

# Pyrenees Facility Operations Environment Plan

Australian Operations Division

July 2024

Revision 19

**THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK**

## TABLE OF CONTENTS

<b>1.</b>	<b>INTRODUCTION .....</b>	<b>17</b>
1.1	Overview.....	17
1.2	Purpose of the Environment Plan.....	17
1.3	Scope of the Environment Plan.....	18
1.4	Environment Plan Summary .....	18
1.5	Structure of the Environment Plan .....	18
1.6	Description of the Titleholder .....	20
1.7	Details of Titleholder and Nominated Liaison Person .....	20
1.7.1	Titleholder.....	20
1.7.2	Nominated Liaison Person.....	20
1.7.3	Arrangements for Notifying Change.....	21
1.8	Woodside / BHP Petroleum Merger .....	21
1.9	Woodside (PetDW) Management System.....	21
1.9.1	Environment Policy .....	22
1.10	Description of Relevant Requirements.....	22
1.10.1	<i>Offshore Petroleum and Greenhouse Gas Storage Act 2006 (Cth)</i> .....	22
1.10.2	<i>Environment Protection and Biodiversity Conservation Act 1999 (Cth)</i> .....	23
1.10.2.1	Recovery Plans and Threat Abatement Plans .....	24
1.10.2.2	Australian Marine Parks .....	25
1.10.2.3	World Heritage Properties .....	25
<b>2.</b>	<b>ENVIRONMENT PLAN PROCESS .....</b>	<b>26</b>
2.1	Overview.....	26
2.2	Environmental Risk Management Methodology .....	26
2.2.1	Woodside PetDW Risk Management Process .....	26
2.2.2	Impact Assessment Process.....	26
2.3	Environment Plan Development Process.....	27
2.4	Establish the Context.....	29
2.4.1	Define the Activity .....	29
2.4.2	Define the Existing Environment .....	29
2.4.3	Relevant Requirements .....	30
2.5	Impact and Risk Identification .....	30
2.6	Impact and Risk Analysis.....	31
2.6.1	Decision Support Framework.....	31
2.6.1.1	Decision Type A .....	32
2.6.1.2	Decision Type B .....	32
2.6.1.3	Decision Type C.....	32
2.6.1.4	Decision Support Framework Tools.....	33
2.6.2	Control Measures (Hierarchy of Controls).....	33
2.6.3	Impact and Risk Classification .....	34
2.6.3.1	Risk Rating Process .....	35
2.7	Impact and Risk Evaluation.....	36
2.7.1	Demonstration of ALARP.....	37

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.7.2	Demonstration of Acceptability.....	37
2.8	Recovery Plan and Threat Abatement Plan Assessment .....	38
2.9	Environmental Performance Outcomes, Environmental Performance Standards, and Measurement Criteria .....	38
2.10	Implement, Monitor, Review and Reporting .....	38
2.11	Consultation.....	39
<b>3.</b>	<b>DESCRIPTION OF THE ACTIVITY .....</b>	<b>40</b>
3.1	Overview.....	40
3.1.1	Overview.....	40
3.2	Location.....	42
3.2.1	Operational Area.....	42
3.3	Timing.....	43
3.4	Subsea Infrastructure Layout and Description .....	43
3.5	Suspended Infrastructure.....	46
3.6	Exploration Well with Wellhead.....	46
3.7	Other Property including Exploration Wellheads in the Licence Areas .....	46
3.8	Characteristics of Target Hydrocarbons .....	47
3.8.1	Production Overview .....	47
3.9	Well Control .....	48
3.10	Pyrenees FPSO.....	48
3.10.1	Facility Design Conditions.....	49
3.10.2	Turret and Mooring .....	50
3.10.3	Hull .....	54
3.10.4	Topsides Layout .....	54
3.11	Modes of Operation .....	56
3.11.1	Connected Mode .....	56
3.11.2	Disconnected Mode .....	56
3.11.3	Transition from Connected to Disconnected Mode.....	56
3.11.4	FPSO Personnel Levels.....	56
3.12	Production Process.....	57
3.12.1	Production System Overview .....	57
3.12.2	Liquid Processing Overview.....	57
3.12.3	Flare System .....	63
3.12.4	Vent System .....	63
3.12.5	Production Water Treatment and Injection System .....	64
3.12.6	Drainage System .....	67
3.12.6.1	Closed Drains.....	67
3.12.6.2	Open Drains .....	67
3.12.7	Seawater System.....	68
3.12.7.1	Cooling Water System.....	68
3.12.7.2	Fresh Water System.....	69
3.12.8	Cargo Storage and Offloading System.....	69
3.12.8.1	Cargo Offloading .....	69
3.12.8.2	Tanker Vetting Procedures.....	70

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.12.9	Ballast System .....	71
3.12.10	Inert Gas System .....	72
3.13	Emergency Blowdown, Shutdown and Safeguarding .....	72
3.13.1	Emergency Blowdown .....	72
3.13.2	Shutdown and Safeguarding Control Systems .....	72
3.13.3	Emergency Shutdown Valves .....	73
3.14	Utility Systems .....	73
3.14.1	Power Generation .....	73
3.14.1.1	Topside Power Generation .....	73
3.14.1.2	Essential (Hull) Generators .....	74
3.14.1.3	Emergency Generators .....	74
3.14.1.4	Uninterruptable Power Supplies .....	74
3.14.2	Diesel Fuel System .....	75
3.14.3	Hydraulic and Lube Oil .....	75
3.14.4	Instrument and Plant Air System .....	75
3.14.5	Nitrogen System .....	76
3.14.6	Steam Systems .....	76
3.14.7	Sewage and Putrescible Wastes .....	76
3.14.8	Cranes and Material Handling .....	76
3.14.9	Passing Vessel Detection .....	77
3.14.10	Facility Lighting .....	77
3.14.11	Chemical Injection System .....	77
3.15	Hazardous Substances and Inventories .....	78
3.15.1	Process and Non-Process Hydrocarbons .....	78
3.15.2	Process and Non-Process Chemicals .....	79
3.15.3	Chemical Selection, Assessment and Approval .....	83
3.15.3.1	Environmental Selection Criteria .....	83
3.15.3.2	Background Overview of OCNS .....	83
3.16	Support Vessel Operations .....	84
3.16.1	Facility Support Vessels .....	84
3.16.2	Other Support Vessels .....	84
3.17	Helicopter Operations .....	85
3.18	Subsea Inspection, Monitoring, Maintenance and Repair Activities .....	85
3.18.1	Inspections .....	85
3.18.2	Monitoring .....	86
3.18.3	Maintenance .....	86
3.18.4	Repair .....	86
3.18.5	Subsea Chemical Usage .....	87
3.18.6	Intervention Isolations .....	87
3.18.7	Marine Growth Removal .....	88
3.18.8	Sediment Relocation .....	88
3.19	Waste Management .....	88
3.19.1	General Non-Hazardous Wastes .....	89
3.19.2	Hazardous Wastes .....	89

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.19.3	Naturally Occurring Radioactive Materials and Sand Management.....	89
<b>4.</b>	<b>DESCRIPTION OF THE EXISTING ENVIRONMENT .....</b>	<b>91</b>
4.1	Overview.....	91
4.2	Regional Context .....	94
4.3	Matters of National Environmental Significance (EPBC Act) .....	96
4.4	Physical Environment .....	96
4.5	Habitats and Biological Communities.....	98
4.6	Protected Species.....	99
4.6.1	Fish, Sharks and Rays.....	100
4.6.2	Marine Reptiles.....	105
4.6.3	Marine Mammals .....	113
4.6.4	Seabirds and Migratory Shorebirds.....	125
4.6.5	Seasonal Sensitivities for Protected Species .....	139
4.7	Key Ecological Features (KEFs) .....	142
4.8	Protected Places.....	144
4.9	Cultural Features and Heritage Values .....	150
4.9.1	Background .....	150
4.9.2	First Nations Peoples.....	150
4.9.2.1	Coastally Adjacent First Nations Groups .....	151
4.9.3	Marine Parks .....	156
4.9.4	Sea Country Values.....	158
4.9.4.1	Desktop Assessment of Sea Country Values .....	159
4.9.4.2	Studies of Cultural Features and Heritage Values .....	175
4.9.4.3	Consultation Feedback to Inform Existing Environment.....	175
4.9.4.4	Summary of cultural features and heritage values.....	186
4.9.4.5	Further context: Intangible cultural heritage.....	192
4.9.4.6	Further context: Marine ecosystems and species.....	194
4.9.5	Heritage Listed Places .....	195
4.9.5.1	Historic Sites of Significance .....	195
4.9.5.2	Underwater Heritage .....	195
4.9.5.3	World, National and Commonwealth Heritage Listed Places .....	196
4.10	Socio-Cultural Environment .....	198
4.10.1	Commercial Fisheries .....	198
4.10.2	Traditional Fisheries.....	211
4.10.3	Tourism and Recreation.....	211
4.10.4	Commercial Shipping.....	212
4.10.5	Oil and Gas.....	214
<b>5.</b>	<b>CONSULTATION .....</b>	<b>219</b>
5.1	Summary .....	219
5.2	Consultation – General Context.....	220
5.3	Identification of Relevant Persons for Consultation .....	224
5.3.1	Regulations 25(1)(a), (b) and (c).....	224
5.3.2	Identification of Relevant Persons under regulations 25(1)(a), (b) and (c).....	224
5.3.3	Regulation 25(1)(d).....	225

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.8.6	Unplanned Hydrocarbon Release: Turret Operations.....	379
6.8.7	Unplanned Hydrocarbon Release: Diesel spill from Bulk Storage .....	383
6.8.8	Unplanned Hydrocarbon or Chemical Release: Hydrocarbon and Chemical Release during Transfer, Storage and Use .....	390
6.8.9	Unplanned Discharges: Hazardous and Non-hazardous Waste Management .....	396
6.8.10	Physical Presence (Unplanned): Interaction with Live Infrastructure .....	400
6.8.11	Physical Presence: Vessel Collision with Marine Fauna .....	403
6.8.12	Physical Presence: Introduction of Invasive Marine Species.....	406
6.9	Recovery Plan and Threat Abatement Plan Assessment .....	416
6.10	Cultural Features and Heritage Values Assessment .....	426
<b>7.</b>	<b>IMPLEMENTATION STRATEGY .....</b>	<b>437</b>
7.1	Overview.....	437
7.2	Systems, Practice and Procedures .....	437
7.3	Woodside PetDW Management System .....	437
7.4	Risk Management.....	438
7.4.1	Management of Risks – Contracting and Procurement .....	438
7.4.2	Management of Risks – Well Integrity.....	438
7.4.3	Management of Risks – Marine Services .....	439
7.5	Change Management .....	439
7.5.1	EP Management of Change and Revision .....	439
7.5.2	OPEP Management of Change.....	440
7.6	Woodside Decommissioning Framework .....	440
7.6.1	Decommissioning in Operations .....	440
7.6.2	Facility Decommissioning Planning.....	441
7.6.3	Inventory of Property.....	441
7.6.4	Pyrenees Decommissioning Strategy .....	443
7.6.5	Decommissioning Planning Activities.....	443
7.6.5.1	Production Infrastructure .....	443
7.6.5.2	Exploration Wells.....	444
7.7	Organisation Structure .....	446
7.7.1	Roles and Responsibilities .....	446
7.8	Unexpected Finds Procedure.....	453
7.9	Training and Competency .....	453
7.9.1	Operations Competency Framework Training.....	454
7.9.2	Permit to Work System Training .....	455
7.9.3	Emergency and Hydrocarbon Spill Response Training .....	455
7.9.4	Subsea IMMR Activity Environmental Awareness.....	455
7.10	Monitoring, Auditing, Management of Non-conformance and Review .....	456
7.10.1	Monitoring.....	456
7.10.2	Management of Knowledge .....	457
7.10.3	Management of Newly Identified Impacts and Risks .....	457
7.10.4	Auditing.....	459
7.10.5	Operations Assurance .....	459

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.10.6	Annual Offshore Inspection/Desktop Review .....	459
7.10.7	Subsea Support Vessel Environment Inspection.....	459
7.10.8	Marine Assurance.....	459
7.10.9	Risk Assessment .....	460
7.10.10	Management of Non-conformance (Internal).....	461
7.11	Review.....	462
7.11.1	Environmental Risk Review .....	462
7.11.2	Learning and Knowledge Sharing .....	462
7.11.3	Continuous Improvement.....	462
7.12	Record Keeping.....	463
7.13	Reporting.....	463
7.13.1	Overview.....	463
7.13.2	Routine Reporting (Internal).....	463
7.13.2.1	Daily Reports.....	463
7.13.2.2	Performance Reporting .....	463
7.13.3	Routine Reporting (External).....	463
7.13.3.1	Ongoing consultation.....	463
7.14	Environmental Performance Review and Reporting.....	465
7.14.1	End of the PAP Notification.....	466
7.14.1.1	Sail-away Notification .....	466
7.14.1.2	End of the Environment Plan.....	466
7.14.2	Incident Reporting (Internal).....	466
7.14.3	Incident Reporting (External) – Reportable and Recordable .....	466
7.14.3.1	Reportable Incidents .....	466
7.14.3.2	Recordable Incidents.....	467
7.14.4	Other External Reporting Requirements and Notifications .....	467
7.15	Emergency Preparedness and Response.....	468
7.15.1	Overview.....	468
7.15.2	Emergency Response Training.....	469
7.15.3	Emergency Response Preparation .....	470
7.15.4	Initial Response to Facility Incident.....	470
7.15.5	Oil and Other Hazardous Materials Spill .....	471
7.15.6	Emergency and Spill Response .....	471
7.15.7	Emergency and Spill Response Drills and Exercises .....	471
7.15.8	Hydrocarbon Spill Response testing of Arrangements .....	472
7.15.9	Testing of Arrangements Schedule.....	472
7.15.10	Cyclone and Dangerous Weather Preparation.....	473
<b>8.</b>	<b>REFERENCES .....</b>	<b>474</b>
<b>9.</b>	<b>LIST OF TERMS AND ACRONYMS.....</b>	<b>487</b>
<b>10.</b>	<b>APPENDICES .....</b>	<b>492</b>
	Appendix A: Woodside Environment and Biodiversity Policy.....	493
	Appendix B: Relevant Requirements .....	495
	Appendix C: EPBC Act Protected Matters Search Tool Results.....	498
	Appendix D: Cultural Heritage Search Results.....	499

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Appendix E: NOPSEMA Reporting Forms ..... 500  
Appendix F: Consultation ..... 501  
Appendix G: Ongoing Engagement with Traditional Owners..... 502  
Appendix H: Oil Spill Preparedness and Response Mitigation Assessment ..... 503  
Appendix I: First Strike Plan..... 504  
Appendix J: Woodside Master Existing Environment ..... 505  
Appendix K: Woodside’s Climate Policy..... 506

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

## LIST OF TABLES

Table 1-1: EP Summary.....	18
Table 1-2: EP process phases, applicable Environment Regulations and relevant section of EP..	18
Table 1-3: Relevant requirements of the OPGGS Act 2006 .....	22
Table 1-4: Conditions from Pyrenees Petroleum Field Development (EPBC 2005/2034) relevant to the PAP .....	23
Table 1-5: Relevant Management Principles under Schedule 5—Australian World Heritage management principles of the EPBC Act. ....	25
Table 2-1: Example of the Environment Values Potentially Impacted which are Assessed within the Environment Plan.....	30
Table 2-2: Example of Layout of Identification of Risks and Impacts in Relation to Risk Sources..	31
Table 2-3: Woodside PetDW Risk Matrix (Environment and Social and Cultural) Consequence Severity Descriptions, Severity Levels and Severity Factors .....	34
Table 2-4: Woodside PetDW Risk Matrix Likelihood Definitions Levels .....	35
Table 2-5: Summary of Woodside’s PetDW Criteria for ALARP Demonstration .....	37
Table 2-6: Summary of Woodside’s PetDW Criteria for Acceptability .....	37
Table 3-1: PAP overview.....	42
Table 3-2: Approximate location of the FPSO and associated subsea wells .....	44
Table 3-3: Status of Pyrenees Suspended Infrastructure in WA-42-L and WA-43-L.....	46
Table 3-4: Status of West Muiron-5 Exploration Well .....	46
Table 3-5 Pyrenees Facility Design Rates.....	49
Table 3-6 Pyrenees Facility Metocean Design Conditions.....	49
Table 3-7 Pyrenees FPSO Mooring System.....	50
Table 3-8 Discharge Pipe Configuration.....	60
Table 3-9 Cooling Water Discharge Specifications.....	69
Table 3-10 Indicative Topsides Process Hydrocarbon Inventories on the Pyrenees FPSO .....	78
Table 3-11 Indicative Process Chemical Types and Storage Quantities.....	81
Table 3-12 Indicative facility support vessel specifications (Go Provider) .....	84
Table 3-13: IMMR activities with the potential to occur.....	86
Table 3-14: Typical Discharge Volumes During Different IMMR and Subsea Activities .....	88
Table 3-15: Marine growth removal techniques.....	88
Table 4-1: Hydrocarbon spill thresholds used to define the EMBA for surface and in-water hydrocarbons. ....	91
Table 4-2: Summary of MNES identified by the EPBC Act PMST as potentially occurring within the Operational Area and EMBA .....	96
Table 4-3: Habitats and Communities within the EMBA .....	98
Table 4-4: Threatened and Migratory Fish, Shark and Ray Species predicted to occur within the Operational Area and EMBA.....	101
Table 4-5: Fish, Shark and Ray BIAs within the Operational Area and EMBA.....	103
Table 4-6: Threatened and Migratory marine reptile species predicted to occur within the Operational Area and EMBA .....	106
Table 4-7: Marine turtle BIAs within the Operational Area and the EMBA .....	107
Table 4-8: Habitat Critical to the Survival of Marine Turtles occurring within the EMBA.....	109
Table 4-9: Threatened and Migratory marine mammal species predicted to occur within the Operational Area and EMBA .....	114
Table 4-10: Marine mammal BIAs within the Operational Area and the EMBA .....	116
Table 4-11: Threatened and Migratory seabird and shorebird species predicted to occur within the Operational Area and EMBA.....	126
Table 4-12: Seabird and shorebird BIAs within the Operational Area and EMBA .....	133
Table 4-13: Key seasonal sensitivities for EPBC Listed threatened migratory species identified as occurring in or near the Operational Area .....	139
Table 4-14: KEFs within the Operational Area and EMBA.....	142
Table 4-15: Established protected places and other sensitive areas overlapping the EMBA .....	144

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-16: Summary of Native Title Claims, Determinations and ILUAs which overlap or are coastally adjacent to the EMBA.....	154
Table 4-17: Summary Marine Park Management Plans that overlap the EMBA.....	157
Table 4-18: Cultural features and heritage values identified in publicly available literature.....	160
Table 4-19: Feedback Received via Consultation to Inform Existing Environment Description....	177
Table 4-20 Summary of cultural features and heritage values.....	187
Table 4-21: Recorded shipwrecks within the EMBA.....	196
Table 4-22: World Heritage Properties and National / Commonwealth Heritage Listed Places within the EMBA.....	196
Table 4-23: Commonwealth and State managed commercial Fisheries overlapping the Operational Area and/or EMBA.....	199
Table 4-24: Other Oil and Gas Facilities located within 50km of the Operational Area.....	214
Table 4-25: Defence areas, facilities and UXOs overlapping the Operational Area (OA) and/or EMBA.....	216
Table 5-1: Categories of relevant persons.....	227
Table 5-2: Methodology for identifying relevant persons within the EMBA undertaken under regulation 25(1)(d) – by category.....	228
Table 6-1: Environmental impact and risk analysis summary table – planned activities.....	247
Table 6-2: Environmental impact and risk analysis summary table – unplanned events.....	248
Table 6-3: Noise sources associated with the PAP.....	275
Table 6-4: National Marine Fisheries Service sound exposure thresholds applicable to marine mammals, Southall et al. (2019).....	275
Table 6-5: Impact threshold for environmental receptors based on Popper et al. (2014).....	276
Table 6-6: Thresholds for permanent threshold shift, temporary threshold shift and behavioural response onset in marine turtles for continuous and impulsive noise.....	276
Table 6-7: Estimated sound transmission loss for two IMMR vessels operating together with a combined SLP of 185 dB re 1 µPa at 100 Hz frequency.....	278
Table 6-8: Estimated annual emissions from fuel combustion (excluding support vessels).....	286
Table 6-9: Estimated annual emissions from flaring.....	287
Table 6-10: Summary of Annual Direct and Indirect emissions attributable to Pyrenees.....	288
Table 6-11 Guideline values and frequency of routine monitoring if PW is discharged from the Pyrenees Facility.....	304
Table 6-12 Calculated guideline values (SSD) and safe dilutions required to achieve predicted no effect concentrations.....	308
Table 6-13: Characteristics of Pyrenees Crude.....	329
Table 6-14: Comparison of whole crude properties of Pyrenees, Stickle and SINTEF’s Martin Linge Crude 13C.....	329
Table 6-15: Summary of Thresholds Applied to the Quantitative Hydrocarbon spill Risk Modelling Results.....	330
Table 6-16: Key receptor locations and sensitivities potentially contacted above impact thresholds by the loss of well containment scenario with summary hydrocarbon spill contact.....	334
Table 6-17: Summary of worst-case loss of containment scenario.....	364
Table 6-18: Identification of Applicability of Recovery Plan and Threat Abatement Plan Objectives and Action Areas.....	417
Table 6-19: Assessment against relevant actions of the Marine Turtle Recovery Plan.....	420
Table 6-20: Assessment against relevant actions of the Blue Whale Conservation Management Plan.....	422
Table 6-21: Assessment against relevant actions of the Grey Nurse Shark Recovery Plan.....	423
Table 6-22: Assessment against relevant actions of the Sawfish and River Shark Recovery Plan.....	424
Table 6-23: Assessment against relevant actions of the Marine Debris Threat Abatement Plan.....	425
Table 7-1: Inventory of Woodside infrastructure within WA-42-L and WA-43-L.....	441
Table 7-2: Roles and responsibilities.....	448

# 1. INTRODUCTION

## 1.1 Overview

Woodside Energy (Australia) Pty Ltd (Woodside), as Titleholder under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Cth) (referred to as the Environment Regulations), and as a participant in the Joint Venture detailed in Section 1.6, submits this Environment Plan as operator of the Pyrenees Facility. The Pyrenees Facility is located in production licences WA-42-L and WA-43-L and commenced operation in 2010. Crude oil is produced from the Ravensworth, Crosby, Stickle, Tanglehead, Wild Bull and Moondyne reservoirs (collectively referred to as 'the Pyrenees reservoirs') via a single stand-alone floating production, storage and offloading vessel (the Pyrenees Venture FPSO).

The operation of the Pyrenees Facility includes the following activities:

- Routine production of crude oil and gas
- Routine and non-routine operations of the Pyrenees FPSO and associated subsea infrastructure
- Routine injection and production of gas to the Macedon-6 injection well, which is maintained and operated under the Macedon Operations Environment Plan.
- Routine and non-routine inspection, monitoring, maintenance and repair (IMMR) of the Pyrenees FPSO and associated subsea infrastructure.
- Disconnection and sail-away of the FPSO

These activities will hereafter be referred to as the Petroleum Activities Program (PAP) and form the scope of this Environment Plan (EP). A more detailed description of the activities is provided in Section 3.

This EP has been prepared in accordance with the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

## 1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- the potential environmental impacts and risks (planned (routine and non-routine) and unplanned) that may result from the PAP are identified
- appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable
- the PAP is carried out in a manner consistent with the principles of ecologically sustainable development (as defined in Section 3A of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act)).

This EP describes the process and resulting outputs of the risk assessment, whereby impacts and risks are managed accordingly.

The EP defines activity-specific environmental performance outcomes (EPOs), standards (EPSs), and measurement criteria (MC). These form the basis for monitoring, auditing, and managing the PAP to be undertaken by Woodside and its contractors. The implementation strategy (derived from the decision support framework tools) specified in this EP provides Woodside and NOPSEMA with the required level of assurance that impacts and risks associated with the PAP are reduced to ALARP and are acceptable.

### 1.3 Scope of the Environment Plan

The scope of this EP covers the activities that define the PAP, as described in Section 3, for a period of up to five years. The Operational Area, as defined in Section 3.2.1, defines the spatial boundary of the PAP.

This EP addresses potential environmental impacts from planned activities and potential unplanned risks that originate from within the Operational Area. Transit to and from the Operational Area by project vessels, as well as port activities associated with these vessels, are not within the scope of this EP. Vessels supporting the PAP operating outside the Operational Area (e.g. transiting to and from port) are subject to applicable maritime regulations and other requirements and are not managed by this EP.

### 1.4 Environment Plan Summary

The EP summary below (Table 1-1) is based on the material provided in this EP, as required by Regulation 35(4).

**Table 1-1: EP Summary**

EP Summary material requirement	Relevant section of this EP containing EP Summary material
The location of the activity	Section 3
A description of the receiving environment	Section 4
A description of the activity	Section 3
Details of the environmental impacts and risks	Section 6
The control measures for the activity	Section 6
The arrangements for ongoing monitoring of the titleholder's environmental performance	Section 7
Response arrangements in the oil pollution emergency plan (OPEP)	Section 7
Consultation already undertaken and plans for ongoing consultation	Section 5
Details of the titleholder's nominated liaison person for the activity	Section 1.7.2

### 1.5 Structure of the Environment Plan

The EP has been structured to reflect the process and requirements of the Environment Regulations, as outlined in Table 1-2.

**Table 1-2: EP process phases, applicable Environment Regulations and relevant section of EP**

Criteria for acceptance	Content Requirements/Relevant Regulations	Elements	Section of EP
Regulation 34(a): is appropriate for the nature and scale of the activity	Regulation 21: Environmental Assessment Regulation 22: Implementation strategy for the environment plan Regulation 24: Other information in the environment plan	The principle of 'nature and scale' applies throughout the EP	Section 2 Section 3 Section 4 Section 5 Section 6 Section 7

Criteria for acceptance	Content Requirements/Relevant Regulations	Elements	Section of EP
<p>Regulation 34(b): demonstrates that the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable</p> <p>Regulation 34(c): demonstrates that the environmental impacts and risks of the activity will be of an acceptable level</p>	<p>Regulation 21(1)–21(7):</p> <p>21(1) Description of the activity</p> <p>21(2)(3) Description of the environment</p> <p>21(4) Requirements</p> <p>21(5)(6) Evaluation of environmental impacts and risks</p> <p>21(7) Environmental performance outcomes and standards</p> <p>Regulation 24(a)–24(c):</p> <p>A statement of the titleholder’s corporate environmental policy</p> <p>A report on all consultations between the titleholder and any relevant person</p>	<p>Set the context (activity and existing environment)</p> <p>Define ‘acceptable’ (the requirements, the corporate policy, relevant persons)</p> <p>Detail the impacts and risks</p> <p>Evaluate the nature and scale</p> <p>Detail the control measures – ALARP and acceptable</p>	<p>Section 1</p> <p>Section 2</p> <p>Section 3</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 7</p>
<p>Regulation 34(d): provides for appropriate environmental performance outcomes, environmental performance standards and measurement criteria</p>	<p>Regulation 21(7):</p> <p>Environmental performance outcomes and standards</p>	<p>EPOs</p> <p>EPSs</p> <p>MC</p>	<p>Section 6</p>
<p>Regulation 34(e): includes an appropriate implementation strategy and monitoring, recording and reporting arrangements</p>	<p>Regulation 22:</p> <p>Implementation strategy for the environment plan</p>	<p>Implementation strategy, including:</p> <p>systems, practices and procedures</p> <p>performance monitoring</p> <p>OPEP and scientific monitoring</p> <p>ongoing consultation.</p>	<p>Section 7</p>
<p>Regulation 34(f): does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the EPBC Act</p>	<p>Regulation 21 (1)–21(3):</p> <p>21(1) Description of the activity</p> <p>21(2) Description of the environment</p> <p>21(3) Without limiting [Regulation 21(2)(b)], particular relevant values and sensitivities may include any of the following:</p> <p>the world heritage values of a declared World Heritage property within the meaning of the EPBC Act;</p> <p>the national heritage values of a National Heritage place within the meaning of that Act;</p> <p>the ecological character of a declared Ramsar wetland within the meaning of that Act;</p> <p>the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act;</p> <p>the presence of a listed migratory species within the meaning of that Act;</p> <p>any values and sensitivities that exist in, or in relation to, part or all of:</p>	<p>No activity, or part of the activity, undertaken in any part of a declared World Heritage property</p>	<p>Section 3</p> <p>Section 4</p> <p>Section 6</p>

Criteria for acceptance	Content Requirements/Relevant Regulations	Elements	Section of EP
	a Commonwealth marine area within the meaning of that Act; or Commonwealth land within the meaning of that Act.		
Regulation 34(g): (i) the titleholder has carried out the consultations required by Division 2.2A (ii) the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate	Regulation 25: Consultation with relevant authorities, persons and organisations, etc. Regulation 24(b): A report on all consultations between the titleholder and any relevant person	Consultation in preparation of the EP	Section 5
Regulation 34(h): complies with the Act and the regulations	Regulation 23: Details of the Titleholder and Nominated Liaison person Regulation 24(c): Details of all reportable incidents in relation to the proposed activity.	All contents of the EP must comply with the Act and the regulations	Section 1.6 Section 7

## 1.6 Description of the Titleholder

Woodside is the Titleholder for this PAP, operating on behalf of the Pyrenees Joint Venture (the Joint Venture).

For the Crosby, Stickle, Tanglehead, Wild Bull and Moondyne reservoirs located within production licence WA-42-L, the Joint Venture comprises of:

- Woodside Energy (Australia) Pty Ltd
- Santos WA PVG Pty Ltd.

For the Ravensworth reservoir split between production licence WA-42-L and the adjacent WA-43-L, the Joint Venture comprises of:

- Woodside Energy (Australia) Pty Ltd
- Santos WA PVG Pty Ltd
- INPEX Alpha Ltd.

## 1.7 Details of Titleholder and Nominated Liaison Person

In accordance with Regulation 23 of the Environment Regulations, details of the titleholder, nominated liaison person and arrangements for the notification of changes are described below.

### 1.7.1 Titleholder

Woodside Energy (Australia) Pty Ltd

11 Mount Street

Perth, Western Australia

T: 1800 442 977

ACN: 39 006 923 879

### 1.7.2 Nominated Liaison Person

Andrew Winter

Corporate Affairs Manager

11 Mount Street

Perth, Western Australia

T: 1800 442 977

E: feedback@woodside.com

### **1.7.3 Arrangements for Notifying Change**

If the titleholder, titleholder's nominated liaison person, or the contact details for the titleholder or the liaison person change, then NOPSEMA will be notified of the change in writing within two weeks or as soon as practicable.

### **1.8 Woodside / BHP Petroleum Merger**

BHP Group Ltd's petroleum assets (BHP Petroleum) and Woodside announced their intention to merge in 2021, which became effective on 1 June 2022. BHP Petroleum policies, standards, processes and procedures were included in the merger agreement and remain valid. Harmonisation of processes between BHP Petroleum and Woodside commenced upon the completion of the merger and will be conducted in a staged manner. The BHP Petroleum HSE Management system (herein referred to as the Woodside (PetDW) HSE Management System) will continue to be used by the Pyrenees facility until potential changes have been assessed.

The Titleholder name change from BHP Petroleum (Australia) Pty Ltd to Woodside Energy (Australia) Pty Ltd was made on 11 July 2022.

### **1.9 Woodside (PetDW) Management System**

All Woodside controlled activities associated with the PAP will be conducted in line with:

- Woodside "Our Values",
- Woodside Environment and Biodiversity Policy (Appendices
-

- Appendix A),
- Woodside (PetDW) Management System,
- Woodside (PetDW) Health, Safety and Environment (HSE) Standard.

The Pyrenees Facility is required to maintain up-to-date practices that adhere to the requirements contained in the Woodside (PetDW) HSE Management System and Standard. Activity-specific environmental management measures specific to the PAP are implemented through this EP.

### 1.9.1 Environment Policy

In accordance with Regulation 24(a) of the Environment Regulations, Woodside’s Environment and Biodiversity Policy is provided in Appendix A of this EP

### 1.10 Description of Relevant Requirements

In accordance with Regulation 21(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the activity and are relevant to the management of risks and impacts of the PAP are detailed in Appendix B. This EP will not be assessed under the *Environmental Protection Act 1986 (WA)* as the activity does not occur on State land or within State Waters.

#### 1.10.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006 (Cth)

The *Offshore Petroleum and Greenhouse Gas Storage Act 2006 (Cth)* (OPGGS Act) regulates exploration and production activities beyond three nautical miles (nm) of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone at 200 nm.

This EP provides relevant information in relation to Section 572 of the OPGGS Act, as detailed in Table 1-3.

**Table 1-3: Relevant requirements of the OPGGS Act 2006**

Section Number	Relevant Requirement	Relevant Section of the EP
<b>Section 572 - Maintenance and removal of property etc. by titleholder</b>		
2	A titleholder must maintain in good condition and repair all structures that are, and all equipment and other property that is: (a) in the title area; and (b) used in connection with the operations authorised by the permit, lease, licence or authority.	Section 3 (specifically Section 3.18)
3	A titleholder must remove from the title area all structures that are, and all equipment and other property that is, neither used nor to be used in connection with the operations: (a) in the title area; and (b) used in connection with the operations authorised by the permit, lease, licence or authority.	Section 7.6
7	This section has effect subject to: (a) any other provision of this Act; and (b) the regulations; and (c) a direction given by NOPSEMA or the responsible Commonwealth Minister under; (i) Chapter 3; or (ii) this Chapter; and (d) any other law.	Section 7.6

Under the OPGGS Act, the Environment Regulations apply to petroleum activities in Commonwealth Waters and are administered by NOPSEMA. The objective of the Environment Regulations is to ensure petroleum activities are performed in a manner:

- consistent with the principles of ecological sustainable development
- by which the environmental impacts and risks of the activity will be reduced to ALARP
- by which the environmental impacts and risks of the activity will be of an acceptable level.

**1.10.2 Environment Protection and Biodiversity Conservation Act 1999 (Cth)**

One of the objectives of the EPBC Act is to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the Act as “Matters of National Environmental Significance” (MNES). The EPBC Act sets a regime which aims to ensure actions taken on (or impacting upon) Commonwealth land or waters are consistent with the principles of ecological sustainable development. When a person proposes to take an action that they believe may need approval under the EPBC Act, they must refer the proposal to the Commonwealth Minister for the Environment and Water.

The Pyrenees Petroleum Field was referred for assessment under the EPBC Act in 2005 (EPBC 2005/2034) and was determined to be a Controlled Action as defined in Part 3 of the EPBC Act. The level of assessment was set at an Environmental Impact Statement (EIS), and the action was subsequently approved with conditions on 26 April 2006. Consolidated Approval Notice – Pyrenees Oil Field (EPBC 2005/2034) dated 8 September 2015 was issued to consolidate the approval conditions, and the approval conditions were subject to variation on the date of the notice. A key element to the variation relates to conditions requiring a plan for managing the impacts of the action. The previous conditions required the Minister’s approval of such plans. The variation now automatically deems the plan to have been approved by the Minister if the measures are:

- included in an environment plan related to the action that was submitted to NOPSEMA after 27 February 2014
- in force under the Environment Regulations.

Conditions relating to the EPBC Act approval that are considered relevant to the scope of this EP are provided in Table 1-4.

**Table 1-4: Conditions from Pyrenees Petroleum Field Development (EPBC 2005/2034) relevant to the PAP**

Section Number	Relevant Requirement	Relevant Section of the EP
1 (c)	<p>The person taking the actions must submit, for the Minister’s approval, a plan (or plans) for managing the offshore impacts of the action. The plan (or plans) must include measures for operations</p> <ul style="list-style-type: none"> <li>i. trading tanker vetting procedures;</li> <li>ii. produced formation water and naturally occurring radioactivity materials monitoring and management;</li> <li>iii. interaction procedures for supply vessels and aircraft that are consistent with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000;</li> <li>iv. monitoring of noise effects of operations on cetaceans; and</li> <li>v. cetacean and whale shark sightings reporting.</li> </ul> <p>Individual offshore activities may not commence until the plan (or plans) for that specific activity has been approved. The approved plan (or plans) must be implemented.</p>	<ul style="list-style-type: none"> <li>i. Section 7.10.8</li> <li>ii. Section, 3.19.3, 6.7.6 and 6.8.9</li> <li>iii. Section 6.7.4</li> <li>iv. Section 6.7.4</li> <li>v. Section 7.14</li> </ul>

Section Number	Relevant Requirement	Relevant Section of the EP
2.	<p>The person taking the action must submit for the Minister's approval an oil spill contingency plan to mitigate the environmental effects of any hydrocarbon spills. The oil spill contingency plan must include:</p> <ul style="list-style-type: none"> <li>• the types of dispersants, protective booms, clean up gear, and related equipment to be used in the event of an oil spill and their storage arrangements;</li> <li>• a demonstrated capacity to deploy oil spill response equipment within 12 hours;</li> <li>• training of staff in oil spill response measures;</li> <li>• identification of sensitive areas, in particular, Ningaloo Marine Park, and specific response measures for these areas; and</li> <li>• the reporting of oil spill incidents.</li> </ul>	<p>Appendix H Appendix I: First Strike Plan Section 7.15.2</p>
3.	<p>The person taking the action must submit a decommissioning plan for approval by the Minister that considers the removal of all structures and components above the sea floor, including floating production, storage and offtake vessels, subsea wells, flowlines, and any other associated infrastructure. Decommissioning may not commence until the plan is approved. The approved plan must be implemented.</p>	<p>Decommissioning is beyond the scope of the EP.</p>
10.	<p>A plan required by condition 1, 2, 3 or 6 is automatically deemed to have been submitted to, and approved by, the Minister if the measures (as specified in the relevant condition) are included in an environment plan (or environment plans) relating to the taking of the action that:</p> <ol style="list-style-type: none"> <li>a) was submitted to NOPSEMA after 27 February 2014; and</li> <li>b) either: <ol style="list-style-type: none"> <li>i. is in force under the OPGGS Environment Regulations; or</li> <li>ii. has ended in accordance with regulation 25A of the OPGGS Environment Regulations.</li> </ol> </li> </ol>	<p>The implementation of this EP is considered to meet this Condition.</p>
10A.	<p>Where a plan required by condition 1, 2 or 6 has been approved by the Minister and the measures (as specified in the relevant condition) are included in an environment plan (or environment plans) that:</p> <ol style="list-style-type: none"> <li>a) was submitted to NOPSEMA after 27 February 2014; and</li> <li>b) either: <ol style="list-style-type: none"> <li>i. is in force under the OPGGS Environment Regulations; or</li> <li>ii. has ended in accordance with regulation 25A of the OPGGS Environment Regulations</li> </ol> </li> </ol> <p>the plan approved by the Minister no longer needs to be implemented.</p>	<p>The implementation of this EP is considered to meet this Condition and supersedes previously approved plans.</p>
10B.	<p>Where an environment plan, which includes measures specified in the conditions referred to in conditions 10 and 10A above, is in force under the OPGGS Environment Regulations that relates to the taking of the action, the person taking the action must comply with those measures as specified in that environment plan.</p>	<p>The implementation of this EP is considered to meet this Condition.</p>

### 1.10.2.1 Recovery Plans and Threat Abatement Plans

Under s139(1)(b) of the EPBC Act, the Minister for the Environment and Water must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the EPBC Act. Similarly, under s268 of the EPBC Act:

“A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.”

In relation to offshore petroleum activities in Commonwealth waters, these requirements are implemented by NOPSEMA via the commitments in the Program. Relevant recovery plans or threat

abatement plans relevant to the scope of this EP have been identified as described and assessed in Section 6.9.

### 1.10.2.2 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs), formally known as Commonwealth Marine Reserves, are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP) is responsible for managing AMPs (supported by Parks Australia) and is required to publish management plans for them. Other parts of the Commonwealth Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans (s362 of the EPBC Act). Relevant AMPs are listed in Section 4.8 and described in Appendix J. The North-west Marine Parks Network Management Plan describes the requirements for management.

### 1.10.2.3 World Heritage Properties

Australian World Heritage management principles are prescribed in Schedule 5 of the EPBC Regulations 2000. Management principles that are considered relevant to the scope of this EP are provided in Table 1-5.

**Table 1-5: Relevant Management Principles under Schedule 5—Australian World Heritage management principles of the EPBC Act.**

Number	Principle	Relevant Section of the EP
3	<p>Environmental impact assessment and approval</p> <p>3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not).</p> <p>3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process.</p> <p>3.03 The assessment process should:</p> <ul style="list-style-type: none"> <li>identify the World Heritage values of the property that are likely to be affected by the action; and</li> <li>examine how the World Heritage values of the property might be affected; and</li> <li>provide for adequate opportunity for public consultation.</li> </ul> <p>3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</p> <p>3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</p> <p>3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.</p>	<p>3.01 and 3.02: Assessment of significant impact on World Heritage values is included in Section 6. Principles are met by the submitted EP.</p> <p>3.03 (a) and (b): World Heritage values are identified in Section 4 and considered in the assessment of impacts and risks for the PAP assessed in Section 6.</p> <p>3.03 (c): Consultation and feedback received in relation to impacts and risks to the Ningaloo World Heritage Property and the Shark Bay World Heritage Property are outlined in Section 5.</p> <p>3.04, 3.05 and 3.06: Principles are considered to be met by the acceptance of this EP.</p>

*Note that Section 1 – General Principles and 2 – Management Planning of Schedule 5 are not considered relevant to the scope of this EP and, therefore, have not been included.*

## 2. ENVIRONMENT PLAN PROCESS

### 2.1 Overview

This section outlines the process taken by Woodside to prepare this EP, once the activity was defined as a petroleum activity. This process describes the activity, the existing environment, followed by the environmental risk management methodology used to identify, analyse and evaluate risks to meet ALARP levels and acceptability requirements, and develop EPOs and EPSs. This section also describes Woodside's risk management methodologies as applied to implementation strategies for the activity.

Regulation 21(5) of the Environment Regulations requires the EP to include details of the environmental impacts and risks of the PAP, and an evaluation of all the environmental impacts and risks, appropriate to the nature and scale of each impact or risk. The objective of the risk assessment process described in this section is to identify risks and associated impacts of an activity, so they can be assessed, and appropriate control measures applied to eliminate, control or mitigate the impact/risk to ALARP, and to determine if the impact or risk level is acceptable.

Environmental impacts and risks include those directly and indirectly associated with the PAP, and include potential emergency and accidental events:

- Planned activities have the inherent potential to cause environmental impacts
- Environmental risks are unplanned events with the potential for environmental impact (termed risk 'consequence').

Herein, potential impacts from planned activities are termed 'impacts', and 'risks' are associated with unplanned events with the potential for environmental impact (should the risk be realised), with such impacts termed potential 'consequences'.

### 2.2 Environmental Risk Management Methodology

#### 2.2.1 Woodside PetDW Risk Management Process

Woodside recognises that risk is inherent to its business and that effective management of risk is vital to delivering on company objectives, success and continued growth. Woodside is committed to managing risk proactively and effectively. The objective of Woodside's PetDW risk management system is to provide a consistent process for recognising and managing risks across Woodside's PetDW business. Achieving this objective includes ensuring risks consider impacts across these key areas of exposure: health and safety, environment, finance, reputation and brand, legal and compliance, and social and cultural.

The environmental risk management methodology used in this EP is based on Woodside's PetDW Risk Management Procedure. This procedure aligns to industry standards, such as International Organization for Standardization (ISO) 31000.

The risk management methodology provides a framework to demonstrate that risks and impacts are continually identified, reduced to ALARP and assessed to be at an acceptable level, as required by the Environment Regulations. A description of each step and how it is applied to the scopes of this activity is provided in Section 2.2 to Section 2.11.

#### 2.2.2 Impact Assessment Process

To support effective environmental risk assessment, the impact assessment process illustrated in Figure 2-1 is used. This provides the steps undertaken to meet the required environment, health and social standards by ensuring impact assessments are undertaken appropriate to the nature and scale of the activity, the regulatory context, the receiving environment, interests, concerns and rights of relevant persons, and the applicable framework of standards and practices.

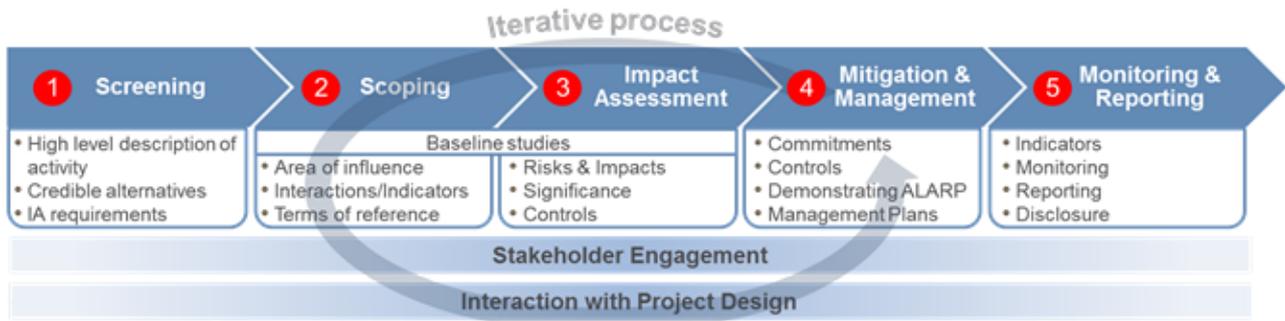

Figure 2-1: Impact assessment process

### 2.3 Environment Plan Development Process

The EP development process is illustrated in Figure 2-2. Each element of this process is discussed further in Section 2.4 to Section 2.10.

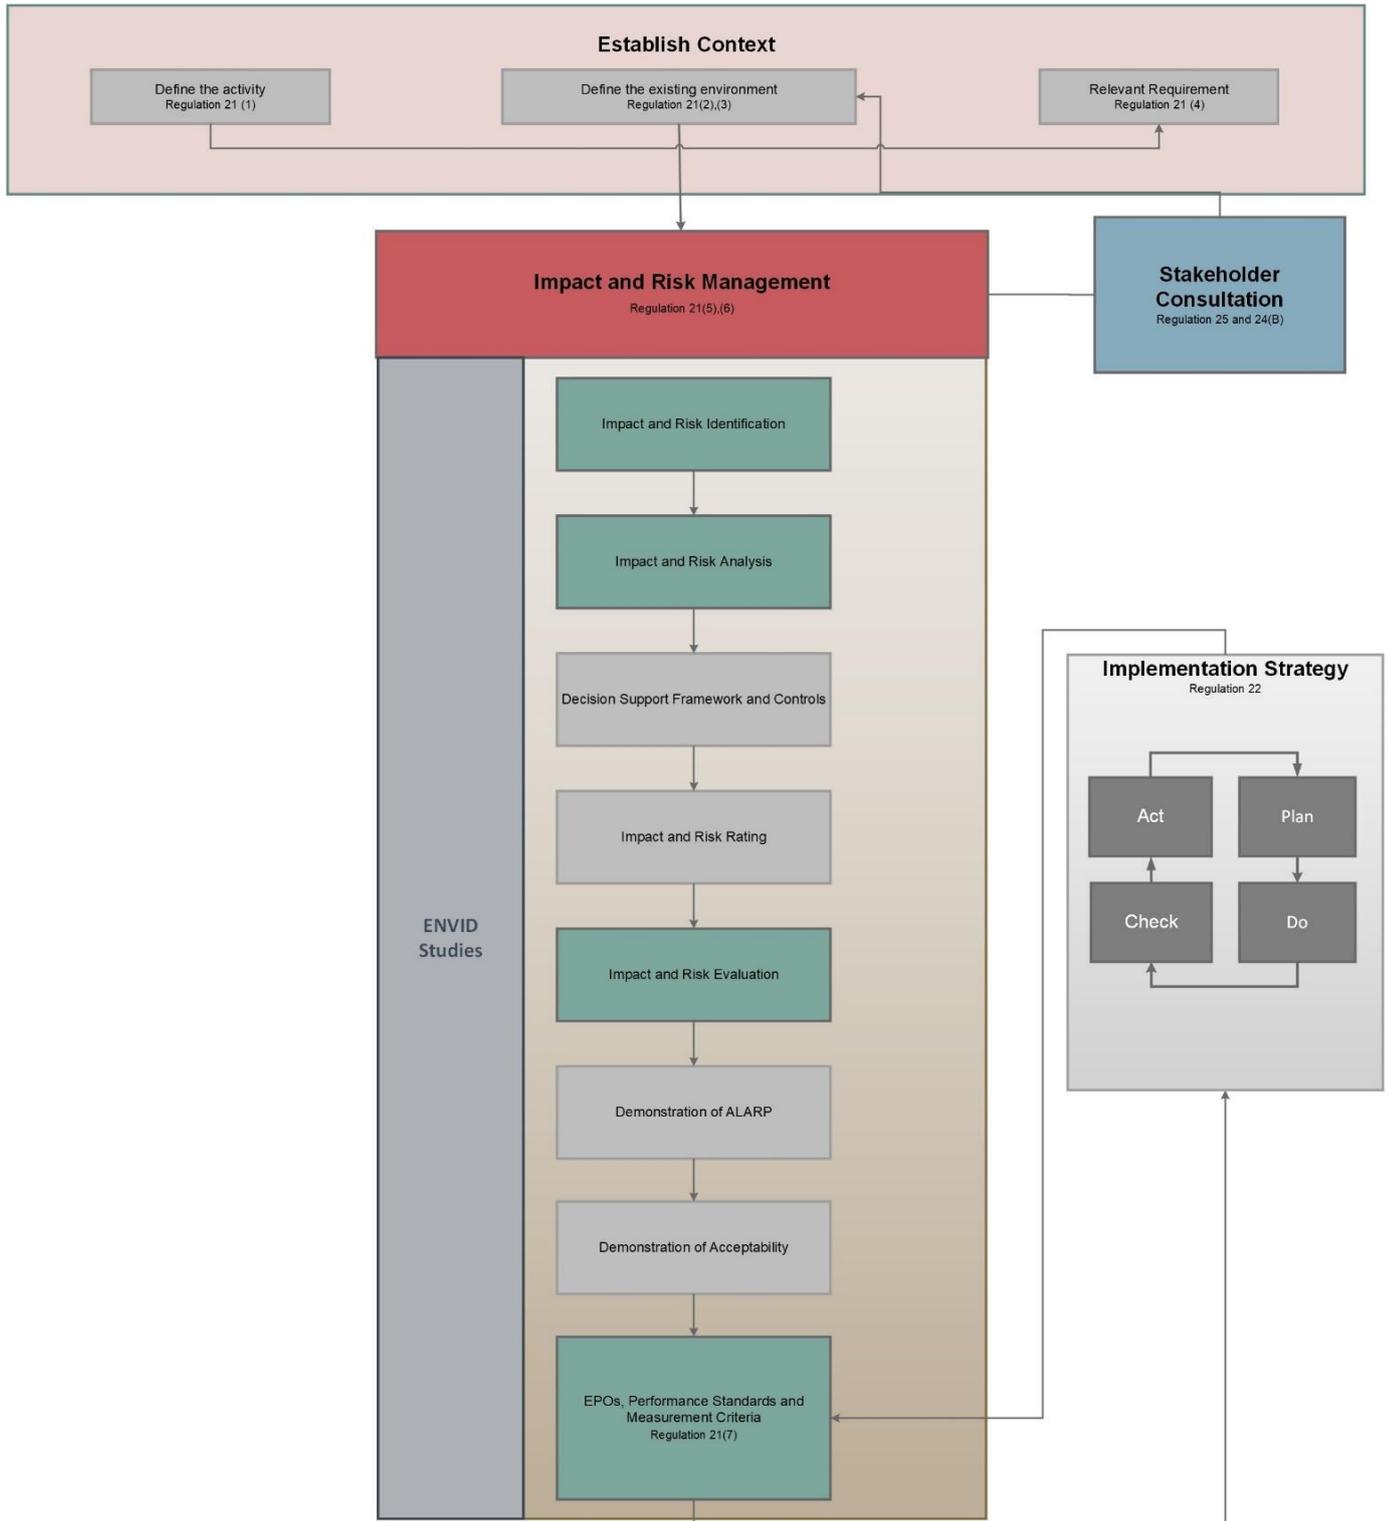

Figure 2-2: Environment Plan Development Process

## 2.4 Establish the Context

### 2.4.1 Define the Activity

This first stage involves evaluating whether the activity meets the definition of a 'petroleum activity' as defined in the Environment Regulations.

The activity is then described in relation to:

- the location
- what is to be undertaken
- how it is planned to be undertaken, including outlining operational details of the activity and proposed timeframes.

The 'what' and 'how' are described in the context of 'environmental aspects'<sup>1</sup> to inform the risk and impact assessment for planned (routine and non-routine) and unplanned (accidents/incidents/emergency conditions) activities.

The activity is described in Section 3 and is referred to as the PAP.

### 2.4.2 Define the Existing Environment

The existing environment that may be affected by the PAP is defined by considering the nature and scale of the activity (size, type, timing, duration, complexity, and intensity of the activity), as described in Section 3. The purpose is to describe the existing environment that may be impacted by the activity, directly or indirectly, by planned or unplanned events.

The Existing Environment (Section 4) is structured into subsections defining the physical, biological, socio-economic and cultural attributes of the area of interest, in accordance with the definition of environment in Regulation 5 of the Environment Regulations. These subsections make particular reference to:

- the environmental, and social and cultural consequences as defined by Woodside (refer to Table 2-3), which address key physical and biological attributes, as well as social and cultural values of the existing environment. These consequence definitions are applied to the impact and risk analysis (refer Section 2.6) and rated for planned and unplanned activities. Additional detail is provided for unplanned hydrocarbon spill risk evaluation.
- EPBC Act MNES including listed threatened species and ecological communities and listed migratory species. Defining the spatial extent of the existing environment is guided by the nature and scale of the PAP (and associated sources of environmental risk). This considers the Operational Area and wider environment that may be affected (EMBA), as determined by the hydrocarbon spill risk assessments presented in Section 6.8. MNES, as defined under the EPBC Act, are addressed through Woodside's PetDW impact and risk assessment (Section 6).
- relevant values and sensitivities, which may include world or national heritage listed areas, listed threatened species or ecological communities, listed migratory species, or sensitive values.

By grouping potentially impacted environmental values by aspect (as presented in Table 2-1), the presentation of information about the receiving environment is standardised. This information is then consistently applied to the risk evaluation section to provide a robust approach to the overall environmental risk evaluation and its documentation in the EP.

---

<sup>1</sup> An environmental aspect is an element of the activity that can interact with the environment.

**Table 2-1: Example of the Environment Values Potentially Impacted which are Assessed within the Environment Plan**

Environmental Value Potentially Impacted Regulations 21(2)(3)						
Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitats	Species	Socio-economic

### 2.4.3 Relevant Requirements

The relevant requirements in the context of legislation, other environmental approval requirements, conditions and standards that apply to the PAP are identified and reviewed and are presented in Appendix B.

The Woodside Environment and Biodiversity Policy is presented in Appendix A: Woodside Environment and Biodiversity Policy.

## 2.5 Impact and Risk Identification

Relevant environmental aspects and hazards have been identified that support the process to define environmental impacts and risks associated with an activity.

The environmental impact and risk assessment presented in this EP has been informed by recent and historic hazard and environmental risk identification studies (e.g. HAZID/ENVID) and consequence modelling studies for high consequence, low probability environmental risks. Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in Section 3), the existing environment (Section 4) and the outcomes of Woodside’s consultation process (Section 5). The environmental outputs of applicable risk and impact workshops and associated studies are referred to as ENVID in this EP.

An environmental impacts and risks identification and assessment workshop was undertaken by multidisciplinary teams comprising relevant operational and environmental personnel with sufficient breadth of knowledge, training and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified, during the workshop, for both planned (routine and non-routine) activities and unplanned (accidents/incidents/emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

Impacts and risks were evaluated and tabulated for each planned activity and unplanned events respectively. Environmental impacts and risks were recorded in an environmental impacts and risk register. The output of the workshop is used to present the risk assessment and form the basis of EPOs, EPSs, and MC. This information is presented in Section 6, following the format presented in Table 2-2.

**Table 2-2: Example of Layout of Identification of Risks and Impacts in Relation to Risk Sources**

Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-economic	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Summary of source of impact/risk														

## 2.6 Impact and Risk Analysis

Risk analysis further develops the understanding of a risk by defining the impacts and assessing appropriate controls, as well as considering previous risk assessments for similar activities, relevant studies, past performance, relevant persons feedback, and the existing environment.

These key steps were undertaken for each identified risk during the risk assessment:

- identify the Decision Type in accordance with the decision support framework
- identify appropriate control measures (preventive and mitigation) aligned with the Decision Type
- assess the risk rating.

### 2.6.1 Decision Support Framework

To support the risk assessment process and the determination of acceptability (Section 2.7.2), Woodside’s PetDW environmental risk management process includes the use of a decision support framework based on principles set out in the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014) (Figure 2-3). This concept is integrated into the environmental impacts and risks identification and assessment workshop to determine the level of supporting evidence that may be required to draw sound conclusions regarding risk level and whether the risk is acceptable and ALARP. Application of the decision support framework confirms:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks and impacts based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher order environmental impacts are subject to further evaluation/assessment).

The framework provides appropriate tools commensurate to the level of uncertainty or novelty associated with the risk/impact (referred to as the Decision Type A, B, or C). The Decision Type is selected based on an informed discussion around the uncertainty of the risk/impact and is documented in impact and risk register worksheets.

This framework enables Woodside to appropriately understand a risk and determine if the risk or impact is acceptable and can be demonstrated to be ALARP.

### 2.6.1.1 Decision Type A

Decision Type A risks and impacts are well understood and established practice. They are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and use professional judgment.

### 2.6.1.2 Decision Type B

Decision Type B risks and impacts typically involve greater uncertainty and complexity; and can include potential higher-order impacts/risks. These risks may deviate from established practice or have some lifecycle implications and therefore require further engineering risk assessment to support the decision and ensure that the risk is ALARP. Engineering risk assessment tools may include:

- risk-based tools such as cost-based analysis or modelling
- consequence modelling
- reliability analysis
- company values.

### 2.6.1.3 Decision Type C

Decision Type C risks and impacts typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty therefore requiring the adoption of the precautionary approach. The risks may result in significant environmental impact, significant project risk/exposure, or may elicit relevant persons concern. For these risks or impacts, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external consultation as part of the risk assessment process.

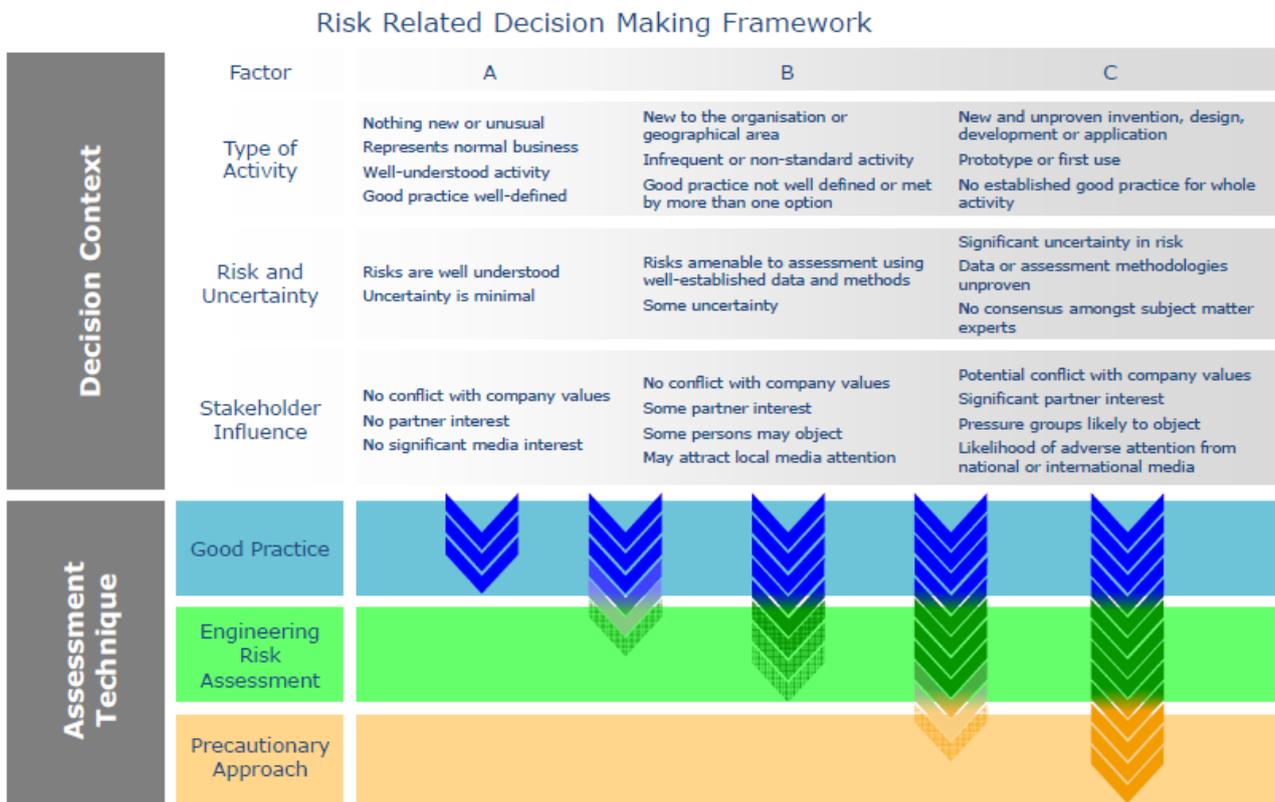

Figure 2-3: Risk-related Decision-making Framework (Oil and Gas UK, 2014)

### 2.6.1.4 Decision Support Framework Tools

These framework tools are applied, as appropriate, to help identify control measures based on the Decision Type described above:

- Legislation, Codes and Standards (LCS) – identifies the requirements of legislation, codes and standards that are to be complied with for the activity.
- Good Industry Practice (GP) – identifies further engineering control standards and guidelines that may be applied by Woodside above that required to meet the LCS.
- Professional Judgement (PJ) – uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- Risk-based Analysis (RBA) – assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost–benefit analysis to support the selection of control measures identified during the risk assessment process.
- Company Values (CV) – identifies values identified in Woodside’s code of conduct, policies and the Woodside Our Values. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- Societal Values (SV) – identifies the views, concerns, and perceptions of relevant persons and addresses those views, concerns and perceptions.

#### 2.6.1.4.1 Decision Calibration

To determine that the alternatives selected and control measures applied are suitable, these tools may be used for calibration (i.e. checking) where required:

- LCS/Verification of Predictions – Verification of compliance with applicable LCS and/or good industry practice.
- Peer Review – Independent peer review of PJs, supported by RBA, where appropriate.
- Benchmarking – Where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk.
- Internal Consultation – Consultation undertaken within Woodside to inform the decision and verify company values are met.
- External Consultation – Consultation undertaken to inform the decision and verify societal values are considered.

Where appropriate, additional calibration tools may be selected specific to the Decision Type and the activity.

### 2.6.2 Control Measures (Hierarchy of Controls)

Risk reduction measures are prioritised and categorised in accordance with the hierarchy of controls, where risk reduction measures at the top of the hierarchy take precedence over risk reduction measures further down:

- **Elimination** of the risk by removing the hazard.
- **Substitution** of a hazard with a less hazardous one.
- **Engineering Controls** include design measures to prevent or reduce the frequency of the risk event, or detect or control the risk event (limiting the magnitude, intensity and duration) such as:
  - Prevention: design measures that reduce the likelihood of a hazardous event occurring
  - Detection: design measures that facilitate early detection of a hazardous event

- Control: design measures that limit the extent/escalation potential of a hazardous event
  - Mitigation: design measures that protect the environment if a hazardous event occurs
  - Response Equipment: design measures or safeguards that enable clean-up/response after a hazardous event occurs.
- **Procedures and Administration** includes management systems and work instructions used to prevent or mitigate environmental exposure to hazards.
  - **Emergency Response and Contingency Planning** includes methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

### 2.6.3 Impact and Risk Classification

Environmental impacts and risks are assessed to determine the potential impact severity/consequence using the process shown in Figure 2-4.

Impacts are classified in accordance with the consequence severity (Table 2-3). The assigned severity level is determined after identifying the Decision Type and appropriate control measures.

Risks are assessed qualitatively and/or quantitatively in terms of both likelihood and consequence severity in accordance with the Woodside PetDW Risk Matrix (see Figure 2-5).

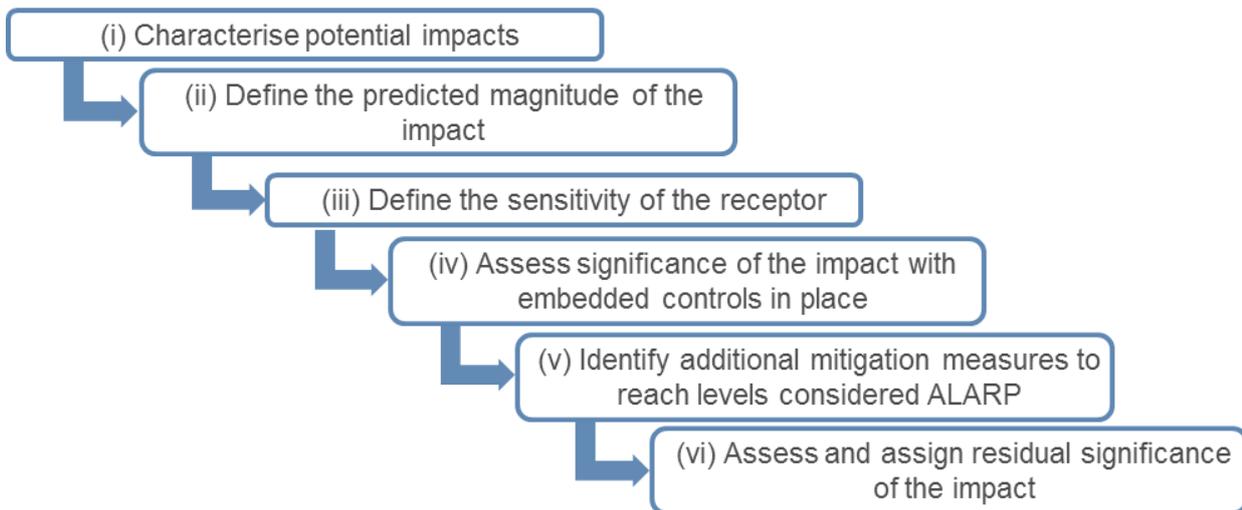

Figure 2-4: Environmental Risk and Impact Analysis

Table 2-3: Woodside PetDW Risk Matrix (Environment and Social and Cultural) Consequence Severity Descriptions, Severity Levels and Severity Factors

Environment	Social and Cultural	Severity Level	Severity Factor
Severe impact to the environment and where recovery of ecosystem function takes 10 years or more	Severe impact on community lasting more than 12 months or a substantiated human rights violation impacting 6 or more people	5 – Severe	1000
Serious impact to the environment and where recovery of ecosystem function takes between 3 years and up to 10 years	Serious impact on community lasting 6-12 months or a substantiated human rights violation impacting 1-5 people	4 – Serious	300
Substantial impact to the environment and where recovery of ecosystem function takes between 1 year and up to 3 years	Substantial impact on community lasting 2–6 months	3 – Substantial	100

Environment	Social and Cultural	Severity Level	Severity Factor
Measurable but limited impact to the environment, where recovery of ecosystem functions takes less than 1 year	Measurable but limited impact on community lasting less than 1 month	2 – Measurable	30
Minor temporary impact to the environment, where the ecosystem functions recover with little intervention	Minor temporary community impact that recovers with little intervention	1 – Minor	10

The impact and risk information, including classification and evaluation information as show in the example (Table 2-2), are tabulated for each planned activity and unplanned event.

### 2.6.3.1 Risk Rating Process

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence severity and likelihood. The assigned risk rating is determined with controls in place, therefore; the risk rating is determined after identifying the Decision Type and appropriate control measures. This is also commonly called residual risk.

The risk rating process considers the potential environmental consequences severity and, where applicable, the social and cultural consequences severity of the risk. The risk ratings are assigned using the Woodside PetDW Risk Matrix (refer to Figure 2-5). The risk matrix delivers a risk rating, which is a score for prioritisation purposes.

The risk rating process is undertaken using the steps described in the subsections below.

#### 2.6.3.1.1 Select the Severity Level

Determine the worst-case credible consequence severity (Table 2-3) associated with the selected event, assuming all controls (preventive and mitigative) are absent or have failed. If more than one potential consequence severity applies, select the highest severity consequence level.

#### 2.6.3.1.2 Select the Likelihood Level

Determine the description that best fits the chance of the selected consequence severity occurring, assuming reasonable effectiveness of the prevention and mitigation controls (Table 2-4).

**Table 2-4: Woodside PetDW Risk Matrix Likelihood Definitions Levels**

Description	Frequency	Likelihood Factor
Highly Likely	Likely to occur within a 1 year period.	3
Likely	Likely to occur within a 1 - 5 year period.	1
Possible	Likely to occur within a 5 - 20 year period.	0.3
Unlikely	Likely to occur within a 20 - 50 year period.	0.1
Highly Unlikely	Not likely to occur within a 50 year period.	0.03

#### 2.6.3.1.3 Calculate the Risk Rating

The risk rating is derived from the consequence severity factor and likelihood level factors above, in accordance with the Woodside PetDW Risk Matrix shown in Figure 2-5. Risk ratings in the green zone are considered “Tolerable” and require no further treatment to reach ALARP. Risk ratings in the red zone are considered higher-order risks, which must be considered further.

A likelihood and risk rating are only applied to environmental risks, not environmental impacts from planned activities.

This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk as an output of the ENVID studies.

Likelihood	Severity Level				
	1	2	3	4	5
Highly Likely	30	90	300	900	3000
Likely	10	30	100	300	1000
Possible	3	9	30	90	300
Unlikely	1	3	10	30	100
Highly Unlikely	0.3	0.9	3	9	30

Figure 2-5: Woodside PetDW Risk Matrix – Risk Level

## 2.7 Impact and Risk Evaluation

Environmental impacts and risks cover a wider range of issues, differing species, persistence, reversibility, resilience, cumulative effects, and variability in severity than safety risks. Determining the degree of environmental risk, and the corresponding threshold for whether a risk/impact has been reduced to ALARP and is acceptable, is evaluated to a level appropriate to the nature and scale of each impact or risk. Evaluation includes considering the:

- Decision Type
- principles of ecological sustainable development – as defined under the EPBC Act
- internal context – ensuring the proposed controls and risk level are consistent with Woodside policies, procedures and standards (Section 7 and Appendices
-

- Appendix A)
- external context – the environment consequence (Section 6) and stakeholder acceptability (Section 5)
- other requirements – ensuring the proposed controls and risk level are consistent with national and international standards, laws and policies.

In accordance with Environment Regulation 34(a), 34(b), 34(c) and 13(5)(b), Woodside applies the process described in the subsections below to demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

### 2.7.1 Demonstration of ALARP

The descriptions in Table 2-5 articulate how Woodside demonstrates that different risks, impacts and Decision Types identified within the EP are ALARP.

**Table 2-5: Summary of Woodside’s PetDW Criteria for ALARP Demonstration**

Decision Type	Demonstration of ALARP Description
<b>Decision Type A</b>	Demonstrating ALARP for lower-order ('Type A') impacts or risks Identified regulatory, corporate and industry good practice controls are implemented, Woodside considers the impact or risk to be managed to ALARP and no further detailed engineering evaluation of controls is required. The application of feasible and readily implementable alternate, additional or improved controls may be adopted opportunistically when demonstrated to further reduce potential environmental impacts or risks.
<b>Decision Type B</b>	Demonstrating ALARP for higher-order ('Type B') impacts or risks In addition to relevant regulatory, corporate and industry good practice controls being implemented, alternate, additional or improved controls should be proposed and evaluated according to their feasibility, reasonableness and practicability to implement to further reduce the potential for impacts and risks associated with the activities Woodside applies a cost and benefit analysis when evaluating additional controls and applies those that are both feasible and where the cost (safety, time, effort and financial) are not grossly disproportionate to the potential reduction in environmental impact or risk afforded by the control.
<b>Decision Type C</b>	Demonstrating ALARP for highest-order ('Type C') impacts or risks Alternate, additional, or improved controls over and above relevant regulatory, corporate and industry good practice must be proposed and evaluated based upon a precautionary approach Woodside ensures feasible controls that have the potential to reduce environmental impacts and risks are implemented, when safe to do so and irrespective of the additional effort, time or financial cost associated with implementing the control.

### 2.7.2 Demonstration of Acceptability

The descriptions in Table 2-6 articulate how Woodside demonstrates how different risks, impacts and Decision Types identified within the EP are acceptable.

**Table 2-6: Summary of Woodside’s PetDW Criteria for Acceptability**

Decision Type	Demonstration of Acceptability
<b>Decision Type A</b>	Woodside demonstrates these risks, impacts and Decision Types are 'Broadly Acceptable' if they meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines. Further effort towards risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.
<b>Decision Type B</b>	Woodside demonstrates these higher order Risks, Impacts and Decision Types are 'Acceptable if ALARP' if it can be demonstrated using good industry practice and risk based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In undertaking this process for Moderate and High risks, Woodside evaluates:

	<ul style="list-style-type: none"> <li>the Principles of ecological sustainable development as defined under the EPBC Act</li> <li>the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, PetDW procedures and standards</li> <li>the external context – consideration of the environment consequence and relevant persons consultation acceptability are considered</li> <li>other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies and consideration of applicable plans for management and conservation advices, conventions and significant impact guidelines (e.g. MNES).</li> </ul>
<b>Decision Type C</b>	<p>When an impact or risk has been evaluated as 'highest-order', the potential environmental impact or risk can only be deemed acceptable once the criteria for 'Type B' demonstration of acceptability detailed above has been met and:</p> <ul style="list-style-type: none"> <li>any alternate, additional or improved controls adopted via implementing a precautionary approach (consistent with the 'Precautionary Principle' as defined within Section 3A of the EPBC Act), can demonstrate residual impacts have been lowered, such that a severity level of '4' becomes 'unlikely' or the severity level of '5' becomes 'highly unlikely' based upon the Woodside PetDW Risk Matrix.</li> </ul>

## 2.8 Recovery Plan and Threat Abatement Plan Assessment

To support the demonstration of acceptability, a separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans (refer Section 1.10.2.1). The steps in this process are:

- Identify relevant listed threatened species and ecological communities (Section 4.6).
- Identify relevant recovery plans and threat abatement plans (Section 6.9).
- List objectives and (where relevant) the action areas of these plans and assess whether these objectives/action areas apply to government, the Titleholder, and the PAP (Section 6.9).
- For those objectives/action areas applicable to the PAP, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action (Section 6.9).

## 2.9 Environmental Performance Outcomes, Environmental Performance Standards, and Measurement Criteria

EPOs, EPSs and MC are defined to address the potential environmental impacts and risks. These are explored in Section 6.

## 2.10 Implement, Monitor, Review and Reporting

An implementation strategy for the PAP describes the specific measures and arrangements to be implemented for the duration of the program. The strategy is based on the principles of Australian Standard/New Zealand Standard (AS/NZS) ISO 14001 Environmental Management Systems, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the PAP to ALARP and Acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the PAP are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies

- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the activity.

The implementation strategy is presented in Section 7.

## **2.11 Consultation**

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 25 of the Environment Regulations. Woodside's consultation methodology is presented in Section 5. Woodside's consultation record is at Appendix F.

### 3. DESCRIPTION OF THE ACTIVITY

#### 3.1 Overview

This section has been prepared in accordance with Regulation 21(1) of the Environment Regulations and describes the activities to be undertaken as part of the PAP under this EP. It includes the location of the activity, general details of the facility's layout, the operational details of the activity, and additional information relevant to consideration of environmental risks and impacts.

##### 3.1.1 Overview

The Pyrenees Facility produces crude oil from six separate oil fields (Ravensworth, Crosby, Stickle, Tanglehead, Wild Bull [Upper Pyrenees] and Moondyne) via a stand-alone floating production, storage and offloading facility (FPSO) in production licences WA-42-L and WA-43-L.

Production commenced in February 2010, with an annual current production rate (correct as of end 2023) from the Pyrenees Facility of 13,000 bbl/day. Production has been declining since about 2011 (Section 3.8.1) and is expected to continue to decline over the life of this EP, until end of field life, which is currently predicted to be around 2035. In addition to the production of hydrocarbons from subsea wells, the associated activities conducted over the life of the EP include:

- crude oil production and offloading
- routine and non-routine operations of the FPSO and associated subsea infrastructure
- periodic subsea inspection, monitoring, maintenance, and repair (IMMR) activities undertaken to ensure the ongoing integrity of infrastructure
- produced water overboarding and reinjection
- reinjection of gas into the Macedon formation via the Macedon-6 well (which is managed and operated under the Macedon Operations Environment Plan; and
- the use of support vessels and helicopter operations.

There is also one exploration well with wellhead attached (West Muiron-5) inside the Operations Area. IMMR of the wellhead is part of the PAP.

Any future decommissioning, well plug and abandonment, drilling, installation or tie-back activities will be the subject of future, separate EPs.

This EP is intended to remain in force for up to five years from EP acceptance by the Regulator.

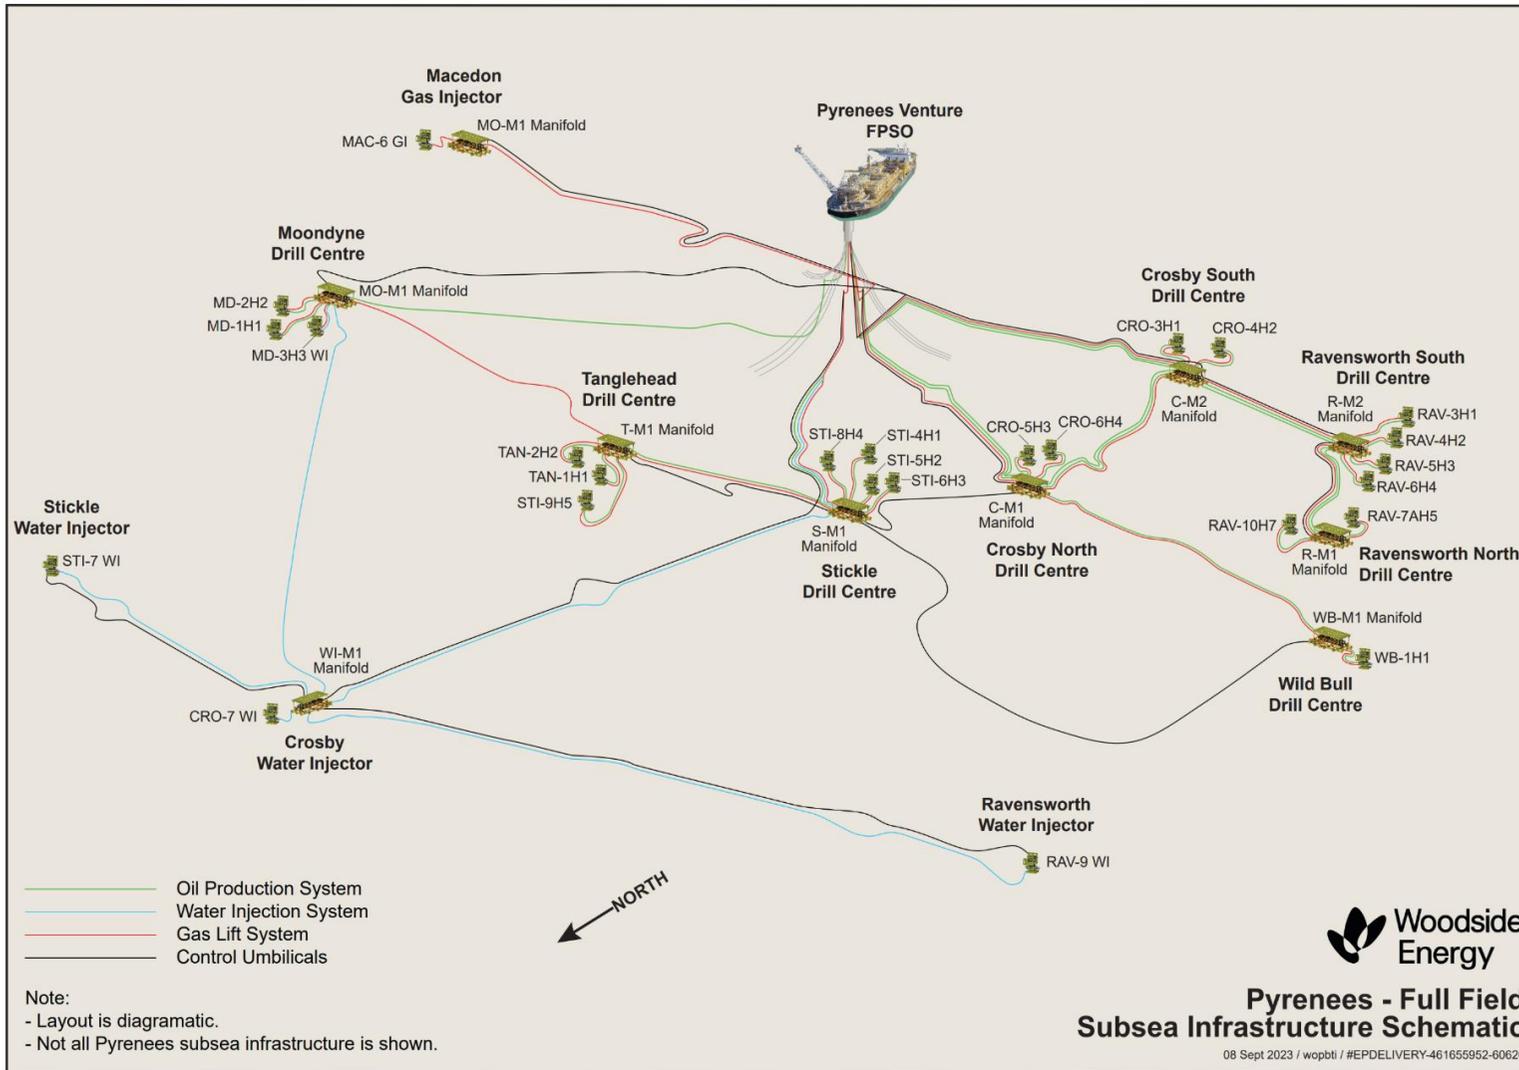

Figure 3-1: Overview of subsea infrastructure layout associated with the Pyrenees FPSO (not to scale)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

A summary of the PAP is presented in Table 3-1.

**Table 3-1: PAP overview**

Item	Description
<b>Production Licence Areas</b>	WA-42-L and WA-43-L
<b>FPSO Location</b>	201298 E, 7615199 N
<b>Water Depth (Lowest Astronomical Tide (LAT)) at FPSO location</b>	200 m
<b>End of Field Life (EOFL) (approx.)</b>	2035
<b>Key components of Pyrenees FPSO facilities</b>	FPSO hull, disconnectable turret and mooring, topside processing equipment and utilities
<b>Key components of subsea infrastructure</b>	26 wells with Xmas trees (including production wells, gas injection wells and water injection wells), manifolds, flowlines/pipelines and umbilicals
<b>Exploration Wells with Wellheads</b>	West Muiron-5
<b>Vessels</b>	FPSO support vessels, IMMR support vessels, and others appropriate to the nature of petroleum activities. Typically one vessel during IMMR activities with 24hr operations, typically 1 or 2 weeks per year.
<b>Key activities</b>	<ul style="list-style-type: none"> <li>• Production of hydrocarbons, including crude oil offloading;</li> <li>• routine and non-routine topsides maintenance;</li> <li>• routine and non-routine inspection, monitoring, maintenance and repair (IMMR) of the subsea infrastructure</li> </ul>

### 3.2 Location

The Pyrenees facility is located in Commonwealth waters approximately 45 km northwest of Exmouth, 14 km from the northern boundary of the Ningaloo Marine Park (Commonwealth waters) and 27 km north-north-west and northwest of the North West Cape, in Western Australia (Figure 3-2).

The Macedon Gas Development, also operated by Woodside, is located approximately 6 km to the southeast of the FPSO, in the same production licence (WA-42-L).

#### 3.2.1 Operational Area

The Operational Area defines the geographical boundary of the PAP. The Operational Area is shown in Figure 3-2 and includes:

- The Pyrenees FPSO and an area extending out to 1500 m to allow for offtake activities; and
- Pyrenees subsea infrastructure, including wells, flowlines, and associated infrastructure, and an area within 1500 m around the infrastructure.

The West Muiron-5 exploration well with wellhead is not connected to the Pyrenees subsea infrastructure and is stand-alone. The location of the wellhead is within the above described Operational Area.

There is also a Petroleum Safety Zone (PSZ) surrounding the FPSO, which is gazetted under the OPGGS Act (Part 6.6 “Safety zones and the area to be avoided”) and marked on navigation charts. The PSZ comprises the FPSO 260 m plus 500 m safety zone and extends to a distance of 760 m radius from the internal Turret of the Pyrenees Venture FPSO.

Vessels are not permitted to enter the PSZ without the consent of the Pyrenees Facility Offshore Installation Manager (OIM). An additional Cautionary Zone of 5 nm is also in place around the Pyrenees FPSO within which contracted vessels must notify the Pyrenees Facility OIM before entering.

### 3.3 Timing

The Pyrenees Facility commenced production in 2010. The facility operates 24 hours a day, 365 days a year.

Planned IMMR activities are typically one to two weeks in duration and occur annually, although this is dependent on weather conditions, operational specifics, timing dependant monitoring, previous results and/or downtime. Non-routine IMMR activities could occur at any time during this EP to respond to unforeseen maintenance and/or production requirements.

End of field life is informed by the production rates of the facility. Production rates at the facility are expected to continually decline, predicting an end of field life around 2035. This EP is intended to remain in force for up to five years from EP acceptance by the regulator.

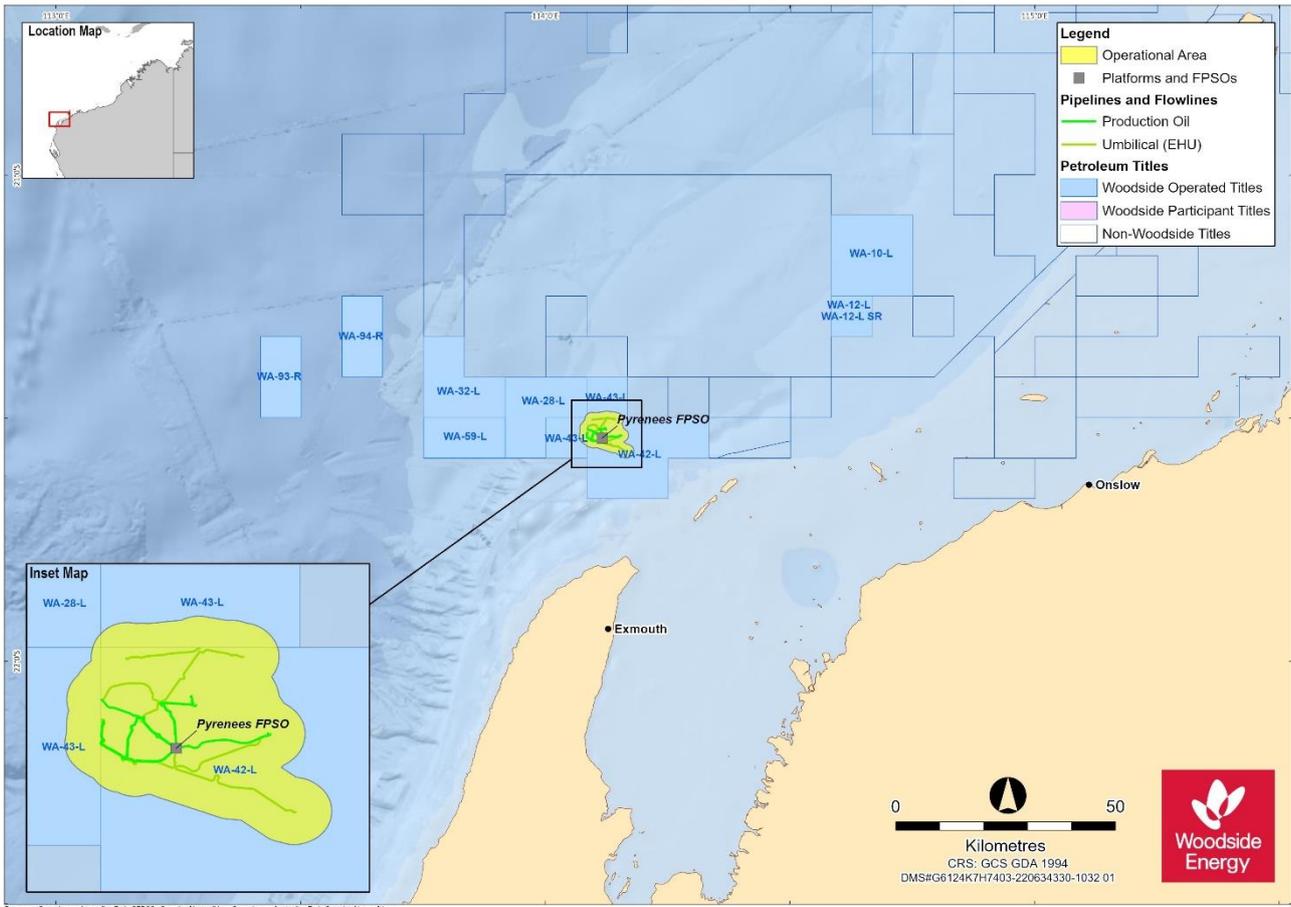

Figure 3-2: Pyrenees Facility location, Operational Area and field layout

### 3.4 Subsea Infrastructure Layout and Description

This section provides an overview of the subsea infrastructure associated with the Pyrenees facility as relevant to consideration of the environmental risks and impacts of the PAP.

The subsea production system includes production, gas injection and water injection wells connected to the Pyrenees Facility via flexible flowlines and risers via a series of subsea manifolds.

Production and gas lift jumpers connect each production well to its manifold. The manifolds are configured to allow the well fluids to be directed via switching valves to either a production flowline or a production/test flowline. Separate production flowlines and production/test flowlines transport the well fluids from the manifolds to the Pyrenees facility. Choke valves to control well rates and gas lift rates are also located on the manifolds.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Multi-phase flow meters and gas lift meters are located on incoming production and outgoing gas lift pipework on each manifold. Dedicated gas lift flowlines distribute dehydrated lift gas, however, can also be used to convey well service fluids to allow flowline flushing and well kill operations. Water injection is provided through a single riser and flowline to a manifold which allows distribution of injection water between the four water injection wells by way of surface-controlled choke valves. Gas injection to the Macedon injection well is via a single riser and flowline terminating at a pipeline end manifold with jumper connection the injection wellhead.

The subsea infrastructure associated with the Pyrenees facility comprises:

- 4 Mid water arches (MWA);
- 8 Riser bases;
- Subsea manifolds (8 production, 1 gas, 1 water injector);
- Dynamic flexible risers and dynamic umbilicals;
- Static flexible flowlines and static umbilicals;
- Subsea distribution unit and umbilical tension assembly installed with umbilicals;
- Hydraulic and electrical jumpers; and
- Subsea trees (19 x production trees, 2 x suspended production wells, 4 x water injection trees, 1 x gas injection/production)

The subsea infrastructure associated with the Pyrenees facility is designed to allow the tie-in of additional wells. The mooring and riser system have allowance for further production riser and umbilical systems. Subsea tie-in points are provided at manifolds for future production, test, and gas lift lines. Future water and/or gas injection wells have the capacity to be connected via a manifold. Controls and chemical injection facilities can be provided from umbilical distribution units or termination assemblies. All the process monitoring and instrumented control across the subsea infrastructure associated with the Pyrenees facility are managed by the central control room on the FPSO.

The layout of the subsea infrastructure associated with the Pyrenees facility is shown in Figure 3-1 and the coordinates of the production, gas injection/production and water injection wells are provided in Table 3-2 with their location, and that of other key infrastructure.

**Table 3-2: Approximate location of the FPSO and associated subsea wells**

### 3.5 Suspended Infrastructure

Table 3-3 outlines the status of suspended subsea infrastructure associated with production wells (not currently producing) within WA-42-L and WA-43-L. The PAP includes operation of this infrastructure as and when required by Operations.

**Table 3-3: Status of Pyrenees Suspended Infrastructure in WA-42-L and WA-43-L**

### 3.6 Exploration Well with Wellhead

The scope of the PAP includes the ongoing management of one exploration well with a wellhead (West Muiron-5) that is not tied back to the Pyrenees facility and has no associated infrastructure (i.e. no Xmas tree (XT) (Table 3-4). The well is managed under an accepted WOMP. The wellhead will continue to be inspected in accordance with the WOMP based on the assessed risk for the well (Section 3.18). Planning for decommissioning is included in Section 7.6.

**Table 3-4: Status of West Muiron-5 Exploration Well**

Well	Block (Surface Location)	Type	Status	Latitude (DMS) / E	Longitude (DMS) / N
West Muiron-5	WA-42-L	Exploration	Plugged & Suspended	21° 32' 52.836" S E: 204627	114° 08' 53.732" E N: 7614499

### 3.7 Other Property including Exploration Wellheads in the Licence Areas

Licence area WA-42-L also includes infrastructure covered under the approved Macedon Operations EP (Commonwealth)<sup>2</sup>. This EP includes two exploration wells with wellheads associated with the

<sup>2</sup> At the time of this EP submission, the Macedon Operations Environment Plan (Commonwealth) is under its five year revision with NOPSEMA.

Macedon field (Macedon-4 and West Muiron-4). All other wells in the WA-42-L and WA-43-L licence areas have been permanently plugged and abandoned and wellheads removed.

### 3.8 Characteristics of Target Hydrocarbons

Generally, the crude oil produced from the Pyrenees reservoirs has very similar properties, which is a heavy crude (API 19°) with some dissolved methane (25 to 30 mol%, ~2 %wt). There are very small quantities of lighter hydrocarbons and no hydrogen sulphide (H<sub>2</sub>S) within the well streams. However, there is minor potential for reservoir souring to occur over time as produced water (PW) injection volumes increase (refer to Figure 3-4). Up to 2.2 mol% CO<sub>2</sub> is present in the well streams.

All of the Pyrenees crude oils can be classified as Group III oils under the International Tanker Owners Pollution Federation (ITOPF) classification system, with the crude oil from the Moondyne reservoir considered the most persistent.

The relevant characteristics of the crude oils from each reservoir are provided in Table 6-13.

#### 3.8.1 Production Overview

The expected production profile for the Pyrenees facility is provided in Figure 3-4 and 3-4. The forecast profiles are provided for demonstrative purposes, representing one set of assumptions for the reservoirs, wells, subsea equipment, and Pyrenees Facility over remaining field life. Actual production rates may vary. Planned dry docks have been included in the production profile in 2024, and notionally for 2029 and 2034.

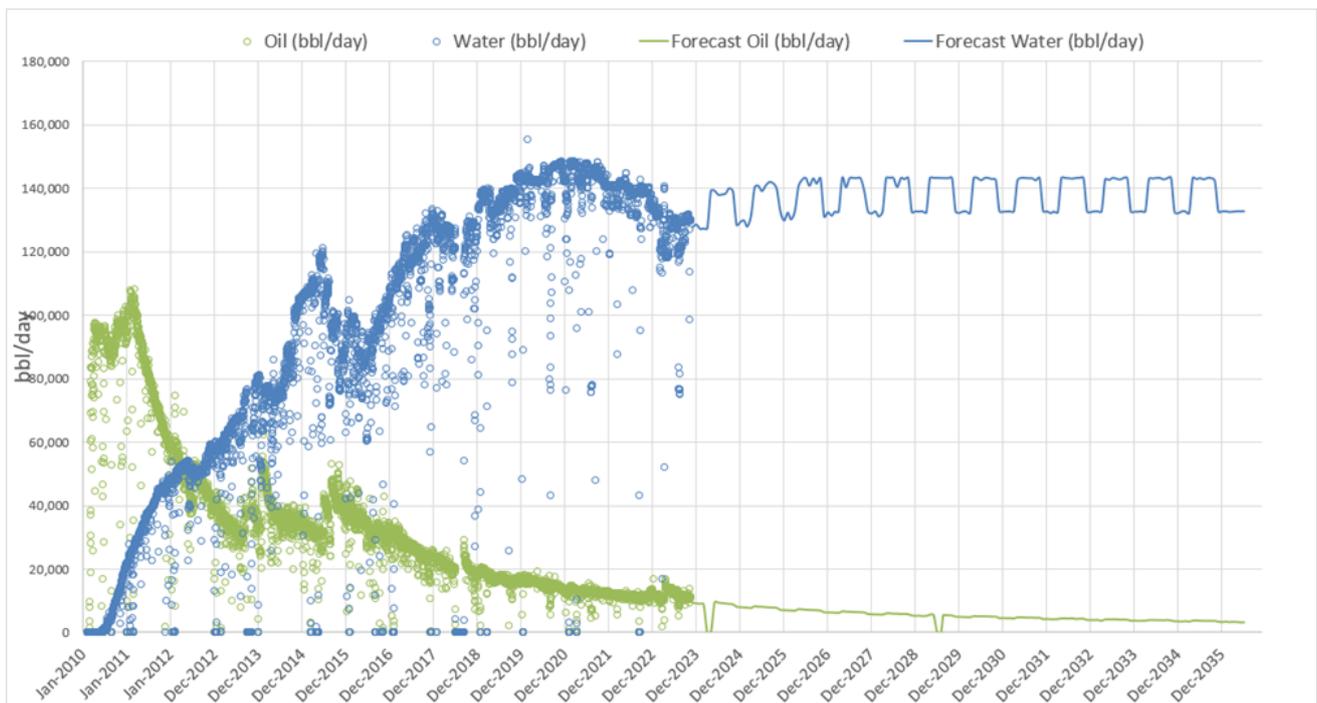

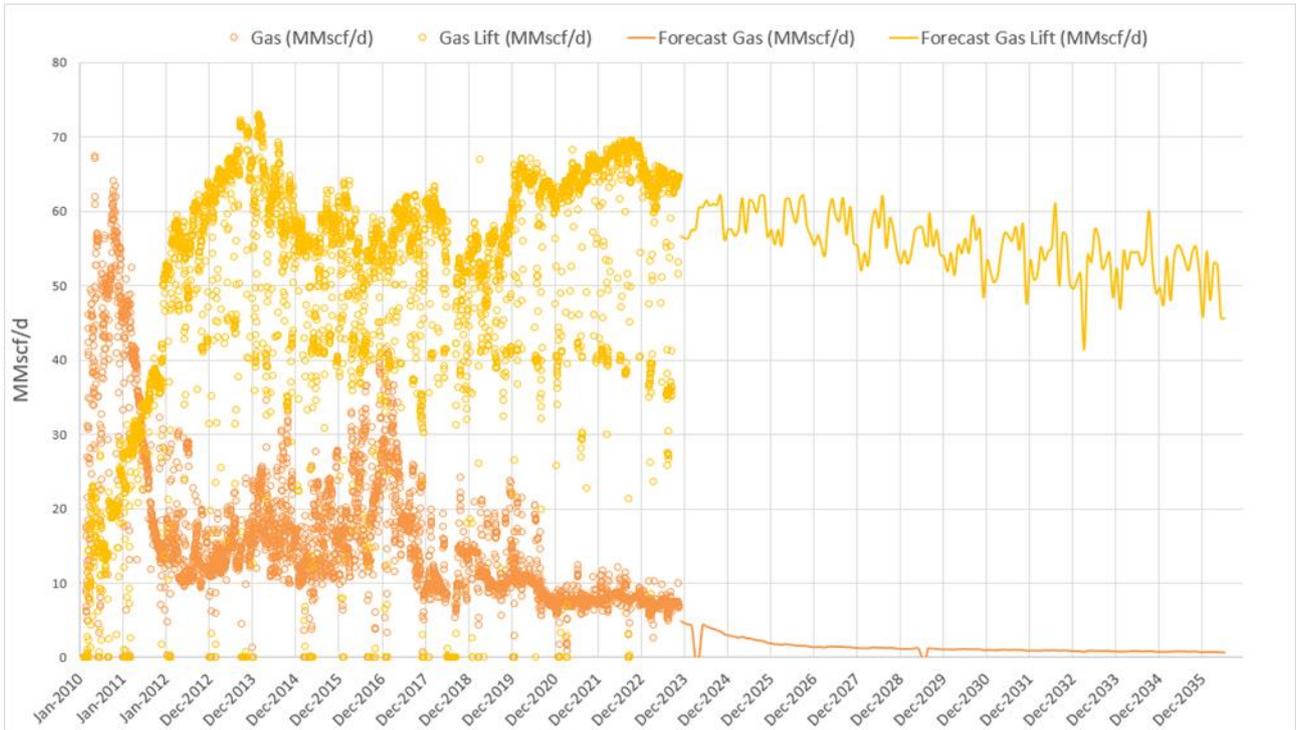

Figure 3-3: Pyrenees Production Forecast for Oil and Water

**Figure 3-4: Pyrenees Production Forecast for Gas**

### 3.9 Well Control

The subsea wells are remotely controlled from the CCR located on the Pyrenees FPSO, via the subsea umbilical system. Well control will involve intermittent discharges of small amounts of water-based hydraulic fluid (<3 m<sup>3</sup> per year) when actuating the various tree valves on the twenty-one subsea production wells. This will be the only planned operational discharge to the marine environment from the offshore infrastructure.

### 3.10 Pyrenees FPSO

Production fluids from the Pyrenees reservoirs are produced to the Pyrenees FPSO, a double hulled stand-alone FPSO (Figure 3-5). Crude oil, formation water and gas are produced with aid of gas lift to the Pyrenees FPSO where they are processed to stabilise the crude oil and store before being offloaded to offtake tankers direct for export.

The Pyrenees FPSO is a conventional double hulled converted Suezmax trading tanker with an overall length of 274 m and a cargo storage capacity of approximately 881,000 barrels of oil. The original basis of design of the process was 96,000 bbl/day of oil, 150,000 bbl/day of water and 60 MMscf/day gas through the compression facilities.

Crude oil is exported directly from the Pyrenees FPSO onto trading tankers. There were 53 offtakes from the Pyrenees FPSO in the first year of production. In 2023, the cargo offtakes had reduced to approximately 8 offtakes per year. The Pyrenees FPSO design rates are detailed in Table 3-5 below.

**Figure 3-5: Pyrenees FPSO**

**Table 3-5 Pyrenees Facility Design Rates**

Fluid/Stream	Units	Design Rate
Oil	STB/D	96,000
Total PW	STB/D	150,000
PW injection	STB/D	≥135,000
Gas Compression	MMSCFD	60
Gas Lift	MMSCFD	55
Gas Injection	MMSCFD	55
Gas Injection Backflow	MMSCFD	15

### 3.10.1 Facility Design Conditions

The Pyrenees FPSO has been designed in accordance with American Bureau of Shipping (ABS) Classification requirements. All FPSO facilities including subsea components, risers, process facilities, and the floater hull and mooring system have been designed to continue operation uninterrupted in a 1 in 100 year non-cyclonic storm and a 1 in 10 year cyclonic storm when disconnected. The subsea mooring system (spider buoy) is designed to a 1 in 1000 year non-cyclonic storm. Table 3-6 shows the metocean design conditions for the Pyrenees FPSO.

**Table 3-6 Pyrenees Facility Metocean Design Conditions**

Parameter	Non-Cyclonic (year)			Cyclonic (year)		
	1	10	100	10	100	10000
<b>Wind</b>						
Gust speed (3 sec) (m/s)	19.9	22.2	23.9	57	75.1	81.8

Spectral mean wave period (s)	12.2	13.1	13.4	10.5	11.2	12.9
Average zero up-crossing period	10.5	11.3	11.6	9.9	10.5	12.1
Maximum single wave height (m)	8.6	9.9	10.4	16.3	21.3	30.1
Period of maximum wave (s)	14	15.1	15.4	11.4	12.9	14.8

### 3.10.2 Turret and Mooring

The Pyrenees FPSO is equipped with a disconnectable turret mooring (DTM) and its own propulsion system to allow evasion of tropical cyclones and to enable sail-away for maintenance.

The Pyrenees FPSO is moored to the seafloor using an internal DTM system located near the bow of the vessel. All main flanges and valves of the turret are located above deck. The DTM system provides for passive weather vaning via bearings incorporated into the turret structure, which allows the vessel to freely pivot according to prevailing winds, waves, and currents. Well fluids flow from the flowlines to the production swivels located in the turret and onto the Pyrenees FPSO for processing. The general arrangement of the turret mooring system is shown in Figure 3-6.

The mooring system consists of a turret mooring spider buoy (see Figure 3-7) which is anchored to the seabed via nine anchor legs comprising chain and wire rope (Table 3-7). The lower end of each anchor leg is connected to a drag anchor embedded into the seabed. The spider buoy and associated turret structure are integrated into structure of the hull.

The design of the spider buoy has ensured that there is sufficient redundancy, which includes:

- The spider buoy can lose one of its anchor legs without loss of station; and
- A single compartment of the spider buoy can be flooded without losing buoyancy.

Disconnection of the flexible risers is achieved by manual intervention of the mechanical connections on the structure and can generally be completed within 12 hours including time for blowdown. After disconnection, the spider buoy submerges to a depth of approximately 30 m. Once disconnected, the Pyrenees FPSO steams away using its own propulsion as a fully classed vessel. Reconnection to the DTM is the opposite of a disconnect. There are no waste streams when restarting suspended wells and subsea infrastructure.

Tropical cyclone sail away activities have a minimum lead time of over 21 hours with the Pyrenees FPSO typically staying within Australian waters for the duration of a cyclonic event.

Dry dock activities occur on a scheduled basis, informed by maintenance and operational requirements, with a sail away to, and anchorage in, Singapore for extended periods of time to complete major works. All re-entries into Australian waters will be in accordance with border security requirements, biosecurity requirements and Woodside procedures including Woodside’s IMS risk assessment process.

**Table 3-7 Pyrenees FPSO Mooring System**

#	Anchor Leg Component	Diameter(mm)	Type	Deployed Length (m) *
1	Top chain	100	Studless	10 + 5

2	Spiral strand wire	63	Sheathed	225
3	Bottom chain	85	Studless	633
4	Drag anchor	-	StevShark	
* Total chain length: 5,787 m; Total wire length: 2,025 m.				

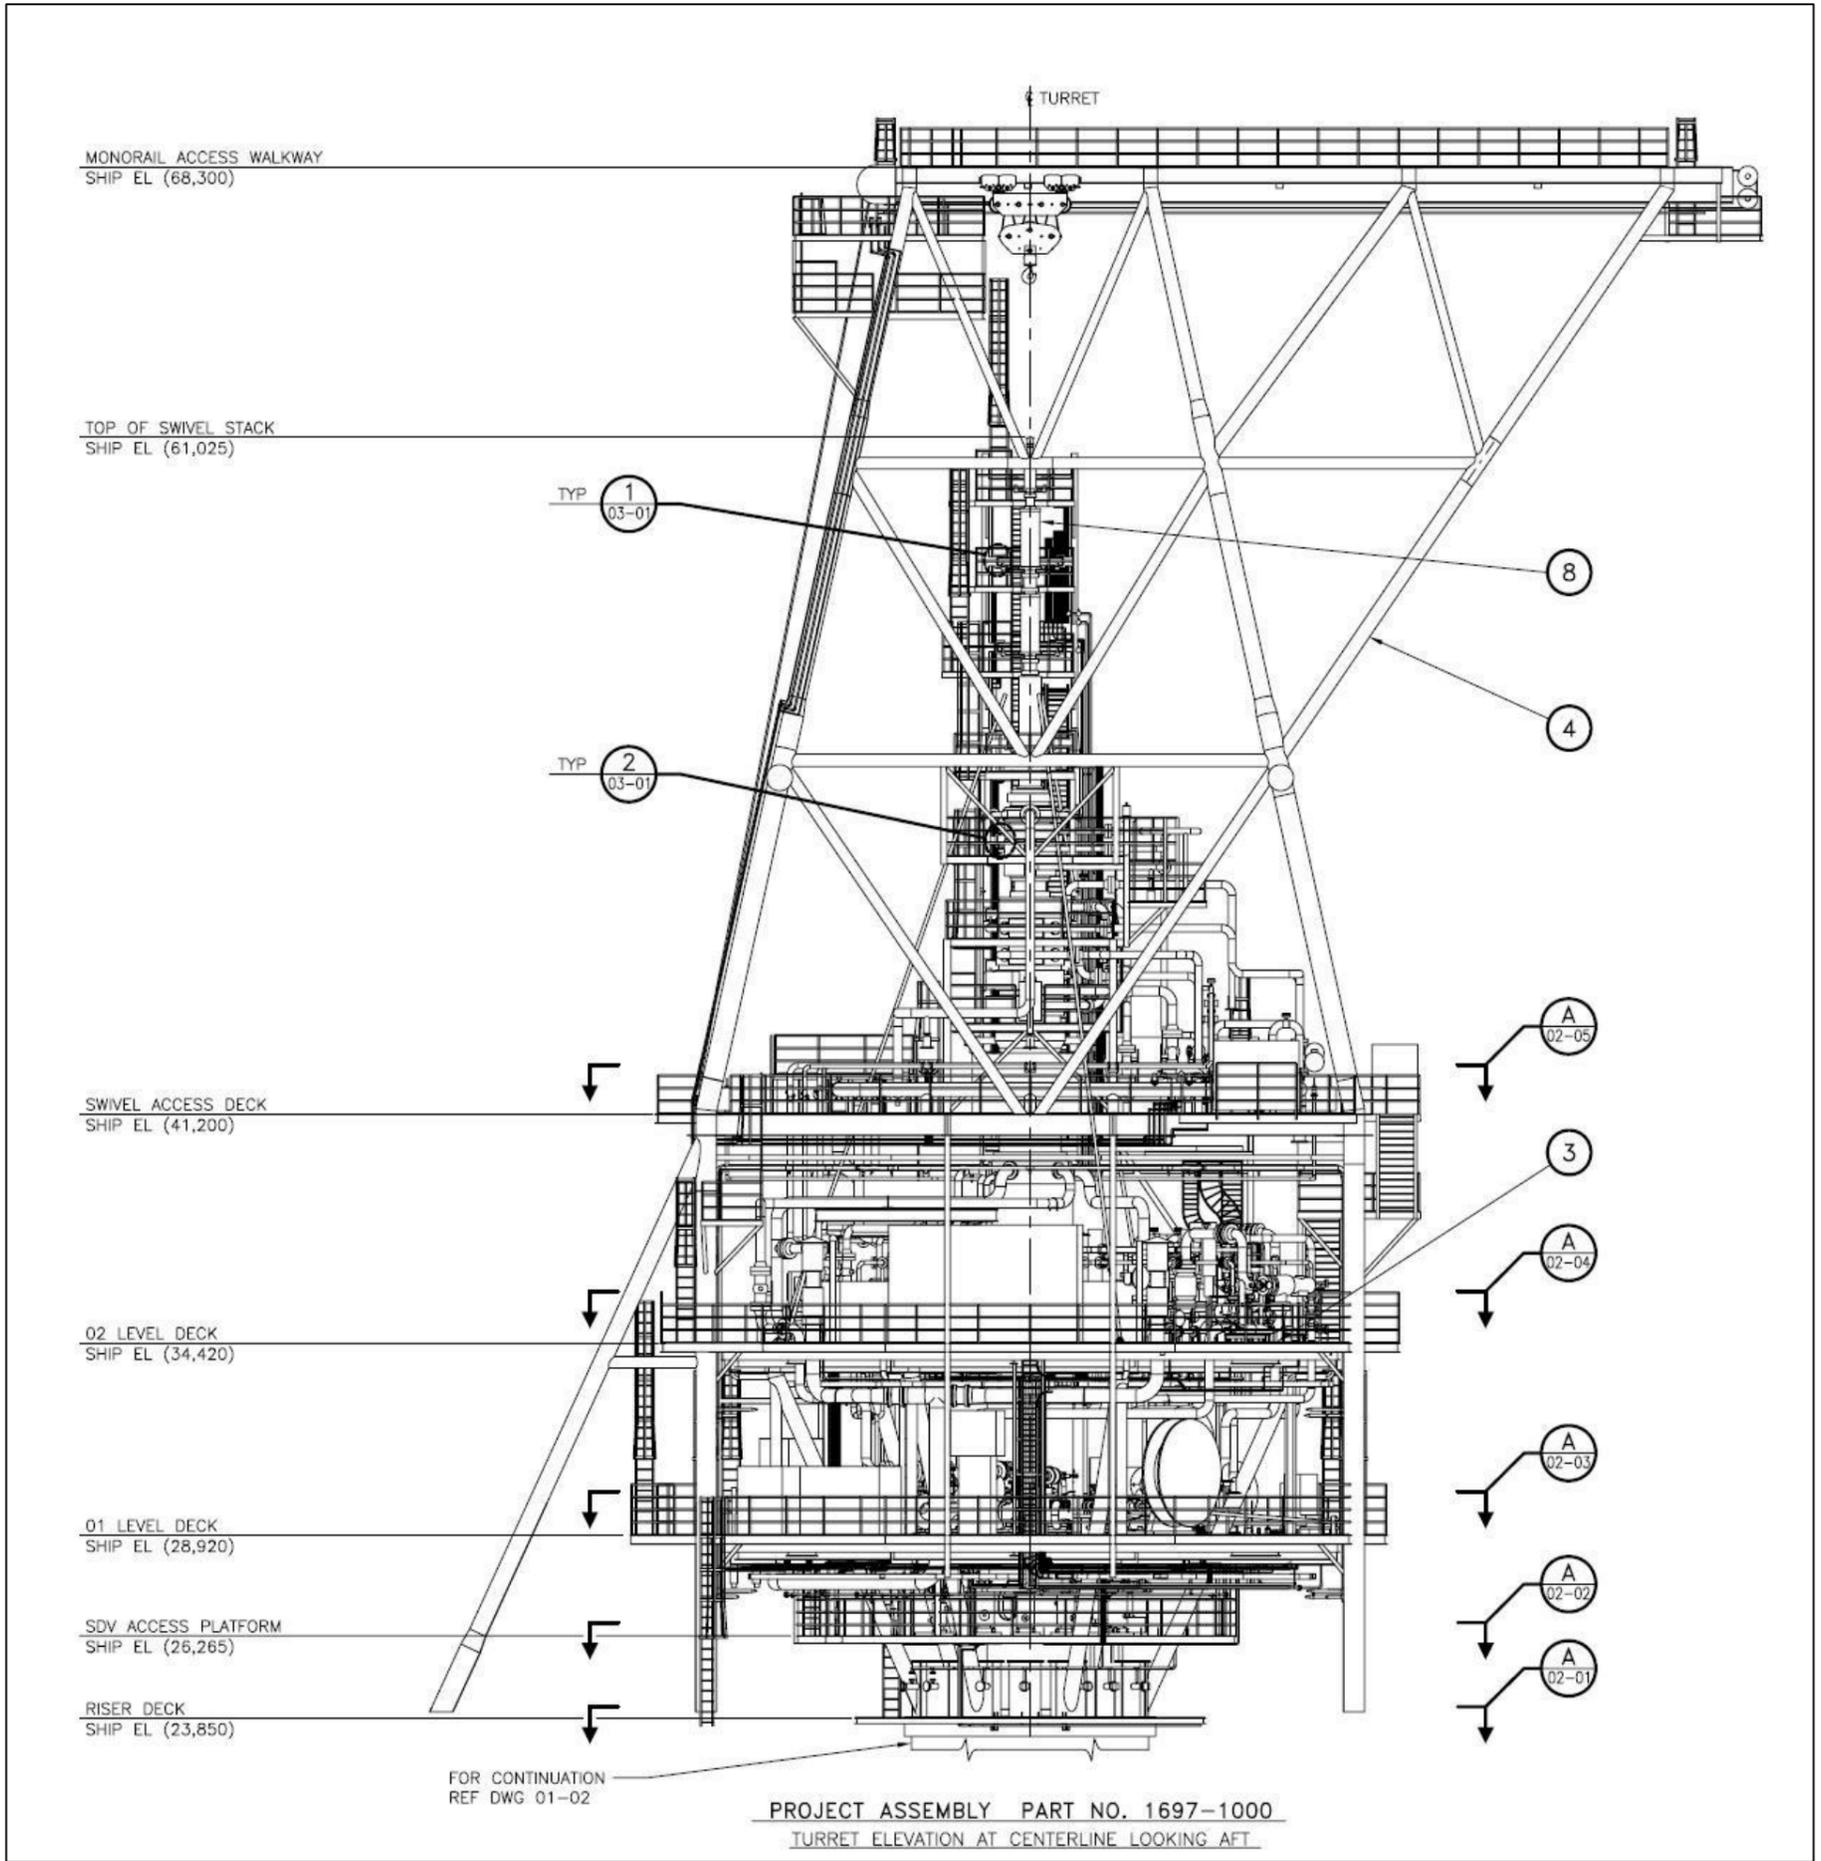

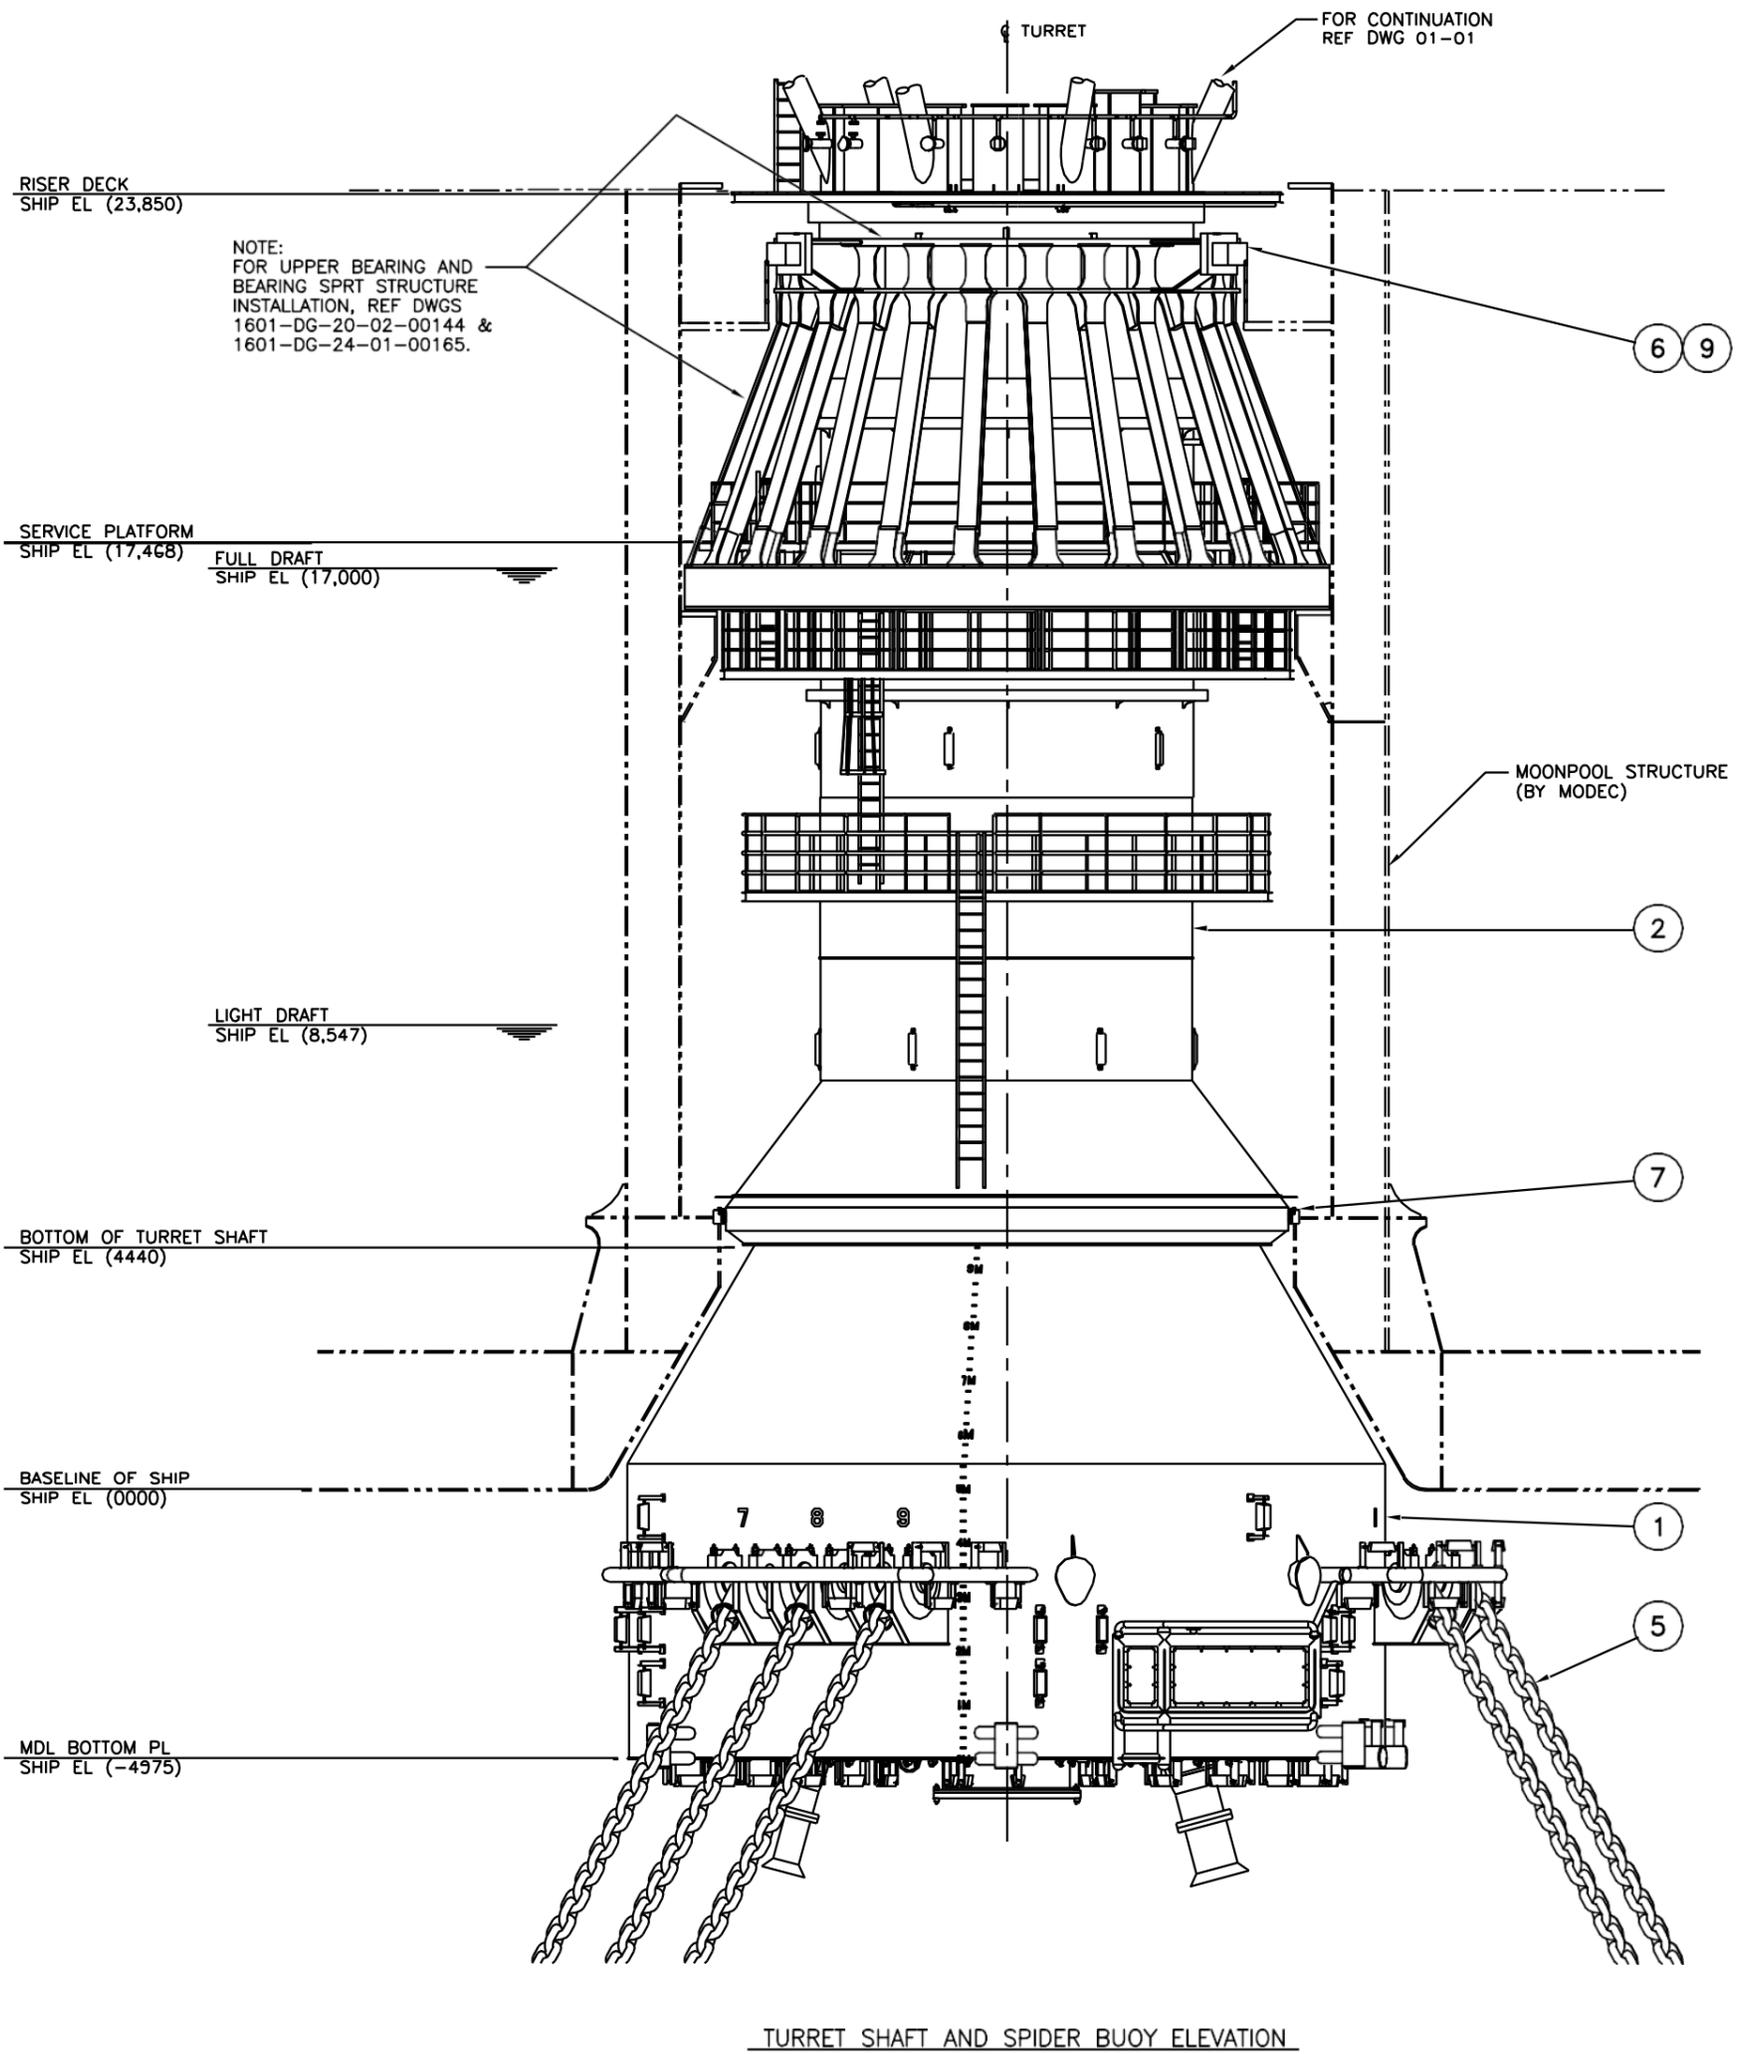

Figure 3-6: Pyrenees FPSO Disconnectable Internal Turret (upper section)

TURRET SHAFT AND SPIDER BUOY ELEVATION

Figure 3-7: Pyrenees FPSO Lower Turret and Spider Buoy

### 3.10.3 Hull

The Pyrenees FPSO hull has been designed to Classification Society requirements and can store up to 881,000 bbls of 19 API crude oil, with an export parcel size of up to 550,000 bbls.

