- La Bella;
- Geographe; and
- Hercules.

Other survey areas included two Hot Tap sites identified as HTX and HTY, and five routes selected for cone penetration tests (CPT) as part of the geotechnical survey plan identified as ARGE (Artisan to Geographe), ARHTX (Artisan to HTX), ARHTY (artisan to HTY), ARLB (Artisan to La Bella) and LBGE (La Bella to Geographe).

The collection of water and sediment/infauna samples for environmental assessment was cancelled by the client for the La Bella, Geographe and Hercules survey areas. Therefore, the collection of water and sediment/infauna samples for environmental assessment occurred only at the Thylacine and Artisan survey areas. Seabed photographs were taken as planned for all survey areas and routes. It is also noted that all survey areas were largely composed of outcropping rock with or without patches of uncemented sediments. Sampling of uncemented sediments was only possible with the grab sampler (as opposed to other devices) and of limited recovery because of the limited thickness of the surficial uncemented sediments.

The survey extent within Otway Basin, including these survey areas, hot taps and survey routes, is shown Figure 1. Environmental sampling sites were located in proximity to the proposed drilling rig mooring locations. The proposed anchor points for the drilling rig are listed in Table 1. The depth at each proposed mooring location was measure at the intersection of the anchor lines (Table 1). Sampling locations are listed in Section 3 for the relevant sampling methods.

Table 1 Location of proposed anchor points (GDA94 UTM 54 S) and water depth for drilling rig sites.

Survey Area	Anchor Point	Depth at Intersection (m LAT)	Easting	Northing

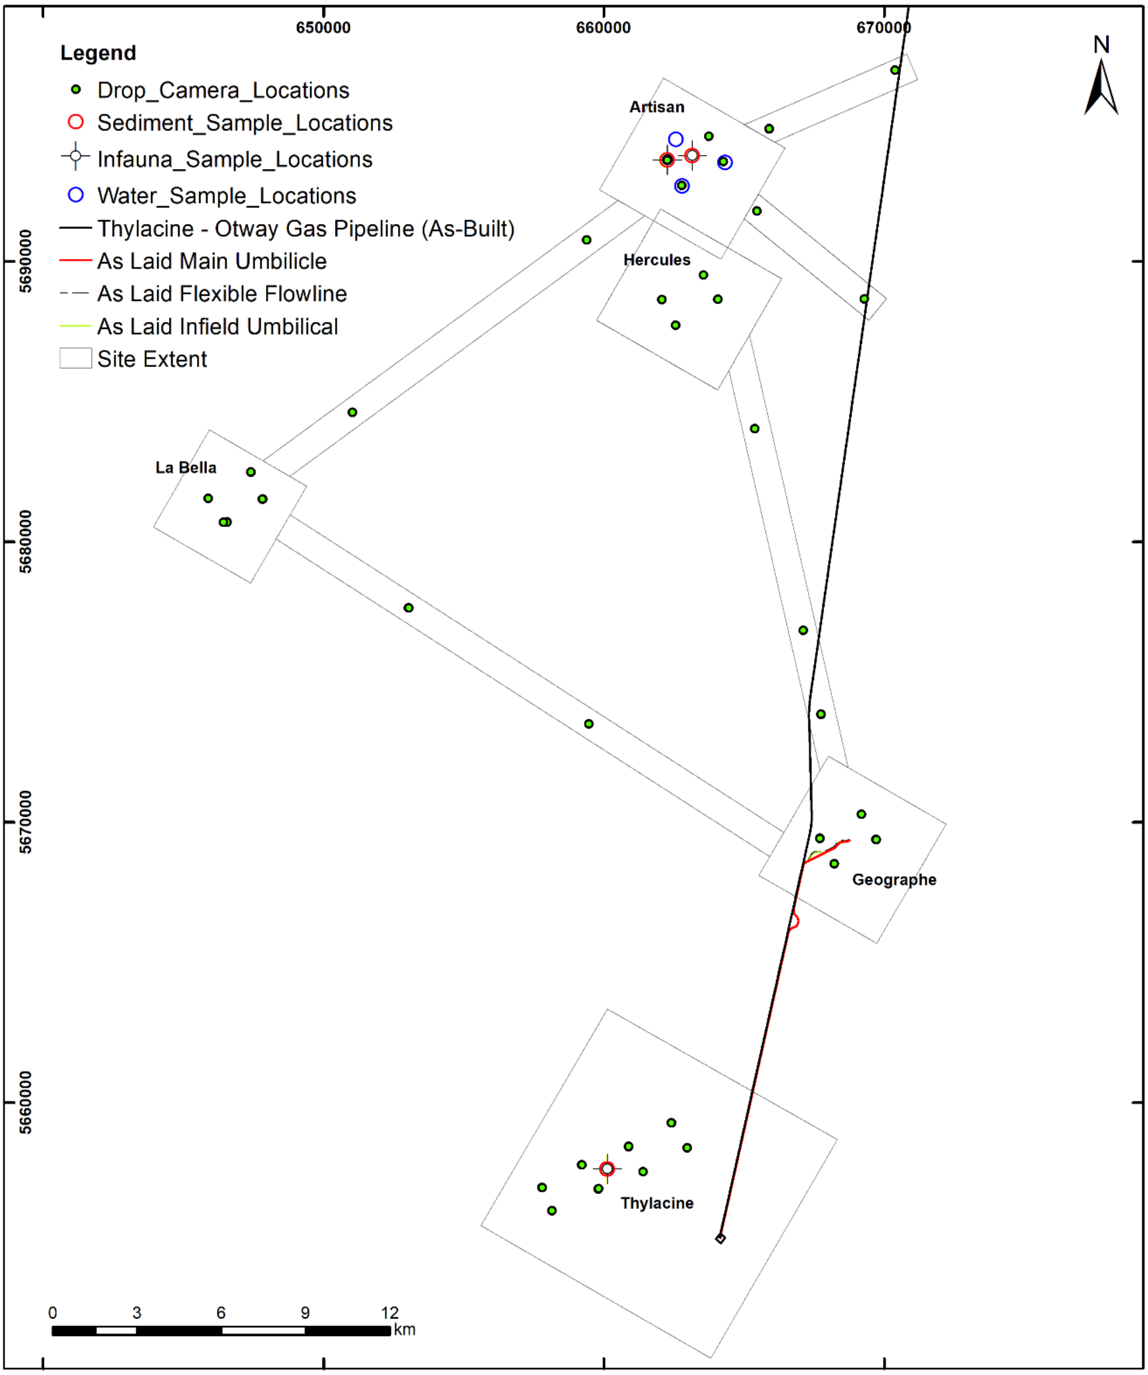

Figure 1 Locations of environmental survey site extents in Otway Basin. Provided by Fugro, April 2020.

3. METHOD

3.1 Survey Operations

The environmental survey was undertaken during several deployments from November 2019 to January 2020. The survey was carried out from the 60 m offshore supply ship *VOS SHINE*. The vessel mobilised from Portland, Victoria.

3.2 Water Quality

3.2.1 Sample Collection

Water quality samples were collected using a 2.2 L Van Dorn Beta water sampler. This sampler was used to obtain water samples from selected water depths. The sampler consisted of an open-ended, clear plastic cylinder with a rubber cap attached at each end. Before deployment, the end caps were held open, under tension, by triggers on the side of the cylinder. The sampler was attached to a rope and lowered by hand over the side of the vessel to the desired depth. A messenger weight attached to the rope was then released to trigger the end caps to close as the messenger contacted the sampler, sealing the water sample inside the cylinder. The sampler was then raised to the surface where the water sample was processed and stored for laboratory analysis.

On retrieval at the surface, the water sampler was inspected against the following sample acceptability criteria:

1. The sample bottle was full; and
2. Both end caps are fully closed; and
3. There was no obvious contamination (e.g. grease or paint chips on, or inside, the sampler).

Any sample that did not comply with these criteria was discarded and another sample was collected at the same site. All samples were recorded on the Environmental Sampling Log (Appendix 1) as per 135846-V01-01-PLA-001 Infauna Lab Testing & Reporting Plan.

Water samples were collected at two of the survey areas – at Artisan and Thylacine on 22 November 2019. Three replicate water samples were collected at each of the survey areas. The locations for water sample collection are listed in Table 2 and shown in Figure 2. Note that there is only one sampling site indicated for the Thylacine field as all samples were collected in close proximity (Figure 2 left). The process described above was carried out at each site and water samples were collected from a depth equal to half of the total water depth at that site.

Table 2 Location (GDA94 UTM 54 S) and depth of water sample collection sites.

Survey Area	Location	Replicate Sample Name	Easting	Northing	Water Depth (m)	Sample Depth (m)	Met Acceptability Criteria
Thylacine	1	1	660119	5657621	104	52	Yes
	1	2	660121	5657619	104	52	Yes
	1	3	660122	5657619	105	52.5	Yes
Artisan	1	1	662936	5692724	66	33	No
	1	2	662782	5692683	66	33	Yes
	2	1	664317	5693523	66	33	Yes
	5	1	662563	5694337	66	33	Yes

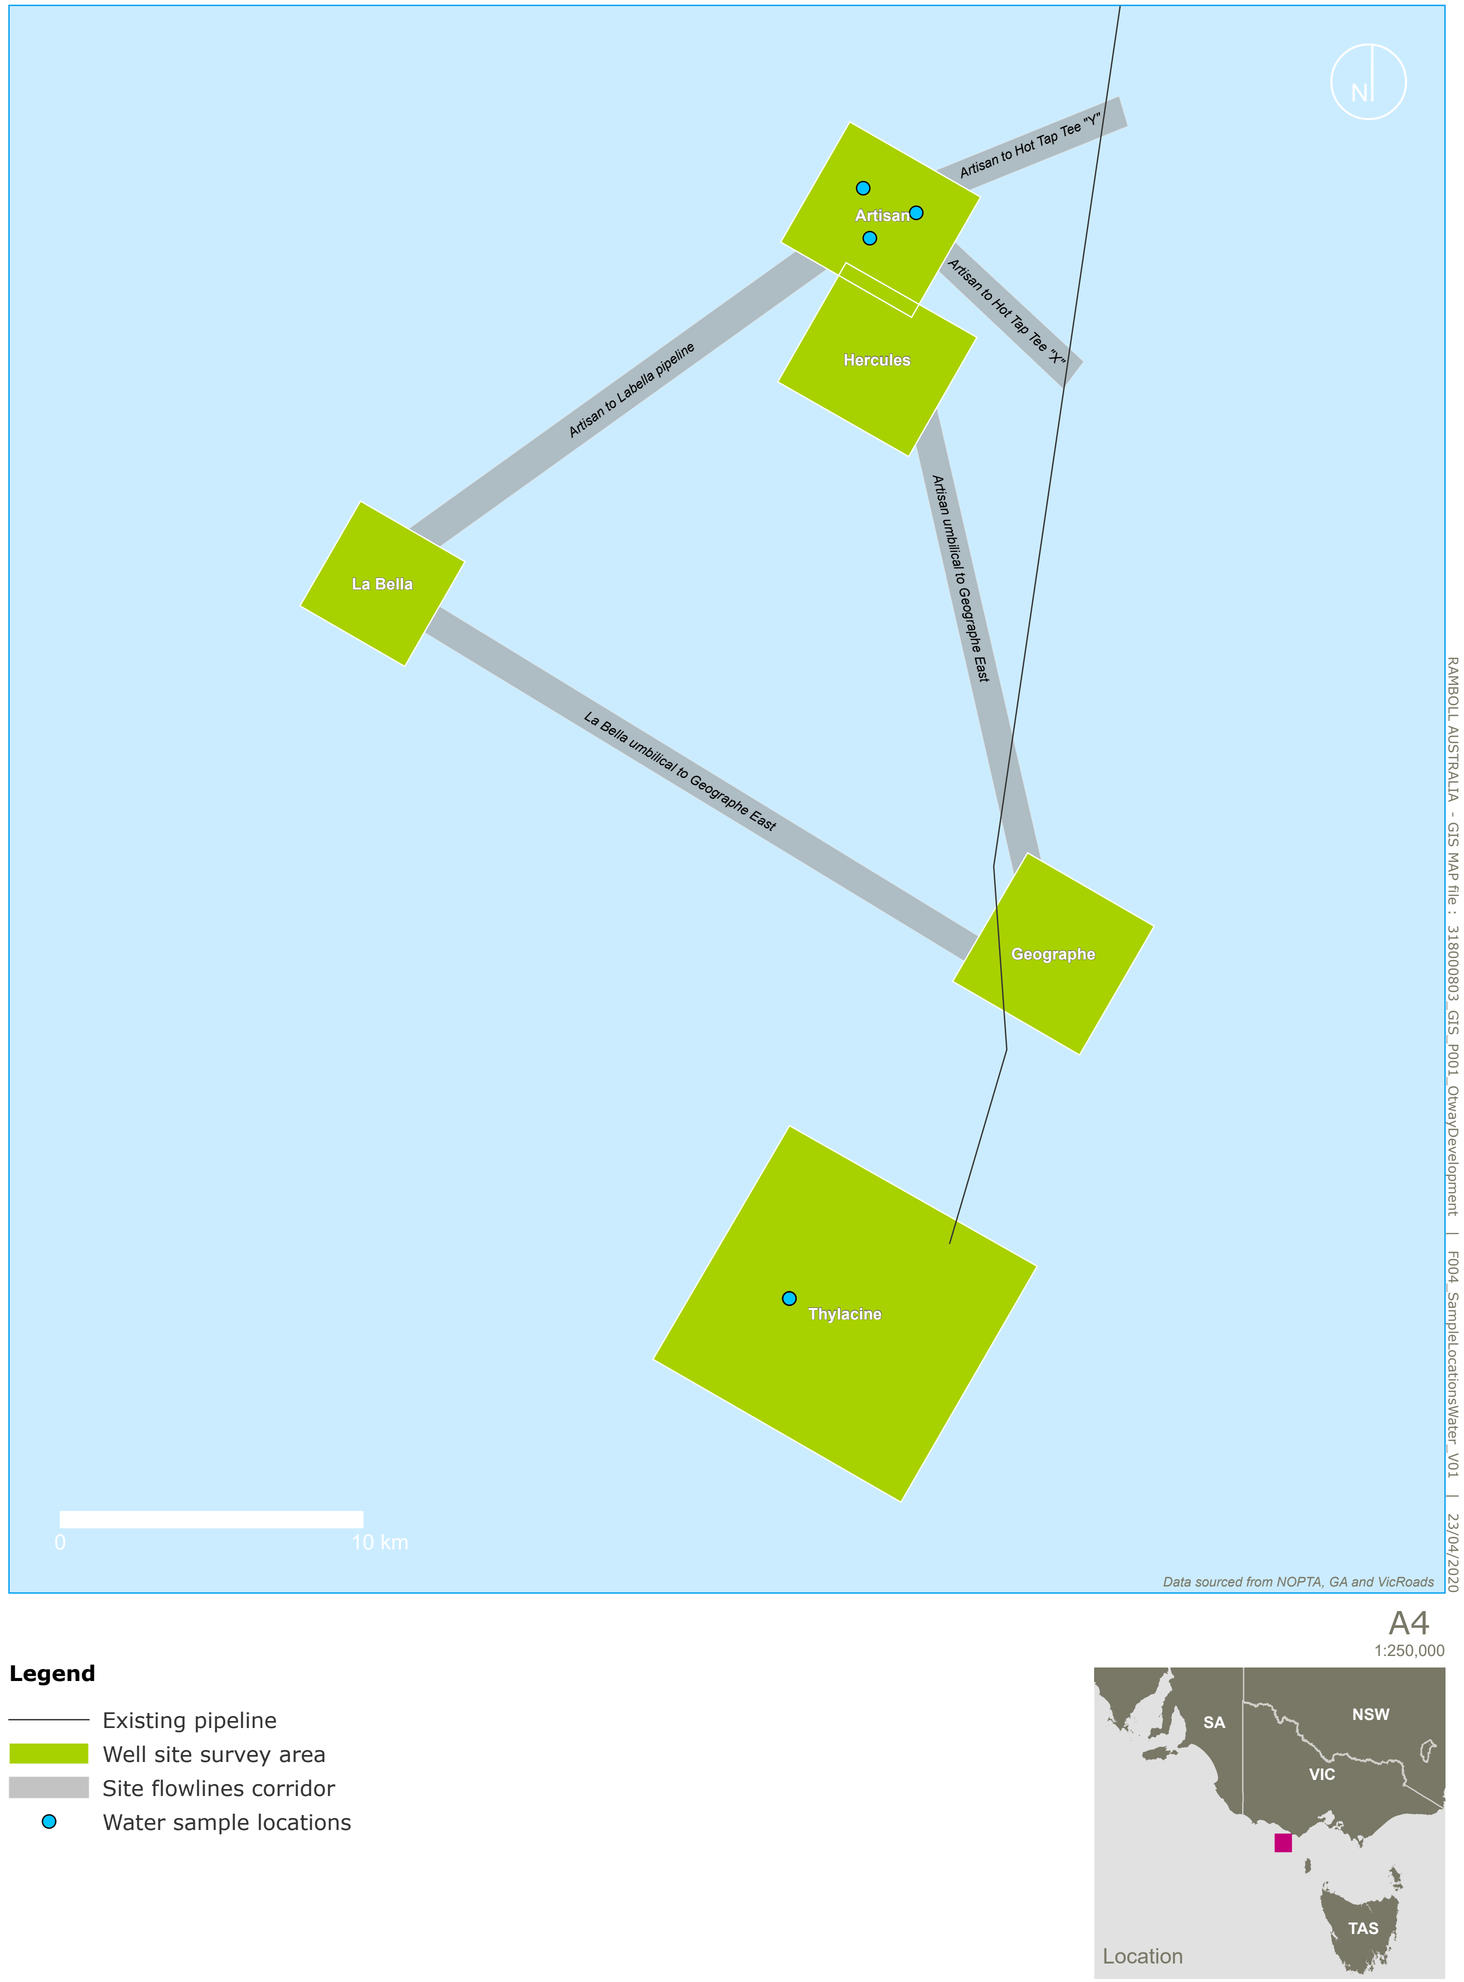

FIGURE 2 | Water sampling locations for Thylacine and Artisan survey areas.

3.2.2 Sample Processing and Analysis

Once a sample was confirmed to be acceptable for analysis, the subsamples were extracted from the water sampler and stored in pre-labelled sample jars provided by the analytical laboratory, Eurofins. The analytical laboratory was NATA accredited and accredited for compliance with ISO/IEC 17025 – Testing.

The water samples were subsampled as follows:

- 1 x 500 mL plastic bottle with no preservative
- 1 x 200 mL glass bottle with no preservative
- 1 x 60 mL plastic bottle with sulphuric acid
- 1 x 60 mL plastic bottle with nitric acid
- 2 x 40 mL glass vials with hydrogen chloride

All samples were stored in a cool, dark location prior to transfer to the laboratory.

One litre of the remaining water sample was then processed for chlorophyll analysis. A simple filtering system was set up which included a Büchner funnel with a rubber seal placed in the mouth of a conical flask and a rubber hose and vacuum hand pump attached to the side arm of the flask. Filter paper (11 µm particle retention at 98% efficiency) was used placed in the funnel and the 1L subsample was suctioned through the filtering system. The filter paper was carefully removed from the funnel using forceps, wrapped in aluminium foil, stored in a labelled sealable plastic bag and frozen prior to transfer to the laboratory.

The following measurements were then taken using a YSI EcoSense handheld meter from the remaining water sample:

- pH
- Dissolved oxygen (DO)
- Oxidation-reduction potential (ORP)
- Temperature (°C)

Sample information was recorded on the Environmental Sample Log (Appendix 1). All sample collection and processing equipment was then rinsed in sterile demineralised water before the next sample was collected.

All water quality subsamples were recorded on the Ramboll Chain of Custody (COC) form. These subsamples were then transferred to the laboratory on the vessel's return to shore. The water quality samples were delivered to the Eurofins laboratory in Melbourne on 26 November 2019.

The water samples were analysed for the presence and concentration of these analytes:

- Total suspended solids (TSS);
- Nutrients including total nitrogen (N), total Kjeldahl nitrogen (TKN), nitrogen oxides (NOx), nitrate (NO^{-}_3), ammonia (NH_3), total phosphorus (TP), and total reactive phosphorus (TRP);
- Chlorophyll *a*;
- Metals/metalloids including arsenic (As), cadmium (Cd), cobolt (Co), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb), and zinc (Zn); and
- Hydrocarbons including total recoverable hydrogens (TRH), benzene, toluene, ethylbenzene and xylene compounds (BTEX), and polycyclic aromatic hydrocarbons (PAH).

The analytical methods for these analytes are included in the laboratory reports in Appendix 2.

3.3 Sediment Quality

3.3.1 Sample Collection

Seabed sediment samples were collected using a Double Van Veen grab sampler. The Double Van Veen grab is designed for sampling the top layer of consolidated sediment consisting of silt and/or sand. The capacity of each grab bucket is ~12 L. The double grab allows for comparable sampling where samples for sediment and biological analysis are required from the same location.

Prior to deployment, the jaws of both grabs were opened and fixed into position using a tension-based catch. The grab sampler was then winched over the stern of the vessel and lowered at a slow, steady rate to prevent the catch from being released too early. When the jaws made contact with the bottom, the release of tension caused the catch to be tripped, allowing the jaws to quickly close to capture the surface sediment. The quantity and quality of the sample was related to the compactness of the sediment whereby the grab sampler returned less sample content from more compacted sediments.

On retrieval at the surface, the grab sampler was inspected against the following sample acceptability criteria:

1. The jaws of the grab are closed; and
2. The surface of the sediment sample covers at least 70% of the grab; and
3. The surface of the sediment sample is undisturbed; and
4. There is no evidence of the sample being washed out; and
5. The sample is at least 20cm deep.

Samples that did not comply with these criteria were typically discarded and another sample was collected at the same site. However, some exceptions to these criteria were allowed on agreement with the client in order to obtain samples for analysis, given the difficulty of obtaining grab samples from the hard seabed substrate. Such instances are noted in the description of results in Section 4. At some sample locations a composite sample was made from several grab drops (up to three drops) to provide enough material for one sample. In these instances, the samples did not achieve a depth of 20 cm. The first sample replicate collected from the Thylacine survey area (Thylacine_1_1) was 15 cm deep and therefore did not meet the acceptance criteria; however, given the difficulty in obtaining suitable samples (owing to the hard seabed), this sample was retained for analysis as all other criteria were met and it was considered to be a useful sample by the field personnel. All samples were recorded on the Environmental Sampling Log (Appendix 1) as per 135846-V01-01-PLA-001 Infauna Lab Testing & Reporting Plan.

Sediment samples were collected at two of the survey areas – at Artisan and Thylacine on 22 November 2019. Three replicate sediment samples were to be collected at each of the survey areas, however, this was not always possible because of the compacted substrate. The resulting samples included four replicate samples from Thylacine and two replicate samples from Artisan. The locations for successful sediment sample collection are listed in Table 3 and shown in Figure 3. Note that there is only one sampling site indicated for the Thylacine field as all samples were collected in close proximity (Figure 3 left). Grab sample positions were provided by Fugro from the marine survey using Ultra Short Base Line positioning systems.

FIGURE 3 | Grab sample locations for sediment and infauna for Thylacine and Artisan survey areas.

Table 3 Location (GDA94 UTM 54 S) and depth of sediment sample collection sites.

Survey Area	Location	Sample Replicate Name	Easting	Northing	Water Depth (m)	Met Acceptability Criteria
Thylacine	1	0	660119	5657621	104	Sample was 15 cm deep, therefore not within acceptance criteria but considered suitable by field personnel. Incorrectly recorded in lab report as Location 2.
	1	1	660121	5657619	104	Yes
	1	2	660122	5657619	105	Yes
	1	3	660120	5657622	104	Yes
Artisan	1	1	663155	5693762	72	This sample was a composite of replicate samples 1, 3, 4 and 6 taken at the same location. Listed as Artisan_GS_A in lab report.
	1	2	663155	5693762	72	No
	1	3	663155	5693762	72	Composite as above.
	1	4	663155	5693762	72	Composite as above.
	1	5	663155	5693762	72	No
	1	6	663155	5693762	72	Composite as above.
	3	1	662264	5693604	75	No
	3	2	662264	5693604	72	No
	3	3	662265	5693604	73	Yes. Listed as Artisan_GS3 in lab report.
	3	4	662265	5693605	74	No sediment sample, infauna sample only.

3.3.2 Sample Processing and Analysis

Once a sample was confirmed to be acceptable for analysis, the sample was photographed, visual observations were recorded, and subsamples were extracted from the sample and stored in pre-labelled sample jars provided by the analytical laboratory.

All sediment grab samples were photographed with a sample identity plate. Notes of the uniformity of the surface, Munsell colour and odour were then recorded. The redox (reduction–oxidation reaction) potential depth (RPD) was measured using a YSI EcoSense handheld meter and probe. Redox potential is a measure of the tendency of a chemical species to acquire electrons from or lose electrons to an electrode and thereby be reduced or oxidised, respectively. Redox potential is measured in millivolts (mV). The redox potential of the sample was measured from the surface and at 10 mm increments to a depth of up to 110 mm, or until resistance was encountered when inserting the probe. The probe was rinsed in fresh water between each sample. Sample information was recorded on the Environmental Sample Log (Appendix 1).

Sediment was then extracted from one grab bucket for sediment quality sampling (with the contents of the other grab bucket being used for infauna sampling). Subsamples were collected by releasing the sample into a collection bin below the sampler. The entire sample was homogenised using a plastic scoop.

Two subsamples were stored in pre-labelled 250 mL glass sample jars for the analysis of contaminants and particle size distribution. All samples were stored in a cool, dark location prior to transfer to the laboratory. All sample collection and processing equipment was then rinsed in fresh water before the next sample was collected.

All sediment quality subsamples were recorded on the Ramboll COC form. These subsamples were then transferred to the laboratory on the vessel's return to shore. The sediment quality samples were delivered to the Eurofins laboratory in Melbourne on 26 November 2019.

The sediment samples were analysed for the presence and concentration of these analytes:

- Sediment particle size as clay-size fraction, silt and sand;
- Total organic carbon (TOC);
- Nutrients including nitrate and nitrite, TKN, total nitrogen, phosphorus, and silicon;
- Metals/metalloids including cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni), tin (Sn), and zinc (Zn).
- Hydrocarbons including Total Petroleum Hydrocarbons (TPH) , total polycyclic aromatic hydrocarbons (PAH) and BTEX (benzene, toluene, ethylbenzene and xylenes, PCBs.

The analytical methods for these analytes are included in the laboratory reports in Appendix 3.

3.4 Infauna Ecology

3.4.1 Sample Collection

Seabed sediment samples for infauna were collected using a Double Van Veen grab sampler, as described in Section 3.2.1 and at the locations presented in Table 4 and Figure 3. The critiera for accepting grab samples for infauna analysis were as described in Section 3.2.1. All samples were recorded on the Environmental Sampling Log (Appendix 1) as per 135846-V01-01-PLA-001 Infauna Lab Testing & Reporting Plan.

3.4.2 Sample Processing and Analysis

Once a sample was confirmed to be acceptable for analysis, the sample was photographed with a sample identity plate. Sediment was then extracted from one grab bucket for infauna sampling (with the contents of the other grab bucket being used for sediment quality sampling). The entire sample was released into a collection bin below the sampler and then transferred to a sample washing system where the sample was placed in a perforated bin to be mixed and rinsed with seawater. The liquified sample was then passed through a series of sieves of 1mm mesh size (top) and 500 µm mesh size (bottom). The remaining infauna and debris were then rinsed into a labelled container and preserved in ethanol at a dilution factor of 2:1 to sample volume. Where a full grab sample was collected, the contents were subsampled to a 6L sample volume to limit the time required for infauna sample processing in the laboratory.

All samples were stored in a chemical locker and were recorded on the Ramboll COC form. These samples were then transferred to the taxonomic analyst on the vessel's return to shore. The laboratory in Gladstone, Queensland received the infauna samples in December 2019.

Infauna organisms present in the samples were identified and counted to Family morpho-species or genus level where possible. Descriptive statistics (e.g., species richness, organism abundance, diversity indices) were used to summarise the seabed biota present. This information is assessed and discussed in the context of the known communities present in the wider Otway Basin, noting the presence of any habitats/species of relevance to the EPBC Act. Multivariate measures were not used in the assessment because of the small dataset and paucity of organisms found in the samples.

Table 4 Location (GDA94 UTM 54 S) and depth of infauna sample collection sites.

Survey Area	Location	Sample Replicate Name	Easting	Northing	Water Depth (m)	Met Acceptability Criteria
Thylacine	1*	0	660119	5657621	104	Sample was 15 cm deep, therefore not within acceptance criteria but considered suitable by field personnel. Incorrectly recorded in lab report as Location 2.
	1	1	660121	5657619	104	Yes
	1	2	660122	5657619	105	Yes
	1	3	660120	5657622	104	Yes
Artisan	1	1	663155	5693762	72	No
	1	2	663155	5693762	72	No
	1	3	663155	5693762	72	No
	1	4	663155	5693762	72	Yes
	1	5	663155	5693762	72	No
	1	6	663155	5693762	72	No
	3	1	662264	5693604	75	No
	3	2	662264	5693604	72	No
	3	3	662265	5693604	73	Yes
	3	4	662265	5693605	74	Sample was 7 cm deep, therefore not within acceptance criteria but considered suitable by field personnel.

3.5 Epibenthic Ecology

3.5.1 Sample Collection

The composition and percent coverage of epifauna was assessed from photographs of the seafloor taken with the Fugro drop camera system. The drop camera system was fitted with a 14.7 megapixel (MP) Canon PowerShot G10 digital camera and a low latency, live video recorder. The system was equipped with twin lasers aimed within the camera field of view to enable calibration of the image size. The lasers were calibrated to a distance of 15 cm. The camera housing was an aluminium enclosure for use in water depths up to 300 m. A mini beacon was attached to the drop camera to accurately track locations during deployment.

The drop camera was deployed via a winch over the stern of the vessel. All data was transferred directly to the surface unit and saved into a dedicated Fugro server. A real-time video feed to the surface enabled preliminary observations of benthic fauna and substrate type to be made during operation.

At each sampling site the camera was lowered and then to three locations approximately 1-2 m apart to obtain a collection of representative samples. At least five photographs were taken at each location to provide a selection of photographs for analysis. Drop camera sites are listed in Appendix 4. Drop camera photographs were taken at all anchor points, hot tap sites and along CPT routes as shown in Figure 4. The average area of seabed in each photograph was 0.5 m^2.

3.5.2 Sample Processing and Analysis

All seafloor photographs were examined to determine their suitability for analysis, with photographs being excluded for the assessment based on the following reasons:

- Poor resolution or blurred image;
- Sediment blow out obscuring the image;
- More than a quarter of the image was in shadow or had poor lighting;
- Images were overlapping (in which case the best quality image was chosen); or
- Images were taken at oblique angles.

For each photograph, the percent coverage of epifauna was estimated and individual, mobile organisms were counted. Photographs were examined to provide a qualitative description of the epifauna communities. Sediment type and percent coverage was also estimated for each photograph.

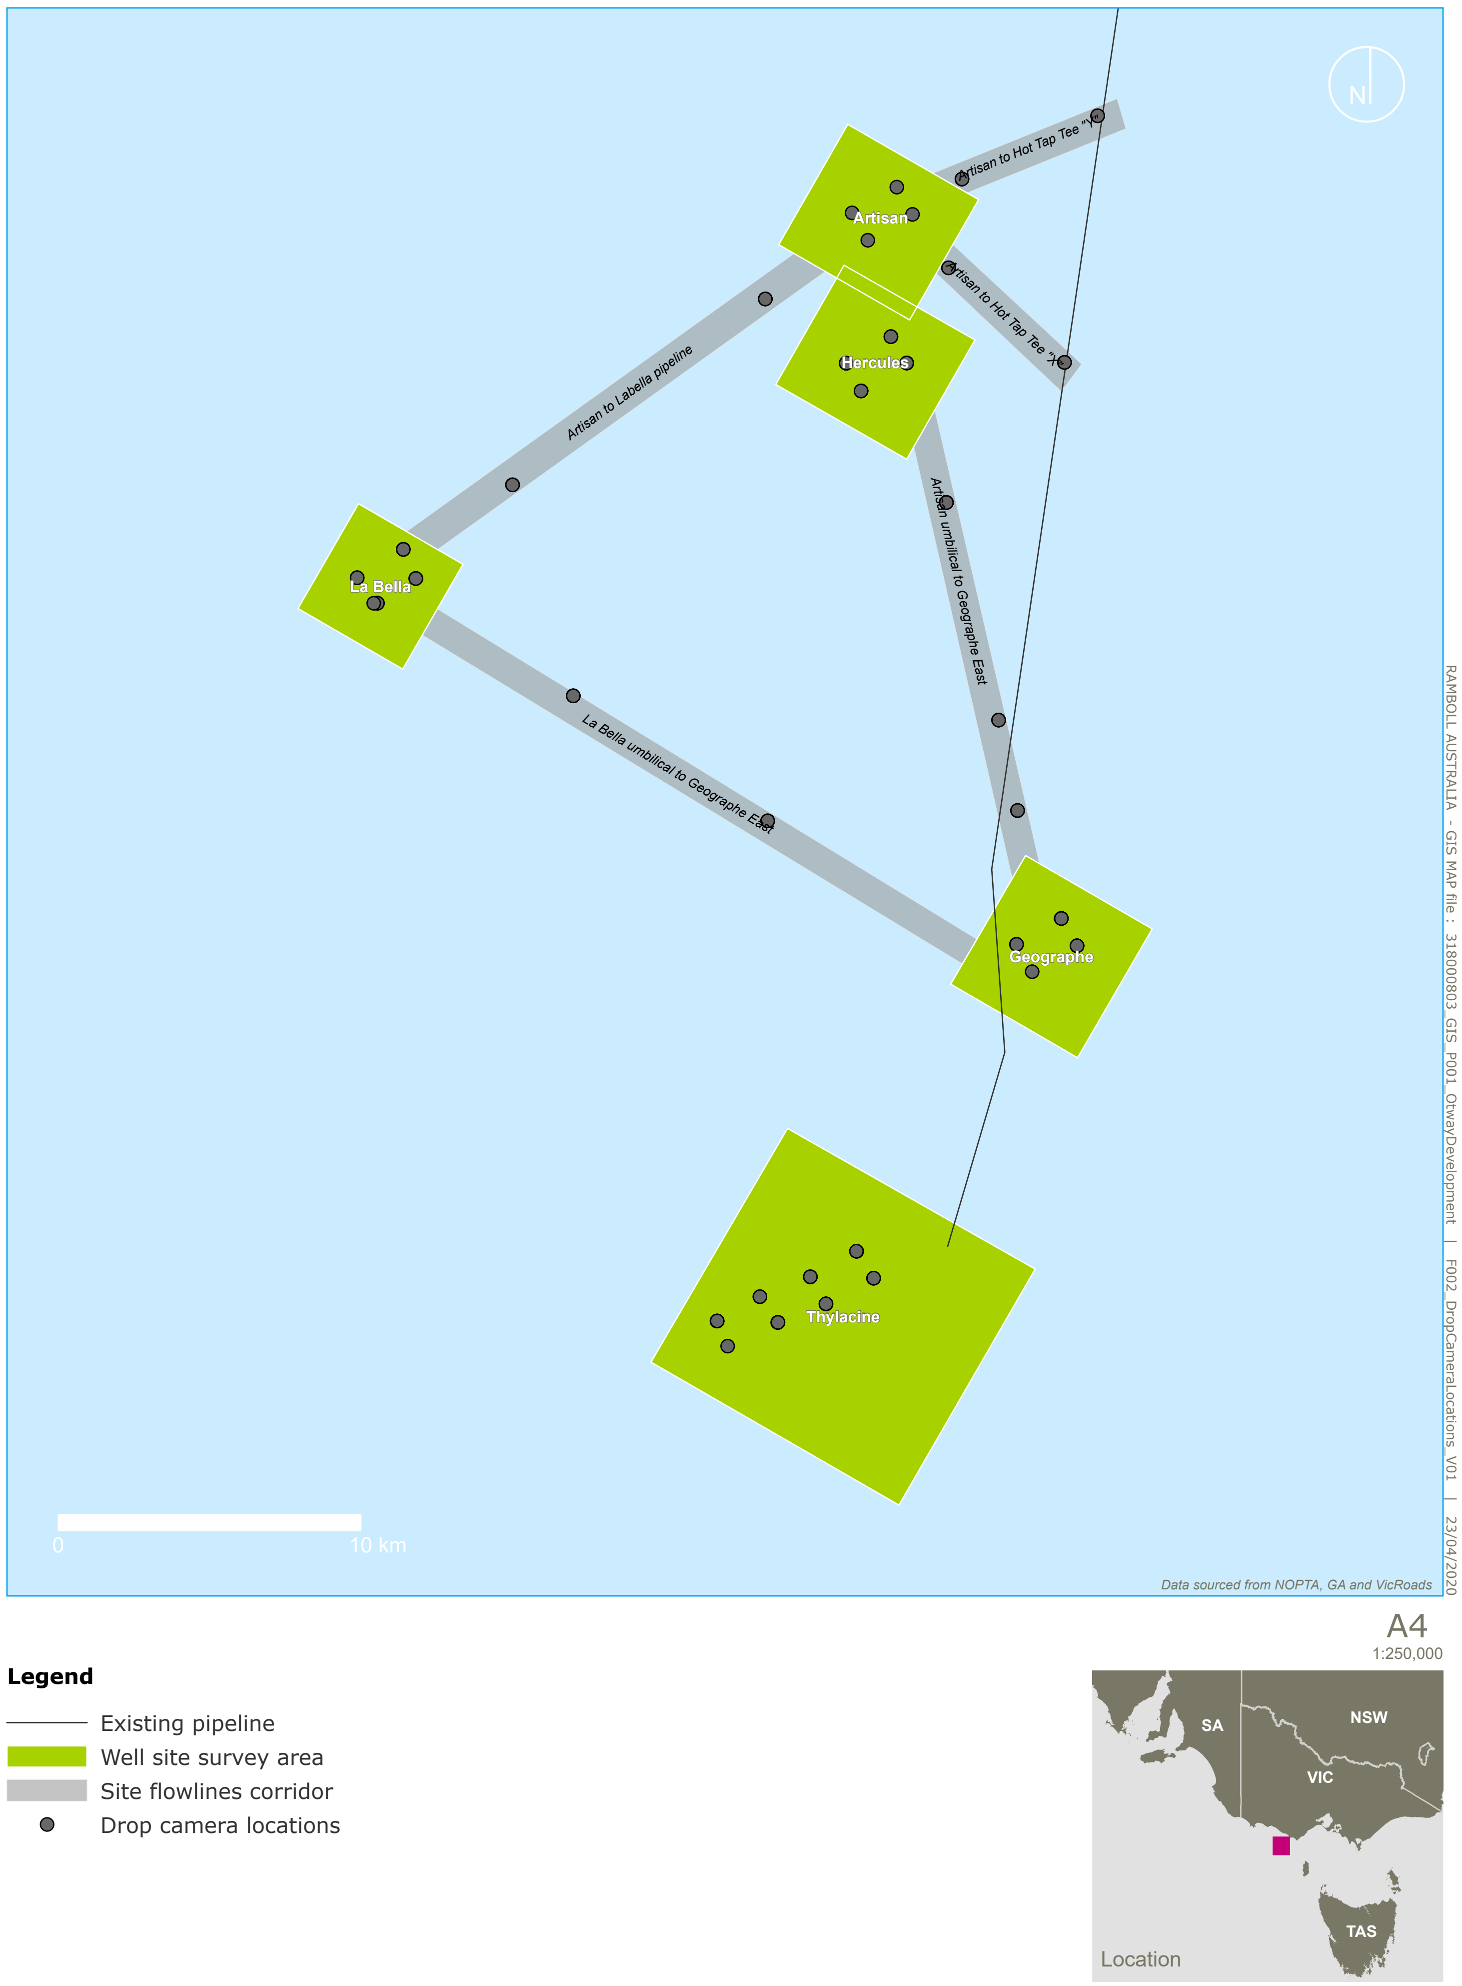

FIGURE 4 | Drop camera locations for all survey areas.

4. RESULTS

4.1 Water Quality

Measurements made *insitu* for water samples collected from the Thylacine and Artisan survey areas are presented in Table 5. Dissolved oxygen (DO) and pH were assessed against the default trigger values for physical and chemical stressors for south-east Australia for slightly disturbed ecosystems set out in the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC, 2000). Trigger values are used to assess risk of adverse effects due to nutrients, biodegradable organic matter and pH in various ecosystem types.

Dissolved oxygen was between the lower and upper limits of 90 and 110% saturation for marine waters in all samples. Likewise, pH was between the lower and upper limits of 8.0 and 8.4 for all samples. The range of ORP measurements indicated a well oxygenated, ecologically healthy environment.

Table 5 Measurements made *insitu* for water samples at Thylacine and Artisan survey areas.

Sample Name	pH	DO (% saturation)	ORP (mV)
Thylacine_1_1	8.19	94.3	215.0
Thylacine_1_2	8.24	95.2	211.4
Thylacine_1_3	8.33	95.2	98.1
Artisan_1_2	8.16	94.0	172.7
Artisan_2_1	8.08	93.1	211.4
Artisan_5_1	8.34	93.8	164.5

The results of laboratory analyses for water samples from the Thylacine and Artisan survey areas are presented in Tables 6 to 11.

The analytes were compared to the relevant ANZECC (2000) – the default trigger values for physical and chemical stressors for nutrient analytes and the trigger values for toxicants at alternative levels of protection for all other analytes.

The concentration of ammonia, nitrite and reactive phosphorus was at or below LOR for all samples. Only one sample contained a concentration of nitrate-nitrite, NO^-_3, TKN and TN above the LOR. This was replicate Thylacine_1_3; however, none of the measurements exceeded ANZECC trigger values. Concentrations of TP were recorded in all samples, but all measurements were well below ANZECC trigger values. TSS was typically within the range expected for unmodified[1] marine ecosystems.

The concentrations of Cd, Cr, Co, Pb, Hg, and Ni were at or below LOR in all samples. The concentration of Cu was below, at or very close to the LOR for all samples.

The concentration of Zn against ANZECC protection level (or trigger values) is shown in Figure 5. All concentrations were below the 90% protection level but concentrations variously exceeded 95 or 99% protection levels. This result is consistent with a slightly disturbed marine system which is described in (ANZECC 2000) as an ecosystem in which biodiversity may have been affected to a

---

[1] Unmodified is a descriptive term used in reference to the quality of the environment and is used in the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC 2000). Effectively unmodified ecosystems, typically (but not always) occur in remote and/or inaccessible locations. While there are no aquatic ecosystems in Australia that are entirely without some human influence, the ecological integrity of unmodified ecosystems is regarded as intact.

small degree by human activity. Therefore, this result is likely reflective of the human activities occurring within and around the study area and the levels of environmental Zn are with a reasonable level of species protection for such an environment.

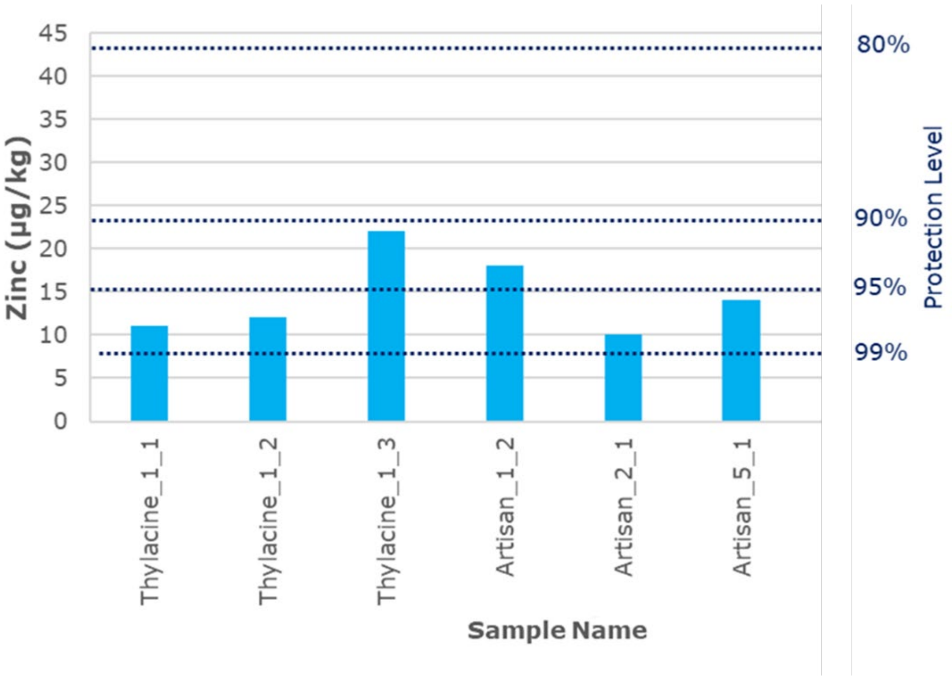

Figure 5 Concentration of Zn in water samples from Thylacine and Artisan survey areas.

BTEXs and PAHs were below the detection limit in all water samples. Very low traces of TRHs were detected in the Thylacine_1_2 water sample but were at levels of no concern. TRHs were below detection limits in all other samples. The level of chlorophyll *a* in filtered samples was below the detection level.

4.2 Sediment Quality

The particle size distribution of marine sediments in each sample is shown in Figure 6 with data recorded in Appendix 3. The particle size is <2 µm for the clay-size fraction, 2-20 µm for the silt fraction and 20-2000 µm for the sand fraction. Note that the sample for Artisan 1_1 was a composite of up to three drops of the grab sampler. The sediment within all samples and, therefore at both survey areas, was predominantly sand with a range of 95-97% as a proportion of each sample. There was very little silt and a maximum of 4.7% for the clay-size fraction. There were no discernible trends based on the location of sample collection. The Munsell colour of all samples as 10YR 8/4.

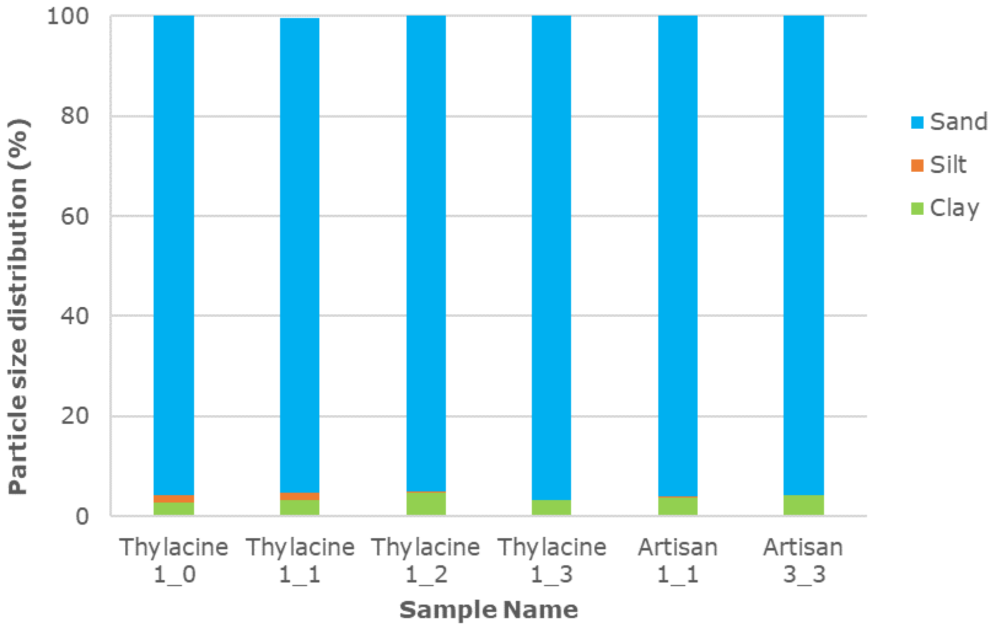

Figure 6 Particle size distribution (%) in sediment samples collected at Thylacine and Artisan survey areas.

The ORP (oxidation-reduction potential) or redox potential of sediments within the samples was measured and the results are presented in Table 12. Note that the measurement probe was inserted into the sediment until resistance prevented further insertion. Given that the substrate was predominantly sand, the probe was typically only inserted to 1-2 cm and no more than 3 cm into the sediment sample. The anoxic layer with low ORP was not detected in any of the sediments analysed and the range of measurements indicated that these sediments maintain a well oxygenated, unmodifed environment.

Table 12 Measurement of oxidation reduction potential in sediment samples at Thylacine and Artisan survey areas.

Sample Name	ORP Measurement Depth (mV)		
	1 cm	2 cm	3 cm
Thylacine_1_0	211	211	No further penetration
Thylacine_1_1	252.7	No further penetration	-
Thylacine_1_2	242.7	No further penetration	-
Thylacine_1_3	225.5	223	216.7
Artisan_1_1	Composite sample; measurement not possible		
Artisan_3_3	242.1	217.3	No further penetration

The results of nutrient analyses are shown in Table 13, Figure 7 and Figure 8. Nitrate-nitrite was not detected in any samples. There was a notable degree of variability in the samples collected in the Thylacine field, however the small number of samples means that a trend or pattern is not discernible. TOC and detectable nitrogen concentrations were slightly higher in the Artisan samples compared to the Thylacine samples. Generally, the concentrations of nutrients in the marine sediments were to be expected for this environment and type of sediment.

Table 13 Nutrients in sediment samples at Thylacine and Artisan survey areas.

Sample Name	mg/kg					Total Organic Carbon (%)
	Phosphorus	Silicon	Nitrate-Nitrite	Total Kjeldahl Nitrogen	Total Nitrogen

Thylacine_1_1	620	1000	< 5	190	190	0.9
Thylacine_1_2	400	950	< 5	130	130	0.5
Thylacine_1_3	< 200	460	< 5	180	180	< 0.1
Average (± S.D.)	467.5 (± 284)	815 (± 245)	NA	183 (± 41)	183 (± 41)	1.0 (± 0.5)
Artisan_1_1	620	570	< 5	310	310	1.6
Artisan_3_3	530	810	< 5	270	270	2.4
Average (± S.D.)	575 (± 64)	690 (± 170)	NA	290 (± 28)	290 (± 28)	2.0 (± 1.0)

Level of Reporting (LOR): phosphorus 200 mg/kg; silicon 5 mg/kg; nitrate-nitrite 5 mg/kg; TKN 10 mg/kg; TN 10 mg/kg; TOC 0.1%.
S.D. = standard deviation. Note that average (± S.D.) calculations are made with half LOR where the sample result was < LOR.

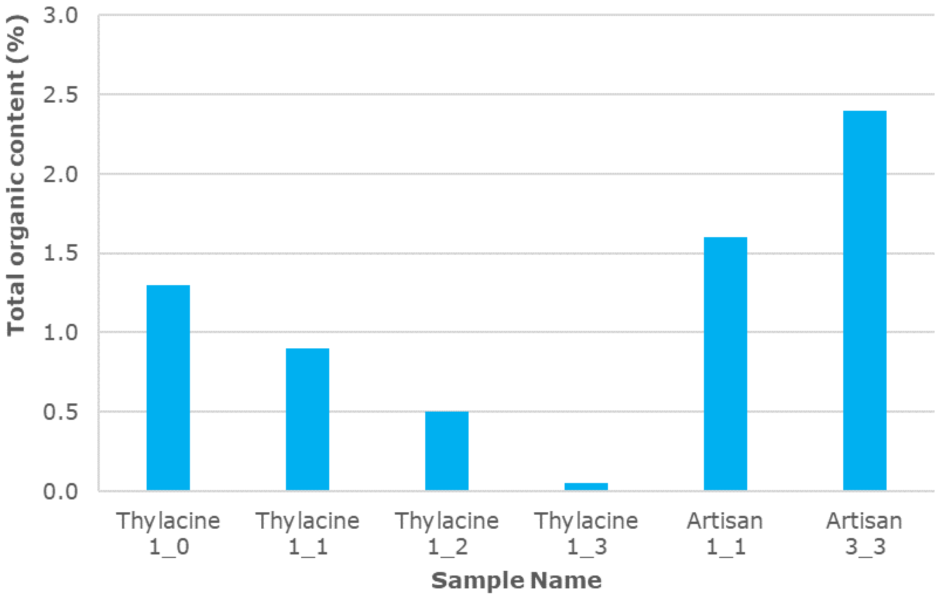

Figure 7 Total organic content (%) in sediment samples collected at Thylacine and Artisan survey areas.

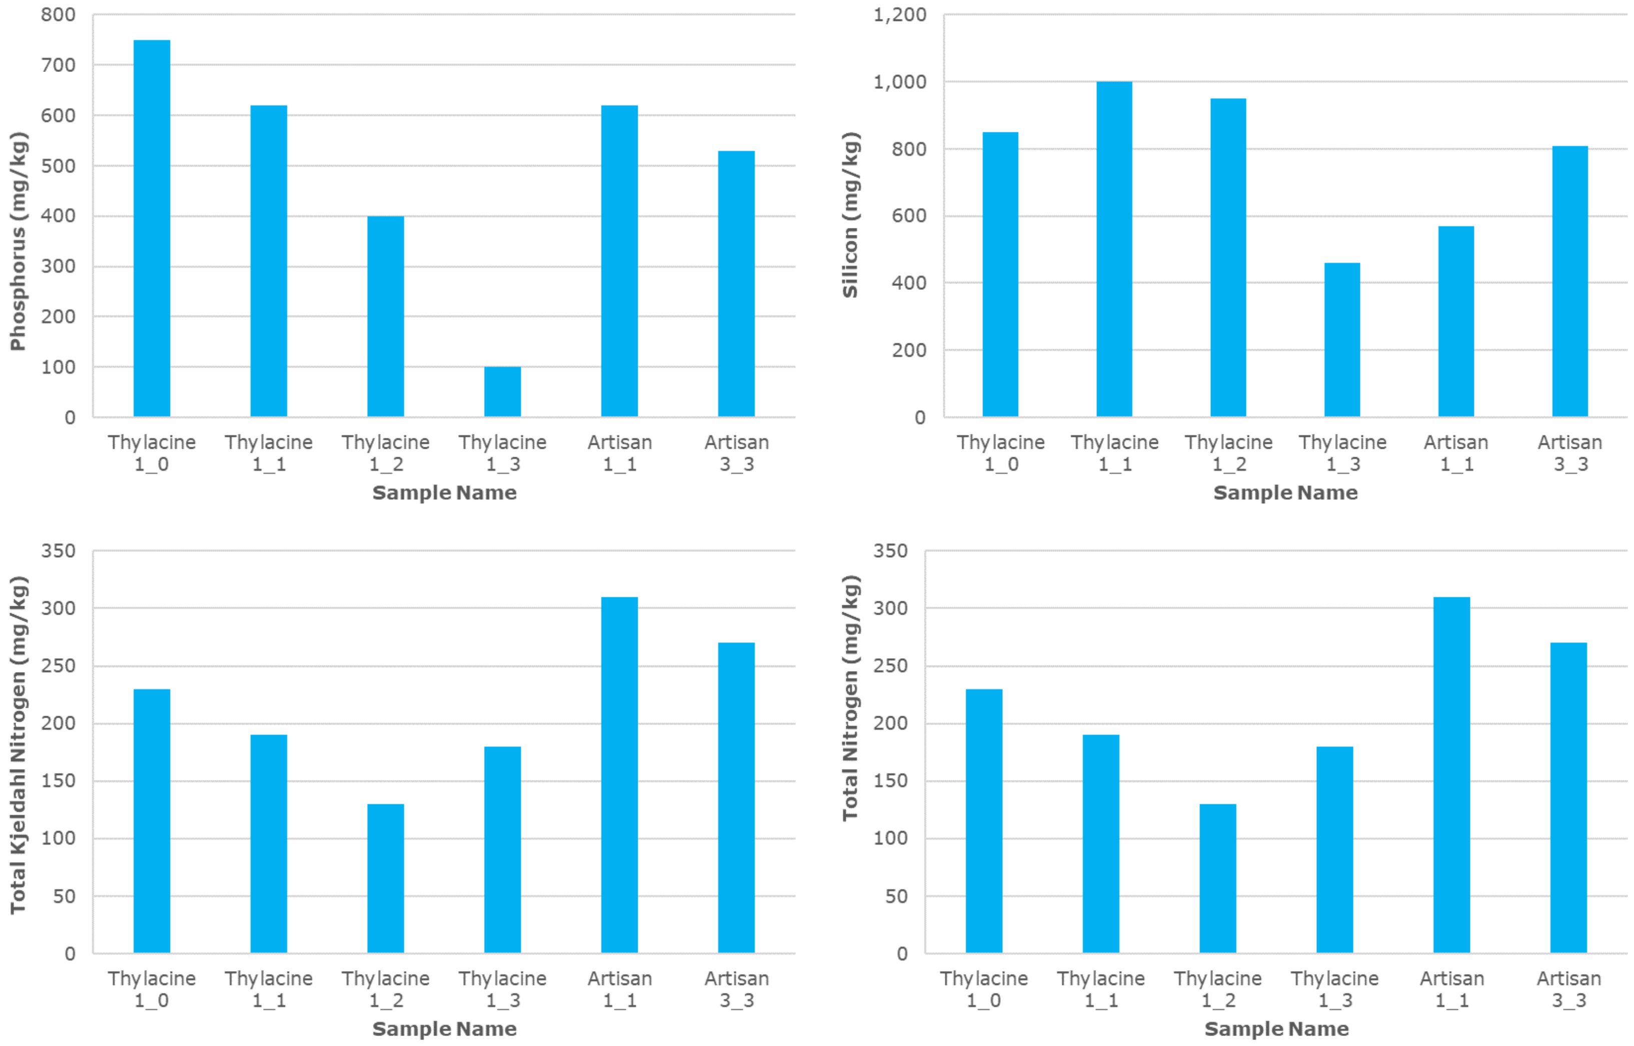

Figure 8 Nutrient concentrations (mg/kg) in sediment samples collected at Thylacine and Artisan survey areas, including phosphorus (top left), silicon (top right), total Kjeldahl nitrogen (bottom left) and total nitrogen (bottom right).

Table 14 presents the results of the analysis for metal compounds in the sediment samples. Of the inorganic compounds tested, Cd, Cu, Pb, Hg, Ni and Sn were below the detection limits (LOR) in all sediment samples. The concentration of Cr in sediments was low, and well below the Interim Sediment Quality Guidelines (ISQG) low trigger value of 80 mg/kg from the recommended sediment quality guidelines set out in ANZECC (2000). The concentration of Cr was slightly higher in the samples from Artisan than those from Thylacine. Zn was detected in two of the six samples (one sample from each field) and was well below the ISQC-Low trigger value of 200 mg/kg.

Table 14 Metals in sediment samples at Thylacine and Artisan survey areas.

4.3 Infauna Ecology

The benthic infauna recorded from the grab samples are presented in Table 20. The benthic infauna identified and counted from samples collected at the Thylacine and Artisan sites were relatively depauperate in both abundance and diversity. A total of 22 morpho-species were identified, from a total of 45 organisms collected from the grab samples. The samples Thylacine_1_1 and Artisan_1_4 had the greatest infauna abundance with nine organisms in each sample (Figure 9). The samples Artisan_1_4 and Artisan_3_4 had the greatest diversity with eight morpho-species) (Figure 10), most of which were polychaete worms or crustaceans (Figure 11).

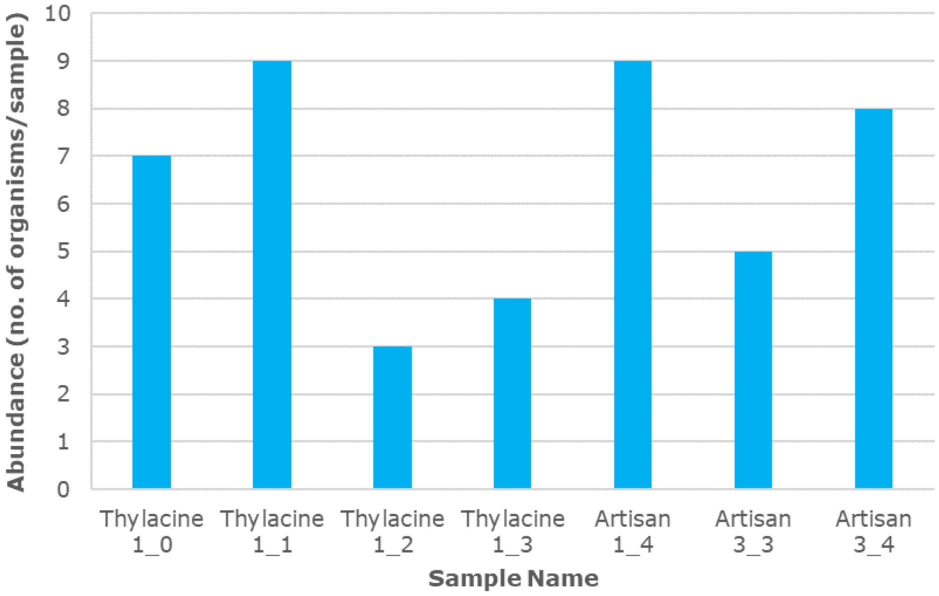

Figure 9 Abundance of benthic infauna in grab samples at Thylacine and Artisan survey areas.

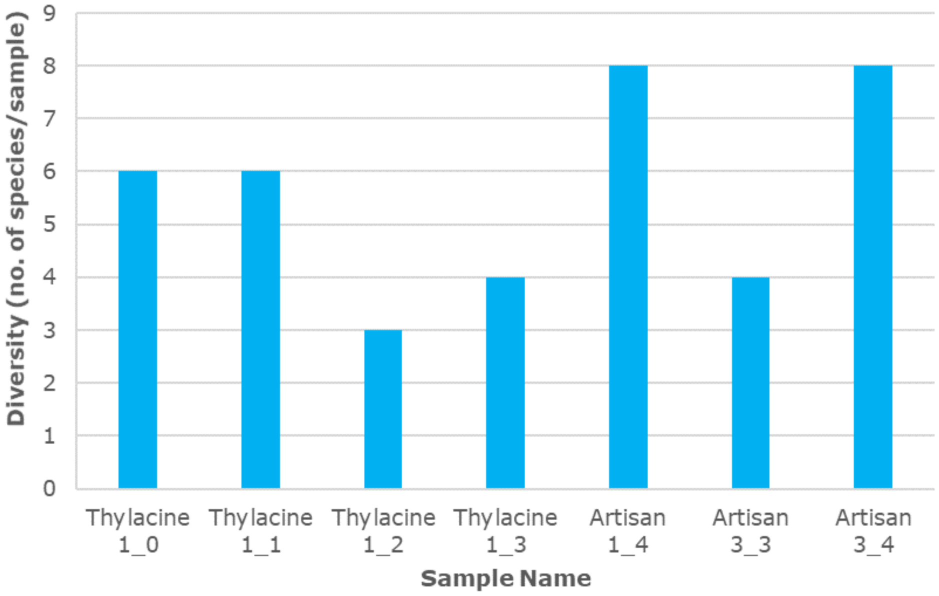

Figure 10 Diversity of benthic infauna in grab samples at Thylacine and Artisan survey areas.

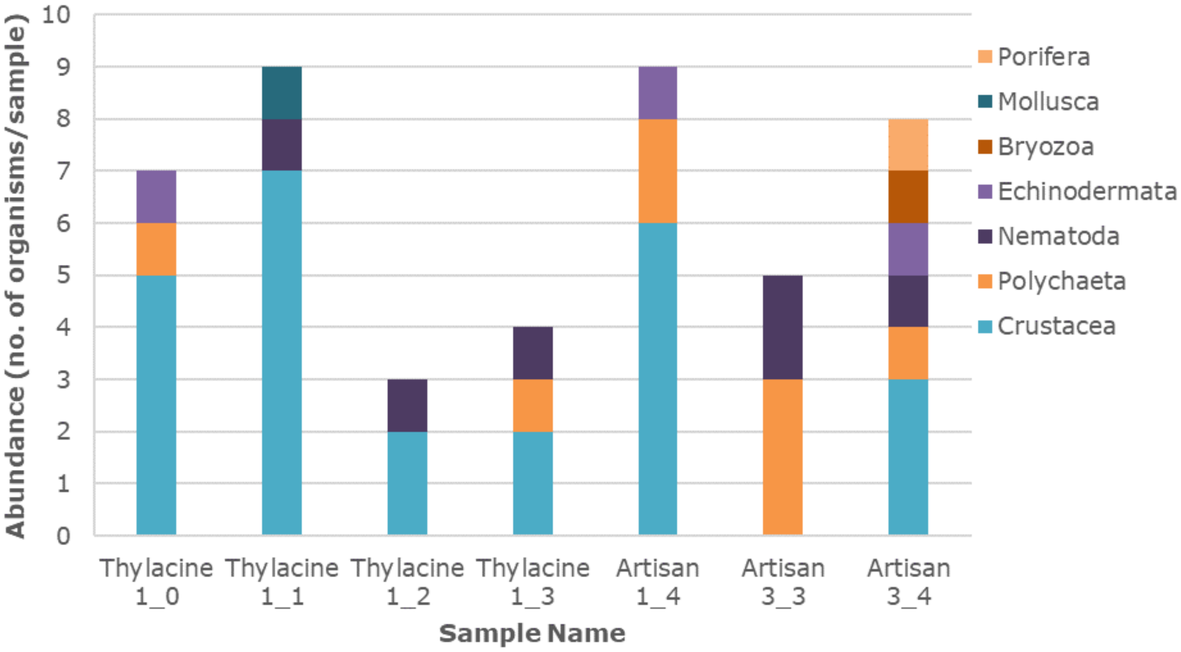

Figure 11 Abundance of benthic infauna by taxonomic group in grab samples at Thylacine and Artisan survey areas.

These results are reflective of the sedimentary environment at the Thylacine and Artisan survey areas, as described in Section 4.2. All sites were dominated by sand, which typically have a lower abundance and diversity of infauna given that this abrasive type of substrate tends to be more easily subjected to hydrodynamic conditions that move the sediment more dynamically than muddy substrates. The consequence of this is a physical environment that is not favourable for filter feeding and burrowing infauna species to inhabit. The observed species typically have a higher tolerance for dynamic environments.

There were no discernible spatial trends in the distribution of sediment particle size. Likewise, there were no clear trends in the abundance, diversity or composition of benthic infauna.

Table 20 Benthic infauna present in sediment samples collected at Thylacine and Artisan survey areas.

Phylum	Class/ Order	Family	Morpho-species	Thylacine				Artisan

4.4 Epibenthic Ecology

A total of 821 photographs were taken of the seafloor with the survey areas in Otway Basin. A total of 442 photographs used in this assessment (Appendix 5), with the remaining images excluded for the reasons as listed in Section 3.5.2. An average of 56 photographs were taken per survey area, 17 photographs per Hot Tap location and 15 photographs per umbilical route. Table 21 provides a summary of the number of photograph replicate samples used for the visual assessment, average (± standard deviation) for percent cover of epifauna, and total abundance of individual (and often mobile) epifauna organisms. Two example images from each survey area, Hot Tap and umbilical route are included in Appendix 6.

Figure 12 shows the average (± S.D.) percent cover of epifauna at each of the drop camera locations. Percent cover ranged from 0 to 80% of the sample photograph for all samples but on average the percent cover was typically no more than 37% cover. The seabed at Hot Tap X had the greatest average coverage of epibiota while the lowest coverage of epibiota was recorded along the CPT route between Artisan and Hot Tap Y (ARHTY) (Figure 12). Artisan and Hercules survey areas had a slighted greater coverage of epifauna, while the CPT routes between survey areas and Hot Tap Y had the least coverage of epifauna.

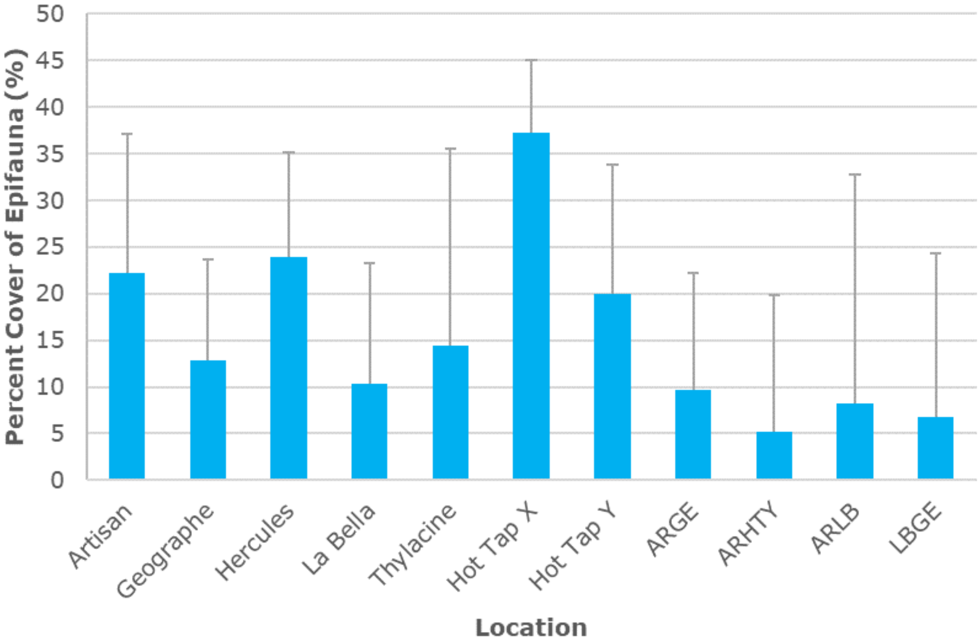

Figure 12 Percent cover of epifauna at drop camera location in Otway Basin.

Figure 13 provides information of the percent cover of epifauna at each drop camera site within these locations and shows the high variability of smaller-scale variability between drop camera sites. For example, the coverage of epifauna at most Thylacine drop camera sites was no more than 16% while at Thylacine 1 the percent cover was up 43% on average.

Of the individual epibenthic organisms, Gastropoda sp. 2 (a cone shell) and crionids (featherstars) were the most abundant (Table 21). Figure 14 shows an example of the seabed at Thylacine 1 (TH1) with a high percent cover of epifauna and a relatively high abundance of crinoids. Further examples are included in Appendix 6.

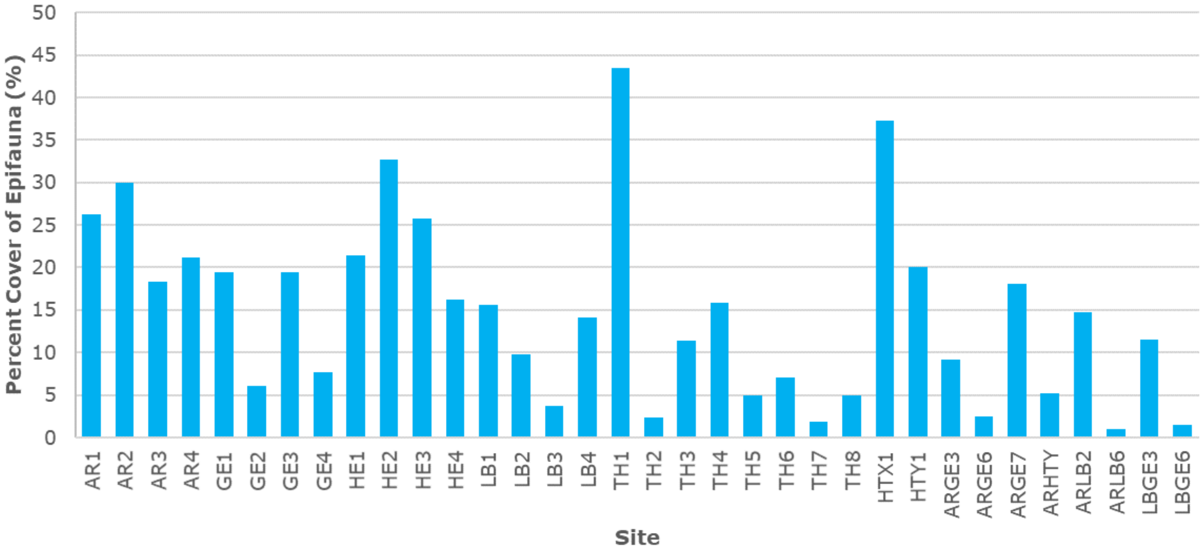

Figure 13 Percent cover of epifauna at drop camera sites in Otway Basin.

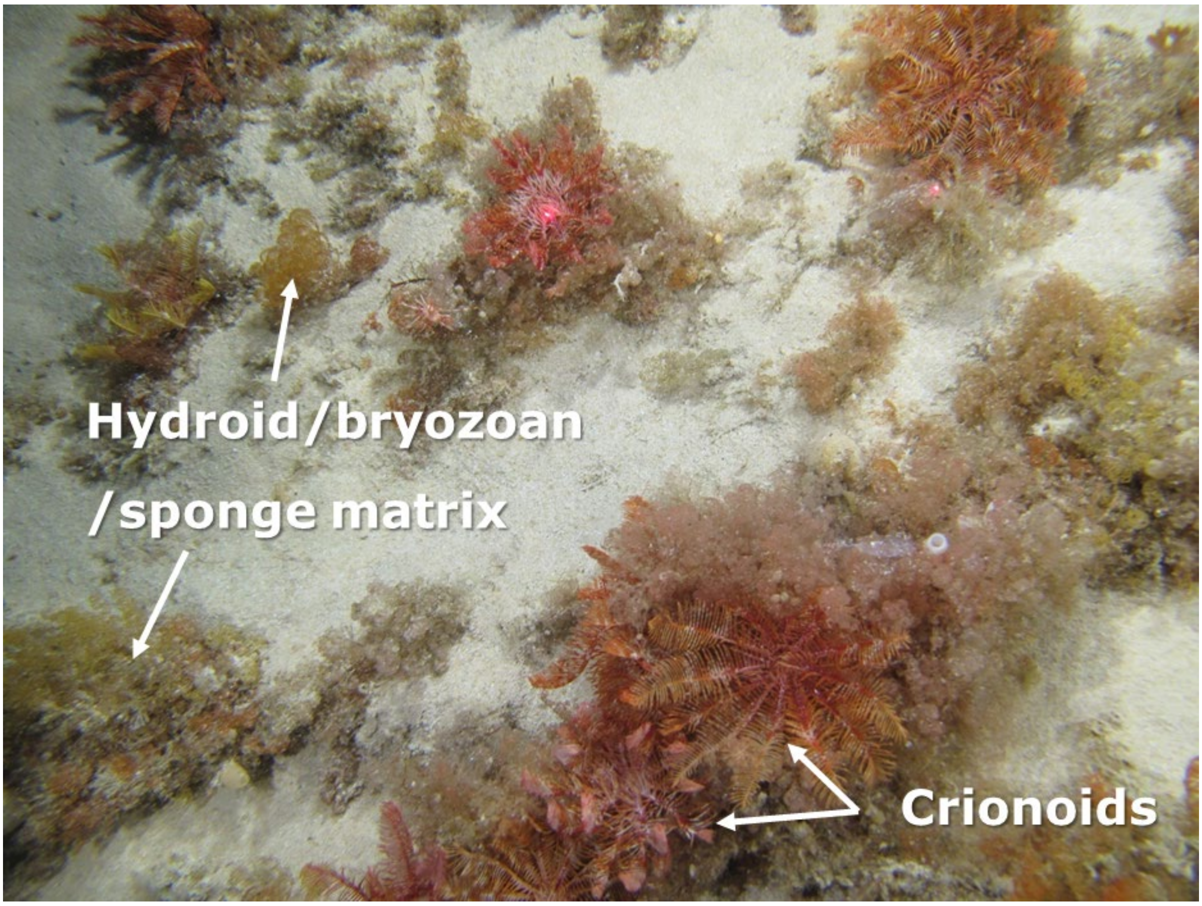

Figure 14 Example of the typical seabed epifauna with high percent cover at Thylacine 1 (TH1).

Table 21 Percent cover and total abundance of epibiota at drop camera sites.

