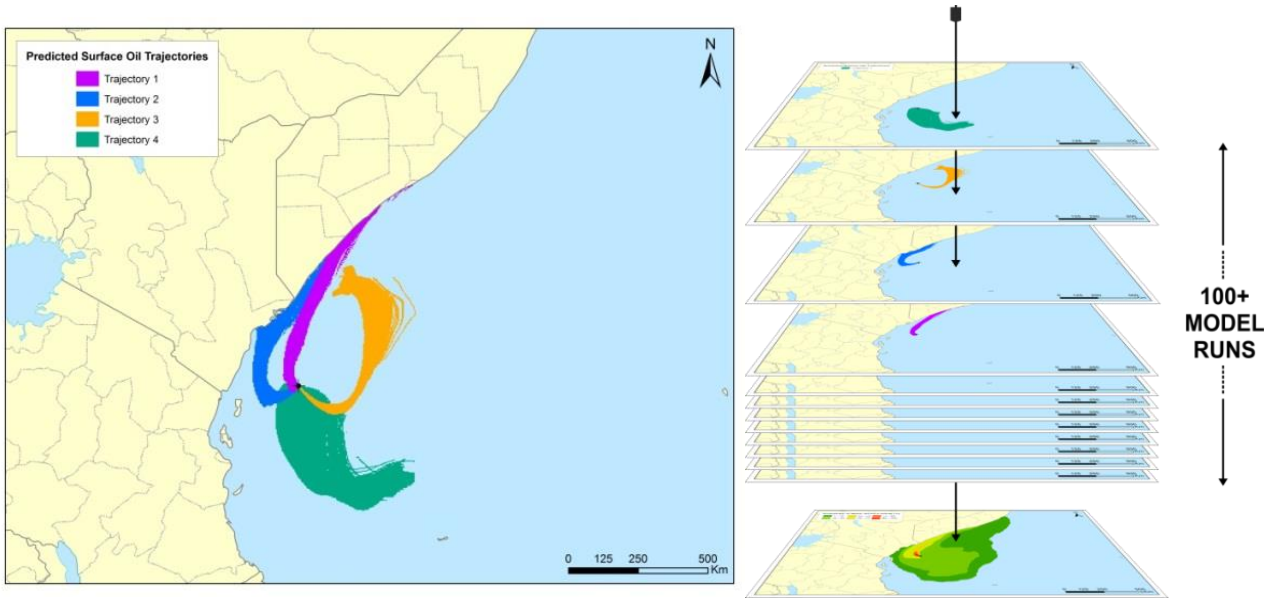

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore and longest length of shoreline contacted by oil.

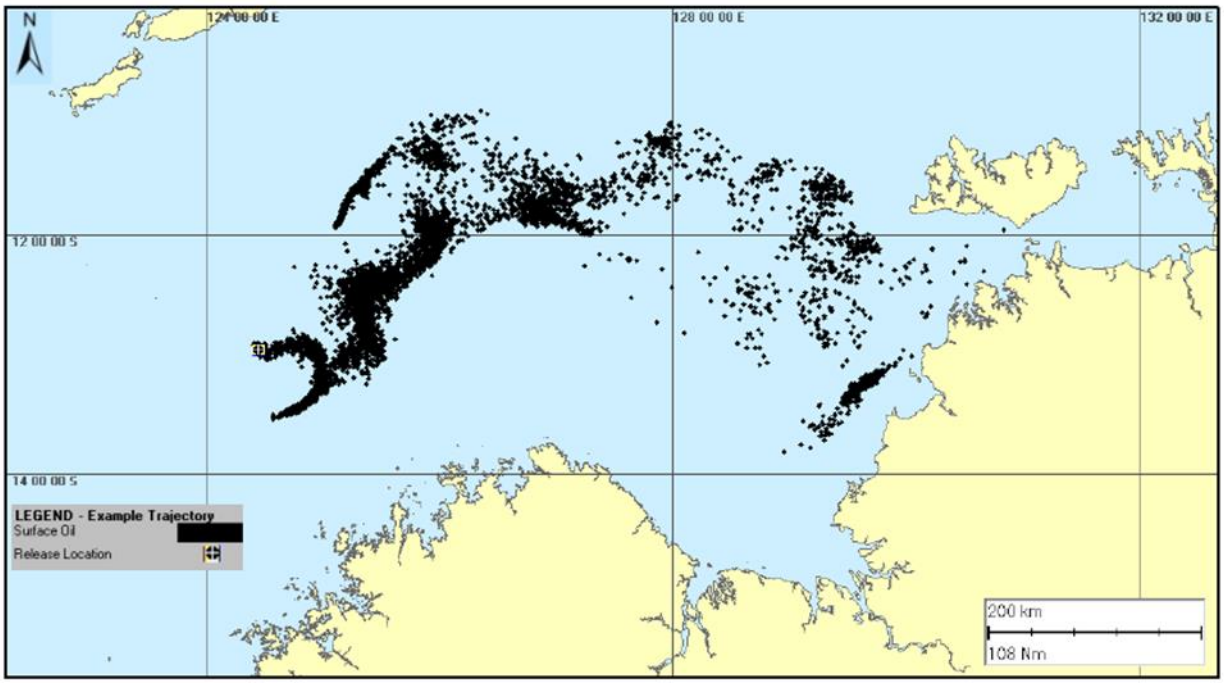

Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10 years of CFSR winds and three-dimensional hindcast HYCOM currents from 2010 to 2019 (inclusive). The currents include the combined influence of HYDROMAP tidal and HYCOM ocean currents;
- Include the wind and current data and hydrocarbon characteristics of the crude oil as input into the three-dimensional oil spill model SIMAP, to model the movement, spreading, weathering and shoreline accumulation by hydrocarbons over time;
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surrounding waters and shorelines. This involved running 100 randomly selected single trajectory simulations (per season), with each simulation having the same spill information (spill volume, location, duration and composition of hydrocarbons) but with varying start times. This ensured that each spill trajectory was subject to a unique set of wind and current conditions; and
- Review the stochastic model results and present the worst-case deterministic runs based on the following criteria:
    a. Largest swept area of floating oil above 1 g/m^2 (visible floating oil);
    b. Minimum time before shoreline accumulation above 10 g/m^2;
    c. Largest volume of oil ashore;
    d. Longest length of shoreline accumulation above 10 g/m^2;
    e. Largest area of entrained hydrocarbons above 10 ppb; and
    f. Largest area of dissolved hydrocarbons above 10 ppb.

3 REGIONAL CURRENTS

The Operational Area is located within the Joseph Bonaparte Gulf, a shallow (generally <100 m) waterbody bordered by the Indian Ocean and Timor Sea. The gulf is characterised by complex geomorphology (i.e. shoals, valleys and terraces) and is dominated by tidal (ranges > 4 m) and wind driven currents which are dependent on season (DEWHA, 2007).

The Indonesian Throughflow brings southwest flowing, less saline, warm waters from the tropics, however the internal gyres generate local currents in any direction. As these gyres migrate through the area, large spatial variations in the speed and direction of currents will occur at a given location over time. The Holloway current, which flows southwest and close to the coastline, intensifies during April to July due to increased wind forcing.

A comprehensive description of the circulation patterns of the Northwest Shelf and Timor Sea is provided in a review by Condie and Andrewartha (2008). A schematic of the ocean currents along the Northwest Australian continental shelf is shown in Figure 3.1.

While, the tidal currents are generally weaker in the deeper waters (beyond the Gulf), its influence is greatest along the near shore, within the Gulf, coastal passage regions and, in and around the islands. Therefore, to accurately account for the movement of an oil spill, which can move between the offshore and near shore region, ocean and tidal currents were combined as part of the study.

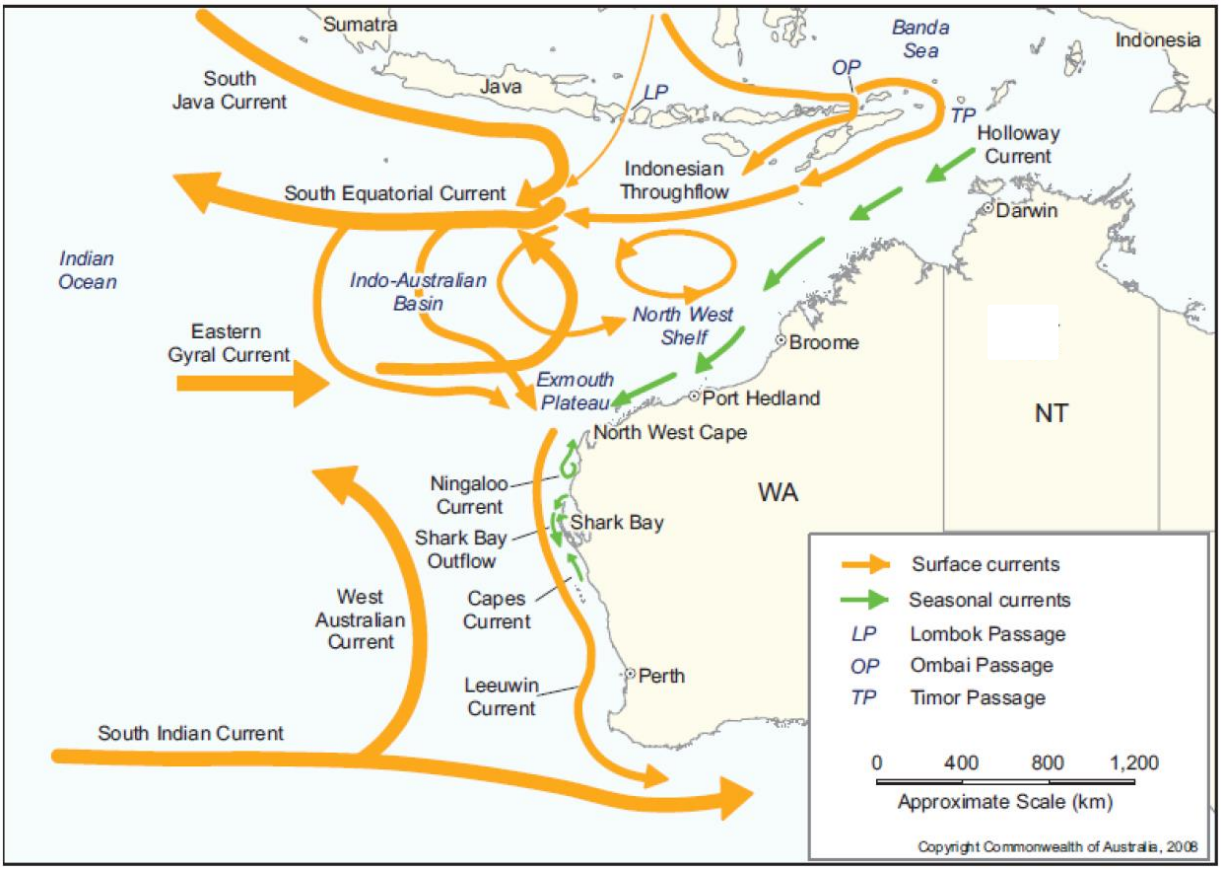

Figure 3.1 Schematic of ocean currents along the Northwest Australian continental shelf. Image adapted from DEWHA (2008).

3.1 Tidal currents

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for more than 30 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

RPS has a global tidal model with global coverage. The model is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

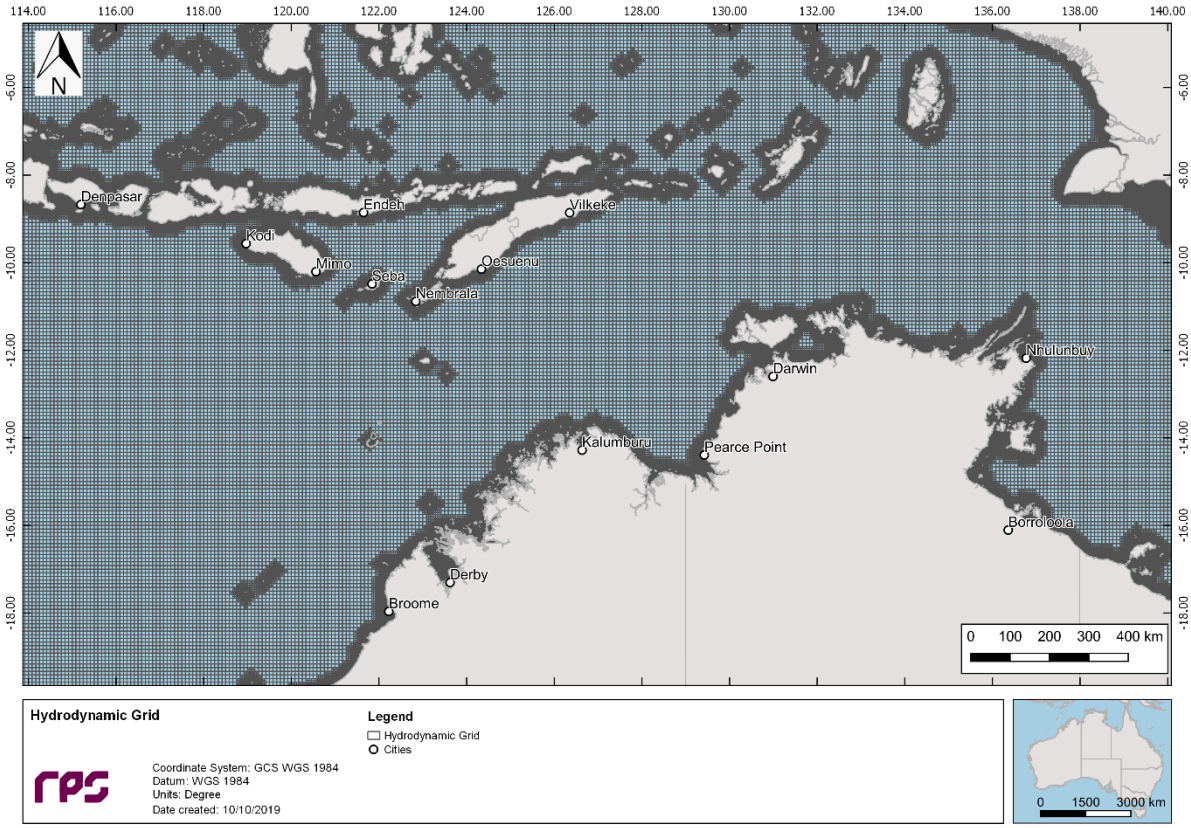

Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

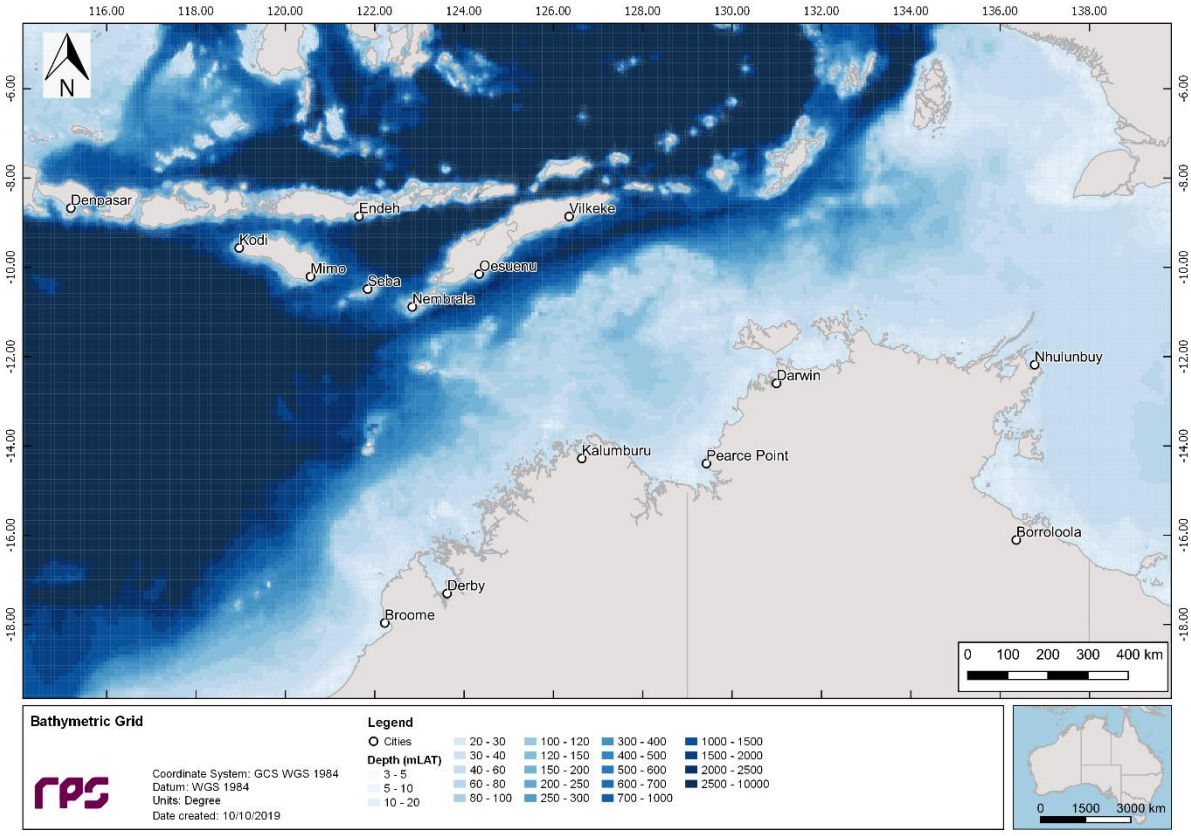

Figure 3.3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex-Poseidon tidal data has been widely used amongst the oceanographic community, being referenced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

Pi = Model predicted surface elevation

Oi = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: Xmodel = Model predicted surface elevation

Xobs = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3.5 and Figure 3.6illustrate a comparison of the predicted and observed surface elevations in January 2014. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3.1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3.1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Calder Shoal	0.95	0.21
Evans Shoal	0.97	0.14
Lacrosse Island	0.97	0.44
Snake Bay	0.98	0.16
The Boxers	0.94	0.23

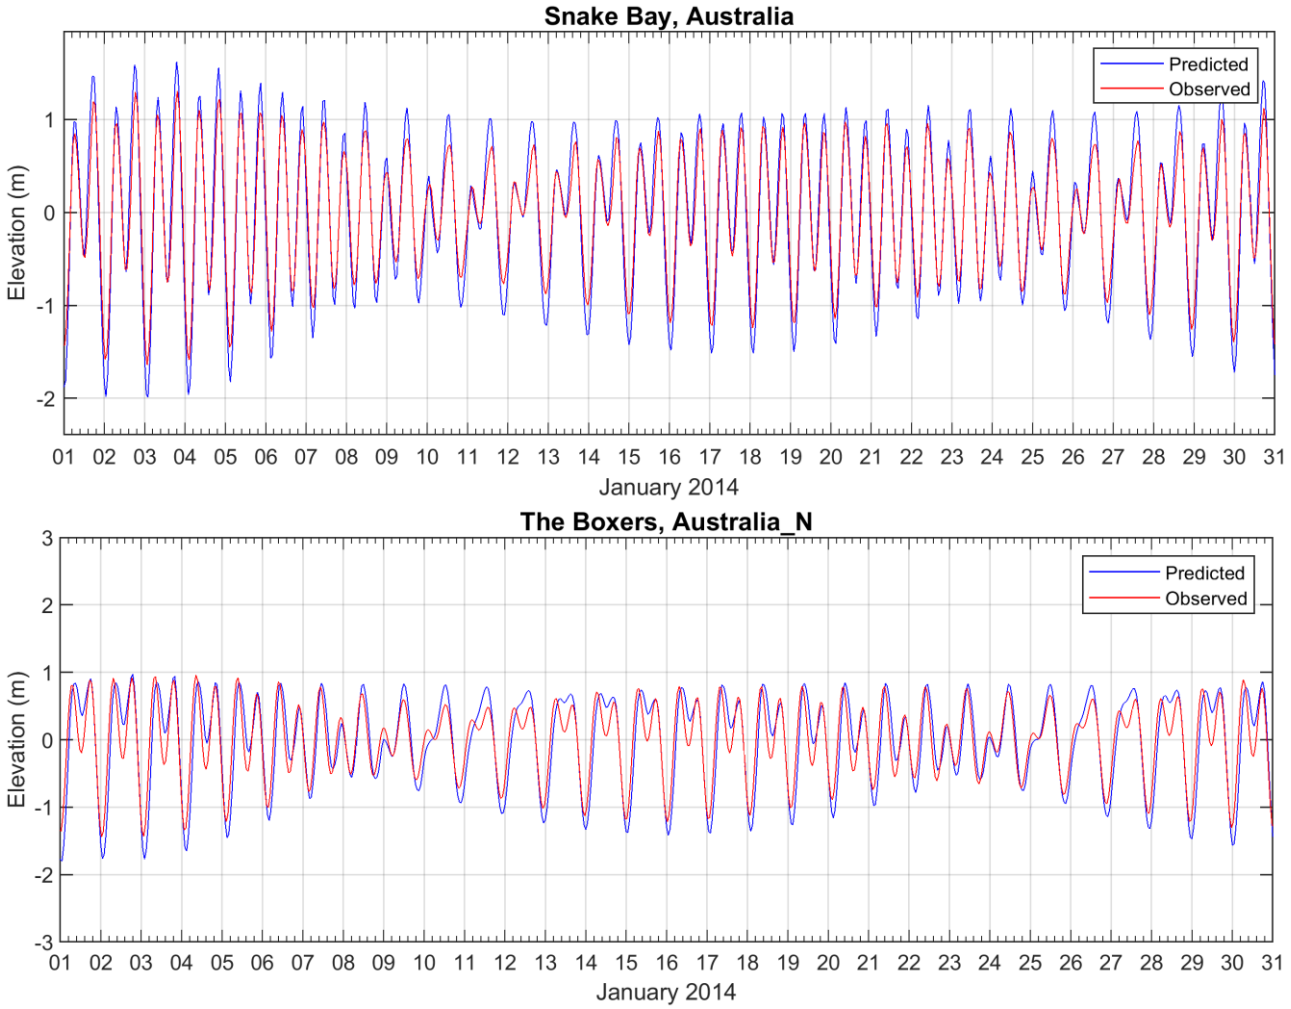

Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Snake Bay (upper image) and The Boxers (lower image).

3.2 Ocean Currents

Data describing the flow of ocean currents was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of once per day. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

For this study, the HYCOM hindcast currents were obtained for the years 2010 to 2019 (inclusive). Figure 3.7 illustrates the spatial resolution of HYCOM currents.

Table 3.2 presents the average and maximum net current speeds from combined HYCOM and tidal currents nearby the Beehive-1 release location. Current speed and direction in the study area were shown to be dominated by the tides, flowing predominantly along the northwest to southeast axis. The monthly current speeds averaged between 0.33 to 0.40 m/s and reached a peak of 0.96 to 1.17 m/s.

Figure 3.8 and Figure 3.9 show the monthly and total current rose distributions resulting from the combination of HYCOM ocean current data and HYDROMAP tidal data nearby the release location.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3.2 Predicted monthly average and maximum surface current speeds nearby the Beehive-1 release location. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Season	Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction (Towards)

4 WIND DATA

High resolution wind data was sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals.

The CFSR wind data for the years 2010–2019 (inclusive) was extracted across the entire current model domain for input into the oil spill model. Figure 4.1 shows the spatial resolution of the wind field used as input into the oil spill model. Table 4.1 presents the monthly average and maximum winds derived from a CFSR wind node nearby the release location.

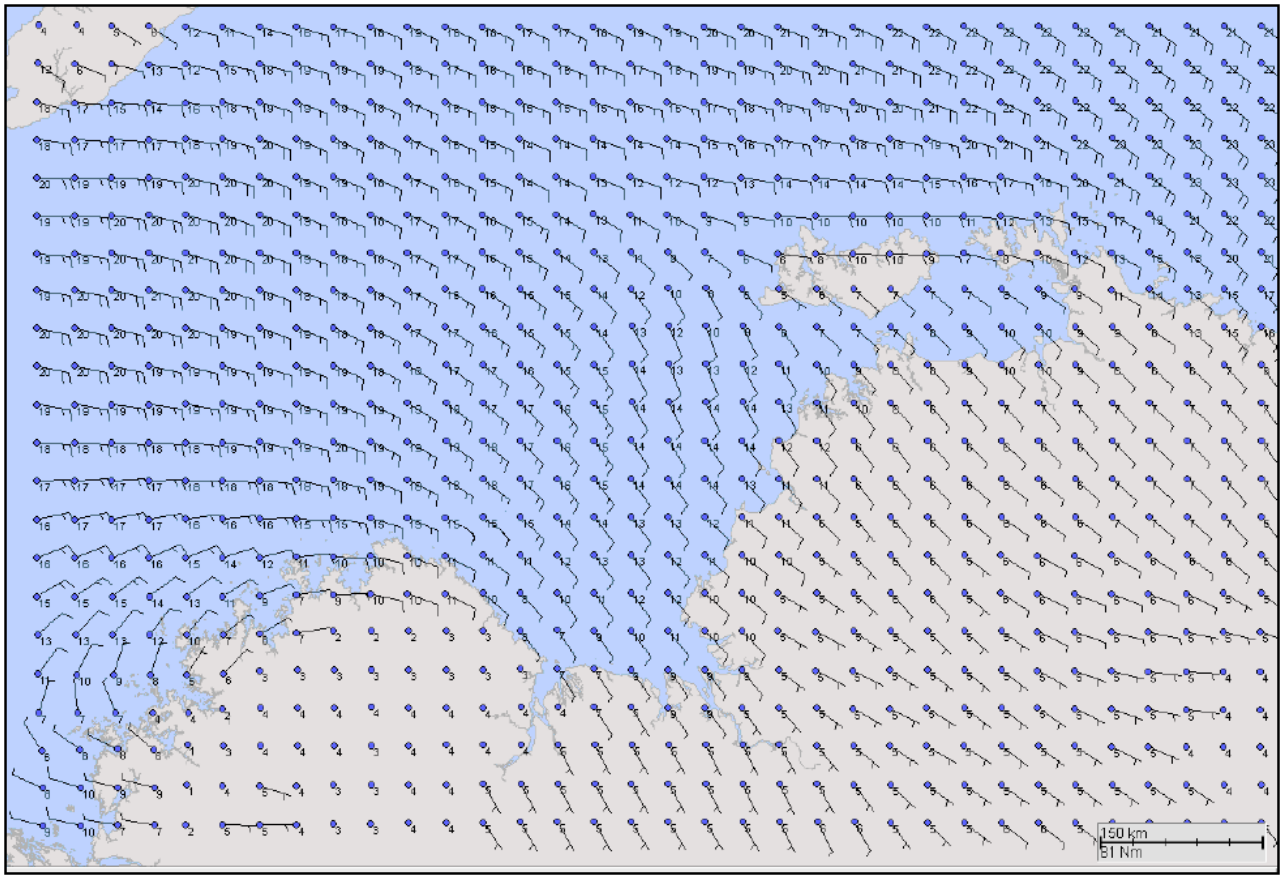

Figure 4.1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

Figure 4.2 and Figure 4.3 show the monthly and total wind rose distributions derived from the CFSR data for the nearest CFSR wind node to the release location. The wind data demonstrated a clear seasonality throughout the year with winds from the west-northwest in summer and southeast during the winter months. Monthly average wind speeds ranged between 8.7 and 14.1 knots whilst monthly maximums oscillated between 24.1 and 46.2 knots.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 3 knots are predominantly used in these wind roses. The length of each segment within a branch

is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

Table 4.1 Predicted average and maximum winds for the nearest CFSR wind node to the Beehive-1 release location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Season	Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction (from)

5 WATER TEMPERATURE AND SALINITY

The monthly sea temperature and salinity profiles of the water column within the study was obtained from the World Ocean Atlas 2013 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013).

To account for depth-varying sea temperature and salinity the modelling used monthly average sea temperature and salinity profiles. Table 5.1 presents the sea temperature and salinity of the surface layer nearby the release sites.

The monthly average sea surface temperatures ranged between 25.9°C (July) and 30.9°C (March). The monthly average salinity values remain relatively consistent ranging between 33.4 psu and 35.2 psu, observed during April and October, respectively.

These parameters were used as factors to inform the weathering, movement and evaporative loss of hydrocarbon spills in the surface and sub-surface layers.

Figure 5.1 illustrates the vertical profile of sea temperature and salinity nearby the release location.

Table 5.1 Monthly average sea surface temperature and salinity in the study area.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

6 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil, a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

6.1 Stochastic Modelling

Stochastic oil spill modelling is created by overlaying a great number (often 100 hundred) simulated hypothetical oil spills (Section 1.2.1). Stochastic modelling involves running numerous individual oil spill simulations using a range of prevailing wind and current conditions that are historically representative of the season and location of where the spill event may occur.

For the stochastic modelling undertaken in this study, 100 oil spills were modelled per season (300 spills in total) using the same spill information (spill volume, duration and oil type) but with varied start dates and times. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations (per season) were analysed to determine the following annualised statistics for every grid cell:

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Probability of contact above defined concentrations;
- Volume of oil that may strand on shorelines from any single simulation;

- Concentration that might occur on sections of individual shorelines;
- Exposure (instantaneous and/or over a specified duration) to dissolved hydrocarbons in the water column; and
- Exposure (instantaneous and/or over a specified duration) to entrained hydrocarbons in the water column.

6.1 Floating, Shoreline and In-Water Thresholds

The thresholds and their relationship to exposure for the sea surface, shoreline, and water column (entrained and dissolved hydrocarbons) are presented in Sections 6.1.1 to 6.1.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of influence are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

6.1.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 6.1). Figure 6.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e., fishing grounds) as a precautionary measure. Table 6.1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009). Concentrations above 10 g/m^2 is also considered the lower actionable threshold, where oil may be thick enough for containment and recovery as well as dispersant treatment (AMSA, 2015).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 6.2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 6.1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 - 0.30	40 - 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

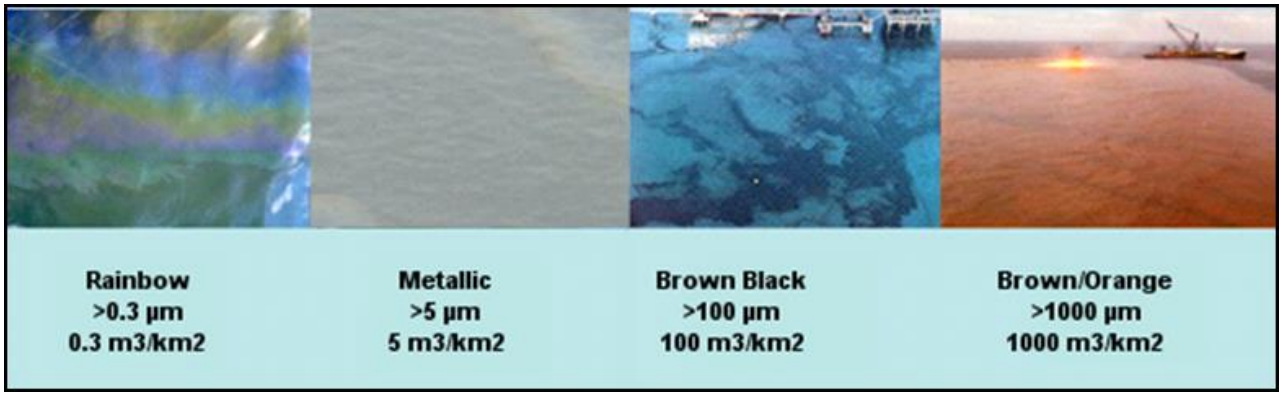

Figure 6.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oilspillsolutions.org, 2015).

Table 6.2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA (2019)).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socio-economic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50*	Approximates surface oil slick and informs response planning

* 50 g/m^2 also used to define the threshold for actionable floating oil.

6.1.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A rocky shoreline was assumed as the default shoreline type for the modelling in this study, as a large part of the shoreline in the study area (especially the western part of the Joseph Bonaparte Gulf) is characterised by exposed rocky shorelines.

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m2, or above, would potentially harm shorebirds and wildlife (fur-bearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum concentration that the oil can be effectively cleaned according to AMSA (2015). This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996), demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high shoreline accumulation”. It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

These shoreline accumulation thresholds derived from extensive literature review (outlined in Table 6.3) align with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 6.3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline concentration (g/m^2)	Description
Low (socio-economic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100*	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

* 100 g/m2 also used to define the threshold for actionable shoreline oil.

6.1.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

6.1.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1 hour timestep (see Table 6.4) were applied in this study to indicate the increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

6.1.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. Insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, therefore they are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC (2000) water quality guidelines. Due to the requirement for relatively long exposure times (> 24 hours) for these concentrations to be expressed, they are likely to be more meaningful for juvenile fish, larvae and planktonic organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1 hour time exposure (Table 6.4), to cover the range of thresholds outlined in ANZECC, (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019).

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 6.4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

Threshold level	Dissolved hydrocarbon concentration (ppb)	Entrained hydrocarbon concentrations (ppb)
Low	10	10
Moderate	50	-
High	400	100

7 OIL PROPERTIES

7.1 Oil Characteristics

7.1.1 Overview

Table 7.1 and Table 7.2 present the physical properties and boiling point ranges analogue crude oil used in this study. The analogue crude oil was carefully selected based on EOG recommendations to represent the crude oil likely to be found within permit area WA-488-P, which is likely to have an API gravity of 43° (light crude). EOG narrowed down oils in the region with a similar API to be Jabiru, Puffin, Mutineer-Exeter and Legendre crudes, all of which have APIs between 42 and 44. Based on having an API closest to that expected at Beehive-1, together with being the most conservative in terms of the residual components, EOG elected to use Jabiru crude as the analogue for spill modelling purposes.

Table 7.1 Physical properties of the oil types used in this study.

Characteristic	Crude Oil
Density (kg/m^3)	813.9 (at 15°C)
API	42.3
Dynamic viscosity (cP)	3.0 (at 20°C)
Pour point (°C)	18
Hydrocarbon property category	Group II
Hydrocarbon property classification	Light-persistent

Table 7.2 Boiling point ranges of the oil types used in this study.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-160 C_{11} to C_{15}	160-380 C_{16} to C_{20}	>380 >C_{20}
Jabiru crude oil	% of total	24.2	20.9	33.9	21.0

The boiling points (BP) are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate.

The aromatic components within the volatile to low-volatility range are also soluble (with decreasing solubility following decreasing volatility) and will dissolve across the oil-water interface. The rate of dissolution will increase with increased surface area. Hence, dissolution rates will be higher under discharge conditions that generate smaller oil droplets.

Atmospheric weathering will commence if and when oil droplets float to the water surface. Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (or less than 180°C BP).
- Up to 24 hours for the C_{11} to C_{15} compounds (180-160°C BP).
- Several days for the C_{16} to C_{20} compounds (160-380°C BP).

- Not applicable for the residual compounds (BP > 380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

The actual fate of released oil in the marine environment will depend greatly on the amount of oil that reaches the surface, either through the initial release or by rising after discharge in the water column.

7.1.2 Crude Oil

The analogue crude oil has an API of 42.3 and a density of 813.9 kg/m^3 (at 15ºC) with a viscosity value (3.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The crude is a mixture of volatile (79%) and persistent hydrocarbons (21%). In favourable evaporation conditions, about 24.2% of the oil mass should evaporate within the first 12 hours (BP < 180 °C); a further 20.8% should evaporate within the first 24 hours (180 °C < BP < 160 °C); and a further 33.9% should evaporate over several days (160 °C < BP < 380 °C). Approximately 21.0% of the oil is shown to be persistent.

7.2 Weathering Characteristics

7.2.1 Overview

A series of model weather tests were conducted to illustrate the potential behaviour of the Jabiru crude oil when exposed to idealised and representative environmental conditions:

- A 1-hour release onto the water surface at a discharge rate of 25 m^3/hr under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (25 °C) and average air temperature (29 °C). The slick was also subject to ambient tidal and drift currents.

- A 1-hour release onto the water surface at a discharge rate of 50 m^3/hr under variable wind conditions (1-12 knots, drawn from representative data files), assuming low seasonal water temperature (25 °C) and average air temperature (29 °C). The slick was also subject to ambient tidal and drift currents.

The first case is indicative of cumulative weathering rates under calm conditions that would not generate entrainment, while the second case may represent conditions that could cause a minor degree of entrainment. Both scenarios provide examples of potential behaviour during periods of a spill event once the oil reaches the surface.

7.2.2 Crude Oil Mass Balance Forecasts

The mass balance forecast for the constant-wind case (Figure 7.1) shows that 45.3% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 7.2), where the winds are of greater strength on average, entrainment of the crude oil into the water column is predicted to increase. Approximately 24 hours after the spill, 54.1% of the oil mass is forecast to have entrained and a further 42.8% is forecast to have evaporated, leaving only

a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

The increased level of entrainment in the variable-wind case will result in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of ~1.3% per day with an accumulated total of ~9.1% after 7 days, in comparison to a rate of ~0.3% per day and an accumulated total of ~2.4% after 7 days in the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over several weeks.

Table 7.3 illustrates the summary of the mass balance for the calm wind and variable wind case at day 7.

Table 7.3 Summary of the mass balance at day 7. Results are based on a 25 m^3 surface release of crude oil over 1 hour, tracked for 7 days under calm and variable wind conditions.

End of the simulation (day 7)		
Exposure Metrics	**Calm wind conditions**	**Variable wind conditions**
Surface/Floating Oil (%)	44.4	0.0
Ashore/Shoreline (%)	0.0	0.0
Entrained (%)	3.6	44.5
Evaporated (%)	49.2	44.2
Decay (%)	2.4	9.1

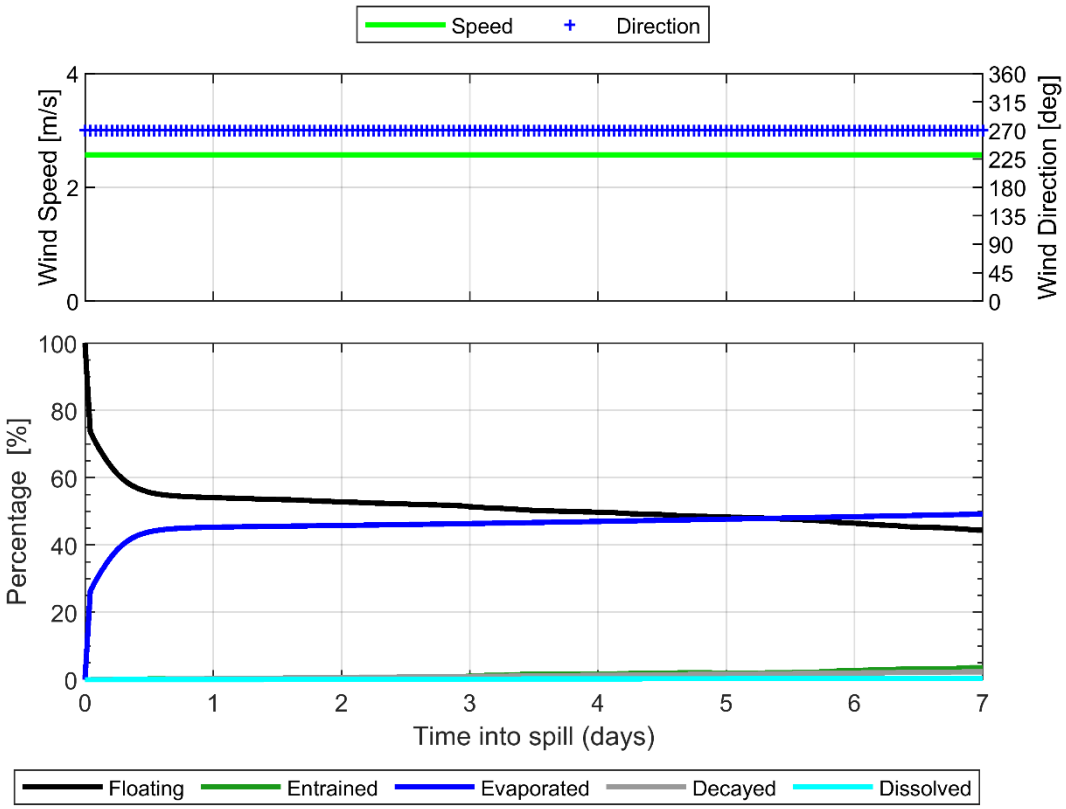

Figure 7.1 Proportional mass balance plot representing the weathering of crude oil spilled onto the water surface over 1 hour and subject to a constant 5 knots (2.6 m/s) wind speed at 25°C water temperature and 29 °C air temperature.

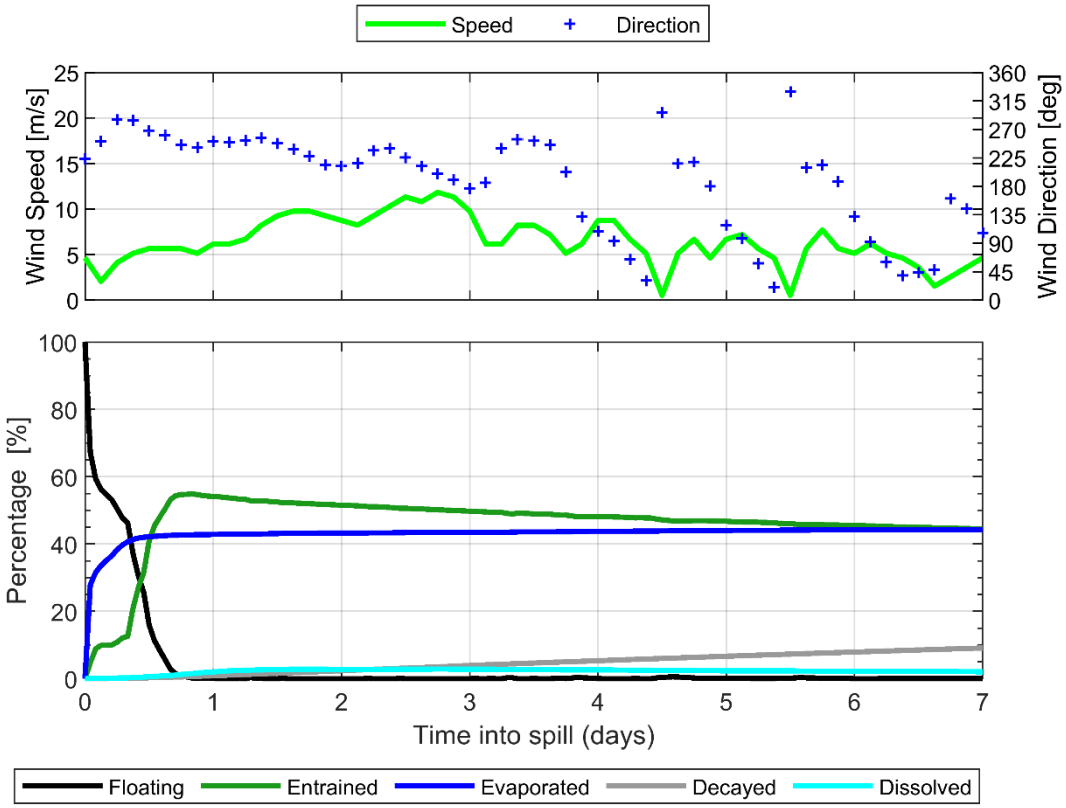

Figure 7.2 Proportional mass balance plot representing the weathering of crude oil spilled onto the water over 1 hour and subject to variable wind speeds (1-12 knots) at 25°C water temperature and 29 °C air temperature.

8 MODEL SETTINGS

Table 8.1 provides a summary of the oil spill model settings for the scenario.

Each season uses the same 100 random spill locations.

Table 8.1 Summary of the oil spill model settings used in this assessment.

Parameter	Scenario
Description	LOWC
Number of randomly selected spill start times per season for each scenario	100 (300 in total)
Release location	Single location at the Beehive-1 exploration well
Model period	Summer (October to February) Transitional (March and September) Winter (April to August)
Oil type	Crude oil
Spill volume	786,858 m^3 (4,949,192 bbl)
Release type	Surface
Release duration	77 days
Simulation length (days)	98
Surface oil concentration thresholds (g/m^2) (NOPSEMA Thresholds)	1, potential low exposure 10, potential moderate exposure 50, potential high exposure
Shoreline load thresholds (g/m^2) (NOPSEMA Thresholds)	10, potential low exposure 100, potential moderate exposure 1,000, potential high exposure
Dissolved hydrocarbon concentrations (ppb) (NOPSEMA Thresholds)	10, potential low exposure 50, potential moderate exposure 400, potential high exposure
Entrained hydrocarbon concentrations (ppb) (NOPSEMA Thresholds)	10, potential low exposure 100, potential high exposure

9 PRESENTATION AND INTERPRETION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of the predicted sea-surface and water column (subsurface) exposure and shoreline accumulation (if predicted).

9.1 Annual Analysis

9.1.1 Statistics

The statistics are based on the following principles:

- The greatest distance travelled by a spill trajectory – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds.
- The probability of oil exposure to a receptor – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The minimum time before oil exposure to a receptor – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value.
- The probability of oil accumulation at a receptor – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The maximum potential oil loading within a receptor – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario.
- The dissolved and entrained hydrocarbon exposure – is determined by recording the maximum instantaneous concentrations at each grid cell by applying a 96-hour time-based averaging.

9.2 Deterministic Trajectories

The seasonal stochastic modelling results were assessed for each scenario, and the “worst case” deterministic runs were identified and are presented in the result section based on the following criteria:

a. Largest swept area of floating oil above 1 g/m^2 (visible floating oil);

b. Minimum time before shoreline accumulation above 10 g/m^2;

c. Largest volume of oil ashore;

d. Longest length of shoreline accumulation above 10 g/m^2;

e. Largest area of entrained hydrocarbons above 10 ppb; and

f. Largest area of dissolved hydrocarbons above 10 ppb.

When no shoreline accumulation above the lowest shoreline accumulation threshold was predicted for any of the seasons modelled, only the largest swept area of floating oil, the largest area of entrained hydrocarbons and the largest area of dissolved hydrocarbons is presented.

9.2.1 Receptors Assessed

A range of environmental receptors and shorelines were assessed for sea surface exposure, shoreline contact and water column exposure as part of the study (see Figure 9.1 to Figure 9.7). Receptor categories (see Table 9.1) include sections of shorelines and offshore islands. All other sensitive receptors other than submerged reefs, shoals and banks (RSB) were sourced from Australian Government Department of Agriculture, Water and the Environment (http://www.environment.gov.au/). Risks of exposure were separately calculated for each sensitive receptor area and have been tabulated.

Table 9.1 Summary of receptors used to assess floating oil, shoreline and in-water exposure to hydrocarbons.

Receptor Category	Acronym	Hydrocarbon Exposure Assessment		
		Water Column	Floating oil	Shoreline

10 RESULTS – SCENARIO – LOWC – 786,858 M^3 SURFACE RELEASE OF CRUDE OIL OVER 77 DAYS

This scenario examined a loss of well control of 786,858 m^3 surface release of crude oil over 77 days, tracked for a period of 98 days. A total of 100 spill trajectories were simulated per season (300 in total).

10.1 presents the seasonal stochastic analysis and Section 10.2 presents the deterministic results.

10.1 Stochastic Analysis

10.1.1 Floating Oil Exposure

Table 10.1 summarises the maximum distance travelled by oil on the sea surface at each threshold for the seasonal conditions assessed. The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure levels was 1,517 km (winter), 153 km (summer) and 61 km (winter) respectively.

Table 10.2 summarises the potential floating oil exposure to individual receptors for each season.

Of all the receptors considered in the assessment, the Joseph Bonaparte Gulf AMP was the only receptor predicted to be exposed to floating oil above the low, moderate and high thresholds during all seasonal conditions.

Figure 10.1 to Figure 10.3 present the zones of potential floating oil exposure for the NOPSEMA thresholds under summer, transitional and winter conditions, respectively.

Table 10.1 Potential zones of floating oil exposure, at each threshold. Results are based on a 786,858 m3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions. The results were calculated from 100 spill trajectories per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from the release location	1,048	153	49
	Maximum distance (km) from the release location (99th percentile)	731	95	45
	Direction	West-Southwest	East-Northeast	South-Southeast
Transitional	Maximum distance (km) from the release location	1,136	79	49
	Maximum distance (km) from the release location (99th percentile)	903	62	46
	Direction	West-Southwest	South-Southeast	South-Southeast
Winter	Maximum distance (km) from the release location	1,517	79	61
	Maximum distance (km) from the release location (99th percentile)	730	68	55
	Direction	West-Northwest	Southeast	Southeast

Table 10.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions. The results were calculated from 100 spill trajectories per season.

10.1.2 Shoreline Accumulation

Table 10.3 presents a summary of the predicted potential shoreline accumulation during seasonal conditions. The probability of accumulation to any shoreline at, or above, the low threshold (10-100 g/m^2) was 100% for all seasons and the minimum time before shoreline accumulation at, or above, the low threshold ranged between 10.29 days (transitional) to 11.58 days (summer). The maximum volume ashore for a single spill trajectory ranged between 406.9 m^3 (winter) and 704.67 m^3 (summer) and maximum length of shoreline contacted at the low threshold was 201 km for winter and 224 km for summer and transitional. The predicted shoreline length above the high (≥1,000 g/m^2) shoreline threshold decreased to a maximum of 16 km, 9 km and 8 km during summer, winter and transitional months respectively.

Table 10.4 summarises the shoreline accumulation on individual receptors during seasonal conditions. The shoreline assessment identified Wyndham - East Kimberley, Thamarrurr, Daly, Victoria Daly and Docherty Island shorelines as the sectors with the largest potential shoreline oil accumulation during summer conditions with volumes ranging between 134.81 m^3 to 404.39 m^3. During the transitional and winter months, the Wyndham - East Kimberley, Victoria Daly and Thamarrurr shorelines recorded potential shoreline oil accumulation ranging between 164.9 m^3 to 414.9 m^3 (transitional) and 155.6 m^3 and 406.9 m^3 (winter). Additionally, Wyndham - East Kimberley recorded the earliest shoreline contact (11.25 days) and the longest length (58.1 km) of shoreline accumulation above the low threshold during transitional conditions.

The maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented for each season in Figure 10.4 to Figure 10.6.

Table 10.3 Summary of oil accumulation across all shorelines. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions. The results were calculated from 100 spill trajectories per season.

Shoreline Statistics	Summer	Transitional	Winter
Probability of accumulation on any shoreline (%)	100	100	100
Absolute minimum time for visible oil to shore (days)	11.58	10.29	11.25
Maximum volume of hydrocarbons ashore (m^3)	704.67	414.9	406.9
Average volume of hydrocarbons ashore (m^3)	259.5	176.9	145.8
Maximum length of the shoreline at 10 g/m^2 (km)	224	224	201
Average shoreline length (km) at 10 g/m^2 (km)	119.7	82.6	90.9
Maximum length of the shoreline at 100 g/m^2 (km)	129	116	99
Average shoreline length (km) at 100 g/m^2 (km)	61.6	45.5	40.9
Maximum length of the shoreline at 1,000 g/m^2 (km)	16	9	8
Average shoreline length (km) at 1,000 g/m2 (km)	5.2	3.5	2.7

Table 10.4 Summary of oil accumulation on individual shoreline sectors. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories.

10.1.3 In-water exposure

10.1.3.1 Dissolved Hydrocarbons

Table 10.7 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m depth layer during seasonal conditions.

In the surface (0-10 m) depth layer, low, moderate and high exposure to dissolved hydrocarbons was recorded for a range of receptors (refer to Table 10.7). The highest dissolved hydrocarbon concentrations were predicted for the Joseph Bonaparte Gulf AMP and the carbonate bank and terrace system of the Sahul Shelf KEF, followed by the North Kimberley MP and Kimberley AMP during all seasonal conditions. In addition, the nearshore waters of the Thamarrurr, Wyndham-East Kimberley, Dorcherty Island, Clump Island Quoin Island, Daly, Victoria Daly shorelines and Ord River floodplain (Ramsar) were some of the receptors with the highest entrained hydrocarbons concentrations for all seasonal conditions.

Figure 10.7 to Figure 10.9 presents the zones of potential dissolved hydrocarbon exposure in the 0-10 m depth layer for the low (10-50 ppb), moderate (50-400 ppb) and high (≥400 ppb) exposure levels (NOPSEMA, 2019) for each season.

Table 10.7 Probability of exposure to individual receptors from dissolved hydrocarbons in the 0–10 m depth layer. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during seasonal conditions. The results were calculated from 100 spill trajectories per season.

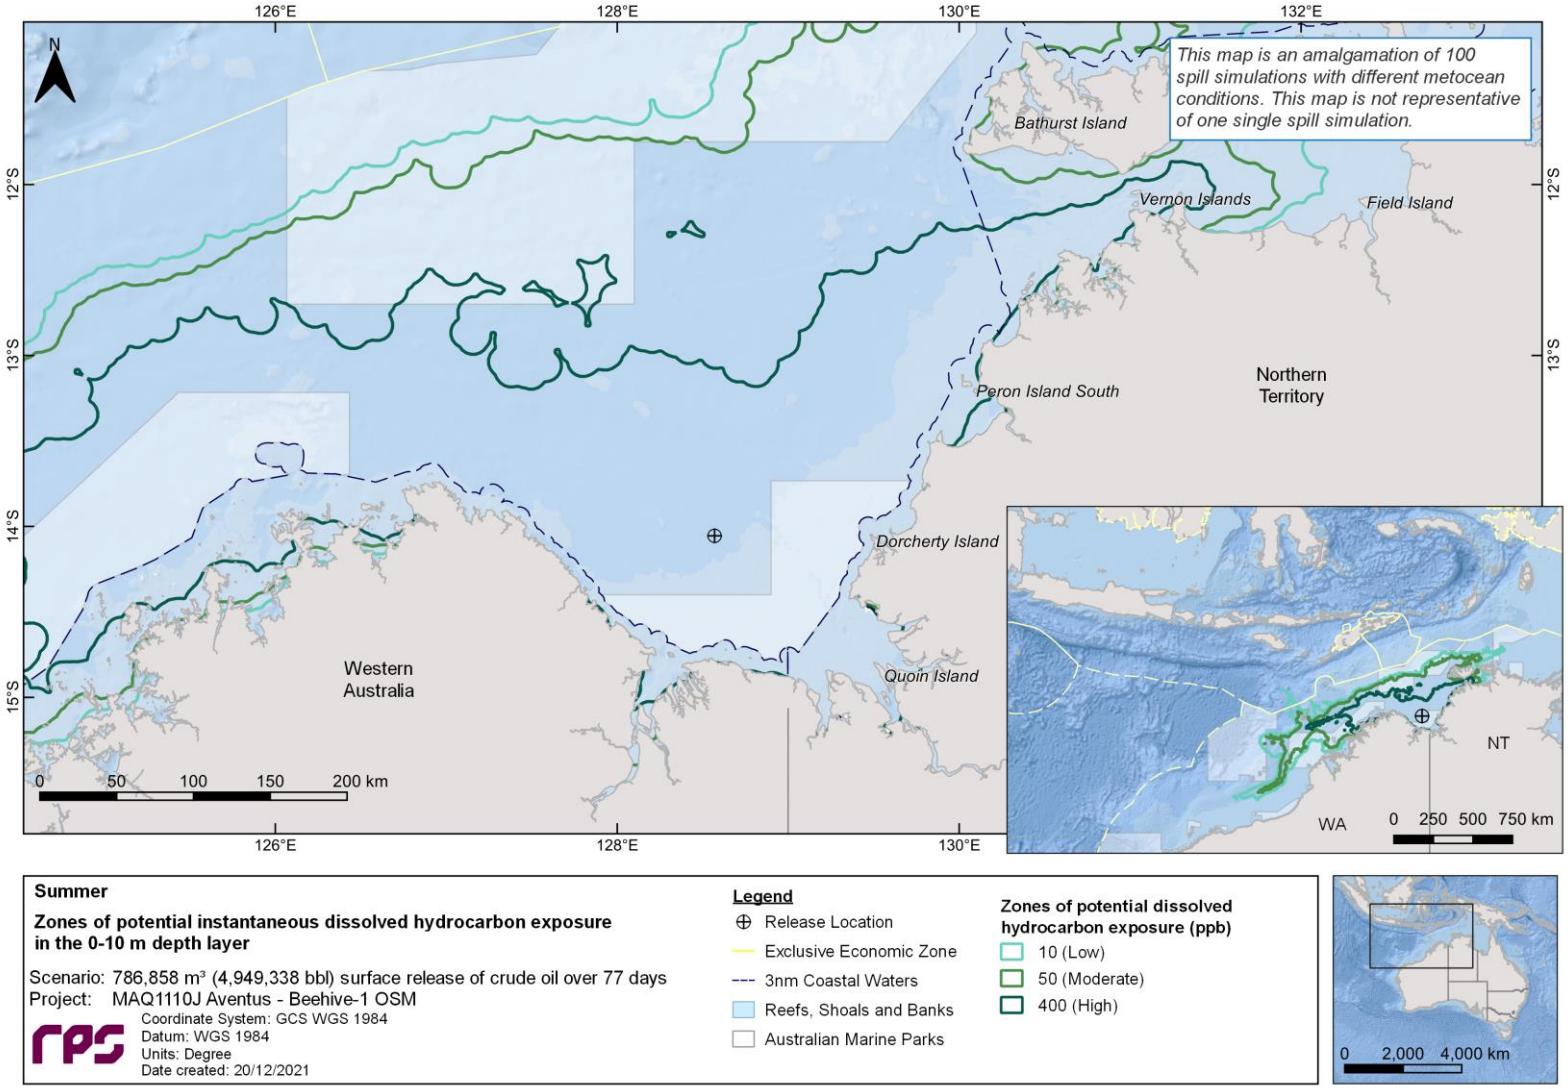

Figure 10.7 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea surface, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories.

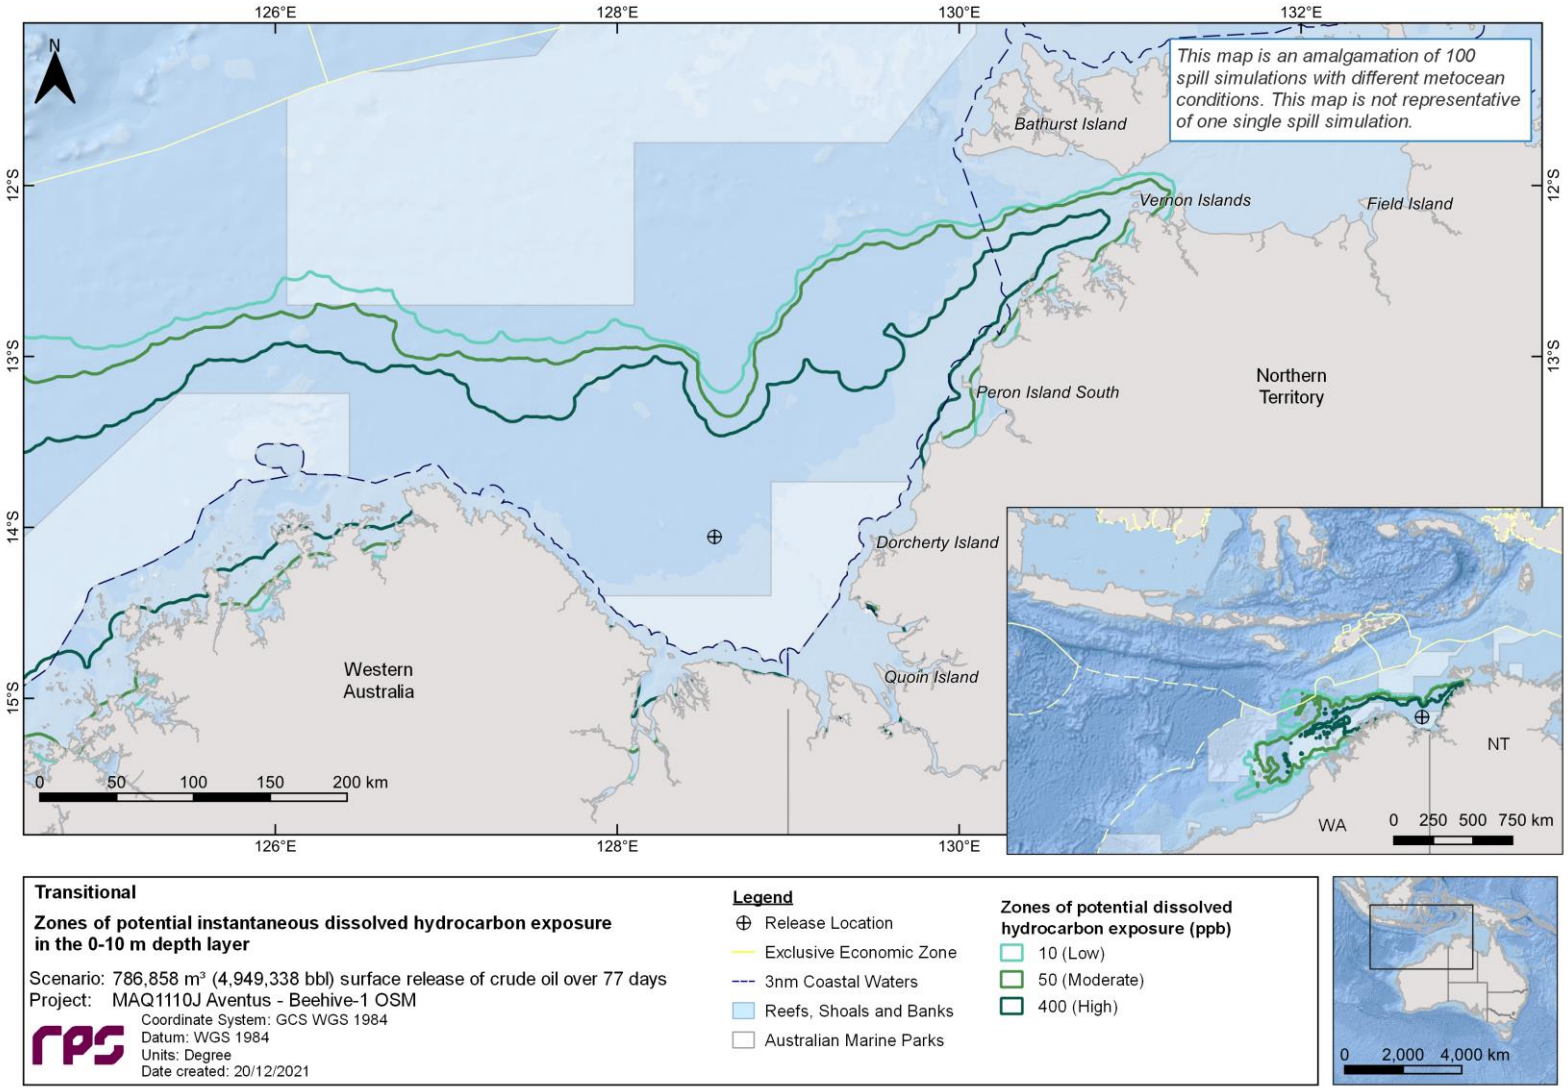

Figure 10.8 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea surface, in the event of a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories.

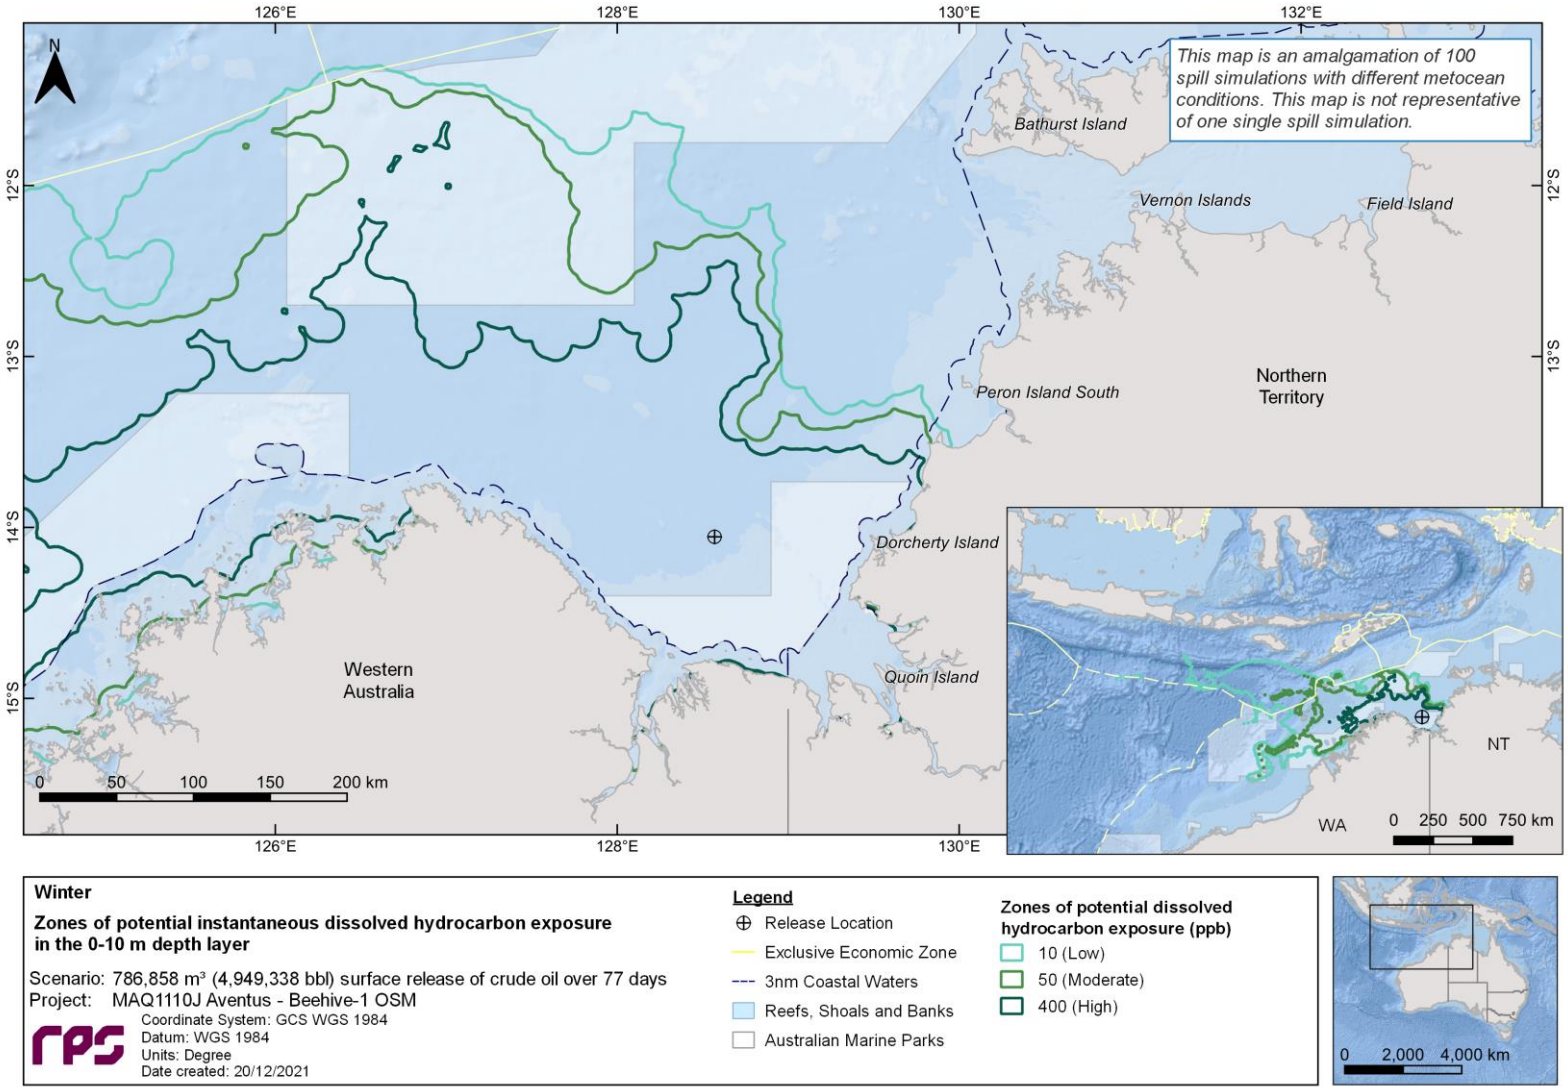

Figure 10.9 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea surface, in the event of a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories.

10.1.3.2 Entrained Hydrocarbons

Table 10.8 presents the probability of exposure to individual receptors from entrained hydrocarbons at the low (10-100 ppb) and high (≥ 100 ppb) exposure levels in the 0-10 m depth layers for all seasonal conditions.

In the surface (0-10 m) depth layer, low and high exposure by entrained hydrocarbons was predicted for a large range of receptors (refer to Table 10.8). The carbonate bank and terrace system of the Sahul Shelf KEF, Joseph Bonaparte Gulf AMP, Kimberley AMP, North Kimberley MP and nearshore waters of the Thamarrurr, Wyndham - East Kimberley, Dorcherty Island, Clump Island, Quoin Island, Daly, Victoria Daly shorelines and Ord River floodplain (Ramsar) were some of the receptors predicted with the highest entrained hydrocarbons concentrations for all three seasons.

Figure 10.10 to Figure 10.12 illustrate the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layers at the low (10-100 ppb) and high (≥100 ppb) exposure levels, for each season, respectively.

Table 10.8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions. The results were calculated from 100 spill trajectories per season.

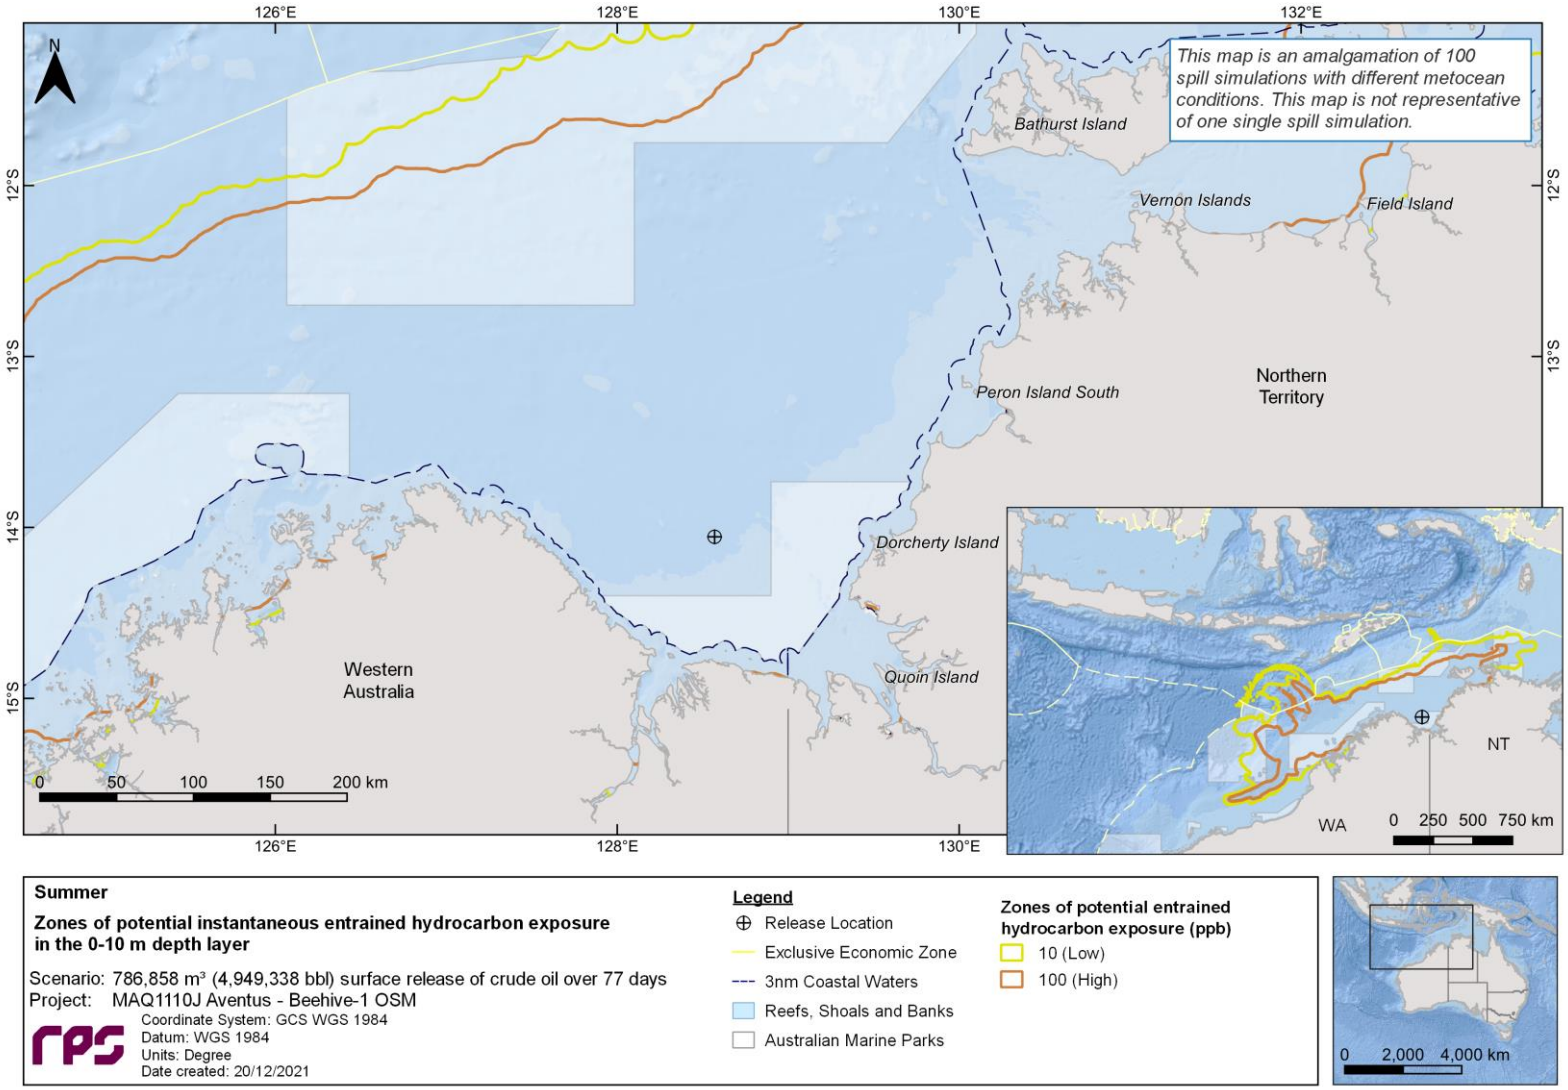

Figure 10.10 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories.

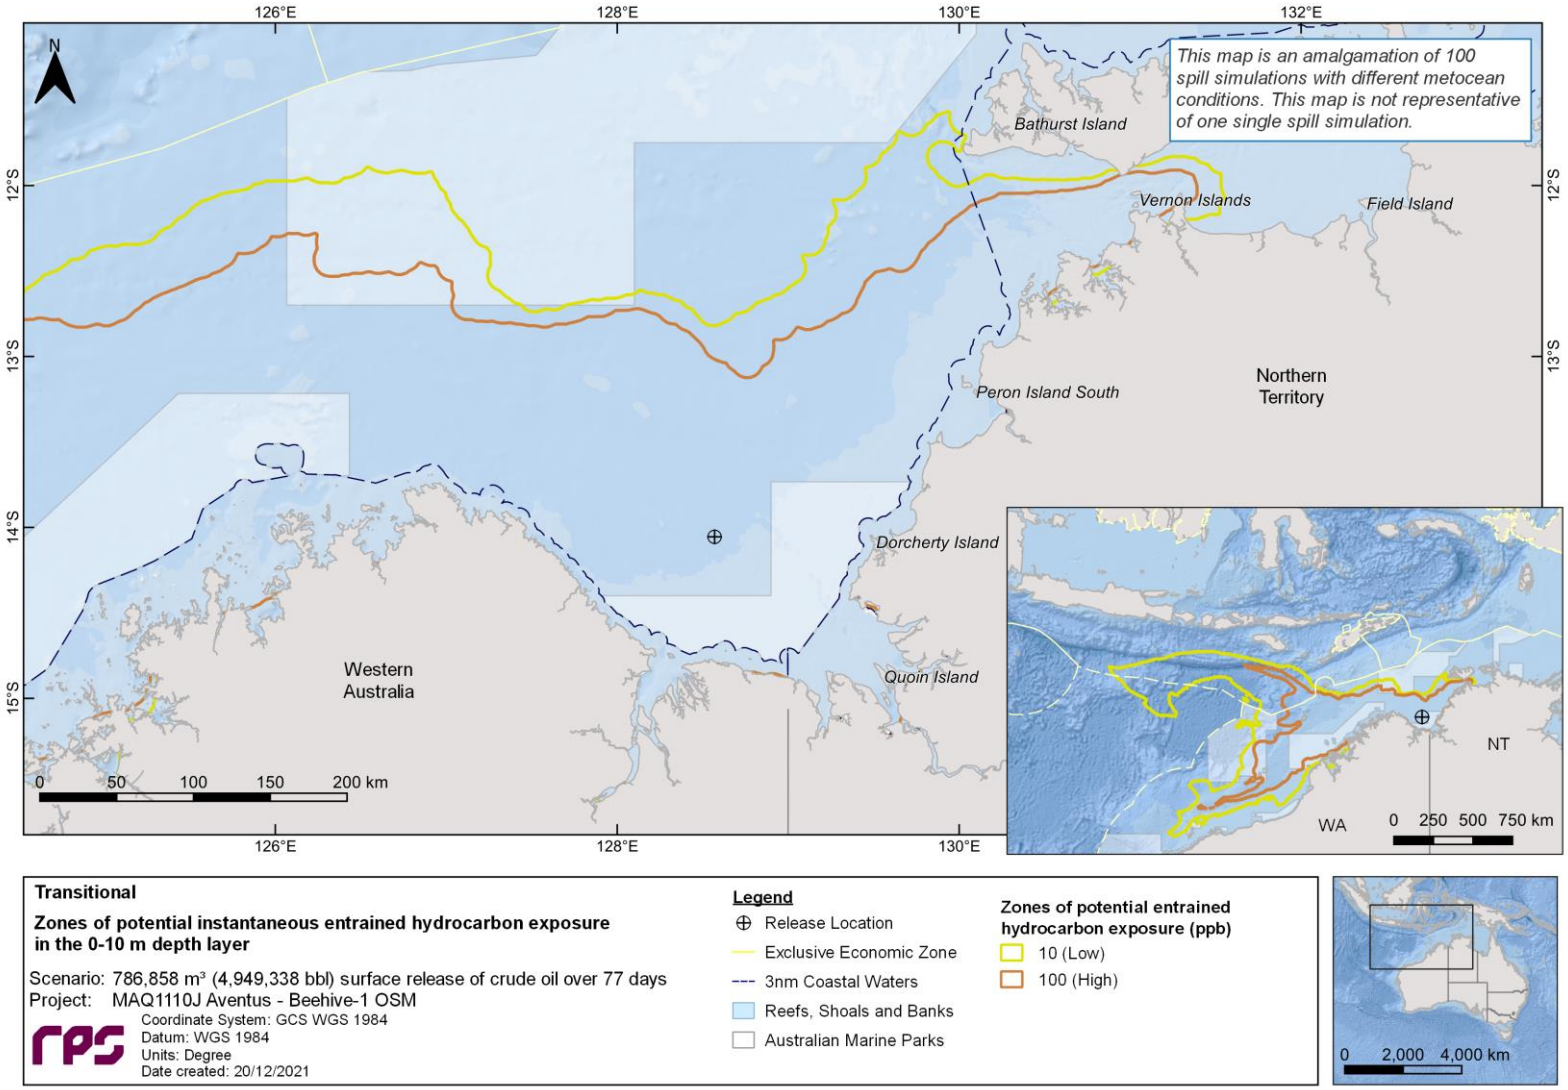

Figure 10.11 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories.