Figure 3-8 and Figure 3-9 show the Pyrenees FPSO hull layout. The cargo holding area comprises six pairs of cargo tanks. There are also two slops tanks (port and starboard) and six pairs of wing and double bottom/sided dedicated ballast tanks, which are dedicated ballast tanks. These tanks provide a 3 m buffer at the vessel side and a 2.5 m buffer on the hull bottom to prevent cargo tank penetration damage. Diesel fuel tanks located in the hull are also provided with a cofferdam between the tank and the vessel's side shell.

The underwater hull and appendages are protected by an automatically controlled impressed current cathodic protection system. The propeller shaft and rudder post are grounded to the hull. Aluminium anodes are fitted in the sea chest on the rudder and propeller aperture and moonpool. Sacrificial zinc anodes (bolting type) have been provided for the water ballast tanks and slop tanks.

In compliance with IMO's AFS Convention and *Protection of the Sea (Harmful Anti-fouling Systems) Act 2006*, the Pyrenees FPSO hull is coated in a TBT-free, self-polishing antifouling coating which was reapplied in May 2024 during drydock. The expected coating lifetime being five years, and the fouling coating is typically re-applied during dry docking every five years. The coating is designed to prevent marine growth buildup on the hull.

### 3.10.4 Topsides Layout

The topsides equipment on the Pyrenees FPSO is located on a number of pre-assembled modules as follows:

- An internal riser mooring near the bow
- Accommodation at the stern containing temporary refuge (TR) which can accommodate the maximum POB (60 personnel). The key areas of the TR are the emergency control centre (ECC/CCR) and the helicopter administration room/muster area
- Gas compression equipment towards the bow (portside)
- Lower pressure process equipment (i.e. hydrocarbon separation) in the middle of the Pyrenees FPSO (i.e. midships)
- Utilities and produced water facilities between the accommodation and process area
- Main power generation located towards the stern starboard side
- Chemical laydown area located on a dedicated bunded deck above the chemical injection skids next to the crane
- Laydown areas adjacent to the crane
- Helideck
- Inclined flare tower.

The FPSO layout is shown in Figure 3-8, Figure 3-9 and Figure 3-10

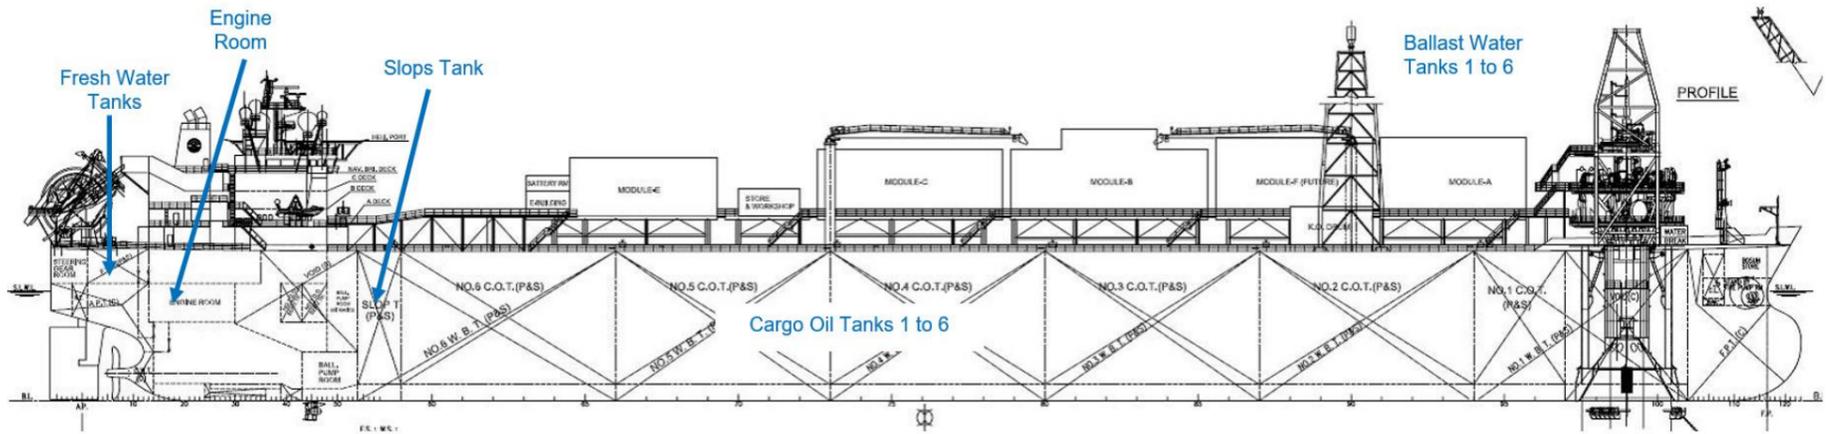

Figure 3-8: Pyrenees FPSO Hull Layout – Profile

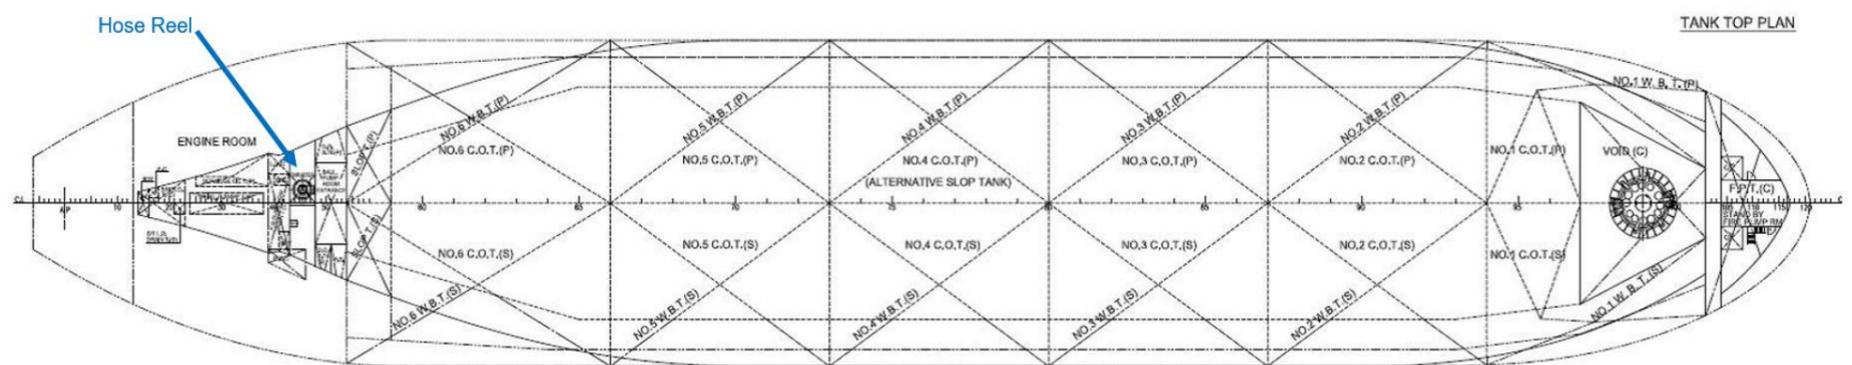

Figure 3-9: Pyrenees FPSO Hull Layout – Tank Top Plan

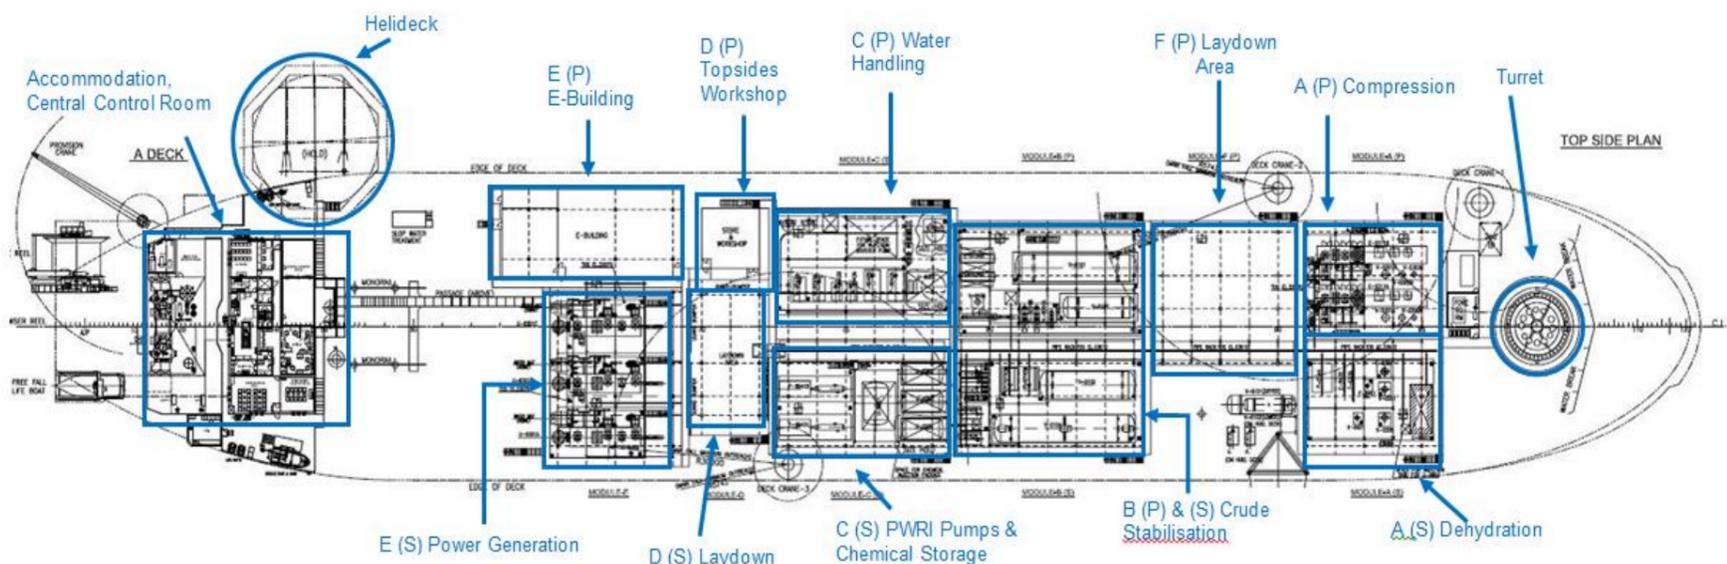

Figure 3-10: Pyrenees FPSO Layout – Modules

### 3.11 Modes of Operation

As described in Section 3.10 the Pyrenees FPSO has the ability to move off station. The Pyrenees FPSO operates in two modes: connected mode and disconnected mode, these are described below.

#### 3.11.1 Connected Mode

In connected mode and upon commencement of reconnection activity after cyclone disconnects, the Pyrenees FPSO is subject to the jurisdiction of the NOPSEMA and operates in accordance with this EP. Routine activities during connected mode include:

- Operation of the subsea production system
- Operation of topsides processing and utilities
- Operation of marine utilities
- crude oil storage and offloading operations
- helicopter and supply vessel operations
- CCR operations
- general services, including accommodation
- IMMR activities, including those undertaken subsea
- shutdown/disconnect and reconnect/start-up for tropical cyclone response.

#### 3.11.2 Disconnected Mode

In disconnected mode, i.e. when the Pyrenees FPSO has completed the disconnection activity and sailed away from the 500 m PSZ, the Pyrenees FPSO falls under the jurisdiction of the Australian Maritime Safety Authority (AMSA) while in Australian waters. The Australian flagged Pyrenees FPSO (registered in Fremantle) is also subject to Class requirements.

During potential periods of extended Pyrenees FPSO sailaway (e.g., when the Pyrenees FPSO is disconnected and sailed away to the shipyard) normal well monitoring from the FPSO is unavailable. During these periods wells are shut-in and managed in accordance with the accepted Pyrenees WOMP. Woodside can demonstrate alignment with current industry good practice with respect to managing well integrity, through ensuring that the well barriers are verified, wells are left in a safe state, and the risk of loss of containment is reduced to ALARP.

During disconnected mode some subsea IMMR activities may occur within the Operational Area.

#### 3.11.3 Transition from Connected to Disconnected Mode

The regulatory body governing the operation of the vessel transitions from NOPSEMA to AMSA when the facility transitions from production to ship mode. As part of the disconnection process, Woodside communicate to the Recognised Organisation (Classification Society), requesting the required Certificates in accordance with the process described in the disconnect procedure.

#### 3.11.4 FPSO Personnel Levels

The total overnight personnel on board (POB) capacity for the Pyrenees FPSO is 60, however actual personnel levels may fluctuate below this. Personnel levels are influenced by a number of activities, including but not limited to:

- crew change
- campaign maintenance
- inspections/audits

- planned facility shutdowns.

## 3.12 Production Process

### 3.12.1 Production System Overview

The Pyrenees FPSO topsides processing system receives well fluids (crude oil, reservoir or PW and associated natural gas) from the production wells, processes it in three stages to separate the crude oil, stores it in the Pyrenees FPSO cargo tanks then offloads cargo to offtake tankers direct for export. Processed gas is used as fuel with excess being reinjected into the Macedon Field via the Macedon-6 bi-directional well. Processed gas is also used as the source of gas for gas lift, and minor amounts may be flared for process safety.

The overall process flow diagram schematic is shown in Figure 3-11 (the blue lines represent water, the green lines represent gas and the black lines represent oil).

The Pyrenees topsides facilities include the following process functions:

- Production and test separation
- Oil stabilisation and dewatering
- Produced water treatment system (PWTS)
- Water injection facilities
- Gas de-hydration, compression and reinjection
- Fuel gas generation and treatment
- Flaring/blowdown facilities.

The processing system is designed to meet crude specifications of 0.5% basic sediment and water (BS&W) and Reid vapour pressure of less than 10 psia, as well as achieving all other environmental discharge limits, as established in the Pyrenees Basis of Design (BoD) (BHP Petroleum, 2007).

Further details of the processing system are detailed in the sections below.

### 3.12.2 Liquid Processing Overview

The crude oil processing system receives the well production fluids via the production manifold and the test manifold. The production manifold sends fluids to the three-phase first stage separator and the test manifold routes fluids to the test separator. Alternatively, the test manifold can route fluids from the subsea test flowlines into the first stage separator (refer to Figure 3-11).

Gas from the first stage and test separation vessels is combined and sent to the suction of the high-pressure compression system. Oil or stable emulsions are sent to the crude heating system and any separated PW is routed to either the PW treatment system (refer Section 3.12.5) or closed drains (refer Section 3.12.6) (if the rate is below the minimum turndown to the PW treatment system).

Heating of the fluids entering the first stage separator is required to achieve acceptable phase separation of formation water and oil from stable emulsions. The crude heating (interstage) system consists of a crude/crude exchanger that recovers heat from the hot crude streams originating from the electrostatic coalescer. The warmed crude/emulsion stream from the cross exchanger are then heated by low-pressure saturated steam to approximately 95°C in the crude heaters.

The hot crude/emulsion stream is then flashed in the three-phase, horizontal second stage separator. The main purpose of the second stage separator is to remove dissolved gases and supply LP fuel gas before the crude is sent to the electrostatic coalescer for dehydration. Again, hot PW is recycled back to the inlet of the first stage separator.

The hot crude/emulsion from the second stage separator is routed to a 2-phase horizontal third stage separator (located above an electrostatic coalescer) with flash gas routed to the LP flare (refer Section 3.12.3). The liquid from the third stage separator is sent to the electrostatic coalescer.

The electrostatic coalescer further separates the oil and water using electric fields to facilitate the coalescence and separation of water droplets from the bulk oil phase. The separated oil stream is then sent to the oil storage system via the crude/crude exchanger. The PW is recycled to the inlet of the first stage separator.

PW from the first stage separator and test separator is routed to the deoiling hydrocyclones. Oil from the deoiling hydrocyclones is routed to the recovered oil collection drum. Water from the deoiling hydrocyclones is routed to the dissolved gas flotation unit (DGF). The DGF separates any remaining gas from the PW, where the gas is routed to the LP flare.

The PW is then either routed to the booster and injection pumps for re-injection in the water injection wells, routed to the slops tanks or is discharged overboard to the marine environment (refer Section 3.12.5 for further details on the PWTS).

Final crude rundown cooling to 45°C occurs after the crude/crude cross exchanger in the rundown cooler by exchanging heat with seawater.

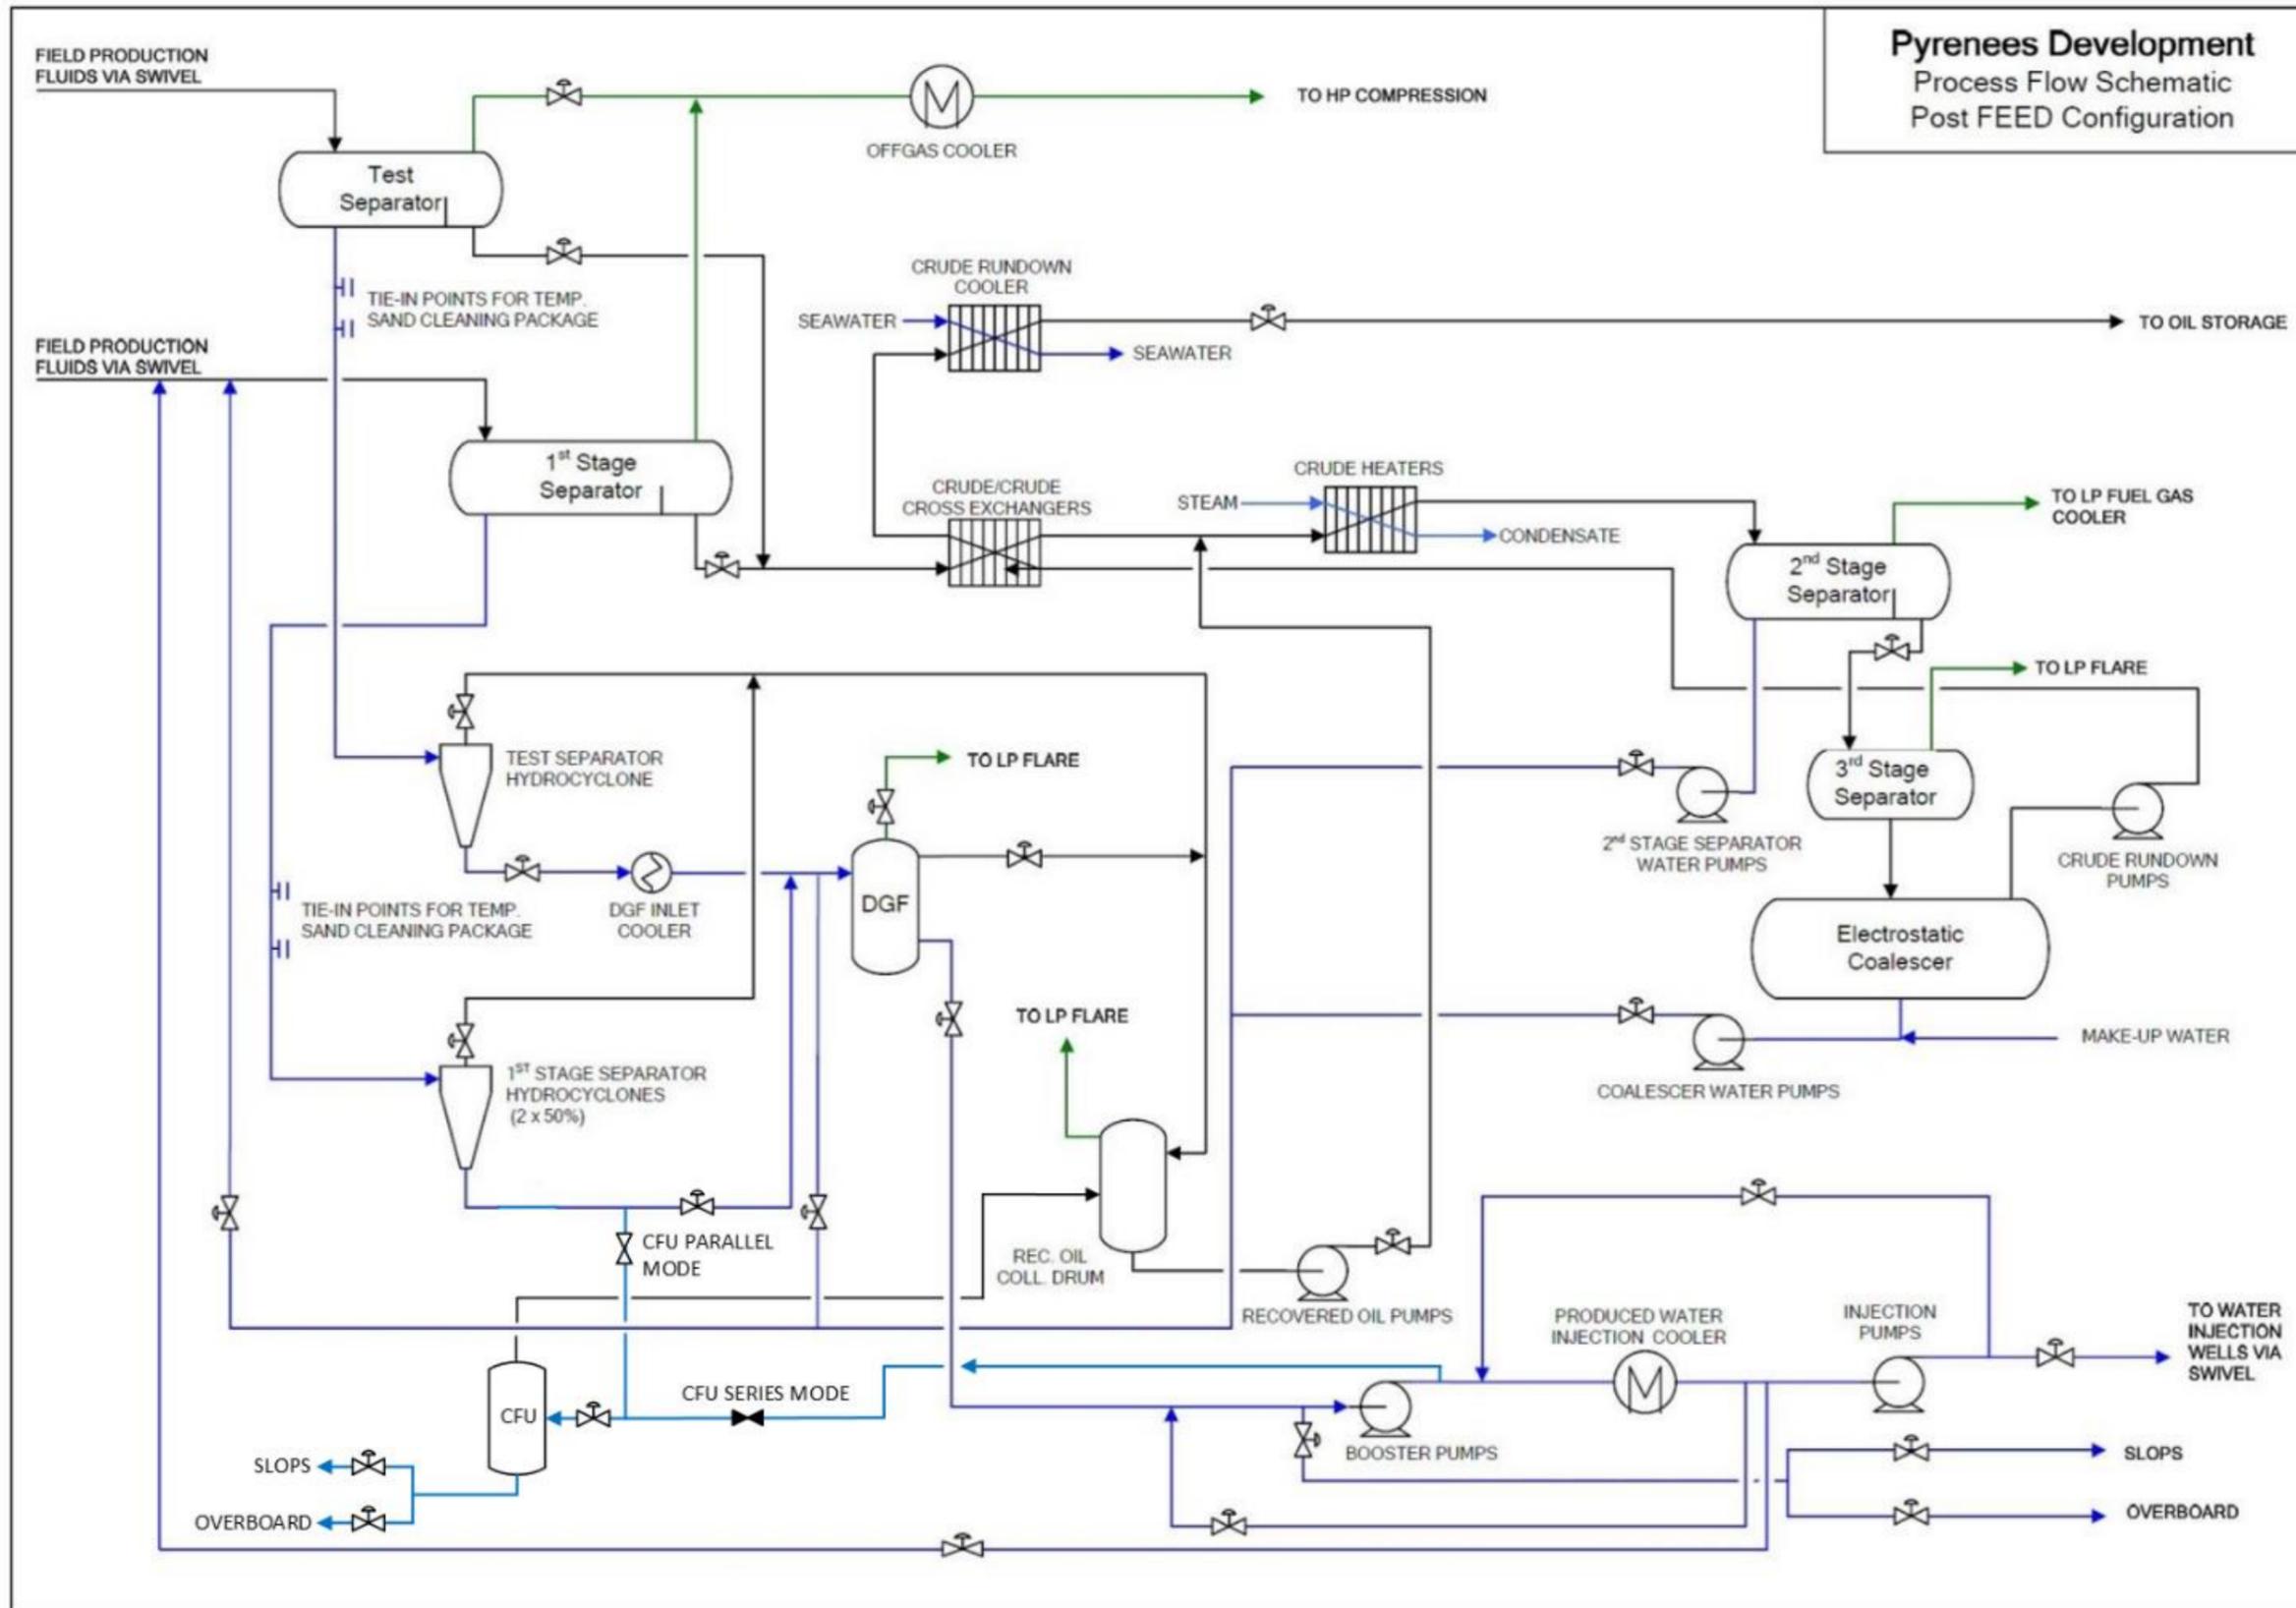

Figure 3-11: Pyrenees Facility Process Flow Schematic

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The CFU, DGF and slops water is discharge out of a DN350 pipe and the cooling water is discharged through the larger DN700 pipe. The pipes are located in close proximity (<2m distant) on the port side, at C module, approximately 120 m from the rear/stern of the Pyrenees FPSO. The discharges depth ranges from 3m to 11m dependent on ships draft with discharge pipe configuration shown in Table 3-8.

**Table 3-8 Discharge Pipe Configuration**

Component	Details	
	PW & Slops Pipes	Cooling Water Pipes
Pipe diameter	350 mm (DN350)	700 mm (DN700)
Pipe orientation	outlet perpendicular to ship hull	outlet perpendicular to ship hull
Discharge Depth	<ul style="list-style-type: none"> <li>Discharge depth - depends on ship's draft (i.e. ships height in water – depends on cargo onboard):</li> <li>11 m (max cargo onboard)</li> <li>7 m ('average' cargo on-board)</li> <li>3 m (min cargo onboard)</li> </ul>	Discharge depth – depends on ship's draft (i.e. ships height in water – depends on cargo onboard): <ul style="list-style-type: none"> <li>11 m (max cargo onboard)</li> <li>7 m ('average' cargo on-board)</li> <li>3 m (min cargo onboard)</li> </ul>
Distance between pipes	1.363 m	

During routine operation, all gas from the first stage and test separators is compressed, dehydrated and used for either fuel gas, gas lift and the surplus injected into the Macedon reservoir. An integrated gas compression and treatment system is provided. Artificial lift is provided via gas lift and surplus formation gas is disposed of via injection into the Macedon reservoir. The gas lift/injection specification is determined by corrosion and hydrate management requirements.

The gas compression equipment comprises two 50% gas turbines direct driven three stage centrifugal compressors (with dual fuel capacity). Each of the compressors has a capacity of 30 MMscf per day (or total capacity of 60 MMscf per day). The off-gas from the test and first stage separators commingle upstream of the off-gas cooler, controlling the suction temperature to the gas compression trains to 45 °C to ensure efficient compression. Gas compression is split into two trains, with each train capable of independent isolation. The fundamental process for the centrifugal compression is outlined in Figure 3-12 (with green indicating gas flow). The compressors are equipped with tandem dry gas seals for shaft sealing. Primary seal leakage gas consisting primarily of natural gas is collected to the LP flare system for safe disposal.

Gas entering a compression train is scrubbed to remove any entrained liquid prior to compression to approximately 25 barg in the first stage of the centrifugal compressor. This gas is then cooled to approximately 40°C by a closed loop tempered water cooling system (refer Section 3.12.7.1) prior to entering a gas scrubber to remove and liquid dropout as a result of the compression and cooling process. The cool dry gas is then compressed to approximately 67 barg in the second stage of compression. The gas is again cooled to approximately 40°C prior to commingling with the cool second stage discharges of the other compression trains.

Liquids knocked out in the first stage suction scrubbers are returned back to the oil processing train upstream of the crude heater. Liquids knocked out in the second stage suction scrubbers is returned to the inlet of the first stage separator. Liquids recovered in the third stage suction scrubbers is returned to the gas dehydration glycol regeneration unit.

Gas from the dehydration system is used to feed the facility HP fuel gas system. This gas is used as the normal fuel source for the gas turbine generators and gas turbine driven compressors. Shortfalls in facility gas balance for fuel and gas lift are made up by producing gas from the Macedon field using the bi-directional gas injection/production well.

The commingled second stage compressor discharge flows through a filter coalescer vessel designed to remove any condensed liquids. In order to provide dry fuel gas, lift gas, and gas for re-injection, the water saturated gas is then passed through a glycol (TEG) dehydration column to remove water to achieve a dewpoint of approximately minus 4°C. The HP fuel gas is taken from the discharge of the glycol dehydration column prior to the dehydrated gas splitting into each train of third stage compression.

The gas entering each third stage train is scrubbed to remove any glycol carryover and other liquids prior to compression to approximately 170 barg in the third stage of compression. The gas is then cooled prior to commingling with the cool third stage discharge of the other compression train.

The HP gas is then distributed between the gas lift and gas re-injection headers. The gas lift rate is set by the required gas lift flows to each of the production wells. The balance of the HP gas is directed to the gas re-injection header for injection into the Macedon reservoir. This situation only occurs when there is surplus gas being produced, i.e. during the early years as the reservoir gas caps are blown down.

When gas from the wells is insufficient to meet the HP fuel gas demand, the gas from the Macedon well is imported by reverse flowing through the injection swivel. This gas is directed to the Macedon scrubber where liquids from the flowline and well are knocked out before the gas is heated en-route to its tie-in upstream of the glycol contactor filter coalescer, where it combines with the second stage compressor discharge gas. This imported Macedon gas is used for HP fuel gas during start-ups and for process pressurisation following blowdown. The design allows for injected gas to be back-flowed to the facility for start-up and to meet fuel gas consumption.

### 3.12.3 Flare System

The flare system consists of two completely independent HP and LP systems to safely dispose of hydrocarbons.

Their main purposes are to safely discharge gas streams during an emergency depressurisation, or when the compression systems are unavailable. However, there are some process streams which continuously pass gas to the flare. Other streams intermittently flow to the flare, such as during process upsets, maintenance activities and when storage vessels are depressurised.

The Pyrenees Facility system was designed to facilitate minimal flaring with exceptions during process upset or maintenance. Although re-injection of surplus gas will avoid significant flaring of gas, a small quantity of gas will be continuously burning at the flare tip for safety reasons and there will be short periods that lead to more significant flaring of gas, such as:

- Transient operations such as start-up and process upset conditions (i.e. failure of the gas injection compressor)
- Emergency flaring caused by emergency depressurisation (blowdown) of equipment
- Emergency relief flows to prevent overpressure (i.e. gas blowby or blocked outlet scenarios)
- Manual depressurisation of topsides equipment
- Venting of topsides equipment for maintenance.

During normal operations, only emissions from low pressure process sources are collected and routed to the LP flare system. Relieving/blowdown devices are provided throughout the process plant to protect the equipment against overpressure during an emergency situation.

The flare system is equipped with liquid knock-out (KO) drums to remove liquids, with self-draining flare headers to the drums. All flare headers have a continuous purge of LP fuel gas to maintain positive pressure and prevent the ingress of air. Nitrogen is used as an alternative purging medium in instances when LP fuel gas is not available.

Vapours from the LP and HP flare scrubbers are flared to the LP and HP flare tips, mounted on the flare tower and integrated with the pilot. The LP and HP flares are smokeless under all operating scenarios. All vapours discharged via the flare system are metered, and liquids recovered from the flare KO drum(s) are routed back to the process plant upstream of the crude heater or to the slops tank.

Flare pilots are kept on fuel gas backed up by propane bottles, and an ignition panel is provided to ignite pilot burners using spark ignition method.

The flare tower is at the bow of the FPSO and has a total height of 90 m above sea level.

### 3.12.4 Vent System

While it is preferable to flare rather than vent, there are some instances where venting may be required. An atmospheric vent system is installed to collect vapours from not normally venting vessels, with discharge to a vent outlet on a dedicated mast riser.

The following tanks on the Pyrenees FPSO are vented:

- Tanks storing non-volatile fluids such as lube oil and non-volatile chemicals, with minimal expected vapour vented during incidental tank filling only
- Cargo tank blanket inert gas (boiler flue gas) during tank level change which is vented through the breather valve on the inert gas main header, routed to vent at the flare tower
- Slops tank which is vented via the breather valve on the vent header, with the outlet located on the flare tower.

Blanket gas from chemical storage vessels which contain potentially flammable and/or hazardous products (e.g. methanol) are not vented, and are instead routed to the LP flare system.

### 3.12.5 Production Water Treatment and Injection System

PW is brought to the surface from the reservoir and put through the PWTS. The PWTS is designed to separate oil and water and polish PW that is brought to the surface with reservoir fluid. The PWTS uses several techniques to stabilise the fluid and separate oil in water (OIW) prior to any returning oil sent back to the process. Polished PW is then reinjected back into the reservoir or diverted to the slops tank during upsets. Partial discharge overboard is also possible via a caisson from the side of the ship at 3 m below the surface (discharge depth with an empty facility load, 11 m at full load; the exact depth varies with ballast/loading) or via the slops tank at surface.

The PW system is designed to process a maximum of 23,848 m<sup>3</sup>/day. Approximately 9,062 m<sup>3</sup>/day can be discharged overboard via the CFU and may plan to be discharged continuously over the next 2.5 years while the subsea injection system is being assessed for an upgrade. Provision to overboard is required to be retained to allow operational flexibility.

The primary separation system involves gas/oil water separator units and hydrocyclone separation before dividing into two systems – dissolved gas flotation unit (DGF) and CFU (Figure 3-13).

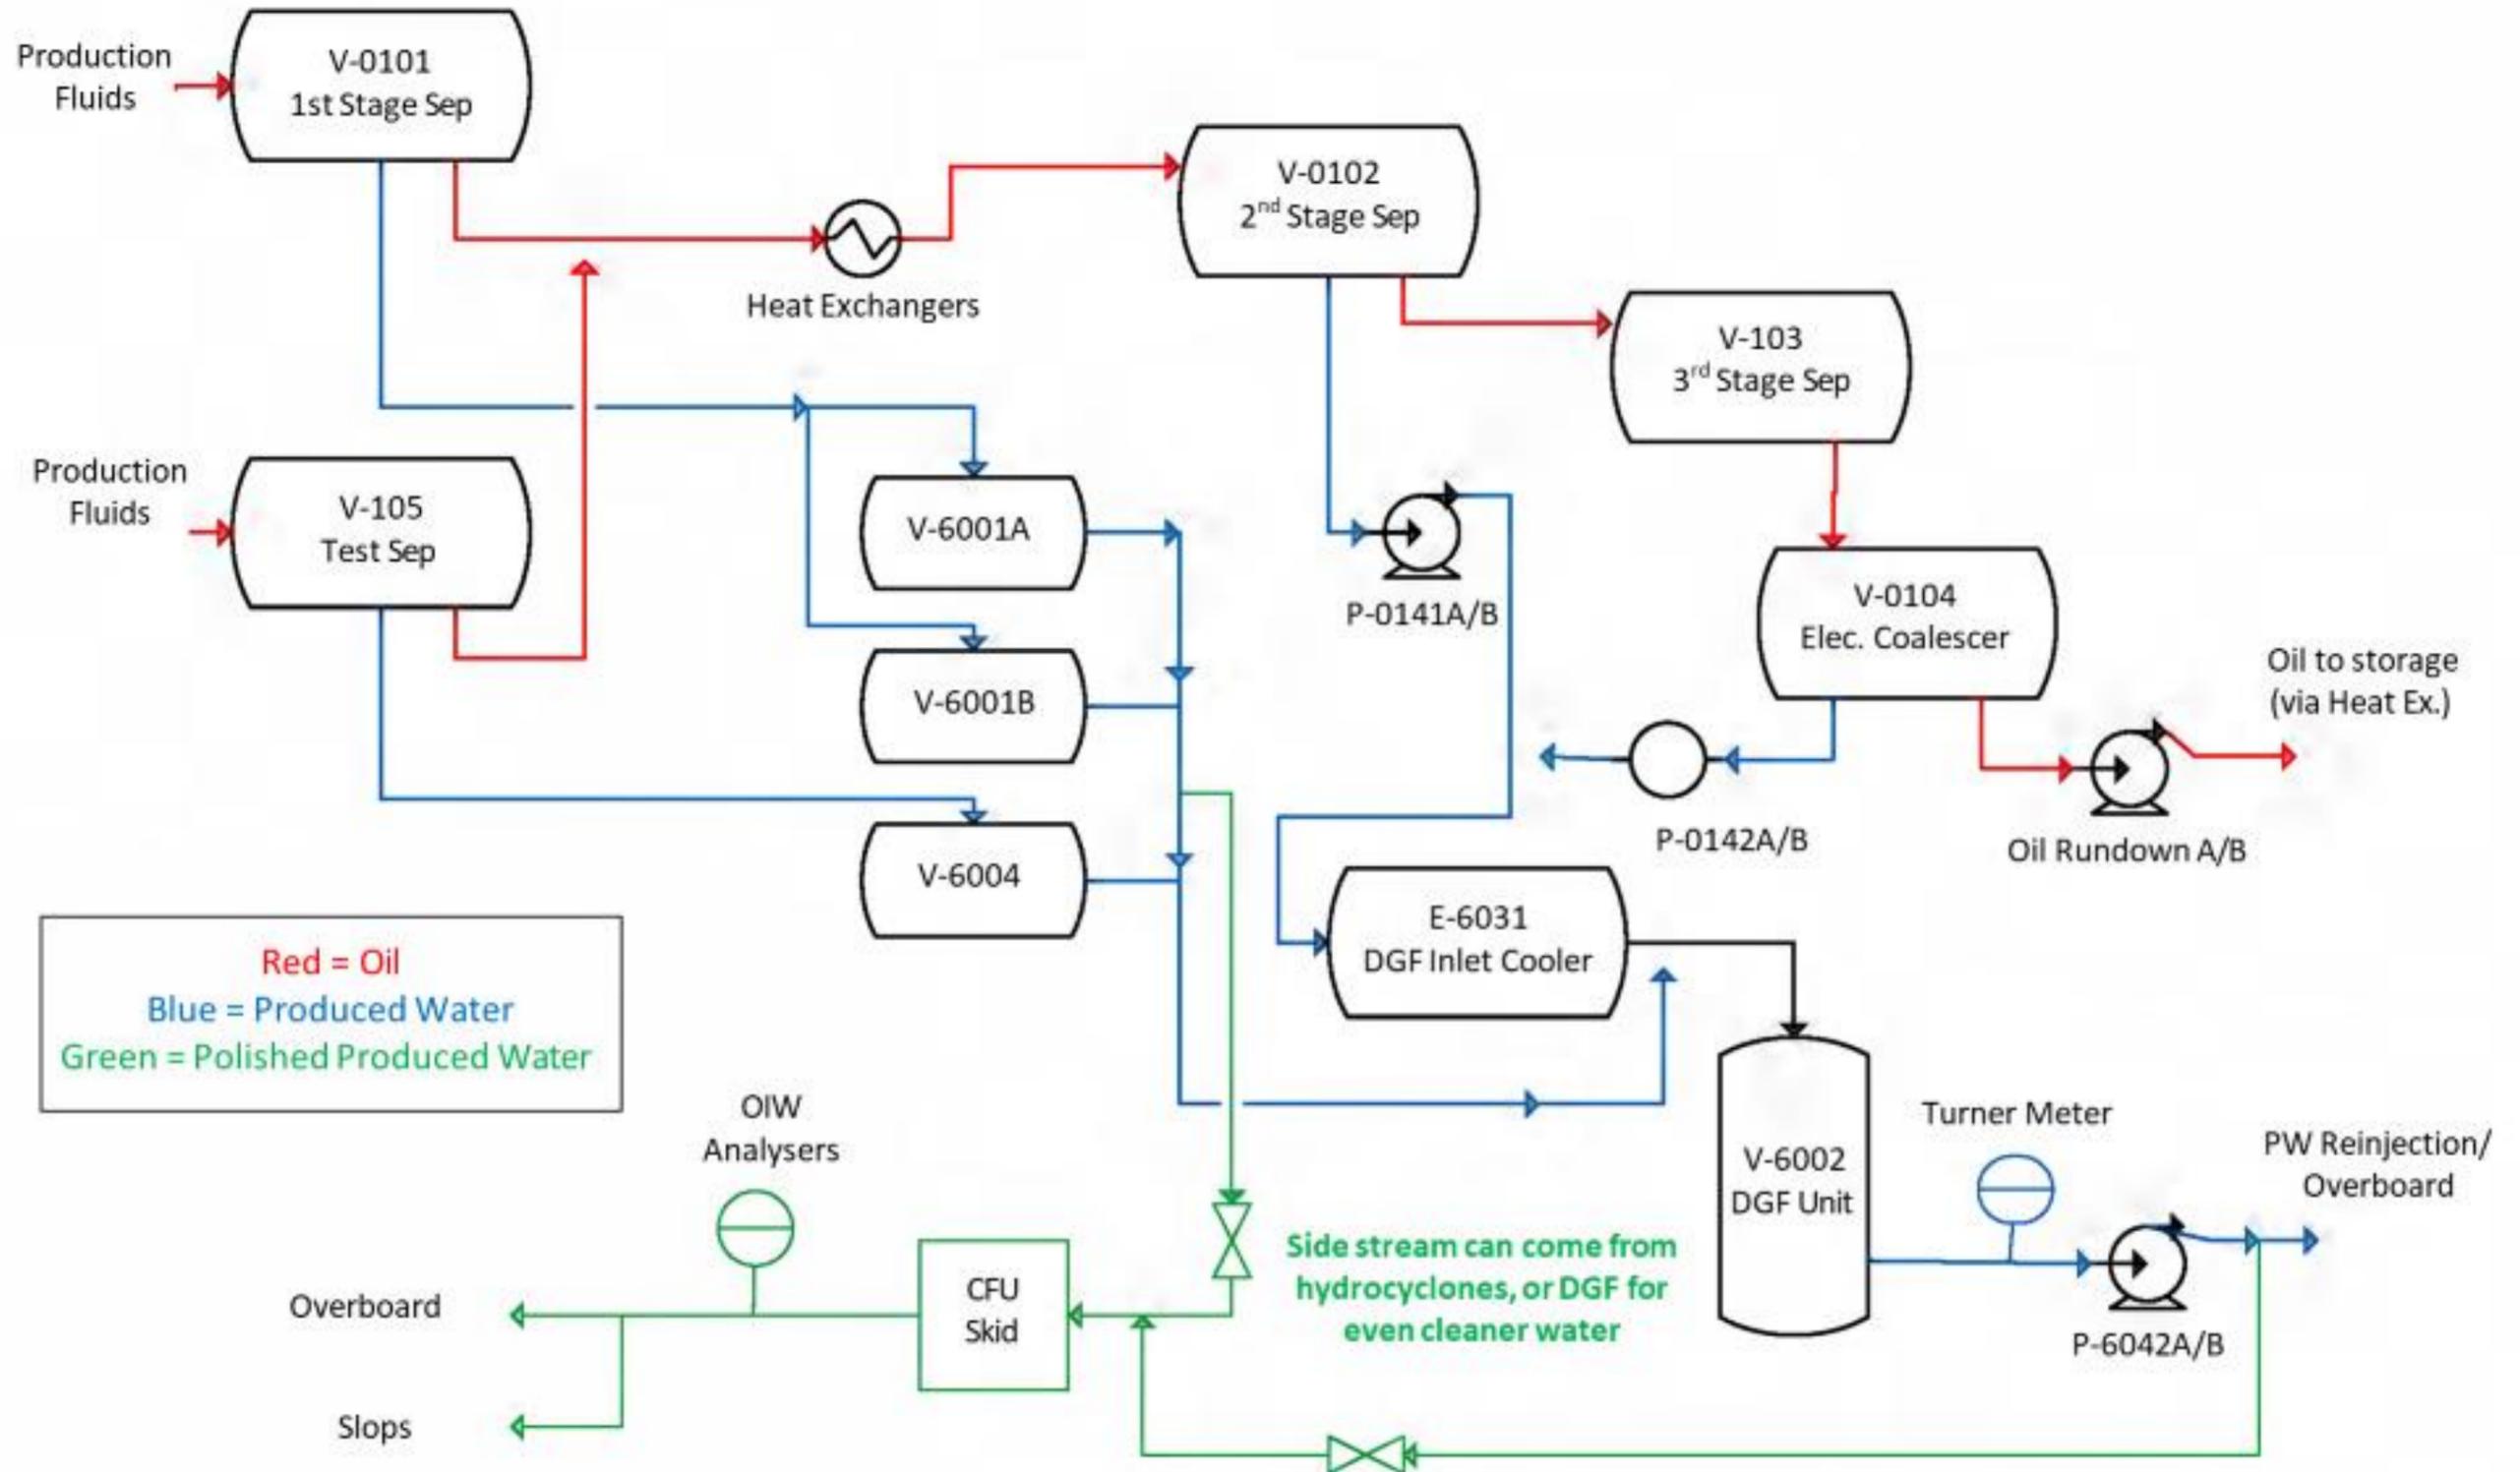

Figure 3-13: Pyrenees Facility PW System Schematic

The DGF is used for additional oil removal with the reject oily water from the DGF sent to the process for re-processing and polished water sent to the reinjection skid, diverted to the slops tanks or discharged overboard. The DGF has been in place since the Pyrenees FPSO begun production in 2009 and in 2024, the design and performance of the DGF was reviewed and improvements to the design were completed to improve produced water quality. A tie in spool was also modified into the process design to allow for the parallel operations of the DGF and CFU to increase the capabilities and further improve produced water quality.

An online analyser monitors the OIW content exiting the DGF:

- If the OIW content is within the injection specification, the PW is reinjected.
- If the OIW content is within specification (<30 mg/L), the PW may be overboard discharged.

The CFU was installed in July 2018. The CFU incorporates residual flotation gas in a secondary separation stage to increase OIW removal efficiency while degassing the clean water outlet. It is used for polishing PW after the hydrocyclones and discharged overboard or routed to slops if failing to meet specifications.

An online analyser monitors the OIW concentration in starboard slops tank:

- If the OIW content is within specification it is returned to the topsides process (upstream of the reinjection pumps) for disposal via reinjection. Direct discharge from the slops tank is feasible if OIW content is within specification however overboard discharge would primarily occur via the CFU.
- If the OIW content is off specification, the PW can be diverted to the port slops tank for further treatment (gravity separation), or manually routed to a dedicated centrifuge treatment system.

If the CFU was returned to service, an online analyser would monitor the oil-in-water exiting the CFU:

- if the OIW content is within specification, the PW is discharged directly overboard.
- if the OIW content is off specification, the PW is automatically diverted to the port slops tank for further treatment (gravity separation) as described above.

All water exiting the DGF or CFU passes through OIW measurement analysers prior to reinjection into the reservoir, diversion to the slops tank or discharge overboard.

Water from the DGF passes through the Turner model TD-4100-XD OIW analyser, which is monitored at the Pyrenees FPSO CCR.

Water from the CFU passes through an Advanced Sensors model EX1000 OIW analyser. This analyser was installed in July 2018 and was chosen to ensure continual reliable and accurate monitoring.

The process OIW monitors after the DGF (AT-6042-01), CFU (44-AIT-6005-12, and slops OIW monitor (AT-6042-02) are configured to allow the slops unit to act as a back-up for the process unit (but not vice-versa) in the event it is not available. All three meters are MARPOL certified.

As an automated fail safe, if any of the meters fail to confirm OIW readings in the overboard discharge stream, inconsistent readings are observed between the CCR and the OIW analysers and/or the verification tests, or the OIW concentrations do not meet the specifications, then PW is diverted to the slops tank, alternative slops tank (Cargo Oil Tank No 4) or other specified storage tank prior to overboard discharge. Samples will be taken to address any consistency in measured results. Overboard discharge will not occur until there is manual OIW result under 30 mg/L and it's confirmed that the calibration values used are suitable as described in Monitoring and Management of Produced Water and Slops Discharge Procedure.

If during any discharge to the marine environment the OIW content is likely to exceed a 24 hour rolling average of 30 mg/L exiting the DGF and the CFU, the overboard discharge is stopped

immediately. If the 24-hour rolling average limit is exceeded whilst discharging overboard, the Event and Investigation Management Procedure (PET-HSE27-RP-PRD-00002) is followed.

In the event OIW analyser readings become unstable or vary substantially over a 24 hour period, 6 hourly OIW readings must be recorded while water is being directed overboard from the PW or slops tanks until online analysers are brought back into specification. These readings must be averaged and entered in the daily Pyrenees Facility Production Report and the Enterprise Upstream (EU) database as per Monitoring and Management of Produced Water and Slops Discharge Procedure (PYHSE-E-0006).

### **3.12.6 Drainage System**

#### **3.12.6.1 Closed Drains**

All pressure vessels and equipment in hydrocarbon service or containing hazardous fluids on the Pyrenees FPSO are provided with a hard-piped drain connection to the closed drains system. The system is generally used to drain liquids from process vessels and equipment prior to maintenance and therefore these sources are normally isolated and only drained after depressurisation. The closed drain system also collects liquids during normal operations.

The collection vessel for the closed drain system is the LP flare KO drum (Section 3.12). Liquids collecting in the LP flare KO drum are normally pumped back to the process upstream of the crude heater, however it is also possible to route the liquids to the slops system in case the process train is unavailable or it is not desirable to return the fluid back to the process (i.e. well clean up fluids). The route to the slop systems is isolated and only used under controlled circumstances.

#### **3.12.6.2 Open Drains**

The Pyrenees FPSO open drain system consists of the following sub-systems:

- Hazardous open drains, which collect liquids from open drain sumps, tundishes and equipment drip trays in areas classified as hazardous
- Non-hazardous open drains, which collect liquids from open drain sumps, tundishes and equipment drip trays in areas classified as non-hazardous
- Chemical drains from bunded containment areas, which allow collection or disposal of chemicals from the chemical injection facilities.

These are discussed in further detail below.

##### **3.12.6.2.1 Hazardous and Non-Hazardous Open Drains**

The open drain systems are designed to handle rainwater, deluge/firewater, wash down water and any spillage of liquids which may also contain solids from process plant deck areas and equipment drip trays. The hazardous and non-hazardous areas on the Pyrenees FPSO have separate open drains collection systems. The hazardous drains in the hydrocarbon modules have dedicated routing to the slops tank, separate from non-hazardous open drains. The hazardous and non-hazardous open drain headers can be routed either to the Port Slops Tank or the 4-Port Slops Tank.

Liquid spills are contained and recovered by routing the open drains system to a series of segregated sumps located in the floors of areas with plated decks to either hazardous or non-hazardous open drains, depending on the area classification. These sumps have their outlet protected by a strainer screen to prevent solids from entering the system and creating blockages. The overflow system for these sumps is designed to minimise the risk of overboard discharge of hydrocarbons (in the case of a spill). Liquid captured in these sumps then flows to a common header, either hazardous or non-hazardous depending on area classification, via gravity to the slops tank system. Water is decanted in the slops system before being treated in the water treatment package (refer Section 3.12.5). Recovered oil is routed to the cargo storage tanks.

A liquid seal is provided at the slop tank inlet connection to prevent inert gas migration from slops tank to plant areas via the open drains system.

All equipment that is likely to have small and/or unpredictable leaks of hydrocarbons or chemicals (such as pump seals) have dedicated drip trays.

Excess flows experienced during deluge or heavy rainfall is managed using two off-takes from the drain sumps – one at a low level routed to the open drains system, the other at a higher level routed to the ships deck. The overflow off-take is designed such that it minimises overflow of hydrocarbon.

### **3.12.6.2.2 Chemical Storage Area Open Drains**

The open drains in the chemical storage areas have the following design features to minimise the risk of release of any spillage to the marine environment.

The chemical storage area consists of two levels - a chemical loading/unloading/handling area at the top level and the chemical storage and injection area, beneath the chemical handling area. Both areas are individually bunded and have drain sumps with segregation according to chemical compatibility.

All chemicals collected on the open drain sump at the top level are piped to the appropriate drain sumps provided in the chemical storage and injection area.

Level switches are provided for the chemical storage and injection area drain sumps which alarm on high level.

The collected drainage from the chemical storage and injection area drain sumps are pumped to a transportable waste collection tote tank in the event of a spill, or to the open drain system during normal operations.

### **3.12.7 Seawater System**

Seawater is pumped onboard the Pyrenees FPSO for use as cooling water and to produce potable and fresh/distilled water. These systems are discussed further below.

#### **3.12.7.1 Cooling Water System**

The purpose of the Pyrenees FPSO seawater systems is to provide process and HVAC cooling. Seawater is delivered to the system from the ship's hull via three seawater lift pumps.

The process cooling water system consists of two sub-systems:

- The tempered water cooling system, which is a closed loop system that provides cooling to process heat exchangers and topsides machinery
- The seawater cooling system, which provides cooling to the closed loop process cooling water and to process coolers.

The tempered water cooling system is a closed loop system which provides cooling for the HP compressors, PW injection pumps, LP fuel gas cooler, steam condensate cooler and sample coolers. There is provision for chemical injection into the system as required (pH buffer, oxygen scavenger, scale/corrosion inhibitor and biocide).

The seawater cooling system is a single pass system used primarily to cool the seawater/tempered water cross exchanger, offgas cooler, crude rundown cooler and PW injection cooler. The seawater is filtered at the intake through the seawater coarse filters to prevent intake of a sudden influx of microalgae, seaweed etc. After use in the cooling water system, the heated seawater is discharged overboard to discharge specifications.

Marine growth is prevented from growing in the seawater cooling system by a sodium hypochlorite copper chlorine system. Antifoam is also injected at the inlet of the seawater deaeration tower to control seawater foaming to reduce deaeration.

The daily seawater cooling flow rate expected during operations is 33,600 – 38,400 m<sup>3</sup>/day. The design return temperature is 46.3°C at the maximum expected surface ambient seawater temperature of 31 °C. Cooling water flow rates and temperature are recorded in PI Process Book as per the below specifications (Table 3-9).

**Table 3-9 Cooling Water Discharge Specifications**

Cooling Water	Unit	Quantity
Cooling Water Discharge Temperature max. <sup>1</sup>	°C	50
Daily flow rate	m <sup>3</sup> /day	48000

1. Limit to comply with environmental requirements and to reduce scaling potential in seawater cooling system.

### 3.12.7.2 Fresh Water System

Fresh and distilled water is produced on the facility by a fresh water generator, which uses heat from the auxiliary boiler steam system or main engine jacket cooling water to evaporate seawater in a vacuum. The vacuum is applied to the separator vessel by the brine ejector and seawater from the ejector pump is used to condense the vapour. The distillate water pump removes the produced water from the condenser and delivers it to either the distilled or potable water tanks.

The fresh water generator consists of heat exchangers, separator shell and condenser, water ejector, the ejector pump, steam injector, distillate pump, salinometer, solenoid valve, deflector, mesh separator, water meter and feed water chemical injection unit.

The fresh water is stored in tanks and distributed by hydrophore units with electric driven pumps. Facilities for transfer of potable water from supply boats to the Pyrenees Facility freshwater storage tanks are also provided.

Fresh water is used for accommodation potable and hot water services, machinery space drinking fountains, topside utilities and safety showers and eye wash stations.

### 3.12.8 Cargo Storage and Offloading System

The Pyrenees FPSO is divided into sealed compartments by a series of longitudinal and transverse bulkheads. There are 6 port cargo tanks and 6 starboard. The Pyrenees FPSO features a double skinned hull (sides and bottom) around the cargo tanks.

The cargo tanks are blanketed with inert gas and maintained at a slight positive pressure, up to 14 kPa(g).

#### 3.12.8.1 Cargo Offloading

Stabilised crude oil is offloaded to tankers (up to 125,000 DWT) moored at the stern of the Pyrenees FPSO in a tandem configuration, using a floating hose (260 m by 16-inch) connected from the stern of the Pyrenees FPSO to the mid-ship manifold of the receiving tanker. A mooring hawser connects the two vessels during crude transfer operations, with the distance between the two vessels approximately 60 m, maintained by an operations support vessel providing static tow on the offtake tanker.

The cargo system is designed to offload 87,430 m<sup>3</sup> (550,000 bbls) in less than 30 hours. Cargo pumping is via electric submerged deep well pumps located in the cargo tanks. The dual carcass floating hose is stored on a hose-reel at the stern of the Pyrenees Facility while not in use. This reduces the likelihood of damage to the hose during handling or impact by vessels (and their propellers) and subsequent oil releases and enables the Pyrenees FPSO to steam away from an incoming cyclone at a higher speed (as the floating hose is not being towed behind).

The offloading system includes an emergency shut off valve at the Pyrenees FPSO stern and an emergency disconnection system. Both are capable of being remotely operated from the CCR. The floating hose has a quick release as part of the hose reel for emergency release. This coupling can be actuated from the CCR in the event of an emergency release of the offtake tanker, to ensure integrity of the hose string is maintained. The design of the unit is such that minimal oil is lost in the event of a release (approximately 40 L).

The mooring system uses a releasable hawser handling winch, which incorporates hawser winch with spooling device, fairlead, strongpoint and hook in a single compact unit. The hawser, chain and messenger rope is paid out and the mooring is complete when the outer chafing chain is locked in the export tanker chain stopper.

The offloading operation is carried out with the assistance of a differential global position system (DGPS) on board the offtake tanker and the Pyrenees FPSO, which reduces the potential for vessel collision. Closed circuit television (CCTV) is provided at the offloading area to monitor offloading operations and minimise the requirement for personnel to be in the area during offloading. In the event of an emergency on either the Pyrenees FPSO or offtake tanker, the offtake tanker would be released via a quick release of the hawser.

Offloading operations support is provided by the following:

- Two pilots and one surveyor, mobilised to the offtake tanker for each offload, transferred from shore to the tanker via the Crew Transfer Vessel. The pilots and surveyor remain on board the tanker during the offload; and
- The support vessel, who passes the hawser pick-up line to the offtake tanker, passes the floating hose pick-up line to the tanker while the tanker's engine is astern, and provides the static tow on the tanker.

### **3.12.8.2 Tanker Vetting Procedures**

Prior to gaining acceptance for offloading from the Pyrenees FPSO, all offtake tankers are vetted according to the Woodside Marine Vessel Vetting Procedure, which also utilises external databases. Woodside uses an in-house system which incorporates a comprehensive shipping database. The principal database includes all operational Oil Tankers globally and utilises a large range of tools to assess ships including:

- Casualty record
- Sanction records
- Class history
- Flag history
- Operational performance
- Greenhouse Gas Emission rating
- Owner audits
- Port state inspections
- Ship operator assessment
- Ship Inspection Report Programme (SIRE) inspections
- Structural analysis
- Terminal feedback.

The Oil Companies International Marine Forum (OCIMF) also maintains a database to which major oil companies contribute inspection reports. The use of both these databases ensures that the most current inspection information is available to assist in the assessment process.

The trading tanker must also submit a wide range of data and evidence for assessment, including compatibility with the Pyrenees FPSO, inspection status, and safety and environmental aspects, including:

- **Compatibility:** Engineering aspects of the vessel that allow it to be loaded at the Pyrenees FPSO including draught, manifold configurations, manoeuvring and mooring aspects, and ability to safely navigate.
- **Inspection status:** A satisfactory physical inspection of the vessel by a certified OCIMF SIRE inspector must have taken place within the last 6 months. Ships older than 15 years are required to be registered in Continuous Assessment Program (CAP) and meet CAP 2 minimum.
- **Certification:** All certification must be in place and all relevant international conventions must be complied with, including current International Safety Management certificate, MARPOL, and classification society registration (such as American Bureau of Shipping, Lloyds, or similar).
- **National guidelines and regulations compliance,** including DAWR Ballast Water Management and antifouling guidelines.
- **Insurance:** Satisfactory oil pollution cover must be held.

Trading tankers are also required to meet Classification Society Rules and are subject to regular inspections that cover various aspects of the vessel's condition. These inspections are required on a specified and regular basis (as prescribed by Class Rules), and include structural aspects of the hull. For trading tankers, these inspection programs include a requirement for regular dry-docking to allow inspection of the external hull.

Once accepted, the tanker must conduct offloading operations in accordance with the Pyrenees Facility Terminal Handbook.

### 3.12.9 Ballast System

The Pyrenees FPSO ballasting system comprises six pairs of wing double bottom ballast tanks and the fore peak tank which surround the cargo tanks, providing a double hull arrangement. The ballast tanks and ballast system maintain stability of the Pyrenees FPSO and manage stress conditions during cargo loading and discharge operations. Control of the ballast system is operated in the CCR, in conjunction with the "Shipmanager" system, which monitors the load forces (e.g., shear forces and bending moments) and to ensure they remain within the acceptable stability envelopes.

The Pyrenees FPSO ballast system complies with ABS Classification Rules and International Maritime Organisation (IMO) (Water Ballast Water Management Convention) requirements. The system consists of:

- Ballast tanks and pumps;
- Hydraulic power unit (HPU) and supply lines;
- Ballast valves and piping; and
- Vessel monitoring system/ballast panel (and associated software).

The ballast tanks and cargo tanks are segregated to minimise potential contamination with oil. Ballast water is also monitored continuously with an explosion meter to detect oil and fuel content. Ballast water is diverted to the slops system when oil/fuel is detected.

Two single stage centrifugal ballast pumps are provided, which take water from the ballast tanks or the sea (via a sea chest) via the ballast ringmain. The port and starboard ballast systems are cross

connected via ringmain piping, allowing pumping from tanks on one side to the other and de-ballasting of any through either pump. Backup power is provided for the loading computer and cargo control panel via the emergency switchboard (i.e. emergency generator).

The ballast valves are hydraulically operated and fail to last position. Findings from the Petrobras P36 incident have been incorporated into the design where practical (e.g. the hydraulics logic ensures that signals outside the 4 to 20 m range are recognised as faults and no subsequent actuation of the ballast valves are carried out). The valve control hydraulic system consists of redundant HPU and back up reservoirs.

### **3.12.10 Inert Gas System**

The inert gas system ensures the atmosphere in the Pyrenees FPSO cargo storage and slop tanks is maintained at a positive pressure to prevent the formation of flammable mixtures during crude oil washing and purging operations and cargo offloading.

The system on the Pyrenees FPSO is a standard inert gas system which uses boiler flue gas as the inert gas, sourced from the exhaust gas duct of the auxiliary boilers. The inert gas has an oxygen content of below 5% by volume. The inert gas plant is located in the engine room. The plant consists of a scrubber and demister, two inert gas blowers, a deck water seal unit, pressure/vacuum breaker, ducting and necessary fittings. The inert gas system is a standalone system with a control panel in the CCR.

## **3.13 Emergency Blowdown, Shutdown and Safeguarding**

### **3.13.1 Emergency Blowdown**

All hydrocarbon inventories on the Pyrenees FPSO are provided with facilities to enable them to be depressurised via the blowdown system. The blowdown system comprises the following:

- Fail open blowdown valves (BDVs) on various process equipment; and
- Control instrumentation, power supply and instrument air.

The status of the BDVs is indicated in the CCR. Blowdown can be initiated manually from the CCR or automatically via the fire and gas system.

The blowdown design philosophy is based on blowdown of vessels from maximum operating pressure to 6.9 barg or 50% of maximum operating pressure within 15 minutes, whichever is lesser.

The actual blowdown has been conservatively based on blowdown from high pressure trips instead of normal operating pressure. This means blowdown from the normal operating pressure can be achieved in less than 15 minutes in most cases.

### **3.13.2 Shutdown and Safeguarding Control Systems**

The Pyrenees FPSO has shutdown and safeguarding systems to automatically sense any abnormal process condition, alert the operator at the operator interface in the CCR and execute actions (such as isolate process inventories, initiate blowdown and shutdown equipment).

The process control system (PCS) continuously monitors and controls the Pyrenees FPSO process and utility systems, including equipment packages and associated facilities. Subsea wells are controlled by a standalone master control station. The PCS is the main data collection point for the information management (e.g. including hydrocarbon accounting for emission reporting).

The alarm monitoring system (AMS) comprises the cargo and ballast control/stress systems, tanker loading facilities, certain utilities and services (e.g. diesel, potable water) and electrical power management for the emergency/essential generators. The AMS is also monitored and controlled in the CCR.

The subsea control system (SCS) includes all electronic components and facilities for full control and monitoring of the subsea facilities and the associated hydraulic power on the vessel deck. The complete subsea installation is normally operated from the subsea master control station (SMCS) remote terminal in the CCR.

### 3.13.3 Emergency Shutdown Valves

Emergency shutdown valves (ESDVs) are provided throughout the topsides hydrocarbon processing plant and in the fuel gas and methanol systems. The ESDVs are designed and installed in accordance with ABS Classification and API standards.

The valves are pneumatically actuated, with the exception of the riser ESDVs which are hydraulically operated. The ESDVs are fail safe design, sprung to close with hydraulic/pneumatic actuation to open (i.e. they fail closed on loss of air/hydraulics or control signal). The valve position is indicated locally and in the CCR.

The topsides ESDVs are fire rated and are protected against long duration riser fires. Emergency shutdown of all isolation valves including the riser ESDVs will occur automatically upon confirmed fire or gas detection or as a result of process upset. ESDVs can also be initiated manually from the CCR and various pushbuttons around the Pyrenees FPSO.

## 3.14 Utility Systems

### 3.14.1 Power Generation

The Pyrenees Facility power generation is derived from the following systems:

- Topside main generators;
- Essential (hull) generators – three sets of diesel generators each providing 950 kW;
- Emergency generator – one set diesel generator producing 300 kW; and
- Uninterruptible power supply.

The primary source of electrical power for the Pyrenees Facility is three (dual fuel gas/diesel) turbine-driven power generators (located topside) and associated distribution system. Production equipment is predominantly electric motor driven with the exception of the gas compressors which, like the main power generators, are also gas turbine driven. The power generation system is designed to be used in both production and ship's navigation requirements.

The Pyrenees Facility power systems are discussed in further detail below.

#### 3.14.1.1 Topside Power Generation

Topside power generation is provided to meet all power requirements for the Pyrenees Facility when connected to the spider buoy and in normal production and offloading mode. This includes all process, utility and marine electrical loads. The topside main generators are also used for connection and reconnection of the Pyrenees FPSO with the turret if it is necessary to use the thruster during the connection process.

The three gas turbine generator sets are 7000 kW gas/diesel Solar Taurus 70 units. The generators normally run on fuel gas, with diesel fuel used only during periods when gas is unavailable, such as black start, turret connection and disconnection.

The main generator fuel system is capable of automatically switching from fuel gas to diesel fuel without interruption to the power supply, initiated either by a specific shutdown signal or upon loss of fuel gas pressure. Alternatively, the system may be manually switched from diesel to fuel gas without interruption to the power supply.

### 3.14.1.2 Essential (Hull) Generators

Diesel generators in the shipside engine room are retained as a standby for marine utility and emergency systems and as the main generator for ship navigation. They additionally allow 'black start' of the main gas turbine generator. The system consists of three diesel engine driven generators of 950 kW each.

In the event of topside generation failure, the shipside generators will supply power to shipside utilities and topside emergency power. Start of shipside main generators (essential generators) is controlled both manually and locally. Power supply change over from topside gas turbine generators to shipside generator is performed with non-blackout power changeover (a short period parallel running of shipside and topside generators for power transfer with sync-check will be catered for as part of the system design).

### 3.14.1.3 Emergency Generators

A diesel engine driven emergency generator is installed within a dedicated machinery room located on the hull's main deck, along with its dedicated diesel day tank (with 18 hours running time). The generator is 300 kW.

The emergency generator satisfies all regulation and class requirements and has sufficient installed capacity to satisfy all hull and topside systems emergency loads, including:

- Emergency and heli-deck lighting
- UPS and battery systems
- Fire and gas detection and prevention
- All emergency response telecommunication systems
- Navigation systems and aids
- Emergency equipment
- Control power for subsea system
- UPS for the control systems.

### 3.14.1.4 Uninterruptable Power Supplies

Stand-alone uninterruptible power supplies provide secure power to the Pyrenees FPSO critical loads for control, communication, safe shutdown and evacuation of the facility. Critical loads are defined as those required to maintain safe condition, equipment, or prevent loss inventory.

The systems are 100% redundant with exception of existing marine battery supplies and are configured to provide automatic and uninterruptible back-up on loss of normal, essential and emergency power. All systems have sufficient storage battery capacity to provide power in accordance with Classification Society requirements for marine and offshore installations. Redundant systems may be supplied from both emergency and normal power supply.

These power supplies also provide clean power services to sensitive instrumentation and telecommunication equipment where close tolerance voltage and frequency conditions are needed and supply disturbances minimised.

The critical loads have minimum battery autonomy periods. The critical loads include:

- Process control and safety systems
- FGS and supporting process control system equipment
- Navigation aid systems
- Electrical system

- Topside unit control panel and mechanical packages
- Critical control and alarm equipment.

Battery autonomy periods are also provided for telecoms essential loads, telecoms normal loads and instrumentation.

### 3.14.2 Diesel Fuel System

Marine diesel oil is used for all sailaways, initial mobilisation voyage and initial start-up and emergency operations, or to cover periods of disruption to production activities in the absence of fuel gas.

Diesel is required as the primary fuel for the following systems:

- Secondary fuel for the topside power generation and marine steam boilers
- FPSO main engine
- Essential generators and the emergency generator
- Firewater pumps (main and standby)
- Lifeboat.

Diesel fuel is bunkered onboard the facility from OSVs and stored in the diesel storage tanks (approximately 2,935 m<sup>3</sup> capacity) located within the aft hull of the Pyrenees FPSO. Approximately 10 L per month of biocide/corrosion inhibitor is added on an as-required basis once diesel is stored onboard the Pyrenees FPSO.

### 3.14.3 Hydraulic and Lube Oil

The hydraulic power units (HPU) provides clean hydraulic fluids at various flow rates and pressures to accommodate the requirements of the below:

- Mooring/topsides:
  - Well subsurface safety valves and xmas tree valves
  - Riser and fluid transfer path emergency shut down valves (ESDVs)
  - Topsides hydraulic ESDVs
  - Ancillary topsides and hull systems hydraulically activated valves
  - Mooring buoy structural connector.
- Marine:
  - Cargo, ballast and slops tank valves
  - Hull systems mooring and hawser winches.

Hydraulic fluid for the subsea control system is water based to minimise flammable hazards. Hydraulic fluid is replenished via tote tanks. The lube oil is used both for the power generation turbines and for major topsides rotating equipment. A lube oil purification system is also provided.

Sealed bulk bins are used to transfer large quantities of lube oil and chemicals offshore. The bins are located topsides at an elevated position with a gravity distribution piping to main oil consuming packages and the oil storage tanks.

### 3.14.4 Instrument and Plant Air System

Instrument air and utility air generation systems are provided via 'control' air compressor/drier/receiver (3 by 50%). This supplies the instrument air header and nitrogen generation system. The instrument air users include:

- Instruments and pneumatic tools;
- Gas turbine power generators; and
- Process packages.

The 'start' air compressor/receiver supplies the utility air header.

### 3.14.5 Nitrogen System

The Pyrenees FPSO process plant is equipped with a 155 m<sup>3</sup>/hr LP nitrogen generation system (i.e., compressed air powered membrane system), with a nitrogen purity of 97.5%. The nitrogen system is used to purge equipment and piping and is used as back up to the flare header purge gas.

### 3.14.6 Steam Systems

Six barg steam is supplied from the ship's hull for use as the heating medium for crude heater after depressurising and desuperheating to 1.0 barg saturated steam. Steam is also supplied to the topsides utility stations from desuperheater downstream. Steam condensate exiting the crude heaters is collected in the condensate collection drum and returned under gravity to the hull via steam condensate cooler.

### 3.14.7 Sewage and Putrescible Wastes

There are two sewage treatment units installed on the Pyrenees FPSO. Sewage treatment unit U-4151 is the primary unit, sized for a maximum of 60 persons on board (POB). This unit was installed during the Pyrenees FPSO conversion. A second unit, sewage treatment unit U-4152, is sized for 32 POB and pre-existed the Pyrenees FPSO conversion. This unit is retained as a standby (emergency) unit.

Both units are combined treatment systems manufactured by "EVAC". Each unit comprises an integrated vacuum generator and a biological sewage treatment system. The system uses an aerobic process whereby activated sludge converts organic substances in waste water to carbon dioxide and water without danger of methane gas production. The units are fully automatic in normal operation and require low maintenance.

Both units are designed to meet the requirements of MARPOL 73/78 Annex IV and USCG 33CFR part 159 which specifies the discharge effluent quality as follows:

- BOD < 50 ppm
- Suspended solids 100 ppm
- Faecal coliforms < 250 pcs /100ml MPN.

Sewage and greywater is discharged from the units to the marine environment in accordance with Annex IV of the International Convention for Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978 (referred to as MARPOL 73/78).

Putrescible waste (food waste) is macerated to a size of less < 25 mm before discharge to the marine environment.

### 3.14.8 Cranes and Material Handling

The Pyrenees FPSO is equipped with material handling equipment to enable maintenance of all major equipment on the Pyrenees FPSO, efficient movement of materials around the Pyrenees FPSO, and transfer of materials to and from OSVs.

### 3.14.9 Passing Vessel Detection

Management controls are in place to reduce the likelihood of unplanned interactions between the Pyrenees FPSO and other vessels. These include features that allow detection of vessels approaching or passing near the Pyrenees FPSO as follows:

- Facility personnel to observe approaching vessels and raise the alarm
- Auto Identification System (AIS)
- Automatic Radar Plotting Aid
- Closed Circuit TV.

Communication systems to notify other vessels of the Pyrenees FPSO's location include:

- Navigation aids, bridge wing searchlights and lights/deck illumination
- Fog signal in restricted visibility
- Radio communications.

The turret also has a radar reflector and navigation lights, which are activated when the Pyrenees FPSO is disconnected.

#### 3.14.10 Facility Lighting

Artificial lighting on the Pyrenees FPSO and support vessels at night is at levels required for safe conduct of operations and for various navigational sea and air safety requirements.

The main criterion for lighting design is to ensure that there is effective lighting to maintain a safe working area, and safe movement around the vessel to enable start-up, inspection and testing. All access ways to emergency pathways are also required to have sufficient light for successful evacuation from the ship in the event of an incident. As a result, the illumination levels on the Pyrenees FPSO have been selected to balance the functional requirements whilst minimising spill illumination from the Pyrenees FPSO. For safe working practices, the current specification requires lighting levels to be 150 lux at one metre above the deck of the FPSO, being 24m above sea level with a deck height of approximately 23m.

The main areas that require direct sea lighting are the emergency departure and muster area on the aft of the ship adjacent to the emergency escape vessel area. This is generally illuminated in the event of an emergency on board and is not classified as normal lighting for the vessel. Additional lighting is required periodically on cranes and around the stern of the Pyrenees FPSO to allow safe lifting and loading and unloading of support vessels and trading tankers.

#### 3.14.11 Chemical Injection System

A chemical injection system is provided for the chemical treatment of production fluids (both subsea and topsides) and to protect piping and equipment. This includes a single chemical injection package, methanol injection package and acetic acid injection package. A separate distribution panel is located on the geo-stationary component of the DTM to facilitate distribution of subsea chemicals.

The system accommodates both continuous and intermittent chemical injection and is designed for minimal manual handling and mainly uses large but standard sized re-usable tanks (tote bins or isotainers for large consumption chemicals) which are filled onshore, shipped offshore, and placed in prearranged dedicated locations to be piped directly into the chemical distribution system. Variable flow positive displacement pumps are used to deliver the chemicals to the required injection points.

Normal loading is from tote/transportable tanks by gravity feed/or pumped to dedicated storage tanks (refer Table 3-10 and Table 3-11 for indicative inventory volumes). Flexible hoses with quick connectors are used to connect the tanks to the hard piped storage tank feed lines. The connectors and flexible hoses are unique for each chemical, used to avoid cross contamination of chemicals.

Individual storage for each chemical is provided and incompatible chemicals are stored in separate bunded areas. The acetic acid and methanol tanks (the largest inventory within the chemical injection area) are individually bunded and drain to the slops tank. The chemical storage area has its own open drains systems, which are described in Section 3.12.6.2.

Indicative chemicals in use and inventories on the Pyrenees FPSO are outlined in Section 3.15.2. Chemicals used in the process and subsea system are recovered onboard the Pyrenees FPSO (normally via the PW system) and reinjected or are alternatively collected and disposed through the slops discharge system.

### 3.15 Hazardous Substances and Inventories

This section provides information on the hazardous substances stored and used on the Pyrenees FPSO and is divided into process and non-process hydrocarbons, and process and non-process chemicals.

#### 3.15.1 Process and Non-Process Hydrocarbons

The main indicative process hydrocarbon inventories on the Pyrenees FPSO are summarised in Table 3-10. In addition to the process inventories, the following non-process hydrocarbon inventories are associated with the Pyrenees FPSO:

- Crude oil in the cargo tanks – Maximum storage capacity 881,000 bbl;
- Crude oil in the offloading hose (temporarily during offtake, 260 m long and 400 mm diameter) and
- Diesel oil in the bulk storage tanks and various day tanks – Approximately 2,452 m<sup>3</sup> (with small quantities stored topsides in the emergency generator and lifeboat).

The hydraulic power units also provide clean hydraulic fluids at various flow rates and pressures to accommodate the requirements of the mooring/topsides and marine users.

**Table 3-10 Indicative Topsides Process Hydrocarbon Inventories on the Pyrenees FPSO**

Inventory	Operating Pressure (bar)	Operating Temp (°C)	Gas Volume (m <sup>3</sup> )	Liquid Volume (m <sup>3</sup> )
First stage separator V-0101	9	39 – 61	99.3	210
Test separator V-0105	9	14 – 47	35.7	73.2
Second stage separator V-0102	4	95 – 100	54.7	187.9
HP1 suction scrubber V-0301	8.5	45	4.3	1.212
HP2 suction scrubber V-0302	23.7	39	2.5	0.54
HP2 compressor C-0312	67.7	39	1.5	Negligible
Glycol contactor T-0351	65	39	13.3	Negligible
HP3 suction scrubber V-0303	64.6	41	1.2	0.6
HP3 compressor C-0313	169	153	1.5	Negligible
Macedon gas scrubber V-0305	72 – 170	14	4.6	0.78

HP fuel gas filter/separator F-6451	64.5	41	4.6	Negligible
HP fuel gas KO drum F-6401	3.5	46	0.7	0.4
HP flare gas KO V-6401	0.1 – 5	27 – 100	63.8	15.79
LP flare gas KO V-6401	0.1 – 0.5	40 – 132	11.6	16.56
Gas lift and gas injection swivel piping	167.7	60	0.1	Negligible
Offgas cooler E-0131	9	39	16.1	Negligible
Fuel gas system piping	27.6	58.4	1.1	Negligible
Production turret/spider buoy	9	29	2.4	0.33
Gas lift turret/spider buoy	167.7	60	1.7	Negligible
Gas injection turret/spider buoy	167.7	60	1.7	Negligible
Crude export	13	60	Negligible	155.6
Well clean-up package	3.5	60	Negligible	53

### 3.15.2 Process and Non-Process Chemicals

Table 3-11 provides an indicative list of process chemicals and their indicative storage inventories onboard the Pyrenees FPSO. Table 3-11 also lists the dosing point in the process, their purpose, typical dose rate, chemical type/classification and chemical risk assessment undertaken.

The chemicals with the largest inventories on the Pyrenees FPSO are discussed in further detail below:

- Methanol is used when required in low dose rates to prevent hydrate formation in the production and gas manifolds in the event the glycol dehydration unit is out of service or off specification, or for chemical line flushing. Pyrenees hydrate management under normal steady state operation is achieved through environmental conditions (e.g. ambient temperature is 21°C). Wells may require methanol injection in the event of a protracted shutdown. For long-term shutdowns (e.g. cyclone disconnect), the flowlines are depressurised and do need to be inhibited with methanol.
- Demulsifier is injected continuously into the wells. The Pyrenees crude is categorised as a heavy oil with an API gravity of 19. Heavy oil development wellstreams are characterised by water dispersions/emulsions. The point at which the water-in-oil emulsion inverts and the water becomes the continuous phase is referred to as the 'inversion point' or 'critical water-cut'. The Pyrenees crude emulsion inversion point is at approximately 90% water cut.

Maintenance chemicals include chemicals which are required for general maintenance or 'housekeeping' activities and are critical for overall maintenance of the facility and its equipment. These may include paints, degreasers, greases, lubricants, and domestic cleaning products. They may also include chemicals required for speciality tasks, such as laboratory testing and analysis.

Maintenance chemicals generally present negligible risk to the environment as they are not discharged as a result of their use (e.g. paint), or are used intermittently and discharged in low volumes (e.g. domestic cleaning products).

**Table 3-11 Indicative Process Chemical Types and Storage Quantities**

Chemical	Chemical Name (indicative only)	Dosing Point and Purpose	Tank Capacity	Estimated Daily Use	Dosage concentration (ppm v/v)	Discharge Concentration (ppm v/v)
Hydrate Inhibitor (Methanol)	Methanol	Subsea wellhead - Control of hydrate formation.	30 m <sup>3</sup>	As required	As required	Variable
Topsides Demulsifier	FLOW18280F	Topside process - Facilitates separation of oil and water.	20 m <sup>3</sup>	Not currently used	0 - 50	<30
Water Clarifier	CHP917407.32H (Cleartron IZB-172)	Topside process - Facilitates separation of oil and water.	9.2 m <sup>3</sup>	150 L	0 – 10	<30
Scale Inhibitor	SCAL16484F2	Topside process and subsea well heads - Control of inorganic scale due to mixing of seawater and PW.	11 m <sup>3</sup>	250 L	13	<40
Corrosion inhibitor	CORR11447A	Topsides process – Control of corrosion.	9.2 m <sup>3</sup>	650 L	30	<10
Biocide	EC6297A	Slops tank and topside process - Control of bacterial count.	5.2 m <sup>3</sup>	450 L and batch dosed every 5 & 7 days	300	The distributed control system logic prevents PW discharge overboard during process biociding and for four hours post dosing.
TEG antifoam	AFMR19029A	Control of foaming in tower.	70 L	As Required	As Required	Variable
Process antifoam	AFMR19242A	Topsides process – Foam control.	14.4 m <sup>3</sup>	108 L	As Required	Variable
TEG pH adjuster	CORR11005A	Adjustment/maintenance of pH.	70L	As Required	As Required	Variable

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Oxygen scavenger	Nalco 7408	Topsides process - Reduce dissolved oxygen concentration to <10 ppb.	5.2 m <sup>3</sup>	As Required	As Required	Variable
Triethylene glycol (TEG)	TEG	Gas Dehydration	11 m <sup>3</sup>	As Required	As Required	Variable
Subsea Demulsifier	Baker Hughes DMO83409AP	Subsea wellhead - Facilitates separation of oil and water.	20 m <sup>3</sup>	480 L	0 - 250	<26
Subsea control fluid	Transaqua HT2 (Castrol)	Subsea wellhead – Hydraulic fluid	5 m <sup>3</sup>	As Required	As Required	Variable

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

### 3.15.3 Chemical Selection, Assessment and Approval

Operational chemicals required by the PAP are selected and approved in accordance with Woodside’s chemical selection and assessment guideline. This process is used to reduce potential impacts and risks associated with chemical use to ALARP by selecting chemicals with the lowest practicable environmental impacts and risks, subject to technical constraints.

#### 3.15.3.1 Environmental Selection Criteria

Woodside’s process for selecting and assessing chemicals follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS) which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands (background on the OCNS scheme is provided below):

- where operational chemicals with an OCNS rating of Gold/Silver/E/D and no OCNS substitution or product warning are selected, or a substance is considered to pose little or no risk (PLONOR) to the environment, no further control is required. Such chemicals do not represent a significant impact on the environment under standard use scenarios and therefore are considered ALARP and acceptable.

If other non-rated chemicals are required, or rated chemicals with a substitution warning, chemical selection process and ALARP justifications are undertaken where required.

The ALARP assessment may consider chemical toxicity, biodegradation, and bioaccumulation potential, using industry standard classification criteria. If a product has no specific ecotoxicity, biodegradation, or bioaccumulation data available, these options are considered:

- environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical, or
- environmental data may be referenced for each separate chemical ingredient (if known) within the product.

#### 3.15.3.2 Background Overview of OCNS

The OCNS Scheme applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances listed on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters such as biodegradation, and bioaccumulation, in accordance one of two schemes (as shown in Figure 3-14):

- HQ Colour Band: Gold, Silver, White, Blue, Orange and Purple (listed in order of increasing environmental hazard); or
- OCNS Grouping: E, D, C, B or A (listed in order of increasing environmental hazard). Applied to inorganic substances, hydraulic fluids and pipeline chemicals only.

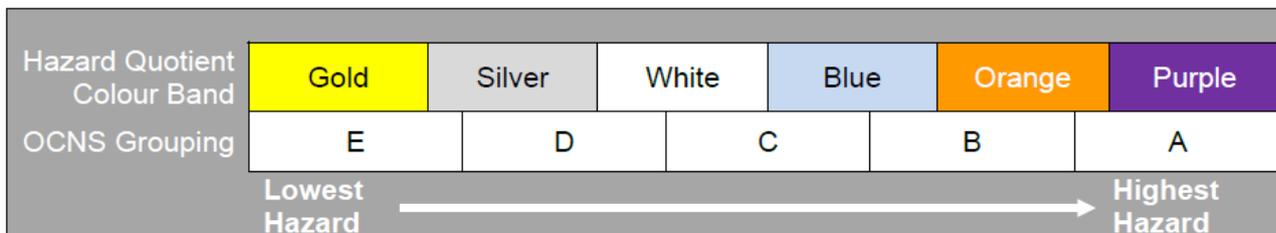

Figure 3-14: OCNS ranking scheme

### 3.16 Support Vessel Operations

Vessels, either LNG or diesel powered, are used in a support capacity for transferring personnel in emergency scenarios, material and equipment to and from the facility. Vessels are also used for project field work. All support vessels are required to undergo a Woodside marine assurance inspection to review compliance with marine laws and Woodside safety and environment requirements.

#### 3.16.1 Facility Support Vessels

Specifications of the Go Provider vessel (Figure 3-15) are presented in Table 3-12 as a representative example of a typical specifications of a support vessel that supports the Pyrenees operations. Vessels supporting the facility vary depending on vessel schedules and availability. While in the field, the vessel also backloads materials and segregated waste for transport back to the King Bay Supply Facility (KBSF) in Karratha.

Figure 3-15 Typical facility support vessel (Go Provider)

Table 3-12 Indicative facility support vessel specifications (Go Provider)

Attribute	Details
Type	Facility Support Vessel
Length overall (LOA)	62.0 m
Breadth	17.0 m
Draft	4.5 m
Dead weight tonnage (DWT)	1,250 tonnes
Accommodation	Berthing for 34 personnel

#### 3.16.2 Other Support Vessels

Other support vessels such as crew transfer vessels, subsea support or project vessels (crewed or remotely operated) are used for field work including cargo operations and subsea IMMR activities. Vessels supporting the activities may vary depending on operational requirements, vessel schedules, capability, and availability.

Typical support vessels use a DP system to allow maneuverability and avoid anchoring when undertaking works, due to the close proximity of subsea infrastructure. However, vessels are equipped with anchors which may be deployed in an emergency or during non-routine activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Vessels used to support IMMR activities may range in length from 50 m to 120 m and include multi-purpose support vessels and dive support vessels. Typically, only a single vessel would be required to implement IMMR activities. Inspections are typically for one to two weeks and occur once or twice a year. Infrequently, there may be a requirement (e.g. a minor repair) for more than one vessel. These activities are still typically only one to two weeks. Repairs may also take longer, up to around four weeks, and if occur, typically only occur once every several years.

Vessels operate 24-hours a day. It is anticipated that vessel time for routine inspection will involve no more than one to two weeks per year, depending upon operational requirements. Maintenance and repair activities may result in additional vessel time, depending on the scale and complexity of the work scope. This would be for around four weeks.

Vessels will use DP to maintain position. All vessels will use marine diesel oil or marine gas oil and will be provisioned in Port. There will be no refuelling of IMMR vessels in the operational area. It is expected that all vessels sourced for IMMR activities will have been previously operating in the North West Bioregion, but may be sourced from within Australian waters or internationally if required.

### 3.17 Helicopter Operations

Helicopters are the primary means of transporting passengers and/or urgent freight to and from the Pyrenees FPSO and support vessels. They are also the preferred means of evacuating personnel in an emergency. Helicopter support is principally supplied from Learmonth Airport.

### 3.18 Subsea Inspection, Monitoring, Maintenance and Repair Activities

Subsea infrastructure is designed not to require significant intervention. Inspection and maintenance are undertaken to ensure the integrity of the infrastructure and identify problems before they present a risk of loss of containment. Maintaining infrastructure integrity also supports decommissioning planning. Intervention may be required to repair identified problems.

To manage subsea threats (risks) the IMMR process requires an appropriate response to be selected to manage specific equipment risks. This is typically one of: Inspection, Maintenance, Monitoring or Repair (IMMR).

The IMMR process for subsea infrastructure, including suspended equipment (Section 3.5), maintains equipment in good condition and repair, for production and to enable future removal.

Subsea activities are typically undertaken from a subsea support vessel or Uncrewed Surface Vessel (USV) and may use an ROV or AUV with transponders to inspect equipment, or divers. For some activities, ROVs or AUVs may also be deployed from the Pyrenees FPSO. It is possible that non-routine repair or replacement activities could require up to two IMMR vessels in the Operational Area at the same time, for approximately 2 weeks.

Maintenance and repair activities may require the deployment of frames/baskets which are temporarily placed on the seabed. These typically have a perforated base with a seabed footprint of about 15 m<sup>2</sup>. This temporary equipment is removed from field via recovery to project vessels at the completion of IMMR activities.

Typical IMMR activities are described below.

#### 3.18.1 Inspections

Inspection of subsea infrastructure is the process of physical verification and assessment of components in order to detect changes to the as-installed location and condition by comparison to initial state following installation and previous inspections. Details of typical subsea infrastructure inspections/surveys are provided in Table 3-13. Inspection of the exploration well with wellhead is determined by the WOMP. Scope and frequency of subsea equipment (operational and suspended) are determined using a Risk Based Inspection (RBI) methodology and associated plans.

RBI is commonly used within the industry as a method for determining inspection frequencies (Energy Institute, 2009; DNV, 2019). RBI for subsea systems that have reached the end of their useful life inherently pose less risk to the environment and may drive a less frequent inspection frequency.

Typical IMMR activities that may occur over the duration of this EP are outlined in Table 3-13.

Typically, total inspection activities are expected to be no more than one to two weeks per campaign with typically no more than 2 campaigns per year, depending on work task requirements.

### 3.18.2 Monitoring

Monitoring of subsea infrastructure refers to the process of surveillance of the physical and chemical environment that a subsea system or component is exposed to in order to determine if and when damage may occur, and (where relevant) predict the rate or extent of that damage. Monitoring activities may include process composition testing, corrosion probes, corrosion mitigation checks, metocean and seismic monitoring, and cathodic protection testing. Other monitoring activities include process monitoring (temp, pressure, etc.), cyclone weather monitoring, and hydraulic fluid usage.

### 3.18.3 Maintenance

Maintenance activities on subsea infrastructure are those required at regular or planned intervals to prevent deterioration or failure of infrastructure. Typical maintenance activities are described in Table 3-13.

### 3.18.4 Repair

Repair activities are those required when a subsea system or component is degraded, damaged or has deteriorated to a level outside of acceptance limits. Damage sustained may not necessarily pose an immediate threat to continued system integrity but may present an elevated level of risk to environment or production reliability. Due to the design of subsea infrastructure and materials used, repairs are undertaken on an as needs basis. The requirements and frequency of these repairs are dictated by the outcome of the inspection and maintenance regimes described above. Typical subsea repair activities included but not limited to, are presented in Table 3-13 below.

Repair activities can result in minor volumes of fluids released to the marine environment associated with disconnection of the component that is being repaired or replaced. This could result in releases of up to approximately 10 m<sup>3</sup> of fluids such as (but not limited to) produced water, hydraulic fluids and/or reservoir hydrocarbons.

When equipment is replaced, the redundant equipment, may remain in-situ or be removed from the field. The location of redundant subsea infrastructure items is recorded as part of the ROV as left survey and included in a database for the Pyrenees subsea inventory.

**Table 3-13: IMMR activities with the potential to occur**

IMMR Activity	Actions
Inspections	<ul style="list-style-type: none"> <li>• Visual inspections of subsea components, looking for damage, degradation, debris etc., requires ROVs or AUVs deployed from a vessel or facility</li> <li>• Multi-beam Echo Sounder survey – involves high frequency, echo sounder along the flowlines and/or umbilical</li> <li>• Side Scan Sonar surveys – involves the use of high frequency along the flowlines and/or umbilical.</li> </ul>
Monitoring	<ul style="list-style-type: none"> <li>• Cathodic Potential readings, to confirm corrosion protection is working - involves ROVs taking cathodic protection (CP) measurements.</li> </ul>
Maintenance	<ul style="list-style-type: none"> <li>• CP maintenance - replacement/new cathodic protection sacrificial anodes may be installed on or adjacent (within the Operational Area) to infrastructure using a vessel and ROV</li> <li>• Burial / deburial of flowlines and / or umbilicals</li> </ul>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

production system. Table 3-14 below shows typical discharge volumes during different IMMR activities.

**Table 3-14: Typical Discharge Volumes During Different IMMR and Subsea Activities**

Activity	Description
Pressure/Leak testing	Chemical dye estimates <10 L.
Flushing	Residual hydrocarbon or chemical release volume is dependent upon component geometry and pumping rates.
Hot stab change out	Hydrocarbons or control fluid estimated <10 L.
SCM changeout	A typical release of diluted acid is up to 4000 L and of control fluid estimated to be 10 L.
Hydraulic flying lead and Umbilical replacement	Typical releases of hydraulic fluid and chemicals is estimated to be <1 L each.
Choke change out	Release of hydrocarbons ~<10 L and a typical acid release of ~<1000 L.
Manifold replacement	Release of small volumes of produced water, approximately 10 m <sup>3</sup>

### 3.18.7 Marine Growth Removal

Due to the relatively high rate of marine growth on the NWS, it is necessary to remove excess growth prior to undertaking many subsea IMMR activities. Marine growth removal is undertaken by ROV. The different techniques that may be used for the PAP are described in Table 3-15.

**Table 3-15: Marine growth removal techniques**

Activity / Equipment	Description
Water jetting	Uses HP water to remove marine growth.
Brush systems	Uses brushes attached to a ROV to remove marine growth.
Acid	Chemically dissolves scale deposits.
Sand/abrasive blasting	Additional cleaning to allow close visual inspections (rare, not typical).

### 3.18.8 Sediment Relocation

If sediment builds up around a flowline or other subsea infrastructure, an ROV-mounted suction pump/dredging unit may be used to relocate the sediment to allow inspection/works to be undertaken. This PAP is limited to the relocation of small amounts of sediment material in the immediate vicinity of the subsea infrastructure (i.e. within the existing footprint). Sediment relocation typically results in minor seabed disturbance and some localised turbidity.

### 3.19 Waste Management

Waste is segregated onboard the Pyrenees FPSO and support vessels and stored in designated skips and waste containers for disposal at appropriate facilities onshore. Wastes are segregated into the following:

- Non-hazardous waste (or general waste)
- Hazardous waste
- Recyclables

### 3.19.1 General Non-Hazardous Wastes

General non-hazardous wastes include domestic and galley waste, scrap materials, packaging, wood and paper and empty containers. Non-hazardous waste materials are stored on board the Pyrenees FPSO and support vessels in suitable containers (segregated from hazardous waste materials) ahead of transport back to shore for disposal/recycling in accordance with regulations.

### 3.19.2 Hazardous Wastes

Hazardous wastes are defined as waste materials that are or contain ingredients harmful to health or the environment. Hazardous wastes generated during the Pyrenees facility operations include recovered solvents, excess or spent chemicals, oil contaminated materials (e.g. sorbents, filters and rags), batteries and used lubricating oils. The volumes of hazardous wastes expected to be generated at the Pyrenees Facility are relatively small.

### 3.19.3 Naturally Occurring Radioactive Materials and Sand Management

Naturally occurring radioactive materials (NORMs) may be brought up from the reservoirs and accumulate in some pipes and vessels on the Pyrenees FPSO. Three main types of material which may contain NORMs have reported to be found on the Facility:

- Scale may be found in upper parts of well completion strings, where it may precipitate out from PW of high salinity and may contain sulphates and carbonates. The most common scale is barium sulphate ( $\text{BaSO}_4$ ). Scale forming material may also precipitate on sand and sludge particles and scale debris may be mixed with sludge and sand inside process vessels.
- Sludge may be found in the slops tanks. The main components of sludge are fine particles of scale, sand, corrosion products, flakes of paint.
- Coarse sand and scale particles, usually retained in separators and sand traps and removed from separators by sparging.

NORMs emit gamma radiation and are a cause of external gamma radiation exposures. Pyrenees facility NORMs are likely to be in the category of low specific activity (LSA) radioactive materials. LSA radioactive materials can emit only a limited amount of radiation which is unlikely to deliver a high radiation dose similar to “strong” radiography or radiotherapy radioactive sources. Due to this fact, radiation exposures and the radiological impact on marine life due to discharges of small volumes of NORMs are likely to be negligible.

A small amount of material from investigations of the process fluids piping systems have yielded low level NORMs. To reduce the accumulation of sand which may contain NORMs, the Pyrenees Facility include the following sand management measures:

- Sand screens are in place on the wells.
- Sand detection/monitoring is included on the subsea manifolds and on the commingled production and test headers located on the turret to enable early detection of screen failure.
- The topside process vessels are equipped with on-line sand removal and sand washing facilities for removal of accumulated sand.

NORMs that are detected on the Pyrenees Facility are managed in accordance with PYHSE-H-0010 – Managing Naturally Occurring Radioactive Materials, which includes the following controls:

- Routine monitoring of radiation around the Pyrenees FPSO and on opening of process vessels using a hand-held meter (such as the Rotem DA-3 or Automess 6150), which indicates the radiation levels in  $\mu\text{Sv/h}$ . All monitoring is conducted by the on-board Radiation Officer. Trigger values for scale and sludge is an External Dose Rate (DR) of  $>0.7 \mu\text{Sv/h}$  and pipework and valves is DR  $>0.5 \mu\text{Sv/h}$ .

- In the event trigger values are exceeded, the material will be collected and stored and transported for disposal in accordance with legislative requirements.
- Control of access to areas where NORMS may be present.
- Guidelines for working within vessels which may be contaminated with NORMs.
- Sampling of scale, sand and sludge as required.
- Procedures for storage, handling and transport and disposal of NORMS-contaminated material.

In the event that meter readings indicate an increased risk of NORMs on the Pyrenees FPSO, the treated PW and slops water will be tested for NORMs (Radium 226 and 228). NORMs have been included as a parameter in the surface water quality monitoring program historically with concentrations in receiving water being below the limits of reporting (Advisian 2022).

## 4. DESCRIPTION OF THE EXISTING ENVIRONMENT

### 4.1 Overview

In accordance with Regulations 21(2) and 21(3) of the Environment Regulations, this section describes the existing environment that may be affected by the PAP (planned and unplanned), as described in Section 3, including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The environment that may be affected (EMBA) is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the combined potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the following scenario:

- Scenario 1: An uncontrolled subsea loss of well control for a duration of 69 days.

The ecological impact thresholds used to delineate the EMBA are defined in Table 4-1. The EMBA also includes any areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations. The EMBA is shown in Figure 4-1.

A second EMBA has also been defined based on the thresholds for potential socio-cultural impact, as defined in Table 4-1. This EMBA is referred to as the “socio-cultural EMBA” and is used to identify social, cultural and economic receptors that could be impacted during a credible hydrocarbon spill scenario.

Collectively the EMBA and socio-cultural EMBA are referred to as “the combined EMBA”.

The EMBA presented does not represent the predicted coverage of any one hydrocarbon spill or a depiction of a slick or plume at any particular point in time. Rather, the areas are a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

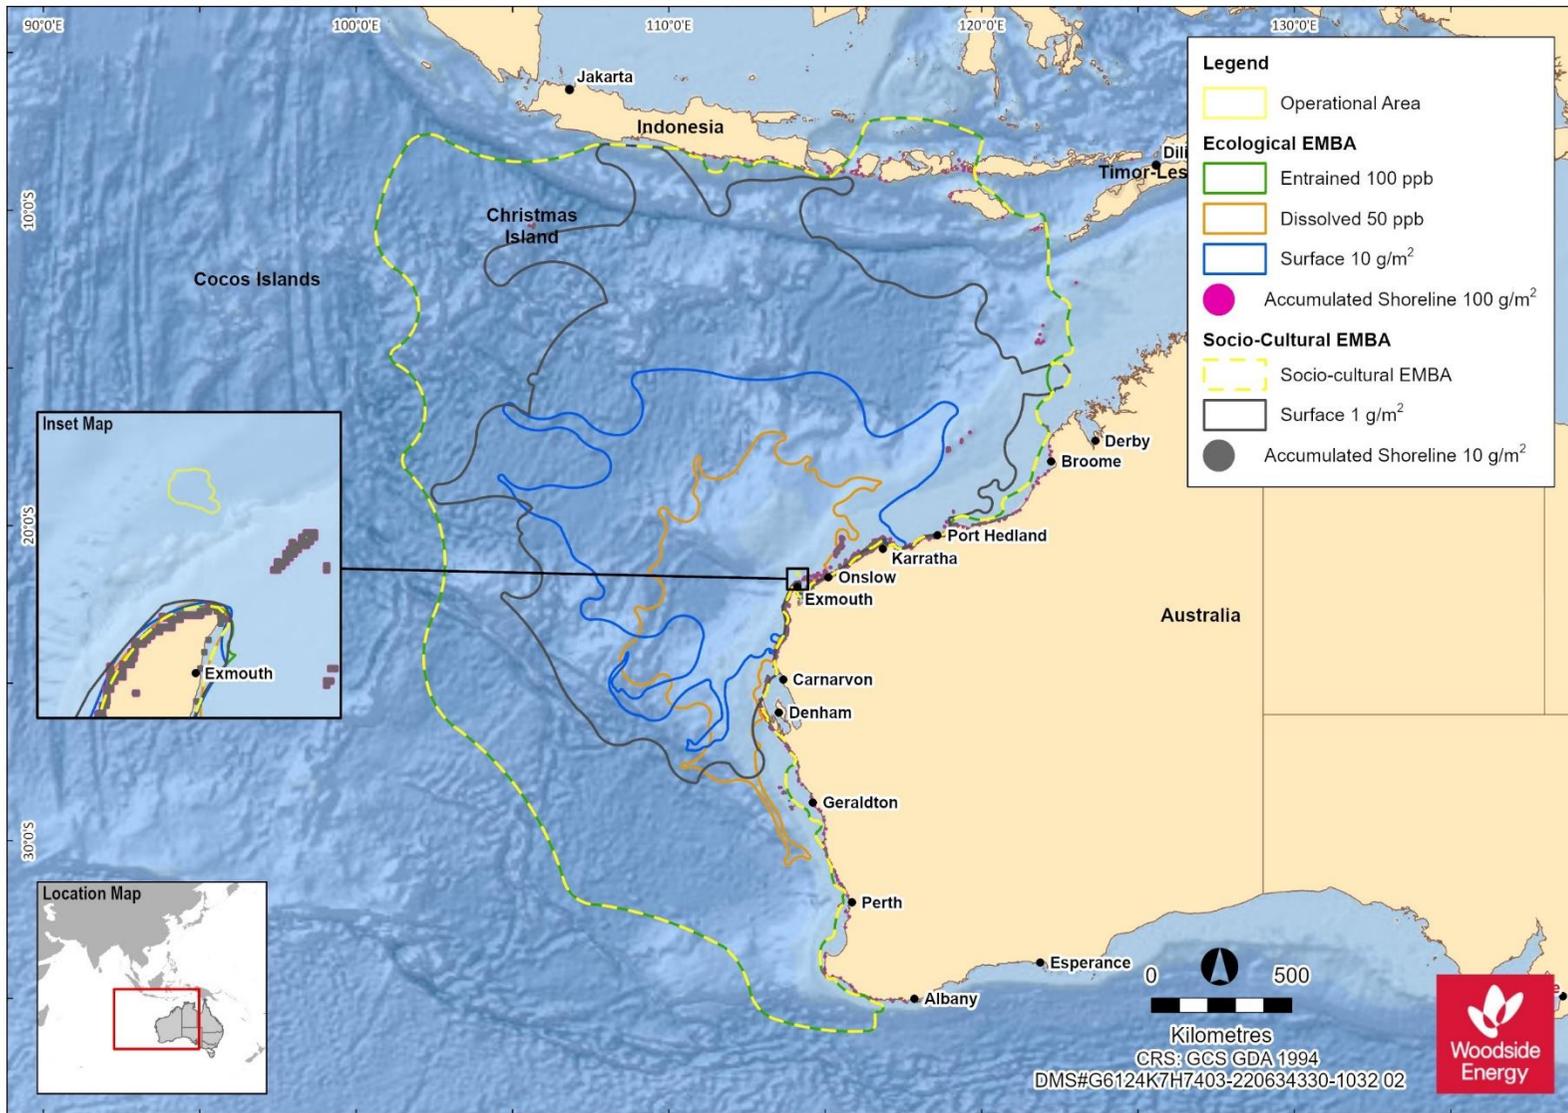

**Table 4-1: Hydrocarbon spill thresholds used to define the EMBA for surface and in-water hydrocarbons.**

Hydrocarbon Type	EMBA <sup>1</sup>	Socio-cultural EMBA <sup>1</sup>	Planning Area for Scientific Monitoring
Surface	10 g/m <sup>2</sup> This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g., to birds and marine mammals) are expected to occur.	1 g/m <sup>2</sup> This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur.  This low exposure value also establishes the planning area for scientific monitoring (NOPSEMA guidance note: A652993, April 2019).	
Dissolved	50 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		10 ppb This low exposure value establishes the planning area for scientific monitoring (based on potential for exceedance of water quality triggers) (NOPSEMA guidance note: A652993, April 2019).  In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold.
Entrained	100 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As entrained hydrocarbons are within the water column and not visible, impacts to socio-

	cultural receptors are associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		
Shoreline	100 g/m <sup>2</sup> This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m <sup>2</sup> This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur.	N/A

<sup>1</sup> Further details including the source of the thresholds used to define the EMBA in this table are provided in Section 6.8.1

## 4.2 Regional Context

The Operational Area is located in Commonwealth waters within the North-west Marine Region (NWMR) as defined under the Integrated Marine and Coastal Regionalisation of Australia (IMCRA v4.0) (Commonwealth of Australia, 2006), in water depths of approximately 190 to 215 m. Within the NWMR, the Operational Area lies within the NWS Province, the Northwest Province and the Central Western Shelf Transition (Figure 4-2)

The combined EMBA extends across the NWMR and down into the South-west Marine Region (SWMR). Provincial Bioregions within the combined EMBA include the:

- Timor Province
- Northwest Shelf Province
- Christmas Island Province
- Northwest Transition
- Northwest Province
- Central Western Shelf Transition
- Central Western Transition
- Central Western Shelf Province
- Central Western Province
- Southwest Shelf Transition
- Southwest Transition
- Southwest Shelf Province
- Southern Province

Woodside's Master Existing Environment Document (Appendix J) summarises the characteristics of the relevant marine provincial bio-regions.

**Figure 4-2: Location of the Operational Area and relevant marine provincial bio-regions**

### 4.3 Matters of National Environmental Significance (EPBC Act)

Table 4-2 summarises the matters of national environmental significance (MNES) overlapping the Operational Area and EMBA, respectively, according to the Protected Matters Search Tool (PMST) results (Appendix C). It should be noted that the EPBC Act PMST is a general database that conservatively identifies areas in which protected species have the potential to occur.

Additional information on these MNES is provided in subsequent sections of this chapter and described in detail in Appendix J.

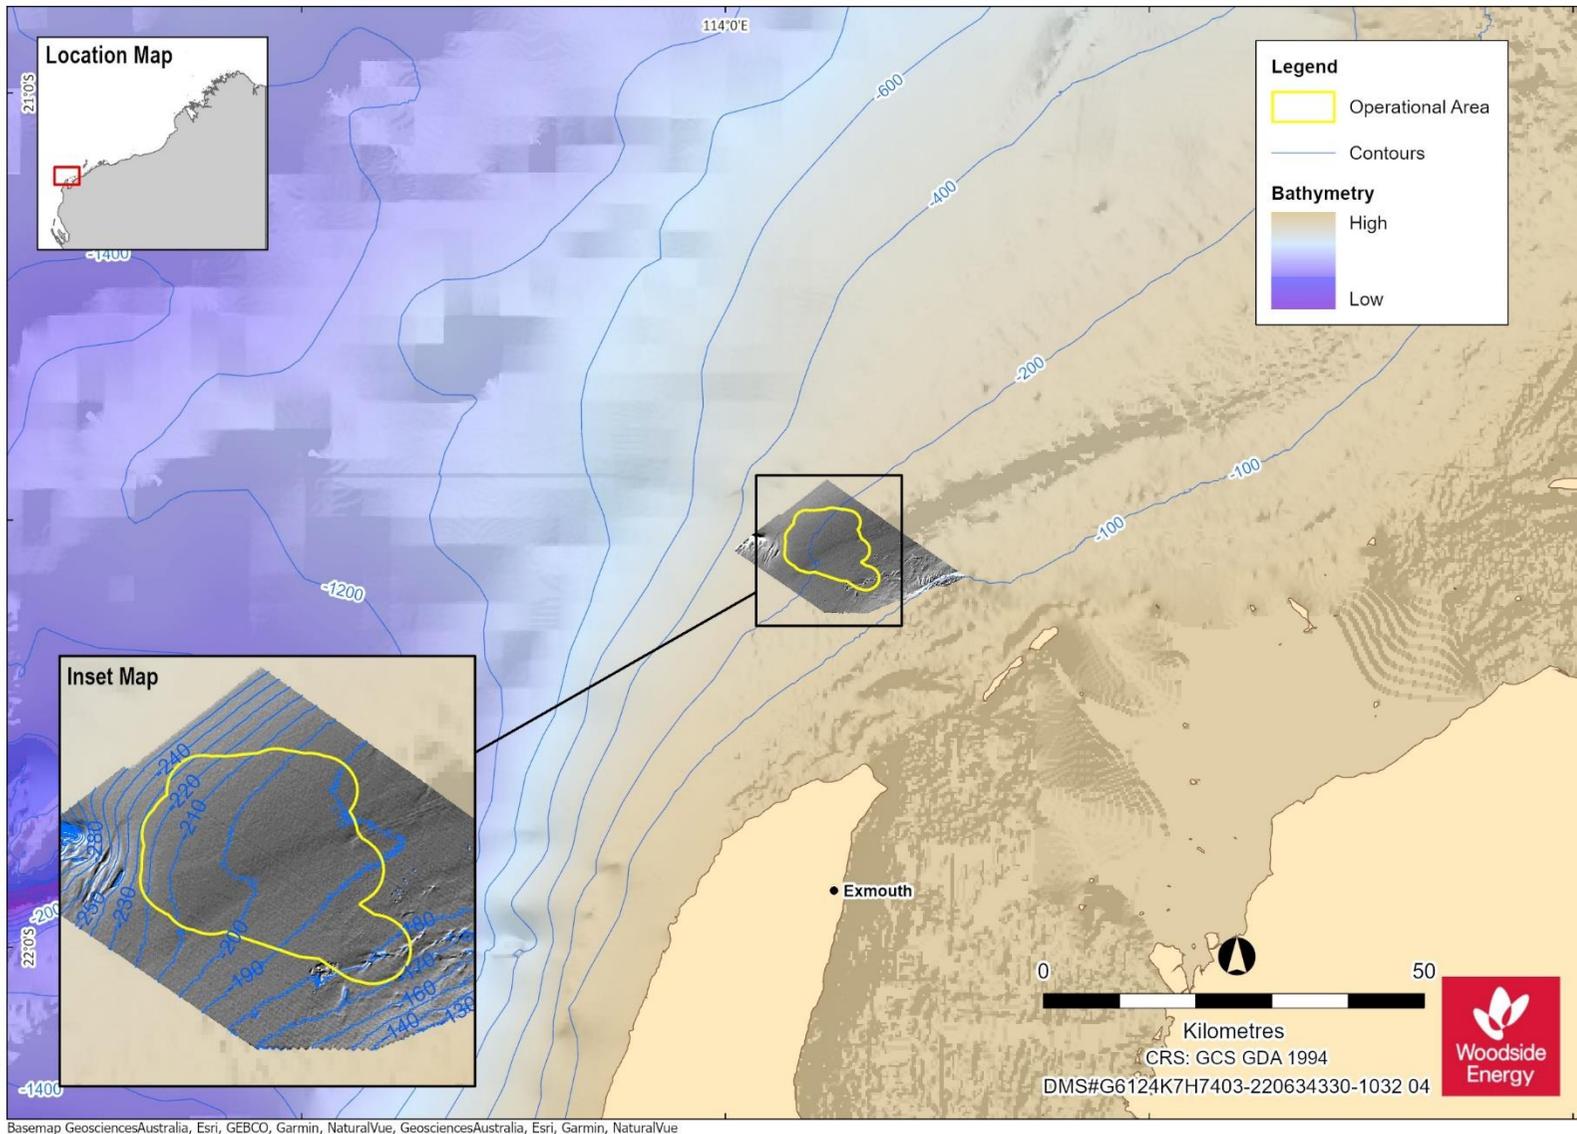

**Table 4-2: Summary of MNES identified by the EPBC Act PMST as potentially occurring within the Operational Area and EMBA**

MNES	Operational Area	EMBA	Relevant Section
World Heritage Properties	0	2	Section 4.9.5.3
National Heritage Places	0	11	Section 4.9.5.3
Wetlands of International Importance (Ramsar)	0	9	Appendix 4.8
Australian Marine Park	0	19	Appendix 4.8
Listed Threatened Ecological Communities	0	8	Appendix 4.8
Listed Threatened Species	17	58	Section 4.6
Listed Migratory Species	27	108	Section 4.6

### 4.4 Physical Environment

The Operational Area lies on the outer continental shelf in water depths of approximately 190 to 215 m (Figure 4-3). The Operational Area is located on the shelf break, the transition from continental shelf to slope, and is generally flat and featureless, with some minor depressions.