A composite, qualitative sample of epifauna from the Artisan field as examined and identified by the Benthic Australia invertebrate laboratory, with the results presented in Table 22. This epifauna was collected from grab samples at Artisan 1. This analysis shows that much of the epifauna is comprised of branching bryozoans, feather-like gorgonian cnidarians and sponges. This complex of encrusting/branching fauna provides refuge for macrofauna such as amphipods, isopods, polychaete worms and molluscs.

Table 22 Epifauna present in grab samples collected at the Artisan field.

Phylum	Class/ Order	Family	Morpho-species	Artisan_1_Epifauna
Annelida	Polychaeta	Amphinomidae	Hermodice spp.	1
		Eunicidae	Eunice spp.	1
		Phyllodocidae	Phyllodocidae sp.	1
		Syllidae	Syllidae sp.	2
		Terebellidae	Terebellidae sp.	1
Cnidaria	Alcyonacea	Alcyonacea	Gorgonian-Feather sp.	1
Crustacea	Amphipoda	Dexaminidae	Dexaminidae sp.	10
		Eusiridae	Eusiridae sp.	2
		Ischyroceridae	Ischyroceridae sp.	2
		Maeridae	Maeridae sp.1	3

			Solitary-Fan	4

5. DISCUSSION

The survey was conducted over in the Otway Basin covering five survey areas, two hot taps and five routes between those locations. The survey areas were located in offshore Commonwealth waters at 32 to 80 km from Port Campbell. Water depth ranged from 70 to 104 m.

The water quality at the Thylacine and Artisan survey areas indicated an undisturbed mid-depth environment, based on the six samples collected during the survey. There were low or undetectable levels of nutrients, metals/metalloids, BTEXs, PAHs and TRHs in the seawater samples. Metal and metalloids measurements were generally below ANZECC trigger values and within the range expected for unmodified, marine waters. The range of ORP measurements indicated a well oxygenated, ecologically healthy environment.

The sandy substrates described for Thylacine and Artisan survey areas are consistent with the reported description for the area of unconsolidated seabed sediments made up of carbonate sands (Barton et al., 2012; Murray-Wallace and Woodroffe, 2014). The sediment quality results were also consistent with Jones and Davies (1983) who described the grain size distribution as sand and gravel covering the entire shelf except for areas of silty sand in central Bass Strait and other locations more remote from the survey area. The authors noted a regional trend of 'reverse grading' whereby sediment tended to become coarser with distance from shore. Fine sand was reported to be the predominant sediment type along the inner shelf of Victoria and off much of Tasmania, grading seawards into medium-grain sand, and locally into coarse sand at the edge of the shelf (Jones and Davies, 1983). While the gravel fraction was not assessed, it is likely that some gravel occurs within the sediment as shown by some larger shell fragments observed in seabed photographs. Sediments had a high ORP and low or undetectable levels of toxicants indicating an unmodified seabed environment.

The Otway Basin is part of the Southeast Marine Bioregion which extends from the far south coast of New South Wales to Kangaroo Island (Commonwealth of Australia, 2015). Significant variation in seafloor features and water depth contribute to the high level of species diversity in the Region and the shelf habitats are reported to support a diverse range of species from a broad range of taxonomic groups (Commonwealth of Australia, 2015). However, there is no readily-available literature describing the seabed fauna of Otway Basin, meaning it is not possible to make a comparison of infauna and epifauna communities detected to prior studies. Most descriptions of the ecological values of the Basin or the Bioregion are at a broad scale and focus of key features such as cetaceans, birds, fisheries and macroalgae habitats (Commonwealth of Australia, 2015).

Based on the assessment of epifauna using seabed photographs, the general impression of the seafloor is of a unmodifed marine environment that supports a patchy complex of branching epibiota (i.e., bryozoans, gorgonian cnidarians and sponges). This complex was highly patchy, covering 0.25 m^2 on average but could be found in patches of at least 0.4 m^2.

A microscopic examination of a qualitative sample of this epibiota indicated that this complex of fauna provide microhabitat for a range of macrofauna such as amphipods, isopods, polychaete worms and molluscs. Such epifaunal habitats are known to provide refuge and other resources for benthic species (Jones, 2006). By comparison, there was a low abundance and diversity of infauna living within the sediment which reflects the coarse nature of the substrate. This type of substrate is highly mobile making it difficult for filter feeders and soft bodies invertebrates to survive and establish significant populations.

In summary, the epibiota on the seabed in the vicinity of the Thylacine and Artisan survey areas is representative of what is expected at depths around 70-100 m. The infauna was of relatively low abundance and diversity as expected for coarse sand substrates. No species or ecological communities listed as threatened under the Environmental Protection and Biodiversity Conservation Act 1999 (the EPBC Act) were observed.

APPENDIX 1
ENVIRONMENTAL SAMPLE LOGS

SAMPLE MANAGEMENT ROUTINES

Project Code: 318000803	**Project Name: Otway Offshore Development**	
Vessel: Vos Shine **Location: Artisan and Thylacine, Otway Basin**	**Sampling Team: Irene Middleton** **Sampling Gear: Van Dorn 2.4L and Van Veen Double benthic grab sampler**	**Date: 22/11/2019**

☑	**All samples are stored on board as required for the analysis**	
☒	**Once ashore samples are transported by air with the sampling team to Perth**	**Not required, samples sent directly from port to lab.**
☑	**All Chain of Costody (COC) forms are copied and saved to cloud storage prior to sample dispatch**	
☑	**Samples for contaminants analyses (metals, metalloids, hydrocarbons) are shipped by courier to EUROFINS in Melbourne with COC documentation**	
☑	**Samples for infaunal analysis are shipped via courier to Benthic Australia, Gladstone, QLD with COC documentation**	
☑	**Image data is saved in its entireity to two separate storage drives, each transported by a different team member to Ramboll's office (holding a relevant COC)**	**Only one team member transported storage drives as only one enviro team member on board at one time. Additional image data sent to Ramboll by Fugro via sercure file transfer.**
☑	**Image data is saved in its entireity to Ramboll's secure servers once back in the office (noted on COC when complete)**

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Eurofins | mgt Suite B4			
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Dec 09, 2019	7 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ug/L:** micrograms per litre
ppm: Parts per million	**ppb:** Parts per billion	**%:** Percentage
org/100mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram
ppm: Parts per million
org/100mL: Organisms per 100 millilitres
mg/L: milligrams per litre
ppb: Parts per billion
NTU: Nephelometric Turbidity Units
ug/L: micrograms per litre
%: Percentage
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Zinc	5	mg/kg	< 5	< 5	< 5	< 5

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
% Clay	Brisbane	Dec 13, 2019	0 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram
ppm: Parts per million
org/100mL: Organisms per 100 millilitres
mg/L: milligrams per litre
ppb: Parts per billion
NTU: Nephelometric Turbidity Units
ug/L: micrograms per litre
%: Percentage
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Authorised By

Robert Johnston	Analytical Services Manager
Emily Rosenberg	Senior Analyst-Metal (VIC)
Jonathon Angell	Senior Analyst-Inorganic (QLD)
Julie Kay	Senior Analyst-Inorganic (VIC)
Scott Beddoes	Senior Analyst-Inorganic (VIC)

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Melbourne	Feb 05, 2020	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Feb 05, 2020	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Melbourne	Feb 05, 2020	
- Method: LTM-ORG-2010 TRH C6-C40			
BTEX	Melbourne	Feb 05, 2020	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Polycyclic Aromatic Hydrocarbons	Melbourne	Feb 05, 2020	14 Days
- Method: LTM-ORG-2130 PAH and Phenols in Soil and Water			
Polychlorinated Biphenyls	Melbourne	Feb 05, 2020	28 Days
- Method: LTM-ORG-2220 OCP & PCB in Soil and Water (USEPA 8082)			
% Moisture	Melbourne	Feb 05, 2020	14 Days
- Method: LTM-GEN-7080 Moisture

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram
ppm: Parts per million
org/100mL: Organisms per 100 millilitres
mg/L: milligrams per litre
ppb: Parts per billion
NTU: Nephelometric Turbidity Units
ug/L: micrograms per litre
%: Percentage
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	No
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Appendix D Beach Fair Ocean Access Procedure Information Sheet

Fair Ocean Access

Minimising fishing impacts from offshore operations

Information Sheet | June 2021

Introduction

Licenced commercial fishers and petroleum title holders have lawful rights and obligations to carry out their activities safely and without interference. Beach is committed to *Fair Ocean Access* by minimising impacts from its offshore activities to commercial fishers.

Beach's *Fair Ocean Access Procedure* sets out commitments by Beach to genuine consultation with fishers to understand and minimise safety, environmental and economic impacts.

Where impacts cannot be minimised by Beach, and a fisher has acted to avoid risks and impacts to a Beach project, Beach's *Fair Ocean Access Procedure* includes a simple and fair process for a fisher to claim compensation for an economic loss, and a rapid approval and payment process.

Safety

Safety is Beach's first priority and operating safely will sometimes require restricted access for relatively small offshore areas over short periods. Beach will consult with fishers to seek to minimise potential disturbance to areas that are regular fishing grounds and where the fisher has no alternative fishing options.

Environmental Protection

Beach's projects are subject to stringent assessment and mitigation of potential environmental impacts. Beach must prepare Environment Plans for its offshore projects. These identify all environmental and socio-economic impacts and set out mitigation measures to reduce impacts, so they are "as low as reasonably practicable" and acceptable by regulators. Mitigation measures may include compensation where impacts on the commercial fishing industry cannot be minimised and where these impacts cause an economic loss.

Assessment of impacts includes identifying State and Commonwealth commercial fisheries that are actively fished in Beach's project areas and any biological or economic impacts to those fisheries. Consultation with commercial fishers is an important part of Beach's environmental assessment process.

Genuine consultation

Beach will consult with openness, transparency and mutual respect with fishers who may be directly impacted by Beach's projects. Beach will use its best endeavours to consult with all potentially impacted fishers during preparation of its Environment Plan for a project, and before projects commence.

Respecting the representative role of fishing associations, Beach will seek engagement with potentially impacted fishers via the relevant association. Beach will also engage directly with a fisher if they are not a member of an association, or where they request direct engagement with Beach.

Where a fishing association or fisher believes they will be impacted by a Beach project, Beach will share its fishing impact assessments, validate that with fishers, and discuss their specific circumstances with the objective of minimising potential impacts.

If project avoidance and impact minimisation is not possible, Beach will provide a copy of its full *Fair Ocean Access Procedure* and discuss mitigation options set out in the procedure, as appropriate to the individual fisher or association.

Economic loss

Beach is committed to the principle that a fisher should not suffer an economic loss as a direct result of a Beach project. Losses may occur for different reasons such as:

- reduced catch from fishing in a new area in order to avoid a Beach project
- reduced catch due to impacts to a fishery from the project activities
- steaming costs to avoid a Beach project area
- costs to repair or replace fishing gear.

Acting in good faith

Beach is committed to a fair, simple and transparent process for a fisher to claim compensation, where the fisher has consulted with Beach in good faith before a project, and provided the fisher has:

- acted to avoid risks and impacts to a Beach project
- acted to mitigate any economic losses to their business that may arise from avoiding risks and impacts to a Beach project
- evidence of fishing in the Beach project area during the same time of year as the project timing, for at least three years within the last five years, unless there are genuine fishery or fishing practice reasons for lesser periods
- historical and current catch and effort evidence and the ability to demonstrate an economic loss, as set out in Beach's *Fair Ocean Access Procedure*.

Making a claim

The *Fair Ocean Access Procedure* sets out a simple claim form and describes the evidence required for a claim, such as historical catch and effort records, current catch and effort records, and fish prices.

Claims must be made within 60 days of completion of a Beach project unless there is evidence that the project has caused an impact to the fishery which has impacted future catch and caused an economic loss.

The *Fair Ocean* Access *Procedure* sets out timeframes for the rapid assessment and payment of successful claims and for ensuring the fisher is kept informed.

Beach will nominate a single point of contact at Beach for a fisher to liaise with.

Claims and evidence will be managed in accordance with Beach's Privacy Policy which can be found on Beach's website.

If a claim is not approved, Beach will provide written reasons for the decision.

Resolving disagreements

Where a fisher and Beach cannot agree on a fisher's claim, the *Fair Ocean Access Procedure* includes steps for appointing an independent expert to resolve the matter. Beach will pay the reasonable costs of the independent expert, as set out in the *Fair Ocean Access Procedure*.

We welcome your questions and feedback

Appendix E EPBC Protected Matters Search Tool Report – Light and Flaring EMBAs

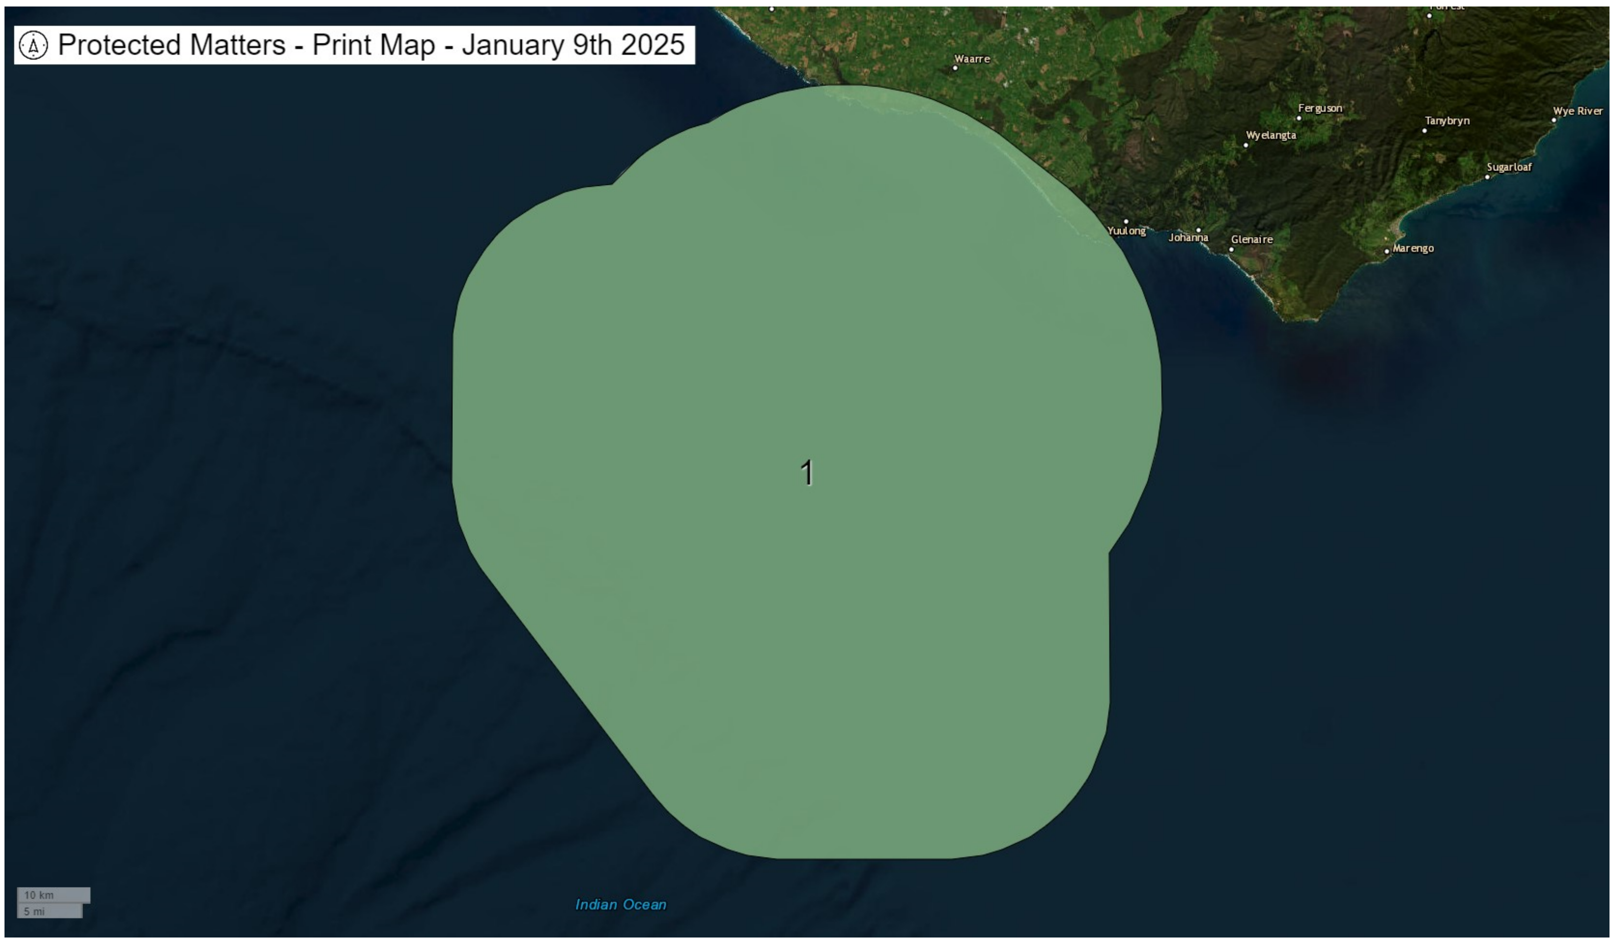
Australian Government

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 09-Jan-2025



Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	3
Listed Threatened Species:	85
Listed Migratory Species:	53

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	89
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	7
Regional Forest Agreements:	1
Nationally Important Wetlands:	1
EPBC Act Referrals:	47
Key Ecological Features (Marine):	1
Biologically Important Areas:	13
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area

Scientific Name	Threatened Category	Presence Text
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Nannoperca obscura		
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat may occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis		
Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Antechinus minimus maritimus		
Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Dasyurus maculatus maculatus (SE mainland population)		
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Species or species habitat likely to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat likely to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat likely to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat may occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat likely to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat may occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Carcharias taurus Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua		
Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata		
White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons		
Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri		
Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov.		
Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma		
Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

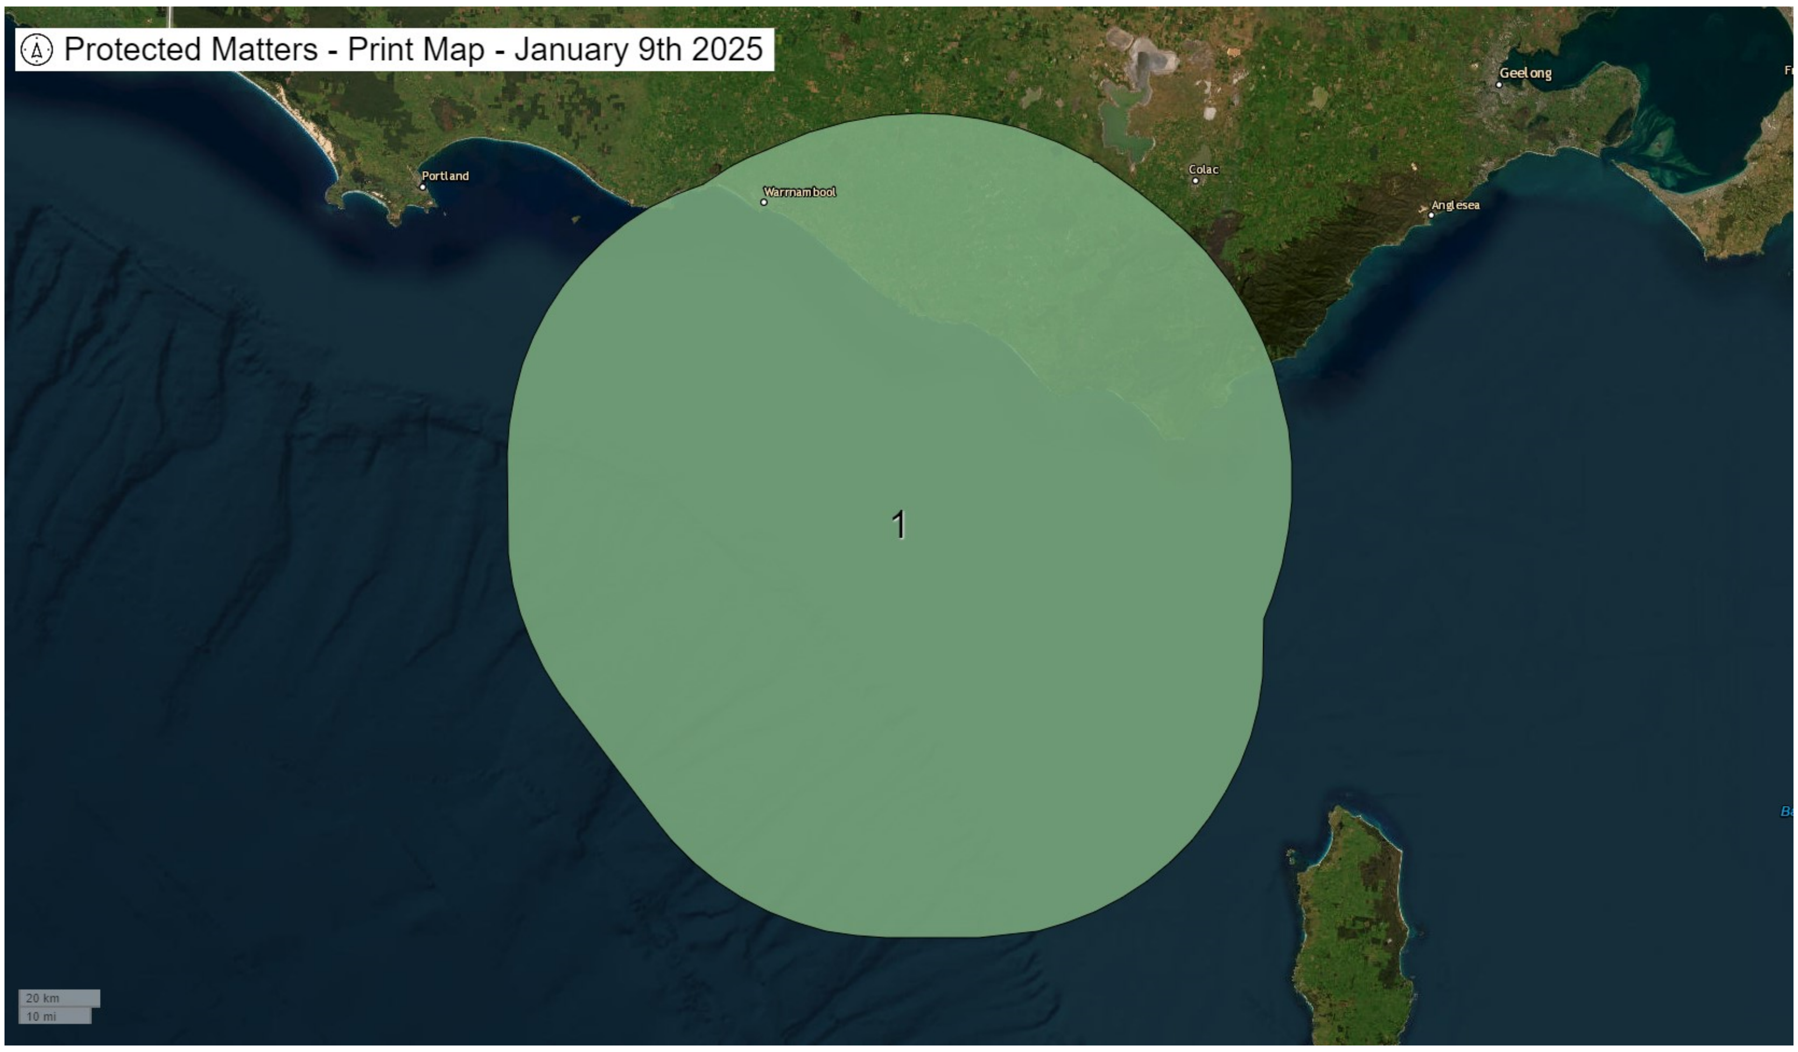
EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 09-Jan-2025



Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	2
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	8
Listed Threatened Species:	107
Listed Migratory Species:	64

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	3
Commonwealth Heritage Places:	1
Listed Marine Species:	108
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	3
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	53
Regional Forest Agreements:	1
Nationally Important Wetlands:	8
EPBC Act Referrals:	86
Key Ecological Features (Marine):	2
Biologically Important Areas:	17
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Port phillip bay (western shoreline) and bellarine peninsula	50 - 100km upstream from Ramsar site
Western district lakes	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community may occur within area
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area

Community Name	Threatened Category	Presence Text
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour may occur within area
Aphelocephala leucopsis Southern Whiteface [529]	Vulnerable	Species or species habitat may occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Fregetta grallaria grallaria White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
CRUSTACEAN		
Euastacus bispinosus Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat likely to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Nannoperca obscura Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
INSECT		
Synemon plana Golden Sun Moth [25234]	Vulnerable	Species or species habitat likely to occur within area
MAMMAL		
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dasyurus maculatus maculatus (SE mainland population) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petauroides volans Greater Glider (southern and central) [254]	Endangered	Species or species habitat likely to occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Astelia australiana Tall Astelia [10851]	Vulnerable	Species or species habitat known to occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Dianella amoena Matted Flax-lily [64886]	Endangered	Species or species habitat likely to occur within area
Dodonaea procumbens Trailing Hop-bush [12149]	Vulnerable	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lachnagrostis adamsonii Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area
Leiocarpa gatesii Wrinkled Buttons [76212]	Vulnerable	Species or species habitat may occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat likely to occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pimelea spinescens subsp. spinescens Plains Rice-flower, Spiny Rice-flower, Prickly Pimelea [21980]	Critically Endangered	Species or species habitat may occur within area
Poa sallacustris Salt-lake Tussock-grass [24424]	Vulnerable	Species or species habitat likely to occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Rutidosis leptorhynchoides Button Wrinklewort [67251]	Endangered	Species or species habitat may occur within area
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat may occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra matthewsii Spiral Sun-orchid [4168]	Endangered	Species or species habitat may occur within area
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eulamprus tympanum marnieae Corangamite Water Skink, Dreeite Water Skink [64487]	Endangered	Species or species habitat known to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharias taurus Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eubalaena australis as Balaena glacialis australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus		
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus		
Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus		
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae		
Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus		
White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Breeding likely to occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche bulleri platei as Thalassarche sp. nov.		
Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma		
Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thalasseus bergii as Sterna bergii		
Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis		
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes		
Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola		
Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis		
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Fish		
Heraldia nocturna		
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis		
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps		
Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus minotaur		
Bullneck Seahorse [66705]		Species or species habitat may occur within area
Histiogamphelus briggsii		
Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus		
Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys mollisoni Mollison's Pipefish [66260]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Bonney Coast Upwelling	South-east
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Scientific Name	Behaviour	Presence
Balaenoptera musculus brevicauda		
Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

TECHNICAL ADDENDUM

DATE: 27 August 2021
FROM: Matthew Koessler, Craig McPherson (JASCO Applied Sciences (Australia) Pty Ltd)
TO: Phil Wemyss (Beach Energy)

SUBJECT: Beach Otway Project: Additional and Revised Modelling Study

1. Summary

JASCO Applied Sciences (JASCO) performed modelling study of underwater sound levels associated with the Beach Energy Otway Development, to supplement drilling and construction results previously presented in Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021).

The results have been revised due to better understanding of the propagation loss in the region gained through the validation monitoring of drilling operations at Artisan-1 McPherson et al. (2021). A significant finding of this study was lack of a thin layer of sand overlying the carbonate seabed structure near Artisan-1, which has a significant influence on propagation loss.

This monitoring project also characterised Monopole Source Levels (MSL) for project vessels (during transit and under dynamic positioning (DP)) and the *Ocean Onyx* Mobile Offshore Drilling Unit (MODU). These source levels are considered in the revised modelling.

Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), and as accumulated sound exposure levels (SEL, L_E) as appropriate for non-impulsive (continuous) noise sources. For the non-time dependent scenarios, the modelled maximum and 95th percentile distances to the marine mammal behavioural threshold based on the current interim NOAA (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources are summarised in Table 1.

For the time-dependent scenarios, the modelled maximum distances to permanent threshold shift (PTS) and temporary threshold shift (TTS) criteria for low-frequency cetaceans (NMFS 2018), which are based on SEL accumulated over a period of time are summarised in Table 2.

Table 1. Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL) from the most appropriate location for considered sources per scenario. MCR: Maximum Continuous Rating, MODU: Mobile Offshore Drilling Unit, OSV: Offshore Supply Vessel, ROV: Remotely Operated Vehicle.

Applicable Scenario number	Well Area	Description	R_{max} (km)	$R_{95\%}$ (km)
A1	Thylacine North-1	MODU Drilling	1.24	1.12

2. Introduction

JASCO Applied Sciences (JASCO) performed modelling study of underwater sound levels associated with the Beach Energy Otway Development, to supplement drilling and construction results previously presented in Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021).

The results have been revised due to better understanding of the propagation loss in the region gained through the validation monitoring of drilling operations at Artisan-1 McPherson et al. (2021) as described in Section 2.1. An overview of the modelling scenarios considered is provided in Section 2.2, with results presented in Section 4, and briefly discussed in Section 5.

For noise effect criteria and explanations on methodologies applied, refer to Koessler et al. (2020), Matthews et al. (2020), Matthews et al. (2021) and McPherson et al. (2021).

2.1. Validation Monitoring Study Summary

The monitoring study (McPherson et al. 2021) was completed in relation to the exploration drilling activities at the Artisan-1 well with the aim of completing an acoustic characterisation of the drilling and associated vessel activity within the Otway Basin. Through this characterisation, validation of the modelling predictions used in Beach Energy Otway Environment Plans (EPs) for the development drilling activities was required.

The exploration well Artisan-1, drilled by the *Ocean Onyx*, was selected for the monitoring program because the predicted distances to thresholds for effects on marine mammals, including pygmy blue whales, were farthest at this location in the modelling study used for the EP (Koessler et al. 2020), as well as because it was the first well in the Otway drilling campaign.

Four JASCO Autonomous Multichannel Acoustic Recorders (AMARs) in C-lander moorings were deployed in February and retrieved in early April. Stations 1 through 4 were deployed at distances of 0.336, 1.13, 5.11, and 25 km from the *Ocean Onyx*. The AMARs recorded continuously at 24-bit resolution and 64 kHz sample rate for the entire deployment. The three stations closest to the *Ocean Onyx* were configured with a single hydrophone, whilst the station 25 km away was configured with three hydrophones to provide directional processing of received sounds.

To assist in the characterisation of *Ocean Onyx* and attendant support vessels, the vessels conducted specific activities under dynamic positioning and followed a nominated transit track between the *Ocean Onyx* and Geelong Supply Base. No specific operational requests were made of the *Ocean Onyx* and vessels during normal drilling activities due to the complexity of operationally meeting any requests. Over the course of the monitoring program, the MODU and support vessels engaged in different operational states with different uncontrollable contributors, such as variable drilling operations, resupply and support operations, weather conditions, and merchant shipping.

A summary of the findings of the monitoring study are described in the following sections.

Source Levels

The Monopole Source Levels determined through the measurement study differed from those either estimated for use in the modelling study or those determined using proxy sources. The key differences are as follows:

- The support vessels are quieter than estimated when they are under slow transit speeds, such as 7 knots.
- The support vessels are louder than estimated when they are travelling at faster transit speeds, with 9 knots used to represent these speeds and the associated MSL.
- The support vessels are louder than estimated when holding station or moving under dynamic positioning.
- The drilling operations of the *Ocean Onyx* are both louder at some frequencies and quieter at others than those for the proxy rig the *Polar Pioneer* (Austin et al. 2018), although the results presented for the *Polar Pioneer* did not examine the changes in level with increased drilling depth (over time) as completed within this study.

Comparison of Results

The results from the measurement study could not be directly compared to the modelling presented in Koessler et al. (2020) due to the differences in actual events compared to the nominal representative scenarios developed and evaluated as part of the EP assessment process. Additionally, the measurements were obtained at a receiver located 1.2 m off the seafloor, which is not the maximum-over-depth results reported in the modelling study. The ranges obtained from the measurement study were reported in relation to the Artisan-1 well location, and thus the centre of the *Ocean Onyx*. The ranges in project related modelling studies are reported from a range of locations, including the centroids of multiple sources, thus it was not possible to report the measurement results in a similar fashion using the small number of recording locations used in this study.

Geological Environment Representation

Previous modelling studies for Beach Energy, Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021), used MONM with the assumption of a 1 m thick layer of sand overlaying the carbonate seabed structure at the Artisan-1 well location. This assumption was made due to the lack of available information, and is similar to other inshore work in the Otway Basin, such as (Duncan et al. 2012), who represented the shelf as two zones, an in-shore zone out to a water depth of about 70 m in which the sand layer has a thickness of between 4–10 m, and an off-shore zone of effectively bare calcarenite probably due to scouring by current and swell. The transition between these two zones is ill-defined due to a lack of datapoints, and lies close to the Artisan-1 location, and a balanced approach of assuming 1 m thick layer of sand overlaying the carbonate seabed structure was judged to be appropriate given available information.

The measurement study has increased the understanding of the geological environment in the region and indicates that the sand overlay is thinner (or non-existent) at shallower water depths. The different environment required the use of an alternate configuration of numerical models to represent the propagation loss.

Propagation Loss

The accuracy of the broadband calculated propagation loss for the Otway Basin continental shelf environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on carbonate seabed (calcarenite) likely to occur within the region. In general, the thinner the sand layer, the greater the overall propagation loss.

When comparing SPL data fits for Stations 1–3 in McPherson et al. (2021), the loss rate is higher than what would have been expected in this environment, considering the higher monopole source levels for the support vessel on DP derived from trial measurements. The differences are likely attributable to the potential absence of a sand veneer.

Comparisons were conducted using JASCO’s Marine Operations Noise Model (MONM), a wide-angle parabolic equation model which applies the BELLHOP Gaussian beam acoustic ray-trace model at higher frequencies, and JASCO’s wavenumber integration model (VSTACK) which can fully account for the elasto-acoustic properties of the sub-bottom. The agreement between the models was excellent when only a comparatively thin (1 m thick) layer of sand overlies the carbonate seabed structure. In an environment such as this, MONM could have been used without correction. However, the comparisons indicate a much higher rates of loss, as would be expected if no (or only a very thin) sand layer were present.

A better understanding of the propagation loss environment, and the revision of the representation and treatment of it through the measurement study, enabled the modelling scenarios for the activities at Artisan-1 presented in Koessler et al. (2020) to be recalculated (Section 6.3 in McPherson et al. (2021)).

2.2. Scenario Details

The scenarios considered within this assessment are detailed below and in Table 3, with the associated modelling sites provided in Table 4. An overview of the scenarios is as follows:

1. Otway Offshore Project Development Drilling Campaign, Thylacine North-1 Operations:
    a. Mobile Offshore Drilling Unit (MODU) conducting normal drilling operations
    b. MODU with Offshore Supply Vessel (OSV) in attendance, standing by and conducting resupply operations under Dynamic Positioning (DP)
2. Otway Offshore Project Operations scenarios:
    1. Operations of the Thylacine platform (at Thylacine-A)
    2. OSV vessel resupply at Thylacine platform for periods of 2, 4, 6 and 8 hrs.
    3. OSV vessel on standby at Thylacine platform for periods of 8 and 24 hrs
4. Otway Offshore Project Construction scenarios: A single nominated pipelay/construction vessel, the Skandi Singapore, was considered for these scenarios. Each scenario was considered with a sound speed profiles for the ‘worst case over the year’ and for the period pygmy blue whales are present in the region, between November and January:
    a. Pipelay vessel (PLV) both stationary and laying pipe at Thylacine North-1 and Artisan-1 operating at 20% of its Maximum Continuous Rating (MCR).
    b. Pipelay vessel operating a Remotely Operated Vehicle (ROV) and cutting tool at Geographe-4. The vessel at Geographe-4 was also modelled operating at 20% and 40% of its Maximum Continuous Rating (MCR).
    c. Quantitively assess the combined sound levels of drilling activities and the construction vessel(s) at the emerging SRW aggregation area at Port Campbell. This scenario considered the drilling activities at

Thylacine North-1 presented in Koessler et al. (2020) and the nominated construction vessel (Skandi Singapore) operating at Geographe-4.

5. Simultaneous assessment for drilling, operations and construction operations were considered for key scenarios:
    a. Drilling at Thylacine while doing Thylacine platform resupply
    b. Drilling at Thylacine while doing installation of Thylacine skid near Thylacine platform. The construction vessel installing the skid was modelled operating at 20% and 40% of its Maximum Continuous Rating (MCR).

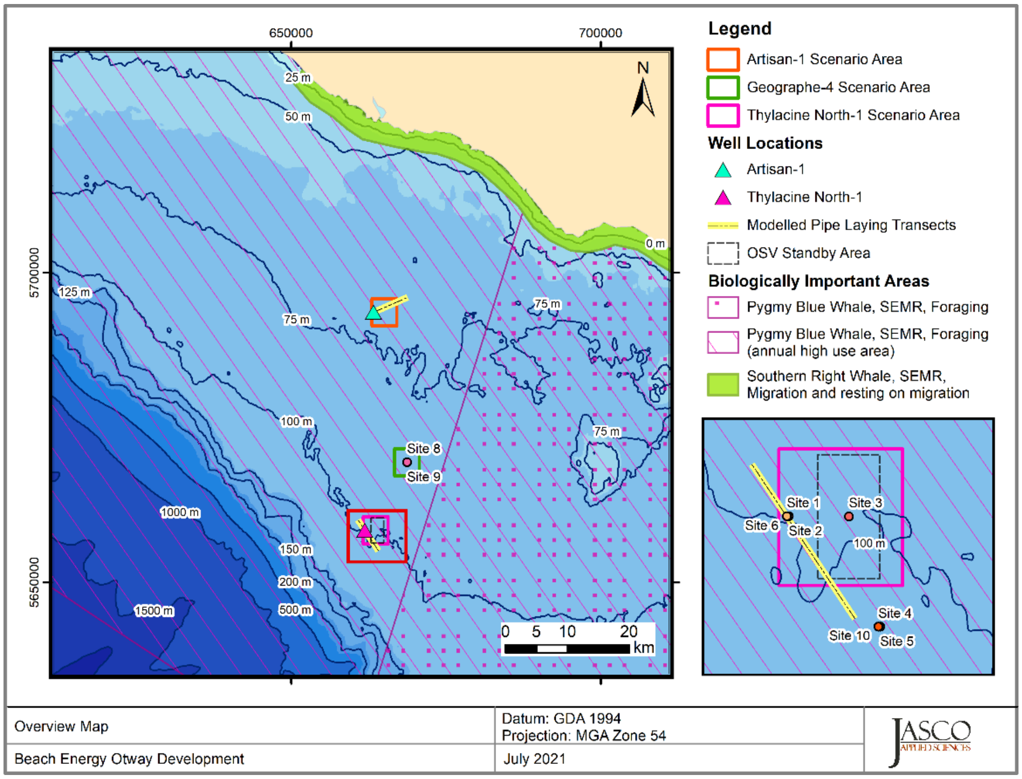

Figure 1. Overview of the modelled area (focus on Thylacine North-1 Scenario Area) and local features within the South East Marine Region (SEMR).

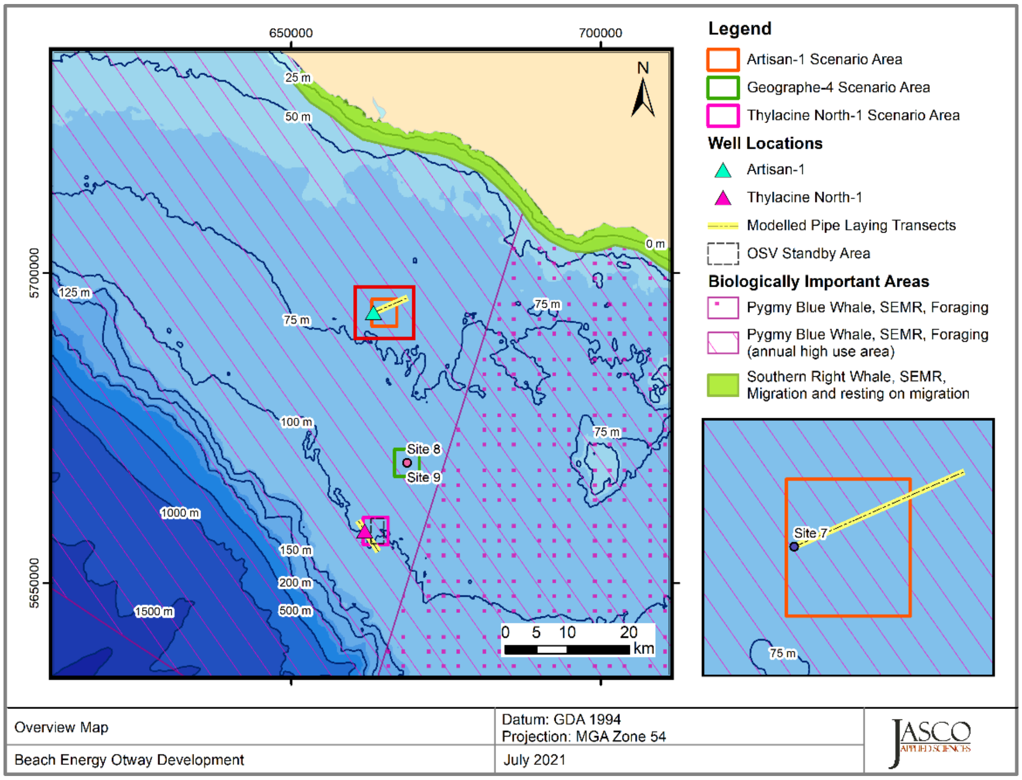

Figure 2. Overview of the modelled area (focus on Artisan-1 Scenario Area) and local features within the South East Marine Region (SEMR).

3. Methods and Parameters

A details description of the employed modelling method and input parameters can be found in refer to Koessler et al. (2020), Matthews et al. (2020), Matthews et al. (2021), Connell et al. (2021) and McPherson et al. (2021). A brief a summary of key elements used in this addendum are provided as follows.

The measured monopole source levels (MSLs) and spectra for the MODU and OSV were used here from McPherson et al. (2021):

- For the MODU drilling, mean levels from Section 5.5.1 in McPherson et al. (2021) were used.
- For scenarios where the OSV was under dynamic positioning (DP) the average spectrum from Section 5.5.2 in McPherson et al. (2021) was used.
- For scenarios where the OSV was transiting or standing by the average slow transit (7 knots) spectrum in McPherson et al. (2021) was used.

For the construction phase scenarios, estimates of the energy source levels (ESLs) for the pipelay/construction vessel were based on the specifications of the *Skandi Singapore* and an ESL derived from recordings of the TechnipFMC flexible lay and construction vessel *Deep Orient*. The specifications of proxy vessel and details on scaling can be found in Matthews et al. (2020), Matthews et al. (2021) and Connell et al. (2021).

Fixed structures such as the WHP have lower radiated sound levels than floating platforms (Spence et al. 2007). Equipment operating onboard floating platforms can contribute to marine environment sound however, airborne and structure-borne (vibration) pathways are considered more significant on these facilities, where equipment can be located below the water line. Underwater noise produced from platforms standing on metal jack-up legs is relatively low given the small surface areas available for sound transmission and also given the location of machinery above the waterline. It is therefore expected that the dominant pathway for sound generation is structure-borne (i.e., vibration from machinery passing through the legs) (Spence et al. 2007).

A study involving the Endeavour Jack-up Rig, operating in Cook Inlet, was conducted by Illingworth and Rodkin (2014) during drilling activities. The results from the sound source verification indicated that sound generated from drilling or generators were below ambient sound levels. The generators used on the Endeavour are mounted on pedestals specifically to reduce sound transfer through the infrastructure, and they are enclosed in an insulated engine room, which may have reduced further underwater sound transmission to levels below those generated by the Spartan 151. The sound source verification revealed that the submersed deep-well pumps that charge the fire-suppression system and cool the generators (in a closed water system) were the most likely dominant contributor the sound field. The measurements are reported as near-source levels recorded close to the bow leg pump system (at 10 m range) (Figure 3-5 in Illingworth and Rodkin Inc. (2014). These were backpropagated using spherical spreading to determine an energy source level (ESL) spectrum. Considering the similarities between a Jack-up Rig and a static WHP the decidecade band spectrum is shown in Figure 3 was used in modelling noise emissions from the Thylacine-A platform.

Furthermore, as discussed by (McPherson et al. 2021) and discussed above in Section 2.1, significant rates of propagation loss were found when analysing the data from the measurement study. As part of the model-measurement validation an adjustment factor was applied broadband received level predictions to account for the loss associated with a cemented limestone seabed (calcarenite) (Section 6.2 in McPherson et al. (2021)). A similar adjustment, which only differed by accounting for sources in different water depths, was applied to broadband level predictions in this addendum as a very similar type of seabed environment is expected at the Thylacine scenario area

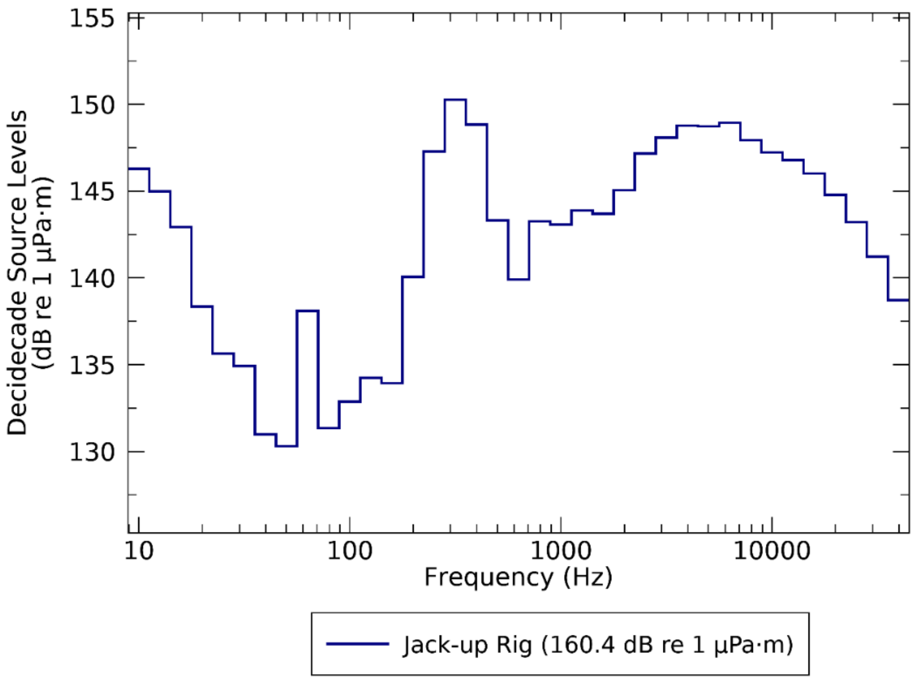

Figure 3. Energy source level (ESL) spectra (in decidecade frequency-band) for the Jack-up Rig considered as a proxy source for the Thylacine WHP.

4. Results

For the considered scenarios (described in Section 2.2), the maximum-over-depth sound fields for the modelled scenarios are presented below in two formats: as tables of distances to sound levels and, where the distances are long enough, as contour maps showing the directivity and distance to various sound levels. Distances to isopleths/thresholds were reported from either the centroid of several sources or from the most dominant single source. When an isopleth completely envelopes multiple sources the centroid was used. When several closed isopleths exist the most dominant source was used.

Tables 5–7 present the maximum and 95% distances (defined in Appendix B.1) to SPL isopleths. Since the SPL metric does not depend on the duration of the operation, these estimates are valid for both, stationary and non-stationary scenarios. Tables 11–16 present the distances to frequency-weighted SEL_{24h} threshold, as well as the total ensonified area for all scenarios.

The maximum-over-depth sound fields for nine scenarios (described in Section were extracted at the emerging SRW aggregation area at Port Campbell, and can be compared to the 120 dB re 1 µPa threshold for marine mammal behavioural response to continuous noise (NOAA 2019).

4.1. Tabulated Results

Table 5. *Scenarios A1–A7:* Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL) from the most appropriate location for considered sources per scenarioA dash indicates the level was not reached within the limits of the modelling resolution (20 m). MODU: Mobile Offshore Drilling Unit, OSV: Offshore Supply Vessel, DP: Dynamic Positioning.

4.2. Sound Field Maps

4.2.1. SPL Maps

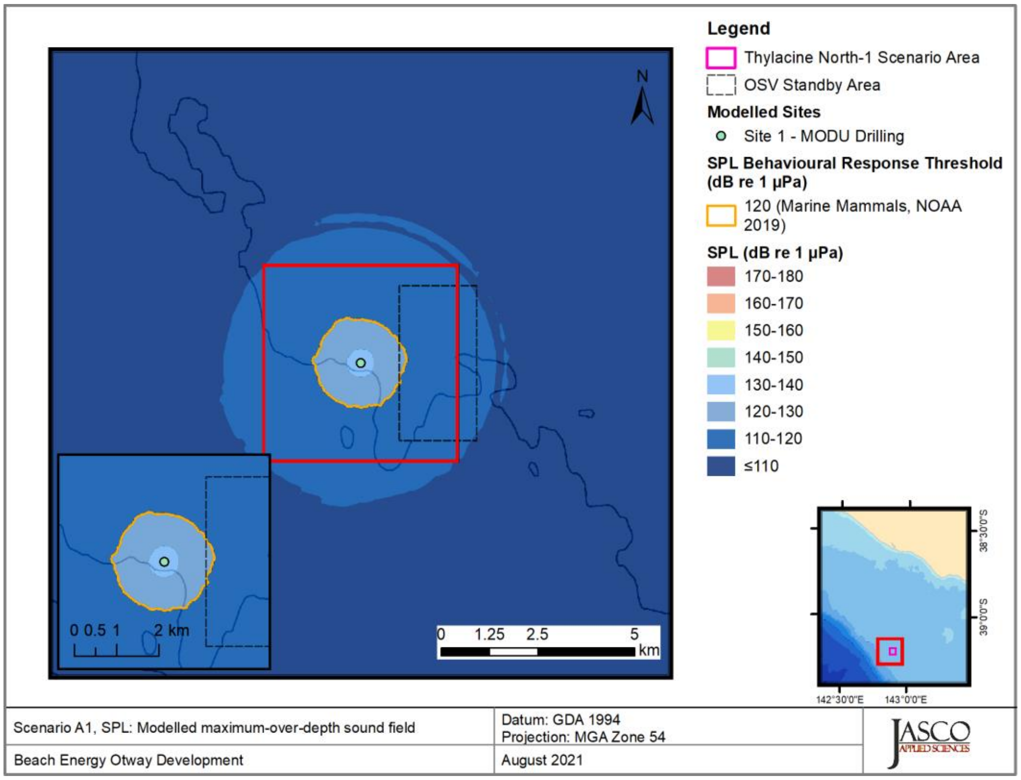

Figure 4. *Thylacine North-1, MODU Drilling (Scenario A1) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

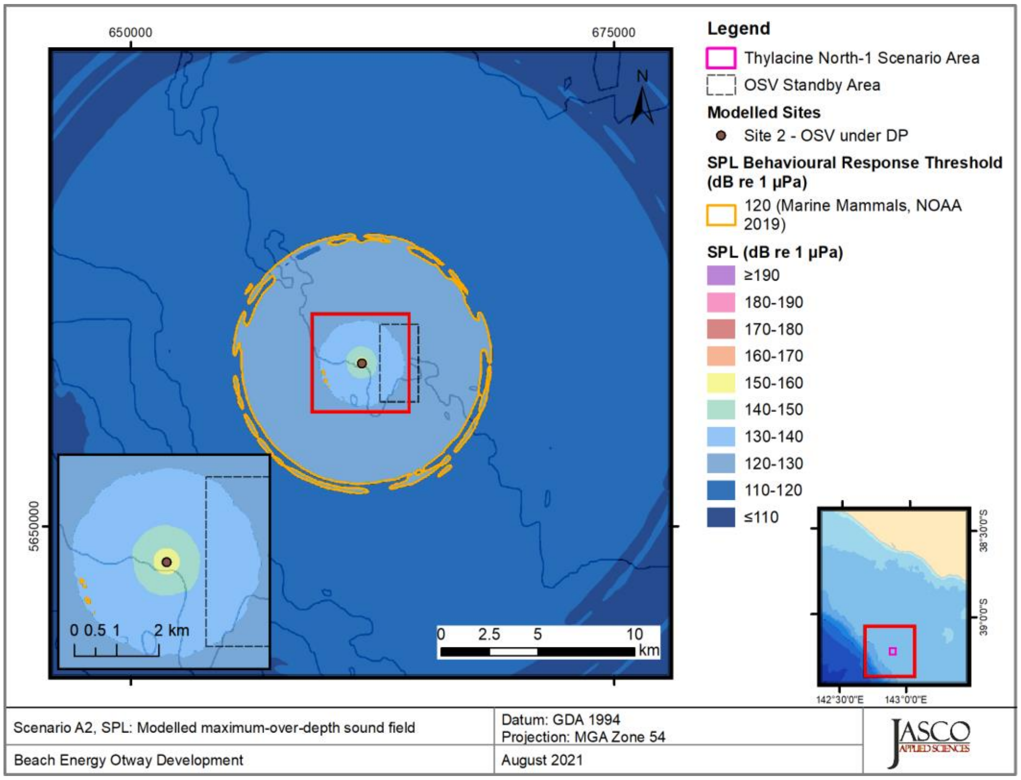

Figure 5. *Thylacine North-1, OSV on DP (Scenario A2) :* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

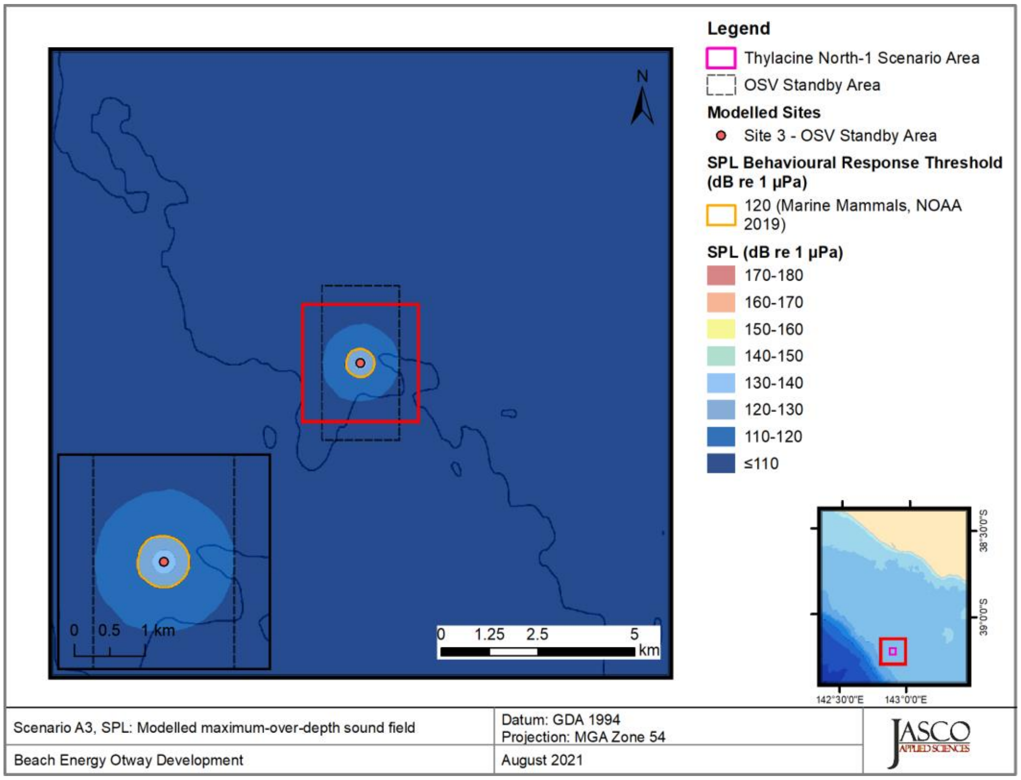

Figure 6. *Thylacine North-1, OSV Standby (Scenario A3) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

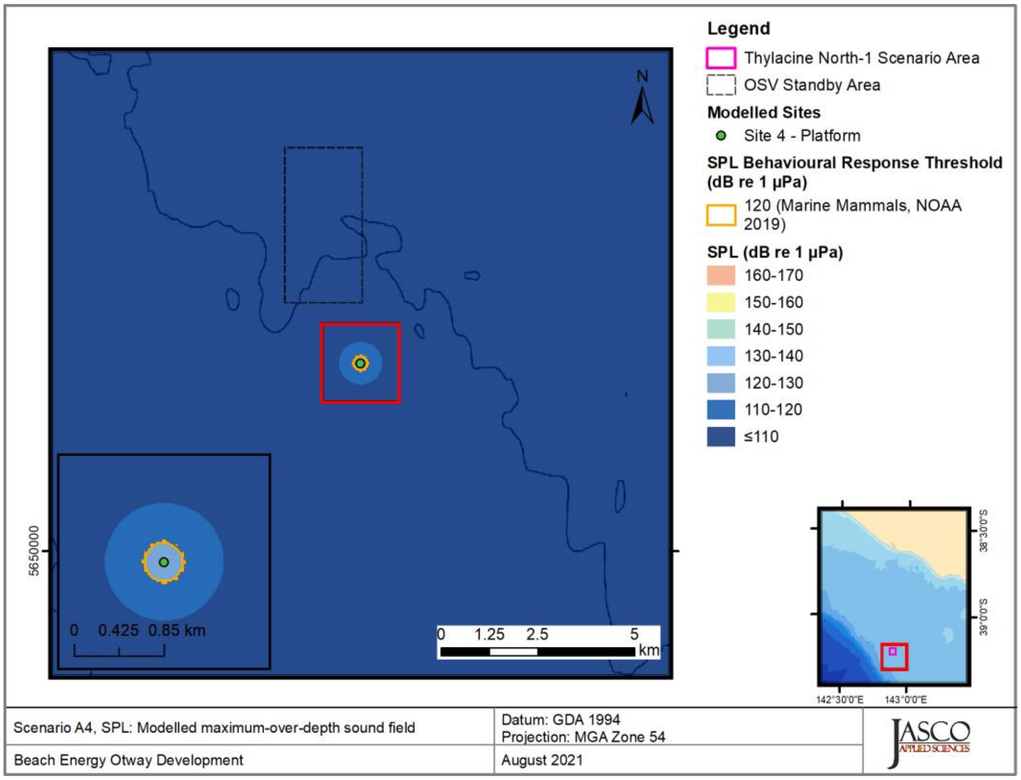

Figure 7. *Thylacine A, Platform Operations (Scenario A4) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

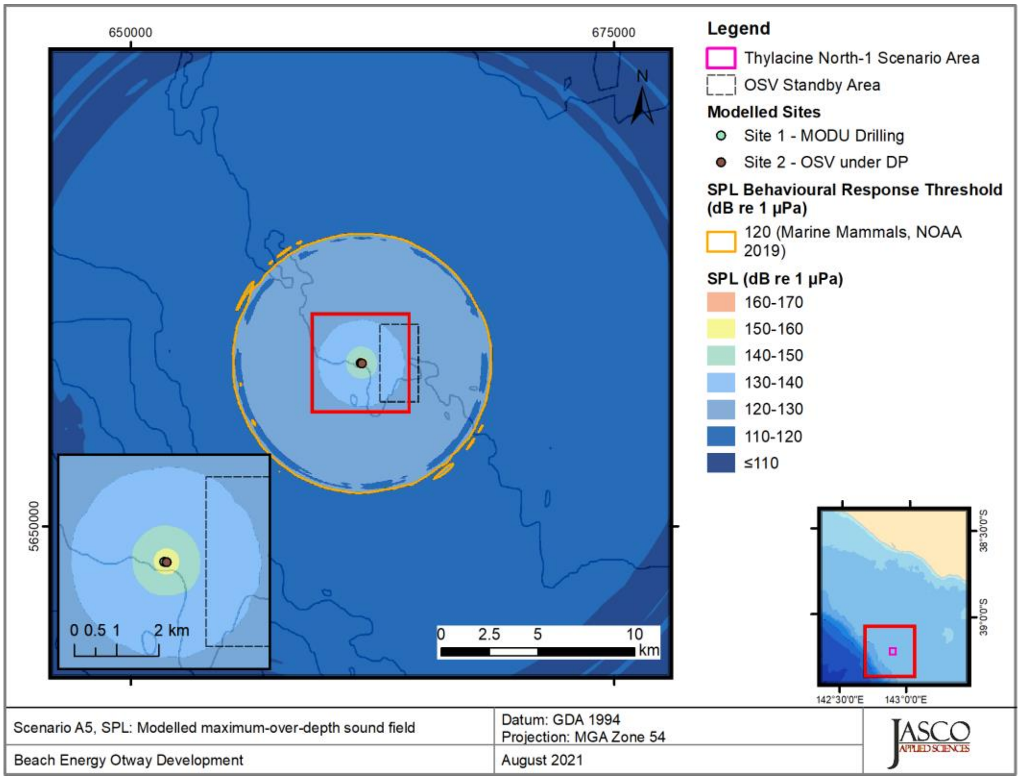

Figure 8. *Thylacine North-1, MODU Drilling and OSV Resupply (Scenario A5) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

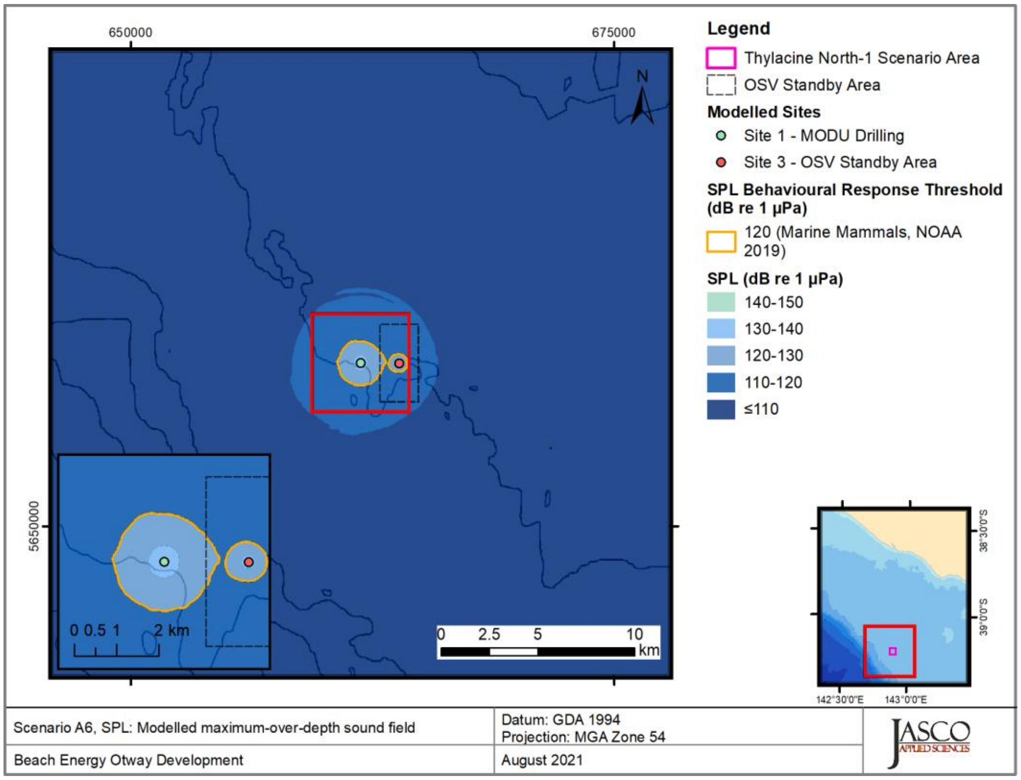

Figure 9. *Thylacine North-1, MODU Drilling and OSV Standby (Scenario A7) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

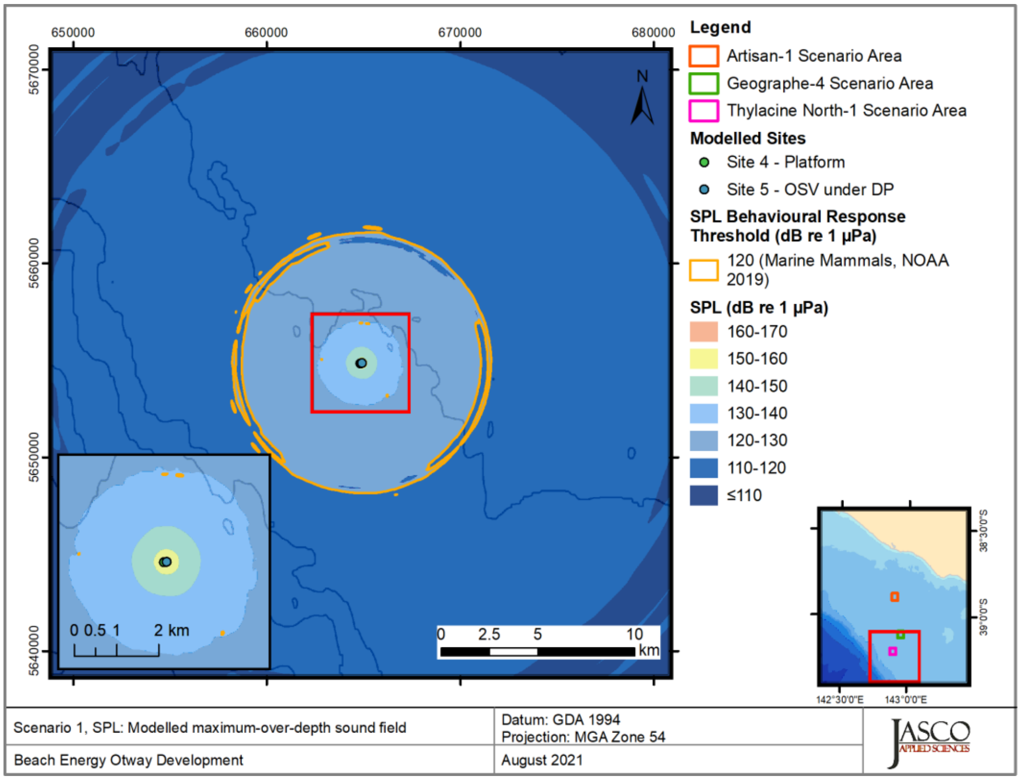

Figure 10. *Thylacine A Platform, Platform Resupply (Scenario 1) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

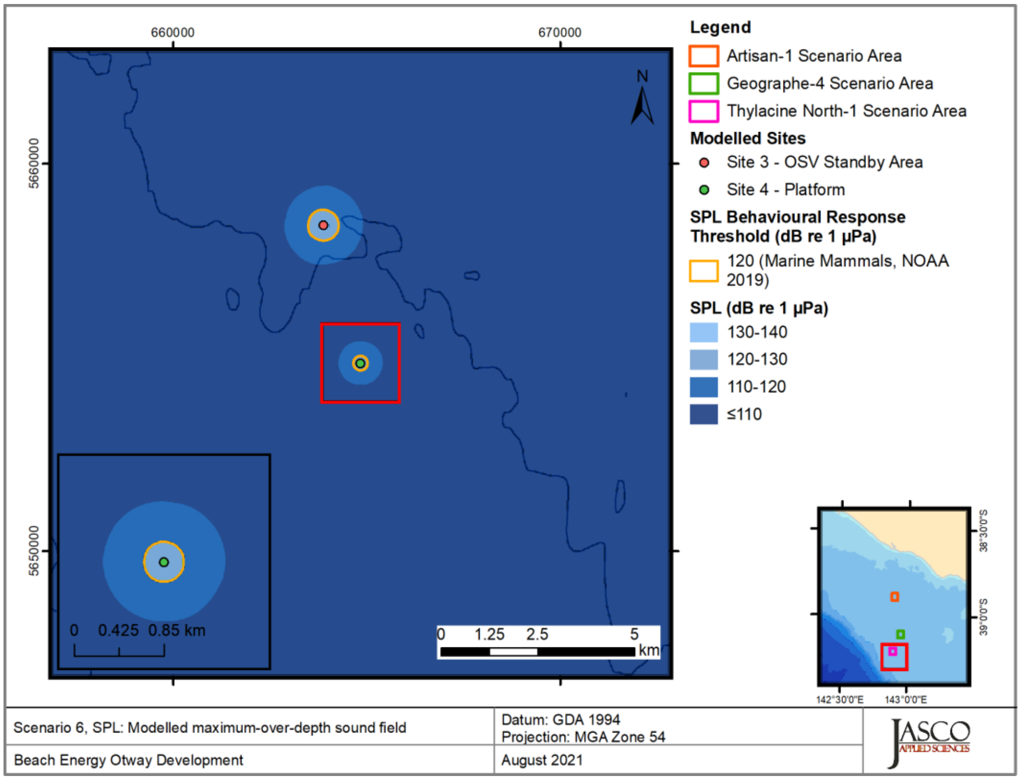

Figure 11. *Thylacine A Platform, OSV standby (Scenario 6) SPL :* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

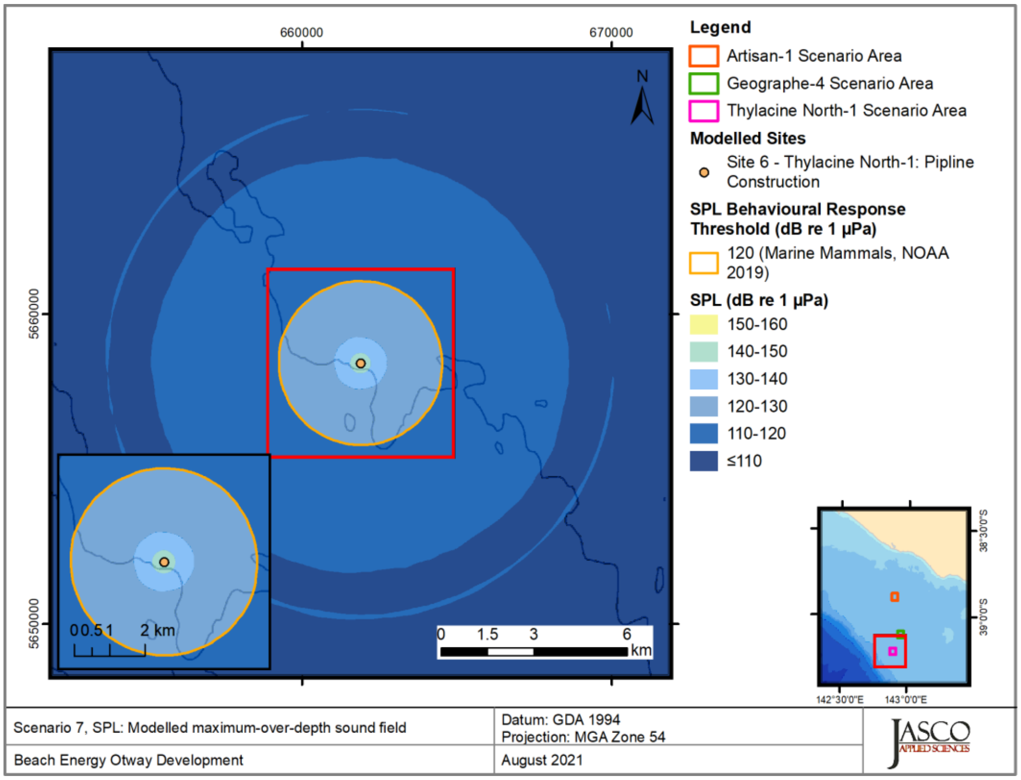

Figure 12. *Thylacine North-1, PLV stationary 20% MCR -June (Scenario 7) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

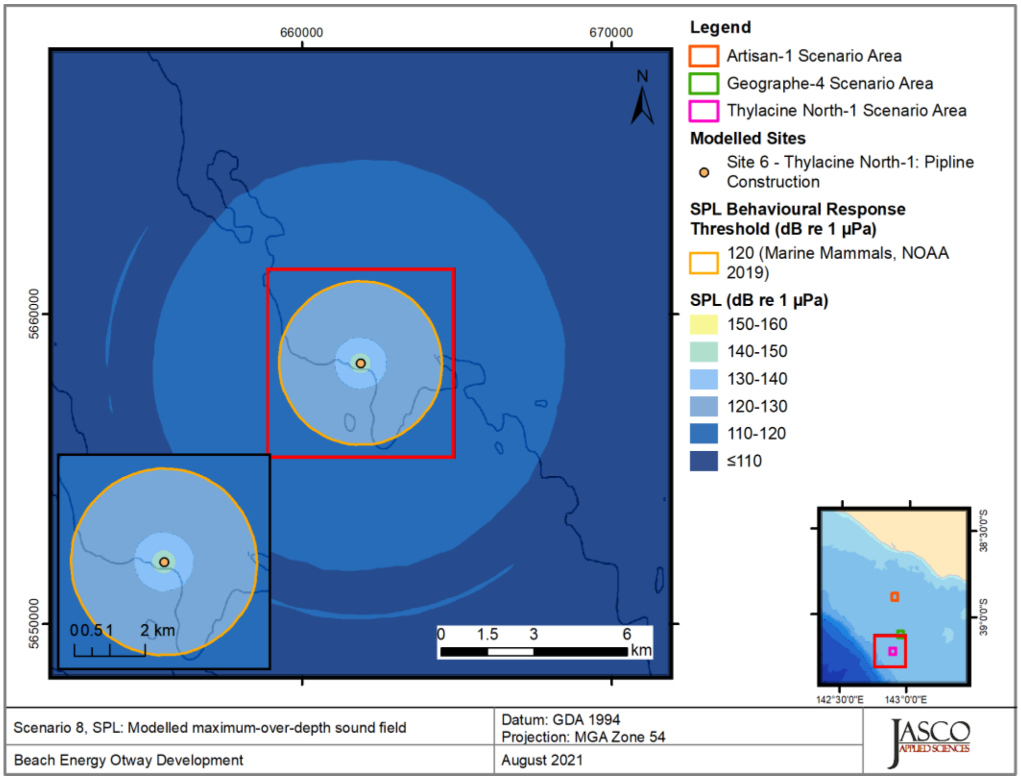

Figure 13. *Thylacine North-1, PLV stationary 20% MCR -November (Scenario 8) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

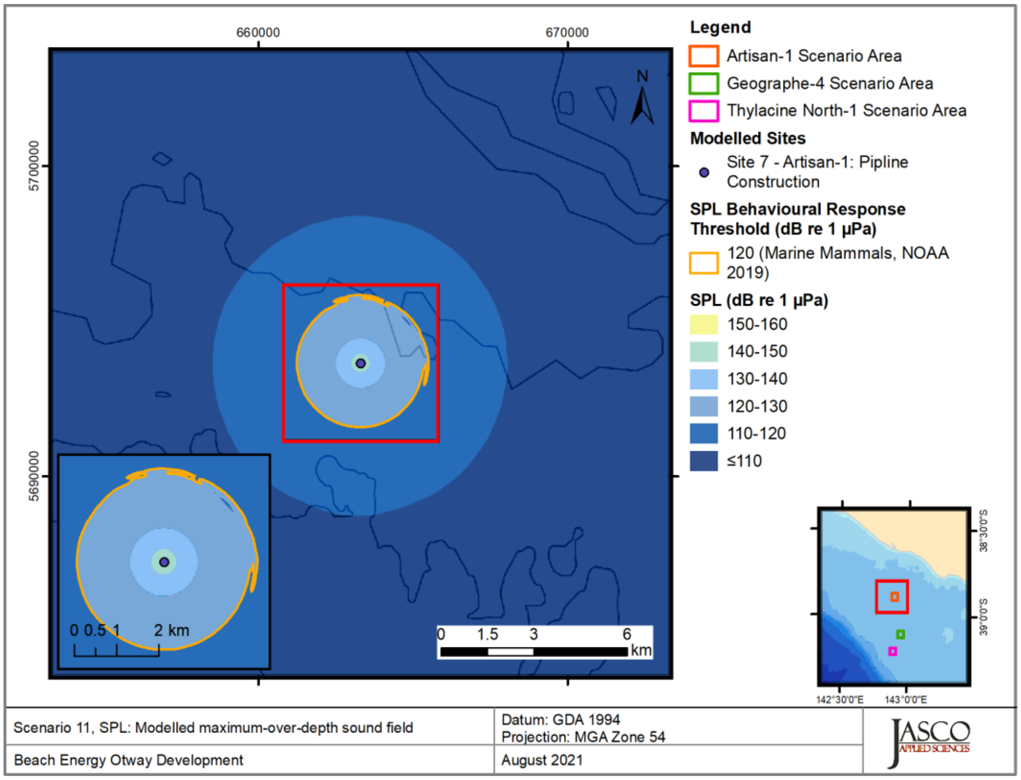

Figure 14. *Artisan-1, PLV stationary 20% MCR -June (Scenario 11) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

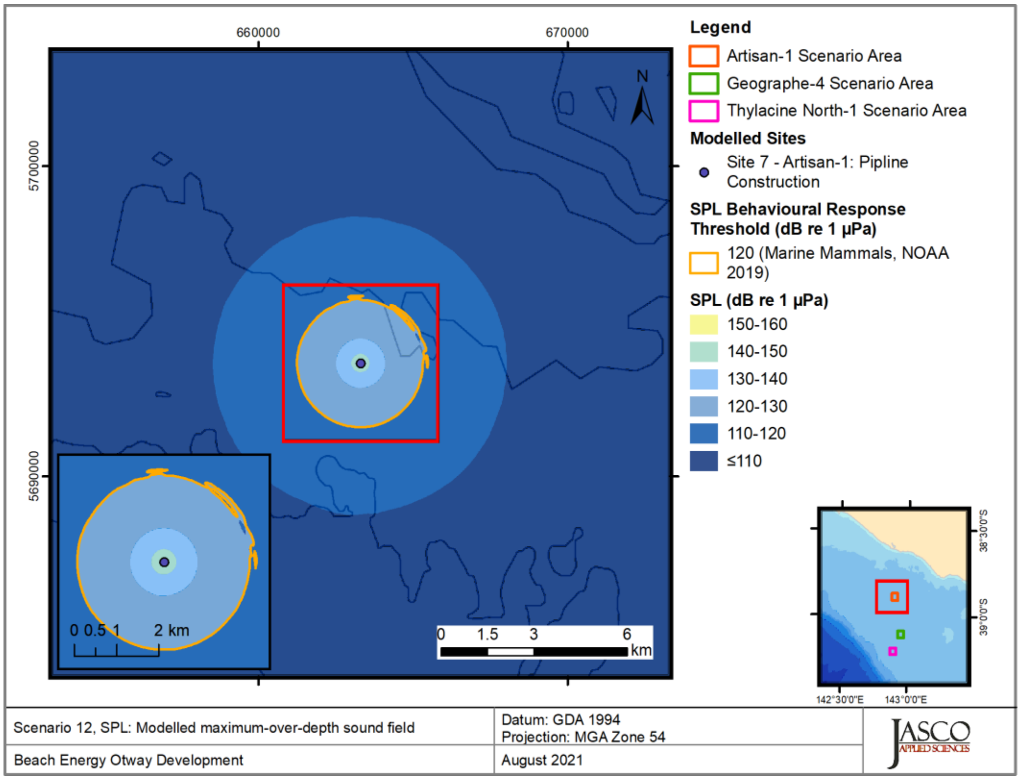

Figure 15. *Artisan-1, PLV stationary 20% MCR - November (Scenario 12) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

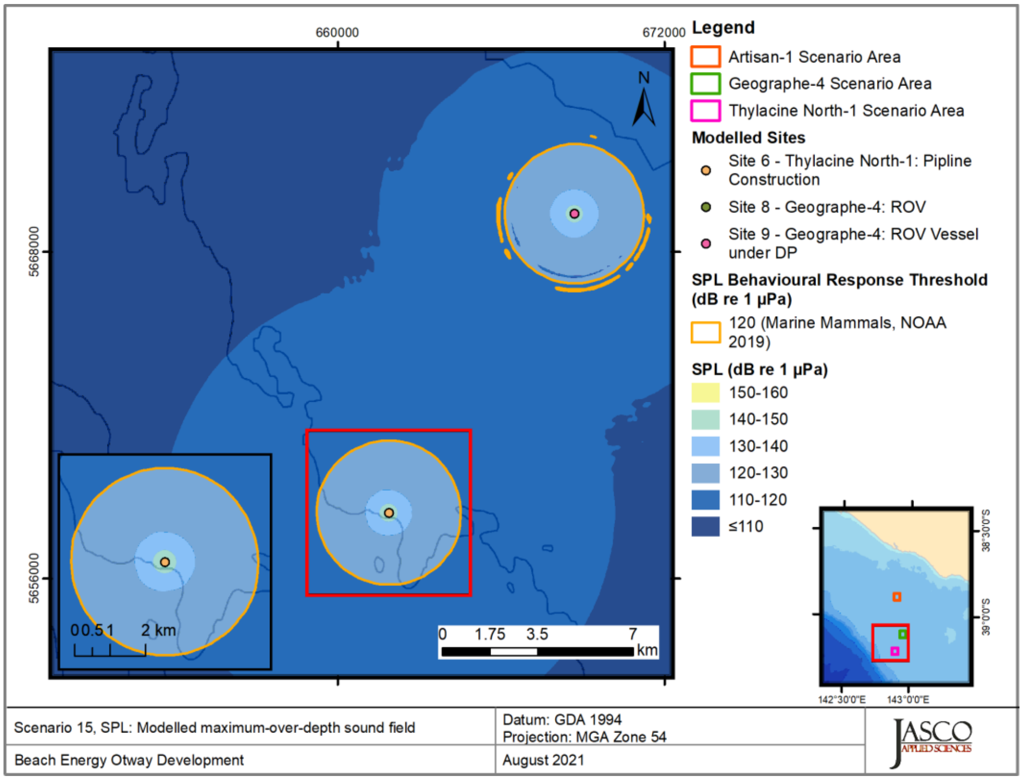

Figure 16. *Thylacine North-1, PLV stationary and ROV operations at Geographe-4 (20% MCR) - June (Scenario 15) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is s hown as an orange contour line.