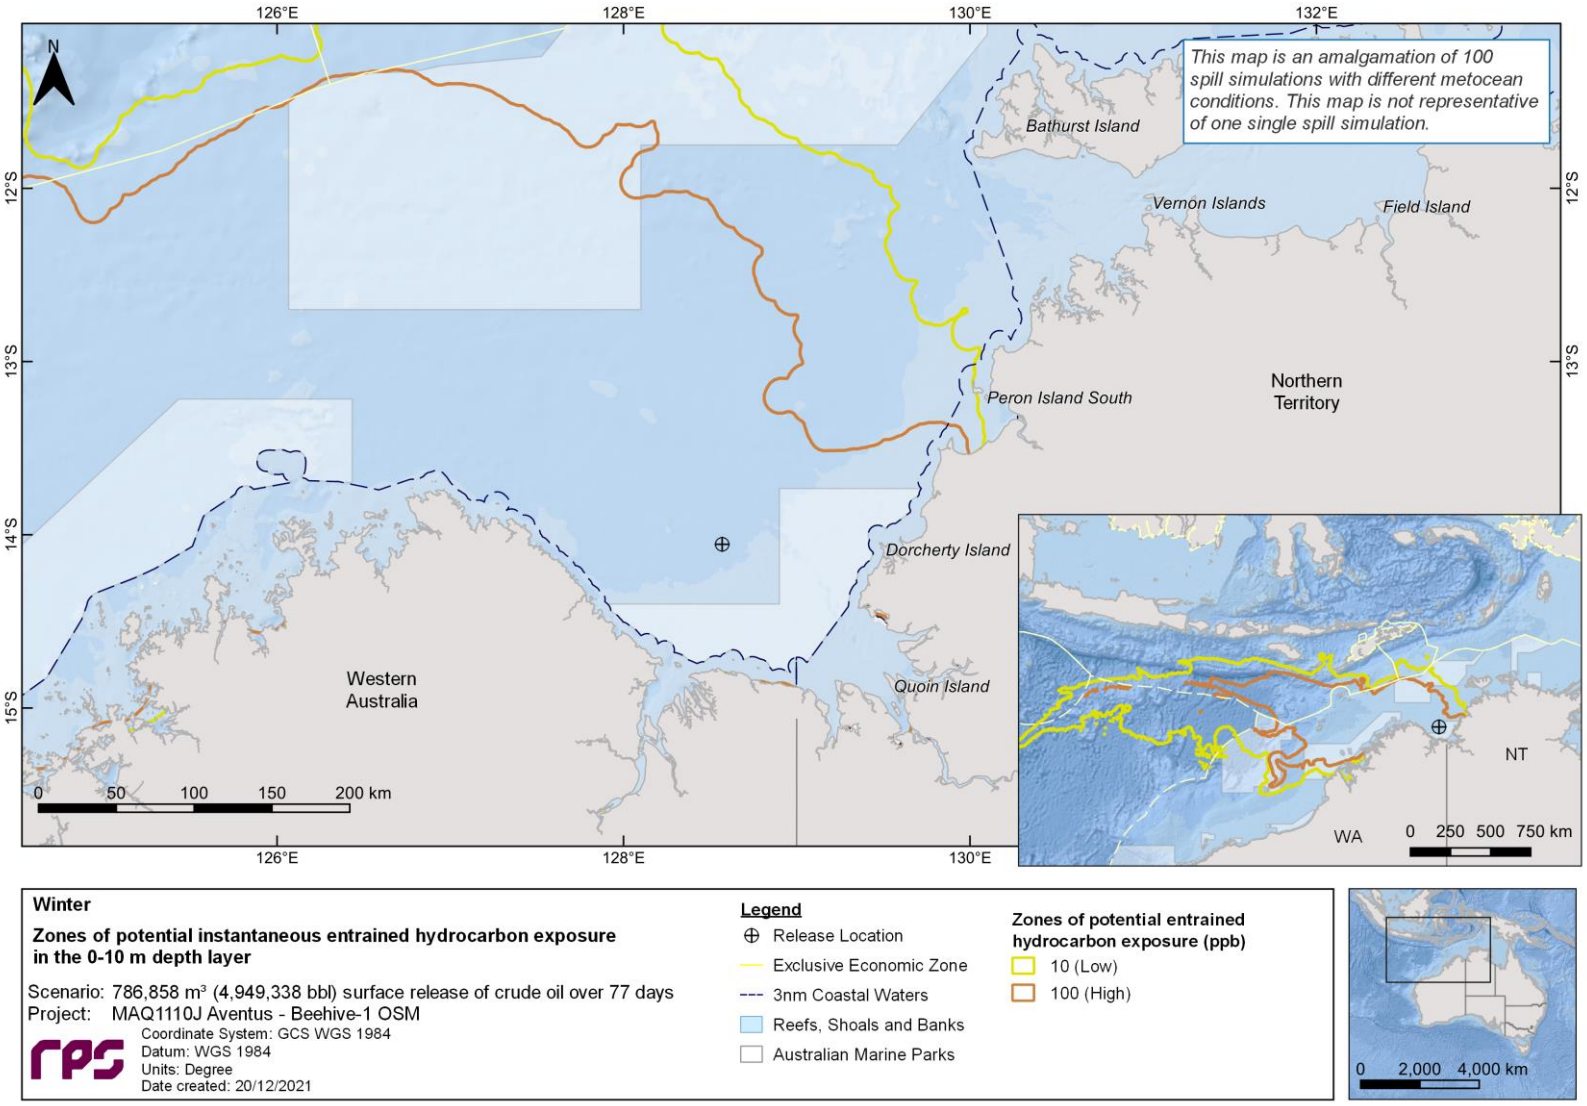

Figure 10.12 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories.

10.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and presented below. The deterministic analysis assessed the largest swept area of floating oil above 1 g/m^2 (see Section 10.2.1), the minimum time before shoreline accumulation above 10 g/m^2 (see Section 10.2.2), the largest volume of oil ashore (see Section 1.1.1), the longest length of shoreline accumulation above 10 g/m^2 (see Section 1.1.1), the largest area of entrained hydrocarbons above 10 ppb (see Section 10.2.5), and the largest area of dissolved hydrocarbons above 10 ppb (see Section 1.1.1).

Table 10.9 presents a summary of all deterministic analysis criteria and the corresponding floating oil, shoreline accumulation, entrained hydrocarbon and dissolved hydrocarbon values at the assessed thresholds.

Table 10.9 Summary of the deterministic analysis. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions.

Variable	Threshold	Deterministic Analysis Criteria: Largest swept area of floating oil above 1 g/m^2	Minimum time before shoreline accumulation above 10 g/m^2	Largest volume of oil ashore	Longest length of shoreline accumulation above 10 g/m^2	Largest area of entrained hydrocarbons above 10 ppb	Largest area of dissolved hydrocarbons above 10 ppb

NC = No contact at, or above the specified shoreline accumulation threshold.

10.2.1 Deterministic Case: Largest swept area of floating oil above 1 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 1 g/m^2 (low threshold and visible floating oil) was identified during summer conditions as run number 79 which started on 16th January 2011 (map illustrated in Figure 10.13).

Figure 10.14 displays the time series of the swept area of low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) floating oil over the 98-day simulation.

Figure 10.15 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.10 summarises the mass balance at the end of the simulation.

Table 10.10 Summary of the mass balance at day 98, for the trajectory that resulted in the largest swept area of floating oil above 1 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)
Surface/Floating Oil (m^3)	0
Entrained (m^3)	140,659
Dissolved (m^3)	419

Decay (m^3)	348,045
Ashore/Shoreline (m^3)	166
Sediment (m^3)	794

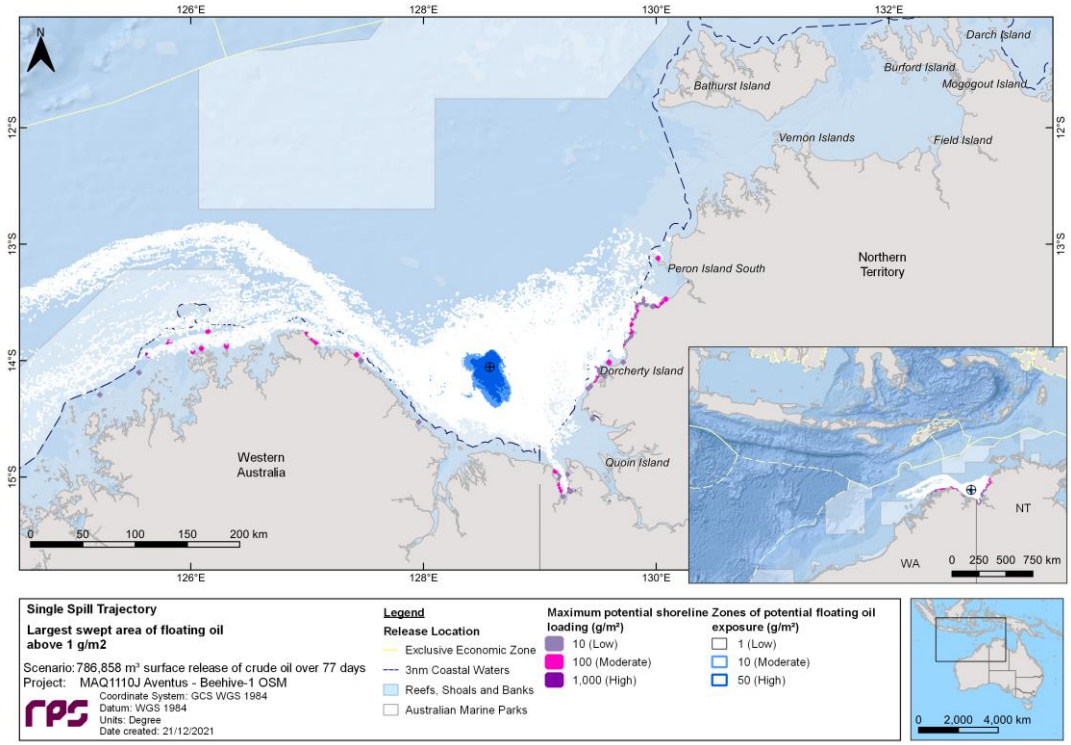

Figure 10.13 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the largest swept area of floating oil above 1 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

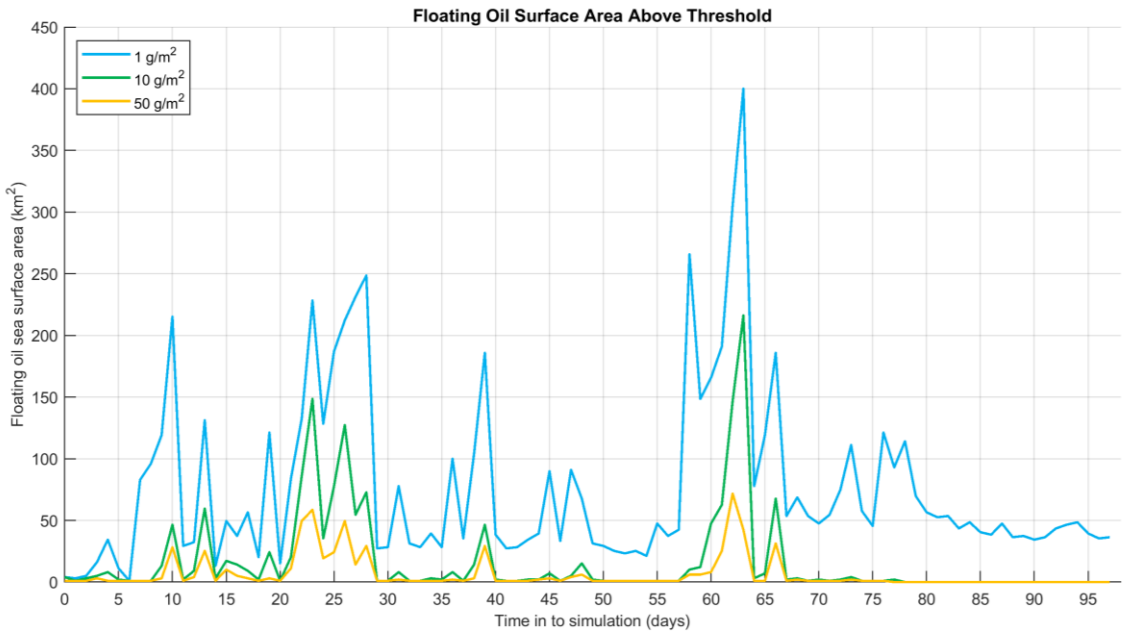

Figure 10.14 Time series of the area of low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) floating oil for the trajectory with the largest swept area of floating oil above 1 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

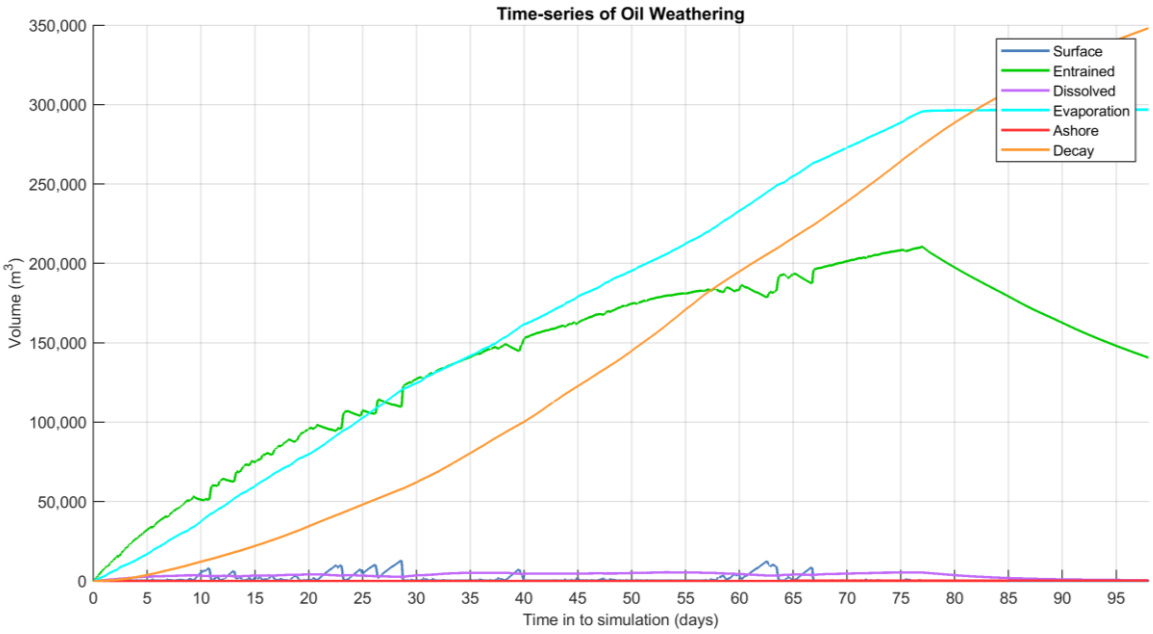

Figure 10.15 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 1 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.2 Deterministic Case: Minimum time before shoreline accumulation above 10 g/m^2

The deterministic trajectory that resulted in the minimum time before shoreline accumulation above the low threshold (10 g/m^2) was identified during transitional conditions as run number 88 which started on the 23rd September 2016 (map illustrated in Figure 10.16

Figure 10.17 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.11 summarises the mass balance at the end of the 98-day simulation.

Table 10.11 Summary of the mass balance at day 98, for the trajectory that resulted in the minimum time before shoreline accumulation above the low threshold (10 g/m^2). Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)
Surface/Floating Oil (m^3)	0
Entrained (m^3)	144,203
Dissolved (m^3)	401
Evaporated (m^3)	317,482
Decay (m^3)	323,707
Ashore/Shoreline (m^3)	271
Sediment (m^3)	794

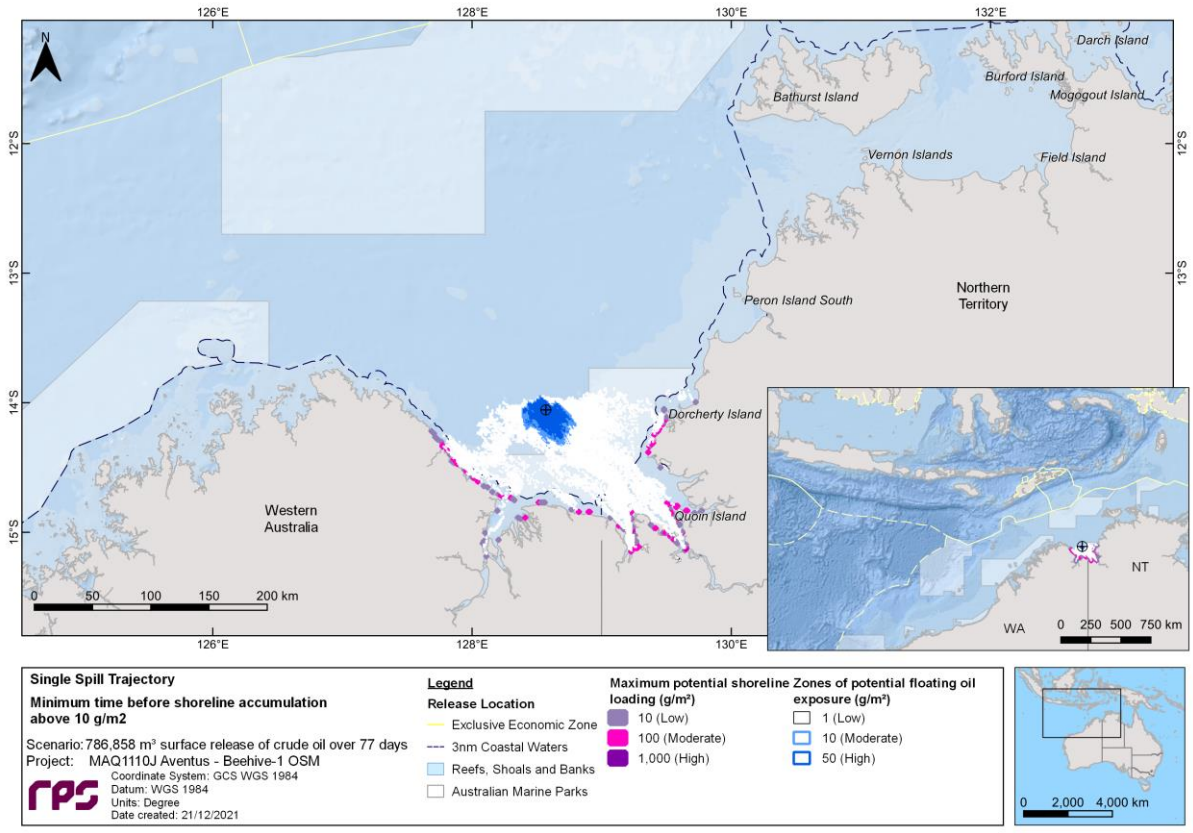

Figure 10.16 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the minimum time before shoreline accumulation above 10 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

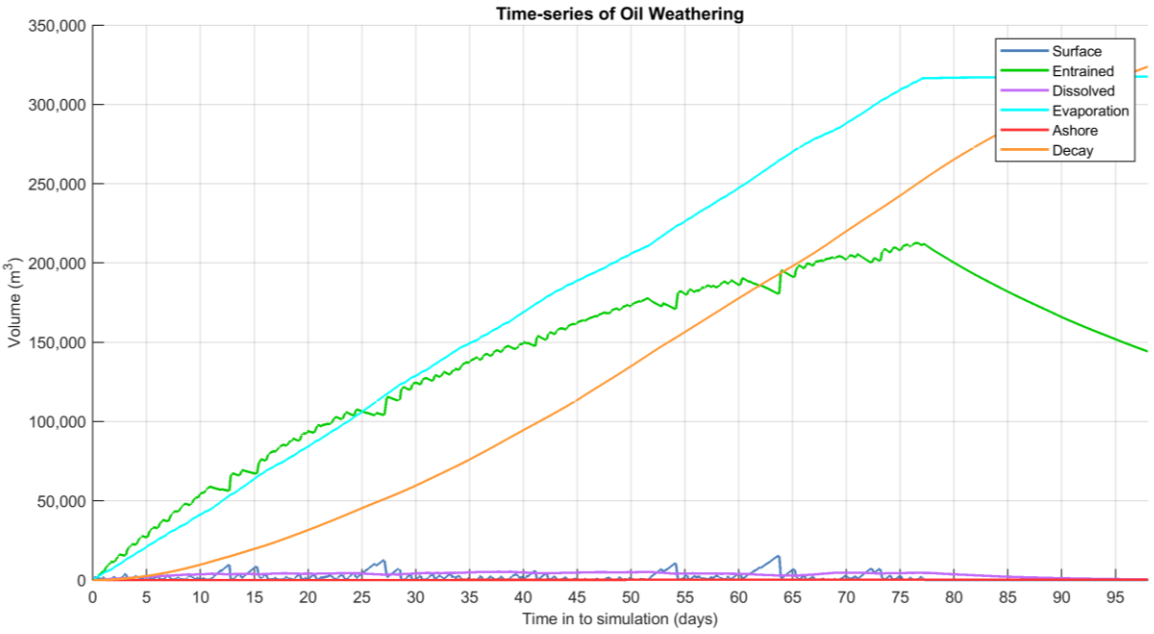

Figure 10.17 Predicted weathering and fates graph for the trajectory with the minimum time before shoreline accumulation above 10 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.3 Deterministic Case: Largest volume of oil ashore

The deterministic trajectory that resulted in the largest volume of oil ashore was identified during summer conditions as run number 84 which started on the 19th December 2011 (map illustrated in Figure 10.18).

Figure 10.19 displays the time series of the volume of oil accumulating on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 98-day simulation.

Figure 10.20 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.12 summarises the mass balance at the end of the simulation.

Table 10.12 Summary of the mass balance at day 98, for the trajectory that resulted in the largest volume of oil ashore. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)
Surface/Floating Oil (m^3)	0
Entrained (m^3)	141,875
Dissolved (m^3)	830
Evaporated (m^3)	325,596
Decay (m^3)	317,102
Ashore/Shoreline (m^3)	659
Sediment (m^3)	794

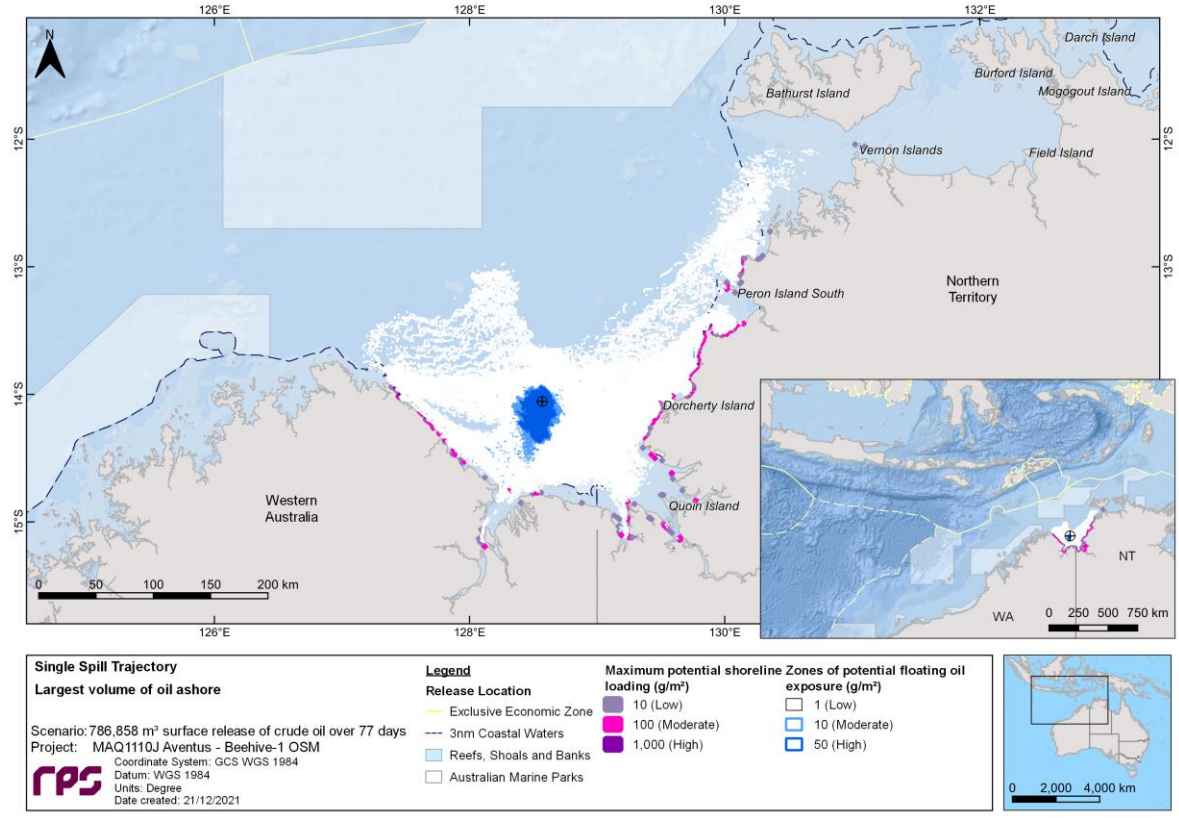

Figure 10.18 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the largest volume of oil ashore. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

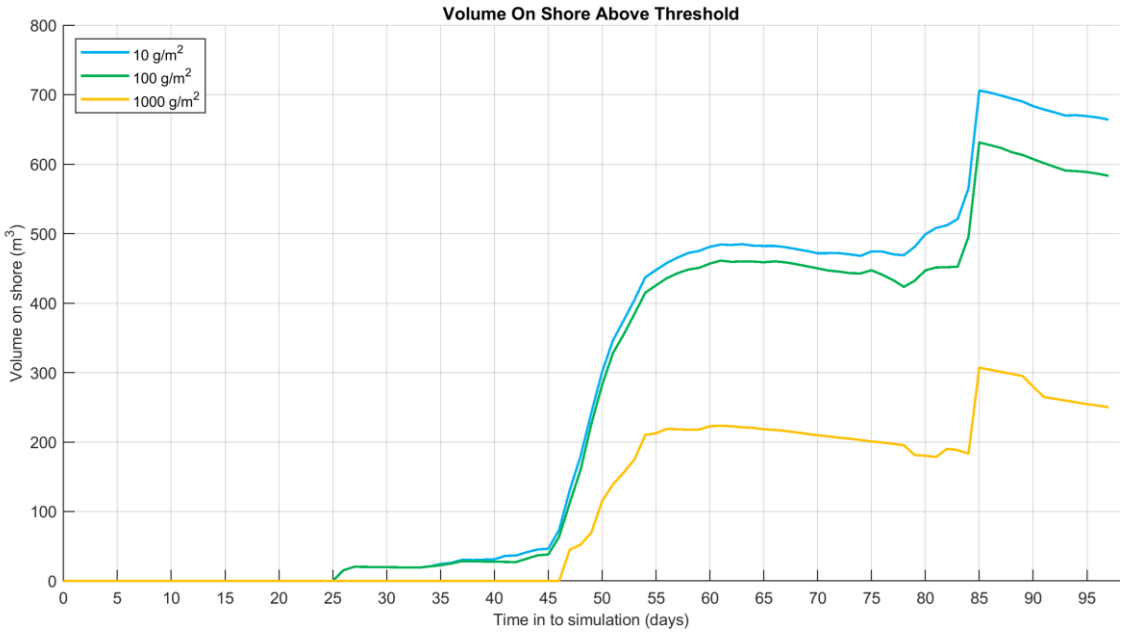

Figure 10.19 Time series of the volume of oil accumulating on shorelines at the low (10 g/m2), moderate (100 g/m2) and high (1,000 g/m2) thresholds for the trajectory with the largest volume of oil ashore. Results are based on a 786,858 m3 surface release of crude oil over 77 days, tracked for 98 days.

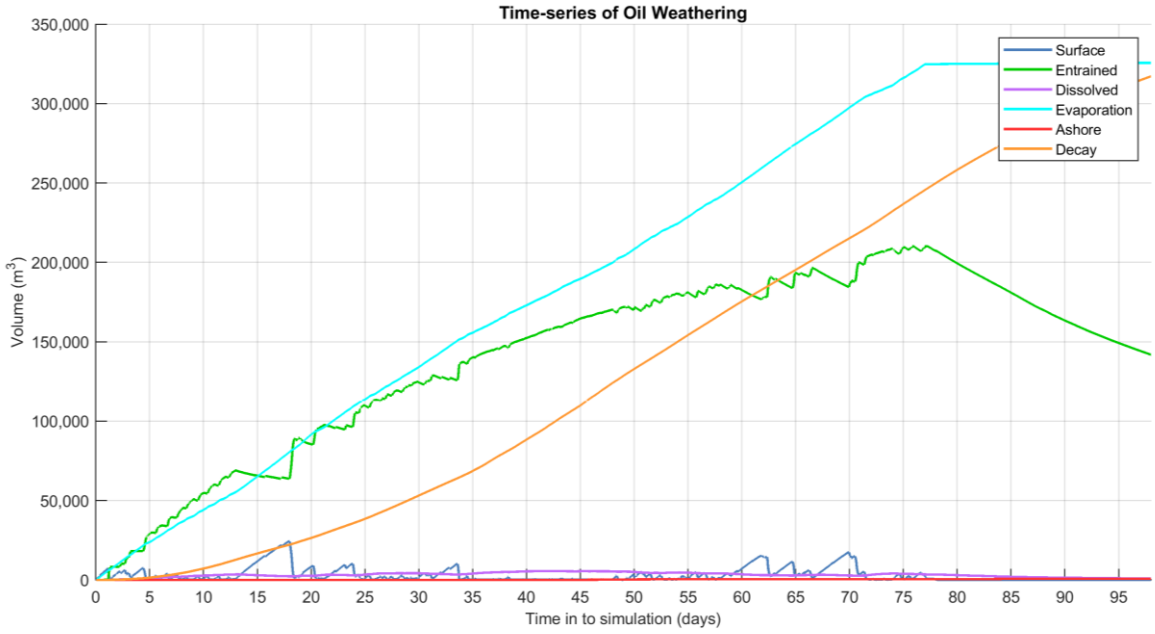

Figure 10.20 Predicted weathering and fates graph for the trajectory with the largest volume of oil ashore. Results are based on a 786,858 m3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.4 Deterministic Case: Longest length of shoreline accumulation above 10 g/m^2

The deterministic trajectory that resulted in the longest length of shoreline accumulation above 100 g/m^2 was identified during summer conditions as run number 33 which started on the 25th November 2013 (map illustrated in Figure 10.21).

Figure 10.22 displays the time series of the length of oil accumulation on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 98-day simulation.

Figure 10.23 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.13 summarises the mass balance at the end of the simulation.

Table 10.13 Summary of the mass balance at day 98, for the trajectory that resulted in the longest length of shoreline accumulation above 10 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)
Surface/Floating Oil (m^3)	0
Entrained (m^3)	140,158
Dissolved (m^3)	491
Evaporated (m^3)	315,572
Decay (m^3)	329,599
Ashore/Shoreline (m^3)	245
Sediment (m^3)	794

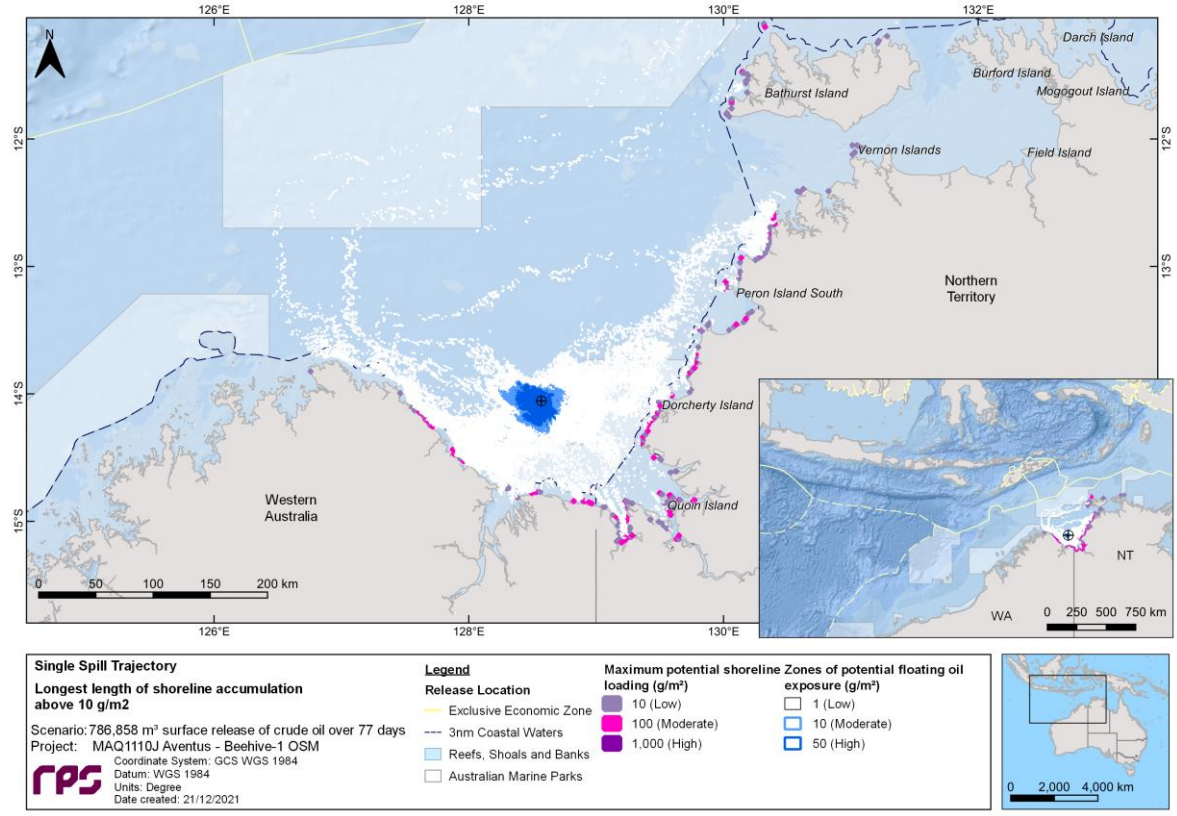

Figure 10.21 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the longest length of shoreline accumulation above 10 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

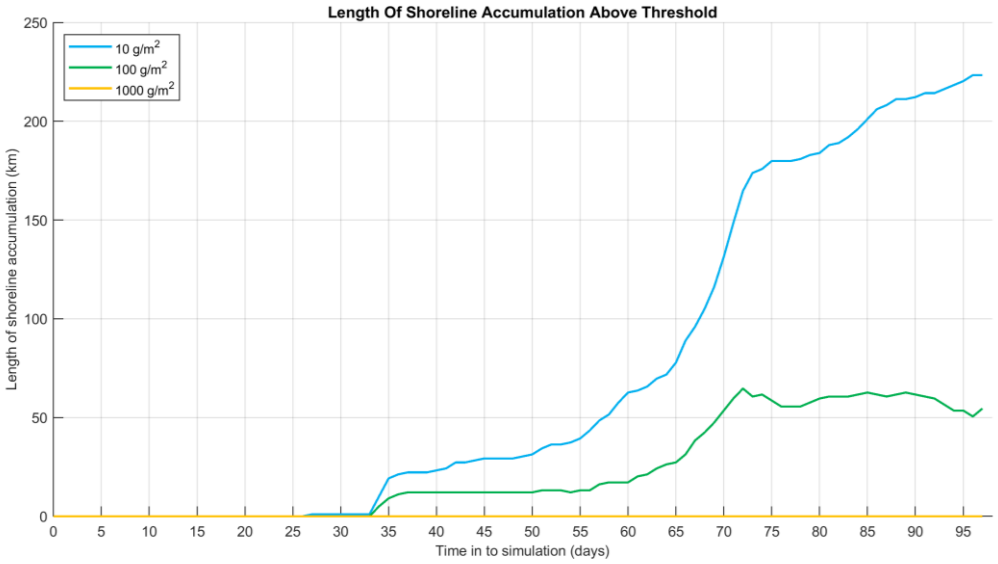

Figure 10.22 Time series of the length of shoreline at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m2) thresholds for the trajectory with the longest length of shoreline accumulation above 10 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

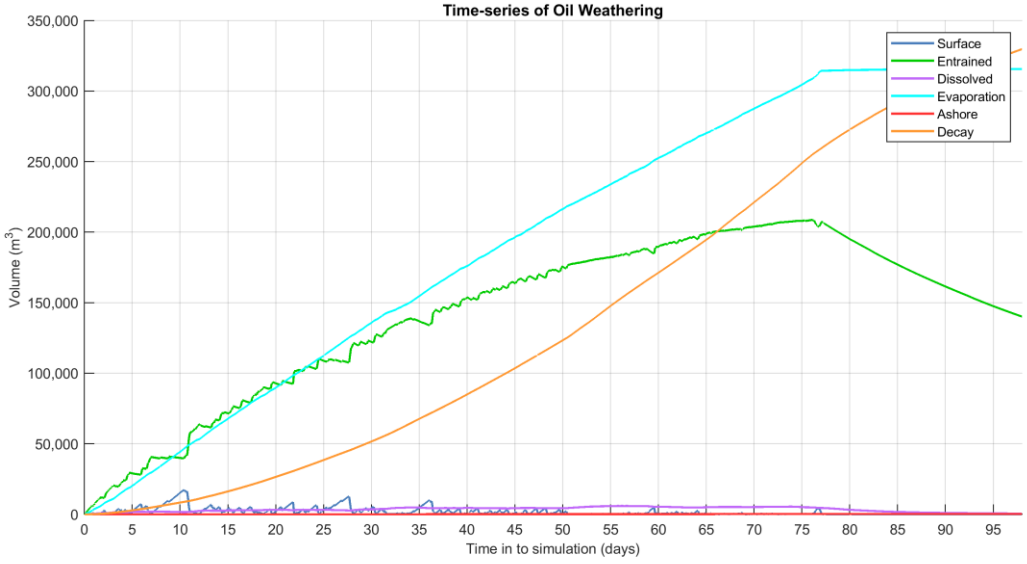

Figure 10.23 Predicted weathering and fates graph for the trajectory with the longest length of shoreline accumulation above 10 g/m^2. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.5 Deterministic Case: Largest area of entrained hydrocarbons above 10 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbons above 10 ppb (low threshold) was identified during winter conditions as run number 1 which started on the 8th June 2011 (map illustrated in Figure 10.24).

Figure 10.25 displays the time series of the area of entrained hydrocarbons at the low (10 ppb) and moderate (100 ppb) thresholds over the 98-day simulation.

Figure 10.26 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.14 summarises the mass balance at the end of the simulation.

Table 10.14 Summary of the mass balance at day 98, for the trajectory that resulted in the largest area of entrained hydrocarbons above 10 ppb. Results are based on 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)
Surface/Floating Oil (m³)	0
Entrained (m³)	142,358
Dissolved (m³)	562
Evaporated (m³)	291,765
Decay (m³)	351,324
Ashore/Shoreline (m³)	55
Sediment (m³)	794

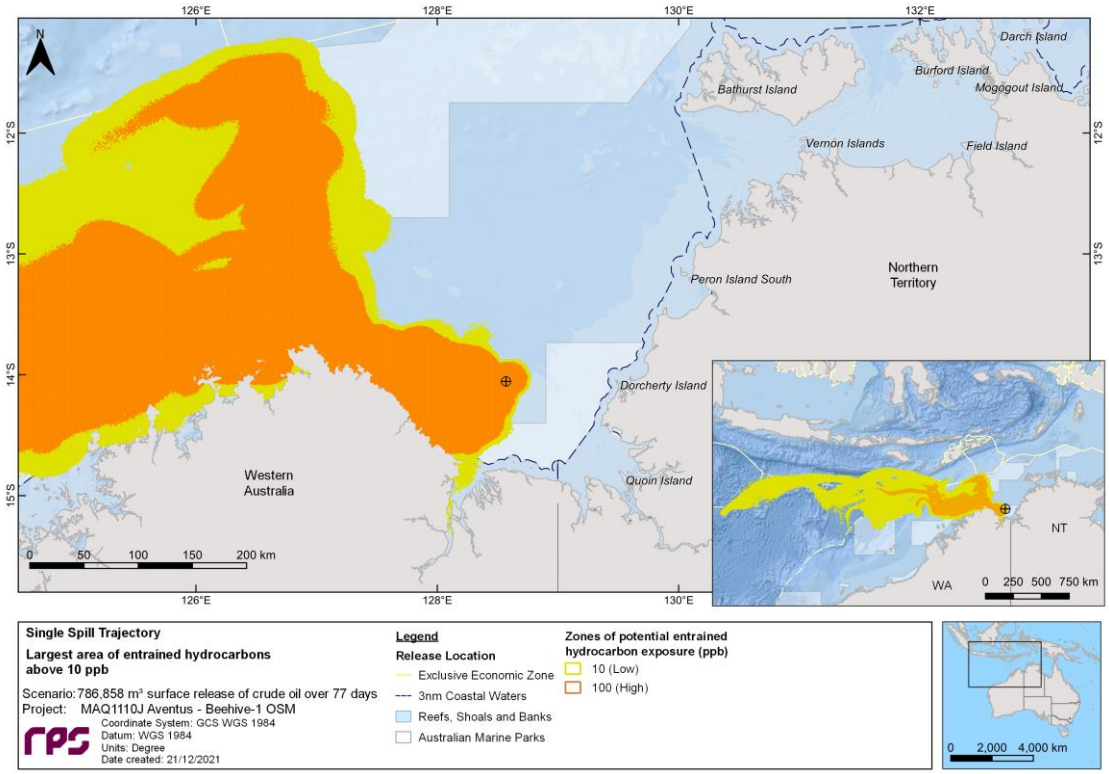

Figure 10.24 Zones of potential entrained hydrocarbon exposure, for the trajectory with the largest area of entrained hydrocarbons above 10 ppb. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

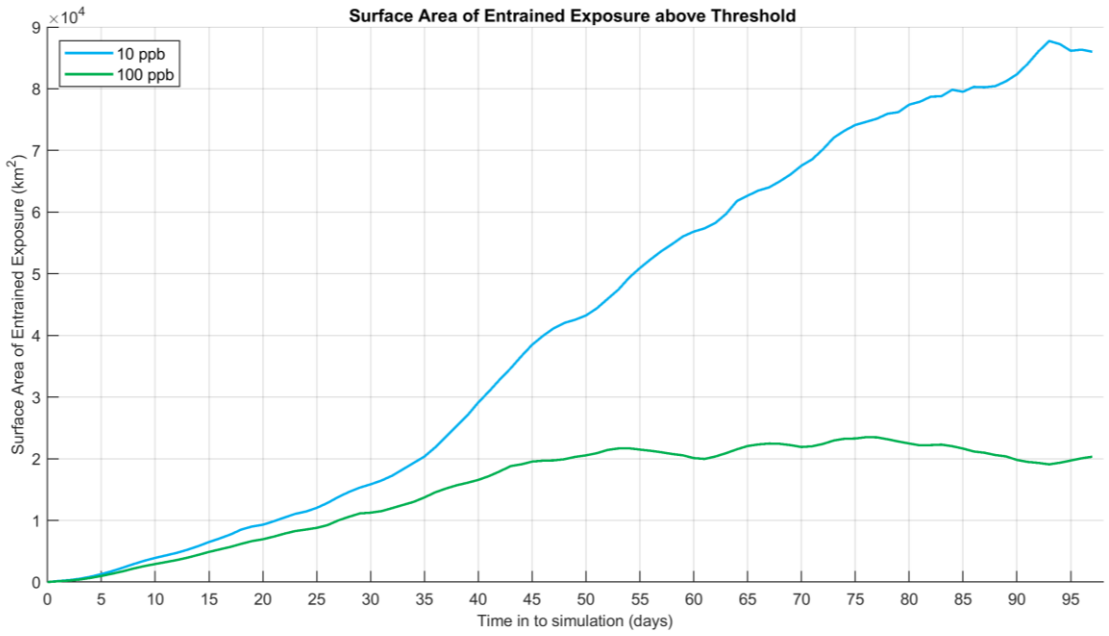

Figure 10.25 Time series of the area of low (10 ppb) and moderate (100 ppb) entrained hydrocarbons for the trajectory with the largest area of entrained hydrocarbons above 10 ppb. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

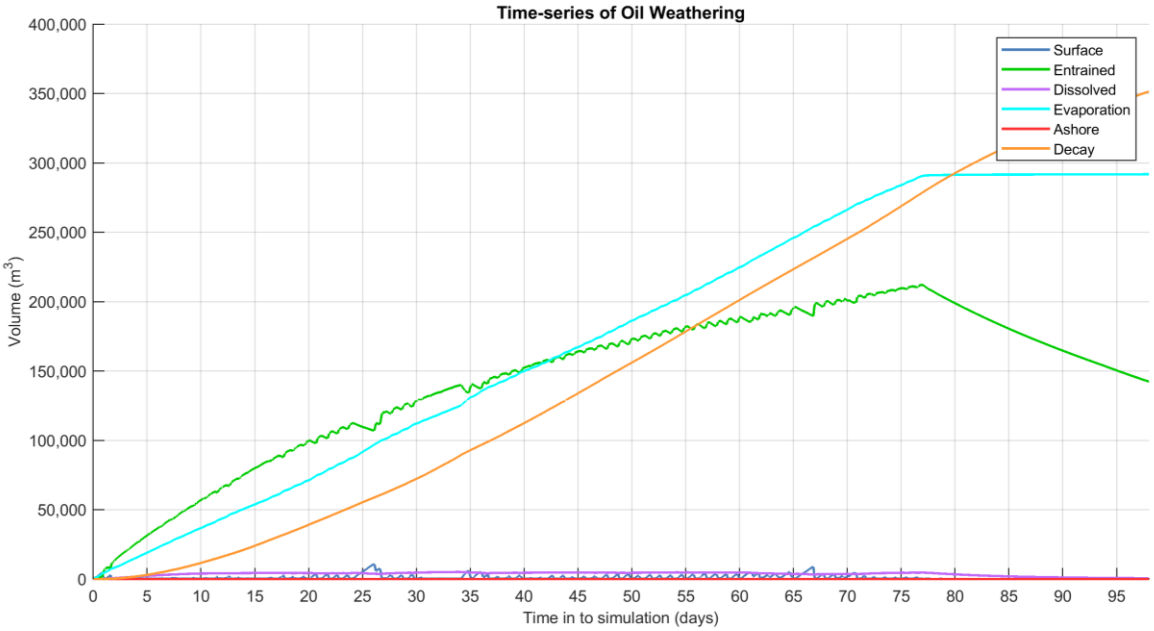

Figure 10.26 Predicted weathering and fates graph for the trajectory with the largest area of entrained hydrocarbons above 10 ppb. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.6 Deterministic Case: Largest area of dissolved hydrocarbons above 10 ppb

The deterministic trajectory that resulted in the largest area of dissolved hydrocarbons above 10 ppb (low threshold) was identified during summer conditions as run number 7 which started on the 27th November 2013 (map illustrated in Figure 10.27).

Figure 10.28 displays the time series of the area of dissolved hydrocarbons at the low (10 ppb), moderate (50 ppb) and high (400 g/m^2) thresholds over the 98-day simulation.

Figure 10.29 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.15 summarises the mass balance at the end of the simulation.

Table 10.15 Summary of the mass balance at day 98, for the trajectory that resulted in the largest area of dissolved hydrocarbons above 10 ppb. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)
Surface/Floating Oil (m^3)	0
Entrained (m^3)	140,338
Dissolved (m^3)	505
Evaporated (m^3)	315,546
Decay (m^3)	329,456
Ashore/Shoreline (m^3)	219
Sediment (m^3)	794

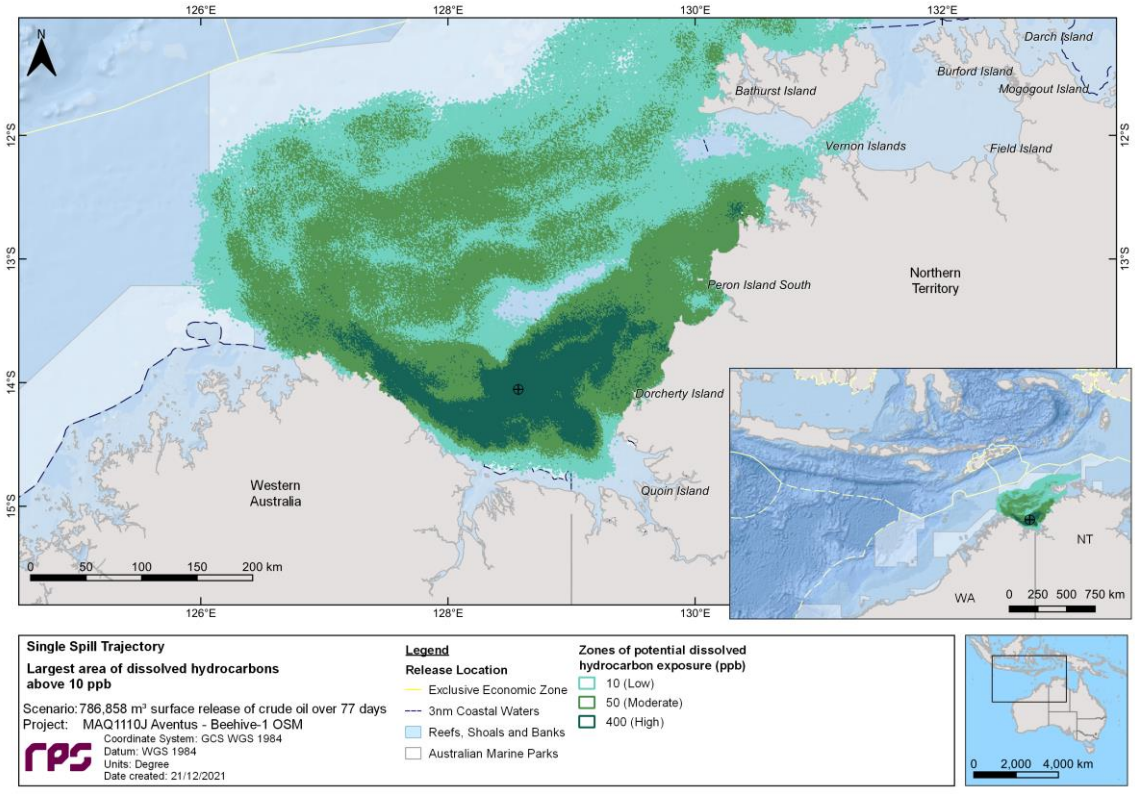

Figure 10.27 Zones of potential dissolved hydrocarbon exposure, for the trajectory with the largest area of dissolved hydrocarbons above 10 ppb. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

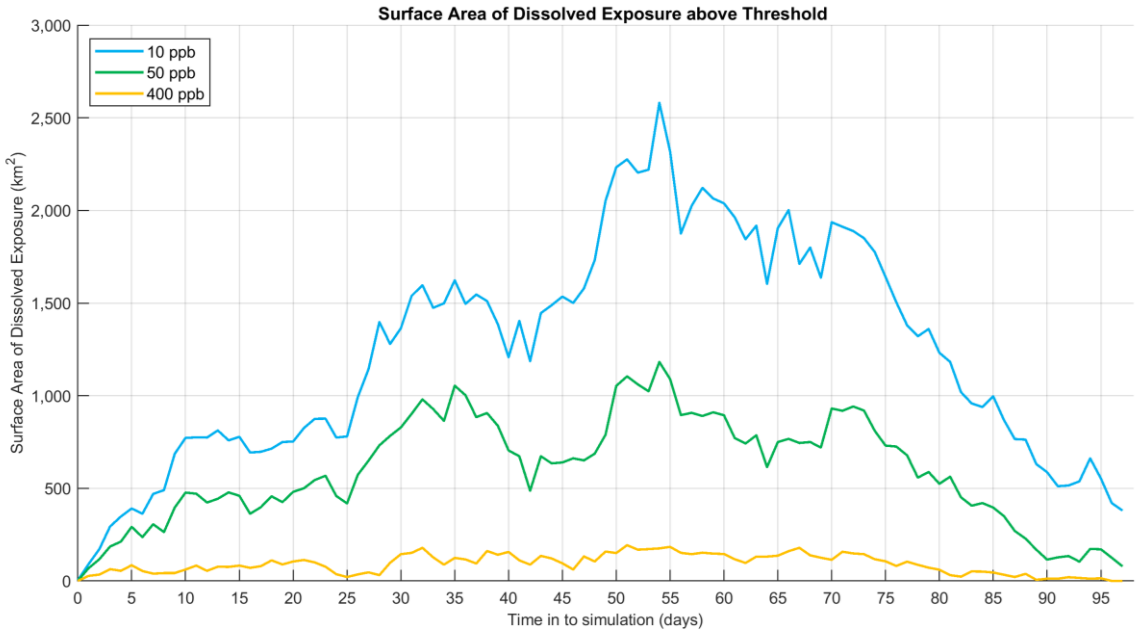

Figure 10.28 Time series of the area of low (10 ppb), moderate (50 ppb) and high (400 ppb) dissolved hydrocarbons for the trajectory with the largest area of dissolved hydrocarbons above 10 ppb. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

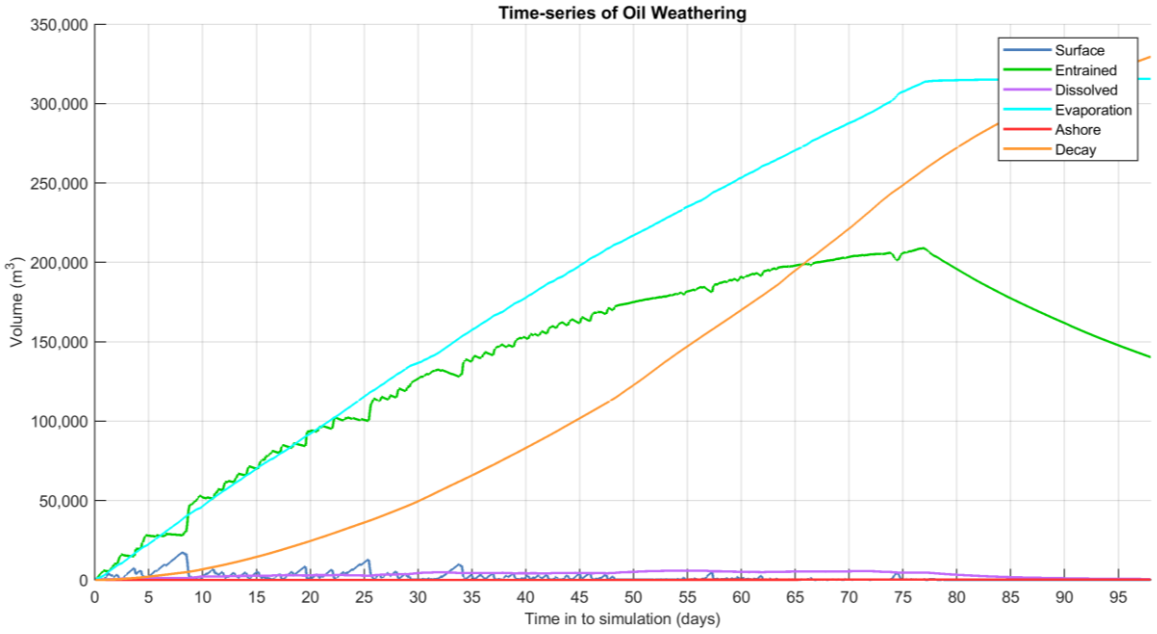

Figure 10.29 Predicted weathering and fates graph for the trajectory with the largest area of dissolved hydrocarbons above 10 ppb. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Contents

Tables

Figures

TERMS AND ABBREVIATIONS

°	Degrees
‘	Minutes
“	Seconds
µm	Micrometre (unit of length; 1 µm = 0.001 mm)
Actionable oil	Oil which is thick enough for the effective use of mitigation strategies
AIS	Automatic identification system
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ASTM	American Society for Testing and Materials
Aventus	Aventus Consulting Pty Ltd
bbl	Barrel (unit of volume; 1 bbl = 0.159 m3)
bbl/d	Barrels per day
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
°C	degree Celsius (unit of temperature)
CFSR	Climate Forecast System Reanalysis
cm	Centimetre (unit of length)
cP	Centipoise (unit of dynamic viscosity)
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
EOG	EOG Resources, Inc.
EP	Environment Plan
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
g/m^2	Grams per square meter (unit of surface area density)

GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IBRA	Interim Biogeographic Regionalisation for Australia
IMCRA	Integrated Marine and Coastal Regionalisation of Australia
IOA	Index of Agreement
ITOPF	International Tanker Owners Pollution Federation Limited
KEF	Key Ecological Feature
km	Kilometre (unit of length)
km^2	Square Kilometres (unit of area)
Knots	unit of speed (1 knot = 0.514 m/s)
LOWC	Loss of well control
m	Meter (unit of length)
m^3	Cubic meter (unit of volume)
m/s	Meter per Second (unit of speed)
MAE	Mean Absolute Error
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park
MP	Marine Park
N	Number of observations
NASA	National Aeronautics and Space Administration (USA)
NCEP	National Centres for Environmental Prediction (USA)
nm	Nautical mile
NOAA	National Oceanic and Atmospheric Administration (USA)
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park
NR	Nature Reserve
O	Observed variable
Oi	Observed surface elevation
OPEP	Oil Pollution Emergency Plan
P	Model-predicted variable
Pi	Model predicted surface elevation
PAH	Polynuclear Aromatic Hydrocarbons
PDSA	Pre-drilling seabed assessment
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics

ppb	Parts per billion (concentration)
psu	Practical salinity nits
RSB	Reefs, Shoals and Banks
scf	Standard cubic feet (defined as one cubic foot of gas at 15.56 °C and at normal sea level air pressure)
Shoreline contact	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
Single Oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
SRTM	Shuttle Radar Topography Mission
Stochastic oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the environment that maybe affected (EMBA) and indicates which locations are more likely to be affected (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be affected in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment

EXECUTIVE SUMMARY

Background

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to undertake the Beehive-1 drilling campaign within permit area WA-488-P located in the Bonaparte Basin in the Joseph Bonaparte Gulf, Western Australia.

Aventus Consulting Pty Ltd (Aventus) has been contracted by EOG to prepare the Environment Plan (EP) and Oil Pollution Emergency Plan (OPEP) for the planned activity.

To inform the potential environmental impact and risk assessments for the proposed drilling campaign, Aventus commissioned RPS to undertake a detailed crude oil spill modelling study assessing the following hypothetical scenario:

- **Scenario**: A 786,858 m^3 (or 4,949,338 bbl) surface release of crude oil over 77 days to represent a loss of well control (unmitigated case).

In addition, the study examined the potential benefit of applying surface dispersant as a mitigation measure (referred to as the mitigated case).

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a ten-year CFSR wind and HYCOM current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 spill simulations initiated at random start times, using the same release information (spill volume, duration and composition of the oil). This ensured that each simulation was subject to different wind and current conditions and, in turn, movement and weathering of the oil for an annual based assessment.

The 100 simulations per season were remodelled under identical conditions, with surface dispersant applied to oil within an area where the age of the oil ranged between 12 hours and 72 hours. A dispersant to oil ratio of 1:20 and effectiveness of 65% was assumed for 10 hours during daylight, starting from 24 hours after the initial release.

The SIMAP system, the methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Oil Properties

An analogue crude oil was used to represent the LOWC scenario. The analogue crude oil was carefully selected based on EOG recommendations to represent the crude oil likely to be found within permit area WA-488-P. The crude oil has an API of 42.3 and a density of 813.9 kg/m^3 (at 15ºC) with a viscosity value (3.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The crude is a mixture of volatile (79%) and persistent hydrocarbons (21%). In favourable evaporation conditions, about 24.2% of the oil mass should evaporate within the first 12 hours (BP < 180 °C); a further 20.8% should evaporate within the first 24 hours (180°C < BP < 160°C); and a further 33.9% should evaporate over several days (160°C < BP < 380°C). Approximately 21.0% of the oil is shown to be persistent.

Results

Scenario: LOWC – 786,858 m^3 Surface Release of Crude Oil over 77 Days

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure levels was 1,517 km (winter), 153 km (summer) and 61 km (winter) respectively, for the unmitigated case. In comparison for the mitigated case (i.e. application of surface dispersant) the maximum distance from the release location to the low, moderate and high exposure levels was 1,257 km west (winter), 134 km east-northeast (summer) and 125 km south-southeast (summer), respectively.

- For spills commencing during summer conditions, the following receptors recorded surface oil exposure greater than 70% for both the unmitigated and mitigated cases: Joseph Bonaparte Gulf AMP, Carbonate bank and terrace system of the Sahul Shelf KEF, North Kimberley MP, Wyndham - East Kimberley nearshore waters, and Northern Territory and Western Australia State Waters

- The probability of accumulation to any shoreline at, or above, the low threshold (10 g/m^2) was 100% for all seasons for both the unmitigated and mitigated cases and the minimum time before shoreline accumulation at, or above, the low threshold ranged between 10.29 days (transitional) to 11.58 days (summer) for the unmitigated case and 10.71 days (winter) to 13.17 days (summer) for the mitigated case.

- The greatest volume of oil on shore from a single spill trajectory was predicted to reduce from 705 m^3 (summer) to 421 m^3 (summer) when the mitigation option was considered. This represented a reduction of 40.3%.

- For all seasonal conditions assessed, the modelling demonstrated a reduction in the length of shoreline contact above the low (39%), moderate (27%) and high (21%) thresholds, when the surface dispersant was applied.

- In the surface (0-10 m) depth layer, low, moderate and high exposure to dissolved hydrocarbons was recorded for a range of receptors for both the unmitigated and mitigated cases. The highest dissolved hydrocarbon concentrations predicted for both cases were the Joseph Bonaparte Gulf AMP and the Carbonate bank and terrace system of the Sahul Shelf KEF, the North Kimberley MP and the Kimberley AMP during the seasonal conditions. As well, the nearshore waters of the Thamarrurr, Wyndham-East Kimberley, Dorcherty Island, Clump Island Quoin, Island, Victoria Daly shorelines and were some of the receptors with the highest entrained hydrocarbons concentrations for all seasonal conditions.

- Predicted low and high entrained hydrocarbons exposure in the surface (0-10 m) depth layer was recorded for a range of receptors. Furthermore, the identified receptors with the highest predicted entrained hydrocarbons concentrations for the unmitigated and mitigated cases for all three seasons, included: Carbonate bank and terrace system of the Sahul Shelf KEF, Joseph Bonaparte Gulf AMP, Kimberley AMP, North Kimberley MP and nearshore waters of the Thamarrurr, Wyndham - East Kimberley, Dorcherty Island, Clump Island, Quoin Island, Victoria Daly shorelines and RSB receptors, Bassett-Smith Shoal, Branch Banks, East Holothuria Reef, Emu Reefs, Holothuria Banks, Howland Shoals, Otway Bank and Tait Bank).

1 INTRODUCTION

1.1 Background

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to undertake a drilling campaign within permit area WA-488-P located in the Bonaparte Basin in the Joseph Bonaparte Gulf, Western Australia.

Aventus Consulting Pty Ltd (Aventus) has been contracted by EOG to prepare the Environment Plan (EP) and Oil Pollution Emergency Plan (OPEP) for the planned activity.

To inform the potential environmental impact and risk assessments for the proposed drilling campaign, Aventus commissioned RPS to undertake a detailed oil spill modelling study assessing the following hypothetical scenario:

- **Scenario**: A 786,858 m^3 (or 4,949,338 bbl) surface release of crude oil over 77 days to represent a loss of well control (unmitigated case).

In addition, the study examined the potential benefit of applying surface dispersant as a mitigation measure (referred to as the mitigated case).

Table 1.1 presents the Beehive-1 exploration well location used for Scenario 1. Figure 1.1 illustrates the exploration well location.

The potential risk of exposure to the surrounding waters and contact to shorelines was assessed for three distinct seasons defined by prevailing wind conditions.

i. summer (October to February),

ii. the transitional periods (March and September), and

iii. winter (April to August).

This approach assists with identifying the environmental values and sensitivities that would be at risk of exposure on a seasonal basis, given the dominant winds and water currents vary significantly among the seasons.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein uses modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Location	Latitude	Longitude
Beehive-1	14° 03' 14.4" S	128° 34' 35.76" E

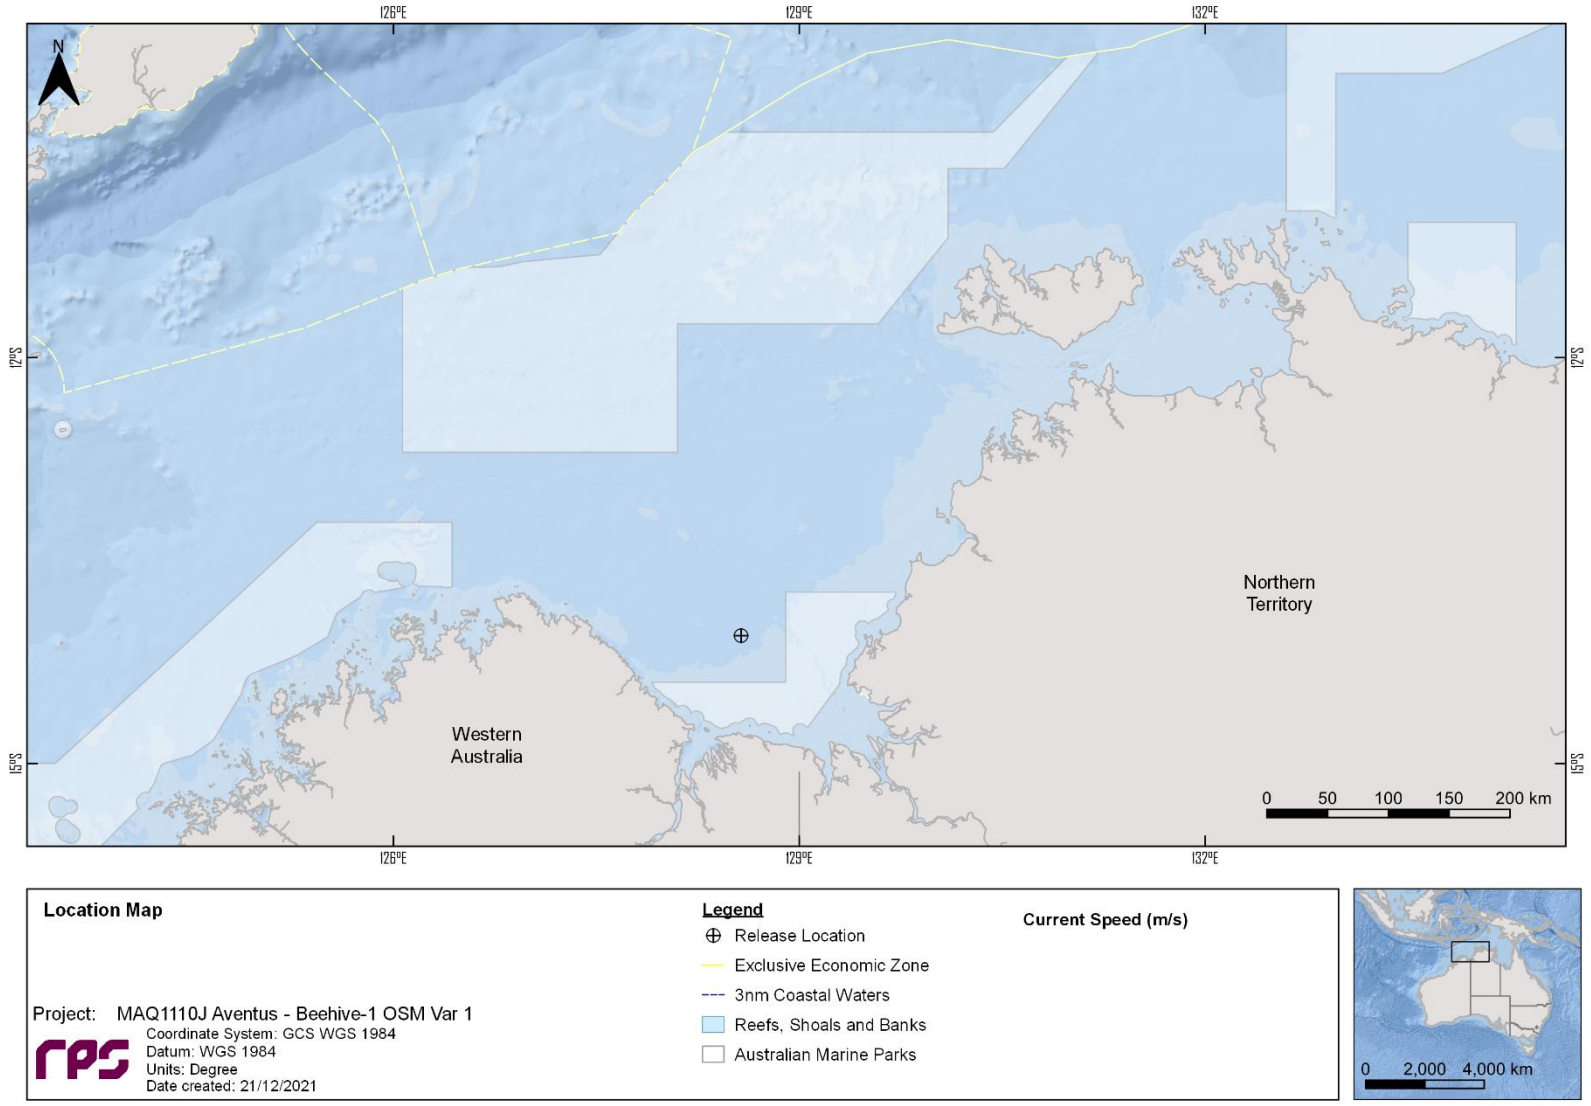

Figure 1.1 Map of the Beehive-1 exploration well.

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

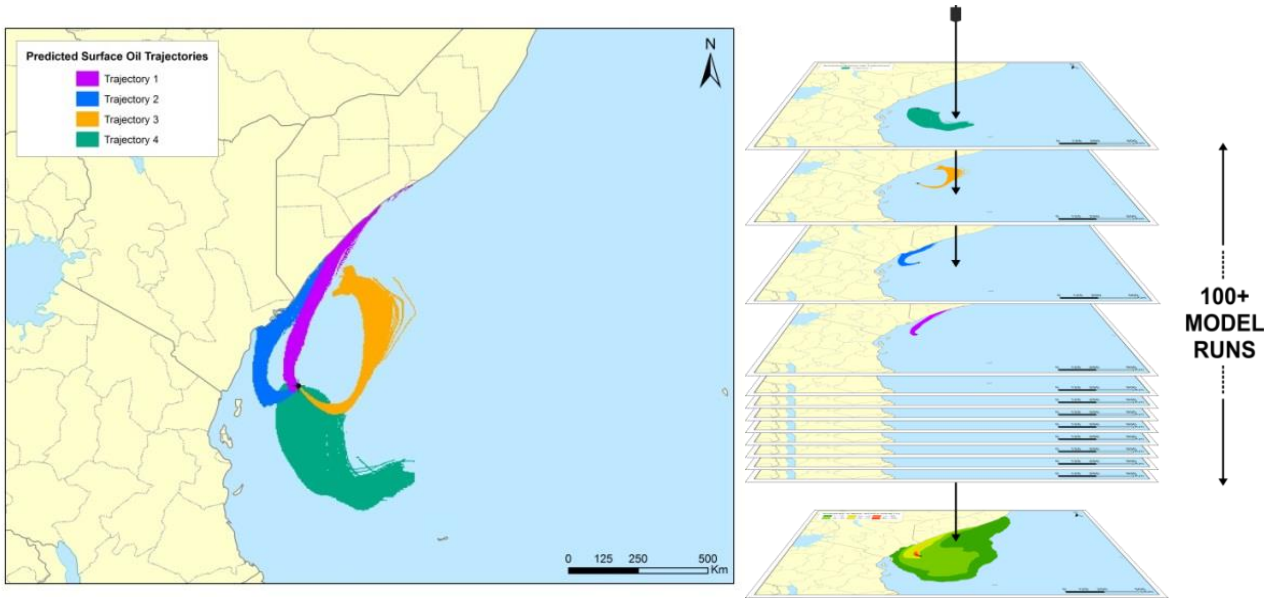

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore and longest length of shoreline contacted by oil.

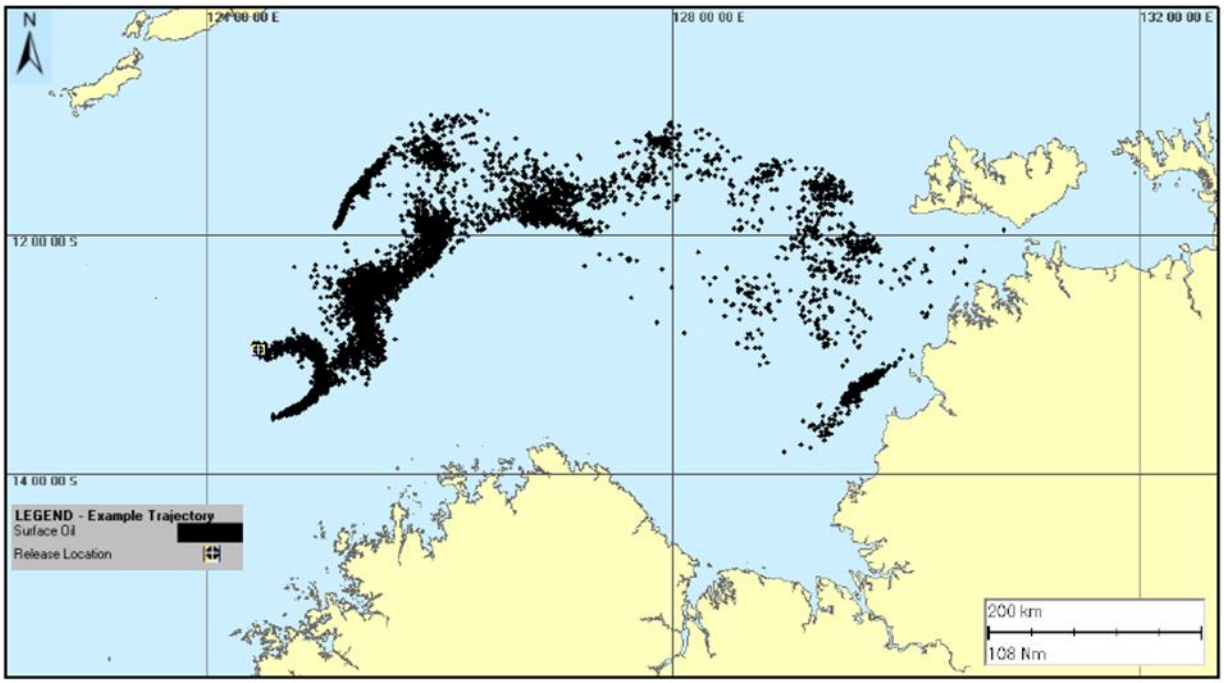

Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10 years of CFSR winds and three-dimensional hindcast HYCOM currents from 2010 to 2019 (inclusive). The currents include the combined influence of HYDROMAP tidal and HYCOM ocean currents;
- Include the wind and current data and hydrocarbon characteristics of the crude oil as input into the three-dimensional oil spill model SIMAP, to model the movement, spreading, weathering and shoreline accumulation by hydrocarbons over time;
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surrounding waters and shorelines. This involved running 100 randomly selected single trajectory simulations (per season), with each simulation having the same spill information (spill volume, location, duration and composition of hydrocarbons) but with varying start times. This ensured that each spill trajectory was subject to a unique set of wind and current conditions;
- Rerun SIMAP's stochastic model with the application of surface dispersant as a mitigation measure to calculate the reduced exposure to surrounding waters and shorelines;
- Review the unmitigated stochastic model results and present the worst-case deterministic runs identified case based on the following criteria:
    a. Largest swept area of floating oil above 1 g/m^2 (visible floating oil);
    b. Minimum time before shoreline accumulation above 10 g/m^2;
    c. Largest volume of oil ashore;
    d. Longest length of shoreline accumulation above 10 g/m^2;
    e. Largest area of entrained hydrocarbons above 10 ppb; and
    f. Largest area of dissolved hydrocarbons above 10 ppb.
- Present a comparison between the unmitigated and mitigated cases for the above worst-case deterministic runs to demonstrate the potential benefit of surface dispersant application.

3 REGIONAL CURRENTS

The Operational Area is located within the Joseph Bonaparte Gulf, a shallow (generally <100 m) waterbody bordered by the Indian Ocean and Timor Sea. The gulf is characterised by complex geomorphology (i.e. shoals, valleys and terraces) and is dominated by tidal (ranges > 4 m) and wind driven currents which are dependent on season (DEWHA, 2007).

The Indonesian Throughflow brings southwest flowing, less saline, warm waters from the tropics, however the internal gyres generate local currents in any direction. As these gyres migrate through the area, large spatial variations in the speed and direction of currents will occur at a given location over time. The Holloway current, which flows southwest and close to the coastline, intensifies during April to July due to increased wind forcing.

A comprehensive description of the circulation patterns of the Northwest Shelf and Timor Sea is provided in a review by Condie and Andrewartha (2008). A schematic of the ocean currents along the Northwest Australian continental shelf is shown in Figure 3.1.

While, the tidal currents are generally weaker in the deeper waters (beyond the Gulf), its influence is greatest along the near shore, within the Gulf, coastal passage regions and, in and around the islands. Therefore, to accurately account for the movement of an oil spill, which can move between the offshore and near shore region, ocean and tidal currents were combined as part of the study.