A description of the physical environment consistent with the Northwest Marine Region is described in detail in Appendix J

**Figure 4-3: Bathymetry of the Operational Area**

## 4.5 Habitats and Biological Communities

Sediments in the Operational Area are expected to be comprised primarily of soft sediment i.e., mud and calcareous clay which is consistent with the wider North West Province, NWS Province and the Central Western Shelf Transition. In 2005, sediment characteristics at the Pyrenees facility were surveyed. Results showed the western portion of the seabed in the area (190 to 260 m depth) are characterised by gravely fine to coarse carbonate sands, while the seabed sediments in the eastern part of the area (190 to 200 m depth) are soft, fine sediments, mainly carbonate silts and clays (BHP, 2022). Further, video footage from 2002 of a sled towed across parts of the Operational Area showed rippled sediment, with rocky nodules and sparse but reasonably even distribution of sponges and soft corals. Typically, soft corals or sponges were seen attached to these small patches of hard substrate, with fish and other invertebrates gathered around (AIMS, 2002).

Hard substrates will occur more broadly in the region and can host more diverse benthic communities. Hard substrate may be associated with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF (Section 4.7), which overlaps the Operational Area.

Key habitats and ecological communities within the EMBA are identified in Table 4-3 and described below.

**Table 4-3: Habitats and Communities within the EMBA**

Habitat/Community	Key locations within the EMBA and Approximate Distance from the Operational Area where Relevant
<b><i>Marine primary producers</i></b>	
<b><i>Coral</i></b>	Ningaloo Coast (9.3 km south) Muiron Islands (19 km south-east) Barrow Island (138 km north-east) Montebello Islands (179 km north-east) Shark Bay (359.4 km south) Rowley Shoals (641.1 km north-east) Houtman Abrolhos islands (745.9 km south) Rottnest Island (1,159.4 km south) Christmas Island (1,518.6 km north-west)
<b><i>Seagrass beds and macroalgae</i></b>	Ningaloo Coast (9.3 km south) Muiron Islands (19 km south-east) Exmouth Gulf (39 km south-east) Barrow Island (138 km north-east) Montebello Islands (179 km north-east) Shark Bay (359.4 km south) Jurien Bay (972.8 km south) Busselton (1,345.6 km south)
<b><i>Mangroves</i></b>	Ningaloo Coast (9.3 km south) Exmouth Gulf (39 km south-east) Montebello Islands (179 km north-east) Dampier (281.4 km north-east) Carnarvon (369.7 km south) Port Headland (477.9 km north-east) Broome (933.2 km north-east)
<b><i>Other communities and habitats</i></b>	
<b><i>Plankton</i></b>	Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR, as detailed in Appendix J.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

#### 4.6.1 Fish, Sharks and Rays

A total of 23 EPBC-listed threatened and/or migratory fish species have been identified to potentially occur within the Operational Area or EMBA. Sixteen of these species are listed as threatened and 13 listed migratory (Table 4-4). There are also 63 EPBC-listed marine species in the EMBA, which do not have a threatened or migratory status and include a variety of pipefish and sea dragons. These species are described in Appendix J.

The Operational Area overlaps the foraging (high density prey) BIA for the whale shark as outlined in Figure 4-4. Four other fish and shark species have BIAs within the EMBA and are outlined in Table 4-5 and detailed further in Appendix J.

**Table 4-4: Threatened and Migratory Fish, Shark and Ray Species predicted to occur within the Operational Area and EMBA**

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Carcharias taurus</i> (west coast population)	Grey nurse shark (west coast population)	Vulnerable	N/A	Species or species habitat may occur within area.	Species or species habitat known to occur within area.
<i>Sphyrna lewini</i>	Scalloped hammerhead	Conservation Dependent	N/A	Species or species habitat likely to occur within area.	Species or species habitat known to occur within area.
<i>Thunnus maccoyii</i>	Southern bluefin tuna	Conservation Dependent	N/A	Species or species habitat likely to occur within area.	Breeding known to occur within area.
<i>Anoxypristis cuspidata</i>	Narrow sawfish	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Carcharhinus longimanus</i>	Oceanic whitetip shark	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat may occur within area
<i>Isurus oxyrinchus</i>	Shortfin mako	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
<i>Isurus paucus</i>	Longfin mako	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
<i>Manta alfredi</i>	Reef manta ray	N/A	Migratory	Species or species habitat known to occur within area	Species or species habitat known to occur within area
<i>Manta birostris</i>	Giant manta ray	N/A	Migratory	Species or species habitat known to occur within area	Species or species habitat may occur within area
<i>Galaxiella nigrostriata</i>	Blackstriped Dwarf Galaxias	Endangered	N/A	N/A	Species or species habitat known to occur within area.

## 4.6.2 Marine Reptiles

A total of 9 EPBC listed threatened and/or migratory reptile species have been identified to potentially occur within the Operational Area or EMBA. 8 of these are threatened species and 7 are listed migratory species, as outlined in Table 4-6.

BIAs for the flatback turtle, green turtle, hawksbill turtle and loggerhead turtle overlap the Operational Area as described in Table 4-6 and shown in Figure 4-5.

Habitat critical for the green turtle, loggerhead turtle, leatherback turtle and the hawksbill turtle is overlapped by, or adjacent to the Operational Area as shown in Figure 4-6 and described in Table 4-6.

BIAs and critical habitat for these four species associated with the EMBA are shown in Figure 4-7 and described in Table 4-7.

An additional 21 EPBC-listed marine reptile species occur in the EMBA, which do not have threatened or migratory status. The majority of these are sea snake species. These listed marine species are described in Appendix J.

**Table 4-6: Threatened and Migratory marine reptile species predicted to occur within the Operational Area and EMBA**

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Caretta caretta</i>	Loggerhead turtle	Endangered	Migratory	Congregation or aggregation known to occur within area.	Breeding, foraging, feeding or related behaviour known to occur within area.
<i>Dermochelys coriacea</i>	Leatherback turtle	Endangered	Migratory	Species or species habitat known to occur within area.	Breeding likely to occur within area. Foraging, feeding or related behaviour known to occur within area.
<i>Chelonia mydas</i>	Green turtle	Vulnerable	Migratory	Species or species habitat known to occur within area.	Breeding known to occur within area.
<i>Eretmochelys imbricata</i>	Hawksbill turtle	Vulnerable	Migratory	Congregation or aggregation known to occur within area.	Breeding, foraging, feeding or related behaviour known to occur within area.
<i>Natator depressus</i>	Flatback turtle	Vulnerable	Migratory	Congregation or aggregation known to occur within area.	Breeding, foraging, feeding or related behaviour known to occur within area.
<i>Aipysurus apraefrontalis</i>	Short-nosed seasnake	Critically Endangered	N/A	N/A	Species or species habitat known to occur within area.
<i>Aipysurus foliosquama</i>	Leaf-scaled seasnake	Critically Endangered	N/A	N/A	Species or species habitat known to occur within area.
<i>Lepidochelys olivacea</i>	Olive Ridley turtle	Endangered	Migratory	N/A	Species or species habitat likely to occur within area Foraging, feeding or related behaviour likely to occur within area.
<i>Crocodylus porosus</i>	Salt-water Crocodile	N/A	Migratory	N/A	Species or species habitat likely to occur within area.

### 4.6.3 Marine Mammals

A total of 17 EPBC Listed threatened and/or migratory marine mammal species have been identified to potentially occur within the Operational Area or EMBA. Six of these species are listed as threatened, and 13 listed migratory species. A further 26 mammal species were identified by the PMST search tool, however as they do not have a marine or migratory listing they are not considered to inhabit shorelines, nor rely on the marine environment for their diet, they are not included in Table 4-9.

The Operational Area overlaps with the distribution and migration BIAs for the Pygmy Blue Whale and Humpback Whale respectively. The migration and foraging BIAs for the Pygmy Blue Whale are further offshore (Figure 4-8), and the resting BIA for the Humpback Whale is located nearby in Exmouth Gulf (Figure 4-9). Four other species of marine mammal species have BIAs within the wider EMBA and are described in Table 4-10 including Southern Right Whale and Dugong BIAs approximately 20km distant from the Operational Area (Figures 4-10 and 4-11).

**Table 4-9: Threatened and Migratory marine mammal species predicted to occur within the Operational Area and EMBA**

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Balaenoptera musculus</i>	Blue whale <sup>1</sup>	Endangered	Migratory	Species or species habitat likely to occur within area.	Migration route known to occur. Foraging, feeding or related behaviour known to occur within area.
<i>Eubalaena australis</i>	Southern right whale	Endangered	Migratory	Species or species habitat likely to occur within area.	Breeding known to occur within area.
<i>Balaenoptera borealis</i>	Sei whale	Vulnerable	Migratory	Species or species habitat likely to occur within area.	Foraging, feeding or related behaviour likely to occur within area.
<i>Balaenoptera physalus</i>	Fin whale	Vulnerable	Migratory	Species or species habitat likely to occur within area.	Foraging, feeding or related behaviour likely to occur within area.
<i>Balaenoptera edeni</i>	Bryde's whale	N/A	Migratory	Species or species habitat likely occur within area.	Species or species habitat likely occur within area.
<i>Megaptera novaeangliae</i>	Humpback whale	N/A	Migratory	Species or species habitat known to occur within area	Breeding known to occur within area. Foraging, feeding or related behaviour known to occur within area.
<i>Orcinus orca</i>	Killer whale	N/A	Migratory	Species or species habitat may occur within area.	Species or species habitat may occur within area.
<i>Physeter macrocephalus</i>	Sperm whale	N/A	Migratory	Species or species habitat may occur within area.	Foraging, feeding or related behaviour known to occur within area.
<i>Tursiops aduncus</i> (Arafura/Timor Sea populations)	Spotted bottlenose dolphin	N/A	Migratory	Species or species habitat known to occur within area.	Species or species habitat known to occur within area.

#### **4.6.4 Seabirds and Migratory Shorebirds**

A total of 81 EPBC Listed threatened and/or migratory or seabird and shorebird species have been identified to potentially occur within the Operational Area or EMBA. 28 of these species are listed as threatened and 74 are listed as migratory species (Table 4-11).

The Operational Area overlaps the BIA (breeding) for the wedge-tailed shearwater, as shown in Figure 4-12. There are an additional 24 species with BIAs that are overlapped by the EMBA which are outlined in Table 4-12 and Figure 4-13.

**Table 4-11: Threatened and Migratory seabird and shorebird species predicted to occur within the Operational Area and EMBA**

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Calidris ferruginea</i>	Curlew sandpiper	Critically Endangered	Migratory	Species or species habitat may occur within area.	Species or species habitat known to occur within area.
<i>Numenius madagascariensis</i>	Eastern curlew	Critically Endangered	Migratory	Species or species habitat may occur within area.	Species or species habitat known to occur within area.
<i>Calidris canutus</i>	Red knot	Endangered	Migratory	Species or species habitat may occur within area.	Species or species habitat known to occur within area.
<i>Macronectes giganteus</i>	Southern-giant petrel	Endangered	Migratory	Species or species habitat may occur within area.	Species or species habitat may occur within area.
<i>Thalassarche carteri</i>	Indian yellow-nosed albatross	Vulnerable	Migratory	Species or species habitat may occur within area.	Species or species habitat likely to occur within area.
<i>Actitis hypoleucos</i>	Common Sandpiper	N/A	Migratory	Species or species habitat may occur within area.	Species or species habitat known to occur within area.
<i>Anous stolidus</i>	Common noddy	N/A	Migratory	Species or species habitat may occur within area.	Breeding known to occur within area.
<i>Ardenna carneipes</i>	Flesh-footed shearwater	N/A	Migratory	Species or species habitat may occur within area.	Breeding known to occur within area.
<i>Calidris acuminata</i>	Sharp-tailed Sandpiper	N/A	Migratory	Species or species habitat may occur within area.	Roosting known to occur within area.
<i>Calidris melanotos</i>	Pectoral Sandpiper	N/A	Migratory	Species or species habitat may occur within area.	Species or species habitat known to occur within area.

### 4.6.5 Seasonal Sensitivities for Protected Species

Seasonal sensitivities for EPBC listed threatened migratory species identified as potentially occurring within and around the Operational Area are identified in Table 4-13. Movement patterns of all protected species identified in Section 4.6 are described in Appendix J.

**Table 4-13: Key seasonal sensitivities for EPBC Listed threatened migratory species identified as occurring in or near the Operational Area**

Species	January	February	March	April	May	June	July	August	September	October	November	December
<b>Fish, sharks and rays</b>												
Great white shark – northern migration (to North West Cape) (DSEWPaC, 2013a)												
Whale shark – northern and southern migration (NWMR) (TSSC, 2015d)												
Whale shark – foraging/ aggregation (Ningaloo Coast) (TSSC, 2015d)												
<b>Marine reptiles<sup>1</sup></b>												
Flatback turtle, Pilbara Coast genetic stock – nesting												
Flatback turtle, Pilbara Coast genetic stock – hatching												
Green turtle, NWS genetic stock – nesting												
Green turtle, NWS genetic stock - hatching												
Hawksbill turtle Western Australia genetic stock – nesting												
Hawksbill turtle Western Australia genetic stock – hatching												
Leatherback turtle – nesting												
Leatherback turtle – hatching												
<b>Mammals</b>

#### 4.7 Key Ecological Features (KEFs)

Two KEF overlap the Operational Area (Figure 4-14). KEFs within the Operational Area and EMBA are identified in Table 4-14 and described in Appendix J.

**Table 4-14: KEFs within the Operational Area and EMBA**

Key Ecological Feature	Approximate Distance and Direction from Operational Area (km)
Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula	Overlaps
Continental Slope Demersal Fish Communities	Overlaps
Ancient Coastline at 125 m Depth Contour	2.5 km south-east
Commonwealth Waters Adjacent to Ningaloo Reef	9.3 km south
Exmouth Plateau	81.7 km north-west
Glomar Shoals	321.1 km north-west
Western demersal slope and associated fish communities	476.2 km south-west
Wallaby Saddle	500.1 km south-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	641.1 km north-east
Western Rock Lobster	679.3 km south
Ancient Coastline at 90-120 m depth	680.5 km south
Perth Canyon and adjacent shelf break, and other west coast canyons	707.4 km south
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	719 km south
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	721.2 km south
Canyons linking the Argo Abyssal Plain with the Scott Plateau	954.4 km north-east
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	1,135.2 km north-east
Commonwealth marine environment within and adjacent to Geographe Bay	1,306.4 km south
Naturaliste Plateau	1,313.4 km south-west
Cape Mentelle upwelling	1,323.5 km south
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	1,383.9 km north-east
Albany Canyons group and adjacent shelf break	1,515.5 km south
Diamantina Fracture Zone	1,585.9 km south

## 4.9 Cultural Features and Heritage Values

### 4.9.1 Background

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places; and
- the social, economic, and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of the Operational Area and EMBA are described.

In line with The Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance (ICOMOS 2013) (Burra Charter) and associated practice notes, Woodside understands heritage value to refer to the cultural significance of a place to an individual or group. A cultural feature, by contrast, is understood to be comparable to the Burra Charter term "fabric" and refer to a place's elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible and intangible dimensions (ICOMOS 2013).

Woodside has undertaken heritage assessment to identify potential cultural values or features that may be impacted by the PAP. This assessment has not identified heritage places, objects or values which will be impacted by the activities planned under this EP (discussed in Section 6.10). However, through consultation with relevant persons, Woodside recognises the spiritual and cultural connection to the environment<sup>3</sup> that First Nations people hold.

### 4.9.2 First Nations Peoples

As a starting point for understanding cultural features of the environment for First Nations groups, Woodside uses the existing systems, such as native title, to identify First Nations groups that may have functions, interests or activities that may be affected. Woodside identifies native title representative bodies and nominated representative entities (defined in Section 5.3.2) as well as native title claims, determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA overlaps. While acknowledging that cultural features and heritage values may exist outside of the native title framework, Woodside considers this to be the broadest extent over which First Nations groups have claimed native title rights and interests.

Native title claims are applications made to the Federal Court under the *Native Title Act 1993* (Cth) for a determination or decision about native title in a particular area. A claim is made by a native title claim group which asserts it holds native title rights and interests in an area of land and/or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so that its native title rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area (Native Title Tribunal).

A requirement to establishing a positive determination of native title in court is proving that there is an organised society that occupied the land and/or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of Mabo

<sup>3</sup> Definition of 'Environment' in Regulation 5 of the Regulations are defined as:

- a) ecosystems and their constituent parts, including people and communities; and
- b) natural and physical resources; and
- c) the qualities and characteristics of locations, places and areas; and
- d) the heritage values of places; and includes
- e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d)

v Queensland (No 2) [1992] HCA 23; (1992) 175 CLR 1 ('Mabo'). Justice Toohey had the following to say (at 187):

*it is inconceivable that indigenous inhabitants in occupation of land did not have a system by which land was utilized in a way determined by that society. There must, of course, be a society sufficiently organized to create and sustain rights and duties...*

Therefore, Woodside understands that native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which First Nations groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found to either exist or not exist. Where native title rights or interests are determined to exist, they will be held by a Registered Native Title Body Corporate (section 57, *Native Title Act 1993*) in trust or as agent for native title holders.

ILUAs are voluntary agreements between native title parties and other people or bodies about the use and management of land and/or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area; or
- a native title claim has been made; or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders (Native Title Tribunal).

The *Native Title Act 1993* also provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the Native Title Act within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details on the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

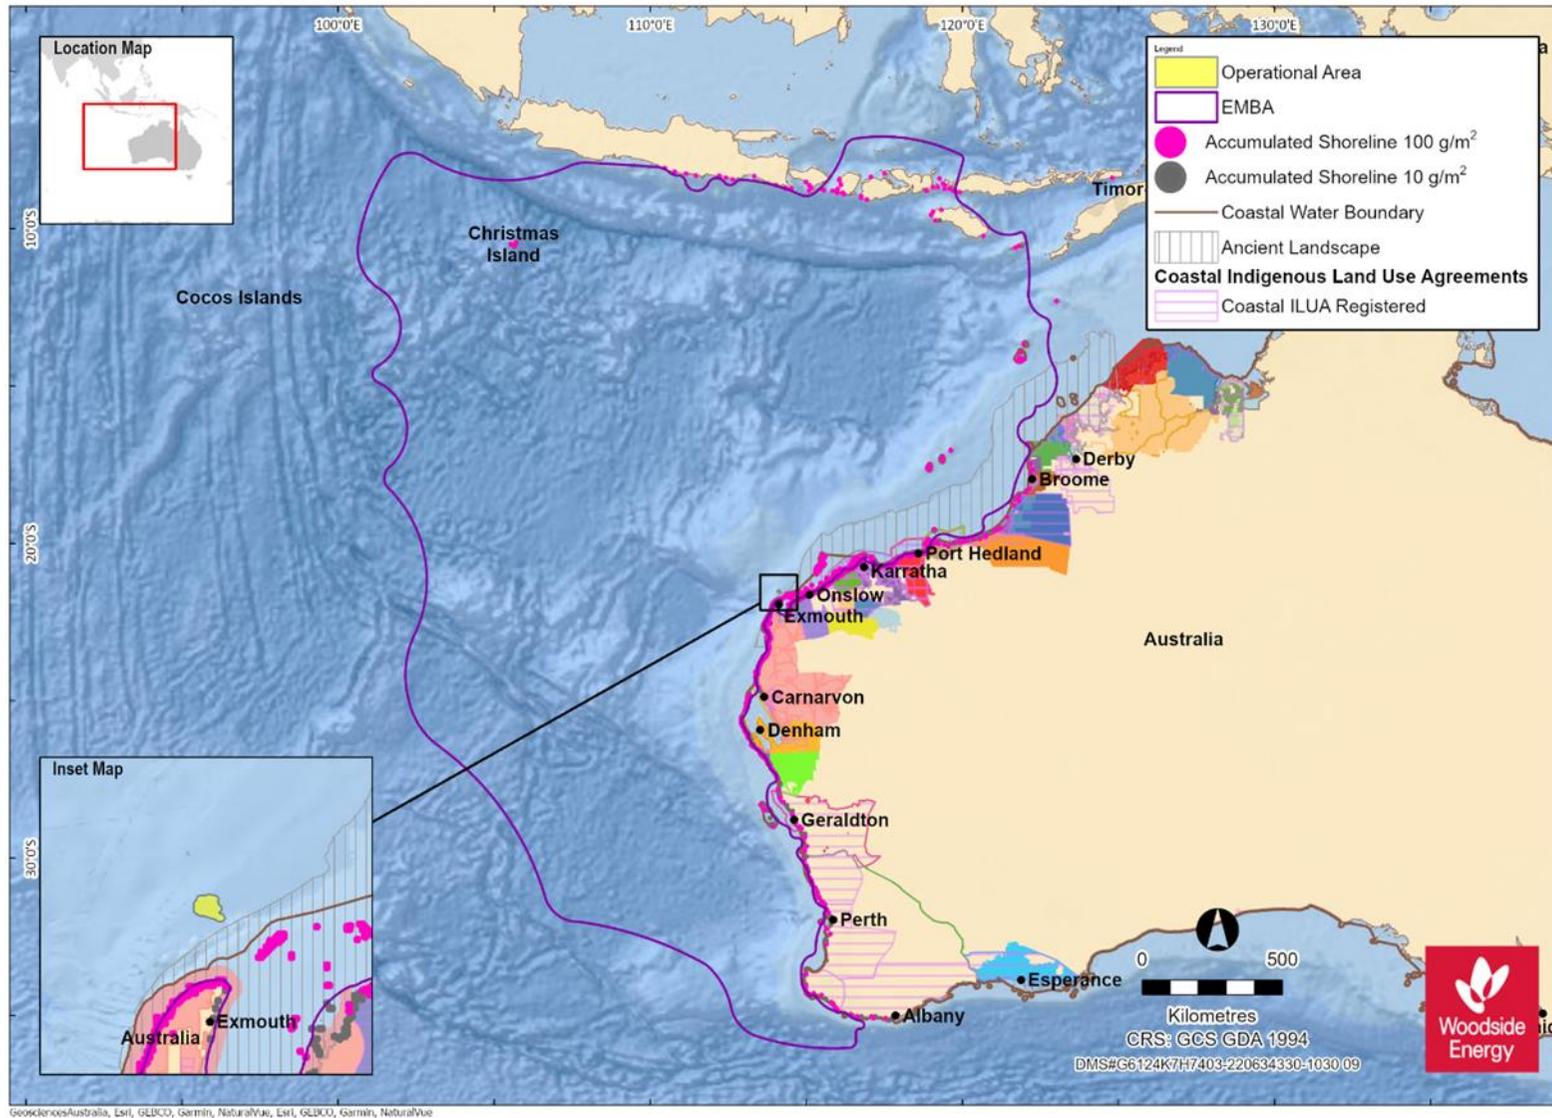

For the activity in this EP, there are no native title claims or determinations and no ILUAs overlapping the Operational Area, however, 26 native title claims and 44 ILUAs overlap the EMBA (see Figure 4-16). A summary of native title claims, determinations and ILUAs which are coastally adjacent to the EMBA is set out in Table 4-16. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

#### **4.9.2.1 Coastally Adjacent First Nations Groups**

Woodside understands that First Nations groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth 2007). To identify cultural features and heritage values which may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to be consulted (See Table 4-16).

Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas which those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for First Nations groups and individuals. This may also, over time, build expectations in the broader First Nations community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge. Woodside also acknowledges that a First Nations group's relative proximity to the Operational Area or EMBA is not necessarily a meaningful indicator of the connection of First Nations groups to the area, and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

A summary of native title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA is set out in Table 4-16. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

### 4.9.3 Marine Parks

Woodside acknowledges that Commonwealth and State marine park management plans have sought to recognise cultural values of First Nations groups. Australian marine parks (AMP) describe this framework in the following way: ‘when making decisions about what can occur in marine parks

and what action we will take to protect marine parks, we take values into account'. AMP summarises these values as natural values, cultural values, heritage values and socio-economic values.

Woodside undertakes an assessment of cultural values within marine park management plans where the operational area or EMBA overlaps an AMP. Woodside considers the management plans of marine parks that overlap the Operational Area and EMBA to determine whether cultural features and heritage values have been identified and whether there are specified representative bodies referenced to contact regarding potential cultural features and heritage values.

- The Operational Area does not overlap any Commonwealth Marine Parks.
- The Operational Area does not overlap any State Marine Parks.
- The EMBA overlaps 17 AMPs managed under the South-West Marine Parks Network Management Plan 2018, North-West Marine Parks Network Management Plan 2018 and North Marine Parks Network Management Plan 2018.
- The EMBA overlaps 12 State Marine Parks.
- The EMBA overlaps the Christmas Island AMP for which management plans are still being developed. No First Nations groups or cultural values are identified for this AMPs in the respective values statements (DNP, 2022a; DNP, 2022b).

Where the plans for these marine parks specify identifiable representative bodies who may hold knowledge of heritage values or cultural features—including but not limited to Registered Native Title Bodies Corporate—these bodies are consulted. Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. Where specified identifiable representative bodies for the AMPs overlapped by the EMBA are expressed in Table 4-17.

The marine park management plans did note across the various AMPs that Yamatji Marlpa Aboriginal Corporation (YMAC), Kimberley Land Council (KLC), South West Aboriginal Land and Sea Council (SWALSC) are the relevant Native Title Representative Bodies or Native Title Service Providers. YMAC and KLC were requested to identify Traditional Custodians who may hold knowledge of heritage values or cultural features (see Table 4-17). SWALSC ceased to be a Native Title Service Provider in 2021 (SWALSC, 2023), and Woodside consults with relevant Regional Corporations formed under the South West Native Title Settlement (see Appendix F).

**Table 4-17: Summary Marine Park Management Plans that overlap the EMBA**

Marine Park Management Plan	Operational Area Overlap	EMBA Overlap	Specified Bodies
<b>Commonwealth Marine Park Management Plan</b>			
Abrolhos AMP	No	Yes	No identifiable body specified

Ningaloo Marine Park	No	Yes	NTGAC
Cape Range National Park	No	Yes	No identifiable body specified
Murujuga National Park	No	Yes	MAC

#### 4.9.4 Sea Country Values

'Sea Country' can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. It has been noted that "the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as 'saltwater country' or 'sea country'. 'Country' refers to more than just a geographical area: it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area." (Smyth 2007). "Sea country is valued for Indigenous cultural identity, health and wellbeing" (DNP 2018b). Cultural identity is understood to refer to the fact that "essence of being a 'Saltwater' person is ontological rather than merely technological. That is, it is about how people

relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people” (McDonald and Phillips, 2021).

In terms of seascape extent, McNiven (2004) suggests that “For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20–30km out to sea, out to the horizon and the limit of human visibility. ... However, in some coastal places, clouds that can be seen well over 100km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon.” While there is some evidence of traditional watercraft in Australia’s North-West, the recorded evidence is limited to travel across inland rivers (e.g. Barber and Jackson 2011) or travel between coastal islands (Paterson et al 2019).

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government’s Indigenous Protected Areas Program. The Indigenous Protected Areas (IPAs) program provides for “areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation...IPAs deliver environmental benefits...Managing IPAs also helps Indigenous communities protect the cultural values of their Country for future generations...” (DCCEEW, 2023a). This intrinsic link concept is also described by MAC (2021) as it relates to the values of the marine environment that are of cultural importance to MAC based on engagement with their Elders and Murujuga Land and Sea Unit Rangers. Elders were clear that all living things in Mermaid Sound are connected and that Mermaid Sound and Dampier Archipelago (Murujuga) are considered one place where the entire environment and all ecosystems hold both cultural and environmental value, with these types of values (cultural and environmental) intrinsically linked (MAC, 2021 as cited in Woodside 2023a).

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple First Nations language groups. Some species may travel as far as 5,000 km from Antarctica to the Kimberley region of Western Australia (Double et al., 2010, 2012), passing First Nations language groups along the entire west coast of Australia. Distribution and migratory patterns of migratory species are described in Section 4.6 and Appendix J.

Sea Country values have been defined using multiple lines of evidence including:

- Desktop assessment of Sea Country values from publicly available sources
- Specific studies including ethnographic surveys and archaeological heritage assessments
- Consultation with First Nations groups and individuals

The process for identifying First Nations groups who may have interests and connection in Sea Country are set out in Section 4.9.2.1 and Section 5. The scope of advice Traditional Custodians were encouraged to provide through project consultation was not limited by reference to any particular boundaries or limits of Sea Country.

#### **4.9.4.1 Desktop Assessment of Sea Country Values**

##### **4.9.4.1.1 Cultural features and heritage values identified in publicly available literature**

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the EMBA or Operational Area. Where cultural features or Sea Country values were identified these are summarised in Table 4-19 according to the First Nations groups (where identified or inferable) who hold these values. Except where specific references are made to cultural values, these are considered to be addressed through the management of environmental values and are not summarised in this section.

**Table 4-18: Cultural features and heritage values identified in publicly available literature**

First Nations Group	Features and Values	Source	Potential for Overlap	
			Operational Area	EMBA
Bardi and Jawi	Feature: The offspring of Bardi and Jawi men inhabit the phenomenal world as incarnations of pre-existent spirit beings called ray or raya which live in specific locations throughout Bardi and Jawi territory including waterholes, springs, trees and rocks on the land or in the sea.	Sampi on behalf of the Bardi and Jawi People v State of Western Australia [2010] FCAFC 26	No	Possible (unspecified)
	Feature: Mythologically important places.		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including dugong, turtle and trochus shell.		No	Possible
	Value: Activities of mythological beings in the sea area.		Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge of the sea and the features within.		Possible (unspecified)	Possible (unspecified)
	Value: The lands and seas and cultural forms and practices making up the body of customary law were created and bequeathed via generations of human forebears by supernatural beings, inamunonjin, who had occupied and/or traversed the Dampier Peninsula-Buccaneer Archipelago region prior to direct human experience of the world.			Possible (unspecified)
	Value: The inamunonjin shaped features of the physical environment and imbued them with their eternal numinal essence. They named sites and set the boundaries of traditional territories and introduced the religious resources such as songs, dances, designs, objects, myths and rituals through which their activities would continue to be celebrated and affirmed. They instituted the basic rules of customs regulating social order.		No	Possible (unspecified)
	Value: The offspring of Bardi and Jawi men inhabit the phenomenal world as incarnations of pre-existent spirit beings called ray or raya which live in specific locations throughout Bardi and Jawi territory including waterholes, springs, trees and rocks on the land or in the sea.		No	Possible (unspecified)

First Nations Group	Features and Values	Source	Potential for Overlap	
			Operational Area	EMBA
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for hunting and fishing.		No	Possible
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for travelling.		No	Possible
	Value: Nobody may access Alarm Shoals as this includes a very significant sacred site and is a very dangerous spiritual place.		No	Possible
	Value: Lalariny, a rock feature in the vicinity of Thomas Bay, has a close association with a particular spiritual being and "nobody should go there"; people who do may be afflicted by a form of physical discomfort.		No	Possible
	Interest: Environmental characteristics of the sea.		Possible (unspecified)	Possible (unspecified)
Gnulli (Baiyungu, Thalanyji, Yinggarda)	Feature: Resources including marine animals. Value: Traditional knowledge holds that ancestors live on the land and in the water. Therefore, people have obligations to access and care for these places (e.g. keeping them clean).	Peck on behalf of the Gnulli Native Title Claim Group v State of Western Australia [2019] FCA 2090	Possible (unspecified)	Possible (unspecified)
	Feature: Resources including mangrove crabs, gastropods, shellfish, dugong, turtle).	Morse 1993	Possible (turtle; Section 4.6.3) No (other resources)	Possible (turtle; Section 4.6.3) No (other resources)
Jabirr Jabirr and Ngumbarl	Feature: Dreaming stories relating to inland areas associated with the headwaters of creeks running west through Jabirr Jabirr country.	National Native Title Tribunal. Registration Test Decision. Rita Augustine & Ors v State of Western Australia (Jabirr Jabirr). NNTT number WC2013/007	No	No
	Feature: During Bugarrlgarra (the Dreaming), a snake travelled from Nurrugun (Carnot Bay) in Jabirr Jabirr country down to Ngumbarl country and across into Yawuru country. When this snake crossed Willie Creek, he changed his name and his kinship group ("skin").		No,	Possible

First Nations Group	Features and Values	Source	Potential for Overlap	
			Operational Area	EMBA
	Value: Sites along the coast point to protracted economic and spiritual use of the land and include artefact scatters, middens, burials and/or ceremonial sites, sites of mythological and historical significance, fish traps and gender-restricted sites.		No	Possible (unspecified)
	Value: Coastal areas used for hunting, fishing and camping.		No	Possible (unspecified)
	Value: Traditional knowledge of the 'changes in seasons which rests on the relationships between the living things within a particular area'.		No	Possible (unspecified)
Kariyarra	Value: Traditional knowledge recalls that a salt water serpent lives in the sea and brings fish to shore.	Zaunmayr, 2016	Possible (unspecified)	Possible (unspecified)
Malgana	Feature: Resources including bobtail, long-tail, kangaroo, emu, pinkgrey galah, mull-hawk, bird eggs (shags [cormorants], seagull, divers), turtle eggs, dugongs, turtle, mullet, bluebone, whiting, snapper, oysters, mussels, crabs, prawns, scallops, cockles, little 'redies', black snapper and mallee fowl.	Oxenham on behalf of the Malgana People v State of Western Australia [2018] FCA 1929	Possible (unspecified)	Possible (unspecified)
	Value: Access to Country.		No	Possible (unspecified)
	Feature: Resources including dugong, green and loggerhead turtles and sharks.	Statton et al., 2021	Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge maintains records of freshwater seeps in the submerged landscape.		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including fish, shellfish, turtles and dugong.	Briggs and Green, 2008	Possible (unspecified)	Possible (unspecified)
	Feature: Archaeological sites.		No	Possible
	Feature: Green sea turtles, dugongs, shags and bottlenose dolphins are species of cultural significance.	Malgana Land and Sea Management et al., 2021	No	Possible
	Value: Sharing and controlling the sharing of knowledge.	Lyons et al., 2021	Possible (unspecified)	Possible (unspecified)
Nanda	Value: Access to Country resulting in physical and mental health.	Drury on behalf of the Nanda People v State of Western	No	Possible (unspecified)

## 4.9.4.2 Studies of Cultural Features and Heritage Values

### 4.9.4.2.1 First Nations Archaeological Heritage Assessment

Woodside understands that communal cultural connection may exist between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that First Nations people have occupied the Australian continent for at least 65,000 years (Clarkson et al 2017) and in many places maintain a strong continuing connection that is said to extend back in First Nations cosmology to the beginning of time.

It is understood that the sea level has risen significantly during the 65,000 years of First Nations occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth et al 2019; UWA 2021). Woodside also understands that, at its lowest level during First Nations occupation, sea level was between 125 m (O’Leary et al 2020, Veth et al 2019, Williams et al 2018) and 130 m below current levels (Benjamin et al 2020, Benjamin et al 2023, UWA 2021). Archaeological material preserved on the Ancient Landscape has the potential to provide further information about the earliest periods of human occupation (Veth et al 2019; UWA 2021).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited and can retain archaeological material from this time (Benjamin et al, 2020; Benjamin et al 2023; see Ward et al 2021 for an opposing view).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline KEF (see Section 4.7) as an area where potential First Nations archaeological material may exist on the seabed, as this covers the full extent of this possible First Nations occupation. The Operational Area does not overlap the Ancient Landscape; however, the EMBA does.

Known First Nations heritage places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or *EPBC Act 1999*. However, these Acts only extend protection to First Nations heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is no First Nations archaeology known to exist anywhere within Commonwealth waters, and no areas subject to declarations or prescriptions under these Acts are located within the EMBA.

For this EP, a search of DPLH’s Aboriginal Cultural Heritage Inquiry System was undertaken, which showed 315 registered Aboriginal sites in the EMBA (see Appendix G).

If First Nations archaeological material is identified within the Operational Area, Woodside will discuss the management of this material with appropriate Traditional Custodian group(s), starting with any adjacent Native Title Body Corporate.

## 4.9.4.3 Consultation Feedback to Inform Existing Environment

### 4.9.4.3.1 Summary of values raised during consultation

A summary of the topics/interests and values raised by First Nations groups through consultations on this PAP, or raised in context of general Project activities or other activities are provided in Table 4-19.

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that “Aboriginal and Torres Strait Islander heritage is managed... according to community ownership” (Heritage Chairs of Australia and New Zealand 2020). Dhawura Ngilan also specifically notes that “Aboriginal and Torres Strait Islander... intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community...” Through consultation Registered Native Title Bodies Corporate and nominated representative corporations

have identified or raised topics relating to environmental values of cultural interest. Woodside recognises the deep spiritual and cultural connection to the environment<sup>4</sup> that First Nations people hold.

The Program of Ongoing Engagement with Traditional Custodians (Appendix G) provides a mechanism for ongoing dialogue between Woodside and Traditional Custodians, beyond that required by regulation 25. The program enables Woodside to manage the potential impacts and risks to cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians. As an example, Woodside is developing a framework for ongoing consultation with BTAC and other groups (Appendix G). Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5).

---

<sup>4</sup> Definition of 'Environment' in Regulation 5 of the OPPGS (Environment) Regulations are defined as:

- a) ecosystems and their constituent parts, including people and communities; and
- b) natural and physical resources; and
- c) the qualities and characteristics of locations, places and areas; and
- d) the heritage values of places; and includes
- e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d)

**Table 4-19: Feedback Received via Consultation to Inform Existing Environment Description**

Relevant First Nations Group/ Individuals	Consultation Context	Description of Feature and Value/Interest	Potential for Overlap	
			Operational Area	EMBA
BTAC representing some of the Gnulli native title claimants (Baiyungu and Thalanyji people)	Raised in context of consultation on activities subject to other EPs	Value: Cultural obligation to care for the environmental values of Sea Country. Sea Country extends “out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands”.	Possible (unspecified)	Possible (unspecified)
Kariyarra Aboriginal Corporation	Raised in context of consultation across various EPs	Feature: Intangible cultural heritage sites including Yinta (ancestral sites underpinning law and connection to Country).	Possible (highly unlikely due to distance)	Possible (unspecified)
		Feature: coastal landforms.	No	Possible (unspecified)
		Feature: coastal native vegetation.	No	Possible (unspecified)
		Feature: tangible cultural heritage sites.	No (feature restricted to Ancient Landscape)	Possible
		Value: resource collection including fishing; trapping; crabbing; catching turtles, dugong and stingray; and collecting shellfish.	No	Possible
		Value: Access to country including visiting offshore islands at low tide.	No	Possible (unspecified)
		Value: Intergenerational knowledge transfer.	Possible (highly unlikely due to distance)	Possible (unspecified)
		Value: Cultural obligations to care for Country, including Sea Country.	Possible	Possible
		Value: Mermaid Sound – ecosystem health.	No	Possible

#### 4.9.4.3.2 Further Information regarding BTAC's Sea Country values

During consultation, BTAC, on behalf of the Thalanyji People, advised it has a cultural obligation to care for the environmental values of Sea Country (refer to Appendix F, Table 1).

In correspondence from 20 February 2023 relating to another Woodside project, BTAC advised that:

BTAC seeks support from Woodside to enable BTAC to define and articulate its values on Sea Country in a manner that could be more clearly understood by the offshore sector, government, and the community. This would enable BTAC and Woodside to collaborate to develop effective management plans that can provide adequate protection to Sea Country values; and BTAC seeks support from Woodside to obtain technical support to review the information and provide BTAC and its members with feedback on the project risks to Sea Country and help BTAC contemplate the potential management controls that could be developed to protect its values and interests.

These requests do not constitute a request for an ethnographic survey. Woodside has agreed to BTAC's request, and the resulting offer of technical support is detailed in Appendix F, Table 1. However, Woodside's offer for technical support has not yet been accepted.

BTAC noted that this Sea Country extends "out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands." In the absence of further advice from BTAC, Woodside understands from this description that BTAC's interests extend to the Montebello Marine Park Multiple Use Zone in the vicinity of the islands.

While an ethnographic survey has not been requested, a review of publicly available literature has been undertaken to seek clarity on the extent of Sea Country for Thalanyji people. This review identified a number of heritage research projects undertaken for the Montebello and Barrow Islands which acknowledge the support of BTAC (e.g. Manne and Veth 2015, Veth et al. 2017), though no information regarding Sea Country values, or the extent of Sea Country, were identified.

Publicly available heritage assessment reports elsewhere on Thalanyji Country tend to rely on established native title boundaries (e.g. Chisholm 2013) or draw on historic maps, particularly those compiled by Norman Tindale and published in 1947 (e.g. Archaeaus 2020). An early 1940's map by Tindale shows "Talaindji" (Thalanyji) Country as exclusively terrestrial and further west than areas typically recognised today as Thalanyji Country (Tindale 1940). This map also shows the Noala people as custodians of the Onslow area and defines Barrow and the Montebello Islands as "Mardudunera" (Mardudhunera) Country—it is unclear from the map if the boundary of Mardudhunera is proposed to represent an extent of Sea Country, or merely note that these islands are part of Mardudhunera Country. A further refined version of this map was produced in 1974 which shows "Talandji" in a location more closely aligned with contemporary understanding of Thalanyji Country and removes the apparent extent of Mardudhunera over Barrow and the Montebello Islands (Tindale 1947). This definition of Thalanyji Country is still confined to the mainland in this map. A more contemporary attempt at mapping traditional Country is shown in The AIATSIS Map of Indigenous Australia (Horton 1996). This map similarly confines Thalanyji Country to terrestrial areas west of Onslow and leaves Barrow and the Montebello Islands unmarked as an area with "No published information available". It is also noted that "This map is based on data collected up to 1994 and is not intended to show precise areas or boundaries" (Horton 1996).

Collective assessments of Sea Country in the Pilbara (Lincoln and Hedge 2019, YMAC et al. 2010) were also found to rely on existing native title boundaries. It is noted in the Pilbara Sea Country Plan (YMAC et al. 2010) that:

Although some differences remain, between and among native title groups, there is now a general sense that most groups have coalesced into final forms that will, in future, be the groups that exercise rights and interests in their respective areas. many of these rights and interests will relate directly to native title. however, there is also a more broadly based appreciation of the need to accept and discharge responsibilities for land and marine management within native title areas regardless of whether native title per se is affected. (YMAC et al. 2010, emphasis added).

The office of the Registrar of Indigenous Corporations records four corporations using the name Thalanyji:

- Buurabalayji Thalanyji Aboriginal Corporation
- Buurabalayji Thalanyji Aboriginal Corporation RNTBC
- Onslow Thalanyji Aboriginal Corporation
- Wurrumalu Thalanyji Aboriginal Corporation

The only currently operative organisation, and the only organisation with an identifiable website, is Buurabalayji Thalanyji Aboriginal Corporation RNTBC. This website states that "Thalanyji Country spreads out across the Ashburton River coastal plain south to Tubridji Point, then across to Yannarie River and upstream to Emu Creek, across the range hills of southwest Pilbara to Henry River and Cane River in the north" (BTAC 2021<https://thalanyji.com.au/>). This description includes coastal areas but provides no description of the extent of Sea Country.

A search of the National Native Title Tribunal register of applications and determinations identified four historic Native Title claims with the name Thalanyji:

- Thalanyji People (WC1995/002)
- Thalanyji People #2 (WC1996/082)
- Thalanyji (WC1999/045)
- Thalanyji 2 (WC2010/004)

Most of these claims were dismissed, and Woodside makes no assessment of the merits of these claims.

The area of WC1995/002, as defined in the map forming Attachment 1 to the Native Title Application<sup>5</sup>, does not include any areas of Sea Country. WC1996/082 does not include a publicly available map on the National Native Title Tribunal website. The Native Title Application<sup>6</sup> does describe the area covered by the claim, including "This country extends from the Tubridji Point on the coast south west of Onslow and tracking south to Yanarrie River." and "The area also includes the waters and associated islands between Tubridji point and Cane River. These islands were visited by Thalanyji People." The extent of this Sea Country from the coast is unclear, but would presumably include islands as distant as Airlie Island, approximately 30 km from the shore.

The area of WC1999/045, as defined in the map forming Attachment C to the Native Title Application<sup>7</sup>, includes an area of water extending approximately 30 km from the mainland coast in encompassing a number of islands, including Airlie Island, Ashburton Island, Bessieres Island, Direction Island, Flat Island, Locker Island, Round Island, Serrurier Island, Table Island, Thevenard Island, Tortoise Island, and the Twin Islands. The area also includes the south-most of the Mangrove Islands, but does not include the other Mangrove Islands.

The area of WC2010/004, as defined in the map forming Attachment C to the Native Title Application<sup>8</sup> includes localised areas of sea up to approximately 5 km beyond the coast.

In none of these applications do the extent of asserted interests extend to Barrow, Mackerel or the Montebello Islands. The furthest extent of a claim is the approximate 30 km margin extended from the mainland coast for WC1999/045. If this margin is precautionarily applied to the coasts of the

<sup>8</sup> [http://www.nntt.gov.au/searchRegApps/NativeTitleClaims/NTDA%20Extracts/WC2010\\_004/WC2010\\_004%20%20Map%20of%20Application%20Area.pdf](http://www.nntt.gov.au/searchRegApps/NativeTitleClaims/NTDA%20Extracts/WC2010_004/WC2010_004%20%20Map%20of%20Application%20Area.pdf)

Montebello Islands (as the closest islands to the operational area which were identified by BTAC in defining their Sea Country) this would not exceed beyond the Montebello Multiple Use Zone within the vicinity of the islands.

In summary, the publicly available information considered in this section does not record any instances of Thalanyji Sea Country extending beyond the Montebello Multiple Use Zone within the vicinity of the islands. The Montebello Islands, Barrow Island or the Mackerel Islands or the Montebello Marine Park Multiple Use Zone, or the islands indicated in WC1999/045 are outside of the Operational Area and EMBA for the activity.

Woodside has developed a robust understanding of Thalanyji Sea Country cultural values and heritage features through publicly available information (Section 4.9.4.1) and consultation with BTAC under regulation 25. Woodside considers that it has taken all reasonable steps to identify cultural features and heritage values of Thalanyji people in the EMBA.

If further guidance from BTAC is received as part of ongoing consultation which changes Woodside's understanding of the extent of Thalanyji Sea Country, Woodside's Management of Change and Management of Knowledge process within EPO 22 will be applied to manage potential impact to newly identified cultural values or features to ALARP and Acceptable levels. This estimation does not limit the extent of consultation with BTAC or the features and values they are encouraged to identify and communicate.

#### **4.9.4.4 Summary of cultural features and heritage values**

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under regulation 25.

Table 4-20 consolidates the cultural features and heritage values identified in Section 4.9.4 and confirms whether there is any potential for these to exist within the Operational Area or EMBA. It also includes topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed in Section 6.6, 6.7, and 6.8.

As cultural features are physical elements of a place, these can generally be assessed for impacts; where a feature is avoided, it is not impacted. Heritage values relate less to what is significant and more to why something is significant; interaction between heritage values and the Operational Area can only be reliably informed by consultation with Traditional Custodians where they are willing to share the necessary knowledge. Assessment of heritage values beyond cultural features alone is addressed in Section 6.10 subject to these caveats.

**Table 4-20 Summary of cultural features and heritage values**

Identified cultural features and heritage values (including interests)	Context	EP Source			Potential for overlap	
		Consultation Feedback	First Nations Archaeological Heritage Assessment	Desktop Literature Assessment	Operational Area	EMBA
<b>Archaeological heritage</b>						
None identified – refer to Section 4.9.4.5 No archaeological sites have been identified beyond terrestrial or intertidal areas, except for two sites at Murujuga in Cape Bruguieres channel and Flying Foam Passage (Benjamin et al. 2020; Benjamin et al 2023). It is recognised that there is the potential for submerged archaeological sites on the Ancient Landscape as noted in Table 4-19, however due to the scope of operations there will be both the Operational Area and EMBA do not overlap the Ancient Landscape.						
<b>Intangible values</b>						
Songlines	Consultation and desktop literature noted dreaming tracks from locations onshore and to islands outside of the EMBA, and through the sea generally, but was not able to determine the routes of any dreaming tracks that may extend across the submerged landscape within the Operational Area.	✓	X	✓	Possible (unspecified)	Possible (unspecified)
Creation/dreaming sites, sacred sites and ancestral beings	Publicly available literature talks to creation/dreaming and ancestral beings, including water serpents, connected to or originating from the sea generally, but cannot be confirmed to relate to features within the EMBA.	✓	X	✓	Possible (unspecified)	Possible (unspecified)

#### 4.9.4.5 Further context: Intangible cultural heritage

Intangible cultural heritage has been identified through consultation with First Nations people as culturally important. Cultural knowledge, as expressed through songlines, dreaming, dance and other cultural practices, can be associated with tangible objects and physical sites that are culturally important to First Nations people (Adler 2021; Bursill et al. 2007). Intangible cultural heritage can also be embodied in the practices, representations, expressions, knowledge, uses and skills associated with physical sites (UNESCO 2003). As a result, physical features may have intangible dimensions (ICOMOS 2013).

##### 4.9.4.5.1 Songlines

Oral Songlines are often described by First Nations people as the law of the land and make up part of the Dreaming (Neale and Kelly 2020:30). Songlines are viewed in Western academia as a framework for relating people to land and consist of a series of invisible, interconnected routes across the landscape that mark significant sites for First Nations people (Higgins 2021:723). Songlines demonstrate First Nations peoples' strong connections to land by revealing sacred knowledge that is place-specific (Roberts 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through, and interacted with, the physical landscape leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include inter alia: rocks, mountains, rivers, caves and hills (Higgins 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge.

In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of First Nations communities across the land (Neale and Kelly 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country make mention of mythical events occurring around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country—for example connections to nearby islands that they once inhabited in their songlines (Smyth and Isherwood 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines in order to communicate sacred knowledge that assists in safe navigation of the ocean (Neale and Kelly 2020:83-84).

The routes of any songlines in the EMBA have not been provided by Traditional Custodians through consultation.

##### 4.9.4.5.2 Creation/dreaming sites, sacred sites and ancestral beings

The only sources located by Woodside with detailed descriptions of the location ancestral beings or creation/dreaming/sacred sites placed these on land or within inland water sources such as rivers or pools. However, some ancestral beings are noted to live within or originate from the sea generally, and some creation stories talk to the creation of features from or in the sea. Additionally, every place on shore or at sea must be assumed to have been created on some level in First Nations cosmology.

#### **4.9.4.5.3 Cultural obligations to care for Country**

Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. In the literature reviewed by Woodside, caring for Country was noted to include, but is not limited to, maintenance of the physical environment and ecosystem. It may also have cultural, spiritual and ritual dimensions such as caring for ancestral beings or ensuring cultural safety. Thalu are places where increase ceremonies are performed to enhance or maintain populations of plants, animals or phenomena. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where e.g., a thalu relates to marine species populations.

#### **4.9.4.5.4 Knowledge of Country/customary law and transfer of knowledge**

Knowledge of and familiarity with the features of Sea Country is itself a value. The inherent potential for restricted or secret knowledge makes this difficult to assess even through consultation with Traditional Custodians. However, aspects such as limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. Further, connection to Country may be damaged where people are displaced or disrupted (e.g., during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald and Phillips, 2021).

Transfer of knowledge includes continuing traditional practices to pass on practical skills. This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

#### **4.9.4.5.5 Connection to Country**

Connection to Country describes the multi-faceted relationship between First nations people and the landscape, which is envisioned as having personhood and spirit. It is also an aspect of personal identity for many First nations people. In the case of Sea Country this can mean identifying as a Saltwater person, where "essence of being a 'Saltwater' person is ontological... it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people" (McDonald and Phillips, 2021).

#### **4.9.4.5.6 Access to Country**

Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Being on Country can be an important way of expressing or maintaining connection to Country (Australian Indigenous HealthInfoNet n.d.). Access is also a value in its own right, as a continuation of traditional Sea Country access and use.

#### **4.9.4.5.7 Kinship systems and totemic species**

Individuals may have kinship to specific species (Smyth 2008, Juluwarlu 2004) and/or a responsibility to care for species (Muller 2008). Kinship arises from totemic associations within First Nations "skin group" systems. It is forbidden for an individual to kill or eat a species who is from the same "skin group" (Juluwarlu 2004). They may also have certain obligations linked to the discussion of caring for Country below. It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that "skin group" from hunting or eating that same species (Juluwarlu 2004).

#### **4.9.4.5.8 Resource collection**

A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and

preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

#### **4.9.4.6 Further context: Marine ecosystems and species**

##### **4.9.4.6.1 Marine mammals**

Whales, and in particular humpback whales, have been identified through consultation with First Nations people as culturally important species, with totemic importance including their populations, biodiversity, and migration patterns. Cultural ceremonies associated with communicating with dolphins have also been raised by MAC through consultation.

Whale symbology expressed through stories, music, and dance can reflect a group's connections with the sea, as well as marine fauna, which then comprise a group's cultural values (Ardler 2023; Bursill et al. 2007; Cressey 1998). Whales also speak to a broader connection that exists between First Nation people and their surrounding environment. Beyond mythology and symbolism, whales can be connected with various economic and social functions associated with everyday life. Cultural knowledge of whales, whale migration, behaviour and the related marine environment may all be important in ensuring the continuation of these socio-economic functions and other related activities that remain valuable to First Nations people (Fijn 2021:47).

Details pertaining to whales and dolphins, their distribution, migration patterns and populations are described in Section 4.6.3, with further details in Appendix J (Master Existing Environment).

##### **4.9.4.6.2 Marine reptiles**

Turtles and sea snakes have been identified through consultation with First Nations people as culturally important species, with turtles identified as a resource. First Nations people that identify marine reptiles as species of totemic importance or integral to songlines may place high cultural value on their protection. No marine reptiles -related songlines have been identified as per Section 4.9.4.5 that have the potential to interact with the Operational Area or EMBA. Note the only songline related to marine reptiles (turtles) was shared by MAC, and was geographically restricted from Fortescue to Withnell Bay, in Mermaid Sound (MAC 2021).

Turtle symbology expressed through stories, music, and dance can reflect an individual or group's connections with the sea, as well as marine fauna, and comprise First Nations' cultural values (Ardler 2023; Bursill et al. 2007). Beyond mythology and symbolism, turtles can be connected with various economic and social functions associated with everyday life including hunting and settlement location. Turtles speak to a broader connection that exists between First Nation people and their surrounding environment, including cultural values associated with food security (Delisle et al.2018:250).

Cultural knowledge of turtles at a population level (turtle migration, behaviour and the related marine environment) may all be important in ensuring the continuation of cultural functions and activities that remain valuable to First Nations people (Fijn 2021:47; Delisle et al.2018). Details pertaining to marine reptiles, their distribution, and populations are described in Section 4.6.2, with further details in Appendix J (Master Existing Environment).

##### **4.9.4.6.3 Fish**

Fish have been identified through consultation with First Nations people as a culturally important species, with fish generally being identified as a resource.

First Nations may identify cultural values associated with fish species as important to maintaining both tangible (physical cultural sites) and intangible (cultural knowledge) cultural heritage. Tangible cultural heritage associated with fish can include important cultural sites such as midden sites, fish traps and thalu sites. Traditional fish traps require traditional knowledge of the surrounding

environment and may involve specialised techniques which have been developed in adaptation to location conditions over time (Fijn 2021:63).

Intangible cultural heritage associated with fish include songlines, dreaming, art, song and dance. Cultural values relating to fish, and other marine fauna, can collectively capture 'Sea Country' which refers to a seascape that Traditional Custodians view, interact with or hold knowledge of. As a result, fish may be culturally value in relationship with broader marine environmental values that are of cultural importance to First Nations people (Smyth 2007).

Details pertaining to fish, sharks and rays are described in Section 4.6.1, with further details in Appendix J (Master Existing Environment).

#### **4.9.4.6.4 Natural environment interests**

First Nations people have advised through consultation that they have a general interest in environmental management and ecosystem health, including understanding changes in water quality as a result of the PAP and potential resultant affects on marine species and benthic communities in the Operational Area and EMBA. This includes marine mammals, marine reptiles, fish, seabirds, plankton and subtidal soft bottom communities, which are described in context of their distribution and populations in Section 4.6, with further details in Appendix J (Master Existing Environment).

#### **4.9.5 Heritage Listed Places**

No listed world, national or commonwealth heritage places overlap the Operational Area.

A search of the Australasian Underwater Cultural Heritage, which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters indicated that there are no underwater heritage sites or shipwrecks within the Operational Area.

Within the EMBA there are two world heritage properties, 11 national heritage places and 16 commonwealth heritage places, these are all listed in Table 4-22. There are also 25 recorded shipwrecks within the EMBA, these are all listed in Table 4-21.

Also, within the EMBA, Ningaloo Reef, Exmouth and the adjacent coastline have a long history of occupancy by Aboriginal communities. The longstanding relationship between Aboriginal people and the land and sea is prevalent in Indigenous culture today and Indigenous heritage places, including archaeological sites, are protected under the *Aboriginal Heritage Act 1972* (WA) or EPBC Act.

For this EP, a DPLH search was undertaken, which indicated a number of registered Indigenous heritage places in the EMBA (Appendix D). The exact location, access, and traditional practices for a number of these sites are not disclosed and if required, such as in the event of a major oil spill, would involve prioritising further consultation with key contacts within Western Australian Department of Aboriginal Affairs (DAA) and relevant local Aboriginal communities.

Woodside understands that there is no Indigenous archaeology known to exist anywhere within Commonwealth waters.

##### **4.9.5.1 Historic Sites of Significance**

There are no known sites of historic heritage significance within the Operational Area. Appendix J describes cultural heritage sites within the EMBA.

##### **4.9.5.2 Underwater Heritage**

A search of the Australian National Shipwreck Database which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters

indicated that there are no sites within the Operational Area, however, numerous shipwrecks exist within the EMBA. Table 4-21 lists shipwrecks within 50 km of the Operational Area.

**Table 4-21: Recorded shipwrecks within the EMBA**

Vessel name (ID number)	Year wrecked	Latitude	Longitude
Gem (4144)	1893	-21.61666667	113.98333333

**4.9.5.3 World, National and Commonwealth Heritage Listed Places**

No listed heritage places overlap the Operational Area. World, National and Commonwealth heritage places within the EMBA are identified in Table 4-22. Appendix J outlines the values and sensitivities of these places.

**Table 4-22: World Heritage Properties and National / Commonwealth Heritage Listed Places within the EMBA**

Listed Place	Distance and direction from Operational Area to Listed Place (km)
<i>World Heritage Properties</i>	

Listed Place	Distance and direction from Operational Area to Listed Place (km)
Ningaloo Coast	8.6 km south-east
Shark Bay, Western Australia	357 km south-west
<b>National Heritage Places</b>	
Ningaloo Coast	8.6 km south-east
Barrow Island and the Montebello-Barrow Islands Marine Conservation Reserves	128.2 km north-east
Dampier Archipelago (including Burrup Peninsula)	256.9 km north-east
Shark Bay, Western Australia	357.4 km south-west
Dirk Hartog Landing Site 1616 - Cape Inscription Area	445.3 km south-west
HMAS Sydney II and HSK Kormoran Shipwreck Sites	578.1.2 km south-west
Batavia Shipwreck Site and Survivor Camps Area 1629 - Houtman Abrolhos	761.4 km south-west
The West Kimberley	855.4 km north-east
Christmas Island Natural Areas	1,503.1 km north-west
Cape Riche	1,517.1 km south-east
Great Western Woodlands of Western Australia	1,641.9 km south-east
<b>Commonwealth Heritage Places</b>	
Ningaloo Marine Area – Commonwealth waters	8.5 km south-east
Learmouth Air Weapons Range Facility	92.6 km south-west
HMAS Sydney II and HSK Kormoran Shipwreck Sites	578.1 km south-west
Mermaid Reef - Rowley Shoals	746 km north-east
Lancelin Defence Training Area	1,030.2 km south-east
Scott Reef and Surrounds - Commonwealth Area	1146 km north-east
Ashmore Reef National Nature Reserve	1,384.4 km north-east
Cape Leeuwin Lighthouse	1,420.5 km south-east
Christmas Island Natural Areas	1,505.2 km north-west
Phosphate Hill Historic Area	1,514.1 km north-west
Bungalow 702	1,515.1 km north-west
Drumsite Industrial Area	1,515.1 km north-west
Industrial and Administrative Group	1,515.3 km north-west
Settlement Christmas Island; Malay Kampong Precinct; Malay Kampong Group; Poon Saan Group	1,515.5 km north-west
Administrators House Precinct	1,515.5 km north-west
South Point Settlement Remains	1,520.7 km north-west

## 4.10 Socio-Cultural Environment

### 4.10.1 Commercial Fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area and EMBA. Fish Cube data were requested to analyse the potential for interaction of fisheries with the Operational Area, which was used to determine consultation with WA State-managed fisheries that may be impacted by proposed petroleum activities (DPIRD, 2020).

Table 4-23 provides an assessment of the potential interaction and Appendix J provides further detail on the fisheries that have been identified through desk-based assessment and consultation (Section 5).

Figure 4-18 4-19 shows fisheries identified as having a potential interaction with the PAP.

**Table 4-23: Commonwealth and State managed commercial Fisheries overlapping the Operational Area and/or EMBA**

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
<b>Commonwealth Managed Fisheries</b> ✓ = overlap with fishery; blue shading = possibility for interaction			
North West Slope Trawl Fishery	✓	✓	The North West Slope Trawl Fishery management area overlaps the Operational area and the EMBA. Between one to six vessels have been active in the fishery since 2005. Fishery Status Reports indicate most recent activity inside the EMBA occurred in the 2020-2021 season (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.
Western Deepwater Trawl Fishery	✗	✓	The Western Deepwater Trawl Fishery management area overlaps the EMBA. Based on Fishery Status Reports the fishery may be active within the EMBA with recent activity during the 2020-2021 season (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.
Western Tuna and Billfish Fishery	✓	✓	The Western Tuna and Billfish Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. However, in the last five years (2016 – 2021), fishing effort has concentrated south of Carnarvon (ABARE., 2021). Accordingly, Woodside considers it a possibility that interaction with this fishery and the PAP.
Southern Bluefin Tuna Fishery	✓	✓	The Southern Bluefin Tuna Fishery management area overlaps the Operational Area and EMBA, spanning the entire Australian Fishing Zone. Since 1992, the vast majority of Australian catch effort have been concentrated in south-eastern Australian waters (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the PAP.
Western Skipjack Fishery	✓	✓	The Western Skipjack Tuna Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the PAP
Small Pelagic Fishery	✗	✓	The Small Pelagic extends from the QLD/NSW border around to the 31° south latitude line near Lancelin, Perth. The management area is split into western, eastern and sardine subareas. Fishery Status Reports indicate the maximum area fished between 2020-2021 occurred outside of the EMBA (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the PAP

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Christmas Island Line Fishery	x	✓	The Christmas Island Line Fishery management area overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Southern and Eastern Scalefish and Shark Fishery (SESSF): Great Australian Bight Trawl Sector	x	✓	The SESSF: Great Australian Bight Trawl Sector extends along the south coast of WA and SA to Kangaroo Island. Fishery Status Reports indicate the maximum area fished between 2020-2021 occurred outside of the EMBA (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the PAP.
<b>State Managed Fisheries</b>			
✓ = spatial overlap with fishery; blue shading = potential for interaction			
Abalone Managed Fishery (Area 3-8)	✓	✓	The Abalone Fishery management area overlaps the Operational Area (Area 8) and EMBA (Area 3-8). The fishery is only active within the EMBA, with 60NM Catch and Effort System (CAES) block reporting 3-15 registered vessels for Greenlip and Brownlip Abalone Fishery. More recently, active vessel numbers were 3-10 across the 2021-2022 seasons, (Strain et al., 2023a). Due to the water depths of the Operational Area at 200m, there is no potential for interaction with the fishery in the Operational Area, given the fishery method. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Abrolhos Islands and Mid-West Trawl Managed Fishery	x	✓	The Abrolhos Islands and Mid-West Trawl Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60NM CAES block reporting between 3-6 vessels across the 2017-2022 seasons (Kangas et al., 2023b, with no active vessels in the 21-22 financial year. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Broome Prawn Managed Fishery	x	✓	The Broome Prawn Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60NM CAES block reporting 3 active vessels undertaking trial fishing activities to investigate whether catch rates were sufficient for commercial fishing across the 2021-2022 seasons, resulting in negligible landings of western king prawns with no by-product (Kangas et al., 2023a). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Cockburn Sound Managed Fishery	x	✓	The Cockburn Sound (Crab) Fishery management area overlaps the EMBA. The Cockburn Sound Crab Managed Fishery has been closed since 2014 (Johnston et al., 2020). If the fishery were to resume, Woodside only considers it a possibility that interactions with the fishery would occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
	x	✓	The Cockburn Sound (Fish Net) Fishery management area overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
	x	✓	The Cockburn Sound (Line and Pot) Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60NM CAES block reporting between 6-8, consistently active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
	x	✓	The Cockburn Sound (Mussel) Fishery management area overlaps the EMBA. There has been no reported catch in the period between 2014-2022 (DPIRD, 2023). If the fishery were to resume, Woodside only considers it a possibility that interactions with the fishery would occur only in the EMBA.
Exmouth Gulf Beach Seine and Mesh Net Managed Fishery	x	✓	The Exmouth Gulf Beach Seine and Mesh Net Managed Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting <3 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Exmouth Gulf Prawn Managed Fishery	x	✓	The Exmouth Gulf Prawn Managed Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60NM CAES block reporting 6 consistently active vessels across the 2017-2022 seasons (DPIRD, 2023). The CAES reporting block overlaps the Operational Area (indicating fishing effort within the OA), the fishery is limited to the spatial extent within the Exmouth Gulf and Muiron Islands. Therefore, Woodside only considers it a possibility that interactions with the fishery may occur only in the EMBA.
Gascoyne Demersal Scalefish Fishery	x	✓	The Gascoyne Demersal Scalefish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 3-12 active vessels across the 2017-2022 seasons (DPIRD, 2023). FishCube data reported no fishing effort at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers there to be potential for interaction with the fishery within the EMBA.
Hermit Crab Fishery	✓	✓	The Hermit Crab Fishery area overlaps the Operational Area and the EMBA. There has been no reported fishing effort in the Operational Area at the 10NM or 60NM CAES reporting blocks. The collection method for the fishery is hand-catch, on shorelines, and therefore the potential for interaction with the Operational Area is not considered.  Less than 3 licences have been active in the fishery within the EMBA, during the 2017-2022 period. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Joint Authority Southern Demersal Gillnet and Demersal Longline Fishery	x	✓	The Joint Authority Southern Demersal Gillnet and Demersal Longline Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 3-11 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Kimberley Crab Managed Fishery	x	✓	The Kimberly Crab Fishery management area overlaps the EMBA. The fishery is active in the EMBA, with an allocation of 1,200 units (600 traps) to license holders and an equivalent allocation of 600 traps to Traditional Owner groups, with 7 people employed in 2021-2022 season (Johnston et al., 2023). Accordingly, Woodside considers there to be a potential for interaction with this fishery in the EMBA
Kimberley Gillnet and Barramundi Fishery	x	✓	The Kimberley Gillnet and Barramundi Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting <3 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Kimberley Prawn Managed Fishery	x	✓	The Kimberley Prawn Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting 3-14 active vessels across the 2017-2022 seasons (DPIRD, 2023). Woodside considers there to be potential for interaction with the fishery in the EMBA.
Mackerel Managed Fishery	✓	✓	The Mackerel Managed Fishery overlaps the Operational Area and EMBA. FishCube data for the Mackerel Managed Fishery is not provided at the 10NM scale, however effort reported in the 60NM CAES block reporting between 3-7 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent in the years since 2012. Woodside considers there may be potential for interaction with the fishery in the Operational Area and EMBA.
Marine Aquarium Fish Managed Fishery	✓	✓	The Marine Aquarium Fish Managed Fishery overlaps the Operational Area and EMBA. FishCube data for the Marine Aquarium Fish Managed Fishery is not provided at the 10NM scale, however effort reported in the 60NM CAES block reporting between 3-5 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent in the years since 2017. The Marine Aquarium Fish Managed Fishery generally collects fish for display in water depths <30m. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Nickol Bay Prawn Limited Entry Fishery	x	✓	The Nickol Bay Prawn Limited Entry Fishery management area overlaps the EMBA. The fishery is active in the EMBA, with 60NM CAES block reporting between 3-8 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
North Coast Shark Fishing	✓	✓	The North Coast Shark Fishing area overlaps the Operational Area and the EMBA. The northern shark fisheries comprise of the North Coast Shark Fishery in the Pilbara and Western Kimberly (closed since 1998), and the Joint Authority of Northern Shark Fishery in the eastern Kimberly, which has not been active since 2008-2009 season (AFMA. 2021). Therefore, Woodside considers there to be no interaction with the fishery and the PAP.
Northern Demersal Scalefish Managed Fishery	✗	✓	The Northern Demersal Scalefish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 3-7 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Octopus Interim Managed Fishery	✗	✓	The Octopus Interim Managed Fishery management area overlaps the EMBA. The fishery is active within the EMBA, 60NM CAES block reporting between 3-9 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Onslow Prawn Limited Entry	✗	✓	The Onslow Prawn Limited Entry Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting <3 active vessels across the 2017-2022 seasons (DPIRD, 2023). The CAES reporting block for the fishery overlaps the Operational Area (indicating fishing effort within the OA), however, the fishery is limited to the spatial extent and boundaries of the fishery. At the nearest point the fishery could only be active at a distance >45km from the Operational Area. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Open Access in the North Coast	✗	✓	The Open Access in the North Coast Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 3-7 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pearl Oyster Managed Fishery	✓	✓	The Pearl Oyster Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 3-6 active vessels across the 2017-2022 seasons (DPIRD, 2023). At the nearest point the fishery could only be active at a distance >45km from the Operational Area. The Pearl Oyster Managed Fishery fishing effort is mostly focused in coastal waters (10-15 m depth) with a maximum depth of 35 m (Lulofs et al., 2002). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Crab Managed Fishery	✓	✓	The Pilbara Crab Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting <3 active vessels across the 2017-2022 seasons (DPIRD, 2023). The Pilbara Crab Managed Fishery covers inshore waters (<50m) from Onslow to Port Headland, with most activity around Nickol Bay (Johnston et al., 2020). However, areas of the fishery north and east of Exmouth and nearshore are currently closed as per Schedule 2 of the Draft Management

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
			Plan for the Pilbara Crab Managed Fishery (DPIRD, 2018b). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Fish Trawl (Interim) Managed Fishery	✓	✓	The Pilbara Fish Trawl (Interim) Managed Fishery area overlaps the Operational Area and EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 3-4 active vessels across the 2017-2022 seasons (DPIRD, 2023). The Pilbara Fish Trawl (Interim) Managed Fishery is divided into 2 zones and an area governed by Schedule 5 (prohibited to trawling) (Newman et al., 2020). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Line Fishery	✓	✓	The Pilbara Line Fishery licensees are permitted to operate anywhere within Pilbara waters (Newman et al., 2021), overlapping the Operational Area and EMBA. The fishery is active in the EMBA, with one 60 NM Catch and Effort System (CAES) block reporting up to 5 licences across the 2017 – 2022 seasons (DPIRD, 2023). FishCube data for the Pilbara Line Fishery is not provided at the 10 NM scale, Therefore, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and/or EMBA.
Pilbara Trap Fishery	✓	✓	The Pilbara Trap Fishery management area overlaps the Operational Area and EMBA. The fishery is active with the overlapping 60 NM CAES block reporting up <3 vessels across the 2017-2022 seasons (DPIRD, 2023). FishCube data for the Pilbara Trap Fishery is not provided at the 10 NM scale. Fishing effort at this level has been consistent over the previous 10-year catch report. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and/or EMBA.
Shark Bay Crab Managed Fishery	✗	✓	The Shark Bay Crab Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 17-23 consistently active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Prawn Managed Fishery	✗	✓	The Shark Bay Prawn Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting between 16-18 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Scallop Managed Fishery	✗	✓	The Shark Bay Scallop Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 24 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
South Coast Crustacean Managed Fishery	x	✓	The South Coast Crustacean Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 5 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Estuarine Managed Fishery	x	✓	The South Coast Estuarine Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 13 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Line and Fish Trap Managed Fishery	x	✓	The South Coast Line and Fish Trap Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 19 active vessels across the 2021-2022 season (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Nearshore Net Managed Fishery	x	✓	The South Coast Nearshore Net Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 10 active vessels across the 2021-2022 season (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Purse-Seine Managed Fishery	x	✓	The South Coast Purse-Seine Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 6 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Salmon Managed Fishery	x	✓	The South Coast Salmon Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 4 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Coast Beach Net Fishery	x	✓	The South West Coast Net Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 9 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Coast Salmon Managed Fishery	✓	✓	The South West Coast Salmon Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting up to 3 active vessels across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

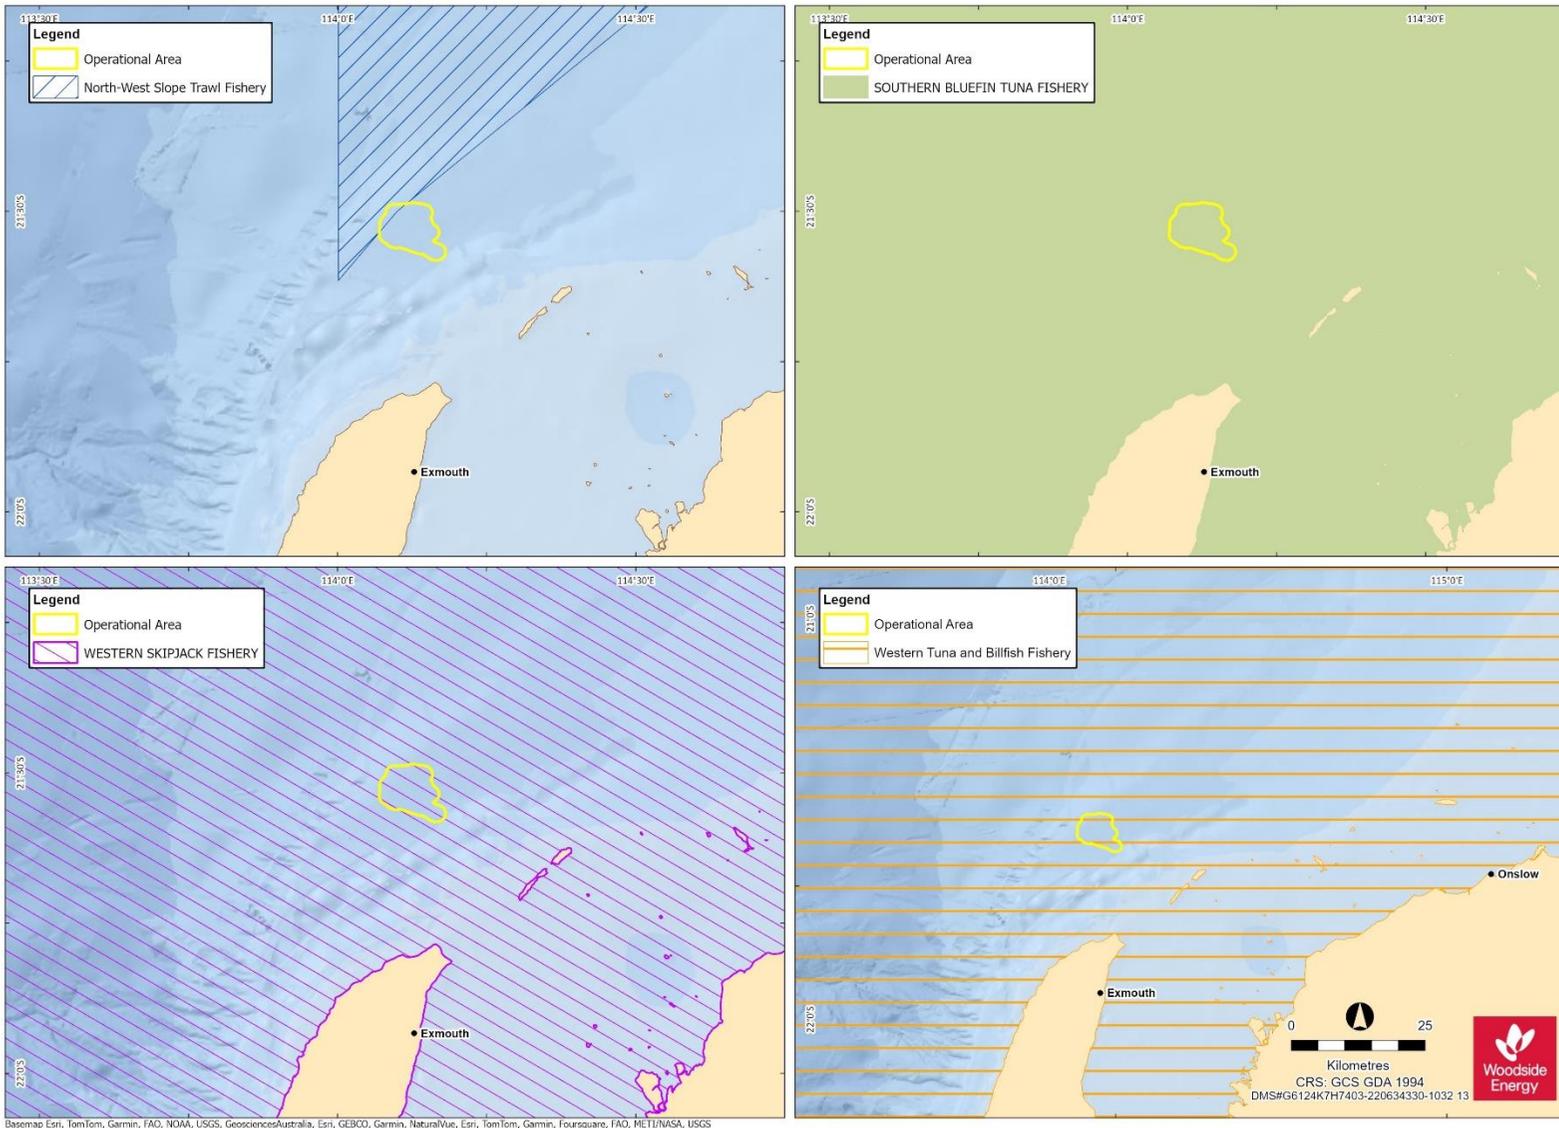

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
South West Trawl Fishery	x	✓	The South West Trawl Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting <3 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Specimen Shell Managed Fishery	✓	✓	The Specimen Shell Managed Fishery management area overlaps the Operational Area and EMBA. The fishery is active within 60NM CAES block overlapping the Operational Area, with <3 licences active during the 2019-2022 season. FishCube data reported <3 licences at the 10NM CAES block overlapping the Operational Area (DPIRD, 2023), with the only activity occurring for a duration of four months in the 2017-2018 season. Although there is overlap with the Operational Area and the CAES reporting block, given the depth and offshore location of the Operational Area and the collection methods of the fishery, it is highly unlikely interactions would occur. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Australian Sea Cucumber Fishery	✓	✓	The West Australian Sea Cucumber Fishery management area overlaps the Operational Area and EMBA. The fishery is active in the EMBA with 60NM CAES block with <3 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. FishCube data reported no fishing effort at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast (Beach Bait Fish Net) Managed Fishery	x	✓	The West Coast (Beach Bait Fish Net) Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60NM CAES block reporting <3 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Blue Swimmer Crab Fishery	x	✓	The West Coast Blue Swimmer Crab Fishery overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017-2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that if any interactions occur with the fishery, they would only occur within the EMBA.
West Coast Deep Sea Crustacean Managed Fishery	✓	✓	The West Coast Deep Sea Crustacean Managed Fishery is permitted to fish in waters deeper than the 150m isobath, overlapping the Operational Area and EMBA. The fishery may be active in the Operational Area with one 60NM CAES block reporting less than 3 vessels in the 2021 – 2022 season (DPIRD, 2023). FishCube data reported no fishing effort at 10 NM CAES blocks in the last five years overlapping the Operational Area (DPIRD, 2023). Woodside considers there to be potential for interaction with the fishery in the Operational Area or EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

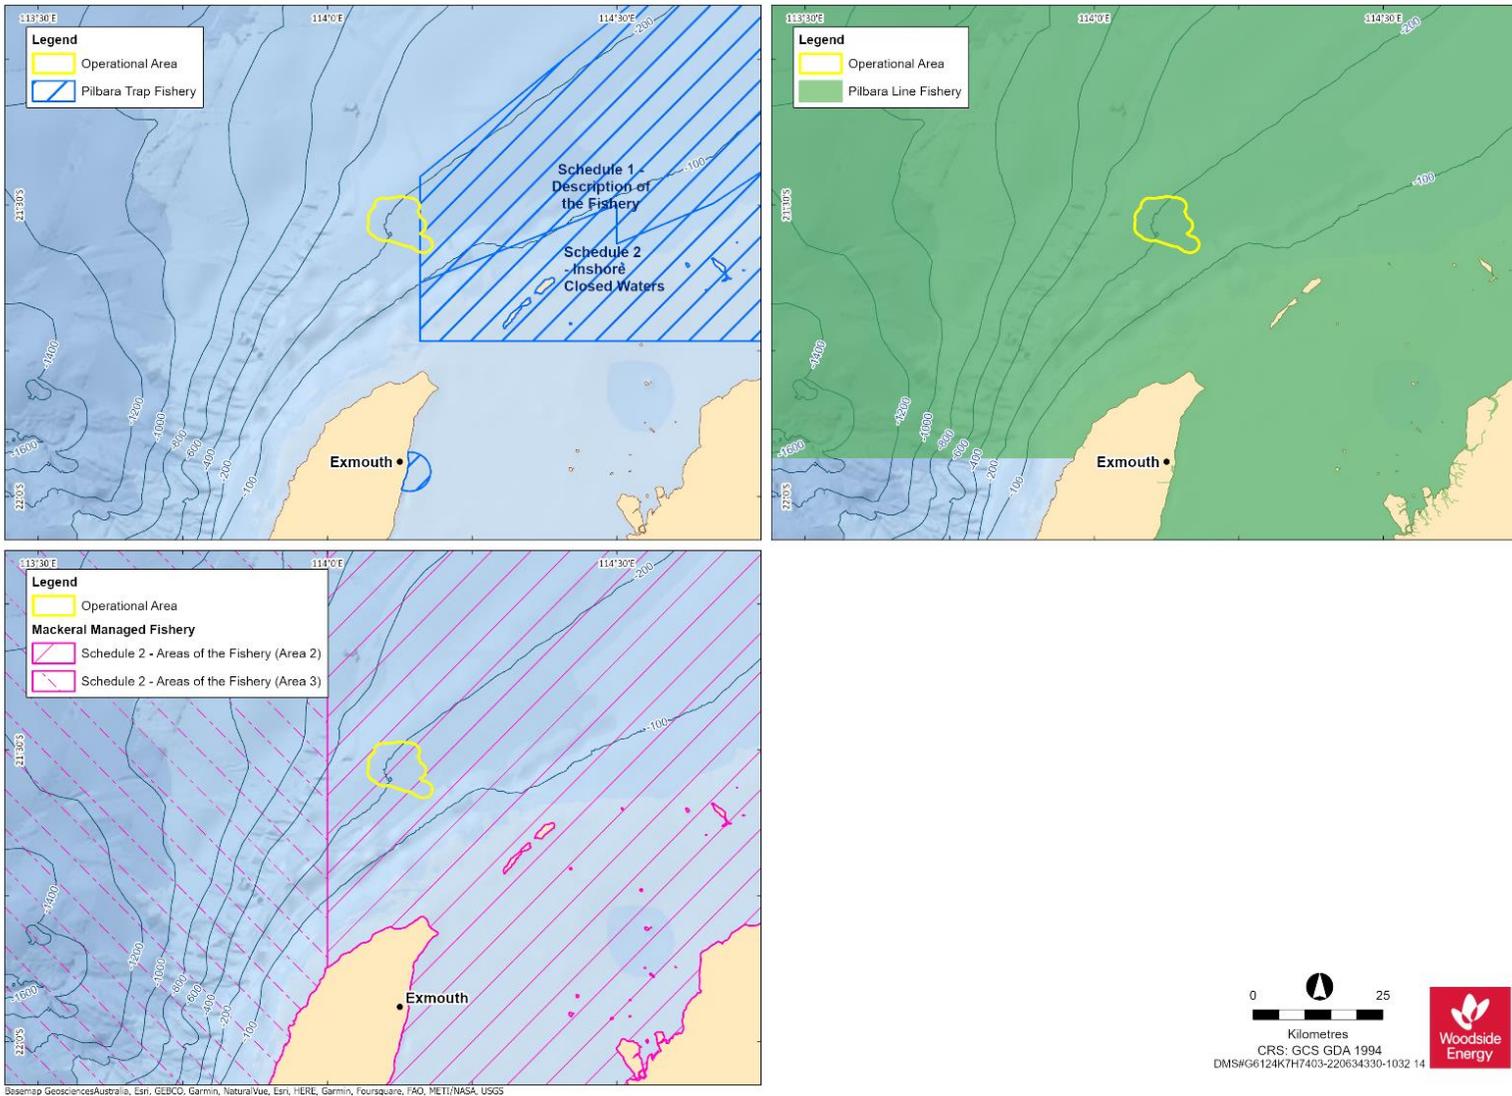

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
West Coast Demersal Gillnet and Demersal Longline	x	✓	The West Coast Demersal Gillnet and Demersal Longline Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60NM CAES block with up to 4 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Demersal Scalefish (Interim) Managed Fishery	x	✓	The West Coast Demersal Scalefish (Interim) Managed Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60NM CAES block with up to 16 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Estuarine Managed Fishery	x	✓	The West Coast Estuarine Managed Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60NM CAES block with up to 11 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort reducing to 7 vessels in the 2020-2022 seasons. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Purse Seine Fishery	x	✓	The West Coast Purse Seine Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60NM CAES block with up to 4 active vessels across the 2017-2022 seasons (DPIRD, 2023), with fishing effort reducing to <3 vessels in the 2018-2022 seasons. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Rock Lobster Fishery	x	✓	The Western Rock Lobster Fishery management area overlaps the EMBA (DPIRD 2023). The fishery is active in the EMBA with 60NM CAES block with up to 94 active vessels across the 2017-2022 seasons (DPIRD, 2023), Vessel numbers in the fishery have steadily declined over the 5-year period with up to 80 and 74 vessels active during the 2020-2022 season respectively. Accordingly, Woodside considers there to be no potential for interaction with this fishery and the PAP.
<b>Other</b>			
Tour Operators	✓	✓	Fishing Tour Operators are permitted to operate across WA state waters and are required to report monthly logbook records of client fish catches. FishCube data reports consistent fishing effort across the 60 NM CAES block that overlaps the EMBA (DPIRD, 2023). Fishing effort was reported by a maximum of 12 licence holder during the 2018-2019 season, with licence numbers varying between <3-12 overall during the 2017-2022 seasons (DPIRD, 2023).  FishCube data reported <3 active tour operators at 10NM CAES blocks overlapping the Operational Area (DPIRD, 2023), which were only active during the 2020-2021 period. FishCube data indicate tour operator fishing effort highest around Ningaloo and Murion Islands and at Barrow Island and the Montebello Islands, east of the EMBA. Woodside considers there to be potential for interaction with the fishery in the Operational Area or EMBA.

### 4.10.2 Traditional Fisheries

A key feature of the north-west marine region is the large tidal range in this part of the Australian coast with daily fluctuations up to 12 meters resulting in vast areas of intertidal land and reef flats available for marine resource harvesting (Smyth, 2007). Further, the tidal range also results in strong tidal currents, especially between islands and at the entrance to embayment's that First Nations people used to travel long distance on rafts and canoes between mainland and the reefs and islands (Smyth, 2007). There are no traditional or customary fisheries within the Operational Area, as these are typically restricted to shallow coastal waters and/or areas with structures such as reefs. However, it is recognised that Barrow Island, Montebello Islands and Ningaloo Reef, all within the wider EMBA, have a known history of fishing when areas were occupied (as from historical records) (CALM 2005).

A Memorandum of Understanding was established with Indonesian fisheries for parts of the Australia Fishing Zone and Continental Shelf (MoU 74). Currently, Scott Reef is the principal reef in the MoU 74 box. This MoU allows Indonesian fishers to participate in traditional fishing activities using traditional methods and is used seasonally. The Operational Area is located outside of the MoU 74 Box however it is overlapped by the EMBA (Appendix J).

### 4.10.3 Tourism and Recreation

Year end March 2023 WA saw 11.7 million overnight (domestic and international) visitors who contributed \$15.9 billion into the economy, \$7.3 billion of which was spent in regional WA (Tourism Research Australia, 2023).

- Australia's South West accounted for approximately \$3.1 billion
- Australia's Coral Coast accounted for approximately \$1.1 billion
- Australia's North West accounted for approximately \$1.9 billion
- Australia's Golden Outback accounted for approximately \$1.1 billion (Tourism WA, 2023).

The Operational Area is located offshore of the North West tourism region which includes parts of the Gascoyne region, the Pilbara region, the Kimberley region. Tourism is concentrated in the vicinity of population centres such as Broome, Dampier, Exmouth, Coral Bay and Shark Bay. Population centres closest to the Operational Area are the towns of Onslow (~97 km east) and Exmouth (~45 km south). Onslow is a coastal town offering easy access to tourists, vacationers and recreational fishers to the Mackerel Islands, a group of ten islands 22 km offshore. Exmouth has become a significant tourist centre with Cape Range National Park, Ningaloo Marine Park and adjacent inshore waters. In 2018-19, the Ningaloo region (Ningaloo Reef and the surrounding coastal region Exmouth Gulf, communities of Exmouth and Coral Bay, and adjacent proposed southern coastal reserves and pastoral leases) contributed an estimated \$110 million in value added to the WA economy (DCBA, 2020).

Peak tourism in the North West occurs from April to October coinciding with winter or the dry season. Marine-based activities are typically concentrated around infrastructure such as boat ramps and camping areas (Smallwood, 2009). Marine facilities, including boat launching ramps, jetties, marinas, etc., near the Operational Area are limited, with most located along the Exmouth Gulf side of the peninsula including:

- Port of Onslow, Beadon Creek
- Point Murat naval supply jetty (restricted access);
- Bundegi - facilities include a concrete launching ramp, car park and public toilets; and
- Exmouth Marina - provides launching, mooring, fuelling and supply facilities for commercial fishing, charter fishing, tourist and commercial/private vessels.
- Boat ramps on the Ningaloo side are located at:

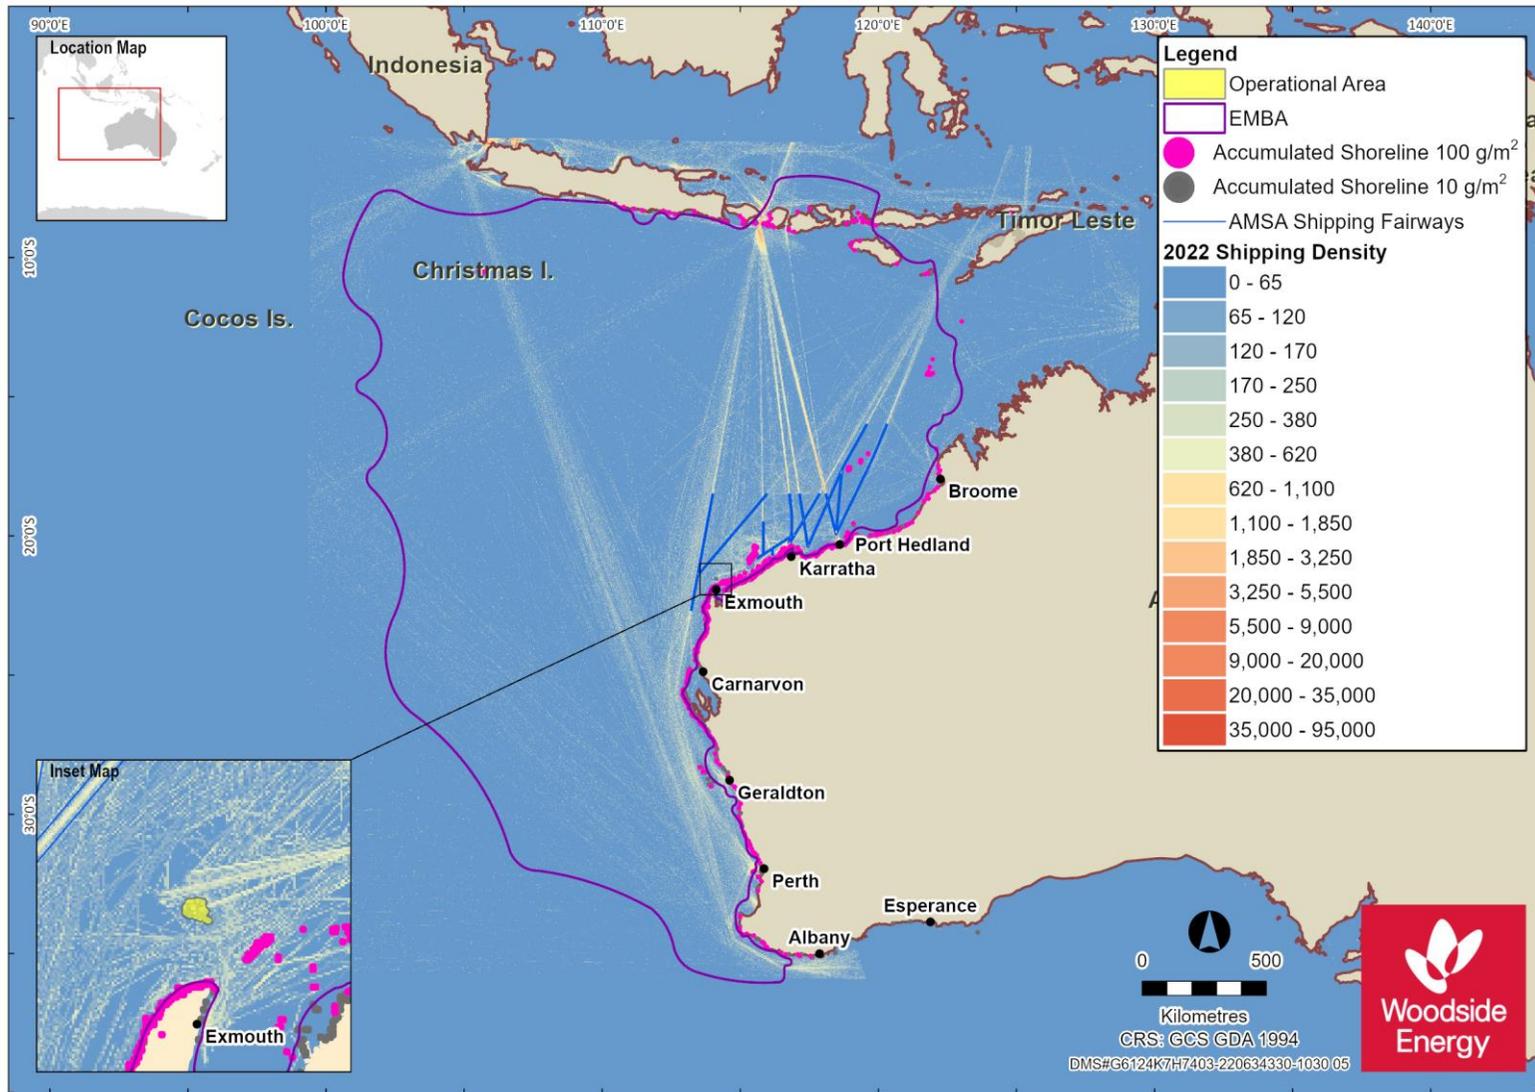

- Tantabiddi Creek - facilities include a concrete launching ramp, car park and public toilets; and
- Coral Bay - concrete launching ramp.

Recreational fisheries and charter boat operators are managed by the Western Australian Department of Primary Industries and Regional Development. With an estimated 740,000 people fishing recreationally in WA, it makes a significant contribution to the economy and attracts vast numbers of visitors to the region each year (Department of Fisheries, 2014). The Ningaloo Marine Park (~9 km from the Operational Area) also provides high-quality fishing for species such as spangled emperor, spanish mackerel and coral trout. The Muiron Islands are ~19 km from the Operational Area and are used recreationally for swimming, snorkelling and scuba diving. Further, the Montebello Islands are ~197 km from the Operational Area and are used for similar recreational activities including camping, fishing, diving and boating.

#### **4.10.4 Commercial Shipping**

The Australian Maritime Safety Authority (AMSA) has introduced a network of marine fairways across the NWMR off WA to reduce the risk of vessel collisions with offshore infrastructure. The Pyrenees FPSO Operational Area within Petroleum Licence WA-42-L and WA-43-L lies outside of these declared and charted shipping fairways.

Refer to Appendix J for shipping information in the EMBA and Figure 4-20 for vessel density within the Operational Area and EMBA.

**Figure 4-20: Vessel density map for the Operational Area and EMBA, derived from AMSA satellite tracking system data (vessels include cargo, LNG tanker, passenger vessels, support vessels, and others/unnamed vessels)**

### 4.10.5 Oil and Gas

The Operational Area is located within an area of established oil and gas operations within the North West Marine Region. Table 4-24 and Figure 4-21 detail other oil and gas facilities located within 50 km of the Operational Area. Appendix J describes current oil and gas development within the EMBA.

**Table 4-24: Other Oil and Gas Facilities located within 50km of the Operational Area**

Facility Name and Operator	Approximate Distance and Direction from Operational Area (km)
Woodside Macedon Subsea Gas Field	Macedon Operational Area overlaps the Pyrenees Operational Area
Woodside Ngujima-Yin FPSO (Vincent Development)	6.6 km south-east
Santos Van Gogh/ Coniston/ Novara Development (Ningaloo Vision FPSO)	9.4 km south

**Figure 4-21: Oil and Gas Infrastructure within and near Operational Area**

Department of Defence (DoD) areas, facilities and UXOs overlapping the Operational Area and EMBA are outlined in Table 4-25 and presented in Figure 4-22. Appendix J describes key DoD areas and facilities.

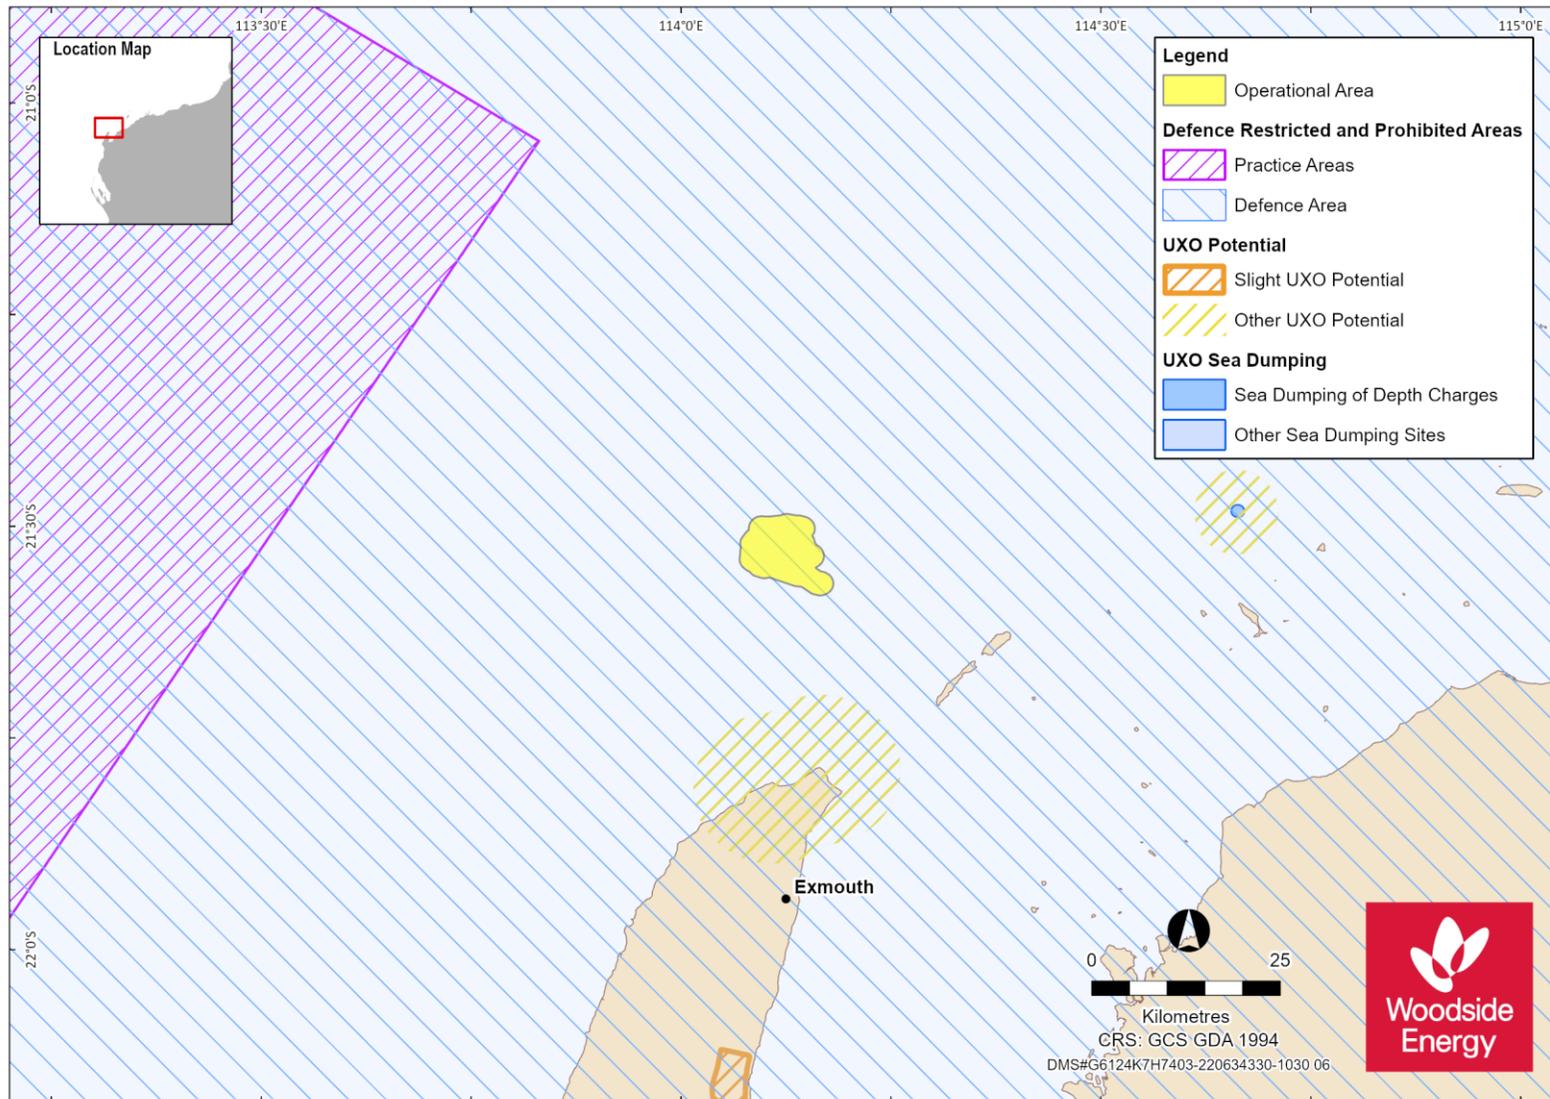

**Table 4-25: Defence areas, facilities and UXOs overlapping the Operational Area (OA) and/or EMBA**

Defence area/ facility	Presence	
	OA	EMBA
Learmonth Air Weapons Range Facility		✓
Learmonth air training area (associated with the Learmonth Air Weapons Range Facility)	✓	✓
Naval Communications Station Harold E. Holt		✓
UXO SDG096 Sea Dumping: Anchor Island. This site is an area used for the dumping at sea of ordnance and other items.		✓
Potential Depth Charge UXO DEP022: Northwest of Bessieres Island. This site was an area where Depth Charges were used in WWII and where some depth charges failed to function.		✓
UXO 793 and 794: Exmouth Gulf: Prior to WWII, RAN bombarded both land and sea targets on and near the peninsula		✓
UXO 1018: Exmouth Gulf: Allied WWII base high explosive ordnance were stored and fired		✓
UXO 1019: Exmouth Gulf: Aerial bombing in the Rough Range area during WWII. Two depth charges were lost overboard in the Bay of Rest area. Artillery fired on land and sea targets		✓
UXO 940: Onslow. Anti-aircraft artillery live firing practices using high explosive ammunition during WWII. Aerial bombing also highly likely.		✓
Potential Depth Charge UXO DEP027: East of Montebello Islands. This site was an area where Depth Charges were used in WW2 and where some depth charges failed to function.		✓
UXO SDG082: Sea Dumping – Ningaloo. This site is an area used for the dumping at sea of ordnance and other items.		✓
UXO SDG129 Sea Dumping - Indian Ocean. This site is an area used for the dumping at sea of ordnance and other items.		✓
Geraldton Seaward - artillery fired seaward during WWII and small quantities of high explosive ammunition were dumped at sea off Geraldton during the 1950s		✓
Oakajee Air Gunnery Range Geraldton - danger area shown seaward of coast. Probable ordnance impacted on land.		✓
Rangeway - live fire anti-armour exercises.		✓
Narngulu - areas most likely to contain UXO are the sand dunes to the west, south west and south of Meru		✓
Separation Point - artillery unit fired from vicinity of Wonthella to beach area of Separation Point in 1942.		✓
Mouth of Greenough River & Southgate Dunes - artillery and anti-armour firings into sand dunes		✓
Jurien Bay Bombing Range - high explosive aerial bombing and strafing		✓
UXO SDG097 Sea Dumping – Coastal WA – Nambug. Area used for the dumping at sea of ordnance and other items.		✓
Flat Rock – area used since 1940 as a high explosive bombing target		✓
Wedge Island - RAAF/Allied Air Forces used Wedge Island as an aerial bombing target during WWII		✓
Ran Gunnery Range Lancelin - area of Ocean west of current Naval Gunnery Range		✓

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Defence area/ facility	Presence	
	OA	EMBA
Lancelin Moore River Artillery Range - used as a high explosive target area by Army from WWII until 1975		✓
Moore River RAAF Armament Range - used as RAAF air to air gunnery training area		✓
Rottnest Seaward Firing - site is one of many that was used for dumping at sea of ammunition and other items after WWII		✓
Cockburn Sound Seawards Firing - WWII live firing of mortars. Post WWII use by army firing 81mm high explosive ammunition, anti-armour rockets and grenades		✓
UXO Sea Dumping sites West of Rottnest Island. Area used for the dumping at sea of ordnance and other items. SDG090, SDG092, SDG117, SDG114, SDG113, SDG118, SDG100, SDG115, SDG098, SDG119, SDG086, SDG124, SDG120, SDG084, SDG094, SDG095, SDG083		✓
Potential Depth Charge UXO North West of Rottnest Island: DEP024, DEP028, DEP029		✓

## 5. CONSULTATION

### 5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 25 of the Environment Regulations.

Consultation is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities. This enables Woodside to consider and assess claims or objections received from relevant persons and for Woodside to adopt appropriate measures in response to those objections or claims so that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP) and will be of an acceptable level.

Consultation is to be informed by both the Environment Regulations and the findings of relevant Courts, including the Full Federal Court in the Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 (Tipakalippa Appeal) (see Section 5.2 and 5.5.5) and Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 (Munkara Case).

For this EP, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from activities in the Operational Area (see Section 4).

Woodside's consultation methodology is divided into two parts:

- The first section (Section 5.2 to 5.5) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 25(1) of the Environment Regulations to identify relevant persons.
- The second section (Section 5.6 to Section 5.7) details Woodside's approach to accepting feedback and assessment of the merit of each objection and claim, and engaging in ongoing consultation for this EP.

Woodside's consultation record is at Appendix F and includes a summary of the following:

- Assessment and identification of relevant persons.
- Consultation information provided to relevant persons, feedback received, Woodside's assessment of the merits of objections or claims and Woodside's response to relevant persons and other stakeholders Woodside chose to consult.
- Engagement with persons or organisations that Woodside chose to contact who are not relevant persons for the purposes of regulation 25(1) of the Environment Regulations (see Section 5.3.7).
- Opportunities provided to persons or organisations to participate in consultation.

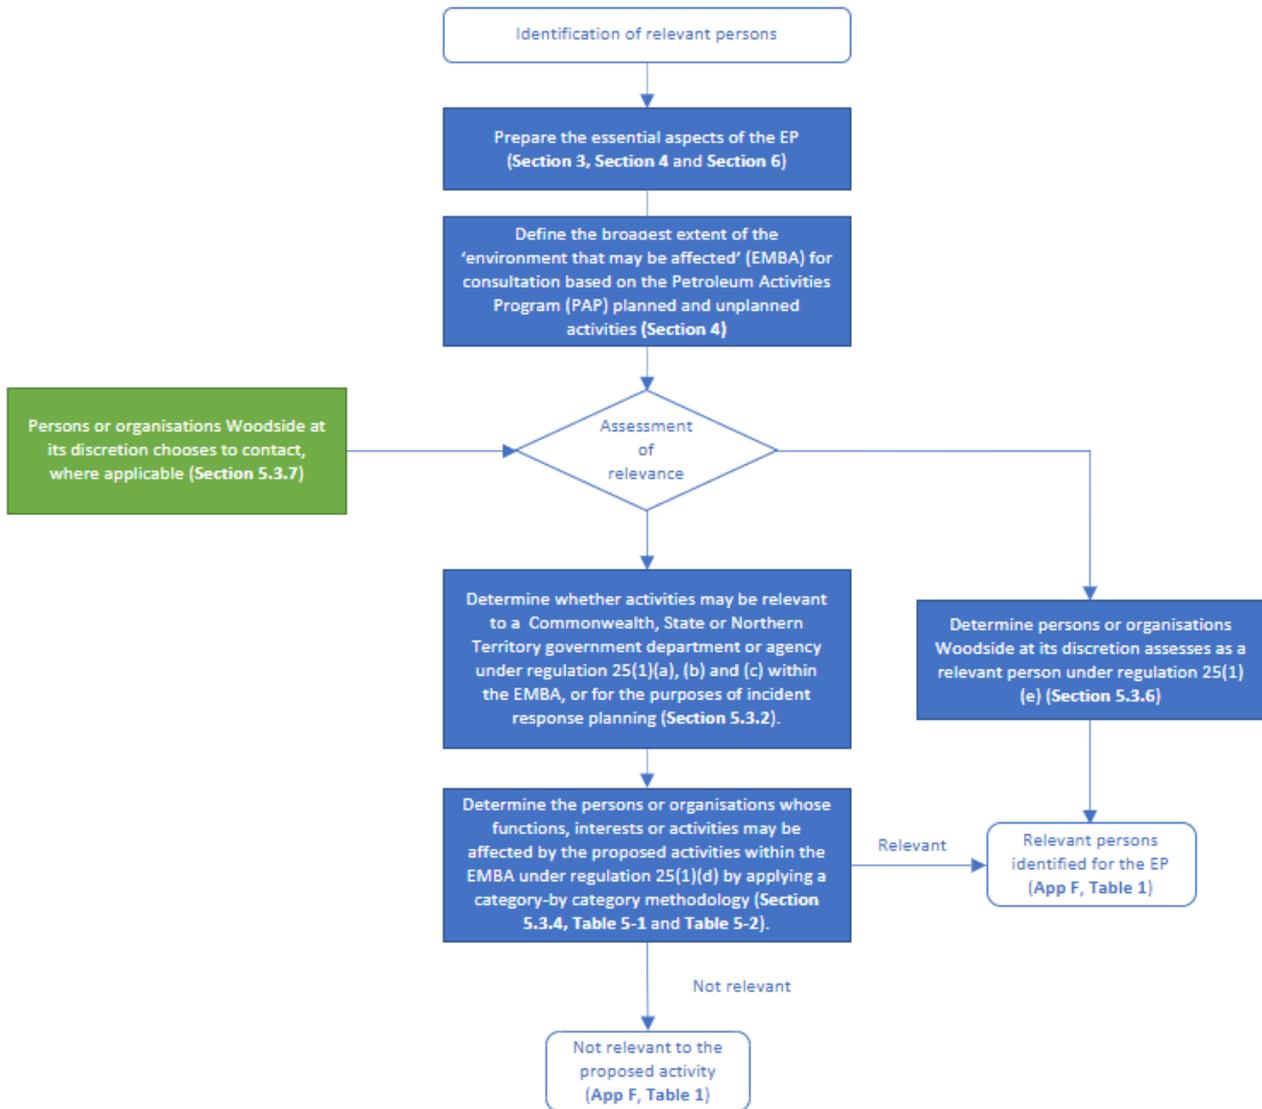

Figure 5-1: Overview of Woodside’s methodology to identify relevant persons

## 5.2 Consultation – General Context

Woodside has a portfolio of quality oil and gas assets and more than 30 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations, to better understand the potential risks and impacts associated with our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult, but rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a PAP. The information in the consultation list has been captured from years of experience - it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's *Guideline on Consultation in the course of preparing an environment plan* (12 May 2023) as well as judicial guidance in the Tipakalippa Appeal on the intent of consultation as follows:

- At paragraph 54 of the appeal decision: ... *provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- At paragraph 89 of the appeal decision: ... *its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The Tipakalippa Appeal and Munkara Case have also been further considered in the context of specific methods for consultation with First Nations relevant persons (Section 5.5.5).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) of the Environment Regulations (Section 5.3). This methodology is consistent with NOPSEMA's guideline and demonstrates that, to meet the requirements of regulation 34 of the Environment Regulations (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.2.1).
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in Section 4.1 and assessed in Section 8).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 25 of the Environment Regulations, which requires a titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an EP:
  - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the EP may be relevant;
  - if the plan relates to activities in the offshore area of a State – the Department of the responsible State Minister.
  - if the plan relates to activities in the Principal Northern Territory offshore area – the Department of the responsible Northern Territory Minister;
  - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP; and
  - any other person or organisation that the titleholder considers relevant (regulation 25(1) of the Environment Regulations).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (regulation 25(2));

- allow a relevant person a reasonable period for the consultation (regulation 25(3)); and
- tell each relevant person that the titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development set out in section 3A of the EPBC Act – see Section 2.
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level (regulation 4 of the Environment Regulations).
- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the petroleum activity.
- is collaborative; Woodside respects that for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside engages with the relevant person with the aim of seeking genuine and meaningful two-way dialogue.
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.13.3.1).

An overview of Woodside's consultation approach is outlined at Figure 5-2.

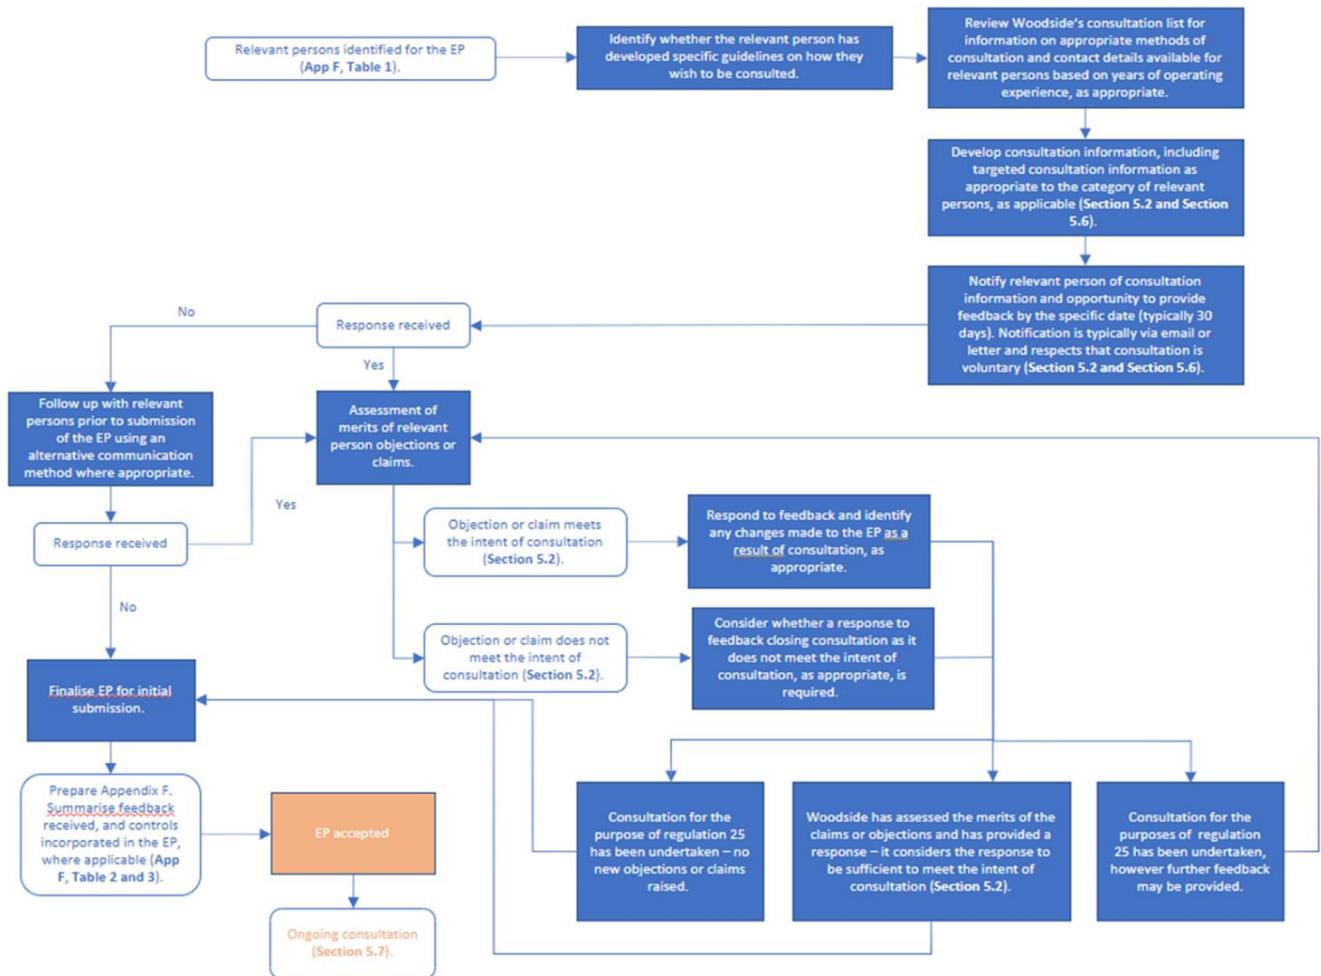

Figure 5-2: Overview of Woodside’s consultation approach.

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

## 5.3 Identification of Relevant Persons for Consultation

### 5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons within the description of regulations 25(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government departments and agencies relevant to the EP are listed in Appendix F, Table 1. In accordance with regulation 25(1)(b) of the Environment Regulations, Woodside consults with the department of the relevant State Minister.

### 5.3.2 Identification of Relevant Persons under regulations 25(1)(a), (b) and (c)

Woodside's methodology for identifying relevant persons under regulations 25(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities to be carried out in the EMBA under the EP may be relevant. This list of relevant departments and agencies is formulated by reference to the responsibilities of the government departments as set out on their websites, in NOPSEMA's GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline (January 2024), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating. This list is revised from time to time, for example, for the purposes of

accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.

- Woodside has categorised government department or agency groups as follows:

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the marine environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies and determines whether those responsibilities overlap with potential risks and impacts specific to the PAP in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry and AHO is responsible for maritime safety and Notices to Mariners. To undertake the PAP in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the PAP. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.
- The list of government departments and agencies assessed as relevant is set out in Appendix F, Table 1.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at Appendix F, Table 2 and Table 3 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the PAP in the EMBA or would not be involved in incident response planning.

### 5.3.3 Regulation 25(1)(d)

To identify a relevant person for the purposes of regulation 25(1)(d), the meaning of “functions, interests or activities” needs to be understood. In regulation 25(1)(d), the phrase “functions, interests or activities” should be construed broadly and consistently with the objects of the Environment Regulations (regulation 4) and the objects of the EPBC Act (section 3A).

In developing its methodology for consultation, Woodside acknowledges the guidance below from NOPSEMA’s GL2086 – Consultation in the course of preparing an environment plan guideline (May 2023):

<b>Functions</b>	Refers to a power or duty to do something.
<b>Interests</b>	Conforms to the accepted concept of 'interest' in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
<b>Activities</b>	Broader than the definition of 'activity' in regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside’s methodology for determining ‘relevant persons’ for the purpose of regulation 25(1)(d) of the Environment Regulations includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA; and
- whether a person or organisation’s functions, interests or activities may be affected by Woodside’s proposed planned or unplanned activities.

On the topic of consulting outside of Australia’s jurisdiction, when assessing potential impacts from planned and unplanned activities for this EP, it was determined there was an extremely low probability of an unplanned hydrocarbon release entering international waters (Section 6.7), specifically Indonesian and Timor Leste waters. Consideration has been given to the functions, interests or activities that may be affected by the activities to be carried out, should a worst-case scenario eventuate, noting that modelling completed to predict the extent of potential impact is based on there being no mitigative controls in place. The more realistic scenario is that appropriate mitigation controls set out in Woodside’s Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans would be in place or will be implemented.

The obligation to consult must be construed in a practical and pragmatic way that makes this process reasonable and workable,<sup>9</sup> and capable of being discharged within a reasonable time.<sup>10</sup> The obligation to identify relevant persons for the purpose of consultation must be capable of practicable and reasonable discharge. The Regulations require relevant persons, and their interests, to be readily ascertainable to the titleholder.<sup>11</sup> In the case of Indonesia, which comprises extensive coastlines and potentially remote communities, Woodside considers potential relevant persons within these communities are not readily ascertainable, for reasons including that there are limited electronic records and public records which allow for the identification of potential functions, interests or activities e.g. fisheries, tourism licences and permits.