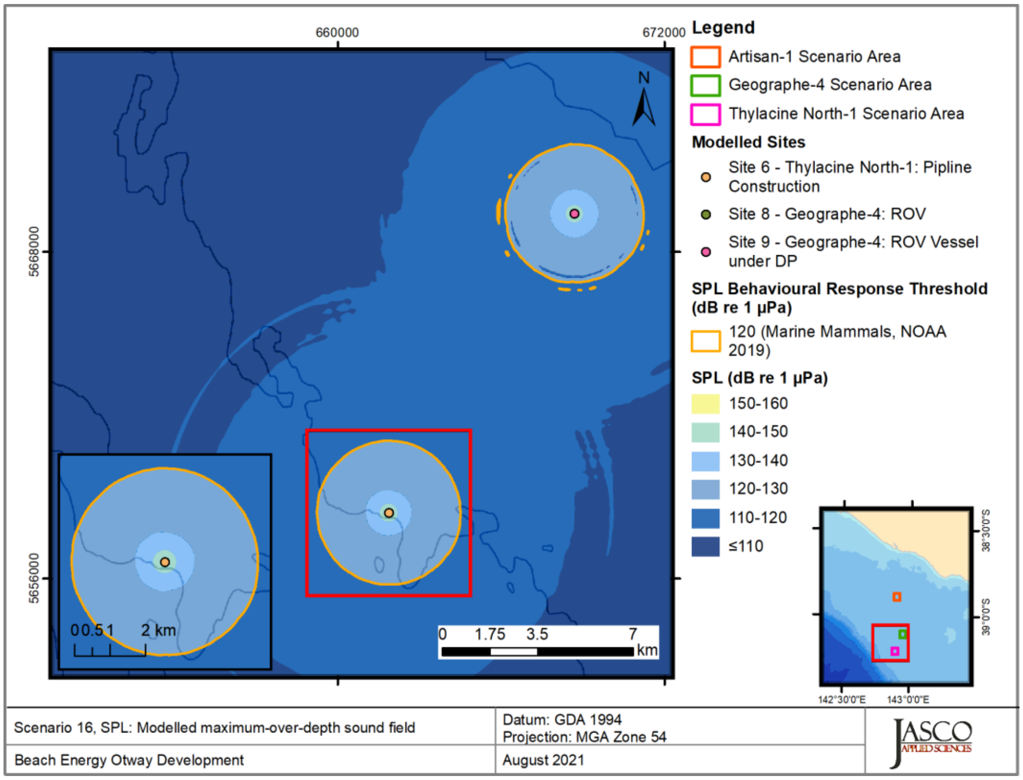

Figure 17. *Thylacine North-1, PLV stationary and ROV operations at Geographe-4 (20% MCR) – November (Scenario 16) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

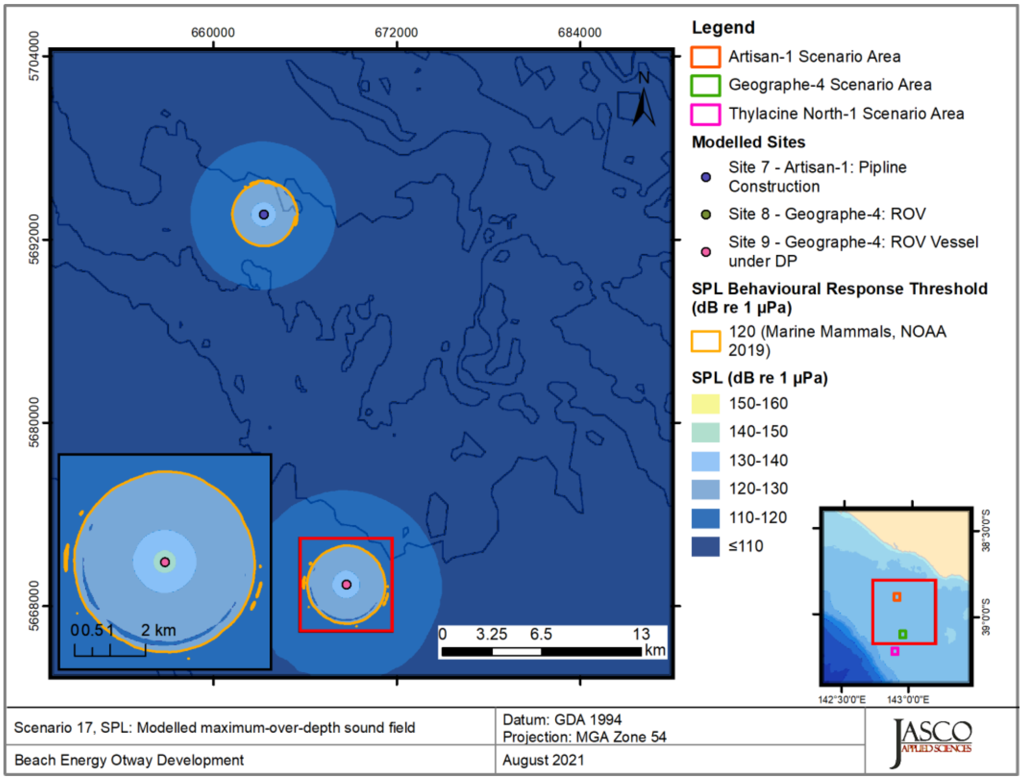

Figure 18. *Artisan-1, PLV stationary and ROV Operations at Geographe-4 (20% MCR) – June (Scenario 17) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

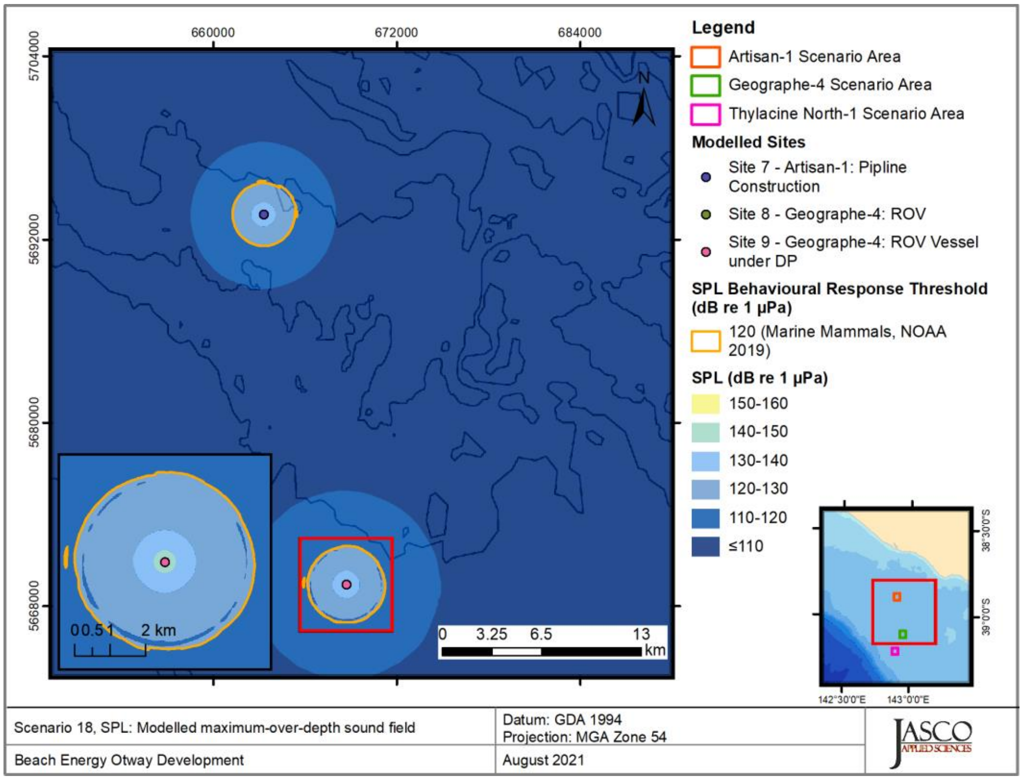

Figure 19. *Artisan-1, PLV stationary and ROV Operations at Geographe-4 (20% MCR) – November (Scenario 18) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

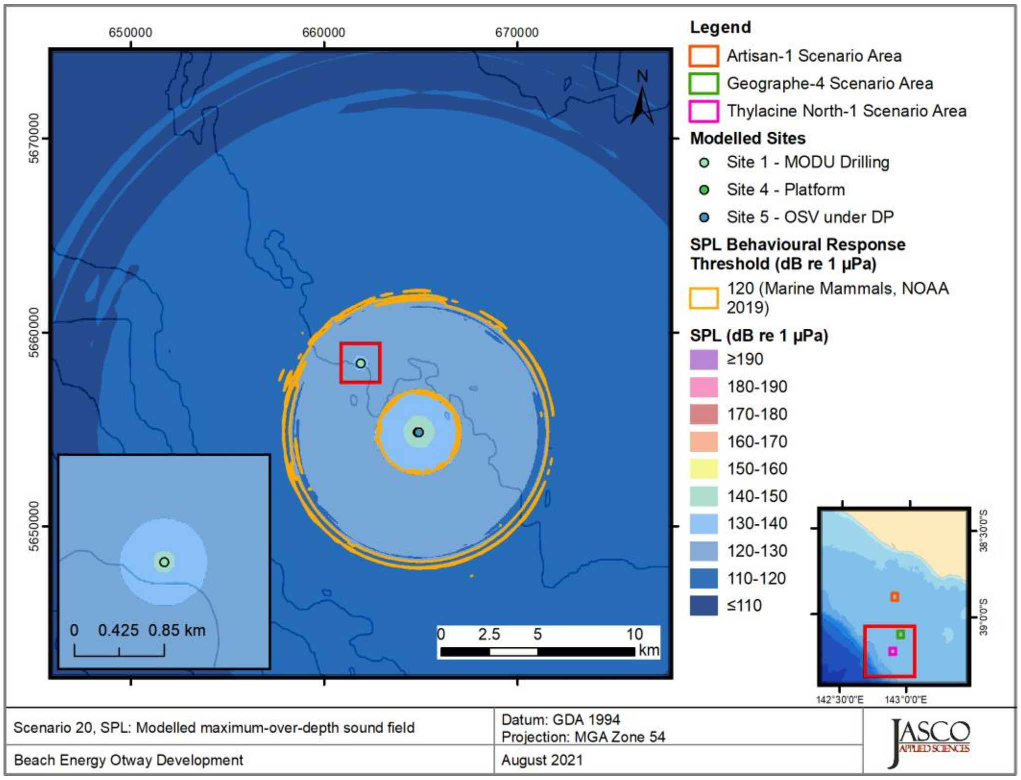

Figure 20. *Thylacine A Platform, Platform Resupply and MODU Drilling (Scenario 20) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

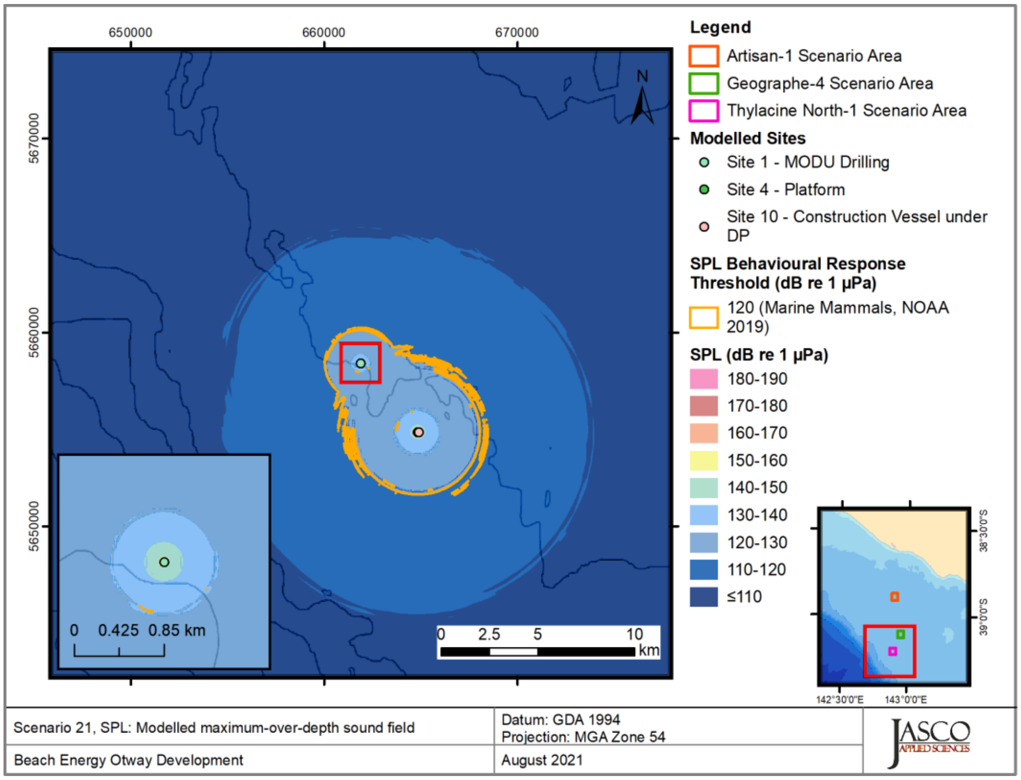

Figure 21. *Thylacine A Platform, Platform operations and skid installation* at 20% MCR *(Scenario 21) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

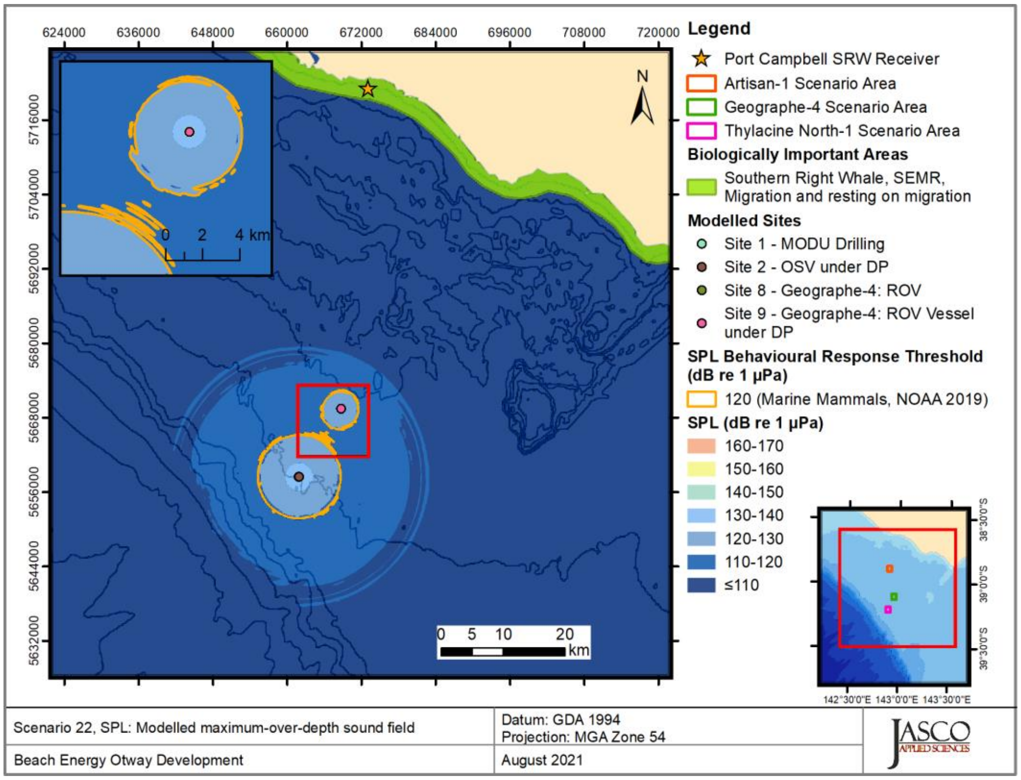

Figure 22. *Concurrent drilling operations at Thylacine North-1 and construction operations (20% MCR) at Geographe-4 (Scenario 22) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

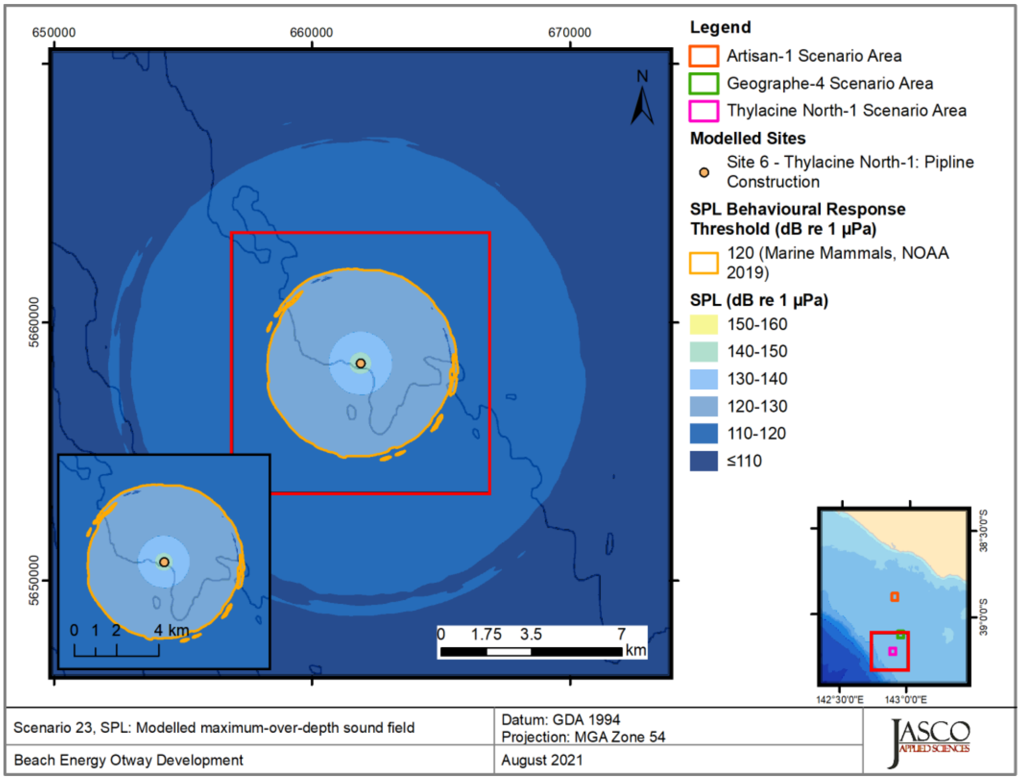

Figure 23. *Thylacine North-1, PLV stationary 40% MCR -June (Scenario 23) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

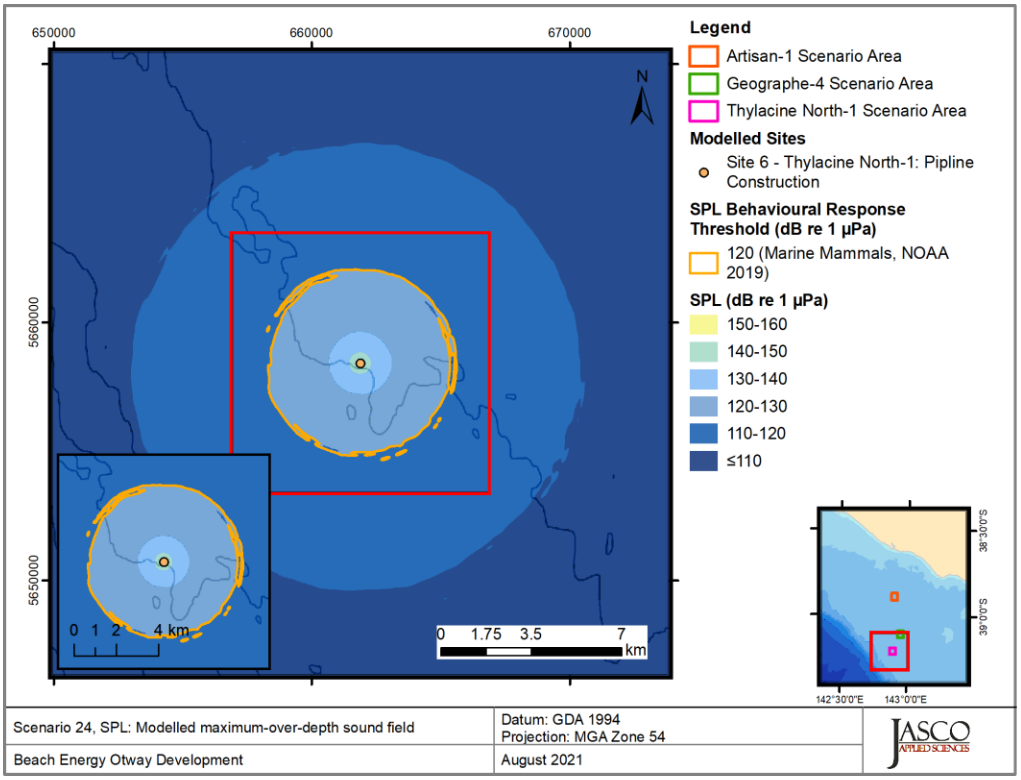

Figure 24. *Thylacine North-1, PLV stationary 40% MCR -November (Scenario 24) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

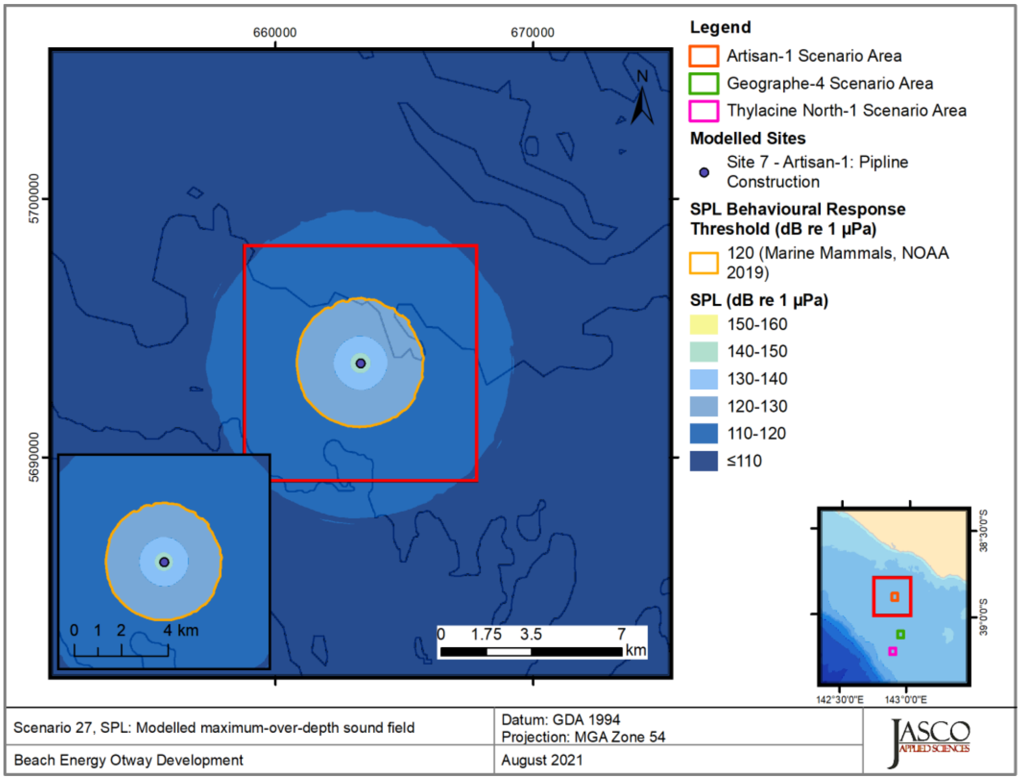

Figure 25. *Artisan-1, PLV stationary 40% MCR -June (Scenario 27) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

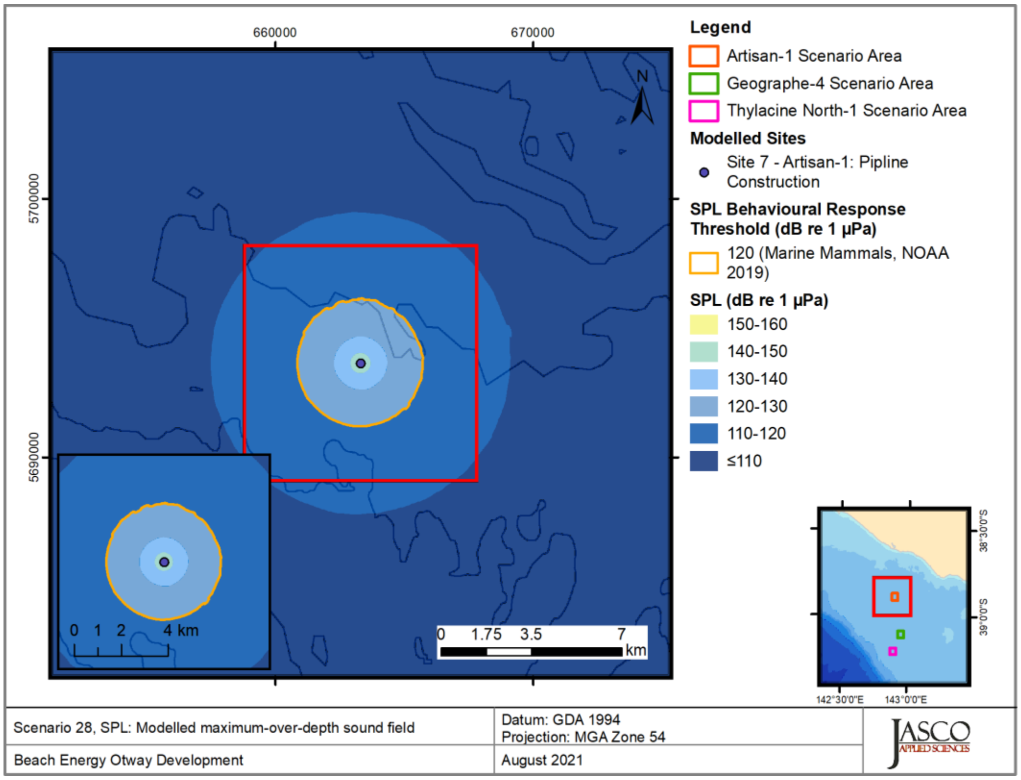

Figure 26. *Artisan-1, PLV stationary 40% MCR -November (Scenario 28) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

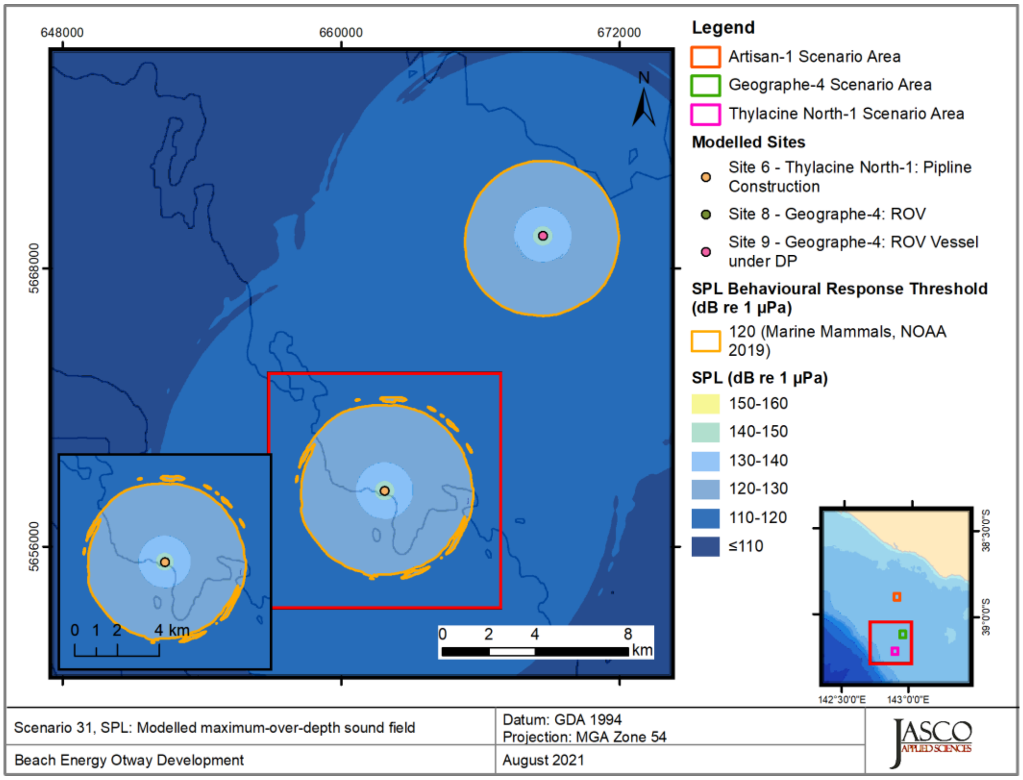

Figure 27. *Thylacine North-1, PLV stationary 40% MCR and ROV operations at Geographe-4 - June (Scenario 31) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

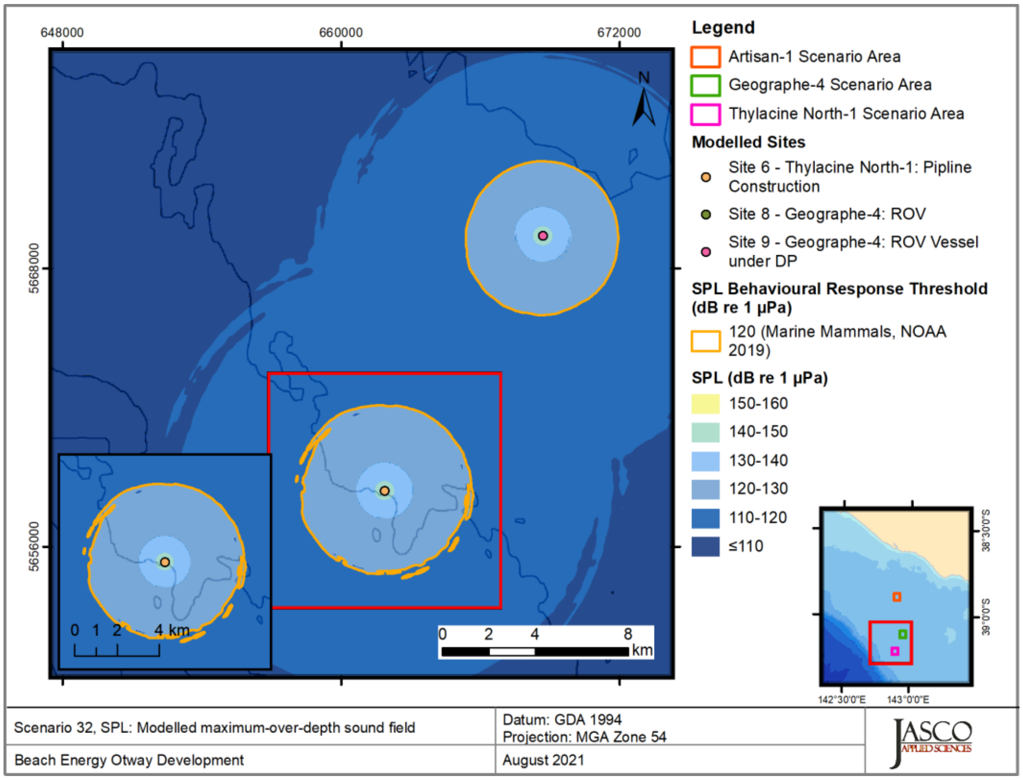

Figure 28. *Thylacine North-1, PLV stationary 40% MCR and ROV operations at Geographe-4 – November (Scenario 32) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

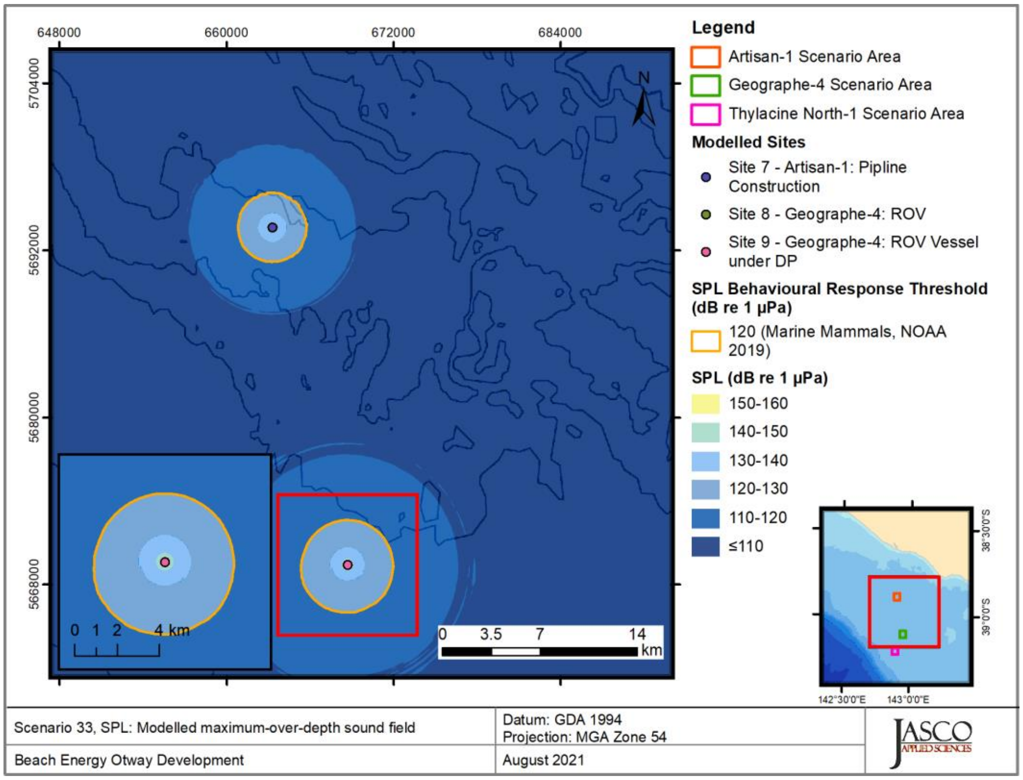

Figure 29. *Artisan-1, PLV stationary 40% MCR and ROV Operations at Geographe-4 – June (Scenario 33) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

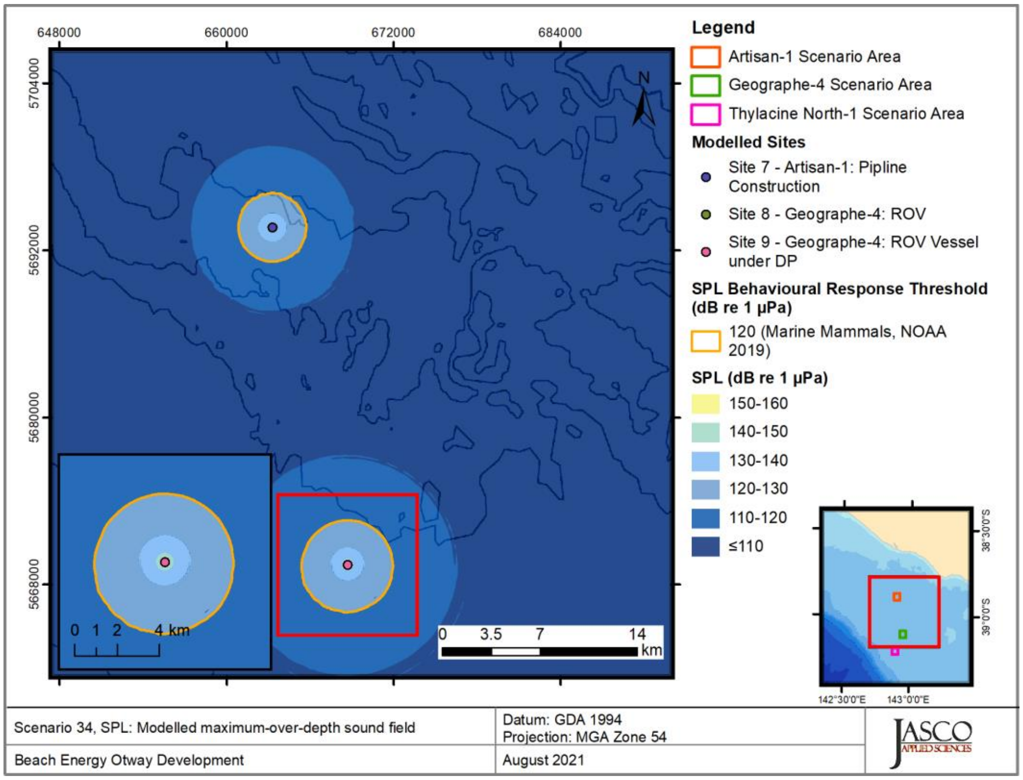

Figure 30. *Artisan-1, PLV stationary 40% MCR and ROV Operations at Geographe-4 – November (Scenario 34) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

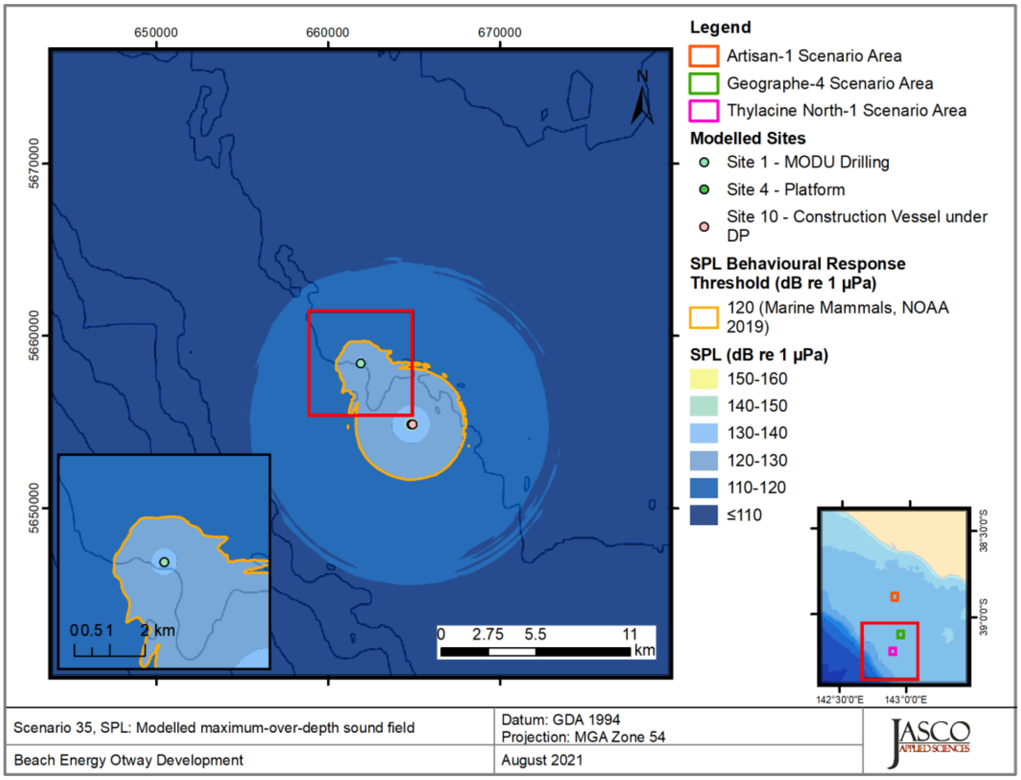

Figure 31. *Thylacine A Platform, Platform operations and skid installation at 40% MCR (Scenario 35) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

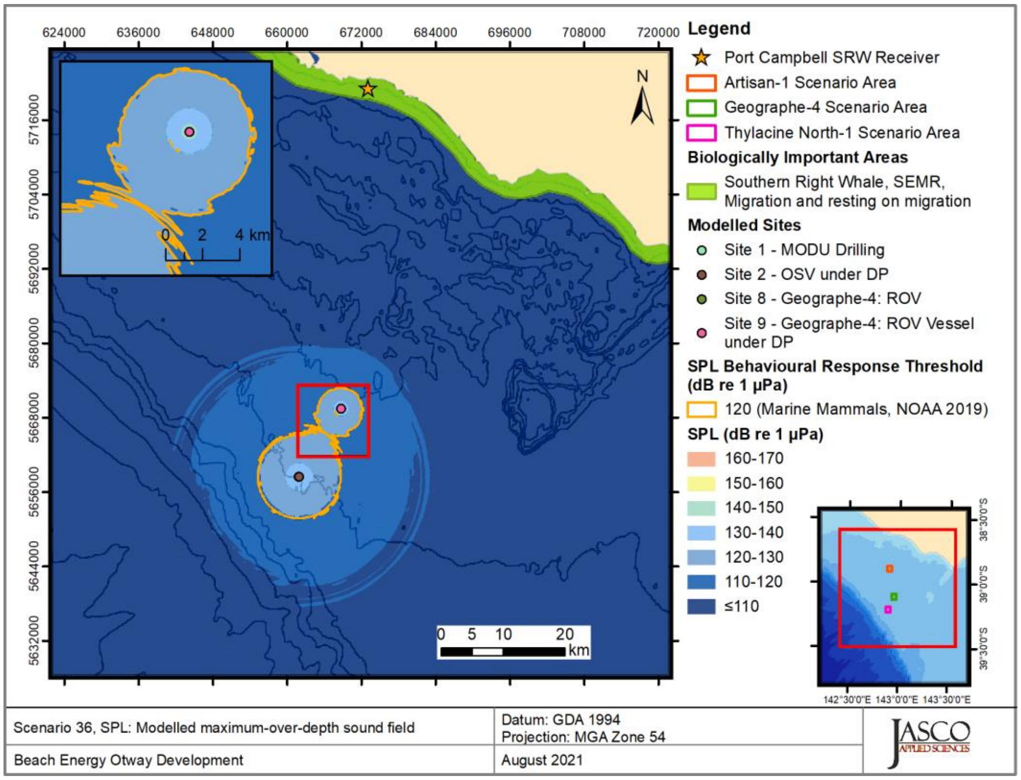

Figure 32. *Concurrent drilling operations at Thylacine North-1 and construction operations (40% MCR) at Geographe-4 (Scenario 36) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

4.2.2. Accumulated SEL_{24h} Maps

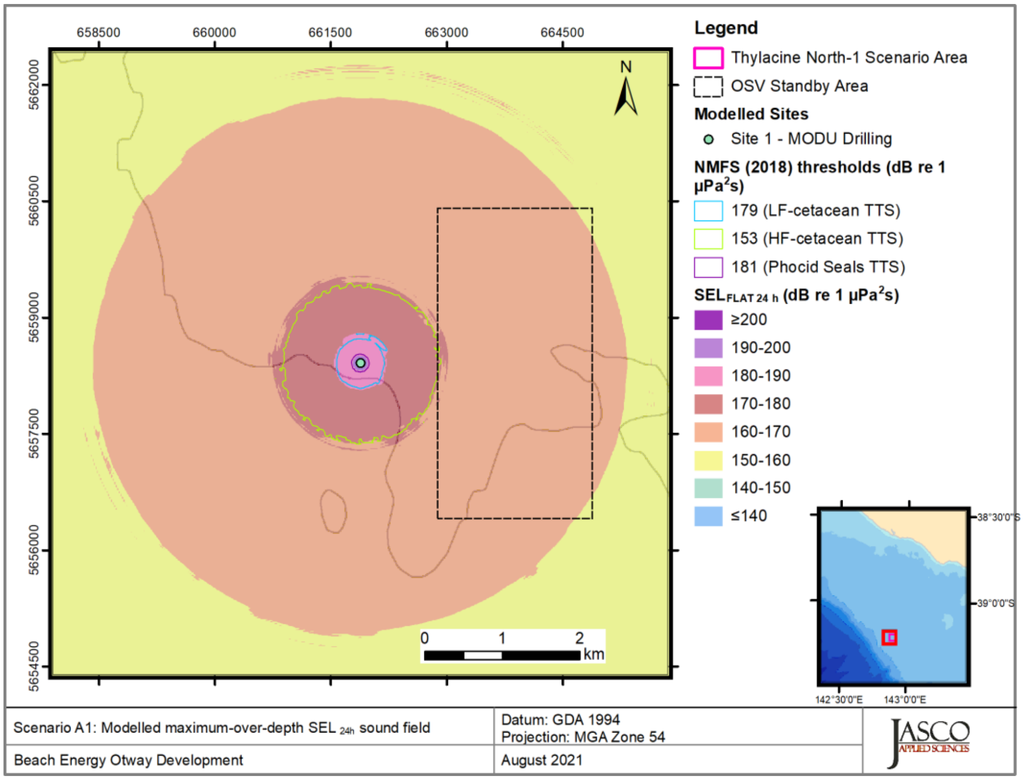

Figure 33. *Thylacine North-1, MODU Drilling (Scenario A1) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

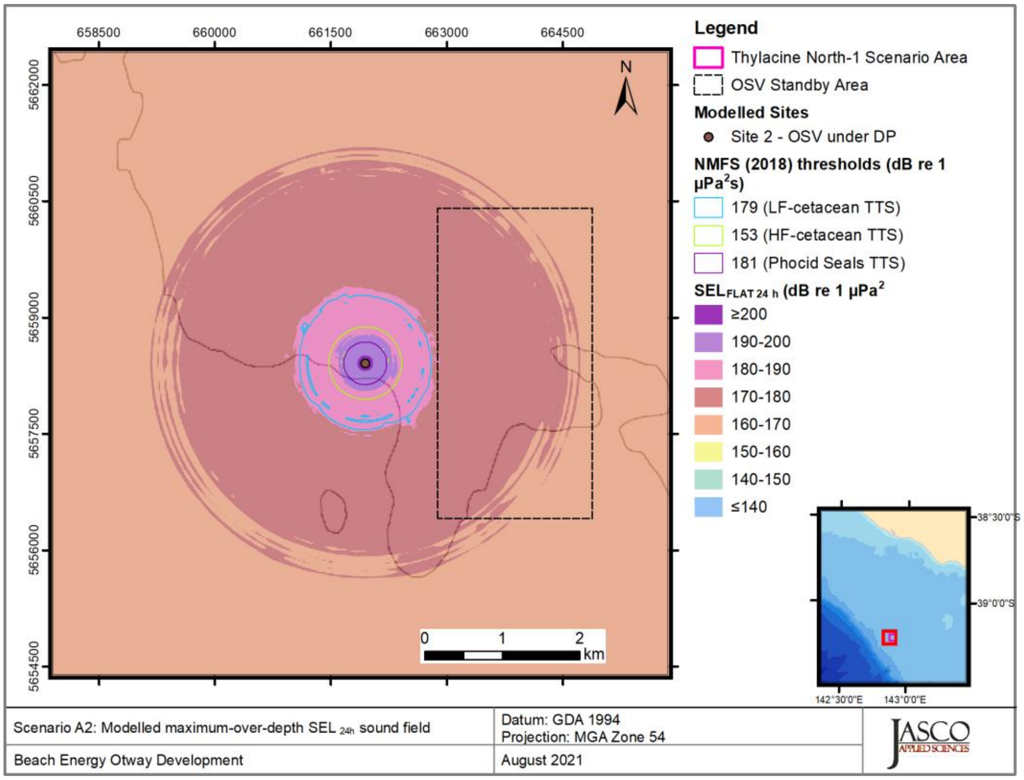

Figure 34. *Thylacine North-1, OSV on DP (4h) (Scenario A2) SEL$_{24h}$*: Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

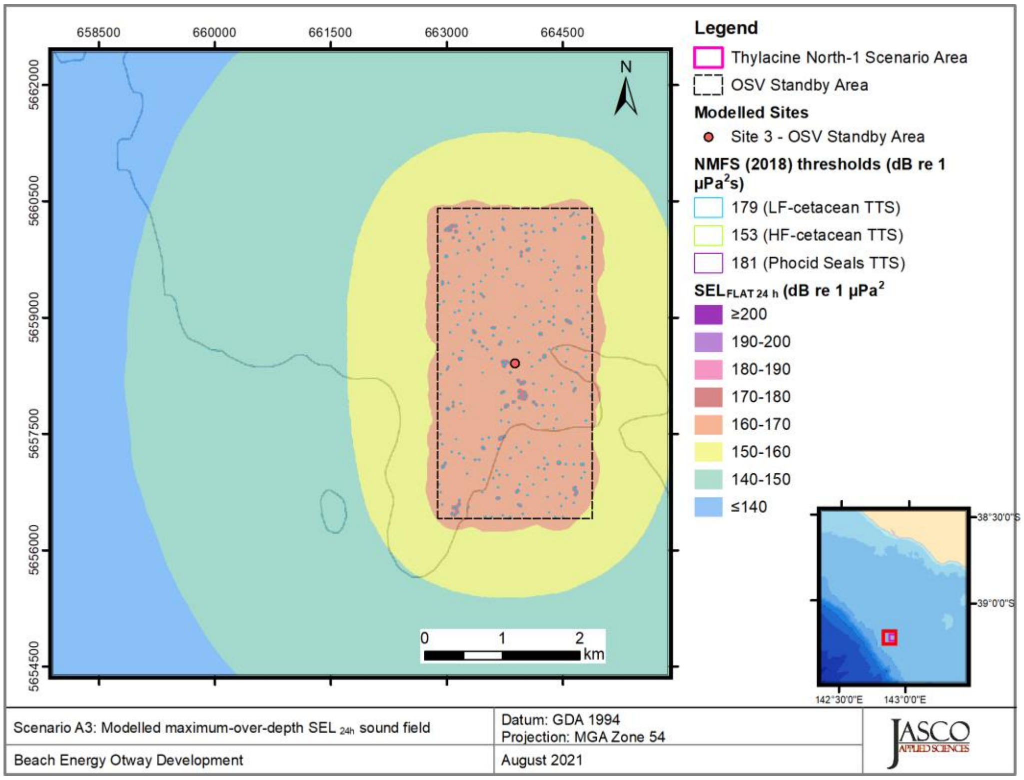

Figure 35. *Thylacine North-1, OSV Standby (Scenario A3) SEL$_{24h}$*: Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

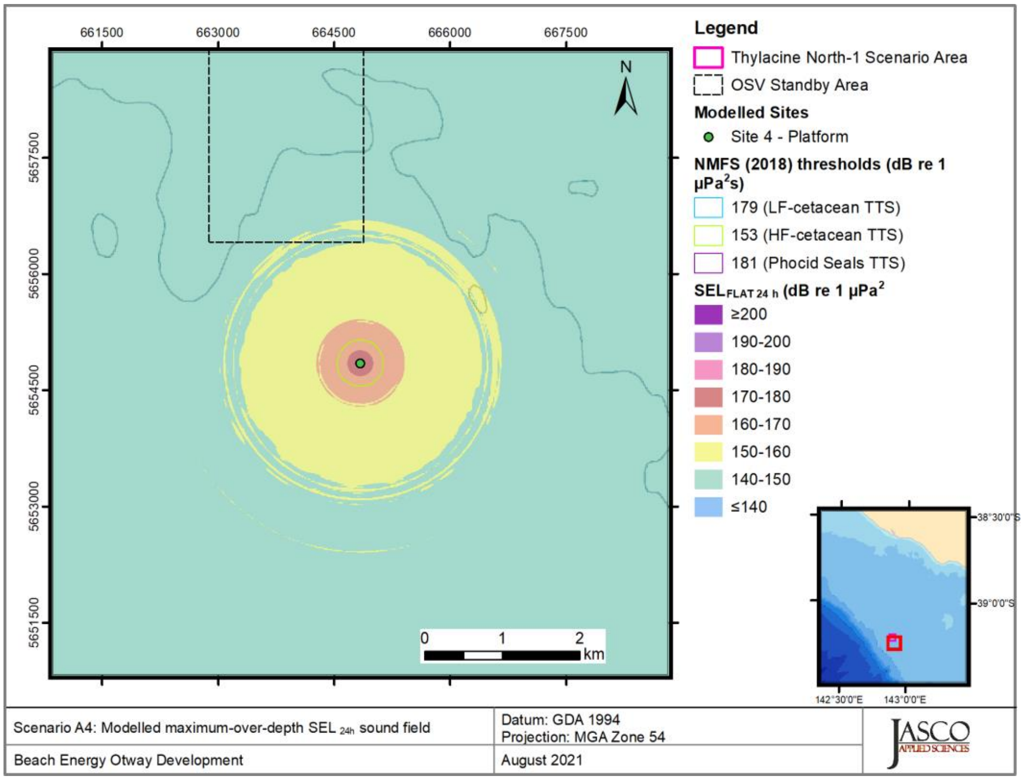

Figure 36. *Thylacine A, Platform Operations (Scenario A4) SEL$_{24h}$*: Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

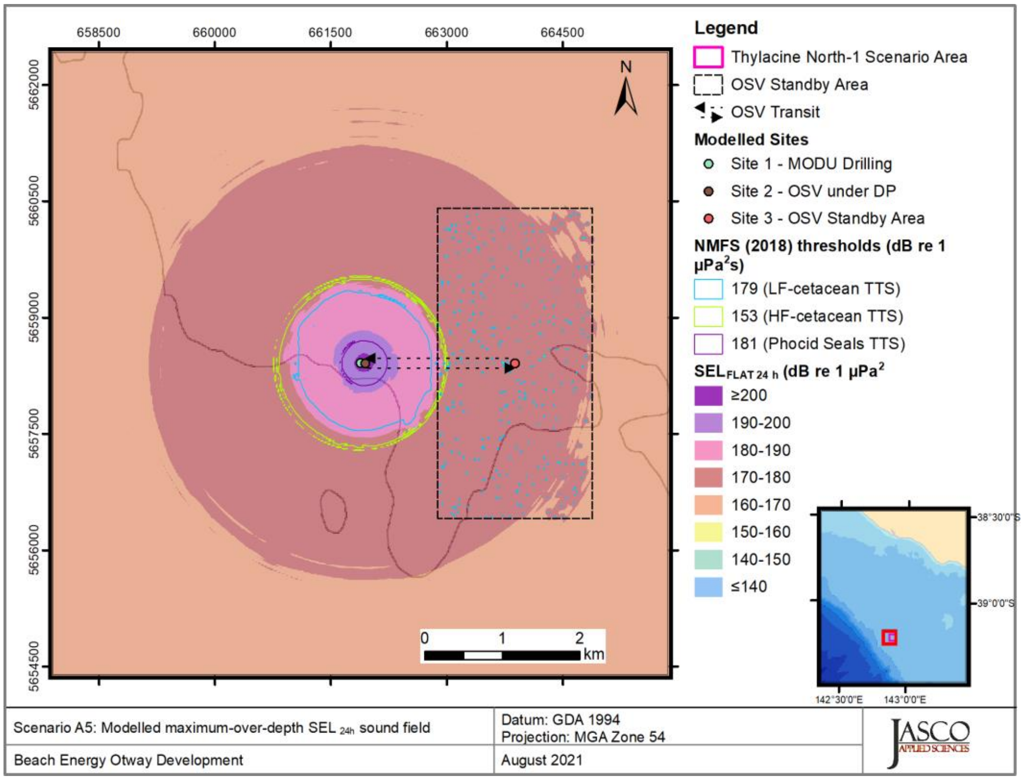

Figure 37. *Thylacine North-1, MODU 4h Resupply Operations (Scenario A5) SEL$_{24h}$*: Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

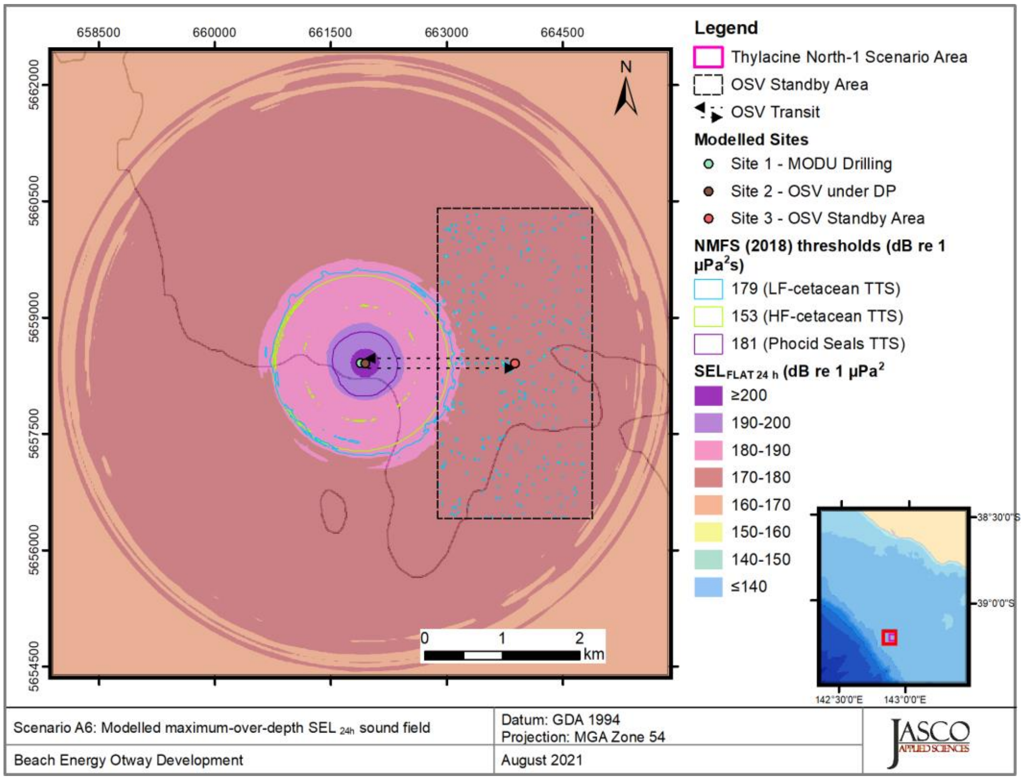

Figure 38. *Thylacine North-1, MODU 8h Resupply Operations (Scenario A6) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.*SEL24h:*

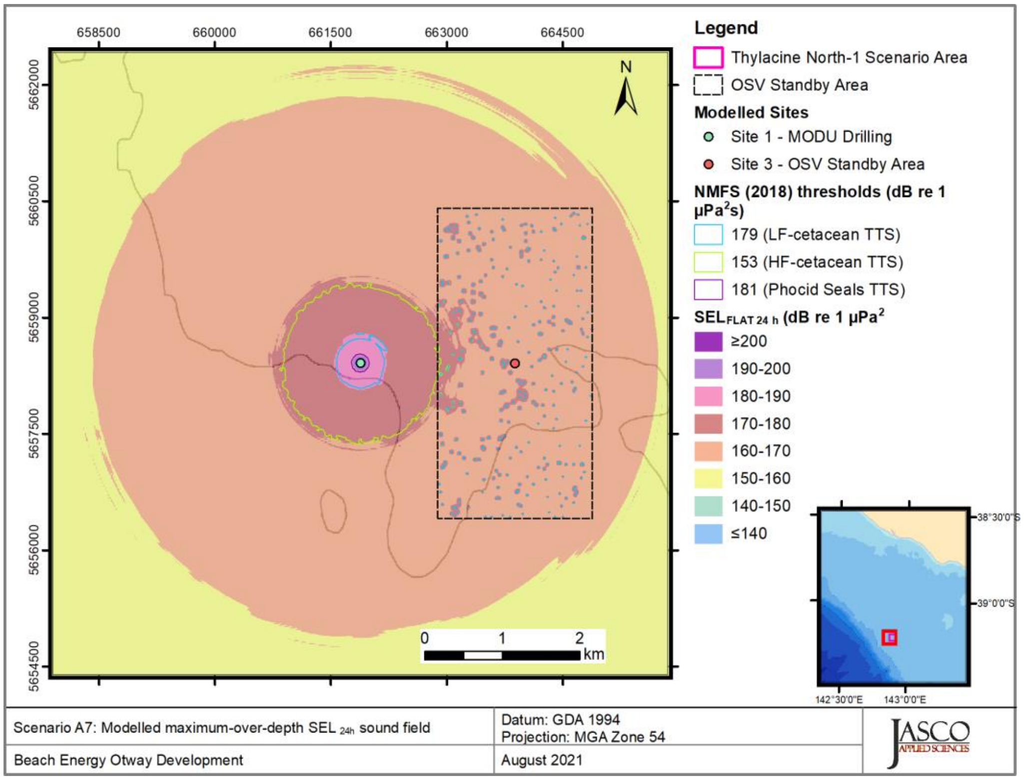

Figure 39. *Thylacine North-1, MODU Drilling and OSV standby (Scenario A7) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

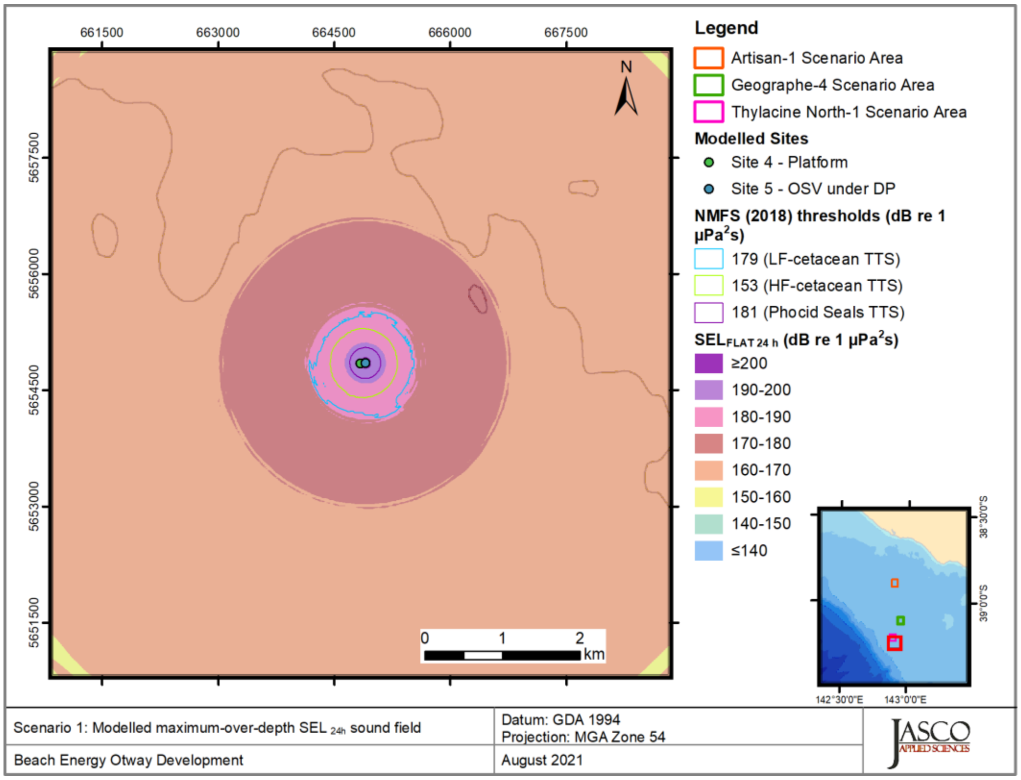

Figure 40. *Thylacine A Platform, 2 h Platform Resupply (Scenario 1) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

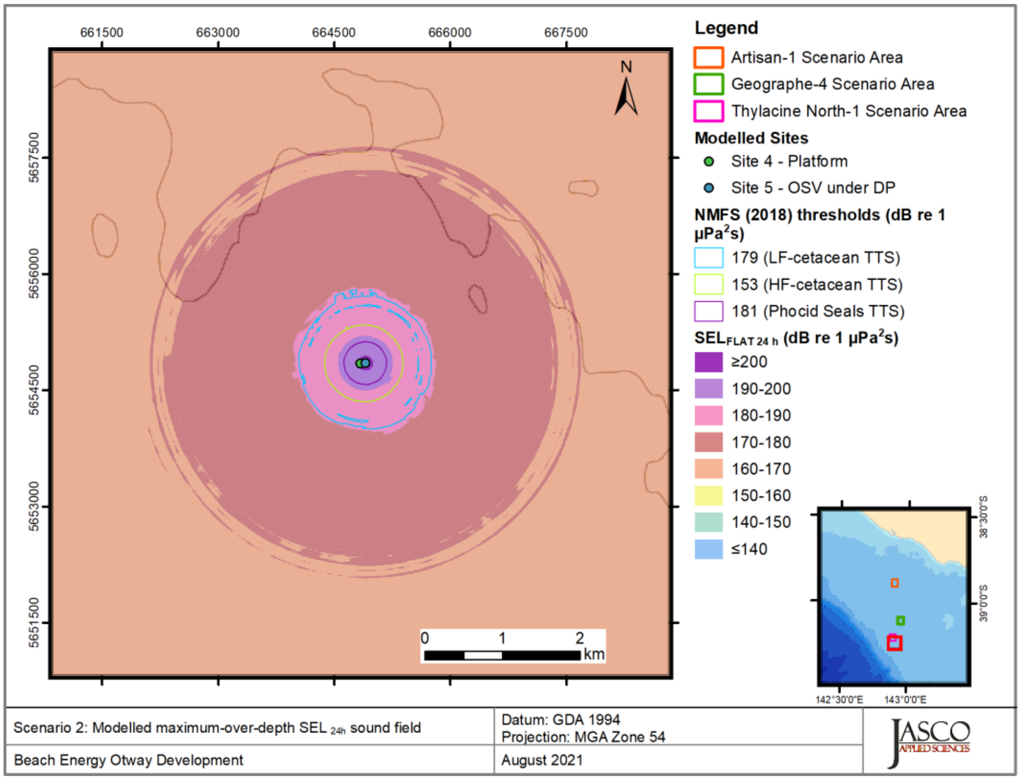

Figure 41. *Thylacine A Platform, 4 h Platform Resupply (Scenario 2) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

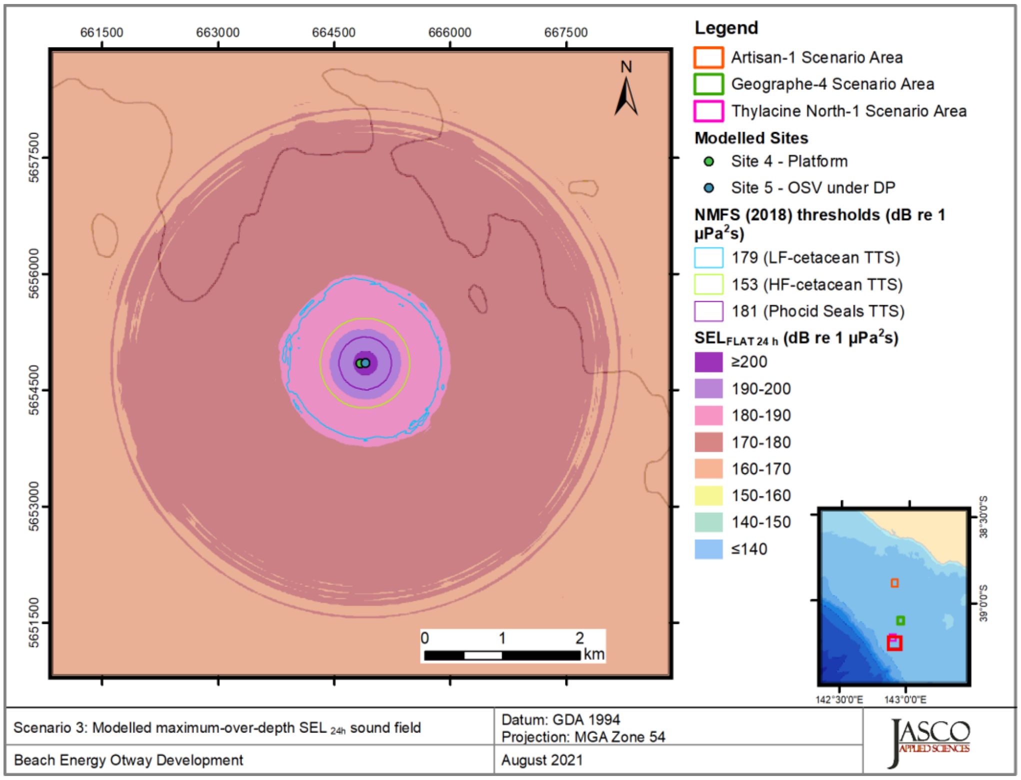

Figure 42. *Thylacine A Platform, 6 h Platform Resupply (Scenario 3) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

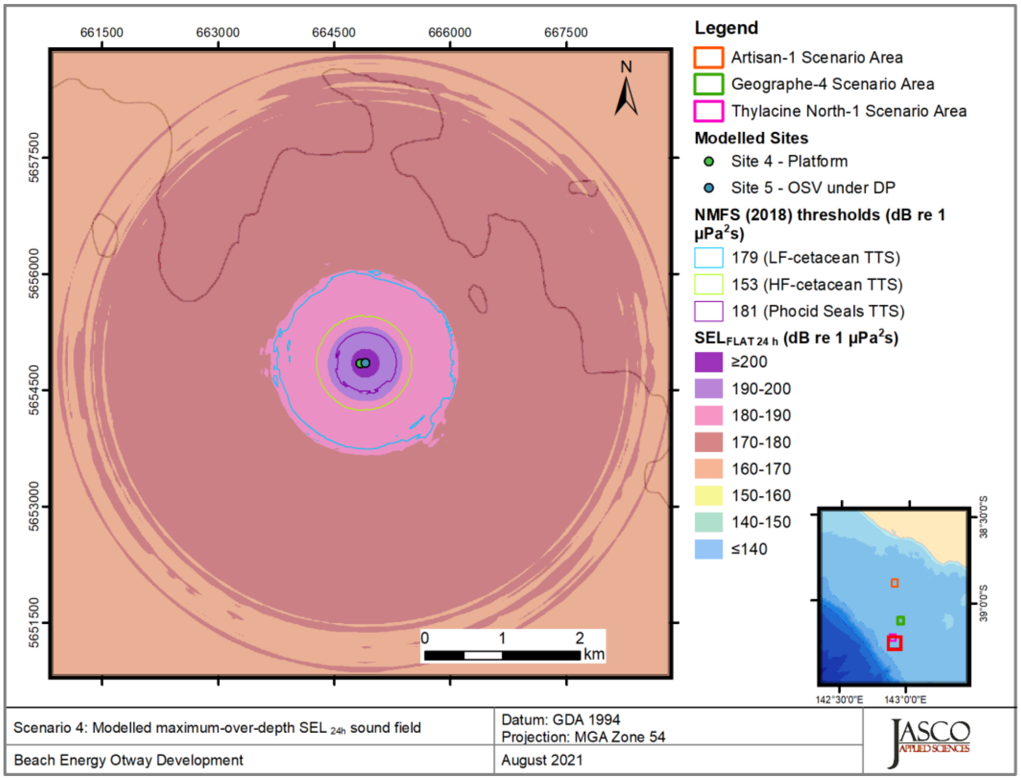

Figure 43. *Thylacine A Platform, 8 h Platform Resupply (Scenario 4) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

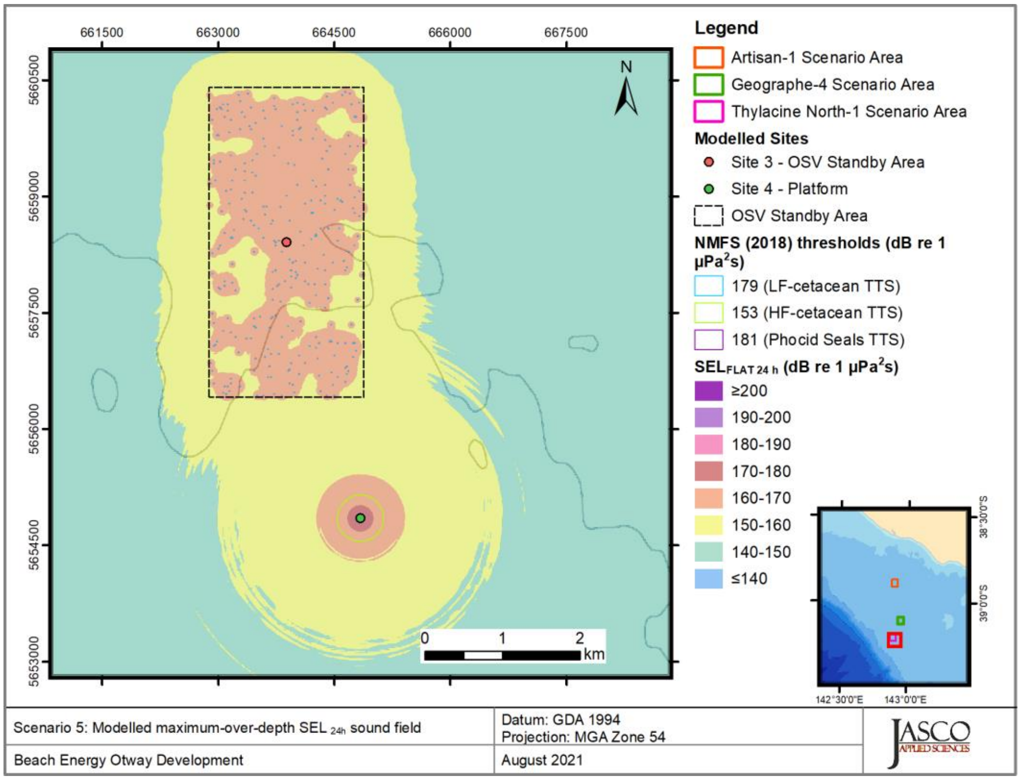

Figure 44. *Thylacine A Platform, 8h OSV standby (Scenario 5) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. 5. Discussion

The approach applied here to model the propagation loss was based is suitable for other locations within the continental shelf portion of the Otway Basin because it is supported by measurements of very similar operational activities (McPherson et al. 2021). However, the accuracy of the modelling propagation loss within this environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on the calcarenite seabed within Otway region. In general, for these types of sources (i.e., vessels and other sources with a significant amount of energy above a few hundred Hertz) the thinner the sand layer, the greater the propagation loss. Having accurate source and site-specific information reduces the amount of uncertainty results due to model inputs uncertainty particularly when seemingly small changes in parametrisation can have reasonable significant changes in predicted results.