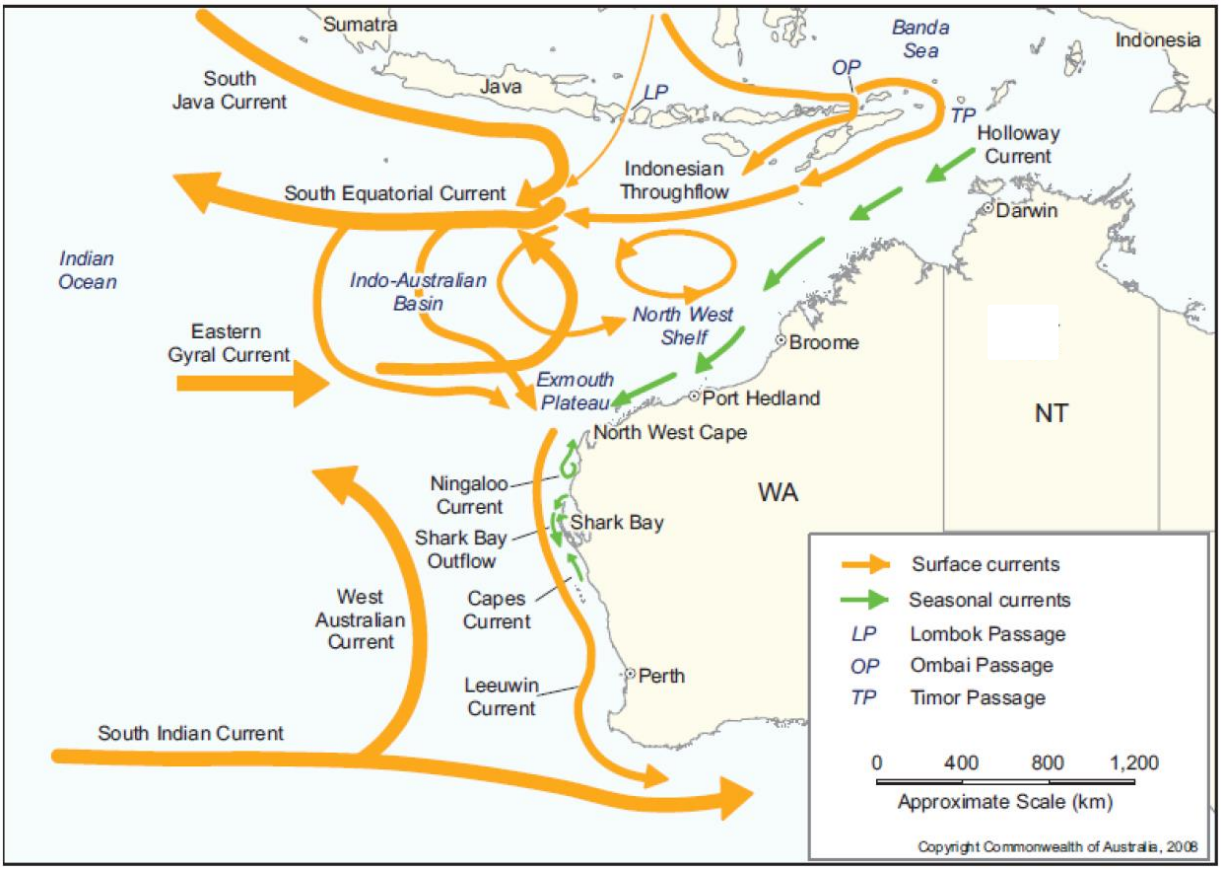

Figure 3.1 Schematic of ocean currents along the Northwest Australian continental shelf. Image adapted from DEWHA (2008).

3.1 Tidal currents

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for more than 30 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

RPS has a global tidal model with global coverage. The model is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

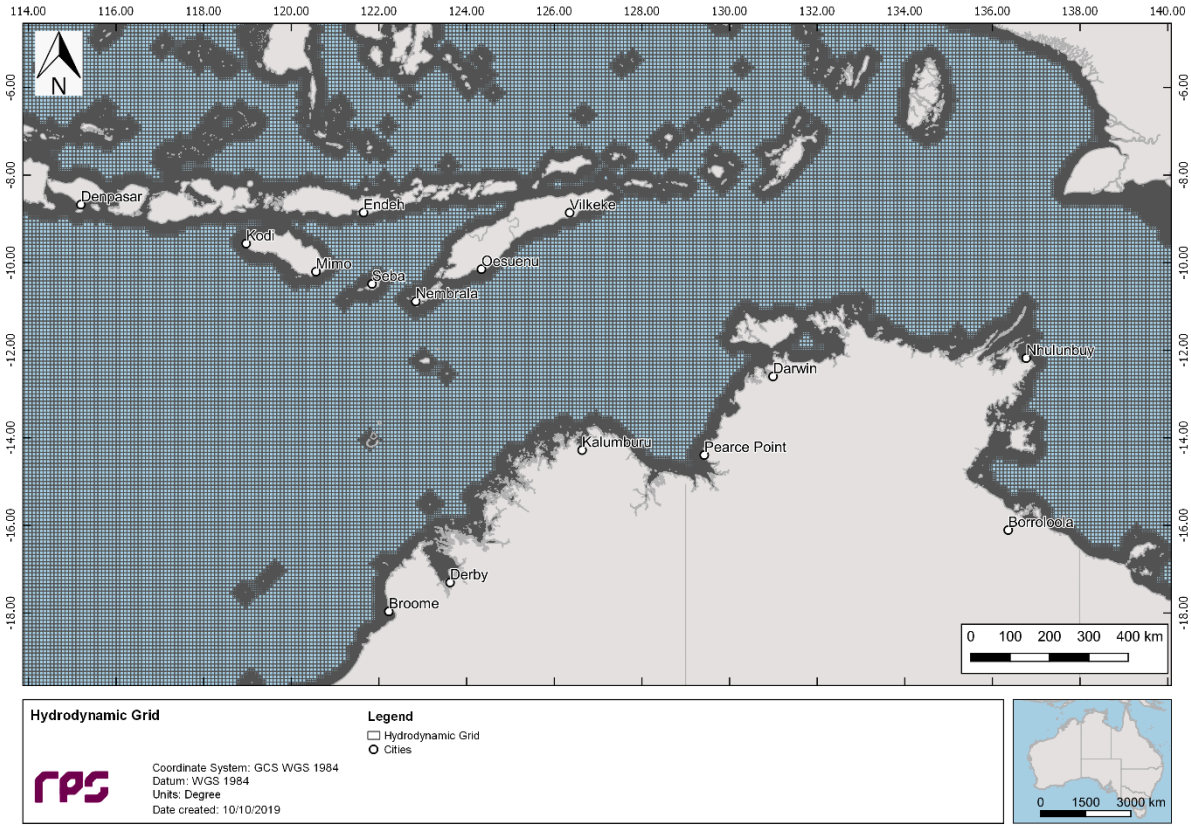

Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

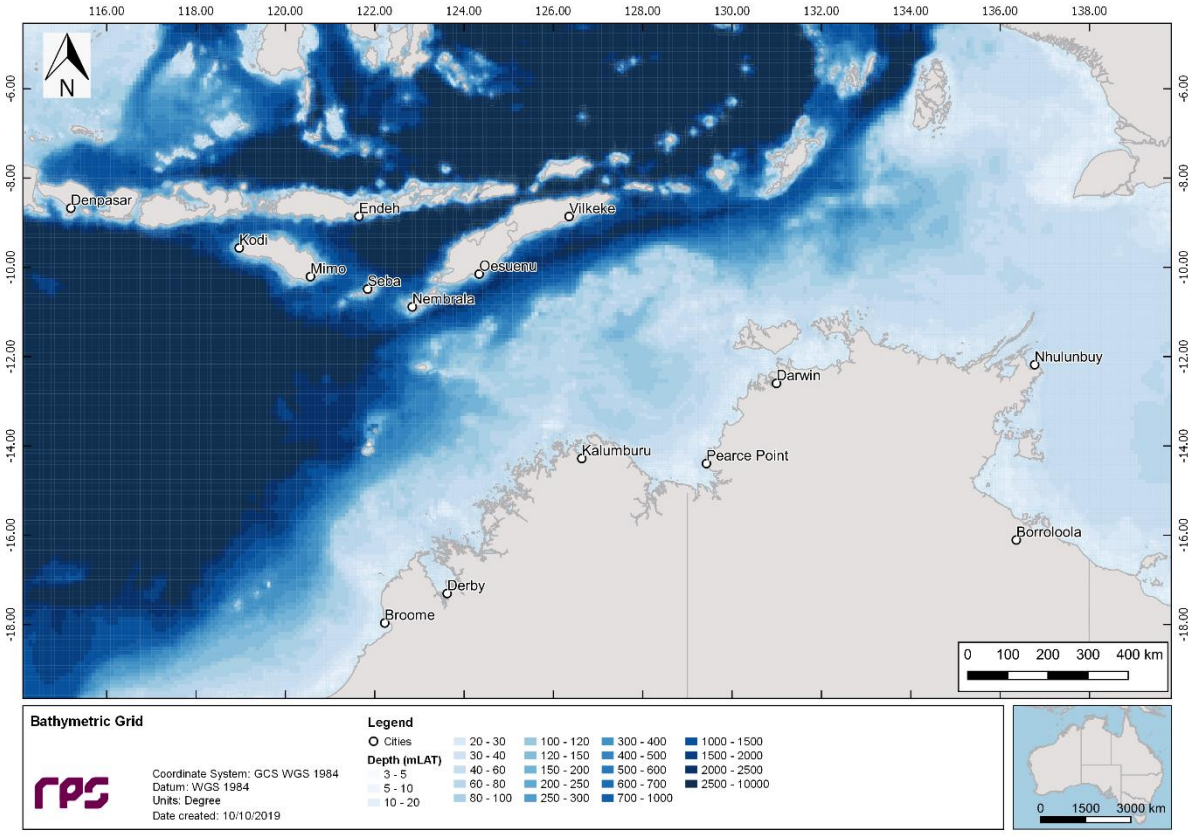

Figure 3.3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex-Poseidon tidal data has been widely used amongst the oceanographic community, being referenced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

Pi = Model predicted surface elevation

Oi = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: Xmodel = Model predicted surface elevation

Xobs = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3.5 and Figure 3.6illustrate a comparison of the predicted and observed surface elevations in January 2014. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3.1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3.1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Calder Shoal	0.95	0.21
Evans Shoal	0.97	0.14
Lacrosse Island	0.97	0.44
Snake Bay	0.98	0.16
The Boxers	0.94	0.23

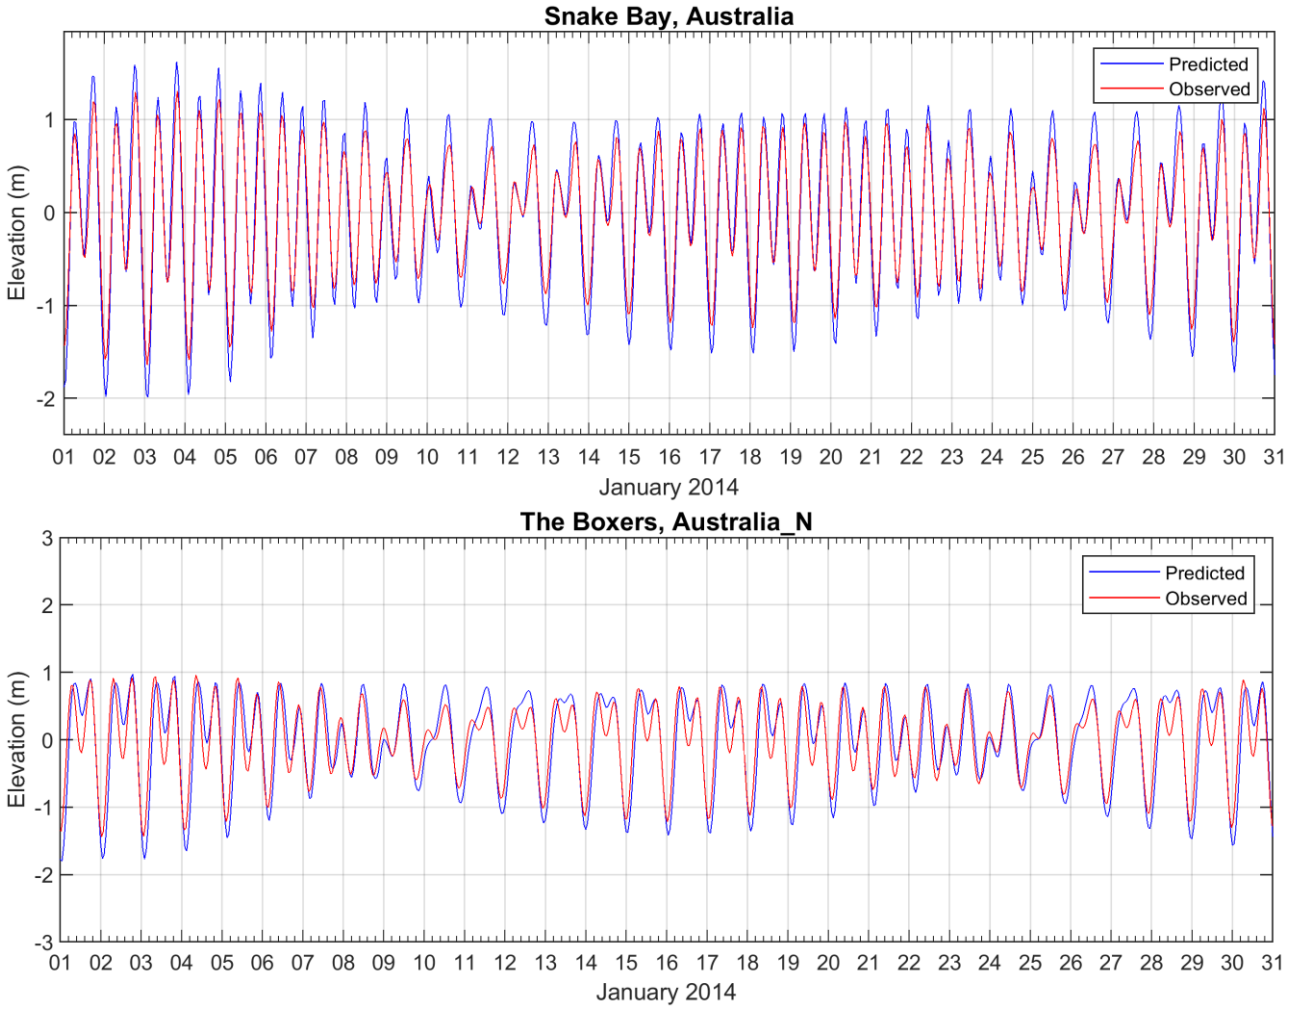

Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Snake Bay (upper image) and The Boxers (lower image).

3.2 Ocean Currents

Data describing the flow of ocean currents was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of once per day. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

For this study, the HYCOM hindcast currents were obtained for the years 2010 to 2019 (inclusive). Figure 3.7 illustrates the spatial resolution of HYCOM currents.

Table 3.2 presents the average and maximum net current speeds from combined HYCOM and tidal currents nearby the Beehive-1 release location. Current speed and direction in the study area were shown to be dominated by the tides, flowing predominantly along the northwest to southeast axis. The monthly current speeds averaged between 0.33 to 0.40 m/s and reached a peak of 0.96 to 1.17 m/s.

Figure 3.8 and Figure 3.9 show the monthly and total current rose distributions resulting from the combination of HYCOM ocean current data and HYDROMAP tidal data nearby the release location.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3.2 Predicted monthly average and maximum surface current speeds nearby the Beehive-1 release location. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Season	Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction (Towards)
Summer	January	0.35	1.10	Northwest and Southeast
	February	0.37	1.12	
Transitional	March	0.40	1.05	
Winter	April	0.39	1.06	
	May	0.35	1.17	
	June	0.34	1.07	
	July	0.35	0.96	
	August	0.37	1.15	
Transitional	September	0.39	1.10	
Summer	October	0.37	1.09	
	November	0.34	1.06	
	December	0.33	0.98	
Minimum		0.33	0.96	
Maximum		0.40	1.17	

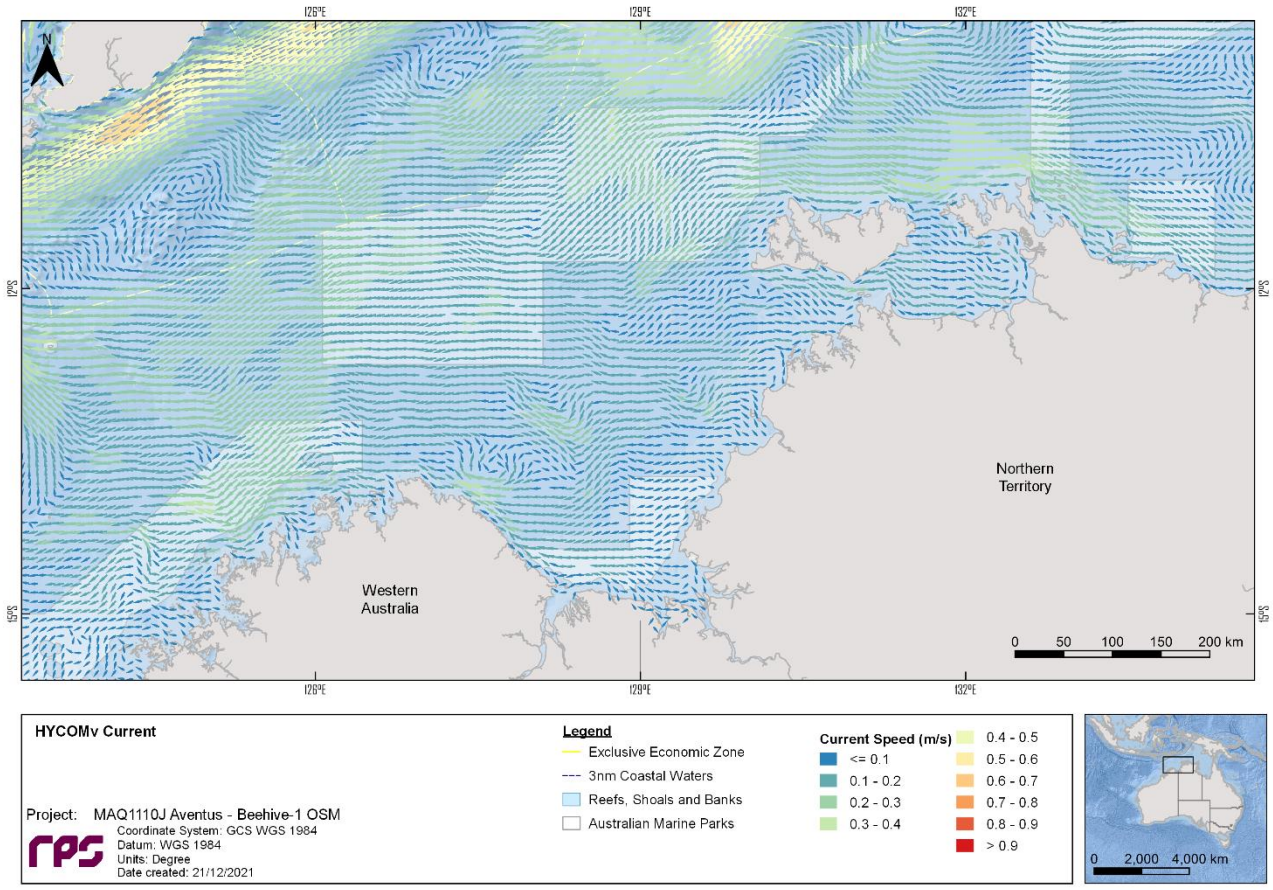

Figure 3.7 Map illustrating the spatial resolution of HYCOM currents.

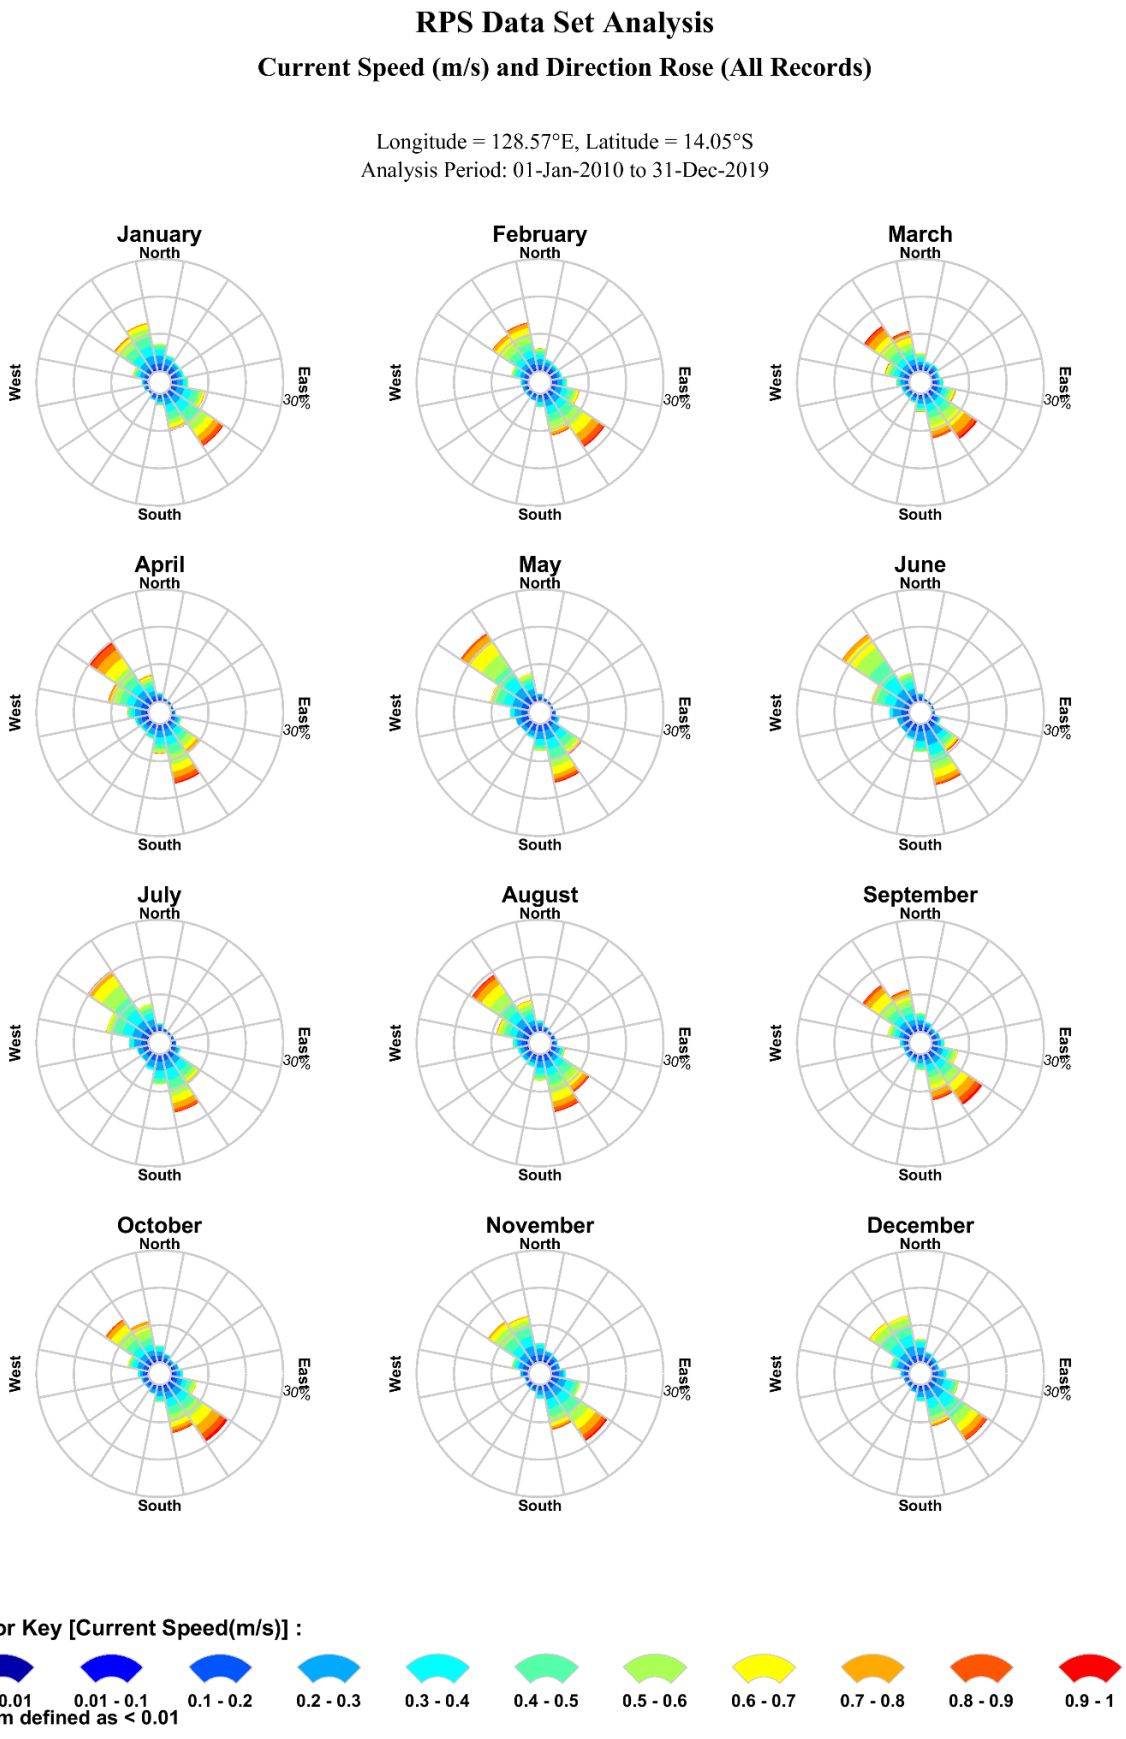

Figure 3.8 Monthly surface current rose plots nearby the Beehive-1 release location (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2010–2019 (inclusive).

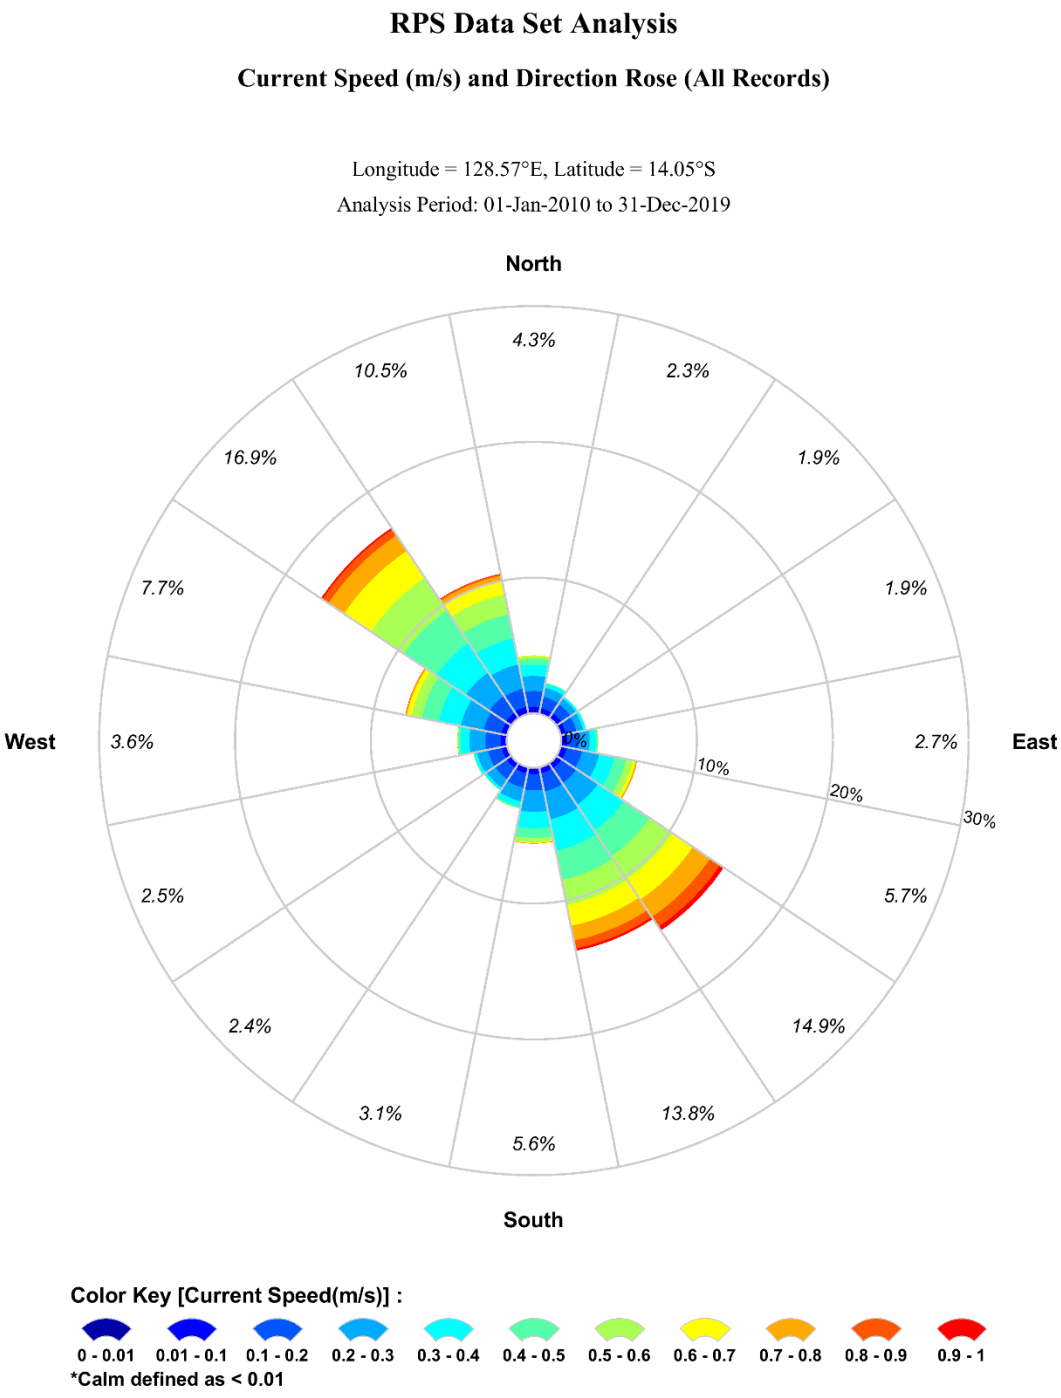

Figure 3.9 Modelled total surface current rose plot nearby the Beehive-1 release location (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2010–2019 (inclusive).

4 WIND DATA

High resolution wind data was sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals.

The CFSR wind data for the years 2010–2019 (inclusive) was extracted across the entire current model domain for input into the oil spill model. Figure 4.1 shows the spatial resolution of the wind field used as input into the oil spill model. Table 4.1 presents the monthly average and maximum winds derived from a CFSR wind node nearby the release location.

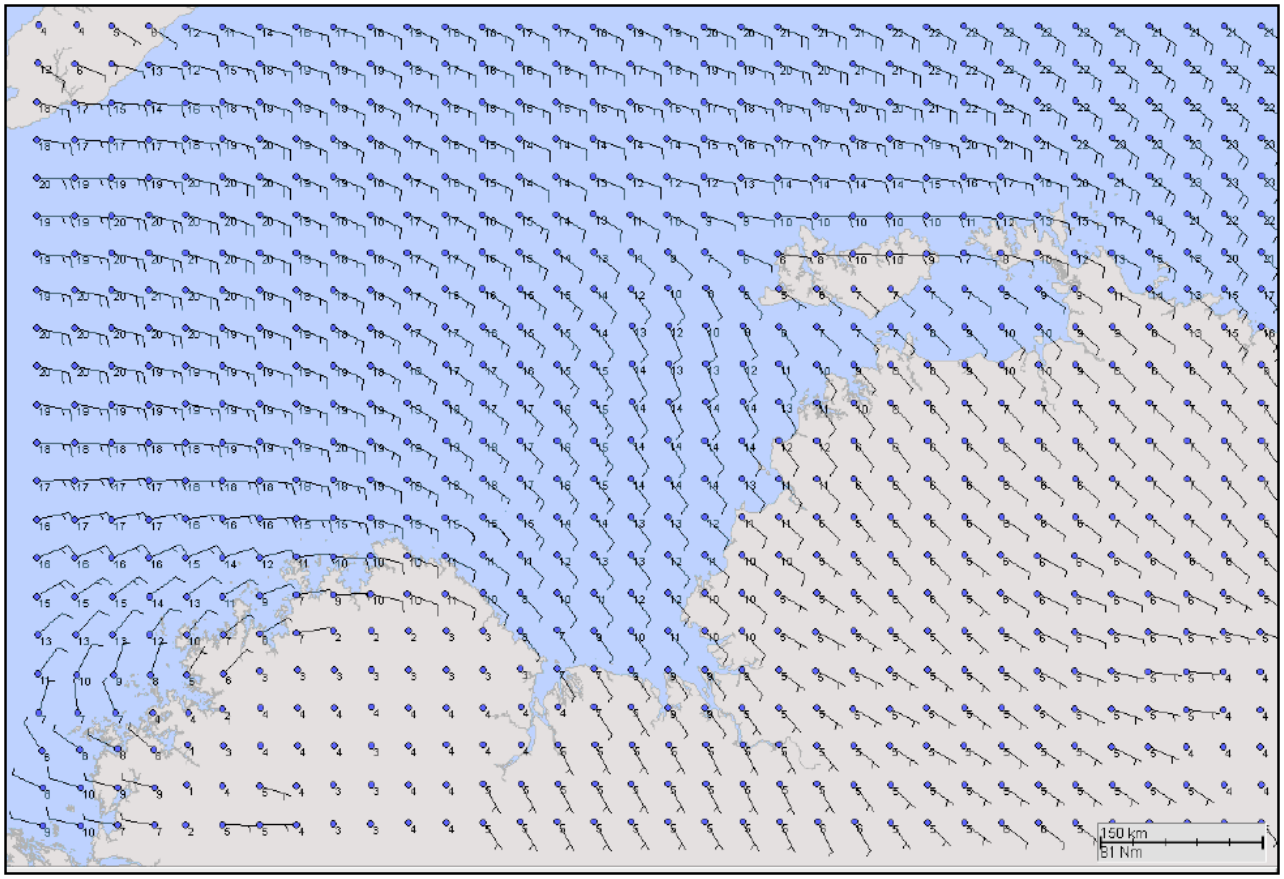

Figure 4.1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

Figure 4.2 and Figure 4.3 show the monthly and total wind rose distributions derived from the CFSR data for the nearest CFSR wind node to the release location. The wind data demonstrated a clear seasonality throughout the year with winds from the west-northwest in summer and southeast during the winter months. Monthly average wind speeds ranged between 8.7 and 14.1 knots whilst monthly maximums oscillated between 24.1 and 46.2 knots.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 3 knots are predominantly used in these wind roses. The length of each segment within a branch

is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

Table 4.1 Predicted average and maximum winds for the nearest CFSR wind node to the Beehive-1 release location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Season	Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction (from)
Summer	January	13.2	44.9	West-Northwest
	February	11.4	35.2	
Transitional	March	9.7	46.2	Variable
Winter	April	9.3	32.7	Southeast
	May	11.7	28.8	
	June	14.1	27.4	
	July	12.3	30.9	
	August	10.4	29.5

	December	9.9	35.9	
Minimum		8.7	24.1	
Maximum		14.1	46.2	

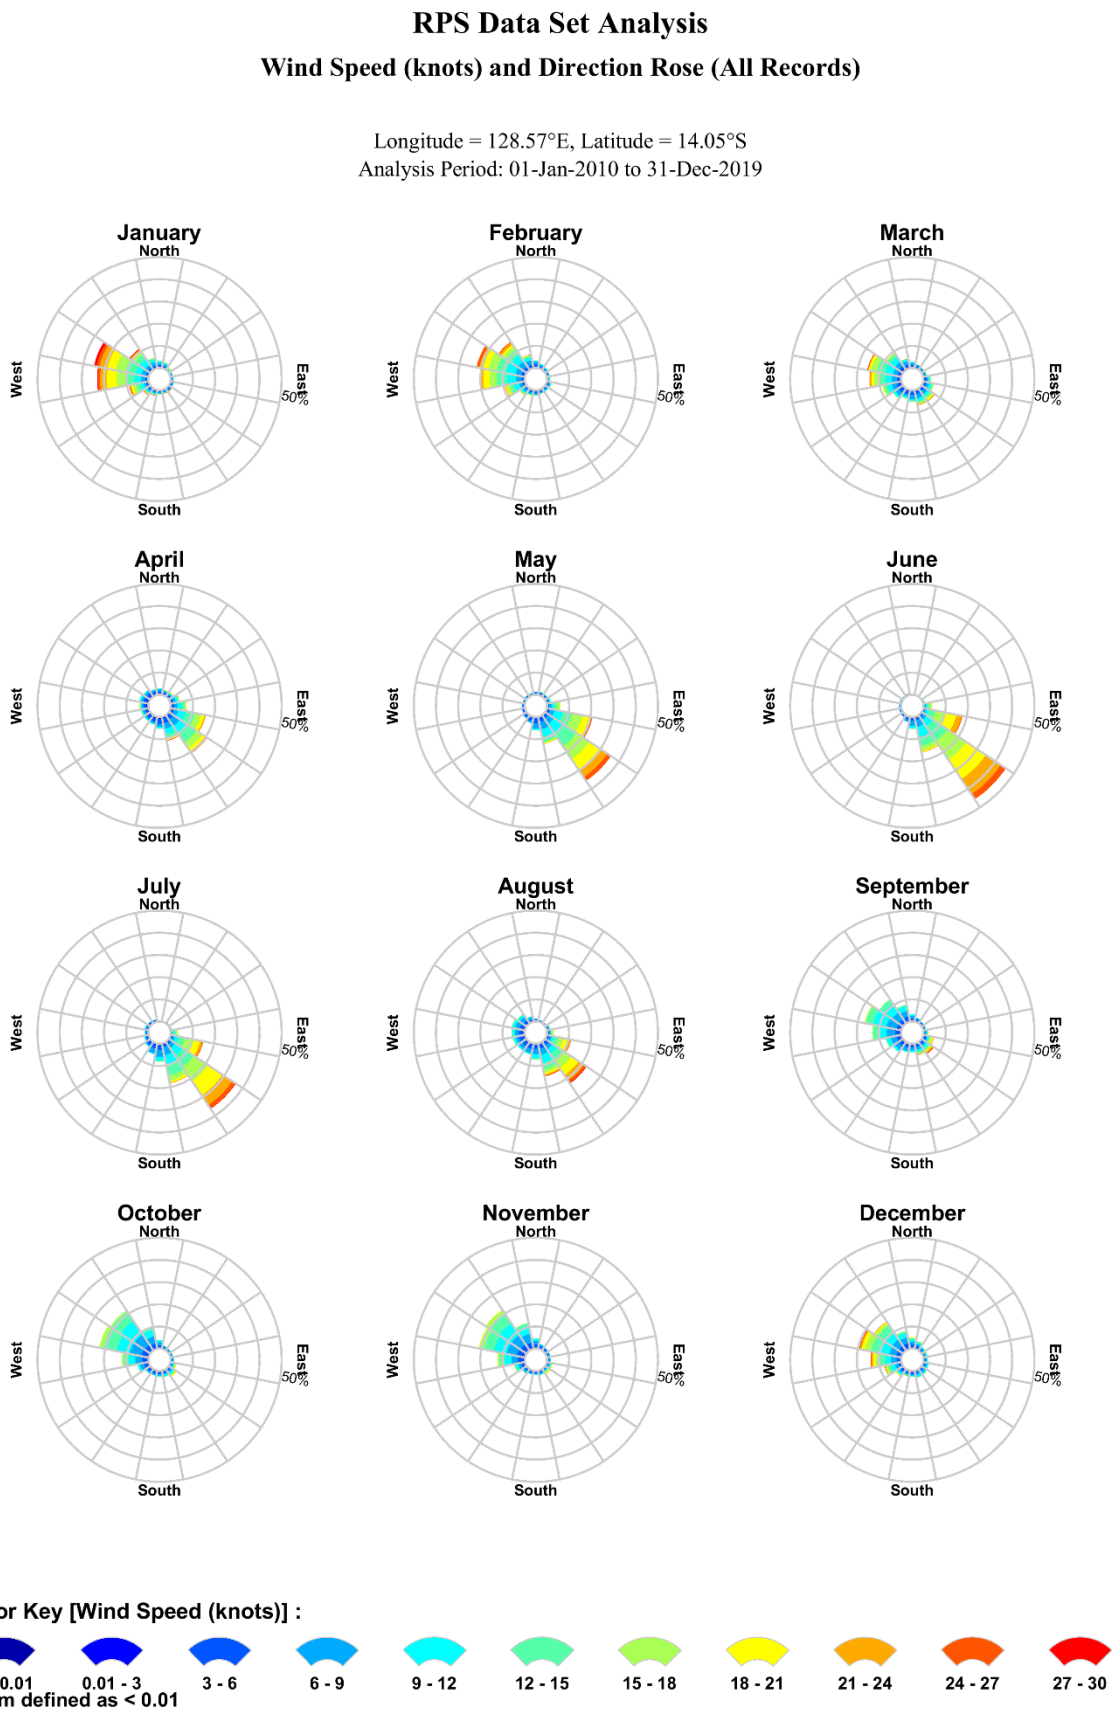

Figure 4.2 Modelled monthly wind rose distributions from 2010–2019 (inclusive), for the closest wind node to the Beehive-1 release location.

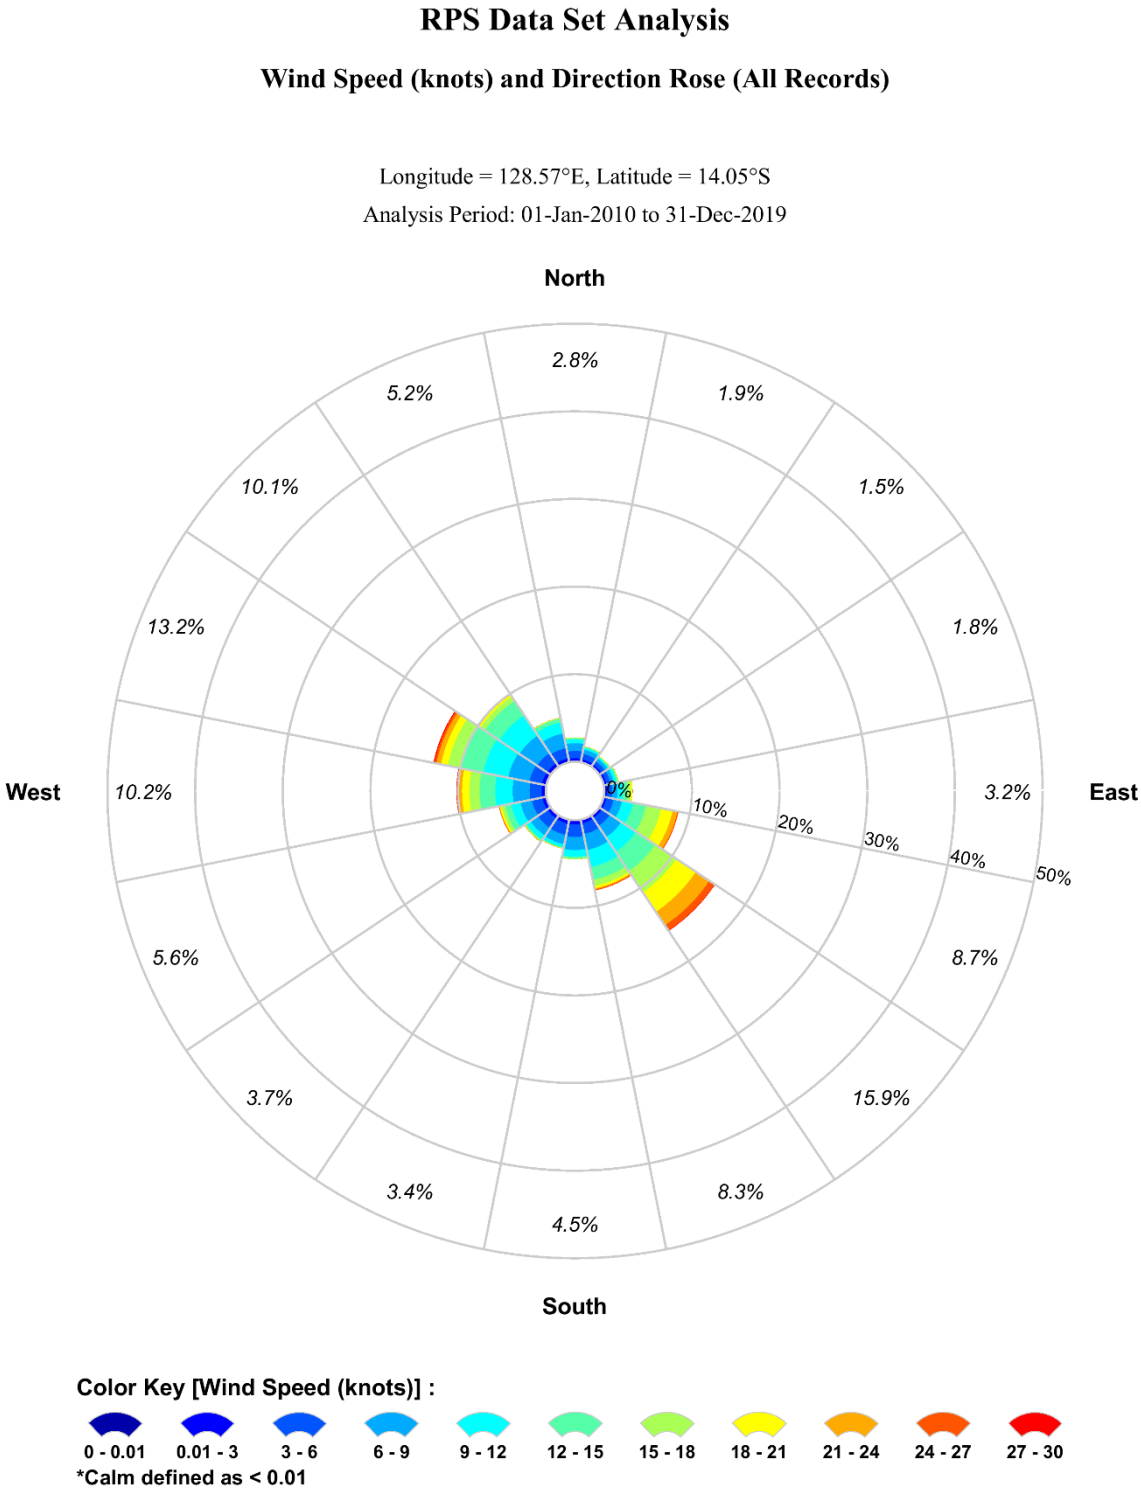

Figure 4.3 Modelled total wind rose distributions from 2010–2019 (inclusive), for the closest wind node to the Beehive-1 release location.

5 WATER TEMPERATURE AND SALINITY

The monthly sea temperature and salinity profiles of the water column within the study was obtained from the World Ocean Atlas 2013 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013).

To account for depth-varying sea temperature and salinity the modelling used monthly average sea temperature and salinity profiles. Table 5.1 presents the sea temperature and salinity of the surface layer nearby the release sites.

The monthly average sea surface temperatures ranged between 25.9°C (July) and 30.9°C (March). The monthly average salinity values remain relatively consistent ranging between 33.4 psu and 35.2 psu, observed during April and October, respectively.

These parameters were used as factors to inform the weathering, movement and evaporative loss of hydrocarbon spills in the surface and sub-surface layers.

Figure 5.1 illustrates the vertical profile of sea temperature and salinity nearby the release location.

Table 5.1 Monthly average sea surface temperature and salinity in the study area.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (ºC)	29.5	30.1	30.9	29.6	28.0	26.8	25.9	26.4	26.8	28.6	30.1	30.0
Salinity (psu)	34.1	34.5	34.9	33.4	33.6	34.8	34.3	34.8	34.2	35.2	34.8	34.8

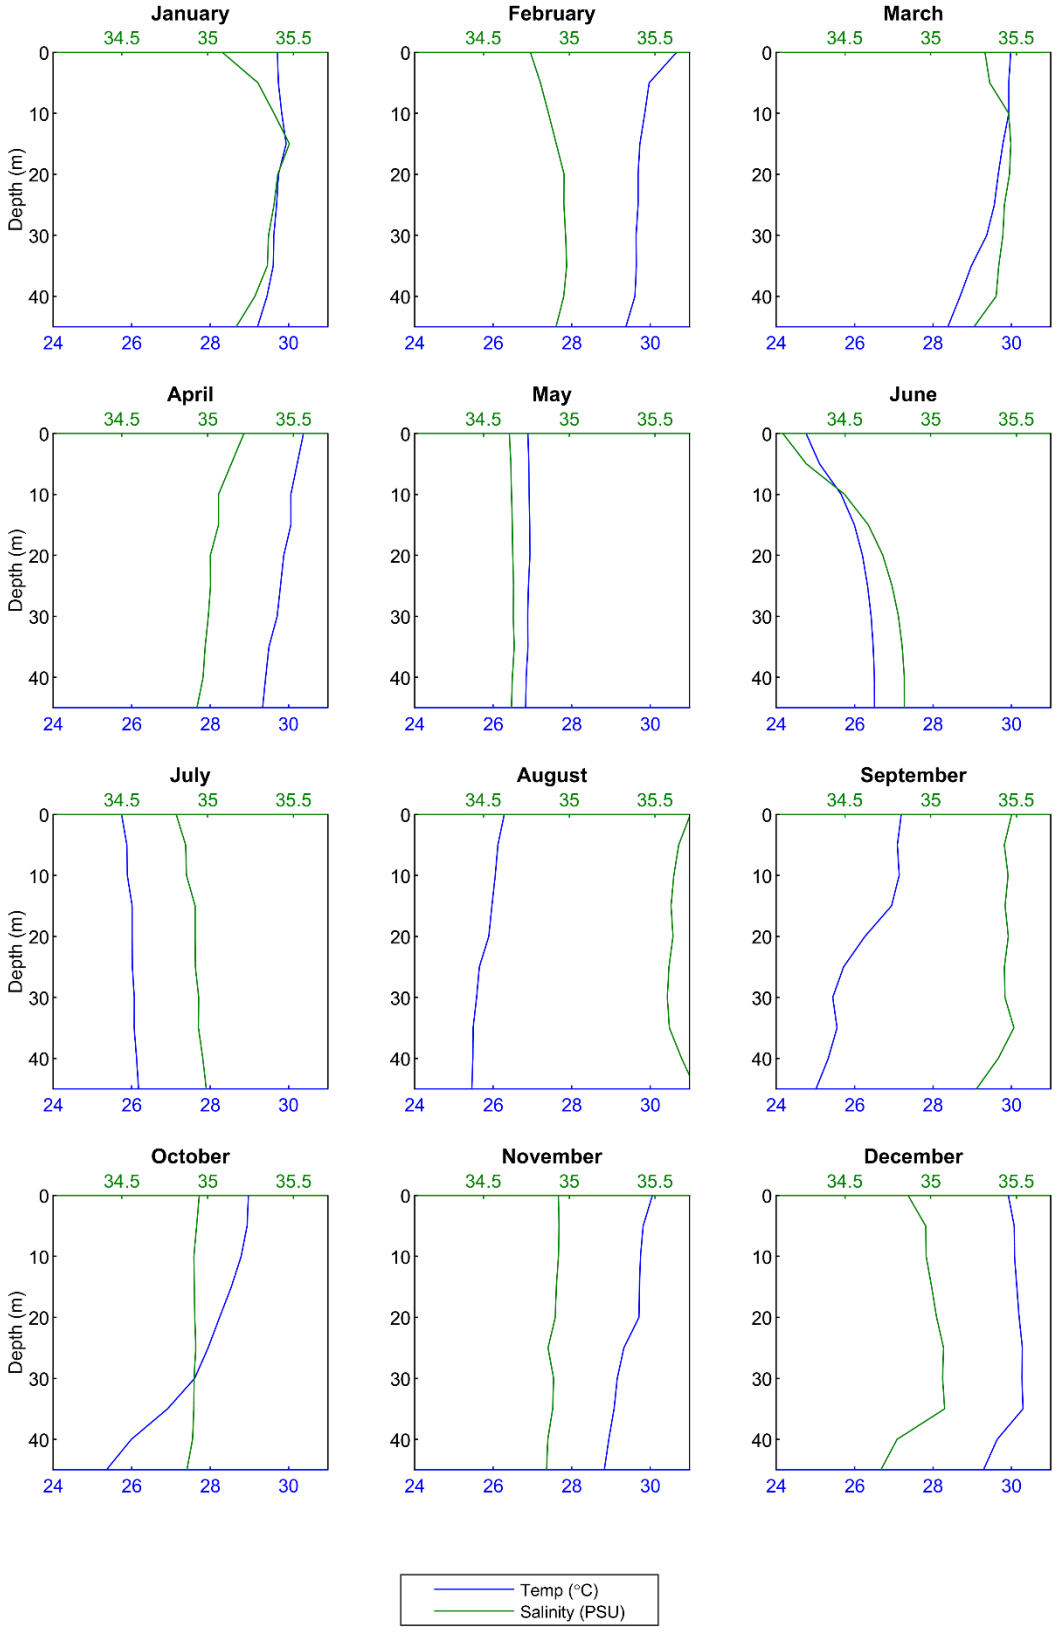

Figure 5.1 Temperature and salinity profiles nearby the Beehive-1 release location.

6 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil, a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

6.1 Stochastic Modelling

Stochastic oil spill modelling is created by overlaying a great number (often 100 hundred) simulated hypothetical oil spills (Section 1.2.1). Stochastic modelling involves running numerous individual oil spill simulations using a range of prevailing wind and current conditions that are historically representative of the season and location of where the spill event may occur.

For the stochastic modelling undertaken in this study, 100 oil spills were modelled per season (300 spills in total) using the same spill information (spill volume, duration and oil type) but with varied start dates and times. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations (per season) were analysed to determine the following annualised statistics for every grid cell:

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Probability of contact above defined concentrations;
- Volume of oil that may strand on shorelines from any single simulation;

- Concentration that might occur on sections of individual shorelines;
- Exposure (instantaneous and/or over a specified duration) to dissolved hydrocarbons in the water column; and
- Exposure (instantaneous and/or over a specified duration) to entrained hydrocarbons in the water column.

6.1 Floating, Shoreline and In-Water Thresholds

The thresholds and their relationship to exposure for the sea surface, shoreline, and water column (entrained and dissolved hydrocarbons) are presented in Sections 6.1.1 to 6.1.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of influence are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

6.1.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 6.1). Figure 6.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e., fishing grounds) as a precautionary measure. Table 6.1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009). Concentrations above 10 g/m^2 is also considered the lower actionable threshold, where oil may be thick enough for containment and recovery as well as dispersant treatment (AMSA, 2015).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 6.2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 6.1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 - 0.30	40 - 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

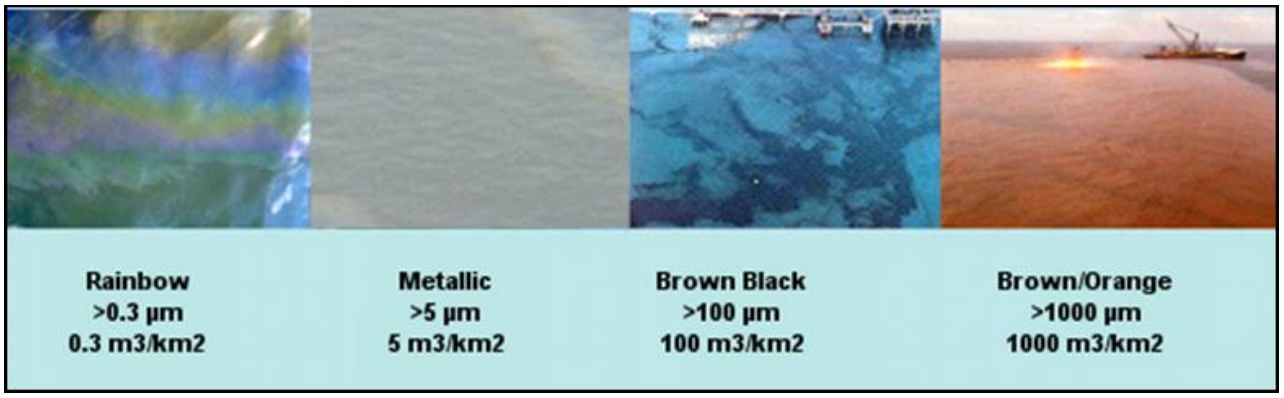

Figure 6.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 6.2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA (2019)).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socio-economic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50*	Approximates surface oil slick and informs response planning

* 50 g/m^2 also used to define the threshold for actionable floating oil.

6.1.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A rocky shoreline was assumed as the default shoreline type for the modelling in this study, as a large part of the shoreline in the study area (especially the western part of the Joseph Bonaparte Gulf) is characterised by exposed rocky shorelines.

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore

clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m2, or above, would potentially harm shorebirds and wildlife (fur-bearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum concentration that the oil can be effectively cleaned according to AMSA (2015). This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996), demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high shoreline accumulation”. It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

These shoreline accumulation thresholds derived from extensive literature review (outlined in

Table 6.3) align with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 6.3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline concentration (g/m^2)	Description
Low (socio-economic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100*	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

* 100 g/m2 also used to define the threshold for actionable shoreline oil.

6.1.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

6.1.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1 hour timestep (see Table 6.4) were applied in this study to indicate the increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

6.1.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. Insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, therefore they are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC & ARMCANZ (2000) water quality guidelines. Due to the requirement for relatively long exposure times (> 24 hours) for these concentrations to be expressed, they are likely to be more meaningful for juvenile fish, larvae and planktonic organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1 hour time exposure (Table 6.4), to cover the range of thresholds outlined in ANZECC & ARMCANZ, (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019).

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 6.4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

Threshold level	Dissolved hydrocarbon concentration (ppb)	Entrained hydrocarbon concentrations (ppb)
Low	10	10
Moderate	50	-
High	400	100

6.2 Aerial Dispersant Operations

The surface dispersant was assumed to be applied on surface oil with an age between 12 hours and 72 hours from the time of release. This enabled the evaporation process to take place during the initial 12 hours following the release whilst also avoiding any waste of dispersant on highly weathered oil, which would be ineffective.

The dispersant effectiveness was set at 65% based on a combination of surface spraying using vessels and airplanes. It was assumed that that the dispersant will be effective on fresh, weathered and emulsified oil with a minimum thickness of 10 µm and a viscosity of up to 12,500 cP. The surface dispersant application was assumed continuous for 10 hours during daylight hours only, starting from 24 hours after the initial release until the end of the spill duration. Winds were capped at 35 knots to ensure safe operating conditions for planes, but also to allow for sufficient mixing of the chemical dispersants and oil at the water surface (API et al. 2001; NOAA 2010). A dispersant to oil ratio of 1:20 was applied.

Table 6.5 summarises the aerial dispersant application parameters.

Table 6.5 Aerial dispersant application parameters.

Parameter	Input
Total Volume available (m^3)	9,066 (refer to Figure 6.2 for daily volumes)
Dispersant to oil ratio	1:20 (only applied on oil > 10 g/m^2)
Dispersant effectiveness (%)	65
Maximum viscosity threshold (cP)	12,500
Minimum Operational Wind Speeds (knots)	2
Maximum Operational Wind Speeds (knots)	35
Operational hours	10 (during daylight only)

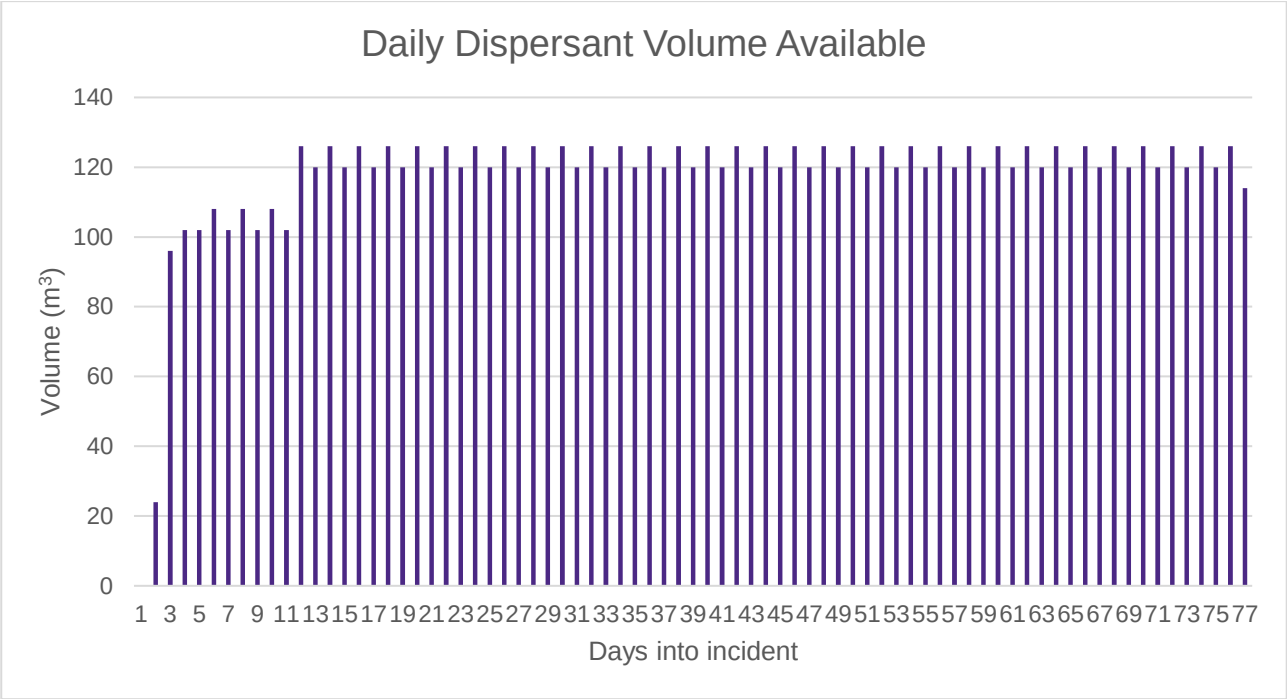

Figure 6.2 Daily dispersant volume available for application

7 OIL PROPERTIES

7.1 Oil Characteristics

7.1.1 Overview

Table 7.1 and Table 7.2 present the physical properties and boiling point ranges analogue crude oil used in this study. The analogue crude oil was carefully selected based on EOG recommendations to represent the crude oil likely to be found within permit area WA-488-P, which is likely to have an API gravity of 43° (light crude). EOG narrowed down oils in the region with a similar API to be Jabiru, Puffin, Mutineer-Exeter and Legendre crudes, all of which have APIs between 42 and 44. Based on having an API closest to that expected at Beehive-1, together with being the most conservative in terms of the residual components, EOG elected to use Jabiru crude as the analogue for spill modelling purposes.

Table 7.1 Physical properties of the oil types used in this study.

Characteristic	Crude Oil
Density (kg/m^3)	813.9 (at 15°C)
API	42.3
Dynamic viscosity (cP)	3.0 (at 20°C)
Pour point (°C)	18
Hydrocarbon property category	Group II
Hydrocarbon property classification	Light-persistent

Table 7.2 Boiling point ranges of the oil types used in this study.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-160 C_{11} to C_{15}	160-380 C_{16} to C_{20}	>380 >C_{20}
Jabiru crude oil	% of total	24.2	20.9	33.9	21.0

The boiling points (BP) are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate.

The aromatic components within the volatile to low-volatility range are also soluble (with decreasing solubility following decreasing volatility) and will dissolve across the oil-water interface. The rate of dissolution will increase with increased surface area. Hence, dissolution rates will be higher under discharge conditions that generate smaller oil droplets.

Atmospheric weathering will commence if and when oil droplets float to the water surface. Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (or less than 180°C BP).
- Up to 24 hours for the C_{11} to C_{15} compounds (180-160°C BP).
- Several days for the C_{16} to C_{20} compounds (160-380°C BP).

- Not applicable for the residual compounds (BP > 380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

The actual fate of released oil in the marine environment will depend greatly on the amount of oil that reaches the surface, either through the initial release or by rising after discharge in the water column.

7.1.2 Crude Oil

The analogue crude oil has an API of 42.3 and a density of 813.9 kg/m^3 (at 15ºC) with a viscosity value (3.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The crude is a mixture of volatile (79%) and persistent hydrocarbons (21%). In favourable evaporation conditions, about 24.2% of the oil mass should evaporate within the first 12 hours (BP < 180 °C); a further 20.8% should evaporate within the first 24 hours (180 °C < BP < 160 °C); and a further 33.9% should evaporate over several days (160 °C < BP < 380 °C). Approximately 21.0% of the oil is shown to be persistent.

7.2 Weathering Characteristics

7.2.1 Overview

A series of model weather tests were conducted to illustrate the potential behaviour of the Jabiru crude oil when exposed to idealised and representative environmental conditions:

- A 1-hour release onto the water surface at a discharge rate of 25 m^3/hr under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (25 °C) and average air temperature (29 °C). The slick was also subject to ambient tidal and drift currents.

- A 1-hour release onto the water surface at a discharge rate of 50 m^3/hr under variable wind conditions (1-12 knots, drawn from representative data files), assuming low seasonal water temperature (25 °C) and average air temperature (29 °C). The slick was also subject to ambient tidal and drift currents.

The first case is indicative of cumulative weathering rates under calm conditions that would not generate entrainment, while the second case may represent conditions that could cause a minor degree of entrainment. Both scenarios provide examples of potential behaviour during periods of a spill event once the oil reaches the surface.

7.2.2 Crude Oil Mass Balance Forecasts

The mass balance forecast for the constant-wind case (Figure 7.1) shows that 45.3% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 7.2), where the winds are of greater strength on average, entrainment of the crude oil into the water column is predicted to increase. Approximately 24 hours after the spill, 54.1% of the oil mass is forecast to have entrained and a further 42.8% is forecast to have evaporated, leaving only

a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

The increased level of entrainment in the variable-wind case will result in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of ~1.3% per day with an accumulated total of ~9.1% after 7 days, in comparison to a rate of ~0.3% per day and an accumulated total of ~2.4% after 7 days in the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over several weeks.

Table 7.3 illustrates the summary of the mass balance for the calm wind and variable wind case at day 7.

Table 7.3 Summary of the mass balance at day 7. Results are based on a 25 m^3 surface release of crude oil over 1 hour, tracked for 7 days under calm and variable wind conditions.

End of the simulation (day 7)		
Exposure Metrics	**Calm wind conditions**	**Variable wind conditions**
Surface/Floating Oil (%)	44.4	0.0
Ashore/Shoreline (%)	0.0	0.0
Entrained (%)	3.6	44.5
Evaporated (%)	49.2	44.2
Decay (%)	2.4	9.1

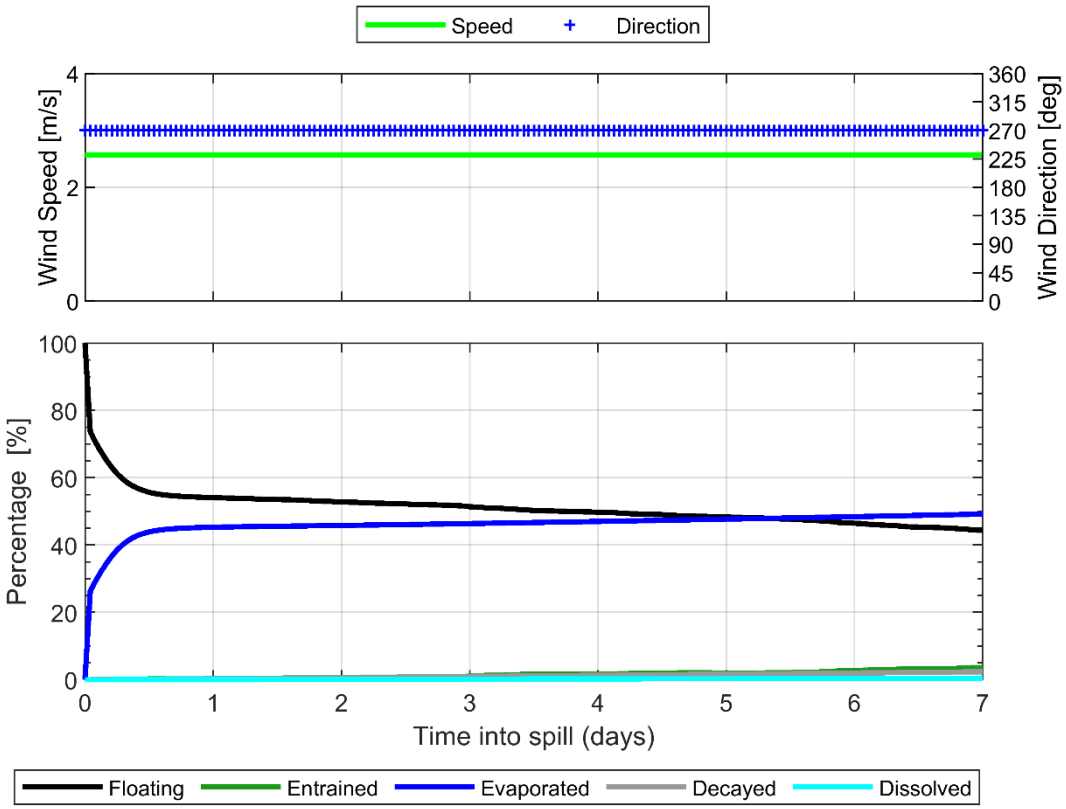

Figure 7.1 Proportional mass balance plot representing the weathering of crude oil spilled onto the water surface over 1 hour and subject to a constant 5 knots (2.6 m/s) wind speed at 25°C water temperature and 29 °C air temperature.

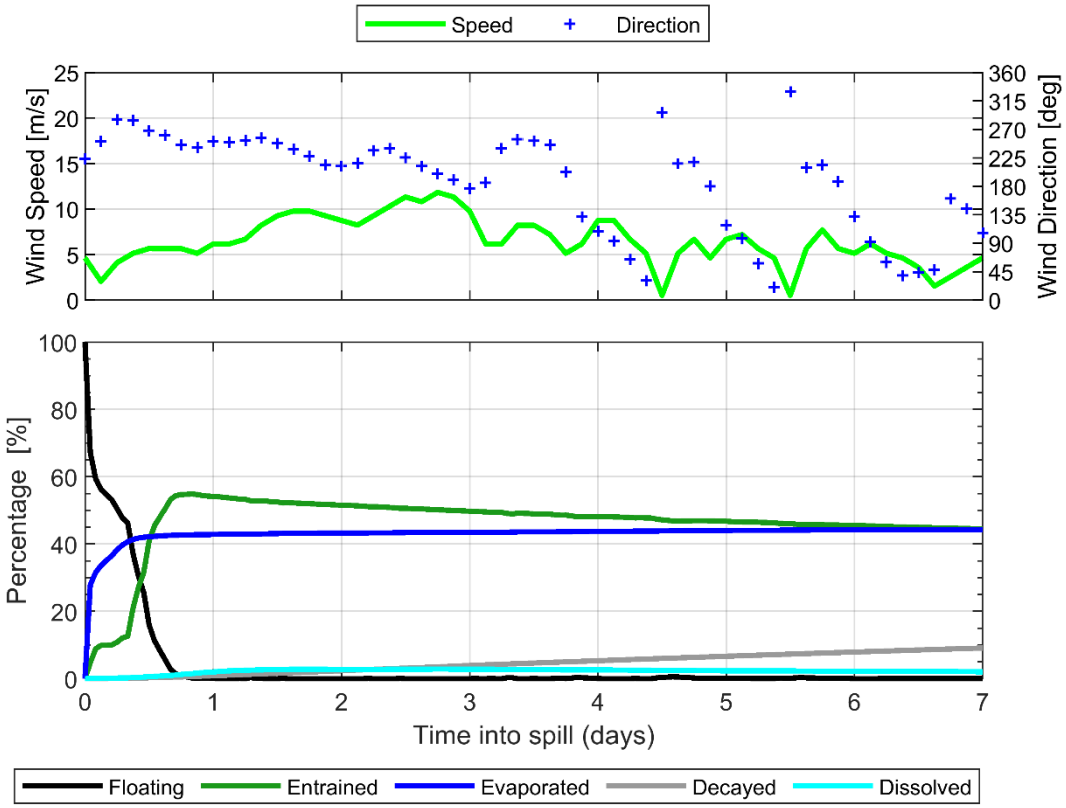

Figure 7.2 Proportional mass balance plot representing the weathering of crude oil spilled onto the water over 1 hour and subject to variable wind speeds (1-12 knots) at 25°C water temperature and 29 °C air temperature.

8 MODEL SETTINGS

Table 8.1 provides a summary of the oil spill model settings for the scenario.

Each season uses the same 100 random spill locations.

Table 8.1 Summary of the oil spill model settings used in this assessment.

Parameter	Scenario
Description	LOWC
Number of randomly selected spill start times per season for each scenario	100 (300 in total)
Release location	Single location at the Beehive-1 exploration well
Model period	Summer (October to February) Transitional (March and September) Winter (April to August)
Oil type	Crude oil
Spill volume	786,858 m^3 (4,949,192 bbl)
Release type	Surface
Release duration	77 days
Simulation length (days)	98
Surface oil concentration thresholds (g/m^2) (NOPSEMA Thresholds)	1, potential low exposure 10, potential moderate exposure 50, potential high exposure
Shoreline load thresholds (g/m^2) (NOPSEMA Thresholds)	10, potential low exposure 100, potential moderate exposure 1,000, potential high exposure
Dissolved hydrocarbon concentrations (ppb) (NOPSEMA Thresholds)	10, potential low exposure 50, potential moderate exposure 400, potential high exposure
Entrained hydrocarbon concentrations (ppb) (NOPSEMA Thresholds)	10, potential low exposure 100, potential high exposure

9 PRESENTATION AND INTERPRETION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of the predicted sea-surface and water column (subsurface) exposure and shoreline accumulation (if predicted).

9.1 Annual Analysis

9.1.1 Statistics

The statistics are based on the following principles:

- The greatest distance travelled by a spill trajectory – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds.
- The probability of oil exposure to a receptor – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The minimum time before oil exposure to a receptor – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value.
- The probability of oil accumulation at a receptor – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The maximum potential oil loading within a receptor – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario.
- The dissolved and entrained hydrocarbon exposure – is determined by recording the maximum instantaneous concentrations at each grid cell by applying a 96-hour time-based averaging.

9.2 Deterministic Trajectories

The seasonal stochastic modelling results were assessed for each scenario, and the “worst case” deterministic runs were identified and are presented in the result section based on the following criteria:

a. Largest swept area of floating oil above 1 g/m^2 (visible floating oil);

b. Minimum time before shoreline accumulation above 10 g/m^2;

c. Largest volume of oil ashore;

d. Longest length of shoreline accumulation above 10 g/m^2;

e. Largest area of entrained hydrocarbons above 10 ppb; and

f. Largest area of dissolved hydrocarbons above 10 ppb.

When no shoreline accumulation above the lowest shoreline accumulation threshold was predicted for any of the seasons modelled, only the largest swept area of floating oil, the largest area of entrained hydrocarbons and the largest area of dissolved hydrocarbons is presented.

9.2.1 Receptors Assessed

A range of environmental receptors and shorelines were assessed for sea surface exposure, shoreline contact and water column exposure as part of the study (see Figure 9.1 to Figure 9.13). Receptor categories (see Table 9.1) include sections of shorelines and offshore islands. All other sensitive receptors other than submerged reefs, shoals and banks (RSB) were sourced from Australian Government Department of Agriculture, Water and the Environment (http://www.environment.gov.au/). Risks of exposure were separately calculated for each sensitive receptor area and have been tabulated.

Table 9.1 Summary of receptors used to assess floating oil, shoreline and in-water exposure to hydrocarbons.

Receptor Category	Acronym	Hydrocarbon Exposure Assessment

10 RESULTS – SCENARIO – LOWC – 786,858 m^3 SURFACE RELEASE OF CRUDE OIL OVER 77 DAYS

This scenario examined a loss of well control of 786,858 m^3 surface release of crude oil over 77 days, tracked for a period of 98 days. A total of 300 spill trajectories were simulated with (mitigated) and without (unmitigated) surface dispersant (i.e. 100 spills per season).

The seasonal stochastic analysis is presented in Section 10.1 and the deterministic trajectory analysis is discussed in Section 10.2.

10.1 Stochastic Analysis

10.1.1 Floating Oil Exposure

Table 10.1 summarises the maximum distance travelled by oil on the sea surface at each threshold for the seasonal conditions assessed, for the unmitigated and mitigated cases.

For the unmitigated case, the maximum distance and corresponding direction from the release location to the low (1–10 g/m^2), moderate (10–25 g/m^2) and high (> 25 g/m^2) exposure levels was 1,517 km west-northwest (winter), 153 km east-northeast (summer) and 61 km southeast (winter), respectively. In comparison, for the mitigated case the maximum distances and corresponding directions were 1,257 km west (winter), 134 km east-northeast (summer) and 125 km south-southeast (summer), for the low, moderate and high threshold, respectively.

Figure 10.1 to Figure 10.3 present sorted bar plots of the predicted area of the low, moderate and high zones of potential floating oil exposure for the unmitigated and mitigated cases from 100 spill trajectories per season and case.

Table 10.2 to Table 10.4 summarise the potential sea surface exposure to individual receptors for each season and case. Of all the receptors considered in the assessment, the Joseph Bonaparte Gulf AMP was the only receptor predicted to be exposed to floating oil above the low, moderate and high thresholds during all seasonal conditions.

For spills commencing during summer conditions, the following receptors recorded surface oil exposure greater than 70% for both the unmitigated and mitigated cases: Joseph Bonaparte Gulf AMP, Carbonate bank and terrace system of the Sahul Shelf KEF, North Kimberley MP, Wyndham - East Kimberley nearshore waters, and Northern Territory and Western Australia State Waters (Table 10.2).

The following receptors recorded surface oil exposure greater than 70% for both the unmitigated and mitigated cases, for spills commencing during the transitional months: Joseph Bonaparte Gulf AMP, Carbonate bank and terrace system of the Sahul Shelf KEF, North Kimberley MP, Wyndham - East Kimberley nearshore waters, and Western Australia State Waters (Table 10.3).

Additionally, for spills commencing during winter conditions, the following receptors recorded surface oil exposure greater than 70% for both the unmitigated and mitigated cases: Joseph Bonaparte Gulf AMP, Carbonate bank and terrace system of the Sahul Shelf KEF, North Kimberley MP, Wyndham - East Kimberley nearshore waters, Cape Bernier - Elsie Island N, Cape Rulhieres - Cape Bernier, Un-named Head - Cape Rulhieres (A), Un-named Head - Cape Rulhieres (B), Un-named Head - Cape Rulhieres (C) Nearshore Waters (DoT Shoreline Cells), and Western Australia State Waters (Table 10.4).

Figure 10.4 to Figure 10.6 present the zones of potential floating oil exposure for the NOPSEMA thresholds under summer, transitional and winter conditions, respectively, for both unmitigated and mitigated cases.

Table 10.1 Potential zones of floating oil exposure at each threshold for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions. The results were calculated from 100 spill trajectories per season and per case.