For example, there are no known licencing requirements either in Australia or in Indonesia or Timor Leste for traditional fishers, therefore, no publicly available information to identify and make contact with persons for consultation purposes. The logistics of access to these fishers, the nature of their activities and distance and remoteness from the Operational Area of this activity of over 1300 kilometres makes international consultation impractical to discharge from a reasonable time and efforts perspective.

Given the extremely low probability of potential impacts, the difficulty of identifying international individuals, and the impracticality of engaging where feedback on unplanned impacts is highly unlikely to inform proposed activities, consultation with international individuals is not required for the activities described in this EP.

Having regard to nature and scale and given the extremely low probability of potential impacts (which are the highly unlikely occurrence of spill traversing international waters), the current processes in place with Department of Foreign Affairs and Trade (DFAT) and the processes and consultation triggers set out in the Woodside’s Oil Spill Preparedness and Response Mitigation Assessment and

<sup>9</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [89], [109], [136], [138], [141]

<sup>10</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [136].

<sup>11</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [136], [147], [153]

Oil Pollution First Strike Plans provide a mechanism for consultation in international waters that will be complied with at the appropriate time, if an incident occurs. In such circumstances, consultation with the DFAT discharges the requirement for consultation with international persons.

Woodside will continue to consult the DFAT for proposed activities outside of Australia's jurisdiction including in the event of a hydrocarbon spill that is likely to traverse international waters as described in the Oil Pollution Emergency Plan – Appendix H of this EP. The process for working with DFAT to manage activities and consultation in the highly unlikely event of a hydrocarbon spill that may traverse international waters is described in the Oil Pollution Emergency Plan – Appendix H of this EP.

### 5.3.4 Identification of relevant persons under regulation 25(1)(d)

Relevant persons under regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under the EP (described in Section 3).
- the EMBA by unplanned activities (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within regulation 25(1)(d) of the Environment Regulations, Woodside adopts the following methodology, and then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA.
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and considering available, relevant literature.

To assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities proposed to be carried out under the EP. The broad categories are identified in Table 5-1 below and identification methodology applied as set out in Table 5-2.

The list of those persons or organisations assessed as relevant persons or organisations Woodside separately chose to contact is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in Table 5-2 as appropriate.

Feedback from relevant persons is summarised at Appendix F, Table 2. Feedback from persons assessed as not relevant but whom Woodside chose to contact or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 3.

**Table 5-1: Categories of relevant persons**

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the Commonwealth Fisheries Management Act 1991 (Cth) and Western Australian Fish Resources Management Act 1994 (WA), which may be amended from time to time.

	Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.
Titleholders and Operators	Registered holder of an offshore petroleum title or GHG title under the OPGGS Act and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are First Nations Australians with cultural rights and interests, or cultural functions or who perform cultural activities over particular lands and waters. Where a First Nations person, group or entity self-identifies and asserts cultural rights, functions, interests or activities, they will be included in the definition of Traditional Custodian for the purpose of this EP.
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians' nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the Native Title Act 1993 (Cth) by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the Native Title Act 1993 with prescribed functions, set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Historical heritage groups or organisations	Legislated or government enlisted groups or organisations responsible for the management of marine heritage.
Local government and elected Parliamentary representatives and recognised local community reference/liaison groups or organisations	Local government body formed under the Local Government Act 1995 (WA) and elected Parliamentary representatives which are responsible for representing the local community. Recognised local community reference or liaison group or organisation in relation to oil and gas matters.
Other non-government groups, organisations, or individuals	Non-government organisation with public website material targeting the proposed activity. Individual who demonstrates the proposed activity could potentially impact their interests, functions or activities.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

**Table 5-2: Methodology for identifying relevant persons within the EMBA undertaken under regulation 25(1)(d) – by category**

Category	Relevant person identification methodology
<p>Commercial fisheries (Commonwealth and State) and peak representative bodies</p>	<p>Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>• Defining the parameters having regard to timing, location and duration of the proposed petroleum activity.</li> <li>• Confirming whether the EMBA overlaps with the fisheries management area (i.e. the spatial area the fishery is legally permitted to fish in) (see Section 4.10).</li> <li>• Woodside acknowledges WAFIC’s consultation guidance<sup>12</sup>) that Titleholders develop separate consultation strategies for significant unplanned events (for example oil spill) where Titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC’s guidance is that consultation on unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs (see Appendix F).</li> <li>• For Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA ABARES and DPIRD Fishcube data within the Operational Area and EMBA (see Section 4.10).</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10) are assessed as relevant to the proposed activity. However, to avoid over consulting and as requested in WAFIC’s guidance, Woodside only consults individual licence holders based on WAFIC’s advice. Woodside also utilises WAFIC’s consultation service whereby WAFIC: <ul style="list-style-type: none"> <li>– directly consults fishery licence holders that are assessed as having a potential for interaction in the Operational Area.</li> <li>– Consults fisheries that are assessed as having a potential for interaction in the EMBA only in the event of an unplanned emergency scenario..</li> </ul> </li> <li>• Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10) are assessed as relevant to the proposed activity.</li> <li>• If Woodside has identified that a Commonwealth or State fishery is a relevant person, then Woodside also consults the fisheries relevant representative body. For example, WAFIC represents the interests of State fisheries in Western Australia. If a State fishery is identified as relevant, Woodside would also identify WAFIC as relevant. Recognised Commonwealth fishery representative bodies are identified by AFMA via its website. WAFIC is the only recognised State fishery representative body.</li> </ul>
<p>Recreational marine users and peak representative bodies</p>	<p>Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>• Using Woodside knowledge and operating experience, applying knowledge of recreational marine users in the area. This assessment is both activity and location based.</li> <li>• Defining the parameters having regard to timing, location and duration of the proposed petroleum activity.</li> <li>• Assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD Fishcube data to assess whether there has been activity within the EMBA in the past 5 years.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• Recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons.</li> </ul>

<sup>12</sup> [Consultation Approach for Unplanned Events - WAFIC](#)

	<ul style="list-style-type: none"> <li>If Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers. These representative bodies are identified via Woodside’s existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.</li> </ul>
Titleholders and Operators	<p>Woodside assesses relevance for other Titleholders and operators using the following steps in its methodology:</p> <ul style="list-style-type: none"> <li>Using WA Petroleum Titles (DEMIRS-011) to determine overlap with other Titleholders or Operators permit areas within the EMBA.</li> <li>Using Woodside knowledge and operating experience, knowledge of other operators in the area.</li> <li>Woodside produces a map showing the outcome of this assessment.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>Titleholders and Operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.</li> </ul>
Peak industry representative bodies	<p>Woodside assesses relevance for peak industry representative bodies using the following steps in its methodology:</p> <ul style="list-style-type: none"> <li>Review of peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside’s proposed activities within the EMBA.</li> <li>Review of Woodside’s existing consultation list.</li> <li>Website search to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside’s proposed activities within the EMBA.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside’s proposed activities within the EMBA are assessed as relevant.</li> </ul>
Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations	<p>Consistent with its understanding of the matters discussed in Section 5, to identify Traditional Custodian groups or individuals, Woodside:</p> <ul style="list-style-type: none"> <li>Uses existing systems of recognition to identify First Nations groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under native title or cultural heritage legislation, or marine park management plans, or identification by other First Nations groups or entities);</li> <li>Notifies and invites consultation with First Nations people through their nominated representative corporation (for example PBCs); or, in the case of native title, and where appropriate, the Native Title Representative Body</li> <li>Requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders);</li> <li>Requests advice as to other First Nations groups or individuals that should be consulted;</li> <li>Advertises widely so as to invite self-identification and consultation by First Nations groups and individuals.</li> </ul> <p>Further detail to Woodsides methodology is as follows. Woodside uses the databases of the National Native Title Tribunal:</p> <ul style="list-style-type: none"> <li>to understand whether there are any Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA;</li> <li>to understand whether there are any relevant Indigenous Land Use Agreements (ILUA), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values.</li> </ul>

	<p>Where there is a positive determination of native title, contacting the PBC or, where their representative is a Native Title Representative Body contacting the Native Title Representative Body.</p> <p>Where appropriate, contacting the relevant Native Title Representative Body to request a list of any First Nations groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA.</p> <p>Review of Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values.</p> <p>First Nations groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body.</p> <p>Request to the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means.</p> <p>Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self identify.</p> <p>Individuals that consider their functions, interests or activities may be affected by a proposed activity are provided an opportunity to self-identify for each EP. Woodside does not presume that self-identification for an activity, covered by another EP, automatically means that an individual/s functions, interest and activities may be affected by other activities where EMBA's overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess risks and impacts to their values, and enable individuals to self-identify.</p> <p>Assessment of relevance: Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.</p>
<p>Native Title Representative Bodies</p>	<p>Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology:</p> <ul style="list-style-type: none"> <li>• A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the Native Title Act 1993 with prescribed functions set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.</li> <li>• Review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• Where the area for which a Native Title Representative Body is recognised under the Native Title Act 1993, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.</li> </ul>
<p>Historical heritage groups or organisations</p>	<p>Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following steps in its methodology:</p> <ul style="list-style-type: none"> <li>• Using the Australasian Underwater Cultural Heritage Database to assess any known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see Section 4.9).</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.</li> </ul>
<p>Local government and elected Parliamentary representatives and recognised local community</p>	<p>Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following steps in its methodology:</p> <ul style="list-style-type: none"> <li>• Review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries My Council database and WA Local Government Association (WALGA) Local Government Directory maps to assess</li> </ul>

<p>reference/liaison groups or organisations</p>	<p>overlap between the local government’s defined area of responsibility and the EMBA.</p> <ul style="list-style-type: none"> <li>• Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector.</li> <li>• Woodside reviews the community reference/liaison group’s terms of reference to determine its area of responsibility and overlap with the EMBA. For example, the Exmouth Community Liaison Group’s area of responsibility in relation to Woodside’s operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group’s area of responsibility is the Pilbara region (i.e. onshore).</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant.</li> <li>• The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.</li> </ul>
<p>Other non-government groups, organisations or individuals</p>	<p>Woodside assesses relevance for other non-government groups, organisations or individuals using the following steps in its methodology:</p> <ul style="list-style-type: none"> <li>• Review of Woodside’s existing consultation list.</li> <li>• Website search of registered non-government groups or organisations (i.e. registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website material specific to the proposed activity at the time of development of the EP.</li> <li>• Organisation has a publicly available mission statement (or purpose) that clearly describes their collective functions, interests or activities.</li> <li>• Review of current website material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with planned activities.</li> <li>• Review of an individual’s feedback to consider whether their functions, interests or activities could be impacted.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• Registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation will be assessed as relevant.</li> <li>• Individual demonstrates their functions, interests or activities could be impacted will be assessed as relevant.</li> </ul>
<p>Research institutes and local conservation groups or organisations</p>	<p>Woodside assesses relevance for research institutes and local conservation groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>• Review of Woodside’s existing consultation list.</li> <li>• Website search for research institutes that may operate within the EMBA. This assessment is both activity and location based.</li> <li>• Website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>• Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant.</li> </ul>

	<ul style="list-style-type: none"> <li>Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.</li> </ul>
--	---

### 5.3.5 Regulation 25(1)(e)

In addition to assessing relevance under regulation 25(1)(d) of the Environment Regulations, Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 25(1)(e) of the Environment Regulations.

### 5.3.6 Identification of Relevant Persons under regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 25(1)(e) of the Environment Regulations.

### 5.3.7 Persons or Organisations Woodside chooses to contact

In addition to undertaking consultation with relevant persons under regulation 25(1) of the Environment Regulations there are persons or organisations that Woodside chooses to contact, from time to time, in relation to a proposed activity. For example, these are persons or organisations:

- that are ‘not relevant’ pursuant to regulation 25(1) of the Environment Regulations but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with.
- that are ‘not relevant’ pursuant to regulation 25(1) of the Environment Regulations but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator.
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is used to inform relevance under Woodside’s methodology. Woodside follows the same methodology for assessing a person or organisations relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.3). The result of Woodside’s assessment of relevance during the development of the EP is outlined at Appendix F, Table 1.

## 5.4 Assessment of Relevant Persons for the Proposed Activity

The result of Woodside’s assessment of relevant persons in accordance with regulation 25(1) is outlined at Appendix F, Table 1 and Appendix F, Table 2.

Persons or organisations that Woodside assessed as not relevant but chose to contact at its discretion in accordance with Section 5.3.4 or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 1 and Appendix F, Table 3.

## 5.5 Consultation Material and Timing

Regulation 25(2) of the Environment Regulations provides that a titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) of the Environment Regulations provides that the titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons, of the proposed activities, respecting that consultation is voluntary and collaborates on a consultation approach where further engagement is sought by the relevant person. The consultation process aims to be appropriate for the category of relevant persons and not all persons or organisations will require the same level of engagement.

Woodside recognises that the level of engagement is dependent on the nature and scale of the OA. Woodside acknowledges published guidance for good practice consultation relevant to different sectors and disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

### 5.5.1 Sufficient Information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes a description of the proposed petroleum activity, the Operational Area or Operational Area depending on the EP, where the activity will take place, the timing and duration of the activity, a location map of the Operational Area or Operational Area and EMBA, a description of the EMBA, relevant exclusion zones and a summary of relevant risks and mitigation and management control measures relevant to the proposed petroleum activity. It also sets out contact details to provide feedback to Woodside.

The level of information necessary to assist a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the OA, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Sufficient information may have been provided to a relevant person even where all documents requested by a relevant person have not been provided. Woodside acknowledges NOPSEMA's brochure entitled Consultation on offshore petroleum environment plans information for the community, which advises persons being consulted that they may inform titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes:

- the name of the EP Woodside is seeking feedback on
- an overview of the activity
- the consultation feedback date
- the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the Native Title Act 1993 for native title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.3 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website and shared directly with relevant persons.
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters

- phone calls
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate
- Let's Talk newsletter – digital and hard copy
- maps outlining a persons or organisations defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area, and
- community meetings, as appropriate
- attendance at on-the-ground community events or planned regional roadshows
- broader awareness campaigns on how to be involved in the EP consultation process.

Woodside recognises that information may be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that as part of genuine two-way dialogue, these forms of communication may evolve, including, for example ,due to changes to organisation representation, as relationships are further established, or a preference for an alternative form of communication is expressed by a person or organisation. There might be limitations in how Woodside can consult with relevant persons.

Typical forms of communications for categories of relevant persons are set out below.

Category of relevant person	Typically accepted form of communication
<b>Government departments / agencies – marine</b>	Woodside applies NOPSEMA’s guideline for engagement with Commonwealth government departments or agencies <a href="#">GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</a> by using email for its consultation unless another form of communication is requested. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
<b>Government departments / agencies – environment</b>	
<b>Government departments / agencies – industry</b>	
<b>Commercial fisheries and peak representative bodies</b> <b>Recreational marine users and peak representative bodies</b>	Commonwealth commercial fisheries: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. State commercial fisheries and recreational marine users: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the Fish Resources Management Act 1994 and Aquatic Resources Management Act 2016, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder’s discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. Peak representative bodies: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
<b>Titleholders and Operators</b>	Email is used as the primary form of communication between titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Woodside's methodology allows relevant persons a reasonable period for consultation (regulation 25(3)). A reasonable period for all relevant persons, including Traditional Custodians, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Regulation 30 of the Regulations sets out a public consultation period of 30 days
- The Department of Mines and Petroleum "Guidelines for Consultation with Indigenous People by Mineral Explorers" directs a period of 21- 30 days of consultation with traditional owners
- While repealed, guidance taken from the Aboriginal Cultural Heritage Act 2021—Consultation Guidelines (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period to allow identification, contact, and response, from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation).

This period of consultation demonstrates that Woodside has provided a "reasonable period" for relevant persons to consult in accordance with regulation 25(3). Commentary in the Tipakalippa Appeal judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

*"it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time..."<sup>13</sup>*

Woodside seeks feedback in order to support preparation of its EP. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to providing a reasonable period for consultation is as follows:

- advertising in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected;
- providing consultation materials directly to identified relevant persons as well as persons who are not relevant but Woodside chose to contact, and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date;
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements;
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person; and
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 2 and Table 3 sets out a history of ongoing consultation and demonstrates that a reasonable period of consultation has been provided for each relevant person.

Woodside considers that consultation for this EP has closed.

<sup>13</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [136].

As detailed in Section 5.6, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate and at all stages of the life of the EP as per Woodside's ongoing consultation approach as described in Section 5.7.

### 5.5.3 Discharge of Regulation 25

The Full Federal Court made clear in the Tipakalippa Appeal that consultation should be approached in a "reasonable", "pragmatic" and "not so literal" way, so that consultation obligations were capable of being met by titleholders (Section 5.5.5).<sup>14</sup> Consultation is a "real world activity" and must be capable of reasonable discharge.<sup>15</sup> The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.<sup>16</sup>

When the titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, the regulation 25 consultation requirements are met.<sup>17</sup> Meeting these obligations requires evaluative judgment to determine reasonable satisfaction of the consultation obligation, and as such, the regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted, and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.<sup>18</sup>

While a titleholder is required to provide an opportunity to consult, the titleholder is not required to obtain consent to engage in the activity from a person being consulted, or confirmation from a person being consulted, that consultation is complete. The Federal Court has commented that a "reasonable opportunity" for consultation must be afforded to relevant persons.<sup>19</sup> A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities, and sufficient time to provide relevant feedback for Woodside to assess relevant persons' objections or claims. Woodside has also provided a reasonable opportunity for there to be genuine two-way dialogue on a person's claims or objections.

Woodside has discharged its duty under regulation 25 of the Environment Regulations. Woodside considers that consultation under regulation 25 of the Environment Regulations is complete.

Appendix F, Table 2 and Table 3 of this EP sets out the history of consultation under regulation 25. To the extent a relevant person says they have further information to share or claims that consultation under regulation 25 has not been completed, Appendix F, Table 2 and Table 3 provides reasons why Woodside considers consultation under regulation 25 has been met in relation to that relevant person.

## 5.5.4 Context of Consultation Approach with First Nations

To comply with regulation 25 of the Environment Regulations, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

## 5.5.5 Approach to Methodology – Woodside’s Interpretation of Tipakalippa

Woodside has implemented a consultation methodology consistent with regulation 25 and guidance provided in the Tipakalippa Appeal (Section 5.2). Woodside’s consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (Section 5.5.6.1 to 5.5.6.4).

Woodside notes the Full Federal Court discussed several Native Title Act 1993 (Cth) cases in response to a submission made in that case that a requirement under regulation 25 to consult “each and every” relevant person would be “unworkable”. The reference to native title cases dealt with how decision-making processes under the NTA requiring “all” members of a group to be contacted for communal approval are interpreted by courts in a “reasonable”, “pragmatic” and “not so literal” way,<sup>20</sup> and how obligations to consult “each and every” person under regulation 25 should be interpreted in a similarly pragmatic way so that consultation is workable. The reference to NTA authorities was made by analogy:

*“It can be seen that the terms of [the native title legislation] are somewhat absolute – “all”. However, [the native title legislation] has consistently been construed in a way that is not so literal ... The cases concerning [the native title legislation] ... have reiterated ... that [the native title legislation] does not require that “all” of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting.”<sup>21</sup>*

*“We consider the authorities in relation to processes under the NTA to be **illustrative** of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner”<sup>22</sup> (emphasis added).*

*“there is no definition of what constitutes “consultation for the purpose of ref 11A [now regulation 25]... A titleholder will need to “demonstrate” to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons”<sup>23</sup> (emphasis added).*

The Judgement in the Tipakalippa Appeal makes it clear that a Titleholder will have some decisional choice in identifying which natural person(s) are to be approached, how the information will be given to allow the “relevant person” to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken.<sup>24</sup> Consultation is not fixed to a rigid process, and will be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 25 requirements through its consultation methodology (Section 5.2).

Consistent with the Tipakalippa Appeal, Woodside considers NTA-style “full group” meetings are not required for there to be compliance with regulation 25. Nominated representative corporations (such as PBCs established under the NTA) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative

<sup>20</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95], [98], [103]-[104] and [109].

<sup>21</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [98].

<sup>22</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96].

<sup>23</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [104].

<sup>24</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [47] and [48].

corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. It is not appropriate for titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

### 5.5.6 Consultation Method

Woodside's First Nations team has experience in engaging and working with First Nations organisations and individuals, including within the Commonwealth native title and cultural heritage systems and state and territory cultural heritage and land rights systems, for several decades. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with First Nations groups' established channels of communication and methods of consultation. The First Nations team exercises its professional judgement and is respectful of long-standing relationships (where in place) when considering consultation with First Nations groups. The First Nations team's approach is also informed by the established systems of recognition for First Nations groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with First Nations groups in the Northern Territory (not relevant for this EP) tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976* (Cth)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them. By contrast, recognition for First Nations groups and their nominated representative corporations in Western Australia falls under the *Native Title Act 1993* (Cth) because the vast majority of the Western Australian coastline is settled under the native title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to Native Title Representative Bodies and PBCs. Native title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA, and also help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgement in the Tipakalippa Appeal endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.<sup>25</sup> Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective First Nations communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our activities, to self-identify (Section 5.5.6.2), and to provide feedback to inform the management of environmental impacts and risks.

Using these processes, Woodside communicates information about EPs by:

- advertising in relevant newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian;
- creating carefully considered Consultation Summary Sheets with information developed by an Indigenous member of the First Nations Team to remove jargon and provide relevant information for people to have informed understandings about the activities;

<sup>25</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95].[104].[153].

- direct contact through nominated representative corporations;
- utilising social media (i.e. Facebook/Instagram), texts and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and on that basis used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. First Nations woman, Professor Bronwyn Castle through 10 years of research found “Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations” (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018));
- For ongoing consultation post regulation 25 of the Environment Regulations consultation, Woodside has a Program of Ongoing Engagement with Traditional Custodians which sets out Woodside's commitment to ongoing engagement and support to care for and manage country, including Sea Country. The program was developed in response to Traditional Custodian feedback;
- Woodside has members of its First Nations team who are based in Karratha and Roebourne and who serve as on-Country points of contact for First Nations organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including encouraging First Nations attendance and involvement at Woodside's information sessions and Community roadshows. Team members on the ground engage in a great deal of preparatory work including by distributing information and providing notice to the community to support First Nations attendance at information sessions and Community roadshows.
- From the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and who to appropriately consult with (such as elders).
- Holding meetings on country at a place and time agreed with Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate); and
- Providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

The First Nations team approach to consultation is also consistent with the Federal Court's decision in the Munkara Case. The Munkara Case notes that the word “culture” (and hence the word “cultural”) has a communal aspect to it. To establish cultural features, it is necessary that the beliefs and values are held by the relevant people as a people. For values, features or beliefs that are expressed by an individual to be “cultural” they cannot simply be an individual's belief - the belief must have a communal aspect too, and demonstrate that the “individual beliefs are broadly representative of the beliefs of other members of the group”<sup>26</sup>. The phrase “cultural features”, when applied to “people” as constituent parts of an ecosystem, is not directed to idiosyncratic views or beliefs of an individual<sup>27</sup>. When the First Nations team is told that a particular value is cultural by an individual Traditional Owner, that information is taken back to the relevant cultural authority to test its broad acceptance. In the case of gender sensitive information, that information would be restricted to the specific gender within the community.

26 Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]

27 Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]

### 5.5.6.1 Identification of Relevant Persons

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) of the Environment Regulations (Section 5.2 and Section 5.3).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.6). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporations. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in Section 5.5.6.4 below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act 1993* (Cth), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which seeks, from members, authorisation of agreements and native title/compensation claims under the Native Title Act 1993 (Cth)<sup>28</sup>.

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation. Woodside requests nominated representative corporations to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

### 5.5.6.2 Opportunity to Self-identify and Identifying Other Individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the

<sup>28</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193, at [104]

role of the nominated representative corporations (Section 5.5.6.1). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Owners' authorised representative entities.
- Recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so nor seek to audit the representative entities for compliance with any request.
- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. To date, most nominated representative corporations have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and Elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

#### **5.5.6.2.1 Sufficient Information**

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is potentially affected.

Woodside produces Consultation Information Sheets for each EP which are provided to relevant persons and organisations for the purpose of seeking feedback on the activity (Section 5.5). In response to feedback from Traditional Custodians on information provisions, Woodside has tailored effective consultation methods for its activities, specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Summary Information Sheet developed and reviewed by Woodside's First Nations Engagement Team and First Nations staff to ensure that content is appropriate to the intended recipients, is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face to face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians' location of choice (where practicable) and with their nominated attendees.

Key project personnel, environmental and First Nations relations experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

### **5.5.6.3 Reasonable Period for Consultation**

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.5)

### **5.5.6.4 Discharge of Regulation 25**

Woodside's consideration and approach to discharging regulation 25 for relevant persons is discussed in Section 5.5.3. In addition to this, Woodside has considered the application of regulation 25 specifically to First Nations based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 25. Woodside considers that consultation under regulation 25 is complete (Section 5.5.3).

## **5.6 Providing Feedback and Assessment of Merit of Objections or Claims**

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled Consultation on offshore petroleum environment plans information for the community, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the EP and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under 34(g) of

the Environment Regulations, there is no requirement for a relevant person to agree or confirm that they have been adequately consulted.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Section 5.3.4). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with regulation 26(8) of the Environment Regulations, sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 25, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

## 5.7 Ongoing Consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to Section 7), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the intended outcome of consultation, Woodside will apply its Management of Change and Review process as appropriate (see Section 7).

## 6. ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA

### 6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MC for the PAP, using the methodology described in Section 2.

### 6.2 Analysis and Evaluation

As required by Regulation 21(5) and 21(6) of the Environment Regulations, the following analysis and evaluation demonstrates that the identified risks and impacts associated with the PAP are reduced to ALARP, are of an acceptable level and considers all operations of the PAP, including potential emergency conditions.

Impacts and risks identified during the ENVID (including decision type, current risk level, acceptability of risk and tools used to demonstrate acceptability and ALARP) have been divided into two broad categories:

- planned (routine and non-routine) activities
- unplanned events (accidents, incidents or emergency situations).

Within these categories, impact and risk assessment groupings are based on environmental aspect<sup>29</sup> (e.g. emissions, physical presence, etc.). For all hazardous events considered, the worst credible consequence was assumed.

The ENVID identified 7 impacts and 10 risks associated with the PAP. Planned activities and unplanned events are summarised in Table 6-1 and Table 6-2. The assigned risk ratings were determined with controls in place as described in Section 2.5.

The analysis and evaluation for the PAP indicate that current environmental risks and impacts associated with the PAP are reduced to ALARP and are of an acceptable level, as discussed further in Section 6.7 to Section 6.8.

---

<sup>29</sup> An environmental aspect is an element of the activity that can interact with the environment.

**Table 6-1: Environmental impact and risk analysis summary table – planned activities**

Aspect	EP Section	Source of Impact	Key Potential Environmental Impacts (Refer to relevant EP section for details)	Severity Level	Acceptability of Impact
Physical presence: disturbance to marine users	Section 6.7.1	Pyrenees Facility, turret mooring system, subsea infrastructure, offtake tanker, OSV and IMMR operations.	Potential isolated social impact potentially resulting from interference with other sea users (e.g. commercial and recreational fishing, and shipping).	1 – Minor	Tolerable
		Presence of subsea infrastructure including mid-depth buoy while Pyrenees FPSO dry-docking (~2-3 months, contingency).	Interference with commercial shipping, fishing and/ or other third party vessels.	1 – Minor	Tolerable
Physical presence: disturbance to the seabed	Section 6.7.2	Presence of Pyrenees Facility, wells and subsea infrastructure modifying marine habitats.	Localised modification of seabed habitat (formation of artificial reef) within Operational Area.	1 – Minor	Tolerable
		Subsea operations, inspection, maintenance, and repair activities resulting in disturbance to seabed.	Potential minor, localised modification and/or small area of damage to seabed habitat within Operational Area and smothering of benthic habitats.	1 - Minor	Tolerable
Routine light emissions: light emissions from FPSO lighting, vessel operations and operational flaring	Section 6.7.3	Light emissions from Pyrenees Facility, vessels (including IMMR) and ROVs.	Potential for short-term, localised behavioural disturbance of phototactic species in close proximity to Pyrenees FPSO and vessels.	1 – Minor	Tolerable
		Light emissions from Pyrenees Facility during flaring.	Minor alterations to marine fauna behaviour in close proximity to the Pyrenees FPSO.	1 – Minor	Tolerable
Routine acoustic emissions: generation of noise during routine operations	Section 6.7.4	Noise generated within the Operational Area from: <ul style="list-style-type: none"> <li>Pyrenees FPSO and associated infrastructure</li> <li>Vessels including IMMR activities (e.g. ROVs, AUVs, side scan sonar, multibeam echo sounder, vessels on DP) and</li> <li>helicopters</li> </ul>	Potential localised physical or behavioural impacts to marine fauna.	1 – Minor	Tolerable
Routine and non-routine atmospheric and greenhouse gas emissions	Section 6.7.5	Routine emissions from diesel driven machinery, gas-powered turbines and heaters, venting, and operational flaring onboard the Pyrenees FPSO	Impacts to regional air-shed.	1 – Minor	Tolerable
		Consideration of indirect emissions associated with third party transportation, oil refining and combustion by end users	GHG emissions and climate change.	No consequence assigned	Tolerable
Routine and non-routine discharges: marine discharges – produced water	Section 6.7.6	Discharge of PW and slops from Pyrenees FPSO.	Overboard discharges causing changes in water quality (hydrocarbon/ chemical/ temperature) leading to environmental impacts to biota within the Operations Area.	1 – Minor	Tolerable
Routine and non-routine discharges: liquid waste and subsea fluids	Section 6.7.7	Release of subsea chemicals or hydrocarbons by actuation of valves or during subsea operations and activities.	Potential for toxic effect to fauna in close association with release point causing changes in water quality (hydrocarbon/ chemical/ temperature) leading to environmental impacts to biota within the Operations Area.	1 – Minor	Tolerable
		Marine discharges of liquid wastes from Pyrenees FPSO and vessel utility systems and drains (sewage, greywater, RO brine reject, cooling water, food waste, rainfall / deck washdown water, firewater deluge testing).	Changes in water quality and biota due to: <ul style="list-style-type: none"> <li>- minor localised nutrient increase from surfactants (soaps and detergents) and chemicals to water column.</li> <li>- minor increase in salinity.</li> <li>- localised nutrient increase from food waste discharge.</li> <li>- detergent, oil, and grease discharge to marine environment during rainfall or washdown activities.</li> </ul>	1 – Minor	Tolerable

**Table 6-2: Environmental impact and risk analysis summary table – unplanned events**

Aspect	EP Section	Source of Risk	Key Potential Environmental Impacts (Refer to relevant EP section for details)	Severity Level	Likelihood	Risk Level	Acceptability
Unplanned Hydrocarbon Release: Loss of Well Containment	Section 6.8.2	Release of hydrocarbons resulting from loss of well containment.	Contamination / pollution of water column.	5 – Severe	Highly Unlikely	30	Tolerable
		Pyrenees FPSO off station (up to 3 months), leaks or weeps from wells will be left undetected until return.	Contamination / pollution of water column.	1 – Minor	Unlikely	1	Tolerable
Unplanned Hydrocarbon Release: Loss of Containment of Bulk Storage (Crude)	Section 6.8.3	Large release of Pyrenees crude oil from bulk storage on Pyrenees FPSO.	Acute/ chronic toxic effect on marine organisms from hydrocarbons.	4 – Serious	Highly Unlikely	9	Tolerable
Unplanned Hydrocarbon Release: Subsea Infrastructure	Section 6.8.4	Accidental releases/ leaks of crude oil from subsea infrastructure	Contamination / pollution of water column.	2 – Measurable	Unlikely	3	Tolerable
Unplanned Hydrocarbon Release: Offtake Operations	Section 6.8.5	Release of crude from equipment failure or processes (offloading, transferring).	Acute/ chronic toxic effect on marine organisms from hydrocarbons.	3 – Substantial	Highly Unlikely	3	Tolerable
Unplanned Hydrocarbon Release: Turret Operations	Section 6.8.6	Hydrocarbon spill from failure during turret operations	Contamination / pollution of water column.	1 – Minor	Unlikely	1	Tolerable
Unplanned Hydrocarbon Release: Diesel spill from Bulk Storage	Section 6.8.7	Diesel spill from ruptured fuel tank due to vessel collision	Contamination / pollution of water column.	2 – Measurable	Highly Unlikely	0.9	Tolerable
Unplanned hydrocarbon or chemical release	Section 6.8.8	Hydrocarbon spills / hazardous chemicals or liquid waste, accidental leaks from storage or equipment, including ROVs.	Contamination / pollution of water column.	1 - Minor	Possible	3	Tolerable
		Spills from bulk transfer of chemical from support vessels to Pyrenees FPSO (bulk contents up to 2,000L).	Contamination / pollution of water column.	2 – Measurable	Unlikely	3	Tolerable
		Diesel spill due to human error / equipment failure during bunkering	Contamination / pollution of water column.	1 – Minor	Unlikely	1	Tolerable
Unplanned Discharges: Hazardous and Non-hazardous Waste Management	Section 6.8.9	Incorrect disposal or accidental discharge of non-hazardous and hazardous waste to the marine environment.	Impacts to marine fauna and/ or water quality.	1 – Minor	Highly unlikely	0.3	Tolerable
		Dropped objects from support/logistical operations – vessel to vessel lifting (e.g. containers and materials).	Impacts to marine fauna and/ or water quality.	1 – Minor	Unlikely	1	Tolerable
Physical Presence (Unplanned): Interaction with Live Infrastructure	Section 6.8.10	Dropped objects from support/logistical operations – interaction with live infrastructure causing loss of containment	Contamination / pollution of water column.	2 - Measurable	Unlikely	3	Tolerable
Physical presence: Vessel Collision with Marine Fauna	Section 6.8.11	Physical presence of vessels resulting in collision with marine fauna.	Potential injury or death of marine fauna (single animal), including protected species.	1 – Minor	Unlikely	1	Tolerable
Physical Presence: Introduction of Invasive Marine Species	Section 6.8.12	Movement of vessels from known high introduced marine species (IMS) risk areas	Potential introduction of IMS possibly resulting in an alteration of the localised environment and major impact to native species.	3 – Substantial	Unlikely	10	Tolerable

### 6.3 Cumulative Impacts

In this EP Woodside has assessed the potential cumulative impacts of the PAP in relation to other relevant activities which could realistically result in overlapping temporal and spatial extents. Other facilities located in close proximity to the Pyrenees Facility consist of the Woodside Ngujima-Yin FPSO, Woodside Macedon Field, and the Santos Ningaloo Vision FPSO (Table 4-24 and Figure 4-21). The Macedon Field Operational Area overlaps the Pyrenees Operational Area in proximity to one well (Macedon-6) (Figure 3-1 and Figure 4-21) Where relevant this EP considers cumulative impacts from the PAP alongside potential impacts from other nearby oil and gas activities.

Given the sources of environmental risks and impacts from the PAP are concentrated around the Pyrenees FPSO, the potential for cumulative impacts is considered to be low. Cumulative impacts are discussed for sources of risk and impacts where such impacts were deemed to be credible.

### 6.4 Environmental Performance Outcomes, Standards and Measurement Criteria

Regulation 21(7) of the Environment Regulations requires that an EP includes EPOs, EPSs and MC that address legislative and other controls to manage the environmental risks and impacts of the activity to ALARP and Acceptable levels.

The EPOs, EPSs and MC specified are consistent with legislative requirements and Woodside's standards and procedures. They have been developed based on the Codes and Standards, Good Industry Practices and Professional Judgement, as part of the acceptability and ALARP justification process.

As defined in regulation 5 of the Environment Regulations, an EPO "for an activity, means a measurable level of performance required for the management of environmental aspects of the activity to ensure that environmental impacts and risks of the activity will be of an acceptable level".

EPOs are set to ensure they are consistent with the principles of ESD as defined in the section 3A of the EPBC Act and demonstrated through the acceptability process, which is applied to each aspect in Section 6, taking into consideration the principles of ESD. The EPOs have been set at a level of environmental performance that is equal to the identified environmental impact or risk.

Impact based EPOs, where qualitative terms (e.g. prevent, limit) are used in EPOs, they are supported by detailed impact assessment in Section 6 such that they can be interpreted as meaning "impact and risk greater than that predicted in this EP".

A risk-based EPO ties in with Woodside's risk management processes so that risk is maintained within a level that has been evaluated as being appropriate to the nature and scale of the risk. Relevant controls are used to identify and treat potential step-outs (resulting in an increased likelihood) from expected controls performance or integrity envelopes.

EPSs and MC are defined to measure environment performance against the EPOs:

EPS are statements of performance required of a control measure in order to manage risk and/or impacts to ALARP and acceptable level. EPS are used as a basis for environmental performance reporting and demonstrates compliance against the EPO.

MCs are outlined defining how environmental performance is measured and sets the criteria to determine whether the EPO and EPS have been met during the activity.

For planned activities, where the activity is undertaken as described and the relevant EPS are implemented it confirms that the EPOs are being met.

The EPOs, EPSs and MC are presented throughout Sections 6.7 and 6.8 and Appendix H (Oil Spill Preparedness and Response Mitigation Assessment). A breach of these EPOs or standards constitutes a 'Recordable Incident' under the Environment Regulations (refer to 7.14.3).

## 6.5 Presentation

The analysis and evaluation (ALARP and acceptability), EPOs, EPSs and MC are presented in tabular form throughout this section, as shown in the sample below. Italicised text in this example table denotes the purpose of each part of the table, with reference to the relevant sections of the Regulations and/or this EP.

<b>Context</b>

## 6.6 Environment Risk/Impacts not Deemed Credible

The ENVID identified one source of environmental risk / impact that was assessed as not being applicable (not credible) within or outside the Operational Area as a result of the PAP, and therefore is described here for information only:

- **Shallow/Near-shore Activities:** The PAP is located in water depths of between 180 and 200 m and at a distance approximately 16 km from nearest landfall (Muiron Islands). Consequently, risks and impacts associated with shallow-water or near-shore activities such as anchoring and vessel grounding were assessed as not credible.

<sup>31</sup> Where impact/consequence descriptors are capitalised and presented within EPOs in Section 6; performance level corresponds with those aligned with the Woodside PetDW Risk Matrix (refer Section 2.6).

## 6.7 Planned Activities (Routine and Non-Routine)

### 6.7.1 Physical Presence: Disturbance to Marine Users

Context														
Facility layout and description – Section 3.4 Support services – Section Subsea Inspection, Monitoring, Maintenance and Repair Activities – Section 3.18				Socio-cultural Environment – Section 4.10				Consultation – Section 5						
Impacts Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Pyrenees FPSO, turret mooring system, subsea infrastructure, offtake tanker, OSV and IMMR operations.							x	A	1 - Minor	-	-	LCS GP PJ	Tolerable	EPO 1
Presence of subsea infrastructure including mid-depth buoy while Pyrenees FPSO dry-docking (~2-3 months, contingency)							x	A	1 - Minor	-	-			
Description of Source of Impact														
<p>The Pyrenees facility commenced operation in 2010 and has been marked on nautical charts since that time. The Pyrenees FPSO and subsea equipment are surrounded by a 500 m radius PSZ, which non project vessels are prohibited from entering, unless authorised by Woodside. The PSZ is a critical safety control intended to reduce the likelihood of interactions between vessels and the Pyrenees FPSO, subsequently increasing safety for both vessels and the Pyrenees facility. Implementation of the PSZ excludes other users from a small area of the sea (approximately 0.79 km<sup>2</sup>).</p> <p>The presence of the Pyrenees Facility (FPSO, subsea infrastructure) and supporting vessels, may be a potential obstacle (exclusion from area) or collision risk/navigational hazard to other marine users (fisheries and/or shipping vessels) in the area.</p> <p>The Pyrenees FPSO and supporting vessels are clearly visible under most conditions and are well lit according to navigational and safety requirements. The nature of the Pyrenees FPSO (e.g. a large steel structure) also ensures a clear radar return to alert ships fitted with anti-collision radars. There are approximately 8 offtakes from the FPSO annually and offtake vessels will enter the Operational Area accordingly.</p>

Routine and non-routine vessel activities associated with the PAP are generally concentrated within the PSZ (e.g. activities performed by support vessels at the Pyrenees FPSO) but can occur anywhere within the Operational Area. Subsea support vessels will undertake activities, such as IMMR activities within the Operational Area at any time. The duration and location of these activities varies depending on the PAP being undertaken. Routine IMMR activities typically require one vessel with 24hr operations, for no more than 1 or 2 weeks per year. Non-routine IMMR activities typically require one IMMR vessel, but may require up to two, with 24hr operations for approximately 2 weeks per activity.

All infrastructure within the scope of this EP is marked on navigation charts.

### Impact Assessment

The PAP has the potential to exclude or displace other marine users. In some instances exclusion or displacement may be temporary, i.e.. from vessel presence during IMMR activities, or permanent, ie. from the ongoing presence of subsea infrastructure. The following paragraphs describe how specific other marine users may be impacted during the PAP.

#### **Commercial Fishing**

A number of commercial fisheries overlap the Operational Area with only four having potential for interactions with the PAP (Section 4.10). The State-managed Pilbara Line Fishery, Pilbara Trap Fishery, Mackerel Managed Fishery and West Coast Deep Sea Crustacean Managed Fishery are considered to have some limited potential for interaction with project activities in the Operational Area (Section 4.10).

Commercial fishing vessels in the vicinity of the Operational Area are most likely to be licenced under the Pilbara Line Fishery and may employ several gear types (including trap and line) (Table 4-23). The Pilbara Line Fishery (condition) is active in the EMBA, with the 60 NM CAES block reporting up to 5 licences across the 2017-2022 seasons. The Pilbara Line Fishery licensees target 45-50 catch species and are permitted to operate anywhere in Pilbara waters, overlapping the operational area and EMBA. A small area of the Operational Area lies within Zone 2 of the fishery which allows Pilbara Trap Fishing only. The 'Zone 2' fishery has a total area of approximately 24,580 km<sup>2</sup>, the portion of this zone that overlaps the Operational Area is approximately 90 km<sup>2</sup>, which is less than 0.4% of the total 'Zone 2' fishery area. As such, impacts from the physical presence of the Pyrenees Facility and subsea infrastructure to this fishery are expected to be confined to localised displacement of fishing effort from the Operational Area.

The Mackerel Managed Fishery reported 3-7 active fishers between the 2017-2022 seasons, with consistent fishing effort since 2012. Previous fishing effort indicates fishing concentrated in coastal Pilbara reefs north-east of the operational area. The managed fishery boundary entirely overlaps the operational area.

The West Coast Deep Sea Crustacean Managed Fishery reported <3 active vessels, in the 60 NM CAES block overlapping the Operational Area.

Based on historic catch data, there are no other commercial fisheries known to use the Operational Area.

#### **Tourism and Recreation:**

Tourism and recreation activity in the Operational Area is expected to be infrequent, with recreational and charter fishing from vessels the only tourism and recreation activities identified as potentially occurring in the Operational Area. Any recreational and charter fishing from vessels is largely undertaken using lines.

Fishing effort for Tourism Charter Operators were reported at the 10NM reporting blocks overlapping the Operational Area, with up to 3 vessels active during the 2020-2021 season.

The annual GAMEX fishing tournament (usually run in March by the Exmouth Game Fishing Club) may result in increased offshore recreational fishing. Operational experience to date has not indicated adverse interactions with recreational fishers occurs during GAMEX. Woodside's experience gained from operating the Nganhurra and Pyrenees FPSOs has shown that very little recreational (including charter) fishing takes place in the vicinity of the Operational Area. Consultation outcomes did not indicate any recreational fishing occurs within the Operational Area (Section 5).

Given the distance from boating facilities (nearest established boat ramps and marina are at Tantabiddi, approximately 42 km from the Operational Area), lack of natural attractions and water depth of the Operational Area, very little interaction with tourism and recreational activities is expected to occur during the PAP. As such, impacts to recreational and charter fishing are expected to be localised and of no lasting effect.

#### **Shipping**

Significant commercial shipping occurs in the broader region where the Operational Area is located, with commercial shipping traffic comprising vessels such as:

- bulk carriers (e.g. mineral ore, salt etc.) from Port Hedland and Dampier;
- offtake tankers;
- support vessels for offshore oil and gas activities; and
- LNG carriers from Dampier, Barrow Island and Ashburton North.

To reduce the likelihood of interactions between commercial vessels and offshore facilities, AMSA have introduced a series of shipping fairways within which commercial vessels are advised to navigate. The fairways are not mandatory; however, AMSA strongly recommends commercial vessels remain within the fairway when transiting the region. The use of shipping fairways is considered to be good seafaring practice, with AUSREP data from AMSA indicating cargo ships and tankers routinely navigate within the established fairways.

The fairway intended to direct north- / south-bound vessel traffic from Barrow Island and the southern Montebello Islands does not overlap the Operational Area.

The presence of the Pyrenees Facility, vessels and subsea infrastructure will not result in impacts to commercial shipping beyond a localised exclusion of shipping traffic from the PSZ and the temporary displacement of commercial shipping due to the presence of subsea support vessels undertaking activities in the Operational Area.

**Oil and Gas**

The Macedon Subsea Gas Field is 5 km east and Ngujima-Yin FPSO is 6.6 km south-east. The nearest facility not operated by Woodside is the Ningaloo Vision FPSO, which lies approximately 9.4 km south of the Operational Area (Section 4.10.5). Given the distance between the Operational Area and petroleum activities undertaken by other operators, no impacts to other operators will occur as a result of the presence of the Pyrenees FPSO, subsea infrastructure or project vessels.

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
<b>Legislation, Codes and Standards</b>				
Contract vessels compliant with Marine Orders for safe vessel operations: <ul style="list-style-type: none"> <li>Marine Order 21 (Safety and emergency procedures) 2016</li> <li>Marine Order 27 (Safety of navigation and radio equipment) 2016</li> <li>Marine Orders 30 (Prevention of Collisions) 2016.</li> </ul>	F: Yes CS: Minimal cost. Standard practice.	Marine Orders 21, 27 and 30 are required under Australian regulations; implementation is standard practice for commercial vessels as applicable to vessel size, type and class. Compliance with Marine Order 21, 27 and 30 reduces the likelihood of adverse interaction of vessels with other marine users.	Control based on legislative requirement – must be adopted.	Yes C 1.1
Implementation of a 500 m PSZ around the Pyrenees FPSO to reduce the likelihood of interaction of vessels with the Pyrenees FPSO.	F: Yes CS: Minimal cost. Standard practice	The PSZ is a requirement under Australian regulations and reduces the likelihood of interaction of vessels with the Pyrenees FPSO.	Control based on legislative requirement – must be adopted.	Yes C 1.2
<b>Good Practice</b>				
Permanent infrastructure is shown on AHO marine charts.	F: Yes CS: Minimal cost. Standard practice.	Notification of AHO will enable them to update maritime charts, thereby reducing the likelihood of interactions with Pyrenees infrastructure.	Benefits outweigh cost sacrifice.	Yes C 1.3

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
Install over-trawl protection on subsea infrastructure.	F: Yes. Over-trawl protection on subsea infrastructure could be fitted to Pyrenees subsea infrastructure. CS: Significant additional cost associated with the design and installation of trawl protection on subsea infrastructure.	Over-trawl protection on subsea infrastructure could mitigate against the potential for commercial fishing trawl gear to damage infrastructure or result in gear loss. However, trawl fishing is unlikely to happen within the Operational Area.	Given the limited portion of the Operational Area that lies within the area open to trawl fishing, the cost of installing over-trawl protection is grossly disproportionate to the environmental benefit.	No

**ALARP Statement:**

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the potential impacts of the physical presence of the Pyrenees Facility, subsea infrastructure and vessels on other users. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

**Demonstration of Acceptability**

**Acceptability Statement:**

The impact assessment has determined that, given the adopted controls, the physical presence of the Pyrenees FPSO, subsea infrastructure and vessels represents a minor impact that is unlikely to result in a potential impact greater than an isolated social impact to commercial fishing, recreational fishing and/or shipping. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders, and expectations of AMSA and AHO provided in consultation with relevant persons. Further opportunities to reduce the impacts and risks have been investigated above.

The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of physical presence of the Pyrenees Facility and support vessels to a level that is tolerable and demonstrate that the EPOs are met.

- inspections – minor, localised sediment resuspension by ROV
- scale and marine growth removal – minor, localised resuspension of sediment; removal of marine biota from subsea infrastructure
- sediment relocation – minor, localised modification of benthic habitat and sediment resuspension
- span rectification
- jumper and umbilical replacement – minor, localised modification of benthic habitat in the vicinity of the jumper / umbilical
- temporary laying of tools on seabed (e.g. seabed baskets) – minor, localised modification of benthic habitat in the vicinity of the basket
- laying of infrastructure during non-routine repair and/or replacement activities.

The area of benthic habitat predicted to be impacted varies depending on the nature and scale of the IMMR activity. Span rectification activities are IMMR activities with the greatest potential to modify benthic habitats, due to the alteration of the existing soft sediment habitat to hard substrate. Woodside’s operational experience on the NWS indicates these activities are typically restricted to relatively short (tens of meters) linear sections of flowlines, with areas of up to approximately 100 m<sup>2</sup> impacted.

Under routine operations, anchoring of vessels undertaking IMMR is avoided in the Operational Area but there may be non-routine activities that require anchoring for safety reasons.

### Impact Assessment

#### **Water and Sediment Quality**

Seabed disturbance may include localised and temporary decline in water quality due to an increase in suspended sediment concentrations and sediment deposition caused by IMMR activities. However, sediment loads are not expected to be significant due to the relatively small footprint for each PAP (IMMR activities described above, and in Section 3.18).

Each discrete IMMR activity near the seabed is likely to cause a single brief disturbance resulting in a transient plume of suspended sediment. This plume will subsequently be deposited down current as particles resettle. Such localised and short-term events may affect small areas of the seabed and consequently, impact the associated biota (typically sparsely distributed infauna and sessile epifauna). Such impacts are expected to be minor (e.g., ingestion of suspended sediment); impacts such as smothering of sessile biota are not expected to occur.

#### **Benthic Habitats**

The benthic habitat within the Operational Area is predominately soft sediment with sparsely associated epifauna which is broadly represented throughout the NWS Province and wider NWS (Section 4.5). Benthic communities of the soft sediment seabed are characterised by burrowing infauna such as polychaetes, with biota such as sessile filter feeders occurring on areas of hard substrate (such as subsea infrastructure).

The infauna communities are also representative of the NWS province; being of low abundance and dominated by polychaetes and crustaceans (RPS Environment and Planning 2012).

IMMR activities may result in potential impacts that may be categorised as:

- direct physical disturbance of benthic habitat; and
- indirect disturbance to benthic habitats from activities such as sediment relocation.

As mentioned, flowline movement is limited to within design and integrity envelopes and may result in slight, localised impact to soft sediment benthic habitats, typically on the scales varying between meters to tens of meters laterally along the flowline corridors.

Direct seabed disturbance, including permanent modification of benthic communities, may result as a consequence of IMMR activities such as span rectification, flowline protection and stabilisation. These activities will typically disturb a small area (typically <100 m<sup>2</sup>) of soft sediment habitat, which is broadly represented in the Operational Area and wider NWS region. This habitat will be replaced by hard substrate (e.g. concrete mattresses, rocks etc.) which is generally uncommon in the middle and outer NWS region.

Over time, this hard substrate is expected to be colonised by sessile benthic biota (e.g. sponges, gorgonians etc.), which may support higher biodiversity benthic fauna (such as fish assemblages), than soft sediment habitats. The estimated overall extent of such direct seabed disturbance is extremely small in relation to the extent of the soft sediment habitats which are broadly represented within the Operational Area and the wider NWS province.

#### **Artificial Habitat:**

Subsea infrastructure provides hard substrate for the settlement of marine organisms; the availability of hard substrate is often a limiting factor in benthic communities. As such, the presence of infrastructure has led to the development of ecological communities which would not have existed otherwise. For example, pipeline infrastructure has been shown

to support more diverse fish assemblages and benthic biota (McLean et al. 2017; Bond, 2018). These communities are relatively diverse compared to the open water and soft sediment habitats in the broader Operational Area.

**Key Ecological Features**

Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula

The KEF is recognised for the unique physical structure of the seafloor and the biodiversity it supports. Studies published by Post et al, (2021) indicate the range of characteristics of the region to include near vertical cliffs, and sediment covered slopes on the upper continental slopes. The canyons are associated with upwelling as they channel deep nutrient-rich waters onto the continental shelf (Brewer, et al. 2007), interacting with the Leeuwin Current at the canyon heads (Sleeman, et al. 2007). Hard substrates dominate the canyons and provide repositories for particulate matter deposited from the shelf and sides of the canyons and provide habitats for deepwater snappers and other species (Brewer, et al. 2007).

The few sediment samples that have been collected from the region indicate sandy to gravelly sediments on the upper shelf and typically muddy sediments on the Exmouth Plateau (Geoscience Australia, 2017). These studies are supported by Thomson & Heimann (2014), concluding the diverse presence of sediment types, including fine-grained silts, sands, and occasional gravels are the key contributing factor to the overall biodiversity and ecological functioning of the seabed.

Given the relatively small overlap of the Operational Area with the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula, the distance from the key Canyon features of the KEF, and nature of the IMMR activities, impacts to the KEF are likely to be slight.

Continental Slope Demersal Fish Communities

The Continental Slope Demersal Fish Communities KEF, supports a high diversity of demersal fish assemblages, including 76 species across the KEF that are considered endemic (Last, et al. 2005). Like the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula the substrate comprising the Continental Slope Demersal Fish Communities KEF, is characterised by a diverse range of sediment types, such as fine, muddy and gravelly sands (Thomson & Heimann, 2014). These diverse sediment compositions and associated seabed habitats contribute to the high biodiversity and productivity of the region. Any direct seabed disturbance from the PAP will be localised and of a short duration, without compromise of the values and key features of the KEF due to the small portion of the KEF that could be impacted and the nature of the activities that are likely to occur associated with the PAP.

\* Defined as "Minor, temporary impact", as in Section 2.6.3

is considered a suitable and conservative surrogate for the light emissions of the Pyrenees FPSO for the following reasons:

- the deck height for operational lighting is similar
- the flaring tower height of the Dorado FPSO (110m) is approximately 20m higher than Pyrenees and so has slightly more visibility than the Pyrenees flare tower
- the receiving environment for the Pyrenees FPSO has a minor elevation equivalent to that of the Dorado FPSO receiving environment.

The Dorado light assessment used satellite data of known maintenance (ie worst case) flaring events at existing LNG facilities to obtain a base radiance value for a flare before applying it to the model, which is considered a more reliable and conservative approach than flare gas rate.

Two scenarios were modelled for the Dorado FPSO:

- operational lighting with no flaring
- operational lighting including flaring.

The Dorado FPSO lighting design and luminaire specifications were applied to the ILLUMINA artificial light at night model (Aubé et al. 2005). The ILLUMINA model is a 3D model that predicts both the extent of visible light and radiance (light received in a specific area). In this assessment light was described in terms of radiance which describes the light received in a specific area and is provided in the units W/m<sup>2</sup>/sr, where W = watts, m<sup>2</sup> = meters squared and sr = steradian (unit of solid angle, equal to the angle at the centre of a sphere subtended by a part of the surface equal in area to the square of the radius).

In the absence of any published or generally accepted units or scale for measuring the impact of artificial light on wildlife, moonlight was selected as a proxy (considered representative of ambient light levels marine fauna are adapted to). The light model output was converted to units of full moon equivalents in an attempt to give the radiance output some biological relevance and to aid interpretation in an environmental impact assessment context. The light emissions are considered to have reduced to ambient when radiance is less than the equivalent of 0.01 (1/100th) of one full moon.

In the non-flaring scenario for the Dorado FPSO, the model results show that radiance reduced to ambient (less than 0.01 full moon equivalent) at 17.7 km from the source. In the flaring scenario, the flare is no longer directly visible at 42.4 km, when the flare drops below the horizon. At this distance, the radiance is equivalent to 0.25 full moons. As the flare drops below the horizon, radiance declines rapidly and is no longer visible.

Given the height of the Pyrenees flare and the nature of flaring that will take place during the PAP is similar to what was modelled for the Dorado FPSO, it is also expected that lighting from the Pyrenees FPSO (flare and navigational lighting) will be visible for up to 42.4 km from the Pyrenees FPSO.

#### **Vessel Lighting**

Support and IMMR vessels will routinely use external lighting to navigate and conduct safe operations at night for the duration of the PAP. Vessel lighting will also be used to communicate the vessels' presence to other marine users (i.e. navigation/warning lights). This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities, including fishing and shipping. Lighting is required for safely operating the vessels and cannot reasonably be eliminated.

Spot lighting may also be used on an as needed basis such as during ROV deployment and retrieval. During IMMR activities, lighting is generated over short periods of time while ROVs are in use, as well as from deck lighting. Given the typical intensity of ROV lights and the attenuation of light in seawater, light from ROVs will be localised to the vicinity of the ROV and vessels.

The distance to the horizon at which vessel lighting is directly visible can be estimated using this formula:

$$\text{horizon distance} = 3.57 \times \sqrt{\text{height}}$$

For lighting on a project vessel ~20 m above sea level, the distance to the visible horizon is approximately 16 km. Any lighting beyond this distance is below the horizon and direct light will not be visible. To also consider radiance, the Dorado FPSO modelling of the non-flaring (operational lighting) scenario can be used as a suitable surrogate given the increased lighting associated with an FPSO and greater deck height compared to standard support and IMMR vessels. The model results show that radiance reduced to ambient (less than 0.01 full moon equivalent) at 17.7 km from the source.

### **Impact Assessment**

Light emissions have the potential to disrupt ecological processes that rely on natural light for visual cues. Light emissions can affect fauna in two main ways:

- Behaviour - many organisms are adapted to natural levels of lighting and the natural changes associated with the day and night cycle as well as the phase of the moon. Artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.

- Orientation - species such as marine turtles and birds may use lighting from natural sources to orient themselves in a certain direction at night. In instances where an artificial light source is brighter than a natural source, the artificial light may override natural cues, leading to disorientation.

Turtle and seabird receptors that have important habitat within a 20 km buffer extent around the Operational Area were considered for the impact assessment for FPSO and vessel operational lighting, based on the light emissions being visible up to 17.7 km away for the FPSO and vessels.

This aligns with recommendations of the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (Commonwealth of Australia, 2023). The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings demonstrated to occur at 15–18 km and fledgling seabirds grounded in response to artificial light 15 km away.

Receptors that have important habitat within a 43 km buffer extent around the Operational Area were considered for the impact assessment for FPSO flare lighting, based on the light emissions being visible up to 42.4 km away from the flare.

The Operational Area overlaps the following seabird and turtle BIAs:

- Hawksbill turtle interesting
- Flatback turtle interesting
- Green turtle interesting
- Loggerhead turtle interesting
- Wedge tailed shearwater breeding

And the following habitat critical to the survival of the species:

- Flatback turtle interesting buffer

Within 43 km of the Operational Area are the following additional areas:

- Hawksbill turtle nesting BIA (19 km from the Operational Area)
- Green turtle nesting BIA (18 km from the Operational Area)
- Green turtle nesting habitat critical (2.6 km and 14 km from the Operational Area)
- Loggerhead turtle nesting habitat critical (2.6 km from the Operational Area)
- Hawksbill turtle nesting habitat critical (14 km from the Operational Area)
- Fairy tern breeding (27 km from the Operational Area)

The majority of fauna expected within the Operational Area is predominantly pelagic fish and zoo plankton, with a low abundance of transient species primarily associated with the BIAs listed above.

### **Seabirds**

All seabird species active at night are vulnerable to artificial light as it can disrupt their ability to orient towards the sea (Commonwealth of Australia, 2020). The potential for bird interactions is dependent upon their ability to perceive the dominant wavelengths in the spectral composition of a light source (Pendoley Environmental, 2023). Species with a nocturnal component to their behaviour and life history, such as procellariiforms (including wedge-tailed shearwaters), are at greater risk of negative impacts from artificial light sources at night. The bulk of the literature concerning impacts of lighting upon procellariiforms relates to the synchronised mass exodus of fledgling seabirds from their nesting sites (Deppe et al., 2017; Raine et al., 2007; Rodriguez et al., 2017a; Rodriguez et al., 2017b), with fewer investigating the impacts of light at sea. Diurnal seabird species, such as terns, noddies and boobies, in contrast to procellariiforms, are less vulnerable to impacts resulting from nocturnal behaviours. However, the presence of lit facilities can result in localised alteration of foraging behaviours such as extended foraging durations. When Seabirds and shorebirds interact with bright light sources which could alter migratory pathways and/or nocturnal roosting behaviours when artificial light spill occurs over the habitat (Pendoley Environmental, 2023).

Artificial lighting can attract and disorient seabird species resulting in species behavioural changes (e.g. circling light sources or disrupted foraging), injury or mortality near the light source as a result of collision (Longcore and Rich, 2004; Gaston et al. 2014). The Operational Area may be occasionally visited by seabirds and migratory shorebirds; however, there is no emergent land that could be used for roosting or nesting habitat within the Operational Area.

In a study of offshore oil platforms in the North Sea, Poot et al. (2008) observed that migrating seabirds can be attracted to the lights and flares of offshore oil platforms, particularly on cloudy nights and in between the hours of midnight and dawn. Migratory shorebirds travelling the East Asian-Australasian Flyway may transit through the Operational Area in the vicinity of the Pyrenees FPSO and vessels enroute to staging areas, before moving onto the mainland south in the spring or Indonesia in the north in the autumn. It is possible that many of the birds on migration may also take advantage of ships and offshore facilities in the area to rest. Migrating birds in the region are at, or near, the end of their migration (or staging area), and if attracted will not be facing long-distance journeys directly upon leaving the facility. Although the migratory diversion is not expected to impact negatively on the birds, if there are identified maintenance, safety and health risks associated with guano from the birds it may be necessary to deter

them from resting on the FPSO. No lasting effect is anticipated from seabirds attracted to the light and diverted from their migratory pathway.

The life stages the most vulnerable for seabirds and migratory shorebirds are nesting adults or fledgling periods (Marangoni et al., 2022). The potential extent of lighting emissions overlaps a foraging and breeding BIA for the wedge-tailed shearwater and the Operational Area is located approximately 19 km from the Muiron Islands, which is a significant breeding site for this species (Cannel et al., 2019). For shearwater species, fledglings are predominantly impacted by onshore lighting sources, which can override sea finding cues and attract fledglings further inland, preventing them from reaching the sea (Mitkus et al., 2018; Telfer et al., 1987). Artificial light can impact important behaviour of nesting adults (e.g., adult nest attendance, maintaining nest sites) or confuse shearwater species, resulting in injury or mortality as a result of birds colliding with structures (Cianchetti-Benedetti et al., 2018; Rodriguez et al., 2017).

The breeding period for the wedge-tailed shearwater is from August to March, with peak incubation and chick rearing during November (Cannel et al., 2019). During this period, adults were observed taking a combination of short (1–4 days) or long (6–30 days) foraging trips from the Muiron Islands towards the north-west (Cannel et al., 2019). During the breeding period, foraging adult wedge-tailed shearwaters were observed travelling up to around 1,000 km from the breeding colony (Cannell et al., 2019). While the PAP will occur during the breeding period, the potential extent of lighting emissions does not represent a significant portion of the known wider breeding and foraging area for wedge-tailed shearwaters. Impacts to wedge-tailed shearwaters from a change in ambient light are therefore considered to be limited to negligible behavioural disturbance to isolated transient individuals, not significant to the population's presence in important breeding and foraging habitat.

The potential extent of lighting emissions overlaps a foraging and breeding BIA for the Fairy Tern located on the northern end of the North West Cape, with the Operational Area approximately 27 km from nesting beaches. The WA breeding population (approximately 5000-6000 mature individuals) is dispersed over approximately 2500 km of coastline (Greenwell, 2021). Within Western Australia, the subspecies comprises a sedentary Pilbara population and a partially migratory population extending from Exmouth to Point Malcolm. The partially migratory population is widely distributed and winters primarily around the northern Houtman Abrolhos Islands (Greenwell, 2021). These birds migrate to breeding areas as far south as Point Malcolm on the eastern south coast and as far north as the Ningaloo coast, while others remain within the Houtman Abrolhos Archipelago (Greenwell, 2021). Within the North west region, breeding occurs in small colonies between June-September on offshore islands, including Simpson Island, Barrow Island, the Montebello Islands, the Lowendal Islands, Thevenard Island, Serrurier Island, the islands in the Dampier Archipelago, Maryanne Shoals and Egret Island (Dunlop 2018; Johnstone et al 2013; Surman pers. Obs.). Colonies tend to occupy areas rather than fixed sites, and nest sites can be abandoned after one or more years, even if they have been successful (Saunders and de Rebeira, 1985). While information regarding foraging ecology of this species within the North west region is lacking, the Australian fairy tern has been studied in South Australia. Here, species typically forages in inshore waters and has been reported to rarely travel beyond 2 km during the breeding season in South Australia (Paton and Rogers 2009). The potential extent of lighting emissions does not represent a significant portion of the known wider breeding and foraging area for Fairy Terns. Terns are a diurnal seabird species, which in contrast to procellariiforms, are less vulnerable to impacts resulting from nocturnal behaviours (Pendoley Environmental, 2023)

Impacts to Fairy terns from a change in ambient light are therefore considered to be limited to negligible behavioural disturbance to isolated transient individuals, not significant to the population's presence in important breeding and foraging habitat. The National Recovery Plan for the Australian Fairy Tern (*Sternula nereis nereis*) (Commonwealth of Australia, 2020a) does not list artificial light as a threat. The nearest Fairy Tern BIA on the North West cape is 27 km away from the Operational Area, outside the 20 km threshold for impact assessment recommended by National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds based on observed effects on fledgling seabirds grounded in response to artificial light 15 km away (Commonwealth of Australia, 2023).

The Wildlife Conservation Plan for Seabirds (CoA 2020b) lists light pollution as a threat with minor consequence (individuals affected but no population level impacts expected).

On this basis the potential impact from light emissions from the PAP on seabirds, including for constant routine low level flaring and intermittent short term more intense flaring is expected to be minor and temporary.

### **Marine Turtles**

The Recovery Plan for Marine Turtles in Australia 2017-2027 (Commonwealth of Australia, 2017) outlines the threats to the survival of marine turtles and considers light pollution a threat to hatchling orientation, survivability / predation, and sea finding behaviours and can inhibit nesting from mature females.

The Operational Area is within the internesting BIA for the green, hawksbill and loggerhead turtle and also within the deemed habitat critical for the flatback turtle. The potential extent of lighting emissions (43 km) overlaps nesting BIAs for loggerhead, hawksbill, green turtles and habitat critical for the hawksbill turtle, loggerhead turtle and green turtle, signifying the presence of turtles within the region and its biological significance.

The nearest potential nesting beaches in relation to the Pyrenees FPSO are the Muiron Islands (27 km south east), and the North West Cape (29 km southwest). Operational lighting and flaring onboard the FPSO may be visible from

these areas. Hatchlings generally show a preference of moving towards horizons which are low and bright, and moving away from horizons that are dark and elevated, using these cues to navigate towards the shoreline (Limpus and Kamrowski, 2013). Once hatchlings are in the water, navigation and direction is expected to be influenced by wave motion, currents and earth magnetic field, rather than artificial light.

Although individuals undertaking behaviours such as interesting, migration, mating (adults) or foraging (adults and pelagic juveniles) may occur within Operational Area and overlap the potential extent of lighting emissions, marine turtles do not use light cues to guide these behaviours. Furthermore, there is no evidence, published or anecdotal, to suggest that interesting, mating, foraging or migrating turtles are impacted by light from offshore vessels (Pendoley Environmental, 2020b).

For nesting females, the presence of lighting amongst other factors is a key factor in site selection when laying clutches (Windle et. al, 2018). The potential impact from lighting on the Pyrenees FPSO is reduced by the distance of the FPSO to marine turtle nesting beaches (Muiron Islands / Ningaloo), which means that the FPSO would be barely visible from ground level from any nesting sites (approximately 27 km away).

A detailed light assessment was undertaken to support the Pyrenees Draft Environmental Impact Statement in 2005 (BHP Petroleum, 2005), the findings from that assessment that are relevant to the activities covered by this EP are as follows:

- Only hatchlings respond positively to light, as a means of guiding them to sea, any offshore light is thought to aid positively to this light cue;
- Light from the Pyrenees FPSO deck is barely visible at water level on North West Cape Beach or Muiron Islands. This means that nesting turtles or turtle hatchlings on the beaches of the mainland or islands would be unable to directly see lighting of the Pyrenees FPSO;
- Light intensity decreases exponentially with distance, therefore any light from the Pyrenees FPSO (including flaring) is highly unlikely to cause any disturbance to nesting or hatching turtles given the distance from the FPSO;
- Since water has a higher albedo than land, once turtles are in the water, navigation is expected to be influenced by wave motion, currents and earth magnetic field, rather than artificial light. The probability of any light from the FPSO being detected by turtles when in the water and this light having any impact is negligible;
- Studies reported by Witherington (1992) on hatchling orientation relative to spectrally controlled light sources indicated that most disruptive wavelengths were in the range of 300 to 500nm. In contrast the light emitted from natural gas flares has peak spectral intensity between 750 to 900nm (WAPET, 1995) and so is highly unlikely to cause disturbance to nesting or hatching turtles. Pendoley (2000) showed that the intensity of two flares (a tower flare and a pit flare) at Thevenard Island, Western Australia, peaked at between 650 to 700 nm. This result is similar to three other flares measured in Australia (Pendoley Environmental, unpublished data). Pendoley (2000) found no significant spectral difference between the two flare types, or when varying flow rates.
- Overall impact assessment of light emissions was considered long term and low and would not cause any significant impacts to protected species or the surrounding marine environment.

It is considered that any impacts to hatchling turtles from artificial light will be limited to possible short-term behavioural impacts to isolated individual hatchlings offshore, with no lasting effect to the species. For adult and pelagic juveniles, light emissions from the facility and vessels are unlikely to result in displacement of, or behavioural changes to individuals.

### **Fish**

Lighting from the presence of a vessel may result in the localised aggregation of fish below the vessel. These aggregations of fish are considered localised and temporary and any long-term changes to fish species composition or abundance is considered highly unlikely. This localised increase in fish extends to those comprising the whale shark's diet. However, given that a large proportion of the diet comprises krill and other planktonic larvae, it is unlikely that a light source will lead to a significant increase in whale shark abundance in the vicinity of the vessels. Similarly, any localised impacts to marine fish is not expected to impact on any commercial fishers in the area. No significant cumulative impacts over the life of the PAP or in relation to other operations and activities in the region (e.g. Ngujima-Yin, Ningaloo Vision) are expected.

### **Ningaloo WHA**

The Ningaloo WHA hosts a range of marine fauna, which are an environmental value of the WHA. Fauna in the Ningaloo WHA may be impacted by light emissions; refer to the section above for an assessment of the potential impacts of artificial light on marine fauna. Given the distance offshore of the Pyrenees FPSO, light from the flare is not considered to result in any impact to the aesthetic values of the Ningaloo WHA

### **Cumulative Assessment**

When considering the source of impact for light emissions Woodside have considered the potential light emitting activities that could overlap temporally and spatially. This includes assessing the operation of supply/IMMR vessels, FPSO facility lighting and flaring occurring simultaneously. This EP also acknowledges there exists an overlap between the Pyrenees Operational Area and the Macedon Operational Area in proximity to Macedon-6 well, however

it is not expected that any more than two supply/IMMR vessels would be present in the Pyrenees Operational Area with one IMMR vessel used to complete any tasks required for both fields sequentially. This EP also acknowledges that the Ngujima-Yin FPSO and the Ningaloo Vision FPSO are both within 10 km of the Operational Area. Given the short duration of the vessel activities it is unlikely that impacts would occur for long enough to have a cumulative impact beyond minor.

The maximum distance of direct visibility for vessel lighting 17.7 km will not be affected by the presence of multiple vessels. However, presence of the vessels will make a small incremental contribution to the overall skyglow visible on the horizon from the coastline. Artificial light monitoring conducted for the proposed Ningaloo Lighthouse Resort Development found that sky glow from flaring on the two FPSOs currently operating off North West Cape (Pyrenees Venture and Ngujima-Yin) is visible at the turtle nesting beaches on the tip of North West Cape (Pendoley Environmental, 2021). It is possible that sky glow from vessels in the Operational Area could contribute to the cumulative sky glow from these facilities, which are located ~27 km and ~41 km, respectively, from turtle nesting beaches on North West Cape. However, any additional contribution to cumulative sky glow is considered to be very marginal, given the much lower elevation of vessel lighting compared to the flare towers on the FPSOs. Furthermore, the lighting impact assessment for the Ningaloo Lighthouse Resort Development concluded that “Sea finding by turtle hatchlings emerging from regional nesting beaches was consistent across the monitored beaches with most hatchling fans successfully orienting seaward and appeared unaffected by the current levels of visible regional sky glow.” (Pendoley Environmental, 2021). Any cumulative impacts to marine turtles from artificial light will therefore be limited to possible minor behavioural impacts to isolated individuals offshore, that are temporary in nature.

**Demonstration of ALARP**

<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)<sup>33</sup></b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
<b>Legislation, Codes and Standards</b>				
No controls identified.				
<b>Good Practice</b>				
Implement Seabird Management Plan on the Pyrenees FPSO	F: Yes. CS: Minimal.	Potential for slight reduction in the likelihood of seabird attraction to vessels and facility resulting in a reduced likelihood of bird strikes.	Potential benefits outweigh cost sacrifice.	Yes C 3.1
Routine lighting will be limited to the minimum required for navigational and safety requirements.	F: Yes. Lighting is typically appropriate for navigation and safety. CS: Minor	Given the potential impacts to turtles during this PAP is insignificant, implementation of this control would not result in a reduction in consequence.	While the control does not result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 3.2
<b>Good Practice</b>				
None identified				
<b>Professional Judgement – Eliminate</b>				
Do not flare.	F: No. Flaring is required for the safe operation of the Pyrenees FPSO. CS: Not considered, control not feasible.	Not considered, control not feasible	Not considered, control not feasible.	No

<sup>33</sup> Qualitative measure

Surplus gas will be re-injected and therefore reducing the flare intensity during routine production operations.	F: Yes. CS: Minor	Given the potential impacts to turtles during this PAP, implementation of this control would not result in a reduction in consequence.	While the control does not result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 3.3
<b>Professional Judgement – Substitute</b>				
Substitute external lighting with light sources designed to minimise impacts to seabirds, shorebirds and marine turtles: <ul style="list-style-type: none"> <li>use flashing/ intermittent lights instead of fixed beam</li> <li>use motion sensors to turn lights on only when needed</li> <li>use luminaires with spectral content appropriate for the species present</li> <li>avoid high intensity light of any colour</li> </ul>	F: Yes. Replacement of external lighting with lighting appropriate for turtles and seabirds is technically feasible, although is not considered to be practicable. CS: Significant cost sacrifice. The retrofitting of all external lighting on the FPSO, etc, would result in considerable cost and time expenditure. Considerable logistical effort to source sufficient inventory of the range of light types onboard the FPSO.	Given the potential impacts to turtles, nesting seabirds and fledglings during this activity are insignificant, implementation of this control would not result in a reduction in consequence. Potential for minor reduction in impact to individual foraging seabirds that may transit the OA, as outlined in the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds.	Grossly disproportionate. Implementation of the control requires considerable cost sacrifice for minimal and provides minimal environmental benefit. The cost/sacrifice outweighs the benefit gained.	No
<b>Professional Judgement – Engineered Solution</b>				
None identified.				
<b>ALARP Statement:</b> On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the potential impacts from routine light emissions from the Pyrenees Facility and PAP to be ALARP, as no reasonable additional/ alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

<b>Demonstration of Acceptability</b>
<p><b>Acceptability Statement:</b></p> <p>The impact assessment has determined that, in its current state, operational light emissions from the Pyrenees Facility and PAP represent a minor disturbance to fauna within the Operational Area.</p> <p>Further opportunities to reduce the impacts have been investigated above. The potential impacts are consistent with good oil-field practice/industry best practice and are considered to be broadly acceptable in its current state. Therefore, Woodside considers standard operations appropriate to manage the impacts of light emissions to a level that is tolerable and demonstrate that the EPOs are met..</p>

source level of 185 dB re 1  $\mu$ Pa (rms SPL) which represents a more than doubling of sound pressure from a single IMMR vessel.

#### **IMMR Activities**

During IMMR activities, ROVs, AUVs, side scan sonar and/or multibeam echo sounder may be used. The noise generated by these sources will typically be of considerably lower intensity than vessel noise, or, in the case of side scan sonar, predominantly at frequencies (>180 kHz) that are outside the hearing thresholds of cetaceans and well above the hearing level of other mammals and fish (DECC, 2011). Side scan sonar devices operate at frequencies similar to those used in 'fish finders' by commercial fishers. The technique involves high frequency sound pulses typically between 100-500 kHz with the higher frequencies providing a greater resolution (DECC, 2011). Side scan sonar used for imaging the subsea infrastructure will be highly directional and at high frequencies which attenuate in the water column and do not propagate over long distances. Multibeam echo sounders are another sonar device which typically operate at frequencies (200-400 kHz for high resolution in shallower waters) that fall outside the hearing range of most marine mammals and fish (DECC, 2011). Given the short duration and infrequent use of these activities, and the rapid attenuation and intermittent nature of high frequency sonar signals, the potential effects are expected to fall off rapidly with distance from the source and be unlikely to cause significant impacts to any marine fauna populations. As sound levels are dependent on the primary (noisiest) sound source rather than being strictly additive, and these activities all require vessel support, they will make little contribution to the overall noise emissions associated with the IMMR activities, which will be dominated by vessel noise.

#### **Helicopters**

Helicopter engines and rotor blades are recognised as a source of noise emissions. Activities relevant to the Operational Area will relate to the landing and take-off of helicopters on the Pyrenees FPSO and potentially subsea support vessels. During these critical stages of helicopter operations, safety is the highest priority. Helicopter noise is emitted to the atmosphere during routine helicopter flights. Noise levels for typical helicopters used in offshore operations (Eurocopter Super Puma AS332) at 150 m separation distance has been measured at a maximum of 90.6 dB (BMT Asia Pacific, 2005). Helicopter flights are at their lowest (i.e. closest point to the sea surface) during periods of take-off and landing from helidecks, which constitutes a relatively short phase of routine flight operations.

#### **Subsea Infrastructure**

The noise produced by an operational wellhead was measured by McCauley (2002a). The broadband noise level was very low, 113 dB re 1  $\mu$ Pa, which is only marginally above rough sea condition ambient noise. For a number of nearby wellheads, the sources would have to be in very close proximity (<50 m apart) before their signals summed to increase the total noise field (with two adjacent sources only increasing the total noise field by 3 dB). Hence, for multiple wellheads in an area, the broadband noise level in the vicinity of the wellheads would be expected to be of the order of 113 dB re 1  $\mu$ Pa. This would drop very quickly to ambient conditions on moving away from the wellhead, falling to background levels within <200 m from the wellhead.

Based on the measurements of wellhead noise discussed in McCauley (2002a), which included flow noise in flowlines, noise produced along a flowline may be expected to be similar to that described for wellheads, with the radiated noise field falling to ambient levels within a hundred metres of the flowline. Woodside has undertaken acoustic measurements on noise generated by operating choke valves associated with the Angel platform (JASCO Applied Sciences, 2015). These measurements indicated choke valve noise is continuous, and the frequency and intensity of noise emitted depends on the rate of production from the well. Noise intensity at low production rates (16% and 30% choke positions) were approximately 154–155 dB re 1  $\mu$ Pa, with higher production rates (85% and 74% choke positions) resulting in lower noise levels (141–144 dB re 1  $\mu$ Pa). Noise from choke valve operation was broadband in nature, with most noise energy concentrated above 1 kHz. Subsea gas wells, such as those in the Angel study, experience higher flow velocities compared to oil wells; as such, the above noise intensity ranges are considered a conservative approximation for Pyrenees facility operations.

#### **Flaring (from FPSO)**

The HP and LP flare system generate noise from combustion. Noise from flaring is emitted at the top of the flare tower, which is approximately 90 m above sea level. Noise from the tip of the flare is not constrained and spreads spherically in all directions. Received levels from airborne propagation modelling were used to ascertain the underwater received levels during flaring activities for the WA-34-L Pyxis Drilling and Subsea Installation EP. Only a very small fraction of the acoustic energy produced from flaring transmits through the air/water boundary due to the surface of water acting as a reflective plane and a significant component of acoustic energy reflecting back into the air. While underwater received sound pressure level during flaring is estimated to be 136 dB re 1  $\mu$ Pa at 1m below the sea surface it is estimated to attenuate to ambient levels within a very short distance (e.g. metres) and therefore is not considered further in the impact assessment.

The estimated underwater noise source levels for sources associated with the Pyrenees facility detailed above are summarised in Table 6-3.

**Table 6-3: Noise sources associated with the PAP**

Noise source	Estimated Sound Pressure Level (dB re 1 µPa)	Frequency Range (kHz)
<b>Continuous Noise</b>		
Offtakes (FPSO + Tanker + Support vessel)	186	Broadband
FPSO	176	Broadband
Support/IMMR vessel using DP	182	Broadband
Wellhead	113	Broadband
Choke valve	155	Broadband
<b>Impulsive Noise</b>		
Multibeam Echo Sounder	214	200-300
Side Scan Sonar	226	120-410
Sub-bottom Profiler (CHIRP)	205	1-12
Sub-bottom Profiler (Pinger)	214	2-12
Sub-bottom Profiler (Boomer)	212	0.5-5

**Impact Assessment**

Elevated underwater noise can affect marine fauna in three main ways (Richardson et al., 1995; Simmonds et al. 2004):

- by causing direct physical effects on hearing or other organs. Hearing loss may be temporary (temporary threshold shift (TTS) referred to as auditory fatigue), or permanent threshold shift (PTS) (injury);
- by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey); and
- through disturbance leading to behavioural changes or displacement from important areas (i.e. BIAs). The occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation.

The marine fauna considered was based on a review of receptors that may be impacted by underwater sound, these were marine mammals, turtles, and fish.

Conservation management plans and Conservation Advice for sea turtles of Australia and the southern right, pygmy blue, sei and fin whales list noise interference as a threat to the survival of the species.

**Impact Thresholds**

To inform the impact assessment, the impact thresholds provided in this section were considered in relation to the credible sources of acoustic emissions.

**Table 6-4: National Marine Fisheries Service sound exposure thresholds applicable to marine mammals, Southall et al. (2019)**

Hearing Group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS Onset Thresholds (Received Level)		TTS Onset Thresholds (Received Level)	
	SPL (L <sub>p</sub> ; dB re 1 µPa)	Weighted SEL <sub>24h</sub> (L <sub>E,24h</sub> ; dB re 1 µPa <sup>2</sup> -s)	PK (L <sub>pk</sub> ; dB re 1 µPa)	Weighted SEL <sub>24h</sub> (L <sub>E,24h</sub> ; dB re 1 µPa <sup>2</sup> -s)	PK (L <sub>pk</sub> ; dB re 1 µPa)
<b>Non-Impulsive (Continuous) Sounds</b>					

Low-frequency cetaceans	120 *	199	-	179	-
High-frequency cetaceans		198	-	178	-
Dugongs		206	-	186	-
<b>Impulsive Sounds</b>					
Low-frequency cetaceans	160	183	219	168	213
High-frequency cetaceans		185	230	170	224
Dugongs		190	226	175	220

\* The 120 dB threshold may be adjusted if background noise levels are at or above this level.

Note: a range of sound units are provided in the table above, reflecting the range of studies from which the data has been derived. The difference in units presents difficulty in reliably comparing threshold values. Where practicable, the threshold values have been compared with indicative sound sources levels of the same sound unit types. The sound units provided in the table above include:

M-weighted sound exposure level (SEL): a weighted sound metric that emphasises the audible frequency bands for the receptor groups – low, mid and high frequency cetaceans. SEL units are time integrated and best suited for continuous noise sources, such as vessels holding station or continuous machinery noise.

Root mean square (rms) sound pressure level (SPL): root mean square of time-series pressure level is useful for quantifying continuous noise sources (as per SEL point above).

**Table 6-5: Impact threshold for environmental receptors based on Popper et al. (2014)**

Receptor	Impairment			Behaviour
	PTS	TTS	Masking	
Fish: no swim bladder	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder not involved in hearing	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder involved in hearing	170 dB rms SPL for 48 hrs	158 dB rms SPL for 12 hrs	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Sea turtles	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) High (I) Moderate (F) Low

Source: PTS and TTS thresholds (Finneran et al., 2017), \* behavioural response threshold (impulsive) (NSF 2011), + behavioural disturbance threshold (impulsive) (McCauley et al., 2000), # behavioural response threshold (continuous) (Popper et al., 2014).

Note: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

### **FPSO and Vessel Noise**

Based on the estimated source levels for an offtake scenario (186 dB) and FPSO during normal operations (176 dB) and the thresholds presented, the potential for noise-induced mortality, PTS and TTS of marine mammals, fish and sea turtles is not considered credible.

However, masking and behavioural impacts may occur in proximity to the noise source. The Pyrenees EIS noise modelling (BHP Petroleum, 2005) indicates that the sound level from an offtake would reduce to 130 db within approximately 3km of the FPSO and to 120 db within approximately 12km. This modelling indicated that the FPSO noise level during normal operations of 176 dB would reduce to 130 db within approximately 2km of the FPSO and to 120 db within approximately 3km. Potential impacts may include:

- cetaceans: potential behavioural disturbance out to approximately 12 km from FPSO for short periods during offtakes, and out to 3km for the remainder of the time.
- fish: potential masking and behavioural disturbance at near and intermediate range; likelihood of TTS is considered not to be credible given fish would move away from the source – demersal fish are not expected to be exposed to underwater noise above impact thresholds
- turtles: potential masking and behavioural disturbance at intermediate and far range.

IMMR activities are typically undertaken from up to two IMMR vessels with DP thrusters to allow manoeuvrability and avoid anchoring when undertaking works near subsea infrastructure. IMMR vessels holding station (e.g., using DP systems; relying on thrusters and main propellers) are considered to be the main source of underwater noise generated during the Petroleum Activities Program. Noise generated from these activities is for discrete work packages and therefore will be intermittent and of short duration (approximately one week per year for routine IMMR activities). It is also most likely that IMMR activities would require only one vessel, however some non-routine IMMR activities included in the scope of this EP could require two vessels which is what this noise assessment is based on.

McCauley (1998) measured underwater broadband noise equivalent to about 182 dB 1µPa at 1 m (rms SPL) from a subsea support vessel holding station in the Timor Sea. It is assumed that one IMMR vessel would have a similar noise level. Two IMMR vessels are conservatively expected to have an overall combined source level of 185 dB re 1µPa (rms SPL) which represents a more than doubling of sound pressure from a single IMMR vessel.

Using the thruster noise measured by McCauley (1998) as an indicative value for the potential thruster noise generated by vessels during the PAP and the thresholds presented, the potential for noise-induced mortality, PTS and TTS of cetaceans, fish, sea turtles and eggs/larvae is not considered credible.

However, masking and behavioural impacts may occur in close proximity (e.g. <2km) to the noise source. Using a simple cylindrical geometric spreading equation to estimate transmission loss (TL) of thruster noise at 185 dB re 1 µPa at 100 Hz, potential impacts may include:

- cetaceans: potential behavioural disturbance out to approximately 2 km from noise source for low frequency cetaceans
- fish: potential masking and behavioural disturbance at near and intermediate range; likelihood of TTS is considered not to be credible given fish would move away from the source – demersal fish are not expected to be exposed to underwater noise above impact thresholds
- turtles: potential masking and behavioural disturbance at intermediate and far range.

Note the estimates in are considered to under-estimate transmission loss, and are inherently conservative, due to:

- use of low frequency (100 Hz) component of thruster noise signature; note thruster noise is typically broadband in nature, with much of the noise energy at frequencies >100 Hz, which are absorbed more rapidly in seawater
- use of high intensity thruster noise (i.e. thruster operating at full power); most time using thrusters is at lower than full power, with concomitant reduction in cavitation noise intensity
- use of a cylindrical spreading model, which may underestimate the effect of geometric spreading.

All support and IMMR vessels are required to comply with EPBC Regulation 2000 – Part 8 Interacting with cetaceans to reduce the likelihood of collisions with cetaceans (refer to Section 6.7.3). Implementing this control may incidentally reduce the noise generated by vessels in proximity to cetaceans, as vessels are travelling slower; slower vessel speeds may reduce underwater noise from machinery (main engines) and propeller cavitation. Fauna such as cetaceans, fish, and turtles are capable of moving away from potential noise sources, and there are no constraints to the movement of these fauna within the Operational Area.

**Table 6-7: Estimated sound transmission loss for two IMMR vessels operating together with a combined SLP of 185 dB re 1 µPa at 100 Hz frequency**

Range (m)	Transmission Loss	Received Noise (dB re 1 µPa)
200	40.1	141.9
1000	54.5	127.5
2000	61.0	121.0
4000	68.0	114.0
10,000	79.0	103.0
20,000	90.0	92.0

Cetaceans

As the migration BIA for humpback whales overlaps the Operational Area and migration BIA for Pygmy Blue Whales is within 5km, there is the potential for these species to be exposed to underwater noise levels that may alter their behaviour when they are present in the region during seasonal migrations. Tagging studies of pygmy blue whales have shown the migratory pathway appears to be in deeper water to the west of the Operational Area, and pygmy blue whales have not been observed from the nearby NY FPSO (unlike humpback whales). Given the underwater noise levels that may credibly be generated during the PAP, and the low likelihood of pygmy blue whales being present in the Operational Area, the potential for impact is considered highly unlikely.

Aerial surveys of humpback whales off North West Cape did not observe any apparent displacement of humpback whales from the area around the nearby NY FPSO (RPS Environment and Planning, 2010a). The majority of humpback whales observed during these surveys were east of the NY FPSO, which is consistent with other surveys showing the majority of humpback whales migrate within continental shelf waters along Western Australia (Double et al., 2010, 2012a). Received noise levels are expected to reduce to 121 dB re µPa within 1 km of the Pyrenees FPSO, which is just above the threshold for behavioural impacts for low frequency cetaceans (120 dB re µPa) (McCauley, 1998).

Humpbacks are regularly observed in close proximity to the Pyrenees FPSO and vessels. The maximum source of noise is below PTS, expected to reach TTS within a short distance and avoidance behaviour is not observed. Given that the overlap of the potential extent of the noise with the BIA is a minor proportion of the overall BIA and the location is not confined, it is considered unlikely humpbacks are adversely impacted by noise from the operation of the Pyrenees FPSO.

The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015a) and associated guidance on key terms requires that pygmy blue whales not be displaced from a foraging area. The nearest recognised foraging BIA for pygmy blue whales is approximately 32 km from the Operational Area at the closest point therefore no potential impact thresholds are not expected to be reached within the pygmy blue whale foraging BIA.

The Operational Area and surrounding waters are characterised as open water with no restrictions (e.g., shallow waters, embayments) to an animal’s ability to avoid the activities. Behavioural response by LF cetaceans (such as pygmy blue whales and the southern right whale) may result in a deviation in course, which is expected to be insignificant in the context of the long distances over which individuals migrate (thousands of kilometres). Cetaceans that are frequently exposed to sounds such as vessel noise may also habituate and adapt to this noise (Richardson et al. 1995; NRCC, 2003). This may be the case for the humpback whale population that regularly passes through areas of significant shipping traffic during their migrations.

Both pygmy blue and humpback whales are considered unlikely to be impacted by underwater noise generated during the PAP.

Mid and high frequency cetaceans (e.g. dolphins) are known to show behavioural disturbance at a range of received noise levels (Southall et al., 2007). Mid and high frequency cetaceans may exhibit short-term behavioural responses to increased levels of underwater noise, such as avoidance or attraction.

Fish

Demersal and pelagic fish species are present in the Operational Area, including fish communities associated with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula and the Continental Slope Demersal Fish Communities KEFs. Vessels holding station using DP are expected to produce sound equivalent to about 182 dB re 1 µPa SPL at 1 m. Modelling undertaken by McPherson et al. (2019) of sound produced by facility and vessel operations found that recoverable injury to some types of fish would only be possible if they remained within a distance of less than 10 m for 48 hours, and TTS if fishes remained within 10 m for at least 12 hours. Pelagic fish are highly mobile and the types of demersal fishes known to occur in the vicinity of the Pyrenees FPSO (e.g. snappers, emperors, cods and groupers) will exhibit some fidelity to the area but are still relatively free-swimming and are not

constrained to such close ranges (i.e. 10 m). Therefore, free-swimming fish remaining in close range to sound sources for periods that subject themselves to TTS and injury is not considered to be a credible scenario.

Potential noise impacts to fish (including whale sharks) are expected to be restricted to masking and behavioural disturbance. Fish may temporarily be displaced from the immediate vicinity of a noise source; however, they would be expected to behave normally once the noise emissions ceased. Benthic species with site fidelity are not likely to be affected by the activity due to the depths to likely habitats and noise attenuation.

A foraging BIA for whale sharks overlaps the Operational Area and this species may be seasonally present (particularly between March and July) during their annual migration to, and from, the aggregation area off Ningaloo Reef. Whale sharks are not considered to be particularly vulnerable to underwater noise, as they do not have a swim bladder (considered to increase the vulnerability of a fish to noise related impacts). Received noise levels are expected to reduce to 103 dB re 1  $\mu$ Pa within 5 km of the Operational Area (McCauley, 1998). Currently, there are no quantitative sound exposure thresholds relevant to whale sharks. It is expected that the potential effects of noise on whale sharks are the same as for other fish species, resulting in minor, localised and temporary behavioural change such as avoidance. Noise attributed to the activity is not likely to interfere with the movement of whale sharks to and from the foraging area at the Ningaloo Reef, given the location is not confined and would not prevent the species from passing through. Therefore, impacts to whale sharks from the Pyrenees FPSO or support vessels are expected to have no lasting effect on the species.

#### Turtles

Vessels holding station are considered to be the predominant noise source related to the activity, with source levels of approximately 182 dB re 1  $\mu$ Pa SPL at m from a support vessel holding station considered to be representative of noise levels generated by vessels used for the PAP. Turtles may occur in the Operational Area as the area contains interesting BIAs and defined Critical Habitat.

Although there are no quantitative sound exposure thresholds for impacts on marine turtles resulting from continuous noise sources, the relative risk for behavioural response is expected to be high within tens of metres of the source, medium within hundreds of metres and low within kilometres from the source. PAPTypical noise levels generated by the FPSO and a support vessel using DP would not exceed these levels (except at extremely close ranges to the source), and prolonged exposure of transient marine turtles at close range is not considered a credible scenario.

Such disturbances are not expected to have any significant effect on individual turtles. As such, no significant impacts to marine turtles from underwater noise are expected.

#### **IMMR Activity Noise**

IMMR activities may generate a range of acoustic emissions; however, the most significant is expected to be from the use of underwater survey equipment. Therefore, this impact assessment is based on the use of MBES and SSS, all other routine IMMR activities are expected to cause lower impacts than those discussed herein.

Underwater noise from MBES and SSS will attenuate rapidly in the water column due to the relatively high frequency of noise emissions from these sources. The operating frequencies of MBES (12–700 kHz) and SSS (75–900 kHz) are well above the hearing range of turtles (1–2 kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2–30 kHz) may be audible to turtles, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Modelling of impulsive sub-bottom profiler sound emissions by Mathews and Zykov (2013) and McPherson et al. (2017) indicates that the 166 dB re 1  $\mu$ Pa (SPL) behavioural disturbance threshold for turtles may only be exceeded within metres or tens of metres of the survey instruments. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound energy is produced at frequencies outside the peak hearing frequency range of turtles. No significant impacts to sensitive fauna are expected to occur as a result of these sources.

Sub-bottom profilers are typically lower frequency than multibeam echo sounders or side scan sonar, and acoustic emissions from sub-bottom profilers may propagate further in the water column. Based on typical source levels and frequencies for sub-bottom profilers and the geometric spreading equation present in vessel noise above, received levels from a sub-bottom profiler will attenuate to 160 dB re 1  $\mu$ Pa rms SPL within approximately 250 m of the source. This is comparable to the noise potentially produced by thrusters (refer to vessel noise section above for a discussion of potential impacts), although sub-bottom profiler emissions are impulsive rather than continuous. Potential impacts to cetaceans from MBES, SSS and sub-bottom profiler may, therefore, include behavioural disturbance if in close proximity to the survey instruments, but ranges to disturbance are less than or equivalent to disturbance ranges for the IMMR vessel itself. PTS or TTS are not considered credible, given individuals would need to be directly next to the noise sources for prolonged duration.

#### **Helicopter Noise**

Water has a very high acoustic impedance contrast compared to air, and the sea surface is a strong reflector of noise energy (i.e., very little noise energy generated above the sea surface crosses into and propagates below the sea surface (and vice versa) – most of the noise energy is reflected). The angle at which the sound path meets the surface influences the transmission of noise energy from the atmosphere through the sea surface, angles >13° from vertical being almost entirely reflected (Richardson et al., 1995). The Operational Area overlaps a breeding BIA for the wedge-

**ALARP Statement:**

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the impacts from routine acoustic emissions from Pyrenees Facility and PAP to be ALARP in its risk state. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

**Demonstration of Acceptability**

**Acceptability Statement:**

The impact assessment has determined that, in its current state, impacts from routine acoustic emissions from the Pyrenees Facility and PAP represent a minor impact /disturbance to marine fauna within the Operational Area. Further opportunities to reduce the impacts and risks have been investigated above. The impacts are consistent with good oil-field practice/industry best practice and are considered to be broadly acceptable in its current state. Therefore, Woodside considers standard operations appropriate to manage the impacts of acoustic emissions to a level that is tolerable and demonstrate that the EPOs are met..

(Scope 1 & 2) and Indirect Emissions (Scope 3), aligned with the definitions of the GHG Protocol Corporate Standard (GHG Protocol 2015) and NGERS.

The main sources of GHG emissions associated with the PAP are from fuel gas consumption, as shown in Table 6-10. GHG emissions sources that are not part of the PAP (e.g. GHG emissions from third party transportation, oil refining and combustion by end users) are also included. In the context of this EP, GHG emissions are classified as Direct and Indirect Emissions, as shown in Table 6-10.

The GHG Protocol 2015 defines indirect GHG emissions as emissions that are a consequence of the activities of the reporting entity, but occur at sources owned or controlled by another entity. For the purposes of this EP the “reporting entity” is the Pyrenees Facility and therefore, third party transportation, oil refining and combustion by end users and support vessel/helicopter operations are considered indirect emissions sources.

Atmospheric emissions attributed to the Pyrenees Petroleum Activity Program, as assessed in this EP, can be classified into two categories:

- Routine emissions from diesel driven machinery and engines onboard the Pyrenees FPSO and support vessels, combustion emissions from gas-powered turbines and heaters, and venting and operational flaring from the Pyrenees FPSO.
- Greenhouse Gas (GHG) emissions refer to gases that trap heat within the atmosphere through the adsorption of longwave radiation reflected from the earth’s surface. This includes both direct and indirect GHG emissions (Table 6-10).

**Direct Atmospheric and GHG Emissions**

Direct emissions generated from the Pyrenees facility during the PAP include gas turbines (that can also run on diesel), flares, fugitives and process vents. Direct emissions and combustion products include CO<sub>2</sub>, water vapour, NO<sub>x</sub>, SO<sub>2</sub>, particulates, Volatile Organic Compounds (VOCs).

The emissions estimates presented provide a representative estimate of activities and operations over the next 5-year period of the Pyrenees Facility Operations EP. Variance within the period may occur, due to a number of factors such as reservoir and production system performance outcomes, planned activities including shutdowns and maintenance activities and unplanned reliability events.

Emissions estimates below are provided as a reasonable estimate to inform an impact and risk assessment associated with activities requiring emissions to air.

**Atmospheric Emissions - Fuel Gas and Diesel Consumption**

Fuel gas consumption for compression and power generation is the predominant source of combustion emissions from the Pyrenees FPSO, primarily the three 7,000 kW gas turbine generators and steam generating boilers. The turbines may run on fuel gas or diesel. Emergency diesel generators may also be used when required. Diesel is used for firewater pumps, emergency generators, cranes and back-up fuel for the turbine generators.

Based on forecasted production and historical performance, it is predicted that Pyrenees will consume approximately 80,000,000 m<sup>3</sup> of fuel gas per year over the next five years, the combustion of which equates to about 162,010 tonnes of CO<sub>2</sub> equivalents. Diesel use is more variable and may be up to 4,500 m<sup>3</sup> per year (excluding support vessels), the combustion of which equates to 12,194 tonnes of CO<sub>2</sub> equivalents.

The estimated annual emissions from fuel combustion have been estimated using emissions factors (as per National Greenhouse and Energy Reporting (NGER) (Measurement) Determination 2008 and National Pollutant Inventory (NPI) Emission Estimation Techniques (EET)) and are presented in Table 6-8.

**Table 6-8: Estimated annual emissions from fuel combustion (excluding support vessels)**

Emission Type	Estimated annual emissions from fuel gas combustion	Estimated annual emissions from diesel combustion
CO <sub>2</sub> (t CO <sub>2-e</sub> )	161,602	12,142
CH <sub>4</sub> (t CO <sub>2-e</sub> )	314	17
N <sub>2</sub> O (t CO <sub>2-e</sub> )	94	35
<b>Total t CO<sub>2-e</sub></b>	<b>162,010</b>	<b>12,194</b>
NO <sub>x</sub> (tonnes)	647	239
CO (tonnes)	166	63

**Atmospheric Emissions - Flaring**

During normal operations, hydrocarbon gas is flared via the HP and LP flare systems. Flaring events are considered non-routine and are typically only associated with activities such as maintenance activities or upset conditions, this is consistent with Woodside’s implementation of the World Bank Zero Routine Flaring Initiative. In line with Woodside’s

implementation of the World Bank Zero Routine Flaring Initiative (ZRFI), non-routine flaring is considered flaring for intermittent and short duration non-routine activities (e.g. start-up) and rectification of unplanned issues (e.g. equipment failure). Flaring which materially exceeds the initially expected project/rectification flaring estimate is then considered routine flaring.

Gas flaring emits greenhouse gases to atmosphere and consumes natural gas, a non-renewable resource. Emissions and combustion products include CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>2</sub>, methane, particulates, and VOCs. Incomplete combustion under certain scenarios may also generate dark smoke.

The release of hydrocarbon gas to atmosphere by flaring is an essential practice, primarily for safety requirements. Surplus gas from the reservoir is reinjected, not flared, which minimises the GHG emissions from the hydrocarbon production system.

Operational flaring is comprised of two elements:

- normal operational flaring associated with flare system purge, pilot and process flows; and
- non-routine, non-operational flaring that may result from activities such as planned shutdowns and ESD testing, and unplanned shutdowns and ESDs, production restarts, equipment outage/failures, subsea flowline depressurisation and well remediation activities.

Based on forecasted production and historical performance, it is predicted that up to 17,000 tonnes of gas is to be flared per year for the next five years including water vapour, inert gas and hydrocarbon gas in routine and non-routine activities. Flaring volumes vary with production rates, non-routine activities, outages and shutdowns. The estimated annual emissions from flaring have been calculated using the NGER measurement determination and NPI EET (Table 6-9).

**Table 6-9: Estimated annual emissions from flaring**

Component	Estimated Annual Emissions
Flared gas (tonnes)	17,000
CO <sub>2</sub> (t CO <sub>2-e</sub> )	47,600
CH <sub>4</sub> (t CO <sub>2-e</sub> )	15,861
N <sub>2</sub> O (t CO <sub>2-e</sub> )	442
<b>Total t CO<sub>2e</sub></b>	<b>63,903</b>
NO <sub>x</sub> (tonnes)	26
CO (tonnes)	148

**Non-Routine Venting of Process Hydrocarbons via Flare System**

During normal operations, hydrocarbon gas is flared via the HP and LP flare systems. These systems are maintained to effectively combust hydrocarbons as a critical component for the safe operation of the Pyrenees facility. In the unlikely event that the flares are extinguished (for example during a tropical cyclone) or unavailable (such as following a major shutdown prior to system ramp-up), the hydrocarbon gas discharged via the flare system may initially not be combusted during the period required to purge the flare system and re-establish flare ignition. This may result in the short term (minutes) low-rate release of hydrocarbon gas to the atmosphere. Intermittent venting from the Pyrenees Facility represents a minor source of atmospheric emissions and is not considered to pose a risk beyond the routine air emissions described in this section.

**Cargo Tank Inert Gas Venting**

The inert gas system supplies inert gas to maintain a positive pressure in the vapour space of cargo tanks to prevent the ingress of air. Hydrocarbon vapour will form in the cargo tanks as volatile hydrocarbons evaporate from the stored crude oil. This vapour is displaced from the cargo tanks as they are filled and vented to the atmosphere. Maintaining inert gas in cargo tank vapour spaces is required for the safe operation of the facility.

**Fugitive Emissions**

Fugitive emissions can occur from pressurised equipment, and are inherent in design, required for infrequent operational activities, or can be caused by unintentional equipment leaks. Sources can include from valves, flanges, pump seals, compressor seals, relief valves, vents, sampling connections, process drains, open-ended lines, casing, tanks and other potential leakage sources from pressurised equipment. Fugitive emissions are, by their nature, difficult to quantify and are estimated by application of methods from the NGER Determination.

As much of the safe operation of the Pyrenees Facility relies on the effective containment of hydrocarbons, the volumes of routine and non-routine fugitive emissions are considered small. The National Greenhouse and Energy Reporting (Measurement) Determination provides methodology for estimating fugitive emissions. Using these estimation techniques, the Pyrenees FPSO reported 9,167 tonnes of CO<sub>2</sub> equivalents lost through fugitive emissions

over the 2022–2023 reporting period. This is expected to remain relatively constant over the EP period (next five years).

Discrete, relatively small volumes of packed gases and charged systems including refrigerant gases are used across the Pyrenees FPSO and vessels, which have potential for small volume leaks (typically less than 100 kg per isolatable inventory). Such gases are used in the HVAC and refrigerant systems onboard the Pyrenees FPSO and vessels.

**Indirect Emissions**

**Emissions from Vessels and Helicopters**

GHG and atmospheric emissions are generated by vessels and helicopters supporting Pyrenees activities. Vessel emissions include those from internal combustion engines and fugitives. Atmospheric and GHG emissions from support vessels vary depending on the nature of activities being undertaken; for example, travelling or “steaming” to a destination at low speed uses less fuel and generates lower atmospheric and GHG emissions than high speed steaming. Emissions generated during safety related vessel standby activities, holding station using DP during loading and unloading of materials to the facility or undertaking subsea IMMR work also vary. Vessel Masters control day to day operations that determine support vessel emissions. Woodside has the potential to influence fleet level approach to support vessel emissions through contracting activities.

Expected annual emissions for vessel and helicopter activities have been estimated to be:

- 4,000 tCO<sub>2-e</sub> for support vessels and IMMR vessels, based on support vessel diesel consumption in 2023, which is considered a high support vessel activity year
- 300 tCO<sub>2-e</sub> for helicopters, based on helicopter flights in 2022, considered a typical helicopter use year.

Indirect emissions from these sources are expected to be relatively constant throughout the EP period and until EOFL.

**Emissions from Shipping, Refining and End-Use Attributable to Pyrenees**

Indirect emissions attributed to Pyrenees results from shipping, refining and combustion/end use of hydrocarbons. Indirect GHG emissions attributed to Pyrenees operations were estimated using historical and forecasted production rates (Table 6-10). Key influences impacting indirect GHG emissions from Pyrenees include:

- Total production – indirect emissions are proportional to total production, which varies with shutdown activity, new field tiebacks or gradual reservoir decline.

Based on historical and forecasted production rates, the indirect emissions from Pyrenees from end use of hydrocarbons are estimated to be approximately 1.72 MtCO<sub>2-e</sub> per annum. These annual emissions are likely to continue through this EP period. This estimate may vary, particularly the timeframe beyond this current EP period, as it is subject to many factors, such as reservoir performance. Woodside’s current forecast is that the reservoirs produced via Pyrenees will decline toward EOFL. Other reservoirs may be discovered and/or tied-back to Pyrenees to mitigate the decline, but overall, the trend of hydrocarbon production from Pyrenees and associated indirect emissions from end use of hydrocarbons are expected to also decline.

**Table 6-10: Summary of Annual Direct and Indirect emissions attributable to Pyrenees**

Source of impact	Annual estimated emissions (MtCO <sub>2-e</sub> )	Total possible emissions for EP period (MtCO <sub>2-e</sub> )
<b>Direct emissions</b>		
Fuel, flaring and fugitives	0.25	1.24
<b>Indirect emissions</b>		
Vessels and helicopters	0.004	0.02
Third party transport of products, refining and combustion <sup>1</sup>	1.72	8.59

<sup>1</sup> Source: Transport and refining based on Oil-Climate Index factors for Australia Cossack. Combustion factors aligned with UN’s 2006 IPCC Guidelines for National Greenhouse Gas Inventories

**Woodside’s Climate Strategy**

The management of emissions from the Pyrenees facility are being managed in line with Woodside’s climate strategy. Woodside’s climate strategy which contains two key elements:

- reducing our net equity Scope 1 and 2 greenhouse gas emissions; and
- investing in products and services for the energy transition. Reducing our net equity Scope 1 and 2 greenhouse gas emissions is supported by three levers: avoiding emissions in design, reducing emissions in operations, and offsetting the remainder with carbon credits.

**Impact Assessment**

**Air quality**

Facility and vessel routine and non-routine emissions, predominantly flaring, have the potential to result in localised, temporary reduction in air quality, generation of dark smoke and contribution to GHG emissions. Potential impacts of emissions depend on the nature of the emissions, as well as the location and nature of the receiving environment. The quantities of atmospheric emissions generated by the Pyrenees Facility are relatively small and will, under normal circumstances, be quickly dissipated into the surrounding atmosphere.

The Operational Area is in a remote offshore location, with no expected adverse interaction with populated areas or sensitive environmental receptors associated with air emissions.

A wedge-tailed shearwater breeding BIA overlaps the Operational Area and several other threatened and migratory seabird species could occur in the Operational Area or nearby. Individual birds would be transiting the offshore area as roosting and nesting habitats occur on land. The nearest potential seabird roosting habitat, the Muiron Islands, lies approximately 19 km south-east of the Operational Area. Given the highly dispersed nature of facility air emissions, no adverse air quality impacts to birds are anticipated due to air emissions.

Potential impacts are expected to be short-term and limited to the airshed local to the Operational Area. Air emission impacts are not expected to have direct or cumulative impacts on sensitive environmental receptors, or above National Environmental Protection (Ambient Air Quality) measures and are expected to disperse well before reaching the nearest populated area (Exmouth).

The flare and potential black smoke resulting from emissions may impact visual amenity. The offshore location of the FPSO is not directly visible from the nearest landfall (North West Cape, 21 km south). Hence, no impacts to visual amenity for residential communities are expected. Visual amenity impairment to tourism activities is not expected.

**GHG emissions**

The energy transition precise shape and pace is expected to vary across countries because they have different starting points, development requirements, resources and capabilities. However, the scale of the transition is clearer, as it will take many trillions of dollars, invested over decades. Woodside uses its capital allocation framework to create a diversified and flexible portfolio, which allows us to respond to changes in demand and supply for our products.

Woodside is working to diversify its portfolio by adding new products and services alongside our existing products, where we believe we have a competitive advantage to supply them successfully through the energy transition. However, demand in petrochemical and heavy transport is likely to be resilient for longer. Woodside sees a demand for oil expected across a range of pathways through the energy transition. The Pyrenees facility will provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life. Woodside sees a role for oil from the Pyrenees facility to meet customer demand.

This impact assessment considers the potential impacts of climate change on sensitive receptors, including MNES within Australian jurisdictions. Climate change impacts cannot be directly attributed to any one activity, as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution started. They do not take into account the net impact of each project or activity. There is no direct link between greenhouse gas emissions from the Pyrenees facility and climate change impacts.

Climate change impacts upon Australian receptors cannot be directly causally linked to any one activity or one project, including the operation of the Pyrenees facility, as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution started. The accumulation of greenhouse gas emissions in the atmosphere is, in turn, influenced by global energy demand and the composition of the global energy mix. The following contextual evaluation is provided. This contextual evaluation assessment considers the potential impacts of climate change on sensitive receptors, including MNES within Australian jurisdictions.

**GHG Emissions – Global and Australian Context**

Climate science is a rapidly evolving field in which new observations continue to deepen understanding of the current and potential impacts of global warming, and the possible pathways for mitigation and adaptation (Woodside 2023a).

The IPCC is the United Nations body for assessing the science related to climate change and finalised the Sixth Assessment Report (AR6) in 2023. This consists of three Working Group contributions and a Synthesis Report. A summary of outcomes of the working group’s contributions comprises a range of matters, which amongst others include:

- The AR6 Working Group I (AR6-WG1) report stated that it is unequivocal that there is human-induced warming. It also stated that increased atmospheric carbon dioxide (CO<sub>2</sub>) levels, generated by human activity, are the largest driver of warming over the longer term, and that there are a range of factors, including emissions of methane, which increase warming in the short-term.
- The AR6-WG2 report stated that human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability. It stated that global warming, reaching 1.5°C in the near-term, would cause

unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans. The report noted that societal choices and actions implemented in the next decade will determine the extent to which medium- and long-term pathways will deliver climate resilient development.

- The AR6 Working Group III (AR6-WG3) report provided an updated global assessment of climate change mitigation progress and pledges and examined the sources of global emissions. It explained developments in emissions reduction and mitigation efforts and assessed the impact of national climate pledges in relation to long-term emissions goals. More than 2,000 quantitative emissions pathways were submitted to the IPCC, of which 1,202 scenarios included sufficient information for assessing the associated warming. The report found that there are many pathways in the literature that likely limit global warming to 2°C with no overshoot, or to 1.5°C with limited overshoot. These variations occur because, while climate science is able to calculate a ‘carbon budget’ of net emissions before any particular temperature outcome is reached, the allocation of this budget between different human activities requires additional judgements about for example technology, economics, consumer preferences and policy choices.
- The AR6 Working Group I (AR6-WGI) report states “[c]limate change is a global phenomenon, but manifests differently in different regions” (IPCC 2021b). IPCC projections for climate change in Australia from the AR6 Working Group II (AR6-WGII) report include:
  - further climate change is inevitable, with the rate and magnitude largely dependent on the emission pathway (very high confidence)<sup>35</sup>
  - ongoing warming is projected, with more hot days and fewer cold days (very high confidence)
  - further sea level rise, ocean warming, and ocean acidification are projected (very high confidence)
  - less winter and spring rainfall is projected in southern Australia, with more winter rainfall in Tasmania, less autumn rainfall in southwestern Victoria and less summer rainfall in western Tasmania (medium confidence), with uncertain rainfall changes in northern Australia.
  - more extreme fire weather is projected in southern and eastern Australia (high confidence)
  - increased drought frequency is projected for southern and eastern Australia (medium confidence)
  - increased heavy rainfall intensity is projected, with fewer tropical cyclones and a greater proportion of severe cyclones (medium confidence) (Lawrence et al. 2022).
- The AR6-WGII report identified nine key climate risks for the Australasian region:
  - loss and degradation of coral reefs and associated biodiversity and ecosystem service values in Australia due to ocean warming and marine heatwaves (very high confidence)
  - loss of alpine biodiversity in Australia due to less snow (high confidence)
  - transition or collapse of alpine ash, snowgum woodland, pencil pine and northern jarrah forests in southern Australia due to hotter and drier conditions with more fires (high confidence)
  - loss of kelp forests in southern Australia due to ocean warming, marine heatwaves, and overgrazing by climate-driven range extensions of herbivore fish and urchins (high confidence)
  - loss of natural and human systems in low-lying coastal areas due to sea level rise (high confidence)
  - disruption and decline in agricultural production and increased stress in rural communities in south-western, southern and eastern mainland Australia due to hotter and drier conditions (high confidence)
  - increase in heat-related mortality and morbidity for people and wildlife in Australia due to heatwaves (high confidence)
  - cascading, compounding and aggregate impacts on cities, settlements, infrastructure, supply-chains and services due to wildfires, floods, droughts, heatwaves, storms and sea level rise (high confidence)
  - inability of institutions and governance systems to manage climate risks (high confidence) (Lawrence et al. 2022).

An earlier report by Australia’s Biodiversity and Climate Change Advisory Group summarised the potential impacts of climate change to marine and terrestrial species, habitats and ecosystems across Australia (Steffen et al. 2009). The 2009 report identified examples of observed changes in Australia’s biota that were considered consistent with the emerging climate change ‘signal’, as genetic constitution, geographic ranges, life cycles, populations, ecotonal boundaries, ecosystems, and disturbance regimes (Steffen et al. 2009). The report also stated:

- “Biodiversity is one of the most vulnerable sectors to climate change”

<sup>35</sup> A level of confidence is expressed using five qualifiers: very low, low, medium, high, and very high. For a given evidence and agreement statement, different confidence levels can be assigned, but increasing levels of evidence and degrees of agreement are correlated with increasing confidence (Lawrence et al. 2022).

- “Australia’s biodiversity is not distributed evenly over the continent but is clustered in a small number of hotspots with exceptionally rich biodiversity”, and that these “include the Great Barrier Reef, south-west Western Australia, the Australian Alps, the Queensland Wet Tropics and the Kakadu wetlands”

Further, it was stated that “many of the most important impacts of climate change on biodiversity will be the indirect ones at the community and ecosystem levels, together with the interactive effects with existing stressors (Steffen et al. 2009). Future climate change (e.g. increased temperature and decreased, but more variable, rainfall) has the potential to have a range of impacts on ecological factors and threaten biodiversity in the Australian mediterranean ecosystem (CSIRO 2017).

Extensive modelling and monitoring studies over the last twenty years provide considerable evidence that global climate change is already affecting and will continue to affect species (Hoegh-Guldberg et al. 2018) however these impacts are likely to be highly species-dependent and spatially variable. The most frequently observed and cited ecological responses to climate change include species distributions shifting towards the poles, upwards in elevation and shifts in phenology (earlier and later autumn life-history events) (M. Dunlop et al. 2012). Climate change may not only change species distribution patterns but also life-history traits such as migration patterns, reproductive seasonality and sex ratios (Steffen et al. 2009).

Impacts of climate change such as altering temperature, rainfall patterns and fire regimes, are likely to lead to changes in vegetation structure across all terrestrial ecosystems within Australia (M. Dunlop et al. 2012; Steffen et al. 2009). Increases in fire regimes will impact Australian ecosystems altering composition structure, habitat heterogeneity and ecosystem processes. Changes in climate variability, as well as averages, could also be important drivers of altered species interactions, both endemic and invasive species (M. Dunlop et al. 2012). Climate change could result in significant ecosystem shifts, as well as alterations to species ranges and abundances within those ecosystems (Hoegh-Guldberg et al. 2018).

The ‘loss of climatic habitat caused by anthropogenic emissions of greenhouse gases’ has been listed as a key threatening process under the EPBC Act (DCCEE 2021). The threatening process consists of reductions in the bioclimatic range within which a given species or ecological community exists due to emissions induced by human activities of greenhouse gases (DCCEE 2021). The process is considered to have a continental distribution, including both terrestrial and marine areas. Ecosystems in which the process occurs include: alpine habitats, coral reefs, wetlands and coastal ecosystems, polar communities, tropical forests, temperate forests, and arid and semi-arid environments (DCCEE 2021).

Coral reefs were recognised by both IPCC and the Australian Government as being at risk of climate change (Lawrence et al. 2022; DCCEE 2021). Protected coral reef areas in Australia include those within World Heritage listed sites, such as Ningaloo Coast, Shark Bay, or the Great Barrier Reef. Climate change has been identified as a threat for each of these World Heritage areas, with potential risks to coral reef as well as other environmental values (such as marine fauna) within these ecosystems (IUCN 2020b; 2020c; 2020a).

Climate variability and change has been identified as a threat to some EPBC Act protected species, including marine turtles, whales, seabirds and migratory shorebirds:

- the Recovery Plan for Marine Turtles in Australia (CoA 2017) states that “[c]limate change is of particular concern to marine turtles because it is likely to have impacts across their entire range and at all life stages. Climate change is expected to cause changes in dispersal patterns, food webs, species range, primary sex ratios, habitat availability, reproductive success and survivorship”.
- the Conservation Management Plan for the Blue Whale (CoA 2015a) states: [c]limate change is expected to cause changes in migratory timing and destinations, population range, breeding schedule, reproductive success and survival of baleen whales, including blue whale species and subspecies”
- the Wildlife Conservation Plan for Seabirds (CoA 2022b) states that “[c]onsequences to seabirds could include negative impacts from an increase in extreme weather events, reduced or changed prey abundance and distribution, and decrease in nesting habitat”
- the Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015) states that “[s]uch changes have the potential to affect migratory shorebirds and their habitats by reducing the extent of coastal and inland wetlands or through a poleward shift in the range of many species”.

The North-west Marine Parks Network Management Plan 2018 (DNP 2018) identifies climate change as a pressure that may impact marine park values. The management plan states that “[t]he impacts of climate change on the marine environment are complex and may include changes in sea temperature, sea level, ocean acidification, sea currents, increased storm frequency and intensity, species range extensions or local extinctions, all of which have the potential to impact on marine park values” (DNP 2018).

Within the Marine Bioregional Plan for the NWMR (DSEWPac 2012), pressures related to climate change are assessed as ‘of potential concern’ for species of marine turtle, inshore dolphins, sawfish, sea snakes, whale shark, dugong, and seabird and shorebird, as well as the KEFs and shipwrecks known to occur in the NWMR.

