

Julimar Operations Environment Plan

Australian Operations

March 2025

Rev 8

This page has been intentionally left blank

TABLE OF CONTENTS

1.	INTRODUCTION	18
1.1	Overview.....	18
1.2	Purpose of the Environment Plan	18
1.3	Scope of the Environment Plan	19
1.4	Environment Plan Summary	20
1.5	Structure of the Environment Plan.....	21
1.6	Description of the Titleholder.....	23
1.7	Details of Titleholder and Nominated Liaison	23
1.7.1	Titleholder.....	23
1.7.2	Nominated Liaison	24
1.7.3	Arrangements for Notifying Change	24
1.8	Operational Interface with the Wheatstone Platform	24
1.8.1	Field Operations Manual	25
1.9	Woodside Management System.....	26
1.9.1	Environment and Biodiversity Policy	28
1.9.2	Climate Policy	28
1.10	Description of Relevant Requirements	29
1.10.1	Offshore Petroleum and Greenhouse Gas Storage Act 2006 (OPGGGS Act).....	29
1.10.2	Environment Protection and Biodiversity Conservation Act 1999 (Cth).....	30
1.10.3	Offshore Project Approval	30
1.10.4	Recovery Plans and Threat Abatement Plans.....	31
1.10.5	Australian Marine Parks	31
1.10.6	World Heritage Properties	32
2.	ENVIRONMENT PLAN PROCESS.....	33
2.1	Overview.....	33
2.2	Environmental Impact and Risk Management Methodology	33
2.2.1	Woodside Risk Management Process.....	33
2.2.2	Health, Safety and Environment Management Procedure	34
2.2.3	Impact Assessment Procedure.....	34
2.2.4	Process Safety Management Procedure and Process Safety Risk Assessment Procedure 35	
2.3	Environmental Plan Development Process	35
2.4	Establish the Context.....	36
2.4.1	Define the Activity	36
2.4.2	Define the Existing Environment	37
2.4.3	Relevant Requirements	38
2.5	Impact and Risk Identification.....	38
2.6	Impact and Risk Analysis	39
2.6.1	Decision Support Framework	39
2.6.1.1	Decision Type A.....	40
2.6.1.2	Decision Type B.....	40

2.6.1.3	Decision Type C.....	40
2.6.1.4	Decision Support Framework Tools	41
2.6.1.5	Decision Calibration	42
2.6.2	Control Measures (Hierarchy of Controls)	42
2.6.3	Impact and Risk Classification.....	42
2.6.4	Risk Rating Process	43
2.6.4.1	Select the Consequence Level	44
2.6.4.2	Select the Likelihood Level	44
2.6.4.3	Calculate the Risk Rating.....	44
2.7	Classification and Analysis of Major Environmental Events (MEEs)	45
2.7.1	Major Environment Event Identification	45
2.7.2	Major Environment Event Classification	46
2.7.3	Bowtie Analysis	46
2.7.4	Major Environment Event Register	48
2.7.5	Safety and Environment Critical Elements and Technical Performance Standards	48
2.7.6	Safety-critical Management System Barriers	49
2.8	Impact and Risk Evaluation	49
2.8.1	Demonstration of As Low As Reasonably Practicable.....	49
2.8.2	Demonstration of Acceptability	49
2.9	Recovery Plan and Threat Abatement Plan Assessment.....	50
2.10	Environmental Performance Outcomes, Environmental Performance Standards and Measurement Criteria	50
2.11	Implement, Monitor, Review and Reporting	51
2.12	Consultation.....	51
3.	DESCRIPTION OF THE ACTIVITY	52
3.1	Overview.....	52
3.2	Location	52
3.3	Operational Area	55
3.4	Timing.....	55
3.5	Activity Components.....	55
3.5.1	Field Inventory	55
3.5.2	Julimar Phase 3 Commissioning and Start-up	58
3.5.3	Steady State Production Operations	58
3.5.4	Greenhouse Gas Emissions	58
3.6	Support Vessel Operations.....	59
3.6.1	Subsea Support Vessels	59
3.6.2	Uncrewed Surface Vessel	60
3.6.3	Remotely Operated Vehicles.....	61
3.7	Helicopter Operations.....	61
3.8	Chemical Usage	62
3.9	Subsea Inspection, Monitoring, Maintenance, and Repair Activities	62
3.9.1	Inspections	62

3.9.2	Monitoring	64
3.9.3	Maintenance	64
3.9.4	Repair	65
3.9.5	Chemical Usage During IMMR Activities	65
3.9.5.1	Typical Discharges During IMMR Activities	66
3.9.6	Marine Growth Removal	66
3.9.7	Sediment Relocation and Disturbance	67
4.	DESCRIPTION OF THE EXISTING ENVIRONMENT	68
4.1	Overview	68
4.2	Regional Context	71
4.3	Physical Environment	71
4.3.1	Seabed Features in the Operational Area	72
4.4	Habitats and Biological Communities	75
4.5	Matters of National Environmental Significance	78
4.6	Protected Species	78
4.6.1	Fish, Sharks and Rays	79
4.6.1.1	Whale shark	82
4.6.2	Marine Reptiles	83
4.6.2.1	Flatback turtle	90
4.6.3	Marine Mammals	91
4.6.3.1	Pygmy Blue Whale	94
4.6.4	Seabirds and Migratory Shorebirds	96
4.6.4.1	Wedge-tailed Shearwater	101
4.6.5	Seasonal Sensitivities for Protected Species	101
4.7	Key Ecological Features (KEFs)	102
4.7.1	Ancient Coastline at 125 m Depth Contour	103
4.7.2	Continental Slope Demersal Fish Communities	104
4.8	Protected Places	104
4.8.1	Montebello Marine Park	106
4.9	Socio-Economic and Cultural Environment	107
4.9.1	Cultural Values and Heritage	107
4.9.1.1	Native Title	107
4.9.1.2	Coastally Adjacent First Nations Groups	108
4.9.1.3	Marine Parks	111
4.9.1.4	General Cultural Values of Marine Ecosystems	112
4.9.2	Sea Country Values	112
4.9.2.1	Desktop Assessment of Sea Country Values	113
4.9.2.2	First Nations Archaeological Heritage Assessment	119
4.9.2.3	Feedback Received via Consultation to Inform Existing Environment Description	119

4.9.3	Summary of Cultural Features and Heritage Values	128
4.9.3.1	Historic Sites of Significance.....	133
4.9.3.2	Historic Underwater Heritage.....	133
4.9.3.3	World, National and Commonwealth Heritage Listed Places	133
4.9.4	Commercial Fisheries.....	134
4.9.5	Pearling and Aquaculture	141
4.9.6	Tourism and Recreation	141
4.9.7	Commercial Shipping	142
4.9.8	Oil and Gas.....	142
4.9.9	Defence	145
4.9.10	Other Industries	145
5.	STAKEHOLDER CONSULTATION	147
5.1	Summary	147
5.2	Consultation – General Context	148
5.3	Identification of Relevant Persons for Consultation	152
5.3.1	Regulations 25(1)(a), (b) and (c)	152
5.3.2	Identification of Relevant Persons under Regulations 25(1)(a), (b) and (c).....	152
5.3.3	Regulation 25(1)(d).....	154
5.3.4	Identification of Relevant Persons under Regulation 25(1)(d)	154
5.3.5	Regulation 25(1)(e).....	161
5.3.6	Identification of Relevant Persons under Regulation 25(1)(e)	161
5.3.7	Persons or Organisations Woodside Chooses to Contact.....	161
5.3.8	Assessment of Relevant Persons for the Proposed Activity.....	162
5.4	Consultation Material and Timing	162
5.4.1	Sufficient Information	162
5.4.2	Reasonable Period for Consultation	165
5.4.3	Discharge of Regulation 25	167
5.5	Context of Consultation Approach with Traditional Custodians.....	168
5.5.1	Approach to Methodology – Woodside’s Interpretation of Tipakalippa Appeal	168
5.5.2	Consultation Method.....	169
5.5.3	Identification of Relevant Persons	171
5.5.4	Opportunity to Self-identify and Identifying Other Individuals.....	172
5.5.5	Sufficient Information	173
5.5.6	Reasonable Period for Consultation	173
5.5.7	Discharge of Regulation 25	173
5.6	Providing Feedback and Assessment of Merit of Objections or Claims	173
5.7	Ongoing Consultation	174
6.	ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENTS CRITERIA.....	176
6.1	Overview.....	176
6.2	Impact and Risk Analysis and Evaluation.....	176

6.3	Impacts and Risks Deemed Not Credible or Outside the Scope of this Environment Plan	184
6.3.1	Risk or Impacts Not Credible	184
6.3.2	Potential Environment Risks Not Within the Scope of this Environment Plan	184
6.3.2.1	GHG Emissions associated with Onshore Processing, Third Party Transport of Products, Regassification, Distribution and End Use	184
6.4	Cumulative Impacts	184
6.5	Environmental Performance Outcomes, Standards and Measurement Criteria.....	185
6.6	Presentation	185
6.7	Planned Activities (Routine and Non-routine).....	188
6.7.1	Physical Presence: Interaction with Other Marine Users	188
6.7.2	Physical Presence: Disturbance to Seabed	196
6.7.3	Routine Acoustic Emissions: Generation of Noise during Operations.....	205
6.7.4	Routine and Non-Routine Discharges: Discharge of Chemicals and Hydrocarbons during Subsea Operations and Activities	220
6.7.5	Routine and Non-Routine Discharges: Support Vessel Operations	227
6.7.6	Routine Atmospheric and Greenhouse Gas Emissions: Fuel Combustion	232
6.7.7	Routine Light Emissions: External Lighting from Support Vessels	245
6.8	Unplanned Activities (Accidents, Incidents, Emergency Situations) – Major Environmental Event	252
6.8.1	MEE Overview	252
6.8.2	Quantitative Spill Risk Assessment Methodology	253
6.8.2.1	Hydrocarbon Characteristics.....	254
6.8.2.2	EMBA and Hydrocarbon Contact Thresholds	256
6.8.2.3	Operational and Scientific Monitoring	257
6.8.3	Unplanned Hydrocarbon Release: Loss of Well Containment (MEE-01)	258
6.9	Unplanned Activities (Accidents, Incidents, Emergency Situations).....	288
6.9.1	Unplanned Hydrocarbon Release: Vessel Collision	288
6.9.2	Unplanned Hydrocarbon Release: Loss of Containment from Subsea Infrastructure	299
6.9.3	Unplanned Hydrocarbon or Chemical Release: Hydrocarbon or Chemical during Transfer, Storage or Use	309
6.9.4	Unplanned Discharge: Loss of Hazardous or Non-Hazardous Waste/Equipment	316
6.9.5	Physical Presence: Vessel Collision with Marine Fauna	323
6.9.6	Physical Presence: Interaction with Live Infrastructure	329
6.9.7	Physical Presence: Disturbance to Seabed from Dropped Objects	333
6.9.8	Physical Presence: Accidental Introduction of Invasive Marine Species.....	336
6.10	Recovery Plan and Threat Abatement Assessment.....	345
7.	IMPLEMENTATION STRATEGY	360
7.1	Overview.....	360
7.2	Systems, Practice, and Procedures	360
7.2.1	WMS Operate Processes	360
7.2.1.1	Operate Plant.....	360
7.2.1.2	Maintain Assets.....	361

7.2.2	Process Safety Management	362
7.2.2.1	Woodside Safety Culture Framework	362
7.2.3	Environmental Considerations during Chemical Selection, Assessment and Approval ..	363
7.2.4	Woodside Invasive Marine Species Risk Assessment Process	365
7.2.4.1	Objective and Scope	365
7.2.4.2	Risk Assessment Process	365
7.2.5	Risk Management.....	367
7.2.6	Management of Risks – Contracting and Procurement.....	368
7.2.7	Management of Risks – Subsea Activities	368
7.2.8	Management of Risks – Major Projects	369
7.2.9	Management of Human Factor Related Risks.....	369
7.2.10	Management of Risks – Well Integrity	369
7.2.11	Management of Risks – Marine Services	370
7.3	Change Management	370
7.3.1	Technical Change Management.....	370
7.3.2	EP Management of Change and Revision	371
7.3.3	Oil Pollution Emergency Plan Management of Change	372
7.3.4	Management of SCE Technical Performance Standards and Management System Performance Standards	372
7.3.4.1	Management System Performance Standards	372
7.3.4.2	SCE Technical Performance Standards	372
7.4	Woodside’s Decommissioning Framework.....	374
7.4.1	Decommissioning in Operations.....	375
7.4.2	Decommissioning Planning	375
7.4.3	Inventory of Property within the Julimar Development	376
7.5	Julimar Decommissioning Strategy	377
7.6	Decommissioning Planning Activities	377
7.6.1	Wells.....	377
7.6.2	Decommissioning Execution Planning	378
7.7	Organisational Structure	378
7.8	Roles and Responsibilities	379
7.9	Communication Strategy	386
7.9.1	Subsea Operating Procedures	386
7.9.2	Information Management.....	386
7.9.3	Onshore.....	386
7.9.4	Offshore.....	386
7.10	Unexpected Finds Procedure	386
7.11	Training and Competency	387
7.11.1	Overview.....	387
7.11.2	Inductions	388
7.11.3	Activities Program Specific Environmental Awareness	388
7.11.4	Operations Personnel.....	388

7.11.5	Environmental Leadership Training	389
7.11.6	Permit to Work System Training	389
7.11.7	Emergency and Hydrocarbon Spill Response Training	389
7.11.8	Subsea Inspection, Monitoring, Maintenance and Repair Activity Environmental Awareness	389
7.11.9	Management of Training Requirements	390
7.12	Monitoring, Auditing, Management of Non-Conformance and Review	390
7.12.1	Monitoring	390
7.12.1.1	Source-based Impacts and Risks	390
7.12.1.2	Management of Knowledge	391
7.12.1.3	Management of Newly Identified Impacts and Risks	391
7.12.2	Auditing	639
7.12.2.1	Operations Assurance	639
7.12.2.2	Subsea Scope Activities	639
7.12.2.3	Marine Assurance	640
7.12.2.4	Risk Assessment	641
7.12.3	Management of Non-conformance	642
7.12.4	Review	642
7.12.4.1	Management Review	642
7.12.4.2	Program of Ongoing Engagement with Traditional Custodians	643
7.12.4.3	Learning and Knowledge Sharing	643
7.12.4.4	Continuous Improvement	643
7.13	Record Keeping	644
7.14	Ongoing Consultation	644
7.15	Reporting	648
7.15.1	Overview	648
7.15.2	Routine Reporting (Internal)	648
7.15.2.2	Regular Health, Safety and Environment Meetings	648
7.15.2.3	Performance Reporting	648
7.15.3	Routine Reporting (External)	649
7.15.3.1	Environmental Performance Review and Reporting	649
7.15.3.2	Start and End Notifications of the Petroleum Activities Program	649
7.15.3.3	End of the Environment Plan	649
7.15.4	Incident Reporting (Internal)	649
7.15.5	Incident Reporting (External) – Reportable and Recordable	650
7.15.5.1	Reportable Incidents	650
7.15.5.2	Recordable Incidents	650
7.15.5.3	Other External Reporting Requirements and Notifications	651
7.16	Emergency Preparedness and Response	654

7.16.1	Overview.....	654
7.16.2	Emergency Response Training.....	655
7.16.3	Emergency Response Preparation.....	655
7.16.3.1	Initial Response to Field Production System Incident.....	656
7.16.3.2	Initial response to Vessel Incident	657
7.16.4	Oil and Other Hazardous Materials Spill	657
7.16.5	Emergency and Spill Response	657
7.16.6	Emergency and Spill Response Drills and Exercises.....	658
7.16.7	Hydrocarbon Spill Response Testing of Arrangements.....	659
7.16.7.1	Testing of Arrangements Schedule.....	659
7.16.8	Cyclone and Dangerous Weather Preparation.....	661
8.	REFERENCES	662
9.	LIST OF TERMS AND ACRONYMS.....	676
APPENDIX A	ENVIRONMENT AND BIODIVERSITY, RISK MANAGEMENT AND CLIMATE POLICIES	681
APPENDIX B	RELEVANT REQUIREMENTS	682
APPENDIX C	WOODSIDE MASTER EXISTING ENVIRONMENT DOCUMENT	683
APPENDIX D	OIL SPILL PREPAREDNESS AND RESPONSE MITIGATION ASSESSMENT	684
APPENDIX E	NOPSEMA REPORTING FORMS	685
APPENDIX F	CONSULTATION	687
APPENDIX G	OIL POLLUTION FIRST STRIKE PLAN.....	688
APPENDIX H	PMST SEARCH	689
APPENDIX I	PROGRAM OF ONGOING ENGAGEMENT WITH TRADITIONAL CUSTODIANS	690
APPENDIX J	ABORIGINAL HERITAGE INQUIRY SYSTEM.....	691

LIST OF TABLES

Table 1-1:	EP summary	21
Table 1-2:	EP process phases, applicable Environment Regulations and relevant section of EP..	21
Table 1-3:	Relevant requirements of the OPGGS Act 2006	29
Table 1-4:	Manner in which the proposed action must be taken as per EPBC 2011/5936 relevant to the Petroleum Activities Program.....	30
Table 1-5:	Conditions of Class Approval relevant to the Petroleum Activities Program	31
Table 1-6:	Relevant Management Principles under Schedule 5—Australian World Heritage management principles of the EPBC Act.....	32
Table 2-1:	Example of the environment values potentially impacted which are assessed within the Environment Plan.....	38
Table 2-2:	Example of layout of identification of risks and impacts in relation to risk sources.....	39
Table 2-3:	Woodside risk matrix (environment and social and cultural) consequence descriptions	43
Table 2-4:	Woodside risk matrix likelihood levels	44

Table 2-5: Summary of Woodside's criteria for demonstrating 'as low as reasonably practicable'.	49
Table 2-6: Summary of Woodside's criteria for acceptability	50
Table 3-1: Petroleum Activities Program Overview	52
Table 3-2: Julimar Development and Associated Infrastructure Locations and Petroleum Permits	53
Table 3-3: Inventory of installed wells and subsea infrastructure, including status	56
Table 3-7: Direct and indirect greenhouse gas emissions sources associated with Julimar Operations and supply chain	58
Table 3-4: Indicative Subsea Support Vessel Specifications (<i>Fugro Etive</i>)	60
Table 3-5: Indicative USV parameters	61
Table 3-6: Typical Subsea Infrastructure Inspections/Surveys and frequencies	63
Table 3-7: Typical maintenance activities and frequencies	64
Table 3-8: Typical Discharge Volumes During Different IMMR and Subsea Activities	66
Table 3-9: Marine Growth Removal Methods	66
Table 4-1: Hydrocarbon spill thresholds used to define EMBA for surface and in-water hydrocarbons	68
Table 4-2: Summary of physical characteristics within the Operational Area and EMBA	71
Table 4-3: Habitats and Communities within the EMBA	75
Table 4-4: Summary of MNES identified by the EPBC Act PMST as potentially occurring within the Operational Area and EMBA.....	78
Table 4-5: Threatened and Migratory Fish, Shark and Ray Species predicted to occur within the Operational Area and EMBA.....	79
Table 4-6: Fish, Shark and Ray BIAs within the Operational Area and EMBA	80
Table 4-7: Threatened and Migratory Marine Reptile Species predicted to occur within the Operational Area and EMBA.....	83
Table 4-8: Marine Turtle BIAs within the Operational Area and EMBA.....	83
Table 4-9: Internesting Habitat Critical to the Survival of Marine Turtle Species predicted to occur within the Operational Area and EMBA	87
Table 4-10: Threatened and Migratory Marine Mammal Species predicted to occur within the Operational Area and EMBA.....	91
Table 4-11: Marine Mammal BIAs within the Operational Area and EMBA	92
Table 4-12: Threatened and Migratory Seabird and Migratory Shorebird Species predicted to occur within the Operational Area and EMBA	96
Table 4-13: Seabird and Shorebird BIAs within the Operational Area and EMBA.....	99
Table 4-14: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area.	102
Table 4-15: KEFs within the Operational Area and EMBA	103
Table 4-16: Established protected places and other sensitive areas location relative to the Operational Area overlapping the EMBA	105
Table 4-17: Summary of Native Title Claims, Determinations and ILUAs which overlap or are coastally adjacent to the EMBA	108
Table 4-18: Summary of Commonwealth, State Marine Park and National Park Management Plans intersecting the EMBA	111
Table 4-19 Cultural features and heritage values identified in publicly available literature.....	113
Table 4-20 Summary of Sea Country values received via consultation.....	121
Table 4-21 Summary of Cultural Features and Values	129
Table 4-22: Known Shipwrecks Near to the Operational Area	133
Table 4-23: World, National and Commonwealth Heritage Listed Places within the EMBA	133
Table 4-24: Commonwealth and State Commercial Fisheries management areas overlapping the Operational Area and EMBA and potential for interaction during the Petroleum Activities Program	135
Table 4-25: Other Oil and Gas Facilities located within the proximity of the Operational Area.....	143
Table 4-26: Live Infrastructure within the Operational Area not covered by this EP.....	143
Table 5-1: Categories of relevant persons.....	155

Table 5-2: Methodology for identifying relevant persons within the EMBA undertaken under Regulation 25(1)(d) – by category	156
Table 6-1: Environmental impact analysis summary of planned and unplanned activities	177
Table 6-2: Environmental impact and risk analysis summary table – unplanned events (including major environmental events).....	180
Table 6-3: Indicative source characteristics of continuous underwater noise associated with the Petroleum Activities Program as reported in (Jiménez-Arranz 2017), McCauley (2005), McCauley (2002), (JASCO Applied Sciences (Australia) Pty Ltd 2024) and Wood (2025).	207
Table 6-4: Thresholds for permanent threshold shift, temporary threshold shift and behavioural response onset for low frequency, high-frequency and very high frequency cetaceans for continuous and impulsive noise	209
Table 6-5: Thresholds for permanent threshold shift, temporary threshold shift and behavioural response onset in marine turtles for continuous and impulsive noise.....	211
Table 6-6: Impact thresholds to fish, sharks and rays for continuous noise.....	212
Table 6-7: Indirect GHG emissions associated with Julimar offshore production	233
Table 6-8: MEE Events for the Julimar Operations.....	252
Table 6-9: Barrier Hierarchy and Type of Effect	253
Table 6-10: Summary of Thresholds Applied to the Quantitative Hydrocarbon Spill Risk Modelling Results	257
Table 6-11: Summary of Worst-case Loss of Well Containment Hydrocarbon Release Scenario	259
Table 6-12: EMBA - Key Receptor Locations and Sensitivities Potentially Contacted Above Impact Thresholds by the Loss of Well Containment Scenario with Summary Hydrocarbon Spill Contact	262
Table 6-13: Characteristics of the marine diesel.....	289
Table 6-14: EMBA - Key Receptor Locations and Sensitivities Potentially Contacted Above Impact Thresholds by the Vessel Collision Scenario with Summary Hydrocarbon Spill Contact	292
Table 6-15: Environmental impact analysis summary of planned and unplanned activities	300
Table 6-16: Key Receptor Locations and Sensitivities Potentially Contacted Above Impact Thresholds by the Loss of Containment from Subsea Infrastructure with Summary Hydrocarbon Spill Contact.....	302
Table 6-17: Assessment of the impacts and risks of invasive marine species introduction associated with the Petroleum Activity.....	338
Table 6-18: Identification of applicability of recovery plan and threat abatement plan objectives and action areas	346
Table 6-19: Assessment against relevant actions of the Marine Turtle Recovery Plan	355
Table 6-20: Assessment against relevant actions of the Blue Whale Conservation Management Plan.....	356
Table 6-21: Assessment against relevant actions of the Sawfish and River Sharks Recovery plan	357
Table 6-22: Assessment against relevant actions of the Albatrosses and petrels National Recovery Plan.....	358
Table 6-23: Assessment against relevant actions of the Marine Debris Abatement Plan.....	358
Table 7-1: Key factors considered as a part of the risk assessment process for vessels	365
Table 7-2: Key factors considered as a part of the risk assessment process for immersible equipment	366
Table 7-3: Summary of Safety and Environment Critical Element Management Procedures.....	373
Table 7-4: Inventory of Woodside infrastructure within the Julimar Development	376
Table 7-5: Roles and responsibilities	380
Table 7-6: Summary of Emissions and Discharges Monitoring for the Petroleum Activities Program	392
Table 7-7: Ongoing consultation engagements	645
Table 7-8: Routine external reporting requirements	649
Table 7-9: External incident reporting requirements	652
Table 7-10: Oil pollution preparedness and response overview	654

1. INTRODUCTION

1.1 Overview

Woodside Energy Julimar Pty Ltd (Woodside), as Titleholder under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Commonwealth) (referred to as the Environment Regulations), on behalf of the Joint Venture detailed in Section 1.6, is operator of the Julimar Field Production System.

Operation of the Julimar Field Production System (including routine testing of the wells and subsea infrastructure is performed from the Wheatstone Platform, (see Section 1.8) Woodside proposes to undertake the following petroleum activities within Production Licence WA-49-L and Pipeline Licences WA-26-PL, WA-29-PL, WA-34-PL, WA-35-PL and WA-36-PL:

- routine production and associated activities
- routine and non-routine inspection, maintenance, monitoring and repair (IMMR) of subsea infrastructure
- initial commissioning and start-up activities for Julimar Development Phase 3 (JDP3) wells and subsea infrastructure

These activities will hereafter be referred to as the Petroleum Activities Program and form the scope of this Environment Plan (EP). A detailed description of the activities is provided in Section 3. This EP has been prepared as part of the requirements under the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

In accordance with the requirements of Regulation 39(1) of the Environment Regulations, Woodside has revised the Julimar Operations EP to incorporate the commissioning and operation of JDP3 as a new stage of the activity under the EP. Key components of the Petroleum Activities Program activity which can be attributed to a new stage of the Julimar Operations EP activity include:

- commissioning, start-up and operation activities associated with JDP3 infrastructure

1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- The potential environmental impacts and risks (planned (routine and non-routine) and unplanned) that may result from the Petroleum Activities Program are identified.
- Appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable.
- The Petroleum Activities Program is carried out in a manner consistent with the principles of ecologically sustainable development (ESD) (as defined in Section 3A of the Commonwealth Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)).

This EP describes the process and resulting outputs of the risk assessment, whereby impacts and risks are managed accordingly.

The EP defines activity-specific environmental performance outcomes, standards and measurement criteria (MC). These form the basis for monitoring, auditing, and managing the Petroleum Activities Program to be undertaken by Woodside and its contractors. The implementation strategy specified in this EP provides Woodside and NOPSEMA with the required

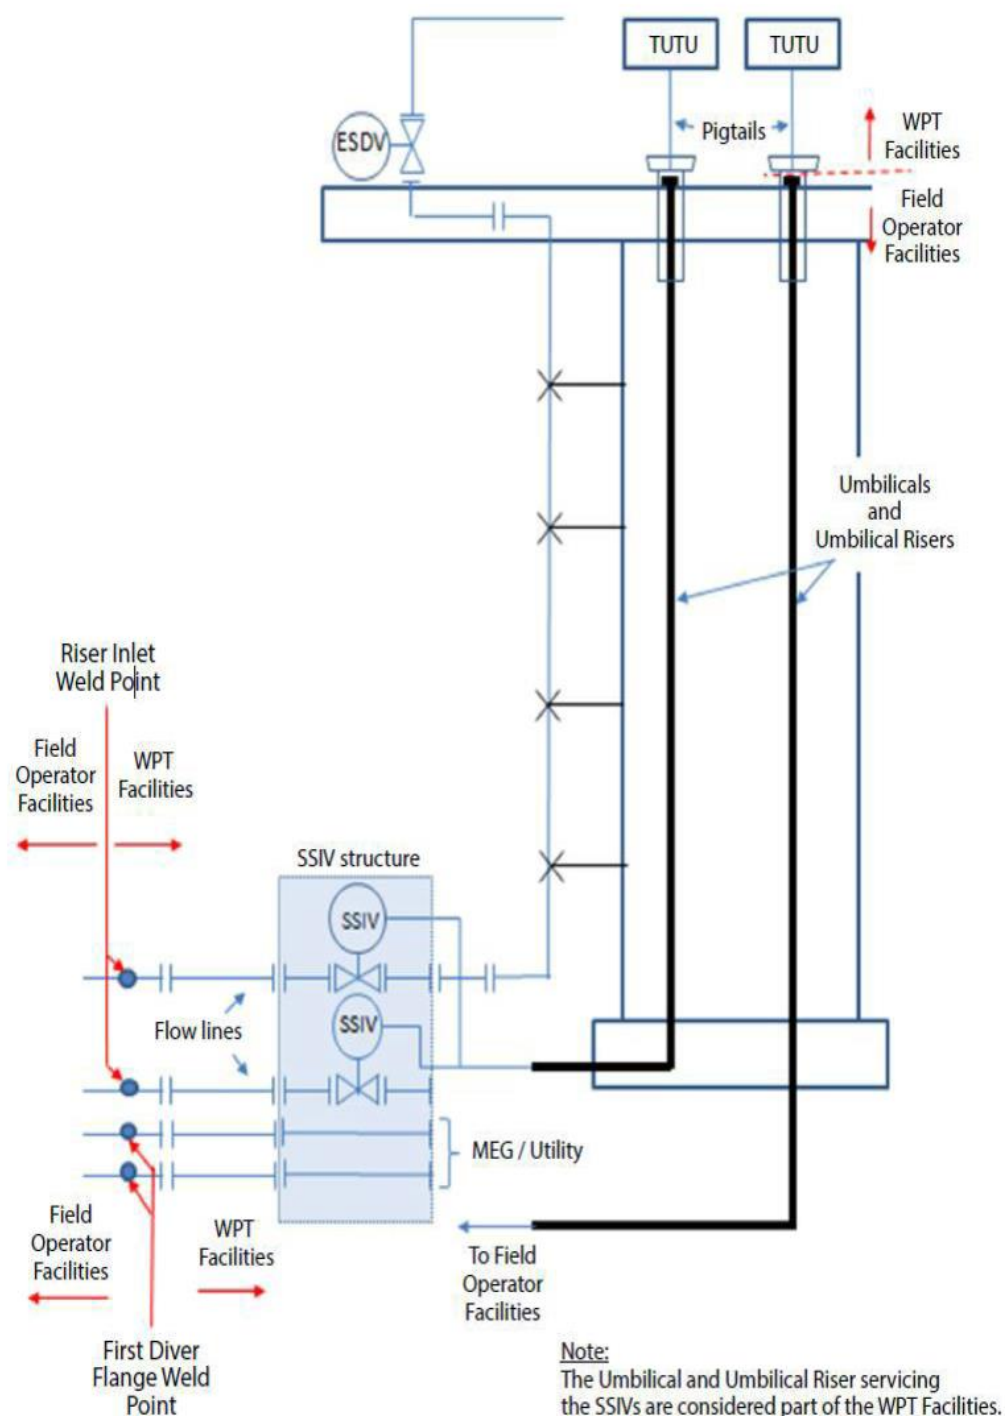

level of assurance that impacts and risks associated with the activity are reduced to ALARP and are acceptable.

1.3 Scope of the Environment Plan

The scope of this EP covers the activities that define the Petroleum Activities Program, as described in Section 3 for a period of up to five years. The Operational Area, as defined in Section 3.3, defines the spatial boundary of the Petroleum Activities Program. This includes the commissioning and start-up activities for JDP3 wells and subsea infrastructure and operations of the wells and subsea infrastructure up to the first weld upstream of the tie-in spool to the subsea isolation valve (SSIV) on the Julimar and Brunello flowlines (Figure 1-1).

Julimar-Brunello well fluids will be processed on the Chevron Australia Pty Ltd (Chevron) operated Wheatstone Platform (WA-3-IL); all activity, environmental impacts and risks downstream of the aforementioned flange on the SSIV (Figure 1-1) are excluded from the scope of this EP and are described in the Start-Up and Operations Environment Plan: Wheatstone Project (Chevron Doc. WS2-COP-00001).

Chevron operates the subsea infrastructure commencing with well unloading. Normal operational discharges from the Wheatstone Platform arising from production of hydrocarbons commingled from the Petroleum Activities Program with other production wells are included in the scope of the Start-Up and Operations Environment Plan: Wheatstone Project. This EP addresses potential environmental impacts from planned activities and potential unplanned events that originate from within the Petroleum Activities Program. Transit to and from the Operational Area by vessels and helicopters, as well as port activities associated with the vessels, are not within the scope of this EP. Vessel and helicopter operations outside the Operational Area continue to be governed by applicable maritime and aerial Regulations and other requirements.

Note: ESDV = emergency shutdown valve, MEG = mono-ethylene glycol, SSIV = subsea isolation valve, TUTU = topside umbilical termination unit, WPT = Wheatstone Platform

Figure 1-1: Designation of Responsibility for Subsea Infrastructure between the Field Operator (Woodside Energy Julimar) and Wheatstone Platform Operator (Chevron), as described in the Julimar-Brunello Field Operating Services Agreement

1.4 Environment Plan Summary

Table 1-1 summarises the content of this EP, as required by Regulation 35(7).

Criteria for acceptance	Content requirements/relevant Regulations	Elements	Section of EP
<i>(ii) the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate</i>	<i>any relevant person by the titleholder, that contains:</i> <i>(i) a summary of each response made by a relevant person; and</i> <i>(ii) an assessment of the merits of any objection or claim about the adverse impact of each activity to which the environment plan relates; and</i> <i>(iii) a statement of the titleholder's response, or proposed response, if any, to each objection or claim; and</i> <i>(iv) a copy of the full text of any response by a relevant person</i>		
Regulation 34(h): <i>complies with the Act, this instrument and any other Regulations made under the Act</i>	Regulation 23: <i>Details of the Titleholder and nominated liaison</i> Regulation 24(c): <i>Details of all reportable incidents in relation to the proposed activity.</i>	<i>All contents of the EP must comply with the Act and the Regulations</i>	Section 1.7 Section 7.15

1.6 Description of the Titleholder

Woodside Energy Julimar Pty Ltd is the Titleholder for this activity, on behalf of its Joint Venture partner KUFPEC Australia (Julimar) Pty Ltd.

Woodside is Australia's leading natural gas producer. Woodside's operations are characterised by strong safety and environmental performance in remote and challenging locations. Wherever Woodside works, it is committed to living its values of one team, we care, innovate every day, results matter and build and maintain trust.

Since 1984, the company has been operating the landmark Australian project, the North West Shelf, which is one of the world's premier liquefied natural gas (LNG) facilities.

Woodside has an excellent track record of efficient and safe production. Woodside strives for excellence in safety and environmental performance and continues to strengthen relationships with customers, partners, co-venturers, governments and communities. Further information about Woodside can be found at <http://www.woodside.com>.

1.7 Details of Titleholder and Nominated Liaison

In accordance with Regulation 23 of the Environment Regulations, details of the titleholder, nominated liaison and arrangements for the notification of changes are described below.

1.7.1 Titleholder

Woodside Energy Julimar Pty Ltd

11 Mount Street

Perth, Western Australia

Telephone: 08 9348 4000

ACN: 130 391 365

1.7.2 Nominated Liaison

Andrew Winter

Corporate Affairs Manager

11 Mount Street

Perth, Western Australia

Telephone: 08 9348 4000

Email: feedback@woodside.com

1.7.3 Arrangements for Notifying Change

If the titleholder, titleholder's nominated liaison, or the contact details for either change, then NOPSEMA will be notified in writing within two weeks or as soon as practicable.

1.8 Operational Interface with the Wheatstone Platform

A contract for services has been entered between Chevron as operator of the Wheatstone Platform (WA-3-IL) and trunkline (WA-25-PL, TPL/25, PL99) and Woodside as operator of the Julimar-Brunello field (WA-49-L) and associated petroleum pipeline and flowlines (WA-26-PL, WA-29-PL, WA-34-PL, WA-35-PL and WA-36-PL) (the Julimar Field Production System). The contract regulates the operational interface between Julimar-Brunello, the Julimar Field Production System and the Wheatstone Platform by specifying field operating services, emergency response arrangements, communication and reporting requirements between Chevron and Woodside.

Under this contract for services Chevron provides field operating services from the Wheatstone Platform to Woodside, which are necessary for the recovery of production fluids from the Julimar Field Production System. The field operating services include, among other matters, operation and maintenance services for the Julimar Field Production System from Wheatstone Platform. This includes operation and maintenance services for all Julimar subsea field infrastructure, wells, well jumpers, subsea wellheads, subsea manifolds, umbilicals and terminations, flowlines and subsea trees upstream of the Julimar Field Production System endpoint (Figure 1-1). The contract also provides for Woodside to conduct vessel-based inspection, maintenance and repair of the Julimar subsea infrastructure.

Chevron field operating services provided under the contract include, for example:

- operation of all field production system controls, valves, chokes and safety devices and monitoring of all the field production system sensors, alarm and instrument data as required by manuals provided by Woodside and consistent with general direction given by Woodside
- operation of all safety shutdown devices
- performing inspections and tests related to the field production system in accordance with applicable laws and Regulations
- integrity and production testing of the Julimar Field Production System (including the subsea trees and system valves, downhole safety valves and the opening of surface controlled subsurface safety valves (SCSSV) and subsea isolation valves (SSIV), as well as the testing of SCSSVs and SSIVs and monitoring and control of the SSIVs through the Wheatstone Platform facilities emergency shutdown system
- performing well tests (including pressure build-up tests and blowdown operations), monitoring well parameters and adjusting normal well parameters in accordance with Woodside's operating manuals and applicable Wheatstone Platform manuals

- performing visual inspection of piping and equipment associated with the Julimar Field Production System and the route of the field production system at time intervals prescribed by applicable Regulations.

Chevron has control of the Julimar Field Production System wells for the purpose of providing field operating services. Control of specific Julimar-Brunello wells is transferred back to Woodside during well work-overs/interventions and internal well work. Handover of control of the Julimar Field Production System or individual wells is undertaken according to a handover process between Chevron and Woodside, which involves confirming the status of the wells and infrastructure, and the transfer of relevant records and test results (with a handover certificate) to ensure system integrity is appropriately maintained.

In the addition to the above field operating services, Chevron also provides emergency response and maintenance services to Woodside and has agreed associated communication and reporting requirements.

Under the contract, Woodside retains commercial responsibility for all Julimar Field Production System operations that are not performed by Chevron from or on the Wheatstone Platform or which are not included in the field operating services provided by Chevron above.

These commercial arrangements do not alter the statutory obligations and responsibilities of the parties pursuant to the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) and Environment Regulations.

1.8.1 Field Operations Manual

Under the aforementioned contract, field operating services are provided by Chevron from the Wheatstone Platform central control room and in accordance with a Field Production System Operating Manual (FPSOM). The FPSOM is required by the contract and applies to the Field Operator facilities, up to, and including, the Julimar well centre. The manual was developed and is maintained by Woodside and the requirements executed by Chevron. It describes the requirements for operating the Julimar-Brunello field including reference to relevant operating and maintenance procedures. It also defines the relevant emergency response bridging documents and communication arrangements.

The manual does not include maintenance or specific operating procedures for the topsides equipment relevant to the Julimar-Brunello field production system, which is maintained in accordance with the requirements of the Chevron Operational Excellence Management System under the Start-Up and Operations Environment Plan: Wheatstone Project.

The Julimar Subsea Inspection, Monitoring, and Maintenance (IMM) Plan describes the inspection, monitoring and maintenance requirements for the Julimar Field Production System, which may be executed either by Woodside or Chevron (Figure 1-2). Communication between Woodside and Chevron is described in Section 7.9.

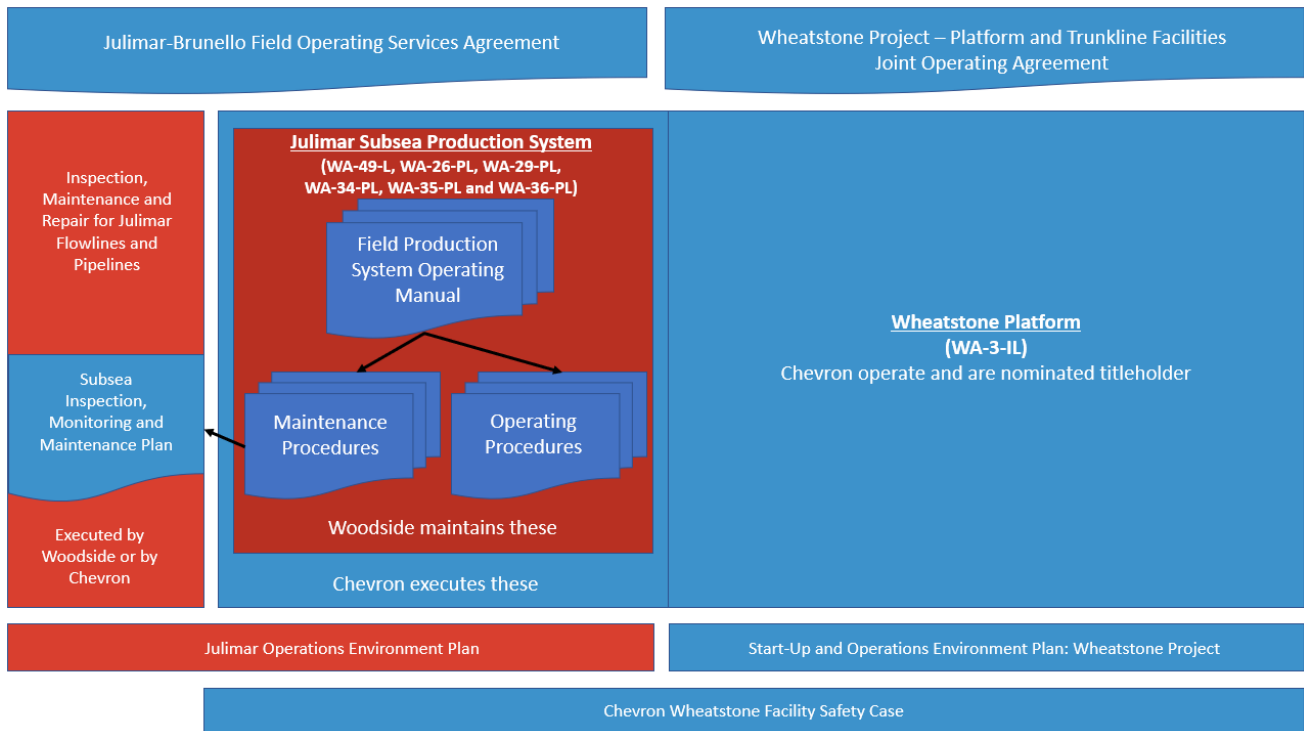

Figure 1-2: Agreements and Supporting Documentation for Operation of the Wheatstone Platform and Julimar Field Production System

1.9 Woodside Management System

The Woodside Management System (WMS) provides a structured framework of documentation to set common expectations governing how all employees and contractors at Woodside will work. Many of the standards presented in Section 6 are drawn from the WMS documentation, which comprises of four elements outlined below (and illustrated in Figure 1-3):

- **Values and Policies:** Set the enterprise-wide direction for Woodside by governing our behaviours, actions, and business decisions and ensuring we meet our legal and other external obligations
- **Expectations:** Set essential activities or deliverables required to achieve the objectives of the Key Business Activities and provide the basis for developing processes and procedures
- **Processes and Procedures:** Processes identify the set of interrelated or interacting activities that transforms inputs into outputs, to systematically achieve a purpose or specific objective. Procedures specify what steps, by whom, and when required to carry out an activity or a process
- **Guidelines:** Provide recommended practice and advice on how to perform the steps defined in Procedures, together with supporting information and associated tools. Guidelines provide advice on how activities or tasks may be performed, information that may be taken into consideration, or, how to use tools and systems.

Figure 1-3: The four major elements of the WMS Seed

The WMS is organised within a business process hierarchy based upon key business activities to ensure the system remains independent of organisation structure, is globally applicable and scalable wherever required. These key business activities are grouped into management, support, and value stream activities as shown in Figure 1-4. The value stream activities capture, generate and deliver value through the exploration and production lifecycle. The management activities influence all areas of the business, while support activities may influence one or more value stream activities.

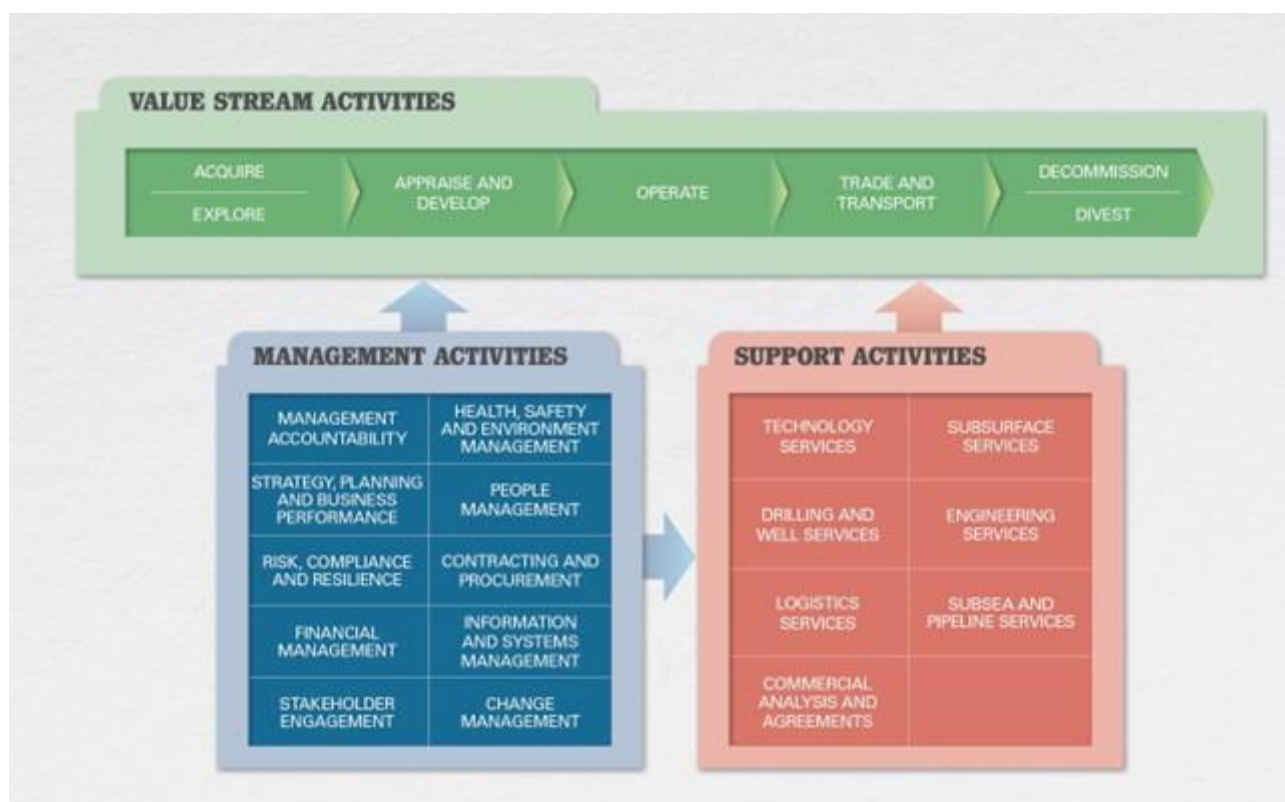

Figure 1-4: The WMS business process hierarchy

1.9.1 Environment and Biodiversity Policy

In accordance with Regulation 24(a) of the Environment Regulations, Woodside's Environment and Biodiversity Policy is provided in Appendix A of this EP. The policy is reviewed regularly and updated as required. The Environment and Biodiversity Policy is made available on our website, along with the other Board policies: <https://www.woodside.com/who-we-are/corporate-governance-and-policies>. The version applicable to the activity covered in this EP was reviewed in December 2024.

1.9.2 Climate Policy

Woodside's Climate Policy (included as Appendix A) identifies principles aimed to achieve Woodside's objective to thrive in this energy transition as a low cost, lower carbon energy provider.

For Woodside, a lower carbon portfolio is one from which the net equity Scope 1 and 2 greenhouse gas emissions, which includes the use of offsets, are being reduced towards targets, and into which new energy products and lower carbon services are planned to be introduced as a complement to existing and new investments in oil and gas. Our Climate Policy sets out the principles that we believe will assist us achieve this aim.

The Climate Policy applies to all Woodside's employees, contractors, and joint venture partners engaging in activities under Woodside's operational control. Woodside managers are also responsible for promotion of the Climate Policy in non-operated joint ventures. Please note that the Climate Policy is reviewed regularly and is updated as required. The Climate Policy is made available on our website, along with the other Board policies:

<https://www.woodside.com/who-we-are/corporate-governance-and-policies>.

1.10 Description of Relevant Requirements

In accordance with Regulation 21(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the activity and are relevant to the management of risks and impacts of the Petroleum Activities Program are detailed in Appendix B.

1.10.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006 (OPGGGS Act)

The *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGGS Act) controls offshore petroleum activities beyond three nautical miles (nm) of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone (EEZ) at 200 nm.

Table 1-3 outlines how the relevant decommissioning requirements of the OPGGS Act have been addressed in this EP. While decommissioning activities are not proposed under this EP the equipment has been designed for full removal. Timely and effective planning for decommissioning is ongoing throughout the asset's lifecycle and includes planning for decommissioning of property at the end of production and decommissioning of disused or redundant property at appropriate points throughout the life of an asset. Suspended, wet stored or preserved equipment will be maintained to enable removal at end of field life.

Table 1-3: Relevant requirements of the OPGGS Act 2006

Section Number	Relevant Requirement	Relevant Section of the EP
Section 270 – Consent to surrender title ¹		
(3)	The Joint Authority may consent to the surrender sought by the application only if the registered holder of the permit, lease or licence:	N/A
	c) has: <ul style="list-style-type: none">to the satisfaction of NOPSEMA, removed or caused to be removed from the surrender area (defined by subsection (7)) all property brought into the surrender area by any person engaged or concerned in the operations authorised by the permit, lease or licence; orarrangements that are satisfactory to NOPSEMA in relation to that property; and	N/A
	e) has provided, to the satisfaction of NOPSEMA, for the conservation and protection of the natural resources in the surrender area; and	N/A
	f) has, to the satisfaction of NOPSEMA, made good any damage to the seabed or subsoil in the surrender area caused by any person engaged or concerned in the operations authorised by the permit, lease or licence.	
Section 572 - Maintenance and removal of property etc. by titleholder		
(2)	A titleholder must maintain in good condition and repair all structures that are, and all equipment and other property that is: <ul style="list-style-type: none">in the title areaused in connection with the operations authorised by the permit, lease, licence or authority.	Section 7.4
(3)	A titleholder must remove from the title area all structures that are, and all equipment and other property that is, neither used nor to be used in connection with the operations: (a) in the title area (b) used in connection with the operations authorised by the permit, lease, licence or authority.	Section 7.4

¹ There is no intent to surrender any titles in the scope of this EP.

Section Number	Relevant Requirement	Relevant Section of the EP
(7)	This section has effect subject to: (a) any other provision of this Act; and (b) the Regulations; and (c) a direction given by NOPSEMA or the responsible Commonwealth Minister under: Chapter 3; or this Chapter; and (d) any other law.	Section 7.4.2

Under the OPGGS Act, the Environment Regulations apply to petroleum activities in Commonwealth Waters and are administered by NOPSEMA. The objective of the Environment Regulations is to ensure petroleum activities are performed in a manner:

- consistent with the principles of ESD
- by which the environmental impacts and risks of the activity will be reduced to ALARP
- by which the environmental impacts and risks of the activity will be of an acceptable level.

1.10.2 Environment Protection and Biodiversity Conservation Act 1999 (Cth)

One of the objectives EPBC Act is to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the Act as 'matters of national environmental significance' (MNES). The EPBC Act sets a regime which aims to ensure actions taken on (or impacting upon) Commonwealth land or waters are consistent with the principles of ESD. When a person proposes to take an action that they believe may need approval under the EPBC Act, they must refer the proposal to the Commonwealth Minister for Environment.

In relation to offshore petroleum activities in Commonwealth waters, in accordance with the Streamlining Offshore Petroleum Approvals Program (the Program), requirements under the Act are now administered by NOPSEMA, commencing February 2014. The Program requires any offshore petroleum activities authorised by the OPGGS Act to be conducted in accordance with an accepted EP. The definition of 'environment' in the Program covers all matters protected under Part 3 of the EPBC Act.

1.10.3 Offshore Project Approval

The Julimar Brunello Gas Development Project was referred for assessment under the EPBC Act (2011/5936). A decision by the Environment Minister determined that the action is not a controlled action, provided it is undertaken in a particular manner. The manner in which the proposed action must be taken are provided in Table 1-4.

Table 1-4: Manner in which the proposed action must be taken as per EPBC 2011/5936 relevant to the Petroleum Activities Program

Condition number	Condition	Relevant Section of EP
1	An Oil Spill Contingency Plan and an Environment Plan as described in the referral and additional information must be approved by the relevant authority and in place prior to the proposed action commencing.	This EP and Appendix D
2	Procedures and equipment systems for ensuring well control must meet best practice industry standards and must be implemented prior to the proposed action commencing. This includes the installation of a minimum of two well barriers as specified in the referral and additional information.	Section 6.8.3

3	The oil spill preparedness and response measures and equipment described in the referral and additional information must be in place prior to the proposed action commencing.	Appendix D
4	To minimise risks of a hydrocarbon release during decommissioning, decommissioning activities must be taken into account in the Environment Plan, as specified in the referral.	N/A Decommissioning is not in scope of this EP (Section 1.10.1)

1.10.4 Recovery Plans and Threat Abatement Plans

Under Section 139(1)(b) of the EPBC Act, the Environment Minister must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the Act. Similarly, under Section 268 of the EPBC Act:

“A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.”

In relation to offshore petroleum activities in Commonwealth waters, these requirements are now administrated by NOPSEMA in accordance with commitments set out in the Program. Relevant recovery plans or threat abatement plans relevant to the scope of this EP have been identified as described in Section 2.9 and assessed in Section 6.10.

1.10.5 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs), formerly known as Commonwealth Marine Reserves, are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP) is responsible for managing AMPs (supported by Parks Australia) and is required to publish management plans for them. Other parts of the Commonwealth Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans (s 362 of the EPBC Act). Relevant AMPs are listed in Section 4.8 and described in Appendix C. The North-west Marine Parks Network Management Plan describes the requirements for management.

Specific zones within AMPs have been allocated conservation objectives as stated below (International Union for Conservation of Nature (IUCN) Protected Area Category) based on the Australian IUCN reserve management principles outlined in Schedule 8 of the EPBC Regulations 2000 (Cth).

Petroleum activities may occur within the Montebello Marine Park Multiple Use Zone (IUCN category VI). The principles for each zone determine what activities are acceptable within a protected area under the EPBC Act. In accordance with the North-west Marine Parks Network Management Plan (DNP 2018), petroleum activities including transportation of minerals by pipeline, and oil spill response are permissible subject to approval in Multiple Use Zone (IUCN category VI) and Special Purpose Zone Trawl (IUCN category VI). Proposed mining operations conducted under usage rights that existed immediately before the declaration of a marine park do not require approval. Conditions of the Class Approval that are considered relevant to the scope of this EP are provided in Table 1-5.

Table 1-5: Conditions of Class Approval relevant to the Petroleum Activities Program

Number	Condition	Relevant Section of EP
1	The Approved Actions must be conducted in accordance with: (a) an Environment Plan accepted under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations [2023] (b) the EPBC Act (c) the EPBC Regulations	Conditions 1a, b, c and f are met by the submitted EP. 1d The impacts on the marine park values have been considered Section 6.7 and 6.9. 1e Consultation has been undertaken with the Director of National Parks

Number	Condition	Relevant Section of EP
	(d) the North-west Network Management Plan (e) any prohibitions, restrictions or determinations made under the EPBC Regulations by the Director of National Parks (f) all other applicable Commonwealth and state laws (to the extent those laws are capable of operating concurrently with the laws and instruments described in paragraphs (a) to (e)).	and no prohibitions, restrictions or determinations have been made (Section 5).
2	If requested by the Director of National Parks, an Approved Person must notify the Director prior to conducting Approved Actions within Approved Zones.	Sections 6.7.1 and 7.14 describe requirements to notify the DNP prior to activities within the Montebello Multiple Use Zone.
3	If requested by the Director of National Parks, an Approved Person must provide the Director with information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones.	If requested by the Director of National Parks, information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones will be provided.

1.10.6 World Heritage Properties

Australian World Heritage management principles are prescribed in Schedule 5 of the EPBC Regulations 2000. Management principles that are considered relevant to the scope of this EP are provided in Table 1-6.

Table 1-6: Relevant Management Principles under Schedule 5—Australian World Heritage management principles of the EPBC Act

Number	Principle	Relevant Section of the EP
3	<p>Environmental impact assessment and approval</p> <p><i>3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not).</i></p> <p><i>3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process.</i></p> <p><i>3.03 The assessment process should:</i></p> <ul style="list-style-type: none"> <i>(a) identify the World Heritage values of the property that are likely to be affected by the action; and</i> <i>(b) examine how the World Heritage values of the property might be affected; and</i> <i>(c) provide for adequate opportunity for public consultation.</i> <p><i>3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</i></p> <p><i>3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</i></p> <p><i>3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.</i></p>	<p>3.01 and 3.02: Assessment of significant impact on World Heritage values is included in Section 6. Principles are met by the submitted EP.</p> <p>3.03(a) and (b): World Heritage values are identified in Section 4.9.3.3 and considered in the assessment of impacts and risks for the Petroleum Activity in Section 6.</p> <p>3.03(c): Relevant stakeholder consultation and feedback received in relation to impacts and risks to the World Heritage Properties are outlined in Section 5.</p> <p>3.04, 3.05 and 3.06: Principles are considered to be met by the acceptance of this EP.</p>

Note that Section 1 – General Principles and 2 – Management Planning of Schedule 5 are not considered relevant to the scope of this EP and, therefore, have not been included.

2. ENVIRONMENT PLAN PROCESS

2.1 Overview

This section outlines the process taken by Woodside to prepare this EP, once the activity was defined as a petroleum activity. The process describes the activity, the existing environment, followed by the environmental risk management methodology used to identify, analyse and evaluate risks to meet ALARP levels and acceptability requirements, and develop EPOs and EPSs. This section also describes Woodside's risk management methodologies as applied to implementation strategies for the activity. The process is repeated when submitting a revised EP having regard to changes to operational processes as well as confirming that the environmental management practices applied remain consistent with good industry practice.

Regulation 21(5) of the Environment Regulations requires the EP to include details of the environmental impacts and risks for the Petroleum Activities Program, and an evaluation of all the impacts and risks, appropriate to the nature and scale of each impact and risk. The objective of the risk assessment process described in this section is to identify risks and associated impacts of an activity, so they can be assessed, and appropriate control measures applied to eliminate, control or mitigate the impact/risk to ALARP, and to determine if the impact or risk level is acceptable.

Environmental impacts and risks include those directly and indirectly associated with the Petroleum Activities Program, and include potential emergency and accidental events:

- **Planned Activities** have the inherent potential to cause environmental impacts.
- **Environmental Risks** are unplanned events with the potential for environmental impact (termed risk 'consequence').

In this section, potential impacts from planned activities are termed 'impacts', and 'risks' are associated with unplanned events with the potential for environmental impact (should the risk be realised), with such impacts termed potential 'consequences'.

2.2 Environmental Impact and Risk Management Methodology

2.2.1 Woodside Risk Management Process

Woodside recognises that risk is inherent to its business and that effective management of risk is vital to delivering on company objectives, success and continued growth. Woodside is committed to managing risk proactively and effectively. The objective of Woodside's risk management system is to provide a consistent process for recognising and managing risks across Woodside's business. Achieving this objective includes ensuring risks consider impacts across these key areas of exposure: health and safety, environment, finance, reputation and brand, legal and compliance, and social and cultural. A copy of Woodside's Risk Management Policy is provided in Appendix A.

The environmental risk management methodology used in this EP is based on Woodside's Risk Management Procedure. This procedure aligns to industry standards, such as international standard ISO 31000. WMS risk management procedures, guidelines and tools provide guidance of specific techniques for managing risk, tailored for particular areas of risk within certain business processes. Procedures applied for environmental risk management include (Section 2.2.2 to 2.2.4):

- Health, Safety and Environment Management Procedure
- Impact Assessment Procedure
- Process Safety Management Procedure.

The risk management methodology provides a framework to demonstrate that risks and impacts are continually identified, reduced to ALARP and assessed to be at an acceptable level, as required by the Environment Regulations. The key steps of Woodside's Risk Management Process

are shown in Figure 2-1. A description of each step and how it is applied to the scopes of this activity is provided in Section 2.2 to Section 2.12.

Figure 2-1: Woodside's risk management process

2.2.2 Health, Safety and Environment Management Procedure

The Health, Safety and Environment Management Procedure provides the structure for managing health, safety and environment (HSE) risks and impacts across Woodside, defines the decision authorities for company-wide HSE management activities and deliverables, and supports continuous improvement in HSE management.

2.2.3 Impact Assessment Procedure

To support effective environmental risk assessment, Woodside's Impact Assessment Procedure (Figure 2-2) provides the steps to meet the required environment, health and social standards by ensuring impact assessments are undertaken appropriate to the nature and scale of the activity, the regulatory context, the receiving environment, interests, concerns and rights of relevant persons, and the applicable framework of standards and practices.

Figure 2-2: Woodside's impact assessment process

2.2.4 Process Safety Management Procedure and Process Safety Risk Assessment Procedure

Due to the nature and scale of petroleum activities, Woodside's Process Safety Management Procedure establishes Woodside's framework for Process Safety Management (Section 7.2.2). This framework includes the Process Safety Risk Assessment Procedure (PSRA). The PSRA is a key part of Woodside's process safety management framework for managing the integrity of systems and processes that handle hazardous substances over the exploration and production lifecycle. The PSRA sets out methods to ensure that process safety risks are understood and controlled, including that all process safety hazards are systematically identified, assessed and treated so that the associated risks are reduced to a level that is tolerable and ALARP.

2.3 Environmental Plan Development Process

The EP development process is illustrated in Figure 2-3. Each element of this process is discussed further in Sections 2.4 to Section 2.11.

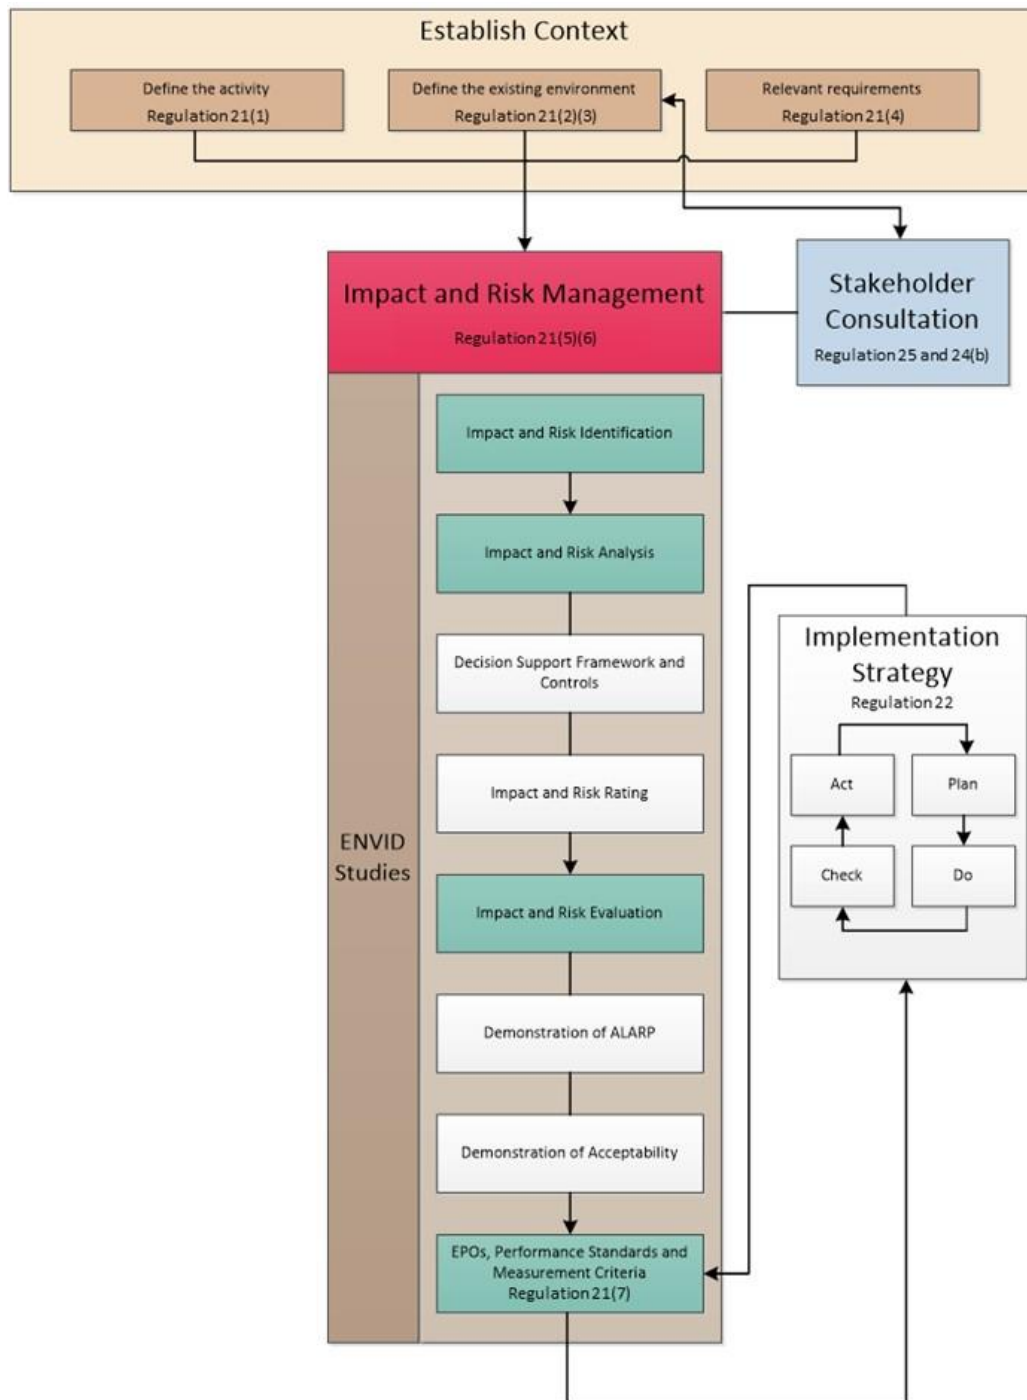

Figure 2-3: Environment Plan development process

2.4 Establish the Context

2.4.1 Define the Activity

This first stage involves evaluating whether the activity meets the definition of a ‘petroleum activity’ as defined in the Environment Regulations. The activity is described in relation to:

- the location
- what is to be undertaken

- how the activity is planned to be undertaken, including outlining operational details of the activity and proposed timeframes.

The 'what' and 'how' are described in the context of 'environmental aspects'² to inform the risk and impact assessment for planned (routine and non-routine) and unplanned (accidents, incidents, emergency conditions) activities.

The activity is described in Section 3 and is referred to as the Petroleum Activities Program.

2.4.2 Define the Existing Environment

The context of the existing environment is described and determined by considering the nature and scale of the activity (size, type, timing, duration, complexity, and intensity of the activity), as described in Section 4. The purpose is to describe the existing environment that may be impacted by the activity, directly or indirectly, by planned or unplanned³ events.

The Existing Environment (Section 4) is structured into subsections defining the physical, biological, socio-economic and cultural attributes of the area of interest, in accordance with the definition of environment in Regulation 5 of the Environment Regulations. These subsections make particular reference to:

- the environmental, and social and cultural consequences as defined by Woodside (refer to Table 2-1), which address key physical and biological attributes, as well as social and cultural values of the existing environment. These consequence definitions are applied to the impact and risk analysis (refer Section 2.2) and rated for all planned and unplanned activities. Additional detail is provided for unplanned hydrocarbon spill risk evaluation.
- EPBC Act MNES including listed threatened species and ecological communities and listed Migratory species. Defining the spatial extent of the existing environment is guided by the nature and scale of the Petroleum Activities Program (and associated sources of environmental risk). This considers the Operational Area and wider EMBA, as determined by the hydrocarbon spill risk assessments presented in Section 6.8.2. MNES, as defined under the EPBC Act, are addressed through Woodside's impact and risk assessment (Section 6).
- relevant values and sensitivities, which may include world or national heritage listed areas, listed threatened species or ecological communities, listed migratory species, or sensitive values.

By grouping potentially impacted environmental values by aspect (as presented in Table 2-1), the presentation of information about the receiving environment is standardised. This information is then consistently applied to the risk evaluation section to provide a robust approach to the overall environmental risk evaluation and its documentation in the EP.

² An environmental aspect is an element of the activity that can interact with the environment.

³ For each source of risk, the credible worst-case scenario in conjunction with impact thresholds is used to determine the spatial extent of the EMBA. The worst-case unplanned event is considered to be an unplanned hydrocarbon release, further defined for each activity through the risk assessment process. Interpretation of stochastic oil spill modelling determines the EMBA for the release, which defines the spatial scale of the environment that may be potentially impacted by the Petroleum Activities Program and in turn provides context to the 'nature and scale' of the existing environment.

Table 2-1: Example of the environment values potentially impacted which are assessed within the Environment Plan

Environmental Value Potentially Impacted Regulations 21(2), (3)					
<i>Marine Sediment</i>	<i>Water Quality</i>	<i>Air Quality (incl Odour)</i>	<i>Ecosystems/ Habitat</i>	<i>Species</i>	<i>Socio- economic</i>

2.4.3 Relevant Requirements

The relevant requirements in the context of legislation, other environmental approval requirements, conditions and standards that apply to the Petroleum Activities Program are identified and reviewed; and are presented in Appendix B.

The Risk Management, Climate and Environment and Biodiversity Policies are referenced in Appendix A.

2.5 Impact and Risk Identification

Relevant environmental aspects and hazards were identified that support the process to define environmental impacts and risks associated with an activity.

The environmental impacts and risks presented in this EP has been informed by recent and historic hazard identification (HAZID) and environmental risk identification studies (e.g., HAZID/ENVID) consequence modelling studies for high consequence, low probability environmental risks, bowtie risk assessments for the Major Environmental Events (MEE) as required by Woodside's PSRA processes, desktop reviews and studies associated with the Petroleum Activities Program. These studies have been reviewed and revalidated, as required, for the revision of this EP. In preparing the revision, Woodside also considers environmental performance and compliance information gathered during the implementation phase of the in-force EP. Further, feedback from NOPSEMA to Woodside across Woodside's portfolio of environment plans has been considered and integrated, where relevant.

Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in Section 3), the existing environment (Section 4) and the outcomes of Woodside's consultation process (Section 5). The environmental outputs of applicable risk and impact workshops and associated studies are referred to as ENVID in this EP.

An environmental impacts and risks identification and assessment workshop was undertaken by multidisciplinary teams comprising relevant operational and environmental personnel with sufficient breadth of knowledge, training and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified, during the workshop, for both planned (routine and non-routine) activities and unplanned (accidents / incidents / emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

Impacts and risks were evaluated and tabulated for each planned activity and unplanned events respectively. Environmental impacts and risks were recorded in an environmental impacts and risk register. The output of the workshop is used to present the risk assessment and form the basis of performance outcomes, standards, and measurement criteria. This information is presented in Section 6, following the format presented in Table 2-2.

Table 2-2: Example of layout of identification of risks and impacts in relation to risk sources

Impact and Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Summary of source of impact/risk													

2.6 Impact and Risk Analysis

As this EP is a revision of an existing operations EP, the risks and impacts from the previous revision of the Julimar Operations EP were reviewed and, where required, revised using the same impact and risk management process applied to new EPs. This allows all previously identified risks and impacts to be fully reassessed, including considering any new or changes to sensitivities, to ensure ALARP and acceptability requirements continue to be met.

Risk analysis further develops the understanding of a risk by defining the impacts and assessing appropriate controls, as well as considering previous risk assessments for similar activities, relevant studies, past performance, external consultation feedback, and the existing environment.

The key steps undertaken for each identified risk during the risk assessment were to:

- identify the Decision Type in accordance with the decision support framework
- identify appropriate control measures (preventive and mitigation) aligned with the Decision Type
- assess the risk rating.

2.6.1 Decision Support Framework

To support the risk assessment process and Woodside's determination of acceptability (Section 2.8.2), Woodside's HSE risk management procedures include the use of a decision support framework based on principles set out in the Guidance on Risk Related Decision Making (OGUK 2014). This concept is integrated into the environmental impacts and risks identification and assessment workshop to determine the level of supporting evidence that may be required to draw sound conclusions regarding risk level and whether the risk is acceptable and ALARP (Section 2.8). Application of the decision support framework confirms:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks and impacts based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher order environmental impacts are subject to further evaluation/assessment).

The framework provides appropriate tools, commensurate to the level of uncertainty or novelty associated with the risk/impact (referred to as Decision Type A, B, or C). The decision type is

selected based on an informed discussion around the uncertainty of the risk/impact and is documented in impacts and risk register worksheets.

This framework enables Woodside to appropriately understand a risk and determine if the risk or impact is acceptable and can be demonstrated to be ALARP.

2.6.1.1 Decision Type A

Decision type A risks and impacts are well understood and established practice; they are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and use professional judgment.

2.6.1.2 Decision Type B

Decision type B risks and impacts typically involve greater uncertainty and complexity and can include potential higher-order impacts and risks. These risks may deviate from established practice or have some lifecycle implications and therefore require further engineering risk assessment to support the decision and ensure that the risk is ALARP. Engineering risk assessment tools may include:

- risk-based tools such as cost-based analysis or modelling
- consequence modelling
- reliability analysis
- company values.

2.6.1.3 Decision Type C

Decision Type C risks and impacts typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty, therefore requiring the adoption of the precautionary approach. The risks may result in significant environmental impact, significant project risk/exposure, or may elicit negative stakeholder concerns. For these risks or impacts, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external consultation as part of the risk assessment process.

Figure 2-4: Risk-related decision-making framework (Oil and Gas UK 2014)

2.6.1.4 Decision Support Framework Tools

These framework tools are applied, as appropriate, to help identify control measures based on the decision type described above.

- **Legislation, Codes and Standards (LCS):** identifies the requirements of legislation, codes and standards that are to be complied with for the activity.
- **Good Industry Practice (GP):** identifies further engineering control standards and guidelines that may be applied by Woodside above that required to meet the LCS.
- **Professional Judgement (PJ):** uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- **Risk-based Analysis (RBA):** assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost–benefit analysis to support the selection of control measures identified during the risk assessment process.
- **Company Values (CV):** identifies values identified in Woodside’s code of conduct, policies and the Woodside Compass. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- **Societal Values (SV):** identifies the views, concerns and perceptions of relevant persons and addresses relevant stakeholder views, concerns and perceptions.

2.6.1.5 Decision Calibration

To determine that the alternatives selected, and control measures applied are suitable, the following tools may be used for calibration (i.e. checking) where required:

- **LCS/Verification of Predictions:** Verification of compliance with applicable LCS and/or good industry practice.
- **Peer Review:** Independent peer review of PJs, supported by RBA, where appropriate.
- **Benchmarking:** Where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk.
- **Internal Consultation:** Consultation undertaken within Woodside to inform the decision and verify company values are met.
- **External Consultation:** Consultation undertaken to inform the decision and verify societal values are considered.

Where appropriate, additional calibration tools may be selected specific to the decision type and the activity.

2.6.2 Control Measures (Hierarchy of Controls)

Risk reduction measures are prioritised and categorised in accordance with the hierarchy of controls, where risk reduction measures at the top of the hierarchy take precedence over risk reduction measures further down:

- **Elimination** of the risk by removing the hazard
- **Substitution** of a hazard with a less hazardous one
- **Engineering Controls** include design measures to prevent or reduce the frequency of the risk event, or detect or control the impact or risk event (limiting the magnitude, intensity and duration) such as:
 - Prevention: design measures that reduce the likelihood of a hazardous event occurring
 - Detection: design measures that facilitate early detection of a hazardous event
 - Control: design measures that limit the extent/escalation potential of a hazardous event
 - Mitigation: design measures that protect the environment if a hazardous event occurs
 - Response Equipment: design measures or safeguards that enable clean-up/response after a hazardous event occurs.
- **Procedures and Administration** includes management systems and work instructions used to prevent or mitigate environmental exposure to hazards
- **Emergency Response and Contingency Planning** includes methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

2.6.3 Impact and Risk Classification

Environmental impacts and risks are assessed to determine the potential impact significance/consequence. The impact significance/consequence considers the magnitude of the impact or risk and the sensitivity of the potentially impacted receptor (Figure 2-5).

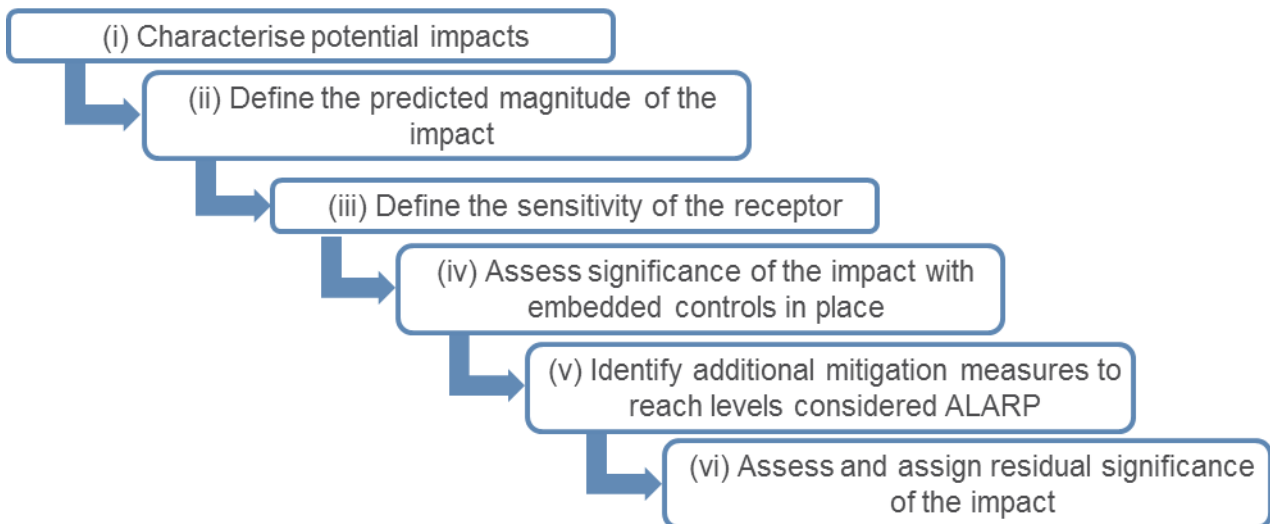

Figure 2-5: Environmental risk and impact analysis

Impacts are classified in accordance with the consequence (Table 2-3) outlined in Woodside's Risk Management Procedure and Risk Matrix (Figure 2-6). Risks are assessed qualitatively and/or quantitatively in terms of both likelihood and consequence in accordance with this matrix.

The impact and risk information, including classification and evaluation information as shown in the example (Table 2-2), are tabulated for each planned activity and unplanned event.

Table 2-3: Woodside risk matrix (environment and social and cultural) consequence descriptions

Environment	Social and cultural	Consequence level
Catastrophic, long-term impact (>50 years) on highly valued ecosystem, species, habitat or physical or biological attribute.	Catastrophic, long-term impact (>20 years) to a community, social infrastructure or highly valued area/item of international cultural significance.	A
Major, long term impact (10–50 years) on highly valued ecosystem, species, habitat or physical or biological attribute.	Major, long-term impact (5–20 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	B
Moderate, medium-term impact (2–10 years) on ecosystem, species, habitat or physical or biological attribute.	Moderate, medium term impact (2–5 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	C
Minor, short-term impact (1–2 years) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	Minor, short-term impact (1–2 years) to a community or highly valued area/item of cultural significance.	D
Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	Slight, short-term impact (<1 year) to a community or area/item of cultural significance.	E
No lasting effect (<1 month). Localised impact not significant to environmental receptor.	No lasting effect (<1 month). Localised impact not significant to area/item of cultural significance.	F

2.6.4 Risk Rating Process

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence and likelihood. The assigned risk rating is determined with controls in place,

therefore; the risk rating is determined after identifying the Decision Type and appropriate control measures.

The risk rating process considers the potential environmental consequences and, where applicable, the social and cultural consequences of the risk. The risk ratings are assigned using the Woodside Risk Matrix (refer to Figure 2-6).

The risk rating process is done using the steps described in the subsections below.

Select the Consequence Level

Determine the worst-case credible consequence (Table 2-3) associated with the selected event, assuming all controls (preventive and mitigative) are absent or have failed. If more than one potential consequence applies, select the highest severity consequence level.

Select the Likelihood Level

Determine the description that best fits the chance of the selected consequence occurring, assuming reasonable effectiveness of the prevention and mitigation controls (Table 2-4).

Table 2-4: Woodside risk matrix likelihood levels

Likelihood description						
Frequency	1 in 100,000– 1,000,000 years	1 in 10,000– 100,000 years	1 in 1,000– 10,000 years	1 in 100– 1,000 years	1 in 10– 100 years	>1 in 10 years
Experience	Remote: Unheard of in the industry	Highly Unlikely: Has occurred once or twice in the industry	Unlikely: Has occurred many times in the industry but not at Woodside	Possible: Has occurred once or twice in Woodside or may possibly occur	Likely: Has occurred frequently at Woodside or is likely to occur	Highly Likely: Has occurred frequently at the location or is expected to occur
Likelihood level	0	1	2	3	4	5

Calculate the Risk Rating

The risk rating is derived from the consequence and likelihood levels determined above, in accordance with the Woodside Risk Matrix shown in Figure 2-6. A likelihood and risk rating are only applied to environmental risks, not environmental impacts from planned activities.

This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk as an output of the ENVID studies.

Figure 2-6: Woodside risk matrix – risk level

To support of ongoing risk management (a key component of Woodside’s Process Safety Management Framework – refer to Implementation Strategy in Section 7), Woodside uses the concept of ‘current risk’ and applies a current risk rating to indicate the current or ‘live’ level of risk, considering the controls that are currently in place and effective on a day-to-day basis. The current risk rating is effective in articulating potential divergence from baseline risk, such as if certain controls fail or could potentially be compromised. Current risk ratings aid in the communication and making visible the risk events and ensures the continual management of risk to ALARP by identifying risk reduction measures and assessing acceptability.

2.7 Classification and Analysis of Major Environmental Events (MEEs)

For Woodside’s production facilities, a further level of analysis is undertaken to identify, classify and analyse MEEs. This extra level of rigour is applied to ensure sufficient controls are in place for risks with potential Level B and above consequences. In the health and safety area, Major Accident Events (MAEs) are identified using a similar process, which supports consistency in managing key risks within Woodside in accordance with Process Safety Risk Management Procedures.

Woodside defines a MEE as an event with potential environment, reputation (pertaining to environment events), social or cultural consequences of level B or higher as per Woodside’s Risk Matrix (Figure 2-6). MEEs are evaluated against credible worst-case scenarios that may occur when all controls are absent or have failed. For this EP, the MEEs presented in the previous revision of the Julimar Operations EP were reviewed and revised to ensure they remain accurate and are adequately managed.

2.7.1 Major Environment Event Identification

The ENVID process identifies numerous sources of risk with differing consequence levels. These risks are screened for those risk events that meet the MEE criteria, and MEE risks are analysed further through detailed consequence modelling and probability/ frequency studies and examined for ‘appropriateness’ of controls in a bowtie risk assessment.

Risks that do not meet the MEE definition, although screened out of the MEE process, are still evaluated for ALARP and risk acceptability using the methodology described in Section 2.8. Some high consequence/low probability events which do not meet the MEE consequence threshold may still undergo additional consequence and probability assessment where they could have a high

adverse impact on the company's reputation or relationships with relevant persons, beyond requirement to demonstrate ALARP and acceptable risk levels following application of controls.

2.7.2 Major Environment Event Classification

A standard naming convention has been established for MEEs; this is based around ensuring the MEE titles reflect the cause of the event (e.g. 'subsea system loss of containment') rather than the event itself (e.g. significant hydrocarbon spill to the marine environment). The MEEs are assigned a unique identification code (e.g. MEE-01, MEE-02, etc.).

2.7.3 Bowtie Analysis

MEEs are subject to more detailed analysis using the bowtie risk assessment technique, which illustrates cause outcomes pathways for each MEE and controls in place to prevent the 'top event' or mitigate the consequences. The key drivers for adopting the bowtie technique for MEEs are that it:

- identifies the controls (prevention and mitigation barriers) necessary to ensure the risk is acceptable and ALARP
- supports the process of demonstrating ALARP (described in Section 2.8)
- enables verification of and linking to the relevant sections of the WMS that supports barriers
- improves the capacity for lessons learnt and incident prevention by being able to directly relate causes of an incident to those controls that failed
- ensures greater visibility and granularity in the assessment process and enables complex risk scenarios to be presented in an easy to understand format.

The bowtie technique (an example bowtie diagram is shown in Figure 2-7) shows the relationships between the 'causes' that may lead to a particular unwanted event ('top event'), together with the range of potential escalation paths that can lead to a variety of 'outcomes' (or consequences). A bowtie also shows the preventive barriers that may prevent a top event from occurring specific to each cause, and the mitigation barriers in place to limit the potential effects once the top event has been realised, specific to each credible MEE outcome.

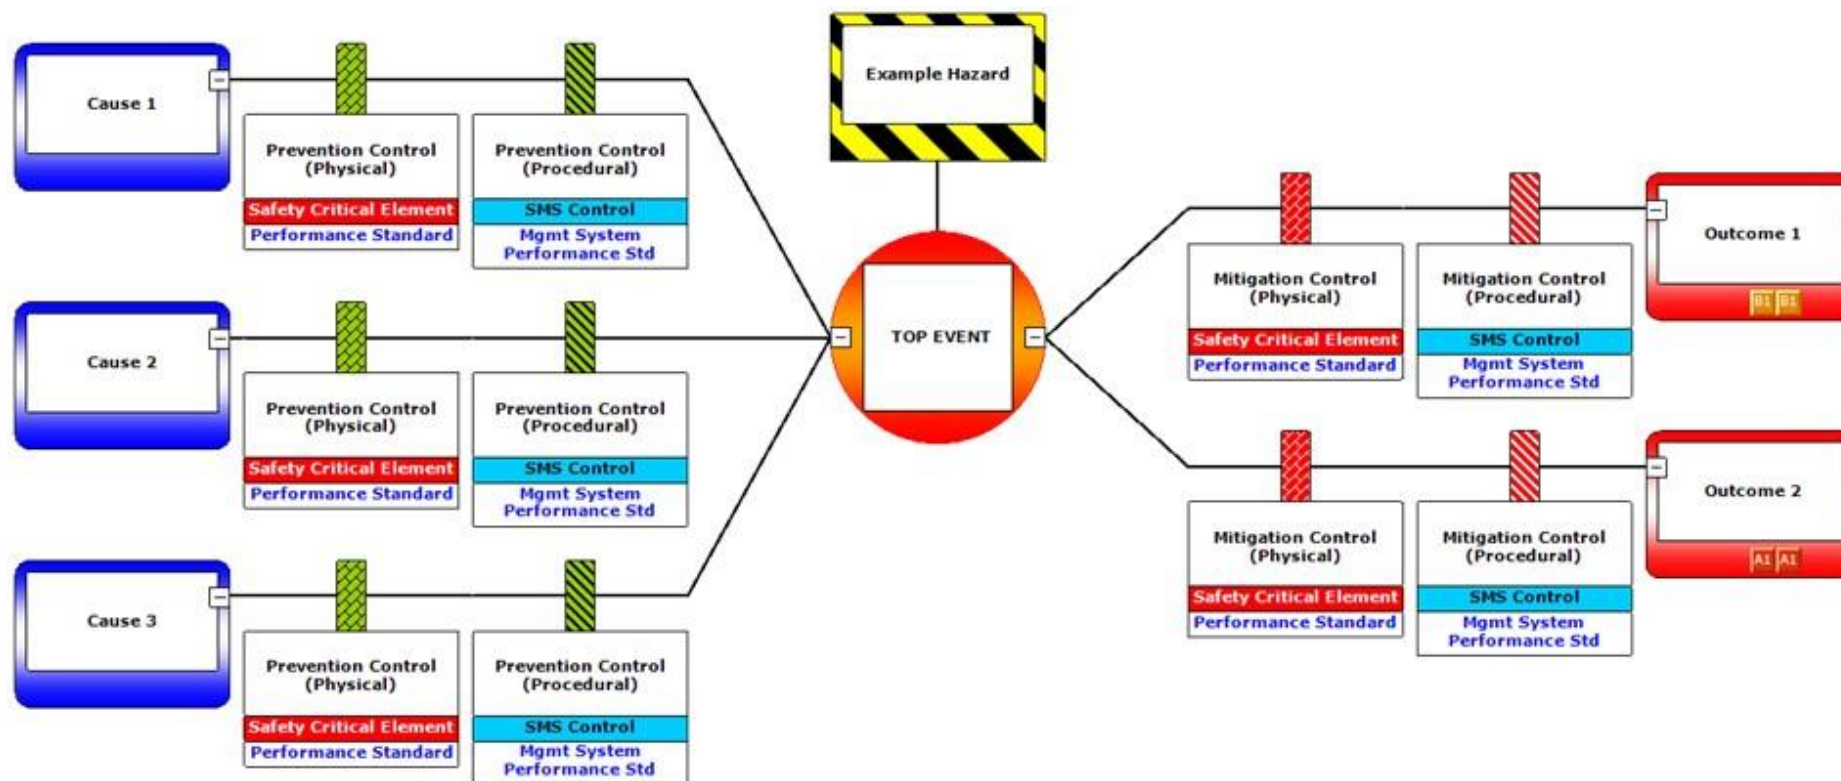

Figure 2-7: Example of bowtie diagram structure

2.7.4 Major Environment Event Register

A MEE register is prepared for each production facility after completing bowtie diagrams. The purpose of the MEE register is to record the MEE identification process, groupings, bowtie diagrams and datasheets in a consolidated format. Datasheets are prepared for each MEE, which summarise the hazard description, hazard management, emergency response, ALARP summary and a list of critical barriers identified on the bowties (known as Safety and Environment Critical Elements (SCEs)).

Potential common causes that contribute to MAEs/MEEs, or that can result in failure or degradation of the controls in place to protect against MAEs/MEEs, include some generic mechanisms of SCE failure and generic human error. These are represented in bowties applicable to multiple MEEs and identified in the MEEs applicable to this EP.

2.7.5 Safety and Environment Critical Elements and Technical Performance Standards

Woodside identifies and manages SCE technical and management system performance standards in accordance with process safety management procedures, risk management procedures and change management procedures (further described in the implementation strategy in Section 7). SCEs are identified for MAEs and MEEs. An SCE is a hardware control, the failure of which could cause or contribute substantially to, or the purpose of which is to prevent or limit the effect of a MAE, MEE or process safety event. In addition, Woodside defines safety and environment critical equipment (SCQ) as an item of equipment or structure forming part of a hardware SCE that supports the SCE in achieving the safety function.

Once an SCE is identified as an MEE barrier for the operated facility, technical performance requirements are developed for the facility SCE in accordance with the Global SCE Performance Standards and process described in the SCE Management Procedures and form the SCE facility performance standards. Each SCE Performance Standard represents a statement of the performance required of an SCE (e.g. functionality, availability, reliability, survivability). SCE Performance Standard requirements are used to establish agreed assurance tasks for each SCE, support the management of operations within acceptable safety and/or environment risk levels, and ensure continuous management of risk to ALARP. An assurance task is an activity carried out by the operator to confirm that the SCE meets, or will meet, its SCE Performance Standard. Examples of assurance tasks include inspection routines, maintenance activities, test routines, instrumentation calibration, and reliability monitoring.

SCE Facility performance standards do not always align directly with EPSs. They are used in conjunction with the WMS to identify and treat potential step-outs from expected controls performance or integrity envelopes and ensure SCE performance can be optimised. Woodside's HSE Event Reporting Guideline describes the process for identifying 'Failure to meet Facility Performance Standard', which is when the SCE does not meet the goal as stated in the relevant Performance Standard (see Section 7.3.4). Situations where SCEs fail to meet Facility Performance Standards represent a potential increase in risk that, if not addressed immediately, have the potential to result in a process safety event, or worsen the consequences of one. Recording SCE Failure to Meet Performance Standard Events into the Event Reporting Database is important to highlight risk, investigate causes, ensure risks are managed and meet potentially applicable external reporting requirements. For applicable SCEs, 'Failure to meet Facility Performance Standard' represent scenarios that may fail to achieve an EPS presented in this EP.

The results of the MEE classification and analysis for Julimar are presented in Section 6.8.1 of this EP. More detail on the SCE and Performance Standards process, and the interrelationships to other parts of the SCE Management Procedures, is described in Section 7.3.4.

2.7.6 Safety-critical Management System Barriers

For each MEE, safety-critical management system specific measures are also identified. These are management system components (generally WMS processes) that are key barriers to, or measures for, managing MEEs.

2.8 Impact and Risk Evaluation

Environmental impacts and risks cover a wider range of issues, differing species, persistence, reversibility, resilience, cumulative effects, and variability in severity than safety risks. Determining the degree of environmental risk, and the corresponding threshold for whether a risk/impact has been reduced to ALARP and is acceptable, is evaluated to a level appropriate to the nature and scale of each impact or risk. Evaluation includes considering the:

- decision type
- principles of ESD – as defined under the EPBC Act
- internal context – ensuring the proposed controls and risk level are consistent with Woodside policies, procedures and standards (Section 7 and Appendix A)
- external context – the environment consequence (Section 6) and stakeholder acceptability (Section 5)
- other requirements – ensuring the proposed controls and risk level are consistent with national and international standards, laws and policies.

In accordance with Regulation 34(a), 34(b), 34(c) and 21(5)(b), Woodside applies the following process to evaluate impacts and risks and demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

2.8.1 Demonstration of As Low As Reasonably Practicable

The descriptions in Table 2-5 articulate how Woodside demonstrates that different risks, impacts and Decision Types identified within this EP are ALARP.

Table 2-5: Summary of Woodside's criteria for demonstrating 'as low as reasonably practicable'

Risk	Impact	Decision type
<i>Low and moderate (C, D, E or F level consequence)</i>	<i>Negligible, slight, or minor (D, E or F)</i>	<i>A</i>
Woodside demonstrates these impacts, risks and decision types are reduced to ALARP if: <ul style="list-style-type: none"> • identified controls meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines, or • further effort towards impact/risk reduction (beyond employing opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained. 		
<i>High, very high or severe (A or B level consequence)</i>	<i>Moderate and above (C, B or A)</i>	<i>B and C</i>
Woodside demonstrates these higher-order impacts, risks and decision types are reduced to ALARP where it can be shown good industry practice and RBA has been employed, if legislative requirements are met, societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.		

2.8.2 Demonstration of Acceptability

The descriptions in Table 2-6 articulate how Woodside demonstrates how different risks, impacts and decision types identified within this EP are Acceptable.

Table 2-6: Summary of Woodside's criteria for acceptability

Risk	Impact	Decision type
Low and moderate	Negligible, slight, or minor (D, E or F)	A
Woodside demonstrates these risks, impacts and decision types are 'broadly acceptable' if they meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines. Further effort towards risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.		
High, very high or severe	Moderate and above (C, B or A)	B and C
<p>Woodside demonstrates these higher order impacts, risks and decision types are 'acceptable if ALARP' if it can be demonstrated using good industry practice and risk based analysis (RBA), if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.</p> <p>In undertaking this process for Moderate and High risks, Woodside evaluates:</p> <ul style="list-style-type: none"> the Principles of ESD as defined under the EPBC Act the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, procedures and standards. the external context – consideration of the environment consequence (Section 6) and stakeholder acceptability (Section 5) are considered Other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies, and applicable plans for management and conservation advices, conventions, and significant impact guidelines (e.g. for MNES). <p>Additionally, Very High and Severe risks require 'Escalated Investigation' and mitigation. If after further investigation the risk remains in the Very High or Severe category, the risk requires appropriate business engagement with increasing involvement of senior management in accordance with Woodside's Risk Management Procedure to accept the risk. This includes due consideration of regulatory requirements.</p>		

2.9 Recovery Plan and Threat Abatement Plan Assessment

To support the demonstration of acceptability, a separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans (**Section 1.10.4**). The steps in this process are:

- identify relevant listed threatened species and ecological communities (Section 4)
- identify relevant recovery plans and threat abatement plans (Section 6.10)
- list all objectives and (where relevant) the action areas of these plans and assess whether these objectives/action areas apply to government, the Titleholder, and the Petroleum Activities Program (Section 6.10).
- For those objectives/action areas applicable to the Petroleum Activities Program, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action (Section 6.10).

2.10 Environmental Performance Outcomes, Environmental Performance Standards and Measurement Criteria

The Environment Regulations define environmental performance outcomes (EPOs) to mean: "a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level". As such, the process of defining an appropriate EPO, has relied on the required levels of performance set either in:

- legislation (such as the OPGGS Act)

- regulator guidance notes such as the Matters of National Environmental Significance– Significant Impact Guidelines (Department of the Environment 2013), or
- specific agreements or expectations with other relevant persons (e.g. fishers or other marine users).

For each evaluated impact and risk, controls adopted during the ENVID and through demonstrating ALARP are paired with activity-specific EPOs, performance standards (PS) and measurement criteria (MC). EPOs, PS and MC form the basis for monitoring and auditing and allow Woodside's environmental performance to be measured through the implementation of this EP to ensure impacts and risks will be managed to a level that is ALARP and acceptable. EPOs, PS and MC are defined for each identified credible impact and risk in Section 6.

2.11 Implement, Monitor, Review and Reporting

An implementation strategy for the Petroleum Activities Program describes the specific measures and arrangements to be implemented for the duration of the Program. The strategy is based on the principles of AS/NZS ISO 14001 Environmental Management Systems, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the Petroleum Activities Program to ALARP and acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the Petroleum Activities Program are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies
- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the activity.

The implementation strategy is presented in Section 7.

2.12 Consultation

Woodside consults relevant persons in the course of preparing an EP in accordance with Regulation 25 of the Environment Regulations. Woodside's consultation methodology is presented in Section 5. Woodside's consultation record is provided in Appendix F.

3. DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with Regulation 21(1) of the Environment Regulations and describes the activities to be undertaken as part of the Petroleum Activities Program under this EP. It includes the location of the activity, general details of the Julimar Development⁴ layout, the operational details of the activity, and additional information relevant to consideration of environmental risks and impacts. An overview of the Petroleum Activities Program is provided in Table 3-1.

Table 3-1: Petroleum Activities Program Overview

Item	Description
Production / Infrastructure Licences	Production licence: <ul style="list-style-type: none"> • WA-49-L Non-Julimar licence areas within the Operational Area (for vessel operations only): <ul style="list-style-type: none"> • WA-34-L Non-Woodside licence area connected to the Julimar Field Production System: <ul style="list-style-type: none"> • WA-3-IL (Chevron operated, includes 20% Julimar Joint Venture), • WA-48-L.
Pipeline Licences	WA-26-PL, WA-29-PL, WA-34-PL, WA-35-PL and WA-36-PL
Water Depth	71 m to 244 m
Key components of subsea infrastructure	Wells, Xmas trees, manifolds, flowlines/pipelines, umbilicals.
Vessels	Subsea support vessels and others appropriate to the nature of the petroleum activities.
Key activities	Julimar Operations include: <ul style="list-style-type: none"> • Routine production from Julimar and Brunello wells; 13 proposed (with up to 16 wells capacity). • Routine and non-routine inspection, maintenance, monitoring and repair of subsea infrastructure (including use of ROVs, AUVs and acoustic sensors). • Initial commissioning and start-up activities for JDP3 wells and subsea infrastructure.

3.2 Location

The Petroleum Activities Program is located in Commonwealth waters in the Carnarvon Sub-basin, within licence areas WA-49-L, WA-26-PL, WA-29-PL, WA-34-PL, WA-35-PL and WA-36-PL. The Operational Area (Figure 3-1) is ~160 km north-west of Dampier and adjacent to the Wheatstone Platform. The closest landfall to the Petroleum Activities Program is the Montebello Islands, about 46 km south-east. Approximate location details for the Petroleum Activities Program are provided in Table 3-2.

⁴ The Julimar Development consists of three development phases: Brunello Phase 1, Julimar Development Phase 2 and Julimar Development Phase 3; collectively these are referred to as the "Julimar Development" throughout this EP.

Table 3-2: Julimar Development and Associated Infrastructure Locations and Petroleum Permits

Activity	Water depth (Approx. in LAT)	Latitude (WGS84)	Longitude (WGS84)	Production licence
Well and centre locations				
BruA-2	149 m	20°01'49.1571" S	115°12'05.6357" E	WA-49-L

3.3 Operational Area

The Operational Area defines the spatial boundary of the Petroleum Activities Program (**Figure 3-1**), as described, risk assessed and managed by this EP, including vessel related petroleum activities within the Operational Area⁵.

For the purposes of this EP the following Operational Area applies:

- subsea hydrocarbon gathering system infrastructure, including historic production wells (BruA-2, BruA-3, BruA-4, BruA-5, BruA-6, JULA-01, JULA-02 and JULA-04), new JDP3 production wells (J85 Development Well, JUA1C, JUA1E, JUB1A and JUB1B), flowlines, umbilicals and an area within 1500 m around the subsea infrastructure up to the first weld upstream of the flowline flange at the Riser Inlet Point.
- a four km radius around the centre of JULA manifold to accommodate a future well into the J-85 reservoir.

3.4 Timing

Production from the Julimar-Brunello Development commenced in 2016 and operates 24 hours a day, year-round. The Brunello and Julimar fields are predicted to remain active for the life of this EP.

3.5 Activity Components

3.5.1 Field Inventory

The layout of the Julimar Brunello Development subsea infrastructure is shown in Figure 3-2. The subsea system is typically controlled from Wheatstone Platform via an integrated power and control cable through the following components:

- umbilicals, which provide hydraulic and electric power, communications and chemical supplies between the platform and subsea components. Umbilicals run between the platform and cross-over manifold through to wells.
- Subsea Control Modules (SCM), which are sealed and pressure compensated electro-hydraulic units (typically found on Xmas trees) and link the surface and subsea controls.

A number of subsea valves may also be overridden manually from a Remote Operated Vehicle (ROV). The subsea infrastructure in title is recorded and tracked using a database. This database is updated as equipment is brought into title, which may include new or replacement equipment (Section 3.9.4; Section 6.7.2). ROV as-found and as-left surveys are undertaken to identify the location of items placed on the seabed. At the completion of an IMMR campaign this data is used to update the inventory for the title. Material items dropped to the marine environment and not recovered (see Section 6.9.4) are added to the inventory for the title. The subsea system has been designed, fabricated and installed in accordance with good practice and international standards. The pipelines, flowlines and wells are marked on nautical charts. Decommissioning planning is done for infrastructure no longer in use.

⁵ Vessels supporting the Petroleum Activities Program operating outside of the Operational Area (e.g. transiting to and from port) are subject to applicable maritime regulations and other requirements which are not managed under this EP

Table 3-3: Inventory of installed wells and subsea infrastructure, including status

Infrastructure	Status ¹	Decommissioning Planning
2 x 22 km 18" Julimar/Brunello flowlines/pipeline	Maintained for production	Section 7.4
1 x 22 km 18" JDP2 flowline	Maintained for production	
1 x ~ 70m 8" JULB1A well to JULB1M manifold flexible flowline	Planned for installation	
1 x ~4.35 km 8" JULB1B well to JULB1M manifold flexible flowline	Planned for installation	
1 x ~2.5 km 10" JULB to ILT flexible flowline	Planned for installation	
1 x ~2 km 8" J-85 (name TBA) to JULA manifold flexible flowline	Planned for installation	
Horizontal spools and vertical jumpers and connectors	Maintained for production	
13 production wells with Xmas trees ²	Maintained for production ³	
Four production manifolds (BruA PM, JULA, JULB, BruA XOM) including SCM's and CDU's	Maintained for production ³	
Electrical, hydraulic and optical flying leads	Maintained for production	
Electro-hydraulic umbilicals and associated structures including MEG Line.	Maintained for production	
Tie-in structures and skids /pipeline end terminations	Maintained for production	
Adjustable pipe support structures	Maintained for production	
Flowline deflection initiators (shrouds)	Maintained for production	

¹ Status at time of submission of this EP (Revision 8)

² Provision for a further 3 wells in a future EP based on available slots in existing manifolds

³ JULB manifold and the five JDP3 wells with Xmas trees are planned for installation at the time of submission of this EP (Revision 8)

Page 57 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

3.5.2 Julimar Phase 3 Commissioning and Start-up

The start-up activities associated with the JDP 3 wells and associated subsea infrastructure are planned to commence H1 2026. All activities may be subject to rescheduling, including delay, based on operational requirements of the Wheatstone Platform or other operational requirements, and external influences such as weather.

Activities for pre-commissioning of the Julimar Phase 3 subsea infrastructure are covered under the accepted *Julimar Phase 3 Drilling and Subsea Installation EP* (Rev. 2), up to the point of introduction of hydrocarbons. Commissioning, including unload and clean-up of wells to maximum rates is covered in this EP. Once hydrocarbons have been introduced into the system (hot commissioning), well completion fluid and subsea flowline preservation fluid (MEG/water mix) are displaced to the Wheatstone platform.

Commissioning and start-up of the JDP3 wells is estimated to take approximately 20 days per well and may occur in a single campaign or over the course of a number of campaigns.

A support vessel (Section 3.6) will be in the field during JDP3 commissioning, assisting with start-up activities, including opening process isolation valves with a remotely operated vehicle (ROV). During commissioning and start-up, support vessels may also assist with troubleshooting or IMMR activities as required for any contingency scenarios.

3.5.3 Steady State Production Operations

In steady state production, reservoir fluids are produced from the Brunello and Julimar fields prior to comingling at the BruA XOM (Figure 3-2). Eight wells currently produce from the fields. This EP includes production from a further three wells tied into the six slot JULA production manifold and two wells tied into a new two slot production manifold at JULB.

Production fluids flow into a separator on the Wheatstone Platform. Separated gas, condensate and produced water (PW) streams are metered prior to combining with the Wheatstone production streams. Combined dehydrated gas and dewatered condensate from the Wheatstone Platform enter the trunkline for the onshore Wheatstone Gas Plant supply, which is outside the scope of this EP.

Emissions and discharges from the Wheatstone Platform are managed under the *Start-Up and Operations Environment Plan: Wheatstone Project*.

3.5.4 Greenhouse Gas Emissions

Direct and indirect sources of greenhouse gas (GHG) emissions associated with the Julimar Operations are summarised in Table 3-4. GHG sources that are not part of Julimar Operations (e.g., from gas processing at the Chevron operated onshore facilities at Ashburton North) are included for completeness, with the relevant EP for these emissions listed in Table 3-4.

Table 3-4: Direct and indirect greenhouse gas emissions sources associated with Julimar Operations and supply chain

Emission Type	Emissions Source	Location	Jurisdiction	Process	EP
Direct	Wheatstone facility process	Offshore facility operated by Chevron	Commonwealth	GHG emissions from fuel, flares, fugitives and process vents	Wheatstone Project Start-up and Operations EP ¹

Indirect	Support vessels (on charter to Woodside)	Offshore at Julimar Operational Areas	Commonwealth	GHG emissions from engines and fugitives on vessels	This EP
	Gas processing at the onshore facilities at Ashburton North	Onshore facility operated by Chevron	State (WA)	GHG emissions from venting reservoir CO ₂ , combustion of gas as fuel, flares and fugitives associated with processing gas to products such as LNG, LPG, condensate and domestic gas	Wheatstone Project Start-up and Operations EP ¹
	Third party transport, regassification and end use of products	Transit and Market managed by Chevron	Subject to consumer location	GHG emissions from transport of products to market, including regassification and distribution of LNG in customer markets, and from combustion of products as part of power generation and other energy solutions within the final market	Wheatstone Project Start-up and Operations EP ¹

1. As noted in Consultation (SI Report, reference 27.3 – 27.6 and summarised in Appendix F Section 4.7) an MOC has been conducted that describes, risk assesses, manages to ALARP and demonstrates these emissions are of an acceptable level within the Start-Up and Operations Environment Plan: Wheatstone Project. In accordance with Regulation 56(1) of the Environment Regulations, Woodside refers NOPSEMA to the information previously given to NOPSEMA in the accepted Wheatstone Start-Up and Operations EP which is available on the NOPSEMA website using the following link: <https://docs.nopsema.gov.au/A853704>.

3.6 Support Vessel Operations

3.6.1 Subsea Support Vessels

Subsea support vessels including uncrewed surface vessels (USVs, see Section 3.6.2) are used to support field work such as subsea IMMR and start-up activities and can operate 24 hours a day. Subsea activities are typically undertaken from a subsea support vessel or USV and may use an ROV (see Section 3.6.3) with transponders. Typical subsea support vessels use a DP system to allow manoeuvrability and avoid anchoring when undertaking works, due to the close proximity of subsea infrastructure. However, vessels are equipped with anchors which may be deployed in an emergency.

The DP system requires the temporary deployment of up to six transponders on the seabed. Transponders are also used for monitoring the location of infrastructure/equipment during a repair. The transponders are attached to small recoverable moorings (metal clump weight or tripod) that are lowered to the seabed and placed in position by ROV. The transponders have a small footprint; less than 0.5 m². The transponders and moorings are recovered using ROVs at the end of the activity.

The length of time that vessels are in field varies depending on the nature of the activity. It is anticipated that vessel time for routine inspection activities will involve no more than one to two weeks per campaign, depending on operational requirements. Maintenance and repair activities may result in additional vessel time of approximately 4 weeks, depending on the scale and complexity of the work scope, but such activities are expected to be infrequent.

Vessels supporting the activities will vary depending on operational requirements, vessel schedules, capability and availability. The specifications of the Fugro Etive (Figure 3-3) are presented in Table 3-5 as an example and represent the typical specifications of a support vessel. IMMR activities may require the use of vessels of various sizes, depending on the scope of work.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: JU-00-RI-10006

Revision: 8.0

Native file DRIMS No: 10484514

Page 59 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

Typically, smaller vessels will be used for non-intervention, inspection activities and the larger vessels for scopes requiring heavier equipment and craneage.

Figure 3-3: Typical Support Vessel (*Fugro Etive*)

On rare occasions, more than one vessel may be needed. This might occur once every two or three years in circumstances where there are several activities that need to be conducted simultaneously.

Table 3-5: Indicative Subsea Support Vessel Specifications (*Fugro Etive*)

Attribute	Details
Type	Operations support vessel
Length overall (LOA)	92.95 m
Breadth	19.70 m
Depth	7.7 m
Gross tonnage	4926 Tonne
Accommodation	100
Dynamic positioning system	DP2
Fuel Capacity	2,225 m ³ (241 m ³ largest isolated diesel tank)

All vessels are typically required to undergo a Woodside Marine Assurance inspection to review compliance with marine laws and Woodside safety and environment requirements. Refer to Section 7.12.2.3 for a summary of the marine assurance process.

Support vessels have appropriate lighting to ensure a safe working environment. They also have appropriate navigational lighting as per maritime requirements. Light and noise emissions may be generated by temporary subsea ROV and transponder (positioning) activities.

Typical support vessels use a dynamic positioning (DP) system in combination with satellite navigation to allow manoeuvrability, maintain position and avoid anchoring when undertaking works due to the proximity of subsea infrastructure. Vessels are equipped with anchors which may be deployed in the event of an emergency. All subsea support vessels will use marine diesel oil or marine gas oil and will be provisioned in port or designated bunkering facilities. There will be no refuelling on site in the Operational Area.

3.6.2 Uncrewed Surface Vessel

A USV may be utilised to complete IMMR activities. The USV will be remotely controlled from an onshore remote operations centre (ROC) in Australia which is staffed 24 hours a day whilst the vessel is in transit or undertaking activities. Key roles in the ROC mirror those on a usual vessel

Page 60 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

management team and include a Vessel Master, Offshore Manager and ROV Supervisor. The vessels are designed with multiple forms of high speed and reliable communication systems to allow connection to the ROC and provide redundancy in the case of disconnection during operations, including an independent emergency low bandwidth satellite communications system. The vessels are also fitted with 360-degree cameras monitored by the remote vessel master supporting safe navigation. The USV is assessed by Woodside Marine (Section 7.12.2.3) to review compliance with marine laws, flag requirements, vessel class and Woodside's safety and environment requirements. Because there are no facilities to support human occupancy on USVs, emissions and discharges are typically limited to cooling water and combustion of marine diesel. The vessel is equipped with bilge monitoring systems to monitor the bilge tanks for hydrocarbons (such as leaks from engine machinery spaces or from marine diesel tanks), and where detected the bilge pumps will auto disable and the vessel will be required to immediately return to port. USV's have a maximum speed of 10 knots and may be equipped with a built-in work class ROV with the ability to deploy and retrieve equipment from the seabed. Key parameters for a typical USV are presented in Table 3-6.

Table 3-6: Indicative USV parameters

Parameter	USV (based on Reach Remote 2)	USV (based on Fugro Maali)
Draft (max)	6 m	2.6 m
Length	23.9 m	12 m
Displacement (Gross Tonnage)	~340 t	14 t
Propulsion System	Diesel-electric hybrid	Diesel-electric hybrid
Total fuel volume	74.1 m ³	3.3 m ³

3.6.3 Remotely Operated Vehicles

Subsea support vessels may be equipped with an ROV system that is maintained and operated by a specialised contractor aboard the vessel. ROVs may be used during for activities such as:

- blowout preventer (BOP) land-out and recovery
- BOP well control contingency
- pre and post installation survey
- removal of sediments on or around subsea infrastructure
- commissioning and start-up of subsea infrastructure.

An ROV can be fitted with various tools and camera systems that can be used to capture permanent records (both still images and video) of the operations and immediate surrounding environment. Specifically, during installation, the ROV is fitted with hydraulically driven tools to facilitate flowline tie-in. An ROV may also be used in the event of an incident to deploy the Subsea First Response Toolkit.

3.7 Helicopter Operations

Helicopters may be used to transport specialist personnel and/or urgent freight to/from the activity vessels. They may also be used as a means of evacuating personnel in the event of an emergency. Helicopter support is principally supplied from Karratha Airport. Helicopter use for the activity is limited to occasional periods of short duration when vessels are present within the Operational Area.

3.8 Chemical Usage

Production chemicals are utilised for purposes such as scale inhibition and prevention of bacterial growth. These may originate from the Wheatstone platform or from a chemical package on a support vessel.

Continuous use chemicals are those that are typically supplied to the Brunello and Julimar fields via Mono Ethylene Glycol (MEG) flowline and umbilicals from the Wheatstone platform and continuously added into the process. These may include:

- MEG used as a hydrate inhibitor
- scale inhibitor manages and prevents scale build-up within subsea equipment
- the subsea control fluid, Castrol Transaqua HT2 and MacDermid Oceanic ECF is used in the subsea control system. The subsea control system is an open-loop system that releases hydraulic fluid by design during valve functioning under steady state operations (about 6 L released per valve actuation)
- Subsea Control Modules (SCM), Control Distribution Units (CDU) and Electrical Flying Leads (EFL) have dielectric fluid to compensate for hydrostatic pressure and protect the electrical components in the subsea control system.

Chemicals that may be used intermittently during subsea IMMR activities are outlined in Section 3.9.5.

3.9 Subsea Inspection, Monitoring, Maintenance, and Repair Activities

Subsea infrastructure is designed not to require significant intervention. Inspection and maintenance are undertaken to ensure the integrity of the infrastructure and identify problems before they present a risk of loss of containment. Intervention may be required to repair identified problems. Maintaining infrastructure integrity also supports decommissioning planning. Intervention may be required to repair identified problems.

Subsea activities can be broadly categorised into Inspection, Monitoring, Maintenance and Repair activities.

Maintenance and repair activities may require the deployment of frames/baskets which are temporarily placed on the seabed. These typically have a perforated base with a seabed footprint of about 15 m². This temporary equipment is removed from the field via recovery to support vessels at the completion of IMMR activities. Typical IMMR activities are described below.

3.9.1 Inspections

Inspection of subsea infrastructure is the process of physical verification and assessment of components in order to detect changes to the as-installed location and condition by comparison to initial state following installation and previous inspections. Details of typical subsea infrastructure inspections/surveys and frequencies are provided in Table 3-7. Actual scope and frequency of subsea equipment (operational and redundant) and pipeline inspections are determined using a Risk Based Inspection (RBI) methodology and associated plans. RBI is commonly used within the industry as a method for determining inspection frequencies (Energy Institute, 2009; DNV, 2019). RBI for redundant/suspended subsea equipment that has been wet-parked, inherently pose less risk to the environment and may drive a less frequent inspection frequency.

During planned inspections, anomalies may be identified by ROV, for example visible hydrates, discharges or bubbling which may indicate fugitive emissions. In accordance with the Subsea and Pipelines Integrity Management Procedure, the anomaly is identified and assessed for scale during the inspection by performing visual bubble estimates or bubble measurements, where it is feasible

to do so. The anomaly and its scale are noted in the anomaly/inspection report and recorded in Woodside's centralised Inspection Database. The anomaly is then assessed to determine future monitoring and/or corrective actions to address the anomaly.

Table 3-7: Typical Subsea Infrastructure Inspections/Surveys and frequencies

Type of Inspection/Survey	Subsea Infrastructure	Purpose	Approximate Frequency
General Visual Inspection (GVI)	All subsea infrastructure	Check general infrastructure integrity.	Varied – every 2-8 years
Close Visual Inspections (CVI)	Production trees and manifold valves	Investigate certain subsea infrastructure components.	Varied – every 2-6 years
Cathodic Protection (CP)	All metallic subsea infrastructure	Check for corrosion and renew sacrificial anodes, if required.	Varied – every 2-6 years
Wall Thickness Surveys	Production and crossover manifolds, flowlines and pipelines	Monitor the condition of subsea infrastructure. (i.e. ultrasonic testing).	Typical: Once every 25 years. Worst Case: Once every 5 years
Acoustic survey including Side Scan Sonar (SSS) and Multibeam Sonar (MBES)	Pipelines and spools	Identify buckling, movement, scour and seabed features. Low frequency/ intensity signals undertaken on the flowlines.	Varied – every 1-6 years
Non-Destructive Testing (NDT)	Pipeline and manifolds (if required)	Evaluates the properties of material/items using electromagnetic, radio graphic, acoustic resonance technology, ultrasonic, or magnetic equipment.	Typical: Once every 25 years. Worst Case: Once every 25 years per well
Seabed sampling surveys including minor grabs/cores	N/A	Identify benthic fauna, sediment characteristics, determine level of penetration / compaction, etc. Grabs/cores typically disturb 0.1m ² of seabed per sample.	Typical: Once every 25 years. Worst Case: Once every 5 years
Water sampling surveys	N/A	Determine water quality around the pipeline.	Typical: Once every 25 years. Worst Case: Once every 5 years
Anode sampling	Production and crossover manifolds, trees, flowlines and pipelines	Samples taken of anode materials for testing.	Typical: Once every 25 years. Worst Case: Once every 25 years.
Marine growth sampling	All subsea infrastructure	Samples taken of marine growth for testing.	Typical: Once every 25 years. Worst Case: Once every 5 years
Sub bottom profiling	Around subsea components	Low frequency echo sounder undertaken to identify returns of metals under the seabed	Varied – every 1-6 years
Laser surveys	Dimensional check on infrastructure	Used to conduct dimensional checks on spools etc. and measure proximity.	Varied – every 1-6 years

3.9.2 Monitoring

Monitoring of subsea infrastructure refers to the process of surveillance of the physical and chemical environment that a subsea system or component is exposed to, to determine if and when damage may occur, and (where relevant) predict the rate or extent of that damage.

Monitoring activities may include process composition testing, acoustic sand detectors, erosion probes, metocean and geological seismic monitoring, and cathodic protection testing.

Pigging may be required for a variety of reasons, including monitoring, or to facilitate modifications. Should pigging be required, provision has been made for the installation of a temporary subsea pig launcher. The pipeline pigging system including the launcher, receiver and the pipeline itself is designed for maximum operating pressure of the production system. The two closed valves on the manifold where the pig launcher is installed remain closed until the pig launcher installation. A seal test is completed creating a sealed process during routine pigging operations.

3.9.3 Maintenance

Maintenance activities on subsea infrastructure are those required at regular or planned intervals to prevent deterioration or integrity failure of infrastructure. Typical maintenance activities are described in Table 3-8.

Table 3-8: Typical maintenance activities and frequencies

Type of maintenance	Subsea infrastructure	Purpose	Approximate Frequency
Cycling of valves	Wells	Test functionality of technical integrity valves	Every 6 months
Marine growth removal	Production and cross over manifolds and retrieval components (e.g. chokes)	Reduce weight or gain visual access	Based on outcomes from visual inspections (Table 3-7) and marine growth trends on regional infrastructure.
Flushing of chemical hydraulic fluid lines	Hydraulic fluid lines	For maintenance and repair scenarios	When required for repair.
Leak and pressure testing	All subsea infrastructure	Test integrity of subsea infrastructure	Following installation of subsea infrastructure components after a repair or intervention, prior to return to service.

Flushing is typically conducted before disconnecting a subsea component to maximise hydrocarbon displacement to reduce potential residual hydrocarbon or chemical releases to the subsea environment upon disconnection. The flushing chemicals used for this activity may be supplied from either the facility (Wheatstone Platform) or a chemical package via a downline from a support vessel. Where possible, flushed fluids are returned to the platform, processed and treated through the production system.

Pressure testing is undertaken to test the integrity of subsea infrastructure, test isolations and identify any leaks. Pressure testing is typically done after construction and prior to normal operation. In the operation phase, there are no planned pressure tests for the Julimar subsea system. If required, pressure is usually applied to the component from the production system but can also be applied via a downline from a support vessel.

Pressure in the isolated section of pipeline or subsea component is monitored to check for any drop-in pressure and review of locations of leaks detected by visual inspection. This is undertaken by flushing the line with a small volume of a chemical dye and an ROV or AUV will be used to locate and observe the leak. A typical release of chemical dye during leak testing is estimated to be <10 L.

3.9.4 Repair

Repair activities are those required when a subsea system or component is degraded, damaged or has deteriorated to a level outside of acceptance limits. Damage sustained may not necessarily pose an immediate threat to continued system integrity but may present an elevated level of risk to environment or production reliability. Due to the design of subsea infrastructure and materials used, repairs will be undertaken on an as needs basis. The requirements and frequency of these repairs will be dictated by the outcome of the inspection and maintenance regimes described in Table 3-7 and Table 3-8. Typical subsea repair activities included but not limited to, are described below:

- subsea choke replacement
- chemical injection metering valve insert replacement
- subsea control module (SCM) or Control Distribution Unit (CDU) replacement
- hydraulic flying lead (HFL) replacement
- electrical flying lead (EFL) replacement
- hotstab change out
- span rectification, pipeline protection and stabilisation
- retrofitting span vibration mitigation devices (shrouds)
- spool replacement repair and recovery
- umbilical/ jumper replacement, relocation, repair and recovery
- flowline/pipeline replacement repair and recovery
- scour prevention installation
- Cathodic Protection System replenishment/repair.

When equipment is replaced, the redundant equipment, may remain in-situ or be removed from the field. The inventory is used to track equipment on the seabed to enable planning for future removal. Currently, there is no redundant equipment in the Operational Area.

A number of techniques may be used for span rectification or component stabilisation and protection including grout bags, mattresses, vibration shrouds, anchors or rock dumping. All techniques require the use of a support vessel crane to deploy the material, and an ROV to ensure it is accurately placed on the seabed. Woodside's operational experience on the North West Shelf indicates these activities are typically restricted to relatively short (tens of metres) linear sections of pipeline, with areas of up to approximately 100 m² impacted.

Mattresses are typically made of concrete and may be used for span rectification or pipeline protection and stabilisation. Mattresses are typically 3 m by 6 m in size, therefore, each may disturb 18 m² of the seabed.

3.9.5 Chemical Usage During IMMR Activities

IMMR chemicals for intermittent use typically originate from a chemical package located onboard a support vessel during specific activities, and may typically include:

- dye - chemical dyes used to identify the source of a leak
- acid – acetic or sulfamic acid (or equivalent) which removes calcium deposits
- grout - the material used in grout, mattresses, and rock is typically concrete-based

- biocide – Biocides are generally used to prevent the bacterial growth in pipelines that may cause corrosion.
- Staurolite products – Staurolite products are used for abrasive/sand blasting to clean and remove marine growth. The main component is staurolite, which is a naturally forming mineral.
- preservation fluids – chemicals used to preserve subsea infrastructure if scope requires subsea infrastructure replacement. Chemicals typically used may include MEG, corrosion inhibitor, oxygen scavenger and biocide.

3.9.5.1 Typical Discharges During IMMR Activities

Minor environmental discharges are expected during subsea IMMR activities (e.g. during pressure/leak testing or flushing). Where practicable, flushing is performed before a subsea component is disconnected to reduce residual hydrocarbon or chemical releases to the environment upon disconnection; instead returning fluids to the Wheatstone platform. Flushing may be supplied from either the Wheatstone platform or via a support vessel. Table 3-9 lists typical discharge volumes during different IMMR activities.

Table 3-9: Typical Discharge Volumes During Different IMMR and Subsea Activities

Activity	Typical Discharge
Pressure/leak testing and investigation	Chemical dye <10 L.
Flushing	Residual hydrocarbon or chemical release (corrosion inhibitor and oxygen scavenger) volume depends on injection port size, component geometry, and pumping rates.
Hot stab change-out	Hydrocarbons or subsea control fluid <10 L.
SCM changeout	Typical releases: acid ~400 L; subsea control fluid ~10 L.
Umbilical replacement	Typical releases of hydraulic fluid, MEG and scale inhibitor are estimated to be <10 L each.
Choke change out	Release of hydrocarbons <10 L and a typical release of MEG is estimated to be 280 L.
Flowline or spools repair, replacement, and recovery	Typical release of hydrocarbon or other chemicals depends on equipment configuration and flushing ability. This will be subject to an ALARP determination for the activity, as per normal practice.

3.9.6 Marine Growth Removal

Due to the relatively high rate of marine growth on the NWS, excess growth may need to be removed before undertaking many subsea IMMR activities. Table 3-10 lists the different techniques used.

Table 3-10: Marine Growth Removal Methods

Activity/Equipment	Description
Water jetting	Uses high pressure water stream to remove marine growth.
Brush systems	Uses brushes attached to an ROV or AUV to physically remove marine growth.
Acid (typically sulfamic or acetic acid)	Chemically dissolves calcium deposits. Volume used is dependent on the amount of marine growth to remove.

3.9.7 Sediment Relocation and Disturbance

If sediment builds up around subsea infrastructure, an ROV-mounted suction pump/dredging unit may be used to relocate the sediment to allow inspection/works to be undertaken. This activity is limited to relocating small amounts of sediment material in the immediate vicinity of the subsea infrastructure (i.e. within the existing footprint). Sediment relocation typically results in minor seabed disturbance (up to 3 m³ if removed by ROV) and some localised turbidity.

If it is determined that anode skids are required for corrosion protection, they are placed on the seabed using a support vessel crane. Some sediment relocation may be required to prepare the area prior to positioning. A typical anode skid has a seabed footprint of about 8 m².

4. DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with Regulation 21(2) and 21(3) of the Environment Regulations, this section describes the existing environment that may be affected by the activity (planned and unplanned, as described in Section 2.4.2), including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The EMBA is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the event of the worst-case credible spill. The ecological impact thresholds used to delineate the EMBA are defined in Section 6.8.2.2. The worst-case credible spill scenario for this EP is loss of well integrity. The EMBA also includes any areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations.

Woodside recognises that hydrocarbons may be visible beyond the EMBA at lower concentrations than the ecological impact thresholds defined in Section 6.8.2.2. These visible hydrocarbons are not expected to cause ecological impacts. In respect of this, an additional socio-cultural EMBA is defined, as the potential spatial extent within which social-cultural impacts may occur from changes to the visual amenity of the marine environment. Receptors relevant to the socio-cultural EMBA include Commonwealth and State marine protected areas (MPAs), National and Commonwealth Heritage Listed places, areas of tourism and recreation, and commercial and traditional fisheries. For this EP, the socio-cultural EMBA for surface hydrocarbons encompasses an area fully within the boundaries of the EMBA for ecological impacts. The EMBA and socio-economic EMBA are shown in Figure 4-1 and described in Table 4-1.

The EMBA presented does not represent the predicted coverage of any one hydrocarbon spill or a depiction of a slick or plume at any particular point in time. Rather, the areas are a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

Table 4-1: Hydrocarbon spill thresholds used to define EMBA for surface and in-water hydrocarbons

Hydrocarbon Type	EMBA ¹	Socio-cultural EMBA ¹	Planning Area for Scientific Monitoring
Surface	10 g/m ² This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.	1 g/m ² This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for scientific monitoring (NOPSEMA guidance note: A652993, (2019)).	
Dissolved	50 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, (2019)). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		10 ppb This low exposure value establishes the planning area for scientific monitoring (based on potential for exceedance of water quality triggers) (NOPSEMA guidance note: A652993, (2019)). This area is described further in Appendix D: Figure 5-1.
Entrained	100 ppb		In the event of a spill, DNP will be notified of AMPs which may be

4.2 Regional Context

The Operational Area is located in Commonwealth waters within the North-west marine region (NWMR), as defined under the Integrated Marine and Coastal Regionalisation of Australia (IMCRA v4.0) (Commonwealth of Australia 2006). Within the NWMR, the Operational Area predominantly lies within the Northwest Shelf Province provincial bioregion (Figure 4-2), with its western part extending into the Northwest Province. Additionally, the EMBA extends into the Northwest Transition, Central Western Transition, and Central Western Shelf Transition provincial bioregions. Additional information on relevant marine bioregions is described in Section 3 of the Master Existing Environment.

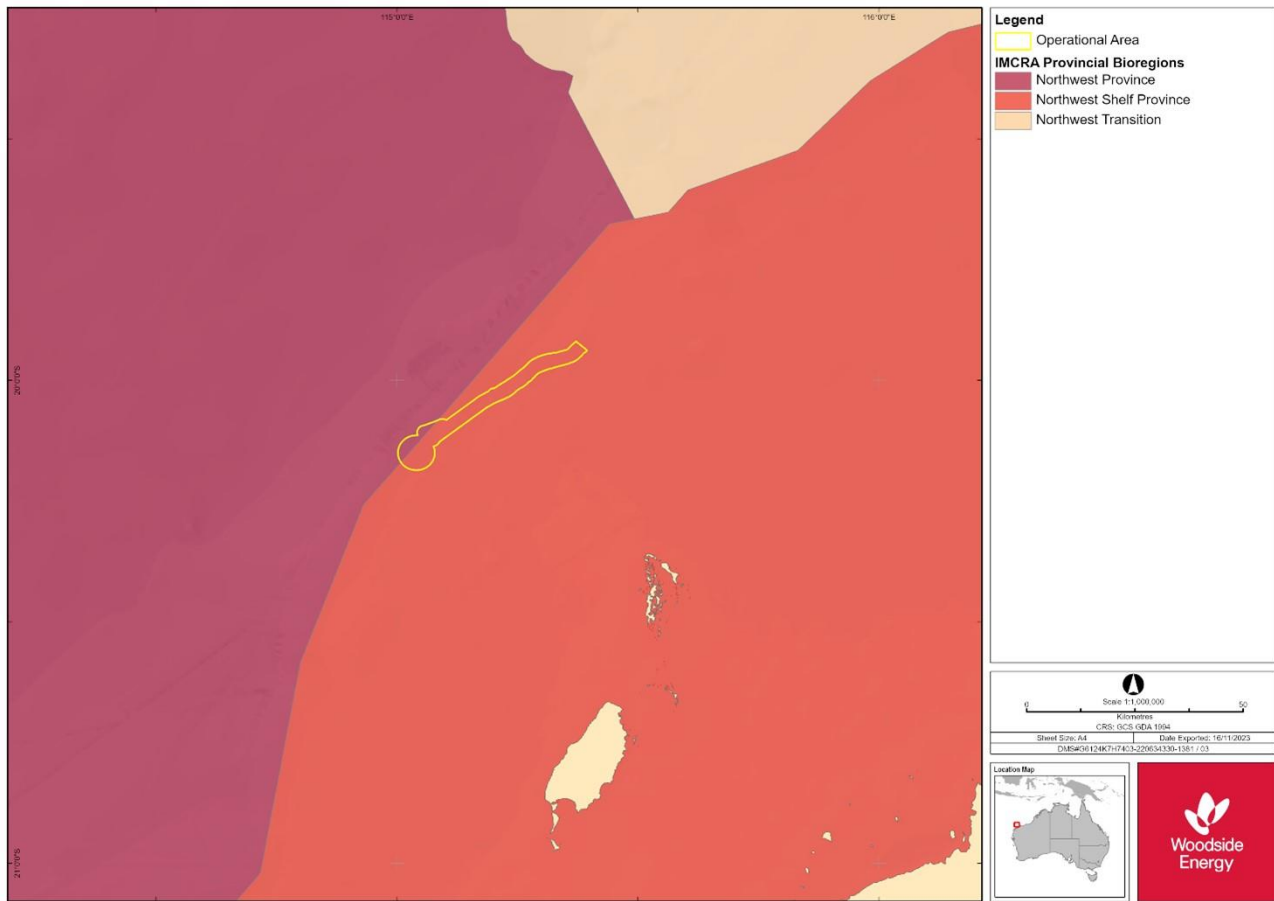

Figure 4-2: Location of the Operational Area and relevant marine bioregions

4.3 Physical Environment

A summary of the physical characteristics identified within the Operational Area and EMBA is described in Table 4-2 and further described in the Master Existing Environment.

Table 4-2: Summary of physical characteristics within the Operational Area and EMBA

Physical characteristics	Description
Climate	The Julimar Operation Area offshore conditions (as reported for the Pluto Offshore Basic Design Data (Woodside 2014) show air temperatures range from highest mean record of 28.71 °C in March to lowest mean record of 22.89 °C in July (as derived from North Rankin records (excluding tropical cyclones).

Physical characteristics	Description
	The broader NWMR experiences a tropical or monsoon climate (in northern Australia areas), exhibiting a hot summer season from October to April and a milder winter season between May and September (BoM 2024)
Winds	Seasonal variability derived from Pluto Offshore Basic Design Data (Woodside 2014) predicted the highest mean wind speed for June and July (7.63 m/s) and the lowest mean wind speed for November and December (7.15 m/s) based on hindcast modelling of wind speed. Winds within the EMBA are expected to follow this pattern.
Currents and tides	The dominant annual current directions within the Pluto offshore facility, in close proximity of the Operational Area, are west or north-west and maximum current speeds between 2 and 3 m/s (Woodside 2014). Geophysical surveys undertaken within the Operational Area indicate that prevailing seafloor currents in this area are orientated east-north east / west-south west (Fugro 2011, Neptune Geomatics 2010). The broader NWMR is primarily influenced by the Indonesian Through Flow (ITF) current and the Leeuwin Current, internal tides and cyclones. The ITF brings warm waters from the Indonesian Archipelago into the NWMR and the Leeuwin Current flows southward along the edge of the continental shelf and is primarily a surface flow (up to 300 m deep). The ITF and Leeuwin Current are strongest during late summer and winter (Holloway and Nye 1985). Tides in the NWMR are semi-diurnal and have a pronounced spring-neap cycle, with tidal currents flooding towards the south-east and ebbing towards the north-west (Pearce, et al. 2003).
Water temperature	Measured seawater temperature (September 2005 and December 2007) in the Pluto offshore facility Basic Design Data shows the mean seawater temperatures at surface and through the water column in the upper 100 m depth range from 26.5 °C at surface to 24 °C at 100 m depth (Woodside 2014). The mean seawater temperature declines rapidly with mean temperatures of 17°C and 15°C at 200 m and 220 m, respectively (Woodside 2014). Within the NWMR the currents contribute to variability in seawater temperature and salinity throughout the water column. The water temperatures ranging between 30 °C in summer and 22 °C in winter (Pearce, et al. 2003). Water temperatures near the seabed have low interannual variability ($\pm 1.5^{\circ}\text{C}$ at depths of 150 m) and become more stable with increasing water depth (Pearce, et al. 2003).
Seabed features and marine sediments	Seabed features in the Operational Area are detailed in Section 4.3.1. Based on Geoscience Australia's geomorphic classification of seabed (Harris, et al. 2005), the geomorphic features present within the EMBA are 'canyon', 'deep/hole/valley', 'pinnacle', 'plateau', 'reef', 'shelf', 'slope', 'terrace', and trench/trough. Rankin Bank and Glomar Shoal located ~25 km and 148 km northeast of the Operational Area, respectively, where identified within the EMBA. Sediments in the NWMR generally become finer with increasing water depth, ranging from sand and gravels on the continental shelf to mud on the continental slope and abyssal plain (Brewer, et al. 2007). The predominant seafloor sediment type within the EMBA are 'calcareous gravel, sand and silt', 'calcareous ooze', and 'mud and calcareous clay' (CSIRO 2015).
Air quality	Due to the extent of the open ocean area, the ambient air quality in the Operational Area and wider offshore region is considered to be of high quality.

4.3.1 Seabed Features in the Operational Area

Approximately ~0.2% (~28 km) of the Ancient Coastline at 125 m depth contour KEF crosses the eastern part of the Operational Area (i.e. sections of the umbilical, MEG line and production flowlines). This KEF, as well as others within the Operational Area, are described in Section 4.7.

A survey by Fugro (2011) for the development of the Julimar Fields provides bathymetric and seabed geomorphological information for the majority of the Operational Area (Figure 4-3).

The survey confirmed the seabed composition is predominantly sediment grading from high energy sediment deposits such as coarse sand and gravel in the east and north-east to low energy sediment deposits such as silt and clay in the west and south-west.