The distances to the effect thresholds based on modelling conducted here and supported by the results of the measurement study McPherson et al. (2021) are generally smaller when compared to those originally presented in Koessler et al. (2020). The understanding of the environment gained through the measurement study allowed for the geological environment to be represented in a site-specific fashion, and a more appropriate configuration of numerical models to represent the environmental propagation loss particularly with the layered calcarenite seabed. The application of the revised modelling approach to represent other Beach Energy activities on the continental shelf of the Otway Basin would be appropriate.

The maximum-over-depth sound field maps presented above show a few instances where threshold contours form concentric ‘rings’ around a source. These are likely the product of propagation interference patterns and the calculations method to account for the loss associated with the cemented limestone seabed (Section 6.2 in McPherson et al. (2021)). Variations in the sound field can produce local maxima and minima in loss which can results in specific levels dipping below thresholds before reaching a maximum extent. Moreover, the near constant bathymetry around most sources produces axial symmetry around a given source. Together these two factors can form the observed 'rings'. Nevertheless, the maximum extent of these contours and associated tabulated radii are a valid prediction of the effect ranges that can be expected from the modelled operations.

The effect of different seasonality on predicted distances to the effect thresholds was minor but present. Considering the modelled Otway Offshore Project Construction scenarios, each scenario was modelled with a sound speed profiles for the 'worst case over the year' and for a period pygmy blue whales are present in the region, between November and January. These sound speed profiles were respectively selected as June and November. The effect thresholds applied to pygmy blue was the low-frequency cetacean SEL_{24h} thresholds based on NMFS (2018). The sound speed profile of November generally produced small distances to the low-frequency cetacean PTS and TTS threshold for the same operational activities modelled with a June SSP, see Tables 13–15. The seasonal differences were at most a few hundred metres. The receiver SPL level at the Port Campbell receiver locations presented in Table 10 are therefore expected to be lower in in November.

The SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding SEL_{24h} radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) are unlikely to stay in the same location for 24 hours. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained in that location for 24 hours.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially impulsive noise such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate noise and its effects on marine life. We provide specific definitions of relevant metrics used in the accompanying report. Where possible we follow the ANSI and ISO standard definitions and symbols for sound metrics, but these standards are not always consistent.

The sound pressure level (SPL; L_p; dB re 1 µPa) is the rms pressure level in a stated frequency band over a specified time window (*T*, s) containing the acoustic event of interest. It is important to note that SPL always refers to a rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T p^2(t)dt \Big/ p_0^2 \right) \tag{A-1}$$

The SPL represents a nominal effective continuous sound over the duration of an acoustic event, such as the emission of one acoustic pulse, a marine mammal vocalization, the passage of a vessel, or over a fixed duration. Because the window length, *T*, is the divisor, events with similar sound exposure level (SEL) but more spread out in time have a lower SPL.

The sound exposure level (SEL; L_E; $L_{E,p}$; dB re 1 µPa^2·s) is a measure related to the acoustic energy contained in one or more acoustic events (*N*). The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (*T*):

$$L_E = 10\log_{10}\left(\int_T p^2(t)dt \Big/ T_0 p_0^2 \right) \tag{A-2}$$

where T_0 is a reference time interval of 1 s. The SEL continues to increase with time when non-zero pressure signals are present. It therefore can be construed as a dose-type measurement, so the integration time used must be carefully considered in terms of relevance for impact to the exposed recipients.

SEL can be calculated over periods with multiple acoustic events or over a fixed duration. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, SEL can be computed by summing (in linear units) SEL of the *N* individual events:

$$L_{E,N} = 10\log_{10}\left(\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \right). \tag{A-3}$$

Appendix B. Methods and Parameters

This section describes the specifications of the seismic source that was used at all sites and the environmental parameters used in the propagation models.

B.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure B-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure B-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure B-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

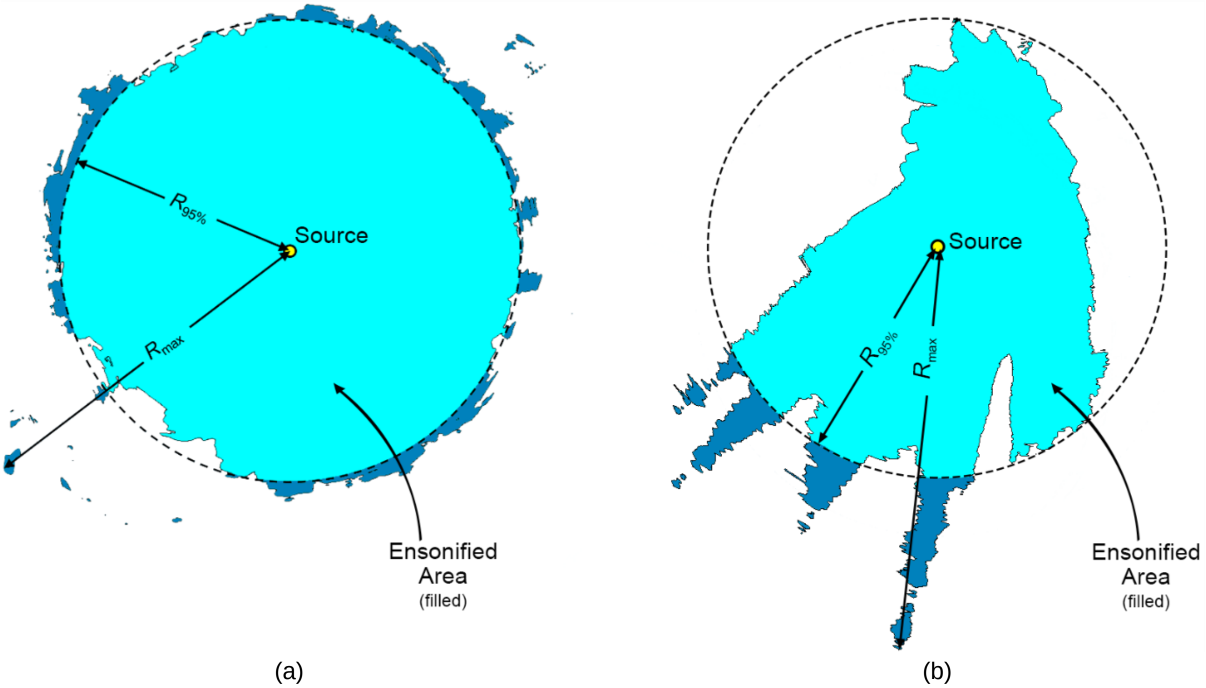

Figure B-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

B.2. Environmental Parameters

B.2.1. Bathymetry

Water depths throughout the modelled areas were extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 100 × 100 m.

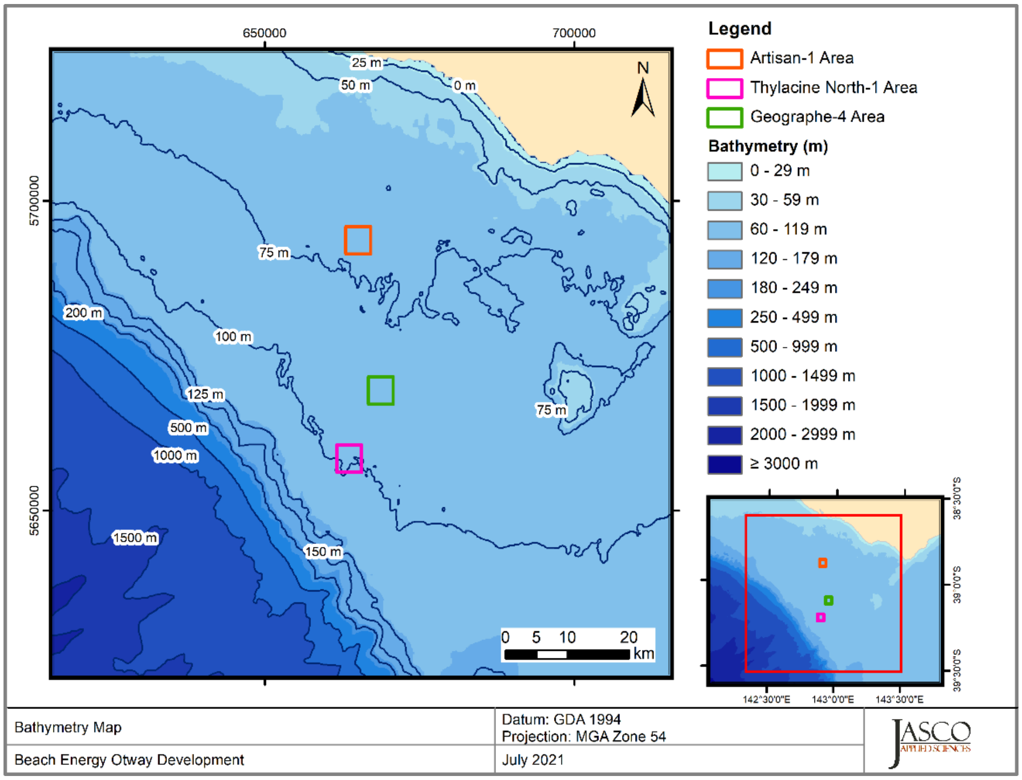

Figure B-2. Bathymetry in the modelled area.

B.2.2. Sound speed profile

The sound speed profile in the area was derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office's *Generalized Digital Environmental Model V 3.0* (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles at distances less than 7 km around the modelled site. The June sound speed profile is expected to be most favourable to longer-range sound propagation across the entire year. As such, June was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. For the pygmy blue whale period between November and January November is expected to be most favourable to longer-range propagation in that period. Figure B-3 shows the resulting profiles, which were used as input to the sound propagation modelling.

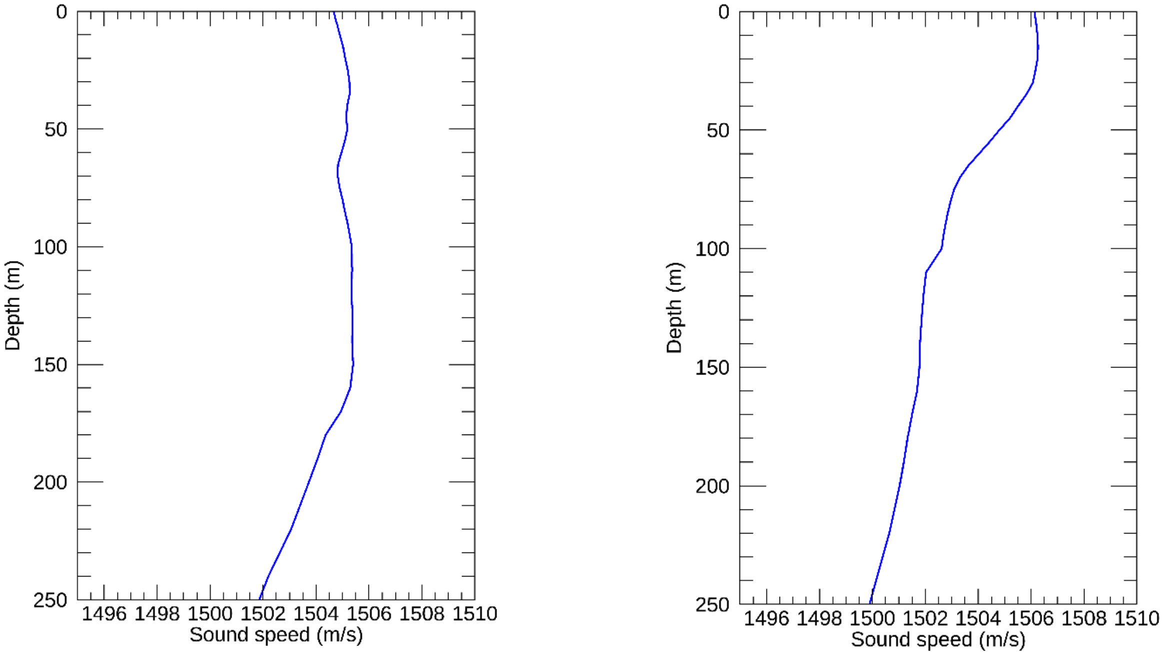

Figure B-3. The modelling sound speed profile corresponding to June (left) and November (right) Profiles are calculated from temperature and salinity profiles from *Generalized Digital Environmental Model* V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

B.2.3. Geoacoustics

The propagation model used in this study consider a single geoacoustic profile for each development area. These profiles determine how sound is reflected from the seabed, as well as how it is transmitted, reflected and absorbed into the sediment layers. As in previous acoustic studies in the area, the modelling area was divided into two seabed types (Wood and McPherson 2018). Both areas are located on the continental shelf, however the seabed in the Thylacine North-1 and were modelled as being characterised by well-cemented carbonate caprock (calcarenite), overlying semi-cemented carbonate rock (calcarenite). This contrast in seabed environment is consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010). Table B-1 present the geoacoustic profile used at the modelled sites in each respective development area.

Table B-1. *Thylacine North-1*: Geoacoustic profile. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	**Predicted lithology**	**Density (g/cm³)**	**Compressional wave**		**Shear wave**	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–0.5	Well-cemented carbonate caprock	2.7	2600	0.50	1200	0.5
0.5–20	Increasingly cemented calcarenite	2.2	2000	0.30	900	0.27

Appendix G Sound Modelling Report – Connell and Koessler 2023

Technical Memo

DATE: 11 December 2023

DOCUMENT: 03248 Version 1.0

FROM: Steven Connell, Matthew Koessler (JASCO Applied Sciences (Australia) Pty Ltd)

TO: Glen Nicholson (Beach Energy)

Subject: Beach Otway Project, Additional Modelling at Well Location South

JASCO Applied Sciences (JASCO) performed additional modelling of underwater sound levels associated with the Beach Energy's exploration, development, and operations within the Otway basin. This study supplements work conducted to date, including drilling and construction results previously presented in Koessler and McPherson (2021), Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021). Additional modelling results have been added to better represent the southern part of the development area at a representative southern well location. In this report location is referred to as "Well Location South".

Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), and as accumulated sound exposure levels (SEL, L_E) as appropriate for non-impulsive (continuous) noise sources. For the non-time dependent scenarios, marine mammal behavioural threshold based on the current interim NOAA (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources are summarised in Section 2.

For the time-dependent scenarios, the modelled maximum distances to permanent threshold shift (PTS) and temporary threshold shift (TTS) criteria for low-frequency cetaceans Southall et al. (2019)., which are based on SEL accumulated over a period of time are summarised in Section 2.

Summary tables of results are provided in Table 1 and 2 below.

Table 1. Maximum (R_{max}) horizontal distances (in km) to sound pressure level (SPL) for the NOAA (2019) behavioural response threshold from the most appropriate location for considered sources per scenario. OSV: Offshore Supply Vessel, MODU: Mobile Offshore Drilling Unit

Scenario number	Well Area	Description	R_{max} (km)
1	Well Location South	MODU Drilling	1.46
2		OSV under Transit	0.41
3		MODU Drilling + OSV under DP (4hr) + OSV under Transit (20hr) (Resupply Ops)	19.6
4		MODU Drilling + OSV under Transit	2.21

Table 2. Summary: Maximum (R_{max}) horizontal distances (in km) for the frequency-weighted LF-cetacean SEL_{24h} TTS thresholds based on Southall et al. (2019) from the most appropriate location for considered sources per scenario. OSV: Offshore Supply Vessel, MODU: Mobile Offshore Drilling Unit

Scenario number	Well Area	Description	R_{max} (km)
1	Well Location South	MODU Drilling	0.23
2		OSV under Transit	0.01
3		MODU Drilling + OSV under DP (4hr) + OSV under Transit (20hr) (Resupply Ops)	1.48
4		MODU Drilling + OSV under Transit	0.23

1. Acoustic Modelling Scenario Details

The modelled sites considered within this additional modelling are provided in Table 3, with the associated modelled scenarios detailed below and provided in Table 4. An overview of the considered scenarios is as follows:

1. MODU Drilling at Well Location South.
2. OSV vessel on standby in a 2x4 km box 2 km east of Well Location South for 24 hours.
3. MODU drilling at Well Location South with OSV under DP alongside MODU performing resupply for 4 hours and OSV vessel on standby in a 2x4 km box 2 km east of Well Location South for 20 hours.
4. MODU drilling at Well Location South with OSV vessel on standby in a 2x4 km box 2 km east of Well Location South for 24 hours.

Table 3. Location details for the modelled sites. OSV: Offshore Supply Vessel, MODU: Mobile Offshore Drilling Unit.

Well	Site	Source	Latitude (S)	Longitude (E)	MGA (GDA94), Zone 54		Water depth (m)
					X (m)	Y (m)	
Well Location South	1	MODU	39° 44' 54.61"	143° 09' 49.54"	685382	5597917	156
	2	OSV (DP)	39° 44' 54.56"	143° 09' 52.23"	685446	5597917	156
	3	OSV (transit)	39° 44' 53.04"	143° 11' 13.52"	687382	5597917	136

Table 4. Description of modelled scenarios, OSV: Offshore Supply Vessel, MODU: Mobile Offshore Drilling Unit.

Scenario	Site	Location	Operation Description
1	1	Well Location South	MODU Drilling
2	3		OSV under Transit
3	1,2,3		MODU Drilling + OSV under DP (4 hr) + OSV under Transit (20 hr) (Resupply Ops)
4	1,3		MODU Drilling + OSV under Transit

2. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is necessary to establish exposure criteria (thresholds) for which sound levels may be expected to have a negative effect on animals. Whether acoustic exposure levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, SPL, and SEL, are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over a 24 h time period. Appropriate subscripts indicate any applied frequency weighting applied. The acoustic metrics in this report reflect the updated ANSI and ISO standards for acoustic terminology, ANSI S1.1 (2013) and ISO 18405:2017 (2017).

The following thresholds and guidelines for this study were chosen because they represent the best available science, and sound levels presented in literature for fauna with no defined thresholds:

1. Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Southall et al. (2019) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals for non-impulsive sources.
2. Marine mammal behavioural threshold based on the current interim U.S. National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources.

3. Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014).
4. Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of PTS and TTS in turtles for non-impulsive sources.

Additional detail on thresholds, guidelines and weighting functions can be found in Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021).

3. Methods

For a detailed description of the employed modelling method and input parameters refer to Koessler et al. (2020), Matthews et al. (2020), Matthews et al. (2021), Connell et al. (2021) and McPherson et al. (2021). The environmental parameters used in the propagation models are described in Appendix B.2. An analysis of seasonal sound speed profiles in Koessler and McPherson (2021) indicated that June was the month most conducive to sound propagation and was chosen for modelling. Modelling also accounted for site-specific bathymetric variations (see Appendix B.2.1) and local geoacoustic properties (see Appendix B.2.3).

3.1. Vessel and MODU Noise Sources

The MODU drilling and OSV under DP and on transit was based on measurements sourced from McPherson et al. (2021). The MODU was the *Ocean Onyx* and the loudest drill measurement was chosen while the OSV was the *Siem Sapphire*. For vessel details see Koessler et al. (2020) while a brief a summary of the measured source levels and spectra for the MODU and OSV used here are provided as follows:

- For the MODU drilling, mean levels from Section 5.5.1 in McPherson et al. (2021) were used.
- For scenarios where the OSV was under dynamic positioning (DP) the average spectrum from Section 5.5.2 in McPherson et al. (2021) was used.
- For scenarios where the OSV was transiting or standing by the average slow transit (7 knots) spectrum in McPherson et al. (2021) was used.

Figure 2 presents a summary plot of considered source spectra.

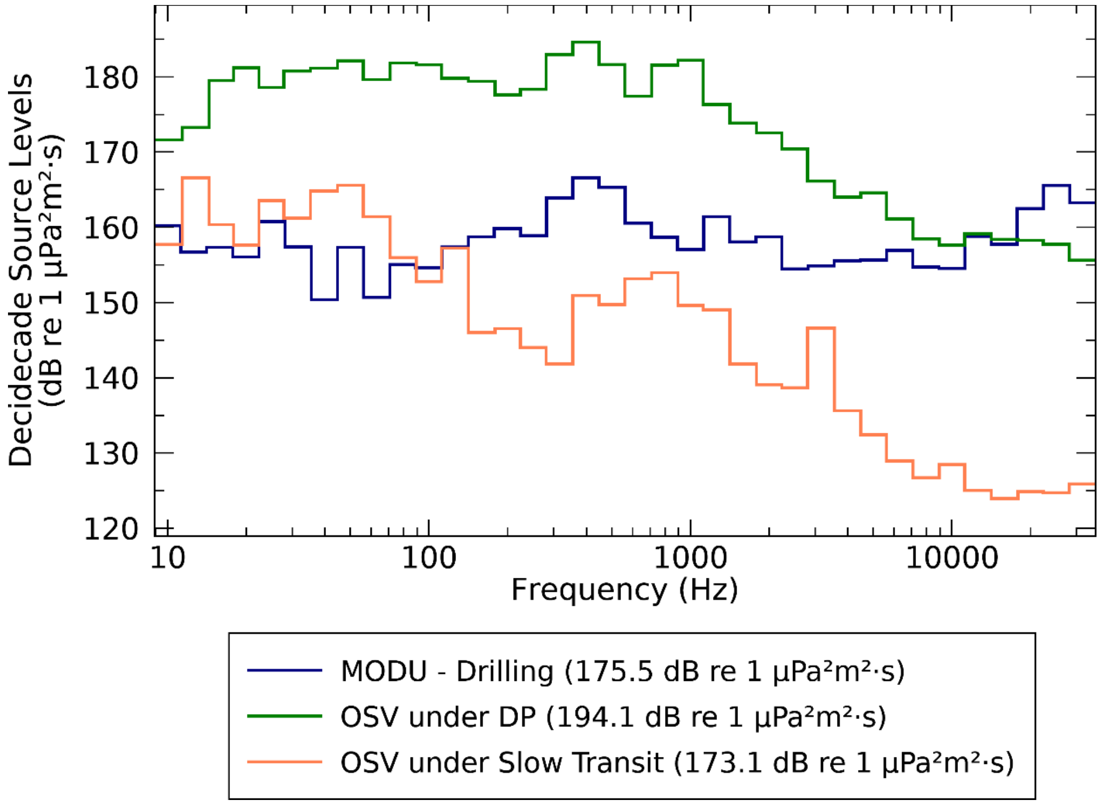

Figure 2. Energy source level (ESL) spectra (in decidecade frequency-band) for all sound sources.

4. Results

Results below are presented in two forms, tables of distances to isopleth contours (Section 4.1) and sound footprint maps (Section 4.2).

4.1. Tabulated Results

Table 5. *All Scenarios:* Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL) from the most appropriate location for considered sources per scenario. A dash indicates the level was not reached within the limits of the modelling resolution (20 m). OSV: Offshore Supply Vessel, DP: Dynamic Positioning, MODU: Mobile Offshore Drilling Unit.

4.2. Sound Field Maps

Maps of the estimated sound fields, threshold contours, and isopleths of interest for SPL (Section 4.2.1) and SEL_{24h} (Section 4.2.2) sound fields are presented below.

4.2.1. SPL Maps

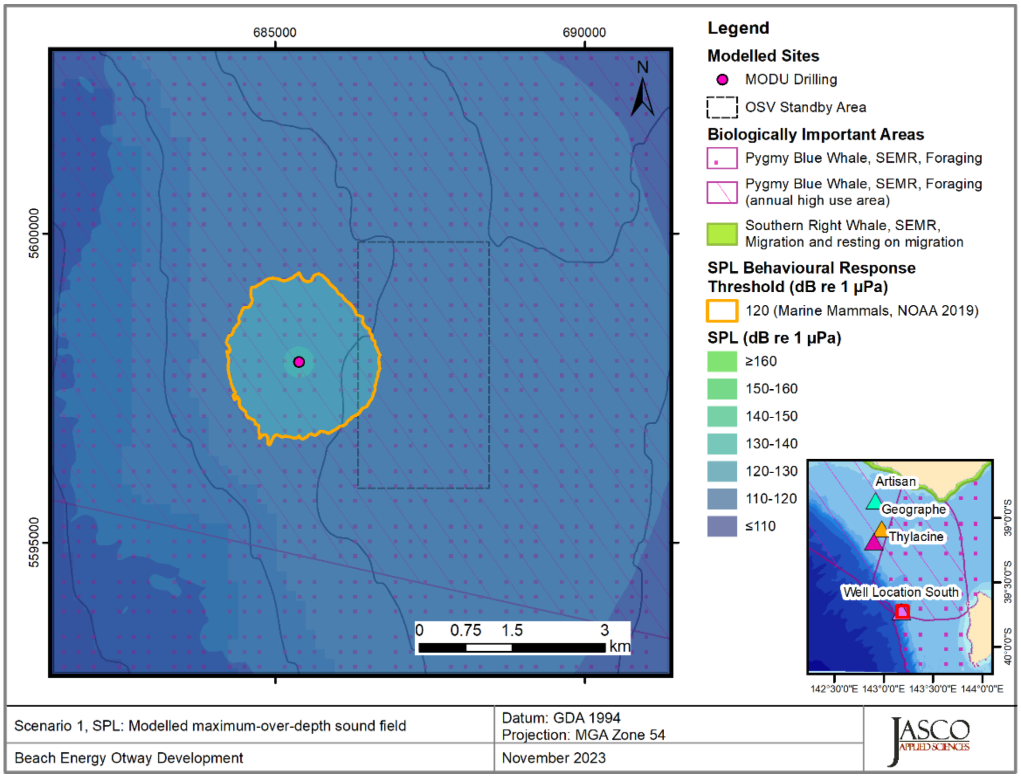

Figure 3. *Well Location South, MODU Drilling*, SPL: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals.

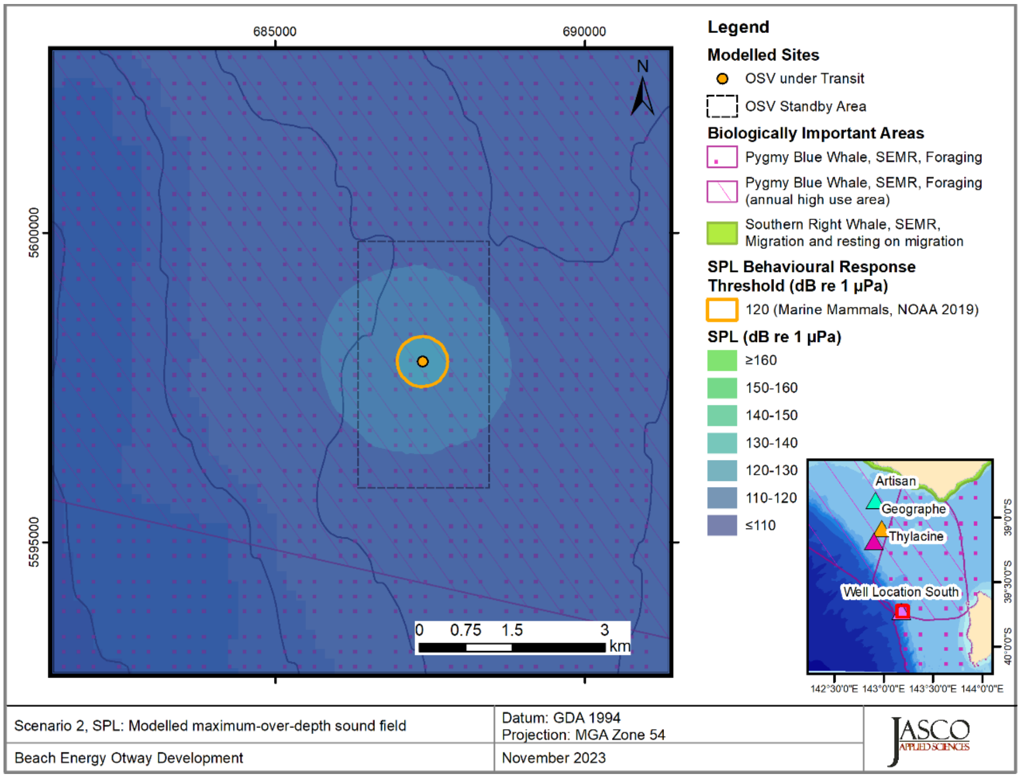

Figure 4. *Well Location South, OSV under Transit*, SPL: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals.

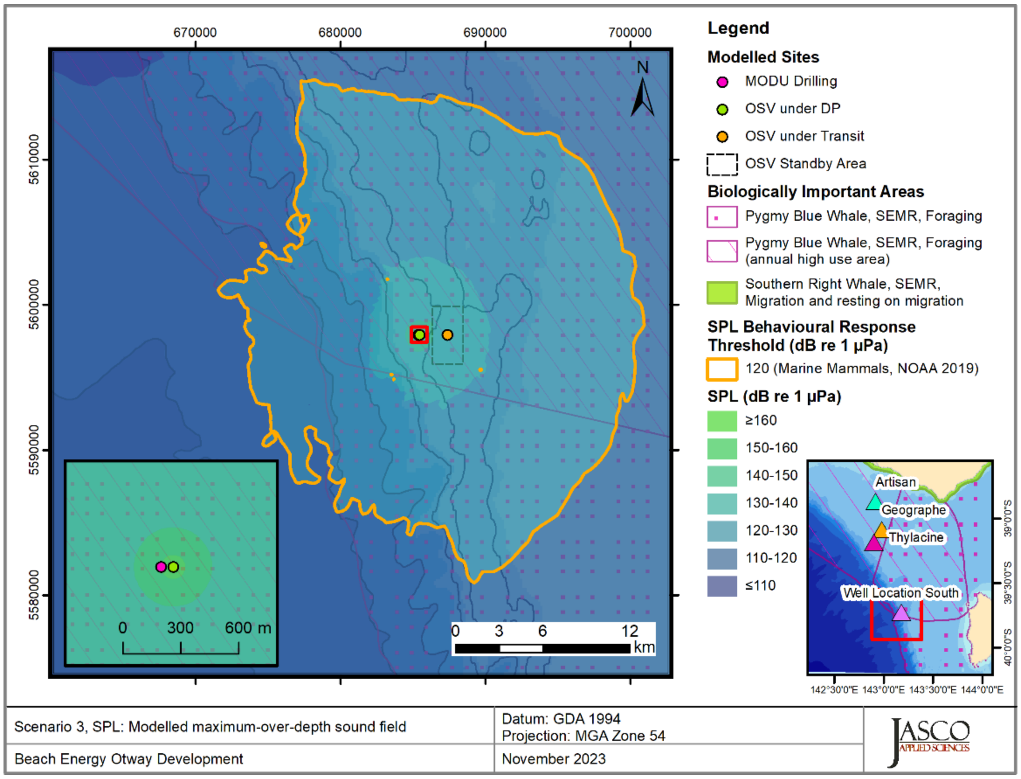

Figure 5. *Well Location South, MODU Drilling, OSV under DP, and OSV under Transit*, SPL: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals.

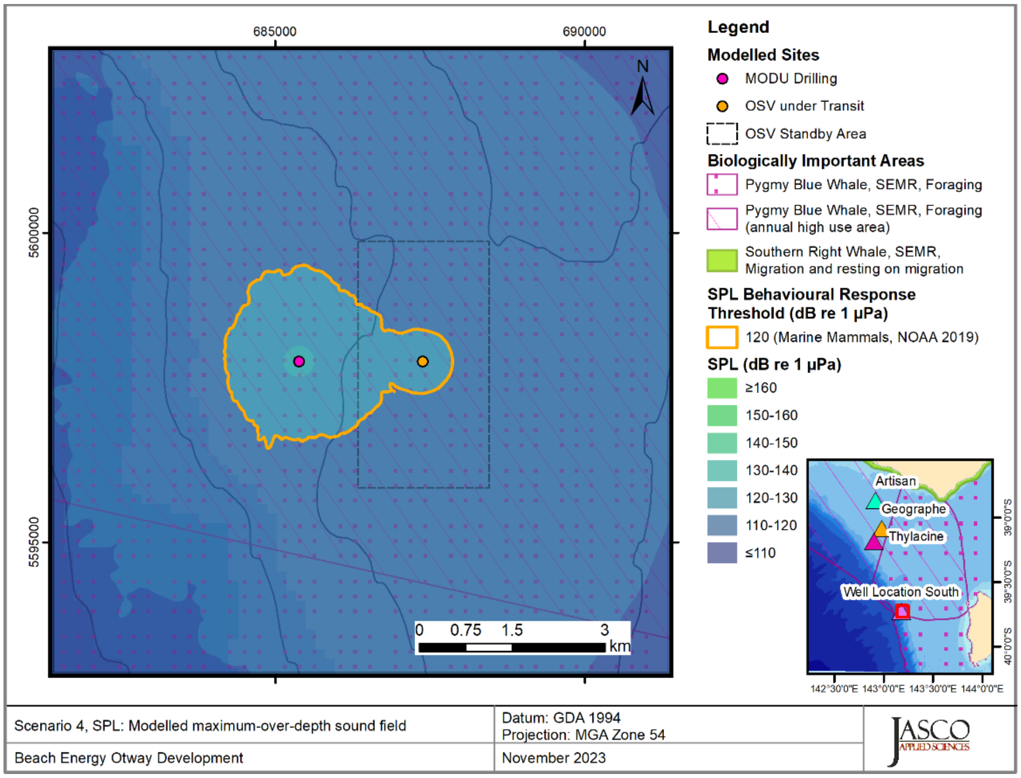

Figure 6. *Well Location South, MODU Drilling and OSV under transit*, SPL: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals.

4.2.2. Accumulated SEL_{24h} Maps

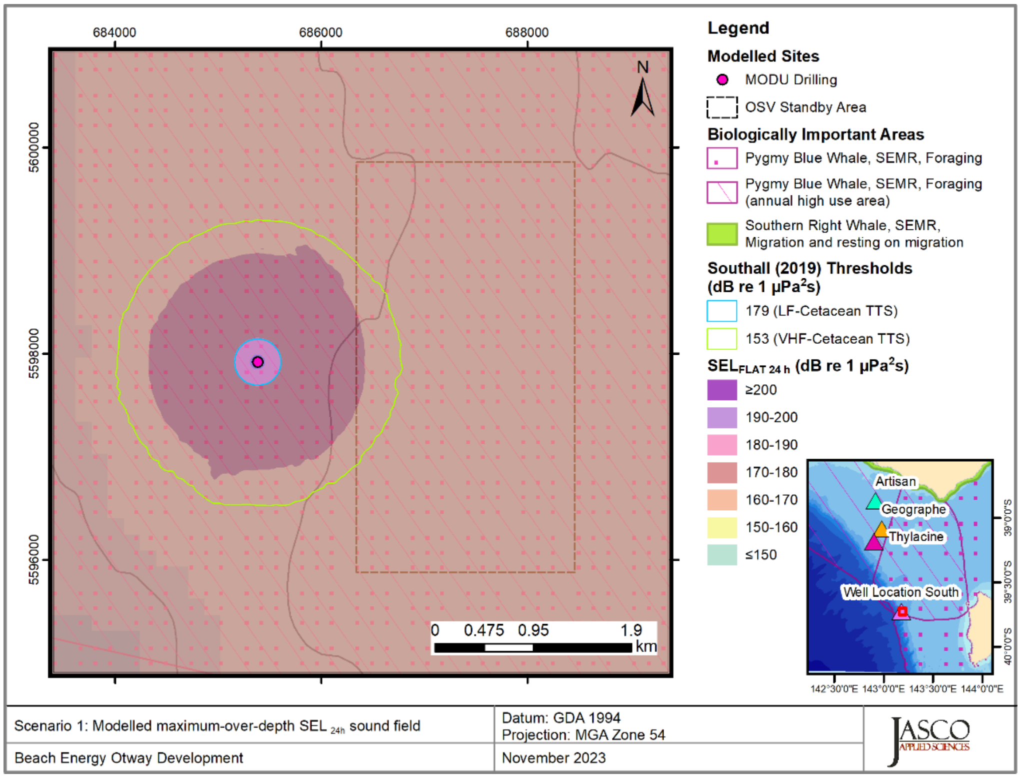

Figure 7. *Well Location South, MODU Drilling*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such they could not be displayed on a map.

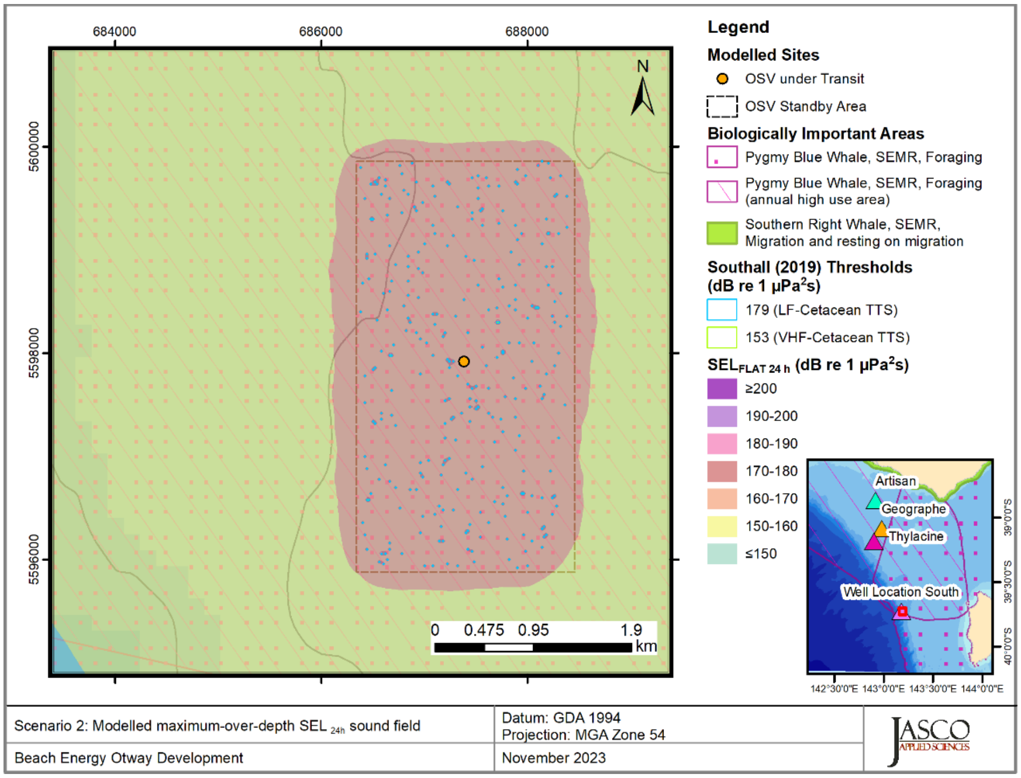

Figure 8. *Well Location South, OSV under Transit*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such they could not be displayed on a map.

Beach Energy Otway Development	November 2023

JASCO APPLIED SCIENCES

Figure 9. *Well Location South, MODU Drilling, OSV under DP (4h), and OSV under Transit (20h)*, sound level contour map of unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such they could not be displayed on a map.

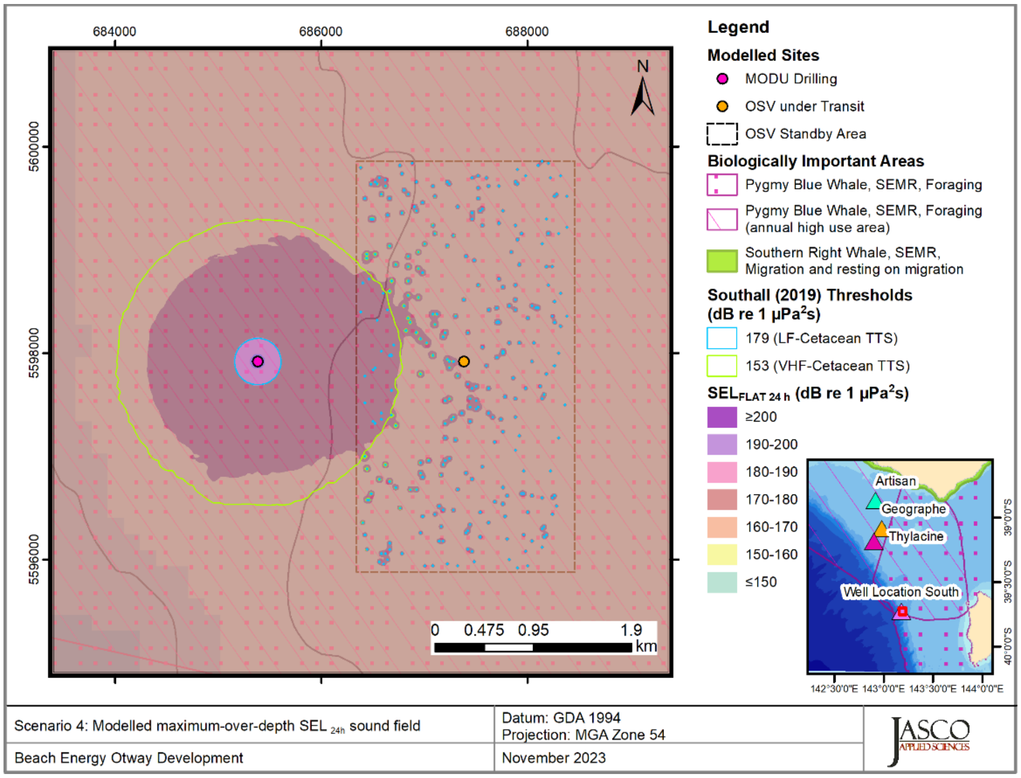

Figure 10. *Well Location South, MODU Drilling and OSV under transit*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such they could not be displayed on a map.

Glossary

1/3-octave

One third of an octave. *Note*: A 1/3-octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

absorption

The conversion of sound energy to heat energy. Specifically, the reduction of sound pressure amplitude due to particle motion energy converting to heat in the propagation medium.

acoustic noise

Sound that interferes with an acoustic process.

acoustic self-noise

Sound at a receiver caused by the deployment, operation, or recovery of a specified receiver, and its associated platform (ISO 18405:2017).

ambient sound

Sound that would be present in the absence of a specified activity (ISO 18405:2017). It is usually a composite of sound from many sources near and far, e.g., shipping vessels, seismic activity, precipitation, sea ice movement, wave action, and biological activity.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium. Attenuation depends on frequency—higher frequency sounds are attenuated faster than lower frequency sounds.

auditory frequency weighting

The process of applying an auditory frequency-weighting function. An example for marine mammals are the auditory frequency-weighting functions published by Southall et al. (2007).

auditory frequency-weighting function

Frequency-weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.

background noise

Combination of ambient sound, acoustic self-noise, and, where applicable, sonar reverberation (ISO 18405:2017) that is detected, measured, or recorded with a signal.

bandwidth

A range within a continuous band of frequencies. Unit: hertz (Hz).

broadband level

The total level measured over a specified frequency range. If the frequency range is unspecified, the term refers to the entire measured frequency range.

cavitation

A rapid formation and collapse of vapor cavities (i.e., bubbles or voids) in water, most often caused by a rapid change in pressure. Fast-spinning vessel propellers typically cause cavitation, which creates a lot of noise.

cetacean

Member of the order Cetacea. Cetaceans are aquatic mammals and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called a longitudinal wave. In seismology/geophysics, it's called a primary wave or P-wave. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

continuous sound

A sound whose sound pressure level remains above the **background noise** during the observation period and may gradually vary in intensity with time, e.g., sound from a marine vessel.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006). For example, one decade up from 1000 Hz is 10,000 Hz, and one decade down is 100 Hz.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Especially suited to quantify variables with a large dynamic range.

decidecade

One tenth of a decade. Approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct), and for this reason sometimes referred to as a 1/3-octave.

decidecade band

Frequency band whose bandwidth is one decidecade. *Note*: The bandwidth of a decidecade band increases with increasing centre frequency.

energy source level

A property of a sound source equal to the sound exposure level measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2\ m^2\ s$.

ensonified

Exposed to sound.

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

frequency

The rate of oscillation of a periodic function measured in cycles per unit time. The reciprocal of the period. Unit: hertz (Hz). Symbol: f. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency-weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function (ISO 18405:2017). For sound of a given frequency, the frequency-weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency-weighting function*: compensatory frequency-weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency-weighting function*: frequency-weighting function describing the sensitivity of an acoustic recording system, which typically consists of a hydrophone, one or more amplifiers, and an analog-to-digital converter.

functional hearing group

Category of animal species when classified according to their hearing sensitivity, hearing anatomy, and susceptibility to sound. For marine mammals, initial groupings were proposed by Southall et al. (2007), and revised groupings are developed as new research/data becomes available. Revised groupings proposed by Southall et al. (2019) include low-frequency cetaceans, high-frequency cetaceans, very high-frequency cetaceans, phocid carnivores in water, other carnivores in water, and sirenians. See auditory frequency-weighting functions, which are often applied to these groups. Example hearing groups for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

geoacoustic

Relating to the acoustic properties of the seabed.

hearing threshold

For a given species or functional hearing group, the sound level for a given signal that is barely audible (i.e., that would be barely audible for a given individual in the presence of specified **background noise** during a specific percentage of experimental trials).

hertz (Hz)

Unit of frequency defined as one cycle per second. Often expressed in multiples such as kilohertz (1 kHz = 1000 Hz).

high-frequency (HF) cetaceans

See functional hearing group. *Note*: The mid- and high-frequency cetaceans groups proposed by Southall et al. (2007) were renamed high- and very-high-frequency cetaceans, respectively, by Southall et al. (2019).

hydrophone

An underwater sound pressure transducer. A passive electronic device for recording or listening to underwater sound.

hydrostatic pressure

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 s), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Sources of impulsive sound include, among others, explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some specified quantity (e.g., sound pressure level isopleth).

knot (kn)

Unit of vessel speed equal to 1 nautical mile per hour.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. For example, a value of sound pressure level with reference to 1 μPa^2 can be written in the form *x* dB re 1 μPa^2.

low-frequency (LF) cetaceans

See functional hearing group.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetaceans

See functional hearing group. *Note*: The mid-frequency cetaceans group proposed by Southall et al. (2007) was renamed high-frequency cetaceans by Southall et al. (2019).

monopole source level (MSL)

A source level that has been calculated using an acoustic model that accounts for the effect of the sea-surface and seabed on sound propagation, assuming a point source (monopole). Often used to quantify source levels of vessels or industrial operations from measurements. See also radiated noise level.

M-weighting

A set of auditory frequency-weighting functions proposed by Southall et al. (2007).

mysticete

Member of the Mysticeti, a suborder of cetaceans. Also known as baleen whales, mysticetes have baleen plates (rather than teeth) that they use to filter food from water (or from sediment as for grey whales). This group includes rorquals (Balaenopteridae, such as blue, fin, humpback, and minke whales), right and bowhead whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. Not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

odontocete

Member of Odontoceti, a suborder of cetaceans. These whales, dolphins, and porpoises have teeth (rather than baleen plates). Their skulls are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

otariid

Member of the family Otariidae, one of the three groupings of pinnipeds (along with phocids and walrus). These eared seals, commonly called fur seals and sea lions, are adapted to semi-aquatic life; they use their large fore flippers for propulsion underwater and can walk on all four limbs on land.

otariid pinnipeds underwater (OW)

See functional hearing group.

other marine carnivores in water (OCW)

See functional hearing group.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of backscattered sound (which are negligible for most ocean-acoustic propagation problems), simplifying the computation of propagation loss.

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. Considered auditory injury. Compare with temporary threshold shift.

phocid

Member of the family Phocidae, one of the three groupings of pinnipeds (along with otariids and walrus). These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves underwater.

phocid pinnipeds underwater (PW), phocid carnivores in water (PCW)

See functional hearing group.

pinniped

Member of the superfamily Pinnipedia, which is composed of phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source

A source that radiates sound as if from a single point.

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, $\mathrm{PL}(x) = \mathrm{SL} - L(x)$. Unit: decibel (dB). See also transmission loss.

radiated noise level (RNL)

A source level that has been calculated assuming sound pressure decays geometrically with distance from the source, with no influence of the sea-surface or seabed. Often used to quantify source levels of vessels or industrial operations from measurements. See also monopole source level.

received level

The level of a given field variable measured (or that would be measured) at a given location.

reference value

Standard value of a quantity used for calculating underwater sound level. The reference value depends on the quantity for which the level is being calculated:

Quantity	Reference value
Sound pressure	$p_0{}^2$ = 1 μPa^2 or p_0 = 1 μPa
Sound exposure	E_0 = 1 μPa^2 s
Sound particle displacement	$\delta_0{}^2$ = 1 pm^2
Sound particle velocity	$u_0{}^2$ = 1 nm^2/s^2
Sound particle acceleration	$a_0{}^2$ = 1 μm^2/s^4

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sirenians (SI)

Members of the order Sirenia, which includes several manatee species and the dugong. See also functional hearing group.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium. In common meaning, a form of energy that propagates through media (e.g., water, air, ground) as pressure waves.

sound exposure

Time integral of squared sound pressure over a stated time interval in a stated frequency band. The time interval can be a specified time duration (e.g., 24 h) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: pascal squared second (Pa^2 s). Symbol: E.

sound exposure level (SEL)

The level (L_E) of the sound exposure (E) in a stated frequency band and time window: $L_E = 10\log_{10}(E/E_0)$ (ISO 18405:2017). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 μPa^2 s.

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum (ISO 18405:2017). Unit: pascal squared second per hertz (Pa^2 s/Hz).

sound field

Region containing sound waves.

sound pressure

The contribution to total pressure caused by the action of sound (ISO 18405:2017). Unit: pascal (Pa). Symbol: p.

sound pressure level (SPL), rms sound pressure level

The level (L_p) of the time-mean-square sound pressure (p_{rms}^2) in a stated frequency band and time window: $L_p = 10\log_{10}(p_{\mathrm{rms}}^2/p_0^2) = 20\log_{10}(p_{rms}/p_0)$, where rms is the abbreviation for root-mean-square. Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 µPa^2. SPL can also be expressed in terms of the root-mean-square (rms) with a reference value of p_0 = 1 µPa. The two definitions are equivalent.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

source level (SL)

A property of a sound source equal to the sound pressure level measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 µPa^2 m^2.

spectrum

Distribution of acoustic signal content over frequency, where the signal's content is represented by its power, energy, mean-square sound pressure, or sound exposure.

surface duct

The upper portion of a water column within which the gradient of the sound speed profile causes sound to refract upward and therefore reflect repeatedly off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity caused by noise exposure. Compare with permanent threshold shift.

thermocline

A depth interval near the ocean surface that experiences larger temperature gradients than the layers above and below it due to warming or cooling by heat conduction from the atmosphere and by warming from the sun.

transmission loss (TL)

The difference between a specified level at one location and that at a different location: $\mathrm{TL}(x_1,x_2) = L(x_1) - L(x_2)$ (ISO 18405:2017). Unit: decibel (dB). See also propagation loss.

unweighted

Term indicating that no frequency-weighting function is applied.

very high-frequency (VHF) cetaceans

See functional hearing group.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol: λ.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 μPa. Because the perceived loudness of sound, especially impulsive noise such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate noise and its effects on marine life. We provide specific definitions of relevant metrics used in the accompanying report. Where possible we follow the ANSI and ISO standard definitions and symbols for sound metrics, but these standards are not always consistent.

The sound pressure level (SPL; L_p; dB re 1 μPa) is the rms pressure level in a stated frequency band over a specified time window (T, s) containing the acoustic event of interest. It is important to note that SPL always refers to a rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T p^2(t)dt \Big/ p_0^2\right) \tag{A-1}$$

The SPL represents a nominal effective continuous sound over the duration of an acoustic event, such as the emission of one acoustic pulse, a marine mammal vocalization, the passage of a vessel, or over a fixed duration. Because the window length, T, is the divisor, events with similar sound exposure level (SEL) but more spread out in time have a lower SPL.

The sound exposure level (SEL; L_E; $L_\mathrm{E,p}$; dB re 1 μPa^2·s) is a measure related to the acoustic energy contained in one or more acoustic events (N). The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T):

$$L_E = 10\log_{10}\left(\int_T p^2(t)dt \Big/ T_0 p_0^2\right) \tag{A-2}$$

where T_0 is a reference time interval of 1 s. The SEL continues to increase with time when non-zero pressure signals are present. It therefore can be construed as a dose-type measurement, so the integration time used must be carefully considered in terms of relevance for impact to the exposed recipients.

SEL can be calculated over periods with multiple acoustic events or over a fixed duration. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, SEL can be computed by summing (in linear units) SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\left(\sum_{i=1}^{N} 10^{\frac{\mathrm{L}_{E,i}}{10}}\right). \tag{A-3}$$

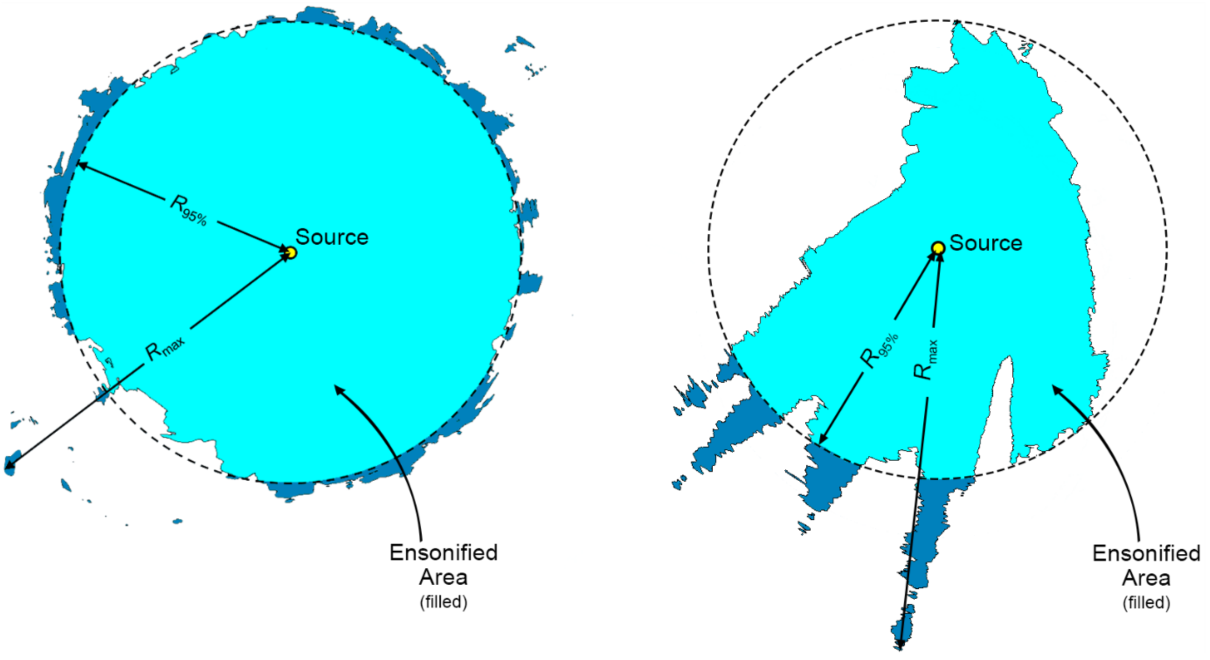
Appendix B. Methods and Parameters

This section describes the specifications of the seismic source that was used at all sites and the environmental parameters used in the propagation models.

B.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure B-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure B-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure B-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.



(a) (b)

Figure B-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

B.2. Environmental Parameters

B.2.1. Bathymetry

Water depths throughout the modelled areas were extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 250 × 250 m.

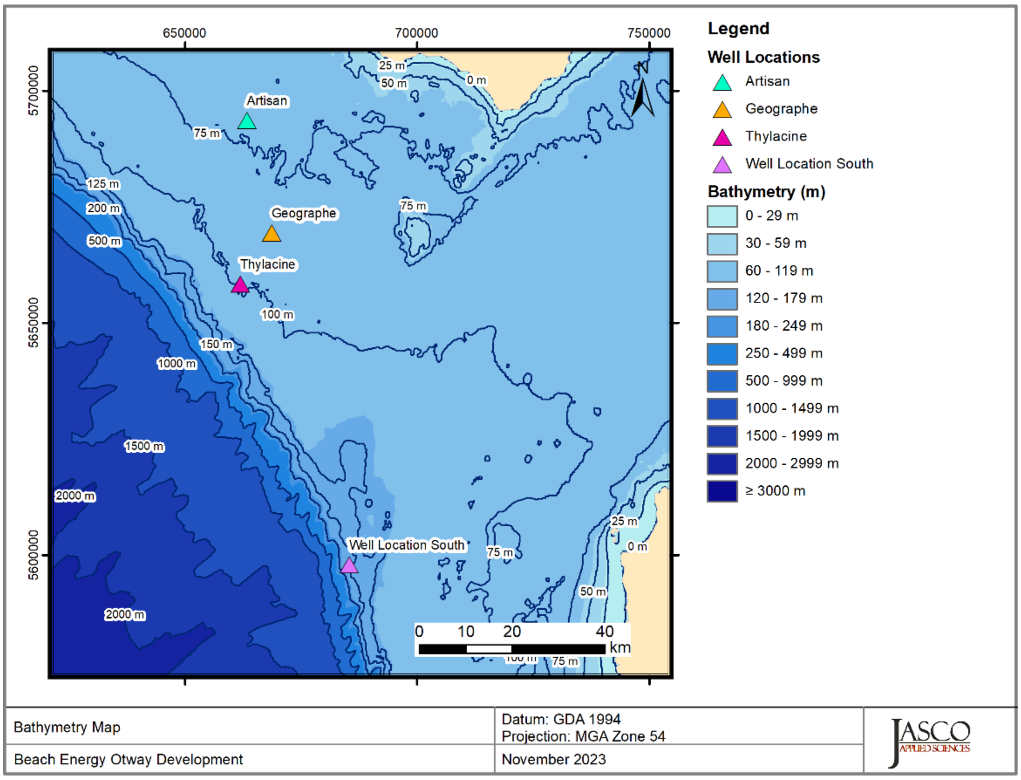


Figure B-2. Bathymetry map of the Beach Otway development area.

B.2.2. Sound speed profile

The sound speed profile in the area was derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office's *Generalized Digital Environmental Model V 3.0* (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles at distances less than 7 km around the modelled site. The June sound speed profile is expected to be most favourable to longer-range sound propagation across the entire year. As such, June was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. For the pygmy blue whale period between November and January November is expected to be most favourable to longer-range propagation in that period. Figure B-3 shows the resulting profiles, which were used as input to the sound propagation modelling.

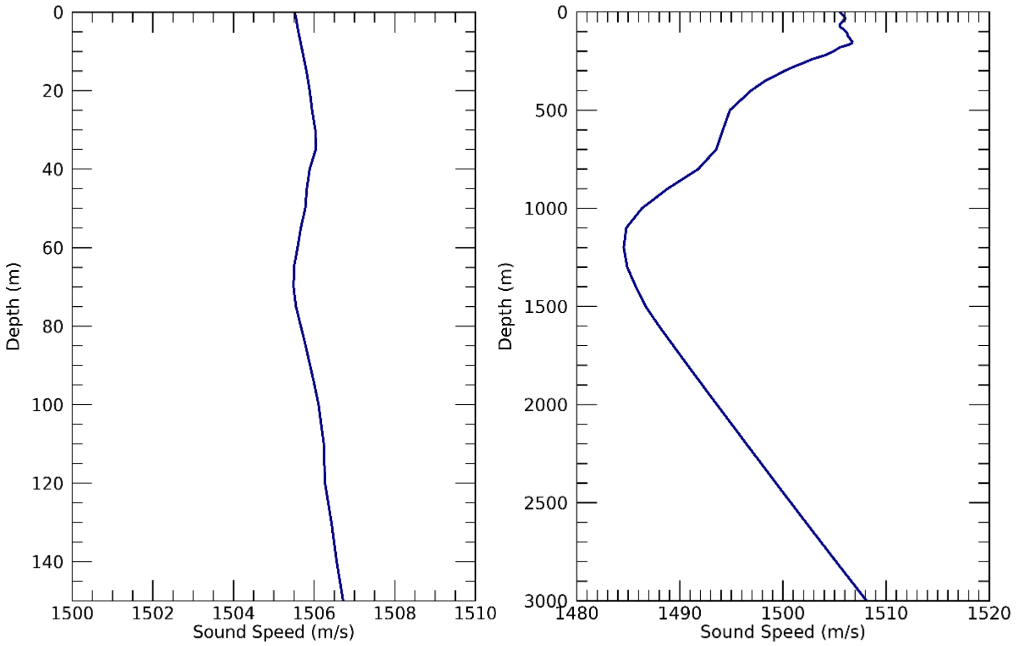

Figure B-3. The modelling sound speed profile corresponding to June for the top 150 m (left) and 3000 m (right) Profiles are calculated from temperature and salinity profiles from *Generalized Digital Environmental Model* V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

B.2.3. Geoacoustics

A single geoacoustic profile was used for modelling. Geoacoustic parameters used for all modelled sites were derived from sedimentary grain size measurements from the Australian Government's Marine Sediments (MARS) database (Heap 2009). On average, the surficial grain size indicates silty sand is present throughout the modelled area. Representative grain sizes were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models. Table B-1 lists the geoacoustic parameters used for modelling. This profile is expected to better represent the slope environment and may yield less accurate towards the continental shelf. On the shelf it is possible that a less reflective seabed type consisting of limestone may be present (Duncan et al. 2013). It is expected that towards the shelf the estimate to threshold ranges may be overestimated.

Table B-1. Geoacoustic profile for all modelled sites.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed(m/s)	Attenuation(dB/λ)	Speed(m/s)	Attenuation(dB/λ)
0–10	Silty carbonate sand to semi-cemented limestone	1.88	1605–1700	0.35–0.70	255	3.65
10–20		1.88–1.89	1700–1755	0.70–0.85		
20–50		1.89–1.90	1755–1850	0.85–1.15

Executive Summary

Overview

JASCO Applied Sciences (Australia), JASCO, completed a monitoring study for Beach Energy (Operations) Ltd (Beach Energy) in relation to the exploration drilling activities at the Artisan-1 well with the aim of completing an acoustic characterisation of the drilling and associated vessel activity within the Otway Basin. Through this characterisation, validation of the modelling predictions used in Beach Energy Otway Environment Plans (EPs) for the development drilling activities was required.

The exploration well Artisan-1, drilled by the *Ocean Onyx*, was selected for the monitoring program because the predicted distances to thresholds for effects on marine mammals, including pygmy blue whales, were farthest at this location in the modelling study used for the EP (Koessler et al. 2020), as well as because it was the first well in the Otway drilling campaign.

Four JASCO Autonomous Multichannel Acoustic Recorders (AMARs) in C-lander moorings were deployed in February and retrieved in early April. Stations 1 through 4 were deployed at distances of 0.336, 1.13, 5.11, and 25 km from the *Ocean Onyx*. The AMARs recorded continuously at 24-bit resolution and 64 kHz sample rate for the entire deployment. The three stations closest to the *Ocean Onyx* were configured with a single hydrophone, whilst the station 25 km away was configured with three hydrophones to provide directional processing of received sounds.

To assist in the characterisation of *Ocean Onyx* and attendant support vessels, the vessels conducted specific activities under dynamic positioning and followed a nominated transit track between the *Ocean Onyx* and Geelong Supply Base. No specific operational requests were made of the *Ocean Onyx* and vessels during normal drilling activities due to the complexity of operationally meeting any requests. Over the course of the monitoring program, the MODU and support vessels engaged in different operational states with different uncontrollable contributors, such as variable drilling operations, resupply and support operations, weather conditions, and merchant shipping.

Data Analysis

The data was analysed to determine total ocean sound levels, which presented the expansive data in a manner that documented the underwater sound conditions near Artisan-1 and allowed a comparison over time, and with external factors that affect sound levels, such as weather and human activities. The data was presented using a range of graphical and statistical representations. JASCO's ShipSound software was used to determine the source levels for the Ocean Onyx during drilling activities and the support vessels whilst under dynamic positioning and transit.

ShipSound calculates two kinds of vessel source levels from the data window: Radiated Noise Level (RNL) and Monopole Source Level (MSL). RNL is equal to the measured sound pressure level, back-propagated according to the distance between a source and the hydrophone using an empirical propagation loss approach. MSL is equal to the measured sound pressure level scaled according to a numerical acoustic propagation loss (PL) model that accounts for the effect of the local environment on sound propagation (i.e., sea-surface reflection, water column refraction and absorption, and bottom loss).

The presence of sounds produced by marine mammals were searched for using a combination of automated detector-classifiers (referred to as automated detectors) and manual review by experienced analysts. The manual review was limited to only a subset (0.5%) of acoustic data, as this was not the primary aim of the project.

Results

The analysis of data at the two stations furthest from the Ocean Onyx, 3 and 4 (5 and 25 km), found a positive correlation between wind speeds and wave heights and sound levels for frequencies over 100 Hz, with the relationship with wind speed being stronger than that for wave height. For both of these stations shipping is a strong contributor. Most days recorded a significant number of vessel detections, with the contributions at Station 4 typically between 40 and approximately 100 Hz. The station most representative of a typical ambient soundscape within the region, Station 4, had a median broadband ambient noise of 104.5 dB re 1 µPa. Dolphins and pygmy blue whales were identified in the data. The data for pygmy blue whales indicates an apparent trend in the animals early in the recording being more to the east and later in the recording being more to the west, through the directional analysis of data from Station 4, but the data were too sparse (and the analysis too limited) to confirm anything about animal movements. Extended analysis may provide more details about their presence and movements during the drilling activities.

The provided drill logs for the Artisan-1 well were reviewed to identify periods of activity defined as drilling, as this was the activity considered in the modelling study Koessler et al. (2020). Seventy ten-minute time periods were deemed suitable for use, which resulted in the MSL being calculated over three different drilling depth ranges and presented as mean and maximum levels. MSL's were calculated for support vessels during dynamic positioning trials and transit, with results summarised in Table 1.

Table 1. Project drill rig and support vessel monopole source levels (MSLs).

Vessel	Measurement	Monopole source level (dB re 1 µPa m)	
		Mean	Maximum
Ocean Onyx	Drilling 26”x42” hole from 95-172 m	175.2	180.0
	Drilling 17.5” hole from 365-621 m	169.3	171.0
	Drilling 12.25” hole up to 1851 m	162.7	170.6
Siem *Sapphire*	Dynamic Positioning Trial	193.9	194.2
	Transit at 7 kn	171.6	173.6
	Transit at 9 kn	185.0	—*
Siem *Aquamarine*	Transit at 9 kn	182.8	—*
Siem *Topaz*	Transit at 9 kn	185.2	—*

* Not reported.

Validation

The Monopole Source Levels determined through the measurement study differed from those either estimated for use in the modelling study or those determined using proxy sources. The key differences are as follows:

- The support vessels are quieter than estimated when they are under slow transit speeds, such as 7 kn.
- The support vessels are louder than estimated when they are travelling at faster transit speeds, with 9 kn used to represent these speeds and the associated MSL.
- The support vessels are louder than estimated when holding station or moving under dynamic positioning.
- The drilling operations of the *Ocean Onyx* are both louder at some frequencies and quieter at others than those for the proxy rig the *Polar Pioneer* (Austin et al. 2018), although the results presented for the *Polar Pioneer* did not examine the changes in level with increased drilling depth (over time) as completed within this study.

The results from the measurement study could not be directly compared to the modelling presented in Koessler et al. (2020) due to the differences in actual events compared to the nominal representative scenarios developed and evaluated as part of the EP assessment process. Additionally, the measurements were obtained at a receiver located 1.2 m off the seafloor, which is not the maximum-over-depth results reported in the modelling study. The ranges obtained from the measurement study are reported in relation to the Artisan-1 well location, and thus the centre of the *Ocean Onyx*. The ranges in the modelling study are reported from a range of locations, including the centroids of multiple sources, thus it is not possible to report the measurement results in a similar fashion using the small number of recording locations used in this study.

The accuracy of the broadband calculated propagation loss for the Otway Basin continental shelf environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on carbonate seabed (calcarenite) likely to occur within the region. In general, the thinner the sand layer, the greater the overall propagation loss.

When comparing SPL data fits for Stations 1–3, the loss rate is higher than what would have been expected in this environment, considering the higher monopole source levels for the support vessel on DP derived from trial measurements. The differences are likely attributable to the potential absence of a sand veneer.

Comparisons were conducted using JASCO's Marine Operations Noise Model (MONM), a wide-angle parabolic equation model which applies the BELLHOP Gaussian beam acoustic ray-trace model at higher frequencies, and JASCO's wavenumber integration model (VSTACK) which can fully account for the elasto-acoustic properties of the sub-bottom. The agreement between the models was excellent when only a comparatively thin (1 m thick) layer of sand overlies the carbonate seabed structure. In an environment such as this, MONM could have been used without correction. However, the comparisons indicate a much higher rates of loss, as would be expected if no (or only a very thin) sand layer were present.

A better understanding of the propagation loss environment, and the revision of the representation and treatment of it through the measurement study, enabled the modelling scenarios for the activities at Artisan-1 presented in Koessler et al. (2020) to be recalculated. The revised results for distances to maximum-over-depth SPL isopleths are presented in Table 2, and the revised results for distances to maximum-over-depth SEL thresholds presented in Table 3.

The understanding of the environment gained through the measurement study allowed for both the geological environment to be represented in a site-specific fashion and the use of a more appropriate configuration of numerical models to represent the propagation loss. The application of the revised modelling approach to represent other Beach Energy activities on the continental shelf of the Otway Basin would be appropriate.

Table 2. Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to the marine mammal behavioural response threshold of 120 dB re 1 µPa sound pressure level (SPL) from the most appropriate location for considered sources per scenario (see table footnotes).

1. Introduction

JASCO Applied Sciences (Australia), JASCO, completed a monitoring study for Beach Energy (Operations) Ltd (Beach Energy) in relation to the exploration drilling activities at the Artisan-1 well with the aim of completing an acoustic characterisation of the drilling and associated vessel activity within the Otway Basin. Through this characterisation, it was then required to validate the modelling predictions used in Beach Energy Otway Environment Plans (EPs) for the development drilling activities. These validation results are applicable for drilling, construction, and operational activities within the Otway Basin.

The exploration well Artisan-1 was selected for the monitoring program, because the predicted distances to thresholds for effects on marine mammals, including pygmy blue whales, were farthest at this location in the modelling study used for the EP (Koessler et al. 2020), as well as because it was the first well in the Otway drilling campaign.

This report presents an overview of the operations, environment, and measurement approaches (Section 2); general information about the marine acoustic environment (Section 3); the methods used for the data analysis, presentation, and modelling validation (Section 4); results of the monitoring program (Section 5); the validation analysis (Section 6); and a discussion of the program results and findings (Section 7).

The location of the four acoustic recording stations and the Artisan-1 well are provided in Table 4 and shown in Figure 1. One JASCO Autonomous Multichannel Acoustic Recorders (AMAR) was deployed at each recording station.

Table 4. Artisan-1 well and acoustic recording stations, including distance to Artisan-1.

Item	Latitude (S)	Longitude (E)	MGA Zone 54 (GDA94)		Water depth (m)	Distance to Artisan-1 (km)
			X (m)	*Y* (m)		
Artisan-1 (well)	38° 53.49077'	142° 52.94869'	663262.0	5693578.0	71.6	–
Station 1	38° 53.39316'	142° 53.14475'	663549.2	5693753.0	71.7	0.336
Station 2	38° 53.16585'	142° 53.61184'	664233.1	5694159.0	70.5	1.13

2. Background Information

2.1. Operational Overview and Logs

The Otway Development Drilling Campaign being undertaken by Beach Energy utilises the *Ocean Onyx* Mobile Offshore Drilling Unit (MODU) (Figure 2). It is held in position via anchors and chains, as opposed to using thrusters, and has dimensions of approximately 100 m in length and width, and a draft of 22.7 m.

Figure 2. *Ocean Onyx* semi-submersible platform.

The following information was provided by Beach Energy:

- Drilling activity logs for the *Ocean Onyx,*
- Daily operational logs for the Development Drilling program,
- Daily vessel activity logs, and
- Vessel locations in ~15-minute increments from the Siem navigation systems.