<p>Forecast, measure, monitor and or estimate facility fuel and flare emissions (in accordance with NGERs/NPI) to inform optimisation management practices and minimise environmental impact of direct Pyrenees and indirect emissions.</p>	<p>F: Yes CS: Moderate cost. Standard practice.</p>	<p>Minimises environmental impact of emissions through planning, ongoing review, governance and optimisation. It combines with good operating practice to maximise production, reduce fuel gas use and emissions to manage cost, which improves energy intensity (e.g. cleaner production), optimising emissions from Pyrenees. **Discussion of ALARP**

Atmospheric Emissions

Given the adopted controls appropriate to manage the impacts of atmospheric emissions. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

GHG Emissions

Risk-Based Analysis

Application of Woodside’s PetDW Risk Management Procedures and other PetDW Procedures reduces GHG emissions risk to ALARP. This includes a system of continual review and improvement of key emissions sources from the Pyrenees FPSO

Societal Values

Consultation was undertaken for this program to identify the views and concerns of relevant stakeholders, as described in Section 5. No specific concerns around air emissions, resulting in changes to air quality and greenhouse gas emissions, were identified through this process.

**ALARP Statement**

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision type A and B for direct and indirect emissions respectively), Woodside considers the adopted controls appropriate to manage the impacts from GHG emissions from the Pyrenees facility and indirect emissions sources that Woodside can practicably influence, including support vessels, during the five year term of this EP. The adopted controls meet legislative requirements including:

- Marine Order 97 for support vessels
- NGRS and NPI reporting for direct emissions attributed to the Pyrenees FPSO
- National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015.

As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

**Demonstration of Acceptability**

**Acceptability Statement: Atmospheric Emissions**

Given the adopted controls, atmospheric emissions represent a negligible impact that is unlikely to result in greater than isolated impacts within close proximity of the Operational Area. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders and National Pollutant Inventory reporting.

The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of atmospheric emissions from the Pyrenees Facility to a level that is broadly acceptable.

**Acceptability Statement: Greenhouse Gas Emissions**

To assess and determine that impacts from GHG emissions will be of an acceptable level, Woodside considered corporate commitments, principles of Ecologically Sustainable Development, Company Values and Societal Values.

Principles of Ecologically Sustainable Development

Giving considerations to economic development that safeguards the welfare of future generations, Pyrenees is considered to align with the following core objectives of ESD by:

- Committing to management and mitigation measures for GHG emissions within operational control of the facility, given the uncertainty about future climate change trajectories.
- Committing to mitigation measures for indirect GHG emissions that are controlled or influenced by operator and connected to the operations of the Pyrenees facility.
- Continue to provide fuel for global markets and pursue the development of lower carbon energy sources with reference to the UN Sustainable Development Goal 7, Affordable and Clean Energy

Internal Context

The PAP is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including:

- Woodside Health, Safety, Environment Policy
- Woodside PetDW Risk Management Policy
- Woodside's Climate Policy
  - Included as Appendix K identifies principles aimed to achieve Woodside's objective to thrive in this energy transition as a low cost, lower carbon energy provider.
  - For Woodside, a lower carbon portfolio is one from which the net equity Scope 1 and 2 greenhouse gas emissions, which includes the use of offsets, are being reduced towards targets, and into which new energy products and lower carbon services are planned to be introduced as a complement to existing and new investments in oil and gas. Our Climate Policy sets out the principles that we believe will assist us achieve this aim.
  - The Climate Policy applies to all Woodside's employees, contractors, and joint venture partners engaging in activities under Woodside's operational control. Woodside managers are also responsible for promotion of the Climate Policy in non-operated joint ventures. Please note that the Climate Policy is reviewed regularly and is updated as required. The Climate Policy is made available on our website, along with the other Board policies: <https://www.woodside.com/who-we-are/corporate-governance-and-policies>.

External Context

GHG emissions are a global concern as such Woodside has undertaken an impact assessment of GHG associated with the Pyrenees operations and identified key measures to address this issue.

According to Wood Mackenzie Energy Research Consultancy, LNG from Woodside operated facilities is amongst the lowest carbon intensity in the world delivered into North Asia.<sup>37</sup>

The global consensus on climate change led to the implementation of the Paris Agreement. The aim of the Paris Agreement, as stated in the Article 2.1(a), is to hold the increase in global average temperature to well below 2°C above pre-industrial levels. The Agreement also aims to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising that this would significantly reduce the risks and impacts of climate change.

Paris Agreement text extract<sup>38</sup>:

<sup>37</sup> Export from the Wood Mackenzie LNG Carbon Emissions Tool available from: <https://www.woodside.com/docs/default-source/our-business---documents-and-files/pluto---documents-and-files/wood-mackenzie-lng-carbon-emissions-tool.pdf>

<sup>38</sup> Paris Agreement: [https://unfccc.int/files/meetings/paris\\_nov\\_2015/application/pdf/paris\\_agreement\\_english\\_.pdf](https://unfccc.int/files/meetings/paris_nov_2015/application/pdf/paris_agreement_english_.pdf)

“Article 2

1. This Agreement, in enhancing the implementation of the Convention, including its objective, aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by:

(a) Holding the increase in the global average temperature to well below 2 °C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5 °C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change;”

This was reaffirmed in December 2023 in the COP28 decision text on the First global stocktake.<sup>39</sup> The text further recognized that the transition away from fossil fuels in energy systems is to be done in a just, orderly and equitable manner accelerating action in this critical decade, so as to achieve net zero by 2050 in keeping with the science.<sup>40</sup> It also recognises that transitional fuels can play a role in facilitating the energy transition while ensuring energy security<sup>41</sup>.

The Paris Agreement establishes a framework where countries make Nationally Determined Contributions (NDCs) to manage and reduce their own emissions.

Australia has ratified the Paris Agreement and has set a target to reduce emissions by 43 per cent below 2005 levels by 2030 and to reach net-zero emissions by 2050. Australia’s emissions projections under a ‘with additional measures’ scenario is projected to be 43% below 2005 levels by 2030 and to reach net zero emissions by 2050 (DISER 2022a). Australia’s emissions projections demonstrate that it is on track to reduce emissions by up to 43% below 2005 levels by 2030 (DCCEEW 2022; DISER 2022a).

The Pyrenees FPSO facility will provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life. Woodside considers that this development is aligned with their goals for supporting the energy transition and is compatible with the Paris Agreement goal to limit global warming to below 2°C.

Woodside is a signatory to several global initiatives which are complementary to our corporate approach to methane emissions management, which include OGMP 2.0 (2024), Oil and Gas Climate Initiative Aiming for Zero Methane Emissions (OGCI Near-Zero) and the Methane Guiding Principles (MGP, 2022), which are voluntary, international multi-stakeholder partnerships between industry and non-industry organisations. Woodside will pursue compliance with these commitments at the Pyrenees facility in line with the control measures.

Other requirements (includes laws, polices, standards and conventions):

Legislation and other requirements considered relevant for this aspect, and a demonstration of how these requirements are met, are described below.

Requirement Demonstration	Requirement Demonstration
Marine Order 97 Gives effect to Annex VI of MARPOL 73/78	The requirements of Marine Order 97 are incorporated into the key control measures.
National Greenhouse and Energy Reporting (NGER) scheme Annual GHG reporting for facilities	The requirements of NGER reporting scheme are incorporated into the key control measures.
National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015 Emission intensity for reservoir carbon from new gas fields	The requirements of NGER Safeguard Mechanism are incorporated into the key control measures.
National Pollutant Inventory (NPI) Reporting Annual air pollutant reporting	The requirements of annual NPI reporting are incorporated into the key control measures.
Conservation Management Plan for the Blue Whale 2015–2025	As described above, the predicted atmospheric and GHG emissions from the Pyrenees facility are considered de minimis, with no link to climate change impacts on Australian or International receptors.

**Acceptability Statement: Greenhouse Gas Emissions**

As per Section 2.7.2 decision type B are acceptable if “ALARP”, demonstrated using good industry practice and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In addition, acceptability is assessed against the above criteria. Further opportunities to reduce the impacts have been investigated (refer ALARP demonstration discussion). Indirect GHG emissions associated with the Pyrenees facility are managed to an acceptable level by meeting (where they exist) legislative requirements, industry codes and standards, applicable company requirements, and industry guidelines, and these have been adopted as key controls.

The adopted controls are considered good oil-field practice/industry best practice and are consistent with Woodside's internal requirements. The potential impacts are considered acceptable if ALARP is demonstrated. As described above, the predicted GHG emissions associated with the Pyrenees facility are considered de minimis and as such, below the acceptable levels and will not materially or substantially contribute to Australia's net GHG emissions or net Global GHG emissions levels.

\* Defined as "Minor, temporary impact", as in Section 2.6.3

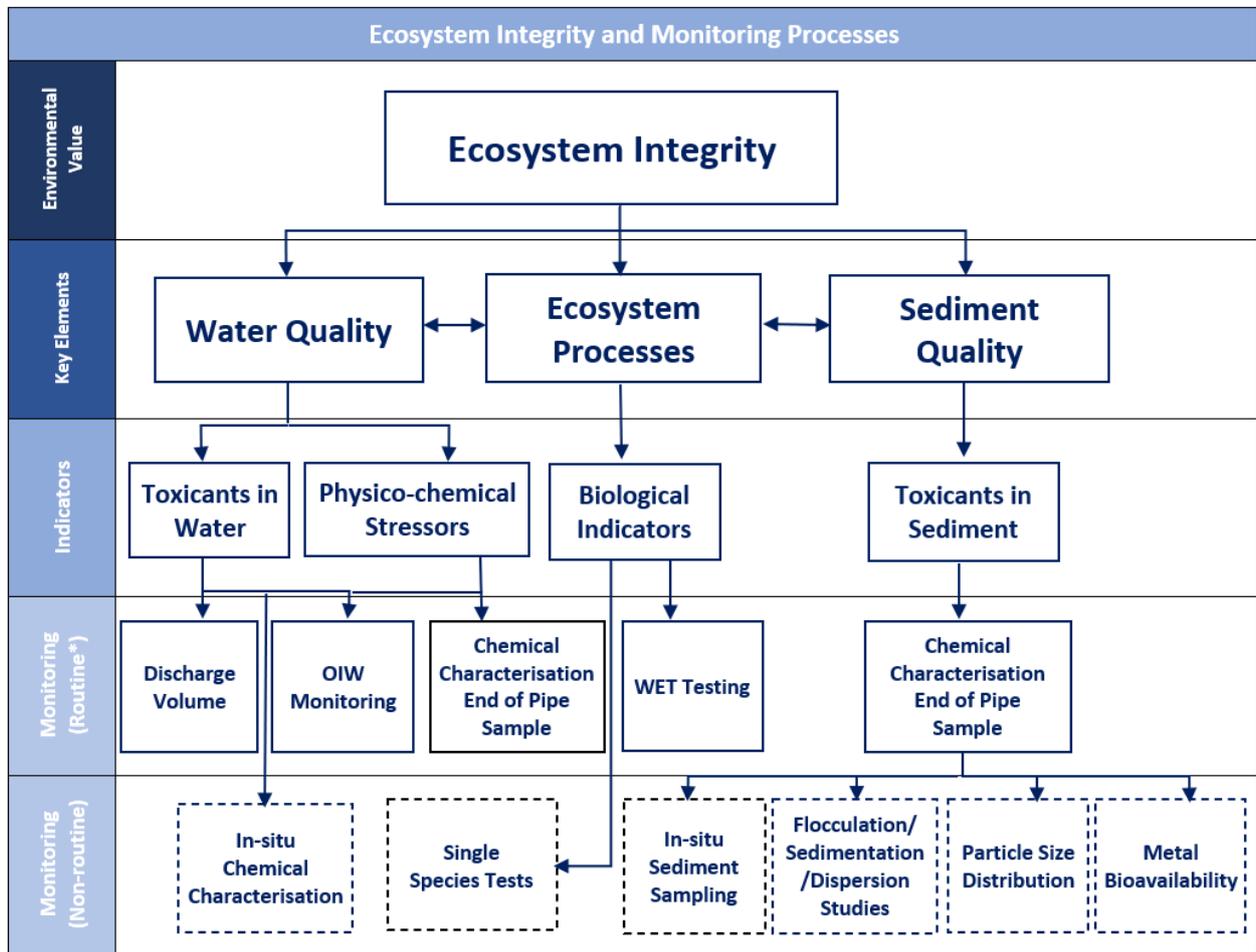

### 6.7.6 Routine and Non-routine Discharges: Marine Discharges - Produced Water

Context														
Pyrenees Facility – Section 3.10 Production Processes – Section 3.12				Physical Environment – Section 4.4 Habitats and Biological Communities – Section 4.5				Stakeholder Consultation – Section 5						
Impacts Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Discharge of PW and slops from the Pyrenees FPSO	-	x	x	-	x	x	-	B	1 - Minor	-	-	LCS GP PJ	Broadly acceptable	EPO 9
Description of Source of Impact														
<p>Produced water (PW) is formation water (derived from a water reservoir below the hydrocarbon formation) or condensed water (water vapour present within gas/condensate that condenses when brought to the surface), or a combination of both. Separation of water from reservoir fluids is not 100% effective and separated PW often contains small amounts of naturally occurring contaminants including dispersed oil, dissolved organic compounds (aliphatic and aromatic hydrocarbons, organic acids and phenols), inorganic compounds (e.g. soluble inorganic chemicals, dissolved metals etc.) and residual process chemicals. A description of the existing Production Water Treatment System (PWTS) has been provided in Section 3.12.5.</p> <p>PW is expected to be routinely reinjected during the duration of this EP although temporary deviations may occur due to maintenance or repairs to the reinjection system. To maintain operational flexibility PW overboard discharge of approximately 9,062 m<sup>3</sup>/day can be discharged overboard via the CFU and may plan to be discharged continuously over the next 2.5 years while the subsea injection system is being assessed for an upgrade. Provision to overboard is required to be retained to allow operational flexibility. 9,062 m<sup>3</sup>/day can be discharged overboard during upset conditions (production restart; maintenance or repairs to the reinjection system). If no PW is discharged, this impact and the associated EP requirements would cease. Although maintenance and repairs of the reinjection system will be required the facility is anticipating returning to &gt;90% reinjection.</p>														
Monitoring and Management Framework														
<p><b>Overview</b></p> <p>This section describes the monitoring and management framework which Woodside has developed to support the monitoring of PW discharges from offshore assets. The Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018) have been implemented and are consistent with the principles of the National Water Quality Management Strategy. Environmental values are defined as particular values or uses of the environment that are important for a healthy ecosystem or for public benefit, welfare, safety or health and that require protection from the effects of pollution, waste discharges and deposits (ANZG, 2018). The relevant environmental values considered are:</p> <ul style="list-style-type: none"> <li>ecosystem integrity – maintaining ecosystem processes (primary production, food chains) and the quality of water, biota and sediment.</li> </ul>														

- cultural and spiritual – in the absence of any specific environmental quality requirements for protection of this value, it is assumed that if water quality is managed to protect ecosystem integrity, this value is achieved in line with the guideline. The link between environmental protection and cultural heritage protection is described further in Section 6.10.

The relationship between key elements of ecosystem integrity, indicators and relevant monitoring activities undertaken on a routine and non-routine monitoring basis are shown in Figure 6-1. As per State Waters Technical Guidance: Protecting the quality of Western Australia’s marine environment (EPA 2016) key elements to maintain ecosystem integrity have been identified as water quality, sediment quality and biological indicators (biota). By limiting the changes to these key elements to acceptable levels there is high confidence ecosystem integrity is maintained. Monitoring changes in water quality as well as investigating potential toxicity via whole effluent toxicity (WET) testing and implementing management to maintain acceptable levels of change is standard industry practice in Commonwealth and State waters. The relevant indicators to understand changes in key elements and therefore potential for impact to ecosystem integrity are physicochemical stressors, toxicants in water, toxicants in sediment and biological indicators. Guideline values for each indicator have been defined and are monitored to detect changes. Guideline values serve as an early warning that potential changes may occur.

The approved mixing zone, protects 95% of species, as calculated using the ANZG (2018) statistical distribution methodology on the results of direct toxicity assessment using sub-lethal chronic endpoints. The protection of 95% of species guidelines have been adopted for a slightly to moderately disturbed system at the approved mixing zone boundary given the discharge location (as per ANZG, 2018). The approved mixing zone boundary for Pyrenees is 200 m from the facility. The justification for these limits of change being ‘acceptable’ is provided in the impact assessment section below.

\* May also be performed on a non-routine basis

**Figure 6-1 Ecosystem Integrity and Monitoring Processes**

**Operational Monitoring**

As described in Section 3.12.5, OIW is monitored during routine discharge operations via online analysers after the CFU and/or DGF. When an elevated OIW concentration is detected, PW is diverted to the slops tanks and, if required, for additional treatment (separation). PW discharged from the slops tank is monitored by an additional OIW analyser.

The process OIW analysers after the DGF and CFU are configured to allow the slops analyser to act as a back-up. If both online OIW analysers are unavailable, manual sampling is undertaken.

Online analyser information is sent via transmitter to the distributed control system (DCS) and is also captured within the process database. The DCS facilitates visibility in the control room, for manual or automated process control changes to be made, and/or initiate alarms (e.g. high OIW specification). The process database information is available onshore for analysis and trending. The results of manual sampling while the analyser is not available are stored in the daily Pyrenees Facility Production Report and the Enterprise Upstream (EU) database.

**Routine Monitoring**

PW is monitored and managed in accordance with the Offshore Marine Discharges Adaptive Management Plan (OMDAMP). The OMDAMP details routine monitoring, assessment against guideline values, analytical methods and actions when a guideline value is exceeded. The OMDAMP is reviewed annually and updated to reflect new methods and adaptive management. Any changes in the OMDAMP are subject to the Change Management requirements.

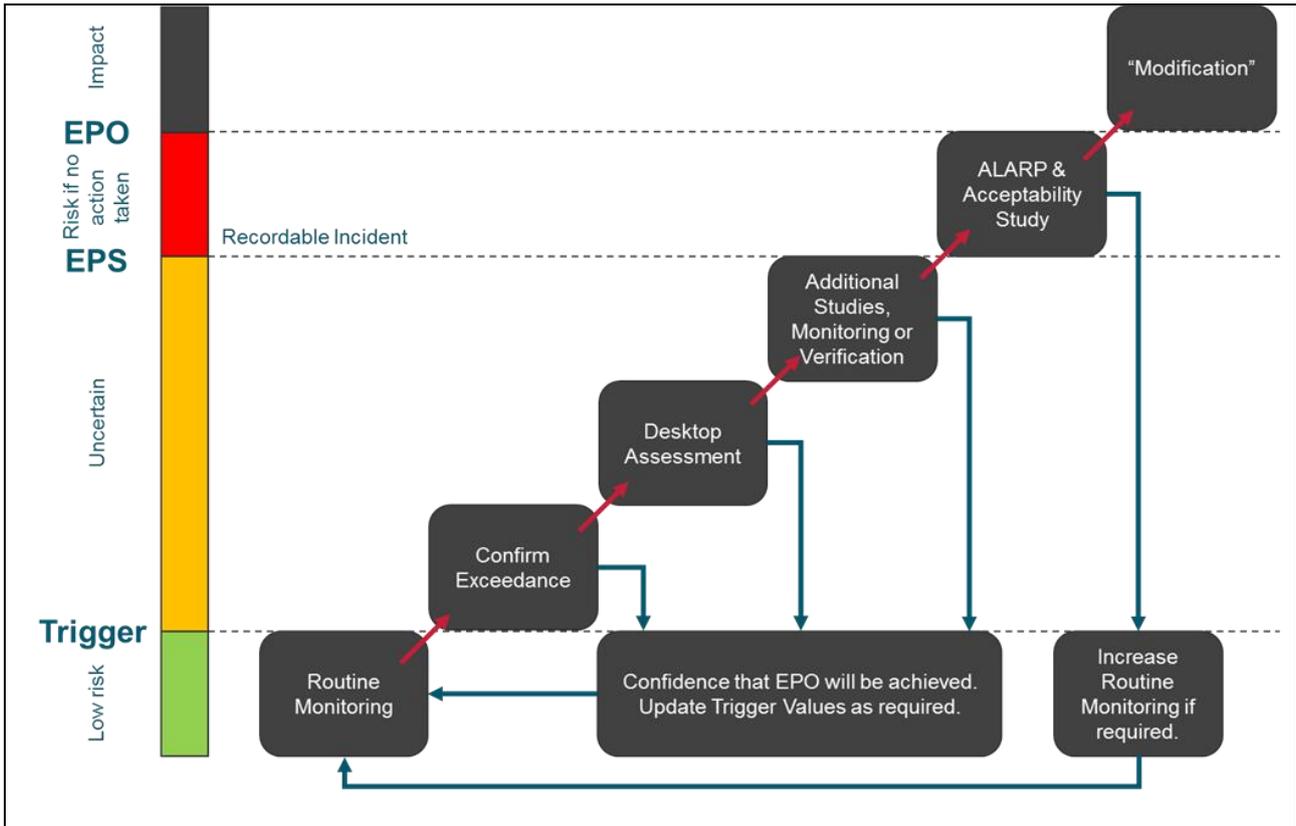

The guideline values are applied through a risk-based approach that is intended to capture uncertainty around the level of impact by staging monitoring and management responses according to the degree of risk to ecosystem integrity. The approach provides a level of confidence that management responses are not triggered too early (i.e. when there is no actual impact) or too late after significant or irreversible damage to the surrounding ecosystem (EPA 2016). Routine monitoring applicable to the facility is undertaken to compare against guideline values (described in Table 6-11). Unacceptable changes in water quality and undiluted PW toxicity can be detected early and can indicate the potential for an impact to biota and sediment prior to it occurring. Whole Effluent Testing (WET) testing confirms if there is a potential for impact on biota. It is not appropriate to monitor for changes in species composition, diversity, etc., as there are limited receptors in the direct impact zone (a surface buoyant plume), and such changes may be detected after an impact occurs, and therefore are not considered appropriate for early detection. PW samples should represent normal operations and be undertaken during periods of normal production at the facility. Where practicable, samples are taken soon after new wells are brought online or after wells cut water. If no PW is discharged, sampling will be suspended until the next discharge period.

The WET tests are undertaken on a broad range of taxa of ecological relevance for which accepted standard test protocols are well established. WET tests are mainly focused on the early life stages of test organisms, when organisms are typically at their most sensitive to contaminants are designed to represent local trophic level receptors. Mainly tropical Australian marine species were selected based on their ecological relevance, known sensitivity to contaminants, availability of robust test protocols, and known reproducibility and sensitivity as test species. The dilutions required to protect 95% of species is calculated using the Warne et al (2018) methodology. If a guideline value is exceeded, there is uncertainty around whether the environmental value is being protected and further investigation is required (Figure 6-2).

**Table 6-11 Guideline values and frequency of routine monitoring if PW is discharged from the Pyrenees Facility**

Parameter	Guideline Value	Frequency
Review of continuous operational OIW monitoring results	Increase in the average monthly OIW concentration by 5 mg/L for more than six consecutive months or by 10 mg/L for two consecutive months.	Monthly.
Chemical characterisation: end of pipe sample – physicochemical and toxicants	Results that are predicted to be higher than the 95% species protection trigger value at the approved mixing zone boundary and are above the results from the earlier toxicity year.	annually during routine operations.
WET testing	The 95% species protection safe dilutions derived from the WET testing species sensitivity distributions are not predicted to be achieved at the boundary of the approved mixing zone and are higher than previous years.	Three yearly, conducted in parallel with annual chemical characterisation
Discharge Volume	Mean discharge rate (m <sup>3</sup> /day) exceeds maximum modelled for defined approved mixing zone.	Monthly volume review

*Note: earlier toxicity year means the year in which the most recent WET test occurred. If a guideline value is exceeded, there is uncertainty around whether the environmental value is being protected and further investigation is required (Figure 6-2).*

**Figure 6-2 Routine Monitoring and Adaptive Management Framework for Produced Water**  
**Further Investigations**

Detectable exceedances in guidelines values may occur without impacting ecosystem integrity. To provide confidence that ecosystem integrity has been achieved, further investigation (as per OMDAMP) would be required in the form of a desktop study to initially assess the exceedance in context of available data (multiple lines of evidence) and confirm if there is potential for impact to the environmental value.

A range of methods can be used to detect guideline value exceedances (e.g. relative percentage difference, control charts, multivariate analysis, etc.) depending on the dataset available. An appropriate method is selected as described in the OMDAMP due to the variable nature of environmental data. If critical data are not available, the desktop study identifies potential data gaps and may recommend additional non-routine studies and/or monitoring to ensure the assessment is appropriately undertaken. The purpose of the 'further investigations' step is to provide certainty that the EPS has been achieved if a guideline value has been exceeded. The key investigation steps are described below.

Confirm the guideline value has been exceeded – Review quality assurance and quality control, methods and possible sources of contamination to determine if the results are reliable, or if any factors have occurred that may compromise the integrity of the monitoring or data.

Desktop assessment to understand whether the EPS is at risk – If a guideline value is confirmed to be exceeded, multiple lines of evidence are considered including historical and current data from routine and non-routine monitoring and studies. This assessment shall consider whether there is adequate evidence to demonstrate that acceptability criteria have been met and ecological integrity is not at risk (EPS not breached). If the desktop assessment determines that the existing body of evidence is insufficient, it shall outline what additional monitoring or studies are required. The desktop assessment is needed before undertaking any additional infield monitoring. It ensures monitoring programs are designed and implemented to provide robust findings based on good survey design. Potential additional monitoring/studies may include but are not limited to:

- single species toxicity testing (collected annually in parallel with routine chemical characterisation should further investigation be required)
- WET testing
- dilution modelling and/or studies
- flocculation, sedimentation, settling velocity and/or dispersion analysis
- metal bioavailability

- scanning electron microscopy and particle size distribution analyses
- in-situ monitoring (water quality and/or sediments).

Routine monitoring activities may be required ahead of schedule and additional monitoring not listed may be undertaken as appropriate. Field monitoring is undertaken in accordance with a plan that details timing, locations and objectives of monitoring.

Conduct additional studies to confirm the EPS is not at risk – Monitoring results provide additional lines of evidence to determine whether there is a risk to ecosystem integrity due to unacceptable changes in water quality, sediment quality, or biological indicators. Given the significant health, safety and technical risks, logistics and planning required, monitoring of the receiving environment is typically only considered when all other sources of evidence are insufficient to demonstrate that ecological integrity is not at risk. The OMDAMP provides detailed guidance on the steps and actions required to be undertaken if a trigger value is exceeded and this may include additional non-routine monitoring to verify that ecological integrity is maintained.

If environmental impact is deemed to be within acceptable limits of change, the desktop assessment may consider a review of guideline values to ensure they are appropriate. If the environmental impact is deemed to be outside of the acceptable limits of change, an ALARP/Acceptability study is required to determine what additional controls can be implemented to ensure the impacts are acceptable. An EPS breach is a Recordable Incident, which is reported and managed as outlined in Section 7.13.

**ALARP/Acceptability Study**

An ALARP/Acceptability study is conducted once it has been determined, as a result of further investigations, that there is potential for an impact that exceeds the acceptable limits of change. The ALARP/Acceptability study shall be conducted in accordance with the ALARP Demonstration Procedure, to determine additional controls that may be necessary to reduce the potential impacts. Additional management measures (controls) may include technology or process upgrades, and reservoir management. Woodside will implement the additional controls identified in the ALARP/Acceptability study, that are required to give confidence that the acceptable limits on environmental impact can be achieved. Field validation of model assumptions and additional monitoring to assess whether impacts have been realised using a gradient monitoring design will be considered.

**Impact Assessment**

Potential impacts from the PW discharge to the marine environment can occur from:

- changes to water quality
- toxicity to biota
- changes to sediment quality.

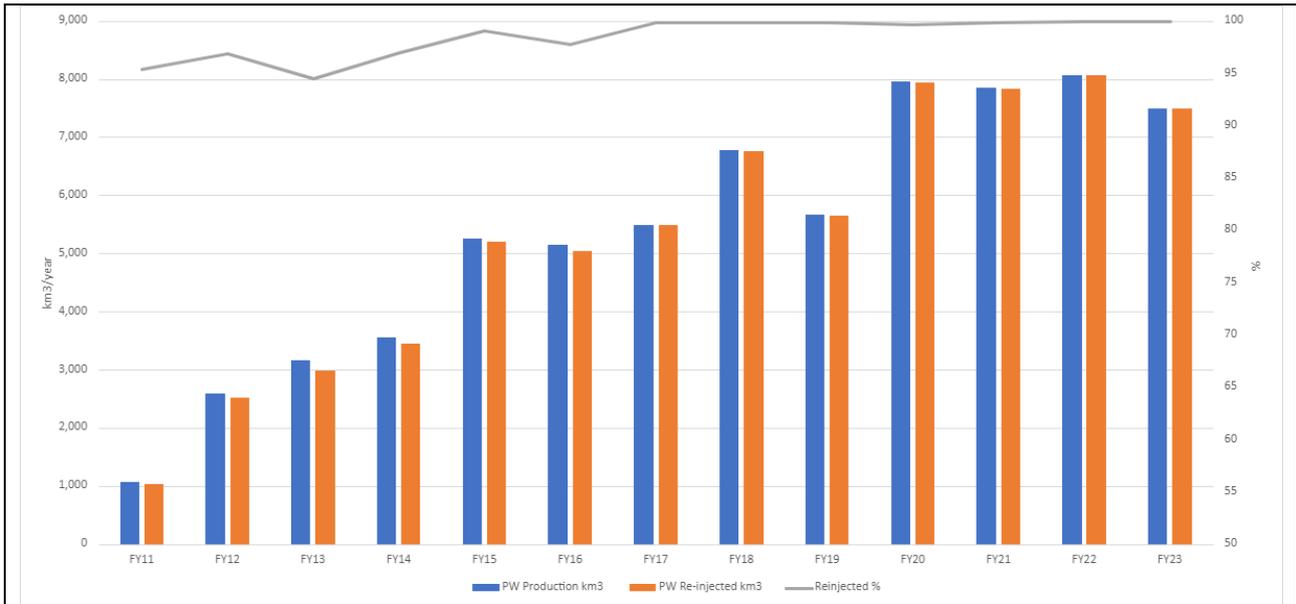

To understand potential impacts from PW discharges, Woodside has undertaken a suite of comprehensive in-situ testing and sampling related to PW discharges representing long-term operational periods from its offshore production facilities. The details of this testing and resultant understanding of potential environmental impacts are outlined below.

**Potential Impacts to Water Quality**

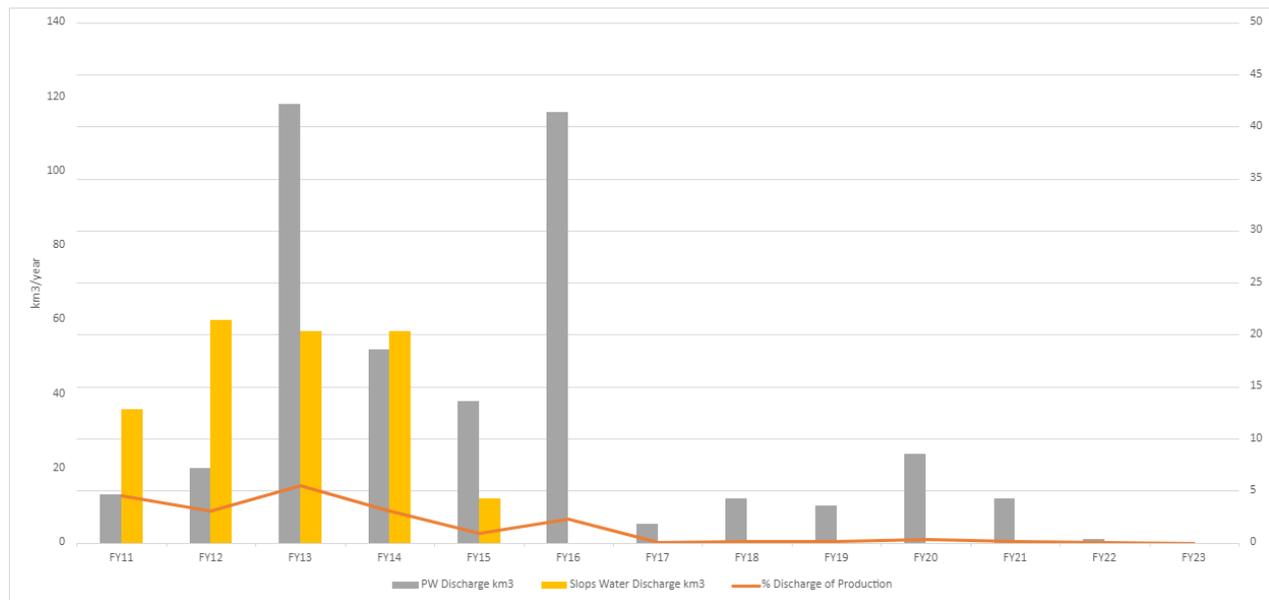

PW is discharged from the Pyrenees FPSO either directly overboard, via the CFU/DGF or via the slops tank at the surface (Section 3.12.5). The plume initially plunges and then rises to the surface as a positively buoyant plume in both scenarios. Potential impacts to water quality have been assessed through chemical characterisation of PW and potential discharge volumes. A change in water quality may occur following routine and non-routine discharges of PW due to process chemicals and residual hydrocarbon in the discharge streams resulting in increased toxicity levels in the vicinity of the discharge point.

**Discharge volumes**

Annual PW production volumes (km<sup>3</sup>) and PW reinjected into the reservoir from the Pyrenees Facility since operational commencement are summarised in Figure 6-4. PW has generally been reinjected back into the reservoir (95%-100% during FY11-FY23). Annual PW volumes (km<sup>3</sup>) discharged to the marine environment from the PW discharge point and the slops discharge are shown in Figure 6-4. PW discharged overboard (including slops) is a relatively small percentage of the PW volume produced (0%-5.5% in 2011- 2023). Slops water is diverted to the slops tank to be further processed and generally reinjected back into the reservoir (100% since FY16) with a relatively small volume discharged overboard prior to that (0%–3.4%).

**Figure 6-3 Annual PW production and reinjection volumes and reinjection percentage from FY11-FY23**

**Figure 6-4 Annual PW and slops water discharge overboard and percentage of production from FY11-FY23**

**Chemical Characterisation of PW (Physicochemical and Toxicants in Water)**

Produced water is known to rapidly dilute once discharged into the ocean, with individual constituent concentrations reducing to below respective guideline values within the approved mixing zone (SKM, 2006). Historical monitoring indicates the approved mixing zone has not been exceeded and provides high confidence that impacts from PW discharge are highly localised and pose negligible effects to environmental receptors (Advisian 2022). Water quality monitoring (in-situ and end of pipe) has been undertaken annually since 2011, with the exceptions of 2018 and 2019 when the FPSO was offline and 2022-2023 when no PW was discharged. Slops sampling was discontinued in 2016 due to 100% reinjection.

In most cases, the end of pipe results are either low or below guideline values resulting in achieving the guideline values within the approved mixing zone of 200 m after taking into account modelled dilutions. Nitrogen, Copper and

Zinc are the only contaminants that consistently exceed the ANZG (2018) end of pipe concentrations but are calculated to be diluted well before the mixing zone boundary (Advisian 2022). Annual surface water quality monitoring across a range of analytes (e.g. metals and metalloids, hydrocarbons, nutrients) has been conducted to coincide with routine end of pipe characterisation since 2016. Results indicate the physical influence of the PW discharge could not be detected in the water column beyond 50 m from the discharge location (Advisian, 2022).

PW may include low levels of naturally occurring radionuclides (NORMs) in particular, uranium 238 and thorium 232 decay chains and the longer-lived radionuclides lead 210, polonium 210, radium 226 (Ra-226) and radium 228 (Ra-228) (Coleman and West, 2000). These radionuclides can occur in produced water either in solution or as fine mineral suspended solids (OSPAR Commission, 2009).

Valeur and Petersen (2013) assessed the ecological hazard related to NORMs in PW discharged to the marine environment. They concluded that NORMs have a strong affinity for particulate matter and discharged NORMs would be adsorbed onto fine grained sediments and particulate matter relatively soon after introduction to the marine environment. In high energy environments, NORMs associated particles would settle and resuspend numerous times until they eventually settle in low energy environments in deep parts of the sea that serve as accumulation areas for fine grained sediments. Over time these particles would be buried beneath the benthic mixing layer of the seabed where they will become isolated from the biosphere and are unlikely to exceed background levels.

The concentration of Ra-226 and Ra-228 within the end of pipe samples has been assessed for Pyrenees PW discharges. Measurements of Ra-226 and Ra-228 in the Pyrenees PW range from below limit of detection to 6 - Bq/L, respectively (Advisian 2017, 2020, 2021). The average concentration of radioactivity (mainly K-40) in surface waters is 13.6 Bq/kg water (Walker and Rose 1990). Currently there are no ANZG (2018) guidelines or international guidance for concentrations of radionuclides in marine water, however, NORM concentrations for Ra-226 and Ra-228 were below the limit of reporting in all in-situ (receiving water) samples tested during water quality surveys (Advisian 2022). In the event that meter readings indicate an increased risk of NORMs on the Pyrenees FPSO, the treated PW and slops water will be tested for NORMs (Ra-226 and 228).

Given the low concentrations of radionuclides, its adsorption to fine grained sediments, no further investigation or analysis will be undertaken as the approved 200 m mixing zone is deemed appropriate. Potential toxicity risk would be accounted for during regular WET testing to determine PW toxicity. Toxic additives which may be present within the PW discharge stream include scale inhibitors, biocides, corrosion inhibitors and a range of other production chemicals (Section 3.15). Dosage concentrations are based on production process requirements. Monitoring and performance of chemical application is completed in line with the Pyrenees Chemical Application Manual. This covers recommended application rates, key performance indicators and monitoring requirements.

There is potential for a slight localised decrease in water quality at the discharge location within the mixing zone and limited adverse effects on marine biota. Within the approved mixing zone, impacts to pelagic fish are expected to be limited to avoidance of the localised area of the plume and short-term localised decline in planktonic organisms in the immediate vicinity of the discharge plume.

**Potential Impacts to Biota**

Most treated PW has low to moderate toxicity (Neff et al. 2011), with actual toxicity of discharge dependant on the chemical constituents of the formation water and any added process chemicals, the level of treatment and dilution with condensed water prior to release, and the dilution of the discharge as it mixes with sea water. Most hydrocarbons in PW are considered non-specific narcotic toxins with additive toxicities; therefore, the toxicity of a PW, in part, depends on the total concentration and range of bioavailable hydrocarbons (Neff 2002). Potential impacts of PW to biota have been assessed through WET testing and dilution modelling to verify the approved mixing zone is being achieved.

**WET testing**

WET testing has been undertaken to allow for interactions between toxicants and to take into account toxicants which cannot readily be measured or are not known to be present in the sample. A range of mainly tropical Australian marine species were selected based on their ecological relevance, known sensitivity to contaminants, availability of robust test protocols and known reproducibility and sensitivity as test species. Upon completion of WET testing, the results are combined into safe dilution estimates for the of 99 and 95% species protection. Routine WET testing has been completed in 2017 and 2021 (Table 6-12).

**Table 6-12 Calculated guideline values (SSD) and safe dilutions required to achieve predicted no effect concentrations**

Species Protection Level	Guideline value (Safe dilutions to achieve Predicted No Effect Concentration)	
	2017	2021
Year	2017	2021
PC99 (50)	0.72 (1:139)	1.90 (1:53)
PC95 (50)	1.8 (1:56)	3.00 (1:34)

A 'moderate' reliability GV for a 99% SPL was calculated as 0.72% PW in ambient seawater on a volume basis from the SSD method, which is equivalent to a safe dilution factor of 1:139. This GV dilution factor for a 99% SPL from the 2017 sample is considered to be representative of a worse case scenario of the facility's PW on the following basis:

- OIW below the DFG unit was 50-55 mg/L, well above the 30 mg/L trigger value allowed for discharge to the marine environment for 'normal' and 'upset' operating conditions, respectively;
- Daily Laboratory Reports of production chemicals usage (i.e. corrosion inhibitor, scale inhibitor, emulsion breaker) were within the ranges.
- Biocide was not injected during PW sampling; and
- TPH in the PW ecotoxicity sample (~7.5 mg/L) is representative of the annual to semi-annual end-of-pipe monitoring (median of 10.5 mg/L).

These results were confirmed again in 2021 by full suite WET testing which resulted in a guideline value of 1.90% PW with a corresponding safe dilution factor of 1:53.

#### **Determination of Approved Mixing Zone**

To determine the potential impact of the PW to the marine environment, modelling was conducted to predict the distance at which safe dilutions are achieved using the 2017 WET testing results to reflect the potential toxicity (RPS, 2017). Multiple cases were evaluated with different continuous PW flow rates over the three main seasons. This approach identifies seasonal variations (if any) and resultant exposure risks to environmental values and sensitivities.

The spatial extent of the mixing zone is <50 m from the outlet for normal operating conditions (up to 2,000 m<sup>3</sup>/day) and <200 m from the outlet for upset conditions (9,062 m<sup>3</sup>/day). As the cooling water (CW) is discharged within ~1.2 m to the PW outlet, the CW (up to 33,600 m<sup>3</sup>/day) enhances the dispersion of the PW stream upon discharge to the ambient marine waters which reduces the required number of dilutions (<1:139) to achieve 99% SPL at mixing zone boundary.

Surface water quality samples taken from a minimum of twelve locations using a gradient approach around the Pyrenees Facility in 2013, 2014, 2015, 2016, 2017, 2020 and 2021 (Advisian (2022)) found no exceedances outside of 50 m, which verifies the modelled rapid dispersion of the PW discharge.

#### **Water Temperature**

Near-field modelling predictions indicate that the 3°C temperature increase (threshold above ambient marine water temperature) is achieved within 5 m horizontally of the PW and cooling water discharge location (APASA 2017). Hence, thermal impacts on marine biota are not expected.

#### **Bioaccumulation**

Bioaccumulation refers to the amount of a substance taken up by an organism through all routes of exposure (water, diet, inhalation, epidermal). The Bioaccumulation Factor is the ratio of the steady-state tissue concentration and the steady-state environmental concentration (assuming uptake is from food and water). PW may contain BTEX, metals, NORMs, PAH and phenols which may potentially bioaccumulate in biota.

The most comprehensive field study assessing bioaccumulation of hydrocarbons and metals from PW discharged into offshore waters is that by Neff et al. (2011). At the request of the U.S. Environmental Protection Agency (USEPA), the Gulf of Mexico Offshore Operators Committee sponsored a study of bioconcentration of selected PW chemicals by marine invertebrates and fish around several offshore production facilities, discharging more than 731 m<sup>3</sup> per day of PW to outer continental shelf waters of the western Gulf of Mexico. The target chemicals identified by USEPA included five metals (As, Cd, Hg, <sup>226</sup>Ra and <sup>228</sup>Ra); three volatile monocyclic aromatic hydrocarbons (MAH), benzene, toluene, and ethylbenzene; and four semi-volatile organic chemicals, phenol, fluorene, benzo(a)pyrene, and di (2-ethylhexyl) phthalate. Additional MAH (m-, p-, and o-xylenes) and a full suite of 40 parent and alkyl-PAH and dibenzothiophenes were also analysed by Neff et al. (2011) in PW, ambient water and tissues at some facilities.

Concentrations of MAH, PAH and phenol as determined by Neff et al. (2011) were orders of magnitude higher in PW than in ambient seawater. There was no evidence of MAH or phenol being bioconcentrated. All MAH and phenol were either not detected (>95% of tissue samples) or were present at trace concentrations in all invertebrate and fish tissue samples. Concentrations of several petrogenic PAHs, including alkyl naphthalenes and alkyl dibenzothiophenes, were slighter, but significantly higher in some bivalve molluscs but not fish, from discharging than from non-discharging facilities. These PAH could have been derived from PW discharges or from tar balls or small fuel spills. Concentrations of individual and total PAH in mollusc, crab and fish tissues were well below concentrations that might be harmful to the marine animals or to humans who might collect them for food at offshore facilities (Neff et al. 2011). PAH concentrations from end of pipe samples from Pyrenees were below the limit of reporting and very low concentrations of BTEX were recorded (Advisian 2020, 2021). Bioaccumulation of BTEX compounds has been observed to occur in the laboratory (Berry, 1980), but only at concentrations far in excess of that discharged from the FPSO; hence, it is unlikely BTEX would bioaccumulate at the exposure concentrations that may be experienced by biota around the FPSO. Water quality sampling surveys showed BTEX, PAH, NORMs, phenols and metals (As, Cd, Hg) in receiving water samples around the Pyrenees facility are below the limit of reporting (LOR) (Advisian, 2022).

The potential environmental impact associated with bioaccumulation of PW constituents in the water column is considered to be very low and limited to a potential localised effect on a small number of non-threatened species in waters immediately surrounding the facility. The potential risk to fisheries is further reduced to ALARP as a result of negligible exposure given the PSZ that prohibits fishing from or near the Pyrenees FPSO. Given the nature of the discharge, the potential for bioaccumulation of contaminants (in particular BTEX) is considered to be minor and restricted to sessile organisms growing on the hull.

**Potential Impacts to AMPs, KEFs and BIAs**

Key Ecological Features

Values and sensitivities of the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula and Continental Slope Demersal Fish Communities KEFs are described in Section 4.7. Deposition of particulates from PW discharge and toxicity of PW in the water column could have the potential to impact these KEFs. Sediment quality impacts are discussed in the following section.

Australian and State Marine Parks

There are no Australian or State Marine Parks within the approved mixing zone. The protected areas nearest to the Operational Area, and therefore the mixing zone, are the Gascoyne Marine Park (7.7 km) and the Ningaloo Marine Park (8.6 km). Given the AMPs are beyond the approved mixing zone impact on Australian or State Marine Parks is not considered further.

Biologically Important Areas

Potential exposure of transient EPBC-listed species from PW discharge is likely to be limited to the approved mixing zone. Individual turtles associated with the 20 km marine turtle internesting buffer (Table 4-7), are not likely to be present in the vicinity of the PW discharge location given the water depth of approximately 200 m. The Pyrenees FPSO is located within the known seasonal (July-Nov) foraging area (BIA) for the whale shark. Considering the low volumes and low levels of PW discharges in the dispersive open environment of the licence area, impacts are considered to be of minor ecological significance to transient, EPBC listed species.

**Potential Impacts to Sediment Quality**

Accumulation of PW contaminants in sediments depends primarily on the volume/concentration of particulates in PW discharges or constituents that sorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths) and re-suspension, bioturbation and microbial decay of those particulates in the water column and on the seabed.

Contaminants in the PW discharge may be introduced into sediments through precipitation of soluble contaminants and flocculation and sedimentation of the particles in the discharge plume. A study into potential sediment accumulation from PW discharge found that the PW at Woodside facilities had very small amounts of solid material, with very little potential of settling or flocculation due to small particle sizes (Jacobs 2016). Dr Graeme Hubbert categorised particulate behaviour based on oceanographic experience and mathematical calculations using settling rates and resuspension velocities for various particle sizes. He determined that particles of a size 1 to 5 µm would never permanently settle out of the water column, and that particles of a size 5 to 40 µm would not permanently settle out of the water column, unless they were in very deep water (> 5000 m) or in areas where hydrodynamic conditions were very weak and did not continuously resuspend the particles (SKM, 2013). Samples will be collected of processed PW for overboard discharge to study the sediment particle sizes that are either in the discharged PW or which flocculate or precipitate out once in contact with seawater to better understand potential sedimentation near the Pyrenees facility.

The combination of elevated near-field dilution of the PW discharge upon exiting the outlet, low PW particulate concentrations (median TSS of 19 mg/L), deep waters (~200 m) and elevated currents (median of 0.2-0.3 m/s) yields a low risk of sediment quality degradation and associated benthic impacts. The 2015 and 2021 sediment quality monitoring programs did not identify any differences in sediment quality that could be attributed to operational discharges between the reference and impact sites (Advisian 2022). The chronic toxicity from PW exposure (GV dilution for 99% SPL) has been used to estimate the spatial extent of the mixing zone by dispersion modelling. Given the buoyant nature of the PW due to lower salinity (30.7 psu) and higher temperatures (55°C) relative to ambient conditions, any potential toxicity effects in the mixing zone will be limited to near surface waters and would not degrade sediment quality.

2017). The overarching objective of the Recovery Plan for Marine Turtles in Australia is to reduce detrimental impacts on Australian populations of marine turtles and hence promote their recovery in the wild. Five species of turtle may occur within the Operational Area, four which have BIAs that intercept the Operational Area. Of those, the Pilbara flatback turtle has internesting habitat identified as habitat critical to the survival of the species that intercepts the Operations Area (60 km buffer from nesting sites). The Recovery Plan identifies chemical discharge as a relevant threat to marine turtles and lists the following relevant priority action: 'Manage anthropogenic activities to ensure marine turtles are not displaced from identified habitat critical to the survival.'

With the proposed controls in place, Woodside considers the potential impacts and risk to marine turtles from changes in water quality from PW discharges are low. The proposed PAP is not inconsistent with the Recovery Plan for Marine Turtles, as impacts and risks associated with production waste discharges were considered in the Environmental Risk Assessment, and a range of control measures were identified and adopted during the ALARP assessments, as detailed below.

#### **Principles of Ecologically Sustainable Development**

Woodside has a strong history of exploration and development of oil and gas reserves in the north-west of Western Australia with an excellent environmental record, while providing revenue to State and Commonwealth Governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore with the aim of uncovering and developing resources. It is under the petroleum title lease agreement that Woodside continues to produce the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations.

Woodside has established a number of research projects in order to understand the marine environments in which it operates, notably in the Exmouth Region and the Kimberley Region, and also Rankin Bank, Glomar Shoals, Enfield Canyon and Scott Reef. Where scientific data does not exist, Woodside works from a base that a pristine natural environment exists and therefore, implements all practicable steps to prevent damage. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions.

Risks are inherent in petroleum activities; however, through sound management, systematic application of policies, standards, procedures and processes, Woodside considers potential PW impact is slight, short term and localised, and discharge of PW is acceptable.

#### **Internal Context**

The PAP is consistent with Woodside corporate policies, standards, procedures and processes as outlined in the Demonstration of ALARP (above) and Environmental Performance Outcomes (below), including:

- Woodside Environment and Biodiversity Policy and;
- Woodside Environmental Performance Procedure (which specifies maximum mixing zones and minimum sampling requirements).

Given that the 95% SPL approved mixing zone has been established (200 m from discharge), the proposed limits of acceptable change meet the requirements of the Environmental Performance Procedure.

Woodside corporate values include working sustainably, with respect to the environment and communities in which it operates, listening to internal stakeholders, relevant persons, and considering Health, Safety and Environment (HSE) when making decisions. Consultation has been undertaken prior to the PAP, as described below.

#### **External Context**

Woodside recognises that its licence to operate from a regulator and societal perspective is to some extent, based on historical performance, complying with appropriate policies, standards and procedures, and perception of the expectations of external stakeholders. External stakeholder consultation (Section 5) was undertaken prior to the PAP and stakeholder feedback (Section 5 and Appendix F) was incorporated into this EP where appropriate.

By providing PW monitoring and control measures that are commensurate with the risk rating, location, and sensitivity of the receiving environment (including social and aesthetic values), Woodside considers that societal concerns are addressed to an acceptable level.

#### **Acceptability Statement**

Routine and non-routine discharges of PW have been evaluated as representing potential slight, localised, short-term impacts to water quality, marine sediment, marine fauna and ecosystem/habitat. As per Section 2.6, Woodside considers 'high order impacts' (Decision Type B impacts such as PW discharge) as acceptable if ALARP is demonstrated using good industry practice, consideration of company and societal values and risk based analysis, if legislative requirements are met and societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained. In addition, acceptability is assessed against the above criteria. Further opportunities to reduce the impacts have been investigated (refer ALARP demonstration discussion). The adopted controls are considered good oil-field practice/industry best practice, are consistent with ANZG (2018) and Woodside's internal requirements. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of PW discharge to a level that is tolerable and demonstrate that the EPOs are met.

- discharge of residual hydrocarbons in subsea lines and equipment and small gas releases associated with isolation testing and breaking containment
- discharge of residual chemicals in subsea lines and equipment, or the use of chemicals (including pigging). These chemicals are used and discharged intermittently in small volumes. Small quantities of chemicals may remain in the flushed infrastructure, which may be released to the environment after disconnection
- discharge of residual fluids during non-routine repair and replacement works, including (but not limited to), small volumes of produced formation water (Section 6.7.6), hydraulic fluids and/or reservoir hydrocarbons.
- During non-routine repairs to the reinjection system there may also be small volumes (approximately 10 m<sup>3</sup>) of produced water discharged at the seabed.
- Liquid waste, including but not limited to:
  - Sewage, Grey Water and Food Waste from all project vessels: The volume of sewage and grey water generated by a typical FPSO is estimated to be in the order of 8 to 9 m<sup>3</sup> per day.
  - Deck drainage from all project vessels: Rainfall and wash down activities on the deck may result in minor quantities of chemical residues, such as detergent, oil and grease entering the deck drainage system and being possibly discharged overboard.
  - Cooling Water and Brine from all project vessels: Seawater is brought onboard and used throughout the Facility for the production of potable water via the flash evaporation water makers and to cool process equipment. The marine discharges from these processes include brine from the creation of potable water and heated seawater. The heated seawater may include sodium hypochlorite, which is used to suppress growth of fouling organisms in the internal seawater systems.
  - Firewater Deluge Testing: Testing of fire pump system using water from seawater lift system. Discharge of firewater to marine environment via a pipe over the side of the Pyrenees FPSO, thus avoiding full deck deluge and potential deck contaminants entering the marine environment. The discharge specification of firewater is similar to that of the cooling water discharge, i.e. chlorine from the Marine Growth Prevention System (MGPS).
  - Subsea fluids: Subsea valves are controlled hydraulically using fluid under pressure to adjust the position of the valve. The subsea control valves operate on an open circuit that leads to loss of subsea control fluid when the valve is activated. Residual hydrocarbons or chemicals remaining in subsea lines and equipment may also be released to the marine environment as a result of subsea intervention works or subsea inspection, maintenance and repair activities.

**Impact Assessment**

**Subsea Fluids**

Subsea control fluid is the main planned routine subsea chemical discharge. An industry standard water-based subsea control fluid is used to control wellhead valves remotely from the Pyrenees FPSO. This is an open loop system, with approximately 1 L of control fluid discharged from the wellhead valves on the seabed when they are operated, which generally only occurs on restart of the process after a shutdown.

Open loop systems are the most commonly used system because of their superior safety performance and reliability. Use of a closed loop system was considered during design of the facility, which recycles control fluids. However, this was not considered feasible due to the limitations of closed loop systems on the speed of valve operation and hence a greater potential for escalation of risks.

Open loop subsea control systems are an industry standard. Given the low volumes discharged during each event, and the limited number of release events, the potential impacts of this discharge are expected to be very localised, with only a slight impact on the marine environment. Consequently, the overall environmental impact is considered to be low.

Minor quantities of other subsea chemicals or hydrocarbons may be released during subsea intervention works or subsea inspection, maintenance and repair activities (refer Table 3-13 for example activities). An indicative list of chemicals used in the Pyrenees Facility subsea systems are listed in Section 3, all of which have an OCNS colour banding of Gold. Due to the water depth, small quantities of release and short duration of release, these chemicals and hydrocarbons will rapidly disperse into the water column (refer Table 3-14).

In summary, the Pyrenees Facility surface water quality monitoring program is designed to measure the effect of marine discharges on the environment to ensure the controls (described below) are effective. Analysis of the water samples includes metals and hydrocarbon contaminants as well as nutrients to examine the potential effects, if any, discharges such as sewage and putrescible waste. The approach for management of marine discharges follows the framework for environmental management outlined in ANZG (2018) and described previously in Section 6.7.6.

There is potential for slight, localised decrease in water quality at planned discharge locations and potential impacts on marine biota. Within the mixing zone, impacts to pelagic fish are expected to be limited to avoidance of the localised

area of the discharge and short-term, localised decline in planktonic organisms in the immediate vicinity of any discharge plume.

Produced formation water that is released subsea during non-routine maintenance and/or repair works is expected to have no more than minor impacts to water quality and species. Given the release would be a once off and the produced water is expected to rapidly disperse in the water column with potential impacts being minor, temporary and in close proximity to the release site

### **Liquid waste**

#### **Nutrient Enrichment**

Discharged macerated food scraps to the marine environment are expected to be rapidly diluted, dispersed and assimilated. No measurable impact to surrounding water quality, outside of a very small, localised mixing zone is expected based on the low volumes of discharge within an open ocean environment.

Some fish and oceanic seabirds may be attracted to the Pyrenees Facility and support vessels by the discharge of food scraps. This attraction may be either direct in response to increased food availability or secondary as a result of prey species being attracted to the facilities. However, because the waste is macerated prior to discharge and the discharge volumes involved are small, the impact is expected to be low.

The most significant environmental impact associated with ocean disposal of sewage is eutrophication. Eutrophication occurs when the addition of nutrients, such as nitrates and phosphates, causes adverse changes to the ecosystem, such as oxygen depletion and phytoplankton blooms. The loading of total nitrogen (TN) and total phosphorus (TP) from sewage discharge from the Pyrenees facility is estimated as follows:

- TN Load: 0.16 to 0.50 kg/day; and
- TP Load: 0.02 to 0.05 kg/day.

Food waste, a solid waste, is also a source of nutrient enrichment and is addressed in this section for the purpose of addressing cumulative effect. Studies on food waste on ships (Polglaze, 2003) have indicated average dry weight nutrient content of 2.4% TN and 0.4% TP. The total TN and TP loading from food waste discharge from the Pyrenees Facility is estimated as follows:

- TN Load: 0.94 kg/day; and
- TP Load: 0.16 kg/day.

The total nutrient load from sewage, grey-water and food waste from the Pyrenees Facility is estimated as follows: □

- TN Load: 1.10 to 1.44 kg/day; and
- TP Load: 0.18 to 0.21 kg/day.

Although the North West Shelf is characterised as a low nutrient environment (DEWHA, 2008) studies of adjacent waters have found the area to be "... a highly productive ecosystem in which nutrients and organic matter are rapidly recycled" (Furnas and Mitchell, 1999). The estimated daily loading is inconsequential in comparison to the daily turnover of nutrients in the area. The impact of nutrients associated with discharge of sewage, grey-water and putrescible waste is considered to be low because of the small mass relative to daily turnover, and the assimilative capacity of the receiving environment (open ocean).

### **Brine**

Desalination brine has a greater density than seawater and is expected to sink and disperse in the currents when discharged. The brine is predicted to have a concentration of around 60 ppt. On this basis, the largest increase of salinity experienced would be approximately 10% in the immediate vicinity of the discharge point. Most species are able to tolerate short-term fluctuations in salinity in the order of 20 to 30% (Walker and McComb, 1990) and it is expected that most pelagic species in the area would be able to tolerate short-term exposure to the slight increase in salinity caused by discharge of the brine.

### **Deck Drainage**

Rainfall and wash down activities on the deck may result in minor quantities of chemical residues, such as detergent, oil and grease entering the deck drainage system and being possibly discharged overboard.

### **Firewater deluge testing and cooling water**

Seawater is used for testing of the fire pump system. Seawater is directed through the firewater pumps and discharged overboard to the marine environment at a similar spec to that of cooling water.

Seawater is also used as a heat exchange medium for the cooling of machinery engines. Seawater is pumped on board then through heat exchangers and subsequently discharged with a temperature elevation in the order of 25°C above ambient. Approximately 48,000 m<sup>3</sup>/day of heated seawater is discharged from the system. When discharged to sea, the cooling water is subject to mixing and loss of heat to the surrounding waters.

The trajectory and dispersion of cooling water discharge has been modelled for a nominal discharge of 100,000 m<sup>3</sup>/day (and hence a conservative estimate of the estimated actual rate of 48,000 m<sup>3</sup>/day) at a water temperature of 46.3°C. The results indicate that at a flow of 100,000 m<sup>3</sup>/day there is a 50% probability of the temperature of surface water

within 25 to 50 m of the discharge point exceeding ambient temperature by more than 2°C. The probability of surface water temperature exceeding the ambient temperature by more than 2°C decreases to 1% within about 60 to 85 m of the discharge point, depending on seasonal variations in the surface currents (Figure 6-5).

The area of detectable increase in seawater temperature is likely to be less than 10 m radius and as such the overall environmental impact of cooling water discharge considered to be low.

The residual copper in the cooling water discharged to the marine environment is estimated to be between 0.52 to 0.69 ppb (as estimated during studies of similar system undertaken by the US Uniform National Discharge Standards Program (US EPA, 1999)). At these low concentrations, the copper will rapidly dilute to ambient background levels on discharge to the marine environment, and the discharge of copper is not expected to result in bioaccumulation. Copper is included as a parameter in the water quality monitoring program.

**Figure 6-5 Predicted dispersion and temperature of cooling water discharge (trajectory and dispersion of cooling water modelled for a nominal discharge of 100,000 m<sup>3</sup> at a water temperature of 25°C above surrounding seawater.**

There is potential for slight, localised decrease in water quality at planned discharge locations and potential impacts on marine biota. Within the mixing zone impacts to pelagic fish are expected to be limited to avoidance of the localised area of the discharge and short-term, localised decline in planktonic organisms in the immediate vicinity of the discharge plume.

**Sediment Quality**

Accumulation of contaminants in sediments (from subsea chemicals or hydrocarbon release), depends primarily on the volume/concentration of particulates in discharges or constituents that adsorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths), and the resuspension, bioturbation and microbial decay of those particulates in the water column and on the seabed. Valve actuation discharges are frequent but low in volume (typically <1 L per actuation). The subsea control fluid used in the open loop system (HT2) is water-based and has an OCNS rating of D with a substitution warning. The substitution warning is for the fluorescein dye which is approximately 150 ppm within the product, due to its low biodegradability. However, the product is non-toxic and does not have a potential to bioaccumulate. Once released the control fluid is expected to mix rapidly in the water column and become diluted, accumulation in sediments is not considered likely.

Given the frequency and volumes of hydrocarbon releases and its buoyancy, accumulation in sediments is not considered likely.

**Ecosystem / Habitats**

Sediments in the Operational Area are expected to be broadly consistent with those in the NWS Province such as sparsely populated silty/sandy sediment habitats (as described in Section 4.5), with filter feeders such as sponges, ascidians, soft corals and gorgonians associated with areas of hard substrate. The only areas of hard substrate expected in the vicinity are artificial habitat associated with subsea infrastructure. Impacts to ecosystems are not expected due to the localised nature of discharge plumes and potential for sediment quality impacts. Given the nature and scale of planned discharges, potential impacts are considered to be localised and negligible.

**KEFs**

The Operational Area of the PAP overlaps two KEFs, namely the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula and the Continental Slope Demersal Fish Communities. Treated sewage, grey water, macerated food waste, deck wash, brine and cooling water and subsea fluids generated during operations, will be managed consistently with MARPOL standards. This will result in volumes and quality of discharge being at a level that is unlikely to result in any impacts to the ecosystem function of the KEFs with any impact being minor and temporary in nature.

Discharges from subsea control fluids may be discharged during wellhead values, which is limited to operational restart or shutdown of the wellheads. Given the small volume and infrequent discharge of subsea chemicals, any impact is likely to be highly localised and not have any impacts to the ecosystem function of the KEFs.

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)<sup>42</sup></b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
<b>Legislation, Codes and Standards</b>				
Contract vessels compliant with Marine Orders for safe vessel operations: <ul style="list-style-type: none"> <li>Marine Orders 91 (Oil)</li> <li>Marine Orders 95 (Pollution prevention – Garbage)</li> <li>Marine Orders 96 – (Pollution prevention – sewage)</li> </ul>	F: Yes CS: Minimal cost. Standard practice.	Marine Orders required under Australian regulations; implementation is standard practice for commercial vessels as applicable to vessel size, type and class. Marine Orders 91, 95 and 96 (pollution prevention) reduces the potential impact of marine wastewater discharges on water quality.	Controls based on legislative requirements – must be adopted.	Yes C 8.1
<b>Good Practice</b>				
All operational chemicals intended or likely to be discharged to the marine environment will be assessed and approved through the Woodside chemical assessment process	F: Yes. Routinely implemented to the chemical selection process for Woodside facilities. CS: Minimal cost. Standard practice.	Selection and assessment of chemicals in accordance with the Woodside process, reduces environmental impacts associated with planned chemical discharge.	Benefits outweigh cost/sacrifice.	Yes C 7.1

<sup>42</sup> Qualitative measure

Open and closed drainage systems will be maintained in accordance with system requirements	F: Yes CS: Minimal cost. Standard practice.	The open hazardous drain system will be maintained to support appropriate disposal of environmentally hazardous liquids.	Benefits outweigh cost sacrifice.	Yes C 8.4
Sewage treatment and discharge equipment onboard to treat sewage and reduce impact to the environment and maintained in good working order.	F: Yes CS: Minimal cost. Standard practice.	The treatment and discharge equipment will be maintained to support the appropriate disposal of sewage.	Benefits outweigh cost sacrifice.	Yes C 8.5
Route hydrocarbons to vessel during disconnection of subsea infrastructure.	F: Yes. However, to do so would introduce significant safety risks to the vessel crew (fire, explosion, asphyxiation). CS: Significant. Equipping and training crew onboard subsea support vessels to safely route hydrocarbons to the vessel would result in significant additional costs (in addition to the increased safety risk identified above).	Small environmental benefit from preventing low concentration hydrocarbon discharge.	Given the increased safety risk and the very low environmental impact from hydrocarbon releases during subsea IMMR activities, the cost of routing hydrocarbons to the vessel is grossly disproportionate to the environmental benefit	No
Decrease frequency of valve actuation.	F: Yes. However, decreasing the frequency of valve may adversely impact the safe functionality and reliability of valves. Reducing the performance of subsea valves may introduce operability impacts, and increased safety and environmental risk associated with loss of containment events. CS: Minimal cost.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location, and types of fluid discharged in an open-ocean environment, and reducing the number of discharges would provide little or no environmental benefit.	Decreasing the frequency of valve actuations would lead to a potential decrease in safe functionality and reliability of valves. When considering the potential safety and environmental risks from such a performance degradation, along with the minor impact from the release of control fluids, the cost of decreasing the frequency of valve actuations is considered to be grossly disproportionate to the environmental benefit.	No

**Demonstration of Acceptability**

**Acceptability Statement:**

The impact assessment has determined that, given the adopted controls, planned routine and non-routine hydrocarbon and chemical discharges represents a localised, minor impact that is unlikely to result in a lasting potential impact on water quality, marine sediment or ecosystem habitat. Further opportunities to reduce the impacts have been investigated above. Fluid discharges from the subsea system during operations and IMMR activities are routine in the oil and gas industry. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine hydrocarbon and chemical discharges to a level that is tolerable and demonstrate that the EPOs are met.

## 6.8 Unplanned Activities (Accidents, Incidents, Emergency Situations)

### 6.8.1 Quantitative Spill Risk Assessment Methodology

Quantitative hydrocarbon spill modelling was undertaken by RPS and GHD, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, Spill Impact Mapping and Analysis Program (SIMAP), which is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces.

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form OIW emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each of the particles (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

All hydrocarbon spill modelling assessments undertaken by RPS and GHD undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

#### 6.8.1.1 Hydrocarbon Characteristics – Pyrenees Crude

##### 6.8.1.1.1 Pyrenees Crude

The relevant characteristics of the crude oils from the Pyrenees reservoirs are listed within Table 6-13.

Based on the ITOPF classification system, Pyrenees crude can be classified as a Group III oil. Group III oils can lose up to 40% by volume through evaporation. As a general rule, the higher the API of the oil (and the lower the specific gravity), the less persistent it will be after a spill.

The data collected on the well fluids suggest that, like the Ravensworth, Crosby and Stickle crude, each reservoir hydrocarbons were expelled from mature sediments that were deposited under sub-oxic (probably marine) conditions, and contain a mixed marine and land-plant-influenced organic matter suite. Steranes based maturity parameters calculated from the branched-cyclics data indicate that all reservoir oil is essentially the same as Ravensworth, Crosby and Stickle crude. Therefore it is considered that the characteristics of all hydrocarbons returned to the Pyrenees FPSO, processed, and stored in the cargo tanks are very similar and therefore considered to have the same characteristics (including weathering).

Based on the ITOPF classification and data analysis of the reservoir hydrocarbons, the characteristics of the most persistent reservoir crudes, hereafter referred to as 'Pyrenees Crude' was used in the modelling and spill risk assessment to ensure the worst-case cargo loss scenario was assessed (see the characteristics in Table 6-13).

**Table 6-13: Characteristics of Pyrenees Crude**

Hydrocarbon Type	Initial Density (g/cm <sup>3</sup> at 15°C)	Viscosity (cP at 40°C)	Component	Volatiles <180°C	Semi-volatiles 180-265°C	Low volatility 265-380°C	Residual >380°C	Aromatic of whole product <380°C (BP)
				Non-persistent			Persistent	
				Boiling Point (BP) (°C)				
Pyrenees Crude	0.9378	55.5	% of total	0.6	8.5	36.13	54.4	14.18
			% aromatics	0.015	0.11	14.05	-	-

### 6.8.1.2 LOWC scenario

Modelling for the LOWC scenario was conducted by GHD for the Pyrenees Phase 4 drilling program. Martin Linge Crude 13C was selected from SINTEF's oil library as the crude analogue. A comparison of the whole oil properties for Stickle Crude, Pyrenees crude and SINTEF's Martin Linge Crude 13C (below) indicates a close match between the four crude oils.

**Table 6-14: Comparison of whole crude properties of Pyrenees, Stickle and SINTEF's Martin Linge Crude 13C**

Parameter	Crosby Crude Oil	Pyrenees Crude Oil	Stickle Crude Oil	SINTEF: Martin Linge Crude 13C
API Gravity	19.42	19.3	18.7	20.73
Wax Content	0.2	0.5	0.5	0.66
Pour Point (°C)	<-24	-30		-36
Asphaltene (%)	0.2	<0.5	0.4	0.11
Specific Gravity	0.9376	0.9374	0.89	0.93
Viscosity (cP)	19 @ 63° C	59.13@ 40° C	11.1 @ 62° C	294 @ 13° C

### 6.8.1.3 Environment that May Be Affected and Hydrocarbon Contact Thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental consequence by delineating which areas of the marine environment could be exposed to hydrocarbon levels exceeding selected hydrocarbon threshold concentrations if a credible hydrocarbon spill scenario occurred. The summary of the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA. The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for a variety of weather and metocean conditions, and the EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs.

As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is presented for each hydrocarbon fate. Together, these EMBA have defined the spatial extent for the existing environment described in Section 4.

The spill modelling outputs are presented as areas that meet threshold concentrations for surface, entrained and dissolved hydrocarbons for the modelled scenarios. Surface spill concentrations are expressed as grams per square metre (g/m<sup>2</sup>), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb). A conservative approach to selecting thresholds was taken by adopting the guideline impact thresholds (NOPSEMA, 2019) for surface, entrained, dissolved and accumulated hydrocarbons to define the EMBA for condensate spills from a loss of well control and loss of marine diesel. An additional threshold has been included to define the boundary within which socio-cultural impacts may occur, based on visible surface oil (1 g/m<sup>2</sup>) impacting on the visual amenity of the marine environment and is described below. Each of these hydrocarbon thresholds are presented in Table 6-15.

**Table 6-15: Summary of Thresholds Applied to the Quantitative Hydrocarbon spill Risk Modelling Results**

Hydrocarbon Type	Surface Hydrocarbon (g/m <sup>2</sup> )	Dissolved Hydrocarbon (ppb)	Entrained Hydrocarbon (ppb)	Accumulated Hydrocarbon (g/m <sup>2</sup> )	Scientific Monitoring (g/m <sup>2</sup> )
Crude Oil	10	50	100	100	1
Marine Diesel	10	50	100	100	1

### 6.8.1.4 Scientific Monitoring

A planning area for scientific monitoring is also described in the Oil Spill Preparedness and Response Mitigation Assessment (Appendix H). This planning area has been set with reference to the low exposure entrained value of 10 ppb detailed in the NOPSEMA (2019) bulletin Oil Spill Modelling.

A scientific monitoring program may be activated following a Level 2 or 3 unplanned hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) for the entire EMBA and in particular, any identified Pre-emptive Baseline Areas (PBAs) for the worst-case credible spill scenario(s) or other identified unplanned hydrocarbon releases associated with the operational activities.

## 6.8.2 Unplanned Hydrocarbon Release: Loss of Well Containment

Context														
Subsea Infrastructure Layout and Description – Section 3.4 FPSO Disconnected Mode – Section 3.11.2			Physical Environment – Section 4.4 Biological Environment – Section 4.5					Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Release of hydrocarbons resulting from loss of well containment.		x	x	x	x	x	x	B	5 - Severe	Highly Unlikely	30	LCS GP RBA SV	Tolerable	EPO 11
Description of Source of Risk														
<p><b>Source of Risk</b></p> <p>A loss of well containment can lead to an uncontrolled release of reservoir hydrocarbons or other well fluids to the environment. Woodside has identified a loss of well containment (LOWC) as the scenario with the worst case credible environmental outcome as a result of this event. The causes of a loss of well containment may include, but are not limited to:</p> <ul style="list-style-type: none"> <li>• internal corrosion</li> <li>• external corrosion</li> <li>• erosion</li> <li>• overpressure of the annuli</li> <li>• fatigue</li> <li>• loss of control of suspended load from vessel (operating near subsea wells).</li> </ul> <p><b>Loss of Well Containment – Credible Scenario</b></p> <p>The PAP includes production from a series of subsea wells. The worst-case credible hydrocarbon spill scenario involves a long-term (69-day) uncontrolled subsea release of 115,600 m<sup>3</sup> of Pyrenees Crude<sup>43</sup>. The loss of well containment scenario was assumed to have a duration of 69 days. This duration is based on the estimated time required to successfully drill an intervention well.</p> <p><b>Quantitative Spill Risk Assessment</b></p> <p>Spill modelling of the worst-case credible loss of well containment spill scenario was undertaken by GHD, to determine the fate of hydrocarbons released based on the assumptions in Section 6.8.1. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA</p>														

<sup>43</sup> Existing modelling was undertaken in 2022 for a release of 156,774 m<sup>3</sup> of Stickle crude at the Stickle 4H-1 well. Given that the available modelling is 41,174 m<sup>3</sup> larger than then spill risk for this activity and is similar distance to the nearest shoreline, it is deemed representative and additional modelling for these areas was therefore not required.

and the potential impacts from the identified worst-case credible release volumes for all loss of well containment scenarios.

**Hydrocarbon Characteristics**

Hydrocarbon characteristics are provided in described in more detail in Section 6.8.1.1.

**Subsea Plume Dynamics**

The loss of well containment scenarios will result in a buoyant plume of hydrocarbons, which has been modelled using the OILMAP-Deep numerical model.

**Likelihood**

In accordance with the Woodside PetDW Risk Matrix, a worst-case loss of well containment has been defined as a 'highly unlikely' event. Information to support this likelihood determination is outlined below. This assessment considers the likelihood of the worst-case credible scenario occurring.

A review of industry statistics indicates that the probability of a loss of well containment for production wells is low (10.6% of 292 recorded blowouts), relative to other activities in other hydrocarbon provinces (Gulf of Mexico and the North Sea), such as exploration drilling (31.5% of blowouts), development drilling (23.6% of blowouts) and well workovers (20.5% of blowouts) (SINTEF, 2017). Separate analysis of blowout data collected between 1991 and 2010 in the North Sea and the US Gulf of Mexico shows that only ten blowouts occurred during the production phase at a frequency of  $1.36 \times 10^{-5}$  blowouts per well year, with all of these events occurring in the US Gulf of Mexico and none occurring in the North Sea (Scandpower, 2013). North Sea standards of well design and operation are considered to be aligned with those applied by Woodside, as outlined in the Pyrenees Well Operations Management Plan (WOMP). This data quantitatively supports the likelihood ranking as described above.

**Consequence**

The spatial extent and fate (including weathering) of the spilled hydrocarbons were considered during the impact assessment for the identified worst-case loss of well containment scenario (presented in the following section). These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by GHD, available information on environmental sensitivities that may credibly be impacted in the event of either worst-case spill event, and relevant literature and studies considering the effects of hydrocarbon exposure. The consequence was considered to be Severe (5).

**Consequence Assessment**

**Environment that May be Affected**

Surface Hydrocarbons

The stochastic modelled floating hydrocarbon EMBA from both loss of well containment is forecast to drift in all directions, reflecting the competing influence of both surface currents and winds across the wide area in which a large and persistent slick could travel over the long duration of the release. At the surface threshold of 10 g/m<sup>2</sup>, floating oil is forecast to potentially occur up to approximately 600 km from the release site. The potential contact above impact thresholds at a number of receptors.

Entrained Hydrocarbons

Stochastic modelling indicated entrained hydrocarbons are forecast to potentially drift in all directions, with the most likely directions of travel being to the south-west of the release site, due to the influence of the NWMR seasonal currents. The modelling indicated that the entrained hydrocarbon EMBA above the 100 ppb threshold concentrations could potentially occur up to 1600 km for the loss of well containment scenario; contact above impact thresholds was forecast at a range of receptors.

Dissolved Hydrocarbons

Dissolved hydrocarbons at the low threshold (10 ppb) were predicted to occur within a limited area up to ~100 km from the spill site. There were no predicted exceedances of the moderate (50 ppb) or high (400 ppb) thresholds anywhere within the model domain. The relatively low flow rate and low proportion of soluble components within the crude oil is insufficient to generate dissolved hydrocarbon concentrations at or above the moderate threshold.

Accumulated Hydrocarbons

Shoreline loading above the low threshold (>10 g/m<sup>2</sup>) was predicted to occur between the Esperance Region (~1900 km to the southeast), and East Nusa Tenggara (~1900 km to the northeast).

**Summary of Potential Impacts to Environmental Value(s)**

Table 6-16 presents the full extent of the EMBA for loss of well containment (within which all other credible hydrocarbon spill EMBA's are contained), i.e. the sensitive receptors and their locations that may be exposed to hydrocarbons (surface, entrained, dissolved and accumulated) at or above the set threshold concentrations in the unlikely event of a loss of well containment during the PAP. Details of these receptors are outlined in Section 4. The

potential biological and ecological impacts of an unplanned hydrocarbon release as a result of a loss of well containment during the PAP are discussed in the following sections.

**Summary of Potential Impacts to Environmental Value(s)**

**Open Water Environment (Near Spill Area)**

**Air Quality**

A hydrocarbon release during a loss of containment has the potential to result in localised, temporary reduction in air quality and contribution of greenhouse gases to the global concentration of these gases in the atmosphere. Potential impacts from reduced air quality are expected to be minor, short-term and predominantly localised.

There is potential for human health effects for workers in the immediate vicinity of atmospheric emissions. The ambient concentrations of methane and VOCs released from diffuse sources is difficult to accurately quantify, although the behaviour and fate is predictable in open offshore environments as it is dispersed rapidly by meteorological factors such as wind and temperature. Methane and VOC emissions from a hydrocarbon release in such environments are rapidly degraded in the atmosphere by reaction with photo chemically-produced hydroxyl radicals.

Due to the unlikely occurrence of a loss of containment; the temporary nature of any methane or VOC emissions (from the weathering of liquid hydrocarbons from a loss of containment); the predicted behaviour and fate of methane and VOCs in open offshore environments; and the significant distance from the Operational Area to the nearest sensitive air shed (town of Exmouth approximately 40 km away), the potential impacts are expected to be minor and short-term.

**Water Quality**

Water quality would be affected in the offshore environment within the EMBA due to hydrocarbon contamination from entrained, dissolved and surface hydrocarbons. Due to the weathering processes of the hydrocarbons, impacts to water quality are anticipated to be minor long term and/or significant short term as a result of hydrocarbon contamination above background levels.

**Marine Sediment Quality**

Floating, entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Hydrocarbons may accumulate (at or above the ecological threshold) at a range of nearshore receptors. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

Studies of hydrocarbon concentrations in deep sea sediments in the vicinity of a catastrophic well blowout indicated hydrocarbon from the blowouts can be incorporated into sediments (Romero et al., 2015). Proposed mechanisms for hydrocarbon contamination of sediments include sedimentation of hydrocarbons and direct contact between submerged plumes and the seabed (Romero et al., 2015).

In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, the extent of potential impacts to the seabed area at and surrounding the release site would be largely confined to a localised footprint. Marine sediment quality would be reduced as a consequence of hydrocarbon contamination for a small area within the immediate release site for a long to medium term, as hydrocarbons in sediments typically undergo slower weathering and degradation (Diercks et al., 2010; Liu et al., 2012).

There is the potential for floating and entrained hydrocarbons to sink following extensive weathering and adsorption of sediment particles, which may result in the deposition of hydrocarbons to the seabed in areas distant from the release location. Such hydrocarbons are expected to be less toxic due to the weathering process.

**Summary of Potential Impacts to Environmental Value(s)**

***Benthic Fauna Communities***

In the event of a major release at the seabed, the stochastic spill model predicted hydrocarbons droplets would be entrained, rapidly transporting them to the sea surface. As a result, the low sensitivity benthic communities associated with the unconsolidated, soft sediment habitat and any epifauna (filter feeders) associated with the Canyon KEFs, and the Continental Slope Demersal Fish Communities KEF, refer to Section 4.7) within and outside the Operational Area are not expected to have widespread exposure to released hydrocarbons. Impacts are expected to be restricted to a localised area relating to the hydrocarbon plume at the point of release, which would result in a small area of seabed and associated epifauna and infauna exposed to hydrocarbons.

Heterotrophic, filter feeding organisms, such as sponges and gorgonians, have been identified as potentially occurring in the canyon features located within the wider EMBA. In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, hydrocarbon exposure to these deep-water filter-feeding communities is unlikely, and exposure at concentrations of ecological consequence is not expected to occur where these heterotrophic communities exist.

Evidence from the Deepwater Horizon spill in the Gulf of Mexico recorded low taxa richness and high nematode/harpacticoid-copepod ratios within 3 km of the release location and moderate impacts up to 17 km away (Montagna et al., 2013). The communities were likely exposed to dispersed hydrocarbons as the response included subsea dispersant application. A loss in benthic biodiversity has been correlated to a decline in deep-water ecosystem functioning (Danovaro et al., 2008). The location of the petroleum activity and the EMBA largely affect continental shelf waters, which are shallower than the Deepwater Horizon spill, and as such may host more diverse infauna communities, although the impacts are considered to be similar. Therefore, a loss of well containment may result in localised but long-term effects on community structure.

***Demersal and Pelagic Fish Populations***

Fish mortalities are rarely observed to occur as a result of hydrocarbon spills (International Tanker Owners Pollution Federation, 2011b). This has generally been attributed to the possibility that pelagic fish are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Fish that have been exposed to dissolved aromatic hydrocarbons are capable of eliminating the toxicants once placed in clean water, so individuals exposed to a spill are likely to recover (King et al., 1996). Where fish mortalities have been recorded, the spills (resulting from the groundings of the tankers Amoco Cadiz in 1978 and the Florida in 1969) have occurred in sheltered bays.

Laboratory studies have shown that adult fish are able to detect hydrocarbons in water at very low concentrations, and large numbers of dead fish have rarely been reported after hydrocarbon spills (Hjermann et al., 2007). This suggests that juvenile and adult fish are capable of avoiding water contaminated with high concentrations of hydrocarbons. However, sub-lethal impacts to adult and juvenile fish may be possible, given long-term exposure (days to weeks) to polycyclic aromatic hydrocarbon (PAH) concentrations (Hjermann et al., 2007), which are typically the most toxic components of hydrocarbons. Light molecular weight aromatic hydrocarbons (i.e. one- and two-ring molecules) are generally soluble in water, which increases bioavailability to gill-breathing organisms such as fish. While modelling of the loss of well containment indicates the potential EMBA for dissolved hydrocarbons is extensive, no time-integrated exposure metrics were modelled; given the oceanographic environment within the wider EMBA, PAH exposures in the order of weeks for pelagic fish are not considered credible.

The effects of exposure to oil on the metabolism of fish appears to vary according to the organs involved, exposure concentrations and route of exposure (waterborne or food intake). Oil reduces the aerobic capacity of fish exposed to aromatics in the water and, to a lesser extent, affects fish consuming contaminated food (Cohen et al., 2005). The liver, a major detoxification organ, appears to be the organ where anaerobic activity is most impacted, probably increasing anaerobic activity to facilitate the elimination of ingested oil from the fish (Cohen et al., 2005).

Fish are perhaps most susceptible to the effects of spilled oil in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Contact with oil droplets can mechanically damage feeding and breathing apparatus of embryos and larvae (Fodrie and Heck, 2011). The toxic hydrocarbons in water can result in genetic damage, physical deformities and altered developmental timing for larvae and eggs exposed to even low concentrations over prolonged timeframes (days to weeks) (Fodrie and Heck, 2011). More subtle, chronic effects on the life history of fish as a result of exposure in early life stages to hydrocarbons include disruption to complex behaviours such as predator avoidance, reproductive and social behaviour (Hjermann et al., 2007). Prolonged exposure of eggs and larvae to weathered concentrations of hydrocarbons in water has also been shown to cause immunosuppression, and allows expression of viral diseases (Hjermann et al., 2007).

PAHs have also been linked to increased mortality and stunted growth rates of early life history (pre-settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen et al., 2017). However, the effect of a hydrocarbon spill on a population of fish in an area with fish larvae and/or eggs, and the extent to which any of the adverse impacts may occur, depends greatly on prevailing oceanographic and ecological conditions at the time of the spill and its contact with fish eggs or larvae.

**Summary of Potential Impacts to Environmental Value(s)**

The Continental Slope Demersal Fish Communities and the Canyons linking the Cuvier Abyssal Plain and the Cape Range KEF overlap the Operational Area. Species found on the continental slopes of these key ecological features been shown to host high levels of endemism (BMT Oceanica, 2016). Additionally, demersal species are associated with the Ancient Coastline KEF (~0.6 km from the Operational Area).

Mortality and sub lethal effects may impact populations located close to the well blow out and within the EMBA for entrained/dissolved aromatic hydrocarbons (≥100 and >50 ppb, respectively). Additionally, if prey (infauna and epifauna) surrounding the well location and within the EMBA is contaminated, this can result in the absorption of toxic components of the hydrocarbons (PAHs), potentially impacting fish populations that feed on these. These impacts may result in localised medium/long term impacts on demersal fish habitat (e.g. seafloor).

Hydrocarbons above ecological thresholds may subsequently impact populations located near to the release location for the worst-case spill scenario, with lethal impacts not considered likely in this offshore environment.

**Protected Places**

**Receptors**

The Australian Marine Parks (AMPs) listed in Section 4.8 may be affected by a worst-case spill scenario. The AMPs were predicted to potentially be contacted by hydrocarbons in the event of a worst-case spill scenario include Ningaloo AMP, Gascoyne AMP, Montebello AMP, Dampier AMP, Shark Bay AMP, etc.

**Impacts**

The Gascoyne Marine Park is the closest AMP to the Operational Area (4 km) predicted to be contacted by hydrocarbons. Impacts to this AMP are discussed below. Impacts to the natural, cultural, heritage and socio-economic values of the other AMPs predicted to be contacted by hydrocarbons in a worst-case spill scenario are expected to be similar, however, of varying severity and duration due to their varying distances from the Operational Area (see Section 4.8).

**Gascoyne Marine Park**

The Gascoyne Marine Park comprises an area about 81,766 km<sup>2</sup>, The Marine Park is assigned IUCN category IV and includes three zones assigned under this plan: National Park Zone (II), Habitat Protection Zone (IV) and Multiple Use Zone (VI). The AMP ranges in water depths from less than 15 m up to 6000 m.

The Gascoyne Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Shelf Transition, Central Western Transition, and Northwest Province. It overlaps with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, Commonwealth waters adjacent to Ningaloo Reef KEF, continental slope demersal fish communities KEF, and the Exmouth Plateau KEF (see 'Key Ecological Features' above for a discussion of impacts to KEFs).

The AMP includes some of the most diverse continental slope habitats in Australia, in particular the continental slope area between North West Cape and the Montebello Trough. Canyons in the Marine Park link the Cuvier Abyssal Plain to the Cape Range Peninsula and are important for their role in sustaining the nutrient conditions that support the high diversity of Ningaloo Reef. The specific values of the AMP and associated impacts are summarised here.

Natural values – The AMP includes diverse benthic and pelagic fish communities and ancient coastline thought to be an important seafloor feature (KEF) and a migratory pathway for humpback whales (BIAs). The AMP supports a range of species including species listed as threatened, migratory, marine or cetacean under the EPBC Act. Biologically important areas within the Marine Park include. BIAs within the AMP include breeding habitat for seabirds, internesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat and migratory pathway for pygmy blue whales.

Cultural values – There is limited information about the cultural significance of this AMP, however, it is noted that sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. Potential impacts to cultural values of the AMP will closely tie in with the impacts to the natural values of the Marine Park, as addressed above and below; and range from moderate mid-term potential impacts to major long-term potential impacts.

Heritage values – There are no World, National or Commonwealth heritage listings within the AMP. However, the Ningaloo Coast World Heritage Property, the Ningaloo Marine Area (Commonwealth waters), and the Ningaloo Coast National Heritage areas are located adjacent to the Gascoyne AMP. Five historic shipwrecks are located within the Marine Park. Impacts to shipwrecks are discussed below under 'Cultural Heritage'.

Social and economic values – Commercial fishing, mining and recreation are important activities in the AMP. These activities contribute to the wellbeing of regional communities and the prosperity of the nation. A worst-case hydrocarbon spill scenario has the potential to result in impacts to these AMPs that range from moderate, medium-term to major, long-term, with the consequence severity dependent on the actual timing, duration and extent of a spill.

**Summary of Potential Impacts to Environmental Value(s)**

**Key Ecological Features**

KEFs potentially impacted by the hydrocarbon spill from a loss of well containment event are provided in Section 4.7. Although these KEFs are primarily defined by seabed geomorphological features, they are described to identify the potential for increased biological productivity and, therefore, ecological significance.

The consequences of a hydrocarbon spill from a loss of well containment event are predicted to result in moderate impacts to values of the KEFs affected (for the values of each KEF, see Section 4.7).

Potential impacts include contamination of sediments, impacts to benthic sediment fauna and associated impacts to demersal fish populations, and reduced biodiversity as described above and below. Most of the KEFs within the EMBA have relatively broad-scale distributions and are unlikely to be significantly impacted. KEFs within the EMBA that are not associated with broad-scale distributions are not expected to be impacted by floating hydrocarbons and contact with entrained and dissolved fractions is predicted to be very low/no contact. Hence, the environmental values of these KEFs are not expected to be impacted.

**Protected Species**

**Cetaceans**

A range of cetaceans were identified as potentially occurring within the Operational Area and wider EMBA (Section 4.6.3). In the event of a loss of well containment, surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations may drift across habitat for oceanic cetacean species and the migratory routes and BIAs of cetaceans considered to be MNES, including humpback whales, southern right whales, sperm whales, pygmy blue whales (north- and southbound migrations), Australian snubfin dolphins, Indo-Pacific humpback dolphin and Indo-Pacific/spotted bottlenose dolphins.

Cetaceans that have direct physical contact with surface, entrained or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (from prey, water and sediments), aspiration of oily water or droplets, and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts and organs, impairment of the immune system, neurological damage (Helm et al., 2015), reproductive failure, adverse health effects (e.g. lung disease, poor body condition) and potentially mortality (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016).

Given the relatively low volatile fractions of the hydrocarbons, the area where potential impacts from inhalation may occur is expected to be localised around the release location. In a review of cetacean observations in relation to large scale hydrocarbon spills, it was concluded that exposure to oil from the Deepwater Horizon resulted in increased mortality to cetaceans in the Gulf of Mexico (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). Long-term population level impacts to killer whales have been linked to the Exxon Valdez tanker spill (Matkin et al., 2008). Geraci (1988) has identified behavioural disturbance (i.e. avoiding spilled hydrocarbons) in some instances for several species of cetacean, suggesting that cetaceans have the ability to detect and avoid surface slicks.

However, observations during spills have recorded larger whales (both mysticetes and odontocetes) and smaller delphinids travelling through and feeding in oil slicks. During the Deepwater Horizon spill, cetaceans were routinely seen swimming in surface slicks offshore (and nearshore) (Aichinger Dias et al., 2017).

Cetacean populations that are resident within the EMBA may be susceptible to impacts from spilled hydrocarbons if they interact with an area affected by a spill. Such species are more likely to occupy coastal waters (refer to the Mainland and Islands section below for additional information). Suitable habitat for oceanic toothed whales (e.g. sperm whales) and dolphins (e.g. spinner dolphin) is broadly distributed throughout the region and as such, however impacts are unlikely to affect an entire population. Other species identified in Section 4.6.3 may also have possible transient interactions with the EMBA.

**Pygmy Blue Whale and Humpback Whale**

Pygmy blue whales and humpback whales are known to migrate seasonally through the wider EMBA, and the migration BIAs in the region for both species overlap the Operational Area. A major spill in May to November would coincide with humpback whale migration through the waters off the Pilbara, North West Cape and Shark Bay. A major spill in April–August or October–January would coincide with pygmy blue whale migration. Both pygmy blue and humpback whales are baleen whales, so are most likely to be significantly impacted by toxic effects when feeding. However, feeding during migrations is low level and opportunistic, with most feeding for both species in the Southern Ocean.

The entrained hydrocarbon EMBA includes pygmy blue whale foraging BIAs (closest being the Ningaloo Coast (approximately 14 km from Operational Area), humpback whale resting BIA at Exmouth Gulf (approximately 23 km away), southern right whale calving BIA at Perth coast (approximately 1108 km away), and sperm whale foraging BIA at Perth Canyon (approximately 1120 km away). Furthermore, the foraging, breeding and calving BIAs for the Australian snubfin dolphin, Indo-Pacific humpback dolphin and Indo-Pacific/spotted bottlenose dolphins (closest being Roebuck Bay for all, approximately 910 km) were identified within the entrained hydrocarbon EMBA. Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

**Summary of Potential Impacts to Environmental Value(s)**

risk of ingestion of hydrocarbons is low. Migrations of both pygmy blue whales and humpback whales are protracted through time and space (i.e. the whole population will not be within the EMBA), and as such, a spill from the loss of well integrity is unlikely to affect an entire population). The humpback whale resting area in Exmouth Gulf and the calving area in Camden Sound are not predicted to be contacted by surface, entrained or dissolved hydrocarbons above threshold concentrations.

A loss of well containment resulting in a well blowout could disrupt a significant portion of the humpback or pygmy blue whale populations. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sublethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, death. However, such disruptions or impacts are not predicted to impact the overall population viability of cetaceans, given the global distribution of these species.

Physical contact with hydrocarbons to these species is likely to have biological consequences, however, it is unlikely to affect an entire population and not predicted to impact on the overall population viability. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Entrained hydrocarbons may also be ingested, particularly by baleen whales which feed by filtering large volumes of water.

**Dugongs**

The following BIAs are present within the EMBA for the dugong in proximity to the North West Cape: Calving, Breeding, Foraging (high density seagrass beds) and Nursing.

**Summary**

A worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts to offshore cetacean species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

**Pinnipeds**

Australian sea lions are found on and around the Aboihos Islands, distant from the Operational Area, but within the wider EMBA. Given the considerable distance from the Operational Area to these receptors, and the time for floating and entrained hydrocarbons to contact (35 and 32 days respectively), entrained and floating hydrocarbons that do reach this area are likely to be weathered. There is the potential for sea lions to interact with floating and stranded hydrocarbons. This may result in diminished ability to thermoregulate due to the loss of insulation, potentially resulting in mortality. Potential impacts are expected to be minor and temporary at a population scale.

**Marine Turtles**

Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (National Oceanic and Atmospheric Administration, 2010). Contact with surface slicks, or entrained hydrocarbon, can therefore result in hydrocarbon adherence to body surfaces (Gagnon and Rawson, 2010) causing irritation of mucous membranes in the nose, throat and eyes, leading to inflammation and infection (National Oceanic and Atmospheric Administration, 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al., 1995). A stress response associated with this exposure pathway includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of their salt gland (Lutcavage et al., 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe and inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours which are the most toxic component of the hydrocarbon spill (Milton and Lutz, 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia and neurological impairment (National Oceanic and Atmospheric Administration, 2010). Contact with entrained hydrocarbons can result in hydrocarbon adherence to body surfaces, causing irritation of mucous membranes in the nose, throat and eyes and leading to inflammation and infection (Gagnon and Rawson, 2010).

Due to the absence of potential nesting habitat and location offshore, the Operational Area is unlikely to represent important habitat for marine turtles.

It is acknowledged that foraging marine turtles may be present foraging within the EMBA, and the EMBA would overlap with the BIAs identified in Section 4 and Appendix F, in particular the inter-nesting BIAs and critical habitats for flatback turtles which extend for ~80 km from known nesting locations. It is noted by Woodside that the PAP will overlap nesting seasons for marine turtles in the region.

In the event of a well blowout, there is potential that surface, entrained and dissolved hydrocarbons exceeding threshold concentrations will be present in offshore waters extending up to 950 km, 1550 km and 1250 km, respectively, from the release site. Therefore, a hydrocarbon spill may disrupt a portion of the population; however, there is no anticipated threat to overall population viability.

Potential impacts to nesting and inter-nesting marine turtles are discussed in the Mainland and Islands (nearshore) impacts discussion.

**Summary of Potential Impacts to Environmental Value(s)**

**Summary**

In the event of a loss of well containment, there is potential that surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations will be present in offshore waters. Therefore, a hydrocarbon spill may disrupt a portion of marine turtle populations for the green, flatback, hawksbill, loggerhead and/or leatherback turtle. However, there is considered to be no threat to overall population viability given the non-persistent nature of predicted hydrocarbons.

**Seasnakes**

Impacts to seasnakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles. They may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation, 2011a). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

In general, seasnakes frequent the waters of the continental shelf area around offshore islands and potentially submerged shoals (water depths <100 m; see Submerged Shoals below). It is acknowledged that seasnakes may be present in the Operational Area and are present in the wider EMBA; however, their abundance is not expected to be high in the deep water and offshore environment. Therefore, a hydrocarbon spill may disrupt a portion of seasnake populations, but there is no threat to overall population viability given their widespread distribution in tropical waters.

**Sharks and Rays**

Hydrocarbon contact may affect whale sharks through ingestion (entrained/dissolved hydrocarbons), particularly if feeding. Whale sharks may transit offshore open waters when migrating to and from Ningaloo Reef, where they aggregate for feeding from March to July (see Mainland and Islands (nearshore waters) below).

Whale sharks may also carry out opportunistic feeding in offshore waters and the Operational Area. The EMBA overlaps the whale shark migration and foraging BIA identified in Section 4.6.1 and Appendix F, within which whale sharks are seasonally present between April and October. Therefore, individual whale sharks that have direct contact with hydrocarbons within the spill-affected area may be impacted, but the consequences to migratory whale shark populations are likely to be minor. White sharks have foraging BIAs within the South-West region which may be impacted by hydrocarbon EMBA.

Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs, either through direct contact or via the food chain (consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange). In the offshore environment, it is probable that pelagic shark species are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Therefore, any impact on sharks and rays is predicted to be minor and only a temporary disruption.

**Summary of Potential Impacts to Environmental Value(s)**

**Seabirds**

Offshore waters are potential foraging grounds for seabirds associated with the coastal roosting and nesting habitat (e.g. Ningaloo, Muiron Islands and the Barrow/Montebello/Lowendal Island Group). There are confirmed foraging grounds off Ningaloo and the Barrow/Montebello/Lowendal Island Group. A BIA for the wedge-tailed shearwater (peak use August–April) overlaps with the Operational Area.

There are also a number of BIAs for seabirds and migratory shorebirds that overlap with the wider EMBA, as provided in Section 4.6.4 and Appendix F.

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may mat feathers. This may lead to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed, 2011). Seabirds generally do not exhibit avoidance behaviour to floating hydrocarbons. Physical contact of seabirds with surface slicks is by several exposure pathways, primarily immersion, ingestion and inhalation. Such contact with hydrocarbons may result in plumage fouling and hypothermia (loss of thermoregulation), decreased buoyancy and potential to drown, inability to fly or feed, anaemia, pneumonia and irritation of eyes, skin, nasal cavities and mouths (Australian Maritime Safety Authority, 2013; International Petroleum Industry Environmental Conservation Association, 2004), and result in mortality due to oiling of feathers or the ingestion of hydrocarbons. Longer term exposure effects that may potentially impact seabird populations include a loss of reproductive success (loss of breeding adults) and malformation of eggs or chicks (Australian Maritime Safety Authority, 2013).

A hydrocarbon spill may result in surface slicks disrupting a significant portion of the foraging habitat for seabirds, including BIAs identified for foraging birds which are generally associated with breeding habitat, and seabirds foraging in waters in proximity to these sites. Seabird distributions are typically concentrated around islands, so hydrocarbons in proximity to nesting/roosting areas may result in increased numbers of seabirds being impacted, with many species of seabirds, such as the wedge-tailed shearwater and species of tern, forage relatively close to breeding islands/colonies. This may lead to impacts upon foraging seabirds in the offshore environment; however, this is not expected to result in a threat to the overall population viability, given the relatively broad distributions of the seabird species.

**Nearshore Waters (Mainland and Islands)**

**Marine Sediment Quality**

Entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Shoreline hydrocarbons may also reach a number of islands. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

**Protected Species**

**Summary of Potential Impacts to Environmental Value(s)**

**Cetaceans**

Coastal populations of small cetaceans are known to reside or frequent nearshore waters, including the Ningaloo Coast, Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern and Northern Island Groups, Shark Bay, and a number of other nearshore and coastal locations including coastal areas of the Indonesian archipelago which may be potentially impacted by surface, entrained and dissolved hydrocarbons exceeding threshold concentrations in the event of a loss of well containment.

The predicted EMBA for surface, entrained and dissolved hydrocarbons extends past Exmouth Gulf and Shark Bay. These areas are known humpback whale aggregation areas during their annual southern migration (September to December); therefore, humpbacks moving into these aggregation areas may be exposed to hydrocarbons above thresholds levels. However, surface, entrained and dissolved hydrocarbons concentrations above thresholds are not expected within Exmouth Gulf itself. No floating hydrocarbon contact at or above threshold concentrations is expected for Camden Sound, an important calving area for humpback whales.

The potential impacts of exposure are as discussed previously in Offshore – Cetaceans. However, nearshore populations of cetaceans are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning.

Nearshore dolphin species (e.g. spotted bottlenose dolphins) may exhibit higher site fidelity than oceanic species, although Geraci (1988) observed relatively little impacts beyond behavioural disturbance. Resident cetacean populations (e.g. numerous dolphin species) known to inhabit nearshore waters with the EMBA for surface hydrocarbons, such as the Laut Sawu Marine National Park, may experience impacts on feeding habitats that could disrupt a portion of the local population, but is not predicted to result in impacts on overall population viability of either dugongs or resident/coastal cetaceans.

A hydrocarbon spill may disrupt a portion of a migratory cetacean population in Indonesian waters, including blue whale and sperm whale populations. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation) and, in rare circumstances, death. However, such disruptions or impacts are not predicted to impact on the overall population viability of migratory cetaceans within Indonesian waters.

**Dugongs**

Potential environment impacts may include the potential for dugongs to ingest hydrocarbons when feeding on oiled seagrass stands, or indirect impacts to dugongs due to loss of this food source due to dieback in worse affected areas. Furthermore, nearshore populations of dugongs are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning.

Hydrocarbon spill modelling indicates that surface hydrocarbons exceeding threshold concentrations may extend into the Lesser Sunda and Southern Java ecoregions of Indonesia, potentially exposing migratory and resident dugongs.

**Summary**

A hydrocarbon spill may have an impact on feeding habitats and disrupt a significant portion of the local population, but it is not predicted to result in impacts on overall population viability of either dugongs or coastal cetaceans.

**Pinnipeds**

Australian sea lions are found in the Houtman Abrolhos Islands Nature Reserve and Ngari Capes Marine Park, distant from the Operational Area but within the wider EMBA. Given the considerable distance from the Operational Area to these receptors, and the lengthy time for surface and entrained hydrocarbons to contact (minimum 25 days for the Abrolhos Islands), surface or entrained hydrocarbons that do reach this area are likely to be weathered.

Hydrocarbons accumulating on shorelines at haul-out locations may result in oiling of sea lions. Oiling may inhibit the ability for sea lions to thermoregulate, potentially resulting in mortality through hypothermia. Oiled sea lions may also ingest hydrocarbons when attempting to clean themselves, potentially resulting in toxic effects.

## Summary of Potential Impacts to Environmental Value(s)

### **Marine Turtles**

Several marine turtle species utilise nearshore waters and shorelines for foraging and breeding (including inter-nesting), with significant nesting beaches along the mainland coast and islands in potentially impacted locations such as the Ningaloo Coast, Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Islands (Northern and Southern Island Groups), Shark Bay, Scott Reef, Ashmore Reef and the southern Indonesian archipelago. There are distinct breeding seasons as detailed in Section 4. The nearshore waters of these turtle habitat areas may be exposed to surface, entrained or dissolved hydrocarbons exceeding threshold concentrations, and accumulated hydrocarbons above threshold concentrations.

The behaviour and biology of marine turtles makes these species relatively vulnerable to population-scale impacts compared to other fauna, such as dugongs. All species of marine turtles exhibit high nesting site fidelity by females, with gene flow between populations primarily mediated by movements of male turtles (FitzSimmons et al., 1997). Additionally, marine turtles rely on nesting beaches to reproduce, which makes them vulnerable to impacts from spilled hydrocarbon accumulations on shorelines through oiling of nesting females and emergent hatchlings, and disturbance of nests from spill response activities (Lauritsen et al., 2017). A spill during nesting and hatching season poses an increased risk to marine turtle populations.

A number of BIAs have been identified for marine turtles, including aggregation, nesting, inter-nesting, mating and foraging areas. A hydrocarbon spill above impact thresholds in these areas may result in impacts to biologically important behaviours. During the breeding season, turtle aggregations near nesting beaches within the wider EMBA are most vulnerable due to greater turtle densities, and potential impacts may occur at the population level of some marine turtle species.

The islands within the Lesser Sunda and Southern Java Ecoregions provide habitat for marine turtles, with the Laut Sawu Marine National Park in particular identified as providing habitat for five species of marine turtles – green, leatherback, olive ridley, loggerhead and flat back turtles. The potential impacts to marine turtles in Indonesian waters contacted by the surface hydrocarbon EMBA and those contacted by accumulated hydrocarbons on shorelines are likely to be similar to those described above for Offshore – Marine Turtles and Mainland and Islands (nearshore waters) – Marine Turtles.

The potential impacts of exposure are as discussed previously in Offshore – Marine Turtles. In the nearshore environment, turtles can ingest hydrocarbons when feeding (e.g. on oiled seagrass stands/macroalgae), or can be indirectly affected by loss of food source (e.g. seagrass due to dieback from hydrocarbon exposure) (Gagnon and Rawson, 2010). In addition, hydrocarbon exposure can impact turtles during the breeding season at nesting beaches. Contact with gravid adult females or hatchlings may occur on nesting beaches (accumulated hydrocarbons) or in nearshore waters (entrained hydrocarbons) where hydrocarbons are predicted to make shoreline contact.

Results from studies of nesting beaches subject to extensive oil pollution from the Deepwater Horizon spill indicated a significant reduction (approximately 44%) in turtle nest density during the nesting season immediately following the spill (Lauritsen et al., 2017). Lauritsen et al. (2017) partially attributed this reduction to direct (e.g. direct mortality of adults due to oiling or toxicity) and indirect (e.g. shoreline disturbance from response activities) impacts from the spill. There was a significant increase in nesting density in the years immediately following the spill, with nesting density returning to levels comparable to pre-spill densities within two nesting seasons (Lauritsen et al., 2017). This indicates that adult female turtles that avoided mortality may have deferred nesting during the spill until subsequent years. The significant decline in nesting density observed following the Deepwater Horizon spill represents a decline of approximately 36% of reproductive output of the turtle population in the study area (Lauritsen et al., 2017); given turtles may take over a decade to reach sexual maturity, the effects of such a reduction in reproductive output may take over a decade to appear in nesting related metrics (which are commonly used to monitor turtle populations).

Based on the deterministic modelling results and the potential for impact and recovery of turtles, a worst-case hydrocarbon spill from a loss of well containment may result in reduced turtle numbers and nesting density; however, it would not be expected to result in elimination of a population. Impacts and subsequent recovery may take decades to occur. To date, no oil spills have been demonstrated to have resulted in elimination of a turtle population at any scale (Yender and Mearns, 2010). Disastrous spills impacting important turtle habitat (including nesting areas) have not been shown to eliminate turtle populations, although direct and indirect impacts have been documented (e.g. Lauritsen et al., 2017; McDonald et al., 2017; Stacy et al., 2017; Vander Zanden et al., 2016). Turtle populations have been shown to be able to recover, even when populations have been reduced to small sizes after experiencing significant declines (Mazaris et al., 2017). As such, population scale impacts to marine turtles from a worst-case loss of well containment would be expected to exhibit recovery, although may take several decades to reach pre-impact population levels due to the relatively long lifespan and late sexual maturity of marine turtle species.

### **Sea snakes**

Impacts to sea snakes for the mainland and island nearshore waters from direct contact with hydrocarbons may occur and may include potential damage to the dermis and irritation to mucous membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation, 2011a).

**Summary of Potential Impacts to Environmental Value(s)**

**Fish**

Fish (and other commercially targeted taxa) in their early life stages (eggs, larvae and juveniles) are at their most vulnerable to lethal and sub-lethal impacts from exposure to hydrocarbons, particularly if a spill coincides with spawning seasons or reaches nursery areas close to the shore (e.g. seagrass and mangroves) (International Tanker Owners Pollution Federation, 2011a). Fish spawning (including for commercially targeted species such as snapper and mackerel) occurs in nearshore waters at certain times of the year, and nearshore waters are also inhabited by higher numbers of juvenile fishes than offshore waters.

Modelling indicated that, in the unlikely event of a major spill, there is potential for entrained or dissolved hydrocarbons to occur in the surface water layers above threshold concentrations in nearshore waters (e.g. Ningaloo Coast, the Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern and Northern Islands Groups, Shark Bay and the Abrolhos Islands). This has the potential to result in lethal and sublethal impacts to a portion of fish larvae in areas contaminated above impact thresholds, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. Although there is the potential for spawning/nursery habitat to be impacted (e.g. mangroves and seagrass beds, discussed above), losses of fish larvae in worst affected areas are unlikely to be of major consequence to fish stocks compared with significantly larger losses through natural predation, and the likelihood that most nearshore areas would be exposed is low (i.e. not all areas in the region would be affected). This is supported by a recent study in the Gulf of Mexico which used juvenile abundance data, from shallow-water seagrass meadows, as indices of the acute, population-level responses of young fishes to the Deepwater Horizon spill. Results indicated that there was no change to the juvenile cohorts following the Deepwater Horizon spill. Additionally, there were no significant post-spill shifts in community composition and structure, nor were there changes in biodiversity measures (Fodrie and Heck, 2011). Any impacts to spawning and nursery areas are expected to be minor and short term, as would flow-on effects to adult fish stocks into which larvae are recruited.

**Sharks and Rays**

Whale sharks and manta rays are known to frequent the Ningaloo Reef system and the Muiron Islands (forming feeding aggregations in late summer/autumn). The Indonesian islands of Komodo and Nusa Penida, Bali are also known to host significant manta ray populations.

Whale sharks and manta rays generally transit along the nearshore coastline and are vulnerable to surface, entrained and dissolved aromatic hydrocarbon spill impacts, with both taxa having similar modes of feeding. Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman and Wilson, 2004). Whale sharks at Ningaloo Reef have been observed using two different feeding strategies, including passive sub-surface ram-feeding and active surface feeding (Taylor, 2007). Passive feeding consists of swimming slowly at the surface with the mouth wide open. During active feeding, sharks swim high in the water with the upper part of the body above the surface with the mouth partially open (Taylor, 2007). These feeding methods would result in the potential for individuals that are present in worst affected spill areas to ingest potentially toxic amounts of surface, entrained or dissolved aromatic hydrocarbons into their body. Large amounts of ingested hydrocarbons may affect their endocrine and immune system in the longer term. The presence of hydrocarbons may displace whale sharks from the area where they normally feed and rest, and potentially disrupt migration and aggregations to these areas in subsequent seasons. Whale sharks may also be affected indirectly by surface, entrained or dissolved aromatic hydrocarbons through the contamination of their prey. The preferred food of whale sharks are fish eggs and phytoplankton which are abundant in the coastal waters of Ningaloo Reef in late summer/autumn, driving the annual arrival and aggregation of whale sharks in this area. If the spill event were to occur during the spawning season, this important food supply (in worse spill affected areas of the reef) may be diminished or contaminated. The contamination of their food supply and the subsequent ingestion of this prey by the whale shark may also result in long term impacts as a result of bioaccumulation.

There is the potential for other resident shark and ray (e.g. sawfish species identified in Section 4.6.1) populations to be impacted directly from hydrocarbon contact or indirectly through contaminated prey or loss of habitat. However, it is probable that shark species will move away from the affected areas.

Shark populations displaced or no longer supported due to habitat loss would be expected to redistribute to other locations. Therefore, the consequences to resident shark and ray populations (if present) from loss of habitat, may result in a disruption to a significant portion of the population; however, it is not expected to impact the overall viability of the population.

**Summary of Potential Impacts to Environmental Value(s)**

**Seabirds**

There is the potential for seabirds, and resident, non-breeding overwintering shorebirds that use the nearshore waters for foraging and resting, to be exposed to surface, entrained and dissolved hydrocarbons. This could result in lethal or sublethal effects. Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in waters near their breeding colony. This results in relatively higher seabird densities in these areas during the breeding season, making these areas particularly sensitive in the event of a spill.

Pathways of biological exposure that can result in impact may occur through ingestion of contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs). Ingestion can also lead to internal injury to sensitive membranes and organs (International Petroleum Industry Environmental Conservation Association, 2004). Whether the toxicity of ingested hydrocarbons is lethal or sublethal will depend on the weathering stage and its inherent toxicity.

Exposure to hydrocarbons may have longer term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks, affecting survivorship and loss of adult birds.

Important areas for foraging seabirds and migratory shorebirds are identified in Section 4.6.4. Suitable habitat or seabirds and shorebirds are broadly distributed along the mainland and nearshore island coasts within the EMBA. Of note are important nesting and resting areas, including (refer to Section 4.6.4 for additional information, including BIAs within the wider EMBA):

- Muiron Islands
- Ningaloo Coast
- North West Cape
- Montebello/Barrow/Lowendal Islands Group (including known nesting habitats on Boodie, Double and Middle Islands)
- Pilbara Islands North and South Island Group
- Shark Bay
- Abrolhos Islands
- Ashmore Reef.

Therefore, a hydrocarbon spill may impact key feeding habitat and disrupt a significant portion of the habitat; however, this is not expected to threaten the overall population viability of seabirds or shorebirds.

**Submerged Shoals and Banks**

**Protected Species**

**Marine Turtles**

There is the potential for marine turtles to be present at submerged shoals such as Ningaloo Reef, Exmouth Reef Montebello Shoals, Barrow Island and Rowley Shoals. These shoals and banks may, at times, be foraging habitat for marine turtles, given the coral and filter feeding biota associated with these areas. Satellite tracking of individual green turtles in the nearshore environment of the NWS did not indicate any overlap of the tracked post-nesting migratory routes and the Operational Area. It is, however, acknowledged that individual marine turtles may be within the surrounding areas. Therefore, a hydrocarbon spill may have a minor disruption to a portion of the population (see offshore description above); however, there is no threat to overall population viability.

**Seasnakes**

There is the potential for seasnakes to be present at submerged shoals such as Exmouth Reef and Barrow Islands Reefs and Shoals. The potential impacts of exposure are as discussed previously in Offshore – Seasnakes.

A hydrocarbon spill may disrupt a portion of the population but there is no threat to overall population viability. Seasnake species in Australia generally show strong habitat preferences (Heatwole and Cogger, 1993); species that have preferred habitats associated with submerged shoals and oceanic atolls may be disproportionately affected by a hydrocarbon spill affecting such habitat.

**Summary of Potential Impacts to Environmental Value(s)**

**Sharks and Rays**

There is the potential for resident shark and ray populations to be impacted directly from hydrocarbon contact, or indirectly through contaminated prey or loss of habitat. Spill model results indicate potential impacts to the benthic communities of Barrow Islands Reefs and Shoals and Ningaloo Reef (modelling showed contact by entrained or dissolved hydrocarbons above threshold concentrations).

Pelagic sharks and rays are expected to move away from areas affected by spilled hydrocarbons. Impacts to such species are expected to be limited to behavioural responses/displacement. Shark and ray species that have associations with submerged shoals and oceanic atolls may not move in response to such habitat being contacted by spilled hydrocarbons. Such species may be more susceptible to a reduction in habitat quality resulting from a hydrocarbon spill. Impacts to sharks and rays are likely to be localised, as they are comparable to other Australian reefs and the NWMR submerged shoals and banks. It is expected that there will be no impacts at the population level.

**All Settings**

**Coral Reefs**

Receptors

The quantitative spill risk assessment and EMBA indicate there would be potential for coral reef habitat to be exposed to surface, dissolved and entrained hydrocarbons. There would be potential for surface, entrained and dissolved hydrocarbons above threshold concentrations to reach reef habitat along the Ningaloo coast and at identified offshore islands such as the Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern Islands Group, Shark Bay, Abrolhos Islands, Ashmore Reef and southern Indonesian islands.

Impacts

The shallow coral habitats are most vulnerable to hydrocarbon coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are also known to cause high coral mortality via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species) (Shigenaka, 2001). The duration of surface slick contact with the reef flat may be reduced, as the slick will likely be lifted off the reef by the flooding tide; however, exposure will be prolonged where hydrocarbons adhere. There is significant potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos, with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. This particularly applies to branching corals, which are reported to be more sensitive than massive corals (Shigenaka, 2001).

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons ( $\geq 100$  and  $>50$  ppb, respectively) has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column, including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities (with reference to Ningaloo Coast). Mortality in a number of coral species is possible, and this would result in the reduction of coral cover and change in the composition of coral communities. Sub-lethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates, and impaired reproduction (Negri and Heyward, 2000). This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Muiron Islands, Barrow/Montebello/Lowendal Islands, Pilbara Southern and Northern Island Groups and Abrolhos Islands) and also the mainland coast (e.g. Ningaloo Coast and Shark Bay).

With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained and dissolved hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon, creating a pressure gradient that drives water in a strong outward flow through channels. These channels are across as much as 15% of the length of Ningaloo Reef (Taylor and Pearce, 1999).

Shoreline Accumulation

As mentioned, shoreline accumulation was modelled to occur at a number of receptors. Shallow coral habitats (i.e. nearshore and intertidal waters) are most vulnerable to hydrocarbons through coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are known to cause high coral mortality (Shigenaka, 2001) via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species). There is, therefore, potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos by entrained hydrocarbons, with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. These impacts are particularly applicable to branching corals which are reported to be more sensitive than massive corals (Shigenaka, 2001).

Recruitment/Spawning

In the unlikely event of a spill occurring at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward, 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

**Summary of Potential Impacts to Environmental Value(s)**

some non-coral species may be affected via direct contact with entrained and dissolved aromatic hydrocarbons, resulting in sub-lethal impacts and in some cases mortality. This is with particular reference to the early life-stages of coral reef animals (reef attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide-ranging fish species. The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo Reef system) will be entirely dependent on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities.

Over the worst affected sections of reef habitat, coral community live cover, structure and composition is predicted to reduce, manifested by loss of corals and associated sessile biota. Recovery of these impacted reef areas typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding, with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities (Underwood, 2009). Recovery at other coral reef areas may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour et al., 2013).

Therefore, a hydrocarbon spill may result in large-scale impacts to coral reefs, particularly Ningaloo Reef, with long term effects (recovery >10 years) likely.

**Submerged Shoals**

The waters overlying the submerged Ningaloo Reef, North West Reef and Tryal Rocks have medium to high probability to be exposed to entrained hydrocarbons above threshold concentrations (at or greater than 100 ppb). These permanently submerged habitat represents sensitive open water benthic community receptors, extending from deep depths to relatively shallow water. Potential biological impacts could include sub-lethal stress and, in some instances, total or partial mortality of sensitive benthic organisms such as corals and the early life stages of resident fish and invertebrate species. Other submerged shoals and banks within the wider EMBA (e.g. Barrow Island Reefs and Shoals, Exmouth Reef, Montebello Shoals) are also predicted to be exposed to entrained or dissolved hydrocarbons above threshold concentrations, just at a lower probability. These submerged shoals and banks are also likely to be exposed to floating hydrocarbons above impact thresholds. Although the waters above these shoals may be contacted by surface slicks, any entrainment of surface hydrocarbons is likely to be restricted to the first few metres of the water column and is considered to pose limited potential for impact to marine primary producer habitats at these locations.

**Non-biogenic Reefs**

The reef communities fringing the Pilbara region (e.g. Pilbara islands) may be exposed to surface or entrained hydrocarbons (at or above threshold concentrations), and consequently exhibit lethal or sub-lethal impacts resulting in partial or total mortality of keystone sessile benthos, particularly hard corals; thus, potential community structural changes to these shallow, nearshore benthic communities may occur. If these reefs are exposed to entrained or dissolved hydrocarbons, impacts are expected to result in localised long-term effects.

## Summary of Potential Impacts to Environmental Value(s)

### **Productivity**

Primary production by plankton (triggered by sporadic upwelling events in the offshore waters) is an important component of the primary marine food web. Planktonic communities are generally mixed, including phytoplankton (cyanobacteria and other microalgae), secondary consuming zooplankton (e.g. copepods), and the eggs and larvae of fish and invertebrates (meroplankton).

Exposure to hydrocarbons in the water column can result in changes in species composition, with declines or increases in one or more species or taxonomic groups (Batten et al., 1998). Phytoplankton may also experience decreased rates of photosynthesis (Tomajka, 1985). For zooplankton, direct effects of contamination may include suffocation, changes in behaviour, or environmental changes that make them more susceptible to predation. Impacts on plankton communities are likely to occur in areas where surface, entrained or dissolved aromatic hydrocarbon threshold concentrations are exceeded, but communities are expected to recover relatively quickly (within weeks or months). This is due to high population turnover, with copious production within short generation times that also buffers the potential for long-term (i.e. years) population declines (International Tanker Owners Pollution Federation, 2011a).