Fugro (2011) reported on three main depth categories as follows:

- **in water depths <120 m LAT:** the seabed undulates due to north-west/south-east trending sand waves comprise coarse sand and gravel sediments. These sand waves, as well as shallow (<0.5 m) pockmarks (both individual and groups of pockmarks) and mega-ripples, were consistently noted in other surveys overlapping the northern portion of the Operational Area (Neptune Geomatics 2010, RPS 2010). Outcropping cemented sediments (reported as high relief and a low ridge) were also recorded in the far north-east of the Operational Area, near the Wheatstone platform, and are generally covered in a thin layer of unconsolidated and partially cemented sediments.
- **in water depths between 120 and 220 m LAT:** the seabed area is smooth and featureless with seabed sediment composition predominately silty fine to medium sand, grading to clay and silt with increasing water depth.
- **in water depths >220 m LAT:** to the southwest of the survey area and outside the Operational Area (beyond the continental shelf), there is a distinct break in the continental slope with north-west trending submarine canyons. Sediments predominately comprise clay and silt.

Past oil and gas activity within the Operational Area was evidenced by anchor scars and drilling discharge deposition associated with the Brunello-1 well (Neptune Geomatics 2008).

Geophysical and benthic habitat surveys within the Operational Area reported sediments to be primarily silty, fine to medium grain calcareous sands (Neptune Geomatics 2008, 2009, 2010, RPS 2010, 2011). Shell fragments were also reported amongst these finer sediments (Neptune Geomatics 2010). Sediment size increased with decreasing depth (toward the east and north-east of the Fugro survey area).

4.4 Habitats and Biological Communities

Key habitats and ecological communities within the Operational Area and EMBA are identified in Table 4-3 and described in Section 4 and 5 of the Master Existing Environment. There are no threatened ecological communities identified within the Operational Area or EMBA.

Table 4-3: Habitats and Communities within the EMBA

Habitat / Community	Description
Marine primary producers	
Coral	<p>Coral reef habitats typically have a high diversity of corals with associated fish communities and support numerous flora and fauna species; many of which are of both commercial and conservation importance. Coral reef habitats are an integral part of the marine environment within the NWMR.</p> <p>There are no coral reef habitats within the Operational Area. The nearest coral reef habitat is located at Rankin Bank, ~25 km northeast of the Operational Area, within the EMBA. Other coral reef habitats in the EMBA include those within the Montebello and Barrow Island protected areas, the Muiron Islands and Ningaloo Coast.</p>
Seagrass beds and macroalgae	<p>Seagrass beds and macroalgae habitats represent a food source for many marine species and may also provide key habitats and nursery grounds to species (DoF 2011). WA's clear coastal waters allow seagrasses to inhabit depths of >40 m; in contrast, in many estuaries, light penetration is poor, so seagrasses are limited to two m in depth (DoF 2011).</p> <p>Seagrass beds and macroalgae habitats represent a food source for many marine species and may also provide key habitats and nursery grounds to species (DoF 2011). WA's clear coastal waters allow seagrasses to inhabit depths of >40 m; in contrast, in many estuaries, light penetration is poor, so seagrasses are limited to two m in depth (DoF 2011). Given the water depth of the Operational Area and seabed habitat depth is beyond the phototrophic zone, ecologically sensitive primary producers do not occur.</p> <p>The nearest seagrass is located at the Montebello and Barrow Islands, ~46 km and 66 km southeast of Operational Area, respectively, within the EMBA. Seagrass beds and macroalgae habitat can also be found within the EMBA at some islands in the Pilbara Island Groups, the Muiron Islands and along the Ningaloo Coast.</p>
Mangroves	<p>Mangrove systems provide complex structural habitats that act as nurseries for many marine species as well as nesting and feeding sites. Mangroves also maintain sediment, nutrient and water quality within habitats and minimise coastal erosion (Nagelkerken, et al. 2008).</p> <p>The closest mangrove habitats to the Operational Area are located at the Montebello and Barrow Islands ~46 km and 66 km southeast of Operational Area, respectively, within the EMBA. Other mangrove habitats associated with the EMBA include those located along the Ningaloo Coast.</p>
Sandy beaches	<p>Given the location of the Operational Area, there are no sandy beaches within this area. Sandy beaches, within the broader EMBA, can be found around mainland and some Pilbara islands.</p>
Salt marshes	<p>Given the location of the Operational Area, there are no salt marshes within this area.</p> <p>The closest salt marshes habitats to the Operational Area are located at the Barrow Islands ~70 km southeast of Operational Area, within the EMBA. Other salt marshes habitats associated with the EMBA include those located along the Ningaloo Coast.</p>
Other communities and habitats	
Plankton	<p>Primary productivity of the NWMR appears to be largely driven by offshore influences (Brewer, et al. 2007), with periodic upwelling events and cyclonic influences driving coastal productivity with nutrient recycling and advection. There is a tendency for offshore phytoplankton communities in the NWMR to be characterised by smaller taxa (e.g. bacteria), whereas shelf waters are dominated by larger taxa such as diatoms (Hanson, et al. 2007).</p> <p>Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR. Within the wider EMBA, peak primary productivity occurs in late summer / early autumn, along the shelf edge of the Ningaloo Reef. It also links to a larger biologically productive period in the area that includes mass coral spawning events, peaks in zooplankton and fish larvae abundance (MPRA 2005) with periodic upwelling throughout the year.</p>

Habitat / Community	Description
Pelagic and demersal fish populations	<p>Demersal fish are associated with a wide range of habitats, including coastal and estuarine ecosystems, macroalgal and seagrass communities, and coral reefs (Hutchins 2001, Blaber, Young and Dunning 1985). Abundance and species richness of demersal fish species and communities (those that live and feed on or near the seabed) typically increase with increasing marine habitat complexity (Gratwicke and Speight 2005).</p> <p>Benthic habitats of the Operational Area are not expected to support a high diversity of demersal fish species. The nearest location identified as supporting high demersal fish richness and abundance is located at Rankin Bank, ~25 km northeast of the Operational Area, within the EMBA. The Continental slope demersal fish communities KEF (see Section 4.7.2) which features high levels of demersal fish endemism has also been identified within the Operational Area and EMBA.</p> <p>Pelagic fish species within the NWMR include both small and large species; small pelagic fish inhabit a range of marine habitats, including inshore and continental shelf waters. They feed on pelagic plankton and represent a food source for a wide variety of predators including larger pelagic fish, sharks, seabirds and marine mammals (Mackie, et al. 2007). Large pelagic fish in the NWMR include commercially targeted species such as mackerel, barracuda, billfishes and tunas (Lewis 2020). Large pelagic fish are typically widespread, found mainly in offshore waters (occasionally on the shelf) and often travel extensively (Hobday, Griffiths and Ward 2009).</p> <p>Pelagic fish species may be present within the Operational Area, although there are no habitats considered important to these species within the Operational Area.</p>
Epifauna and infauna	<p>Surveys within the Operational Area (RPS 2010, 2011) have found that benthic epifauna associated with the soft sediment seabed habitat comprise sparsely (<5%) distributed filter and deposit feeding invertebrates; such as sea whips, soft corals, gorgonians and occasional echinoderms. Bioturbation of surveyed habitats ranged from sparse (>5% coverage) to dense (>25% coverage) indicating infauna and decapod (shrimp) and demersal fish presence.</p> <p>Outcropping hard substrates (e.g. emergent limestone) located to the east and north-east of the Operational Area (survey areas ENV001, ENV002, ENV003 shown on Figure 4-4) were found to feature a greater abundance of invertebrate fauna, including sea whips, gorgonians and sponges; these habitats were also associated with fish such as banner fish, trevally and red emperor (RPS 2010, 2011). An ROV inspection of existing petroleum infrastructure associated with the Pluto pipeline (north-east of the Operational Area) found these structures also provided shelter for fish species and substrate for filter feeding species to attach to (RPS 2011). Other petroleum infrastructure within the survey areas, such as well heads, were similarly found to be associated with benthic invertebrates and fish species (RPS 2010, 2011).</p> <p>The benthic infauna and epifauna found within the Operational Area are representative of the wider NWMR (and EMBA) (Brewer, et al. 2007, Rainer 1991).</p>

4.5 Matters of National Environmental Significance

Table 4-4 summarises the matters of national environmental significance (MNES) under the EPBC Act that overlap the Operational Area and EMBA, according to EPBC Act Protected Matters Search Tool (PMST) (Appendix H). The PMST is a general database that conservatively identifies areas in which protected species have the potential to occur.

Table 4-4: Summary of MNES identified by the EPBC Act PMST as potentially occurring within the Operational Area and EMBA

MNES	Number Overlapping the Operational Area	Number Overlapping the EMBA	Relevant Section of the EP and Master Existing Environment
World Heritage Properties	0	1	Section 4.9.3.3
National Heritage Places	0	1	Section 11.2 of the Master Existing Environment
Wetlands of International Importance (Ramsar)	0	0	Not relevant to this EP
Commonwealth Marine Area	2	2	Section 4 and 5 of the Master Existing Environment
Listed Threatened Ecological Communities	0	0	Not relevant to this EP
Listed Threatened Species	25	53	Section 4.6
Listed Migratory Species	37	62	Sections 3 to 8 of the Master Existing Environment.

4.6 Protected Species

A total of 91 EPBC Act listed species considered to be MNES were identified as potentially occurring within the EMBA, of which a subset of 44 species were identified as potentially occurring within the Operational Area. The full list of marine species identified from the PMST reports is provided in Appendix H including several MNES that are not considered to be credibly impacted (e.g. terrestrial species within the EMBA). Criteria for determining species to be considered for impact assessment is outlined in Section 3.2 of the Master Existing Environment.

Two conservation dependent species have also been identified with a potential to occur within the Operational Area and EMBA. These species, the scalloped hammerhead and Southern Bluefin Tuna, are listed on the Species Profile and Threats Database (DCCEE n.d.).

Table 4-5 to Table 4-13 list the species identified by the PMST that have a potential to be impacted by the Petroleum Activities Program, as well as overlapping Biologically Important Areas (BIAs) or Habitat Critical to Survival (Habitat Critical) for these species. Further information of threatened and/or migratory species with BIAs within the Operational Area is provided in the following subsections. An additional description of each species within the is included in Section 5 to Section 8 of the Master Existing Environment. Figure 4-5 to Figure 4-9 show the spatial overlap with relevant BIAs and Habitat Critical areas and the Operational Area.

4.6.1 Fish, Sharks and Rays

Table 4-5: Threatened and Migratory Fish, Shark and Ray Species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Anoxypristis cuspidata</i>	Narrow sawfish	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area

4.6.1.1 Whale shark

The whale shark, *Rhincodon typus*, is a planktivorous shark and feed on a variety of planktonic organisms including krill, jellyfish, and crab larvae (Last and Stevens, Sharks and rays of Australia. 2nd edition 2009).

Whale sharks form seasonal aggregations at Ningaloo Reef between March and July (TSSC 2015c). However, seasonal aggregation can be variable, with individual whale sharks recorded at other times of the year.

This species undergoes an annual migration along the 200 m isobath of the WA coast between July and November (TSSC 2015c). Timing of the whale shark migration to and from Ningaloo coincides with the coral mass spawning period when there is an abundance of food (krill, planktonic larvae and schools of small fish) in the waters adjacent to Ningaloo Reef (DCCEEW 2024a). At Ningaloo Reef, whale sharks stay within a few kilometres of the shore and in waters about 30–50 m deep (Wilson, et al. 2005). After the aggregation period, the distribution of the whale sharks is largely unknown. Satellite tracking Figure 4-5 has shown that the sharks may follow three migration routes from Ningaloo (Meekan and Radford 2010):

- north-west, into the Indian Ocean
- directly north, towards Sumatra and Java
- north-east, passing through the NWS and travelling along the shelf break and continental slope.

Anecdotal evidence from sightings data collected from the Woodside offshore facilities on the NWS indicate whale sharks are present on the NWS in the months of April, July, August, September and October, corresponding with the whale shark's seasonal migration to and from the Ningaloo Reef. However, the numbers of individual whale sharks that transit through the Operational Area is expected to be low, based on the number of whale sharks aggregating at Ningaloo and on the different migration paths that the sharks may follow.

It is expected that whale sharks may traverse the vicinity of the Operational Area during their migrations to and from Ningaloo Reef. However, presence of the whale shark within the area would be of a relatively short duration and not in significant numbers, given the main aggregations are recorded in coastal waters, particularly the Ningaloo Reef edge (DPW 2013, MPRA 2005).

4.6.2 Marine Reptiles

Table 4-7: Threatened and Migratory Marine Reptile Species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Aipysurus apraefrontalis</i>	Short-nosed sea snake ⁶	Critically Endangered	N/A	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Aipysurus foliosquama</i>	Leaf-scaled sea snake	Critically Endangered	N/A	N/A	Species or species habitat known to occur within area
<i>Caretta caretta</i>	Loggerhead turtle	Endangered	Migratory	Species or species habitat known to occur within area	Breeding known to occur within area
<i>Chelonia mydas</i>	Green turtle	Vulnerable	Migratory	Species or species habitat known to occur within area	Breeding known to occur within area

4.6.2.1 Flatback turtle

Flatback turtle nesting on Barrow Island occurs between October and March, with peak nesting activity occurring between November and January (Commonwealth of Australia 2017a). On Barrow Island, nesting activity is concentrated on the east coast on sandy, low-sloped, low-energy beaches with wide, shallow intertidal zones (K. Pendoley 2005, Pendoley, et al. 2014).

The Montebello Islands and Barrow Island are identified as nesting habitat critical to the survival of the species, as is the 60 km internesting buffer (Figure 4-7) around the Montebello Islands (Commonwealth of Australia 2017a).

Post-nesting satellite tracking indicates foraging occurs along the WA coast in water shallower than 130 m and within 315 km of shore (Commonwealth of Australia 2017a). However, the foraging ecology of post-hatchling Flatback turtles is currently unknown. Limited observations suggest they feed on small animals living in the water column (Commonwealth of Australia 2017a). During internesting turtles remain close to the nesting beach or rookery (Commonwealth of Australia 2017a).

A habitat suitability modelling study for internesting Flatback turtles in the NWS region of WA (Whitlock, Pendoley and Hamann 2016) was conducted to identify areas of suitable Flatback turtle internesting habitat and determine overlap with identified industrial hazards. The study used a turtle tracking dataset of 47 nesting female turtles from five important rookeries in the NWS study area, including Barrow Island. The results showed internesting Flatback turtles from all rookeries remained within water depths of <44 m, with a mean depth of <10 m (Whitlock, Pendoley and Hamann 2016). Results also showed internesting turtles from all rookeries remained within <28 km of the nearest coast, with a mean distance from the coast of <6.1 km. The habitat suitability modelling study defined suitable Flatback turtle internesting habitat as water depths of 0–16 m within 5–10 km of the coast. Unsuitable Flatback turtle internesting habitat was defined as waters >25 m deep and >27 km from the coast (Whitlock, Pendoley and Hamann 2016). The Operational Area is therefore, classified as unsuitable for internesting Flatback turtles.

Another recent study involving satellite tracking data for 11 Flatback turtles following nesting on the Lacepede Islands (Thums, Waayers and Pattiaratchi 2017) found that Flatback turtles remained at an average distance of 15.75 ± 12.25 km from the nesting beach in water depths of <20 m.

Other previous studies (Dobbs 2007, Guinea, Sperling and Whiting 2006, Pendoley Environmental 2010) have also presented findings that internesting behaviour was only observed in water depths of <40 m. One of these studies (Pendoley Environmental 2010) further indicates that internesting Flatback turtles have relatively shallow dives, with 85% of the time during spent in ≤ 20 m water depth, of which most was spent in 5–10 m ($27 \pm 2.7\%$) and 10–15 m ($22.3 \pm 3.5\%$) water depths.

The Operational Area is in water depths ranging from ~71 m to ~244 m and ~46 km from the nearest Island. As such is not likely that Flatback turtles occur in the Operational Area.

4.6.3 Marine Mammals

Table 4-10: Threatened and Migratory Marine Mammal Species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA

4.6.3.1 Pygmy Blue Whale

There are two recognised sub-species of blue whale in the Southern Hemisphere, both of which are recorded in Australian waters. These are the southern (or 'true') blue whale (*Balaenoptera musculus*) and the 'pygmy' blue whale (*Balaenoptera musculus brevicauda*) (Commonwealth of Australia 2015). In general, southern blue whales occur in waters south of 60°S (i.e. in the Antarctic). and pygmy blue whales occur in waters north of 55°S. On this basis, blue whales sighted in the NWMR are likely to be pygmy blue whales.

The East Indian Ocean (EIO) pygmy blue whale population is seasonally distributed from Indonesia (a potential breeding ground) to south-west of Australia and east across the Great Australian Bight and Bonney Upwelling to beyond the Bass Strait (Blue Planet Marine 2020). McCauley et al. (2018) describe three migratory stages around Australia for the EIO pygmy blue whale population: a 'southbound migratory stage' where whales travel southwards from Indonesian waters offshore from the WA coastline; a protracted 'southern Australian stage' where animals spread across southern waters of the Indian Ocean and south of Australia; and a 'northbound migratory stage' where animals travel north back to Indonesia again.

Extensive passive acoustic monitoring throughout the NWMR indicates migratory timing and distribution of pygmy blue whales (noting this survey method detects vocalising whales):

- acoustic monitoring conducted by McCauley and Jenner in the Exmouth and northern Montebello Islands region identified a peak period in the northern migration of pygmy blue whales from April to August, and from November through to late December during the southern migration
- northbound migration between mid-April and early August and southbound migration between October to December (noting the absence of any southbound detection in 2007) (R. McCauley 2011)
- noise loggers deployed for a full year period in 2019 detected pygmy blue whales on their northern and southern migration. The noise loggers were located at various locations ~50 km northwest of the Operational Area, in ~1300 m water depth. The majority of pygmy blue whales detected on their northern migration occurred from mid-April to the end July, then again on their southern migration in November through to early-December (Chevron Australia 2019)
- a targeted passive acoustic monitoring program to detect southbound migratory pygmy blue whales ran from late October 2021 to March 2022 with a deepwater ALTO lander (900 m depth) to the west of the Montebello Trough and C-lander (190 m depth) at the outer edge of the NWS (Warren, et al. 2023). Despite vessel noise dominating low frequencies throughout the recording periods at both recording locations, pygmy blue whale song vocalisations and D-calls were detected from the start of the recording period through November and early December 2021
- an offshore trial of Distributed Acoustic Sensing using fibre optic cables (submarine telecommunications cable) to detect low-frequency whales recorded vocalising pygmy blue whales within 12 km detection range within a 50 km long area on the outer edge of NWS (Debens, et al. 2024). Pygmy blue whale detections were made from mid-November (commencement of the trial) through to mid-December 2023 and a couple of detections in early January 2024.

Thums et.al. (2022) used passive acoustic monitoring and satellite telemetry data to assess the spatial extent of the distribution, migration and foraging areas for pygmy blue whales in the South-east Indian Ocean. They highlighted extensive use of slope habitat off Western Australia and minimal use of shelf habitat. Additionally, pygmy blue whales off WA were mostly engaged in

migration, with short periods of foraging. This study (Thums, Ferreira, et al. 2022) determined the 'most important areas' based on largest percentage of whales and high move persistence, for migration along the WA coast as an almost continuous stretch from southern WA to around the latitude of Rowley Shoals. The Operational Area does not intersect with this 'most important areas' for migration (Figure 4-8).

Whale density predictions indicate greatest numbers of pygmy blue whales during April - June (northern migration), and November - December (southern migration) (Thums, Ferreira, et al. 2022).

Thums et.al. (2022) also identified the 'most important areas' for foraging based on greatest time spent, largest percentage of whales, and lowest move persistence along the WA coast included the Perth Canyon and vicinity, the shelf edge off Geraldton, and discontinuous use of the shelf edge from Ningaloo Reef to Rowley Shoals. The Operational Area does not intersect with this 'most important areas' for foraging (Figure 4-8).

A recent satellite tracking data for pygmy blue whales have identified that the continental slope off the north-west Australian coast was predicted to be suitable habitat for migration and foraging (Ferreira, Jenner and Jenner 2024). This information is aligned with other recent studies in the north-west of Australia. The Operational Area intersects with these suitable habitats for migration and foraging.

The Conservation Management Plan for the Blue whale (Commonwealth of Australia 2015) also identifies 'Possible Foraging Areas'. These 'Possible Foraging Areas' have been characterised as foraging BIAs. The closest foraging BIA is ~212 km southwest of the Operational Area.

The pygmy blue whale feeds in the Perth Canyon at depths of 200 to 300 m, which overlaps the typical distribution of krill (200–500 m water depth (day) to surface (night) (Commonwealth of Australia 2015). Other possible feeding grounds off the WA coast include the wider area around the Perth Canyon, and possible foraging areas off the Ningaloo Coast and at Scott Reef (Commonwealth of Australia 2015).

4.6.4 Seabirds and Migratory Shorebirds

Table 4-12: Threatened and Migratory Seabird and Migratory Shorebird Species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Actitis hypoleucos</i>	Common sandpiper	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Anous stolidus</i>	Common noddy	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat likely to occur within area
<i>Apus pacificus</i>	Fork-tailed swift	N/A	Migratory	N/A	Species or species habitat likely to occur within area
<i>Ardenna carneipes</i>	Flesh-footed shearwater	N/A	Migratory	N/A	Species or species habitat likely to occur within area
<i>Ardenna pacifica</i>	Wedge-tailed shearwater	N/A	Migratory	N/A	Breeding known to occur within area
<i>Calidris acuminata</i>	Sharp-tailed sandpiper	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Calidris canutus</i>	Red knot	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Calidris ferruginea</i>	Curlew sandpiper	Critically Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Calidris melanotos</i>	Pectoral sandpiper	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Calonectris leucomelas</i>	Streaked shearwater	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
<i>Charadrius leschenaultii</i>	Greater sand plover	Vulnerable	Migratory	N/A	Species or species habitat known to occur within area
<i>Charadrius veredus</i>	Oriental plover	N/A	Migratory	N/A	Species or species habitat may occur within area

4.6.4.1 Wedge-tailed Shearwater

The Wedge-tailed shearwater (*Arena pacific*) is a pelagic, marine seabird known from tropical and subtropical waters (DCCEEW 2024). Its distribution is widespread across the Indian and Pacific oceans with a global population of 2.6 million pairs. Of this, approximately one million pairs breed in Australia, most of which do so on islands in WA between Rottnest Island in the south to Ashmore Reef in the north (DCCEEW 2024).

Adults are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean over-wintering grounds from late June onwards to re-excavate their burrows (Pendoley Environmental 2019). This species is highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period (Pendoley Environmental 2019). Once hatched, adults leave the burrows to forage locally during the day returning at night to feed chicks until they are ready to fledge (Nicholson 2002). Due to the high synchronicity in egg laying, fledging is restricted to the first two weeks of April (Nicholson 2002).

This species is seen in North West WA from June to April (DBCA 2017). The breeding season in the Pilbara region occurs between November and April (DBCA 2017). Breeding behaviours are typically nocturnal in Wedge-tailed shearwaters.

Breeding behaviours are nocturnal in Wedge-tailed shearwaters. Adults return to and depart the colony at night and fledglings depart the colony at night. In the lead up to fledging, chicks also leave their burrows to exercise their wings outside burrows. Known breeding locations in the NWMR include Forestier Island (Sable Island), Bedout Island, Dampier Archipelago, Passage Island, Lowendal Island, islands off Barrow Island (Mushroom, Double and Boodie islands), islands in the Onslow area (including Airlie, Bessieres, Serrurier, North and South Muiron and Locker islands), islands in Freycinet Estuary, and south Shark Bay (Slope, Friday, Lefebvre, Charlie, Freycinet, Double and Baudin islands (DSEWPC 2012). This species forages relatively close to breeding islands and its diet consists of squid, fish and crustaceans (DSEWPC 2012), tracking studies found that foraging activities at sea were more frequent during the day compared with at night (Catry, et al. 2009, Weimerskirch, de Grissac, et al. 2020).

Wedge-tailed shearwaters breeding on the Muiron Island (north) undertook extensive foraging trips during the incubation period (1,200 – 1,400 km) and shorter trips during chick rearing (<300 km, (Cannell, Hamilton and Driessen 2019)). Longer foraging trips took individuals in a NW direction offshore towards oceanic seamounts. Conversely, the shorter tended to include waters to the west and NW of the Muiron Islands (Cannell, Hamilton and Driessen 2019). In addition to the Muiron Islands, this dual foraging strategy, whereby parents alternate or mix short and long trips, have been recorded in Wedge-tailed shearwaters breeding in the east of Australia (Peck and Congdon 2005), and New Caledonia (Weimerskirch, Le Corre, et al. 2005). However, divergent foraging strategies have been detected between colonies, which is linked to the proximity of colonies to high productivity waters (Peck and Congdon 2005, Weimerskirch, Le Corre, et al. 2005).

4.6.5 Seasonal Sensitivities for Protected Species

Seasonal sensitivities for protected migratory species identified as potentially occurring within the Operational Area are identified in Table 4-14 Movement patterns of all protected species identified in Section 4.5 are described in Section 5 of the Master Existing Environment.

Table 4-14: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area.

Species	January	February	March	April	May	June	July	August	September	October	November	December
Fish, sharks and rays												
Whale shark - foraging (northward from Ningaloo) ¹												
Mammals												
Pygmy blue whale - northern Migration ²												
Pygmy blue whale - southern Migration ³												
Marine reptiles												
Flatback turtle - Pilbara Stock (F-Pil) ⁴ Nesting												
Seabirds and shorebirds												
Wedge-tailed shearwater - breeding / foraging *fledgling emergence (first two weeks of April)												
	Species may be present in the Operational Area and display biologically important behaviour in the region.											
	Peak period. Presence of animals is reliable and predictable each year in the region.											
	Species not likely to be present or undertaking biologically important behaviour in											

References for species seasonal sensitivities:

¹ Whale shark foraging northward from Ningaloo in Spring (DCCEEW, 2024b15). Migration along the north coast of WA also known to occur between July - November (TSSC, 2015d). Potential presence of whale sharks year-round at Ningaloo (Norman et al., 2017).

² Pygmy blue whale northern migration April - August (DCCEEW, 2024b15; DSEWPaC, 2012a; McCauley et al., 2018; CoA, 2015a). Peak April- July (Thums et al., 2022)

³ Pygmy blue whale southern migration October- December, possibly into January (DCCEEW, 2024b15; DSEWPaC, 2012a citing (McCauley and Jenner, 2010; McCauley et al., 2018; Thums et al., 2022; CoA, 2015a). Peak November - December (Thums et al., 2022).

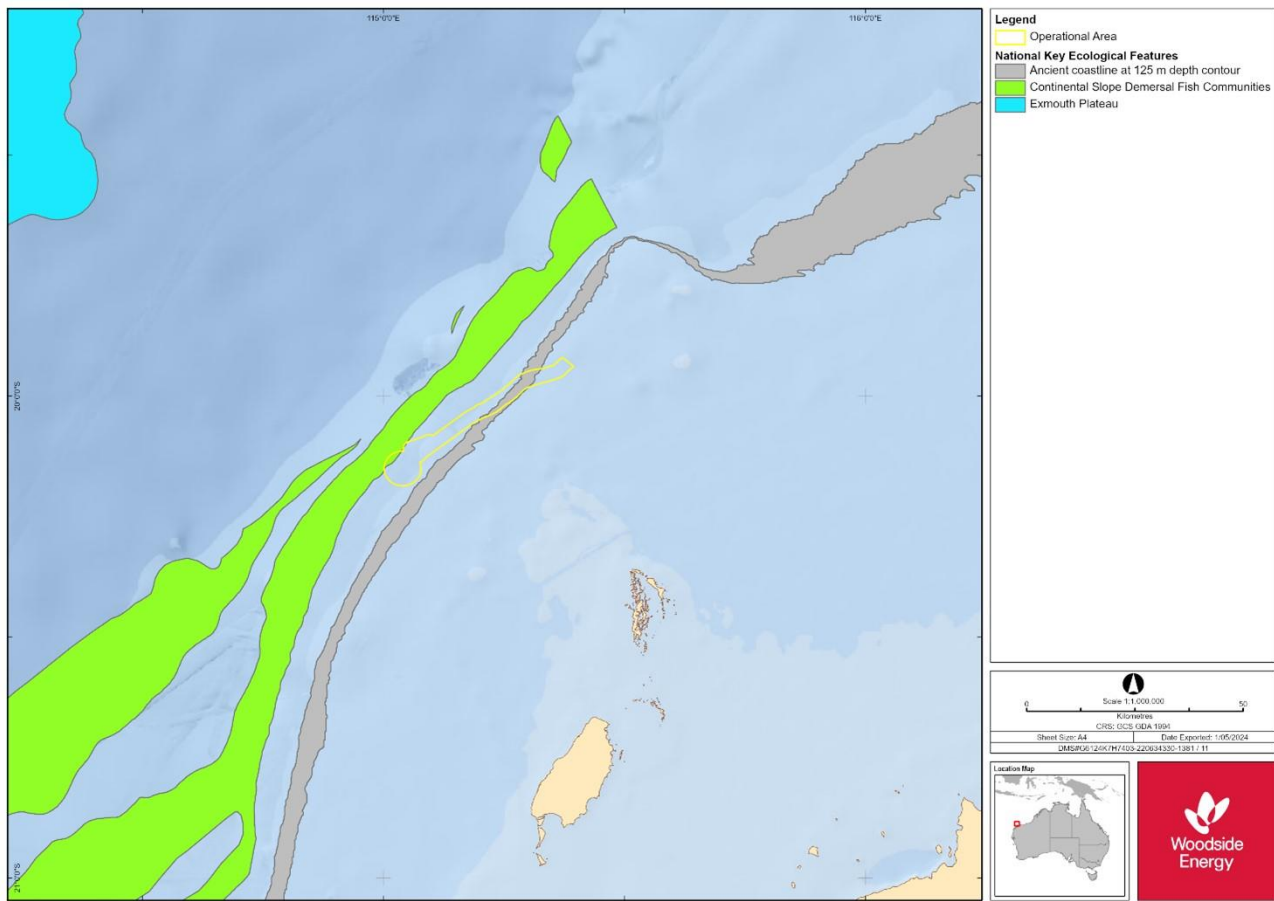

⁴ Flatback turtle nesting Pilbara stock October- March (CoA, 2017).

4.7 Key Ecological Features (KEFs)

KEFs within the Operational Area and EMBA are identified in Table 4-15 and described in Section 9 of the Master Existing Environment. Further information of the KEFs within the Operational Area is provided in the following subsections. Figure 4-10 shows the spatial overlap with KEFs and the Operational Area.

Table 4-15: KEFs within the Operational Area and EMBA

Key Ecological Feature	Distance and Direction from Operational Area to KEF (km)
Ancient Coastline at 125 m depth contour	~0.2% of the KEF (~31 km ²) crosses the eastern part of the Operational Area (i.e. sections of the umbilical, MEG line and production flowlines)
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	~140 km southwest of the Operational Area
Commonwealth waters adjacent to Ningaloo Reef	~41 km south of the Operational Area
Continental Slope Demersal Fish Communities	~0.02% of the KEF (~6 km ²) overlaps the northwest of the Operational Area (no planned overlap with the infrastructure)
Exmouth Plateau	~184 km southwest of the Operational Area
Glomar Shoals	~130 km east of the Operational Area

Figure 4-10: KEFs overlapping the Operational Area

4.7.1 Ancient Coastline at 125 m Depth Contour

The Ancient Coastline at 125 m depth contour KEF is recognised for its biodiversity values (unique sea-floor feature with ecological properties of regional significance), which apply to both the benthic and pelagic habitats within the feature (DSEWPC 2012).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: JU-00-RI-10006

Revision: 8.0

Native file DRIMS No: 10484514

Page 103 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

Parts of the Ancient Coastline, particularly where it exists as a rocky escarpment, are thought to provide biologically important habitats in areas otherwise dominated by soft sediments (DSEWPC 2012). The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient rich environment. Little is known about fauna associated with the hard substrate of the escarpment, but it is likely to include sponges, corals, crinoids, molluscs, echinoderms and other benthic invertebrates' representative of hard substrate fauna in the North West Shelf bioregion (DSEWPC 2012).

Although the Ancient Coastline adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner, et al. 2009).

4.7.2 Continental Slope Demersal Fish Communities

This species assemblage is recognised as a KEF because of its biodiversity values, including high levels of endemism (DSEWPC 2012).

The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the North-west Province is high compared to elsewhere along the Australian continental slope (DSEWPC 2012). The continental slope between North-west Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last, Lyne, et al. 2005).

Demersal fish species occupy two distinct demersal biomes associated with the upper slope (225–500 m water depths) and the mid-slope (750–1,000 m) (DSEWPC 2012). Bacteria and fauna present on the continental slope are the basis of the food web for demersal fish and higher-order consumers in this system. Loss of benthic habitat along the continental slope at depths known to support demersal fish communities may lead to a decline in species richness, diversity and endemism associated with this feature (DSEWPC 2012).

4.8 Protected Places

The Operational Area (i.e. <1 km of the umbilical, MEG line and production flowlines) overlaps with ~0.1% (3.26 km²) of the Montebello Marine Park. No other protected places overlap the Operational Area. The Montebello Marine Park is located offshore of Barrow Island and 80 km west of Dampier extending from the Western Australian State water boundary and is adjacent to the Western Australian Barrow Island and Montebello Islands Marine Parks. This Marine Park covers an area of 3413 km² and water depths from less than 15 m to 150 m. Further information on the Montebello Australian Marine Park within the Operational Area is provided in Section 4.8.1.

Protected places within the Operational Area and EMBA are identified in Table 4-16 and presented in Figure 4-11. Section 10 of the Master Existing Environment (Appendix C) describes the values and sensitivities of protected places and other sensitive areas in the EMBA.

There are no wetlands of international importance (Ramsar) identified within the Operational Area or EMBA.

	Distance and Direction from Operational Area to protected place or sensitive area (km)	IUCN category* or relevant park zone
Jurabi Coastal Park	~202 km southwest of the Operational Area	IUCN II

*Conservation objectives for IUCN categories include:

Ia: Strict Nature Reserve

Ib: Wilderness Area

II: National Park

III: Natural Monument or Feature

IV: Habitat/Species Management Area

V: Protected Landscape

VI: Protected area with sustainable use of natural resources – allow human use but prohibits large scale development.

IUCN categories for the marine park are provided and, in brackets, the IUCN categories for specific zones within each Marine Park as assigned under the North-west Marine Parks Network Management Plan 2018 and South-west Marine Parks Network Management Plan 2018.

^Terrestrial parks and nature reserves were identified from hydrocarbon spill modellings based on the predicted shoreline contact with hydrocarbons above threshold concentrations for the socio-cultural EMBA (Table 4-1).

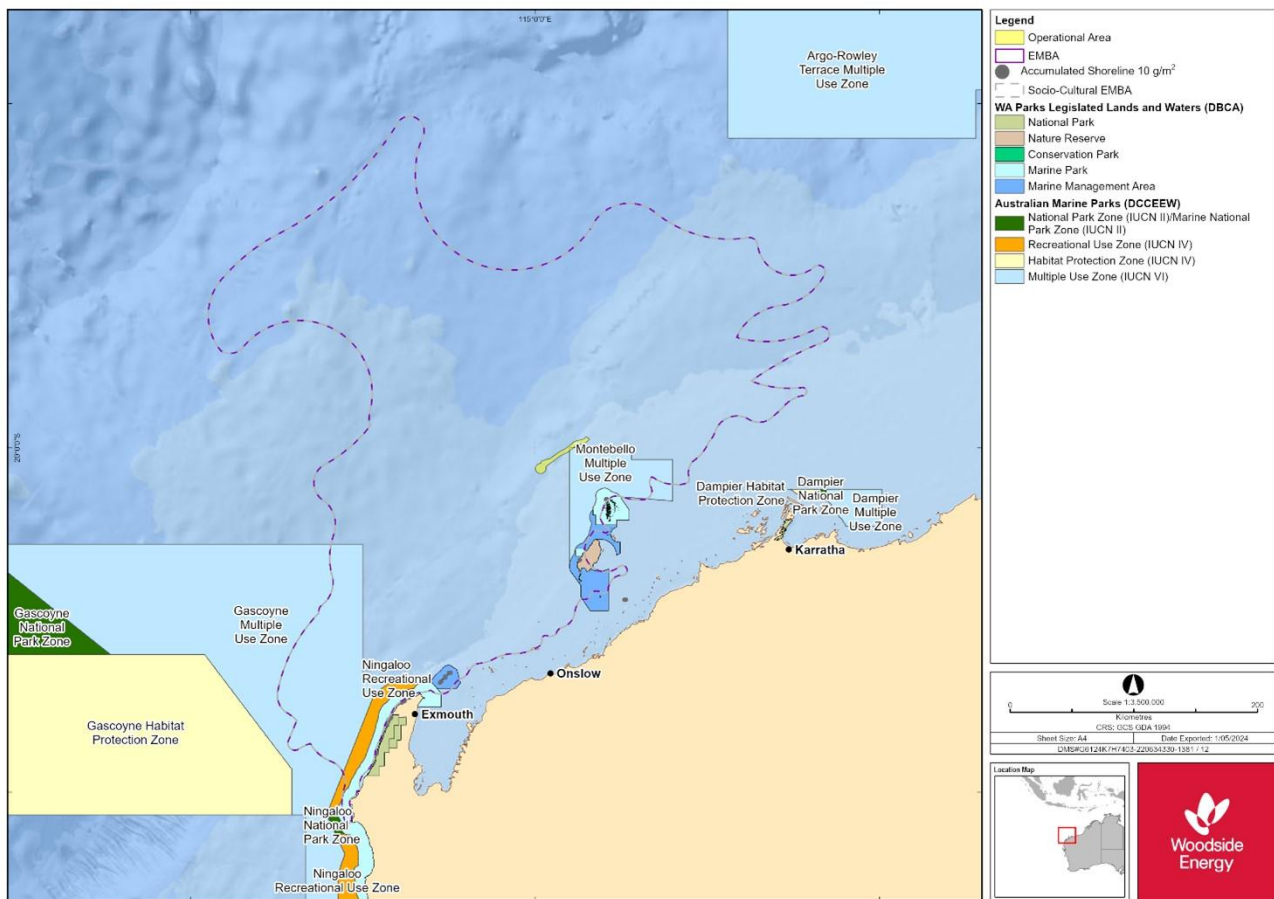

Figure 4-11: Protected Areas overlapping the Operational Area or EMBA

4.8.1 Montebello Marine Park

The Montebello Marine Park includes shallow shelf environments and provides protection for shelf and slope habitats, as well as pinnacle and terrace seabed features. The North-west Marine Parks Network Management Plan (DNP 2018) identifies the following values for the Montebello Marine Park:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: JU-00-RI-10006

Revision: 8.0

Native file DRIMS No: 10484514

- **Natural Values:** the Marine Park includes examples of ecosystems representative of the Northwest Shelf Province - a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities. A key ecological feature of the Marine Park is the Ancient Coastline at the 125 m depth contour. The Marine Park supports a range of species listed under the EPBC Act. Biologically important areas within the Marine Park include breeding habitat for seabirds, internesting, foraging, mating, and nesting habitat for marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks.
- **Cultural Values:** the Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Pilbara region. Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years.
- **Heritage Values:** no international, Commonwealth or national listings apply to the Marine Park, however the Marine Park is adjacent to the Western Australia Barrow Island and the Montebello– Barrow Island Marine Conservation Reserves which have been nominated for national heritage listing. The Marine Park contains two known shipwrecks listed under the *Historic Shipwrecks Act 1976*: Trial (wrecked in 1622), the earliest known shipwreck in Australian waters and Tanami (unknown date).
- **Social and Economic Values:** tourism, commercial fishing, mining and recreation are important activities in the Marine Park.

4.9 Socio-Economic and Cultural Environment

4.9.1 Cultural Values and Heritage

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places
- the social, economic and cultural features of the broader environment.

In line with The Australia ICOMOS Burra Charter (2013) (Burra Charter) and associated practice notes, Woodside understands heritage value to refer to the cultural significance of a place to an individual group. A cultural feature, by contrast, is understood to be comparable to the Burra Charter term “fabric” and refer to a place’s elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible or intangible dimensions (ICOMOS 2013).

4.9.1.1 Native Title

There are no native title claims/determinations, or ILUAs overlapping the Operational Area (Table 4-17 and Figure 4-12). There is one Native Title claim and no ILUAs overlapping the EMBA (Table 4-17 and Figure 4-12).

As a starting point for understanding social and cultural features of the environment for Indigenous (First Nations) groups, Woodside uses the existing systems, such as Native Title, to identify Indigenous groups that may have functions, interests or activities that may be affected. To that end, Woodside identifies Native Title representative bodies and nominated representative entities (defined in **Section 5**), as well as native title claims, determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA may overlap. Woodside considers this to be the broadest extent over which Indigenous groups have claimed Native Title rights and interests. Further information of native titles and ILUAs is provided in the Master Existing Environment.

4.9.1.2 Coastally Adjacent First Nations Groups

Woodside understands that Indigenous groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth 2007). To identify cultural features and heritage values which may exist outside of a Native Title claim, determination and ILUA areas, Woodside considers Native Title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant Indigenous groups to be consulted (see Section 5.3).

Table 4-17 and Figure 4-12 identifies the Native Title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA.

Table 4-17: Summary of Native Title Claims, Determinations and ILUAs which overlap or are coastally adjacent to the EMBA

Claim / Determination / ILUA	Registered Native Title Body Corporate (RNTBC)	Overlap with EMBA	Coastally adjacent to the EMBA

4.9.1.3 Marine Parks

Woodside undertakes an assessment of cultural values within Marine Park Management Plans where the Operational Area or EMBA overlaps a Marine Park.

Woodside considers the management plans of marine parks that overlap the Operational Area and the EMBA to determine whether cultural features and heritage values have been identified and whether there are specified Traditional Custodians or representative bodies referenced to contact regarding potential cultural features and heritage values. For completeness, Woodside considers these cultural features and heritage values identified in the management plans, where EP relevant Traditional Custodians or representative bodies are represented. These values are outlined in Table 4-18.

The Operational Area overlaps the Montebello AMP. The EMBA overlaps with features of the Gascoyne, Montebello and Ningaloo AMPs managed under the North-west Marine Parks Network Management Plan 2018 (Director of National Parks, 2018). The EMBA overlaps a further 5 State Marine Parks and 2 National Parks. Where these plans specify identifiable representative bodies who may hold knowledge of heritage values or cultural features – including but not limited to Registered Native Title Bodies Corporate – these bodies are consulted (Section 5.3). Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. Identifiable representative bodies for the marine parks overlapped by the EMBA are specified in Table 4-18 below.

Management plans for the AMPs note shipwrecks within the AMPs and overlap with World, National and Commonwealth heritage lists. These are addressed in Section 4.8.1 above.

The Management Plan for the Ningaloo Marine Park and Muiron Islands Marine Management Area 2005–2015: Management Plan Number 52 (Marine Parks and Reserves Authority and Department of Conservation and Land Management, 2005) (relating to the Muiron Islands Marine Management Area and Ningaloo Marine Park) notes the aesthetic values of the seascape as a cultural value and that “Panoramic vistas of turquoise lagoon waters, reefs, beaches, breaking surf and the blue open ocean beyond the reef line are major attractions of the reserves.” In particular the plan notes that “Inappropriate structures along the coastline, on the islands and in the surrounding waters have the potential to degrade the aesthetic values of the reserves. Coastal developments and maritime infrastructure projects must therefore be planned with careful consideration of this issue.” As the activity described in this EP does not include the addition of any structures within these parks, no impacts on the aesthetic values of these parks are anticipated.

Table 4-18: Summary of Commonwealth, State Marine Park and National Park Management Plans intersecting the EMBA

Marine Park Management Plan	Operational Area Overlap	EMBA Overlap	Specified Bodies

Cape Range National Park	No	Yes	Yamatji Marlpa Aboriginal Corporation

4.9.1.4 General Cultural Values of Marine Ecosystems

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. ‘Country’ refers to more than just a geographical area: it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area.” (Smyth 2007). The link between environmental protection and cultural heritage protection is illustrated in the Australian Government’s Indigenous Protected Areas (IPAs) Program. The IPAs program provides for areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation (DCCEEW 2024).

There are no IPAs overlapping the Operational Area or EMBA.

McNiven (2004) suggests that “For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20 to 30 km out to sea, out to the horizon and the limit of human visibility... However, in some coastal places, clouds that can be seen well over 100 km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon.” While there is some evidence of traditional watercraft in Australia’s North West, the recorded evidence is limited to travel across inland rivers (Barber and Jackson 2011) or travel between coastal islands (Paterson, et al. 2019). Indigenous groups who may have interests and connection in Sea Country are identified in Section 4.9.2.1.

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple Indigenous language groups.

Further information of general cultural values of marine ecosystems is provided in the Master Existing Environment.

4.9.2 Sea Country Values

Sea Country values of marine ecosystems are further described in Appendix C. An impact to marine ecosystems has the potential to impact cultural values where the impact is detectable within Sea Country. Potential impacts to these cultural values are assessed in Section 6.

Woodside initiates consultation on cultural values of Sea Country where Traditional Custodians or representative institutions are identified, or self-identify, as relevant persons. Cultural features or heritage values related to marine species within the Operational Area or EMBA raised by Traditional Custodians in the course of preparing the EP. Values identified in publicly available literature are summarised in the following sections.

4.9.2.1 Desktop Assessment of Sea Country Values

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the Operational Area or EMBA. Where cultural features or Sea Country values were identified these are summarised in Table 4-19 according to the First Nations groups (where identified or inferable) who hold these values.

Table 4-19 Cultural features and heritage values identified in publicly available literature

First Nations Group	Features and Values	Source	Potential for overlap	
			Operational Area	EMBA
Gnulli (Baiyungu, Thalanyji, Yinggarda)	Feature: resources including marine animals. Value: traditional knowledge holds that ancestors live on the land and in the water. Therefore, Indigenous people have obligations to access and care for these places (e.g., keeping them clean).	Peck on behalf of the Gnulli Native Title Claim Group v State of Western Australia (2019)	Possible (unspecified)	Possible (unspecified)

4.9.2.2 First Nations Archaeological Heritage Assessment

Woodside understands that communal cultural connection may exist between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that Aboriginal people have occupied the Australian continent for at least 65,000 years (Clarkson, et al. 2017) and in many places maintain a strong continuing connection that is said to extend back in Indigenous cosmology to the beginning of time.

It is understood that the sea level has risen significantly during the 65,000 years of Indigenous occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth, et al. 2019). Woodside also understands that, at its lowest level during Indigenous occupation, sea level was between 125 m (O'Leary, Paumard and Ward 2020, Veth, et al. 2019, Williams, et al. 2018) and 130 m below current levels (Benjamin, O'Leary, et al. 2020, UWA 2021, Benjamin, O'Leary, et al. 2023).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited, and can retain archaeological material from this time (Benjamin, O'Leary, et al. 2023, Benjamin, O'Leary, et al. 2020, Ward, et al. 2022).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline KEF (see Section 4.7.1) as an area where potential Indigenous archaeological material may exist on the seabed, as this covers the full extent of this possible Indigenous occupation. Known Indigenous heritage places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or EPBC Act 1999. However, these Acts only extend protection to Indigenous heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is no known Indigenous archaeology and no areas subject to declarations or prescriptions under these Acts within the Operational Area.

Based on the Department of Planning, Lands and Heritage (DPLH) Aboriginal Heritage Inquiry system (DPLH 2024) no Aboriginal Cultural Heritage (ACH) Register or lodgement was identified in the Operational Area (Appendix J). Within the EMBA, two registered and 20 lodged ACH were identified (Appendix J). It is noted that only two of the lodged ACH identified (i.e. 885 and 891) have potential coastal and/or marine interface that intersect with the geographic extent of the EMBA; however, the predicted shoreline exposure above threshold concentrations is not expected to occur in either of these areas. It is also noted that the DPLH include a buffer around these sites to protect privacy regarding the location. As such, the identified heritage sites may not be present within the EMBA.

At the time of writing the EP, no sites of significance within the Operational Areas or EMBA were identified by Traditional Custodians.

4.9.2.3 Feedback Received via Consultation to Inform Existing Environment Description

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan vision "Aboriginal and Torres Strait Islander heritage is managed consistently across jurisdictions according to community ownership" (HCOANZ 2020). Dhawura Ngilan also specifically notes that Aboriginal and Torres Strait Islander heritage has been impacted by colonisation and its intangible knowledge systems, which are held in songlines and language, are endangered; this knowledge is held by Elders and the community, and by recordings held by both Custodians and research and collecting institutions (HCOANZ 2020). Through consultation with relevant persons, RNTBC have identified or raised topics relating to environmental values of cultural interest. These include a broad interest in the marine fauna, including whales and turtles (Appendix F).

During consultation, BTAC advised it has a cultural obligation to care for the environmental values of Sea Country (Appendix F). In the course of consultation specific to another Woodside EP, BTAC raised the importance of archaeological sites on nearshore islands. Given the EMBA for this activity extends to nearshore areas coastally adjacent to BTAC native title lands, these values may be relevant in the event of an unplanned hydrocarbon spill.

Woodside has committed to ongoing engagement to further understand these values. Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process.

As a result of feedback received during consultation on this and other EPs in the region, it is feasible that additional cultural and broader interests in the environment exist. For completeness in describing the Existing Environment, feedback received by relevant persons and organisations on cultural features and heritage values are summarised below in Table 4-20.

Table 4-20 Summary of Sea Country values received via consultation

Relevant First Nations Group / Individuals	Context	Description of Value / Feature / Interest	Potential for Overlap	
			Operational Area	EMBA
Buurabalayji Thalanyji Aboriginal Corporation	Raised during the course of consultation for another EP	Value: Connection to Sea Country Enduring deep connection to Sea Country north of Onslow, extending out to Islands off the Pilbara coast such as the Montebello islands, Barrow Island and the Mackerel Islands	Possible	Possible
Kariyarra Aboriginal Corporation	Raised during the course of consultation for another EP	Value: Turtles	Possible	Possible
		Value: Access to Sea Country (1) Accessing Sea Country for fishing, trapping, crabbing catching turtle, hunting dugong, using stingray barbs for spears and collecting shellfish. (2) Visiting offshore islands at low tide	No (all)	Possible (all)
		Value: Marine species resources Resource species of cultural interest to Kariyarra people include marine mammals, fish, molluscs including bivalves, gastropods and cephalopods.	Possible	Possible
		Value: The existence of intangible cultural heritage including the Yinta (associated with Sea Country). From Kariyarra Native Title documents it is clear that Yinta are significant cultural/spiritual sites, often a pool or water source but possibly a hill or other feature. These are, at least generally, associated with creation beings and are a core part of cultural rights to land in determining who can use or speak for an area.	Possible	Possible
		Interest: Coastal Landforms (Cultural interest)	No	Possible

Yindjibarndi Aboriginal Corporation	Consultation for this EP	No values raised	-	-
Yinggarda Aboriginal Corporation	Raised during the course of consultation for another EP	Value: Coastal Fishing Local communities enjoy fishing along the coast, including for (1) Shark Bay Mullet that is an important resource.	No	Possible
		Value: Ecosystem Health Plants, animals and the environment are inexorably linked to their culture	Possible	Possible
		Value: Dugongs	Possible	Possible
		Feature: Seagrass Important food source for dugongs (Shark Bay)	No	Possible
		Value: Whales (1) potential impact to migration patterns of whales; (2) and potential collisions with vessels	Possible	Possible
Self-identified first nation representative groups				
Ngarluma Yindjibarndi Foundation Ltd	Consultation for this EP	No values raised	-	-

4.9.3 Summary of Cultural Features and Heritage Values

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under Regulation 25 of the Environment Regulations.

The cultural features and heritage values identified in Section 4.9.2.1 and Section 4.9.2.3 confirms whether there is any potential for these to exist within the Operational Area or EMBA. As previously described topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed.

A summary of cultural features and heritage values identified through both consultation and desktop assessment is provided in Table 4-21.

Where cultural features are physical elements of a place, these can generally be assessed for impacts; where a feature is avoided, impacts from planned activities are not predicted. Heritage values relate less to what is significant and more to why something is significant; potential interactions between heritage values and the activities carried out in the Operational Area can only be reliably informed by consultation with Traditional Custodians where they are willing to share the necessary knowledge.

Table 4-21 Summary of Cultural Features and Values

Identified cultural features and heritage values	Context	EP Source		Potential for overlap	
		Consultation Feedback	Desktop Literature Assessment	Operational Area	EMBA
Archaeological Heritage and Landscapes					
Coastal/ island archaeological sites	Coastal archaeological sites include shell middens, artefact scatters, skeletal material/burial sites, camps, meeting places, hunting places and water sources.	✓	✓	No	Possible (shoreline accumulation only)
Petroglyphs	Petroglyphs are a form of rock art. Petroglyphs are a prominent feature particularly at Murujuga where it is found on hard, volcanic rock.	✓	x	Possible (submerged)	Possible (submerged)
Fish traps	Stone arrangements constructed in intertidal areas which fill with fish at high tide and trap them at low tide.	✓	✓	No	Possible (submerged)
Submerged archaeological sites	The Ancient Landscape extends between 125m and 130m below current sea level. Ancient occupation of this area may have left traces through now submerged archaeological sites.	✓	✓	No	Possible
Rivers, waterholes, tidal channels and seeps	Water sources on the Ancient Landscape which may be culturally significant or archeologically prospective.	✓	✓	No	Possible
Submerged hills	Hills on the Ancient Landscape which may be culturally significant or archeologically prospective. As sea level rose these hills would have become islands and eventually submerged.	x	✓	No	Possible
Intangible values					
Songlines	Publicly available literature talks to Songlines associated with ancestral beings that travelled Sea Country.	✓	✓	Possible (unspecified)	Possible (unspecified)
Creation/ Dreaming sites, sacred sites and ancestral beings	Publicly available literature talks to creation/dreaming and ancestral beings, including water serpents, connected to or originating from the sea generally.	✓	✓	Possible (unspecified)	Possible (unspecified)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP Source		Potential for overlap	
		Consultation Feedback	Desktop Literature Assessment	Operational Area	EMBA
Ceremonial sites	Places where ceremony (e.g. thalu ceremonies) are performed. All identified ceremonial sites are located onshore.	✓	✓	No	Possible (unspecified)
Cultural obligations to care for Country	Cultural obligation to care for the environmental values of Sea Country. Exclusion of Traditional Custodians from Sea Country or decision making processes may inhibit ability to care for Country.	✓	✓	Possible (unspecified)	Possible (unspecified)
Knowledge of Country/ customary law and transfer of knowledge	The preservation and transmission of knowledge is dependent on the preservation of the environment generally. Exclusion of Traditional Custodians from Sea Country may inhibit the transfer of knowledge.	✓	✓	Possible (unspecified)	Possible (unspecified)
Connection to Country	Connection to Country is described in publicly available literature as "important to the Traditional owners' spirituality and religion". Connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge.	✓	✓	Possible (unspecified)	Possible (unspecified)
Access to Country	Limitations on Traditional Custodians accessing or enjoying areas of Sea Country.	✓	✓	No	No (No limitations on access beyond the Operational Areas)
Kinship systems and totemic species	Traditional Custodians have connection to species through kinship and totemic systems. An individual may have obligation to care for or not consume a species to which they are kin.	✓	✓	Possible	Possible
Resource collection	Fishing, hunting, gathering of marine species including marine mammals, marine reptiles, fish and invertebrates.	✓	✓	No	Possible
Marine ecosystems and species

Identified cultural features and heritage values	Context	EP Source		Potential for overlap	
		Consultation Feedback	Desktop Literature Assessment	Operational Area	EMBA
Intertidal communities: Bivalves, gastropods, echinoderms (sea urchins), crustaceans	Resource.	✓	✓	No	Possible
Seabirds	Culturally important species Birds (including shags, seagulls and osprey) and bird eggs as a resource	✓	✓	Possible	Possible
Benthic habitats: Macroalgal communities	Interest only, raised as a natural environment interest.	✓	✓	No	Possible
Shoreline habitats: Mangroves	Critical breeding ground for marine and terrestrial wildlife. Mangroves would have provided shelter, crabbing, digging for shellfish, could be turtle nurseries. Mangrove seeds as resource	✓	✓	No	Possible
Shoreline habitats: Intertidal sand/ mudflat communities	Interest only, raised as a natural environment interest.	✓	✓	No	Possible
Shorelines	Interest only, raised as a natural environment interest.	✓	✓	No	Possible
Marine Park/ coastal reserves	Interest and responsibility	✓	✓	No	Possible

4.9.3.1 Historic Sites of Significance

Places of historic cultural significance are protected under Commonwealth, State and local regimes. Places inscribed on the National or World Heritage list are protected through various provisions of the EPBC Act 1999 (Cth). Historic places may also be protected under the *Heritage Act 2018* (WA).

Historic sites of significance and heritage value are found along adjacent foreshores of the NWMR. There are no known sites of Historic cultural heritage significance within the Operational Area.

4.9.3.2 Historic Underwater Heritage

The remains of vessels and aircraft in Commonwealth waters, along with any associated article, are automatically protected under the *Underwater Cultural Heritage Act 2018* (Cth) after 75 years.

A search of the Australasian Underwater Cultural Heritage (UCH) Database (DCCEEW n.d.), which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters indicated that there are no UCH within the Operational Area. Within the EMBA only historic (>75 years old) shipwrecks and other shipwreck sites were identified (see Table 4-22). No sunken aircraft, or other types or artefacts, were identified within the EMBA.

Table 4-22: Known Shipwrecks Near to the Operational Area

Vessel Name (ID Number)	Year Wrecked	Wreck Location	Distance from the Operational Area According to ANSD Database
Marietta (4457) Barrow Island	1905	Barrow Island	1.5 km
Wild Wave (China) (5113)	1873	Monte Bello Island	
Vianen (5062)	1628	Barrow Island Area	
Curlew (3925)	1911	At Onslow, Monte Bellos Group	
Tanami (4899)	1622	Trial Rocks	30 km
Trial (4938)	1622	Trial Rocks	31 km

4.9.3.3 World, National and Commonwealth Heritage Listed Places

No listed heritage places overlap the Operational Area. World, National and Commonwealth heritage places within the EMBA are identified in Table 4-23. Section 11.2 of the Master Existing Environment describes the values and sensitivities of these places.

Table 4-23: World, National and Commonwealth Heritage Listed Places within the EMBA

Listed Place	Distance and Direction from Operational Area to Listed Place (km)
World Heritage Places (WHP)	
The Ningaloo Coast	~168 km southwest of the Operational Area
National Heritage Places (NHP)	
The Ningaloo Coast	~168 km southwest of the Operational Area
Commonwealth Heritage Places (CHP)	
Ningaloo Marine Area - Commonwealth Waters	~185 km southwest of the Operational Area

4.9.4 Commercial Fisheries

Five State and no Commonwealth management areas with fishing effort were identified within the Operational Area. Fish Cube and ABARES Annual Fishery Status Reports Map data were used, together with feedback from consultation (**Section 5**), to analyse the potential for interaction with commercial fisheries within the Operational Area for the Petroleum Activities Program (Department of Primary Industries and Regional Development [DPIRD], 2019-2023; Australian Bureau of Agricultural and Resource Economics and Sciences [ABARES], 2018-2022).

Table 4-24 provides an assessment of the potential interaction and Section 11.5.1 of the Master Existing Environment provides further detail on the fisheries that have been identified. Table 4-24 shows fisheries identified as having a potential interaction with the Petroleum Activities Program.

Table 4-24: Commonwealth and State Commercial Fisheries management areas overlapping the Operational Area and EMBA and potential for interaction during the Petroleum Activities Program

Fishery Name	Overlap with Operational Area	Overlap with EMBA	Description
			<p>Potential for interaction with the management area during activity</p> <p>✕ no spatial overlap</p> <p>✓ spatial overlap</p> <p>Blue shading indicates possibility of interaction</p>
Commonwealth Managed Fisheries			
North-West Slope Trawl Fishery	✕	✓	<p>The North-West Slope Trawl Fishery management area is located ~2 km north of the Operational Area and overlaps the EMBA. The fishery operates off north-western Australia from 114°E to 125°E roughly between the 200 m isobath and the outer boundary of the Australian Fishing Zone (Butler, et al. 2023). Three vessels were active in the 2021-22 season, decline from 4 in the 2021-22 season, and trawl-hours decreased from 4,420 in 2020-21 to 3,950 in 2021-22. (Butler, et al. 2023).</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA and in close proximity to the Operational Area, particularly near its northern boundary.</p>
Southern Bluefin Tuna Fishery	✓	✓	<p>The Southern Bluefin Tuna Fishery management area overlaps the Operational Area and EMBA. The Southern Bluefin Tuna Fishery spans the Australian Fishing Zone, however since 1992, the majority of Australian catch has concentrated in south-eastern Australia (Butler, et al. 2023).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area or EMBA.</p>
Western Deepwater Trawl Fishery	✕	✓	<p>The Western Deepwater Trawl management area is located ~105 km west of the Operational Area and overlaps the EMBA. The fishery operates off the Western Australian coast, in the Gascoyne Region ranging between the North West Cape and Shark Bay. The fishery uses demersal trawling methods, in waters seaward of a line approximating the 200 m isobath (Butler, et al. 2023). Fishing effort has been relatively low since 2005-2006, with 1 to 3 vessels active in the fishery since 2004-2005, and 2 active vessels recorded in 2021-2022 (Butler, et al. 2023).</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA</p>
Western Skipjack Fishery	✓	✓	<p>The Western Skipjack Tuna Fishery management area overlaps the Operational Area and EMBA. The Western Skipjack Tuna Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is currently not active, and no fishing effort has occurred since 2009 (Butler, et al. 2023).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area or EMBA.</p>

Fishery Name	Overlap with Operational Area	Overlap with EMBA	Description
			<p>Potential for interaction with the management area during activity</p> <p>✖ no spatial overlap</p> <p>✓ spatial overlap</p> <p>Blue shading indicates possibility of interaction</p>
Western Tuna and Billfish Fishery	✓	✓	<p>The Western Tuna and Billfish Fishery management area overlaps the Operational Area and EMBA. However, the majority of Australian catch has concentrated off south-west of Western Australia with (Butler, et al. 2023).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area or EMBA.</p>
State Managed Fisheries			
Abalone Managed Fishery	✓	✓	<p>The Abalone Fishery management area overlaps the Operational Area and EMBA. The fishery operates in shallow coastal waters off the south-west and south coasts of WA (Newman, et al. 2023). The fishery method is shore-based and hand caught with spatial limitations. Based on FishCube data for the fishery provided at 60 nm graticular reporting block, there are no fishing effort recorded within the Operational Area or EMBA (DPIRD 2023).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area or EMBA.</p>
Exmouth Gulf Prawn Managed Fishery	✖	✓	<p>The Exmouth Gulf Prawn Fishery management area is located ~160 km southwest of the Operational Area and overlaps the EMBA. The fishery operates in the Exmouth Gulf, targeting species generally <50 m water depth. The fishery is limited to the spatial extent within the Exmouth Gulf and Muiron Islands.</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA.</p>
Mackerel Managed Fishery (Area 2)	✓	✓	<p>The Mackerel Managed Fishery management area overlaps the Operational Area and the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, <three vessels were identified with activity within the vicinity of the Operational Area (DPIRD 2023).</p> <p>Catch for the Fishery was 198 t for the Spanish mackerel and 14 t for the grey mackerel in 2022, an increase from 2021 catch effort (8.9 t). Over the past 10 years a reduced catch of Spanish mackerel, the main commercial catch species, is presented. The commercial catch of grey mackerel has been consistently below 20 t since 2006. The commercial landings of other tropical large pelagic species such as Amberjack (<i>Seriola dumerili</i>), and Cobia (<i>Rachycentron canadum</i>) were stable, with all remaining species <10 t in 2022. The fishery is managed through designated areas, and extends from coastal waters to the EEZ, in waters northwards of Cape Leeuwin to the NT border.</p> <p>Woodside considers that interactions with the fishery may occur in the Operational Area and EMBA.</p>

Fishery Name	Overlap with Operational Area	Overlap with EMBA	Description
			<p>Potential for interaction with the management area during activity</p> <p>✖ no spatial overlap</p> <p>✓ spatial overlap</p> <p>Blue shading indicates possibility of interaction</p>
Marine Aquarium Fish Managed Fishery	✓	✓	<p>The Marine Aquarium Managed Fishery management area overlaps the Operational Area and the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was identified in the 2019-2023 seasons within the EMBA. The Marine Aquarium Fishery is a diver-based fishery and therefore restricted to relatively shallow (i.e. outside of the Operational Area).</p> <p>Woodside considers that interactions with the fishery may occur in the Operational Area and EMBA.</p>
Nickol Bay Prawn Managed Fishery	✖	✓	<p>The Nickol Bay Prawn Managed Fishery management area is located ~142 km east of the Operational Area and overlaps the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the EMBA (DPIRD 2023).</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA.</p>
North Coast Shark Fishery	✖	✓	<p>The North Coast Shark Fishery management area overlaps the EMBA. Based on FishCube data for the fishery vessel activity was not identified within the Operational Area or EMBA (DPIRD 2023). Historically, no fishing has occurred since 2008/09 (Newman, et al. 2023).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area or the EMBA.</p>
Onslow Prawn Limited Entry Fishery	✓	✓	<p>The Onslow Prawn Managed Fishery management area overlaps the Operational Area and the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the Operational Area; however, it was identified within the EMBA (DPIRD 2023).</p> <p>Woodside considers that interactions with the fishery may occur in the Operational Area and EMBA.</p>
Pearl Oyster Managed Fishery (Zone 1)	✓	✓	<p>The Pearl Oyster Managed Fishery management area overlaps the Operational Area and EMBA. The Fishery is located in shallow coastal waters, designated by four zones extending from Exmouth to Kununurra and the seaward boundary demarcated by the 200 nm EEZ. The fishery is currently managed under the <i>Pearling Act 1990</i> (Hart, Murphey and Brown 2023).</p> <p>Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the Operational Area or EMBA (DPIRD 2023).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area and EMBA.</p>

Fishery Name	Overlap with Operational Area	Overlap with EMBA	Description
			<p>Potential for interaction with the management area during activity</p> <p>✖ no spatial overlap</p> <p>✓ spatial overlap</p> <p>Blue shading indicates possibility of interaction</p>
Pilbara Crab Managed Fishery	✓	✓	<p>The Mackerel Managed Fishery management area overlaps the Operational Area and the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, <three vessels were identified with activity within the vicinity of the Operational Area (DPIRD 2023).</p> <p>Catch for the Pilbara Crab Managed Fishery was 11.2 t in 2022, an increase from 2021 catch effort (8.9 t). The total catch in 2021 was a substantial increase from the 2.1 t caught in 2020, which was the lowest landed catch in 20 years. In 2022 the blue swimmer crab catch accounted for ~2% of the State commercial catch. The blue swimmer crab stock status is considered sustainable – adequate.</p> <p>The fishery operates via hourglass trap methods in water depths up to 50 m and is concentrated around Dampier. Blue swimmer crabs are targeted by the Pilbara Crab Managed Fishery, primarily within inshore waters around Nickol Bay.</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA.</p>
Pilbara Line Managed Fishery	✓	✓	<p>The Pilbara Trap Managed Fishery management area overlaps the Operational Area and EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, up to six vessels were identified with potential activity in the vicinity of the Operational Area (DPIRD 2023).</p> <p>The Pilbara Line Managed Fishery boat licences are permitted to operate anywhere within "Pilbara waters", bounded by a line commencing at the intersection of 21° 56'S latitude and the high-water mark on the western side of the North-west Cape on the mainland of WA; west along the parallel to the intersection of 21° 56'S latitude and the boundary of the AFZ and north to longitude 120°E.</p> <p>The Pilbara Line Managed Fishery caught 104 t in 2022 a decrease from 2021 catches effort (124 t). Of the total commercial catch in the Pilbara in 2022 (2,485 t), only 4% was taken by the line sector.</p> <p>The fishery uses demersal long line methods and operates mainly in deeper waters of the western Pilbara.</p> <p>Woodside considers that interactions with the fishery may occur in the Operational Area and EMBA.</p>
Pilbara Trap Limited Entry Fishery	✓	✓	<p>The Pilbara Trap Managed Fishery management area overlaps the Operational Area and EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, up to three vessels were identified with activity within the vicinity of the Operational Area (DPIRD 2023).</p>

Fishery Name	Overlap with Operational Area	Overlap with EMBA	Description
			<p>Potential for interaction with the management area during activity</p> <p>✖ no spatial overlap</p> <p>✓ spatial overlap</p> <p>Blue shading indicates possibility of interaction</p>
			<p>The Pilbara Trap Managed Fishery caught 597 t in 2022 a decrease from 2021 catch effort (662 t). Of the total commercial catch in the Pilbara in 2022 (2,485 t), 72% were landed by the trawl sector, with 24% taken by the trap sector, and 4% taken by the line sector.</p> <p>The catch is made up of around 45-50 different fish species. The main species landed by the fisheries in the Pilbara subregion are blue spotted emperor, red emperor, and rankin cod. The Pilbara Demersal Scale Fishery of red emperor was within the acceptable catch range; however, the total catch of the trap fishery exceeded the acceptable catch range in 2022.</p> <p>The fishery uses demersal trap methods, in waters depths of ~30 m isobath to 200 m isobath.</p> <p>Woodside considers that interactions with the fishery may occur in the Operational Area and EMBA.</p>
Pilbara Fish Trawl (Interim) Managed Fishery	✖	✓	<p>The Pilbara Fish Trawl (Interim) Managed Fishery (zone 1) management area overlaps the western part of the Operational Area and the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the Operational Area in the 2019-2023 seasons; however, it was identified within the vicinity of the EMBA.</p> <p>Accordingly, Woodside considers that interactions with the fishery may occur in the EMBA.</p>
Specimen Shell Managed Fishery	✓	✓	<p>The Specimen Shell Managed Fishery overlaps the Operational Area and the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the Operational Area; however, it was identified within the vicinity of the EMBA (DPIRD 2023). The fishery is largely diver-based, targeting specimen shells in water depths mostly <30 m.</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA.</p>
The South-West Coast Salmon Fishery	✓	✓	<p>The South-West Coast Salmon Managed Fishery management area overlaps the Operational Area and EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the Operational Area or EMBA (DPIRD 2023). Historically, no fishing has occurred north of the Perth Metropolitan Area.</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area and EMBA.</p>

Fishery Name	Overlap with Operational Area	Overlap with EMBA	Description
			<p>Potential for interaction with the management area during activity</p> <p>✖ no spatial overlap</p> <p>✓ spatial overlap</p> <p>Blue shading indicates possibility of interaction</p>
Western Australian Sea Cucumber Fishery	✖	✓	<p>The Western Australian Sea Cucumber Fishery management area overlaps the EMBA. Fishing occurs mostly in the northern half of the State, from Exmouth Gulf to the Northern Territory border. Access is managed under Ministerial Exemptions (Exemption). The fishery is largely diver-based, with smaller amount by wading (Newman, et al. 2023). Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was identified within the EMBA (DPIRD 2023).</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA.</p>
West Coast Deep Sea Crustacean Managed Fishery	✓	✓	<p>The West Coast Deep Sea Crustacean Managed Fishery management area overlaps the Operational Area and EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the Operational Area; however, it was identified within the vicinity of the EMBA (DPIRD 2023).</p> <p>Woodside considers that interactions with the fishery may occur in the EMBA.</p>
West Coast Rock Lobster Managed Fishery	✖	✓	<p>The Western Rock Lobster Fishery management area is located ~173 km southwest of the Operational Area and overlaps the EMBA. Based on FishCube data for the fishery provided at 10 nm graticular reporting block, vessel activity was not identified within the EMBA (DPIRD 2023). The fishery mainly operates from Cape Leeuwin in the South to Shark Bay in the North the west coast of WA between Shark Bay and Cape Leeuwin (Marine Stewardship Council n.d.).</p> <p>Woodside considers that interactions with the fishery may not occur in the Operational Area or EMBA.</p>

Revision: 8.0

Native file DRIMS No: 10484514

Page 140 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

There are no traditional or customary fisheries within the Operational Area, as these are typically restricted to shallow coastal waters and/or areas with structures such as reefs. Within the wider EMBA, Barrow Island, Montebello Islands and Ningaloo Reef have known history of fishing when areas were occupied (as from historical records) (DCLM 2005, DEC 2007).

Areas that are covered by registered native title claims are likely to practice Aboriginal fishing techniques at various sections of the Western Australia coastline. Under amendments made in 2012 to the *Conservation and Land Management Act 1984* (WA) Aboriginal people can hunt (except in marine sanctuary zones or marine nature reserves) dugong, turtle, or crocodiles in WA.

4.9.5 Pearling and Aquaculture

There are no pearling leases or aquaculture sites within the Operational Area, as these are typically restricted to shallow coastal waters. Within the EMBA, there are known pearling leases around Montebello Islands and aquaculture sites around Airlie and Thevenard Islands.

Aquaculture activities in the North Coast bioregion are dominated by the production of pearls (from the *Pinctada margaritifera* oyster). A large number of pearl oysters for seeding are obtained from wild stocks and supplemented by hatchery produced oysters, with major hatcheries operating at Broome and around the Dampier Peninsula (Newman, et al. 2023). Primary spawning of the pearl oyster occurs from mid-October to December. A smaller secondary spawning occurs in February and March (Gaughan and Santoro 2020).

In the Gascoyne Coast bioregion, aquaculture activities are focused on the blacklip oyster (*Pinctada margaritifera*) and Akoya pearl oyster (*Pinctada imbricata*) (Gaughan and Santoro 2020). Several hatcheries supply *P. margaritifera* juveniles to the region's developing black pearl farms. Other aquaculture developments in the Gascoyne Coast bioregion include emerging producers of coral and live rock species for aquariums (Newman, et al. 2023). Rock oyster trials are nearing completion near Karratha in the Pilbara region, however there is no commercial production of the species in this region at this stage (Newman, et al. 2023).

4.9.6 Tourism and Recreation

A survey report conducted for the 2020–2021 season by the WA DPIRD (Ryan, Lai and Smallwood 2022) identified that most boat-based recreational fishing effort occurred in nearshore habitat (46% and 54% for North Coast and Gascoyne Coast respectively), followed by inshore demersal habitats (32% and 39% for North Coast and Gascoyne Coast respectively). Most fishing effort was attributed to line fishing (87% and 91% for North-Coast and Gascoyne Coast respectively).

Tour operator fishing efforts recorded over a 10-year period (2013–2023) (DPIRD 2023) identified three vessels' operations within the Operational Area. Recreational fisheries in the wider EMBA are expected in shallow coastal waters.

The recreation and tourism industries in the Pilbara are of high social value with approximately 965,000 visitors over the last five years (Tourism Western Australia 2023). Tourism continued to grow in 2022, with over 1 million visitors (Tourism Western Australia 2023).

The Operational Area is located offshore of the North West tourism region which includes parts of the Gascoyne and Pilbara, region. Tourism is a key economic driver for the Pilbara with more than one million visitors to the region every year. Tourism visitation continued to grow in 2022, with the number of visitors to Karijini National Park in 2022 having doubled in comparison to 2020 (PDC 2022).

The main marine nature-based tourist activities in the Gascoyne region are concentrated around and within the Ningaloo World Heritage Area (~168 km southwest of the Operational Area). Ningaloo's economic contribution to WA is attributed to four key types of economic activity, tourism

expenditure by international, interstate and WA visitors to the Ningaloo region, commercial fishing in the Exmouth Gulf, recreation activity involving the Reef by residents of the Ningaloo region and management and research relating to the Reef (DBCA 2020).

4.9.7 Commercial Shipping

The Australian Maritime Safety Authority (AMSA) has established a network of marine fairways to reduce the risk of vessel collisions with offshore infrastructure. None of these fairways intersect with the Operational Area; the nearest fairway is approximately 32 km west of the Operational Area (Figure 4-13). Vessel tracking data suggest shipping is concentrated to the east of the Operational Area, which is likely associated with oil and gas activities.

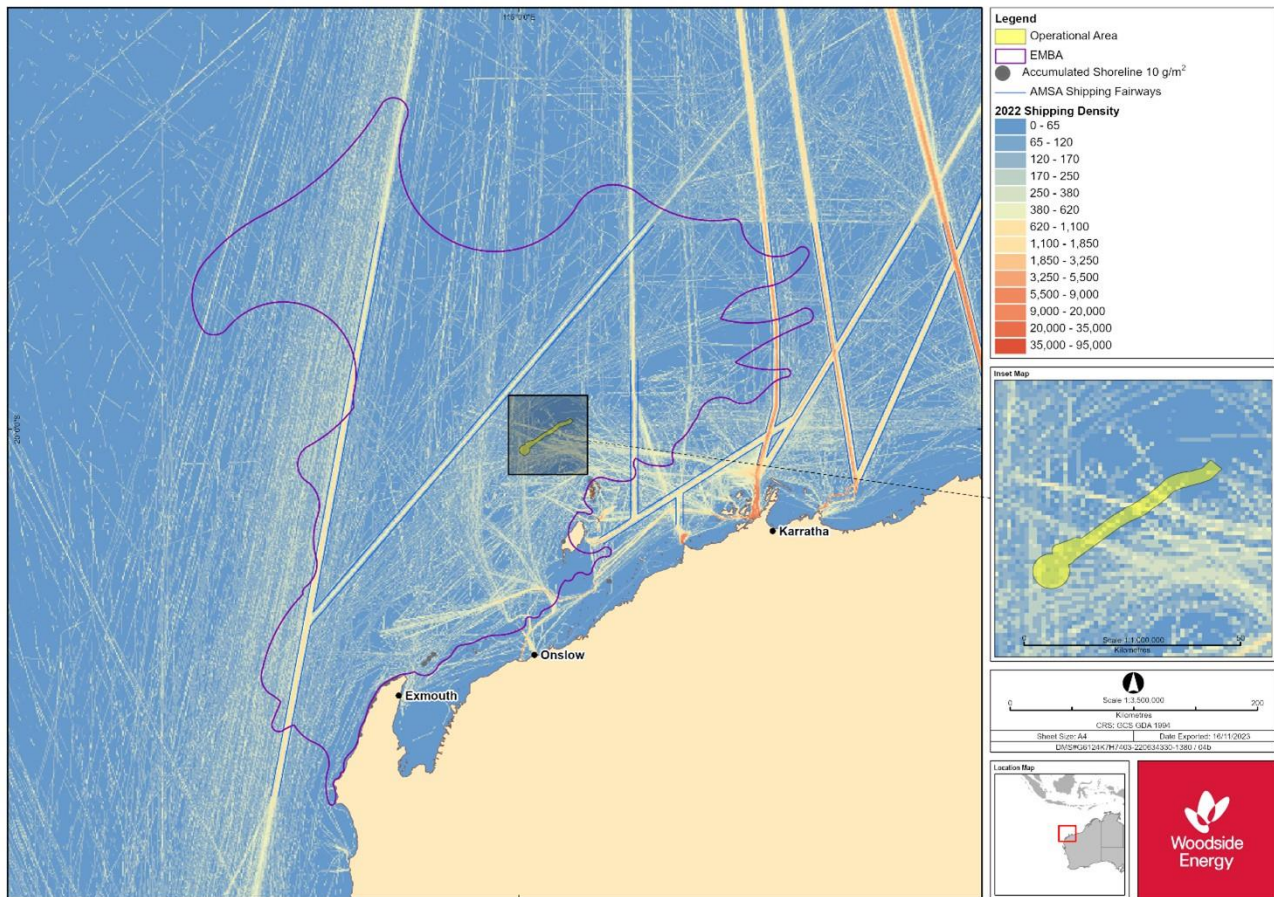

Figure 4-13: Vessel density map for the Operational Area and EMBA, derived from AMSA satellite tracking system data

4.9.8 Oil and Gas

The Operational Area is located within an area of established oil and gas operations in the broader NWMR. Table 4-25 and Figure 4-14 shows other oil and gas facilities within the region to the Operational Area.

Table 4-26 outlines the existing live infrastructure within the Operational Area and approximate distances from infrastructure associated with the Operational Area. Existing live infrastructure is also shown in Figure 4-14, and includes:

- sections of the Woodside Pluto subsea infrastructure which intersects the Operational Area, including the production flowlines, MEG pipeline and umbilical, as described in the Pluto Offshore Facility Operations Environment Plan.
- a section of the Woodside Scarborough Export Trunkline which intersects the Operational Area, as described in the Scarborough Offshore Facility and Trunkline (Operations) Environment Plan.
- the Wheatstone Platform and associated subsea infrastructure, as described in the *Start-Up and Operations Environment Plan: Wheatstone Project*⁷.

Table 4-25: Other Oil and Gas Facilities located within the proximity of the Operational Area

Facility Name and Operator	Distance and Direction from Operational Area (km)
Wheatstone Platform – Chevron	Within the southeast extent of the Operational Area
Pluto Platform – Woodside	~4 km south of the Operational Area
Goodwyn Platform – Woodside	~64 km northeast of the Operational Area
North Rankin Complex – Woodside	~86 km northeast of the Operational Area
John Brookes Platform – Santos	~30 km south of the Operational Area
Wonnich Platform – Santos (suspended)	~52 km south of the Operational Area

Table 4-26: Live Infrastructure within the Operational Area not covered by this EP

Component and Operator	Distance and Direction from Julimar Flowline (km)	Distance and Direction from BruA manifold (km)
Jansz-lo pipeline – Chevron	~16.9 km west of the Julimar flowline	
Wheatstone trunkline – Chevron	Parallel to Julimar flowline. Wheatstone pipeline is ~220 m at its closest point	~6.4 km northeast from BruA manifold
Pluto pipeline – Woodside	Crosses Julimar flowline	~9.3 km northeast from BruA manifold
Scarborough trunkline – Woodside	Crosses Julimar flowline	~7.5 km northeast from BruA manifold

The PAA overlaps the following titles for which Woodside is not a titleholder:

- WA-48-L: Chevron Australia Pty Ltd is the contact titleholder of production licence WA-48-L (Figure 4-14). While the IMMR activities will be undertaken within Woodside operated pipeline licences, the Operational Area includes a radius of 1,500m from the subsea infrastructure, and allows for the movement and positioning of vessels. This means that vessel surface activity may temporarily occur within this adjacent title.
- Communication between Woodside and Chevron is described in Section 7.9.

5. STAKEHOLDER CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an Environment Plan (EP) in accordance with Regulation 25 of the Environment Regulations. (In this Section, references to 'Regulations' are to the Environment Regulations, unless otherwise stated).

Consultation is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities. This enables Woodside to assess the merits of objections or claims about the adverse impact of each activity to which the EP relates that are received from relevant persons and for Woodside to adopt appropriate measures (if any) in response to those objections or claims so that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP) and will be of an acceptable level.

Consultation is informed by both the Environment Regulations and the findings of relevant Courts, including the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 (Tipakalippa Appeal)* (see Section 5.2 and 5.5.1) and *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9* (Munkara Case).

For this EP, Woodside has considered both the Operational Area (Operational Area) and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from activities in the Operational Area (see Section 4).

Woodside's consultation methodology is divided into two parts:

- The first section (Section 5.2 to Section 5.5) provides an overview of Woodside's consultation methodology for its EPs, including how we apply Regulation 25(1) to identify relevant persons (Figure 5-1).
- The second section (Section 5.6 to Section 5.7) details Woodside's approach to accepting feedback and assessment of the merits of each objection or claim about the adverse impact of each activity to which the EP relates and engaging in ongoing consultation for this EP.

Woodside's consultation record is at Appendix F and includes a summary of the following:

- assessment and identification of relevant persons
- consultation information provided to relevant persons, feedback received, Woodside's assessment of the merits of objections or claims and Woodside's response to relevant persons and other stakeholders Woodside chose to consult
- engagement with persons or organisations that Woodside chose to contact who are not relevant persons for the purposes of Regulation 25(1) (see Section 5.3.4)
- opportunities provided to persons or organisations to participate in consultation.

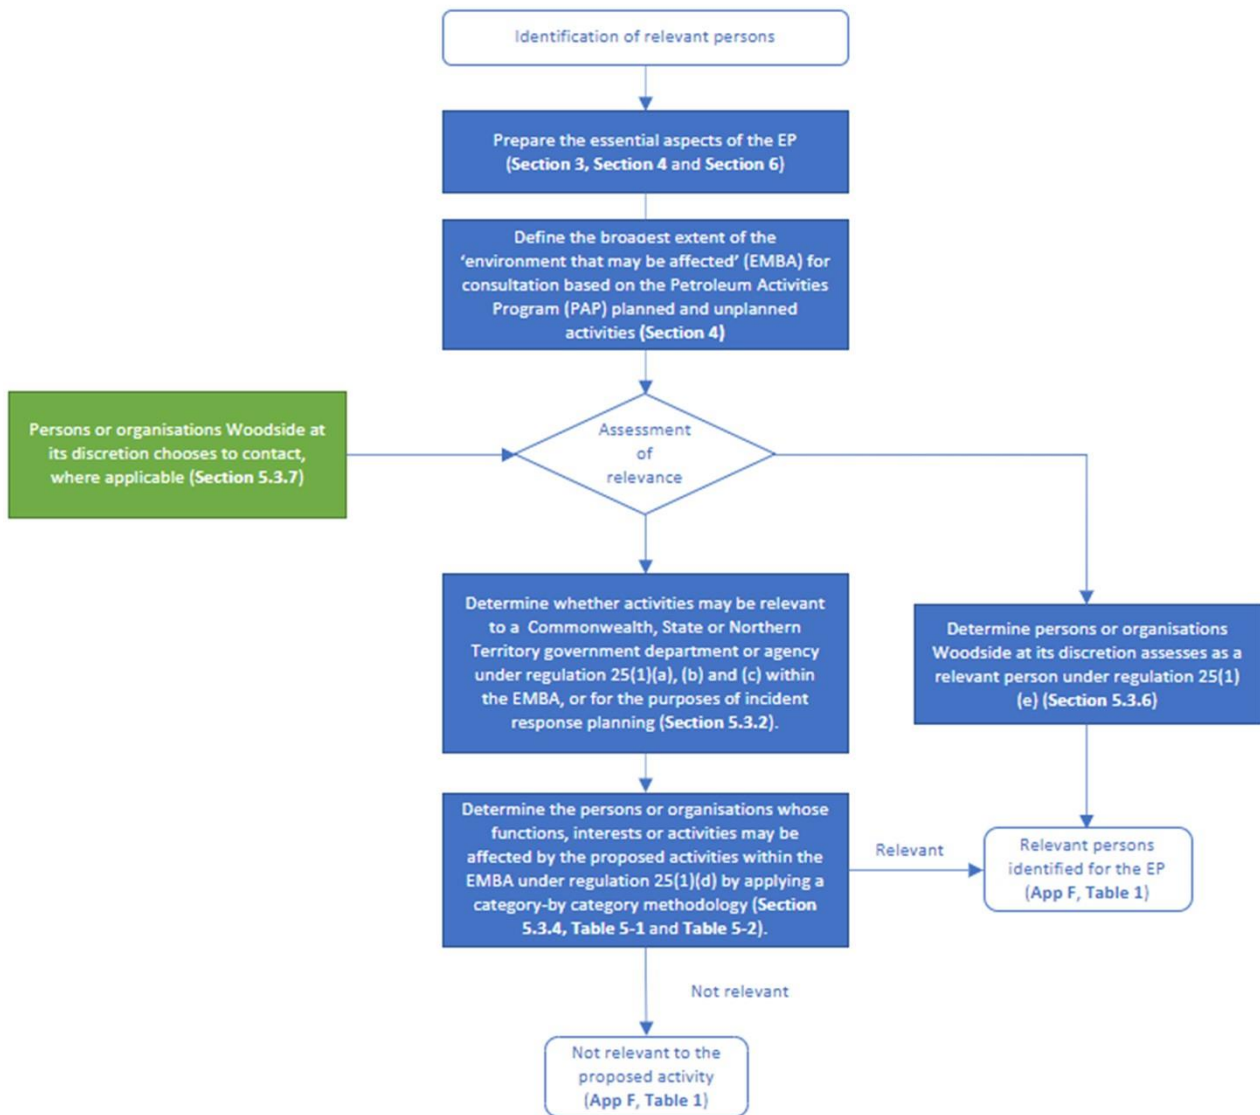

Figure 5-1: Overview of Woodside's methodology to identify relevant persons

5.2 Consultation – General Context

Woodside has a portfolio of quality oil and gas assets and more than 40 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations, to better understand the potential risks and impacts associated with our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations, enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult but, rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a Petroleum Activities Program (PAP). The information in the consultation list has been captured from years of experience: it contains

insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's Guideline on Consultation in the course of preparing an environment plan (12 May 2023) as well as judicial guidance in the *Tipakalippa Appeal* on the intent of consultation, as follows:

- *At paragraph 54 of the appeal decision: ... provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- *At paragraph 89 of the appeal decision: ...its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The *Tipakalippa Appeal* and *Munkara Case* have also been further considered in the context of specific methods for consultation with First Nations' relevant persons (Section 5.5.1).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons in accordance with Regulation 25(1) (Figure 5-1 and Section 5.3.4). This methodology is consistent with NOPSEMA's Guideline and demonstrates that, to meet the requirements of Regulation 34 (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.3)
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in Section 4.1 and assessed in Section 6.9).

Woodside has undertaken consultation in the course of preparing this EP in compliance with Regulation 25, which requires a titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an EP:
 - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the EP may be relevant
 - if the plan relates to activities in the offshore area of a State – the Department of the responsible State Minister
 - if the plan relates to activities in the Principal Northern Territory offshore area – the Department of the responsible Northern Territory Minister
 - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP
 - any other person or organisation that the Titleholder considers relevant (Regulation 25(1)).

- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (Regulation 25(2))
- allow a relevant person a reasonable period for the consultation (Regulation 25(3))
- tell each relevant person that the titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (Regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development (ESD) set out in section 3A of the *EPBC Act* – see Section 2
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level (Regulation 4)
- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the petroleum activity
- is collaborative. Woodside respects that, for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside engages with the relevant person with the aim of seeking genuine and meaningful two-way dialogue
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.14).

An overview of Woodside's consultation approach is outlined at Figure 5-2.

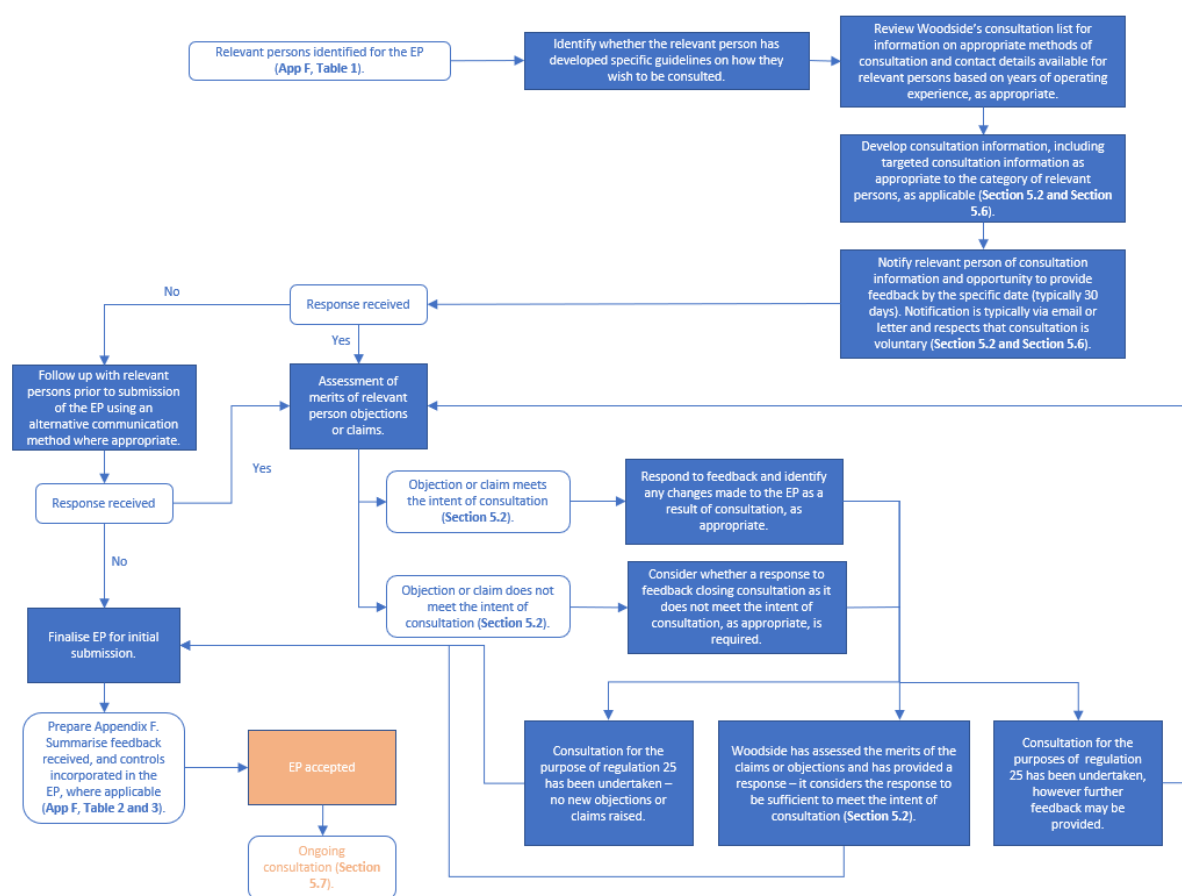

Figure 5-2: Overview of Woodside's consultation approach

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

- Federal Court:

5.3 Identification of Relevant Persons for Consultation

5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons under Regulations 25(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those Regulations. The government departments and agencies relevant to the EP are listed in Appendix F, Table 1. In accordance with Regulation 25(1)(b), Woodside consults with the Department of the relevant State Minister.

5.3.2 Identification of Relevant Persons under Regulations 25(1)(a), (b) and (c)

Woodside's methodology for identifying relevant persons under Regulations 25(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities to be carried out in the EMBA under the EP may be relevant. This list of relevant departments and agencies is formulated by reference to the responsibilities of the government departments, as set out on their websites, in NOPSEMA's GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline (January 2024), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating. This list is revised from time to time, for example, for the purposes of accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.

- Woodside has categorised government department or agency groups as follows:

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies, determining whether those responsibilities overlap with potential risks and impacts specific to the Petroleum Activities Program in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry; and AHO is responsible for maritime safety and Notices to Mariners. To undertake the Operational Area in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the Operational Area. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.
- The list of government departments and agencies assessed as relevant is set out in Appendix F, Table 1.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at Appendix F, Table 2 and Table 3 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the Operational Area in the EMBA or would not be involved in incident response planning.

5.3.3 Regulation 25(1)(d)

To identify a relevant person for the purposes of Regulation 25(1)(d), the meaning of “functions, interests or activities” needs to be understood. In Regulation 25(1)(d), the phrase “functions, interests or activities” should be construed broadly and consistently with the objects of the Environment Regulations (Regulation 4) and the objects of the *EPBC Act* (section 3A).

In developing its methodology for consultation, Woodside acknowledges the guidance below from NOPSEMA’s GL2086 – Consultation in the course of preparing an environment plan guideline (May 2023):

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of ‘interest’ in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of ‘activity’ in Regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside’s methodology for determining ‘relevant persons’ for the purpose of Regulation 25(1)(d) includes consideration of:

whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA

- whether a person or organisation’s functions, interests or activities may be affected by Woodside’s proposed planned or unplanned activities

5.3.4 Identification of Relevant Persons under Regulation 25(1)(d)

Relevant persons under Regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under the EP (described in Section 3)
- the EMBA by unplanned activities (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within Regulation 25(1)(d), Woodside adopts the following methodology and then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions, interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation’s functions, interests or activities may be affected by Woodside’s proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and considering available, relevant literature.

To assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities to be carried out under the EP. The broad categories are identified in Table 5-1 below and identification methodology applied as set out in **Table 5-2**.

The list of those persons or organisations assessed as relevant persons or organisations Woodside separately chose to contact is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in Table 5-2, as appropriate.

Feedback from relevant persons is summarised at Appendix F, Table 2. Feedback from persons assessed as “not relevant” but whom Woodside chose to contact, or self-identified and Woodside assessed as “not relevant”, are summarised at Appendix F, Table 3.

Table 5-1: Categories of relevant persons

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the <i>Commonwealth Fisheries Management Act 1991 (Cth)</i> and the <i>Western Australian Fish Resources Management Act 1994 (WA)</i> , which may be amended from time to time. Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.
Titleholders and Operators	Registered holder of an offshore petroleum title or GHG title under the <i>OPGGS Act</i> and associated Regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are First Nations Australians with cultural rights and interests or cultural functions or who perform cultural activities over particular lands and waters. Where a First Nations person, group or entity self-identifies and asserts cultural rights, functions, interests or activities they will be considered under the definition of Traditional Custodian for the purpose of this EP (as appropriate).
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the <i>Native Title Act 1993 (Cth)</i> by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the <i>Native Title Act 1993</i> with prescribed functions, set out in Part 11 of the <i>Native Title Act 1993</i> , which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Historical heritage groups or organisations	Legislated or government enlisted groups or organisations responsible for the management of marine heritage.
Local government and elected Parliamentary representatives and recognised local community	Local government body formed under the <i>Local Government Act 1995 (WA)</i> and elected Parliamentary representatives which are responsible for representing the local community. Recognised local

Category	Explanation
reference/liaison groups or organisations	community reference or liaison group or organisation in relation to oil and gas matters.
Other non-government groups, organisations or individuals	Non-government organisation with public website material targeting the proposed activity. Individual who demonstrates the proposed activity could potentially impact their interests, functions or activities.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-2: Methodology for identifying relevant persons within the EMBA undertaken under Regulation 25(1)(d) – by category

Category	Relevant person identification methodology
Commercial fisheries (Commonwealth and State) and peak representative bodies	<p>Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. Confirming whether the EMBA overlaps with the fisheries management area (i.e., the spatial area the fishery is legally permitted to fish in) (see Section 4.9.4). Woodside acknowledges WAFIC's consultation guidance⁸, that Titleholders develop separate consultation strategies for significant unplanned events (for example an oil spill) where titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC's guidance is that consultation on unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs (see Section 7.15.5). For Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA, ABARES and DPIRD Fishcube data within the Operational Area and EMBA (see Section 4.9.4). <p>Assessment of relevance:</p> <ul style="list-style-type: none"> State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.9.4) are assessed as relevant to the proposed activity. However, to avoid over consulting and as requested in WAFIC's guidance, Woodside only consults individual licence holders based on WAFIC's advice. Woodside also utilises WAFIC's consultation service whereby WAFIC: <ul style="list-style-type: none"> directly consults fishery licence holders that are assessed as having a potential for interaction in the Operational Area consults fisheries that are assessed as having a potential for interaction in the EMBA only in the event of an unplanned emergency scenario.

⁸ [Consultation Approach for Unplanned Events - WAFIC](#)

Category	Relevant person identification methodology
Recreational marine users and peak representative bodies	<ul style="list-style-type: none"> Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.9.4) are assessed as relevant to the proposed activity. If Woodside has identified that a Commonwealth or State fishery is a relevant person, then Woodside also consults the fisheries relevant representative body. For example, WAFIC represents the interests of State fisheries in Western Australia. If a State fishery is identified as relevant, Woodside would also identify WAFIC as relevant. Recognised Commonwealth fishery representative bodies are identified by AFMA via its website. WAFIC is the only recognised State fishery representative body. <p>Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> Using Woodside knowledge and operating experience, applying knowledge of recreational marine users in the area. This assessment is both activity and location based. Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. Assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD Fishcube data to assess whether there has been activity within the EMBA in the past 5 years. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons. If Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers. These representative bodies are identified via Woodside's existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.
Titleholders and Operators	<p>Woodside assesses relevance for other Titleholders and operators using the following steps in its methodology:</p> <ul style="list-style-type: none"> Using GPInfo to determine overlap with other Titleholders or Operators permit areas within the EMBA. Using Woodside knowledge and operating experience, applying knowledge of other operators in the area. Woodside produces a map showing the outcome of this assessment. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Titleholders and Operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.
Peak industry representative bodies	<p>Woodside assesses relevance for peak industry representative bodies using the following steps in its methodology:</p> <ul style="list-style-type: none"> Review of peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside's proposed activities within the EMBA.

Category	Relevant person identification methodology
Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations	<ul style="list-style-type: none"> Review of Woodside's existing consultation list. Website search to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside's proposed activities within the EMBA. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside's proposed activities within the EMBA are assessed as relevant. <p>Consistent with its understanding of the matters discussed in Section 4.9, to identify Traditional Custodian groups or individuals, Woodside:</p> <ul style="list-style-type: none"> uses existing systems of recognition to identify First Nations groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under Native Title or cultural heritage legislation, or marine park management plans, or identification by other First Nations groups or entities) notifies and invites consultation with First Nations people through their nominated representative corporation (for example Prescribed Body Corporates (PBCs)); or, in the case of Native Title and where appropriate, the Native Title Representative Body requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders. requests advice as to other First Nations groups or individuals that should be consulted advertises widely so as to invite self-identification and consultation by First Nations groups and individuals. <p>Further detail to Woodsides methodology is as follows.</p> <p>Woodside uses the databases of the National Native Title Tribunal:</p> <ul style="list-style-type: none"> to understand whether there are any Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA to understand whether there are any relevant Indigenous Land Use Agreements (ILUAs), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. <p>Where there is a positive determination of Native Title, contacting the PBC or, where their representative is a Native Title Representative Body, contacting the Native Title Representative Body.</p> <p>Where appropriate, contacting the relevant Native Title Representative Body to request a list of any First Nations groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA.</p> <p>Review of Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values.</p> <p>In Victoria, using the Victorian Aboriginal Heritage Council data to determine whether there are any Registered Aboriginal Parties</p>

	<p>(RAP) appointed under the <i>Aboriginal Heritage Act 2006</i> (Vic), that overlap or are adjacent to the EMBA.</p> <p>First Nations groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body.</p> <p>Request to the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means.</p> <p>Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self-identify.</p> <p>Individuals that consider their functions, interests or activities may be affected by a proposed activity are provided an opportunity to self-identify for each EP. Woodside does not presume that self-identification for an activity, covered by another EP, automatically means that an individual/s functions, interests and activities may be affected by other activities where EMBA's overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess risks and impacts to their values, and enable individuals to self-identify.</p> <p>Assessment of relevance:</p> <p>Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.</p>
Native Title Representative Bodies	<p>Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology:</p> <ul style="list-style-type: none"> • A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the <i>Native Title Act 1993</i> with prescribed functions set out in Part 11 of the <i>Native Title Act 1993</i>, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies. • Review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Where the area for which a Native Title Representative Body is recognised under the <i>Native Title Act 1993</i>, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.
Historical heritage groups or organisations	<p>Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following steps in its methodology:</p> <ul style="list-style-type: none"> • Using the Australasian Underwater Cultural Heritage Database to assess known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see Section 4.9.3). <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.

Category	Relevant person identification methodology
Local government and recognised local community reference/liaison groups or organisations	<p>Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following steps in its methodology:</p> <ul style="list-style-type: none"> Review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries 'My Council' database and WA Local Government Association (WALGA) Local Government Directory maps to assess overlap between the local government's defined area of responsibility and the EMBA. Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. Woodside reviews the community reference/liaison group's terms of reference to determine its area of responsibility and overlap with the EMBA. For example, the Exmouth Community Liaison Group's area of responsibility in relation to Woodside's operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e., onshore). <p>Assessment of relevance:</p> <ul style="list-style-type: none"> The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant. The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.
Other non-government groups, organisations or individuals	<p>Woodside assesses relevance for other non-government groups, organisations or individuals using the following steps in its methodology:</p> <ul style="list-style-type: none"> Review of Woodside's existing consultation list. Website search of registered non-government groups or organisations (i.e., registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website and/or social media material specific to the proposed activity at the time of development of the EP. Organisation has a publicly available statement (or purpose) that clearly describes their collective functions, interests or activities. Review of current website and/or social media material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with the EMBA. Review of an organisation's / individual's feedback to consider whether their functions, interests or activities within the EMBA may be affected by the activities to be carried out under the Environment Plan. Considering interests outside the EMBA would be considered too remote and contrary to the purpose of the Environment Plan.

Category	Relevant person identification methodology
	<p>Assessment of relevance:</p> <ul style="list-style-type: none"> Registered non-government groups or organisations with current targeted public material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation will be assessed as relevant. Individual demonstrates their functions, interests or activities may be impacted will be assessed as relevant.
Research institutes and local conservation groups or organisations	<p>Woodside assesses relevance for research institutes and local conservation groups or organisations using the following steps in its methodology:</p> <ul style="list-style-type: none"> Review of Woodside's existing consultation list. Website search for research institutes that may operate within the EMBA. This assessment is both activity and location based. Website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant. Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.

5.3.5 Regulation 25(1)(e)

In addition to assessing relevance under Regulation 25(1)(d), Woodside has discretion to categorise any other person or organisation as a relevant person under Regulation 25(1)(e).

5.3.6 Identification of Relevant Persons under Regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under Regulation 25(1)(e).

5.3.7 Persons or Organisations Woodside Chooses to Contact

In addition to undertaking consultation with relevant persons under Regulation 25(1), from time to time there are persons or organisations that Woodside chooses to contact in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to Regulation 25(1), but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with
- that are 'not relevant' pursuant to Regulation 25(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is used to inform relevance under Woodside's methodology. Woodside follows the same methodology for

assessing a person or organisations relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.3). The result of Woodside's assessment of relevance during the development of the EP is outlined at Appendix F, Table 1.

5.3.8 Assessment of Relevant Persons for the Proposed Activity

The result of Woodside's assessment of relevant persons in accordance with Regulation 25(1) is outlined at Appendix F, Table 1 and Appendix F, Table 2.

Persons or organisations that Woodside assessed as not relevant but chose to contact at its discretion in accordance with Section 5.3.4, or self-identified and Woodside assessed as not relevant, are summarised at Appendix F, Table 1 and Appendix F, Table 3.

5.4 Consultation Material and Timing

Regulation 25(2) provides that a titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) provides that the titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons of the proposed activities, respecting that consultation is voluntary, and collaborates on a consultation approach where further engagement is sought by the relevant person. The consultation process aims to be appropriate for the category of relevant persons and not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Operational Area. Woodside acknowledges published guidance for good practice consultation, relevant to different sectors and disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

5.4.1 Sufficient Information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes:

- a description of the proposed petroleum activity:
- the Operational Area or PAA, dependant on the EP
- where the activity will take place
- the timing and duration of the activity
- a location map of the Operational Area or PAA and EMBA
- a description of the EMBA
- relevant exclusion zones
- a summary of relevant risks and mitigation and management control measures relevant to the proposed petroleum activity (PPA).

It also sets out contact details to provide feedback to Woodside.

The level of information necessary to assist a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant

persons who may be impacted by planned activities in the Operational Area, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Sufficient information may have been provided to a relevant person even where all documents requested by a relevant person have not been provided. Woodside acknowledges NOPSEMA's brochure entitled 'Consultation on offshore petroleum environment plans information for the community', which advises persons being consulted that they may inform Titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes:

- the name of the EP Woodside is seeking feedback on
- an overview of the activity
- the consultation feedback date
- the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the Native Title Act 1993 for Native Title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.3 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website and shared directly with relevant persons
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters
- phone calls
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate
- Let's Talk newsletter – digital and hard copy
- maps outlining a person or organisation's defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area
- community meetings, as appropriate
- attendance at on-the-ground community events or planned regional roadshows
- broader awareness campaigns on the how to be involved in the EP consultation process

Woodside recognises that information may be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be

demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that, as part of genuine two-way dialogue, these forms of communication may evolve including, for example due to changes to organisation representation, as relationships are further established, or a preference for an alternative form of communication is expressed by a person or organisation. There might be limitations in how Woodside can consult with relevant persons.

Typical forms of communications for categories of relevant persons are set out below.

Category of relevant person	Typically accepted form of communication
Government departments / agencies – marine	Woodside applies NOPSEMA's guideline for engagement with Commonwealth government departments or agencies GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023 by using email for its consultation unless another form of communication is requested.
Government departments / agencies – environment	
Government departments / agencies – industry	
Commercial fisheries and peak representative bodies	<p>Commonwealth commercial fisheries: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p> <p>State commercial fisheries and recreational marine users: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the <i>Fish Resources Management Act 1994</i> and <i>Aquatic Resources Management Act 2016</i>, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder's discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p> <p>Peak representative bodies: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p>
Recreational marine users and peak representative bodies	
Titleholders and Operators	Email is used as the primary form of communication between Titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Traditional Custodians and nominated representative corporations	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Native Title Representative Bodies	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.

Historical heritage groups or organisations	NOPSEMA's guideline (<u>GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</u>) for engagement with government departments or agencies is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Local government and recognised local community reference/liaison groups or organisations	Local government: NOPSEMA's guideline (<u>GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</u>) for engagement with local government is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Community reference/liaison groups and chambers of commerce: Email and presentations are used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Other non-government groups or organisations	Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Research Institutes and Local conservation groups or organisations	Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at Appendix F, Table 2.

Appendix F, Table 3 sets out the information which is provided to persons or organisations that are not relevant for the purposes of Regulation 25, but which Woodside has chosen to contact.

When engaging in consultation, Woodside notifies relevant persons that, in accordance with Regulation 25(4), the relevant person may request that the Titleholder notifies NOPSEMA that particular information the person or organisation provides in the consultation not be published, and that information subject to that request will not be published under the Environment Regulations.

5.4.2 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the EP.

Woodside's methodology allows relevant persons a reasonable period for consultation (Regulation 25(3)). A reasonable period for all relevant persons, including Traditional Custodians, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Regulation 30 sets out a public consultation period of 30 days.
- The Department of Mines, Energy and Petroleum (DEMIRS) “*Guidelines for Consultation with Indigenous People by Mineral Explorers*” directs a period of 21-30 days of consultation with traditional owners.
- While repealed, guidance taken from the *Aboriginal Cultural Heritage Act 2021*—*Consultation Guidelines* (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period to allow identification, contact and response from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation).

This period of consultation demonstrates that Woodside has provided a “reasonable period” for relevant persons to consult in accordance with Regulation 25(3). Commentary in the *Tipakalippa Appeal* judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

*“it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time...”*⁹

Woodside seeks feedback in order to support preparation of its EP. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to providing a reasonable period for consultation is as follows:

- advertising in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected
- providing consultation materials directly to identified relevant persons as well as persons who are not relevant, but Woodside chose to contact and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 2 and Table 3 sets out a history of ongoing consultation and demonstrates that a reasonable period of consultation has been provided. Woodside considers that consultation for this EP has closed.

As detailed in Section 5.6, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate and at all

⁹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [136].

stages of the life of the EP as per Woodside's ongoing consultation approach described in Section 5.7.

5.4.3 Discharge of Regulation 25

The Full Federal Court made clear in the *Tipakalippa Appeal* that consultation should be approached in a “reasonable”, “pragmatic” and “not so literal” way, so that consultation obligations were capable of being met by titleholders (Section 5.5.1).¹⁰ Consultation is a “real world activity” and must be capable of reasonable discharge.¹¹ The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.¹²

When the Titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, then Regulation 25 consultation requirements are met.¹³ Meeting these obligations requires evaluative judgement to determine reasonable satisfaction of the consultation obligation and, as such, the Regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.¹⁴

While a Titleholder is required to provide an opportunity to consult, the Titleholder is not required to obtain consent to engage in the activity from a person being consulted, or confirmation from a person being consulted, that consultation is complete. The Federal Court has commented that a “reasonable opportunity” for consultation must be afforded to relevant persons.¹⁵ A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed the steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities; and sufficient time to provide relevant feedback for Woodside to assess relevant persons' objections or claims. Woodside has also provided a reasonable opportunity for there to be genuine two-way dialogue on a person's claims or objections.

Woodside has discharged its duty under Regulation 25 and considers that is complete.

Appendix F, Table 2 and Table 3 of this EP sets out the history of consultation under Regulation 25. To the extent a relevant person says that they have further information to share or claims that consultation under Regulation 25 has not been completed, Appendix F, Table 2 and Table 3 provide reasons why Woodside considers consultation under Regulation 25 has been met, in relation to that relevant person.

5.5 Context of Consultation Approach with Traditional Custodians

To comply with Regulation 25, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

5.5.1 Approach to Methodology – Woodside’s Interpretation of Tipakalippa Appeal

Woodside has implemented a consultation methodology consistent with Regulation 25 and guidance provided in the *Tipakalippa Appeal* (Section 5.5.2). Woodside’s consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (Section 5.5.3 to 5.5.7).

Woodside notes the Full Federal Court discussed several *Native Title Act 1993 (Cth)* cases in response to a submission made in that case that a requirement under Regulation 25 to consult “each and every” relevant person would be “unworkable”. The reference to Native Title cases dealt with how decision-making processes under the NTA requiring “all” members of a group to be contacted for communal approval are interpreted by courts in a “reasonable”, “pragmatic” and “not so literal” way,¹⁶ and how obligations to consult “each and every” person under Regulation 25 should be interpreted in a similarly pragmatic way, so that consultation is workable. The reference to NTA authorities was made by analogy:

“It can be seen that the terms of [the native title legislation] are somewhat absolute – “all”. However, [the native title legislation] has consistently been construed in a way that is not so literal ... The cases concerning [the native title legislation] ... have reiterated ... that [the native title legislation] does not require that “all” of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting.”¹⁷

*“We consider the authorities in relation to processes under the NTA to be **illustrative** of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner”¹⁸ (emphasis added).*

“there is no definition of what constitutes “consultation for the purpose of Reg11A [now Regulation 25] ... A titleholder will need to “demonstrate” to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons”¹⁹ (emphasis added).

The Judgment in the *Tipakalippa Appeal* makes it clear that a Titleholder will have some decisional choice in identifying which person(s) are to be approached, how the information will be given to allow the “relevant person” to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken.²⁰ Consultation is not fixed to a rigid process and will be adapted so that it is informed by the relevant person or group. Woodside has met its Regulation 25 requirements through its consultation methodology (Section 5.2).

¹⁶ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95], [98], [103]-[104] and [109].

¹⁷ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [98].

¹⁸ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96].

¹⁹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [104].

²⁰ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [47] and [48].

Consistent with the Tipakalippa Appeal, Woodside considers NTA-style “full group” meetings are not required for there to be compliance with Regulation 25. Nominated representative corporations (such as PBCs established under the NTA) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. It is not appropriate for Titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.2 Consultation Method

Woodside's First Nations team has experience in engaging and working with First Nations organisations and individuals, including within the Commonwealth native title and cultural heritage systems, and state and territory cultural heritage and land rights systems. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with First Nations groups' established channels of communication and methods of consultation. Woodside's First Nations team exercises its professional judgement and is respectful of long-standing relationships (where in place) when considering consultation with First Nations groups. The First Nations team's approach is also informed by the established systems of recognition for First Nations groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with First Nations groups in the Northern Territory (not relevant for this EP) tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976 (Cth)*) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them.

By contrast, recognition for First Nations groups and their nominated representative corporations in Western Australia falls under the *Native Title Act 1993 (Cth)* because the vast majority of the Western Australian coastline is settled under the Native Title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to, Native Title Representative Bodies and PBCs.

Native title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA and help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgment in the *Tipakalippa Appeal* endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.²¹ Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective First Nations communities. Woodside follows these processes for the appropriate broad capture of individuals'

²¹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95].[104].[153].

awareness of our activities, to self-identify (Section 5.5.4), and to provide feedback to inform the management of environmental impacts and risks.

Using these processes, Woodside communicates information about EPs by:

- advertising in relevant indigenous and non-indigenous newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian
- creating carefully considered Summary Consultation Information Sheets with information developed by Woodside's First Nations Team to remove jargon and present relevant information in a simplified format.
- directing contact through nominated representative corporations
- utilising social media (i.e. Facebook/Instagram), texts, phone calls and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and, on that basis, used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. First Nations woman, Professor Bronwyn Castle, through 10 years of research found *"Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations"* (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018))
- carrying out ongoing consultation post Regulation 25 consultation where Woodside has a Program of Ongoing Engagement with Traditional Custodians. This program sets out Woodside's commitment to ongoing engagement and support to care for and manage country, including Sea Country. The program was developed in response to Traditional Custodian feedback.
- basing members of its First Nations team in Karratha and Roebourne and who serve as on-Country points of contact for First Nations organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including distributing information and providing notice to the community to support Traditional Custodian attendance and involvement at Woodside's information sessions and Community roadshows.
- ensuring that from the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and who to appropriately consult with (such as elders)
- holding meetings on Country at a place and time agreed with Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate)
- providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

The First Nations team approach to consultation is also consistent with the Federal Court's decision in the *Munkara Case*. The *Munkara Case* notes that the word "*culture*" (and hence the word "*cultural*") has a communal aspect to it. To establish cultural features, it is necessary that the beliefs and values are held by the relevant people *as a people*. For values, features or beliefs that

are expressed by an individual to be “cultural” they cannot simply be an individual’s belief - the belief must have a communal aspect too and demonstrate that the “individual beliefs are broadly representative of the beliefs of other members of the group”²². The phrase “cultural features”, when applied to “people” as constituent parts of an ecosystem, is not directed to idiosyncratic views or beliefs of an individual²³. When the First Nations team is told that a particular value is cultural by an individual Traditional Owner, that information is taken back to the relevant cultural authority to test its broad acceptance. In the case of gender sensitive information, that information would be restricted to the specific gender within the community.

5.5.3 Identification of Relevant Persons

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with Regulation 25(1) (Section 5.2 and 5.3).

Specific to Woodside’s approach for identifying relevant Traditional Custodians, Woodside’s First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation, where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.4). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporation. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate, including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in Section 5.5.4 below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act 1993 (Cth)*, such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which seeks, from members, authorisation of agreements and Native Title/compensation claims under the *Native Title Act 1993 (Cth)*²⁴.

²² *Munkara v Santos NA Barossa Pty Ltd* (No 3) [2024] FCA 9 at [205]

²³ *Munkara v Santos NA Barossa Pty Ltd* (No 3) [2024] FCA 9 at [205]

²⁴ *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193, at [104]

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation. Woodside requests nominated representative corporations to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.4 Opportunity to Self-identify and Identifying Other Individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (Section 5.5.3). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Custodians authorised representative entities.
- Recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so, nor seek to audit the representative entities for compliance with any request.
- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. To date, most nominated representative corporations have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and Elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

5.5.5 Sufficient Information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is potentially affected.

Woodside produces Consultation Information Sheets for each EP which is provided to relevant persons and organisations for the purpose of seeking feedback on the activity (Section 5.4). In response to feedback from Traditional Custodians on information provisions, Woodside has tailored effective consultation methods for its activities. These methods are specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Summary Information Sheet developed and reviewed by Woodside's First Nations Team to ensure that content is appropriate to the intended recipients, which is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face-to-face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians location of choice (where practicable) and with their nominated attendees. Along with members of Woodside's First Nations engagement team, key project personnel and environmental experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a Titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

5.5.6 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.4.2).

5.5.7 Discharge of Regulation 25

Woodside's consideration and approach to discharging Regulation 25 for relevant persons is discussed in Section 5.4.3. In addition to this, Woodside has considered the application of Regulation 25 specific to First Nations based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under Regulation 25 of the Environment Regulations. Woodside considers that consultation under Regulation 25 is complete (Section 5.5.7).

5.6 Providing Feedback and Assessment of Merit of Objections or Claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined

in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled Consultation on offshore petroleum environment plans information for the community, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the EP and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under Regulation 34(g), there is no requirement for a relevant person to agree or confirm that they have been adequately consulted. During consultation, relevant persons may seek to introduce other issues (such as agreements) not specific to EP consultation. Concepts of agreements associated with broader consultation nevertheless consultation to specific EPs can occur.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Section 5.3.7). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with Regulation 26(8), sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under Regulation 25, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

5.7 Ongoing Consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to Section 7.14), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the

intended outcome of consultation, Woodside will apply its Management of Change and Review process as appropriate (see Section 7.3).

6. ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENTS CRITERIA

6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MC for the Petroleum Activities Program, using the methodology described in Section 2 of this EP. Impacts and risks associated with the Petroleum Activities Program are summarised in Table 6-1 and Table 6-2, and evaluated in Sections 6.7 and 6.9. MEEs require a further level of analysis and are assessed separately in Section 6.9.

6.2 Impact and Risk Analysis and Evaluation

As required by Regulations 21(5) and 21(6) of the Environment Regulations, the analysis and evaluation demonstrate that the identified risks and impacts associated with the Petroleum Activities Program are reduced to ALARP, are of an acceptable level and consider all operations of the activity, including potential emergency conditions.

Impacts and risks identified during the ENVID (including Decision Type, current risk level, acceptability of risk and tools used to demonstrate acceptability and ALARP) have been divided into two broad categories:

- planned (routine and non-routine) activities
- unplanned events (accidents, incidents or emergency situations).

Within these categories, impact and risk assessment groupings are based on environmental aspect²⁵ (e.g., emissions, physical presence, etc). For all hazardous events considered, the worst credible consequence was assumed.

The ENVID identified 7 impacts, and 10 risks associated with the Petroleum Activities Program. Planned activities and unplanned events are summarised in Table 6-1 and Table 6-2. The analysis and evaluation for the Petroleum Activities Program indicate that current environmental risks and impacts associated with the activity are reduced to ALARP and are of an acceptable level, as discussed further in Sections 6.7 and 6.9.

²⁵ An environmental aspect is an element of the activity that can interact with the environment.

Table 6-1: Environmental impact analysis summary of planned and unplanned activities

Aspect	EP Section	Source of Impact	Key potential environmental impacts (refer to relevant EP section for details)	Controll ed impact classifi cation	Residual impact level (ALARP controls in place)	Acceptability of Impact
Physical presence: Interaction with other marine users	6.7.1	Presence of vessels and subsea infrastructure excluding or displacing other users from the Operational Area (commercial shipping, fishing, other oil and gas operations).	Potential isolated social impact resulting from interference with other sea users (e.g., commercial and recreational fishing, and shipping).	F	Social and Cultural – No lasting effect (<1 month). Localised impact not significant to areas/items of cultural significance.	Broadly acceptable
Physical presence: Disturbance to seabed	6.7.2	Presence of Julimar and Brunello subsea infrastructure.	Localised modification of seabed habitat (formation of artificial reef) within Operational Area.	F	Environment – No lasting effect (<1 month). Localised impact not significant to environmental receptors.	Broadly acceptable
		Subsea operations, IMMR activities including span rectification (concrete mattresses etc.) as well as installation of pig receivers/launchers at the subsea wells.	Potential minor, localised modification of seabed habitat within the Operational Area.			
		Disturbance to seabed from ROV operation (including localised sediment relocation from sediment mobilisation techniques and marine growth removal)	Potential minor, localised loss or damage to benthic habitats, including benthic communities and marine primary producers.			
		Placement and retrieval of seabed transponders and temporary installation aids.

6.3 Impacts and Risks Deemed Not Credible or Outside the Scope of this Environment Plan

During the ENVID process, risks and/or impacts can be identified as either being not credible or relevant to the Petroleum Activity or outside the scope of the EP.

6.3.1 Risk or Impacts Not Credible

All of the impacts or risks identified and discussed during the ENVID were found to be credible and therefore subject to full environmental assessment.

6.3.2 Potential Environment Risks Not Within the Scope of this Environment Plan

The ENVID identified the following environmental risks that were assessed as not being applicable within or outside the Operational Area as a result of the Petroleum Activities Program and, therefore, were determined to not form part of this EP. These are described in the next sections for information only.

6.3.2.1 GHG Emissions associated with Onshore Processing, Third Party Transport of Products, Regassification, Distribution and End Use

Julimar infrastructure is operated from, and hydrocarbons processed by, the Chevron operated offshore Wheatstone Platform and onshore Wheatstone LNG Plant. Therefore, emissions associated with the offshore platform, onshore processing, and third party transport of Julimar gas products, as well as distribution and end use, are addressed in, and managed in accordance with Chevron's *Wheatstone Project - Start-Up and Operations EP* accepted by NOPSEMA on 1/08/2022. Correspondence with Chevron that the GHG emissions from the new JDP3 wells are accounted for and controls implemented in accordance with the *Wheatstone Project Start-up and Operations EP* can be found in SI Report, reference 27.3 – 27.6 and summarised in Appendix F Section 4.7.

Woodside's consultation notes GHG emissions associated with new Julimar wells are described, risk assessed, managed to ALARP and are of an acceptable level by the in-force *Wheatstone Project Start-up and Operations EP*. GHG emissions associated with the Julimar operations are described generally in Sections 3.5.4 and 6.7.6.

6.4 Cumulative Impacts

Woodside has assessed the cumulative impacts of the Petroleum Activities Program in relation to other relevant petroleum activities. Other facilities located in proximity to the Operational Area were identified within Section 4.9.8. While there is spatial overlap with a number of pipelines, it is highly unlikely that concurrent activities with other operations would occur, due to required communications between operators and the inherent risk reduction in avoiding such situations. Therefore, no cumulative risks or impacts will credibly occur.

However, given the concentration of sources of environmental risks and impacts from the Petroleum Activities Program are localised, the potential for cumulative impacts is considered to be low. Where relevant, the cumulative impacts of activities associated with undertaking multiple concurrent or parallel activities associated with this Petroleum Activities Program have been assessed for cumulative impacts.

6.5 Environmental Performance Outcomes, Standards and Measurement Criteria

Regulation 21(7) of the Environment Regulations requires that an EP includes Environmental Performance Outcomes (EPOs), Environmental Performance Standards (EPSs) and Measurement Criteria that address legislative and other controls to manage the environmental risks and impacts of the activity to ALARP and Acceptable levels.

As defined in Regulation 5 of the Environment Regulations, an EPO “for an activity, means a measurable level of performance required for the management of environmental aspects of the activity to ensure that environmental impacts and risks of the activity will be of an acceptable level”.

The EPOs, EPSs and MC specified in this EP are consistent with legislative requirements and Woodside’s standards and procedures. They have been developed based on the Codes and Standards, Good Industry Practices and Professional Judgement outlined in Sections 2.6.2 and Section 2.6.3, as part of the acceptability and ALARP justification process.

The EPOs, EPSs and MC are presented throughout this section and in Appendix D (Oil Spill Preparedness and Response). A breach of these EPOs or EPSs constitutes a ‘Recordable Incident’ under the Environment Regulations (refer to Section 7.15.5).

For the physical and biological receptors within the EMBA, Woodside has set EPOs that are consistent with the Matters of National Environmental Significance – Significant impact guidelines 1.1 (Department of the Environment 2013). EPOs are set so that they are consistent with the principles of ESD as defined in the Section 3A of the EPBC Act and this is demonstrated through the acceptability process (described in Section 2.8.2), which is applied to the aspects / receptors in Section 6. The EPOs for planned activities have been set at a level of environmental performance that considers the planned activities and associated level of environmental impact. This means that it can be demonstrated that changes which do not trigger EP resubmission as per MOC process (refer to Section 7.3) are able to be managed to the Acceptable level.

For social receptors, including fishing and other commercial activities, the EPOs that have been set reflect the requirements in the section 280(2) of the OPGGS Act, in that the activities undertaken as a part of the development of Julimar should not interfere with other marine users, to a greater extent than is necessary for the exercise of right conferred by the titles granted.

6.6 Presentation

The analysis and evaluation (ALARP and acceptability), EPOs, EPSs and MC are presented in tabular form throughout this section, as shown in the sample below. Italicised text in this example table denotes the purpose of each part of the table, with reference to the relevant sections of the Regulations and/or this EP.

6.7 Planned Activities (Routine and Non-routine)

6.7.1 Physical Presence: Interaction with Other Marine Users

Context													
Field Inventory – Section 3.5.1 Support Vessel Operations – Section 3.6			Socio-economic– Section 4.9 Cultural Values and Heritage – Section 4.9.1				Consultation – Section 5						
Impact Evaluation Summary													
Source of Impact	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Presence of vessels and subsea infrastructure excluding or displacing other users from the Operational Area (commercial fishing, commercial shipping, tourism and recreation, and other oil and gas operations).						X	A	F	-	-	LCS GP	Broadly Acceptable	EPO 1
Description of Source of Impact													
<p>There is a 250 m Petroleum Safety Zone (PSZ) around the production wells and crossover manifolds, which vessels are prohibited from entering unless authorised by Woodside. The PSZ is a critical safety control intended to reduce the likelihood of interactions between vessels and the facility, which increases safety for both vessels and the facility. Implementation of the PSZ excludes other users from a small area (approximately 0.79 km²).</p> <p>Vessels are present in the Operational Area intermittently throughout the Petroleum Activities Program, including during JDP3 commissioning, and IMMR activities during operations, all of which are to be undertaken by a subsea support vessel (see Section 3.6). The duration and location of these activities varies depending on the activity being undertaken, and is described in detail in Sections 3.5.2, and 3.9 and will typically result in a support vessel being in the field for one to two weeks but maybe be present for up to six weeks.</p> <p>Additionally, vessels associated with the Wheatstone operations, Pluto operations and other oil and gas activities, may be present in the Operational Area during the course of the Petroleum Activities Program. Vessels associated with these activities may include IMMR vessels and supply vessels.</p>													
Impact Assessment													
Environmental Value(s) Potentially Impacted													
Exclusion and Displacement of Other Users													
Interaction with other marine users due to the physical presence of in the Petroleum Activities Program may result in localised changes to the functions, interests or activities of other users.													
Commercial Fishing													
The Operational Area overlaps the fisheries management areas of three Commonwealth and 11 State managed commercial fisheries. As presented in Table 4-24, however, based on catch data none of the Commonwealth and only													

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

five of the State fisheries were assessed as having the potential to interact with the Petroleum Activities. The overlap of the Operational Area with commercial fishing activity may temporarily exclude fishers from the area resulting in a potential displacement and potential loss of gear (particularly in relation to deployed traps). The potential impact to commercial fisheries in the Operational Area is considered to be localised displacement/avoidance by commercial fishing vessels within the immediate vicinity. In observance of good seamanship, all support vessels will avoid any close and/or disruptive engagement with any commercial fishing activity. As such, the potential impact is considered to be localised with no lasting effect.

The presence of permanent subsea infrastructure, over the 25-year field life could present a hazard to bottom trawl fisheries due to the risk of equipment entanglement and subsequent equipment damage/loss. As illustrated in Table 4-24, the only trawl fishery that may interact with the Petroleum Activities within the Operational Area is the Pilbara Trap Limited Entry Fishery, with up to three vessels operating within the vicinity of the Operational Area (DPIRD 2023), however, since the Julimar Development commenced operations in 2016, this fishery has not raised any objections of claims during ongoing consultation, suggesting that impacts to trawl fisheries are not at risk of interference.

Commercial Shipping

The presence of activity vessels could potentially cause temporary disruption to commercial shipping. To reduce the likelihood of interactions between commercial vessels and offshore facilities, AMSA has introduced a series of shipping fairways within which commercial vessels are advised to navigate. The fairways are not mandatory however AMSA strongly recommends that commercial vessels remain within the fairways when transiting the region. The use of shipping fairways is considered to be good seafaring practice; Australian Ship Reporting System data from AMSA indicates that cargo ships and tankers routinely navigate within the established fairways. Notably, no recognised shipping fairways overlap the Operational Area (Figure 4-13); the nearest fairway lies about 32 km west of the Operational Area.

The AHO has been notified of the location of subsea infrastructure (see Table 3-2) for marking on nautical charts. Water depths of subsea infrastructure range between about 71 and 200 m.

Tourism and Recreation

Tourism and recreation activity in the Operational Area is expected to be infrequent. Recreational and charter fishing from vessels are the only tourism and recreation activities identified as potentially occurring in the Operational Area. Tour operator fishing efforts recorded over a 10-year period (2013–2023) (DPIRD, 2023) identified <three vessels' operations within the Operational Area. In the event that a charter boat was fishing within the Operational Area, displacement as a result of the Petroleum Activities Program would be minimal. Therefore, the potential impact, including over the life of field, is considered to be localised with no lasting effect.

Oil and Gas Operations

The Wheatstone Platform and associated subsea infrastructure are located at the northern end of the Operational Area. Uncontrolled access in the vicinity of this facility could increase the potential for interference with the facility and supporting vessels. Vessel based activities for the Julimar Development are managed via the Wheatstone Platform Operator Permit to Work (PTW) process, which limits the potential for any non-compatible cumulative activities. In this way, the potential cumulative impact to other marine users, due to the Petroleum Activities Program in conjunction with other oil and gas operations, is considered to be localised with no lasting effect.

Over-trawl protection on flowlines.	F: Yes. Over-trawl protection on subsea infrastructure could be fitted to subsea infrastructure. CS: Significant additional cost associated with designing and installing trawl protection on subsea infrastructure.	Over-trawl protection on subsea infrastructure could mitigate the potential for commercial fishing trawl gear to damage infrastructure or result in gear loss.	Given the Operational Area only overlaps a small portion of the fisheries management area open to trawl fishing, the cost of installing over-trawl protection is considered grossly disproportionate to the environmental benefit.	No
ALARP Statement: On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the potential impacts of the physical presence of the subsea infrastructure and support vessels on other users. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability
Acceptability Statement: The impact assessment has determined that, given the adopted controls, physical presence of the support vessels represents a negligible impact that is unlikely to result in a potential impact greater than an isolated social impact to commercial fishing, recreational fishing and shipping, and other oil and gas titleholders. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders, and expectations of AMSA and AHO provided in consultation with relevant persons. The potential impacts and risks are considered broadly acceptable, if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of physical presence of the Julimar Development subsea infrastructure, and support vessels to a level that is broadly acceptable.

EPOs, PS and MC			
EPO	Controls	PS	MC
EPO 1 Impacts to relevant marine users from the Petroleum Activities Program planned activities will be limited through the provision of appropriate information/notification	C 1.1 Vessels to adhere to the navigation safety requirements including the Navigation Act 2012 and any subsequent Marine Orders. Description of Source of Impact													
Operations Seabed disturbance associated with the Petroleum Activities Program can occur during operations and associated activities including: <ul style="list-style-type: none">Physical presence of the subsea infrastructure (operational and redundant).Scour, spans, and flowline movement inherent in design.Vessel based subsea IMMR activities. Subsea infrastructure has been installed throughout the Operational Area (Section 3.5.1) and impacts to the seabed during installation of this equipment has been subject to separate EPs. The seabed disturbance from ongoing presence of installed infrastructure is outlined below (also see Section 3.5.1). Subsea Operations													

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The presence of subsea infrastructure may result in localised scouring, within the Operational Area, around the infrastructure due to currents, subsurface waves and seabed sediment fluid dynamics. Scour around subsea infrastructure may necessitate IMMR activities as part of integrity management practices.

Flowline movement may occur as per design and within integrity margins along the flowline corridor and is influenced by prevailing metocean conditions. Lateral movement which is larger than expected may necessitate IMMR activities. Refer to Subsea equipment loss of containment (Section 6.9.2) which includes controls to limit scour and flowline movement within integrity requirement.

IMMR Activities

To maintain the integrity of subsea infrastructure, Woodside may be required to undertake routine subsea IMMR activities, as described in Section 3.9. Activities that constitute IMMR may impact the benthic environment in the vicinity of the activity. IMMR activities identified as impacting the benthic environment include, but are not limited to:

- inspections – localised sediment resuspension by ROV
- marine growth removal – localised resuspension of sediment; removal of marine biota from subsea infrastructure
- sediment relocation – localised modification of benthic habitat and sediment resuspension
- span rectification, pipeline protection and stabilisation – minor, localised modification of benthic habitat within footprint of Operational Area subject to rectification/protection/stabilisation
- flowline, jumper and umbilical replacement – minor, localised modification of benthic habitat in the vicinity of the flowline/ jumper/ umbilical
- spool repair/replacement – minor, localised modification of benthic habitat in the vicinity of the spool
- temporary placement of tools on the seabed e.g. baskets – minor localised modification of the benthic habitat in the vicinity of the items
- pig launcher/receiver installation and retrieval - minor, localised modification of benthic habitat and sediment resuspension in the vicinity of the receiver.

The seabed area predicted to be impacted varies depending on the nature and scale of the IMMR activity. No impact is expected beyond the Operational Area. Span rectification is the IMMR activity with the greatest potential to modify the seabed, due to the alteration of the existing soft sediment habitat to (artificial) hard substrate. Woodside's operational experience on the North West Shelf indicates that these activities (e.g., span rectification, pipeline protection and stabilisation) are typically restricted to relatively short (tens of metres) linear sections of pipeline with up to approximately 100 m² of seabed impacted.

Impact Assessment

Environmental Value(s) Potentially Impacted

IMMR activities can be categorised into two potential impacts:

- direct physical disturbance of benthic habitat
- indirect disturbance to benthic habitats from sedimentation.

Subsea infrastructure provides hard substrate which may be colonised by sessile benthic invertebrates, such as sponges or soft corals. These may subsequently result in habitat creation for demersal fish populations.

Water Quality

Seabed disturbance may include localised and temporary decline in water quality due to increased suspended sediments; increased sediment deposition caused by IMMR activities, however, sediment loads are not expected to be significant due to the relatively small footprint and duration of each activity and event (described above, and in Section 3). Similarly, removal of marine growth from subsea infrastructure to maintain structural integrity on an as-required basis would cause localised temporary decrease in water quality and suspended sediment from water jetting activities.

Ecosystem/Habitats

The Operational Area predominantly consists of soft sediment benthic communities, with the exception of a small portion in the vicinity of the Wheatstone platform (see Section 4.3.1).