The operational and activity logs used local time, which was Australian Eastern Daylight Time (AEDT), UTC+11 until 4 Apr 2021 at 3:00 am, when they changed over to Australian Eastern Standard Time (AEST), UTC+10. Therefore, AEDT is considered local time for the monitoring program. Vessel location data, including and Automated Identification System (AIS) data, as well as other ancillary environmental data and JASCO's recorders use UTC as the time zone. Thus, to avoid potential confusion, all timestamps were converted to UTC.

The *Ocean Onyx* anchoring operation commenced on 11 Feb 2021 and completed on 12 Feb 2021 local time; therefore, 01:00 12 Feb 2021 UTC was considered the start of data with the *Ocean Onyx* moored and in location after all anchor handling was complete. The *Ocean Onyx* departed Artisan-1 on 28 Mar 2021, after commencing disconnect operations on 26 Mar 2021 local time; therefore, 00:00 25 Mar 2021 UTC was considered the end of drilling or rig operations for analysis purposes.

2.2. Vessel Traffic

Regional vessel movement information, including for the project vessels, was obtained from MarineTraffic (www.marinetraffic.com), with data supplied for the time range between 1 Feb 2021 and 5 Apr 2021 in the region. The requested area was 11,003 km^2, with the vertices shown in Table 5.

The supplied data used a one-hour timestamp for vessel locations and all data were derived from satellites, with no terrestrial reporting stations in the vicinity. Figure 3 shows the marine traffic in the project area, derived from vessels broadcasting on the Automated Identification System (AIS), with a map focused on Artisan-1 shown in Figure 4.

Table 5. MarineTraffic data request bounds.

Vertex	Latitude (S)	Longitude (E)	MGA Zone 54 (GDA94)	
			X (m)	*Y* (m)
1	38° 38.71418'	142° 15.17165'	609029.0	5721846.24
2	38° 36.92154'	143° 55.51902'	754698.76	5721846.24
3	39° 17.70699'	143° 57.20532'	754698.76	5646313.77
4	39° 19.54340'	142° 15.89490'	609029.0	5646313.77

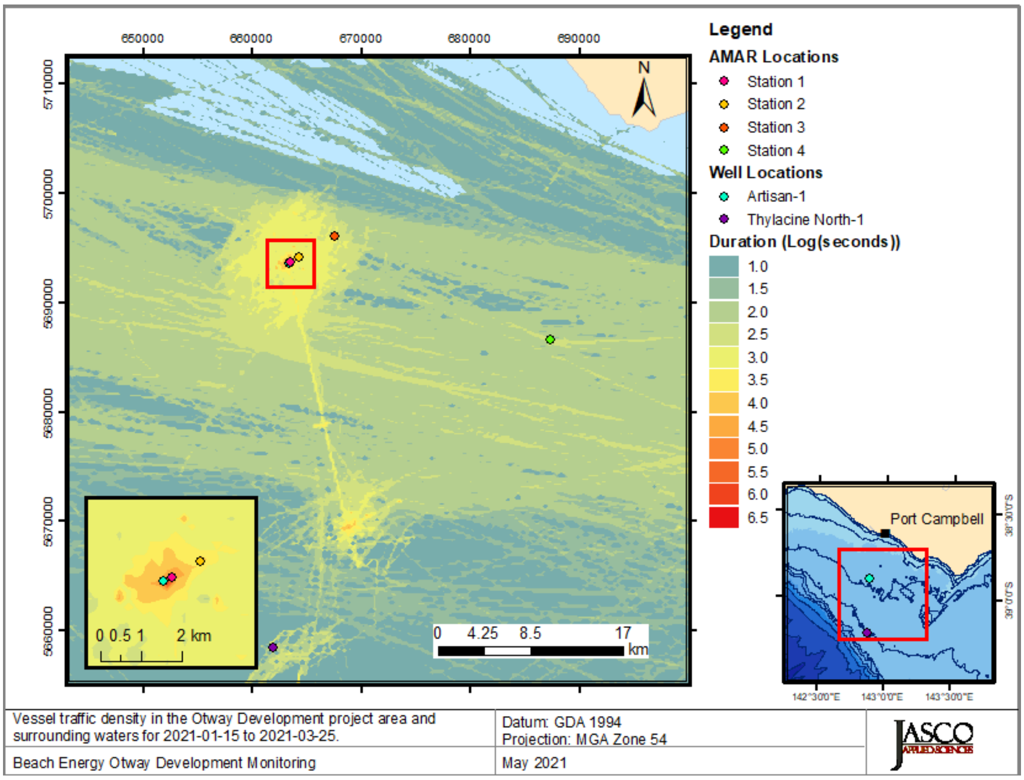

Figure 3. Vessel traffic density within the Development Drilling project area and surrounding waters for 15 Jan to 25 Mar 2021.

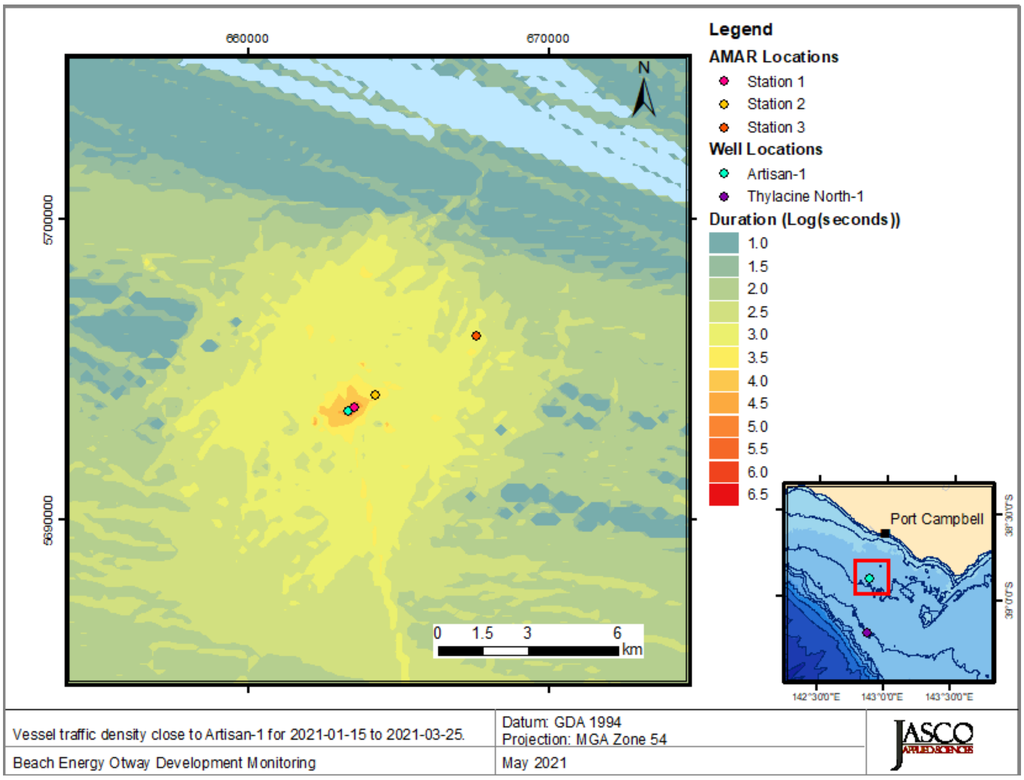

Figure 4. Vessel traffic density near Artisan-1 for 15 Jan to 25 Mar 2021.

2.3. Weather Conditions

Weather conditions at Artisan-1 were quantified through nowcast data provided by MetraWeather (Australia) for the period 00:00 on 1 Feb through until 24:00 6 Apr 2021 (UTC). The data included the following parameters:

- Significant wave height,
- Peak wave period,
- Peak wave direction,
- Significant wave height of swell >8 second period,
- Average wind speed,
- Wind direction, and
- Maximum wind gust speed.

Figure 5 shows the wave and swell weight, and Figure 6 shows the wind and gust speeds.

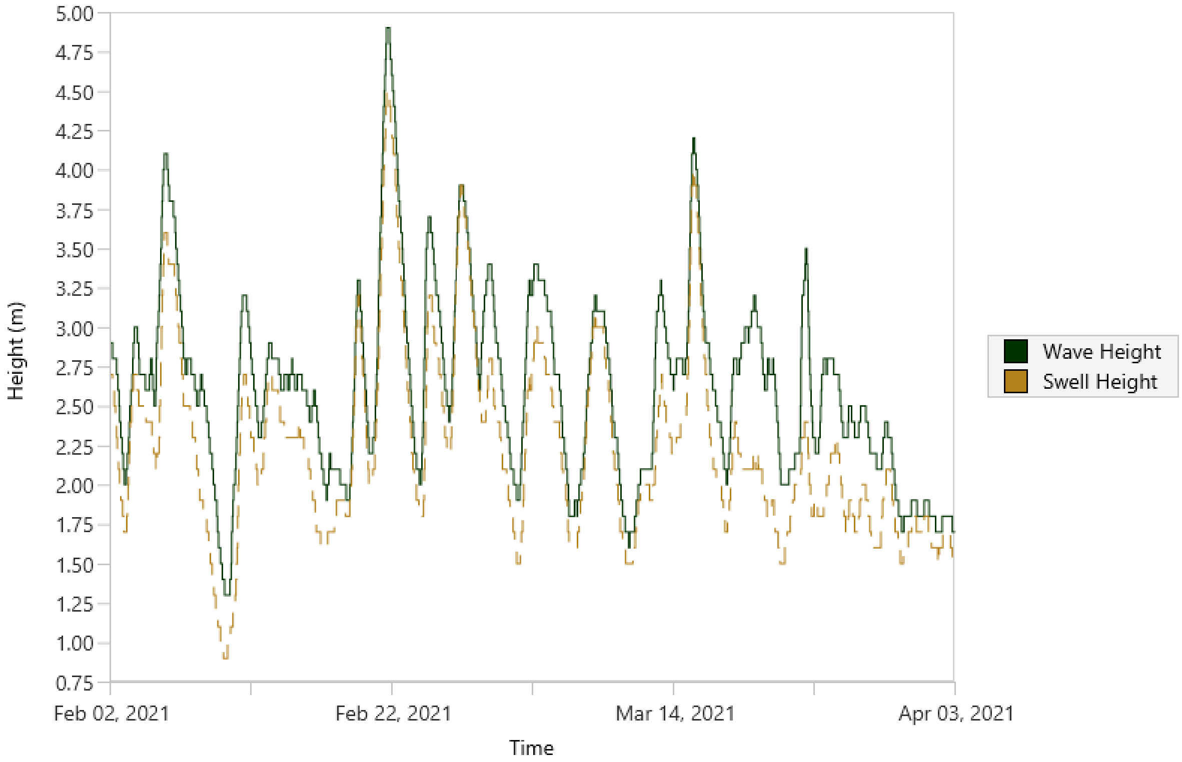

Figure 5. Hourly significant wave height (m) and significant swell height (m), with a period of greater than 8 seconds.

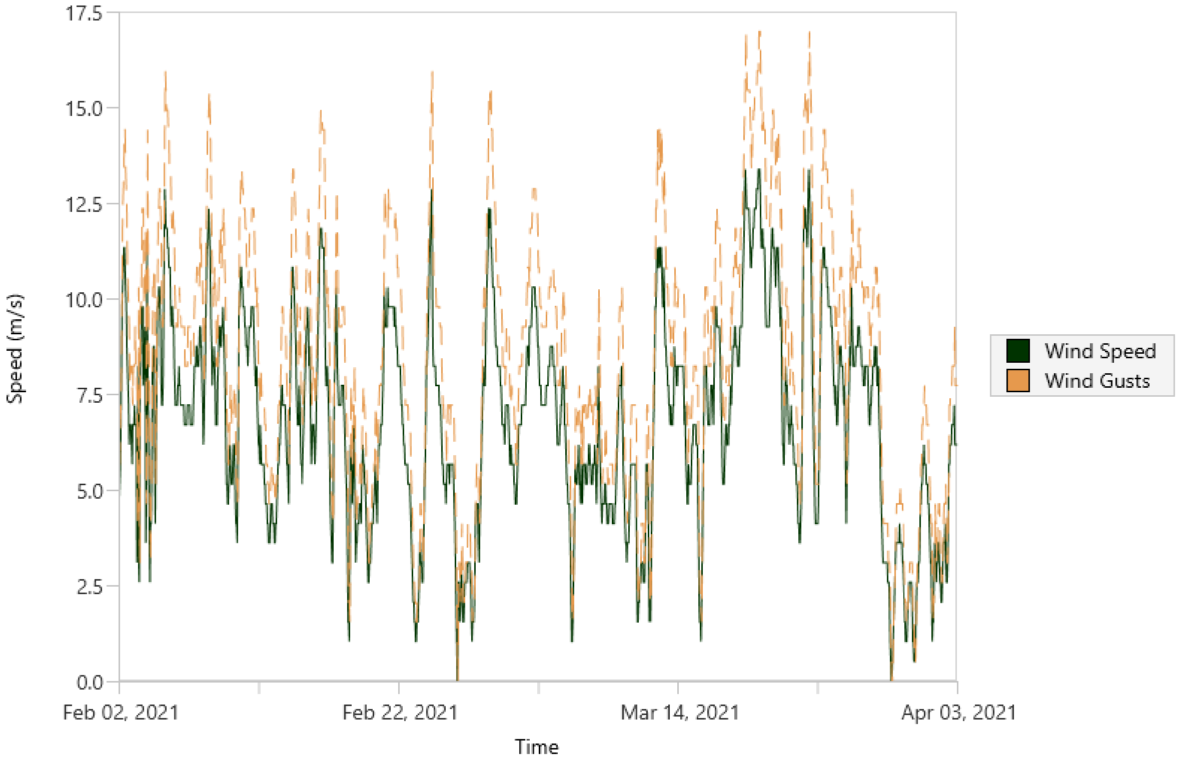

Figure 6. Hourly average wind speed (m/s) and maximum gust speed (m/s).

2.4. Geology

The propagation model used in this study considers a single geologic seabed profile for the Artisan area. The previous work by Koessler et al. (2020) considered two geologic and associated geoacoustic profiles. For deeper areas closer to the continental shelf edge, a profile characterised by well-cemented carbonate caprock (calcarenite) overlying semi-cemented calcarenite was used. Closer to the Artisan area the seabed, located in shallower waters, was characterised by a thin veneer of coarse sand/gravel overlying cemented and semi-cemented carbonate rock. This profile was selected based on a mixture of previous modelling studies (Wood and McPherson 2018) and client supplied geologic reports.

All these sources support a generalised geologic structure within the first 100 m seabed consisting of cemented or semi-cemented calcareous rock (‘calcarenite’) on the continental shelf within Artisan area. Collated information also indicated that there was the potential for a thin layer of coarse sand that could overlay the more cemented calcarenite. This was also indicated by seafloor sediment grab samples from the MARS sediment database (Heap 2009). The seabed environment was considered to be consistent with larger scale geological data and interpretations of the Australian continental shelf environment as summarised by James and Bone (2010), who indicated that the sediments along the continental shelf may be subject to transport and erosion yielding non-uniform distributions of seafloor sediment thickness.

2.5. Specific Source Measurement Operations

2.5.1. MODU Measurements

No operational requirements were requested of the *Ocean Onyx* or attendant support vessels while conducting resupply or standby operations during the drilling program due to the complexity of operationally meeting any requests. Over the course of the monitoring program, the MODU and support vessels engaged in different operational states, with different uncontrollable contributors, such as variable drilling operations, resupply and support operations, weather conditions, and merchant shipping. Operational details were obtained from the provided logs (Section 2.1).

2.5.2. Support Vessel Measurements

Specific operations were defined for the characterisation of the support vessels prior to the *Ocean Onyx* being moored, and while in transit to and from Geelong. For transit measurements, vessels were requested to pass along a defined track line according to ANSI S12.64 (R2014), with the vessel maintaining the straightest track possible and a requested separation from the AMAR of 150 m at the closest point of approach (CPA), with a water depth of 70 m. In deep water vessel noise measurements, it is a requirement for the vessels to be a minimum of either 100 m or one vessel length away from the recorder; in this case the typical vessel length is 91 m. Whilst there are standards for deep water source level measurements, there are none for shallow water environments. Methods to make accurate shallow water measurements of vessel source levels are currently being investigated by JASCO and DW Ship Consult for Transport Canada, with the findings to contribute to standard development (Ainslie et al. 2020); these methods were considered during the design of this study where possible.

The transit measurement track defined at Station 4 is shown in Figure 7, and in increased detail in Figure 8.

For measurements of dynamic positioning (DP), three exercises were defined, with *Exercise Two* completed twice. The three exercises all commenced at a horizontal separation of 150 m from the AMAR:

- *Exercise One*: Vessel to hold station, broadside to AMAR and operate at weather determined power levels for a minimum of 5 minutes.
- *Exercise Two*: Vessel to hold station, broadside to AMAR, then induce maximum reasonable thrust level and move in a perpendicular direction away from the AMAR in the up current direction for two minutes, reset and repeat exercise.
- *Exercise Three*: Vessel to hold station, broadside to AMAR, then using DP, step the vessel to the corners of a 10 × 10 m box using weather determined thruster levels.

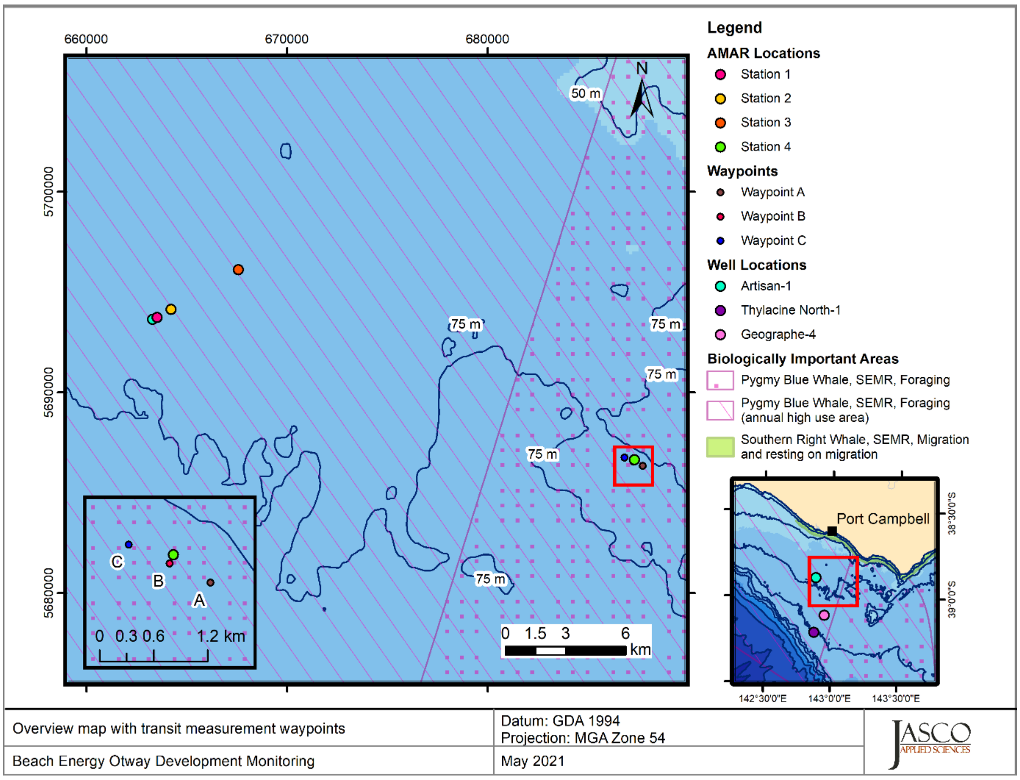

Figure 7. Map showing AMAR locations along with the three waypoints for the measurement track at Station 4 for transit vessels, Waypoints A, B, and C.

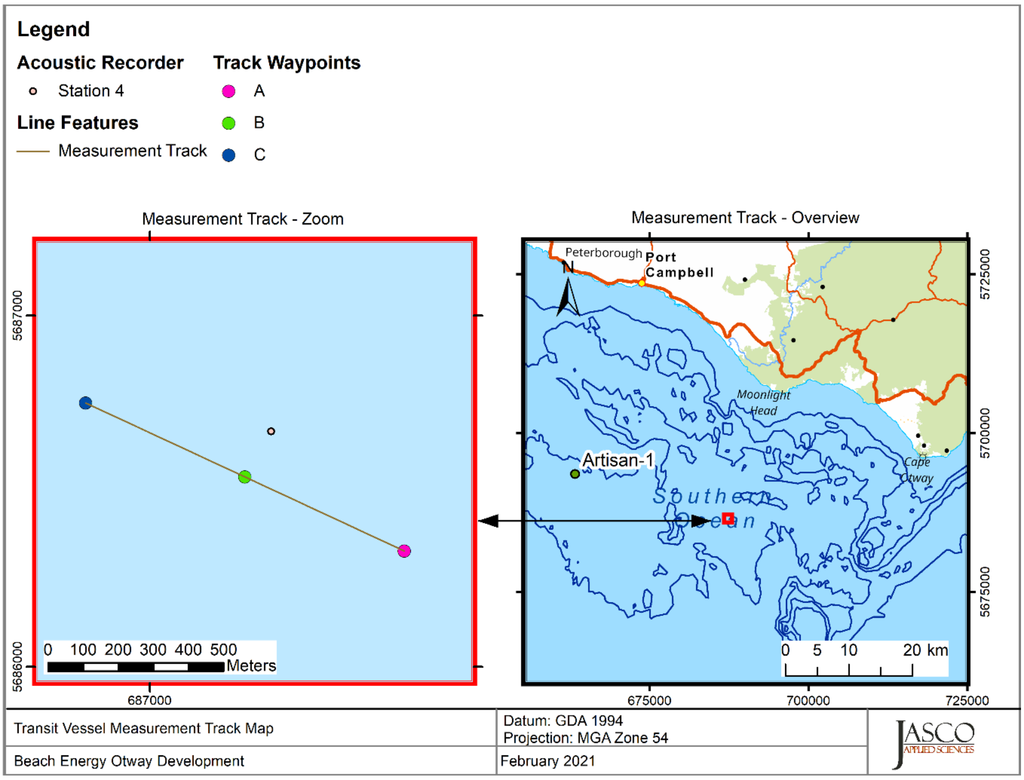

Figure 8. Zoom in of measurement track at Station 4 for transit vessels, as shown in Figure 7.

2.6. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is first necessary to establish exposure criteria (thresholds) for which sound levels may be expected to have a negative effect on animals. Whether acoustic exposure levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed sound exposure level (SEL) based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, sound pressure level (SPL), and SEL (Appendix A), are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over a 24 h time period. Appropriate subscripts indicate any applied frequency weighting applied. The acoustic metrics in this report reflect the amended ANSI and ISO standards for acoustic terminology, ANSI S1.1 (S1.1-2013), and ISO 18405:2017 (2017a).

The following thresholds and guidelines for this study were chosen because they represent the best available science, and sound levels presented in literature for fauna with no defined thresholds:

1. Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from the US National Oceanic and Atmospheric Administration (NOAA) Technical Guidance (NMFS 2018) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals for non-impulsive sources.
2. Marine mammal behavioural threshold based on the current interim U.S. National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources.

The criteria applied in this study to assess possible effects of vessel noise on marine mammals are summarised in Table 6, with frequency weighting explained in Appendix E.

Table 6. Criteria for effects of continuous noise exposure, including vessel noise, for marine mammals: Unweighted sound pressure level (SPL) and 24 h sound exposure level (SEL_{24h}) thresholds.

Hearing group	NOAA (2019)	NMFS (2018)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2 s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2 s)
Low-frequency (LF) cetaceans	120	199	179
High-frequency (HF) cetaceans		198	178
Very high-frequency (VHF) cetaceans		173	153
Phocid seals		201	181
Otariid seals		219	199

L_p denotes sound pressure level period and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa^{2}s.

3. Marine Acoustic Environment

3.1. Ambient Ocean Soundscape

The ambient acoustic environment, or soundscape, consists of cumulative contributions from abiotic (geophonic), biotic (biophonic), and man-made (anthrophonic) sound sources (Krause 2008). Variation in soundscape characteristics over time and space can act as proxies for geographical, biological, and anthropogenic events occurring within an environment.

In the marine environment, geophonic elements of the soundscape commonly correlate with oceanographic conditions. Increased sea state and wind speed lead to higher sound intensities across frequencies ranging from 500 Hz to 30 kHz, via sound produced by breaking waves, cavitation, surface flow noise, and pressure changes (Knudsen et al. 1948, Wenz 1962) (Figure 9). Rainfall elevates sound levels in the 1–15 kHz frequency range, via surface impacts and bubble entrainment (Heindsmann et al. 1955, Bom 1969, Scrimger et al. 1987). The specific frequency band affected by rainfall depends on rain strength and droplet size. Abiotic acoustic contributions are often unpredictable or irregular (Urick 1983). For example, significant low frequency acoustic energy can be contributed to marine soundscapes by earthquakes and sea ice movement (Urick 1974, Matsumoto et al. 2014). On the other hand, biophonic contributions often feature seasonal and diel activity patterns (Hannay et al. 2013, Erbe et al. 2017). Water movement, or flow noise, is considered to be a pseudo-noise that results from eddies and vortices forming as water flows past an acoustic receiver, and is not considered to be part of a marine soundscape (Strasberg 1979).

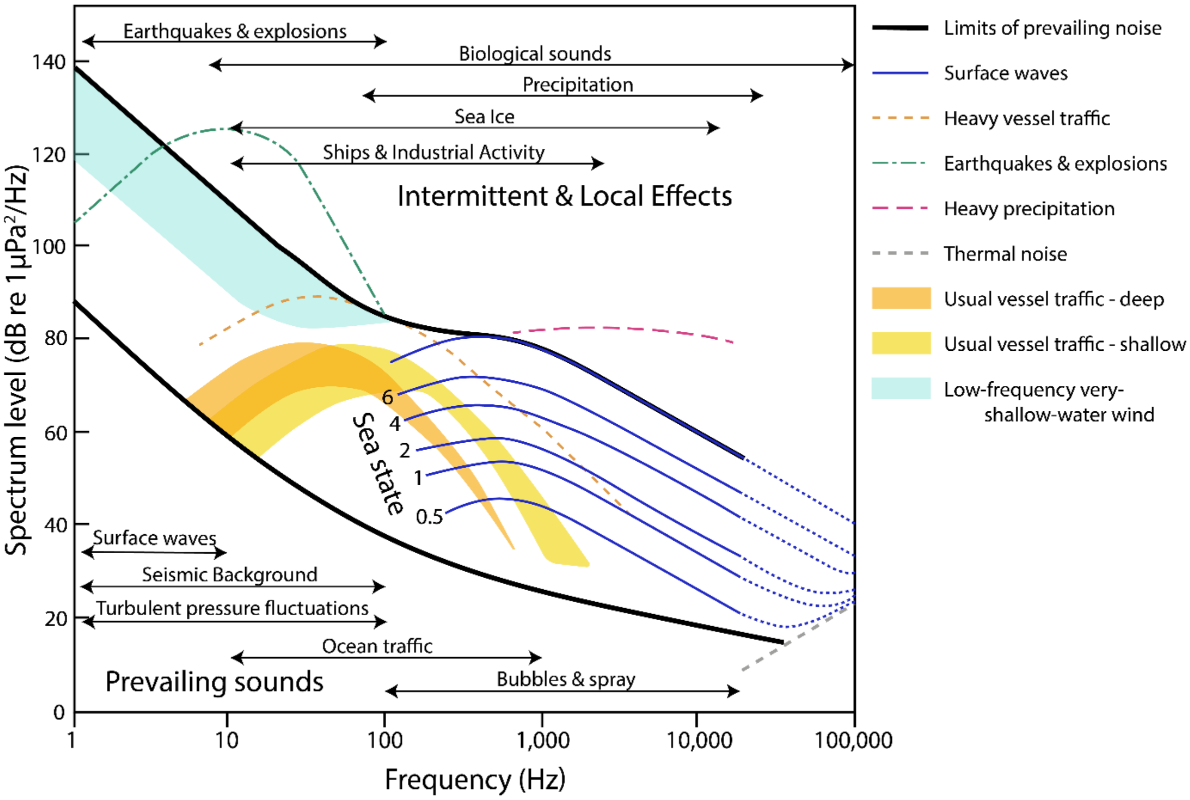

Figure 9. Wenz curves describing pressure spectral density levels of marine ambient sound from weather, wind, geologic activity, and commercial shipping (adapted from NRC 2003, based on Wenz 1962). Thick lines indicate limits of prevailing ambient sound.

3.2. Anthropogenic Contributors to the Soundscape

Anthropogenic (human-generated) sounds are relatively recent additions to soundscapes and, unlike biophonic contributors, often overlap in frequency, space, or time (Cato 1997, van Opzeeland and Boebel 2018). Anthrophonic contributors to global ocean noise include vessel traffic (commercial and recreational) at frequencies mainly in the frequency band 50–500 Hz. This sound can be a by-product of vessel operations, such as engine sound radiating through vessel hulls and cavitating propulsion systems, or it can be a product of active acoustic data collection with seismic surveys, military sonar, and depth sounding as the main contributors.

Marine construction projects involve vessel operations and project specific noise sources that can produce a range of both impulsive and non-impulsive noise. The contribution of anthropogenic sources to the ocean soundscape has increased from the 1950s to 2010, largely due to greater maritime shipping traffic (Ross 1976, Andrew et al. 2011). Oil and gas exploration with seismic airguns, marine pile driving, and oil and gas production platforms elevate sound levels over significant ranges when present (Bailey et al. 2010, Miksis-Olds and Nichols 2016, Delarue et al. 2018).The extent of seismic survey sounds has increased substantially following the expansion of oil and gas exploration into deep water, and seismic sounds have been detected across ocean basins (Nieukirk et al. 2004). Recent trends suggest that global sound levels are leveling off or potentially decreasing in some areas (Andrew et al. 2011, Miksis-Olds and Nichols 2016).

A recent paper examining seasonal fluctuations of ambient sound level in the Pacific Ocean (Ainslie et al. 2021) determined that a 5 dB increase in ambient sound level in the frequency range 63–125 Hz was caused by increases in vessel traffic and vessel size in the second half of the 20th century. A larger (approximate 10 dB) increase at lower frequencies (~16–32 Hz), often attributed incorrectly to shipping, occurs in bands dominated by baleen whale vocalisations. This paper also found that the seasonal dependence in ambient sound level is explained by seasonal changes in average sea surface temperature. This work provides a holistic and valuable examination of long-term trends.

3.3. Soniferous Marine Life

Biophonic contributors to marine soundscapes include tonal and pulsive vocalisations produced by marine mammals, fish, and invertebrates to communicate, orientate, and feed. Seasonal trends in biophonic sounds can act as proxies for behaviours, such as the migration of whales (e.g., Leroy et al. 2016, Gavrilov et al. 2018, Jolliffe et al. 2019). Other sounds of animal origin that contribute to marine soundscapes include by-products of behaviour, such as the snaps produced by snapping shrimp (*Alpheus heterochaelis*) during agonistic or foraging behaviours (Versluis et al. 2000). Snapping shrimp can increase background sound levels by a factor of 10 (20 dB) in the 500 Hz to 20 kHz frequency band (Hildebrand 2009). When a large number of sound-producing animals are present, both voluntary and involuntary sounds can combine to generate choruses where individual sounds cannot be distinguished. Chorusing fish can temporarily elevate the background sound levels by greater than tenfold in the 100 and 2000 Hz frequency band (Cato 1992, Zelick et al. 1999).

Diel trends in choruses can be indicative of time-specific behaviours, such as crepuscular or nocturnal fish activity (McCauley and Cato 2000, D'Spain and Batchelor 2006, McCauley and Cato 2016), with a variety of different species contributing the to the soundscape (Parsons et al. 2016, Parsons et al. 2017).

Many fish species produce sound during the breeding season or when engaged in agonistic behaviours (Amorim 2006). Several species of gadids (cod family), such as Northern cod (*Gadus morhua*) and haddock (*Melanogrammus aeglefinus*), form spawning aggregations that have been detected acoustically (Nordeide and Kjellsby 1999, Hawkins et al. 2002). The acoustic monitoring of fish is hindered by a limited understanding of their acoustic repertoire and behaviour. Nevertheless, the stereotypical nature of acoustic signals produced by some species have led to the development of dedicated acoustic detectors (e.g., cod; see Urazghildiiev and Van Parijs 2016). These detectors allow for a more systematic analysis of acoustic data for fish occurrence. Irrespective of species identity, fish choruses can raise ambient noise levels and therefore influence local soundscapes (Erbe et al. 2015).

The main, best documented, biological contributors to the ocean soundscape are marine mammals. All studied cetacean and pinniped species produce sounds ranging in frequency from ~8 Hz for blue whale (*Balaenoptera musculus*) and fin whale (*B. physalus*) vocalisations to 150 kHz for some porpoise and dolphin vocalisations (Richardson et al. 1995).

Baleen whale sounds can double background sound levels within their frequency bands and persist for extended periods of time (McDonald et al. 2008), such as species off southern Australia, including pygmy blue and southern right whales, that are all notable contributors when present (Cato 1991, McCauley et al. 2001, Gavrilov and McCauley 2013, Erbe et al. 2016, McPherson et al. 2017). For instance, fin whale songs can raise noise levels in the 18–25 Hz band by 15 dB for extended durations (Simon et al. 2010).

Marine mammals, cetaceans in particular, rely almost exclusively on sound for navigating, foraging, breeding, and communicating (Clark 1990, Edds-Walton 1997, Tyack and Clark 2000). Although species differ widely in their vocal behaviour, most can be reasonably expected to produce sounds on a regular basis. Passive acoustic monitoring is therefore increasingly preferred as a cost-effective and efficient survey method. Seasonal and sex- or age-biased differences in sound production, as well as signal frequency, source level, and directionality, all influence the applicability and success rate of acoustic monitoring, thus its effectiveness must be considered separately for each species.

In most cases, baleen whale signals can be reliably identified to the species level, although, seasonal variation in the types of vocalisations produces results in seasonal differences in our ability to detect these species acoustically. For example, the tonal signals produced by blue, fin, and sei (*B. borealis*) whales tend to show lots of similarities in late spring and summer, but they are markedly different from September to April. These issues are considered and discussed on a case-by-case basis.

Knowledge of the acoustic signals of the marine mammals expected in the study area varies across species. These sounds can be split into two broad categories: Tonal signals, including baleen whale moans and delphinid whistles, and echolocation clicks produced by all odontocetes mainly for foraging and navigating. Although the signals of most species have been described to some extent, these descriptions are not always sufficient for reliable, systematic identification, let alone to design automated detectors to process large data sets.

3.4. Changes to Sound as it Travels in the Ocean

A key question in the study of underwater sound is how a sound changes in nature as it propagates from its source to a receiver some distance away. Understanding and modelling sound propagation in the ocean is a complex topic that is the subject of numerous studies. This section provides a descriptive overview of key sound propagation concepts to assist with the results presented in this report. These concepts are integral to interpreting how sounds emitted by a source are transformed into those received some distance away. The sounds are transformed by 1) geometric spreading losses; 2) reflection, scattering, and absorption at the seabed and sea surface; 3) refraction due to changes in sound speed with depth; and 4) absorption by sea water. This section does not address point 3), as sound refraction plays only a minor role in shallow water, such as the Otway Development area.

At one extreme, the echolocation clicks of porpoises at 130 kHz travel only 500 m before becoming inaudible (Au et al. 1999). At the other extreme, sounds from fin whales (20 Hz) and low frequency energy from seismic airguns (5–100 Hz) can be detected thousands of km away under the right conditions (Nieukirk et al. 2012).

Geometric spreading losses: Sound levels from an omnidirectional point source in the water column are reduced with range, a process known as *geometric spreading loss*. As sound leaves the source, each spherical sound wave propagates outward and the sound energy is spread out over this ever-expanding sphere. The farther you are from the source, the lower the sound level you will receive. The received sound pressure levels at a recorder located a distance R (in m) from the source are $20\log_{10}R$ dB lower than the source level (SL) referenced to a standard range of 1 m. However, the sound cannot spread uniformly in all directions forever. Once the waves interact with the sea surface and seabed, the spreading becomes cylindrical rather than spherical and is limited to the cylinder formed by the surface and seabed with a lower range-dependent decay of $10\log_{10}R$ dB. Thus, the water depth is a key factor in predicting spreading losses and thus received sound levels. These spherical and cylindrical spreading factors provide limits for quick approximations of expected levels from a given source. In very shallow waters, sound rapidly attenuates if the water depth is less than a quarter of a wavelength (Urick 1983).

Reflection, scattering, absorption at the sea surface and seabed: If geometric spreading were the only factor governing sound attenuation in water, then at a given distance from a source, sound levels in shallow waters would almost always be higher than those in deep waters. In shallow water, however, the sound interacts with the seabed and sea surface more often than sound travelling in deep waters does, and these interactions reflect, absorb, and scatter the sounds. The sea surface behaves approximately as a pressure release boundary, where incident sound is almost completely reflected with opposite phase. As a result, the sum of the incident and reflected sounds at the sea-surface is zero. At the seabed, many types of interactions can occur depending on the composition of the bottom. Soft silt and clay bottoms absorb sound, sand and gravel bottoms tend to reflect sound like a partially reflective mirror, and some hard yet elastic bottoms, such as limestone, reflect some of the sound while absorbing some of the energy by converting the compressional waves to elastic shear waves.

Absorption by sea water: As sound travels through the ocean, some of the energy is absorbed by molecular relaxation in the seawater, which turn the acoustic energy into heat. The amount of absorption that occurs is quantified by an attenuation coefficient, expressed in units of decibels per kilometre (dB/km). This absorption coefficient depends on the temperature, salinity, pH, and pressure of the water, as well as the sound frequency. In general, the absorption coefficient increases with the square of the frequency, so low frequencies are less affected. The absorption of acoustic wave energy has a noticeable effect (>0.05 dB/km) at frequencies above 1 kHz. For example, at 10 kHz the absorption loss over 10 km distance can exceed 10 dB, as computed according to the formulae of François and Garrison (1982a, b).

4. Methods

4.1. Acoustic Data Acquisition

Underwater sound was recorded with four Autonomous Multichannel Acoustic Recorders (AMARs, JASCO; Figure 10). The AMARs were each fitted with M36 omnidirectional hydrophones (GeoSpectrum Technologies Inc., −164 re 1 V/µPa at 1 kHz sensitivity) and recorded continuously at 24-bit resolution at 64 kHz. Three AMARs stored acoustic data with three SD cards with 512 GB memory each (1.5 TB total), and one AMAR (Station 4) used seven SD-cards with 512 GB memory each (3.5 TB total). Appendix C provides details about the calibration procedure.

The deployment of the AMARs coincided with an inspection trip of the pre-laid anchors at the Artisan 1 drilling location by the Siem *Sapphire*. They were deployed on 3 Feb 2021, for an intended deployment duration of approximately 60 days. The deployment of one of the moorings is shown in Figure 11. The mooring at Station 3 released upon contact with the seafloor, potentially due to the lander striking a rock on the seafloor. It was immediately retrieved, and after sourcing a new weight plate and being re-configured, it was re-deployed on 24 Feb 2021. The retrieval of the moorings was conducted by Beach under guidance from JASCO on 3 Apr 2021.

The AMARs were deployed as part of a JASCO C-lander, with tandem acoustic releases (Figure 10). Each mooring consisted of:

- An AMAR G4 and battery packs,
- A Xeos Apollo Locator Beacon,
- Custom syntactic foam,
- A tandem acoustic release system (EdgeTech), and
- An anchor weight.

The AMAR hydrophones were protected by a hydrophone cage, which was covered with a nylon shroud to minimise noise artifacts from water flow (described in Section 3.1). The AMAR at Station 4 was configured with three hydrophones to allow for directional analysis (Thode et al. 2019).

Figure 10. The four C-Lander bottom moorings with Autonomous Multichannel Acoustic Recorders (AMAR G4s; JASCO) used for the project prior to loading onto the Siem *Sapphire*.

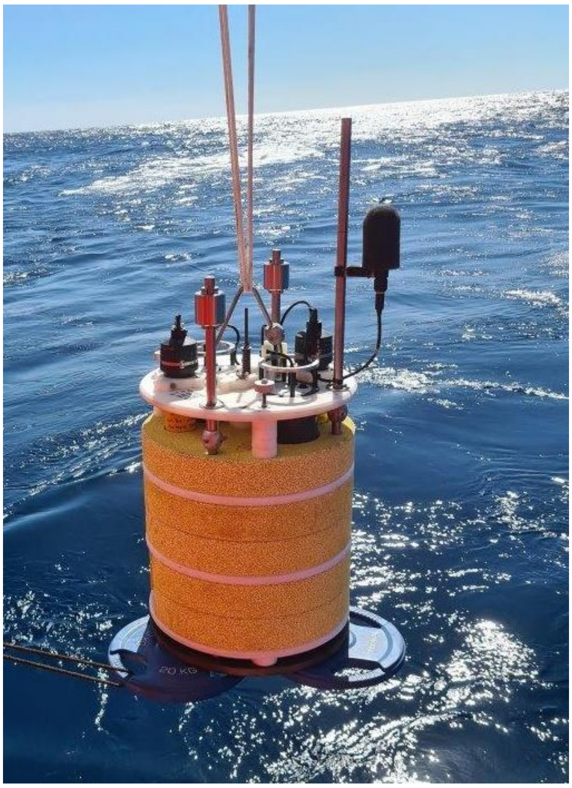

Figure 11. A single hydrophone C-Lander bottom mooring during deployment.

Table 7. Operation period, location, and depth of the Autonomous Multichannel Acoustic Recorders (AMARs) deployed at the Otway Project Area

Station	AMAR	Deployment	Recording duration (days)	Retrieval	Deployment duration (days)	Hydrophone details
1	628	3 Feb 2021	63	3 Apr 2021	58	One M36-V35-900
2	626	3 Feb 2021	63	3 Apr 2021	58	
3	627	24 Feb 2021	42	3 Apr 2021	37	
4	629	3 Feb 2021	63	3 Apr 2021	58	Three M36-V35-900

4.2. Data Analysis

The AMARs collected approximately 10.46 TB of acoustic data during this study, the equivalent of 1 year and 85 days JASCO used a specialised computing platform (PAMlab; JASCO) capable of processing acoustic data hundreds of times faster than real time. The system performed automated analysis of total ocean noise and sounds from vessels, other anthropogenic sources, and marine mammal vocalisations to provide context for the ambient ocean soundscape, anthropogenic contributors, and soniferous marine life (Section 3). Appendix D outlines the stages of the automated analysis.

4.2.1. Total Ocean Sound Levels

The data collected for the project spanned a frequency band between 10 Hz and 32 kHz. The goal of the total ocean sound analysis was to present the expansive data in a manner that documented the underwater sound conditions near Artisan-1 and allowed a comparison over time, along with external factors that change sound levels, such as weather and human activities.

The first stage of the total sound level analysis involves computing the peak sound pressure level and root-mean-square sound pressure level (SPL) for each minute of data collected. This reduced the data to a manageable size without compromising the value for characterising the soundscape (ISO 2017b, Ainslie et al. 2018, Martin et al. 2019). The SPL analysis was performed by averaging 120 fast-Fourier transforms (FFTs) that each include 1 s of data with a 50% overlap and that use the Hann window to reduce spectral leakage. The 1-minute average data were stored as power spectral densities (1 Hz resolution up to 455 Hz and millidecades frequency bands above 455 Hz) and summed over frequency to calculate decidecade band SPL levels. The millidecade band analysis approach is described in Martin et al. (2021). Millidecades are logarithmically spaced frequency bands but have a bandwidth equal to 1/1000th of a decade. The use of millidecades instead of 1 Hz frequency bands reduces the size of the spectral data by a large factor without compromising the use of the data.

Decidecade band levels are very similar to 1/3-octave-band levels. Table B-1 lists the decidecade band frequencies, and Table B-2 lists the decade-band frequencies. The decidecade analysis sums the frequency range from the millidecade bands (representing the frequency range 10 Hz to 32 kHz) in the power spectral density data to a manageable set of 45 bands. The decade bands further summarise the sound levels into four frequency bands for manageability. Detailed descriptions of the acoustic metrics and decidecade analysis can be found in Appendices B.1 and B.2.

In Section 5, the total sound levels are presented as:

- **Band-level plots**: These strip charts show the averaged received sound pressure levels as a function of time within a given frequency band. We show the total sound levels (across the entire recorded bandwidth from 10–32,000 Hz) and the levels in the decade bands of 10–100 (Decade A), 100–1000 (Decade B), 1000–10,000 (Decade C). The 10–100 Hz band is associated with pygmy blue whales, large shipping vessels, flow (or pseudo-noise) and mooring noise, and seismic survey impulses. Sounds within the 100–1000 Hz band are generally associated with the physical environment such as wind and wave conditions but can also include both biological and anthropogenic sources such as minke and humpback whales, fish, nearby vessels, seismic surveys, and pile driving. Sounds above 1000 Hz include high-frequency components of humpback whale sounds, odontocete whistles and echolocation signals, wind- and wave-generated sounds, and sounds from human sources at close range including pile driving, vessels, seismic surveys, and sonars.

- **Long-term Spectral Averages (LTSAs)**: These colour plots show power spectral density levels as a function of time (*x*-axis) and frequency (*y*-axis). The frequency axis uses a logarithmic scale, which provides equal vertical space for each decade increase in frequency and allows the reader to equally see the contributions of low and high-frequency sound sources. The LTSAs are excellent summaries of the temporal and frequency variability in the data.
- **Decidecade box-and-whisker plots**: In these figures, the 'boxes' represent the middle 50% of the range of sound pressure levels measured, so that the bottom of the box is the sound level 25th percentile (L_{25}) of the recorded levels, the bar in the middle of the box is the median (L_{50}), and the top of the box is the level that exceeded 75% of the data (L_{75}). The whiskers indicate the maximum and minimum range of the data.
- **Spectral density level percentiles**: The decidecade box-and-whisker plots are representations of the histogram of each band's sound pressure levels. The power spectral density data has too many frequency bins for a similar presentation. Instead, coloured lines are drawn to represent the L_{eq}, L_5, L_{25}, L_{50}, L_{75}, and L_{95} percentiles of the histograms. Shading is provided underneath these lines to provide an indication of the relative probability distribution. It is common to compare the power spectral densities to the results from Wenz (1962), which documented the variability of ambient spectral levels off the US Pacific coast as a function of frequency of measurements for a range of weather, vessel traffic, and geologic conditions. The Wenz levels are appropriate for approximate comparisons only because the data were collected in deep water, largely before an increase in low-frequency sound levels due to human activities (Andrew et al. 2011).
- **Daily sound exposure levels (SEL; $L_{E,\mathrm{24h}}$)**: The SEL represents the total sound energy received over a 24 h period, computed as the linear sum of all 1-minute values for each day. It has become the standard metric for evaluating the probability of temporary or permanent hearing threshold shift in marine mammals. Long-term exposure to sound impacts an animal more severely if the sounds are within its most sensitive hearing frequency range. Therefore, during SEL analysis, recorded sounds are typically filtered by the animal's auditory frequency weighting function (Appendix E) before integrating to obtain SEL. For this analysis, the 10 Hz and above SEL were computed as well as the SEL weighted by the marine mammal auditory filters (NMFS 2018).

4.2.2. Directional Processing: Maximum Likelihood Beamforming

A maximum likelihood beamformer was applied to direction finding of the Station 4 acoustic data. For random continuous and impulsive signals, such as ship noise, anthropogenic noise, and marine animal vocalisations, the beamforming technique is reduced to Distance of Arrival (DOA) estimation. The sufficient statistic for random signals is the sampled covariance matrix,

$$\boldsymbol{C}(f,t) = \sum_t^{t+T_C} \boldsymbol{x}(f,t)\boldsymbol{x}^+(f,t)\,, \tag{1}$$

computed using N-dimensional DFT spectrums of array outputs, $\boldsymbol{x}(f,t) = [x_1(f,t), \dots, x_N(f,t)]^T$; where $x_n(f,t) = DFT\{x_n(t)\}$ is the short-time discrete Fourier Transform of the output of the *n*th hydrophone, $x_n(t)$. The output of the beamformer can be represented as:

$$P(f,t,\theta,\varepsilon) = \boldsymbol{w}^+(f,\theta,\varepsilon)\boldsymbol{C}(f,t)\boldsymbol{w}(f,\theta,\varepsilon)\,, \tag{2}$$

where $\boldsymbol{w}(f,\theta,\varepsilon) = [w_1(f,\theta,\varepsilon), \dots, w_N(f,\theta,\varepsilon)]^T$ is the N-dimensional vector of weighting coefficients of the array; and symbol "+" denotes transpose and complex conjugation, θ is the azimuth angle and ε is the estimation error. Figure 12 shows an example of the beamformer output in azimuth domain, $P(f,t,\theta,\varepsilon = 0)$. In this figure, colour represents the azimuth. The azimuth and elevation estimates of random signals can be computed for each frequency f and time slice t as:

$$\{\hat{\theta}(f,t), \hat{\varepsilon}(f,t)\} = arg \max_{\theta,\varepsilon} P(f,t,\theta,\varepsilon)\,. \tag{3}$$

An example of the directional information we obtain from this approach is shown in Figure 12. The performance of the beamformer is presented in Urazghildiiev and Hannay (2017). This method is most effective between 50 and 3000 Hz. The direction of true North was obtained using AIS data compared to vessel movements observed in the acoustic data.

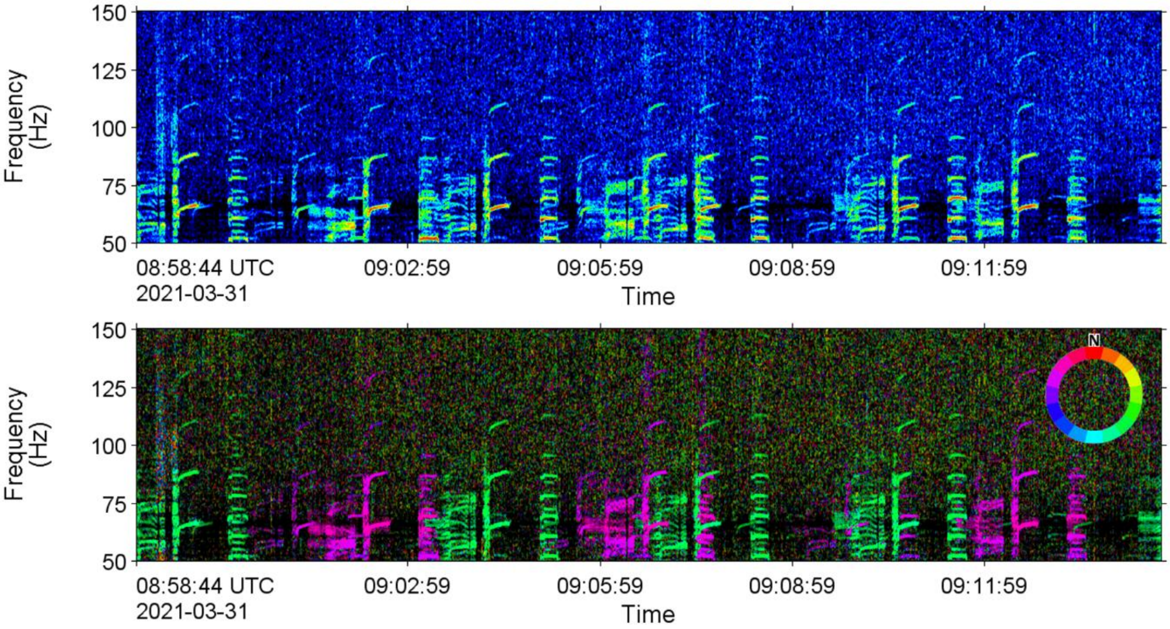

Figure 12. Spectrogram (top) versus directogram (bottom) of same data. In the directogram, colour represents the direction of arrival, with the colour legend shown in the top right corner. In the spectrogram, we cannot tell how many pygmy blue whales are vocalising; however, the directional information allows us to see that there were two animals singing.

4.2.3. Source Level Measurements with ShipSound

4.2.3.1. Overview

JASCO's ShipSound software monitors sound level measurements and AIS broadcasts from passing vessels. For vessel transiting scenarios, it identifies vessels that traverse a predefined transit area and then automatically extracts the corresponding acoustic data for analysis. It uses a vessel's broadcast speed together with a cepstral analysis of the Lloyd mirror pattern to determine the timing and location of closest point of approach (CPA) of the vessel's acoustic centre. For stationary sources, such as MODU or vessels in DP, it processes acoustic data within the specified period for the activity. ShipSound can analyse streaming data from a hydrophone in real time or, as in the case of the Beach Otway recorders, analyse archival hydrophone data downloaded from autonomous recorders. The vessel AIS data were based on Marine Traffic AIS data, vessel measurement logs, as well as client-provided data. AIS data were fed into the ShipSound system for vessel source level analysis. Environmental conditions, such as wind speed, were also recorded for each measurement. Ocean current data can be used to calculate speed through water (STW) from speed over ground (SOG) information received via AIS for each vessel measurement. However, current speed was not available in this project area, so STW was not calculated.

For transiting vessel measurements, the ANSI/ASA S12.64 data window is defined by the period over which the acoustic centre is within ±30° of the CPA. ShipSound can automatically determine the data window. For stationary sources, ShipSound determines the data window based on input specified time. ShipSound processes a single acoustic channel in 1-second periods stepped in 0.5-second intervals (Figure 13). Spectrum measurements are calculated using 1-second fast Fourier transforms, shaded using a Hanning window.

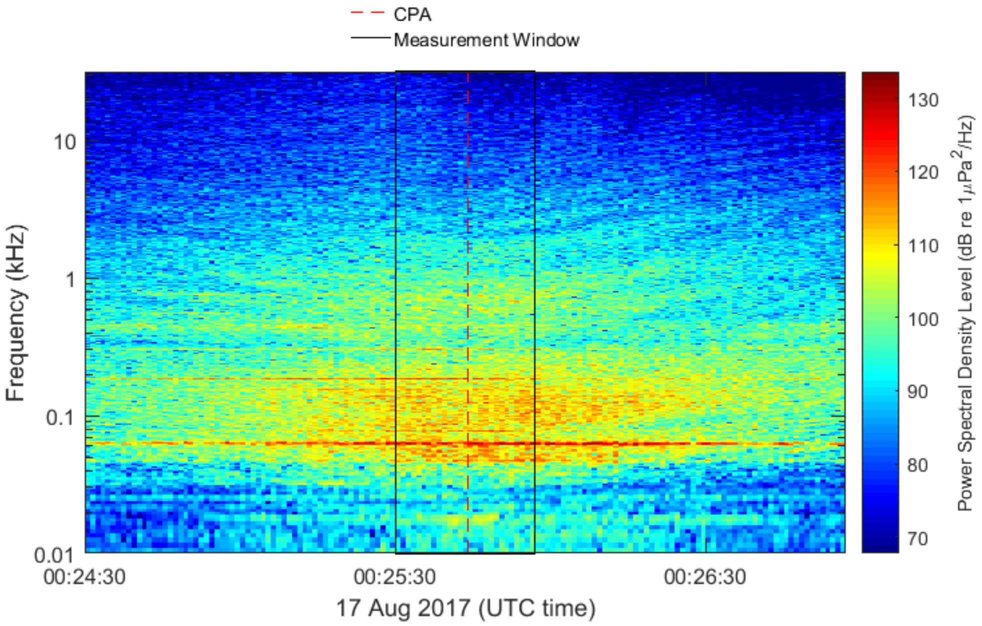

Figure 13. Spectrogram of a single transiting vessel measurement from ShipSound, showing the closest point of approach (CPA) time (dashed red line) and the measurement window (black box) used for calculating vessel source levels. The spectrogram shows the spectrum of the underwater sound pressure recorded on the hydrophone versus time and frequency.

ShipSound calculates two kinds of vessel source levels from the data window: Radiated Noise Level (RNL) and Monopole Source Level (MSL). RNL is equal to the measured sound pressure level, back-propagated according to the distance between a source and the hydrophone. The software applies the ANSI/ASA S12.64 Grade-A method for back-propagation distance: it determines instantaneous vessel range (R) in metres from the measurement hydrophone for each 1-second step within the data window. The RNL back propagation method of 20 x $\mathrm{Log}_{10}(R)$ is applied to the spectra of each step separately. MSL is equal to the measured sound pressure level scaled according to a numerical acoustic propagation loss (PL) model that accounts for the effect of the local environment on sound propagation (i.e., sea-surface reflection, water column refraction and absorption, and bottom loss). Since no single acoustic model is applicable at all sampled ranges and frequencies, a hybrid TL model was used to calculate MSL as follows:

1. At frequencies less than 4 kHz and ranges less than 120 m, PL was calculated using a wavenumber integration model (Hannay et al. 2010, Jensen et al. 2011), which computes reflection coefficients for layered elastic media (Brekhovskikh 1980).
1. At frequencies less than 4 kHz and ranges greater than 240 m, PL was calculated using a wide-angle parabolic equation model (Collins 1993), modified to treat reflection losses for an elastic seabed using a complex-density equivalent fluid approximation (Zhang and Tindle 1995).
2. At frequencies less than 4 kHz and ranges between 120 m and 240 m, PL was calculated from the average of the parabolic equation and wavenumber integration models.
3. At frequencies greater than 4 kHz, PL was calculated using an image-method model (Brekhovskikh and Lysanov 2003), which accounts for surface and seabed reflection coefficients and frequency-dependent absorption (François and Garrison 1982b).

Average TL in each decidecade band was based on the mean propagation factor calculated at 50 frequencies, which were spaced logarithmically between the minimum and maximum band limits. Mean source depth for the MSL calculation was taken to be:

1. For vessel transit, source depth is defined as shaft depth minus 0.7 of the propeller radius. The stern propeller diameter of 4.2 m was used for the calculation.
2. For vessel in DP, since all the thrusters were operating and each are at different depths, the source depth is defined as 0.7 times vessel static draft reported on AIS.
3. For the MODU, the source depth is defined as half the static draft reported on AIS, which gives 11 m of the source depth.

The TL was smoothed by assuming the source depth had a Gaussian distribution, in a manner similar to Wales and Heitmeyer (2002), where the standard deviation was taken to be 30% of the source depth. Additional details regarding the automated source level measurement system are given in Hannay et al. (2016b). ShipSound also calculates background noise in each frequency band. For vessel measurements, ShipSound only accepts measured source band levels if they exceed the background levels by 3 dB or more. ShipSound corrects the band levels if they exceed background levels by 3–10 dB but rejects them if they are less than 3 dB above background. Adjusted and rejected levels are flagged in the database. Figure 14 summarises this approach.

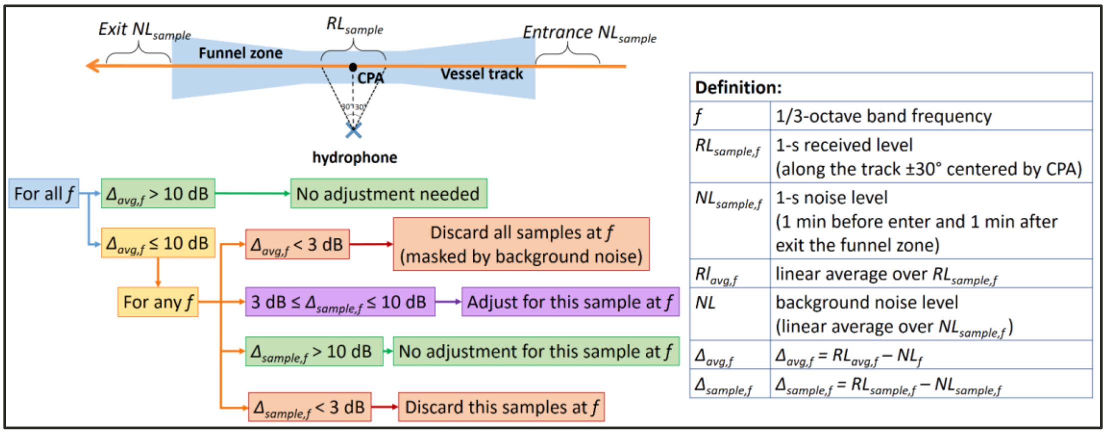

Figure 14. Background noise comparison and adjustment process.

PortListen includes a web-based user interface to access vessel and measurement information. A table view screen lets the user select and view multiple measurements by vessel criteria. This information, including broadband MSL and RNL source levels, can be exported as a spreadsheet. Vessel measurements are summarised in PDFs, presenting vessel and environment information, and the 1/3-octave-band MSL and RNL source levels. A manual quality review of every measurement was performed by an experienced analyst using the web-based interface. An analyst may reject a measurement because it contains interference from other vessels, has high levels of background noise, or if a vessel does not have constant speed and a straight track inside the data window.

MSL was the preferred metric for noise modelling because MSL back-propagation better accounts for the effect of the environment on vessel source levels (e.g., from absorption, surface, and seabed reflections) than RNL back-propagation. Measurements for vessel transits were obtained at different speeds, Ross's classical power law model (Ross 1976) was used to adjust the source levels to a reference speed. The change in source level (SL) to relative changes in speed:

$$\mathrm{SL} - \mathrm{SL}_{\mathrm{ref}} = C_v \times 10 \log_{10}\left(\frac{v}{v_{\mathrm{ref}}}\right). \tag{4}$$

In this equation, SL is the source level at speed v, $\mathrm{SL}_{\mathrm{ref}}$ is the source level at some reference speed v_{ref}, and $\mathrm{C_v}$ = 6, which is a coefficient corresponding to the slope of the curve.

4.2.3.2. MODU

The provided drill logs for the Artisan-1 well were reviewed to identify periods of activity defined as drilling, as this was the activity considered in the modelling study Koessler et al. (2020). Activities associated with mooring operations, cementing, installation of the Blow Out Preventer (BOP), or running casing were not considered. Twenty time periods for drilling were identified, and Long-term Spectral Averages (LSTAs) were created to review the data. From these data, 115 ten-minute time periods were identified as suitable or of interest for processing with ShipSound, listed in Table 8. Of these measurements, 70 were accepted (i.e., passed a manual quality review). Some measurements were rejected by the contamination of nearby vessels in DP (by checking both AIS data and noise spectrum). Source level measurements were matched with drill logs and the source levels were grouped by the drilling activities. The MSL was calculated over three different drilling depth ranges and presented as mean and maximum levels.

Table 8. Details of selected measurement periods for the *Ocean Onyx* mobile offshore drilling unit (MODU) and corresponding drill activities.

Drill activity	Date	Start	End	QC status
Spudded Artisan 1 at 2100 h. Drilled from 94.7 m (seabed) to 115 mMDRT. Pumped 100 bbl PHG sweep and took MWD survey at connection. Survey at 95.62 mMDRT: 0.82 deg inc, 13.97 deg azimuth. *Parameters*: 10–40 rpm, 3–5 kft-lbs torq, 8–10 klbs WOB, 600 gpm, 170 psi SPP	2021 Feb 23	10:05:00	10:15:00	Rejected

4.2.3.3. Vessels

ShipSound was used to process a total of 4 vessel DP measurements collected from Station 2, five vessel transit measurements collected from Station 2, and 16 vessel transit measurements collected from Station 4. All these measurements were accepted measurements. Details of the measurements were shown in Table 9. The classical power law model of Ross (1976) was used to calculate source levels to a referenced speed (Section 4.2.3.1), with the speed scaling coefficients C_v = 6 proposed by Ross (1976).

Table 9. Vessel measurements collected from Stations 2 and 4.

4.2.4. Fit Equations

For each minute of data at each station, the analysis provided the range and received sound levels, with the metric of interest being SPL. To be able to understand the trends of the change in sound levels with range, and to interpolate the sound levels in between the measurement locations, it is required to obtain equations which represent the measurement data. The data were fit using linear models from 'R' (R Core Team 2020) of the form:

$$\text{model} = lm(\text{SPL} \sim \log(range) + range)\,. \tag{5}$$

The tilde (~) is used to separate the left- and right-hand sides in a model formula. The models provide the following values that fit the data:

- An intercept,
- Coefficients multiplied by log10(range), and
- Range.

The coefficient of log10(range) may be interpreted as the average geometric spreading for the environment. The coefficient of range may be interpreted as an additional loss term that models the effects of reflection and scattering when the sound interacts with the surface and seabed. This simple model formulation is valid when:

- There are no systematic changes to the geometric spreading–i.e., it is not valid very close to the Ocean Onyx and associated vessel movements within the 500 m zone where DP is required,
- The seabed geoacoustic properties are approximately constant, and
- The water depth does not significantly vary.

The models were used to predict the most likely data values for ranges of 20 to 6000 m, as well as the 90% prediction interval. The top of the prediction interval corresponds to the value that is greater than 95% of the measured data. The distance to 95% of the measured data is not the same as the $R_{95\%}$ range determined through modelling.

The coefficient of determination (r2) was used to assess the validity of the fit, with fits where r2 was less than 0.85 being flagged as suspect.

The per-minute SPL at each station was influenced by both the operations centred on the Ocean Onyx and sound sources close to each station. To create a model which focuses on understanding the trends of the change in sound level with range in relation to activities closes to Station 1, the data was split into three different sets. The data was therefore presented in the following ways:

- All per-minute SPL data from Station 1–3 while the Ocean Onyx was operational (01:00 12 Feb through until 00:00 25 Mar)
- Per-minute SPL data for per-minute SPL at Station 1 between 130 and 150 dB re 1µPa, thereby excluding periods when high noise levels, likely due to a close support vessel, or support vessels operating at high thrust levels which might skew the fit.
- Per-minute SPL data for per-minute SPL at Station 1 over 150 dB re 1µPa, to examine the trends in change in sound level with range for notably loud period at Station 1.
- The low-frequency weighted per-minute SPL can be adjusted by $10*\log_{10}(T)$, where T is 1440 (the number of minutes in 24 h) to determine the daily SEL for each of the three data sets.

4.2.5. Vessel Noise Detection

Outside of the specific individual vessel analysis requirements, vessels are detected in two steps (Martin 2013):

1. Detect constant, narrowband tones produced by a vessel's propulsion system and other rotating machinery (Arveson and Vendittis 2000). These sounds are also referred to as tonals. We detect the tonals as lines in a 0.125 Hz resolution spectrogram of the data (8 s of data, Hann window, 2 s advance).
2. Assess the SPL for each minute in the 40–315 Hz shipping frequency band, which commonly contains most sound energy produced by mid-sized to large vessels. Background estimates of the shipping band SPL and system-weighted SPL are then compared to their mean values over a 12 h window, centred on the current time.

Vessel detections are defined by the following criterion (Figure 15):

1. SPL in the shipping band (40–315 Hz) is at least 3 dB above the 12 h mean for the shipping band for at least 5 min.
2. AND at least three shipping tonals (0.125 Hz bandwidth) are present for at least 1 min per 5 min window. Tonals are difficult to detect during turns and near the closest points of approach (CPA) due to Lloyds' mirror and Doppler effects.
3. AND SPL in the shipping band is within 12 dB of the system weighted SPL.

The duration where these constraints are valid is identified as a period with shipping present. A 10 min shoulder period before and after the detection period is also included in the shipping period. The shipping period is searched for the highest 1 min SPL in the vessel detection band, which is then identified as the CPA time. This algorithm is designed to find detectable shipping, meaning situations where the vessel noise can be distinguished from the background. It does not identify cases of two vessels moving together or cases of continuous noise from stationary platforms, such as oil and gas drilling and dynamic positioning operations. Those situations are easily identified from tools such as the daily SEL and long-term spectral average figures.

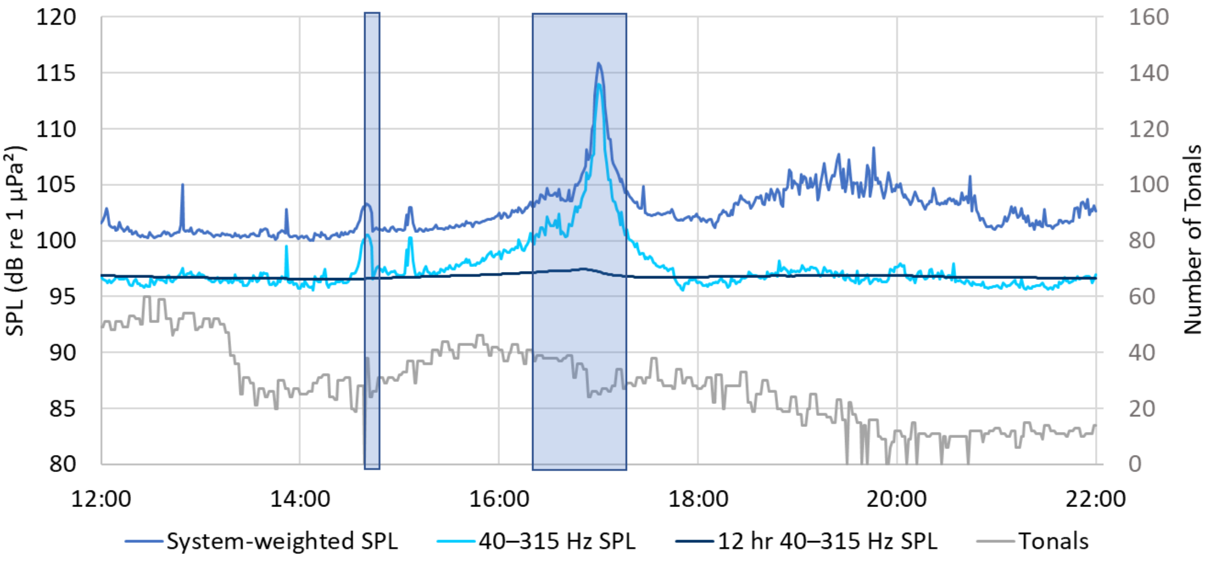

Figure 15. Example of broadband and 40–315 Hz band sound pressure level (SPL), as well as the number of tonals detected per minute as a vessel approached a recorder, stopped, and then departed. The shaded area is the period of shipping detection. Fewer tonals are detected at the vessel's closest point of approach (CPA) at 17:00 because of masking by broadband cavitation noise and due to Doppler shift, that affects the tone frequencies.

4.2.6. Seismic Survey Event Detection

Seismic pulse sequences were looked for using correlated spectrogram contours. The processing calculated spectrograms using a 300 s long window with 4 Hz frequency resolution and a 0.05 s time resolution (Reisz window). All frequency bins were normalised by their medians over window the 300 s window. The detection threshold was set to three times the median value at each frequency. If pulses were found, contours were created by joining the time-frequency bins above threshold in the 7–1000 Hz band using a 5 × 5 bin kernel. Contours 0.2–6 s in duration with a bandwidth of at least 60 Hz are then further analysed.

The process is used to create an “event” time series by summing the normalised value of the frequency bins in each time step that contained detected contours. The event time series is auto correlated to look for repeated events. The correlated data space was normalised by its median, and a detection threshold of 3 was applied. Peaks larger than their two nearest neighbours can be identified, and the list of peaks searched for entries with a set repetition interval. The allowed spacing between the minimum and maximum time peaks was 4.8–65 s, which captures the normal range of seismic pulse periods. If at least six regularly spaced peaks occur, the original event time series is searched for all peaks that match the repetition period within a tolerance of 0.25 s. The duration of the 90% SPL window of each peak can be determined from the originally sampled time series, and pulses more than three second long were rejected.

Despite the flexibility of the detection process, no impulses were detected, and thus no results are presented for seismic survey impulses.

4.2.7. Marine Mammal Detection Overview

We used a combination of automated detector-classifiers (referred to as automated detectors) and manual review by experienced analysts to determine the presence of sounds produced by marine mammals in the acoustic data. First, a suite of automated detectors was applied to the full data set (Appendices D.1 and D.2). Second, a subset (0.5%) of acoustic data was selected for manual analysis of marine mammal acoustic occurrence. The subset was selected based on automated detector results via our Automatic Data Selection for Validation (ADSV) algorithm (Kowarski et al. 2021) (Appendix D.3). Third, manual analysis results were compared to automated detector results to determine automated detector performance (Appendix D.4). Finally, hourly marine mammal occurrence plots were created that incorporated both manual and automated detections as well as automated detector performance metrics to provide a reliable representation of marine mammal presence in the acoustic data (Section 5.7). These marine mammal analysis steps are summarised here and described in detail in Appendix D.

4.2.7.1. Automated Click Detection

Odontocete clicks are high-frequency impulses ranging from 5 to over 150 kHz (Au et al. 1999, Møhl et al. 2000). We applied an automated click detector to the acoustic data to identify clicks from sperm whales and delphinids. This automated detector is based on zero-crossings in the acoustic time series. Zero-crossings are the rapid oscillations of a click’s pressure waveform above and below the signal’s normal level (e.g., Figure D-1). Zero-crossing-based features of automatically detected events are then compared to templates of known clicks for classification (see Appendix D.1 for details).

4.2.7.2. Automated Tonal Signal Detection

Tonal signals are narrowband, often frequency-modulated, signals produced by many species across a range of taxa (e.g., baleen whale moans and delphinids whistles). They range predominantly between 15 Hz and 20 kHz (Steiner 1981, Berchok et al. 2006, Risch et al. 2007). The automated tonal signal detector identified continuous contours of elevated energy and classified them against a library of marine mammal signals (see Appendix D.2 for details).

4.2.7.3. Evaluating Automated Detector Performance

JASCO's suite of automated detectors are developed, trained, and tested to be as reliable and broadly applicable as possible. However, the performance of marine mammal automated detectors varies across acoustic environments (e.g., Hodge et al. 2015, Širović et al. 2015, Erbs et al. 2017, Delarue et al. 2018). Therefore, automated detector results must always be supplemented by some level of manual review to evaluate automated detector performance. Here, we manually analysed a subset of 5 min acoustic files for the presence/absence of marine mammal acoustic signals via spectrogram review in JASCO's PAMlab software. A subset (0.5%) of acoustic data from each station was selected via ADSV for manual review (Appendix D.3).

To determine the performance of the automated detectors at each station per 5 min acoustic file, the automated and manual results (excluding files where an analyst indicated uncertainty in species occurrence) were fed into an algorithm that calculates precision (*P*), recall (*R*), and Matthew's Correlation Coefficient (*MCC*) (see Appendix D.4 for formulas). *P* represents the proportion of files with detections that are true positives. A *P* value of 0.90 means that 90% of the files with automated detections truly contain the targeted signal, but it does not indicate whether all files containing acoustic signals from the species were identified. *R* represents the proportion of files containing the signal of interest that were identified by the automated detector. An *R* value of 0.90 means that 90% of files known to contain a target signal had automated detections, but it says nothing about how many files with automated detections were incorrect. An MCC is a combined measure of *P* and *R*, where an MCC of 1.00 indicates perfect performance–all events were correctly detected. The algorithm determines a per file automated detector threshold (the number of automated detections per file at and above which automated detections were considered valid) that maximizes the MCC.

The acoustic occurrence of each species (both automated and manual results) was plotted using JASCO's Ark software as time series showing presence/absence by hour over each day of the recording period. Automated detector performance metrics are provided alongside these figures and should be considered wen interpreting results.

4.3. Modelling Validation

In order to validate the modelled predictions presented in Koessler et al. (2020), the calculated Monopole Source Levels (MSLs), which were computed from measured data using the method outlined in Section 4.2.3, were used to update the acoustic model inputs for the scenarios from Koessler et al. (2020). This process yielded new ranges to thresholds based on in-situ measured data. Only the scenarios for Artisan (i.e., Scenario 5 – 8 in Koessler et al. (2020)) were consider for a validation exercise.

The following process was implemented for updating the inputs to the acoustic model.

1. Update the sound speed profile to use predictions from the Global Ice Ocean Prediction System (GIOPS) forecasting system for the period when the data was acquired. Determine and median profile to best represent potential propagation conditions over the February 2021 – March 2021 periods.
2. Update the decidecade MSLs and MSL source depth based on the results of the ShipSound analysis presented in Section 5.5.
3. Re-run all propagation modelling, gridding and radii calculations as detailed in Koessler et al. (2020) with these updated input parameters for all scenarios.

During this process, the data fit plots discussed in Section 4.2.4 and presented Section 5.3 were reviewed in the context of results from previous modelled scenarios and newly acquired MSLs to infer the appropriateness of the seabed selection for the Artisan development area and its effect on the distances to thresholds. Further detail can be found in Section 6.2.