Nearshore waters and adjacent offshore waters surrounding the offshore islands (e.g. Muiron Islands, Montebello/Barrow/Lowendal Islands Group) and to the west of the Ningaloo Reef system are also known locations of seasonal upwelling events and productivity. The seasonal productivity events are critical to krill production, which supports megafauna aggregations such as whale sharks and manta rays in the region. This has the potential to result in lethal and sub-lethal impacts to a certain portion of plankton in affected areas, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. The submerged shoals of Ningaloo Reef and North West Reef are areas associated with sporadic upwelling and associated primary productivity events. Stochastic spill model results predict entrained hydrocarbons (at or above the 100 ppb threshold) may reach these shoals. However, recovery would occur. Therefore, any impacts are likely to be temporary and on exposed planktonic communities present in the EMBA.

Hydrocarbon contact during the spawning seasons for resident shoal community benthos and fish (meroplankton), particularly exposure to in-water toxicity effects to biota, may result in the loss of a discrete cohort population, but would not affect the longer-term viability of resident populations. Therefore, any impacts to resident shoal community benthos and fish (meroplankton) are likely to be temporary and localised at the shoals.

### **Filter Feeders**

Hydrocarbon exposure to filter-feeding communities (e.g. deepwater communities 20–200 m) and nearshore filter feeders that are present (shallower water <20 m) in may potentially be impacted by entrained/dissolved hydrocarbons.

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons ( $\geq 100$  and  $\geq 50$  ppb, respectively) has the potential to result in lethal or sub-lethal toxic effects. Sub-lethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White et al., 2012). Any impacts may result in localised long-term effects to community structure and habitat.

Offshore filter-feeding communities, include such as communities around Ningaloo Reefs or on hard substrate associated with the Canyons linking the Cuvier Abyssal Plain and Continental Slope Demersal Fish Communities KEF or other locations may be impacted depending on the depth of exposure. Nearshore filter feeder communities identified within the Ningaloo Marine Park (approximately 8 km from the Operational Area) may be exposed to hydrocarbons. Such impacts may result in localised, long-term effects to community structure and habitat.

### **Seagrass Beds, Macroalgae and Mangroves**

Spill modelling has predicted that surface, entrained and dissolved hydrocarbons above threshold concentrations have the potential to contact a number of shoreline sensitive receptors, such as those supporting biologically diverse, shallow subtidal and intertidal communities. The variety of habitat and community types, from the upper subtidal to the intertidal zones support a high diversity of marine life and are used as important foraging and nursery grounds by a range of invertebrate and vertebrate species. Depending on the trajectory of the surface and entrained/dissolved plume, macroalgal/seagrass communities including the Ningaloo Coast (patchy and low cover associated with the shallow limestone lagoonal platforms), Muiron Islands (associated with limestone pavements), the Barrow/Montebello/Lowendal Islands, Shark Bay, the Pilbara Southern Island Group (documented as low and patchy cover), the Northern Island Group, the Abrolhos Islands, the Kimberley Coast, Ashmore Reef and southern Indonesian islands have the potential to be exposed.

Seagrass in the subtidal and intertidal zones have different degrees of exposure to hydrocarbon spills. Subtidal seagrass is generally considered much less vulnerable to surface oil spills than intertidal seagrass, primarily because freshly spilled hydrocarbons, including crude oil, float under most circumstances. Dean et al. (1998) found that oil mainly affects flowering, therefore, species that are able to spread through apical meristem growth are not as affected (such as *Zostera*, *Halodule* and *Halophila* species).

Seagrass in the intertidal zone is particularly vulnerable, as it may come into direct contact with surface hydrocarbons, as well as entrained components, which can smother and kill seagrasses if it coats the leaves and stems (Taylor and Rasheed, 2011). This conclusion is supported by Howard et al. (1989) who noted that surface hydrocarbon spills

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

**Summary of Potential Impacts to Environmental Value(s)**

which become stranded on the seagrass and smother it during the rise and fall of the tide can result in reduced growth rates, blackened leaves and mortality. Wilson and Ralph (2011) concluded that long-term impacts to seagrass are unlikely unless hydrocarbon is retained within the seagrass meadow for a sustained duration.

Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al., 2010). The potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should serve to lower the content of soluble aromatic components before contact occurs. Exposure to entrained/dissolved aromatic hydrocarbons may result in mortality, depending on actual entrained/dissolved aromatic hydrocarbon concentration received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sub-lethal stress, causing reduced growth rates and a reduction in tolerance to other stress factors (Zieman et al., 1984).

Mangrove habitat and associated mud flats and salt marsh at Ningaloo Coast (small habitat areas), the Pilbara islands, the Montebello Islands and southern Indonesian islands were identified within the EMBA. Hydrocarbons coating prop roots of mangroves can occur from surface hydrocarbons when hydrocarbons are deposited on the aerial roots. Hydrocarbons deposited on the aerial roots can block the pores used to breathe or interfere with the trees' salt balance, resulting in sub-lethal and potential lethal effects. Mangroves can also be impacted by entrained/dissolved aromatic hydrocarbons that may adhere to the sediment particles. In low energy environments such as in mangroves, deposited sediment-bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (National Oceanic and Atmospheric Administration, 2014). The hydrocarbons comprise a proportion of persistent residual fractions; therefore, deposited hydrocarbons are likely to persist in the sediment, potentially causing chronic sub-lethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from oil spills can take 20–30 years (National Oceanic and Atmospheric Administration, 2014); therefore, recovery from any impacts would be long-term (>10 years).

**Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rocky Shores**

Shoreline exposure for the upper and lower areas differ. The upper shore has the potential to be exposed to surface slicks, while the lower shore is subjected to dissolved or entrained oil.

Potential impacts may occur due to surface hydrocarbon contact with intertidal areas, including sandy shores, mudflats and rocky shores. Hydrocarbons at sandy shores are incorporated into fine sediments through mixing in the surface layers from wave energy, penetration down worm burrows and root pores (International Petroleum Industry Environmental Conservation Association, 2000). Hydrocarbons in the intertidal zone can adhere to sand particles; however, high tide may remove some or most of the hydrocarbons back out of the sediments. Typically, hydrocarbons are only incorporated into the surface layers to a maximum of 10 cm (International Petroleum Industry Environmental Conservation Association, 2000). It is predicted that a number of sandy shores along the coastline may have accumulated hydrocarbons  $\geq 100$  g/m<sup>2</sup>. As described earlier, accumulated hydrocarbons  $\geq 100$  g/m<sup>2</sup> could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat. The persistence of the hydrocarbons will be dependent on the wave exposure, but can be months to years.

The impact of oil on rocky shores is largely dependent on the incline and energy environment. On steep/vertical rock faces on wave exposed coasts, there is likely to be no impact from a spill event. However, a gradually sloping boulder shore in calm water can potentially trap large amounts of oil (International Petroleum Industry Environmental Conservation Association, 2000). The impact of the spill on marine organisms along the rocky coast will be dependent on the toxicity and weathering of the hydrocarbon. Similar to sandy shores, accumulated hydrocarbons  $\geq 100$  g/m<sup>2</sup> could coat the epifauna along rocky coasts and impact the reproductive capacity and survival. Intertidal mudflats are susceptible to potential impacts from hydrocarbons, as they are typically low energy environments and therefore trap oils. Intertidal mudflats have been identified in the EMBA along the Ningaloo coast, Pilbara coastline and as far north as Indonesia. The extent of oiling is influenced by the neap and spring tidal cycle, and seasonal highs and lows affecting mean sea level. Potential impacts to tidal flats include heavy accumulations covering the flat at low tide; however, it is unlikely that oil will penetrate the water-saturated sediments. However, oil can penetrate fine sediments through animal burrows and root pores. It has been demonstrated that infaunal burrows allow hydrocarbons to enter subsurface sediments, where it can be retained for months.

The toxicity of stranded surface hydrocarbons and the in-water toxicity of the entrained or dissolved hydrocarbons reaching the shorelines will determine impacts to marine biota such as sessile barnacle species and/or mobile gastropods and crustaceans such as amphipods. Lethal and sub-lethal impacts may be expected where the entrained or dissolved hydrocarbon concentration threshold is >100 or >50 ppb, respectively. Impacts may result in localised changes to the community structure of these shoreline habitats, which would be expected to recover in the medium term (2–5 years).

**Indonesian Waters**

**All Settings**

**Summary of Potential Impacts to Environmental Value(s)**

**Coral Reef**

The fringing coral reefs of the islands of the Lesser Sunda and Southern Java ecoregions may be impacted by surface and accumulated hydrocarbons at or above threshold levels in the event of loss of well containment. The potential impacts on shallow water coral reef systems are discussed above for Mainlands and Islands (Nearshore Waters) – Coral Reef. There is the potential for lethal impacts due to the physical hydrocarbon coating of coral reef systems, with likely mortality of corals (adults, juveniles and established recruits) at areas contacted by surface hydrocarbons above threshold concentrations.

**Seagrass Beds/Macroalgae and Mangroves**

Seagrass meadows, macroalgae and mangroves in the intertidal and subtidal habitats of the islands of the Lesser Sunda and Southern Java ecoregions all have the potential to be contacted by surface hydrocarbons exceeding threshold levels, in the unlikely event of a loss of well containment. The potential impacts on these habitats and communities are discussed above for Mainland and Islands (Nearshore Waters).

**Open Water – Productivity/Upwelling**

Floating hydrocarbons are the only fraction identified by stochastic modelling as potentially reaching Indonesian waters above impact thresholds. Given the distance between the release location and sensitivities in Indonesia, any hydrocarbons reaching Indonesian waters will be highly weathered. The majority of soluble and volatile components of the hydrocarbon will have been lost prior to reaching Indonesian waters.

The Lesser Sunda and Southern Java ecoregions of Indonesia experience seasonal upwellings that support megafauna such as migratory cetacean species. The potential impacts to cetaceans from surface hydrocarbons are discussed above in Offshore – Cetaceans and Mainland and Islands (nearshore waters) – Cetaceans.

Mantra rays and whale sharks attracted to seasonal upwellings may experience indirect impacts if the spill was to coincide with a seasonal event such as plankton aggregations. However, surface slicks that have not entered the water column by entrainment or dissolution are unlikely to have a significant impact on plankton populations, as only a small proportion of the population will be close to the surface. The main pathways for direct exposure and contamination of plankton are digestion and transport of hydrocarbon particles through the gut (Gajbhiye et al., 1995), and exposure to OIW emulsions which adhere to the external body wall or gills. Both these pathways are unlikely to result from surface hydrocarbons. Therefore, significant impacts on open water productivity and upwelling in Indonesian waters are considered unlikely.

**Spawning/Nursery Areas**

As discussed for Indonesia – Pelagic Fish, there is the potential for intertidal nursery areas such as mangroves and seagrass meadows to be contacted by surface hydrocarbons at or above threshold concentrations, potentially leading to impacts such as smothering of mangroves and seagrasses. Impacts to mangroves and seagrasses may result in indirect impacts to early life stages of marine fauna species (such as fish species targeted by local fishers) using these habitats. Given the nature of the hydrocarbon (highly weathered, soluble and volatile components significantly diminished, etc) and the sporadic nature of shoreline/shallow water contact, impacts are expected to be localised, with no population- or ecosystem-scale impacts expected.

**Nearshore Filter Feeders**

Potential impacts to nearshore filter feeders in Indonesian waters are unlikely, given the lack of entrained or dissolved hydrocarbons, and the limited potential for surface slicks to entrain into the water column.

**Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rocky Shores**

The islands of the Lesser Sunda and Southern Java ecoregions have the potential to be contacted by surface hydrocarbons and accumulated hydrocarbons above threshold levels. The potential impacts to shoreline habitats are discussed above for Mainland and Islands (nearshore waters) – Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rock Shores.

Prolonged stranding of surface hydrocarbons, particularly for low energy environments such as mudflats, may lead to localised changes to the community structure of these shoreline habitats (International Tanker Owners Pollution Federation, 2011a) which would be expected to recover in the medium term (2–5 years).

<b>Summary of Potential Impacts to Socio-economic Values</b>	
<b>Setting</b>	<b>Receptor Group</b>
<b>All Settings</b>	<p><u>Cultural Heritage</u></p> <p>A number of historic shipwrecks have been identified in the vicinity of North West Cape. The spill results do not predict surface slicks contacting the identified wrecks. However, shipwrecks occurring in the subtidal zone will be exposed to entrained/dissolved hydrocarbons, and marine life that shelter and take refuge in and around these wrecks may be affected by in-water toxicity of dispersed hydrocarbons. The consequences of such hydrocarbon exposure may include large fish species moving away, and/or resident fish species and sessile benthos such as hard corals exhibiting sub-lethal and lethal impacts (which may range from physiological issues to mortality).</p> <p>The foreshore and hinterland of North West Cape and along the coastline to Shark Bay contain numerous Aboriginal sites such as burial grounds, middens and fish traps. Only sites that are located below the high-water mark are expected to be impacted from a spill. This could result in hydrocarbon contamination of the site, which may affect the cultural significance and traditional practices associated with the sites.</p> <p>Within the wider EMBA are a number of designated heritage places (Section 4.8). These places are also covered by other designations such as World Heritage Area, Marine Park and Listed Shipwreck. Potential impacts have therefore been discussed in the sections above.</p>
<b>Offshore Waters</b>	<p><u>Fisheries – Commercial</u></p> <p>The spill scenario that was modelled may cause significant direct impacts on the target species of Commonwealth and offshore State fisheries within the defined EMBA. Further details are provided within the ecological impact to fish above.</p> <p><u>Commercial Fisheries</u></p> <p>Southern Bluefin Tuna, Western Skipjack Tuna, Small Pelagic, Southern and Eastern Scalefish and Shark Fisheries</p> <p>The tuna and small pelagic fisheries target pelagic fish species. Adult fish are highly mobile and able to move away from the spill affected area or avoid the surface waters; however, hydrocarbon concentrations in the upper water column could lead to potential exposure through direct absorption of hydrocarbons, and indirectly by the consumption of contaminated prey (Merkel et al., 2012). Given these pelagic species are distributed over a wide geographical area, the impacts at the population or species level are considered minor in the unlikely event of a spill. A major loss of hydrocarbon from the PAP may lead to an exclusion of fishing from the spill affected area for an extended period.</p> <p>North West Slope, Western Deepwater Trawl, and Western Tuna and Billfish Fisheries</p> <p>The predicted EMBA resulting from an uncontrolled loss of hydrocarbon from a loss of well containment may result in direct impacts on the species fished by the North West Slope Trawl Fishery and Western Deep Trawl Fishery. These fisheries target benthic species (demersal finfish and crustaceans) in water greater than 200 m deep. The Northwest Slope Trawl Fishery targets scampi and deep-water prawns. These species are less mobile and will therefore not be able to easily move away from the location of a well blowout. Mortality/sub-lethal effects may impact populations located close to the well blowout location. Mortality and sub-lethal effects may impact localised populations of targeted species close to the well blow out and within the EMBA for entrained/dissolved hydrocarbons (<math>\geq 100</math> and <math>\geq 50</math> ppb, respectively). However, the entrained hydrocarbon is likely to be confined in the upper water column, therefore the demersal species are less likely to be exposed to hydrocarbons than pelagic species. This is particularly relevant, as the majority of the fishing effort for both these fisheries is located distant from the location of a potential well blowout. Exploited fish resources in these areas are less likely to be impacted significantly, as hydrocarbons at this distance are likely to be confined in the upper water column.</p> <p>The Western Tuna and Billfish Fishery may also be impacted by the predicted EMBA. This fishery targets highly mobile, pelagic fish populations, which are able to move away from the spill affected area. However, as stated above, hydrocarbon concentrations in the upper water column could lead to potential direct and indirect exposure impacts. As these pelagic species are distributed over a wide geographical area, the impacts at the population or species level are considered minor in the unlikely event of a spill.</p> <p>A major loss of hydrocarbons from the PAP may lead to an exclusion of fishing from the spill affected area for an extended period.</p> <p><u>State Fisheries</u></p> <p>Hydrocarbons from a major spill may impact on the area fished by a number of State fisheries within the EMBA. These fisheries generally use a range of gear types (trawl, trap and line), and operate from shallow inshore water to water depths up to 200 m, targeting demersal and pelagic</p>

**Summary of Potential Impacts to Socio-economic Values**

finfish species and prawns. In the unlikely event of a major hydrocarbon spill, there is the potential for the targeted fish species to be exposed to entrained and/or dissolved aromatic hydrocarbons in the water column. However, the potential for direct impact would be reduced, as target species such as mackerel and snapper are likely to avoid the surface water layer underneath oil slicks. Demersal species (such as finfish and crustaceans) have limited mobility, and therefore will not be able to easily move away from a spill. Mortality/sub-lethal effects may impact populations located close to the well blowout location. The demersal and crustacean (prawn) fisheries are located over 20 km from the location of a potential well blowout. Populations in these areas are less likely to be impacted significantly, as hydrocarbons at this distance are likely to be entrained/dissolved or weathered and confined in the upper water column. A major loss of hydrocarbons from the PAP may lead to an exclusion of fishing from the spill-affected area for an extended period.

A number of other State and Commonwealth fisheries, further afield in the EMBA, may also be affected by a major spill; however, the impacts to these far field fisheries will be similar to those described below for 'General Fisheries Impacts'.

Summary

Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration which removes hydrocarbons from tissues by metabolic processes, although it is dependent upon the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons, while crustaceans (such as prawns) have a reduced ability (Yender et al., 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential contamination of seafood can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender et al., 2002). A major spill would result in the establishment of an exclusion zone around the spill affected area. There would be a temporary prohibition on fishing activities for a period of time, and subsequent potential for economic impacts to affected commercial fishing operators.

Tourism and Recreation

Recreational fishers predominantly target tropical species, such as emperor, snapper, grouper, mackerel, trevally and other game fish. Recreational angling activities include shore-based fishing, private boat and charter boat fishing, with the peak in activity between April and October (Smallwood et al., 2011) for the Exmouth region. Limited recreational fishing takes place in the offshore waters of the Operational Area. Impacts on species that are recreationally fished are described above under 'Summary of Potential Impacts to Other Species'.

A major loss of hydrocarbons from the PAP may lead to exclusion of marine nature-based tourist activities, resulting in a loss of revenue for operators. Tourism is a major industry for the region, and visitor numbers would likely reduce if a hydrocarbon spill were to occur based on the perception of hydrocarbon spills and associated impacts resulting in moderate, medium term (5–10 years) impacts to community and highly valued areas.

Offshore Oil and Gas Infrastructure

In the unlikely event of a major spill, surface hydrocarbons may affect production from existing petroleum facilities (platforms and FPSOs), as well as activities such as drilling and seismic exploration. For example, facility water intakes for cooling and fire hydrants could be shut off, which could in turn lead to the temporary cessation of production activities. Spill exclusion zones established to manage the spill could also prohibit activity support vessel access as well as offtake tankers approaching facilities off the North West Cape. The impact on ongoing operations of regional production facilities would be determined by the nature and scale of the spill and metocean conditions. Furthermore, decisions on the operation of production facilities in the event of a spill would be based primarily on health and safety considerations. The closest production is the Nganhurra FPSO (operated by Woodside). Other nearby facilities include the Santos-operated Ningaloo Vision FPSO. Operation of these facilities is likely to be affected in the event of a well blowout spill.

**Summary of Potential Impacts to Socio-economic Values**

**Nearshore Island and Mainland Coastal Areas (Nearshore Waters)**

Fisheries – Commercial

In the unlikely event of a loss of well containment, there is the possibility that target species in some areas utilised by a number of state fisheries could be affected, including pearl aquaculture in the North West Cape (including Exmouth Gulf) and wild oysters in the Pearl Oyster Managed Fishery that are within the nearfield EMBA, and further afield the Western Rock Lobster Fishery and a number of west coast and south coast fisheries (refer to for fisheries within the wider EMBA). Targeted fish, prawn, mollusc and lobster species and pearl oysters could experience sub-lethal stress, or in some instances mortality, depending on the concentration and duration of hydrocarbon exposure and its inherent toxicity. In addition, there is also the potential for commercial and artisanal Indonesian fisheries and aquaculture (e.g. seaweed farming) to be impacted (see above for potential impacts to seagrasses).

Prawn Managed Fisheries

In the event of a major spill, the modelling indicated the surface, entrained and dissolved EMBA may extend to nearshore waters closest to the mainland Pilbara and Gascoyne coasts, including the actively fished areas of the designated Onslow Prawn Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Broome Prawn Managed Fishery, Kimberley Prawn Managed Fishery, Nikol Bay Prawn Limited Entry Fishery and the Shark Bay Prawn and Scallop Managed Fishery, and managed prawn nursery areas. Note that the majority of the demarcated area for the prawn managed fishery in the Exmouth Gulf (proper) is outside the EMBA.

Prawn habitat utilisation differs between species in the post-larval, juvenile and adult stages (Dall et al. 1990) and direct impacts to benthic habitat due to a major spill have the potential to impact prawn stocks. For example, juvenile banana prawns are found almost exclusively in mangrove-lined creeks (Rönnbäck et al., 2002), whereas juvenile tiger prawns are most abundant in areas of seagrass (Masel and Smallwood, 2000). Adult prawns also inhabit coastline areas, but tend to move to deeper waters to spawn. In the event of a major spill, a range of subtidal habitats that support juvenile prawns may be exposed to hydrocarbons above impact thresholds, including:

- Muiron Islands
- Montebello Islands
- Barrow Island
- Lowendal Islands
- Pilbara Northern and Southern Island Groups
- Shark Bay
- Ningaloo Coast.

Localised loss of juvenile prawns in worst spill affected areas is possible. Whether lethal or sub-lethal effects occur will depend on duration of exposure, hydrocarbon concentration and weathering stage of the hydrocarbon, and its inherent toxicity. Furthermore, seafood consumption safety concerns and a temporary prohibition on fishing activities may lead to subsequent potential for economic impacts to affected commercial fishing operators.

Fisheries – Traditional

The wider EMBA intersects the formally recognised “MoU Box” covering Scott Reef and surrounds, Montebello Island and Ashmore Reef. Indonesian traditional fishers target trochus, sea cucumbers (holothurians), abalone, green snail, sponges, giant clams and finfish, including sharks. Impacts would be similar to those identified for commercial fishing, in the form of a potential exclusion zone and contamination/tainting of fish stocks. This may result in discarding of catch, or reduced fishing effort due to fishery closure.

Tourism and Recreation

In the unlikely event of a major spill, the nearshore waters of the Ningaloo coast and shorelines further south and north (including Indonesia) could be reached by surface slicks, entrained hydrocarbons and dissolved hydrocarbons, depending on prevailing wind and current conditions. As these locations offer a number of amenities such as fishing, swimming and using beaches and surrounds, they have a recreational value for local residents and visitors (regional, national and international). If a well blowout event resulted in hydrocarbon contact, there could be restricted access to beaches for a period of days to weeks, until natural weathering, tides, currents or oil spill response (e.g. shoreline clean-up if safe to do so) removes the hydrocarbons. In the event of a well blowout, tourists and recreational users may also avoid areas due to perceived impacts, including after the oil spill has dispersed.

Typically, a hydrocarbon spill that results in visible slicks in coastal waters and on shorelines will disrupt recreational activities, particularly tourism and its supporting services. In the unlikely event

<b>Summary of Potential Impacts to Socio-economic Values</b>	
	<p>of a well blowout, hydrocarbons may accumulate on shorelines (at or above a set threshold), and there is potential for visible surface slicks (&lt;10 g/m<sup>2</sup>) (i.e. a rainbow sheen) to reach sensitive receptor locations, for example, key tourist areas of the Ningaloo Coast (see 4.8) or the full list of receptors). As a result of surface slicks in nearshore waters and potential accumulation on beaches, it is expected that there will be a temporary cessation of all marine-based tourism activities on the spill-affected coast and wider coastal area for a period of weeks or longer, until natural weathering or tides and currents remove the hydrocarbons or clean-up operations remove beached oil.</p> <p>A temporary prohibition on charter boat recreational fishing trips and any other marine nature-based tourism trips to locations such as the Ningaloo Reef, Exmouth Reef Rowley Shoals, Montebello Islands may be put into effect, depending on the trajectory of the plume, resulting in a loss of revenue for operators.</p> <p>There is the potential for stakeholder perception that this environment will be contaminated over a large area and for the longer term, resulting in a prolonged period of tourism decline. Oxford Economics (2010) assessed the duration of hydrocarbon spill related tourism impacts and found that, on average, it took 12 to 28 months to return to baseline visitor spending. There is likely to be significant impacts to the tourism industry, wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism. Recovery and return of tourism to pre-spill levels will depend on the size of the spill, effectiveness of the spill clean-up, and change in any public misconceptions regarding the spill (Oxford Economics, 2010).</p>
<b>Indonesian Waters</b>	<p><u>Fisheries – Commercial</u></p> <p>Within the Lesser Sunda and Southern Java ecoregions, aquaculture, encompassing a variety of species and methods, contributes significantly to local employment and food production. The main species farmed are seaweed, prawns and fish. If surface hydrocarbons at or above threshold levels contact aquaculture operations, impacts are likely to include shutdown of production, contamination/tainting of product, and, in the case of seagrass potentially exposed at low tides, smothering and dieback. Indirect impacts are likely to include loss of income and economic impacts to coastal communities.</p>
	<p><u>Fisheries – Traditional</u></p> <p>The Lesser Sunda and Southern Java ecoregions of Indonesia are a productive area for Indonesian artisanal fisheries. The potential impacts to these fisheries from surface hydrocarbons at or above threshold levels would be similar to those described above for Offshore and Mainland and Islands traditional and commercial fisheries and would be likely to include exclusion zones and the potential tainting/contamination of catch. Indirect impacts may include impacts to local economies of coastal communities.</p>
	<p><u>Tourism and Recreation</u></p> <p>Tourism is a major industry within the Lesser Sunda and Southern Java ecoregions, with the islands of Bali, Flores, Lombok, Komodo and the Gili Islands particularly important popular tourist destinations, with beach and coastal activities primary attractions. Contact with surface or accumulated hydrocarbons above threshold levels with these areas is likely to result in similar impacts to those described above for Mainland and Islands (nearshore waters) – Tourism and Recreation and would include restricted access to beaches for a period of days to weeks or longer, and the potential for tourist perception that this environment will be contaminated over a large area and for the longer term. This could result in a potential prolonged period of tourism decline. Indirect impacts are likely to include loss of income and economic disruption to a portion of the Lesser Sunda and Southern Java ecoregions.</p> <p>There is also the potential for the following Indonesian Marine National Parks and National Parks to be contacted by surface and accumulated hydrocarbons at or above threshold levels:</p> <ul style="list-style-type: none"> <li>• Laut Sawu Marine National Park</li> <li>• Tanjung Tampa Nature Recreation Park.</li> </ul> <p>Impact on the protected areas is discussed in the sections above for ecological values and sensitivities. Additionally, such hydrocarbon contact may alter stakeholder understanding and/or perception of the protected marine environment, given these represent areas largely unaffected by anthropogenic influences and contain biologically diverse environments.</p>

<b>Demonstration of ALARP</b>

<b>Professional Judgement – Engineered Solution</b>				
Maintain well mechanical integrity to contain reservoir fluids within the well envelope to avoid LOWC.	F: Yes CS: Minimal cost. Standard practice.	Enhanced well mechanical integrity can significantly reduce the potential consequences of an incident.	Benefits outweigh cost sacrifice.	Yes C 9.4
<b>ALARP Statement:</b> On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release from loss of well containment. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

<b>Demonstration of Acceptability</b>
<p><b>Acceptability Statement</b></p> <p>Acceptability is demonstrated with regard to the considerations below.</p> <p><u>Principles of Ecologically Sustainable Development</u></p> <p>Woodside is a proud Australian company that is here for the long term. Woodside has a strong history of exploration and development of oil and gas reserves in the north west of Western Australia, with an excellent environmental record while providing revenue to State and Commonwealth Governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore, with the aim of uncovering and developing resources. It is under the lease agreement that Woodside has determined the potential to develop the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations.</p> <p>Woodside has established a number of research projects in order to understand the marine environments in which they operate, notably in the Exmouth Region and the Kimberley Region, including Rankin Bank, Glomar Shoals, Enfield Canyon and Scott Reef. Where scientific data does not exist, Woodside assumes a pristine natural environment exists and therefore implements all practicable steps to prevent damage. Woodside’s corporate values require that we consider the environment and communities in which we operate when making decisions.</p> <p>Woodside looks after the communities and environments in which it operates. Risks are inherent in petroleum activities; however, through sound management and systematic application of policies, standards, procedures and processes, Woodside considers that despite this risk, the extremely low likelihood of loss of well containment is acceptable.</p> <p><u>Internal Context</u></p> <p>The PAP is consistent with Woodside corporate policies, standards, procedures, processes, and training requirements as outlined in the Demonstration of ALARP and EPOs, including:</p> <ul style="list-style-type: none"> <li>• Woodside Environment and Biodiversity Policy</li> <li>• the Performance Standards developed and implemented for the Pyrenees facility</li> <li>• hydrocarbon spill preparedness and response strategies are considered applicable to the nature and scale of the risk, and associated impacts of the response are reduced to ALARP (Appendix H).</li> <li>• Woodside corporate values include working sustainably, with respect to the environment and communities in which we operate, listening to internal and external stakeholders, and considering HSE when making decisions. Consultation, outlined below, has been undertaken prior to the PAP.</li> </ul> <p><u>External Context – Societal Values</u></p> <p>Woodside recognises that its licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. Consultation, outlined below, has been undertaken prior to the PAP:</p> <p>Woodside has consulted with AMSA and WA Department of Transport (DoT) on spill response strategies. In accordance with the Memorandum of Understanding between Woodside and AMSA, a copy of the Oil Pollution First Strike Plan was provided to AMSA and DoT.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Other relevant persons were consulted (Section 5) and their feedback incorporated into this EP where appropriate. By providing hydrocarbon spill response measures that are commensurate with the risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes this addresses societal concerns to an acceptable level.

Other Requirements (includes Laws, Policies, Standards and Conventions)

The PAP is consistent with laws, policies, standards and conventions, including:

- accepted Safety Case (as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009
- mutual aid MoU for relief well drilling is in place
- accepted WOMP as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011
- notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with Section 7.10.

The PAP is consistent with the objectives in the Ningaloo management plans (Management Plan for Ningaloo Marine Park and Muiro Islands Marine Management Areas, Ningaloo Marine Park Management Plan) in relation to water quality, coral, shoreline and intertidal, macroalgal, seagrass, mangroves, seabirds and social and economic values.

#### Description of Source of Impact

**Source of risk**

Several events could result in significant structural damage to the Pyrenees FPSO hull, with potential for hydrocarbon release. This scenario identifies the release of hydrocarbons to the marine environment from a rupture of one of the crude storage tanks on the FPSO, which would require a severe accidental event. An incident that could result in loss of containment of the Pyrenees Facility cargo tanks is a collision by a support or OSV, offloading tanker or errant merchant vessel.

The likelihood that such a collision could result in a structural damage to the hull of an extent that a loss of containment from a cargo tank could occur would depend on the speed, angle and location of collision, and the size/weight of the colliding vessel. A review of literature indicates that although collisions with FPSOs have occurred in the past by support vessels and offtake tankers, no collisions have occurred with errant vessels or merchant tankers. Further, although collisions with support vessels and offtake tankers have caused structural damage to both vessels, no loss of containment from the cargo tanks has occurred in the past (refer Metzger et al., 2010 and Cavaye and Waibl, 2008).

A Marine Transport assessment determined that due to radar controls and communication systems in place on both the FPSO and merchant vessels and the 25km distance from shipping lanes, the possibility of collision by a powered merchant vessel with the Pyrenees Facility is not considered credible [8].

However, although very low in likelihood, the scenarios of collision of a vessel or offtake tanker are considered credible. Given the controls in place at the Facility during offtake, literature indicates that collisions during offtake can successfully be avoided, and if a collision does occur, the impact will be reduced and not cause significant structural damage to either vessel (refer Pyrenees Marine Transport Assessment and Cavaye and Waibl, 2008). Such controls include tandem mooring with the tanker approaching downwind and static tow at the Pyrenees FPSO stern, double hull structure, turret mooring rather than spread mooring, and control of size/weight of vessels offtaking and weather/sea state limits of operation. All these controls are in place at the Pyrenees Facility.

Structural damage to the Pyrenees Facility hull from collision by a vessel is considered the most credible scenario of vessel collision resulting in loss of cargo tank containment. A review of literature indicates that a supply or support vessel would need to be travelling at greater than 15 knots and strike at a direct 90 degree angle to breach the hull of a double-skinned FPSO (Cavaye and Waibl, 2008). Support vessel speeds in the Pyrenees Operations Area are strictly controlled to less than 1 knot within the Operations Area, and the competence and operations of contracted vessels is ensured through the marine assurance process. Collision from a support vessel would also be cushioned by the impact protection at the bow of the vessel.

On this basis, the loss of containment from the cargo tank as a result of a support vessel collision is considered a worst possible case scenario. However it should be noted that given the controls in place, collision of any vessel with

the Pyrenees FPSO, which could result in sufficient structural damage to cause a cargo tank loss of containment, is considered to be the lowest likelihood (although worst possible case scenario) of all unplanned events identified for the Facility.

The cargo tanks located along the sides of Pyrenees Facility have a capacity of 14,569m<sup>3</sup> of crude oil. The rupture of up to two tanks caused by a direct side impact of similar sized tanker with the beam of the impacting vessel being less than the width of the two tanks is considered plausible. A volume of up to 50% of the content of the two full tanks, a total of 14,600m<sup>3</sup>, is considered the maximum plausible release in the event that two tanks are simultaneously ruptured based on vessel draft conditions and loss of inventory above the water line due to the hydrostatic head of the inventory. This is consistent with industry guidance which assumes 50% loss of a ruptured tank, the full loss of two tanks has been deemed as not credible.

This is a conservative volume given that loss of inventory would not be instantaneous, and inter-tank transfer would immediately be initiated to adjacent undamaged tanks via inter-tank valves to minimise the potential release volume. Furthermore, Woodside has a contract in place with ABS, which enables them to be available to provide immediate advice on optimal cargo transfer in the highly unlikely case of such an event.

**Loss of Containment from Bulk Storage**

Modelling has been carried out for a cargo tank release of crude oil to the marine environment of 14,600m<sup>3</sup> to evaluate the potential environmental impacts that may occur. The results are detailed below.

Details of the modelling scenario used for a release of crude oil from a cargo tank rupture caused by a support vessel collision with the Pyrenees Facility are provided in Section 6.8.1. The characteristics of Pyrenees Crude was used as the basis for modelling the for the loss of containment of bulk storage scenario; refer to Section 6.8.1 for additional information on modelling methods, hydrocarbon characteristics and environmental impact thresholds.

**Table 6-17: Summary of worst-case loss of containment scenario**

Scenario	Hydrocarbon	Spill Duration (hours)	Modelling Duration (days)	Depth (BMSL)	Latitude (DMS)	Longitude (DMS)	Total Hydrocarbon Release Volume (m <sup>3</sup> )
Surface release	Pyrenees Crude	12	56	Surface	21° 32' 28.1" S	114° 06' 58.6" E	14,600

**Consequence Assessment**

This section discusses the outcomes of spill trajectory modelling undertaken for a hydrocarbon release from the Pyrenees Facility cargo tank rupture scenario. It focusses on the likelihood of oil contact with specific sensitive locations at a particular threshold.

**Summary of Hydrocarbon Spill Modelling**

To assess the potential fate and environmental impact of a 14,600 m<sup>3</sup> crude oil release, modelling was undertaken to indicate the potential extent the oil may travel once released.

The detailed environmental risk assessment of this scenario indicates that the overall risk to sensitive environmental resources is low. This assessment has been aided by the use of spill modelling techniques that have been extensively tested and are based on real oil characteristics and measured local current and weather conditions.

Modelling undertaken for a 14,600 m<sup>3</sup> release on the sea surface indicated that potential zones of surface exposure of > 10 g/m<sup>3</sup> were predicted to extend predominantly towards the northwest during all seasons. However, there would be some contact with the Ningaloo Marine Park and adjacent coastal and reef areas. The highest probability of surface contact at any threshold was 43% for the Gascoyne Marine Park, offshore from the Ningaloo coastline, with a minimum time of 7 hours to arrive at this threshold.

Shoreline contact areas for a 14,600 m<sup>3</sup> release of crude from the Pyrenees Facility (with no oil spill response intervention for 56 days) are shown to contact a number of receptors. The highest probability of any shoreline contact was 14.5% at Ningaloo State Marine Park, Ningaloo Coast and Exmouth (approximately 27 km away); with other shoreline contact probabilities ranging between < 0.5 to 10%. As expected, the time to shoreline contact ranged from around 1.5 days (37 hours) for the shorelines of Ningaloo State Marine Park, Ningaloo Coast World Heritage Area and Exmouth, and between approximately 2 to 5 days for Cape Range, and the northern island groups; Muiron Island, Barrow Island, Middle Island, Boodie Island, Sunday Island, Peak Island, and Flat Island.

AMSA guidance indicates that wave action alone is sufficient to clean shorelines with thickness < 100 g/m<sup>2</sup>. Therefore, when considering the probabilities and locations of shoreline thickness ≥ 100 g/m<sup>2</sup>, there was a relatively low probability (ranging from <0.5 to 8%) of any shoreline contact exceeding this threshold at any location.

The most likely location (8% probability) for oil to come ashore at > 100 g/m<sup>2</sup> was in proximity to Point Coates on North West Cape.

It is noteworthy that the environmental sensitivities of the Exmouth Gulf, including scattered mangroves along some of the small inlets on the western side, and areas of high priority mangroves and intertidal mudflats utilised as seabird and migratory shorebird habitat, are described in the OSPRMA. However, the shoreline accumulation results

indicated a no greater than 0.5% probability of concentrations > 100 g/m<sup>2</sup> of oil accumulating on these important habitats.

The stochastic hydrocarbon spill modelling for entrained and dissolved hydrocarbons indicated that hydrocarbons are forecast to drift in a predominantly a south-west direction from the release site. The modelling indicated that the entrained hydrocarbons (>100 ppb) and dissolved hydrocarbons (>50 ppb) could occur at a number of receptors. Analysis of the stochastic modelling identified Gascoyne Marine Park to have the highest probability of entrained (48.5%) and dissolved (52.5%) hydrocarbons at or greater than 100 ppb or 50 ppb, respectively.

**Summary of Potential Impacts**

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from Pyrenees FPSO cargo tank loss of containment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA (2024), available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.

The credible worst-case hydrocarbon spill scenario that may arise from cargo tank loss of containment may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill to these receptors considered in Section 6.8.3. The consequence was considered to be Serious (4).

<b>ALARP Statement:</b> On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release from loss of containment of bulk stored crude. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

## Demonstration of Acceptability

### **Acceptability Statement**

Loss of bulk storage containment has been evaluated as having a Serious consequence if it occurred. With controls in place the overall risk of this event is Tolerable. Acceptability is demonstrated with regard to the considerations below:

#### Principles of Ecologically Sustainable Development

Woodside is a proud Australian company that is here for the long term. Woodside has a strong history of exploration and development of oil and gas reserves in the north west of Western Australia, with an excellent environmental record while providing revenue to State and Commonwealth Governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore, with the aim of uncovering and developing resources. It is under the lease agreement that Woodside has determined the potential to develop the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations.

Woodside has established a number of research projects in order to understand the marine environments in which they operate, notably in the Exmouth Region and the Kimberley Region, including Rankin Bank, Glomar Shoals, Enfield Canyon and Scott Reef. Where scientific data does not exist, Woodside assumes a pristine natural environment exists and therefore implements all practicable steps to prevent damage. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions.

Woodside looks after the communities and environments in which it operates. Risks are inherent in petroleum activities; however, through sound management and systematic application of policies, standards, procedures and processes, Woodside considers that despite this risk, the extremely low likelihood of loss of well containment is acceptable.

#### Internal Context

The PAP is consistent with Woodside corporate policies, standards, procedures, processes, and training requirements as outlined in the Demonstration of ALARP and EPOs, including:

- Woodside Environment and Biodiversity Policy
- the Performance Standards developed and implemented for the Pyrenees Facility; and
- hydrocarbon spill preparedness and response strategies are considered applicable to the nature and scale of the risk, and associated impacts of the response are reduced to ALARP (Appendix H).
- Woodside corporate values include working sustainably, with respect to the environment and communities in which we operate, listening to internal and external stakeholders, and considering HSE when making decisions. Consultation, outlined below, has been undertaken prior to the PAP.

#### External Context – Societal Values

Woodside recognises that its licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. Consultation, outlined below, has been undertaken prior to the PAP:

Woodside has consulted with AMSA and WA Department of Transport (DoT) on spill response strategies. In accordance with the Memorandum of Understanding between Woodside and AMSA, a copy of the Oil Pollution First Strike Plan was provided to AMSA and DoT.

Other relevant persons were consulted (Section 5) and their feedback incorporated into this EP where appropriate.

By providing hydrocarbon spill response measures that are commensurate with the risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes this addresses societal concerns to an acceptable level.

#### Other Requirements (includes Laws, Policies, Standards and Conventions)

The PAP is consistent with laws, policies, standards and conventions, including:

- accepted Safety Case (as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009;
- mutual aid MoU for relief well drilling is in place;
- accepted WOMP as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011; and
- notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with Section 7.14.3.

The PAP is consistent with the objectives in the Ningaloo management plans (Management Plan for Ningaloo Marine Park and Muiron Islands Marine Management Areas, Ningaloo Marine Park Management Plan) in relation to water quality, coral, shoreline and intertidal, macroalgal, seagrass, mangroves, seabirds and social and economic values

### 6.8.4 Unplanned Hydrocarbon Release: Subsea Infrastructure

Context														
Subsea Infrastructure Layout and Description – Section 3.4			Physical Environment – Section 4.4 Biological Environment – Section 4.5				Consultation – Section 5							
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Accidental releases/ leaks of crude oil from subsea infrastructure		x	x		x	x	x	A	2 - Measurable	Unlikely	3	LCS GP	Tolerable	EPO 13
Pyrenees FPSO off station (up to 3 months), leaks or weeps from wells will be left undetected until return.		x	x	x	x	x	x	A	1- Minor	Unlikely	1	LCS GP RB A SV	Tolerable	
Description of Source of Impact														
<p>Consideration has been given to the potential sources of hydrocarbons from subsea infrastructure leak or failure events that could lead to potential environmental impacts. It was identified that the greatest loss of hydrocarbons from subsea infrastructure was from damage to (severing of) a production jumper or production flow line. The release rate for a severed production line would depend on the network lineup and number of wells flowing into the damaged section of the subsea network, and the response time to perform a production shut down and isolation. Individual well productivity and water cut would also influence the potential release volumes. It is noted that the average producing water cut of Pyrenees is around 92 % (Q3 2023) and forecasted to increase further through to end of field life. Pyrenees wells require gas lift to flow and have been shown to be unable to self-lift (without the aid of gas lift) at water cut in excess of around 60 % to a back pressure equivalent to seabed (mudline) pressure. The current daily rate of the most productive wells in the Pyrenees field is approximately 2,500 m<sup>3</sup>/day total liquid (which is approximately 250 m<sup>3</sup>/day of oil) when producing to the production facility</p> <p>For a severing of a production line and release to the marine environment, the following has been assumed:</p> <ul style="list-style-type: none"> <li>• An initiating event within the field caused by an event such as an anchor drag or dropped heavy object overboard</li> <li>• The event does not disrupt gas lift to the online wells, remaining intact</li> <li>• The Xmas tree remains intact with hydraulic controls normal and operative</li> <li>• Those wells requiring gas lift continue to produce</li> <li>• Wells within the impacted network section are able to flow to the sea bed (mudline) with approximately 20 bar back pressure in 200 m water depth . This assumption adopts a worst case simplification to neglect any pressure drop effects of the remaining subsea network</li> <li>• A worst case operational response is proposed to be 2 hrs before action taken to shut wells and gas lift in</li> </ul>														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- A worst case network lineup is assumed whereby up to 4 wells are online to either the Crosby, Ravensworth or Stickle networks, as well as a commingled manifold lineup allowing all 4 wells to crossflow through the impacted subsea network.

Based on the SIMOPS monitoring procedures in place within the Pyrenees Operations Area, procedures and mitigation controls for heavy lifting activities, maintenance and design of subsea infrastructure and the Emergency Response procedures that would be activated following an incident, it has been estimated that a credible time to become aware of a rupture to a production line, and then cascade shut down procedures and stop flow is 2 hours at a worst case. The reality is that the entire field would be closed down prior to the anticipated arrival of a dragging rig. Similarly, wells within the range of a dropped object with significant mass would be shut in immediately following reports to the OIM. However these realistic responses have been omitted for the purposes of creating this scenario.

A worst case estimate has been calculated using a proxy model for the most productive well in each of the Crosby, Stickle and Ravensworth networks flowing to mudline back pressure with 4 mmscf/d gas lift per well for 4 wells at 90% watercut. The total spill volumes over a 2 hr flow period from a severed production jumper would be:

- Crosby – 90 m<sup>3</sup> oil (790 m<sup>3</sup> formation water);
- Stickle – 110 m<sup>3</sup> oil (1110 m<sup>3</sup> formation water);
- Ravensworth – 100 m<sup>3</sup> oil (1000 m<sup>3</sup> formation water);

(Note, Moondyne considered to be significantly lower volume, as there are only 2 wells in this network).

Therefore the worst case scenario for a production flowline failure is severing the Stickle production flowline (or production jumper), with an estimated worst case release of 110 m<sup>3</sup> oil over 2 hours before the Emergency Response procedure would shut down production flow.

There is also an unlikely credible scenario for hydrocarbons to enter the marine environment when the FPSO is off station. This could be caused by slow leaks or weeps from the wells that are unable to be detected while the FPSO is disconnected. The PAP includes scenarios for the FPSO to leave station for short periods of time associated with events such as cyclonic weather and for extended periods of time associated with dry docking.

### Consequence Assessment

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon from accidental leaks from subsea infrastructure and from undetected leaks or weeps during FPSO sail away, were considered during the impact assessment for a maximum credible spill scenario from subsea flowline and riser loss of containment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.

The credible worst-case hydrocarbon spill scenario that may arise from subsea flowline and riser loss of containment may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill, the impacts of hydrocarbons on those receptors have been fully assessed in Section 6.8.2. The consequence associated with the volumes from accidental leaks, weeps or spills from subsea wells and infrastructure was considered Measurable (2).

### Demonstration of ALARP

<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)<sup>46</sup></b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>

Establish and maintain a 500 m Petroleum Safety Zone.	F: Yes CS: Minimal cost. Standard practice.	The PSZ is a requirement under Australian regulations and reduces the likelihood of interaction of vessels with the Pyrenees FPSO.	Control based on legislative requirement – must be adopted.	Yes C 1.2
In the event of a spill emergency response activities implemented in	F: Yes CS: Minimal cost. Standard practice.	Rapid response in line with pre-prepared response plan will	Control based on legislative	Yes C 9.5

<sup>46</sup> Qualitative measure

**Demonstration of Acceptability**

**Acceptability Statement**

The proposed management controls for preventing and minimising the risk of release of hydrocarbons from subsea infrastructure are comprehensive and consistent with all relevant codes and standards and good oilfield practice. No reasonably practicable additional controls have been identified that would provide a significant net environmental benefit.

The magnitude of the spill is unlikely to be greater than an estimated worst case release of 110 m3 oil over 2 hours. The offshore oceanic location is such that any spills would be rapidly diluted and dispersed, with any environmental effects being temporary and localised, with significant impacts not expected owing to the short exposure timeframe.

In summary, all relevant controls were considered as part of the ALARP assessment, and as no other reasonable additional controls were identified that would further reduce the impacts and risks of an unplanned spill from subsea infrastructure without a gross disproportionate sacrifice, the impacts and risks are considered ALARP. Woodside undertakes regular consultation with relevant persons about its operations/ activities providing them with sufficient and reasonable opportunities to raise any new concerns or issues for the duration of this PAP.

Woodside is satisfied that when the accepted controls are implemented that the impact and residual risk of an unplanned spill from subsea infrastructure to the environment is considered 'ALARP' and that adherence to the performance standards will manage the impacts and risks to an acceptable level.

### 6.8.6 Unplanned Hydrocarbon Release: Turret Operations

Context														
Utility System – Section 3.14			Physical Environment – Section 4.4 Biological Environment – Section 4.5					Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Hydrocarbon spill from failure during turret operations			x					A	1 - Minor	Unlikely	1	LCS GP	Tolerable	EPO 15
Description of Source of Impact														
<p><b>Source of Risk</b></p> <p>Turret operations have the potential to result in a small amount of crude oil being spilt to the marine environment. Three credible scenarios for this have been identified and are described below. In all credible scenarios a spill would be expected to be no more than 1 m<sup>3</sup>.</p> <p><b>Failure to Disconnect from Turret</b></p> <p>The disconnect system includes a primary and backup set of collet ring drive cylinders, either of which can release (unlock) the DTM, which then drops away. These systems are subject to routine maintenance and hence inability to disconnect is considered unlikely. In combination, the robustness of the Pyrenees FPSO / mooring system and the disconnect mechanism results in a negligible risk of a spill.</p> <p><b>Failure of Mooring System</b></p> <p>A failure of the mooring system could result in a small release of crude oil. The mooring system is designed to remain intact with the loss of a single mooring line, therefore there would be no spill associated with the loss of a single line. Further, a mooring monitoring system has been implemented on the Facility. The system monitors the Pyrenees FPSO position relative to the mooring with an audible excursion alarm sounding in the bridge and CCR should the FPSO move outside an allowed maximum radius.</p> <p><b>Connect/disconnect Turret</b></p> <p>The riser spool is disconnected only when the associated well is shut-in and/or the riser isolation valves are closed, sealing the spool off from upstream inventory. Downstream valves are also closed. Prior to splitting flanges, the spool is drained while still hooked up (a bypass valve is used). When the draining is complete, the flanges are split and a very small amount of hydrocarbon fluid may escape. This hydrocarbon fluid is contained with absorbent matting so the potential for an oil spill (estimated at less than 1 m<sup>3</sup>) to reach the sea is considered as negligible.</p> <p><b>Likelihood</b></p> <p>In accordance with the Woodside PetDW Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood has been determined as Unlikely.</p>														
Consequence Assessment														
<p>The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from loss of hydrocarbons to the marine environment from a transfer/offtake operation. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.</p>

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)48</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
<p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release during turret operations. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.</p>				

<b>Demonstration of Acceptability</b>
<p><b>Acceptability Statement</b></p> <p>The consequence assessment has determined that, given the adopted controls, accidental releases of less than 1 m3 hydrocarbons from turret operations to the marine environment represents a minor risk rating that is unlikely to result in a consequence greater than minor short-term impacts. Further opportunities to reduce the risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders. Consultation with relevant persons has not indicated any concerns in relation to accidental spills of hydrocarbons during turret operations.</p> <p>Woodside acknowledges that uncertainty on cultural values may remain, however, the Ongoing Program on Traditional Custodian Feedback has been developed to enable Woodside to manage potential uncertainty on the impacts and risks to cultural values which may be identified at the time during Woodside’s activities via ongoing dialogue with Traditional Custodians.</p> <p>The potential risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of accidental spills of hydrocarbons during transfer, storage and use to a level that is broadly acceptable.</p>

### 6.8.7 Unplanned Hydrocarbon Release: Diesel spill from Bulk Storage

Context														
Utility System – Section 3.14				Physical Environment – Section 4.4 Biological Environment – Section 4.5				Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Diesel spill from ruptured fuel tank due to vessel collision			X					A	2 - Measurable	Highly Unlikely	0.9	LCS GP	Tolerable	EPO 16
Description of Source of Impact														
<p><b>Source of Risk</b></p> <p>Diesel is stored on board the Pyrenees FPSO and OSV, as a fuel for vessel engines and generators. Rupture of one of the diesel oil fuel tanks on the Pyrenees FPSO would require a severe accidental event, such as collision by errant ship. The potential for an accident of this type to occur was considered in the ENVID but discounted as ‘very rare’ due to the tanks being located centrally inboard towards the stern and is not considered further. Rupture of an OSVs fuel tanks would require direct collision from the side with enough force to rupture a wing tank. Direct stern and direct bow impacts to an OSV are unlikely to rupture a fuel tank because of the location tanks in these areas are protected by overhang of the deck.</p> <p>AMSA have analysed historical data (DNV, 2011) to identify the spill frequency per year for all ship types and accident types. The overall frequency of collision accidents leading to a spill event in Australian waters is <math>1.6 \times 10^{-5}</math>.</p> <p>The maximum volume likely to be released from a single OSV tank rupture is approximately 120 m3. Previously, a conservative assumption of two wing tanks being ruptured leading to a loss of 250 m3 has been modelled, however, reference to AMSA’s analysis of historical data (DNV, 2011) indicates that this is overly conservative and not representative the credible worst-case. It considered that a credible worst-case is rupture of a single wing tank. The theoretical capacity is 120 m3 however, it is normal practice not to fill more than 90% (i.e. 108 m3) and all OSVs have the capacity to transfer fuel between tanks, which would further reduce the volume released. Hence, modelling has been conducted for a 100 m3 diesel release (APASA, 2012). The estimated probability of a release of this quantity is approximately <math>2.7 \times 10^{-6}</math> (for comparison the risk of a 200 m3 spill is approximately <math>1.8 \times 10^{-6}</math>).</p> <p><b>Hydrocarbon Characteristics and Quantitative Spill Risk Assessment</b></p> <p>Diesel fuel is a light petroleum distillate with a predominance of 12 carbon atoms to 14 carbon atoms (C12 to C14) hydrocarbon compounds. Diesel fuels may vary in their properties depending on their origin and particular additives but are generally comprised of moderate concentrations of benzene, toluene, ethylene and xylene (BTEX) and low concentrations of polycyclic aromatic hydrocarbons (PAHs) of low molecular weight such as naphthalene, fluorene and phenanthrene. The specific gravity of diesel ranges from 0.84 to 0.88 g/cm3 (30 to 32° API) and the pour point varies between -17°C and -30°C. Diesel fuels have a low viscosity of approximately 13 cSt (at 20°C) and are categorised, using the International Tanker Owners Pollution Federation (ITOPF) methods, as light persistent oils.</p> <p>Stochastic modelling predicated that the maximum distance that a 100 m3 spill of diesel above the 1 µm threshold was predicted to travel was approximately 15 km west of the surface release site, after which there was no diesel predicted to remain on the water surface above the selected threshold.</p> <p>A conservative EMBA is as follows for the 100 m3 diesel spill:</p>														

- Surface 1 µm – 15 km radius; and
- Entrained > 960 ppb.hrs 19.5 km (0-5 m); 11.6 km (5-10 m).

If diesel is spilled to the sea surface, the more volatile BTEX components will evaporate or breakdown rapidly leaving behind the PAH components, which continually evaporate or breakdown more slowly over several days as it thins out on the water surface. For the environmental conditions experienced in the Pyrenees Facility area, diesel is expected to undergo rapid spreading and this (together with evaporative loss) will result in a relatively rapid slick break up.

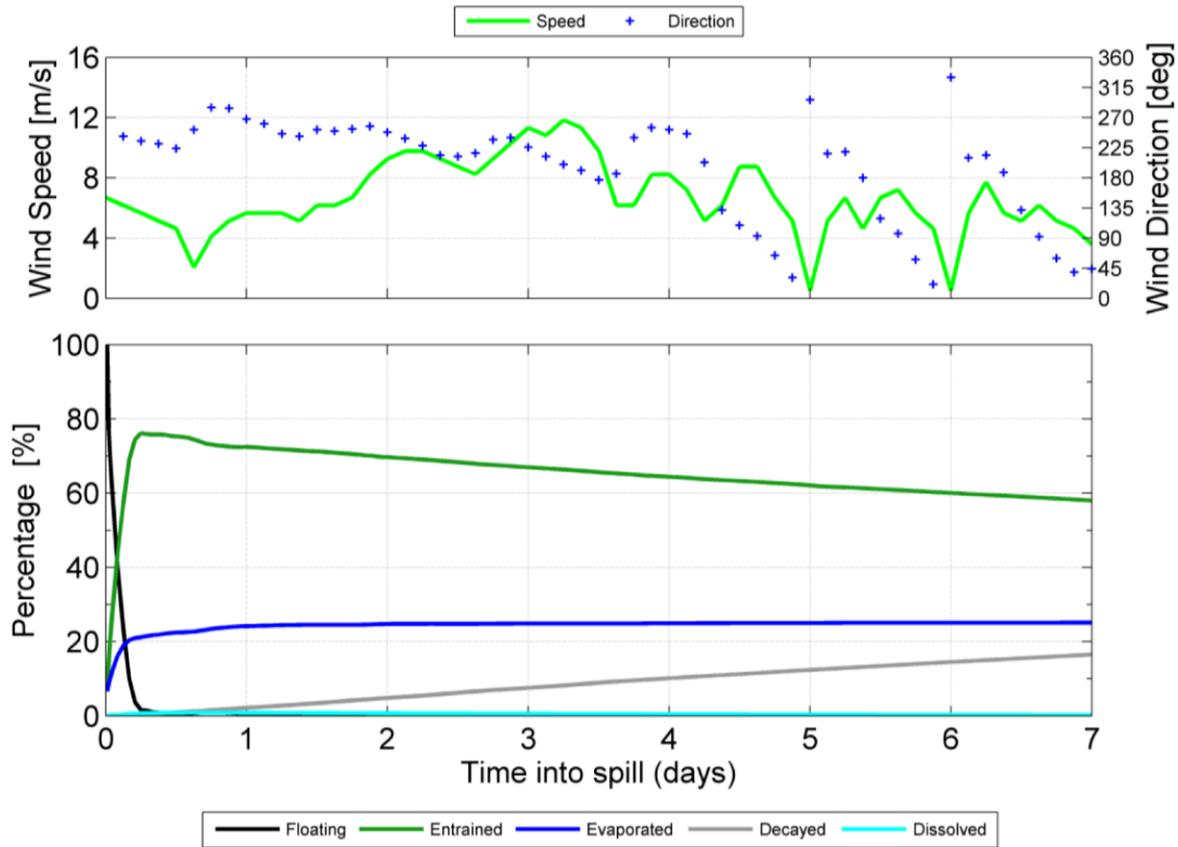

The BTEX components in diesel are the main source of toxicity to marine organisms and hence it is generally observed that the toxicity of spilled diesel decreases as the diesel weathers, decreasing from about 8 to 12 ppm for fresh diesel (Neff et al., 2000). A spill of diesel in the Pyrenees Facility area will have an immediate acute impact on the water column biota in the vicinity of the spill origin. Given the water depth at the Pyrenees location, a surface spill of diesel will not impact directly on the seafloor benthos.

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. In general, about 6% of the oil mass should evaporate within the first 12 hours (boiling point < 180°C); a further 35% should evaporate within the first 24 hours (180°C < boiling point < 265°C); and a further 54% should evaporate over several days (265°C < boiling point < 380°C). About 5% of the oil is shown to be persistent. The aromatic content of the oil is about 3%.

The mass balance forecast for the constant-wind case for marine diesel shows that about 41% of the oil is predicted to evaporate within 24 hours. Under these calm conditions the majority of the remaining oil on the water surface weathers at a slower rate due to comprising the longer-chain compounds with higher boiling points. Evaporation of the residual compounds slows significantly and is then subject to more gradual decay through biological and photochemical processes.

Under the more realistic variable-wind case, where the winds are of greater strength, entrainment of marine diesel into the water column is indicated to be significant. About 24 hours after the spill, around 72% of the oil mass is forecast to have entrained and a further 24% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds tend to remain entrained beneath the surface under conditions that generate wind waves (about >6 m/s).

The increased level of entrainment in the variable-wind case results in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 2.4% per day with an accumulated total of ~16% after seven days, in comparison to a rate of ~0.2% per day and an accumulated total of 1.3% after seven days in the constant-wind case. Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration extends the area of potential effect.

**Figure 6-6: Proportional mass balance plot representing the weathering of marine diesel spilled onto the water surface as a one-off release (50 m3 over one hour) and subject to variable wind at 27°C water temperature and 25°C air temperature.**

**Likelihood**

In accordance with the Woodside PetDW Risk Matrix, given prevention and mitigation measures in place, the likelihood has been determined as Highly Unlikely.

**Consequence Assessment**

Stochastic modelling predicated that the maximum distance that a 100 m3 spill of diesel above the 1 µm threshold was predicted to travel was approximately 15 km west of the surface release site, after which there was no diesel predicted to remain on the water surface above the selected threshold.

A conservative EMBA is as follows for the 100 m3 diesel spill:

- Surface 1 µm – 15 km radius; and
- Entrained > 960 ppb.hrs 19.5 km (0-5 m); 11.6 km (5-10 m).

The BTEX components in diesel are the main source of toxicity to marine organisms and hence it is generally observed that the toxicity of spilled diesel decreases as the diesel weathers; decreasing from about 8 to 12 ppm for fresh diesel (Neff et al., 2000). A spill of diesel will have an immediate acute impact on the water column biota in the vicinity of the spill origin. Given the water depth throughout the Operational area is generally greater than ~200 m, a surface spill of diesel would not impact directly on the seafloor benthos.

The diesel EMBA would include sensitive receptors within the water column (entrained), on the water surface including shallow water habitats adjacent to the shore, and effects on shorelines of the mainland and adjacent islands.

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from a diesel spill from vessel collision. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.

The credible worst-case hydrocarbon spill scenario that may arise from loss of diesel to the marine environment from a vessel collision may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill to these receptors considered in Section 6.8.2 (Loss of Well Containment). The consequence was considered to be Measurable (2).

<b>ALARP Statement:</b>				
<p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of accidental release of diesel from bulk storage. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.</p>				

<b>Demonstration of Acceptability</b>
<p><b>Acceptability Statement</b></p> <p>In the highly unlikely event of a vessel collision resulting in the loss of bulk storage marine diesel to the marine environment, the stochastic modelling undertaken predicts that no diesel at or above the minimum thickness threshold of 10 µm would contact any shoreline. In all seasons, surface waters to the northwest of the diesel release location would most likely to come into contact with diesel above 10 µm thickness threshold, with no diesel predicted to remain on the water surface past 8 hours.</p> <p>The potential sensitive receptors present in the immediate area of the diesel spill will include fish and marine mammals, marine reptiles and seabirds at the sea surface that become coated in diesel or through ingestion. The impact on these sensitive receptors would be negligible and is likely to be limited to a small number of transient individuals, given the distance from the nearest shoreline and as there are no important areas of habitat are present in the immediate vicinity. In summary, all relevant controls were considered as part of the ALARP assessment, and as no other reasonable additional controls were identified that would further reduce the impacts and risks of an unplanned diesel spill due to vessel collision without a gross disproportionate sacrifice, the impacts and risks are considered ALARP. Woodside undertakes regular consultation with relevant persons about its operations/ activities providing them with sufficient and reasonable opportunities to raise any new concerns or issues for the duration of this PAP.</p> <p>Woodside is satisfied that when the accepted controls are implemented that the impact and residual risk of an unplanned diesel spill due to vessel collision is considered 'ALARP' and that adherence to the performance standards will manage the impacts and risks to an acceptable level and demonstrate that the EPOs are met.</p>

Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Hydrocarbon spills / hazardous chemicals or liquid waste, accidental leaks from storage or equipment, including ROVs,			x			x		A	1 - Minor	Possible	3	LCS GP	Tolerable	EPO 17
Spills from bulk transfer of chemical from support vessels to Pyrenees FPSO (bulk contents up to 2,000L).			x			x		A	2 - Measurable	Unlikely	3			
Diesel spill due to human error / equipment failure during bunkering			x					A	1 - Minor	Unlikely	1			
Description of Source of Risk														
<p><b>Hydrocarbon and Chemical Use and Storage</b></p> <p>Various hydrocarbons and chemicals are stored onboard the Pyrenees Facility and vessels, to power equipment. Such liquids include fuel, refined oil, lube oil, biocides, corrosion inhibitors, hydraulic oil, lubricating oils, cleaning and cooling agents, and methanol.</p> <p>Accidental loss of such liquids or liquid wastes to the marine environment could occur as a result of spillage during handling, inadequate bunding and/ or storage, inadequate method of securing or tank/ pipework failure, leak from equipment or rupture or failure of hoses.</p> <p>The volume of chemical or refined oil likely to be accidentally released from a leak or spillage and be released into the marine environment, based on a review of past incidents and possible causes, is less than approximately 80 L.</p> <p><b>Bulk Chemical Transfer</b></p> <p>Chemicals are transferred to the Pyrenees Facility from support vessels by bulk transfer. The most likely spill volume of chemicals during bulk transfer is likely to be less than 200 L based on the volume of the transfer hose and the immediate shutoff of the pumps by personnel involved in the bulk transfer process. However, the worst-case credible spill scenario could result in up to 2,000 L of chemicals being discharged. The chemical used in the largest volume, and therefore the most likely to be discharges in this worst-case spill scenario, is methanol. This unlikely scenario represents a complete failure of the bulk transfer hose combined with a failure to follow procedures (which require transfer activities to be monitored), coupled with a failure to immediately shut off pumps.</p>														

**Marine Diesel Bunkering**

Diesel is stored on board the Pyrenees FPSO, off take tanker and OSV as fuel for vessel engines and generators. Diesel could potentially impact the marine environment if accidentally released during diesel transfer operations from Pyrenees FPSO to offtake tanker or OSV to Pyrenees FPSO.

Diesel transfer has the potential to result in an accidental spill to the marine environment. In a review of the risk of spills in the marine environment, the risk of spill of greater than 1 tonne from fuel transfer was found to be 0.18 spills per year from all transfer operations in Australian waters. There is very little data on the frequency of spills from ship to ship transfers. AMSA (DNV, 2011) noted that the UK experience of ship-to-ship transfer was estimated to be 1 spill over 1 tonne in 2000 tanker offloading operations, giving a spill frequency of  $5 \times 10^{-4}$  per transfer operation.

The potential causes of such an event occurring has been identified as:

- Failure of the hoses during pumping. The maximum credible spill that would occur from total failure of a diesel transfer hose is approximately 450 L (volume of 100 m of 75 mm diameter hose) plus allowance for time to shut down the pump. The most credible response time is considered to be 15 seconds, the worst case is considered to be 2 minutes if the operator is absent or not vigilant. The calculated loss (assuming an average pumping rate of 225 m<sup>3</sup> per hour) is 1.4 m<sup>3</sup> diesel. If compounded by human error the volumes could potentially increase to 7.5 m<sup>3</sup> for diesel (estimated probability of 0.028%). For conservativeness a spill volume of 10 m<sup>3</sup> has been considered in the risk assessment; and
- Failure of connections or valves at disconnection. Valves are dry break but if a valve was to fail at disconnection worst-case loss would result in contents of the hose, approximately 450 L, being released to sea.

**Quantitative Diesel Spill Risk Assessment**

For the environmental conditions experienced in the Pyrenees Facility Operations Area, diesel is expected to undergo rapid spreading and this, together with evaporative loss, will result in a relatively rapid slick break up. Numerical modelling completed as part of the Pyrenees Expansion was used to predict the trajectory and fate of 10 m<sup>3</sup> of spilled diesel from the Pyrenees Facility. This volume represents worst case (7.5 m<sup>3</sup>) plus a further conservative additional volume. The model was set to provide data on final surface loading of 10 g/m<sup>2</sup>. The selected thickness is equivalent to a concentration of approximately 10 ppm if the diesel was to be distributed throughout the top 1 m of water column. These concentrations were chosen as the end point because 10 ppm of diesel represents 24 hour LC50 for sensitive species (24 hour LC50 range for diesel is approximately 2 to 600 ppm depending on species and life cycle stage – US EPA Toxbase).

The maximum distance that diesel above the 10 g/m<sup>2</sup> threshold was predicted to travel was approximately 3.0 km west of the surface release site at the well location, after which there was no diesel predicted to remain on the water surface above the thickness threshold of 10 g/m<sup>2</sup>.

The stochastic modelling demonstrated that visible hydrocarbons would be clear of the water surface within 25 hours. Under the annual conditions assessed, no contact with the shorelines was predicted.

**Consequence Assessment**

**Marine Diesel**

Given the low viscosity of marine diesel, along with the high portion of volatile components, a spill of up to 7.5 m<sup>3</sup> of marine diesel during transfer, storage or use would spread and weather rapidly. Environmental receptors at risk would be restricted to those in the immediate vicinity and may include:

- marine fauna, particularly fauna associated with the sea surface (e.g. seabirds, air breathing vertebrates)
- plankton.

Given the relatively small worst-case credible release volume, the non-persistent nature of marine diesel and the low sensitivity of the immediate receiving environment within the Operational Area (i.e. offshore open water environment, refer to Section 4) potential impacts are expected to be short term (< 1 year) and confined to less than 3 km from the release location. Such impacts may include:

- localised decrease in water quality, and
- acute toxic effects to planktonic organisms in the immediate area of the spill.

Impacts to plankton may include acute toxicity resulting in mortality of planktonic organisms. Given the rapid turn-over of plankton communities, these impacts would be short-lived (hours to days). Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by a marine diesel spill. Impacts to larger fauna such as cetaceans and marine turtles are expected to be light fouling, potentially resulting in irritation of sensitive membranes such as the eyes, mouth, and digestive system (Helm et al. 2015). Mortality of larger fauna is not expected to occur. No impacts to ecosystem function are expected.

No impacts are predicted to the canyons linking the Cuvier Abyssal and the Cape Range Peninsula or the Continental Slope Demersal Fish Communities KEFs. Although, they do overlap the Operational Area (see Section 4), they are well outside the spill impact zone due to their depths.

Minor, short-term impacts may occur to other marine users (e.g. commercial fisheries); however, as the worst case marine diesel spill is only 7.5 m<sup>3</sup>, and there is already no fishing within the PSZ, it is unlikely there would be any significant impact to commercial fishers.

**Chemicals and Non-Process Hydrocarbons**

MEG and TEG are miscible in water; both are rated OCNS Group E and MEG is considered PLONOR. A maximum credible spill of MEG or TEG is expected to mix with the receiving environment with no lasting environmental impact. Accidental releases of chemicals (including corrosion inhibitor) or non-process hydrocarbons decrease the water quality in the immediate area of the release. The consequence is expected to be a minor short term impact given the open ocean mixing environment, distance from sensitive receptors and relatively low credible release volumes.

Depending on the chemical released, the toxicity and/or potential to bioaccumulate may potentially result in localised impacts to water quality, sediment quality, pelagic fish or other marine species in the vicinity of the discharge. Potential impacts to plankton from an accidental chemical spill may include acute toxicity, resulting in mortality of planktonic organisms. Given the rapid turnover of plankton communities and nature and scale of the credible releases, these impacts would be short-lived (hours to days). Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by an accidental chemical spill. Impacts to air-breathing fauna such as cetaceans, birds and marine turtles are expected to be restricted to irritation of sensitive membranes, such as the eyes, mouth and digestive system.

Minor short term impacts may occur to other marine users (e.g. commercial fisheries); however, as there is minimal fishing effort within the Operational Area, it is unlikely there would be any significant impact to commercial fishers.

<b>ALARP Statement:</b> On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of accidental spills of hydrocarbons or chemicals from bunkering/refuelling and from storage, use and transfer. As no reasonable additional/alternative controls were identified that would further reduce the consequences and risks without grossly disproportionate sacrifice, the risks are considered ALARP.				

**Demonstration of Acceptability**

**Acceptability Statement:**

The consequence assessment has determined that, given the adopted controls, accidental spills during bunkering/refuelling, or spills from storage, transfer and use represent a moderate risk rating that is unlikely to result in a consequence greater than Minor temporary impact to the environment, where the ecosystem functions recovers with little intervention. Further opportunities to reduce the risks have been investigated above.

The magnitude of the worst-case spill is unlikely to be greater than 10 m3. Stochastic modelling undertaken for a spill of this magnitude predicts that no shoreline or coastal reef habitats will be contacted by hydrocarbons at the modelled thresholds. More than 50% of the diesel would be evaporated within 8 hours of an accidental spill and the oceanic location is such that any spills would be rapidly diluted and dispersed, with any environmental effects being temporary and localised, with significant impacts not expected owing to the short exposure timeframe.

The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders. The potential risks are considered tolerable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of bunkering/refuelling, and storage, transfer and use to a level that is tolerable and demonstrate that the EPOs are met.

information in a document. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EP<sup>52</sup> submitted by Woodside, and accepted by NOPSEMA, for the detail of the assessment and response in such a scenario. Potential impacts therefore include time and costs associated with inspecting the infrastructure and time and costs associated with any associated repair, which are expected to be slight and short-term in nature.

**Potential subsequent loss of containment**

In the unlikely event of an object being dropped on live infrastructure, and in the further unlikely event of a severe interaction with the infrastructure, there is a possibility that live infrastructure could be ruptured releasing hydrocarbons into the marine environment in such a scenario. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs submitted by Woodside for the operation of the live infrastructure associated with the Macedon field production system, and accepted by NOPSEMA, for the detail of potential impacts, receptors and the extent of the environment that may be affected in such a scenario, being:

- Macedon Operations EP (NOPSEMA Doc A680730, <https://docs.nopsema.gov.au/A680730>)

As detailed in this Section above and below, this EP addresses the risks and impacts (interaction with live infrastructure) that arise from the activities under this EP (interaction from dropped objects). This EP also contains controls to prevent such an event from occurring that are within the operational control of this EP. As detailed in this Section, the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure is not within the operational control of this EP. As detailed below, the risks and impacts of the activities under this EP are managed to ALARP and an acceptable level by implementing the SIMOPS plan and notifying the relevant Operators in the instance of an interaction with live infrastructure to allow the relevant Operator’s detailed response strategies under the relevant operations EPs to be triggered, if required. In the event of a loss of containment caused by an interaction with live infrastructure Woodside will follow direction from the Macedon operations team and will respond as per the relevant requirements. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EP submitted by Woodside for the live infrastructure associated Macedon field production system, and accepted by NOPSEMA, for the detail of the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure.<sup>53</sup>

<sup>54</sup> Qualitative measure

**ALARP Statement**

Woodside considers the adopted controls appropriate to manage the risks of a significant dropped object or anchor drag interacting with live infrastructure within the Operational Area. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without disproportionate sacrifice, the risks and consequences are considered ALARP.

**Demonstration of Acceptability**

**Acceptability Statement**

The impact assessment has determined that interaction with live infrastructure from dropped objects or a loss of station keeping of the MODU represents a low current risk rating and is unlikely to result in a risk consequence greater than slight. The adopted controls are considered industry good practice.

The potential risks and consequences are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of seabed disturbance from dropped objects / anchor drag to an acceptable level and demonstrate that the EPOs are met.

### 6.8.11 Physical Presence: Vessel Collision with Marine Fauna

Context														
Vessels – Section 3.16							Species – Section 4.6							
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Physical presence of vessels resulting in collision with marine fauna.						X		A	1 - Minor	Unlikely	1	LCS	Tolerable	EPO 20
Description of Source of Risk														
<p>The vessels operating in the Operational Area may present a potential hazard to cetaceans and other protected marine fauna, such as whale sharks and marine reptiles. Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement and reproduction), and mortality.</p> <p>The factors that contribute to the frequency and severity of impacts due to collisions include vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth) and the type of animal potentially present and their behaviours.</p> <p>There is a requirement that all vessels within the Operational Area move at low speeds, generally less than 8 knots, unless in an emergency.</p>														
Consequence Assessment														
<p>The likelihood of vessel/whale collision being lethal is influenced by vessel speed; the greater the speed at impact, the greater the risk of mortality (Jensen and Silber 2004, Laist et al. 2001). Vanderlaan and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. According to the data of Vanderlaan and Taggart (2007), it is estimated that the risk is less than 10% at a speed of 4 knots. Vessel-whale collisions at this speed are uncommon and, based on reported data contained in the US National Ocean and Atmospheric Administration database (Jensen and Silber 2004) there only two known instances of collisions when the vessel was travelling at less than 6 knots, both of these were from whale watching vessels that were deliberately placed amongst whales.</p> <p>Vessels undertaking the PAP within the Operational Area are likely to be travelling less than 8 knots; much of the time vessels are holding station. Therefore, the risk of a vessel collision with protected species resulting in death is inherently low.</p> <p>The Operational Area overlaps the humpback whale migration BIA, where humpback whales are seasonally abundant during their annual migrations. Aerial surveys undertaken by Woodside indicate that the majority of humpback whales migrating in the region typically occur east of the Operational Area; the majority of the whales occurred in depths less than 500 m, with the greatest density of whales concentrated in water depths of 200 to 300 m (RPS Environment and Planning 2010a). It is expected that humpback whales could occur within the Operational Area during their seasonal migration period, however harmful interactions between vessels and humpback whales in the Operational Area are considered highly unlikely due to the slow speed of vessels in the Operational Area.</p> <p>A pygmy blue whale migration BIA also overlaps the Operational Area. Analysis of underwater noise logger data indicated pygmy blue whales are present in waters off North West Cape between October to December (northbound migration) and April to August (southbound migration) (McCauley and Jenner 2010). Satellite tagging studies have shown pygmy blue whales migrating along the Western Australian coast near the Operational Area in water depths between 200 m and 1000 m, which includes the depth range of the Operational Area (approximately 340 to 849 m).</p>														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Pygmy blue whales were not recorded in a series of whale monitoring flights between July and September (RPS Environment and Planning 2010a), although these flights were intended to record humpback whales and did not extensively sample deeper waters preferred by pygmy blue whales.

Given the seasonality of humpback whales in the Operational Area, and seasonality and low density of pygmy blue whales recorded in the Operational Area, harmful interactions between vessels and whales during the PAP are considered unlikely. Given the typical speeds of vessels within the Operational Area, any collision between vessels and whales is not expected to result in mortality.

Whale sharks are at risk from vessel strikes when feeding at the surface, or in shallow waters where there is limited option to dive. Whale sharks may traverse offshore waters, including the Operational Area, during their migrations to and from Ningaloo Reef, and a BIA for foraging whale sharks overlaps the Operational Area. However, it is not expected whale sharks would occur in large numbers within the Operational Area, given there is no main aggregation area within the vicinity of the Operational Area, and their presence would be transitory and of a short duration. There are no constraints preventing whale sharks from moving away from vessels (e.g. shallow water or shorelines).

The Operational Area overlaps or is adjacent to foraging and interbreeding BIAs and habitats critical to the survival of green turtle, loggerhead turtle, leatherback turtle and Hawksbill turtle. The nearest nesting habitat is 18 km for green turtle and loggerhead turtle nesting BIAs, at Muiron Island. Water depth within the Operational Area is approximately 200 m. With consideration of the absence of potential nesting or foraging habitat for turtles (i.e. no emergent islands, reef habitat or shallow shoals) and the water depth, it is considered that the Operational Area is unlikely to represent important habitat for marine turtles. Individual turtles may infrequently transit the area. It is acknowledged that there are significant nesting sites along the mainland coast and islands of the region.

The typical response from turtles on the surface to the presence of vessels is to dive (a potential “startle” response), which decreases the risk of collisions (Hazel et al. 2007). As with cetaceans, the risk of collisions between turtles and vessels increases with vessel speed (Hazel et al. 2007). Given the low speeds of vessels undertaking the PAP, along with the expected low numbers of turtles within the Operational Area, interactions between vessels and turtles are considered highly unlikely. It is unlikely that vessel movement associated with the PAP will have a significant impact on marine fauna populations given:

- the low presence of transiting individuals;
- avoidance behaviour commonly displayed by whales, whale sharks and turtles; and
- low operating speed of the PAP support vessels (generally less than 8 knots or stationery, unless operating in an emergency).
- Activities are considered unlikely to result in a consequence greater than minor short-term disruption to individuals or a small proportion of the population, and no impact on critical habitat or fauna activity.

### 6.8.12 Physical Presence: Introduction of Invasive Marine Species

Context														
Vessels – Section 3.16 FPSO Disconnected Mode – Section 3.11.2				Biological Environment – Section 4.5 Species – Section 4.6				Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems / Habitat	Species	Socio-cultural	Decision Type	Severity Level	Likelihood	Risk Level	ALARP Tool	Acceptability	Outcome
Movement of vessels and Pyrenees FPSO from known high introduced marine species (IMS) risk areas					X	X		A	3 - Substantial	Unlikely	10	LC SGP	Tolerable	EPOs 21
Description of Source of Risk														
<p>The Pyrenees Facility relies on vessels to service routine operations, offtake cargo, and IMMR. Vessels are potential vectors for the introduction of invasive marine species (IMS) to the Operational Area during the PAP, and include:</p> <ul style="list-style-type: none"> <li>• facility support vessels: typically sourced from Australian waters and generally considered to be low risk, these vessels are the most commonly used vessels in the Operational Area;</li> <li>• offtake tankers: typically from international waters and generally considered to be low risk, these tankers may visit the Operational Area approximately 8 times per year, with offtake frequency declining as production rates decline; offtake operations may take up to 30 hrs to complete; and</li> <li>• subsea support vessels or USVs – may be sourced from Australia or overseas, depending on requirements and vessel availability.</li> </ul> <p>The Pyrenees FPSO may leave the Operational Area to avoid dangerous weather and to undergo modifications and repairs. This may include spending short periods of time in areas that are considered high risk for the presence of potential IMS, such as ports beyond Australian waters.</p> <p>IMS may be introduced to the Operational Area from these activities through:</p> <ul style="list-style-type: none"> <li>• the discharge of ballast water; and</li> <li>• release of IMS propagules/fragments from biofouling.</li> </ul> <p>Potential IMS can be drawn into ballast tanks during on-boarding of ballast water as cargo is unloaded or to balance vessels under load. Offtake tankers use ballast water to maintain vessel stability. This ballast is discharged when loading crude oil from the Pyrenees FPSO during offtake operations. The Pyrenees FPSO may require ballast water to operate safely when detached from the DTM. Ballast water taken on within the Operational Area (i.e. prior to detachment) is considered unlikely to host IMS due to the offshore location and deep water (approximately 200 m water depth). When returning from beyond Australian waters, the Pyrenees FPSO routinely undertakes ballast water exchanges to achieve low risk ballast water. Ballast water exchanges are not typically required by facility support or subsea vessels. All support and subsea vessels are required to have low risk ballast water on-board prior to being contracted to Woodside.</p> <p>All vessels are subject to some level of marine fouling. Organisms attach to the vessel hull, particularly in areas where organisms can find a good surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests, etc.). Biofouling organisms can become established in an area through the release of propagules (e.g. eggs or larvae), or by attaching to substrate after becoming detached from the host vessel.</p>

**Consequence Assessment**

Non-indigenous Marine Species (NIMS) have been introduced into a region beyond their natural biogeographic range and can survive, reproduce and establish founder populations. Not all NIMS introduced into an area will thrive or cause demonstrable impacts. Indeed, the majority of NIMS around the world are relatively benign; few have spread widely beyond sheltered ports and harbours. Only a subset of NIMS that become abundant and impact social/cultural, human health, economic and/or environmental values can be considered IMS. IMS have historically been introduced and translocated around Australia by a variety of human means, including biofouling and ballast water.

Species of concern are those that are:

- not native to the region;
- likely to survive and establish in the region; and
- able to spread by human mediated or natural means.

Species of concern vary from one region to another depending on various environmental factors such as water temperature, depth, salinity, nutrient levels and habitat type. These factors dictate their survival and invasive capabilities. IMS are typically species that occur in shallow water, and hence are unlikely to survive in much of the Operational Area; the Pyrenees FPSO hull, the mooring and sections of risers near the sea surface are the only substrates considered suitable for establishment of potential IMS.

Introducing IMS into the local marine environment may alter the ecosystem, as IMS have characteristics that make them superior (in a survival and/or reproductive sense) to indigenous species. They may prey upon local species which had previously not been subject to this kind of predation, and therefore not have evolved protective measures against the attack. They may outcompete indigenous species for food, space or light, and can also interbreed with local species, creating hybrids such that the endemic species is lost.

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas, once established. If the introduction is captured early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

Despite the potential high consequence of the establishment of a marine pest within a high value environment as a result of introduction, unlike coastal or sheltered nearshore waters, the deep offshore open waters of the Operational Area are not conducive to the settlement and establishment of IMS. The PAP is undertaken in an open ocean, offshore location away from shorelines and/or critical habitat, more than 14 nm from a shore and in waters approximately 200 m deep. The impacts of introducing a marine pest in this offshore location would have a lower consequence than introduction within a nearshore location, as the introduction of IMS and associated establishment is considered highly unlikely.

When examining the potential impacts from translocation of marine pests to the Pyrenees Facility itself, interactions with the facility and any support vessels (most likely Australian sourced) and tankers are limited, with time within the 500 m PSZ around the facility limited to support vessel transfers/bunkering. However, the risk of this occurring is considered manageable, given the ballast water and biofouling controls which are implemented for the PAP.

Summary of Potential Impacts to Environmental Value(s)

In support of Woodside’s assessment of the impacts and risks of IMS introduction associated with the petroleum activity program, risk and impact evaluations of the different aspects of marine pest translocation associated with the activity are undertaken. The results of this assessment are presented in the table lines below.

As a result of this assessment Woodside has presented the highest potential severity level as 2 (Measurable) and likelihood as Highly Unlikely resulting in an overall Tolerable risk following the implementation of identified controls.

IMS Introduction Aspect	Credibility of Introduction	Consequence of Introduction	Likelihood
Transfer of IMS from infected vessel to Operational Area and establishment on the seafloor or subsea infrastructure.	Not Credible The deep offshore open waters of the Operational Area, away from shorelines and/or critical habitat, more than 12 nm from a shore and in waters 320-849 m deep are not conducive to the settlement and establishment of IMS.		
Transfer of IMS from infected vessel to and	Credible	If IMS were to establish this would potentially result in	Unlikely (0.1)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>subsequent establishment on the Pyrenees FPSO.</p>	<p>There is potential for the transfer of marine pests to occur.</p>	<p>fouling of intakes (depending on the pest introduced) and would likely result in the quarantine of the Pyrenees FPSO until eradication could occur (through cleaning and treatment of infected areas), which would be costly to undertake.                  Substantial (3) – Reputation and Brand                  Such introduction would be expected to have Substantial (3) impact to Woodside’s reputation and brand, and close scrutiny of asset level operations or future proposals.                  Measurable (2)– Environment                  Environmental consequence of introduction of IMS to the Pyrenees FPSO is considered measurable (2), localised and would relate to habitat directly on the Pyrenees FPSO.</p>	<p>Interactions between the Pyrenees FPSO and support vessels will be limited during the petroleum activity program, with a 500m safety exclusion zone being adhered to.                  Offtake tankers are considered to present a low IMS risk do not directly contact the Pyrenees FPSO and are within the Operational Area for short periods of time (typically &lt;36 hrs).                  Spread of marine pests via ballast water or spawning in these open ocean environments is considered Unlikely (0.1).</p>
<p>Transfer of IMS to Pyrenees FPSO while disconnected and returning to Operational Area from shipyard.</p>	<p>Credible                  There is potential for the transfer of marine pests to occur.</p>	<p>If IMS were to return on the FPSO and establish, this would potentially result in fouling of intakes (depending on the pest introduced), and likely result in the quarantine of the Pyrenees FPSO until eradication could occur (through cleaning and treatment of infected areas). This would be costly to undertake.                  Measurable (2) – Environment                  Environmental consequence of introduction of IMS to the Pyrenees FPSO is considered measurable (2), localised, and would relate to habitat directly on the Pyrenees FPSO.                  Substantial (3)– Reputation and Brand                  Such introduction would be expected to have a substantial (3) impact to Woodside’s reputation and brand, and close scrutiny of asset level operations or future proposals.</p>	<p>Unlikely (0.1)                  Interactions between the Pyrenees FPSO and support vessels will be limited during the PAP, with a 500 m PSZ being adhered to.                  In addition, controls will be implemented (refer to ALARP discussion below) on return of the Pyrenees FPSO from the shipyard to limit likelihood of IMS translocation.                  Spread of marine pests via ballast water or spawning in these open ocean environments is considered Unlikely (0.1).</p>
<p>Transfer of IMS from infected vessel to a subsequent establishment on Pyrenees FPSO, then transfer of IMS to a</p>	<p>Not Credible                  Risk is considered so remote that it is not credible for the purposes of the PAP.</p>		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>secondary vessel from the Pyrenees FPSO.</p>	<p>The transfer of a marine pest from an infected activity vessel to the Pyrenees FPSO was already considered highly unlikely, given the offshore open ocean environment. Furthermore, if this was to happen controls would be implemented to respond to the transfer, before many other vessels had opportunities to interact with the FPSO.</p> <p>For a marine pest to then establish into a mature spawning population on the Pyrenees FPSO and then transfer to another support vessel is not considered credible (i.e. beyond the Woodside PetDW risk matrix).</p> <p>The Pyrenees FPSO is in an offshore, open ocean, deep environment.</p> <p>Support vessels only spend short periods of time alongside the Pyrenees FPSO (i.e. during backloading or bunkering activities).</p> <p>There is also no direct contact (i.e. they are not tied up alongside) during these activities.</p> <p>It's also noted that Woodside has been conducting marine vessel movements between the FPSO and WA ports (such as Dampier) for a long period of time, and no IMS has been detected in these ports (DoF 2017).</p>

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
All project vessels will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements	F: Yes CS: Minimal cost. Standard practice.	Reduction in the likelihood that ballast water will host IMS.	Controls based on legislative requirements under the Biosecurity Act 2015 – must be adopted.	Yes C 17.1
Internationally sourced project vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.	F: Yes CS: Minimal cost. Standard practice.	Reduction in the likelihood that ballast water will host IMS.	Controls based on legislative requirements under the Biosecurity Act 2015 – must be adopted.	Yes C 17.2
<b>Good Practice</b>				
Woodside’s IMS risk assessment process will be applied to the project vessels and immersible equipment. Assessment will consider the following risk factors: For vessels: <ul style="list-style-type: none"> <li>• vessel type</li> <li>• recent IMS inspection and cleaning history, including for internal niches</li> <li>• out-of-water period prior to mobilisation</li> <li>• age and suitability of antifouling coating at mobilisation date</li> <li>• internal treatment systems and history</li> <li>• origin and proposed area of operation</li> <li>• number of stationary/slow speed periods greater than seven days</li> <li>• region of stationary or slow periods</li> <li>• type of activity – contact with seafloor.</li> </ul> For immersible equipment: <ul style="list-style-type: none"> <li>• region of deployment since last thorough clean, particularly coastal locations</li> </ul>	F: Yes CS: Minimal cost. Good practice implemented across all Woodside Operations.	Identifies potential risks and additional controls implemented accordingly. In doing so, the likelihood of transferring marine pests between FPSO and project vessels within the Operational Area is reduced. No change in consequence would occur.	Benefits outweigh cost/sacrifice.	Yes C 17.3

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
<ul style="list-style-type: none"> <li>duration of deployments</li> <li>duration of time out of water since last deployment</li> <li>transport conditions during mobilisation</li> <li>post-retrieval maintenance regime.</li> </ul> <p>Based on the outcomes of each IMS risk assessment, management measures commensurate with the risk (such as the treatment of internal systems, IMS inspections or cleaning) will be implemented to minimise the likelihood of IMS being introduced.</p>				
<p>Undertake diver-based monitoring of the Pyrenees FPSO for IMS.</p>	<p>F: Potentially, diver-based surveys are technically feasible for the Pyrenees FPSO but are not approved under the in-force Safety Case.</p> <p>CS: Significant. IMS inspections of in-water assets typically requires vessel logistics and diver-based inspection teams to reliably detect IMS. This is a costly, time-consuming process that would likely require facility simultaneous operational constraints, and invariably introduces a series of significant safety risks in a hazardous offshore environment.</p> <p>Monetary cost of IMS survey for Pyrenees FPSO sized infrastructure would be comparable to safe diver campaign arrangements in the order of AUD\$200k/day plus mob/demob costs. Costs of ROV to support survey are in the order of AUD\$150k/day plus mob/demob costs (based on subsea ROV hire costs).</p>	<p>FPSO monitoring does not prevent the potential for translocation (i.e. only as a mitigation measure). Detection may facilitate for subsequent development of options to manage IMS. Subsequent success may be limited due to structure complexity and hazardous environment.</p>	<p>Grossly disproportionate. Interactions between FPSO and support/subsea vessels posing IMS translocation risk will be limited, and the vessels involved will have been managed through the implementation of Woodside's IMS Management Plan (IMSMP) (C19.2) a verified process which provides Woodside confidence in the verification of EPO 12.</p> <p>Consequently, any additional benefit gained through the implementation of this control is considered disproportionate given material execution safety risks, and controls already adopted (and noting already incurred</p>	<p>No</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
	Health and safety exposure includes those of personnel while conducting diver-based surveys- 4 days of 2-3 people (based on subsea ROV surveys of similar size), as well as offshore vessel and facility simultaneous operations hazards.		cost through implementation of IMSMP (i.e. inspections and cleaning where risk warrants)) and the unlikely likelihood of a translocation event.	
<b>Professional Judgement – Eliminate</b>				
Do not use vessels.	F: No. No alternative to the use of vessels during the PAP was identified. Given that vessels must be used to undertake the PAP. There is no feasible means to eliminate the source of risk. CS: Not assessed, control not feasible	Not assessed, control not feasible.	Not assessed, control not feasible.	No
<b>Professional Judgement – Substitute</b>				
Source vessels based in Australia only.	F: Yes. Support vessels are routinely sourced from Australia. However, depending on the nature of subsea IMMR activities, there may not be a suitable subsea support vessel within Australian waters. CS: Potential for significant cost and schedule impacts.	Reduction in the likelihood that a vessel will host IMS.	Disproportionate. The cost/sacrifice is grossly disproportionate to the benefit gained.	No
IMS Inspection of all vessels.	F: Yes. Approach to inspect vessels is feasible. CS: Significant cost and schedule impacts. Thorough inspections require vessels to be removed from the sea (e.g. slipped or dry docked) and examined by an IMS expert. This process incurs significant financial and schedule sacrifices. Timely vessel based support is integral to the safe and efficient operation of the Pyrenees FPSO and subsea infrastructure.	Reduction in the likelihood that a vessel will host IMS.	Disproportionate. The cost/sacrifice is grossly disproportionate to the benefit gained.	No

<b>Demonstration of ALARP</b>				
<b>Control Considered</b>	<b>Control Feasibility (F) and Cost/Sacrifice (CS)</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Control Adopted</b>
Inspection of Pyrenees FPSO by IMS Inspector prior to return from international sail away.	F: Yes. Approach to inspect vessels is feasible. CS: Significant cost and schedule impacts. Thorough inspections require vessels to be removed from the sea (e.g. slipped or dry docked) and examined by an IMS Inspector. This process incurs significant financial and schedule sacrifices.	Reduction in the likelihood that the FPSO would host IMS on return to Operational Area from international sail away.	Although the inspection of all vessels associated with Pyrenees operations is considered disproportionate (rejected control above), considering the implementation of Woodside's IMSMP (C11.2, the inspection of the Pyrenees FPSO itself by an IMS Inspector is considered appropriate given the added level of confidence it provides.	Yes C 17.4
<b>Professional Judgement – Engineered Solution</b>				
None identified.				
<b>ALARP Statement:</b> The risk assessment has determined that, given the adopted controls, introduction of IMS represent a tolerable risk. Further opportunities to reduce the risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of invasive marine species to an acceptable level.				

<b>Demonstration of Acceptability</b>
<b>Acceptability Statement:</b> The risk assessment has determined that, given the adopted controls, introduction of IMS represents a tolerable risk to marine communities within the Operational Area. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS to an acceptable level and demonstrate that the EPOs are met..

## 6.9 Recovery Plan and Threat Abatement Plan Assessment

This section describes the assessment that Woodside has undertaken to demonstrate that the PAP is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017).
- Recovery Plan for the White Shark (*Carcharodon carcharias*) (Commonwealth of Australia, 2013a)
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) 2014 (Commonwealth of Australia, 2014).
- Sawfishes and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b).
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (Commonwealth of Australia, 2018).
- Conservation Management Plan for the Blue Whale 2015–2025 (Commonwealth of Australia, 2015a).
- Conservation Management Plan for the Southern Right Whale 2011-2021 (Commonwealth of Australia, 2012a)
- Recovery Plan for the Australian Sea Lion (Commonwealth of Australia, 2013b).
- National Recovery Plan for albatrosses and petrels (Commonwealth of Australia, 2022)
- Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australia, 2015c)
- Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020b).
- National Recovery Plan for the Australian Fairy Tern (Commonwealth of Australia, 2020a)
- National Recovery Plan for the Christmas Island Frigatebird (Commonwealth of Australia, 2004)

Table 6-18 lists the objectives and (where relevant) the action areas of these plans, and also describes whether these objectives/action areas are applicable to government, the Titleholder, and/or the PAP. For those objectives/action areas applicable to the PAP, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the PAP are not inconsistent with that action. The results of this assessment against relevant actions are presented in Table 6-19 to Table 6-22.

**Table 6-18: Identification of Applicability of Recovery Plan and Threat Abatement Plan Objectives and Action Areas**

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	PAP
Marine Turtle Recovery Plan			
Long-term Recovery Objective: Minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so they can be removed from the EPBC Act threatened species list	Y	Y	Y
Interim Recovery Objectives			
Current levels of legal and management protection for marine turtle species are maintained or improved, both domestically and throughout the migratory range of Australia's marine turtles	Y		
The management of marine turtles is supported	Y		
Anthropogenic threats are demonstrably minimised	Y	Y	Y
Trends in nesting numbers at index beaches and population demographics at important foraging grounds are described	Y	Y	
Action Areas			
A. Assessing and addressing threats			
A1. Maintain and improve efficacy of legal and management protection	Y		
A2. Adaptively manage turtle stocks to reduce risk and build resilience to climate change and variability	Y		
A3. Reduce the impacts of marine debris	Y	Y	Y
A4. Minimise chemical and terrestrial discharge	Y	Y	Y
A5. Address international take within and outside Australia's jurisdiction	Y		
A6. Reduce impacts from terrestrial predation	Y		
A7. Reduce international and domestic fisheries bycatch	Y		
A8. Minimise light pollution	Y	Y	Y
A9. Address the impacts of coastal development/infrastructure and dredging and trawling	Y	Y	
A10. Maintain and improve sustainable Indigenous management of marine turtles	Y		
B. Enabling and measuring recovery			
B1. Determine trends in index beaches	Y	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	PAP
B2. Understand population demographics at key foraging grounds	Y		
B3. Address information gaps to better facilitate the recovery of marine turtle stocks	Y	Y	Y
Blue Whale Conservation Management Plan			
Long-term recovery objective: Minimise anthropogenic threats to allow for their conservation status to improve so that they can be removed from the EPBC Act threatened species list	Y	Y	Y
Interim Recovery Objectives			
The conservation status of blue whale populations is assessed using efficient and robust methodology	Y		
The spatial and temporal distribution, identification of BIAs, and population structure of blue whales in Australian waters is described	Y	Y	Y
Current levels of legal and management protection for blue whales are maintained or improved and an appropriate adaptive management regime is in place	Y		
Anthropogenic threats are demonstrably minimised	Y	Y	Y
Action Areas			
A. Assessing and addressing threats			
A.1: Maintain and improve existing legal and management protection	Y		
A.2: Assessing and addressing anthropogenic noise	Y	Y	Y
A.3: Understanding impacts of climate variability and change	Y		
A.4: Minimising vessel collisions	Y	Y	Y
B. Enabling and Measuring Recovery			
B.1: Measuring and monitoring population recovery	Y		
B.2: Investigating population structure	Y		
B.3: Describing spatial and temporal distribution and defining biologically important habitat	Y	Y	Y
Grey Nurse Shark Recovery Plan			
Overarching Objective			

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	PAP
To assist the recovery of the grey nurse shark in the wild, throughout its range in Australian waters, with a view to: improving the population status, leading to future removal of the grey nurse shark from the threatened species list of the EPBC Act ensuring that anthropogenic activities do not hinder the recovery of the grey nurse shark in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific Objectives			
Develop and apply quantitative monitoring of the population status (distribution and abundance) and potential recovery of the grey nurse shark in Australian waters	Y		
Quantify and reduce the impact of commercial fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Quantify and reduce the impact of recreational fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Where practicable, minimise the impact of shark control activities on the grey nurse shark	Y		
Investigate and manage the impact of ecotourism on the grey nurse shark	Y		
Manage the impact of aquarium collection on the grey nurse shark	Y		
Improve understanding of the threat of pollution and disease to the grey nurse shark	Y	Y	Y
Continue to identify and protect habitat critical to the survival of the grey nurse shark and reduce the impact of threatening processes within these areas	Y	Y	
Continue to develop and implement research programs to support the conservation of the grey nurse shark	Y	Y	
Promote community education and awareness in relation to grey nurse shark conservation and management	Y		
Sawfish and River Sharks Recovery Plan			
Primary Objective			
To assist the recovery of sawfish and river sharks in Australian waters with a view to: improving the population status leading to the removal of the sawfish and river shark species from the threatened species list of the EPBC Act ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific Objectives			

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	PAP
Reduce and, where possible, eliminate adverse impacts of commercial fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of recreational fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of Indigenous fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate the impact of illegal, unregulated and unreported fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of collection for public aquaria on sawfish and river shark species	Y		
Improve the information base to allow the development of a quantitative framework to assess the recovery of, and inform management options for, sawfish and river shark species	Y		
Develop research programs to assist conservation of sawfish and river shark species	Y	Y	
Improve community understanding and awareness in relation to sawfish and river shark conservation and management	Y		
<b>Marine Debris Threat Abatement Plan</b>			
Objectives			
Contribute to long-term prevention of the incidence of marine debris	Y	Y	
Understand the scale of impacts from marine plastic and microplastic on key species, ecological communities and locations	Y	Y	Y
Remove existing marine debris	Y		
Monitor the quantities, origins, types and hazardous chemical contaminants of marine debris, and assess the effectiveness of management arrangements for reducing marine debris	Y		
Increase public understanding of the causes and impacts of harmful marine debris, including microplastic and hazardous chemical contaminants, to bring about behaviour change	Y		

**Table 6-19: Assessment against relevant actions of the Marine Turtle Recovery Plan**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Marine Turtle Recovery Plan	Action Area A3: Reduce the impacts from marine debris	Action: Support the implementation of the Marine Debris Threat Abatement Plan (TAP) Priority actions at stock level: G-NWS – Understand the threat posed to this stock by marine debris LH-WA – Determine the extent to which marine debris is impacting loggerhead turtles F-Pil – no relevant actions	Refer Section 6.8.9 Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to marine turtles. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the PAP.	EPO 10 C 10.1 to 10.4, C 9.5 PS 10.1 to 10.3, PS 9.5
	Action Area A8: Minimise light pollution	Action: Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats Priority actions at stock level: G-NWS – as above LH-WA – no relevant actions F-Pil – Manage artificial light from onshore and offshore sources to ensure biologically important behaviours of nesting adults and emerging/dispersing hatchlings can continue	Refer Section 6.7.3 Not inconsistent assessment: The assessment of light emissions has considered the potential impacts to marine turtles. Internesting, mating, foraging or migrating turtles are not impacted by light from offshore vessels. Based on the frequency and nature of IMMR activities, the impacts to adult turtles moving through the Operational Area from vessel lighting are expected to be localised and temporary with no lasting effect.	EPO 8 C 8.1 PS 8.1
	Action Area B1: Determine trends at index beaches	Action: Maintain or establish long-term monitoring programs at index beaches to collect standardised data critical for determining stock trends, including data on hatchling production Priority actions at stock level: G-NWS – Continue long-term monitoring of index beaches LH-WA – Continue long-term monitoring of nesting and foraging populations F-Pil – no relevant actions	Not inconsistent assessment: Woodside contributes to Action Area B1 via its support of the Ningaloo Turtle Program.	N/A

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area B3: Address information gaps to better facilitate the recovery of marine turtle stocks	Action: Understand the impacts of anthropogenic noise on marine turtle behaviour and biology Priority actions at stock level: G-NWS – Given this is a relatively accessible stock that is likely to be exposed to anthropogenic noise – Investigate the impacts of anthropogenic noise on turtle behaviour and biology and extrapolate findings from the NWS stock to other stocks LH-WA – no relevant actions F-Pil – no relevant actions	Refer Sections 6.7.4 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to marine turtles. IMMR related noise is not expected to result in behavioural response, injury or mortality of individuals, or any other lasting effect.	EPO 3 C 3.1 PS 3.1
Assessment Summary The Marine Turtle Recovery Plan has been considered during the assessment of impacts and risks, and the PAP is not considered to be inconsistent with the relevant actions of this plan.				

**Table 6-20: Assessment against relevant actions of the Blue Whale Conservation Management Plan**

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Blue Whale Conservation Management Plan	Action Area A.2: Assessing and addressing anthropogenic noise	Action 2: Assessing the effect of anthropogenic noise on blue whale behaviour Action 3: Anthropogenic noise in BIAs will be managed such that any blue whale continues to use the area without injury <sup>2</sup> , and is not displaced from a foraging area	Refer Sections 6.7.4 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to pygmy blue whales. Acoustic emissions from project vessels will not cause injury to any pygmy blue whale. There are no known or possible foraging areas for pygmy blue whales within or adjacent to the Operational Area. If the PAP within the Operational Area overlaps with an individual northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration.	EPO 3 C 3.1 PS 3.1

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area A.4: Minimising vessel collisions	Action 3: Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented	Refer Section 6.8.10 Not inconsistent assessment: The assessment of vessel collision with marine fauna has considered the potential risks to pygmy blue whales. If the PAP within the Operational Area overlaps with an individual northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration. Vessel collisions with pygmy blue whales are highly unlikely to occur, given the low operating speed of support vessels.	EPO 11 C 11.1 PS 11.1
	Action Area B.3: Describing spatial and temporal distribution and defining biologically important habitat	Action 2: Identify migratory pathways between breeding and feeding grounds Action 3: Assess timing and residency within BIAs	Not inconsistent assessment: Woodside contributes to Action Area B3 via its support of targeted research initiatives (e.g. satellite tracking of pygmy blue whale migratory movements <sup>3</sup> ).	N/A
Assessment Summary The Blue Whale Conservation Management Plan has been considered during the assessment of impacts and risks, and the PAP is not considered to be inconsistent with the relevant actions of this plan.				

**Table 6-21: Assessment against relevant actions of the Grey Nurse Shark Recovery Plan**

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Grey Nurse Shark Recovery Plan	Objective 7: Improve understanding of the threat of pollution	Action 7.1: Review and assess the potential threat of introduced species, pathogens and pollutants	Refer Section 6.8.1 Not inconsistent assessment: This EP includes an assessment of the impacts from accidental release of solid wastes as well as planned discharges of drilling waste on marine species.	N/A

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Sawfish and River Shark Recovery Plan	Objective 5: Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	Action 5c: Identify risks to important sawfish and river shark habitat and measures needed to reduce those risks	Refer <b>Sections 6.8</b> Not inconsistent assessment: The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to sawfish and river shark. Spill risk strategies and response program include management measures, as identified and required.	Refer <b>Sections 6.7.5 and 6.8</b> Detailed oil spill preparedness and response EPOs, EPSs and MC for the PAP are present in Appendix H: Oil Spill Preparedness and Response Mitigation Assessment

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Objective 6: Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	Action 6a: Assess the impacts of marine debris including ghost nets, fishing gear and plastics on sawfish and river shark species	Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to sawfish. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the PAP.	N/A
Assessment Summary The Sawfish and River Shark Recovery Plan has been considered during the assessment of impacts and risks, and the PAP is not considered to be inconsistent with the relevant actions of this plan.				

**Table 6-23: Assessment against relevant actions of the Marine Debris Threat Abatement Plan**

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Marine Debris TAP	Objective 2: Understand the scale of marine plastic and microplastic impact on key species, ecological communities and locations	Action 2.04: Build understanding related to plastic and microplastic pollution	Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to the marine environment. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the PAP.	N/A
Assessment Summary: The Marine Debris TAP has been considered during the assessment of impacts and risks, and the PAP is not considered to be inconsistent with the relevant actions of this plan.

Aspect	Cultural Features and Heritage Values			
Unplanned Activities	The potential environmental risks to species considered to have cultural value to Traditional Owners have been summarised below and attributed a risk rating to understand cumulative impacts on them as a cultural feature or heritage value.			
	<b>Aspect</b>		<b>Risk Rating</b>	
	<b>Environmental risk assessment to marine species</b>	<b>Marine mammals</b>	<b>Marine reptiles</b>	<b>Fish</b>
	6.8.2 Unplanned Hydrocarbon Release: Loss of well containment	30	30	30
	6.8.4 Unplanned Hydrocarbon Release: Subsea infrastructure	3	3	3
	6.8.5 Unplanned Hydrocarbon Release: Offtake Operations	3	3	3
6.8.3 Unplanned Hydrocarbon Release: Loss of Containment of Bulk Storage (Crude)	9	9	9	
Impact and Risk Assessment	<p>The PAP has the potential to impact cultural features and heritage values through the following ways:</p> <p><u>Intangible Cultural Heritage</u></p> <ul style="list-style-type: none"> <li>• Songlines: Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale and Kelly, 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas infrastructure exists in many areas of the North West Shelf, and that songlines are still acknowledged and recognised. It is inferred that if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. “weaken” a songline) rather than binary or absolute (i.e. destroy a songline).</li> <li>• Creation/dreaming sites; sacred sites; ancestral beings: Activities that physically alter landscape features may be assumed to potentially impact values of creation/dreaming sites, sacred sites or ancestral beings.</li> <li>• Cultural obligations to care for Country: Environmental impacts may be assumed to impact rights and obligations to care for Sea Country. Exclusion of Traditional Custodians from Sea Country (e.g. by restricting access) or decision-making processes (e.g. by not conducting ongoing consultation) are other potential sources of impact.</li> <li>• Knowledge of Country/customary law and transfer of knowledge: Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population. Therefore, the transmission of these skills is expected to be impacted where there are impacts at the species/population level. Limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge.</li> <li>• Connection to Country: Where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge this may damage connection to Country (McDonald and Phillips, 2021).</li> <li>• Access to Country: Impacts to access to Country may be classified as temporary (e.g. where exclusion zones exist around activities for safety reasons) or permanent (e.g. where infrastructure obstructs access or navigation). Impacts to access to Country can only occur in areas that were traditionally accessed by Traditional Custodians. As described in Section 4.9 this is anticipated to be focussed on areas adjacent to the coast.</li> <li>• Restrictions on Access to Country: Access to the operational area has not been identified as a cultural issue, however some areas within the EMBA may not be culturally appropriate to access. Impacts to this value may occur where spill response access areas that are not appropriate, or in ways that are not consistent with traditional law.</li> <li>• Kinship systems and totemic species: It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu, 2004). It is therefore inferred that the management of totemic or</li> </ul>

Aspect	Cultural Features and Heritage Values
	<p>kinship species applies at the species/population level and not to individual plants and animals.</p> <ul style="list-style-type: none"> <li>Resource collection: Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, marine species (as resources) will be impacted where there is an impact at the species/population level.</li> </ul> <p><u>Marine Ecosystems and Species:</u></p> <ul style="list-style-type: none"> <li>Marine ecosystems may hold both cultural and environmental value (see Section 4.9) with cultural and environmental values intrinsically linked (DCCEEW, 2023; MAC, 2021 as cited in Woodside, 2023a). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country—the seascape which Traditional Custodians view, interact with or hold knowledge of.</li> </ul> <p><u>Coastal landforms</u></p> <ul style="list-style-type: none"> <li>Coastal landforms may have cultural values either through association with intangible values described above (e.g. as features of a songline, physical manifestations of ancestor beings etc.) or as archaeologically prospective locations (e.g. water sources with increased habitation/use, dunes used for burials etc.)</li> </ul> <p><b>Intangible Values</b></p> <p><u>Songlines</u></p> <p>Management of intangible cultural heritage can include reducing impacts and risks to tangible features that are associated with intangible cultural heritage (UNESCO, 2003; ICOMOS, 2013). Impacts to marine plants, animals and other cultural features associated with songlines might impact the intergenerational transmission of knowledge of songlines when individuals can no longer witness or interact with the cultural features tied to songlines on Country. Therefore, managing songlines may require environmental controls to minimise potential impact to marine fauna at a population level, including migratory routes. Refer to species specific assessment below for further information.</p> <p>Physical features comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. Songlines can become lost, fragmented, or broken when there is a loss of Country or impact to culturally important physical features (Neale and Kelly, 2020:30). No specific details of songlines within the EMBA have been provided by relevant persons during consultation for this Activity, and no landforms typical of songlines (e.g. rocks, mountains, rivers, caves and hills (Higgins 2021:724)) are anticipated to be impacted by the Activity.</p> <p><u>Creation/Dreaming Sites; Sacred Sites; Ancestral Beings</u></p> <p>Woodside has undertaken all reasonable steps to identify creation and dreaming sites, sacred sites, and places associated with ancestral beings within the EMBA. No such sites have been identified. A review of relevant literature has been undertaken which has identified creation, dreaming and ancestral narratives related to the sea more broadly without confirming where (if anywhere) these overlap the EMBA. These references are of a general nature, and do not identify any features or values requiring specific protection or management from the proposed activities.</p> <p>In the literature reviewed, sea serpents or water serpents are common in Aboriginal creation narratives, and several references were identified. The majority of these refer to serpents residing within inland rivers or pools outside of the EMBA (Barber and Jackson, 2011, Hayes v Western Australia [2008] FCA 1487, Juluwarlu, 2004; Water Corporation, 2019). In some versions, the serpent originates from the sea or coast and creates the rivers as it heads inland. Areas of the current coastline and past coastlines at various points along the Ancient Landscape—where the Serpent would have emerged onto the land—are within the EMBA. Areas of the broader ocean where the serpent may have originally lived are not specified. Barber and Jackson (2011) also recount a story where a freshwater serpent pushes a sea serpent back into the ocean where it presumably continues to reside. This does not provide the specificity required to determine the location of sea serpents within the sea, and it is possible that the ocean as a whole (out to and beyond other continents) should be viewed generally as housing the sea serpent(s). Consultation with Traditional Custodians and ethnographic surveys have not identified impacts on sea serpents from the PAP. However, by analogy to other water serpent narratives across Australia, possible impact pathways may include interruption of its path by blocking or reducing flows of water, damaging sacred sites such as thalu or rock art sites or depleting water sources.</p>

Aspect	Cultural Features and Heritage Values
	<p>No impacts to water flows (either tidal movement or ocean currents) or depletion of water sources are anticipated from this PAP.</p> <p><u>Cultural Obligations to Care for Country</u></p> <p>Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. Lack of access to coastally located cultural sites that carry songlines or remain ceremonially important can impact First Nations people's livelihoods and impact their ability to carry out cultural obligations on Country.</p> <p><u>Knowledge of Country/Customary Law and Transfer of Knowledge</u></p> <p>Cultural knowledge about Sea Country/customary law and the intergenerational transmission of knowledge are important values identified through consultation, assessments and the literature review. Transfer of knowledge includes continuing traditional practices to pass on practical skills.</p> <p>Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population—for example traditional fishing methods require the survival of traditional fish resources. Therefore, ensuring the transmission of cultural knowledge may require environmental controls protecting species and migratory pathways at a population level. Refer to species specific assessment below for further information.</p> <p><u>Connection to Country</u></p> <p>Connection to Country describes the multi-faceted relationship between First Nations people and the landscape, which is envisioned as having personhood and spirit. No impacts to connection to country are anticipated as a result of exclusion or displacement of Aboriginal communities. Access to Country is discussed below.</p> <p><u>Access to Country</u></p> <p>Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Access is also a value in its own right, as a continuation of traditional Sea Country access and use.</p> <p>Access to areas within the Operational Area may be limited where exclusion zones are established around vessels for safety purposes. Further the exclusion zones around drilling activities are temporary and presence of subsea infrastructure are not anticipated to affect navigation, particularly given the water depth. Access to Country within the EMBA is also not expected to be affected in the highly unlikely event of an unplanned hydrocarbon release. However relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix H.</p> <p><u>Restrictions on Access to Country</u></p> <p>No information was received which suggested any part of the Operational Area cannot be accessed in a culturally appropriate way. However, some areas of the EMBA may be subject to cultural restrictions on access or may be culturally dangerous to access in any respect. Access to these areas would only be required in response to an unplanned impact.</p> <p><u>Kinship Systems and Totemic Species</u></p> <p>Individuals may have kinship to specific species (Smyth, 2008; Juluwarlu, 2004) and/or a responsibility to care for species (Muller, 2008). These relationships are understood to impose obligations on Traditional Custodians. It is understood that these obligations do not impose restrictions on other people generally, but it is considered that impacts to species at a population level may inhibit Traditional Custodians with kinship relationships' ability to perform their obligations where this results in reduced or displaced populations. It is therefore considered that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. As such, impacts to individual marine fauna is not expected to impact on the totemic or kinship cultural connection. Refer to species specific assessment below for further information.</p> <p><u>Resource Collection</u></p> <p>A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these</p>

Aspect	Cultural Features and Heritage Values
	<p>communities may be impacted where there is an impact at the species/population level. Refer to species specific assessment below for further information.</p> <p>Relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix H.</p> <p><b>Marine Species</b></p> <p><u>Marine Mammals</u></p> <p>There are increase ceremonies/rituals for species of animals and plants, important to First Nations, to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where, for example, the thalu relates to marine species populations. As thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals—for example the thalu site on Murujuga which “brings in whales to beach” will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.</p> <p>Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, 2021). First Nations groups have expressed interest about whale migratory routes and studies (Table 4-19). Inter-generational transmission of cultural knowledge (including songlines) relating to marine mammals may be impacted where changes to population or behaviour at a population level results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group’s intangible cultural heritage (UNESCO, 2003).</p> <p>As described in the relevant environmental impact and risk assessment, potential impacts to whales are limited to behavioural disturbance to transient individuals, which are not considered to be ecologically significant at a population level, and hence not expected to impact the value of marine mammals, including the transmission of cultural knowledge. The Operational Area does overlap the BIAs for Migration for the Pygmy Blue Whale and Humpback Whale. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.</p> <p><u>Marine Reptiles</u></p> <p>Turtles and their eggs have been identified through consultation and existing literature as an important resource, particularly as food sources (Table 4-19). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) will be impacted where there is an impact at the species/population level.</p> <p>Intangible cultural heritage may also include the transmission of cultural knowledge about marine reptiles, such as nesting areas, hunting areas and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, 2021). First Nations groups have expressed an interest regarding turtle monitoring programs and migration patterns (Table 4-19). Activities that impact turtle populations and their marine environment may have an indirect impact on some Aboriginal communities as this can limit access to cultural sites or deplete hunting areas that would threaten local food security (Delisle et al., 2018:251). Inter-generational transmission of cultural knowledge (including Songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group’s intangible cultural heritage (UNESCO, 2003).</p> <p>As described in the relevant environmental impact and risk section, potential impacts to marine reptiles are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts will not occur to significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. Further, the Operational Area and EMBA do overlap marine turtle BIAs. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.</p>

Aspect	Cultural Features and Heritage Values
	<p>The impact and risk assessment has determined that the planned activities are unlikely to result in an impact greater than MInor (1) and unplanned activities are assessed to have a residual risk rating of 30 (or lower) which is considered "Tolerable" according to the Woodside PetDW Risk Matrix.</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5 of this EP).</p>

Demonstration of ALARP				
Control considered	Feasibility (F) & Cost/Sacrifice (Cs)	Benefit in Impact/Risk Reduction	Proportionality	Adopted
<p>Apply a 'living heritage'<sup>58</sup> management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.</p>	<p>F: Yes. CS: Minimal.</p>	<p>Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.</p>	<p>Benefits outweigh cost/sacrifice.</p>	<p>Yes C 22.1</p>

<sup>58</sup> Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation, and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness.

<b>Demonstration of ALARP</b>				
<i>Control considered</i>	<i>Feasibility (F) &amp; Cost/Sacrifice (Cs)</i>	<i>Benefit in Impact/Risk Reduction</i>	<i>Proportionality</i>	<i>Adopted</i>
As marine ecosystems may hold both cultural and environmental value (see Section 4.9), with cultural and environmental values intrinsically linked, in addition to the above controls, the controls in Section 6.7 and Section 6.8 will reduce impacts to cultural features and heritage values.				
<b>ALARP Statement</b>				
On the basis of the impact and risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A). Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				
<b>Demonstration of Acceptability</b>				
<b>Acceptability Statement:</b>				
The impact and risk assessment has determined that the planned activities are unlikely to result in an impact greater than Minor (1) and unplanned activities are assessed to have a residual risk rating of 30 (or lower) which is considered "Tolerable" according to the Woodside PetDW Risk Matrix.				
The Operational Area does not overlap the Ancient Landscape. The EMBA overlaps the Ancient Landscape. The PAP is not anticipated to have a significant impact on MNES (Section 4) including marine fauna with a First Nations connection with, or traditional use in nearshore areas as defined in Section 4.9.4. Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable if ALARP.				

<b>Demonstration of ALARP</b>				
<i>Control considered</i>	<i>Feasibility (F) &amp; Cost/Sacrifice (Cs)</i>	<i>Benefit in Impact/Risk Reduction</i>	<i>Proportionality</i>	<i>Adopted</i>
Apply a 'living heritage' <sup>60</sup> management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes. CS: Minimal.	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 22.1

<sup>60</sup> Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation, and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness.

<b>Demonstration of ALARP</b>				
<b>Control considered</b>	<b>Feasibility (F) &amp; Cost/Sacrifice (Cs)</b>	<b>Benefit in Impact/Risk Reduction</b>	<b>Proportionality</b>	<b>Adopted</b>
As marine ecosystems may hold both cultural and environmental value (see Section 4.9), with cultural and environmental values intrinsically linked, in addition to the above controls, the controls in Section 6.7 and Section 6.8 will reduce impacts to cultural features and heritage values.				
<b>ALARP Statement</b>				
On the basis of the impact and risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A). Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				
<b>Demonstration of Acceptability</b>				
<b>Acceptability Statement:</b>				
The impact and risk assessment has determined that the planned activities are unlikely to result in an impact greater than Minor (1) and unplanned activities are assessed to have a residual risk rating of 30 (or lower) which is considered "Tolerable" according to the Woodside PetDW Risk Matrix.				
The PAP and the EMBA do not overlap the Ancient Landscape and they are not anticipated to have a significant impact on MNES (Section 4) including marine fauna with a First Nations connection with, or traditional use in nearshore areas as defined in Section 4.9.4. Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable if ALARP.				

<b>Environmental Performance Outcomes, Standards and Measurement Criteria related to Cultural Features and Heritage Values<sup>62</sup></b>			
<b>EPO</b>	<b>Adopted Control(s)</b>	<b>EPS</b>	<b>MC</b>
EPO 27 No Impact to cultural features and heritage values, as stated in Table 4-20, great than a consequence level of Minor (1) from the PAP	C 17.1 Apply a "living heritage management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledge across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	PS 17.1.1 Woodside will continue to give voice to Traditional Custodians to identify interests, transmit information and express concern	MC 17.1.1 Records demonstrate Change Management and Management of Knowledge processes have been followed where new controls or management
		PS 17.1.2 Woodside will assess and where deemed practicable will implement appropriate cultural protocols by Traditional Custodians	MC 17.1.2 Records demonstrate Woodside implemented cultural protocols as requested.