Soft Sediment Benthic Communities

The benthic habitat within the Operational Area is predominantly soft sediment with sparsely associated epifauna (RPS Group, 2011), which is broadly represented throughout the Northwest Province. Benthic communities of the soft sediment seabed are characterised by burrowing infauna, such as polychaetes, with biota such as sessile filter

feeders occurring on areas of hard substrate (such as existing subsea infrastructure). Each discrete IMMR activity near the seabed is likely to cause a brief disturbance which may result in suspended sediment. This sediment will subsequently be deposited down current as particles resettle. Such localised and short-term events may affect small areas of the seabed and, consequently, impact the associated biota (typically sparsely distributed infauna and sessile epifauna). Given the expected nature and scale of resuspension resulting from these disturbances, impacts such as smothering or burial are not expected. Rather, impacts are likely to be restricted to increased ingestion of inedible sediments by filter feeders. Biota in the region are well adapted to periodic turbidity events caused by cyclones and tidal movements. As such, impacts from turbidity caused by these disturbances are not expected to have any lasting effect on benthic biota. The estimated overall extent of such direct seabed disturbance is extremely small in relation to the extent of the soft sediment habitats, which are broadly represented within the Operational Area and the wider Northwest Province. Operational experience indicates disturbance to soft sediment habitats around subsea infrastructure associated with the Petroleum Activities Program is localised with no lasting effect.

Hard Substrate Benthic Communities

Areas of cemented sediments occur about 3 km along the north-eastern end of the Operational Area in proximity to the Wheatstone Platform (Figure 4-4) and support benthic invertebrate communities of sessile filter feeding biota, including large sea fans, sponges, soft corals, sea whips and ascidians (Neptune Geomatics, 2010a; RPS Group, 2010, 2011), likely providing habitat for demersal fish populations. The filter feeding community associated with these hard substrates is considered of higher ecological value than the surrounding soft sediment habitat but encompasses a relatively small proportion of the Operational Area. Activities near the seafloor may result in slight and temporary impacts to filter feeders from localised burial (sedimentation) and minimal direct permanent loss of filter feeder habitat as a result of seabed disturbance during IMMR activities (see impacts discussed in 'Soft Sediment Benthic Fauna Communities' above). Although impacts to filter feeding communities resulting from project activities may result in permanent loss, this is expected to be restricted to a small portion of filter feeder habitat. Loss of a small portion of filter feeder habitat due to this Petroleum Activities Program may temporarily impact demersal fish populations associated with the cemented sediment outcrops, however, the ecological integrity of filter feeder communities within the region is expected to be maintained. Impacts are, therefore, expected to be localised with no lasting effect.

Ancient Coastline at the 125 m Depth Contour KEF

The Operational Area overlaps about 0.2% (or 28 km²) of the 16,190 km² Ancient Coastline KEF. It is noted that the Ancient Coastline at 125 m KEF is associated with areas of seabed outcroppings but the only evidence of such seabed habitat is that found in the north-eastern end of the Operational Area in proximity to the Wheatstone platform (See Hard Substrate Benthic Communities above) with the majority of the Operational Area seabed habitat composed of unconsolidated, soft sediment, such habitats are widely distributed in the NWMR (Section 4.3). The Operational Area represents a buffer around the subsea infrastructure to facilitate vessel operations; however, the potential for seabed disturbance is much more localised (i.e. within tens of metres of the subsea infrastructure). Therefore, potential impacts to this KEF are expected to be localised with no lasting effect.

Montebello Australian Marine Park

A small proportion (0.07% or 2.7 km²) of the Operational Area overlaps the Montebello AMP Multiple Use Zone. The AMP includes values associated with the shallow shelf environments. No regionally significant benthic habitats or fauna, or shelf/slope or pinnacle and terrace habitats associated with this AMP were recorded during seabed surveys of a portion of the Operational Area (Advisian, 2019).

A total of 0.29 km² of the Julimar/Brunello pipeline/flowlines is present within the AMP boundary. Minimal, direct loss of seabed habitat in the AMP may be possible if IMMR activities occurs within the AMP boundary. Indirect impacts may occur as a result of sedimentation. These direct and indirect impacts are discussed in relation to soft sediment benthic fauna communities above.

Further, cumulative impacts are not predicted to occur as it is expected that any Pluto or Wheatstone subsea infrastructure IMMR activities will be spatially and temporally separated (See Section 3.5). The predicted impacts of these other activities will be similar to those described above, with localised seabed impacts in the vicinity of the subsea infrastructure.

Artificial Habitat

The presence of subsea infrastructure provides hard substrate for the settlement of marine organisms; the availability of hard substrate is often a limiting factor in benthic communities. As such, the presence of subsea infrastructure has led to the development of ecological communities which would not have existed otherwise. For example, pipeline infrastructure has been shown to support more diverse fish assemblages and benthic biota (Bond 2018, McLean 2017). These communities are relatively diverse compared to the open water and soft sediment habitats in the broader Operational Area.

The provision of artificial habitat associated with the subsea infrastructure has either no adverse environmental impact or a low level of positive environmental impact through increasing biological diversity.

Values and SensitivitiesCultural Heritage

As described in Section 4.7.1 and above, the Operational Area overlaps the Ancient Coastline at 125 m depth contour KEF and therefore there is the potential that Cultural features may exist and these may potentially be impacted during seabed disturbance resulting from operations and associated activities.

ALARP Statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.6.1) and Woodside's criteria for demonstrating ALARP (Section 2.8.1), Woodside considers the adopted controls appropriate to manage potential impacts and risks associated with seabed disturbance subsea IMMR activities. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability			
Acceptability Statement: The impact assessment has determined that, given the adopted controls, seabed disturbance from subsea activities represents no lasting effect that is unlikely to result in a potential impact to benthic habitats. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of tie-back activities and subsea IMMR activities to a level that is broadly acceptable.

6.7.3 Routine Acoustic Emissions: Generation of Noise during Operations

Context													
Subsea Operations Support Vessels – Section 3.6 Helicopter Operations – Section 3.7 Subsea IMMR Activities – Section 3.9				Protected Species – Section 4.6 Socio-economic– Section 4.9				Consultation – Section 5					
Impact Evaluation Summary													
Source of Impact	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Noise generated within the Operational Area from: • support vessels • helicopters • IMMR activities • continuous sources, including wellheads and pipelines					X	X	A	F	-	-	LCS GP	Broadly Acceptable	EPO 4
Description of Source of Impact													
<p>Support vessels, subsea operations including IMMR activities as well as helicopter operations will generate noise both in the air and underwater, due to normal operation of machinery and propeller movement. Typical noise levels for these sources are provided in Table 6-3 below. This noise will contribute to and can exceed ambient noise levels which range from around 90 dB re 1 µPa sound pressure level (SPL) under very calm, low wind conditions, to 120 dB re 1 µPa SPL under windy conditions (McCauley, 2005).</p> <p>Continuous (Non-Impulsive) Sources</p> <p><u>Wellheads, Pipelines and Subsea infrastructure</u></p> <p>Wellhead noise is expected to originate primarily from choke valves. However, depending rates of flow, source levels have been reported to vary described below. Considering the variability in the reported source levels noise from McPherson et al. (2015) were scaled to 161.5 dB re 1 µPa²m² (JASCO Applied Sciences (Australia) Pty Ltd 2024)). For a number of nearby wellheads, the sources would have to be in very close proximity (< 50 m apart) before their signals summed to increase the total noise field (with two adjacent sources only increasing the total noise field by three dB). Hence for multiple wellheads in an area, the broadband levels in the vicinity of the wellheads would be expected to be of the order of 130 dB re 1 µPa SPL and this would drop very quickly to ambient conditions on moving away from the wellhead, falling to background levels within 200 m from the wellhead. Woodside has undertaken acoustic measurements on the noise generated by the operation of choke valves associated with the analogous subsea development to the Julimar Development (Angel facility) (McPherson 2015). These measurements indicated choke valve noise is continuous, and the frequency and intensity of noise emitted is dependent on the rate of production from the well. Noise intensity at low production rates (16% and 30% choke positions) were approximately 154 to 155 dB re 1 µPa (SPL) , with higher production rates (85% and 74% choke positions) resulting in lower noise</p>													

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

levels (141 to 144 dB re 1 μ Pa SPL). Noise from choke valve operation was broadband in nature, with the majority of noise energy concentrated above 1 kHz. Noise from choke valve operation was considered minor compared to noise generated by vessels using thrusters in the area. Given the low levels of noise emitted by subsea infrastructure such as wellheads, choke valves and flowlines, no impacts to marine fauna from these noise sources are expected. Measurements of noise generated by choke valves indicated it is relatively high frequency (>1 kHz), and hence it attenuates over relatively short distances in the water column; significant impacts to marine fauna are not considered credible and therefore not considered further in the impact assessment.

Overall, as the SPLs for continuously operating subsea infrastructure are below the threshold shifts and behavioural response onsets for most marine fauna, the impacts are qualitatively considered where relevant.

Support Vessels and Operation of Dynamic Positioning Systems

Support vessels used for JDP3 commissioning and IMMR activities will be DP capable vessels (see Section 3.6). The sound levels and frequencies generated by vessels varies with the size of the vessel, speed, engine type and the activity being undertaken. Vessels produce low frequency sound (i.e., below 1 kHz) from the operation of machinery, hydrodynamic flow sound around the hull and from propeller cavitation, which is typically the dominant source of sound (Ross 1993).

Vessels in the 50 to 100 m size class (e.g., supply ships, crew boats, research vessels) produce broadband source levels in the 165 to 180 dB re 1 μ Pa (SPL) range (Gotz 2009). In comparison, underwater sound levels generated by large ships can produce levels exceeding 190 dB re 1 μ Pa (Gotz 2009), and small vessels up to the 20 m size class typically produce sound at source levels of 151 to 156 dB re 1 μ Pa (Richardson 1995). McCauley (1998) measured underwater broadband noise equivalent to about 182 dB re 1 μ Pa at 1 m (SPL) from a support vessel holding station in the Timor Sea; it is expected that similar noise levels will be generated by support vessels used for this Petroleum Activity.

Helicopter Transfers

Helicopter activities may occur in the Operational Area, including landing and take-off on support vessel helidecks. Sound emitted from helicopter operations is typically below 500 Hz (Richardson 1995). The peak received level diminishes with increasing helicopter altitude, but the duration of audibility often increases with increasing altitude. Richardson et al. (1995) reports that helicopter sound is audible in air for four minutes before it passed over underwater hydrophones, but detectable underwater for only 38 seconds at 3 m depth and 11 seconds at 18 m depth. Noise levels reported for a Bell 212 helicopter during fly-over was reported at 162 dB re 1 μ Pa (SPL) and for Sikorsky-61 is 108 dB re 1 μ Pa (SPL) at 305 m (Simmonds 2004). Water has a very high acoustic impedance contrast compared to air, and the sea surface is a strong reflector of noise energy (i.e., very little noise energy generated above the sea surface crosses into and propagates below the sea surface (and vice versa) – the majority of the noise energy is reflected). The angle at which the sound path meets the surface influences the transmission of noise energy from the atmosphere through the sea surface, angles >13° from vertical being almost entirely reflected (Richardson 1995). Given this, and the typical characteristics of helicopter flights within the Operational Area (duration, frequency, altitude and air speed), the opportunity for underwater noise levels to exceed the behavioural thresholds is not considered credible and is not assessed further.

Non-routine Impulsive Sources

Subsea IMMR Activities

Subsea IMMR activities may result in localised, temporary increased in underwater noise. Sources proposed (Table 6-3) have frequency outputs ranging from 2 kHz (SBP CHIRP) to 900 kHz (SSS).

MBES and SSS are low-energy, high-resolution geophysical survey instruments that may be required for IMMR every 1 to 6 years to identify buckling, movement, scour and seabed features. MBES have operating frequencies ranging from 12 kHz to 700 kHz (Jiménez-Arranz 2017) with peak pressure (PK) source levels between approximately 210 and 245 dB re 1 μ Pa at 1 m (Jiménez-Arranz 2017); Zykov, 2013; (MacGillivray 2014) MBES generate micro-pulses of high frequency sound in a highly focused beam directed towards the seabed, which attenuates rapidly underwater compared to lower frequency sound sources. Due to this directionality and short pulse duration, there is relatively low sound energy and very limited horizontal sound propagation. The high operating frequencies of many MBES are typically above the hearing range of the low frequency (LF) cetacean (7 Hz to 35 kHz; (Southall 2019)) Activities Area. The high operating frequencies of MBES are also above the hearing ranges of marine turtles (<2 kHz, (Finneran 2017)) and the majority of fish species (100 Hz to several kHz; (Ladich n.d.), (A. H. Popper 2014)). Additionally, sound sources generated closer to the seabed have a lower received noise level in the horizontal direction due to seafloor scattering and absorption. Similar to MBES, SSS produce micro-pulses of sound in a focussed swath directed at the seabed. SSS operating frequencies may range between 75 kHz and 900 kHz, with sound energy attenuating rapidly with horizontal distance from the main swath (Jiménez-Arranz 2017); Zykov, 2013). Representative source levels range between 200 and 235 dB re 1 μ Pa PK at 1 m (Jiménez-Arranz 2017); Zykov, 2013). The high operating frequencies of SSS places the dominant sound frequencies above the hearing range of most marine fauna species, including LF cetaceans, turtles and fish, although some of the lower frequency devices may be audible to HF

cetaceans (MacGillivray et al., 2013; Zykov, 2013). Sub-bottom profiling may also be undertaken every 1-6 years to identify features under the seabed. Most commercial SBPs are small, low-powered, high-resolution and shallow-penetrating systems, producing electrical pulses across a range of frequencies (Salgado-Kent 2016, Jiménez-Arranz 2017). The instruments proposed for the survey produce pulses of sound between approximately 2 kHz and 30 kHz with source levels between approximately 170 and 230 dB re 1 μ Pa PK at 1 m.

Positioning Equipment

An array of long baseline (LBL) and/or ultra-short baseline (USBL) transponders may be used for positioning during IMMR activities. Transponders typically emit pulses of medium frequency sound, generally within the range 21 to 31 kHz. The estimated SPL at source ranges from 180 to 202 dB re 1 μ Pa SPL at 1 m (Jiménez-Arranz 2017). Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders will not emit any sound when on standby, and when required for precise positioning they will emit one chirp every five seconds.

Summary of source levels

Table 6-3: Indicative source characteristics of continuous underwater noise associated with the Petroleum Activities Program as reported in (Jiménez-Arranz 2017), McCauley (2005), McCauley (2002), (JASCO Applied Sciences (Australia) Pty Ltd 2024) and Wood (2025).

Acoustic Noise Sources	Estimated SPL (dB re 1 μ Pa SPL) @1 m unless otherwise stated	Frequency Range (kHz)
Vessels (Continuous)		
Support vessels, ASV using DP	182	Broadband
IMMR Activity Noise (Pulsed)		
Multibeam Echo Sounder (MBES)	210–247	12 to 700 (deep) 150 to 700 (shallow)
Side Scan Sonar (SSS)	200–234	75 to 900
Sub-bottom Profiler (SBP) (Pinger)	161–205	2-20
Sub-bottom Profiler (SBP) (Chirp)	167–212	2-23
Ultrashort baseline/ acoustic array	Intermittent	187 to 196
Wellhead, Flowlines and Subsea Infrastructure (Continuous)		
Choke valve / Wellhead	155 – 161.5	Broadband

* Range provided was not measured at the noise source; therefore, this should be used as an indicative estimate only and cannot be used to estimate exposure thresholds closer to the source.

Cumulative noise emissions

During the Petroleum Activity, there could be times where noise emissions arise from concurrent activities within the Operational Area, both from the Petroleum Activity and non-associated activities. These include:

- routine operations of the subsea infrastructure and routine or non-routine IMMR activities
- routine operations of the nearby Wheatstone Infrastructure with routine or non-routine IMMR activities associated with the infrastructure within the Operational Area

Impact Assessment

Receptors

The Operational Area lies in waters about 71 to 244 m deep on the continental shelf. The fauna associated with this area is predominantly open-water pelagic fish species. Threatened and/or migratory fauna, particularly, the Flatback turtle, pygmy blue whale, foraging wedge-tailed shearwaters and migratory whale sharks are described as potentially transiting the wider area seasonally. The Operational Area overlaps with BIAs for these EPBC Act listed and the potential for noise impacts are discussed below for all except the shearwater, given noise impacts to avifauna are not

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

credible as helicopters will only be utilised infrequently and there is no emergent land that could be used for roosting or nesting habitat in the Operational Area so any individuals are expected to only be transiting through the area and able to avoid the noise source.

The Operational Area overlaps small a portion of the Ancient Coastline at 125 m KEF. Fauna associated with the KEF seabed areas of hard substrate (such as outcropping) are assumed to include diverse and abundant demersal fish species as compared to the bare, soft sediment areas. As such demersal fish were evaluated for potential impacts of noise emissions. It is noted that the Ancient Coastline at 125 m KEF is associated with areas of seabed outcroppings but the only evidence of such seabed habitat was in the northeast area of the Operational Area in proximity to the Wheatstone platform with the majority of the Operational Area seabed habitat composed of unconsolidated, soft sediment (Section 4.3). Also of note, is that some demersal fish species are also likely to be associated with existing subsea infrastructure and probably similar in composition as that described for other subsea infrastructure on the NWS (McLean et al., 2017).

Potential Impacts of Noise

Elevated underwater noise can affect marine fauna, including cetaceans, fish, turtles, sharks and rays, in three main ways (Richardson 1995, Simmonds 2004).

- by causing direct physical effects on hearing or other organs. Hearing loss may be temporary (temporary threshold shift (TTS) referred to as auditory fatigue), or permanent threshold shift (PTS) (injury)
- by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey)
- through disturbance leading to behavioural changes or displacement from important areas (e.g., BIAs). The occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation.

Sound Propagation

Increasing the distance from the noise source usually results in the level of noise reducing, due primarily to the spreading of the sound energy with distance. The way that the noise spreads (geometrical divergence) depends upon several factors such as water column depth, pressure, temperature gradients, and salinity, as well as surface and bottom conditions.

Cetaceans

Species Sensitivity and Exposure Thresholds

Marine mammals and especially cetaceans rely on sound for important life functions including individual recognition, socialising, detecting predators and prey, navigation and reproduction (Weilgart 2007, C. D. Erbe 2018, C. R. Erbe 2015). Underwater noise can affect marine mammals in various ways including interfering with communication (masking), behavioural changes, a shift in the hearing threshold (PTS and TTS), physical damage and stress (C. Erbe 2012, Rolland 2012). Frequency-specific hearing sensitivity differs among marine mammals, influencing how they are affected by noise exposure. For the purposes of predicting the effects of noise exposure on different groups of cetaceans, blue whales, humpback whales and other large mysticete (baleen) whales are categorised as Low Frequency (LF) cetaceans, while odontocetes (toothed whales and dolphins) are categorised as High Frequency or Very High Frequency cetaceans (Southall 2019).

The Operational Area overlaps with several threatened and/or migration cetaceans. Only the migration BIA for pygmy blue whales (Section 4.6.3) partially overlaps the northwestern part of the Operational Area.

As identified in Section 4.6.3.1 predictions indicate greatest numbers of pygmy blue whales in the NWMR during April through August (northern migration), and October to late December with a few detections early January (southern migration).

A recent satellite tracking data for pygmy blue whales have identified that the continental slope off the north-west Australian coast was predicted to be suitable habitat for migration and foraging (Ferreira, Jenner and Jenner 2024). This information is aligned with other recent studies in the north-west of Australia. The Operational Area intersects with these suitable habitats for migration and foraging

The thresholds that could result in behavioural response for cetaceans is expected to be 120 dB re 1 μ Pa (SPL) for continuous noise sources, and 160 dB re 1 μ Pa (SPL) for impulsive noise sources (Table 6-4). TTS and PTS for cetaceans as a result of impulsive and continuous noise (non-impulsive) are also presented in Table 6-4. These thresholds have been adopted by the United States National Oceanic and Atmospheric Administration (NOAA) (National Marine Fisheries Service 2014, National Marine Fisheries Service (US) 2018, National Oceanic and Atmospheric Administration (US) 2019, Southall 2019). Updates to the recommended thresholds in October 2024 (National Marine Fisheries Services 2024) are shown in Table 6-4, with slightly increased PTS and TTS thresholds across all cetacean hearing groups exposed to impulsive and continuous noise (non-impulsive), with the exception of slightly lower PTS and TTS thresholds for low-frequency cetaceans exposed to continuous noise (non-impulsive).

Adopted thresholds are based on best data available and published in peer-reviewed literature and represent conservative internationally accepted and applied impact evaluation thresholds (see Table 6-4).

Table 6-4: Thresholds for permanent threshold shift, temporary threshold shift and behavioural response onset for low frequency, high-frequency and very high frequency cetaceans for continuous and impulsive noise

Hearing group	Impulsive					Continuous

The Conservation Management Plan for the Blue Whale (BWCMP) (Commonwealth of Australia 2015), a recovery plan made under the EPBC Act, defines important areas for pygmy blue whales and these are also described with reference to BIAs in the National Conservation Values Atlas (NCVA), with particular emphasis placed on foraging areas and migration corridors. As noted above and in **Section 4.6.3**, the migratory corridor overlaps the northwestern part of the Operational Area with the nearest foraging BIA (Ningaloo possible foraging area) approximately 212 km to the south of the Operational Area. Action Area A.2.3 of the BWCMP states: "Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury and is not displaced from a foraging area". Furthermore, the Guidance on Key Terms within the *Blue Whale Conservation Management Plan* (Department of Agriculture, Water and the Environment 2021), underwater noise emissions from the petroleum activities program must not:

- result in injury³² (TTS or PTS) to any pygmy blue whale in BIAs, or
- displace a pygmy blue whale from a foraging BIA.

The following assessment of impacts to cetaceans includes consideration of the requirements of the BWCMP with respect to pygmy blue whales.

Predicted Underwater Noise Impacts to Cetaceans

Support Vessel Noise Impacts

Vessels holding station are considered to be the predominant noise source related to the Petroleum Activity McCauley (1998) measured underwater broadband noise equivalent to about 182 dB re 1 μPa SPL (SPL) at 1 m from a support vessel holding station in the Timor Sea. Similar noise levels are expected to be generated by similar sized support vessels used for the Petroleum Activity.

Updated PTS and TTS thresholds for LF cetaceans are 197 dB re 1 $\mu\text{Pa}^2\text{s}$ (SEL weighted) and 177 dB re 1 $\mu\text{Pa}^2\text{s}$ (SEL weighted), respectively for continuous noise sources (Table 6-4). Typical sound exposures generated by a

³² For the purpose of interpreting and applying Action Area A.2 of the Blue Whale CMP, injury is both permanent and temporary hearing impairment (Permanent Threshold Shift and Temporary Threshold Shift) and any other form of physical harm arising from anthropogenic sources of underwater noise (Department of Agriculture, Water and the Environment 2021).

support vessel using DP would not exceed these levels (except at extremely close ranges to the source), so PTS and TTS in LF cetaceans, such as large baleen whales, is not anticipated.

Potential impacts to cetaceans may instead include behavioural disturbance from vessels. The thresholds that could result in behavioural response for cetaceans is expected to be 120 dB re 1 μ Pa (SPL) for continuous noise sources such as vessels (Table 6-4). Acoustic modelling undertaken for a support vessel operating on DP predicted that sound from each sound source individually would exceed the 120 dB threshold up to a maximum distance of 670 m, while combined sound sources exceeded the threshold to a distance of 1.07 km (McPherson 2019). Therefore, 1 km is considered a very conservative estimate of the range at which underwater sound propagating from a single project vessel may cause a behavioural response in cetaceans.

Cetaceans are capable of moving away from potential noise sources, and there are no constraints to their movement within the Operational Area. LF cetaceans such as humpback whales and pygmy blue whales may be seasonally present in the Operational Area, though limited to individuals infrequently transiting through the area. Interactions between pygmy blue whales or humpback whales with vessels typically result in avoidance behaviour, with whales generally moving away from vessels (Bauer 1986, Stamation 2009).

IMMR Activities

Zykov (2013) conducted acoustic modelling for five low energy survey instruments off the coast of California, including MBES, SSS and sub-bottom profiler. All equipment types were modelled in the sandy bottom environment, similar to that of the Operational Area. Although the bathymetry, salinity, water temperature and sub-seafloor sediment type may differ, given the similarities in equipment type and seafloor habitat, the modelling is considered comparable for the nature and scale of the low energy IMMR survey equipment.

The high operating frequencies of MBES and SSS places the majority of sound frequencies above the auditory range of LF cetaceans. Dolphins and other HF cetaceans, which have peak hearing sensitivity up to 110 kHz, with potential for some limited hearing ability up to approximately 160 kHz (National Marine Fisheries Service (US) 2018, Southall 2019), may be able to detect a small amount of the sound energy from some instruments in the lower operating frequency ranges available for MBES and SSS (MacGillivray 2014, R. McCauley 2002, Zykov 2013).

The modelling by Zykov (2013) indicates that the sound emissions from MBES and SSS do not exceed PTS and TTS accumulated sound exposure criteria for LF cetaceans at any distance, and do not exceed criteria for HF cetaceans beyond 2 to 3 m horizontal distance from the source, which is not considered to be a credible exposure scenario for mobile marine fauna. Zykov (2013) also estimated the maximum distance at which the unweighted 160 dB re 1 μ Pa (SPL) behavioural disturbance threshold for impulsive sound was reached was 290 m for MBES and 690 m for SSS. Again, it is emphasised that many MBES and SSS instruments may operate at frequencies outside of the hearing range of cetaceans and so these would not be audible or result in behavioural disturbance. For instruments with frequencies that overlap with the hearing ranges of cetaceans, a significant proportion of the sound energy may still be outside of their hearing ranges; therefore, the perceived sound levels are reduced and the horizontal distances at which behavioural disturbances may occur are less than those inferred by the unweighted 160 dB re 1 μ Pa (SPL) behavioural disturbance threshold. For example, modelling of weighted SPLs by Zykov (2013) for MBES indicated that the 160 dB re 1 μ Pa (SPL) behavioural threshold was not exceeded for LF cetaceans at any distance and was limited to approximately 205 m horizontal distance for HF cetaceans. For SSS, the modelling of weighted SPLs indicated that the 160 dB re 1 μ Pa (SPL) behavioural threshold was exceeded at horizontal distances of 110 m for LF cetaceans and 611 m for HF cetaceans.

Acoustic modelling of sub-bottom profilers by Zykov (2013) and McPherson and Wood (2017), indicates limited horizontal sound propagation outside of the main directional field of sound. The modelling studies also indicate that PK and SEL_{24h} thresholds for PTS are not exceeded. The potential for TTS resulting from SEL_{24h} is limited to within a few metres from the moving sound source (Wood 2017, Zykov 2013) which is not considered to be a credible exposure for mobile marine fauna. Exceedance of the 160 dB re 1 μ Pa SPL behavioural response threshold for impulsive sound is limited to within a few metres in most instances, or up to a maximum of 50 m depending upon which SBP instrument is used, water depth and the seabed sediment characteristics (Zykov, 2013; McPherson and Wood, 2017).

Potential impacts to cetaceans from MBES, SSS and sub-bottom profiler may, therefore, include behavioural disturbance if in close proximity to the survey instruments, but ranges to disturbance are less than or equivalent to disturbance ranges for the IMMR vessel itself. PTS or TTS are not considered credible, given individuals would need to be directly next to the noise sources for prolonged duration.

Transponders used for positioning during IMMR activities have the potential to cause some temporary behavioural disturbance to cetaceans. The typical frequencies of 21 to 31 kHz produced by the transponders are most audible to HF cetaceans such as toothed whales and dolphins rather than LF cetaceans, and the source levels (180 to 202 dB re 1 μ Pa at 1 m SPL) rapidly attenuate within a very short distance from the source, such that PTS or TTS are not considered credible. Based on empirical spreading loss estimates measured by Warner and McCrodan (2011),

received levels from USBL transponders are expected to exceed the cetacean behavioural response threshold for impulsive sources out to about 42 m.

Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders do not emit sound when on standby. When required for general positioning, they emit one chirp every five seconds (estimated to be required for 4 hrs at a time). When required for precise positioning, they emit one chirp every second (estimated to be required for 2 hrs at a time). Due to the short duration chirps, the temporary and intermittent use and the mid frequencies used by positioning equipment, the acoustic noise from the transponders is unlikely to have a substantive effect on the behavioural patterns of cetaceans.

In summary, potential impacts to blue whales, humpback whales and other cetaceans from predicted noise levels are expected to be limited to behavioural impacts within a localised area around vessels with no lasting effect.

Marine Turtles

Species Sensitivity and Exposure Thresholds

Noise interference is identified as a key threat to threatened marine turtles (Commonwealth of Australia 2017a). While marine turtles may occur in the Operational Area (Table 4-7), there are no known significant foraging habitat (i.e. no emergent islands, reef habitat or shallow shoals/banks). The Operational Area only overlaps with the internesting buffer BIA and habitat critical for the Flatback Turtle.

As identified in Section 4.6.2.1 Whittock, Pendoley and Hamann (2016) conducted a study to identify areas of suitable Flatback turtle internesting habitat. The habitat suitability modelling defined suitable Flatback turtle internesting habitat as water depths of 0–16 m within 5–10 km of the coast. The Operational Area is classified as unsuitable for internesting Flatback turtles based on these criteria. Furthermore, other studies (Dobbs 2007, Guinea, Sperling and Whiting 2006, Pendoley Environmental 2010, Thums, Waayers and Pattiaratchi 2017) have found that Flatback turtles remain in shallow water. Given that the Operational Area has water depths ranging from ~71 m to ~244 m, it is unlikely to support Flatback Turtles. However, transient turtles may occasionally occur in the Operational Area.

There is a paucity of data regarding responses of marine turtles to underwater noise. *The Recovery Plan for Marine Turtles* (Commonwealth of Australia 2017a) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). However, turtles have been shown to respond to low frequency sound, with indications that they have the highest hearing sensitivity in the frequency range 100 to 700 Hz (Bartol 2003).

McCauley et al. (2000) observed the behavioural response of caged green and loggerhead turtles to impulsive sound (an approaching seismic airgun). For received levels above 166 dB re 1 μ Pa SPL, the turtles increased their swimming activity and above 175 dB re 1 μ Pa they began to behave erratically, which was interpreted as an agitated state. The 166 dB re 1 μ Pa SPL has been used as the threshold level for a behavioural disturbance response by the US NMFS (National Science Foundation 2011) and is applied to this impact assessment. No quantitative (numerical) thresholds have been developed for behavioural effects from continuous sources (e.g., vessel noise) on marine turtles. However, Popper et al. (2014) propose qualitative impact criteria for near-field, intermediate and far-field exposures (A. H. Popper 2014). Finneran et al. (2017) presents thresholds for turtle PTS and TTS for both impulsive and continuous sound exposures.

The thresholds listed in **Table 6-5** are considered appropriate for the assessment of effects from impulsive and continuous sound sources during the Petroleum Activities Program.

Table 6-5: Thresholds for permanent threshold shift, temporary threshold shift and behavioural response onset in marine turtles for continuous and impulsive noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	Behavioural response (dB re 1 μ Pa)	PTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	Behavioural response (dB re 1 μ Pa)
Marine turtles	204	189	166* 175+	220	200	(N) High (I) Moderate (F) Low [#]

Source: PTS and TTS thresholds (Finneran 2017), * behavioural response threshold (impulsive) (NSF 2011), + behavioural disturbance threshold (impulsive) (McCauley, R. 2000), # behavioural response threshold (continuous) (A. H. Popper 2014).

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after (A. H. Popper 2014)).

Predicted Underwater Noise Impacts to Turtles

Support Vessel Noise Impacts

As noted above, vessels holding station are considered to be the predominant noise source related to the Operational Area, with source levels of approximately 182 dB re 1 μ Pa SPL at 1 m from a support vessel holding station considered to be representative of noise levels generated by vessels used for the Operational Area.

Although there are no quantitative sound exposure thresholds for impacts on marine turtles resulting from continuous noise sources, the relative risk for behavioural response is expected to be high within tens of metres of the source, medium within hundreds of metres and low within kilometres from the source (Table 6-5). PTS and TTS thresholds for turtles are 220 dB re 1 μ Pa² s (SEL weighted) and 200 dB re 1 μ Pa² s (SEL weighted), respectively (Table 6-5). Typical noise levels generated by a support vessel using DP would not exceed these levels (except at extremely close ranges to the source), while a behavioural response may be expected at extremely close ranges (within tens of metres) from the source and as such, prolonged exposure of transient marine turtles at close range is not considered a credible scenario.

As outlined above, marine turtles are not expected to be in the area. Marine turtles are also capable of moving away from potential noise sources, and there are no constraints to their movement within the Operational Area. Therefore, impacts to marine turtles from support vessels are expected to be of no lasting effect.

IMMR Activities

As outlined above for cetaceans, Zykov (2013) conducted noise modelling for low energy survey instruments, with the modelling for MBES, SSS and sub-bottom profiler considered comparable for the nature and scale of the low energy IMMR survey equipment. The operating frequencies of MBES (12 to 700 kHz) and SSS (75 to 900 kHz) are well above the hearing range of turtles (0.1 to 2 kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2 to 30 kHz) may be audible to turtles, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Modelling of impulsive sub-bottom profiler sound emissions by Zykov (2013) and McPherson and Wood (2017) indicates that the 166 dB re 1 μ Pa (SPL) behavioural disturbance threshold for turtles may only be exceeded within metres or tens of metres of the survey instruments. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound energy is produced at frequencies outside the peak hearing frequency range of turtles.

Transponders used for positioning during IMMR activities typical operate at frequencies of 21 to 31 kHz which is well outside the peak hearing frequency range of turtles (0.1 to 2 kHz). Therefore, no impacts are considered credible.

In summary, potential impacts to turtles from predicted noise levels are expected to be limited to behavioural impacts within a localised area around vessels with no lasting effect.

Fish, Sharks and Rays

Species Sensitivity and Exposure Thresholds

Fishes are primarily sensitive to the particle motion component of sound at close range to a sound source, while the presence of the swim bladder results in a varying degree of sensitivity of some fishes to sound pressure (Popper AN 2019). Consequently, fishes are broadly categorised into three groups with respect to their hearing capabilities that are relevant to the types of fishes and sharks that may be present in the Operational Area (A. H. Popper 2014).

- Fishes with no swim bladder or other gas chamber (e.g., sharks, mackerels) – Sensitive only to particle motion, not sound pressure changes.
- Fishes with swim bladders, but without a direct connection between the swim bladder and the inner ear (e.g., demersal snappers and emperors) – Hearing primarily involves particle motion with some limited ability to indirectly detect changes in sound pressure.
- Fishes with a swim bladder or other gas volume connected directly to the inner ear (e.g., herrings, sardines, pilchards, shads) – These fishes are able to detect both sound pressure as well as particle motion.

Note: The sound units provided in the table above include relative risk (high, medium and low) is given for fish (all types) at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after (A. H. Popper 2014)).

Predicted Underwater Noise Impacts to Fish

Support Vessel Noise Impacts

Vessels holding station using DP are expected to produce sound equivalent to about 182 dB re 1 μ Pa SPL at 1 m. Modelling undertaken by McPherson et al. (2019) of sound produced by facility and vessel operations found that recoverable injury to some types of fish would only be possible if they remained within a distance of less than 10 m for 48 hours, and TTS if fishes remained within 10 m for at least 12 hours. Pelagic fish are highly mobile and the types of demersal fishes known to occur in the vicinity of the Julimar Development (e.g., snappers, emperors, cods and groupers) will exhibit some fidelity to the area but are still relatively free-swimming and are not constrained to such close ranges (i.e., 10 m). Therefore, free-swimming fish remaining in close range to sound sources for periods that subject themselves to TTS and injury is not considered to be a credible scenario.

There are no quantitative sound exposure thresholds for impacts on fish, sharks and rays resulting from continuous noise sources. The relative risk for behavioural response is expected to be high within tens of metres of the source, medium within hundreds of metres and low within kilometres from the source (Table 6-6). While some localised behavioural avoidance and masking in the vicinity of the loudest sound sources from the support vessels may occur in some fishes, no lasting effect is anticipated. Fish are also known to habituate to continuous noise sources, which is consistent with fish congregating around operating offshore oil and gas structures.

Considering the overlap of the whale shark foraging BIA with the Operational Area, it is likely there may be increased numbers of individuals during migratory periods. Currently, there are no quantitative sound exposure thresholds specific to whale sharks. It is expected that the potential effects of noise on whale sharks are the same as for other fish species, resulting in minor, localised and temporary behavioural change such as avoidance. Therefore, impacts to whale sharks from support vessels are expected to have no lasting effect. Other fauna associated with the Operational Area includes predominantly pelagic species of fish, with migratory species such as rays transiting through the Operational Area; these species may be similarly affected by noise from support vessels.

IMMR Activities

As outlined above, Zykov (2013) conducted noise modelling for low energy survey instruments, with the modelling for MBES, SSS and sub-bottom profiler considered comparable for the nature and scale of the low energy IMMR survey equipment. The operating frequencies of MBES (12 to 700 kHz) and SSS (75 to 900 kHz) are well above the peak hearing ranges of fish (100 Hz to several kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2 to 30 kHz) will be audible to fish, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound energy is produced at frequencies outside the peak hearing frequency range of fish.

Transponders used for positioning during IMMR activities typical operate at frequencies of 21 to 31 kHz which is well outside the hearing frequency range of fish. Therefore, no impacts are considered credible.

In summary, potential impacts to fish, sharks and rays from predicted noise levels are expected to be limited to behavioural impacts within a localised area around vessels with no lasting effect.

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by noise emissions, such as marine mammals and turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle . 2018). Whale species are subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to ecologically significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

ALARP Statement: On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the potential impacts from routine acoustic emissions from vessels, helicopters and subsea infrastructure. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability
Acceptability Statement: The impact assessment has determined that, given the adopted controls, impacts from routine acoustic emissions from support vessels and subsea infrastructure represent a negligible impact /disturbance to marine fauna within the Operational Area. Further opportunities to reduce the impacts and risks have been investigated above. The impacts are consistent with good oil-field practice/industry best practice and are not inconsistent with management plans for key EPBC listed species (e.g. <i>The Conservation Management Plan for the Blue Whale</i>). The potential impacts and risks are considered broadly acceptable, if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of acoustic emissions to a level that is broadly acceptable.

Description of Source of Impact													
Hydrocarbons and chemicals may be discharged as a result of planned routine and non-routine operations and activities as described below. Operations and JDP3 start-up Operational discharges including: <ul style="list-style-type: none">discharge of subsea control fluids – Castrol Transaqua HT2 subsea control fluid is used to control valves remotely from the Wheatstone Platform. It is an open-loop system, designed to release control fluid from the control system during valve operations (e.g., up to about 6 L per valve actuation).non-routine subsea fluid discharges associated with subsea equipment as a result of subsea IMMR activities. IMMR activities, with nominal discharges, including hydrocarbon losses are described in Table 3-9, the largest being 400L release of acid associated with SCM change out.													
Impact Assessment													
Environmental Value(s) Potentially Impacted

Water Quality

Subsea control fluids are discharged in relatively small volumes (up to about 6 L per valve actuation) during valve operations at or near the seabed. Once released into a low-sensitivity receiving environment, subsea control fluids are expected to mix rapidly and dilute in the water column.

Hydrocarbon may be released during operation and IMMR activities that break containment of isolated subsea infrastructure. Hydrocarbons will become dispersed as bubbles in the water column, which will rise to the surface. The concentration of gas will not be sufficient to form an explosive atmosphere or result in asphyxiation. Water-soluble components of the gas, such as carbon dioxide and sulphur dioxide will dissolve in the seawater as the gas bubbles rise in the water column. These soluble gasses occur naturally and are present in relatively low amounts. No measurable impacts to water quality are expected to occur as a result of the gas release.

The condensate will be released with gas which will act to disperse the condensate within the water column as it rises to the sea surface. The resulting condensate droplets will rise slowly in the water column and may be transported away from the release location by currents. Upon reaching the sea surface, the condensate will almost entirely evaporate, with a relatively small portion remaining entrained in the water column. Condensate droplets are not expected to reach the surface in sufficient quantities to result in surface slicks above thicknesses that result in biological impacts, although a sheen may be visible. Any condensate reaching the surface will spread and weather rapidly, as described in Section 6.8.3. Soluble hydrocarbons will be distributed in the water column through natural water movement and the buoyancy of the condensate droplets and are expected to drop below concentrations recognised as causing biological impacts within tens to hundreds of metres of the release location.

Other chemicals, such as the dye used for non-routine leak detection, is non-toxic, and given the small volumes (< 10L) will rapidly disperse within the water column.

Sediment Quality

Accumulation of contaminants in sediments depends primarily on the volume/concentration of particulates in discharges or constituents that adsorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths), and the resuspension, bioturbation and microbial decay of those particulates in the water column and on the seabed. Valve actuation discharges are frequent but low in volume (typically <6 L). Given the frequency and volumes of hydrocarbon releases, accumulation in sediments is not considered likely.

Ecosystem / Habitats

Sediments in the Operational Area are expected to be broadly consistent with those in the NWS Province, with filter feeders such as sponges, ascidians, soft corals and gorgonians associated with areas of hard substrate. The only areas of hard substrate expected in the vicinity are artificial habitat associated with subsea infrastructure and the consolidated sediment and limestone ridge in proximity to the Wheatstone Platform which are not in the vicinity of any valves (Figure 4-3).

Subsea control fluids and other chemicals that may be discharged (e.g. dye for leak testing) are non-toxic and do not have the potential to bioaccumulate. Impacts to ecosystems are not expected due to the localised nature of discharges and lack of potential for sediment quality impacts.

Receptors that may be impacted by a condensate release during IMMR activities are in-water receptors within the vicinity of the release location.

Only a very small portion of the planktonic community at a bioregional scale would credibly be impacted. Planktonic communities have high turnover rates, and recovery from any impacts would occur rapidly. Given the small volume of soluble hydrocarbons, the planktonic community in the upper part of the water column will not be impacted.

Large-scale oil spills in open water typically do not result in fish kills, and it is assumed that fishes in open water will actively avoid harmful concentrations of hydrocarbons. Given the relatively small volume of hydrocarbons released and the resulting localised impact, it is unlikely that displacement of pelagic fishes will occur.

Given the nature and scale of planned discharges, potential impacts are considered to be slight and short term (expected to recover once routine discharges cease).

Values and Sensitivities

KEFs

The Operational Area overlaps about 0.2% (or 28 km²) of the 16,190 km² Ancient Coastline KEF at 125 m Depth Contour. No significant escarpments, species of conservation significance, emergent features or areas of high biological productivity characteristically associated with the Ancient Coastline KEF have been observed in the small portion of overlap with the Operational Area. Therefore, potential impacts to this regional-scale KEF are expected to be negligible.

AMPs

A small proportion (0.07% or 2.7 km²) of the Operational Area overlaps the Montebello AMP Multiple Use Zone. No sensitive benthic habitats or invertebrate or vertebrate fauna have been identified within the Operational Area in the small portion which overlaps the AMP during dedicated survey (Advisian, 2019). Therefore, no impacts to the marine park sensitivities are anticipated as a result of these localised discharges.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS) ³⁶	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	CS: Significant. The design, procurement and retrofitting of a closed-loop system would result in considerable offshore logistics, exposure to safety hazards during installation, and significant financial burden through direct costs and lost production.	open-ocean environment, and avoiding the discharges would provide little or no environmental benefit.	considered to be grossly disproportionate to the environmental benefit.	
Professional Judgement – Engineered Solution				
Routing hydrocarbons to vessel during disconnection of subsea infrastructure.	F: Yes. However, to do so would introduce significant safety risks to the vessel crew (fire, explosion, asphyxiation). CS: Significant. Equipping and training crew on-board subsea support vessels to safely route hydrocarbons to the vessel would result in significant additional costs (in addition to the increased safety risk identified above).	Small environmental benefit from preventing low concentration hydrocarbon discharge.	Given the increased safety risk and the very low environmental impact from hydrocarbon releases during subsea IMMR activities, the cost of routing hydrocarbons to the vessel is grossly disproportionate to the environmental benefit.	No
Decreasing the frequency of valve actuation.	F: Yes. However, decreasing the frequency of valve actuation may adversely impact the safe functionality and reliability of valves. Reducing the performance of subsea valves may introduce operability impacts, and increased safety and environmental risk associated with loss of containment events. CS: Minimal cost.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location and types of fluid discharged in an open ocean environment, and reducing the number of discharges would provide little or no environmental benefit.	Decreasing the frequency of valve actuations would lead to a potential decrease in safe functionality and reliability of valves. When considering the potential safety and environmental risks from such a performance degradation, along with the minor impact from the release of control fluids, the cost of decreasing the frequency of valve actuations is considered to be grossly disproportionate to the environmental benefit.	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS) ³⁶	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
<p>ALARP Statement:</p> <p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine hydrocarbon and chemical discharges. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>The impact assessment has determined that, given the adopted controls, planned routine and non-routine hydrocarbon and chemical discharge represents a localised short-term impact that is unlikely to result in a potential impact greater than slight short-term effects on water quality, marine sediment or ecosystem habitat. Further opportunities to reduce the impacts have been investigated above. Fluid discharges from the subsea system during operations, IMMR, are routine in the oil and gas industry. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine hydrocarbon and chemical discharges to a level that is broadly acceptable.</p>

6.7.5 Routine and Non-Routine Discharges: Support Vessel Operations

Context													
Support Vessels – Section 3.6			Physical Environment – Section 4.3				Consultation – Section 5						
Impact Evaluation Summary													
Source of Impact	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Routine and non-routine discharge of deck and bilge water, grey water, sewage and putrescible wastes from the activity vessels to the marine environment		X					A	F	-	-	LCS	Broadly Acceptable	EPO 6
Description of Source of Impact													
<p>Support vessels may discharge sewage, grey water and putrescible wastes. while undertaking activities specified in Sections 3.5, Section 3.6 and Section 3.9: Discharges may include:</p> <ul style="list-style-type: none">• small volumes (up to 7.5 m³ per vessel per day³⁷) of treated sewage and putrescible wastes to the marine environment• routine/periodic discharge of relatively small volumes of bilge water. Bilge tanks receive fluids from many parts of the vessel and can contain water, oil, detergents, solvents, chemicals, particles and other liquids, solids or chemicals (while vessel is moving)• variable water discharge from activity vessel decks directly overboard or via deck drainage systems and may contain small quantities of oil, grease and detergents if present on deck. Water sources could include rainfall events and/or from deck activities such as cleaning/wash-down of equipment/decks• cooling water from machinery engines on the activity vessels and brine water produced during the desalination process of reverse osmosis to produce potable water on board. <p>Environmental risk relating to the disposal/discharges above regulated levels or incorrect disposal/discharge of waste would be unplanned (non-routine/accidental) and are addressed in Section 6.9.4.</p>													
Impact Assessment													
<p>The environmental impact associated with ocean disposal of sewage and other organic wastes (i.e. putrescible waste) is eutrophication. Eutrophication occurs when the addition of nutrients, such as nitrates and phosphates, causes adverse changes to the ecosystem, such as oxygen depletion and phytoplankton blooms. Other contaminants of concern occurring in these discharges may include ammonia, <i>E. coli</i>, faecal coliform, volatile and semi-volatile organic compounds, phenol, hydrogen sulphide, metals, surfactants and phthalates.</p>													

³⁷ Calculated using an average volume of 75 L/person/day and a maximum of 100 persons on board (POB) which is typical for type of vessels that will be used for the Petroleum Activity (see Section 3.6)

Woodside monitored sewage discharges at its Torosa-4 Appraisal Drilling campaign which demonstrated that a 10 m³ sewage discharge reduced to about 1% of its original concentration within 50 m of the discharge location. In addition to this, monitoring at distances of 50, 100 and 200 m downstream of the drill rig and at five different water depths confirmed that discharges were rapidly diluted and no elevations in water quality monitoring parameters (e.g. total nitrogen, total phosphorous and selected metals) were recorded above background levels at any station (Woodside Energy Limited 2011). This assessment is considered to be conservative as the monitoring was undertaken for a stationary discharge while discharges of bilge and sewage will only occur while the vessels are moving. Mixing and dispersion would be further facilitated in deep offshore waters, consistent with the location of the Operational Area, through regional wind and large-scale current patterns resulting in the rapid mixing of surface and near-surface waters where sewage discharges may occur.

Furthermore, open marine waters do not typically support areas of increased ecological sensitivity, due to the lack of nutrients in the upper water column and lack of light penetration at depth. Therefore, presence of other receptors such as fish, reptiles, birds and cetaceans in significant numbers, and in close proximity to the Operational Area, is unlikely. Research also suggests that zooplankton composition and distribution are not affected in areas associated with sewage dumping grounds (McIntyre and Johnston, 1975). Plankton communities are expected to rapidly recover from any such short-term, localised impact, as they are known to have naturally high levels of mortality and a rapid replacement rate.

Additional discharges outlined, which may include other non-organic contaminants (e.g. bilge water), rapidly dilute through the same mechanisms as above and are expected to be in very small quantities and concentrations as to not pose any significant risk to any relevant receptors. As such, no significant impacts from the planned (routine and nonroutine) discharges that are listed above are anticipated because of the minor quantities involved, the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area.

Vessel activity for the Petroleum Activities Program is intermittent and when within the Operational Area vessels are generally not in a single location for an extended period, and only discharge while moving. As a result, these routine and non-routine discharges are expected to be intermittent in nature for the duration of the Petroleum Activities Program. It is possible that protected marine fauna transiting the localised area may come into contact with these discharges (e.g. EIO pygmy blue whales, whale sharks and marine turtles) as they traverse the Operational Area during their seasonal migrations (Section 4.6). However, given the localised extent of impacts and rapid dilution from significant impacts to marine fauna are not expected.

Cumulative Impacts

Given the activities that may be conducted during the Petroleum Activities Program, there is the potential for cumulative impacts from discharges of sewage, putrescible waste, grey water, bilge water or drain water and other marine discharges including PW, due to: cumulative discharges from differing point sources (Wheatstone Platform and support vessels). Vessel activities for the Petroleum Activities Program are intermittent (see Section 3.5, Section 3.6 and Section 3.9) and when within the Operational Area, vessels are generally not in a single location for an extended period, and only discharge while moving. As a result, these routine and non-routine discharges are expected to be intermittent in nature for the duration of the Petroleum Activities Program. Therefore, cumulative impacts to water quality within the Operational Area are expected to be localised and short-term with no lasting effect.

ALARP Statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage potential impacts associated with routine and non-routine discharges from activity vessels. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of Acceptability
Acceptability Statement: The impact assessment has determined that, given the adopted controls, planned discharges (routine and non-routine) may result in result in a potential impact greater than localised impacts not significant to environmental receptors, and no lasting effect. BIAs within the Operational Area include the pygmy blue whale migration, flatback turtle internesting buffer, whale shark foraging, and wedge-tailed shearwater breeding BIA. However, these species are not expected to be impacted. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered standard industry practice and meet legislative requirements under Marine Orders 91, 95 and 96. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of these discharges to a level that is broadly acceptable.

6.7.6 Routine Atmospheric and Greenhouse Gas Emissions: Fuel Combustion

Context													
Support Vessels – Section 3.6	Physical Environment – Section 4.3						Consultation – Section 5						
Impact Evaluation Summary													
Source of Impact	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour) and global atmospheric GHG concentration	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Helicopter and Vessel emissions (including incinerators)			X				A	F	-	-	LCS GP PJ	Broadly Acceptable	EPO 7
GHG emissions associated with third party transportation, regassification and combustion by end users.			X				See Section 6.3.2.1						
Description of Source of Impact													
<p>Atmospheric emissions associated with the Petroleum Activities Program can be classified into two categories:</p> <ul style="list-style-type: none">Atmospheric emissions (non-greenhouse gas emissions) are gases and particulates from an activity, or piece of machinery, which have a recognised adverse effect on human health and/or flora and fauna. The main emissions responsible for these effects include carbon monoxide (CO), oxides of nitrogen (NOx), sulphur dioxide (SO2), particulate matter less than 10 microns (PM10), non-methane volatile organic compounds (VOCs), BTEX (benzene, toluene, ethylbenzene and xylenes), which are specific VOCs of interest.Greenhouse gas (GHG) emissions refer to gases that trap heat within the atmosphere through the absorption of longwave radiation reflected from the earth's surface. The main gases associated with this effect include carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O). <p>Other greenhouse gases include perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF6). There are considered to be both direct and indirect GHG emissions.</p> <p>The GHG Protocol 2015 defines indirect GHG emissions as emissions that are a consequence of the activities of the reporting entity but occur at sources owned or controlled by another entity. For the purposes of this EP the “reporting entity” is the Wheatstone Platform and therefore, onshore processing and support vessel/helicopter operations are considered indirect emissions sources (as noted in SI Report, references 27.3 – 27.6 and summarised in Appendix F, reference 4.7.3.). As Julimar infrastructure is operated from and processed by the Chevron operated Wheatstone Platform there are no direct emissions (Scope 1 and 2). In the context of this EP, GHG emissions are classified as Indirect Emissions, as shown in Table 6-7. Applying definitions from the GHG Protocol Corporate Accounting and Reporting Standard, GHG emissions associated with the activity are considered indirect because they are not from sources that are owned or controlled by Woodside. Therefore while Woodside has influence over GHG emissions</p>

from the vessels via contractual arrangements and scope definition, Woodside does not have the authority to implement operational policies.

Greenhouse Gas and Atmospheric Emissions associated with Support Vessels and Helicopters

GHG and atmospheric emissions are generated by vessels and helicopters supporting Julimar. Vessel emissions include those from internal combustion engines and fugitives. Atmospheric and GHG emissions associated with support vessels vary depending on the nature of activities being undertaken; for example, travelling or “steaming” to a destination at low speed uses less fuel and generates lower atmospheric and GHG emissions than high speed steaming. Emissions generated during holding station using DP whilst undertaking subsea IMMR work also vary. Vessel Masters control day to day operations that determine support vessel emissions. Woodside has the potential to influence fleet level approach to support vessel emissions through contracting activities. Refrigerant gases are used onboard supply vessels in small quantities.

Expected GHG emissions for vessel and helicopter activities have been estimated to be:

- 2,448 tCO₂-e for JDP3 commissioning, based on diesel consumption of 900 m³ (5 wells at 20 days per well at 9m³ per day; once off).
- 342.7 tCO₂-e for IMMR vessels, based on diesel consumption of 126 m³ (average longest campaign of 14 days at 9m³ per day; annual).
- 685.4 tCO₂-e for IMMR vessels for a once-in-field-life repair contingency taking 4 weeks, based on diesel consumption of 252 m³ (average longest campaign of 28 days at 9m³ per day; once off).
- 200 tCO₂-e for helicopters, based on Jet A1 fuel consumption in 2023 (annual).

Indirect emissions relating to these sources are expected to be relatively constant throughout the EP period and until EOFL.

GHG Emissions associated with Product End-use

Indirect emissions associated with Julimar result from third party transport of products, regassification, distribution and combustion by end users. Indirect GHG emissions associated with Julimar operations were estimated using historical emissions intensity methods. Key influences impacting indirect GHG associated with Julimar include:

- Total production – indirect emissions are proportional to total production, which varies with shutdown activity, or gradual reservoir decline.
- Composition of produced gas – onshore emissions are proportional to reservoir CO₂.
- Split of saleable products– the proportion of hydrocarbons from Julimar sold as LNG, condensate, domestic gas and LPG varies. Each product requires differing amounts of energy to process to the point of sale and varies based on reservoir composition, field contribution and commercial reasons.

Indirect emissions associated with annual production of Julimar, and from transport and customer combustion, are estimated to be approximately 0.55 MtCO₂-e per annum, totalling up to 4.35 MtCO₂-e at expected EOFL. This is based on operational data for production from Julimar.

End of field life (EOFL) is predicted to be 2035, subject to reservoir performance and life extension studies. As per Section 6.3.2.1 emissions from third party transport of products, regassification, distribution and end use are covered by Chevron, and managed in accordance with the Wheatstone Project - Start-Up and Operations (as noted in SI Report, references 27.3 – 27.6 and summarised in Appendix F, reference 4.7.3.).

Table 6-7: Indirect GHG emissions associated with Julimar offshore production

Source of Impact	Annual maximum estimated emissions (MtCO ₂ -e)	Total possible maximum emissions until EOFL ¹ (2024-2035) (MtCO ₂ -e)
Offshore Wheatstone Platform annual direct GHG emissions ²	0.088	0.97
Vessels and helicopters ³	0.00368	0.0091
Onshore hydrocarbon processing ¹	1.06	7.49
Third-party transport of products, regassification, distribution and end use ⁴	7.54	82.99

¹ End of field life (EOFL) is predicted to be 2035 subject to reservoir performance and life extension studies.

2 Source: EcolInvent 3.5 database and National Greenhouse and Energy Reporting (Measurement) Determination 2008. EcolInvent v3.5 represents a large collection of inventory data. It has been recognised as emission factor source for the European Union Renewable Energy Directive greenhouse gas methodology and is aligned to the principles of the NGERs methodology. Transport and refining based on Oil-Climate Index factors for Australia Cossack. Combustion factors aligned with UN's 2006 IPCC Guidelines for National Greenhouse Gas Inventories. Emissions factors used are the default values as product customer's destination and use of the products are unknown.

2 The emissions forecast from the offshore Platform and onshore hydrocarbon processing plant, are calculated using Woodside gas intensity estimation factors. They are informed by the inputs provided by the UPGs including Julimar Brunello and Wheatstone Iago. Therefore, the emissions are directly related to the quantity of feed gas provided by each of the UPGs to the facility. Production may vary depending on reservoir performance, and is subject to operation of the Wheatstone platform by Chevron. Estimates include commissioning and start-up activities of the JDP3 wells.

3 JDP3 commissioning and a contingency repair scope are once-off activities. Only annual IMMR and helicopter emissions have been calculated on an ongoing annual basis until EOFL.

4 Source: Estimated using EcolInvent 3.5 database and National Greenhouse and Energy Reporting (Measurement) Determination 2008. EcolInvent v3.5 represents a large collection of inventory data. It has been recognised as emission factor source for the European Union Renewable Energy Directive greenhouse gas methodology and is aligned to the principles of the NGERs methodology. Transport and refining based on Oil-Climate Index factors for Australia Cossack. Combustion factors aligned with UN's 2006 IPCC Guidelines for National Greenhouse Gas Inventories. Emissions factors used are the default values as product customer's destination and use of the products are unknown.

Plateau production from the Julimar Brunello fields is maintained by the JDP3 wells, and the annual estimated maximum emissions forecast remains steady. JDP3 wells increase the period of time plateau production is maintained and extends EOFL. Annual estimates of the offshore Wheatstone platform direct GHG emissions for 2025 onwards is described in Section 6.2.3.2 of the Wheatstone Project Start-up and Operations EP (~0.40 Mtpa CO₂-e). Annual estimates of the onshore hydrocarbon processing of gas is described in Section 6.2.3.3 of the Wheatstone Project Start-up and Operations EP as 4.2 Mtpa CO₂-e. Annual transport, regasification and third-party end use of products is estimated 36.8 MtpaCO₂-e. As noted in Consultation (SI Report, reference 27.3 – 27.6 and summarised in Appendix F Section 4.7) an MOC has been conducted that describes, risk assesses, manages to ALARP and demonstrates these emissions are of an acceptable level within the Start-Up and Operations Environment Plan: Wheatstone Project. In accordance with Regulation 56(1) of the Environment Regulations, Woodside refers NOPSEMA to the information previously given to NOPSEMA in the accepted Wheatstone Start-Up and Operations EP which is available on the NOPSEMA website using the following link: <https://docs.nopsema.gov.au/A853704>. Production may vary and is subject to reservoir performance.

All estimates are sensitive to production rate, which is subject to uncertainty associated with reservoir and process performance and will change over the life of the field. The precise shape and pace of the energy transition is uncertain. It is expected to vary across countries because they have different starting points, development requirements, resources and capabilities. However, the scale of the transition is clearer, as it will take many trillions of dollars, invested over decades. Today, Woodside has a portfolio of oil and gas assets. We are also diversifying our portfolio by investing in new energy products and lower carbon services that can avoid or reduce customer emissions. We see an ongoing role for gas from the Julimar development to support our customers' plans to secure their energy needs while they reduce their emissions.

Impact Assessment

Fuel combustion has the potential to result in localised, temporary reduction in air quality, generation of smoke and contribution to greenhouse gas emissions. Given the short duration and open ocean location of the activity vessels during the Petroleum Activities Program (which leads to the rapid dispersion of air pollutants), the potential impacts are expected to have no lasting effect, with no cumulative impacts when considered in the context of existing oil and gas operations in the region.

Atmospheric emissions from activity vessels are not expected to contribute in a material way to air quality in the nearest mainland sensitive airshed (town of Dampier about 160 km away), as part of the combined air pollutant emissions from other Petroleum Activities Programs such as Pluto or Wheatstone and other marine users (commercial vessels).

Greenhouse Gas Emissions – Habitat and Biological Communities, Protected Species, Key Ecological Features, Protected Places, Socioeconomic and Cultural Environment

This impact assessment considers the potential impacts of climate change on sensitive receptors, including MNES within Australian jurisdictions. Climate change impacts cannot be attributed to any one activity or one project, including the Julimar project, as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution started. They do not take into account the net impact of each project or activity. There is no direct link between greenhouse gas emissions from the Julimar Development project and climate change impacts.

Uncontrolled when printed. Refer to electronic version for most up to date information.

Climate change impacts upon Australian receptors cannot be linked to the Julimar development but are instead the result of the accumulation of net greenhouse gas emissions in the atmosphere. The accumulation of net greenhouse gas emissions in the atmosphere is, in turn, influenced by global energy demand and the composition of the global energy mix. Although the Julimar development cannot be linked to climate change impacts; the following contextual evaluation is provided.

GHG Emissions – Global and Australian Context

Climate science is a rapidly evolving field in which new observations continue to deepen understanding of the current and potential impacts of global warming, and the possible pathways for mitigation and adaptation (Woodside, 2023a).

The IPCC is the United Nations body for assessing the science related to climate change and finalised the Sixth Assessment Report (AR6) in 2023. This consists of three Working Group contributions and a Synthesis Report. A summary of outcomes of the working group's contributions comprises a range of matters, which amongst others include:

- The AR6 Working Group I (AR6-WG1) report stated that it is unequivocal that there is human-induced warming. It also stated that increased atmospheric carbon dioxide (CO₂) levels, generated by human activity, are the largest driver of warming over the longer term, and that there are a range of factors, including emissions of methane, which increase warming in the short-term.
- The AR6-WG2 report stated that human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability. It stated that global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans. The report noted that societal choices and actions implemented in the next decade will determine the extent to which medium- and long-term pathways will deliver climate resilient development.
- The AR6 Working Group III (AR6-WG3) report provided an updated global assessment of climate change mitigation progress and pledges and examined the sources of global emissions. It explained developments in emissions reduction and mitigation efforts and assessed the impact of national climate pledges in relation to long-term emissions goals. More than 2000 quantitative emissions pathways were submitted to the IPCC, of which 1202 scenarios included sufficient information for assessing the associated warming. The report found that there are many pathways in the literature that likely limit global warming to 2°C with no overshoot, or to 1.5°C with limited overshoot. These variations occur because, while climate science is able to calculate a 'carbon budget' of net emissions before any particular temperature outcome is reached, the allocation of this budget between different human activities requires additional judgements about for example technology, economics, consumer preferences and policy choices.

For further information related to Woodside's approach to climate change, please see Section 5.3 'Managing Physical Risk' and 6.3 'A Just Transition' of Woodside's Climate Transition Action Plan and 2023 Progress Report.

Additionally, an update on 2024 progress can be seen in Woodside's 2024 Climate Update and on our website.

The AR6 Working Group I (AR6-WGI) report states "climate change is a global phenomenon, but manifests differently in different regions" (IPCC 2021b). IPCC projections for climate change in Australia from the AR6 Working Group II (AR6-WGII) report include:

- further climate change is inevitable, with the rate and magnitude largely dependent on the emission pathway (very high confidence)
- ongoing warming is projected, with more hot days and fewer cold days (very high confidence)
- further sea level rise, ocean warming, and ocean acidification are projected (very high confidence)
- less winter and spring rainfall is projected in southern Australia, with more winter rainfall in Tasmania, less autumn rainfall in southwestern Victoria and less summer rainfall in western Tasmania (medium confidence), with uncertain rainfall changes in northern Australia
- more extreme fire weather is projected in southern and eastern Australia (high confidence)
- increased drought frequency is projected for southern and eastern Australia (medium confidence)
- increased heavy rainfall intensity is projected, with fewer tropical cyclones and a greater proportion of severe cyclones (medium confidence) (Lawrence et al., 2022).

The AR6-WGII also contains information about projected impacts to health and well-being for the Australasian region including, amongst others:

- detrimental effects on human health due to heat stress, changing rainfall patterns including floods and drought climate-sensitive air pollution (including that caused by wildfires) (high confidence) and vector-borne diseases (medium confidence)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- vulnerability to detrimental effects of climate change will vary with socioeconomic conditions (high confidence) (Lawrence et al. 2022).

The AR6-WGII report identified nine key climate risks for the Australasian region:

- loss and degradation of coral reefs and associated biodiversity and ecosystem service values in Australia due to ocean warming and marine heatwaves (very high confidence)
- loss of alpine biodiversity in Australia due to less snow (high confidence)
- transition or collapse of alpine ash, snowgum woodland, pencil pine and northern jarrah forests in southern Australia due to hotter and drier conditions with more fires (high confidence)
- loss of kelp forests in southern Australia due to ocean warming, marine heatwaves, and overgrazing by climate-driven range extensions of herbivore fish and urchins (high confidence)
- loss of natural and human systems in low-lying coastal areas due to sea level rise (high confidence)
- disruption and decline in agricultural production and increased stress in rural communities in south-western, southern and eastern mainland Australia due to hotter and drier conditions (high confidence)
- increase in heat-related mortality and morbidity for people and wildlife in Australia due to heatwaves (high confidence)
- cascading, compounding and aggregate impacts on cities, settlements, infrastructure, supply-chains and services due to wildfires, floods, droughts, heatwaves, storms and sea level rise (high confidence)
- inability of institutions and governance systems to manage climate risks (high confidence) (Lawrence et al., 2022).

An earlier report by Australia's Biodiversity and Climate Change Advisory Group summarised the potential impacts of climate change to marine and terrestrial species, habitats and ecosystems across Australia (Steffen et al., 2009). The 2009 report identified examples of observed changes in Australia's biota that were considered consistent with the emerging climate change 'signal', as genetic constitution, geographic ranges, lifecycles, populations, ecotonal boundaries, ecosystems, and disturbance regimes (Steffen et al., 2009). The report also stated:

- "Biodiversity is one of the most vulnerable sectors to climate change".
- "Australia's biodiversity is not distributed evenly over the continent but is clustered in a small number of hotspots with exceptionally rich biodiversity", and that these "include the Great Barrier Reef, south-west Western Australia, the Australian Alps, the Queensland Wet Tropics and the Kakadu wetlands".

Further, it was stated that "many of the most important impacts of climate change on biodiversity will be the indirect ones at the community and ecosystem levels, together with the interactive effects with existing stressors (Steffen et al., 2009). Future climate change (e.g., increased temperature and decreased, but more variable, rainfall) has the potential to have a range of impacts on ecological factors and threaten biodiversity in the Australian Mediterranean ecosystem (CSIRO, 2017).

Extensive modelling and monitoring studies over the last 20 years provide considerable evidence that global climate change is already affecting and will continue to affect species (Hoegh-Guldberg et al., 2018); however, these impacts are likely to be highly species-dependent and spatially variable. The most frequently observed and cited ecological responses to climate change include species distributions shifting towards the poles, upwards in elevation and shifts in phenology (earlier and later autumn life-history events) (M. Dunlop et al., 2012). Climate change may not only change species distribution patterns but also life-history traits such as migration patterns, reproductive seasonality and sex ratios (Steffen et al., 2009).

Impacts of climate change such as altering temperature, rainfall patterns and fire regimes, are likely to lead to changes in vegetation structure across all terrestrial ecosystems within Australia (M. Dunlop et al., 2012; Steffen et al., 2009). Increases in fire regimes will impact Australian ecosystems altering composition structure, habitat heterogeneity and ecosystem processes. Changes in climate variability, as well as averages, could also be important drivers of altered species interactions, both endemic and invasive species (M. Dunlop et al., 2012). Climate change could result in significant ecosystem shifts, as well as alterations to species ranges and abundances within those ecosystems (Hoegh-Guldberg et al., 2018).

The 'loss of climatic habitat caused by anthropogenic emissions of greenhouse gases' has been listed as a key threatening process under the EPBC Act (DCCEEW, 2021). The threatening process consists of reductions in the bioclimatic range within which a given species or ecological community exists due to emissions induced by human activities of greenhouse gases (DCCEEW, 2021). The process is considered to have a continental distribution, including both terrestrial and marine areas. Ecosystems in which the process occurs include: alpine habitats, coral reefs, wetlands and coastal ecosystems, polar communities, tropical forests, temperate forests, and arid and semi-arid environments (DCCEEW, 2021).

Coral reefs were recognised by both IPCC and the Australian Government as being at risk of climate change (Lawrence et al., 2022; DCCEEW, 2021). Protected coral reef areas in Australia include those within World Heritage listed sites, such as Ningaloo Coast, Shark Bay, or the Great Barrier Reef. Climate change has been identified as a threat for each of these World Heritage areas, with potential risks to coral reef as well as other environmental values (such as marine fauna) within these ecosystems (IUCN, 2020b, 2020c, 2020a).

Climate variability and change has been identified as a threat to some EPBC Act protected species, including marine turtles, whales, seabirds and migratory shorebirds:

- The Recovery Plan for Marine Turtles in Australia (CoA 2017) states that “climate change is of particular concern to marine turtles because it is likely to have impacts across their entire range and at all life stages. Climate change is expected to cause changes in dispersal patterns, food webs, species range, primary sex ratios, habitat availability, reproductive success and survivorship”.
- The Conservation Management Plan for the Blue Whale (CoA 2015a) states: climate change is expected to cause changes in migratory timing and destinations, population range, breeding schedule, reproductive success and survival of baleen whales, including blue whale species and subspecies”.
- The Recovery Plan for the Southern Right Whale (DCCEEW, 2024b) states that ‘modelling the links between krill and whale population dynamics with climate change, including changes in ocean temperature, primary productivity, and sea ice, suggests future ocean conditions are likely to have a negative impact on krill populations and in association the baleen whale species that feed on them.’
- The Wildlife Conservation Plan for Seabirds (CoA 2022) states that “consequences to seabirds could include negative impacts from an increase in extreme weather events, reduced or changed prey abundance and distribution, and decrease in nesting habitat”.
- The Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015) states that ‘such changes have the potential to affect migratory shorebirds and their habitats by reducing the extent of coastal and inland wetlands or through a poleward shift in the range of many species”.

The North-west Marine Parks Network Management Plan 2018 (DNP, 2018) identifies climate change as a pressure that may impact marine park values. The management plan states that “the impacts of climate change on the marine environment are complex and may include changes in sea temperature, sea level, ocean acidification, sea currents, increased storm frequency and intensity, species range extensions or local extinctions, all of which have the potential to impact on marine park values” (DNP, 2018).

Within the Marine Bioregional Plan for the NWMR (DSEWPac, 2012), pressures related to climate change are assessed as ‘of potential concern’ for species of marine turtle, inshore dolphins, sawfish, sea snakes, whale shark, dugong, and seabird and shorebird, as well as the KEFs and shipwrecks known to occur in the NWMR.

Emissions associated with Julimar are not predicted to contribute materially or substantially to Australia’s total GHG emissions, and no specific link between indirect greenhouse gas emissions associated with the Julimar development and climate change impacts upon Australian receptors can be determined.

Demonstration of Acceptability
<p>Acceptability Statement</p> <p><u>Atmospheric Emissions</u></p> <p>The impact assessment has determined that, given the adopted control below, fuel combustion is unlikely to result in a potential impact greater than a temporary decrease in local air quality, with no lasting effect. Further opportunities to reduce impacts have been investigated above. The controls adopted are considered good practice and meet the legislative requirements within Marine Order 97. The potential impacts are considered broadly acceptable if the adopted control is implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of the described emissions to a level that is broadly acceptable.</p> <p><u>GHG Emissions</u></p> <p><u>Internal Context</u></p> <p>The Petroleum Activities Program is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including:</p> <ul style="list-style-type: none"> Woodside Environment and Biodiversity Policy Woodside Risk Management Policy Woodside Climate Policy. <p>For further information related to Woodside's approach to climate change, please see Section 5.3 'Managing Physical Risk' and Section 6.3 'A Just Transition' of Woodside's Climate Transition Action Plan and 2023 Progress Report.</p> <p><u>External Context</u></p> <p>Woodside recognises that our licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders.</p> <p>The global consensus on climate change led to the implementation of the Paris Agreement. The aim of the Paris Agreement, as stated in the Article 2.1(a), is to hold the increase in global average temperature to well below 2°C above pre-industrial levels. The Agreement also aims to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising that this would significantly reduce the risks and impacts of climate change. Paris Agreement text extract⁴⁰:</p>

⁴⁰ Paris Agreement: https://unfccc.int/files/meetings/paris_nov_2015/application/pdf/paris_agreement_english_.pdf

"Article 2

1. *This Agreement, in enhancing the implementation of the Convention, including its objective, aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by:*

(a) Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change;"

This was reaffirmed in December 2023 in the COP28 decision text on the First global stocktake.⁴¹ The text further recognised that the transition away from fossil fuels in energy systems is to be done in a just, orderly and equitable manner accelerating action in this critical decade, so as to achieve net zero by 2050 in keeping with the science.⁴² It also recognises that transitional fuels can play a role in facilitating the energy transition while ensuring energy security⁴³.

The Paris Agreement establishes a framework where countries make Nationally Determined Contributions (NDCs) to manage and reduce their own emissions.

Australia has ratified the Paris Agreement and has set a target to reduce emissions by 43% below 2005 levels by 2030 and to reach net-zero emissions by 2050. Australia's emissions projections under a 'with additional measures' scenario is projected to be 43% below 2005 levels by 2030 and to reach net zero emissions by 2050 (DISER, 2022a). Australia's emissions projections demonstrate that it is on track to reduce emissions by up to 43% below 2005 levels by 2030 (DCCEEW, 2022; DISER, 2022a).

Australia's Long-Term Emissions Reduction Plan (DISER, 2021) presents Australia's whole-of-economy plan to achieving net zero emissions by 2050 with priority technologies estimated to achieve 85% reduction and yet-to-be identified emerging technologies abating the remainder. The plan identified LNG as a critical transition fuel and expects growth in the sector with higher use in 2030 than it is today but acknowledging that growth will depend on the preferences of customers and the pace of international action (DISER, 2021).

Climate science has drawn a robust link between cumulative emissions of greenhouse gases and global temperature levels. The link between cumulative emissions and temperature levels allows a carbon budget to be calculated. This is the remaining amount of net emissions (i.e. all global sources of emissions minus all global sinks of emissions) that can occur before today's concentration of greenhouse gases increases to the concentration associated with potential temperature outcomes.

However, the distribution of this carbon budget across different human activities requires additional judgements about a wider range of social, economic and technological factors and consumer and policy choices. Strategies to achieve emissions reductions include transitioning from fossil fuels without CCS to very low-or zero-carbon energy sources, such as renewables or fossil fuels with CCS, demand side measures and improving efficiency, reducing non-CO₂ emissions, and deploying carbon dioxide removal (CDR) methods to counterbalance residual greenhouse gas emissions. Pathways to limit warming therefore show different combinations of sectoral mitigation strategies consistent with a given warming level.

As a result, the demand for oil and gas in climate-related scenarios that could limit global warming to 1.5°C or 2°C is uncertain. For example, in the AR6-WG3 report, the IPCC stated that in pathways that limit warming to 1.5°C (with a greater than 50% probability and with no or limited overshoot) the potential global use of gas in 2050 ranges from 30% above 2019 levels to 85% below them with a median 45% decline.

Woodside considers that a stable energy transition will be one in which energy is affordable and reliable, as well as lower carbon. The Julimar development, together with the new wells from JDP3, will provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life (to 2035). Woodside considers that this development is aligned with their goals for supporting the energy transition and is compatible with the Paris Agreement goal of holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels.

Principles of Ecologically Sustainable Development

Giving consideration to economic development that safeguards the welfare of future generations, Julimar is considered to align with the following core objectives of ESD by:

⁴¹ FCCC/PA/CMA/2023L.17 (Draft decision distributed 13 December 2023) First global stocktake text extracts https://unfccc.int/sites/default/files/resource/cma2023_L17_adv.pdf (Section I, Clause 3)

⁴² FCCC/PA/CMA/2023L.17 (Draft decision distributed 13 December 2023) First global stocktake text extracts https://unfccc.int/sites/default/files/resource/cma2023_L17_adv.pdf (Section II, Subsection A, Clause 28 (d))

⁴³ FCCC/PA/CMA/2023L.17 (Draft decision distributed 13 December 2023) First global stocktake text extracts https://unfccc.int/sites/default/files/resource/cma2023_L17_adv.pdf (Section II, Subsection A, Clause 29)

- Contributing to an incremental reduction in global GHG emissions by displacing more carbon intensive power generation (e.g., coal), firming up renewables, or in hard-to-abate sectors.
- Providing gas to anticipated customers who's nationally determined contributions indicate an important role for LNG in supporting their decarbonisation plans under the Paris Agreement.

Other Requirements (Includes Laws, Policies, Standards and Conventions)

Legislation and other requirements considered relevant for this aspect, and a demonstration of how these requirements are met, are described below.

Requirement	Demonstration
Marine Order 97 Gives effect to Annex VI of MARPOL 73/78	The requirements of Marine Order 97 are incorporated into the key control measures.
<p>Conservation Management Plan for the Blue Whale 2015–2025</p> <p>Management action A3.1: Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica</p> <p>Conservation Advice Balaenoptera borealis Sei Whale</p> <p>Conservation action: Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica</p> <p>Conservation Advice Balaenoptera physalus Fin Whale</p> <p>Conservation action: Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica</p> <p>National Recovery Plan for the Southern Right Whale action area A3.1: Continue to meet Australia's international commitments to address causes of climate change, including greenhouse gas emissions</p> <p>Recovery Plan for Marine Turtles in Australia Management action A2.1: Continue to meet Australia's international commitments to address the causes of climate change</p>	<p>As described above, the predicted atmospheric and GHG emissions from Julimar are considered de minimis, with no link to climate change impacts on Australian or International receptors.</p> <p>Therefore, the EP is not considered to be inconsistent with the Conservation Management Plan for the Blue Whale 2015–2025 (CoA, 2015a), Conservation Advice for Sei Whale (TSSC 2015b), Conservation Advice for Fin Whale (TSSC, 2015b), National Recovery Plan for the Southern Right Whale (DCCEEW, 2024b) or the Recovery Plan for Marine Turtles in Australia (CoA, 2017).</p>

Acceptability Statement: Greenhouse Gas Emissions

As per **Section 2.6.1**, decision type B, GHG emissions are acceptable if “ALARP” is demonstrated using good industry practice and risk-based analysis, if legislative requirements are met and societal concerns are accounted for

Uncontrolled when printed. Refer to electronic version for most up to date information.

and the alternative control measures are grossly disproportionate to the benefit gained. In addition, acceptability is assessed against the above criteria. Further opportunities to reduce the impacts have been investigated (refer ALARP demonstration discussion).

As per Section 6.3.2.1 indirect GHG emissions associated with the Julimar are managed to an acceptable level by Chevron by meeting (where they exist) legislative requirements, industry codes and standards, applicable company requirements, and industry guidelines, and these have been adopted as key controls within the Wheatstone Project Start-Up and Operations Environment Plan. The adopted controls are considered good oil-field practice/industry best practice and are consistent with Woodside's internal requirements. The potential impacts are considered acceptable if ALARP is demonstrated. As described above, the predicted GHG emissions associated with Julimar are considered de minimis and as such, below the acceptable levels and will not materially or substantially contribute to Australia's net GHG emissions or net Global GHG emissions levels.

EPOs, PS and MC			
EPO	Controls	PS	MC
EPO 7 Impacts of routine offshore atmospheric emissions will be limited to planned activities and impacts described as part of the Petroleum Activities Program.	C 7.1 Contract vessels complying with Marine Order 97 (Marine pollution prevention – air pollution)	PS 7.1 Vessels compliant with Marine Order 97 (Marine Pollution Prevention – Air Pollution) to restrict emissions to those necessary to perform the activity. 	C 7.2 Contracting strategy and evaluation for hire of support vessels includes consideration of vessel emissions parameters and low carbon/alternative fuels.	PS 7.2 Evaluation of tenders for support vessels considers emissions parameters.	MC 7.2.1 Records demonstrate that emissions were considered in tender evaluations.

6.7.7 Routine Light Emissions: External Lighting from Support Vessels

Context													
Support Vessels Operations – Section 3.6 Subsea IMMR Activities – Section 3.9			Habitats and Biological Communities – Section 4.4 Socio-economic– Section 4.9 Cultural Values and Heritage – Section 4.9.1				Consultation – Section 5						
Impact Evaluation Summary													
Source of Impact	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Light emissions from support vessels, ROVs, inspection tools.					X	X	A	F	-	-	LCS GP	Broadly Acceptable	EPO 8
Description of Source of Impact													
<p>Vessels used to support this Petroleum Activity will have external lighting to allow safe operations, and to meet mandatory navigational requirements for safe navigation and safe operations at night. This lighting typically consists of bright white (i.e., metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities including fishing and shipping.</p> <p>While the line of sight may extend tens of kilometres from the source, the light density (measured in Lux – which represents the intensity of light that arrives at or leaves a surface, as perceived by the human eye) rapidly decreases as distance increases from the source of the light. Monitoring indicated that light density (from navigational lighting) attenuated to below 1.00 Lux and 0.03 Lux at distances of 300 m and 1.4 km, respectively, from the source (a MODU) (Woodside, 2014f). Light densities of 1.00 and 0.03 Lux are comparable to natural light densities experienced during deep twilight and during a quarter moon. Navigational lighting required for support vessels is less than required for a MODU, given they are much smaller in size. Therefore, assuming light emissions from support vessels are below 1.00 Lux within 300 m from the source is conservative.</p> <p>IMMR activities</p> <p>In addition to lighting to allow safe operations, and to meet mandatory navigational requirements, during IMMR activities underwater lighting is generated for short periods while ROVs/AUVs are in use. Given the typical intensity of ROV/AUV lights and inspection tools and the attenuation of light in seawater, light from ROVs/AUVs and inspection tools will be localised to the vicinity of the ROV/AUV, operating in close proximity to subsea infrastructure. During</p>

IMMR activities, vessels generally move slowly over the subsea infrastructure and are in the Operational Area for short periods of time.

JDP3 Commissioning

A support vessel, as described in Section 3.6, will be required to support the commissioning of the JDP3 wells at the JULB Manifold location, which is located ~39 km from the Wheatstone platform. The commissioning is expected commence in 1 H-2026 and take approximately 20 days per well, with the support vessel remaining stationary over the BRUA manifold location during this time.

Cumulative Light Sources

Lighting may also arise from other facilities and associated activities not included in this EP. These include the nearby Wheatstone and Pluto platforms which may result in slightly elevated ambient light levels.

Impact Assessment

Lighting from support vessels may appear from direct unshielded light sources or through skyglow. Where direct light falls upon the ocean, this area of light is referred to as light spill. Skyglow is the diffuse glow caused by light that is screened from view, but through reflection and refraction creates a glow in the atmosphere. The distance at which direct light and skyglow may be visible from the source is dependent on the lighting on the vessel and environmental conditions.

Receptors that have important habitat present within a 20 km buffer of the Operational Area were considered as having potential for interaction, based on recommendations of the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (NLPW). The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings (15 to 18 km) and fledgling seabirds grounded in response to artificial light 15 km away (DCCEEW 2023).

Light emissions can affect fauna in two main ways:

- Behaviour: many organisms are adapted to natural levels of lighting and the natural changes associated with the day and night cycle as well as the phase of the moon. Artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.
- Orientation: organisms such as marine turtles and birds may use lighting from natural sources to orient themselves in a certain direction at night. In instances where an artificial light source is brighter than a natural source, the artificial light may act to override natural cues, leading to disorientation.

Vessel operations will take place within the Operational Area located in an open water, offshore environment, about 46 km from the nearest emergent islands (Montebello Islands). A number of BIAs overlap the Operational Area and EPBC Act listed fauna may transit through the Operational Area (refer to Section 4.64.5).

Light pollution is identified as a key threat to species of marine turtles and seabirds identified as occurring within the Operational Area (Section 4.5). Relevant conservation actions outlined in recovery plans and Wildlife Conservation Management plans for these species are outlined in Section 6.10.

Marine Turtles

The National Light Pollution Guidelines for Wildlife (DCCEEW, 2023) specify a 20 km buffer around vessel activities when considering the assessment of potential impacts to turtle behaviour from both direct light and sky glow. Although the Flatback turtle interneresting BIA is within the Operational Area, given the distance of the nearest turtle nesting and interneresting areas (habitat critical to survival to marine turtles) is the Montebello Islands, about 46 km from the Operational Area at the nearest point, there is no potential for lighting impacts. This is with specific reference to turtle hatchling emergence.

Although individuals undertaking migration and potential foraging at the nearest suitable habitat at Glomar Shoal (1 km distance at its closest point from the Operational Area), marine turtles do not use light cues to guide these behaviours. Further, there is no evidence, published or anecdotal, to suggest that foraging or migrating turtles are impacted by light from offshore vessels. As such, light emissions from the vessels are unlikely to result in displacement of, or behavioural changes to individuals in these life stages (Environmental 2020)

Seabirds

Artificial lighting can attract and disorient seabird species resulting in species behavioural changes (e.g. circling light sources or disrupted foraging), injury or mortality near the light source as a result of collision (Longcore and Rich, 2004; Gaston 2014). The Operational Area may be occasionally visited by seabirds and migratory shorebirds but there is no emergent land that could be used for roosting or nesting habitat in the Operational Area. The nearest suitable habitat is the Montebello Islands, 46 km to the south-west. One BIA for wedge-tailed shearwater breeding overlaps with the Operational Area, with the breeding period occurring from August to April (Section 4.6.4). Adult shearwaters are vulnerable to artificial lighting during the breeding cycle, when returning to and leaving the nesting colony to maintain nesting sites or forage. Foraging wedge-tailed shearwaters may be attracted to sources of light emissions to feed on

fish drawn to the light, however, the species feeds predominantly during the day (I. A. Catry 2009). Migratory shorebirds may be present in (A. K. Delisle 2017) or fly through the region between July and December, and again between March and April as they complete migrations between Australia and offshore locations. The risk associated with seabirds or migratory shorebirds attracted to artificial lighting is considered to be low, impacts are expected to be limited to minor behavioural disturbance to isolated individuals, with no displacement from important habitat.

Fish (including sharks and rays)

Lighting from the presence of a vessel may result in the localised aggregation of fish below the vessel. These aggregations of fish are considered localised and temporary and any long-term changes to fish species composition or abundance is considered highly unlikely. This localised increase in fish extends to those comprising the whale shark's diet. However, given that a large proportion of the diet comprises krill and other planktonic larvae, it is unlikely that a light source will lead to a significant increase in whale shark abundance in the vicinity of the vessels. Similarly, any localised impacts to marine fish are not expected to impact on any commercial fishers in the area.

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by light emissions, such as turtles and plankton, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (A. K. Delisle 2017)). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes result in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Cumulative Impacts

Given the:

- indicative timings of JDP3 commissioning activities listed above
 - likely duration and frequency of IMMR activities (see Table 3-7) and the duration of JDP3 commissioning activities
- there is a low likelihood of simultaneous operations and hence cumulative impact from light emissions.

Professional Judgement – Engineered Solution				
Support vessels to use block-out blinds / curtains on accommodation windows at night during peak turtle hatchling emergence period (November to March) and with the wedge-tailed shearwater fledgling exodus in Apr.	F: Yes. Installing block-out blinds / curtains is technically feasible. CS: Minimal cost/sacrifice. Accommodation modules on vessels usually have window treatments for crew comfort.	Reducing light emissions from the vessel at night can reduced light glow and the area over which light may impact turtle hatchling emergence and wedge-tailed shearwater fledgling exodus.	Benefits outweigh minimal cost/ sacrifice of implementation.	Yes C 8.3
ALARP Statement: On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the potential impacts from routine light emissions from the support vessel activities to be ALARP. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP				

Demonstration of Acceptability
Acceptability Statement: The impact assessment has determined that, given the adopted controls, routine light emissions from external lighting from the support vessels represent a localised impact /disturbance to marine fauna within the Operational Area. BIAs within the Operational Area for light sensitive species consist of Flatback turtle internesting and Wedge-tailed shearwater breeding BIA. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans including the advice in the <i>National Light Pollution Guidelines for Wildlife</i> (2023). The Petroleum Activities Program is deemed consistent with the conservation advice and this guideline. Further opportunities to reduce the impacts have been investigated above. The potential impacts are consistent with good oil-field practice/industry best practice and are considered to be broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of light emissions to a level that is broadly acceptable.

6.8 Unplanned Activities (Accidents, Incidents, Emergency Situations) – Major Environmental Event

For Woodside, an analysis is undertaken to identify, classify and analyse major environmental events (MEEs), as described in Section 2.7. This extra level of rigour is applied to determine sufficient controls for operational activities are in place for risks with potential Level B and above consequences as per Woodside's Risk Matrix. MEEs are evaluated against credible worst-case scenarios that may occur when all controls are absent or have failed. The risk considered in this section has therefore been identified as a MEE due to the potential for significant consequence. These sources of risk are subject to additional consideration in accordance with the process described in Section 2.6.4. Risks associated with the Petroleum Activities Program that have been classified as MEEs are summarised in Section 6.8.1 and include the Loss of Well Containment. The quantitative spill risk assessment methodology used to assess the potential consequence of credible spills is outlined in Section 6.8.2. Credible hydrocarbon spills that have not been classified as MEEs are assessed in Section 6.9. Risks that do not meet the MEE definition, although screened out of the MEE process, are still evaluated for ALARP and risk acceptability using the methodology described in Section 2.6.

6.8.1 MEE Overview

Section 2.7 outlines the process for additional analysis and evaluation of MEEs.

Section 6.8.3 presents the bowtie output for the MEE identified (Table 6-8).

Table 6-8: MEE Events for the Julimar Operations

No.	Hazard	Top Event
MEE-01	Unplanned Hydrocarbon Release	Loss of Well Containment

Section 6.8.3 includes a summary of the hazard description, hazard management, emergency response, ALARP summary and a list of SCE barriers identified on the bowtie. Each group of SCEs is listed under Technical Performance Standards, with consistent naming conventions used across Woodside's process safety management processes (e.g. pipeline integrity SCEs are captured as P09 – Pipeline Systems).

Section 6.8.3 presents the bowtie that illustrate the causes, outcomes and controls/barriers in place to manage potential common cause event (CCE) failure mechanisms for MEE controls associated with generic SCE equipment failure and also human error. Human Error is managed via the WMS and the Generic Human Error is included in the MEE section for completeness.

ALARP is demonstrated through controls and barriers being analysed for selection based on their independence, prioritised in accordance with the Hierarchy of Controls where controls further up the hierarchy take precedence over controls further down, and further analysed to consider the type of effect the control provides. ALARP controls presented for MEE bowties are labelled in accordance with Type of Effect classifications presented in Table 6-9.

Woodside has developed a tailored ALARP position for hydrocarbon spill response, including EPOs, EPSs and MC for preparedness and response. The response arrangements are a mitigative control that applies to all MEEs where a hydrocarbon release may credibly occur. The hydrocarbon spill response arrangements are described in Appendix D.

Table 6-9: Barrier Hierarchy and Type of Effect

Type of Effect	Legend	Description
Elimination (Technical)		Elimination controls form the 'first line of defence'. They eliminate the underlying hazard and therefore are the most effective category of control measure. If practicable, they should be selected in preference to any other type, as their existence removes the need for any other controls (e.g. a corrosion-resistant metal could replace the original material of construction).
Elimination (Administration)		
Prevention (Technical)		Prevention controls are intended to remove certain causes of incidents or reduce their likelihood. The corresponding hazard remains, but the frequency of incidents involving the hazard is lowered (e.g. introduction of regular maintenance programs can prevent the development of events involving the hazard). Where hazards and causes could not be 'eliminated', controls are required to prevent them from leading to unwanted events and consequences.
Prevention (Administration)		
Detection (Technical)		Detection controls are those that identify a potentially hazardous scenario (e.g. a change in operating parameters), allowing initiation of procedures or systems to prevent the cause occurring. Controls that detect the occurrence of events are often critical to being able to respond with other control measures that reduce the propagation of the events. Detection controls themselves often provide no actual control other than the awareness of the need to respond.
Detection (Administration)		
Reduction/Control (Technical)		Reduction controls are intended to limit the scale and consequence of incidents. They include systems that detect incidents and take some action (e.g. to reduce the rate of leakage of a toxic gas) and also aspects such as inter-unit separation that prevent escalation of fire and explosion incidents. As there is always potential for controls to fail, additional measures are required to limit the scale and severity of any unwanted event or outcome that may arise, by providing the ability to intervene and limit the propagation of the events.
Reduction/Control (Administration)		
Mitigation (Technical)		Mitigation controls take effect in response to an incident. They include controls that lessen the significance or damage caused by an unwanted event. Such controls only take effect after the hazardous event and outcomes occur. Mitigation controls are generally those designed to protect personnel against the consequences of a hazard or to aid in recovering from the effects of the hazard.
Mitigation (Administration)		

6.8.2 Quantitative Spill Risk Assessment Methodology

As part of the risk identification process, Woodside identified the range of credible hydrocarbon spill scenarios that may occur during the Petroleum Activities Program. Scenarios that have been classified as MEEs are assessed in Sections 6.8.3. Scenarios that are not classified as MEEs (as explained in Section 6.8.1) are assessed in Section 6.9.

Quantitative hydrocarbon spill modelling was undertaken by RPS, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, SIMAP

(Spill Impact Mapping and Analysis Program), which is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces.

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form oil in water emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each of the particles (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

Hydrocarbon spill modelling assessments undertaken by RPS undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

6.8.2.1 Hydrocarbon Characteristics

Brunello condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi-volatile components. In general, about 45.5% of the oil mass should evaporate within the first 12 hours, a further 37.3% should evaporate within the first 24 hours and a further 10.3% should evaporate over several days. About 6.9% of the oil is shown to be persistent (RPS 2020).

The whole oil has a low asphaltene content (~0.5%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle (RPS 2020).

Soluble, aromatic, hydrocarbons contribute about 11.2% by mass of the whole oil, ~6.9% by mass is highly soluble and highly volatile. The fate of this component, which include the benzene, toluene, ethylbenzene, and xylene (BTEX) compounds, varies depending on the release conditions and subsequent setting. Subsea discharge favours the process of dissolution but if dissolved plume rises to the surface water, the compounds tend to evaporate from the water into the atmosphere. A further 2.4% by mass is contributed by moderately volatile and soluble di-aromatic hydrocarbons. These compounds dissolve more slowly but tend to persist in soluble form for longer (RPS 2020).

The mass balance forecast for the constant-wind case for Brunello condensate (Figure 6-1) shows that ~83% of the oil is predicted to evaporate within 24 hrs. Under calm conditions, the majority of the remaining oil on the water surface weathers at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds slows significantly, and they would then be subject to more gradual decay through biological and photochemical processes (RPS 2020).

Figure 6-1: Proportional Mass Balance Plot Representing the Weathering of Brunello Condensate Spilled onto the Water Surface as a One-off Instantaneous Release and Subject to a Constant 5 kn (2.6 m/s) Wind at 27 °C Water Temperature and 25 °C Air Temperature.

Under the variable-wind case (Figure 6-2), where the winds are of greater strength, entrainment of Brunello condensate into the water column is predicted to increase; ~24 hours after the spill, ~16% of the oil mass is forecast to have entrained and a further 78% is forecast to have evaporated, leaving only a small proportion of the oil floating on the

water surface (<4%). The residual compounds tend to remain entrained beneath the surface under conditions that generate wind waves (~6 m/s).

Figure 6-2: Proportional Mass Balance Plot Representing the Weathering of Brunello Condensate Spilled onto the Water Surface as a One-off Instantaneous Release and Subject to Variable Wind at 27 °C Water Temperature and 25 °C Air Temperature.

6.8.2.2 EMBA and Hydrocarbon Contact Thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental consequence by delineating which areas of the marine environment could be exposed to hydrocarbon levels exceeding selected hydrocarbon threshold concentrations if a credible hydrocarbon spill scenario occurred. The summary of the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA. The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for a variety of weather and metocean conditions, and the EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs.

As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is presented for each fate. Together, these EMBA have defined the spatial extent for the existing environment described in Section 4.

The spill modelling outputs are presented as areas that meet threshold concentrations for surface, entrained and dissolved hydrocarbons for the modelled scenarios. Surface spill

concentrations are expressed as grams per square metre (g/m^2), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb).

A conservative approach to selecting thresholds was taken by adopting the guideline impact thresholds (NOPSEMA 2019) for surface, entrained, dissolved and accumulated hydrocarbons to define the EMBA for condensate spills from a loss of well control. An additional threshold has been included to define the boundary within which socio-cultural impacts may occur, based on visible surface oil (1 g/m^2) impacting on the visual amenity of the marine environment. Each of these hydrocarbon thresholds are presented in Table 6-10 and described in the subsections below.

Table 6-10: Summary of Thresholds Applied to the Quantitative Hydrocarbon Spill Risk Modelling Results

Hydrocarbon Type	EMBA				Socio-cultural EMBA	
	Surface hydrocarbon (g/m^2)	Dissolved hydrocarbon (ppb)	Entrained hydrocarbon (ppb)	Accumulated / shoreline hydrocarbon (g/m^2)	Surface hydrocarbon (g/m^2)	Accumulated Shoreline Hydrocarbon (g/m^2)
Condensate	10	50	100	100	1	10
Marine Diesel	10	50	100	100	1	10

6.8.2.3 Operational and Scientific Monitoring

A planning area for operational scientific monitoring is also described in Annex C of the Oil Spill Preparedness and Response Mitigation Assessment (Appendix D). This planning area has been set with reference to the low exposure entrained value of 10 ppb detailed in the NOPSEMA (2019) bulletin Oil Spill Modelling. This low exposure threshold is based on the potential for exceeding water quality triggers.

An operational scientific monitoring program may be activated following a release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) and in particular, any identified pre-emptive baseline areas for the worst-case credible spill scenario or other identified unplanned hydrocarbon releases associated with the operational activities.

6.8.3 Unplanned Hydrocarbon Release: Loss of Well Containment (MEE-01)

Context													
Failure of integrity of subsea infrastructure – Section 3.5	Physical Environment – Section 4.3						Consultation – Section 5

Loss of well containment of reservoir fluids from a Julimar or Brunello well (e.g. Xmas tree, well production tubing etc.) resulting in loss of hydrocarbons to the environment.		X	X	X	X	X	B	B	1	M	LCS GP PJ RBA CV SV	Acceptable if ALARP	EPO 9
Description of Source of Risk													
<p>A loss of well containment can lead to an uncontrolled release of reservoir hydrocarbons and associated fluids to the environment resulting in a well blowout. Woodside has identified a well blowout as the scenario with the worst-case credible environmental outcome as a result of this event. Due to the potential consequences, a loss of well containment is considered to be a MEE (MEE-01). A loss of containment from a subsea production flowline could occur due to a variety of causes including:</p> <ul style="list-style-type: none">• internal corrosion• external corrosion• erosion• mechanical failure• overpressure of the annuli in conjunction with failure of a primary containment measure• loss of control of suspended load from vessel (operating near subsea wells). <p>A number of common failures causes due to human error and SCE failures are presented in the generic Human Error and SCE Failure bowties Figure 6-3 and Figure 6-4.</p> <p>Loss of Well Containment – Credible Scenarios</p> <p>The Julimar Field Production System includes up to 13 production wells. The credible worst-case loss of well containment scenario identified for the Petroleum Activities Program is the BRUA-2 well blow-out at seabed. The credible worst-case subsea release was based on a review of all the wells, with BRUA-2 evaluated to be the worst-case scenario due to a higher condensate gas ratio as compared to the other wells.</p>													

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The loss of well containment scenario was modelled to a duration of 75 days which is the estimated time required to successfully drill a relief well. The characteristics of Brunello Condensate was used as the basis in the modelling (Table 6-11). Refer to Section 6.8.2 for additional information on modelling methods and environmental impact, thresholds and hydrocarbon characteristics justifications.

Table 6-11: Summary of Worst-case Loss of Well Containment Hydrocarbon Release Scenario

Scenario	Hydrocarbon	Average Rate (m ³ /day)	Duration (days)	Depth (m)	Latitude (GDS84)	Longitude (GDS84)	Release Volume (m ³)
Well blow-out at seabed – subsea well with highest condensate gas ratio.	Brunello Condensate	741.9	75	149	20°01'49.1571"S	115°12'05.6357"E	55647

Decision Type, Risk Analysis and ALARP Tools

Woodside implements industry standard practice in well design and construction. In the company's recent history, it has not experienced a well integrity event that has resulted in significant releases or significant environmental impacts. Woodside has never experienced a worst-case loss of well containment in its operational history.

Decision Type

A Decision Type B has been applied to this risk under the Guidance on Risk Related Decision Making (OGUK 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this Decision Type, a further level of analysis has been applied using risk-based tools including the Bowtie Methodology (described in Section 2.7.3) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability, through peer review, benchmarking and consultation (Section 5).

The release of hydrocarbons as a result of well loss of containment is considered a MEE (MEE-01). The hazard associated with this MEE is hydrocarbons in subsea wells.

Quantitative Spill Risk Assessment

Spill modelling of the worst-case credible loss of well containment spill scenario was undertaken by RPS (RPS 2020) to determine the fate of hydrocarbons released based on the assumptions in Section 6.8.2. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volumes for all loss of well containment scenarios.

Hydrocarbon Characteristics

Hydrocarbon characteristics of Brunello Condensate are provided in Table 6-11 and described in more detail in Section 6.8.2.1.

Likelihood

In accordance with the Woodside Risk Matrix, a worst-case loss of well containment has been defined as highly unlikely (1) event as it 'has occurred once or twice in the industry' (experience-based likelihood) and aligns with a frequency of a '1 in 10,000 to 1 in 100,000 year' event. Information to support this likelihood determination is outlined below.

Review of industry statistics indicates that the probability of a loss of well containment for production wells is low (10.6% of blowouts) relative to other activities in other hydrocarbon provinces (Gulf of Mexico and the North Sea), such as exploration drilling (31.5% of blowouts), development drilling (23.6% of blowouts) and well workovers (20.5% of blowouts) (SINTEF 2017).

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbon were considered during the impact assessment for a worst-case loss of well containment (presented in the following section). In addition to condensate in the reservoir fluids, environmental impact assessment considerations included the mercury (Hg) content in some of the Brunello wells, which would see predominantly elemental Hg being released to the

marine environment. A screening assessment was conducted to determine whether any of the hydrocarbon components or Hg will dominate the toxicity of the reservoir fluids. It was determined that although the 99% species protection criteria for Hg (0.1 ug/L) in comparison to the 100 ppb (100 ug/L) impact threshold for entrained hydrocarbons indicates Hg is a 1,000 times more toxic to marine environment than hydrocarbons, the entrained hydrocarbon content exceeded the worst case Hg content in reservoir fluids by a factor of 40,000 indicating the overall toxicity of the released well fluids would be determined by the concentrations of hydrocarbons in the water column. Subsequent consequent modelling and risk assessment considered therefore the fate of hydrocarbons in the marine environment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (Section 4) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environmental Value(s) Potentially Impacted

EMBA

The overall EMBA for the Petroleum Activities Program is based on stochastic modelling which compiles data from multiple hypothetical worst-case spill simulations under a variety of weather and metocean conditions (as described in Section 6.8.1). The EMBA covers a larger area than the area that would be affected during any single spill event, and therefore represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. The trajectory of a single spill would have a considerably smaller footprint. As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is discussed for each fate.

Surface Hydrocarbons

Hydrocarbon spill modelling results for surface hydrocarbons are shown in Table 6-12. The modelled hydrocarbon slick is forecast to drift in all directions depending on the modelled parameters, reflecting the competing influence of both surface currents and winds across the wide area, and may extend up to 13 km south east from the release site at concentrations above the environmental impact threshold (10 g/m²). The Montebello Marine Park is the only receptor with a probability (92% and 4%) of impact from floating oil concentrations >1 g/m² and >10 g/m², respectively. The minimum time to oil reaches sensitivity is 12 hours (1 g/m²) and 60 hours (10 g/m²). Note that the Operational Area overlaps the AMP, and the release of BRUA-2 well is in close proximity to the AMP.

Entrained Hydrocarbons

Hydrocarbon spill modelling results for entrained hydrocarbons are shown in Table 6-12. The modelled entrained hydrocarbons are forecast to potentially drift in all directions, extending up to 338 km from the release site at or above the 100 ppb impact threshold level. Contact by entrained oil at concentrations equal to or greater than 100 ppb is predicted at several locations, including the Montebello Marine Park (86%), Rankin Bank (44%), Ningaloo Marine Park and World Heritage area (21%), Muiron Islands (18%) and Gascoyne Marine Park (17%) (refer to Table 6-12 for all locations). The maximum entrained oil concentration forecast for any receptor is predicted at 1,277 ppb within the Montebello Marine Park. Note that the Operational Area overlaps the AMP, and the release of BRUA-2 well is in close proximity to the AMP.

Dissolved Hydrocarbons

Hydrocarbon spill modelling results for dissolved hydrocarbons are shown in Table 6-12. The modelled dissolved hydrocarbons are forecast to potentially drift in all directions, extending up to 223 km from the release site at the 50 ppb impact threshold level. Contact by dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb impact threshold is predicted at Montebello Marine Park (76%) and Rankin Bank (15%), with possible contact at other receptors at probabilities of 1% (Table 6-12). The maximum dissolved aromatic hydrocarbon concentration forecast for any receptor is predicted as 428 ppb within the Montebello Marine Park. Note that the Operational Area overlaps the AMP, and the release of BRUA-2 well is in close proximity to the AMP.

Accumulated Hydrocarbons

Hydrocarbon spill modelling results for accumulated hydrocarbons are shown in Table 6-12. No shoreline contact above environmental impact threshold level was predicted to occur. Five receptors are predicted to receive shoreline oil at concentrations greater than 10 g/m² (socio-cultural threshold). The Muiron Islands are identified as the worst-case (Table 6-12), with a probability of 9%, a maximum volume along the shoreline of 3 m³ and a maximum local accumulated concentration of 73 g/m.

Consequence Assessment Summary

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-12 presents the full extent of the EMBA, i.e. the sensitive receptors and their locations that may be exposed to hydrocarbons (surface, entrained, dissolved and accumulated) at or above the set impact threshold concentrations in the remote likelihood of a major hydrocarbon release from a loss of well control occurring during the Petroleum Activities Program. Details of these receptors are outlined in Section 4. The potential biological and ecological impacts of an unplanned hydrocarbon release as a result of a loss of well integrity during the Petroleum Activities Program are presented in the following sections.

Table 6-12: EMBA - Key Receptor Locations and Sensitivities Potentially Contacted Above Impact Thresholds by the Loss of Well Containment Scenario with Summary Hydrocarbon Spill Contact

Summary of Potential Impacts to Environmental Values

Modelling shows that ~83% of the hydrocarbon released is predicted to evaporate within 24 hours depending on wind conditions, and a further 10% should evaporate over several days, with only about 7% shown to be persistent (RPS 2020). About 24 hours after the spill, around 16% of the hydrocarbon mass is forecast to have entrained, leaving only a small proportion of the hydrocarbon floating on the water surface (<4%).

Water Quality

Water quality would be affected due to hydrocarbon contamination above impact thresholds. These are defined by the EMBA descriptions for each of the surface, entrained and dissolved hydrocarbon fates and their predicted extent. Due to the weathering processes of the Brunello condensate (>80% will evaporate), potential impacts may result in slight, short-term impacts to water quality (E), with impacts predicted to be greatest for areas closest to the potential release location in offshore waters as a result of hydrocarbon contamination above background levels.

Marine Sediment Quality

Studies of hydrocarbon concentrations in deep-sea sediments in the vicinity of a catastrophic well blowout indicated hydrocarbons can be incorporated into sediments (Romero, et al. 2015). Proposed mechanisms for hydrocarbon contamination of sediments include sedimentation of hydrocarbons and direct contact between submerged plumes and the seabed (Romero, et al. 2015). In the event of a major hydrocarbon release, modelling indicates that a pressurised release of condensate would atomise into droplets that would be transported into the water column to the surface. Consequently, the extent of potential impacts to the seabed area at and surrounding the release site would be confined to a localised footprint.

Sediments within the Operational Area are primarily silty, fine to medium grain calcareous sands with small shell fragments (Section 4.3.1). Marine sediment quality would be reduced as a consequence of hydrocarbon contamination for a small area within the immediate release site for a medium term (C).

Air Quality

A hydrocarbon release resulting from a loss of well containment has the potential to result in short-term reduction in air quality and contribution of GHG (CH₄ and reservoir CO₂) to the atmosphere (Middlebrook, et al. 2011). The concentrations of air pollutants released from diffuse sources is difficult to accurately quantify as emissions disperse rapidly by meteorological factors such as wind (Queensland Government 2017), temperature, among others (NOAA n.d.). Methane and VOC emissions from a hydrocarbon release in offshore environments are rapidly degraded in the atmosphere.

The Operational Area is ~160 km north-west of Dampier and ~46 km south-east to the closest landfall (Montebello Islands).

Due to the unlikely occurrence of a loss of well containment; the temporary nature of any methane or VOC emissions (from either gas surfacing or weathering of liquid hydrocarbons from a loss of well containment); the predicted behaviour and fate of the air pollutants in open offshore environments; and the significant distance from the Operational Area to the nearest sensitive air shed, the potential impacts are expected to be slight, short-term (E).

Marine Primary Producers

Submerged Shoals

Modelling predicts that waters overlying the Rankin Bank are the only submerged shoals that may be impacted by a worst-case spill scenario (Table 6-12). The waters overlying the Rankin Bank have the potential to be exposed (44%) to entrained hydrocarbons above threshold concentrations (100 ppb) 126 hours (~5 days) after the release occurs. Rankin Bank comprises three main sedimentary banks rising steeply from between 80 and 120 m below sea level, reaching 20 to 40 m below the sea surface.

Entrained hydrocarbons reaching these shoals will be highly weathered, with the volatile and water soluble (often the most toxic) components expected to have dissipated. The permanently submerged habitats of Rankin Bank represents sensitive open water benthic community receptors, extending from deep depths to relatively shallow water. Given the water depth, it is likely the potential for biological impact is significantly reduced when compared to the upper water column layers. However, potential biological impacts could include sub-lethal stress and in some instances total or partial mortality of sensitive benthic organisms such as corals and the early life stages of resident fish and invertebrate species.

The submerged shoals are areas associated with sporadic upwelling and associated primary productivity events. Impacts to plankton communities from exposure to entrained hydrocarbons above threshold

concentrations may result in short-term changes in plankton community composition but recovery would occur. Hydrocarbon contact during the spawning seasons for resident shoal community benthos and fish (meroplankton), particularly exposure to in-water toxicity effects to biota, may result in the loss of a discrete cohort population but would not affect the longer term viability of resident populations. Therefore, any impacts to resident shoal community benthos and fish (meroplankton) are likely to be localised at the shoals and temporary.

Hydrocarbon exposure to offshore filter-feeding communities may occur depending on the depth of the entrained/dissolved hydrocarbons. Exposure to entrained (aromatic) hydrocarbons (≥ 50 ppb) has potential to result in lethal or sub-lethal toxic effects. Sub-lethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White, et al. 2012). Shoals that are exposed to entrained and/or dissolved hydrocarbons are expected to result in localised long-term effects, depending on the exposure concentrations and degree of weathering.

Due to the weathering processes of the Brunello condensate ($>80\%$ will evaporate), potential impacts may result in minor, short-term impacts to Rankin Bank submerged shoal (D).

Coral Reef

Modelling predicts that there would be potential for coral reef habitat to be exposed to entrained hydrocarbons above threshold concentrations (100 ppb) (Table 6-12). Sensitivities identified include Montebello Marine Park, Barrow Islands, Rankin Bank, Southern Pilbara Island Group and Ningaloo Coast World Heritage and Marine Park. The modelling also predicts that maximum entrained oil concentrations in the vicinity of the release site show that concentrations >100 ppb are not expected to exceed depths of around 20 m (RPS 2020).

Exposure to entrained hydrocarbons ≥ 100 ppb has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column (<20 m), including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities. Mortality in a number of coral species is possible, and this could result in the reduction of coral cover and change in the composition of coral communities. Sublethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates, and impaired reproduction (Negri and Heyward 2000). This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Barrow / Montebello / Muiron Islands) and the mainland coast (i.e. Ningaloo Coast). With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon, creating a pressure gradient that drives water in a strong outward flow through channels. These channels are across as much as 15% of the length of Ningaloo Reef (Taylor and Pearce 1999).

If a spill occurs at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition, some non-coral species may be affected via direct contact with entrained hydrocarbons, resulting in sublethal impacts and in some cases mortality—particularly early life-stages of coral reef animals (reef-attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide ranging fish species. The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo Reef system) will depend on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities.

Over the worst-affected sections of reef habitat, coral community live cover, structure and composition may reduce, manifested by loss of corals and associated sessile biota. Recovery of these impacted reef areas typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding, with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities (Underwood 2009). Recovery at other coral reef areas may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour, et al. 2013).

In the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in large scale impacts to coral populations within the EMBA, with long-term effects (recovery >10 years) on coral habitats (B).

Seagrass Beds/Macroalgae and Mangroves

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Modelling predicts that entrained hydrocarbons above threshold concentrations (100 ppb) have the potential to contact sensitivities that support seagrass beds/macroalgae and mangroves communities. These sensitivities includes nearshore protected areas such as Barrow and Montebello Islands, Southern Pilbara Island Group and Ningaloo Coast World Heritage and Marine Park (Table 6-12).

The variety of habitat and community types, from the upper subtidal to the intertidal zones support a high diversity of marine life and are used as important foraging and nursery grounds by a range of invertebrate and vertebrate species. Exposure to entrained hydrocarbons may result in mortality, depending on actual entrained exposure concentrations received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sublethal stress, causing reduced growth rates and reduced tolerance to other stress factors (Zieman, Iverson and Ogden 1984). Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie, Macinnis-Ng and Ralph 2010.). However, the potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should lower the content of soluble aromatic components before contact occurs.

Entrained hydrocarbons may adhere to the sediment particles and in low-energy environments such as in mangroves, deposited sediment bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (NOAA 2014). Hydrocarbons may persist in the sediment, potentially causing chronic sublethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from any impacts could be long-term (>10 years).

In the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in large scale impacts to seagrass beds/macroalgae and mangroves communities within the EMBA, with long-term effects (recovery >10 years) on these habitats (B).

Other Communities / Habitats

Benthic Fauna Communities

Benthic fauna within the relatively small area of predicted impacts to seabed sediments in the immediate release site would be highly likely to be impacted due to hydrocarbon exposure above ecological thresholds. However, the modelling also predicts that maximum entrained oil concentrations in the vicinity of the release site show that concentrations >100 ppb are not expected to exceed depths of around 20 m (RPS 2020). Furthermore, in the event of a major release at the seabed, the stochastic spill model predicted the entrainment of hydrocarbon droplets and rapid transport to the sea surface limiting the exposure and potential ecological impact footprint to benthic communities.

The benthic habitats around the wells are representative of the NWMR and are primarily comprised of soft, sandy substrates grading to clay and silt with increasing water depth (Section 4.3.1). The low sensitivity, widespread benthic communities associated with the soft sediment habitat are not expected to have widespread exposure to released hydrocarbons.

Benthic fauna at geomorphic features located within the water column such as shoals and banks may be impacted by dissolved and/or entrained hydrocarbons are assessed separately.

Due to the weathering processes of the Brunello condensate, characteristics of the benthic habitat and infrequency of the event, potential impacts may result in short-term impacts to benthic communities (E).

Spawning/Nursery Areas

Modelling predicts that entrained hydrocarbons above threshold concentrations (100 ppb) have the potential to contact sensitivities that support spawning/nursery areas (Table 6-12). Sensitivities identified include Montebello Marine Park, Montebello and Barrow Islands, Rankin Bank, Southern Pilbara Island Group and Ningaloo Coast World Heritage and Marine Park. The modelling also predicts that maximum entrained oil concentrations in the vicinity of the release site show that concentrations >100 ppb are not expected to exceed depths of around 20 m (RPS 2020). This has the potential to result in lethal and sublethal impacts to a portion of fish larvae in areas contaminated above impact thresholds, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon.

Fish (and other commercially targeted taxa) in their early life stages (eggs, larvae and juveniles) are at their most vulnerable to lethal and sublethal impacts from exposure to hydrocarbons, particularly if a spill coincides with spawning seasons or reaches nursery areas close to the shore (e.g. seagrass and mangroves) (ITOPF 2011). Fish spawning (including for commercially targeted species such as snapper and mackerel) occurs in nearshore waters at certain times of the year, and nearshore waters are also inhabited by higher numbers of juvenile fishes than offshore waters.

Although there is the potential for spawning/nursery habitat to be impacted, losses of fish larvae in worst-affected areas are unlikely to be of major consequence to fish stocks compared with significantly larger losses through natural predation, and the likelihood that most nearshore areas would be exposed is low (i.e. not all

areas in the region would be affected). This is supported by a study in the Gulf of Mexico, which used juvenile abundance data from shallow-water seagrass meadows as indices of the acute, population-level responses of young fishes to the Deepwater Horizon spill. Results indicated that there was no change to the juvenile cohorts following the Deepwater Horizon spill. Additionally, there were no significant post-spill shifts in community composition and structure, nor were there changes in biodiversity measures (Fodrie and Heck Jr. 2011).

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in moderate medium-term impacts to spawning fish and/or nursery areas within the EMBA (C), with consequence severity dependent on the actual timing, duration and extent of a spill in relation to key spawning periods and locations.

Open Water – Productivity/Upwelling

Primary production by plankton (triggered by sporadic upwelling events in the offshore waters) is an important component of the primary marine food web. Planktonic communities are generally mixed, including phytoplankton (cyanobacteria and other microalgae), secondary consuming zooplankton (e.g. copepods), and the eggs and larvae of fish and invertebrates (meroplankton). Exposure to hydrocarbons in the upper water column can result in changes in species composition, with declines or increases in one or more species or taxonomic groups (Batten, Allen and Wotton 1998). Phytoplankton may also experience decreased rates of photosynthesis (Tomajka 1985). For zooplankton, direct effects of contamination may include suffocation, changes in behaviour, or environmental changes that make them more susceptible to predation. Impacts on plankton communities are likely to occur in areas where surface, entrained or dissolved aromatic hydrocarbon threshold concentrations are exceeded, but communities are expected to recover relatively quickly (within weeks or months). This is due to high population turnover, with copious production within short generation times that also buffers the potential for long-term (i.e. years) population declines (ITOPF 2011).

Waters in the North West Shelf (e.g. Ningaloo Coast, Montebello Marine Park) are known locations of seasonal upwelling events and productivity. The seasonal productivity events are critical to krill production, which supports megafauna aggregations such as whale sharks and rays in the region. This has the potential to result in lethal and sublethal impacts to a certain portion of plankton in affected areas, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. However, recovery would occur.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to plankton populations within the EMBA (D).

Filter Feeders

The modelling predicts that maximum entrained oil concentrations in the vicinity of the release site show that concentrations >100 ppb are not expected to exceed depths of around 20 m (RPS 2020). Entrained hydrocarbons are therefore, not expected to impact filter feeder habitats in deep offshore waters such as filter feed communities associated with the KEFs.

Hydrocarbon exposure to shallow nearshore filter feeding communities (<20 m) (e.g. Montebello Islands, Rankin Bank) may occur. Exposure to in water aromatic hydrocarbons has the potential to result in lethal or sublethal toxic effects. Sublethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White, et al. 2012). Any impacts may result in localised long-term effects to community structure and habitat.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in long-term impacts to filter feeders within the EMBA (D).

Non-biogenic Reefs

Modelling predicts that entrained hydrocarbons above threshold concentrations (100 ppb) have the potential to contact sensitivities that support non-biogenic Reefs (Table 6-12). Non-biogenic reefs were identified in the Southern Pilbara Island Group. The probability of contact to the Southern Pilbara Island Group is only 4% (Table 6-12).

Lethal or sublethal impacts to non-biogenic Reefs result in partial or total mortality of keystone sessile benthos, particularly hard corals; thus, potential community structural changes to these shallow, nearshore benthic communities may occur. However, due to the probability to contact this habitat (4%), impacts are expected to be minor to non-biogenic Reefs (D).

Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rocky Shores

Shoreline exposure for the upper and lower areas differ. The upper shore has the potential to be exposed to surface slicks, while the lower shore is potentially exposed to entrained hydrocarbon. Potential impacts may occur due to hydrocarbon contact with intertidal areas, including sandy shores, mudflats and rocky shores, listed in Table 6-12. Hydrocarbon at sandy shores is incorporated into fine sediments through mixing in the

surface layers from wave energy, penetration down worm burrows and root pores. Hydrocarbon in the intertidal zone can adhere to sand particles; however, high tide may remove some or most of the hydrocarbon back of the sediments. Typically, hydrocarbon is only incorporated into the surface layers to a maximum of 10 cm (Etkin 2003). Note that no shoreline accumulation above threshold concentrations ($>100 \text{ g/m}^2$) was identified by the modelling and long-term impacts to shorelines is not expected.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in slight short-term impacts to these habitats within the EMBA (E).

Protected species

Cetaceans

Offshore Cetaceans

Several cetaceans species were identified as potentially occurring within the EMBA (Section 4.6.3). In the event of a LOWC, surface, entrained, and dissolved hydrocarbons exceeding environmental impact threshold concentrations may drift across habitat for cetacean species. Migratory routes and BIAs of cetaceans considered to be MNES may be affected, including humpback whales, southern right whales and pygmy blue whales' migration.

Cetaceans that have direct physical contact with surface, entrained, or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (from prey, water and sediments), aspiration of oily water or droplets, and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees (DHNRTD 2016)). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts, and organs. Other potential impacts include impairment of the immune system, neurological damage (Helm, et al. 2015), reproductive failure, other adverse health effects (e.g. lung disease, poor body condition), and mortality (DHNRTD 2016). Physical contact with hydrocarbons is likely to have biological consequences for these species. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Hydrocarbons may also be ingested, particularly by baleen whales (e.g. pygmy blue whales and humpback whales), which feed by filtering large volumes of water.

Geraci (1990) has identified behavioural disturbance through avoidance of spilled hydrocarbons in several species of cetacean, suggesting that cetaceans have the ability to detect surface slicks. However, observations during spills have recorded larger whales (both mysticetes and odontocetes) and smaller delphinids travelling through and feeding in oil slicks. During the Deepwater Horizon spill, cetaceans were routinely seen swimming in surface slicks offshore and nearshore (Dias, et al. 2017). In a review of the impacts of large-scale hydrocarbon spills on cetaceans, it was found that exposure to oil from the Deepwater Horizon resulted in increased mortality to cetaceans in the Gulf of Mexico (DHNRTD 2016), and long-term population level impacts to killer whales were linked to the Exxon Valdez tanker spill (Matkin, et al. 2008).

A major spill could coincide with the migration of humpback whales, southern right whales, or pygmy blue whales (Section 4.6.3) depending on the timing of the potential spill event. These whales are baleen whales, so are most likely to be most impacted by toxic effects when feeding. However, feeding during migrations is low level and opportunistic, with most feeding for both species occurring in the Southern Ocean.

Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the risk of ingestion of hydrocarbons is low. Migration of whales are protracted through time and space (i.e. the whole population will not be within the EMBA), and as such, a spill from the LOWC is unlikely to affect an entire population.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore cetacean species (B), with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Nearshore Cetaceans and Dugongs

Coastal populations of small cetaceans and dugongs are known to reside or frequent nearshore waters, including the Ningaloo Coast, Muiron Islands, and Pilbara Southern Island Group. Modelling predicts that entrained hydrocarbons above threshold concentrations (100 ppb) have the potential to contact these sensitivities (Table 6-12). Note that no shoreline accumulation above threshold concentrations ($>100 \text{ g/m}^2$) was identified by the modelling.

The Ningaloo Coast is a known to provide high marine species diversity and abundance to different cetacean. A reproduction BIA for southern right whales, a foraging BIA for pygmy blue whales and breeding, nursing and

calving BIAs for dugongs are known to occur; therefore, whales and dugongs may be exposed to entrained hydrocarbons above thresholds levels.

The potential impacts of exposure are discussed above. However, nearshore populations of cetaceans and dugongs are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning. Nearshore dolphin species (e.g. spotted bottlenose dolphins) may exhibit higher site fidelity than oceanic species, although Geraci (1990) observed relatively little impacts beyond behavioural disturbance. Additional potential environment impacts may also include the potential for dugongs to ingest hydrocarbons when feeding on oiled seagrass stands, or indirect impacts to dugongs due to loss of this food source due to dieback in worst-affected areas.

Cetacean populations that are within the EMBA may be susceptible to impacts from spilled hydrocarbons if they interact with an area affected by a spill. Suitable habitat for oceanic toothed whales (e.g. sperm whales) and dolphins is broadly distributed throughout the region and as such, impacts are unlikely to affect an entire population.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to inshore cetacean species (B), with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Marine Turtles

Offshore

Five marine turtle species identified as threatened or migratory were identified as potentially occurring within the EMBA, with a number of BIAs and Habitat Critical areas identified within the EMBA (Section 4). Modelling predicted that floating hydrocarbons above threshold concentrations (>10 g/m²) have the potential to contact only Montebello Marine Park, which is identified as nesting area for marine turtles (Table 6-12). The probability of contact to the Montebello Marine Park is only 4% (Table 6-12).

Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (NOAA 2010). Therefore, contact with surface slicks or entrained hydrocarbon can result in hydrocarbons adhering to body surfaces (Gagnon and Rawson 2010) causing irritation of mucous membranes in the nose, throat and eyes, leading to inflammation and infection (NOAA 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage, et al. 1995). A stress response associated with this exposure includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of the salt gland (Lutcavage, et al. 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe as they may inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours, which are the most toxic component of the hydrocarbon spill (Milton and Lutz 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia, and neurological impairment (NOAA 2010). Contact with entrained hydrocarbons can result in hydrocarbons adhering to body surfaces, causing irritation of mucous membranes in the nose, throat and eyes and leading to inflammation and infection (Gagnon and Rawson 2010).

Given the hydrocarbon is expected to weather rapidly (>80% will evaporate) when released to the environment, relatively fresh entrained hydrocarbons (which are typically relatively close to the release location) are considered to have the greatest potential for impact. Given the non-persistent nature of the hydrocarbons and the relatively small floating hydrocarbon EMBA in sensitivities areas (i.e. Montebello Marine Park), the area where potential impacts from inhalation may occur would be localised around the release location.

In the event of a LOWC, there is potential that surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations will be present in offshore waters. Therefore, a hydrocarbon spill may disrupt a portion of marine turtle populations identified in Section 4.6.2. However, there is considered to be no threat to overall population viability given the non-persistent nature of predicted hydrocarbons. Therefore, moderate, medium-term impact on these species (C) are expected.

Nearshore

Marine turtles are known to utilise nearshore waters and shorelines for foraging and breeding activities (including interbreeding), with significant nesting beaches along the WA mainland coast and nearshore islands in locations that may be impacted by a LOWC (including the Ningaloo Coast, Muiron Islands, Montebello and Barrow Islands, and Pilbara Southern Islands Group).

Seasonal timings for breeding, nesting and hatchling dispersal (i.e. timing per BIA and Habitat critical) for each marine turtle species is provided in Section 4.6.2. The nearshore waters of these marine turtle habitat areas may be exposed to surface, entrained or dissolved hydrocarbons exceeding threshold concentrations. In addition, a number of islands along the WA coastline are predicted to be contacted by accumulated

hydrocarbons above the ecological impact threshold; including the Muiron Islands, Barrow Island and the Montebello Islands (Table 6-12).

The potential impacts of exposure are as previously discussed. In the nearshore environment, turtles can ingest hydrocarbons when feeding and/or can be indirectly affected by loss of a food source (e.g. seagrass due to dieback from hydrocarbon exposure) (Gagnon and Rawson 2010). In addition, hydrocarbon exposure can impact on turtles during the breeding season at nesting beaches. Contact with gravid adult females or with hatchlings may occur on nesting beaches (accumulated hydrocarbons) or in nearshore waters (entrained hydrocarbons) where hydrocarbons are predicted to make shoreline contact. Note that no shoreline accumulation above thresholds concentrations ($>100 \text{ g/m}^2$) was identified by the modelling. Males waiting in nearshore areas to mate with adult females may also be impacted by entrained hydrocarbons.

Marine turtles aggregating near nesting beaches within the EMBA during the mating and nesting seasons are most vulnerable to hydrocarbons, due to greater turtle densities and the possible disruption to important life cycle behaviours. Potential impacts may occur at the population level due to the presence of a high number of breeding individuals and hatchlings (during hatchling dispersal) and may impact on overall population viability of marine turtle species. However, given the volatile nature of the hydrocarbons population level impacts are not anticipated to occur. Therefore, moderate, medium-term impact (C) to marine turtles in the nearshore are expected.

Sea snake

Two sea snake species which are listed threatened under the EPBC Act were identified by the PMST as potentially occurring within the EMBA.

Impacts to sea snakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles and may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (ITOPF 2011). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

In general, sea snakes primarily frequent on reef flats or in shallow waters of the outer reef edges to depths of 10 m (DSEWPaC 2011). Their abundance is not expected to be high in the EMBA. However, sea snake species in Australia generally show strong habitat preferences (Heatwole and Cogger 1993); species that have preferred habitats associated with submerged shoals may be disproportionately affected by a hydrocarbon spill affecting such habitat.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to sea snakes (B), with consequence severity dependent on the duration and extent of a spill in relation to the distribution of sea snakes.

Fish, Sharks and Rays

Offshore

Several shark and ray species which are listed threatened under the EPBC Act were identified as potentially occurring within the EMBA (Section 4.6.1). Foraging BIAs for the whale shark, were also identified. Whale sharks are, therefore, likely to transit the open offshore waters within the EMBA while they migrate to and from Ningaloo Reef. There are no known areas of aggregation for other species in the offshore waters of the EMBA.

Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs either through direct contact or via the food chain (i.e. consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange). In the offshore environment, it is probable that pelagic shark species, such as the whale shark, are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas.

Impacts to whale sharks from a hydrocarbon spill will depend on the timing of the spill; however, whale sharks as a pelagic species are expected to demonstrate avoidance behaviour and population level impacts are not anticipated. Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in moderate medium-term impacts to sea fish, sharks and rays (C).

Nearshore

Whale sharks and rays are known to utilise nearshore waters and shorelines for foraging and feeding activities (e.g. Ningaloo Reef, Muiron Islands). These coastlines are predicted to be contacted by entrained hydrocarbons above the ecological impact threshold (Table 6-12). Note that no shoreline accumulation above thresholds concentrations ($>100 \text{ g/m}^2$) was identified by the modelling.

Whale sharks and manta rays generally transit along the nearshore coastline in these areas and are vulnerable to surface, entrained and dissolved aromatic hydrocarbon spill impacts, with both taxa having similar modes of feeding.

Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman and Wilson 2004). Whale sharks at Ningaloo Reef have been observed using two different feeding strategies, including passive sub-surface ram-feeding and active surface feeding (J. Taylor 2007) g. Passive feeding consists of swimming slowly at the surface with the mouth wide open. During active feeding, sharks swim high in the water with the upper part of the body above the surface with the mouth partially open (J. Taylor 2007). These feeding methods would result in the potential for individuals that are present in worse affected spill areas to ingest potentially toxic amounts of entrained or dissolved aromatic hydrocarbons into their body. Large amounts of ingested hydrocarbons may affect their endocrine and immune system in the longer term.

The presence of hydrocarbons may also cause displacement of whale sharks from important feeding and resting areas at Ningaloo Reef, potentially disrupt migration and aggregations to these areas in subsequent seasons. Whale sharks may also be affected indirectly by entrained or dissolved aromatic hydrocarbons through the contamination of their prey. The preferred food of whale sharks are planktonic organisms which are abundant in the coastal waters of Ningaloo Reef in late summer/autumn, driving the annual arrival and aggregation of whale sharks in this area. If a worse-case spill event were to occur during the spawning season, this food supply (in worse spill affected areas of the reef) may be diminished or contaminated. The contamination of their food supply and the subsequent ingestion of this prey by the whale shark may also result in long term impacts as a result of bioaccumulation.

There is the potential for other coastal shark species (e.g. dwarf, narrow, green sawfish) to be impacted directly from hydrocarbon contact and/or indirectly through contaminated prey or loss of habitat. Excluding sawfish, which may exhibit high site fidelity, it is most likely that shark species (as mobile animals) will move away from spill affected areas and suffer minimal direct impact.

A spill reaching the Ningaloo coastline during key aggregation periods and impacting important whale shark foraging areas may have severe impacts to the local whale shark population, including possible mortality of individuals and impacts to life cycle habitats such as migration patterns. Most species of shark and ray (including whale sharks) are, however, expected to move away from spill affected areas with minimal impacts.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to fish, sharks and rays (B), with consequence severity dependent on the duration and extent of a spill in relation to the distribution of these species.

Seabirds and Migratory Shorebirds

Offshore

Several seabirds and shorebirds species which are listed threatened under the EPBC Act were identified as potentially occurring within the EMBA (Section 4.6.4). Breeding BIAs for the fairy tern, lesser crested tern, roseate tern and wedge-tailed shearwater, were also identified.

Seabirds and migratory shorebirds are particularly vulnerable to contact with floating hydrocarbons, which may mat their feathers. This may lead to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed 2011). Notably, the credible LOWC result in a relatively small floating hydrocarbon EMBA which is primarily centred around the release location. Subsequently, the potential for seabird exposure to floating hydrocarbons is considered to be low.

Migratory shorebirds are considered unlikely to interact with spilled hydrocarbons as they are not expected to stop over within the offshore waters where the EMBA may occur during their migrations between mainland/island areas. Many seabirds and migratory shorebirds forage over extensive areas (some hundreds of kilometres out to sea) so individuals may be present.

Seabirds which plunge dive to feed on prey may contact entrained or dissolved hydrocarbons, most likely through ingestion of prey which are contaminated. Impacts to prey abundance as a result of hydrocarbons may also indirectly impact individuals.

Breeding BIAs for seabirds and migratory shorebirds that overlap with the EMBA are associated with locations along the Pilbara and Gascoyne coasts and islands. The breeding BIA for the wedge-tailed shearwater overlaps with the Operational Area. It is likely that individual birds may, therefore, transit the Operational Area, where impact concentrations are higher. Other species' BIAs are ~40 km away and these species are less likely to occur within the Operational Area.

Given the relatively low area of floating hydrocarbons and the lack of key aggregation areas for migratory shorebirds and seabirds within the Operational Area, impacts at the population level are not anticipated.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in minor impacts to migratory seabirds (D).

Nearshore

In the event of a LOWC, there is the potential for seabirds, and resident/non-breeding overwintering shorebirds that use the nearshore waters within the EMBA for foraging and resting, to be exposed to hydrocarbons above ecological impact thresholds. Impacts may include both lethal or sub-lethal effects, as discussed above and in more detail below.

Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in nearshore waters near to their breeding colony, resulting in intensive feeding by higher seabird densities in these areas during the breeding season and making these areas particularly sensitive in the event of a spill.

Migratory shorebirds may be exposed to stranded hydrocarbon when foraging or resting in intertidal habitats, however, direct oiling is typically restricted to relatively small portion of birds, and such oiling is typically restricted to the birds' feet. Unlike seabirds, shorebird mortality due to hypothermia from matted feathers is relatively uncommon (Henkel, Sigel and Taylor 2012). Indirect impacts, such as reduced prey availability, may occur (Henkel, Sigel and Taylor 2012).

Surface hydrocarbons contact above impact threshold ($>10 \text{ g/m}^2$) was predicted to occur only in Montebello Marine Park, with a 4% probability (Table 6-12). As mentioned, predicted surface hydrocarbons are also relatively restricted to the release location. Shoreline hydrocarbon contact above ecological thresholds ($>100 \text{ g/m}^2$) was not predicted to occur (Table 6-12). Direct impacts, therefore, at the population level are not anticipated.

Impacts are likely to occur through the ingestion of contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs) which have been exposed to surface, shoreline, entrained or dissolved hydrocarbons within the EMBA. Ingestion of contaminated prey can also lead to internal injury to sensitive membranes and organs (IPIECA 2004). Whether the toxicity of ingested hydrocarbons is lethal or sub-lethal will depend on the weathering stage and its inherent toxicity. Exposure to hydrocarbons may have longer term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks, affecting survivorship and loss of adult birds. Seabirds also typically nest above the high-water mark, meaning nesting areas would not be expected to be directly impacted.

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in minor impacts to seabirds and shorebirds (D).

Other Species

Demersal and pelagic Fish Populations

Demersal and pelagic fish species are mainly associated with the following offshore features within the EMBA:

- Ancient coastline at the 125 m depth contour KEF
- Continental slope demersal fish communities KEF
- Commonwealth waters adjacent to Ningaloo Reef
- Glomar Shoals KEF
- Rankin Bank.

These geomorphic features may host relatively diverse or abundant fish assemblages compared to the otherwise relatively featureless continental shelf habitats of the NWMR. Impacts to KEFs are discussed below. Indirect impacts due to decreased habitat quality at these KEFs to pelagic and demersal fish communities are considered unlikely. Impacts to pelagic fish (associated with receptors such as Glomar Shoals and Rankin Bank) from hydrocarbons are described herein.

Fish mortalities are rarely observed to occur as a result of hydrocarbon spills (ITOPF 2011). This has generally been attributed to the possibility that pelagic fish are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Fish that have been exposed to dissolved aromatic hydrocarbons are capable of eliminating the toxicants once placed in clean water, so individuals exposed to a hydrocarbon release are likely to recover (King, et al. 1996). Where fish mortalities have been recorded, the spills (resulting from the groundings of the tankers Amoco Cadiz in 1978 and the Florida in 1969) have occurred in sheltered bays.