5. Results

5.1. Soundscape Characterisation

Long-term spectra averages, power spectral density, and decidecade band box plots are shown in Figure 16 for all stations during the period the *Ocean Onyx* was moored (01:00 12 Feb through 00:00 25 Mar 2021), with the decade band percentile levels presented in Table 10.

The same plots are presented for two examples of operational activity at the *Ocean Onyx* (Table 8), Figure 17, from 5 Mar 2021, which included resupply and drilling operations, and Figure 18, from 26 Feb 2021, for a drilling operations with support vessels further from the *Ocean Onyx*.

5.1.1. Spectrograms and Statistical Analysis

The spectrogram and band-level plots for all stations (Figure 16) provide an overview of the sound variability in time and frequency presenting an overview of presence and level of contribution from different sources. Short-term events appear as vertical stripes on the spectrograms and spikes on the band level plots. Long-term events affect (increasing or decreasing accordingly) the band level over the event period and appear in the spectrograms as horizontal bands of colour.

The most prominent feature to note is the decrease in sound level with distance from the drill rig. Stations 1 and 2, located 336 m and 1132 m from the platform respectively, demonstrate elevated sound levels across all frequencies, but particularly at frequencies under approximately 2000 Hz. This is consistent with the bands most typically impacted by seismic and pressure fluctuations, as well as vessel noise, as can be seen in the Wenz curves of Figure 9. At these two stations, the L_{50} and above, as well as the L_{mean} percentiles exceed the upper limit of the Wenz curve across all frequencies. At Stations 3 and 4, located 5 km and 25 km from the platform respectively, the sound levels are much reduced. Station 3 still receives some sound energy emitted from the platform and associated operations, whereas these contributions are not notable within Station 4's soundscape, as can be seen in the two right side panels of Figure 16. The soundscape of these two stations is more influenced by vessel traffic, apparent by the 'ripples' in the L_{mean} percentiles between 40 and approximately 100 Hz, which are due to narrowband tones produced by vessel propulsion systems.

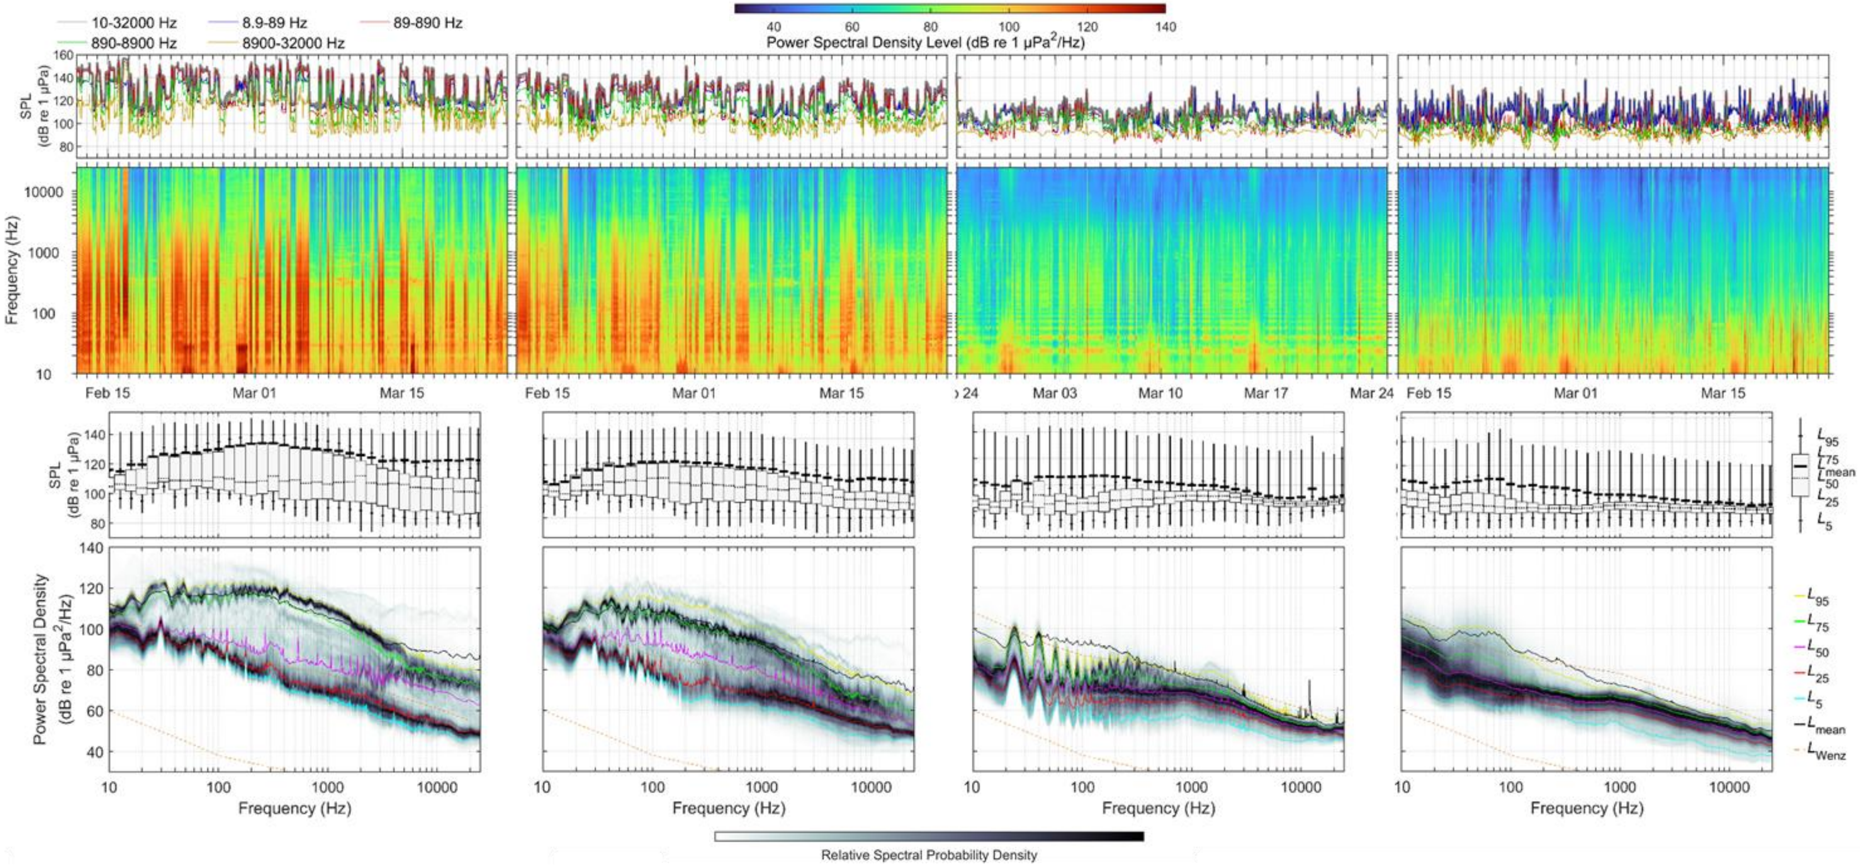

Figure 16. *Entire Ocean Onyx moored period*: (Top row) In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound, (bottom row) percentiles and mean of decidecade sound pressure level (SPL) and percentiles and probability density (grayscale) of 1-min power spectral density levels, by station compared to the Wenz curve limits (coloured lines) of prevailing noise (Wenz 1962), for 01:00 12 Feb through until 00:00 25 Mar, for Stations 1, 2 and 4, or from 12:00 24 Feb for Station 3.

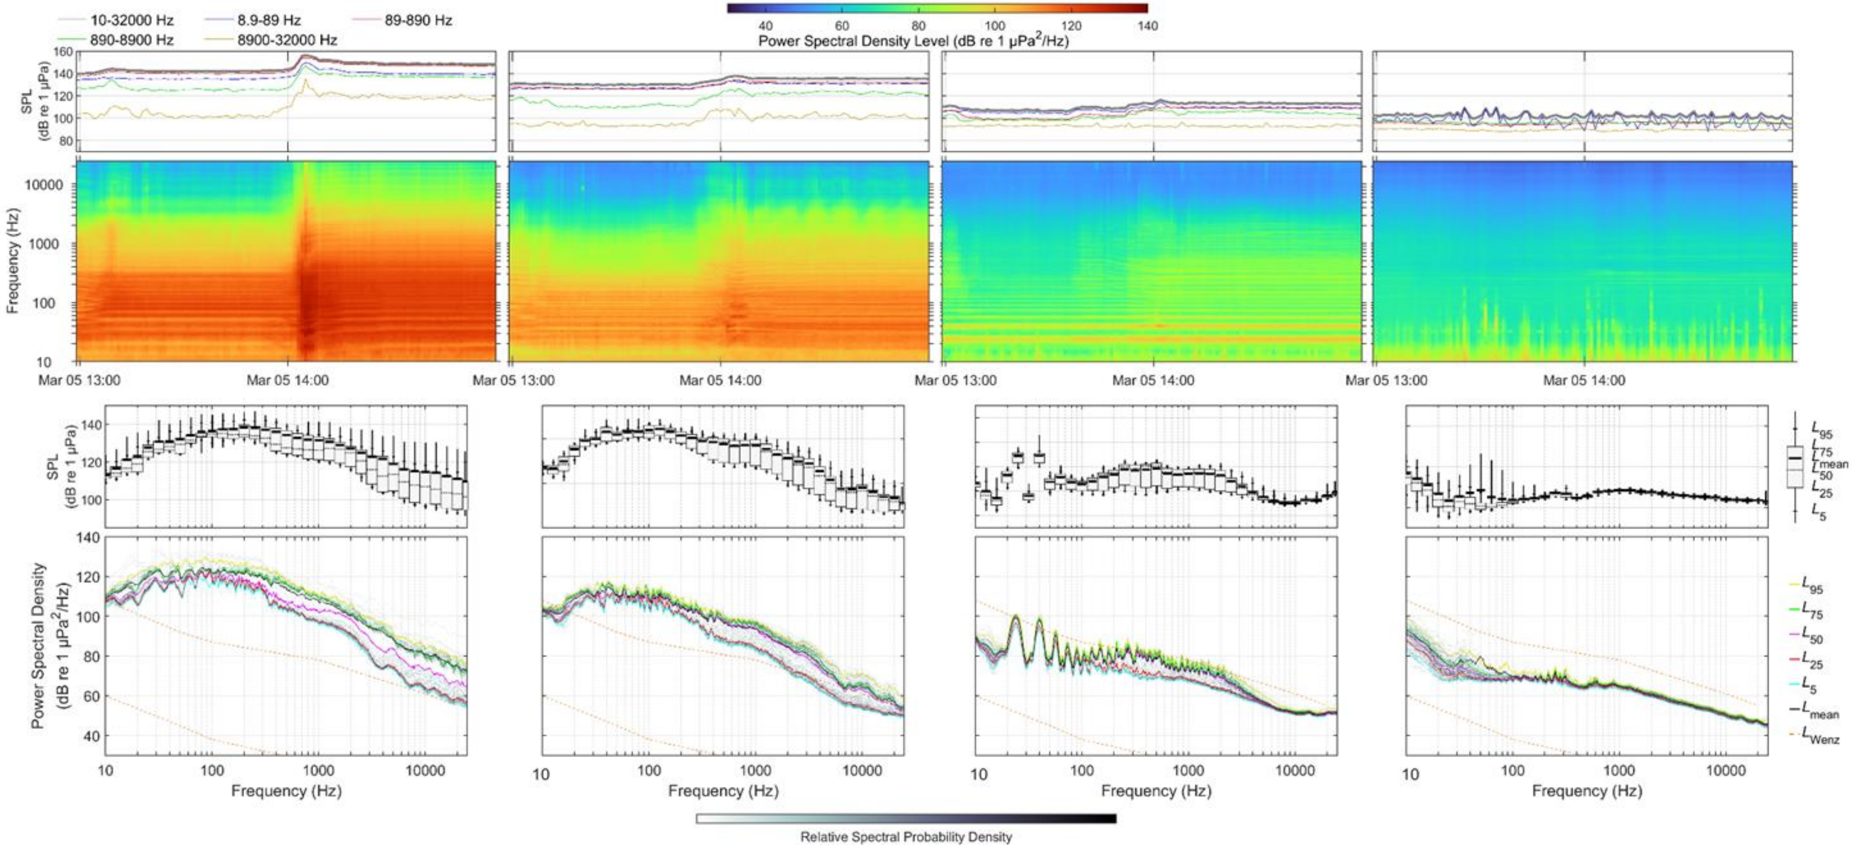

Figure 17. *Drilling and vessel operation 5 Mar 2021*: (Top row) In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound, (bottom row) percentiles and mean of decidecade sound pressure level (SPL) and percentiles and probability density (grayscale) of 1-min power spectral density levels, by station for a drilling period on 5 Mar 2021 (Table 8) which included resupply and support vessels, compared to the Wenz curve limits (coloured lines) of prevailing noise (Wenz 1962).

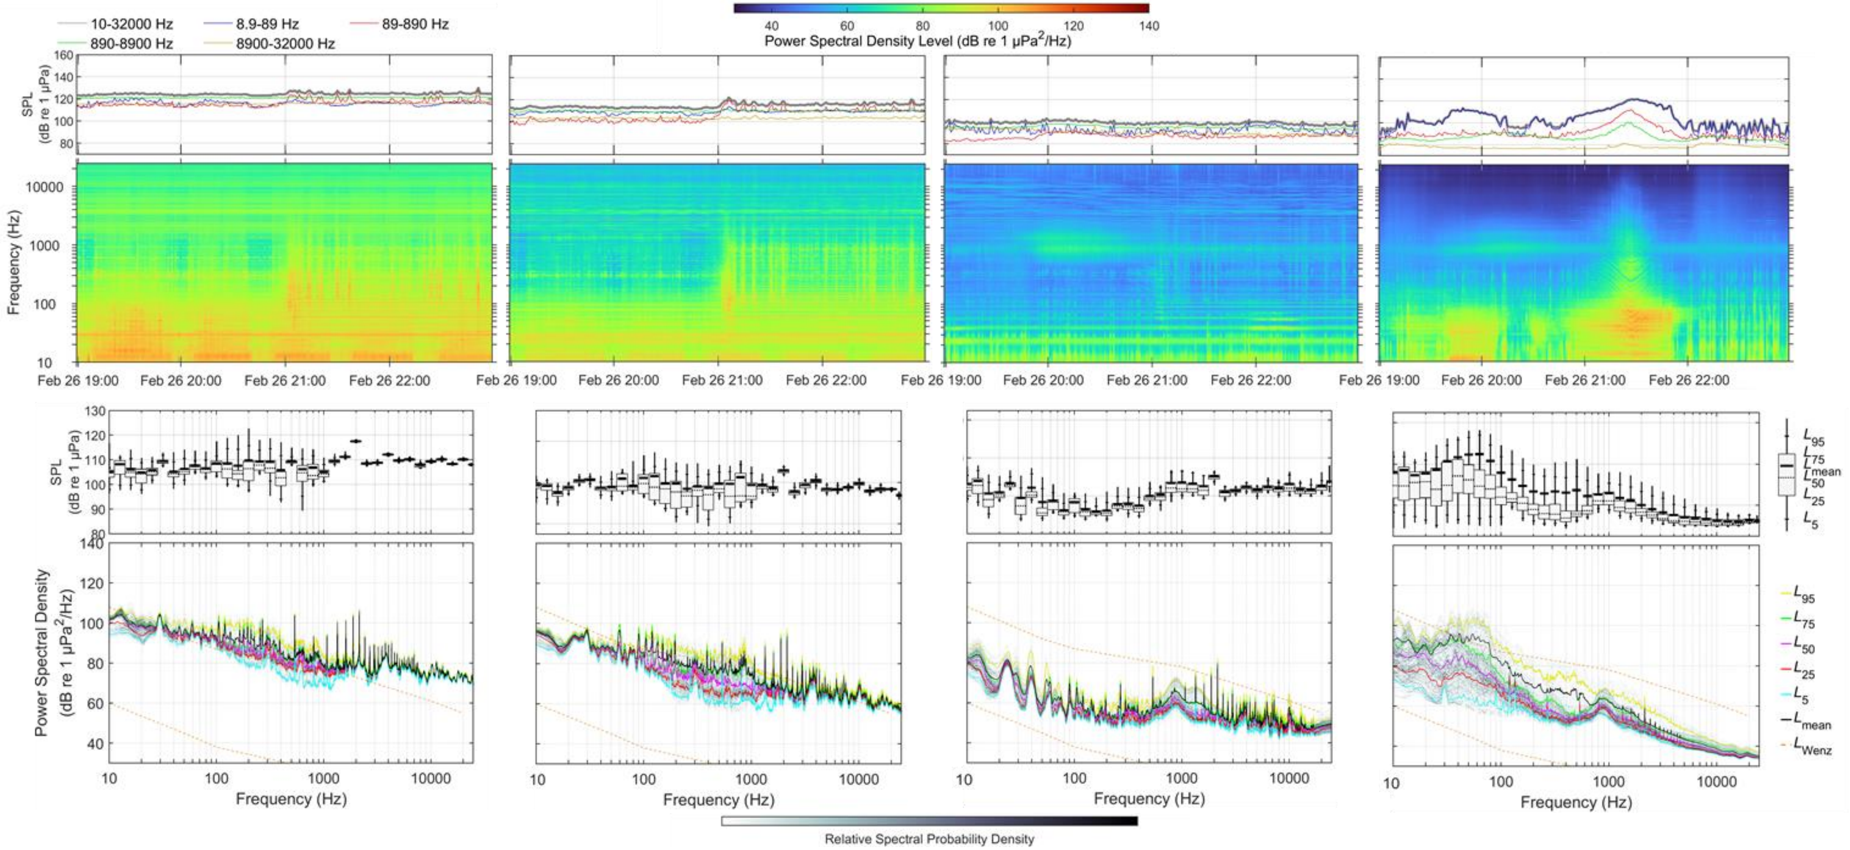

Figure 18. *Drilling operations 26 Feb 2021*: (Top row) In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound, (bottom row) percentiles and mean of decidecade sound pressure level (SPL) and percentiles and probability density (grayscale) of 1-min power spectral density levels, by station for a drilling period on 5 Mar 2021 compared to the Wenz curve limits (coloured lines) of prevailing noise (Wenz 1962).

Table 10. Statistical a0nalysis of sound levels while *Ocean Onyx* was moored, 01:00 12 Feb through until 00:00 25 Mar 2021, for Stations 1, 2, and 4, or from 12:00 24 Feb 2021 for Station 3. SPL units: dB re 1 µPa.

5.1.2. Frequency Weighted Sound Exposure Levels

The perception of underwater sound depends on the hearing sensitivity of the receiving animal in the frequency bands of the sound. Hearing sensitivity in animals, however, varies over the frequency band of their hearing (the hearing curve (audiogram) usually resembling a U-shaped form). The frequency range of hearing and hearing sensitivity differ between species, resulting in the fact that different species will perceive underwater sound differently. Auditory (frequency) weighting functions (Appendix E) are applied to account for this difference as they reflect an animal's ability to hear a sound, emphasising the frequency band of best sensitivity over frequencies animals do not hear well. Figure 19 shows the difference between perceived ambient noise by low-, mid- and high frequency cetaceans. Similar to the figures in Section 5.1.1, Figure 19 demonstrates the decrease in sound levels with distance from the drilling platform. Station 4 is more exposed to general shipping traffic within the shipping lanes when compared to Station 3 (Figure 3), and thus its daily SEL were more variable, being less influenced or driven by activity close to the *Ocean Onyx* more by the frequency of shipping traffic. The low-frequency cetacean weighted daily SEL for all stations, along with the thresholds for PTS and TTS (Section 2.6) are shown in Figure 20.

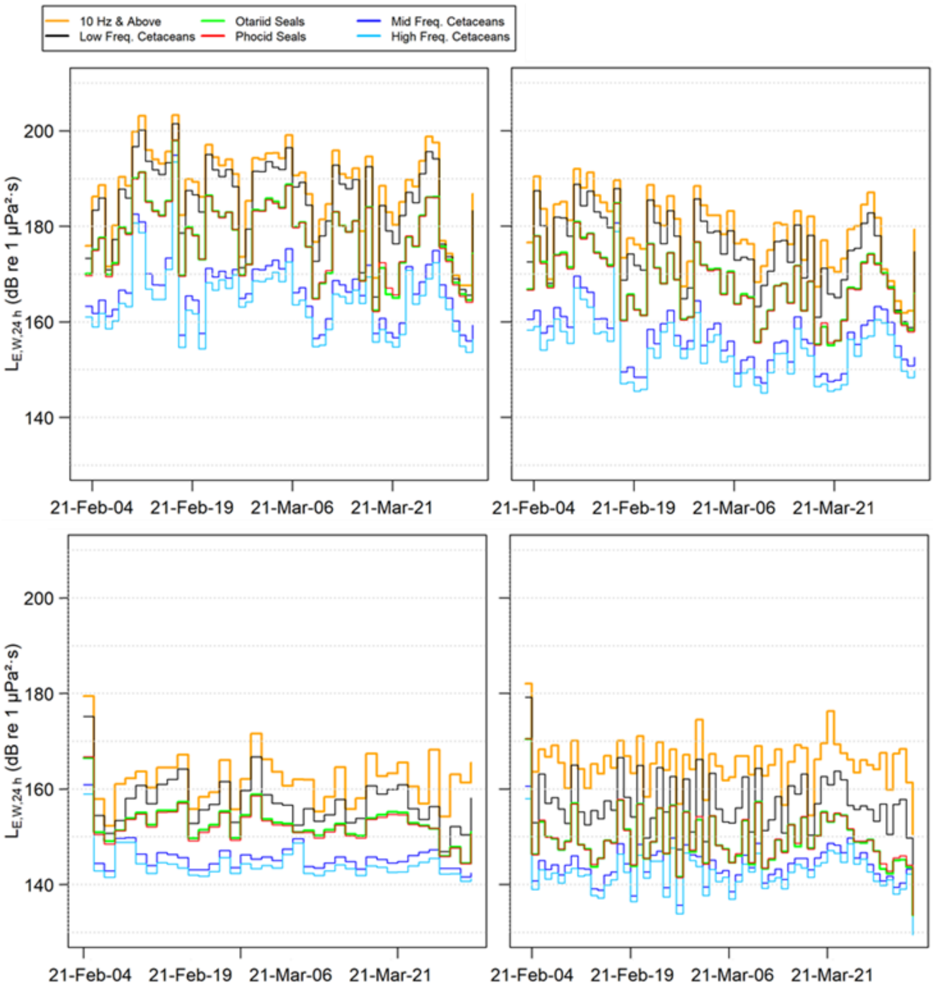

Figure 19. Auditory frequency weighted ambient noise (10 Hz and above) over the measurement period shown as daily sound exposure levels (SEL) (NMFS 2018). (Top left to right) Stations 1 and 2 and (bottom left to right) Stations 3 and 4. Locations are provided in Table 4.

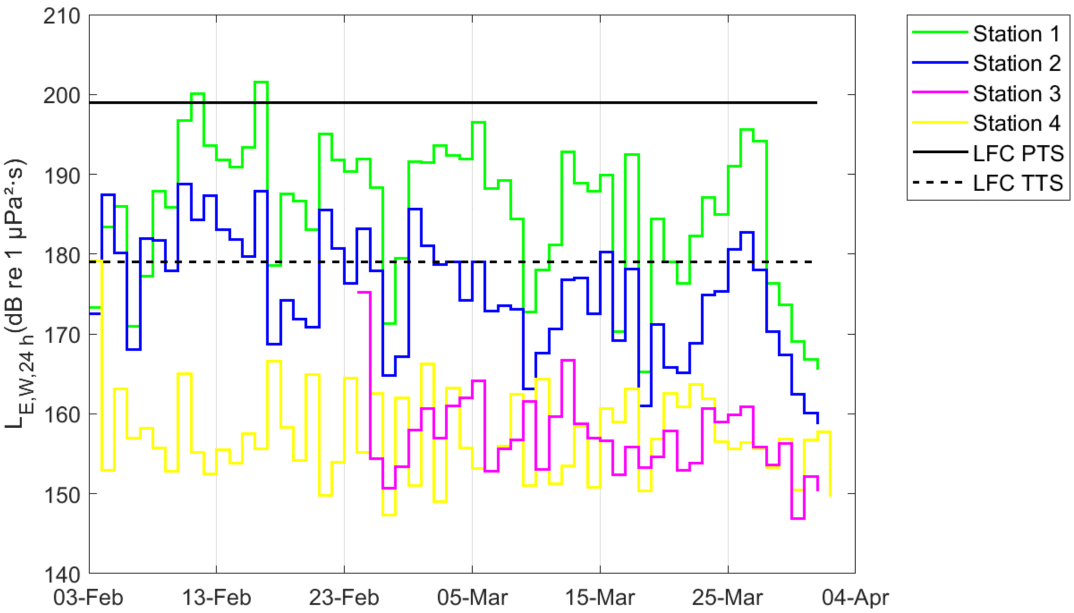

Figure 20. Daily low-frequency cetacean (LFC) weighted sound exposure levels (SEL) (NMFS 2018) at each station (composite created from Figure 19, station locations provided in Table 4), including thresholds for permanent threshold shift (PTS) and temporary threshold shift (TTS) (Table 6).

5.2. Environmental Correlations

The environmental conditions during the drilling period, specifically the wave height and wind speed, were compared to sound pressure levels during the drilling period in the 20 Hz, 80 Hz, 630 Hz, 3150 Hz, and 125000 Hz decidecade bands in the correlograms in Figure 21. Correlograms offer two ways to visualise correlations between two variables: the upper right panels show the scatter plot between each variable pair, and the bottom left show the strength of the correlation both by amount of the circle filled and depth of the colour. Blue represents a positive correlation, and red a negative. The four panels show Stations 1 to 4, respectively. The impact of wind and wave conditions on underwater soundscape is generally above 100 Hz, as shown in Figure 9 (Wenz 1962).

Stations 1 and 2, at 336 and 1132 m from the drill rig respectively, show very little correlation of sound level at any band with wind or wave conditions. At these stations, the soundscape was dominated by drilling operations. As the distance to the station increases, i.e., for Stations 3 and 4 at 5 and 25 km, the wind speeds and wave heights have a positive correlation with sound levels, although the relationship with wind speed is much stronger than that for wave height.

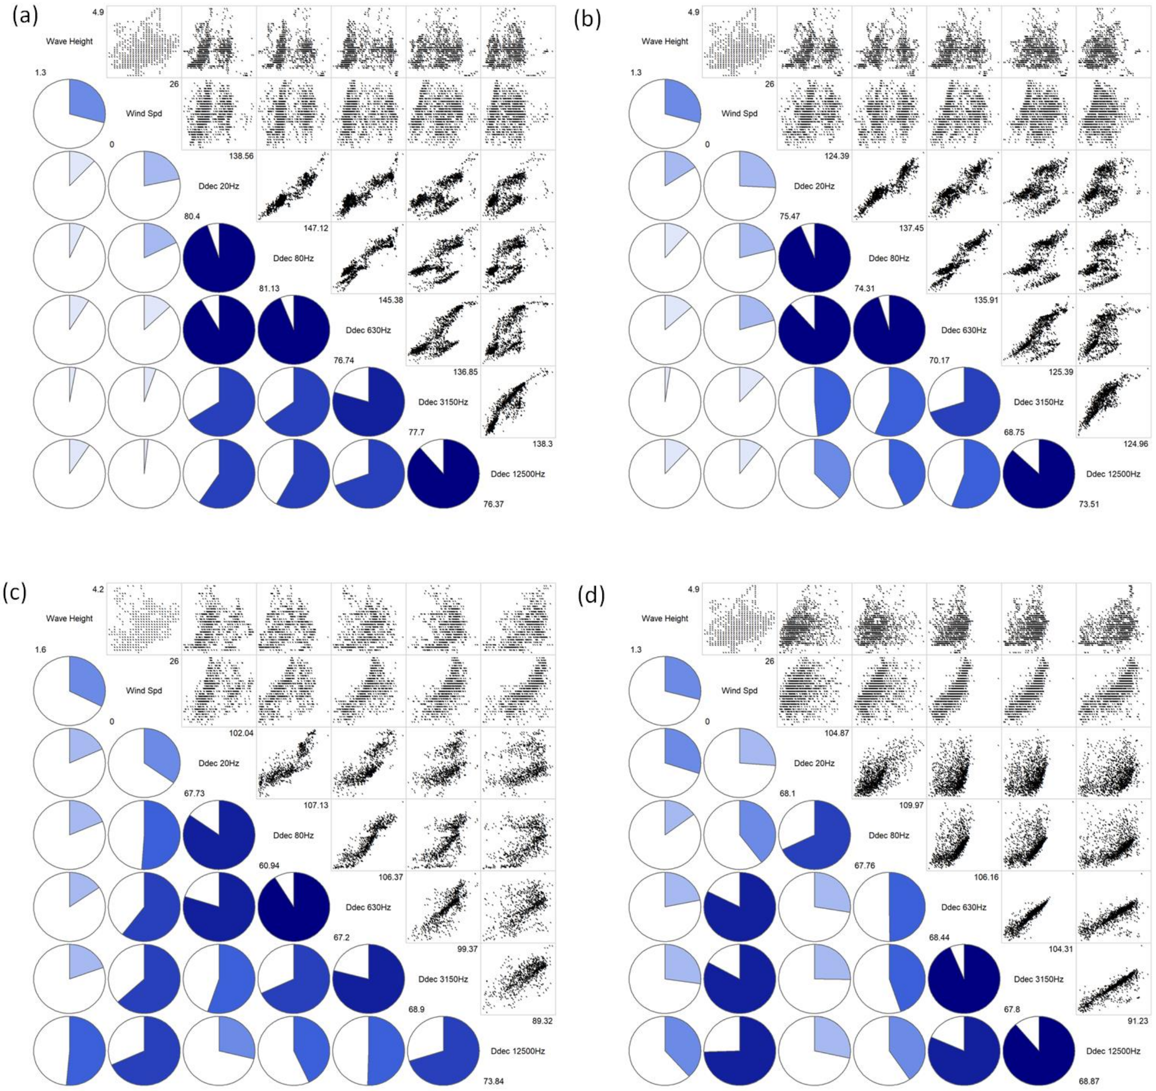

Figure 21. Correlogram comparing weather conditions to sound levels in five specified decidecade bands for (a) Station 1 at 300 m; (b) Station 2 at 1 km; (c) Station 3 at 5 km; and (d) Station 4 channel 1 at 25 km.

5.3. Data Fits

The per-minute SPL data from Station 1–3 while the Ocean Onyx was moored (01:00 12 Feb through until 00:00 25 Mar 2021) was analysed according to the methods detailed in Section 4.2.4, with the results presented in Figures 22 and 23. These fits were used to gain an understanding of the propagation loss environment, and to complete the validation analysis (Section 4.3), as discussed in Section 6.2.

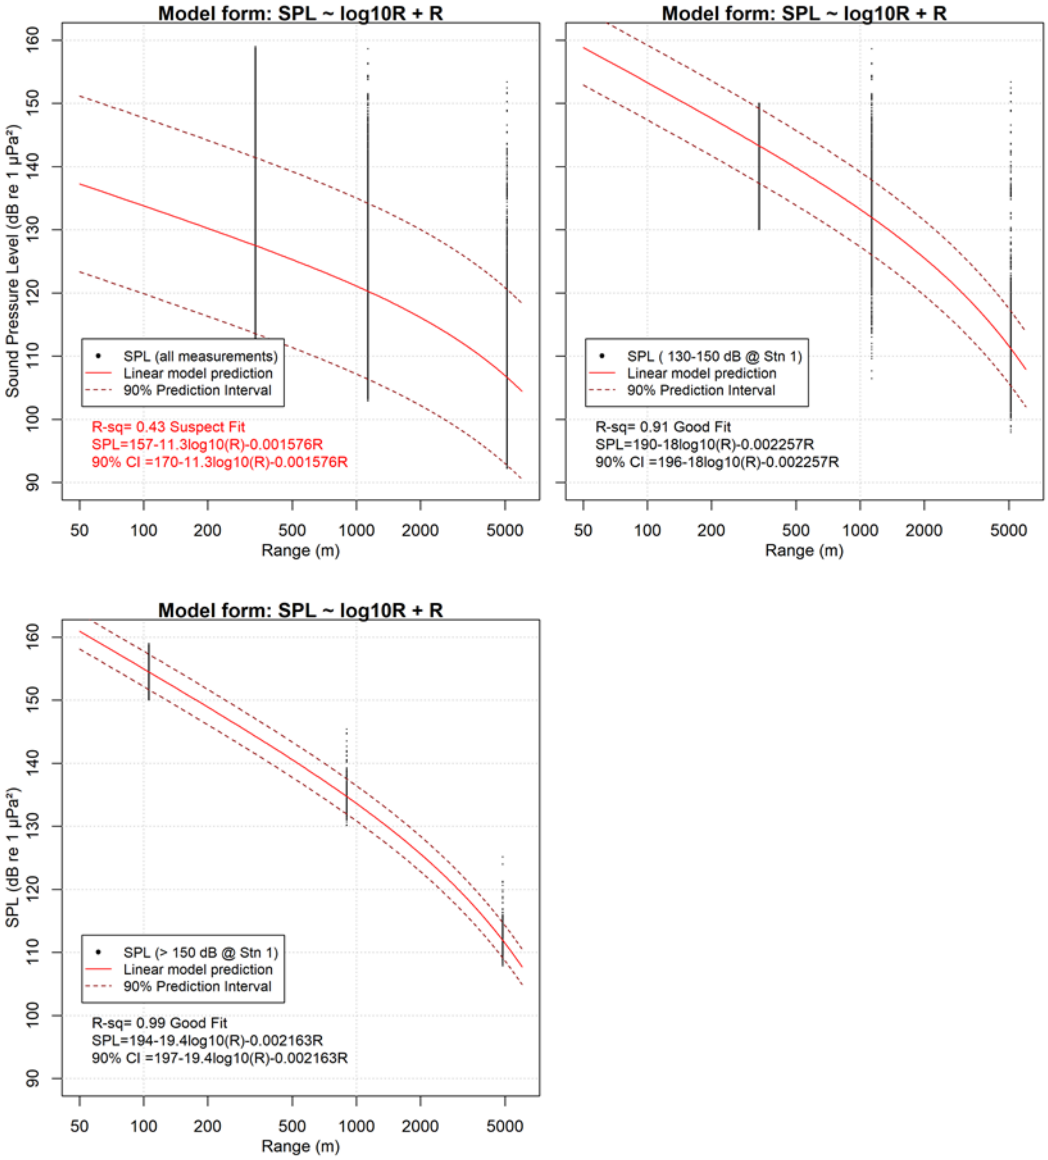

Figure 22. Per-minute sound pressure level (SPL) plotted against range for Stations 1–3, for the entire period the *Ocean Onyx* is present (top-left), levels at Station 1 between 130 and 150 dB re 1µPa (top-right), and levels at Station 1 above 150 dB re 1µPa (bottom-left).

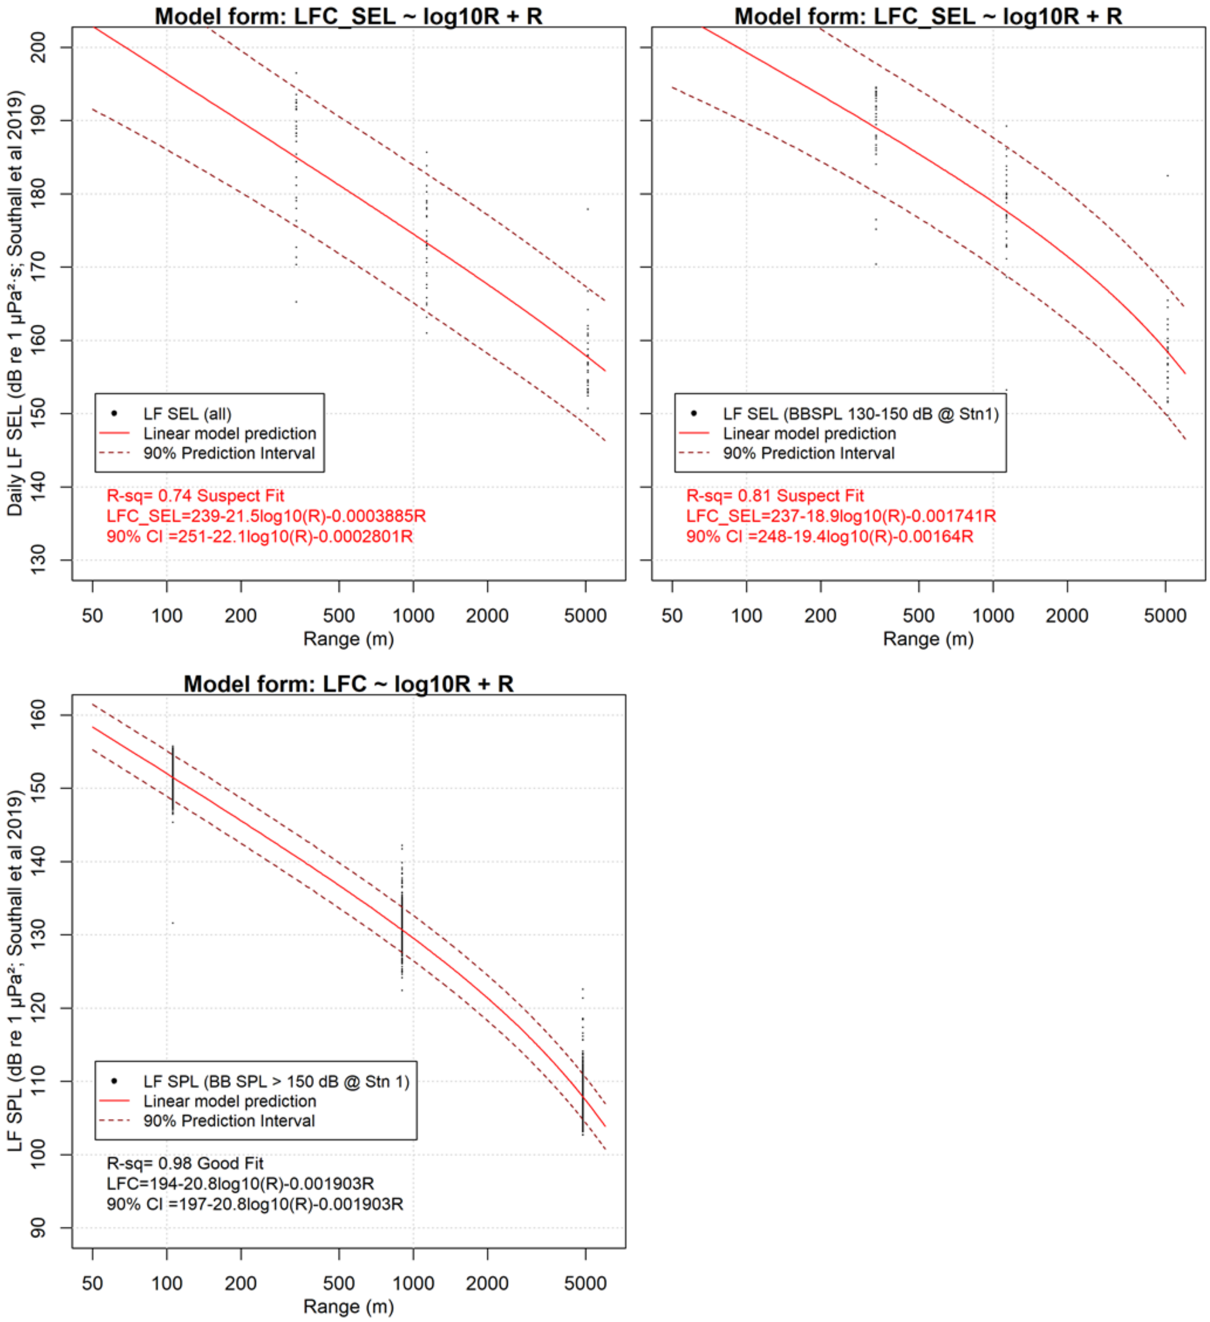

Figure 23. Daily low-frequency cetacean weighted sound exposure level (SEL) (calculated from frequency weighted per-minute sound pressure level (SPL)) plotted against range for Stations 1–3, for the entire period the *Ocean Onyx* is present (top-left), levels at Station 1 between 130 and 150 dB re 1µPa (top-right), and levels at Station 1 above 150 dB re 1µPa (bottom-left).

5.4. Drilling Operations

A detailed analysis was undertaken on two file snippets from Station 1, focused on correlating the acoustic signals to the drilling logs, and providing details on some of the signals observed in the acoustic data.

5.4.1. Snippet 1

A snippet of data from Station 1 for 22 Feb 2021 from 14:14:37 was examined to look for alignment between the acoustic data and the drilling logs to provide a detailed insight into the noise producing sources. The drilling log for this period stated:

> Continued drilling 26" x 42" hole from 115m to 171m (SectionTD). Several small stringers encountered at 140m and 157m. Pumped 100bbl PHG sweep and took MWD survey at connection. Survey @ 135mMDRT: 0.5deg inc.
>
> Parameters: 60rpm, 3-5kft-lb tq, 10klbs WOB, 800-1,100gpm, 400-550psi SPP

The spectrogram of the entire wav file is shown in Figure 24, with a shorter timescale and more focused frequency range shown in Figure 25, both showing components above 10 Hz only. In this data, drilling tonals with a spacing of 155 Hz were identified (Figure 26), and the analysis of the very low frequency tonals (Figure 27) clearly shows a 1 Hz tonal, which aligns with the 60 rpm drilling speed in the logs. A steady state pump operating at centre frequencies of 2992 Hz and 3062 Hz, with a strong correlation to high frequency harmonics (Figure 28). In this snippet there were three unstable narrowband noise sources present which are likely due to the drilling operations. This is considered likely due to their harmonic spacing under varying loads of operations. Tonals indicate that something, potentially the drill bit or the main aperture rod, is rotating between 52 and 74 RPM. This appears unrelated to the steady state pumps, which are likely high pressure pumps that fluctuate very little over time or load. During this recording, a vessel was also present although it did not appear to be operating under DP.

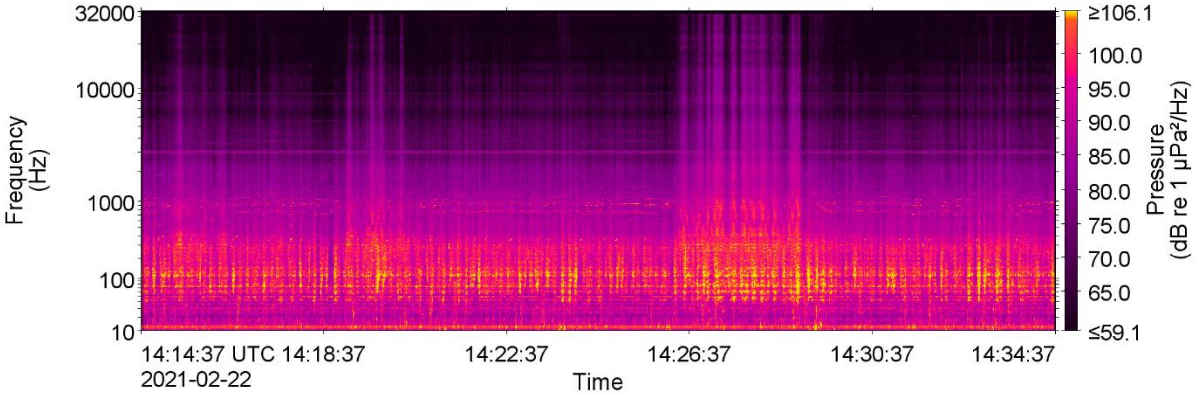

Figure 24. Spectrogram of 20 minutes of drilling operations on 22 Feb 2021 from 14:14:37 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

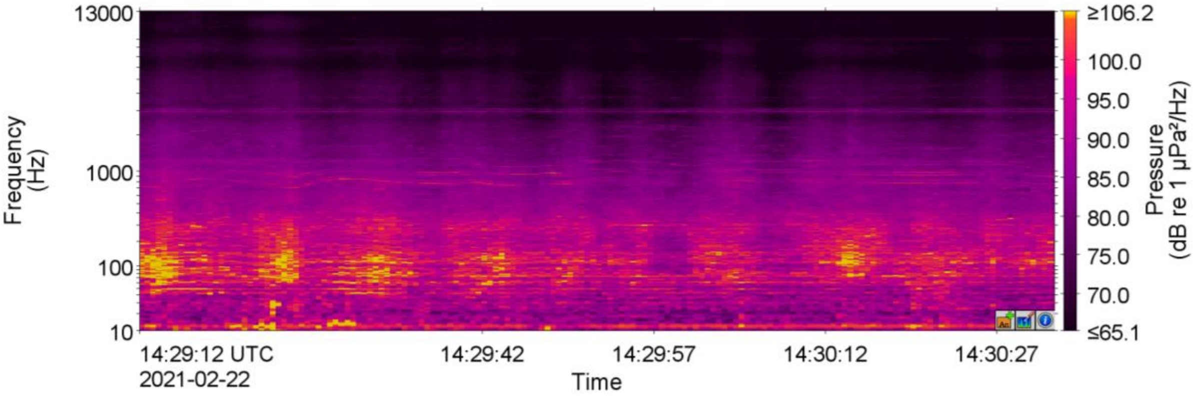

Figure 25. Spectrogram of 80 s minutes of drilling operations on 22 Feb 2021 from 14:29:12 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

Figure 28. Example of correlation between harmonics and load on main pump with centre frequencies of 2992 and 3062 Hz. The example also shows the diesel generators with engine firings rates fluctuating between 149 and 152 Hz while under hotel load from *Ocean Onyx*.

5.4.2. Snippet 2

A snippet of data from Station 1 for 08 Mar 2021 from 18:14:40 was examined to look for alignment between the acoustic data and the drilling logs to provide a detailed insight into the noise producing sources. The drilling log for this period stated:

> Drilled ahead 12-1/4" hole from 1,433m to 1,545m.
> Parameters:
> Flow: 1,000gpm, Boost Pump-250gpm, SPP: 3,000psi, RPM: 120 surface/217 bit
> Tq: Off 1-2kft-lbs/On 5-10kft-lbs. WOB: 5-15klbs P/U wt: 300klbs, S/O wt: 325klbs, Rot: 315klbs. Average ROP: 18.6m/hr
> ESD: 11.18ppg, ECD: 11.37ppg
> Offline: Displaced the Boost line and flushed the MGS utilising the boost pump
> - total of 20 strokes pumped (10bbls).
> At 1,510m MW over the shakers recorded at 10.7ppg (ESD-10.88ppg).
> Ceased centrifuging and weighted up the mud with additions of barite. MW at 1543m recorded at 11.1ppg.

The spectrogram of the entire wav file is shown in Figure 29, with a shorter timescale and more focused frequency range shown in Figure 30, both showing components above 10 Hz only. In this snippet there is no secondary source, such as a support vessel, present, just the *Ocean Onyx*. The narrowband tonals below 200 Hz indicate that the revolutions-per-minute fluctuate between 178 and 220 rpm, this aligns with data pins 9, 13 and 16 in Figure 31, along with various higher frequency harmonics. A second low-frequency rotating source, with a speed of 120.6 rpm was detected, Figure 32, and it demonstrates no apparent relationship between the 1.63:1 reduction ratio present in the low frequency spectrum to the other source. These frequencies align with information provided in the drill logs.

The data indicates various generator (diesel gensets and pumps) running in multiple configurations. All appear to be running in a steady-state fashion with varying loads, apparent through the fluctuations in frequency. Two distinct gensets are noted in particular as running hotel load, as they are more stable than the others which are likely being used for the *Ocean Onyx* drilling operations, and thus having changing requirements which changes their load. The tone at 3 kHz which is consistent without fluctuation, shown clearly in Figure 34, is probably a high-pressure pump which does not fluctuate with power draw, as no banding (harmonics) are observed, the motor is not a pole motor.

Figure 35 shows three distinct gensets (one tonal each) with accompanying cylinder firing rates throughout the spectrogram. These appear related to *Ocean Onyx* drilling operations as there are no secondary contacts on spectrogram (such as vessels) and the tonals fluctuate with power draw over time.

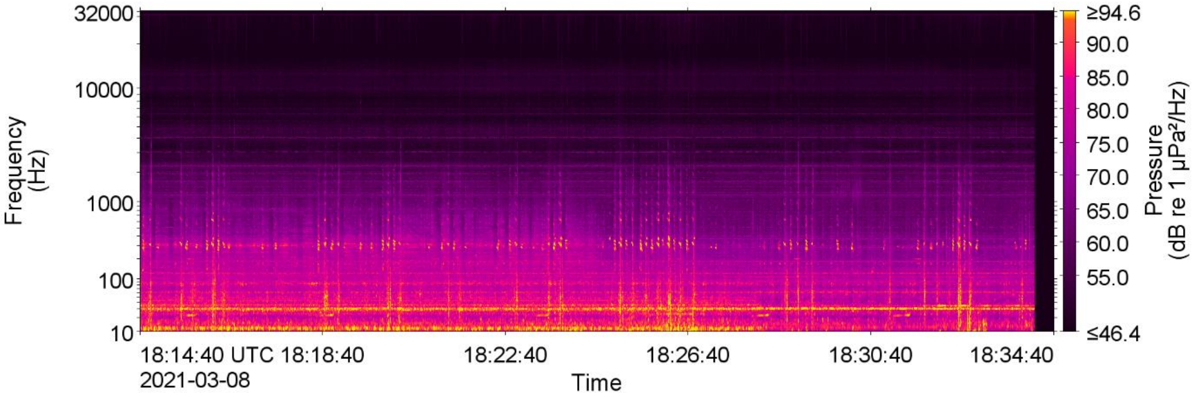

Figure 29. Spectrogram of 20 minutes of drilling operations on 08 Mar 2021 from 18:14:40 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

5.5. Source Levels

ShipSound was used to determine the source levels for the *Ocean Onyx* and support vessels under dynamic positioning and during transits using the methods detailed in Section 4.2.3 and the operations described in Section 2.5. The following sections detail the Monopole Source Levels for each of these sources.

5.5.1. MODU

Following the method detailed in Section 4.2.3.2 and the periods specified in Table 8, the mean and maximum MSL for the *Ocean Onyx* was determined for three drilling depth ranges (Figure 36). The mean MSL is more representative of typical levels for each drilling depth and therefore suitable for comparison to the levels used in Koessler et al. (2020). Three example ShipSound reports are provided in Appendix G.1, and a spectrogram of drilling activities extracted from the ShipSound report included in Appendix G.1.2 is shown in Figure 37.

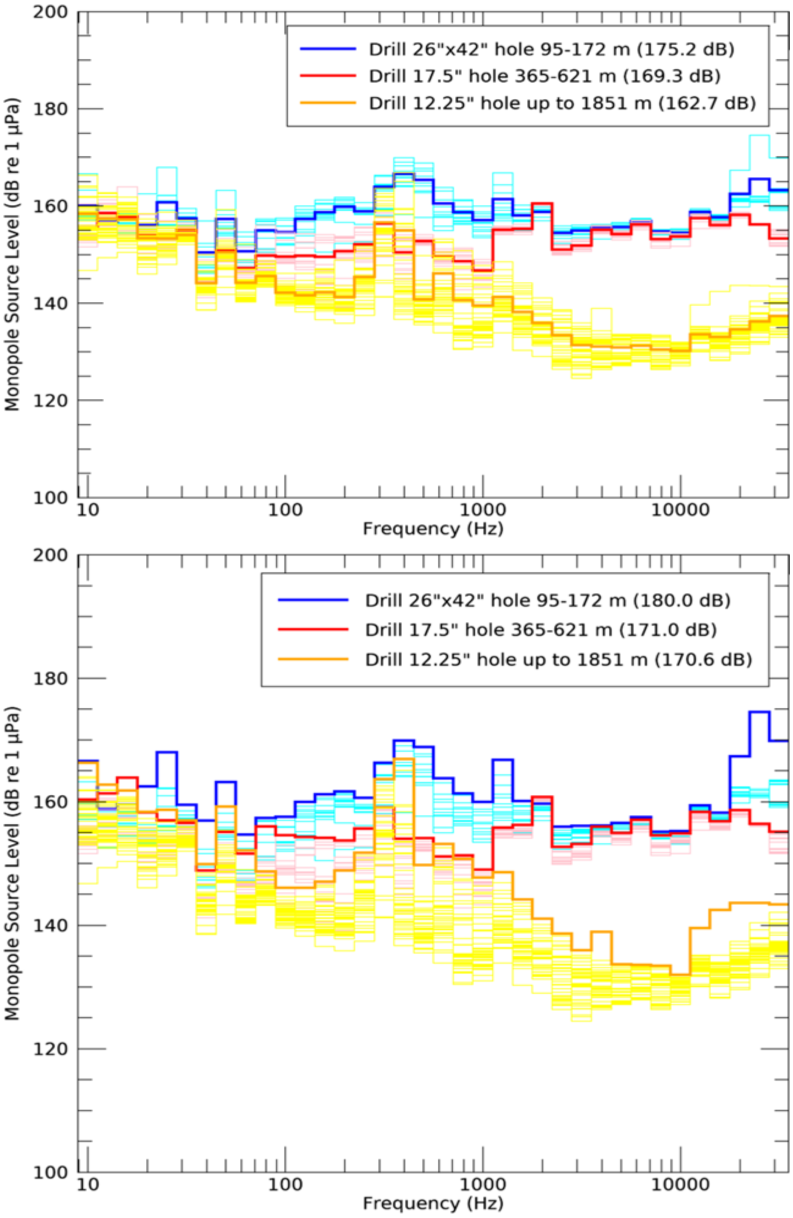

Figure 36. Monopole Source Level (MSL) and spectra for *Ocean Onyx* Mobile Offshore Drilling Unit (MODU) from Station 1 ShipSound processing, averaged over a ShipSound measurements over three different drilling depths, mean (top) and maximum (bottom).

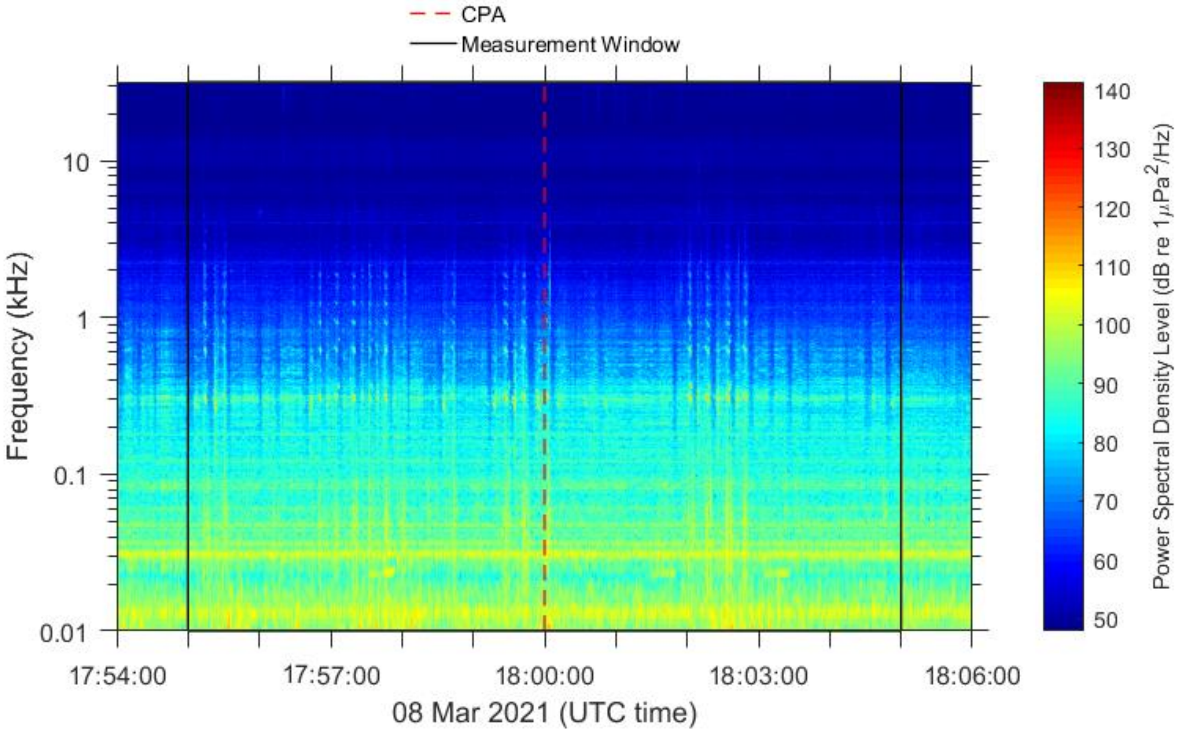

Figure 37. Spectrogram from ShipSound report included in Appendix G.1.2, with a calculated Monopole Source Level (MSL) of 159.6 dB re 1µPa m.

Table 11. *Ocean Onyx* monopole source levels (MSLs) from Figure 36.

Measurement	Monopole source level (dB re 1 µPa m)	
	Mean	Maximum
Drilling 26”x42” hole from 95–172 m	175.2	180.0
Drilling 17.5” hole from 365–621 m	169.3	171.0
Drilling 12.25” hole up to 1851 m	162.7	170.6

5.5.2. Vessels under Dynamic Positioning

Following the method detailed in Section 4.2.3 for vessels under dynamic positioning, the mean MSL was determined to be 193.9 dB re 1 µPa (Figure 38). The mean representative of typical levels from the trials of dynamic positioning is therefore suitable for comparison to the levels used in Koessler et al. (2020). One example ShipSound report is provided in Appendix G.2.

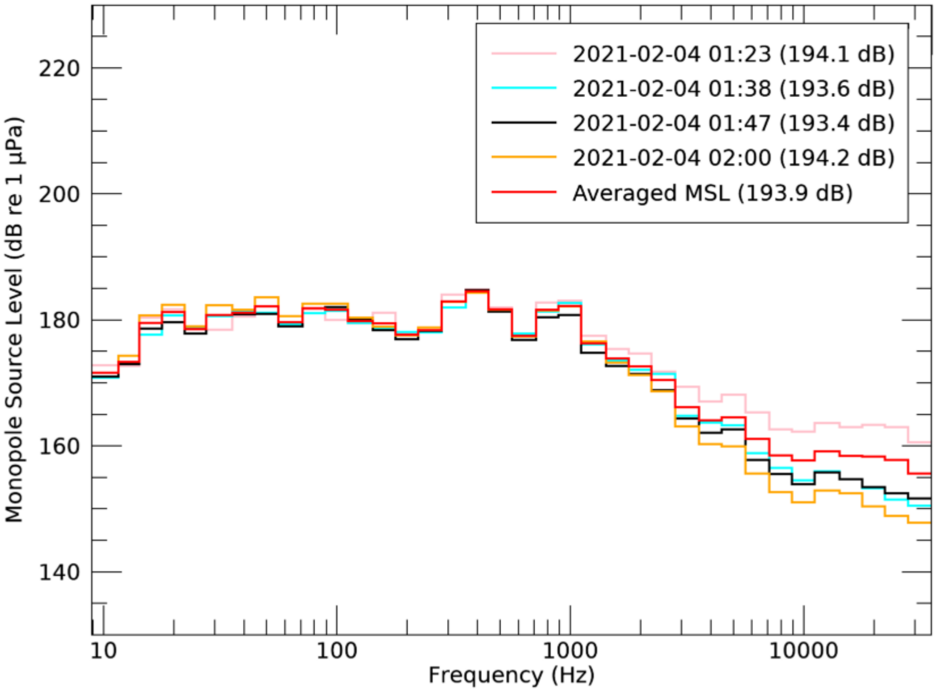

Figure 38. Monopole Source Level (MSL) and spectra for Siem *Sapphire* in dynamic positioning (DP) from Station 2 ShipSound processing. The MSL was averaged over all ShipSound measurements.

5.5.3. Vessels during Transit

Following the method detailed in Section 4.2.3 for vessels under transit, the mean MSL was determined for each vessel, the Siem *Sapphire* under transit at both 7 and 9 kn (Figures 39 and 40), and the Siem *Aquamarine* and *Topaz* at 9 kn (Figures 41 and 42). The two transit speeds are therefore suitable for comparison to the levels used in Koessler et al. (2020). One example ShipSound report is provided in Appendix G.3.

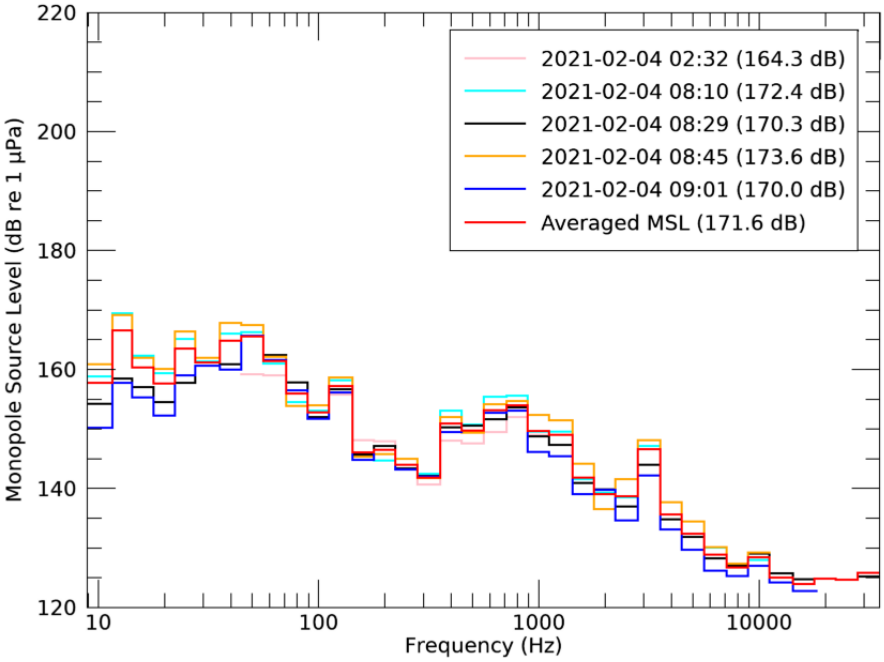

Figure 39. Monopole Source Level (MSL) and spectra for Siem *Sapphire* from Station 2 ShipSound processing. The MSL was converted to 7 kn and averaged over a few ShipSound measurements.

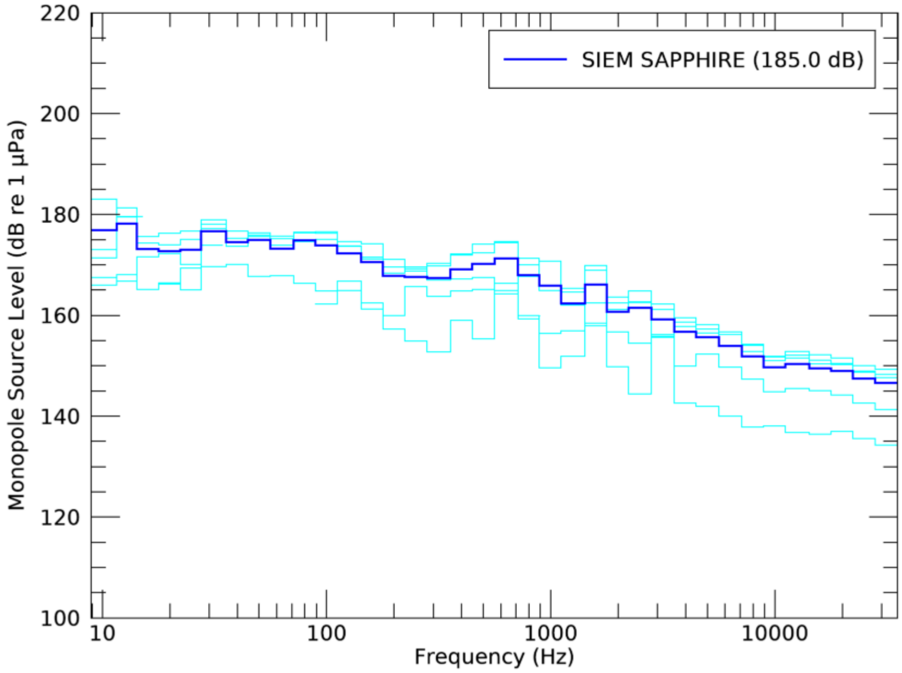

Figure 40. Monopole Source Level (MSL) and spectra for Siem *Sapphire* from Station 4 ShipSound processing. The MSL was converted to 9 kn and averaged over a few ShipSound measurements.

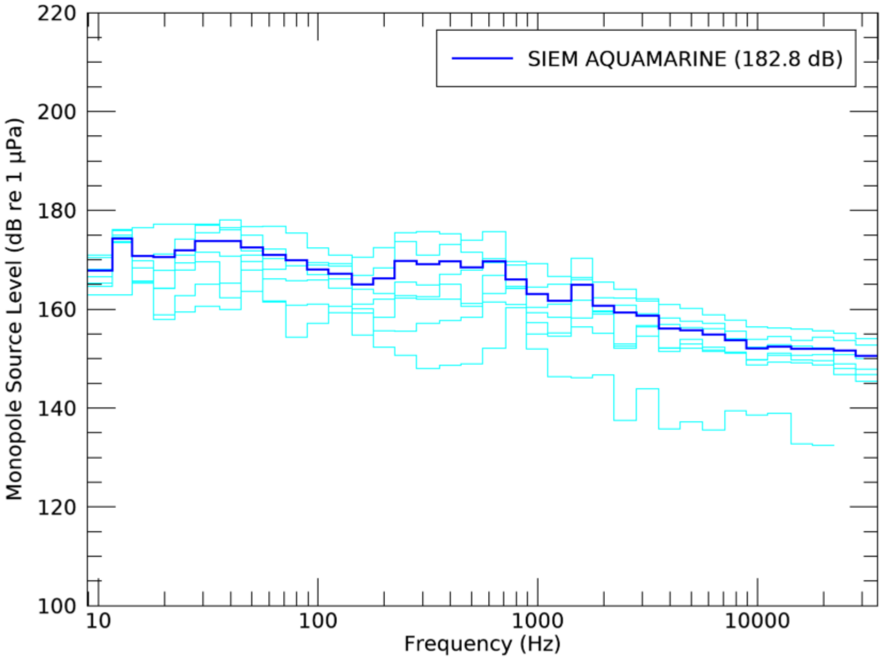

Figure 41. Monopole Source Level (MSL) and spectra for Siem *Aquamarine* from Station 4 ShipSound processing. The MSL was converted to 9 kn and averaged over a few ShipSound measurements.

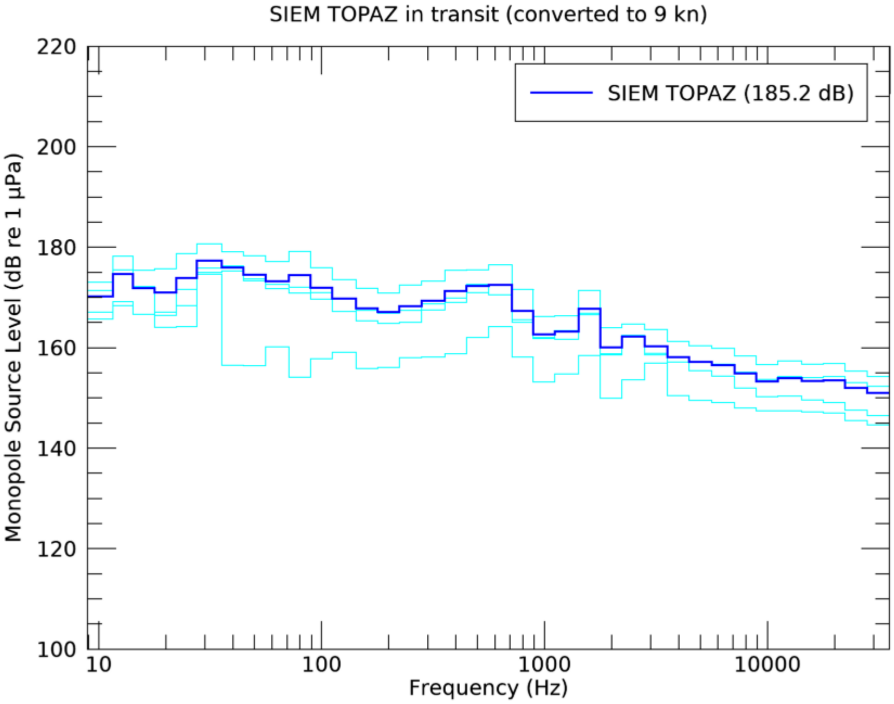

Figure 42. Monopole Source Level (MSL) for Siem *Topaz* from Station 4 ShipSound processing. The MSL was converted to 9 kn and averaged over a few ShipSound measurements.

5.6. Vessel Detections

Vessels were detected throughout the entire recording period using the automated detection algorithm described in Section 4.2.2. Results are shown for the two stations farthest from the *Ocean Onyx*, Stations 3 and 4 (Figure 43). Figure 44 shows an example of a large container vessel passing with a Lloyd’s mirror pattern, and the map of the pass is shown in Figure 45, along with less defined contributions from vessel operations at the *Ocean Onyx* to the north-west (purple) between 100 and 1000 Hz. A spectrogram of a closer vessel pass and associated map are shown in Figures 46 and 47.

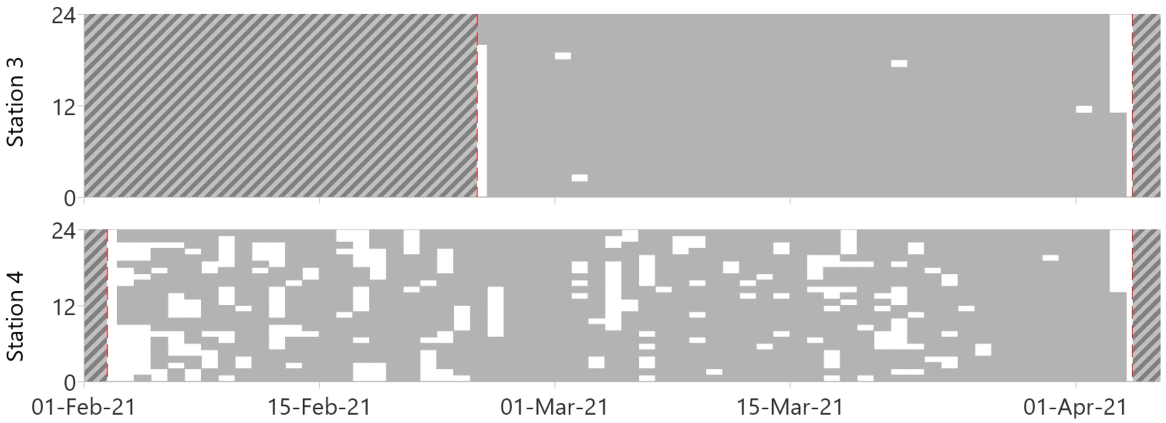

Figure 43. Vessel detections each hour (vertical axis) compared to date (horizontal axis) over the entire recording period at Stations 3 and 4. Vertical dashed lines (red) indicate AMAR deployment and retrieval dates.

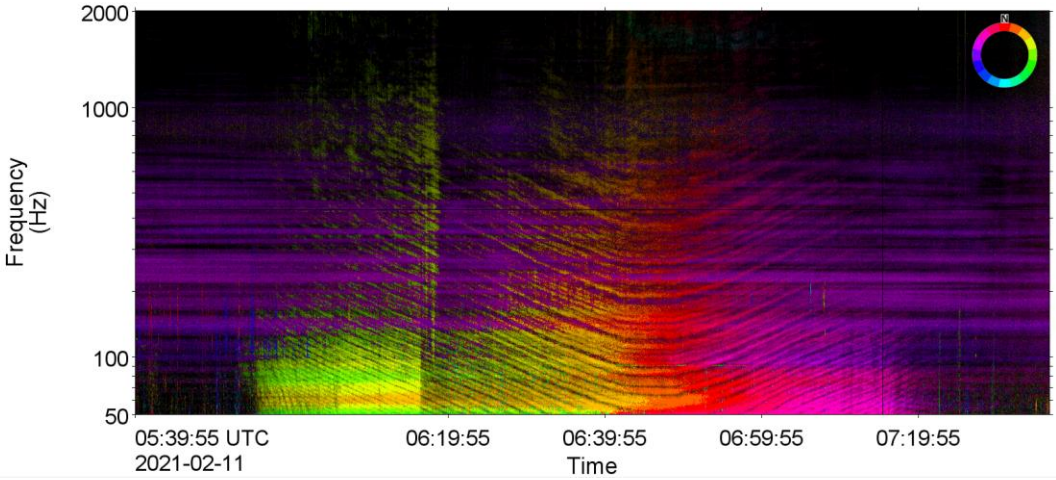

Figure 44. Example of a 334 m long container ship (*E.R. Tokyo*) travelling at 16 kn passing within 5.9 km north of Station 4 from east to west (green/yellow through to purple) that illustrates the Lloyd’s mirror, or bathtub pattern over 2 h, with less defined contributions from vessel operations at the *Ocean Onyx* to the north-west (purple) between 100 and 1000 Hz. This pattern is caused by constructive and destructive interference between direct and reflected paths of sound (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

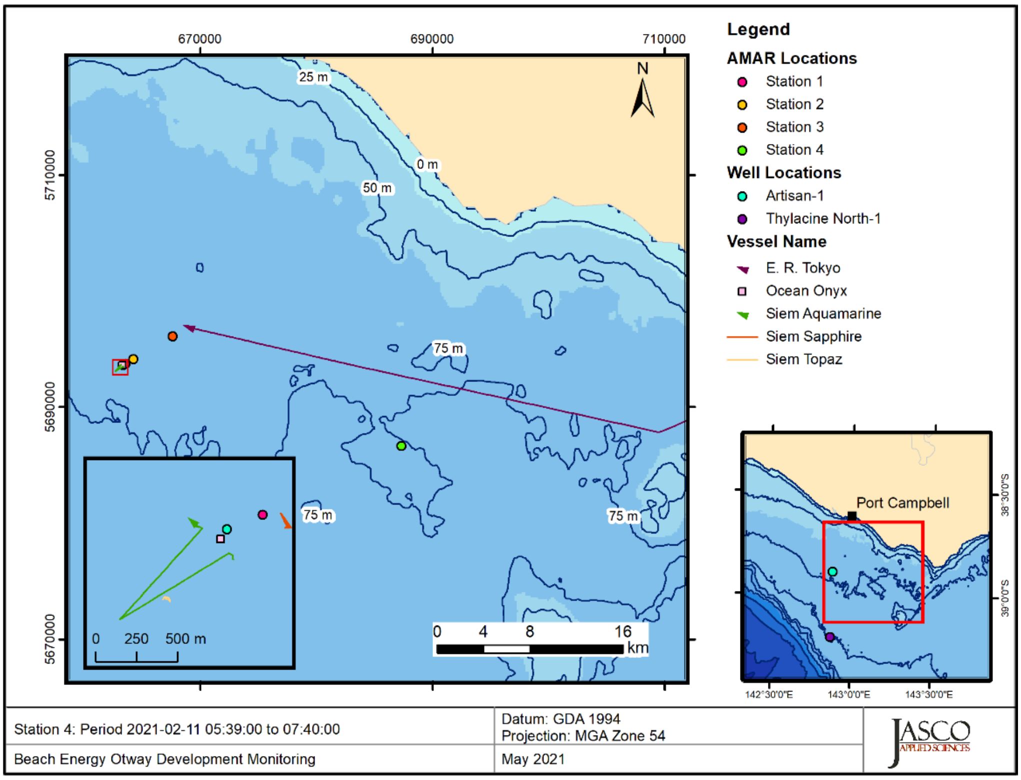

Figure 45. Map of automatic identification system (AIS) reported vessel locations for the spectrogram shown in Figure 44.