Season	Distance and direction travelled	Zones of potential floating oil exposure					
		Unmitigated			Mitigated		
		Low	Moderate	High	Low	Moderate	High
Summer	Maximum distance (km) from the release location	1,048	153	49	984	134	125
	Maximum distance (km) from the release location (99^{th} percentile)	731	95	45	728	121	46
	Direction	West-Southwest	East-Northeast	South-Southeast	West	East-Northeast	South-Southeast
Transitional	Maximum distance (km) from the release location	1,136	79	49	1,030	115	50
	Maximum distance (km) from the release location (99^{th} percentile)	903	62	46	861	56	46
	Direction	West-Southwest	South-Southeast	South-Southeast	West-Southwest	West	South-Southeast
Winter	Maximum distance (km) from the release location	1,517	79	61	1,257	84	63
	Maximum distance (km) from the release location (99^{th} percentile)	730	68	55	686	68	57
	Direction	West-Northwest	Southeast	Southeast	West	Southeast	Southeast

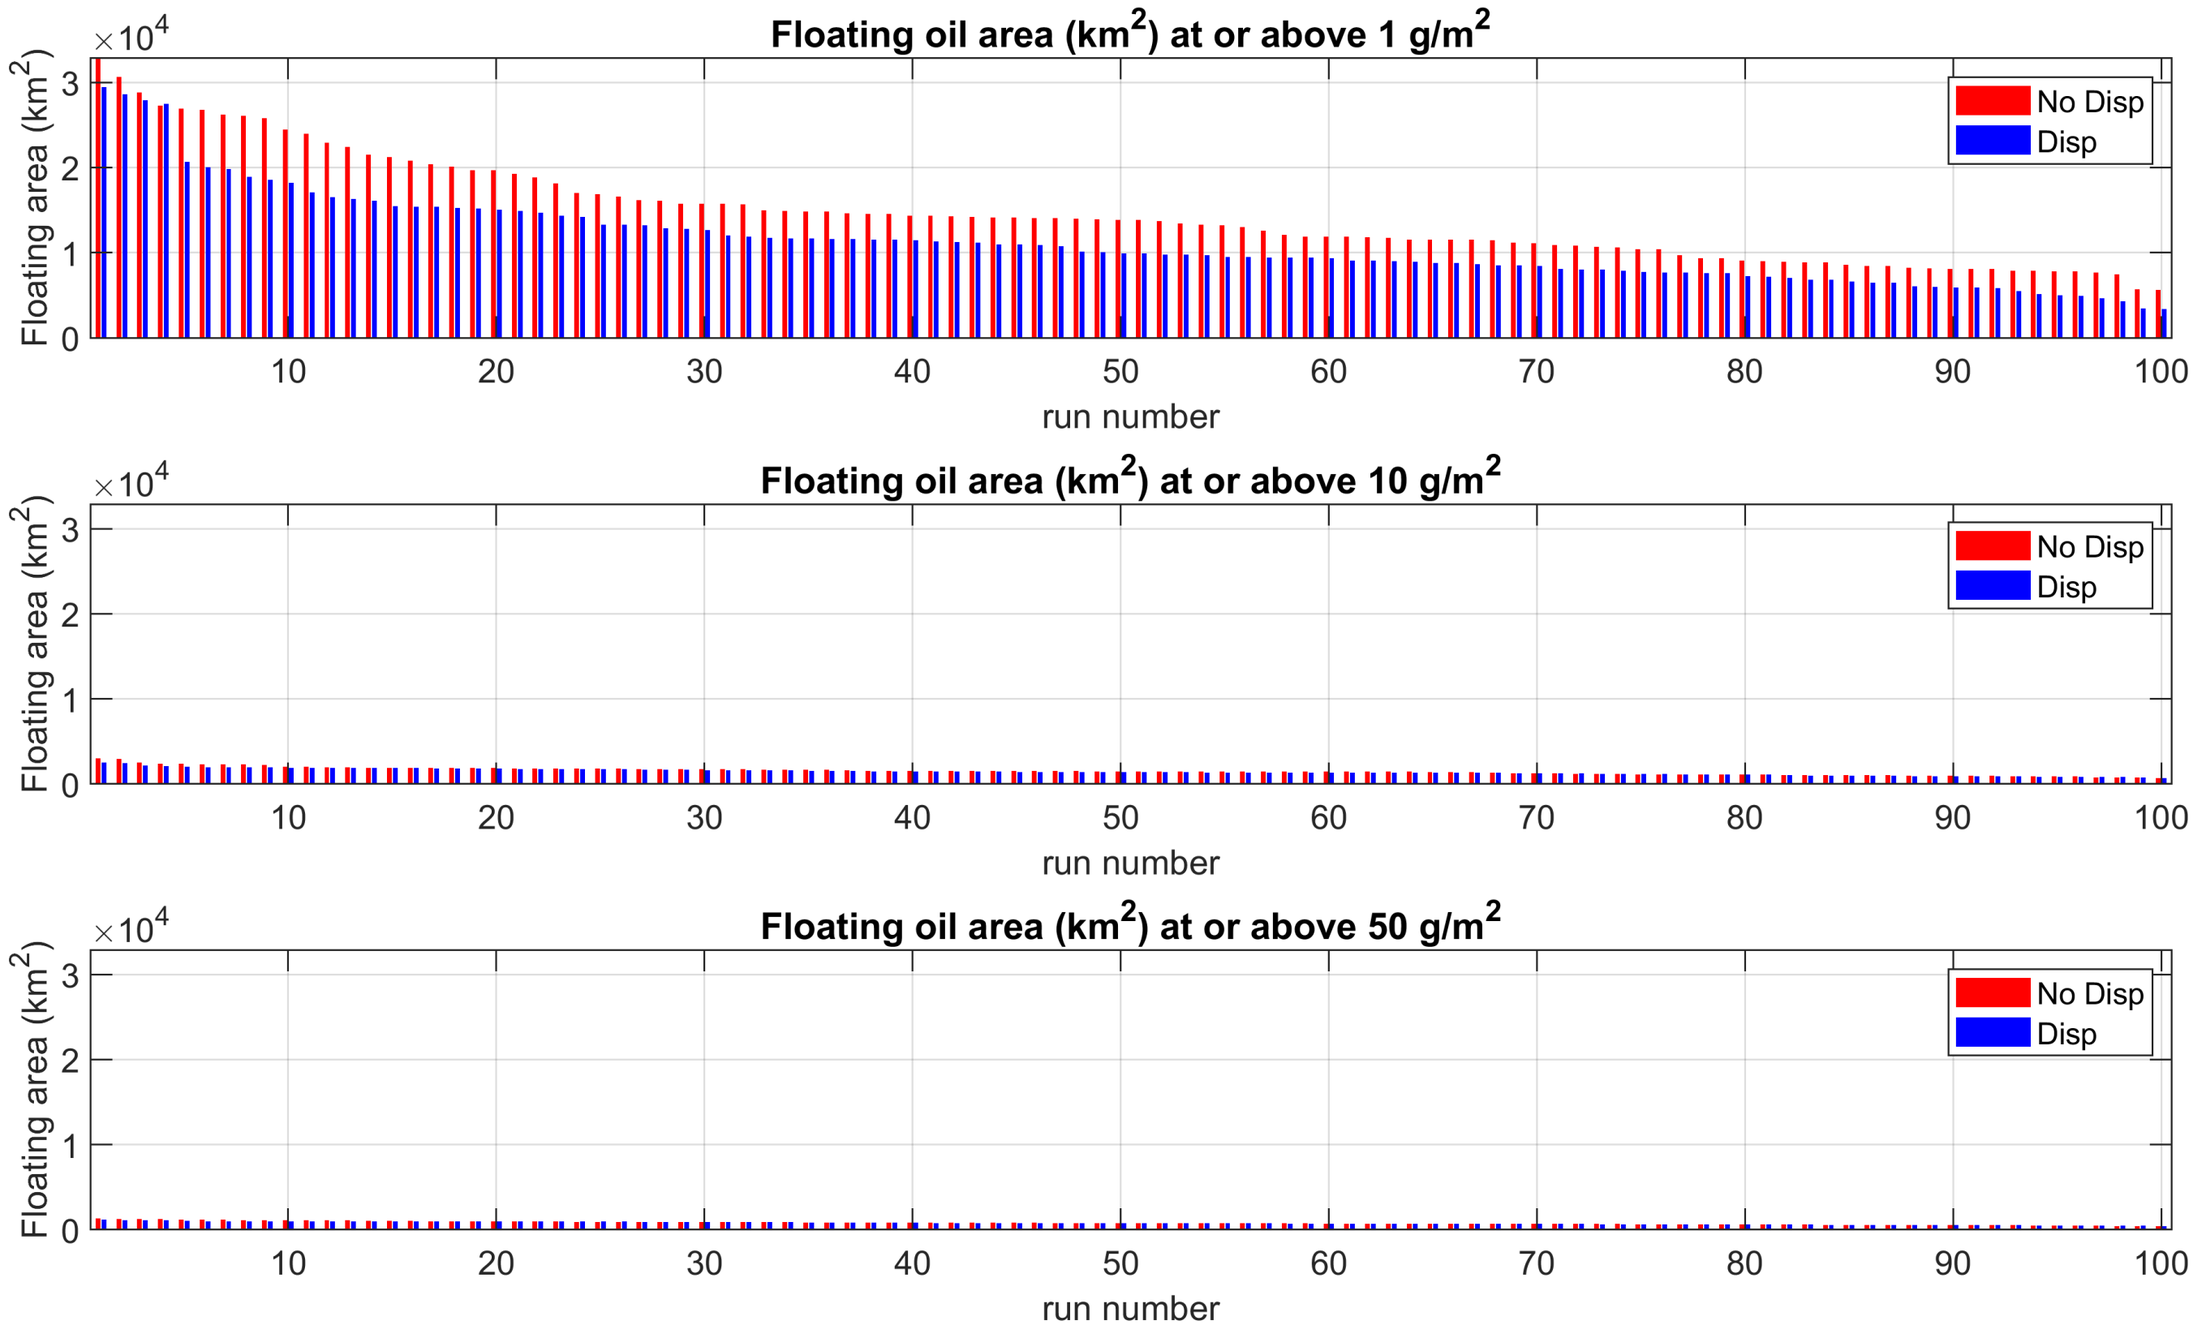

Figure 10.1 Sorted bar plots of the predicted area of the low, moderate and high zones of potential floating oil exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m³ of crude oil over 77 days, tracked for 98 days during summer conditions. The results from 100 spill trajectories are presented.

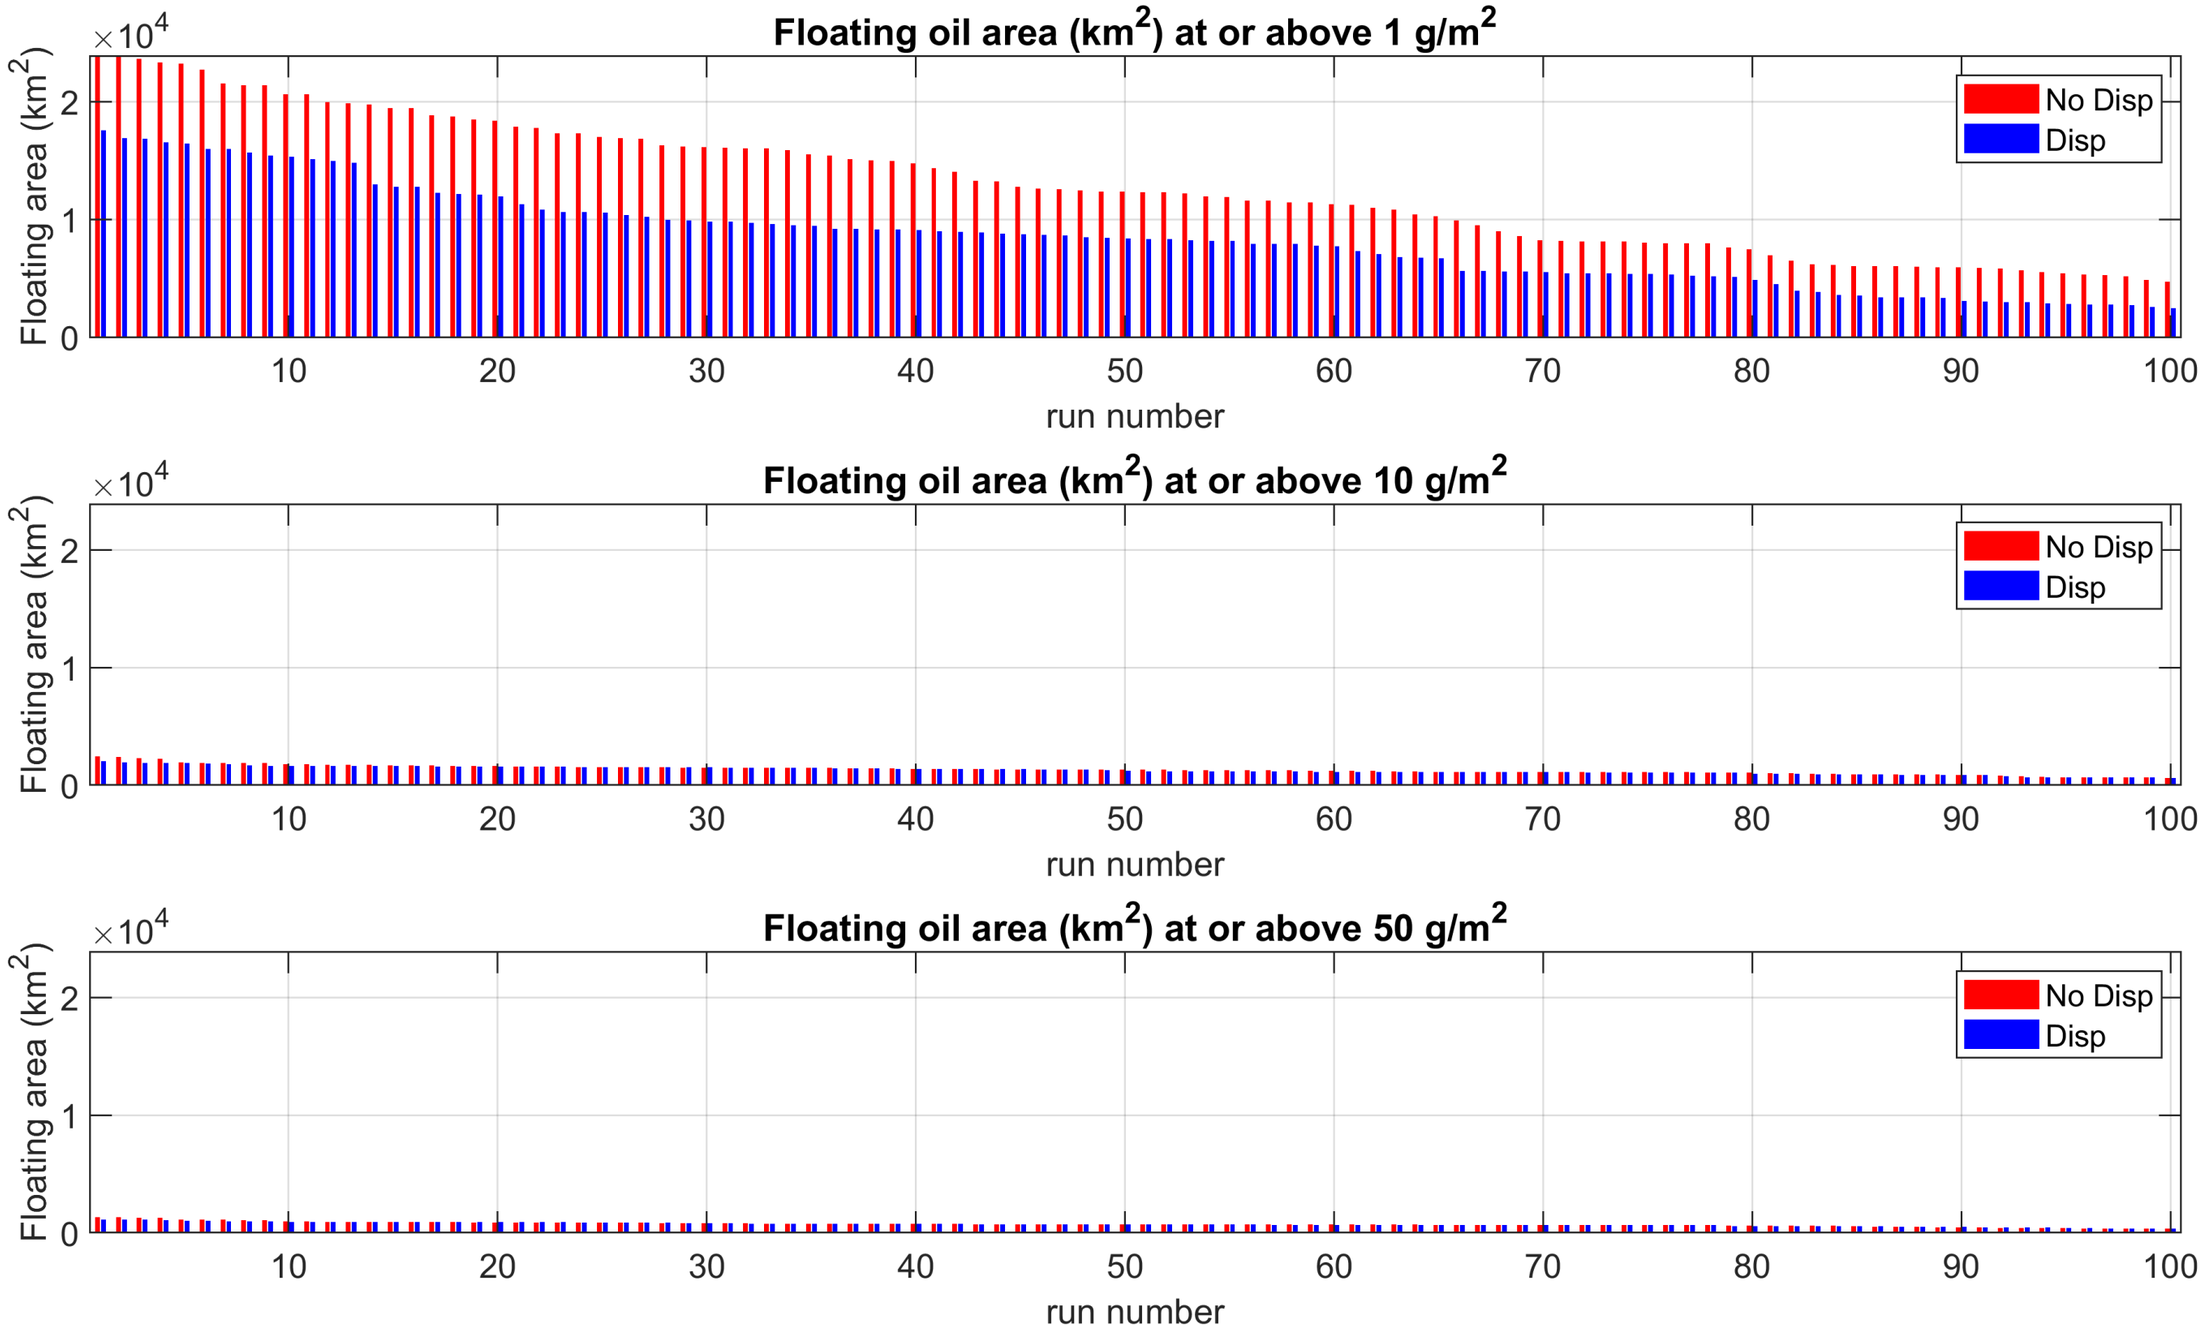

Figure 10.2 Sorted bar plots of the predicted area of the low, moderate and high zones of potential floating oil exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during transitional conditions. The results from 100 spill trajectories are presented.

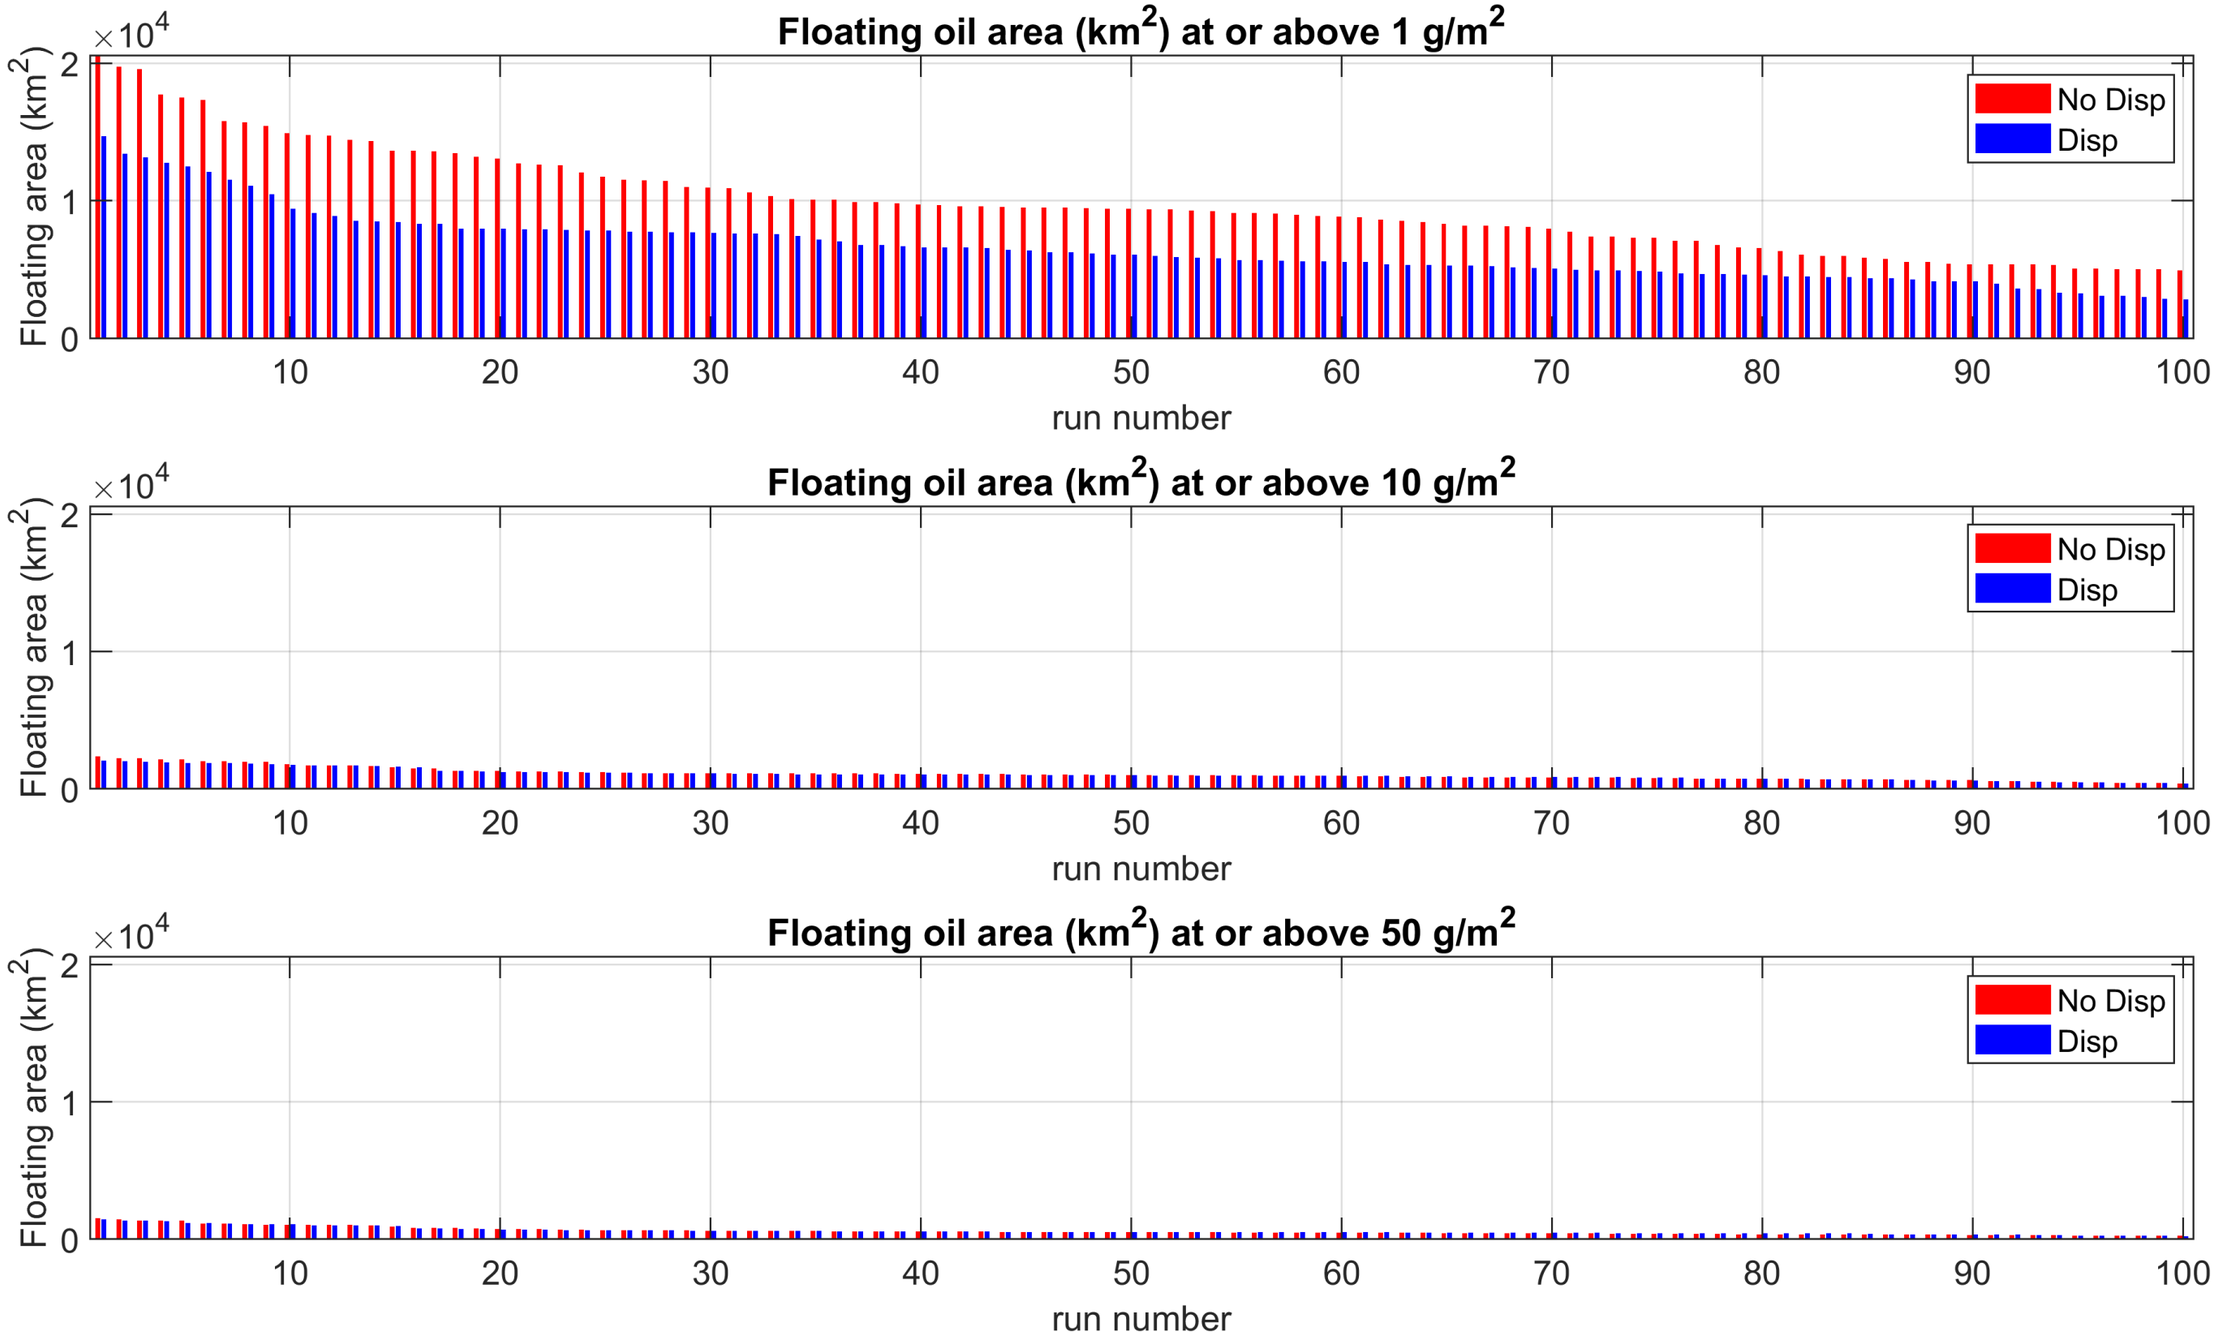

Figure 10.3 Sorted bar plots of the predicted area of the low, moderate and high zones of potential floating oil exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m³ of crude oil over 77 days, tracked for 98 days during winter conditions. The results from 100 spill trajectories are presented.

Table 10.2 Summary of the potential floating oil exposure to individual receptors for both the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories per season.

Table 10.3 Summary of the potential floating oil exposure to individual receptors for both the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories per season.

Table 10.4 Summary of the potential floating oil exposure to individual receptors for both the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories per season.

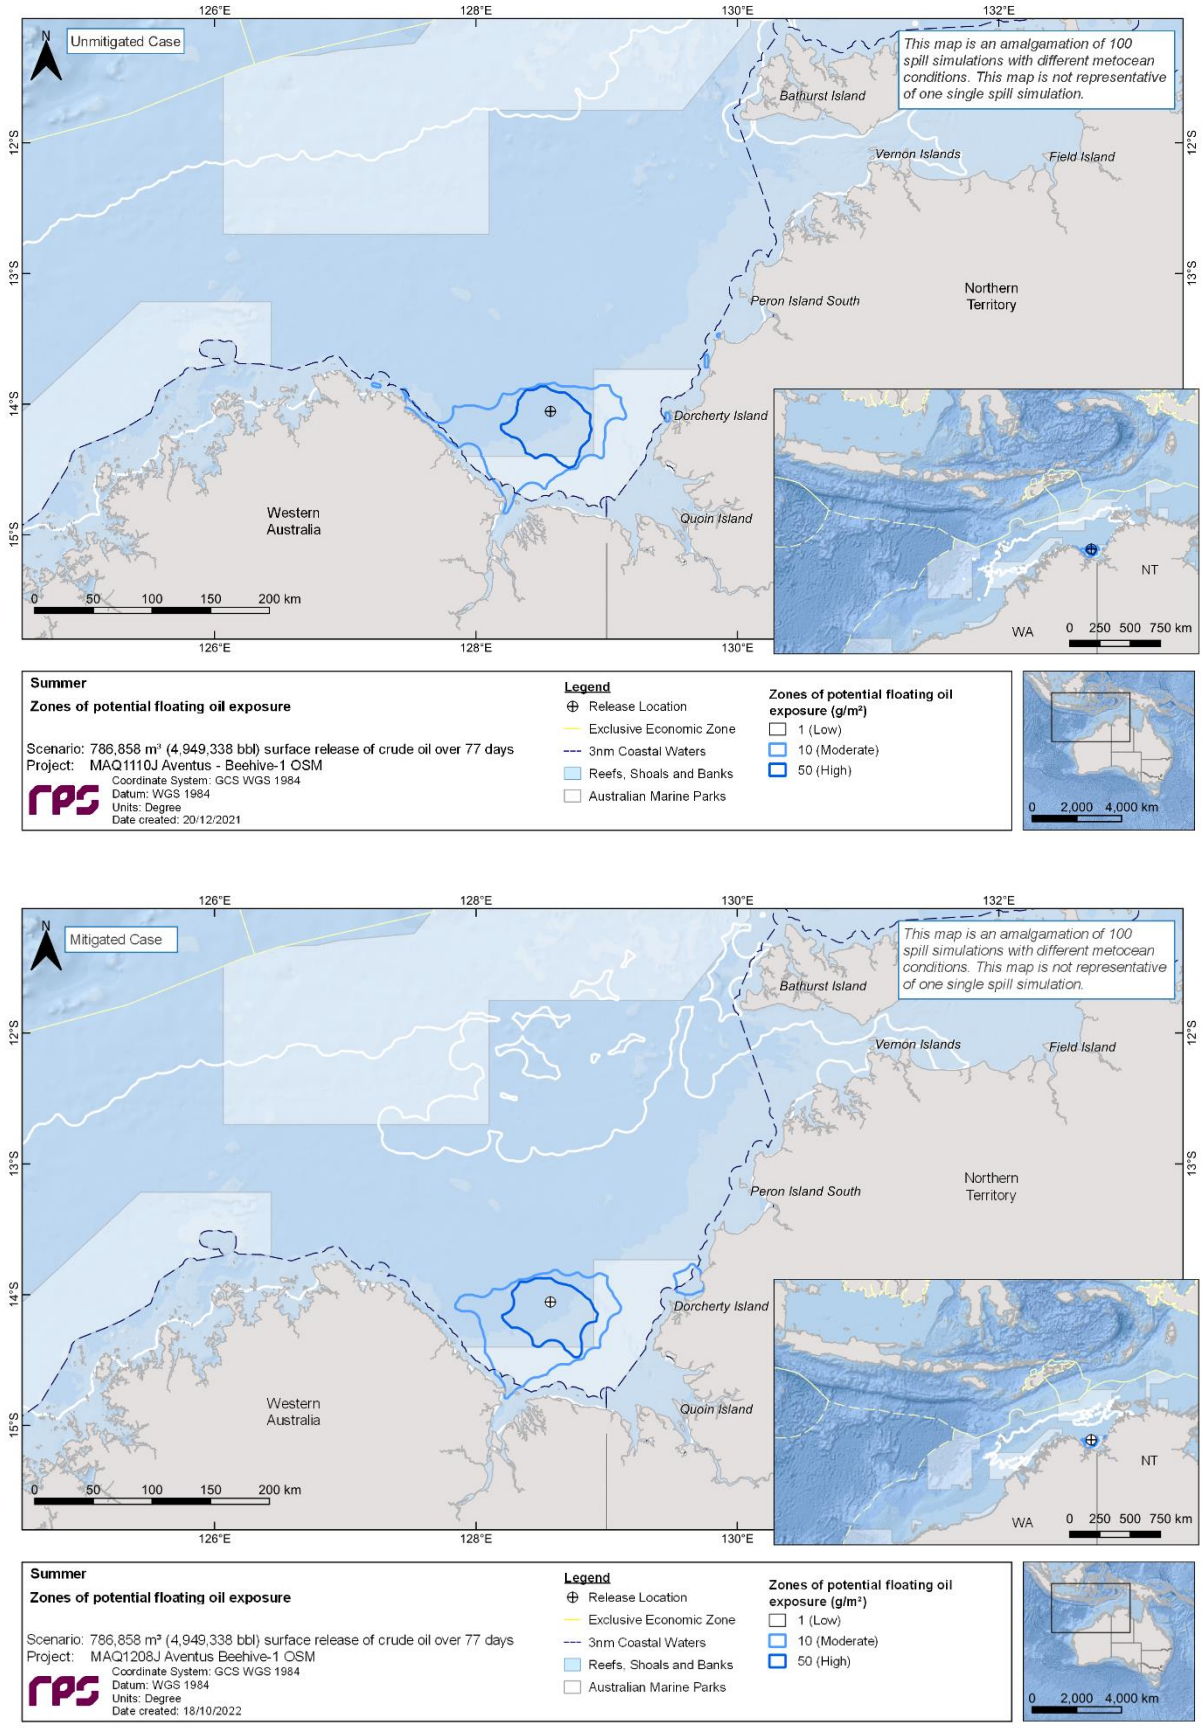

Figure 10.4 Zones of potential floating oil exposure for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during summer conditions. The results were calculated from 100 spill trajectories.

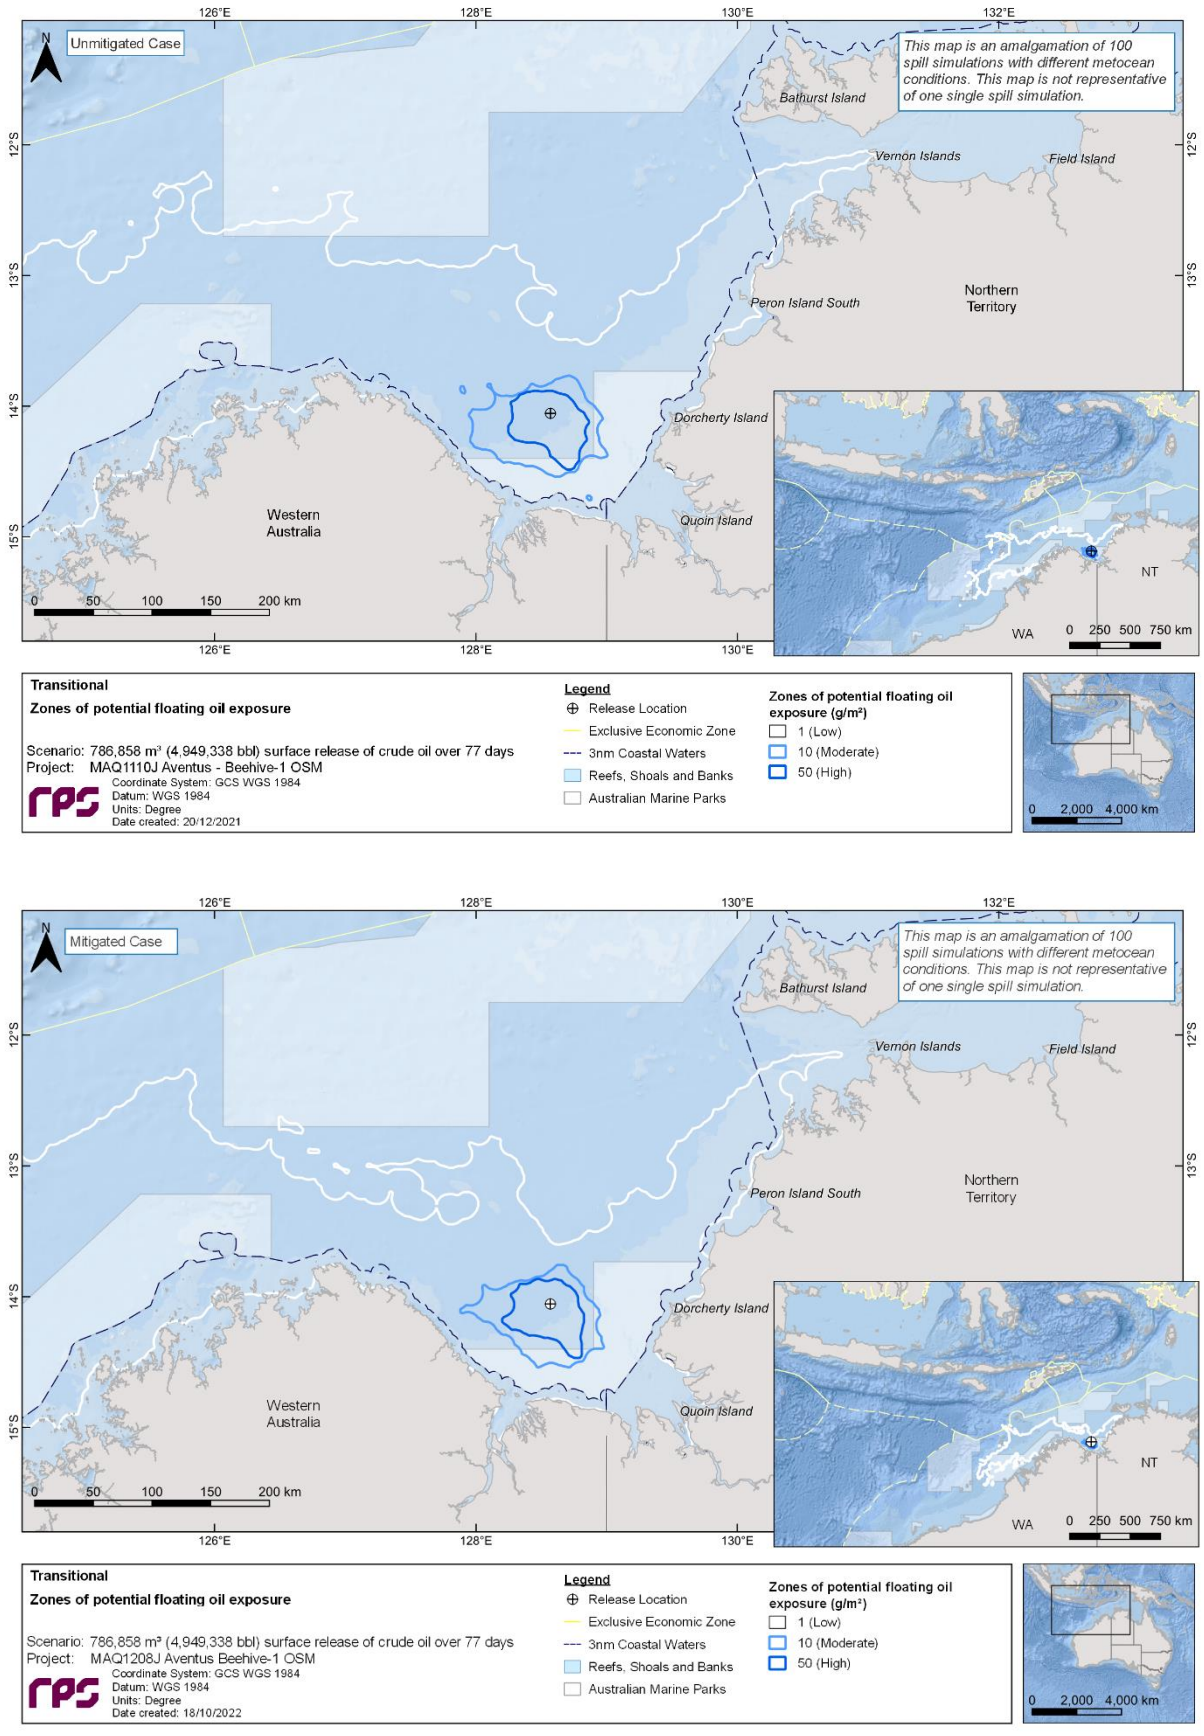

Figure 10.5 Zones of potential floating oil exposure for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during transitional conditions. The results were calculated from 100 spill trajectories.

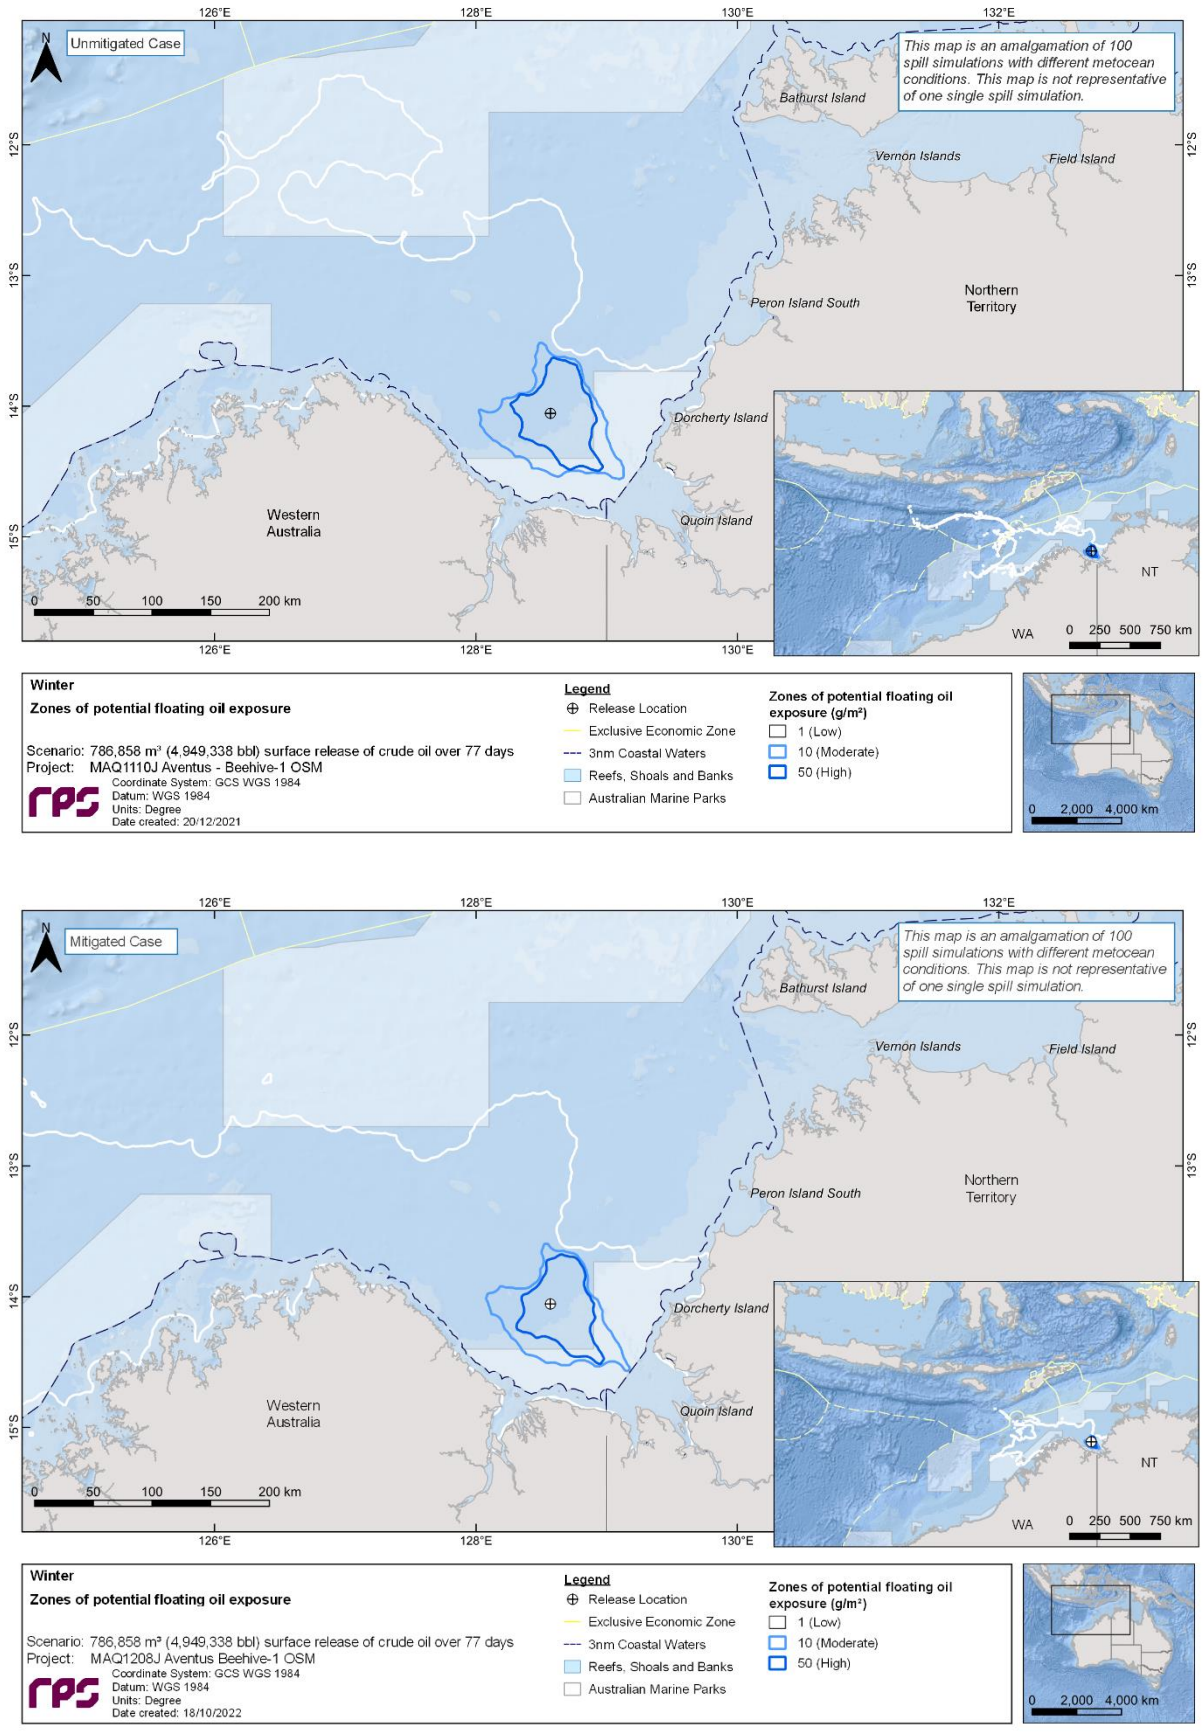

Figure 10.6 Zones of potential floating oil exposure for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during winter conditions. The results were calculated from 100 spill trajectories.

10.1.2 Shoreline Accumulation

Table 10.5 presents a summary of the predicted potential shoreline accumulation during seasonal conditions for the unmitigated and mitigated cases.

For the unmitigated case, the probability of accumulation to any shoreline at, or above, the low threshold (10 g/m^2) was 100% for all seasons and the minimum time before shoreline accumulation at, or above, the low threshold ranged between 10.29 days (transitional) to 11.58 days (summer). The maximum volume ashore for a single spill trajectory ranged between 406.9 m^3 (winter) and 705.0 m^3 (summer) and the maximum length of shoreline contacted at the low threshold was 201 km for winter and 225 km for summer.

Similarly, for the mitigated case, the probability of accumulation to any shoreline at, or above, the low threshold (10 g/m^2) was 100% for all seasons and the minimum time before shoreline accumulation at, or above, the low threshold ranged between 10.71 days (winter) to 13.17 days (summer). The maximum volume ashore for a single spill trajectory ranged between 204.8.6 m^3 (winter) and 421.0 m^3 (summer), which represented a reduction of 50% in the maximum volume ashore in comparison to the unmitigated case. The maximum length of shoreline contacted at the low threshold for the mitigated case ranged between 132 km (winter) and 151 km (summer). For all seasonal conditions assessed, the modelling demonstrated a maximum reduction in the length of shoreline contact above the low (39%), moderate (27%) and high (21%) thresholds, when the surface dispersant was applied.

Table 10.5 Summary of oil accumulation across all shorelines for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions. The results were calculated from 100 spill trajectories per season.

Shoreline Statistics	Unmitigated			Mitigated		
	Summer	Trans	Winter	Summer	Trans	Winter
Probability of accumulation on any shoreline (%)	100	100	100	100	100	100
Absolute minimum time for visible oil to shore (days)	11.58	10.29	11.25	13.17	10.79	10.71
Maximum volume of hydrocarbons ashore (m^3)	705.0	414.9	406.9	421.0	380.8	204.8
Average volume of hydrocarbons ashore (m^3)	259.5	176.9	145.8	178.6	96.8	64.2
Maximum length of the shoreline at 10 g/m^2 (km)	225	224	201	151	143	132
Average shoreline length (km) at 10 g/m^2 (km)	119.7	82.6	90.9	92.9	54.4	55.2
Maximum length of the shoreline at 100 g/m^2 (km)	129	116	99	98	84	53
Average shoreline length (km) at 100 g/m^2 (km)	61.6	45.5	40.9	43.6	26.2	19.1
Maximum length of the shoreline at 1,000 g/m^2 (km)	16	9	8	13	6	2
Average shoreline length (km) at 1,000 g/m^2 (km)	5.2	3.5	2.7	3.5	2.2	1.3

Table 10.6 to

Table 10.8 summarises the shoreline accumulation on individual receptors for each season for the unmitigated and mitigated cases.

For the unmitigated case, the shoreline assessment identified Wyndham - East Kimberley, Thamarrurr, Daly, Victoria Daly, Dorcherty Island and Un-named Head - Cape Rulhieres (A) shorelines as the sectors with the largest potential shoreline oil accumulation during summer conditions with volumes ranging between 134.8 m^3 to 404.4 m^3 (Table 10.6). During the transitional and winter months, the Wyndham - East Kimberley, Victoria Daly and Thamarrurr shorelines recorded potential shoreline oil accumulation ranging between 164.9 m^3 to 414.9 m^3 (transitional; Table 10.7) and 155.6 m^3 and 406.9 m^3 (winter; Table 10.8). Additionally, Wyndham - East Kimberley recorded the earliest shoreline contact (11.25 days) and the longest mean length (58.1 km) of shoreline accumulation above the low threshold during transitional conditions.

Similarly, for the mitigated case, the shoreline assessment identified Daly, Dorcherty Island, Thamarrurr, Victoria Daly, Wyndham - East Kimberley, Cape Bernier - Elsie Island N, Un-named Head - Cape Rulhieres (A), Un-named Head - Cape Rulhieres (C), Davidsons Point - Crystal Head (D) and Davidsons Point - Cape Bougainville (D) shorelines as the sectors with the largest potential shoreline oil accumulation during summer conditions with volumes ranging between 40.1 m^3 to 339.1 m^3 (Table 10.6). During the transitional months, for the mitigated case the Browse Island, Quoin Island, Thamarrurr, Victoria Daly, Wyndham - East Kimberley, East Cape Domett - WA-NT Border (A), Cape Bernier - Elsie Island N, Un-named Head - Cape Rulhieres (A), Un-named Head - Cape Rulhieres (C), Cape Bougainville - Low Island Point (D) Davidsons Point - Crystal Head (D) and Davidsons Point - Cape Bougainville (D) shorelines recorded potential shoreline oil accumulation ranging between 36.4 m^3 to 344.7 m^3 (Table 10.7). In comparison during the winter months for the mitigated case the shorelines with the largest potential shoreline oil accumulation was Wyndham - East Kimberley, Aunty Islet - Thurburn Bluff, Cape Bernier - Elsie Island N, Davidsons Point - Crystal Head (D), Davidsons Point - Cape Bougainville (C), Davidsons Point - Cape Bougainville (D), Augereau Island - Davidsons Point ranging between 30.1 m^3 and 201.9 m^3 (Table 10.8). Additionally, during both transitional and winter conditions the Wyndham - East Kimberley shoreline recorded the earliest shoreline contact (10.79 days, transitional and 10.71 days, winter) and the longest mean length (40.5 km, transitional and 38.7 km, winter) of shoreline accumulation above the low threshold.

Figure 10.7 to Figure 10.9 present sorted bar plots of the predicted length of shoreline accumulation for the low, moderate and high shoreline accumulation thresholds for the unmitigated and mitigated cases from 100 spill trajectories per season and case.

The maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented for each season, for both unmitigated and mitigated cases in Figure 10.10 to Figure 10.12.

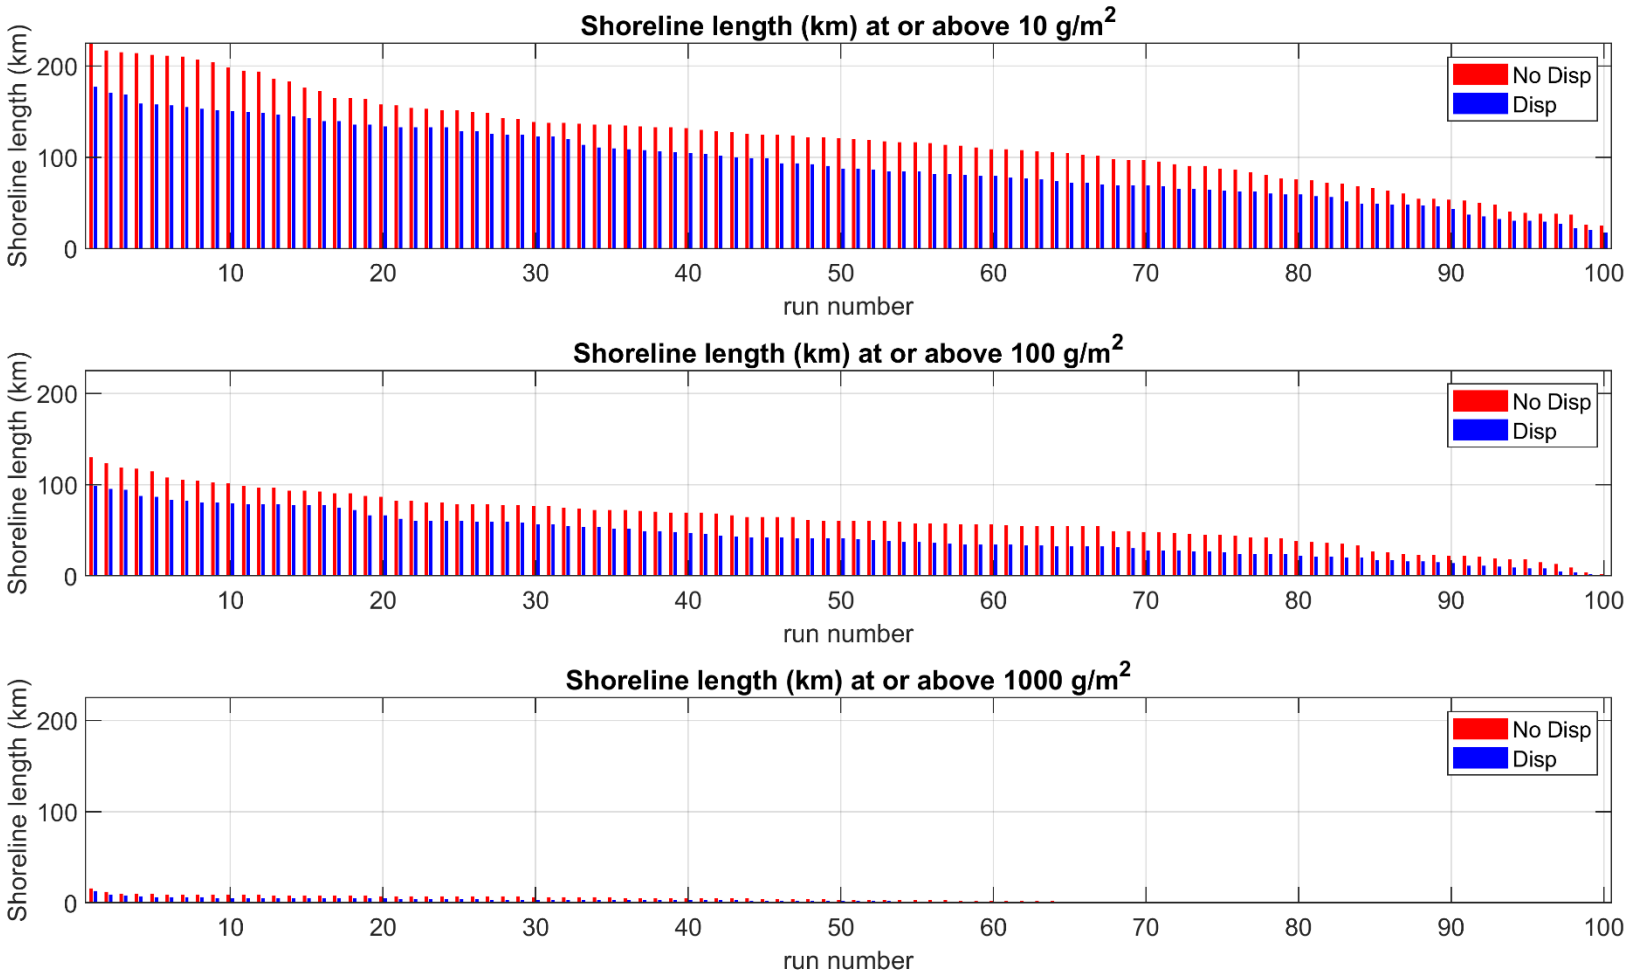

Figure 10.7 Sorted bar plots of the predicted length of shoreline accumulation for the low, moderate and high shoreline accumulation thresholds for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during summer conditions. The results from 100 spill trajectories are presented.

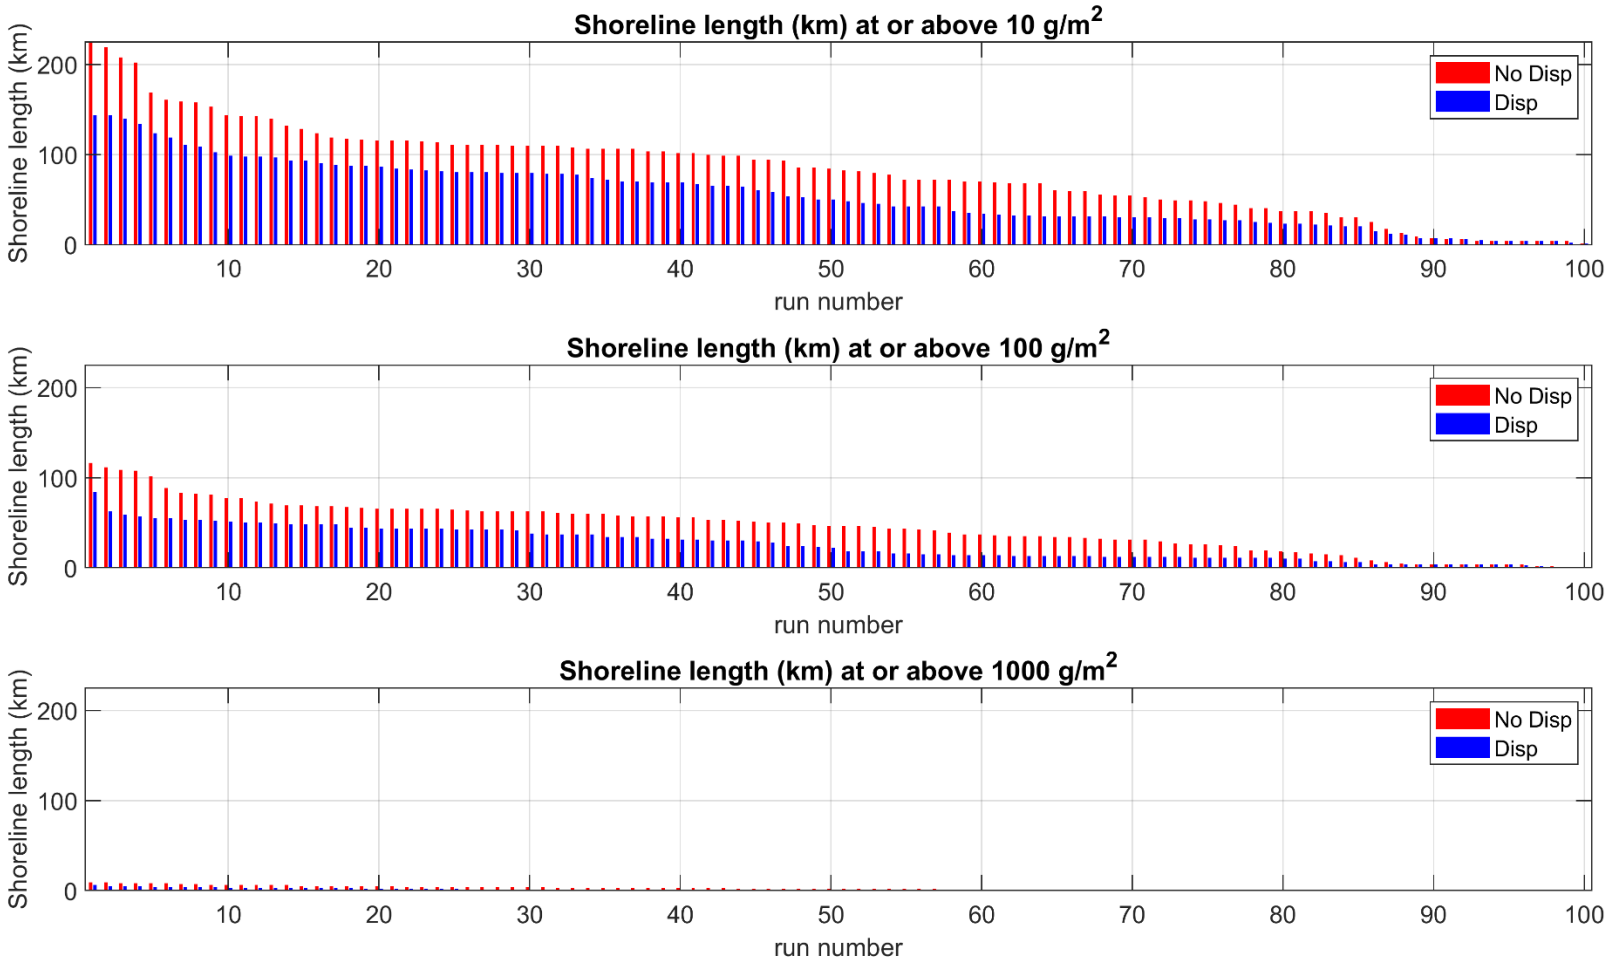

Figure 10.8 Sorted bar plots of the predicted length of shoreline accumulation for the low, moderate and high shoreline accumulation thresholds for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during summer conditions. The results from 100 spill trajectories are presented.

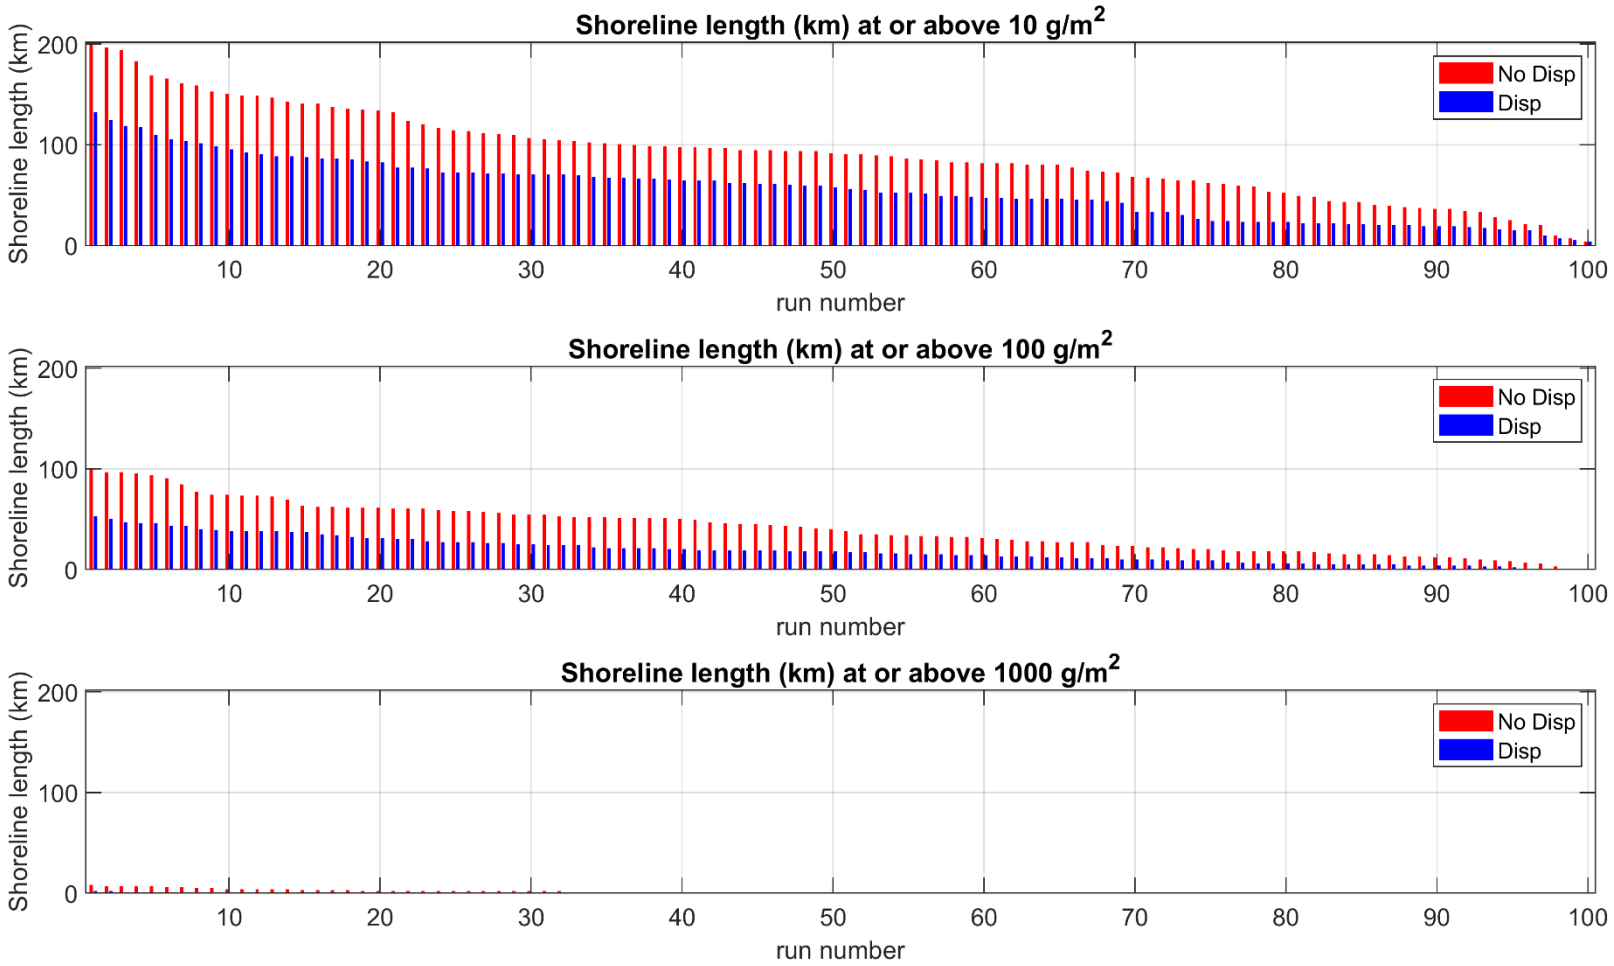

Figure 10.9 Sorted bar plots of the predicted length of shoreline accumulation for the low, moderate and high shoreline accumulation thresholds for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during summer conditions. The results from 100 spill trajectories are presented.

Table 10.6 Summary of oil accumulation on individual shoreline sectors for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories.

Table 10.7 Summary of oil accumulation on individual shoreline receptors for the unmitigated and mitigated cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories.

Table 10.8 Summary of oil accumulation on individual shoreline receptors for the unmitigated and mitigated cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories.

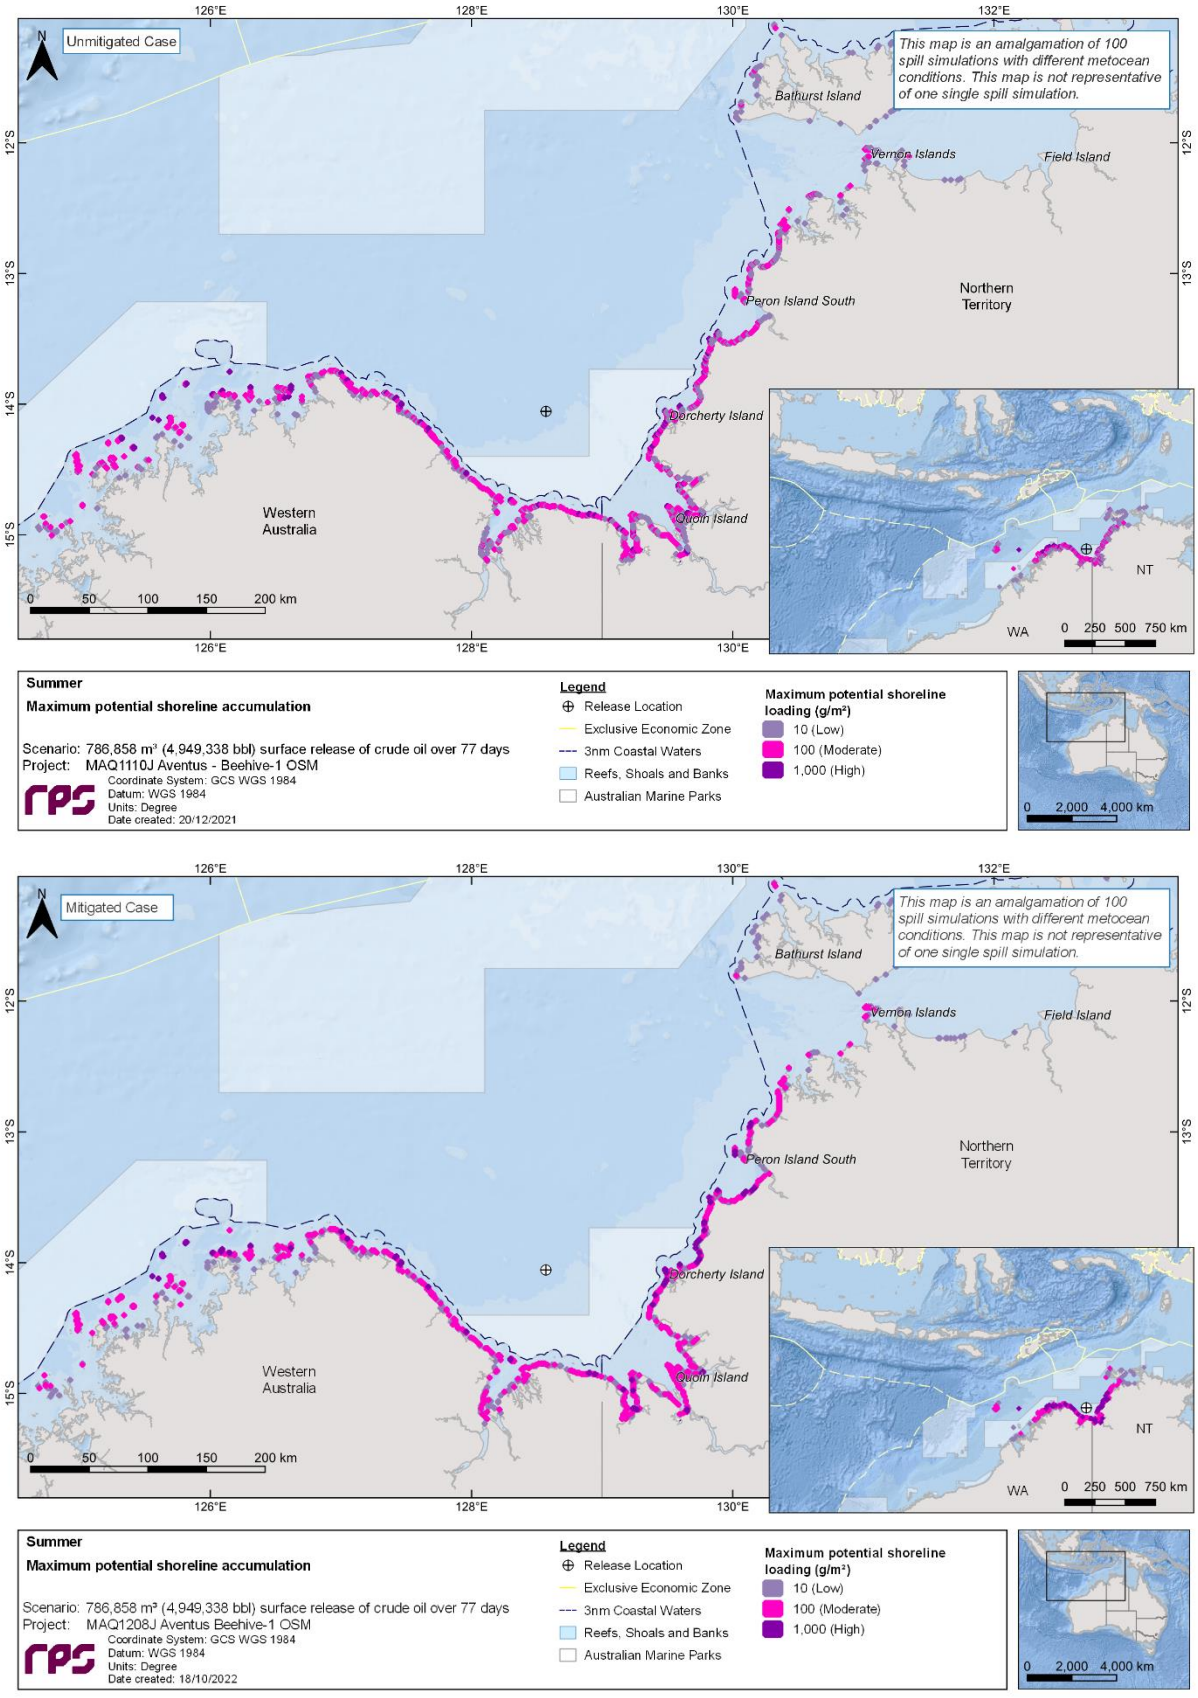

Figure 10.10 Maximum potential shoreline loading for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during summer conditions. The results were calculated from 100 spill trajectories.