Laboratory studies have shown that adult fish are able to detect hydrocarbons in water at very low concentrations, and large numbers of dead fish have rarely been reported after hydrocarbon spills (Hjermann, et al. 2007). This suggests that juvenile and adult fish are capable of avoiding water contaminated with high

Uncontrolled when printed. Refer to electronic version for most up to date information.

concentrations of hydrocarbons. However, sublethal impacts to adult and juvenile fish may be possible, given long-term exposure (days to weeks) to polycyclic aromatic hydrocarbon (PAH) concentrations (Hjermann, et al. 2007), which are typically the most toxic components of hydrocarbons. Light molecular weight aromatic hydrocarbons (i.e. one- and two-ring molecules) are generally soluble in water, which increases bioavailability to gill-breathing organisms such as fish.

The effects of exposure to hydrocarbons on the metabolism of fish appears to vary according to the organs involved, exposure concentrations and route of exposure (waterborne or food intake). Oil reduces the aerobic capacity of fish exposed to aromatics in the water and, to a lesser extent, affects fish consuming contaminated food (Cohen, Gagnon and Nugegoda 2005). The liver, a major detoxification organ, appears to be the organ where anaerobic activity is most impacted, probably increasing anaerobic activity to help eliminate ingested oil from the fish (Cohen, Gagnon and Nugegoda 2005).

Fish are perhaps most susceptible to the effects of hydrocarbon spills in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Contact with oil droplets can damage feeding and breathing apparatus of embryos and larvae (Fodrie and Heck Jr. 2011). The toxic hydrocarbons in water can result in genetic damage, physical deformities and altered developmental timing for larvae and eggs exposed to even low concentrations over prolonged timeframes (days to weeks) (Fodrie and Heck Jr. 2011). More subtle, chronic effects on the life history of fish as a result of exposure in early life stages to hydrocarbons include disruption to complex behaviours such as predator avoidance, reproductive and social behaviour (Hjermann, et al. 2007). Prolonged exposure of eggs and larvae to weathered concentrations of hydrocarbons in water has also been shown to cause immunosuppression and allows expression of viral diseases (Hjermann, et al. 2007). PAHs have also been linked to increased mortality and stunted growth rates of early life history (pre-settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen, et al. 2017). However, the effect of a hydrocarbon spill on a population of fish in an area with fish larvae and/or eggs, and the extent to which any of the adverse impacts may occur, depends greatly on prevailing oceanographic and ecological conditions at the time of the spill and its contact with fish eggs or larvae.

Mortality and sublethal effects may impact populations located close to the release event for entrained/dissolved aromatic hydrocarbons above ecological impact threshold. Additionally, if prey (infauna and epifauna) surrounding the LOWC and within the EMBA is contaminated, this can result in the absorption of toxic components of the hydrocarbons (PAHs), potentially impacting fish populations that feed on these.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts (B) to demersal fish assemblages, particularly, in the area surrounding the release site but slight impacts to pelagic fish species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' movements and distributions.

Protected Places

Three AMPs may be affected by a worst-case spill scenario (Table 6-12). The AMPs were predicted to potentially be contacted by surface (Montebello Marine Park), entrained (Montebello Marine Park, Ningaloo Marine Park and Gascoyne Marine Park) and dissolved (Montebello Marine Park and Ningaloo Marine Park) hydrocarbons above ecological thresholds in the event of a worst-case spill scenario. Montebello Marine Park was also predicted to potentially be impacted by surface hydrocarbons above social thresholds. Note that the Operational Area overlaps the AMP, and the release of BRUA-2 well is in close proximity to the AMP. Therefore, an assessment of the Montebello Marine Park will be undertaken since it represents the worst-case scenario.

Montebello Marine Park

The Montebello Marine Park comprises an area of ~3,413 km², all of which is zoned as a Multiple Use Zone (IUCN VI). This AMP ranges in depth from <15 m up to 150 m.

The Montebello Marine Park contains habitats, species and ecological communities associated with the Northwest Shelf Province (DNP 2018). It includes one key ecological feature: the ancient coastline at the 125 m depth contour. Impact to KEFs are assessed below.

The AMP provides connectivity between the deeper waters of the continental shelf and slope, and the adjacent Barrow Island and Montebello Islands State Marine Parks. The specific values of the AMP and associated impacts are summarised here.

Natural values: The AMP includes diverse benthic and pelagic fish communities and ancient coastline thought to be an important seafloor feature (KEF) and a migratory pathway for whales (BIA). The AMP supports a range of species, including those listed as threatened, migratory, marine and/or cetacean under the EPBC Act. BIAs within the AMP include breeding habitat for seabirds, interbreeding, foraging, mating and nesting habitat for

marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks. Impacts to the relevant species and BIAs are discussed in the sections above.

Cultural values: There is limited information about the cultural significance of this AMP, however, it is noted that Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. Potential impacts to cultural values of the AMP will closely tie in with the impacts to the natural values of the Marine Park, as addressed above and below; and range from moderate mid-term potential impacts to major long-term potential impacts.

Heritage values: There are no World, National or Commonwealth heritage listings that apply to the AMP. Two historic shipwrecks are located within the Marine Park. Impacts to shipwrecks are discussed below under 'Cultural Heritage'.

Social and economic values: Tourism, commercial fishing, mining and recreation are important activities in the AMP. These activities contribute to the wellbeing of regional communities and the prosperity of the nation. Impacts to tourism and recreation are discussed below.

A worst-case hydrocarbon spill scenario has the potential to result in impacts to these AMPs that range from moderate, medium-term to major, long-term, with the consequence severity dependent on the actual timing, duration and extent of a spill.

KEFs

KEFs potentially impacted by the hydrocarbon spill from a LOWC are detailed in Section 4.7. Although these KEFs are primarily defined by seabed geomorphological features, they can indicate a potential for increased biological productivity and, therefore, ecological significance.

The consequences of a hydrocarbon spill from a LOWC are predicted to result in minor impacts to values of the KEFs affected (for the values of each KEF, Refer Section 4.7). Impacts to benthic habitats are not predicted given the maximum depth of entrained hydrocarbons above 100 ppb is predicted to be 20 m beyond the immediate source. Potential impacts to associated demersal fish assemblages and pelagic communities may occur as previously described.

The KEFs within the EMBA have relatively broad-scale distributions and are unlikely to be significantly impacted. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts (C) to the ecological values of KEFs within the EMBA, with impacts predicted to be greatest for habitats closest to the potential release location.

Summary of Potential Impacts to Socio-economic Values

Fisheries – Commercial

Offshore

A hydrocarbon release during a loss of well containment event has the potential to result in direct impacts to target species of Commonwealth and State fisheries within the defined EMBA (refer to Section 4.9.4). Lethal and sublethal effects may impact localised populations of targeted species within the EMBA for entrained/dissolved hydrocarbons above thresholds. However, entrained hydrocarbons are likely to be confined in the upper water column; therefore, demersal species are less likely to be exposed to hydrocarbons than pelagic species. A major loss of hydrocarbons from the Petroleum Activity may also lead to an exclusion of fishing from the spill-affected area for an extended period.

Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration, which removes hydrocarbons from tissues by metabolic processes, although its efficacy depends on the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons, while crustaceans (such as prawns) have a reduced ability (Yender, Michel and Lord 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential seafood contamination can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender, Michel and Lord 2002).

A major spill would result in the establishment of an exclusion zone around the spill-affected area. There would be a temporary prohibition on fishing activities for a period of time, and subsequent potential for minor economic impacts to affected commercial fishing operators.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major, long-term impacts (B) to commercial fisheries within the EMBA, particularly for pelagic fisheries and fisheries with most of their effort focused within the EMBA.

Nearshore

In the highly unlikely event of a LOWC, there is the possibility that target species in some areas used by a number of State fisheries, prawn fisheries, pearl oyster fisheries and aquarium, and land hermit crab fisheries in nearshore waters of the mainland coast and islands that are within the EMBA could be affected. Targeted fish, prawn, mollusc and lobster species could experience sub-lethal stress, or in some instances mortality, depending on the concentration and duration of hydrocarbon exposure and its inherent toxicity.

The hydrocarbons predicted to reach these nearshore water locations will be in an advanced state of weathering and at concentrations typically associated with lethal and sub-lethal impacts to only the most sensitive marine organisms.

Therefore, direct impacts may be limited to sub-lethal impacts only. However, there is also the potential for tainting of target species and for negative public perception.

Prawn Managed Fisheries

In a major spill, the modelling indicated the entrained EMBA may extend to nearshore waters closest to the mainland Pilbara and Gascoyne coasts. Note that the majority of the demarcated area for the prawn managed fishery in the Exmouth Gulf (proper) is outside the EMBA. Those fisheries that occur within the EMBA (refer to Section 4.9.4) occur in shallow, nearshore waters where limited hydrocarbon exposures are predicted to occur.

Prawn habitat utilisation differs between species in the post-larval, juvenile and adult stages (Dall, et al. 1990). Direct impacts to benthic habitat due to a major spill has the potential to impact prawn stocks. For example, juvenile banana prawns are found almost exclusively in mangrove-lined creeks (Rönnbäck, et al. 2002), whereas juvenile tiger prawns are most abundant in areas of seagrass (Masel and Smallwood 2000). Adult prawns also inhabit coastline areas but tend to move to deeper waters to spawn. In a major spill, the model predicted shallow subtidal and intertidal habitats at the Muiron Islands, Montebello Islands, Barrow Island, Pilbara Southern Islands Group, and mangrove and seagrass habitats of the Ningaloo Coast are located within the EMBA and could be exposed to hydrocarbon concentrations above threshold concentrations, depending on the trajectory of the plume. Localised loss of juvenile prawns in worse spill affected areas is possible. Whether lethal or sub-lethal effects occur will depend on duration of exposure, hydrocarbon concentration, weathering stage of the hydrocarbon and its inherent toxicity. Furthermore, seafood consumption safety concerns and a temporary prohibition on fishing activities may lead to subsequent potential for economic impacts to affected commercial fishing operators.

Therefore, a worst-case credible hydrocarbon spill scenario has the potential to result in displacement of fishing activities in the spill-affected area for an extended period, detrimental impacts to seafood quality, and stress/mortality affects to target species including prawn stocks through critical habitat destruction across commercial fisheries within the EMBA. As such, a worst-case hydrocarbon spill scenario has the potential to result in major, long-term impacts (B) to commercial fisheries within the EMBA.

Tourism including Recreational Activities

In the event of a major spill, the nearshore waters of offshore islands and reefs (e.g. Barrow / Montebello / Muiron Islands, Pilbara Islands etc.) as well as the Ningaloo coast could be reached by entrained and dissolved hydrocarbons depending on prevailing wind and current conditions. There is also a low probability (up to 9%) of shoreline accumulation above the socio-cultural threshold at few receptor sites (Table 6-12). As these locations offer a number of amenities such as fishing, swimming and using beaches and surrounds, they have a recreational value for local residents and visitors. If a LOWC resulted in hydrocarbon contact, there could be restricted access to beaches for a period of days to weeks, until natural weathering, tides, currents or oil spill response (e.g. shoreline clean-up if safe to do so) removes the hydrocarbons. Tourists and recreational users may also avoid areas due to perceived impacts, including after the oil spill has dispersed.

Recreational fishers predominantly target large tropical species, such as emperor, snapper, grouper, mackerel, trevally and other game fish. Recreational angling activities include shore-based fishing, private boat and charter boat fishing, with peak activity between April and October (Smallwood, et al. 2011) for the Exmouth region.

There is the potential for stakeholder perception that this environment will be contaminated over a large area and for the longer term, resulting in a prolonged period of tourism decline. Oxford Economics (2010) assessed the duration of hydrocarbon spill-related tourism impacts and found that, on average, it took 12 to 28 months to return to baseline visitor spending. There is likely to be significant impacts to the tourism industry, wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism. Recovery and return of tourism to pre-spill levels will depend on the size of the

spill, effectiveness of the spill clean-up, and change in any public perceptions regarding the spill (Oxford Economics 2010).

Consequently, in the case of a LOWC (highly unlikely), a worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts to tourism and recreation (C) within the EMBA.

Offshore Oil and Gas Infrastructure

A hydrocarbon release during a loss of well containment event has the potential to result in disruptions to production at existing petroleum facilities (e.g. platforms and Floating Production Storage and Offloading facilities), as well as activities such as drilling and seismic exploration. For example, facility water intakes for cooling and fire hydrants could be shut off if contacted by floating hydrocarbons, which could in turn lead to the temporary cessation of production activities. Spill exclusion zones established to manage the spill could also prohibit access for activity support vessels as well as offtake tankers approaching facilities off the North West Cape.

The impact on ongoing operations of regional production facilities would be determined by the nature and scale of the spill and metocean conditions. Furthermore, decisions on the operation of production facilities in the event of a spill would be based primarily on health and safety considerations. The closest production facilities are:

- Wheatstone Platform (operated by Chevron): within the southeast extent of the Operational Area
- Pluto Platform (operated by Woodside): ~4 km south of the Operational Area
- John Brookes Platform (operated by Santos): ~30 km south of the Operational Area
- Goodwyn Alpha Platform (operated by Woodside): ~64 km northeast of the Operational Area
- North Rankin Complex (operated by Woodside): ~86 km northeast of the Operational Area
- Okha FPSO Facility (operated by Woodside): ~117 km northeast of the Operational Area
- Angel Platform (operated by Woodside): ~135 km northeast of the Operational Area.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in slight, short-term impacts (E) to oil and gas industry.

Heritage – European and Indigenous / Underwater Cultural Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that Sea Country, including marine ecosystems and species, archaeological heritage and heritage sites, marine parks, as well as intangible cultural heritage may be impacted in the event of a hydrocarbon release from LOWC. Cultural features and heritage values that have the potential to be impacted include:

Marine ecosystems and species: Marine ecosystems may hold both cultural and environmental value to Traditional Custodians (see Section 4.9.1), with cultural and environmental values intrinsically linked (DCCEE 2023). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country – the seascape which Traditional Custodians view, interact with or hold knowledge of. The EMBA is known to include habitat for culturally important species such as whales, whale sharks, turtles, dugongs, plankton, and seagrass (Sections 4.5 to 4.9.1). In the event of a worst-case release of hydrocarbon individual fauna may be directly impacted or impacted through temporary degradation of their habitats, however, no population level impacts are expected. Impacts are not expected to occur to ecologically significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Heritage Sites:

The EMBA overlaps two registered Aboriginal Sites and 20 lodged Sites. Note that shoreline accumulation above social thresholds concentrations (>10 g/m²) was identified by the modelling in Ningaloo Coast North World Heritage and a few State terrestrial parks (Table 6-12). Any oil that reaches the shoreline has potential to impact on indigenous heritage places along the coastline. In the unlikely event of a hydrocarbon release, shoreline accumulation may affect sensitive artefacts or areas, which could damage their heritage value.

Marine Parks:

The EMBA overlaps three AMPs under North-West Marine Parks Network Management Plan 2018 and five State Marine Parks and Nature Reserves (Section 4.8). Due to the low maximum concentrations predicted to reach any marine park, it is not anticipated that their values will be compromised.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Intangible cultural heritage: Impacts may occur to intangible cultural values such as songlines; creation / dreaming sites, sacred sites, ancestral beings; cultural obligations to care for Country; knowledge of Country/customary law and transfer of knowledge; connection to Country; Access to Country; kinship systems and totemic species, resource collection. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, Donald Thomson: Observations of Animal Connections in Visual Ethnography in Northern Australia 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003). In the unlikely event of a hydrocarbon release, intangible cultural heritage values may be impacted.

MEE-01 Loss of Well Containment – Risk Analysis

Bowtie risk analysis was undertaken to assess MEE-01; refer to Figure 6-3 and Figure 6-4 for bowtie diagrams.

<ul style="list-style-type: none"> ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability well integrity codes and standards. <p>For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to determine technical integrity.</p> <p>A quantitative spill risk assessment was undertaken (refer to Section 6.8.2 for details of the method used).</p>				
Company Values				
Corporate values require all personnel at Woodside to comply with appropriate policies, standards, procedures and processes while being accountable for their actions and holding others to account in line with the Woodside Compass. As detailed above, the Petroleum Activities Program will be undertaken in line with these policies, standards and procedures that include suitable controls to prevent loss of well containment, and response should a loss of well containment occur.				
Societal Values				
<p>Due to the Petroleum Activities Program's proximity to sensitive receptors (e.g. Montebello Marine Park) and the potential extent of the wider EMBA, the LOWC risk rating presents a Decision Type B in accordance with the decision support framework described in Section 2.6.1. Consultation was undertaken for this program to identify the views and concerns of relevant persons, as described in Section 5.</p> <p>Woodside has sent a Consultation Information Sheet to all identified relevant persons regarding the Petroleum Activities Program (Section 5). Woodside has consulted with AMSA and the WA Department of Transport (DoT) on spill response strategies. A copy of the Oil Pollution First Strike Plan was provided to AMSA and DoT.</p>				
<p>ALARP Statement:</p> <p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the Decision Type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood unplanned hydrocarbon release as a result of a LOWC.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of well integrity, ensuring the wells are operated within their design envelope through operating practices, and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEE are specified and assured through implementing the WOMP, SCE management procedures including technical performance standards for SCEs and Management System Performance Standards for Safety Critical Procedures and ensuring the implementation of the Wheatstone Offshore Facilities Safety Case – Operations.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the WOMP provides for the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:</p> <ul style="list-style-type: none"> ongoing hazard identification, risk assessment and the identification of control measures ongoing integrity management of hardware control measures in accordance with the technical performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability well integrity codes and standards. <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural control of well intervention activities, it is considered that MEE risk associated with LOWC from Julimar subsea wells are managed to ALARP.</p>

Demonstration of Acceptability

Acceptability Statement:

LOWC has been evaluated as having a 'Moderate' risk rating. As per Section 2.6.3, Woodside considers 'Moderate' risk ratings as acceptable if ALARP is demonstrated using good industry practice, consideration of company and societal values and risk based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.

Acceptability is demonstrated with regard to the considerations below.

Principles of Ecologically Sustainable Development

Woodside is a proud Australian company that is here for the long-term. Woodside has a strong history of exploration and development of oil and gas reserves in the North West of WA with an excellent environmental record, while providing revenue to State and Commonwealth Governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore with the aim of uncovering and developing resources. It is under the lease agreement that Woodside has determined the potential to develop the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations.

Woodside has established a number of research projects in order to understand the marine environments in which we operate, notably in the Exmouth Region and the Kimberley Region; including Rankin Bank, Glomar Shoal, Enfield Canyon and Scott Reef. Where scientific data do not exist, Woodside assumes that a pristine natural environment exists and therefore, implements all practicable steps to prevent damage. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions.

Woodside looks after the communities and environments in which we operate. Risks are inherent in petroleum activities; however, through sound management, systematic application of policies, standards, procedures and processes, Woodside considers that despite this risk, the extremely low likelihood of loss of well containment is acceptable.

Internal Context

The Petroleum Activities Program is consistent with Woodside corporate policies, standards, procedures, processes and training requirements as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including:

- Woodside Health, Safety, Environment and Quality Policy
- Woodside Risk Management Policy
- The SCE technical Performance Standards developed and implemented for the Julimar Field Production System.

Hydrocarbon spill preparedness and response strategies are considered applicable to the nature and scale of the risk and associated impacts of the response are reduced to ALARP.

Woodside's corporate values include working sustainably, with respect to the environment and communities in which we operate, listening to internal and external stakeholders and considering Health, Safety and Environment (HSE) when making decisions. Stakeholder consultation, outlined below, has been undertaken prior to the Petroleum Activities Program.

External Context – Societal Values

Woodside recognises that our licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. External stakeholder consultation, outlined below, has been undertaken prior to the Petroleum Activities Program:

- Woodside has consulted with AMSA and WA DoT on spill response strategies. A copy of the Oil Pollution First Strike Plan was provided to AMSA and DoT.
- Consultation with other relevant stakeholders (Section 5) and incorporation of stakeholder feedback into this EP where appropriate.
- By providing hydrocarbon spill response measures that are commensurate with the risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes that this addresses societal concerns to an acceptable level.

Other Requirements (includes laws, policies, standards and conventions)

The Petroleum Activities Program is consistent with laws, policies, standards and conventions, including:

- Accepted Safety Case (as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009)
- Mutual aid memorandum of understanding for relief well drilling is in place
- Accepted WOMP as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011
- Notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with Section 7.15.

The EMBA overlaps a number of BIAs for threatened and migratory species. Relevant species recovery plans and conservation advice have been considered during the impact assessment and, given the adopted controls, the Petroleum Activities Program is not considered to be inconsistent with the overall objectives and actions of these plans (Section 6.10).

Description of Source of Risk														
<p>The temporary presence of vessels in the Operational Area during Petroleum Activities Program may result in a navigational hazard for commercial shipping within the immediate area. This navigational hazard could result in a third-party vessel colliding with an activity vessel resulting in release of hydrocarbons.</p> <p>IMMR vessels have multiple isolatable diesel tanks typically located mid-ship and typically range in size from 22 to 250 m³.</p> <p>In the unlikely event of a vessel collision, the vessel will have the capability to pump marine diesel from a ruptured tank to a tank with spare volume in order to reduce the potential volume of fuel released to the environment.</p> <p>Industry Experience</p> <p>Registered vessels or foreign flag vessels in Australian waters are required to report events to the Australian Transport Safety Bureau (ATSB), AMSA or Australian Search and Rescue (AusSAR).</p> <p>From a review of the ATSB marine safety and investigation reports relevant to oil and gas industry vessels conducted for this EP (ATSB 2011), one vessel collision occurred in 2011/12 that resulted in a spill of 25–30 L of oil into the marine environment as a result of a collision between a tug and support vessel off Barrow Island. Two other vessel collisions occurred in 2010, one in the port of Dampier, where a support vessel collided with a barge being towed. Minor damage was reported and no significant injury to personnel or pollution occurred. The second 2010 vessel collision involved a vessel under pilot control in port connecting with a vessel</p>

alongside a wharf, causing it to sink. No reported pollution resulted from the sunken vessel. These incidents demonstrate the likelihood of low volume hydrocarbon releases in the unlikely event of a vessel collision.

From 2010 to 2011, the ATSB's annual publication defines the individual safety action factors identified in marine accidents and incidents: 42% related to navigation action (2011). Of those, 15% related to poor communication and 42% related to poor monitoring, checking and documentation (ATSB 2011). The majority of these related to the grounding instances.

Credible Scenario

The worst-case hydrocarbon spill scenario for a vessel collision is defined as a maximum volume of 250 m³ of marine diesel resulting from a catastrophic rupture and loss of the largest single diesel tank inventory on a vessel.

For a vessel collision to result in this remote but credible scenario several factors must align, as follows:

- vessel interaction must result in a collision
- the force of the collision should be sufficient to breach the vessel hull
- the tank breach must occur in the location of the fuel tank
- the fuel tank must be full, or at least of volume which is higher than the point of penetration.

The probability of this chain of events is considered remote.

Quantitative Hydrocarbon Risk Assessment

Analogous modelling was performed by RPS, on behalf of Woodside to determine the fate of marine diesel. Existing modelling was undertaken in 2022 for a release of 500 m³ of MDO ~6 km from the Operational Area. Given that the available modelling is 50% larger than then spill risk for this activity, within the same vicinity and slightly closer to Montebello Islands, it is deemed representative and additional modelling was therefore not required.

The modelling assessed the extent of a marine diesel spill for all seasons, using an historic sample of wind and current data for the region. The results of the modelling can be used to demonstrate that a marine diesel spill within the Operational Area has an EMBA that is not predicted to include any shoreline contact or accumulation at impact thresholds. A total of 200 replicate simulations were modelled over an annual period.

Hydrocarbon Characteristics

Marine diesel is a mixture of both volatile and persistent hydrocarbons. Predicted weathering of marine diesel, based on typical conditions in the region, indicates that around 72% of the oil mass is forecast to have entrained and a further 24% is forecast to have evaporated over the first 24 hours (Figure 6-6) (RPS 2022). After this time the majority of the remaining hydrocarbon is entrained into the upper water column, leaving only a small proportion of the oil floating on the water surface (<1%). Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay and/or evaporate over time scales of several weeks to a few months.

Given the environmental conditions experienced in the Operational Area, marine diesel is expected to undergo rapid spreading and this, together with evaporative loss, is likely to result in a rapid dissipation of the spill.

Marine diesel distillates tend not to form emulsions at the temperatures found in the region. The characteristics of the marine diesel are given in Table 6-13.

Table 6-13: Characteristics of the marine diesel

Hydrocarbon type	Initial density (g/cm ³) at 25 °C	Viscosity (cP @ 25 °C)	Component BP (°C)	Volatiles % <180	Semi volatiles % 180 to 265	Low volatility (%) 265 to 380	Residual (%) >380
				Non-Persistent			Persistent
Marine diesel	0.829	4.0	% of total	6	34.6	54.4	5

Consequence Assessment

Environmental Value(s) Potentially Impacted

EMBA

The EMBA covers a larger area than the area that would be affected during any single spill event, and therefore represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. The trajectory of a single spill would have a considerably smaller footprint. As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is discussed for each fate.

Surface Hydrocarbons

Quantitative hydrocarbon spill modelling results for surface hydrocarbons are shown in Table 6-14. If this scenario occurred, a surface hydrocarbon slick would form down-current of the release location, with the trajectory dependent on prevailing wind and current conditions at the time. The modelling indicates that the EMBA would be confined to open water, with surface hydrocarbons extending up to about 105 km and 65 km from the release location at or above the 1 g/m² and 10 g/m² impact threshold. A socio-cultural EMBA for surface hydrocarbons which includes the threshold for visible surface hydrocarbons of 1 g/m² may extend beyond the EMBA in which ecological impacts may occur.

Entrained Hydrocarbons

Quantitative hydrocarbon spill modelling results are shown in Table 6-14. If this vessel collision scenario occurred, a plume of entrained hydrocarbons would form down-current of the release location, with the trajectory dependent on prevailing current conditions at the time. The modelling indicates that locations exposed to entrained hydrocarbons at or above the threshold concentration of 100 ppb are restricted to offshore areas, islands, and reefs. Table 6-14 provides details of receptors potentially contacted by entrained diesel at or above 100 ppb.

Dissolved Hydrocarbons

Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted to be confined to offshore areas and reefs. Dissolved hydrocarbon concentrations above 400 ppb are not predicted to contact any sensitive receptor locations.

Accumulated Hydrocarbons

Hydrocarbon spill modelling results for accumulated hydrocarbons are shown in Table 6-14. No shoreline contact above impact threshold (i.e. social or ecological) level was predicted to occur.

Summary of Potential Impacts to Environmental Values

In the event of a 500 m³ release of marine diesel spill due to vessel collision, the modelling predicts a low probability (up to 19.5% and 5% [Table 6-14]) of receptors being contacted by entrained hydrocarbons >100 ppb and dissolved aromatic hydrocarbons >50 ppb, respectively. The greatest likelihood of contact is at the Montebello Marine Park (19.5% for entrained and 5% for dissolved) followed by Tryal Rocks (8.5% for entrained only). All other sensitive locations identified in Table 6-14 are predicted to have 3.5% or less probability of contact at entrained threshold concentrations. No other sensitivities were identified to be contacted by dissolved hydrocarbons above impact threshold. No shoreline accumulation was identified by the social or ecological threshold was identified either. Further, entrained hydrocarbons reaching these environments will be highly weathered, with the volatile and water soluble (often the most toxic) components expected to have dissipated. Surface hydrocarbons above 10 g/m² was only predicted to contact Montebello Marine Park with a 1.5% probability.

The potential impacts of spilled hydrocarbons to species (protected and otherwise), marine primary producers, other habitats and communities, water quality, marine sediment quality, air quality, protected areas and socio-economic values are described in detail in Section 6.8.3. The potential impacts of entrained hydrocarbons provided in Section 6.8.3, and the scale of impact described provides a suitable assessment for potential impacts of a 500 m³ release of marine diesel. As identified in Section 6.8.3, the probability of receptors being contacted by entrained hydrocarbons >100 ppb is up to 86%, by dissolved >50 ppb is 76% and surface hydrocarbons above 10 g/m² was 4%.

Impacts specific to a spill of marine diesel are summarised below. It is noted that the toxic components in marine diesel include alkylated naphthalene's which can be rapidly accumulated by marine biota including invertebrates such as marine oysters, clams, shrimp, as well as a range of vertebrates, such as finfish. Marine diesel also contains additives that contribute to its toxicity. Given the localised area of the potential EMBA and the rapid dispersion, dilution and weathering of a marine diesel spill, it is expected that any potential impacts will be low magnitude and temporary in nature.

Protected Species

As identified in Section 4.6 protected species including migrating pygmy blue whales may be encountered near the Operational Area, and therefore could be impacted in close proximity to the marine diesel spill location, where the volatile, water soluble and most toxic components of the diesel may be present. However, the window for exposure to hydrocarbons with the potential for any toxicity effects in these waters would be limited to a few days following the spill. Potential impacts may include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, organ or neurological damage leading to death. Given the absence of critical habitats or aggregation areas, cetaceans in the area are expected to be transient, and impacts are expected to be limited to individuals or small groups of animals. Impact on the overall population viability of cetaceans are not predicted.

There is also the potential for migrating whales, dugongs and coastal dolphin populations to be exposed in nearshore waters, however, the low concentrations and advanced degree of weathering of hydrocarbons in these nearshore waters is not expected to result in any discernible sublethal or lethal impacts to cetaceans.

The EMBA overlaps with BIAs for marine turtle internesting habitat, as identified in Section 4.6.2. Turtle internesting habitats, such as those in waters adjacent to the Montebello Islands, are predicted to have very limited or no exposure to surface or dissolved hydrocarbons above their respective impact threshold concentrations. Some marine turtles in these areas may be exposed to patchy occurrences of entrained hydrocarbons, which would be in an advanced state of weathering with reduced toxicity. Low concentrations are only capable of causing sublethal impacts to the most sensitive marine organisms and no lethal or sub-lethal impacts to marine turtles are expected in the BIAs. The potential for lethal and sub-lethal impacts to marine turtles is limited to small numbers of transient individuals that may be present in offshore waters near the release location.

Seabirds may also be exposed to marine diesel on the sea surface or upper water column, if resting or foraging in waters near to the spill. Impacts may include mortality due to oiling of feathers or the ingestion of hydrocarbons. However, due to the limited spatial extent of a marine diesel spill and limited window for exposure, population level impacts are not expected.

Other protected species that may occasionally transit through the area and may potentially be exposed to a marine diesel spill, include shark and ray species such as whale sharks and manta rays. Should sharks or rays be present in offshore waters near the Operational Area during the spill, direct impacts may occur if foraging within surface slicks or in the upper 20 to 30 m of the water column containing entrained hydrocarbons and dissolved aromatics. Contamination of their food supply and the subsequent ingestion of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

this prey may also result in long term impacts as a result of bioaccumulation. Impacts are again predicted to be limited to a small number of animals given the absence of key habitat and the low numbers of animals that may transit through the area during the short period when spilled hydrocarbons are present.

Given the limited number of animals that may be impacted and the rapid dispersion of marine diesel, it is considered that any potential impacts will be minor.

Other Species, Habitats and Communities

Within the EMBA for a marine diesel spill resulting from a vessel collision, there is the potential for plankton communities to potentially be impacted where entrained hydrocarbon threshold concentrations are exceeded. A range of lethal and sublethal impacts may occur to plankton exposed to entrained or dissolved hydrocarbons within the EMBA. Communities are expected to recover quickly (weeks/months) due to high population turnover (ITOPF 2011). It is therefore considered that any potential impacts would be low magnitude and temporary in nature. Pelagic fish populations in the open water offshore environment of the EMBA are highly mobile and have the ability to move away from a marine diesel spill. The spill-affected area would be confined to the surface layer and upper 20 to 30 m of the water column. It is therefore unlikely that fish populations would be exposed to widespread hydrocarbon contamination. Pelagic fish populations are distributed over a wide geographical area so impacts on populations or species level are considered to be negligible. Combined with these factors and the rapid dispersion of marine diesel, it is considered that any potential impacts will be minor.

Other communities (e.g. demersal fish, benthic infauna and epifauna) and key sensitivities (e.g. KEFs) occur within the EMBA, however will not be directly exposed or impacted by a marine diesel spill as hydrocarbons are confined to the upper layers of the water column.

Water Quality

It is likely that water quality will be reduced at the release location of the spill; however, such impacts to water quality would be temporary and localised in nature due to the rapid dispersion and weathering of marine diesel. The potential impact is therefore expected to be low.

Protected Areas

Entrained hydrocarbons at or exceeding the 100 ppb threshold have a low probability of contacting the Montebello, Ningaloo and Gascoyne Marine Parks. Entrained hydrocarbons are only predicted within the surface waters of the deep open waters of these protected areas, with no contact to seabed habitats or to shoreline contact. Potential impacts to water quality and the natural values (e.g. mobile protected species) in these areas would be temporary and localised in nature due to the rapid dispersion and weathering of the marine diesel, as described above.

Socio-economic

A marine diesel spill is considered unlikely to cause significant direct impacts on the target species fished by the Commonwealth and State active fisheries identified in Section 4.9.4 which overlap with the EMBA. The fisheries that operate within the EMBA predominantly target demersal fish species (demersal finfish and crustaceans) that inhabit waters in the range of >60 to 200 m depth, or pelagic species which are highly mobile. Therefore, a marine diesel spill is expected to only result in negligible impacts, considering that hydrocarbons are confined to the upper layers of the water column. Visible surface hydrocarbons at or exceeding 1 g/m² may also occur up to 53 km from the release site (RPS 2022), which may result in fouling of fishing gear and a perception of impacts to fish stocks by fisheries stakeholders and the public. There is the potential that a fishing exclusion zone would be applied in the area of the spill, which would put a temporary ban on fishing activities and therefore potentially lead to subsequent economic impacts on commercial fishing operators if they were planning to fish within the area of the spill. Such measures would likely be in place for less than a week and would not result in widespread or long-term impacts to fishing activities.

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that Sea Country, including marine ecosystems and species, archaeological heritage and heritage sites, marine parks, as well as intangible cultural heritage may be impacted in the event of a hydrocarbon release from a vessel collision. Cultural features and heritage values that have the potential to be impacted are considered in Section 6.8.3.

Summary of Potential Impacts to Environmental Values(s)

Given the adopted controls, the overall risk rating for an unplanned hydrocarbon release resulting from a vessel collision is Moderate based on a Minor consequence (short term impact: 1 to 2 years), to the high value receptors (marine fauna, AMPs, KEFs and commercial fishing), and a highly unlikely likelihood.

ALARP Statement: Based on the environmental risk assessment objectives and use of the relevant tools appropriate to the Decision Type (i.e. Decision Type A, Section 2.6.1), Woodside considers the adopted controls appropriate to manage the impacts and risks of an unplanned loss of hydrocarbon as a result of vessel collision. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability
Acceptability Statement: The impact assessment has determined that an unplanned loss of hydrocarbons as a result of a vessel collision represents a moderate current risk rating that is unlikely to result in potential impacts greater than localised, minor and temporary disruption to a small proportion of the population and have no impact on critical habitat or activity. Further opportunities to reduce the impacts and risks have been investigated above. Relevant recovery plans and conservation advice have been considered during the impact assessment and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. The adopted controls are consistent with the most relevant regulatory guidelines, good oil-field practice/industry best practice and meet the legislative requirements of Marine Orders 21, 27 and 30. The

Subsea Equipment Loss of Containment – Credible Scenario

The worst-case credible scenario for a subsea equipment Loss of Containment was assessed to be a short-term (5.2 hours) subsea release of 1,062 m³ of Brunello Condensate from a full-bore rupture at the JDP2 flowline inlet, representing worst-case loss of containment when the isolation between the Brunello and Julimar Production Flowlines is open and the inventory from three separate flowlines is released at once (Table 6-15).

Chemicals, gas and liquid hydrocarbons are present in subsea equipment and unplanned releases could also occur as minor weeps/seeps/bubbles. Many of these are planned design release locations, for gas, however unplanned releases of liquid hydrocarbons and chemicals could occur. Discharge of minor fugitive hydrocarbons from wells and subsea equipment (e.g. weeps/seeps/bubbles) could be identified during subsea inspection activities (refer to Section 3.9.1).

Refer to Section 6.8.2 for quantitative spill risk assessment methodology.

Table 6-15: Environmental impact analysis summary of planned and unplanned activities

Scenario	Hydrocarbon	Duration (hours)	Depth (m)	Latitude (GDS84)	Longitude (GDS84)	Total Oil Release (m ³)
Loss of containment when the isolation between the Brunello and Julimar Production Flowlines is open and the inventory from three separate flowlines is released at once.	Brunello Condensate	5.2	175	20°01'53.40"S	115°12'09.30"E	1,062

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in subsea system design and construction. In the company's recent history, it has not experienced any subsea integrity events that have resulted in significant environmental impacts. The Julimar Field Production System has never experienced a worst-case subsea loss of containment in its operational history.

Decision Type

A Decision Type A has been applied to this risk under the Guidance on Risk Related Decision Making (OGUK 2014). This scenario was considered to have a consequence rating of D – Minor, short-term impact (1 to 2 years) on species, habitat (but not affecting ecosystem function), physical or biological attribute.

Hydrocarbon Characteristics

Brunello condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi-volatile components. In general, ~45.5% of the oil mass should evaporate within the first 12 hours, a further 37.3% should evaporate within the first 24 hours and a further 10.3% should evaporate over several days. About 83% of the oil is predicted to evaporate within 24 hours and ~6.9% of the oil is shown to be persistent (RPS 2020).

Consequence Assessment**Environmental Value(s) Potentially Impacted****EMBA**

The EMBA for the loss of containment from subsea infrastructure is based on stochastic modelling which compiles data from multiple hypothetical worst-case spill simulations under a variety of weather and metocean conditions (as described in Section 6.8.2). Therefore, the EMBA covers a larger area than that which would be affected during any single spill event and represents the total extent of all the locations where hydrocarbon

thresholds could be exceeded from all modelled runs. The trajectory of a single spill would have a considerably smaller footprint.

This EMBA is significantly smaller than the overall EMBA for the Petroleum Activities Program which is based on the worst-case spill scenario (loss of well control), as detailed in Section 6.8.3. As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is discussed for each fate.

Surface Hydrocarbons

The probability contour figures for floating oil indicate that concentrations equal to or greater than the 10 g/m² impact threshold could potentially be found in the form of slicks up to 24 km from the spill site and at 1 g/m² (socio-economic threshold) up to 70 km from the spill site. The Montebello Marine Park is the only receptor with a probability (1.5%) of impact from floating oil concentrations greater than 10 g/m² as a result of the loss of subsea containment scenario.

Entrained and dissolved Hydrocarbons

Entrained oil concentrations equal to or greater than the 100 ppb impact threshold are predicted to be found up to 265 km from the spill site and dissolved aromatic hydrocarbon concentrations equal to or greater than the 50 ppb threshold are predicted to be found up to 215 km from the spill site. Rankin Bank (5%) and the Montebello Marine Park (22%) are the only receptors predicted to be impacted at the 100 ppb entrained threshold and are also the only receptors with potential impact at the 50 ppb dissolved threshold (2.5% and 11% respectively).

Accumulated Hydrocarbons

No receptors are predicted to receive shoreline oil at impact (100 g/m²) or socio-economic (10 g/m²) thresholds.

Consequence Assessment Summary

Table 6-16 presents all receptors that may be impacted by the loss of containment from subsea infrastructure EMBA (i.e. the sensitive receptors and their locations that may be exposed to hydrocarbons [including surface, entrained, dissolved and accumulated hydrocarbon fates] at or above the adopted thresholds). These receptors are described in Section 4.

The potential biological and ecological impacts of an unplanned hydrocarbon release as a result of a loss of containment from subsea infrastructure during the Petroleum Activity to these receptors are considered in MEE-01 (Section 6.8.3). No further assessment has been undertaken in this section.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS) ⁴⁶	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
<p>ALARP Statement:</p> <p>On the basis of the environmental assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.6.1) Woodside considers the adopted controls appropriate to manage potential risks associated with a low likelihood unplanned hydrocarbon release as a result of a loss of subsea containment.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of a loss of containment through design of subsea equipment integrity and ensuring the systems are operated within their design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The application of Woodside Risk Management Procedures, and Chevron implementation of the Wheatstone Offshore Facilities Safety Case and Environment Plan ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:</p> <ul style="list-style-type: none"> ongoing hazard identification, risk assessment and the identification of control measures ongoing integrity management of hardware control measures in accordance with the technical performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability. <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural controls, it is considered that the risks associated with a subsea loss of containment are managed to ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>The risk assessment has determined that an unplanned loss of hydrocarbon from subsea infrastructure represents a moderate current risk rating that is unlikely to result in potential consequence greater than minor and short-term disruption to species or habitat but not affecting ecosystem function. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice.</p> <p>Further opportunities to reduce the risks and consequences have been investigated above. The adopted controls are considered good oil-field practice / industry best practice. The potential risks and consequences are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of the described emissions, to a level that is broadly acceptable.</p>

6.9.3 Unplanned Hydrocarbon or Chemical Release: Hydrocarbon or Chemical during Transfer, Storage or Use

Context													
Vessels Operations – Section 3.6 Chemical Usage During IMMR Activities – Section 3.9.5		Physical Environment – Section 4.3 Biological Environment – Section 4.4 Protected Species – Section 4.5 KEFs – Section 4.7 Protected Places – Section 4.8 Socio-Economic Environment – Section 4.9						Consultation – Section 5					
Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Accidental discharge of hydrocarbons or chemicals from vessel activities, and equipment used in subsea IMMR activities.		X		X	X	X	A	E	3	M	LCS GP	Broadly Acceptable	EPO 12
Description of Source of Risk													
<p>Chemicals will be used during the Petroleum Activities Program for various purposes (refer to Section 3.8 and 3.9.5). Selection of chemicals is undertaken in accordance with the Woodside Chemical Selection and Assessment Environment Guideline. Spills of chemicals (including non-process hydrocarbons) can originate from equipment on the support vessel decks or subsea (refer to Section 7.2.3 for an assessment of the impacts of planned chemical discharges).</p> <p>IMMR</p> <p>Due to the short duration of IMMR activities, significant chemical/fluid storage volumes are not anticipated. Storage areas are typically set up with effective primary and secondary bunding to contain deck spills. Releases from equipment are predominantly from the failure of hydraulic hoses, which can either be located within bunded areas or outside of bunded or deck areas (e.g. over water on cranes).</p> <p>Woodside’s operational experience identifies that spills are most likely to originate from hydraulic hoses and have been <0.1 m³, with an average volume of <0.01 m³.</p> <p>The accidental discharge of hydrocarbons and/or chemicals to the subsea marine environment can result from the failure of seals on the field production system, resulting in leaks of MEG, subsea hydraulic fluids, scale inhibitor, etc. A MEG line or umbilical release could result in loss of control fluids ranging from 1 to 25 m³, based on the volumes contained in the flowlines. A valve loss of containment could result in control fluids leaking up to about 1 m³ per day.</p> <p>The ROVs used in IMMR activities require hydraulic fluid to function. This is supplied through hoses containing about 100 L of fluid. On occasion hydraulic lines to the ROV arms and other tooling may become caught which may potentially result in minor leaks to the marine environment. Hydraulic lines may be isolated to prevent full loss of inventory if a leak is detected.</p>

Consequence Assessment**Environmental Value(s) Potentially Impacted**

The largest LoC identified above was estimated to be up to 25 m³ of MEG; thus, this scenario was used in the following consequence evaluations.

Water Quality

Unplanned release of hydrocarbons or chemicals from vessels and equipment may decrease the water quality in the immediate area of the release. However, the impacts are expected to be temporary and very localised as only small volumes of hydrocarbons or chemicals (up to 25 m³) would be discharged. The unplanned releases are expected to rapidly disperse and dilute in the marine environment.

Given the offshore / open water location, the small and the infrequent nature of the release, unplanned release would result in no lasting effects and highly localised changes to the water quality (F).

Benthic Habitats and Communities

The benthic habitats within the Operational Area are representative of the NWMR and are primarily comprised of soft, sandy substrates grading to clay and silt with increasing water depth with some smaller areas of hard outcropping and site attached species (i.e. close to Wheatstone platform, in water depths <120 m), as described in Section 4.3. MEG toxicity is very low and it is on the OSPAR list of substances that are considered PLONOR. Unplanned MEG release is expected to mix with the receiving environment with no adverse impacts to habitats. Potential impacts to benthic communities as a result of unplanned discharges of hydrocarbons and/or chemicals at the volumes described above are expected to be negligible, with no lethal stress impacts. Due to the low abundance of benthic fauna in the Operational Area, the offshore / open water location, the small and the infrequent nature of the release, the unplanned release would result in no lasting effects and highly localised impacts to benthic habitats and communities (F).

Fish, Marine Reptiles and Marine Mammals

As a result of a change in water quality, potential impacts to marine fauna may occur. However, MEG toxicity is very low and it is on the OSPAR list of substances that are considered PLONOR. Unplanned MEG release is expected to mix with the receiving environment with no adverse impacts to marine fauna. The following values and sensitivities were identified within the Operational Area: a foraging BIA for the whale shark, interesting buffer BIA and habitat critical for the fatback turtle and a migration BIA for pygmy blue whale.

Given the small and the infrequent nature of the release, rapid dispersion and dilution and no sedentary behaviour was identified, potential impacts to these values and sensitivities are expected to be limited. Marine fauna, which is expected to be transient, would need to pass directly through the plume at the time the unplanned discharges are released. Therefore, slight, short-term impact on species but not affecting ecosystem function are expected (E).

KEFs and Protected places

Impacts to values and sensitivities located within the Montebello AMP are also unlikely, particularly as <1 km of the Operational Area (umbilical, MEG line and production flowlines with no valves) overlaps with 0.1% of the AMP boundary.

Similarly, potential impacts to the Ancient Coastline at the 125 m depth contour KEF (described in Section 4.7.1) are expected to be limited, particularly as no characteristics typical of this KEF have been identified during surveys of the relevant areas other than the outcroppings to the north-east of the Operational Area (i.e. close to Wheatstone platform, in water depths <120 m). Potential impacts to the Continental slope demersal fish communities KEF are not expected due to limited overlap with this KEF (~0.02%) and no overlap with the infrastructure was identified (Table 4-15).

Given the small and the infrequent nature of the release, rapid dispersion and dilution and limited overlapping with the KEFs and Montebello AMP, potential impacts to the values and sensitivities within these areas are expected to be limited. Therefore, no lasting effects and localised impacts to the values and sensitivities within these areas are expected (F).

Socio-economic

No impacts on socio-economic receptors are expected due to the low levels of fishing activity in the Operational Area (Table 4-24) and tourism and recreational activities (Section 4.9.6) the volumes of hydrocarbons/chemicals that could be unplanned released, and the localised and temporary nature of the impacts.

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by unplanned discharges of hydrocarbon/chemicals, such as marine mammals,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

whale sharks and marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle, et al. 2018). Whale species may be subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community. (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

	transportation and lifting operations.			
<p>ALARP Statement:</p> <p>On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.6.1) and Woodside's criteria for demonstrating ALARP (Section 2.8.1), Woodside considers the adopted controls are appropriate to manage potential risks associated with unplanned loss of hydrocarbon or chemical. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the risks are considered ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>The risk assessment has determined that an unplanned discharge of hydrocarbons or chemicals represents a low to moderate current risk rating that has the potential to result in short-term impact on species but not affecting ecosystem function. BIAs within the Operational Area include the whale shark foraging area, internesting buffer, and habitat critical for the flatback turtle and pygmy blue whale migration. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. The adopted controls are considered consistent with industry legislation, codes and standards, good practice and professional judgement and meet the requirements and expectations of Australian Marine Orders identified during impact assessment.</p> <p>The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of an unplanned discharge of chemicals/hydrocarbons to a level that is broadly acceptable.</p>

6.9.4 Unplanned Discharge: Loss of Hazardous or Non-Hazardous Waste/Equipment

Context													
Support Vessel Operations – Section 3.6	Physical Environment – Section 4.3						Consultation – Section 5						
	Biological Environment – Section 4.4												
	Protected Species – Section 4.5												
	Socio-Economic Environment – Section 4.9												
Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Accidental loss of solid hazardous and non-hazardous waste to the marine environment.	X	X			X	X	A	F	2	L	LCS GP	Broadly Acceptable	EPO 13
Description of Source of Risk													
<p>Non-hazardous and Hazardous Waste</p> <p>Normal operations on the support vessels generate a variety of hazardous and non-hazardous wastes. These materials could potentially impact the marine environment, if incorrectly disposed of, lost overboard or discharged in significant quantities.</p> <p>Non-hazardous wastes include domestic and industrial wastes such as paper and cardboard, aluminium cans, bottles, polystyrene, organics and scrap steel. Hazardous wastes include recovered solvents, excess or spent chemicals, oil contaminated materials (e.g. sorbents, filters and rags), batteries and used lubricating oils. Sand and sludges may be periodically generated during process and vessel maintenance.</p> <p>Equipment that has been recorded as being lost on previous activities has primarily been windblown or dropped overboard; and has included items such as personal protective equipment and small tools or materials. These events have occurred during backloading activities, periods of adverse weather and/or as a result of incorrect waste storage.</p> <p>All waste materials not suitable for discharge to the environment, including hazardous wastes (i.e. solid wastes), generated during the Petroleum Activities Program are transported to shore for disposal or recycling by Woodside’s licenced waste contractor.</p>													
Consequence Assessment													
Environmental Value(s) Potentially Impacted													
The potential impacts of hazardous or non-hazardous solid waste/equipment accidentally discharged to the marine environment include contamination of the environment as well as secondary impacts relating to potential contact of marine fauna with waste. This could result in entanglement or ingestion and lead to injury and death of individual animals depending on the nature of the waste. The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on

the location of the Operational Area, the types, size and frequency of wastes that could occur, and species presence.

Water and Sediment Quality

Hazardous solid wastes such as paint cans, oily rags, oil contaminated materials, etc., can cause localised contamination of the water and sediment through a release of toxins and chemicals. Given the small volumes of any unplanned solid waste discharge, and the infrequent nature of the event, these would result in no lasting effects and highly localised changes to the water quality and marine sediments (F).

Seabirds and Migratory Shorebirds, Fish, Marine Reptiles and Marine Mammals

Marine fauna most at risk from marine pollution include marine reptiles and seabirds, through ingestion or entanglement (Commonwealth of Australia 2017a, 2018). Ingestion or entanglement has the potential for physical harm which may limit feeding/foraging behaviours (Commonwealth of Australia 2017a, 2018) and thus can result in mortalities. Injury and fatality to vertebrate marine life caused by ingestion of, or entanglement in, harmful marine debris was listed, in 2003, as a key threatening process under the EPBC Act (Commonwealth of Australia 2018).

The Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (2018). listed harmful marine debris as a key threatening process under the EPBC Act. This harmful marine debris includes "land-sourced garbage, fishing gear from recreational and commercial fishing abandoned or lost to the sea, and vessel-sourced, solid, non-biodegradable floating materials disposed of or lost at sea". Marine debris has also been identified as threat in the Recovery Plan for Marine Turtles in Australia (2017a); however, ingestion of marine debris is particularly likely for turtles foraging in coastal waters.

The temporary or permanent loss of waste materials into the marine environment is not expected to have a significant environmental impact, based on the location of the Operational Area, nature and scale of activities that may generate wastes and the types, size and frequency of wastes that could occur. Consequently, only localised impacts to marine fauna at an individual level may occur (F).

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by unplanned loss of hazardous and non-hazardous waste/equipment, such as marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle, et al. 2018). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Demonstration of Acceptability

Acceptability Statement:

The risk assessment has determined that, given the adopted controls, accidental discharge of non-hazardous and hazardous wastes represents a low risk rating and is expected to result in a consequence no greater than highly localised impacts to water quality, marine sediment and marine species with no lasting effects.

Woodside, across its operations, has a well-established waste management culture which underpins a strong performance and limits the potential for accidental releases to the marine environment. Opportunities to reduce waste management impacts and risks are employed through standard practices such as job planning, implementation of the Waste Management Plan and job hazard analysis practices. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders.

Section 6.10 demonstrates that the Petroleum Activities Program is not inconsistent with any recovery plan of threat abatement plan for a listed threatened species of ecological community. Regard has also been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts.

On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.6.1), Woodside considers impacts/risks to be managed to a level that is broadly acceptable.

6.9.5 Physical Presence: Vessel Collision with Marine Fauna

Context													
Support Vessel Operations – Section 3.6				Protected Species – Section 4.5 Socio-Economic Environment – Section 4.9				Consultation – Section 5					
Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Physical presence of vessels resulting in collision with marine fauna					X	X	A	E	1	L	LCS	Broadly Acceptable	EPO 14
Description of Source of Risk													
<p>Activities associated with the Petroleum Activities Program will require vessels. Only vessel transiting within the Operational Area are within the scope of this EP, and therefore, assessed in this section. The type and number of vessels in the Operational Area at any one time, and the duration of presence, will differ depending on the activities being undertaken.</p> <p>Commissioning, and start up activities will be undertaken by a single support vessel and are expected to take one month to complete (Section 3.4). Inspection activities may take one to two weeks per campaign, and maintenance and repair activities, which are infrequent, may result in additional vessel time up to four weeks, depending on the scale and complexity of the work scope. On rare occasions, more than one vessel may be needed for IMMR (Section 3.6). Vessels for either activity are likely to be travelling <8 knots and/or will be stationary within the Operational Area.</p>													
Consequence Assessment													
Environmental Value(s) Potentially Impacted													
<p>Vessel collisions between the vessel (e.g. hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement and reproduction) and mortality. The frequency and severity of impacts due to collisions vary due to vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth), and the type of marine fauna potentially present and their behaviours.</p> <p>The likelihood of vessel/whale collision being lethal is mainly influenced by vessel speed; the greater the speed at impact, the greater the risk of mortality (Jensen, Silber and Calambokidis 2004, Laist, et al. 2001). Vanderlaan and Taggart (2007) found that lethal injury to large whales as a result of a vessel strike increases from about 20% at 8.6 knots (kn) to 80% at 15 kn. Vessels within the Operational Area are likely to be travelling <8 knots (and will often be stationary). Therefore, the risk of a vessel collision with protected species resulting in death is inherently low.</p>

Marine species listed as threatened and/or migratory have the potential to occur within the Operational Area. A foraging BIA for the whale shark, interesting buffer BIA and habitat critical for the flatback turtle and a migration BIA for pygmy blue whale was also identified. No known key aggregation areas (resting, breeding or feeding) are located within the Operational Area.

Marine Mammals, Sharks and Marine Reptiles

Laist et al. (2001) noted that individuals engaged in behaviours such as feeding, mating or nursing may be more vulnerable to vessel collision, when distracted by these activities. Some species responded by undertaking shallow dives at a slow descent, none showed signs of horizontal movement away from the approaching ship (Commonwealth of Australia 2017c). However, blue whales demonstrated limited behavioural response when being approached by ships (McKenna, et al. 2015). As previously described, lethal injury to large whales as a result of a vessel strike increases from about 20% at 8.6 kn to 80% at 15 kn (Vanderlaan and Taggart 2007). This data also suggest that the risk is <10% at a speed of four knots (Vanderlaan and Taggart 2007).

Vessel-whale collisions at this speed are uncommon and, based on reported data contained in the US NOAA database (Jensen, Silber and Calambokidis 2004), there only two known instances of collisions when the vessel was travelling at less than six kn. Both of these were from whale watching vessels that were deliberately placed among whales. Between 1988 and 2000 there were only three documented incidents involving small marine mammal (Commonwealth of Australia 2017c), such as dolphins, though it is difficult to determine if this is due to a lower collision rate or lower detection rate of incidents.

The pygmy blue whale migration BIA partially overlaps the northwestern part of the Operational Area; thus, individuals may occasionally be present during seasonal migrations (Table 4-10). However, based on recent satellite tracking and acoustic detection, pygmy blue whales travel further offshore in deeper waters (Thums, Ferreira, et al. 2022).

Whale sharks are at risk from vessel strikes when feeding at the surface or in shallow waters (where there is limited option to dive). Whale sharks migrate large distances and can be found in coastal offshore waters where they spend ~25% of their time <two metres from the surface and >40 % of their time in the upper 15 m of the water columns (Commonwealth of Australia 2017c).

The foraging BIA (northward from Ningaloo along the 200 m isobath) overlaps with the Operational Area. Whale sharks may traverse the Operational Area during their migrations to and from Ningaloo Reef (>180 km southwest of the Operational Area), where they form seasonal aggregations (TSSC 2015c). As such it is expected that their presence would be transitory and of a short duration (i.e. during spring).

A study by Hazel et al. (2007) recorded 60% of green turtles fleeing from vessels travelling at four km/h, while only 4% fled from vessels travelling at 19 km/h. This study concluded that most turtles would be unlikely to avoid vessels travelling at speeds greater than four km/h. Vessel disturbance, including collision, has been identified as a threat to marine turtles; however, is particularly an issue in shallow coastal foraging habitats and interesting areas (Commonwealth of Australia 2017a). The Plan also mentions that boat strike occurs in highly populated areas.

An interesting buffer BIA and habitat critical for the flatback turtle were identified overlapping the Operational Area. However, considering the absence of potential nesting or foraging habitat (i.e. no emergent islands, reef habitat or shallow shoals) and as identified in Section 4.6.2.1, the water depth within the Operational Area (>70 m) and distance from the closest coast (>45 km), it is unlikely that the Operational Area represents important habitat for marine turtles; therefore, only transient individuals are expected.

Given the previous details, it is not expected that vessel activities within the Operational Area could have a significant impact on marine fauna populations given (1) the low presence of transiting individuals, (2) no known key aggregation, feeding, mating or nursing areas were identified within the Operational Area (3) the Operational Area is not considered to be a 'confined migratory pathway' (e.g. no constraints preventing fauna from moving away from vessels to avoid injury) and (4) low operating speed of the activity support vessels (generally <eight knots or stationary, unless operating in an emergency). Activities are considered unlikely to result in a consequence greater than slight, short-term disruption to individuals or a small proportion of the population, and no impact on critical habitat or fauna activity (E).

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by a collision with a support vessel, such as marine mammals, whale sharks and marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic

Uncontrolled when printed. Refer to electronic version for most up to date information.

systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle, et al. 2018). Whale species may be subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, Donald Thomson: Observations of Animal Connections in Visual Ethnography in Northern Australia 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

<p>ALARP Statement:</p> <p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.6.1), Woodside considers the adopted controls appropriate to manage potential risks associated with potential vessel collision with marine fauna. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the risks are considered ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>The risk assessment has determined that, given the adopted controls, vessel collision with marine fauna represents a low current risk rating that is highly unlikely to result in a potential impact greater than slight, short term disruption to a small proportion of the population, and no impact on critical habitat or activity. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet the requirements of Part 8 (Division 8.1) of the EPBC Regulations 2000. The management of interactions with marine fauna is consistent with the objectives of approved conservation advice and recovery plans for marine fauna, including cetaceans and whale sharks, where human interference has been identified as a threat.</p> <p>The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of vessel collision with marine fauna to a level that is broadly acceptable.</p>

6.9.6 Physical Presence: Interaction with Live Infrastructure

Context													
Vessels Operations – Section 3.6 IMMR Activities – Section 3.9			Socio-Economic Environment – Section 4.9					Consultation – Section 5					
Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Interaction with live infrastructure from dropped objects.						X	A	E	1	L	GP	Broadly Acceptable	EPO 15
Description of Source of Risk													
<p>As detailed in Section 4.9.8, there is existing live subsea infrastructure in the Operational Area, which includes pipeline crossings the Pluto and Scarborough subsea system (operated by Woodside) and Chevron’s Wheatstone trunkline in close proximity (~220 m away at the closest point). During the Petroleum Activities Program, activities may be conducted that present a risk of dropped objects over the nearby live infrastructure.</p> <p>Dropped Objects</p> <p>There is the potential for objects to be dropped overboard from vessels to the marine environment. Objects that have been dropped during previous offshore activities include small numbers of personal protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners), hardware fixtures (e.g. riser hose clamp) and drill equipment (e.g. drill pipe). However, there is potential for larger equipment to be dropped during the activity, particularly during recovery of infrastructure from the seabed. The spatial extent in which dropped objects can occur is restricted to the Operational Area.</p>													
Consequence Assessment													
Environmental Value(s) Potentially Impacted													
<p>Interactions with other marine users</p> <p>In the unlikely event of an object being dropped on live infrastructure there is potential impacts to the infrastructure and the Operators of that infrastructure.</p> <p>As identified in Section 4.9.8, within the Operational Area, there is the Wheatstone pipeline owned and operated by Chevron, as well as the Pluto and Scarborough pipelines owned and operated by Woodside.</p> <p>If interactions with live infrastructure were to occur, Woodside would notify the relevant operations team in accordance with Appendix G (for Woodside assets), or Communication Strategy (for Chevron assets - see Section 7.9). This would trigger responses from the Operator to assess and respond to any damage caused in accordance with the relevant operations EP for the live infrastructure. Under Regulation 56 of the Environment Regulations, a titleholder may refer NOPSEMA to information previously given to NOPSEMA for another purpose under the OPGGS Act, the Environment Regulations or any other Regulations made under the Act, to comply with a requirement on the titleholder under the Environment Regulations to give NOPSEMA information or include information in a document. In accordance with this Regulation, NOPSEMA is referred to</p>													

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

the relevant operations EPs⁵⁴ submitted by the Operators of the live infrastructure, and accepted by NOPSEMA, for the detail of the Operators' assessment and response in such a scenario. Potential impacts therefore include time and costs associated with inspecting the infrastructure and time and costs associated with any associated repair, which are expected to be slight and short-term in nature.

Potential subsequent loss of containment

In the unlikely event of an object being dropped on live infrastructure, and in the further unlikely event of a severe interaction with the infrastructure, there is a possibility that live infrastructure could be ruptured releasing hydrocarbons into the marine environment in such a scenario. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs submitted by the Operators of the live infrastructure, and accepted by NOPSEMA, for the detail of potential impacts, receptors and the extent of the environment that may be affected in such a scenario, being:

- Wheatstone Project Start-up and Operations EP, Section 6.2.9 (NOPSEMA Doc. A853704 <https://docs.nopsema.gov.au/A853704>).
- Pluto Facility Operations Environment, MEE-05 (NOPSEMA Doc. A680743 <https://docs.nopsema.gov.au/A680743>)
- Scarborough Seabed Intervention and Trunkline Installation, Section 6.5.2 (NOPSEMA Doc. A1027151 <https://docs.nopsema.gov.au/A1027151>)

As detailed in the Section above, the EPs address the risks and impacts (interaction with live infrastructure) that arise from the activities under this EP (interaction from dropped objects). This EP also contains controls to prevent such an event from occurring that are within the operational control of this EP. As detailed in this Section, the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure is not within the operational control of this EP.

As detailed below, the risks and impacts of the activities under this EP are managed to ALARP and an acceptable level by implementing the SIMOPS plan and notifying the relevant Operators in the instance of an interaction with live infrastructure to allow the relevant Operator's detailed response strategies under the relevant operations EPs to be triggered, if required. In the event of a loss of containment caused by an interaction with live infrastructure Woodside will follow direction from the relevant Operator and will respond as per the relevant Operator's requirements. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs submitted by the Operators of the live infrastructure, and accepted by NOPSEMA, for the detail of the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure⁵⁶.

6.9.7 Physical Presence: Disturbance to Seabed from Dropped Objects

Context													
Support Vessel Operations – Section 3.6 IMMR – Section 3.9				Biological Environment – Section 4.4 Socio-Economic Environment – Section 4.9				Consultation – Section 5					
Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Dropped objects resulting in the disturbance of benthic habitat.	X	X		X		X	A	F	1	L	GP	Broadly Acceptable	EPO 16
Description of Source of Risk													
<p>During vessel operations, the primary cause for unplanned seabed disturbance is through dropped objects from the vessels.</p> <p>There is the potential for objects to be dropped overboard from the vessels to the marine environment. Objects that have been dropped during previous offshore activities include small numbers of personal protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners) hardware fixtures (e.g. riser hose clamp) and drill equipment (e.g. drill pipe); however, there is also potential for larger equipment to also be dropped during the activity. The spatial extent in which dropped objects can occur is restricted to the Operational Area.</p>													
Consequence Assessment													
Environmental Value(s) Potentially Impacted													
<p>In the unlikely event of an object being dropped into the marine environment, potential environmental impacts would be limited to minor physical impacts on benthic communities localised and temporary decline in water quality. In most cases, objects will be able to be recovered; however, there may be instances where objects are unable to be recovered due to health and safety, operational constraints or other factors such as the difficulty of recovering dropped objects at depth. When dropped objects are unable to be recovered, the impact to benthic habitat will continue to be minor but permanent.</p> <p>Water Quality</p> <p>Unplanned seabed disturbance may include localised and temporary decline in water quality due to increased suspended sediments. The potential impacts are expected to be localised to around the area of the dropped object and rapidly dissipate.</p> <p>The frequency (infrequent) and nature (usually small items) of this seabed disturbance is significantly smaller than those identified in planned seabed disturbance (Section 6.7.2). Therefore, turbidity resulting from the described activities is not expected to result in any significant environmental impacts. Thus, it would result in no lasting effects and highly localised changes to the water quality (F).</p> <p>Benthic Habitats and Communities</p>

The benthic habitats within the Operational Area are representative of the NWMR and are primarily comprised of soft, sandy substrates grading to clay and silt with increasing water depth with some smaller areas of hard outcropping and site attached species (i.e. close to Wheatstone platform, in water depths <120 m), as described in Section 4.3.1. In addition, two KEFs were identified:

- ancient coastline at 125 m depth contour (0.2% of the KEF [~31 km] crosses the eastern part of the Operational Area)
- continental slope demersal fish communities (~0.02% of the KEF [~6 km] overlaps the northwest of the Operational Area)

Due to the limited overlapping with either KEF and the infrequency of the potential impact, any unplanned seabed disturbance within the KEFs would be minor and relatively small compared to the size of them. Furthermore, as previously described, the benthic habitats within the Operational Area are representative of the NWMR.

Considering the type, size, scale and frequency of dropped objects that could occur and the low abundance of benthic fauna in the Operational Area, unplanned seabed disturbance would result in no lasting effects and highly localised impacts to benthic habitats and communities (F).

Cultural Values and Heritage

As described in Section 4.9.1 and above, the Operational Area partially overlaps the Ancient Coastline at 125 m depth contour KEF and therefore there is the potential that Indigenous Cultural features may exist and these may potentially be impacted during seabed disturbance resulting from dropped objects. While no cultural features have been identified in the Operational Area, further archaeological studies will be undertaken prior to the activity commencing to understand any potential cultural features.

6.9.8 Physical Presence: Accidental Introduction of Invasive Marine Species

Context													
Support Vessel Operations – Section 3.6 IMMR – Section 3.9			Biological Environment – Section 4.4 Socio-Economic Environment – Section 4.9				Consultation – Section 5						
Risk Evaluation Summary													
Source of Risk	Environmental Value Potentially Impacted						Evaluation						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Introduction and establishment of invasive marine species (IMS) in vessel ballast tanks or on vessels/submersible equipment.				X		X	A	E	1	L	LCS GP	Broadly Acceptable	EPO 17
Description of Source of Risk													
<p>During the Petroleum Activities Program, vessels and submersible equipment have the potential to introduce IMS through biofouling and ballast water exchange, cross contamination between vessels and vessel interactions with the Wheatstone facility. All vessels are subject to some level of marine fouling. Organisms may attach to the vessel hull, particularly in areas where organisms can find a good attachment surface (e.g. seams, strainers and unpainted surfaces), and/or in areas where turbulence is lowest (e.g. niches and sea chests). Organisms can also be drawn into ballast tanks during onboarding of ballast water as cargo is loaded or to balance vessels under load.</p> <p>During the Petroleum Activities Program vessels will transit to and from the Operational Area. Submersible equipment required for IMMR activities (e.g. ROV/AUV) is transported to and used within the Operational Area. There is the potential that this equipment may be used on other projects before being used on this activity. Consequently, there is the potential for IMS translocation.</p> <p>Vessels may be sourced from the local area (Dampier, Port Hedland, etc.) or from further afield (e.g. international waters), depending on the type of vessel required and the availability of vessels. Vessels arriving from international waters typically call into Dampier, where quarantine clearance including ballast log reviews is conducted in accordance with the <i>Biosecurity Act 2015</i>.</p>													
Consequence Assessment													
Environmental Value(s) Potentially Impacted													
Non-indigenous marine species (NIMS) are those species that have been introduced into a region beyond their natural biogeographic range and have the ability to survive, reproduce and establish founder populations. Not all NIMS introduced into an area will thrive or cause demonstrable impacts (i.e. become IMS) (DoF 2016). In WA, the greatest number of NIMS is found in the south-west corner of the State, Perth, Fremantle waters, Albany and Bunbury (DoF 2016). Only a subset of NIMS that become abundant and impact on social/cultural, human health, economic and/or environmental values can be considered IMS. For example, in WA waters, of the 60 known NIMS only seven species are consider IMS (Wells 2024).

Once introduced, IMS may prey on local species (which had previously not been subject to this kind of predation and therefore, not have evolved protective measures against the attack) (NOAA n.d.). IMS may outcompete indigenous species for food, habitat or light and can also interbreed with local species, creating hybrids such that the endemic species is lost (NOAA n.d.). These changes to the local marine environment result in changes to the natural ecosystem.

Potential IMS have historically been introduced and translocated around Australia by various natural (e.g. marine debris and ocean currents) and human means (e.g. biofouling and ballast water) (DCCEEW 2024). Potential IMS vary from one region to another depending on various environmental factors, such as water temperature, salinity, nutrient levels and habitat type, which dictate their survival and invasive capabilities. IMS typically require hard substrate in the photic zone, therefore requiring shallow waters to become established.

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas once established. If the introduction is detected early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

Despite the potential high consequence of an IMS being introduced and established in a high-value environment, the deep offshore open waters of the Operational Area (i.e. >70 m) result in low light levels at the seabed, which are not conducive to the settlement and establishment of IMS. Furthermore, the distance to the closest island (~46 km [Montebello Islands]), mainland coast (~130 km) and large port (~160 km [Dampier]) are also not conducive to the settlement and establishment of IMS.

Table 6-17 provides an assessment of the IMS impacts and risks associated with the Petroleum Activity.

Epifauna and Infauna

Epifauna and infauna are susceptible to impacts from IMS due to the risk of changes to the ecosystem dynamics such as competition for resources and predation.

Benthic productivity on the outer continental shelf and slope is low, and is a function of water depth, low nutrient availability, and the absence of hard substrates. Studies completed within the region indicate that benthic composition in deep-water habitats is generally lower in abundance than shallow water habitats of the region (Brewer, et al. 2007, DEWHA 2008). As described in Section 4.4, surveys within the Operational Area (RPS 2010, 2011) have found that benthic epifauna associated with the soft sediment seabed habitat comprise sparsely (<5%) distributed filter and deposit feeding invertebrates. The benthic infauna and epifauna found within the Operational Area are representative of the wider NWMR (and EMBA) (Brewer, et al. 2007, Rainer 1991).

The relatively deep offshore open waters of the Operational Area (>70 m) are not conducive to the settlement and establishment of IMS due to low light levels. Furthermore, the Operational Area is away from shorelines and/or critical habitat. Consequently, as identified in Table 6-17, impact to epifauna/infauna in the Operational Area is not considered credible.

Industry, Shipping, Defence

The establishment of IMS has the potential to cause changes to the functions, interests or activities of other users through indirect impact such as changes to fisheries target species resulting in economic and social implications, or due to compromised reputation to the oil and gas industry.

Given translocation to, and colonisation of IMS to the Operational Area is not considered credible, vessel activities is not expected to result in establishment of IMS, and as such not adversely affect other marine user activities in the region.

Based on the impact evaluation, the magnitude of potential impacts of a change to the functions, interests or activities of other users is slight (see Table 6-17). Leading to a Slight (E) risk consequence.

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that ecosystem health that may be affected by accidental introduction and establishment of IMS, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

Listening and talking with Country, which includes Sea Country, through stories, songlines, and other practices are ways Traditional Custodians care for, navigate, and connect with Country (Woodward, et al. 2020). Songlines rely on the continued health of Country, and people's continued access and connection to it

(McConnell, et al. 2021). When Country is damaged or altered, so too are songlines and the knowledge they embody and enact (McConnell, et al. 2021).

As described above, translocation to, and colonisation of IMS to the Operational Area is not considered credible, as such, no impact pathway to a change in access to Country from an accidental introduction and establishment of IMS within the Operational Area are anticipated. Cultural values and intangible cultural heritage associated with ecosystem health are expected to be maintained.

Summary of Potential Impacts to Environmental Values

In support of Woodside's assessment of the impacts and risks of IMS introduction associated with the Petroleum Activities Program, a risk and impact evaluation of the different aspects of marine pest translocation associated with the activity was conducted. The results of this assessment are presented in Table 6-17.

As a result of this assessment, Woodside has presented the highest potential environment consequence as E 'slight, short-term local impact' and a likelihood as Remote (0), resulting in an overall low risk following the implementation of identified controls.

Table 6-17: Assessment of the impacts and risks of invasive marine species introduction associated with the Petroleum Activity

IMS introduction aspect	Credibility of introduction	Consequence of introduction	Likelihood
Transfer of IMS from infected vessel to the Operational Area and establishment on the seafloor or subsea infrastructure.	Not Credible The deep offshore open waters of the Operational Area (i.e. >70 m), away from shorelines and/or critical habitat and >46 km from a shore, are not conducive to the settlement and establishment of IMS.		
Transfer of IMS from infected vessel to and subsequent establishment on the Wheatstone Platform.	Not Credible The translocation of IMS from a colonised vessel to the Wheatstone Platform is not considered credible. The Platform is located in an offshore, open ocean, deep environment. Woodside is not the operator and therefore, interaction with this infrastructure is not expected.		
Introduced to Operational Area and establishment on a vessel.	Credible There is potential for the transfer of marine pests between vessels within the Operational Area.	Environment – Not Credible The translocation of IMS from a colonised vessel to shallower environments via natural dispersion is not considered credible, given that the Operational Area is >46 km from nearshore environments. There is, therefore, no credible environmental risk and the assessment is limited to Woodside's reputation. Reputation – E If IMS were to establish on a vessel, this could potentially impact the vessel operationally through the fouling of intakes, result in translocation of an IMS into the Operational Area. Depending on the species, potentially transfer of an IMS to other support vessels, which would likely result in the quarantine of the vessel until eradication could occur (through cleaning and treatment of	Remote (0) Interactions between vessels will be limited to the Petroleum Activities Program. A minimum of 500 m safety exclusion zones will be adhered to around the vessel, and interactions limited to short periods of time alongside (i.e. during some IMMR activities). There is also no direct contact (i.e., they are not tied up alongside) during these activities. Spread of marine pests via ballast water or spawning in these open ocean environments is also considered remote.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		infected areas), which would be costly to perform. Such introduction would be expected to have slight impact to Woodside's reputation, particularly with Woodside's contractors, and would likely have a reputational impact on future proposals.	
Transfer of IMS from infected vessel to and subsequent establishment on platform, then transfer of IMS to a secondary vessel from the Wheatstone Platform.	Not Credible The risk is considered so remote that it is not credible for the purposes of the Petroleum Activity. The transfer of a marine pest from an infected vessel to the Wheatstone Platform is considered not credible. Furthermore, for a marine pest to then establish into a mature spawning population on the platform and then transfer to another support vessel is not considered credible (i.e. beyond the Woodside risk matrix). The Platform is located in an offshore, open ocean, deep environment. Woodside is not the operator and therefore, interaction with this infrastructure is not expected.

inspections or cleaning) will be implemented to minimise the likelihood of IMS being introduced.				
Professional Judgement – Eliminate				
No discharge of ballast water during the Petroleum Activities Program.	F: No. Ballast water discharges are critical for maintaining vessel stability. Given the nature of the Petroleum Activities Program, the use of ballast (including the potential discharge of ballast water) is considered to be a safety critical requirement. CS: Not assessed, control not feasible.	Not assessed, control not feasible.	Not assessed, control not feasible.	No
Eliminate use of vessels.	F: No. Given that support vessels must be used to implement project, there is no feasible means to eliminate the source of risk. CS: Loss of the project.	Not assessed, control not feasible.	Not assessed, control not feasible.	No
Professional Judgement – Substitute				
Source vessels based in Australia only	F: Potentially. Limiting activities to only use local support vessels could potentially pose a significant risk in terms of time and duration of sourcing a vessel, as well as the ability of the local vessels to perform the required tasks. For example, there are limited installation vessels based in Australian Waters. While the project will attempt to source support vessels locally it is not always possible. Availability cannot always be	Sourcing vessels from within Australia will reduce the likelihood of IMS from outside Australian waters, however, it does not reduce the likelihood of introduction of species native to Australia but alien to the Operational Area and NWMR, or of IMS that have established elsewhere in Australia. The consequence is unchanged.	Disproportionate. Disproportionate. Sourcing vessels from Australian waters may result in a reduction in the likelihood of IMS introduction to the Operational Area; however, the potential cost of implementing this control is grossly disproportionate to the minor environmental gain (or reducing an already remote likelihood of IMS introduction)	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS) ⁵⁷	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	<p>guaranteed when considered competing Oil and Gas activities in the region. In addition, sourcing Australian based vessels only will cause increases in cost due to pressures of support vessel availability.</p> <p>CS: Significant cost and schedule impacts due to restrictions of vessel hire opportunities.</p>		<p>potentially achieved by using only Australian based vessels, consequently this risk is considered not reasonably practicable.</p>	
Inspect all vessels for IMS	<p>F: Yes. Approach to inspect vessels could be a feasible option.</p> <p>CS: Significant cost and schedule impacts. In addition, Woodside's IMS risk assessment process is seen to be more cost effective as this control allows Woodside to manage the introduction of marine pests through biofouling, while targeting its efforts and resources to areas of greatest concern.</p>	<p>Inspection of all vessels for IMS would reduce the likelihood of IMS being introduced to the Operational Area. However, this reduction is unlikely to be significant, given the other control measures implemented. No change in consequence would occur.</p>	<p>Disproportionate. The cost/sacrifice outweighs the benefit gained, as other controls to be implemented achieve an ALARP position.</p>	No
Professional Judgement – Engineered Solution				
None identified				
<p>ALARP Statement:</p> <p>On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.6.1), Woodside considers the adopted controls appropriate to manage the impacts and risks of introducing IMS. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>The risk assessment has determined that, given the adopted controls, translocation of IMS may result in slight impact, and the likelihood of introducing IMS to the Operational Area and then subsequently to the Wheatstone Platform is considered highly unlikely. BIAs within the Operational Area include the EIO pygmy blue whale</p>

migration BIA, flatback turtle interbreeding BIA, whale shark foraging BIA, and wedge-tailed shearwater breeding BIA. However, these species are not expected to be impacted by IMS.

Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good practice/industry best practice. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS to an acceptable level.

6.10 Recovery Plan and Threat Abatement Assessment

As described in Section 1.10.4, NOPSEMA will not accept an EP that is inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community. This section describes the assessment that Woodside has undertaken to demonstrate that the Petroleum Activities Program is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- *Recovery Plan for Marine Turtles in Australia 2017–2027* (Commonwealth of Australia 2017a).
- *Conservation Management Plan for the Blue Whale 2015–2025* (Commonwealth of Australia 2015).
- *Recovery Plan for the Grey Nurse Shark (Carcharias taurus) 2014* (Commonwealth of Australia 2014).
- *Sawfishes and River Sharks Multispecies Recovery Plan* (Commonwealth of Australia 2015).
- *Recovery Plan for the White Shark (Carcharodon carcharias)* (Commonwealth Australia 2013).
- *National Recovery Plan for albatrosses and petrels* (Commonwealth of Australia 2022).
- *National Recovery Plan for the Australian Fairy Tern (Sternula nereis nereis)* (Commonwealth of Australia 2020).
- *National Recovery Plan for the Australian Painted Snipe (Rostratula australis)* (Commonwealth of Australia 2022).
- *National Recovery Plan for the Southern Right Whale (Eubalaena australis)* (DCCEEW 2024).
- *Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018* (Commonwealth of Australia 2018).

Table 6-18 lists the objectives and (where relevant) the action areas of these plans, and also describes whether these objectives/action areas are applicable to government, the Titleholder, and/or the Petroleum Activities Program. For those objectives/action areas applicable to the Petroleum Activities Program, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the activity are clearly inconsistent with that action or not. The results of this assessment against relevant actions are presented in Table 6-19 to Table 6-22.

	Government	Titleholder	Petroleum Activities Program
Primary Objective			
<p>To assist the recovery of the white shark in the wild throughout its range in Australian waters with a view to:</p> <ul style="list-style-type: none"> improving the population status leading to future removal of the white shark from the threatened species list of the EPBC Act ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future. 	Y	Y	Y
Specific Objectives			
Develop and apply quantitative measures to assess population trends and any recovery of the white shark in Australian waters and monitor population trends.	Y		
Quantify and minimise the impact of commercial fishing, including aquaculture, on the white shark through incidental (illegal and/or accidental) take, throughout its range in Australian waters.	Y		
Quantify and minimise the impact of recreational fishing on the white shark through incidental (illegal and/or accidental) take, throughout its range in Australian waters.	Y		
Where practicable minimise the impact of shark control activities on the white shark.	Y		
Investigate and manage (and where necessary reduce) the impact of tourism on the white shark.	Y		
Quantify and minimise the impact of international trade in white shark products through implementation of CITES provisions.	Y		
Continue to identify and protect habitat critical to the survival of the white shark and minimise the impact of threatening processes within these areas	Y		
Continue to develop and implement relevant research programs to support the conservation of the white shark.	Y		
Promote community education and awareness in relation to white shark conservation and management.	Y		
Encourage the development of regional partnerships to enhance the conservation and management of the white shark across national and international jurisdictions.	Y		
Albatrosses and petrels National Recovery Plan			
Long-term recovery objective: The populations of albatross and petrel species breeding and/or foraging in Australia's jurisdiction have increased to such a size that each species no longer qualifies for listing as threatened under any of the EPBC Act listing criteria.	Y	Y	Y

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
Strategies to achieve the objective			
Ensure ongoing protection of albatross and petrel breeding sites and habitats in Australia's jurisdiction.	Y	Y	Y
Improve the understanding of the size, structure and population trends for albatrosses and petrels breeding in Australia's jurisdiction.	Y		
Improve effectiveness of management measures that reduce land-based threats to albatrosses and petrels breeding in Australia's jurisdiction.	Y	Y	
Improve effectiveness of management measures that reduce marine-based threats to albatrosses and petrels foraging in Australia's jurisdiction.	Y	Y	Y
Improve understanding of generalised threats to albatrosses and petrels breeding and foraging within Australia's jurisdiction.	Y	Y	Y
Improve community awareness of the conservation of albatrosses and petrels.	Y		
Achieve substantial progress towards global conservation of albatrosses and petrels in international conservation and fishing forums.	Y		
Action Areas			
A. Assessing and addressing threats			
A.1: Ongoing protection of albatross and petrel species breeding sites and habitats in Australia's jurisdiction	Y		
A.2: Prevent introduction of alien species to breeding islands in Australia's jurisdiction	Y	Y	
A.3: Identify whether competition with native species is causing population declines	Y		
A.4: Identify diseases likely to have a population-level effect on breeding populations	Y		
A 5: Avoid or minimise incidental catch (or bycatch) of seabirds during fishing operations in Australia's jurisdiction	Y		
A 6: Advocate for effective international measures for conserving albatrosses and petrels	Y		
A 7: Minimise the effects of marine debris, plastics and pollution	Y	Y	Y
B. Enabling and Measuring Recovery			
B.1: Monitor population and conservation status of breeding populations in Australia's jurisdiction	Y		
B.2: Monitor the effects of fishing on albatrosses and petrels in Australia's jurisdiction	Y		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
B.3: Increase community understanding of and involvement in the conservation of albatrosses and petrels	Y		
B 4: Increase understanding of the effects of climate change on albatrosses and petrels in Australia and identify ways to increase the resilience of the species to these effects.	Y		
B 5: Implement statutory requirements	Y		
Australian Fairy Tern Recovery Plan			
Long-term recovery objective: The Australian Fairy Tern population has increased in size to such an extent that the species no longer qualifies for listing as threatened under any of the Environment Protection and Biodiversity Conservation Act 1999 listing criteria.	Y	Y	Y
Strategies to achieve objectives			
Manage and protect known Australian Fairy Tern breeding populations at the landscape scale	Y		
Develop and apply techniques to measure changes in population trend(s) in order to measure the efficacy of recovery actions	Y		
Reduce, or eliminate threats at breeding, non-breeding and foraging sites	Y	Y	
Undertake research and monitoring to improve understanding of breeding, non-breeding and foraging ecology in order to better target management actions and habitat restoration	Y		
Engage community stakeholders in Australian Fairy Tern conservation	Y		
Coordinate, review and report on recovery progress	Y		
Australian Painted Snipe Recovery Plan			
Long-term recovery objective: The Australian Painted Snipe population has increased in size to such an extent that the species no longer qualifies for listing as threatened under any of the Environment Protection and Biodiversity Conservation Act 1999 listing criteria.	Y	Y	Y
Strategies to achieve objectives			
Manage and protect known Australian Painted Snipe habitat at the landscape scale	Y		
Develop and apply techniques to measure changes in population trajectory in order to measure the success of recovery actions	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
Reduce, or eliminate threats at breeding and non-breeding habitats	Y	Y	
Undertake research to improve knowledge of the habitat requirements, biology and behaviour of Australian Painted Snipe	Y		
Engage community stakeholders to improve awareness of the conservation of Australian Painted Snipe	Y		
Coordinate, review and report on recovery progress	Y		
<i>Southern Right Whale Recovery Plan</i>			
Long-term Recovery Objective: The long-term vision for the recovery of the southern right whale is that the population has increased in size to a level that the conservation status has improved, and the species no longer qualifies for listing as threatened under any of the EPBC Act listing criteria.	Y	Y	Y
<i>Interim Recovery Objectives</i>			
Current levels of Commonwealth and State legislative and management protection for southern right whales are implemented, maintained, or improved, so threats continue to be managed and reduced over the life of the plan	Y	Y	Y
Anthropogenic threats are managed consistent with ecologically sustainable development principles to facilitate recovery of southern right whales	Y	Y	Y
Population dynamics, including demographics, distribution, residency, and coastal movement across the species range are monitored and quantified using robust, standardised, best-practice methodology to assess population recovery	Y		
The population structure of southern right whales in Australian waters is clearly characterised, including the level of interchange of individuals among coastal reproductive areas, to evaluate the degree to which the western and eastern populations are separate populations and inform the degree of connectivity with other southern right whale populations (e.g., New Zealand)	Y		
Capability of First Nation Australians, research, citizen science, and general community groups is improved to assist in addressing recovery actions of southern right whales in Australia	Y		
<i>Action Areas</i>			
A. Assessing and addressing threats			
A1. Maintain, implement, and improve efficacy of current legislative and management protection	Y		
A2. Address habitat degradation impacts from coastal and offshore marine infrastructure developments	Y	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
A3. Understand impacts of climate variability and anthropogenic climate change on population recovery	Y		
A4. Manage and mitigate the threat of entanglements from commercial active or discarded fishing gear	Y		
A5. Assess, manage, and mitigate impacts from anthropogenic noise	Y	Y	
A6. Manage, minimise, and mitigate the threat of vessel strike.	Y	Y	
B. Measuring recovery			
B1. Measure and monitor population demographics and recovery	Y		
B2. Characterise population structure	Y		
B3. Determine migratory paths and offshore distribution	Y		
B4. Improve capability of First Nation Australians, research, citizen science, and general community groups to assist management of southern right whales	Y		
Marine Debris Threat Abatement Plan			
Objectives			
Contribute to long-term prevention of the incidence of marine debris	Y	Y	
Understand the scale of impacts from marine plastic and microplastic on key species, ecological communities and locations	Y	Y	Y
Remove existing marine debris	Y		
Monitor the quantities, origins, types and hazardous chemical contaminants of marine debris, and assess the effectiveness of management arrangements for reducing marine debris	Y		
Increase public understanding of the causes and impacts of harmful marine debris, including microplastic and hazardous chemical contaminants, to bring about behaviour change	Y

Table 6-19: Assessment against relevant actions of the Marine Turtle Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	Relevant EPO and PS
Marine Turtle Recovery Plan	Action Area A3: Reduce the impacts from marine debris.	Action: Support the implementation of the Marine Debris Threat Abatement Plan (TAP). <u>Priority actions at stock level:</u> G-NWS – Understand the threat posed to this stock by marine debris. LH-WA – Determine the extent to which marine debris is impacting Loggerhead turtles. F-Pil – No relevant actions.	Refer to Section 6.9.4 Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to marine turtles. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the Petroleum Activities Program.	EPO 13 PS 13.1
	Action Area A4: Minimise chemical and terrestrial discharge.	Action: Ensure spill risk strategies and response programs adequately include management for marine turtles and their habitats, particularly in reference to 'slow to recover habitats'; e.g. nesting habitat, seagrass meadows or coral reefs. <u>Priority actions at stock level:</u> G-NWS – Ensure that spill risk strategies and response programs include management for turtles and their habitats. LH-WA & F-Pil – Ensure that spill risk strategies and response programs include management for turtles and their habitats, particularly in reference to slow to recover habitats, e.g. seagrass meadows or corals	Refer to Section(s) 6.8.3, 6.9.1 and 6.9.2. Not inconsistent assessment: The assessment of accidental release of hydrocarbons has considered the potential risks to marine turtles. Spill risk strategies and response program include management measures for turtles and their nesting habitats.	Refer to Section(s) 6.8.3, 6.9.1 and 6.9.2. Detailed oil spill preparedness and response performance outcomes, standards and measurement criteria for the Petroleum Activities Program are present in Appendix D.
	Action Area A8: Minimise light pollution.	Action: Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats. <u>Priority actions at stock level:</u> G-NWS – As above. LH-WA – No relevant actions.	Refer to Section 6.7.7 Not inconsistent assessment: The assessment of light emissions has considered the potential impacts to marine turtles. Internesting, mating, foraging or migrating turtles are not impacted by light from offshore vessels.	EPO 8b PS 8.1, 8.2, 8.3

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	Relevant EPO and PS
		F-Pil – Manage artificial light from onshore and offshore sources to ensure biologically important behaviours of nesting adults and emerging/dispersing hatchlings can continue.		
	Action Area B3: Address information gaps to better facilitate the recovery of marine turtle stocks.	Action: Understand the impacts of anthropogenic noise on marine turtle behaviour and biology. <u>Priority actions at stock level:</u> G-NWS – Given this is a relatively accessible stock that is likely to be exposed to anthropogenic noise – Investigate the impacts of anthropogenic noise on turtle behaviour and biology and extrapolate findings from the North West Shelf stock to other stocks. LH-WA – No relevant actions. F-Pil – No relevant actions.	Refer to Section 6.7.3 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to marine turtles. Noise related to the Petroleum Activities Program is not expected to result in behavioural response, injury or mortality of individuals, or any other lasting effect.	EPO 4a, b PS 4.1, 4.3
Assessment Summary The Marine Turtle Recovery Plan has been considered during the assessment of impacts and risks and the Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-20: Assessment against relevant actions of the Blue Whale Conservation Management Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	Relevant EPO and PS
Blue Whale Conservation Management Plan	Action Area A2: Assessing and addressing anthropogenic noise.	Action 2: Assessing the effect of anthropogenic noise on blue whale behaviour. Action 3: Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to use the area without injury and is not displaced from a foraging area.	Refer to Section 6.7.3 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to pygmy blue whales. Acoustic emissions from vessels will not cause injury to any pygmy blue whale. There are no known or possible foraging areas for pygmy blue whales within or adjacent to the Operational Area. If the Petroleum Activities Program overlaps with an individual	EPO 4a, b PS 4.1, 4.4

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	Relevant EPO and PS
			northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration.	
	Action Area A4: Minimising vessel collisions	Action 3: Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented.	Refer to Section 6.9.5 Not inconsistent assessment: The assessment of vessel collision with marine fauna has considered the potential risks to pygmy blue whales. Vessel collisions with pygmy blue whales are highly unlikely to occur, given the low operating speed of support vessels.	EPO 14 PS 4.1, 4.4
	Action Area B3: Describing spatial and temporal distribution and defining biologically important habitat.	Action 2: Identify migratory pathways between breeding and feeding grounds. Action 3: Assess timing and residency within biologically important areas.	Not inconsistent assessment: Woodside contributes to Action Area B3 via its support of targeted research initiatives (e.g. satellite tracking of pygmy blue whale migratory movements).	N/A

Assessment Summary

The Blue Whale Conservation Management Plan has been considered during the assessment of impacts and risks and the Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan.

7. IMPLEMENTATION STRATEGY

7.1 Overview

Regulation 22 of the Environment Regulations requires an EP to contain an implementation strategy for the activity. The implementation strategy for the Petroleum Activities Program confirms fit-for-purpose systems, practices and procedures are in place to direct, review and manage the activities so that environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and PS outlined in this EP are achieved.

Woodside, as Operator, is responsible for ensuring that the Petroleum Activities Program is managed in accordance with this Implementation Strategy and the WMS (Section 1.8).

7.2 Systems, Practice, and Procedures

All operational activities are planned and performed in accordance with relevant legislation and standards, management measures identified in this EP and internal environment standards and procedures (Section 6). The systems, practices and procedures that will be implemented are listed in the Performance Standards adopted in Section 6.

Document names and reference numbers may be subject to change during the statutory duration of this EP and is managed through a Change Register and update process.

7.2.1 WMS Operate Processes

Under the WMS Operate Activity (see Section 1.9 for an overview of the WMS), there are four overarching processes; those directly relevant to the implementation of this EP and environmental management during the Petroleum Activities Program are described below (Operate Plant Process and the Maintain Assets Process).

7.2.1.1 Operate Plant

The objective of the Operate Plant Process is to ensure production is carried out in a safe, efficient, reliable and economic manner, and that all required process variables are within allowable limits. This ensures the potential for unplanned (accident/incident) events that may impact the environment are minimised. The Operate Plant Process develops key activities to support ongoing production activities to ensure the facility is operated within the Basis of Design. The process also identifies required production routines, routine execution, recording of data gathered and formulation of remedial activities. The Operate Plant Process includes the Integrated Safe System of Work (ISSoW) system (described below).

In addition, the Operating Practice MSPS (M02) is in place to assure operating practices are in place, such that:

- integrity-critical operating procedures are available, accurate, up to date, understood and used
- safe operating and technical integrity limits are defined, understood and the process is managed within these limits
- The Julimar Field Production Systems Operating Manual describes what is undertaken and “how” Chevron must “operate” the wells that are under its control. This key document is developed and maintained by Woodside and the requirements executed by Chevron. It describes the requirements for operating the Julimar-Brunello field including reference to relevant operating and maintenance procedures. It also defines the relevant emergency response bridging documents and communication arrangements.

7.2.1.1.1 Permit to Work

The *Wheatstone Platform Permit to Work Manual* process outlines the key systems and practices required to achieve effective management of permit-controlled work. The PTW system is a key element in ensuring that all necessary steps are taken to manage the safety of personnel, protection of the environment and technical integrity of the facility and the Julimar Field Production System. Vessels liaise with the Wheatstone Platform to obtain a PTW prior to working on subsea infrastructure, JDP3 commissioning.

The PTW system takes a risk-based approach to all activities with tasks with higher levels of risk subjected to greater scrutiny and control. The PTW system also allows for low-risk routine tasks to be carried out with minimal but adequate administration. The primary objective of PTW is to ensure that work meets regulatory requirements, as well as internal requirements for how to safely manage the execution of work. Specifically, that activities are properly planned, risk assessed, controlled, co-ordinated, and safely executed. It provides a methodical approach to identify hazards, assess risks, create and support permits to work and associated certificates.

In keeping with ALARP principles, this system is critical to ensuring the appropriate level of hazard identification and risk assessment is carried out for activities performed on the Julimar Field Production System.

In addition, the Safe Work Control MSPS (M04) is in place to assure effective safe work control, permit to work and task risk management arrangements are in place and followed to control the risks arising from work activities.

7.2.1.2 Maintain Assets

The Maintain Assets Process aims to improve the reliability and availability of plant and equipment (which includes that required for safe operation) through well managed and planned execution of maintenance that promotes a proactive maintenance culture.

Maintenance, inspection and testing systems and procedures are in place to safeguard the integrity of the Julimar Field Production System. The maintenance strategy for the Julimar Field Production System is based on optimising safety, minimising environmental impact and maximising production. Maintenance practices used to establish well managed maintenance strategies, planned execution and improvement are described in the Maintenance of Assets Procedure.

A risk-based approach is used as the basis for establishing and prioritising inspection, maintenance and testing requirements at the Julimar Field Production System. Equipment is assessed to establish equipment criticality with respect to the consequences and likelihood of equipment failure. This informs determination of appropriate maintenance and inspection activities. Maintenance activities are allocated risk rankings according to the criticality of equipment, to ensure high risk maintenance work orders are completed as a priority.

A computerised maintenance management system (CMMS) provides a database called SAP-PM that contains Julimar Field Production System registers, equipment details, spare parts data and associated planned maintenance tasks. This system is used to plan, monitor and record maintenance activities. The system provides a variety of reports that enable monitoring and assessment of maintenance activities.

SCE Technical Performance Standards identify SCEs and associated assurance activities. These activities are identified in the CMMS and given the appropriate priority (Technical Integrity status). Refer to Section 7.3.4 for more detail on SCE Technical Performance Standards and how they differ from EPSs required by the Environment Regulations. SCE Technical Performance Standards form a key component in the processes and systems implemented by Woodside to maintain safety and environment critical plant and equipment.

In addition, the Maintenance and Inspection MSPS (M03) is in place to assure that the necessary inspection and maintenance requirements are identified and carried out to maintain the integrity of SCEs and SCCs.

7.2.2 Process Safety Management

To ensure that Woodside protects the safety, security and health of its employees, contractors, the environment and assets, Woodside has adopted the Energy Institute's Process Safety Management (PSM) framework within its Process Safety Management Procedure which sets out a disciplined framework for managing the integrity of systems and processes that handle hazardous substances over the production (and exploration) lifecycle. It deals with the prevention and control of events that have potential to release hazardous materials and energy.

PSM consists of four main focus areas. Each focus area contains a number of PSM requirements that define key aspects required to ensure that PSM is integrated through the organisation. There are twenty PSM requirements. The focus areas and requirements are shown in Figure 7-1. Chevron process safety management framework is outlined in the Wheatstone Facility Safety Case (including Julimar-Brunello pipelines) with the interface documents outlined in the Julimar field production Systems Operating Manual.

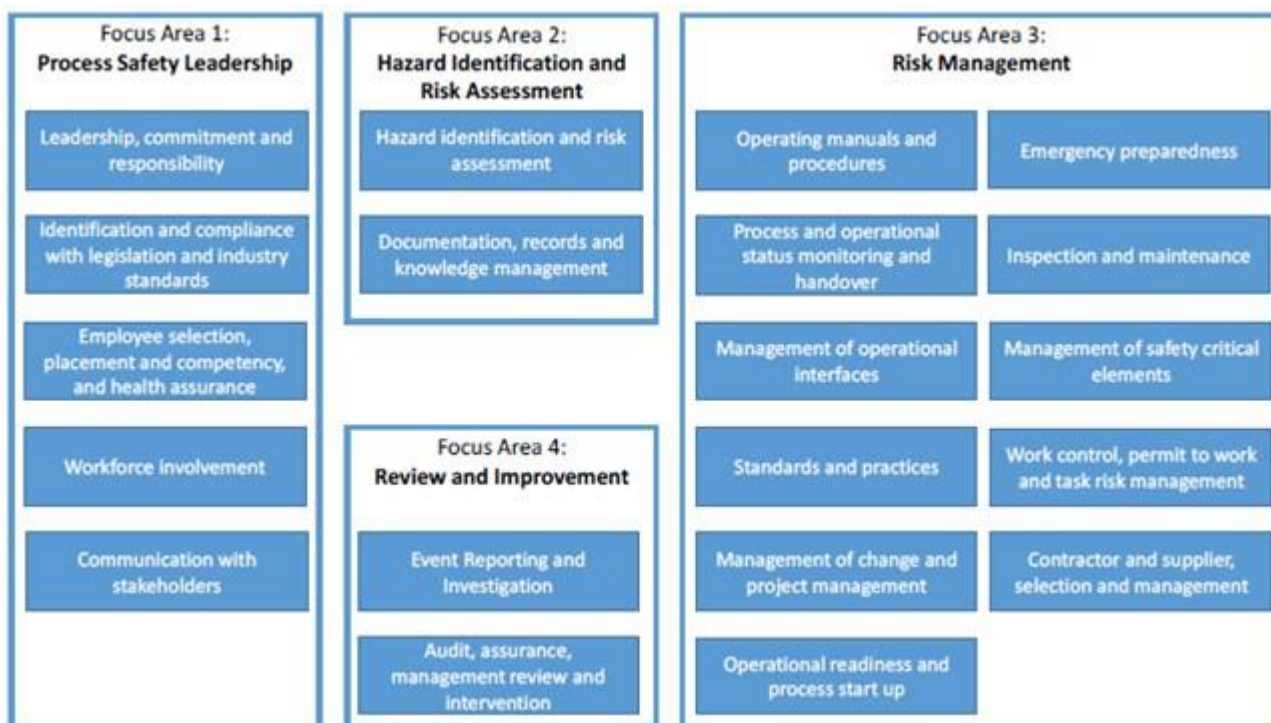

Figure 7-1: Process Safety Management Focus Areas

7.2.2.1 Woodside Safety Culture Framework

Woodside's 'Our Safety Culture' framework (shown in Figure 7-2) promotes a strong HSE culture and is a key enabler for effective process safety management. This framework outlines the expected behaviours for everyone including supervisors and managers/executives, and is openly discussed as part of inductions, training and development. Chevron safety culture framework is outlined in the Wheatstone Facility Safety Case (including Julimar-Brunello pipelines).

Figure 7-2: Woodside 'Our Safety Culture' Framework

7.2.3 Environmental Considerations during Chemical Selection, Assessment and Approval

Operational chemicals required by the Petroleum Activities Program are selected and approved in accordance with Woodside's process for selecting and assessing chemicals. This process is used to reduce potential impacts and risks associated with chemical use to ALARP by selecting chemicals with the lowest practicable environmental impacts and risks, subject to technical constraints.

A summary of the environmental requirements of the Chemical Selection and Assessment Environment Guideline is outlined below.

Environmental Selection Criteria

Woodside's process for selecting and assessing chemicals follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS) which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands (background on the OCNS scheme is provided below).

Operational chemicals are selected / assessed in compliance with the Woodside process for selecting and assessing chemicals, specifically:

- where operational chemicals with an OCNS rating of Gold/Silver/E/D and no OCNS substitution or product warning are selected, or a substance is considered to pose little or no risk to the environment, no further control is required. Such chemicals do not represent a significant impact on the environment under standard use scenarios and therefore are considered ALARP and acceptable
- if other OCNS-rated or non-OCNS-rated operational chemicals are selected, the chemical is assessed as follows:
 - if there is **no planned discharge** of the operational chemical to the marine environment, written technical verification of the 'no discharge' fate is provided, and no further assessment is required
 - if there is **planned discharge** of the operational chemical to the marine environment, a further assessment and ALARP justification is conducted.

The ALARP assessment considers chemical toxicity and biodegradation, and bioaccumulation potential, using industry standard classification criteria (Centre for Environment, Fisheries and Aquaculture Science scheme criteria).

If a product has no specific ecotoxicity, biodegradation, or bioaccumulation data available, these options are considered:

- environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical
- environmental data may be referenced for each separate chemical ingredient (if known) within the product.

If no environmental data is available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical are investigated, with preference for options with a hazard quotient (HQ) band of Gold or Silver, or in OCNS Group E or D with no substitution or product warnings.

If no more environmentally suitable alternatives are available, further risk-reduction measures (e.g. controls related to use and discharge) are considered for the specific context and implemented where relevant to ensure the risk is ALARP and acceptable.

Once the further assessment/ALARP justification has been completed, confirmation that the environmental risk as a result of chemical use is ALARP and acceptable is obtained from the relevant manager.

Background Overview of OCNS

The OCNS applies the requirements of the Oslo–Paris Convention for the Protection of the Marine Environment of the North East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances listed on the OCNS list of registered products have an assigned ranking based on toxicity and other relevant parameters (e.g. biodegradation, bioaccumulation), in accordance one of two schemes (as shown in Figure 7-3)

- **HQ Colour Band:** Gold, Silver, White, Blue, Orange, and Purple (listed in order of increasing environmental hazard)
- **OCNS Grouping:** E, D, C, B, or A (listed in order of increasing environmental hazard). Applied to inorganic substances, hydraulic fluids, and pipeline chemicals only.

Hazard Quotient Colour Band	Gold	Silver	White	Blue	Orange	Purple
OCNS Grouping	E	D	C	B	A	
	Lowest Hazard  Highest Hazard					

Figure 7-3: Offshore Chemical Notification Scheme Ranking

7.2.4 Woodside Invasive Marine Species Risk Assessment Process

7.2.4.1 Objective and Scope

To minimise the risk of introducing IMS as a result of the Petroleum Activities Program, all applicable vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below).

The objective of the risk assessment process is to identify the level of threat a contracted vessel, or immersible equipment poses if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

In context of the activities specified in **Section 3**, the IMS risk assessment process does not apply to:

- vessels or immersible equipment that do not plan to enter the IMS Management Area (IMSMA)⁵⁹
- 'new build' vessels or immersible equipment launched less than 14 days prior to mobilisation
- locally sourced vessels or immersible equipment from within the Western locally sourced zone⁶⁰. Vessels, or immersible equipment are defined as locally sourced when the same supply facilities/port have been used since their last IMS inspection, full hull clean in dry dock or application of antifouling coating (AFC).

7.2.4.2 Risk Assessment Process

Woodside's IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species (IMO Guidelines, 2011).

To effectively evaluate the potential for vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each support vessel, or immersible equipment planning to undertake activities within the IMSMA/Operational Area. The risk assessment process considers a range of factors, as listed in Table 7-1 and Table 7-2.

The IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. A QA/QC process is implemented for all Woodside conducted IMS risk assessments where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the risk assessment process.

Table 7-1: Key factors considered as a part of the risk assessment process for vessels

⁵⁹The IMSMA is defined as all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 nm from land ('Territorial Seas', and including Australian territorial islands). The IMSMA also includes: (i) all waters which are shallower than the 50-metre depth contour outside of the 12 nm boundary, thereby encompassing submerged reefs and atolls, and (ii) Operational Areas defined in environmental approvals. The IMSMA is based on current maritime boundary definitions, legal frameworks and requirements, IMS risk interpretations and existing management arrangements applied by Commonwealth and State/Territory regulatory agencies.

⁶⁰The Western Locally Sourced Zone (W-LSZ) spans an area that includes the entire Western Australian coastline out to the Exclusive Economic Zone (EEZ) limit at 200 nm (excluding any government-declared Quarantine Areas).

Factors	Details
Vessel type	The risk of IMS infection varies depending on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g., dredges) in comparison to simple vessels (e.g., crew transfer vessel).
Recent IMS inspection and cleaning history, including for internal niches	In the case of biofouling on external hull niches, different risk ratings are applied dependant on whether out-of-water or in-water IMS inspections by qualified IMS inspectors and cleaning (if required) have been undertaken prior to contract commencement. If an IMS inspection (and clean if required) has not been undertaken in the past six months (from the time of contract commencement), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces.
Out-of-water period before mobilisation	A risk reduction factor can be applied for vessels that are hauled out and then mobilised as deck cargo or by road during mobilisation, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.
Age and suitability of AFC at mobilisation date	AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel's normal speeds and activity profile (i.e., proportion of time spent stationary or below three knots), and its main operational region (i.e., tropical, sub-tropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable the risk factor applied reduces with age since application.
Internal treatment systems	A risk reduction factor applied if the vessel has an internal biological fouling control system in place at the time of assessment, or evidence of manual dosing.
Vessel origin and proposed area of operation	Differing risk ratings are assigned in relation to the climatic relationship between the vessel's origin and the proposed climatic region of the proposed area of operation. Highest risk rating is applied to similar climatic regions.
Number of stationary/slow speed periods >7 days	A risk factor is calculated based on the number of 7 day periods that the vessel has operated at stationary or at low speed (less than three knots) in port or coastal waters which is any waters less than 50 metres deep outside 12 nautical miles from land or any waters within 12 nm of land. The greater the number of periods, the higher the risk factor applied.
Region of stationary or slow periods	A further multiplier is applied depending on the location of the stationary/slow speed periods. The highest risk rating applied if the stationary or slow speed periods occurred within ports or coastal waters of the same climatic region,
Type of activity – contact with seafloor	The potential for the introduction of IMS varies on the planned vessel activity taking place. Those activities that come in contact with sediments and thus have the potential to accumulate and harbour IMS in areas such as hoppers (dredges) and spud cans (drilling rigs) are considered to have a greater risk of infection.

Table 7-2: Key factors considered as a part of the risk assessment process for immersible equipment

Factors	Details
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 day). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (less than 50 metres deep and/or within 12 nautical miles from land) are given the highest risk rating.
Duration of deployments	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the period of immersion the higher the risk rating applied.
Duration of time out of water since last deployment	A further risk reduction factor can be applied for immersible equipment that has been out of the water for an extended period.
Transport conditions during mobilisation	If the equipment is stored in damp conditions, then a high risk factor is applied, while if equipment is stored in dry and well ventilated (low humidity) conditions then a low risk factor is applied.

Page 366 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

Post-retrieval maintenance regime	A risk reduction factor is applied if the equipment/item of interest is routinely washed, cleaned, checked and/or disassembled between project sites, while a higher risk rating is applied where no routine cleaning occurs.
-----------------------------------	---

Following implementation of the risk assessment process, vessels and/or immersible equipment are classified as one of three risk categories, as defined below:

- ‘Low’ – Low risk of introducing IMS of concern and hence no additional management required, or management options have been applied to reduce the risk
- ‘Uncertain’ – Risk of introducing IMS is not apparent and as such the precautionary approach is adopted, and additional management options may be required
- ‘High’ – High risk of introducing IMS means additional management options are required prior to this vessel mobilising to the Operational Area.

Following the allocation of a ‘low’ risk rating for a vessel or immersible equipment, the information provided by the vessel operator for the purposes of risk assessment must be confirmed prior to mobilisation. For vessels or equipment classified as posing an ‘uncertain’ or ‘high’ theoretical risk, a range of management options are presented to reduce this theoretical risk to acceptable levels and achieve a low-risk status. These management options have been developed with the intention of reducing IMS risk to levels that are as low as reasonably practicable (i.e., ALARP). It is a flexible approach that allows for a range of management actions to be tailored for a specific vessel movement. These will be assessed on a case-by-case basis and may include:

- having a suitably qualified and experienced IMS inspector inspect (desktop, in-water or dry dock) to verify risk status; where practicable, the inspection shall occur within seven days (but not more than 14 days) prior to final departure to the Operational Area
- applying in-water or dry dock cleaning of the hull and other niche areas, typically applied where the risk assessment outcome is High risk driven by the age of the AFC on the vessel and its time spent in similar climatic region ports
- treating vessels. internal seawater systems, typically applied in isolation for vessels with AFC applied to their hull within the last 12 months and where subsequent assessment through the process achieves a Low risk rating
- limiting the duration that the vessel spends within the IMSMA to a maximum of 48 hours (cumulative entries); applicable for Uncertain risk vessels only
- rejecting the vessel.

Support vessels and immersible equipment are required to be a low risk of introducing IMS prior to entering the Operational Area.

7.2.5 Risk Management

Risk management processes and practices are applied on an ongoing basis to design, production and maintenance activities for Julimar operations to manage risks to personnel, assets and the environment.

Potential environmental consequences and impacts from the Julimar operations are risk assessed and controlled in accordance with the Woodside risk management processes described in Section 2.2 of this EP (Environmental Risk Management Methodology).

The results of the Julimar operations ENVID are described in Section 6 and in the Julimar Field Production System Environmental Impacts and Risk Register. This register, in conjunction with the EP, provides a demonstration that environmental risks have been identified, and that appropriate

controls are in place to manage those risks to a level that is acceptable and ALARP throughout the life of the Julimar Field Production System.

A number of other risk management tools and techniques are used by Julimar operations to manage environmental and other risks on a routine basis during operational, maintenance and inspection tasks. Examples include:

- the processes outlined in Section 2.2
- risk management tools (e.g. Hazard Identification and Risk Assessments, Operational Risk Assessments, the technical Management of Change (MoC) system (Section 7.3), and Step back 5 x 5)
- integrity review studies, HAZIDs and Hazard Operability studies.

These tools, risk and integrity management practices are described further in the Wheatstone Facility Safety Case (including Julimar-Brunello pipelines), WOMP, and the Control of Operational Risk Procedure.

In addition, other risk sub-processes and practices are also applied within Woodside on an ongoing basis to manage different types of risk. A summary of those relevant to the Petroleum Activities Program is provided below. Woodside's risk management processes (refer to Section 2.2.1), along with the supporting risk sub-processes and practices discussed in this section, ensure the environmental impacts and risks of the activity continue to be identified and reduced to a level that is ALARP.

7.2.6 Management of Risks – Contracting and Procurement

Suppliers and contractors play a significant role in meeting the resource needs of Woodside's operations, including the Julimar Field Production System operations. Effective management of environmental risks in contracts is achieved by setting clear expectations and managing environmental risks throughout the duration of the contract. Environmental risks in contracts are managed under the Contracting and Procurement Procedure supported by the Health, Safety and Environment in Contracting Guideline. The guideline provides a risk-based approach to contractor selection and management and is aligned with '*HSE Management – Guidelines for Working Together in a Contract Environment*' (International Association of Oil and Gas Producers, Report No. 423).

The Engineering Standard Quality Requirements for Supply of Products and Services defines specific quality requirements for engineering contracts and purchase orders. The specified quality control requirements in the Standard are required to be complied with as applicable to the scope of supply.

7.2.7 Management of Risks – Subsea Activities

Subsea activities are managed in line with the Subsea and Pipelines Integrity Management Procedure which defines the practices and technical requirements that must be applied to deliver and safeguard integrity of the subsea equipment and pipelines during the Julimar Field Production System lifecycle. It provides the relationship between the PSM Framework (including management of change) and Subsea and Pipelines Group services processes.

IMMR activities are managed under the Manage IMMR Work Procedure. Risk assessments are conducted as required under this procedure.

These requirements are supported by implementation of the Subsea Construction and Inspection, Maintenance and Repair Environment Screening Questionnaire tool. The screening questionnaire is used to understand the scope of the activity, potential environmental impact and if additional regulatory approvals are required. To achieve this, the questionnaire captures key project

information such as seabed disturbance, chemical usage and waste. This information is used by an environment focal point to determine if further assessment is required. For scopes that have the potential for environmental impact, an assessment is undertaken against this EP and other Woodside environmental requirements. If determined by the Subsea and Pipeline Environment Screening Questionnaire process, an EP MoC review (as per Section 7.3.2) may be undertaken to confirm if the level of environmental risk warrants revision and resubmission of an EP.

Key environmental requirements and regulatory commitments are communicated to project teams and incorporated into key project documentation where applicable and required (i.e. not addressed via existing Woodside practices).

7.2.8 Management of Risks – Major Projects

Major projects are required to follow the Appraise and Develop Management Procedure and the Opportunity Management Framework. This procedure defines the requirements to deliver a commercially valuable production facility or modify to an existing facility. The process workflow requires integration of work from various functions utilising their people and processes, including Environment, for example HSE philosophy and regulatory approval requirements.

These requirements are supported by implementation of the Brownfields Environment Screening Questionnaire tool. The screening tool is used to determine if a project has the potential for environmental impact or requires additional regulatory approvals. For projects that have the potential for environmental impact, an environmental focal point is assigned, and the risks and impacts assessed against this EP and other Woodside environmental requirements.

Key environmental requirements and regulatory commitments are communicated to project teams and incorporated into key project documentation where applicable and required (i.e. not addressed via existing Woodside practices). Where it is identified that the project scope has the potential to result in significant modification or change to the Julimar Field Production System description provided in the EP, or where potential significant new environmental risks or impacts or significant increases in an existing environmental risk or impact are identified, an EP MoC review (as per Section 7.3.2) may be undertaken to confirm if the level of environmental risk warrants revision and resubmission of an EP.

7.2.9 Management of Human Factor Related Risks

The term 'human factors' is used to describe the consideration of people as part of complex systems. Woodside defines 'human factors' as follows: 'human factors uses what we know about people, organisation and work design to influence performance'.

As outlined in Section 6.8.1 human factors can contribute to MEEs or result in failure or degradation of the controls in place to protect against MEEs. The WMS includes a number of procedures designed to manage human factors related risks and prevent incident causation.

7.2.10 Management of Risks – Well Integrity

Wells are managed throughout their lifecycle in line with the Well Lifecycle Management Procedure. This procedure provides the basis for ensuring well integrity in accordance with the Process Safety Management Procedure.

In addition, wells are required to have a regulator-accepted Well Operations Management Plan to demonstrate that well integrity risks are managed to ALARP levels. Wells associated with the Julimar Field Production System are managed under a WOMP.

7.2.11 Management of Risks – Marine Services

Woodside's Marine Services Function provides a platform for the conduct of safe and efficient Marine Operations across Woodside through the Marine Services Management. A set of procedures that support vessel assurance and management (including HSE and quality management) are in place to ensure marine operations are conducted in a safe and efficient manner, and in accordance with regulatory requirements. Management of subsea activities on subsea support vessels is managed by the SSPL Function.

7.3 Change Management

Woodside's Change Management Procedure describes requirements for change management at owned or controlled operations/sites.

Change management is used where there is no existing approved business baseline, such as a process, procedure or accepted practice, or where conformance with an approved baseline is not possible or intended; for example, due to equipment fault or failure or a recently discovered issue which will take time to rectify. Change management is also used when the baseline is changed (e.g. the process is modified). It applies to management of temporary, permanent, planned or unplanned change encompassing one or more of the following:

- plant (equipment, plant, technology, facilities, operations or materials)
- projects (budget, schedule)
- people (organisation structure, performance, roles)
- process (WMS content, processes, procedures, standards, legislation, information).

Woodside's change management process hierarchy is depicted in Figure 7-4. The hierarchy has been developed with sub-processes to address the different types of change performed at Woodside.

Figure 7-4: Change Management Hierarchy

To help manage the day to day operation of the Julimar Field Production System, Woodside has developed a Golden Safety Rules Booklet, which provides a summary of mandatory requirements for safety in the workplace and includes guidance for managing changes that have a Health, Safety, Integrity and/or Environment impact.

7.3.1 Technical Change Management

Technical changes within the Operations Division are managed using the Management of Change – Assets Procedure. The objective of the procedure is to ensure HSE risks associated with both realised and potential changes, including any failure to meet the Julimar Field Production System Performance Standards, are identified, assessed and reduced to ALARP (Section 7.3.4 provides further information on management of Performance Standards).

Assessed changes must be recommended, agreed and decided upon based on the assessed current level of risk, as defined by Woodside's Technical Decision Authority matrices.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Native file DRIMS No: 10484514

Page 370 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

The management of change requirements contained in the Process Safety Management Procedure and Management System Performance Standard M05 Management of Change are considered when conducting any changes with the potential to impact process safety.

The Engineering Management Procedure specifies key requirements of engineering related changes, and requires that engineering Technical Decisions are agreed, recommended and decided at the appropriate engineering authority level according to the risk. Change management and risk assessment include consideration of applicable legislation/Regulation.

Change is also managed under management system requirements set out as part of major projects (Brownfields), wells integrity, subsea and pipelines integrity management and marine management system. Change management includes consideration of regulatory requirements, managed in accordance with the Regulatory Compliance Management Procedure.

In addition, the Management of Change MSPS (M05) is in place to assure process safety risks arising from change (temporary and permanent) are systematically identified, assessed and managed.

The Julimar Field Production System is managed under Chevron's Operations Safety Case for the Julimar-Brunello Pipeline therefore management of change (MoC) will comply with the requirements of the Chevron Operations Excellence Management System (OEMS). Woodside implements a MoC interface process that complies with both the Chevron OEMS and the Woodside Change Management Operating Standard, the interface process describes how change will be managed for the following scenarios:

- change to the Julimar Field Production System instigated by Woodside
- change to the Julimar Field Production System or systems that can impact the Julimar Field Production System instigated by Chevron.

The MoC interface process ensures that the relevant Woodside stakeholder/s including relevant Integrity Authorities (as defined in *Engineering Management Procedure*) are consulted during the change assessment. The interface process shall also ensure that the consultation occurs during the initial assessment phase of the proposed change and the relevant Woodside stakeholder endorses the change prior to implementation.

7.3.2 EP Management of Change and Revision

Management of changes are managed in accordance with Woodside's Environmental Approval Requirements Australia Commonwealth Guideline. Management of changes relevant to this EP, concerning the scope of the activity description (Section 2.10) including: review of advances in technology at stages where new equipment may be selected such as vessel contracting; changes in understanding of the environment, DCCEEW EPBC Act listed threatened and migratory species status, Part 13 statutory instruments (recovery plans, threat abatement plans, conservation advice, wildlife conservation plans) and current requirements for AMPs (Section 4.8); and potential new advice from external stakeholders (Section 5), will be managed in accordance with Regulation 39 of the Environment Regulations.

Risk will be assessed in accordance with the environmental risk management methodology (Section 2.8) to determine the significance of any potential new environmental impacts or risks not provided for in this EP. Risk assessment outcomes are reviewed in compliance with Regulation 38 and 39 of the Environment Regulations. Minor changes where a review of the activity and the environmental risks and impacts of the activity do not trigger a requirement for a formal revision under Regulation 38 or 39 of the Environment Regulations, will be considered a 'minor revision'. Minor administrative changes to this EP, where an assessment of the environmental risks and impacts is not required (e.g., document references, phone numbers, etc), will also be considered a 'minor revision'. Minor revisions as defined above will be made to this EP using Woodside's

Revision: 8.0

Native file DRIMS No: 10484514

Page 371 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

document control process. Minor revisions will be tracked in an MOC Register to ensure visibility of cumulative risk changes, as well as enable internal EP updates/reissuing as required. This document will be made available to NOPSEMA during regulator environment inspections.

7.3.3 Oil Pollution Emergency Plan Management of Change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulation 38 and 39 to determine if EP, including OPEP, resubmission is required (see Section 7.3.2).

Changes with potential to influence minor or technical changes to the OPEP are tracked in management of change records, project records and incorporated during internal updates of the OPEP or revisions to the EP.

7.3.4 Management of SCE Technical Performance Standards and Management System Performance Standards

7.3.4.1 Management System Performance Standards

Woodside ensures safety critical management processes function as required through the application of Management System Performance Standards (MSPS). MSPS are developed and owned at non-facility specific level (i.e. pan Woodside) and include assurance checks for the key requirements of the applicable management system.

Individual facilities demonstrate conformance against the MSPS through the conduct of reviews. Non-conformances against an MSPS are internally managed in accordance with the Woodside Management System.

7.3.4.2 SCE Technical Performance Standards

An SCE is defined by Woodside as a hardware barrier, the failure of which could cause or contribute substantially to, or the purpose of which is to prevent or limit the effect of a MAE/MEE, or Process Safety Event.

Woodside identifies/develops, implements, monitors/assures, responds and verifies/optimises SCEs by applying SCE technical Performance Standards as described in the Safety and Environment Critical Element (SCE) Management Procedure. Response to an SCE failure is managed by the Control of Operational Risk Procedure. Key elements of the procedure are summarised in Table 7-3.

Table 7-3: Summary of Safety and Environment Critical Element Management Procedures

Identify/Develop	<p>Safety and Environment Critical Element Management Procedure</p> <p>Identify SCE – SCEs must be identified from the facilities PSRAs (e.g. Formal Safety Assessments) (Section 2.2). The identification of SCEs for which Performance Standards are required are part of the formal safety and environmental risk assessment processes. Woodside's Global Performance Standards (based on industry and Woodside Standards) should be used for preliminary selection of SCEs.</p> <p>Complete Engineering Design Studies – Engineering design studies must be completed to demonstrate that SCE Performance Criteria specified in the global Performance Standard and/or determined by PSRA will be met by the facility design, allowing for normal SCE degradation in operation. The studies must establish the testing and inspection tasks required to assess performance against the criteria. The scope and frequency of SCE Assurance Tasks are guided by the SCE Global Performance Standard and may require designated Engineering Design Studies. Studies could include Reliability Centred Maintenance, Risk Based Inspection and LOPA (Layers of Protection) studies to determine the Assurance Task scope and frequencies, RBI plans, and classification and implementation requirements for instrumented safeguarding.</p> <p>Develop Performance Standards – Facilities must develop Performance Standards for all applicable SCEs by:</p> <ul style="list-style-type: none"> • selecting the relevant Global Performance Standard (including Assurance Tasks) • considering facility specific requirements and applicable regulatory requirements • adding the specific data from the facility Engineering Design Studies and PSRA to compile scope and frequency of SCE assurance activities.
Implement	<p>Management of Hardware Controls in the Operate Phase Procedure</p> <p>Identify SCE in Asset Register – SCEs must be uniquely identified on the asset register and assigned Performance Standard flags.</p> <p>Develop Testing, Inspection and Maintenance Programs – SCE assurance tasks are developed into maintenance procedures.</p> <p>Implement Testing, Inspection and Maintenance Programs – SCE testing, inspection and maintenance requirements must be implemented in the CMMS (Section 7.2.1.2).</p>
Maintain/Assure	<p>Management of Hardware Controls in the Operate Phase Procedure</p> <p>Execute Testing, Inspection and Maintenance Programs – On completion of SCC and SCE assurance tasks, results must be recorded with all relevant detail, assessed for conformance with the Performance Criteria and any follow-on correction work identified.</p> <p>Conduct Fitness for Service (FFS) Assessment – In some instances, an engineering FFS assessment may be required to determine whether equipment has failed its performance standard requirements, e.g. assessment of corrosion defects following inspection of piping. Detailed results of FFS assessment may be recorded out of CMMS.</p> <p>External Reporting – External notification obligations for SCE events must be understood (i.e. based on local regulatory requirements). External communications must be in accordance with the health safety and environment event reporting and investigation procedure (Section 7.15.5).</p> <p>Manage and Analyse Results – The results from assurance tasks must be accurately recorded to support data analysis. Analysis will enable appropriate action to be taken to minimise future failure recurrences and enable assessment of overall system performance and reliability to verify SCE effectiveness in revealing failures and to allow predictive maintenance.</p>
Respond	<p>Control of Operational Risk Procedure</p> <p>Respond to SCE Failure – SCE failure (technical Performance Standard non-conformance) is a failure to achieve the given Performance Criteria. SCE failures must be managed in accordance with a structured review process. This process may require the application of the facility MOPO which provides prescriptive guidelines to be followed in the event of a reduction in the performance of an SCE, or managed in accordance with the Management of Change – Assets Procedure (Section 7.3).</p> <p>Management of Hardware Controls in the Operate Phase Procedure</p> <p>Report Internally – SCE failure/damage and SCE demands must be reported in accordance with the Health Safety and Environment Event Reporting and Investigation Procedure (Section 7.15.4).</p> <p>Report Externally – External notification obligations for SCE failure/damage must be understood (i.e., based on local regulatory requirements). External communications must be in accordance with the health safety and environment event reporting and investigation procedure (Section 7.15.4).</p>
Verify/	<p>Management of Hardware Controls in the Operate Phase Procedure</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	<p>Review SCE Performance – SCE performance reviews must be conducted to ensure requirements for maintaining SCE performance are being met.</p> <p>Manage Change – Any change to the Performance Standards must be conducted in accordance with the Change Management Procedure (Section 7.3).</p>
--	--

SCE Facility Performance Standards are a statement of the performance required of an SCE (e.g. functionality, availability, reliability, survivability), which is used as the basis for establishing agreed assurance tasks and managing the hazard. An assurance task is an activity carried out to confirm that the SCE meets, or will meet, its SCE Performance Standard. Examples of assurance tasks include inspection routines, maintenance activities, test routines, and reliability monitoring.

These assurance tasks are identified in the CMMS, flagged against their associated Performance Standard, and given the appropriate priority (defined as Technical Integrity). Management systems are in place to manage the completion of maintenance.

Events where the SCC/SCE have not met their specified performance criteria must be managed in accordance with a structured review process. This process may require the application of the facility Manual of Permitted Operation (MOPO) which provides prescriptive guidelines to be followed in the event of a reduction in the performance of an SCE in specific defined circumstances; or, if the MOPO does not cover the event, according to procedures for the assessment and management of operational risk.

Internal notification of SCC failures must be made in accordance with maintenance management workflows. Failures to meet a Facility Performance Standard occur where SCC events lead to the functional objectives (goal and/or applicable key requirement statements) of the facility Performance Standard for the SCE not being met (i.e. lost or unavailable), taking into account any redundancy inherent within the SCE. These events are reported in the Event Reporting Database as potential SCE Failure to Meet Facility Performance Standard Events.

These are internally reported as Hazard Events. Where 'Failure to meet a Facility Performance Standard' leads to a loss of hydrocarbon containment, or a release of energy, it is internally reported (and externally where relevant) as a Loss of Primary Containment or Environmental Spill event, depending on the nature of the release.

Additionally, confirmed 'Failure to meet a Facility Performance Standard' events for the SCEs identified in the MEE bowties may equate to a breach of EPOs and/or EPSs. The review to identify such events for external reporting considers whether the hazard event is relevant to environmental SCE functional objectives (goal and/or applicable key requirements) of the SCE Facility Performance Standard and whether the event poses a risk to achieving EPOs and EPSs. The WMS Regulator Event Reporting Guideline provides additional information regarding external SCE related reporting obligations.

There may also be planned changes/deviations from SCE Technical Performance Standards, these are managed via procedures for the assessment and management of operational risk, and endorsed in accordance with the engineering management procedures (described further within Section 7.3). This management process ensures risks (including environment) are managed so that the planned change/deviation does not result in unacceptable impact or risk, remains ALARP and regulatory requirements are met.

7.4 Woodside's Decommissioning Framework

Decommissioning is a routine, planned activity for the offshore oil and gas industry. Current best practice for decommissioning includes:

- designing for decommissioning during the development phase of projects / facilities;

- maintaining and removing property, equipment and infrastructure, such as a facility or a pipeline, and plugging wells associated with a petroleum activity;
- assessing decommissioning options and opportunities during the operational life of the facility leading up to cessation of production;
- selecting, developing and planning the selected decommissioning option;
- executing decommissioning plans; and
- restoring the marine environment.

This assists with compliance with Section 572(3) of the OPGGS Act, which requires titleholders to remove property from the title area when it is neither used, nor to be used, in connection with the operations. Under section 572(7) of the OPGGS Act, the property removal requirements under section 572(3) of the OPGGS Act have effect subject to any other provision of the OPGGS Act, the regulations, directions given by NOPSEMA or the responsible Commonwealth Minister under Chapter 3 or Chapter 6 of the OPGGS Act, and any other law. Under section 270(3) of the OPGGS Act, before title surrender, all property brought into the surrender area by any person engaged or concerned in the operations authorized by the permit, lease or licence must be removed or cause to be removed from the surrender area to the satisfaction of NOPSEMA, or arrangements that are satisfactory to NOPSEMA must be made in relation to the property. Sections 572(7) and 270(3) of the OPGGS Act provide scope for in-situ decommissioning and other arrangements to be made where it can be demonstrated that the risks and impacts are ALARP and acceptable as well as comply with all other Acts and legislation.

7.4.1 Decommissioning in Operations

Asset specific decommissioning plans are typically developed prior to cessation of production. Planning includes redundant infrastructure as well as structures coming to the end of production and, decommissioning critical systems to enable removal. Appropriate maintenance plans are developed and implemented to ensure decommissioning critical systems meet the requirements to facilitate removal.

7.4.2 Decommissioning Planning

Decommissioning planning generally commences two to 10 years prior to cessation of production (Figure 7-5). The timeframe selected for decommissioning planning depends on the complexity of the facility and infrastructure requiring decommissioning.

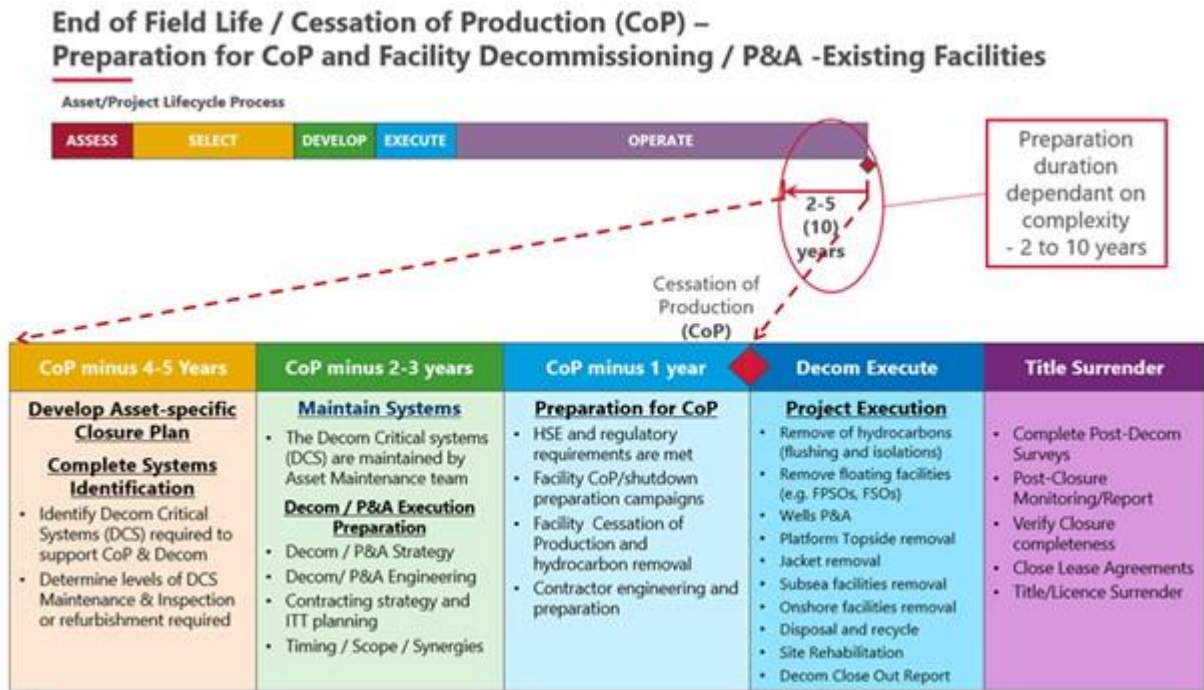

Figure 7-5: Woodside's process for decommissioning planning

7.4.3 Inventory of Property within the Julimar Development

An inventory of property located within the Julimar development in petroleum title WA-49-L and associated pipeline licenses in Commonwealth waters covered under this EP, is provided below in Table 7-4. For a more detailed breakdown of key subsea infrastructure of the Julimar Development see Table 3-3. Other infrastructure in the WA-49-L outside of the Julimar Development are beyond the scope of this EP and are covered under the NWS and Julimar Exploration Wellhead Decommissioning Environment Plan (Document ID: 1401778035, accepted 3 July 2024). and Balnaves Plug and Abandonment Environment Plan (Document ID: 1401739439, accepted 16 December 2021).

Table 7-4: Inventory of Woodside infrastructure within the Julimar Development

Item	Description	Status	Decommissioning Phase
WA-49-L			
Subsea wells			
8 wells (Phase 1 and 2)	Subsea production wells in Julimar and Brunello fields	Maintained for production	Not yet applicable
5 wells (Phase 3)	Subsea production wells in Julimar and Brunello fields	To be drilled	Not yet applicable
Subsea infrastructure - Julimar			
JDP Phase 1/2: 2 x 22 km 18" rigid pipeline (Julimar, Brunello) 23 km 4" MEG pipeline	Production subsea infrastructure	Maintained for production	Planning pending (~5+ years)

2 x 22 km umbilical Anchor structures, rigid spools, flexible and control jumpers			
JDP Phase 3: 5 wells, associated manifolds and flexible 8" flowlines	Production subsea infrastructure – to be installed	Maintained for production (once installed)	Not yet applicable

7.5 Julimar Decommissioning Strategy

Cessation of production for the Julimar development is presently estimated to be 2035. Timing is indicative only and subject to unnotified change based on production forecasting.

Decommissioning of the Julimar development is being considered in a single stage, with all infrastructure anticipated to remain in service through to EoFL. Consideration of implementation of decommissioning in phases will be contemplated if equipment is determined to be redundant ahead of EoFL. End state decisions and execution methodologies will be finalised at EOFL.

In line with Woodside's decommissioning planning process outlined above, an Asset Closure Management Plan has been prepared for the Julimar Offshore assets.

Decommissioning of the infrastructure will be undertaken in two phases:

- decommissioning planning
- decommissioning execution (after cessation of property)

Woodside adopts a risk based approach to the planning and execution of decommissioning of property. The timing of the main activities related to decommissioning planning and execution for the Julimar development are subject to change as plans develop and specific decommissioning requirements are defined.

7.6 Decommissioning Planning Activities

Planning for decommissioning mostly includes desktop studies and engineering design but may also leverage data from inspections and other activities undertaken during IMMR within the scope of the Petroleum Activities Program.

During the decommissioning planning phase all infrastructure will be managed and maintained within the scope of this EP to meet Woodside's obligations under Section 572. With equipment associated with the Julimar development inspected, monitored and maintained in accordance with the Woodside Asset Maintenance and inspection regime for producing infrastructure.

Decommissioning execution activities will adopt a risk based approach, that considers the NOPSEMA Decommissioning Compliance Strategy 2024-2029 (NOPSEMA, 2023a).