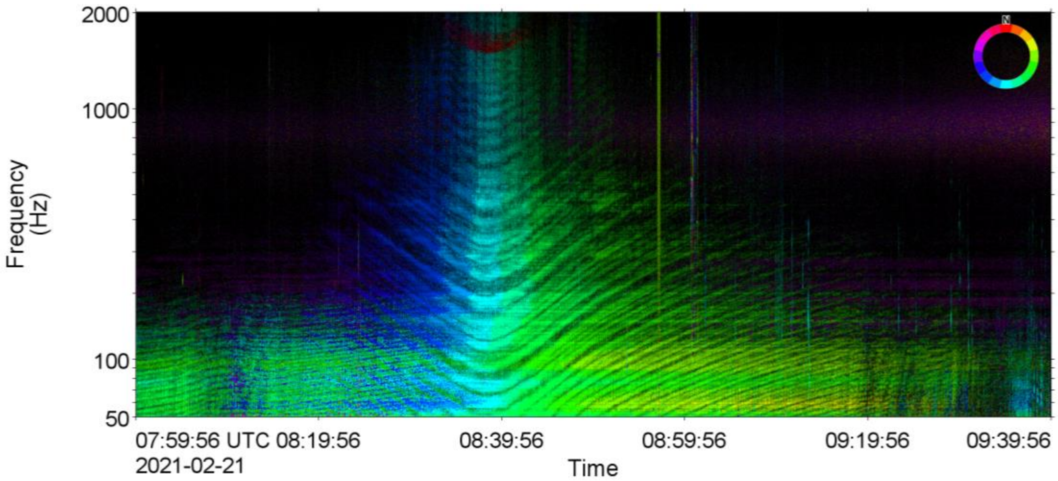

Figure 46. Example of a 200 m long vehicle carrier (*Tombarra*) travelling at 13 kn passing within 2.6 km south of Station 4 from east to west (green/yellow through to purple) that illustrates the Lloyd's mirror, or bathtub pattern over 2 h, with less defined contributions from vessel operations at the *Ocean Onyx* to the north-west (purple) between 100 and 1000 Hz. This pattern is caused by constructive and destructive interference between direct and reflected paths of sound (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

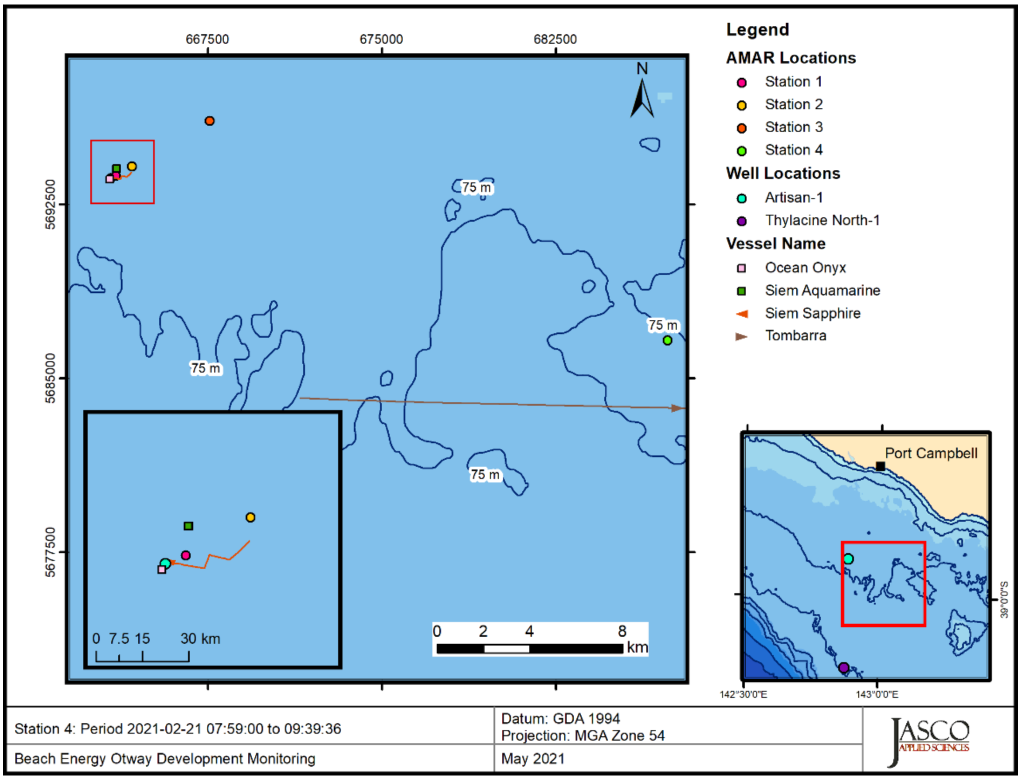

Figure 47. Map of automatic identification system (AIS) reported vessel locations for the spectrogram shown in Figure 46.

5.7. Marine Mammals

The acoustic presence of marine mammals was identified automatically by JASCO's detectors (Section 4.2.7.3) and validated via the manual review of 0.5% of the data, which represents 312 of the 5 min sound files, or 26 h worth of data. Acoustic signals of pygmy blue whales and dolphins were identified and vocalisations of other mysticetes, such as humpback and southern right whales, were not detected by the detectors (D.2), or observed during the 0.5% manual review.

5.7.1. Dolphins

Dolphins produce both impulsive (click) and tonal (whistle) sounds that show less species-level specificity than other marine mammal signals and are therefore more difficult to distinguish acoustically. Due to the directionality of impulsive clicks and the associated degradation of their spectral features when recorded at increasing angles away from the longitudinal axis of the vocalising animal, delphinid clicks cannot be confidently assigned to individual species. Furthermore, because the audible frequency of the acoustic data only reached 32 kHz, much of the energy from dolphin clicks (which can reach over 150 kHz) was not captured. Because of the overlap in spectral features of tonal signals from different dolphin species (Steiner 1981) and the expected but unquantified variability of these signals around the few described vocalisation types, we were unable to distinguish dolphin whistles by species.

The dolphin clicks and whistles observed in the data (Figure 48) were likely produced by short-beaked common dolphins (*Delphinus delphis*), and/or bottlenose dolphins (*Tursiops sp.*) (Bilgmann et al. 2007, Bilgmann et al. 2014, Charlton-Robb et al. 2015). These signals were observed at all stations throughout the recording period with detections highest at Station 4 and through the month of March at Stations 1, 2, and 3 (Figures 49 and 50). It was apparent that dolphin clicks occurred more at night than during the day, particularly at Stations 1–3 (Figure 49).

A third vocalisation type believed to be produced by dolphin calves was also observed in March at Station 3 alongside whistles (Figure 51). These lower frequency patterns of ‘chirps’ and ‘quacks’ have previously been attributed by JASCO analysts to young bottlenose dolphins.

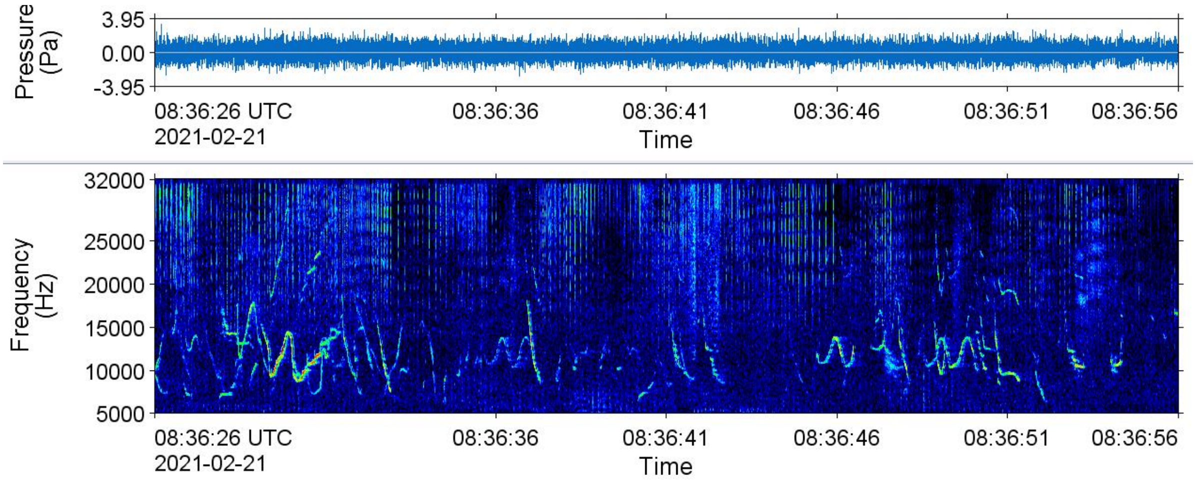

Figure 48. Spectrogram of dolphin clicks and whistles recorded on 21 Feb 2021 at Station 4 (64 Hz frequency resolution, 0.01 s time window, 0.005 s time step, Hamming window, normalised across time). The window length is 30 s.

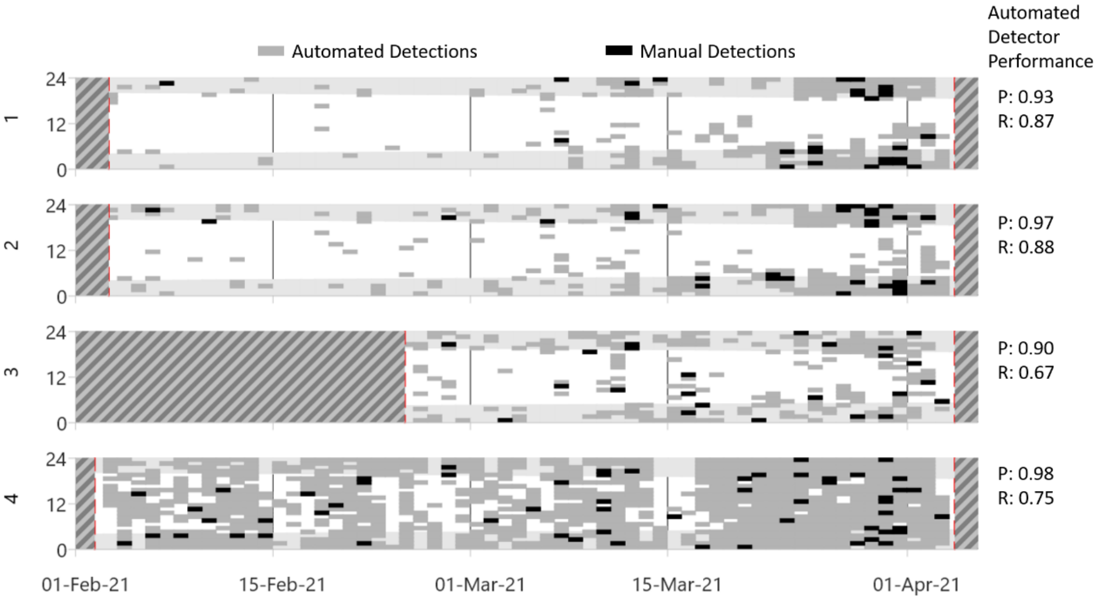

Figure 49. Daily and hourly occurrence of dolphin click detections recorded at Stations 1–4 (top – bottom) with automated detector performance metrics included along right side. The grey areas indicate hours of darkness from sunset to sunrise (Ocean Time Series Group 2009). Hashed areas indicate when there was no acoustic data and red dashed lines indicate the start and end of recordings. Automated detector results are for the dolphin click train detector.

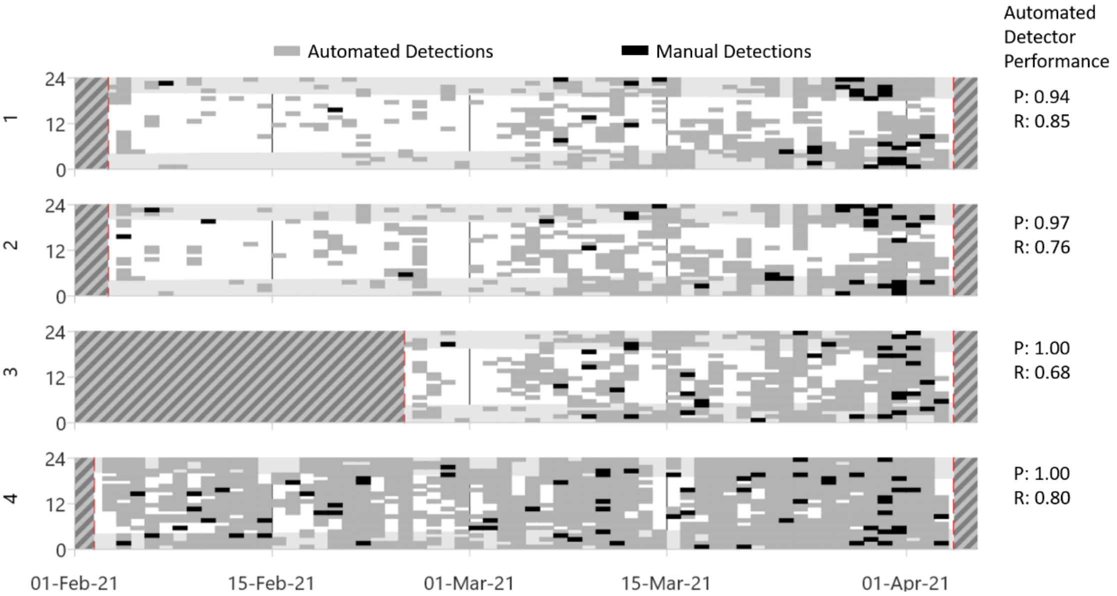

Figure 50. Daily and hourly occurrence of dolphin whistle detections recorded at Stations 1–4 (top – bottom) with automated detector performance metrics included along right side. The grey areas indicate hours of darkness from sunset to sunrise (Ocean Time Series Group 2009). Hashed areas indicate when there was no acoustic data and red dashed lines indicate the start and end of recordings. Automated detector results are for the WhistleHigh detector.

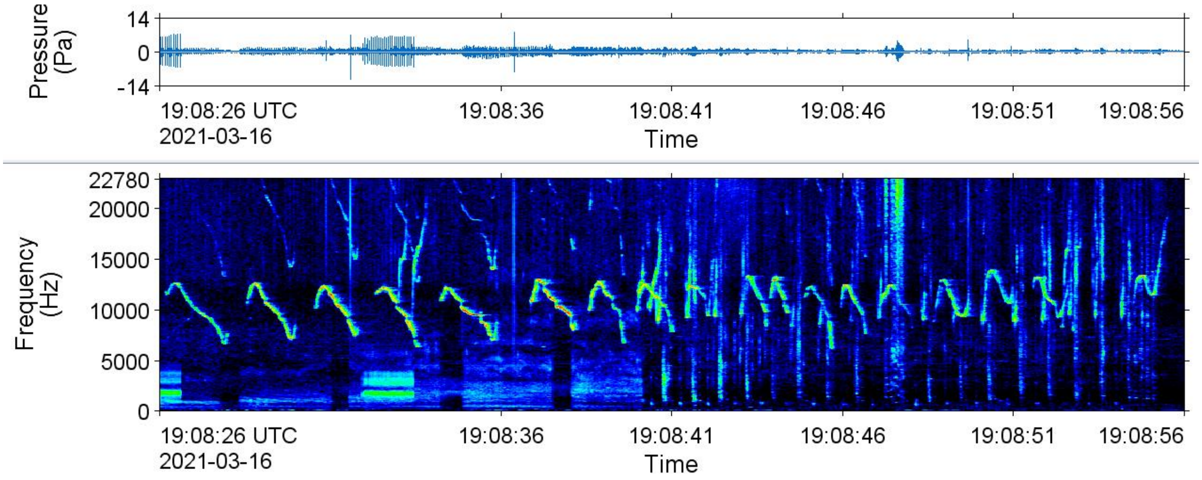

Figure 51. Spectrogram of dolphin whistles (above 5000 Hz) and sounds from young dolphins (majority present under 5000 Hz) recorded on 16 Mar 2021 at Station 3 (2 Hz frequency resolution, 0.125 s time window, 0.03125 s time step, Hamming window, normalised across time). The window length is 30 s.

5.7.2. Pygmy Blue Whales

Songs of pygmy blue whales (*Balaenoptera musculus brevicauda*; Figures 52 and 53) were detected sporadically through February and the first half of March. By the end of March, the signals were present in almost every hour of recording (Figure 54). This pattern of occurrence was reflected across all recording stations (Figure 54). In addition to the songs containing A, B, and C notes (Figures 52 and 53) (McDonald et al. 2006, Gavrilov and McCauley 2013, McCauley et al. 2018) that were the most common blue whale vocalisation in the data, blue whale D calls (Figure 55) (Recalde-Salas et al. 2014) were also present at the end of March and into April.

At Station 4, the direction of the blue whale acoustic signals relative to the recorder position was observed. An example of this is provided in Figure 52, where one blue whale is singing to the northwest, and one is singing to the southeast. Similarly, in Figure 55, the blue whale is calling from south of the recorder. When manually analysing blue whales at Station 4, an annotation was created for every direction of calling animals and the direction saved with the annotation. Figure 56 summarises these blue whale directional results from manual analysis. Blue whales occurred in all directions relative to Station 4, and there were 1–3 individuals confirmed vocalising at a time (Figure 56). Early in the recording, there is an apparent trend in the animals being more to the east and, later in the recording, being more to the west. However, the data were too sparse to confirm anything about animal movements.

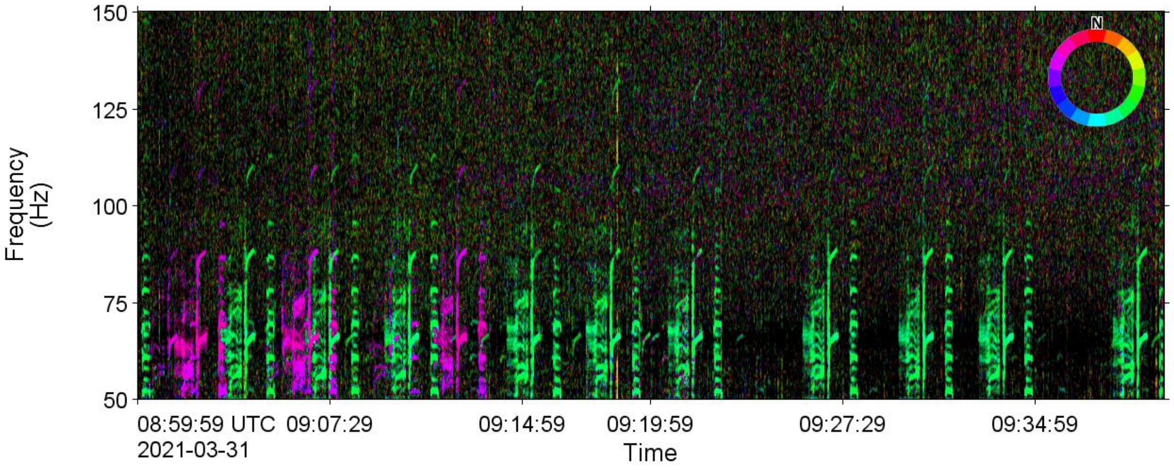

Figure 52. Directogram of pygmy blue whale songs recorded on 31 Mar 2021 at Station 4 (UTC) (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time). Displaying ~40 min of data. One blue whale is singing to the northwest of Station 4 (pink) and one is singing to the southeast of Station 4 (green).

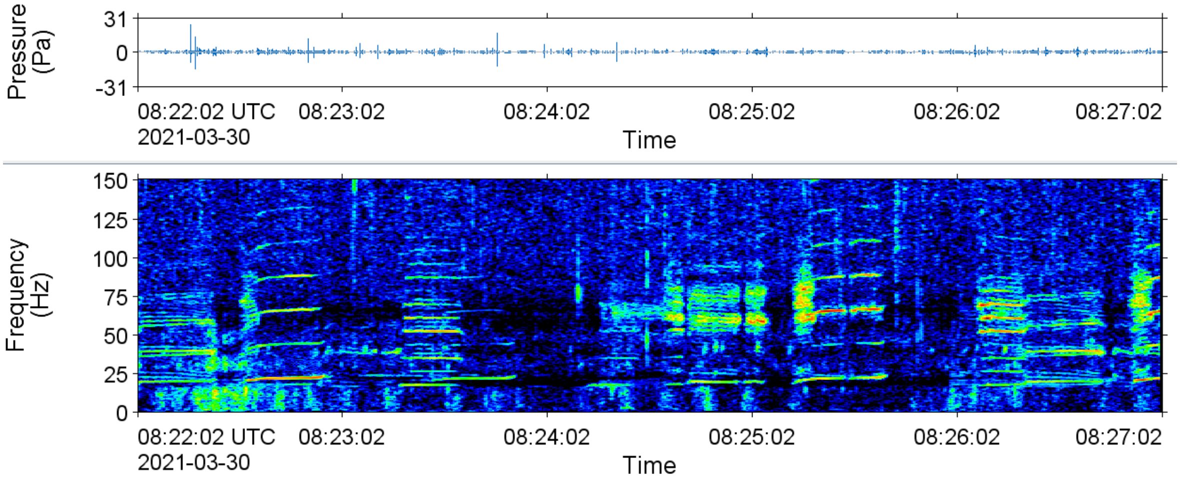

Figure 53. Spectrogram of pygmy blue whale songs recorded on 30 Mar 2021 at Station 3 (UTC) (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time). Displaying 5 min of data.

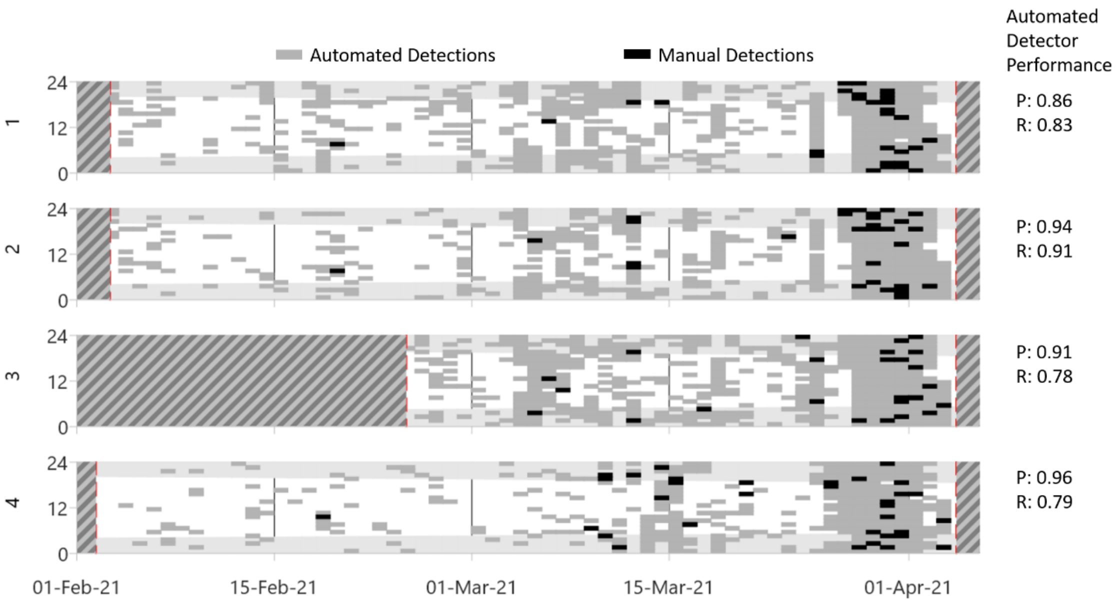

Figure 54. Daily and hourly occurrence of pygmy blue whale vocalisations recorded at Stations 1–4 (top – bottom) with automated detector performance metrics included along right side. The grey areas indicate hours of darkness from sunset to sunrise (Ocean Time Series Group 2009). Hashed areas indicate when there was no acoustic data and red dashed lines indicate the start and end of recordings. Automated detector results are for the AUS_BW_BH20 detector.

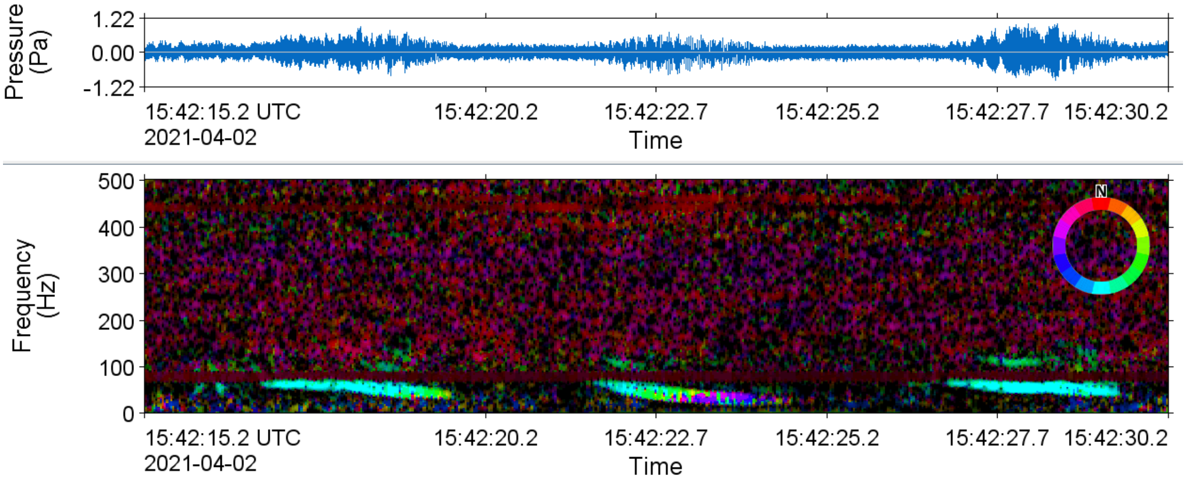

Figure 55. Directogram of pygmy blue D calls recorded on 2 Apr 2021 at Station 4 (UTC) (2 Hz frequency resolution, 0.125 s time window, 0.03125 s time step, Hamming window, normalised across time). Displaying 16 s of data. The blue whale is vocalising to the south of Station 4 (teal). In the second call, the frequencies fall below those which can be accurately determined with the hydrophone spacing using, with the colour of the signal changing from teal to purple and navy blue.

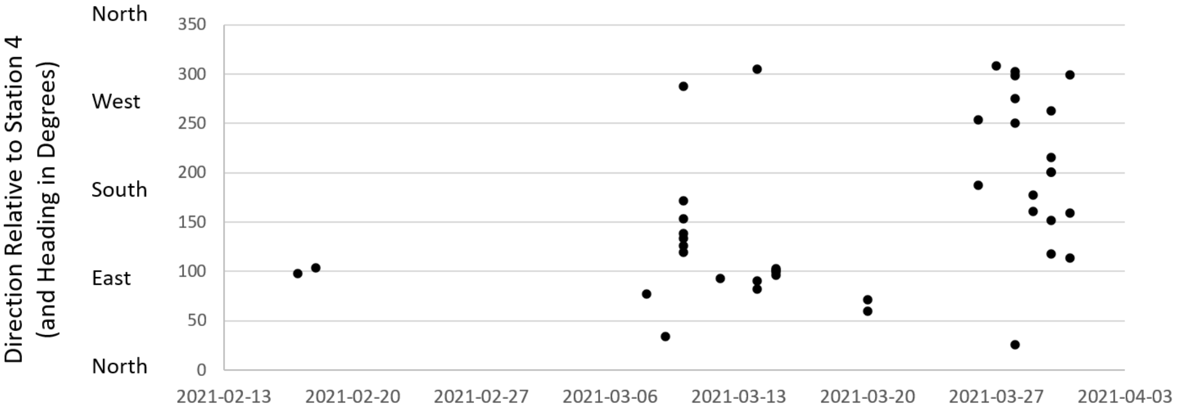

Figure 56. Plot of direction of blue whale vocalisations relative to Station 4 over the recording period where each point is a calculated from a manual annotation created during the 0.5% manual validation analysis (one annotation per direction per 5 min file analysed).

5.7.3. Other Potential Biological Sounds

Occasionally during manual analysis, pulses ranging from ~750 to 1250 Hz (Figure 57) were observed that may have been produced by fish. Alternatively, these signals could be a result of some anthropogenic activity, noises from which were noted through much of the data during manual review, particularly at Stations 1 and 2. Fish chorusing activity was apparent in the LTSAs, in particular at Station 4, with examples provided in Figures 58–60.

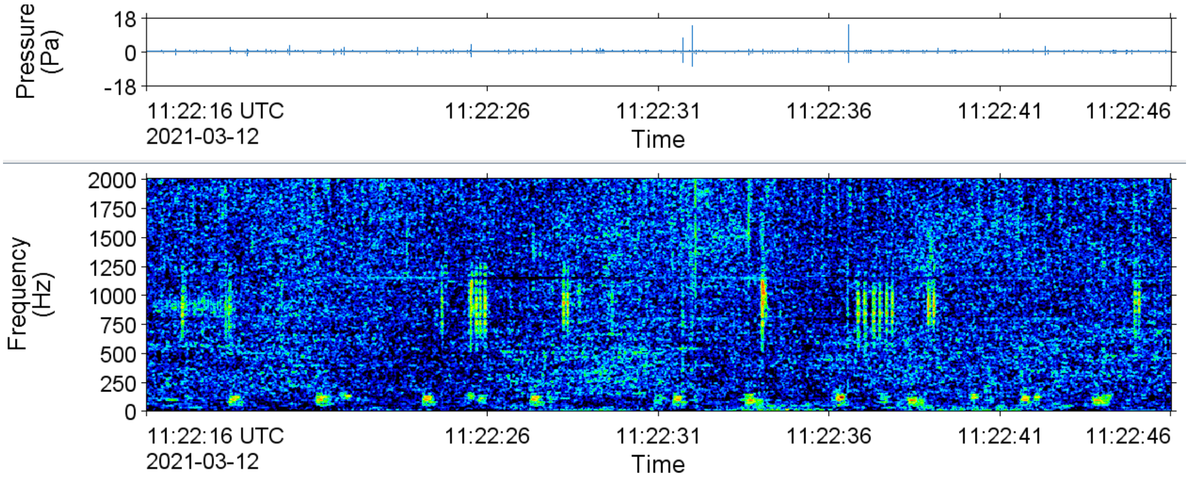

Figure 57. Spectrogram of unknown signals potentially produced by fish (pulses at 500–1250 Hz) recorded on 12 Mar 2021 at Station 3 (UTC) (2 Hz frequency resolution, 0.125 s time window, 0.03125 s time step, Hamming window, normalised across time). Displaying 30 s of data.

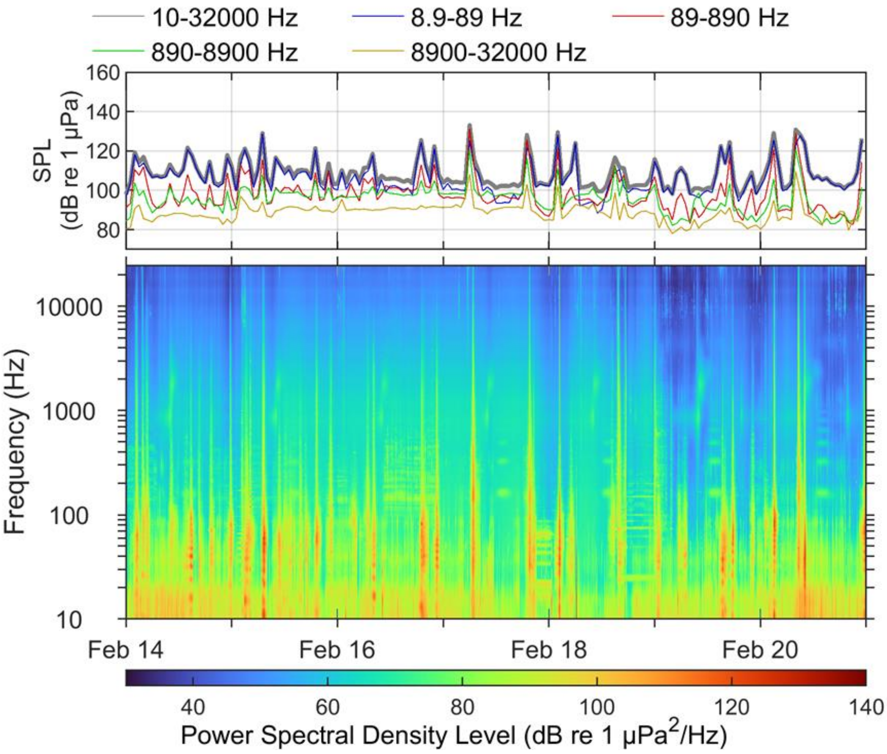

Figure 58. In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound for one week of data at Station 4, showing daily fish chorus's between 700 and 2000 kHz, and between 150 and 450 Hz, more obvious after 17 Feb 2021.

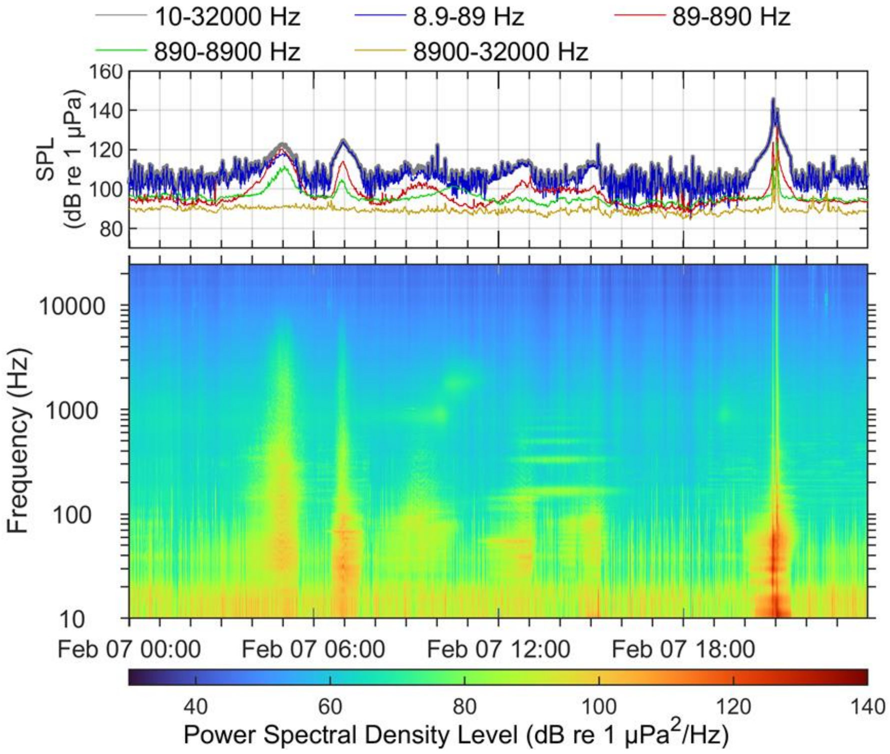

Figure 59. In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound for one day of data at Station 4, showing the daily fish chorus between 700 and 2000 kHz, and between 150 and 450 Hz, apparent in Figure 58, and six vessel transits.

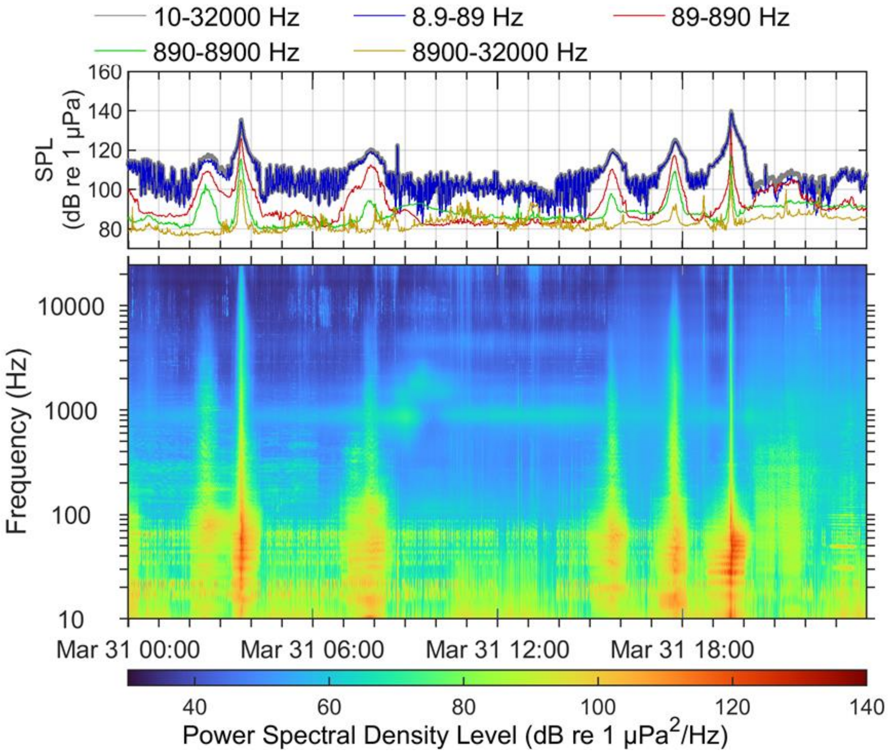

Figure 60. In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound for one day of data at Station 4, showing the daily fish chorus between 700 and 2000 kHz, lasting almost the entire day, along with six vessel transits.

6. Validation Analysis

Table 12 presents the four scenarios that need to be considered to validate the pre-measurement modelling presented in Koessler et al. (2020) for the Artisan-1. The scenarios are described in Table 12, with the modelling site locations and descriptions provided in Table 13.

Table 12. Description of modelling scenarios for the Artisan-1 development area from Koessler et al. (2020)

Well	Scenario number	Description	Associated modelled sites
Artisan-1	5	MODU, normal drilling operations	4
	6	OSV standby, independent of MODU, for 24 h	6
	7	MODU with OSV during resupply operations (including 4 hours alongside the MODU)	4, 5 and 6
	8	MODU with OSV standby (combination of Scenarios 5 and 6)	4 and 6

Table 13. Location details for the validation modelled sites.

Well	Site	Source	Latitude (S)	Longitude (E)	MGA Zone 54 (GDA94)		Water depth (m)
					X (m)	*Y* (m)	
Artisan-1	4	MODU	38° 53' 27.4106"	142° 52' 58.4450"	663300	5693640	71.5
	5	OSV	38° 53' 27.4021"	142° 53' 01.0962"	663364	5693639	71.6
	6	OSV standby	38° 53' 26.1553"	142° 54'21.4165"	665300	5693637	70.2

6.1. Source Level Comparison

The modelled source levels used in Koessler et al. (2020) are shown in Figures 61–63 alongside MSLs from the measurement program.

The mean estimated source levels for the vessels under transit used in the modelling study, which were derived based on the scaling of the power level, were similar to the MSL determined through the measurement study, which varied significantly with vessel speed (between 171.6 and 185.2 dB re µPa m). The trend of decreased MSL with speed follow those from studies on commercial shipping and ferries (MacGillivray et al. 2019). The measured MSL under dynamic positioning was different to that used in Koessler et al. (2020), in part due to the vessel power levels applied, but also because the approach used to estimate sound levels under dynamic positioning is based upon vessels under transit and is an approximation based on the Maximum Continuous Rating (MCR). Limited measurements of vessels under dynamic positioning using standardised measurement approaches are reported in literature, and there are significant differences between the thruster models and specifications, depths, and vessel dynamic positioning systems which control thruster operations. Therefore, this characterisation is a valuable contribution to understanding the MSLs for systems installed in anchor handling vessels.

The mean MSLs for the *Ocean Onyx* Figure 63 decrease as the drilling depth increases. The estimate of the *Ocean Onyx* source level spectrum was based on the Transocean *Polar Pioneer*, a similarly sized MODU. The *Polar Pioneer* was measured by JASCO while anchored and drilling, and had a broadband (10 Hz to 35 kHz) source level of 170.1 dB re 1 µPa m (Austin et al. 2018), although the source level used in the modelling was 178.7 dB re 1 µPa m. The mean maximum MSL from the measurement program was 175.2 re 1 µPa m, associated with shallowest drilling depths.

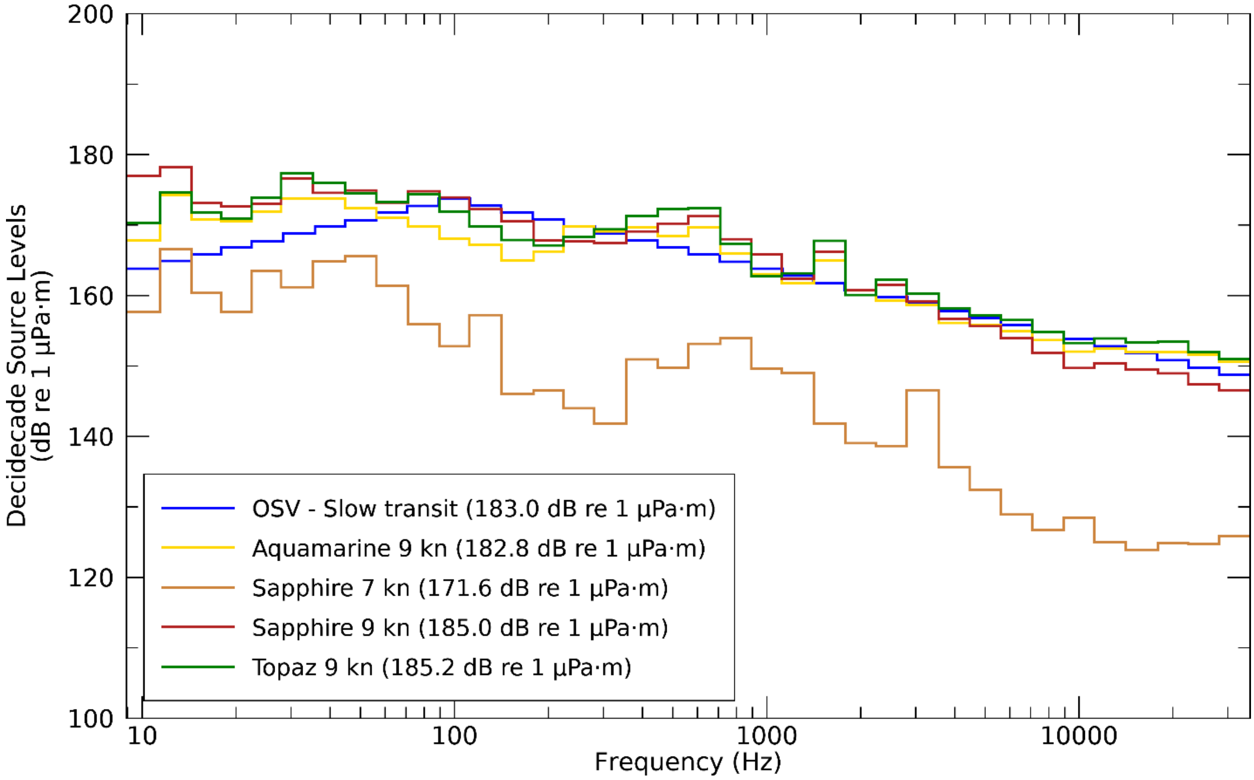

Figure 61. *Offshore Support Vessel (OSV)*: Decidecade source level spectra of the modelled OSV, slow transit (15% MCR) and Monopole source levels (MSLs) determined through the measurement program.

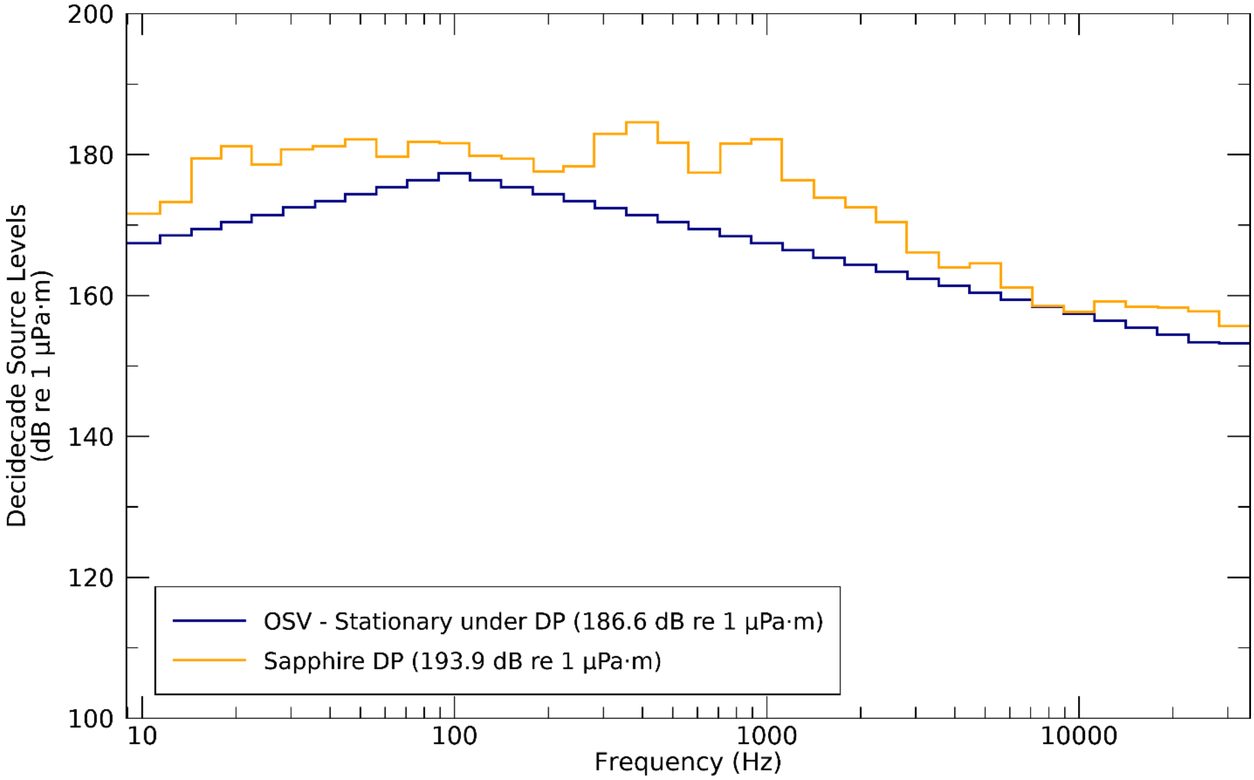

Figure 62. *Offshore Support Vessel (OSV)*: Decidecade source level spectra of the modelled DP (20% MCR) and MSLs determined through the measurement program.

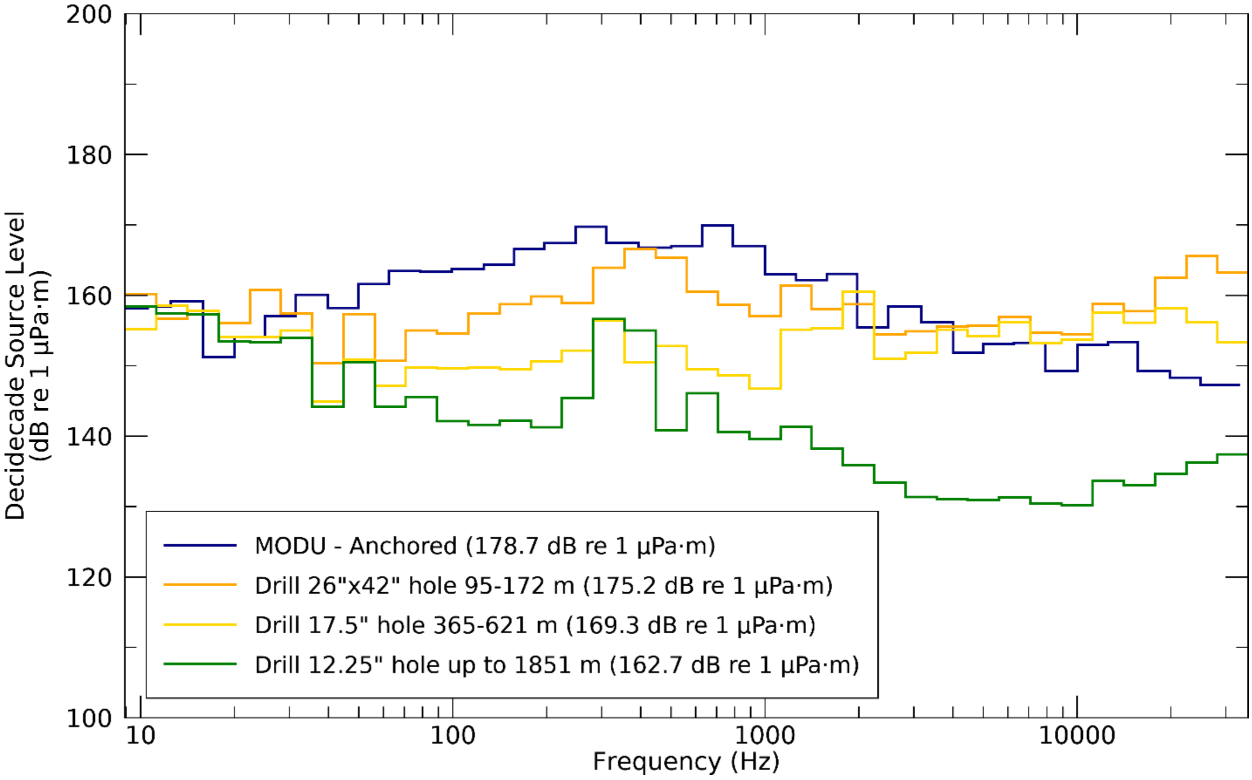

Figure 63. *Mobile Offshore Drilling Unit (MODU)*: Decidecade source level spectra of the modelled MODU, and the mean MSLs determined through the measurement program of the *Ocean Onyx* for three stages of drilling.

6.2. Understanding Propagation Loss

The plotted data and curve fits, as discussed in Section 4.2.4 and presented in Section 5.3, provide substantial detail on the environmental effects on the propagation of acoustic energy in the water column. In comparing SPL data fits for Stations 1–3, the loss rate is higher than what would have been expected in this environment, considering the higher MSLs for the support vessel on DP derived from measurements. In consideration of the potential variations in the seabed geologic compositions as indicated in Section 2.4, any difference may be attributed to the existence or absence of a thin veneer of sand.

A comparison exercise was conducted using JASCO's Marine Operations Noise Model (MONM) and JASCO's wavenumber integration model (VSTACK; Hannay et al. 2010, Jensen et al. 2011). VSTACK computes propagation loss versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. It is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom.

A simple range-independent isovelocity water column (1500 m/s) was modelled considering a calcarenite seabed with and without a thin layer of sand as detailed in the Appendix of Koessler et al. (2020). The decidecade spectra of the measured MODU in Section 6.1 were combined with the modelled propagation loss from MONM and VSTACK to produce received level (SPL; L_p) scatter plots with range. Receivers were chosen to span the water column and the MSL source depth was located at 11 m. The results are shown below in Figures 64 and 65 when considering the mean maximum decidecade MSL presented above in Section 6.1 .

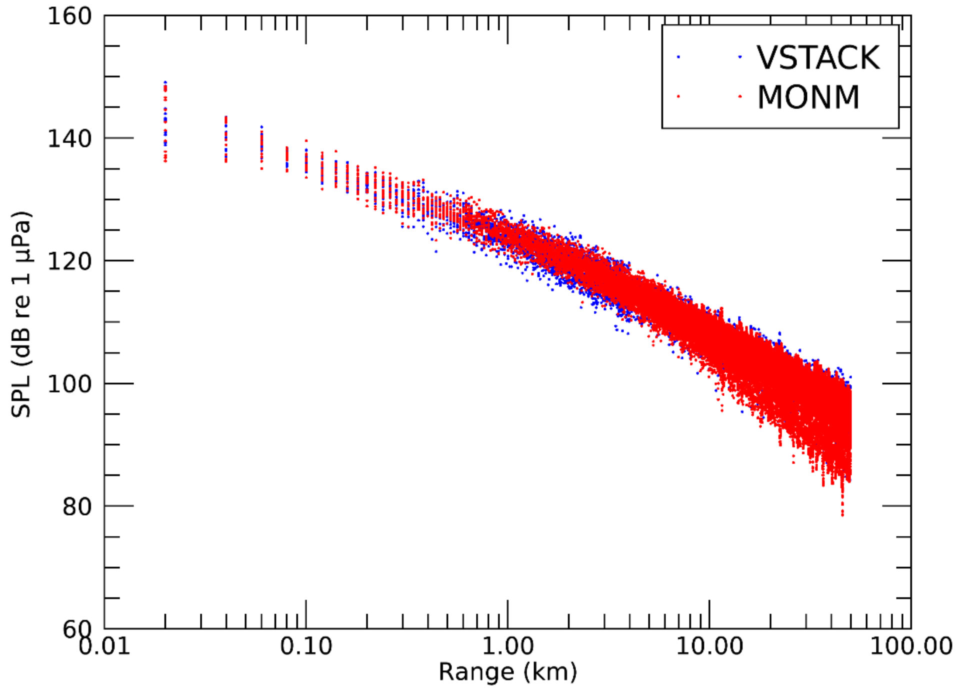

Figure 64 *Mobile Offshore Drilling Unit (MODU)*: Predicted received levels (SPL) for a simplified range independent environment with a calcarenite seabed with a thin overlying veneer of sand.

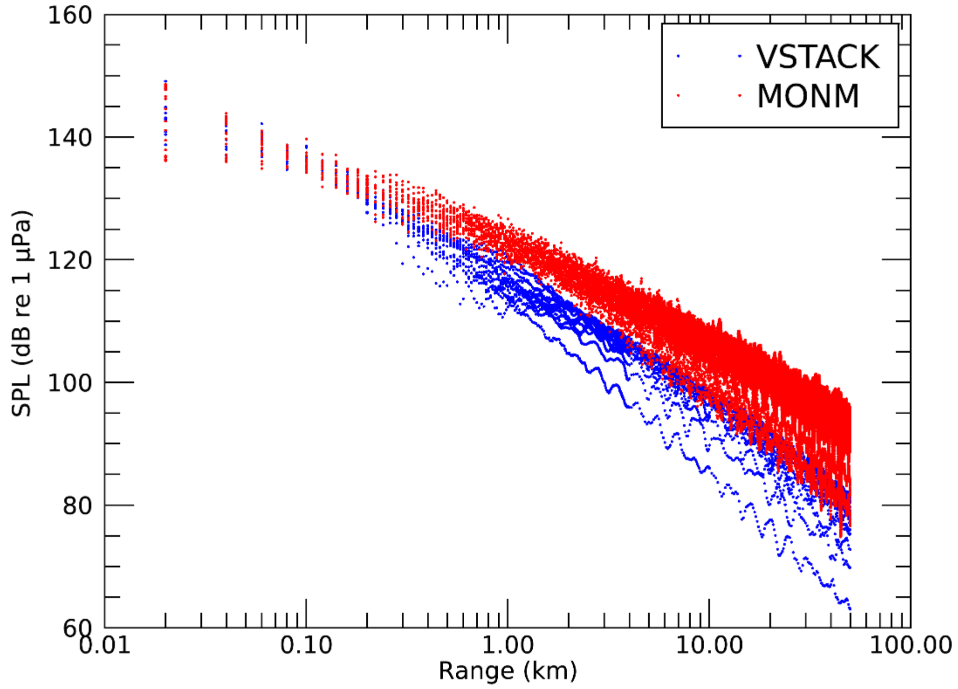

Figure 65 *Mobile Offshore Drilling Unit (MODU)*: Predicted received levels (SPL) for a simplified range independent environment with a calcarenite seabed with no sand layer.

When considering the results from VSTACK, the indication is that much higher rates of loss would be expected if no sand layer were present. Considering the variably of the distribution of seafloor sediments within the wider region, the higher rates of loss indicate that that the any overlaying sand is much thinner than or completely absent at the seafloor. In consideration of these modelled results and the SPL curve fits in in Section 5.3, the validation exercise was therefore carried out with the geoacoustic model consisting of well-cemented carbonate caprock, overlying semi-cemented carbonate rock.

An additional broadband correction was applied to the propagation loss results from MONM to account for the higher rates of loss when the full for the elasto-acoustic properties of the sub-bottom are consider. The differences between the broadband SPL from MONM and VSTACK were extracted at the same modelled ranges and depths that corresponded range independent predictions. The 90th percentile of the resultant dB differences was selected at each range to generate a generalised conversion function for each individual site to be modelled. The conversion functions were applied after the propagation loss calculation from MONM but before summing decidecade band levels, gridding, and radii calculations for each modelled site in each modelled scenario considered. Figure 66 shows an example comparison of the re-modelled results for Scenario 7 (MODU with OSV during resupply operations), at a receiver depth of 70.5 m (the median depth of measurement Stations 1–3) and an azimuth of 60°, against the data and 90th percentile data fit bounds for when the levels at Station 1 are above 150 dB re 1µPa (Figure 22). It is inferred that the data plotted here is associated with operational activity in the vicinity of the MODU and therefore may be similar to the modelled resupply operations scenario, at least for comparative purposes. The similar decay rates between the modelling and measured data indicate that re-modelled results presented here are broadly within measured range of levels for similar operations.

However, these data contain many different operations that will not exactly align with nominal representative scenarios for modelling, due to the time varying nature of the operations and associated produced sound levels. The modelled scenario produces levels that intersect the upper bound of the measured data, and therefore it is likely conservative through using the static MSL and operational representations – whilst a more detailed scenario is possible to be created (Quijano et al. 2019), that was beyond the scope of this study.

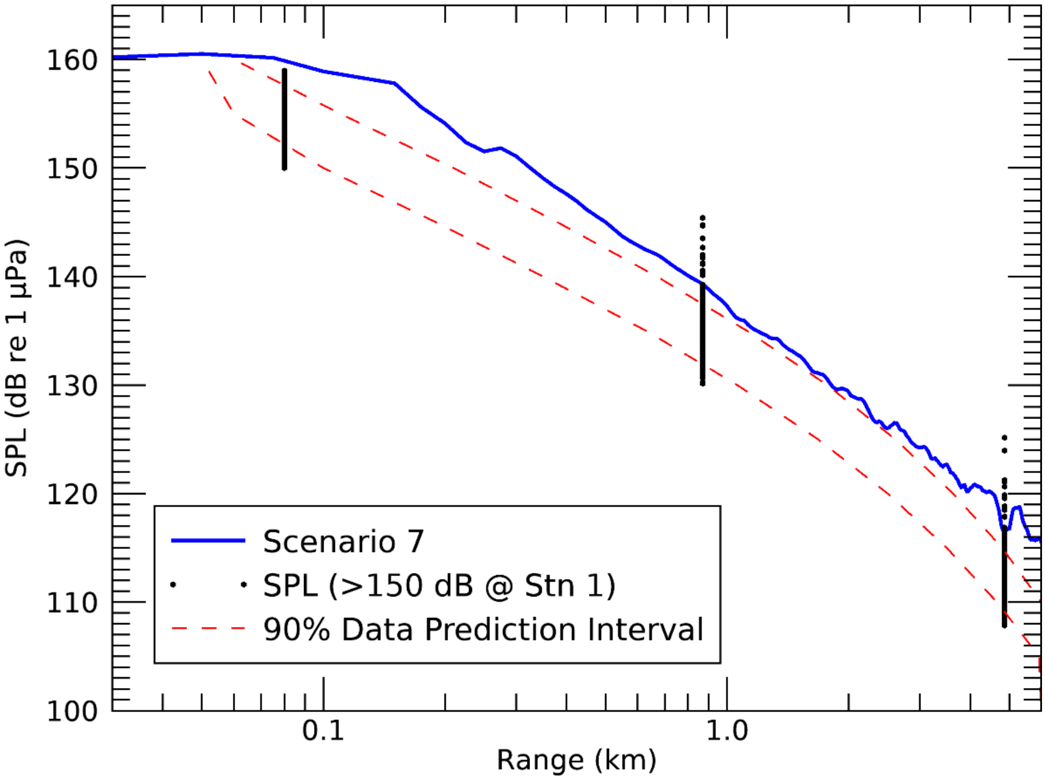

Figure 66. Generalised model validation plot.

6.3. Revised Threshold Distances

The results from the measurement study cannot be directly compared to the modelling presented in Koessler et al. (2020) due to the differences in actual events compared to the nominal representative scenarios developed and evaluated as part of the EP assessment process. Additionally, the measurements were obtained at a receiver 1.2 m off the seafloor, not at the maximum-over-depth results reported in the modelling study. The ranges obtained from the measurement study are reported in relation to the Artisan-1 well location, and thus the centre of the *Ocean Onyx*. The ranges in the modelling study are reported from a range of locations, including the centroids of multiple sources, thus it is not possible to report the measurement results in a similar fashion using the small number of recording locations used in this study.

However, the understanding of the propagation loss environment, and the revision of the representation and treatment of it as detailed in Section 6.2, enabled the modelling scenarios for activities at Artisan-1 presented in Koessler et al. (2020) to be recalculated. The revised results for distances to maximum-over-depth SPL isopleths are presented in Table 14 and compared in Table 15 to the original modelling. The revised results for distances to maximum-over-depth SEL thresholds are presented in Table 16 and compared in Table 17 to the original modelling.

7. Discussion and Conclusion

7.1. Ambient Soundscape

The insights into ambient soundscape within the Otway Basin and in the vicinity of the Development Drilling program can be obtained through the data recorded at Station 4, and in part, Station 3. Stations 1 and 2 are too close to the location of the Artisan-1 well and associated activity to provide any information about ambient noise while the *Ocean Onyx* is present. Whilst data exists outside the period in which the *Ocean Onyx* is present, this data includes noise from the moored rig anchor chains, which are not a typical soundscape contributor.

The correlograms (Section 5.2) show a positive correlation between wind speeds and wave heights and sound levels for frequencies over 100 Hz, with the relationship with wind speed being stronger than that for wave height. For both stations shipping is a strong contributor: most days recorded a significant number of vessel detections (Section 5.6), with the contributions at Station 4 apparent in the power spectral density and percentile plot (Figure 16), between 40 and approximately 100 Hz. If the support vessels for the Development Drilling program did not pass near Station 3 as often while under station keeping, the number of close vessel passes would have been less, and thus it is likely that the statistics presented in Table 10 would have reflected a soundscape with quieter sound levels on average.

In terms of monitoring work with the Otway and Bass Strait regions, between 2009 and 2016 the Integrated Marine Observing System (IMOS) has been recording underwater sound south of Portland, Victoria (38°32.5' S, 115°0.1'E). Prominent sound sources identified in recordings include blue and fin whales at frequencies below 100 Hz, ship noise at 20 to 200 Hz, and fish at 1 to 2 kHz (Erbe et al. 2016). In the broader region, primary contributors to background sound levels were wind, rain and currents-and waves-associated sound at low frequencies under 2 kHz (Przeslawski et al. 2016), and biological sound sources including dolphin vocalisations were also recorded.

To gain an understanding of the existing marine acoustic environment to inform the impact assessment for the Otway Gas Development, acoustic monitoring was undertaken by Woodside (2003). During April-May 2001, two underwater noise loggers were placed (5.1 km and 2.9 km) south-west of an exploration petroleum drilling vessel at the Thylacine site to measure underwater noise before, during, and after drilling activity. Only one of the loggers (5.9 km) was able to be recovered. A further logger was placed in the shipping lane approximately 60 kms due south of Port Fairy to measure ambient noise produced by physical, man-made and biological sources between late November 2001 and early March 2002.

A summary of the report states that the following features were noted with respect to underwater noise environment at the Thylacine location:

- Relatively quiet with only the passage of several boats (about ten) evident.
- The rig tender and drill rig noise show clearly from 13:00 on the 3 May 2001.
- Drill rig noise was evident as sharp tones.
- Rig tender noise was evident either at a low but persistent level for days or in short bursts of high level noise for several hours associated with manoeuvring, use of thrusters or as a close passage by the receiver.
- The horizontal banding characteristic of persistent calling by pygmy blue whales was not evident, rather these call types occurred infrequently and at low levels indicating the respective sources were at long range.
- Evidence of low-level, distant evening fish choruses only.

However, at the shipping lane location, it was noted:

- Regular passages of boats evident.
- Regular evening fish choruses, there were also dawn choruses and persistent low level calling by these sources over daytime.
- Blue whale calling persisted over many hours, an example is the first close passage for the season just before midday on 4 January 2002 followed by several more animals a day later.
- Evidence of calling from at least three other whale species.
- Baseline broadband underwater noise for the period was in the order of 93 to 97 dB re 1 µPa with shipping raising the averaged noise level above 105 dB re 1 µPa for 6% of the deployment time.

An acoustic monitoring program was also undertaken during exploratory drilling of the Casino-3 well. A sound logger located 28.03 km from the drill site did not detect drilling noise and recorded ambient noise that ranged between 90 and 110 dB re 1 µPa (McCauley 2004). Passive acoustic monitoring commissioned by Origin from April 2012 to January 2013, 5 km offshore from the coastline east of Warrnambool, identified that ambient underwater noise in coastal areas is generally higher than further offshore, with a mean of 110 dB re 1 µPa and maximum of 161 dB re 1 µPa.

JASCO has not reviewed these historical reports and the associated activity descriptions within them, or information on the vessels and MODU used, therefore direct comparison between the data collected during exploratory drilling of the Casino-3 well and the Artisan-1 well should be conducted with caution.

Comparing the results from a recorder 28.3 km from drilling operations at Casino 3 with Station 4, the results for Station 4 were a median broadband ambient noise of 104.5 dB re 1 µPa, a mean of 118.3 dB re 1 µPa, a minimum of 86.6 dB re 1 µPa, and a maximum of 153.6 dB re 1 µPa, which is both quieter and louder than those for Casino 3. The mean levels at Station 4 are 8.3 dB higher than those recorded 5 km offshore of Warrnambool, while the maximum recorded at Station 4 is lower by 7.4 dB. The use of percentiles, as provided in Section 5.1.1, Figure 16 and Table 10, in the context of contributors such as weather (Section 5.2), shipping (Section 5.6), and marine mammals (Section 5.7), provides a more nuanced understanding of sound levels received at a recording station. Local variations in ambient noise and received levels can depend upon water depth and the proximity to contributors In this case, the shipping lanes (Section 2.2) and the frequency and proximity of vessel passes are strong drivers of the ambient noise at Station 4. The use of Station 4 as a dedicated measurement location for the support vessels (Section 2.5.2) does not change the relevance of the results from this measurement location, as those vessels would still have been transiting at similar speeds and along similar tracks on trips between Geelong and Artisan-1. The quieter levels reported at Thylacine in Lattice Energy (2017) are likely due to the placement of the monitoring station at a distance from the shipping lanes (Figure 3), which limited their contributions to the data set and thus resulted in a lower reported range of received sound levels.

7.2. Modelling Validation

The Monopole Source Levels determined through the measurement study differed from those either estimated for use in the modelling study or those determined using proxy sources. The key differences are as follows:

- The support vessels are quieter than estimated when they are under slow transit speeds, such as 7 kn.
- The support vessels are louder than estimated when they are travelling at faster transit speeds, with 9 kn used to represent these speeds and the associated MSL.
- The support vessels are louder than estimated when holding station or moving under dynamic positioning.
- The drilling operations of the *Ocean Onyx* are both louder at some frequencies and quieter at others than those for the proxy rig the *Polar Pioneer* (Austin et al. 2018), although the results presented for the *Polar Pioneer* did not examine the changes in level with increased drilling depth (over time) as completed within this study.

The relationship between vessel speed and MSL is well known, with recent detailed examinations on shipping traffic associated with the Port of Vancouver (Joy et al. 2019, Trounce et al. 2019, JASCO Applied Sciences and SMRU Consulting 2020). Conducting the measurement campaign in deeper water, along with higher time resolution location reporting systems for the vessels, automated high time resolution engine information reporting, and a greater number of vessel passes at a range of speeds would further develop this dataset to allow for more accurate predictions of sound level in relation to vessel speed or operations. Predictions of sound levels using speed and operational state is preferred to estimates determined using scaling of power levels, particularly when considering the range of propulsion systems on the vessels.

The measurement of sound levels for vessels under DP is complex and time consuming. It requires dedicated operations in the absence of other activities, which is a challenge considering the task requirements of typical support and anchor handling vessels. Few studies have reported the MSL of support vessels under DP, with the majority estimating the RNL rather than MSL. The large range of thrusters and operational control systems and the variable source depths of each individual thruster contribute to the complexity of estimating source levels. Measurement studies are complicated by environmental conditions and the specifics of each vessel. The MSLs calculated from each of the three DP exercises defined (Section 2.5.2) were very similar. However, the ability to replicate these across different weather conditions and position holding constraints would likely provide valuable information which could help contextualise future modelling studies.

The MSLs reported within this study can be used as inputs to modelling studies for other operations for the same or similar vessels or MODU’s. However, the reported ranges to thresholds are specific to the Artisan-1 well location, and not transferrable to other locations, particularly in different water depths, geologic environments, and sound speed profiles. The approach developed to represent the propagation loss based upon the measurement results is suitable for other locations within the continental shelf portion of the Otway Basin. However, the accuracy of the representation of the propagation loss within this environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on the calcarenite seabed within the region. In general, the thinner the sand layer, the greater the propagation loss.

The agreement between VSTACK and MONM would be expected depend on the level and frequency content of the modelled source and the thickness of any unconsolidated sediments at the seafloor as low frequency energy will be less sensitive to thin layers. For the comparison conducted here in Section 6.2, the comparison between VSTACK and MONM is excellent when only a comparatively thin 1 m thick layer of sand overlies the carbonate seabed structure. If the data decay rates were more indicative of propagation over a layer of sediment, then MONM could have been used without correction.

The distances to the effect thresholds based on the measurement study results (Section 6.3) are reduced compared to those presented in Koessler et al. (2020). The understanding of the environment gained through the measurement study allowed for the geological environment to be represented in a site specific fashion, and a more appropriate configuration of numerical models to represent the propagation loss. The application of the revised modelling approach to represent other Beach Energy activities on the continental shelf of the Otway Basin would be appropriate.

7.3. Development Drilling Program Contributions

Soundscape contributions of the Development Drilling operations were activity-dependent and depended upon proximity to both the *Ocean Onyx* and associated support vessels. At the three closest stations, the relative contributions are demonstrated through the LTSAs and percentiles for the entire period the *Ocean Onyx* was operational at Artisan-1, and two presented example periods. One of the presented example periods involved significant contributions to the sound fields at the three stations close to the rig presented in Section 5.1.1, as well as considering the per station daily SELs (Section 5.1.2).

A better understanding of the contributions from the Development Drilling operations on a regional scale is provided through the data recorded at Station 4, 25 km from the *Ocean Onyx* (whilst drilling operations were being conducted at Artisan-1), and they did not appear to be a significant contributor to the overall soundscape. While the operational contributions were not significant at Station 4, they were apparent throughout different stages of the activity. At long ranges, the contribution from the drilling itself is hard to distinguish from associated vessel operations, complicated by support vessels manoeuvring over an area greater than 100 km^2. The support vessels operating under dynamic position while completing tasks at Artisan-1 which required high thrust levels, such as anchor handling and accurate station keeping in high sea states, were apparent at Station 4 (for example Figure 44). The configuration of Station 4 to be able to present received signals with the context of direction allowed for the attribution of signals to specific sources. Whilst the recording station 28 km from the Casino 3 drilling operation reported in Lattice Energy (2017) was not able to detect drilling noise, the analysis would not have been able to attribute detected vessel noise to the support vessels for the rig. Therefore, it is likely that the Casino 3 monitoring program recorded noise associated with the drilling program but was unable to attribute it due to the lack of context provided by single omni-directional hydrophone recorder configurations (similar to Stations 1–3).

Periods with less dynamic positioning utilisation, such as between 17:00 and 18:39 on 8 Mar 2021, ShipSound report in Appendix G.1.2, with the spectrogram shown in Figure 37, had only faint potential contributions noticeable at Station 4 (Figure 67). In this figure, long tonals which originate in a north-west direction (the direction of Artisan-1) are apparent between 100 and 250 Hz. However, these are not apparent in data at Station 1 (Figure 37), and thus potentially do not originate close to the rig. In addition to these tonals, the spectrogram shown in Figure 67 shows periods of rain, the approach of the 17 m long sailing boat *Zatara* (Figure 68), which passes within 686 m of Station 4 at a speed of 8 kn, and a likely fish chorus between 800 and 1000 Hz from the north-west.

The rig move operations were apparent, similarly to other periods of high thrust levels, with contributions from the support vessels throughout the tow period matching the relative direction received at Station 4 (Figures 69 and 70). The frequency range, which was still typically detectable at long ranges, 100 to up to 1000 Hz, is above the frequency range for the fundamentals and primary harmonics for pygmy blue whale vocalisations (Section 5.7.2), as shown in Figure 69. Therefore, the potential effect on the communication and listening space (Hannay et al. 2016a), and thus masking, at longer ranges is less apparent than it is for seismic survey activity, or regions in which low frequency signals experience less loss then they do in locations with highly absorptive seabeds.

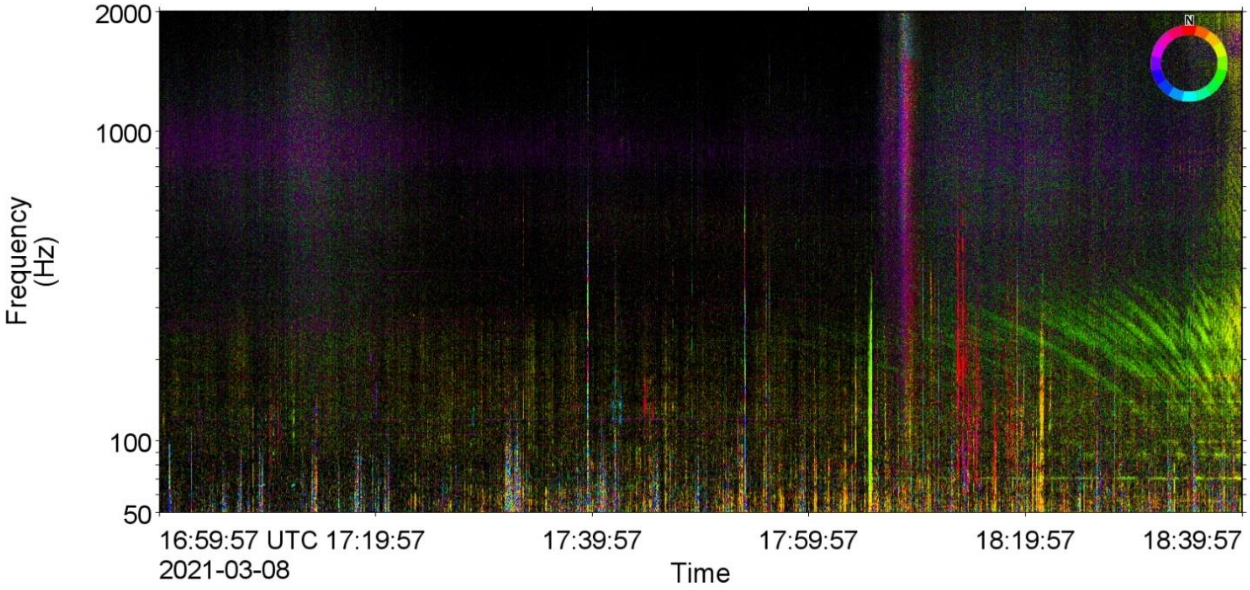

Figure 67. Data recorded on Station 4 including *Ocean Onyx* ShipSound analysis reports between 17:00 and 18:39 on 8 Mar 2021, ShipSound report in Appendix G.1.2, with the spectrogram shown in Figure 37 (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

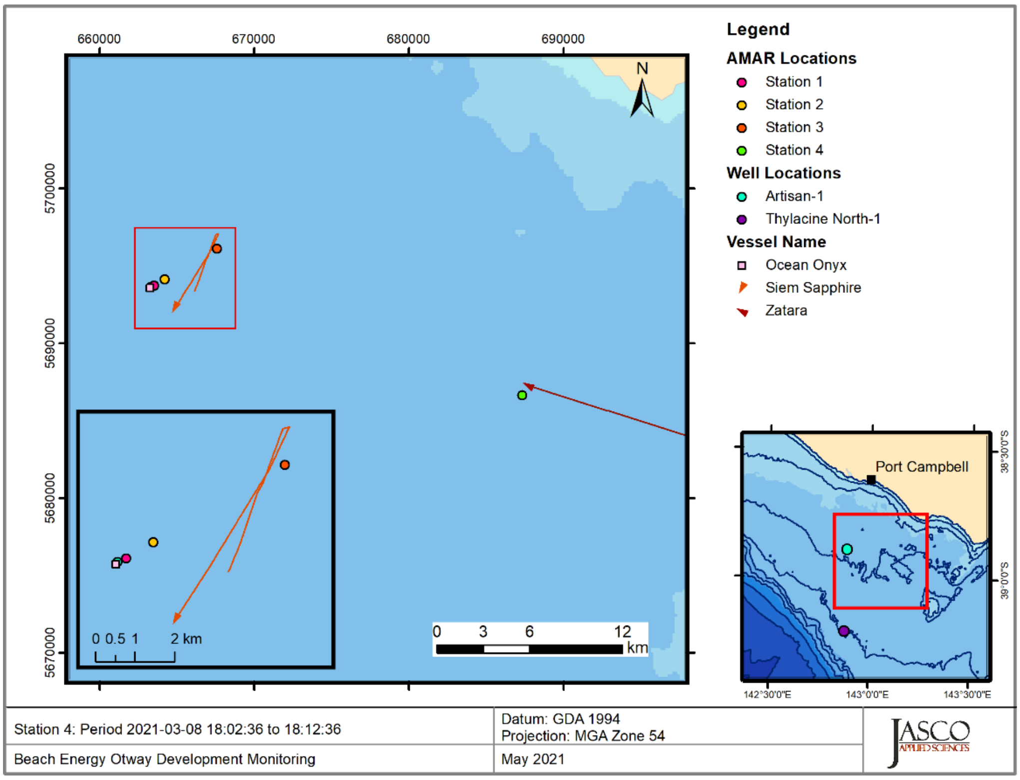

Figure 68. Map of AIS reported vessel locations for the spectrogram shown in Figure 67.