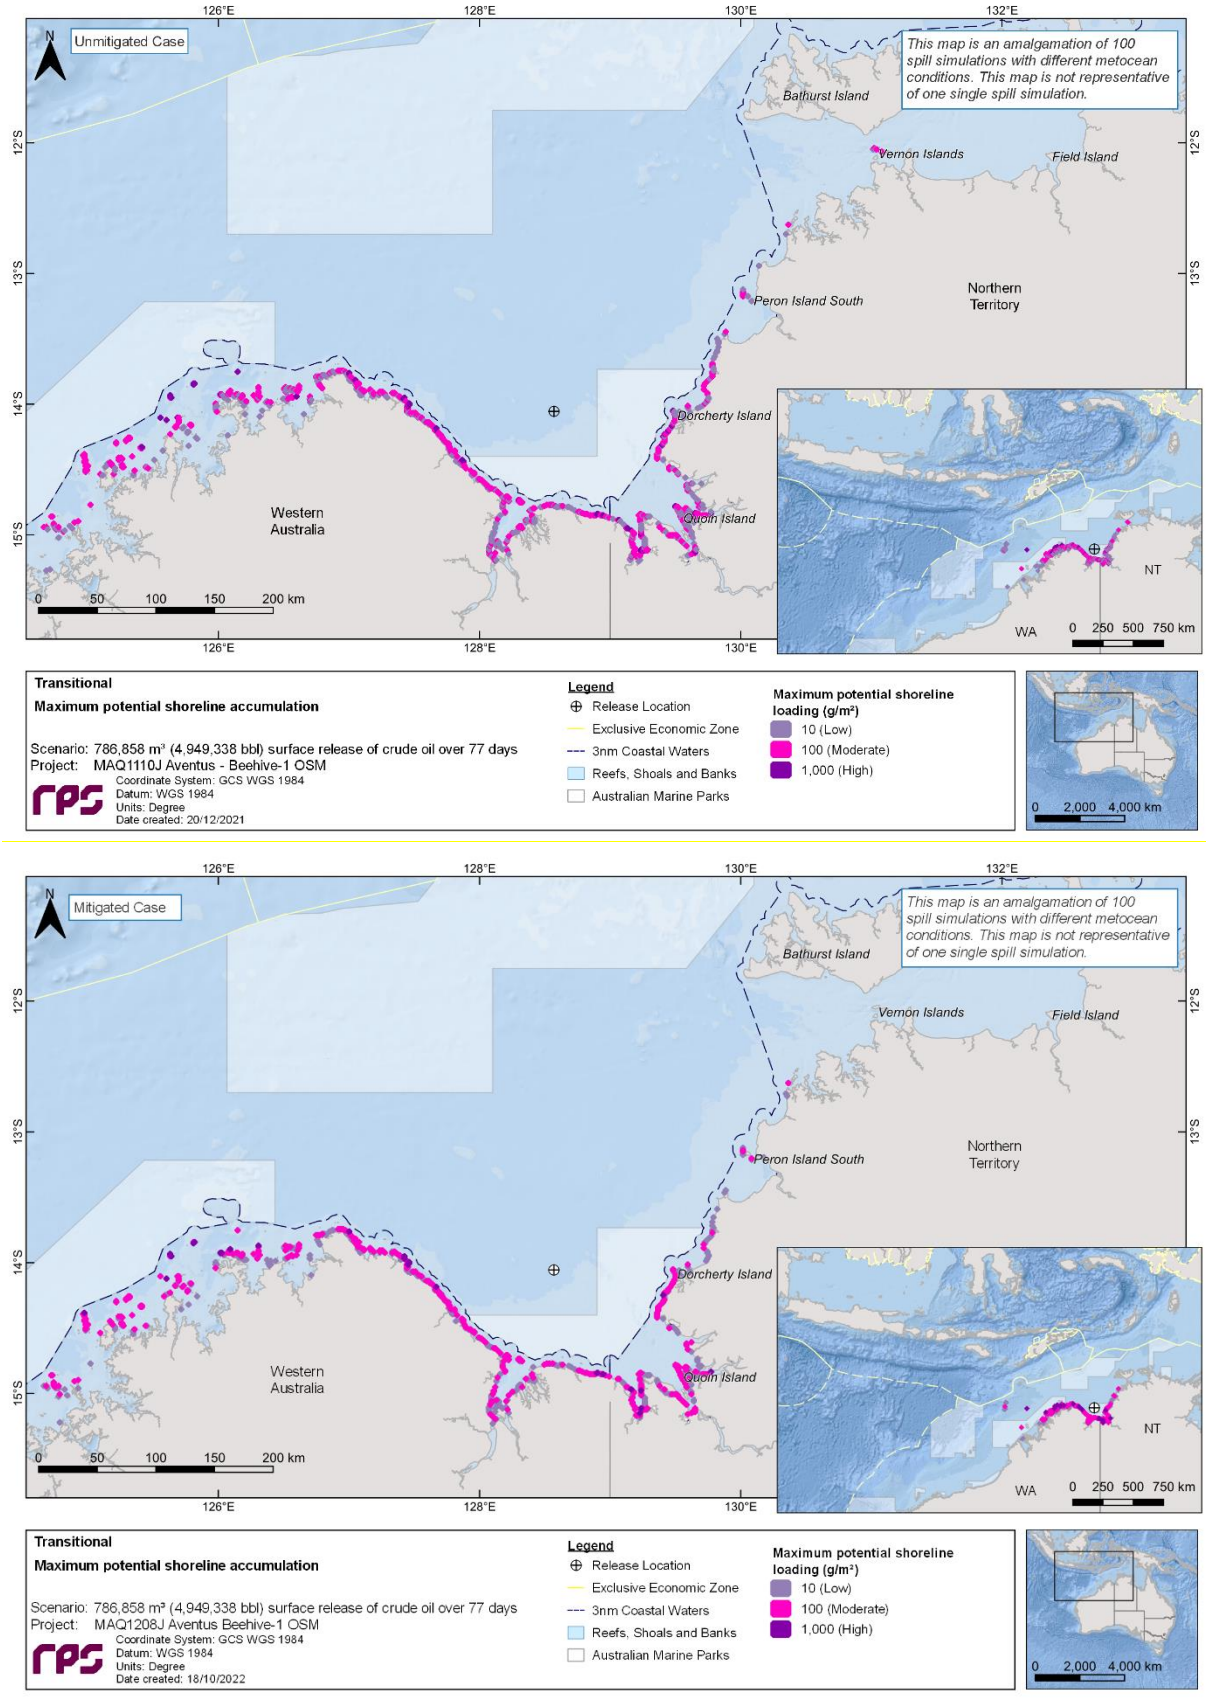

Figure 10.11 Maximum potential shoreline loading for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during transitional conditions. The results were calculated from 100 spill trajectories.

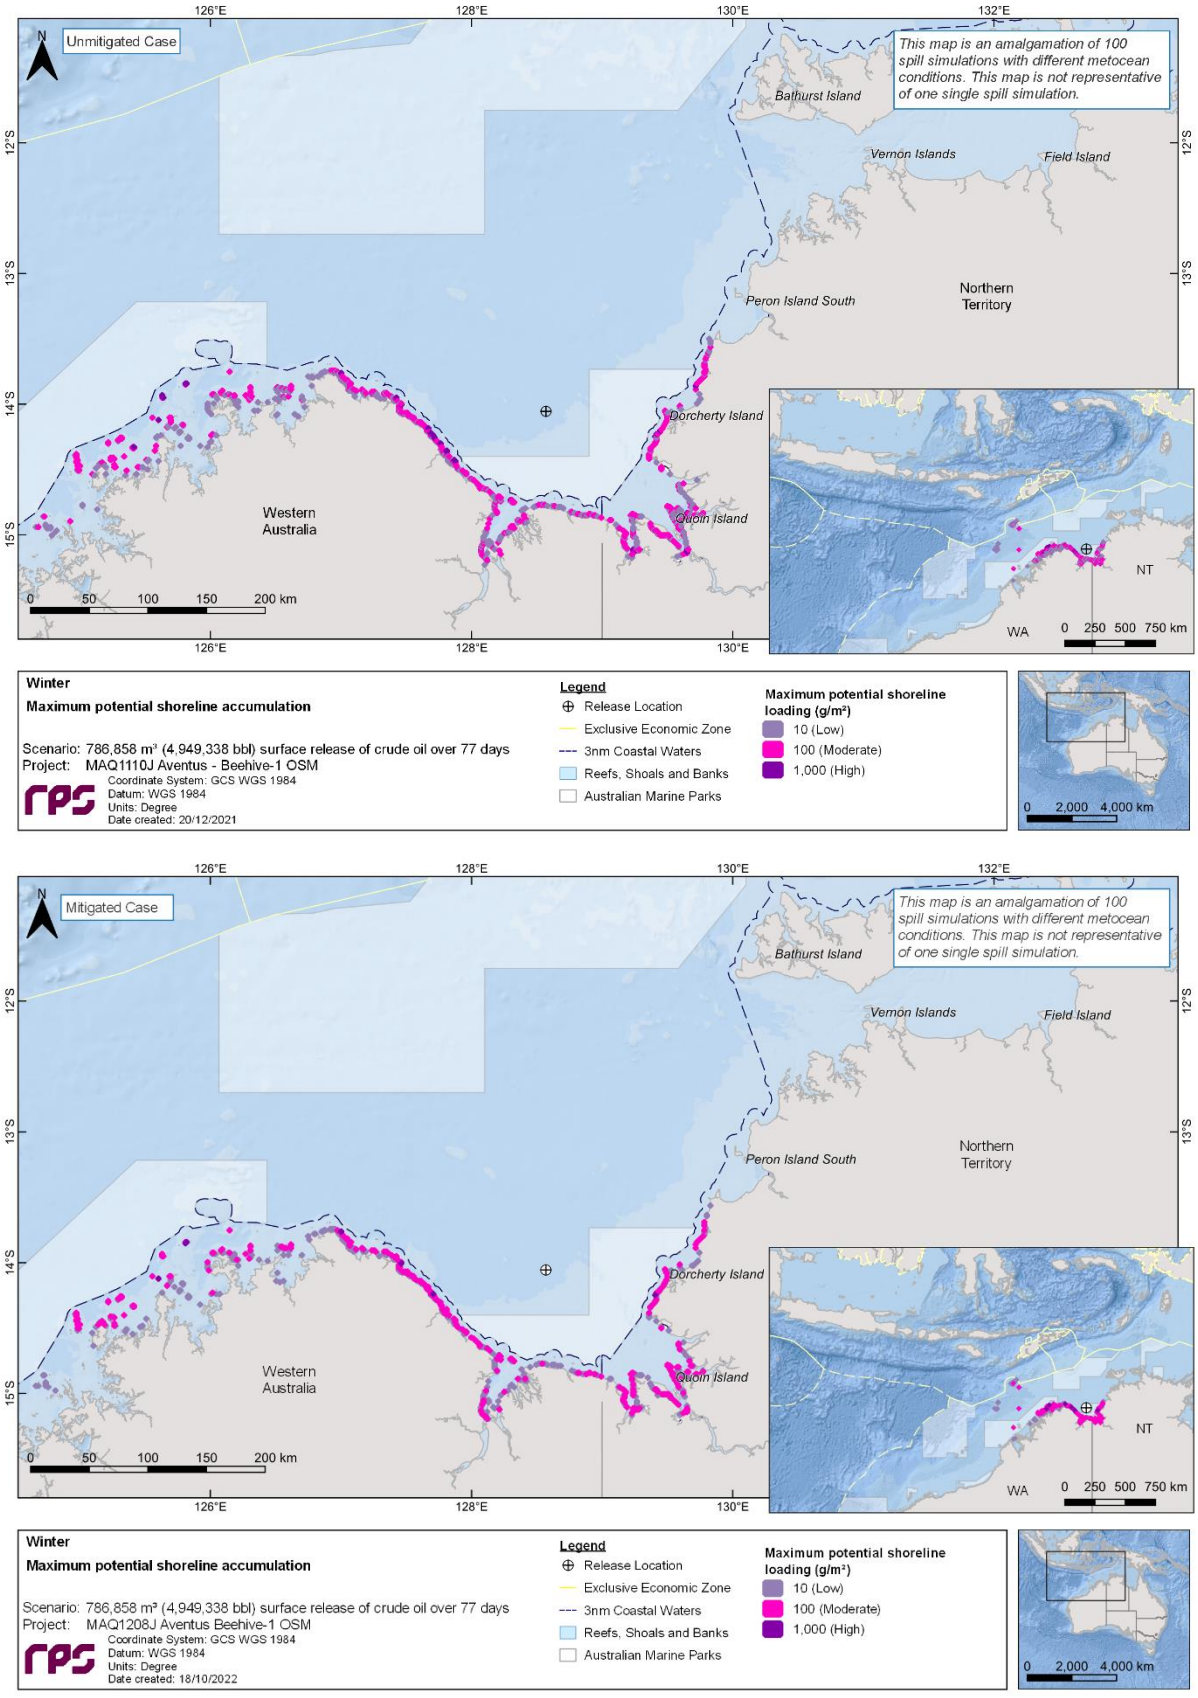

Figure 10.12 Maximum potential shoreline loading for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during winter conditions. The results were calculated from 100 spill trajectories.

10.1.3 In-water exposure

10.1.3.1 Dissolved Hydrocarbons

Figure 10.13 to Figure 10.15 present sorted bar plots of the predicted area of the low, moderate and high zones of dissolved hydrocarbon exposure for the unmitigated and mitigated cases from 100 spill trajectories per season and case.

Table 10.9 to Table 10.11 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m depth layer during seasonal conditions for the unmitigated and mitigated cases.

For the unmitigated case, in the surface (0-10 m) depth layer, low, moderate and high exposure to dissolved hydrocarbons was recorded for a range of receptors. The highest dissolved hydrocarbon concentrations were predicted for the Joseph Bonaparte Gulf AMP and the Carbonate bank and terrace system of the Sahul Shelf KEF, followed by the North Kimberley MP and Kimberley AMP during all seasonal conditions. In addition, the nearshore waters of the Thamarrurr, Wyndham-East Kimberley, Dorcherty Island, Clump Island, Quoin Island, Daly, Victoria Daly shorelines and Ord River floodplain (Ramsar) were some of the receptors with the highest entrained hydrocarbons concentrations for all seasonal conditions.

Additionally, for the mitigated case for the surface depth layer the highest dissolved hydrocarbon concentrations were predicted for the Joseph Bonaparte Gulf and Kimberly AMPs, the Carbonate bank and terrace system of the Sahul Shelf KEF, the North Kimberley MP, and the East Cape Domett - WA-NT Border (C), Bare Hill - East Cape Domett (E), Cape Rulhieres - Cape Bernier, Un-named Head - Cape Rulhieres (B) and Un-named Head - Cape Rulhieres (C) Nearshore Waters (DoT Shoreline Cells) during the seasonal conditions. Additionally, Thamarrurr, Wyndham-East Kimberley, Dorcherty Island, Clump Island, Quoin Island, Daly, Victoria Daly shorelines and were some of the receptors with elevated entrained hydrocarbons concentrations for all seasonal conditions, coinciding with the same predicted receptors for the unmitigated case.

Figure 10.16 to Figure 10.18 presents the zones of potential dissolved hydrocarbon exposure in the 0-10 m depth layer for the low, moderate and high exposure levels for each season and case.

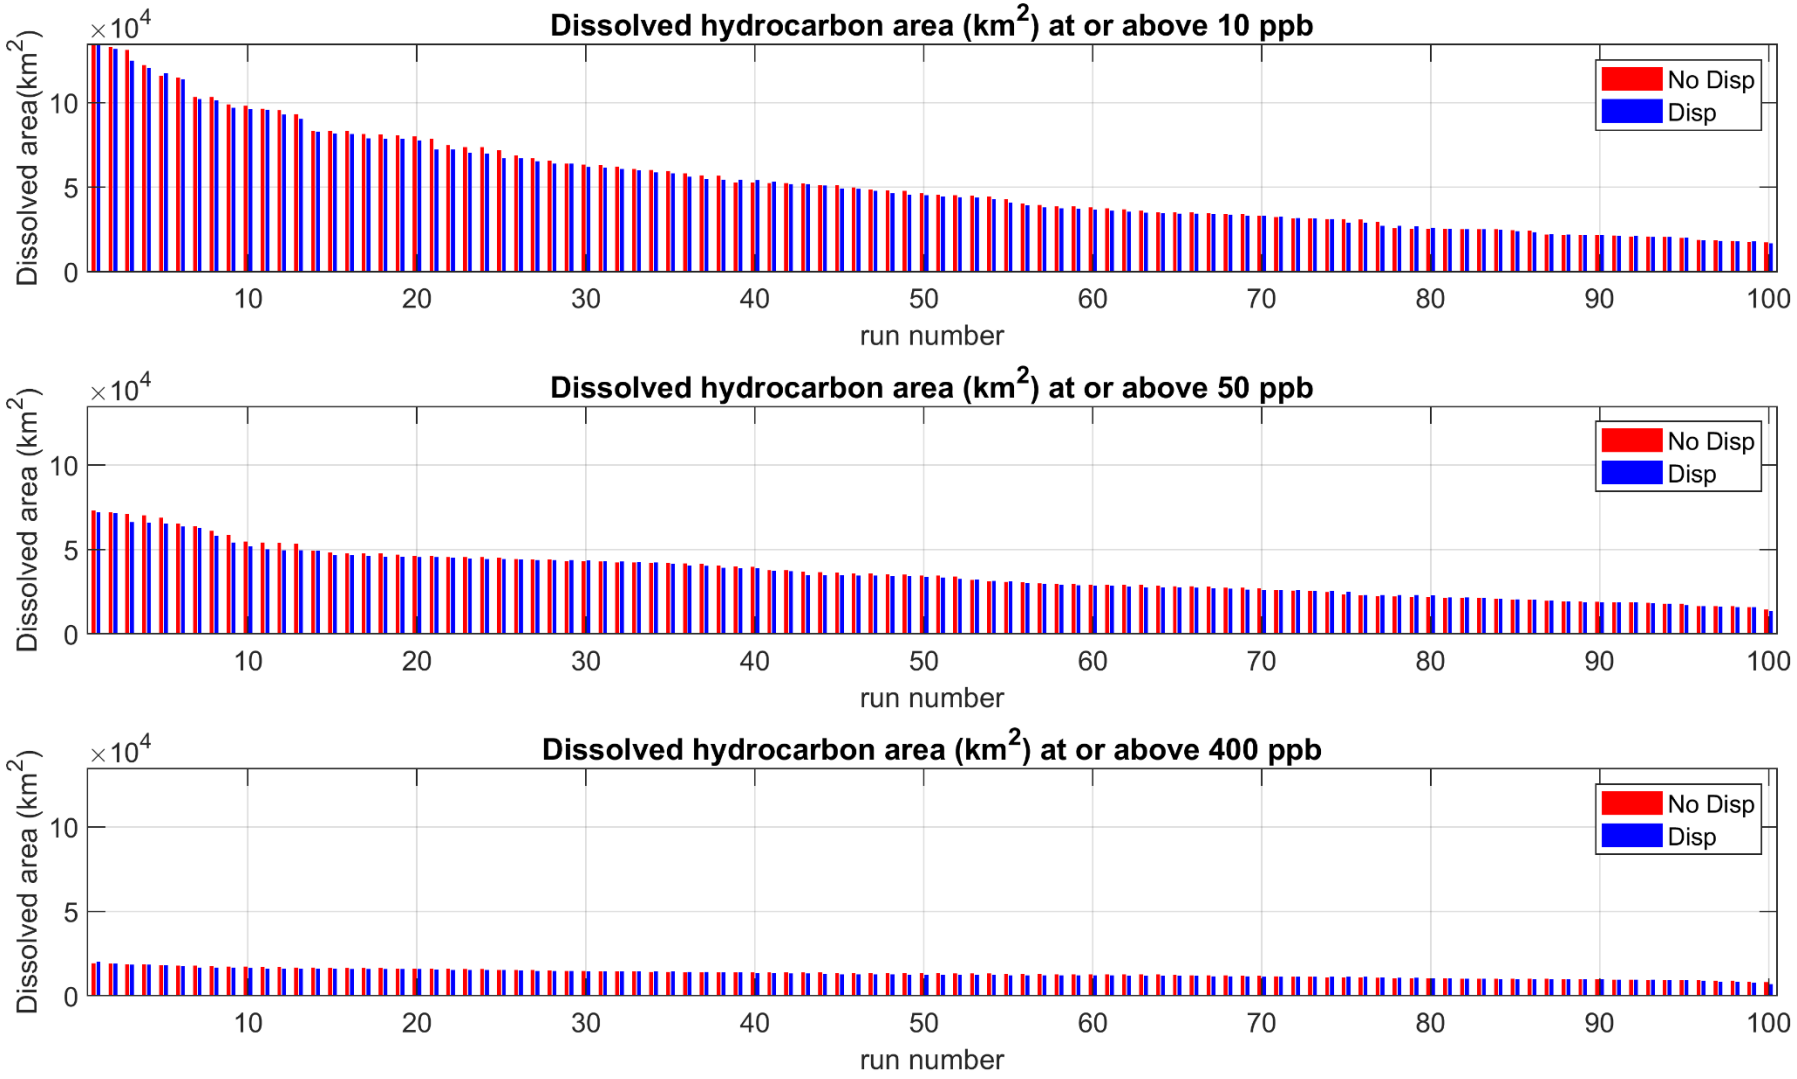

Figure 10.13 Sorted bar plots of the predicted area of the low, moderate and high zones of dissolved hydrocarbon exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m³ of crude oil over 77 days, tracked for 98 days during summer conditions. The results from 100 spill trajectories are presented.

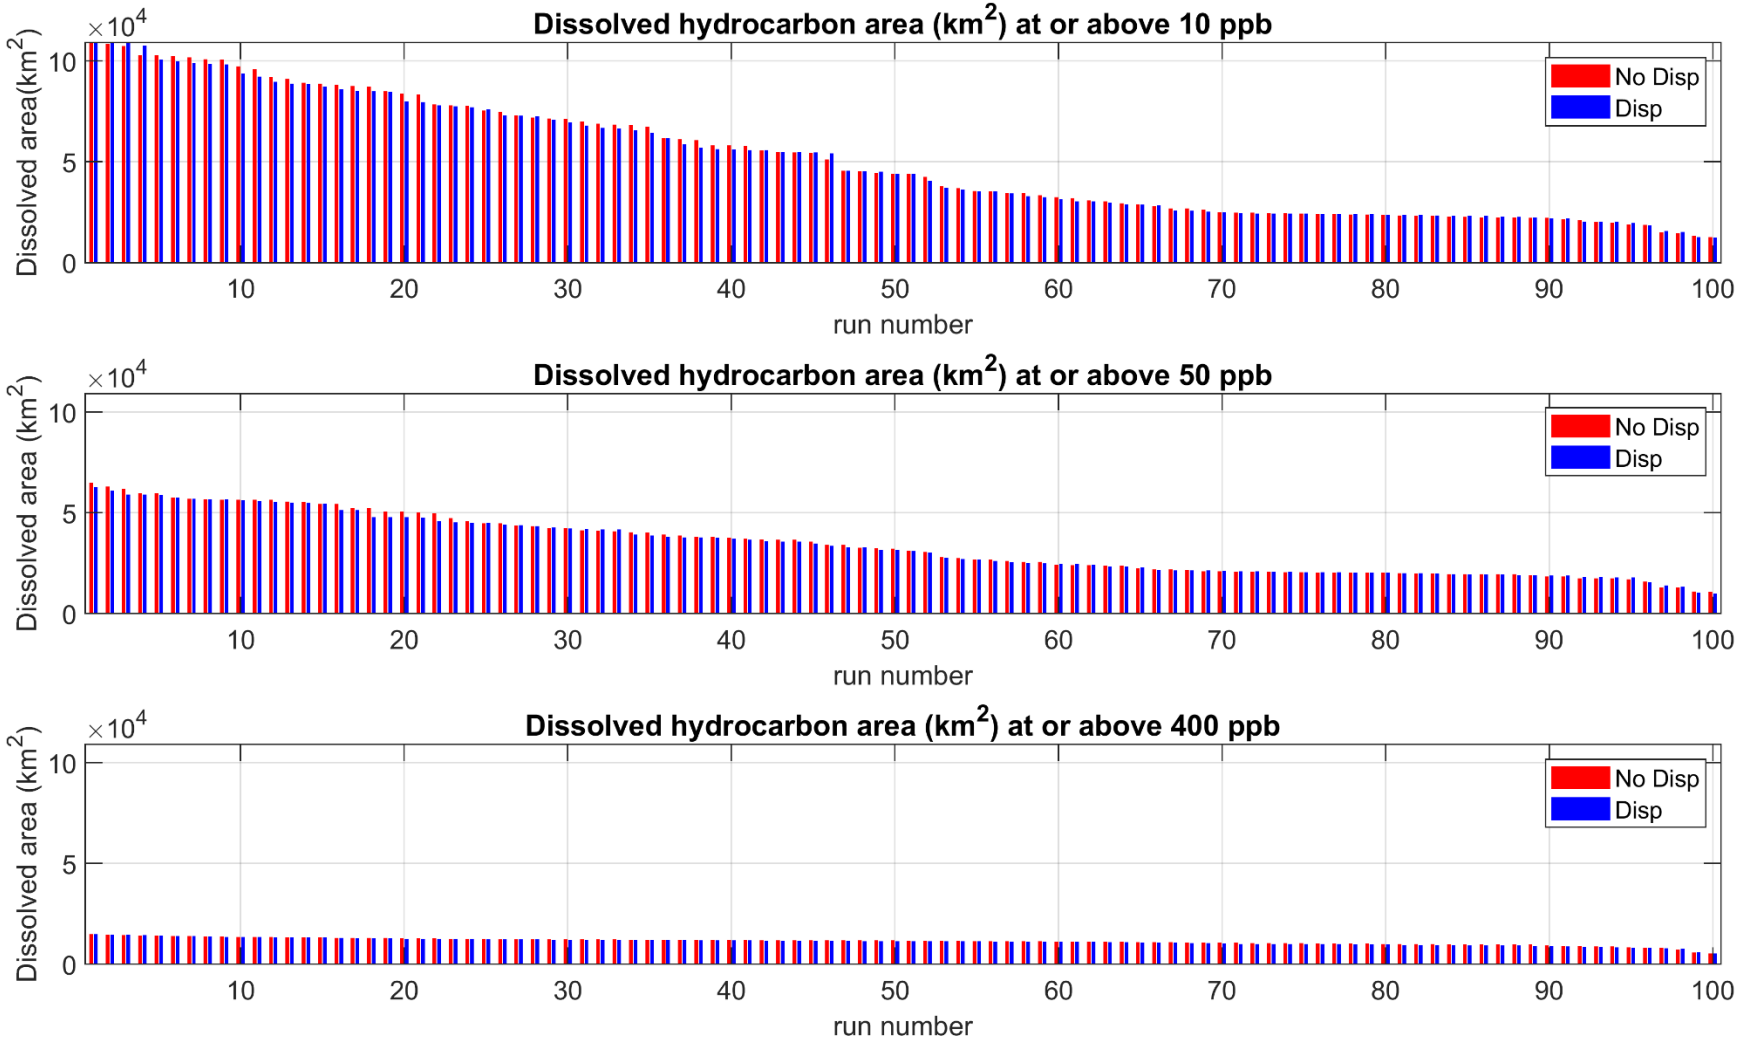

Figure 10.14 Sorted bar plots of the predicted area of the low, moderate and high zones of dissolved hydrocarbon exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m³ of crude oil over 77 days, tracked for 98 days during transitional conditions. The results from 100 spill trajectories are presented.

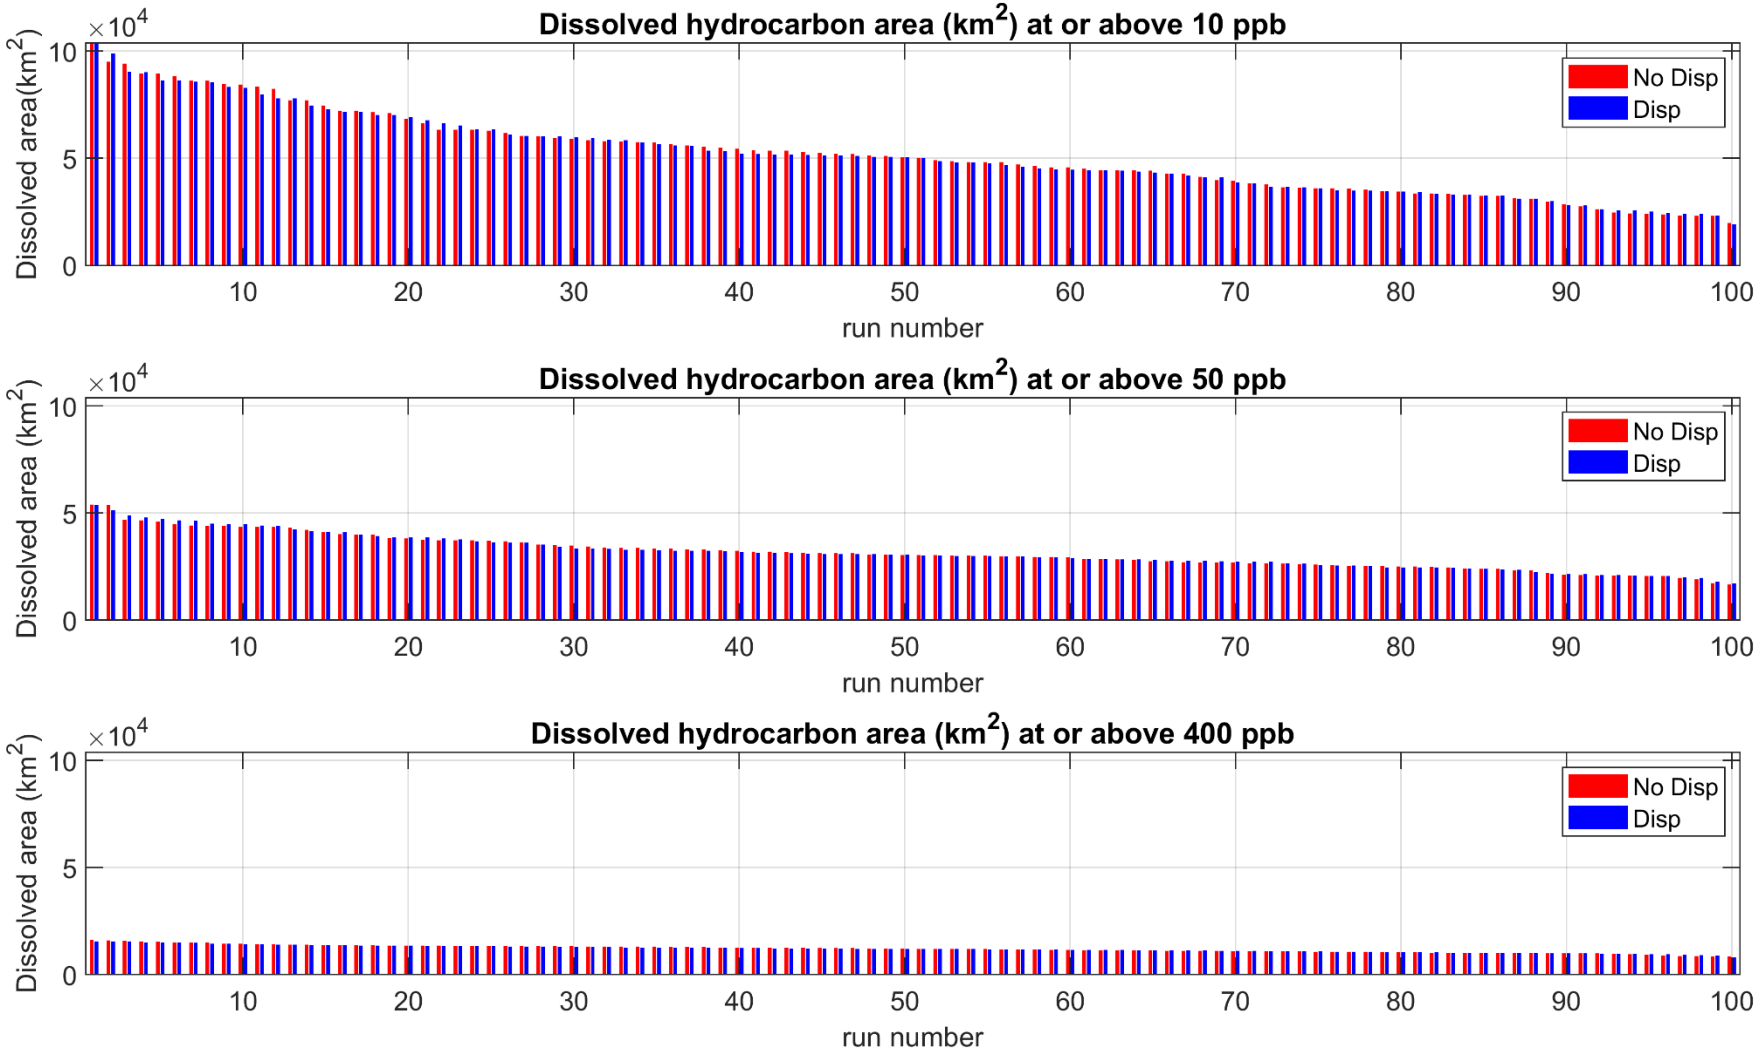

Figure 10.15 Sorted bar plots of the predicted area of the low, moderate and high zones of dissolved hydrocarbon exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during winter conditions. The results from 100 spill trajectories are presented.

Table 10.9 Probability of exposure to individual receptors from dissolved hydrocarbons in the 0–10 m depth layer, for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during summer conditions. The results were calculated from 100 spill trajectories per season.

Table 10.10 Probability of exposure to individual receptors from dissolved hydrocarbons in the 0–10 m depth layer, for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during transitional conditions. The results were calculated from 100 spill trajectories per season.

Table 10.11 Probability of exposure to individual receptors from dissolved hydrocarbons in the 0–10 m depth layer, for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days during winter conditions. The results were calculated from 100 spill trajectories per season.

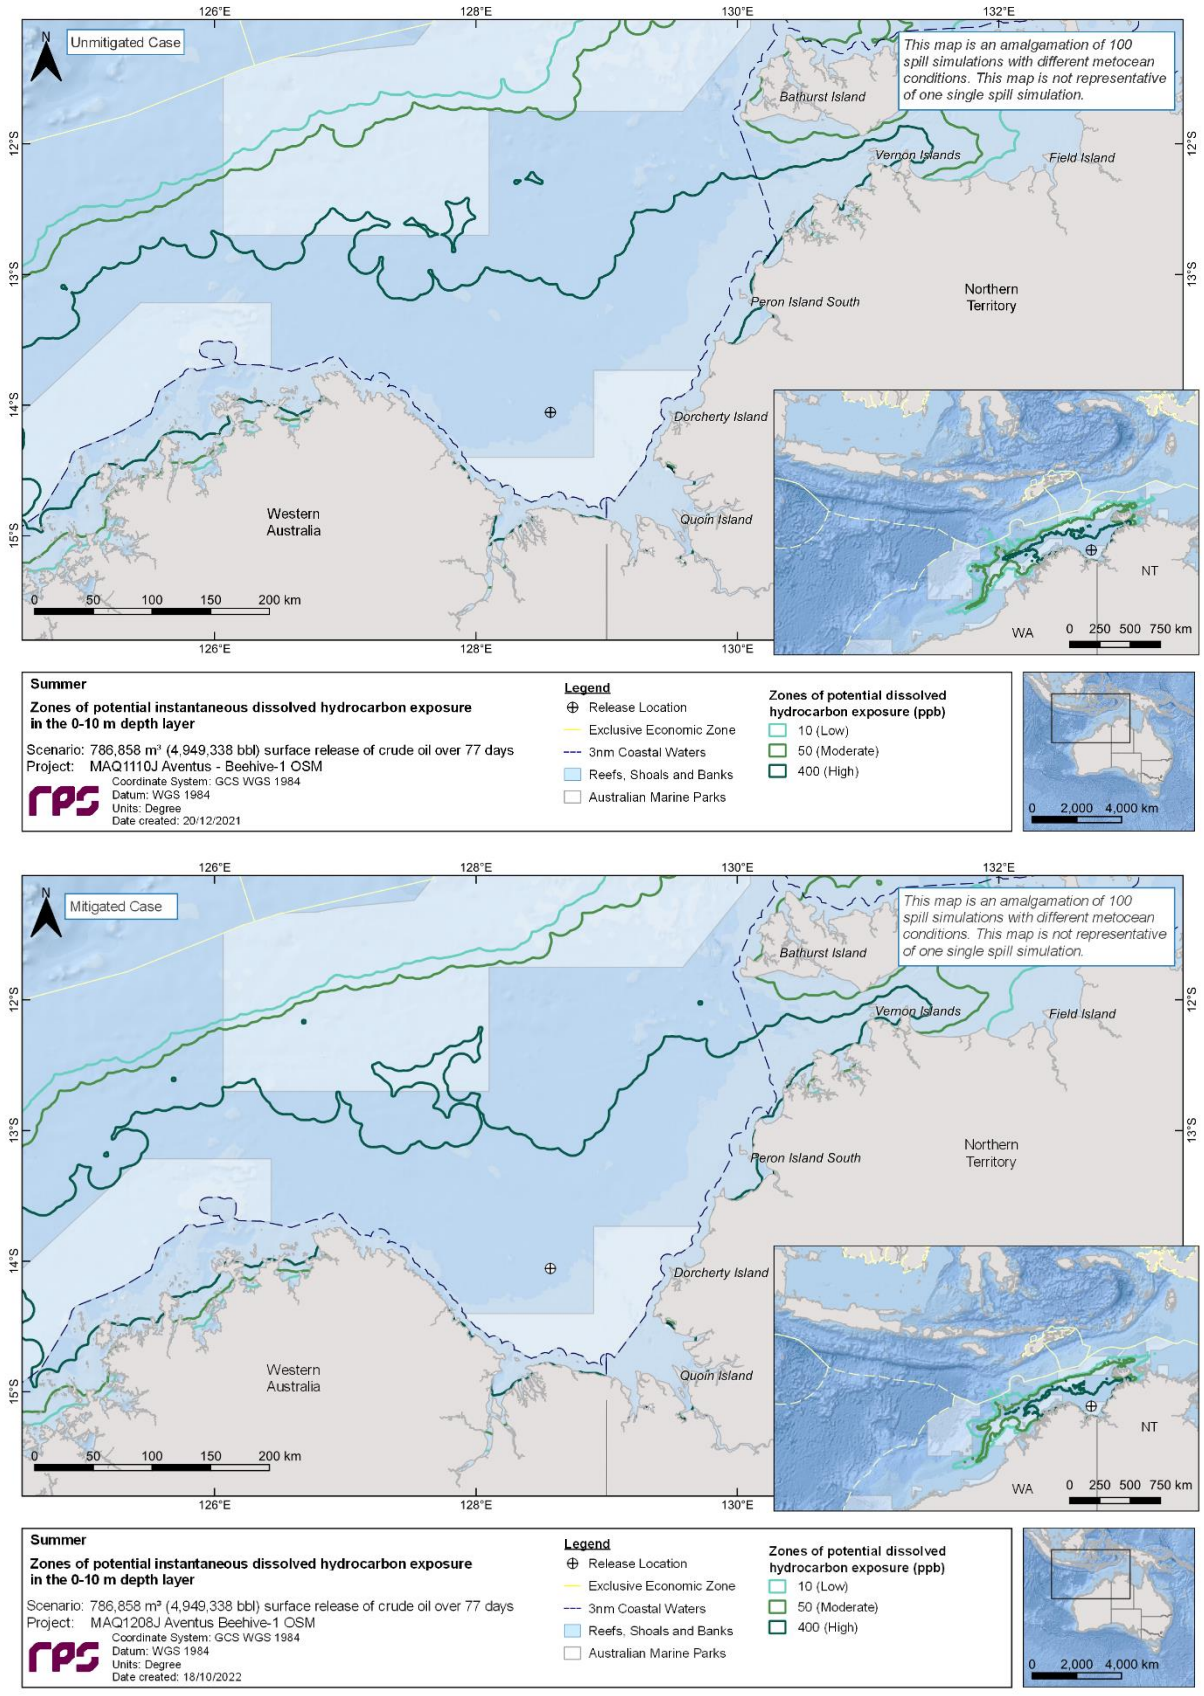

Figure 10.16 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea surface for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories.

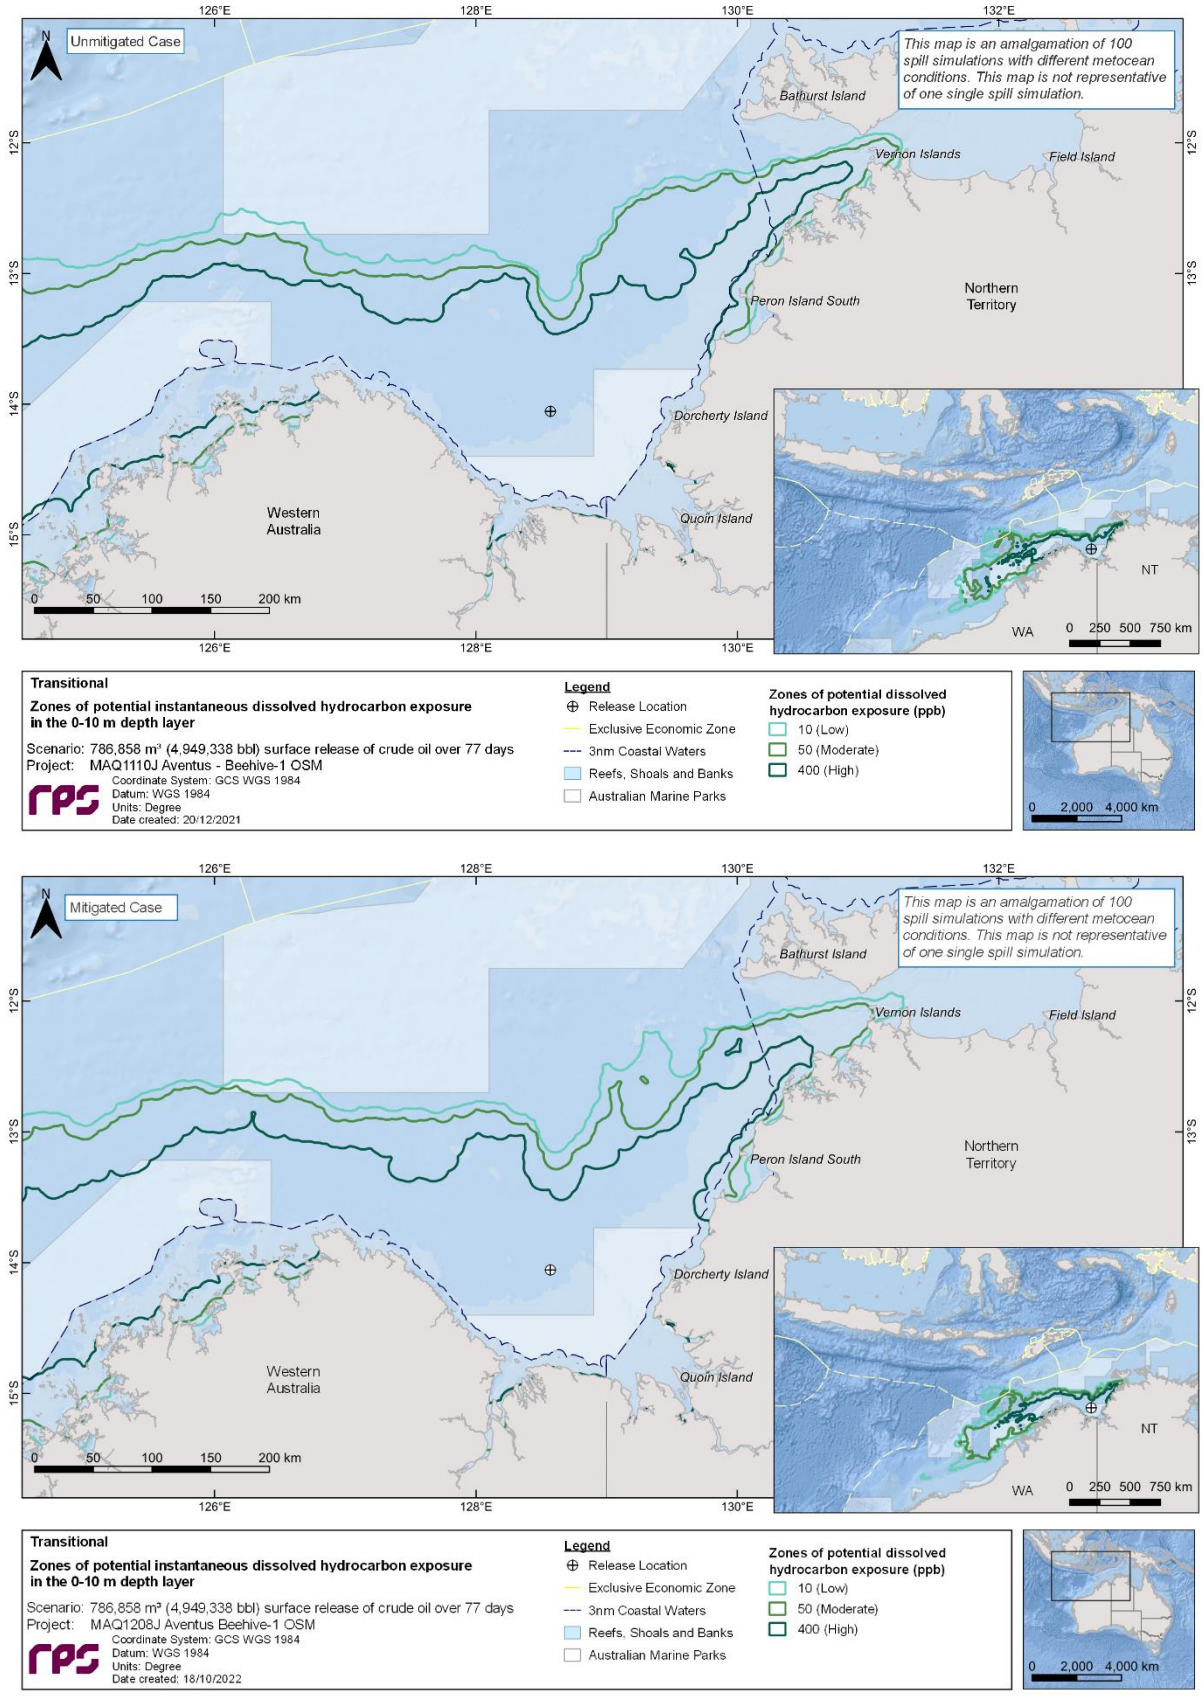

Figure 10.17 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea surface for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories.

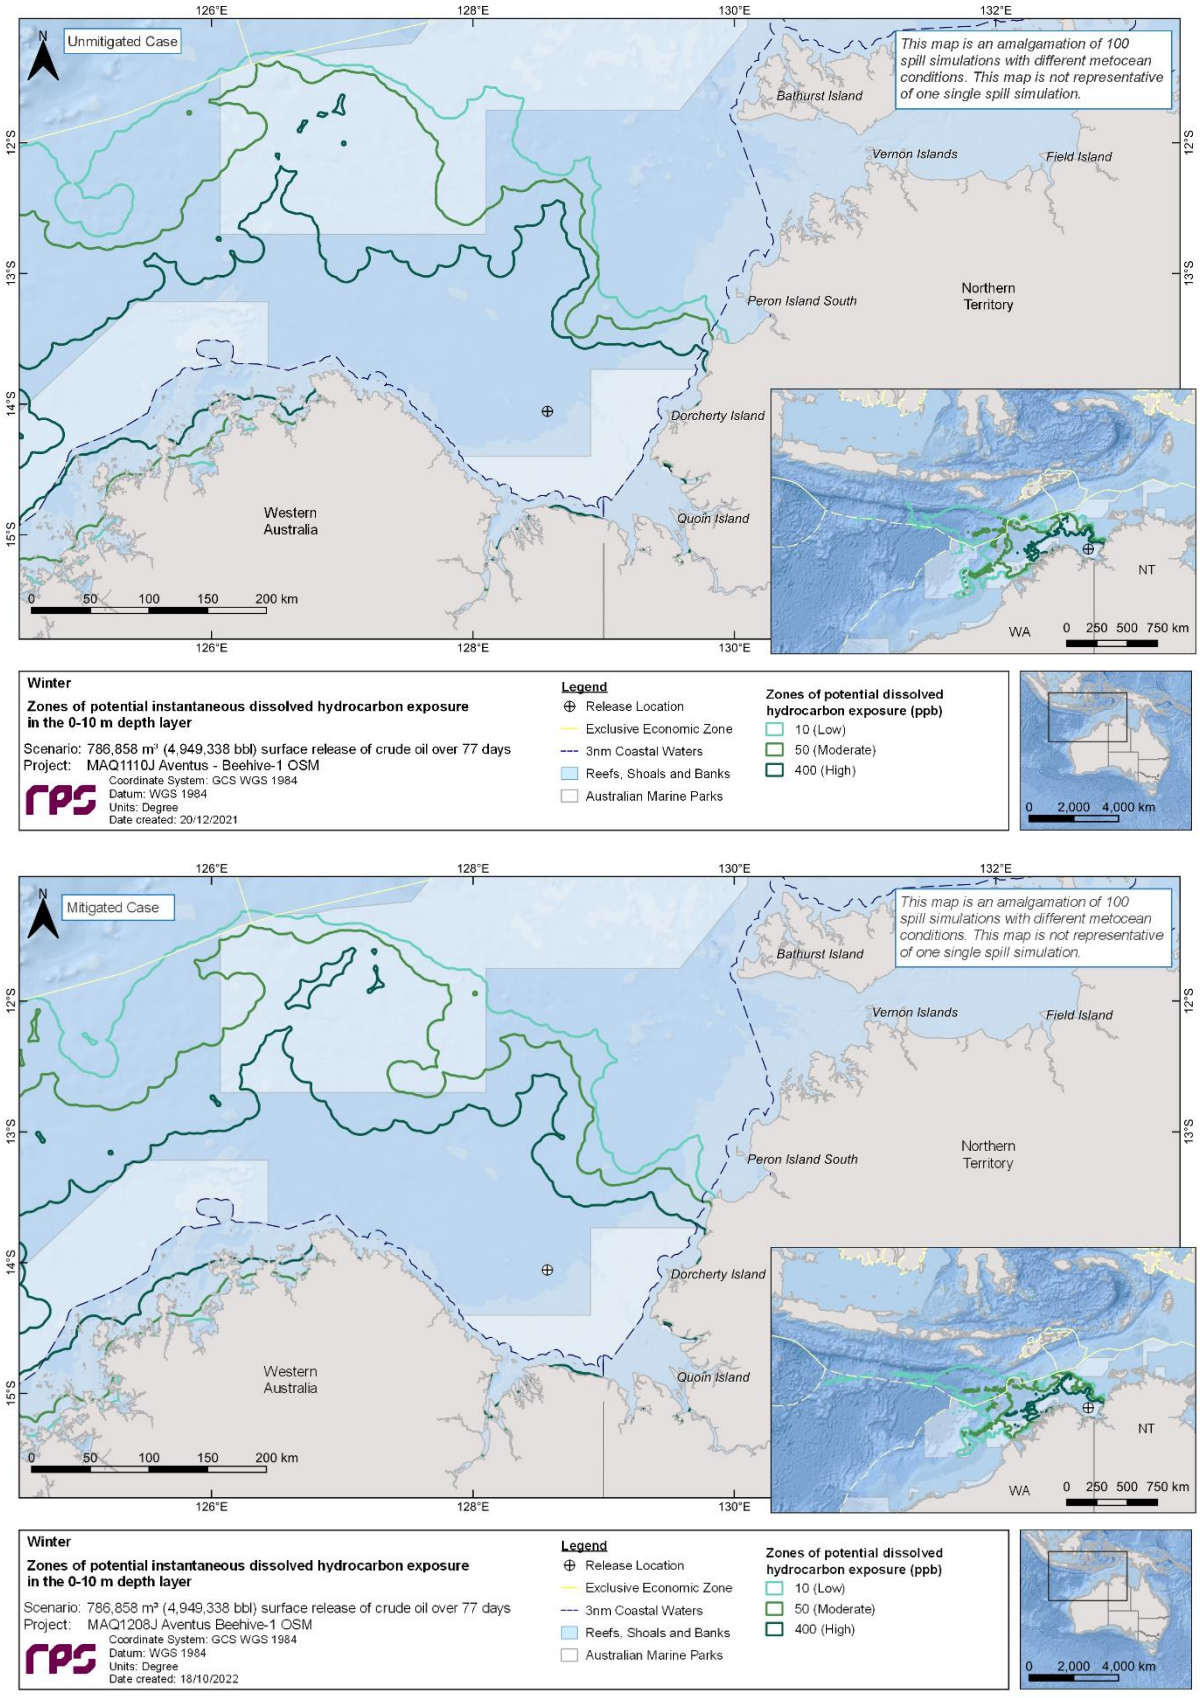

Figure 10.18 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea surface for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories.

10.1.3.2 Entrained Hydrocarbons

Figure 10.19 to Figure 10.21present sorted bar plots of the predicted area of the low and high zones of entrained hydrocarbon exposure for the unmitigated and mitigated cases from 100 spill trajectories per season and case.

Table 10.12 to Table 10.14 presents the probability of exposure to individual receptors from entrained hydrocarbons at the low (10-100 ppb) and high (≥ 100 ppb) exposure levels in the 0-10 m depth layers for all seasonal conditions for the unmitigated and mitigated cases.

For the unmitigated case, in the surface (0-10 m) depth layer, low and high exposure by entrained hydrocarbons was predicted for a large range of receptors. The Carbonate bank and terrace system of the Sahul Shelf KEF, Joseph Bonaparte Gulf AMP, Kimberley AMP, North Kimberley MP and nearshore waters of the Thamarrurr, Wyndham - East Kimberley, Dorcherty Island, Clump Island, Quoin Island, Daly, Victoria Daly shorelines and Ord River floodplain (Ramsar) were some of the receptors predicted with the highest entrained hydrocarbons concentrations for all three seasons.

Similar to the unmitigated case, the surface (0-10 m) depth layer model results for the mitigated case demonstrated low and high exposure by entrained hydrocarbons was predicted for a large range of receptors. Furthermore, the identified receptors with the highest predicted entrained hydrocarbons concentrations for the mitigated case for all three seasons (e.g. Carbonate bank and terrace system of the Sahul Shelf KEF, Joseph Bonaparte Gulf AMP, Kimberley AMP, North Kimberley MP and nearshore waters of the Thamarrurr, Wyndham - East Kimberley, Dorcherty Island, Clump Island, Quoin Island, Victoria Daly shorelines and RSB receptors, Bassett-Smith Shoal, Branch Banks, East Holothuria Reef, Emu Reefs, Holothuria Banks, Howland Shoals, Otway Bank and Tait Bank) were very similar between the mitigated and unmitigated cases.

Figure 10.22 to Figure 10.24 illustrate the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layers at the low and high exposure levels, for each season and case.

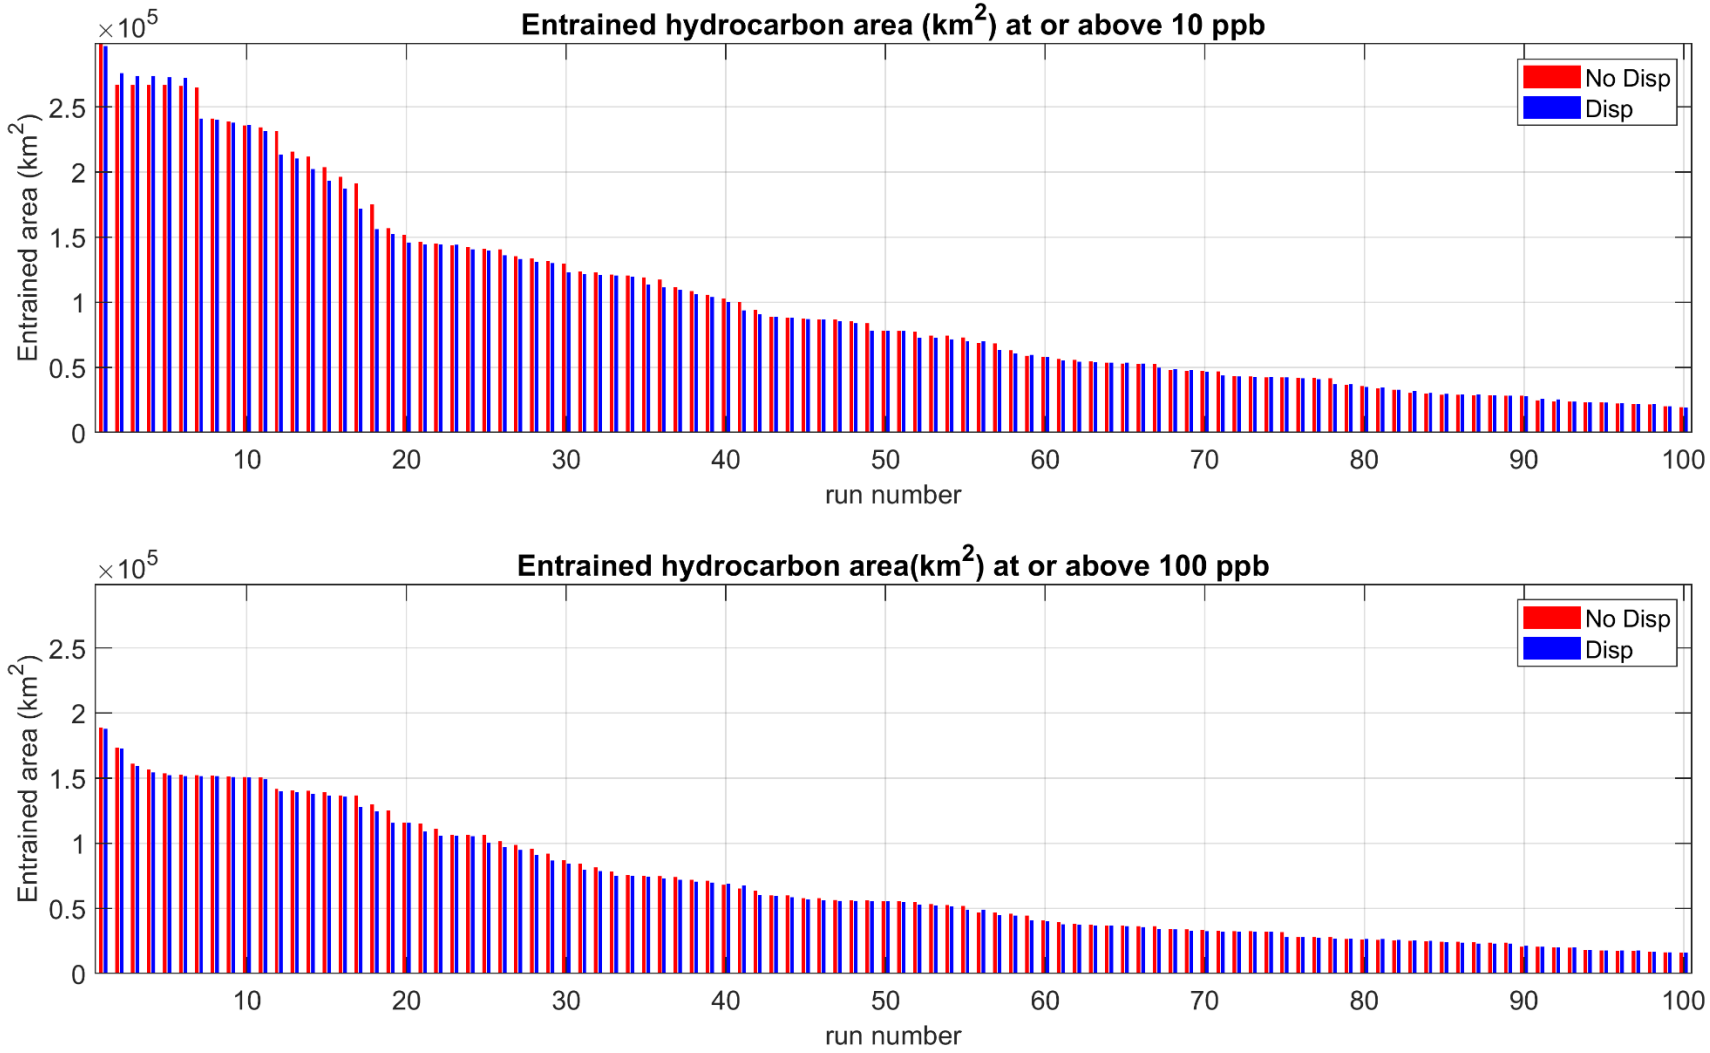

Figure 10.19 Sorted bar plots of the predicted area of the low and high zones of entrained hydrocarbon exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m³ of crude oil over 77 days, tracked for 98 days during summer conditions. The results from 100 spill trajectories are presented.

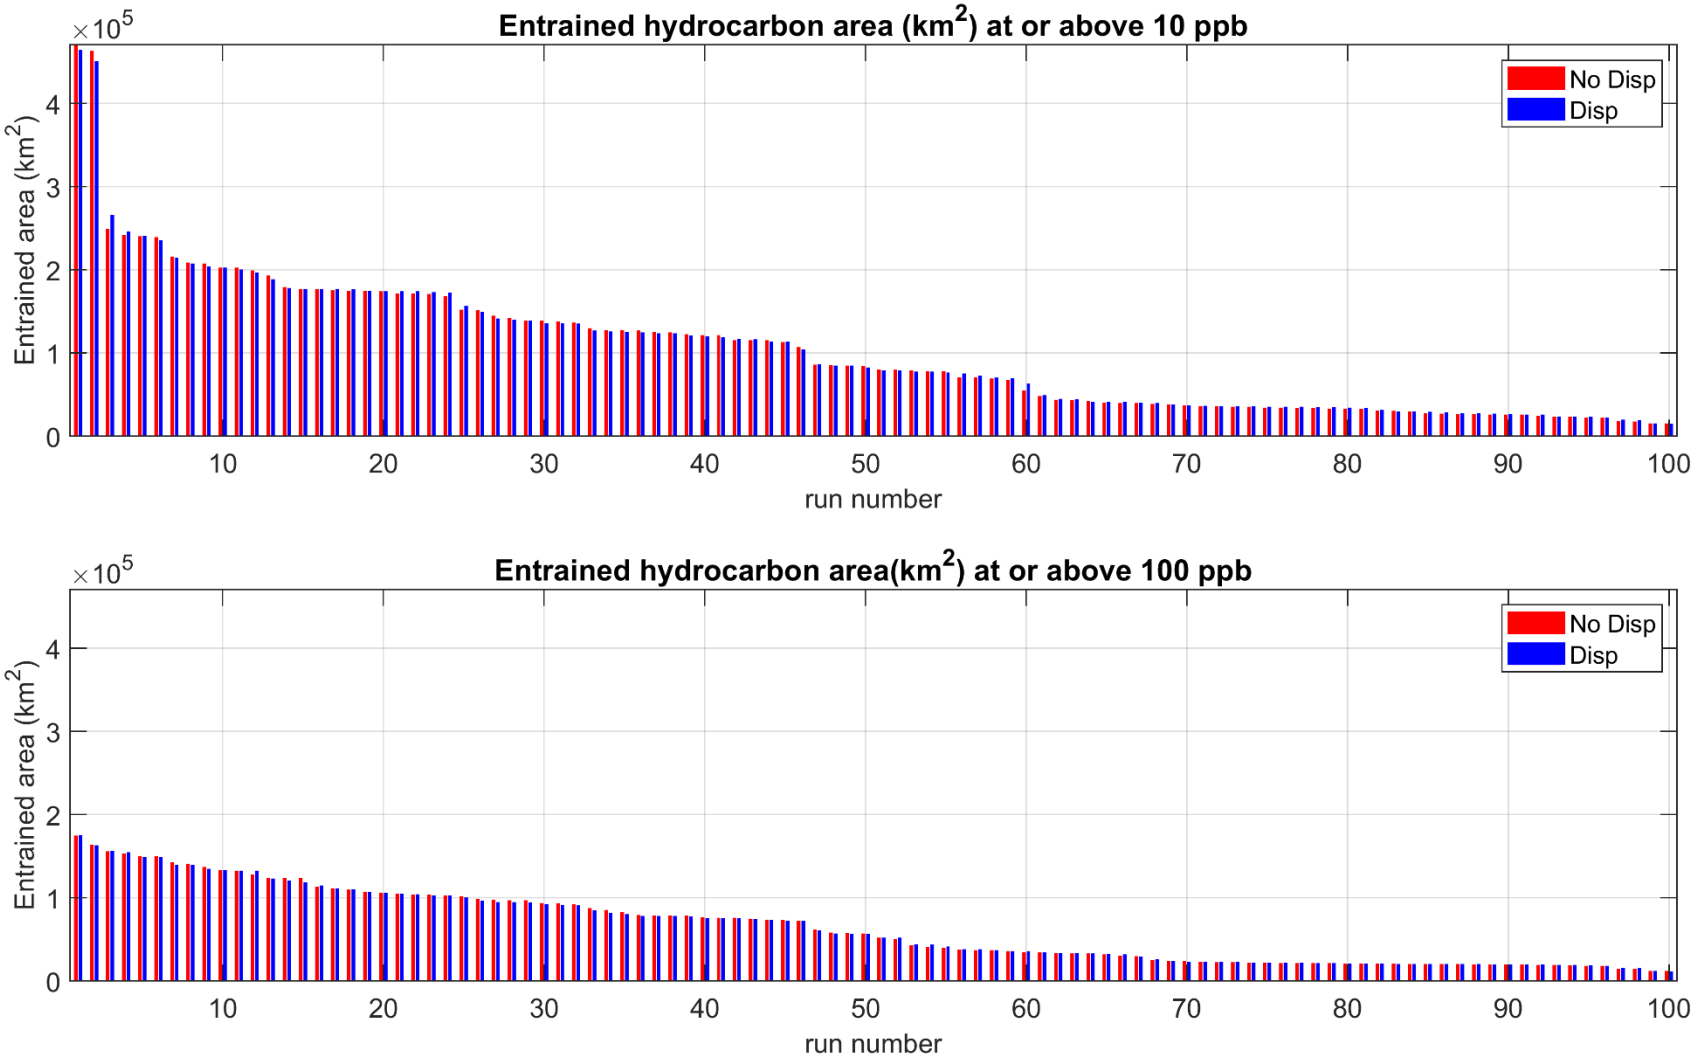

Figure 10.20 Sorted bar plots of the predicted area of the low and high zones of entrained hydrocarbon exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during transitional conditions. The results from 100 spill trajectories are presented.

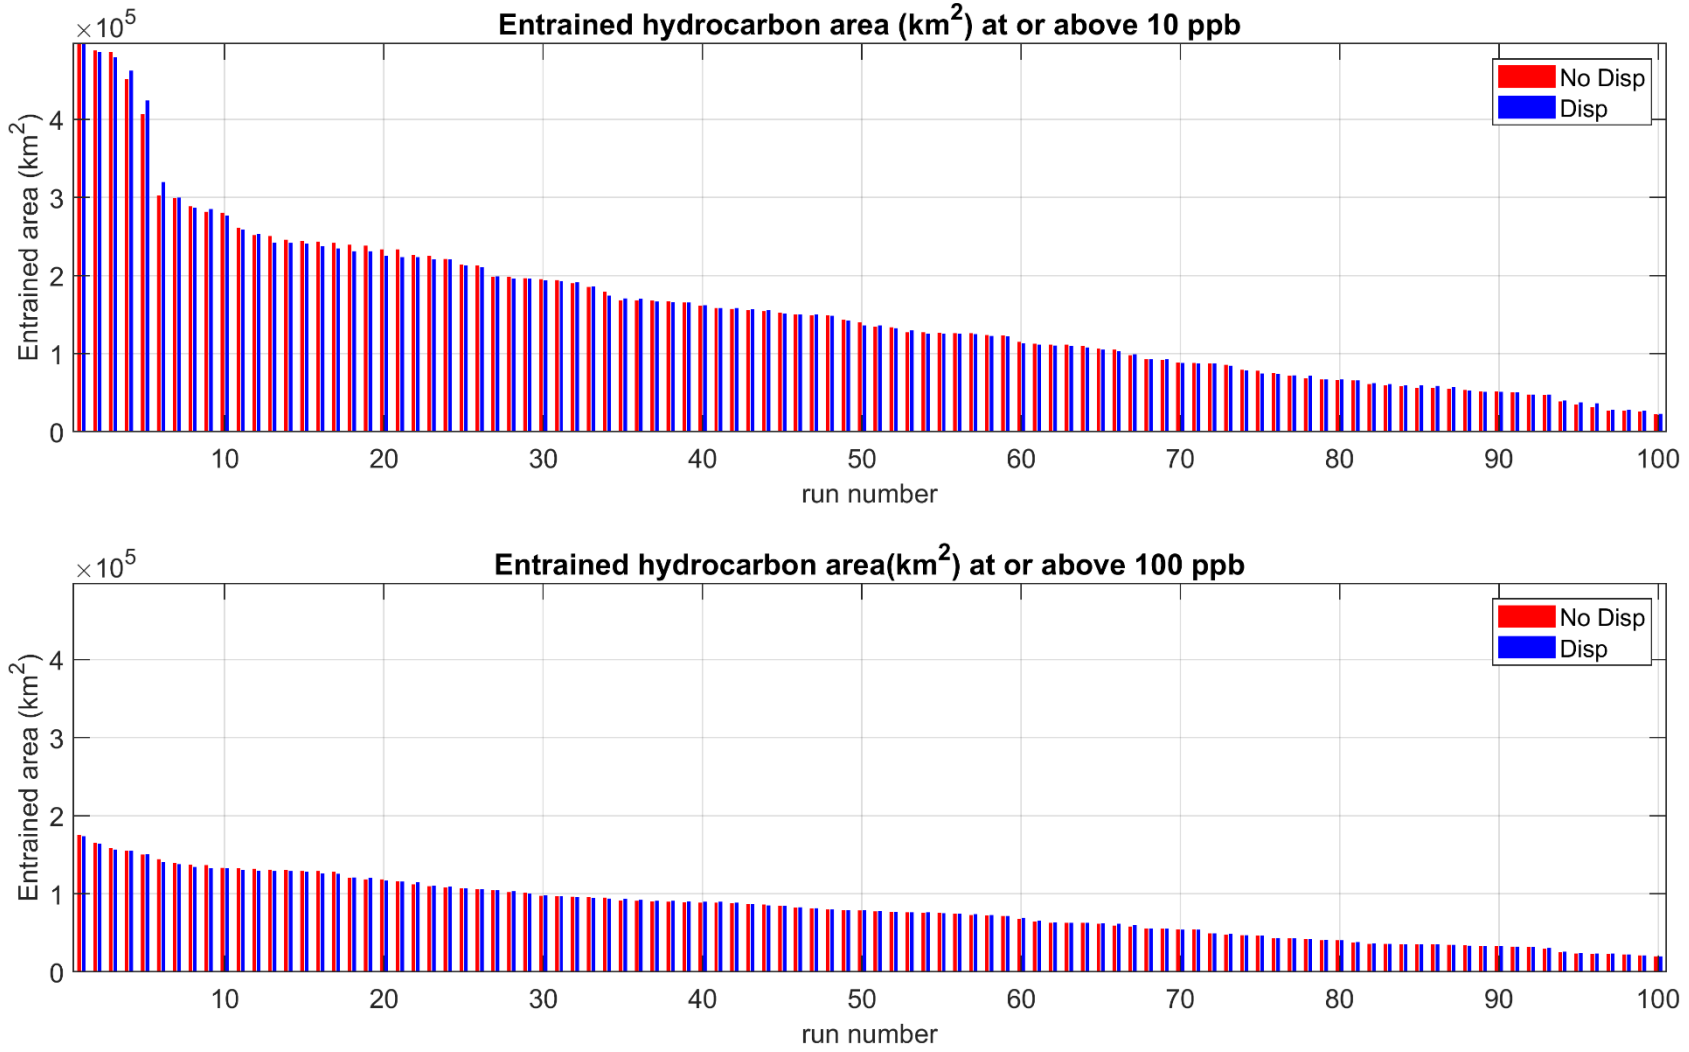

Figure 10.21 Sorted bar plots of the predicted area of the low and high zones of entrained hydrocarbon exposure for the unmitigated (red) and mitigated (blue) cases, in the event of a 786,858 m^3 of crude oil over 77 days, tracked for 98 days during winter conditions. The results from 100 spill trajectories are presented.

Table 10.12 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer, for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories per season.

Table 10.13 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer, for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories per season.

Table 10.14 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer, for the unmitigated and mitigated cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories per season.

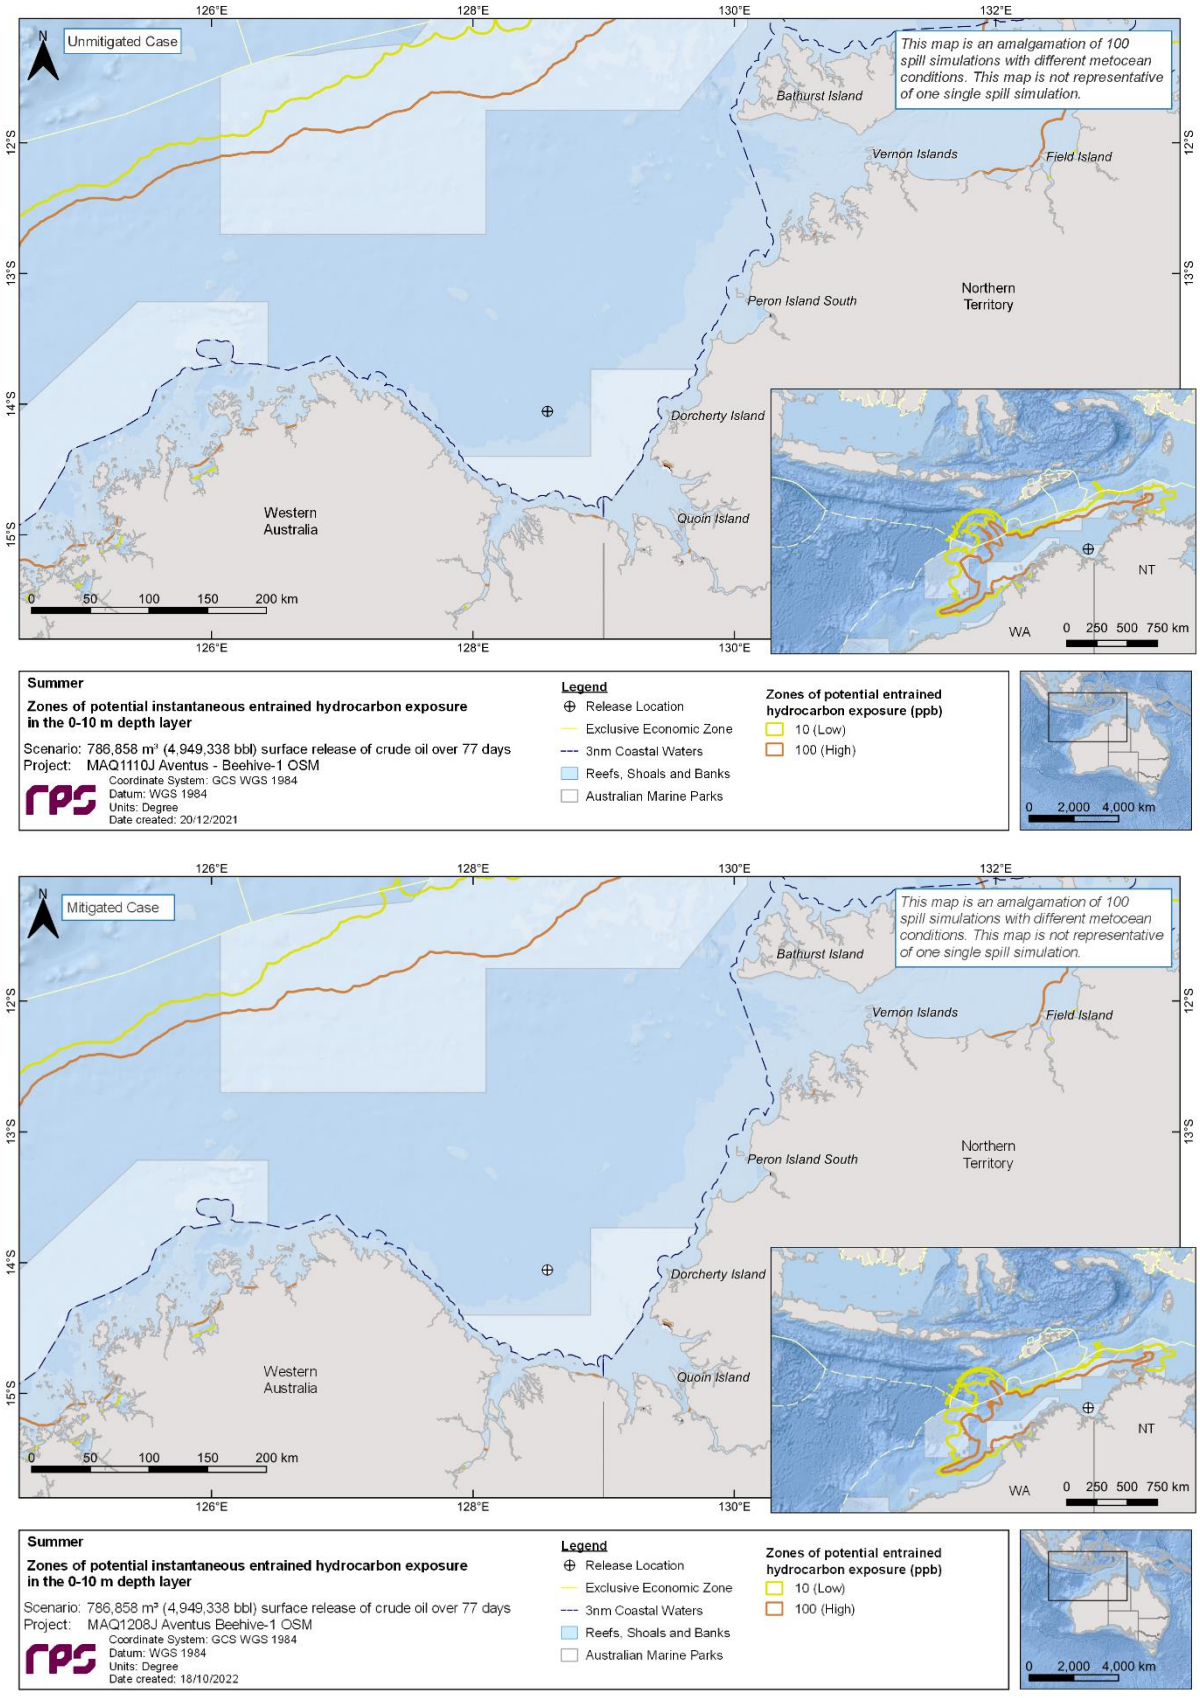

Figure 10.22 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during summer conditions. The results were calculated from 100 spill trajectories.