7.6.1 Wells

Woodside plans to undertake detailed technical assessment of production wells within the Julimar development. This is ensure that wells are abandoned to the relevant regulatory requirements, including permanent downhole barriers. Production wells are monitored and maintained in accordance with Woodside's Well Integrity Process for production wells. Monitoring continues as per the approved WOMP and the well integrity management procedure. Plug and abandonment of production wells within the Julimar Development will be covered under a separate EP.

7.6.2 Decommissioning Execution Planning

Consistent with Woodside's process (Figure 7-5) detailed decommissioning planning will commence prior to CoP. Detailed planning entails technical engineering studies, contracting activities, approvals planning, consultation with stakeholders, as well as works to assess decommissioning options, timing and risk management. Decommissioning activities will be subject to separate approvals.

7.7 Organisational Structure

The following Woodside organisational structure provides leadership and direction for operation of the Julimar operations and environmental performance:

- the Executive Vice President (EVP) and Chief Operating Officer (COO) Australian Operations report to the Chief Executive Officer (CEO)
- the Vice President (VP) Bass Strait & Wheatstone reports to the EVP and COO Australian Operations
- the Asset Manager and support teams report to the VP Bass Strait & Wheatstone
- the VP HSE Australian Operations reports to the EVP and COO Australian Operations
- the Environment and Sustainability Manager reports to the VP HSE Australian Operations
- all facilities are supported by a team of environmental professionals who report to the Environment and Sustainability Manager.

All facilities are supported functionally by a number of multi-discipline teams including engineering, project development, health and safety, process safety, marine assurance, human resources, subsea, drilling and completions, corporate etc.

All facilities are supported by other Woodside functional teams including:

- **Engineering** – supports operating assets in terms of engineering standards/guidelines and governance processes, systems, applications and specialist personnel to support these standards/guidelines
- **HSE Support** – provides specific guidance and access to specialist HSE resources including assistance for governance and training, as well as guidance on Woodside HSE standards
- **Subsea** – responsible for the installation and IMMR activities on subsea infrastructure including Julimar Field Production System structures, flowlines, manifolds and subsea isolation valves to ensure integrity
- **Drilling and Completions** – ensures the safe planning and execution of drilling (note drilling is excluded from the scope of this EP), completion and work over operations
- **Brownfields** – responsible for the engineering, construction and execution of small projects on operational facilities to ensure ongoing integrity and safe operation
- **Marine Group** – responsible for chartering vessels to support Woodside's offshore production facilities including vessels to aid emergency response
- **Aviation Group** – provides personnel transport, material transport, emergency evacuation and search and rescue capabilities.

A simplified chart of the structural organisation of the Julimar operations is shown in Figure 7-6.

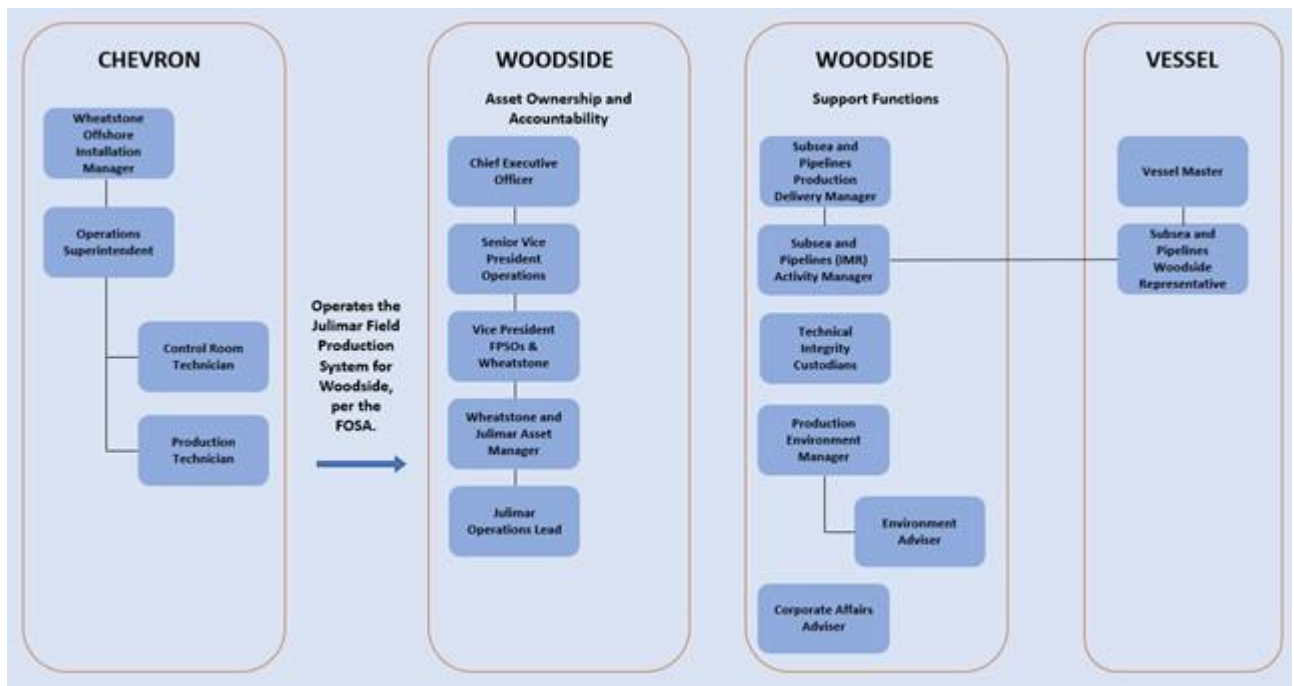

Figure 7-6: Julimar & Wheatstone Operations Organisation Structure

7.8 Roles and Responsibilities

Key roles and responsibilities for Woodside and contractor personnel relating to implementing, managing and reviewing this EP are described in Table 7-5. Roles and responsibilities for oil spill preparation and response are outlined in Appendix D and the [Woodside Oil Pollution Emergency Arrangements \(Australia\)](#). Roles and responsibilities for Julimar Development emergency response are outlined in the Wheatstone Facility Safety Case (including Julimar-Brunello pipelines) and are consistent with the Julimar Emergency Response Interface Plan.

It is the responsibility of Woodside and contractors to implement the Woodside Corporate Health, Safety and Environment Policy (Appendix A) in their areas of responsibility and to ensure that the personnel are suitably trained and competent in their respective roles.

Table 7-5: Roles and responsibilities

Title (Role)	Environmental Responsibilities
Onshore Based Personnel	
Woodside Projects Environment Adviser	<ul style="list-style-type: none"> • Verify relevant Environmental Approvals for the activities exist prior to commencing activity. • Track compliance with performance outcomes and performance standards as per the requirements of this EP. • Prepare environmental component of relevant Induction Package. • Assist with the review, investigation and reporting of environmental incidents. • Ensure environmental monitoring and inspections/audits are undertaken as per the requirements of this EP. • Liaise with relevant regulatory authorities as required. • Assist in preparation of external regulatory reports required, in line with environmental approval requirements and Woodside incident reporting procedures. • Monitor and close out corrective actions (Campaign Action Register (CAR)) identified during environmental monitoring or audits. • Provide advice to relevant Woodside personnel and contractors to assist them to understand their environment responsibilities. • Liaise with primary installation contractors to ensure communication and understanding of environment requirements as outlined in this EP and in line with Woodside's Compass values and management systems.
Asset Manager	<ul style="list-style-type: none"> • Be accountable for ensuring all necessary regulatory approvals are in place to operate. • Approve (decide on) the content to be contained in the Environment Plan. • Be accountable for managing the asset throughout its operations in accordance with legislative/regulatory requirements (including this EP) and WMS requirements. • Agree facility key performance indicators (KPIs), including environment KPIs and is accountable for their achievement. • Be responsible for continuous improvement of operations of the facility, including environmental performance. • Decide on technical decisions where required based on assessed current level of risk. • Be accountable for incident notification, reporting and investigation in line with regulatory requirements, the WMS and EP requirements.
Asset Superintendent	<ul style="list-style-type: none"> • Be responsible for the operation of the facility in accordance with legislative/regulatory requirements (including this EP) and the WMS. • Decide on technical decisions where required based on assessed current level of risk. • Be accountable for aspects of integrity management. • Communicate changes relevant to the EP to the Production Environment team. • Be responsible for continuous improvement of operations of the facility, including environmental performance. • Be accountable for conformance to production Operations processes.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (Role)	Environmental Responsibilities
Technical Support Lead	<ul style="list-style-type: none"> • Be responsible for safeguarding process safety with respect to the asset. • Ensure technical integrity risks are identified, managed and reduced to ALARP. • Recommend technical decisions where required based on assessed current level of risk. • Be accountable for the operation of the facility in accordance with legislative/regulatory requirements (including this EP) and the WMS.
Integrity Authorities (Technical Integrity Custodians, Technical Authorities and Engineering Authorities)	<ul style="list-style-type: none"> • Agree technical integrity decision based on assessed current level of risk when discipline owner. • Undertake process safety responsibilities as defined under the Woodside process safety framework.
Julimar Operations Lead /Focal Point	<ul style="list-style-type: none"> • Provides Julimar Field Production System operational guidance and oversight. • Accountable for maintenance of Field Operating Guidelines, Operating Procedures and Field Production System Operating Manual. • Provides an ongoing interface between Chevron Operations and the Woodside functional support groups.
Environment & Sustainability Manager Australian Operations	<ul style="list-style-type: none"> • Facilitate operations environmental approval documentation and timely submission in accordance with regulatory requirements. • Ensure Asset and supporting personnel understand and adhere to legislative and regulatory environment requirements, EP requirements and the environmental requirements of the WMS. • Develop and maintain appropriate Production environmental processes and procedures. • Monitor and communicate to internal stakeholders all relevant changes to legislation, policies, regulator organisation that may impact the EP or business. • Facilitate review of the EP, including revision to the EP and in relation to any technical decisions or proposed changes to operations.
Environment Adviser Australian Operations	<ul style="list-style-type: none"> • Manage change relevant to the EP in accordance with the Regulations and the EP. • Ensure environmental monitoring, offshore inspections, and reporting is undertaken as per the requirements of this EP. • Coordinate and monitor closeout of corrective actions. • Ensure environmental inspections/audits are undertaken as per the requirements of the EP. • Ensure environmental incident reporting meets regulatory requirements (as described within the EP) and WMS.
Corporate Affairs Adviser	<ul style="list-style-type: none"> • Prepare and implement the Consultation Plan for the Petroleum Activities Program. • Report on consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (Role)	Environmental Responsibilities
	<ul style="list-style-type: none"> Perform ongoing liaison and notification as required as per Section 7.14.
Subsea and Pipelines (IMMR) Activity Manager	<ul style="list-style-type: none"> Ensure IMMR activities undertaken in line with EP commitments. Manage IMMR change requests for the activity and notify the Subsea and Pipelines Environment Adviser of any scope changes in a timely manner. Be responsible for governance of IMMR related activities for subsea support vessels. Provide sufficient resources to implement the EP requirements. Monitor and close out corrective actions raised from IMMR environmental inspections/audits or incidents.
Woodside Marine Assurance Superintendent	<ul style="list-style-type: none"> Conduct relevant audit and inspection to confirm vessels comply with relevant Marine Orders and Woodside Marine Charters Instructions requirements to meet safety, navigation and emergency response requirements.
Woodside CIMT Deputy Incident Commander	<p>On receiving notification of an incident, the Woodside CIMT Deputy Incident Commander shall:</p> <ul style="list-style-type: none"> Establish and take control of the IMT and establish an appropriate command structure for the incident Assess situation, identify risks and actions to minimise the risk Communicate incident progress to relevant persons within the organisation Develop the incident action plan (IAP) including setting objectives for action Approve, implement and manage the IAP Communicate within and beyond the incident management structure Manage and review safety of responders Address the broader public safety considerations Conclude and review activities.
Contractor Sponsors	<ul style="list-style-type: none"> Ensure implementation of EP for the contractor's scope of work. Ensure contractors have adequate environmental capability in order to execute their respective scopes of work. Review contractor environmental performance as required.
Offshore Personnel (Chevron)	
Wheatstone Offshore Installation	<ul style="list-style-type: none"> Ensures operational obligations on Wheatstone are satisfied under the Julimar Brunello Field Operating Services Agreement: Comply with relevant platform and subsea commitments of this EP Ensures compliance with applicable legislation, guidelines, company policies and procedures.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (Role)	Environmental Responsibilities
Manager (Chevron)	<ul style="list-style-type: none"> Ensures Chevron's Permit to Work process is appropriately applied to relevant Julimar and Brunello work scopes Ensure compliance to relevant platform and subsea commitments of the <i>Start-Up and Operations Environment Plan: Wheatstone Project</i> (Chevron Doc. WS2-COP-00001), including that Wheatstone platform personnel have relevant training to meet the requirements of the document.
Operations Superintendent (Chevron)	<ul style="list-style-type: none"> Ensures Wheatstone platform persons are competent and compliant with all aspects of their tasks. Complies with operational obligations on Wheatstone are satisfied under the Julimar Brunello Field Operating Services Agreement. Complies with and ensures the compliance of others with HSE policies and procedures pertaining to accessing, working on and operating the Julimar Field Production System.
Control Room Technician (Chevron)	<ul style="list-style-type: none"> Operate the Wheatstone Platform following standard operating procedures to meet Operational Excellence Management System commitment to Environment and within compliance of all associated procedures and standards. Respond to emergency incidents as per the Wheatstone Platform Emergency Response Plan. Act upon any SIMOPs activities or safety systems that may be compromised.
Production Technician (Chevron)	<ul style="list-style-type: none"> Complies with HSE policies and procedures pertaining to accessing and working on and operating the Julimar Development. Respond to emergency incidents as per the WP Emergency Response Plan.
Vessel Based Personnel	
Vessel Master (all Project Support Vessels)	<ul style="list-style-type: none"> Ensure the vessel management system and procedures are implemented. Ensure personnel commencing work on the vessel receive an environmental induction that meets the relevant requirements specified in this EP. Ensure personnel are competent to undertake the work they have been assigned. Verify SOPEP drills are conducted as per the vessel's schedule. Ensure the vessel Emergency Response Team (ERT) has been given sufficient training to implement the SOPEP. Ensure any environmental incidents or breaches of relevant Environmental Performance Outcomes or performance standards detailed in this EP, are reported immediately to the Woodside Representative. Ensure corrective actions for incidents or breaches are developed, communicated to the Woodside Representative, and tracked to close out in a timely manner. Close out of actions is communicated to the Woodside Representative.
Vessel Logistics Coordinators	<ul style="list-style-type: none"> Ensure waste is managed on the relevant support vessels or installation vessel and sent to shore as per the relevant Waste Management Plan.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (Role)	Environmental Responsibilities
Vessel HSE Advisers	<ul style="list-style-type: none"> Support the Vessel Master to ensure the controls detailed in this EP relevant to offshore activities are implemented on the vessel and help collect and record evidence of implementation (other controls are implemented, and evidence collected onshore). Support the Vessel Master to ensure the Environmental Performance Outcomes are met and the performance standards detailed in this EP are implemented on the vessel. Support the Vessel Master to ensure environmental incidents or breaches of outcomes or standards outlined in this EP, are reported, and corrective actions for incidents and breaches are developed, tracked and closed out in a timely manner. Ensure periodic environmental inspections/reviews are completed and corrective actions from inspections are developed, tracked and closed out in a timely manner. Review Contractors procedures, input into Toolbox talks and JSAs. Provide day to day environmental support for activities in consultation with the Woodside Environment Adviser.
Contractor Project Manager	<ul style="list-style-type: none"> Confirm that activities are undertaken in accordance with this EP, as detailed in the Woodside approved Contactor Environmental Management Plan. Ensure personnel commencing work on the project receive a relevant environmental induction that meets the requirements specified in this EP. Ensure personnel are competent to undertake the work they have been assigned. Ensure any environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported immediately to the Woodside Responsible Engineer or Vessel Master.
Woodside Site Representative/ Resident Engineer	<ul style="list-style-type: none"> Ensure activities are undertaken as detailed in this EP. Ensure the management measures made in this EP are implemented on the vessel. Ensure environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported as per the Woodside Corporate Event Notification Matrix. Verify HSE improvement actions identified during the project are implemented where practicable. Ensure periodic environmental inspections are completed.
Title (role)	Responsibilities Related to Environment Plan
All Personnel	
All relevant Wheatstone Platform and onshore support personnel	<ul style="list-style-type: none"> Understand the Woodside standards and procedures that apply to their area of work. Understand the environmental risks and control measures that apply to their area of work. Carry out assigned activities in accordance with approved procedures and the EP. Follow instructions from relevant supervisor with respect to environmental protection. Cease operations which are deemed to present an unacceptable risk to the environment. Participate in environmental assurance activities and inspections as required.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (Role)	Environmental Responsibilities
	<ul style="list-style-type: none">• Prompt reporting of environmental hazards/incidents to their supervisor and assist in event investigation.

7.9 Communication Strategy

7.9.1 Subsea Operating Procedures

Julimar Subsea Operating procedures define the limits of the Julimar Development boundaries. The procedures cover the following operating scenarios and are integrated into the relevant Chevron topside operating procedures:

- Start-up and Shutdown
- Routine Operations
- MEG Flushing
- Valve integrity Operations
- Hydrate localisation and remediation.

Updates to procedures is outlined in the Woodside Information Management Plan and undertaken in accordance with Chevron MOC requirements (Section 7.3.1).

7.9.2 Information Management

The Woodside Information Management Plan addresses document management and communication of changes between Woodside and Chevron.

A Computerised Maintenance Management System (CMMS) interface enables oversight of critical maintenance activities on the Julimar Field Production System. The system provides Woodside with oversight of critical tasks in accordance with relevant technical integrity standards, using monitoring techniques and alarms that replicate those established for other Woodside facilities. Non-compliance with any critical maintenance activities performed on the Wheatstone Platform will result in relevant notification and close out as provided for in the operating contract.

7.9.3 Onshore

Woodside interface closely with Chevron to ensure Julimar Field Production System deliverables are aligned with the relevant Chevron deliverables to provide a consistent approach to Operational documentation.

Regular interface meetings are held. Meetings include representatives from Chevron and Woodside Operations teams and interface coordinators.

7.9.4 Offshore

Chevron's permit to work system (Wheatstone Platform Permit to Work Manual (Chevron Doc ABU-COP-0011) for the Julimar Field Production System is authorised by appropriate personnel on the Wheatstone Platform.

Recordable incidents from the Wheatstone Platform or contracted vessels under the Julimar Operations Environment Plan will be reported to Woodside within 72 hrs of occurrence and recorded in event reporting software and investigated appropriately, in accordance with Woodside Event Reporting and Investigation Procedure (WM1040PF7386000) (refer also Section 7.15).

7.10 Unexpected Finds Procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as 'any trace of human existence that has a cultural, historical or archaeological character and is located under water'); the following Unexpected Finds Procedure will apply:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: JU-00-RI-10006

Revision: 8.0

Native file DRIMS No: 10484514

Page 386 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

- all activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage, including any imagery, description and location
- person who discovers the heritage object must inform the Activity Supervisor
- activity Supervisor must notify Woodside's Principal Heritage Adviser
- Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed
- no seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside's Principal Heritage Adviser
- Woodside's Principal Heritage Adviser must notify a qualified underwater archaeologist and provide all available documentation of the potential Underwater Cultural Heritage
- if the potential Underwater Cultural Heritage appears to be Aboriginal underwater cultural heritage, Woodside's Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed
- if the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the UCH Act, Woodside's Principal Heritage Advisor must notify the Minister responsible for the UCH Act, the DCCEE underwater archaeology section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum
- if the suspected heritage object includes human remains, Woodside's Principal Heritage Adviser must also notify:
 - the Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains
 - the Office of the Federal Environment Minister in accordance with Section 20 of the ATSIHP Act
- work must not recommence in the vicinity of the potential heritage object until Woodside's Principal Heritage Adviser provides written approval. Woodside's Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

7.11 Training and Competency

7.11.1 Overview

Woodside as part of its contracting process assesses a proposed contractor's environmental management systems to determine the level of compliance with the standard AS NZ ISO 14001. This assessment is performed for the Petroleum Activities Program as part of the pre-mobilisation process. The assessment determines whether there is a clearly defined organisational structure that sets out the roles and responsibilities for key positions. The assessment also assesses whether there is an up-to-date training matrix that defines any corporate and site/activity-specific environmental training and competency requirements.

As a minimum, environmental awareness training is required for all personnel, detailing awareness and compliance with the contractor's environmental policy and environmental management system.

7.11.2 Inductions

Inductions are provided to all relevant personnel (e.g. contractors and Company representatives) before mobilising to or on arrival at the activity location. The induction covers the HSE requirements and environmental information specific to the activity location. Attendance records will be maintained.

The Petroleum Activities Program induction may cover information about:

- description of the activity
- ecological and socio-economic values of the activity location
- Regulations relevant to the activity
- Woodside's Environmental Management System – Health Safety and Environment Policy
- EP importance/structure/implementation/roles and responsibilities
- main environmental aspects/hazards and potential environmental impacts and related performance outcomes
- oil spill preparedness and response
- monitoring and reporting on performance outcomes and standards using measurement criteria
- incident reporting
- operations competency framework training
- permit to work training
- production environmental leadership training and environment awareness training
- emergency and hydrocarbon spill response training
- inductions for subsea IMMR (vessel based) personnel
- Unexpected Finds Procedure and reporting requirements (**Section 7.10**).

Records for Woodside operations personnel, in relation to the above-listed training, are maintained in Woodside's learning management system. Contractor training records are also maintained.

Competence of operations personnel can be reviewed via online dashboards.

7.11.3 Activities Program Specific Environmental Awareness

Before commencing the activities associated with the Petroleum Activities Program, a pre-activity meeting will be held on-board support vessels with all relevant personnel. The pre-activity meeting provides an opportunity to reiterate specific environmental sensitivities or commitments associated with the activity. Relevant sections of the pre-activity meeting will also be communicated to the support vessel personnel. Attendance lists are recorded and retained.

During operations, regular HSE meetings will be held. During these meetings, recent environmental incidents are reviewed and awareness material presented.

7.11.4 Operations Personnel

Training and competency for personnel on the Wheatstone Platform is managed in accordance with commitments in the *Start-Up and Operations Environment Plan: Wheatstone Project* (Chevron

Doc WS2-COP-00001). As part of that training process Woodside provides training to relevant Wheatstone Platform maintenance personnel for the Julimar Field Production System.

Training requirements for Julimar Field Production System have been incorporated into the overall Wheatstone Platform Competency Management System (CMS), which includes maintaining competency. The CMS is managed in accordance with the Wheatstone Operations Training Plan. Chevron report on competency compliance to Woodside. Training for Julimar includes web-based training modules, operator training simulator and vendor training. Competency assessment is managed in accordance with Chevron Wheatstone Operations Training Plan.

7.11.5 Environmental Leadership Training

Woodside personnel in leadership roles working on the Julimar Field Production System, for more than three months will undertake Environmental Leadership training. The training covers Woodside's policies and standards, environmental legislative requirements, the EP, key environmental risks and impacts, hazard and incident reporting, environmental management tools and accountabilities.

7.11.6 Permit to Work System Training

The *Wheatstone Platform Permit to Work* system (see Section 7.2.1) is a key element in ensuring that all necessary steps are taken to ensure the safety of personnel, protection of the environment and technical integrity of the facility and the Julimar Field Production System. The system takes a risk-based approach to all activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control.

All members of the workforce that are required to work with the system (Section 7.2.1) receive training commensurate with the level of authority and responsibility they hold.

7.11.7 Emergency and Hydrocarbon Spill Response Training

All operations personnel involved in crisis and emergency management are required to commit to ongoing training, process improvement and participation in emergency and crisis response (both real and simulated), including emergency drills specific to potential incidents at the Julimar operations. Training includes task specific training and role-based training and 'on the job' experience (i.e. participation in crisis or emergency management exercises).

Woodside Hydrocarbon Spill Preparedness Advisor(s) are responsible for maintaining hydrocarbon spill preparedness competency. This includes the identification and development of approved competency and non-competency based courses, identification of relevant personnel required to undertake training and ensuring training records are maintained. Minimum Woodside capabilities continue to be identified and documented.

7.11.8 Subsea Inspection, Monitoring, Maintenance and Repair Activity Environmental Awareness

At the beginning of, and during a new Subsea IMMR activity, the Subsea Support Vessel crew including contractor crew, Woodside representatives and other relevant personnel are required to undertake a vessel induction before commencing work. This induction covers HSE requirements for the vessel and IMMR activities, and as required environmental information specific to the activity location. The induction may cover the following environmental information:

- adherence to standards and procedures, and the use of Job Safety Analysis and permit to work hazard identification and management process
- spill management including prevention, response and clean-up, location of spill kits and reporting requirements

- waste management requirements and location of bins
- reporting of marine fauna, location of forms and charts
- chemical management requirements.

All personnel who undertake the project induction are required to sign an attendance sheet which is retained.

7.11.9 Management of Training Requirements

All personnel on support vessels are required to be competent to perform their assigned positions. This may be in the form of external or 'on the job' training. The vessel Safety Training Coordinator (or equivalent) is responsible for identifying training needs, keeping records of training performed and identifying minimum training requirements.

7.12 Monitoring, Auditing, Management of Non-Conformance and Review

Regulation 22(5) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself. This section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental risks and impacts of the Julimar Development against the EPOs, EPSs and MCs, with a view to continuous improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

7.12.1 Monitoring

Woodside and its contractors will perform a program of periodic monitoring during the Petroleum Activities Program – starting at mobilisation of each activity and continuing through the duration completion of the Program. This information will be collected using the tools and systems outlined below, developed based on the EPOs, controls, PS and MC in this EP. The tools and systems will collect, as a minimum, the data (evidence) referred to in the MC in Section 65.7 and Appendix D.

The collection of this data will form part of the permanent record of compliance maintained by Woodside and will act as the basis for demonstrating that the EPOs and PS are met, which will be summarised in a series of routine reporting documents.

7.12.1.1 Source-based Impacts and Risks

The tools and systems to monitor environmental performance, where relevant, will include:

- daily reports which include leading indicator compliance
- periodic review of waste management and recycling records
- use of contractor's risk identification program that requires personnel to record and submit safety and environment risk observation cards routinely (frequency varies with contractor)
- collection of evidence of compliance with the controls detailed in the EP relevant to offshore activities by the Woodside Offshore HSE Adviser (other compliance evidence is collected onshore)
- environmental discharge reports that record volumes of planned and unplanned discharges to ocean and atmosphere
- internal auditing and assurance program as described in Section 7.3.

Throughout this activity, Woodside will continuously identify new source-based risks and impacts through the Monitoring and Auditing systems and tools described above and in Section 7.3.

7.12.1.2 Management of Knowledge

Review of knowledge relevant to the existing environment is undertaken in order to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). New knowledge checks take place both routinely primarily via quarterly and annual knowledge reviews and ad hoc (as information is obtained), and encompasses the following topics:

- environmental science – update checks conducted via desktop reviews: scientific literature, government publications and Woodside supported publications and studies relating to existing environment topics (including but not limited to species and habitats) as well as EPBC Act Matters of National Environmental Significance (Part 3) and Part 13 statutory instruments
- socio-economic environment and stakeholder information – update checks conducted via desktop reviews: scientific literature, government publications and Woodside consultation
- environmental legislation – monitoring of emerging regulatory changes and the subsequent management of regulatory change (as outlined in the WMS Regulatory Compliance Management Procedure).

A management of knowledge tracker is maintained to record reviews and updates. Communication of relevant new knowledge is addressed at the EP Consolidation meetings where changes in knowledge prompt a consideration of management of change, this is actioned and documented appropriately.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of management of change are documented in the WMS Environment Plan Guideline. Any relevant new information on cultural values and heritage will be assessed using the EP Management of Change Process (refer to Section 7.3).

Under the Oil Spill Scientific Monitoring Program preparedness, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Environment Science Team and tracked via the Corporate Environment Baseline Database.

7.12.1.3 Management of Newly Identified Impacts and Risks

New sources of receptor based impacts and risks identified through monitoring and auditing systems and tools and the Woodside Environment Knowledge Management System are assessed using the Change Management Process (Section 7.3).

Table 7-6: Summary of Emissions and Discharges Monitoring for the Petroleum Activities Program

Category	Parameter to be Monitored/Reported	Monitoring Frequency	Monitoring Equipment/Methodology	EP Reference
<i>Planned Discharges</i>				
Discharge of subsea control fluids during well actuations	Subsea control fluid consumption	Normally continuous process indication/monthly review	Subsea control fluid consumption surveillance. Process indication for gross leaks/ruptures	Section 6.7.4
Discharge of hydrocarbons and chemicals during subsea IMMR activities	Volumes of hydrocarbons and chemicals released subsea	As required, during IMMR activities (activity specific)	Estimates based on known volumes pumped and ROV observation	Section 6.7.4
Waste recycling and disposal	Quantities of solid and liquid wastes disposed of onshore	Ongoing	Support vessel waste log	Section 6.7.5
<i>Unplanned Emissions and Discharges</i>				
Unplanned emissions and discharges	Nature of release	As required	HSEQ Event Reporting System (First Priority)	Sections 6.9.1 to 6.9.4

Native file DRIMS No: 10484514

Page 392 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

7.12.2 Auditing

Environmental performance auditing will be performed to:

- identify potential new, or changes to existing environmental impacts and risk, and methods for reducing those to ALARP
- confirm that mitigation measures detailed in this EP are effectively reducing environmental impacts and risk, that mitigation measures proposed are practicable and provide appropriate information to verify compliance
- confirm compliance with the Performance Outcomes, Controls and Standards detailed in this EP.

Internal auditing will be performed to cover each key project activity as summarised below.

7.12.2.1 Operations Assurance

To provide confidence, based on evidence commensurate with risk, that business objectives are met, business activities are performed and risks are managed, assurance is performed as described in the Provide Assurance Procedure and the Provide Assurance Guideline. The Guideline aims to explain how the Operations Division Assurance Team implement WMS Assurance requirements, while concurrently satisfying the Operations Division's specific objectives.

Environmental assurance activities are conducted on a regular basis to help:

- verify environmental risks and potential impacts are being managed in accordance with the EPOs and EPSs detailed in this EP
- monitor, review and evaluate the effectiveness of the performance outcomes and standards detailed in this EP
- verify effectiveness of the EP implementation strategy
- identify potential non-conformances.

The outputs of the assurance process are corrective actions that feed the improvement process. Therefore, assurance is a key driver of continuous improvement.

Under the Field Operating Services Agreement (FOSA) Chevron is required to act in accordance with the direction provided by Woodside and the guidelines and procedures contained in the Field Production System Operating Manual provided by Woodside (Section 7.8).

Under the FOSA, Woodside has the means to monitor the performance of Chevron, including access to real-time data and reporting, and has access rights to all facilities under the Joint Operating Agreement.

7.12.2.2 Subsea Scope Activities

The following internal assurance will be performed for the subsea scope activities:

- pre-mobilisation inspection/audit report will be conducted by a relevant person (before commencing). The scope of the audits are risk-based and specific to the relevant activity, but will generally focus on aspects relating to ensuring appropriate understanding of environmental commitments and the operational readiness of the activity scope, including appropriate environmental controls in place. All installation vessels associated with the above

Uncontrolled when printed. Refer to electronic version for most up to date information.

scopes will be audited by Woodside. Support or transport vessels will be assessed on a risk-based approach, but will be audited via the primary subsea installation contractor's process

- at least one operational compliance audit relevant to applicable EP commitments will be conducted by a Woodside Environment Adviser for the subsea campaign. The audit may be conducted offshore or office-based, subject to the duration of the activity and logistics of performing the audit offshore for short duration scopes (e.g., pipelay).
- contractor-specific HSE audits will also be conducted of the associated support vessels. The audits will consider the implementation of HSE management, risk management, as well as pre-mobilisation and offshore readiness
- vessel based HSE inspections will be conducted fortnightly by vessel HSE personnel. Each inspection will focus on a specific risk area relevant to the project activity and a formal report will be issued (for example, bunkering controls, chemical and discharge management, cetacean reporting, etc)
- annual inspection of Woodside's long term hire subsea support vessels are undertaken to ensure compliance with both the EP and the approved Contractor Management system.

The internal audits and reviews, combined with the ongoing monitoring described in Section 7.12.1, and collection of evidence for MC are used to assess EPOs and standards.

As part of Woodside's EMS and/or assurances processes, activities may also be periodically selected for environmental audits as per Woodside's internal auditing process. Audit, inspection and review findings relevant to continuous improvement of environmental performance are tracked through the Environmental Commitments and Actions Register.

7.12.2.3 Marine Assurance

Woodside's marine assurance is managed by the Marine Assurance Team in accordance with Woodside's Marine Offshore Vessel Assurance Procedure. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

Woodside's Marine Offshore Assurance process is mandatory for all vessels (other than Tankers and Floating Production Storage and Offloading vessels) that are chartered directly by or on behalf of Woodside, including for short term hires (i.e., <3 months in duration) It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust Safety Management System.

The process is multi-faceted and encompasses the marine assurance activities of:

- Offshore Vessel Management and Self-Assessment (OVMSA) review
- DP system verification
- vessel inspections
- project support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance

system onboard. Woodside Marine Assurance Specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside marine vessel inspection
- Oil Companies International Marine Forum (OCIMF) Offshore Vessel Inspection Database (OVID) inspection
- IMCA CMID inspection
- marine warranty survey.

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval. Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, there does exist an opportunity to further scrutinise the proposed vessel.

Where a vessel inspection and/or OVMSA Verification Review is not available and all reasonable efforts based on time and resource availability to complete an vessel inspection and/or OVMSA Verification Review are performed (i.e., short term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternate means of inspection, known as a risk assessment (Section 7.12.2.4).

Environmental requirements specific to offshore facility support vessel contractors are communicated via Woodside marine charterers instructions. This document provides the Master of a vessel on hire to Woodside, with a clearly defined set of requirements and procedures for operating the vessel in the vicinity of the Woodside's operating facilities. The document includes information on:

- applicable legislation and guidelines
- roles and responsibilities
- marine fauna interaction guidance
- incident reporting requirements.

Environmental requirements specific to Subsea Support Vessels are communicated via the Subsea Environmental Compliance Package. This document outlines mandatory environmental management requirements for Subsea Support Vessels and associated contractors.

7.12.2.4 Risk Assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist, where the vessel meets the short-term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

Page 641 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

- management control factors:
 - company audit score (i.e. management system)
 - vessel HSE incidents
 - vessel Port State Control deficiencies
 - instances of Port State Control vessel detainment
 - years since previous satisfactory vessel inspection
 - age of vessel
 - contractors' prior experience operating for Woodside
- activity risk factors:
 - people health and safety risks (a function of the nature of the work and the area of operation)
 - environmental risks (a function of environmental sensitivity, activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))
 - value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
 - reputation risk
 - exposure (i.e. exposure to risk based on duration of project)
 - industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

7.12.3 Management of Non-conformance

Woodside classifies non-conformances with EPOs and standards in this EP as environmental incidents. Woodside employees and contractors are required to report all environmental incidents, and these are managed as per Woodside's HSE Event Reporting and Investigation Procedure which includes learning requirements.

An internal computerised database called First Priority is used to record and report these incidents. Details of the event, immediate action taken to control the situation, investigation outcomes and corrective actions to prevent reoccurrence are all recorded. Corrective actions are monitored using First Priority and closed out in a timely manner.

Woodside uses a consequence matrix for classification of environmental incidents, with the significant categories being A, B and C (as detailed in Section 2.8). Detailed investigations are completed for all categories A, B, C and high potential environmental incidents.

7.12.4 Review

7.12.4.1 Management Review

Within the Environment Function, senior management regularly monitor and review environmental performance and the effectiveness of managing environmental risks and performance. Within each

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Function and Business Unit Leadership Team (e.g. Drilling and Completions, Subsea and Developments/Projects), managers review environmental performance regularly, including through quarterly HSE review meetings.

Woodside's Operations Division Environment Team will perform routine reviews of the effectiveness of the implementation strategy and associated tools. This will involve reviewing the:

- Operations Division environment KPIs (leading and lagging)
- tools and systems to monitor environmental performance (detailed in Section 7.12.1)
- Reviews of oil spill arrangements and testing are performed in accordance with Section 7.16.7.

7.12.4.2 Program of Ongoing Engagement with Traditional Custodians

Woodside will undertake an annual review of the Program of Ongoing Engagement with Traditional Custodians (Appendix I) to determine its effectiveness and adapt the program accordingly. The annual review will also include an assessment of appropriateness of the methods used to undertake ongoing consultation with Traditional Custodians.

7.12.4.3 Learning and Knowledge Sharing

Learning and knowledge sharing occurs via a number of different methods including:

- event investigations
- event bulletins
- after action review conducted at the end of each well, including review of environmental incidents as relevant
- formal and informal industry benchmarking
- cross asset learnings
- engineering and technical authorities discipline communications and sharing.

In the event that activities described in this EP do not occur continuously or sequentially, before recommencing activities after a cessation period greater than 12 months, impacts, risks and controls will be reviewed.

The process will identify or review impacts and risks associated with the newly-commencing activity, and will identify or review controls to ensure impacts and risks remain/are reduced to ALARP and acceptable levels. Information learned from previous activities conducted under this EP will be considered. Controls which have previously been excluded on the basis of proportionality will be reconsidered. Any required changes will be managed by the MOC process outlined below (Section 7.3).

7.12.4.4 Continuous Improvement

Continuous Improvement (CI) Projects to improve production or environmental performance that involve modification or major maintenance on the Julimar Field Production System are typically managed by Brownfields Engineering and required to follow appraise and develop management procedures. Currently, the Procedure requires that all projects be managed in accordance with the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Opportunity Management Framework which supports the progressive maturation of an opportunity through value creation in the Assess and Select Phases and the maintenance of value in the Develop and Execute phases.

To support the accountable executive to make a decision on whether a CI Project should proceed to the next phase in the Opportunity Management Framework, it is sometimes necessary to conduct a trial of the modification to determine the outcomes that can be expected if the modification is implemented. Due to prioritisation of resources, the phased progress of opportunities, competition between different solutions and long-term strategic and financial considerations, it is not possible to set quantitative success criteria to determine whether a modification will be implemented based on the results of trials. Instead, the results of a trial are used to inform a decision on whether to progress the CI Project to the next phase in the Opportunity Management Framework. Decisions are typically made with two key considerations; whether the business is ready to proceed which has a technical/functional focus and whether there is a business case for progressing to the next phase. The business case may consider the ALARP position for the CI Project, if relevant.

7.13 Record Keeping

Compliance records (outlined in MC in **Section 6**) will be maintained.

Record keeping will be in accordance with Regulation 22(6) that addresses maintaining records of emissions and discharges.

7.14 Ongoing Consultation

Although consultation for the purpose of Regulation 25 is complete, in accordance with Regulation 22(15) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside proposes to undertake the engagements with directly impacted relevant persons and additional persons listed in Table 7-7. Relevant new information identified during ongoing consultation will be assessed using the EP Management of Knowledge (refer to Section 7.12.1.2 and Management of Change Process (refer to Section 7.3)).

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who present at those meetings are from community and industry and include Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, industry representative bodies, Community and industry organisations.

Relevant persons and those who are simply interested in the activities, can otherwise remain up to date on this activity through subscribing to our website the Woodside website, or by reading the publicly available version of the EP on NOPSEMA's website, where available.

Should consultation feedback be received following EP acceptance that identifies relevant new information or a measure or control that requires implementation or update to meet the intended outcome of consultation (see Section 5), Woodside will apply its EP Management of Knowledge process (refer to Section 7.12.1.2 and Management of Change process (refer to Section 7.3)), as appropriate.

Woodside has developed a Program of Ongoing Engagement with Traditional Custodians (Appendix I), which is compliant with Corporate Woodside Policies Strategies and procedures and directly informed by feedback from Traditional Custodians. It provides a mechanism for ongoing

dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the activity and in relation to caring for and managing country, including Sea Country. The Program will be tailored to each Traditional Custodian group and may include, as agreed with relevant Traditional Custodians:

- social investment to support Indigenous ranger programs
- support for Indigenous oil spill response capabilities
- support for recording Sea Country values
- support to Traditional Custodian groups to build capabilities and capacity with respect to ability to engage with Woodside and the broader O&G industry on activities
- development of ongoing relationships with Traditional Custodian groups
- any other initiatives proposed for the purpose of protecting Country including cultural values.

At the time of EP submission, a number of specific activities as part of ongoing consultation regarding the activity are planned with Traditional Custodian Relevant Persons. These are described in Appendix I. Where Traditional Custodian relevant persons have requested information or further engagement considered as ongoing consultation, but have not requested a framework agreement, these requests have been captured in Table 7-7. However, a framework agreement may still be initiated by these groups at any time.

Table 7-7: Ongoing consultation engagements

Report/ information	Recipient	Purpose	Frequency	Content
Notification (email)	AHO	As requested by AMSA during consultation	Notify AHO no less than 4 weeks prior to commencement if vessels are undertaking activities within the Operational Area for > 3 three weeks at a time	PS 1.5 (Section 6.7.1) Date of activity start.
Updates (email)			As required.	Changes to planned activities.
Notification (email)	AMSA	As requested by AMSA during consultation	Notify of AMSA JRCC of activities where vessels will be in the Operational Area < 3 weeks 24-48 hours before vessel activity commencement date.	PS 1.7 (Section 6.7.1) Date of activity start.
Update (email)			Provide updates to the AHO and AMSA JRCC should there be changes to the activity.	Changes to planned activities.

Any relevant new information on cultural values will be assessed using the EP Management of Knowledge (Section 7.12.1.2) and Management of Change Process (refer to Section 7.3).

7.15 Reporting

7.15.1 Overview

To meet the EPOs and EPSs outlined in this EP, Woodside reports at a number of levels, as outlined in the next sections. Routine Reporting (Internal)

7.15.2 Routine Reporting (Internal)

7.15.2.1.1 Daily Progress Reports and Meetings

The following daily reports, containing environmental performance information are issued:

- Pan-Woodside Daily Production Report – The report includes facility performance information on production and a log of any HSE events
- Subsea support vessel Daily Progress Report(s) – During JDP3 commissioning as well as IMMR activities, daily reports are issued by the Woodside Site Representative. The reports provide performance information on HSE events, diesel use, together with equipment information, current and planned work activities.

Meetings between key personnel are used to transfer information, discuss incidents, agree plans for future activities and develop plans and accountabilities for resolving issues.

7.15.2.2 Regular Health, Safety and Environment Meetings

Regular dedicated HSE meetings are held with the offshore and Perth-based management and advisers to address targeted HSE incidents and initiatives. Minutes of these meetings are produced and distributed as appropriate.

7.15.2.3 Performance Reporting

Monthly and quarterly performance reports are developed and reviewed by the Function and Business Unit Leadership Teams (e.g., Drilling and Completions, Operations). These reports cover a number of subject matters, including:

- HSE incidents (including high potential incidents and those related to this EP) and recent activities
- corporate KPI targets, which include environmental metrics
- outstanding actions as a result of audits or incident investigations

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- technical high and low lights
- status of subsea IMMR activities.

7.15.3 Routine Reporting (External)

7.15.3.1 Environmental Performance Review and Reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information on environmental performance to the appropriate regulator. Regulatory reporting requirements are summarised in Table 7-8.

Table 7-8: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Reports	NOPSEMA	Monthly, by 15th of each month	Details of recordable incidents that have occurred during the Petroleum Activities Program for previous month (if applicable).
Annual Environment Plan Performance Report	NOPSEMA	Annual, by 30 April of the year following reporting period	Compliance with EPOs, controls and standards outlined in this EP, in accordance with the Environment Regulations.
National Pollutant Inventory (NPI) Report	DCCEEW	Annual, by 30 September each year	Summary of the emissions to land, air and water including those from the facility. Reporting period 1 July to 30 June each year.
National Greenhouse and Energy Reporting (NGERS)	Clean Energy Regulator	Annual, by 31 October each year	Summary of energy use and greenhouse gas emissions including those from the facility. Reporting period is 1 July to 30 June each year.

7.15.3.2 Start and End Notifications of the Petroleum Activities Program

7.15.3.2.1 JDP3 commissioning

In accordance with Regulation 54, Woodside will notify NOPSEMA of the commencement of the Petroleum Activities Program at least ten days before the activity commences and will notify NOPSEMA within ten days of completing the activity.

7.15.3.2.2 End of the Petroleum Activities Program Notification

In accordance with Regulation 54, Woodside will notify NOPSEMA within ten days of the completion of the Petroleum Activities Program.

7.15.3.3 End of the Environment Plan

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activities Program has ended, all of the obligations identified in this EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 46 of the Environment Regulations.

7.15.4 Incident Reporting (Internal)

The process for reporting environmental incidents is described in Section 7.15 of this EP. It is the responsibility of the Woodside Project Manager to ensure reporting of environmental incidents meets Woodside and regulatory reporting requirements as detailed in the Woodside HSE Event Reporting and Investigation Procedure and this section of this EP.

7.15.5 Incident Reporting (External) – Reportable and Recordable

7.15.5.1 Reportable Incidents

A reportable incident is defined under Regulation 5 of the Environment Regulations as:

- ‘an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage’.

A reportable incident for the Petroleum Activities Program is:

an incident that has caused environmental damage with a Consequence Level of Moderate C+ or above (as defined under Woodside’s Risk Table; refer to Section 2.2)

an incident that has the potential to cause environmental damage with a Consequence Level of Moderate C+ or above (as defined under Woodside’s Risk Table – refer to Section 2.6).

The environmental risk assessment (Section 6) for the Petroleum Activities Program identifies those risks with a potential consequence level of C+ for environment. The incidents that have the potential to cause this level of impact include hydrocarbon loss of containment events to ocean resulting from:

- loss of well containment (MEE-01)

Any such incidents represent potential events which would be reportable incidents. Reporting of incidents is undertaken with consideration of NOPSEMA (2014) guidance stating, ‘if in doubt, notify NOPSEMA’, and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the Regulations.

7.15.5.1.1 Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 47, 48 and 49 of the Environment Regulations. Woodside will:

- report all reportable incidents to the regulator (orally) as soon as practicable (ASAP), but within two hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator (NOPTA) and the Department of the responsible State Minister (DEMIRS) ASAP after orally reporting the incident
- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0831 – Reportable Environmental Incident (Appendix E) which must be submitted to NOPSEMA ASAP, but within three days of the incident or of its detection by Woodside
- provide a copy of the written report to the NOPTA and DEMIRS, within seven days of the written report being provided to NOPSEMA.

AMSA will be notified of oil spill incidents ASAP after their occurrence, and DCCEEW notified if MNES are to be affected by the oil spill incident.

7.15.5.2 Recordable Incidents

A recordable incident is defined under Regulation 5 of the Environment Regulations as a ‘breach of an EPO or EPS, in the EP that applies to the activity, that is not a reportable incident’.

Any breach of the EPOs or EPSs (as presented within Section 6) will be raised as a recordable incident and managed as per the notification and reporting requirements outlined below and internal requirements outlined in Section 7.15.

7.15.5.2.1 Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 50(2), no later than 15 days after the end of the calendar month using the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report (Appendix E) detailing:

- all recordable incidents that occurred during the calendar month
- all material facts and circumstances concerning the recordable incidents that the operator knows or is able, by reasonable search or enquiry, to find out
- any action taken to avoid or mitigate any adverse environment impacts of the recordable incidents
- the corrective action that has been taken, or is proposed to be taken, to prevent similar recordable incidents
- the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring in the future.

7.15.5.3 Other External Reporting Requirements and Notifications

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, Table 7-9 describes the incident and notification reporting requirements that also apply in the Operational Area.

Table 7-9: External incident reporting requirements

Event	Responsibility	Notifiable party	Notification requirements	Contact	Contact details
External incident reporting requirements					
Any marine incidents during Petroleum Activities Program	Offshore Installation Manager or Vessel Master	AMSA	Incident Alert Form 18 as soon as reasonably practicable Within 72 hours after becoming aware of the incident, submit Incident Report Form 19	AMSA	reports@amsa.gov.au
Oil pollution incidents in Commonwealth waters	Offshore Installation Manager or Vessel Master	AMSA Rescue Coordination Centre (RCC)	Without delay as per <i>Protection of the Sea Act</i> , part II, section 11(1), AMSA JRCC notified verbally via the national emergency 24-hour notification contact of the hydrocarbon spill; follow up with a written Pollution Report ASAP after verbal notification	RCC Australia	Phone: 1800 641 792 or +61 2 6230 6811 AFTN: YSARYCYX
Any marine incidents during Petroleum Activities Program	Offshore Installation Manager or Vessel Master	Chevron Australia Pty Ltd	Verbally notify Security Operations Centre of event and estimated volume and hydrocarbon lost	Chevron Perth Security Operations Centre	+61 8 9262 2543 +61 417 442 081 Alt (0427 495 187)
Any oil pollution incident which has the potential to significantly impact MNES.	Offshore Installation Manager or Vessel Master	DCCEEW	Phone call notification	Secretary of the DCCEEW	Phone: 1800 803 772 Email: protected.species@environment.gov.au
Any oil pollution incident which has the potential to enter a National Park or requires oil spill response activities to be conducted within a National Park	Offshore Installation Manager or Vessel Master	DNP	Reported verbally, as soon as is practicable. The notification should include: <ul style="list-style-type: none"> • titleholder details • time and location of the incident (including name of marine park likely to be affected) • proposed response arrangements as per the Oil Pollution Emergency Plan (e.g. dispersant, containment, etc.) 	Director of National Parks (DNP)	Phone: 0419 293 465 (24 Hr duty officer)

7.16 Emergency Preparedness and Response

7.16.1 Overview

Under Regulation 22(8), the implementation strategy must contain an oil pollution emergency plan (OPEP) and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

A summary of how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements is shown in Table 7-10.

Table 7-10: Oil pollution preparedness and response overview

Content	Environment Regulations Reference	Document/Section Reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 21(5), (6), 22(2)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix D)
Describes the oil pollution emergency plan	Regulation 22 (8)	Environment Plan: Woodside's oil pollution emergency plan has the following components: Woodside Oil Pollution Emergency Arrangements (Australia) Julimar Oil Pollution First Strike Plan (Appendix G) Oil Spill Preparedness and Response Mitigation Assessment (Appendix D) In accordance with Regulation 56 of the Environmental Regulations the Woodside Oil Pollution Emergency Arrangements (Australia) was provided with the Scarborough Drilling and Completions EP, accepted by NOPSEMA on 1 December 2023.
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22 (9)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix D) Julimar Oil Pollution First Strike Plan (Appendix G)
Details the arrangements for updating and testing the oil pollution response arrangements	Regulation 22(8)(12),(13)(14)	Environment Plan: Section 7.16.7. Oil Spill Preparedness and Response Mitigation Assessment (Appendix D)
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22(10)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix D)
Demonstrates that the oil pollution response arrangements are consistent with the national system for oil pollution preparedness and control	Regulation 22(11)	Woodside Oil Pollution Emergency Arrangements (Australia)

7.16.2 Emergency Response Training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk based training needs analysis on positions required for effective emergency response (Table 7-11).

Table 7-11: Emergency response training requirements

IMT Position	Minimum Competency
Corporate Incident Management Team (CIMT) Incident Commander and Deputy Incident Commander	<ul style="list-style-type: none"> • IMT Fundamentals Course (internal course) or equivalent • ICS 100/200 • IMO3 or equivalent spill response specialist level with an oil spill response organisation (OSRO) • Participation in L2 activation, exercise or skills maintenance
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	<ul style="list-style-type: none"> • IMT Fundamentals Course or equivalent • ICS 100/200 • Oil spill theory • Participation in L2 activation, exercise or skills maintenance
Environment Unit Leader	<ul style="list-style-type: none"> • IMT Fundamentals Course • ICS 100/200 • IMO2 or equivalent spill response specialist level with an OSRO • Participation in L2 activation, exercise or skills maintenance
Note on competency/equivalency	
<p>In 2023 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Crisis and Emergency Management training and the oil spill response training requirements for IMT roles.</p> <p>The revised IMT Fundamentals training Program aligns with the performance requirements of the <i>PMAOMIR320 – Manage Incident Response Information</i> and <i>PMAOMOR418 - Coordinate Incident Response</i>.</p> <p>In 2023, Woodside took the decision to align its global incident command arrangements to the Incident Command System (ICS). As such all rostered members of the Incident Management Team are trained up to ICS 200.</p> <p>In addition to baseline incident management training, all rostered members of the CIMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course (OSREC) which involves the completion of two online AMSA Modules (Introduction to National Plan and Incident Management; and Introduction to Oil Spills) and face-to-face training.</p> <p>Woodside Learning Services is responsible for collating and maintaining personnel training records. The HSP Dashboard reflects the competencies required for each oil spill role (IMT/operational).</p>	

7.16.3 Emergency Response Preparation

The Corporate Incident Management Team (CIMT) based in Woodside's head office in Perth, is the onshore coordination point for an offshore emergency. The CIMT is staffed by a roster of appropriately skilled personnel available on call 24 hours a day. The CIMT, under the leadership of the CIMT Leader, supports the site-based Incident Management Team by providing additional support in areas such as operations, logistics, planning, people management and public information (corporate affairs). A description of Woodside's Incident Command Structure and arrangements is further detailed in the Woodside Oil Pollution Emergency Arrangements (Australia).

Woodside will have a number of Emergency Response Plans (ERP) in place relevant to the PAP. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Uncontrolled when printed. Refer to electronic version for most up to date information.

The ERP for activities covered by this EP references the *Wheatstone Upstream Emergency Response Plan* (ERP). The ERP contains instructions for oil pollution emergencies, vessel emergency, medical emergency, search and rescue, reportable incidents, incident notification, contact information and activation of the Contractor's emergency centre and Woodside Communication Centre (WCC).

The *Wheatstone Start-up and Operations Oil Pollution Emergency Plan* outlines requirements for response to an oil spill from field production systems tied into the Wheatstone Platform. Initial response to a subsea release from the Julimar Field Production System would be managed in accordance with the *Julimar Emergency Response Interface Plan* and the *Wheatstone Upstream ERP*, until transferred to Woodside control.

In addition, the Emergency Preparedness MSPS (M06) is in place to assure that in the event of an incident, the organisation is appropriately prepared for all necessary actions which may be required for the protection of People, Environment, Asset, Reputation and Livelihood.

7.16.3.1 Initial Response to Field Production System Incident

In the event of an emergency arising from the Julimar Field Production System, the Wheatstone Platform OIM will assume overall onsite command and continue initial emergency response operations until transfer of control as described in the *Wheatstone Upstream ERP*. The *Wheatstone Upstream ERP* provides guidance on establishing emergency management control, mobilising resources offshore and onshore, and dealing with external authorities and third party contractors.

As per the *Julimar Emergency Response Interface Plan*, Chevron will notify Woodside immediately (within 2 hrs) upon detection of spills from, or suspected to be from, the Julimar Field Production System via the WCC. Key incident details that will be communicated include:

- time of incident
- whether the release is controlled
- weather, tide and current details
- apparent trajectory of the spill.

If an emergency occurs, including unplanned release of hydrocarbon, the Wheatstone Platform operator shall promptly take such action that is necessary to remedy or alleviate such an emergency. For an oil spill incident initial actions to be undertaken by Chevron may include deployment of tracker buoy and opportunistic visual observations, as per the Julimar Operations Oil Pollution First Strike Plan (Appendix G).

In the event of an oil pollution emergency arising from the Julimar Field Production System, Woodside is Control Agency. Woodside would activate a concurrent CIMT, in close liaison with Chevron, including stand up and activation of relevant response arrangements suitable to the nature and scale of the event and subject to relevant Net Environmental Benefit Assessment and Incident Action Plan.

Transfer of Control

The *Emergency Response Interface Plan* describes transfer of control in an emergency event from Chevron and Woodside. With regards to an emergency that is determined to be attributable to the Julimar Field Production System that would require a long-term response (i.e. > 12 hrs); when safe to do so, a decision may be taken for Woodside to take over the coordination of the emergency response and manage the long-term resolution. Such a decision must be agreed between Chevron and Woodside and communicated to key stakeholders detailed in the *Emergency Response*

Interface Plan. To extent required, the appropriate regulatory agency(s) must also approve the transfer of control of the response operations to the Woodside.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the Petroleum Activities Program, as detailed in Appendix D. These performance outcomes, standards and measurement criteria apply to all activities within Woodside control. Activities controlled by Chevron would be subject to the Start-Up and Operations *Environment Plan: Wheatstone Project* (Chevron Doc. WS2-COP-00001) and associated Oil Spill Offshore Response Plan commitments and performance measures.

7.16.3.2 Initial response to Vessel Incident

In the event of an emergency on a vessel, the Vessel Master will assume overall onsite command and act as the Emergency Response Coordinator (ERC). All persons aboard the vessel will be required to act under the ERC's directions. The vessel will maintain communications with the Wheatstone Platform OIM, Asset Manager and/or other emergency services in the event of an emergency, as set out in the relevant ERP. Emergency response support can be provided by the Contractor's emergency centre or CIMT if requested by the ERC.

The Julimar Oil Pollution First Strike Plan provides immediate actions required to commence a response (Appendix G). Vessels will have SOPEPs in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Julimar Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

7.16.4 Oil and Other Hazardous Materials Spill

A significant hydrocarbon spill during the Petroleum Activities Program is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. Following transfer of control from Chevron, the [Woodside Oil Pollution Emergency Arrangements \(Australia\)](#) document, supported by the Julimar Oil Pollution First Strike Plan which provides tactical response guidance to the activity/area Appendix G and Appendix D of this EP, cover spill response for this Petroleum Activities Program.

The Crisis and Emergency Management Team manages Woodside's hydrocarbon spill response equipment stockpile. Woodside also maintains a suite of contracts for access to additional specialist response equipment and trained personnel as required via Australian and international spill response organisations and labour supply companies. In the event of a major spill, Woodside enact first strike response actions, in liaison with the relevant Control Agency, as detailed in the activity-specific Oil Pollution First Strike Plan.

Vessels will have SOPEPs in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

7.16.5 Emergency and Spill Response

Woodside categorises incidents in relation to response requirements as follows:

Level 1 Incident

A Level 1 incident can be resolved through the use of existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site/regionally based teams using existing resources and functional support services.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: JU-00-RI-10006

Revision: 8

Native file DRIMS No: 10484514

Page 657 of 445

Uncontrolled when printed. Refer to electronic version for most up to date information.

Level 2 Incident

A Level 2 incident is characterised by a response that requires external operational support to manage the incident. It is triggered in the event the capabilities of the tactical level response are exceeded. This support is provided to the activity via the activation of all, or part of, the responsible CIMT.

Level 3 Incident

A Level 3 incident or crisis is identified as a critical event that seriously threatens the organisation's People, the Environment, company Assets, Reputation, Livelihood. At Woodside, the Crisis Management Team (CMT) manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal & commercial, reputation, etc.). The CIMT may also be activated as required to manage the operational incident response requirements.

7.16.6 Emergency and Spill Response Drills and Exercises

Testing of Woodside's capability to respond to incidents will be conducted in alignment with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in the Julimar Oil Pollution First Strike Plan (Appendix G). Woodside's emergency response testing regime is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards/risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are reference point for emergency management and crisis management exercising schedule development. External participants may be invited to attend exercises (e.g. government agencies, specialist service providers, hydrocarbon spill response organisations or industry members with which Woodside has mutual aid arrangements).

The overall objective of exercising is to tests procedures, skills and teamwork of the Emergency Response and Command Teams in their ability to respond to MAEs and MEEs. After each exercise, the team holds a debrief session, during which the exercise is reviewed. Any lessons learnt or areas for improvement are identified and incorporated into revised procedures where appropriate.

Table 7-12: Testing of Response Capability to Incidents

Response Category	Scope	Response Testing Frequency	Response Testing Objective
Level 1 Response	Exercises are project / activity specific	Two comprehensive Level 1 'First Strike' drills conducted per year, per asset. Additional Level 1 emergency drills routinely conducted (Approximately one per fortnight).	<ul style="list-style-type: none"> Comprehensive exercises test elements of the Julimar Oil Pollution First Strike Plan (Appendix G). Emergency drills are scheduled to test other aspects of the Emergency Response Plan.
Level 2 Response	Exercises are facility / vessel specific	A minimum of one Emergency Management exercise is conducted biennially.	<ul style="list-style-type: none"> Testing both the facility IMT response and/or that of the CIMT following handover of incident control.
Level 3 Response	Exercises are relevant to all Woodside assets	The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Emergency Management.	<ul style="list-style-type: none"> Test the ability of the company to respond to and manage a crisis level incident.

7.16.7 Hydrocarbon Spill Response Testing of Arrangements

In the event of a spill, several arrangements underpin Woodside's ability to implement a response across its petroleum activities. To adequately test these arrangements, the Crisis and Emergency Management Team confirms that tests are conducted in alignment with the Hydrocarbon Spill Testing of Arrangements Schedule.

- Woodside's arrangements for spill response are common across its Australian operating assets and activities to ensure the controls are consistent. The overall objective of testing these arrangements is to maintain Woodside's ability to respond to a hydrocarbon spill, specifically to: confirm relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities
- test response arrangements and actions to validate response plans

incorporate lessons learned are incorporated into Woodside's processes and procedures and make improvements where required. If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or activity locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable. In addition to the testing of response capability described in Table 7-12, up to eight formal exercises are planned annually, across Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

7.16.7.1 Testing of Arrangements Schedule

Woodside's Testing of Arrangements Schedule (Figure 7-7) aligns with international good practice for spill preparedness and response management; the testing is compatible with the International Petroleum Industry Environmental Conservation Association Good Practice Guide and the Australian Institute for Disaster Resilience (AIDR) Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside's regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g., capability, equipment and personnel). For example, an arrangement could be to test Woodside's personnel capability for conducting scientific monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment. The vertical columns relate to how hydrocarbon spill arrangements will be tested over the 3-year rolling schedule. The sub-heading for the column describes the standard method of testing likely to be undertaken (e.g., discussion exercise, desktop exercise), and the green cells indicate the arrangements that could be tested for each method. Some arrangements may be tested across multiple exercises (e.g., critical arrangements) or via other 'additional assurance' methods outside the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g., audits, no-notice drills, internal exercises, assurance drills).

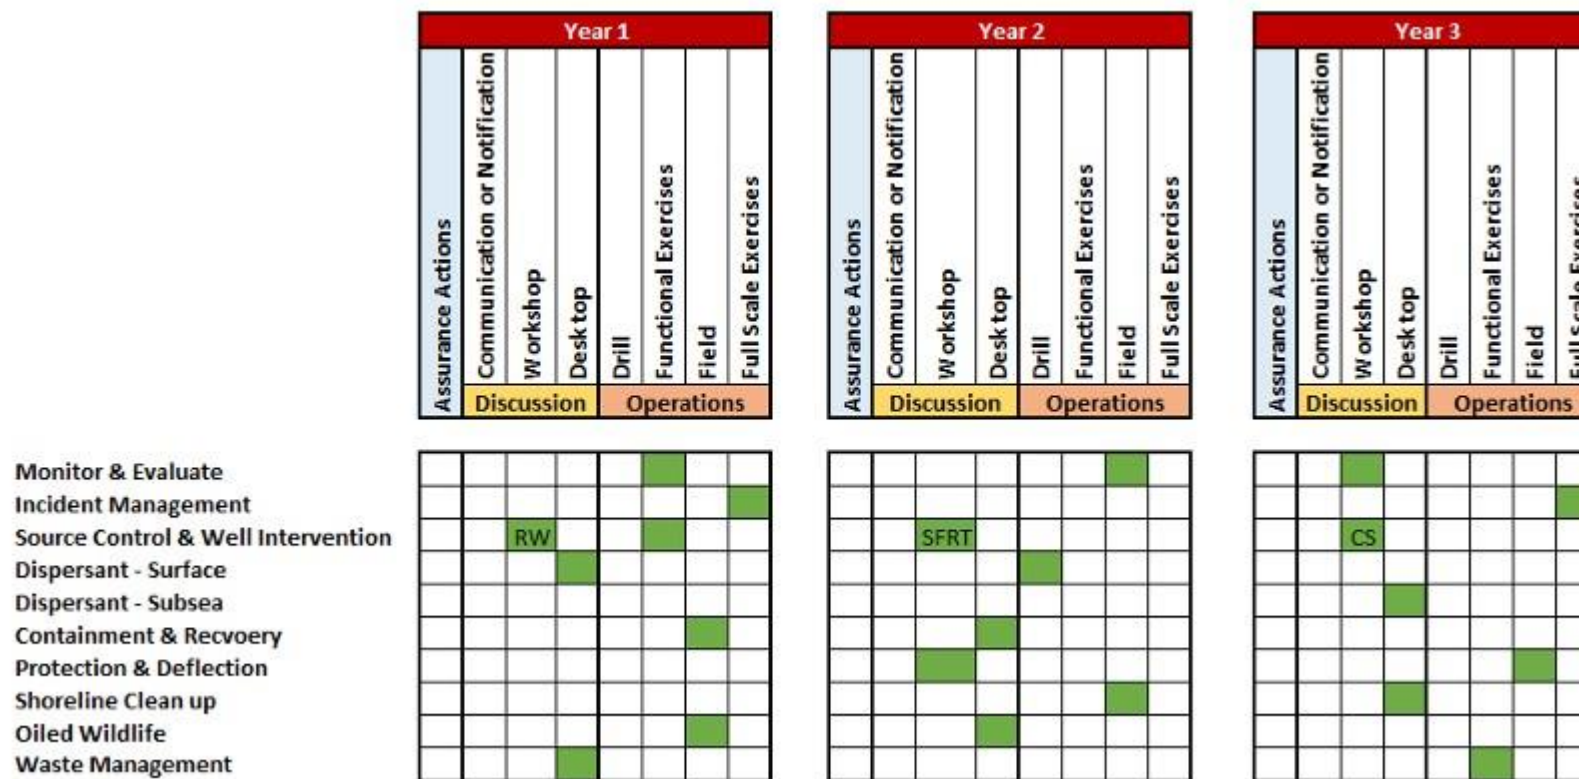

Figure 7-7: Indicative Three Yearly Testing of Arrangements Schedule

7.16.8 Cyclone and Dangerous Weather Preparation

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

The support vessels receive regular forecasts from the Bureau of Meteorology (BoM). If a cyclone (or severe weather event) is forecast, the path and its development will be plotted and monitored using the BoM data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activities Program, the asset Cyclone Contingency Plan and the vessel's Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

9. LIST OF TERMS AND ACRONYMS

Acronym	Description
ABARES	Australian Bureau of Agricultural and Resource Economics and Sciences
ABN	Australian business number
AEP	Australian Energy Producers
AFMA	Australian Fisheries Management Authority
AHO	Australian Hydrographic Office
AIS	Automatic Identification System
ALARP	as low as reasonably practicable
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
AUV	autonomous underwater vehicles
BIA	biologically important area
BoM	Bureau of Meteorology
BOP	blowout preventer
BP	boiling point
BTAC	Buurabalayji Thalanyji Aboriginal Corporation
BWCMP	Blue Whale Conservation Management Plan
CAES	catch and effort system
CCE	common cause effect
CCR	central control room
CFA	Commonwealth Fisheries Association
CHARM	chemical hazard and risk management
CIMT	Corporate Incident Management Team
cm	centimetres
CMMS	Computerised Maintenance Management System
CMT	Crisis Management Team
CP	cathodic protection
CS	cost sacrifice
CSIRO	Commonwealth Scientific and Industrial Research Organisation
Cth	Commonwealth
CV	company values
CVI	close visual inspections
DAA	Department of Aboriginal Affairs
dB	decibel
DCCEEW	Department of Climate Change, Energy, the Environment and Water
DCLM	Department of Conservation and Land Management
DEWHA	Department of the Environment, Water, Heritage and the Arts
DISER	Department of Industry, Science, Energy and Resources

Climate Policy

BACKGROUND

The Intergovernmental Panel on Climate Change has stated that “it is unequivocal that human influence has warmed the atmosphere, ocean and land”. An objective of the Paris Agreement is to hold “the increase in the global average temperature to well below 2°C above pre-industrial levels” and to pursue “efforts to limit the temperature increase to 1.5°C”. Many countries have set targets to reduce greenhouse gas emissions, including by changing the way they produce and consume energy.

OBJECTIVE

Woodside’s objective is to thrive in this energy transition as a low cost, lower carbon energy provider.

PRINCIPLES

Woodside aims to achieve the objective by:

- Setting science-based¹ near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned² scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated.³
- Developing and operating oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
- Investing in new energy products and lower carbon services to reduce customers’ emissions (part of Woodside’s Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- Publishing transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.
- Aligning our advocacy to the principles of this Climate Policy.

¹ Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of “science-based” (published 2021) which states “targets are considered ‘science-based’ if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement—limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.”. See <https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures-prototype.pdf> (Appendix A).

² Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of “Paris-aligned scenarios” (published 2021) which states “scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.” See <https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures-prototype.pdf> (Appendix A).

³ Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside’s ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside’s ownership interest.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venture participants engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2024.

Risk Management Policy

OBJECTIVES

Woodside recognises that risk is inherent in our business and the effective management of risk is vital to deliver our strategic objectives, continued growth and success. We are committed to managing risks in a proactive and effective manner as a source of competitive advantage.

Our approach protects us against potential negative impacts, enables us to take risk for reward and improves our resilience against emerging risks. The objective of our risk management framework is to provide a single consolidated view of risks across the company to understand our full risk exposure and prioritise risk management and governance.

The success of our approach lies in the responsibility placed on everyone at all levels to proactively identify, assess and treat risks relating to the objectives they are accountable for delivering.

PRINCIPLES

Woodside achieves these objectives by:

- Applying a structured and comprehensive framework for the identification, assessment and treatment of current risks and response to emerging risks;
- Ensuring line of sight of financial and non-financial risks at appropriate levels of the organisation;
- Demonstrating leadership and commitment to integrating risk management into our business activities and governance practices;
- Recognising the value of stakeholder engagement, best available information and proactive identification of potential changes in external and internal context;
- Embedding risk management into our critical business processes and control framework;
- Understanding our exposure to risk and tolerance for uncertainty to inform our decision making and assure that Woodside is operating with due regard to the risk appetite endorsed by the Board; and
- Evaluating and improving the effectiveness and efficiency our approach.

APPLICABILITY

The Managing Director of Woodside is accountable to the Board of Directors for ensuring this Policy is effectively implemented.

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2024.

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision-making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new activities¹ within the boundaries of natural sites on the UNESCO World Heritage List.²
- Not undertaking new activities within IUCN Protected Areas³ unless compatible with management plans in place for the area.
- Achieving net zero deforestation⁴ for new activities.
- Developing Biodiversity Management Plans for all new major projects (CAPEX >US\$2 billion).
- Supporting positive biodiversity outcomes in regions and areas in which we undertake activities.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Revised by the Woodside Energy Group Ltd Board in December 2024.

¹ Does not include non-industrial and existing activities that are compatible with maintenance of the listed outstanding universal values.

² New UNESCO World Heritage Listings that overlap existing activities will be assessed at the time of listing.

³ New IUCN Protected Areas that overlap existing activities will be assessed at the time of listing.

⁴ Definition of Forest: 'native trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared'.

Legislation or Regulation	Description	Relevant
<i>Corporations Act 2001</i>	This Act is the principal legislation regulating matters of Australian companies, such as the formation and operation of companies, duties of officers, takeovers and fundraising.	The titleholder has provided ACN details within the meaning of the Act.
<i>Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)</i> Environment Protection and Biodiversity Conservation Regulations 2000	Commonwealth Department of Sustainability, Environment, Water, Population & Communities administers Act that provides legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places—defined in the EPBC Act as matters of national environmental significance (NES). These include nationally threatened species and ecological communities, migratory species and Commonwealth marine areas. The Act regulates assessment and approval of proposed actions likely to have a significant impact on a matter of NES. The approval decision is made by a delegate of the Australian Government Environment Minister. Regulations provide for a wide range of detail essential for the operation of the Act, including regulations relating to management of Commonwealth reserves, information requirements for assessment processes, enforcement, granting of various permits, publication requirements and criteria that need to be met in relation to a wide variety of decision-making processes provided for under the Act.	This Act applies to all aspects of the activity that have the potential to impact MNES. NOPSEMA manages compliance with the relevant regulations and plans under the Act for this EP. Where activities have existing approvals under the Act, these will continue to apply.
<i>Environment Protection (Sea Dumping) Act 1981</i> Environment Protection (Sea Dumping) Regulations 1983	The Act regulates the dumping at sea of controlled material (including certain wastes and other matter), the incineration at sea of controlled material, loading for the purpose of dumping or incineration, export for the purpose of dumping or incineration, and the placement of artificial reefs. Permits are required for any sea dumping activities. Operational discharges from vessels are not defined as ‘dumping’ under the 1996 Protocol to the Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972 and therefore not regulated under the Act.	Prior to permanently leaving any structure in-situ, BHP will obtain a Sea Dumping Permit in accordance with the requirements of the Sea Dumping Act.
<i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i>	Legislation concerning Australian offshore petroleum exploration & production in Commonwealth Waters. National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) is an independent safety and environmental management Authority funded by levies on industry participants and regulates matters with powers conferred directly from OPGGS Act and via Regulations concerned with: occupational health & safety law at facilities and offshore operations under Schedule 3 environmental management structural integrity of Wells under Resource management regulations.	Applies to all aspects of petroleum activities.

Legislation or Regulation	Description	Relevant
Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009	<p>Regulations administered by NOPSEMA to ensure offshore petroleum activity is carried out in a manner consistent with the principles of ecologically sustainable development and in accordance with an accepted environment plan, in particular:</p> <p>assessment of EPs, including associated OPEPs (previously oil spill contingency plans)</p> <p>investigation of accidents, occurrences and circumstances with regard to deficiencies in environmental management.</p>	Applies to environmental management of petroleum activities.
<i>Offshore Petroleum and Greenhouse Gas Storage (Regulatory Levies) Act 2003</i>	Act to impose levies relating to the regulation of offshore petroleum activities, including well levies and environment plan levy.	A levy will be applied to the petroleum activities under this EP.

1. INTRODUCTION

1.1 Purpose

This document applies, where indicated in the relevant Environment Plan (EP), to Woodside Energy Ltd. (Woodside) activities and operations.

1.2 Scope

This document describes the existing environment within the Woodside areas of activity located in Commonwealth waters off north-western Western Australia (WA), with a focus on the North-west Marine Region (NWMR) (Figure 1-1). This document includes details of the particular and relevant values and sensitivities of the environment as required by the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth) (OPGGS (E) Regulations) to inform the impact and risk evaluation of Woodside's activities within the NWMR. Furthermore, the key values of the South-west Marine Region (SWMR) and the North Marine Region (NMR) are summarised to encompass areas outside the NWMR. This is with reference to the environment that may be affected (EMBA), as defined and described in individual EPs, for unplanned hydrocarbon spill risks. Additional information appropriate to the nature and scale of the impacts and risks of activities that may interact with the environment will be used to further inform impact and risk assessments and be included in the Description of the Existing Environment of individual EPs.

APPENDIX A This document is informed by a variety of resources that includes: a search of the Department of Climate Change, Energy, the Environment and Water (DCCEEW) Protected Matters Search Tool (PMST) for the marine bioregions (NWMR, SWMR and NMR) and the three PMST reports provided in PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

; State (WA)/ Commonwealth Marine Park Management Plans, the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) Species Profile and Threats Database (SPRAT), EPBC Act Part 13 statutory instruments (recovery plans, conservation advices and wildlife conservation plans for listed threatened and migratory species); and peer reviewed scientific publications, as well as Woodside and Joint Venture (JV) funded studies and other titleholder funded study findings available in the public domain.

1.3 Review and Revision

The information presented in this document is reviewed and updated on at least a five-year basis. Key updates are captured in a 'change register'. Material risk may trigger updates within the five-year review period, as per the OPGGS (E) Regulations. Key updates may include but are not limited to the status of EPBC Act listed species, Part 13 Instruments, policies and guidelines, key advice from external stakeholders and recently published scientific literature.

1.4 Regional Context

Where relevant, the physical, biological and social environments within the areas of interest are discussed with reference to the three marine bioregions of Australia: North-west Marine Region (NWMR), South-west Marine Region (SWMR) and North Marine Region (NMR). The Marine Bioregional Plans has been prepared under section 176 of the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)¹ (Table 1-1). The NWMR is the focal marine bioregion for the Woodside Description of the Existing Environment as this is currently the location of most of Woodside's activities.

Table 1-1: Description of the marine bioregions

Marine Bioregion	Description
North-west (DSEWPAC, 2012a)	The NWMR includes all Commonwealth waters (from three nautical miles (NM) from the Territorial Sea Baseline to the 200 NM Exclusive Economic Zone (EEZ) boundary) extending from the WA/Northern Territory border to Kalbarri, south of Shark Bay in WA, covering an area of approximately 1.07 million km ² and includes extensive areas of shallower waters on the continental shelf, as well as deep areas of abyssal plain where water depths are 5000 m or greater.
South-west (DSEWPAC, 2012b)	The SWMR comprises Commonwealth waters from the eastern end of Kangaroo Island in South Australia to Shark Bay in WA. The region spans approximately 1.3 million km ² of temperate and subtropical waters and abuts the coastal waters of SA and WA.
North (DSEWPAC, 2012c)	The NMR comprises Commonwealth waters from West Cape York Peninsula to the NT/WA border). The region covers approximately 625,689 km ² of tropical waters in the Gulf of Carpentaria and Arafura and Timor seas, and abuts the coastal waters of Queensland and the NT.

2. PHYSICAL ENVIRONMENT

2.1 Regional Context

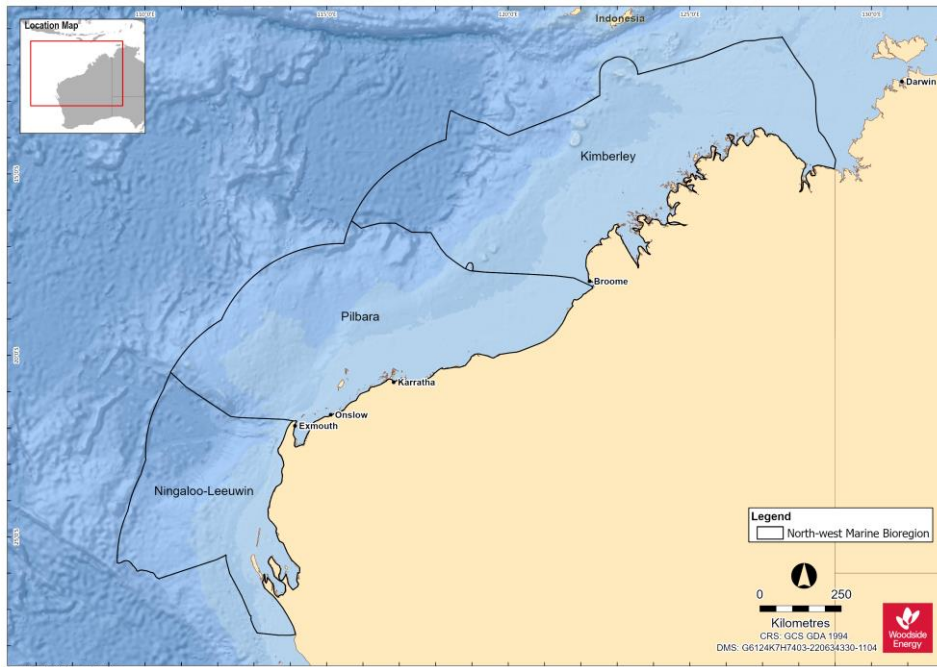

The key physical characteristics of the NWMR, SWMR and NMR are presented in Table 2-1. The remainder of this section then focuses entirely on the NWMR.

Table 2-1: Key physical characteristics of the NWMR, SWMR and NMR

Bioregion	Key Characteristics
North-west Marine Region	The NWMR experiences a tropical monsoonal climate towards the northern extent of the region, transitioning to tropical arid and subtropical arid within the central and southern areas of the region (DSEWPAC, 2012a).
	The NWMR is part of the Indo-Australian Basin, the ocean region between the north-west coast of Australia and the Indonesian islands of Java and Sumatra. Dominant currents in the Region include: the South Equatorial Current, the Indonesian Throughflow; the Eastern Gyral Current, and the Leeuwin Current (DEWHA, 2007a).
	The seafloor of the NWMR consists of four general feature types: continental shelf; continental slope; continental rise; and abyssal plain and is distinguished by a range of topographic features including canyons, plateaus, terraces, ridges, reefs, and banks and shoals.
South-west Marine Region	The SWMR contains both subtropical and temperate climates, with overall light climatic cycles.
	The SWMR experiences complex and unusual oceanographic patterns, driven largely by the Leeuwin Current and its associated currents that have a significant influence on biodiversity distribution and abundance.
	The major seafloor features of the SWMR include a narrow continental shelf on the West coast to the waters off South-west WA, and a wide continental shelf dominated by sandy carbonate sediments of marine origin in the Great Australian Bight. The region also contains a steep, muddy continental slope, many canyons and large tracts of abyssal plains (DSEWPAC, 2012b).
North Marine Region	The NMR experiences a tropical monsoonal climate with complex weather cycles, including high temperatures and heavy seasonal yet variable rainfall and cyclones, which can be both destructive (loss of seagrass and mangroves) and constructive (mobilisation of sediment into coastal habitats).
	The NMR comprises Commonwealth waters from West Cape York Peninsula to the NT-WA border, covering tropical waters in the Gulf of Carpentaria and Arafura and Timor seas. Currents in the NMR are driven largely by strong winds and tides, with only minor influences from oceanographic currents such as the Indonesian Throughflow and the South Equatorial Current (DSEWPAC, 2012c).
	The seafloor of the NMR consists mainly of a wide continental shelf, as well as other geomorphological features such as shoals, banks, terraces, valleys, shallow canyons and limestone pinnacles.

2.2 Marine Systems of the North-west Marine Region (NWMR)

The NWMR is divided into three large scale ecological marine systems on the basis of the influence of major ocean currents, seafloor features and eco-physical processes (e.g. climate, tides, freshwater inflow) upon the Region (DSEWPAC, 2012a). The three large scale marine systems approximate the Woodside activity areas within the NWMR (Figure 2-1). The key characteristics of each marine system are outlined in Table 2-2.

Note: Woodside areas align with the marine systems as described in DEWHA (2007a)

Figure 2-1: The marine systems of the NWMR (data source: DEWHA, 2007a)

Table 2-2: Key characteristics of the marine systems of the NWMR

Marine System	Woodside Activity Area	Key Characteristics
Kimberley	Browse	Tropical monsoonal climate Strong influence from Indonesian Throughflow Predominantly tropical Indo-Pacific species Subject to episodic offshore cyclonic activity, rarely crossing the coast Large tidal regimes Freshwater input from terrestrial monsoonal run-off Turbid coastal waters (i.e. light limited systems) Dominated by shelf environments Predominantly hard substrates in inner to mid-shelf environments Includes a number of shelf-edge atolls (i.e. Scott Reef, Rowley Shoals)
Pilbara	North West Shelf (NWS) / Scarborough	Tropical arid climate Transition between Indonesian Throughflow and Leeuwin Current dominated areas Predominantly tropical species High cyclone activity with frequent crossing of the coast Transitional tidal zone Internal tide activity Large areas of shelf and slope Dry coast with ephemeral freshwater inputs
Ningaloo-Leeuwin	North-west Cape	Subtropical arid climate Leeuwin Current consolidates Transitional tropical/temperate faunal area Higher water clarity in near-shore and offshore environments Narrow shelf and slope Marginal tidal range Seasonal wind forcing more dominant influence on marine environment

2.3 Meteorology and Oceanography

This section describes the general meteorological conditions and oceanography for the NWMR and provides further detail for the three Woodside activity areas (Table 2-3). The NWMR is influenced by a complex system of ocean currents that change between seasons and between years, which generally result in its surface waters being warm and nutrient-poor, and of low salinity (DEWHA, 2007a). The mix of bathymetric features, complex topography and oceanography across the whole North-west marine environment has created and supports a globally important marine biodiversity hotspot (Wilson, 2013). The purpose of Table 2-3 is to provide high-level physical characteristics of the marine environment within and across the NWMR. This subsection does not describe warming trends or discuss forecast trajectories for the NWMR.

Table 2-3: NWMR climate and oceanography summary

Receptor	Description
Meteorology	
Seasonal patterns	The NWMR associated land mass of the Australian continent is characterised as a hot and humid summer climate zone. The broader NWMR experiences variations of a tropical or monsoon climate. In the far north-west (Kimberley), there is a hot summer season from December to March and a milder winter season between April and November. The Pilbara area is described as having a tropical arid climate with high cyclone activity (DEWHA, 2007a). The Pilbara and North-west Cape has a hot summer season from October to April and a milder winter season between May and September with transition periods between the summer and winter regimes.
Air temperature and rainfall	In summer (between September and March), maximum daily temperatures range from 18°C to 36°C. During winter (May to July), mean daily temperatures range from 12°C to 30°C (BOM, 2023c), refer to Figure 2-2. Rainfall in the region typically occurs during the summer, with highest falls observed late in the season. This is often associated with the passage of tropical low-pressure systems and cyclones.
Wind	Wind patterns in north-west WA are dictated by the seasonal movement of atmospheric pressure systems. During summer, high-pressure cells produce prevailing winds from the north-west and south-west, which vary between 10 and 13 ms ⁻¹ . During winter, high-pressure cells over central Australia produce north-easterly to south-easterly winds with average speeds of between 6 and 8 ms ⁻¹ . Refer to Figure 2-3.
Tropical cyclones	The NWS and Pilbara coast (within the NWMR) experiences more cyclonic activity than any other region of the Australian mainland coast (BOM, 2021a). Tropical cyclone activity typically occurs between November and April and is most frequent in the region during December to March (i.e. considered the peak period), with an average of about one cyclone per month (BOM, 2021a). Refer to Figure 2-4.
Oceanography	
Ocean temperature	Waters in NWMR are tropical year-round, with sea surface temperature in open shelf waters reaching ~26°C in summer and dropping to ~22°C in winter. Nearshore temperatures (as recorded for the NWS area) fluctuate more widely on an annual basis from ~23°C in winter to ~31°C in summer (Hallenberger et al., 2022), indicative of present-day sea surface temperatures, acquired from the CSIRO Oceans and Atmosphere database. Refer to Figure 2-5, for the seasonal variation across and within the NWMR.
Currents	The major surface currents influencing north-west WA flow towards the poles and include the Indonesian Throughflow, the Leeuwin Current, the South Equatorial Current, and the Eastern Gyral Current. The Ningaloo Current, the Holloway Current, the Shark Bay Outflow, and the Capes Current are seasonal surface currents in the region. Below these surface currents are several subsurface currents, the most important of which are the Leeuwin Undercurrent and the West Australian Current. These subsurface currents flow towards the equator in the opposite direction to surface currents (DEWHA, 2007a). Refer to Figure 2-6. The offshore waters of the NWMR are characterised by surface and subsurface boundary currents that flow along the continental shelf/slope and are enhanced through inflows from the ocean basins and are an important conduit for the poleward heat and mass transport along the West coast (Wijeratne et al., 2018). Local physical oceanography is strongly influenced by the large-scale water movements of the Indonesian Throughflow (Liu et al., 2015; Sutton et al., 2019). Typically, a warm and well-mixed oligotrophic surface layer, and a cooler and more nutrient rich deeper water layer (Menezes et al., 2013).
Waves	Sea surface waves within the NWMR generally reflect the direction of the synoptic winds and flow predominately from the South-west in the summer and East in winter (Pearce et al., 2003). The NWS within the NWMR is a known area of internal wave generation. Both internal tides and internal waves are thought to be more prevalent during summer months due to the increased stratification of the water column (DEWHA, 2007a). Along the continental slope of the NWMR, strong internal waves and interaction between semi-diurnal tidal currents and seabed topographic features facilitates upwelling events and localised productivity events (Holloway, 2001).

Receptor	Description
Tides	<p>Tides on the NWS (NWMR) increase as the water moves from deep towards the shallower coast. The highest offshore tides are experienced at the border of the Browse and Canning basins. The smallest tides are experienced at the Exmouth Plateau, near the coast.</p> <p>Tides of the NWS (NWMR) are predominantly semi-diurnal (two highs and two lows each day), but with increasing importance of the diurnal (once per day) inequality at the southern and northern extremities of the NWS.</p> <p>The tide range—represented by the Mean Spring Range (MSR)—increases northwards along the coast from 1.4 m at North-west Cape (Point Murat) to 7.7 m at Broome, before decreasing again (apart from local amplification in King Sound and Collier Bay) to about 5 m off Cape Londonderry. The MSR then increases again through Joseph Bonaparte Gulf and on up 5.5 m at Darwin (RPS, 2016).</p>

2.3.1 Browse

Table 2-4: Summary meteorology and oceanography for Browse (refer to Error! Reference source not found. for supporting metocean figures and data sources)

Receptor	Description
Meteorology	
Seasonal patterns	The Browse area overlapping the Kimberley marine system experiences tropical monsoon climate with two distinct seasons: the wet season from December to March and dry season from April to November.
Air temperature	The mean annual air temperature recorded at Troughton Island between 2010 and 2020 ranged from 22.5°C in 2019 to 32.8°C in 2016 and highest mean monthly air temperatures were recorded for the months of November and December (BOM, 2023a).
Rainfall	Rainfall recorded from Troughton Island in the Browse basin ranged from barely detectable (<1 mm) mean monthly level to >100 mm in December to March, with the highest rainfall recorded for January (reflecting the wet monsoon season of the Kimberley marine system) (BOM, 2023a).
Wind	The dry season experiences high-pressure systems that bring East to South-easterly winds with average wind speeds during the season of approximately 16.6 km/h and maximum wind gusts of 65 km/h. In contrast the wet season brings predominately westerly winds with average wind speeds approximately 17 km/h and maximum gusts exceeding 100 km/h (generally associated with tropical cyclones (MetOcean Engineers, 2005).
Oceanography	
Currents	Surface currents exhibit seasonal directionality, with flow to the South-west during March to June and more variable outside this period (Woodside, 2019). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.

2.3.2 North West Shelf / Scarborough

Table 2-5: Summary meteorology and oceanography for the North West Shelf and Scarborough (refer to Error! Reference source not found. for supporting metocean figures and data sources)

Receptor	Description
Meteorology	
Seasonal patterns	The NWS and Scarborough areas experience the monsoonal climate of the wider NWMR with a distinct wet and dry seasonal regime and transitions periods between seasons.
Air temperature	Air temperatures as measured at the North Rankin A platform on the NWS ranged from a maximum average of 39.8°C in summer to a minimum average temperature of 15.2°C in winter (Woodside, 2015).
Rainfall	Rainfall patterns annually reveal the wet season with highest rainfalls during the late summer, often associated with the passage of tropical low-pressure systems and cyclones. Rainfall in the dry season is typically extremely low (Pearce et al., 2003) and Error! Reference source not found..
Wind	Winds are typically from the southwest during the wet season (summer) and tending from the south-east during the dry season (winter). The summer south-westerly winds are driven by high pressure cells that pass from west to east over the Australian continent. During the winter period, the relative position of the high-pressure cells shifts further north, leading to prevailing south-easterly winds from the mainland (Pearce et al., 2003) and Error! Reference source not found..
Oceanography	
Currents	The large-scale ocean currents of the NWMR, primarily the Indonesian Throughflow and Leeuwin Current (and Holloway Current), are the primary influence on the NWS and Scarborough areas. The Indonesian Throughflow and Leeuwin Current are strongest during the late summer and winter and flow reversals to the north-east, typically short-lived and weak when there are strong south-westerly winds, can generate localised upwelling on the shelf edge (Holloway and Nye, 1985; James et al., 2004; Condie et al., 2006).

2.3.3 North-west Cape

Table 2-6: Summary meteorology and oceanography for the North-west Cape (refer to Error! Reference source not found. for supporting metocean figures)

Receptor	Description
Meteorology	
Seasonal patterns	The climate of the NWMR is dry tropical exhibiting a hot summer season and a mild winter season. There are often distinct transition periods between the summer and winter regimes, characterised by periods of relatively low winds.
Air temperature	Air temperatures in the North-west Cape area range from high summer temperatures (maximum average of 38°C) and mild winter temperatures (minimum average of 11.5°C) as recorded from the Learmonth Airport (BOM, 2023b).
Rainfall	Rainfall typically occurs during the summer, with highest rainfall during later summer and autumn (mean monthly level to >19 mm), with the highest rainfall recorded during June, often associated with the passage of tropical low-pressure systems and cyclones. Rainfall is typically low in winter (<2 mm) (BOM, 2023b).
Wind	Winds vary seasonally, generally from the south-west quadrant during summer months and the south, south-east quadrant during the autumn and winter months. The summer south-westerly winds are driven by high pressure cells that pass from west to east over the Australian continent. Winds typically weaken and are more variable during the transitional period between the summer and winter seasons, generally between April to August.

Oceanography	
Currents	Surface currents exhibit seasonal directionality, with flow to the south-west during March to June and more variable outside this period (Woodside, 2022). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.

2.4 Physical Environment of NWMR

Based on the Integrated Marine and Coastal Regionalisation of Australia (IMCRA) Version 4.0, there are eight provincial bioregions that occur within the NWMR, which are based on patterns of demersal fish diversity, benthic habitat and oceanographic data (Commonwealth of Australia, 2006), Figure 2-7. Of the eight provincial bioregions that occur within the NWMR, these include four offshore (~65% of total NWMR area) and four shelf (~35% of total NWMR area) bioregions (Baker et al., 2008).

The NWMR is a tropical carbonate margin that comprises an extensive area of shelf, slope and abyssal plain/deep ocean floor, as well as complex areas of bathymetry such as plateau, terraces and major canyons (Harris et al., 2005). A series of reefs are located on the outer shelf/slope of the NWMR, including Ashmore, Cartier, Scott and Seringapatam reefs (Baker et al., 2008). The distribution of seafloor geomorphic features has been systematically mapped over much of the Australian margin and adjacent seafloor. The mapped area can be divided into 10 geomorphic regions, of which the NWMR overlays two; the Western Margin and Northern Margin (Harris et al., 2005). Most of the region consists of either continental slope (61%) or continental shelf (28%) (DEWHA, 2007a), with more than 40% of the NWMR having a water depth less than 200 m. The shallow shelf is contrasted by features such as the Cuvier and Argo abyssal plains, which reach depths of more than 5 km. A unique feature of the region is the significant narrowing of the continental shelf around North-west Cape (approximately 7 km wide) from the broad continental shelf in the north of the region (approximately 400 km wide at Joseph Bonaparte Gulf) (DEWHA, 2007a), Figure 2-8.

The geological history of the region, as well as its geomorphology and oceanography, has influenced the composition and distribution of sediments (DEWHA, 2007a). The sedimentology of the NWMR is dominated by marine carbonates, which show a broad zoning and fining with water depth. Main trends of the NWMR sediments include a tropical carbonate shelf that is dominated by sand and gravel, an outer shelf/slope zone that is dominated by mud and a relatively homogenous rise and abyssal plain/deep ocean floor that is dominated by non-carbonate mud (Baker et al., 2008), Figure 2-9. The distribution and resuspension of sediments on the inner shelf is strongly influenced by the strength of tides across the continental shelf as well as episodic events such as cyclones. Further offshore, on the mid to outer shelf and on the slope itself, sediment movement is primarily influenced by ocean currents and internal tides (DEWHA, 2007a).

This variation in bathymetry and interactions with oceanographic processes provides a diversity of habitats to marine fauna and flora within the NWMR.

2.5 Air Quality

The ambient air quality of all three marine regions is largely unpolluted due to the extent of the open ocean area, the activities currently carried out in each and the relative remoteness of each region.

Vessel traffic and existing offshore surface infrastructure are the only likely sources of pollutants in the marine region. Closer to the coast there may be localised and temporary reductions in air quality around areas of high vessel traffic, or due to the occurrence of dust storms and bushfires. International contributors to reduced air quality in the marine region may include 'slash-and-burn' agricultural methods and large forest fires in South-east Asian regions (Vadrevu et al., 2014; Kim Oanh et al., 2018).

3. MATTERS OF NATIONAL ENVIRONMENTAL SIGNIFICANCE (EPBC ACT)

3.1 Summary of Matters of National Environmental Significance (MNES)

APPENDIX B This section summarises the matters of national environmental significance (MNES) reported for the three bioregions; NWMR (Table 3-1), SWMR (Table 3-2) and NMR (Table 3-3), based on the Protected Matters search reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

).

Additional information on these MNES is provided in subsequent sections (referenced in Table 3-1, Table 3-2 and Table 3-3).

Table 3-1: Summary of MNES identified by the EPBC Act Protected Matters Search Tool (PMST) within and potentially occurring within the NWMR

3.2 Part 13 Statutory Instruments for EPBC Act Listed Threatened and Migratory Species in the NWMR, South-west Marine Region (SWMR) and North Marine Region (NMR)

A screening process was conducted to identify which EPBC Act listed threatened and migratory species, and associated Part 13 statutory instruments, are relevant in the context of the assessment of impacts and risks associated with petroleum activities in each of the Woodside activity areas. The screening criteria included:

- overlap among the Woodside activity areas with habitat critical for survival (e.g. marine turtles) and with biologically important areas (BIAs) (overlapping the marine environment) for any listed threatened and/or migratory species as reported in the PMST searches
- published literature, unpublished reports and/or credible anecdotal information (e.g. feedback from stakeholders) indicating species presence/occurrence within the Woodside activity areas
- temporal overlap between the likely timing of petroleum activities and peak periods for key critical life stage behaviours (e.g. breeding, nesting, calving, resting, foraging, migration)
- environmental aspects associated with petroleum activities that have been identified as a key threat to a species in a Part 13 statutory instrument (e.g. anthropogenic noise, light emissions, marine debris).

APPENDIX G Relevant EPBC Act threatened and migratory species and their Part 13 statutory instruments are listed in Table 3-4. For the full list of EPBC Act listed species for each marine bioregion refer to the PMST reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

).

Table 3-4: Summary of EPBC Act threatened and migratory species to be considered for impact or risk evaluation for Woodside operations

Species	EPBC Act Part 13 Statutory Instrument
All vertebrate marine fauna	Threat Abatement Plan for the impacts of marine debris on vertebrate marine life (Commonwealth of Australia, 2018)
Marine Mammals	
Blue whale	Conservation Management Plan for the Blue Whale: A Recovery Plan under the <i>Environment Protection and Biodiversity Conservation Act 1999</i> 2015–2025 (Commonwealth of Australia, 2015a)
Southern right whale	National Recovery Plan for the Southern Right Whale <i>Eubalaena australis</i> (DCCEEW, 2024a)
Sei whale	Conservation Advice <i>Balaenoptera borealis</i> sei whale (Threatened Species Scientific Committee, 2015a)
Fin whale	Conservation Advice <i>Balaenoptera physalus</i> fin whale (Threatened Species Scientific Committee, 2015c)
Australian sea lion	Recovery Plan for the Australian Sea Lion (<i>Neophoca cinerea</i>) 2013 (DSEWPAC, 2013a) Conservation Advice <i>Neophoca cinerea</i> Australian Sea Lion (Threatened Species Scientific Committee, 2020a) (in effect under the EPBC Act from 23-Dec-2020)
Marine Reptiles	
All marine turtle species (loggerhead, green, leatherback, hawksbill, flatback, olive ridley)	Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017) National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (DCCEEW, 2023d)
Mitchell's water monitor	Conservation Advice for <i>Varanus mitchelli</i> (Mitchell's water monitor) (DCCEEW, 2023c)

Greater sand plover	Conservation Advice <i>Charadrius leschenaultii</i> Greater sand plover (DCCEEW, 2023g)
Black-tailed godwit	Conservation Advice for <i>Limosa limosa</i> black-tailed godwit (DCCEEW, 2024h)
Common greenshank	Conservation Advice for <i>Tringa nebularia</i> (common greenshank) (DCCEEW, 2024i)
Asian dowitcher	Conservation Advice for <i>Limnodromus semipalmatus</i> (Asian dowitcher) (DCCEEW, 2024j)
Ruddy turnstone	Conservation Advice for <i>Arenaria interpres</i> (ruddy turnstone) (DCCEEW, 2024k)
Sharp-tailed sandpiper	Conservation Advice for <i>Calidris acuminata</i> (sharp-tailed sandpiper) (DCCEEW, 2024l)
Terek sandpiper	Conservation Advice for <i>Xenus cinereus</i> (terek sandpiper) (DCCEEW, 2024m)
Grey plover	Conservation Advice for <i>Pluvialis squatarola</i> (grey plover) (DCCEEW, 2024n)

4. HABITAT AND BIOLOGICAL COMMUNITIES

4.1 Regional Context

The NWMR habitats range from nearshore benthic primary producer habitats such as seagrass beds, coral communities and mangrove forests, to offshore soft sediment seabed habitats and submerged and emergent reef systems. These habitats support biological communities that range from low density sessile and mobile benthos, such as sponges, molluscs and echinoids (with noted areas of sponge hotspot diversity) in offshore soft sediment habitat (DSEWPAC, 2012a) to complex, diverse, remote coral reef systems.

Benthic primary producer habitats, such as seagrass beds, coral communities and mangrove forests within the SWMR, are described as a mixture of tropical and temperate species, due to the seasonal influences of the tropical waters carried south by the Leeuwin Current and the temperate waters carried north by the Capes Current (DSEWPAC, 2012b).

The NMR shares similar habitat types to the NWMR. The predominant habitat of the region includes soft muddy sediments on relatively flat terrain. Other habitat types include seagrasses, reefs, shoals and coastal habitats such as mangroves and coastal wetlands (Rochester et al., 2007).

The summary of key habitats and biological communities provided in the following sub-sections is focused on the primary features of relevance to the activity areas within the NWMR – primarily the offshore habitats of the continental shelf and slope, submerged shoals and banks, and remote oceanic reef systems of recognised conservation value.

4.2 Biological Productivity of NWMR

Primary productivity of the NWMR is generally low and appears to be largely driven by offshore influences (Brewer et al., 2007), with periodic upwelling events and cyclonic influences driving coastal productivity with nutrient recycling and advection. Seasonal weather patterns also influence the delivery of nutrients from deep-water to shallow water. Cyclones and North-westerly winds during the North-west monsoon (approximately November–March) and the strong offshore winds of the South-east monsoon (approximately April–September) facilitate the upwelling and mixing of nutrients from deep-water to shallow water environments (Brewer et al., 2007).

The Indonesian Throughflow (ITF) has an important effect on productivity in the northern areas of the Region. Generally, its deep, warm and low nutrient waters suppress upwelling of deeper comparatively nutrient-rich waters, thereby forcing the highest rates of primary productivity to occur at depths associated with the thermocline. When the ITF is weaker, the thermocline lifts bringing deeper, more nutrient-rich waters into the photic zone and hence resulting in conditions favourable to increased productivity (DEWHA, 2007a). Similarly, the Leeuwin Current has a significant role in determining primary productivity in the southern areas of the NWMR. As with the ITF, the overlying warm oligotrophic waters of the Leeuwin Current suppress upwelling. A subsurface chlorophyll maximum is therefore formed at a depth in the water column where nutrients and light are sufficient for photosynthesis to proceed. Seasonal changes in the strength of the Leeuwin Current influence primary productivity levels, and seasonal interactions between the Leeuwin and Ningaloo currents in the south of the NWMR, are believed to be particularly important (DEWHA, 2007a).

Internal tides (defined as internal waves generated by the barotropic tide) are a striking characteristic of many parts of the NWMR and are associated with highly stratified water columns. Internal waves (solitons), which can raise cooler, generally more nutrient rich water higher in the water column, are generated between water depths of 400 m and 1000 m where bottom topography results in a significant change in water depth over a relatively short distance. Cyclones are episodic events in the NWMR that contribute to spikes in productivity through enrichment of surface water layers due to enhanced vertical mixing of the water column. Temporary increases in primary productivity as a result of cyclones generally last between one and two weeks, and it is believed that the impacts of

cyclones are generally limited to waters less than 100 m deep and affect benthic communities more substantially than pelagic systems (DEWHA, 2007a).

Water depth also has a significant overriding influence over productivity in the marine environment, due to its influence on light availability. This is reflected by distinct onshore and offshore assemblages of major pelagic groups of phytoplankton, microzooplankton, mesoplankton and ichthyoplankton. Productivity booms are thought to be triggered by seasonal changes to physical drivers or episodic events, as detailed above, which result in rapid increases in primary production over short periods, followed by extended periods of lower primary production. The trophic systems in the NWMR are able to take advantage of blooms in primary production, enabling nutrients generated to be used by different groups of consumers over long periods (DEWHA, 2007a).

Little detailed information is available about the trophic systems in the NWMR. The utilisation of available nutrients is thought to differ between pelagic and benthic environments, influenced by water depth and vertical migration of some species groups in the water column. In the pelagic system, it is thought that approximately half of the nutrients available are utilised by microzooplankton (e.g. protozoa) with the remainder going to macro/meso-zooplankton (e.g. copepods). As primary and secondary consumers, gelatinous zooplankton (e.g. salps, coelenterates) and jellyfish are thought to play an important role in the food web, contributing a significant proportion of biomass in the marine system during and for periods after booms in primary productivity. Salps are semi-transparent, barrel-shaped marine animals that can reproduce quickly in response to bursts in primary productivity and provide a food source for many pelagic fish species (DEWHA, 2007a).

4.3 Planktonic Communities in the NWMR

The NWMR has two distinct phytoplankton assemblages; a tropical oceanic community in offshore waters and a tropical shelf community confined to the NWS (Hallegraeff, 1995). MODIS (Moderate Resolution Imaging Spectrometer) satellite datasets from the NWMR indicates that chlorophyll (and thus phytoplankton) levels are low in summer months (December to March) and higher in the winter months (Schroeder et al., 2009). Low chlorophyll levels during summer months may be a result of lower plankton productivity during the wet season or lower nutrient inputs from warm surface waters dominant during summer. However, it is likely that much of the primary production is taking place below the surface, where the MODIS imagery does not penetrate (Schroeder et al., 2009). The winter months are relatively cloud-free and surface chlorophyll is high throughout most of the region.

Zooplankton may include organisms that complete their lifecycle as plankton (e.g. copepods, euphausiids) as well as larval stages of other taxa such as fishes, corals and molluscs. Peaks in zooplankton such as mass coral spawning events (typically in March and April) (Rosser and Gilmour, 2008) and fish larvae abundance (CALM, 2005a) can occur throughout the year. Spatial and temporal patterns in the distribution and abundance of macro-zooplankton on the North-west Shelf are influenced by sporadic climatic and oceanographic events, with large inter-annual changes in assemblages (Wilson et al., 2003). Amphipods, euphausiids, copepods, mysids and cumaceans are among the most common components of the zooplankton in the region (Wilson et al., 2003).

4.3.1 Browse

Phytoplankton within the Browse activity area is expected to reflect the conditions of the NWMR. There is a tendency for offshore phytoplankton communities in the NWMR to be characterised by smaller taxa (e.g. bacteria), whereas shelf waters are dominated by larger taxa such as diatoms (Hanson et al., 2007).

Zooplankton within the activity area may include organisms that complete their lifecycle as plankton (e.g. copepods, euphausiids) as well as larval stages of other taxa such as fishes, corals and molluscs. Peaks in zooplankton such as mass coral spawning events (typically in March and April) (Rosser and Gilmour, 2008; Simpson et al., 1993) and fish larvae abundance (CALM, 2005a) can occur throughout the year.

The influence of the Indonesian Throughflow restricts upwelling across the Kimberley System (approximately equates to the Browse activity area). However, small-scale topographically associated current movements and upwellings are thought to occur, which inject nutrients into specific locations within the system and result in 'productivity hot-spots'. Similarly, internal waves, generated at the shelf break (e.g. west of Browse Island and around submerged cliffs located at the continental shelf edge) play a role in making nutrients available in the photic zone (Sutton et al., 2019). Productivity within shallow nearshore waters is driven primarily by tidal movement and terrestrial runoff whereby nutrients are mixed by tidal action and new inputs of organic matter come from the land.

4.3.2 North West Shelf / Scarborough

Plankton communities within the NWS / Scarborough activity area are expected to reflect conditions of the NWMR. Internal tides along the NWS and Exmouth Plateau result in the drawing of deeper cooler waters into the photic zone, stirring up nutrients and triggering primary productivity. Broadly the greatest productivity within this sub-system is found around the 200 m isobath associated with the shelf break.

4.3.3 North-west Cape

Waters of the North-west Cape experience a relatively high diversity of phytoplankton groups including diatoms, coccolithophorids and dinoflagellates. During the warmer months blooms of *Trichodesmium* occur in the region, these have been observed particularly on the frontal systems around Point Murat (Heyward et al., 2000).

Average Leeuwin Current phytoplankton biomass is characteristic of low productivity oceanic waters like the Indian, Pacific and Atlantic Oceans (Hanson et al., 2005). However, the Canyons linking the Cuvier Abyssal Plain and Cape Range Peninsula KEF are connected to the Commonwealth waters adjacent to Ningaloo Reef and may also have connections to Exmouth Plateau. The canyons are thought to interact with the Leeuwin Current to produce eddies inside the heads of the canyons, resulting in waters from the Antarctic intermediate water mass being drawn into shallower depths and onto the shelf (Brewer et al., 2007). These waters are cooler and richer in nutrients and strong internal tides may also aid upwelling at the canyon heads (Brewer et al., 2007). The narrow shelf width (about 10 km) near the canyons facilitates nutrient upwelling and relatively high productivity. This high primary productivity leads to high densities of primary consumers, such as micro and macro-zooplankton, such as amphipods, copepods, mysids, cumaceans, euphausiids (Brewer et al., 2007).

4.4 Habitats and Biological Communities in the NWMR

4.4.1 Offshore Habitats and Biological Communities

The NWMR has a large area of continental shelf and continental slope, with a range of bathymetric features such as canyons, plateaus, terraces, ridges, reefs, banks and shoals. The marine environment in this region is typified by tropical to sub-tropical marine ecosystems with diverse habitats from soft sediments, canyons, remote oceanic coral reef systems and continental shelf limestone pavement seabed habitat. The NWMR encompasses large seabed areas of deepwater seabed habitats dominated by soft sediments (sandy and muddy substrata with occasional patches of coarser sediments) and sparse benthic biota. Comprehensive surveys and documentation of habitats and biota from the shelf to deep waters (100 m to 1000 m) spanning 13 sites between Barrow Island and Ashmore Reef, running downslope across the continental shelf and slope of NWS were conducted in 2007 (Williams et al., 2010). Sites on the continental slope (approximately 400 m deep) predominately comprised soft, muddy sediments and epifauna were sparsely distributed and limited to isolated individual sessile biota such as crinoids, anemones, glass sponges and sea pens. Occasional non-sessile biota, characteristic of the deeper water benthic communities was recorded and included: echinoderms (urchins, holothurians and sea stars) and decapod crustaceans (prawns

and crabs). Similar benthic biota composition was reported for the continental slope seabed habitats at depths of 700-1000 m (Williams et al., 2010). With reference to the NWS, multiple surveys have documented habitats comprising bare unconsolidated carbonate sediments supporting a sparse assemblage of deposit and filter feeding organisms, including glass sponges, urchins, sea cucumbers, sea stars and crustaceans (URS, 2010). Filter feeding communities documented within the NWS include bryozoans, sponges, gorgonians, and hydroids attached to consolidated substrate; these were interspersed with sand which hosted fewer filter feeders (AIMS, 2014). Infauna associated with soft, unconsolidated sediment habitat such as polychaetes are widespread and well represented along the continental shelf and upper slopes (Brewer et al., 2007; RPS, 2012). The key habitats and biological communities that are representative of the broader NWMR are summarised in Table 4-1.

The key habitats and biological communities representative of the broader SWMR and NMR are summarised in Table 4-2 and Table 4-3.

There is a marked biodiversity gradient from high ecological valued coastal (primary producer habitats and associated benthic and mobile biota) to the lower valued deeper offshore habitats comprising soft, unconsolidated sediments and typically sparser biota (epifauna and infauna), with the exception of the submerged shoal features, remote oceanic reef systems of the Rowley Shoals, Scott Reef and Ashmore Reef, as well as the fringing reef habitats of Ningaloo, the Kimberley coastline, the offshore island groups such as Barrow Island, Lowendal and Montebello Islands, and the Dampier Archipelago. A brief overview of the high valued biodiversity reef and mesophotic habitats and associated benthic communities are presented in the following sub-sections.

4.4.2 Browse

The most diverse habitats and benthic communities in the Kimberley region of North-western Australia, are where the oceanic reef systems of Ashmore, Cartier, Scott and Seringapatam reefs, and the Rowley Shoals, sit near the edge of the continental shelf hundreds of kilometres from the mainland and from each other (Gilmour et al., 2019 and 2023), refer to Figure 4-1. The long-term monitoring program for Scott Reef and the Rowley Shoals conducted by AIMS since 1994 is now one of the world's longest studies of coral reef ecosystems and provides unprecedented understanding of the background (baseline) changes at oceanic reefs on Australia's North-west Shelf, encompassing the physical drivers, and underlying processes of change (impact and recovery) from acute disturbances (heat stress – coral mass-bleaching and cyclones).

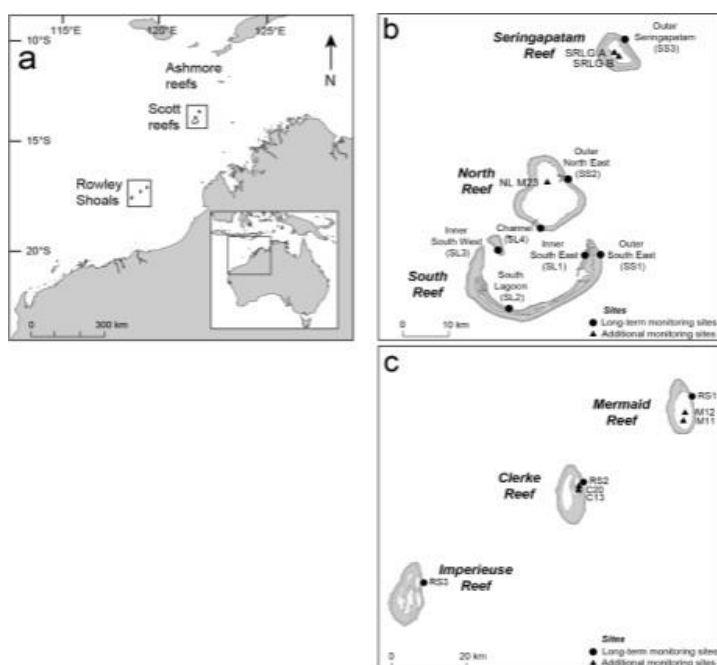

Figure 4-1: The position of Scott Reef, Ashmore and the Rowley Shoals off North-western Australia and location of permanent long-term monitoring sites (source: Gilmour et al., 2023)

Scott Reef is an annular reef approximately 17 km long and 16 km wide comprising two coral reef atolls rising steeply from depths of approximately 400 to 500 m. These atolls, referred to as South Scott Reef and North Scott Reef, are separated by a deep channel (Figure 4-1). North Scott Reef features an emergent reef flat, outer slope habitats and a shallow lagoon approximately 20 m deep with two small channels linking it to the surrounding ocean. The shallow closed waters of North Scott Reef lagoon contain a range of habitats from bare sand, sand with coral outcrops, and to shallow to deep lagoonal coral dominated habitats (Gilmour et al., 2013). This in contrast to the deeper, more open lagoon of South Scott Reef described as an extensive, unique mesophotic (30–70 m depth) coral dominated habitat comprising hard corals, calcareous algae, soft corals, sponges, bryzoans and other invertebrates (Gilmour et al. 2013; Heyward and Radford, 2019). It is largely protected from the direct influence of major storms by the surrounding horseshoe-shaped emergent reef rim (Heyward and Radford, 2019). South Scott Reef shallow water habitats also include reef flats (of low coral cover) and extensive outer reef slopes with the highest hard coral diversity of any habitat at Scott Reef (Gilmour et al., 2013).

Over the past 30 years the coral communities at Scott Reef have been extensively studied and the Scott Reef long-term monitoring program showed that from 1994 to 2021, the mean cover of hard and soft corals on the reef slopes was 36%, and ranged between 13% to 59%. Decreases in coral cover were caused by damaging waves, generated by storms and cyclones, and recurrent heat stress causing coral bleaching. The most severe heat stress and mass coral bleaching occurred in 1998 and 2016. Recovery from the first mass-bleaching event in 1998 took over a decade. By 2010, coral cover had reached pre-bleaching levels (45%). Despite moderate coral bleaching and cyclone disturbances, cover had increased by 49% in January 2016, after which the reefs were impacted by a second mass bleaching event that reduced mean coral cover to 15%. Five years after the 2016 mass bleaching event, total cover of hard and soft corals had reached 34%, showing a similar rate

of recovery to that following the 1998 mass bleaching (Gilmour et al., 2023). The Rowley Shoals comprise three distinct reef continental shelf atolls of similar dimension, shape and orientation, named Mermaid Reef, Clerke Reef and Imperieuse Reef. The reefs are orientated north-south and are approximately 30 to 40 km apart. Each atoll covers an area approximately 80 to 90 km² and extends almost vertically from seafloor depths of approximately 400 m. Each atoll comprises extensive lagoon habitat composed of bare sand, coral dominated patches and coral outcrops, emergent reef crests and outer reef slopes. At high tide only the sandy cays of Clerke Reef and Imperieuse Reef remain visible.

Across the Rowley Shoals, the reef crest and reef slope were most similar and the lagoon most unique in terms of habitat and benthic communities. Hard corals and coralline algae were the most abundant biota (>40%) and other benthic organisms such as sponges, ascidians and macroalgae are rare (<5%). Soft corals were also rare (<1%) at all reefs and habitats, apart from the reef slope (4%) at Mermaid Reef. Across all surveys (1995 to 2019), the mean cover of hard and soft corals at the reef slope was 46% and ranged between 26% and 58%. Decreases in coral cover were primarily due to frequent storms and cyclones. Between 2005 and 2008, three cyclones and moderate heat stress caused a mean reduction in coral cover (52% to 42%) at the reef slope habitat across the Rowley Shoals. Coral bleaching was low (<10%) in January 2016 except for minor to moderate (11 to 30%) bleaching at two lagoon sites at Mermaid Reef. A prolonged heat stress period (45 days) in May 2020 caused the worst coral bleaching on record (approximately 20%) across reef habitats, with the highest heat stress and declines in coral cover at the reef slope for Imperieuse Reef (9%) and minor bleaching and small decreases in coral cover at the reef slope (5%) and lagoon (3%) at Clerke Reef (Gilmour et al., 2023).

The reefs of Seringapatam, Scott Reef, Ashmore Reef and Cartier Island are recognised as key ecological features (KEFs) within NWMR, refer to Table 10-1. Protected Area status (Australian Marine Parks and State Marine Parks and Reserves) is listed and described in Section 11 and includes the Commonwealth Marine Parks of Ashmore Reef, Cartier Island, Kimberley and Mermaid Reef, and the State Marine Parks of the North Kimberley, the Rowley Shoals and Lalang-garram horizontal falls and North Lalang-garram.

4.4.3 North West Shelf / Scarborough

The NWS contains numerous submerged shoal features and as relatively recent surveys have revealed several of these features are of high biodiversity value comprising hard coral and macro-algae communities on upper reaches of the shoals and mesophotic filter-feeding benthic communities in deeper waters on and in proximity to the shoal features, namely, Rankin Bank and Glomar Shoal.

4.4.3.1 Rankin Bank

Rankin Bank comprises three main sedimentary banks rising steeply from between 80 and 120 m below sea level, reaching 20 – 40 m below the sea surface and featuring plateaus and troughs (Abdul Wahab et al., 2018). Rankin Bank is one of only two large, complex bathymetrical features on the outer western shelf of the West Pilbara (the other being Glomar Shoal, about 125 km West-south west) (Abdul Waheb et al., 2018), Figure 4-1.

Surveys of Rankin Bank were undertaken by the Australian Institute of Marine Science (AIMS) in 2013 and in 2017 to better understand the habitats and complexity of the submerged shoal ecosystems, and associated fish assemblages (AIMS, 2014; Abdul Waheb et al., 2018 and 2017; Jones et al., 2021). The surveys were undertaken using various methods, including multibeam survey, towed video, Stereo Baited Underwater Video Survey (SBRUVS) and beam transmissions (to measure turbidity), at depths between 20 and 115 m (Abdul Waheb et al., 2018). Water column data were also collected in January 2017 to examine potential temporal variation in these parameters (Abdul Waheb et al., 2018).

Seabed sediments at Rankin Bank were primarily carbonate with a grain size of mostly sand, with

Page 46 of 381

Uncontrolled when printed. Refer to electronic version for most up to date information.

finer muds found at the deeper sample sites (AIMS, 2014). Sand was also found to increase with depth and unconsolidated reef exceeded 30% at all depths (Abdul Waheb et al., 2018). Hydrocarbon and trace metal concentrations in sediments indicated the bank was unaffected by anthropogenic pollution (AIMS, 2014). Turbidity was lower at Rankin Bank than Glomar Shoal during the survey, with beam transmissions remaining above 95% at all depths (Abdul Waheb et al., 2018). Turbidity was slightly lower in 2017, whereas temperature and salinity were slightly higher at all depths (Abdul Waheb et al., 2018).

Proportion of cover by benthic taxa was highest for macroalgae and hard corals, particularly at depths less than 40 m, and decreased with increasing depth. Other benthic taxa included soft corals and sponges which were present in lower proportions at all depths. Encrusting corals were common, reaching cover of about 12.5% at depths less than 40 m. Solitary corals were also present (about 10% cover) primarily at depths between 40 and 60 m. Foliose and submassive/columnar corals were also present (Abdul Waheb et al., 2018).

Fish abundance and diversity at Rankin Bank were found to be comparable with other reefs in north-west Australia, and notably twice as abundant and 1.5 times more diverse than those fishes identified in a comparable survey at Glomar Shoal (Abdul Waheb et al., 2018). A total of 205 fish species were recorded at Rankin Bank, 100 of which were common to both Glomar Shoal and Rankin Bank. Depth, location, sand, sponges and hard coral were all found to contribute to the fish communities present. Specifically, fish communities were primarily associated with hard coral and shallow depths at Rankin Bank (Abdul Waheb et al., 2018).

4.4.3.2 Glomar Shoal

Glomar Shoal is a large (215 km²) and complex bathymetrical feature situated on the outer continental shelf off the Pilbara. Glomar Shoal is about 8.5 times wider than Rankin Bank at the 60 m contour. Glomar Shoal rises from 80 m depth on its south-west side and 70 m depth on its north-eastern side to form a single plateau at 40 m depth (Abdul Waheb et al., 2018). Together with Rankin Bank, these remote shallow water areas represent regionally unique habitats and are considered likely to play an important role in the productivity of the Pilbara region (AIMS, 2014; Abdul Wahab et al., 2018), Figure 4-1.

Baseline biodiversity and habitat mapping surveys of the benthic habitats and communities at Glomar Shoal and Rankin Bank were undertaken in 2013 and 2017 by AIMS (2014) as detailed in Abdul Waheb et al. (2018) and Jones et al. (2021), respectively. Salinity and temperature were found to be slightly higher in 2017 compared with the 2013 values (Abdul Wahab et al., 2018), most likely due to seasonality. Substrates at Glomar Shoal were found to vary with depth, from coarse unconsolidated sediment at depths greater than 60 m and hard substrate (i.e. consolidate reef) supporting benthic communities comprising hard and soft corals, sponges and macroalgae at depths <40 m (Abdul Wahab et al., 2018). Total cover of benthic taxa (hard coral, soft coral, sponges and other benthic biota) was highest at depths <40 m and decreased with depth (Abdul Wahab et al., 2018). At depths of 60 to 80 m benthic cover was low (about 2%) and at depths greater than 80 m benthic cover was barely present (Abdul Wahab et al., 2018).

A total of 170 fish species were identified at Glomar Shoal and fish abundance and diversity of the demersal fish communities of Glomar Shoal were found to vary with seabed habitat type; sand, hard coral and sponge coverage influenced fish communities, with higher abundance and diversity of fish associated with shallow hard coral habitats. (Abdul Wahab et al., 2018). In general, the fish abundance and diversity of Glomar Shoal are considered comparable with other reefs and the submerged shoals and banks in the region, although less diverse and abundant than fish assemblages at Rankin Bank (Abdul Wahab et al., 2018).

Glomar Shoal is recognised as a KEF within NWMR, refer to Table 10-1. Protected Area status (Australian Marine Parks and State Marine Parks and Reserves) is described in Section 11 and includes the Commonwealth Marine Park of Montebello, and the State Marine Parks of Montebello Islands and Barrow Island and the Barrow Island marine management area.

4.4.4 North-west Cape

Ningaloo Reef and Shark Bay are among Australia's iconic marine areas, and the significance of these ecosystems is recognised through their inclusion in State and Commonwealth Marine Parks and the World Heritage Register. Ningaloo Reef is the only example in the world of an extensive fringing reef on the West coast of a continent and is host to over 200 coral species and more than 500 reef fish species. Shark Bay is the most westerly point of Australia and represents a transition zone between temperate and tropical marine fauna, resulting in high species diversity (Miller et al., 2015), including fringing coral communities on the leeside of the barrier islands of Dirk Hartog, Bernier and Dorre. Ningaloo Reef is one of the longest (approximately 300 km) and most pristine fringing reefs in the world, with an unusually narrow continental shelf. Deep oceanic waters, the reef and coastline habitats and benthic communities are in close proximity resulting in a huge array of internationally significant marine life coexisting. More than 200 hard coral, 500 fish, 650 mollusc, 600 crustacean, 1000 marine algae, 155 sponge and 25 echinoderm species have been recorded from the shelf, slope and deep-water habitats². Refer to the CSIRO Ningaloo Outlook program for further information and publications relating to the shallow and deep-water reef systems, and megafauna species (marine turtles and whale sharks)³.

The extensive reef system has been classified by topography and benthic cover using airborne hyperspectral surveys and much of the area was allocated as shallow, flat lagoons intersected by narrow, deeper channels that facilitate water circulation. Five distinct geomorphic/benthic classes of coral-algae mosaics in different topographic settings: coral and algal communities (reef flat and very shallow areas), coral and algal communities (backreef and shallow forereef), coral and algal communities (deep forereef and other deep areas), sand or limestone pavement (lagoon slopes and flat lagoon areas) (Kobryn et al., 2022).

Ningaloo and the Muiron Islands fringing reef habitat supports benthic communities dominated by algae and consolidated reef in the shallow reef environment. Surveys conducted by AIMS in 2024 documented hard coral cover averaged approximately 13% across the Ningaloo Marine Park area (Miller et al., 2015). A notable pattern in the benthos recorded by Miller et al. (2015) was an increase in coral cover with latitude, with the highest coral cover recorded around Coral Bay and the reef areas in southern Ningaloo. Coral cover was the lowest at the East Ningaloo Province (northern Exmouth Gulf) (<6%). Relative to Scott Reef and the Rowley Shoals, the Ningaloo benthic communities are distinct in that they are characterised by high biotic cover overall, but dominated by algal cover and with less than half the cover of key biota including hard corals, soft corals and sponges as recorded on offshore reefs (Miller et al., 2015).

Ningaloo Reef is vulnerable to storm damage and marine heat stress events that have resulted in past localised coral damage and moderate coral bleaching. Coral bleaching occurred in 2022 due to warm ocean temperatures driven by the 2021–22 La Niña. The region's last severe marine heatwave was driven by the 2010–11 La Niña, which resulted in bleaching being recorded for the first time on Ningaloo⁴. Also of note is the recurrent deoxygenation events at Bills Bay (Coral Bay) following coral spawning events. In March 2022, the deoxygenation event was triggered by a combination of weather and oceanographic conditions that led to a prolonged trapping of coral spawn in Bills Bay and this in turn caused mass coral mortality and a large but localised fish kill. The 2022 deoxygenation event was the seventh such event recorded in documented history (Richards et al., 2024).

The Shark Bay region is renowned for its terrestrial and marine biodiversity including seagrass cover extending over 4000 km² of the bay and the 1.030 km² Wooramel Seagrass Bank is the largest structure of its type in the world. Baseline surveys conducted in 2014 by AIMS specifically targeted the outer Shark Bay area and the habitats and benthic communities surrounding the barrier islands

² <https://www.dbca.wa.gov.au/management/world-heritage-areas/ningaloo-coast-world-heritage-area#:~:text=One%20of%20the%20longest%20and,life%20coexisting%20in%20one%20area> [accessed on 18/08/2024]

⁴ <https://www.csiro.au/en/research/environmental-impacts/climate-change/state-of-the-climate>

of Dirk Hartog, Bernier and Dorre. Sand was a dominant feature of the benthos (>60%), particularly in areas inside the bay and in deep water outside the bay. Benthic communities in relatively sheltered areas of outer Shark Bay were characterised by seagrass and turf algae, whereas in more exposed locations, benthos was dominated by macroalgal and turf algal communities. Corals and sponges made up <1% of the cover in outer Shark Bay, although due to inclement weather during surveys shallow areas where coral species are more likely to occur could not be surveyed. Observations of patchy but high coral cover in shallow parts of some towed video transects suggests coral cover across outer Shark Bay may have been underestimated. The highest coral cover was recorded in the channel between Dirk Hartog and Dorre Islands, indicating this area may be particularly favourable for coral growth (Miller et al., 2015).

Commonwealth waters adjacent to Ningaloo Reef is recognised as a KEF within NWMR, refer to Table 10-1. Protected Area status (Australian Marine Parks and State Marine Parks and Reserves) is described in Section 11 and includes the Commonwealth Marine Parks of Ningaloo and Shark Bay, and the State Marine Parks of Ningaloo Reef, the Muiron Islands marine management area, Shark Bay marine park and Hamelin Pool nature reserve.

4.4.5 Shoreline, Coastal Habitats and Biological Communities

The NWMR encompasses offshore and coastal waters, islands and mainland shoreline habitats typified by mangroves, tidal flats, saltmarshes, coral reefs (remote, offshore reef systems to extensive fringing reef systems such as Ningaloo), sandy beaches, and smaller areas of rocky shores. Each of these shoreline types has the potential to support different flora and fauna assemblages due to the different physical factors (e.g. waves, tides, light,) influencing the habitat.

The key shoreline habitats representative of the broader NWMR are summarised in Table 4-1.

The key shoreline habitats representative of the broader SWMR and NMR are summarised in Table 4-2 and Table 4-3.

Table 4-1: Habitats and biological communities within the NWMR

Habitat/Community	Browse	NWS / Scarborough	North-west Cape	Reference
<i>Offshore habitats and biological communities</i>				
Soft sediment with infauna	The offshore environment of the NWMR comprises predominately of seabed habitats dominated by soft sediments (sandy and muddy substrata with occasional patches of coarser sediments) and sparse benthic biota. The benthic communities inhabiting the predominantly soft, fine sediments of the offshore habitats are characterised by infauna such as polychaetes, and sessile and mobile epifauna such as crustacea (shrimp, crabs and squat lobsters) and echinoderms (starfish, cucumbers). The density of benthic fauna is typically lower in deep-sea sediment habitats (greater than 200 m) than in shallower coastal sediment habitats, but the diversity of communities may be similar.			
Soft sediment with hard substrate outcropping	A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope, and escarpments. This habitat is found in offshore areas of the NWMR, often associated with key ecological features such as the ancient coastline at 125 m depth contour KEF.			Section 10
	Ancient coastline at 125 m depth contour KEF Continental Slope Demersal Fish Communities KEF	Ancient coastline at 125 m depth contour KEF Continental Slope Demersal Fish Communities KEF	Ancient coastline at 125 m depth contour KEF Continental Slope Demersal Fish Communities KEF	Section 10
Coral reef	Coral reef habitats within the NWMR have a high species diversity that includes corals, and associated reef species such as fishes, crustaceans, invertebrates, and algae. Coral reef habitats of the offshore environment of the NWMR include remote oceanic reef systems, large platform reefs, submerged banks and shoals.			
	Browse Island Scott Reef Seringapatam Reef Ashmore Reef Cartier Island Hibernia Reef	Rowley Shoals (including Mermaid Reef, Clerke Reef, Imperieuse Reef) Glomar Shoal Rankin Bank		Section 4.4.1 Section 10 Section 11
Seagrass and macroalgae communities	Seagrass beds and benthic macroalgae reefs are a main food source for many marine species and also provide key habitats and nursery grounds (Heck et al., 2003; Wilson et al., 2010). In the northern half of Western Australia, these habitats are restricted to sheltered and shallow waters, including around offshore reef systems, due to large tidal movement, high turbidity, large seasonal freshwater run-off and cyclones.			
	Scott Reef, Seringapatam Reef, Ashmore Reef	Rowley Shoals (including Mermaid Reef, Clerke Reef, Imperieuse Reef)		Section 11

Habitat/Community	Browse	NWS / Scarborough	North-west Cape	Reference
Filter feeders/ heterotrophic	Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA, 2008). Filter feeders generally live in areas that have strong currents and hard substratum, often associated with deeper environments of the shoals and banks in the offshore NWMR.			
	Lower outer reef slopes of the oceanic reef systems such as Scott Reef	Glomar Shoal Rankin Bank Ancient coastline at 125 m depth contour KEF	Cape Range canyon system	Section 4.4.1 Section 10 Section 11
Sandy beaches	Sandy beaches are dynamic environments, naturally fluctuating in response to external forcing factors (e.g. waves, currents, etc). Sandy beaches vary in length, width and gradient, and in sediment type, composition, and grain size throughout the NWMR, being found around islands and reefs in the offshore areas of the region.			
	Browse Island Scott Reef (Sandy Islet) Ashmore Reef Cartier Island	Montebello Islands Lowendal Islands Barrow Island	Muiron Islands	Section 11
Nearshore/coastal habitats and biological communities				
Coral reef	Coral reef habitats typically found in nearshore regions of the NWMR include the fringing reefs around coastal islands and the mainland shore.			
	Kimberley East Holothuria and Long Reefs Bonaparte and Buccaneer Archipelagos Montgomery Reef Adele complex (Beagle, Mavis, Albert, Churchill reefs, Adele Island)	Dampier Archipelago Montebello, Lowendal and Barrow Island Groups	Ningaloo Reef Exmouth Gulf Shark Bay	Section 11
Seagrass and macroalgae communities	Seagrass beds and benthic macroalgae reefs are a main food source for many marine species and also provide key habitats and nursery grounds (Heck Jr. et al., 2003; Wilson et al., 2010). In the nearshore areas of the NWMR, these habitats are restricted to sheltered and shallow waters due to large tidal movement, high turbidity, large seasonal freshwater run-off and cyclones. These areas include in bays and sounds and around reef and island groups.

Habitat/Community	Browse	NWS / Scarborough	North-west Cape	Reference
Filter feeders/ heterotrophic	Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA, 2007a). Filter feeders generally live in areas that have strong currents and hard substratum. Conversely, higher diversity infauna is mainly associated with soft unconsolidated sediment and infauna communities are considered widespread and well represented along the continental shelf and upper slopes of the NWMR. In nearshore areas of the NWMR, these species are generally found around reef systems.			
		Deeper habitats of Rankin Bank and Glomar Shoal	Deeper habitats of Ningaloo Reef and the protected sponge zone in the south	
Mangroves	Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie et al., 2006). Mangrove forests can help stabilise coastal sediments, provide a nursery ground for many species of fish and crustacean, and provide shelter or nesting areas for seabirds (McClatchie et al., 2006). Mangroves are confined to shoreline habitats, in nearshore areas of the NWMR.			
	Dampier Peninsula (including Carnot Bay, Beagle Bay and Pender Bay)	Pilbara Coastline (including Ashburton River Delta, Coolgra Point, Robe River Delta, Yardie Landing, Yammadery Island and the Mangrove Islands) Montebello, Lowendal and Barrow Island Groups Roebuck Bay	Shark Bay Mangrove Bay, Cape Range Peninsula Exmouth Gulf	Section 11
Saltmarshes	Saltmarsh communities are confined to shoreline habitats and are typically dominated by dense stands of halophytic plants such as herbs, grasses, and low shrubs. The diversity of saltmarsh plant species increases with increasing latitude (in contrast to mangroves). The vegetation in these environments is essential to the stability of the saltmarsh, as they trap and bind sediments. The sediments are generally sandy silts and clays and can often have high organic material content.			
		Eighty Mile Beach Roebuck Bay	Shark Bay	Section 11
Sandy beaches	Sandy beaches are dynamic environments, naturally fluctuating in response to external forcing factors (e.g. waves, currents, etc). Sandy beaches vary in length, width and gradient, and in sediment type, composition, and grain size throughout the NWMR. Sandy beaches are important for both resident and migratory seabirds and shorebirds and can also provide an important habitat for turtle nesting and breeding. They are located along many coastlines of the nearshore environments of the NWMR.

Table 4-2: Habitats within the SWMR

Habitat/Community	Location
<i>Offshore</i>	
Soft sediment with infauna	Most of the SWMR seafloor is composed of soft unconsolidated sediments, but due to large variations in bathymetry there are marked differences in sedimentary composition and benthic assemblage structure across the region. Despite the prevalence of these habitats in the SWMR, very little is known about the composition or distribution of the region's sedimentary infauna (DEWHA, 2008b).
Soft sediment with hard substrate outcropping	<p>A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope, and escarpments.</p> <p>Perth Canyon Marine Park Ancient coastline at 90 to 120 m depth contour KEF Diamantina Fracture Zone Naturaliste Plateau</p>
Coral reef	To date, studies and understanding of the corals within the SWMR have concentrated on the shallow water areas in State waters. Within the deeper Commonwealth waters of the SWMR little is known of the distribution of corals.
Filter feeders/heterotrophic	<p>Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWR, 2007). Filter feeders generally inhabit deeper habitat (below the photic zone) that have strong currents and hard substratum.</p> <p>Ancient coastline at 90 to 120 m depth Diamantina Fracture Zone Naturaliste Plateau Perth Canyon Marine Park South-west Corner Marine Park</p>
<i>Nearshore</i>	
Coral reef	<p>The northern extent of the SWMR coincides loosely with the disappearance of abundant and diverse coral from coastal habitats. To the south of Shark Bay, abundant corals occur predominantly around offshore islands, with corals at inshore sites occurring in very isolated patches of non-reef coral communities, usually of reduced species richness.</p> <p>Houtman Abrolhos Islands Rottnest Island</p>

Habitat/Community	Location
Seagrass and macroalgae communities	Within the SWMR, macroalgae and seagrass communities are noted for their extent, species richness and endemism. The clear waters of the region allow light to reach greater depths, with some species found at much greater depths than usual (down to 120 m) (DEWR, 2007). Of the known species there are more than 1000 species of macro-algae and 22 species of seagrass consisting of tropical and temperate species. Seagrass and macro-algae occur in areas with sheltered bays and in the inter-reef lagoons along exposed sections of the coast.