<sup>62</sup> As marine ecosystems may hold both cultural and environmental value (see Section 4.9.1), with cultural and environmental values intrinsically linked, in addition to the specific controls for cultural features and heritage values, the controls and performance standards in Section 6.7 and 6.8 will reduce impacts to cultural features and heritage values.

## 7. IMPLEMENTATION STRATEGY

### 7.1 Overview

Regulation 22 of the Environment Regulations requires an EP to contain an implementation strategy for the activity. The implementation strategy for the PAP confirms fit-for-purpose systems, practices and procedures are in place to direct, review and manage the activities so that environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and EPSs outlined in this EP are achieved.

Woodside, as Operator, is responsible for ensuring that the PAP is managed in accordance with this implementation strategy.

### 7.2 Systems, Practice and Procedures

All operational activities are planned and carried out in accordance with relevant legislation and internal environment standards and procedures identified in this EP (Section 6).

Processes are implemented to verify controls to manage environmental impacts and risks to:

- a level that is ALARP and acceptable
- meet EPOs
- comply with EPSs defined in this EP.

The systems, practices and procedures that will be implemented are listed in the EPSs contained in this EP. Document names and reference numbers may be subject to change during the statutory duration of this EP; this is managed through a change register and management of change (MoC) process (Section 7.5). Further information regarding some of the key systems, practices and procedures relevant to implementation of this EP is provided below.

### 7.3 Woodside PetDW Management System

The Woodside PetDW Management System defines the boundaries within which all activities are conducted. It provides a structured framework to set common requirements, boundaries, expectations, governance and assurance for all activities. It also supports accountabilities and responsibilities as defined in the organisational structure. The overarching objective of the Woodside PetDW Management System is to aspire to zero harm to people, communities and the environment, and achieve leading industry practice.

This EP has been designed to meet the environmental aspects of the Woodside PetDW Management System framework and establishes the foundation for continual improvement through the application, monitoring and auditing of consistent requirements across all aspects of the PAP including;

- Identification of statutory obligations and commitments to ensure maintenance of license to operate
- Implementation of petroleum risk management processes, including this EP
- Scheduled monitoring and auditing of control implementation
- Completion of reviews, and reporting outcomes of these reviews

## 7.4 Risk Management

Risk management processes and practices are applied on an ongoing basis to design, production and maintenance activities for the Pyrenees Facility to manage risks to personnel, assets and the environment.

Potential environmental consequences and impacts of the Pyrenees Facility are assessed and controlled in accordance with the Woodside PetDW risk management processes described in Section 2.2 of this EP (Environmental Risk Management Methodology).

The results of the Pyrenees Facility ENVID are described in Section 6 and in the Environmental Impacts and Risk Register. This register, in conjunction with the EP, provides a demonstration that environmental impacts and risks have been identified, and that appropriate controls are in place to manage them to a level that is acceptable and ALARP throughout the life of the facility.

A number of other risk management tools and techniques are used to manage environmental and other risks on a routine basis during operational, maintenance and inspection tasks. Examples include:

- the processes outlined in Section 2
- risk management tools including Hazard Identification and Risk Assessments and Level 2 Risk Assessments, Operational Risk Assessments, the technical MoC system (Section 7.5), and Step back 5 x 5
- integrity review studies, HAZIDs and Hazard Operability studies.

These tools, risk and integrity management practices are described further in the Pyrenees Facility Safety Case and the WOMP.

In addition, other risk sub-processes and practices are also applied within Woodside on an ongoing basis to manage different types of risk. A summary of those relevant to the PAP is provided below. Woodside PetDW's risk management processes (refer to Section 2.2.1), along with the supporting risk sub-processes and practices discussed in this section, ensure the environmental impacts and risks of the PAP continue to be identified and reduced to a level that is ALARP.

### 7.4.1 Management of Risks – Contracting and Procurement

Suppliers and contractors play a significant role in meeting the resource needs of Woodside PetDW's operations. Effective management of environmental risks in contracts is achieved by setting clear expectations and managing environmental risks throughout the duration of the contract.

The Health, Safety and Environment in Contracts and Procurement Procedure establishes the HSE requirements to manage contractors performing tasks in relation to the plant and pipeline. The Health, Safety and Environment in Contracts and Procurement Procedure ensures contractors are informed of their requirement to comply with the requirements of the Woodside (PetDW) HSE Management system. Third-parties are assessed under the process prior to being engaged. This process includes, but is not limited to an assessment of HSE, management and maintenance systems.

### 7.4.2 Management of Risks – Well Integrity

Wells are managed throughout their lifecycle in line with the Well Lifecycle Management Procedure. This procedure provides the basis for ensuring well integrity in accordance with the Process Safety Management (PSM) Procedure.

In addition, wells are required to have a regulator accepted WOMP to demonstrate that well integrity risks are managed to ALARP levels. Wells tied back to the facility and ETA wells are managed under a WOMP.

Management of operating wells can be formally transferred from Operations to the Global Wells and Seismic (GWS) team for activities such as well intervention and workover. Where activities are undertaken by GWS, the risks are managed under the GWS Risk Management Procedure, which specifically addresses the risk of loss of containment from a well or well related equipment. This procedure supplements the Woodside Risk Management Procedure.

### 7.4.3 Management of Risks – Marine Services

Woodside's Marine Services Function provides a platform for the conduct of safe and efficient Marine Operations across Woodside through the Marine Services Management. A set of procedures that support vessel assurance and management (including HSE and quality management) are in place to ensure marine operations are conducted in a safe and efficient manner, and in accordance with regulatory requirements.

More details on vessel assurance and the communication of environment requirements to vessels are provided in Section 7.10.4.

Vessel masters are required to request clearance from the facility Offshore Installation Manager (OIM) or delegate prior to entering the 500 m PSZ.

## 7.5 Change Management

Change management is used where there is no existing approved business baseline, such as a process, procedure or accepted practice, or where conformance with an approved baseline is not possible or intended; for example, due to equipment fault or failure or a recently discovered issue which will take time to rectify. Change management is also used when the baseline is changed (e.g. the process is modified). It applies to management of temporary, permanent, planned or unplanned change encompassing one or more of the following:

- plant (equipment, plant, technology, facilities, operations or materials)
- projects (budget, schedule)
- people (organisation structure, performance, roles)
- process (WMS content, processes, procedures, standards, legislation, information).

### 7.5.1 EP Management of Change and Revision

Woodside's Environmental Approval Requirements Australia Commonwealth Guideline provides guidance on the Environment Regulations that may trigger a revision and resubmission of the EP to NOPSEMA. The document also provides guidance on what may constitute as new source-based or receptor-based impacts and risks, or a significant increase in an existing source of environmental risk (to provide context in determining if EP resubmission is required under Regulations 19 and 39 of the Environment Regulations).

Minor EP changes, where a review of the activity and the environmental risks and impacts of the activity shows the changes do not trigger regulatory requirements to resubmit the EP, will be considered a 'minor revision'.

Changes with potential to influence minor or technical changes to the EP text are tracked in MoC records, project records, or the EP Updates Register, and incorporated during internal updates of the EP or the five-yearly revision.

In accordance with the requirements of Regulation 41 of the Environment Regulations, Woodside will also submit to NOPSEMA a proposed revision to this EP at least 14-days before the end of each period of five years, commencing on the day on which the original and subsequent revisions of the EP are accepted under Regulation 35 of the Environment Regulations.

## 7.5.2 OPEP Management of Change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulation 39 to determine if EP, including OPEP, resubmission is required (see Section 7.5.1). Changes with potential to influence minor or technical changes to the OPEP are tracked in management of change records, project records and incorporated during internal updates of the OPEP or the five-yearly revision.

## 7.6 Woodside Decommissioning Framework

Decommissioning is a planned activity for the offshore oil and gas industry. Current best practice is for decommissioning to include:

- designing for decommissioning during the development phase of projects / facilities
- maintaining and removing property, equipment and infrastructure, such as a facility or a pipeline, and plugging wells associated with a petroleum activity
- assessing decommissioning options and opportunities during the operational life of the facility leading up to cessation of production
- selecting, developing and planning the selected decommissioning option
- executing decommissioning plans; and
- restoring the marine environment.

This assists with compliance with Section 572(3) of the OPGGS Act, which requires titleholders to remove property when it is neither used, nor to be used, in connection with the operations. Under section 572(7) of the OPGGS Act, the property removal requirements under section 572(3) of the OPGGS Act have effect subject to any other provision of the OPGGS Act, the regulations, directions given by NOPSEMA or the responsible Commonwealth Minister, and any other law. Under section 270(3) of the OPGGS Act, before title surrender, all property brought into the surrender area must be removed to the satisfaction of NOPSEMA, or arrangements that are satisfactory to NOPSEMA must be made in relation to the property. Sections 572(7) and 270(3) of the OPGGS Act provide scope for in-situ decommissioning and other arrangements to be made where it can be demonstrated that the risks and impacts are ALARP and acceptable as well as comply with all other Acts and legislation.

### 7.6.1 Decommissioning in Operations

Asset specific decommissioning plans are typically developed prior to cessation of production. Planning includes redundant infrastructure as well as structures coming to the end of production and

decommissioning critical systems to enable, as a base case, removal. Appropriate maintenance plans are developed and implemented to ensure decommissioning critical systems meet the requirements to facilitate removal.

### 7.6.2 Facility Decommissioning Planning

Decommissioning planning generally commences 2-10 years prior to Cessation of Production (CoP) (Figure 7-1). The timeframe selected for decommissioning planning depends on the complexity of the facility and infrastructure requiring decommissioning.

#### End of Field Life / Cessation of Production (CoP) – Preparation for CoP and Facility Decommissioning / P&A -Existing Facilities

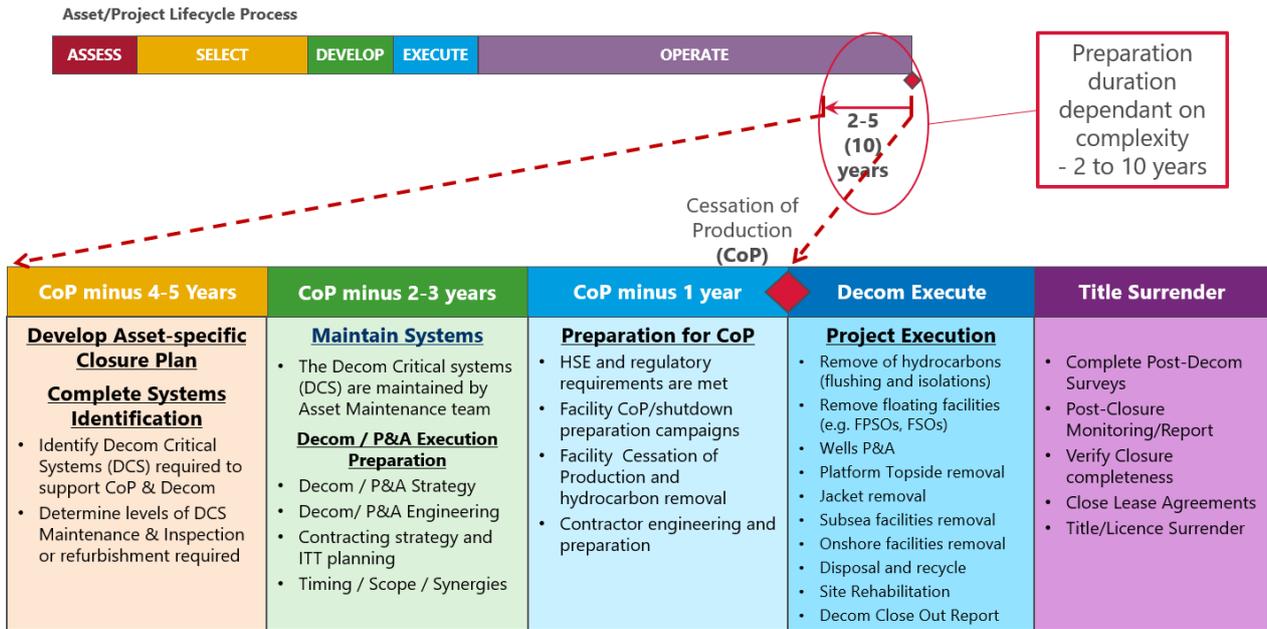

Figure 7-1: Woodside’s process for decommissioning planning

### 7.6.3 Inventory of Property

Details of subsea infrastructure located within WA-45-L and WA-43-L, including its status, is provided in Table 7-1.

Property inventories are maintained for all Woodside assets and updated with any additional property brought into the field in accordance with the asset management system.

WA-42-L and WA-43-L also contain a number of exploration wells that have been abandoned with wellheads removed. As there is no remaining infrastructure associated with these wells they have not been included in Table 7-1.

Table 7-1: Inventory of Woodside infrastructure within WA-42-L and WA-43-L

Item	Description	Status
<b>WA-42-L</b>		
Pyrenees FPSO	Production facility	Operational

- Plug and abandonment of production wells: within three years of cessation of production
- Decommissioning of subsea equipment: within five years of cessation of production.

### 7.6.5.2 Exploration Wells

One exploration well with a wellhead that has been temporarily abandoned is within the scope of this EP (West Muiron-5). This well has been plugged for abandonment however, has not yet been approved for abandonment by NOPSEMA.

Woodside continues to undertake detailed technical assessments of the well. This is to ensure that the well is abandoned to the relevant regulatory requirements, including permanent downhole barriers. A WOMP to enable final NOPSEMA assessment and subsequent abandonment application is planned to be submitted by the end of 2025.

Decommissioning of the exploration wellhead is to progress once the well has been accepted as permanently abandoned. Depending on the outcomes of barrier assessments the well will either require plugging and abandonment activities or be approved as a candidate for decommissioning. Timing of these activities is subject to change and highly dependent on the assessments to be undertaken by Woodside and NOPSEMA. Any future plug and abandonment activities are not included within the scope of this EP.

Current planning for wellhead decommissioning is premised upon applying the regulatory base case of removal, with consideration of the principles of ALARP and acceptability. Once a well has been accepted as permanently abandoned and the decommissioning activity is defined, a separate EP will be submitted for the wellhead decommissioning activity. This well with a wellhead is to continue to be maintained until it is decommissioned.

Should the well require further plugging and abandonment activities, these will be carried out under a separate, activity specific EP.

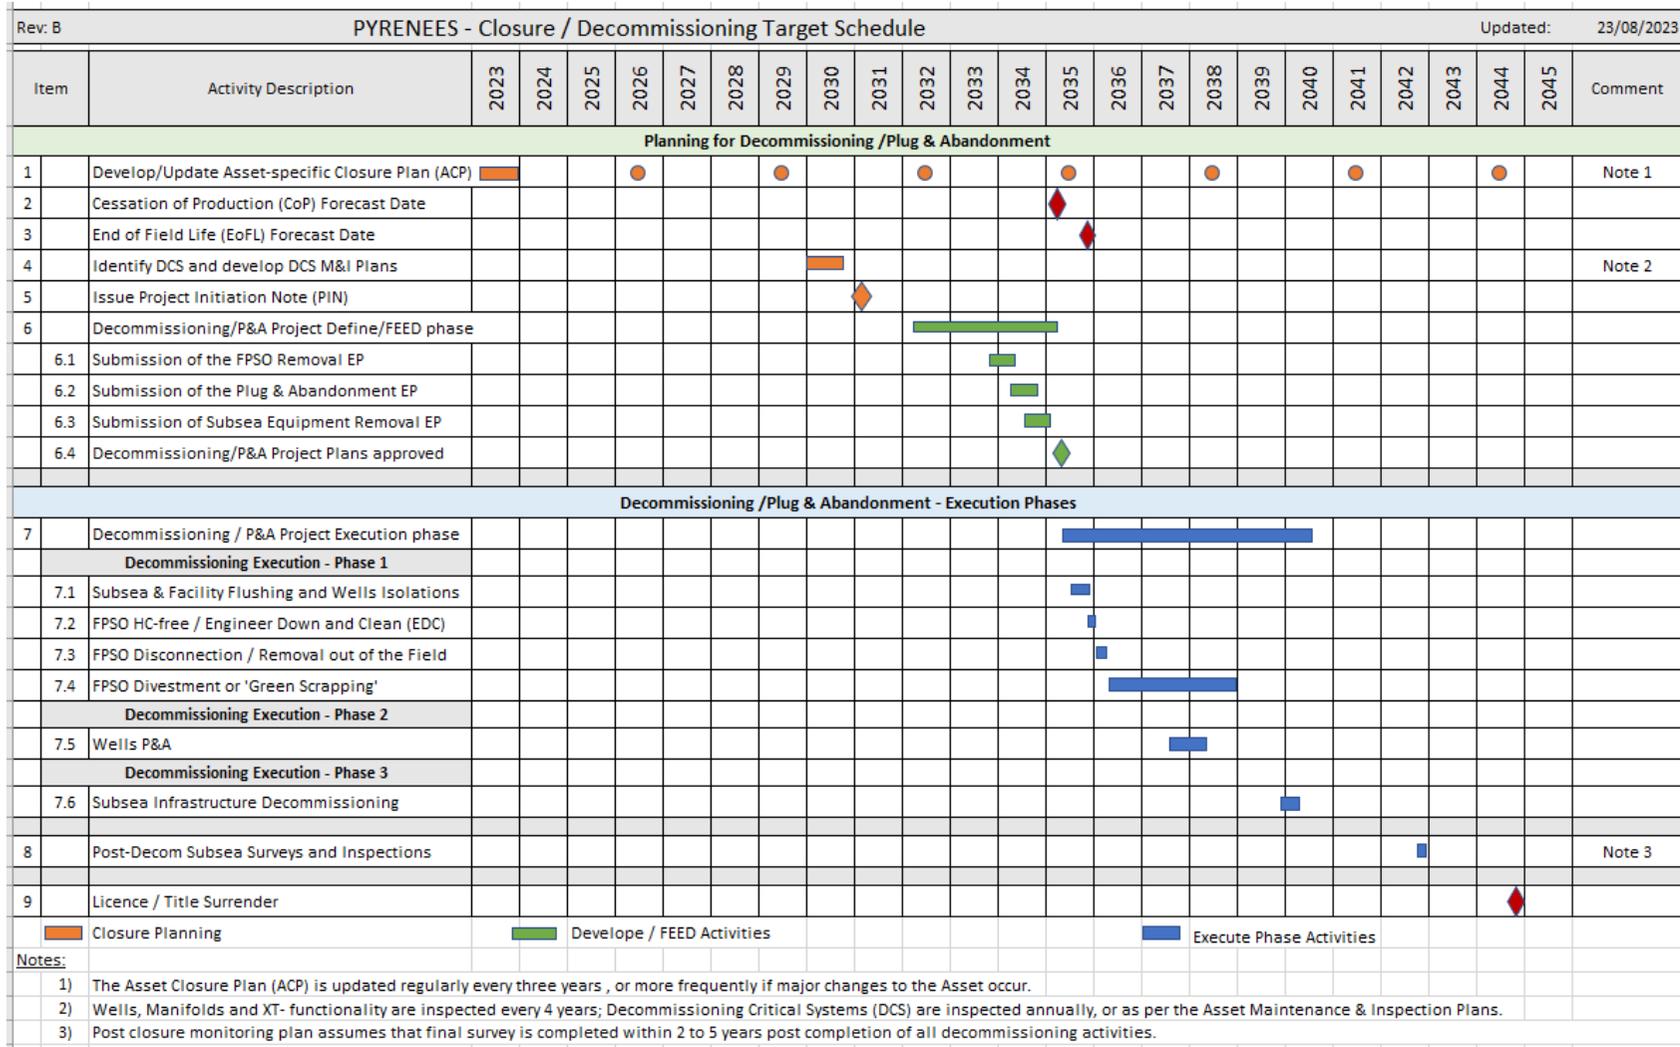

Figure 7-2: Pyrenees Decommissioning / P&A Target Schedule

## 7.7 Organisation Structure

The following Woodside organisational structure provides leadership and direction for operation of the Pyrenees Facility and environmental performance:

- the Executive Vice President Australian Operations (EVP AusOps) reports to the Chief Executive Officer
- the FPSOs and Macedon Vice President (VP) report to the EVP
- the Pyrenees Asset Manager reports to the VP FPSOs and Macedon
- the Pyrenees Offshore Installation Manager (OIM) reports to the Asset Manager
- the Reliability & Integrity Manager reports to the VP FPSOs and Macedon
- the functional support teams report to the corresponding Business Unit VP

Production facilities are supported by a team of environmental professionals who report to the Environment Manager. Facilities are supported by other Woodside functional teams including:

- HSE – provides specific guidance and access to specialist HSE resources including assistance for governance and training, as well as guidance on Woodside HSE standards
- Global Wells and Seismic – ensures the safe planning and execution of drilling (note drilling is excluded from the scope of this EP), completion and work over operations
- Projects – responsible for the engineering, construction and execution of small projects on operational facilities to ensure ongoing integrity and safe operation
- Marine Group – responsible for chartering vessels to support Woodside's offshore production facilities including vessels to aid emergency response
- Aviation Group – provides personnel transport, material transport, emergency evacuation and search and rescue capabilities.

### 7.7.1 Roles and Responsibilities

As required by Regulation 22(4), this section of the implementation strategy establishes a clear chain of command that sets out the roles and responsibilities of personnel in relation to the implementation, management and review of the EP, ranging from senior management to operational personnel.

Key roles and responsibilities for Woodside and Contractor personnel in relation to the implementation, management and review of this EP are described below in Table 7-2. Roles and responsibilities for hydrocarbon spill preparation and response are outlined in Table 7-2 and the Woodside [Oil Pollution Emergency Arrangements \(Australia\)](#). Roles and responsibilities for facility emergency response are outlined in the Pyrenees Facility Safety Case and are consistent with the Pyrenees Emergency Response Plan (ERP).

It is the responsibility of all Woodside employees and contractors to apply the Woodside Environment and Biodiversity Policy (Appendices

Appendix A) in their areas of responsibility.

**Table 7-2: Roles and responsibilities**

Title (role)	Environmental Responsibilities
<b>All Personnel</b>	
All facility based personnel and onshore support personnel	<ul style="list-style-type: none"> <li>• understand the Woodside standards and procedures that apply to their area of work</li> <li>• understand the environmental risks and control measures that apply to their area of work</li> <li>• carry out assigned activities in accordance with approved procedures and the EP</li> <li>• follow instructions from relevant supervisor with respect to environmental protection</li> <li>• cease operations which are deemed to present an unacceptable risk to the environment</li> <li>• participate in environmental assurance activities and inspections as required</li> <li>• prompt reporting of environmental hazards/incidents to their supervisor and assist in event investigation.</li> </ul>
<b>Office-based Personnel</b>	
Pyrenees Asset Manager	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• accountable for ensuring all necessary regulatory approvals are in place to operate</li> <li>• approves (decides on) the content to be contained in the EP</li> <li>• accountable for managing the asset throughout its operations in accordance with legislative/regulatory requirements (including this EP) and WMS requirements.</li> <li>• responsible for continuous improvement of operations of the facility, including environmental performance</li> <li>• decides on technical decisions where required based on assessed current level of risk</li> <li>• accountable for aspects of integrity management</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• decides on technical decisions where required based on assessed current level of risk</li> <li>• accountable for incident notification, reporting and investigation in line with regulatory requirements, the WMS and EP requirements</li> <li>• communicates changes relevant to the EP to the Production Environment team</li> <li>• accountable for conformance to production Operations processes</li> </ul>
Maintenance Engineering Team Leader (METL)	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• responsible for safeguarding process safety with respect to the asset</li> <li>• ensure technical integrity risks are identified, managed and reduced to ALARP</li> <li>• recommends technical decisions where required based on assessed current level of risk</li> </ul>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
Integrity Authorities (Technical Integrity Custodians, Technical Authorities and Engineering Authorities)	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• agree technical integrity decision based on assessed current level of risk when discipline owner</li> <li>• undertake process safety responsibilities as defined under the Woodside process safety framework.</li> </ul>
Production Environment Manager	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• facilitate operations environmental approval documentation and timely submission in accordance with regulatory requirements</li> <li>• develop and maintain appropriate Production environmental processes and procedures</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• Monitor and communicate to internal stakeholders all relevant changes to legislation, policies, regulator organisation that may impact the EP or business</li> <li>• facilitate review of the EP, including five-yearly revision and in relation to any technical decisions or proposed changes to operations</li> </ul>
Production Environment Adviser	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• manage change relevant to the EP in accordance with the Regulations and the EP</li> <li>• Resourcing, Training and Competencies</li> <li>• liaise with Woodside contractors and Subsea Support Bessel crew to communicate and ensure their understanding of IMMR related requirements under this EP</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• ensure environmental monitoring, offshore inspections, and reporting is undertaken as per the requirements of this EP</li> <li>• coordinate and monitor closeout of corrective actions</li> <li>• ensure environmental inspections/audits are undertaken as per the requirements of the EP</li> <li>• ensure environmental incident reporting meets regulatory requirements (as described within the EP) and WMS requirements</li> </ul>
Subsea and Pipelines (IMMR) Activity Manager	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• ensure IMMR process undertaken in line with EP commitments</li> <li>• manage IMMR change requests for the activity and notify the Production Environment Adviser of any scope changes in a timely manner</li> <li>• responsible for governance of IMMR related activities for Subsea Support Vessels.</li> <li>• Resourcing, Training and Competencies</li> <li>• provide sufficient resources to implement the EP requirements</li> </ul>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
	<ul style="list-style-type: none"> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• monitor and close out corrective actions raised from IMMR environmental inspections/audits or incidents</li> </ul>
Corporate Affairs Adviser	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• relevant person identification and consultation</li> <li>• reporting on consultation</li> <li>• ongoing relevant person liaison as required.</li> </ul>
Woodside Marine Services Function	<ul style="list-style-type: none"> <li>• responsible for pre-charter assurance for all contracted vessels</li> <li>• conduct of ongoing operational assurance of vessels contracted through Woodside Marine, to confirm vessels operate in compliance with relevant legislation, rules and Woodside Marine Charterers Instructions in order to be able to meet safety, navigation, operational and emergency response requirements.</li> </ul>
Contractor Sponsors	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• ensure implementation of EP for the contractor's scope of work</li> <li>• Resourcing, Training and Competencies</li> <li>• ensure contractors have adequate environmental capability in order to execute their respective scopes of work</li> <li>• review contractor environmental performance as required.</li> </ul>
<b>Offshore-based Personnel</b>	
Offshore Installation Manager (OIM)	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• in charge of the facility and the field</li> <li>• accountable for implementation of the EP at the facility</li> <li>• ensures offshore personnel comply with regulatory/legislative requirements (including the EP) and the WMS</li> <li>• responsible for Area Operations compliance with Technical Integrity requirements including MoC process, Permit to Work process and MOPO and process safety requirements</li> <li>• single point responsible person for the coordination of simultaneous activities</li> <li>• implement relevant offshore environment initiatives and review environmental performance to drive continuous improvement.</li> <li>• ensure effective communication with workforce on environmental performance</li> <li>• ensure incidents are reported and investigated in line with WMS and EP requirements, with appropriate actions initiated and closed out</li> <li>• decides on technical decisions where required based on assessed current level of risk</li> </ul>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
	<ul style="list-style-type: none"> <li>• communicates changes relevant to the EP to the Production Environment team.</li> <li>• Resourcing, Training and Competencies</li> <li>• accountable for the performance and development of direct reports, ensuring operator capability and competency across all shifts and ensuring the skill requirements of the Production division are being met.</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• lead response efforts (as Incident Controller) in managing emergency or crisis scenarios</li> <li>• ensure exercises and drills are conducted in a manner to assure the facility's ability to respond effectively to an emergency</li> </ul>
<p>Operations Supervisor/Operations Team Leader/Maintenance Team Leader/ Shift Supervisor</p>	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• accountable for the day-to-day operations of the facility including effective shift handover; completion and logging of operator routine</li> <li>• responsible for operations shift compliance to all legislative and regulatory requirements as defined in the EP</li> <li>• responsible for permitting and isolation for all frontline work activities</li> <li>• responsible for leading and coordinating a multi-disciplined team performing specific duties required to support the facility, including helicopter operations, vessel movements and consumable controls.</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• responsible for following emergency response protocols in accordance with the emergency response procedure and fulfilling allocated emergency response roles</li> </ul>
<p>Operations and Maintenance Technicians</p>	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• responsible for all daily operations on the facility within their operational control.</li> <li>• undertake daily operational and maintenance tasks in accordance with approved standards and procedures to ensure compliance with the EP.</li> <li>• manage day-to-day environmental risks through use of Permit to Work and other risk management tools.</li> <li>• identify opportunities for continuous improvement and communicate these to their Supervisor.</li> <li>• complete training requirements to maintain competence and knowledge in operating and maintaining equipment, and manage environmental risks and impacts.</li> <li>• participate in environmental assurance activities and inspections as required.</li> <li>• report all environmental hazards and incidents and assist in investigations.</li> </ul>

Vessel Master of Support Vessel (Facility and Subsea Support Vessels)	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• understand and manage HSE aspects of the vessel, including environmental requirements</li> <li>• communicate with OIM as required regarding potential environmental risks applicable to vessel activities</li> <li>• ensure vessel meets quarantine requirements</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• notify AMSA and other authorities of any incidents as per maritime requirements</li> <li>• provide, as requested by Woodside, copies of documents, records, reports and certifications (i.e. fuel use, ballast exchanges, waste logs, etc.) in a timely manner to assist in compliance reporting</li> <li>• ensure the vessel's Emergency Response Team have sufficient training to implement the vessel's SOPEP</li> <li>• ensure all emergency and SOPEP drills are conducted</li> <li>• ensure that vessel procedures are followed in the event of an emergency or spill</li> <li>• immediately notify the Woodside Representative of any environmental incidents.</li> </ul>
Subsea and Pipelines Site Woodside Representative	<ul style="list-style-type: none"> <li>• Systems, Practices and Procedures</li> <li>• ensure relevant management measures in this EP are implemented on the Subsea Support Vessel</li> <li>• Resourcing, Training and Competencies</li> <li>• ensure Subsea Support Vessel induction attendance is recorded.</li> <li>• Monitoring, Auditing, Non-conformance and Emergency Response</li> <li>• ensure periodic environmental inspections are completed</li> <li>• ensure environmental incidents or breaches of EPOs, EPSs or MCs are reported in accordance with Woodside and regulatory requirements</li> </ul>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

## 7.8 Unexpected Finds Procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as ‘any trace of human existence that has a cultural, historical or archaeological character and is located under water’); the following Unexpected Finds Procedure will apply:

- All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage, including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside’s *Global Heritage Manager*.

Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.

No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside’s *Global Heritage Manager*.

Woodside’s *Global Heritage Manager* must notify a qualified underwater archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.

If the potential Underwater Cultural Heritage appears to be Aboriginal underwater cultural heritage, Woodside’s *Global Heritage Manager* must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.

If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years or is otherwise reportable under Section 40 of the UCH Act, Woodside’s *Global Heritage Manager* must notify the Minister responsible for the UCH Act, the DCCEE underwater archaeology section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.

If the suspected heritage object includes human remains, Woodside’s *Global Heritage Manager* must also notify:

- The Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains; and
- The Office of the Minister for the Environment and Water in accordance with Section 20 of the ATSIHP Act.

Work must not recommence in the vicinity of the potential heritage object until Woodside’s Principal Heritage Adviser provides written approval. Woodside’s *Global Heritage Manager* must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

## 7.9 Training and Competency

As required by Regulation 22(5), this section of the implementation strategy includes measures that ensure all personnel associated with operating the facility are aware of their EP related responsibilities, and that all relevant personnel have appropriate competencies and training.

Environmental training is undertaken to ensure employees and contractors whose work may impact on the environment have the necessary awareness, knowledge and competence appropriate for their role.

Different levels of training are undertaken in relation to managing environmental risks and impacts for the production offshore facilities and associated Subsea Support Vessel based IMMR activities, as follows:

- inductions for offshore facility workers and visitors
- operations competency framework training
- permit to work training
- production environmental leadership training and environment awareness training
- emergency and hydrocarbon spill response training
- inductions for subsea IMMR (vessel based) personnel.
- Records for Woodside production personnel, in relation to the above listed training, are maintained in Woodside's learning management system. Contractor training records are also maintained.
- Competence of operations personnel can be reviewed via online dashboards.
- Inductions for Offshore Facility Workers and Visitors

A comprehensive induction process is in place for personnel working on or visiting Woodside's offshore production facilities. The induction process is designed to equip personnel with the HSE awareness and skills necessary for them to manage their own safety and environmental performance and contribute to others working around them. The induction process includes:

**Common Production Induction** – All employees and contractors who have not accessed a production facility within twelve months are required to undertake this induction prior to mobilisation. It includes Woodside's values, HSE and Process Safety, continuous improvement, risk management and Permit to Work.

**Facility Specific Induction** – All employees and contractors that have not accessed the production facility within six months are required to undertake this induction on arrival at the facility. This induction covers the HSE and emergency response issues specific to each facility. For environment, this induction covers the Facility EP, prevention of spills, waste management, fauna interactions, hazard identification and risk assessment, and incident reporting.

**Production Offshore Environmental Leadership Training** – Key operations leadership roles (as specified within the Operations Competency Framework) are required to complete this competency on commencement of the new role and three yearly thereafter. The training covers Woodside's policies and standards, environmental legislative requirements, the EP, key environmental risk and impacts, environmental reporting, environmental management tools (e.g. improvement planning, compliance reviews and audits), hydrocarbon spill response and environmental accountabilities.

**Production Offshore Environmental Awareness Training** – All new offshore operational personnel are required to undertake this online training on commencement of the new role and two yearly thereafter. This training covers environmental legislative requirements, the facility EP, key environmental hazards and control measures (including waste management, spill prevention, chemical storage, wildlife interactions), environmental management tools, hazard and incident reporting, spill response, and environmental responsibilities.

### **7.9.1 Operations Competency Framework Training**

The Operations Competency Guideline defines a framework to make sure all personnel on operating facilities are competent to perform their work and that competency is managed. By doing this, the potential for unplanned (accident/incident) type events that could result in environmental impact is minimised.

Operational Area Licence to Operate (LTO) roles are those roles related to oil and gas processing, equipment maintenance, marine regulations, emergency response and any other roles involved with safeguarding the facility integrity, including all roles where high-risk work licences are required. Additionally, roles mandated by Woodside such as Medic and helicopter landing officer are included in the LTO roles process.

The requisite competency and training for each LTO role has been defined. Competencies for these LTO roles are stipulated by the governance group for each respective position and are based on the relevant Australian or International standards which apply. In cases where no Australian or International standards are available or applicable, training is based on the relevant Woodside Standard as determined by the respective governance group.

Contractors working on Woodside facilities are required to verify the competency of their personnel through the contractor's own verification systems. Additionally, contractor personnel working on Woodside facilities are required to be registered in Woodside's Contractor Verification Service (CVS) beforehand. Personnel registered in CVS have had their skills and qualifications independently verified on behalf of Woodside thereby confirming that contractor personnel hold the required competencies before mobilisation to the facility.

The LTO Roles Report (available online on the Woodside Competency Reporting Dashboard on the Production Academy Intranet page) provides the conformance status of the facility against the LTO roles requirements.

### **7.9.2 Permit to Work System Training**

The Permit to Work system (see Section 7.3) is a key element in ensuring that all necessary steps are taken to ensure the safety of personnel, protection of the environment and technical integrity of the facility. The Permit to Work system takes a risk-based approach to all activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control.

All members of the workforce that are required to work with Permit to Work receive training commensurate with the level of authority and responsibility they hold in the Permit to Work system.

### **7.9.3 Emergency and Hydrocarbon Spill Response Training**

All operations personnel involved in crisis and emergency management are required to commit to ongoing training, process improvement and participation in emergency and crisis response (both real and simulated), including emergency drills specific to potential incidents at the facility. Training includes task specific training and role based training and 'on the job' experience (i.e. participation in crisis or emergency management exercises). Roles based training is further described in Section 7.15.

An overview of Woodside's hydrocarbon spill response training and competency requirements are provided in dashboards for key responder roles. The roles are consistent with Woodside's crisis and emergency management incident control structure.

Woodside Hydrocarbon Spill Preparedness Advisor(s) are responsible for maintaining hydrocarbon spill preparedness competency. This includes the identification and development of approved competency and non-competency based courses, identification of relevant personnel required to undertake training and ensuring training records are maintained. Minimum Woodside capabilities will continue to be identified and documented.

### **7.9.4 Subsea IMMR Activity Environmental Awareness**

At the beginning of, and during a new Subsea IMMR activity, the Subsea Support Vessel crew including contractor crew, Woodside representatives and other relevant personnel are required to undertake a vessel induction before commencing work. This induction covers HSE requirements for the vessel and IMMR activities, and as required environmental information specific to the activity location. The induction may cover the following environmental information:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- adherence to standards and procedures, and the use of Job Safety Analysis and permit to work hazard identification and management process
- spill management including prevention, response and clean-up, location of spill kits and reporting requirements
- waste management requirements and location of bins
- reporting of marine fauna, location of forms and charts
- chemical management requirements.

All personnel who undertake the project induction are required to sign an attendance sheet which is retained.

Regular HSE meetings are held on Subsea Support Vessels with crew. During these meetings, any environmental incidents are reviewed, and environmental awareness material presented.

## 7.10 Monitoring, Auditing, Management of Non-conformance and Review

Regulation 22(6) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself.

This Section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental risks and impacts of the facility against the EPOs, EPSs and MCs, with a view to continuous improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

### 7.10.1 Monitoring

Woodside and its Contractors undertake a program of periodic monitoring during the PAP. This information will be collected using the tools and systems outlined below based on the EPOs, controls, EPSs and MCs in this EP. Environmental aspects are integrated into Woodside-wide functional and asset review and assurance processes, which deliver effective governance. This integration of environmental controls into appropriate parent systems and processes includes PSM (Section 7.4.2), contractor management (Section 7.4) and marine assurance (Section 7.10.8), and provides multi-faceted assurance of routine implementation.

The tools and systems collect, as a minimum, the data (evidence) referred to in the MCs in Section 6.7 and Section 6.8. The collection of this data will form part of the record of compliance maintained by Woodside and form the basis for demonstrating that the EPOs and EPSs are met. Compliance is summarised in a series of routine reporting documents (refer to Section 7.14).

The following tools and systems to monitor environmental performance, (including collection of evidence of compliance with controls), where relevant, include:

- environmental emissions/discharge reporting systems that record volumes of planned discharges to ocean and atmosphere, e.g. via the Production Allocation System and process historian database – a summary of emissions and discharges monitoring that is undertaken during the PAP is provided within Table 7-3
- routine internal reporting (as described in Section 7.13.2) and routine external annual compliance reporting (as described in Section 7.13.3)
- internal auditing and assurance program (as described in Section 7.10.4).

Collectively, these systems/tools involve collection of evidence of compliance with controls. Throughout the PAP, Woodside continues to identify new source-based risks and impacts through the Monitoring and Auditing systems and tools described above and within Section 7.10.

Other examples of assurance tasks implemented through the EP include (as an example);

- start of shift operator walk arounds
- permit to work hazard, risk management check list, area sign-on, and permit audits
- ongoing maintenance performance assurance (e.g. conformance dashboard)
- management system performance audits reviews (e.g. MSPSs) (Section 7.10.4)
- data gathering and governance dashboard presentations (e.g. Woodside Integrated Risk and Compliance System).

### **7.10.2 Management of Knowledge**

Review of knowledge relevant to the existing environment is undertaken in order to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). Relevant knowledge is defined as:

- Environmental science supporting the description of the existing environment
- Socio-cultural environment and relevant persons information
- Environmental legislation.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of MoC are documented in the WMS EP Guideline.

Under the Oil Spill Scientific Monitoring Program preparedness, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Environment Science Team and tracked via the Corporate Environment Baseline Database.

### **7.10.3 Management of Newly Identified Impacts and Risks**

New sources of receptor based impacts and risks identified through monitoring and auditing systems and tools and the Woodside Environment Knowledge Management System are assessed using the Change Management Process (Section 7.5).

**Table 7-3: Summary of emissions and discharges monitoring for the PAP**

Category	Parameter to be Monitored/Reported	Monitoring Frequency	Monitoring Equipment/Methodology	EP Reference
<b>Planned Emissions</b>				
Atmospheric Emissions from fuel combustion	Greenhouse, energy and criteria pollutants	Normally continuous process metering/annual reporting	NGERS and NPI reporting estimation methods (e.g. fuel/flare flow meters, throughput meters, process estimation)	Section 6.7.5
	Fuel gas and flare intensity	Normally continuous process metering/monthly reviews	Fuel and flare flowmeters inform intensity profiles – tracked against optimisation targets	Section 6.7.5
<b>Planned Discharges</b>				
Discharge of subsea control fluids during well actuations	Subsea control fluid consumption	Normally continuous process indication/monthly review	Subsea control fluid consumption surveillance. Process indication for gross leaks/ruptures	Section 6.7.7
Discharge of hydrocarbons and chemicals during subsea IMMR activities	Volumes of hydrocarbons and chemicals released subsea	As required, during IMMR activities (PAP specific)	Estimates based on known volumes pumped and ROV observation	Section 6.6.4
Discharge of PW	OIW concentration of discharged PW	Normally continuous process metering / monthly review	Normally continuous process metering / monthly review	Section 6.7.6
		Up to 6-hourly during non-routine operations	Manual sampling	
	PW chemical character	Annually	PW chemical characterisation	
	PW ecotoxicity	3 yearly	PW ecotoxicity testing	
Discharge of cooling water	Total Residual Chlorine	Periodically	Total Residual Chlorine testing	Section 6.7.6
Waste recycling and disposal	Quantities of solid and liquid wastes disposed of onshore	Ongoing	Facility waste manifest	Section 6.8.1
<b>Unplanned Emissions and Discharges</b>				
Unplanned emissions and discharges	Nature of release	As required	HSE Event Reporting System (First Priority)	Sections 6.8.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

## 7.10.4 Auditing

### 7.10.5 Operations Assurance

To provide confidence, based on evidence commensurate with risk, that business objectives are met, business activities are performed and risks are managed, assurance is performed as described in the Provide Assurance Procedure and the Provide Assurance Guideline. The Guideline aims to explain how the Operations Division Assurance Team implement WMS Assurance requirements, while concurrently satisfying the Operations Division's specific objectives.

Operations Assurance Assignments are contained within the Operations Division Integrated Assurance Assignment Plan.

Environmental assurance activities are conducted on a regular basis to help:

- verify environmental risks and potential impacts are being managed in accordance with the EPOs and EPSs detailed in this EP
- monitor, review and evaluate the effectiveness of the performance outcomes and standards detailed in this EP
- verify effectiveness of the EP implementation strategy
- identify potential non-conformances.

The outputs of the assurance process are corrective actions that feed the improvement process. Therefore, assurance is a key driver of continuous improvement.

### 7.10.6 Annual Offshore Inspection/Desktop Review

An inspection/review of the facility is undertaken every calendar year by the Production Environment Team, via either an offshore inspection or desktop review. Selected risk areas/activities are inspected to review environmental performance against the EPOs and EPSs, and verify that control measures are effective in reducing the environmental risks and impacts of the PAP to an ALARP and acceptable level.

The inspection/review also includes review of conformance with selected aspects of the EP implementation strategy. All risk sources/activities applicable to the offshore facility will be reviewed over a three-year rolling period. Records of findings and records of close-out of any corrective or improvement actions are maintained (close-out is tracked in Woodside's action tracking system).

### 7.10.7 Subsea Support Vessel Environment Inspection

Environmental inspections of subsea support vessels are undertaken. This involves annual and ongoing inspections of subsea support vessels to ensure that any subsea support vessel is compliant with both the EP and the approved Contractor Management system. Inspections are conducted in line with the SSPL contractor implementation package, however, may include additional requirements for project specific inspection items.

Vessel inspection findings are captured within a closeout report. Actions arising from subsea support vessel environmental audits are added to the relevant Environmental Commitments and Actions Register (eCAR) within the Subsea Construction, IMMR Environment Project Register. This eCAR is used to track support vessel compliance with EP commitments, including any findings and corrective actions.

### 7.10.8 Marine Assurance

Woodside's marine assurance is managed by the Marine Assurance Team of the Logistics Function Marine Services Group in accordance with Woodside's Marine Offshore Vessel Assurance Procedure. The Woodside process is based on industry standards and consideration of guidelines

and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

Woodside's Marine Offshore Assurance process is mandatory for all vessels (other than Tankers and Floating Production Storage and Offloading vessels) that are chartered directly by or on behalf of Woodside, including for short term hires (i.e. <3 months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust Safety Management System.

The process is multi-faceted and encompasses the following marine assurance activities:

- Safety Management System Assessment
- Dynamic Positioning (DP) System Verification
- Vessel Inspections
- Project support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard. Woodside Marine Assurance Specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- OCIMF OVID Inspection
- IMCA CMID Inspection
- Marine Warranty Survey

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval. Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, there does exist an opportunity to further scrutinise the proposed vessel.

OVID inspections are objective in nature and reflect what was observed by the Inspector while conducting the inspection. The inspection provides observations as opposed to non-conformities.

Where an OVID vessel inspection and/or OVMSA Verification Review is not available and all reasonable efforts based on time and resource availability to complete a vessel OVID inspection and/or OVMSA Verification Review are performed (i.e. short term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternate means of inspection, known as a risk assessment.

### **7.10.9 Risk Assessment**

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or an OVID vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist Superintendent, or the nominated deputy, where the vessel meets the short term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the

level of management control a vessel is subject to against the risk factors associated with the PAP or role.

Several factors are assessed as part of a vessel risk assessment, including:

- Management control factors:
- Company audit score (i.e. management system)
- vessel HSE incidents
- vessel Port State Control deficiencies
- instances of Port State Control vessel detainment
- years since previous satisfactory vessel inspection
- age of vessel
- contractors' prior experience operating for Woodside.

PAP risk factors:

- people health and safety risks (a function of the nature of the work and the area of operation)
- environmental risks (a function of environmental sensitivity, PAP type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))
- value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
- reputation risk
- exposure (i.e. exposure to risk based on duration of project)
- industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to PAP risk. If the vessel management control is not deemed to appropriately manage PAP risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

#### **7.10.10 Management of Non-conformance (Internal)**

Woodside employees and Contractors are required to internally report all environmental incidents and hazards, including potential non-conformances with EPOs and EPSs in this EP.

The Health, Safety and Environment Event Reporting and Investigation Procedure defines how incidents and hazards are internally reported. Key requirements are set out through the use of an Event Report Form, which includes details of the event, immediate action taken to control the situation, and corrective actions to prevent reoccurrence. An internal online database called First Priority is used for the recording and reporting of these events. Corrective actions are monitored using First Priority and closed out in a timely manner.

Detailed investigations are completed for incidents with an actual impact of A, B or C, and high potential environmental incidents and hazards. The classification, reporting, investigation and actioning of environmental incidents and hazards is undertaken in accordance with the Health, Safety and Environment Event Reporting and Investigation Procedure supported by the HSE Event Reporting Guideline. Event bulletins may be used for communication of learnings from significant events.

Non-conformances with EPOs and EPSs are also internally reported and investigated in accordance with Regulatory Compliance Management Procedure, supported by the Regulatory Compliance Management Guideline.

External regulatory reporting requirements for this PAP are outlined in Section 7.13 of this EP.

## 7.11 Review

### 7.11.1 Environmental Risk Review

Woodside PetDW risk management processes include risk review, are described in Sections 7.4 and Section 7.11 and are applied on a day-to-day basis. The Facility Environmental Impacts and Risk Register must be reviewed and updated every five years.

Monitoring (Section 7.10.1), assurance (Section 7.10.4) and review (Section 7.11) are also used to identify potential new information that may arise during the PAP and ensure that performance outcomes and standards are being met and EP environmental control measures are effective. Whilst conducting these activities, qualified, experienced environment advisors, in consultation with experienced Operational and/or Engineering personnel use their professional judgement, to identify potential new control measures that have potential to improve environmental outcomes or reduce risk. As various monitoring/assurance/review processes are used there is not an overarching procedure/checklist that is suitable to contain a prompt for consideration of new environmental controls.

In addition, Woodside's risk management practices and processes are systematically applied on an ongoing basis to activities provided for within the EP (as summarised within Section 7.4). Via these processes and practices, new risk controls for individual planned and unplanned events may be selected and implemented (proportional to risk levels). When such risk controls are identified by environmental advisors as being relevant to the overarching EP sources of risk, these may also be added as new EP control measures. Any new or improved EP environmental controls or specific measures (that have the potential to improve environmental outcomes or reduce risk), can be tracked within the production EP updates register for incorporation into the EP at its next revision. The EP may be internally revised to reflect these changes without resubmission.

Where review processes identify new or improved controls relevant to environmental risks identified in this EP (that have the potential to improve environmental outcomes or reduce risk), the EP may be internally revised to reflect these changes without resubmission.

### 7.11.2 Learning and Knowledge Sharing

Learning and knowledge sharing occurs via a number of different methods, including for example:

- operations learnings meetings
- event investigations
- event bulletins
- engineering and technical authorities discipline communications and sharing.

### 7.11.3 Continuous Improvement

Continuous improvement (CI) projects to improve production or environmental performance that involve refurbishment, modification or major maintenance on the facility are typically managed by Brownfields Engineering and required to follow appraise and develop management procedures. The Procedure requires that all projects be managed in accordance with the Opportunity Management Framework, which supports the progressive maturation of an opportunity through value creation in the Assess and Select Phases and the maintenance of value in the Develop and Execute phases.

To support the accountable executive to make a decision on whether a CI Project should proceed to the next phase in the Opportunity Management Framework, it is sometimes necessary to conduct a trial of the modification to determine the outcomes that can be expected if the modification is implemented. Due to prioritisation of resources, the phased progress of opportunities, competition between different solutions and long-term strategic and financial considerations, it is not possible to set quantitative success criteria to determine whether a modification will be implemented based on the results of trials. Instead, the results of a trial are used to inform a decision on whether to progress the CI Project to the next phase in the Opportunity Management Framework. Decisions are typically made with two key considerations; whether the business is ready to proceed which has a technical/functional focus and whether there is a business case for progressing to the next phase. The business case may consider the ALARP position for the CI Project, if relevant.

## 7.12 Record Keeping

Compliance records (outlined in MCs in Section 6) are maintained. Record keeping is in accordance with Regulation 22(7) that addresses maintaining records of emissions and discharges such that the records can be used to assess whether EPOs and EPSs are being met (refer to Section 7.10.1 and Table 7-3 for a summary of records that are retained).

## 7.13 Reporting

### 7.13.1 Overview

In order to meet the EPOs and EPSs outlined in this EP, Woodside undertakes reporting at a number of levels. These reporting arrangements are outlined below.

### 7.13.2 Routine Reporting (Internal)

#### 7.13.2.1 Daily Reports

The following daily reports, containing environmental performance information are issued:

Pan-Woodside Daily Production Report – The report includes facility performance information on production and a log of any HSE events.

Subsea support vessel Daily Progress Report(s) – During subsea IMMR activities, daily reports are issued by the Woodside Site Representative. The reports provide performance information on HSE events, diesel use, together with equipment information, current and planned work activities.

#### 7.13.2.2 Performance Reporting

A number of routine performance reports are developed in support of the facility operational activities. These reports cover HSE, production and process safety performance. Information included in these reports, relevant to the EP, includes:

- summary of environment incidents
- current and planned work activities, significant events (e.g. shutdowns, failures)
- integrity status and process safety metrics
- status of subsea IMMR activities.

### 7.13.3 Routine Reporting (External)

#### 7.13.3.1 Ongoing consultation

In accordance with Regulation 22 (15) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside’s approach to ongoing consultation is that feedback and comments received from relevant persons and additional persons continue to be assessed and responded to, as required, through the life of an EP, including during EP assessment and throughout the duration of the accepted EP, in accordance with the intended outcome of consultation (as set out in Section 5.2).

Woodside proposes to undertake the engagements with directly impacted relevant persons and additional persons listed in Table 7-4. Relevant new information identified during ongoing consultation will be assessed using the EP Management of Knowledge (refer to Section 7.10.2 and Management of Change Process (refer to Section 7.5).

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who present at those meetings are from community and industry and include Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, industry representative bodies, Community and industry organisations.

Relevant persons, additional persons and those who are merely interested in the activities, can otherwise remain up to date on this activity through subscribing to the Woodside website, or by reading the publicly available version of the EP on NOPSEMA’s website, where available.

Should consultation feedback be received following EP acceptance that identifies a measure or control that requires implementation or update to meet the intended outcome of consultation (see Section 5.2), Woodside will apply its EP Management of Knowledge process (refer to Section 7.10.2 and Management of Change Process (refer to Section 7.5) as appropriate.

Woodside has developed a Program of Ongoing Engagement with Traditional Custodians (Appendix G), directly informed by feedback from Traditional Custodians. It provides a mechanism for ongoing dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the possible consequences of an activity to be carried out under an EP on their functions, interests and activities as they relate to cultural values. The program enables Woodside to manage uncertainty on the impacts and risks to cultural values which may be identified at any time during Woodside’s activities via ongoing dialogue with Traditional Custodians.

Any significant changes on this activity will be communicated to relevant persons.

**Table 7-4: Ongoing consultation engagements**

Report/ Information	Recipient	Purpose	Frequency	Content
Program of Ongoing Engagement with Traditional Custodians (Appendix G)	Relevant cultural authorities	Identification, assessment and consideration of cultural values relevant to the Operational Area and EMBA.	Ongoing	Assessment of cultural values. Any relevant new information on cultural values will be assessed using the EP Management of Knowledge (Section 7.10.2) and Management of Change Process (refer to Section 7.5).
Notification (email)	Other relevant persons	Notification of significant change	As required	Notification of significant change
Emails/ Meetings	Persons or organisations who provide feedback to Woodside post EP submission.	Identification, assessment and consideration of feedback, claims and/ or objections	As appropriate	Assessment of claims and/ or objections. Relevant new information will be

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

				assessed using the EP Management of Knowledge (Section 7.10.2) and Management of Change Process (refer to Section 7.5).
Notification (email)	Australasian Underwater Cultural Heritage Database Any other stakeholders as required in the Unexpected Finds Procedure (Section 7.8).	Report any unexpected finds of potential Underwater Cultural Heritage.	If triggered by Unexpected Finds Procedure (Section 7.8).	Refer to Unexpected Finds Procedure (Section 7.8).

### 7.14 Environmental Performance Review and Reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information on environmental performance to the appropriate regulator.

Routine regulatory reporting requirements are summarised in Table 7-5. The requirements include that Woodside will develop and submit an annual Environmental Performance Report to NOPSEMA, with the first report submitted within 12 months of the commencement of activities covered by this EP (as per the requirements of Regulation 22(7) (i.e. by 30 June the following year).

**Table 7-5: Routine external reporting requirements**

Report	Recipient	Frequency	Content
Monthly Recordable Incident Report	NOPSEMA	Monthly, by 15 of each month	As required by Regulation 50, details of recordable incidents that have occurred under the EP for the previous month. Refer to Section 7.14.3 for more detail.
Annual EP Performance Report	NOPSEMA	Annual, by 30 June of the year following reporting period	As required by Regulation 22(2) and 26C the report will report compliance with the EPOs and EPSs outlined in Section 6 of this EP. The reporting period is 1 January to 31 December each year.
Regulation 54 start or end of activity notification form	NOPSEMA	At least 10 days before an activity (or stage of an activity) commences; and within 10 days after completion. This includes instances where production temporarily ceases associated with FPSO sail away.	As required by Regulation 54, Woodside must notify NOPSEMA that an activity (or stage of an activity) is to commence at least 10 days before the activity commences; and within 10 days after completion.
NPI Report	DCCEEW	Annual, by 30 September each year	Summary of the emissions to land, air and water including those from the facility. Reporting period 1 July to 30 June each year.
National Greenhouse and Energy Reporting (NGERS)	Clean Energy Regulator	Annual, by 31 October each year	Summary of energy use and greenhouse gas emissions including those from the facility. Reporting period is 1 July to 30 June each year.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Any such incidents represent potential events which would be reportable incidents. Reporting of incidents is undertaken with consideration of NOPSEMA (2014) guidance stating, 'if in doubt, notify NOPSEMA', and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the regulations.

### **Notification**

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 47 and 48 of the Environment Regulations. Woodside will:

- orally notify NOPSEMA of all reportable incidents to the regulator as soon as practicable, but within two hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator (NOPTA) and the Department of the responsible State Minister (Department of Energy, Mines, Industry Regulation and Safety [DEMIRS]) as soon as practicable after the oral notification of the incident
- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0929 – Reportable Environment Incident which must be submitted to NOPSEMA as soon as practicable, but within three days of the incident or of its detection by Woodside
- provide a copy of the written report to NOPTA and DEMIRS, within seven days of the written report being provided to NOPSEMA.

### **7.14.3.2 Recordable Incidents**

A recordable incident is defined under Regulation 5 of the Environment Regulations as a 'breach of an EPO or EPS, in the EP that applies to the activity, that is not a reportable incident'.

Any breach of the EPOs or EPSs (as presented within Section 6) will be raised as a recordable incident and managed as per the notification and reporting requirements outlined below and internal requirements outlined in Section 7.10.107.13.

### **Notification**

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 50. Woodside will:

- provide a written record not later than 15 days after the end of the calendar month using a format consistent with the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report.

### **7.14.4 Other External Reporting Requirements and Notifications**

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, the following incident reporting requirements also apply in the Operational Area if the spill originates from a vessel:

Any oil pollution incidents in Commonwealth Waters will be reported (by the vessel master) to AMSA RCC as per Article 8 and Protocol I of MARPOL within two hours via the national emergency 24-hour notification contacts, and a written report within 24-hours of the request by AMSA. (This requirement is included in the Oil Pollution First Strike Plan).

If the ship is at sea, reports are to be made to:

Free call: 1800 641 792

Phone: 08 9430 2100 (Fremantle).

Any spills greater than ten tonnes in Commonwealth Waters must be reported (by the vessel master) to AMSA within one hour. (This requirement is detailed in the Oil Pollution First Strike Plan). Reports are to be made via the national 24-hour emergency notification contacts (AusSAR: RCC):

Rescue Coordination Centre Australia (RCC Australia)

Phone: 02 6230 6811

Facsimile: 02 6230 6868

Telex: 62349

Free call: 1800 641 792

AFTN: YSARYCYX.

A hydrocarbon spill incident with potential to significantly impact MNES must be reported to DCCEEW..

If the activity described within this EP results in the unintentional death of or injury to a fauna that constitute MNES (i.e. species listed as Threatened or Migratory under the EPBC Act), and the activity was not authorised by a permit, DCCEEW should be notified within seven days of becoming aware of the results of the activity:

The Secretary

DCCEEW

Hotline: 1800 803 772

Email: protected.species@environment.gov.au.

For hydrocarbon spill incidents, other agencies and organisations will be notified as appropriate to the nature and scale of the incident as per procedures and contact lists in the Oil Pollution Emergency Arrangements (Australia) and the Oil Pollution First Strike Plan (Attachment H), including but not limited to:

A hydrocarbon spill incident with the potential to significantly impact MNES must be reported to DCCEEW.

## 7.15 Emergency Preparedness and Response

### 7.15.1 Overview

Under Regulation 22(8), the implementation strategy must contain an OPEP and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

A summary of how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements is shown in Table 7-6.

**Table 7-6: Oil Pollution Preparedness and Response Overview**

Content	Environment Regulations Reference	Document/Section Reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 21 (5), (6), 22(2)	Appendix H: Oil Spill Preparedness and Response Mitigation Assessment

Content	Environment Regulations Reference	Document/Section Reference
Describes the OPEP	Regulation 22 (8)	EP: Section 7.15. Woodside’s OPEP has the following components: <a href="#">Oil Pollution Emergency Arrangements (Australia)</a> Appendix I: First Strike Plan Appendix H: Oil Spill Preparedness and Response Mitigation Assessment In accordance with Regulation 31 of the Environmental Regulations the Woodside <a href="#">Oil Pollution Emergency Arrangements (Australia)</a> was provided with the Julimar Phase 2 Drilling and Subsea Installation EP, accepted by NOPSEMA on 8 November 2019
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22 (9)	Appendix H: Oil Spill Preparedness and Response Mitigation Assessment Appendix I: First Strike Plan
Details the arrangements for updating and testing the oil pollution response arrangements	Regulation 22 (8) (12) (13) (14)	EP: Section 7.15.9 Appendix H: Oil Spill Preparedness and Response Mitigation Assessment
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22 (10)	Appendix H: Oil Spill Preparedness and Response Mitigation Assessment
Demonstrates that the oil pollution response arrangements are consistent with the national system for oil pollution preparedness and control	Regulation 22 (11)	<a href="#">Oil Pollution Emergency Arrangements (Australia)</a> .

### 7.15.2 Emergency Response Training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk based training needs analysis on positions required for effective emergency response.

**Table 7-7: Emergency Response Training Requirements**

IMT Position	Minimum Competency
Corporate Incident Management Team (CIMT) Incident Commander and Deputy Incident Commander	<ul style="list-style-type: none"> <li>• IMT Fundamentals Course (internal course) or equivalent</li> <li>• ICS 100/200</li> <li>• IMO3 or equivalent spill response specialist level with an oil spill response organisation (OSRO)</li> <li>• Participation in L2 activation, exercise or skills maintenance</li> </ul>
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	<ul style="list-style-type: none"> <li>• IMT Fundamentals Course or equivalent</li> <li>• ICS 100/200</li> <li>• Oil spill theory</li> <li>• Participation in L2 activation, exercise or skills maintenance</li> </ul>
Environment Unit Leader	<ul style="list-style-type: none"> <li>• IMT Fundamentals Course</li> <li>• ICS 100/200</li> <li>• IMO2 or equivalent spill response specialist level with an OSRO</li> <li>• Participation in L2 activation, exercise or skills maintenance</li> </ul>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

**Note on competency/equivalency**

In 2023 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Crisis and Emergency Management training and the oil spill response training requirements for CIMT roles.

The revised IMT Fundamentals training Program aligns with the performance requirements of the PMAOMIR320 – Manage Incident Response Information and PMAOM0R418 - Coordinate Incident Response.

In 2023, Woodside took the decision to align its global incident command arrangements to the Incident Command System (ICS). As such all rostered members of the Incident Management Team are trained up to ICS 200.

In addition to baseline incident management training, all rostered members of the CIMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course (OSREC) which involves the completion of two online AMSA Modules (Introduction to National Plan and Incident Management; and Introduction to Oil Spills) and face-to-face training.

Woodside Learning Services (WLS) are responsible for collating and maintaining personnel training records. The HSP Dashboard reflects the competencies required for each oil spill role (IMT/operational).

**7.15.3 Emergency Response Preparation**

The Corporate Incident Management Team (CIMT) based in Woodside’s head office in Perth, is the onshore coordination point for an offshore emergency. The CIMT is staffed by a roster of appropriately skilled personnel available on call 24 hours a day. The CIMT, under the leadership of the CIMT Leader, supports the site-based Incident Management Team by providing additional support in areas such as operations, logistics, planning, people management and public information (corporate affairs). A description of Woodside’s Incident Command Structure and arrangements is further detailed in the Woodside Oil Pollution Emergency Arrangements (Australia).

Woodside will have a number of Emergency Response Plans (ERP) in place relevant to the PAP. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident.

In addition, the Emergency Preparedness MSPS (M06) is in place to assure that in the event of an incident, the organisation is appropriately prepared for all necessary actions which may be required for the protection of People, Environment, Asset, Reputation and Livelihood.

**7.15.4 Initial Response to Facility Incident**

The facility is equipped with emergency shutdown systems designed to protect personnel, the facility and the environment from unsafe operating conditions and catastrophic situations.

Emergency shutdown systems are provided as a means of isolation in response to process upsets and facility conditions (including associated flowlines and risers) that could result in loss of hydrocarbon inventories, or to reduce the potential impact from a hydrocarbon loss of containment event on the facility. Provision has been made for process and facility alarm systems to provide early indication of any process upset conditions and potential hazardous events, including fire and gas alarms.

The ERP relevant to the facility and subsea infrastructure covers health, safety, asset and environmental risks (including fire, structural integrity, sabotage, etc.) to ensure the range of occupational, asset and environmental risk exposures from incidents have been considered and plans are in place for their management. The plan provides specific details on the initial response required during events with potential significant environmental consequences such as a hydrocarbon spill, subsea hydrocarbon leak or potential collision.

The Oil Pollution First Strike Plan provides immediate actions required to commence a response. Vessels have SOPEPs in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Oil Pollution First Strike Plan is intended to

work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the PAP, as detailed in Appendix H: Oil Spill Preparedness and Response Mitigation Assessment.

### 7.15.5 Oil and Other Hazardous Materials Spill

A significant hydrocarbon spill during the PAP is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. The Woodside OPEA (Australia) document is supported by Appendix I: First Strike Plan which provides tactical response guidance to the PAP.

The Security and Emergency Management Function is responsible for the management of Woodside's hydrocarbon spill response equipment and for the maintenance of hydrocarbon spill preparedness and response documentation. In the event of a major spill, Woodside will request that AMSA (administrator of the National Plan) provides support to Woodside through advice and access to equipment, people and liaison. The interface and responsibilities, as defined under the National Plan, are described in the OPEA (Australia). AMSA and Woodside have a MoU in place to support Woodside in the event of a hydrocarbon spill.

### 7.15.6 Emergency and Spill Response

Woodside categorises incidents in relation to response requirements as follows:

- **Level 1 Incident** – A Level 1 incident can be resolved through the use of existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site / regionally based teams using existing resources and functional support services.
- **Level 2 Incident** – A Level 2 incident is characterised by a response that requires external operational support to manage the incident. It is triggered in the event the capabilities of the tactical level response are exceeded. This support is provided to the activity via the activation of all, or part of, the responsible CIMT.
- **Level 3 Incident** – A Level 3 incident or crisis is identified as a critical event that seriously threatens the organisation's People, the Environment, company Assets, Reputation, or Livelihood. At Woodside, the Crisis Management Team (CMT) manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation etc.). The CIMT may also be activated as required to manage the operational incident response requirements.

### 7.15.7 Emergency and Spill Response Drills and Exercises

Testing of Woodside's capability to respond to incidents will be conducted in alignment with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in Figure 7-3. Woodside's emergency response testing regime is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards/risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are the reference point for emergency management and crisis management exercise schedule development. External participants may be invited to attend exercises, such as government agencies, specialist service providers, oil spill response organisations or industry members with which we have mutual aid arrangements.

The overall objective of exercising is to test procedures, skills and teamwork of the Emergency Response and Command Teams in their ability to respond to major events. After each exercise, the team holds a debrief session, during which the exercise is reviewed. Any lessons learnt or areas for improvement are identified and incorporated into revised procedures where appropriate.

#### Table 7-8: Testing of response capability

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Response Category	Scope	Response Testing Frequency – Operations	Response Testing Objective
<b>Level 1 Response</b>	Exercises are project-/ activity-specific	Two comprehensive Level 1 ‘First Strike’ drills conducted per year, per asset. Additional Level 1 emergency drills routinely conducted (approximately one per fortnight).	Comprehensive exercises test elements of Appendix I: First Strike Plan Emergency drills are scheduled to test other aspects of the Emergency Response Plan.
<b>Level 2 Response</b>	Exercises are facility/ vessel-specific	A minimum of one Emergency Management exercise is conducted biennially.	Testing both the facility IMT response and/or that of the CIMT following handover of incident control.
<b>Level 3 Response</b>	Exercises are relevant to all Woodside assets	The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Emergency Management.	Test Woodside’s ability to respond to and manage a crisis level incident

### 7.15.8 Hydrocarbon Spill Response testing of Arrangements

There are a number of arrangements which, in the event of a spill, will underpin Woodside’s ability to implement a response across its petroleum activities. In order to ensure these arrangements are adequately tested, the Capability Development Team within Security and Emergency Management ensures tests are conducted in alignment with the Hydrocarbon Spill Testing of Arrangements Schedule.

Woodside’s arrangements for spill response are common across its Australian operating assets and activities to ensure the controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- Ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities.
- Test response arrangements and actions to validate response plans.

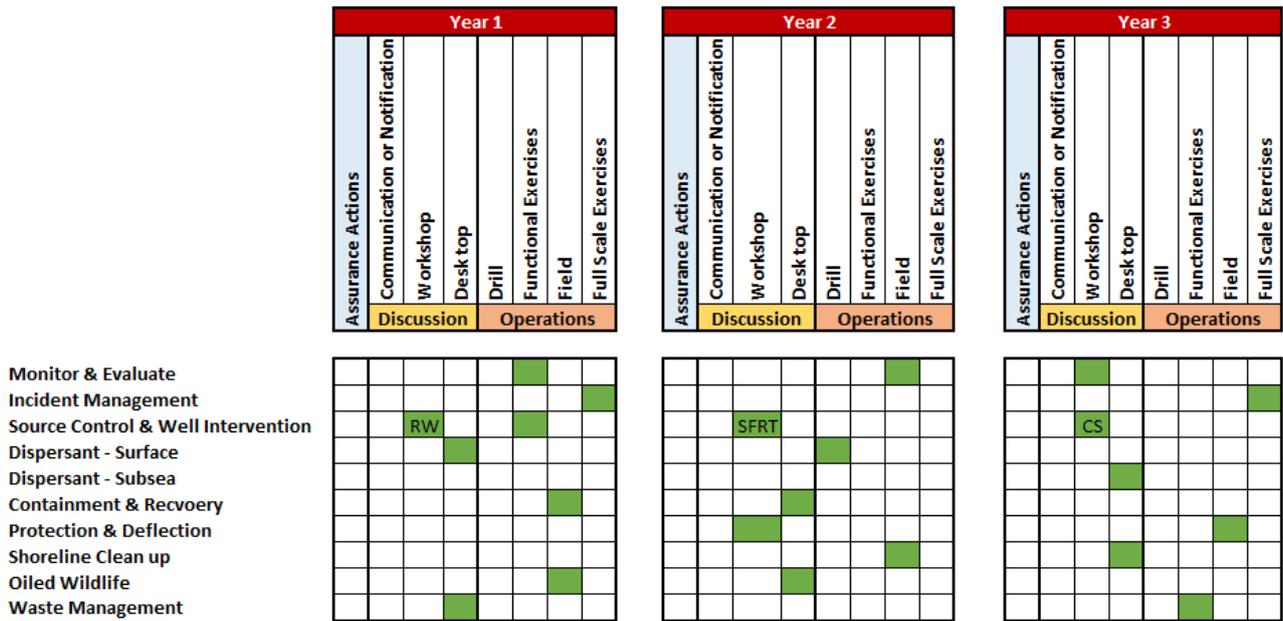

Ensure lessons learned are incorporated into Woodside’s processes and procedures and improvements are made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in Figure 7-3, up to eight formal exercises are planned annually, across Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

### 7.15.9 Testing of Arrangements Schedule

Woodside’s Testing of Arrangements Schedule (Figure 7-3) aligns with international good practice for spill preparedness and response management; the testing is compatible with the IPIECA Good Practice Guide and the Australian Institute for Disaster Resilience (AIDR) Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside’s ability to implement a response across its petroleum activities.

**Figure 7-3: Indicative 3-yearly testing of arrangements schedule**

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside’s regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g., capability, equipment and personnel). For example, an arrangement could be to test Woodside’s personnel capability for conducting scientific monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment.

The vertical columns relate to how hydrocarbon spill arrangements will be tested over the 3-year rolling schedule. The sub-heading for the column describes the standard method of testing likely to be undertaken (e.g., discussion exercise, desktop exercise), and the green cells indicate the arrangements that could be tested for each method.

Some arrangements may be tested across multiple exercises (e.g., critical arrangements) or via other ‘additional assurance’ methods outside the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g., audits, no-notice drills, internal exercises, assurance drills).

**7.15.10 Cyclone and Dangerous Weather Preparation**

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

Subsea support vessels receive regular forecasts from the Bureau of Meteorology (BoM). If a cyclone (or severe weather event) is forecast, the path and its development will be plotted and monitored using the BoM data. If there is the potential for the cyclone (severe weather event) to affect the PAP, the asset Cyclone Contingency Plan and the vessel’s Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

## 9. LIST OF TERMS AND ACRONYMS

Acronym	Description
@	At
~	Approximately
<	Less/fewer than
>	Greater/more than
≤	Less than or equal to
≥	Greater than or equal to
°C	Degrees Celsius
2TL	Second Trunkline
3D	Three-dimensional
ABN	Australian Business Number
ACN	Australian Company Number
AEP	Australian Energy Producers (formerly APPEA)
AFMA	Australian Fisheries Management Authority
AHO	Australian Hydrographic Office
AIMS	Australian Institute of Marine Science
ALARP	As low as reasonably practicable
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
AS/NZS	Australian Standard/New Zealand Standard
AW	Abandoned wells with Wellhead (AW)
BESS	Battery Energy Storage System
BDV	Blow-down Valve
BIA	Biologically Important Area
BoM	Bureau of Meteorology
BOP	Blowout Preventer
CCE	Common cause event
CCR	Central Control Room
CFU	Compact Flootation Unit
CIMT	Corporate Incident Management Team
cm	Centimetre
cm <sup>3</sup>	Cubic centimetre
CMMS	Computerised Maintenance Management System
CMT	Crisis Management Team
CO	Carbon monoxide
CO <sub>2</sub>	Carbon dioxide
COO	Chief Operations Officer
cP	Centipoise

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Acronym	Description
CS	Cost Sacrifice
CV	Company Value
CVS	Contractor Verification Service
CW	Cooling Water
D&C	Drilling and Completions
dB re 1 µPa	Decibels relative to one micropascal; the unit used to measure the intensity of an underwater sound
DGF	Dissolved Gas Floatation unit
DEMIRS	Western Australian Department of Energy, Mines, Industry Regulation and Safety
DNP	Director of National Parks
DoEE	Commonwealth Department of the Environment and Energy
DoT	Western Australian Department of Transport
DP	Dynamic positioning
DPIRD	Department of Primary Industry and Regional Development
eCAR	Environmental Commitments and Actions Register
EMBA	Environment that may be affected
ENVID	Environment Identification (study)
EP	Environment Plan
EPBC Act	Commonwealth Environment Protection and Biodiversity Conservation Act 1999
EPO	Environmental Performance Objective
EPS	Environment Performance Standard
ERP	Emergency Response Plan
ESD	Emergency Shutdown
ETA	Exploration wells Temporary Abandoned (ETA)
EY	Echo Yodel
FFS	Fitness for Services
FPSO	Floating production, storage, and offtake
g	Gram
GP	Good Practice
HAZID	Hazard identification (study)
HP	High Pressure
HQ	Hazard Quotient
HSE	Health, Safety, and Environment
HSEC	Health, Safety and Environment Coordinator
HVAC	Heating, ventilation and air conditioning
IFL	Interfield Line
ILUA	Indigenous Land Use Agreements
IMMR	Inspection, maintenance, monitoring, and repair
IMS	Invasive Marine Species

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Acronym	Description
IMSMP	Invasive Marine Species Management Plan
IPIECA	International Petroleum Industry Environmental Conservation Association
ISO	International Organization for Standardization
IUCN	International Union for Conservation of Nature
KEF	Key Ecological Feature
KDA	Keast Dockrell
kg	Kilogram
KGP	Karratha Gas Plant
kHz	Kilohertz
km	Kilometre
kn	Knot
KO	Knock Out (drum)
KPI	Key Performance Indicator
kW	Kilowatt
L	Litre
LAT	Lowest Astronomical Tide
LCS	Legislation, Codes and Standards
LNG	Liquefied Natural Gas
LOR	Limit of Reporting
LP	Low Pressure
LPA	Lady Nora Pemberton
LTO	Licence to Operate
m	Metre
m/s	Metres per second
m <sup>2</sup>	Square metre
m <sup>3</sup>	Cubic metre
MAE	Major Accident Event
MARPOL	The International Convention for the Prevention of Pollution From Ships, 1973 as modified by the Protocol of 1978.
MBES	Multibeam Sonar
MC	Measurement Criteria
MEG	Monoethylene glycol
mg	Milligram
ml	Millilitre
MNES	Matters of National Environmental Significance
MoC	Management of Change
MOPO	Manual of Permitted Operation
MoU	Memorandum of Understanding
MPA	Marine Protected Area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Acronym	Description
MSPS	Management System Performance Standards
MW	Megawatt
n.d.	No date
N/A	Not Applicable
N2O	Nitrous oxide
NGERS	National Greenhouse and Energy Reporting Scheme
NIMS	Non-indigenous Marine Species
nm	Nautical mile
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NOPTA	National Offshore Petroleum Titles Administrator
NORM	Naturally Occurring Radioactive Material
NOX	Oxides of nitrogen
NPI	National Pollutant Inventory
NRA	North Rankin Alpha
NRC	North Rankin Complex
NTA	Native Tittle Act
NWMR	North-west Marine Region
NWS	North West Shelf
OCIMF	Oil Companies International Marine Forum
OCNS	Offshore Chemical Notification Scheme
OIM	Offshore Installation Manager
OIW	Oil in water
OPEA	Oil Pollution Emergency Arrangements (Australia)
OPEP	Oil Pollution Emergency Plan
OPGGGS Act	Commonwealth Offshore Petroleum and Greenhouse Gas Storage Act 2006
OSPAR	Oslo–Paris Convention for the Protection of the Marine Environment of the North East Atlantic
PAH	Polycyclic aromatic hydrocarbon
PAP	PAP
PetDW	Petroleum Deepwater
PBC	Prescribed Body Corporates
pH	Measure of acidity or basicity of a solution
PJ	Professional Judgement
PLONOR	Pose Little or no Risk to the Environment
PMST	Protected Matters Search Tool
PoB	Personnel Onboard
ppb	Parts per billion
ppm	Parts per million
PSM	Process Safety Management

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Acronym	Description
PSRA	Process Safety Risk Assessment
PSZ	Petroleum safety zone
PW	Produced Water
RATSIB	Representative Aboriginal/Torres Strait Islander Bodies
RBA	Risk-based Analysis
RBI	Risk-based Inspection
RCC	Rescue Coordination Centre
RESDV	Riser Emergency Shutdown Valve
RO	Reverse osmosis
ROV	Remotely operated vehicle
SCC	Safety and Environment Critical Component
SCM	Subsea Control Module
SCQ	Safety and Environmental Critical Equipment
SIMAP	Spill Impact Mapping and Analysis program
SKM	Sinclair Knight Mertz (company)
sm3	Standard cubic metres
SOPEP	Ship Oil Pollution Emergency Plan
SOX	Sulfur oxides
SSPL	Subsea and Pipelines
SSIV	Sub-sea Isolation Valve
SSSV	Sub-sea Safety Valve
SV	Societal Value
SVP	Senior Vice President
T	Tonne
TEG	Triethylene glycol
TV	Trigger Value
UK	United Kingdom
UPS	Uninterrupted Power Supply; battery power system
VOC	Volatile Organic Compound
VP	Vice President
WA	Western Australia
WAFIC	Western Australian Fishing Industry Council
WALGA	Western Australian Local Government Association
WGS84	World Geodesic System 1984
WMS	Woodside Management System
Woodside	Woodside Energy Limited
WOMP	Well Operations Management Plan

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

## **10. APPENDICES**

## **APPENDIX A: WOODSIDE ENVIRONMENT AND BIODIVERSITY POLICY**

## Environment and Biodiversity Policy

### OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

### PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new exploration or development of hydrocarbons within the boundaries of natural sites on the UNESCO World Heritage List (as specified at 1 December 2022). Existing activity may continue if compatible with maintenance of the listed outstanding universal values.
- Not undertaking new exploration or development of hydrocarbons within IUCN Protected Areas (as specified at 1 December 2022) unless compatible with management plans in place for the area. Existing activity may continue if compatible with management plans in place for the area.
- Achieving net zero deforestation<sup>1</sup> associated with new projects that take a Final Investment Decision (FID) after 1 December 2022.
- Developing Biodiversity Action Plans for all new major projects (CAPEX >USD\$2 billion) that take a FID after 1 December 2022.
- Supporting positive biodiversity outcomes in regions and areas in which we operate.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

### APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

*Approved by the Woodside Energy Group Ltd Board in December 2022.*

<sup>1</sup> Definition of Forest: 'trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared'.

## APPENDIX B: RELEVANT REQUIREMENTS

The below table refers to Commonwealth Legislation related to the project.

Commonwealth Legislation	Legislation Summary
Air Navigation Act 1920 Air Navigation Regulations 1947 Air Navigation (Aerodrome Flight Corridors) Regulations 1994 Air Navigation (Aircraft Engine Emissions) Regulations 1995 Air Navigation (Aircraft Noise) Regulations 1984 Air Navigation (Fuel Spillage) Regulations 1999	This Act relates to the management of air navigation.
Australian Maritime Safety Authority Act 1990	This Act establishes a legal framework for the Australian Maritime Safety Authority (AMSA), which represents the Australian Government and international forums in the development, implementation and enforcement of international standards including those governing ship safety and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters.
Australian Radiation Protection and Nuclear Safety Act 1998	This Act relates to the protection of the health and safety of people, and the protection of the environment from the harmful effects of radiation.
Biosecurity Act 2015 Quarantine Regulations 2000 Biosecurity Regulation 2016 Australian Ballast Water Management Requirements 2017	This Act provides the Commonwealth with powers to take measures of quarantine, and implement related programs as are necessary, to prevent the introduction of any plant, animal, organism or matter that could contain anything that could threaten Australia's native flora and fauna or natural environment. The Commonwealth's powers include powers of entry, seizure, detention and disposal.  This Act includes mandatory controls on the use of seawater as ballast in ships and the declaration of sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers.
Environment Protection and Biodiversity Conservation Act 1999 Environment Protection and Biodiversity Conservation Regulations 2000	This Act protects matters of national environmental significance (NES). It streamlines the national environmental assessment and approvals process, protects Australian biodiversity and integrates management of important natural and culturally significant places.  Under this Act, actions that may be likely to have a significant impact on matters of NES must be referred to the Minister for the Environment and Water
Environment Protection (Sea Dumping) Act 1981 Environment Protection (Sea Dumping) Regulations 1983	This Act provides for the protection of the environment by regulating dumping matter into the sea, incineration of waste at sea and placement of artificial reefs.
Industrial Chemicals (Notification and Assessment Act) 1989 Industrial Chemicals (Notification and Assessment) Regulations 1990	This Act creates a national register of industrial chemicals. The Act also provides for restrictions on the use of certain chemicals which could have harmful effects on the environment or health.

Commonwealth Legislation	Legislation Summary
<p>National Environment Protection Measures (Implementation) Act 1998                      National Environment Protection Measures (Implementation) Regulations 1999</p>	<p>This Act and Regulations provide for the implementation of National Environment Protection Measures (NEPMs) to protect, restore and enhance the quality of the environment in Australia and ensure that the community has access to relevant and meaningful information about pollution.</p> <p>The National Environment Protection Council has made NEPMs relating to ambient air quality, the movement of controlled waste between states and territories, the national pollutant inventory, and used packaging materials.</p>
<p>National Greenhouse and Energy Reporting Act 2007                      National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</p>	<p>This Act and associated Rule establishes the legislative framework for the NGER scheme for reporting greenhouse gas emissions and energy consumption and production by corporations in Australia.</p>
<p>Navigation Act 2012                      Marine order 12 – Construction – subdivision and stability, machinery and electrical installations                      Marine order 30 - Prevention of collisions                      Marine order 47 – Offshore Industry units                      Marine order 57 - Helicopter operations                      Marine order 91 - Marine pollution prevention—oil                      Marine order 93 - Marine pollution prevention—noxious liquid substances                      Marine order 94 - Marine pollution prevention—packaged harmful substances                      Marine order 96 - Marine pollution prevention—sewage                      Marine order 97 - Marine pollution prevention—air pollution</p>	<p>This Act regulates navigation and shipping including Safety of Life at Sea (SOLAS). The Act will apply to some activities of the MODU and project vessels.</p> <p>This Act is the primary legislation that regulates ship and seafarer safety, shipboard aspects of marine environment protection and pollution prevention.</p>
<p>Offshore Petroleum and Greenhouse Gas Storage Act 2006                      Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023                      Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011                      Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009</p>	<p>This Act is the principal Act governing offshore petroleum exploration and production in Commonwealth waters. Specific environmental, resource management and safety obligations are set out in the Regulations listed.</p>
<p>Ozone Protection and Synthetic Greenhouse Gas Management Act 1989                      Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995</p>	<p>This Act provides for measures to protect ozone in the atmosphere by controlling and ultimately reducing the manufacture, import and export of ozone depleting substances (ODS) and synthetic greenhouse gases, and replacing them with suitable alternatives. The Act will only apply to Woodside if it manufactures, imports or exports ozone depleting substances.</p>
<p>Protection of the Sea (Powers of Intervention) Act 1981</p>	<p>This Act authorises the Commonwealth to take measures for the purpose of protecting the sea from pollution by oil and other noxious substances discharged from ships and provides legal immunity for persons acting under an AMSA direction.</p>

Commonwealth Legislation	Legislation Summary
<p>Protection of the Sea (Prevention of Pollution from Ships) Act 1983                      Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994                      Marine order 91 - Marine pollution prevention—oil                      Marine order 93 - Marine pollution prevention—noxious liquid substances                      Marine order 94 - Marine pollution prevention—packaged harmful substances                      Marine order 95 - Marine pollution prevention—garbage                      Marine order 96 - Marine pollution prevention—sewage                      Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007                      MARPOL Convention</p>	<p>This Act relates to the protection of the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances.</p> <p>The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 nautical miles (nm) off the coast out to the end of the Australian Exclusive Economic Zone (200 nm). It also applies within the 3 nm of the coast where the State/Northern Territory does not have complementary legislation.</p> <p>All the Marine Orders listed, except for Marine Order 95, are enacted under both the Navigation Act 2012 and the Protection of the Sea (Prevention of Pollution from Ships) Act 1983.</p> <p>This Act is an amendment to the Protection of the Sea (Prevention of Pollution from Ships) Act 1983. This amended Act provides the protection of the sea from pollution by oil and other harmful substances discharged from ships.</p>
<p>Protection of the Sea (Harmful Antifouling Systems) Act 2006                      Marine order 98—(Marine pollution—anti-fouling systems)</p>	<p>This Act relates to the protection of the sea from the effects of harmful anti-fouling systems. It prohibits the application or reapplication of harmful anti-fouling compounds on Australian ships or foreign ships that are in an Australian shipping facility.</p>

Department of Climate Change, Energy,  
the Environment and Water

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 26-Jun-2024

[Summary](#)

[Details](#)

[Matters of NES](#)

[Other Matters Protected by the EPBC Act](#)

[Extra Information](#)

[Caveat](#)

[Acknowledgements](#)

# Summary

## Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	None
<a href="#">National Heritage Places:</a>	None
<a href="#">Wetlands of International Importance (Ramsar)</a>	None
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	2
<a href="#">Listed Threatened Ecological Communities:</a>	None
<a href="#">Listed Threatened Species:</a>	26
<a href="#">Listed Migratory Species:</a>	40

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

# Caveat

## 1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

## 2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

## 3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

## 4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

# Summary

## Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">Listed Migratory Species:</a>	108

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

# Details

## Matters of National Environmental Significance

### World Heritage Properties [\[ Resource Information \]](#)

Name	State	Legal Status
<a href="#">Shark Bay, Western Australia</a>	WA	Declared property
<a href="#">The Ningaloo Coast</a>	WA	Declared property

### National Heritage Places [\[ Resource Information \]](#)

Name	State	Legal Status
<b>Historic</b>		
<a href="#">HMAS Sydney II and HSK Kormoran Shipwreck Sites</a>	EXT	Listed place
<a href="#">Batavia Shipwreck Site and Survivor Camps Area 1629 - Houtman Abrolhos</a>	WA	Listed place
<a href="#">Dirk Hartog Landing Site 1616 - Cape Inscription Area</a>	WA	Listed place

### Indigenous

<a href="#">Dampier Archipelago (including Burrup Peninsula)</a>	WA	Listed place
--	----	--------------

### Natural

<a href="#">Shark Bay, Western Australia</a>	WA	Listed place
<a href="#">The Ningaloo Coast</a>	WA	Listed place
<a href="#">The West Kimberley</a>	WA	Listed place

### Wetlands of International Importance (Ramsar Wetlands) [\[ Resource Information \]](#)

Ramsar Site Name	Proximity
<a href="#">Ashmore reef national nature reserve</a>	Within Ramsar site
<a href="#">Eighty-mile beach</a>	Within Ramsar site
<a href="#">Hosnies spring</a>	Within Ramsar site
<a href="#">Peel-yalgorup system</a>	Within 10km of Ramsar site
<a href="#">The dales</a>	Within Ramsar site
<a href="#">Vasse-wonnerup system</a>	Within 10km of Ramsar site

## Commonwealth Marine Area

[ [Resource Information](#) ]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

### Feature Name

Commonwealth Marine Areas (EPBC Act)

## Listed Threatened Ecological Communities

[ [Resource Information](#) ]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
<a href="#">Aquatic Root Mat Community 1 in Caves of the Leeuwin Naturaliste Ridge</a>	Endangered	Community known to occur within area
<a href="#">Aquatic Root Mat Community in Caves of the Swan Coastal Plain</a>	Endangered	Community known to occur within area
<a href="#">Banksia Woodlands of the Swan Coastal Plain ecological community</a>	Endangered	Community likely to occur within area
<a href="#">Empodisma peatlands of southwestern Australia</a>	Endangered	Community likely to occur within area
<a href="#">Honeymyrtle shrubland on limestone ridges of the Swan Coastal Plain Bioregion</a>	Critically Endangered	Community likely to occur within area

Community Name	Threatened Category	Presence Text
<a href="#">Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula</a>	Endangered	Community may occur within area
<a href="#">Proteaceae Dominated Kwongkan Shrublands of the Southeast Coastal Floristic Province of Western Australia</a>	Endangered	Community likely to occur within area
<a href="#">Scott River Ironstone Association</a>	Endangered	Community likely to occur within area
<a href="#">Sedgeland in Holocene dune swales of the southern Swan Coastal Plain</a>	Endangered	Community known to occur within area
<a href="#">Subtropical and Temperate Coastal Saltmarsh</a>	Vulnerable	Community likely to occur within area
<a href="#">Tuart (<i>Eucalyptus gomphocephala</i>) Woodlands and Forests of the Swan Coastal Plain ecological community</a>	Critically Endangered	Community likely to occur within area

## Listed Threatened Species [ [Resource Information](#) ]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.  
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
<b>BIRD</b>		
<a href="#">Accipiter hiogaster natalis</a> Christmas Island Goshawk [82408]	Endangered	Species or species habitat known to occur within area
<a href="#">Anous tenuirostris melanops</a> Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
<a href="#">Aphelocephala leucopsis</a> Southern Whiteface [529]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Ardenna grisea</a> Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
<a href="#">Atrichornis clamosus</a> Noisy Scrub-bird, Tjimiluk [654]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Botaurus poiciloptilus</a> Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Vulnerable	Roosting known to occur within area
<a href="#">Calyptorhynchus banksii naso</a> Forest Red-tailed Black-Cockatoo, Karrak [67034]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cereopsis novaehollandiae grisea</a> Cape Barren Goose (south-western), Recherche Cape Barren Goose [25978]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Chalcophaps indica natalis</a> Christmas Island Emerald Dove, Emerald Dove (Christmas Island) [67030]	Endangered	Species or species habitat known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Dasyornis longirostris</a> Western Bristlebird [515]	Endangered	Species or species habitat known to occur within area
<a href="#">Diomedea amsterdamensis</a> Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea dabbenena</a> Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
<a href="#">Erythrotriorchis radiatus</a> Red Goshawk [942]	Endangered	Species or species habitat may occur within area
<a href="#">Erythrura gouldiae</a> Gouldian Finch [413]	Endangered	Species or species habitat may occur within area
<a href="#">Falco hypoleucos</a> Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Fregata andrewsi</a> Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Leipoa ocellata</a> Malleefowl [934]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Limnodromus semipalmatus</a> Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Limosa lapponica menzbieri</a> Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Endangered	Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Malurus leucopterus edouardi</a> White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Malurus leucopterus leucopterus</a> White-winged Fairy-wren (Dirk Hartog Island), Dirk Hartog Black-and-White Fairy-wren [26004]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Ninox natalis</a> Christmas Island Hawk-Owl, Christmas Boobook [66671]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pachyptila turtur subantarctica</a> Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Papasula abbotti</a> Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Pezoporus occidentalis</a> Night Parrot [59350]	Endangered	Species or species habitat may occur within area
<a href="#">Phaethon lepturus fulvus</a> Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Breeding known to occur within area
<a href="#">Phaethon rubricauda westralis</a> Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]	Vulnerable	Roosting known to occur within area
<a href="#">Polytelis alexandrae</a> Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat may occur within area
<a href="#">Psophodes nigrogularis nigrogularis</a> Western Heath Whipbird [64449]	Endangered	Species or species habitat known to occur within area
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Rostratula australis</a> Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
<a href="#">Sternula nereis nereis</a> Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
<a href="#">Thalassarche carteri</a> Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Thalassarche cauta</a> Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
<a href="#">Turdus poliocephalus erythropleurus</a> Christmas Island Thrush [67122]	Endangered	Species or species habitat likely to occur within area
<a href="#">Turnix varius scintillans</a> Painted Button-quail (Houtman Abrolhos) [82451]	Endangered	Species or species habitat known to occur within area
<a href="#">Tyto novaehollandiae kimberli</a> Masked Owl (northern) [26048]	Vulnerable	Species or species habitat may occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area
<a href="#">Zanda baudinii listed as Calyptorhynchus baudinii</a> Baudin's Cockatoo, Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Breeding known to occur within area
<a href="#">Zanda latirostris listed as Calyptorhynchus latirostris</a> Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area

## CRUSTACEAN

Scientific Name	Threatened Category	Presence Text
<a href="#">Engaewa pseudoreducta</a> Margaret River Burrowing Crayfish [82674]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Kumonga exleyi</a> Cape Range Remipede [86875]	Vulnerable	Species or species habitat likely to occur within area
<b>FISH</b>		
<a href="#">Galaxias truttaceus (Western Australian population)</a> Western Trout Minnow [89857]	Endangered	Species or species habitat known to occur within area
<a href="#">Galaxiella nigrostriata</a> Blackstriped Dwarf Galaxias, Black-stripe Minnow [88677]	Endangered	Species or species habitat known to occur within area
<a href="#">Hoplostethus atlanticus</a> Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
<a href="#">Milyeringa veritas</a> Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Nannatherina balstoni</a> Balston's Pygmy Perch [66698]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Ophisternon candidum</a> Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Seriolella brama</a> Blue Warehou [69374]	Conservation Dependent	Species or species habitat likely to occur within area
<a href="#">Thunnus maccoyii</a> Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
<b>INSECT</b>		
<a href="#">Hesperocolletes douglasi</a> Douglas' Broad-headed Bee, Rottnest Bee [66734]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Trioza barrettae</a> Banksia brownii plant louse [87805]	Endangered	Species or species habitat known to occur within area
<b>MAMMAL</b>		
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Bettongia lesueur Barrow and Boodie Islands subspecies</a> Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Bettongia lesueur lesueur</a> Burrowing Bettong (Shark Bay), Boodie [66659]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Bettongia penicillata ogilbyi</a> Woylie [66844]	Endangered	Species or species habitat known to occur within area
<a href="#">Crocidura trichura</a> Christmas Island Shrew [86568]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Dasyurus geoffroi</a> Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dasyurus hallucatus</a> Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Breeding known to occur within area
<a href="#">Isoodon auratus barrowensis</a> Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Lagorchestes conspicillatus conspicillatus</a> Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Lagorchestes hirsutus bernieri</a> Rufous Hare-wallaby (Bernier Island) [66662]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Lagorchestes hirsutus Central Australian subspecies</a> Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
<a href="#">Lagorchestes hirsutus dorreeae</a> Rufous Hare-wallaby (Dorre Island) [66663]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Lagostrophus fasciatus fasciatus</a> Banded Hare-wallaby, Merrnine, Marnine, Munning [66664]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Macroderma gigas</a> Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Macrotis lagotis</a> Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Myrmecobius fasciatus</a> Numbat [294]	Endangered	Species or species habitat may occur within area
<a href="#">Neophoca cinerea</a> Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
<a href="#">Osphranter robustus isabellinus</a> Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Parantechinus apicalis</a> Dibbler [313]	Endangered	Species or species habitat known to occur within area
<a href="#">Perameles bougainville</a> Shark Bay Bandicoot [278]	Endangered	Species or species habitat known to occur within area
<a href="#">Petrogale lateralis lateralis</a> Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
<a href="#">Phascogale calura</a> Red-tailed Phascogale, Red-tailed Wambenger, Kenngoor [316]	Vulnerable	Species or species habitat may occur within area
<a href="#">Potorous gilbertii</a> Gilbert's Potoroo, Ngilkat [66642]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pseudocheirus occidentalis</a> Western Ringtail Possum, Ngwayir, Womp, Woder, Ngoor, Ngoolangit [25911]	Critically Endangered	Breeding known to occur within area
<a href="#">Pseudomys fieldi</a> Shark Bay Mouse, Djoongari, Alice Springs Mouse [113]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pseudomys shortridgei</a> Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat likely to occur within area
<a href="#">Pteropus natalis</a> Christmas Island Flying-fox, Christmas Island Fruit-bat [87611]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Rhinonicteris aurantia (Pilbara form)</a> Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Saccolaimus saccolaimus nudicluniatus</a> Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Setonix brachyurus</a> Quokka [229]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Trichosurus vulpecula arnhemensis</a> Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area
<b>OTHER</b>		
<a href="#">Westralunio carteri</a> Carter's Freshwater Mussel, Freshwater Mussel [86266]	Vulnerable	Species or species habitat known to occur within area
<b>PLANT</b>		
<a href="#">Andersonia gracilis</a> Slender Andersonia [14470]	Endangered	Species or species habitat likely to occur within area
<a href="#">Andersonia pinaster</a> Two Peoples Bay Andersonia [67444]	Vulnerable	Species or species habitat may occur within area
<a href="#">Androcalva bivillosa</a> Stragglng Androcalva [87807]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Anigozanthos bicolor subsp. minor</a> Little Kangaroo Paw, Two-coloured Kangaroo Paw, Small Two-colour Kangaroo Paw [21241]	Endangered	Species or species habitat known to occur within area
<a href="#">Asplenium listeri</a> Christmas Island Spleenwort [65865]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Banksia brownii</a> Brown's Banksia, Feather-leaved Banksia [8277]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Banksia mimica</a> Summer Honeypot [82765]	Endangered	Species or species habitat may occur within area
<a href="#">Banksia nivea subsp. uliginosa</a> Swamp Honeypot [82766]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Banksia squarrosa subsp. argillacea</a> Whicher Range Dryandra [82769]	Vulnerable	Species or species habitat may occur within area
<a href="#">Banksia verticillata</a> Granite Banksia, Albany Banksia, River Banksia [8333]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Beyeria lepidopetala</a> Small-petalled Beyeria, Short-petalled Beyeria [18362]	Endangered	Species or species habitat likely to occur within area
<a href="#">Caladenia barbarella</a> Small Dragon Orchid, Common Dragon Orchid [68686]	Endangered	Species or species habitat may occur within area
<a href="#">Caladenia bryceana subsp. cracens</a> Northern Dwarf Spider-orchid [64556]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Caladenia elegans</a> Elegant Spider-orchid [56775]	Endangered	Species or species habitat known to occur within area
<a href="#">Caladenia granitora</a> [65292]	Endangered	Species or species habitat known to occur within area
<a href="#">Caladenia hoffmanii</a> Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat likely to occur within area
<a href="#">Caladenia huegelii</a> King Spider-orchid, Grand Spider-orchid, Rusty Spider-orchid [7309]	Endangered	Species or species habitat likely to occur within area
<a href="#">Caladenia lodgeana</a> Lodge's Spider-orchid [68664]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Caleana dixonii listed as Paracaleana dixonii</a> Sandplain Duck Orchid [87944]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Calectasia cyanea</a> Blue Tinsel Lily [7669]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Chamelaucium sp. S coastal plain (R.D.Royce 4872)</a> Royce's Waxflower [87814]	Vulnerable	Species or species habitat may occur within area
<a href="#">Chordifex abortivus</a> Manypeaks Rush [64868]	Endangered	Species or species habitat likely to occur within area
<a href="#">Chorizema humile</a> Prostrate Flame Pea [32573]	Endangered	Species or species habitat may occur within area
<a href="#">Chorizema varium</a> Limestone Pea [16981]	Endangered	Species or species habitat known to occur within area
<a href="#">Conostylis micrantha</a> Small-flowered Conostylis [17635]	Endangered	Species or species habitat may occur within area
<a href="#">Diuris drummondii</a> Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Diuris micrantha</a> Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Diuris purdiei</a> Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat may occur within area
<a href="#">Drakaea concolor</a> Kneeling Hammer-orchid [56777]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Drakaea elastica</a> Glossy-leaved Hammer Orchid, Glossy-leaved Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Drakaea micrantha</a> Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Drummondita ericoides</a> Morseby Range Drummondita [9193]	Endangered	Species or species habitat likely to occur within area
<a href="#">Eucalyptus argutifolia</a> Yanchep Mallee, Wabling Hill Mallee [24263]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Eucalyptus beardiana</a> Beard's Mallee [18933]	Vulnerable	Species or species habitat may occur within area
<a href="#">Eucalyptus cuprea</a> Mallee Box [56773]	Endangered	Species or species habitat may occur within area
<a href="#">Gastrolobium papilio</a> Butterfly-leaved Gastrolobium [78415]	Endangered	Species or species habitat may occur within area
<a href="#">Hemiandra gardneri</a> Red Snakebush [7945]	Endangered	Species or species habitat likely to occur within area
<a href="#">Isopogon uncinatus</a> Albany Cone Bush, Hook-leaf Isopogon [20871]	Endangered	Species or species habitat likely to occur within area
<a href="#">Kennedia glabrata</a> Northcliffe Kennedia [16452]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Kennedia lateritia</a> Augusta Kennedia [45985]	Endangered	Species or species habitat likely to occur within area
<a href="#">Lambertia echinata subsp. occidentalis</a> Western Prickly Honeysuckle [64528]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Lambertia orbifolia</a> Roundleaf Honeysuckle [15725]	Endangered	Species or species habitat likely to occur within area

<a href="#">Thelymitra stellata</a> Star Sun-orchid [7060]	Endangered	Species or species habitat may occur within area
<a href="#">Wurmbea tubulosa</a> Long-flowered Nancy [12739]	Endangered	Species or species habitat may occur within area
<b>REPTILE</b>		
<a href="#">Aipysurus apraefrontalis</a> Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Aipysurus foliosquama</a> Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Breeding known to occur within area
<a href="#">Cryptoblepharus egeriae</a> Christmas Island Blue-tailed Skink, Blue- tailed Snake-eyed Skink [1526]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Ctenotus lancelini</a> Lancelin Island Skink [1482]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Ctenotus zasticus</a> Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cyrtodactylus sadleiri</a> Christmas Island Giant Gecko [86865]	Endangered	Species or species habitat known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Egernia stokesii badia</a> Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat likely to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Lepidodactylus listeri</a> Christmas Island Gecko, Lister's Gecko [1711]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Lerista neviniae</a> Nevin's Slider [85296]	Endangered	Species or species habitat known to occur within area
<a href="#">Liasis olivaceus barroni</a> Pilbara Olive Python [66699]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Liopholis pulchra longicauda</a> Jurien Bay Skink, Jurien Bay Rock-skink [83162]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
<a href="#">Ramphotyphlops exocoeti</a> Christmas Island Blind Snake, Christmas Island Pink Blind Snake [1262]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Tiliqua scincoides intermedia</a> Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Varanus mertensi</a> Mertens' Water Monitor, Mertens's Water Monitor [1568]	Endangered	Species or species habitat may occur within area
<a href="#">Varanus mitchelli</a> Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat may occur within area
<b>SHARK</b>		
<a href="#">Carcharias taurus (west coast population)</a> Grey Nurse Shark (west coast population) [68752]	Vulnerable	Congregation or aggregation known to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Centrophorus uyato</a> Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
<a href="#">Galeorhinus galeus</a> School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat likely to occur within area
<a href="#">Glyphis garricki</a> Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
<a href="#">Pristis clavata</a> Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
<a href="#">Pristis pristis</a> Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pristis zijsron</a> Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Sphyrna lewini</a> Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area
<b>SPIDER</b>		
<a href="#">Idiosoma nigrum</a> Shield-backed Trapdoor Spider, Black Rugose Trapdoor Spider [66798]	Vulnerable	Species or species habitat known to occur within area
<b>Listed Migratory Species</b> [ <a href="#">Resource Information</a> ]		
Scientific Name	Threatened Category	Presence Text
<b>Migratory Marine Birds</b>		
<a href="#">Anous stolidus</a> Common Noddy [825]		Breeding known to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Ardena carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
<a href="#">Ardena grisea</a> Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
<a href="#">Ardena pacifica</a> Wedge-tailed Shearwater [84292]		Breeding known to occur within area
<a href="#">Ardena tenuirostris</a> Short-tailed Shearwater [82652]		Breeding known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Diomedea amsterdamensis</a> Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea dabbenena</a> Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
<a href="#">Fregata andrewsi</a> Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
<a href="#">Hydroprogne caspia</a> Caspian Tern [808]		Breeding known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Onychoprion anaethetus</a> Bridled Tern [82845]		Breeding known to occur within area
<a href="#">Phaethon lepturus</a> White-tailed Tropicbird [1014]		Breeding known to occur within area
<a href="#">Phaethon rubricauda</a> Red-tailed Tropicbird [994]		Breeding known to occur within area
<a href="#">Phoebastria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Sterna dougallii</a> Roseate Tern [817]		Breeding known to occur within area
<a href="#">Sternula albifrons</a> Little Tern [82849]		Breeding known to occur within area
<a href="#">Sula dactylatra</a> Masked Booby [1021]		Breeding known to occur within area
<a href="#">Sula leucogaster</a> Brown Booby [1022]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Sula sula</a> Red-footed Booby [1023]		Breeding known to occur within area
<a href="#">Thalassarche carteri</a> Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Thalassarche cauta</a> Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
<b>Migratory Marine Species</b>		
<a href="#">Anoxypristis cuspidata</a> Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Carcharhinus longimanus</a> Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Breeding known to occur within area
<a href="#">Crocodylus porosus</a> Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Breeding known to occur within area

### Listed Marine Species [ [Resource Information](#) ]

Scientific Name	Threatened Category	Presence Text
<b>Bird</b>		
<a href="#">Acrocephalus orientalis</a> Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area overfly marine area
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Anous minutus</a> Black Noddy [824]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Anous stolidus</a> Common Noddy [825]		Breeding known to occur within area
<a href="#">Anous tenuirostris melanops</a> Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
<a href="#">Ardenna carneipes as Puffinus carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
<a href="#">Ardenna grisea as Puffinus griseus</a> Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
<a href="#">Ardenna pacifica as Puffinus pacificus</a> Wedge-tailed Shearwater [84292]		Breeding known to occur within area
<a href="#">Ardenna tenuirostris as Puffinus tenuirostris</a> Short-tailed Shearwater [82652]		Breeding known to occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
<a href="#">Bubulcus ibis as Ardea ibis</a> Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area overfly marine area
<a href="#">Calidris subminuta</a> Long-toed Stint [861]		Species or species habitat known to occur within area overfly marine area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Vulnerable	Roosting known to occur within area overfly marine area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Cecropis daurica as Hirundo daurica</a> Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
<a href="#">Cereopsis novaehollandiae grisea</a> Cape Barren Goose (south-western), Recherche Cape Barren Goose [25978]	Vulnerable	Species or species habitat known to occur within area overfly marine area
<a href="#">Chalcites osculans as Chrysococcyx osculans</a> Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius ruficapillus</a> Red-capped Plover [881]		Roosting known to occur within area overfly marine area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area overfly marine area
<a href="#">Chroicocephalus novaehollandiae as Larus novaehollandiae</a> Silver Gull [82326]		Breeding known to occur within area
<a href="#">Diomedea amsterdamensis</a> Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea dabbenena</a> Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Eudyptula minor</a> Little Penguin [1085]		Breeding known to occur within area
<a href="#">Fregata andrewsi</a> Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
<a href="#">Glareola maldivarum</a> Oriental Pratincole [840]		Species or species habitat known to occur within area overfly marine area
<a href="#">Haliaeetus leucogaster</a> White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Himantopus himantopus</a> Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
<a href="#">Hirundo rustica</a> Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
<a href="#">Hydroprogne caspia as Sterna caspia</a> Caspian Tern [808]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Larus pacificus</a> Pacific Gull [811]		Breeding known to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Species or species habitat known to occur within area overfly marine area
<a href="#">Limnodromus semipalmatus</a> Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]	Endangered	Roosting known to occur within area overfly marine area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Merops ornatus</a> Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
<a href="#">Motacilla cinerea</a> Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Species or species habitat known to occur within area overfly marine area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Onychoprion anaethetus as Sterna anaethetus</a> Bridled Tern [82845]		Breeding known to occur within area
<a href="#">Onychoprion fuscatus as Sterna fuscata</a> Sooty Tern [90682]		Breeding known to occur within area
<a href="#">Pachyptila turtur</a> Fairy Prion [1066]		Species or species habitat known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Breeding known to occur within area
<a href="#">Papasula abbotti</a> Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area
<a href="#">Pelagodroma marina</a> White-faced Storm-Petrel [1016]		Breeding known to occur within area
<a href="#">Phaethon lepturus</a> White-tailed Tropicbird [1014]		Breeding known to occur within area
<a href="#">Phaethon lepturus fulvus</a> Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Breeding known to occur within area
<a href="#">Phaethon rubricauda</a> Red-tailed Tropicbird [994]		Breeding known to occur within area
<a href="#">Phalacrocorax fuscescens</a> Black-faced Cormorant [59660]		Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Phalaropus lobatus</a> Red-necked Phalarope [838]		Roosting known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]	Vulnerable	Roosting known to occur within area overfly marine area
<a href="#">Pterodroma macroptera</a> Great-winged Petrel [1035]		Breeding known to occur within area
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Puffinus assimilis</a> Little Shearwater [59363]		Breeding known to occur within area
<a href="#">Puffinus huttoni</a> Hutton's Shearwater [1025]		Foraging, feeding or related behaviour known to occur within area
<a href="#">Recurvirostra novaehollandiae</a> Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
<a href="#">Rostratula australis as Rostratula benghalensis (sensu lato)</a> Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
<a href="#">Stercorarius antarcticus as Catharacta skua</a> Brown Skua [85039]		Species or species habitat may occur within area
<a href="#">Sterna dougallii</a> Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Sternula albifrons</a> as <a href="#">Sterna albifrons</a> Little Tern [82849]		Breeding known to occur within area
<a href="#">Sternula nereis</a> as <a href="#">Sterna nereis</a> Fairy Tern [82949]		Breeding known to occur within area
<a href="#">Stiltia isabella</a> Australian Pratincole [818]		Species or species habitat known to occur within area overfly marine area
<a href="#">Sula dactylatra</a> Masked Booby [1021]		Breeding known to occur within area
<a href="#">Sula leucogaster</a> Brown Booby [1022]		Breeding known to occur within area
<a href="#">Sula sula</a> Red-footed Booby [1023]		Breeding known to occur within area
<a href="#">Thalassarche carteri</a> Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Thalassarche cauta</a> Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalasseus bengalensis</a> as <a href="#">Sterna bengalensis</a> Lesser Crested Tern [66546]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Thalasseus bergii</a> as <a href="#">Sterna bergii</a> Greater Crested Tern [83000]		Breeding known to occur within area
<a href="#">Thinornis cucullatus</a> as <a href="#">Thinornis rubricollis</a> Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
<a href="#">Tringa brevipes</a> as <a href="#">Heteroscelus brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa glareola</a> Wood Sandpiper [829]		Species or species habitat known to occur within area overfly marine area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
<a href="#">Tringa totanus</a> Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area overfly marine area
<b>Fish</b>		
<a href="#">Acentronura australe</a> Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area
<a href="#">Acentronura larsonae</a> Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
<a href="#">Bhanotia fasciolata</a> Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Bulbonaricus brauni</a> Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
<a href="#">Campichthys galei</a> Gale's Pipefish [66191]		Species or species habitat may occur within area
<a href="#">Campichthys tricarinatus</a> Three-keel Pipefish [66192]		Species or species habitat may occur within area
<a href="#">Choeroichthys brachysoma</a> Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
<a href="#">Choeroichthys latispinosus</a> Muiron Island Pipefish [66196]		Species or species habitat may occur within area
<a href="#">Choeroichthys sculptus</a> Sculptured Pipefish [66197]		Species or species habitat may occur within area
<a href="#">Choeroichthys suillus</a> Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
<a href="#">Corythoichthys amplexus</a> Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
<a href="#">Corythoichthys flavofasciatus</a> Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
<a href="#">Corythoichthys haematopterus</a> Reef-top Pipefish [66201]		Species or species habitat may occur within area
<a href="#">Corythoichthys intestinalis</a> Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Corythoichthys schultzi</a> Schultz's Pipefish [66205]		Species or species habitat may occur within area
<a href="#">Cosmocampus banneri</a> Roughridge Pipefish [66206]		Species or species habitat may occur within area
<a href="#">Cosmocampus maxweberi</a> Maxweber's Pipefish [66209]		Species or species habitat may occur within area
<a href="#">Doryrhamphus baldwini</a> Redstripe Pipefish [66718]		Species or species habitat may occur within area
<a href="#">Doryrhamphus dactyliophorus</a> Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
<a href="#">Doryrhamphus excisus</a> Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
<a href="#">Doryrhamphus janssi</a> Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
<a href="#">Doryrhamphus multiannulatus</a> Many-banded Pipefish [66717]		Species or species habitat may occur within area
<a href="#">Doryrhamphus negrosensis</a> Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
<a href="#">Festucalex scalaris</a> Ladder Pipefish [66216]		Species or species habitat may occur within area
<a href="#">Filicampus tigris</a> Tiger Pipefish [66217]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Halicampus brocki</a> Brock's Pipefish [66219]		Species or species habitat may occur within area
<a href="#">Halicampus dunckeri</a> Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
<a href="#">Halicampus grayi</a> Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
<a href="#">Halicampus macrorhynchus</a> Whiskered Pipefish, Ornate Pipefish [66222]		Species or species habitat may occur within area
<a href="#">Halicampus mataafae</a> Samoan Pipefish [66223]		Species or species habitat may occur within area
<a href="#">Halicampus nitidus</a> Glittering Pipefish [66224]		Species or species habitat may occur within area
<a href="#">Halicampus spinirostris</a> Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
<a href="#">Haliichthys taeniophorus</a> Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
<a href="#">Heraldia nocturna</a> Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
<a href="#">Hippichthys cyanospilos</a> Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
<a href="#">Hippichthys heptagonus</a> Madura Pipefish, Reticulated Freshwater Pipefish [66229]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Hippichthys penicillus</a> Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
<a href="#">Hippichthys spicifer</a> Belly-barred Pipefish, Banded Freshwater Pipefish [66232]		Species or species habitat may occur within area
<a href="#">Hippocampus angustus</a> Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
<a href="#">Hippocampus breviceps</a> Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
<a href="#">Hippocampus histrix</a> Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
<a href="#">Hippocampus kuda</a> Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
<a href="#">Hippocampus planifrons</a> Flat-face Seahorse [66238]		Species or species habitat may occur within area
<a href="#">Hippocampus spinosissimus</a> Hedgehog Seahorse [66239]		Species or species habitat may occur within area
<a href="#">Hippocampus subelongatus</a> West Australian Seahorse [66722]		Species or species habitat may occur within area
<a href="#">Hippocampus trimaculatus</a> Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
<a href="#">Histiogamphelus cristatus</a> Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Leptoichthys fistularius</a> Brushtail Pipefish [66248]		Species or species habitat may occur within area
<a href="#">Lissocampus caudalis</a> Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
<a href="#">Lissocampus fatiloquus</a> Prophet's Pipefish [66250]		Species or species habitat may occur within area
<a href="#">Lissocampus runa</a> Javelin Pipefish [66251]		Species or species habitat may occur within area
<a href="#">Maroubra perserrata</a> Sawtooth Pipefish [66252]		Species or species habitat may occur within area
<a href="#">Micrognathus brevirostris</a> thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
<a href="#">Micrognathus micronotopterus</a> Tidepool Pipefish [66255]		Species or species habitat may occur within area
<a href="#">Mitotichthys meraculus</a> Western Crested Pipefish [66259]		Species or species habitat may occur within area
<a href="#">Nannocampus subosseus</a> Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
<a href="#">Notiocampus ruber</a> Red Pipefish [66265]		Species or species habitat may occur within area
<a href="#">Phoxocampus belcheri</a> Black Rock Pipefish [66719]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Phycodurus eques</a> Leafy Seadragon [66267]		Species or species habitat may occur within area
<a href="#">Phyllopteryx taeniolatus</a> Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
<a href="#">Pugnaso curtirostris</a> Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
<a href="#">Solegnathus hardwickii</a> Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
<a href="#">Solegnathus lettiensis</a> Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
<a href="#">Solenostomus cyanopterus</a> Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
<a href="#">Stigmatopora argus</a> Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
<a href="#">Stigmatopora nigra</a> Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
<a href="#">Syngnathoides biaculeatus</a> Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
<a href="#">Trachyrhamphus bicoarctatus</a> Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
<a href="#">Trachyrhamphus longirostris</a> Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Urocampus carinirostris</a> Hairy Pipefish [66282]		Species or species habitat may occur within area
<a href="#">Vanacampus margaritifer</a> Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
<a href="#">Vanacampus phillipi</a> Port Phillip Pipefish [66284]		Species or species habitat may occur within area
<a href="#">Vanacampus poecilolaemus</a> Longsnout Pipefish, Australian Longsnout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
<b>Mammal</b>		
<a href="#">Arctocephalus forsteri</a> Long-nosed Fur-seal, New Zealand Fur-seal [20]		Breeding known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Breeding known to occur within area
<a href="#">Neophoca cinerea</a> Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
<b>Reptile</b>		
<a href="#">Aipysurus apraefrontalis</a> Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Aipysurus duboisii</a> Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
<a href="#">Aipysurus foliosquama</a> Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Aipysurus fuscus</a> Dusky Sea Snake [1119]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Aipysurus laevis</a> Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
<a href="#">Aipysurus mosaicus as Aipysurus eydouxii</a> Mosaic Sea Snake [87261]		Species or species habitat may occur within area
<a href="#">Aipysurus pooleorum</a> Shark Bay Sea Snake [66061]		Species or species habitat may occur within area
<a href="#">Aipysurus tenuis</a> Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Breeding known to occur within area
<a href="#">Crocodylus johnstoni</a> Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
<a href="#">Crocodylus porosus</a> Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Emydocephalus annulatus</a> Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
<a href="#">Ephalophis greyae as Ephalophis greyi</a> Mangrove Sea Snake [93738]		Species or species habitat may occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Hydrelaps darwiniensis</a> Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
<a href="#">Hydrophis coggeri</a> Cogger's Sea Snake [25925]		Species or species habitat may occur within area
<a href="#">Hydrophis czeblukovi</a> Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
<a href="#">Hydrophis elegans</a> Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
<a href="#">Hydrophis hardwickii as Lapemis hardwickii</a> Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
<a href="#">Hydrophis kingii as Disteira kingii</a> Spectacled Sea Snake [93511]		Species or species habitat may occur within area
<a href="#">Hydrophis macdowelli as Hydrophis mcdowelli</a> MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
<a href="#">Hydrophis major as Disteira major</a> Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
<a href="#">Hydrophis ornatus</a> Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
<a href="#">Hydrophis peronii as Acalyptophis peronii</a> Horned Sea Snake [93509]		Species or species habitat may occur within area
<a href="#">Hydrophis platura as Pelamis platurus</a> Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<a href="#">Hydrophis stokesii</a> as <a href="#">Astrotia stokesii</a> Stokes' Sea Snake [93510]		Species or species habitat may occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

## Whales and Other Cetaceans [ [Resource Information](#) ]

Current Scientific Name	Status	Type of Presence
<b>Mammal</b>		
<a href="#">Balaenoptera acutorostrata</a> Minke Whale [33]		Species or species habitat may occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Berardius arnuxii</a> Arnoux's Beaked Whale [70]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Delphinus delphis</a> Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Breeding known to occur within area
<a href="#">Feresa attenuata</a> Pygmy Killer Whale [61]		Species or species habitat may occur within area
<a href="#">Globicephala macrorhynchus</a> Short-finned Pilot Whale [62]		Species or species habitat may occur within area
<a href="#">Globicephala melas</a> Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
<a href="#">Grampus griseus</a> Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
<a href="#">Hyperoodon planifrons</a> Southern Bottlenose Whale [71]		Species or species habitat may occur within area
<a href="#">Indopacetus pacificus</a> Longman's Beaked Whale [72]		Species or species habitat may occur within area
<a href="#">Kogia breviceps</a> Pygmy Sperm Whale [57]		Species or species habitat may occur within area
<a href="#">Kogia sima</a> Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
<a href="#">Lagenodelphis hosei</a> Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat likely to occur within area
<a href="#">Lissodelphis peronii</a> Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]		Breeding known to occur within area
<a href="#">Mesoplodon bowdoini</a> Andrew's Beaked Whale [73]		Species or species habitat may occur within area
<a href="#">Mesoplodon densirostris</a> Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
<a href="#">Mesoplodon ginkgodens</a> Ginkgo-toothed Beaked Whale, Ginkgo-toothed Whale, Ginkgo Beaked Whale [59564]		Species or species habitat may occur within area
<a href="#">Mesoplodon grayi</a> Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
<a href="#">Mesoplodon hectori</a> Hector's Beaked Whale [76]		Species or species habitat may occur within area
<a href="#">Mesoplodon layardii</a> Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
<a href="#">Mesoplodon mirus</a> True's Beaked Whale [54]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
<a href="#">Orcaella heinsohni</a> Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat may occur within area
<a href="#">Peponocephala electra</a> Melon-headed Whale [47]		Species or species habitat may occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
<a href="#">Pseudorca crassidens</a> False Killer Whale [48]		Species or species habitat likely to occur within area
<a href="#">Sousa sahalensis</a> Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
<a href="#">Stenella attenuata</a> Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
<a href="#">Stenella coeruleoalba</a> Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
<a href="#">Stenella longirostris</a> Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
<a href="#">Steno bredanensis</a> Rough-toothed Dolphin [30]		Species or species habitat may occur within area
<a href="#">Tasmacetus shepherdi</a> Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
<a href="#">Tursiops aduncus</a> Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
<a href="#">Tursiops aduncus (Arafura/Timor Sea populations)</a> Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
<a href="#">Tursiops truncatus s. str.</a> Bottlenose Dolphin [68417]		Species or species habitat may occur within area
<a href="#">Ziphius cavirostris</a> Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

## Key Ecological Features

[\[ Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
<a href="#">Albany Canyons group and adjacent shelf break</a>	South-west
<a href="#">Ancient coastline at 125 m depth contour</a>	North-west
<a href="#">Ancient coastline at 90-120m depth</a>	South-west
<a href="#">Ashmore Reef and Cartier Island and surrounding Commonwealth waters</a>	North-west
<a href="#">Canyons linking the Argo Abyssal Plain with the Scott Plateau</a>	North-west
<a href="#">Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula</a>	North-west
<a href="#">Cape Mentelle upwelling</a>	South-west
<a href="#">Commonwealth marine environment surrounding the Houtman Abrolhos Islands</a>	South-west
<a href="#">Commonwealth marine environment surrounding the Recherche Archipelago</a>	South-west

Name	Region
<a href="#">Commonwealth marine environment within and adjacent to Geographe Bay</a>	South-west
<a href="#">Commonwealth marine environment within and adjacent to the west coast inshore lagoons</a>	South-west
<a href="#">Commonwealth waters adjacent to Ningaloo Reef</a>	North-west
<a href="#">Continental Slope Demersal Fish Communities</a>	North-west
<a href="#">Diamantina Fracture Zone</a>	South-west
<a href="#">Exmouth Plateau</a>	North-west
<a href="#">Glomar Shoals</a>	North-west
<a href="#">Mermaid Reef and Commonwealth waters surrounding Rowley Shoals</a>	North-west
<a href="#">Naturaliste Plateau</a>	South-west
<a href="#">Perth Canyon and adjacent shelf break, and other west coast canyons</a>	South-west
<a href="#">Serिंगapatam Reef and Commonwealth waters in the Scott Reef Complex</a>	North-west
<a href="#">Wallaby Saddle</a>	North-west
<a href="#">Western demersal slope and associated fish communities</a>	South-west
<a href="#">Western rock lobster</a>	South-west

<a href="#">Physeter macrocephalus</a> Sperm Whale [59]	Foraging (abundant food source)	Known to occur

# Caveat

## 1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

## 2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

## 3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

## 4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

# Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

## **APPENDIX D: CULTURAL HERITAGE SEARCH RESULTS**

## List of Aboriginal Cultural Heritage (ACH) Register

---

### Search Criteria

436 Aboriginal Cultural Heritage (ACH) Register in Shapefile - PyreneesConsultationEMBA. Warning: Search area complex so results may be inaccurate. Contact DPLH for assistance.