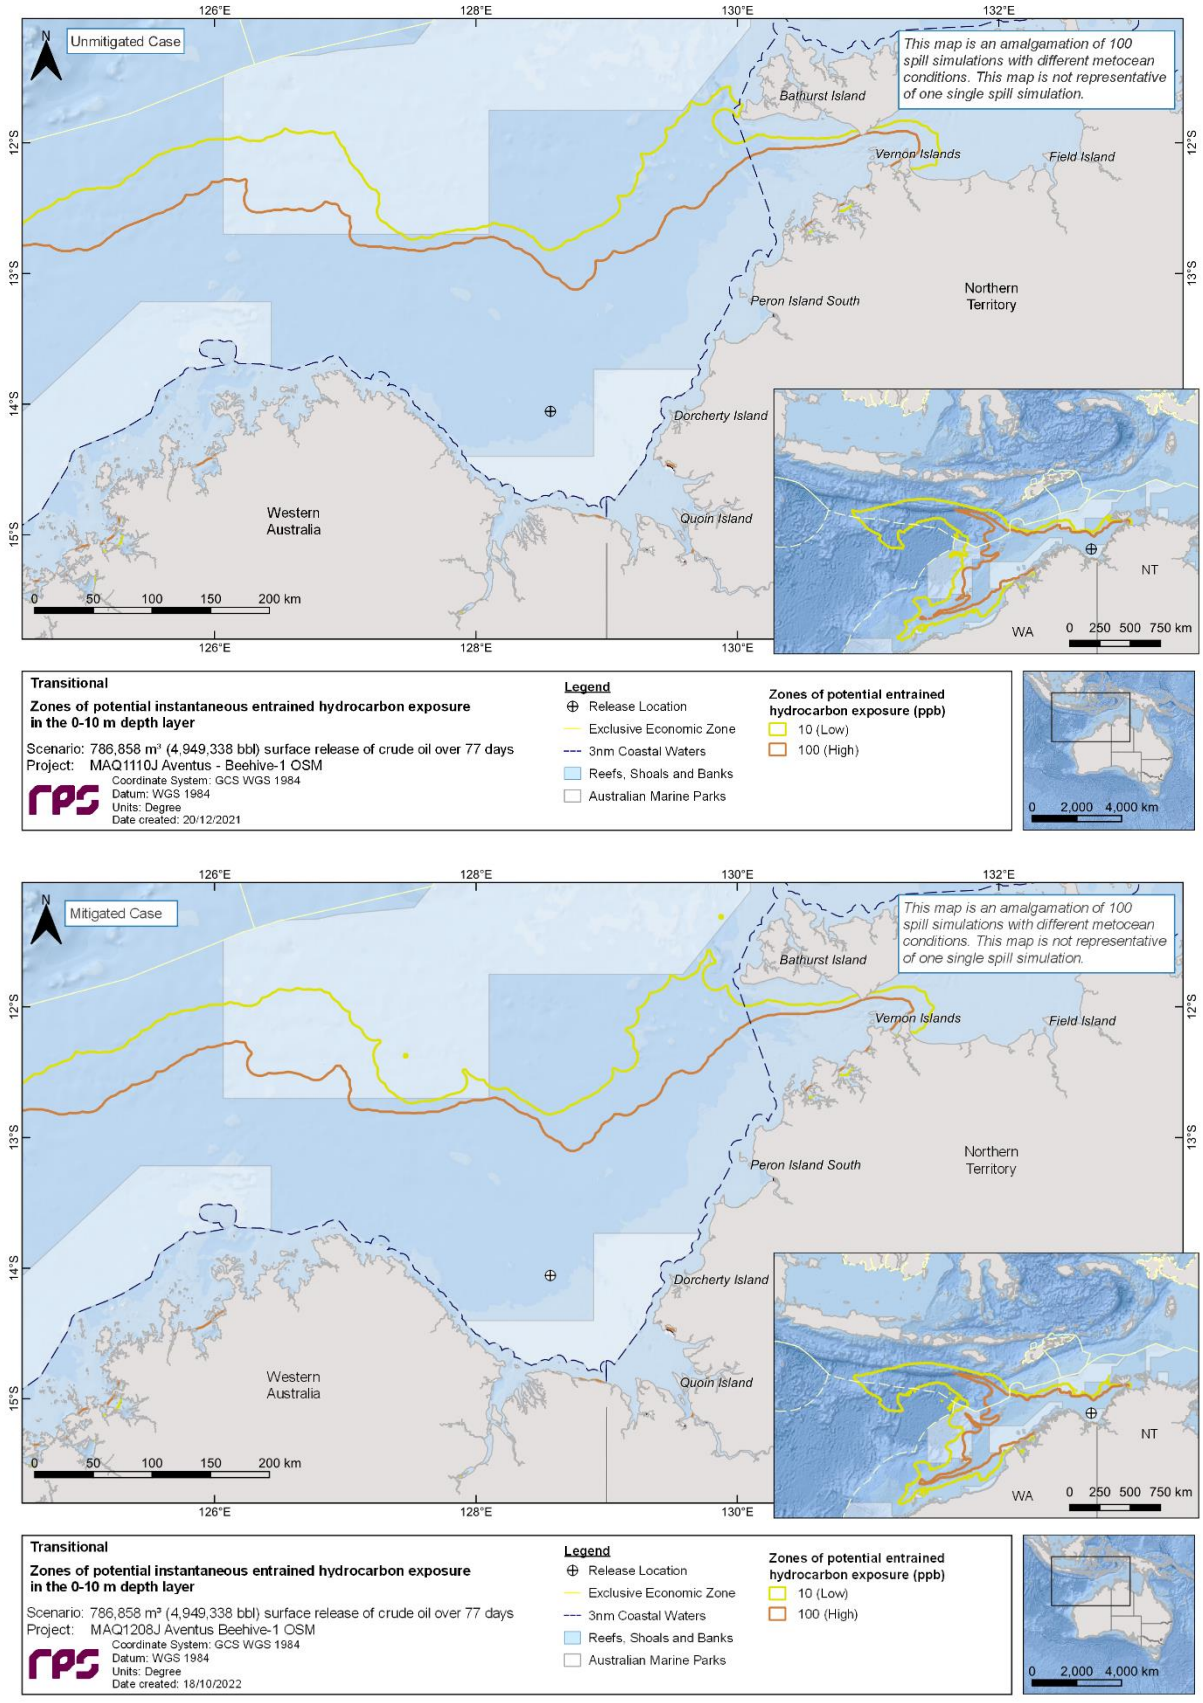

Figure 10.23 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during transitional conditions. The results were calculated from 100 spill trajectories.

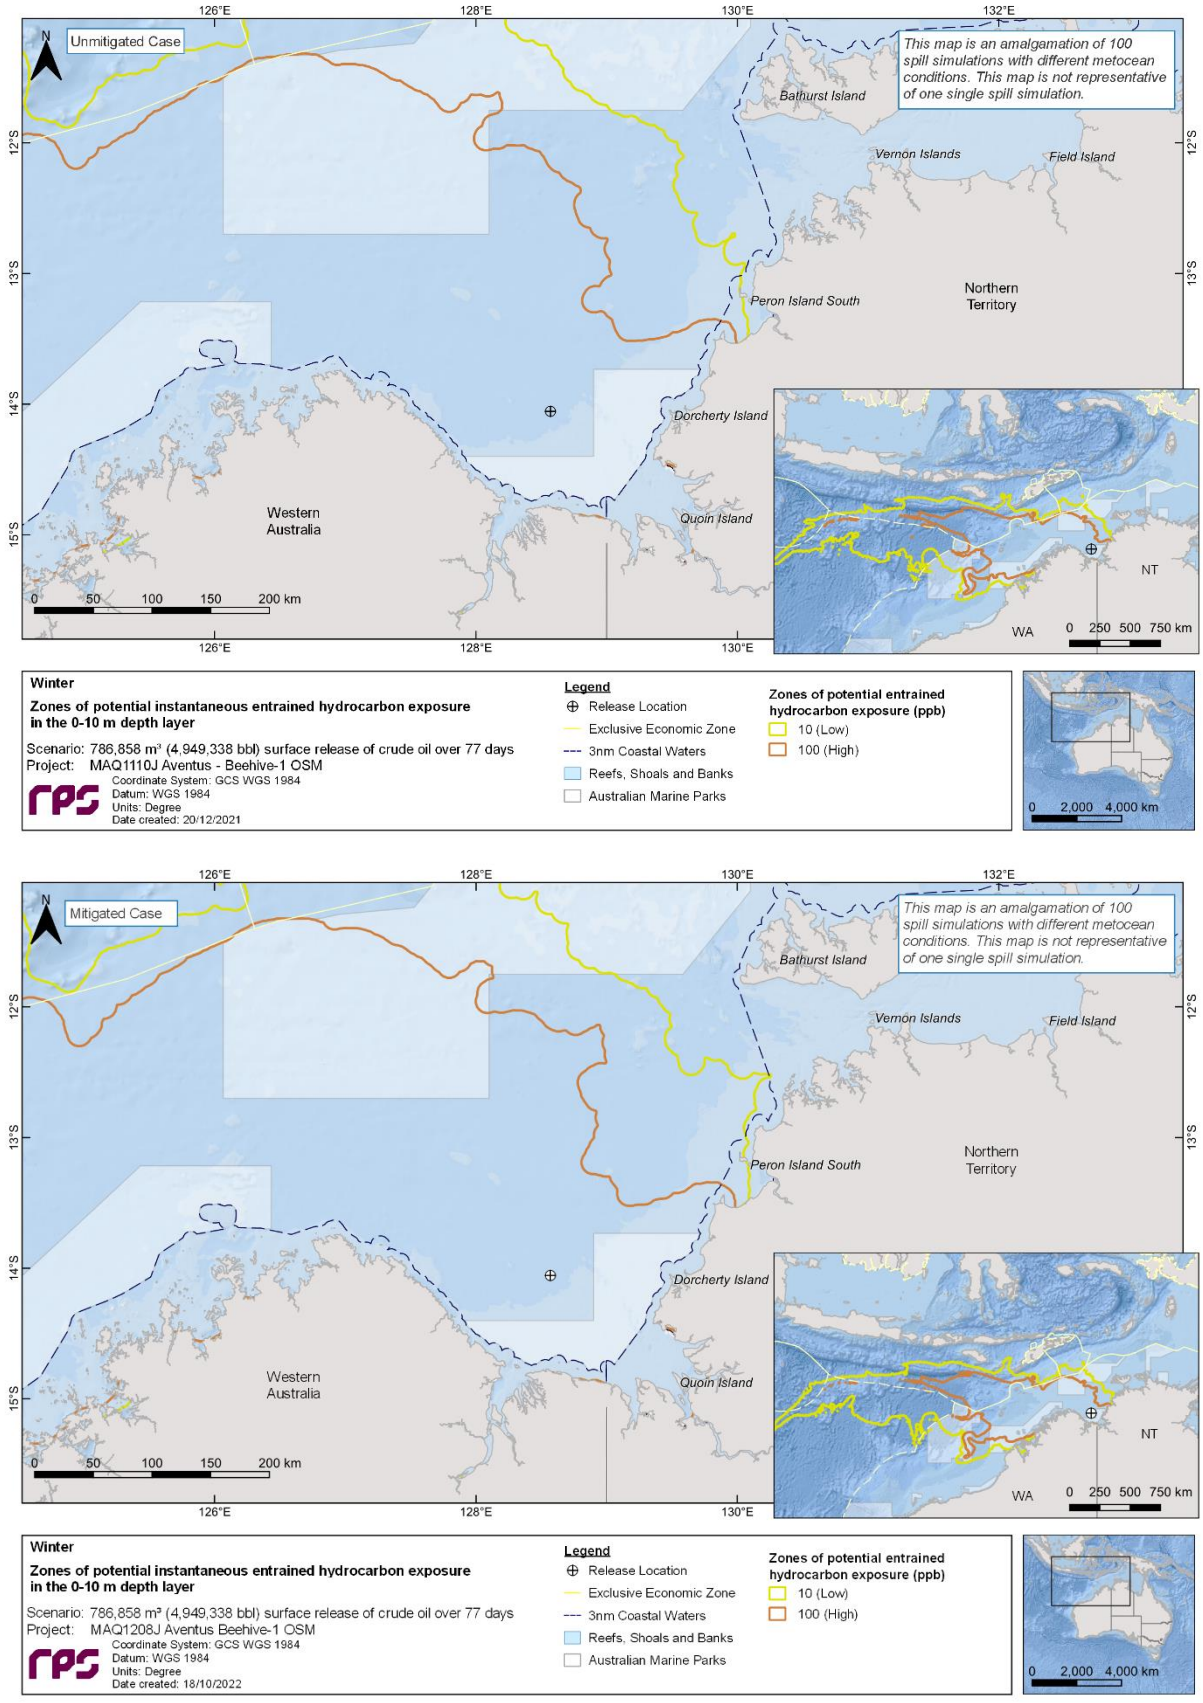

Figure 10.24 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface for the unmitigated (upper image) and mitigated (lower image) cases, in the event of a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days, during winter conditions. The results were calculated from 100 spill trajectories.

10.2 Deterministic Analysis

The stochastic modelling results were assessed for the unmitigated case, and the “worst case” deterministic runs were identified and presented below. The deterministic analysis assessed the largest swept area of floating oil above 1 g/m^2 (see Section 10.2.1), the minimum time before shoreline accumulation above 10 g/m^2 (see Section 10.2.2), the largest volume of oil ashore (see Section 10.2.3), the longest length of shoreline accumulation above 10 g/m^2 (see Section 10.2.4), the largest area of entrained hydrocarbons above 10 ppb (see Section 10.2.5), and the largest area of dissolved hydrocarbons above 10 ppb (see Section 10.2.6).

Table 10.15 presents a summary of all deterministic analysis criteria, the corresponding floating oil, shoreline accumulation, entrained hydrocarbon and dissolved hydrocarbon values at the assessed thresholds used and the seasonal model simulations used for comparison between the unmitigated and mitigated model results for the individual deterministic analysis runs.

Table 10.15 Summary of the deterministic analysis for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days, during seasonal conditions and both cases.

Start Date		16th January 2011		23rd September 2016		19th December 2011		25th November 2013		8th June 2011		27th November 2013	

10.2.1 Deterministic Case: Largest swept area of floating oil above 1 g/m^2

The unmitigated deterministic trajectory that resulted in the largest swept area of floating oil above 1 g/m^2 (low threshold and visible floating oil) was identified during summer conditions as run number 79 which started on 16th January 2011 (map illustrated in Figure 10.25).

Figure 10.26 displays the time series of the swept area of low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) floating oil over the 98-day simulation, for the unmitigated and mitigated cases. For the unmitigated case, the maximum area of coverage of visible oil on the sea surface was predicted to occur 63 days after the spill started and covered approximately 400 km^2 (compared to 350 km^2, for the mitigated case). Floating oil above the moderate threshold (or actionable surface oil threshold) was predicted to spread across a maximum area of 215 km^2 (unmitigated case) and 190 km^2 (mitigated case). The total extent of actionable surface oil was predicted at 1,524 km^2 for the unmitigated case versus 1,328 km^2 (mitigated case) (refer to Table 10.15).

Figure 10.27 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.16 summarises the mass balance at the end of the simulation for the unmitigated and mitigated cases.

Table 10.16 Summary of the mass balance at day 98 for the trajectory that resulted in the largest swept area of floating oil above 1 g/m^2 for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)	
	Unmitigated	Mitigated
Surface/Floating Oil (m^3)	0	0
Entrained (m^3)	140,659	140,980
Dissolved (m^3)	419	437
Evaporated (m^3)	296,775	295,524
Decay (m^3)	348,045	348,985
Ashore/Shoreline (m^3)	166	138
Sediment (m^3)	794	794

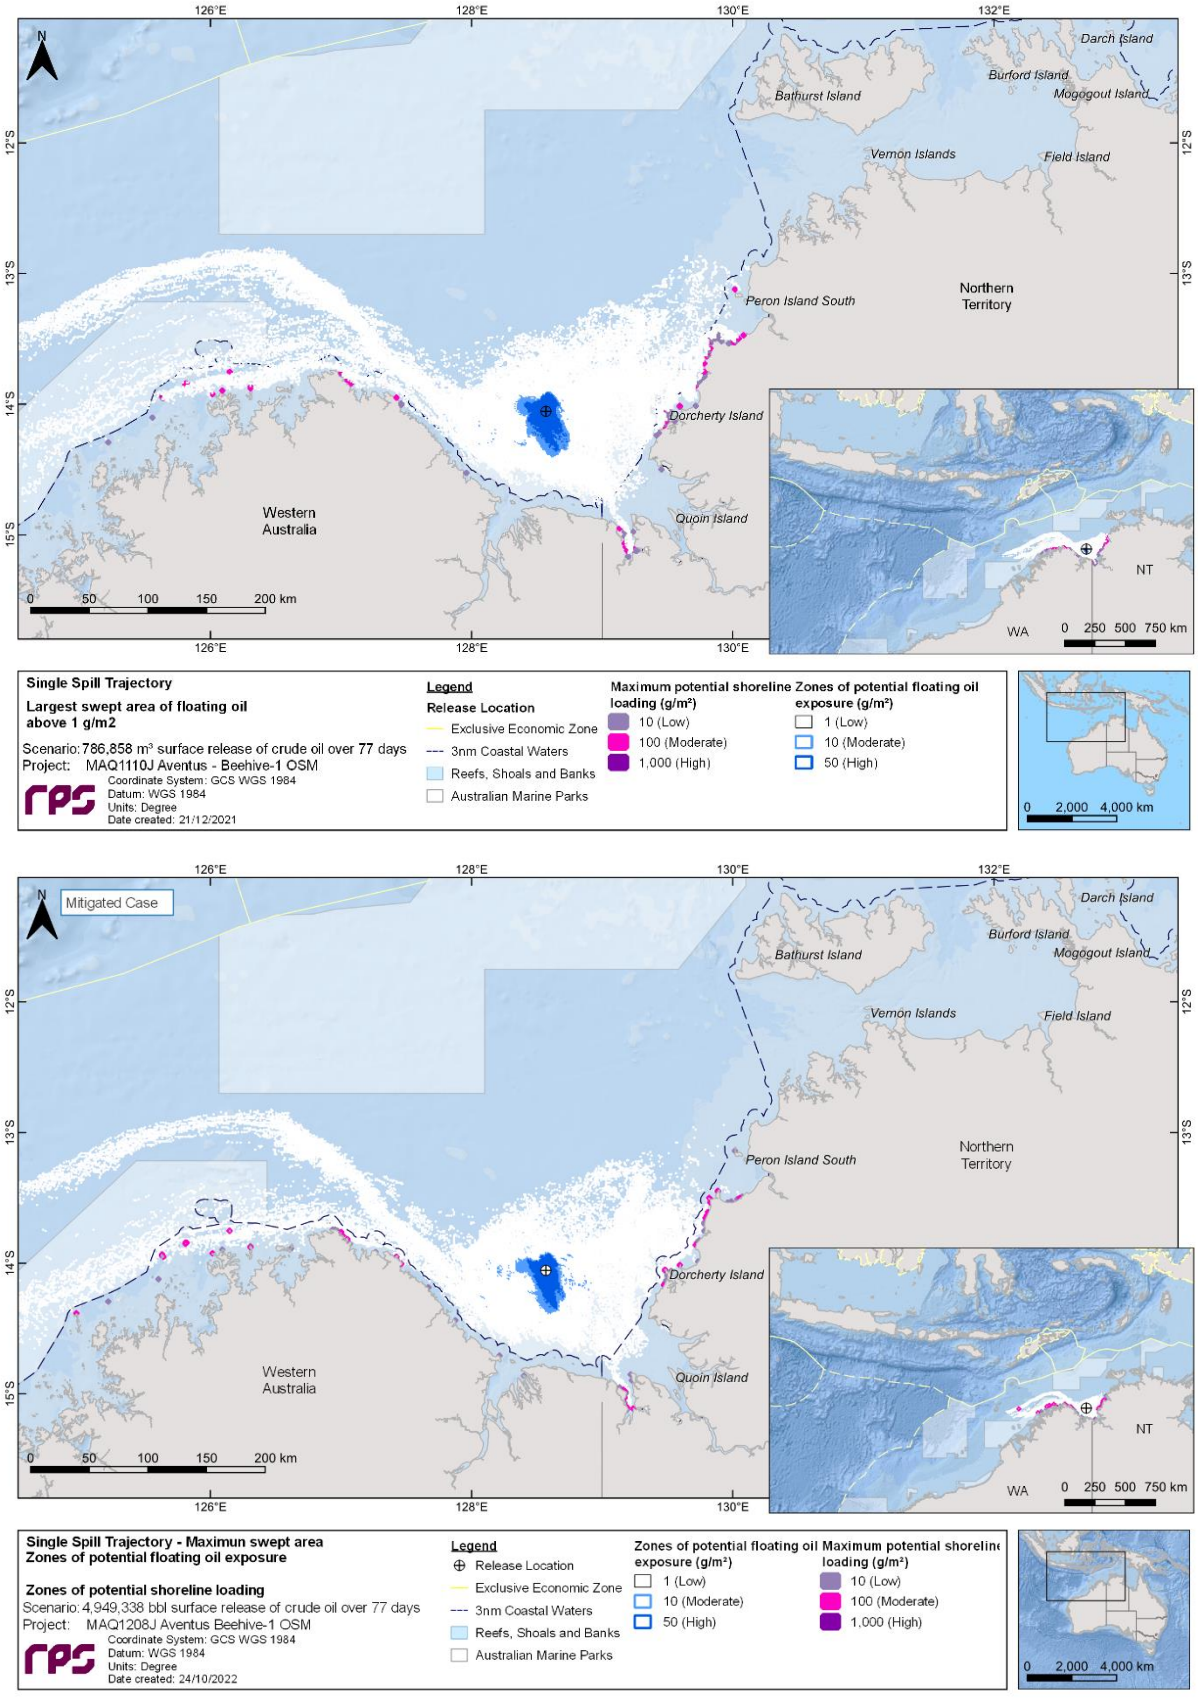

Figure 10.25 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the largest swept area of floating oil above 1 g/m^2 for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

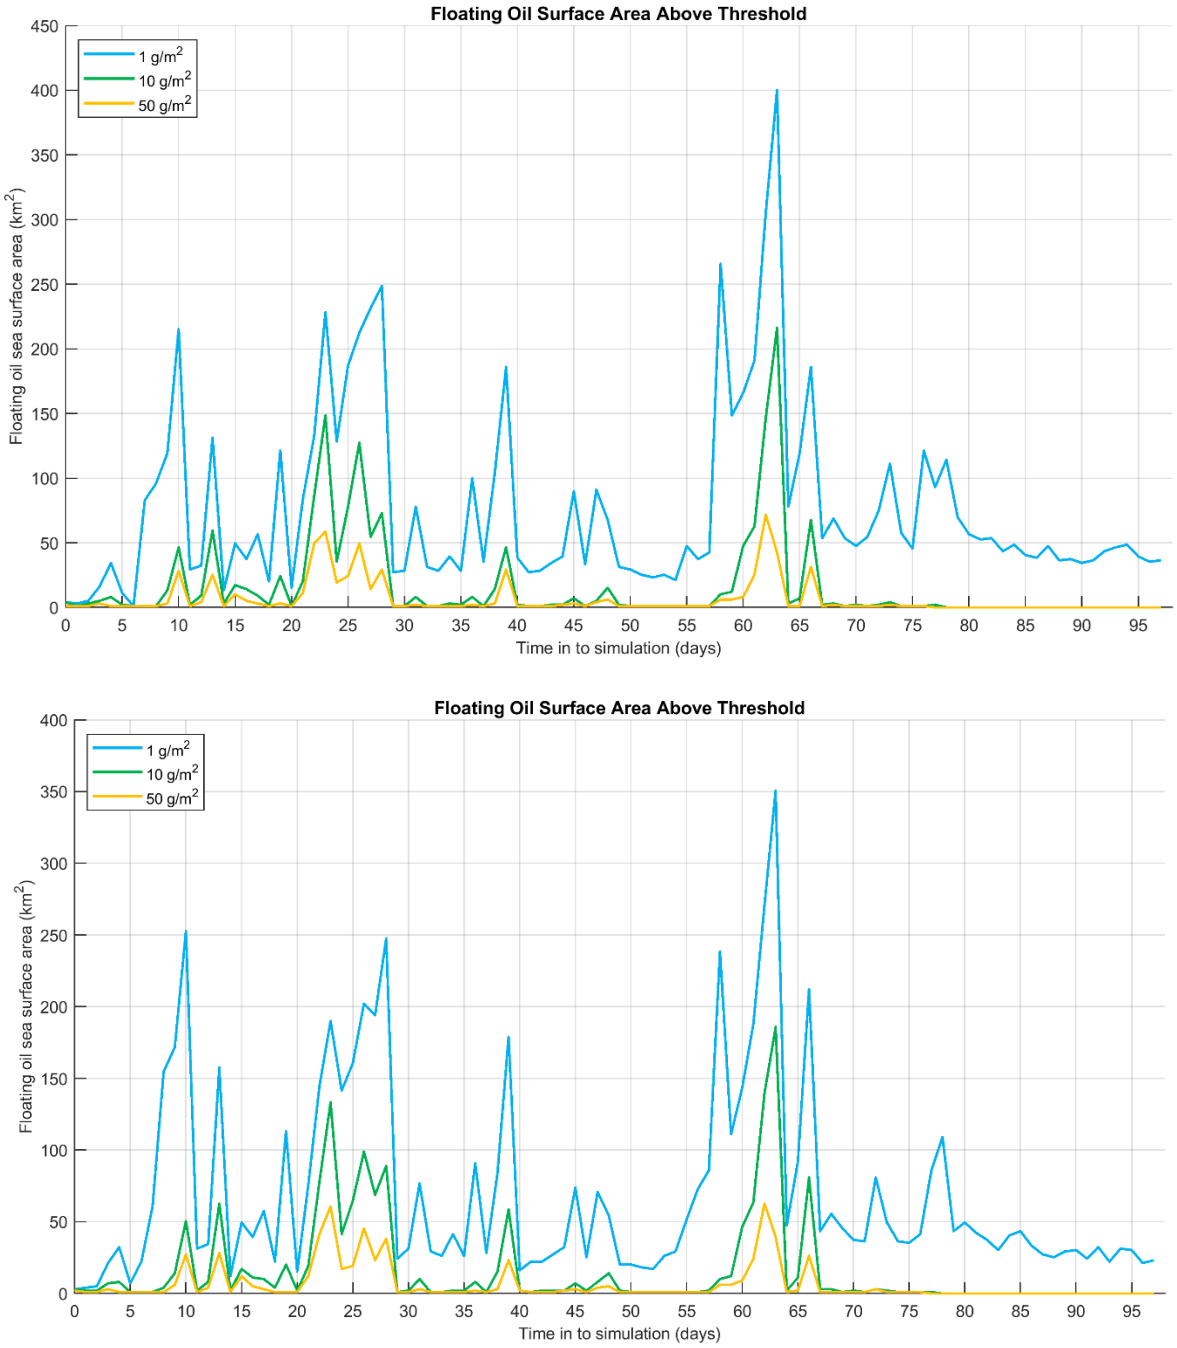

Figure 10.26 Time series of the area of low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) floating oil for the trajectory with the largest swept area of floating oil above 1 g/m^2 for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

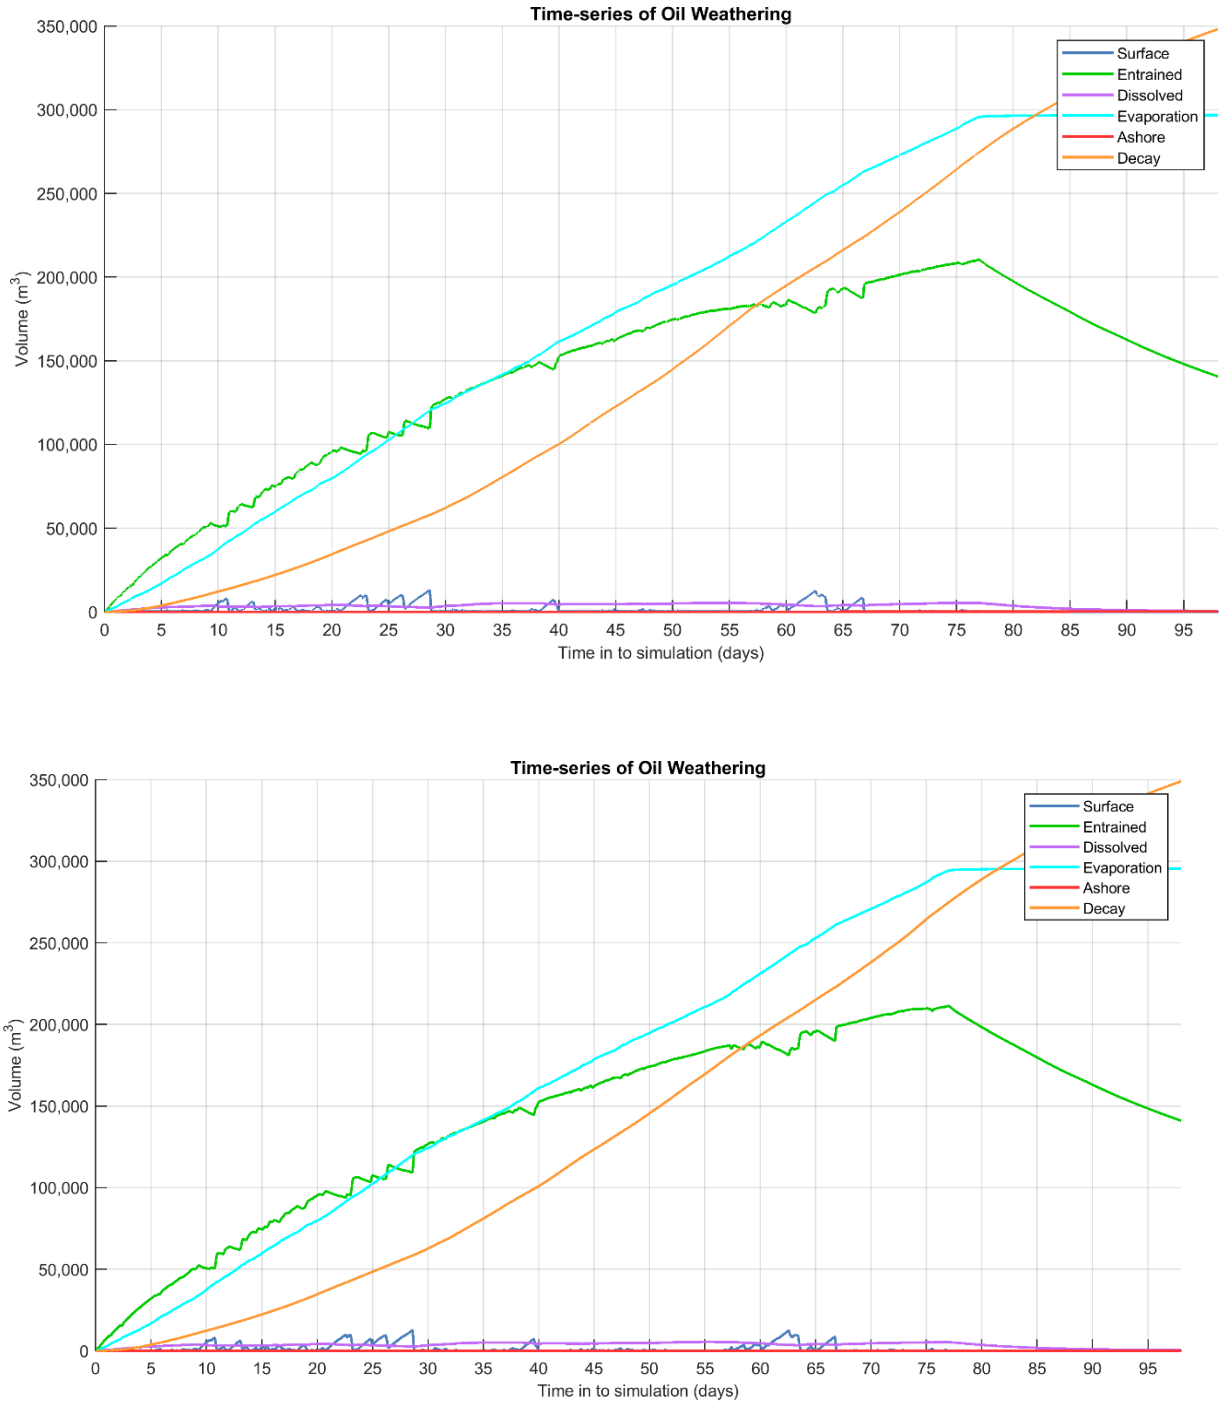

Figure 10.27 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 1 g/m^2 for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.2 Deterministic Case: Minimum time before shoreline accumulation above 10 g/m^2

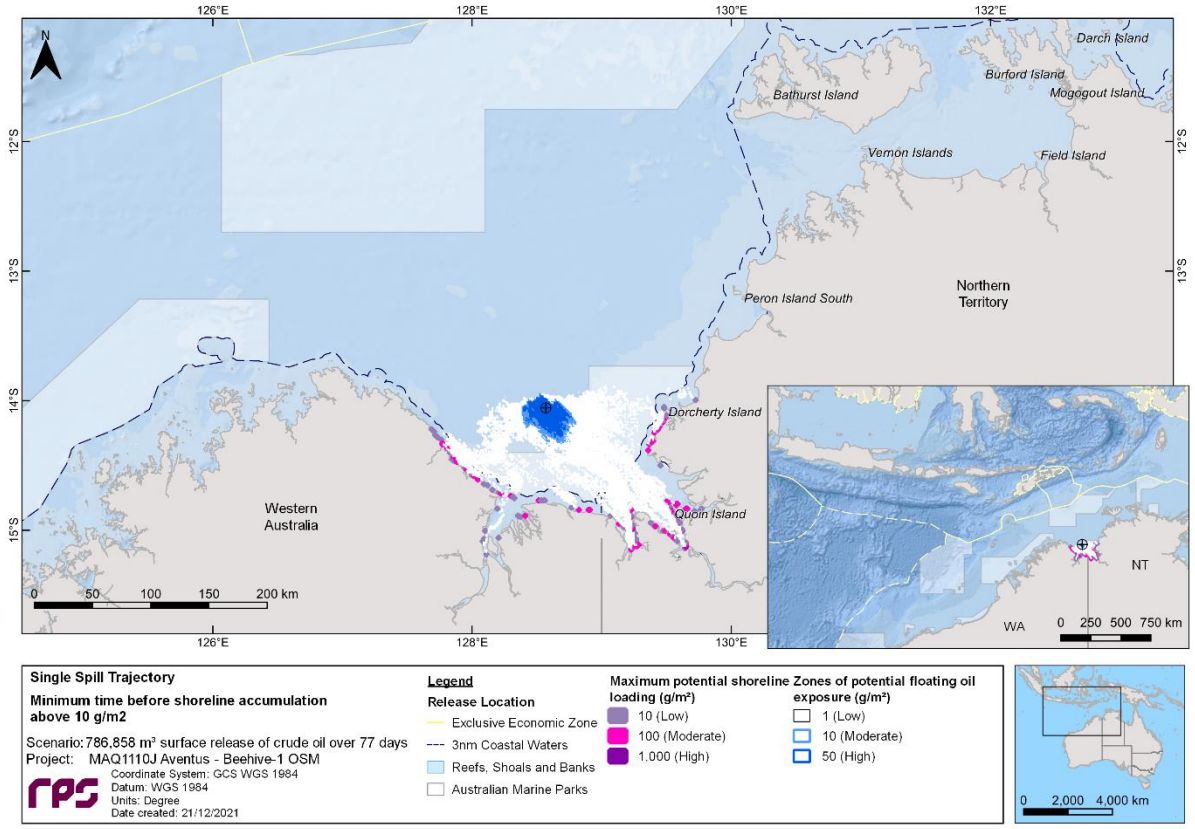
The unmitigated deterministic trajectory that resulted in the minimum time before shoreline accumulation above the low threshold (10 g/m^2) was identified during transitional conditions as run number 88 which started on the 23rd September 2016 (map illustrated in Figure 10.28).

The maximum shoreline length contacted by oil above the low, moderate and high thresholds predicted for the unmitigated case was 212 km, 124 km and 16 km, versus 86 km, 48 km and 1 km for the mitigated case. Surface oil was predicted to arrive to the shoreline after 603 hours (unmitigated) and 531 hours (mitigated). The total volume of oil ashore was predicted to reduce from 271 m^3 (unmitigated) to 141 m^3 (mitigated) (refer to Table 10.15).

Figure 10.29 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.17 summarises the mass balance at the end of the 98-day simulation for the unmitigated and mitigated cases.

Table 10.17 Summary of the mass balance at day 98 for the trajectory that resulted in the minimum time before shoreline accumulation above the low threshold (10 g/m^2) for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)	
	Unmitigated	Mitigated
Surface/Floating Oil (m^3)	0	0
Entrained (m^3)	144,203	143,969
Dissolved (m^3)	401	348
Evaporated (m^3)	317,482	317,009
Decay (m^3)	323,707	324,596
Ashore/Shoreline (m^3)	271	141
Sediment (m^3)	794	794



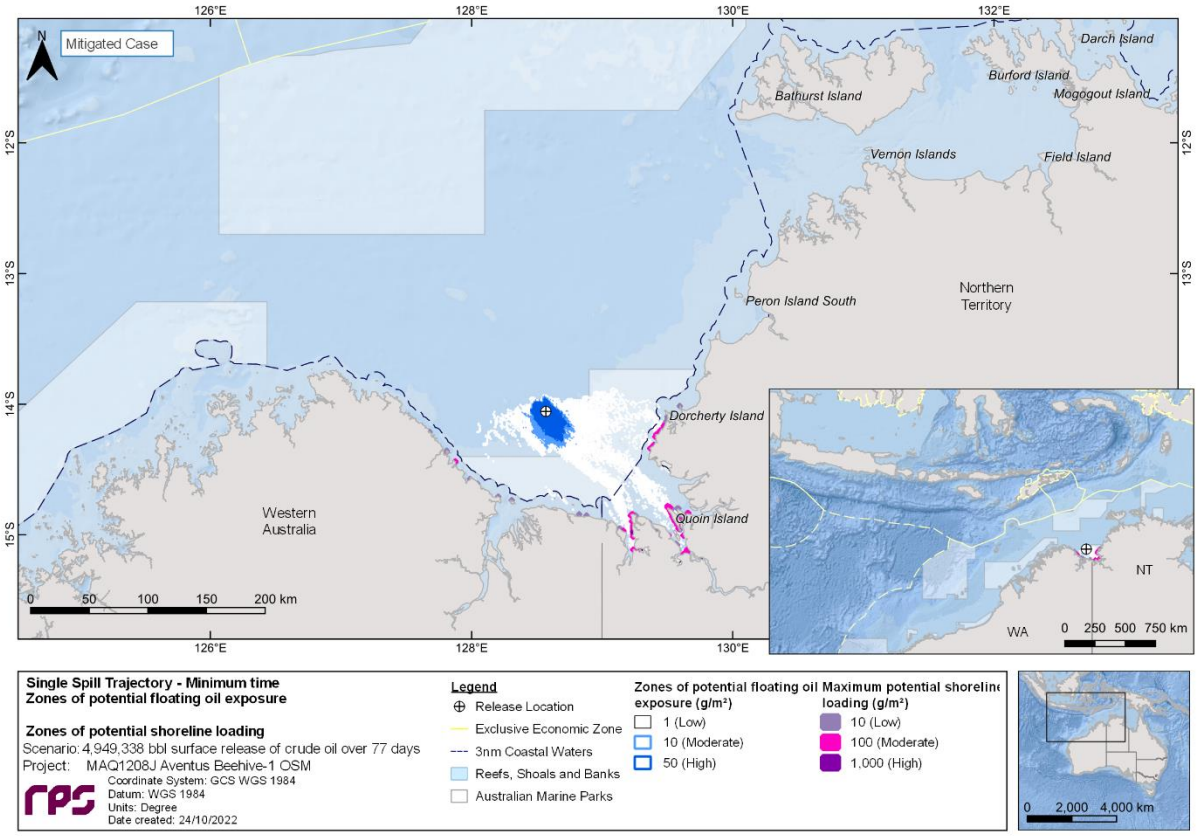


Figure 10.28 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the minimum time before shoreline accumulation above 10 g/m² for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

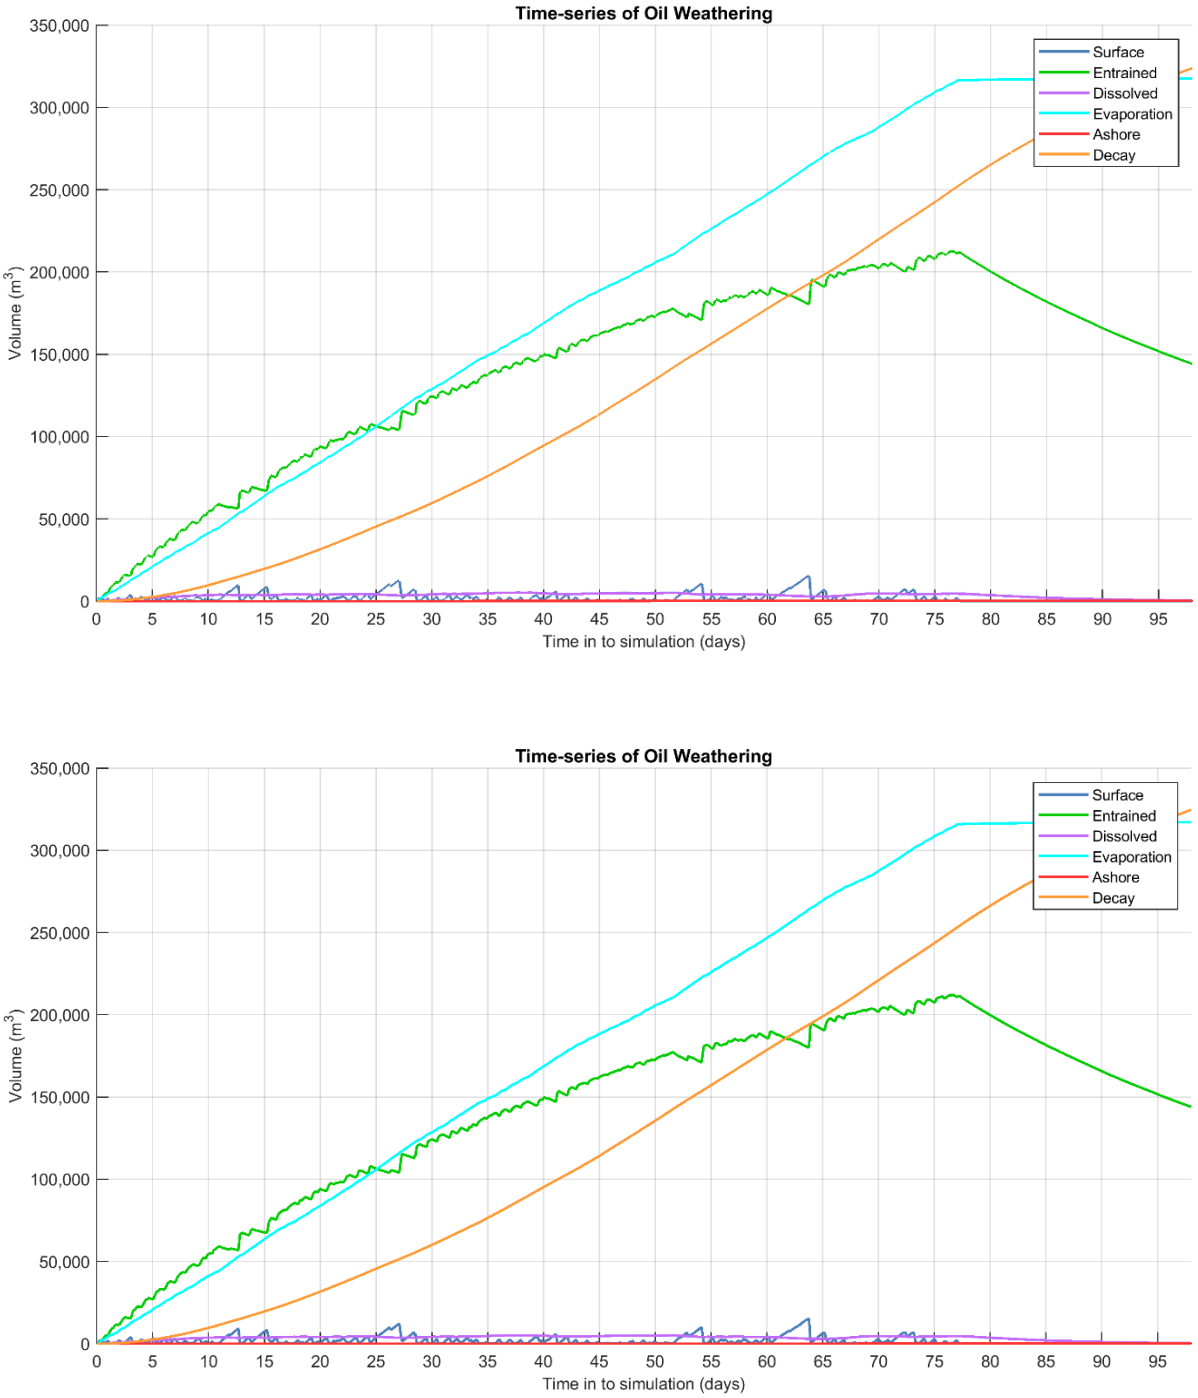

Figure 10.29 Predicted weathering and fates graph for the trajectory with the minimum time before shoreline accumulation above 10 g/m^2 for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.3 Deterministic Case: Largest volume of oil ashore

The unmitigated deterministic trajectory that resulted in the largest volume of oil ashore was identified during summer conditions as run number 17 which started on the 19th December 2011 (map illustrated in Figure 10.30).

Figure 10.31 displays the time series of the volume of oil accumulating on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 98-day simulation, for the unmitigated and mitigated cases. The maximum shoreline length contacted by oil above the low, moderate and high thresholds predicted for the unmitigated case was 186 km, 115 km and 10 km, versus 171 km, 94 km and 9 km for the mitigated case, however the total volume of oil ashore was predicted to reduce from 705 m^3 (unmitigated) to 421 m^3 (mitigated) (refer to Table 10.15).

Figure 10.32 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.18 summarises the mass balance at the end of the simulation for the unmitigated and mitigated cases.

Table 10.18 Summary of the mass balance at day 98 for the trajectory that resulted in the largest volume of oil ashore for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)	
	Unmitigated	Mitigated
Surface/Floating Oil (m^3)	0	0
Entrained (m^3)	141,875	141,474
Dissolved (m^3)	830	907
Evaporated (m^3)	325,596	325,218
Decay (m^3)	317,102	318,068
Ashore/Shoreline (m^3)	659	397
Sediment (m^3)	794	794

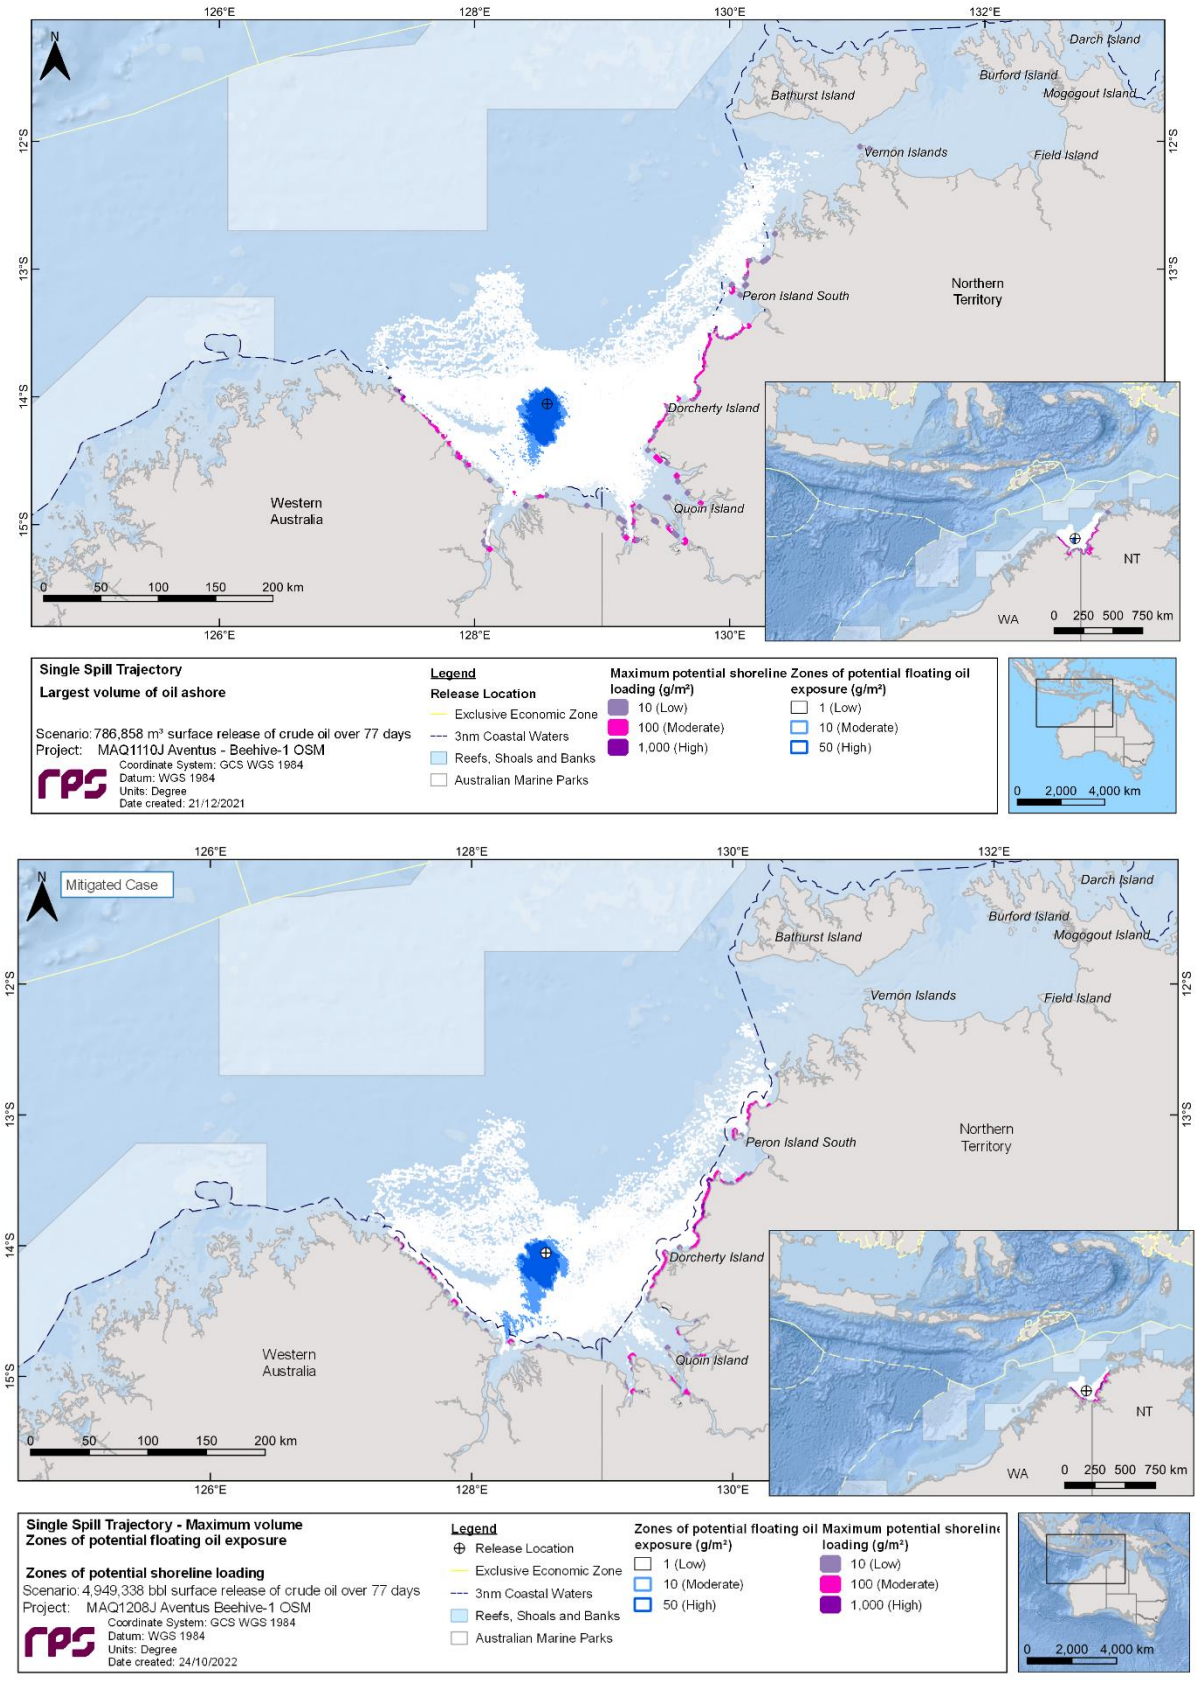

Figure 10.30 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the largest volume of oil ashore for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

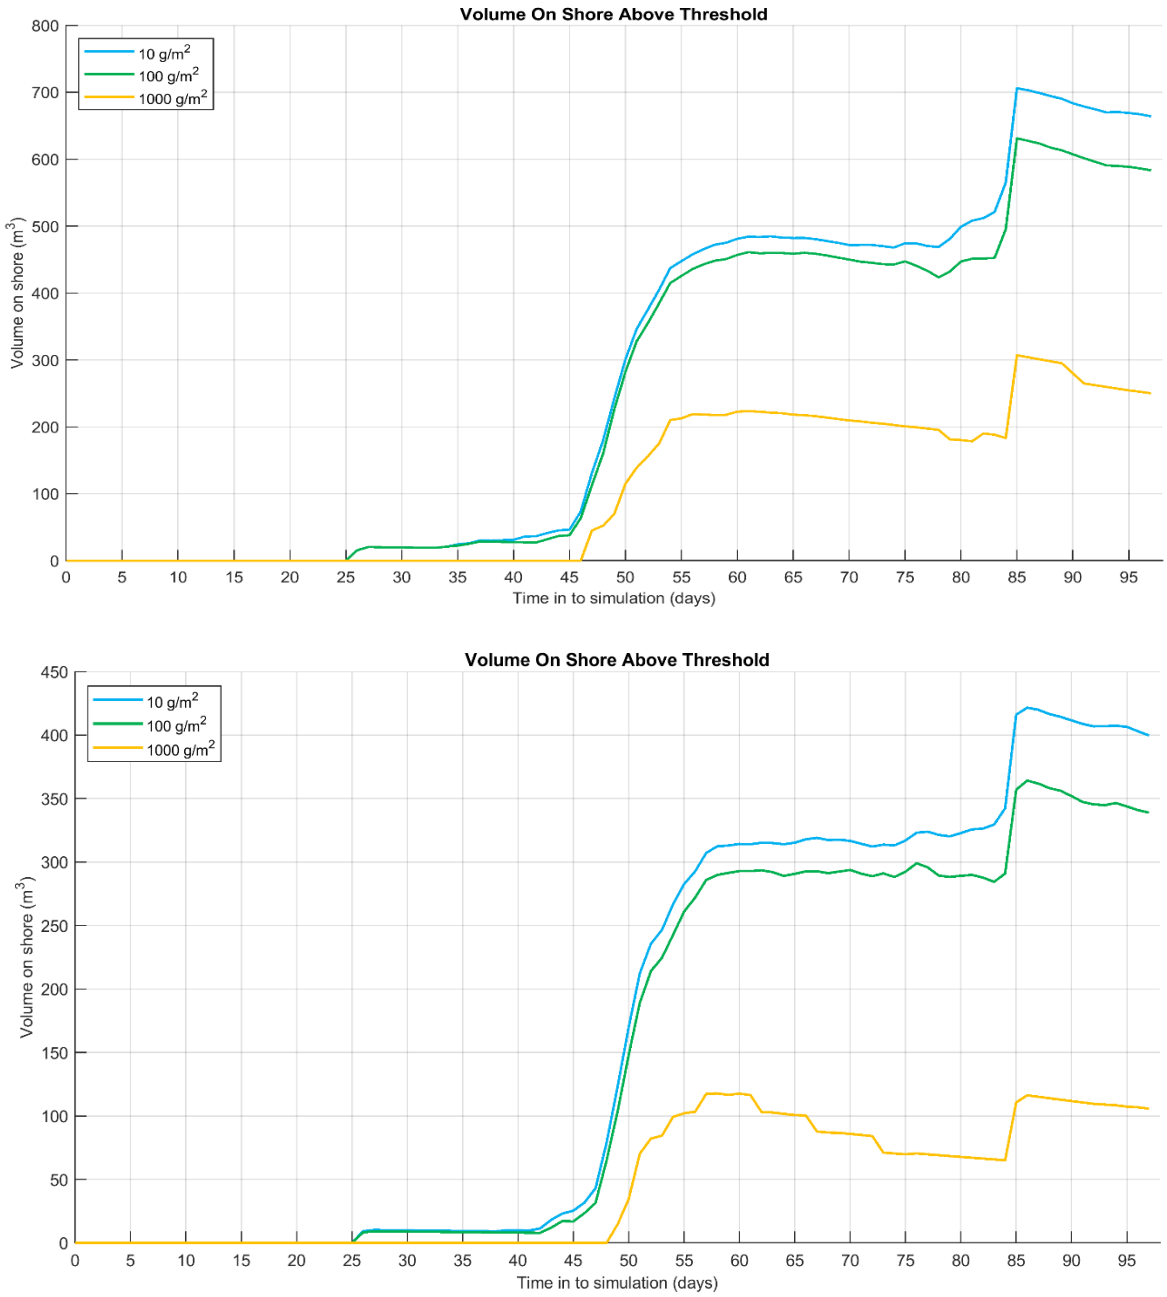

Figure 10.31 Time series of the volume of oil accumulating on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds for the trajectory with the largest volume of oil ashore for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m3 surface release of crude oil over 77 days, tracked for 98 days.

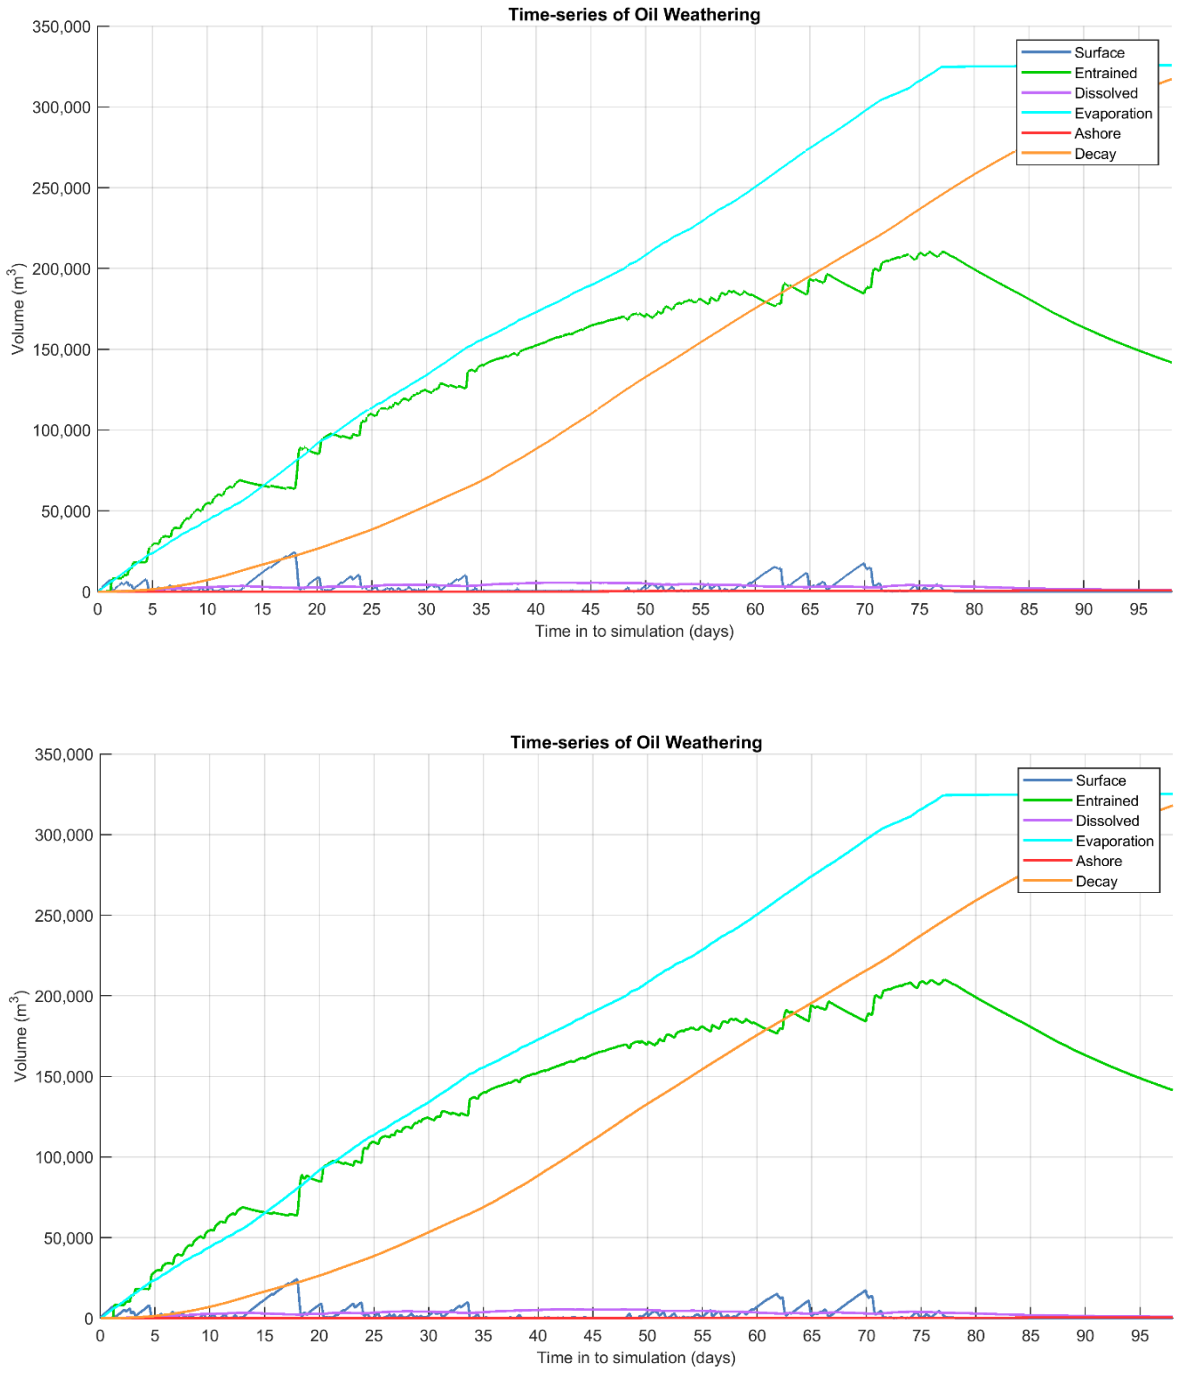

Figure 10.32 Predicted weathering and fates graph for the trajectory with the largest volume of oil ashore for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.4 Deterministic Case: Longest length of shoreline accumulation above 10 g/m^2

The unmitigated deterministic trajectory that resulted in the longest length of shoreline accumulation above 100 g/m^2 was identified during summer conditions as run number 33 which started on the 25th November 2013 (map illustrated in Figure 10.33).

Figure 10.34 displays the time series of the length of oil accumulation on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 98-day simulation, for the unmitigated and mitigated cases. The maximum shoreline length contacted by oil above the low and moderate thresholds predicted for the unmitigated case was 225 km and 86 km, versus 151 km, and 41 km for the mitigated case. The total volume of oil ashore was predicted to reduce from 232 m^3 (unmitigated) to 128 m^3 (mitigated) (refer to Table 10.15).

Figure 10.35 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.19 summarises the mass balance at the end of the simulation for the unmitigated and mitigated cases.

Table 10.19 Summary of the mass balance at day 98 for the trajectory that resulted in the longest length of shoreline accumulation above 10 g/m^2 for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)	
	Unmitigated	Mitigated
Surface/Floating Oil (m^3)	0	0
Entrained (m^3)	140,158	140,485
Dissolved (m^3)	491	443
Evaporated (m^3)	315,572	314,137
Decay (m^3)	329,599	330,863
Ashore/Shoreline (m^3)	245	135
Sediment (m^3)	794	794

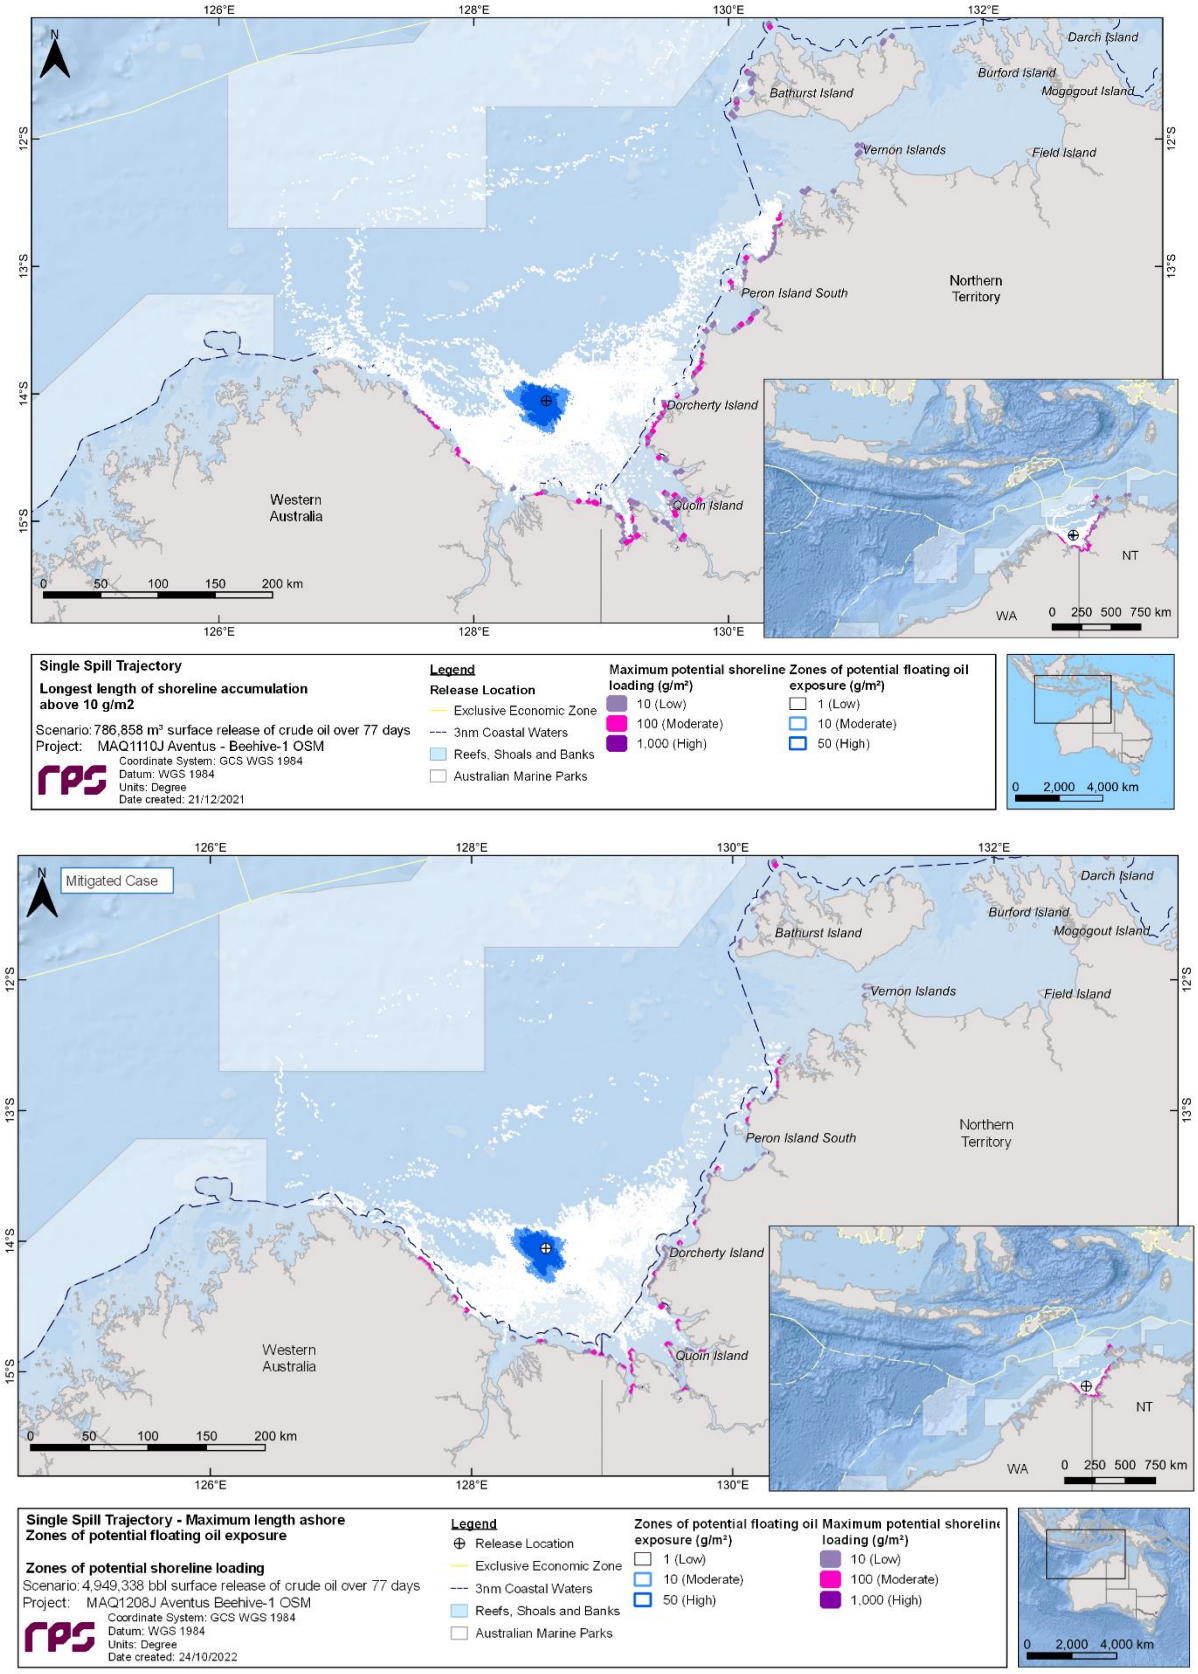

Figure 10.33 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the longest length of shoreline accumulation above 10 g/m² for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

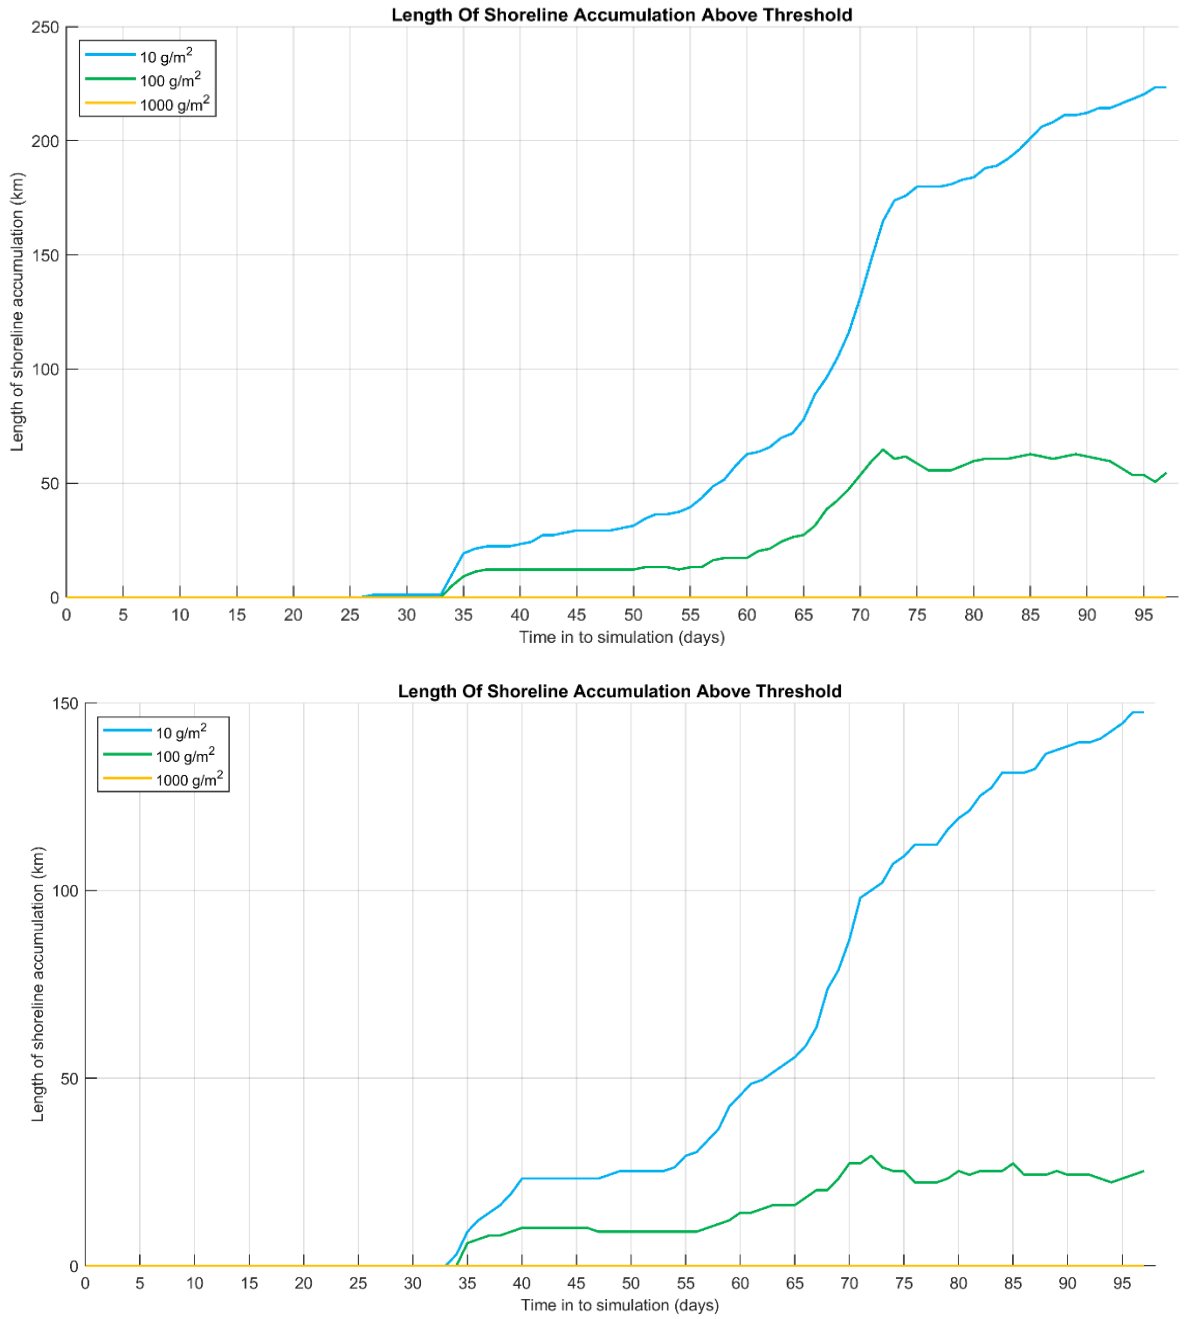

Figure 10.34 Time series of the length of shoreline at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds for the trajectory with the longest length of shoreline accumulation above 10 g/m^2 for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

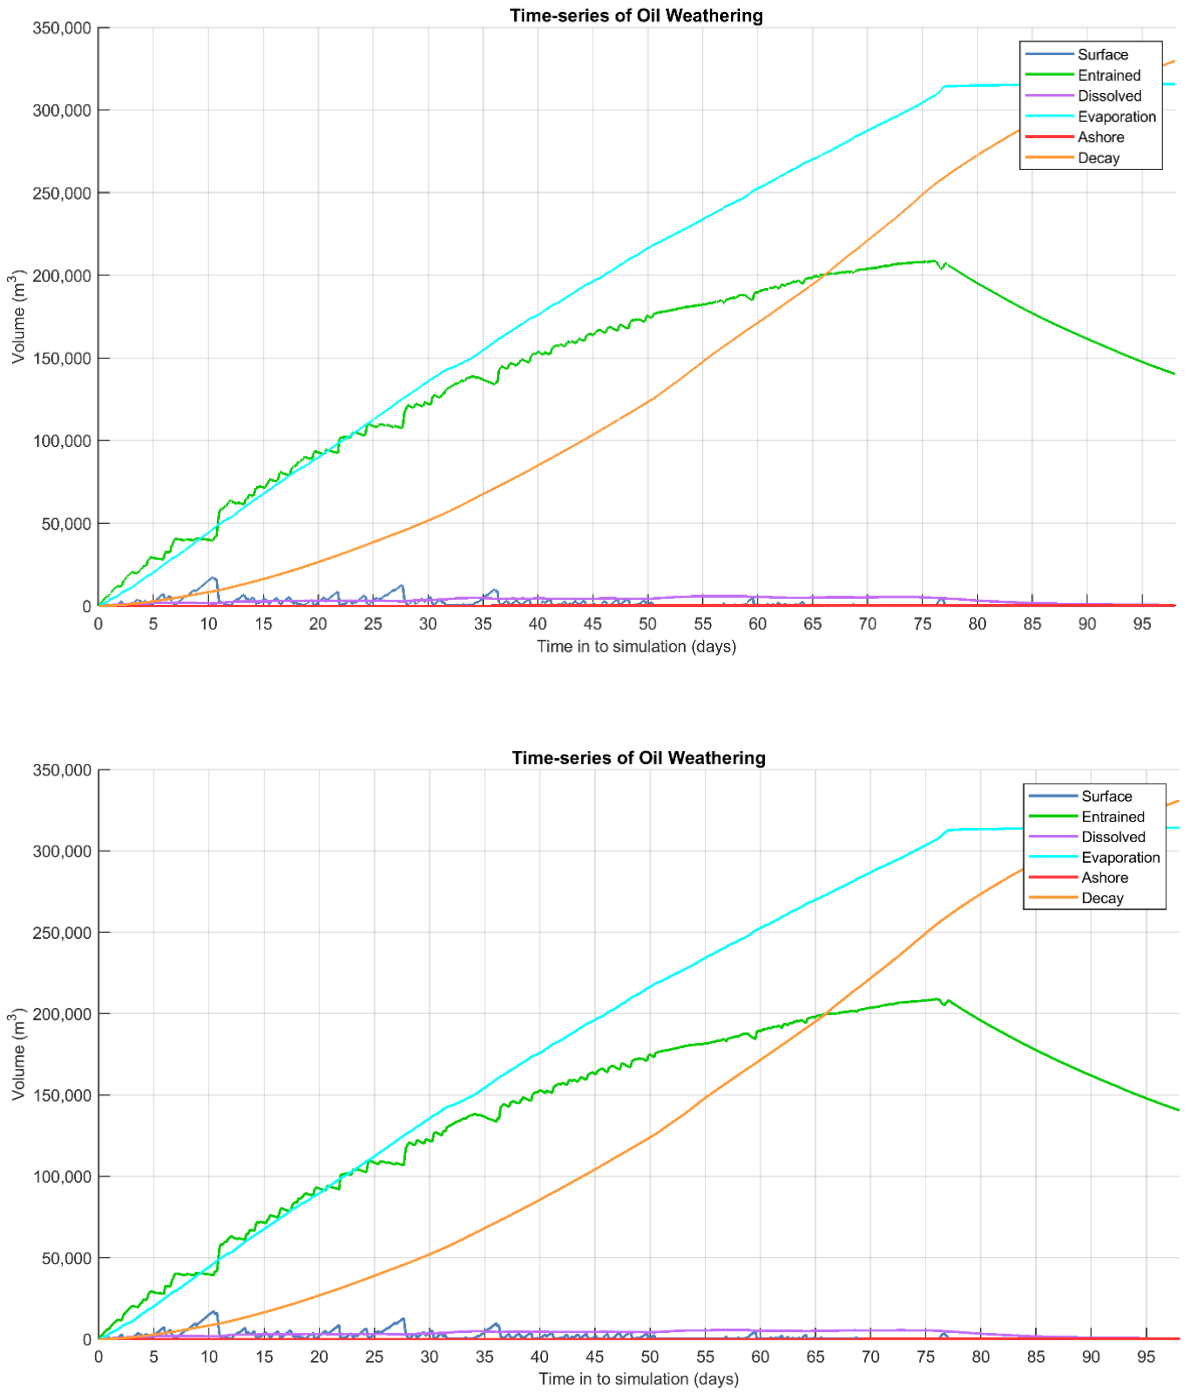

Figure 10.35 Predicted weathering and fates graph for the trajectory with the longest length of shoreline accumulation above 10 g/m^2 for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.5 Deterministic Case: Largest area of entrained hydrocarbons above 10 ppb

The unmitigated deterministic trajectory that resulted in the largest area of entrained hydrocarbons above 10 ppb (low threshold) was identified during winter conditions as run number 1 which started on the 8th June 2011 (map illustrated in Figure 10.36).

Figure 10.37 displays the time series of the area of entrained hydrocarbons at the low (10 ppb) and moderate (100 ppb) thresholds over the 98-day simulation, for the unmitigated and mitigated cases. The maximum shoreline length contacted by oil above the low and moderate thresholds predicted for the unmitigated case was 37 km and 17 km, versus 15 km and 3 km for the mitigated case. The total volume of oil ashore was predicted to increase from 55 m^3 (unmitigated) to 14 m^3 (mitigated) (refer to Table 10.15).

Figure 10.38 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.20 summarises the mass balance at the end of the simulation for the unmitigated and mitigated cases.