Table 4-3: Habitats and biological communities within the NMR

Habitat/Community	Location
<i>Offshore habitats and biological communities</i>	
Soft sediment with infauna	Most of the offshore environment of the NMR is characterised by relatively flat expanses of soft sediment seabed. The soft sediments of the region are characterised by moderately abundant and diverse communities of infauna and mobile epifauna dominated by polychaetes, crustaceans, molluscs, and echinoderms.
Soft sediment with hard substrate outcropping	A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope, and escarpments. The variability in substrate composition may contribute to the presence of unique ecosystems. Species present include sponges, soft corals and other sessile filter feeders associated with hard substrate sediments.
	Carbonate bank and terrace system of the Van Diemen Rise KEF Pinnacles of the Bonaparte Basin KEF
Coral reef	Offshore coral reefs within the NMR are generally associated with a series of submerged shoals and banks. The shoals/banks in the region support tropical marine biota consistent with that found on emergent reef systems of the Indo West Pacific region such as Ashmore Reef, Cartier Island, Seringapatam Reef and Scott Reef (Heyward et al., 1997).
	Pinnacles of the Bonaparte Basin KEF Evans Shoal Tassie Shoal Blackwood Shoal
Filter feeders/heterotrophic	Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA, 2007b). Filter feeders generally live in areas that have strong currents and hard substratum and typically associated with the deeper habitats of the submerged shoals and banks, and canyon features.

Description of the Existing Environment

Habitat/Community	Location
Nearshore	
Coral reef	Within the NMR corals occur both as reefs and in non-reef coral communities. Nearshore reefs include patch reefs and fringing reefs sparsely distributed within the region. Coral reefs within the NMR provides breeding and aggregation areas for many fish species including mackerel and snapper and offer refuges for sea snakes and apex predators such as sharks.
	Submerged coral reefs of the Gulf of Carpentaria KEF Darwin Harbour
Seagrass and macroalgae communities	Seagrasses provide key habitats in the NMR. They stabilise coastal sediments and trap and recycle nutrients. They provide nursery grounds for commercially harvested fish and prawns and provide feeding grounds for dugongs and green turtles. Seagrass distribution in the region is largely associated with sheltered small bays and inlets including shallow waters surrounding inshore islands.
	Field Island The mainland coastline adjacent to Kakadu National Park
Filter feeders/ heterotrophic	Filter feeder epifauna such as sponges, ascidians, soft corals, and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA, 2007b). Filter feeders generally inhabit areas that have strong currents and hard substratum.
	Cape Helveticus
Mangroves	Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie et al., 2006). Mangroves provide habitat for waterbirds and support many commercially and recreationally important fish and crustacean species for parts of their life cycles. They buffer the coast from large tidal movements, storm surges and flooding.
	Tiwi Islands Darwin Harbour The mainland coastline adjacent to the Daly River
Sandy beaches	Sandy beaches vary in length, width and gradient, and in sediment type, composition, and grain size throughout the NMR and are important for both resident and migratory seabirds and shorebirds. Sandy beaches can also provide an important habitat for turtle nesting. They are located along many coastlines of the nearshore environments of the islands and mainland shores of the NMR.
	Tiwi Islands Cobourg Peninsula Joseph Bonaparte Gulf

5. FISHES, SHARKS AND RAYS

5.1 Regional Context

Western Australian waters provide important habitat for listed fishes, sharks, and rays including areas that support key life stages such as breeding, foraging, and migration routes for fish species. Pelagic and demersal fishes occupy a range of habitats throughout each of the regions, from coral reefs to open offshore waters, and are an extremely important component of ecosystems, providing a link between primary production and higher predators, with many species being of conservation value and important for commercial and recreational fishing.

The NWMR supports a wide diversity of global fish species. Of the approximately 500 shark species found worldwide, 94 are found in the region (DEWHA, 2008). Approximately 54 species of syngnathids (seahorses, seadragons, pipehorses and pipefishes) and one species of solenostomids (ghostpipefishes) are also known to occur in the NWMR or adjacent State waters (DSEWPAC, 2012a).

The fish fauna of the SWMR includes more than 900 species occupying a large variety of habitats. However, only three species of bony fishes known to occur in the region are listed under the EPBC Act as threatened or marine species, and seven listed species of shark (DSEWPAC, 2012b).

The NMR is considered an important area for the sawfish and river shark species group, with five species of sawfishes and river sharks listed under the EPBC Act known to occur in the region (DSEWPAC, 2012c). Approximately 28 species of syngnathids and two species of solenostomids are listed marine and known to occur in the NMR, however there is a paucity of knowledge on the distribution, relative abundance and habitats of these species in the region (DEWHA, 2008).

The following sections focus on the fish species (including sharks and rays) listed as threatened or migratory that are known to occur within the NWMR. In addition, listed, conservation-dependent fish and shark species for the NWMR are described. A detailed account of commercial and recreational fisheries that operate in the region is provided in Section 12.

Table 5-1 outlines the threatened and migratory fish species that may or are known to occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice.

Table 5-2 includes fish species listed as conservation dependent that may occur within the NWMR, NMR and SWMR.

Table 5-2: EPBC Act listed Conservation Dependent species of fishes and sharks that may occur in the NWMR, NMR and SWMR

Species Name	Common Name	Likely Occurrence / Distribution	Listing Advice
<i>Hoplostethus atlanticus</i>	Orange roughy, deep-sea perch, red roughy	SWMR	No conservation listing advice for this species. Refer to the Marine bioregional plan for the SWMR (DSEWPAC, 2012b) for further information. Managed under AFMA's Orange Roughy Stock Rebuilding Strategy (AFMA, 2014).
<i>Sphyrna lewini</i>	Scalloped hammerhead	NWMR, NMR and SWMR ⁷	Threatened Species Scientific Committee, 2018.
<i>Galeorhinus galeus</i>	School shark, eastern school shark, snapper shark, tope, soupfin shark	SWMR	Threatened Species Scientific Committee, 2009.
<i>Centrophorus uyato</i>	Little gulper shark	NWMR and SWMR	No conservation listing advice for this species. Refer to listing advice (Threatened Species Scientific Committee, 2013).

⁷ A recurrent aggregation of scalloped hammerheads has been recorded within the Shoalwater Islands Marine Park (32° S; 115° E), 240 km south of Jurien Bay, observed from drone footage collected during the 2019 and 2020 Austral summers. The species has rarely been recorded south of Jurien Bay previously (López et al., 2022).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.2 Protected Sharks, Sawfishes and Rays in the NWMR

APPENDIX I The EPBC Act Protected Matters search (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR)

) identified seven species of shark and five species of river shark or sawfish listed as threatened and/or migratory within the NWMR. In addition, two species of ray (the reef manta ray and giant manta ray) are listed as migratory within the region (Table 5-3).

5.2.1 Sharks and Sawfishes

The shark species that may or are known to occur within the NWMR include: the whale shark, grey nurse shark, white shark, shortfin mako, and longfin mako (Table 5-3).

Five species of river shark or sawfish that may or are known to occur in the NWMR include: the narrow sawfish, northern river shark, freshwater sawfish, green sawfish and dwarf sawfish (Table 5-3).

There are identified biologically important areas (BIAs) within the NWMR for the whale shark, freshwater sawfish, green sawfish, and dwarf sawfish (Table 5-5).

Table 5-3: Information on the EPBC-listed threatened shark, fish and sawfish species that may or are known to occur within the NWMR

Species	Preferred Habitat and Diet	Habitat Location
Whale shark	Preferred habitat: They have a widespread distribution in tropical and warm temperate seas, throughout oceanic and coastal Australian waters (Last and Stevens, 2009). Diet: Whale shark are planktivorous and feed on a variety of planktonic species including krill, jellyfish, and crab larvae (Last and Stevens, 2009).	Ningaloo Reef is the main known aggregation site for whale sharks in Australian waters and has the largest density of whale sharks per kilometre in the world (Martin, 2007). Acoustically tagged whale sharks have been detected on the NWS in June, July and October–January (Thomson et al. 2021). Satellite tagging and sightings of whale sharks off the Western Australian coast indicate that whilst whale sharks aggregate in higher numbers at Ningaloo Reef seasonally, they may be present year-round (Norman et al., 2017). Refer Table 5-5 for the BIA summary for the whale shark.
Grey nurse shark (west-coast population)	Preferred habitat: Most found in temperate waters on, or close to, the bottom of the continental shelf, from close inshore to depths of about 200 m (McAuley, 2004; Kyne et al., 2021). Diet: A variety of teleost and elasmobranch fishes and some cephalopods (Gelsleichter et al., 1999; Smale, 2005).	Details of movement patterns of the western sub-population are unclear (McAuley, 2004) and key aggregation sites have not been formally identified within the NWMR (Chidlow et al., 2006). The NWMR represents the northern limit of the West-coast population. Sighting and bycatch data have indicated grey nurse sharks are present near Exmouth and Shark Bay between May to December (Hoschke et al., 2023).
White shark	Preferred habitat: The species typically occurs in temperate coastal waters between the shore and the 100 m depth contour; however, adults and juveniles have been recorded diving to depths of 1000 m (Bruce et al., 2006; Bruce, 2008). Diet: Smaller white sharks (less than 3 m length) feed primarily on teleost and elasmobranch fishes, broadening their diet as larger sharks to include marine mammals (Last and Stevens, 2009).	There are no known aggregation sites for white sharks in the NWMR, and this species is most often found south of North-west Cape, in low densities (DSEWPAC, 2012a). Given the migratory nature of the species, it most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Revision: 2

Woodside ID: 1401743486

Page 63 of 381

Uncontrolled when printed. Refer to electronic version for most up to date information.

Species	Preferred Habitat and Diet	Habitat Location
Shortfin mako	<p>Preferred habitat: The shortfin mako shark is a pelagic species with a circumglobal, wide-ranging oceanic distribution in tropical and temperate seas (Mollet et al., 2000). Tagging studies indicate shortfin makos spend most of their time in water less than 50 m deep but with occasional dives up to 880 m (Abascal et al., 2011; Stevens et al., 2010). Satellite telemetry data suggest shortfin makos have multiple movement phases, displaying both high connectivity between Australian populations and periods of residency (Corrigan et al., 2018).</p> <p>Diet: Feeds on a variety of prey, such as teleost fishes, other sharks, marine mammals, and marine turtles (Campana et al., 2005).</p>	<p>Given the migratory nature of the species, it most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p>
Longfin mako	<p>Preferred habitat: A pelagic species with a wide-ranging, patchy, oceanic distribution in tropical and temperate seas (Mollet et al., 2000; Kyne et al., 2021). They have been recorded at depth ranges of 0–1752 m (Kyne et al., 2021).</p> <p>Diet: Primarily teleost fishes and cephalopods (primarily squid) (Last and Stevens, 2009).</p>	<p>Records on longfin mako sharks are sporadic and their complete geographic range is not well known (Reardon et al., 2006).</p> <p>Given the migratory nature of the species, most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p>
Mackerel/ porbeagle shark	<p>Preferred habitat: The porbeagle shark primarily inhabits offshore waters around the edge of the continental shelf. They occasionally move into coastal waters, but these movements are temporary (Campana and Joyce, 2004; Francis et al., 2002). The porbeagle shark is known to dive to depths exceeding 1300 m (Campana et al., 2010; Saunders et al., 2011). Depth range records are 0–370 m (Kyne et al., 2021).</p> <p>Diet: Primarily teleost fish, elasmobranchs, and cephalopods (primarily squid) (Joyce et al., 2002; Last and Stevens, 2009).</p>	<p>In Australia, the species occurs in waters from southern Queensland to South-west Australia (Last and Stevens, 2009). Distribution within the NWMR is unknown, but there are several records for this species within the NWS (Atlas of Living Australia (ALA)).</p>
Oceanic whitetip shark	<p>Preferred habitat: The oceanic whitetip shark is globally distributed in warm-temperate and tropical oceans (Andrzejczek et al., 2018). The species may occur in tropical and sub-tropical offshore and coastal waters around Australia. They primarily occupy pelagic waters in the upper 200 m of the water column; however, they have been observed diving to depths of around 1000 m, potentially associated with foraging behaviour (Howey-Jordan et al., 2013; D'Alberty et al., 2017). The species is highly migratory, travelling large distances between shallow reef habitats in coastal waters and oceanic waters (Howey-Jordan et al., 2013). The species does exhibit a strong preference for warm and shallow waters above 120 m.</p> <p>Diet: Opportunistic feeders and generally target a variety of finfishes and pelagic squid, depending on habitat. Targets pelagics such as tuna in open ocean as noted by the large bycatch numbers in the long line fisheries.</p>	<p>Given the migratory nature of the species, it most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p>

Species	Preferred Habitat and Diet	Habitat Location
Narrow sawfish	Preferred habitat ¹ : Shallow coastal, estuarine, and riverine habitats, however it may occur in waters up to 40 m deep (D'Anastasi et al., 2013). Diet: Shoaling fishes, such as mullet, as well as molluscs and small crustaceans (Cliff and Wilson, 1994).	Shallow coastal waters of the Pilbara and Kimberly coasts (Last and Stevens, 2009).
Northern river shark	Preferred habitat ¹ : Rivers, tidal sections of large tropical estuarine systems and macrotidal embayments, as well as inshore and offshore marine habitats (Pillans et al., 2009; Thorburn and Morgan, 2004). Adults have been recorded only in marine environments. Juveniles and sub-adults have been recorded in freshwater, estuarine and marine environments (Pillans et al., 2009). Depth range of up to 23 m (Kyne et al., 2021). Diet: Variety of fish and crustaceans (Stevens et al., 2005).	The northern river shark has a relatively restricted northern Australian range (although with an extent of occurrence >20,000 km ²) (Kyne et al., 2021). Within the NWMR records have come from both the West and East Kimberley, including King Sound, the Ord and King rivers, West Arm of Cambridge Gulf and also from Joseph Bonaparte Gulf (Thorburn and Morgan, 2004; Stevens et al., 2005; Thorburn, 2006; Field et al., 2008; Pillans et al., 2008, Whitty et al., 2008; Wynen et al., 2008).
Large-tooth (freshwater) sawfish	Preferred habitat: Sandy or muddy bottoms of shallow coastal waters, estuaries, river mouths and freshwater rivers, and isolated water holes. Diet: Shoaling fishes, such as mullet, as well as molluscs and small crustaceans (Cliff and Wilson, 1994).	The large-tooth sawfish has a wide Northern Australia range (Kyne et al., 2021). The Kimberley region, particularly the Fitzroy River, is identified as an important nursery site (Bateman et al. 2024). The Exmouth Gulf represents the approximate southern limit for the large-tooth (freshwater) sawfish, although there are a few historical records further south (Bateman et al., 2024). Refer to Table 5-5 for the BIA summary for the Large-tooth (freshwater) sawfish.
Green sawfish	Preferred habitat ¹ : Inshore coastal environments including estuaries, river mouths, embayments, and along sandy and muddy beaches, as well as offshore marine habitat (Stevens et al., 2005; Thorburn et al., 2003). They are found at depths of up to 70 m (Kyne et al., 2021). Diet: Schools of baitfish and prawns (Pogonoski et al., 2002), molluscs and small crustaceans (Cliff and Wilson, 1994).	An aggregation of green sawfish (<i>Pristis zijsron</i>) has been identified in the Garig Gunak Barlu National Park (Cobourge Peninsula, NMR). Davies et al. (2022) suggests this may be a nursery area. The Ashburton River Estuary (Onslow region) has been recorded as a nursery site, with juveniles also observed along the Pilbara coast and Exmouth Gulf (Bateman et al., 2024). Refer Table 5-5 for the BIA summary for the green sawfish.
Dwarf sawfish	Preferred habitat ¹ : Shallow (up to 20 m) silty coastal waters and estuarine habitats, occupying relatively restricted areas and moving only small distances (Stevens et al., 2008; Kyne et al., 2015). Diet: Shoaling fish such as mullet, molluscs, and small crustaceans (Cliff and Wilson, 1994).	Literature indicates the most southern range for the dwarf sawfish is Port Hedland (Bateman et al., 2024). Refer Table 5-5 for the BIA summary for the dwarf sawfish.

¹ Preferred habitat as described within the Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b).

5.2.2 Rays

Rays are commonly found in the NWMR. Two listed and migratory species of ray are known to occur within the NWMR: the reef manta ray and giant manta ray.

No BIAs for either the reef or giant manta ray species have been identified in the NWMR.

Table 5-4: Information on migratory ray species within the NWMR

Species	Preferred Habitat and Diet	Habitat Location
Reef manta ray	Preferred habitat: The reef manta ray is commonly sighted within productive nearshore environments, such as island groups, atolls or continental coastlines. However, the species has also been recorded at offshore coral reefs, rocky reefs, and seamounts (Marshall et al., 2009). Recorded depth range of 0–432 m (Kyne et al., 2021). Diet: Feed on planktonic organisms including krill and crab larvae.	A resident population of reef manta rays has been recorded at Ningaloo Reef. No BIAs identified for NWMR.
Giant manta ray	Preferred habitat: The species primarily inhabits near-shore environments along productive coastlines with regular upwelling, but they appear to be seasonal visitors to coastal or offshore sites including offshore island groups, offshore pinnacles and seamounts (Marshall et al., 2011). Recorded depth range of up to 1000 m (Kyne et al., 2021). Diet: Feed on planktonic organisms including krill and crab larvae.	The Ningaloo coast is an important area for giant manta rays from March to August (Preen et al., 1997). No BIAs identified for NWMR.

5.3 Fish, Shark and Sawfish Biological Important Areas in the NWMR

A review of the Australian Marine Spatial Information System (GA, 2024) identified biologically important areas (BIAs) for four species of fish, shark and sawfish (whale shark, largetooth (freshwater) sawfish, green sawfish and dwarf sawfish) within the NWMR. The BIAs for the whale shark and the sawfish species include foraging, nursing, juvenile and pupping areas. These are described in Table 5-5.

Table 5-5: Fish, whale shark and sawfish BIAs within the NWMR (source: AMSIS, accessed 14/08/2024)

	Woodside Activity Area			BIAs			
	Browse	NWS	NWC	Reproduction - Pupping	Reproduction - Nursing	Juvenile	Foraging
Whale shark	✓	✓	✓	No pupping BIA identified within the NWMR	No nursing BIA identified within the NWMR	N/A	Foraging (high density) in Ningaloo Marine Park and adjacent Commonwealth waters (Mar–Jul) Foraging northward from Ningaloo along the 200 m isobath (Jul–Nov).
Green sawfish	✓	✓	-	Pupping in Cape Keraudren (pupping occurs in summer in a narrow area adjacent to shoreline) Pupping in Willie Creek Pupping in Roebuck Bay Pupping in Cape Leveque Pupping in waters adjacent to Eighty Mile Beach Pupping (likely) in Camden Sound	Nursing in Cape Keraudren Nursing in waters adjacent to Eighty Mile Beach	No juvenile BIA identified within the NWMR.	Foraging in Cape Keraudren Foraging in Roebuck Bay Foraging in Cape Leveque Foraging in Camden Sound

5.4 Fish Assemblages of the NWMR

5.4.1 Regional Context for Fish Assemblages of NWMR

The NWMR contains a diverse range of fishes of tropical Indo-west Pacific affinity (Allen et al., 1988). The region is characterised by the highest level of endemism and species diversity compared with other areas of the Australian continental slope. Last et al. (2005) recorded 1431 species from the three bioregions encompassing the continental slope, whilst also acknowledging some information gaps. A study of fish assemblages of the Dampier Archipelago found habitat type and complexity influenced fish abundance, with significantly higher abundance in mangrove and coral habitats (Moustaka, et al. 2024).

The NWMR is known for its demersal slope fish assemblages; the continental slope of the Timor Province and the North-west Transition supports more than 418 and 505 species of demersal fishes respectively, of which 64 are considered to be endemic. This is the second richest area for demersal fish species across the entire Australian continental slope. Conversely, the broad Southern Province, which covers most of southern Australia, supports 463 species with only 26 possibly being endemic. The continental slope demersal fish assemblages of the NWMR have been identified as a KEF (DEWHA, 2008), as described in Section 10.

The ancient coastline at 125 m depth contour KEF within the NWMR is thought to support enhanced diversity. Drivers of fish species richness, biodiversity and assemblage composition have been assessed, finding that depth, seafloor complexity and habitat type explain richness and abundance of fish assemblages (Currey-Randall et al., 2021). This study also found that fish communities along the ancient coastline KEF are similar to other mesophotic areas on the NWS. Most of the surveyed feature was characterised by soft sediment and highly mobile fish species (Currey-Randall et al., 2021).

The NWMR also features a diversity of pelagic fishes (those living in the pelagic zone) and benthopelagic fishes, including tuna, billfish, bramid, lutjanids, serranids and some sharks (DEWHA, 2007a). These species feed on salps and jellyfish, and more often on secondary consumers such as squid and bait fish. Water depth provides an indication of the level of interaction between pelagic and benthic communities within the NWMR; in waters deeper than 1000 m, for instance, the trophic system is pelagically-driven and benthic communities rely on particulates that fall to the seafloor (DEWHA, 2007a).

Pelagic fishes play an important ecological role within the NWMR; small pelagic fishes, such as lantern fish, inhabit a range of marine environments, including inshore and continental shelf waters and form a vital link in and between many of the region's trophic systems, feeding on pelagic phytoplankton and zooplankton and providing a food source for a wide variety of predators including large pelagic fishes, sharks, seabirds and marine mammals (Bulman, 2006; Mackie et al., 2007). Large pelagic fishes, such as tuna, mackerel, swordfish, sailfish and marlin are found mainly in oceanic waters and occasionally on the continental shelf (Brewer et al., 2007). Both juvenile and adult phases of the large pelagic species are highly mobile and have a wide geographic distribution, although the juveniles more frequently inhabit warmer or coastal waters (DEWHA, 2008).

5.4.1.1 Listed Fish Species in the NWMR

The family Syngnathidae is a group of bony fishes that includes seahorses, pipefishes, pipehorses and seadragons. Along with syngnathids, members of the related Solenostomidae family (ghost pipefishes) are also found in the NWMR (DSEWPAC, 2012a).

APPENDIX J There are 55 solenostomid and syngnathid species that are listed marine species that may occur within the NWMR, although no species is currently listed as threatened or migratory, according to the PMST report (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

).

Syngnathids live in nearshore and inner shelf habitats, usually in shallow coastal waters, among seagrasses, mangroves, coral reefs, macroalgae dominated reefs, and sand or rubble habitats (Dawson, 1985; Lourie et al., 1999; Lourie et al., 2004; Vincent, 1996). Two species, the winged seahorse (*Hippocampus alatus*) and western pipehorse (*Solegnathus sp. 2*) have been identified in deeper waters of the NWMR (up to 200 m) (DSEWPAC, 2012a), however, these species were not identified by the Protected Matters search of the NWMR.

Knowledge about the distribution, abundance and ecology of both syngnathids and solenostomids in the NWMR is limited. No BIAs for syngnathids and solenostomids have been identified in the NWMR.

5.4.2 Browse

The proposed Browse activity area includes biologically important habitat for the whale shark and three sawfish species, being:

- whale shark (foraging northward from Ningaloo along the 200 m isobath (July–November) (Table 9-1)
- largetooth (freshwater) sawfish (pupping, nursing and foraging areas)
- green sawfish (pupping, nursing and foraging areas)
- dwarf sawfish (pupping, nursing and foraging areas).

BIAs for the shark and sawfish species are outlined in Table 5-5 and Figure 5-1.

The proposed Browse activity area has partial overlap with the continental slope demersal fish communities KEF.

5.4.3 North West Shelf / Scarborough

The NWS / Scarborough activity area includes biologically important habitat for the whale shark and three sawfish species, being:

- whale shark (foraging northward from Ningaloo along the 200 m isobath (July–November) (Table 9-1)
- freshwater sawfish (pupping, nursing and foraging areas)
- green sawfish (pupping, nursing and foraging areas)
- dwarf sawfish (pupping, nursing and foraging areas).

BIAs for the whale shark and sawfish species are outlined in Table 5-5 and Figure 5-1.

The NWS / Scarborough activity area has partial overlap with the continental slope demersal fish communities KEF. The continental slope between North-west Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last et al., 2005).

5.4.4 North-west Cape

The North-west Cape activity area includes biologically important foraging habitat for the whale shark, being:

- foraging (high density) in Ningaloo Marine Park and adjacent Commonwealth waters (March–July) (Table 9-1)
- foraging northward from Ningaloo along the 200 m isobath (July–November) (Table 9-1).

BIAs for the whale shark are outlined in Table 5-5 and Figure 5-1. The North-west Cape activity area coincides with part of the continental slope demersal fish communities KEF.

6. MARINE REPTILES

6.1 Regional Context for Marine Reptiles

The NWMR contains important habitat for listed marine reptiles, including areas that support key life stages such as nesting, internesting, migration and foraging for marine turtle species, and habitats supporting resident sea snake and crocodile populations.

APPENDIX K Six of the seven marine turtle species occur in Australian waters, and all six (the green turtle, hawksbill turtle, loggerhead turtle, flatback turtle, leatherback turtle and olive ridley turtle) occur in the NWMR and NMR, with four species of marine turtles occurring in the SWMR (see Protected Matters reports in PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

).

APPENDIX L There are 25 listed species of sea snake reported within or adjacent to the NWMR (Guinea, 2007a; Udyawer et al., 2016), of which four are endemic to reef habitats in the remote parts of the region (see NWMR Protected Matters report in PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

).

APPENDIX M There are significantly fewer marine reptile species that frequently occur within the SWMR and presently include four species of listed marine turtle and six sea snake species. Other species of sea snake may occur because of the southward-flowing Leeuwin Current as vagrants in the region (DSEWPAC, 2012b) (see SWMR Protected Matters report in PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

).

APPENDIX N Twenty-eight listed sea snake species ‘may’ occur in the NMR, as reported in the Protected Matters report in PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

The following sections focus on the listed marine reptile species known to occur within the NWMR.

Table 6-1 outlines the threatened and migratory marine reptile species that may or are known to occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice.

Table 6-1: Marine reptile species identified by the EPBC Act PMST that may occur within or utilise habitats in the NWMR for key life cycle stages

6.2 Marine Turtles in the NWMR, SWMR and NMR Bioregions

According to the Protected Matters search (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) six species of marine turtle known to occur within the NWMR are listed as threatened and migratory (three Vulnerable and three Endangered) under the EPBC Act—the green (*Chelonia mydas*), hawksbill (*Eretmochelys imbricata*), flatback (*Natator depressus*), loggerhead (*Caretta caretta*), leatherback (*Dermochelys coriacea*) and olive ridley (*Lepidochelys olivacea*) turtles (DSEWPAC, 2012a) (refer Table 6-1).

The NWMR supports globally significant breeding populations of four marine turtle species: the green, hawksbill, flatback and loggerhead turtle. Olive ridley turtles are known to forage within the NWMR, but there are only occasional records of the species nesting in the region. Leatherback turtles regularly forage over Australian continental shelf waters within the NWMR but there are also no records of the species nesting in the region (DSEWPAC, 2012a).

The six marine turtle species reported for the NWMR also occur within the NMR.

Four marine turtle species; the green, loggerhead, flatback, and leatherback turtle, have presumed feeding areas within the SWMR; however, no known nesting areas exist within the region (DSEWPAC, 2012b).

Discrete genetic stocks have evolved within each marine turtle species. This is the result of marine turtles returning to the location where they hatched. These genetically distinct stocks are defined by the presence of regional breeding aggregations. Stocks are composed of multiple rookeries in a region and are delineated by where there is little or no migration of individuals between nesting areas. Turtles from different stocks typically overlap at feeding grounds (Commonwealth of Australia, 2017). There are 17 genetic stocks across both the NWMR and NMR (nine in the NWMR, six in the NMR, and two overlapping both regions). Of these 17 genetic stocks, nine are known to occur within Woodside's three areas of activity (Table 6-2).

6.2.1 Life Cycle Stages

Marine turtles are highly migratory during non-reproductive life phases and have high site fidelity during breeding and nesting life phases. The majority of their lives are spent in the ocean, with only adult female marine turtles coming ashore to lay eggs in the sand above the high-water mark on natal beaches (Commonwealth of Australia, 2017). Figure 6-1 summarises the generalised life cycle of marine turtles. Species-specific life cycle information is outlined within the Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia, 2017).

Figure 6-1: Generalised life cycle of marine turtles (Commonwealth of Australia, 2017)

6.2.2 Habitat Critical to Survival for Marine Turtles in the NWMR

The Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia, 2017) identifies habitat critical to the survival of a species for marine turtle stocks under the EPBC Act. Habitat critical to survival is defined by the EPBC Act *Significant Impact Guidelines 1.1 – Matters of National Environmental Significance* as areas necessary:

- for activities such as foraging, breeding or dispersal
- for the long-term maintenance of the species (including the maintenance of species essential to the survival of the species)
- to maintain genetic diversity and long-term evolutionary development
- for the reintroduction of populations or recovery of the species.

The Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia, 2017) has identified nesting locations and associated internesting areas as habitat critical to survival for four marine turtle species within the NWMR and these are identified, described and mapped in Table 6-2 and Figure 6-2. No habitat critical to survival has been identified within the NWMR for olive ridley or leatherback turtles.

Table 6-2 outlines the relevant genetic stock, habitat critical to survival and key life cycle stage seasonality of the four species of marine turtles within the NWMR.

Table 6-2: Genetic stock, habitat critical to survival and key life cycle stage seasonality of the four species of marine turtles within the NWMR

6.3 Marine Turtle Biological Important Areas in the NWMR

A review of the Australian Marine Spatial Information System (GA, 2024), the Marine Bioregional Plan for the North-west Marine Region (DSEWPAC, 2012a) and the Recovery Plan for Marine Turtles in Australia (CoA, 2017) identified BIAs for the four marine turtle species that occur within the NWMR. These are described in Table 6-3.

Table 6-3: Marine turtle BIAs within the NWMR

Species	Woodside Activity Area			BIAs				
	Browse	NWS/S	NWC	Mating	Nesting	Interesting	Foraging	Migration ¹⁰
Green turtle	✓	✓	✓	Barrow Island Montebello Islands (including Hermite Island, North West Island, Trimouille Island) Dampier Archipelago (islands to the west of the Burrup Peninsula) Ashmore Reef	Barrow Island Montebello Islands (including Hermite Island, North West Island, Trimouille Island) Middle Island Dampier Archipelago (islands to the west of the Burrup Peninsula) North and South Muiron Islands North West Cape Delambre Island Legendre Island and Huay Island Lacepede Islands Scott Reef – Sandy Island Ashmore Reef Cartier Island Cassini Island	Locations of 20 km interesting buffer BIAs for green turtles are described in the Marine Bioregional Plan for the North-west Marine Region (DSEWPAC, 2012a). Year round and seasonal 20 km interesting buffer BIAs are located around nesting sites. Habitat critical to survival interesting buffer (Table 6-2) is the legally recognised area of protection under the EPBC Act	Foraging inshore areas of Barrow Island Foraging at Montgomery Reef Foraging at Montebello Islands Foraging at Dixon Island Foraging around Ashmore Reef Foraging at Seringapatam Reef and Scott Reef Foraging in the De Grey River area to Bedout Island Foraging around the Islands between Cape Preston and Onslow and inshore of Barrow Island Foraging around Dampier Archipelago (islands to the west of the Burrup Peninsula) Foraging at Legendre Island and Huay Island Foraging around Delambre Island Foraging in the Joseph Bonaparte Gulf	Migration corridor at Dampier Archipelago (islands to the west of the Burrup Peninsula). Green turtles can migrate more than 2600 km between their feeding and nesting grounds. Individual turtles foraging in the same area do not necessarily take the same migration route (Limpus et al., 1992). Ferreira et al. (2021) broadly identified two migratory corridors, one used by the NWS stock-Pilbara and another used by the NWS stock-Kimberley and the Scott-Browse stock with some overlap at the northern and southern extents respectively. This study showed that the foraging distribution of green turtles from two stocks in WA expands throughout North-west and northern Australian coastal waters,

¹⁰ Migration BIA included in AMSIS (GA, 2024). General information for migratory behaviours also provided.

Hawksbill turtle	✓	✓	✓	Montebello Islands Barrow Island Lowendal Island Group Dampier Archipelago (to the west of the Burrup Peninsula)	Lowendal Island Group Montebello Islands (including Ah Chong and South East islands) Rosemary Island Delambre Island Barrow Island Varanus Island and Thevenard Island Dampier Archipelago (to the west of the Burrup Peninsula) Ningaloo Coast and Jurabi Coast Sandy Islet at Scott Reef	Locations of 20 km internesting buffer BIAs for hawksbill turtles are described in the Marine Bioregional Plan for the North-west Marine Region (DSEWPAC, 2012a). Year round and seasonal 20 km internesting buffer BIAs are located around nesting sites. Habitat critical to survival internesting buffer (Table 6-2) is the legally recognised area of protection under the EPBC Act	Recent data shows foraging ranges from the north of Exmouth Gulf to offshore Broome (Fossette et al., 2021a). Foraging around the Lowendal Island group Foraging at Delambre Island Foraging around Dixon Island Foraging in the De Grey River area to Bedout Island Foraging around the islands between Cape Preston and Onslow and inshore of Barrow Island Foraging around the islands of the Dampier Archipelago (to the west of the Burrup Peninsula) Foraging at Ashmore Reef	Migration corridor at Dampier Archipelago (islands to the west of the Burrup Peninsula). Individuals may migrate up to 2400 km between their nesting and foraging grounds (DSEWPAC, 2012a), although reproductive migration distances over 1000 km appear less common in hawksbill turtles than other species (Fossette et al., 2021a). Recent satellite tracking data shows turtles migrating from WA rookeries remained on the continental shelf, with the majority following the coastline and dispersing in a north-easterly direction, with some turtles from the Montebello Archipelago and Lowendals moving in a south-westerly direction and some stopping around Barrow Island. A migratory corridor was observed from

Flatback turtle	✓	✓	-	Lacepede Islands Montebello Islands Dampier Archipelago (islands to the West of the Burrup Peninsula) Mating at Barrow Island	Thevenard Island – South Coast (summer) high use on beaches with high dune height Barrow Island Montebello Islands (including Hermite Island, North West Island, Trimouille Island) Dampier Archipelago (islands to the west of the Burrup Peninsula) Delambre Island Legendre Island and Huay Island Dixon Island Intercourse Island West of Cape Lambert Various locations along the Pilbara coast between Karratha and Broome, including Cape Thouin, Mundabullangana, Cowrie Beach, Port Hedland (Cemetery Beach, Paradise	Locations of 80 km internesting buffer BIAs for flatback turtles are described in the Marine Bioregional Plan for the North-west Marine Region (DSEWPAC, 2012a). Year-round and seasonal internesting buffer BIAs of 80 km are located around nesting sites, extending 20 km further than the habitat critical to survival. Habitat critical to survival internesting buffer (Table 6-2) is the legally recognised area of protection under the EPBC Act	Foraging at the islands between Cape Preston and Onslow and inshore of Barrow Island. Foraging at Montebello Islands Foraging at Dampier Archipelago (islands to the West of the Burrup Peninsula) Foraging at Legendre Island and Huay Island Foraging at Delambre Island Foraging in the Joseph Bonaparte Depression Foraging in waters adjacent to James Price Point	Migration corridor at Dampier Archipelago (islands to the west of the Burrup Peninsula). The flatback turtle is a resident to Australian waters and spends 99% of its time within the Australian EEZ. A migratory corridor connects the coastlines between the Kimberley and Pilbara (Peel et al., 2024). There is evidence that some flatback turtles undertake long-distance migrations between breeding and feeding grounds (Limpus et al., 1983). However, flatback turtles generally do not have a pelagic phase to their lifecycle. Instead, hatchlings grow to maturity in shallow coastal waters thought to be close to their natal beaches (DSEWPAC, 2012a). A study predicting the dispersal of flatback

6.4 Marine Turtle Summary for NWMR

Six of the seven marine turtle species occur within the Woodside activity areas. Across all three areas, globally significant breeding populations of four marine turtle species; the green, hawksbill, flatback and loggerhead turtle, have been recorded.

However, offshore waters do not represent biologically important habitat for marine turtles in any of the three Woodside activity areas. Isolated records of transient individuals (on post-nesting migration) are expected, but there is no evidence of important habitat or behaviours for marine turtles in the offshore, open water environment of the NWS, in general.

6.4.1 Browse

The proposed Browse activity area includes major nesting areas that support globally significant breeding populations of two marine turtle species:

- the green turtle, including two distinct genetic stocks (Ashmore Reef and Scott Reef-Browse Island)
- the flatback turtle, Cape Domett genetic stock.

Locations of habitat critical for each of the two species are outlined in Table 6-2 and Figure 6-2.

BIAs for the green and flatback turtle are outlined in Table 6-3 and Figure 6-3.

Table 6-4: Marine turtle key information for Browse activity area.

Species / Genetic Stock	Key Information
Green Turtle	
Ashmore Reef Stock (G-AR)	<p>The G-AR stock nests in a localised area of the Indian Ocean in the Ashmore Reef and Cartier Island Australian Marine Park (AMP) areas. Population estimates are not available for Ashmore Reef, although annual breeding numbers are thought to be in the low hundreds (Whiting, 2000).</p> <p>Designated habitat critical for the G-AR stock are the nesting locations of Ashmore Reef and Cartier Reef, and an internesting buffer of 20 km radius around these rookeries, year-round with peak internesting activity occurring December to January (refer Table 6 of the Recovery Plan).</p> <p>Juvenile and adult turtles forage within the tidal/sub-tidal habitats of offshore islands and coastal waters with coral reef, mangrove, sand, rocky reefs, and mudflats where there are algal turfs or seagrass meadows present (Commonwealth of Australia, 2017).</p>
Scott Reef-Browse Island Stock (G-ScBr)	<p>The G-ScBr stock is a discrete unit known to nest at only two locations within the North-east Indian Ocean—Sandy Islet and Browse Island. There is currently very limited data available for the G-ScBr stock, therefore population numbers are not known.</p> <p>Designated habitat critical for the G-ScBr stock are the nesting locations of Sandy Islet and Browse Island, and an internesting buffer of 20 km radius around these rookeries, for the period November to March (refer Table 6 of the Recovery Plan).</p> <p>Surveys conducted at Scott Reef in 2006, 2008 and 2009 indicate that the summer months from late November to February are the preferred breeding season for green turtles at Sandy Islet (Guinea, 2009).</p> <p>Satellite tagging studies (Pendoley, 2005; Guinea, 2011) have provided an indication of the behaviour and migratory routes of adult green turtles leaving Scott Reef. Most animals appear to swim through South Reef lagoon and disperse toward the Western Australian mainland via two distinct post-nesting migration pathways; travelling east and north toward the Bonaparte Archipelago and then north along the coast to foraging areas in NT waters or travelling south to Cape Leveque and then south along the coast to the Turtle Islands off the mouth of the De Grey River in the Pilbara region (Ferreira et al., 2021).</p>
Flatback Turtle	
Cape Domett Stock (F-CD)	<p>Cape Domett is an important high density nesting area (Tucker et al., 2021). Combined with a smaller site at Lacrosse Island, the F-CD stock is one of the largest flatback turtle stocks in Australia. Average nesting abundance at Cape Domett is estimated at 3250 females per year (Whiting et al., 2008).</p> <p>Designated habitat critical for the F-CD stock are the nesting locations of Cape Domett and Lacrosse Island, and an internesting buffer of 60 km radius around these rookeries, year-round with peak internesting activity occurring July to September.</p> <p>Extending further than the habitat critical internesting buffer, an internesting buffer BIA of 80 km is located at Cape Domett and Lacrosse Island.</p>

6.4.2 North West Shelf / Scarborough

The NWS / Scarborough activity area includes major nesting areas that support globally significant breeding populations of three marine turtle species, representing four discrete genetic stocks:

- the green turtle, NWS genetic stock
- the hawksbill turtle, WA genetic stock
- the flatback turtle, South-west Kimberley stock and Pilbara genetic stock.

Locations of habitat critical for each of the four species are outlined in Table 6-2 and Figure 6-2.

BIAs for the green, hawksbill, and flatback turtles are outlined in Table 6-3 and Figure 6-3.

Table 6-5: Marine turtle key information for NWS / Scarborough activity area

Species / Genetic Stock	Key Information
Green Turtle	
NWS Stock (G-NWS)	<p>The G-NWS stock is one of the largest green turtle stocks in the world and the largest in the Indian Ocean. The G-NWS stock is estimated at approximately 20,000 individuals (DSEWPAC, 2012a) and the trend for the stock is reported as stable (Commonwealth of Australia, 2017).</p> <p>Major rookeries of the NWS stock within the NWS / Scarborough activity area are located at Lacepede Islands, Montebello Islands, Barrow Island (Tucker et al., 2021), Bells Beach, Delambre Island, Mundabullangana, Port Hedland, and Thevenard Island. These areas are designated habitat critical for survival of the stock and include an interesting buffer of 20 km radius around these rookeries from November to March.</p>
Hawksbill Turtle	
Western Australia Stock (H-WA)	<p>The H-WA stock is the largest in the Indian Ocean. The majority of the nesting for this stock is located in the Pilbara. The Dampier Archipelago has the largest nesting aggregation recorded. In particular, Rosemary Island supports the most significant hawksbill turtle rookery in the WA region and one of the largest in the Indian Ocean; approximately 500 to 1000 females nest on the island annually, more than at any other WA rookery (Pendoley, 2005; Pendoley et al., 2016).</p> <p>Major rookeries of the H-WA stock within the NWS / Scarborough activity area are located at Rosemary Island, Delambre Island and the Montebello Islands. These areas are designated habitat critical for the stock and include an interesting buffer of 20 km radius around these rookeries from October to February.</p>
Flatback Turtle	
South-west Kimberley Stock (F-swKim)	<p>The genetic relationship between this nesting aggregation and the Cape Domett and Pilbara stocks is currently under review. Population numbers of the F-swKim stock are unknown.</p> <p>Major rookeries of the F-swKim stock are located at Eighty Mile Beach and Eco Beach. These areas are designated habitat critical for the stock and include an interesting buffer of 60 km radius around these rookeries from October to March.</p>
Pilbara Stock (F-Pil)	<p>The extent of genetic relatedness of flatback turtles along the WA coast is currently under review. Population numbers of the F-Pil stock are unknown.</p> <p>This stock nests on many islands in the Pilbara and southern Kimberley, with major rookeries at Mundabullangana Beach, Delambre Island, Rosemary Island and Barrow Island. These areas are designated habitat critical for the F-Pil stock and include an interesting buffer of 60 km radius around these rookeries from October to March. A study using aerial photogrammetry showed nesting beaches were spread across the Pilbara from Y Island (Exmouth Gulf) in the southwest, to Bedout Island in the north and Mulla Mulla Downs Creek in the east (Fossette et al., 2021b).</p> <p>Other large flatback rookeries include Legendre Island and Thevenard Island. The Dampier Archipelago has been identified as a high-use area for flatback nesting (i.e. >50% of the stock) (Fossette et al., 2021b).</p> <p>Extending further than the habitat critical interesting buffer, a year-round interesting buffer BIA of 80 km is located north and north-west of the Montebello Islands. However, use level for this BIA has been defined as very low (Commonwealth of Australia, 2017) and the habitat critical interesting buffer is the legally recognised area of protection under the EPBC Act <i>Significant Impact Guidelines 1.1 – Matters of National Environmental Significance</i>.</p> <p>Post-nesting satellite tracking indicates foraging occurs along the WA coast in water shallower than 130 m and within 315 km of shore (Commonwealth of Australia, 2017). Flatbacks exhibit high fidelity to nesting beaches during periods of nesting attempts (Peel et al., 2024).</p>

No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.</p> <p>Controlled Ref No: G2000RH1401743486 Revision: 2 Woodside ID: 1401743486 Page 99 of 381</p> <p>Uncontrolled when printed. Refer to electronic version for most up to date information.</p>	

6.4.3 North-west Cape

The North-west Cape activity area includes major nesting areas that support globally significant breeding populations of two marine turtle species, representing two discrete genetic stocks:

- the green turtle, NWS genetic stock
- the loggerhead turtle, Western Australia genetic stock.

Locations of habitat critical for each of the two species are outlined in Table 6-2, Figure 6-2 and Figure 6-3.

A 2018 survey, including on-beach monitoring of the Muiron Islands and Ningaloo Coast from North-west Cape to Bungleup (Rob et al., 2019), supports the concept that North-west Cape and the Muiron Islands are major important nesting areas for green and loggerhead turtles, as identified in the Recovery Plan (Commonwealth of Australia, 2017).

Table 6-6: Marine turtle key information for North-west Cape activity area

Species / Genetic Stock	Key Information
Green Turtle	
NWS Stock (G-NWS)	<p>The G-NWS stock is one of the largest green turtle stocks in the world and the largest in the Indian Ocean. The G-NWS stock is estimated at approximately 20,000 individuals (DSEWPAC, 2012a) and the trend for the stock is reported as stable (Commonwealth of Australia, 2017).</p> <p>There is one major rookery of the G-NWS stock located within the North-west Cape activity area. Located on the mainland coast of the North-west Cape, this area is designated habitat critical for the stock and includes an interesting buffer of 20 km radius around the rookery from November to March.</p> <p>For the 2022–23 Ningaloo Turtle Program season, green turtles were the most active species in the NW Cape division, with 91.2% of total turtle activity (DBCA, 2023a). The number of green turtle nests has varied largely among years since commencement of the program in 2002 (range of 1.06 to 18.13 nests per subsection per day) with an average of 5.69. The average number of green turtle nests in the 2022–23 peak season were below average, with 4.07 nests per subsection per day (DBCA, 2023a). There have been two clear peaks (2011–12 and 2020–21) in activity since the beginning of the Ningaloo Turtle Program, where activity has been approximately 2.5 to 11 times greater than other seasons (DBCA, 2023a). Both seasons coincided with La Niña weather patterns (DBCA, 2021a).</p>
Loggerhead Turtle	
Western Australia Stock (LH-WA)	<p>The LH-WA stock is one of the largest in the world (Limpus, 2009). The trend for the stock is reported as stable (Commonwealth of Australia, 2017).</p> <p>Major rookeries of the LH-WA stock are located at Dirk Hartog Island, Muiron Islands and Gnarlaloo Bay. These areas are designated habitat critical for the stock and include an interesting buffer of 20 km radius around these rookeries from November to May.</p> <p>Dirk Hartog Island in the Shark Bay Marine Park, with an average of 122 nests per day over 2.1 km (Reinhold and Whiting, 2014), is recognised as the most important loggerhead turtle rookery in WA (Commonwealth of Australia, 2016; as cited in Rob et al., 2019).</p> <p>The standardised level of loggerhead turtle nesting along the North-west Cape was above the long-term average (0.36) for the 2022–23 season and the third highest since the Ningaloo Turtle Program began (2002), with 0.46 nests per subsection per day (DBCA, 2021a).</p>

6.5 Sea Snakes

Sea snakes are commonly found in the NWMR and NMR, but less so in the SWMR, and occupy three broad habitat types: shallow water coral reef and seagrass habitats, deepwater soft bottom habitats away from reefs, and surface water pelagic habitats (Guinea, 2007a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Revision: 2

Woodside ID: 1401743486

Page 100 of 381

Uncontrolled when printed. Refer to electronic version for most up to date information.

There are 25 listed species of sea snake reported within or adjacent to the NWMR (Guinea, 2007a; Udyawer et al., 2016), of which four are endemic to reef habitats in the remote parts of the region:

- dusky sea snake (*Aipysurus fuscus*)
- large headed sea snake (*Hydrophis pacificus*)
- short-nosed sea snake (*Aipysurus apraefrontalis*)
- leaf-scaled sea snake (*Aipysurus foliosquama*).

The short-nosed sea snake, the leaf-scaled sea snake, and the dusky sea snake are listed threatened species (Critically Endangered or Endangered) under the EPBC Act (Table 6-7).

The Kimberley coast has the world's highest diversity of sea snakes, supporting over one third of all known species (Somaweera and Saunders, 2015). There is currently limited knowledge about the ranges and distribution patterns of sea snake species in the NWMR, in addition to a lack of understanding of population status and threats. Recent findings of *A. apraefrontalis* and *A. foliosquama* in locations outside of their previously defined ranges have highlighted the lack of information on species distributions in the NWMR (Udyawer et al., 2016). Udyawer et al. (2020) used a correlative modelling approach to understand habitat associations and identify suitable habitats for five sea snake species (*A. apraefrontalis*, *A. foliosquama*, *A. fuscus*, *A. l. pooleorum* and *A. tenuis*). Species-specific habitat suitability was modelled across 804,244 km² of coastal waters along the NWS, and the resulting habitat suitability maps enabled the identification of key locations of suitable habitat for these five species (refer Table 6-6).

No habitat critical to survival or BIAs for sea snake species have been identified in the NWMR. While the Ashmore Reef and Cartier Island AMPs have been recognised for their high diversity and density of sea snakes (DSEWPAC, 2012a), surveys have revealed a steep decline in sea snake numbers at Ashmore Reef (Guinea, 2007b; Lukoschek et al., 2013). Leaf-scaled and short-nosed sea snakes have been absent from surveys at Ashmore Reef since 2001, despite an increase in survey intensity (Guinea, 2006, 2007b; Guinea and Whiting, 2005; Lukoschek et al., 2013). The reason for the decline is unknown.

Table 6-7: Information on threatened sea snake species within the NWMR

Species	Preferred Habitat and Diet	Habitat Location
Short-nosed sea snake	Preferred habitat: Primarily on reef flats or in shallow waters of outer reef edges to depths of 10 m (Minton et al., 1975). Typically, movement is restricted to within 50 m of reef flat habitat (Guinea and Whiting, 2005). Diet: Primarily fishes and eels.	The short-nosed sea snake has been recorded from Exmouth Gulf to the reefs of the Sahul Shelf, although most records come from Ashmore and Hibernia reefs (Guinea and Whiting, 2005). Key locations of suitable habitat: Ashmore Reef, Exmouth Gulf and coral habitat fringing the Muiron Islands and the Montebello Islands (Udyawer et al., 2020).
Leaf-scaled sea snake	Preferred habitat: The leaf-scaled sea snake occurs in shallow protected areas of reef flats, typically in water depth less than 10 m. Diet: Primarily shallow water coral-associated wrasse, gudgeons, clinids and eels (McCosker, 1975; Voris, 1972; Voris and Voris, 1983).	The leaf-scaled sea snake has only been recorded at Ashmore and Hibernia reefs (Guinea and Whiting, 2005), indicating it has a very limited distribution. Key locations of suitable habitat: Ashmore Reef, Shark Bay, Exmouth Gulf, Barrow Island and Montebello Islands (Udyawer et al., 2020).
Dusky sea snake	Preferred habitat: The dusky sea snake is a reef specialist that is only known to occur on complex hard coral reefs and shoals – both emergent and subsurface. Has only been recorded at depths of 0–20 m however may occur in deeper areas with less survey effort (DCCEEW, 2024o). Diet: Stomach content analyses have identified benthic gobies, wrasses and occasionally fish eggs (DCCEEW, 2024o).	The dusky sea snake has been recorded sparsely and patchily from reefs and shoals at the outer margin and mid-shelf of the Australian continental shelf, specifically at the Scott Reef complex (Scott Reef, North Scott Reef and Sandy Islet) and nearby Seringapatam Reef, Heywood Shoal, and at Ashmore Reef, Cartier Island and Hibernia Reef. The dusky sea snake has not been detected at Ashmore Reef, Cartier Island or Hibernia Reef since the early 2000s. The species may occur undetected at mid-shelf shoals which comprise the shallowest of sea mounts and banks that occur along a north-easterly crescent from south of Heywood Shoal, past Cartier Island, to Ashmore Reef (DCCEEW, 2024o).

6.6 Crocodiles

The salt-water crocodile (*Crocodylus porosus*) is a listed migratory species under the EPBC Act known to occur within the NWMR. The species is found in most major river systems of the Kimberley, including the Ord, Patrick, Forrest, Durack, King, Pentecost, Prince Regent, Lawley, Mitchell, Hunter, Roe and Glenelg rivers. The largest populations occur in the rivers draining into the Cambridge Gulf and the Prince Regent River and Roe River systems. There have also been isolated records in rivers of the Pilbara region, around Derby near Broome and as far south as Carnarvon on the mid-west coast. No BIAs for salt-water crocodile have been identified in the NWMR.

6.7 Water Monitor

Mitchell's water monitor (*Varanus mitchelli*) is listed as critically endangered under the EPBC Act. The species is known to occur in wetlands and coastal floodplains in the northern extent of the NWMR, with distribution from Yampi Sound Training Area, across the Kimberley and into the Top End of the Northern Territory and far northwest Queensland (DCCEEW, 2023c). The species inhabits freshwater and saline wetlands that range from seasonal gorges in upper catchments to large rivers and coastal floodplains. It has been recorded in rivers, creeks, riffle zones, gorges, springs, lagoons, swamps, mangroves, and foreshores (DCCEEW, 2023c).

Habitat critical to the survival of the species has not been mapped however includes all areas where the species persists following the establishment of cane toads and areas within known distribution where habitat occurs or can be restored (terrestrial) (DCCEEW, 2023c). No BIAs for Mitchell's water monitor have been identified in the NWMR.

7. MARINE MAMMALS

7.1 Regional Context

The offshore waters of WA include important habitat for marine mammals, including areas that support key life stages such as breeding, calving, foraging, and migration. Of the 45 species of cetacean occurring in Australian waters, 27 species occur regularly in the waters of the NWMR, nine species in the waters of the NMR and 33 species in the SWMR. The waters of the NWMR and the NMR support globally significant dugong populations (DSEWPAC, 2012a, 2012c).

The NWMR is an important migratory pathway between feeding grounds in the Southern Ocean and breeding grounds in tropical waters of the NWMR for several cetacean species (DSEWPAC, 2012a). Numerous large mysticetes (baleen whale) species, in particular the humpback whale, are known to utilise the region for migration and calving, and the pygmy blue whale is known to utilise the region for foraging and as a migration pathway between southern feeding and northern breeding/feeding areas north of the equator.

The SWMR is an important area for numerous marine mammal species including pinniped species, large, migratory whale species and resident coastal whale and dolphin species (DSEWPAC, 2012b).

The NMR and adjacent areas are important for several species of cetacean, particularly inshore dolphin species. These species, and other marine mammals, rely on the waters of the NMR and adjacent coastal areas for breeding and foraging (DSEWPAC, 2012c).

Table 7-1 outlines the threatened and migratory marine mammal species that may occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice.

Table 7-1: Marine mammal species identified by the EPBC Act PMST that may occur within the NWMR

7.2 Cetaceans in the NWMR

Cetaceans are generally widely distributed and highly mobile. In general, distribution patterns reflect seasonal feeding and breeding areas, characterised by high productivity, and migration routes associated with reproductive patterns. The NWMR is an important migratory pathway between feeding grounds in the Southern Ocean and breeding grounds in tropical waters for several cetacean species (DSEWPAC, 2012a).

From the Protected Matters search, 34 EPBC Act listed species were recorded as potentially occurring or having habitat within the NWMR (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR).

) Of those, 12 cetacean species are listed as threatened and/or migratory, including baleen whales, toothed whales and dolphins that occur within the NWMR (Table 7-2).

7.3 Dugongs in the NWMR

The dugong is listed as migratory under the EPBC Act. Dugongs inhabit seagrass meadows in coastal waters, estuarine creeks and streams, and reef systems (DSEWPAC, 2012a).

Some of the coastal waters adjacent to the NWMR support significant populations of dugongs, including Shark Bay, Exmouth Gulf, in and adjacent to Ningaloo Reef, in coastal waters along the Kimberley coast, and on the edge of the continental shelf at Ashmore Reef (DEWHA, 2008).

Although the patterns of dugong movement in WA are not well understood, it is thought that dugongs move in response to availability of seagrass (Marsh et al., 1994; Preen et al., 1997) and water temperature. Cleguer and Marsh (2023) present the most contemporary data on dugongs and population estimates via an inventory of dugong aerial surveys of Australia, including northwest Australia (Shark Bay, Ningaloo, Exmouth Gulf and Pilbara, the Kimberley Region).

There are a number of BIAs for dugong within and adjacent to waters of the NWMR (refer Section 7.5).

7.4 Pinnipeds in the NWMR

APPENDIX Q The Australian sea lion is listed as a species that may occur or may have habitat within the NWMR (Protected Matters search – PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

). It is included here as the Australian sea lion is the only pinniped endemic to Australia (Strahan, 1983) and has been recorded within the southern extent of the NWMR at Shark Bay, WA (Kirkwood et al., 1992). The most northern known breeding colony is at the Houtman Abrolhos Islands in the SWMR. The Australian sea lion's breeding range extends from the Houtman Abrolhos Islands, WA to The Pages Island, east of Kangaroo Island, SA. The Australian sea lion was listed as endangered in 2020 (Threatened Species Scientific Committee, 2020a). An assessment of the status and trends in abundance of this endemic, coastal pinniped species (Goldsworthy et al., 2021) documented an overall reduction in pup abundance over three generations, providing strong evidence that the species meets IUCN endangered criteria.

There are no BIAs for the Australian sea lion in the NWMR.

7.5 Marine Mammals in the NWMR

Marine mammal descriptions within the NWMR including baleen whales, toothed whales and dolphins and dugongs are presented in Table 7-2.

Table 7-2: Information on the threatened/migratory marine mammal species within the NWMR

Species	Key Information
<i>Baleen whales (Mysticeti) – Low Frequency hearing</i>	
Humpback whale	<p>In Australian waters, there are two genetically distinct populations of humpback whales that migrate annually along the west (Group IV/ Group D) and east (Group V) coasts between May and November (Jenner et al., 2001). The population of humpback whales (<i>Megaptera novaeangliae</i>) known as Group IV/D migrate annually from Antarctic feeding grounds passing along the coast of Western Australia to warm tropical waters including the Kimberley, North West Cape, and Exmouth Gulf for breeding and calving (Russell et al., 2024). The biannual migration of humpback whales through the NWMR occurs in winter (June to August) for northbound migrating whales and southbound in early spring (September to November). Population data for the West Australian sub-population is considerably variable (DAWE, 2022). The population has been increasing in size at a rate of approximately 10% per annum since the cessation of whaling in Western Australian waters by 1963 (Thums et al., 2018) and population numbers have increased from approximately 2000 to 3000 individuals in 1991 to between 19,200–33,850 individuals in 2008 (Bannister and Hedley, 2001; Beijder et al., 2019; Hedley et al., 2011). Aerial surveys off the WA coast undertaken between 2000 and 2008 produced a population estimate for the Group IV population of 26,100 individuals (Salgado Kent et al., 2012) and the predicted increasing trend in abundance predicted by modelling (Thums et al., 2018). The International Whaling Commission (IWC) estimated that in 2012 the Western Australian subpopulation had recovered to 90% (74–98% 90% PI) of its pre-whaling levels and projected that by 2020 it would have reached 98% (88–100% PI) (IWC 2015 cited in (DAWE, 2022)). Due to the unprecedented population recovery the humpback whale was removed from the EPBC Act threatened species list as it was deemed no longer eligible for inclusion (DAWE, 2022) after a previous listing as Vulnerable for many decades.</p> <p>The Group IV population migrates northward from their Antarctic feeding grounds around May each year, reaching the NWMR around early June. The southward migration subsequently starts in mid-September, after time for breeding and calving (typically within August and September) (Threatened Species Scientific Committee, 2015b). Within the NWMR there are key calving areas between Broome and the northern end of Camden Sound, and resting areas in the southern Kimberley region, Exmouth Gulf and Shark Bay. In particular, high numbers of humpback whales are observed in Camden Sound and Pender Bay from June to September each year (Threatened Species Scientific Committee, 2015b) and as far south as Gourdon Bay in the Kimberley (Thums et al., 2018). There are reports of neonates present further south, suggesting that the calving areas may be poorly defined, expanding or returning to pre-whaling patterns as the population recovers. Aerial photogrammetric surveys in 2013 and 2015 recorded large numbers of humpback whale calves along the North-west Cape, with estimated minimum relative calf abundance of 463–603 in 2013 and 557–725 in 2015 (Irvine et al., 2018). The majority of calves sighted in both years (85% in 2013; 94% in 2015) were neonates, and these observations indicate that a minimum of approximately 20% of the expected number of calves of this population are born near, or south of the North-west Cape. Thus, the calving grounds for the Group IV population extend south from Camden Sound to at least North-west Cape, 1000 km South-west of the currently recognized calving area (Irvine et al., 2017) and further south, as reported for Geographe Bay and Flinders Bay (in July and August) in south-west, Western Australia (Jolliffe et al., 2024).</p> <p>The seasonal presence of humpback whales is presented in Table 9-1.</p> <p>Migration, breeding and calving BIAs for the humpback whale within the NWMR are presented in Table 7-3 and Figure 7-2.</p>
Blue whale	<p>There are two recognised sub-species of blue whale in the Southern Hemisphere, both of which are recorded in Australian waters. These are the southern (or 'true') blue whale (<i>Balaenoptera musculus</i>) and the 'pygmy' blue whale (<i>Balaenoptera musculus brevicauda</i>) (Commonwealth of Australia, 2015a). In general, southern blue whales occur in waters south of 60°S and pygmy blue whales occur in waters north of 55°S (i.e. not in the Antarctic). On this basis, it is reasonably assumed all blue whales sighted in the NWMR are likely to be pygmy blue whales.</p>

Species	Key Information
	<p>The migratory population, known as the East Indian Ocean (EIO) pygmy blue whale population, migrate biannually through the NWMR. This population is seasonally distributed from Indonesia (a potential breeding ground) to south-west of Australia and east across the Great Australian Bight and Bonney Upwelling to beyond the Bass Strait (Blue Planet Marine, 2020; McCauley et al., 2018). Migration seems to be variable, with some individuals appearing as resident to areas of high productivity and others undertaking migrations across long distances (Commonwealth of Australia, 2015a). McCauley et al. (2018) describe three migratory stages around Australia for the EIO pygmy blue whale population, based on collated passive acoustic data: a 'southbound migratory stage' where whales travel southwards from Indonesian waters offshore from the WA coastline, mostly from October to December but possibly into January of the following year; a protracted 'southern Australian stage' (January to June) where animals spread across southern waters of the Indian Ocean and south of Australia (with movement as far south as the Southern Subtropical Convergence Zone); and a 'northbound migratory stage' (April to August) where animals travel north back to Indonesia again.</p> <p>Extensive passive acoustic monitoring throughout the NWMR indicates migratory timing and distribution of pygmy blue whales (noting this survey method detects vocalising whales):</p> <ul style="list-style-type: none"> Acoustic monitoring conducted by McCauley and Jenner (2010) in the Exmouth and northern Montebello Islands region identified a peak period in the northern migration of pygmy blue whales from April to August, and from November through to late December during the southern migration. Northbound migration between mid-April and early August and southbound migration between October to December and possibly into January for the Scott Reef area 2006-2009 (McCauley, 2011) (noting the absence of any southbound detection in 2007). Noise loggers deployed for a full year period in 2019 detected pygmy blue whales on their northern and southern migration. The noise loggers were located at various locations ~40–50 km west of the project area, and in ~1300 m water depth. The majority of pygmy blue whales detected on their northern migration occurred from mid-April to the end July, then again on their southern migration in November through to early December (Chevron Australia, 2019) Gavrilov et al. (2018) analysed acoustic data from an array of ocean bottom seismographs (recorded in December 2014) to detect pygmy blue whales and showed the southbound migration was over an extended offshore corridor traversing an area up to 400 km to the northwest of the North-west Cape. A targeted passive acoustic monitoring program to detect southbound migratory pygmy blue whales ran from late October 2021 to March 2022 with a deepwater ALTO lander (900 m depth) to the west of the Montebello Trough and C-lander (190 m depth) at the outer edge of the NWS (Warren et al., 2023). Despite vessel noise dominating low frequencies throughout the recording periods at both recording locations, pygmy blue whale song vocalisations and D-calls were detected from the start of the recording period through November and early December 2021. An offshore trial of Distributed Acoustic Sensing (DAS) using fibre optic cables (submarine telecommunications cable) to detect low-frequency whales recorded vocalising pygmy blue whales within 12 km detection range within a 50 km long area on the outer edge of NWS (Debens et al. 2024). Pygmy blue whale detections were made from mid-November (commencement of the trial) through to mid-December 2023 and a couple of detections in early January 2024. <p>The first satellite tracks of pygmy blue whales for this population documented northbound migration between Western Australia and Indonesia (Double et al., 2014) and identified areas where whales had highest occupancy, such as Perth Canyon, Naturalist Plateau, North-west Cape region and the Banda Sea. Pygmy blue whales tagged in the Bonney Upwelling region of South Australia in 2015 showed that most of the tagged whales remained in South Australian waters during the tracking period but one documented the migration to Indonesia via Western Australian waters and a return journey (albeit via intermittent data) of the southbound migration to the southern coast of Western Australia (Möller et al., 2020).</p> <p>Thums et.al. (2022) used passive acoustic monitoring and satellite telemetry data (a combination of existing data and tag tracking data collected for Western Australia 2019–2022) to assess the spatial extent of the distribution, migration and foraging areas for pygmy blue whales in the South-east</p>

Species	Key Information
	<p>Indian Ocean associated with the northbound migration. The tag tracking results highlighted extensive use of slope habitat off Western Australia and minimal use of shelf habitat by pygmy blue whales. Additionally, pygmy blue whales off Western Australia were mostly engaged in migration, with short periods of foraging. Whale density was highest in the southern part of the North-west Australian coast and whales were there between April–June, and November–December. This study also compared foraging and migration areas to described areas of importance (BIAs), some aligned such as migratory BIA for northbound pygmy blue whales whilst some had less than 10% overlap (Thums et al., 2022). The timing, distribution and behaviour of southbound pygmy blue whales is less well documented with reference to satellite tagging. Limited tagged whale data from Double et al. (2014), Möller et al. (2020) and Thums et al. (2022) indicated connectivity of migrating pygmy blue whales from South Australia through Western Australia to and back from Indonesia. Mustika et al. (2024), satellite tag tracking data for two southbound pygmy blue whales (tagged in Indonesia) suggest varying migratory pathways from the Savu Sea to subantarctic waters as well as extended time in the Southern Subtropical Convergence Zone. One tagged whale traversed a migratory path through offshore waters of Western Australia towards Heard and McDonalds islands covering a distance of almost 6000 km and travelling at 100 km per day. In contrast a second tagged whale took a migratory journey similar to the documented northbound route to the North-west Cape before heading out into offshore waters and spending time in the Subantarctic Front before looping back up through the Perth Canyon, North-west Cape and towards Savu Sea (Mustika et al., 2024).</p> <p>There is currently insufficient data to accurately estimate population numbers of the pygmy blue whale in Australian waters (Blue Planet Marine, 2020; Commonwealth of Australia, 2015a). There are, however, two estimates of population size of the EIO pygmy blue whale for WA. McCauley and Jenner (2010) calculated the population to be between 662 and 1559 individuals in 2004 based on passive acoustics (whale vocalisations), and Jenner et al. (2008) (based on photographic mark and recapture) calculated between 712 and 1754 individuals, but both estimates did not account for animals travelling further west into the Indian Ocean (McCauley et al., 2018). More recent passive acoustic data estimates a 4.3% growth rate that applies to the proportion of EIO pygmy blue whales seasonally present in offshore water off south-eastern Australia and may not reflect the full population but does imply an increasing population (McCauley et al., 2018).</p> <p>Thums et al., (2022) identified the most important foraging (and/ or resting/ breeding) areas from south to north as: (1) the Perth Canyon and vicinity; (2) the shelf edge off Geraldton; (3) the shelf edge from Ningaloo Reef to the Rowley Shoals (not continuous) and including a couple of small areas near the shelf edge off approx. 25°S; and (4) the Banda Sea. The Foraging BIA off the South-west of Western Australia encompassed 83% of the most important areas in that region (Thums et al., 2022).</p> <p>The pygmy blue whale is typically present in the Perth Canyon from November to June, with an observed peak between March and May (Commonwealth of Australia, 2015a; Blue Planet Marine, 2020). The pygmy blue whale feeds in the Perth Canyon at depths of 200 to 300 m, which overlaps the typical distribution of krill (200–500 m water depth (day) to surface (night)) (McCauley et al., 2004; Commonwealth of Australia, 2015a). Other possible feeding grounds off the WA coast include the wider area around the Perth Canyon, and possible foraging areas off the Ningaloo Coast and at Scott Reef (Commonwealth of Australia, 2015a).</p> <p>The seasonal presence of pygmy blue whales is presented in Table 9-1.</p> <p>Refer Table 7-3 and Figure 7-4 for the location and type of BIAs for blue whales in the NWMR. There is a migratory BIA for the pygmy blue whale within WA waters, which extends for most of the length of the NWMR within offshore waters.</p>

Species	Key Information
Bryde's whale	<p>The Bryde's whale is the least migratory of its genus and is restricted geographically from the equator to approximately 40°N and S, or the 20° isotherm (Bannister et al., 1996). The species is known to exhibit inshore and offshore forms varying in morphology and migratory behaviours in other international locations (Bannister et al., 1996). This appears to also be the case within Australian waters. Bryde's whales have been identified as occurring in both oceanic and inshore waters, with the only key localities recognised in WA being in the Houtman Abrolhos Islands and north of Shark Bay (Bannister et al., 1996). Data suggests offshore whales migrate seasonally, heading towards warmer tropical waters during the winter; however, information about migration within the NWMR is not well known (McCauley and Duncan, 2011). McCauley (2011b) detected Bryde's whales using acoustic loggers deployed in and around Scott Reef from 2006 to 2009. Other acoustic logger data of Bryde's whale vocalisations recorded between Ningaloo and north of Darwin showed no apparent trends or seasonality (McCauley, 2011a).</p> <p>There are no identified BIAs for this species in the NWMR.</p>
Southern right whale	<p>The southern right whale occurs primarily in waters between about 20°S and 60°S and moves from high latitude feeding grounds in summer to warmer, low latitude, coastal locations in winter (Bannister et al., 1996). Two populations of southern right whale occur in Australian waters: the western and eastern (DCCEEW, 2024a). Southern right whales in Australian waters predominantly occur in aggregations in coastal water reproductive areas where they calve and nurse their young from May to October, primarily occupying shallow waters (< 10m depth) within 1 km of the coastline (Charlton et al., 2019; Smith et al., 2022, cited in DCCEEW, 2024a). Peak period of abundance is late July to August, with seasonal variability. Females accompanied by a calf generally occupy the calving ground for two to three months between June and September (DCCEEW, 2024a). For the western population, breeding occurs in Exmouth Gulf and in calving areas along the south coast of WA outside of the NWMR (DCCEEW, 2023). A stranding record exists for the far north Kimberley coast (ALA, 2006). Known females have rarely been observed on the Australian coastline in the year prior to calving, suggesting mating and conception may predominantly occur away from calving grounds, potentially on feeding grounds (Watson et al., 2021 cited in DCCEEW, 2024a). There is a significant energetic cost to the mother in the late stages of gestation (i.e. last trimester) and calf growth rate has been found to be dependent on the maternal body size and condition of the mother (Christiansen et al. 2018 and Christiansen et al. 2022 cited in DCCEEW, 2024a). Foraging ecology of southern right whales is poorly understood and observations of foraging whales are rare (DCCEEW, 2024a). There is evidence of a population increase of the western population, whereas there is greater uncertainty of the population status and trends of the eastern population (DCCEEW, 2024a). Southern right whale abundance in Australian waters is still far below estimated historic abundance (>20%) (DCCEEW, 2024a).</p> <p>There is a reproduction BIA and habitat critical to survival (HCTS) for the southern right whale located within Exmouth Gulf (DCCEEW, 2024a). A migration BIA extends 3 NM out from the coastline from Ningaloo and spans down the Western Australian coastline and across the south and south-east coast of Australia (DCCEEW, 2024a). Nursing and calving behaviours are known to occur within reproductive BIAs. HCTS for the southern right whale has been identified as all reproductive BIAs across the species range (DCCEEW, 2024a). Refer Figure 7-1 and Section 7.6 for HCTS for southern right whale in the NWMR. Refer to Table 7-3 and Figure 7-5 for BIAs for southern right whales in the NWMR</p>

Species	Key Information
Antarctic minke whale	<p>The Antarctic minke whale have a circumpolar distribution south of 60°S during summer (Risch et al., 2019) and has been recorded off all Australian States (apart from the NT) in winter (refer to DCCEWE SPRAT profile). Their seasonal distribution and migration patterns are poorly understood (Risch et al., 2019). The species is highly associated with sea ice and feeds in cold Antarctic waters over the summer. It is thought that the Antarctic minke whale migrates through offshore waters of Western Australia to about 20°S to feed and possibly breed (Bannister et al., 1996). Information about timing and distribution, behaviour (migration and breeding) within the NWMR, however, is presently not known. In the high latitudinal winter breeding grounds in other regions, the species appears to be distributed off the continental shelf edge. No population estimates are available for Antarctic minke whales in Australian waters. Acoustic detection has been recorded for the Perth Canyon and Exmouth Plateau (McCauley, 2011) and more recently acoustic detection indicated presence in offshore waters of NWS in late October and all of November and was absent (based on no vocalisation and detection) in December 2021 to March 2022 (over a monitoring period from October 2021 to March 2022) (Warren et al., 2023).</p> <p>There are no identified BIAs for this species in the NWMR.</p>
Sei whale	<p>The sei whale is a baleen whale with a worldwide oceanic distribution and is expected to seasonally migrate between low latitude wintering areas and high latitude summer feeding grounds (Bannister et al., 1996; Prieto et al., 2012). There are no known mating or calving areas in Australian waters. The species has a preference for deep waters, typically occurs in oceanic basins and continental slopes (Prieto et al., 2012), and exhibits a migration pathway influenced by seasonal feeding and breeding patterns. Sei whales have been infrequently recorded in Australian waters (Bannister et al., 1996). Reliable estimates of the sei whale population size in Australian waters are currently not possible due to a lack of dedicated surveys and their elusive characteristics. Similarly, the extent of occurrence and area of occupancy of sei whales in Australian waters cannot be calculated due to the rarity of sighting records. They will typically travel in small pods of three to five individuals, with some segregation by age, sex and reproductive status. Calving grounds are presumed to exist in low latitudes with mating and calving potentially occurring during winter months (Threatened Species Scientific Committee, 2015a).</p> <p>There are no known mating or calving areas in Australian waters, and there are no identified BIAs for this species in the NWMR.</p>
Fin whale	<p>The fin whale is a large baleen whale distributed worldwide. Fin whales migrate annually between high latitude summer feeding grounds and lower latitude over-wintering areas (Bannister et al., 1996) and follow oceanic migration paths. The species is uncommonly encountered in coastal or continental shelf waters. Australian Antarctic waters are important feeding grounds for fin whales but there are no known mating or calving areas in Australian waters (Morrice et al., 2004). The species has been observed in groups of six to 10 individuals, as well as in pairs and alone (Threatened Species Scientific Committee, 2015c). Accurate distribution patterns are not known within Australian waters and the majority of data is from stranding events.</p> <p>Fin whales have been recorded vocalising off the Perth Canyon, WA, between January and April 2000 (McCauley et al., 2000). It is currently not possible to accurately estimate the population size of fin whales in Australian waters predominantly due to the species' behaviour and local ecology, as the proportion of time they spend at the surface varies greatly depending on these factors. In addition, natural fluctuations of fin whales in Australian waters are unknown; however, long-range movements do appear to be prey-related (Aulich et al., 2022). A recent study by Aulich et al. (2022) used passive acoustic monitoring as a tool to identify the migratory movements of fin whales in Australian waters. On the west coast, the earliest arrival of these animals from Antarctica occurred at Cape Leeuwin in April, and between May and October they migrated along the WA coastline to the Perth Canyon, which likely acts as a feeding zone for migratory whales (Aulich et al., 2022). Some whales were found to continue migrating northwards along the WA coastline with vocalisation presence recorded as far north as Dampier between August and late October (Aulich et al., 2022).</p> <p>There are no identified BIAs for this species in the NWMR.</p>

Species	Key Information
Omura's whale	<p>Omura's whale is a species of baleen whale that was first described in 2003. Previously specimens of Omura's whale were identified as pygmy/dwarf Bryde's whales, however morphological and molecular evidence identified Omura's whale as a distinct species not closely related to Bryde's whale in 2003 (Ottewell et al., 2016).</p> <p>It was believed that the range of Omura's whale was restricted to the eastern Indo-Pacific, however recent discoveries suggest the species may have a more widespread distribution (Ottewell et al., 2016; Cerchio et al., 2019). In Australia, presence of this species was confirmed in 2015 when, what was later determined to be an Omura's whale, was stranded on the northwest coast of Australia, near Exmouth (Ottewell et al., 2016). An in-depth review conducted by Cerchio et al. (2019) concluded that Omura's whale can primarily be found in tropical and warm-temperate waters and is currently known from all ocean basins excluding the central and eastern Pacific. Further, a strong tendency toward a coastal and neritic water distribution was found, although there were several pelagic water records, the majority of which were on the continental shelf and within shallow seas throughout the documented range (Cerchio et al., 2019).</p> <p>Omura's whales were detected by passive acoustic monitoring:</p> <p>Warren et al. (2023) targeted passive acoustic monitoring program to detect southbound migratory pygmy blue whales ran from late October 2021 to March 2022 with a deepwater ALTO lander (900 m depth) to the west of the Montebello Trough and C-lander (190 m depth) at the outer edge of the NWS. Calls of the Omura's whales were detected at both recording locations throughout the recording period. Detections were, however, more common at the deeper water location, in terms of both number of detection days and number of detection hours per day (Warren et al., 2023). The shelf edge location showed Omura's present primary in December, however this lander malfunctioned and stopped recording in mid-January 2022.</p> <p>An offshore trial of distributed acoustic sensing (DAS) using fibre optic cables (submarine telecommunications cable) to detect low-frequency whales recorded vocalising Omura's whales within 12 km detection range along a 50 km long area on the outer edge of NWS (Debens et al., 2024). Omura's whale detections were made from at the beginning of December 2023 through to mid-January 2024 (and the end of the trial).</p> <p>Currently little is known about the ecology and life history characteristics of Omura's whale resulting in an IUCN listing of Data Deficient. There are no identified BIAs for this species in the NWMR.</p>

Species	Key Information
Toothed whales (Odontoceti) – High Frequency hearing	
Sperm whale	<p>Sperm whales are the largest of the toothed whales and are distributed worldwide in deep waters (greater than 200 m) off continental shelves and sometimes near shelf edges (Bannister et al., 1996). The species tends to inhabit offshore areas at depths of 600 m or more and is uncommon in waters less than 300 m deep (Ceccarelli et al., 2011). There is limited information about sperm whale distribution in Australian waters, however, they are usually found in deep offshore waters, with more dense populations close to continental shelves and canyons. In the open ocean, there is a generalised movement of sperm whales southwards in summer, and corresponding movement northwards in winter, particularly for males. Detailed information about the distribution and migration patterns of sperm whales off the WA coast is not available. Females with young may reside within the NWMR all year round, males may migrate through the region and the species may be associated with canyon habitats (Ceccarelli et al., 2011).</p> <p>Sperm whales have been recorded in deep waters off North-west Cape and appear to occasionally venture into shallower waters in other areas. Twenty-three sightings of sperm whales (variable pod sizes, ranging from one to six animals) were recorded by marine mammal observers (MMOs) during the North- west Cape MC3D marine seismic survey (December 2016 to April 2017) (Woodside, 2020). These animals were observed in deep, continental slope waters of the Montebello Saddle (maximum distance of approximately 90 km from North-west Cape), and the waters overlying the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF. The deep waters above the gully/saddle on the inner edge of the plateau (the Montebello Saddle) are thought to be important for sperm whales that may feed in the region (based on 19th Century whaling records; Townsend, 1935).</p> <p>Recent studies such as acoustic detection indicated sperm whale presence in deep, offshore waters but not at the edge of the NWS (over a monitoring period of October 2021 to March 2022, for the deepwater location). However, while sperm whales were detected every month, occurring in bouts, there was no evidence for lasting use of the area around this recording location (Warren et al., 2023). Ferriera et al. (2024) reported sperm whale sightings off the North-west Cape in May 2023. A total of 26 individual sperm whales were sighted about 30 km offshore in groups up to ten individuals. The sperm whales were observed displaying surface logging behaviour with frequent and numerous blows prior to flukes up dives (indicative of deep feeding behaviour). Such aggregations appear to be an annual occurrence and at the same time as migratory pygmy blue whale feed and move through the same area, to the west and offshore of Ningaloo and North-west Cape.</p> <p>There are no identified BIAs for this species in the NWMR.</p>
Orca (killer whale)	<p>The preferred habitat of killer whales includes oceanic, pelagic and neritic (relatively shallow waters over the continental shelf) regions, in both warm and cold waters. Killer whales appear to be more common in cold, deep waters; however, they have been observed along the continental slope and shelf, particularly near seal colonies, as well as in shallow coastal areas of WA (Bannister et al., 1996; Thiele and Gill, 1999). The total number of killer whales in Australian waters is unknown, however, it may be that the total number of mature animals within waters around the continent is less than 10,000. Killer whales are known to make seasonal movements, and probably follow regular migratory routes, but no information is available for the species in Australian waters. Killer whales are top-level carnivores, and there are reports from around Australia of attacks on dolphins, juvenile humpback whales, blue whales, sperm whales, dugongs and Australian sea lions (Bannister et al., 1996). Killer whales are known to target humpback whales, particularly calves, off Ningaloo Reef during the humpback southern migration season (Pitman et al., 2015). Overall, observations suggest that humpback calves are a predictable, plentiful, and readily taken prey source for killer whales off Ningaloo Reef for at least five months of the year.</p> <p>Additionally, there are records of killer whales attacking dugongs in Shark Bay (Anderson and Prince, 1985). However, there are no recognised key localities or important habitats for killer whales within the NWMR (DSEWPAC, 2012a).</p> <p>There are no identified BIAs for this species in the NWMR.</p>

Species	Key Information
Australian snubfin dolphin	<p>Stranding and museum specimen records indicate that Australian snubfin dolphins occur only in waters off northern Australia, from approximately Broome on the west coast to the Brisbane River on the east coast (Parra et al., 2002). Aerial and boat-based surveys indicate that Australian snubfin dolphins occur mostly in protected shallow waters close to the coast, and close to river and creek mouths (Parra, 2006; Parra et al., 2006; Parra et al., 2002). Within the NWMR, this species has been found in the shallow coastal waters and estuaries along the Kimberley coast. Beagle and Pender bays on the Dampier Peninsula, and tidal creeks around Yampi Sound and between Kuri Bay and Cape Londonderry are important areas for Australian snubfin dolphins (DEWHA, 2008). Roebuck Bay has generally been considered the south-western limit of snubfin dolphin distribution across northern Australia, but the species has been recorded in Port Hedland harbour, the Dampier Archipelago, Montebello Islands, Exmouth Gulf and off North-west Cape (Allen et al., 2012). Roebuck Bay supports one of the largest known populations of Australian snubfin dolphins (D'Cruz et al., 2022). A first comprehensive catalogue of snubfin dolphin sightings has been compiled for the Kimberley, north-west Western Australia (Bouchet et al. 2021) and documented that snubfin dolphins are consistently encountered in shallow water (<21 m depth) close to (<15 km) freshwater inputs with high detection rates in known hotspots such as Roebuck Bay and Cygnet Bay as well as suitable coastal habitat in the wider Kimberley region.</p> <p>Refer Table 7-3 and Figure 7-6 for the location and type of BIAs for Australian snubfin dolphins in the NWMR.</p>
Indo-Pacific humpback dolphin (Australian humpback dolphin)	<p>Previously included with <i>Sousa chinensis</i>, the Australian humpback dolphin (<i>S. sahulensis</i>) was elevated to a species in 2014. <i>S. chinensis</i> is now applied for humpback dolphins in the eastern Indian and western Pacific Oceans and <i>S. sahulensis</i> for humpback dolphins in the waters of the Sahul Shelf from northern Australia to southern New Guinea (Jefferson and Rosenbaum, 2014). The Australian humpback dolphin is listed as <i>S. chinensis</i> under the EPBC Act.</p> <p>The Australian humpback dolphin (referred to as 'humpback dolphin' hereafter) inhabits the tropical/subtropical waters of the Sahul Shelf across northern Australia and southern Papua New Guinea (Jefferson and Rosenbaum, 2014). Based on historical stranding data, museum specimens and opportunistic sightings collected during aerial and boat-based surveys for other fauna, it has been inferred that humpback dolphins occur from the WA/NT border south-west to Shark Bay (Hanf et al., 2016). Allen et al. (2012) suggested that humpback dolphins use a range of inshore habitats, including both clear and turbid coastal waters across northern WA. The waters surrounding North-west Cape are an important area for the species. Boat-based surveys up to 5 km out from the coast (Brown et al., 2012) recorded humpback dolphins from 0.3 to 4.5 km away from shore and in depths ranging from 1.2 to 20 m, with a mean of ~8 m. Other studies around North-west Cape, surveying waters up to 5 km from the coast, recorded humpback dolphins in water depths of up to 40 m (Hanf et al., 2016). Based on density, site fidelity and residence patterns, North-west Cape is clearly an important habitat toward the south-western limit of this species' range (Hunt et al., 2017). Humpback dolphins do not appear to undergo large-scale seasonal migrations, although seasonal shifts in abundance have been observed (Parra & Cagnazzi, 2016 cited in DCCCEW, 2023a).</p> <p>Aerial transect surveys conducted in the Kimberley region show the abundance for humpback dolphins was estimated to be 1546 in 2016 and 2690 in 2017 (Raudino et al., 2023). Dolphin densities were greatest in inshore waters, with greatest densities in Exmouth Gulf, Dampier Archipelago, and Great Sandy Islets (Raudino et al., 2023). Aerial surveys targeting dugongs over the western Pilbara have recorded humpback dolphins more than 60 km from the mainland in shallow shelf waters (i.e. <30 m deep) near Barrow Island and the western Lowendal Islands (Hanf, 2015). The species has also been recorded in fringing coral reef and shallow, sheltered sandy lagoons at the Montebello Islands (Raudino et al., 2018). Over the past ten years a number of studies have focused on populations of humpback dolphins along the Kimberley coast, including Roebuck Bay, the Dampier Peninsula, Cone Bay, Yampi Sound, Prince Regent River and the Cambridge Gulf (Brown et al., 2016).</p> <p>Refer Table 7-3 and Figure 7-7 for the location and type of BIAs for Indo-Pacific humpback dolphins in the NWMR.</p> <p>It is also noted that findings reported by Brown et al., (2014) indicated there was evidence of hybridisation of the Australian snubfin and humpback dolphin populations in north-western Australia.</p>

Species	Key Information
Indo-Pacific bottlenose dolphin (Spotted bottlenose dolphin)	<p>There are four known sub-populations of spotted bottlenose dolphins, of which the Arafura/Timor Sea populations were identified as potentially occurring within the NWMR. The species is restricted to inshore areas such as bays and estuaries, nearshore waters, open coast environments, and shallow offshore waters including coastal areas around oceanic islands, from Shark Bay to the western edge of the Gulf of Carpentaria. The species forages in a range of habitats but is generally restricted to water depths of less than 200 m (DSEWPAC, 2012a). Important foraging/breeding areas include the shallow coastal waters and estuaries along the Kimberley coast and Roebuck Bay. Aerial transect surveys conducted in the Kimberley region showed the abundance for the bottlenose dolphins has been declining with estimated abundance of 3713 in 2015, 2638 in 2016 and 1635 in 2017. Dolphin densities were greatest in inshore waters, with greatest densities in Exmouth Gulf, Dampier Archipelago, and Great Sandy Islets (Raudino et al., 2023). A study at North-west Cape found that during winter months, presence in coastal lagoons west of the North-west Cape was more likely than other seasons. In spring, probability of spotted bottlenose dolphin occurrence was higher outside of the Ningaloo Marine Park (noting summer data was not included in this study) (Haughey et al., 2021).</p> <p>Refer Table 7-3 and Figure 7-8 the location and type of BIAs for spotted bottlenose dolphins in the NWMR.</p>
Sirenians	
Dugong	<p>Dugongs are distributed along the WA coast throughout the Gascoyne, Pilbara and Kimberley. Specific areas supporting dugong populations include: Shark Bay; Ningaloo and Exmouth Gulf; the Pilbara coast (Exmouth Gulf to De Grey River [Marsh et al., 2002]); and Eighty Mile Beach and the Kimberley coast, including Roebuck Bay (Bayliss and Hutton, 2017). Dugong distribution is correlated with the seagrass habitats upon which it feeds, although water temperature has also been correlated with dugong movements and distribution (Preen et al., 1997; Preen, 2004). Dugongs are known to migrate between seagrass habitats (hundreds of kilometres) (Sheppard et al., 2006), and in Shark Bay they exhibit seasonal movements as a behavioural thermoregulatory response to winter water temperatures (Holley et al., 2006; Marsh et al., 2011). Abundance aerial surveys have been conducted in Australian dugong habitat areas since the early 1980s. These surveys indicate that dugong populations are now stable at a regional scale in Shark Bay and in the Exmouth and Ningaloo Reef area. The entire Kimberley region has only been surveyed in 2015 and 2017, so only baseline information on dugong distribution and abundance is available for Ningaloo and Shark Bay areas (Cleguer and Marsh, 2023).</p> <p>Refer Table 7-3 and Figure 7-9 for the location and type of BIAs for dugong in the NWMR.</p>

Species	Key Information
<i>Pinnipeds</i>	
Australian sea lion	<p>The Australian sea lion is the only endemic pinniped (true seals, fur seals and sea lions) in Australian waters. It is a member of the Otariidae (eared seals) family. The birth interval in Australian sea lions is around 17–18 months. The Australian sea lion is unique among pinnipeds in being the only species that has a non-annual breeding cycle that is also temporally asynchronous across its range (DSEWPAC, 2013a; Threatened Species Scientific Committee, 2020a). This means the breeding period (copulation and birthing) in one colony will occur at different times to breeding in another colony. The Australian sea lion is a specialised benthic forager—that is, it feeds primarily on the sea floor. Studies have shown that the species will eat a range of prey, including fish, cephalopods (squid, cuttlefish and octopus), sharks, rays, rock lobsters and penguins (DSEWPAC, 2013a; Threatened Species Scientific Committee, 2020a). The Australian sea lion feeds on the continental shelf, most commonly in depths of 20–100 m, and they typically travel up to about 60 km from their colony on each foraging trip, with a maximum distance of around 190 km when over shelf waters.</p> <p>The current breeding distribution of the Australian sea lion extends from the Houtman Abrolhos Islands on the west coast of WA to the Pages Islands in SA. Sites for the 58 breeding colonies occurring in WA and SA are designated as habitat critical to the survival of the species under the Recovery Plan for the Australian sea lion (DSEWPAC, 2013a). Of these, four are located in the SWMR along the west coast of WA: Abrolhos Islands (Easter Group), Beagle Island, North Fisherman Island and Buller Island. There are also a number of foraging BIAs for both males and females along the west coast, extending from the Abrolhos Islands south to Rockingham.</p> <p>There is no designated habitat critical to survival or identified BIAs for this species in the NWMR. Figure 7-9 shows the foraging BIAs for the Australian sea lion to the south of the NWMR in the northern extent of the SWMR.</p>

7.6 Habitat Critical to the Survival for Marine Mammals in the NWMR

The southern right whale is the only marine mammal which has habitat critical to the survival (HCTS) of a species defined.

The National Recovery Plan for the Southern Right Whale (DCCEEW, 2024a) identifies HCTS under the EPBC Act. The *EPBC Act Significant Impact Guidelines 1.1 – Matters of National Environmental Significance 2013* state that “An action is likely to have a significant impact on a threatened species if there is a real chance or possibility that it will: adversely affect habitat critical to the survival of a species.” The definition of HCTS for a species are areas necessary:

- for activities such as foraging, breeding, roosting, or dispersal
- for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators)
- to maintain genetic diversity and long-term evolutionary development, or
- for the reintroduction of populations or recovery of the species or ecological community.

HCTS for the southern right whale has been identified as all reproductive BIAs across the species range (Figure 7-1). The identification of HCTS reflects that southern right whales display strong site fidelity to calving areas in Australian coastal waters, within and between years, over decadal time spans (Bannister, 2001; Charlton et al., 2021; Watson et al., 2021 cited in DCCEEW, 2024a). Reproductive areas have been identified as HCTS for the species, because:

- they meet the species' essential life cycle requirements for reproduction (e.g., mating, calving, and nursing) and reproduction is known to occur at that location
- there is a level of occupancy by individual breeding females at these locations of multiple days in any given year, and across multiple years, for long-term maintenance of the species
- they are critical for recovery of the southern right whale in terms of expanding habitat occupancy and contributing to the maintenance of genetic diversity as site fidelity may lead to small-scale genetic differences.

No 'Critical Habitat' as defined under section 207A of the EPBC Act has been identified for the southern right whale (DCCEEW, 2024a).

7.7 Biological Important Areas in the NWMR

A review of the Australian Marine Spatial Information System (GA, 2024) identified BIAs representing important life cycle stages and behaviours for six species of marine mammal in the NWMR: the humpback whale, the pygmy blue whale, Australian snubfin dolphin, Australian humpback dolphin, spotted bottlenose dolphin and dugong, are presented in Table 7-3.

Table 7-3: Marine mammal BIAs within the NWMR

Species	Woodside Activity Area			BIAs				
	Browse	NWS/S	NWC	Resting	Foraging ¹³	Reproduction		Migration
						Breeding	Calving	
Humpback whale ¹¹	✓	✓	✓	Shark Bay Exmouth Gulf (north migration – early June) (south migration – late Aug to Oct) Southern Kimberley region	No foraging BIA identified within the NWMR	Nursing Kimberley coast from the Lacepede Islands to north of Camden Sound (mid Aug–early Sept)	Core calving in waters off the Kimberley coast from the Lacepede Islands to north of Camden Sound (mid Aug–early Sept)	Southern border of the NWMR to north of the Kimberley (arrive June).
Blue whale and pygmy blue whale ^{14 15}	✓	✓	✓	No resting BIA identified within the NWMR	Possible foraging areas off Ningaloo and Scott Reef	No breeding BIA identified within the NWMR	No calving BIA identified within the NWMR	Augusta to Derby. Along the shelf edge at depths of 500 m to 1000 m; appear close to Ningaloo Coast Montebello Islands area on southern migration (north: April–Aug) (south: Oct–late Dec). Potentially still present January (McCauley et al., 2018).
Southern right whale ¹⁶	-	-	✓	No resting BIA identified within the NWMR	No foraging BIA identified within the NWMR	Exmouth Gulf	No calving BIA identified within the NWMR	Migration along Australian coastline between April to October extending up to the Exmouth Gulf breeding BIA.

¹³ Includes areas defined as 'foraging', 'foraging likely' and 'foraging (high density prey)' as per AMSIS (GA, 2024). These areas are shown in the BIA figures.

7.8 Marine Mammal Summary for the NWMR

7.8.1 Browse

The Browse activity area includes biologically important habitat for six threatened and/or migratory marine mammal species:

- blue whale and pygmy blue whale (foraging and migration areas)
- humpback whale (breeding, calving and migration areas)
- Indo-Pacific humpback dolphin (foraging, breeding and calving areas)
- Australian snubfin dolphin (foraging, breeding and calving areas)
- spotted bottlenose dolphin (foraging, breeding and calving areas)
- dugong (foraging).

BIAs for the marine mammal species are outlined in Table 7-3.

7.8.2 North West Shelf / Scarborough

The NWS / Scarborough activity area includes biologically important habitat for six threatened and/or migratory marine mammal species:

- blue whale and pygmy blue whale (foraging and migration areas)
- humpback whale (resting and migration areas)
- Indo-Pacific humpback dolphin (foraging, breeding and calving areas)
- Australian snubfin dolphin (foraging, breeding and calving areas)
- spotted bottlenose dolphin (present but no BIAs)
- dugong (foraging and calving areas).

BIAs for the marine mammal species are outlined in Table 7-3.

7.8.3 North-west Cape

The North-west Cape activity area includes biologically important habitat for four threatened and/or migratory marine mammal species:

- blue whale and pygmy blue whale (foraging and migration areas)
- southern right whale (reproduction area)
- humpback whale (resting and migration areas)
- spotted bottlenose dolphin (present but no BIAs)
- dugong (foraging and breeding/ calving areas).

BIAs for the marine mammal species are outlined in Table 7-3.

8. SEABIRDS AND MIGRATORY SHOREBIRDS OF THE NWMR

8.1 Regional Context

The NWMR supports high numbers and species diversity of seabirds and migratory shorebirds including many that are EPBC Act listed, threatened and migratory. The NWMR marine bioregional plan reported 34 seabird species (listed as threatened, migratory and/or marine) that are known to occur, and 30 of 37 species of migratory shorebird species that regularly occur in Australia, are recorded at Ashmore Reef in the NWMR (DSEWPAC, 2012d). The NWMR marine bioregional plan also noted that Roebuck Bay and Eighty Mile Beach are internationally significant and recognised migratory shorebird locations.

A 'Seabird and Shorebird Existing Knowledge and Threats' report was prepared (2022) and updated in 2024 (Worley, 2024) to identify key bird species (categorised: pelagic seabirds, nearshore seabirds, shorebirds and others) and their threats in the NWMR (Advisian, 2024). The high and moderate occurrence species for the NWMR were informed from this report, as well as from PMST results. The report identified 92 species.

Each species was assigned to one of three frequency of occurrence levels:

- high – breeding and foraging aggregations known to occur
- moderate – known or likely presence
- low – may occur, or at limits of species range.

Table 8-1 includes those considered key species, i.e. high or moderate occurrence (Worley, 2024), and listed threatened and/or migratory under the EPBC Act with a total of 56 key species identified (comprising 22 seabirds and 34 shorebirds).

Many migratory seabirds and shorebirds are protected through bilateral agreements between Australia and Japan (JAMBA), China (CAMBA) and the Republic of Korea (ROKAMBA), recognising the migratory route and important stopover and resting habitats of the East Asian-Australasian Flyway (EAAF). Important migratory bird habitats are also recognised as part of protected wetlands of international significance under the Ramsar Convention. Important Bird Areas (IBAs) for the NWMR, which are also recognised as global Key Biodiversity Areas (KBAs) (BirdLife Australia¹⁷), include:

- Roebuck Bay KBA (and Ramsar site): internationally significant migratory shorebird species
- Mandora Marsh and Anna Plains KBA (adjacent to Eighty Mile Beach, Ramsar site): internationally significant migratory shorebird species
- Dampier Saltworks KBA: internationally significant migratory shorebird species
- Montebello Islands KBA: shorebird and seabird species
- Barrow Island KBA: shorebird and seabird species
- Exmouth Gulf Mangroves KBA: internationally significant migratory shorebird species.

Table 8-1 presents a list of the high and moderate occurrence threatened and migratory seabird and shorebird species (as per subject matter expert review, Worley (2024)) that occur within the NWMR, with their conservation/protected status, relevant recovery plans and/or conservation advice.

8.2 Seabirds in the NWMR

Seabirds are birds that are adapted to life within the marine environment (oceanic and coastal) and are generally long-lived, have delayed breeding and have fewer young than other bird species (Commonwealth of Australia, 2020a).

At least 22 key seabird species (high and moderate occurrence, listed as threatened and/ or migratory under the EPBC Act) are known to occur in the NWMR. These include a variety of species of terns, noddies, petrels, shearwaters, frigatebirds, and boobies.

Seabird species can be grouped into pelagic and nearshore seabirds, based on lifecycle behaviour, distributions and key habitats (Worley, 2024). Pelagic species spend most of their life at sea, ranging over large distances to forage. These pelagic species only come onshore to breed and raise chicks at natal or high-fidelity breeding colonies on remote, offshore island locations in and adjacent to the NWMR. Many species are ecologically significant to the NWMR, as they are endemic to the region, can be present in large numbers in breeding seasons and non-breeding seasons, and many exhibit extensive annual migrations that include marine areas outside the Australian EEZ (DSEWPAC, 2012d). Nearshore seabirds are confined to nearshore areas (unless migrating), have shorter foraging trips during breeding and may rest on land/shoreline habitats outside of breeding periods (Worley, 2024).

The presence of seabirds within the NWMR is influenced by seabird species that migrate and forage in the area during the non-breeding season and this includes many seabird species that breed on the Houtman Abrolhos in the SWMR. Pelagic seabirds have been documented foraging at current boundaries and seasonal upwellings within the NWMR (refer to Sutton et al., 2019). The Houtman Abrolhos Islands National Park located in the SWMR is one of the most significant seabird breeding locations in the eastern Indian Ocean. 16 species of seabirds breed there. 80% of common (brown) noddies, 40% of sooty terns and all the lesser noddies found in Australia nest at the Houtman Abrolhos (Surman, 2019). Important seabird areas in the NWMR are as identified by the KBAs (refer to Section 8.1), EPBC Act Bioregional Biologically Important Areas and subject matter expert review, as presented in Worley (2024).

8.2.1 High-occurrence Key Seabird Species

Species descriptions for high occurrence key seabird species are provided below. High occurrence seabird species were defined as those with breeding and foraging aggregations within NWMR (Worley, 2024).

8.2.1.1 Wedge-tailed Shearwater (Pelagic Seabird)

The wedge-tailed shearwater (*Ardenna pacifica*) is listed migratory under the EPBC Act and Biodiversity Conservation Act 2016 (WA) (BC Act). It is a pelagic, marine seabird known from tropical and subtropical waters. Its distribution is widespread across the Indian and Pacific oceans with a global population of 2.6 million pairs. Of this, approximately one million pairs breed in Australia, most of which do so on islands in Western Australia between Rottnest Island in the south to Ashmore Reef in the north. The largest breeding populations are at the Houtman Abrolhos (600,000 pairs – Surman and Nicholson, 2009), and throughout the NWS region of the NWMR, where large populations on Muiron Islands (300,000 pairs) and Serrurier Island (60,000 pairs) exist (Surman and Nicholson, 2009, 2015).

Adults are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean over-wintering grounds from late-June onwards to re-excavate their burrows. This species is highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period. They lay their single egg during early-November, which is then incubated until the chick hatches (after 53 days) in early-January. Once hatched, adults leave the burrows to forage locally during the day returning at night to feed chicks until they are ready to fledge (Nicholson, 2002).

Page 147 of 381

Uncontrolled when printed. Refer to electronic version for most up to date information.

Due to the high synchronicity in egg laying, fledging is restricted to the first two weeks of April (Nicholson, 2002).

Breeding behaviours are nocturnal in wedge-tailed shearwaters. Adults return to and depart the colony at night and fledglings depart the colony at night. In the lead up to fledging, chicks also leave their burrows to exercise their wings outside burrows. Adults may not return to feed chicks each night; wedge-tailed shearwaters breeding on the Muiron Island (north) undertook extensive foraging trips during the incubation period (1200–1400 km) and shorter trips during chick rearing (<300 km, Cannell et al., 2019). Longer foraging trips took individuals in a north-west direction offshore towards oceanic seamounts. Conversely, the shorter tended to include waters to the west and north-west of the Muiron Islands (Cannell et al., 2019). In addition to the Muiron Islands, this dual foraging strategy, whereby parents alternate or mix short and long trips, have been recorded in wedge-tailed shearwaters breeding at Heron Island, Queensland, Lord Howe Island, Tasmania (Peck and Congdon, 2005), and New Caledonia (Weimerskirch et al., 2020). However, divergent foraging strategies have been detected between colonies, which is linked to the proximity of colonies to high productivity waters (Peck and Congdon, 2005; Weimerskirch et al., 2020). While the presence of squid and lanternfish in their diet (Surman and Nicholson, 2009) suggests nocturnal foraging occurs in this species, GPS tracking studies found that foraging activities at sea were more frequent during the day compared with at night (Weimerskirch et al., 2020; Catry et al., 2009). During the day, resting periods on the sea surface were short whereas at night individuals spent a large proportion of their time resting at the surface (Weimerskirch et al., 2020). Other prey species include schooling bait fishes and cephalopods, often feeding in association with other pelagic seabird species such as sooty terns and common noddies, and pelagic fishes such as tunas and mackerels. Diet composition is likely to vary between colonies, depending upon the prey available, and thus determining both the foraging strategy, as described above, and also the division of nocturnal and diurnal foraging. Wedge-tailed shearwaters dive between 3 and 66 m, actively pursuing prey by feeding at the surface or by actively swimming below bait schools.

Post-breeding, wedge-tailed shearwaters breeding on the Houtman Abrolhos Islands and Varanus Island migrated 4500 km north-west to equatorial waters of the Indian Ocean around 90°E (Surman et al., 2018), traversing the NWMR, and those from the Great Barrier Reef migrated to the northern hemisphere, approximately 6000 km northwards to Micronesia (McDuie and Congdon, 2016).

Wedge-tailed shearwaters are observed during breeding across all shelf waters and are the most frequently encountered seabird at sea. Large numbers of wedge-tailed shearwaters have been observed foraging off the NWS between May–August (Surman pers obs.).

Foraging and breeding BIAs are located for the wedge-tailed shearwater across the NWMR (Figure 8-1). It is noted that both breeding and foraging BIAs represent foraging habitat utilised by adult (chick-rearing) wedge-tailed shearwaters during the breeding season.

8.2.1.2 Australian Lesser Noddy (Pelagic Seabird)

The Australian lesser noddy (*Anous tenuirostris melanops*), which is endemic to Australia, is listed vulnerable under the EBPC Act and endangered under the BC Act. The largest breeding colonies are found on the Houtman Abrolhos Islands with fewer records of breeding on Ashmore Reef (Clark et al., 2011; Cannell and Surman, 2021). Possible colonisation of Cocos (Keeling) Island is reported; however, it is unconfirmed if this is the Australian subspecies (Stokes and Hinchey, 1990).

At the Houtman Abrolhos Islands, the breeding population has been estimated at ~50,000 breeding pairs (Surman et al., 2016). At this location, studies indicate that breeding is not highly synchronised; the single egg clutches were laid over a 102-day period from late August to early December, peaking in September (Surman and Wooller, 1995). The incubation period averaged 34 days and the fledging period 40 days. (Surman and Wooller, 1995).

Studies of foraging ecology of breeding Australian lesser noddies at the Houtman Abrolhos Islands found that they are largely diurnal, foraging between 04h00 and 20h40 and returning to their colony

at night (Surman et al., 2017). From this study, the GPS tracks of 17 adults during incubation or chick provisioning revealed that most foraging trips lasted for between two and four hours with a total trip distance of less than 40 km. However, some trips lasted up to 16 hours covering distances of up to 112 km (Surman et al., 2017). During non-breeding, birds appear to remain near the breeding islands year-round (Higgins and Davies, 1996).

Due to differences in climate and seasonality experienced at the Houtman Abrolhos Islands and Ashmore Reef, timing of breeding differs. The Ashmore Reef population has been recorded breeding in the Austral autumn/winter (Clarke and Herrod, 2016), while the Houtman Abrolhos Islands populations breed during the Austral spring/summer (Surman and Wooller, 1995).

No BIAs for the Australian lesser noddy overlap the NWMR and tracking data suggests that individuals breeding at the Houtman Abrolhos Islands foraged predominantly in a south-westerly direction, remaining within waters of the SWMR (Surman et al., 2017). Several individuals were observed roosting with common noddies on Bernier Island, near Carnarvon in 2022 (Nicholson pers obs.). However, it is unlikely that waters of the NWMR provide significant habitat for individuals breeding at the Houtman Abrolhos Islands. The small population of this subspecies breeding on Ashmore Reef may show similar foraging ecology during breeding and remain in the vicinity of the islands, utilising habitats of the NWMR.

8.2.1.3 Brown Booby (Pelagic Seabird)

The brown booby (*Sula leucogaster*) is listed migratory under the EPBC Act and BC Act. It is a cosmopolitan species with a pan-tropical distribution. Within the NWMR, large colonies occur at offshore islands including the Lacepede Islands (17,000 pairs, Mustoe and Edmunds, 2008), Ashmore Reef (5000 pairs at Middle Island and 3000 pairs at East Island in 2007, Swann, 2005a; Swann, 2005b; Swann, 2005c; Milton, 2005; Clarke, 2010), Bedout Island (1000 pairs) and Adele Island (7500 pairs, Burbidge et al., 1987). Small colonies of up to 10 pairs have been recorded at Overhanging Rock, within the Lowendal Islands (Nicholson, pers obs.). The total breeding population in the Australian region in 1996–97 was estimated at 59,940 to 73,900 pairs (WBM Oceanics and Claridge, 1997).

Brown boobies do not migrate far from their breeding islands, rarely dispersing more than 240 km from their natal colony (Dunlop et al., 2001). Brown boobies forage within 50 km of their colony where they plunge dive, reaching up to 15 m depth and pursuing their prey when ascending after the dive (Austin et al., 2021). Brown booby diet is principally medium to large surface schooling prey (northern pilchard, Indian anchovy, flying fish and cephalopods), often associated with feeding tunas and mackerels (Cannell et al. 2022; Austin et al., 2021).

Brown boobies are not prone to waterlogging and will roost on the seas surface and are known to form large aggregations on oil and gas platforms throughout the NWMR (Surman pers obs.), Woodside facilities indicating wider distribution of non-breeding individuals across the NWMR.

Breeding/foraging BIAs for the brown booby in the NWMR are associated with breeding colonies on Ashmore Reef, Adele Island, White Island, Lacepede Islands and Bedout Island (Figure 8-3). Breeding is reported as occurring between January and March, however this becomes protracted through to October at Ashmore Reef (Clarke et al., 2016). Brown Boobies are resident in the NWMR throughout the year, although they may forage long distances over the open ocean (Surman and Nicholson. 2011).

Breeding/foraging BIAs for the brown booby in the NWMR are associated with breeding colonies on Ashmore Reef, Adele Island, White Island, Lacepede Islands and Bedout Island (Figure 8-3).

8.2.1.4 Red-Footed Booby (Pelagic Seabird)

The red-footed booby (*Sula sula*) is listed migratory under the EPBC Act and BC Act. Compared to brown boobies, the red-footed booby occurs in fewer numbers across the NWMR. Within the NWMR they breed at Ashmore Reef (up to 100 pairs, Clarke and Herrod, 2016) and Adele Island (14 pairs,

Uncontrolled when printed. Refer to electronic version for most up to date information.

Botle et al., 2004). At Ashmore Reef they have been recorded breeding year-round (Clarke and Herrod, 2016).

The red-footed booby is one of the most widely distributed of the boobies across oceanic waters in the tropical Indian Ocean; during non-breeding, individuals have been observed up to 800 km from their natal colony (Dunlop et al., 2001). However, individuals are limited to a range of 150 km from the breeding colony when breeding (Wiemerskirch et al., 2005). In the Ashmore area, adults have been detected up to 125 km from the nearest breeding islands during October (unpubl. data, referenced in Clarke and Herrod, 2016).

Red-footed boobies are diurnal foragers, plunge diving for flying fishes (predominately) across their range (Commonwealth of Australia, 2020a). Breeding/foraging BIAs for the red-footed booby are associated with breeding colonies at Ashmore Reef and Adele Island (Figure 8-3).

8.2.1.5 Masked Booby (Pelagic Seabird)

The masked booby (*Sula dactylatra*) is listed as migratory under the EBPC Act. Within the NWMR, the sub-species *Sula dactylatra bedouti* ranges from the Dampier Archipelago, along the entire coast into the NMR and across to Queensland (Merchant and Higgins, 1990). Individuals have also been recorded at Barrow Island.

Within the NWMR, Bedout and Adele Island represent the main breeding locations with 400 and 320 breeding pairs estimated at each respectively (Marchant and Higgins, 1990; Swann et al., 2002). Breeding is also reported at the Ashmore Reef group with up to 30 breeding pairs recorded on Middle Island and 15 pairs on East Island (Burbidge and Fuller, 1996; Hassell et al., 2003; Swann, 2005a; Swann, 2005b; Swann, 2005c; Milton, 2005; Clarke, 2010; Clarke et al., 2016). Up to two pairs have also been recorded breeding in the Lacapade Group (Hassell et al., 2003).

A recent study of individuals from Bedout Island indicated low genetic exchanges (mitochondrial genes) with other masked booby colonies currently studied, suggesting a dependence on local recruitment for population persistence (Kingsley et al., 2019). Further, the low exchange of mitochondrial genes may reflect high breeding site fidelity and limited foraging distances during the breeding season. Due to the concentration in a relatively small number of areas to breed, any catastrophe at these sites (e.g. oil spills, or disturbance/vandalism of nests) could have a substantial impact on the population (Birds Australia, August 2005).

Studies of foraging behaviour of individuals breeding within the NWMR are lacking, however studies at other locations indicate that foraging is diurnal and ranges vary between 100 and 200 km of the breeding colony (Weimerskirch et al., 2008).

There are no BIAs for this species in the NWMR.

8.2.1.6 Common Noddy (Pelagic Seabird)

The common (or brown) noddy (*Anous stolidus*) is listed as migratory under the EPBC Act and BC Act. The species is widespread in tropical and subtropical areas within and beyond Australia. This seabird species is gregarious and normally occurs in flocks, up to hundreds of individuals, when feeding or roosting.

The Houtman Abrolhos is the primary breeding habitat for the common noddy in the Eastern Indian Ocean, although breeding occurs across offshore islands of the NWMR, albeit in fewer numbers, including Bedout Island, Montebello Islands and Fazer Island (Johnstone et al., 2013), and Ashmore Reef (Clark and Herrod, 2016). Breeding at Ashmore Reef has been recorded as occurring between April and November (Clark and Herrod, 2016).

During breeding, individuals nesting on Lancelin Island in the SWMR were found to forage diurnally (Shephard et al., 2018). Tracked individuals travelled an average of 97 km from the colony with an average trip distance of 141 km, with significantly longer trips during chick rearing compared to incubation (Shephard et al., 2018).

The species is highly pelagic outside breeding (March to August), with breeding individuals of the Houtman Abrolhos Islands travelling ~950 km north to the NWMR (Surman et al., 2017). The species is often reported roosting on unmanned oil and gas platforms within the NWS and Timor Sea (Surman pers comm, 2021).

Although widespread across the NWMR during breeding and non-breeding, no BIAs for this species are located in the NWMR.

8.2.1.7 Bridled Tern (Pelagic Seabird)

The bridled tern (*Onychoprion anaethetus*, listed as *Sterna anaethetus*) is listed migratory under the EPBC Act and BC Act. It is a common summer breeding visitor to the NWMR between September and April, especially around Dampier Archipelago and the Montebello Islands (Johnstone et al., 2013). Breeding has also been reported on the Lowendal Islands (Nicholson, 2002), Passage Islands and islands off Onslow from November–March (Johnstone et al., 2013). Small breeding populations have also been recorded on East Island at Ashmore Reef between April–November and the Lacapède Islands (Clarke and Herrod, 2016; Johnstone and Storr, 1998).

The migration and local movements of breeding birds within the NWMR are poorly defined; two individuals were tracked departing the Houtman Abrolhos islands in April/May, transiting along the continental shelf waters before departing Australian waters and migrating towards the Western Celebes Sea, east of Borneo (Surman et al., 2018). These individuals departed the Western Celebes Sea in August/September returning to the Houtman Abrolhos islands around 14 days later (Surman et al., 2018). This species has been regularly recorded on the continental shelf up to 70 km away from breeding locations during oceanic surveys (Surman and Nicholson, 2011; Dunlop et al., 2001).

Bridled terns feed diurnally on a range of species of fish, crustaceans, cephalopods and insects. In Australia, they feed almost entirely on fish, though they also take crustaceans and aquatic insects. They often feed on schools of fish forced to the surface by other predators (Dunlop, 1997). Bridled Terns forage mainly by contact dipping, with birds hovering or gliding close to the surface of the sea and swooping down and immersing only the head and breast when attacking prey, which are usually taken from the top few centimetres of the sea surface (<20 cm) (Dunlop, 1997).

During breeding at Penguin Island, WA, individuals foraged most commonly between 20 km and 40 km from the nearest breeding colony, though some were observed at distances up to 80 km (Dunlop, 1997). This species has also been recorded within 70 km of their breeding colonies within the NWMR, on outer continental shelf waters (Nicholson, 2002; Dunlop et al., 2001).

Although foraging may be concentrated around breeding colonies during the breeding season, no BIAs in the NWMR have been identified for this species.

8.2.1.8 Frigate Birds (Pelagic Seabirds)

The lesser (*Fregata ariel*) and great frigatebirds (*Fregata minor*) are both listed migratory under the EPBC Act and BC Act. They are the most widely distributed of the frigatebirds, with a pan-tropical distribution.

In the NWMR, the great frigatebird nests at Ashmore Reef and Adele Island. At Ashmore Reef they are found to breed year-round (Clark and Herrod, 2016). In addition to the Ashmore Reef and Adele Island, the lesser frigatebird also nests at Cartier Island, the Lacapède Islands and Bedout Island, which is thought to support more than 1% of the world's breeding population (BirdLife International, 2021). On Ashmore Reef, the species breed in the Austral winter (Clark and Herrod, 2016).

During breeding, great frigatebirds breeding in the South China Sea on average foraged 75 km (maximum 150 km) from their breeding colony and lesser frigatebirds 123 km (maximum 300 km) (Mott et al., 2017).

Outside of breeding, frigatebirds may disperse significant distances from their breeding colonies (Mott et al., 2017). Great frigatebirds are wide ranging, being recorded between 900–1400 km from

their natal colonies (Dunlop et al., 2001). Tracking studies of non-breeding lesser and great frigatebirds roosting on Ashmore Reef and Adele Island demonstrated that individuals have large distributions including Australian coastal waters and in addition to the South China, Java and Sulu Seas and the Gulf of Thailand (Mott et al., 2021). During the wet season in particular, Australian waters provided optimal habitat for non-breeding individuals of both species. (Mott et al., 2021).

Both frigatebirds forage by snatching prey from the surface waters, or when prey break the surface. They also rely heavily upon kleptoparasitism, harrying other seabirds returning to their colonies with food until it is regurgitated. Frigatebirds are susceptible to waterlogging, so do not plunge or splash dive for prey nor do they roost on the seas surface. Across the NWMR they forage on flying fish, cephalopods, anchovies, northern pilchards and other medium sized prey (8–30 cm, Surman pers. obs.).

Breeding/foraging BIAs for the great frigatebird in the NWMR are associated with breeding colonies on Ashmore Reef and Adele Island. For the lesser frigatebird, breeding/foraging BIAs are associated with breeding colonies on Ashmore Reef, Adele Island, White Island, Lacepede Islands and Bedout Island (Figure 8-4).

8.2.1.9 White-tailed Tropicbird (Pelagic Seabird)

The white-tailed tropicbird (*Phaethon lepturus*) is listed migratory under the EBC Act and BC Act. The species breeds across many sites, but in low numbers (Commonwealth of Australia, 2020). In Australia, between 6000 and 12,000 pairs nest on Christmas Island, with smaller fragmented populations at North Keeling Island (40 pairs). These individuals are expected to be members of the Christmas Island white-tailed tropicbird sub species *Phaethon lepturus fulvus*. While individuals of this subspecies can forage at great distances from colonies (see below), the numbers occurring in the NWMR are expected to be low.

In the NWMR, the white-tailed tropicbird is known to nest on Ashmore Reef and the Rowley Shoals, (10 breeding pairs and up to three nesting pairs; Clark, 2010; Burbidge et al., 1996, respectively). Breeding can occur year-round (Clarke and Herrod, 2016).

Pennycuik et al. (1990) demonstrated that the white-tailed tropicbirds breeding in Puerto Rico foraged up to 89 km from the nest site when breeding and moved considerably larger distances when not breeding. Dunlop et al. (2001) observed birds from Christmas Island foraging singly between 1400–1600 km south-east of Christmas Island.

This species regularly roosts on the seas surface, in between bouts of foraging. It is a solitary forager, rarely feeding in association with other seabird species and always in waters favourable for its principal prey, flying fish (Santos et al., 2018). The species is a surface forager that occasionally undertakes shallow dives (Marchant and Higgins, 1990).

There are breeding BIAs associated with nesting occurring at the Rowley Shoals and Ashmore Reef within the NWMR (Figure 8-5).

8.2.1.10 Red-tailed Tropicbird (Pelagic Seabird)

The red-tailed tropic bird is listed as Endangered (since December 2023) under the EPBC Act and 'Priority 4' under the BC Act.

Across the NWMR, the largest population breeds on Christmas Island (1400–2000 pairs, references within Sommerfeld et al., 2015) with additional key breeding locations on Cocos (Keeling) Group and islands of Ashmore Reef Marine Park (17–24 breeding pairs, Clarke et al., 2011; Clarke and Herrod, 2016). At Ashmore Reef, breeding pairs were observed year-round, with no discernible peak in breeding activity (Clarke et al., 2011).

The red-tailed tropicbird is a shallow diving species typically foraging diurnally within the first 4 m of the water column (LeCorre, 1997). There is limited information concerning foraging range when breeding in Australia, but observations at sea in the Ashmore Reef region demonstrate they are

capable of foraging considerable distances from land (unpubl. data, Clarke, 2010). This corroborates data from elsewhere in their global range which reported foraging distances of 240 km during incubation, 109 km during chick rearing and maximum distances of 380 km (Fayat et al., 2023). This species has been observed during boat surveys of the outer shelf of the NWMR year-round (Surman and Nicholson, 2011).

There are no BIAs for this species within the NWMR.

8.2.1.11 Australian Fairy Tern (Nearshore Seabird)

The Australian fairy tern (*Sternula nereis nereis*) is listed vulnerable under the EPBC Act. The WA breeding population (approximately 5000–6000 mature individuals) is dispersed over approximately 2500 km of coastline (Greenwell, 2021). Within Western Australia, the subspecies comprises a sedentary Pilbara population and a partially-migratory population extending from Exmouth to Point Malcolm. Individuals of the partially-migratory population may occasionally migrate into the southern region of the NWMR during the winter months.

Within the NWMR breeding occurs in small colonies between June–September on offshore islands, including Simpson Island, Barrow Island, the Montebello Islands, the Lowendal Islands, Thevenard Island, Serrurier Island, the islands in the Dampier Archipelago, Maryanne Shoals and Egret Island (Dunlop, 2018; Johnstone et al., 2013; Surman pers. obs.). Colonies tend to occupy areas rather than fixed sites, and nest sites can be abandoned after one or more years, even if they have been successful (Saunders and de Rebeira, 1985).

While information regarding foraging ecology of this species within the NWMR is lacking, the Australian fairy tern has been studied in South Australia. Here, species typically forages in inshore waters and has been reported to rarely travel beyond 2 km during the breeding season in South Australia (Paton and Rogers, 2009).

Australian fairy terns are diurnal plunge diving seabirds, feeding exclusively on small (<60 mm) surface schooling bait fishes throughout their range. Prey include species of sprats, hardy heads and larval prey of some demersal fish species. Unlike many other terns, fairy terns are not dependent upon large pelagic fishes to drive their prey to the surface.

Breeding and foraging BIAs are identified for the fairy tern in the NWMR, as presented in Figure 8-2.

8.2.1.12 Little Tern (Nearshore Seabird)

The little tern (*Sternula albifrons*) is listed migratory under the EPBC Act and BC Act. There are three sub-populations of little tern in Australia and two of these occurring in the NWMR: the northern Australian breeding subpopulation occurring around Broome and extending across the NWMR to Cape York, and an east Asian breeding subpopulation, with the terns present from Shark Bay to south-eastern Queensland during the Austral summer.

Recent surveys have found that little terns breed across the NWMR in small colonies (Surman pers. obs.). However, identification between subpopulations is difficult, and population estimates have high error due to the overlapping range and remote breeding sites of the northern populations. A southwards movement of breeding distribution has been noted at three key locations; Lowendal Islands (Surman pers comm.), Burrup Peninsula (Nicholson pers comm.), and North-west Cape (Greenwell and Dunlop, 2021). Little terns usually forage close to their breeding colonies, typically within 5 km (Bertolero et al., 2005) mainly on small fish (<10 cm in length), but they also eat crustaceans, insects, annelids and molluscs.

Little is known about the breeding and foraging ecology of little terns, however BIAs for foraging and resting have been identified across the NWMR (Figure 8-2), with a peak in breeding activity between June and October.

8.2.1.13 Roseate Tern (Nearshore Seabird)

The roseate tern (*Sterna dougallii*) is listed migratory under the EPBC Act and BC Act. This species is generally sub-tropical in distribution and there are many breeding populations in the NWMR, including Ashmore Reef, Bonaparte Archipelago, Lacepede Islands, Dampier Archipelago and the Lowendal Islands.

The largest roseate tern breeding colony in Western Australia is in the Houtman Abrolhos Islands (Surman and Nicholson, 2009). Large colonies breed within the Lowendal Island and Montebello Island region where there is a stronghold for this species (Higgins and Davies, 1996). A large breeding colony has also been recorded on Goodwyn Island on the Dampier Archipelago (Higgins and Davies, 1996). Peak breeding times across the NWMR are between May to August.

Birds are known to usually move away from breeding colonies following breeding, but their non-breeding range is not well defined (Higgins and Davies, 1996). Many non-breeding roseate terns have been observed at several remote locations in the Kimberley and there are high numbers also recorded at the Eighty Mile Beach Ramsar site (Surman pers obs).

Roseate terns will forage diurnally, up to 60 km from their colonies and always over deeper shelf waters, rather than shallow coastal areas (Surman and Wooller, 2003). Roseate terns will also readily raft (roost in flocks on the sea surface) after foraging episodes (Commonwealth of Australia, 2020).

Roseate terns predominately eat small pelagic fish taken by plunge diving or surface dipping, typically foraging in dense flocks overflying predatory fishes that push their prey to the surface. Roseate terns may plunge to 20 cm depth.

Breeding BIAs across the NWMR are associated with known breeding colonies on islands, while a resting BIA encompasses Eighty Mile Beach (Figure 8-2).

8.2.1.14 Caspian Tern

The Caspian tern (*Hydroprogne caspia*) is listed migratory under the EPBC Act and BC Act. It is moderately common across coastlines of the NWMR and offshore islands (Johnstone et al., 2013).

Breeding occurs as solitary nests or in colonies of up to 52 breeding pairs mainly on islands, including North Turtle Island, Dampier Archipelago including Enderby Island, and Frazer Island, and occasionally on mainland coasts, such as Cape Preston and the Northwest Cape, from late March to early November (Johnstone et al., 2013).

During breeding, adults can forage up to 60 km from the colony during this period to catch fish and meet their elevated energetic requirements at this time (Burger et al., 1996; Balance et al., 2008). The Caspian tern is a diurnal forager, with the length and frequency of foraging trips, as well as relative time spent foraging or attending chicks, changing with food resource availability (Dunlop and McNeill, 2017).

Caspian tern usually forage in shallow, sheltered waters, by plunge-diving for various prey species (Serventy et al., 1971).

Although foraging BIAs occur in the SWMR, no BIAs for this species have been identified in the NWMR.

8.2.1.15 Greater Crested Tern

The greater crested tern (*Thalasseus bergii*) is listed migratory under the EPBC Act and BC Act. The species is widespread along coastlines of the NWMR and offshore islands (Johnstone et al., 2013).

Many populations remain sedentary in their breeding areas or disperse locally (del Hoyo et al., 1996), although some are more migratory (Urban et al., 1986). The species breeds in large, dense colonies, or in small groups of fewer than ten pairs amidst colonies of other species, such as silver gull (del Hoyo et al., 1996). Colonies are located on islands, including those as far offshore as Bedout,

Legendre and the Montebello and Lowendal Islands (Johnstone et al., 2013). Adult breeders have shown both high site fidelity and also flexibility in their breeding localities depending upon the spatial and temporal reliability of food resources (Crawford et al., 2002).

Breeding occurs from late March to May (Johnstone et al., 2013). During breeding, greater crested terns conduct short, diurnal foraging trips close (<40 km) to the colony (Surman and Wooller, 2003; Rock et al., 2007; McLeay et al., 2010) with most foraging behaviour displayed by individuals at distances >5 km (McLeay et al., 2010).

The chicks are predominantly fed pelagic fish, a diet that varies among colonies and years (Chiaradia et al., 2002; McLeay et al., 2009). Adults may forage more widely on inshore reef fish (Surman and Wooller, 2003), crustaceans and cephalopods using a plunge diving method (Commonwealth of Australia, 2020a).

Although there is known habitat use in the NWMR, there are no designated BIAs for the greater crested tern in the NWMR.

8.2.2 Moderate-occurrence Key Seabird Species

Species descriptions for moderate occurrence key pelagic and nearshore seabird species are summarised in Table 8-2.

Table 8-2: Species summary for moderate occurrence pelagic and nearshore seabird species within the NWMR

Species	NWMR presence	Predominant feeding behaviour	Diet
Amsterdam albatross	Year-round low-density presence associated with foraging breeding and non-breeding individuals	Diurnal and nocturnal Dipping, surface-seizing, diving to depths ≥ 2 m	Squid, fish and crustaceans
Flesh-footed shearwater	Non-breeding, migration: Jun–Aug	Diurnal and nocturnal Pursuit-plunging, surface-seizing	Fish, cephalopods
Soft-plumaged petrel	Non-breeding, migration: Jan–Jun	Diurnal and nocturnal Dipping, surface-seizing	Crustaceans, fish
Streaked shearwater	Non-breeding: Dec–Apr	Diurnal and nocturnal Surface-seizing	Fish, squid, crustacean
Wilson's storm petrel	Non-breeding: Jun–Dec	Diurnal and nocturnal Dipping, surface-seizing	Crustaceans, fish
Common tern	Non-breeding: Aug–Mar	Diurnal Surface-plunging, dipping	Fish

8.2.3 Biologically Important Areas for Seabirds in the NWMR

A review of the Australian Marine Spatial Information System (GA, 2024) identified BIAs representing important life cycle stages and behaviours for nine species of seabird in the NWMR. These are presented in Table 8-3.

Table 8-3: Seabird BIAs within the NWMR (source: AMSIS, 2024 [accessed on 12/08/24])

Seabird Species	Woodside Activity Area			BIAs			
	Browse	NWS/S	NWC	Breeding/Foraging	Foraging	Breeding	Resting
Australia fairy tern	-	✓	✓	-	No foraging BIAs in the NWMR Foraging in high numbers: the BIA is located in the SWMR including the Houtman Abrolhos Islands	Dampier Archipelago, Montebello, Lowendal and Barrow Island Groups, south Ningaloo and Bernier Island of Shark Bay	-
Wedge-tailed shearwater	✓	✓	✓	Widespread area of the NWMR offshore and inshore waters	Foraging in high numbers: the BIA is located in the SWMR including the Houtman Abrolhos Islands	-	-
Great frigatebird	✓	-	-	Ashmore Reef, Adele Island	-	-	-
Lesser frigatebird	✓	✓	-	Off Eighty Mile Beach, Lacepedes, Adele Island, North Kimberley and Ashmore Reef	-	-	-
Brown booby	✓	✓	-	Off Eighty Mile Beach, Lacepedes, Adele Island, North Kimberley and Ashmore Reef	-	-	-
Red-footed booby	✓	-	-	Adele Island, Ashmore Reef	-	-	-
Little tern	✓	✓	-	Rowley Shoals, Adele Island	-	-	-
Roseate tern	✓	✓	✓	-	No foraging BIAs in the NWMR Foraging (provisioning young) and foraging BIAs located in the SWMR – Houtman Abrolhos Islands, the nearest BIA to the NWMR	Dampier Archipelago, Montebello, Lowendal and Barrow Island Groups, south Ningaloo and barrier island of Shark Bay	Eighty Mile Beach

8.2.4 Seabird Summary for NWMR

8.2.4.1 Browse

The Browse activity area includes biologically important habitat for seven threatened and/or migratory seabird species:

- wedge-tailed shearwater (breeding/foraging)
- great and lesser frigatebirds (breeding/foraging)
- brown booby (breeding/foraging)
- red-footed booby (breeding/foraging)
- little tern (breeding/foraging)
- roseate tern (breeding and resting)
- white-tailed tropicbird (breeding).

BIAs for the seabird species are outlined in Table 8-3.

8.2.4.2 North West Shelf / Scarborough

The NWS / Scarborough activity area includes biologically important habitat for seven threatened and/or migratory seabird species:

- Australian fairy tern (breeding)
- wedge-tailed shearwater (breeding/foraging)
- lesser frigatebird (breeding/foraging)
- brown booby (breeding/foraging)
- white-tailed tropicbird (breeding)
- little tern (breeding/foraging)
- roseate tern (breeding and resting).

BIAs for the seabird species are outlined in Table 8-3.

8.2.4.3 North-west Cape

The North-west Cape activity area includes biologically important habitat for three threatened and/or migratory seabird species:

- Australian fairy tern (breeding)
- wedge-tailed shearwater (breeding/foraging)
- roseate tern (breeding and resting).

BIAs for the seabird species are listed and described in Table 8-3.

8.3 Shorebirds

APPENDIX S Shorebirds (migratory and resident species) are generally associated with wetland or coastal environments, and the NWMR hosts many shorebird species, particularly in the Austral summer (refer to PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR)

for the EPBC Act PMST reports on listed species of shorebirds). Shorebirds may use coastal environments for feeding, nesting or migratory stopovers. In coastal environments, shorebirds generally feed during low tide on exposed intertidal mud and sand flats, and roost in suitable habitat above the high- water mark.

The NWMR is situated within the East Asian – Australian Flyway (EAAF), a geographic region supporting populations of migratory shorebirds throughout their annual cycle. The EAAF extends from breeding grounds in the Russian tundra, Mongolia and Alaska southwards through east and south-east Asia, to non-breeding areas of Indonesia, Papua New Guinea, Australia and New Zealand (Weller and Lee, 2017). All shorebird species identified undertake annual migrations from breeding sites in the northern hemisphere to more southern non-breeding sites within the EAAF (Bamford et al., 2008).

The EAAF encompasses a large proportion of the NWMR. Migratory shorebirds may migrate through the offshore areas of the NWMR between overwinter grounds in Australia and breeding sites in the northern hemisphere (Bamford et al., 2008). Peak migration occurs between March and May (northern migration) and August and November (southern migration) (Bamford et al., 2008). Migration routes of some migratory shorebird species have been characterised using band recoveries (Minton et al 2006), however the migration pathways taken between sightings are poorly understood.

Migratory shorebird species are present in Australia during the non-breeding period (December to February), in coastal and inland habitats where adult birds build up the energy reserves necessary to support northward migration and subsequent breeding (Commonwealth of Australia, 2015c). During this time, individuals must maintain an energy intake greater than their energy expenditure to recover from the southward migration, to allow moulting, and to build fat reserves in preparation for the northward migration (Commonwealth of Australia, 2015c). The high energy demands of migration means that both foraging and resting during the non-breeding period are vital for individual fitness and survival.

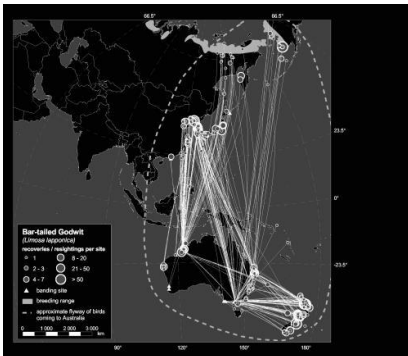

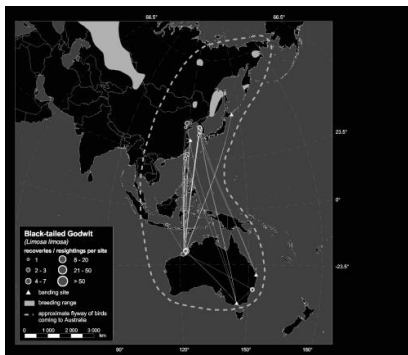

Due to differences in coastal or wetland habitat requirements between roosting and foraging behaviours, areas used most by migratory shorebirds usually comprise networks of foraging and roosting habitats. Shorebirds move between areas of this network depending on the time of day, availability of resources, levels of disturbance and environmental conditions (Commonwealth of Australia, 2015c). Displacement from one habitat or the other may result in utilisation of sub-optimal habitat and/or increase energetic demands via increased distance between habitats.

Within the EAAF, “a wetland should be considered internationally important if it regularly supports 1% of the individuals in a population of one species or subspecies of waterbird” (Ramsar Convention Bureau, 2000). All shorebirds identified as high occurrence key species occur in shoreline habitats within the NWMR for at least part of their non-breeding season in Australia.

Ashmore Reef is documented as a BIA for migratory shorebirds in the NWMR (DSEWPAC, 2012a).

Species descriptions, including information on migration routes where available, for key high and moderate occurrence shorebird species are provided in Table 8-4 and Table 8-5. It should be noted that Minton et al. (2006) did not report on the Pilbara region or Exmouth Gulf, so the migratory pathways may be incompletely depicted.