### Disclaimer

Aboriginal heritage holds significant value to Aboriginal people for their social, spiritual, historical, scientific, or aesthetic importance within Aboriginal traditions, and provides an essential link for Aboriginal people to their past, present and future. In Western Australia Aboriginal heritage is protected under the *Aboriginal Heritage Act 1972*.

All Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported or exists on the Register.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you provide the details to the Department via <https://achknowledge.dplh.wa.gov.au/ach-enquiry-form> and we will make every effort to rectify it as soon as possible.

### South West Settlement ILUA Disclaimer

Your heritage enquiry is on land **within or adjacent to** the following Indigenous Land Use Agreement(s): Wagyl Kaip & Southern Noongar Indigenous Land Use Agreement, Gnaala Karla Booja Indigenous Land Use Agreement, South West Boojarah #2 Indigenous Land Use Agreement, Yued Indigenous Land Use Agreement, Whadjuk People Indigenous Land Use Agreement.

On 8 June 2015, six identical Indigenous Land Use Agreements (ILUAs) were executed across the South West by the Western Australian Government and, respectively, the Yued, Whadjuk People, Gnaala Karla Booja, Ballardong People, South West Boojarah #2 and Wagyl Kaip & Southern Noongar groups, and the South West Aboriginal Land and Sea Council (SWALSC).

The ILUAs bind the parties (including 'the State', which encompasses all State Government Departments and certain State Government agencies) to enter into a Noongar Standard Heritage Agreement (NSHA) when conducting Aboriginal Heritage Surveys in the ILUA areas, unless they have an existing heritage agreement. It is also intended that other State agencies and instrumentalities enter into the NSHA when conducting Aboriginal Heritage Surveys in the ILUA areas. It is recommended a NSHA is entered into, and an 'Activity Notice' issued under the NSHA, if there is a risk that an activity will 'impact' (i.e. by excavating, damaging, destroying or altering in any way) an Aboriginal heritage site. The Aboriginal Heritage Due Diligence Guidelines, which are referenced by the NSHA, provide guidance on how to assess the potential risk to Aboriginal heritage.

Likewise, from 8 June 2015 the Department of Energy, Mines, Industry Regulation and Safety (DEMIRS) in granting Mineral, Petroleum and related Access Authority tenures within the South West Settlement ILUA areas, will place a condition on these tenures requiring a heritage agreement or a NSHA before any rights can be exercised.

If you are a State Government Department, Agency or Instrumentality, or have a heritage condition placed on your mineral or petroleum title by DEMIRS, you should seek advice as to the requirement to use the NSHA for your proposed activity. The full ILUA documents, maps of the ILUA areas and the NSHA template can be found at <https://www.wa.gov.au/organisation/departments-of-the-premier-and-cabinet/south-west-native-title-settlement>.

Further advice can also be sought from the Department of Planning, Lands and Heritage via <https://achknowledge.dplh.wa.gov.au/ach-enquiry-form>.

WALIA does not warrant the accuracy or completeness of the location information data or its suitability for any particular purpose.

## List of Aboriginal Cultural Heritage (ACH) Register

---

### Terminology

**ID: ACH on the Register** is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

#### Access and Restrictions:

- **Boundary Reliable (Yes/No):** Indicates whether to the best knowledge of the Department, the location and extent of the ACH boundary is considered reliable.
- **Boundary Restricted = No:** Represents the actual location of the ACH as understood by the Department.
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km<sup>2</sup>) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Culturally Sensitive = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- **Culturally Sensitive = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact via <https://achknowledge.dplh.wa.gov.au/ach-enquiry-form>.
- **Culturally Sensitive Nature:**
  - **No Gender / Initiation Restrictions:** *Anyone* can view the information.
  - **Men only:** Only *males* can view restricted information.
  - **Women only:** Only *females* can view restricted information.

#### Status:

- **Register:** Aboriginal cultural heritage places that are assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972*.
- **Lodged:** Information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972*.
- **Historic:** Aboriginal heritage places assessed as not meeting the criteria of Section 5 of the *Aboriginal Heritage Act 1972*. Includes places that no longer exist as a result of land use activities with existing approvals.

**Place Type:** The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

**Legacy ID:** This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

#### Coordinates

Map coordinates are based on the GDA 94 Datum.

## Consultation Approach

For the Pyrenees Facility Operations Environment Plan (EP), Woodside has taken a broad and proactive tiered consultation approach over a period of up to nine months.

This approach was aimed at raising public awareness of the consultation opportunity and to enable self-identification. It included a social media campaign and advertising in national, state, regional and Indigenous newspapers.

The tiered consultation approach discharges regulation 25 of the Environment Regulations' requirements. The approach is proactive, extended, has enabled self-identification, and has raised broad awareness of Woodside's activities related to this EP.

Consultation for this EP was also combined with another operations EP.

### Tiered Consultation Approach

Regulation 25	Woodside's consultation approach assessed and identified relevant persons, enabled two-way dialogue and engagement, and included email and phone call follow up. The approach taken comfortably satisfies the requirements of regulation 25: to give relevant persons sufficient information and allow a reasonable period of time for consultation (see: Section 5).
Proactive	To raise awareness of the consultation process, and to enable grass-roots consultation, Woodside undertook advertised regional consultation roadshows and facilitated consultation at regional community events.
Extended	A reasonable consultation period was provided to enable an informed assessment of possible consequences on functions, interests or activities and associated supportive communication activities.
Self-Identification	Broad communication activities were undertaken to build awareness of consultation and enable self-identification, supported by targeted education materials.
Broad Understanding	Broad proactive communication activities were undertaken with the public to raise awareness of Woodside's activities.

### Building on the Existing Consultation Approach

For this EP, Woodside has built on its consultation methodology and undertaken additional consultation activities throughout the consultation period to ensure a reasonable period of time and sufficient information has been provided to relevant persons so that they can make an informed assessment of the possible consequences of the activity on their functions, interests or activities.

The approach for this included:

- a consultation period of up to nine months
- undertaking proactive consultation activities to provide sufficient information to relevant persons
- raising awareness of the consultation process and opportunity to provide feedback
- driving participation in the consultation process.

An overview of this approach is shown below:

## CONSULTATION TIMELINE

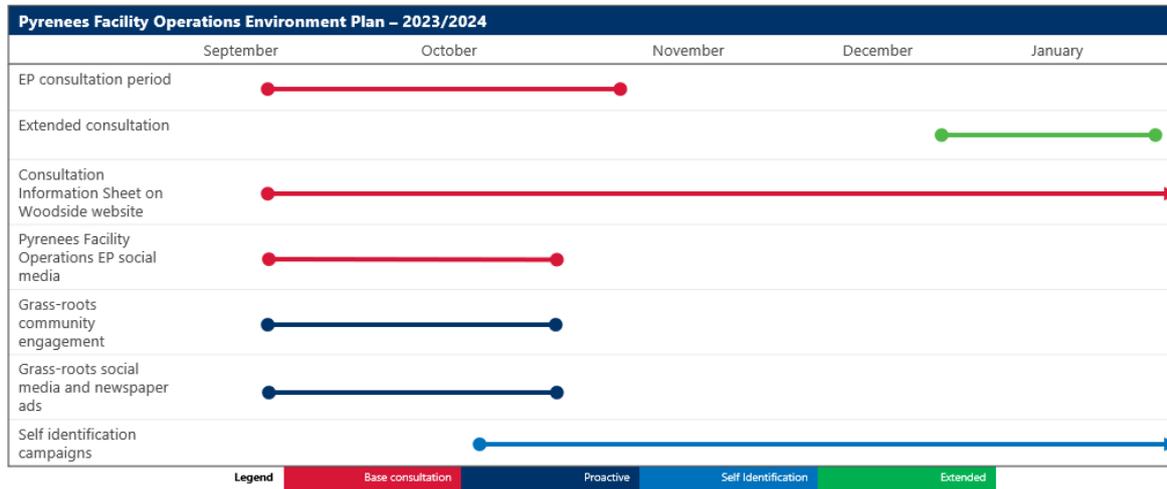

Figure 1: Pyrenees Facility Operations Consultation Activity

### Traditional Custodian Consultation Approach

Woodside has meaningful long-term relationships with relevant Traditional Custodians specifically tailored to provide for effective engagement which is continuous and is not confined to individual EPs, instead covering all EPs and other issues that are relevant at the time of engagement.

To this end, consultation on any particular EP, including this EP, happens before, during and after the designated consultation period in a more holistic manner allowing for an understanding of the bigger picture and accommodating cultural requirements.

For the past nine months, where requested, Woodside has been working with nominated representative bodies to develop Consultation Agreement Frameworks which aim to enable each group to be consulted in a manner appropriate to their needs.

### eNGO Consultation Approach

Woodside has an established history of consulting with environmental non-government organisations (eNGOs) as part of its EP consultation. In its methodology (Section 5.3.4, Table 5-2), eNGOs are considered “Other non-government groups or organisations” and “Research institutes and local conservation groups or organisations”. Relevant person identification for these categories is based on registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation.

So that eNGOs were given sufficient information and a reasonable period of time to consult, Woodside:

- advertised the consultation period (social and traditional media)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- directly consulted eNGOs
- participated in regional community events (which were advertised) in the Pilbara and Gascoyne, which could be attended by any eNGOs including local groups (if eNGOs attended these sessions, they did not identify themselves).

### **eNGO Response**

For this EP, Woodside identified six eNGOs as not relevant but which Woodside nevertheless chose to contact. None of the six eNGOs provided feedback on this EP.

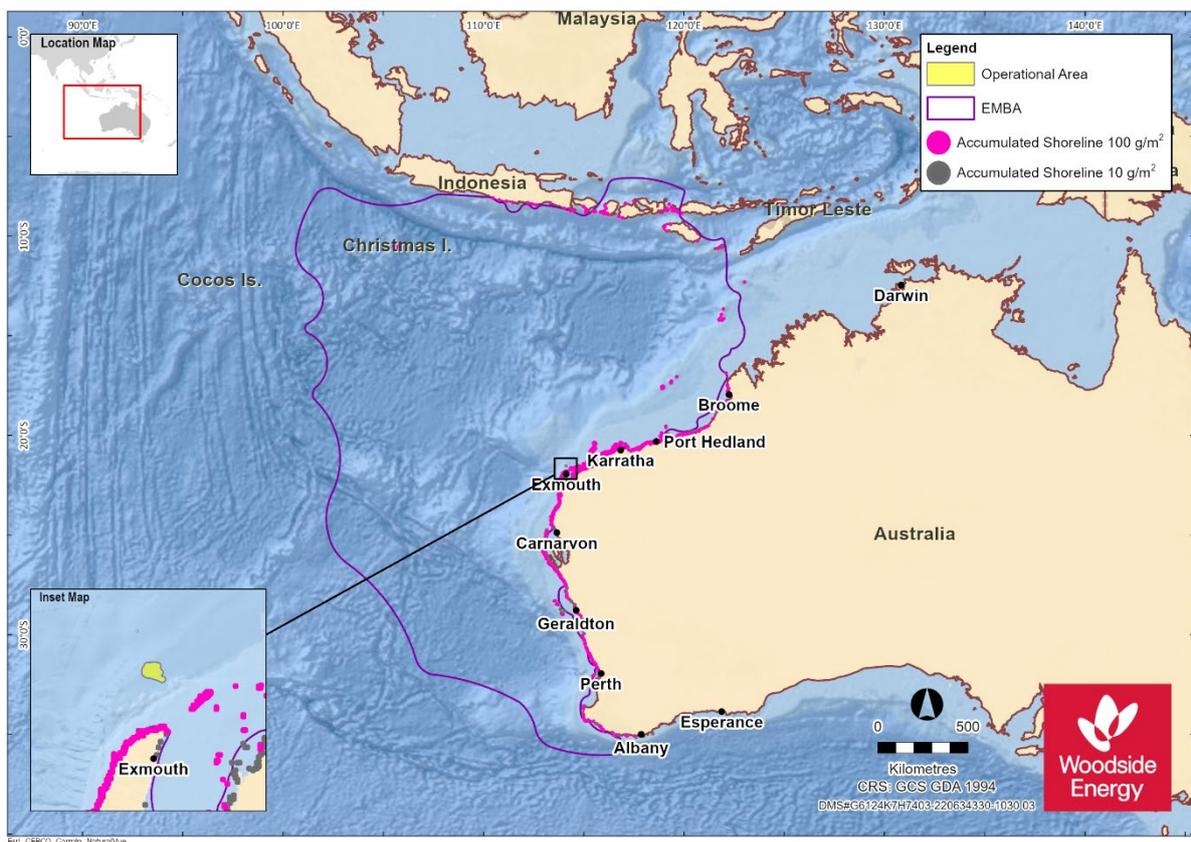

## Relevancy Assessment

### Assessment of Relevant Persons for the Proposed Activity

The result of Woodside’s assessment of relevant persons in accordance with regulation 25(1) of the Environment Regulations is outlined below at **Table 1** and **Table 2**.

Persons or organisations that Woodside assessed as not relevant but nonetheless chose to contact at its discretion in accordance with **Section 5.3.7** or self-identified and Woodside assessed as not relevant are summarised below at **Table 1** and **Table 3**.

Some stakeholders in **Table 1** and **Table 3** were provided with consultation information on this EP as consultation was combined with another operations EP. While these stakeholders were not assessed as relevant for this EP, they were given the opportunity to provide feedback on both EPs.

**Figure 2: Pyrenees Operational Area and EMBA for this EP.**

**Table 1: Assessment of Relevancy**

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
<b>Commonwealth and State Government Departments or Agencies – Marine</b>			
Australian Border Force (ABF)	Responsible for coordinating maritime security	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. ABF's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Department of Foreign Affairs and Trade (DFAT)	Responsible for promoting and protecting Australia's interests internationally and contributes to global stability and economic growth. DFAT manages Australia's relationships and interaction with the governments of our neighbouring countries.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. DFAT has no direct role in the management of the Commonwealth marine area, but has an interest in ensuring that consultation with foreign entities, both private and government, is effective and is aligned with Australia's interests. DFAT manages Australia's relationships and interaction with the governments of our neighbouring countries. The proposed activity has the potential to impact DFAT's functions, interests or activities as the EMBA overlaps Indonesian and Timor Leste waters.	Yes
Department of Infrastructure, Transport, Regional Development, Communications and the Arts (DITRDCA)	Responsible for managing fisheries within 12 nm of Christmas Island	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. The Christmas Island Line Fishery is active in the EMBA. DITRDCA's responsibilities may be relevant to the activity as the Christmas Island Line Fishery is active in the EMBA.	Yes
Australian Fisheries Management Authority (AFMA)	Responsible for managing Commonwealth fisheries	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. No Commonwealth fisheries are active in the Operational Area. The North West Slope Trawl Fishery, Western Deepwater Trawl Fishery,	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		<p>Western Tuna and Billfish Fishery and Christmas Island Line Fishery are active in the EMBA.</p> <p>AFMA's responsibilities may be relevant to the activity as the North West Slope Trawl Fishery, Western Deepwater Trawl Fishery, Western Tuna and Billfish Fishery and Christmas Island Line Fishery are active in the EMBA.</p>	
Australian Hydrographic Office (AHO)	Responsible for maritime safety and Notices to Mariners	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations.</p> <p>AHO's responsibilities may be relevant to the activity as there are proposed vessel activities.</p>	Yes
Australian Maritime Safety Authority (AMSA) – Marine Safety	Statutory agency for vessel safety and navigation	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations.</p> <p>AMSA – Marine Safety's responsibilities may be relevant to the activity as there are proposed vessel activities.</p>	Yes
Australian Maritime Safety Authority (AMSA) – Marine Pollution	Legislated responsibility for oil pollution response in Commonwealth waters	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations.</p> <p>AMSA – Marine Pollution's responsibilities may be relevant to the activity as the proposed activity has a hydrocarbon spill risk which may require AMSA response in Commonwealth waters.</p>	Yes
Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries	Responsible for implementing Commonwealth policies and programs to support agriculture, fishery, food and forestry industries	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations.</p> <p>No Commonwealth fisheries are active in the Operational Area. The North West Slope Trawl Fishery, Western Deepwater Trawl Fishery, Western Tuna and Billfish Fishery and Christmas Island Line Fishery are active in the EMBA.</p> <p>DAFF – Fisheries responsibilities may be relevant to the activity the North West Slope Trawl Fishery, Western Deepwater Trawl Fishery, Western Tuna and Billfish Fishery and Christmas Island Line Fishery are active in the EMBA.</p>	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Department of Defence (DoD)	Responsible for defending Australia and its national interests.	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations.</p> <p>DoD's responsibilities may be relevant to the activity as defence training areas lie within the EMBA.</p>	Yes
Department of Primary Industries and Regional Development (DPIRD)	Responsible for managing State fisheries	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations.</p> <p>The Mackerel Managed Fishery (Schedule 2 – Area 2), Pilbara Line Fishery (Condition), Pilbara Trap Managed Fishery and West Coast Deep Sea Crustacean Managed Fishery are active in the Operational Area.</p> <p>The Abalone Managed Fishery, Abrolhos Islands and Mid West Trawl Managed Fishery, Broome Prawn Managed Fishery, Cockburn Sound (Line and Pot) Managed Fishery, Exmouth Gulf Beach Seine and Mesh Net Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Hermit Crab Fishery, Joint Authority Southern Demersal Gillnet and Demersal Fishery, Kimberley Crab Managed Fishery, Kimberley Gillnet and Barramundi Managed Fishery, Mackerel Managed Fishery (Schedule 2 – Area 1, 2, 3; Schedule 3), Mandurah to Bunbury Developing Crab Fishery, Marine Aquarium Fish Managed Fishery, Nickol Bay Prawn Managed Fishery, Northern Demersal Scalefish Managed Fishery, Octopus Interim Managed Fishery, Onslow Prawn Managed Fishery, Open Access in the North Coast, Gascoyne Coast and West Coast Bioregions, Pearl Oyster Managed Fishery, Pilbara Crab Managed Fishery, Pilbara Fish Trawl (Interim) Managed Fishery, Pilbara Line Fishery (Condition), Pilbara Trap Managed Fishery, Shark Bay Crab Managed Fishery, Shark Bay Prawn Managed Fishery, Shark Bay Scallop Managed Fishery, South Coast Crustacean Managed Fishery, South Coast Estuarine Managed Fishery, South Coast Line and Fish Trap Managed Fishery, South Coast Nearshore Net Managed Fishery, South Coast Purse-Seine Managed Fishery, South Coast Salmon Managed Fishery, South West Coast Beach Net Fishery (Order), South West Coast Salmon Managed Fishery, South West Trawl Fishery, Specimen Shell Managed Fishery, West Australian Sea Cucumber Fishery, West Coast (Beach Bait Fish Net) Managed Fishery, West Coast Deep Sea Crustacean Managed</p>	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		<p>Fishery, West Coast Demersal Gillnet and Demersal Longline, West Coast Demersal Scalefish (Interim) Managed Fishery, West Coast Estuarine Managed Fishery, West Coast Purse Seine Fishery, West Coast Rock Lobster Managed Fishery have been active in the EMBA within the last 5 years.</p> <p>DPIRD's responsibilities may be relevant to the activity as the government department responsible for State fisheries.</p>	
Department of Transport (DoT)	Legislated responsibility for oil pollution response in State waters	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations.</p> <p>The proposed activity has a hydrocarbon spill risk, which may require DoT response in State waters.</p>	Yes
Department of Planning, Lands and Heritage (DPLH)	Responsible for state level land use planning and management, and oversight of Aboriginal cultural heritage and built heritage matters.	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations.</p> <p>There is known Maritime Cultural Heritage overlapping the EMBA.</p>	Yes
Western Australian Museum	Manages 200 shipwreck sites of the 1,500 known to be located off the Western Australian coast.	<p>Woodside has applied its methodology for 'Historical cultural heritage groups or organisations' under regulation 25(1)(b).</p> <p>There are known shipwrecks overlapping the EMBA which the Western Australian Museum may be responsible for.</p>	Yes
Pilbara Ports Authority	Responsible for the operation of the Port of Dampier and Port of Port Hedland.	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations.</p> <p>The proposed activity has the potential to impact Pilbara Ports Authority's responsibilities as the EMBA overlaps the Pilbara Ports Authority's area of responsibility.</p>	Yes
Southern Ports	Responsible for the operation of the Port of Albany and Port of Bunbury.	<p>Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations.</p> <p>The EMBA does not overlap Southern Ports' area of responsibility.</p> <p>Woodside contacted Southern Ports, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.</p>	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Kimberley Ports Authority	Responsible for the operation of the Port of Broome.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Kimberley Ports Authority's responsibilities as the EMBA overlaps Kimberley Ports Authority's area of responsibility.	Yes
Mid West Ports Authority	Responsible for the operation of the Port of Geraldton.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Mid West Ports Authority's responsibilities as the EMBA overlaps Mid West Ports Authority's area of responsibility.	Yes
Fremantle Port Authority	Responsible for the operation of Port of Fremantle.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Fremantle Port Authority's responsibilities as the EMBA overlaps Fremantle Port Authority's area of responsibility.	Yes
Port of Christmas Island	Responsible for the operation of the Port of Christmas Island.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Port of Christmas Island's responsibilities as the EMBA overlaps Port of Christmas Island's area of responsibility.	Yes
Port of Cocos (Keeling) Island	Responsible for the operation of the Port of Cocos (Keeling) Island.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The EMBA does not overlap Port of Cocos (Keeling) Island's area of responsibility. Woodside contacted Port of Cocos Islands, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
<p>Department of Agriculture, Fisheries and Forestry (DAFF) – Biosecurity (marine pests, vessels, aircraft and personnel)</p>	<p>DAFF administers, implements and enforces the Biosecurity Act 2015. The Department requests to be consulted where an activity has the potential to transfer marine pests.</p> <p>DAFF also has inspection and reporting requirements to ensure that all conveyances (vessels, installations and aircraft) arriving in Australian territory comply with international health regulations and that any biosecurity risk is managed.</p> <p>The Department requests to be consulted where an activity involves the movement of aircraft or vessels between Australia and offshore petroleum activities either inside or outside Australian territory.</p>	<p>Woodside has applied its methodology for ‘Government departments / agencies – environment’ under regulation 25(1)(a) of the Environment Regulations.</p> <p>DAFF – Biosecurity’s responsibilities may be relevant to the proposed activities in the EMBA in the prevention of introduced marine species.</p>	<p>Yes</p>
<p>Department of Climate Change, Energy, the Environment and Water (DCCEEW)</p>	<p>Responsible for implementing Commonwealth policies and programs to support climate change, sustainable energy use, water resources, the environment and our heritage.</p> <p>Administers the <i>Underwater Cultural Heritage Act 2018</i> in collaboration with the States, Northern Territory and Norfolk Island, which is responsible for the protection of shipwrecks, sunken aircraft and other types of underwater heritage and their associated artefacts in Commonwealth waters.</p>	<p>Woodside has applied its methodology for ‘Government departments / agencies – environment’ under regulation 25(1)(a) of the Environment Regulations.</p> <p>DCCEEW’s responsibilities may be relevant to the proposed activities in the EMBA as there are potential environmental impacts from the proposed activity.</p> <p>There is known Maritime Cultural Heritage overlapping the EMBA.</p>	<p>Yes</p>
<p>Director of National Parks (DNP)</p>	<p>Responsible for the management of Commonwealth parks and conservation zones.</p>	<p>Woodside has applied its methodology for ‘Government departments / agencies – environment’ under regulation 25(1)(a) of the Environment Regulations.</p> <p>DNP’s responsibilities may be relevant to the activity as DNP requires an awareness of activities that occur within AMPs, and an understanding of potential impacts and risks to the values of parks (NOPSEMA guidance note: N-04750-GN1785 A620236, June 2020). Titleholders are required to consult DNP on offshore petroleum and greenhouse gas exploration activities if they occur in, or may impact</p>	<p>Yes</p>

		on the values of marine parks, including where potential spill response activities may occur in the event of a spill (i.e. scientific monitoring).	
Ningaloo Coast World Heritage Advisory Committee (NCWHAC)	Supports the DBCA to manage the Ningaloo Coast World Heritage Area.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. The NCWHAC's responsibilities may be relevant to the activity as the EMBA overlaps the Ningaloo Marine Park.	Yes
Department of Biodiversity, Conservation and Attractions (DBCA)	Responsible for managing WA's parks, forests and reserves to achieve wildlife conservation and provide sustainable recreation and tourism opportunities.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. The DBCA's responsibilities may be relevant to the activity as EMBA overlaps WA parks, forests or reserves. Activities have the potential to impact marine tourism in the EMBA.	Yes
Northern Territory Department of Industry, Tourism and Trade (DITT) (Aquatic Biosecurity)	Monitors and manages the risk of new marine pests arriving in the Northern Territory.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. DITT (Aquatic Biosecurity)'s responsibilities do not overlap the EMBA. Woodside contacted DITT (Aquatic Biosecurity), in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No
Department of Industry, Tourism and Trade (DITT) - NT Fisheries	Responsible for managing State fisheries in the Northern Territory	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The EMBA does not extend into NT Fisheries' area of responsibility. Woodside contacted NT Fisheries, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No
Northern Territory Department of Environment, Parks and Water Security (DEPWS)	Responsible for managing the Northern Territory's policies to protect the environment and natural resources.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. The EMBA does not overlap NT parks, forests or reserves. Woodside contacted DEPWS, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Northern Territory Environment Protection Agency (NTEPA)	Responsible for promoting the ecologically sustainable development of the Northern Territory	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. The hydrocarbon spill risk associated with the proposed activity does not extend into NT state waters. Woodside contacted NTEPA, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No
Northern Territory Department of Infrastructure, Planning and Logistics (DIPL) (Marine Safety)	Responsible for marine safety in Northern Territory waters.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. DIPL (Marine Safety)'s responsibilities do not overlap the EMBA. Woodside contacted DIPL (Marine Safety), in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No
<b>Commonwealth and State Government Departments or Agencies – Industry</b>			
Department of Industry, Science and Resources (DISR)	Department of relevant Commonwealth Minister.	Required to be consulted under regulation 25(1)(a) of the Environment Regulations.	Yes
Department of Energy, Mines, Industry Regulation and Safety (DEMIRS)	Department of relevant State Minister	Required to be consulted under regulation 25(1)(c) of the Environment Regulations.	Yes
Northern Territory Department of Industry, Tourism and Trade (DITT) (Energy and Mining)	Department of relevant State Minister	Required to be consulted under regulation 25(1)(c) of the Environment Regulations where the Northern Territory is relevant. The EMBA does not overlap Northern Territory waters. Woodside contacted DITT (Energy and Mining), in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No
<b>Commonwealth Commercial fisheries and representative bodies</b>

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
North West Slope and Trawl Fishery	Commonwealth commercial fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.</p> <p>Although the fishery overlaps the Operational Area, the fishery has not been active in the Operational Area within the last 5 years. The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.</p>	Yes
Southern Bluefin Tuna Fishery	Commonwealth commercial fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.</p> <p>Woodside does not consider that the proposed activity will present a risk to licence holders, given since 1992, the majority of Australian catch has concentrated in south-eastern Australia. (Patterson et al., 2022). In addition, given fishing methods by licence holders for species fished in this fishery (Australia has a 35% share of total global allowable catch of Southern Bluefin Tuna, which is value-added through tuna ranching near Port Lincoln (South Australia), or fishing effort in New South Wales (Australian Southern Bluefin Tuna Industry Association).</p>	No
Western Deepwater Trawl Fishery	Commonwealth commercial fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.</p> <p>The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.</p>	Yes
Western Skipjack Fishery	Commonwealth commercial fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.</p> <p>Woodside does not consider that the activity will present a risk to licence holders, given the fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (Patterson et al., 2022). In addition, interactions are not expected given the species' pelagic distribution fishing methods for species fished by licence holders.</p>	No

[Individual 1]	State Member for North West Central	<p>Woodside has applied its methodology for 'Local government and elected Parliamentary representatives, community groups or organisations' under regulation 25(1)(d) of the Environment Regulations.</p> <p>The Shire of Shark Bay identified [Individual 1] as a potentially relevant person.</p> <p>Woodside chose to contact [Individual 1] at its discretion in line with Section 5.3.7.</p>	No
Malay Association of Christmas Island (MACI)	Incorporated association responsible for promoting Malay culture and heritage on Christmas Island and advocating on issues relating to the island in general.	<p>Woodside has applied its methodology for 'Local government and elected Parliamentary representatives, community groups or organisations' under regulation 25(1)(d) of the Environment Regulations.</p> <p>The MACI is an incorporated association whose objects are to maintain and promote Malay culture and heritage on Christmas Island as well to advocate on issues relating to the opportunity and prosperity for Malay residents and the island in general.</p> <p>Woodside contacted MACI at its discretion in line with Section 5.3.7</p>	No
<b>Other non-government groups or organisations</b>			
350 Australia (350A)	Non-government organisation	<p>Woodside has applied its methodology for 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations to determine 350A's relevance for the proposed activity.</p> <p>Woodside has assessed that 350A's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2).</p>	No

		Woodside chose to contact 350A at its discretion in line with Section 5.3.7.	
Greenpeace Australia Pacific (GAP)	Non-government organisation	Woodside has applied its methodology for 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations. Woodside has assessed that GAP's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2). Woodside chose to contact GAP at its discretion in line with Section 5.3.7.	No
Australian Conservation Foundation (ACF)	Non-government organisation	Woodside has applied its methodology for 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations. Woodside has assessed that ACF's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2). Woodside chose to contact ACF at its discretion in line with Section 5.3.7.	No
Australian Marine Conservation Society (AMCS)	Non-government organisation	Woodside has applied its methodology for 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations. Woodside has assessed that AMCS's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2). Woodside chose to contact AMCS at its discretion in line with Section 5.3.7.	No
Conservation Council of Western Australia (CCWA)	Non-government organisation	Woodside has applied its methodology for 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations. Woodside has assessed that CCWA's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2).	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		Woodside chose to contact CCWA at its discretion in line with Section 5.3.7.	
Sea Shepherd Australia (SSA)	Non-government organisation	Woodside has applied its methodology for 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations. Woodside has assessed that SSA's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2). Woodside chose to contact SSA at its discretion in line with Section 5.3.7.	No
<b>Research institutes and local conservation groups or organisations</b>			
Cape Conservation Group (CCG)	Local conservation group focused on protecting the terrestrial and marine environment of the North West Cape	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 25(1)(d) of the Environment Regulations. CCG's conservation activities have the potential to intersect with the EMBA as the EMBA overlaps North West Cape.	Yes
Protect Ningaloo	Local conservation group focused on protecting the Exmouth Gulf and Ningaloo Reef and Cape Range	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 25(1)(d) of the Environment Regulations. Protect Ningaloo's conservation activities have the potential to intersect with the EMBA as the EMBA overlaps North West Cape and Ningaloo Reef.	Yes
University of Western Australia (UWA)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 25(1)(d) of the Environment Regulations. There is no known research being undertaken by the UWA that intersects within the EMBA. Woodside chose to contact UWA at its discretion in line with Section 5.3.7.	No

Western Australia Marine Science Institution (WAMSI)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 25(1)(d) of the Environment Regulations. There is no known research being undertaken by WAMSI that intersects within the EMBA. Woodside chose to contact WAMSI at its discretion in line with Section 5.3.7.	No
Australian Institute of Marine Science (AIMS)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 25(1)(d) of the Environment Regulations. There is no known research being undertaken by AIMS that intersects within the EMBA. Woodside chose to contact AIMS at its discretion in line with Section 5.3.7.	No
Commonwealth Scientific and Industrial Research Organisation (CSIRO)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 25(1)(d) of the Environment Regulations. There is no known research being undertaken by the CSIRO that intersects within the EMBA. Woodside chose to contact CSIRO at its discretion in line with Section 5.3.7.	No
<b>Other</b>			
Save Our Songlines and/ or [Individual 2] and/ or [Individual 3]	Non-government organisation	Woodside has applied its methodology for 'Traditional Custodians and nominated representative corporations' and 'Other non-government groups or organisations' under regulation 25(1)(d) to determine Save Our Songlines' (SOS) and/ or [Individual 2] and/ or [Individual 3] relevance for the proposed activity. Save Our Songlines' and/ or [Individual 2] and/ or [Individual 3] stated interest is to stop or pause Scarborough gas and to stop new industry on the Burrup; and oppose planned expansion of the Burrup Hub industry by Woodside, Perdaman and Yara. In addition, their stated interests also include the protection of Murujuga rock art. This scope of the activity under this EP does not fall within their stated interests (see Section 6.6 in the EP).	No

## Consultation Activities

### Pyrenees Facility Operations EP Consultation Activities

Woodside has been conducting extensive consultation with relevant persons and other parties for this EP since September 2023 when consultation commenced with interested and affected stakeholders as part of a planned, integrated and consistent approach to stakeholder engagement for Woodside's proposed opportunities. A broad consultation process has been undertaken with relevant persons for the Pyrenees Facility Operations EP. Consultation aims to be inclusive, transparent, voluntary, respectful and two-way. Consultation was undertaken by email, letter, phone call and/or meeting.

- Woodside advertised the planned activities proposed for this EP in national, state and relevant local newspapers (see Record of Consultation, reference 3.1). Regional newspapers do not require subscription and are available (and in some cases delivered) directly to households. All communities within or adjacent to the EMBA had access to this information via this media. No direct comments or feedback were received from the advertisements.

Koori Mail	Indigenous	20 September 2023
National Indigenous Times	Indigenous	26 September 2023

- A Consultation Information Sheet was provided to relevant persons and persons Woodside chose to contact (see Section 5.3.7), which included details such as an activity overview, maps, a summary of key risks and/or impacts and management measures (Record of Consultation, reference 1.1).
- Since the commencement of the initial consultation period (September 2023), the stakeholder Consultation Information Sheet (Record of Consultation, reference 1.1) has been available on Woodside's website. The Woodside Consultation Information Sheets include a toll-free 1800 phone number and Woodside's feedback email address ([feedback@woodside.com.au](mailto:feedback@woodside.com.au)).
- Additional targeted information was provided to relevant marine users including AHO and AMSA – Marine Safety (Record of Consultation, reference 1.14). This information included maps and additional information relevant to the specific category of persons. The relevant persons had a 42-day period in which to provide feedback.
- Where appropriate, Woodside conducted phone calls and meetings with relevant persons.
- Where appropriate, targeted follow-up emails were sent to relevant persons who had not provided a response prior to the close of the target feedback period.
- Woodside considered relevant person responses and assessed the merits and relevance of objections and claims about the potential adverse impact of the proposed activity set out in the EP, in accordance with the intended outcome of consultation (see Section 5.2).
- Consultation activities undertaken with relevant persons are summarised at Appendix F, Table 2.
- Engagement undertaken with persons or organisations Woodside assessed as not relevant but chose to contact (see Section 5.3.7) or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 3.

### Social media

- From 13 September 2023, Woodside commenced a sponsored social media campaign (Record of Consultation, reference 3.2) geotargeting local government authorities in Perth metropolitan area, regional areas in the north of WA and regional areas in the south of WA, which are within or coastally adjacent to the EMBA for the proposed activities. The campaign had a reach of more than 1.3 million and brought the proposed activity to the attention of persons who may be interested, and advised persons or organisations on how they can find out more about Woodside's proposed activities by visiting Woodside's website.

Platform	Geotargeted Reach	Post Dates	Impact
Facebook and Instagram	<b>Perth Metro:</b> Users 18+ within 80km	13 September 2023 – 11 October 2023	<b>Reach:</b> 1,146,919. <b>Frequency:</b> 4.42 <b>Impressions:</b> 5,071,662 <b>Clicks:</b> 4780 <b>Click Through Rates%:</b> 0.09
Facebook and Instagram	<b>Regional – North:</b> Users 18+ located within 80km of key coastline towns plus Christmas and Cocos (Keeling) Islands	13 September 2023 – 11 October 2023	<b>Reach:</b> 295,721 <b>Frequency:</b> 3.19 <b>Impressions:</b> 942,344 <b>Clicks:</b> 1153 <b>Click Through Rates%:</b> 0.12
Facebook and Instagram	<b>Regional – South:</b> Users 18+ located within 80km of key coastline towns.	13 September 2023 – 11 October 2023	<b>Reach:</b> 226,182 <b>Frequency:</b> 4.46 <b>Impressions:</b> 1,007,884 <b>Clicks:</b> 1134 <b>Click Through Rates%:</b> 0.11

### Community information sessions

- Woodside has held a number of Community Information Sessions where this EP's Consultation Information Sheets were available and discussed. See tables in Record of Consultation, References 3.3.1, 3.3.2, 3.3.3, 3.3.4, 3.4.1 and 3.4.2.

Date (2023)	Location	Event (if applicable)
18, 19 and 20 September 2023	Karratha, Port Hedland and Roebourne	Community Consultation Roadshow
10 and 11 October 2023	Karratha	Pilbara Summit 2023
16 and 17 October 2023	Carnarvon and Denham	Community Consultation Roadshow
23 October 2023	Exmouth	Community Consultation Roadshow
4 November 2023	Dampier	Dampier Beachside Twilight Markets
19 May 2024	Exmouth	Exmouth Community Markets

## Traditional Custodian Specific Consultation

In addition to the approaches above including community information sessions, additional activities were undertaken with relevant Traditional Custodians, which were specifically designed to provide for effective engagement with Traditional Custodians and so that information was provided in a form that was readily accessible and appropriate (Section 5.5). Consultation undertaken specifically with Traditional Custodians for this Environment Plan includes:

- Direct engagement with nominated representative bodies via the contact listed on the ORIC website, requesting advice on how they would like to be engaged and asking whether other members and/or individuals should be consulted. This has resulted in:
  - Meetings with directors, elders and any nominated representatives, on country or in Perth
  - Requests and offers of resourcing to enable and support consultation
  - Exchange of written feedback and correspondence
  - A Summary Consultation Information Sheet, developed and reviewed by Indigenous representatives in collaboration with technical experts to ensure content is appropriate for the intended recipients, was provided to relevant Traditional Custodian groups (Record of Consultation, reference 1.2) and phone calls to provide context to the consultation were made.
- Ongoing efforts were made to engage and develop relationships with these bodies via a variety of means such as email, phone calls, alternative contacts, texts, social media and in some cases physical visits.
- Consultation meetings with attendees decided by Traditional Custodian groups, supported by senior Woodside representatives, subject matter experts, First Nations Relations advisers with skills and experience in community engagement. Meetings are developed through a two-way consultation process to ensure effective information sharing via:
  - Mutually agreed agenda avoiding time pressure
  - Encouraging Traditional Custodian attendees to control the pace of the meeting and pause at any time to ask questions, seek clarification or provide feedback
  - Visual aids such as posters, presentations, simplified technical videos and real-world pictures and footage
  - Emphasis on potential planned and unplanned risks and impacts of the activity.
  - Ample opportunity for questions and feedback
  - Discussion about ongoing relationship development and opportunities
  - Distribution of hard-copy Consultation Information Sheets (Record of Consultation, reference 1.1) and Summary Information Sheets (Record of Consultation, reference 1.2)
  - Meeting all costs such as sitting fees, travel, legal support and executive support and other support required
- Advertising in Indigenous publications such as the Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) (Record of Consultation, reference 3.1.20 and 3.1.21).
- Woodside has a geotargeted sponsored social media campaign (Record of Consultation, reference 3.2) to various communities that are coastally adjacent to the EMBA for the proposed activities.
  - The wide-reaching campaign brought the proposed activity to the attention of persons who may be interested and advised persons or organisations how they can find out about Woodside's proposed activities by visiting Woodside's website, which details the intent of consultation with relevant persons under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth). The campaign

reached around 1,369,350 people and was viewed more than 7 million times across various regions as shown in Record of Consultation, reference 3.2.

- These social media posts were developed with input from Indigenous representatives. Social media is a highly effective means to engage Indigenous audiences as outlined in Indigenous Digital Life (Professor Carlson, 2021). Advertisements used language and information appropriate to Indigenous audiences. Feedback from community engagements indicates a high level of penetration for this technique.

Woodside has employed a diverse range of techniques to allow relevant persons to become aware of the proposed activity and how it may affect their functions, activities or interests, and to understand their ability to provide feedback. The combination of PBC engagement meetings, traditional print media, social media and face-to face community interaction was designed with input from Indigenous representatives and adapted to the audience, so that it provides a wide-ranging opportunity to consult.

## Table 2: Consultation Report with Relevant Persons or Organisations

The black numbering in the **Summary of information provided and record of consultation for this EP** section in Table 2 denotes an item raised by a relevant person. The green numbering denotes Woodside’s response to that item.

Commonwealth and State Government Departments or Agencies – Marine		
Australian Border Force (ABF)		
<p><b>Summary of information provided and record of consultation for this EP:</b></p> <ul style="list-style-type: none"> <li>On 13 September 2023, Woodside emailed ABF advising of the proposed activity (Record of Consultation, reference 1.3) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>On 16 October 2023, Woodside sent a reminder email to ABF following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.</li> </ul>		
Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has addressed maritime security-related issues in Section 6 of the EP based on previous offshore activities. No additional measures or controls are required.
Outcomes of consultation		
<p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with ABF for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:</p> <ul style="list-style-type: none"> <li>Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.</li> <li>Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.</li> </ul>

Woodside will follow up its AMSA notification by way of an online report via AMSA's website.</li> <li>• Other relevant government departments as soon as practicable. These notifications include DFAT via <a href="mailto:sea.law@dfat.gov.au">sea.law@dfat.gov.au</a> and <a href="mailto:globalwatchoffice@dfat.gov.au">globalwatchoffice@dfat.gov.au</a>.</li> </ul> <p>No additional measures or controls are required.</p>
<p><b>Outcomes of consultation</b></p>		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DFAT for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DFAT on 13 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided DFAT with the opportunity to provide feedback over a 10-month period.

**Department of Infrastructure, Transport, Regional Development, Communications and the Arts (DITRDCA)**

**Summary of information provided and record of consultation for this EP:**

- On 15 December 2023, Woodside emailed DITRDCA advising of the proposed activity (Record of Consultation, reference 1.101) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 9 January 2024, Woodside sent a reminder email to DITRDCA following up on the proposed activity (Record of Consultation, reference 2.19) and included a link to the Consultation Information Sheet on Woodside’s website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.

**Outcomes of consultation**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DITRDCA for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DITRDCA on 15 December 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email seeking feedback on the proposed activity.
- Woodside has provided the DITRDCA with the opportunity to provide feedback over a 6-month period.

**Australian Fisheries Management Authority (AFMA)**

**Summary of information provided and record of consultation for this EP:**

- On 20 September 2023, Woodside emailed AFMA advising of the proposed activity (Record of Consultation, reference 1.34) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 10 October 2023, AFMA sent an email (SI Report, reference 1.1) to thank Woodside for the advice and:
  - (1) Advised it had no specific comments on the proposal.
  - (2) Encouraged Woodside, if it had not already done so, to engage directly with Commonwealth fishing operators in the area and included contact details for relevant industry associations.
- On 27 October 2023, Woodside responded thanking AFMA for its email (SI Report, reference 1.2). Woodside:
  - (1) Noted AFMA had no specific comments on the proposal.
  - (2) Confirmed it had provided information to relevant fishery licence holders as well as the representative organisations and fishing industry associations recommended by AFMA.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
(1)	(1)	(1) Not required.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>AFMA advised it had no specific comments on the proposal.</p>	<p><b>Woodside assessment:</b> Woodside accepts that AFMA has no comments on the proposed activities. <b>Woodside response:</b> Woodside noted AFMA had no comments on the proposal.</p>	
<p><b>(2)</b> AFMA encouraged Woodside to consult directly with fishing operators who have entitlements to fish within the proposed area.</p>	<p><b>(2)</b> <b>Woodside assessment:</b> Woodside has consulted relevant individual Commonwealth fishing operators as well as representative bodies of fisheries with entitlement to fish within the proposed area. <b>Woodside response:</b> Woodside advised it had consulted relevant individual Commonwealth fishing operators in the area, as well as representative bodies and fishing industry associations recommended by AFMA.</p>	<p><b>(2)</b> Woodside has assessed the potential for interaction with Commonwealth managed fisheries in Section 4.10.1 of the EP.</p>
<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside has consulted AFMA, DAFF - Fisheries, CFA, Tuna Australia, ASBTIA, Northern Prawn Fishery Industry Pty and individual relevant licence holders. Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should further feedback be received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional controls or measures are required.</p>

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with AFMA for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River

Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.

- Consultation Information provided to AFMA on 20 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has addressed and responded to AFMA over a 10-month period.

**Australian Hydrographic Office (AHO)**

**Summary of information provided and record of consultation for this EP:**

- On 15 September 2023, Woodside emailed AHO advising of the proposed activity (Record of Consultation, reference 1.13) and provided a Consultation Information Sheet, shipping lanes map (Record of Consultation, reference 1.14) and a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to AHO (Record of Consultation, reference 2.1) following up on the proposed activity and provided the shipping lanes map and a link to the Consultation Information Sheet on Woodside's website.
- **(1)** On 17 October 2023, AHO provided its standard response, acknowledging receipt of Woodside's email (SI Report, reference 2.1) and noted the data would be registered, assessed, prioritised and validated in preparation for updating navigational charting products. **(1)** Woodside noted AHO's standard response regarding how it would use the information provided.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
<p><b>(1)</b> AHO acknowledged receipt of consultation emails.</p>	<p><b>(1)</b> <b>Woodside assessment:</b> Woodside noted the AHO's acknowledgement of its consultation information. <b>Woodside response:</b> Woodside noted AHO would use Woodside's data to update navigational charting products but had no specific feedback on the EP.</p>	<p><b>(1)</b> Not required.</p>
<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional measures or controls are required.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

### Outcomes of Consultation

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with AHO for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to AHO on 15 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has provided AHO with the opportunity to provide feedback over a 10-month period.

### Australian Maritime Safety Authority (AMSA) – Marine Safety

#### Summary of information provided and record of consultation for this EP:

- On 15 September 2023, Woodside emailed AMSA – Marine Safety advising of the proposed activity (Record of Consultation, reference 1.13) and provided a Consultation Information Sheet, GIS shape file, shipping lanes map (Record of Consultation, reference 1.14) and a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 25 September 2023, AMSA – Marine Safety thanked Woodside for its email (SI Report, reference 3.1) and:
  - (1) Advised that as the infrastructure was already in place, previous advice provided by AMSA remained.
  - (2) Reminded Woodside that vessels should exhibit appropriate lights and shapes to reflect the nature of operation.
  - (3) Confirmed Woodside should evaluate and implement adequate anti-collision measures.
- On 10 October 2023, Woodside thanked AMSA – Marine Safety for its feedback (SI Report, reference 3.2). Woodside also:
  - (1) Noted that previous advice from AMSA regarding these operations remained.
  - (2) Confirmed vessels would exhibit appropriate lights and shapes to reflect the nature of operations and the obligation to comply with the International Rules for Preventing Collisions at Sea.
  - (3) Advised that while Woodside did not propose to implement further anti-collision measures for this activity at this time, collision risk mitigation measures were constantly being evaluated.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p><b>(1)</b> Previous advice from AMSA regarding the operations remained.</p>	<p><b>(1)</b> <b>Woodside assessment:</b> Woodside accepts previous advice from AMSA regarding the operations remains relevant. <b>Woodside response:</b> Woodside noted that previous AMSA – Marine Safety advice regarding the operations remained relevant.</p>	<p><b>(1)</b> Not required.</p>
<p><b>(2)</b> Vessels should exhibit appropriate lights and shapes.</p>	<p><b>(2)</b> <b>Woodside assessment:</b> Woodside complies with the International Rules for Preventing Collisions at Sea. <b>Woodside response:</b> Woodside confirmed vessels would exhibit appropriate lights and shapes to reflect the nature of operations and the obligation to comply with the International Rules for Preventing Collisions at Sea.</p>	<p><b>(2)</b> The EP contains a number of controls that address AMSA's feedback on lighting and compliance with the international rule for preventing collisions at sea (see Section 6.7 of the EP).</p>
<p><b>(3)</b> Woodside should evaluate and implement adequate anti-collision measures.</p>	<p><b>(3)</b> <b>Woodside assessment:</b> Woodside is continuously evaluating existing collision risk mitigation measures. <b>Woodside response:</b> Woodside advised it did not propose to implement further anti-collision measures for the activity at this time, but collision risk mitigation measures were constantly being evaluated and implemented.</p>	<p><b>(3)</b> The EP contains a number of controls that address AMSA's feedback on lighting and compliance with the international rule for preventing collisions at sea (see Section 6.7 of the EP).</p>
<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should further feedback be received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional measures or controls are required.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p><b>Outcomes of consultation</b></p> <p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with AMSA – Marine Safety for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. No additional measures or controls are required.</p>

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with AMSA – Marine Pollution for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to AMSA – Marine Pollution on 15 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided AMSA - Marine Pollution with the opportunity to provide feedback over a 10-month period.

**Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries**

**Summary of information provided and record of consultation for this EP:**

- On 15 September 2023, Woodside emailed DAFF – Fisheries advising of the proposed activity (Record of Consultation, reference 1.33) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to DAFF – Fisheries following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside has consulted AFMA, CFA, Tuna Australia, ASBTIA and individual relevant licence holders. Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Vessels are required to comply with the Australian Biosecurity Act 2015, specifically the Australian Ballast Water Management Requirements (as defined under the Biosecurity Act 2015) (aligned with the International Convention for the Control and Management of Ships’ Ballast Water and Sediments) to prevent introducing IMS. Vessels will be assessed and managed to prevent the introduction of invasive marine species in accordance

		<p>with Woodside’s Invasive Marine Species Management Plan (see Section 6.8.12 of the EP).</p> <p>Woodside has assessed the potential for interaction with Commonwealth managed commercial fisheries in Section 4.10.1 of the EP.</p> <p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.</p> <p>No additional measures or controls are required.</p>
--	--	---

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DAFF – Fisheries for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DAFF - Fisheries on 15 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure Consultation on offshore petroleum environment plans: Information for the community.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided DAFF - Fisheries with the opportunity to provide feedback over a 10-month period.

**Department of Defence (DoD)**

**Summary of information provided and record of consultation for this EP:**

- On 15 September 2023, Woodside emailed DoD advising of the proposed activity (Record of Consultation, reference 1.7) and provided a Consultation Information Sheet, defence map (Record of Consultation, reference 1.8) and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website as well as the defence map.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- On 25 October 2023, DoD sent an email thanking Woodside for the information (SI Report, reference 4.1) and provided feedback regarding:
  - (1) The location of the activity areas within an exercise area and restricted airspace.
  - (2) Unexploded ordnance (UXO) that may be present on and in the seafloor, and that Woodside must inform itself as to the risks associated with conducting activities in that area, with the Commonwealth of Australia taking no responsibility for reporting the UXO in the area, identifying or removing UXO from the area, or any loss or damage suffered or incurred by Woodside or any third party arising out of, or directly related to, UXO in the area.
  - (3) DoD's notification requirements including liaison with the Australian Hydrographic Service/Office (AHS/AHO).
- On 1 November 2023, Woodside thanked DoD for its feedback (SI Report, reference 4.2) and confirmed:
  - (1) It had noted the location of activity areas and the presence of exercise areas and restricted airspace.
  - (2) It had noted the advice regarding location, identification, removal or damage to equipment from unexploded ordinances (UXO)s.
  - (3) The Australian Hydrographic Service/Office (AHS/AHO) had been engaged for this activity and is part of the activity notification protocols.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
<p>(1) The location of exercise areas and restricted airspace.</p>	<p>(1) <b>Woodside assessment:</b> Woodside is aware of the exercise area and restricted airspace. <b>Woodside response:</b> Woodside confirmed it had it had noted DoD's advice on the location of activity areas within an exercise area and restricted airspace.</p>	<p>(1) Woodside has recorded the defence areas, facilities and UXOs overlapping the Operational Area and/or EMBA in Section 4.10.6 of the EP.</p>
<p>(2) The risk of unexploded ordnance (UXO) in the area.</p>	<p>(2) <b>Woodside assessment:</b> Woodside is aware of the risks associated with UXO in the activity area. <b>Woodside response:</b> Woodside confirmed it had noted the DoD's advice with respect to the risk, location, identification, removal or damage from UXO.</p>	<p>(2) Woodside has recorded the defence areas, facilities and UXOs overlapping the Operational Area and/or EMBA in Section 4.10.6 of the EP.</p>
<p>(3) The need for Woodside to continue liaison with AHO and ensure AHO is notified three weeks prior to the actual commencement of activities.</p>	<p>(3) <b>Woodside assessment:</b> Woodside recognises the need to liaise with the AHO.</p>	<p>(3) Woodside will notify the AHO of the location of new permanent infrastructure to enable update of maritime charts, as required, as referenced in PS 1.3 of this EP.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	<b>Woodside response:</b> Woodside advised the AHO had been engaged by Woodside for these activities and was included in Woodside’s activity notification protocols.	Notifying the AHO provides DoD with information of the PAP through maritime safety information.
While feedback has been received, there were no objections or claims.	Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DoD for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DoD on 15 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside sent a follow up email seeking feedback on the proposed activities.
- Woodside has addressed and responded to DoD over a 10-month period.

**Department of Primary Industries and Regional Development (DPIRD)**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside emailed DPIRD advising of the proposed activity (Record of Consultation, reference 1.38) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to DPIRD following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p>No feedback, objections or claims received despite follow-up.</p>	<p>Woodside has consulted DPIRD, WAFIC, and relevant individual licence holders (via WAFIC).</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has assessed the potential for interaction with State managed fisheries issues in Section 4.10.1 of this EP.</p> <p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.</p> <p>No additional measures or controls are required.</p>
<p><b>Outcomes of consultation</b></p>		
<p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DPRID for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:</p> <ul style="list-style-type: none"> <li>• Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.</li> <li>• Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.</li> <li>• Consultation Information provided to DPIRD on 22 September 2023 based on their function, interest and activities.</li> <li>• Woodside has provided a link to NOPSEMA’s brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>• Woodside sent follow-up email seeking feedback on the proposed activities.</li> <li>• Woodside has provided DPIRD with the opportunity to provide feedback over a 10-month period.</li> </ul>		
<p><b>Department of Transport (DoT)</b></p>		
<p><b>Summary of information provided and record of consultation for this EP:</b></p> <ul style="list-style-type: none"> <li>• On 13 September 2023, Woodside emailed DoT advising of the proposed activity (Record of Consultation, reference 1.3) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>• <b>(1)</b> On 02 October 2023, DoT responded to Woodside’s email (SI Report, reference 5.1) and asked to be consulted if there was a risk of a spill impacting State waters.</li> </ul>

**Department of Planning, Lands and Heritage (DPLH)**

**Summary of information provided and record of consultation for this EP:**

- On 13 September 2023, Woodside emailed DPLH advising of the proposed activity (Record of Consultation, reference 1.11) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to DPLH following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.
- On 18 October 2023, DPLH thanked Woodside for the opportunity to provide feedback (SI Report, reference 6.1) and:
  - (1) Confirmed it administered Crown land within the boundaries of the State of Western Australia, including coastal waters out to three nautical miles offshore.
  - (2) Recommended consultation with the Department of Biodiversity, Conservation and Attractions (DBCA), given the proximity of the proposal to Marine Reserve 2.
  - (3) Noted that due to the proposal’s location outside of coastal waters, it had no further comment to make.
- On 6 November 2023, Woodside responded thanking DPLH for its feedback (SI Report, reference 6.2). Woodside:
  - (1) Noted DPLH’s area of administration.
  - (2) Confirmed it had consulted DBCA for the EP.
  - (3) Acknowledged that, due to the operation’s location outside of coastal waters, DPLH had no further comment.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p>(1) DPLH confirmed it administered Crown land in WA, including coastal waters out to three nautical miles offshore.</p>	<p>(1) <b>Woodside assessment:</b> Woodside understands DPLH’s area of administration. <b>Woodside response:</b> Woodside confirmed it had noted DPLH’s area of administration.</p>	<p>(1) Not required.</p>
<p>(2) Due to the proximity of the proposal to Marine Reserve 2, DPLH recommended Woodside consult the Department of Biosecurity, Conservation and Attractions (DBCA).</p>	<p>(2) <b>Woodside assessment:</b> Woodside has consulted DBCA for this EP. <b>Woodside response:</b> Woodside confirmed to DPLH that DBCA had also been consulted for this EP.</p>	<p>(2) Woodside has assessed DBCA as a relevant person for this EP (see Appendix F, Table 1) in accordance with regulation 25(1) of the Environment Regulations and consulted it alongside DPLH.</p>

<p><b>(3)</b> DPLH advised it had no further comment given the operation's location outside coastal waters.</p>	<p><b>(3)</b> <b>Woodside assessment:</b> Woodside accepted that DPLH had no comment. <b>Woodside response:</b> Woodside acknowledged that DPLH had no further comment on the proposal given the location.</p>	<p><b>(3)</b> Not required.</p>
<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (See Section 7.5.1 of the EP).</p>	<p>The EP demonstrates that there are no known underwater heritage sites or shipwrecks within the Petroleum Activities Area and identifies that there are no credible impacts to the values of any underwater heritage or shipwrecks as a result of planned activities (Sections 4.9.3 and 6.10). While impacts to underwater heritage sites or shipwrecks are possible in the event of an unplanned hydrocarbon spill, Woodside considers it adopts appropriate controls to prevent a hydrocarbon spill and controls to respond in the highly unlikely event of a hydrocarbon spill, as demonstrated in Section 6.8. No additional measures or controls are required.</p>

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DPLH for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DPLH on 13 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has addressed and responded to DPLH over a 10-month period.

**Western Australian Museum**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

**Summary of information provided and record of consultation for this EP:**

- On 13 September 2023, Woodside emailed WA Museum advising of the proposed activity (Record of Consultation, reference 1.10) and provided a Consultation Information Sheet, list of shipwrecks and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 9 October 2023, WA Museum responded thanking Woodside for the information (SI Report, reference 7.1). WA Museum:
  - (1) Advised that under the Underwater Heritage Act 2018, proponents should, in the first place, contact DCCEEW as the Commonwealth regulator.
  - (2) Directed Woodside to refer to the Commonwealth Government’s Underwater Cultural Heritage Guidance for Offshore Developments regarding UCH assessments and draft Guidelines for Working in the Near and Offshore Environment to Protect Underwater Cultural Heritage.
  - (3) Recommended that Woodside engages a suitably qualified and experienced maritime archaeologist to undertake a UCH Desktop Assessment to identify Aboriginal and non-Aboriginal UCH within the project area.
  - (4) Recommended that Woodside consult with Traditional Owners where appropriate if the project involves seabed disturbance in water shallower than 130m.
- On 15 November 2023, Woodside responded and thanked WA Museum for its feedback (SI Report, reference 7.2). Woodside:
  - (1) Confirmed it had consulted the Commonwealth regulator, DCCEEW, for this EP.
  - (2) Confirmed it referred to the Commonwealth Government’s Underwater Cultural Heritage Guidance for Offshore Developments regarding UCH assessments and draft Guidelines for Working in the Near and Offshore Environment to Protect Underwater Cultural Heritage.
  - (3) Noted that as this EP involved ongoing operations, mapping and identification for non-Aboriginal UCH within the project area had previously been completed.
  - (3) Advised that Woodside engaged a desktop review by qualified and experienced maritime archaeologists for seabed disturbing activities to a depth of approximately 130m. As the shallowest water depth for the Operational Area of this activity is 180m, Woodside considered the projects area to be beyond the depth contours for potential Aboriginal UCH.
  - (4) Confirmed that while this activity did not involve seabed disturbance in water shallower than 130m, Woodside consulted with Traditional Owners in the course of preparing EPs and also engaged in ongoing consultation subsequent to the approval of EPs.
  - (4) As per Woodside’s ongoing consultation approach, feedback and comments received continued to be assessed and responded to, as required, through the life of an EP.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p>(1) Woodside should contact DCCEEW as the Commonwealth regulator.</p>	<p>(1) <b>Woodside assessment:</b> Woodside assessed DCCEEW as relevant and has consulted it for this EP. <b>Woodside response:</b> Woodside confirmed it had consulted DCCEEW, as the Commonwealth regulator, for this EP.</p>	<p>(1) Woodside assessed DCCEEW as a relevant person for this EP (see Appendix F, Table 1) in accordance with regulation 25(1) of the Environment Regulations and consulted it as described in Appendix F, Table 2.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p><b>(2)</b> Refer to the Commonwealth Government's Underwater Cultural Heritage Guidance for Offshore Developments.</p>	<p><b>(2)</b> <b>Woodside assessment:</b> Woodside refers to the Commonwealth Government's relevant underwater cultural guidance and draft guidelines. <b>Woodside response:</b> Woodside confirmed it referred to the Commonwealth Government's Underwater Cultural Heritage Guidance for Offshore Developments regarding UCH assessments and draft Guidelines for Working in the Near and Offshore Environment to Protect Underwater Cultural Heritage.</p>	<p><b>(2)</b> Not required.</p>
<p><b>(3)</b> Engage a maritime archaeologist to undertake a UCH Desktop Assessment.</p>	<p><b>(3)</b> <b>Woodside assessment:</b> Mapping has been completed for the ongoing operations associated with this EP, and the water depth of the Operational Area is considered too deep for potential Aboriginal UCH. <b>Woodside response:</b> Woodside noted that as this EP involved ongoing operations, mapping had already been completed for non-Aboriginal UCH. As the shallowest water depth for the Operational Area of this activity is 180m, Woodside considered the project area to be beyond the depth contour for potential Aboriginal UCH.</p>	<p><b>(3)</b> Not required.</p>
<p><b>(4)</b> Woodside recommended to consult Traditional Owners where appropriate if the project involves seabed disturbance in water shallower than 130m.</p>	<p><b>(4)</b> <b>Woodside assessment:</b> This activity does not involve seabed disturbance in water shallower than 130m. <b>Woodside response:</b> Woodside confirmed that although this activity did not involve seabed disturbance in water shallower than 130m, Woodside consulted Traditional Owners in the course of preparing EPs and also engaged in ongoing consultation subsequent to the approval of the EP.</p>	<p><b>(4)</b> Consultation with Traditional Owners is described in Appendix F, Table 2 of the EP.</p>
<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback</p>	<p>The EP demonstrates that there are no known underwater heritage sites or shipwrecks within the Petroleum Activities Area and identifies that there are no</p>

	<p>be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>credible impacts to the values of any underwater heritage or shipwrecks as a result of planned activities (Sections 4.9 and 6.10). While impacts to underwater heritage sites or shipwrecks are possible in the event of an unplanned hydrocarbon spill, Woodside considers it adopts appropriate controls to prevent a hydrocarbon spill and controls to respond in the highly unlikely event of a hydrocarbon spill, as demonstrated in Section 6.8.</p> <p>As part of ongoing consultation engagements as set out in Table 7-4 of the EP, Woodside will notify WAM of any unexpected finds of potential Underwater Cultural Heritage under the Unexpected Finds Procedure (as described in Section 7.8 of the EP).</p> <p>No additional measures or controls are required.</p>
--	---	--

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with WA Museum for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to WA Museum on 15 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has addressed and responded to WA Museum over a 10-month period.

**Pilbara Ports Authority**

**Summary of information provided and record of consultation for this EP:**

- On 19 September 2023, Woodside emailed Pilbara Ports Authority advising of the proposed activity (Record of Consultation, reference 1.29) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.

<ul style="list-style-type: none"> <li>On 16 October 2023, Woodside sent a reminder email to Pilbara Ports Authority following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.</li> </ul>		
Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow up.	Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.
<b>Outcomes of consultation</b>

	completed for non-Aboriginal UCH. As the shallowest water depth for the Operational Area of this activity is 180m, Woodside considers the project area to be beyond the depth contour for potential Aboriginal UCH.	4.9 and Section 6.7). While impacts to underwater heritage sites or shipwrecks are possible in the event of an unplanned hydrocarbon spill, Woodside considers it adopts appropriate controls to prevent a hydrocarbon spill and controls to respond in the highly unlikely event of a hydrocarbon spill, as demonstrated in Section 6.8 of this EP.
<b>(2)</b> It noted Woodside is already aware of the Underwater Cultural Heritage Act 2018.	<b>(2)</b> <b>Woodside assessment:</b> Woodside agrees it is aware of the Underwater Cultural Heritage Act 2018. <b>Woodside response:</b> Woodside confirmed it was aware of the legislative requirements of the Underwater Cultural Heritage Act 2018.	<b>(2)</b> Not required.
<b>(3)</b> A summary of legislation and protections, key responsibilities and obligations, and management considerations and recommendations from the UCH Act 2018.	<b>(3)</b> <b>Woodside assessment:</b> Woodside adheres to the Underwater Cultural Heritage Act 2018. <b>Woodside response:</b> Woodside confirmed it had noted the Department's summary of key legislation and protections, responsibilities and obligations, and management considerations and recommendations from the UCH Act 2018.	<b>(3)</b> Not required.
While feedback has been received, there were no objections or claims.	Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.  No additional measures or controls are required.
<b>Outcomes of consultation</b>		
Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DCCEEW for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:		
<ul style="list-style-type: none"> <li>• Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.</li> </ul>		

- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DCCEEW on 15 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has addressed and responded to DCCEEW over a 10-month period.

#### Director of National Parks (DNP)

##### Summary of information provided and record of consultation for this EP:

- On 19 September 2023, Woodside emailed DNP advising of the proposed activity (Record of Consultation, reference 1.30) and provided a Consultation Information Sheet and a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to DNP following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside's website.
- On 9 November 2023, Woodside sent a second reminder email to DNP following up on the proposed activity (Record of Consultation, reference 2.16) and included a link to the Consultation Information Sheet on Woodside's website.
- On 7 December 2023, DNP responded to Woodside and apologised for the delayed response (SI Report, reference 9.1). DNP noted that:
  - **(1)** Based on the information provided, the planned activity did not overlap any Australian Marine Parks (AMPs) therefore there were no authorisation requirements from the DNP.
  - **(2)** To assist in the preparation of an EP for petroleum activities, NOPSEMA has worked closely with Parks Australia to develop and publish a guidance note that outlines what titleholders need to consider and evaluate. Titleholders should ensure the EP:
    - Identified and managed all impacts and risks on Australian Marine Park values (including ecosystem values) and had considered all options to avoid or reduce them to as low as reasonably practicable (ALARP).
    - Clearly demonstrated the activity would not be inconsistent with the North-west Marine Parks Network Management Plan 2018.
  - **(3)** It did not require further notification of progress made in relation to this activity unless details regarding the activity changed and resulted in an overlap with a marine park or new impact, or for emergency responses.
- On 14 December 2023, Woodside responded thanking DNP for its email (SI Report, reference 9.2) and:
  - **(1)** Noted DNP's confirmation that planned activities did not overlap any AMPs and there were no authorisation requirements.
  - **(2)** Confirmed Woodside had taken into consideration the 'Petroleum Activities and Australian Marine Parks' guidance note to ensure the EP:

- Identified and managed all impacts and risks on AMP values (including ecosystem values) to an acceptable level.
  - Clearly demonstrated that the activities would not be inconsistent with the North-west Marine Parks Network Management Plan 2018.
- (3) Confirmed Woodside would notify DNP in relation to these activities if details regarding the activities changed and resulted in an overlap with or new impact to a marine park, or for emergency responses.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p>(1) Planned activities do not overlap any Australian Marine Parks and there are therefore no authorisation requirements from the DNP.</p>	<p>(1) <b>Woodside assessment:</b> Woodside noted there were no authorisation requirements from the DNP. <b>Woodside response:</b> Woodside noted the DNP’s confirmation that planned activities did no overlap AMPs and there are no authorisation requirements.</p>	<p>(1) Not required.</p>
<p>(2) Woodside should ensure EPs identify and manage all impacts and risks on AMP values, and clearly demonstrate that activities will not be inconsistent with the management plan.</p>	<p>(2) <b>Woodside assessment:</b> Woodside has considered the ‘Petroleum Activities and Australian Marine Parks’ guidance note to assess and manage impacts and risks to AMPs. <b>Woodside response:</b> Woodside confirmed it had taken into consideration the ‘Petroleum Activities and Marine Parks’ guidance note to ensure the EP identified and managed all risks on AMP values, and clearly demonstrated that activities will not be inconsistent with the management plan.</p>	<p>(2) The EP demonstrates how Woodside will identify and manage all impacts and risks on Australian Marine Park values (including ecosystem values) to an ALARP and acceptable level and that the activity is not inconsistent with the management plan (see Section 6.8 of the EP).</p>
<p>(3) It does not require further notification of progress unless details regarding the activity change and result in an overlap with a marine park or new impact, or for emergency responses.</p>	<p>(3) <b>Woodside assessment:</b> Woodside will notify DNP in the event of relevant changes to the activity, or for emergency responses. <b>Woodside response:</b> Woodside confirmed it would notify DNP if activities changed and resulted in an overlap with or new impact to a marine park, or for emergency responses.</p>	<p>(3) Woodside will provide notification of significant change, as appropriate, to relevant persons as referenced in Section 7.13.3.1 of the EP. Woodside will ensure DNP is made aware of any incidences within a marine park for the activity, as per the commitment in the Oil Pollution First Strike Plan (Appendix I).</p>

<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>No additional measures or controls are required</p>
--	--	--

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DNP for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DNP on 19 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent follow up emails seeking feedback on the proposed activities.
- Woodside has addressed and responded to DNP over a 10-month period.

**Ningaloo Coast World Heritage Advisory Committee (NCWHAC)**

**Summary of information provided and record of consultation for this EP:**

- On 13 September 2023, Woodside emailed NCWHAC advising of the proposed activity (Record of Consultation, reference 1.3) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to NCWHAC following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.
- On 9 November 2023, Woodside sent a second reminder email to NCWHAC following up on the proposed activity (Record of Consultation, reference 2.16) and included a link to the Consultation Information Sheet on Woodside’s website. No response was received.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.
<b>Outcomes of consultation</b>		
<p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with NCWHAC for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:</p> <ul style="list-style-type: none"> <li>• Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.</li> <li>• Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.</li> <li>• Consultation Information provided to NCWHAC on 13 September 2023 based on their function, interest and activities.</li> <li>• Woodside has provided a link to NOPSEMA’s brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>• Woodside has sent follow up emails seeking feedback on the proposed activities.</li> <li>• Woodside has provided NCWHAC with the opportunity to provide feedback over a 10-month period.</li> </ul>		
<b>Department of Biodiversity, Conservation and Attractions (DBCA)</b>		
<p><b>Summary of information provided and record of consultation for this EP:</b></p> <ul style="list-style-type: none"> <li>• On 13 September 2023, Woodside emailed DBCA advising of the proposed activity (Record of Consultation, reference 1.3) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>• On 23 October 2023, DBCA responded thanking Woodside for the email and consultation information (SI Report, reference 10.1). DBCA noted: <ul style="list-style-type: none"> <li>– <b>(1)</b> The operations were in vicinity of reserves managed by DBCA under the CALM act and given the ecological importance of areas potentially affected by a hydrocarbon release from the proposed activities, it was considered important that the baseline values and state of the potentially affected environment were appropriately understood and documented prior to operations commencing.</li> </ul> </li> </ul>		

<ul style="list-style-type: none"> <li>– (2) It would like to have confidence that Woodside had established appropriate baseline survey data on the current state of areas supporting important ecological values and any current contamination if present within the area of potential impact of hydrocarbon releases.</li> <li>– (3) It undertakes monitoring in marine parks and reserves and published monitoring reports which are available on its website, however Woodside should be aware this monitoring is targeted to inform DBCA’s values and objectives and is not necessarily suitable to provide baseline information for oil spill risk assessment and management planning.</li> <li>– (4) It recommended Woodside refer to the Department of Climate Change, Energy, the Environment and Water’s National Light Pollution Guidelines for Wildlife as a best-practice industry standard for managing potential impacts of light pollution on marine fauna.</li> <li>– (5) In the event of a hydrocarbon release, it was requested that Woodside notify DBCA’s Pilbara regional office as soon as practicable on (08) 9182 2000.</li> <li>– (6) It would not implement an oiled wildlife management response on behalf of a petroleum operator except as part of a whole of government response mandated by regulatory decision makers.</li> <li>– (7) Woodside should refer to the Department of Transport’s web content regarding marine pollution and the Offshore Petroleum Industry Guidance Note of 2020 titled Marine Oil Pollution: Response and Consultation Arrangements. (7) Woodside refers to DoT’s content in the development of its response plans.</li> <li>• On 31 October 2023, following feedback from the Shire of Shark Bay that the DBCA’s Shark Bay office may also wish to provide feedback, Woodside emailed DBCA Shark Bay advising of the proposed activity (Record of Consultation, reference 1.61) and provided a Consultation Information Sheet. Woodside noted in the email that DBCA’s main department had already provided feedback on the activity.</li> <li>• On 15 November 2023, Woodside responded thanking DBCA’s main department for its feedback on 23 October 2023 (SI Report, reference 10.2). Woodside:             <ul style="list-style-type: none"> <li>– (1, 2) Confirmed it maintained knowledge and an understanding of areas of ecological importance within and adjacent to operational areas.</li> <li>– (3) Advised its oil spill scientific monitoring program would provide for a quantitative assessment of the overall environmental impacts in the event of an unplanned hydrocarbon release.</li> <li>– (4) Confirmed the lighting associated with the Pyrenees Facility Operations EP and any associated activity vessels was required as a priority for safe operation.</li> <li>– (4) Confirmed it had considered DCCEEW’s National Light Pollution Guidelines with respect to vessel activities. The impact assessment determined that the impacts of lighting were as low as reasonably practicable (ALARP).</li> <li>– (5) Advised it had incorporated the DBCA Pilbara regional office telephone number as part of the notifications listed in the Oil Pollution First Strike Plan, which describes the incident management structure, notification and reporting requirements, the Operational Area, activity specific credible spill scenarios, and the hydrocarbon spill response strategies available.</li> <li>– (6) Noted that DBCA would not implement an oiled wildlife management response on behalf of a petroleum operator.</li> </ul> </li> <li>• On 15 December 2023, Woodside sent a reminder email to the DBCA’s Shark Bay office following up on the proposed activity (Record of Consultation, reference 2.19) and included a link to the Consultation Information Sheet on Woodside’s website.</li> </ul>		
<b>Summary of Feedback, Objection or Claim</b>	<b>Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response</b>	<b>Inclusion in Environment Plan</b>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p><b>(1)</b> Ecologically important areas including marine parks and coastal conservation reserves in the vicinity of the proposed operations.</p>	<p><b>(1)</b> <b>Woodside assessment:</b> Woodside is aware of ecologically important areas and has ensured there are no credible impacts from planned activities. <b>Woodside response:</b> Woodside confirmed that areas of ecological importance in the proximity of the EP Operational Areas would not be impacted by planned activities.</p>	<p><b>(1)</b> The EP demonstrates that the proposed activities are outside the boundaries of a proclaimed State Marine Park and identifies that there are no credible impacts to the values of any State Marine Parks as a result of planned activities (Section 4.9.3 and Section 6.8 of the EP). While impacts to Commonwealth Marine Parks are possible in the event of an unplanned hydrocarbon spill, Woodside considers it adopts appropriate controls to prevent a hydrocarbon spill and controls to respond in the highly unlikely event of a hydrocarbon spill, as demonstrated in Sections 6.8.2-6.8.8 of the EP.</p>
<p><b>(2)</b> The establishment of appropriate baseline survey data on the current state of areas.</p>	<p><b>(2)</b> <b>Woodside assessment:</b> Woodside maintains knowledge of areas of ecological importance adjacent to the Operational Area and assesses the existing environment that may be affected in the EP. <b>Woodside response:</b> Woodside confirmed it maintained knowledge and an understanding of areas of ecological importance adjacent to Operational Areas.</p>	<p><b>(2)</b> A description of the existing environment that may be affected is provided in Section 4 of this EP.</p>
<p><b>(3)</b> Encouraging Woodside to acquire the necessary information to implement a Before-After Control Impact (BACI) framework.</p>	<p><b>(3)</b> <b>Woodside assessment:</b> Woodside has the necessary information to assess environmental impacts in the event of an unplanned hydrocarbon release. <b>Woodside response:</b> Woodside confirmed its oil spill scientific monitoring program (SMP) would provide for a quantitative assessment of the overall environmental impacts in the event of an unplanned hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors.</p>	<p><b>(3)</b> Under the Oil Spill Scientific Monitoring Program preparedness, an annual review and update to environmental baseline studies database is completed and documented as described in Section 7.10.2 of this EP.</p>
<p><b>(4)</b> Recommending Woodside refers to DCCEEW's National Light Pollution Guidelines for Wildlife.</p>	<p><b>(4)</b> <b>Woodside assessment:</b> Woodside referred to DCCEEW's National Light Pollution Guidelines for Wildlife in the preparation of this EP.</p>	<p><b>(4)</b> Woodside's impact assessment for light emissions is based on recommendations of the National Light Pollution Guidelines for Wildlife (see Section 6.7.3).</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	<b>Woodside response:</b> Woodside confirmed it had considered DCCEEW's National Light Pollution Guidelines for Wildlife and that lighting associated with this EP was required as a priority for safe operation.	
<b>(5)</b> Its 'Incidents and Emergency process, including that Woodside notify DBCA's Pilbara office as soon as practicable in the event of a hydrocarbon release.	<b>(5)</b> <b>Woodside assessment:</b> Woodside has incorporated the DBCA Pilbara number into its First Strike Plan. <b>Woodside response:</b> Woodside noted DBCA's Incidents and Emergency Response and confirmed the DBCA Pilbara number had been incorporated as part of the Oil Pollution First Strike Plan.	<b>(5)</b> DBCA's Pilbara phone number has been incorporated into the Oil Pollution First Strike Plan for this EP (see Appendix I).
<b>(6)</b> The implementation of an oiled wildlife management response.	<b>(6)</b> <b>Woodside assessment:</b> Woodside notes DBCA will not implement an oiled wildlife management response on behalf of an operator. <b>Woodside response:</b> Woodside acknowledged that DBCA would not implement an oiled wildlife management response on behalf of a petroleum operator.	<b>(6)</b> Woodside's Oiled Wildlife Response is included in the Oil Spill Preparedness and Response Mitigation Assessment for this EP (see Appendix H).
<b>(7)</b> Woodside should refer to the DoT's web content on marine pollution, and the guidance note Marine Oil Pollution: Response and Consultation Arrangements.	<b>(7)</b> <b>Woodside assessment:</b> Woodside refers to DoT's marine pollution content in the development of its response plans. <b>Woodside response:</b> Woodside noted DBCA's reference to DoT's marine oil pollution content.	<b>(7)</b> Woodside refers to the specified marine oil pollution content and guidance note in its First Strike Plan for this activity (Appendix I).
While feedback has been received, there were no objections or claims.	Woodside engages in ongoing consultation throughout the life of an EP. Should further feedback be received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.
<b>Outcomes of consultation</b>		
Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DBCA for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DBCA on 13 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has addressed and responded to DBCA over a 10-month period.

**Commonwealth and State Government Departments or Agencies – Industry**

**Department of Industry, Science and Resources (DISR)**

**Summary of information provided and record of consultation for this EP:**

- On 13 September 2023, Woodside emailed DISR advising of the proposed activity (Record of Consultation, reference 1.3) and provided a Consultation Information Sheet and a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to DISR following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside's website.

<b>Summary of Feedback, Objection or Claim</b>	<b>Assessment of Merits of Feedback, Objection or Claim and Woodside's Response</b>	<b>Inclusion in Environment Plan</b>
No feedback, objections or claims received despite follow-up.	Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DISR for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DISR on 13 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided DISR with the opportunity to provide feedback over a 10-month period.

**Department of Energy, Mines, Industry Regulation and Safety (DEMIRS)**

**Summary of information provided and record of consultation for this EP:**

- On 13 September 2023, Woodside emailed DEMIRS advising of the proposed activity (Record of Consultation, reference 1.3) and provided a Consultation Information Sheet and a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to DEMIRS following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside's website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside engages in ongoing consultation throughout the life of an EP. Should further feedback be received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with DEMIRS for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.

- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to DEMIRS on 13 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided DEMIRS with the opportunity to provide feedback over a 10-month period.

**Commonwealth Commercial fisheries and representative bodies**

**North West Slope and Trawl Fishery**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside emailed North West Slope and Trawl Fishery individual licence holders advising of the proposed activity (Record of Consultation, reference 1.38) and provided a Consultation Information Sheet.
- On 18 October 2023, Woodside sent a reminder email to North West Slope and Trawl Fishery following up on the proposed activity (Record of Consultation, reference 2.3) and included a link to the Consultation Information Sheet on Woodside's website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside has consulted AFMA, DAFF – Fisheries, CFA and individual relevant licence holders. Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has assessed the potential for interaction with Commonwealth-managed commercial fisheries in Section 4.10.1 of this EP. Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional measures or controls are required.

**Outcomes of consultation**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside has discharged its obligations for consultation under Regulation 25(1) and consultation with North West Slope and Trawl Fishery for the purpose of 25(1) is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to North West Slope and Trawl Fishery on 22 September 2023 based on their function, interest and activities.
- Woodside has sent a follow up email seeking feedback on the proposed activity.
- Woodside has provided the North West Slope and Trawl Fishery with the opportunity to provide feedback over a 10-month period.

**Western Deepwater Trawl Fishery**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside emailed Western Deepwater Trawl Fishery individual licence holders advising of the proposed activity (Record of Consultation, reference 1.37) and provided a Consultation Information Sheet.
- On 18 October 2023, Woodside sent a reminder email to Western Deepwater Trawl Fishery following up on the proposed activity (Record of Consultation, reference 2.3) and included a link to the Consultation Information Sheet on Woodside’s website.

<b>Summary of Feedback, Objection or Claim</b>	<b>Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response</b>	<b>Inclusion in Environment Plan</b>
No feedback, objections or claims received despite follow-up.	Woodside has consulted AFMA, DAFF - Fisheries, CFA, and individual relevant licence holders.  Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has assessed the potential for interaction with Commonwealth-managed commercial fisheries in Section 4.10.1 of this EP.  Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.  No additional measures or controls are required.

**Outcomes of consultation**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside has discharged its obligations for consultation under Regulation 25(1) and consultation with Western Deepwater Trawl Fishery for the purpose of 25(1) is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to Western Deepwater Trawl Fishery on 22 September 2023 based on their function, interest and activities.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided the Western Deepwater Trawl Fishery with the opportunity to provide feedback over a 10-month period.

**Western Tuna and Billfish Fishery**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside emailed Western Tuna and Billfish Fishery individual licence holders advising of the proposed activity (Record of Consultation, reference 1.37) and provided a Consultation Information Sheet.
- On 18 October 2023, Woodside sent a reminder email to Western Tuna and Billfish Fishery following up on the proposed activity (Record of Consultation, reference 2.3) and included a link to the Consultation Information Sheet on Woodside’s website.
- **(1)** On 19 October 2023, a licence holder from the Western Tuna and Billfish Fishery responded asking to be removed from Woodside’s mailing list and for Woodside to consult with Tuna Australia (SI Report, reference 12.1).
- **(1)** On 2 November 2023, Woodside responded thanking the licence holder for their email and confirming they would be removed from Woodside’s mailing list and correspondence would be directed to Tuna Australia (SI Report, reference 12.2).

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p><b>(1)</b> A licence holder from the Western Tuna and Billfish Fishery asked to be removed from Woodside’s mailing list and for Woodside to consult with Tuna Australia.</p>	<p><b>(1)</b> <b>Woodside assessment:</b> Woodside accepts that the consultation process is voluntary. <b>Woodside response:</b> Woodside confirmed it had removed the licence holder from mailing lists and correspondence would be directed to Tuna Australia.</p>	<p><b>(1)</b> Not required.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside has consulted Tuna Australia, AFMA, DAFF - Fisheries, CFA, ASBTIA and individual relevant licence holders.</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has assessed the potential for interaction with Commonwealth managed commercial fisheries in Section 4.10.1 of this EP.</p> <p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.</p> <p>No additional measures or controls are required.</p>
--	---	---

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under Regulation 25(1) and consultation with Western Tuna and Billfish Fishery for the purpose of 25(1) is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to Western Tuna and Billfish Fishery on 22 September 2023 based on their function, interest and activities.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has provided Western Tuna and Billfish Fishery with the opportunity to provide feedback over a 10-month period.

**Christmas Island Line Fishery**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside emailed/sent a letter to Christmas Island Line Fishery individual licence holders advising of the proposed activity (Record of Consultation, reference 1.37 and 1.43) and provided a Consultation Information Sheet.
- On 16 and 18 October 2023, Woodside sent a reminder letter/email to Christmas Island Line Fishery following up on the proposed activity (Record of Consultation, reference 2.3 and 2.17) and included a link/QR code to the Consultation Information Sheet on Woodside’s website.

<p><b>Tuna Australia</b></p>		
<p><b>Historical Engagement:</b></p> <ul style="list-style-type: none"> <li>• Between 15 March 2023 and 4 September 2023, in relation to other Woodside EPs, Tuna Australia: <ul style="list-style-type: none"> <li>– Provided its position statement for engaging on EPs and project proposals.</li> <li>– Advised that due to increased activity of proponents seeking to access offshore areas for various maritime developments, Tuna Australia could no longer coordinate consultation with offshore energy activities on behalf of its members without a services agreement in place.</li> <li>– Advised it did not agree with proposed amendments made by Woodside to a draft services agreement.</li> </ul> </li> </ul> <p><b>Summary of information provided and record of consultation for this EP:</b></p>		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- On 22 September 2023, Woodside emailed Tuna Australia advising of the proposed activity (Record of Consultation, reference 1.37) and provided a Consultation Information Sheet and a link to NOPSEMA's brochure Consultation on offshore petroleum environment plans: Information for the community.
- On 31 October 2023, Woodside sent a reminder email to Tuna Australia following up on the proposed activity (Record of Consultation, reference 2.11) and included a link to the Consultation Information Sheet on Woodside's website.
- On 6 November 2023, Tuna Australia emailed Woodside regarding this EP (SI Report, reference 13.1) and stated:
  - (1) It could assist to help Woodside reach concession owners and licence holders of potentially impacted fisheries to meet regulatory consultation requirements.
  - (2) Proponents must address planned fishing effort and development of the fishery, and focussing on historical fishing effort as the basis for validating the EP was a flawed assessment.
  - (3) Concern about recent consultation by energy companies using outdated mailing lists sourced from AFMA or elsewhere, while Tuna Australia's database was up to date and actively managed.
  - (2) It assisted energy companies to meet genuine and comprehensive consultation and reporting requirements. Its view was that consultation not conducted through its services was highly likely to be incomplete. Tuna Australia could not support this EP as it believed Woodside had fallen short of genuine and comprehensive consultation.
  - (4) Woodside should advise if it wished to progress with a services agreement.
- On 22 November 2023, Woodside responded thanking Tuna Australia for its email (SI Report, reference 13.2) and advised:
  - (1) Offshore proponents must consult relevant persons under the Commonwealth Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009.
  - (1) Woodside's consultation process identified relevant persons and provided them sufficient information and a reasonable period to make an informed assessment of the possible consequences of the proposed activity on their functions, interests and activities.
  - (3) Woodside obtained contact details of individual Commonwealth fishing statutory fishing rights and fishing permit holders so that consultation was consistent with the Environment Regulations. As noted on its website, AFMA's expectation was that petroleum operators consulted with fishing operators about all activities and projects which may affect day-to-day fishing activities.
  - (1, 3) In addition to consulting individual licence holders, Woodside consulted relevant fishing industry associations and representative bodies such as Tuna Australia and Commonwealth Fisheries Association, and referred to the AFMA website to help inform which associations and bodies were relevant.
  - (1, 2, 3) While the management area for the Western Tuna and Billfish Fishery overlapped the Operational Area, based on AFMA data, no recent fishing effort had occurred within the Operational Area for at least the past 10 years. Despite this, Woodside chose to consult licence holders in this fishery.
  - (4) The Offshore Environment Regulations did not require entry into services agreements in order to meet EP consultation requirements. Woodside has met its consultation obligations under the Environment Regulations and given Tuna Australia sufficient time and information.
- On 5 December 2023, Tuna Australia responded and thanked Woodside for its advice (SI Report, reference 13.3) and noted:
  - (2) It was concerned Woodside was electing to cherry-pick on how to meet statutory requirements, for example by focussing on fishing effort and disregarding important information in the OPGGS Act 2006 and Regulations.

- (5) To progress consultation, it wished to pause the process while it took advice.
- (1) It could assist Woodside to develop an EP that was improved and met regulatory requirements.
- On 20 December 2023, Woodside responded and thanked Tuna Australia for its response. (SI Report, reference 13.4). Woodside advised:
  - (2) Woodside met its legislative and regulatory requirements in the development and implementation of an EP.
  - (5) Woodside would continue to consult Tuna Australia and individual Commonwealth licence holders for proposed activities where relevant and as appropriate.
  - (1) Consultation was voluntary, and Tuna Australia could decide whether it wished to engage in the process or not.
- On 21 December 2023, Tuna Australia responded and thanked Woodside for its response (SI Report, reference 13.5). It noted:
  - (1, 4) The OPGGS Act 2006 clearly stated that when developing an EP, the proponent must demonstrate they could “carry on those activities in a manner that does not interfere with navigation, fishing or the conservation of the resources of the sea and seabed”. It had provided its industry position statement and, it was prepared to provide services to ensure the EP met legislative and regulatory requirements. Tuna Australia would ensure thorough and comprehensive consultation on the proposed EP and without this advice, any EP submitted to NOPSEMA would be incomplete, inadequate and would not meet regulatory requirements.
  - (1, 4) Tuna Australia would welcome comment from NOPSEMA on the content required in an EP to meet regulatory requirements when considering potential impacts on Australian tuna fisheries, especially in the context of knowing that it could comprehensively provide this information through a services agreement and Woodside has chosen not to engage.
  - (4) Tuna Australia was breaking for the festive season but urged Woodside to consider whether it would like to enter a services agreement and to advise accordingly in the week of 8 January 2024.

**Ongoing engagement:**

- Between 5 February 2024 and 17 July 2024, ongoing discussions between Woodside and Tuna Australia regarding other EPs included:
  - Concern from Tuna Australia regarding the provision and frequency of industry data from AFMA.
  - Reiteration from Woodside that it was willing to have a working relationship with Tuna Australia and that it had previously engaged on a draft agreement, however Tuna Australia had not been willing to make amendments to the draft agreement.
  - Tuna Australia providing an amended draft services agreement.
  - A meeting during which Woodside and Tuna Australia discussed fishing effort, Woodside’s methodology for determining relevancy, and an agreement that both parties were committed to genuine consultation.
  - Woodside providing activities when a service agreement might be used due to the potential impact on the Western Tuna and Billfish Fishery.
  - Woodside confirming it would continue to consult Tuna Australia where historical catch effort overlapped the EMBA, but this wouldn’t be under a services agreement. Services agreement would be deployed where there was historical catch effort in the Operational Area.
  - Tuna Australia advising it did not agree with the proposed way forward for managing consultation as its view was that catch history was only one factor that must be considered when planning activities, and that it wished to meet with Woodside again to discuss.
  - Woodside agreeing to reconvene with Tuna Australia and suggesting dates for the meeting.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
<p><b>(1)</b> Tuna Australia could provide comprehensive consultation for EPs and without its support, consultation was likely to be incomplete.</p>	<p><b>(1)</b> <b>Woodside assessment:</b> Woodside disagrees that consultation would be incomplete without Tuna Australia support. Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25 of the Environment Regulations that is consistent with NOPSEMA's guideline. <b>Woodside response:</b> Woodside advised Tuna Australia that Woodside's consultation process identified relevant persons and provided them with sufficient information and a reasonable period in which to provide feedback.</p>	<p><b>(1)</b> Woodside has assessed the potential for interaction with Commonwealth managed commercial fisheries in Section 4.10.1 of this EP and identified relevant persons in Appendix F, Table 1 of the EP in accordance with regulation 25 of the Environment Regulations.</p>
<p><b>(2)</b> Noted that focusing on historical fishing effort was a flawed assessment for relevancy.</p>	<p><b>(2)</b> <b>Woodside assessment:</b> Woodside disagrees that considering historical fishing effort, sourced from government agencies, in determining relevant fisheries is flawed. This information helps to determine where a fisher could typically fish and that this location could be impacted by a proposed activity. <b>Woodside response:</b> Woodside determined and advised that although the Western Tuna and Billfish Fishery management area overlapped the Operational Area, there had been no fishing effort in the Operational Area for at least the past 10 years. Despite this, Woodside chose to consult licence holders in the fishery.</p>	<p><b>(2)</b> Woodside has assessed the potential for interaction with Commonwealth managed commercial fisheries in Section 4.10.1 of this EP and identified relevant persons in Appendix F, Table 1 of the EP in accordance with regulation 25 of the Environment Regulations.</p>
<p><b>(3)</b> Concern about energy companies sourcing mailing lists from AFMA or elsewhere.</p>	<p><b>(3)</b> <b>Woodside assessment:</b> Woodside considers purchasing contact details from a relevant Government agency is an appropriate means in which to contact relevant licence holders. <b>Woodside response:</b> Woodside obtains contact details of Commonwealth statutory fishing rights and fishing permit holders so that consultation is consistent with the Regulations, as per the expectation from AFMA that</p>	<p><b>(3)</b> Not required.</p>

	<p>petroleum operators consulted with fishing operators about all activities and projects which may affect day-to-day fishing activities. In addition to consulting individual licence holders, Woodside consulted relevant fishing industry associations and representative bodies such as Tuna Australia and Commonwealth Fisheries Association, and referred to the AFMA website to help inform which associations and bodies were relevant.</p>	
<p><b>(4)</b> Recommended entering into a services agreement to support consultation.</p>	<p><b>(4)</b> <b>Woodside assessment:</b> The Offshore Environment Regulations do not require the entry into a fee-for-service agreement in order to meet EP consultation requirements. Given Tuna Australia was not willing to make any amendments to the agreement to address Woodside’s concerns, Woodside has not agreed to enter into an agreement. Outside of a fee-for-service agreement, Woodside is willing to explore options on how best to consult Tuna Australia and licence holders. <b>Woodside response:</b> Woodside advised that consultation regulations did not require entry into a services agreement in order to engage in consultation or for an EP to be complete. Woodside confirmed it respects that, for a relevant person, consultation was voluntary. Woodside advised Tuna Australia the level of feedback provided by an organisation, if any, was at the person or organisation’s discretion, and Woodside was open to suggestions from Tuna Australia on ways to improve efficiency and simplicity for feedback.</p>	<p><b>(4)</b> Consultation with Tuna Australia is complete as reflected in Table 2 of Appendix F.</p>
<p><b>(5)</b> Wished to pause discussions on the consultation process while it took advice.</p>	<p><b>(5)</b> <b>Woodside assessment:</b> Woodside has provided sufficient information and a reasonable period to provide information on potential impacts to its interests, functions or activities. Woodside will continue to consult Tuna Australia when relevant. <b>Woodside response:</b> Woodside noted Tuna Australia’s wish to pause the consultation process and advised it</p>	<p><b>(5)</b> Not required.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	<p>would continue to consult Tuna Australia and Commonwealth licence holders for proposed activities where relevant and as appropriate, and that consultation was voluntary, and Tuna Australia could decide whether it wished to engage in the process or not.</p>	
<p>Woodside has addressed objections and claims as noted above.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>No additional measures or controls are required.</p>
<p><b>Outcomes of consultation</b></p>		
<p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with Tuna Australia for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:</p> <ul style="list-style-type: none"> <li>• Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.</li> <li>• Woodside published advertisements in a national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.</li> <li>• Consultation Information provided to Tuna Australia on 22 September 2023 based on their function, interest and activities.</li> <li>• Woodside has provided a link to NOPSEMA's brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>• Woodside has sent a follow up email seeking feedback on the proposed activities.</li> <li>• Woodside has addressed and responded to Tuna Australia over a 10-month period.</li> </ul>		
<p><b>Pearl Producers Association</b></p>		
<p><b>Summary of information provided and record of consultation for this EP:</b></p> <ul style="list-style-type: none"> <li>• On 26 September 2023, Woodside emailed Pearl Producers Association advising of the proposed activity (Record of Consultation, reference 1.45) and provided a Consultation Information Sheet and a link to NOPSEMA's brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> </ul>		

<ul style="list-style-type: none"> <li>On 17 October 2023, Woodside sent a reminder email to Pearl Producers Association following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside's website.</li> </ul>		
Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	<p>Woodside has consulted AFMA, DAFF - Fisheries, and CFA.</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has assessed the potential for interaction with Commonwealth managed commercial fisheries in Section 4.10.1 of this EP.</p> <p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.</p> <p>No additional measures or controls are required.</p>
<b>Outcomes of consultation</b>		
<p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with Pearl Producers Association for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:</p> <ul style="list-style-type: none"> <li>Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.</li> <li>Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.</li> <li>Consultation Information provided to Pearl Producers Association on 26 September 2023 based on their function, interest and activities.</li> <li>Woodside has provided a link to NOPSEMA's brochure <i>Consultation on offshore petroleum environment plans: Information for the community</i>.</li> <li>Woodside has sent a follow up email seeking feedback on the proposed activities.</li> <li>Woodside has provided Pearl Producers Association with the opportunity to provide feedback over a 10-month period.</li> </ul>		
<b>State Commercial fisheries and representative bodies</b>		
<b>Western Australian Fishing Industry Council (WAFIC)</b>		
<b>Summary of information provided and record of consultation for this EP:</b>		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- On 21 September 2023, Woodside emailed WAFIC advising of the proposed activity (Record of Consultation, reference 1.31) and provided an overview and Consultation Information Sheet for distribution to licence holders in six State fisheries relevant to the Operational Area of the proposed activity.
- On 21 September 2023, WAFIC responded thanking Woodside (SI Report, reference 14.1) for its email and:
  - (1) Advised it would send out the consultation material under its agreement with Woodside.
  - (2) Asked Woodside to confirm the relevance of the Marine Aquarium Fish Managed Fishery and Specimen Shell Managed Fishery, on the basis that the hand collection and diving methods used in this fishery were not applicable at the water depths of the proposed activity.
- On 21 September 2023, Woodside responded thanking WAFIC for its email (SI Report, reference 14.2). Woodside also:
  - (2) Confirmed that on the basis of the activity water depths, it would remove Marine Aquarium Fish Managed Fishery and Specimen Shell Managed Fishery from relevant fisheries for this activity.
- (1) On 21 September 2023, Woodside emailed WAFIC with an amendment to the information intended for distribution to the relevant fisheries, including an additional line regarding notification of activities (SI Report, reference 14.3).
- (1) On 21 September 2023, WAFIC emailed Woodside (SI Report, reference 14.4) confirming it had sent the amended version of the consultation information to licence holders in the four fisheries relevant to the Operational Area for this EP: Mackerel Managed Fishery (Area 2), Pilbara Line Fishery, Pilbara Trap Managed Fishery, and West Coast Deep Sea Crustacean Managed Fishery.
- On 18 October 2023, Woodside sent a reminder email to WAFIC following up on the proposed activity (SI Report, reference 14.5). Woodside noted that it understood WAFIC may not consider it necessary to send a reminder email to individual licence holders but provided a link to the Consultation Information Sheet on Woodside's website for WAFIC's information and for distribution to licence holders at WAFIC's discretion.
- On 19 October 2023, WAFIC thanked Woodside for its email (SI Report, reference 14.6) and confirmed that:
  - (3) As per WAFIC's protocol to avoid consultation fatigue, it did not consider it necessary to issue a consultation reminder to commercial licence holders.
  - (4) WAFIC would take time to review the consultation material ahead of the closure of the consultation period.
- On 31 October 2023, Woodside sent an email (SI Report, reference 14.7) to WAFIC in which Woodside thanked WAFIC for:
  - (3) Its advice that consultation reminders were not necessary for individual licence holders.
  - (4) Its intention to review the consultation material.
- On 31 October 2023, WAFIC emailed Woodside (SI Report, reference 14.8). WAFIC:
  - (1) Confirmed it had not received any feedback or concerns from licence holders regarding this EP.
  - (5) Confirmed that given the activity in this EP was standard business for Woodside, it had no further comment at this stage.
  - (6) Confirmed and agreed that Woodside would send all notifications regarding activities to WAFIC.
  - Requested to be consulted on any future development activities considered for the other operations EP.
- On 1 November 2023, Woodside responded thanking WAFIC for its email (SI Report, reference 14.9) and:
  - (5) Noted there was no feedback or concerns from licence holders and no further comment from WAFIC.

- (6) Noted that as this and another EP included ongoing operations no activity notifications were expected, but confirmed it would provide WAFIC with start and end activity notifications for the associated drilling, construction and installation activities related to the other operations EP.
- On 6 November 2023, WAFIC responded thanking Woodside for its email (SI Report, reference 14.10).

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p>(1) WAFIC advised it would send consultation material to relevant licence holders, and, following the consultation period, confirmed it received no feedback or concerns from licence holders.</p>	<p>(1) <b>Woodside assessment:</b> Woodside notes relevant licence holders received the consultation information via WAFIC and accepts there was no feedback or concerns raised. <b>Woodside response:</b> Woodside thanked WAFIC for distributing the consultation information to relevant licence holders and for confirming no feedback or concerns were raised by the licence holders.</p>	<p>(1) Not required.</p>
<p>(2) Asked Woodside to clarify the relevance to the Operational Area of two fisheries based on the collection and diving methods.</p>	<p>(2) <b>Woodside assessment:</b> Woodside assessed WAFIC’s feedback regarding the relevancy of two fisheries and based on WAFIC’s expertise on water depths and the methods of hand collection and diving, determined it would not consider the Marine Aquarium and Specimen Shell fisheries relevant to the Operational Area for this EP. <b>Woodside response:</b> Woodside confirmed it would not consider the Marine Aquarium and Specimen Shell fisheries as relevant to this EP, based on WAFIC’s advice.</p>	<p>(2) Woodside has assessed the potential for interaction with State managed commercial fisheries in Section 4.10.1 of this EP. Woodside has updated its assessment of relevancy for consultation purposes (see Appendix F, Table 1) to reflect WAFIC’s advice and consultation guidelines.</p>
<p>(3) Advised it did not consider it necessary to send reminder emails to licence holders for this activity.</p>	<p>(3) <b>Woodside assessment:</b> Woodside accepts WAFIC’s advice that reminder emails are not necessary for individual licence holders. <b>Woodside response:</b> Woodside acknowledged WAFIC’s advice that it was not necessary to send reminder emails to individual licence holders.</p>	<p>(3) Not required.</p>
<p>(4)</p>	<p>(4)</p>	<p>(4) Not required.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Confirmed it would take time to review the consultation material before the end of the consultation period.	<b>Woodside assessment:</b> Woodside noted WAFIC would review the consultation material. <b>Woodside response:</b> Woodside thanked WAFIC for reviewing the consultation material.	
<b>(5)</b> Noted it had no further comment on the EP at this stage.	<b>(5)</b> <b>Woodside assessment:</b> Woodside accepts that WAFIC has no comment on the EP at this time. <b>Woodside response:</b> Woodside noted WAFIC had reviewed the consultation material and did not have further comment on the EP at this stage.	<b>(4)</b> Not required.
<b>(6)</b> Confirmed Woodside should send all notifications regarding activities to WAFIC.	<b>(6)</b> <b>Woodside assessment:</b> As this EP involves ongoing operations, no activity notifications are expected. <b>Woodside response:</b> Woodside confirmed to WAFIC that there were not expected to be activity notifications for the ongoing operations involved with this EP.	<b>(6)</b> Not required.
While feedback has been received, there were no objections or claims.	Woodside has consulted DPIRD, WAFIC and individual licence holders (via WAFIC). Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with WAFIC for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times,

Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.

- Consultation Information provided to WAFIC on 20 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email seeking feedback on the proposed activities.
- Woodside has addressed and responded to WAFIC over a 10-month period.

**Mackerel Managed Fishery (Area 2)**

**Summary of information provided and record of consultation for this EP:**

- On 21 September 2023, WAFIC, on behalf of Woodside, emailed Mackerel Managed Fishery (Area 2) individual licence holders advising of the proposed activity (Record of Consultation, reference 1.32) and provided a Consultation Information Sheet.
- As per advice from WAFIC regarding its consultation guidelines, no follow-up email was required to the Mackerel Managed Fishery (Area 2).

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
No feedback, objections or claims received.	Woodside has consulted DPIRD, WAFIC and individual licence holders (via WAFIC). Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has assessed the potential for interaction with State managed commercial fisheries in Section 4.10.1 of this EP. Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under Regulation 25 and consultation with Mackerel Managed Fishery (Area 2) for the purpose of 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times,

Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.

- Consultation Information provided to Mackerel Managed Fishery (Area 2), via WAFIC, on 21 September 2023 based on their function, interest and activities.
- Woodside has provided the Mackerel Managed Fishery (Area 2) with the opportunity to provide feedback over a 10-month period.

**West Coast Deep Sea Crustacean Managed Fishery**

**Summary of information provided and record of consultation for this EP:**

- On 21 September 2023, WAFIC, on behalf of Woodside, emailed West Coast Deep Sea Crustacean Managed Fishery individual licence holders advising of the proposed activity (Record of Consultation, reference 1.32) and provided a Consultation Information Sheet.
- As per advice from WAFIC regarding its consultation guidelines, no follow-up email was required to the West Coast Deep Sea Crustacean Managed Fishery.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received.	Woodside has consulted DPIRD, WAFIC and individual relevant licence holders (via WAFIC). Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has assessed the potential for interaction with State managed commercial fisheries in Section 4.10.1 of this EP. Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP. No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 and consultation with West Coast Deep Sea Crustacean Managed Fishery for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to West Coast Deep Sea Crustacean Managed Fishery, via WAFIC, on 21 September 2023 based on their function, interest and activities.

Gascoyne Recreational Marine Users		

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside sent a letter to Gascoyne Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 1.41) and provided a Consultation Information Sheet and referred to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder letter to Gascoyne Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 2.5) and included a QR code link to the Consultation Information Sheet on Woodside's website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow up.	<p>Woodside has consulted Recfishwest, Marine Tourism WA, WA Game Fishing Association and individual recreational marine users.</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.</p> <p>No additional measures or controls are required.</p>

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with Gascoyne Recreational Marine Users for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to Gascoyne Recreational Marine Users on 22 September 2023 based on their function, interest and activities.
- Woodside has referred Gascoyne Recreational Marine Users to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up letter seeking feedback on the proposed activities.

- Woodside has provided Gascoyne Recreational Marine Users with the opportunity to provide feedback over a 10-month period.

**Pilbara/Kimberley Recreational Marine Users**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside sent a letter to Pilbara/Kimberley Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 1.41) and provided a Consultation Information Sheet and referred to NOPSEMA’s brochure Consultation on offshore petroleum environment plans: Information for the community.
- On 16 October 2023, Woodside sent a reminder letter to Pilbara/Kimberley Recreational Marine Users following up on the proposed activity (Record of Consultation, reference 2.5) and included a QR code link to the Consultation Information Sheet on Woodside’s website.

**Summary of Feedback, Objection or Claim**

**Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response**

**Inclusion in Environment Plan**

No feedback, objections or claims received despite follow-up.

Woodside has consulted Recfishwest, Marine Tourism WA, WA Game Fishing Association and individual recreational marine users.  
Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).

Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.  
No additional measures or controls are required.

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with Pilbara/Kimberley Recreational Marine Users for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to Pilbara/Kimberley Recreational Marine Users on 22 September 2023 based on their function, interest and activities.

- Woodside has referred Pilbara/Kimberley Recreational Marine Users to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up letter seeking feedback on the proposed activities.
- Woodside has provided Pilbara/Kimberley Recreational Marine Users with the opportunity to provide feedback over a 10-month period.

**Lombadina Aboriginal Corporation (LAC)**

LAC have been identified as a relevant person through their functions, interests or activities as a Pilbara/Kimberley Recreational Marine User, as identified in Table 1. LAC is not a Prescribed Body Corporate under the Native Title Act 1993 and associated regulations.

**Historical engagement:**

- On 25 July 2023, Woodside emailed LAC NOPSEMA's Consultation Guidelines, Consultation Brochure, and Draft Policy for Managing Gender-Restricted Information. This email also reiterated Woodside's request that LAC advise Woodside of any other Traditional Custodian groups or individuals with whom Woodside should consult. No response was received to this email.

**Summary of information provided and record of consultation for this EP:**

- On 6 October 2023, Woodside emailed LAC advising of the proposed activity (Record of Consultation, reference 1.97) and provided a simplified Consultation Information Sheet (including a link to the detailed information sheet on Woodside's website) as well as a summary overview fact sheet. The email requested information on the interests that lac and its members may have within the EMBA, information on how LAC would like to engage, and requested that LAC provide information to other individuals as required.
- On 10 October 2023, Woodside met with LAC in person for a consultation meeting on this activity. Woodside explained the activity, noting that it is a 5-year submission review and had been operating since 2008 and was located near Exmouth. Woodside described the EMBA and how the EMBA is created. Woodside talked through the NOPSEMA guidelines.
  - (1) LAC asked a question about how Woodside drilled into the ocean floor. Woodside said they would provide an animation drilling video that demonstrated the process.
  - Woodside asked LAC if there were any cultural values that they would like Woodside to know about noting that there is the option to require information to be kept confidential. Woodside asked whether LAC had any further questions or concerns in relation to this EP. LAC responded no to both queries.
  - Woodside said it was able to fund future meetings.
- (1) On 17 October 2023, Woodside emailed LAC thanking them for the 10 October 2023 meeting and reaffirmed that feedback on EPs can be provided over the life of the EP and does not need to occur before the activity commences. Woodside also provided a drilling video as requested by LAC at the meeting. No response has been received.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside's Response	Inclusion in Environment Plan
---	--	-------------------------------

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>(1) LAC requested more information about how Woodside drills into the ocean floor.</p>	<p>(1) <b>Woodside assessment:</b> Woodside acknowledged LAC’s request for more information about drilling. <b>Woodside response:</b> Woodside responded to LAC’s requests for information by explaining the process and providing a video. No further information was requested on this topic.</p>	<p>(1) Existing controls considered sufficient, as described in Section 6 and 7.</p>
<p>While feedback has been received, there were no objections or claims.</p>	<p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>No additional measures or controls are required.</p>
<p><b>Outcomes of consultation</b></p>		
<p>Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with LAC for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.5 of the EP. Specifically:</p> <p><b>Sufficient Information:</b></p> <ul style="list-style-type: none"> <li>• Woodside sought direction on LAC’s preferred method of consultation. As sufficient information and a reasonable period have been provided (see below), any meetings would be considered as ongoing engagement post regulation 25 consultation.</li> <li>• Provided Consultation Information Sheet and Consultation Summary Sheets developed by Indigenous staff to LAC. These set out details of the proposed activity, the location of the activity, the timing of the activity as well as the potential risks and impacts of the activity with controls in a digestible, plain English format.</li> <li>• Articulated planned and unplanned environmental risks and impacts, with proposed controls.</li> <li>• Confirmed the purpose of consultation and set out in detail what is being sought through consultation.</li> <li>• Asked for the consultation and information sheets to be distributed to members and individuals.</li> <li>• Woodside has provided NOPSEMA’s Brochure “Consultation on offshore petroleum environment plans” and Guideline “Guideline: Consultation in the course of preparing an environment plan”.</li> <li>• Advised that LAC’s can request that particular information provided in the consultation not be published (to align with regulation 25(4) of the Environment Regulations).</li> </ul> <p><b>Reasonable Period:</b></p> <ul style="list-style-type: none"> <li>• Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo,</li> </ul>		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023).

- Woodside commenced consultation with LAC in October 2023. Woodside has addressed and responded to LAC over nine months, demonstrating a “reasonable” period of consultation.
- Woodside asked LAC if it was aware of any other Traditional Custodian groups or individuals with whom Woodside should consult. None were identified.
- Woodside engages in ongoing consultation, beyond that required by regulation 25 of the Environment Regulations, throughout the life of an EP. Should feedback be received after the EP has been accepted (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).
- Woodside considers the measures and controls described in this EP address the potential impact from the proposed activity on LAC’S functions, interests or activities.

**Karratha Recreational Marine Users**

**Summary of information provided and record of consultation for this EP:**

- On 14 September 2023, Woodside emailed Karratha Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 1.6) and provided a Consultation Information Sheet and a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to Karratha Recreational Marine Users following up on the proposed activity (Record of Consultation, reference 2.1) and included a link to the Consultation Information Sheet on Woodside’s website.

<b>Summary of Feedback, Objection or Claim</b>	<b>Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response</b>	<b>Inclusion in Environment Plan</b>
No feedback, objections or claims received despite follow-up.	Woodside has consulted Recfishwest, Marine Tourism WA, WA Game Fishing Association and individual recreational marine users.  Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.  No additional measures or controls are required.

**Outcomes of consultation**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with Karratha Recreational Marine Users for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to Karratha Recreational Marine Users on 14 September 2023 based on their function, interest and activities.
- Woodside has provided a link to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up email to Karratha Recreational Marine Users seeking feedback on the proposed activities.
- Woodside has provided the Karratha Recreational Marine Users with the opportunity to provide feedback over a 10-month period.

**West Coast Recreational Marine Users**

**Summary of information provided and record of consultation for this EP:**

- On 22 September 2023, Woodside sent a letter to West Coast Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 1.41) and provided a Consultation Information Sheet and referred to NOPSEMA’s brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder letter to West Coast Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 2.5) and included a QR code link to the Consultation Information Sheet on Woodside’s website.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
No feedback, objections or claims received despite follow-up.	Woodside has consulted Recfishwest, Marine Tourism WA, WA Game Fishing Association and individual recreational marine users.  Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).	Woodside has implemented a consultation program to advise relevant persons of the PAP and provide opportunity to raise objections or claims, as referenced as PS 1.4 in this EP.  No additional measures or controls are required.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

### Outcomes of consultation

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with West Coast Recreational Marine Users for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to West Coast Recreational Marine Users on 22 September 2023 based on their function, interest and activities.
- Woodside has referred West Coast Recreational Marine Users to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up letter seeking feedback on the proposed activities.
- Woodside has provided West Coast Recreational Marine Users with the opportunity to provide feedback over a 10-month period.

### South Coast Recreational Marine Users

#### Summary of information provided and record of consultation for this EP:

- On 22 September 2023, Woodside sent a letter to South Coast Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 1.41) and provided a Consultation Information Sheet and a link to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- On 16 October 2023, Woodside sent a reminder email to South Coast Recreational Marine Users advising of the proposed activity (Record of Consultation, reference 2.5).
- On 4 October 2023, a fishing charter operator consulted as part of the South Coast Recreational Marine Users emailed Woodside (SI Report, reference 15.1) and commented they were vehemently against the proposal of FPSOs in the Carnarvon Basin due to the risks to marine and shore environments which, in their opinion, outweighed the projects. Their concerns regarded:
  - (1) The potential of a crude oil spill and/or the release of hydrocarbons and the effect on marine life, Ningaloo Reef, and coastline.
  - (2) The impact on shoreline bird life and marine mammals such as whales.
  - The drilling of two new wells associated with another EP (which was consulted in conjunction with this EP), and the impact on the World Heritage-listed reef and coast.
  - Seismic blasting carried out to search for the new wells associated with the other EP, and the impact on the natural environment including fauna.

- On 12 October 2023, Woodside emailed the fishing charter operator thanking them for their email, and asked to confirm they were referencing activities relating to this EP, and which stakeholder group they were part of (SI Report, reference 15.2).
- On 12 October 2023, the fishing charter operator responded to Woodside confirming their comments were in relation to this EP and that they were part of the coastal tourism stakeholder group (SI Report, reference 15.3).
- On 27 November 2023, Woodside responded (SI Report, reference 15.4) and advised:
  - (1) In accordance with Woodside’s risk assessment for this EP, a worst-case loss of well containment has been defined as a ‘highly unlikely’ event. In the highly unlikely event of a hydrocarbon release, Woodside has a well-developed oil response management framework, including specific responses for sensitive areas such as Ningaloo Marine Park, and an Oil Pollution First Strike Plan which guides the immediate response.
  - (2) The potential impacts on bird life and marine animals depend on the timing, duration and extent of a spill in the highly unlikely event this occurs. Response options to mitigate environmental impacts include tracking the spill, the use of protective barriers, shoreline clean-up techniques, prevention of the spill contacting wildlife where feasible and rehabilitation of wildlife where contact occurs, and long-term monitoring of sensitive species and sites after a spill event.
  - The other EP included production from a proposed additional two wells via subsea tieback to existing infrastructure. There were no planned impacts on the nearby World Heritage area or coastline as a result of the proposed additional wells or ongoing activities proposed under the other EP. The proposed activity to drill the two wells would be subject to a separate and future EP, for which Woodside would undertake consultation.
  - There were no seismic activities associated with the other EP.

Summary of Feedback, Objection or Claim	Assessment of Merits of Feedback, Objection or Claim and Woodside’s Response	Inclusion in Environment Plan
<p><b>(1)</b> Fishing charter operator’s concerns about the potential of a crude oil spill and its impact on marine life, reef and coastline.</p>	<p><b>(1)</b> <b>Woodside assessment:</b> Woodside has assessed the risk of worst-case loss of well containment as ‘highly unlikely’. <b>Woodside response:</b> Woodside advised a worst-case loss of well containment had been defined as a ‘highly unlikely’ event and it had a well-developed oil response management framework including an Oil Pollution First Strike Plan.</p>	<p><b>(1)</b> The risks associated with unplanned activities are assessed in Section 6.8 of this EP.</p>
<p><b>(2)</b> Fishing charter operator’s concerns about the impact on shoreline birds and marine mammals.</p>	<p><b>(2)</b> <b>Woodside assessment:</b> Woodside has developed response plans to mitigate or avoid impacts on shoreline birds and marine mammals in the highly unlikely event of a hydrocarbon release. <b>Woodside response:</b> Woodside advised the impact on animals depended on the timing, duration and extent of a spill. 	barriers, shoreline clean-up techniques, prevention of contact with wildlife and rehabilitation of wildlife where contact occurs, and long-term monitoring of species and sites after a spill.	
Woodside has addressed claims and objections as noted above.	<p>Woodside has consulted Recfishwest, Marine Tourism WA, WA Game Fishing Association and individual recreational marine users.</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.5.1 of the EP).</p>	<p>Woodside has consulted South Coast Recreational Marine Users in the course of preparing this EP. Woodside has assessed the claims or objections raised by a South Coast Recreational Marine User. No additional measures or controls have been put in place.</p> <p>Woodside considers the measures and controls described within this EP address the potential impact from the proposed activities on the South Coast Recreational Marine Users' functions, interests or activities.</p> <p>No additional measures or controls are required.</p>

**Outcomes of consultation**

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and consultation with South Coast Recreational Marine Users for the purpose of regulation 25 is complete. Sufficient information and a reasonable period have been provided, as described in Section 5.4 of the EP. Specifically:

- Consultation Information Sheet publicly available on the Woodside website since 12 September 2023.
- Woodside published advertisements in national, state and relevant local newspapers including The Australian, The West Australian, NT News, Pilbara News, North West Telegraph, Midwest Times, Manjimup-Bridgetown Times, Kalgoorlie Miner (13 September 2023), Broome Advertiser, South Western Times, Kimberley Echo, Albany Advertiser, Countryman, Narrogin Observer, Great Southern Herald, Harvey Waroona Reporter (14 September 2023) and Augusta Margaret River Times, Busselton Dunsborough Times, Geraldton Guardian (15 September 2023), Koori Mail (20 September 2023) and National Indigenous Times (26 September 2023) advising of the proposed activities and requesting feedback.
- Consultation Information provided to South Coast Recreational Marine Users on 22 September 2023 based on their function, interest and activities.
- Woodside has referred South Coast Recreational Marine Users to NOPSEMA's brochure *Consultation on offshore petroleum environment plans: Information for the community*.
- Woodside has sent a follow up letter seeking feedback on the proposed activities.
- Woodside has addressed and responded to South Coast Recreational Marine Users over a 10-month period.

**Christmas Island Recreational Marine Users**