Table 10.20 Summary of the mass balance at day 98 for the trajectory that resulted in the largest area of entrained hydrocarbons above 10 ppb for the unmitigated and mitigated cases. Results are based on 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)	
	Unmitigated	Mitigated
Surface/Floating Oil (m^3)	0	0
Entrained (m^3)	142,358	141,994
Dissolved (m^3)	562	549
Evaporated (m^3)	291,765	290,931
Decay (m^3)	351,324	352,576
Ashore/Shoreline (m^3)	55	14
Sediment (m^3)	794	794

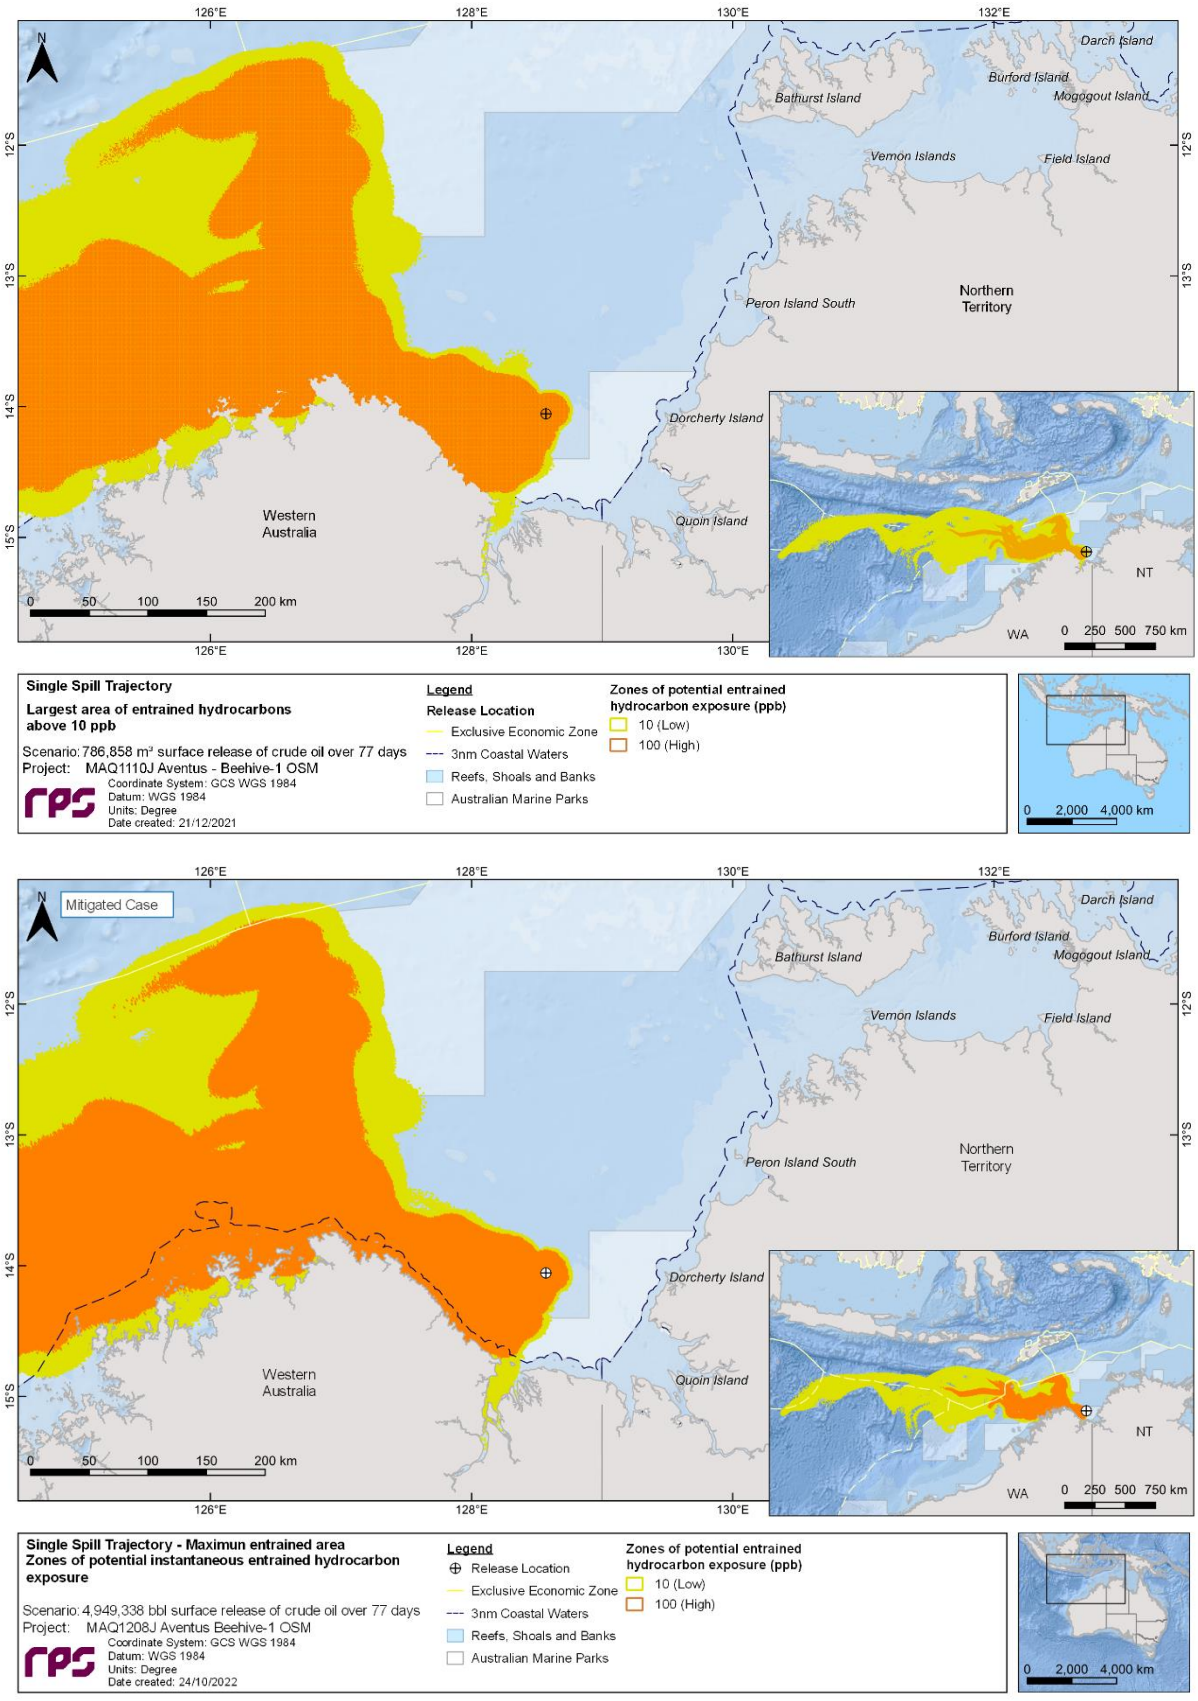

Figure 10.36 Zones of potential entrained hydrocarbon exposure, for the trajectory with the largest area of entrained hydrocarbons above 10 ppb for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

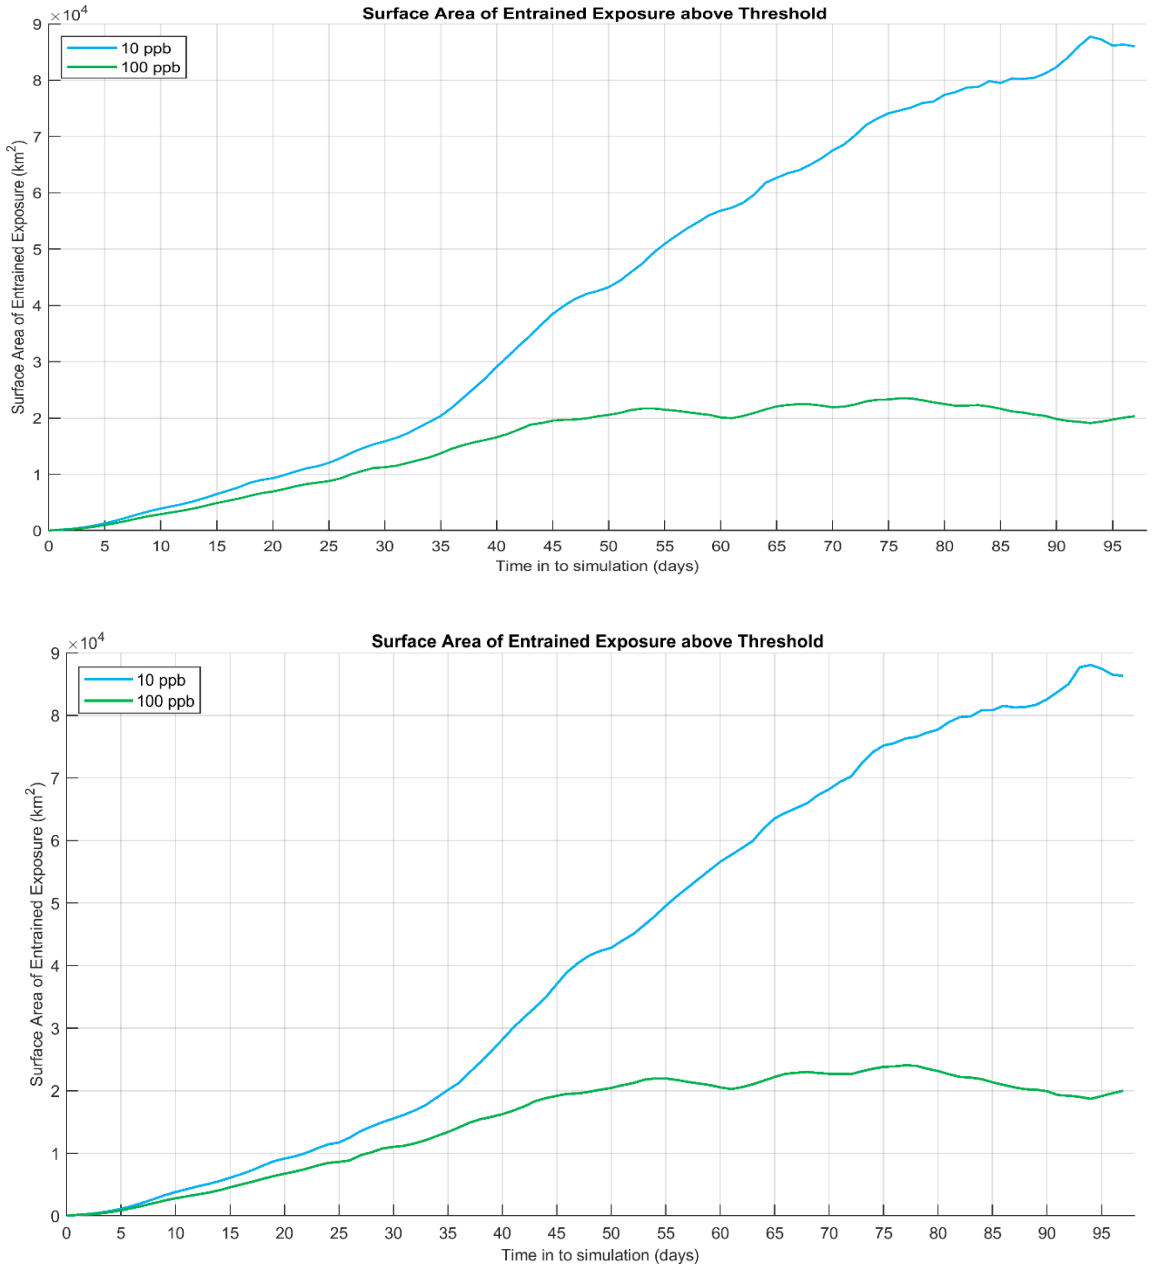

Figure 10.37 Time series of the area of low (10 ppb) and moderate (100 ppb) entrained hydrocarbons for the trajectory with the largest area of entrained hydrocarbons above 10 ppb for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

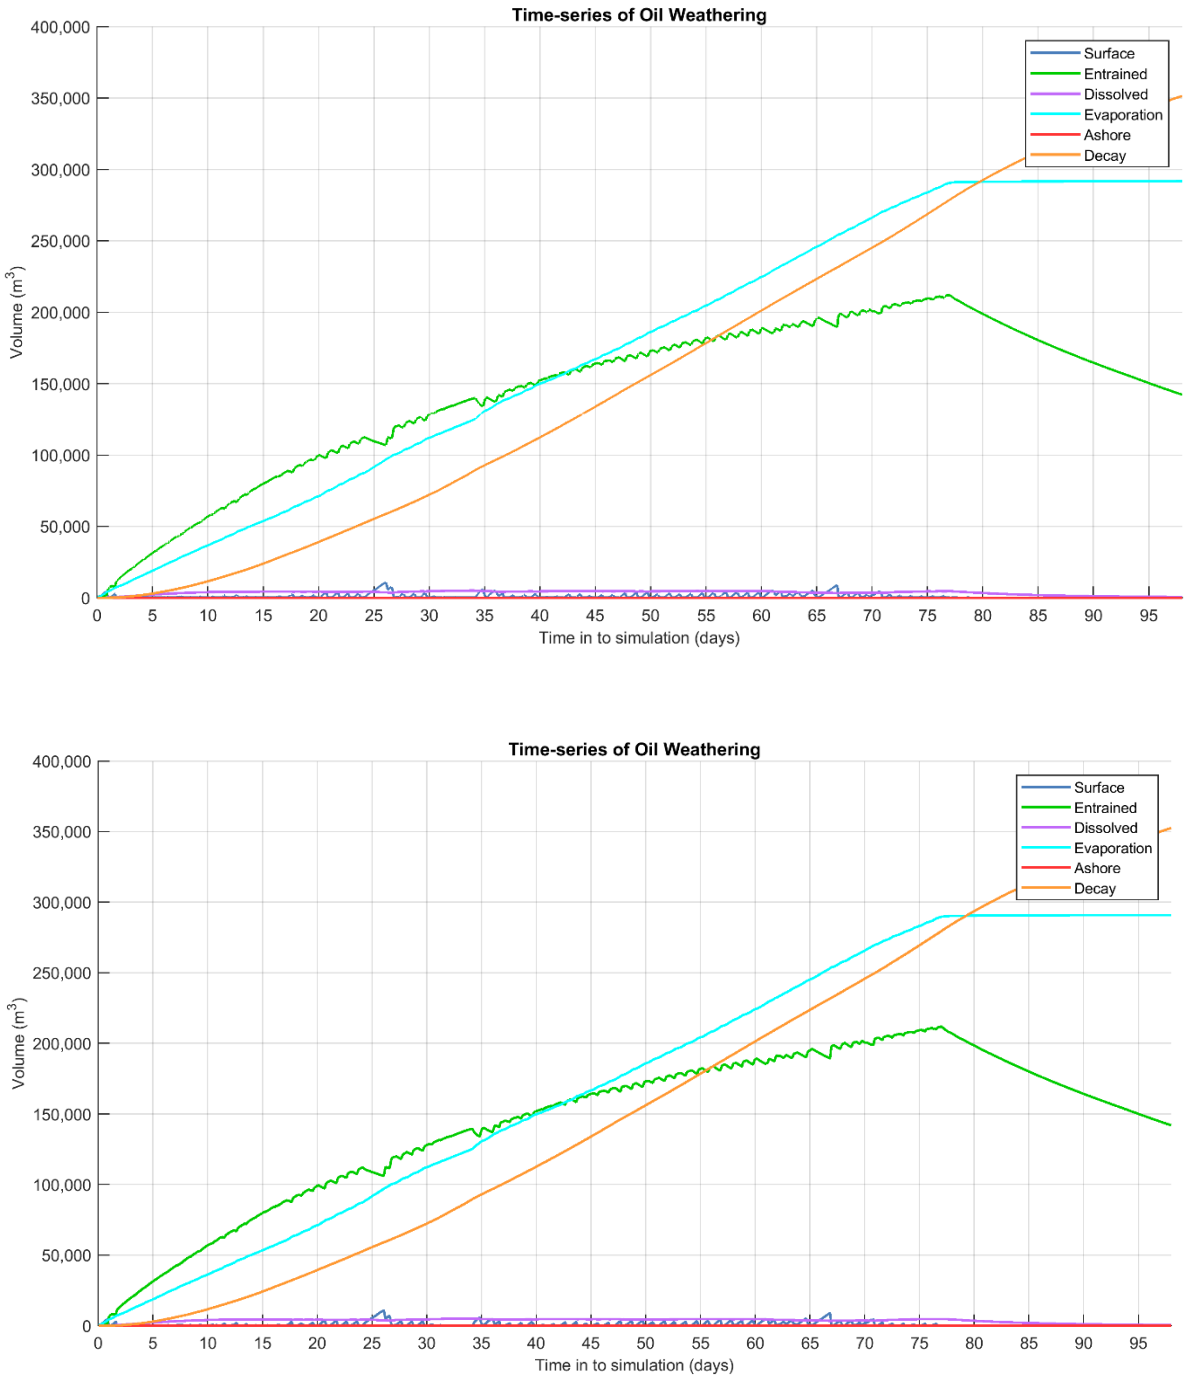

Figure 10.38 Predicted weathering and fates graph for the trajectory with the largest area of entrained hydrocarbons above 10 ppb for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

10.2.6 Deterministic Case: Largest area of dissolved hydrocarbons above 10 ppb

The unmitigated deterministic trajectory that resulted in the largest area of dissolved hydrocarbons above 10 ppb (low threshold) was identified during summer conditions as run number 7 which started on the 27th November 2013 (map illustrated in Figure 10.39).

Figure 10.40 displays the time series of the area of dissolved hydrocarbons at the low (10 ppb), moderate (50 ppb) and high (400 g/m^2) thresholds over the 98-day simulation, for the unmitigated and mitigated cases. The maximum shoreline length contacted by oil above the low and moderate thresholds predicted for the unmitigated case was 198 km and 72 km, versus 145 km, and 37 km for the mitigated case. The total volume of oil ashore was predicted to increase from 219 m^3 (unmitigated) to 118 m^3 (mitigated) (refer to Table 10.15).

Figure 10.41 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.21 summarises the mass balance at the end of the simulation for the unmitigated and mitigated cases.

Table 10.21 Summary of the mass balance at day 98 for the trajectory that resulted in the largest area of dissolved hydrocarbons above 10 ppb for the unmitigated and mitigated cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Exposure Metrics	End of the simulation (day 98)	
	Unmitigated	Mitigated
Surface/Floating Oil (m^3)	0	0
Entrained (m^3)	140,338	140,077
Dissolved (m^3)	505	510
Evaporated (m^3)	315,546	315,100
Decay (m^3)	329,456	330,258
Ashore/Shoreline (m^3)	219	118
Sediment (m^3)	794	794

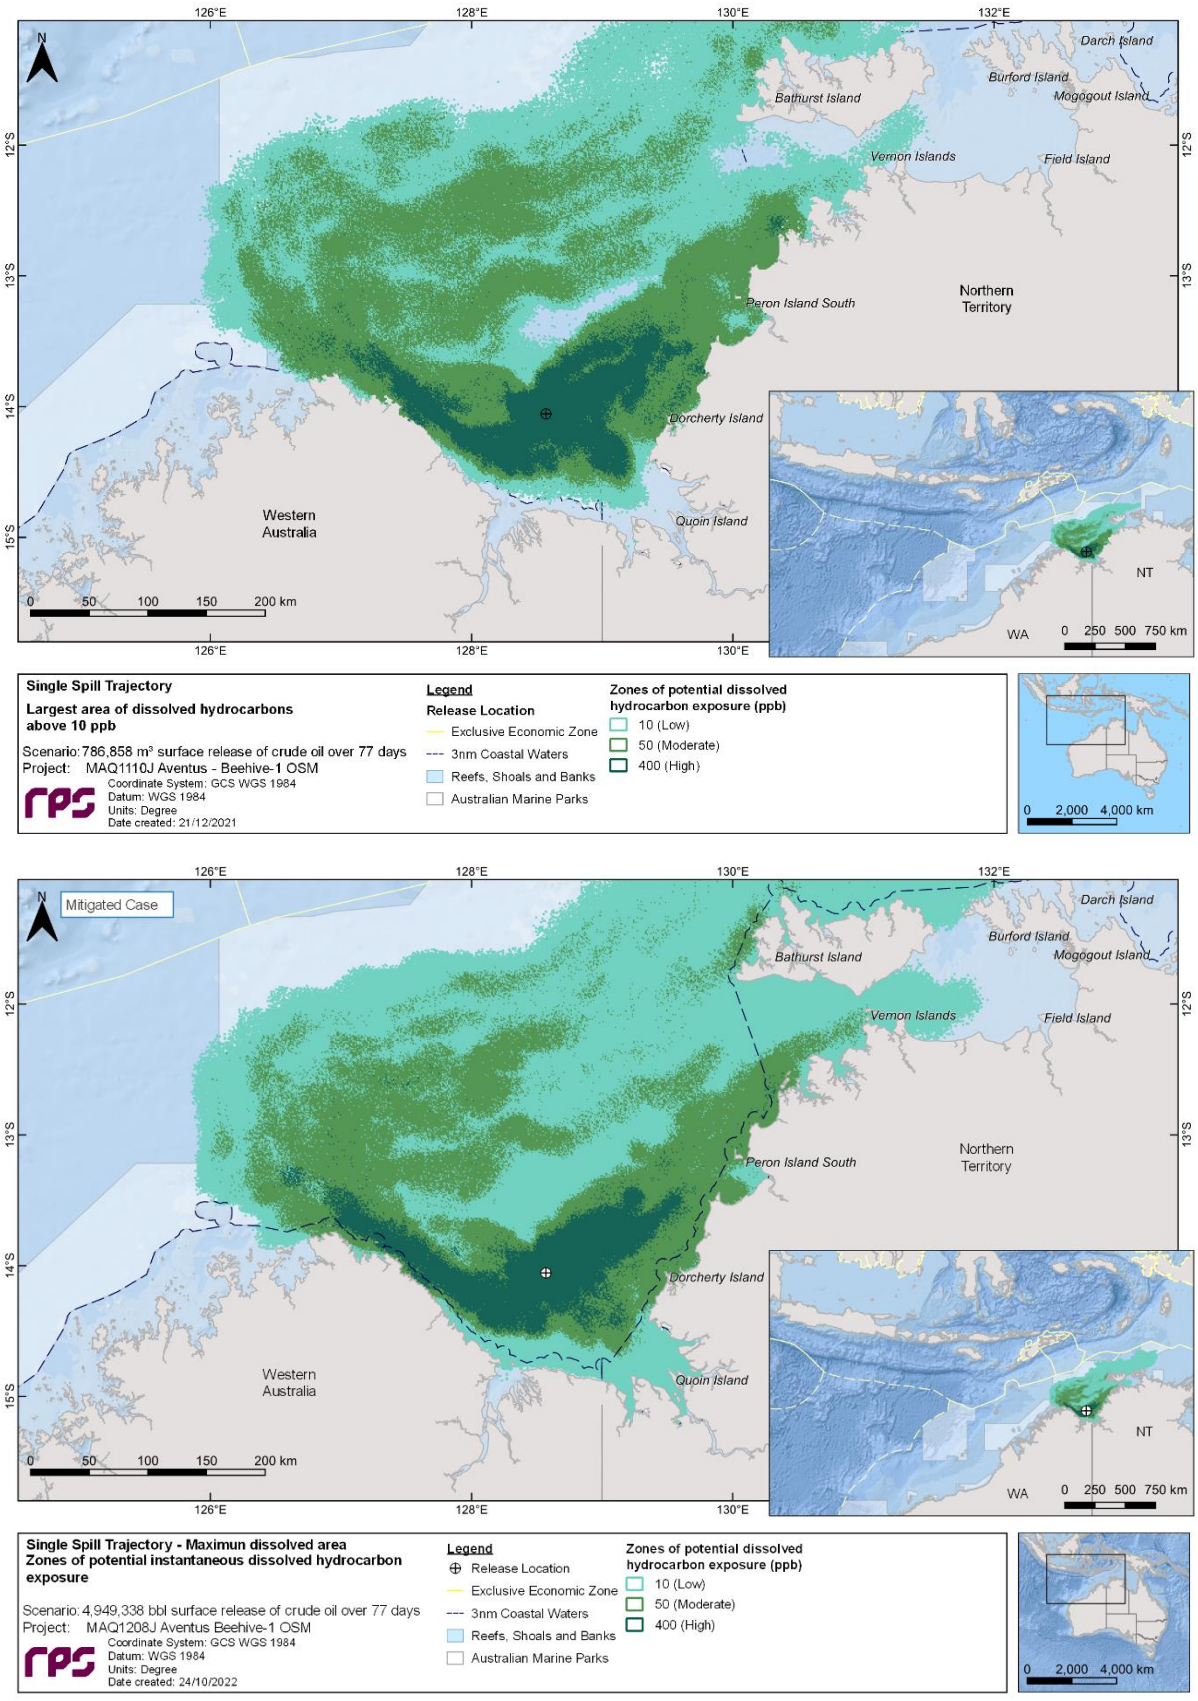

Figure 10.39 Zones of potential dissolved hydrocarbon exposure, for the trajectory with the largest area of dissolved hydrocarbons above 10 ppb for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m³ surface release of crude oil over 77 days, tracked for 98 days.

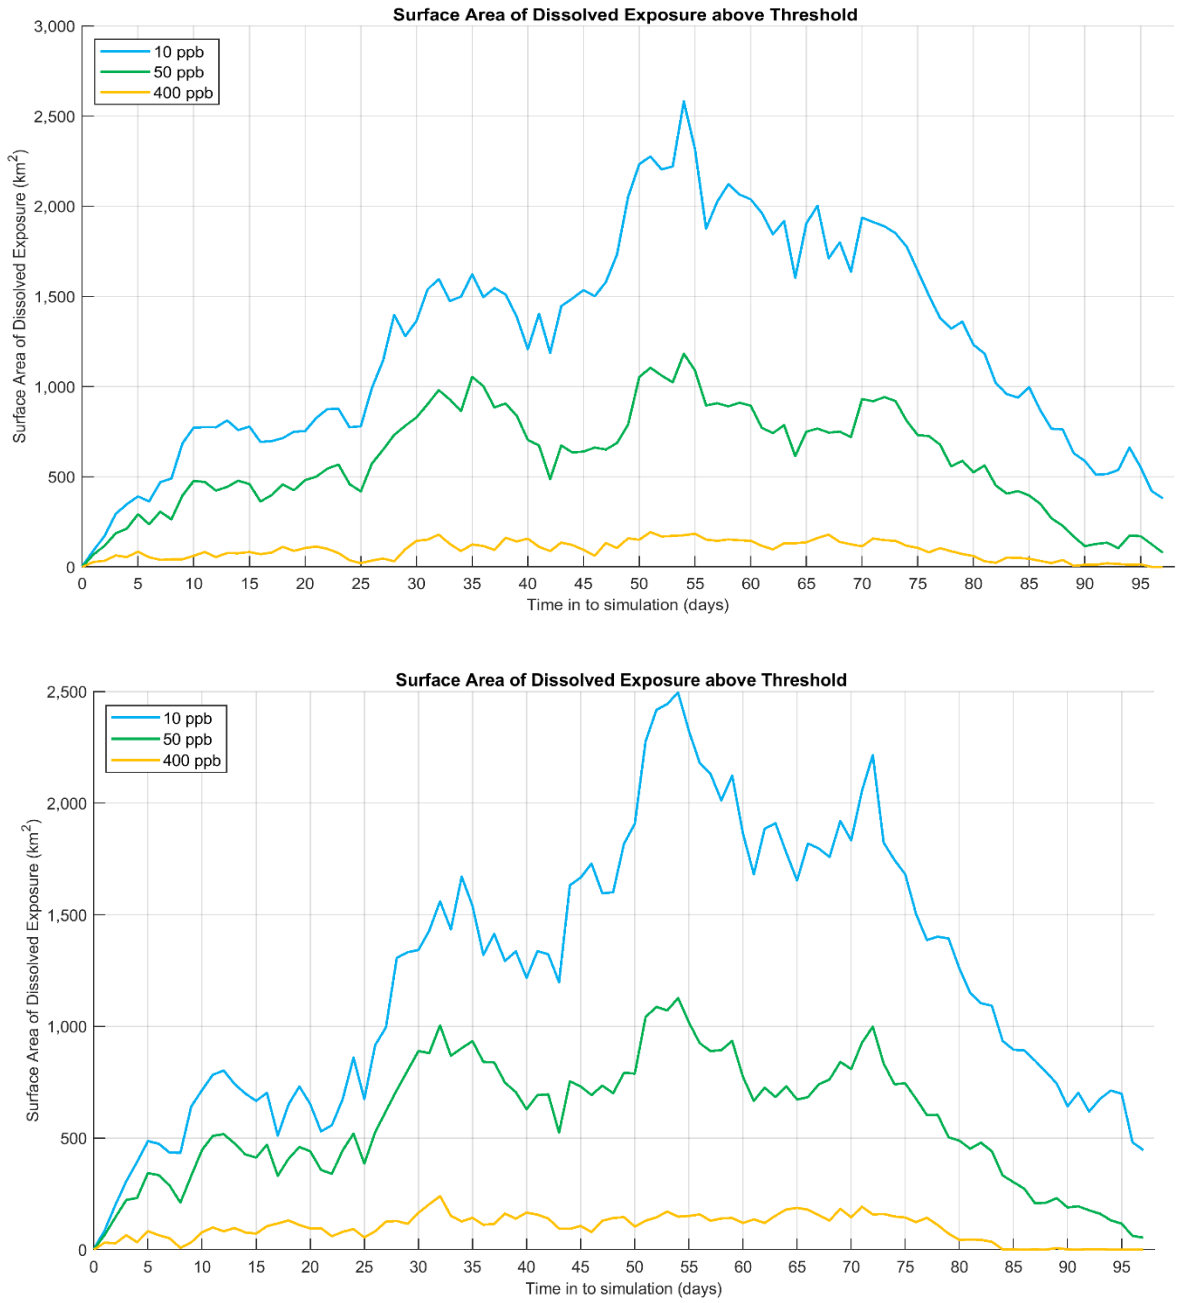

Figure 10.40 Time series of the area of low (10 ppb), moderate (50 ppb) and high (400 ppb) dissolved hydrocarbons for the trajectory with the largest area of dissolved hydrocarbons above 10 ppb for the unmitigated (upper image) and mitigated (lower image) cases. Results are based on a 786,858 m^3 surface release of crude oil over 77 days, tracked for 98 days.

Management actions/ strategies	Compliance with management plan
Communication, education and awareness program.	
Develop information on marine parks in the Network to encourage increased awareness and understanding of their values and management arrangements.	No impacts.
Provide infrastructure in and adjacent to the Network, such as signs and marker buoys, to increase understanding of marine park values and rules, particularly at sites that are regularly visited.	No impacts.
Establish a North Network advisory committee to support and collaborate with the Director in management.	No impacts.
Tourism and visitor experience program.	
Promote visitor experiences that foster curiosity and appreciation of natural and heritage values in the Network.	No impacts.
Work with other Commonwealth, state and territory government agencies, and the tourism industry to support tourism initiatives, events and attractions that promote visitor experiences in marine parks.	No impacts.
Facilitate partnerships between Indigenous people and tourism operators.	No impacts.
Indigenous engagement program.	
Collaborate with traditional owners and Indigenous ranger groups and relevant partners to undertake marine park management such as surveillance, monitoring and threat mitigation including marine debris removal, and implement actions identified in sea country plans where applicable.	No impacts.
Identify opportunities and mechanisms to engage traditional owners and Indigenous rangers in the management of marine parks.	No impacts.
Increase understanding of traditional knowledge, map cultural values and manage significant sites.	No impacts.
Implement cultural awareness training for Parks Australia staff in association with traditional owners.	No impacts.
Establish protocols for researchers working with Parks Australia to guide engagement with traditional owners	No impacts.
Marine science program.	
Monitor social and economic uses and their benefits and impacts on marine parks.	No impacts.
Monitor the condition of important habitats such as reef systems and their vulnerability to climate change.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts.
Monitor the impact of invasive species on marine park values and the effectiveness of management.	No impacts.

Management actions/ strategies	Compliance with management plan
Collaborate with other Commonwealth, state and territory government agencies, marine park users and the science sector to support long-term monitoring. For example, monitoring of coral reefs, protected species and the effects of fishing on marine parks.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts.
Investigate opportunities to extend citizen science programs.	No impacts.
Assessments and authorisations program.	
Issue authorisations—a permit, class approval, activity licence or lease—for activities in marine parks assessed as acceptable either by the Director or another government or industry policy, plan or program accepted by the Director.	No impacts.
Work with other Commonwealth, state and territory government agencies to improve experiences and consistency of approaches for people seeking authorisations.	No impacts.
Park protection and management program.	
Enable infrastructure such as moorings to protect habitats and enhance visitor safety.	No impacts.
Collaborate with and support other agencies that undertake invasive and protected species management and marine debris removal. For example, biosecurity assessments, research, or removal of ghost nets.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts.
Work with other Commonwealth, state and territory government agencies to respond to environmental incidents and accidents.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP.
Collaborate with traditional owners and Indigenous ranger groups to undertake management actions.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Management actions/ strategies	Compliance with management plan
Compliance program.	
Work with other Commonwealth, state and territory government agencies, particularly where parks adjoin state or territory marine parks, in compliance planning, including implementing actions to deter illegal activities and encourage voluntary compliance.	No impacts.
Collaborate with Commonwealth, state and territory government agencies in surveillance, including water and aerial patrols.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP.

Assessment of the Beehive-1 exploration drilling LoWC spill risk against the North-West Marine Parks Network Management Plan (Director of National Parks, 2018)

The following information summarises the probabilities of exposure (%) to the AMPs in the North Marine Parks Network based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Argo-Rowley AMP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	2	-	-	7	-	-	2	-	-
Dissolved – 0-10 m below sea surface	3	1	-	7	5	-	2	1	-
Entrained – 0-10 m below sea surface	10		9	17		10	12		3

Kimberley AMP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	43	-	-	57	-	-	70	-	-
Dissolved – 0-10 m below sea surface	49	47	24	62	58	20	84	67	15
Entrained – 0-10 m below sea surface	56		48	74		62	93		88

Mermaid Reef AMP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	-	-	-	-	-	-
Dissolved – 0-10 m below sea surface	-	-	-	3	2	-	2	-	-
Entrained – 0-10 m below sea surface	7		-	11		5	2		2
Shoreline (AMP)	-	-	-	-	-	-	-	-	-
Mermaid reef shoreline exposure (reef)	-	-	-	-	-	-	-	-	-

Ashmore Reef AMP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	-	-	-	1	-	-
Dissolved – 0-10 m below sea surface	-	-	-	-	-	-	5	-	-
Entrained – 0-10 m below sea surface	-		-	-		-	25		14
Shoreline (AMP)	-	-	-	-	-	-	-	-	-
Ashmore reef shoreline exposure (reef)	-	-	-	-	-	-	7	3	-

Cartier Island AMP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	-	-	-	2	-	-
Dissolved – 0-10 m below sea surface	-	-	-	-	-	-	4	-	-
Entrained – 0-10 m below sea surface	-		-	-		-	32		15
Shoreline (AMP)	-	-	-	-	-	-	-	-	-
Cartier Island shoreline exposure (island)	-	-	-	-	-	-	11	5	-

Montebello AMP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	-	-	-	-	-	-
Dissolved – 0-10 m below sea surface	-	-	-	-	-	-	-	-	-
Entrained – 0-10 m below sea surface	-		-	1		-	-		-

Management actions/ strategies	Compliance with management plan
Communication, education and awareness program.	
Develop information on marine parks in the Network to encourage increased awareness and understanding of their values and management arrangements. For example, an Ashmore Reef Marine Park visitor guide.	No impacts.
Provide infrastructure in and adjacent to the Network, such as signs and marker buoys, to increase understanding of marine park values and rules, particularly at sites that are regularly visited, and	No impacts.
Establish a North-west Network advisory committee to support and collaborate with the Director in management.	No impacts.
Tourism and visitor experience program.	
Promote visitor experiences that foster curiosity and appreciation of natural and heritage values in the Network, for example whale shark watching at Ningaloo Marine Park, diving at Mermaid Reef Marine Park, and bird watching at Ashmore Reef Marine Park.	No impacts.
Work with other Commonwealth and state government agencies, and the tourism industry to support tourism initiatives, events and attractions that promote visitor experiences in marine parks.	No impacts.
Facilitate partnerships between Indigenous people and tourism operators, and support the application of the Uunguu Visitor Management pass system for the native title determination area.	No impacts.
Indigenous engagement program.	
Collaborate with traditional owners, Indigenous ranger groups and relevant partners to undertake marine park management such as surveillance, monitoring and threat mitigation including marine debris removal, and implement actions identified in sea country plans where applicable.	No impacts.
Identify opportunities and mechanisms to engage traditional owners and Indigenous rangers in the management of marine parks.	No impacts.
Increase understanding of traditional knowledge, map cultural values and manage culturally significant sites.	No impacts.
Implement cultural awareness training for Parks Australia staff in association with traditional owners.	No impacts.
Establish research protocols in association with traditional owners, like those in the Collaborative Science on Kimberley Saltwater Country - A Guide for Researchers.	No impacts.
Marine science program.	
Monitor social and economic uses and their benefits and impacts on marine parks in the Network	No impacts.
monitor the condition of important habitats such as reef systems at Ningaloo, Mermaid, Kimberley, Ashmore and Cartier Marine Parks, and their vulnerability to climate change	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts.

Management actions/ strategies	Compliance with management plan
Monitor the impact of invasive species on marine park values and the effectiveness of management. For example, tropical fire ant impacts on seabirds and turtles at Ashmore Reef Marine Park, and the effectiveness of management such as baiting.	No impacts.
Collaborate with other Commonwealth and state government agencies, marine park users and the science sector to support long-term monitoring. For example monitoring of coral reefs, protected species and the effects of fishing on marine parks.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts.
Investigate opportunities to extend citizen science programs.	No impacts.
Assessments and authorisations program.	
Issue authorisations—a permit, class approval, activity licence or lease—for activities in marine parks assessed as acceptable either by the Director or another government or industry policy, plan or program accepted by the Director.	No impacts.
Work with other Commonwealth and state government agencies to improve experiences and consistency of approaches for people seeking authorisations.	No impacts.
Park protection and management program.	
Enable infrastructure such as moorings to protect habitats and enhance visitor safety	No impacts.
Collaborate with and support other agencies that undertake invasive and protected species management and marine debris removal. For example, this may include biosecurity assessments, research, or removal of ghost nets.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts.
Work with other Commonwealth and state government agencies to respond to environmental incidents and accidents.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP.
Collaborate with traditional owners and Indigenous ranger groups to undertake management actions.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Management actions/ strategies	Compliance with management plan
Compliance program.	
Work with other Commonwealth and state government agencies, particularly where parks adjoin state marine parks, in compliance planning, including implementing actions to deter illegal activities and encourage voluntary compliance.	No impacts.
Collaborate with Commonwealth and state government agencies in surveillance, including water and aerial patrols.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP.

Assessment of the Beehive-1 exploration drilling LoWC spill risk against the Ord River and Parry Lagoons nature reserves management plan 77 2012 (Department of Environment and Conservation 2012)

The following information summarises the probabilities of exposure (%) to the Ord River Floodplain Ramsar Site based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Ord River Floodplain Ramsar Site	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	12	-	-	13	-	-	8	-	-
Dissolved – 0-10 m below sea surface	33	18	1	36	25	5	50	27	2
Entrained – 0-10 m below sea surface	67		37	45		39	68		64

Management actions/ strategies	Compliance with management plan
Protect the values of the planning area.	
Undertake the process for a change in tenure for the Ord River and Parry Lagoons nature reserves to 'class A' nature reserves.	No impacts.
Investigate an appropriate tenure for Parry Lagoons Nature Reserve, for example, a national park category, to better accommodate future visitor needs.	
Undertake the process for incorporating proposed additions as identified in Table 1 into the existing nature reserves.	
Traditional owner involvement in management of the planning area.	
Prepare a joint management agreement under the CALM Act with the Yawoorroong Miriuwung Gajerrong Yirrgeb Noong Dawang Aboriginal Corporation, as resources become available, as identified in the Ord Final Agreement	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Determine interest of pursuing joint management arrangements for the applicable portion of the planning area with the Balanggarra people.	
Foster relations with other traditional owners who speak for country.	
Ensure consultation with and approval from traditional owners who speak for country, for any amendments to land tenure that may occur over land for which they speak.	
Work with traditional owners to promote their participation in commercial activities.	
Ensure consultation with and approval from traditional owners who speak for country, for any research activities that may occur on land for which they speak.	

Management actions/ strategies	Compliance with management plan
Refer development and resource use proposals to traditional owners who speak for country.	
Maintain hydrological regimes occurring at the time of Ramsar listing in 1990.	
Liaise with the Department of Water (DoW) to provide input into environmental water allocations for the Ord River.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Undertake studies to increase knowledge of hydrological requirements of the Ord River to maintain ecological values.	
Work cooperatively with state and federal government authorities to maintain Ramsar values.	
Conserve native plants and plant communities.	
Maintain and monitor vegetation diversity by reducing threatening processes, such as inappropriate fire regimes, altered hydrological regimes and high densities of introduced animals, such as cattle.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Work cooperatively with state and federal government authorities to maintain Ramsar values.	
Conserve specially protected and other native fauna.	
Support the preparation and implementation of recovery plans for any threatened fauna species.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Protect native fauna from introduced and problem animals through appropriate control regimes where necessary.	
Work cooperatively with state and federal government authorities to maintain Ramsar values.	
Monitor the abundance and composition of key fauna species.	

Management actions/ strategies	Compliance with management plan
Prevent loss of native species and decline in plant communities from weed invasion.	
Consistent with regional weed prioritisation, prepare, implement and monitor a weed control program based upon invasiveness, existing and potential impacts, current and potential distribution, and feasibility of control.	No impacts.
Support the Australian Quarantine and Inspection Service to monitor the occurrence of, and potentially control the spread of, weed species.	
Continue to work with other agencies and adjacent landholders to control environmental weeds	
Prevent impacts of introduced and other problem animals on the values of the planning area.	
Consistent with regional prioritisation for introduced and problem animals, prepare a control program based upon existing and potential impacts, current and potential distribution, feasibility of control and capacity for long-term monitoring.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Work with neighbours to limit cattle intrusions onto the reserves (for example, assist adjoining landowners to ensure boundary fences are adequate to exclude cattle, where practicable).	
Support the Australian Quarantine and Inspection Service and Department of Agriculture and Food to monitor the occurrence of, and potentially control the spread of, introduced animals.	
Implementation of the State Cane Toad Initiative, in collaboration with community-based groups and scientific institutions, to slow the westward spread of cane toads.	
Prevent impacts of altered hydrological regimes on the values of the planning area.	
Work with DoW and Water Corporation to provide information to assess adequate flow for the Ord River to maintain the ecological character of the Ramsar site.	No impacts.
Protect biodiversity, people and property within the planning area. Maintain cultural responsibilities.	
Prepare and implement a prescribed burning program which is in accordance with the key principles and considers the knowledge and responsibilities of traditional owners.	No impacts.
Continue to liaise with neighbouring landholders and local government to integrate fire management across the landscape.	
Integrate fire management with weed and introduced species control programs.	

Management actions/ strategies	Compliance with management plan
Protect and conserve the value of the land to the culture and heritage of Aboriginal persons. Traditional owners using their traditional lands for customary purposes.	
Enhance understanding of the value of the planning area to the culture and heritage of Aboriginal persons.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Ensure that the values of the land to the culture and heritage of Aboriginal persons inform and guide management actions	
Where applicable, apply the Miriuwung-Gajerrong Cultural Planning Framework (Hill et al. 2008) to inform and guide management actions.	
Work with traditional owners who speak for country, to protect heritage sites within the planning area.	
Ensure management activities attempt to minimise material adverse effect on Aboriginal culture and heritage.	
Protect other cultural heritage.	
Ensure management activities attempt to minimise material adverse effects on other cultural heritage.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Facilitate visitor enjoyment, appreciation and understanding of the values of the planning area	
Provide a range of opportunities for visitors, and ensure they are consistent with the purpose of the reserves, pose no adverse impacts on the environment or unreasonably interfere with visitor experiences	No impacts.
Minimal risks to visitors and encouragement of appropriate visitor behaviour	
Develop a visitor risk management plan in accordance with department policy that identifies and assesses the risks associated with all recreation sites and monitors and regularly reviews visitor risk.	No impacts.

Management actions/ strategies	Compliance with management plan
Increase community awareness, understanding and appreciation of the values of the planning area to foster support for its protection and effective management.	
Provide information to visitors, volunteers, commercial operators and the tourism industry on: • day-use opportunities • the values and management issues within the planning area such as its importance for migratory waterbirds, visitor safety, permitted activities and regulations • cultural heritage to promote visitor awareness, appreciation and understanding • potentially hazardous areas and activities • Leave No Trace principles	No impacts.
Update existing signage and brochures and install new signs at all access points, including information on Aboriginal cultural interpretation.	
Increase community awareness of the need to keep domestic animals out of the planning area	
Provide safe and convenient access within the planning area for visitors and management, where appropriate	
Maintain designated access points to the planning area to facilitate four-wheel-drive, walking and birdwatching activities.	No impacts.
Pending a future increase in visitor numbers, develop defined walking trails if required	
Passive, low impact visitor use of the planning area	
Encourage visitor use that is consistent with protecting and promoting the values of the planning area.	No impacts.
Provide a range of day-use opportunities consistent with department policies as resources permit	
Provide management solutions to mitigate visitor impacts.	
Commercial tourism activities that extend the range of services, facilities and experiences available, which are compatible with management outcomes.	
Evaluate proposals for licences and commercial tourism leases according to legislation and departmental policies and allow their establishment where appropriate.	No impacts.
Ensure that all commercial operations are managed under a lease, licence or permit agreement with appropriate conditions.	
Minimal impacts from mineral and petroleum exploration and development, including basic raw material extraction and development activities, on the values of the planning area.	
Refer proposals, where appropriate, to the Conservation Commission, to provide advice to the Minister for Environment	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP
Ensure access to basic raw materials from within the planning area by local government authorities and private contractors is allowed only when:	

Management actions/ strategies	Compliance with management plan
• the material is to be used within the planning area • extraction complies with this management plan and the purpose, class and tenure of the reserves • extraction complies with existing department policies and guidelines.	and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Minimal impacts from water resource use on the values of the planning area	
Issue licences as required under the CALM Act for water extraction from bores and other water sources located within the planning area.	No impacts.
Refer proposals that require or effect water resources that may adversely impact upon the values of the planning area to the EPA for consideration of assessment under the EP Act, ensuring consultation with DoW and the Water Corporation.	
Refer proposals to the Conservation Commission, to provide advice to the Minister for Environment.	
Minimal impacts from the installation and maintenance of public utilities on the values of the planning area	
Encourage all new public utilities and services to be located outside of the reserves	No impacts.
Refer proposals that may adversely impact upon the planning area to the EPA for consideration of assessment under the EP Act.	
Refer proposals to the Conservation Commission to provide advice to the Minister for Environment.	
Degraded areas being restored to a condition resembling the natural environment within the local vicinity.	
Coordinate rehabilitation works with weed control, fire management and cattle exclusion to allow natural regeneration wherever possible	No impacts.
Utilise plant stock or seed of local provenance where active rehabilitation is required.	
Effective community involvement in the management of the planning area.	
Continue to encourage, promote and support volunteers and community groups with essential resources to help them carry out their activities.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Liaise with the Balanggarra and Miriuwung Gajerrong traditional owners, neighbouring landowners and land managers, local authorities, relevant government agencies and other stakeholders in the management of cross-boundary issues.	
Notify adjacent pastoralists of cattle located within the planning area, permit pastoralists to muster cattle and advise pastoralists that any stock remaining after mustering will be eradicated.	
Monitor possible impacts associated with implementing the management plan to provide for improved management	

Management actions/ strategies	Compliance with management plan
Conduct or support research on issues and values required to report on this management plan, and the establishment of baseline information that includes: • current hydrological processes and water quality to determine adequacy to maintain the ecological character of the planning area • macroinvertebrate indicator species to determine water quality and detect levels of change • native plants that are rare, threatened or in need of special protection • vegetation condition and composition and any levels of change in condition and composition • abundance and composition of key fauna species and detect levels of change • threatening processes, such as fire and introduced plants and animals • the impacts of groundwater extraction within the planning area and from adjacent areas, particularly Mantinea Flats irrigation area • visitors' use of the area and its impacts.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Provide support for cultural heritage research of the reserves and incorporate traditional custodians' cultural knowledge in the management of the reserves	

Assessment of the Beehive-1 exploration drilling LoWC spill risk against the North Kimberley Marine Park Joint Management Plan 2016 Uunguu, Balanggaarra, Miriuwung Gajerrong, and Wilinggin management areas management plan 89 (WA Department of Parks and Wildlife, 2016).

The following information summarises the probabilities of exposure (%) to the North Kimberley Marine Park based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

North Kimberley MP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	91	9	-	90	-	-	98	-	-
Dissolved – 0-10 m below sea surface	68	55	33	85	78	44	97	96	88
Entrained – 0-10 m below sea surface	86		71	86		81	98		97

The following information summarises the probabilities of exposure (%) to the King Shoals Sanctuary Zone from the LoWC scenario

King Shoals Sanctuary Zone	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Bare Hill - East Cape Domett (E) (WAMOPRA DoT shoreline cell)									
Sea surface	59	5	-	50	-	-	60	-	-
Dissolved – 0-10 m below sea surface	66	52	17	53	40	25	86	78	30
Entrained – 0-10 m below sea surface	82		70	62		56	92		87
Shoreline	40	25	-	38	30	-	60	43	-

The following information summarises the probabilities of exposure (%) to the Cape Domett Special Use Zone from the LoWC scenario

Cape Domett Special Purpose Zone	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
East Cape Domett – WA- NT Border (C) (WAMOPRA DoT shoreline cell)									
Sea surface	47	5	-	44	-	-	45	-	-
Dissolved - 0-10 m below sea surface	65	46	14	44	40	23	68	59	24
Entrained - 0-10 m below sea surface	75		54	57		48	79		67
Shoreline	45	26	5	44	33	2	52	35	1

Management objectives	Compliance with management plan
Management of cultural values.	
To ensure that Aboriginal culture and heritage sites in the marine park are protected and conserved.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To support traditional owner connection to country including spiritual and cultural values.	
To enable traditional owners to realise livelihoods from their country.	
To provide recognition of and support for traditional owner rights to continue customary practices and to benefit from their country consistent with the purpose of the marine park.	
The facilitate and maintain the opportunity for Aboriginal people to fulfil their cultural obligations as protectors and managers of their country.	
Management of natural values.	
Natural values are not significantly impacted by human activities in the marine park and baseline status is maintained (or improved) across their natural range.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP.
Obtain an adequate biophysical, social and cultural knowledge base of values to support future management requirements.	
Acquire adequate knowledge of the impacts of climate change and develop applicable management strategies within the marine park.	
Investigate the extent and significance of current impacts and potential pressures, and if necessary implement management strategies.	
Increase local community and visitor knowledge of the cultural, ecological and social importance of key natural values.	
Management of recreation, tourism and community values.	
To promote visitor access to and enjoyment of the marine park while maintaining the outstanding cultural and natural values.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP.
To increase community understanding and appreciation of the marine park's values and support for management arrangements.	
To support continued enjoyment of recreational fishing opportunities within the marine park while maintaining the outstanding cultural and natural values.	
To minimise risks to visitors, and encourage appropriate visitor behaviour.	
To ensure human activities do not significantly impact on historic sites in and adjacent to the marine park.	

Management objectives	Compliance with management plan
Management of commercial values.	
Commercial fishing To recognise and allow for commercial fishing whilst maintaining the cultural and natural values of the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Pearling and aquaculture To recognise the historical and socio-economic value of pearling by providing for the maintenance of a viable pearling industry while maintaining the cultural and natural values of the marine park.	
Mineral extractions (oil, gas and mining) To ensure industry and associated activities are managed in a manner consistent with the objectives of the marine park.	
Economic opportunities for traditional owners Enable traditional owners to assess and realise commercial opportunities for their benefit.	
To provide for traditional owner subsistence and commercial enterprises and activities consistent with maintain cultural and natural values of the marine park.	

Assessment of the Beehive-1 exploration drilling LoWC spill risk against the Lalang-garram/Camden Sound Marine Park management plan 73 2013–2023 (Department of Parks and Wildlife, 2013)

The following information summarises the probabilities of exposure (%) to the Lalang-garram/Camden Sound Marine Park based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Lalang-garram/Camden Sound Marine Park	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	2	-	-	-	-	-
Dissolved – 0-10 m below sea surface	6	1	-	9	2	-	3	1	-
Entrained – 0-10 m below sea surface	17		9	36		15	19		5

Management actions/ strategies	Compliance with management plan
To ensure the marine park has the appropriate legal, administrative, financial and human resource frameworks in place so that it is appropriately managed in partnership with Traditional Owners and in a collaborative setting with other agencies.	
Implement all legal provisions necessary to establish and jointly manage the marine park, including registration of ILUAs; execution of Joint Management Agreements; reservation of intertidal areas within the marine park; gazettal of a CALM Act classified waters notice; and FRM Act fisheries management orders.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Develop and implement joint collaborative operational plans [DPaW, relevant JMB(s) DoF].	
Develop and apply management targets for Aboriginal culture and heritage values within one year of management plan implementation.	
Undertake a five-year review of the adequacy of management arrangements in the marine park with a particular focus on humpback whales and the special purpose zone (whale conservation). The review will also include the adequacy of management arrangements for other ecological values, including the adequacy of the zoning scheme and protection of the value of the area for the culture and heritage of Aboriginal people.	
Ensure the provision of necessary information and support for assessments of the implementation of the management plan by the MPRA.	
Take into account the guidance and aspirations of Traditional Owners, which are contained in a number of Traditional Owner documents including the North Kimberley Saltwater Country and Healthy Country Plans (e.g. Wunambal Gaambera Healthy Country Plan 2010-2020 and Dambimangari Healthy Country Plan 2012-2022), in protecting and conserving the value of the land and sea to the culture and heritage of Aboriginal people	

Management actions/ strategies	Compliance with management plan
Ensure the setting of conditions for new developments and operations are consistent with management program objectives and management targets for ecological values.	
Develop a maritime incident response plan, specific to the marine park that complements the state's marine oil spill response plan.	
Undertake a review of shipping activity in the marine park to determine the need for navigational measures such as compulsory pilotage and/or designation of shipping routes.	
Ensure any boundary revision of the pearling 'transport exempt area' is consistent with the special purpose zone (pearling).	
Develop and implement a plan for detection and mitigation response to marine pest incursion/outbreak in the marine park, including vessel risk assessments.	
Through the relevant JMB(s), assist Traditional Owners to develop a sustainable management strategy for turtle and dugong.	
Develop a cultural awareness training program approved by the relevant Aboriginal Corporation(s) for government employees and/or contractors working on the ground or in the management of the proposed park.	
To provide world-class commercial and recreational opportunities for users and visitors to the marine park while conserving Aboriginal cultural heritage and marine biodiversity, with a particular emphasis on the protection of humpback whale cows and calves.	
Gazette a Wildlife Conservation (close season for humpback cows and calves) Notice under the provisions of the WC Act applicable to the special purpose zone (whale conservation) and sanctuary zones specifying provisions such as: 1.1 A person in control of a vessel must not move it closer than 500 metres to humpback cows and calves and should maintain that distance. 1.2 A vessel within 500 metres of a humpback cow and calf should manoeuvre at a speed that creates minimal wake in a direct line to a distance greater than 500 metres from the cow and calf as soon as practicable. 1.3 If a humpback cow and calf approach in close proximity of a vessel, that vessel must be operated in neutral gear and with due consideration to navigation and vessel safety, move the vessel away to a distance greater than 500 metres from the cow and calf initially at a speed less than 5 knots for the first 100 metres. 1.4 No in-water interaction is permitted with humpback cows and calves. 1.5 Helicopters may not hover above humpback cows and calves. 1.6 Helicopters and fixed wing aircraft must remain at an altitude above 1,650 feet (500 metres) and a horizontal distance of 500 metres from humpback cows and calves.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Management actions/ strategies	Compliance with management plan
1.7 A person may not make, or cause to be made, a noise that is likely to frighten or otherwise cause distress to a whale because of its loudness or suddenness or for any other reason. 1.8 A person may not play a recording of sounds made under water in a manner that is likely to be heard by a whale	
During the life of the management plan, consider the need and options for temporal closures to vessels during the core whale visitation period in the special purpose zone (whale conservation).	
If necessary, and taking into account vessel safety issues, gazette speed restriction notice in special purpose zones (whale conservation) and sanctuary zones to reduce the risk of vessel collision with humpback whales.	
Consider commercially licensed operators that may be exempt from some conditions of the Wildlife Conservation (close season for humpback cows and calves) Notice if engaged in endorsed research and monitoring programs for humpback whale cows and calves.	
Ensure that the granting and renewal of commercial operations licences and leases in relation to marine park access and wildlife interaction is consistent with the management plan permitted use table, management targets, Wildlife Conservation (close season) Notices and any other conditions developed for Lalang-garram / Camden Sound Marine Park.	
Control access to sites that Traditional Owners consider unsuitable for visitation through the commercial tour operator licence system in collaboration with Traditional Owners.	
Apply strict commercial tour operator conditions to ensure culturally sensitive and appropriate visitation to approved cultural heritage sites and traditional country in collaboration with Traditional Owners.	
Ensure licence conditions for commercial tour vessels engaged in whale watching consistently include a requirement for operators to collect basic information on whale position and behaviour to assist humpback whale research and monitoring.	
Consider the restriction of access to localised high-use humpback whale calving and nursing areas by vessel or aircraft if humpbacks are found to be sensitive to these activities.	
Restrict access to seaplane landings in the special purpose zone (whale conservation) between June and November unless absolutely necessary for safety reasons.	
Develop and implement new management arrangements for visitor access, which will include considering restriction of foot access to Montgomery Reef.	
Develop information to ensure that visitors are aware of the cultural values of the marine park and are aware of cultural laws and protocols regarding visitor risk and safety.	
Ensure the granting and renewals of licences and leases relating to pearling operations within the marine park is consistent with the management plan permitted use table and management targets.	

Management actions/ strategies	Compliance with management plan
Ensure the granting and renewal of authorisations for commercial fishing operations within the marine park is consistent with the management plan permitted use table and management targets.	
Ensure the authorisation of maritime developments within the marine park is consistent with the management plan permitted use table and management targets.	
Consult as necessary in regard to the issuing and renewal of licences, leases and permits under the WC Act, CALM Regulations, FRM Act and Pearling Act.	
Advise commercial tour operators that it is prohibited to disturb sites protected under the Maritime Archaeological Act 1973, Historic Shipwrecks Act 1976 and Aboriginal Heritage Act 1976.	
Establish and maintain a quantitative and qualitative spatial database of human use within the marine park.	
Ensure the implementation of EPBC Act Policy Statement 2.1 – Interaction between offshore seismic exploration and whales (Australian Government 2008a) within and adjacent to the marine park.	
Prepare a mooring and anchoring plan	
Implement and administer the mooring and anchoring plan.	
Conduct periodic visitor risk assessments in the marine park as required and mitigate identified issues.	
Facilitate training that enhances knowledge of maritime and terrestrial heritage site management.	
Ensure appropriate liaison regarding the introduction or maintenance of navigation infrastructure within the marine park.	
Develop and implement codes of practice as necessary to ensure responsible use of the marine park.	
To foster a high level of community understanding and appreciation of the marine park's values, as well as support for management.	
Develop an education and interpretation plan designed to raise awareness and stewardship of the importance of ecological, cultural and social values (especially those identified with management targets that form the key performance indicators), with emphasis on humpback whales; appropriate behaviours within zones to reduce human impacts and ensure public safety.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement the education and interpretation plan, including delivery of interpretive materials and presentations to the community, commercial tour operators and businesses with an interest in the marine park.	
Collaboratively develop and implement education and interpretation programs, where culturally appropriate, to raise awareness and knowledge of visitors to the marine park about Aboriginal connections with the marine and coastal environment and areas of cultural significance.	
Provide education and interpretive information about the marine park's values and management arrangements to fishing, boat and yacht clubs operating in Broome, Derby, Wyndham and Darwin.	

Management actions/ strategies	Compliance with management plan
To have meaningful public participation in the management of the marine park.	
Prepare and implement a public participation plan that encourages involvement in management through a range of opportunities.	No impacts.
Facilitate public participation in the management of the marine park through appropriate engagement mechanisms.	
Maintain a database of public participation.	
To have a high level of compliance with management arrangements specified for the marine park.	
Develop and implement a collaborative patrol and enforcement plan. a. Facilitate cross-authorisation of enforcement officers as appropriate. b. Monitor compliance with the Wildlife Conservation (close season for humpback cows and calves) Notice within the special purpose zone (whale conservation) and sanctuary zones. c. Ensure the implementation of the Strategy for the Management of Sewage Discharge from Vessels into the Marine Environment (Department for Planning and Infrastructure 2004) and thereby prohibit the discharge of sewage from vessels in the sanctuary zone, in all areas within 500 metres of the shore and in Kuri Bay, Camden Harbour, Sampson Inlet, St George Basin, Prince Regent River, and 'The River' at Montgomery Reef. d. Promote the management plan among commercial tour operators and visitors to inform them about their responsibilities and encourage them to voluntarily report any inappropriate or unlawful activity. e. Ensure marine park visitors obtain and comply with appropriate regulations, licences and permits. f. Maintain a database of compliance statistics and issues for management assessment. g. Patrol the shoreline and waters of the marine park for marine debris and remove as necessary.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To implement a collaborative and cost-effective research program to improve knowledge and understanding of humpback whales, other important ecological values, cultural heritage and human use in the marine park.	
In consultation with Traditional Owners prepare a collaborative marine research plan. Ensure the research plan utilises existing traditional ecological knowledge and cutural values, includes further research on indigenous cultural values and integrates research on TEK and cultural values with Western science programs.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Ensure that all research projects undertaken by or on behalf of DPaW comply with DPaW's Science Policy (No. 78) and associated guidelines.	
Establish habitat mapping and characterisation for the marine park to support management and the five-year review.	
Ensure the marine research plan addresses key gaps in knowledge for threatened species and species of special conservation significance with management targets that form key performance indicators.	

Management actions/ strategies	Compliance with management plan
In consultation with Traditional Owners, develop protocols to ensure the research plan and any research undertaken in the marine park is culturally appropriate and that information shared by Traditional Owners is used in a culturally appropriate manner. Research partnerships between research scientists and Traditional Owners should be accompanied by a research agreement.	
Ensure the granting and renewal of permits relating to scientific research is consistent with the management plan permitted use table, management targets, cultural protocols and Wildlife Conservation (close season) Notices as appropriate	
Undertake further research to assist with a five-year review of the adequacy of management arrangements in the marine park, particularly with regard to humpback whales and the special purpose zone (whale conservation) and the adequacy of the zoning scheme for habitat and species representativeness and protection, including St George Basin.	
Spatially and qualitatively characterise the use of the marine park by humpback whales, including the identification of high-use humpback whale calving and nursing areas.	
Consider and use information from cultural mapping projects initiated by Traditional Owners and use it to help inform management actions and responses in relation to Aboriginal cultural and heritage values.	
Spatially and qualitatively characterise human use of the marine park by recreational and commercial users.	
Investigate the extent and significance of interactions between commercial fishing and humpback whales and other specially protected species.	
Ensure outcomes from the research program are incorporated into adaptive marine park management, as well as planning and policy programs.	
Implement research components of the Humpback whale recovery plan (Australian Government 2005) and other relevant species conservation plans/strategies with respect to the marine park.	
Maintain a database of ecological and socio-economic research relevant to management.	
Provide logistical and financial support to researchers where possible.	
To implement a collaborative and cost-effective marine monitoring program to provide for adaptive management and to inform assessment of management effectiveness within the marine park.	
Prepare a collaborative and cost-effective marine monitoring plan. Ensure the marine monitoring plan uses existing traditional ecological knowledge.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described
Ensure that all monitoring activities undertaken by or on behalf of DPaW comply with DPaW's Science Policy (No. 78) and associated guidelines.	

Management actions/ strategies	Compliance with management plan
Progressively implement the marine monitoring plan with a primary focus on determining if management targets have been achieved for key performance indicators.	in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement monitoring components of the Humpback whale recovery plan (Australian Government 2005), and other relevant species conservation plans/strategies with respect to the marine park.	
Ensure an appropriate level of monitoring is undertaken by developers operating with approval in or adjacent to the marine park.	
Consider the potential implications of climate change when developing a marine monitoring program.	
Develop and apply management targets to ecological values identified through the research program.	
In partnership with Traditional Owner rangers, develop and implement an ongoing turtle and dugong monitoring program.	
Develop and apply management targets for human values and uses.	
Ensure biosecurity issues are considered during the development of the marine monitoring plan.	

Assessment of the Beehive-1 exploration drilling LoWC spill risk against the Rowley Shoals Marine Park Management Plan 2007-2017 (WA Department of Environment and Conservation, 2007)

The following information summarises the probabilities of exposure (%) to the Rowley Shoals Marine Park based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Rowley Shoals MP	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	1	-	-	-	-	-
Dissolved – 0-10 m below sea surface	-	-	-	3	-	-	2	1	-
Entrained – 0-10 m below sea surface	7		-	10		4	2		2

Management actions/ strategies	Compliance with management plan
To ensure that a fair and equitable zoning scheme is implemented within the park within 6 months of the release of the management plan.	
Gazette appropriate notices under the CALM Act and FRM Act to implement the zoning scheme.	No impacts.
Inform visitors about the types of zones, reasons for and restrictions on activities in the Marine Park using signage, information manuals and education programs.	
Develop and implement procedures to ensure coordination between Government agencies and stakeholders to maximise efficiency and effectiveness of surveillance and enforcement activities.	
Gazette the Marine Park as a mooring control area and seek appointment as the controlling authority within one year of gazettal.	
Develop Codes of Practice for marine based industries and recreational sectors, where necessary.	
To enhance community understanding of and support for the park through education and interpretation programs and active participation in ongoing management.	
Develop and implement, in collaboration with DoF, other relevant agencies and commercial operators, a marine education program to ensure Park users are aware of and understand the values of the park, management zones and regulations, and the reasons for these controls.	No impacts.
Develop and distribute to the community and visitors a range of education materials about the Marine Park's values, pressures on these values, management strategies and targets, as well as marine conservation more broadly.	
Assist the fishing, tourism, charter and other key sectors to access and deliver marine information courses/materials to their staff or patrons.	
To facilitate on-going community participation in the management of the park.	

Management actions/ strategies	Compliance with management plan
Establish and maintain a MAC, or other appropriate mechanism to facilitate community input into the ongoing management of the park.	No impacts.
Encourage charter industry involvement in education and interpretation programs.	
Encourage charter industry involvement in monitoring programs.	
To maximise public compliance with regulations related to the ongoing management of the park.	
Facilitate cross authorisation of Government enforcement officers as appropriate.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Develop and implement procedures to ensure coordination between Government agencies to maximise efficiency and effectiveness of patrol and enforcement activities.	
Develop and implement a surveillance and enforcement program, in collaboration with DoF, to ensure an adequate level of compliance with zoning restrictions.	
Assess the suitability and, if appropriate implement remote surveillance technology.	
Implement education strategies outlined in this plan to support compliance activities.	
Develop a MOU between DEC and CoastWatch in regard to maintaining regular surveillance flights and reporting for the Rowley Shoals Marine Park.	
Monitor illegal fishing activities by crews of foreign fishing vessels (CoastWatch).	
Develop and maintain a database of incidences of illegal fishing and species taken by crews of foreign fishing vessels.	
Investigate opportunities for appointment of honorary enforcement officers.	
To remediate existing human impacts on the ecological and social values of the park. To provide visitor facilities that enhance visitor enjoyment of and minimise environmental impact to, the Park. To take reasonable steps to minimise visitor risk where possible in the park	
Undertake triennial assessment to identify areas of human impact in the park, assess rehabilitation options and, where appropriate, implement these measures.	No impacts.
Undertake a triennial risk assessment of human use patterns and trends in the park, and where changes in use have potential to cause environmental impacts, assess preventative options and where appropriate, implement these measures.	
Undertake a triennial assessment of visitor risk in the park and, where necessary, implement appropriate measures to minimise visitor risk.	
To obtain an appropriate understanding of the biodiversity and key ecological and social processes within the park. To promote ecological and social research in the Park that improves knowledge of the Park and the technical basis for management decisions	

Management actions/ strategies	Compliance with management plan
Develop and progressively implement a coordinated and prioritised research program focused on key values and processes of the park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Develop and maintain detailed habitat and wildlife distribution maps for the park.	
Develop and maintain a database of human usage in the park.	
Identify, prioritise and communicate high priority ecological and social research projects relevant to the management of the park to appropriate research organisations, via a strategic research plan with the aim of maximising priority research outcomes for the park.	
Develop and maintain a database of historical and current research in the park.	
Facilitate ecological and social research in the park conducted by research, academic and educational institutions, by providing financial and logistical assistance (where possible).	
To determine the status and trends in the condition of, and threats to, the ecological values and the effectiveness of management responses in the reserves. To provide the necessary information for the MPRA and DEC audit function. To promote ecological and social monitoring in the park that can detect changes to the ecological values and aid management decisions.	
Develop and progressively implement an integrated and prioritised ecological and social monitoring program for the Park, with a particular emphasis on MPRA and DEC audit requirements.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Ensure that proponents of development proposals or activities with the potential to impact on the Park's values conduct appropriate compliance monitoring programs.	
Encourage Commonwealth marine research agencies to continue with long-term reference sites to better understand natural variability and key ecological processes (e.g. recruitment, herbivory etc) in the reserves.	

Limits of acceptable change for the Ord River Floodplain Ramsar Site from the Ecological Character Description (Department of Environment and Conservation, 2008)

Limits of acceptable change
Hydrology
Wet season flows sufficient to provide: 4 or more spells over 125 m 3 /s, 2 or more spells over 200 m 3 /s and at least one over 300 m 3 /s. Total annual durations of at least 10, five and one day(s) for 125 m3 /s, 200 m3 /s and 300 m3 /s spells respectively.
Data deficient, however connectivity between Parry Lagoons and the estuary every 3 – 5 years is optimum for maintaining ecological character. Data deficient – baseline must be established before limits can be set. However annual inundation is essential.
Nutrients
Median nutrient concentrations within the Ord Estuary and Parry Lagoons of: < 50 g/L nitrate-nitrite and < 20 g/L phosphate. To be revised when further data becomes available.
Dissolved oxygen
Dissolved oxygen concentrations in the estuary no less than 90% saturation.
Salinity
Salinity during the dry season in the Estuary and False mouths of the Ord to average 30 – 35 ppt.
Annual median salinity in Parry Lagoons < 1ppt.
Toxicants
Atrazine < 0.7 g/L Endosulphan < 0.03 g/L.
Phytoplankton
Annual median chlorophyll a concentrations 10 – 15 g/L (Note this is an estimate based on limited data and should be reviewed with additional monitoring).
Mangrove
Mangrove extent > 26,000 ha Mangrove species 14 No significant change in mangrove distribution and zonation.
Sedge/grassland
Current extent and community composition not known - baseline must be established before quantitative limits can be made No significant change in community composition or extent.
Aquatic vegetation
Current extent and community composition not known - baseline must be established before quantitative limits can be made No significant change in community composition or extent.
Invertebrates

Limits of acceptable change
Insufficient information to set a baseline - baseline must be established before quantitative limits can be made No significant change in community composition or abundance.
Fish
Insufficient information to set a baseline with the possible exception of barramundi and Threadfin Salmon based on commercial fishing data. However, total catch of Barramundi has decreased substantially since the time of listing (Fisheries WA 2003 – 2007), - Baseline must be established before quantitative limits can be made No significant change in community composition or abundance.
Significant species such as the Freshwater Sawfish, Green Sawfish and Northern River Shark require additional protection. However, without population estimates, quantitative limits are difficult to set. - baseline must be established before quantitative limits can be made.
Wetland dependent birds
LAC set based on Ramsar criteria and reason for listing In a majority of the years in which the Parry Floodplain Wetlands is extensively inundated, the system supports: • 20,000 waterbirds substantial numbers of migratory shorebirds • substantial breeding by waterbirds • large numbers of Plumed Whistling-Duck and Little Curlew • at least occasional (1 in 20 year) occurrence of Australian Painted Snipe provided that appropriately frequent, systematic and comprehensive surveys of waterbirds have been conducted at these times.
Crocodiles
No significant change in mean populations for each of these species Mean population estimates for the Saltwater Crocodile = 80 and Freshwater Crocodile = 400 in the lower Ord River.

Assessment of the Beehive-1 exploration drilling LoWC spill risk against the Lalang-gaddam Marine Park Joint Management Plan 98 2022 (DBCA, 2022)

The following information summarises the probabilities of exposure (%) to the Lalang-gaddam Marine Park based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Lalang-garram / Camden Sound marine park	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	-	-	-	2	-	-	-	-	-
Dissolved – 0-10 m below sea surface	6	1	-	9	2	-	3	1	-
Entrained – 0-10 m below sea surface	17		9	36		15	19		5

Wyndham - East Kimberley Nearshore Waters	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Shoreline	78	70	41	83	79	30	99	93	23
Sea Surface	70	2	-	77	-	-	93	-	-
Dissolved – 0-10 m below sea surface	61	49	27	79	68	40	97	95	82
Entrained – 0-10 m below sea surface	82		62	86		72	97		97

Derby-West Kimberley Shoreline Sector	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Shoreline	2	-	-	2	-	-	-	-	-
Entrained – 0-10 m below sea surface	8		-	13		1	5		-

Dissolved – 0-10 m below sea surface	5	-	-	4	-	-	3	-	-
Entrained – 0-10 m below sea surface	15		8	35		15	12		5

Cockell and Nicolle Reefs Receptor	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Entrained – 0-10 m below sea surface	9		-	11		-	4		1

Management actions/ strategies	Compliance with management plan
To ensure that cultural laws and protocols are understood and respected in the marine park	
Ensure marine park management is consistent with cultural laws and protocols.	No impacts
Support Dambeemangarddee people to visit their Sea Country with younger generations to enable crossgenerational exchange of information and maintain connection to country within the Dambeemangarddee community.	
Support Dambeemangarddee people to undertake cultural planning to record the culture and heritage values of the park and inform management.	
Support DAC to ensure visitors, government employees and/or contractors working in the marine park are aware of cultural laws and protocols by developing and implementing cultural awareness communication tools, training and materials.	
Monitor the level of satisfaction of Dambeemangarddee Traditional Owners that they have been able to maintain connection to country.	
To support DAC to increase Dambeemangarddee's involvement in the day-to-day management and operation of the marine park to enhance Dambeemangarddee's ability to look after country and keep it healthy. To conserve and protect sites of cultural significance	
Continue to support DAC to explore and implement tailored training, education and mentoring to fulfil positions of employment relating to the management of the marine park.	No impacts
Support DAC to build their capacity in the management of the marine park and work collaboratively to develop succession plans, career pathways and support networks.	

Management actions/ strategies	Compliance with management plan
Support DAC to review and adapt operational staff structures to be able to undertake a greater role in the day-to-day park management.	
Support DAC to secure long term funding for positions of employment by Dambeemangarddee people relating to the marine park.	
Monitor the level of satisfaction of Dambeemangarddee Traditional Owner's that they have been able to undertake their role as protectors and managers of country and culture in the context of the jointly managed marine park.	
In collaboration with Dambeemangarddee Traditional Owners, develop and apply commercial tour operator licence conditions to ensure culturally sensitive and appropriate visitation to cultural heritage sites.	
Develop and implement tools to measure and monitor effects of visitor and management activities on cultural heritage, sites and ecological values; and implement strategies to address issues where appropriate.	
Work with Dambeemangarddee people and commercial operators to promote culturally appropriate visitation.	
Support Dambeemangarddee to develop protocols for visitors to Dambeemangarddee Sea Country and educate visitors about appropriate behaviour, respecting privacy and access restrictions where applicable.	
Consider information from cultural mapping projects initiated by Traditional Owners and utilise this to help inform management actions and responses in relation to Aboriginal cultural and heritage values.	
To apply language and traditional knowledge and integrate it with conservation science and management of the marine park To maintain oral traditional knowledge	
Undertake and/ or support research to facilitate the systematic recording of oral knowledge by elders and Traditional Owners whilst on-country.	No impacts.
Monitor the level of satisfaction that traditional ecological knowledge is integrated into management of the marine park.	
Investigate opportunities and develop a process to integrate Dambeemangarddee traditional ecological knowledge with contemporary research and monitoring, where appropriate.	
Work with DAC to change formal names of key sites and areas back to their traditional names (e.g. changing Raft Point to Ngumbree) and ensure traditional names are used in signage, education material, documents, maps and when naming facilities relating to the marine park.	
Support and undertake research to better understand Dambeemangarddee traditional knowledge applicable to the marine park.	
To uphold Traditional Owner connection to country including spiritual and cultural values and customary use.	

Management actions/ strategies	Compliance with management plan
Support Dambeemangarddee people to continue to carry out customary activities, including customary fishing and hunting, in the marine park.	No impacts.
Support Dambeemangarddee people to manage sustainable populations of marine wildlife (e.g. julawaddaa (turtle), waliny (dugongs), sharks, rays etc.).	
Work with Dambeemangarddee people to ensure that monitoring programs provide information to facilitate the development and implementation of sustainable management arrangements for customary take.	
Monitor the level of satisfaction of Dambeemangarddee people that they have been able to continue customary practices and benefit from country consistent with the purpose of the marine park.	
Develop mechanisms to feedback information to the Dambeemangarddee Community on the health of customary hunted animals such as jaiya (fish), julawaddaa (turtles) and waliny (dugongs) to support cultural and marine management decisions and facilitate the development and implementation of sustainable management arrangements for customary hunting.	
To ensure that the seabed structural complexity, geomorphic processes and coastal landforms are not significantly impacted by human activities within the marine park	
Ensure that coastal infrastructure and resource development proposals for the area that have the potential to disturb the geomorphology of the marine park are appropriately assessed in accordance with the Environment Protection Act 1986 (EP Act).	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of geomorphology and the pressures acting on it within the marine park.	
Undertake and/ or support research to characterise the geomorphic features and processes in the marine park and their associated ecological functions.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of geomorphology.	
To ensure that water and sediment quality is not significantly impacted by human activities within the marine park	
Undertake and/or support research on water and sediment quality in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of water and sediment quality within the marine park including establishing baselines for water and sediment variables and identifying the pressures acting on them.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting water and sediment quality.	
Where required, support the development and implementation of Parks and Wildlife's maritime incident response plans, which support the State Emergency Management Plan for Marine Oil Pollution.	
Develop and implement biosecurity, mitigation and detection programs.	