Table 8-4: Species summary for high and selected moderate occurrence key shorebird species

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Bar-tailed godwit ²⁰	Widespread around the coast as far east as Derby, with a few scattered records elsewhere in the Kimberley <i>Internationally important site:</i> <ul style="list-style-type: none"> Roebuck Bay Eighty Mile Beach 	Sandy beaches, sandbars, spits and also in near-coastal saltmarsh	Tidal estuaries and harbours	Worms, molluscs, crustaceans, insects and some plant material	
Black-tailed godwit	Found in coastal regions of all States and Territories of Australia <i>Internationally important site:</i> <ul style="list-style-type: none"> Roebuck Bay 	Claypan	Intertidal mudflats or sandflats	Annelids, crustaceans, arachnids, fish eggs and spawn and tadpoles	

²⁰ Nominate species *Limosa lapponica*. Subspecies which may occur includes *L. l. menzbieri*, which is listed Critically Endangered under the EPBC Act. Specific information on *L. l. menzbieri* is lacking, but information regarding habitat use and diet for the nominate species is considered applicable.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Broad billed sand piper	Regular visitor to coasts of the Pilbara and Kimberley between Onslow and Broome <i>Internationally important site:</i> <ul style="list-style-type: none"> Port Hedland Saltworks 	Sheltered sandy, shelly or shingly beaches	Mudflats, mangroves	Worms, including polychaetes, molluscs, crustaceans, insects and seeds	<p>The map shows the distribution of Broad-billed Sandpipers in Australia. A dashed line outlines the breeding range from Onslow in Western Australia to Broome in Northern Territory. Various symbols indicate roosting sites and their international importance. A legend explains the symbols: a circle with a dot for roosting sites, a circle with a cross for internationally important roosting sites, and a circle with a plus sign for internationally important foraging sites. It also shows the breeding range and the approximate timing of birds arriving in Australia.</p>
Common redshank	Records in the Gascoyne region, Coral Bay and Carnarvon Widespread from the Dampier Saltworks to Roebuck Bay and Broome Ashmore Reef	Sheltered coastal wetlands such as bays, river estuaries, lagoons, inlets and saltmarsh	Bare mud or sand, or on algal deposits, round the edges of wetlands	Worms, molluscs, crustaceans, arachnids and insects	Not available

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Curlew sandpiper	Widespread around coastal and subcoastal plains Non-breeding one year old birds may remain in Australia rather than migrating north <i>Internationally important site:</i> <ul style="list-style-type: none"> • Dampier Saltworks • Port Hedland Saltworks • Eighty Mile Beach • Roebuck Bay 	Bare dry shingle, shell or sand beaches, sandspits and islets in or around coastal or near-coastal lagoons and other wetlands	Mudflats and nearby shallow water	Worms, molluscs, crustaceans, and insects, as well as seeds	
Marsh sandpiper	Widespread, notable areas include Eighty Mile Beach, Port Hedland Saltworks	Tidal mudflats	Mudflats, marshy vegetation	Molluscs, crustaceans and insects	

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Eastern curlew	Continuous distribution from Barrow Island and Dampier Archipelago through the Kimberley region <i>Internationally important site:</i> <ul style="list-style-type: none"> Eighty Mile Beach Roebuck Bay 	Sandy spits, sandbars and islets, beaches near the high-water mark, coastal vegetation including low saltmarsh or mangroves	Soft sheltered intertidal sandflats or mudflats, saltflats and saltmarsh, in proximity to mangroves, among rubble on coral reefs, and beaches near the tideline	Crustaceans small molluscs, insects	
Great knot	Common on the coasts of the Pilbara and Kimberley, from the Dampier Archipelago to the Northern Territory border <i>Internationally important site:</i> <ul style="list-style-type: none"> Eighty Mile Beach Roebuck Bay 	Roosts in large groups in open areas, often at the water's edge or in shallow water close to feeding grounds	Sheltered coastal habitats with large intertidal mudflats or sandflats	Bivalves, gastropods, crustaceans and other invertebrates

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Grey-tailed tattler	Widespread from Houtman Abrolhos and the mainland adjacent to the Kimberley <i>Internationally important site:</i> <ul style="list-style-type: none"> Barrow Island Roebuck Bay Eighty Mile Beach Lacepede Islands 	Branches of mangroves, snags or driftwood	Shallow water on hard intertidal substrates, such as reefs and rock platforms, in rock pools and among rocks and coral rubble	Polychaetes, molluscs, crustaceans, insects and, occasionally, fish	 <p>Grey-tailed Tattler (Heteroscolopax brevipes) Roostsites / nightingales per site</p> <ul style="list-style-type: none"> ● 1 ● 10-20 ○ 2-3 ○ 21-50 ○ 4-7 ○ 51-100 <p>▲ breeding site --- breeding range --- approximate flow of birds moving to Australia</p>
Lesser Sand Plover	<i>Widespread, internationally important site:</i> <ul style="list-style-type: none"> Eighty Mile Beach Roebuck Bay Broome Port Hedland Saltworks 	Beaches, banks, spits of sand or shell, occasionally rocky spits, islets and reefs	Exposed intertidal sandflats and mudflats of beaches or estuaries, occasionally shallow water in saltworks	Molluscs, worms, crustaceans and insects	 <p>Lesser Sand Plover (Charadrius dominicus) Roostsites / nightingales per site</p> <ul style="list-style-type: none"> ● 1 ● 10-20 ○ 2-3 ○ 21-50 ○ 4-7 ○ 51-100 <p>▲ breeding site --- breeding range --- approximate flow of birds moving to Australia</p>

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Oriental plover	Most records are along the north- western coast, between Exmouth Gulf and Derby in Western Australia <i>Internationally important site:</i> <ul style="list-style-type: none"> • Dampier Saltworks • Port Hedland Saltworks • Eighty Mile Beach • Roebuck Bay 	Soft wet mud or in shallow water of beaches and tidal mudflats	Short grass, hard stony bare ground, mudflats or among beachcast seaweed on beaches	Insects, including termites, beetles, grasshoppers, crickets	Not available
Oriental pratincole	Widespread along the coasts of the Pilbara and Kimberley <i>Internationally important site:</i> <ul style="list-style-type: none"> • Eighty Mile Beach • Roebuck Plains 	Bare areas such as claypans or areas with low vegetation, such as saltmarsh	Open plains, floodplains or short grassland, artificial wetlands (saltworks), beaches, mudflats and islands, or around coastal lagoons Usually feeds aerially, at heights varying from just above the ground up to 300 m	Insects, including dragonflies, cicadas, beetles, moths, ants, termites, locusts, grasshoppers, flies, bees and wasps	Not available

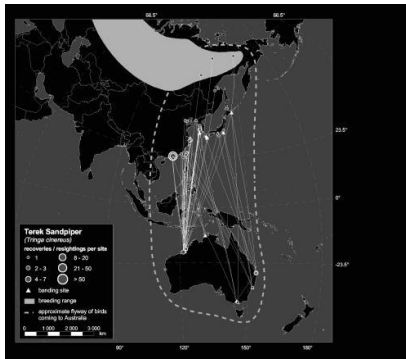

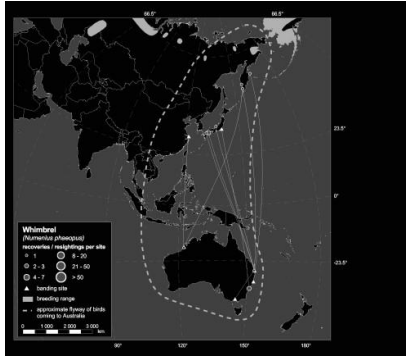

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Pacific golden plover	Widespread along the coasts of the Pilbara and Kimberley <i>Nationally important site:</i> <ul style="list-style-type: none">Eighty Mile Beach	Sandy beaches and spits, rocky points, islets, exposed reef, occasionally mangrove and saltmarsh vegetation, beachcast seaweed, levee banks and saltwork evaporation ponds	Sandy, muddy and rocky shores, sheltered estuaries and lagoons, occasionally saltmarsh, mangrove or pasture	Molluscs, polychaete worms, insects, insect larvae, spiders, crustaceans, occasionally seeds, leaves, lizards, bird eggs and fish	
Red knot	Large numbers regularly recorded in north-west Australia <i>Internationally important site:</i> <ul style="list-style-type: none">Eighty Mile BeachRoebuck Bay	Sandy beaches, spits and islets, and mudflats close to feeding grounds	Soft substrate near the water edge including intertidal mudflats and sandflats exposed by low tide	Worms, bivalves, gastropods, crustaceans and echinoderms	

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton et al (2006)
Red-necked stint	Widespread in coastal areas across Australia <i>Internationally important site:</i> <ul style="list-style-type: none"> Barrow Island Port Hedland Saltworks Eighty Mile Beach Roebuck Bay 	Sheltered beaches, spits, banks or islets of sand, mud, coral or shingle, occasionally in saltmarsh or other vegetation	Feed in dense flocks on bare wet mud such as intertidal mudflats or sandflats, or in very shallow water	Marine worms, molluscs, snails and slugs, shrimps, spiders, beetles, flies and ants	
Ruddy turnstone	Found in most coastal regions across Australia <i>Internationally important site:</i> <ul style="list-style-type: none"> Barrow Island Eighty Mile Beach Roebuck Bay Lacepede Islands 	Beaches above the tideline, among rocks, shells, beachcast seaweed or other debris	Between lower supralittoral and lower littoral zones of foreshores. Often forage among banks of stranded seaweed or other tide-wrack. Occasionally forage on exposed rocky platforms, coral reefs and mudflats	Insects, worms, crustaceans, molluscs, and spiders Occasionally been known to eat fish, birds' eggs and carrion and human food scraps	
Ruff	Periodically recorded in Port Hedland, Kununurra and the Argyle Diamond Mine	Wetlands with exposed mudflats and short dense vegetation	Exposed mudflats with shallow water and dry mud	Moss, plant fibre, seeds, annelid worms, molluscs, crustaceans, spiders, insects, fish and amphibians	Not available

Table 8-5: Species summary for moderate occurrence key shorebird species

Species	NWMR Presence	Roosting Habitat	Foraging Habitat	Diet
Asian dowitcher	Regular visitor to the north-west between Port Hedland and Broome <i>Internationally important sites:</i> <ul style="list-style-type: none"> • Roebuck Bay • Port Hedland saltworks 	Coastal lagoons, estuaries and tidal creeks	Intertidal mud flats	Polychaete worms and larvae, also insect larvae and molluscs
Australian painted snipe	Widespread in low numbers	Shallow freshwater wetlands with bare mud and dense canopy cover	Dense vegetation cover, occasionally mudflats and grassland	Vegetation, seeds, insects, worms, molluscs and crustaceans
Little curlew	Widespread with distribution concentrated along the northern coast from Port Hedland during the non-breeding season. <i>Internationally important sites:</i> <ul style="list-style-type: none"> • Roebuck Plains • Roebuck Bay • Anna Plains • Derby Sewage Ponds • Parry Floodplain 	Short, dry grassland, and occasionally dry saltmarshes, coastal swamps, mudflats or sandflats in estuaries, or on the beaches of sheltered coasts.	Short, dry grassland and sedgeland with shallow freshwater pools or seasonal inundation	Insects, seeds and berries.
Common greenshank	Occurs in all types of wetlands and has the widest distribution of any shorebird in Australia <i>Internationally important sites:</i> <ul style="list-style-type: none"> • Eighty Mile Beach • Roebuck Bay 	Wetlands, shallow pools and puddles, or slightly elevated on rocks, sandbanks or small muddy islets	Edges of wetlands, in soft mud on mudflats, in channels, among pneumatophores of mangroves or other sparse, emergent or fringing vegetation, such as sedges or saltmarsh	Molluscs, crustaceans, insects, and occasionally fish and frogs
Common sandpiper	Widespread in low numbers	Rocks or in roots or branches of vegetation, especially mangroves	Bare soft mud at the edges of wetlands	Molluscs, crustaceans and insects
Pectoral sandpiper	Low numbers recorded across the Gascoyne, Pilbara and Kimberley regions	Coastal lagoons, estuaries, bays, swamps, lakes, inundated grasslands, saltmarshes, river pools, creeks, floodplains and artificial wetlands	Bare soft mud at the edges of wetlands	Algae, seeds, crustaceans, arachnids and insects

Species	NWMR Presence	Roosting Habitat	Foraging Habitat	Diet
Wood sandpiper	NWMR supports largest numbers in Australia. Notable areas include Parry floodplain, Shark Bay	Low trees, grassy hillocks	Bare soft mud at the edges of wetlands	Insects and molluscs
Long-toed stint	Widespread along the coasts of the Pilbara and Kimberley	Shallow inland wetlands	Wetland or islets with wet mud or shallow water and short vegetation	Seeds, molluscs, crustaceans, insects, occasionally algae
Pin-tailed snipe	Recorded in the Pilbara, Port Hedland, Myaree Pool, Maitland River and near Karratha	Wide variety of wetland habitats including flooded paddy-fields, wet grasslands, seepage swamps and marshland	Muddy shorelines of swamps and along streams	Molluscs, adult and larval insects, earthworms and occasionally crustaceans, seeds and other plant matter
Swinhoe's snipe	Recorded in the Pilbara, Kimberley, Mount Goldsworthy, Mount Blaize and near the Mitchell Plateau	Grasses and rushes around the edge of fresh and brackish marshes	Grasses and rushes near the water edge, in addition to hummocks or on mudflats around seepage areas	Earthworms, adult and larval insects

8.4 Other Marine Birds

Species descriptions for high occurrence key other marine bird species are summarised in Table 8-6.

Table 8-6: Species summary for high occurrence key other marine bird species

Species	NWMR presence	Predominant feeding behaviour	Diet
Fork-tailed swift	<i>Non-breeding:</i> Oct–Apr Widespread in coastal areas as far north as Carnarvon, including some on nearshore and offshore islands Scattered along the Pilbara coast to the east Kimberley region	Aerial forager, flying anywhere from 1 m to 300 m above the ground to forage Typically feed in flocks ranging from 10 to 1000 birds	Insectivorous
Osprey	<i>Breeding:</i> April to February, though depends on latitude. NWMR individuals breeding early in season compared to SWMR <i>Non-breeding:</i> remain in breeding territories Continuous distribution of the species around the coast except for a possible gap at Eighty Mile Beach	Hover momentarily and then dive down, sometimes in stages, before snatching prey from near the surface with the feet or by plunging into the water feet first	Fish, especially mullet where available Rarely take molluscs, crustaceans, insects, reptiles, birds and mammals

⁷Green turtle nesting Scott Reef-Browse Island Stock November–March (CoA, 2017).

⁸Green turtle nesting NWS Stock November–March (CoA, 2017).

⁹Hawskbill turtle nesting Western Australia Stock October–February (CoA, 2017).

¹⁰Flatback turtle nesting Cape Domett Stock – year-round (peak July–September) (CoA, 2017).

¹¹Flatback turtle nesting South-west Kimberley Stock – October–March (CoA, 2017).

¹² Flatback turtle nesting Pilbara Stock – October–March (CoA, 2017).

¹³Unknown stock nesting Kimberley May–July (CoA, 2017).

¹⁴Loggerhead turtle nesting Western Australia stock November–May.

¹⁵Fin whale presence NWMR May–October (Aulich et al., 2022). Migrating north from Cape Leewuin (SWMR) May–October. Present offshore Dampier August–October (Aulich et al., 2022).

¹⁶Humpback whale northern migration. Range June–September (DCCEEW, 2024b15; TSSC, 2015b; DSEWPac, 2012a). Peak July–August (Salgado Kent et al., 2012).

¹⁷Humpback whale southern migration. Range July–November. Peak August- October. (TSSC, 2015b; Irvine and Salgado Kent, 2019; Salgado Kent et al., 2012; DSEWPac, 2012a)

¹⁸Humpback whale – reproduction (nursing, Kimberley coast) Winter (DCCEEW, 2024b15). Breeding August–September (DSEWPac, 2012a; TSSC, 2015b). Calves present off Kimberley in October (Thums et al., 2018).

²Pygmy blue whale northern migration April–August (DCCEEW, 2024b15; DSEWPac, 2012a; McCauley et al., 2018; CoA, 2015a). Peak April–July (Thums et al., 2022) refers to Western Australia from the Perth Canyon (April/May) to the North West Shelf (June/July).

²¹Pygmy blue whale southern migration October–December, possibly into January (DCCEEW, 2024b15; DSEWPac, 2012a citing (McCauley and Jenner, 2010; McCauley et al., 2018; Thums et al., 2022; CoA, 2015a). Peak November–December (Thums et al., 2022).

²²Southern right whale calving and migratory presence in Exmouth Gulf (NWMR) June to September with peak months July and August (DCCEEW, 2024a) All seabird seasonality information derived from BIA metadata, scientific publications and expert opinion (Worley, 2024).

¹⁹Limited data however sightings reported year-round (Cerchio et al., 2019).

10. KEY ECOLOGICAL FEATURES

Key ecological features (KEFs) are elements of the Commonwealth marine environment that are considered to be important for a marine region's biodiversity or ecosystem function and integrity. KEFs have been identified by the Australian Government based on advice from scientists about the ecological processes and characteristics of the area.

KEFs meet one or more of the criteria of:

- a species, group of species, or a community with a regionally important ecological role (e.g. a predator, prey that affects a large biomass or number of other marine species)
- a species, group of species or a community that is nationally or regionally important for biodiversity
- an area or habitat that is nationally or regionally important for:
 - enhanced or high productivity (such as predictable upwellings – an upwelling occurs when cold nutrient-rich waters from the bottom of the ocean rise to the surface)
 - aggregations of marine life (such as feeding, resting, breeding or nursery areas), or
 - biodiversity and endemism (species which only occur in a specific area)
- a unique seafloor feature, with known or presumed ecological properties of regional significance.

APPENDIX T Thirteen KEFs are designated within the NWMR, 12 KEFs within the SWMR and eight KEFs within the NMR. These KEFs have been identified in the Protected Matters search (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) and outlined in Table 10-1, Table 10-2 and Table 10-3, and Figure 10-1, Figure 10-2 and Figure 10-3.

Table 10-1: Key Ecological Features (KEFs) within the NWMR

KEF Name	Woodside Activity Area			Values ¹	Description
	Browse	NWS/S	NW Cape		
Carbonate bank and terrace system of the Sahul Shelf	✓	-	-	<p>Unique seafloor feature with ecological properties of regional significance</p> <p>Regionally important because of their role in enhancing biodiversity and local productivity relative to their surrounds.</p> <p>The carbonate banks and terraces provide areas of hard substrate in an otherwise soft sediment environment which are important for sessile species</p>	<p>The carbonate banks and terrace system of the Sahul Shelf are located in the western Joseph Bonaparte Gulf and to the north of Cape Bougainville and Cape Londonderry. The carbonate banks and terraces are part of a larger complex of banks and terraces that occurs on the Van Diemen Rise in the adjacent NMR.</p> <p>The bank and terrace system of the Van Diemen Rise covers approximately 31,278 km² and forms part of the larger system associated with the Sahul Banks to the north and Londonderry Rise to the east. The feature is characterised by terrace, banks, channels and valleys (DSEWPAC, 2012c). The banks, ridges and terraces of the Van Diemen Rise are raised geomorphic features with relatively high proportions of hard substrate that support sponge and octocoral gardens. These, in turn, provide habitat to other epifauna, by providing structure in an otherwise flat environment (Przeslawski et al., 2011). Plains and valleys are characterised by scattered epifauna and infauna that include polychaetes and ascidians. These epibenthic communities support higher order species such as olive ridley turtles, sea snakes and sharks (DSEWPAC, 2012c).</p>
Pinnacles of the Bonaparte Basin	✓	-	-	<p>Unique seafloor feature with ecological properties of regional significance</p> <p>Provide areas of hard substrate in an otherwise soft sediment environment and so are important for sessile species</p> <p>Recognised as a biodiversity hotspot for sponges</p> <p>The Pinnacles of the Bonaparte Basin KEF is located within both the NWMR and NMR (refer Table 10-3)</p>	<p>The Pinnacles of the Bonaparte Basin provide areas of hard substrate in an otherwise relatively featureless environment, the pinnacles are likely to support a high number of species, although a better understanding of the species richness and diversity associated with these structures is required (DSEWPAC, 2012a, 2012c). Covering >520 km² within the Bonaparte Basin, this feature contains the largest concentration of pinnacles along the Australian margin. The Pinnacles of the Bonaparte Basin are thought to be the eroded remnants of underlying strata; it is likely that the vertical walls generate local upwelling of nutrient-rich water, leading to phytoplankton productivity that attracts.</p> <p>aggregations of planktivorous and predatory fish, seabirds, and foraging turtles (DSEWPAC, 2012a, 2012c).</p>

Ashmore Reef and Cartier Island and surrounding Commonwealth waters	✓	-	-	High productivity, biodiversity and aggregation of marine life that apply to both the benthic and pelagic habitats within the feature	Ashmore Reef is the largest of only three emergent oceanic reefs present in the north-eastern Indian Ocean and is the only oceanic reef in the region with vegetated islands. Ashmore contains a large reef shelf, two large lagoons, several channelled carbonate sand flats, shifting sand cays, an extensive reef flat, three vegetated islands—East, Middle and West islands—and surrounding waters. Rising from a depth of more than 100 m, the reef platform is at the edge of the NWS and covers an area of 239 km ² . Ashmore Reef and Cartier Island and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of birds and other marine life; they are areas of enhanced primary productivity in an otherwise low- nutrient environment (DSEWPAC, 2012a). Ashmore Reef supports the highest number of coral species of any reef off the WA coast.
Seringapatam Reef and the Commonwealth waters in the Scott Reef complex	✓	-	-	Support diverse aggregations of marine life, have high primary productivity relative to other parts of the region, are relatively pristine and have high species richness, which apply to both the benthic and pelagic habitats within the feature	Seringapatam Reef and the Commonwealth waters in the Scott Reef complex are regionally important in supporting the diverse aggregations of marine life, high primary productivity, and high species richness associated with the reefs themselves. As two of the few offshore reefs in the North-west, they provide an important biophysical environment in the region (DSEWPAC, 2012a).

Continental slope demersal fish communities	✓	✓	✓	High biodiversity of demersal fish assemblages, including high levels of endemism	<p>The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the North-west Province is high compared to elsewhere along the Australian continental slope (DSEWPAC, 2012a). The continental slope between North-west Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last et al., 2005). The slope of the Timor Province and the Northwest Transition also contains more than 500 species of demersal fishes of which 64 are considered endemic (Last et al., 2005), making it the second richest area for demersal fishes throughout the whole continental slope.</p> <p>Demersal fish species occupy two distinct demersal biomes associated with the upper slope (225–500 m water depths) and the mid-slope (750–1000 m). Although poorly known, it is suggested that the demersal slope communities rely on bacteria and detritus-based systems comprised of infauna and epifauna, which in turn become prey for a range of teleost fishes, molluscs and crustaceans (Brewer et al., 2007). Higher-order consumers may include carnivorous fishes, deepwater sharks, large squid, and toothed whales (Brewer et al., 2007). Pelagic production is phytoplankton-based, with hot spots around oceanic reefs and islands (Brewer et al., 2007)</p>

Ancient coastline at 125 m depth contour	✓	✓	✓	<p>Unique seafloor feature with ecological properties of regional significance</p> <p>Provides areas of hard substrate and therefore may provide sites for higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment</p>	<p>Several steps and terraces as a result of Holocene sea level changes occur in the region, with the most prominent of these features occurring as an escarpment along the NWMR and Sahul Shelf at a water depth of 125 m.</p> <p>The ancient coastline is not continuous throughout the NWMR and coincides with a well-documented eustatic stillstand at about 130 m depth worldwide (Falkner et al., 2009).</p> <p>Where the ancient coastline provides areas of hard substrate, it may contribute to higher diversity and enhanced species richness relative to soft sediment habitat (Falkner et al., 2009). Parts of the ancient coastline, represented as rocky escarpment, are considered to provide biologically important habitat in an area predominantly made up of soft sediment.</p> <p>The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient-rich environment. Although the ancient coastline adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner et al., 2009).</p>
Canyons linking the Argo Abyssal Plain and Scott Plateau	-	✓	-	<p>Facilitates nutrient upwelling, creating enhanced productivity and encouraging diverse aggregations of marine life</p> <p>Likely to be important due to their historical association with sperm whale aggregations</p>	<p>Interactions with the Leeuwin Current and strong internal tides are thought to result in upwelling at the canyon heads, thus creating conditions for enhanced productivity in the region (Brewer et al., 2007). As a result, aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, predatory fishes and seabirds are known to occur in the area due to its enhanced productivity (Sleeman et al., 2007).</p>

KEF Name	Woodside Activity Area			Values ¹	Description

Glomar Shoal	-	✓	-	An area of high productivity and aggregations of marine life including commercial and recreational fish species	Glomar Shoal is a submerged littoral feature located about 150 km north of Dampier on the Rowley shelf at depths of 33–77 m (Falkner et al., 2009). Studies by Abdul Wahab et al. (2018) found a number of hard coral and sponge species in water depths less than 40 m. One hundred and seventy different species of fishes were detected with greatest species richness and abundance in shallow habitats (Abdul Wahab et al., 2018). Fish species present include a number of commercial and recreational species such as rankin cod, brown striped snapper, red emperor, crimson snapper, bream and yellow-spotted triggerfish (Falkner et al., 2009; Fletcher and Santoro, 2009). These species have recorded high catch rates associated with Glomar Shoal, indicating that the shoal is likely to be an area of high productivity.
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	-	✓	-	Regionally important in supporting high species richness, higher productivity and aggregations of marine life	The Mermaid Reef and Commonwealth waters surrounding the Rowley Shoals KEF is adjacent to the three nautical mile State waters limit surrounding Clerke Reef and Imperieuse Reef, and include the Mermaid Reef Marine Park as described in Section 11. The reefs provide a distinctive biophysical environment in the region. They have steep and distinct reef slopes and associated fish communities. In evolutionary terms, the reefs may play a role in supplying coral and fish larvae to reefs further south via the southward flowing Indonesian Throughflow. Both coral communities and fish assemblages differ from similar habitats in eastern Australia (Done et al., 1994).

KEF Name	Woodside Activity Area			Values ¹	Description
	Browse	NWS/S	NW Cape		
Exmouth Plateau	-	✓	✓	Unique seafloor feature with ecological properties of regional significance, which apply to both benthic and pelagic habitats. Likely to be an important area of biodiversity as it provides an extended area offshore for communities adapted to depths of approximately 1000 m	The Exmouth Plateau is a large, mid-slope, continental margin plateau that lies off the northwest coast of Australia. It ranges in depth from about 500 to more than 5000 m and is a major structural element of the Carnarvon Basin (Miyazaki and Stagg, 2013). The large size of the Exmouth Plateau and its expansive surface may modify deep water flow and be associated with the generation of internal tides; both of which may subsequently contribute to the upwelling of deeper, nutrient-rich waters closer to the surface (Brewer et al., 2007). Satellite observations suggest that productivity is enhanced along the northern and southern boundaries of the plateau (Brewer et al., 2007). Sediments on the plateau suggest that biological communities include scavengers, benthic filter feeders and epifauna (DSEWPAC, 2012a). Fauna in the pelagic waters above the plateau are likely to include small pelagic species and nekton attracted to seasonal upwellings, as well as larger predators such as billfishes, sharks and dolphins (Brewer et al., 2007). Protected and migratory species are also known to pass through the region, including whale sharks and cetaceans.
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	-	-	✓	Unique seafloor feature with ecological properties of regional significance The feature creates an enhanced productivity environment, attracting aggregations of fish and higher-order consumers such as large predatory fish, sharks, toothed whales and dolphins	The canyons are associated with upwelling as they channel deep water from the Cuvier Abyssal Plain up onto the slope, Exmouth Plateau and Ningaloo Reef. This nutrient-rich water interacts with the Leeuwin Current at the canyon heads (DSEWPAC, 2012a). Aggregations of whale sharks, manta rays, sea snakes, sharks, large predatory fish, and seabirds are known to occur in this area.
Commonwealth waters adjacent to Ningaloo Reef	-	-	✓	High productivity and diverse aggregations of marine life The Commonwealth waters adjacent to Ningaloo Reef and associated canyons and plateaus are interconnected and support the high productivity and species richness of Ningaloo Reef. Ningaloo Reef is globally significant as it is the only extensive coral reef in the world that fringes the west coast of a continent	The Leeuwin and Ningaloo currents interact, leading to areas of enhanced productivity in the Commonwealth waters adjacent to Ningaloo Reef. Aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, large predatory fish, and seabirds are known to occur in this area (DSEWPAC, 2012a). The spatial boundary of this KEF, as defined in the Australian Marine Spatial Information System, is defined as the waters contained in the existing Ningaloo AMP provided in Section 11.

Wallaby Saddle	-	-	✓	High productivity and aggregations of marine life: Representing almost the entire area of this type of geomorphic feature in the NWMR. It is a unique habitat that neither occurs anywhere else nearby (within hundreds of kilometres) nor with as large an area (Falkner et al., 2009)	The Wallaby Saddle may be an area of enhanced productivity. Historical whaling records provide evidence of sperm whale aggregations in the area of the Wallaby Saddle, possibly due to the enhanced productivity of the area and aggregations of baitfish (DSEWPAC, 2012a).

Table 10-2: Key Ecological Features (KEFs) within the SWMR

KEF Name	Values ¹	Description
Albany Canyons group and adjacent shelf break	High productivity and aggregations of marine life, and unique seafloor feature with ecological properties of regional significance Both benthic and demersal habitats within the feature are of conservation value	The Albany Canyons group is thought to be associated with small, periodic subsurface upwelling events, which may drive localised regions of high productivity. The canyons are known to be a feeding area for sperm whale and sites of orange roughly aggregations. Anecdotal evidence also indicates that this area supports fish aggregations that attract large predatory fish and sharks.
Ancient coastline at 90-120 m depth	Relatively high productivity and aggregations of marine life, and high levels of biodiversity and endemism The feature creates topographic complexity, that may facilitate benthic biodiversity and enhanced biological productivity	Benthic biodiversity and productivity occur where the ancient coastline forms a prominent escarpment, such as in the western Great Australian Bight, where the sea floor is dominated by sponge communities of significant biodiversity and structural complexity.
Cape Mentelle upwelling	Facilitates nutrient upwelling, supporting high productivity and diverse aggregations of marine life	The Cape Mentelle upwelling draws relatively nutrient-rich water from the base of the Leeuwin Current, up the continental slope and onto the inner continental shelf, where it results in phytoplankton blooms at the surface. The phytoplankton blooms provide the basis for an extended food chain characterised by feeding aggregations of small pelagic fish, larger predatory fish, seabirds, dolphins and sharks.
Commonwealth marine environment surrounding the Houtman Abrolhos Islands (and adjacent shelf break)	High levels of biodiversity and endemism within benthic and pelagic habitats	The Houtman Abrolhos Islands and surrounding reefs support a unique mix of temperate and tropical species, resulting from the southward transport of species by the Leeuwin Current over thousands of years. The Houtman Abrolhos Islands are the largest seabird breeding station in the eastern Indian Ocean. They support more than one million pairs of breeding seabirds.
Commonwealth marine environment surrounding the Recherche Archipelago	Aggregations of marine life and high levels of biodiversity and endemism within benthic and demersal communities	The Recherche Archipelago is the most extensive area of reef in the SWMR. Its reef and seagrass habitat supports a high species diversity of warm temperate species, including 263 known species of fish, 347 known species of molluscs, 300 known species of sponges, and 242 known species of macroalgae. The islands also provide haul-out (resting areas) and breeding sites for Australian sea lions and New Zealand fur seals.

Description of the Existing Environment

KEF Name	Values ¹	Description
Commonwealth marine environment within and adjacent to the west-coast inshore lagoons	High productivity and aggregations of marine life within benthic and pelagic habitats Important for benthic productivity and recruitment for a range of marine species	These lagoons are important for benthic productivity, including macroalgae and seagrass communities, and breeding and nursery aggregations for many temperate and tropical marine species. They are important areas for the recruitment of commercially and recreationally important fish species. Extensive schools of migratory fish visit the area annually, including herring, garfish, tailor and Australian salmon.
Commonwealth marine environment within and adjacent to Geographe Bay	High productivity and aggregations of marine life, and high levels of biodiversity, recruitment within benthic and pelagic communities	Geographe Bay is known for its extensive beds of tropical and temperate seagrass that support a diversity of species, many of them not found anywhere else. The bay provides important nursery habitat for many species. Juvenile dusky whaler sharks use the shallow seagrass habitat as nursery grounds for several years, before ranging out to adult feeding grounds along the shelf break. The seagrass also provides valuable habitat for fish and invertebrates (Carruthers et al., 2007). It is also an important resting area for migratory humpback whales.
Diamantina Fracture Zone	Unique seafloor feature with ecological properties of regional significance which apply to its benthic and demersal habitats	The Diamantina Fracture Zone is a rugged, deep-water environment of seamounts and numerous closely spaced troughs and ridges. Very little is known about the ecology of this remote, deep-water feature, but marine experts suggest that its size and physical complexity mean that it is likely to support deep-water communities characterised by high species diversity, with many species found nowhere else.
Naturaliste Plateau	Unique seafloor feature with ecological properties of regional significance including high species diversity and endemism which apply to its benthic and demersal habitats	The Naturaliste Plateau is Australia's deepest temperate marginal plateau. The combination of its structural complexity, mixed water dynamics and relative isolation indicate that it supports deep-water communities with high species diversity and endemism.
Perth Canyon and adjacent shelf break, and other west-coast canyons	An area of higher productivity that attracts feeding aggregations of deep-diving mammals and large predatory fish. It is also recognised as a unique seafloor feature with ecological properties of regional significance	The Perth Canyon is the largest known undersea canyon in Australian waters. Deep ocean currents rise to the surface, creating a nutrient-rich cold-water habitat attracting feeding aggregations of deep-diving mammals, such as pygmy blue whales and large predatory fish that feed on aggregations of small fish, krill and squid.

KEF Name	Values ¹	Description
Western demersal slope and associated fish communities of the Central Western Province	Provides important habitat for demersal fish communities and supports species groups that are nationally or regionally important to biodiversity	The western demersal slope provides important habitat for demersal fish communities, with a high level of diversity and endemism. A diverse assemblage of demersal fish species below a depth of 400 m is dominated by relatively small benthic species such as grenadiers, dogfish and cucumber fish. Unlike other slope fish communities in Australia, many of these species display unique physical adaptations to feed on the sea floor (such as a mouth position adapted to bottom feeding), and many do not appear to migrate vertically in their daily feeding habits
Western rock lobster	A species that plays a regionally important ecological role	This species is the dominant large benthic invertebrate in the region. The lobster plays an important trophic role in many of the inshore ecosystems of the SWMR. Western rock lobsters are an important part of the food web on the inner shelf, particularly as juveniles.

¹Values description sourced from Marine bioregional plan for the South-west Marine Region (DSEWPAC, 2012b) and the DAWE SPRAT database.

Table 10-3: Key Ecological Features (KEFs) within the NMR

KEF Name	Values ¹	Description
Carbonate bank and terrace system of the Van Diemen Rise	Important for its role in enhancing biodiversity and local productivity relative to its surrounds and for supporting relatively high species diversity The feature has been identified as a sponge biodiversity hotspot (Przeslawski et al. 2014)	The bank and terrace system of the Van Diemen Rise is part of the larger system associated with the Sahul Banks to the north and Londonderry Rise to the east; it is characterised by terrace, banks, channels and valleys. The variability in water depth and substrate composition may contribute to the presence of unique ecosystems in the channels. Species present include sponges, soft corals and other sessile filter feeders associated with hard substrate sediments of the deep channels; epifauna and infauna include polychaetes and ascidians. Olive ridley turtles, sea snakes and sharks are also found associated with this feature.
Gulf of Carpentaria basin	Regional importance for biodiversity, endemism and aggregations of marine life relevant to benthic and pelagic habitats	The Gulf of Carpentaria basin is one of the few remaining near-pristine marine environments in the world. Primary productivity in the Gulf of Carpentaria basin is mainly driven by cyanobacteria that fix nitrogen but is also strongly influenced by seasonal processes. The soft sediments of the basin are characterised by moderately abundant and diverse communities of infauna and mobile epifauna dominated by polychaetes, crustaceans, molluscs, and echinoderms. The basin also supports assemblages of pelagic fish species including planktivorous and schooling fish, with top predators such as shark, snapper, tuna, and mackerel.
Gulf of Carpentaria coastal zone	High productivity, aggregations of marine life (including several endemic species) and high biodiversity compared to broader region	Nutrient inflow from rivers adjacent to the NMR generates higher productivity and more diverse and abundant biota within the Gulf of Carpentaria coastal zone than elsewhere in the region. The coastal zone is near pristine and supports many protected species such as marine turtles, dugongs, and sawfishes. Ecosystem processes and connectivity remain intact; river flows are mostly uninterrupted by artificial barriers and healthy, diverse estuarine and coastal ecosystems support many species that move between freshwater and saltwater environments.
Pinnacles of the Bonaparte Basin	Unique seafloor feature with ecological properties of regional significance Provide areas of hard substrate in an otherwise soft sediment environment and so are important for sessile species Recognised as a biodiversity hotspot for sponges The Pinnacles of the Bonaparte Basin KEF is located within both the NWMR and NMR (refer Table 10-1)	Covering more than 520 km ² within the Bonaparte Basin, this feature contains the largest concentration of pinnacles along the Australian margin. The Pinnacles of the Bonaparte Basin are thought to be the eroded remnants of underlying strata; it is likely that the vertical walls generate local upwelling of nutrient-rich water, leading to phytoplankton productivity that attracts aggregations of planktivorous and predatory fish, seabirds and foraging turtles.
Plateaux and saddle north-west of the Wellesley Islands	High species abundance, diversity and endemism of marine life	Abundance and species density are high in the plateaux and saddle as a result of increased biological productivity associated with habitats rather than currents. Submerged reefs support corals that are typical of northern Australia, including corals that have bleach-resistant zooxanthellae; and particular reef fish species that are different to those found elsewhere in the Gulf of Carpentaria. Species present include marine turtles and reef fish such as coral trout, cod, mackerel, and shark. Seabirds frequent the plateaux and saddle, most likely due to the presence of predictable food resources for feeding offspring.

Description of the Existing Environment

KEF Name	Values ¹	Description
Shelf break and slope of the Arafura Shelf	The shelf break and slope of the Arafura Shelf is defined as a key ecological feature for its ecological significance associated with productivity emanating from the slope It also forms part of a unique biogeographic province (Last et al., 2005)	The shelf break and slope of the Arafura Shelf is characterised by continental slope and patch reefs and hard substrate pinnacles. The ecosystem processes of the feature are largely unknown in the region; however, the Indonesian Throughflow and surface wind-driven circulation are likely to influence nutrients, pelagic dispersal and species and biological productivity in the region. Biota associated with the feature is largely of Timor–Indonesian Malay affinity.
Submerged coral reefs of the Gulf of Carpentaria	High aggregations of marine life, biodiversity and endemism Twenty per cent of the reefs found in the NMR are situated within this KEF (Harris et al., 2007)	The submerged coral reefs of the Gulf of Carpentaria are characterised by submerged patch, platform and barrier reefs that form a broken margin around the perimeter of the Gulf of Carpentaria basin, rising from the sea floor at depths of 30–50 m. These reefs provide breeding and aggregation areas for many fish species including mackerel and snapper and offer refuges for sea snakes and apex predators such as sharks. Coral trout species that inhabit the submerged reefs are smaller than those found in the Great Barrier Reef and may prove to be an endemic sub-species.
Tributary Canyons of the Arafura Depression	High productivity and high levels of species diversity and endemism of marine life within the benthic and pelagic habitats of the feature	The tributary canyons are approximately 80–100 m deep and 20 km wide. The largest of the canyons extend some 400 km from Cape Wessel into the Arafura Depression, and are the remnants of a drowned river system that existed during the Pleistocene era. Sediments in this feature are mainly calcium-carbonate rich, although sediment type varies from sandy substrate to soft muddy sediments and hard, rocky substrate. Marine turtles, deep sea sponges, barnacles and stalked crinoids have all been identified in the area.

11. PROTECTED AREAS

11.1 Regional Context

Protected areas include World Heritage Properties, National Heritage Places, Wetlands of International Importance, Australian Marine Parks, State Marine Parks and Reserves, Threatened Ecological Communities and the Australian Whale Sanctuary. The PMST Reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) show that there are 29 protected areas found in the NWMR, 18 in the SWMR and 9 in the NMR.

Australian Marine Parks are outlined in Table 11-1, Table 11-2, Table 11-3 and Table 11-4. All other protected areas of each of the marine regions NWMR, SWMR and NMR are outlined in Table 11-5, Table 11-6, Table 11-7 and Table 11-8 respectively.

11.2 World Heritage Properties

World Heritage listings are sites of outstanding universal value and meet at least 10 selection criteria, compiled of cultural and natural basis criteria. World Heritage listings classed as meeting outstanding natural criteria are discussed in this section and World Heritage sites classed as meeting outstanding cultural criteria are discussed in Section 12.

The list of Australia's World Heritage Properties and the PMST Reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) show two World Heritage Properties within the NWMR (Table 11-6), one World Heritage Property within the SWMR (Table 11-7), and though not reported in the NMR PMST Report, Kakadu National Park World Heritage Area is included in Table 11-8.

11.3 National and Commonwealth Heritage Places – Natural

The National Heritage List is Australia's list of natural, historic, and Indigenous places of outstanding significance to the nation. The National Heritage List Spatial Database describes the place name, class (Indigenous, natural, historic), and status. Commonwealth Heritage Places are a collection of sites recognised for their Indigenous, historical and/or natural values which are owned or controlled by the Australian Government.

Only National and Commonwealth Heritage Places classed as natural are discussed in this section. Heritage Places classed as Indigenous or historic are discussed in Section 12.

A search of the National Heritage List Spatial Database and the PMST Reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) identified three natural National Heritage Places in the NWMR (Table 11-6), one in the SWMR (Table 11-7) and for the NMR, Kakadu National Park (not included in the PMST report) is included in Table 11-8.

A search of the Commonwealth Heritage List identified six natural commonwealth heritage places within the NWMR (Table 11-8) and one within the SWMR (Table 11-7).

11.4 Wetlands of International Importance (listed under the Ramsar Convention)

Australia has 65 Ramsar wetlands that cover >8.3 million ha. Ramsar wetlands are those that are representative, rare, or unique wetlands, or that are important for conserving biological diversity.

The List of Wetlands of International Importance held under the Ramsar Convention and the PMST Reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) identified four Ramsar Sites with coastal features within the NWMR (Table 11-6), five in the SWMR (Table 11-7) and two for the Northern Territory, included for the NMR (not included in the PMST

report) (Table 11-8).

11.5 Australian Marine Parks

Australian Marine Parks (AMPs), proclaimed under the EPBC Act in 2007 and 2013, are located in Commonwealth waters from the outer edge of State and Territory waters (3 NM) to the outer boundary of Australia's EEZ 200 NM from the shore.

PMST Reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) show 16 AMPs within the NWMR, 10 within the SWMR and eight within the NMR. These are displayed in Figure 11-1, Figure 11-2 and Figure 11-3, respectively.

The values of all marine parks identified in the North-West, South-West and North Marine Network management plans are described in Table 11-1, Table 11-3 and Table 11-4, respectively.

There are also two AMPs in the Indian Ocean territories. These are the Cocos (Keeling) Islands Marine Park and the Christmas Island Marine Park (Table 11-2, Figure 11-1) (Commonwealth of Australia, 2021).

11.5.1 North West Marine Parks Network

Table 11-1 describes Australian Marine Parks within the North West Marine Park Network, according to the North West Marine Parks Network Management Plan 2018 (DNP, 2018a).

Table 11-1: Summary of Commonwealth Australian Marine Parks (AMPs) in the North West Marine Park Network

North West Marine Park Network	IUCN Zones	Description and Values
Argo-Rowley Terrace Marine Park	National Park (II) Multiple Use (VI) Special Purpose Zone (Trawl) (VI)	Description The Argo-Rowley Terrace Marine Park is located approximately 270 km north-west of Broome, Western Australia, and extends to the limit of Australia's exclusive economic zone. This AMP covers an area of 146,003 km ² and water depths between 220 m and 6000 m, protecting ecological communities in the deep offshore region. The AMP provides connectivity between the Mermaid Reef Marine Park and WA Rowley Shoals Marine Park.
		Natural values The marine park includes ecosystems representative of: <ul style="list-style-type: none"> Northwest Transition—an area of shelf break, continental slope, and the majority of the Argo Abyssal Plain. Key topographic features include Mermaid, Clerke and Imperieuse Reefs Timor Province—an area dominated by warm, nutrient-poor waters. Canyons are an important feature in this area of the marine park and are generally associated with high productivity and aggregations of marine life. Key ecological features are: <ul style="list-style-type: none"> canyons linking the Argo Abyssal Plain with the Scott Plateau Mermaid Reef and Commonwealth waters surrounding Rowley Shoals. The marine park includes a range of seafloor features such as canyons on the slope between the Argo Abyssal Plain, Rowley Terrace and Scott Plateau. These are believed to be up to 50 million years old and are associated with small, periodic upwellings that results in localised higher levels of biological productivity. The marine park includes species listed under the EPBC Act. Biologically important areas within the marine park include resting and breeding habitat for seabirds and a migratory pathway for the pygmy blue whale.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. As noted in the North West Marine Park Management Plan, limited information regarding the cultural significance of this marine park is currently available (DNP, 2018a).
		Heritage values There are no international, Commonwealth or national heritage listings relevant to the Argo-Rowley Terrace Marine Park. The marine park contains two known shipwrecks listed under the <i>Historic Shipwrecks Act 1976</i> : <i>Alfred</i> (wrecked in 1908) and <i>Pelsart</i> (wrecked in 1908).

North West Marine Park Network	IUCN Zones	Description and Values
		Social and economic values Socio-economic values of this marine park include commercial fishing and mining.
Ashmore Reef Marine Park	Sanctuary (Ia) Recreational Use (IV)	Description The Ashmore Reef Marine Park is located approximately 630 km north of Broome and 110 km south of the Indonesian island of Roti. The marine park is located in Australia's External Territory of Ashmore and Cartier Islands. It is within an area subject to a Memorandum of Understanding (MoU) between Indonesia and Australia, known as the MoU Box. The marine park covers an area of 583 km ² and water depths from less than 15 m to 500 m. Natural values The Ashmore Reef Marine Park includes ecosystems representative of the Timor Province—a bioregion with a depth range from about 200 m near the shelf break to 5920 m over the Argo Abyssal Plain. Ashmore Reef is an important feature of the bioregion. There are two distinct demersal fish communities: one on the upper slope, the other mid slope. The marine environment includes two extensive lagoons, sand flats, shifting sand cays, extensive reef flat and large areas of seagrass. The reef ecosystems are comprised of hard and soft corals, gorgonians, sponges and a range of encrusting organisms, with the highest number of coral species of any reef off the Western Australian coast. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within the marine park include breeding, foraging and resting habitat for seabirds, resting and foraging habitat for migratory shorebirds, foraging, mating, nesting and interbreeding habitat for marine turtles, foraging habitat for dugong, and a migratory pathway for pygmy blue whales. The Ashmore Reef Ramsar site includes the largest of the atolls in the region. West Island, Middle Island and East Island represent the only vegetated islands in the region. The site supports internationally significant populations of seabirds and shorebirds, is important for turtles (green, hawksbill and loggerhead) and dugong, and has the highest diversity of hermatypic (reef-building) corals on the West Australian coast. It is known for its abundance and diversity of sea snakes, although populations at Ashmore Reef have been in decline since 1998. Key ecological features are: <ul style="list-style-type: none"> Ashmore Reef and Cartier Island and surrounding Commonwealth waters continental slope demersal fish communities—an area of high-diversity demersal fish assemblages. Cultural values Sea country is valued for Indigenous Australians cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. As noted in the North West Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP, 2018a). This marine park is valued in Indonesian culture as it contains Indonesian artefacts and grave sites. Ashmore lagoon is still accessed as a rest or staging area for traditional Indonesian fishers travelling to and from fishing grounds within the MoU Box.

North West Marine Park Network	IUCN Zones	Description and Values
		Heritage values Ashmore Reef is a Commonwealth Heritage listed site, meeting criteria A, B and C.
		Social and economic values Tourism, recreation and scientific research are important activities in this marine park.
Carnarvon Canyon Marine Park	Habitat Protection (IV)	Description The Carnarvon Canyon Marine Park is located approximately 300 km north-west of Carnarvon. It covers an area of 6177 km ² and a water depth range of 1500–6000 m.
		Natural values This marine park includes ecosystems representative of the Central Western Transition—a bioregion characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities. It includes the Carnarvon Canyon, a single-channel canyon covering the entire depth range of this marine park. Ecosystems of this marine park are influenced by tropical and temperate currents, deep-water environments and proximity to the continental slope and shelf. The soft-bottom environment at the base of the Carnarvon Canyon is likely to support deep seafloor species (e.g. holothurians, polychaetes and sea-pens). This marine park supports a range of species listed under the EPBC Act.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.
		Heritage values No international, Commonwealth or national heritage listings apply to the marine park.
		Social and economic values Commercial fishing is an important activity in the marine park.
Cartier Island Marine Park	Sanctuary (Ia)	Description The Cartier Island Marine Park is located approximately 45 km south-east of Ashmore Reef Marine Park and 610 km north of Broome, Western Australia. Both marine parks are in Australia's External Territory of Ashmore and Cartier Islands and are also within an area subject to a Memorandum of Understanding (MoU) between Indonesia and Australia, known as the MoU Box. The Cartier Island Marine Park covers an area of 172 km ² and water depths from less than 15 m to 500 m.

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural values</p> <p>This marine park includes ecosystems representative of the Timor Province—a bioregion with a depth range from about 200 m near the shelf break to 5,920 m over the Argo Abyssal Plain. The reefs and islands of this bioregion are regarded as biodiversity hotspots.</p> <p>Key ecological features are:</p> <ul style="list-style-type: none"> Ashmore Reef and Cartier Island and surrounding Commonwealth waters continental slope demersal fish communities. <p>There are two distinct demersal fish communities of the continental slope: one on the upper slope, the other mid slope.</p> <p>This marine park includes an unvegetated sand island (Cartier Island), mature reef flat, a small, submerged pinnacle (Wave Governor Bank), and two shallow pools to the north-east of the island. It is also an area of high diversity and abundance of hard and soft corals, gorgonians (sea fans), sponges and a range of encrusting organisms. The reef crests are generally algal dominated, while the reef flats feature ridges of coral rubble and large areas of seagrass.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and foraging habitat for seabirds, interbreeding, nesting and foraging habitat for marine turtles and foraging habitat for whale sharks.</p> <p>This marine park is internationally significant for its abundance and diversity of sea snakes.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP, 2018a).</p> <p>Heritage values</p> <p>This marine park contains one known shipwreck listed under the <i>Historic Shipwrecks Act 1976</i>: the <i>Ann Millicent</i> (wrecked in 1888). No international or national heritage listings apply to this marine park.</p> <p>Social and economic values</p> <p>Scientific research is an important activity in this marine park.</p>
Dampier Marine Park	National Park (II) Habitat Protection (IV) Multiple Use (VI)	<p>Description</p> <p>The Dampier Marine Park is located approximately 10 km North-east of Cape Lambert and 40 km from Dampier, extending from the Western Australian state water boundary. This marine park covers an area of 1252 km² and a water depth range between less than 15 m and 70 m.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural values</p> <p>This marine park includes ecosystems representative of the Northwest Shelf Province—a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and foraging habitat for seabirds, interesting habitat for marine turtles and a migratory pathway for humpback whales.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Ngarluma, Yindjibarndi, Yaburara, and Mardudhunera people have responsibilities for sea country in this marine park. The native title holders for these people are represented by the Ngarluma Aboriginal Corporation and Yindjibarndi Aboriginal Corporation. These Prescribed Bodies Corporate represent traditional owners with native title over coastal areas adjacent to this marine park.</p> <p>The Yamatji Marpa Aboriginal Corporation is the Native Title Representative Body for the Pilbara and Yamatji regions.</p> <p>Heritage values</p> <p>No international, Commonwealth or national listings apply to this marine park, however the marine park is approximately 10 km north of the Dampier Archipelago (including Burrup Peninsula) national heritage listing, which has significant Indigenous heritage values including rock art sites.</p> <p>Social and economic values</p> <p>Port activities, commercial fishing and recreation, including fishing, are important activities in this marine park.</p>
Eighty Mile Beach Marine Park	Multiple Use (VI)	<p>Description</p> <p>The Eighty Mile Beach Marine Park is located approximately 74 km north-east of Port Hedland, adjacent to the Western Australian Eighty Mile Beach Marine Park. This marine park covers an area of 10,785 km² and water depth ranges between less than 15 m and 70 m.</p> <p>Natural values</p> <p>This Marine Park includes examples of ecosystems representative of the Northwest Shelf Province—a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding, foraging and resting habitat for seabirds, interesting and nesting habitat for marine turtles, foraging, nursing and pupping habitat for sawfish and a migratory pathway for humpback whales.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The sea country of the Nyangumarta, Karajarri and Ngarla people extends into the Eighty Mile Beach Marine Park. Sea country is culturally significant and important to their identity. They have an unbroken, deep spiritual connection to their sea country, with traditional practices continuing today. Staple foods of living cultural value for the Nyangumarta, Karajarri and Ngarla people include saltwater fish, turtles, dugong, crabs and oysters. Access to sea country by families is important for cultural traditions, livelihoods and future socio-economic development opportunities.</p> <p>The native title holders for the Nyangumarta, Karajarri and Ngarla people are represented by the Karajarri Aboriginal Corporation, Nyangumarta Karajarri Aboriginal Corporation, Nyangumarta Warrarn Aboriginal Corporation, and Wanparta Aboriginal Corporation. These Prescribed Body Corporates represent traditional owners with native title over coastal area adjacent to the marine park. They are the points of contact for their respective areas of responsibility for sea country in the marine park.</p> <p>The Kimberley Land Council and the Yamatji Marlpa Aboriginal Corporation are the Native Title Representative Bodies for Kimberley and Pilbara regions.</p> <p>Heritage values</p> <p>This marine park contains three known shipwrecks listed under the Historic Shipwrecks Act 1976: <i>Lorna Doone</i> (wrecked in 1923), <i>Nellie</i> (wrecked in 1908), and <i>Tifera</i> (wrecked in 1923).</p> <p>No international, Commonwealth or national listings apply to the marine park.</p> <p>Social and economic values</p> <p>Tourism, commercial fishing, pearling and recreation are important activities in this marine park.</p>
Gascoyne Marine Park	National Park (II) Habitat Protection (IV) Multiple Use (VI)	<p>Description</p> <p>The Gascoyne Marine Park is located approximately 20 km off the west coast of the Cape Range Peninsula, adjacent to the Ningaloo Reef Marine Park and the Western Australian Ningaloo Marine Park and extends to the limit of Australia's exclusive economic zone. This marine park covers an area of 81,766 km² and water depth varies between 15 m and 6000 m.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural values</p> <p>This marine park includes ecosystems representative of:</p> <ul style="list-style-type: none"> • Central Western Shelf Transition—continental shelf with water depths up to 100 m, and a significant transition zone between tropical and temperate species • Central Western Transition—characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, benthic slope communities comprising tropical and temperate species • Northwest Province—an area of continental slope comprising diverse and endemic fish communities. <p>Key ecological features are:</p> <ul style="list-style-type: none"> • canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula • Commonwealth waters adjacent to Ningaloo Reef • continental slope demersal fish communities • Exmouth Plateau. <p>Ecosystems represented in this Marine Park are influenced by the interaction of the Leeuwin Current, Leeuwin Undercurrent and the Ningaloo Current.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding habitat for seabirds, interesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat and migratory pathway for pygmy blue whales.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Gnulli people have responsibilities for sea country in this marine park. The Yamatji Marpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Heritage values</p> <p><i>World heritage</i></p> <p>The Ningaloo Coast was listed as an area of outstanding universal value under the World Heritage Convention in 2011, meeting world heritage listing criteria vii and x. The Ningaloo Coast World Heritage Property is adjacent to the marine park.</p> <p><i>Commonwealth heritage</i></p> <p>The Ningaloo Marine Area (Commonwealth waters) meets the Commonwealth heritage listing criteria A, B and C. The Ningaloo Marine Area is adjacent to the marine park.</p> <p><i>National heritage</i></p> <p>The Ningaloo Coast meets the national heritage listing criteria A, B, C, D, and F and is adjacent to the marine park.</p> <p><i>Historic shipwrecks</i></p> <p>The marine park contains more than five known shipwrecks listed under the Historic Shipwrecks Act 1976.</p> <p>Social and economic values</p> <p>Commercial fishing, mining and recreation are important activities in this marine park.</p>
Kimberley Marine Park	Habitat Protection (IV) National Park (II) Multiple Use (VI)	<p>Description</p> <p>The Kimberley Marine Park is located approximately 100 km north of Broome, extending from the Western Australian state water boundary north from the Lacepede Islands to the Holothuria Banks offshore from Cape Bougainville. This marine park is adjacent to the Western Australian Lalanggarra/Camden Sound Marine Park and the North Kimberley Marine Park. This marine park covers an area of 74,469 km² and water depths from less than 15 m to 800 m.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural Values</p> <p>This marine park includes ecosystems representative of:</p> <ul style="list-style-type: none"> • Northwest Shelf Province—a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and an ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. • Northwest Shelf Transition—straddles the North-west and North Marine Regions and in the Northwest includes shelf break, continental slope, and the majority of the Argo Abyssal Plain and is subject to a high incidence of cyclones. Benthic biological communities in the deeper parts of the bioregion have not been extensively studied, although high levels of species diversity and endemism occur among demersal fish communities on the continental slope. • Timor Province—water depths (of the bioregion) ranging from about 200 m near the shelf break to 5920 m over the Argo Abyssal Plain. The reefs and islands of the bioregion are regarded as biodiversity hotspots. Endemism in demersal fish communities of the continental slope is high; two distinct communities have been identified on the upper and mid slopes. <p>Key ecological features are:</p> <ul style="list-style-type: none"> • ancient coastline at the 125 m depth contour • continental slope demersal fish communities. <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and foraging habitat for seabirds, internesting and nesting habitat for marine turtles, breeding, calving and foraging habitat for inshore dolphins, calving, migratory pathway and nursing habitat for humpback whales, migratory pathway for pygmy blue whales, foraging habitat for dugong and foraging habitat for whale sharks.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Wunambal Gaambera, Dambimangari, Mayala, Bardi Jawi and the Nyul Nyul people's sea country extends into the Kimberley Marine Park. The Wunambal Gaambera people's country includes daagu (deep waters), with about 3400 km² of their sea country located in this marine park. The Wunambal Gaambera, Dambimangari, Mayala, Bardi Jawi and the Nyul Nyul people have an unbroken connection to their sea country, having deep spiritual connection through Wunggurr (creator snakes) that still live in the sea.</p> <p>Staple foods of living cultural value include saltwater fish, turtles, dugong, crabs and oysters. Access to sea country by families is important for cultural traditions, livelihoods and future socio-economic development opportunities.</p> <p>The national heritage listing for the West Kimberley recognises the following key cultural heritage values:</p> <ul style="list-style-type: none"> • Wanjina Wunggurr Cultural Tradition which incorporates many sea country cultural sites • log-raft maritime tradition, which involved using tides and currents to access warruru (reefs) far offshore to fish • interactions with Makassan traders around sea foods over hundreds of years • important pearl resources that were used in traditional trade through the wunan and in contemporary commercial agreements. <p>The Wunambal Gaambera, Dambimangari and Bardi Jawi people consider that these values extend into the Kimberley Marine Park. The Wanjina Wunggurr is law of the Wunambal Gaambera and Dambimangari people and it is recognised that all of the sea country, land, plants and animals were put there by Wanjina Wunggurr. Under Wanjina Wunggurr law, the Wunambal Gaambera and Dambimangari people have a responsibility to manage country, to maintain the health of the country and all living things.</p> <p>The Wunambal Gaambera, Bardi Jawi, Mayala and the Nyul Nyul people have had native title determined over parts of their sea country included in this marine park. The native title holders for these people are represented by the Wunambal Gaambera Aboriginal Corporation, Bardi and Jawi Niimidiman Aboriginal Corporation and the Kimberley Land Council. These representative bodies are the points of contact for their respective areas of sea country for this marine park.</p> <p>The Kimberley Land Council is the Native Title Representative Body for the Kimberley region.</p> <p>Heritage values</p> <p>This Marine Park contains more than 40 known shipwrecks listed under the Historic Shipwrecks Act 1976.</p> <p>No international, Commonwealth or national heritage listings apply to the marine park, however the marine park is adjacent to the national heritage place of the West Kimberley.</p> <p>Social and economic values</p> <p>Tourism, commercial fishing, mining, recreation, including fishing and traditional use, are important activities in this marine park.</p>

North West Marine Park Network	IUCN Zones	Description and Values
Mermaid Reef Marine Park	National Park (II)	Description The Mermaid Reef Marine Park is located approximately 280 km North-west of Broome, adjacent to the Argo–Rowley Terrace Marine Park and approximately 13 km from the Western Australian Rowley Shoals Marine Park. This marine park covers an area of 540 km ² and water depths from less than 15 m to 500 m. Mermaid Reef is one of three reefs forming the Rowley Shoals. The reefs of the Rowley Shoals are significant as they are considered ecological stepping stones for reef species originating in Indonesian/Western Pacific waters, are one of a few offshore reef systems on the NWS, and may also provide an upstream source for recruitment to reefs further south.
		Natural values This marine park includes examples of ecosystems representative of the Northwest Transition—an area of shelf break, continental slope, and the majority of the Argo Abyssal Plain. Together with Clerke Reef and Imperieuse Reef, Mermaid Reef is a biodiversity hotspot and key topographic feature of the Argo Abyssal Plain. A key ecological feature of this marine park is the Mermaid Reef and Commonwealth waters surrounding the Rowley Shoals. Ecosystems of this marine park are associated with emergent reef flat, deep reef flat, lagoon, and submerged sand habitats. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding habitat for seabirds and a migratory pathway for the pygmy blue whale.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP, 2018a).
		Heritage values No international or national listings apply to this marine park. Mermaid Reef–Rowley Shoals was established on the Commonwealth Heritage List in 2004, meeting Commonwealth heritage listing criteria A, B, C and D. This marine park contains one known shipwreck listed under the Historic Shipwrecks Act 1976: <i>Lively</i> (wrecked in 1810).
		Social and economic values Tourism, recreation, and scientific research are important activities in this marine park.
Montebello Marine Park	Multiple Use (VI)	Description The Montebello Marine Park is located offshore of Barrow Island and 80 km west of Dampier extending from the Western Australian State water boundary, and is adjacent to the Western Australian Barrow Island and Montebello Islands marine parks. This marine park covers an area of 3413 km ² and water depths from less than 15 m to 150 m.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural values</p> <p>This marine park includes examples of ecosystems representative of the Northwest Shelf Province—a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities. A key ecological feature of this Marine Park is the ancient coastline at the 125 m depth contour.</p> <p>This marine park supports a range of species listed under the EPBC Act. Ningaloo Marine Park	National Park (II) Recreational Use (IV)	<p>Description</p> <p>The Ningaloo Marine Park stretches approximately 300 km along the west coast of the Cape Range Peninsula, and is adjacent to the Western Australian Ningaloo Marine Park and Gascoyne Marine Park. This marine park covers an area of 2435 km² and a water depth range of 30 m to more than 500 m.</p> <p>This marine park provides connectivity between deeper offshore waters of the shelf break and coastal waters of the adjacent Western Australian Ningaloo Marine Park. It includes some of the most diverse continental slope habitats in Australia, including the continental slope area between North-west Cape and the Montebello Trough. Canyons in this marine park are important for sustaining the nutrient conditions that support the high diversity of Ningaloo Reef.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural values</p> <p>This marine park includes examples of ecosystems representative of:</p> <ul style="list-style-type: none"> • Central Western Shelf Transition—continental shelf of water depths up to 100 m, and a significant transition zone between tropical and temperate species • Central Western Transition—characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities comprising tropical and temperate species • Northwest Province—an area of continental slope comprising diverse and endemic fish communities • Northwest Shelf Province—a dynamic environment, influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. <p>Key ecological features are:</p> <ul style="list-style-type: none"> • canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula • Commonwealth waters adjacent to Ningaloo Reef • continental slope demersal fish communities. <p>Ecosystems represented in this marine park are influenced by interaction of the Leeuwin Current, Leeuwin Undercurrent and the Ningaloo Current.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and/or foraging habitat for seabirds, interesting habitat for marine turtles, a migratory pathway for humpback whales, foraging habitat and migratory pathway for pygmy blue whales, breeding, calving, foraging and nursing habitat for dugong and foraging habitat for whale sharks.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Gnulli people have responsibilities for sea country in this marine park.</p> <p>The Yamatji Marpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Heritage values</p> <p><i>World heritage</i></p> <p>This marine park is within the Ningaloo Coast World Heritage Property, meeting world heritage listing criteria vii and x. The area is valued for high terrestrial species endemism, marine species diversity and abundance, and the interconnectedness of large-scale marine, coastal and terrestrial environments. The area connects the limestone karst system and fossil reefs of the ancient Cape Range to the nearshore reef system of Ningaloo Reef, to the continental slope and shelf in Commonwealth waters.</p> <p><i>National heritage</i></p> <p>The Ningaloo Coast overlaps this marine park, meeting the national heritage listing criteria A, B, C, D, and F.</p> <p><i>Commonwealth heritage</i></p> <p>The Ningaloo Marine Area (Commonwealth waters) meets Commonwealth heritage listing criteria A, B and C. The Ningaloo Marine Area overlaps this marine park.</p> <p><i>Historic shipwrecks</i></p> <p>This marine park contains more than 15 known shipwrecks listed under the Historic Shipwrecks Act 1976.</p> <p>Social and economic values</p> <p>Tourism and recreation, including fishing, are important activities in this marine park.</p>
Roebuck Marine Park	Multiple Use (VI)	<p>Description</p> <p>The Roebuck Marine Park is located approximately 12 km offshore of Broome and is adjacent to the Western Australian Yawuru Nagulagun/Roebuck Bay Marine Park. This marine park covers an area of 304 km² and a water depth range of less than 15 m to 70 m.</p> <p>This marine park is adjacent to the Roebuck Bay Ramsar site, recognised as one of the most important areas for migratory shorebirds in Australia; and the Western Australian Yawuru Nagulagun/Roebuck Bay Marine Park, providing connectivity between offshore and inshore coastal waters of Roebuck Bay.</p> <p>Natural values</p> <p>This marine park includes examples of ecosystems representative of the Northwest Shelf Province—a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and resting habitat for seabirds, foraging and internesting habitat for marine turtles, a migratory pathway for humpback whales and foraging habitat for dugong.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. Yawuru people have always recognised the waters of Roebuck Bay as nagula (Yawuru sea country), and have customary responsibilities to care for it. They have a deep spiritual connection to offshore landscapes from Bugarrigarra (creator beings), and believe that snake-like metaphysical beings inhabit the sea. Cultural sites in sea country are also a source of law. The Yawuru people harvest marine resources according to the six Yawuru seasons. They have harvested pearl shell for food and cultural purposes. Fish are a staple food source, and fishing a form of cultural expression, connecting people to their country, modelled on tradition and based in traditional law. Access to sea country by families is important to cultural traditions, livelihoods and future socio-economic development opportunities. The Yawuru Native Title Holders Aboriginal Corporation is the Prescribed Body Corporate representing traditional owners with native title over coastal areas adjacent to this marine park, and is the point of contact for sea country in this marine park. The Kimberley Land Council is the Native Title Representative Body for the Kimberley region.</p> <p>Heritage values No international, Commonwealth or national listings apply to the marine park, however it is adjacent to the West Kimberley National Heritage Place.</p> <p>Social and economic values Tourism, commercial fishing, pearling and recreation, including fishing, are important activities that occur in the marine park.</p>
Shark Bay Marine Park	Multiple Use (VI)	<p>Description The Shark Bay Marine Park is located approximately 60 km offshore of Carnarvon, adjacent to the Shark Bay world heritage property and national heritage place. This marine park covers an area of 7443 km², extending from the Western Australian State water boundary, and a water depth range between 15 m and 220 m.</p>

North West Marine Park Network	IUCN Zones	Description and Values
		<p>Natural values</p> <p>This Marine Park includes examples of ecosystems representative of:</p> <ul style="list-style-type: none"> • Central Western Shelf—a predominantly flat, sandy and low-nutrient area, in water depths 50–100 m. The bioregion is a transitional zone between tropical and temperate species • Central Western Transition—characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities comprising tropical and temperate species. <p>Ecosystems represented in this marine park are influenced by the Leeuwin, Ningaloo and Capes currents.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding habitat for seabirds, interbreeding habitat for marine turtles, and a migratory pathway for humpback whales. This marine park and adjacent coastal areas are also important for shallow-water snapper.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Gnulli and Malgana people have responsibilities for sea country in this marine park.</p> <p>The Yamatji Marpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to this Marine Park, but this marine park is adjacent to the Shark Bay, Western Australia World Heritage Property and Shark Bay, Western Australia National Heritage Place.</p> <p>The marine park contains approximately 20 known shipwrecks listed under the Historic Shipwrecks Act 1976.</p> <p>Social and economic values</p> <p>Tourism, commercial fishing, mining and recreation, including fishing, are important activities in the marine park.</p>

11.5.2 Indian Ocean Territory

Table 11-2 describes the values of the Indian Ocean territory Australian Marine Parks (Commonwealth of Australia, 2021).

Table 11-2: Summary of Commonwealth marine parks within Indian Ocean territories

Indian Ocean Territory Marine Park	IUCN Zones	Values
Christmas Island Marine Park	National Park (II) Habitat Protection (IV)	Description Christmas Island Marine Park covers an area of 277,016 km ² and extends from the island's shoreline to the limit of Australia's exclusive economic zone, approximately 200 NM from shore (except to the north of Christmas Island). This marine park adjoins the marine boundary of Christmas Island National Park, which extends 50 m seaward from the island. Almost all the island's port is excluded from this marine park, except for a very small and narrow part of the port's western boundary.
		Natural values The tropical waters and fringing coral reefs that surround Christmas Island contain a mix of coral reef species from both the Indian and Pacific Oceans and over 680 species of fish have been recorded in the region. The overlap of these waters gives rise to varieties of hybrid marine fish and some endemic species. Christmas Island also has the world's greatest diversity and abundance of land crabs. The island's waters are essential for the crabs, as they migrate to the coast to breed and release their eggs into the ocean. This marine park contains a range of unique seafloor features, habitats and species, particularly seamounts and deep-sea plains. Biologically important areas include foraging areas for the endemic Abbott's booby, Christmas Island frigatebird and golden bosun and other seabirds that nest on Christmas Island, as well as whale shark feeding areas and southern bluefin tuna breeding habitat.
		Cultural values The ocean is a centrepiece of life for many community members, of Christmas Island including those of Malay and Chinese heritage who maintain strong cultural traditions and connections to the surrounding marine environment.
		Social and economic values This marine park is valued for fishing (commercial, recreational and subsistence), diving, snorkelling and tourism. There is potential for scientific study and educational activities.
Cocos (Keeling) Islands Marine Park	National Park (II) Habitat Protection (IV)	Description Cocos (Keeling) Islands are located around 2,750 km north-west of Perth and the Cocos (Keeling) Islands Marine Park covers a 467,054 km ² area, extending from most of the islands' shoreline to the limit of the Australian exclusive economic zone, approximately 100 NM from shore. The Cocos (Keeling) Islands are a group of 27 tropical low-lying coral islands.

Indian Ocean Territory Marine Park	IUCN Zones	Values
		Natural values The central lagoon system and outer reefs are two of the islands' important habitats. The lagoon encompasses a variety of unique and distinct habitats. This includes seagrass, which is essential for the resident green turtle population (which is a genetically distinct stock that is unique to the islands) as well as for sustaining fish populations. The outer reef habitats are dominated by hard and soft corals and have a high abundance and diversity of reef fish and other species. The offshore waters contain a range of unique seafloor features, habitats, and species, particularly seamounts, deep-sea plains, and a significant deep-sea ridgeline. This marine park also protects the foraging habitat of nesting seabirds on North Keeling Island (Pulu Keeling National Park), as well as species such as dolphins, deep-sea fish and sharks that are or may be threatened elsewhere in the region.
		Cultural values Most of the islands' community members are Cocos Malay, who maintain vibrant and unique cultural traditions including strong cultural connections to the surrounding marine environment. The lagoon and ocean are an important part of life for all community members living on the remote atoll.
		Social and economic values This marine park is valued for recreational and subsistence activities (i.e., fishing, boating, diving, snorkelling, kite surfing, and kayaking), tourism, scientific research, and educational activities.

11.5.3 South-west Marine Parks Network

Table 11-3 describes the Australian Marine Parks within the South-west Marine Parks Network (South-west Network), according to the South West Marine Parks Network Management Plan 2018 (DNP, 2018b).

Table 11-3: Summary of Commonwealth AMPs for the South West Marine Park Network

South West Marine Park Network	IUCN Zones	Natural Values
Abrolhos Marine Park	National Park (II) Habitat Protection (IV) Multiple Use (VI) Special Purpose Zone (Trawl) (VI)	Description The Abrolhos Marine Park is located adjacent to the Western Australian Houtman Abrolhos Islands, covering a large offshore area extending from the Western Australian State water boundary to the edge of Australia's exclusive economic zone. It is located approximately 27 km south-west of Geraldton and extends north to approximately 330 km west of Carnarvon. The northernmost part of the shelf component of the marine park, north of Kalbarri, is adjacent to the Shark Bay World Heritage Area. This marine park covers an area of 88,060 km ² and a water depth range between less than 15 m and 6000 m.

South West Marine Park Network	IUCN Zones	Natural Values
		<p>Natural values</p> <p>This marine park includes ecosystems representative of:</p> <ul style="list-style-type: none"> • Central Western Province—characterised by a narrow continental slope incised by many submarine canyons and the most extensive area of continental rise in any of Australia's marine regions. A significant feature within the area are several eddies that form off the Leeuwin Current at predictable locations, including west of the Houtman Abrolhos Islands. • Central Western Shelf Province— a predominantly flat, sandy and low nutrient area, in water depths between 50 and 100 m. Significant seafloor features of this area include a deep hole and associated area of banks and shoals offshore of Kalbarri. The area is a transitional zone between tropical and temperate species. • Central Western Transition—a deep ocean area characterised by large areas of continental slope, a range of significant seafloor features including the Wallaby Saddle, seasonal and sporadic upwelling, and benthic slope communities comprising tropical and temperate species. • South-west Shelf Transition—a narrow continental shelf that is noted for its physical complexity. The Leeuwin Current has a significant influence on the biodiversity of this nearshore area as it pushes subtropical water southward along the area's western edge. The area contains a diversity of tropical and temperate marine life including a large number of endemic fauna species. <p>Key ecological features are:</p> <ul style="list-style-type: none"> • Commonwealth marine environment surrounding the Houtman Abrolhos Islands • demersal slope and associated fish communities of the Central Western Province • mesoscale eddies • Perth Canyon and adjacent shelf break, and other west-coast canyons • western rock lobster • ancient coastline between 90 m and 120 m depth • Wallaby Saddle. <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging and breeding habitat for seabirds, foraging habitat for Australian sea lions and white sharks, and a migratory pathway for humpback and pygmy blue whales. The marine park is adjacent to the northernmost Australian sea lion breeding colony in Australia on the Houtman Abrolhos Islands.</p>

South West Marine Park Network	IUCN Zones	Natural Values
		<p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Nanda and Naaguja People have responsibilities for sea country in this marine park. Traditional owners have strong stories that connect ocean and land. Artefacts from ancestors are abundant on islands in the adjacent State marine park. The Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.</p>
		<p>Heritage values</p> <p>No international heritage listings apply to this marine park, however this marine park is adjacent to the Western Australian Shark Bay World Heritage Property, listed as an area of outstanding universal value under the World Heritage Convention in 1991, meeting world heritage listing criteria vii, viii, ix, and x.</p> <p>No Commonwealth or national heritage listings apply to this marine park, however this marine park is adjacent to the Western Australian Shark Bay National Heritage Place.</p> <p>This marine park contains 11 known shipwrecks listed under the Historic Shipwrecks Act 1976. The <i>Zuytdorp</i> (wrecked in 1712) historic shipwreck protected zone lies in State waters adjacent to the northernmost part of the shelf component of the marine park, north of Kalbarri. The <i>HMAS Sydney II</i> and <i>HSK Kormoran</i> Shipwreck Sites (1941) lie at 2,500 m depth about 75 km east of the northern part of the marine park. This site is on the National Heritage List and a historic shipwreck protected zone. The <i>Batavia</i> (wrecked on the adjacent Abrolhos Islands in 1629) Shipwreck Site and Survivor Camps Area are on the National Heritage List.</p>
		<p>Social and economic values</p> <p>Tourism, commercial fishing, mining, recreation including fishing, are important activities in the marine park.</p>
Bremer Marine Park	National Park Zone (II) Special Purpose Zone (Mining Exclusion) (VI)	<p>Description</p> <p>The Bremer Marine Park is located approximately half-way between Albany and Esperance, offshore from the Fitzgerald River National Park, extending from the Western Australian State water boundary. This marine park covers an area of 4472 km² and water depths from 15 m to 5000 m.</p>

South West Marine Park Network	IUCN Zones	Natural Values
		<p>Natural values</p> <p>This marine park includes examples of ecosystems representative of:</p> <ul style="list-style-type: none"> • Southern Province—includes the deepest ocean areas of the Australian exclusive economic zone, reaching depths of around 5900 m, and is characterised by a long continental slope incised by numerous, well-developed submarine canyons • South-west Shelf Province—marine life in this area is very diverse and likely influenced by the warm waters of the Leeuwin Current. The sheltered bays along the south coast are important southern right whale calving areas. <p>Key ecological features are:</p> <ul style="list-style-type: none"> • Albany Canyon group and adjacent shelf break • ancient coastline between 90 m and 120 m depth. <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds, Australian sea lions, and white sharks, a migratory pathway for humpback whales, and a significant calving area for southern right whales. This marine park includes canyons—important aggregation areas for killer whales.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Noongar people have responsibilities for sea country in this Marine Park. Local traditional owners recognise Kaart, Koort and Waarnginy (head, heart and talking) as bringing together the narratives and protocols that have been practiced for thousands of years and the kinship that influences all stages and cycles of life. Traditional owners have responsibility for cultural values and are focussed on the creation and regeneration of spiritual, ethical, cultural and practical benefits and opportunities for marine systems.</p> <p>The South West Aboriginal Land and Sea Council is the Native Title Service Provider for the South-west region.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to this marine park.</p> <p>Social and economic values</p> <p>Tourism, commercial fishing and recreation, including fishing, are important activities in this marine park.</p>
Eastern Recherche Marine Park	National Park Zone (II) Special Purpose Zone (VI)	<p>Description</p> <p>The Eastern Recherche Marine Park is located approximately 135 km east of Esperance, adjacent to the Recherche Archipelago, close to the Western Australian Cape Arid National Park. This marine park covers an area of 20,575 km², extending from the Western Australia State water boundary to the edge of Australia's exclusive economic zone, and a water depth range from less than 15 m to 6000 m.</p>

South West Marine Park Network	IUCN Zones	Natural Values
Geographe Marine Park	National Park Zone (II) Habitat Protection (IV) Multiple Use (VI) Special Purpose (Mining Exclusion Zone) (VI)	Description The Geographe Marine Park is located in Geographe Bay, approximately 8 km west of Bunbury and 8 km north of Busselton, adjacent to the Western Australian Ngari Capes Marine Park. This marine park covers an area of 977 km ² , extending from the Western Australian State water boundary, and a water depth range between 15 m and 70 m.
		Natural values This marine park includes examples of ecosystems representative of the South-west Shelf Province—an area of diverse marine life, influenced by the warm waters of the Leeuwin Current. The bioregion includes globally important biodiversity hotspots, such as the waters off Geographe Bay. Key ecological features are: <ul style="list-style-type: none"> • Commonwealth marine environment within and adjacent to Geographe Bay • western rock lobster. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds, a migratory pathway for humpback and pygmy blue whales, and a calving buffer area for southern right whales.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Noongar people have responsibility for sea country in this marine park. Traditional owners have maintained cultural responsibilities for sea country as passed down from elders, to keep the oceans healthy, to support spiritual wellbeing and to uphold and protect obligatory cultural responsibilities for future generations. The South West Aboriginal Land and Sea Council is the Native Title Service Provider for the South-west region.
		Heritage values No international, Commonwealth or national heritage listings apply to this marine park. This marine park contains eight known shipwrecks listed under the Historic Shipwrecks Act 1976.
		Social and economic values Tourism, commercial fishing and recreation, including fishing, are important activities in the marine park.

South West Marine Park Network	IUCN Zones	Natural Values
Great Australian Bight Marine Park	National Park Zone (II) Multiple Use Zone (VI) Special Purpose Zone (Mining Exclusion) (VI) Special Purpose Zone (VI)	<p>Description</p> <p>The Great Australian Bight Marine Park is located approximately 12 km south-east of Eucla and 174 km west of Ceduna, adjacent to the South Australian Far West Coast and Nuyts Archipelago marine parks. This marine park covers an area of 45,822 km², extending from South Australian State water boundary to the edge of Australia's exclusive economic zone, and a water depth range between less than 15 m and 6000 m.</p> <p>Natural values</p> <p>This marine park includes examples of ecosystems representative of:</p> <ul style="list-style-type: none"> Great Australian Bight Shelf Transition—a vast and shallow area, characterised by an extensive area of flat continental shelf. The invertebrate communities that inhabit the seafloor are among the most diverse in the world. The inshore areas of the bioregion are globally important for the threatened southern right whale and the Australian sea lion. Southern Province—includes the deepest ocean areas of the Australian exclusive economic zone, reaching depths of around 5,900 m, and that is characterised by a long continental slope, numerous, well-developed submarine canyons, and extensive mid-slope terraces such as the Ceduna Terrace. <p>Key ecological features are:</p> <ul style="list-style-type: none"> ancient coastline between 90 m and 120 m depth benthic invertebrate communities of the eastern Great Australian Bight small pelagic fish of the South-west Marine Region. <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds, Australian sea lions, white sharks and pygmy blue and sperm whales, and a calving area, migratory pathway and large aggregation area for southern right whales.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Mirning and Wirangu people have responsibilities for sea country in this marine park. The far west coast region of South Australia includes over 1000 km of coastline along the Nullarbor Cliffs of the Great Australian Bight and the Nuyts Archipelago, and supports a sea-based tradition and culture.</p> <p>The Mirning people have a strong connection to land and sea country of the Nullarbor, and the Wirangu people have a strong connection to land and sea country across the remainder of the far west coastal region. Fishing is woven into the beliefs and values of this region, through the use of resources such as shellfish, periwinkles, abalone and razorfish; and the sharing of traditional fishing knowledge, catch and meals. The care and protection of these waters, the coastline, marine life and resources correspond directly with cultural stories, sites and knowledge.</p> <p>South Australian Native Title Services is the native title service provider for the South Australian region.</p>

South West Marine Park Network	IUCN Zones	Natural Values
Murat Marine Park	National Park Zone (II)	Heritage values No international, Commonwealth or national heritage listings apply to this marine park. This marine park contains two known shipwrecks listed under the Historic Shipwrecks Act 1976— <i>SS Cambewarra</i> (wrecked in 1914) and <i>Oleander</i> (wrecked in 1884).
		Social and economic values Tourism, commercial fishing, mining and recreation, including fishing, are important activities in this marine park.
		Description The Murat Marine Park is located 86 km off the west coast south-west of Ceduna, south of the South Australian Nuyts Archipelago Marine Park. This marine park covers an area of 938 km ² and is relatively shallow, with water depths between less than 15 m and 70 m.
		Natural values This marine park includes examples of ecosystems representative of the Great Australian Bight Shelf Transition—a vast and shallow area characterised by an extensive area of flat continental shelf. The invertebrate communities that inhabit the seafloor are among the most diverse in the world. The inshore areas of the bioregion are globally important for the threatened southern right whale and the Australian sea lion. Key ecological features are: <ul style="list-style-type: none"> • benthic invertebrate communities of the eastern Great Australian Bight • small pelagic fish of the South-west Marine Region. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds and Australian sea lions.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Mirning people have a strong attachment to land and sea country of the Nullarbor, while the Wirangu people have a strong attachment to land and sea country across the remainder of the far west coast region. The care and protection of the waters, coastline, marine creatures, marine environments and sea resources correspond directly with cultural stories and important cultural sites and knowledge. South Australian Native Title Services is the native title service provider for the South Australian region.
		Heritage values No international, Commonwealth or national heritage listings apply to this marine park.

South West Marine Park Network	IUCN Zones	Natural Values
		Social and economic values The remoteness of this marine park makes access difficult with most recreational and tourism activities confined to State waters. Commercial ships may pass through this Marine Park to and from the port of Ceduna.
Perth Canyon Marine Park	National Park (II) Habitat Protection (IV) Multiple Use (VI)	Description The Perth Canyon Marine Park is located approximately 52 km west of Perth and approximately 19 km west of Rottnest Island. This marine park covers an area of 7409 km ² and water depths range between 120 m and 5000 m.
		Natural values This marine park includes examples of ecosystems representative of: <ul style="list-style-type: none"> Central Western Province—characterised by a narrow continental slope incised by many submarine canyons, including Perth Canyon, and the most extensive area of continental rise in any of Australia's marine regions. A significant feature within the area are several eddies that form off the Leeuwin Current at predictable locations, including the Perth Canyon. South-west Shelf Province—marine life in this area is diverse and influenced by the warm waters of the Leeuwin Current. South-west Transition—significant features of this area include the submarine canyons that incise the northern parts of the slope and the deep-water mixing that results from the dynamics of major ocean currents when these meet the seafloor, particularly in the Perth Canyon. South-west Shelf Transition—consists of a narrow continental shelf that is noted for its physical complexity. The Leeuwin Current has a significant influence on the biodiversity of this nearshore area as it pushes subtropical water southward along the area's western edge. The area contains a diversity of tropical and temperate marine life including many endemic fauna species. Key ecological features are: <ul style="list-style-type: none"> Perth Canyon and adjacent shelf break, and other west-coast canyons demersal slope and associated fish communities of the Central Western Province western rock lobster mesoscale eddies. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds, Antarctic blue, pygmy blue and sperm whales, a migratory pathway for humpback, Antarctic blue and pygmy blue whales, and a calving buffer area for southern right whales.

South West Marine Park Network	IUCN Zones	Natural Values
		Social and economic values Tourism, commercial fishing and recreation are important activities in this marine park. The Kangaroo Island community values the island's unique qualities and character.
South-west Corner Marine Park	National Park (II) Habitat Protection (IV) Multiple Use (VI) Special Purpose (VI) Special Purpose (Mining Exclusion)	Description The South-west Corner Marine Park is located adjacent to the Western Australian Ngari Capes Marine Park, covering an extensive offshore area that is closest to Western Australia State waters approximately 48 km west of Esperance, 73 km west of Albany and 68 km west of Bunbury, and extends to the edge of Australia's exclusive economic zone. This marine park covers an area of 271,833 km ² and a water depth range from less than 15 m to 6400 m.
		Natural values This marine park includes ecosystems representative of: <ul style="list-style-type: none"> Southern Province—includes the deepest ocean areas of the Australian exclusive economic zone, reaching depths of around 5,900 m, and is characterised by a long continental slope incised by numerous, well-developed submarine canyons and the Diamantina Fracture Zone, a rugged area of deep seafloor comprising seamounts and many ridges and troughs. South-west Transition—the main features of this area are the Naturaliste Plateau, the deepest submarine plateau along Australia's continental margins. The Naturaliste Plateau supports rich and diverse biological communities. Deep-water mixing results from the dynamics of major ocean currents when these meet the seafloor. South-west Shelf Province—marine life in this area is diverse and influenced by the warm waters of the Leeuwin Current. A small upwelling of nutrient-rich water off Cape Mentelle during summer increases productivity locally, attracting aggregations of marine life. Key ecological features are: <ul style="list-style-type: none"> Albany Canyon group and adjacent shelf break Cape Mentelle upwelling Diamantina Fracture Zone Naturaliste Plateau western rock lobster ancient coastline between 90 m and 120 m depth. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds, Australian sea lions, white sharks and sperm whales, a migratory pathway for Antarctic blue, pygmy blue and humpback whales, and a calving buffer area for southern right whales.

South West Marine Park Network	IUCN Zones	Natural Values
Two Rocks Marine Park	Multiple Use (VI)	Heritage values No international, Commonwealth or national heritage listings apply to this marine park.
		Social and economic values Tourism and commercial and recreational fishing are important activities in this marine park.
		Description The Two Rocks Marine Park is located approximately 25 km north-west of Perth, to the north-west of the Western Australian Marmion Marine Park. The marine park covers an area of 882 km ² , extending from the Western Australian State water boundary, and a water depth range from 15 m to 120 m.
		Natural values This marine park includes examples of ecosystems representative of the South-west Shelf Transition—an area of narrow continental shelf that is noted for its physical complexity. The Leeuwin Current has a significant influence on the biodiversity of this nearshore area as it pushes subtropical water southward along the area's western edge. The area contains a diversity of tropical and temperate marine life including endemic fauna species. The inshore lagoons are thought to be important areas for benthic productivity and recruitment for marine species. Key ecological features are: <ul style="list-style-type: none"> • Commonwealth marine environment within and adjacent to the west-coast inshore lagoons • western rock lobster • ancient coastline between 90 m and 120 m depth. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat for seabirds and Australian sea lions, a migratory pathway for humpback and pygmy blue whales, and a calving buffer area for southern right whales.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Swan River traditional owners have responsibilities for sea country in this marine park. Traditional owners have maintained cultural responsibilities for sea country as passed down from elders, to keep the oceans healthy, to support spiritual wellbeing and to uphold and protect obligatory cultural responsibilities for future generations. The South West Aboriginal Land and Sea Council is the Native Title Service Provider for the South-west region.
		Heritage values No international, Commonwealth or national heritage listings apply to this marine park.

South West Marine Park Network	IUCN Zones	Natural Values
		Social and economic values Tourism, commercial fishing, recreation, including fishing, and scientific research are important activities in this marine park.
Western Eyre Marine Park	National Park Zone (II) Multiple Use Zone (VI) Special Purpose Zone (VI) Special Purpose Zone (Trawl) (VI)	Description The Western Eyre Marine Park is located approximately 123 km ² south-west of Port Lincoln and 28 km west of Streaky Bay, adjacent to South Australia's Investigator, West Coast Bays and Nuyts Archipelago marine parks. This marine park covers an area of 57,944 km ² , extending from the South Australian State water boundary to the edge of Australia's exclusive economic zone, and water depths range between 15 m and more than 6000 m. Natural values This marine park includes ecosystems representative of: <ul style="list-style-type: none"> • Spencer Gulf Shelf—seasonal winds and ocean currents interact with seafloor features to produce a number of small seasonal upwellings that are important for biological productivity. The area is noted for its very diverse seafloor communities, productivity hotspots and aggregations of marine life associated with seasonal upwellings of nutrient-rich water. • Great Australian Bight Shelf Transition—a vast and shallow area, characterised by an extensive area of flat continental shelf. The invertebrate communities that inhabit the seafloor are among the most diverse in the world. The inshore areas of the bioregion are globally important for the threatened southern right whale and the Australian sea lion. • Southern Province—includes the deepest ocean areas of the Australian exclusive economic zone, reaching depths of around 5,900 m, and is characterised by a long continental slope; numerous, well-developed submarine canyons; and extensive mid-slope terraces such as the Ceduna Terrace. Key ecological features are: <ul style="list-style-type: none"> • ancient coastline between 90 m and 120 m depth • Kangaroo Island Pool, canyons and adjacent shelf break, and Eyre Peninsula upwellings • mesoscale eddies • benthic invertebrate communities of the eastern Great Australian Bight • small pelagic fish of the South-west Marine Region. This marine park provides connectivity between deeper offshore waters and the adjacent South Australian Investigator, West Coast Bays and Nuyts Archipelago Marine Parks. Waters surrounding the Nuyts Archipelago and Investigator Group form part of the ecologically important offshore islands that protect the coastline. This marine park is a hotspot for productivity, with feeding aggregations of marine mammals, sharks and seabirds. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and foraging habitat for seabirds, foraging habitat for Australian sea lions, white sharks and pygmy blue and sperm whales, and a calving buffer area for southern right whales.

11.5.4 North Marine Park Network

Table 11-4 describes the Commonwealth marine parks within the North Marine Park Network according to the North Marine Park Network Management Plan 2018 (DNP, 2018c).

Table 11-4: Summary of Commonwealth AMPs for the North Marine Park Network

North Marine Park Network	IUCN Zones	Values
Arafura Marine Park	Multiple Use Zone (VI) Special Purpose Zone (VI)	<p>Description The Arafura Marine Park is located approximately 256 km north-east of Darwin and 8 km offshore of Croker Island, Northern Territory. It extends from Northern Territory waters to the limit of Australia's exclusive economic zone. This marine park covers an area of 22,924 km², and a water depth range from less than 15 m to 500 m.</p>

North Marine Park Network	IUCN Zones	Values
	Special Purpose Zone (Trawl) (VI)	<p>Natural values</p> <p>The Arafura Marine Park includes examples of ecosystems representative of:</p> <ul style="list-style-type: none"> Northern Shelf Province—a dynamic region, with gently sloping shelf topped with a number of pinnacles at depths ranging from 5 m to 30 m. Tidal eddies induce localised upwellings and hotspots of productivity, which correspond with aggregations of marine life within this Marine Park. Timor Transition Province—includes continental slope, canyons, ridges, terraces and the Arafura Depression. The primary drivers of biological productivity are associated with deep water upwellings at canyon heads, driven by strong tides. <p>The key ecological feature in this marine park is the tributary canyons of the Arafura Depression. The canyons channel deep ocean waters, enhancing productivity and supporting large predatory fish, whale sharks, sawfish and marine turtles, deep sea sponges, and barnacles.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include interesting habitat for marine turtles and important foraging and breeding habitat for seabirds.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Yuwurrumu members of the Mandilarri-Ildugij, the Mangalara, the Murran, the Gadura-Minaga and the Ngaynjaharr clans have responsibilities for sea country in this marine park. These clans have native title determined over part of their sea country, which is included in this marine park. The Northern Land Council is the Native Title Representative Body for the Northern Territory's northern region and is assisting these native title holders in the absence of a native title Prescribed Body Corporate. It is the point of contact for this marine park.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to this marine park.</p> <p>Social and economic values</p> <p>Commercial fishing, tourism, and recreation, including fishing, are important activities in this marine park.</p>
Arnhem Marine Park	Special Purpose Zone (VI)	<p>Description</p> <p>The Arnhem Marine Park is located approximately 100 km south-east of Croker Island and 60 km south-east of the Arafura Marine Park. It extends from Northern Territory waters surrounding the Goulburn Islands, to the waters north of Maningrida. This marine park covers an area of 7125 km² and water depth ranges from less than 15 m to 70 m.</p>

North Marine Park Network	IUCN Zones	Values
		<p>Natural values</p> <p>This marine park includes ecosystems representative of the Northern Shelf Province. Internal currents in the region drive a net clockwise movement of nutrient-rich coastal water contributing to high biological diversity. Tidal eddies induce localised upwellings and hotspots of productivity that correspond with aggregations of marine life within this marine park. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging habitat and a migratory pathway for marine turtles and seabirds.</p>
Gulf of Carpentaria Marine Park	National Park Zone (II) Special Purpose Zone (Trawl) (VI)	<p>Description</p> <p>The Gulf of Carpentaria Marine Park is located approximately 90 km north-west of Karumba, Queensland and is adjacent to the Wellesley Islands in the south of the Gulf of Carpentaria basin. This Marine Park covers an area of 23,771 km² and water depths range from less than 15 m to 70 m.</p> <p>Natural values</p> <p>This marine park includes ecosystems representative of the Northern Shelf Province—a dynamic region with a gently sloping shelf topped with a number of pinnacles at depths ranging from 5 m to 30 m. Tidal eddies induce localised upwellings and hotspots of productivity that correspond with aggregations of marine life within the marine park.</p> <p>Key ecological features are:</p> <ul style="list-style-type: none"> • Gulf of Carpentaria basin • Gulf of Carpentaria coastal zone • plateaux and saddle north-west of the Wellesley Islands • submerged coral reefs of the Gulf of Carpentaria. <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and foraging areas for seabirds and interesting and foraging areas for turtles.</p>

North Marine Park Network	IUCN Zones	Values
		<p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Lardil, Yangkaal, Kaiadlit and Gangalidda people of the Wellesley Islands have a continuing spiritual connection with their sea country and responsibilities for managing that country. They have had their native title rights recognised.</p> <p>Both the Thuwathu-Bujimulla Indigenous Protected Area (IPA) and the Wellesely Island Sea Claim determination extend over part of the Gulf of Carpentaria Marine Park. The Thuwathu-Bujimulla IPA includes 160 sites of cultural heritage significance and the largest collection of stone fish traps in the southern hemisphere.</p> <p>The Lardil, Yangkaal, Kaiadlit and Gangalidda people of the Wellesley Islands hold a wealth of cultural knowledge about their islands and sea country. They recognise the presence of the Rainbow Serpent (Thuwathu or Bujimulla) in cyclones, waterspouts and rainbows, and understand that the Rainbow Serpent has the power to cause a special type of sickness known as Markiriil in Lardil. They also consider that there are dangerous places on their country where spirits can do you harm if you are not accompanied by the right people for that area. Many prominent marine features, such as reefs, rocks, oyster banks or sand bars have their own specific names. Among these named sites are special 'story places', where significant events happened in the past, where people carry out ritual activities to maintain particular animal or plant species, or which are responsible for making tidal floods, cyclones or strong winds.</p> <p>The Lardil people, as the traditional owners of Mornington Island and surrounding sea country, are recognised as the people of the Wellesley Islands with the authority to speak for sea country within the Gulf of Carpentaria Marine Park. The Gulf Region Aboriginal Corporation Prescribed Body Corporate represents the Lardil, Yangkaal, Kaiadlit and Gangalidda native title holders of the Wellesley Islands and is the point of contact for this Marine Park. The Carpentaria Land Council Aboriginal Corporation is the Native Title Representative Body for the region.</p> <p>Heritage values</p> <p>This marine park contains four known shipwrecks listed under the Historic Shipwrecks Act 1976—<i>Douglas Mawson</i> (wrecked in 1923); <i>A.D.C.</i> (wrecked in 1886); <i>Wild Duck</i> (wrecked in 1876); and <i>Ada</i> (wrecked 1886).</p> <p>No international, Commonwealth or national heritage listings apply to this marine park.</p> <p>Social and economic values</p> <p>Commercial fishing, tourism, and recreation, including fishing, are important activities in this marine park.</p>
Limmen Marine Park	Habitat Protection Zone (IV)	<p>Description</p> <p>The Limmen Marine Park is located approximately 315 km south-west of Nhulunbuy, Northern Territory, in the south-west of the Gulf of Carpentaria. It extends from Northern Territory waters, between the Sir Edward Pellew Group of Islands and Maria Island in the Limmen Bight, adjacent to the Northern Territory Limmen Bight Marine Park. This marine park covers an area of 1399 km² and water depths range from less than 15 m to 70 m.</p>

North Marine Park Network	IUCN Zones	Values
		<p>Natural values</p> <p>This marine park includes examples of ecosystems representative of the Northern Shelf Province—a dynamic region with gently sloping shelf, topped with a number of pinnacles at depths ranging from 5 m to 30 m. Tidal eddies induce localised upwellings and hotspots of productivity that correspond with aggregations of marine life within this marine park.</p> <p>The key ecological feature in this marine park is the Gulf of Carpentaria coastal zone—nutrients from rivers flowing into the coastal zone support high productivity and diverse biota. A prominent seafloor feature within this marine park is the Labyrinthian Shoals, a group of sand banks, some with rocky heads, in depths of less than 1.8 m.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include interesting and foraging habitat for marine turtles.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Marra people have responsibilities for sea country in this marine park, and share song-lines that travel through this Marine Park with the Yanyuwa People. The Northern Land Council is the Native Title Representative Body for the Northern Territory's northern region.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to this marine park.</p> <p>Social and economic values</p> <p>Commercial fishing, tourism, and recreation, including fishing, are important activities in this marine park.</p>
Wessel Marine Park	Habitat Protection Zone (IV) Special Purpose Zone (Trawl) (VI)	<p>Description</p> <p>The Wessel Marine Park is located approximately 22 km east of Nhulunbuy, Northern Territory. It extends from Northern Territory waters adjacent to the tip of the Wessel Islands to Northern Territory waters adjacent to Cape Arnhem. This marine park covers an area of 5908 km² and water depths between 15 m and 70 m.</p>

North Marine Park Network	IUCN Zones	Values
		<p>Natural values</p> <p>This marine park includes examples of ecosystems representative of the Northern Shelf—a dynamic region with gently sloping shelf topped with a number of pinnacles at depths ranging from 5 m to 30 m. Tidal eddies induce localised upwellings and hotspots of productivity that correspond with aggregations of marine life within this marine park.</p> <p>The key ecological feature in this marine park is the Gulf of Carpentaria basin—characterised by soft sediments that support abundant and diverse communities dominated by polychaetes, crustaceans, molluscs and echinoderms, with pelagic fish species such as shark, snapper, tuna and mackerel.</p> <p>This marine park overlaps the Arafura Sill, which is a seafloor barrier that restricts movement of water into the Gulf of Carpentaria basin and forms a distinct biogeographical transition point for sessile invertebrate (e.g. sponges and corals) and fish species.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding habitat for seabirds and interesting and foraging habitat for marine turtles.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>The Yolngu people have responsibilities for sea country in this marine park. This marine park contains sites which are registered under the Northern Territory Aboriginal Sacred Sites Act 1989 (NT). The Northern Land Council is the Native Title Representative Body for the Northern Territory's northern region.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to this marine park.</p> <p>Social and economic values</p> <p>Commercial fishing, tourism, and recreation, including fishing, are important activities in this marine park.</p>
West Cape York Marine Park	National Park Zone (II) Habitat Protection Zone (IV) Special Purpose Zone (VI)	<p>Description</p> <p>The West Cape York Marine Park is located adjacent to the northern end of Cape York Peninsula approximately 25 km south-west of Thursday Island and 40 km north-west of Weipa, Queensland. It extends from Queensland State waters to the limit of Australia's exclusive economic zone. This Marine Park covers an area of 16,012 km² and water depths range from less than 15 m to 70 m.</p>

North Marine Park Network	IUCN Zones	Values
		<p>Natural values</p> <p>This marine park includes ecosystems representative of:</p> <ul style="list-style-type: none"> Northeast Shelf Transition—includes continental shelf, shallow water depths and high bottom salinity. It is influenced by tidal currents and has sandy substrates and reefs supporting benthic marine communities, reef-dwelling and pelagic species. Northern Shelf Province—a dynamic region with gently sloping shelf topped with a number of pinnacles at depths ranging from 5 m to 30 m. Tidal eddies induce localised upwellings and hotspots of productivity that correspond with aggregations of marine life within this marine park. <p>Key ecological features are:</p> <ul style="list-style-type: none"> Gulf of Carpentaria basin Gulf of Carpentaria coastal zone. <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include breeding and foraging habitat for seabirds, interesting and foraging habitat for marine turtles and dugong, and foraging, breeding and calving habitat for dolphins.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years.</p> <p>Torres Strait Islanders and coastal First Nations people of the west coast of Cape York have responsibilities for sea country in this marine park.</p> <p>The Cape York Land Council is the Native Title Representative Body for the Cape York region, which includes most of this marine park. The Carpentaria Aboriginal Land Council and the Torres Strait Regional Authority also perform the function of Native Title Representative Bodies for parts of this marine park.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to the marine park.</p> <p>The marine park contains one known shipwreck listed under the Historic Shipwrecks Act 1976.</p> <p>Social and economic values</p> <p>Commercial fishing, tourism, and recreation, including fishing, are important activities in this marine park.</p>
Oceanic Shoals	National Park Zone (II) Multiple Use (VI) Oceanic Shoals Special Purpose (Trawl) (VI)	<p>Description</p> <p>The Oceanic Shoals Marine Park is located west of the Tiwi Islands, approximately 155 km north-west of Darwin, Northern Territory and 305 km north of Wyndham, Western Australia. It extends to the limit of Australia's exclusive economic zone.</p> <p>The marine park covers an area of 71,743 km² and water depths from less than 15 m to 500 m.</p>

North Marine Park Network	IUCN Zones	Values
	Habitat Protection (IV)	Natural values This marine park includes ecosystems representative of the Northwest Shelf Transition—a dynamic environment influenced by strong tidal currents, upwellings of nutrient-rich waters, and a range of prominent seafloor features. The pinnacles, carbonate banks and shoals are sites of enhanced biological productivity. Key ecological features are: <ul style="list-style-type: none"> • carbonate bank and terrace systems of the Van Diemen Rise • carbonate bank and terrace system of the Sahul Shelf • pinnacles of the Bonaparte Basin • shelf break and slope of the Arafura Shelf. This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this marine park include foraging and interesting habitat for marine turtles.
		Cultural values Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. At the commencement of this plan, there was limited information about the cultural significance of this marine park. The Northern Land Council and the Kimberley Land Council are the Native Title Representative Bodies for the Northern Territory's northern region, and the Kimberley region. The Tiwi Land Council collectively represents traditional owners of the Tiwi Islands.
		Heritage values No international, Commonwealth or national heritage listings apply to this marine park.
		Social and economic values Commercial fishing and mining are important activities in this marine park.
Joseph Bonaparte Gulf Marine Park	Multiple Use Zone (VI) Special Purpose Zone (VI) (NMR only)	Description The Joseph Bonaparte Gulf Marine Park is located approximately 15 km west of Wadeye, Northern Territory, and approximately 90 km north of Wyndham, Western Australia, in the Joseph Bonaparte Gulf. It is adjacent to the Western Australian North Kimberley Marine Park. This marine park covers an area of 8597 km ² and water depth ranges between less than 15 m and 100 m.

North Marine Park Network	IUCN Zones	Values
		<p>Natural values</p> <p>This marine park includes examples of ecosystems representative of the Northwest Shelf Transition—a dynamic environment influenced by strong tidal currents, monsoonal winds, cyclones and wind generated waves. The large tidal ranges and wide intertidal zones near this marine park create a physically dynamic and turbid marine environment.</p> <p>The key ecological feature in this marine park is the carbonate bank and terrace system of the Sahul Shelf—characterised by terraces, banks, channels and valleys supporting sponges, soft corals, sessile filter feeders, polychaetes and ascidians.</p> <p>This marine park supports a range of species listed under the EPBC Act. Biologically important areas within this Marine Park include foraging habitat for marine turtles and the Australian snubfin dolphin.</p> <p>Cultural values</p> <p>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. The Miriuwung, Gajerrong, Doolboong, Wardenybeng and Gija and Balangarra people have responsibilities for sea country in this marine park. They are represented by the following Prescribed Bodies Corporate: Miriuwung and Gajerrong Aboriginal Corporation, and Balangarra Aboriginal Corporation. These corporations are the points of contact for their respective areas of sea country in this marine park. The Northern Land Council and the Kimberley Land Council are the Native Title Representative Bodies for the Northern Territory's northern region, and the Kimberley region.</p> <p>Heritage values</p> <p>No international, Commonwealth or national heritage listings apply to this marine park, however this marine park is adjacent to the West Kimberley National Heritage Place.</p> <p>Social and economic values</p> <p>Tourism, commercial fishing, mining, and recreation including fishing, are important activities in this marine park.</p>

APPENDIX U No Threatened Ecological Communities (TECs) as listed under the EPBC Act are known to occur within the marine waters of the NWMR, or NMR as indicated by the PMST Reports (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR)

). The Monsoon vine thickets (which is a TEC) occurs on the coastal dunes of Dampier Peninsula (NWMR). The subtropical and temperate coastal saltmarsh (which is a TEC) occurs within the marine water of the SWMR. Both TECs are described in Table 11-5.

Table 11-5: Summary of threatened ecological communities within the NWMR, NMR and SWMR

Threatened Ecological Community	Description	Conservation Values
<i>Threatened Ecological Communities in the NWMR</i>		
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	<p>The ecological community represents certain occurrences of monsoon vine thickets in the southwest Kimberley region of Western Australia, predominantly restricted to the coastlines of the Dampier Peninsula from Broome in the south to One Arm Point in the north and on the northeastern coast of the Peninsula from One Arm Point to Goodenough Bay (DSEWPac, 2013d).</p> <p>The TEC occurs as discontinuous patches of dense vegetation and contains approximately 23% of vascular plant species that occur on the Dampier Peninsula. The ecological community contains deciduous, semi-deciduous and evergreen perennial flora species (DSEWPac, 2013d).</p>	<p>The Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula ecological community is listed as endangered (DSEWPac, 2013d).</p> <p>The extent of the ecological community corresponds to country (the traditional lands) of the Bardi Jawi, Djabera Djabera, Goolaraballoo, Jabirr Jabirr, Nyul Nyul and Yawuru Indigenous people. The ecological community is of cultural significance (DSEWPac, 2013d).</p> <p>Patches of the TEC operate as an ecological network with birds, mammals and frugivore species providing connectivity. The vegetation provides refuge for animals (DSEWPac, 2013d).</p>
<i>Threatened Ecological Communities in the NMR</i>		
N/A		

Threatened Ecological Communities in the SWMR		
Subtropical and Temperate Coastal Saltmarsh	<p>The ecological community spans six state jurisdictions: Queensland (southern), New South Wales, Victoria, Tasmania, South Australia and Western Australia (south-western) (DSEWPaC, 2013c). The TEC occupies a relatively narrow strip along the Australian coast, in areas which have an intermittent or regular tidal influence.</p> <p>The coastal saltmarsh community consists mainly of salt-tolerant vegetation including grasses, herbs, sedges, rushes and shrubs (Adam, 1990 cited in DSEWPaC, 2013c).</p>	<p>The Subtropical and Temperate Coastal Saltmarsh TEC is listed as vulnerable (DCCEEW, 2023a). This TEC consists of organisms including and associated with saltmarsh in coastal regions of sub-tropical and temperate Australia (DSEWPaC, 2013c).</p> <p>A wide range of infaunal and epifaunal invertebrates and low and high tide visitors such as fish, birds and prawns also inhabit the TEC (DSEWPaC, 2013c). It is reported as an important nursery habitat for fish and prawn species. The dominant marine residents are benthic invertebrates, including molluscs and crabs (Ross et al., 2009 cited in DSEWPaC, 2013c) with insects also abundant and considered an important food source for fauna (DSEWPaC, 2013c).</p>

11.7 Australian Whale Sanctuary

The Australian Whale Sanctuary has been established to protect all whales and dolphins found in Australian waters. Under the EPBC Act all cetaceans (whales, dolphins and porpoises) are protected in Australian waters.

The Australian Whale Sanctuary includes all Commonwealth waters from the three nautical mile State/Territory waters limit out to the boundary of the economic exclusion zone (i.e. out to 200 NM and further in some places). Within the Australian Whale Sanctuary it is an offence to kill, injure or interfere with a cetacean. Severe penalties apply to anyone convicted of such offences.

11.8 State Marine Parks and Reserves

State Marine Parks and Reserves, proclaimed under the Conservation and Land Management Act 1984 (WA) (CALM Act), are located in State waters and vested in the WA Conservation and Parks Commission. State Marine Parks and Reserves of Western Australia have been considered, with 10 occurring in the NWMR (Table 11-6) and six occurring in the SWMR (Table 11-7).

Three new marine parks were established in 2022 in the Buccaneer Archipelago of the Kimberley. Boundaries commenced on July 1, 2023. The parks have been co-designed and are joint-managed by Traditional Owners, alongside with the Department of Biodiversity, Conservation and Attractions (DBCA, 2021b). The three new marine parks are:

- Bardi Jawi Gaarra Marine Park
- Lalang-gaddam Marine Park (formed from the amalgamation of Lalang-garram/Camden Sound Marine Park, Lalang-garram/Horizontal Falls Marine Park, North Lalang-garram Marine Park and Maiyalam Marine Park along Western Australia's Kimberley Coast)
- Mayala Marine Park.

There is a marine park to be defined in the Exmouth Gulf (EPA, 2022). The Exmouth Gulf Taskforce Interim Report to the Minister for Environment (DWER, 2023) outlines the values and recommended management approach of the Exmouth Gulf Marine Park.

11.9 Summary of Protected Areas Within the NWMR

Table 11-6: Protected areas within the NWMR

Protected Area	Woodside Activity Area			IUCN Protected Area Category* or Relevant Park Zone	Description and Values
	Browse	NWS/S	NW Cape		
World Heritage Properties					
Shark Bay World Heritage Property	-	-	✓		Description The Shark Bay World Heritage Property is adjacent to the Shark Bay AMP and was included on the World Heritage List in 1991 (UNESCO, 1991).
					Conservation Values Universal values of the Shark Bay World Heritage Property include large and diverse seagrass beds, stromatolites and populations of dugong and threatened species. Inscribed under Natural Criteria vii, viii, ix and x (UNESCO, 1991).
The Ningaloo Coast World Heritage Property	-	-	✓		Description The Ningaloo Coast World Heritage Property is approximately 710,000 ha and lies within the Ningaloo AMP and was included on the World Heritage List in 2011 (UNESCO, 2011).
					Conservation Values Universal values of the Ningaloo Coast World Heritage Property include high marine species diversity and abundance; in particular, Ningaloo Reef supports both tropical and temperate marine reptiles and mammals. Inscribed under Natural Criteria vii and x (UNESCO, 2011).
National Heritage Places – Natural					
Shark Bay	-	-	✓		Description The Shark Bay National Heritage Place consists of the same area included in the Shark Bay World Heritage Property (refer above) and was established on the National Heritage List in 2007 (DEC, 2008).

					Conservation Values This national heritage place has a number of exceptional natural features, including one of the largest and most diverse seagrass beds in the world, colonies of stromatolites and rich marine life including a large population of dugongs, and also provides a refuge for a number of other globally threatened species. Shark Bay meets the national heritage listing criteria a, b, c, d, e, f, g, h and I (DEC, 2008).
The Ningaloo Coast	-	-	✓		Description The Ningaloo Coast National Heritage Place consists of the same area included in the Ningaloo Coast World Heritage Property (refer above) and was established on the National Heritage List in 2010 (Commonwealth of Australia, 2010). Natural Values The Ningaloo Coast contains one of the best developed near-shore reefs in the world, being home to rugged limestone peninsulas, spectacular coral and sponge gardens and the whale shark. The Ningaloo Coast meets the national heritage listing criteria a, b, c, d, and f (Commonwealth of Australia, 2010).
The West Kimberley	✓	✓	-		Description The West Kimberley National Heritage Place covers an area of around 192,000 km ² located in the north-west of Australia from Broome to Wyndham, and was established on the National Heritage List in 2011 (Commonwealth of Australia, 2011). Conservation Values The Kimberley plateau, north-western coastline and northern rivers of the West Kimberley provide a vital refuge for many native plants and animals that are found nowhere else or which have disappeared from much of the rest of Australia. In addition, Roebuck Bay is internationally recognised as one of Australia's most significant sites for migratory wading birds. This national heritage place also contains a remarkable history of First Nations occupation, with many places of indigenous sacred value. The West Kimberley meets the national heritage listing criteria a, b, c, d, e, f, g, h and I (Commonwealth of Australia, 2011).

Commonwealth Heritage Places – Natural					
Mermaid Reef – Rowley Shoals	-	✓	-		Description The Mermaid Reef – Rowley Shoals Commonwealth Heritage Place is located within the boundary of the Mermaid Reef Marine National Nature Reserve. The site was listed as a Commonwealth Heritage Place in 2004 (DCCCEEW, n.d.-a).
					Conservation Values The Mermaid Reef-Rowley Shoals Commonwealth Heritage Place is regionally important for the diversity of its fauna and together with Clerke and Imperieuse reefs, has biogeographical significance due to the presence of species which are at, or close to, the limits of their geographic ranges, including fishes known previously only from Indonesian waters. Rowley Shoals is important for benchmark studies as one of the few places off the north-west coast of Western Australia which have been the site of major biological collection trips by the WA Museum (DCCCEEW, n.d.-a).
Ashmore Reef National Nature Reserve	✓	-	-		Description The Ashmore Reef Commonwealth Heritage Place is located within the boundary of the Ashmore Reef Marine Park (refer AMPs below). The site was listed as a Commonwealth Heritage Place in 2004 (DCEEW, n.d-d).
					Conservation Values Ashmore Reef has major significance as a staging point for wading birds migrating between Australia and the Northern Hemisphere and supports high concentrations of breeding seabirds, many of which are nomadic and typically breed on small isolated islands. Ashmore Reef is an important scientific reference area for migratory seabirds, sea snakes and marine invertebrates. The Ashmore Reef Commonwealth Heritage Place is significant for its history of human occupation and use. The island is believed to have been visited by Indonesian fisherman since the early eighteenth century. The islands were used both for fishing and as a staging point for voyages to the southern reefs off Australia’s coast (DCEEW, n.d-d).

					<p>Conservation Values</p> <p>The Yampi Defence Area occurs at the confluence of three biogeographic regions in the North-west of Australia. It exhibits diverse landforms, soils, and vegetation representative of the sandstone plateaux of the wetter areas of the North-west Kimberley to the broad plains and pindin scrub of the drier areas in the South-west Kimberley. The Yampi peninsula contains one of the richest amphibian records in the Kimberley.</p> <p>The Yampi Defence Area meets the Commonwealth heritage listing criteria a,b,c (DCCEEW, n.d.-c).</p>
Learmonth Air Weapons Range Facility	-	-	✓		<p>Description</p> <p>Located along the Ningaloo coastline, the Learmonth Air Weapons Range Facility was one of Australia's most active bombing ranges until 1990. It is of considerable importance in documenting sea level and landform changes since the late Cenozoic period (DCCEEW, n.d.-b).</p> <p>Conservation Values</p> <p>The area includes an ancient reef complex and cave fauna that is of exceptional importance. The ages of the reef terraces are key to understanding the timing of uplift events.</p> <p>The Learmonth Air Weapons Range Facility meets the Commonwealth heritage listing criteria a,b,c (DCCEEW, n.d.-b).</p>

Wetlands of International Importance (Ramsar)					
Ashmore Reef National Nature Reserve	✓	-	-	Ramsar	Description The Ashmore Reef Ramsar site is located within the boundary of the Ashmore Reef Marine Park (refer AMPs below). The site was listed under the Ramsar Convention in 2002 (Commonwealth of Australia, 2002b).
					Conservation Values The Ashmore Reef Ramsar site supports internationally significant populations of seabirds and shorebirds, is important for turtles (green, hawksbill and loggerhead) and dugong, and has the highest diversity of hermatypic (reef-building) corals on the Western Australian coast. It is known for its abundance and diversity of sea snakes. However, since 1998 populations of sea snakes at Ashmore Reef have been in decline (Commonwealth of Australia, 2002b).
					Cultural Values Indonesian fishers have regularly visited Ashmore Reef since the early eighteenth century to fish within the area and use the islands for staging points before travelling to other reefs in the region. Indonesian artefacts have been found on Cartier Island, and West, Middle and East Islands (Commonwealth of Australia, 2002b).
Eighty Mile Beach	-	✓	-	Ramsar	Description The Eighty Mile Beach Ramsar site covers an area of 1250 km ² , located along a long section of the Western Australian coastline adjacent to the Eighty Mile Beach AMP (refer below) (CALM, 2003a).
					Conservation Values The Eighty Mile Beach Ramsar site includes saltmarsh and a raised peat bog more than 7000 years old. The site contains the most important wetland for waders in north-western Australia, supporting up to 336,000 birds, and is especially important as a land fall for waders migrating south for the austral summer (CALM, 2003a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Roebuck Bay	-	✓	-	Ramsar	<p>Description</p> <p>The Roebuck Bay Ramsar site covers an area of 550 km², located south of Broome and adjacent to the Roebuck AMP (refer below) (CALM, 2003b).</p> <p>Conservation Values</p> <p>The Roebuck Bay Ramsar site is recognised as one of the most important areas for migratory shorebirds in Australia. The site regularly supports over 100,000 waterbirds, with numbers being highest in the austral spring when migrant species breeding in the Palearctic stop to feed during migration.</p> <p>Roebuck Bay supports one of the largest known populations of Australian snubfin dolphins (<i>Orcaella heinsohni</i>)—a species with a limited distribution, vulnerable conservation status, and high cultural value (CALM, 2003a; D'Cruz <i>et.al.</i>, 2022).</p>
Ord River Floodplain	✓			Ramsar	<p>Description</p> <p>The Ord River Floodplain Ramsar site is in the East Kimberley region and encompasses an extensive system of river, seasonal creek, tidal mudflat, and floodplain wetlands. The site is a nursery, feeding and/or breeding ground for migratory birds, waterbirds, fish, crabs, prawns, and crocodiles. The site supports vulnerable species under the EPBC Act, including: Freshwater Sawfish (<i>Pristis microdon</i>), Green Sawfish (<i>Pristis zijsron</i>) and the Australian Painted Snipe (<i>Rostratula australis</i>). The site is also one of the only two known habitats in WA of the nationally endangered Northern River Shark (<i>Glyphis garricki</i>) (DCCEEW, 2019a).</p> <p>Conservation Values</p> <p>The site represents the best example of wetlands associated with the floodplain and estuary of a tropical river system in the Tanami-Timor Sea Coast Bioregion in the Kimberley.</p> <p>In addition, the False Mouths of the Ord are the most extensive mudflat and tidal waterway complex in Western Australia (DCCEEW, 2019a).</p>

Wetlands of National Importance (DAWE, 2019)					
Ashmore Reef	✓	-	-		Description Ashmore Reef is a shelf-edge platform reef located among the Sahul Banks of north-western Australia. It covers an area of 583 km ² and consists of three islets surrounded by intertidal reef and sand flats (DCCEEW, 2019b).
					Conservation Values These islets are major seabird nesting sites with 20 breeding species recorded to date. The total bird population has been estimated to exceed 100,000 during the peak breeding season. The marine reserve also has the highest diversity of marine fauna of the reefs on the NWS and differs from other reefs and coastal areas in the region. The area meets criteria 1, 3, 4 and 5 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).
Mermaid Reef	-	✓	-		Description Mermaid Reef Marine Park covers an area of around 540 km ² , located ~280 km west north-west of Broome, and is the most north-easterly atoll of the Rowley Shoals (DCCEEW, 2019b).
					Conservation Values The reefs of the Mermaid Reef Marine Park have biogeographic value due to the presence of species that are at or close to the limit of their distribution. The coral communities are one of the special values of Mermaid Reef. The area meets criteria 1, 2 and 3 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).
Exmouth Gulf East	-	-	✓		Description Exmouth Gulf East covers an area of 800 km ² and includes wetlands in the eastern part of Exmouth Gulf, from Giralia Bay; to Urala Creek, Locker Point (DCCEEW, 2019b).

Protected Area	Woodside Activity Area			IUCN Protected Area Category* or Relevant Park Zone	Description and Values
	Browse	NWS/S	NW Cape		
					Conservation Values The Exmouth Gulf East is an outstanding example of tidal wetland systems of the low coast of north-west Australia, with well-developed tidal creeks, extensive mangrove swamps and broad saline coastal flats. The site is one of the major population centres for dugong in WA and its seagrass beds and extensive mangroves provide nursery and feeding areas for marine fishes and crustaceans in the Gulf. The area meets criteria 1, 2 and 3 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).
Hamelin Pool	-	-	✓		Description Hamelin Pool covers an area of 900 km ² in the far south-east part of Shark Bay (DCCEEW, 2019b).
					Conservation Values Hamelin Pool is an outstanding example of a hypersaline marine embayment and supports extensive microbialite (subtidal stromatolite) formations, which are the most abundant and diverse examples of growing marine microbialites in the world. The area meets criteria 1 and 6 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).
Shark Bay East	-	-	✓		Description Shark Bay East covers a 250 km area of coastline comprising tidal wetlands, and marine waters less than 6 m deep at low tide, in the east arm of Shark Bay (DCCEEW, 2019b).

Protected Area	Woodside Activity Area			IUCN Protected Area Category* or Relevant Park Zone	Description and Values

					<p>Conservation Values</p> <p>The site is an outstanding example of a very large, shallow marine embayment, with particularly extensive occurrence of seagrass beds and substantial areas of intertidal mud/sandflats and mangrove swamp.</p> <p>The site supports what is probably the world's largest discrete population of dugong; it is also a major nursery and/or feeding area for turtles, rays, sharks, other fishes, prawns and other marine fauna; and is a major migration stop-over area for shorebirds.</p> <p>The area meets criteria 1, 2, 3, 4, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).</p>
State Marine Parks and Reserves					
North Kimberley Marine Park	✓	-	-	Sanctuary, Special Purpose and General Use Zones	<p>Description</p> <p>The North Kimberley Marine Park covers. 18,450 km² with its south- western boundary located ~270 km north-east of Derby (DPAW, 2016a).</p>
					<p>Conservation Values</p> <p>The marine park covers approximately 1,845,000 hectares. The coral reefs of the North Kimberley have the greatest diversity in Western Australia and are some of the most pristine and remarkable reefs in the world. The park surrounds more than 1000 islands and is home to listed species such as dugongs, marine turtles, and sawfishes (DPAW, 2016a).</p>
					<p>Social and Economic Values</p> <p>The park features diverse wildlife, remarkable scenery and cultural heritage which provides excellent opportunities for tourism experiences, recreational and nature-based activities such as fishing and hunting (DPAW, 2016a).</p>
					<p>Cultural Values</p> <p>The Wunambal Gaambara, Balanggarra, Ngarinyin and Miriuwung Gajerrong people have strong and ongoing cultural connections to the North Kimberley saltwater country and rely on coastal and marine environments and resources for their cultural identity, livelihoods and economy (DPAW, 2016a).</p>

Rowley Shoals Marine Park	-	✓	-	Sanctuary, Recreation and General Use Zones	<p>Description</p> <p>The Rowley Shoals comprise of three reef systems, Mermaid Reef, Clerke Reef and Imperieuse Reef, all 30-40 km apart. These reef systems are located ~300 km west north-west of Broome (DEC, 2007a).</p> <p>Conservation Values</p> <p>The three coral atolls of the Rowley Shoals Marine Park comprise of shallow lagoons inhabited by diverse corals and abundant marine life, each covering around 80 km² at the edge of Australia's continental shelf (DEC, 2007a).</p> <p>Further offshore, the seafloor slopes away to the abyssal plain, some 6000 m below. Undersea canyons slice the slope; these features are commonly associated with diverse communities of deep-water corals and sponges and create localised upwellings that aggregate pelagic species like tunas and billfish (DEC, 2007a).</p> <p>Social and Economic Values</p> <p>Due to its remote location, the Rowley Shoals has low numbers of visitors with most arriving aboard licenced charter boats. Popular activities in the area include scuba diving, recreational fishing, and boating (DEC, 2007a).</p>
Yawuru Nagulagun / Roebuck Bay Marine Park	-	✓	-	Special Purpose Zone	<p>Description</p> <p>Yawuru Nagulagun / Roebuck Bay Marine Park is a series of intertidal flats lying on the coast to the south-east of Broome.</p> <p>Conservation Values</p> <p>Roebuck Bay is an internationally significant wetland and one of the most important feeding grounds for migratory shorebirds in Australia. Australian snubfin and Australian humpback dolphins frequent the waters and humpback whales pass through on their annual migration. Flatback turtles nest on the shores and are found in the bay's waters with other sea turtle species. Seagrass and macroalgae communities provide food for protected species such as the dugong and flatback turtles (DPAW, 2016b).</p> <p>Social and Economic Values</p> <p>The marine park is adjacent to Broome and supports tourism activities and provides an active outdoor lifestyle for the residents of the region (DPAW, 2016b).</p>

					Cultural Values The Yawuru people have lived along the shores of Roebuck Bay for thousands of years and have a dynamic and enduring relationship with the Yawuru country. The coastline is important for cultural activities and is a place for hunting, fishing, gathering and camping for the Yawuru people (DPAW, 2016b).
Eighty Mile Beach Marine Park	-	✓	-	Sanctuary, Recreation, Special Purpose and General Use Zones	Description Eighty Mile Beach Marine Park covers ~2000 km ² stretching across 220 km of coastline between Port Hedland and Broome (DPAW, 2014a).
					Conservation Values Eighty Mile Beach Marine Park is one of the world's most important feeding grounds for small wading birds that migrate to the area each summer, travelling from countries thousands of kilometres away. The marine park is a major nesting area for flatback turtles which are found only in northern Australia. Sawfishes, dugongs, dolphins and millions of invertebrates inhabit the sand and mud flats, seagrass meadows, coral reefs and mangroves (DPAW, 2014a).
					Social and Economic Values Social values of the marine park include tourism, nature-based recreational activities and commercial fishing (DPAW, 2014a).
					Cultural Values The Karajarri, Nyangumarta and Ngarla people have a powerful connection to the land and sea of this region. Traditional hunting and fishing are important cultural activities for the traditional owners of this marine park (DPAW, 2014a).

Montebello Islands Marine Park, Barrow Island Marine Park and Barrow Island Marine Management Area (jointly managed)	-	✓	-	Sanctuary, Recreation, General Use and Special Purpose Zones	<p>Description</p> <p>The Montebello Islands Marine Park, Barrow Island Marine Park and Barrow Island Marine Management Area are located off the north-west coast of WA, ~1600 km north of Perth, and cover areas of ~583 km², 42 km² and 1,147 km², respectively (DEC, 2007b).</p> <p>Conservation Values</p> <p>The Montebello/Barrow Islands marine conservation reserves have very complex seabed and island topography, resulting in a myriad of different habitats, subtidal coral reefs, macroalgal and seagrass communities, subtidal soft-bottom communities, rocky shores and intertidal reef platforms, which support a rich diversity of invertebrates and finfish.</p> <p>The reserves are important breeding areas for several species of marine turtles and seabirds, which use the undisturbed sandy beaches for nesting. Humpback whales migrate through the reserves and dugongs occur in the shallow warm waters (DEC, 2007b).</p> <p>Social and Economic Values</p> <p>Major commercial fishing and pearling occur within the area which provide employment and economic value to surrounding communities. Nature based-tourism, water sports and recreational fishing are popular recreational activities undertaken in the area (DEC, 2007b).</p> <p>Cultural Values</p> <p>There are no recorded seabed aboriginal sites within this park. However, it is possible there are aboriginal archaeological sites on the seabed that were created before the most recent sea level rise (DEC, 2007b).</p>

Ningaloo Marine Park and Muiron Islands Marine Management Area (jointly managed)	-	-	✓	Sanctuary, Recreation, General Use and Special Purpose Zones	Description The Ningaloo Marine Park and Muiron Islands Marine Management Area are located off the North-west Cape, ~1200 km north of Perth, and cover areas of ~2633 km ² and 286 km ² respectively (CALM, 2005a).
					Ecological Values Ningaloo Reef is the largest fringing coral reef in Australia. Temperate and tropical currents converge in the Ningaloo region resulting in highly diverse marine life including spectacular coral reefs, abundant fishes and species with special conservation significance such as turtles, whale sharks, dugongs, whales and dolphins. The region has diverse marine communities including mangroves, algae and filter-feeding communities and has high water quality. These values contribute to the Ningaloo Marine Park being regarded as the State's premier marine conservation icon. The Muiron Islands Marine Management Area is also important, containing a very diverse marine environment, with coral reefs, filter-feeding communities and macroalgal beds. In addition, the Islands are important seabird and green turtle nesting areas (CALM, 2005a).
					Social and Economic Values The Ningaloo region has a high number of visitors enjoying the area who come to appreciate nature-based tourism which brings important economic value to the communities of the area (CALM, 2005a).
					Cultural Values The Ningaloo Reef has a long history of occupancy by aboriginal communities and aboriginal heritage sites. The Jinigudira and Baiyungu people have lived in this region for thousands of years and use coastal areas for fishing, camping and hunting of turtles and dugongs (CALM, 2005a).

Shark Bay Marine Park and Hamelin Pool Marine Nature Reserve (jointly managed)	-	-	✓	Sanctuary, Recreation, General Use and Special Purpose Zones	<p>Description</p> <p>The Shark Bay Marine Park and Hamelin Pool Marine Nature Reserves are located 400 km north of Geraldton, covering areas of ~7487 km² and 1270 km², respectively (CALM, 1996).</p> <p>Conservation Values</p> <p>Seagrass covers over 4000 km² of the Shark Bay Marine Park, with 12 different species making it one of the most diverse seagrass assemblages in the world. Dugongs regularly use this habitat, with the bay containing one of the largest dugong populations in the world. Humpback whales also use the bay as a staging post in their migration along the coast. Green and loggerhead turtles occur in the bay, with Dirk Hartog Island providing the most important nesting site for loggerheads in Western Australia.</p> <p>Hamelin Pool contains the most diverse and abundant examples of stromatolites found in the world. These are living representatives of stromatolites that existed some 3500 million years ago (CALM, 1996).</p> <p>Social and Economic Values</p> <p>Commercial fishing and tourism are important economic values of the region. Popular recreational activities include nature-based tourism, recreational fishing and water sports (DEC, 2008).</p> <p>Cultural Values</p> <p>The Malgana people occupy the land and waters in the vicinity of Shark Bay and have strong cultural connection to the region. The area is important for cultural practices and for fishing, hunting and camping for the Malgana people (DEC, 2008).</p>

Bardi Jawi Gaarra Marine Park	✓	-	-	Sanctuary, Recreation, Special Purpose Zones (biocultural conservation and cultural protection), and General use	<p>Description</p> <p>The Bardi Jawi Gaarra Marine Park is located in the West Kimberley region surrounding the northern part of the Dampier Peninsula and the western islands of the Buccaneer Archipelago covering areas of ~2040 km².</p> <p>Conservation Values</p> <p>The Bardi Jawi Gaarra Marine Park has a tidal range of 11 m, which is the highest in Australia. The mangrove lined creeks, intertidal and fringing reef areas that encompass the coastline and islands are ecologically important and host a vast number of plants and animals that have adapted to the unique area. Migratory marine mammals including humpback whales migrate to the areas between June and November each year to birth their young. Dugongs visit the area in the cooler months from May to July (DBCA, 2022a).</p> <p>Social and Economic Values</p> <p>Commercial fishing, pearling and aquaculture are important economic activities that occur within this region. The area is a popular tourism destination and hosts a number of recreational activities and water sports (DBCA, 2022a).</p> <p>Cultural Values</p> <p>The Bardi and Jawi people have a significant connection to the animals, sites and places within this region which are connected by stories and songlines. The sea country is used for hunting, fishing, cultural activities and business (DBCA, 2022a).</p>
Lalang-gaddam Marine Park	✓	-	-	Sanctuary, Recreation, General Use and Special Purpose Zones	<p>Description</p> <p>Amended joint management plan for the Lalang-gaddam / Camden Sound, Lalang-gaddam / Horizontal Falls and North Lalang-gaddam marine parks, and indicative joint management plan for the proposed Maiyalam Marine Park.</p> <p>The Lalang-gaddam Marine Park is located in the Kimberley region of Western Australia and adjacent to Derby and the Shire of Wyndham. The Class A marine park covers ~13,085 km² (DBCA, 2022b).</p>

Protected Area	Woodside Activity Area			IUCN Protected Area Category* or Relevant Park Zone	Description and Values
	Browse	NWS/S	NW Cape		
					<p>Conservation Values</p> <p>The Lalang-gaddam / Camden Sound Marine Park is the most important humpback whale nursery in the Southern Hemisphere. It also features the spectacular coastal Montgomery Reef.</p> <p>The marine park is home to six species of threatened marine turtle. Australian snubfin and Indo-Pacific humpback dolphins, saltwater crocodiles, manta rays, several species of protected sawfish, and the world's large population of dugongs (~12,000).</p> <p>The Lalang-gaddam Marine Park's most celebrated attraction, The Horizontal Falls is created by massive tides of up to 10 m and narrow gaps in two parallel tongues of land meaning the tide falls faster than the water can escape, producing 'horizontal falls'. There are also islands with fringing coral reefs and mangrove-lined creeks and bays.</p> <p>This marine park has a number of islands fringed with coral reef and has been identified as an ecological hotspot and supports more than 1% of the world's population of brown boobies, with up to 2,000 breeding pairs.</p> <p>Approximately 500 pairs of crested terns also nest on the island (DBCA, 2022b).</p> <p>Social and Economic Values</p> <p>This marine park has spectacular scenery which attracts a number of tourists and generates approximately \$563 million annually. Recreational fishing and recreational maritime activities are popular within this marine park. Commercial fisheries can operate within the waters of this marine park, however many do not regularly fish within this area. Pearling and aquaculture occurs within this marine park and provides economic value for the region (DBCA 2022b).</p> <p>Cultural Values</p> <p>The area is of cultural significance to the Dambeemangarddee people who have lived on the land and cared for land and sea country for tens of thousands of years. Some animals such as the barramundi and rock cod have particular cultural significance and are sacred animals to the Dambeemangarddee people. Numerous coastal and marine plants continue to be an important food source for the traditional owners of this marine park (DBCA, 2022b).</p>

Mayala Marine Park	✓	-	-	Sanctuary, Recreation, General Use and Special Purpose Zones	<p>Description The Mayala Marine Park is a Class A reserve located in the West Kimberley region and covers ~3150 km² (DBCA, 2022c).</p> <p>Conservation Values The Mayala Marine Park has a tidal range of 11 m, the highest in Australia. The mangrove lined creeks, intertidal and fringing reef areas that encompass the coastline and islands are ecologically important and host a vast number of plants and animals that have adapted to the unique area. The seagrass communities provide habitat and food for many species including turtles and dugongs. Migratory marine mammals including humpback whales migrate to the areas between June and November each year to birth their young. Dugongs visit the area in the cooler months from May to July (DBCA, 2022c).</p> <p>Social and Economic Values Due to the extraordinary natural values of the area, the number of visitors to the area has continued to grow over the years. Popular activities within the park include fishing, boating, and wildlife watching. The waters of this area provide optimal conditions for commercial fishing, pearling and aquaculture (DBCA, 2022c).</p> <p>Cultural Values The area is of exceptional cultural significance to the Malaya people who are true saltwater people and use both land and sea resources and have a strong connection to the land, animals and plants of the region. This marine park has many sacred sites that occur on land and sea which include artefacts, fish traps, and man-made structures. This marine park is culturally significant to the Malaya people who care for country and use this marine park for fishing, hunting and camping (DBCA, 2022c).</p>

11.10 Summary of Protected Areas Within the SWMR

Table 11-7: Protected areas within the SWMR

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
World Heritage Properties		
Australian Convict Sites (Fremantle Prison)		Description Fremantle Prison contains well preserved remnants of the earliest phase of European settlement of Western Australia. The Prison includes 16 intact convict-built structures surrounded by a six-metre-high limestone perimeter wall. The prison is one of the largest surviving convict establishments in the world (DCCEEW, 2021a).
		Conservation Values The Australian Convict Sites represent the global phenomenon of convictism—the forced migration of convicts to penal colonies in the 18th and 19th centuries (DCCEEW, 2021a).
National Heritage Places-- Natural		
N/A		
Commonwealth Heritage Places-- Natural		
Garden Island		Description Garden Island, and in particular the Cliff Point Historic Site, is highly valued by the community for its cultural associations as the site of first settlement in Western Australia. The absence of feral predators means that Garden Island provides a significant refuge for animals vulnerable to predation on the mainland (DAWE, 2004).
		Conservation Values It is likely that Indigenous values exist at this place. As yet these have not been identified, documented or assessed for National Estate significance by the Australian Heritage Commission. Species of particular interest include the Tammar wallaby (<i>Macropus eugenii</i>), carpet python (<i>Morelia spilota</i>), and the lined skink (<i>Lerista lineata</i>). The parabolic sand dunes on the western side of the island are among the best-preserved dunes of the Quindalup soil unit (DAWE, 2004).
Wetlands of International Importance (Ramsar)		
Becher Point Wetlands	Ramsar	Description Beecher Point Wetlands is a system of about sixty small wetlands located near Rockingham in south- west WA, covering an area of around 7 km ² . The site was listed under the Ramsar Convention in 2001 (DPAW, 2014b).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
		<p>Conservation Values</p> <p>The wetlands support sedgelands, herblands, grasslands, open-shrublands and low open-forests. The sedgelands that occur within the linear wetland depressions of the Ramsar site are a nationally listed threatened environmental community.</p> <p>At least four species of amphibians and 21 species of reptiles have been recorded on the site. The site also supports the southern brown bandicoot.</p> <p>The site meets criteria 1 and 2 of the Ramsar Convention (DPAW, 2014b).</p>
Forrestdale and Thomsons Lakes	Ramsar	<p>Description</p> <p>Forrestdale Lake is located in the City of Armadale and Thomsons Lake is located in the City of Cockburn both of which lie within the southern Perth metropolitan area, in Western Australia.</p> <p>The site was listed under the Ramsar Convention in 1990 (CALM, 2003c).</p>
		<p>Conservation Values</p> <p>The lakes are surrounded by medium density urban development and some agricultural land. The sediments of Thomsons Lake are between 30,000 and 40,000 years old, which are the oldest lake sediments discovered in WA to date.</p> <p>These lakes are the best remaining examples of brackish, seasonal lakes with extensive fringing sedgeland, typical of the Swan Coastal Plain.</p> <p>The site meets criteria 1, 3, 5 and 6 of the Ramsar Convention (CALM, 2003c).</p>
Peel-Yalgorup System	Ramsar	<p>Description</p> <p>The Peel-Yalgorup System, located adjacent to the City of Mandurah in Western Australia, is a large and diverse system of shallow estuaries, coastal saline lakes and freshwater marshes.</p> <p>The site was listed under the Ramsar Convention in 1990 (CALM, 2003d).</p>
		<p>Conservation Values</p> <p>The Peel-Yalgorup System Ramsar site is the most important area for waterbirds in south-western Australia. It supports a large number of waterbirds, and a wide variety of waterbird species. It also supports a wide variety of invertebrates, and estuarine and marine fish. The system also includes an occurrence of thrombolites.</p> <p>The site meets criteria 1, 3, 5 and 6 of the Ramsar Convention (CALM, 2003d).</p>

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
Vasse-Wonnerup System	Ramsar	Description The Vasse-Wonnerup System Ramsar wetland is situated in the Perth Basin, south-western Western Australia. The site was listed under the Ramsar Convention in 1990 (DPAW, 2014b).
		Conservation Values The Vasse-Wonnerup System is an extensive, shallow, nutrient-enriched wetland system of highly varied salinities. Large areas of the wetland dry out in late summer. The Vasse-Wonnerup System supports tens of thousands of resident and migrant waterbirds of a wide variety of species. More than 80 species of waterbird have been recorded in the system, such as red-necked avocets and black-winged stilts, wood sandpiper, sharp-tailed sandpiper, long-toed stint, curlew sandpiper and common greenshank. 13 waterbird species are also known to breed at the Ramsar site, including the largest regular breeding colony of black swans in south-western Australia. The site meets criteria 5 and 6 of the Ramsar Convention (DPAW, 2014b).
Lake Warden System	Ramsar	Description The Lake Warden System Ramsar site is located adjacent to Esperance, south-western Australia. It is a system of saline lakes, lagoons and marsh areas behind beach-front dunes and at least one relatively narrow connection to the sea. The site was listed under the Ramsar Convention in 1990.
		Conservation Values The wetlands within the Lake Warden System form a system of inter-connected lakes and coastal brackish/saline lagoons connected by channels. It provides a significant habitat, nursery and refuge for waterbirds. Supporting up to 20,000 birds regularly. The system supports over 1% of hooded plovers in south-western Australia who breed regularly at the Lake Warden System. It meets criteria 1, 5 and 6 of the Ramsar Convention (DEC, 2009b).
Wetlands of National Importance (DAWE, 2019)		
Rottneest Island Lakes		Description The Rottneest Island Lakes site is the cluster of 18 lakes and swamps on the north-east part of Rottneest Island (DCCEEW, 2019b).
		Conservation Values An outstanding example of a series of lakes/swamps of varied depth and salinity located on an offshore island; the only island among 200 plus in WA exceeding 10 ha in area, that has a salt-lake complex; the only known example of seasonally meromictic lakes in Australia. The area meets criteria 1, 2, 3 and 6 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
State Marine Parks and Reserves		
Jurien Bay Marine Park	Sanctuary, Special Purpose and General Use Zones	Description The Jurien Bay Marine Park is located on the central west coast of WA ~200 km north of Perth and covers an area of 824 km ² (CALM, 2005b).
		Ecological Values The Jurien Bay region is dominated by five major marine habitats: seagrass meadows, bare or sparsely vegetated mobile sand, shoreline and offshore intertidal reef platforms, subtidal limestone reefs, and reef pavement. An extensive limestone reef system parallel to the shore has created a huge shallow lagoon that provides perfect habitat for Australian sea lions, dolphins and a myriad of juvenile fish. Extensive seagrass meadows inside the reef shelter many marine animals such as western rock lobsters, octopus and cuttlefish that make up the diet of young sea lions. The marine park also surrounds dozens of ecologically important islands that contain rare and endangered animals found nowhere else in the world (CALM, 2005b).
		Social and Economic Values Commercial fishing for rock lobster has the highest economic value of any single species commercial fishery in Australia and is important for the economy of the Jurien Bay region. Recreational water activities such as fishing, boating, surfing, diving, and wind surfing are popular within the area (CALM, 2005b).
		Cultural Values The Nyungar people have occupied the land and waters in this region and depended on coastal resources for more than 30,000 years. There are burial sites, middens and other sites of significance listed within the region (CALM, 2005b).
Marmion Marine Park	Sanctuary, Recreation and Special Use Zones.	Description The Marmion Marine Park lies within State waters between Trigg Island and Burns Beach and encompasses a coastal area of ~95 km ² . Marmion Marine Park was the State's first marine park, declared in 1987 (CALM, 1992).
		Ecological Values The marine park has a number of sanctuary zones including Little Island, The Lumps and the Boyinaboat Reef protecting a variety of habitats from limestone reefs, seagrass beds and clear shallow lagoons that support a diversity of marine life. In addition, there are the general use zone and the Waterman Recreation Area. The marine park contains important habitat for the endemic Australian sea lion, an array of seabird species, and migratory whales are regular visitors (CALM, 1992; DPAW, 2016c).

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
		<p>Social Values</p> <p>The marine park is popular for recreational water activities including boating, swimming, kayaking, snorkelling, whale watching, kite and windsurfing. Scuba diving and freediving is common at the Boyinaboat Reef which is located close to Hillary's Boat Harbour. Recreational fishing is permitted in most areas (DPAW, 2016c).</p>
South Coast Marine Park	Sanctuary Zone Special Purpose Zone (cultural protection) Special Purpose Zone (whale conservation) Special Purpose Zone (wildlife conservation) General Use Zone	<p>Description</p> <p>The south-west marine park lies within State waters, between Bremer Bay to the WA/SA border.</p>
		<p>Ecological Values</p> <p>The marine park supports seagrass meadows, macroalgae, cetaceans, pinnipeds, shorebirds and seabirds, fish, sharks and rays, and marine invertebrates. The South-west region has some of the highest seagrass and macroalgal diversity globally, approximately half of the species found here occur nowhere else in the world. The marine park supports foraging areas for cetaceans and seabird and shorebirds, and habitat for the Australian sea lion and New Zealand fur seal. The region supports high proportion of endemic species and high diversity of marine invertebrates (DBCA, 2024).</p>
		<p>Social Values</p> <p>The marine park supports recreational and commercial fishing, and recreational activities and tourisms such as, diving and snorkelling, surfing, four-wheel driving, camping, wildlife watching, swimming, kayaking, and boating (DBCA, 2024).</p>
		<p>Cultural and heritage values</p> <p>First Nations people have had connection in the Western Australian south coast for tens of thousands of years. Native title or traditional ownership has been recognised for several First Nations groups throughout the region, including the Wagyl Kaip and Southern Noongar Traditional Owners, and the Esperance Nyungar, Ngadju People and Mirning People native title holders.</p>
Swan Estuary Marine Park	Special Purpose and Nature Reserve Zones	<p>Description</p> <p>Three biologically important areas of Perth's Swan River make up the Swan Estuary Marine Park, including Alfred Cove, Pelican Point and Crawley. These three sites cover a total area of 3.4 km² (CALM, 1999).</p>
		<p>Ecological Values</p> <p>The sand flats, mud flats and beaches at the three locations of the Swan Estuary Marine Park provide the only remaining significant feeding and resting areas in the Swan Estuary for trans-equatorial migratory wading and waterbirds. This Marine Park and adjacent reserves also provide habitat for a diverse assemblage of aquatic and terrestrial flora and fauna (CALM, 1999).</p>
		<p>Social and Economic Values</p> <p>Nature-based wildlife tourism operates in the area and this Marine Park supports commercial net fishing. Recreational activities that occur within the area include fishing, bird watching, kayaking, windsurfing, boating, and sightseeing (DBCA, 2023).</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
		<p>Cultural Values</p> <p>The Whadjuk people are the traditional owners of the land and waters of Swan Canning Estuary and have frequented the waters of this park for many years. The estuarine and terrestrial habitats provide a source of fish, shellfish, reptiles and birds for hunting (CALM, 1999; DBCA, 2023).</p>
Shoalwater Islands Marine Park	Sanctuary, Special Purpose and General Use Zones	<p>Description</p> <p>The Shoalwater Islands Marine Park is located adjacent to Rockingham on the south-west coast of Western Australia, ~50 km south of Perth and covers an area of ~66 km² (DEC, 2007c).</p>
		<p>Ecological Values</p> <p>The Shoalwater Islands Marine Park consists of a complex seabed and coastal topography consisting of islands, limestone ridges and reef platforms, protected inshore areas and deeper basins, sandbars and beaches, and is home to five species of cetacean and 14 species of sea and shore bird. The waters of this marine park are also used to access feeding grounds for the little penguin (<i>Eudyptula minor</i>) colony on Penguin Island, which is close to the northernmost limit of the species' range and is the largest known breeding colony in Western Australia (DEC, 2007c). A recent study has also reported a recurrent aggregation of scalloped hammerheads (<i>Sphyrna lewini</i>) within this marine park (López et al., 2022).</p>
		<p>Social and Economic Values</p> <p>Commercial fisheries target a number of species within the area and this marine park also supports a mussel farming industry. Tourism is a popular activity within this marine park and includes water sports such as scuba diving, snorkelling, sailing, kayaking, kite surfing, and windsurfing. Recreational fishing is popular in this area and is likely to increase. The diversity of this marine park biota makes this marine park important for scientific research and education among tertiary institutions, schools and outdoors organisations (DEC, 2007c).</p>
		<p>Cultural Values</p> <p>This marine park is of cultural significance to the Gnaarla Karla Booja people who are the traditional owners and have frequented this marine park for thousands of years. The Gnaarla Karla Booja people have continued to use this Marine Park for fishing and hunting. Shoalwater and Garden Island areas are significant parts of the story of creation and there are a number of sites adjacent to and within this marine park that are registered as culturally significant (DEC, 2007c).</p>

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
Ngari Capes Marine Park	Sanctuary, Special Purpose and Recreation Zones	Description The Ngari Capes Marine Park is located off the south-west coast of Western Australia, ~250 km south of Perth, covering ~1238 km ² (DEC, 2013).
		Ecological Values The Ngari Capes Marine Park consists of a complex arrangement of sandy bays, high energy limestone and granite reefs bordered by headlands and cliffs and two weathered capes. Coral communities consist of both tropical and temperate species. Cetaceans and pinnipeds are resident in and/or transient through this Marine Park as well as a diverse range of seabirds and shorebirds (DEC, 2013).
		Social and Economic Values A diverse range of commercial fisheries and aquaculture occur within and around this marine park targeting species such as abalone, salmon, sharks, demersal finfish, baitfish, and western rock lobster. This marine park offers a wide range of attractions for marine based tourism which include shore-based and boat-based whale watching tours and dive and snorkel tours. Recreational activities that occur within this marine park include diving, fishing, snorkelling and wildlife watching (DEC, 2013).
		Cultural Values The Pibelman and Wardani people occupy the lands adjacent to this marine park and utilise the coastline for fishing, hunting, ceremonial activities and resource gathering as they have continued to do for thousands of years. At least 45 sites of Indigenous significance have been identified within or adjacent to this marine park. Many marine species including mammang borungar (whale) and kalda (sea mullet) are culturally significant to the Indigenous people of the southwest region (DEC, 2013).
Walpole and Nornalup Inlets Marine Park	Recreation Zone	Description The Walpole and Nornalup Inlets Marine Park is located adjacent to the towns of Walpole and Nornalup on the south coast of Western Australia, ~120 km west of Albany, and covers ~14 km ² (DEC, 2009a).
		Conservation Values The Walpole and Nornalup Inlets Marine Park consists of a geologically complex lagoonal estuarine system comprising three significant rivers and two connected inlets that are permanently open to the ocean. Approximately 40 marine and estuarine finfish species commonly inhabit the inlet system, as well as a variety of shark and ray species and numerous seabirds and shorebirds. The sandy beaches and shoreline vegetation of the inlet system are of high ecological and social importance to this marine park (DEC, 2009a).
		Social Values The diversity of wildlife and easily accessible terrestrial, estuarine, and coastal scenery has enhanced nature-based tourism within the area. Popular recreational activities that occur within this marine park include boating, fishing, swimming, hiking, bird watching, and wildlife watching (DEC, 2009a).

11.11 Summary of Protected Areas Within the NMR

Table 11-8: Protected Areas within the NMR

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
<i>World Heritage Properties</i>		
Kakadu National Park		Description Kakadu National Park is a living landscape with exceptional natural and cultural values. It is the largest National Park in Australia and preserves the greatest variety of ecosystems on the Australian continent including extensive areas of floodplains, mangroves, tidal mudflats, coastal areas and monsoon forests. The park was inscribed on the World Heritage list in three stages over 11 years. It is located in tropical north Australia covering a total area of 19,810 km ² (Director of National Parks, 2016).
		Ecological Values The conservation values reflect the WHA Criterion: (i), (vi), (vii) and (ix): Natural features relate to Criterion (vii) – the remarkable contrast between the internationally recognised Ramsar-listed wetlands and the spectacular rocky escarpment and its outliers and Criterion (ix) – four major river systems of tropical Australia and floodplains that are dynamic environments, shaped by changing sea levels and big floods every wet season. These floodplains illustrate the ecological and geomorphological effects that have accompanied Holocene climate change and sea level rise. Kakadu National Park contains important and significant habitats supporting a diverse range of flora and fauna. Coastal areas of the park are dominated by mudflats which are mostly lined by mangroves which support breeding and nursery grounds for a variety of animals. The threatened flatback turtles nest on Field Island which is within the park. Kakadu National Park is a key habitat for threatened species including one species of river shark, two sawfish species and two inshore dolphin species (Director of National Parks, 2016).
		Social Values Kakadu National Park is a popular tourist destination which provides important economic value to the region through boat and fishing tours and wildlife tours. Commercial tours operate within the area which provides employment opportunities for local communities. Popular recreational activities within the park include bushwalking, camping, recreational fishing and boating, swimming, wildlife watching, and viewing culturally significant sites (Director of National Parks, 2016).
		Cultural Values The Bininj/Mungguy people are the traditional owners of Kakadu National Park and have had longstanding custodianship and spiritual connection with the Kakadu region and continue to use the park for cultural practices. Kakadu holds one of the world's greatest concentrations of rock art sites and there is thought to be up to 15,000 sites in total with some sites estimated to be over 20,000 years old (Director of National Parks, 2016).

National Heritage Places -- Natural		
Kakadu National Park		Refer to World Heritage Property description and values above.
Commonwealth Heritage Places-- Natural		
N/A		
Wetlands of International Importance (Ramsar)		
Kakadu National Park		Description Australian Ramsar site number 2. The stage 1 and 2 Ramsar sites, established in 1980, 1985 and 1989, respectfully were combined into a single Ramsar site in 2010 (BMT WBM, 2010).
		Conservation Values The Kakadu National Park Ramsar site straddles the western edge of the Arnhem Land Plateau encompassing a range of landforms and extensive floodplains. It is a mosaic of contiguous wetlands comprising the catchments of two large river systems, the East and South Alligator rivers and encompasses extensive tidal mudflat areas. It is an internationally important site for migratory shorebirds as part of the EAAF (BMT WBM, 2010).
Cobourg Peninsula		Description Australian Ramsar site number 1 established in 1974. This Ramsar site includes freshwater and extensive intertidal areas but excludes subtidal areas. It is in a remote location and there has been minimal human impact on the site (BMT WBM, 2011).
		Conservation Values The wetlands encompassed in the Ramsar site are some of the better protected and near-natural wetlands in the bioregion and there is a diverse array of wetland in a confined area. The site supports important turtle nesting habitat and habitat for coastal dolphin species and is an internationally significant migratory shorebird habitat as part of the EAAF and an important location for seabird breeding colonies (BMT WBM, 2011).

Protected Area	IUCN Protected Area Category* or Relevant Park Zone	Description and Values
Wetlands of National Importance (DAWE, 2019)		
Southern Gulf Aggregation		Description The site is a complex continuous wetland aggregation in the Gulf of Carpentaria, covering an area of ~5460 km ² located 58 km east of Burketown, Queensland (DCCEEW, 2019b).
		Conservation Values The Southern Gulf Aggregation is the largest continuous estuarine wetland aggregation of its type in northern Australia. It is one of the three most important areas for shorebirds in Australia. The area meets criteria 1, 2, 3, 4, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia (DCCEEW, 2019b).
		Social Values The area is an important site for recreational barramundi fishing and is a popular site for ecotourism (DCCEEW, 2019b).
Territory Marine Parks and Reserves		
Cobourg Marine Park	II, IV, VI	Description Cobourg Marine Park covers an area of 2290 km ² and is located in the waters surrounding the Cobourg Peninsula ~220 km north-east of Darwin. This marine park is part of the larger Garig Gunak Barlu National Park. Garig Gunak Barlu National Park includes both this marine park and the Cobourg Sanctuary (Northern Territory Government, 2011)
		Conservation Values Cobourg Marine Park is located in the Cobourg and Van Diemen Gulf marine bioregions with the northern portion of the marine park covered by the Cobourg marine bioregion and the southern portion covered by the Van Diemen Gulf marine bioregion. This marine park is characterised by a number of deeply incised bays and estuaries on its northern shores. These bays are ancient river valleys that were drowned during periods of sea level rise and provide a varied environment and habitat that is quite distinct from the open water areas of the marine park. The areas of the marine park that have been studied and where extensive collections have been made indicates that the Marine Park supports rich and diverse marine life including live coral reefs, seagrass, diverse reef and pelagic fish populations, saltwater crocodiles, and six species of threatened marine turtles and dugong (Northern Territory Government, 2011).
		Social and Economic Values A variety of commercial fisheries, aquaculture and pearling occur within this marine park. The marine park has visitors who stay within the Cobourg sanctuary, sailors who moor in the area and guests who stay at onsite accommodation. Water sports such as fishing, boating, sailing, scuba diving, recreational fishing, sightseeing and wildlife viewing are popular activities undertaken in the marine park (Northern Territory Government, 2011).

12. SOCIO-ECONOMIC AND CULTURAL ENVIRONMENT

This section summarises the information relating to the socio-economic and cultural environment of the regions offshore of Western Australia, with a focus on the NWMR and to a lesser extent the SWMR and NWR.

12.1 Cultural Values and Heritage

Woodside's approach to Cultural Values and Heritage management reflects our publicly available [First Nations Communities Policy](#) (Woodside, 2022). This policy is underpinned by core principles that ensure our management of cultural heritage is thorough, transparent and supported by consultation and continued engagement with First Nations communities. Our approach to the identification, management and protection of cultural heritage is consistent with the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP), engaging with First Nations communities in ways that reflect the principles of seeking Free, Prior and Informed Consent (FPIC). Where heritage is concerned Woodside seeks to avoid impact, or if avoidance is not possible, to minimise and mitigate impact through consultation with relevant First Nations communities. We seek to ensure Traditional Owners and Custodians are central to heritage management so that cultural values are understood and remain protected.

Australia ICOMOS (International Council on Monuments and Sites) is a non-government peak body for cultural heritage professionals formed as a national committee for ICOMOS (international). Australia ICOMOS' mission is to lead cultural heritage conservation in Australia by issuing standards and practice notes. Woodside understands heritage value to mean the cultural significance of a place to an individual or group in line with the Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance (Australia ICOMOS, 2013) (Burra Charter), and associated practice notes. A cultural feature is therefore comparable to the Burra Charter term "fabric" and refers to a place's elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible or intangible dimensions (Australia ICOMOS, 2013).

12.1.1 Native Title

Woodside uses established systems, such as native title, to identify First Nations groups that may have functions, interests or activities that may be affected. While acknowledging that cultural features and heritage values may exist outside of the native title framework, native title claims, determinations and ILUAs are defined under the *Native Title Act 1993* (Cth). Woodside considers this to be the broadest extent over which First Nations groups have claimed native title rights and interests.

Native title claims are applications made to the Federal Court under the Native Title Act for a determination or decision about native title in a particular area. A claim is made by a native title claim group which asserts it holds native title rights and interests in an area of land and/or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so that its native title rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area ([Native Title Tribunal](#)).

A requirement to establishing a positive determination of native title in court is proving that there is an organised society that occupied the land and/or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of *Mabo v Queensland (No 2)* ([\[1992\] HCA 23](#); [\(1992\) 175 CLR 1](#) ('Mabo')). Justice Toohey had the following to say (at 187):

it is inconceivable that indigenous inhabitants in occupation of land did not have a system by which land was utilized in a way determined by that society. There must, of course, be a society sufficiently

organized to create and sustain rights and duties...

Therefore, Woodside understands that native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which First Nations groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found to either exist or not exist. Where native title rights or interests are determined to exist, they will be held by a Registered Native Title Body Corporate (section 57, Native Title Act 1993) in trust or as agent for native title holders.

Indigenous Land Use Agreements (ILUAs) are voluntary agreements between native title parties and other people or bodies about the use and management of land and/or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area, or
- a native title claim has been made, or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders ([Native Title Tribunal](#)).

The Native Title Act provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the Native Title Act within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details on the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

12.1.2 Coastal First Nations Groups

First Nations groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth, 2007). To identify cultural features and heritage values which may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to areas of operation to be an instructive means of identifying potentially relevant First Nations groups to be consulted.

Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas which those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for groups and individuals. This may also, over time, build expectations in the broader community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge.

Woodside acknowledges that a First Nations group's relative proximity to any Operational Areas is not necessarily a meaningful indicator of the connection to the area and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

12.1.3 Sea Country

"Sea country is valued for Indigenous cultural identity, health and wellbeing" (DNP, 2018a, 2018b).

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. This is one aspect of the broader concept of "Sea Country", which can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. It has been noted that "the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as 'Saltwater Country' or 'Sea Country'.

'Country' refers to more than just a geographical area: it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area." (Smyth, 2007).

It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country—the seascape which Traditional Custodians view, interact with or hold knowledge of. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government's Indigenous Protected Areas Program. The Indigenous Protected Areas program provides for "areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation...IPAs deliver environmental benefits...Managing IPAs also helps Indigenous communities protect the cultural values of their country for future generations..." (DCCEEW, 2024c).

McNiven (2004) suggests that "For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20–30km out to sea, out to the horizon and the limit of human visibility. However, in some coastal places, clouds that can be seen well over 100km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon." While there is some evidence of traditional watercraft in Australia's North West, the recorded evidence is limited to travel across inland rivers (e.g. Barber and Jackson, 2011) or travel between coastal islands (Paterson et al., 2019).

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple Indigenous language groups. Some species may travel as far as 5000 km from Antarctica to the Kimberley region of Western Australia (Double et al., 2010, 2012), passing First Nations language groups along the entire west coast of Australia.

Table 12-1: Commonly identified Sea Country species and habitats

Value	Details
Marine mammals	Whales, and in particular humpback whales and dugongs, are commonly identified through consultation with First Nations people as culturally important species, with totemic importance. Common interests include maintaining their populations, biodiversity, and migration patterns.
Marine reptiles	Turtles and sea snakes are commonly identified through consultation with First Nations people as culturally important species and a favoured resource. First Nations people that identify marine reptiles as species of totemic importance or integral to songlines may place high cultural value on their protection. Cultural knowledge of turtles at a population level (turtle migration, behaviour and the related marine environment) may all be important in ensuring the continuation of cultural functions and activities that remain valuable to First Nations people (Fijn, 2021:47; Delisle et al., 2018).
Fish and cephalopods	Fish and squid are commonly identified through consultation with First Nations people as a culturally important species, with fish generally being identified as a resource. First Nations may identify cultural values associated with fish species as important to maintaining both tangible (physical cultural sites) and intangible (cultural knowledge) cultural heritage. Tangible cultural heritage associated with fish can include important cultural sites such as midden sites, fish traps and thalu sites. There are increase ceremonies/rituals for species of squid and octopus to enhance or maintain populations. Thalu are places where these increase ceremonies are performed.
Seabirds	Seabirds, and in particular shags, are commonly identified through literature as a culturally significant species (Malgana Land and Sea Management et al., 2021), as well as a resource (seabird eggs; Smyth, 2007).
Benthic habitats	First Nations groups identify benthic habitats as valuable for both their ecological and aesthetic values. Corals attract fish and seagrass providing shelters for fauna, as well as an important resource for dugongs.
Shoreline habitats	First Nations groups identify shoreline habitats as valuable for their ecological values, including mangroves for providing shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia, 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli.

12.1.4 Marine Parks

Woodside acknowledges that Commonwealth and State Marine Park Management Plans have sought to recognise cultural values and responsibilities of First Nations groups. Australian Marine Parks (AMP) describe this framework in the following way: 'when making decisions about what can occur in marine parks and what action we will take to protect AMPs, we take values into account'. AMP summarises these values as natural values, cultural values, heritage values and socio-economic values (Refer to Section 11.5).

12.1.5 Indigenous Protected Areas (IPAs)

Indigenous Protected Areas (IPAs) are areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation through voluntary agreements with the Australian Government. IPAs are an essential component of Australia's National Reserve System, which is the network of formally recognised parks, reserves and protected areas across Australia. There are currently 85 dedicated IPAs over 74 million hectares. These account for more than 50 per cent of the National Reserve System (NIAA, 2023). As of August 2024, an additional 36 Traditional Owner consultation projects to develop management plans for proposed IPAs are underway (DCCEEW, 2024c). Ten Sea Country IPA consultation projects were announced in 2022. One of these, Tukujana pa Karajarri Kura Jurrar, is in the NWMR and extends from the existing Karajarri IPA into the sea off the south-west Kimberley coast (DCCEEW, 2024c). The Indigenous Protected Areas program is administered by the National Indigenous Australians Agency in partnership with DCCEEW. Dedicated and proposed IPAs are shown in Figure 12-4.

The following IPAs are within the NWMR:

12.1.5.1 Nyangumarta Warrarn IPA

The Nyangumarta Warrarn IPA is comprised of four areas totalling approximately 28,675 km², including parts of the Great Sandy Desert, Walyarta Conservation Reserve, Kujungurru Warrarn Conservation Reserve Area and the Eighty Mile Beach Marine Park Intertidal Area. The traditional owners of the designated IPA self-identify as and are identified by other Pilbara First Nations people as Nyangumarta people. Nyangumarta people are the native title holders of the land and waters.

Ecological values in the IPA include a complex wetland system associated with Mandora Marsh, known to Nyangumarta people as Nyamaring. Walyarta (or Salt Creek). The Mandora Marsh area holds the most inland distribution of mangroves in Australia and the mound springs associated with Mandora Marsh area, such as Yalayala (Eil Eil), are recognised as important bird nesting sites (NWAC and YMAC, 2015).

12.1.5.2 Karajarri IPA

Karajarri Indigenous Protected Area (IPA) was dedicated in 2014, to manage, protect and enhance Karajarri country. The IPA covers nearly 25,000 km² of land in the southern Kimberley, including 130 km of coastline stretching from Gordon Bay to Cape Missiessy. It comprises extensive coastlines, tidal creeks and wetlands as well as arid country that stretches into the Great Sandy Desert (NIAA, n.d.).

Karajarri people want to ensure areas of cultural and natural significance are looked after correctly according to their own protocols, and they view their environmental responsibilities as Palanapayana Tukjana Ngurra meaning “everybody looking after country properly” (KTLA, 2014a).

The IPA includes two different zoning categories to help manage country: IUCN Category 2 (National Park) and Category 6 (Protected area with sustainable use of resources). The category 2 zoning allows for the area to become part of an integrated system of protected areas with Eighty-mile beach to the south and Roebuck Bay to the north of the IPA (KTLA, 2014a).

To assist in the planning and development of the IPA, the Karajarri Traditional Lands Association (KTLA) developed a Healthy Country Plan, which provides direction for addressing threats and for working on priorities for land and cultural site management (KTLA, 2014b).

The Tukumana pa Karajarri Kura Jurrar IPA has been announced under the Sea Country IPA Program, extending from the existing Karajarri IPA into the sea off the south-west Kimberley coast (DCCEEW, 2023b). The area includes a network of coastal habitats, such as intertidal and subtidal reefs, mangrove systems, lagoons and tidal creeks, and connects the Ramsar sites of Roebuck Bay and Eighty-mile Beach (DCCEEW, 2023b).

12.1.5.3 Yawuru IPA

The Yawuru IPA was dedicated by Yawuru people in 2017, covering 2109 km² of Yawuru coastal and inland country (YRNTBC, 2014). The Yawuru people are the Native Title holders of their land and sea—their ancestors have lived along the foreshores of Roebuck Bay, across the Pindan Plains and inland along the fringes of the Great Sandy Desert for thousands of years (NIAA, n.d.-a).

The Yawuru IPA is managed under the Walyjalajala nagulagabu birrangun buru Plan of Management for 2017-2026 (YRNTBC, 2014). The plan includes eight targets for management, being:

- Yawuru cultural knowledge and practice
- Yawuru significant areas
- Yawuru rights and responsibilities
- Niyamarri – sand dunes

- Bilarra – wetlands
- Birra – bush and pindan country
- Nagulagun – saltwater country (deep water and intertidal)
- seasonal resources and biodiversity.

Cultural values include Yawuru named sites, tracks and areas, historical sites associated with pearling and pastoral industries, archaeological sites and traditional bush/sea resources. Ecological values include reefs and seagrass beds that provide habitat for dugongs (*Dugong dugon*) and EPBC Act-listed threatened sea turtle species including hawksbill turtle (*Eretmochelys imbricata*), loggerhead turtle (*Caretta caretta*), green turtle (*Chelonia mydas*) and flatback turtle (*Nataden depressus*). Roebuck Bay is a Ramsar site and has a known population of snubfin dolphins (*Orcaella heinsohni*) (Figure 7-6). Other ecological values include pearl shell beds for pearl oysters and habitat for a range of EPBC Act listed threatened species (YRNTBC, 2014).

12.1.5.4 Bardi Jawi IPA

Bardi Jawi IPA is located 160 km north of Broome and covers 1269.9 km² of land and sea country (NIAA, n.d.-b). The main communities on Bardi country are Djarindjin, Lombadina and Ardyaloon (One Arm Point). Bardi people live on the mainland of the Dampier Peninsula and islands immediately offshore from Ardyaloon. Jawi people call the islands further east, including Iwany (Sunday Island), their traditional country. Today people live in outstations spread along the mainland Peninsula coastline (KLC/BJNAC RNTBC, 2013).

During the IPA consultation process, The Bardi Jawi rangers guided meetings with individual family groups to identify what they considered important to look after. An IPA steering committee was formed, who contributed cultural knowledge to the Bardi Jawi Indigenous Protected Area Management Plan (2013–2023). They were assisted by The Nature Conservancy in Conservation Action Planning (CAP). This plan highlights targets to be protected on country:

- marnany (fringing reefs)
- aarli (fish)
- odorr (dugong) and goorlil (turtle)
- significant sites, language, law and culture
- traditional oola (water) places
- indigenous plant resources (KLC/BJNAC RNTBC, 2013).

Jardagarr (coastal country) is classed under IUCN Category 4, and Niimidiman (inland country) is classed under Category 6. Niimidiman harbours many plant and animal species of high cultural value. For example, Irrgil trees are used for making boomerangs and Marrga, Joolgirr and Bilimangard trees are used for making shields. Some Niimidiman areas feature traditional Oola (water) places and stories attached to these places are culturally important. Ecological values of the Jardagarr (coastal) country includes many species of native garrabal (birds), including eastern curlews and fork-tailed swifts (KLC/BJNAC RNTBC, 2013).

12.1.5.5 Dambimangari IPA

Dambimangari IPA is located between Broome and Darwin, stretching east to the Prince Regent area. It covers 6,422.94 km² of landscape, including open grasslands, eucalyptus woodlands, intertidal flats and rocky reefs and shoals (NIAA, n.d.-c). Dambimangari is the traditional home of the Worrarra people. Dambimangari peoples' identity is interwoven with the sea and its reefs and islands. Reefs are important hunting grounds for jaya (saltwater fish) and warliny (dugong).

The targets for protection are identified in the Dambimangari Healthy Country Plan 2012–2022 as:

- cultural sites
- reefs, beaches and islands
- saltwater fish
- turtle and dugong
- whales and dolphins
- rivers, waterholes, waterfalls and wetlands (freshwater systems)
- culturally important native animals
- bush fruits and medicine plants
- right-way fire (DAC, 2012).

Jurluwarra (saltwater-turtle) and warliny (dugong) are culturally important to Dambimangari people as a food source. Cultural sites include rock art sites, stone arrangements, burial sites and important camping beaches that were used for resting when travelling through saltwater country (DAC, 2012).

12.1.5.6 Uunguu IPA

Stage one of the Uunguu IPA was declared on May 23, 2011, coinciding with the Native Title Determination and release of the Healthy Country Plan. The IPA covers 7,598.06 km². It has been home to the Wunambal Gaambara people for many thousands of years and is part of the Wanjin Wunggurr culture. Wunambal Gaambara people call their country Uunguu – ‘our living home’. Two of the reserves extend to the low water mark at Bougainville Peninsula, Vansittart Bay, Anjo Peninsula, Napier Broome Bay and islands in Rothsay Water (WGAC, 2017). A Saltwater IPA Plan of Management was created in 2017 as a sub-plan for the Wunambal Gaambara Healthy Country Plan (WGAC, 2017)²¹.

Ten targets identified in the Wunambal Gaambara Healthy Country Plan are:

- Wanjin Wunggurr Law – our culture,
- right way fire,
- aamba (kangaroos and wallabies) and other meat foods,
- Wulo (rainforest),
- Yawal (waterholes),
- bush plants,
- rock art,
- cultural places on islands,
- fish and other seafoods,
- mangguru (marine turtles) and balguja (dugong) (WGAC, 2010).

The Uunguu Rangers look after land and sea country through pest control, visitor management, cultural heritage conservation, monitoring flora and fauna and fire management (NIAA, n.d.-c).

²¹ Marine areas were proposed to be added to the Uunguu IPA as an International Union for Conservation of Nature (IUCN) Category VI (Managed Resource) Protected Area, early in 2018.

12.1.5.7 Balanggarra IPA

The Balanggarra IPA was dedicated on August 7, 2013. The IPA spans over one million hectares of land and sea country in the Kimberley region and has been home to the Balanggarra people for thousands of years. The five big rivers of the north Kimberley intersect on Balanggarra country. These rivers include the King River, Forest River, Pentecost River, Durack River and Ord River. The region also borders the Cambridge Gulf and Timor Sea. Three species of vulnerable sawfish are found in the waters of this region (Kimberley Land Council, n.d).

Nine targets identified in the Balanggarra Healthy Country Plan 2012–2022 are:

- Balanggarra law and culture
- our gra or country (land, sea, rivers, islands)
- cultural sites (rock art sites, burial sites, heritage places)
- native animals
- accessible bush tucker / medicine plants
- right way fire
- freshwater (places and freshwater fish)
- saltwater fish and seafood
- migratory saltwater species (turtle, dugong, whales, dolphins).

The Balanggarra Rangers manage 1000 km of river and sea frontage on their country to manage and protect and enhance the unique biodiversity values of their country (Balanggarra Aboriginal Corporation, 2011).

12.1.5.8 Wilinggin IPA

The Wilinggin IPA spans over 2.4 million hectares of remote country in the central north Kimberley region and was declared in 2013. It included basalt ranges and sandstone cliffs which rise 250 m high. The area has wooded grasslands, pockets of rainforest, extensive mangrove systems, tidal mudflats, rivers, creeks and billabongs. The Ngarinyin people are the traditional owners of this area and have lived on Wilinggin country for thousands of years (NIAA, n.d-d). Wilinggin Country is mostly landlocked, apart from two small saltwater areas which include Walcott Inlet and Prince Frederick Harbour.

Seven targets identified in the Wilinggin Healthy Country Plan 2023–2032 are:

- becoming strong on country
- food and medicine plants
- bushfire
- law and culture sites
- law and culture
- freshwater places
- wildlife and bush meats.

The Wungurr Rangers are caretakers of the unique natural and cultural values of Wilinggin country (Wilinggin Aboriginal Corporation, 2022).

12.1.6 First Nations Cultural Heritage

Woodside understands that communal cultural connection exists between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that First Nations people have occupied the Australian continent for at least 65,000 years (Clarkson et al., 2017) and in many places maintain a strong continuing connection that is said to extend back in Indigenous cosmology to the beginning of time.

Archaeological sites identified onshore with the potential to exist in intertidal or submerged locations include petroglyphs, fish traps and artefact scatters or burials contained within sand dunes. As archaeological sites, these features have archaeological value which relates to the preservation of their fabric (i.e. the tangible features) and their context (i.e. their location and relationship to other archaeological and natural features). Archaeological sites may also have intangible dimensions (ICOMOS, 2013) cultural value that exist in addition to their archaeological or scientific value.

Intangible values are a living expression of cultural heritage that is prevalent across generations. These values can be traditional, and they can also be new and living at the same time. An understanding of the intangible cultural heritage of different First Nations communities helps with intercultural dialogue and encourages mutual respect (UNESCO, 2011). Intangible cultural heritage is safeguarded through practicing and passing on knowledge or expressions by the people to whom it belongs to (NNTC, n.d). Figure 12-5 provides context to common intangible themes that exist in First Nations communities.

Table 12-2: Intangible heritage values associated with Sea Country

Value	Details
Songlines	<p>Oral songlines are often described by First Nations people as the law of the land and make up part of the Dreaming (Neale and Kelly, 2020:30). Songlines are viewed in Western academia as a framework for relating people to land and consist of a series of invisible, interconnected routes across the landscape that mark significant sites for First Nations people (Higgins, 2021:723). Songlines demonstrate First Nations peoples' strong connections to land by revealing sacred knowledge that is place-specific (Roberts, 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through, and interacted with, the physical landscape leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include inter alia: rocks, mountains, rivers, caves and hills (Higgins, 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale and Kelly, 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge.</p> <p>In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of First Nations communities across the land (Neale and Kelly, 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country make mention of mythical events occurring around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country—for example, connections to nearby islands that they once inhabited in their songlines (Smyth and Isherwood, 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins, 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines in order to communicate sacred knowledge that assists in safe navigation of the ocean (Neale and Kelly, 2020:83-84).</p>

Value	Details
Creation/dreaming sites, sacred sites and ancestral beings	The only published sources located by Woodside with detailed descriptions of the location of ancestral beings or creation/dreaming/sacred sites place these on land, or within inland water sources such as rivers or pools. However, some ancestral beings are noted to live within or originate from the sea generally, and some creation stories talk to the creation of features from or in the sea. Additionally, every place on shore or at sea must be assumed to have been created on some level in First Nations cosmology.
Cultural obligations to care for Country	Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. In the literature reviewed by Woodside, caring for Country was noted to include, but is not limited to, maintenance of the physical environment and ecosystem. It may also have cultural, spiritual and ritual dimensions such as caring for ancestral beings or ensuring cultural safety. Thalu are places where what are known as "increase ceremonies" are performed to enhance or maintain populations of plants, animals or phenomena. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where e.g., a thalu relates to marine species populations.
Knowledge of Country/customary law and transfer of knowledge	Knowledge of and familiarity with the features of Sea Country is itself a value. The inherent potential for restricted or secret knowledge makes this difficult to assess even through consultation with Traditional Custodians. However, aspects such as limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. Further, connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald and Phillips, 2021). Transfer of knowledge includes continuing traditional practices to pass on practical skills. This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003).
Connection to Country	Describes the multi-faceted relationship between First Nations people and the landscape, which is envisioned as having personhood and spirit. It is also an aspect of personal identity for many First Nations people. In the case of Sea Country this can mean identifying as a Saltwater person, where "essence of being a 'Saltwater' person is ontological... it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people" (McDonald and Phillips, 2021).
Access to Country, including Sea Country	Access is necessary for the continuation of other values including caring for Country, carrying out cultural practices and the transfer of traditional knowledge. Being on Country can be an important way of expressing or maintaining connection to Country (Australian Indigenous HealthInfoNet, n.d.). Access is also a value in its own right, as a continuation of traditional Sea Country access and use.
Kinship systems and totemic species	Individuals may have kinship to specific species (Smyth, 2008; Juluwarlu, 2004) and/or a responsibility to care for species (Muller, 2008). Kinship arises from totemic associations within First Nations "skin group" systems. It is forbidden for an individual to kill or eat a species who is from the same "skin group" (Juluwarlu, 2004). They may also have certain obligations linked to the discussion of caring for Country above. It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that "skin group" from hunting or eating that same species (Juluwarlu, 2004).
Resource collection	A number of marine species are identified through consultation and literature as important resources, particularly as food sources (see Section 12.1.4). In addition to their immediate value as sustenance, the gathering and preparation of these resources is informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

On 15 November 2023, the *Aboriginal Heritage Act 1972* (WA) was restored as the legislation that manages Aboriginal heritage in Western Australia (DPLH, 2024). Under section 17 of that Act it is an offence to excavate, destroy, damage, conceal or alter any Aboriginal site without authorisation. Where there is a risk of injury or desecration to a significant Aboriginal area, even where permitted under the AHA, any Aboriginal person may apply to the federal Environment Minister for a declaration under sections 9 or 10 of the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* (Cth) for the protection and preservation of that area.

12.1.6.1 Submerged Cultural Heritage

It is understood that the sea level has risen significantly during the 65,000 years of Indigenous occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth et al., 2019; UWA, 2021). At its lowest level during Indigenous occupation, the sea level was between 125 m (O'Leary et al., 2020; Veth et al., 2019; Williams et al., 2018) and 130 m below current levels (Benjamin et al., 2020; Benjamin et al., 2023; UWA, 2021).

Archaeological material preserved on the Ancient Landscape has the potential to provide further information about the earliest periods of human occupation (Veth et al., 2019; UWA, 2021).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited, and can retain archaeological material from this time (Benjamin et al., 2020; Benjamin et al., 2023; see Ward et al., 2022 for an opposing view).

Certain landscapes have been identified as archaeologically prospective on the submerged Ancient Landscape, including:

- submerged water sources (rivers, waterholes, tidal channels and seeps) which have an increased likelihood of use or habitation as past generations used the associated resources (UWA, 2021)
- submerged calcarenite ridges younger than human occupation of the continent which may have formed over and protected artefacts in-situ (Veth, 2019)
- prominent landscape features (e.g. hills, particularly of igneous rock formations) that may have been foci for cultural activity (UWA, 2021)
- karst depressions and other "catch points" where artefacts may accumulate following disturbances caused by inundation (UWA, 2021; Nutley, 2022; Nutley, 2023a)
- Madeleine Shoals has been specifically identified by Murujuga Aboriginal Corporation (MAC) as an archaeologically prospective feature due to its igneous rock formations which have the potential to contain petroglyphs.

The sites considered most likely to survive inundation, based on the review of existing literature, were logically the more robust forms including:

- midden and artefacts within cemented dunes, relict water holes, and beach rock deposits
- quarry outcrops, extraction pits, and associated reduction debris in fine-grained volcanic outcrops
- curvilinear stone structures and standing stones sitting on volcanic pavements and jammed into volcanic rock piles
- lag deposits of artefacts and possibly midden on hardpan in suitable landscape contexts with good preservation conditions (e.g. shallow declination shorelines in sheltered passages of the inner archipelago or on the leeward side of hard-rock/fringing reef cause-ways adjacent to the outer islands)
- small overhangs and shelters with preserved deposits, facing away from the dominant wave and wind action (Veth et al., 2019).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the ancient coastline KEF as an area where potential First Nations archaeological material may exist on the seabed, as this covers the full extent of this possible occupation. Known places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or EPBC Act. However, these Acts only extend protection to First Nations heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is currently no First

Nations archaeology known to exist anywhere within Commonwealth waters and no areas subject to declarations or prescriptions under these Acts.

12.1.6.2 First Nations Sites of Significance

Murujuga (the Burrup Peninsula) has a very high density of significant Indigenous heritage sites and places with tangible and intangible heritage values. The area has one of the largest, densest, and most diverse collections of rock art in the world. It is estimated that the peninsula and surrounding islands contain over a million petroglyphs (rock engravings) covering a broad range of styles and subjects. The landscape also contains quarries, middens, fish traps, rock shelters, ceremonial sites, artefact scatters, grinding patches and stone arrangements that evidence tens of thousands of years of human occupation. These places are linked to First Nations cosmology, Dreaming stories and songs through the stories, knowledge and customs that are still held by Traditional Custodians.

In 2007 the Dampier Archipelago (including the Burrup Peninsula) was included on the National Heritage List due to outstanding heritage values relating to Australia's cultural history contained in the large number, density, diversity, distribution and fine execution of rock art. Within the National Heritage Place, the Murujuga National Park covers 4913 ha and is co-managed by the Murujuga Aboriginal Corporation and the Department of Biodiversity, Conservation and Attractions. The Murujuga Cultural Landscape was also added to Australia's Tentative World Heritage List in 2020, with full World Heritage Listing anticipated in 2024.

The Department of Planning, Lands and Heritage maintains a register of registered sites and heritage places. There are over 1600 registered sites on Murujuga and the Dampier Archipelago with around 1100 other heritage places. This register is not comprehensive and will be complemented by heritage surveys where necessary. Protection of National and World Heritage values is also legislated through various provisions of the EPBC Act. Murujuga National Park is managed under the *Conservation and Land Management Act 1984* (WA).

12.1.7 Historic Sites of Significance

Places of historic cultural significance are protected under Commonwealth, State and local regimes. Places inscribed on the National or World Heritage list are protected through various provisions of the EPBC Act. Historic places may also be protected under the *Heritage Act 2018* (WA); under section 129 of this Act the prohibited alteration, demolition, damage, despoilment or removal of objects from a registered place may result in a fine of A\$1 million. Protection of heritage by local government typically emanates from local planning schemes produced under Part 5 of the *Planning and Development Act 2005* (WA).

Historical sites of significance and heritage value are found along adjacent foreshores of the SWMR, NWMR and NWR.

12.1.8 Historic Underwater Heritage

The remains of vessels and aircraft in Commonwealth waters, along with any associated article, are automatically protected under the *Underwater Cultural Heritage Act 2018* (Cth) after 75 years. This is applicable whether the existence or location of the article is known or unknown, as per section 16 of the Act. Other articles of underwater cultural heritage may be declared for protection as outlined in section 17 of the Act. Remains and relics of any ship lost, wrecked or abandoned in Western Australian waters before 1900 are protected by the *Maritime Archaeology Act 1973* (WA).

There are no known National Heritage listed shipwrecks in the NWMR and NMR (Table 12-3 and Table 12-4). The only known National heritage listed shipwrecks are within the SWMR and include:

- the *HMAS Sydney II*
- the *HSK Kormoran*
- the *Batavia*.

Information on National Heritage listed shipwrecks in the SWMR can be found in Table 12-5.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Revision: 2

Woodside ID: 1401743486

Page 296 of 381

Uncontrolled when printed. Refer to electronic version for most up to date information.

Known historical shipwreck sites in Western Australian waters are listed in the [WA Maritime Museum Shipwreck Database](#). Known historical shipwreck sites in Commonwealth waters are listed in [Australasian Underwater Cultural Heritage Database](#). These databases only cover known historical sites. Known shipwrecks listed in these databases for the NWMR, NMR and SWMR are shown in Figure 12-6, Figure 12-7 and Figure 12-8 respectively.

12.1.9 World, National and Commonwealth Listed Heritage Places

The EPBC Act protects the heritage values of National Heritage Listed and World Heritage Listed places. Any action that will have or is likely to have a significant impact on the heritage values of these places are offences under Part 3, Division 1 of the EPBC Act unless the action is permitted under one of the mechanisms of the EPBC Act. These mechanisms include a number of exceptions set out in Part 4, approvals granted under Part 9 and ministerial decisions under Division 2 Part 7.

Australia's National Heritage Sites are those of outstanding natural, historic and/or Indigenous significance to Australia. Indigenous Protected Areas and National Heritage places classed as natural are discussed in Section 11.3. Historic and/or Indigenous National Heritage Listed Places of the NWMR and SWMR include:

- Dampier Archipelago (including Burrup Peninsula)
- Dirk Hartog Landing Site/Cape Inscription
- *HMAS Sydney II*, *HSK Kormoran* Shipwreck Sites
- *Batavia* Shipwreck Site and Survivor Camps Area 1629 – Houtman Abrolhos
- Cheetup Rock Shelter.

Commonwealth Heritage Places are a collection of sites recognised for their Indigenous, historical and/or natural values, which are owned or controlled by the Australian Government. A number of these sites are owned or controlled by the Department of Defence, as well as Government agencies relating to maritime safety, customs and communication. Commonwealth Heritage places classed as natural are discussed in Section 11.3. Listed Heritage Places in the NWMR are all natural with two related to defence activities which include:

- Yampi Defence Area (Table 11-6)
- Learmonth Air Weapons Range Facility (Table 11-6).

World Heritage Properties are those sites that hold universal value which transcends any value that may be held by any one nation. These sites and their qualities are detailed in the Convention concerning the Protection of the World Cultural and Natural Heritage (the World Heritage Convention), to which Australia is a founding member. The Protected Matters Search Report (PROTECTED MATTER SEARCH REPORTS FOR NWMR, SWMR AND NMR

) lists two natural World Heritage Properties in the NWMR (refer Section 11.2). There are no cultural heritage listings located within the NWMR.

Summary tables of heritage places for NWMR, SWMR and NMR are presented in Table 12-3, Table 12-4, and Table 12-5.

Table 12-3: Heritage Places (Indigenous and historic) within the NWMR

National Heritage Properties						
Dampier Archipelago (including Burrup Peninsula)	-	✓	-	Indigenous	The Dampier Archipelago (including the Burrup Peninsula) contains one of the densest concentrations of rock engravings in Australia with some sites containing thousands or tens of thousands of images.	The rock engravings comprise images of avian, marine and terrestrial fauna, schematised human figures, figures with mixed human and animal characteristics and geometric designs. At a national level it has an exceptionally diverse and dynamic range of schematised human figures some of which are arranged in complex scenes. The fine execution and dynamic nature of the engravings, particularly some of the composite panels, exhibit a degree of creativity that is unusual in Australian rock engravings.
Dirk Hartog Landing Site 1616 – Cape Inscription Area	-	-	✓	Historic	Cape Inscription is the site of the oldest known landings of Europeans on the WA coastline.	The Cape Inscription area displays uncommon aspects of Australia’s cultural history because of the cumulative effect its association with these explorers and surveyors had on growing knowledge of the great southern continent in Europe. The association of the site with these early navigators stimulated the development of the European view of the great southern continent at a time when they began to look at the world with a modern scientific outlook.

Cheetup Rock Shelter	Indigenous	Cheetup, meaning “place of the birds”, is the name of a spacious rock shelter located in Cape Le Grand National Park, about 55 km east of Esperance in WA. First Nations people associated with the place identify themselves as Nyungar/Noongar, Ngadju (shortened from Ngadjunmaia) or Mirning.	Cheetup rock shelter provides outstanding evidence for the antiquity of processing and use of cycad seeds by First Nations people. The seeds of the cycad are extremely toxic and can cause speedy death if eaten fresh without proper preparation to remove the toxins. The presence of <i>Macrozamia riedlei</i> seeds in a pit lined with Xanthorrhoea (grass tree) leaf bases indicates that First Nations people in the Esperance region had the knowledge to remove the toxins of this important source of carbohydrate and protein at least 13,200 years ago.
Batavia Shipwreck Site and Survivor Camps Area 1629 – Houtman Abrolhos	Historic	The Batavia and its associated sites hold an important place in the discovery and delineation of the WA coastline. The wreck of the Batavia, and other Dutch ships like her, convinced the VOC (Dutch East India Company) of the necessity of more accurate charts of the coastline and resulted in the commissioning of Vlamingh's 1696 voyage.	Because of its relatively undisturbed nature the archaeological investigation of the wreck itself has revealed a range of objects of considerable value as well as to artefact specialists and historians.

Heritage Places	Class	Description	Conservation Values
HMAS Sydney II and HSK Kormoran Shipwreck Sites	Historic	The naval battle fought between the Australian warship HMAS Sydney II and the German commerce raider HSK Kormoran off the WA coast during World War II was a defining event in Australia's cultural history. HMAS Sydney II was Australia's most famous warship of the time and this battle has forever linked the stories of these warships to each other. The loss of HMAS Sydney II along with its entire crew of 645 following the battle with HSK Kormoran, remains as Australia's worst naval disaster.	The shipwreck sites of HMAS Sydney II and HSK Kormoran have outstanding heritage value to the nation because of their importance in a defining event in Australia's cultural history and for their part in development of the process of the defence of Australia.
Commonwealth Heritage Properties			
Cliff Point Historic Sites	Historic	Cliff Head is a limestone bluff on the east coast of Garden Island. Evidence of occupation has been reported from the beach just north of the head, the immediate hinterland, the ridge above and on the south face of the ridge.	The Cliff Point Historic Site, individually significant within the area of Garden Island, is important as the first site inhabited by Governor Stirling's party in 1829 when founding the colony of WA, and as WA's first official non-convict settlement. The site was occupied in the first instance by Captain Charles Fremantle before the arrival of Captain Stirling. The party occupied the site for two months before a move was made to the Swan River settlement on the mainland.
HMAS Sydney II and HSK Kormoran Shipwreck Sites	Historic	As above.	As above.
J Gun Battery	Historic	J Battery comprised two 155 mm long range guns, the other similar battery being at Cape Peron on the mainland at the entrance to Cockburn Sound. Located in the dune systems at the north-western corner of Garden Island, elements of the J Battery complex are now covered in part by sand.	J Gun Battery (1942) is individually significant within the area of Garden Island (Register No. 019544) and is historically important as the first gun battery constructed on Garden Island and as one of two long range gun batteries which played a strategic role in the coastal defences of Cockburn Sound and Fremantle following the entry of Japan into the Second World War (1939–45).

12.2 Socio-Economic Values

Socio-economic values include commercial and traditional fishing, tourism and recreation, shipping, oil and gas activities and defense activities.

12.2.1 Commercial Fisheries – Commonwealth and State

The Australian Fisheries Management Authority (AFMA) manages fisheries on behalf of the Commonwealth Government and is bound by objectives under the *Fisheries Management Act 1991* (Cth).

WA State commercial fisheries are managed by the WA Department of Primary Industries and Regional Development (WA DPIRD) under the *Fish Resources Management Act 1994* (WA), *Fisheries Resources Management Regulations 1995* (WA), relevant gazetted notices and licence conditions, and applicable Fishery Management Plans.

Commonwealth and State managed fisheries that are licensed to operate within the NWMR are summarised in Table 12-6.

Table 12-6: Commonwealth and State managed fisheries

Fishery	Woodside Activity Area			Description

Commonwealth Managed Fisheries						
Southern Bluefin Tuna Fishery	✓	✓	✓	Management area:	The Southern Bluefin Tuna Fishery covers the entire EEZ around Australia, out to 200 NM from the coast. They do not fish in the Woodside activity area.	
				Species targeted	Fishing methods	Fishing depth
				Southern bluefin tuna (<i>Thunnus maccoyii</i>)	Longline, purse seine fishing, and minor line (troll and poling).	Southern bluefin tuna is a pelagic species which can be found to depths of 500 m (AFMA, 2021a).
				Fishing effort	Most of the Australian fishing effort is by purse-seine vessels in the Great Australian Bight and waters off South Australia during summer months, and by longline off the New South Wales coastline during winter months (Patterson and Dylewski, 2023a). The Southern Bluefin Tuna Fishery is shared amongst countries. Australia currently has a 35% share of the total global allowable catch. Whilst wild capture fishing in Australia to sell directly to market can occur anywhere throughout the fisheries range, currently most of that quota is value-added through ranching (on-growing the wild captured fish for an extra five to six months). Ranching requires significant infrastructure, a resident labour force, plus proximity to a fishery able to supply a large quantity of natural feed/sardines (40,000+ tonnes). North-west WA is critically important regardless of how the quota is fished because of the proximity to the single spawning ground of this global roaming species. Young fish (one to four years of age) move from the spawning ground in the north-east Indian Ocean into the Australian EEZ and southwards along the Western Australian coast (Patterson and Dylewski, 2023). The stock is classified as not overfished (Patterson and Dylewski, 2023a). A total of 5972 t bluefin tuna catch was recorded for the 2021–22 fishing season, an increase from 5646 t in the 2020–21 period (Patterson and Dylewski, 2023a). Of the total catch, 4957 t were collected using purse seine and 1015 from pelagic longline.	
				Active licences/ vessels	Eight purse seine vessels and 22 longline vessels, an increase from seven purse seine vessels and 20 longline vessels in the 2020–21 period (Patterson and Dylewski, 2023a).

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
Western Skipjack Tuna Fishery	✓	✓	✓	Management area:	The combined western and eastern skipjack tuna (<i>Katsuwonus pelamis</i>) fisheries encompass the entire Australian EEZ. The Western Skipjack Tuna Fishery extends westward from the SA/ Victorian border across the Great Australian Bight and around the west coast of WA to the Cape York Peninsula.	
				Species targeted	Fishing methods	Fishing depth
				Western skipjack tuna (<i>Katsuwonus pelamis</i>)	Fishers use purse seine gear (about 98% of catch) and sometimes pole and line when fishing for skipjack tuna.	Western skipjack tuna is a pelagic species that can be found to depths of 260 m (AFMA, 2021b).
				Fishing effort:	The Skipjack Tuna Fishery has not been actively fished since the 2008–09 fishing season (Patterson and Delewski, 2023b). The management arrangements for this fishery will be reviewed if active boats re-enter the fishery.	
				Active licences/ vessels:	No active vessels operating since 2009 (Patterson and Delewski, 2023b).	
Western Tuna and Billfish Fishery	✓	✓	✓	Management area:	The Western Tuna and Billfish Fishery extends to the Australian EEZ boundary in the Indian Ocean.	
				Species targeted	Fishing methods	Fishing depth
				Key species caught in the fishery are bigeye tuna (<i>Thunnus obesus</i>), yellowfin tuna (<i>T. albacares</i>) and swordfish (<i>Xiphias gladius</i>). Striped marlin (<i>Kajikia audax</i>) is a minor component of the catch. Catch of albacore (<i>T. alalunga</i>), a non-quota species, can approach levels similar to yellowfin tuna catch in some years (Blake et al., 2022a).	Fishers mainly use pelagic longline fishing gear to catch the targeted species. Minor line (including handline, troll, rod and reel) can also be used, and purse seine.	Species have a broad depth distribution, with tuna occurring at 150–300 m, striped marlin at 150 m and swordfish at up to 600 m (BRS, 2007).
				Fishing effort:	The fishery operates in Australia's EEZ and high seas of the Indian Ocean. Fishing effort in recent years has been concentrated off south-west WA, with occasional activity off SA (Patterson et al., 2023). A total of 145 t catch was landed in the 2021–22 seasons, a decrease from 252 t in the 2020–21 period (Patterson et al., 2023). The striped marlin, bigeye tuna, and yellowfin tuna are classified as subject to overfishing (Patterson et al., 2023).

Fishery	Woodside Activity Area			Description	
	Browse	NWS/S	NWC		
				Active licences/ vessels:	Two pelagic longline and 3 minor line vessels were active during the 2021-22 season (Patterson et al., 2023).
Western Deepwater Trawl Fishery			✓	Management area	The Western Deepwater Trawl Fishery is in deep water off WA, from the line approximating the 200 m isobath to the edge of the Australian Fishing Zone (AFZ). (Blake et al., 2021).
				Species targeted	Fishing methods
				More than 50 species, historically dominated by six commercial finfish species or species groups: <ul style="list-style-type: none"> orange roughy (<i>Hoplostethus atlanticus</i>) oreos (<i>Oreosomatidae</i>) boarfish (<i>Pentacerotidae</i>) eteline snapper (<i>Lutjanidae: Etelinae</i>) apsiline snapper (<i>Lutjanidae: Apsilinae</i>) sea bream (<i>Lethrinidae</i>). 	Demersal trawl.
				Fishing effort:	Fishing depth
				The number of vessels active in the fishery and total hours trawled have fluctuated from year to year. Notably, total hours trawled were relatively high for a brief period during the early 2000s when fishers targeted ruby snapper and deep-water bugs (Patterson et al., 2020). Total trawl hours have been variable but relatively low since 2005–06. In 2021–22, 76 trawl-hours were recorded in the fishery, down from a recent peak of 1108 in 2017–18 (Keller et al., 2023). The total catch was 12 t in the 2021–22 season, up from 5 t in the 2020–21 season and no deepwater bugs were caught between 2020 and 2022 (Keller et al., 2023). Ruby snapper made up 40% of the catch in 2021–22 and 31% in 2020–21 (Keller et al., 2023). Ruby snapper and deepwater bugs stock are considered not subject to overfishing but the biomass status of deepwater bugs are classified as uncertain (Keller et al., 2023).	Water deeper than 200 m (Blake et.al., 2021).
				Active licences/ vessels:	Since 2004–05, one to three vessels have been active in the fishery, with two active vessels in 2021–22 (Keller et al., 2023).

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
North-west Slope Trawl Fishery	✓	✓		Management area:	The North-west Slope Trawl Fishery extends from 114 °E to 125 °E, from the 200 m isobath to the outer limit of the AFZ (200 NM from the coastline, which is the boundary of the Australian EEZ).	
				Species targeted	Fishing methods	Fishing depth
				Australian scampi (<i>Metanephrops australiensis</i>) and smaller quantities of velvet and Boschma's scampi (<i>M. velutinus</i> and <i>M. boschmai</i>). A quantity of prawns is harvested each season, and squids are becoming an increasingly significant component of the catch. Mixed snappers (<i>Lutjanidae</i>) and redspot emperor (<i>Lethrinus lentjan</i>) have historically been an important component of the catch (Blake et al., 2021).	Fishing for scampi occurs over soft, muddy sediments or sandy habitats, using demersal trawl gear on the continental slope (Patterson et al., 2017).	Typically depths of 350 to 600 m (Patterson et al., 2017).
				Fishing effort:	The North-west Slope Trawl Fishery commenced in 1985 and the number of active vessels peaked at 21 in the 1986–87 season, decreasing to between 1 and 6 vessels per year since 2005-06 (Keller and Curtotti, 2023). A total catch of 85.8 t was recorded in 2021–22, a decrease from 87.05 t in 2020–21 (Keller and Curtotti, 2023). Of the total catch, the Australian scampi species comprised of approximately 33% (29 t), down from 50% (44 t) in 2020–21. The stock assessment of scampi in the fishery are classified as not subject to overfishing (Keller and Curtotti, 2023).	
				Active licences/ vessels:	Three vessels were active in the 2021-22 season, decline from 4 in the 2021-22 season, and trawl-hours decreased from 4,420 in 2020-21 to 3,950 in 2021-22 (Keller and Curtotti, 2023).

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
Pilbara Fish Trawl (Interim) Managed Fishery		✓		Management area:	The Pilbara Trawl (Interim) Managed Fishery is a high intensity fishery divided into two zones and an area governed by Schedule 5 (prohibited to trawling). In addition to the Prohibited Trawl Fishing area, no fish trawl units are allocated for use in Zone 1 or Areas 3 and 6 of Zone 2 (which comprises six management areas) (Newman et al., 2021a).	
				Species targeted	Fishing methods	Fishing depth
				The fishery targets more than 50 scalefish species. The main demersal scalefish species landed by the fisheries in the Pilbara region are bluespotted emperor, red emperor and rankin cod (Newman et al., 2021a). The key species caught by the Pilbara Trawl (Interim) Managed Fishery include crimson snapper, bluespotted emperor trevally and threadfin bream (DPIRD, 2020).	Demersal trawl. The fishery operates with standard stern trawling gear (single net with extension sweeps) (Newman et al., 2021a).	The fishery operates in waters between 50 and 200 m water depth (Allen et al., 2014; Newman et al., 2015).
				Fishing effort:	Based on State of the Fisheries annual reports provided by DPIRD, catch trends were seen to be increasing over the past reporting years, until the past two seasons. The Pilbara Trawl (Interim) Managed Fishery catch was 1784 t in 2022, 1928 t in 2021, 2087 t in 2020, 2142 t in 2019, 1996 t in 2018, 1780 t in 2017, 1529 t in 2016, 1172 t in 2015 and 1105 t in 2014 (Wakefield et al., 2023a). The fishery landed 72% of total commercial catches of the demersal scale fish in the Pilbara in 2022. Increasing catch rates and fishing mortality spawning biomass estimates indicate that imposed effort reductions since 2008 have resulted in increased fish abundance and stock rebuilding in the fishery (Wakefield et al., 2023a). In 2021, the total catch of the indicator species red emperor in the Pilbara Demersal Scalefish Fisheries (includes trawl, trap and line sectors) was 192 t, which is within the acceptable catch range (Wakefield et al., 2023). The biological stocks for the Pilbara Demersal Scalefish Fisheries are classified as sustainable-adequate (Wakefield et al., 2023a).	
				Active licences/ vessels:	Four active vessels in the trawl sector in 2022 (Wakefield et al., 2023a).	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
Pilbara Trap Managed Fishery		✓	✓	Management area:	The Pilbara Trap Managed Fishery covers the area from Exmouth northwards and eastwards to the 120° line of longitude, and offshore as far as the 200 m isobath. Like the trawl fishery, the trap fishery is also managed using input controls in the form of individual transferable effort allocations monitored with a satellite-based vessel management system. The fishery includes six licences allocated to three vessels, operating principally from Onslow.	
				Species targeted	Fishing methods	Fishing depths
				The catch is made up of around 45 to 50 different fish species. The fishery generally targets long-lived, high-value demersal scalefish such as red emperor and Rankin cod but also lands significant catches of shorter-lived species such as blue spotted emperor (DPIRD, 2020).	Demersal fish traps.	Approximately 30 m isobath to 200 m isobath (DPIRD. n.d.).
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Pilbara Trap Managed Fishery caught 597 t in 2022, 662 t in 2021, 584 t in 2020, 680 t in 2019, 563 t in 2018, 573 t in 2017, 495 t in 2016, 510 t in 2015 and 268 t in 2014 (Wakefield et al., 2023a). The total catch of 597 t in 2022 made up 24% of the total catch by the Pilbara Demersal Scale Fishery and exceeded the acceptable catch range for the total catch (Wakefield et al., 2023a).	
				Active licences/ vessels:	Three active vessels in the trap sector in 2022 (Wakefield et al., 2023a).	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Pilbara Line Managed Fishery		✓	✓	Management area:	The Pilbara Line Managed Fishery boat licences are permitted to operate anywhere within 'Pilbara water', bounded by a line commencing at the intersection of 21° 56'S latitude and the high-water mark on the western side of the North-west Cape on the mainland of WA; west along the parallel to the intersection of 21° 56'S latitude and the boundary of the AFZ and north to longitude 120°E.	
				Species targeted	Fishing method	Fishing depths
				The Pilbara Line Managed Fishery catch is made up around 45–50 different fish species. The fishery targets similar demersal species to the Pilbara Trap and Trawl fisheries, as well as some deeper offshore species such as ruby snapper and eightbar grouper (DPIRD, 2020).	Demersal long line.	Information not available.
				Fishing effort:	Based on State of the Fisheries annual reports provided by DPIRD, catch trends are as follows: The Pilbara Line Managed Fishery caught 104 t in 2022, 124 t in 2021, 167 t in 2020, 148 t in 2019, 93 t in 2018, 143 t in 2017, 126 t in 2016, 97 t in 2015 and 40 t in 2014 (Wakefield et al., 2023a). The total catch of 104 t in 2022 made up 4% of the total catch by the Pilbara Demersal Scalefish Fishery and was within the acceptable catch range (Wakefield et al., 2023a).	
				Active licences/ vessels:	Four active vessels in 2022 (Wakefield et al., 2023a).	
Mackerel Managed Fishery	✓	✓	✓	Management area:	The commercial fishery extends from the West Coast Bioregion to the WA/NT border. There are three managed fishing areas: Area 1: Kimberley (121° E to the WA/NT border); Area 2: Pilbara (114° E to 121° E) and Area 3: Gascoyne (27° S to 114° E) and West Coast (Cape Leeuwin to 27° S) (Lewis et al., 2020).	
				Species targeted	Fishing methods	Fishing depth
				Spanish mackerel (<i>Scomberomorus commerson</i>), grey mackerel (<i>S. semifasciatus</i>), other species from the genus <i>Scomberomorus</i> .	Trolling, baits or lures cast, jigging (Lewis et al., 2020).	Information not available.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort: <p>Most of the catch is taken from waters off the Kimberley and Pilbara coasts (Lewis et al., 2020), reflecting the tropical distribution of mackerel species (Molony et al., 2015). Most fishing activity occurs around the coastal reefs of the Dampier Archipelago and Port Hedland area, with the seasonal appearance of mackerel in shallower coastal waters most likely associated with feeding and gonad development before spawning (Mackie et al., 2003).</p> <p>Previous years catch based on State of the Fisheries annual reports provided by DPIRD: 212 t in 2022, 310 t in 2021, 290 t in 2020, 291 t in 2019, 214 t in 2018 (the lowest on record (Lewis et al., 2020), 283 t in 2017, 276 t in 2016, 302 t in 2015 and 322 t in 2014 (Lewis and Rynvis, 2023).</p> <p>The landed catch in 2021 was 238 t for Spanish mackerel and 10 t for grey mackerel (Lewis and Watt, 2023). The commercial landings for other large pelagic species, such as the amberjack and cobia were 19.7 t and 18.2 t, and other species contributed to the remaining <10 t of the total catch (Lewis and Watt, 2023).</p> <p>All species stocks are sustainable-adequate (Lewis and Rynvis, 2023).</p>		
				Active licences/ vessels: <p>There were 16 vessels in 2022, primarily from May to November (Lewis and Rynvis, 2023).</p>		
Marine Aquarium Fish Managed Fishery	✓	✓	✓	Management area: <p>The Marine Aquarium Fish Managed Fishery can operate throughout WA State waters. The fishery is typically more active in waters south of Broome and higher levels of effort around the Capes region, Perth, Geraldton, Exmouth, Dampier, and Broome (Newman et al., 2021b). There has been recent effort in the waters from Broome northwards to the NT border (Newman et al., 2023a).</p>		
				Species targeted <p>Finfish, hard coral, soft coral, tridacnid clams, syngnathids (seahorses and pipefish), other invertebrates (including molluscs, crustaceans, echinoderms), algae, seagrasses and 'live rock'.</p> <p>The resource potentially includes over 1500 species of marine aquarium fishes (Newman et al., 2021b).</p>	Fishing methods <p>The fishery is diver-based, which typically restricts effort to safe diving depths (less than 30 m).</p>	Fishing depth <p>Information not available.</p>

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort: Total catch for the Marine Aquarium Fish Managed Fishery in 2022 was 98,694 fishes and invertebrates, 17.83 t of coral, live rock, and living sand, and 39 L of marine plants and live feed. (Newman et al., 2023a). In 2021, the total catch for the Marine Aquarium Fish Managed Fishery was 92,227 fishes (including syngnathids, invertebrates and sponges), 27.97 t of coral, live rock and living sand, and 42 L of marine plants and live feed (Newman et al., 2023). In 2020 was 89,925 fishes, 32.12 t of coral, live rock and living sand and <20 L of marine plants and live feed (Newman et al., 2021b). Dominant fish species caught in 2022 include spotted blenny (<i>Istiblennius meleagris</i>), scribbled angelfish (<i>Chaetodontoplus duboulayi</i>), black-axil chromis (<i>Chromis atripectoralis</i>), stripey (<i>Microcanthus strigatus</i>), Vachell's glassfish (<i>Ambassis vachellii</i>), margined coralfish (<i>Chelmon marginalis</i>), black-axil chromis (<i>Chromis atripectoralis</i>), and blue and yellow wrasse (<i>Anampses lennardi</i>) (Newman et al., 2023a). The breeding stocks of landed species are classified as sustainable-adequate (Newman et al., 2023a)		
				Active licences/ vessels: 13 licences were active in 2022 across the Marine Aquarium Fish Managed Fishery and the Hermit Crab Fishery (Newman et al., 2023a).		
Western Australian Sea Cucumber Fishery (formerly Beche-de-mer Fishery)	✓	✓	✓	Management area: Fishing occurs mostly in the northern half of WA from Exmouth Gulf to the NT border and is managed under Ministerial Exemptions. Shark Bay was fished for the first time in 2020 (Hart et al., 2023a) and again in 2021 (Newman et al., 2022).		
				Species targeted	Fishing methods	Fishing depth
				Two main species: sandfish (<i>Holothuria scabra</i>) and redfish (<i>Actinopyga echinites</i>).	Diving and wading. Collected by hand.	The targeted species typically inhabit nearshore in shallow depths.
				Fishing effort: Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Western Australian Sea Cucumber Fishery caught 56.5 t in 2022, 41.3 t in 2021 3.6 t in 2020, 6.9 t in 2019, 62 t in 2018 (Gaughan and Santoro, 2020), 135 t in 2017, 93 t in 2016 and 38 t in 2015. In 2022, 45.2 t of the total catch consisted of sandfish (<i>Holothuria scabra</i>), 10.8 t deepwater redfish (<i>Actinopyga echinites</i>), and 0.5 t of black teatfish (<i>Holothuria whitmaei</i>) (Newman et al., 2023d). Sandfish were collected from the Kimberley only, which was last fished in 2017 (Hart et al., 2023). Deepwater redfish and black teatfish were harvested from Shark Bay (under an exception licence granted to native title holders), which was the second time this stock had been fished (Hart et al., 2023). The stock status of sandfish, in the Kimberly, and red fish species landed are considered to be sustainable- adequate, while the sandfish in the Pilbara are not sustainable – inadequate. (Hart et al., 2023f).

Fishery	Woodside Activity Area			Description	
	Browse	NWS/S	NWC		
				Active licences/ vessels:	Two operating vessels operating in 2022 (Hart et al., 2023f).
Onslow Prawn Managed Fishery		✓		Management area:	The Onslow Prawn Managed Fishery encompasses a portion of the continental shelf off the Pilbara.
				Species targeted	Fishing methods
				Western king prawns (<i>Penaeus esculentus</i>), brown tiger prawns (<i>Penaeus esculentus</i>), blue endeavour prawns (<i>Metapenaeus endeavouri</i>).	Low opening, otter prawn trawl systems.
				Fishing effort:	Fishing depth
				The total landings for the Onslow Prawn Managed Fishery in 2022 are not available due to data confidentiality (Wilkin, et al. 2023b). In 2021 were less than the target catch range of 60 t (Kangas et al., 2023a). 37 days of fishing took place in 2021, compared to 13 days in 2020 (Kangas et al., 2023a). The breeding stocks of banana, brown tiger, and western king prawns are considered sustainable-adequate (Kangas et al., 2023a).	Fishery and or fishing activity overlaps the Beadon Creek dredging scope (Sporer et al., 2015).
Pearl Oyster Managed Fishery	✓	✓	✓	Active licences/ vessels:	One vessel active in 2021 (Kangas et al., 2023a).
				Management area:	The Pearl Oyster Managed Fishery is located in shallow coastal waters, designated by four zones extending from Exmouth to Kununurra and the seaward boundary demarcated by the 200 NM EEZ. The fishery is currently managed under the <i>Pearling Act 1990</i> (Hart et al., 2023b).
				Species targeted	Fishing methods
				Silver lipped pearl oysters (<i>Pinctada maxima</i>).	Drift diving.
				Fishing effort:	Fishing depth
				In 2021, catch was taken from Zones 2 and 3 only with no fishing in Zone 1, which has not been fished from 2017 to 2021 (Hart et al., 2023b). In 2022, the number of wild-caught pearl oysters was 756,531 (Hart et al., 2023d). Total dive hours increased in 2022 from 8175 hours in 2021 to 10,906 hours due to a 28% increase in harvest. (Hart et al., 2023d). Zones one to three are all considered to be sustainable – adequate (Hart et al., 2023b).	Fishing effort is mostly focused in shallow coastal waters (10–15 m depth), with a maximum depth of 35 m (Lulofs et al., 2002).

Fishery	Woodside Activity Area			Description	
	Browse	NWS/S	NWC		
				Active licences/ vessels:	Six active vessels in 2022 (Hart et al., 2023b).
Pilbara Crab Managed Fishery		✓	✓	Management area:	The Pilbara Crab Managed Fishery covers inshore waters from Onslow to Port Hedland (between longitudes 115° 5' 60" E and 120° E), with most activity around Nickol Bay (Johnston et al., 2020b). Areas of the fishery north and east of Exmouth and nearshore are currently closed as per Schedule 2 of the Draft Management Plan for the Pilbara Crab Managed Fishery (DPIRD, 2018b).
				Species targeted	Fishing methods
				Blue swimmer crab (<i>Portunus armatus</i>) (Johnston et al., 2021).	Hourglass traps (Johnston et al., 2021).
				Fishing effort:	Fishing depth
				Previous years catch based on State of the Fisheries annual reports provided by DPIRD: Catch for the Pilbara Crab Managed Fishery was 11.2 t in 2022, 9.7 t in 2021, 0.6 t in 2020 and 19.3 t in 2019 (Johnston et al., 2023a). The total catch in 2021 was a substantial increase from the 2.1 t caught in 2020, which was the lowest landed catch in 20 years (Johnston et al., 2023a). In 2022 the blue swimmer crab catch accounted for 2% of the State commercial catch, all taken by the fishery (Johnston et al., 2023a). The blue swimmer crab stock status is considered sustainable – adequate (Johnston et al., 2023a).	Up to 50m deep (Johnston et al., 2020a).
South West Coast Salmon Managed Fishery	✓	✓	✓	Active licences/ vessels:	No information available currently.
				Management area:	The South-west Coast Salmon Managed Fishery operates on various beaches south of the metropolitan area and includes all WA waters north of Cape Beaufort except Geographe Bay.
				Species targeted	Fishing methods
				Western Australian salmon (<i>Arripis truttaceus</i>).	Beach seine nets.
				Fishing effort:	Fishing depth
				No fishing occurs north of the Perth metropolitan area, despite the managed fishery boundary extending to Cape Beaufort (WA/Northern Territory border), as advised by WAFIC. The commercial catch for the entire West Coast Nearshore and Estuarine Finfish resource was 302.5 t in 2022. The total catch of Western Australian salmon was 82.9 t in 2022, a decrease from 88.5 t in 2021. The Western Australian Salmon stock status is considered sustainable – adequate. (Duffy et al., 2023c).	Information not available.

Fishery	Woodside Activity Area			Description	
	Browse	NWS/S	NWC		
				Active licences/vessels:	The number of active vessels or licences in 2021 is unknown, however there were approximately 12 commercial fishers employed in 2018 (Duffy et al., 2023)
Specimen Shell Managed Fishery	✓	✓	✓	Management area:	The Specimen Shell Managed Fishery encompasses the entire WA coastline, but effort is concentrated in areas adjacent to the population centres such as Broome, Exmouth, Shark Bay, Geraldton, Perth, Mandurah, the Capes area and Albany (Hart et al., 2023c). There are several closed areas where the fishery is not permitted to operate. These include various marine parks and aquatic reserves, such as Ningaloo Marine Park. The Perth metropolitan area is also important because of its populations of two rare cowrie species (Hart et al., 2023c).
				Species targeted	Fishing methods
				The Specimen Shell Managed Fishery targets the collection of specimen shells for display, collection, cataloguing and sale. About 200 species of specimen shell are collected each year. There is some focus of effort on mollusc families that are most popular with shell collectors, such as cowries, cones, murexes and volutes (Hart et al., 2023c).	Collection is predominantly by hand when diving to wading in shallow, coastal waters, though in deeper water collection may be conducted by remotely operated vehicles (limited to one per licence).
				Fishing effort:	Fishing depth
				A total of 5074 specimen shells were collected in 2022, distributed over 200 species (Hart et al., 2023f). A total of 5443 specimen shells were collect distributed over 200 species in 2021 (Hart et al., 2023b). Total number of specimen shells collected in 2020 was 4258 shells, across 206 species (Hart et al., 2021c). Stocks of landed species in the Specimen Shell Managed Fishery are classified as sustainable – adequate (Hart et al., 2023f).	For collection by hand, (diver-based) this typically restricts effort to safe diving depths (less than 30 m). ROV collection could enable depths up to 300 m (Hart et al., 2023c).
				Active licences/vessels:	An exemption for the trial of remotely operated underwater vehicles (limited to one per licence) was in place during 2021 (Hart et al., 2023c). There was a total of 30 licences in the fishery, of which 16 licences were fished in 2022 (Hart et al., 2023f). Effort in 2022 was 388 days (Hart et al., 2023f).

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
West Australian Abalone Fishery	✓	✓	✓	Management area:	The Western Australian Abalone Managed Fishery includes all coastal waters from the WA and SA border to the WA and NT border. The fishery is concentrated on the south coast and the west coast. It is divided into eight management areas. The fishery for Greenlip and Brownlip abalone operates in areas 1–4 and the Roe's abalone fishery operates in areas 1, 2, 5, 6, 7 and 8 (DoF, 2011).	
				Species targeted	Fishing methods	Fishing depth
				Greenlip abalone (<i>Haliotis laevis</i>), brownlip abalone (<i>Haliotis conicopora</i>), Roe's abalone (<i>Haliotis roei</i>).	Divers.	Distribution to 5 m depth for Roe's abalone and 40 m depth for greenlip/brownlip abalone (DOF, 2011).
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The total catch for greenlip and brownlip abalone in 2022 was 40.1 t whole weight (26.6 t greenlip and 13.5 t brownlip), (Strain et al., 2023d), an increase from 2021 which was 39 t whole weight (greenlip 25.9 t and brownlip 13.1 t) (Strain et al., 2023a). The total catch in 2021 was the lowest catch recorded for greenlip/brownlip in 53 years (Strain et al., 2023d). The Roe's abalone resource catch for 2022 was 28.9 t, a 2.6% decrease from the previous season (Strain et al., 2023c). In 2021 was 29.7 t whole weight, an increase from 18.2 t whole weight in 2020 (Strain et al., 2023a). The stock status of greenlip abalone is considered inadequate and brownlip abalone is adequate (Strain et al., 2023a). The stock status of the Roe's abalone is considered adequate (Strain et al., 2023c).	
				Active licences/ vessels:	There were 16 registered vessels in 2022 for the Greenlip and Brownlip Abalone Fishery (Strain et al., 2023d) and 21 for Roe's, however only a small proportion were active (Strain et al., 2023c).	
Western Australia Joint Authority Northern Shark Fishery	✓			Management area:	The Western Australia Joint Authority Northern Shark Fishery extends from longitude 12° 45'E to the Northern Territory border.	
				Species targeted	Fishing methods	Fishing depth
				Blacktip shark (<i>Carcharhinus tilstoni</i>), spot-tail shark (<i>Carcharhinus sorrah</i>).	Gillnets and longlines.	Information not available.
				Fishing effort:	Since 2005, 60% of the waters have been closed to finishing and limited on the number of fishing days. No catch has been reported since 2008/2009 (Braccini and Watt, 2023).	
				Active licences/ vessels:	Information not available.

West Coast Deep Sea Crustacean Managed Fishery	✓	✓	✓	Management area:	The West Coast Deep Sea Crustacean Managed Fishery extends north from Cape Leeuwin to the WA/NT border in water depths greater than 150 m within the AFZ.	
				Species targeted	Fishing methods	Fishing depth
				The fishery targets deepwater crustaceans: <ul style="list-style-type: none"> crystal (snow) crab (<i>Chaceon albus</i>) giant (king) crab (<i>Pseudocarcinus gigas</i>) champagne (spiny) crabs (<i>Hypothalassia acerba</i>). Catches are dominated by crystal crabs of which 99% of their total allowable catch was landed in 2020 (How and Baudains, 2021).	Baited pots, or traps, are operated in long-lines which have between 80 and 180 pots attached to a main line marked by a float at each end.	Deeper than 150 m (and mostly at depths of between 500–800 m). Most of the commercial crystal crab catch is taken in depths of 500–800 m (WAFIC ²²).
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The total landings were 133.5 t in 2022, 155.5 t in 2021, 156.1 t in 2020, 155.7 t in 2019 and 168 t in 2018. The total landings of crustaceans in 2022 was dominated by crystal crabs (123.2 t). A further 10 t of champagne crabs and 0.1 t of giant crab were also landed in 2022 (How et al., 2023c). The stock status for crystal crab is considered adequate. However, it is likely that the stock biomass is near or below its threshold level, but above its limit level (How and Wiberg, 2023a).	
				Active licences/ vessels:	There were seven licence holders with five vessels active in 2022 (How et al., 2023c).	
Abrolhos Islands and Mid-West Trawl Fishery			✓	Management area:	The Abrolhos Islands and Mid-West Trawl Fishery operates around the Abrolhos Islands within the SWMR.	
				Species targeted	Fishing methods	Fishing depth
				Saucer scallops (<i>Ylistrum balloti</i> , formerly <i>Amusium balloti</i>).	Otter trawl.	Saucer scallops occur in inshore waters around 40 m depth at the Abrolhos Islands (Kangas et.al., 2021a).

²² <https://www.wafic.org.au/fishery/west-coast-deep-sea-crustacean-fishery/>

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Abrolhos Islands and Mid-West Trawl Fishery did not fish in 2022 due to the stock being environmentally limited. (Wilkin et al., 2023a) The fishery landed 123.1 t meat weight (615.1 t whole weight) in 2021, 238.6 t meat	
				Active licences/ vessels:	The number of vessels is unreported. There were 10 licences in 2021 (Kangas et al., 2023b).	
Broome Prawn Managed Fishery	✓			Management area:	The Broome Prawn Managed Fishery operates off Broome and forms part of the North Coast Prawn Fishery.	
				Species targeted	Fishing methods	Fishing depth
				Western king prawn (<i>Penaeus latisulcatus</i>), brown tiger prawns (<i>Penaeus esculentus</i>), blue endeavour prawns (<i>Metapenaeus endeavouri</i>).	Low opening, otter prawn trawl systems	Trawling is generally in waters between 30 and 60 m deep, however can occur down to 100 m (DOEH, 2004).
				Fishing effort:	The DPIRD state of State of the Fisheries annual reports indicate that no fishing efforts occurred in 2022 and extremely low fishing effort occurred in 2021, 2020 and 2019 (Wilkin et al., 2023b). The stock status of western king prawns is considered sustainable – adequate (Kangas et al., 2023a).	
				Active licences/ vessels:	No boats undertook trial fishing activities in 2022 (Wilkin et al., 2023b).	
Exmouth Gulf Prawn Managed Fishery			✓	Management area:	The Exmouth Gulf Prawn Managed Fishery operates within the sheltered waters of Exmouth Gulf. The fishery occupies a total area of 4000 km ² , with only half of this area being trawled (Fletcher and Santoro, 2015).	
				Species targeted	Fishing methods	Fishing depth
				Western king prawn (<i>Penaeus latisulcatus</i>), brown tiger prawn (<i>Penaeus esculentus</i>), blue endeavour prawn (<i>Metapenaeus endeavouri</i>), banana prawn (<i>Penaeus merguensis</i>).	The fishery uses low opening, otter prawn trawl systems (Kangas et al., 2021c).	Information not available.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
Gascoyne Demersal Scalefish Managed Fishery			✓	Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Exmouth Gulf Prawn Managed Fishery landed 898 t in 2022, 777 t in 2021, 673 t in 2020, 821 t in 2019, 880 t in 2018, 713 t in 2017 and 822 t in 2016 (Wilkin et al., 2023c). The total catch comprised of 411 t of brown tiger prawns, 218 t of western king prawns, and 269 t of blue endeavour prawns (Wilkin et al., 2023c). Stock status of landed species is considered sustainable – adequate (Kangas et al., 2023c).	
				Active licences/ vessels:	The number of participation vessels is six. Approximately 126 people, including skippers and other crew were employed in 2022 (Wilkin et al., 2023c).	
				Management area:	The Gascoyne Demersal Scalefish Managed Fishery is located between the southern Ningaloo Coast to south of Shark Bay with a closure area at Point Maud to Tantabiddi (WAFIC ²³).	
				Species targeted	Fishing methods	Fishing depth
				Pink snapper (<i>Chrysophrys auratus</i>), goldband snapper (<i>Pristipomoides multidens</i>). Other demersal species caught include: <ul style="list-style-type: none"> tropical snappers emperors cods mulloway trevallies. 	Mechanised handlines.	The target species inhabit waters deeper than 20 m (Jackson et.al., 2021a).
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Gascoyne Demersal Scalefish Managed Fishery reported a total commercial catch of 166 t in 2022, 164 t in 2020–21, 207 t in 2019–20, 173 t in 2018–19 and 210 t in 2017–18. The total of commercial catches comprised 42 t of pink snapper, 83 t goldband snapper, and 41 t of other mixed species (Jackson et al., 2023c). The stock status for pink snapper is considered recovering, with goldband snapper considered sustainable – adequate (Jackson et al., 2023c).

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Active licences/ vessels:	Ten vessels fished during 2022, six of which fished for more than 10 days during peak pink snapper season (Jackson et al., 2023c).	
Kimberley Crab Managed Fishery (formerly Kimberley Developing Mud Crab Fishery)	✓			Management area:	Kimberley Crab Managed Fishery is one of two small trap-based crab fisheries that exist in the North Coast Bioregion between Cambridge Gulf and Broome (Gaughan and Santoro, 2018). In November 2018, the fishery transitioned from developing to fully managed (Johnston et al., 2020b).	
				Species targeted	Fishing methods	Fishing depth
				Brown mud crab (<i>Scylla olivacea</i>), green mud crab (<i>Scylla serrata</i>).	Trap. Exemption holders use crab traps and drop nets in waters adjacent to native title lands (Johnston et al., 2023).	Information not available.
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The total crab landed was 13.6 t in 2022, 9.7 t in 2021, 1.5 t in 2020, 3.2 t in 2018 and 7.4 t in 2019. In 2022, Kimberley Crab Managed Fishery landed a total catch of 2.4 t of brown mud crab represented the entire reported commercial mud crab catch (Johnston et al., 2023a). Mud crab species in the managed fishery is considered sustainable – adequate (Johnston et al., 2023a).	
				Active licences/ vessels:	There is an allocation of 1200 units (equivalent to 600 traps) to licence holders (Johnston et al., 2023). An equivalent allocation of 600 traps for commercial purposes was provided to Traditional Owner groups through the granting of non-transferable Instruments of Exemption under the <i>Fish Resources Management Act 1994</i> . Two people were employed in 2022 between August and October (Johnston et al., 2023a).	
Nickol Bay Prawn Managed Fishery		✓		Management area:	The Nickol Bay Prawn Managed Fishery operates in nearshore and offshore waters of the Pilbara region along the NWS. Trawling has been reported to occur at several locations along the Pilbara coast to the east of the Burrup Peninsula, including within the waters of Nickol Bay (Fletcher and Santoro, 2015).	
				Species targeted	Fishing methods	Fishing depth
				Banana prawn (<i>Penaeus merguensis</i>), western king prawn (<i>Penaeus latisulcatus</i>), brown tiger prawn (<i>Penaeus esculentus</i>), blue endeavour prawn (<i>Metapenaeus endeavour</i>).	Low opening, otter prawn trawl systems.	Information not available.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort: Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Nickol Bay Prawn Managed Fishery landed 51 t in 2022, 123.4 t in 2021, 202.4 t in 2020, 254 t in 2019 and 81 t in 2018 (Wilkin et al., 2023b). Of the total landings in 2022, landings were dominated by 42 t banana prawns and 7 t brown tiger, and 2 t blue endeavour (Wilkin et al., 2023b). Fishing effort was 62 boat days, a decrease from 175 days in 2021 (Wilkin et al., 2023b). The banana prawn stock status within the Nickol Bay Prawn Managed Fishery is considered sustainable-adequate (Wilkin et al., 2023b).		
				Active licences/ vessels: There were three participating vessels in 2022 (Wilkin et al., 2023b).		
Northern Demersal Scalefish Managed Fishery	✓			Management area: The Northern Demersal Scalefish Managed Fishery is divided into two fishing areas: an inshore sector (Area 1) and an offshore sector (Area 2) (Newman et al., 2018). Area 1 permits line fishing only, between the high-water mark and the 30 m isobath. Area 2 permits handline, dropline and fish trap fishing methods and is further divided into zones. Zone A is an inshore area, Zone B comprises the area with most historical fishing activity, and Zone C is an offshore deep slope area representing waters deeper than 200 m (Fletcher et al., 2017).		
				Species targeted	Fishing methods	Fishing depth
				Goldband snapper (<i>Pristipomoides multidentis</i>), blue-spotted emperor (<i>Lethrinus punctulatus</i>), red emperor (<i>Lutjanus sebae</i>), rankin cod (<i>Epinephelus multinotatus</i>).	Handline, dropline and fish trap.	Information not available.
				Fishing effort: Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Northern Demersal Scalefish Managed Fishery landed 1458 t in 2022, 1544 t in 2021, 1419 t in 2020, 1507 t in 2019, and 1297 t in 2018. In 2022, the majority of the catch was landed from Zone B, with 1235 t in 2022. The 2022 catch of jobfish group (<i>Pristipomoides spp.</i>) was 552 t, 91% of which was goldband snapper (Wakefield et al., 2023a). The stock status of landed species in the managed fishery is classified as sustainable – adequate (Wakefield et al., 2023a).		
				Active licences/ vessels: Eight active vessels in 2022 (Wakefield et al., 2023a).		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Octopus Interim Managed Fishery	-	-	-	Management area:	The Octopus Interim Managed Fishery operates from Kalbarri Cliffs in the north to Esperance in the south.	
				Species targeted	Fishing methods	Fishing depth
				<i>Octopus djinda</i> , which is closely related to <i>Octopus tetricus</i> .	Primary method is baited octopus trap (combination of active trapping via trigger mechanisms, and passive trapping – shelter traps) (Hart et al., 2023d).	In inshore waters to a depth of 70 m (DPIRD, 2018a).
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: Commercial catch for the Octopus Interim Managed Fishery was 744 t in 2022, 487 t in 2021, 254 t in 2020, 453 t in 2019, 314 t in 2018, 257 t in 2017 and 252 t in 2016 (Hart et al., 2023g). In 2022, the total catch of octopus was 744 t live weight, which was 53% higher than 2021 with a total catch of 487 t (Hart et al., 2023g). Octopus stock status in 2022 is considered sustainable-adequate (Hart et al., 2023g).	
				Active licences/ vessels:	27 active vessels in 2022 (Hart et al., 2023g).	
Shark Bay Beach Seine and Mesh Net Managed Fishery	-	-	-	Management area:	The Shark Bay Beach Seine and Mesh Net Managed Fishery operates from Denham.	
				Species targeted	Fishing methods	Fishing depth
				Whiting (yellowfin <i>Sillago schomburgkii</i>), sea mullet (<i>Mugil cephalus</i>), tailor (<i>Pomatomus saltatrix</i>), western yellowfin bream (<i>Acanthopagrus australis</i>).	Beach seine and mesh net.	Information not available.
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: Total catch was 131 t in 2022, 135 t in 2021, 171 t in 2020, 175 t in 2019 and 176 t in 2018. Of the total catch in 2022, 78 t consisted of whiting, 25 t of sea mullet, 16 t of western yellowfin bream, 6 t of tailor, and 1.5 t of pink snapper (Jackson et al., 2023b). The stock status of targeted species is sustainable - adequate (Jackson et al., 2023b).	
				Active licences/ vessels:	Five vessels were active in 2022 (Jackson et al., 2023b).

Shark Bay Crab Managed Fishery	-	-	-	Management area:	The Shark Bay Crab Managed Fishery operates within the NWMR. It is based primarily in Carnarvon but operates throughout the waters of Shark Bay.	
				Species targeted	Fishing methods	Fishing depth
				Blue swimmer crab (<i>Portunus armatus</i>)	Trap and trawl.	Information not available.
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The fishery landed 401 t in 2022, 549 t in 2020–21, 638 t in 2019–20, 529 t in 2018–19 and 518 t in 2017–18. The fishery closed for a period of 18 months in 2012 and 2013 to promote stock recovery, following a series of adverse environmental conditions between 2010 and 2011 (Chandrapavan et al., 2023). Limited commercial fishing resumed under a national quota management system between 2013 and 2017 (Chandrapavan et al., 2023). The current stock status is sustainable-adequate (Chandrapavan et al., 2023).	
				Active licences/ vessels:	In the trawl sector in 2022 there were 10 licenced vessels based in Carnarvon with an additional eight vessels traveling to Carnarvon. There were three trap vessels (Chandrapavan et al., 2023a).	
Shark Bay Prawn and Scallop Managed Fishery	-	-	-	Management area:	The Shark Bay Prawn Managed Fishery is the highest producing WA fishery for prawns. The Shark Bay Scallop Managed Fishery is usually Western Australia's most valuable scallop fishery (Kangas et al., 2021b).	
				Species targeted	Fishing methods	Fishing depth
				Western king prawn (<i>Penaeus latisulcatus</i>), brown tiger prawn (<i>Penaeus esculentus</i>), endeavour prawns (<i>Metapenaeus endeavouri</i>), coral prawns (<i>Metapenaeopsis</i> sp.), saucer scallop (<i>Amusium balloti</i>).	Low-opening otter trawls.	Information not available.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Shark Bay Prawn Managed Fishery landed 831 t in 2022, 1,303 t in 2021, 1268 t in 2020, 1214 t in 2019, 1091 t in 2018 and 1608 t in 2017. Of the total landings, 503 t comprised of western king prawn, 326 t of brown tiger prawn, and 2 t of blue endeavour prawn (Wilkin et al., 2023d). The Shark Bay Scallop Managed Fishery has been managed under a quota management framework since the fishery reopened in 2015 (Kangas et al., 2021b). Scallop landings for Shark Bay were 35 t (177 t meat weight) in 2022, 123.6 t meat weight (618.2 t whole weight) in 2021, 177.1 t meat weight (885.5 t whole weight) in 2020 and 339 t meat weight (1,694 t whole weight) in 2019. All stocks for target species are considered sustainable-adequate (Wilkin et al., 2023a).	
				Active licences/ vessels:	In the trawl sector in 2022 there were 10 licenced vessels based in Carnarvon with an additional eight vessels traveling to Carnarvon (Wilkin et al., 2023d). In the Shark Bay Scallop Managed Fishery there are boats licensed to take scallops (11 Class A licences) and boats that also fish for prawns (18 Class B licenses). There were eight vessels (Wilkin et al., 2023a).	
				Management area:	The South Coast Crustacean Managed Fishery comprises four fisheries: the Windy Harbour/Augusta Rock Lobster Managed Fishery, the Esperance Rock Lobster Managed Fishery, the Southern Rock Lobster Pot Regulation Fishery and the South Coast Deep-Sea Crab Fishery.	
South Coast Crustacean Managed Fishery	-	-	-	Species targeted	Fishing methods	Fishing depth
				Southern rock lobster (<i>Jasus edwardsii</i>), western rock lobster (<i>Panulirus cygnus</i>), giant crab (<i>Pseudocarcinus gigas</i>), crystal crab (<i>Chaceon albus</i>), champagne crab (<i>Hypothalassia acerba</i>).	Pots.	Information not available.
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The South Coast Crustacean Managed Fishery reported a total catch of 23.8 t in 2022, 27.4 t in 2020–21, 52.5 t in 2019–20, 67.5 t in 2018–19 and 101.2 t in 2017–18 season. In 2022, the total crustacean landings comprised of champagne crabs (3.6 t), southern rock lobster (6.4 t), giant crabs (5.7 t), western rock lobster (5 t), and crystal crabs (3.1 t) (How et al, 2023d). The stock status is sustainable – adequate (How and Wiberg, 2023b).

				Active licences/ vessels:	The South Coast Crustacean Managed Fishery is based on mobile vessels that employ a skipper and one to three crew. In 2022, there were nine participating vessels (How et al, 2023d).
South Coast Purse Seine Managed Fishery	-	-	-	Management area:	The South Coast Purse Seine Managed Fishery is active in coastal waters between Cape Leeuwin and the South Australia border. Landings are primarily off Albany, Bremer Bay and Esperance (Norriss and Blazeski, 2020). The managed fishery has five management zones: centred on King George Sound (Zone 1), Albany (Zone 2), Bremer Bay (Zone 3), Esperance (Zone 4) and a developmental zone near Cape Leeuwin (Zone 5) where catches have been negligible (Norriss and Blazeski et al., 2023a).
				Species targeted	Fishing methods
				Small pelagic finfish. Australian sardine (pilchards, <i>Sardinops sagax</i>), yellowtail scad (<i>Trachurus novaezelandiae</i>), Australian anchovy (<i>Engraulis australis</i>), scaly mackerel (<i>Sardinella lemuru</i>), maray (<i>Etrumeus jacksoniensis</i>). Entitled to take sandy sprat (<i>Hyperlophus vittatus</i>) and blue sprat (<i>Spratelloides robustus</i>), however not reported caught since 1993/94.	Purse seine nets from vessels.
				Fishing effort:	Information not available.
				Active licences/ vessels:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The South Coast Purse Seine Managed Fishery landed 1636 t in 2022, 1255 t in 2020–21, 1498 t in 2019–20, 1064 t in 2018–19 and 2168 t in the 2017–18 season. The total catch in 2022, consisted of >99% of Australian sardines (Norriss and Blazeski et al., 2023c). Fishing effort in 2022 was 576 boat days (Norriss and Blazeski et al., 2023c). The stock status for the Australian sardine is considered sustainable – adequate (Norriss and Blazeski et al., 2023c).

South-west Trawl Managed Fishery	-	-	-	Management area:	The South-west Trawl Managed Fishery is a multi-species fishery and includes two of WA's smaller scallop fishing grounds at Fremantle and north of Geographe Bay (Fairclough and Walters, 2018).	
				Species targeted	Fishing methods	Fishing depth
				Scallops (<i>Ylistrum balloti</i> , formerly <i>Amusium balloti</i>) and associated by-products. In years of low scallop catches, licencees may use trawl gear to target fin-fish species.	Trawl.	Information not available.
				Fishing effort:	Catch levels are unavailable for recent years. The fishery was not active in 2015 or 2016 (Fairclough and Walters, 2018). Effort in the fishery is highly variable and typically fluctuates in response to recruitment variability in saucer scallops and prawns. In 2021 <1% of the allowable area was trawled in the South-west Trawl Managed Fishery (Kangas et al., 2023b). The stock status of scallops is considered sustainable-adequate (Wilkin et al., 2023a).	
				Active licences/ vessels:	One vessel fished in 2022 (Wilkin et al., 2023a).	
The South Coast Salmon Managed Fishery	-	-	-	Management area:	The South Coast Salmon Managed Fishery is one of two fisheries operating in the South Coast Bioregion that target nearshore and estuarine finfish.	
				Species targeted	Fishing methods	Fishing depth
				Western Australian salmon (<i>Arripis truttaceus</i>), southern school whiting (<i>Sillago bassensis</i>), Australian herring (<i>Arripis georgianus</i>), King George whiting (<i>Sillaginodes punctatus</i>), sea mullet (<i>Mugil cephalus</i>), estuary cobbler (<i>Cnidoglanis macrocephalus</i>), black bream (<i>Acanthopagrus butcheri</i>).	Beach seines, haul nets and gill nets.	Information not available.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: Total catch for the South Coast Estuarine and Nearshore Scalefish and Invertebrates Resource was 267.6 t for 2022, 275.1 t in 2021 and 334 t in 2020. Of this, the South Coast Salmon Managed Fishery landed 48.5 t of Western Australian salmon in 2021, 76 t in 2020 and 56.5 t in 2019. The stock status of target species is sustainable-adequate (Duffy et al., 2023b).	
				Active licences/ vessels:	Catch was recorded against eight licences in 2022 (Duffy et al., 2023d).	
West Coast Beach (Beach Bait Fish Net) Managed Fishery	-	-	-	Management area:	Primarily active in the Bunbury areas in the SWMR, operates between 26° and 33° S.	
				Species targeted	Fishing methods	Fishing depth
				Whitebait.	Beach-based haul nets.	Information not available.
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The total catch of whitebait in 2022 was 23.3 t, an increase from 21.3 t in 2021 (Duffy et al., 2023c). The fishery continues to be environmentally limited with stocks recovering from the 2010/11 marine heat wave (Duffy et al., 2023a). The stock status is inadequate – environmentally limited (Duffy et al., 2023c).	
				Active licences/ vessels:	The number of active vessels in 2021 is unknown, however five licensees reported landings of whitebait in 2011 (Smith et al., 2011)	
West Coast Demersal Gillnet and Demersal Longline (Interim) Managed Fishery	-	-	-	Management area:	The West Coast Demersal Gillnet and Demersal Longline (Interim) Managed Fishery is part of the Temperate Demersal Gillnet and Demersal Longline Fishery, which operates between 26° and 33° S, and the Joint Authority Southern Demersal Gillnet and Demersal Longline Managed Fishery, which operates from 33° S to the WA/SA border (Braccini and Blay, 2020).	
				Species targeted	Fishing methods	Fishing depth
				Gummy shark (<i>Mustelus antarcticus</i>), dusky shark (<i>Carcharhinus obscurus</i>), whiskery shark (<i>Furgaleus macki</i>). Sandbar shark (<i>C. plumbeus</i>) Scalefish are a byproduct.	Gillnet and longline.	Information not available.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside Activity Area			Description		
	Browse	NWS/S	NWC			
				Fishing effort: Catches of elasmobranchs and fishing effort for the Temperate Demersal Gillnet and Demersal Longline Fishery peaked during the late 1980s and early 1990s and have stabilised at lower levels in recent years (Braccini and Watt, 2021). Previous years values from State of the Fisheries annual reports provided by DPIRD: Estimated annual value to the fishery was \$0.23 million for 2021–22, \$0.17 million for 2020–21, \$0.11 million for 2019–20, \$0.2 million for 2018–19 and \$0.3 million for 2017–18. Stock status for the gummy and whiskery shark is considered sustainable – adequate, with the dusky and sandbar shark status sustainable – recovering (Braccini and Rynvis, 2023).		
				Active licences/ vessels: Vessel and license data is not available. There were approximately 10 to 11 skippers and crew employed during 2020–22 period (Braccini and Rynvis, 2023).		
West Coast Demersal Scalefish Interim Managed Fishery	-	-	-	Management area: The West Coast Demersal Scalefish Interim Managed Fishery is the main commercial fishery that targets demersal species in the West Coast Bioregion. It encompasses the waters from just south of Shark Bay down to just east of Augusta and extends seaward to the 200 NM boundary. The fishery is divided into four inshore management areas and one offshore management area.		
				Species targeted	Fishing methods	Fishing depth
				The resource comprises over 100 species, including: <ul style="list-style-type: none"> • baldchin groper (<i>Choerodon rubescens</i>) • dhufish (<i>Glaucosoma hebraicum</i>) • pink snapper (<i>Pagrus auratus</i>). 	Lines.	Information not available.
				Fishing effort: Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The West Coast Demersal Scalefish Interim Managed Fishery retained 240 t in 2022, 259 t in 2021, 227 t in 2020, 254 t in 2019 and 230 t in 2018. Management commenced to recover stocks for the West Coast Demersal Scalefish Resource in 2008. Landings since 2008 have been below the stock recovery benchmark of 450 t (Fisher et al., 2023a).		
				Active licences/ vessels: 30 licenced vessels operated in 2022 (Fisher et al., 2023a).

West Coast Purse Seine Managed Fishery	-	-	-	Management area:	Most of the catch in the West Coast Purse Seine Managed fishery are taken from between Cape Leeuwin and Geraldton. This region is separated into three zones (Northern Development Zone, Perth Metropolitan, and Southern Development zone (Norriss and Blazeski, 2023b).	
				Species targeted	Fishing methods	Fishing depth
				Small pelagic finfish such as: <ul style="list-style-type: none"> • scaly mackerel (<i>Sardinella lemuru</i>) • pilchards (<i>Sardinops sagax</i>) • Australian anchovy (<i>Engraulis australis</i>) • yellowtail scad (<i>Trachurus novaezelandiae</i>) • maray (<i>Etrumeus teres</i>) 	Purse seine.	Information not available.
				Fishing effort:	Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The total combined catch taken by the West Coast Purse Seine Managed Fishery and developmental licencees was 259 t in 2022, 504 t in 2021, 493 t in 2020, 527 t in 2019 and 340 t in 2018. In 2022, the total catch consisted of 66% scaley mackerel and 31% Australian sardine (Norriss and Blazeski, 2023d). Both the scaley mackerel and Australian sardine have a stock status classified as sustainable – adequate (Norriss and Blazeski, 2023d).	
				Active licences/ vessels:	Five active vessels in 2022 (Norriss and Blazeski, 2023d).	
West Coast Rock Lobster Managed Fishery			✓	Management area:	The West Coast Rock Lobster Fishery operates from Shark Bay south to Cape Leeuwin. The fishery is managed using zones, seasons and total allowable catch. The recreational fishery targets the western rock lobsters using baited pots and by diving between North-west Cape and Augusta.	
				Species targeted	Fishing methods	Fishing depth
				Western rock lobster (<i>Panulirus cygnus</i>).	Baited pots.	Information not available.

Fishery	Woodside Activity Area			Description	
	Browse	NWS/S	NWC		
				Fishing effort: Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The total catch for the West Coast Rock Lobster Fishery was 6342 t in 2022 (De Lestang and Walsh, 2023). Due to COVID-19 related logistics and marketing issues, the 2020–21 season was extended from 12 to 18 months. Since the current extended season is still in progress, data has been reported on a 12-month period (15 Jan 2021 to 14 Jan 2022) (How and Wiberg, 2023a). Landings for the 12-month (2021–22) season was 6334 t and the 18-month 2020–21 season was 9132 t. Commercial landings over the traditional 12-month season (15 Jan 2020 to 14 Jan 2021) were 5696 t. The fishery landed 6397 t in 2019 and 6400 t in 2018 and 2017. The stock status for the western rock lobster is classified as sustainable – adequate (How and Wiberg, 2023a).	
				Active licences/ vessels: 218 vessels were active in the 2022 season (De Lestang and Walsh, 2023).	

12.2.2 Fish Habitat Protection Areas

Fish Habitat Protection Areas (FHPAs) are areas of special protection and management in Western Australian waters. They are established in areas identified as having a particular value for the protection of fish and their habitats, education and/or aquaculture and which is considered to require a higher level of protection than other parts of the marine environment (DPIRD, 2013). They are set under section 115 of the *Fish Resources Management Act 1994* (WA) for:

- the conservation and protection of fish, fish breeding areas, fish fossils or the aquatic ecosystem
- the culture and propagation of fish and experimental purposes related to that culture and propagation, or
- the management of fish and activities relating to the appreciation or observation of fish.

Under the Act, fish can include a range of organisms including finfish, crustaceans, molluscs, corals, seagrass and algae at all stages of their life cycles. FHPAs and a marine reserve declared under the *Conservation and Land Management Act 1984* (WA) cannot exist in the same area (DPIRD, 2013).

Management of an FHPA is designed and carried out to achieve the purposes outlined in a Plan of Management. FHPAs may restrict non-fishing related activities, such as the use of anchors, if they are considered to be inconsistent with the purpose of the FHPA; for example, if there is a risk to damage of fragile marine formations such as coral reefs. Protection may also involve the management of human activities such as dredging, draining of wetlands, and fishing or diving near sensitive marine habitats (DPIRD, 2013). Western Australia has six FHPAs (four within the NWMR and two within the SWMR):

- Abrolhos Islands
- Kalbarri Blue Holes
- Miaboolya Beach
- Point Quobba
- Cottesloe Reef
- Lancelin Island Lagoon.

12.2.2.1 FHPAs Within the NWMR

Abrolhos Islands

The Houtman Abrolhos Islands (Abrolhos) is an archipelago of up to 210 small islands and associated reefs located approximately 65–90 km offshore from Geraldton, Western Australia (WA) (Evans et al., 2022). The Abrolhos FHPA includes all waters from the high-water mark of the Abrolhos Islands out to three nautical miles; an area of about 2500 km² (Evans et al., 2022).

The islands and waters of the Abrolhos are of significance for both land-based (e.g. seabird breeding, migratory shorebirds, carpet pythons, tammar wallabies, and significant flora and vegetation) and marine-based values (e.g. diverse and unique range of fish and marine aquatic species, significant commercial and recreational fisheries, aquaculture and marine tourism) (Evans et al., 2022). The reefs of the Abrolhos are extremely diverse, with approximately 184 species of coral, 295 species of marine algae and 389 species of fish (Evans et al., 2022).

The Abrolhos Includes specific regulations such as:

- temporal (seasonal) closures (e.g. closed season for baldchin groper, *Choerodon rubescens*, between 1 November and 31 January)

- spatial closures (e.g. Reef Observation Areas ~64.3km² or 2.6% of Abrolhos FHPA)
- recreational fishing specific bag and possession limits (Evans et al., 2022).

The marine state territorial waters of the Abrolhos continue to be managed by the Department of Primary Industries and Regional Development.

Kalbarri Blue Holes

The Blues Holes form part of an inshore coastal limestone reef system to the west of the town of Kalbarri. The northern boundary of the FHPA is located immediately west of the northern end of the Blue Holes car park and extends south from this point for approximately 420 m. The width of the FHPA varies from around 130 m wide at the southern end, to approximately 140 m wide at the northern end (DoF, 2007).

The Kalbarri Blue Holes FHPA includes part of a near-shore limestone reef system, which stretches intermittently from Red Bluff in the South to the Murchison River Mouth in the North (DoF, 2007). To First Nations people, access to the reef system – near to the river mouth – is likely to have made it a significant site for hunting fish and gathering seafood. The river mouth beside Kalbarri, is called 'Wudumalu' or 'Wutumalu' by the local Nhanda language group (DoF, 2014a).

The reef provides a base for a range of recreational activities including swimming, scuba diving and snorkelling. There is an abundance of finfish, shellfish, crustaceans, corals, seagrasses and sponges living there. There are up to 70 species of finfish, 10 types of sponge, and 11 species of coral found in the reef system (DoF, 2014a).

Regulations for protection of Kalbarri Blue Holes include:

- All marine life is protected, and no fishing activities are permitted.
- The use of all motorised vessels (boats and jet skis) is prohibited within the FHPA's waters (DoF, 2014a).

Miaboolya Beach

Miaboolya Beach is an area of the Gascoyne River delta near Carnarvon. The FHPA covers the nearshore waters and extends north to South Bejaling and south to the northern side of the Gascoyne River mouth. In addition, it includes the adjoining mangrove system, associated seasonal creeks and salt marshes (DoF, 2003).

The Miaboolya system has regional importance as a fish nursery and general fish habitat. Native fauna includes juvenile finfish species such as tailor (*Pomatomus saltatrix*), mullet (*Argyrosomus spp.*) and sand whiting (*Sillago ciliata*), and various crab species including mud crabs, blue swimmer and green mud crabs (family *Portunidae*). The fish and crab stocks use this environment for breeding, growth and development. Resident and migratory populations of birds, marine turtles and dolphins also exist within the area and contribute to its environmental value (DoF, 2003).

The Miaboolya area is of important cultural and historical value to the Gnulli native title group. The area is a place for traditional food collection and gathering for social occasions (DoF, 2003).

Recreational fishing is permitted however there are restrictions in place by the Department of Fisheries (DoF, 2014b).

Point Quobba

The Point Quobba FHPA adjoins the well-known 'Blowholes' tourist attraction at Quobba Station, 75 km north-west of Carnarvon WA, at the northernmost point of Shark Bay (DoF, 2004).

The marine life and habitats of the area are of considerable scientific and recreational interest and are highly valued in the local community. However, the area is at risk from a high level of use and conflict between users, due to the area's proximity to popular tourism sites, the boat ramp, camping and settlement areas (DoF, 2004).

The marine habitat at Point Quobba is in a transition zone between tropical and temperate climatic zones and is therefore highly diverse. It contains a mix of endemic temperate south-west Australian species and tropical and temperate Indo-Pacific species. The FHPA provides relatively sheltered breeding and feeding habitat for more than 100 species (DoF, 2015)

Point Quobba lies within the traditional area of the Baiyungu people, who are members of the Gnulli Group. The Baiyungu people use the area regularly, sometimes to collect trochus for consumption at Point Quobba and Black Rock (DoF, 2004).

There is a designated 'restricted area' within the FHPA to protect vulnerable habitats and fish species from human activity. Within this area commercial and recreational fishing and jet-skiing are prohibited. Restrictions on fishing in the rest of the FHPA are defined by the Department of Fisheries (DoF, 2015).

12.2.2.2 FHPAs Within the SWMR

Cottesloe Reef

The Cottesloe reef system stretches intermittently for approximately 4.4 km from a point 300 m south of the artificial surfing reef at the Cable Station to North Street, Cottesloe. It is located on a limestone shelf, which is known locally as the Cottesloe Fringing Bank. This shelf extends approximately 1.5 km offshore from the beach. Limestone pinnacles, elevated platforms, and water-eroded limestone outcrops form most of the surface reef structure. In places, sea-grass patches and kelp beds occur within 100 m of the shoreline (DoF, 2001a).

The reef is readily accessible to the public and intensively used by locals and other Perth metropolitan residents and is therefore vulnerable to human impacts. The reef system and its waters are highly popular for recreational activities including surfing, windsurfing, swimming, paddle skiing, line fishing, spear fishing, snorkelling and scuba diving.

The Cottesloe Reef system contains a unique and diverse range of marine habitats. These include sand, sand with seagrass, limestone reef with large kelp and macroalgae, sponge beds and garden bottoms. In deeper water, corals, sea cucumbers and sponge gardens thrive and the slope of the reef platform at Mudurup Rocks provides habitat for animals such as feather stars and small molluscs, which are protected from heat and drying during low summer tides. An abundance of finfish can be found in and around the reef system, including herring, tailor, skipjack (silver trevally), whiting, morwong and tarwhine (silver bream). The reef is also a breeding ground for squid, Port Jackson sharks and other elasmobranchs including stingrays (DoF, 2001a; DoF 2010).

Regulations for protection of Cottesloe Reef include:

- Spearfishing is prohibited throughout the FHPA.
- Commercial fishing is prohibited throughout the FHPA.
- Recreational fishing (except net fishing) for fish such as tailor, herring, whiting, skipjack and garfish is permitted in the FHPA, subject to recreational fishing rules for the West Coast region.
- Anchoring of any craft in the FHPA is prohibited.
- Five yellow moorings have been provided within the FHPA for use by boats up to 12 m. These moorings are removed during winter (April–November) to prevent damage from winter storms (DoF, 2010).

Lancelin Island Lagoon

Lancelin Island is an emergent limestone feature of the coastal marine environment of the mid-west coast of Western Australia. The island is located approximately 110 km north of Perth and 800 m offshore from the Lancelin town site (DoF, 2001b).

The Lancelin Island Lagoon is a small area of reef habitat on the western side of Lancelin Island and

a popular snorkelling and diving destination. Water depth ranges from less than 0.3 m on the intertidal reefs to less than 3 m on the sand or seagrass-covered bottom. The area has a diverse array of benthic marine habitat. During a marine survey of the area, over 200 flora and fauna species were positively identified, with more remaining unidentified due to the diversity of species (DoF, 2001a).

The management strategy for the Lancelin Island Lagoon includes the following regulations:

- Prohibit all recreational and commercial fishing, aquaculture and collecting in the FHPA.
- Prohibit boat anchorage within the FHPA.
- Investigate the means to prohibit mining and exploration within the FHPA and in adjacent areas where the environmental values of the FHPA may be compromised (DoF, 2001a).

12.2.3 Aquaculture

Aquaculture operations in the northwest are typically restricted to inland and shallow coastal waters.

12.2.3.1 West Coast Bioregion

Aquaculture activities in the West Coast bioregion, defined by the Department of Primary Industries and Regional Development (DPIRD) (as the government body responsible management of primary industries in WA) are focused on blue mussels and edible oysters (mainly in Cockburn Sound) and marine algae for production of beta-carotene, used as a food additive and as a nutritional supplement. Offshore marine finfish production is also being developed, initially focusing on yellowtail kingfish near Geraldton.

There is also an emerging black pearl industry (from the *Pinctada margaritifera* oyster) in the Abrolhos Islands. As well as expansion in the production of Akoya pearls (small white pearls from *Pinctada fucata martensi*), *Pinctada albina* (small, yellow pearls) and *Pteria penguin*, which are often used to produce half (mabe) pearls in pink and bluish shades.

Aquaculture licences for producing coral and live rock (pieces of old coral reefs colonised by marine life, such as beneficial bacteria, for aquariums) at the Abrolhos Islands have also been issued and other applications are being assessed (DPIRD, 2023).

12.2.3.2 Gascoyne Coast Bioregion

In the Gascoyne Coast bioregion, aquaculture activities are focused on the blacklip oyster (*Pinctada margaritifera*) and Akoya pearl oyster (*Pinctada imbricata*) (Gaughan and Santoro, 2020). Several hatcheries supply *P. margaritifera* juveniles to the region's developing black pearl farms.

Other aquaculture developments in the Gascoyne Coast bioregion include emerging producers of coral and live rock species for aquariums (DPIRD, 2023).

12.2.3.3 North Coast Bioregion

Aquaculture activities in the North Coast bioregion is dominated by the production of pearls (from the *Pinctada margaritifera* oyster). A large number of pearl oysters for seeding are obtained from wild stocks and supplemented by hatchery produced oysters, with major hatcheries operating at Broome and around the Dampier Peninsula (DPIRD, 2023). Primary spawning of the pearl oyster occurs from mid-October to December. A smaller secondary spawning occurs in February and March (Gaughan and Santoro, 2020).

Finfish aquaculture in the Kimberley region is dominated by Barramundi located in the Kimberley Aquaculture Development Zone which lies approximately 200 km north-east of Broome. Rock oyster trials are nearing completion near Karratha in the Pilbara region, however there is no commercial production of the species in this region at this stage (DPIRD, 2023).

There is one indigenous project at One Arm Point that operates a marine hatchery that focuses on a variety of ornamental and edible marine species (DPIRD, 2023).

12.2.3.4 South Coast Bioregion

Aquaculture activities in the South Coast bioregion is dominated by the production of edible oysters (Akoya and rock oysters) and mussels within King George Sound in Albany. Other forms of private aquaculture in the region include sea cage farming of abalone, which are restricted to the South Coast near Augusta (Flinders Bay) and Esperance (Wylie Bay) (DPIRD, 2023).

12.3 Fisheries – Traditional

Traditional or customary fisheries are typically restricted to shallow coastal waters and/or areas with structures such as reef. The Western Australia Recreational Fishing Guide (2024) states that First Nations people do not need a recreational fishing licence in any waters if it is in accordance with continuing tradition and for individual or familial consumption, not for a commercial purpose.

Dugong, fish and marine turtles that move between coastal and Commonwealth waters are important components of the First Nations people's culture and diet. First Nations people continue to actively manage their sea country in coastal waters of WA in order to protect and manage the marine environment, its resources and cultural values.

Indonesian fishers can fish within designated areas under the Australia-Indonesia Memorandum of Understanding regarding the Operations of Indonesian Traditional Fishermen in Areas of the Australian Fishing Zone and Continental Shelf – 1974 (MoU 74). Traditional fishing is allowed within the MoU Box (Figure 12-9), which encompasses: Ashmore Reef (Pulau Pasir), Cartier Island (Pulau Baru), Seringapatam Reef (Afringan), Scott Reef (Pulau Dato) and Browse Island (Berselan). Restrictions have since been introduced around Ashmore Reef and Cartier Island following their designation as Nature Reserves under the Commonwealth's *National Parks and Wildlife Conservation Act 1975* in 1983 and 2000, respectively.

The MoU allows Indonesian fishers to fish in designated areas using traditional methods only. These methods include reef gleaning, free-diving, hand lining and other non-mechanised methods. Scott Reef is currently the principal reef in the MoU 74 Box and is utilised seasonally by Indonesian fishers to harvest trepang, trochus shells and other reef species. The peak season is July to October due to more favourable wind conditions, and to allow fishers to sun dry their catch on their boat decks (ERM, 2009). Browse Island is also frequently visited by shark fishers who mostly fish along the eastern margin of the MoU 74 Box.

The Agreement between the Government of Australia and the Government of the Republic of Indonesia Relating to Cooperation in Fisheries (1992 *Fisheries Cooperation Agreement*) provides the framework for fisheries and marine cooperation between Australia and Indonesia. Cooperation under the Agreement today takes place under the auspices of the Working Group on Marine Affairs and Fisheries. Research reports on reef top species in the MoU Box indicate that stocks in the area are severely depleted. In 2009 the Working Group on Marine Affairs and Fisheries agreed to a Roadmap for MoU Box Cooperative Management (DAWE, 2020a).

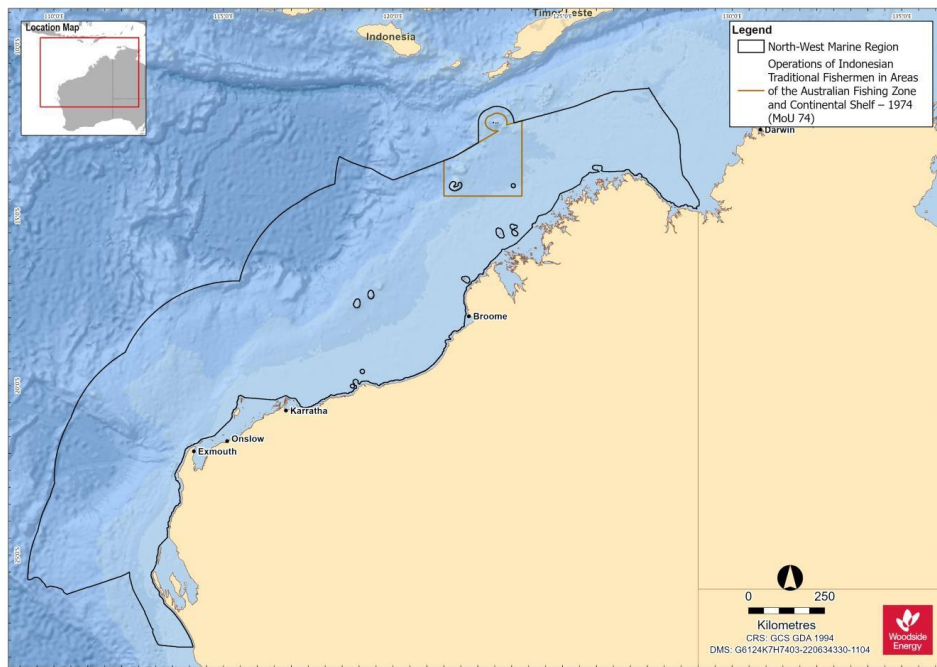

Figure 12-9: MOU 74 Box: operations of Indonesian traditional fishermen in areas of the Australian Fishing Zone and Continental Shelf – 1974

12.4 Tourism and Recreation

Western Australia's tourism sector is important to industry and the economy. In 2022–23, tourism accounted for 6.8% of WA's total jobs and generated a gross total value added of \$11.9 billion (Tourism Western Australia, 2024a).

The Kimberley, Pilbara and Gascoyne regions are popular visitor destinations for Australian and international tourists. Tourism is concentrated in the vicinity of population centres, including Broome, Dampier, Exmouth, Coral Bay and Shark Bay. Recreational and tourism activities include charter fishing, recreational fishing, diving, snorkelling, marine fauna watching, and yachting (Tourism Western Australia, 2024b).

Australia's Coral Coast and North West had a 27% and 22% growth respectively, in intrastate spend compared to 2019. The state's highest intrastate spend on record occurred with WA residents spending \$9.3 billion on trips within the state (Tourism Western Australia, 2024b).

12.4.1 Gascoyne Region

Tourism has the fourth largest economic output of all the major industries of the Gascoyne region (GDC, 2023). It contributes significantly to the local economy in terms of both income and employment. In 2022, the region had over 271,100 overnight visitors and tourism had an average economic output of \$182 million between 2021 and 2022 (GDC, 2023).

The COVID-19 pandemic disrupted the tourism industry of the Gascoyne region in previous years, particularly by reducing availability of the overseas workforce. However, the phasing out of restrictions has increased interstate and international travel, and visitor numbers have remained high

with inter-state tourism numbers increasing in 2021 in comparison to 2020 (GDC, 2022). The main attraction of the coastline for tourists is the quality of marine life. The region supports extensive scuba diving, snorkelling and fishing and specialised eco-tourism activities include whale shark and manta ray observation at Ningaloo, and dolphin and dugong viewing in Shark Bay (Newman et al., 2023b). In 2018–19, the Ningaloo region (Ningaloo Reef and the surrounding coastal region Exmouth Gulf, communities of Exmouth and Coral Bay, and adjacent proposed southern coastal reserves and pastoral leases) contributed an estimated \$110 million in value added to the WA economy (DCBA, 2020). Ningaloo's economic contribution to WA is attributed to four key types of economic activity, tourism expenditure by international, interstate and WA visitors to the Ningaloo region, commercial fishing in the Exmouth Gulf, recreation activity involving the Reef by residents of the Ningaloo region and management and research relating to the Reef (DCBA, 2020). More than 90% of this value added is attributed to the domestic and international tourists who visit Ningaloo each year (DCBA, 2020). Dark sky tourism flourished in 2023 with an influx of visitors coming together in Exmouth to witness a rare hybrid solar eclipse (GDC, 2023). The natural phenomena brought thousands of visitors both interstate and international to the region in April 2023.

The first Cultural Tourism experience was launched in 2022 on the Ningaloo Coast. Departing from Coral Bay, the Cultural Tour provides visitors the opportunity to experience a unique perspective on the coastline's rich cultural heritage and unique environment. The main marine nature-based tourist activities are concentrated around and within the Ningaloo WHA (GDC, 2022). The Aboriginal AstroTourism Project was launched where First Nations people were consulted on night sky constellations and trained in dark sky tourism. Through this program star gazing experiences were successfully delivered to approximately 665 visitors over 10 nights during the Ningaloo Eclipse (GDC, 2023).

12.4.2 Pilbara Region

Recreation and tourism activities within the Pilbara are of high social value. Tourism is a key economic driver for the Pilbara with more than 1 million visitors to the region every year. Tourism visitation continued to grow in 2022, with the number of visitors to Karajini National Park in 2022 having doubled in comparison to 2020 (PDC, 2022). Multi-year tourism infrastructure development funding has been provided for the Niminjarra Highway to provide easier access to the Karlamilyi National Park and enhance cultural tourism opportunities and to the Whim Creek Hotel to re-establish a tourism destination between Karratha and Hedland (PDC, 2023).

Recreational fishing within the Pilbara region tends to be concentrated in State waters adjacent to population centres. Recreational fishing is known to occur around the Dampier Archipelago with boats launched from boat ramps around Dampier and Karratha. Once at sea, charter vessels may also frequent the waters surrounding the Montebello Islands (Williamson et al., 2006).

12.4.3 Kimberley Region

Tourism is one of the main industries in the Kimberley region, alongside resources, construction, agriculture and retail (KDC, 2022).

Recreation and tourism activities in the Kimberley region occur predominantly in WA State waters (extending offshore 3 NM from the mainland), adjacent to coastal population centres (e.g. Broome), with a peak in activity during the winter months (dry season). These activities include recreational fishing, diving, snorkelling, wildlife watching and boating (Newman et al., 2023b).

Primary dive locations in the Kimberley region include the Rowley Shoals, including Mermaid Reef AMP, Scott Reef, Seringapatam Reef, Ashmore Reef AMP and Cartier Island (Newman et al., 2023b).

12.5 Shipping

Commercial shipping traffic is high within the NWMR with vessel activities including commercial

fisheries, tourism such as cruises, international shipping and oil and gas operations. There are 12 ports adjacent to the NWMR, including the major ports of Dampier, Port Hedland and Broome, which are operated by their respective port authorities. These ports handle large tonnages of iron ore and petroleum exports in addition to salt, manganese, feldspar chromite and copper (DEWHA, 2008).

Heavy vessel traffic exists within the Pilbara Port Authority management area which recorded 9594 vessel movements in the Port of Dampier, 6,786 vessel movements in the Port of Port Hedland, and 807 vessel movements in the Port of Ashburton in the 2022/23 reporting period (PPA, 2023). Twenty-six designated anchorages for bulk carriers, petroleum and gas tankers, drilling rigs, offshore platforms, and pipelay vessels are located offshore of Rosemary Island.

In 2012, AMSA established a network of shipping fairways off the northwest coast of Australia. The shipping fairways, while not mandatory, aim to reduce the risk of collision between transiting vessels and offshore infrastructure. The fairways are intended to direct large vessels such as bulk carriers and LNG ships trading to the major ports into pre-defined routes to keep them clear of existing and planned offshore infrastructure (AMSA, 2013).

12.6 Petroleum Basins

The NWMR supports a number of industries including petroleum exploration and production.

Within the NWMR there are seven sedimentary petroleum basins: Northern and Southern Carnarvon basins, Perth, Browse, Roebuck, Offshore Canning and Bonaparte basins (GA, 2023). Of these, the Northern Carnarvon, Browse and Bonaparte basins hold large quantities of gas and comprise most of Australia's reserves of natural gas (DEWHA, 2008), which is reflected by the level of development in the area. In addition to existing facilities, there are proposed developments in the region. This includes proposals to develop gas and condensate from a number of fields within the NWMR.

In addition to the oil and gas industry, other land-based industries depend upon the marine environment in the nearshore area. These include ports, salt mines such as Karratha and Onslow, LNG onshore processing facilities such as Burrup Hub, Thevenard Island, Barrow Island, Varanus Island, and small-scale desalination plants at Barrow Island, Burrup, Cape Preston and Onslow.

12.7 Defence

Key Australian Department of Defence (DoD) operational areas and facilities areas of the NWMR for training and operational activities, include:

- An operating logistics base has been established in Dampier to support vessels patrolling the waters around offshore oil and gas facilities. A dedicated navy administrative support facility is also being constructed at the nearby township of Karratha (DEWHA, 2008).
- The Taylor Barracks are the headquarters of the Pilbara regiment, one of three Regional Force Surveillance Units conducting surveillance and reconnaissance of remote areas of northern Australia. This base is located in Karratha (DoD, n.d.).
- The Royal Australian Air Force currently maintains two 'bare bases' in remote areas of WA that are used for military exercises. One of these is the Royal Australian Air Force Base in Learmonth. The Royal Australian Air Force maintains the Commonwealth Heritage listed Learmonth Air Weapons Range Facility, which is located between Ningaloo Station and the Cape Range National Park. The air training area associated with the Learmonth base extends over the offshore region.
- The Royal Australian Air Force Base Curtin is located on the north coast of WA, south-east of Derby and 170 km east of Broome. It provides support for land, air and sea operations aimed to support Australia's northern approaches.

- The Naval Communications Station Harold E. Holt is located ~6 km north of Exmouth. The main role of the station is to communicate at very low frequencies (19.8 kHz) with Australian and United States submarines and ships in the eastern Indian Ocean and the western Pacific Ocean (DEWHA, 2008).
- Areas may be subject to Unexploded Ordnance (UXO) as a result of military activities. These are offshore sites where ammunition and explosives have been dumped, or which have been used as live bombing or firing ranges. Defence maintains a record of sites confirmed as, or reasonably suspected of being affected by UXO. There are several suspected UXO sites in the NWMR (Australian Government Defence, n.d.).