Management actions/ strategies	Compliance with management plan
Investigate and designate suitable areas for vessel sewage discharge and if required, incorporate into education, patrol and enforcement programs to enforce sewage discharge arrangements.	
Work with relevant departments, marine park users and stakeholders to address sources of marine debris and abandoned infrastructure in the marine park to reduce the amount of floating, submerged and beached debris and pollution entering the marine park.	
As part of on-country work, patrol the shoreline and waters of the marine park for marine debris and remove and record as necessary and seek support of partners and marine park users to do the same.	
To ensure that waddaroo (coral reef) communities are not significantly impacted by reef walking and other human activities within the marine park.	
Monitor the condition of waddaroo communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement management strategies to mitigate or stop any human activities within the marine park which are negatively impacting the condition of waddaroo communities.	
Regulate foot access to intertidal areas considered unsuitable for visitation e.g. intertidal waddaroo reefs (through commercial operator licences, by regulation or other mechanisms as relevant).	
Undertake and/or support research into waddaroo communities in the marine park.	
To ensure the diversity, abundance and health of julum and jirdarm communities are not significantly impacted by human activities within the marine park.	
Implement management strategies to mitigate or stop human activities within the marine park which are negatively impacting the condition of julum and jirdarm communities in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of julum and jirdarm communities and the pressures acting on them within the marine park.	
Undertake and/or support research on the characterisations of the diversity, density, abundance, and distribution of julum and jirdarm communities in the marine park.	
To ensure that jindirm and galow communities are not significantly impacted by human activities in the marine park.	
Monitor the condition of jindirm and galow communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement management strategies to mitigate or stop human activities in the marine park which are negatively impacting the condition of jindirm and galow communities in the marine park.	
Undertake and / or support research to characterise the diversity, density, abundance, and distribution of jindirm and galow communities in the marine park.	

Management actions/ strategies	Compliance with management plan
To ensure that filter feeding communities are not significantly impacted by human activities within the marine park.	
Monitor the condition of subtidal filter feeding communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are impacting the condition of geomorphology.	
Undertake and /or support research to characterise the diversity, density, abundance, and distribution of filter feeding communities in the marine park.	
To ensure that sand and mudflat communities are not significantly impacted by human activities within the marine park.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of intertidal sand and mudflat communities.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of intertidal sand and mudflat communities and the pressures acting on them within the marine park.	
Undertake and/or support research to characterise the diversity and community composition of intertidal sand and mudflat communities in the marine park.	
To ensure julawaddaa are not significantly disturbed by human activities occurring within and immediately adjacent to the marine park. To manage customary harvesting of julawaddaa for cultural and ecological sustainability.	
Monitor the condition of julawaddaa and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement management strategies to mitigate or stop any impacts from human activities or predators within the marine park which are negatively impacting on the condition of julawaddaa.	
Ensure that management of julawaddaa in the marine park aligns with relevant international and regional agreements (e.g. Convention of Migratory Species of Wild Animals and MoU on the Conservation and Management of Marine Turtles and their Habitats of Indian Ocean and South-East Asia).	
Refer to customary hunting strategies (section 6.4) to develop sustainable management arrangements for customary hunting of julawaddaa.	
Undertake and/or support research to characterise natural variability, movement patterns and critical habitats for julawaddaa within the marine park.	
To ensure non-targeted (those not targeted by recreational and commercial fishers) jaiya, shark and ray species are not significantly impacted by human activities within the marine park. To manage targeted (those targeted by recreational and commercial fishers) jaiya, shark and ray species for cultural and ecological sustainability.	

Management actions/ strategies	Compliance with management plan
Undertake and /or support research to characterise jaiya, shark and ray diversity, abundance, biomass/ size frequency, movement patterns and critical habitats within the marine park and to understand the ecological role of targeted jaiya, species and the consequences of their removal.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of jaiya, shark and rays and the pressures acting on them in the marine park.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of jaiya and sustainability of targeted jaiya.	
To ensure waliny are not significantly impacted by human activities in the marine park. To manage customary harvesting of waliny for cultural and ecological sustainability.	
Undertake and/or support research to characterise natural variability, movement patterns and critical habitats for waliny within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of waliny and the pressures acting on them within the marine park	
Maintain records of the incidence of boat collisions with waliny.	
Refer to customary hunting strategies in section 6.4 to develop sustainable management arrangements for customary hunting of waliny.	
To ensure ngunubange are not significantly impacted by human activities in the marine park.	
Spatially and qualitatively characterise the use of the marine park by humpback whales including the identification of high-use humpback whale calving and nursing areas	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of ngunubange and the pressures acting on them within the marine park	
Implement components of the humpback whale recovery plan (Australian Government 2005) and other relevant species conservation plans/strategies with respect to the marine park.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of ngunubange which could include: • considering the need and options for temporal closures to vessels or vessel speed restrictions during the core ngunubange visitation period in the special purpose zone (whale conservation). • restricting access to localised high-use humpback whale calving and nursing areas by vessel or aircraft if humpback whales are found to be sensitive to these activities [DoT]. • restrict access to seaplane landings in the special purpose zone (whale conservation) between June and November unless absolutely necessary for safety reasons [DBCA, DoT, Civil Aviation Safety Authority].	

Management actions/ strategies	Compliance with management plan
Ensure the implementation of EPBC Act Policy Statement 2.1 – Interaction between offshore seismic exploration and whales (Australian Government 2008a) within and adjacent to the marine park.	
To ensure jigeedany are not significantly impacted by human activities in the marine park.	
Monitor the condition of jigeedany and the pressures acting on them within the marine park	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of jigeedany.	
Undertake research to characterise jigeedany diversity, abundance, natural variability and critical habitats within the marine park.	
To ensure goiyoiya are not significantly impacted by human activities in the marine park.	
Educate users about known and potential distribution of goiyoiya and of the risk of feeding or interacting with them to ensure compliance.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of goiyoiya and the pressures acting on them within the marine park.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of goiyoiya.	
Undertake and/or support research on the abundance and condition of goiyoiya in the marine park.	
To ensure that sea and shore banarddee that inhabit or migrate through the marine park are not significantly impacted by human activities in the marine park.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of sea and shore banarddee.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of sea and shore banarddee and the pressures acting on them within the marine park.	
Undertake and/or support research to characterise the diversity, abundance, natural variability, distribution and habitat requirements of sea and shore banarddee in the marine park.	
To ensure non-targeted (those not targeted by recreational and commercial fishers) invertebrate species are not significantly impacted by human activities within the marine park. To manage targeted invertebrate species (those targeted by recreational and commercial fishers) for cultural and ecological sustainability.	
Monitor the condition of invertebrates and the pressures acting on them in the marine park.	

Management actions/ strategies	Compliance with management plan
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the condition of invertebrates and sustainability targeted invertebrates.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Undertake and/or support research to characterise the diversity, abundance, natural variability, distribution and habitat requirements of invertebrates within the marine park and to understand the ecological role of targeted invertebrate species and the consequences of their removal.	
To promote visitor access to and enjoyment of the marine park while maintaining the outstanding cultural and natural values. To maintain the cultural, ecological and social values of the marine park that are important for nature-based and cultural tourism.	
Work with Dambeemangarddee people and commercial operators to promote culturally appropriate visitation	No impacts.
Implement regulations to restrict or control access to areas within the marine park that are unsuitable for visitation for ecological, cultural or safety reasons (through commercial operator licences, by regulation or other mechanism as relevant).	
Expand the visitor plan to cover the entirety of the Lalang-gaddam Marine Park and prioritise and implement strategies	
Ensure that the granting and renewal of commercial operations licences and leases in relation to marine park access and wildlife interaction is consistent with the plan, permitted use table, management targets and BC Act.	
Undertake a review of shipping activity in the marine park to determine the need for navigational measures such as compulsory pilotage, speed limits and/or designation of shipping routes.	
Develop information to ensure that visitors are aware of the cultural values of the marine park and are aware of cultural laws and protocols regarding visitor risk and safety.	
Ensure that monitoring programs assess the effectiveness of the park's management arrangements for visitor safety and satisfaction and adapt management strategies as required.	
Conduct periodic visitor risk assessments in the marine park as required and mitigate identified issues.	
Establish and maintain a quantitative and qualitative spatial database of human use within the marine park.	
Ensure maritime safety guidelines are followed.	
Facilitate goiyoiya (estuarine crocodile) handling and removal training for relevant departmental staff and Mayala rangers.	
Investigate the need for additional mechanisms to ensure the safety of seaplanes and vessels operating within the marine park.	

Management actions/ strategies	Compliance with management plan
Work with stakeholders to maintain ongoing, safe access for visitors to Garaanngaddim (Horizontal Falls).	
Work with relevant agencies to prepare for and respond to emergencies.	
Assess the need for a mooring and anchoring plan and prepare and implement if necessary.	
If required and appropriate, promote opportunities for sustainable recreation and tourism, including the provision of visitor facilities if required.	
To maintain the ecological values of the marine park that support recreational fishing. To ensure that, in collaboration with the community and DPIRD, recreational fishing is managed in a manner consistent with maintaining the marine park's cultural and ecological values while providing for social uses and enjoyment. To work collaboratively (agencies, stakeholders and community) to maintain and promote quality recreational and customary fishing opportunities in the marine park.	
Through a collaborative approach with Traditional Owners, Recfishwest and recreational fishers, develop fishing regulations for the SPZ (biocultural conservation) which help ensure recreational fishing is culturally appropriate.	No impacts.
Educate recreational fishers on the zoning scheme and any restrictions that may apply to their activities in the marine park.	
Conduct research to determine if ecosystem effects from recreational fishing occur in the marine park and undertake adaptive management actions if required.	
Investigate whether populations of recreationally targeted species are sustainable in the marine park and undertake adaptive management actions if required.	
Monitor spatial and temporal patterns in recreational fishing activity and catch and report the results to DBCA and the Conservation and Parks Commission for the periodic reviews of the implementation of the management plan.	
Identify sites with maritime heritage in the marine park to facilitate long term management. Provide visitor facilities and or interpretive information to enhance visitor enjoyment of, and where appropriate to mitigate or stop impacts on, maritime heritage values in the marine park.	
Advise commercial tour operators that it is prohibited to disturb sites protected under the Maritime Archaeological Act 1973, Historic Shipwrecks Act 1976 and Heritage Act 2018.	No impacts.
Provide information to enhance visitor enjoyment of, and reduce impacts on, European heritage and other maritime sites if required.	
To enable Dambeemangarddee Traditional Owners to realise livelihoods and achieve economic benefits from their Sea Country, consistent with the purpose of the marine park.	

Management actions/ strategies	Compliance with management plan
Identify opportunities to provide employment, business and training for Dambeemangarddee people on-country to help look after country and maintain connection to country.	No impacts.
Work with stakeholders to facilitate Dambeemangarddee employment opportunities in industries such as the tourism industry.	
Encourage and support Dambeemangarddee people to develop business opportunities on country.	
To maintain the ecological values of the marine park which are important to the continuation of commercial fishing industries. To ensure that, in collaboration with the industry and DPIRD, commercial fishing is managed in a manner that is consisted with maintaining the values of the marine park	
Ensure the granting and renewal of authorisations for commercial fishing operations within the marine park are consistent with the plan, permitted use table and management targets.	No impacts.
Educate commercial fishers on the zoning scheme and any restrictions that may apply to their activities in the marine park.	
Work with commercial fishers, through peak stakeholder bodies to ensure operations are conducted in a culturally sensitive manner.	
Monitor commercial fishing catch and effort in the marine park to inform periodic reviews of the implementation of the management plan.	
Implement management strategies to mitigate or stop any significant impacts from commercial fishing activities within the marine park which are negatively impacting the values of the marine park.	
Conduct research to determine if ecosystem effects from commercial fishing occur in the marine park and investigate the extent and significance of interactions between commercial fishing and marine mammals and other protected species and provide information to managers.	
To maintain the ecological values of the marine park which are important to the continuation of a viable aquaculture and pearling industry. To ensure that, in collaboration with the industry and DPIRD, aquaculture and pearling is managed in a manner that is consistent with maintaining the values of the marine park.	
Ensure any boundary revision of the pearling 'transport exempt area' is consistent with the special purpose zone (pearling).	No impacts.
Ensure the granting and renewals of licences and leases relating to pearling and aquaculture operations within the marine park is consistent with the management plan permitted use table and management targets.	
Work with the pearling industry to ensure continued access through the Garaanngaddim (Horizontal Falls) for recreational and commercial vessels.	

Management actions/ strategies	Compliance with management plan
Work with the aquaculture industry to better understand and mitigate the potential impacts of aquaculture on the values of the marine park, particularly regarding risks to the natural stocks of ilerdda (barramundi) in the marine park and report results back to marine park managers.	
To ensure industry and associated activities are managed in a manner consistent with the objectives of the marine park.	
Consider the quality of the remote seascapes of the marine park in site planning and assessment of development proposals.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Provide advice on the assessment, setting of conditions, and monitoring and reporting requirements for mineral, petroleum and pipeline activities consistent with management objectives and management targets for values of the marine park.	
Ensure ongoing access to the marine park for the enjoyment of country and customary practices is considered during any development proposal.	
Ensure an appropriate level of monitoring is undertaken by developers operating with approval in or adjacent to the marine park.	
Develop a memorandum of understanding (MoU) with KPA to ensure complementary management arrangements.	
Ensure the setting of conditions for new developments and operations are consistent with management program objectives and management targets for ecological values.	
Provide formal advice to the Commission and EPA for the environmental assessment of proposed mineral, petroleum and pipeline activities in and adjacent to the marine park.	
Ensure appropriate liaison regarding the introduction or maintenance of navigation infrastructure within the marine park.	
Where mining, petroleum and pipeline activities have been approved, allow access for mining, petroleum and pipeline activities (e.g. ship loading facilities) within the Ganbadba Sanctuary Zone, Traverse Island Special Purpose Zone (recreation and conservation) and general use zones where required.	
To obtain increased understanding of the biodiversity, biocultural and cultural values and key ecological process and socio-economic uses within the marine park to inform management. To promote research that improves knowledge of the values of the marine park to inform management decisions. To maximise the integration of conservation science with traditional knowledge in all aspects of research within the marine park	
In consultation with Dambeemangarddee Traditional Owners prepare a collaborative prioritised marine research plan that: • utilises existing traditional knowledge and cultural values • includes further research on Indigenous cultural values	No impacts.

Management actions/ strategies	Compliance with management plan
• integrates research on traditional knowledge and cultural values with Western science programs; • addresses key gaps in knowledge for ecological values of the marine park, including threatened species and species of special conservation significance.	
Ensure granting and renewal of permits relating to scientific research is consistent with the management plan.	
Spatially and qualitatively characterise human use of the marine park by recreational and commercial users.	
Ensure outcomes from the research plan are used to prepare and implement a coordinated and prioritised long-term monitoring plan and are incorporated into adaptive marine park management.	
Develop scientific and research protocols and partnership agreement frameworks through the JMB that support genuine scientific/research partnerships with DAC.	
Develop and implement protocols to ensure research is culturally appropriate and that information shared by Dambeemangarddee Traditional Owners is used in a culturally appropriate manner.	
Provide opportunities for Dambeemangarddee Traditional Owners including rangers and departmental staff to be involved and trained in research applicable to the management of the marine park.	
Ensure findings of research by external organisations is shared with Dambeemangarddee Traditional Owners, DBCA and DPIRD.	
Joint management partners are the lead for all strategies. Supporting agencies are listed in brackets. If agencies are required to take a lead role, their name is in bold.	
Identify and communicate high priority research projects which address key knowledge gaps to appropriate external organisations and funding bodies.	
Facilitate or support research in the park, including projects by external organisations, by providing assistance where possible.	
Liaise with industry, other government agencies and non-government organisations to access information held on ecological research in the area.	
Investigate mechanisms to work with commercial operators engaged in wildlife viewing to collect basic information e.g. position and behaviour to assist with research and monitoring.	
To monitor key cultural, ecological and social values in the marine park within a 'condition-pressure-management response' framework, to provide knowledge to assess, adapt and improve management.	
Develop and implement a prioritised collaborative and coordinated monitoring program that; assesses the effectiveness of the zoning scheme and management arrangements for protection of the park values, with a focus on condition, pressure and response indicators and metrics for high priority values.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth,

Management actions/ strategies	Compliance with management plan
• assesses the nature, level and potential impacts of pressures (from human activities and external pressures such as climate change), including the provision of early warning of critical changes in pressures on park values. • provides a better understanding of the dynamic nature of undisturbed marine ecosystems as reference points for comparisons with altered environments. • uses traditional knowledge and where possible provides capacity building and employment opportunities for Traditional Owners. • meets Commission requirements for assessing the implementation of the plan.	state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Support Dambeemangarddee People to develop and apply longer term management targets and performance measures for Aboriginal culture and heritage values.	
Provide necessary information and support for assessments of management plan implementation by the Commission.	
Develop and apply management targets to cultural, ecological and socio-economic values identified through the research and monitoring programs.	
Ensure records are kept of any stranded marine fauna.	
To increase understanding of climate change on the marine park and increase the resilience of values to climate change.	
Undertake research to better understand the emerging and predicted impacts of climate change on ecological and biocultural values.	No impacts.
Educate marine park users about the effects of climate change on the values of the marine park and encourage users to reduce their carbon emissions where possible.	
Support international and national climate change initiatives and where possible develop regional and local level adaptive management responses for the protection of park values, informed by research and monitoring outcomes.	
Monitor marine park values and the climate-related pressures acting on them to inform the development of local and regional level adaptive management responses for the protection of park values.	
Assess areas, habitats and species which are most at risk to the effects of climate change and increase their resilience by reducing other pressures where possible.	
To ensure the marine park has appropriate legal, administrative, financial, operational and human resource frameworks in place so that it is effectively jointly managed in partnership with Dambeemangarddee Traditional Owners and in a collaborative setting with other agencies	
Implement all legal provisions necessary to establish and jointly manage the marine park, including registration of ILUAs; execution of JMAs; reservation of intertidal areas within the marine park; gazettal of a CALM Act classified waters notice; and FRM Act fisheries management orders.	No impacts.

Management actions/ strategies	Compliance with management plan
Work with DAC and Dambeemangarddee Traditional Owners to develop commercial tour operator licence conditions to manage access in special purpose zones (cultural protection) to ensure activities including fishing is compatible with the purpose of protecting the value of the land and waters to the culture and heritage of Traditional Owners.	
Develop and implement joint collaborative operational plans.	
Ensure the objectives detailed in the JMAs are applied to all management activities in the marine park	
Develop and maintain appropriate staff structures and operational equipment, including vessels and infrastructure to implement the plan and JMA effectively.	
In accordance with DPIRD's responsibilities under the FRM Act, Pearling Act 1990, and ARM Act (when implemented), develop a framework for DPIRDs involvement in the joint management of the marine park including mechanisms for DPIRD to attend JMB meetings.	
Consult as necessary in regard to the issuing and renewal of licences, leases and permits under the BC Act, CALM Regulations, FRM Act and Pearling Act 1990.	
Where possible, work with neighbouring land and water managers to reduce environmental impacts on marine park values such as regulating sewage discharge.	
Develop induction materials for new JMB members and DBCA staff to acquaint them with the marine park and the role of the JMB.	
Develop and implement a monitoring and evaluation framework to assess joint management effectiveness for the marine park.	
Provide licences and permits with appropriate conditions where required.	
Undertake and/or support feasibility studies for establishing and using seasonal land-based camps for marine park operations.	
Undertake a five-year review (within five years of the date of the CALM Act s62 classified waters notice for the amalgamated parks) of the adequacy of management arrangements, including the zoning scheme, for the marine park.	
DPIRD to provide advice to the JMB and attend meetings as required.	
To enhance community understanding of and support for the marine park and achieve a high level of compliance with regulations, permitted uses and other management arrangements within the marine park.	
Develop and implement a collaborative education and compliance program to maximise compliance with the management plan and to encourage tour operators, visitors on private vessels and commercial fishing, pearling and mining operators to report any inappropriate or unlawful activity.	No impacts.

Management actions/ strategies	Compliance with management plan
Monitor, promote and enforce compliance with fisheries and marine park legislation, including illegal foreign fishing.	
Collaboratively develop and implement an education and interpretation plan to raise awareness and stewardship of the marine park which includes: • information on ecological and cultural values • information on cultural protocols • the zoning and other management arrangements • the condition of the park • safety and any relevant regulations, policies and guidelines relating to management.	
Ensure marine park users, including commercial operators, are aware of and comply with relevant legislation for the protection of marine mammal and other wildlife interaction policies and guidelines.	
Facilitate cross-authorisation of enforcement officers as appropriate including training Dambeemangarddee Rangers in CALM Act compliance with the intention of obtaining the status of honorary enforcement officers pursuant to the CALM Act.	
Facilitate training of Dambeemangarddee rangers in FRM Act compliance, to enable Dambeemangarddee rangers to engage in DPIRD compliance activities.	
Ensure marine park visitors obtain and comply with appropriate regulations, licences and permits.	
Maintain a database of compliance statistics and adapt management strategies to address any noncompliance issues.	
Develop and implement codes of practice as necessary to ensure responsible use of the marine park.	
Install and maintain zone markers and educational signage for the marine park where appropriate.	
Promote the plan among commercial tour operators and visitors to inform them about their responsibilities and encourage them to voluntarily report any inappropriate or unlawful activity.	
Noting remoteness of the marine park, when opportunities arise, facilitate public participation in the management of the marine park, and maintain a database of public participation.	
To assess and evaluate management effectiveness.	
Develop and implement a performance assessment process that is consistent with DBCA and Commission policy and ensure results are reported back to the Dambeemangarddee Community.	No impacts.
Provide necessary information and support for the performance assessment process.	
Support the JMB and DAC to conduct periodic reviews of the effectiveness of plan implementation in meeting cultural, capacity building and other priority objectives.	

Assessment of the Beehive-1 exploration drilling LoWC spill risk against Mayala Marine Park Management Plan 2022 (DBCA, 2022)

The following information summarises the probabilities of exposure (%) to the Mayala Marine Park based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Derby-West Kimberley Shoreline Sector	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Shoreline	2	-	-	2	-	-	-	-	-
Entrained – 0-10 m below sea surface	8		-	13		1	5		-

Broome Shoreline Sector	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Shoreline	1	-	-	-	-	-	1	-	-
Entrained – 0-10 m below sea surface	2		-	7		-	1		-

Bathurst Island Nearshore waters	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Sea surface	1	-	-	-	-	-	-	-	-
Shoreline	4	3	-	-	-	-	-	-	-
Dissolved – 0-10 m below sea surface	6	2	-	-	-	-	-	-	-
Entrained – 0-10 m below sea surface	20		12	-		-	-		-

Management actions/ strategies	Compliance with management plan
To uphold Mayala's connection to Country and promote economic opportunities. To promote increased understanding and respect for Mayala living cultural landscape and concepts of the marine park.	
Support Mayala people to visit their saltwater Country to maintain their connection to Country, through on-country trips, employment and enterprise development.	No impacts.
Support Mayala to develop and implement cultural awareness communication tools, emphasising the importance of cultural and heritage values for both Traditional Owners and the wider community.	
Design and develop management tools to address the impacts of human activities that may prevent cultural fulfilment to uphold Traditional Owner cultural rights and obligations.	
Support Mayala to define a framework to ensure the right cultural processes are used for assessment and approval of proposals in the marine park.	
Assess and monitor human activities that impact on the continuity of cultural fulfilment and upholding the cultural rights and obligations to continue the enjoyment of Country.	
Develop cultural awareness training material and implement training for government employees and / or contractors working in the marine park.	
Support Mayala to develop protocols for visitors on Mayala Country and educate visitors about appropriate behaviour, respecting privacy and access restrictions where applicable.	
To facilitate and maintain the opportunity for Mayala people to care for Country and keep it healthy so that future generations can continue to experience Country. To conserve and protect sites of cultural significance.	
Ensure marine park management is consistent with cultural laws and protocols.	No impacts.
Ensure Elders and younger generations are involved in the management of the marine park	
Support Mayala MIAC to establish on-country ranger teams, bases and outposts.	
Work with Mayala people to conduct a mapping exercise to document Mayala Sea Country and intertidal zones to assist other management programs (and share where appropriate).	
Work with Mayala people to conduct a mapping exercise to document Mayala Sea Country and intertidal zones to assist other management programs (and share where appropriate).	
Develop and implement tools to measure and monitor effects of visitor and management activities on cultural heritage values and sites and implement strategies to address issues where appropriate.	
In collaboration with Mayala Traditional Owners, develop and apply commercial operator licence conditions to ensure culturally sensitive and appropriate visitation in the marine park especially for cultural heritage sites.	

Management actions/ strategies	Compliance with management plan
Implement regulations to restrict or control access to areas within the marine park that Mayala Traditional Owners consider unsuitable for visitation (through commercial operator licences, by regulation or other mechanism as relevant).	
Support MIAC to explore and implement, tailored training, education and mentoring to enable Mayala people to fulfil positions of employment relating to the management of the marine park.	
Assess the use and condition of cultural sites and implement further strategies to improve the spiritual and physical condition of them where possible.	
Support Mayala MIAC to communicate and regulate protocols for access to Mayala islands.	
Ensure cultural heritage sites in the marine park are protected, particularly significant and sensitive sites at risk.	
Support MIAC to build their capacity in the management of the marine park and work collaboratively to develop succession plans, career pathways and support networks.	
Develop a transition plan to build Mayala's capacity to take on management of the ranger team and conduct periodic reviews of progress.	
To apply language and traditional knowledge and integrate it with conservation science, management and in education about the marine park. To assist in waking up Oowini language.	
Where possible use Mayala and Bardi languages for place names, in signage, educational material, reporting and when naming facilities.	No impacts.
Continue to support the transfer of traditional knowledge through on country learning opportunities, including supporting Mayala people to visit their saltwater country with younger generations to support cross-generational exchange of information.	
Undertake and support research to gain a better understanding of Mayala traditional knowledge applicable to the marine park.	
Investigate opportunities and develop a process for integrating Mayala traditional knowledge, and knowledge holders, into marine park management.	
Recognition of and support for the right of Mayala people to continue customary practices and to benefit from their Country, consistent with the purpose of the marine park.	
Support Mayala people to continue to carry out customary activities, including customary fishing and hunting, in the marine park.	No impacts.

Management actions/ strategies	Compliance with management plan
As part of the education and interpretation plan develop mechanisms to inform users of the marine park about Mayala rights, as the recognised Traditional Owners, to enjoy Mayala Country and maintain their customary practices.	
Work with Mayala people and other Traditional Owner groups to develop sustainable management arrangements for customary hunting of marine wildlife (e.g. Goorlil (turtles), odorr (dugongs), joorroo (sharks) and barnamb (rays) etc.) and develop a customary fishing/ hunting guide.	
Develop mechanisms to feedback information from research and monitoring programs to the Mayala Community on the condition of customary hunted animals such as goorlil (turtles) and odorr (dugongs), to support cultural and marine management decisions and facilitate the development and implementation of sustainable management arrangements for customary hunting.	
To ensure that marrgoorr (coral) and marnany (reef) communities are not significantly impacted by reef walking and other human activities within the marine park	
Undertake and/or support research to characterise the diversity and condition of marrgoorr (coral) and marnany (reef) communities in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of marrgoorr (coral) and marnany (reef) communities and the pressures acting on them in the marine park.	
Regulate foot access to intertidal marnany (reef) and other areas unsuitable for visitation (through commercial operator licence conditions, by regulation or other mechanisms as relevant).	
Educate users of the reserves about the ecological importance of marrgoorr (coral) and marnany (reef) communities and the potential detrimental effects of in discriminant marnany (reef) walking, collecting, anchoring and boating activities on communities.	
To ensure mangrove communities are not significantly impacted by human activities in the marine park.	
Undertake and/or support research to characterise the diversity, density, abundance and distribution of mangrove communities in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of mangrove communities and the pressures acting on them within the marine park.	
Educate users of the important ecological role of mangrove communities and the potential impacts of human activities, particularly vessel wash on these communities.	
To ensure the diversity, abundance and condition of noomool (seagrass) and laanyji (macroalgae) communities are not significantly impacted by human activities within the marine park.	

Management actions/ strategies	Compliance with management plan
Undertake and/or support research to characterise the diversity, abundance and distribution of noomool (seagrass) and laanyji (algae) communities in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Monitor the condition of noomool (seagrass) and laanyji (macroalgae) communities and the pressures acting on them within the marine park.	
Educate users of the important ecological role of noomool (seagrass) and laanyji (macroalgae) communities and the potential impacts of human activities, particularly vessel mooring, and nutrient and pollution inputs on these communities.	
To ensure that water and sediment quality are not significantly impacted by human activities in the marine park.	
Develop and implement a biosecurity, mitigation and monitoring program.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Undertake and/or support research on water and sediment quality in the marine park, including establishing baselines for water and sediment quality variables.	
Monitor the condition of water and sediment quality within the marine park and the pressures acting on it.	
Designate areas for vessel sewage discharge and incorporate into education, patrol and enforcement programs to enforce sewage discharge arrangements.	
As part of on-Country work, patrol the shoreline and waters of the marine park for marine debris and remove and record as necessary, and seek support of partners and marine park users to do the same.	No impacts.
Work with relevant departments, marine park users and stakeholders to address sources of marine debris and abandoned infrastructure in the marine park to reduce the amount of floating, submerged and beached debris and pollution entering the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Map the areas of the marine park that are highly sensitive to oil and chemical spills and ensure that this information is accessible to the State Marine Oil Pollution Coordination Group.	
Educate users of the importance of good water and sediment quality, and the potential impacts human activities, particularly nutrient and pollution inputs can have on these communities.	No impacts.
To ensure that the seabed structural complexity, geomorphic processes and coastal landforms are not significantly impacted by human activities within the marine park.	
Undertake and/ or support research to characterise the geomorphic features and processes in the marine park and their associated ecological functions.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth,
Monitor the condition of geomorphology and the pressures acting on it within the marine park	

Management actions/ strategies	Compliance with management plan
Ensure that coastal infrastructure and resource development proposals for the area that have the potential to disturb the geomorphology of the marine park are appropriately assessed in accordance with the EP Act.	state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure that filter feeding communities are not significantly impacted by human activities within the marine park.	
Undertake and support research to characterise the diversity, density, abundance and distribution of filter feeding communities in the marine park.	No impacts.
Educate users of the important ecological role of subtidal filter feed communities and the potential impacts that human activities can have on these communities.	
Monitor the condition of subtidal filter feeding communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure that intertidal sand and mudflat communities are not significantly impacted by human activities within the marine park.	
Undertake and/or support research to characterise the diversity, community composition and condition of intertidal sand and mudflat communities in the marine park.	No impacts.
Monitor the condition of intertidal sand and mudflat communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users of the important ecological role of subtidal filter feed communities and the potential impacts that human activities can have on these communities.	No impacts.
To ensure goorlil are not significantly disturbed by human activities occurring within and on the boundary of the marine park To manage customary harvesting of goorlil for cultural and ecological sustainability**.**	

Management actions/ strategies	Compliance with management plan
Ensure that management of goorlil in the marine park supports relevant international and regional agreements (e.g. Convention of Migratory Species of Wild Animals and MoU on the Conservation and Management of Marine Turtles and their Habitats of Indian Ocean and South-East Asia).	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Undertake and/or support research to characterise natural variability, movement patterns and critical habitats for goorlil within the marine park.	No impacts.
Monitor the condition of goorlil and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users of the marine park on how to reduce damage to goorlil habitat and impacts on individuals and to respect cultural practice.	No impacts.
To ensure non-targeted (those not targeted by recreational and commercial fishers) aarli, joorroo and barnamb species are not significantly impacted by human activities within the marine park. To manage targeted (those targeted by recreational and commercial fishers) aarli, joorroo, and barnamb species for cultural and ecological sustainability**.**	
Undertake and /or support research to characterise aarli, joorroo and barnamb diversity, abundance, biomass/size frequency, movement patterns and critical habitats within the marine park and to understand the ecological role of targeted aarli species and the consequences of their removal.	No impacts.
Monitor the condition of aarli (fish), joorroo (sharks and barnamb (ray) stocks and the pressures acting on them in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Management actions/ strategies	Compliance with management plan
Educate users about recreational fishing rules and the ecological importance of aarli (fish), joorroo (sharks) and barnamb (rays).	No impacts.
To ensure odorr are not significantly impacted by human activities in the marine park. To manage customary harvesting of odorr for cultural and ecological sustainability**.**	
Undertake and/or support research on the abundance, distribution, natural variability and habitat requirements of odorr in the marine park.	No impacts.
Monitor the condition of odorr and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users about ways to minimise disturbance to odorr and respect cultural practice	No impacts.
Maintain records of the incidence of boat collisions with odorr	
To ensure miinimbi (whales) and bayalbarr (dolphins) are not significantly impacted by human activities in the marine park.	
Undertake and/or support research to characterise miinimbi and bayalbarr diversity, abundance, natural variability and critical habitats within the marine park.	No impacts.
Monitor the condition of miinimbi and bayalbarr and the pressures acting on them within the marine park	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Facilitate large miinimbi disentanglement response training for relevant departmental staff and Mayala rangers.	No impacts.
Educate users about ways to minimise disturbance to miinimbi and bayalbarr, including rules for miinimbi watching.	
Maintain a record of stranding and mortalities of miinimbi and bayalbarr in the marine park	

Management actions/ strategies	Compliance with management plan
To ensure linygurra (estuarine crocodiles) are not significantly impacted by human activities in the marine park.	
Monitor the condition of linygurra (estuarine crocodiles) and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Undertake and/or support research on the abundance, and condition of linygurra (estuarine crocodiles) in the marine park.	No impacts.
Educate users about known and potential distributions of linygurra (estuarine crocodiles) and of the risk of feeding them and ensure compliance.	
To ensure that sea and shore garrabal (birds) that inhabit or migrate through the marine park are not significantly impacted by human activities in the marine park**.**	
Educate users about ways to minimise disturbance to sea and shorebirds including the use of drones.	No impacts.
Undertake and/or support research to characterise sea and shore garrabal diversity, abundance, natural variability, movement patterns and critical habitats within the marine park	
Monitor the condition of sea and shore garrabal and the pressures acting on them within the marine park	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure non-targeted invertebrate species are not significantly impacted by human activities within the marine park. To manage targeted invertebrate species for cultural and ecological sustainability**.**	
Educate users about ways to minimise disturbance to and taking of invertebrates.	No impacts.
Undertake and/or support research to characterise the diversity, abundance, distribution and habitat requirements of invertebrates within the marine park and to understand the ecological role of targeted invertebrate species and the consequences of their removal [DPIRD for targeted species].	

Management actions/ strategies	Compliance with management plan
Monitor the condition of invertebrates susceptible to localised depletion in the marine park and take remedial action if human activities are impacting these species [DPIRD for targeted species].	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To identify, protect and conserve the natural and cultural values of Tanner Island.	
Ensure cultural heritage values, cultural knowledge and cultural laws and protocols inform land management.	No impacts.
Undertake or support baseline surveys of native plants, animals and ecological communities	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Rename the Tanner Island Nature Reserve to its traditional name.	No impacts.
Implement restrictions on visitor access as required for cultural or environmental reasons (through commercial operator licences, by regulation or other mechanisms as relevant).	
To enable Mayala Traditional Owners to realise livelihoods and achieve economic benefits from their Sea Country, consistent with the purpose of the marine park	
Identify opportunities to provide a range of employment, business and career development opportunities that are culturally appropriate and relevant to the management of the marine park.	No impacts.
Support MIAC to attract funding to assist with management of the marine park.	
Seek to employ or upskill Mayala people in roles relating to the marine park.	
Work with stakeholders to facilitate Mayala employment opportunities in industries such as the tourism industry.	
Encourage and support Mayala people to develop and enhance existing business opportunities on Country.	
To provide for nature-based and cultural tourism activities and ensure that they are managed in a manner that is consistent with maintaining the cultural, ecological and social value of the marine park. To maintain the cultural, ecological and social values of the marine park that are important for nature-based and cultural tourism.	

Management actions/ strategies	Compliance with management plan
To minimise risks to visitors and encourage appropriate behaviour	
Encourage the establishment of Mayala owned commercial tourism business in the marine park.	No impacts.
Ensure promotion and marketing of the marine park is consistent with Mayala's aspirations and cultural protocols.	
In collaboration with Mayala Traditional Owners and MIAC, develop a visitor management plan.	
Work with Mayala people and commercial operators to promote culturally appropriate visitation and facilitate the establishment of high-quality commercial tourism operations that: • Increase visitor enjoyment and safety • Demonstrate a commitment to protect and promote the park's cultural, natural, recreation and tourism values • Ensure staff and passengers behave appropriately and respectfully at cultural sites • Ensure staff and passengers respect and adhere to Mayala protocols for visitation on land and sea • Conduct operations according to departmental policy and licence conditions (Tourism WA) • Foster community stewardship of the marine park • Reduce impacts on sites • Enhance visitor's cultural experience	
Develop a voluntary visitor pass, for the marine park to plan for sustainable and culturally appropriate visitor usage.	
Conduct a visitor survey to gather data on visitor numbers, locations, anchoring points etc. to understand potential impacts and to aid the development of monitoring programs and a mooring and anchoring plan.	
Promote opportunities for sustainable recreation and tourism, including the provision of visitor facilities if required.	
Assess the need for a mooring and anchoring plan in the marine park and implement if required.	
Maintain a quantitative and qualitive spatial data bases of human use in the marine park.	
Conduct periodic visitor risk assessment in the marine park as required and mitigate identified issues.	
Facilitate linygurra (estuarine crocodile) handling and removal training for relevant departmental staff and Mayala rangers.	
Educate marine park users about protocols and regulations for the use of drones in the marine park to minimise impacts and disturbance to marine park values.	
Work with relevant agencies to prepare for and respond to emergencies.	

Management actions/ strategies	Compliance with management plan
Work with relevant agencies and industry bodies to adapt and improve existing mapping programs or apps reflecting marine park risks and zoning.	
Undertake a review of shipping activity in the marine park to determine the need for navigational measures such as compulsory pilotage, speed limit and/or designation of shipping routes.	
Educate marine park users of the risks in the marine park e.g. strong currents, cyclones and linygurra (estuarine crocodiles).	
To maintain the ecological values of the marine park that support recreational fishing. To ensure that, in collaboration with the community and DPIRD, recreational fishing is managed in a manner consistent with maintaining the marine park's cultural and ecological values while providing for social uses and enjoyment. To work collaboratively (with agencies, stakeholders and the community) to maintain and promote safe and enjoyable recreational fishing opportunities in the marine park.	
Through a collaborative approach with traditional owners, Recfishwest and recreational fishers, develop fishing regulations for the SPZ (biocultural conservation) which help ensure recreational fishing is culturally appropriate.	No impacts
Work with MIAC and Elders to develop, communicate and promote a Mayala-led sustainable fishing protocol including traditional seasonal calendars and access restrictions for dissemination to recreational fishers, fishing clubs and commercial tour operators.	
Educate recreational fishers on the zoning scheme, fisheries regulations and any restrictions that may apply to their activities in the marine park, seek information on management issues in the marine park and seek feedback on management responses.	
Conduct and/or support research to determine if ecosystem effects from recreational fishing occur in the marine park and undertake adaptive management actions if required	
Monitor recreational fishing catch and effort in the marine park and report the results to DBCA and the Commission for the periodic reviews of the implementation of the management plan.	
Investigate whether populations of recreationally targeted species are sustainable in the marine park and undertake adaptive management actions if required.	
To maintain the ecological values of the marine park which are important to the continuation of commercial fishing industries. To ensure that, in collaboration with the industry and DPIRD, commercial fishing is managed in a manner that is consisted with maintaining the values of the marine park	
Ensure Mayala are kept informed and involved in the monitoring and management measures for commercial fishing stocks in the marine park.	No impacts.
Work with commercial fishers, through peak stakeholder bodies to ensure operations are conducted in a culturally sensitive manner.	

Management actions/ strategies	Compliance with management plan
Conduct research to determine if ecosystem effects from commercial fishing occur in the marine park and undertake adaptive management actions if required.	
Monitor commercial fishing catch and effort in the marine park to inform periodic reviews of the implementation of the management plan and make data available to MIAC/JMB.	
Investigate the extent and significance of interactions between commercial fishing and marine mammals and other protected species and address as required.	
To maintain the ecological values of the marine park which are important to the continuation of a viable aquaculture industry. To ensure that, in collaboration with the industry and DPIRD, aquaculture is managed in a manner that is consistent with maintaining the values of the marine park.	
Ensure that aquaculture authorisations are consistent with the management plan and include appropriate monitoring programs, lighting, navigational marking and site utilisation conditions.	No impacts.
Work with the Aquaculture Council of Western Australia and aquaculture proponents to ensure environmental best practice aquaculture management is applied in the marine park.	
Work with aquaculture companies and DPIRD to help them conduct operations in a culturally sensitive manner.	
To maintain the ecological values of the marine park which are important to the continuation of a viable pearling industry. To ensure that, in collaboration with the industry and DPIRD, pearling is managed in a manner that is consistent with maintaining the values of the marine park.	
Ensure that pearling authorisations are consistent with the management plan and include appropriate monitoring programs, lighting, navigational marking and site utilisations conditions.	No impacts.
Work with pearling proponents and other relevant stakeholders to ensure environmental best practice management is applied in the marine park.	
Work with pearling companies and DPIRD to help them conduct operations in a culturally sensitive manner.	
To ensure that, in collaboration with the Western Australian Museum, human activity does not significantly affect historical sites or shipwrecks in the marine park. To increase awareness of maritime heritage within the local community and among visitors.	
Identify sites with maritime heritage value within the marine park and development and implement plans of management for identified sites (WAM, Heritage Council of WA)	No impacts.
Provide interpretive information to enhance visitor enjoyment of, and where appropriate to mitigate or stop impacts on, maritime heritage values in the marine park.	
To ensure industry, development and associated activities are managed in a manner consistent with the objectives of the marine park.	
Develop a memorandum of understanding (MoU) with KPA to ensure complementary management arrangements.	No impacts.

Management actions/ strategies	Compliance with management plan
Provide formal advice to the Commission, the EPA and/or the Minister for Environment relating to mineral, petroleum and pipeline activities in and adjacent to the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Provide advice on the assessment, setting of conditions, and monitoring and reporting requirements for mineral, petroleum and pipeline activities consistent with management objectives and management targets for values of the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Consider the quality of the remote seascapes of the marine park in site planning and assessment of development proposals.	No impacts.
To obtain increased understanding of the biodiversity, biocultural and cultural values and key ecological process and socio-economic uses within the marine park to inform management. To promote research that improves knowledge of the values of the marine park to inform management decisions. To maximise the integration of conservation science with traditional ecological knowledge in all aspects of research in the marine park	
Encourage and promote involvement of Mayala people in research projects where possible.	No impacts.
Ensure that new knowledge from research and monitoring is communicated to MIAC and the Mayala community.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Prepare a research plan which is informed by existing research and considers the research strategies and priorities listed in this joint management plan and/or emerging priorities nominated by the JMB.	
Develop a communication framework to guide the communication of science and knowledge to MIAC and the Mayala community.	
Collate and review existing research information to inform development of a research plan.	
Identify and communicate high priority research projects which address key knowledge gaps to appropriate external organisations and funding bodies.	No impacts.

Management actions/ strategies	Compliance with management plan
Develop and implement protocols (where possible utilising or adapting existing protocols) to ensure research is culturally appropriate, commences only with appropriate permissions and that information shared by Traditional Owners is used in a culturally appropriate manner.	
Develop scientific and research protocols and partnership agreement frameworks through the JMB that support genuine scientific and research partnerships with MIAC.	
Where possible, support two-way science programs in schools.	
Facilitate or support research in the marine park, including projects by external organisations, by providing assistance where possible.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Ensure granting and renewal of permits relating to scientific research is consistent with the management plan and complies with DBCA's Science Policy (No.28) and associated guidelines and any protocols developed with MIAC.	No impacts.
To monitor key cultural, ecological and social values in the marine park within a 'condition pressure-management response' framework, to provide a basis to assess, adapt and improve management.	
Facilitate knowledge transfer and uptake of research and monitoring findings to adaptive marine park management, planning and policy, and where relevant report on conservation achievements and challenges.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Encourage monitoring in the marine park which aligns with Mayala and departmental priorities.	
Collate and review existing monitoring information and techniques to inform the development of a monitoring plan	
Prepare a monitoring plan which considers the strategies and priorities listed in this joint management plan and/or emerging priorities nominated by the JMB.	
Develop a cultural values monitoring framework (and data storage and access process) to guide these activities in a joint management context, with respect to cultural Law and governance.	No impacts.
Develop and implement protocols to ensure monitoring is culturally appropriate and that any cultural information shared is used in a culturally appropriate manner e.g. supporting ISWAG/ KISSP protocols.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described
Investigate opportunities and develop a process to integrate traditional ecological knowledge with monitoring, where appropriate.	

Management actions/ strategies	Compliance with management plan
Liaise with industry, other government agencies and nongovernment organisations to access information held on ecological monitoring in the area.	in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Provide necessary information and support for assessments of management plan implementation by the Commission.	
To increase understanding of climate change on the marine park and increase the resilience of values to climate change.	
Support international and national climate change initiatives where relevant in marine park research and adaptive management.	No impacts.
Ensure that impacts of climate change are considered in monitoring programs of the KPI's for the marine park.	
Assess areas, habitats and species which are most at risk from the effects of climate change and increase their resilience by reducing other pressures where possible.	
Monitor marine park values and the climate-related pressures acting on them to inform the development of local and regional level adaptive management responses for the protection of park values.	
Educate marine park users about the effects of climate change on the values of the marine park and encourage users to reduce their carbon emissions where possible.	
Support or provide necessary information to contribute to climate forecast models to help predict the impacts of climate change on the values of the marine park.	
To ensure the marine park has appropriate legal, administrative, financial, operational and human resource frameworks in place so that it is effectively jointly managed in a collaborative setting.	
Ensure the objectives detailed in the JMA are applied to all management activities in the marine park.	No impacts.
Collaborate with and provide advice to agencies, stakeholders and adjacent land managers, where necessary, to ensure the protection of marine park values and complementary management of adjacent reserves.	
Implement all legal provisions necessary to establish and jointly manage the marine park including execution of the JMA, gazettal of the zoning scheme under the CALM Act and gazettal of orders under the FRM Act.	
Develop governance tools to support effective and efficient decision-making by the JMB, including terms of references, code of conduct and conflict resolution policy.	
Develop and maintain appropriate staff structures, funding, operational equipment including vessels and infrastructure to adequately implement the joint management plan and JMA.	
Develop and maintain understanding of and support for the marine park governance, management plan and activities by the local Mayala community.	
Investigate the need for, and if required, support MIAC to develop procedures to guide the JMB on what cultural decisions need to be referred to MIAC.	

Management actions/ strategies	Compliance with management plan
Develop and maintain an understanding about the delegation of authority from the MIAC to JMB and vice versa, in relation to advice given to external parties and marine park management decisions, consistent with the joint management plan	
Promote culturally inclusive hiring processes by inviting MIAC nominated JMB representative/s to participate in hiring processes for positions related to the marine park.	
Provide licences and permits with appropriate conditions where required.	
Develop annual work plans.	
Develop collaborative operational plans for the implementation of relevant strategies in the plan.	
Work with the MIAC and Mayala Traditional Owners to develop commercial tour operator licence conditions to manage access in special purpose zones (cultural protection) to ensure activities including fishing are compatible with the purpose of protecting the land and waters to the culture and heritage of Traditional Owners.	
Facilitate regional annual meetings between the JMBs of Mayala, Bardi Jawi and Lalang-gaddam marine parks.	
In accordance with DPIRD's responsibilities under the FRM Act, Pearling Act, and ARM Act (when implemented), develop a framework for DPIRDs involvement in the joint management of the marine park including mechanisms for DPIRD to attend JMB meetings.	
Develop materials to aid communication of the management plan to the Mayala community and support MIAC and JMB in the implementation of the plan.	
Pursue external funding opportunities to implement strategies in the joint management plan.	
DPIRD to provide advice to and attend JMB meetings as required.	
Undertake routine inspections and maintenance of department managed infrastructure in the marine park, particularly zone markers and signage.	
Undertake a five-year review of the permitted activities in the special purpose zones.	
Consider the need for temporary or longer-term restrictions e.g. speed limits and/or additional measures where necessary to protect threatened species, ecological communities, and natural features or for safety reasons.	
To enhance community understanding of and support for the marine park and achieve a high level of compliance with regulations, permitted uses and other management arrangements within the marine park.	
Ensure marine park users, including researchers, obtain and comply with appropriate formal permissions.	No impacts.
Encourage voluntary compliance and peer enforcement of regulations.	

Management actions/ strategies	Compliance with management plan
Develop an education and interpretation program which communicates: • the importance of the marine park's values • the purposes of management zones and regulations • appropriate behaviour to reduce human impacts and ensure public safety • Mayala native title rights and visitor protocols on sea and land; and • considers all education and interpretation strategies listed in the management plan.	
Develop and implement a collaborative patrol and enforcement plan.	
Monitor, promote and enforce compliance with fisheries and marine park legislation, including illegal foreign fishing.	
Install zone markers and educational signage for the marine park where appropriate.	
Noting remoteness of the marine park, where possible develop and implement a public participation plan for the marine park which encourages community involvement in management through a range of opportunities including education, research and monitoring.	
Develop, monitor and maintain a database of compliance statistics and adapt management strategies to address any non-compliance issues.	
Facilitate cross-authorisation of enforcement officers as appropriate including training Mayala rangers in CALM Act compliance with the intention of them obtaining the status of honorary enforcement officers pursuant to the CALM Act.	
Facilitate training of Mayala Rangers in FRM Act compliance, to engage in DPIRD compliance activities.	
To assess and evaluate management effectiveness.	
Develop and implement a performance assessment process that is suitable in a joint management setting that is consistent with DBCA and Commission policy and ensure results are reported back to the Mayala Community.	No impacts.
Through the JMB, support MIAC to conduct periodic reviews of the effectiveness of plan implementation in meeting cultural, capacity building and other priority objectives.	
Develop and implement a monitoring and evaluation framework to assess joint management effectiveness for the marine park.	
Provide necessary information and support for the performance assessment process.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the values of the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described

Management actions/ strategies	Compliance with management plan
	in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Assessment of the Beehive-1 exploration drilling LoWC spill risk against Bardi Jawi Gaarra Marine Park Joint Management Plan 2022 (DBCA, 2022)

The following information summarises the probabilities of exposure (%) to the Bardi Jawi Gaarra Marine Park based on the RPS (2022) report *Beehive-1 – Exploration Drilling, Crude Oil Spill Modelling with Surface Dispersant Application* (noting the results presented are for the unmitigated case)

Broome Shoreline Sector	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Shoreline	1	-	-	-	-	-	1	-	-
Entrained – 0-10 m below sea surface	2		-	7		-	1		-

Derby-West Kimberley Shoreline Sector	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Shoreline	2	-	-	2	-	-	-	-	-
Entrained – 0-10 m below sea surface	8		-	13		1	5		-

Cunningham Island	Summer			Transitional			Winter		
	Low	Mod	High	Low	Mod	High	Low	Mod	High
Dissolved – 0-10 m below sea surface	-	-	-	1	-	-	1	-	-
Entrained – 0-10 m below sea surface	4		-	9		-	2		-

Management actions/ strategies	Compliance with management plan
To uphold Bardi and Jawi's connection to Country and ensure activities in the marine park do not adversely affect opportunities for Bardi and Jawi people to have ongoing cultural connection to Country and economic opportunities. To promote increased understanding and respect for Bardi and Jawi living cultural landscape and concepts of the marine park	
Support Bardi and Jawi people to maintain their connection to Country, through on-Country trips, employment and enterprise development.	No impacts.
Support Bardi and Jawi people to develop and implement cultural awareness communication tools, emphasising the importance of cultural and heritage values for both Traditional Owners and the wider community.	
Design and develop management tools to address the impacts of human activities that may prevent cultural fulfilment to uphold Traditional Owner cultural rights and obligations.	
Support Bardi and Jawi to define a framework to ensure the right cultural processes are used for assessment and approval of proposals in the marine park	
Assess and monitor human activities that impact on the continuity of cultural fulfilment and upholding the cultural rights and obligations to continue the enjoyment of Country.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Develop cultural awareness training material and implement training for government employees and/or contractors working in the marine park.	No impacts.
Support Bardi and Jawi to develop protocols for visitors on Bardi and Jawi Country and educate visitors about appropriate behaviour, respecting privacy and access restrictions where applicable.	
To facilitate and maintain the opportunity for Bardi and Jawi people to care for Country and keep it healthy so that future generations can continue to experience Country. To conserve and protect sites of cultural significance	
Ensure marine park management is consistent with cultural Laws and protocols.	No impacts.
Ensure cultural Elders and younger generations are involved in the management of the marine park.	
Ensure the management programs for the marine park complement and integrate with those developed and implemented for other areas of Bardi and Jawi Country such as the Bardi Jawi IPA plan.	

Management actions/ strategies	Compliance with management plan
Develop and implement tools to measure and monitor effects of visitor and management activities on cultural heritage values and sites and implement strategies to address issues where appropriate	
In collaboration with Bardi and Jawi Traditional Owners develop and apply commercial operator licence conditions to ensure culturally sensitive and appropriate visitation in the marine park especially for cultural heritage sites.	
Implement regulations to restrict or control access to areas within the marine park that Bardi and Jawi Traditional Owners consider unsuitable for visitation (through commercial operator licences, by regulation or other mechanism as relevant).	
Support BJNAC to explore and implement tailored training, education and mentoring to enable Bardi and Jawi people to fulfil positions of employment relating to the management of the marine park.	
Support BJNAC to build their capacity in the management of the marine park and work collaboratively to develop succession plans, career pathways and support networks.	
Ensure cultural heritage sites in the marine park are protected, particularly significant and sensitive sites at risk.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Assess the use and condition of cultural sites and implement further strategies to improve the spiritual and physical condition of them where possible.	No impacts.
Collaborate with Bardi and Jawi Rangers to patrol, educate and enforce zoning and management arrangements particularly for the special purpose zones (cultural protection) and restricted access areas.	
To apply language and traditional knowledge and integrate it with conservation science management in education about the marine park.	
Where possible, use Bardi and Jawi place names and Bardi and Jawi language in signage, educational material, reporting and naming facilities.	No impacts.
Continue to support the transfer of traditional knowledge through on-Country learning opportunities.	
Work with Bardi and Jawi to support Bardi and Jawi's language program where relevant to the marine park.	
Undertake and support research to gain a better understanding of Bardi and Jawi traditional knowledge applicable to the marine park and develop a database to capture this knowledge.	

Management actions/ strategies	Compliance with management plan
Investigate opportunities and develop a process for integrating Bardi and Jawi's traditional ecological knowledge, and knowledge holders, with conservation science and management applicable to the marine park.	
Recognition of and support for the right of Bard Jawi people to continue customary practices and to benefit from their Country, consistent with the purpose of the marine park	
Support Bardi and Jawi people to continue to carry out customary activities, including customary fishing and hunting, in the marine park.	No impacts.
As part of the education and interpretation plan develop mechanisms to inform users of the marine park about Bardi and Jawi rights, as the recognised Traditional Owners, to enjoy Bardi and Jawi Country and maintain their customary practices.	
Work with Bardi and Jawi people and other traditional owner groups to develop sustainable management arrangements plan for customary fishing and hunting of marine wildlife (e.g. goorlil (turtles), odorr (dugongs), joorroo (sharks) and barnamb (rays) etc. and develop a customary fishing/ hunting guide.	
Develop mechanisms to feedback information to the Bardi and Jawi Community on the condition of customary hunted animals such as green turtles and odorr (dugongs), to support cultural and marine management decisions and facilitate the development and implementation of sustainable management arrangements for customary hunting.	
To ensure that marrgoorr and marnany communities are not significantly impacted by reef walking and other human activities within the marine park.	
Undertake and/or support research on marrgoorr and marnany communities in the marine park.	No impacts.
Monitor the condition of marrgoorr and marnany communities and the pressures acting on them in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Regulate foot access to intertidal marnany and other areas unsuitable for visitation (through commercial operator licences, by regulation or other mechanisms as relevant).	No impacts.
Educate users of the marine park about the ecological importance of marrgoorr (coral) and marnany (reef) communities and the potential detrimental effects of indiscriminate marnany (reef) walking, collecting, anchoring and boating activities on communities.	

Management actions/ strategies	Compliance with management plan
To ensure mangrove communities are not significantly impacted by human activities in the marine park.	
Educate users of the important ecological role and cultural value of mangrove and saltmarsh communities and the potential impacts of human activities, particularly vehicle damage.	No impacts.
Undertake and/or support research to characterise the diversity, density, abundance and distribution of mangrove and saltmarsh communities in the marine park.	
Monitor the condition of mangrove and saltmarsh communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure the diversity, abundance and condition of noomool and laanyji communities are not significantly impacted by human activities within the marine park	
Undertake and/or support research to characterise the diversity, density, abundance and distribution of noomool and laanyji communities in the marine park.	No impacts.
Monitor the condition of noomool and laanyji communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users of the important ecological role of noomool and laanyji communities and the potential impacts of human activities, particularly vessel mooring, and nutrient and pollution inputs on these communities.	No impacts.
To ensure that water and sediment quality are not significantly impacted by human activities in the marine park.	
Develop and implement a biosecurity, detection and mitigation program.	No impacts.
Undertake and/or support research on water and sediment quality in the marine park, including establishing baselines for water and sediment quality.	
Monitor the condition of water and sediment quality within the marine park including establishing baselines for water and sediment quality variables and identifying the pressures acting on it.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any

Management actions/ strategies	Compliance with management plan
Map the areas of the marine park that are highly sensitive to oil and chemical spills and ensure that this information is accessible to the State Marine Oil Pollution Coordination Group.	potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Designate areas for vessel sewage discharge and incorporate into education, patrol and enforcement programs to enforce sewage discharge arrangements.	No impacts.
As part of on-Country work, patrol the shoreline and waters of the marine park for marine debris and remove and record as necessary, and seek support of partners and marine park users to do the same.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Work with relevant departments, marine park users and stakeholders to address sources of marine debris and abandoned infrastructure in the marine park to reduce the amount of floating, submerged and beached debris and pollution entering the marine park.	
Educate users of the importance of good water and sediment quality, and the potential impacts human activities, particularly nutrient and pollution inputs can have on these communities.	No impacts.
To ensure that the seabed structural complexity, geomorphic processes and coastal landforms are not significantly impacted by human activities within the marine park.	
Undertake and/or support research to characterise the geomorphic features and processes in the marine park.	No impacts.
Monitor the condition of geomorphology and the pressures acting on it within the marine park.	
Ensure that coastal infrastructure and resource development proposals for the area that have the potential to disturb the geomorphology of the marine park are appropriately assessed in accordance with the EP Act.	
To ensure that filter feeding communities are not significantly impacted by human activities within the marine park.	
Educate users of the important ecological role of subtidal filter feed communities and the potential impacts that human activities can have on these communities.	No impacts.
Undertake and support research to characterise the diversity, density, abundance and distribution of filter feeding communities in the marine park.	
Monitor the condition of subtidal filter feeding communities and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described

Management actions/ strategies	Compliance with management plan
	in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure that intertidal sand and mudflat communities are not significantly impacted by human activities within the marine park.	
Undertake and/ or support research to characterise the diversity, community composition and condition of intertidal sand and mudflat communities and oombans in the marine park.	No impacts.
Monitor the condition of intertidal sand and mudflat communities and oombans and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users of the important ecological role of intertidal sand and mudflat communities and the potential impacts that human activities can have on these communities.	No impacts.
To ensure goorlil are not significantly disturbed by human activities occurring within and on the boundary of the marine park. To manage customary harvesting of goorlil for cultural and ecological sustainability.	
Ensure that management of goorlil in the marine park supports relevant international and regional agreements (e.g. Convention of Migratory Species of Wild Animals and MoU on the Conservation and Management of Marine Turtles and their Habitats of Indian Ocean and South-East Asia).	No impacts.
Undertake and/or support research to characterise natural variability, movement patterns and critical habitats for goorlil within the marine park.	
Monitor the condition of goorlil and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Management actions/ strategies	Compliance with management plan
Educate users of the marine park on how to reduce damage to goorlil habitat and impacts on individuals and to respect cultural practice.	No impacts.
To ensure non-targeted (those not targeted by recreational and commercial fishers) aarli, joorroo and barnamb species are not significantly impacted by human activities within the marine park. To manage targeted (those targeted by recreational and commercial fishers) aarli, joorroo and barnamb species for cultural and ecological sustainability	
Undertake or support research to characterise aarli, joorroo and barnamb diversity, abundance, biomass/size frrequency, movement patterns and critical habitats within the marine park and to understand the ecological role of targeted aarli species and the consequences of their removal.	No impacts.
Monitor the condition of aarli, joorroo and barnamb stocks and the pressures acting on them in the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users about recreational fishing rules and the ecological importance of aarli (fish), joorroo (sharks) and barnamb (rays).	No impacts.
To ensure odorr are not significantly impacted by human activities in the marine park. To manage customary harvesting of odorr for cultural and ecological sustainability.	
Undertake and/or support research on the abundance, distribution, natural variability and habitat requirements of odorr in the marine park.	No impacts.
Monitor the condition of odorr and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Educate users about ways to minimise disturbance to odorr and respect cultural practice.	No impacts.
Maintain records of the incidence of boat collisions with odorr.	
To ensure miinimbi and bayalbarr are not significantly impacted by human activities in the marine park	

Management actions/ strategies	Compliance with management plan
Facilitate large whale disentanglement response training for relevant departmental staff and Bardi Jawi Rangers.	No impacts.
Educate users about ways to minimise disturbance to miinimbi (whales) and bayalbarr (dolphins), including rules for whale watching.	
Maintain a record of stranding and mortalities of miinimbi (whales) and bayalbarr (dolphins) in the marine park.	
Monitor the condition of miinimbi and bayalbarr and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Undertake and/or support research to characterise miinimbi and bayalbarr diversity, abundance, natural variability and critical habitats within the marine park.	No impacts.
To ensure linygurra are not significantly impacted by human activities in the marine park.	
Educate users about known and potential distributions of linygurra and of the risk of feeding them and ensure compliance.	No impacts.
Undertake and/or support research on the abundance and condition of linygurra in the marine park.	
Monitor the condition of linygurra and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure that sea and shore garrabal (birds) that inhabit or migrate through the marine park are not significantly impacted by human activities in the marine park.	
Educate users about ways to minimise disturbance to sea and shore garrabal including the use of drones.	No impacts.
Undertake and/or support research to characterise sea and shore garrabal diversity, abundance, natural variability, movement patterns and critical habitats within the marine park.	

Management actions/ strategies	Compliance with management plan
Monitor the condition of sea and shore garrabal and the pressures acting on them within the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To ensure non-targeted invertebrate species are not significantly impacted by human activities within the marine park. To manage targeted invertebrate species for cultural and ecological sustainability	
Educate users about ways to minimise disturbance and taking of invertebrates (e.g. trumpet shells and clams).	No impacts.
Undertake and/or support research to characterise the diversity, abundance, natural variability, distribution and habitat requirements of invertebrates within the marine park and to understand the ecological role of targeted invertebrate species and the consequences of their removal.	
Monitor the condition of invertebrates susceptible to localised depletion in the marine park and take remedial action if human activities are impacting these species.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
To identify, protect and conserve the natural and cultural values of Swan Island	
Ensure cultural heritage values, cultural knowledge and cultural Laws and protocols inform land management.	No impacts.
Rename the Swan Island Nature Reserve to its traditional name.	
Implement restrictions on visitor access as required for cultural or environmental reasons (through commercial operator licences, by regulation or other mechanisms as relevant).	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.

Management actions/ strategies	Compliance with management plan
Undertake or support baseline surveys of native plants, animals and ecological communities.	No impacts.
To enable Bardi and Jawi Traditional Owners to realise livelihoods and achieve economic benefits from their Sea Country, consistent with the purpose of the marine park	
Identify opportunities to provide a range of employment, business and career development opportunities that are culturally appropriate and relevant to the management of the marine park.	No impacts.
Seek to employ or train Bardi and Jawi people in roles relating to the management of the marine park.	
Work with stakeholders to facilitate Bardi and Jawi employment opportunities in industries such as the tourism industry.	
Encourage and support Bardi and Jawi people to develop and enhance business opportunities on-Country.	
Support BJNAC to attract funding to assist with management of the marine park.	
To provide for nature-based and cultural tourism activities and ensure that they are managed in a manner that is consistent with maintaining the cultural, ecological and social value of the marine park. To maintain the cultural, ecological and social values of the marine park that are important for nature-based and cultural tourism. To minimise risks to visitors and encourage appropriate behaviour.	
Encourage the establishment of Bardi and Jawi owned commercial tourism businesses in the marine park.	No impacts.
Ensure promotion and marketing of the marine park is consistent with Bardi and Jawi's aspirations and cultural protocols.	
Work with Bardi and Jawi people and commercial operators to promote culturally appropriate visitation and facilitate the establishment of high-quality commercial tourism operations that: • Increase visitor enjoyment and safety • Demonstrate a commitment to protect and promote the park's cultural, natural, recreation and tourism values • Ensure staff and passengers behave appropriately and respectfully at cultural sites • Conduct operations according to Parks and Wildlife Service policy and licence conditions • Foster community stewardship of the marine park • Reduce impacts on sites • Enhance visitor's cultural experiences	
In collaboration with Bardi and Jawi Traditional Owners and BJNAC, develop a visitor management plan.	
Develop a voluntary visitor pass, for the marine park to plan for sustainable and culturally appropriate visitor usage.	
Conduct a visitor survey to gather data on use of the marine park including visitor numbers, locations and anchoring points to understand potential impacts and direct monitoring programs.	

Management actions/ strategies	Compliance with management plan
Assess the need for a mooring and anchoring plan in the marine park and implement if required.	
Conduct periodic visitor risk assessment in the marine park as required and mitigate identified issues.	
Undertake a review of shipping activity in the marine park to determine the need for navigational measures such as compulsory pilotage, speed limit and/or designation of shipping routes.	
Maintain a quantitative and qualitative spatial database of human use in the marine park.	
Work with relevant agencies and industry bodies to adapt and improve existing mapping programs or apps reflecting marine park risks and zoning.	
Educate marine park users of the risks in the marine park including strong currents, cyclones and crocodiles.	
Facilitate linygurra (estuarine crocodile) handling and removal training for relevant departmental staff and Mayala rangers.	
Work with relevant agencies to prepare for and respond to emergencies situations e.g. search and rescue.	
Educate marine park users about protocols and regulations for the use of drones in the marine park to minimise impacts and disturbance to marine park values.	
Promote opportunities for sustainable recreation and tourism, including the provision of visitor facilities if required.	
To maintain the ecological values of the marine park that support recreational fishing. To ensure that, in collaboration with the community and DPIRD, recreational fishing is managed in a manner consistent with maintaining the marine park's cultural and ecological values while providing for social uses and enjoyment. To work collaboratively with agencies, stakeholders and the community to maintain and promote safe and enjoyable recreational fishing opportunities in the marine park.	
Through a collaborative approach with traditional owners Recfishwest, and recreational fishers, develop fishing regulations for the SPZ (biocultural conservation) which help ensure recreational fishing is culturally appropriate.	No impacts.
Work with BJNAC and Elders to develop, communicate and promote a Bardi and Jawi-led sustainable fishing protocol including traditional seasonal calendars and access restrictions for dissemination to recreational fishers, fishing clubs and commercial tour operators.	
Educate recreational fishers on the zoning scheme, fisheries regulations and any restrictions that may apply to their activities in the marine park.	
Conduct research to determine if ecosystem effects from recreational fishing occur in the marine park and undertake adaptive management actions if required.	

Management actions/ strategies	Compliance with management plan
Monitor recreational fishing catch and effort in the marine park and report the results to DBCA and the Commission for the periodic reviews of the implementation of the management plan.	
Investigate whether the take of recreationally targeted species is sustainable in the marine park and undertake adaptive management actions if required.	
To maintain the ecological values of the marine park which are important to the continuation of commercial fishing industries. To ensure that, in collaboration with the industry and DPIRD, commercial fishing is managed in a manner that is consisted with maintaining the values of the marine park.	
Ensure Bardi and Jawi are kept informed and where possible involved in the monitoring and management measures for commercial aarli (fish) stocks in the marine park.	No impacts.
Work with commercial fishers, through peak stakeholder bodies, to ensure operations are conducted in a culturally sensitive manner.	
Conduct research to determine if ecosystem effects from commercial fishing occur in the marine park and undertake adaptive management actions if required.	
Investigate the extent and significance of interactions between commercial fishing and marine mammals and other protected species and address as required.	
Monitor commercial fishing catch and effort in the marine park to inform periodic reviews of the implementation of the management plan and make data available to MIAC/ JMB.	
To maintain the ecological values of the marine park which are important to the continuation of a viable aquaculture industry. To ensure that, in collaboration with the industry and DPIRD, aquaculture is managed in a manner that is consistent with maintaining the values of the marine park.	
Work with the Aquaculture Council of Western Australia and aquaculture proponents to ensure environmental best practice aquaculture management is applied in the marine park.	No impacts.
Work with aquaculture companies and DPIRD to help them conduct operations in a culturally sensitive manner.	
Monitor, promote and enforce compliance with fisheries and marine park legislation.	
Ensure that aquaculture authorisations are consistent with the management plan and include appropriate monitoring programs, lighting, navigational marking and site utilisation conditions.	
To maintain the ecological values of the marine park which are important to the continuation of a viable pearling industry. To ensure that, in collaboration with the industry and DPIRD, pearling is managed in a manner that is consistent with maintaining the values of the marine park.	
Work with the Pearl Producers Association and pearling proponents to ensure environmental best practice management is applied in the marine park.	No impacts.
Work with pearling companies and DPIRD to help them conduct operations in a culturally sensitive manner.	

Management actions/ strategies	Compliance with management plan
Monitor, promote and enforce compliance with fisheries and marine park legislation.	
Ensure that pearling authorisations are consistent with the management plan and include appropriate monitoring programs, lighting, navigational marking and site utilisation conditions.	
To ensure that, in collaboration with the Western Australian Museum, human activity does not significantly affect historical sites or shipwrecks in the marine park. To increase awareness of maritime heritage within the local community and among visitors.	
Identify sites with maritime heritage value within the marine park and develop and implement plans of management for identified sites.	No impacts.
Provide interpretive information to enhance visitor enjoyment of and, where appropriate, to mitigate or stop impacts on maritime heritage values in the marine park.	
To ensure industry, development and associated activities are managed in a manner consistent with the objectives of the marine park.	
Provide formal advice to the Commission, the EPA and/or the Minister for Environment relating to mineral, petroleum and pipeline activities in and adjacent to the marine park.	No impacts.
Provide advice on the assessment, setting of conditions, and monitoring and reporting requirements for mineral, petroleum and pipeline activities consistent with management objectives and management targets for values of the marine park.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Consider the quality of the remote seascapes of the marine park in site planning and assessment of development proposals.	
To obtain increased understanding of the biodiversity, biocultural and cultural values and key ecological process and socio-economic uses within the marine park to inform management. To promote research that improves knowledge of the values of the marine park to inform management decisions. To maximise the integration of conservation science with traditional ecological knowledge in all aspects of research in the marine park	
Encourage involvement of Bardi and Jawi people in research projects where possible.	No impacts.
Ensure that new knowledge from research and monitoring is communicated to BJNAC and the Bardi Jawi community.	
Prepare a research plan which is informed by existing research and considers the research strategies and priorities listed in this joint management plan and/or emerging priorities nominated by the JMB.	
Develop a communication framework to guide the communication of science and knowledge to BJNAC and the Bardi Jawi community.	

Management actions/ strategies	Compliance with management plan
Identify and communicate high priority research projects which address key knowledge gaps to appropriate external organisations and funding bodies and ensure results are shared with marine park managers.	
Develop and implement protocols (where possible utilising or adapting existing protocols) to ensure research is culturally appropriate, commences only with appropriate permissions and that information shared by Traditional Owners is used in a culturally appropriate manner.	
Develop scientific and research protocols and partnership agreement frameworks through the JMB that support genuine scientific and research partnerships with BJNAC.	
Where possible, support two-way science programs in schools.	
Facilitate or support research in the marine park, including projects by external organisations, by providing assistance where possible.	
Ensure granting and renewal of permits relating to scientific research is consistent with the management plan and complies with DBCA's Science Policy (No.28) and associated guidelines and any protocols developed with BJNAC.	
To monitor key cultural, ecological and social values in the marine park within a 'condition pressure-management response' framework, to provide a basis to assess, adapt and improve management.	
Facilitate knowledge transfer and uptake of monitoring findings to adaptive marine park management, planning and policy, and where relevant report on conservation achievements and challenges.	No impacts.
Encourage monitoring in the marine park which aligns with Mayala and departmental priorities.	
Collate and review existing monitoring information and techniques to inform the development of a monitoring plan.	
Prepare a monitoring plan which considers the strategies and priorities listed in this joint management plan and/or emerging priorities nominated by the JMB.	
Develop a cultural values monitoring framework (and data storage and access process) to guide these activities in a joint management context, with respect to cultural Law and governance.	
Develop and implement protocols to ensure monitoring is culturally appropriate and that any cultural information shared is used in a culturally appropriate manner e.g. ISWAG/KISSP protocols are supported.	
Investigate opportunities and develop a process to integrate traditional ecological knowledge with monitoring, where appropriate.	
Liaise with industry, other government agencies and non-government organisations to access information held on ecological monitoring in the area.	

Management actions/ strategies	Compliance with management plan
Provide necessary information and support for assessments of management plan implementation by the Commission.	
To increase understanding of the effects of climate change on the values of the marine park and increase the resilience of values to climate change.	
Support international and national climate change initiatives where relevant in marine park research and adaptive management.	No impacts.
Ensure that impacts of climate change are considered in monitoring programs of the KPI's for the marine park.	
Assess areas, habitats and species which are most at risk from the effects of climate change and increase their resilience by reducing other pressures where possible.	
Monitor marine park values and the climate-related pressures acting on them to inform the development of local and regional level adaptive management responses for the protection of park values.	
Educate marine park users of impacts of climate change on marine park values and encourage them to reduce their carbon emissions where possible.	
Support or provide necessary information to contribute to climate forecast models to help predict the impacts of climate change on the values of the marine park.	
To ensure the marine park has appropriate legal, administrative, financial, operational and human resource frameworks in place so that it is effectively jointly managed in a collaborative setting	
Ensure the objectives detailed in the JMA are applied to all management activities in the marine park.	No impacts.
Collaborate with and provide advice to agencies, stakeholders and adjacent land managers, where necessary, to ensure the protection of marine park values and complementary management of adjacent reserves.	
Implement all legal provisions necessary to establish and jointly manage the marine park including execution of the JMA, gazettal of the zoning scheme under the CALM Act and gazettal of orders under the FRM Act.	
Develop governance tools to support effective and efficient decision-making by the JMB including terms of references, code of conduct and conflict resolution policy.	
Develop and maintain appropriate staff structures, funding, operational equipment, including vessels, and infrastructure to adequately implement the joint management plan and JMA.	
Develop and maintain understanding of and support for the marine park governance, management plan and activities, by the local Bardi Jawi community.	
Investigate the need for, and if required, support BJNAC to develop procedures to guide the JMB on what cultural decisions need to be referred to BJNAC.	

Management actions/ strategies	Compliance with management plan
Develop and maintain an understanding about the delegation of authority from the BJNAC to JMB and vice versa, in relation to advice given to external parties and marine park management decisions, consistent with the joint management plan.	
Promote culturally inclusive hiring processes by inviting BJNAC nominated JMB representative/s to participate in hiring processes for positions related to the marine park.	
Provide licences and permits with appropriate conditions where required.	
Develop annual work plans.	
Develop collaborative operational plans for implementation of relevant strategies in the plan.	
Work with the BJNAC and Bardi and Jawi Traditional Owners to develop commercial tour operator licence conditions to manage access in special purpose zones (cultural protection) to ensure activities including fishing are compatible with the purpose of protecting the land and waters to the culture and heritage of Traditional Owners.	
Facilitate regional annual meetings between the JMBs of Bardi, Jawi, Mayala and Lalang-gaddam marine park.	
In accordance with DPIRD's responsibilities under the FRM Act, Pearling Act, and ARM Act (when implemented), develop a framework for DPIRDs involvement in the joint management of the marine park including mechanisms for DPIRD to attend JMB meetings.	
Develop materials to aid communication of the management plan to the Bardi and Jawi community and support BJNAC and JMB in the implementation of the plan.	
Pursue external funding opportunities to implement strategies in the joint management plan.	
Develop and implement a monitoring and evaluation framework to assess joint management effectiveness for the marine park.	
Undertake a five-year review of the permitted activities in the special purpose zones.	
Undertake routine inspections and maintenance of department managed infrastructure in the marine park, particularly zone markers and signage.	
Consider the need for temporary or longer-term restrictions e.g. speed limits and/or additional measures where necessary to protect threatened species, ecological communities, and natural features or for safety reasons.	
To enhance community understanding of and support for the marine park and achieve a high level of compliance with regulations, permitted uses and other management arrangements within the marine park.	
Ensure marine park users, including researchers, obtain and comply with appropriate formal permissions.	In the event of a Level 2 or 3 oil spill, the OPEP and OSMIP will be implemented to monitor and mitigate any

Management actions/ strategies	Compliance with management plan
	potential impacts. Arrangements with Commonwealth, state and territory government agencies are described in the OPEP and OSMIP. Traditional owners and Indigenous owner groups will be notified in the event of a spill and will be invited to assist in response strategies, such as shoreline assessment and responses.
Encourage voluntary compliance and peer enforcement of regulations.	No impacts.
Develop an education and interpretation plan which communicates: • the importance of the marine park's values • the purposes of management zones and regulations • appropriate behaviour to reduce human impacts and ensure public safety • Bardi and Jawi native title rights and visitor protocols on sea and land; and • Consideration of all education and interpretation strategies listed in the management plan	
Develop and implement a collaborative patrol and enforcement program.	
Monitor, promote and enforce compliance with fisheries and marine park legislation, including illegal foreign fishing.	
Install zone markers and educational signage for the marine park where appropriate.	
Develop and implement a public participation plan for the marine park, which encourages community involvement in management through a range of opportunities including in education, research and monitoring.	
Develop, monitor and maintain a database of compliance statistics and adapt management strategies to address any non-compliance issues.	
Facilitate cross-authorisation of enforcement officers as appropriate including training Bardi Jawi Rangers in CALM Act compliance with the intention of them obtaining the status of honorary enforcement officers pursuant to the CALM Act.	
Facilitate training of Bardi Jawi Rangers in FRM Act compliance, to engage in DPIRD compliance activities.	
Investigate and implement, where necessary, mechanisms to restrict vehicle access in the marine park to designated areas only.	
To assess and evaluate management effectiveness.	
Develop and implement a performance assessment process that is suitable in a joint management setting and is consistent with DBCA and Commission policy and ensure results are reported back to the Bardi and Jawi Community.	No impacts.

Management actions/ strategies	Compliance with management plan
Through the JMB, support BJNAC to conduct periodic reviews of the effectiveness of plan implementation in meeting cultural aspirations, capacity building and other priority objectives.	
Develop and implement a monitoring and evaluation framework to assess joint management effectiveness for the marine park.	
Provide necessary information and support for the performance assessment process.	
Implement management strategies to mitigate or stop any impacts from human activities within the marine park which are negatively impacting the values of the marine park.