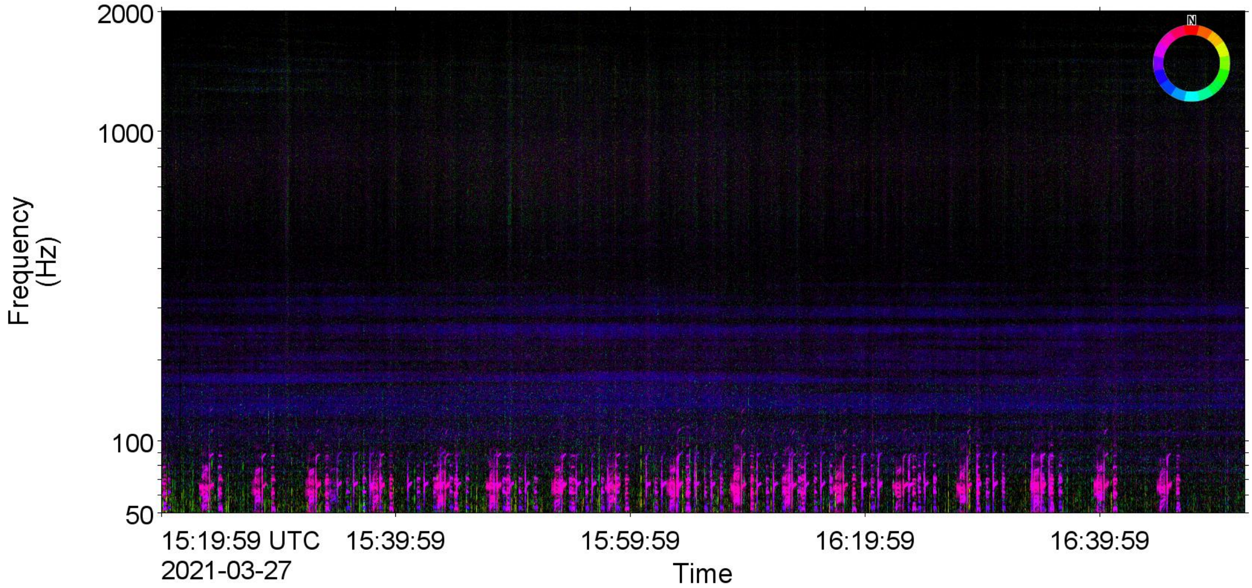

Figure 69. Example of the contribution of the three support vessels and the *Ocean Onyx* while ~23 km away in a south-west direction under tow from Artisan-1 to Geographe, apparent via the blue horizontal striations between 100 and 500 Hz, along with multiple pygmy blue whales in a west to north-west direction of Station 4 (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

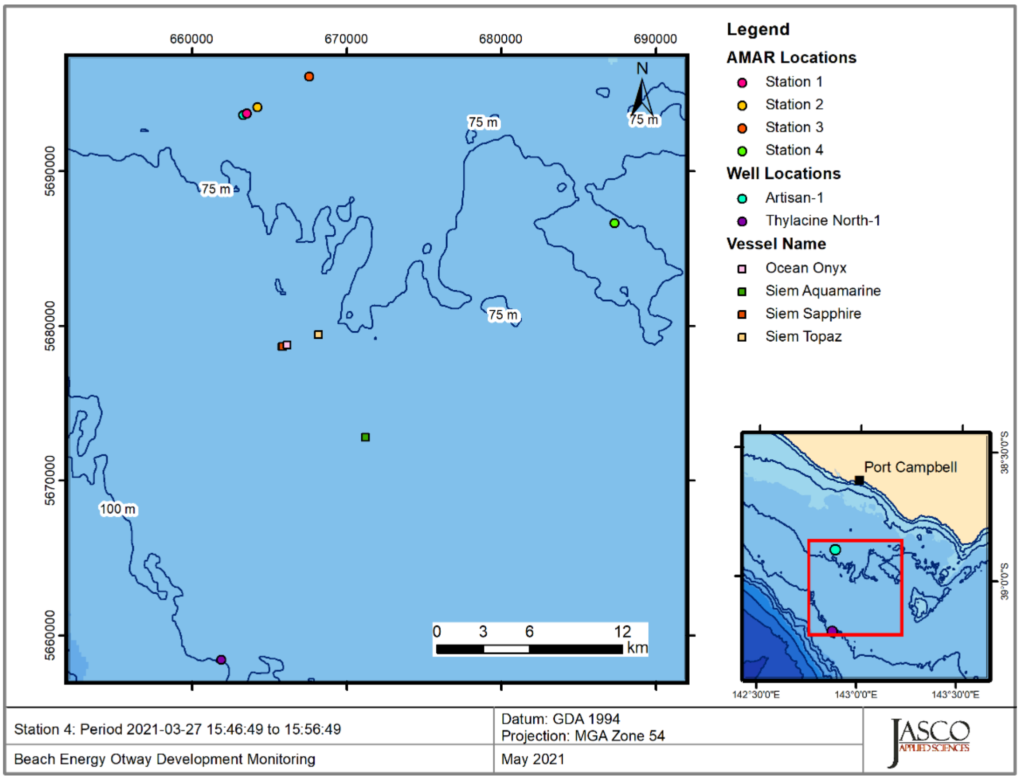

Figure 70. Map of automatic identification system (AIS) reported vessel locations for the spectrogram shown in Figure 69.

7.4. Marine Mammals

The marine mammal acoustic detection results presented in this report provide an index of acoustic occurrence for each species. Although they can be used to describe the relative occurrence of a species, several factors influence the detectability of the targeted signals. Although acoustic detection does indicate presence, an absence of detections (automated or manual) does not necessarily indicate an absence of animals. An animal may be present but not detected if no individuals were vocalising near the recorder, their signals were masked by environmental and/or anthropogenic noise sources, or a combination of these factors. Different sound propagation environments and different seasonal effects will impact the detection range of a given signal over time and, therefore, influence the number of detectable signals. The acoustic signals of both dolphins and pygmy blue whales were present in the acoustic data. vVcalisations of other mysticetes, such as humpback and southern right whales, were not detected by the detectors (D.2), or observed during the 0.5% manual review.

7.4.1. Dolphins

Dolphin species reported in offshore Victorian waters include the short-beaked common and bottlenose dolphins (Bilgmann et al. 2007, Bilgmann et al. 2014). Burrunan dolphins (*Tursiops australis*) can also occur in the region (Charlton-Robb et al. 2015), although they are likely more coastal. While it would be ideal to discriminate between species, success has been limited using automated detectors, and the detailed manual analysis required to attempt to identify individual species is beyond the scope of this report (Steiner 1981, Rendell et al. 1999, Oswald et al. 2003, Baron et al. 2008).

Based on the occurrence of echolocation clicks and whistles, dolphins occurred in the area throughout the recording period at all stations. Dolphin acoustic occurrence was low in February and increased through March at Stations 1, 2, and 3. In contrast, dolphins were consistently present at an almost hourly basis at Station 4. It is impossible to say whether the sparsity of dolphins at Stations 2 and 3 in February is a result of the animals not being common or of their signals being masked by the high noise environment (Figure 16).

The predominance of delphinid clicks during hours of darkness could correspond to foraging on prey species that follow the diel vertical migrations of zooplankton. Similar patterns have been observed in studies of a number of whale species (Víkingsson 1997, Au et al. 2000, Wiggins et al. 2005, Baumgartner and Fratantoni 2008, Sayigh et al. 2013) and by JASCO in studies conducted in northern Australian waters (McPherson et al. 2012, McPherson et al. 2014, McPherson et al. 2016). However, recent research suggests that though such patterns are common, they may not be as closely linked to prey as previously thought (Osiecka et al. 2020).

The presence of sounds believed to be produced by young bottlenose dolphins suggests that not only were dolphins using this region to socialize (indicated by presence of whistles) and forage (indicated by presence of clicks), but they also care for their young.

7.4.2. Pygmy Blue Whales

The acoustic occurrence of pygmy blue whale vocalisations in the acoustic data was unsurprising as they have previously been reported in the region and the Bonney Upwelling is a known foraging area for this species (Garcia-Rojas et al. 2018, McCauley et al. 2018, Möller et al. 2020). Tag data indicates that blue whales are most common in the recording area between January and July, coinciding with the upwelling season of the region (Möller et al. 2020). The lack of clear directional movement during the recording period is unsurprising given both the small sample size and that this area is believed to be a location where blue whales aggregate, as opposed to a migratory corridor where a more consistent pattern in direction over time would be expected. The data does indicate an apparent trend in the animals early in the recording being more to the east and later in the recording being more to the west, but the data were too sparse to confirm anything about animal movements. A monitoring program with directional stations distributed across the Otway Basin would be able to provide this information.

The presence of songs indicates the presence of male pygmy blue whales and the increased regularity of songs at the end of March at all stations corresponds with the onset of the winter singing season for this species (McCauley et al. 2018). Indeed, we cannot say whether the increased vocal activity in March is a result of increased animals in the region or a shift in acoustic behaviour. The blue whale occurrence results were extremely similar across recording stations which is unsurprising given the close vicinity of the recorders that were likely simultaneously recording the same blue whale vocalisations which can propagate great distances, as demonstrated for both pygmy and Antarctic blue whales (Gavrilov and McCauley 2013, Miller et al. 2013, Warren et al. 2021). It is believed that non-song D calls can be produced by male or female blue whales, and it may be a social call (Recalde-Salas et al. 2014).

Acknowledgements

The authors would like to thank the captain and crew of the Siem vessels *Sapphire*, *Aquamarine* and *Topaz*, as well as Klaus Lucke from JASCO for performing the fieldwork.

Glossary

1/3-octave

One third of an octave. Note: A one-third octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec; ISO 2017a).

1/3-octave-band

Frequency band whose bandwidth is one one-third octave. Note: The bandwidth of a one-third octave-band increases with increasing centre frequency.

90%-energy time window

The time interval over which the cumulative energy rises from 5 to 95% of the total pulse energy. This interval contains 90% of the total pulse energy. Symbol: T_{90}.

90% sound pressure level (90% SPL)

The root-mean-square sound pressure levels calculated over the 90%-energy time window of a pulse. Used only for pulsed sounds.

absorption

The reduction of acoustic pressure amplitude due to acoustic particle motion energy converting to heat in the propagation medium.

ambient noise

All-encompassing sound at a given place, usually a composite of sound from many sources near and far (ANSI S1.1-1994 (R2004)), e.g., shipping vessels, seismic activity, precipitation, sea ice movement, wave action, and biological activity.

annotation

A labelled selection of a period of time and frequency within a spectrogram as created by a human analyst during **manual analysis**.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

audiogram

A graph of hearing threshold level (sound pressure levels) as a function of frequency, which describes the hearing sensitivity of an animal over its hearing range.

audiogram weighting

The process of applying an animal’s audiogram to sound pressure levels to determine the sound level relative to the animal’s hearing threshold (HT). Unit: dB re HT.

Auditory frequency weighting (auditory weighting function, frequency-weighting function)

The process of band-pass filtering sounds to reduce the importance of inaudible or less-audible frequencies for individual species or groups of species of aquatic mammals (ISO 2017a). One example is M-weighting introduced by Southall et al. (2007) to describe “Generalised frequency weightings for various functional hearing groups of marine mammals, allowing for their functional bandwidths and appropriate in characterizing auditory effects of strong sounds”.

automated detection

The output of an **automated detector**.

automated detector

An algorithm that includes both the **automated detection** of a sound of interest based on how it stands out from the background and its automated classification based on similarities to templates in a library of reference signals.

background noise

Total of all sources of interference in a system used for the production, detection, measurement, or recording of a signal, independent of the presence of the signal (ANSI S1.1-1994 (R2004)). Ambient noise detected, measured, or recorded with a signal is part of the background noise.

bandwidth

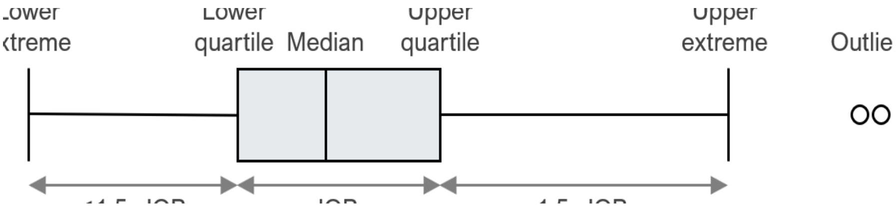
The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI and ASA S1.13-2005 (R2010)).

bar

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to 10^5 Pa or 10^{11} µPa.

box-and-whisker plot

A plot that illustrates the centre, spread, and overall range of data from a visual 5-number summary. The box is the interquartile range (IQR), which shows the middle 50% of the data—from the lower quartile (25th percentile) to the upper quartile (75th percentiles). The line inside the box is the median (50th percentile). The whiskers show the lower and upper extremes excluding outliers, which are data points that fall more than 1.5 × IQR beyond the upper and lower quartiles.



broadband sound level

The total sound pressure level measured over a specified frequency range. If the frequency range is unspecified, it refers to the entire measured frequency range.

cavitation

A rapid formation and collapse of vapor cavities (i.e., bubbles or voids) in water, most often caused by a rapid change in pressure. Fast-spinning vessel propellers typically cause cavitation, which creates a lot of noise.

cetacean

Any animal in the order Cetacea. These are aquatic, mostly marine mammals and include whales, dolphins, and porpoises.

continuous sound

A sound whose sound pressure level remains above ambient sound during the observation period (ANSI and ASA S1.13-2005 (R2010)). A sound that gradually varies in intensity with time, for example, sound from a marine vessel.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 2006).

decidecade

One tenth of a decade (ISO 2017a). Note: An alternative name for decidecade (symbol ddec) is “one-tenth decade”. A decidecade is approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct) and for this reason is sometimes referred to as a “one-third octave”.

decidecade band

Frequency band whose bandwidth is one decidecade. Note: The bandwidth of a decidecade band increases with increasing centre frequency.

decibel (dB)

One-tenth of a bel. Unit of level when the base of the logarithm is the tenth root of ten, and the quantities concerned are proportional to power ([ANSI] American National Standards Institute S1.1-1994 (R2004)).

delphinid

Family of oceanic dolphins, or Delphinidae, composed of approximately thirty extant species, including dolphins, porpoises, and killer whales.

duty cycle

The time when sound is periodically recorded by an acoustic recording system.

far-field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point. The distance to the acoustic far-field increases with frequency.

fast-average sound pressure level

The time-averaged sound pressure levels calculated over the duration of a pulse (e.g., 90%-energy time window), using the leaky time integrator from Plomp and Bouman (1959) and a time constant of 125 ms. Typically used only for pulsed sounds.

fast Fourier transform (FFT)

A computationally efficiently algorithm for computing the discrete Fourier transform.

frequency

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: *f*. 1 Hz is equal to 1 cycle per second.

hearing group

Groups of marine mammal species with similar hearing ranges. Commonly defined functional hearing groups include low-, mid-, and high-frequency cetaceans, pinnipeds in water, and pinnipeds in air.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For example, the second harmonic of a sound has a frequency that is double the fundamental frequency of the sound.

hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual in the absence of significant background noise during a specific percentage of experimental trials.

hertz (Hz)

A unit of frequency defined as one cycle per second.

high-frequency (HF) cetacean

The functional cetacean hearing group that represents those odontocetes (toothed whales) specialised for hearing high frequencies.

hydrophone

An underwater sound pressure transducer. A passive electronic device for recording or listening to underwater sound.

intermittent sound

A level of sound that abruptly drops to the background noise level several times during the observation period.

impulsive sound

Sound that is typically brief and intermittent with rapid (within a few seconds) rise time and decay back to ambient levels (NOAA 2013, ANSI S12.7-1986 (R2006)). For example, seismic airguns and impact pile driving.

low-frequency (LF) cetacean

The functional cetacean hearing group that represents mysticetes (baleen whales) specialised for hearing low frequencies.

manual analysis

Human examination of acoustic data via visual review of spectrograms and/or aural inspection of data.

manual detection

The output of **manual analysis** as recorded in an **annotation**.

masking

Obscuring of sounds of interest by sounds at similar frequencies.

mean-square sound pressure spectral density

Distribution as a function of frequency of the mean-square sound pressure per unit bandwidth (usually 1 Hz) of a sound having a continuous spectrum (ANSI S1.1-1994 (R2004)). Unit: $\mu Pa^2/Hz$.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetacean

The functional cetacean hearing group that represents those odontocetes (toothed whales) specialised for mid-frequency hearing.

mysticete

Mysticeti, a suborder of cetaceans, use their baleen plates, rather than teeth, to filter food from water. They are not known to echolocate, but they use sound for communication. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is broadband, narrowband or tonal, brief or prolonged, continuous or intermittent, and typically does not have a high peak pressure with rapid rise time (typically only small fluctuations in decibel level) that impulsive signals have (ANSI S3.20-1995 (R2008)). For example, marine vessels, aircraft, machinery, construction, and vibratory pile driving (NIOSH 1998, NOAA 2015).

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

odontocete

The presence of teeth, rather than baleen, characterizes these whales. Members of the Odontoceti are a suborder of cetaceans, a group comprised of whales, dolphins, and porpoises. The skulls of toothed whales are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

peak pressure level (PK)

The maximum instantaneous sound pressure level, in a stated frequency band, within a stated period. Also called zero-to-peak pressure level. Unit: decibel (dB).

percentile level, exceedance

The sound level exceeded *n* % of the time during a measurement.

permanent threshold shift (PTS)

A permanent loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

pinniped

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

power spectrum density

Generic term, formally defined as power in W/Hz, but sometimes loosely used to refer to the spectral density of other parameters such as square pressure or time-integrated square pressure.

pressure, acoustic

The deviation from the ambient hydrostatic pressure caused by a sound wave. Also called overpressure. Unit: pascal (Pa). Symbol: *p*.

received level (RL)

The sound level measured (or that would be measured) at a defined location.

rms

root-mean-square.

signature

Pressure signal generated by a source.

sound

A time-varying pressure disturbance generated by mechanical vibration waves travelling through a fluid medium such as air or water.

sound exposure

Time integral of squared, instantaneous frequency-weighted sound pressure over a stated time interval or event. Unit: pascal-squared second ($Pa^2 \cdot s$) (ANSI S1.1-1994 (R2004)).

sound exposure level (SEL)

A cumulative measure related to the sound energy in one or more pulses. Unit: dB re 1 $\mu Pa^2 \cdot s$. SEL is expressed over the summation period (e.g., per-pulse SEL [for airguns], single-strike SEL [for pile drivers], 24-hour SEL).

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum (ANSI S1.1-1994 (R2004)). Unit: $\mu Pa^2 \cdot s/Hz$.

sound pressure level (SPL)

The decibel ratio of the time-mean-square sound pressure, in a stated frequency band, to the square of the reference sound pressure (ANSI S1.1-1994 (R2004)).

For sound in water, the reference sound pressure is one micropascal (p_0 = 1 μPa) and the unit for SPL is dB re 1 μPa^2:

$$L_p = 10\log_{10}(p^2/p_0^2) = 20\log_{10}(p/p_0)$$

Unless otherwise stated, SPL refers to the root-mean-square (rms) pressure level. See also 90% sound pressure level and fast-average sound pressure level. Non-rectangular time window functions may be applied during calculation of the rms value, in which case the SPL unit should identify the window type.

source level (SL)

The sound level measured in the far-field and scaled back to a standard reference distance of 1 metre from the acoustic centre of the source. Unit: dB re 1 μPa·m (pressure level) or dB re 1 $\mu Pa^2 \cdot s \cdot m$ (exposure level).

spectral density level

The decibel level ($10 \cdot \log_{10}$) of the spectral density of a given parameter such as SPL or SEL, for which the units are dB re 1 $\mu Pa^2/Hz$ and dB re 1 $\mu Pa^2 \cdot s/Hz$, respectively.

spectrogram

A visual representation of acoustic amplitude compared with time and frequency.

spectrum

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

validated detection

The output of an **automated detector** that has been subsequently validated by a human analyst.

Appendix A. Underwater Acoustics

A.1. Acoustic Metrics

Sound levels with individual metrics defined below, are presented as:

- Broadband and approximate-decade-band SPL over time for these frequency bands for the low sample rate: 10 Hz–32 kHz (Nyquist), 10–100 Hz, 100 Hz to 1 kHz, 1–10 kHz, and 10–32 kHz. For the high sample rate, the Nyquist is 256 kHz.
- Spectrograms: Ambient noise at each station was analysed by Hamming-windowed fast Fourier transforms (FFTs), with 1 Hz resolution and 50% window overlap. The 120 FFTs performed with these settings are averaged to yield 1 min average spectra.
- Statistical distribution of SPL in each decidecade. The boxes of the statistical distributions indicate the first (L_5), second (L_{50}), and third (L_{75}) quartiles. The whiskers indicate the maximum and minimum range of the data. The solid line indicates the sound pressure level (SPL) or L_{eq} in each decidecade.
- Spectral level percentiles: Histograms of each frequency bin per 1 min of data. The L_{eq}, L_5, L_{25}, L_{50}, L_{75}, and L_{95} percentiles are plotted. The L_5 percentile curve is the frequency-dependent level exceeded by 95% of the 1 min averages. Equivalently, 5% of the 1 min spectral levels are above the 95th percentile curve.
- Daily cumulative sound exposure levels (SEL (24 h)): computed for the total received sound energy. The SEL (24 h) is the linear sum of the 1 min sound exposure levels (SEL). These SEL values were weighted to mimic different functional hearing groups according to the marine mammal frequency-weighted curves described in Appendix E.

Sound is most commonly described using the sound pressure level (SPL) metric. Underwater sound amplitude levels are commonly measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 μPa.

SPL (dB re 1 μPa) is the decibel level of the rms pressure in a stated frequency band over a time window (*T; s*) containing the acoustic event:

$$\mathrm{SPL} = 10\log_{10}\left(\frac{1}{T}\int_T p^2(t)\,dt \Big/ p_0^2\right) \tag{A-1}$$

The SPL is a measure of the effective pressure level over the duration of an acoustic event, such as the emission of one acoustic pulse or sweep. Because the window length, T, is the divisor, events more spread out in time have a lower SPL even though they may have similar total acoustic energy density.

Power spectral density (PSD) level is a description of how the acoustic power is distributed over different frequencies within a spectrum. It is expressed in dB re 1 μPa^2/Hz.

The sound exposure level (SEL, dB re 1 μPa^2·s) is a measure of the total acoustic energy contained in one or more acoustic events. The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T_{100}):

$$\mathrm{SEL} = 10\log_{10}\left(\int_{T_{100}} p^2(t)\,dt \Big/ T_0 p_0^2\right) \tag{A-2}$$

where T_0 is a reference time interval of 1 s. The SEL represents the total acoustic energy received at a location during an acoustic event; it measures the total sound energy an organism at that location would be exposed to.

Because the SPL and SEL are both computed from the integral of square pressure, these metrics are related by the following expression, which depends only on the duration of the energy time window T:

$$\mathrm{SPL} = \mathrm{SEL} - 10\log_{10}(T) \tag{A-3}$$

Sound level statistics, namely percentiles, were used to quantify the distribution of recorded sound levels. The *n*th percentile level (L_n) is the level (i.e., PSD level, SPL, or SEL) *n*% of the data are below this level. L_{eq} is the linear arithmetic mean of the sound power, which can be substantially different from the median sound level L_{50}. SPL can also be referred to as L_{eq}, which stands for ‘equivalent level’. The two terms are used interchangeably throughout. L_{95}, the level exceeded by only 5% of the data, represents the highest typical sound levels measured. Sound levels between L_5 and L_{99} are generally from very close passes of vessels, very intense weather events, and other infrequent conditions. L_5 represents the quietest typical conditions.

Appendix B. Acoustic Data Analysis Methods

The data sampled at 64 kHz and 512 kHz was processed for ambient sound analysis, vessel noise detection, and detection of all marine mammal vocalisations. This section describes the ambient, vessel, and marine mammal detection algorithms employed (Figure B-1).

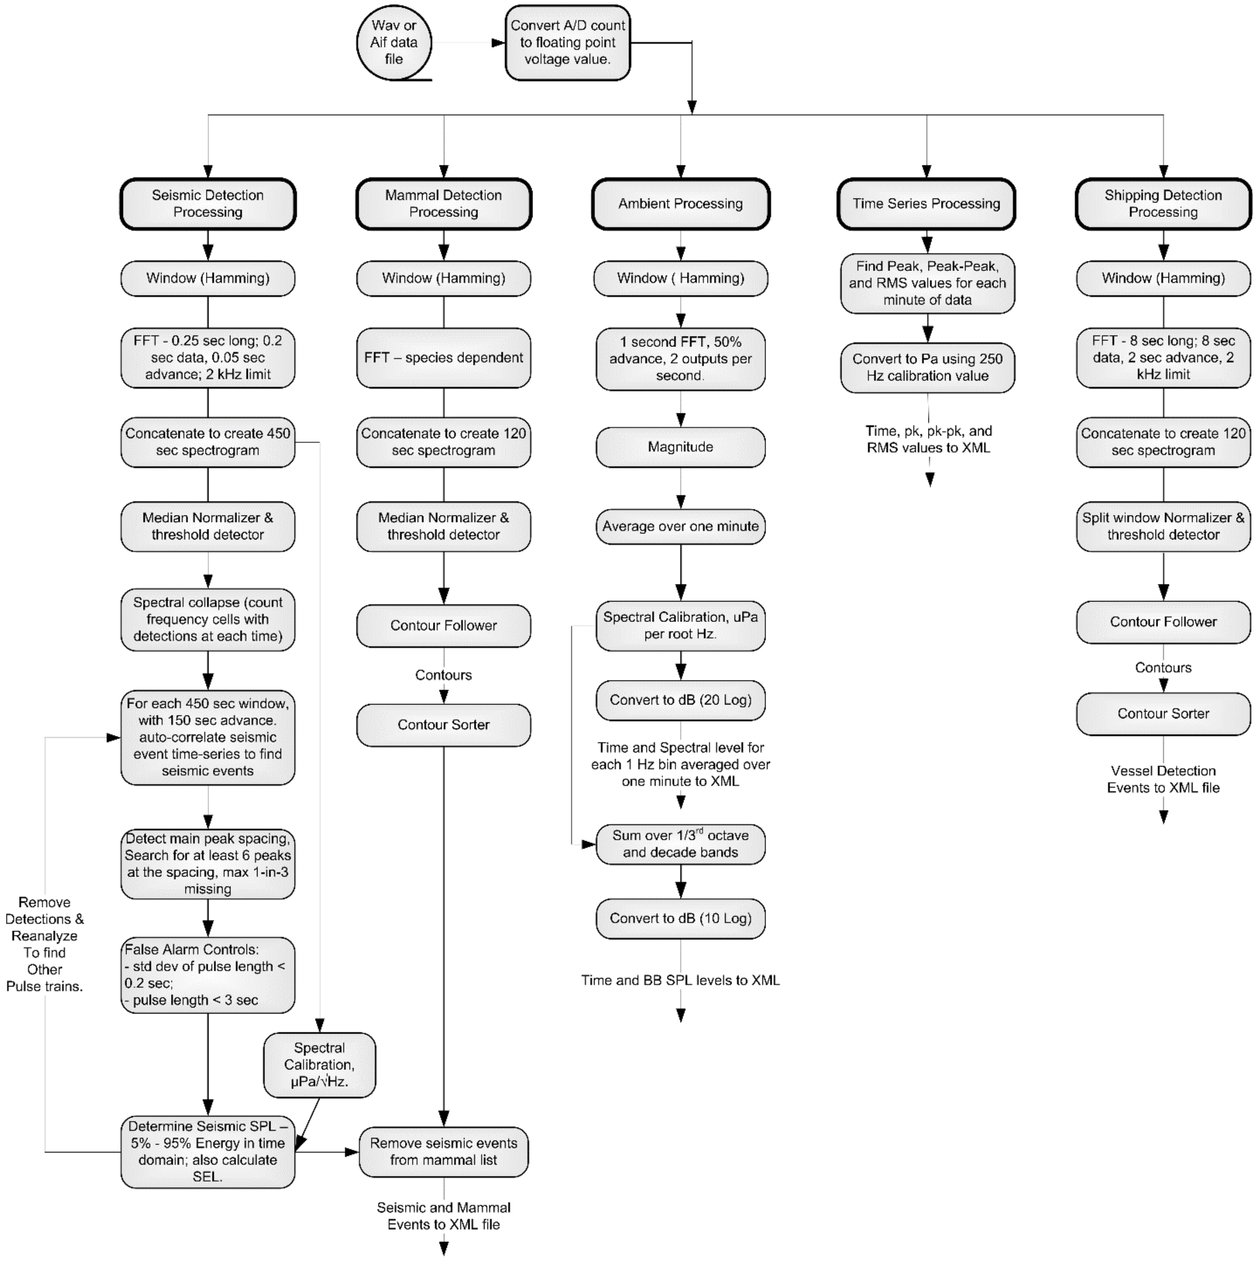

Figure B-1. Major stages of the automated acoustic analysis process performed with JASCO's custom software suite.

B.1. Total Ambient Sound Levels

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 μPa. Because the perceived loudness of sound, especially impulsive noise such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate noise and its effects on marine life. We provide specific definitions of relevant metrics used in this report. Where possible we follow the ANSI and ISO standard definitions and symbols for sound metrics, but these standards are not always consistent.

The zero-to-peak pressure level, or peak pressure level (PK or $L_{p,pk}$; dB re 1 μPa), is the decibel level of the maximum instantaneous sound pressure level in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$\mathrm{PK} = L_{p,\mathrm{pk}} = 10\log_{10}\frac{\max|p^2(t)|}{p_0^2} \qquad \text{(B-6)}$$

PK is often included as criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of a noise event, it is generally a poor indicator of perceived loudness.

The sound pressure level (SPL or L_p; dB re 1 μPa) is the decibel level of the root-mean-square (rms) pressure in a stated frequency band over a specified time window (T; s) containing the acoustic event of interest. It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$\mathrm{SPL} = L_p = 10\log_{10}\left[\frac{1}{T}\int_T p^2(t)\,dt \Big/ p_0^2\right] \qquad \text{(B-7)}$$

The SPL represents a nominal effective continuous sound over the duration of an acoustic event, such as the emission of one acoustic pulse, a marine mammal vocalisation, the passage of a vessel, or over a fixed duration. Because the window length, *T*, is the divisor, events with similar sound exposure level (SEL), but more spread out in time have a lower SPL.

The sound exposure level (SEL or L_E, dB re 1 μPa^2·s) is a measure related to the acoustic energy contained in one or more acoustic events (N). The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T):

$$\mathrm{SEL} = L_E = 10\log_{10}\left[\int_T p^2(t)\,dt \Big/ T_0 p_0^2\right] \qquad \text{(B-8)}$$

where T_0 is a reference time interval of 1 s. The SEL continues to increase with time when non-zero pressure signals are present. It therefore can be construed as a dose-type measurement, so the integration time used must be carefully considered in terms of relevance for impact to the exposed recipients.

SEL can be calculated over periods with multiple events or over a fixed duration. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \qquad \text{(B-9)}$$

To compute the SPL(T_{90}) and SEL of acoustic events in the presence of high levels of background noise, equations B-6 and B-7 are modified to subtract the background noise contribution:

$$\mathrm{SPL}(T_{90}) = L_{p90} = 10\log_{10}\left[\frac{1}{T_{90}}\int_{T_{90}}\left(p^2(t)-\overline{n^2}\right)dt\Big/p_0^2\right] \tag{B-10}$$

$$L_E = 10\log_{10}\left[\int_T\left(p^2(t)-\overline{n^2}\right)dt\Big/T_0p_0^2\right] \tag{B-11}$$

where $\overline{n^2}$ is the mean square pressure of the background noise, generally computed by averaging the squared pressure of a temporally-proximal segment of the acoustic recording during which acoustic events are absent (e.g., between pulses).

Because the SPL(T_{90}) and SEL are both computed from the integral of square pressure, these metrics are related numerically by the following expression, which depends only on the duration of the time window T:

$$L_p = L_E - 10\log_{10}(T) \tag{B-12}$$

$$L_{p90} = L_E - 10\log_{10}(T_{90}) - 0.458 \tag{B-13}$$

where the 0.458 dB factor accounts for the 10% of SEL missing from the SPL(T_{90}) integration time window.

Energy equivalent SPL (dB re 1 µPa) denotes the SPL of a stationary (constant amplitude) sound that generates the same SEL as the signal being examined, $p(t)$, over the same period of time, T:

$$L_{\mathrm{eq}} = 10\log_{10}\left[\frac{1}{T}\int_T p^2(t)\,dt\Big/p_0^2\right] \tag{B–14}$$

The equations for SPL and the energy-equivalent SPL are numerically identical; conceptually, the difference between the two metrics is that the former is typically computed over short periods (typically of 1 s or less) and tracks the fluctuations of a non-steady acoustic signal, whereas the latter reflects the average SPL of an acoustic signal over times typically of one minute to several hours.

B.2. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. These values directly compare to the Wenz curves, which represent typical deep ocean sound levels (Figure 9) (Wenz 1962). This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a "1/3-octave" because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the ith band, $f_{\mathrm{c}}(i)$, is defined as:

$$f_{\mathrm{c}}(i) = 10^{\frac{i}{10}}\ \mathrm{kHz} \tag{B-1}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{\mathrm{lo},i} = 10^{\frac{-1}{20}} f_{\mathrm{c}}(i) \quad \text{and} \quad f_{\mathrm{hi},i} = 10^{\frac{1}{20}} f_{\mathrm{c}}(i) \tag{B-2}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure B-2).

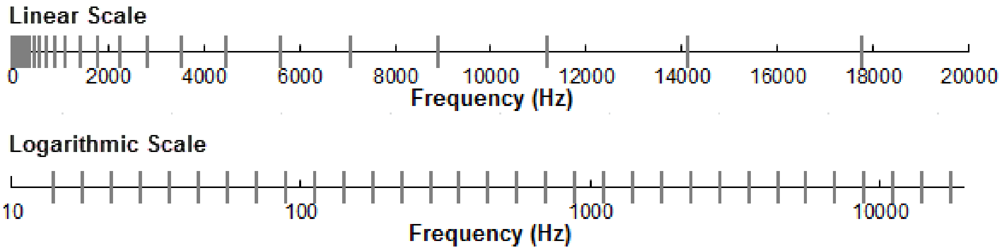

Figure B-2. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{\mathrm{lo},i}$ and $f_{\mathrm{hi},i}$:

$$L_{p,i} = 10 \log_{10} \int_{f_{\mathrm{lo},i}}^{f_{\mathrm{hi},i}} S(f)\, df \tag{B-3}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_{i} 10^{\frac{L_{p,i}}{10}} \tag{B-4}$$

Figure B-3 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the spectral levels at higher frequencies. Decidecade band analysis is applied to continuous and impulsive noise sources. For impulsive sources, the decidecade band SEL is typically reported.

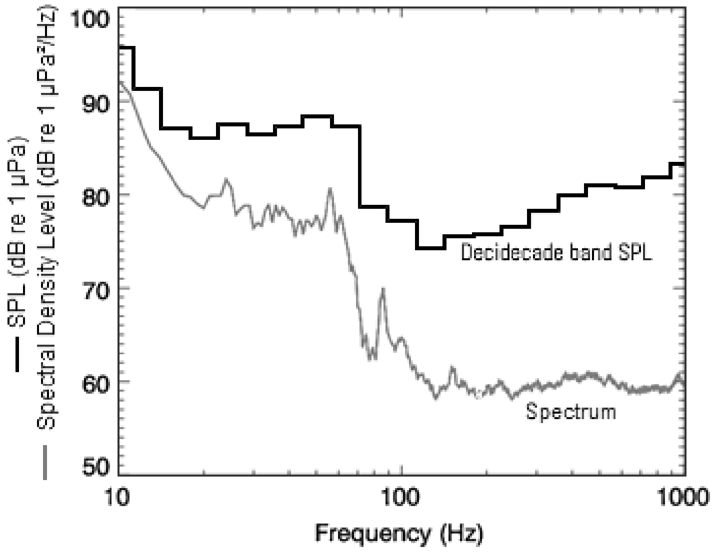

Figure B-3. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.

Table B-1. Decidecade band frequencies (Hz)

Band	Lower frequency	Nominal centre frequency	Upper frequency
10	8.9	10.0	11.2
11	11.2	12.6	14.1
12	14.1	15.8	17.8
13	17.8	20.0	22.4
14	22.4	25.1	28.2
15	28.2	31.6	35.5
16	35.5	39.8	44.7

18	56.2	63.1	70.8
19	70.8	79.4	89.1
20	89.1	100.0	112.2
21	112	126	141
22	141	158	178
23	178	200	224
24	224	251	282
25	282	316	355
26	355	398	447
27	447	501	562
28	562	631	708
29	708	794	891
30	891	1000	1122
31	1122	1259	1413
32	1413	1585	1778
33	1778	1995	2239
34	2239	2512	2818
35	2818	3162	3548
36	3548	3981	4467
37	4467	5012	5623
38	5623	6310	7079
39	7079	7943	8913
40	8913	10000	11220
41	11220	12589	14125
42	14260	16000	17952
43	17825	20000	22440
44	22281	25000	28050
45	28074	31500	35344

Table B-2. Decade-band frequencies (Hz)

Decade band	Lower frequency	Nominal centre frequency	Upper frequency
A	10	50	100
B	100	500	1,000
C	1,000	5,000	10,000

B.3. Millidecade Band Analysis

JASCO Applied Sciences has adopted a hybrid millidecade spectrum system to store and exchange passive acoustic spectral data to optimize data resolution while minimising data size, described in Martin et al. (2021).

Millidecades are logarithmically spaced frequency bands but have a bandwidth equal to 1/1000th of a decade. This frequency resolution is high enough to support many types of analysis, including analysing different types of soundscapes, computing weighted sound exposure levels, and summing the millidecades to find decidecades, 1/3-octave, and other desired frequency bands. The size of the millidecade files greatly compresses the acoustic data compared to 1 Hz resolution, such that data from long-term, multiple-station, high-sampling frequency projects can easily be stored at a single location. For example, there are 1,000 millidecades in each frequency decade, where a decade is an increase in the frequency by a factor of 10. A pure millidecade presentation of a spectrum from 1–100,000 Hz has 5,000 bands rather than 100,000 1 Hz bands, which results in a 20:1 decrease in the amount of data required for storage or exchange. For a 256 kHz spectrum, which is becoming a common size for recorders sampling at 512 kHz, there are 3,206 hybrid millidecades resulting in a compression ratio of 80:1.

The format uses 1-Hz resolution up to 455 Hz and millidecades frequency bands above 455 Hz. The lowest millidecades over-resolve (bin sizes <1 Hz) the space between 1–435 Hz for nearly all soundscape applications. To address this, a hybrid solution was applied that uses 1 Hz bands up to 455 Hz, where the millidecades are 1 Hz wide.

Similar to decidecades, the centre frequency for the ith millidecade (f_{c_i}) is defined as

$$f_{c\_i} = 10^{i/1{,}000}\ (\mathrm{Hz}) \tag{15}$$

and the lower (f_{lo_i}) and upper (f_{hi_i}) bounds for each millidecade are

$$f_{lo\_i} = f_{c\_i} \cdot 10^{-1/2{,}000}\ (\mathrm{Hz}) \tag{16}$$

$$f_{hi\_i} = f_{c\_i} \cdot 10^{1/2{,}000}\ (\mathrm{Hz})\ . \tag{17}$$

Appendix C. Recorder Calibration

The AMAR was calibrated before deployment with a pistonphone type 42AC precision sound source (G.R.A.S. Sound & Vibration A/S; Figure C-1). Due to the unforeseen delay of the retrieval the battery life was exhausted which prevented a calibration after retrieval. The pistonphone calibrator produces a constant tone at 250 Hz at a fixed distance from the hydrophone sensor in an airtight space with known volume. The recorded level of the reference tone on the AMAR yields the system gain for the AMAR and hydrophone. To determine absolute sound pressure levels, this gain was applied during data analysis. Typical calibration variance using this method is less than 0.7 dB absolute pressure.

Figure C-1. Split view of a G.R.A.S. 42AC pistonphone calibrator with an M36 hydrophone.

Appendix D. Marine Mammal Detection Methodology

D.1. Automated Click Detector for Odontocetes

We applied an automated click detector/classifier to the data to detect clicks from odontocetes (Figure D-1.). This detector/classifier is based on the zero-crossings in the acoustic time series. Zero-crossings are the rapid oscillations of a click's pressure waveform above and below the signal's normal level (e.g., Figure D-1.). Clicks are detected by the following steps (Figure D-1.):

1. The raw data is high-pass filtered to remove all energy below 5 kHz. This removes most energy from other sources such as shrimp, vessels, wind, and cetacean tonal calls, yet allows the energy from all marine mammal click types to pass.
2. The filtered samples are summed to create a 0.334 ms rms time series. Most marine mammal clicks have a 0.1–1 ms duration.
3. Possible click events are identified with a split-window normaliser that divides the 'test' bin of the time series by the mean of the 6 'window' bins on either side of the test bin, leaving a 1-bin wide 'notch'.
4. A Teager-Kaiser energy detector identifies possible click events.
5. The high-pass filtered data is searched to find the maximum peak signal within 1 ms of the detected peak.
6. The high-pass filtered data is searched backwards and forwards to find the time span where the local data maxima are within 9 dB of the maximum peak. The algorithm allows for two zero-crossings to occur where the local peak is not within 9 dB of the maximum before stopping the search. This defines the time window of the detected click.
7. The classification parameters are extracted. The number of zero crossings within the click, the median time separation between zero crossings, and the slope of the change in time separation between zero crossings are computed. The slope parameter helps to identify beaked whale clicks, as beaked whales can be identified by the increase in frequency (upsweep) of their clicks.
8. The Mahalanobis distance between the extracted classification parameters and the templates of known click types is computed. The covariance matrices for the known click types, computed from thousands of manually identified clicks for each species, are stored in an external file. Each click is classified as a type with the minimum Mahalanobis distance unless none of them are less than the specified distance threshold.

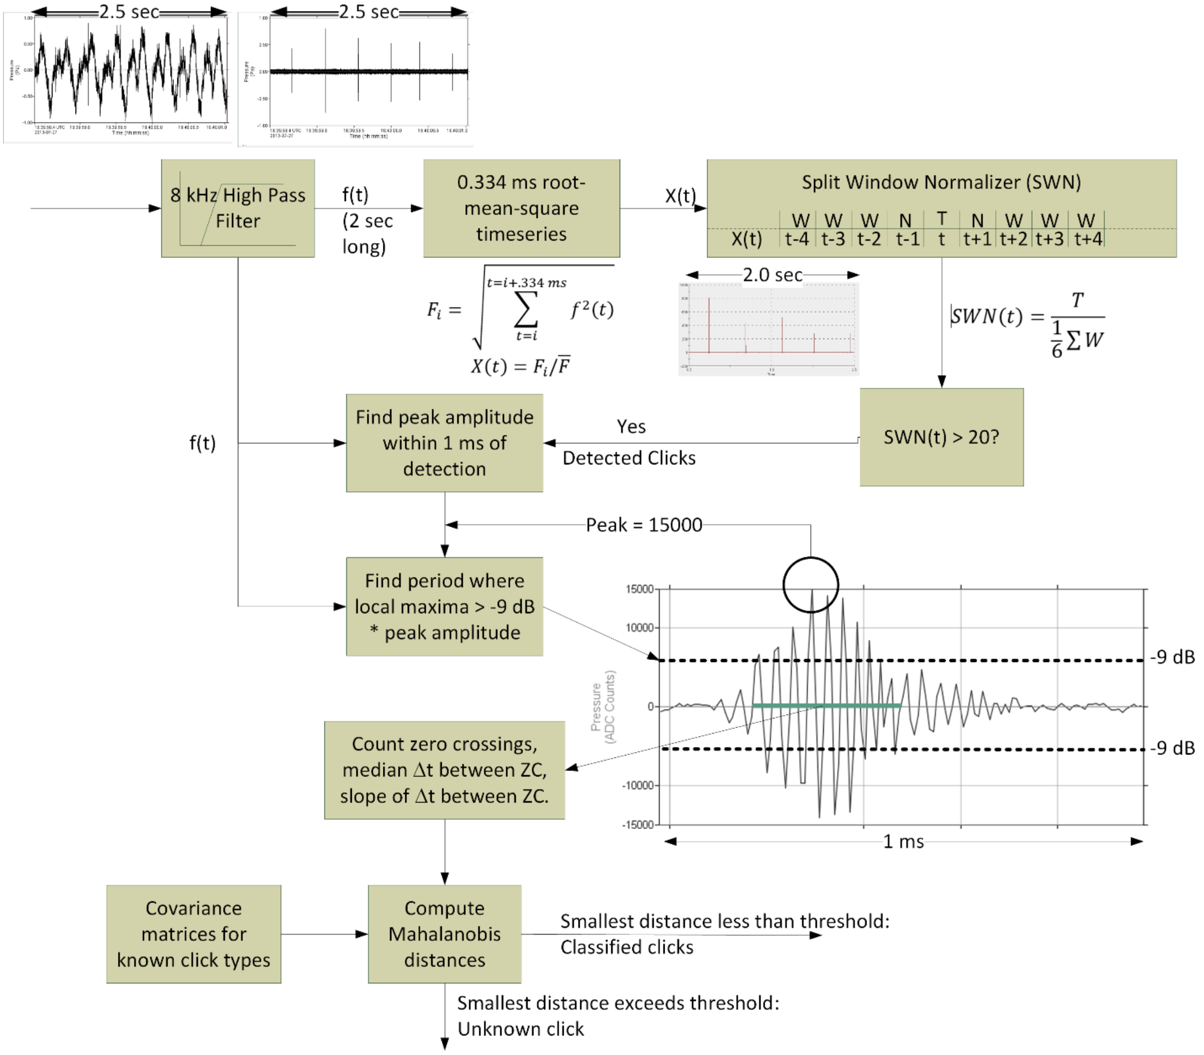

Figure D-1. The automated click detector/classifier block diagram.

Odontocete clicks occur in groups called click trains. Each species has a characteristic inter-click-interval (ICI) and number of clicks per train. The automated click detector includes a second stage that associates individual clicks into trains (Figure D-2). The steps of the click train associator algorithm are:

1. Queue clicks for N seconds, where N is twice the maximum number of clicks per train times the maximum ICI.
2. Search for all clicks within the window that have Mahalanobis distances less than 11 for the species of interest (this gets 99% of all clicks for the species as defined by the template).
3. Create a candidate click train if:
    a. The number of clicks is greater or equal to the minimum number of clicks in a train;
    b. The maximum time between any two clicks is less than twice the maximum ICI, and
    c. The smallest Mahalanobis distance for all clicks in the candidate train is less than 4.1.
4. Create a new ‘time-series’ that has a value of 1 at the time of arrival of each clicks and zeroes everywhere else.
5. Apply a Hann window to the timeseries then compute the cepstrum.

4\. A click train is classified if a peak in the cepstrum with amplitude > 5 times the standard deviation of the cepstrum occurs at a quefrency between the minimum maximum ICI.

5\. Queue clicks for N seconds

6. Search for all clicks within the window that have Mahalanobis distances less than 10 (equal to the extent of the variance in the training data set).
7. If the number of clicks is greater than or equal to 3 and dT is less than 2 * max ICI, make a new time-series at the 0.333 ms rate; where the value is 1 when the clicks occurred and 0 for all other time bins. Perform the following processing on this time series:
   a. Compute cepstrum
   b. ICI is the peak of the cepstrum with amplitude > 5 * stdev and searching for quefrency between minICI and maxICI.
   c. For each click related to the previous Ncepstrum, create a new time series and compute ICI; if we get a good match, extend the click train; find a mean ICI and variance.
8. If the click features, total clicks and mean ICI match the species, output a species_click_train detection.

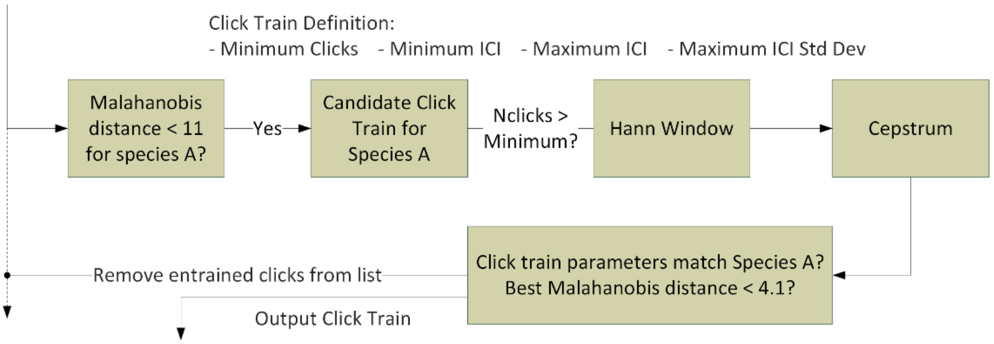

Figure D-2. The click train automated detector/classifier block diagram.

D.2. Automated Tonal Signal Detection

Marine mammal tonal acoustic signals are automatically detected by the following steps:

1. Spectrograms of the appropriate resolution for each mammal vocalisation type that were normalised by the median value in each frequency bin for each detection window Table D-1 were created.
2. Adjacent bins were joined, and contours were created via a contour-following algorithm (Figure D-3).
3. A sorting algorithm determined if the contours match the definition of a marine mammal vocalisation (Table D-2).

Due to the available time, a limited validation of the detections was performed by opening files with detections to check if actual calls were present.

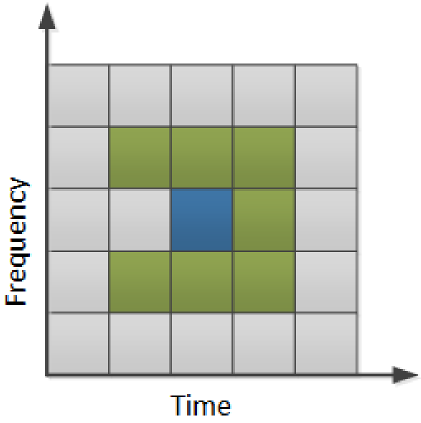

Figure D-3. Illustration of the search area used to connect spectrogram bins. The blue square represents a bin of the binary spectrogram equalling 1 and the green squares represent the potential bins it could be connected to. The algorithm advances from left to right so grey cells left of the test cell need not be checked.

Table D-1. Fast Fourier Transform (FFT) and detection window settings for all automated contour-based detectors used to detect tonal vocalisations of marine mammal species expected in the data. Values are based on JASCO’s experience and empirical evaluation on a variety of data sets.

D.3. Automatic Data Selection for Validation (ADSV)

To standardise the file selection process for the selection of data for manual analysis, we applied our Automated Data Selection for Validation (ADSV) algorithm. Details of the ADSV algorithm are described in Kowarski et al. (2021) and a schematic of the process is provided in Figure D-4. ADSV computes the distribution of three descriptors that describe the automated detections in the full data set: the Diversity (number of automated detectors triggered per file), the Counts (number of automated detections per file for each automated detector), and the Temporal Distribution (spread of detections for each automated detector across the recording period). The algorithm removes files from the temporary data set that have the least impact on the distribution of the three descriptors in the full data set. Files are removed until a pre-determined data set size (*N*) is reached, at which point the temporary data set becomes the subset to be manually reviewed.

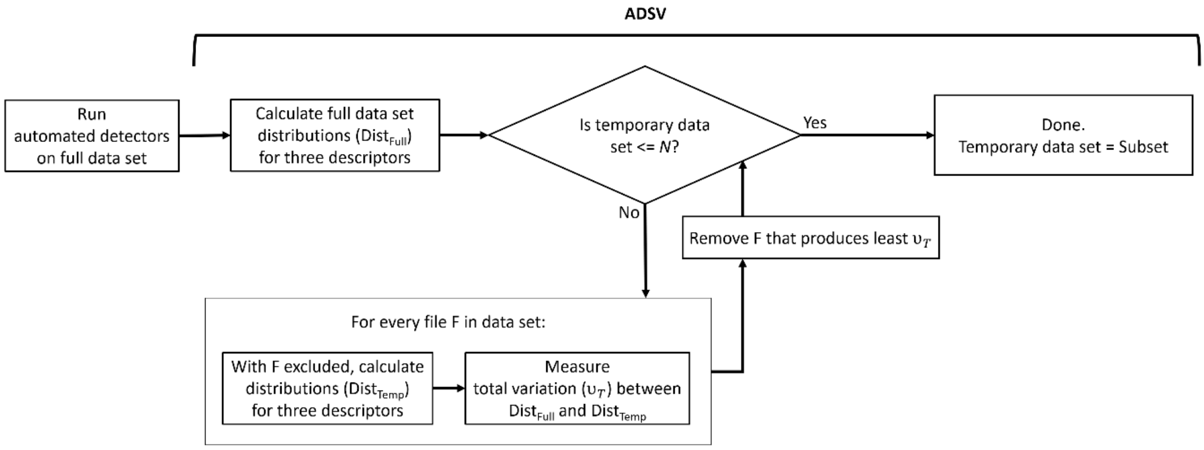

Figure D-4. Automated Data Selection for Validation (ADSV) process Figure 1 from Kowarski et al. (2021).

For the present work, an *N* of 0.5% was selected, largely due to limited scope for this project and marine mammal analysis. Even with limited manual review, the results presented here can be considered reliable, but some caveats should be considered. It is important to note that with such limited data manually reviewed, very rare species may have been missed or their occurrence underestimated. If the 0.5% subset of data manually analysed was not sufficiently large to capture the full range of acoustic environments in the full data set, the resulting automated detector performance metrics may be inaccurate and therefore should be taken as an estimate.

D.4. Automated Detector Performance Calculation and Optimization

All files selected for manual validation were reviewed by one of two experienced analysts using JASCO's PAMlab software to determine the presence or absence of every species, regardless of whether a species was automatically detected in the 5 min file. Although the automated detectors classify specific signals, we validated the presence/absence of species at the file level, not the detection level. Acoustic signals were only assigned to a species if the analyst was confident in their assessment. When unsure, analysts would consult one another, peer reviewed literature, and other experts in the field. If certainty could not be reached, the file of concern would be classified as possibly containing the species in question or containing an unknown acoustic signal. Next, the validated results were compared to the automated detector results in three phases to refine the results and ensure they accurately represent the occurrence of each species in the study area.

In phase 1, the human validated versus automated detector results were plotted as time series and critically reviewed to determine when and where automated detections should be excluded. Questionable detections that overlap with the detection period of other species were scrutinized. By restricting detections spatially and/or temporally where appropriate, we can maximize the reliability of the results. No temporal restrictions were necessary for our automated detector results.

In phase 2, the performance of the automated detectors was calculated and optimized for each species using a threshold, defined as the number of automated detections per file at and above which detections of species were considered valid.

To determine the performance of each automated detector and any necessary thresholds, the automated and validated results (excluding files where an analyst indicated uncertainty in species occurrence) were fed to a maximum likelihood estimation algorithm that maximizes the probability of detection and minimizes the number of false alarms using the Matthews Correlation Coefficient (MCC):

$$MCC = \frac{TPxTN - FPxFN}{\sqrt{(\mathrm{TP}+\mathrm{FP})(\mathrm{TP}+\mathrm{FN})(\mathrm{TN}+\mathrm{FP})(\mathrm{TN}+\mathrm{FN})}}$$

$$P = \frac{TP}{TP+FP}; R = \frac{TP}{TP+FN}$$

where *TP* (true positive) is the number of correctly detected files, *FP* (false positive) is the number of files that are false detections, and *FN* (false negatives) is the number of files with missed detections. No thresholds were necessary for our automated detector results.

In phase 3, detections were further restricted to include only those where *P* was greater than or equal to 0.75. When *P* was less than 0.75, only validated results were used to describe the acoustic occurrence of a species. All species in the present data set had automated detectors that performed sufficiently well. The occurrence of each species was plotted using JASCO's Ark software as time series showing presence/absence by hour over each day.

Appendix E. Auditory Frequency Weighting Functions

The potential for anthropogenic sounds to impact marine mammals is largely dependent on whether the sound occurs at frequencies that an animal can hear well, unless the sound pressure level is so high that it can cause physical tissue damage regardless of frequency. Auditory (frequency) weighting functions reflect an animal's ability to hear a sound (Nedwell and Turnpenny 1998, Nedwell et al. 2007). Houser et al (2017) provide an example illustrating the effect of applying a weighting function to a (hypothetical) sound (Figure E-1).

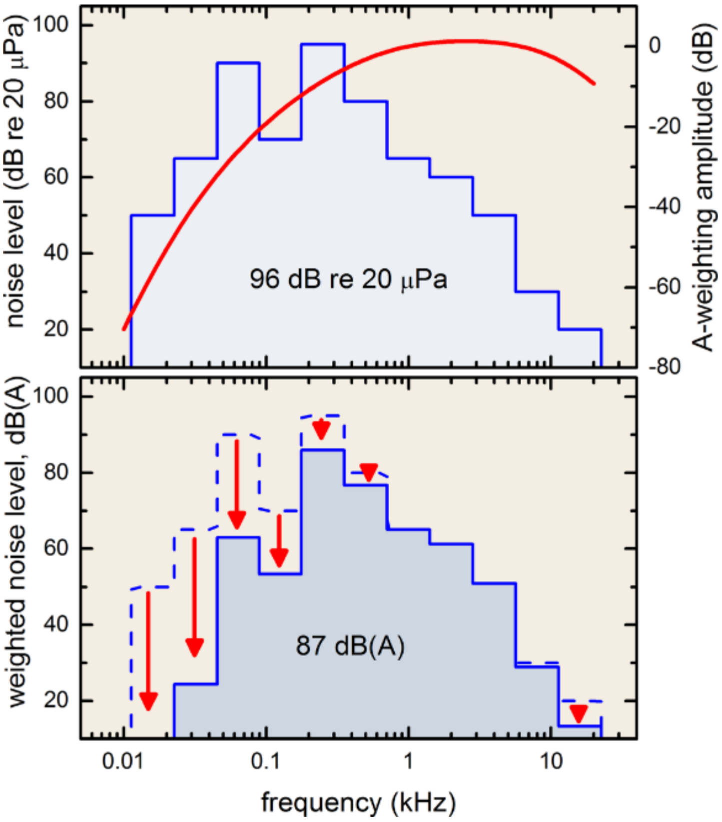

Figure E-1. Application of an auditory weighting function. Blue line shows a hypothetical, octave-band sound pressure spectrum in air, with a total sound pressure level (integrated over all octave-bands) of 96 dB re 20 µPa (This example uses in air-noise levels; therefore, a different reference pressure (20 µPa) applies. The principle is identical to underwater sound where a reference pressure of 1 µPa applies). (Top) Red line shows the human A-weighting function amplitude (A-weighting applies only to human hearing). (Bottom) To determine the weighted exposure level, the A-weighting amplitude at each frequency is added to the sound pressure level at each frequency (red arrows). The weighted spectrum has lower amplitude at the frequencies where the A-weighting function amplitudes are negative. The values from 1–4 kHz do not change substantially, because the weighting function is flat (i.e., the weights are near zero). The weighted SPL is calculated by integrating the weighted spectrum across all octave-bands; the result is 87 dBA, meaning a sound pressure level of 87 dB re 20 µPa after applying the human A-weighting function (Source: Houser et al. 2017).

To better reflect the auditory similarities between phylogenetically closely related species, but also significant differences between species groups among the marine mammals, the extant marine mammal species are assigned to functional hearing groups based on their hearing capabilities and sound production (NMFS 2018) (Table E-1). This division into broad categories is intended to provide a realistic number of categories for which individual noise exposure criteria were developed and the categorisation as such has proven to be a scientifically justified and useful approach in developing auditory frequency weighting functions and deriving noise exposure criteria for marine mammals.

Table E-1. Marine mammal hearing groups (NMFS 2018).

Hearing group	Generalised hearing range*
Low-frequency (LF) cetaceans (mysticetes or baleen whales)	7 Hz to 35 kHz
Mid-frequency (MF) cetaceans (odontocetes: delphinids, beaked whales)	150 Hz to 160 kHz
High-frequency (HF) cetaceans (other odontocetes)	275 Hz to 160 kHz
Phocid pinnipeds (PW) (underwater)	50 Hz to 86 kHz
Otariid pinnipeds (OW) (underwater)	60 Hz to 39 kHz

* The generalised hearing range for all species within a group. Individual hearing will vary.

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

In 2015, a U.S. Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^2\right]^a\left[1+(f/f_{hi})^2\right]^b}\right)\right] \qquad \text{(E-1)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid-, and high-frequency cetaceans, phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses noise impacts on marine mammals (NMFS 2016, NMFS 2018). Table E-2 lists the frequency-weighting parameters for each hearing group; Figure E-2 shows the resulting frequency-weighting curves.

Table E-2. Parameters for the auditory weighting functions used in this project as recommended by NMFS (2018).

Hearing group	a	b	f_{lo} (Hz)	f_{hi} (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
Mid-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
High-frequency cetaceans (true porpoises, *Kogia*, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Phocid seals in water	1.0	2	1,900	30,000	0.75
Otariid seals in water	2.0	2	940	25,000	0.64

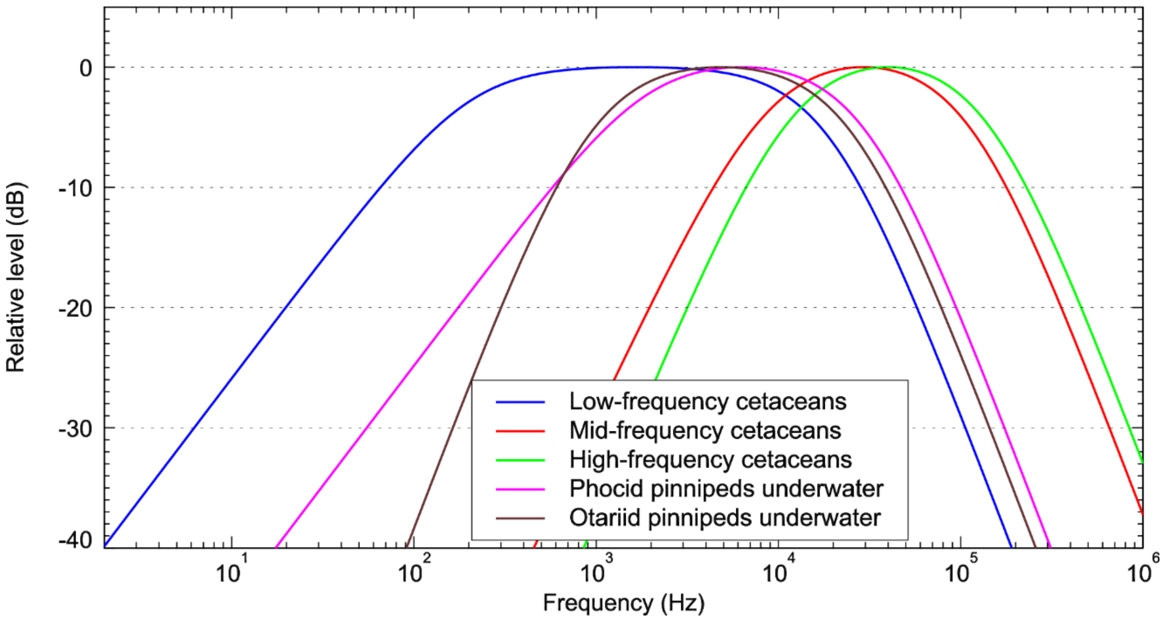

Figure E-2. Auditory weighting functions for functional marine mammal hearing groups as recommended by NMFS (2018).

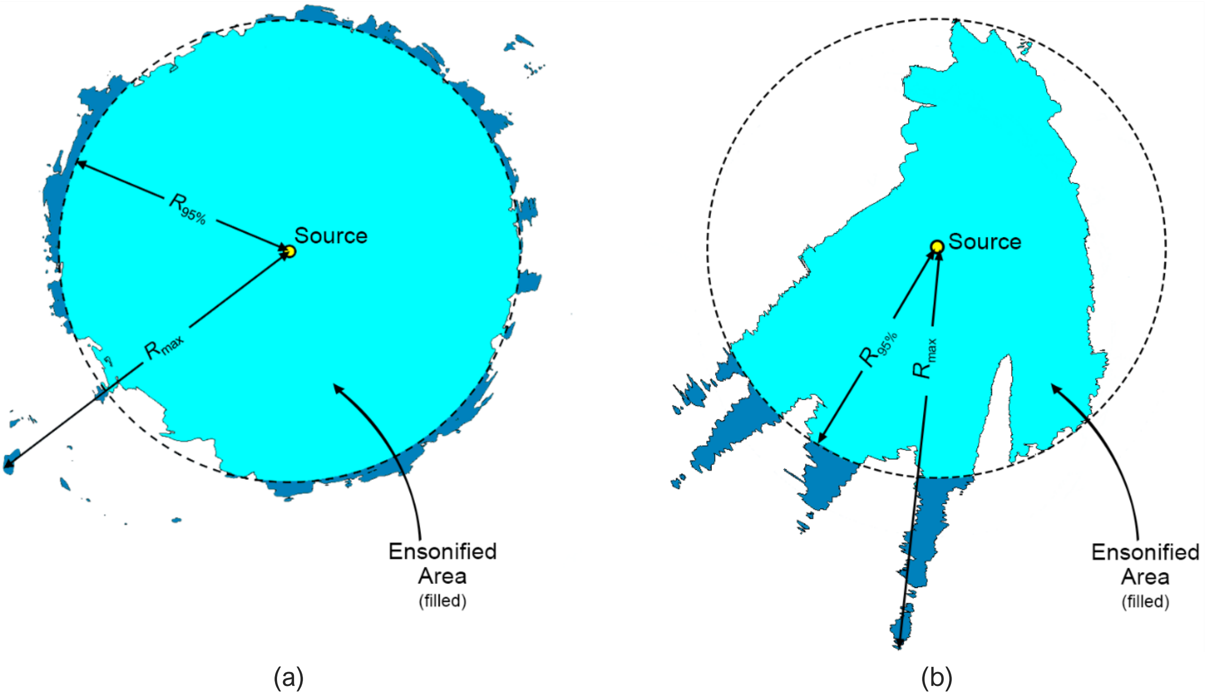
Appendix F. Methods and Parameters

This section describes the specifications of the seismic source that was used at all sites and the environmental parameters used in the propagation models.

F.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure F-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure F-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure F-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.



(a) (b)

Figure F-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

F.2. Environmental Parameters

F.2.1. Bathymetry

Water depths throughout the modelled areas were extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 100 × 100 m.

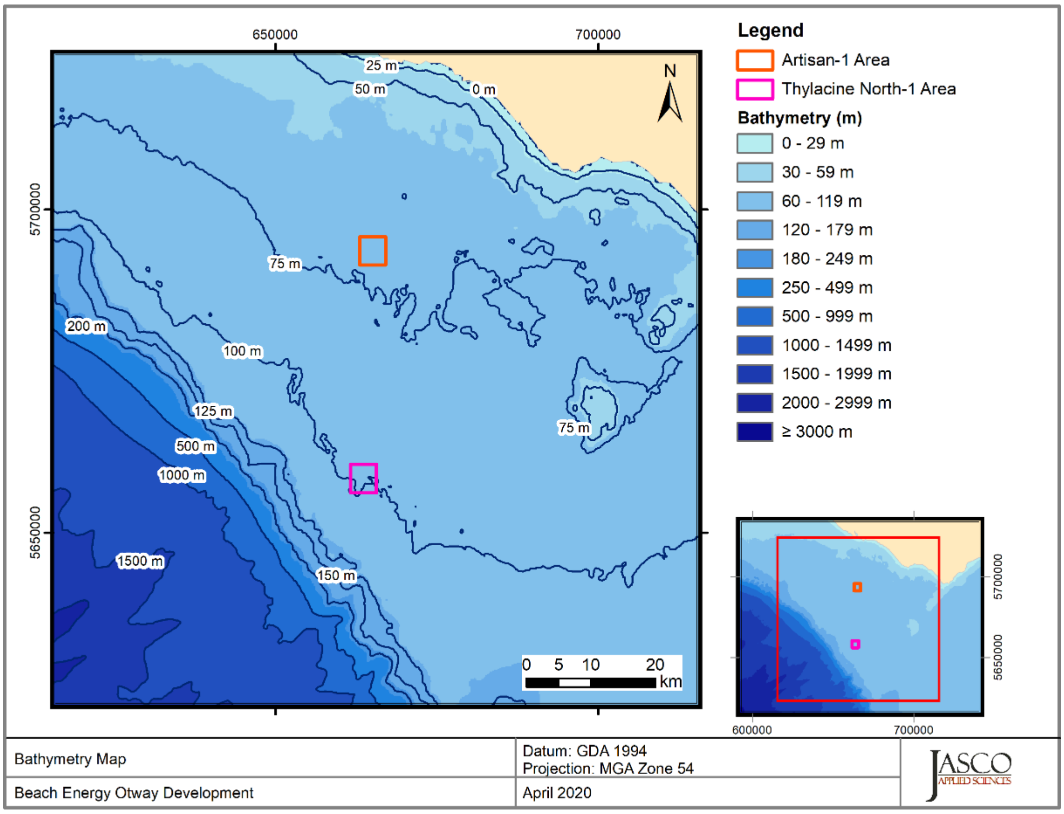


Figure F-2. Bathymetry in the modelled area.

F.2.2. Sound speed profile

Between 0–77 m water depth, mean daily sound speed profiles were derived from the Global Ice Ocean Prediction System (GIOPS) forecasting system for the period when the measurement data was acquired (February 2021 to March 2021 inclusive). A median profile determined to best represent potential propagation conditions over the periods. For deeper water depths below 77 m the sounds speed profile was combined with the sound speed profiles from GDEM (GDEM; Teague et al. 1990, Carnes 2009).

The GIOPS is a data assimilation system that combines satellite and in-situ measurements for ice and ocean analyses and forecasts. Available sea ice analysis products are generated from sea ice concentration data and other satellite measurements from the Canadian Ice Service. For oceanographic variables, GIOPS assimilates a variety of satellite and in-situ observations (Argos profiling floats, ice buoys, moorings, ship observations, and others) to provide a 3-d representation of ocean temperature and salinity, water velocity, sea surface height and mixed layer depth. Meant primarily as a forecasting tool, the daily reported results are not archived long term for general use, but JASCO started caching GIOPS output in 2017 to support Arctic programs.

GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

The February and March were selected for sound propagation modelling to ensure to align with the measurement period. Figure F-3 shows the resulting profile, which was used as input for the sound propagation modelling.

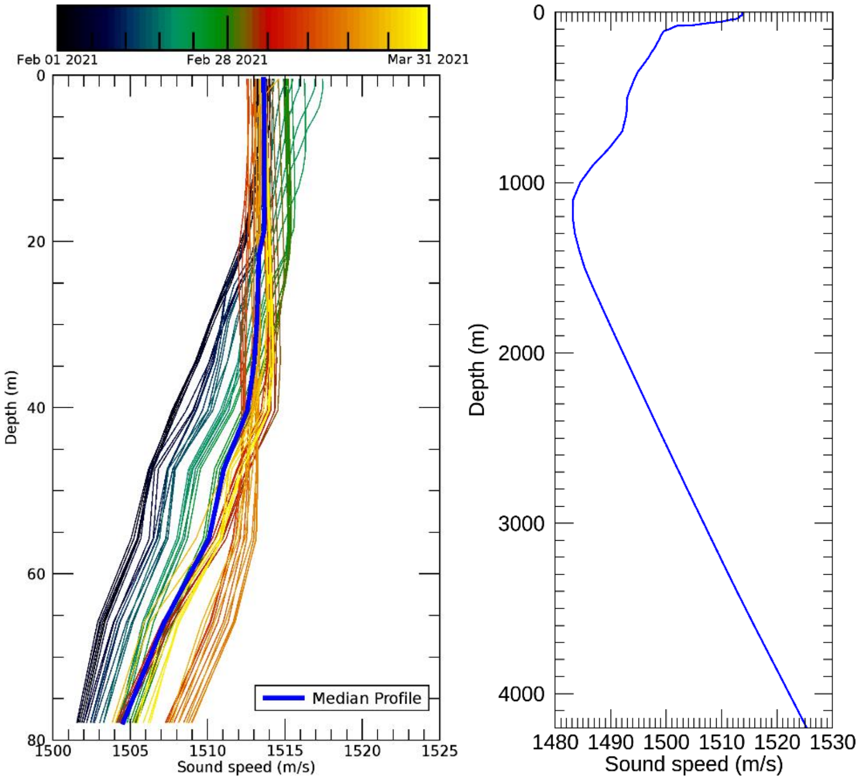

Figure F-3. The sound speed profile used for modelling: The daily and median profiles for the first 77 m from Global Ice Ocean Prediction System (GIOPS) (left) and full depth (right).

F.2.3. Geoacoustics

The propagation model used in this study consider a single geoacoustic profile for the modelled area. These profiles determine how sound is reflected from the seabed, as well as how it is transmitted, reflected, and absorbed into the sediment layers. The seabed in the Artisan-1, located in shallower waters, was characterised by cemented and semi-cemented carbonate rock (calcarenite). semi-cemented carbonate rock with the potential for a thin overlying veneer of coarse sand. This geologic model of the seabed environment is consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010). Tables F-1 and F-2 present the geoacoustic profiles used modelled sites for each seabed type considered.

Table F-1. *Artisan-1*: Carbonate rock geoacoustic profile. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–0.5	Well-cemented carbonate caprock	2.7	2600	0.50	500	0.4
0.5–20	Increasingly cemented calcarenite	2.2	2000	0.30		
20–40		2.3	2120	0.34		
40–60		2.4	2240	0.38		
60–80		2.5	2360	0.42		
80–100		2.6	2480	0.46		
>100	Well-cemented calcarenite	2.7	2600	0.5		

Table F-2. *Artisan-1*: Carbonate rock geoacoustic profile with overlying sand veneer. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–1	Coarse carbonate sand	2.03	1800	0.85	300	3.68

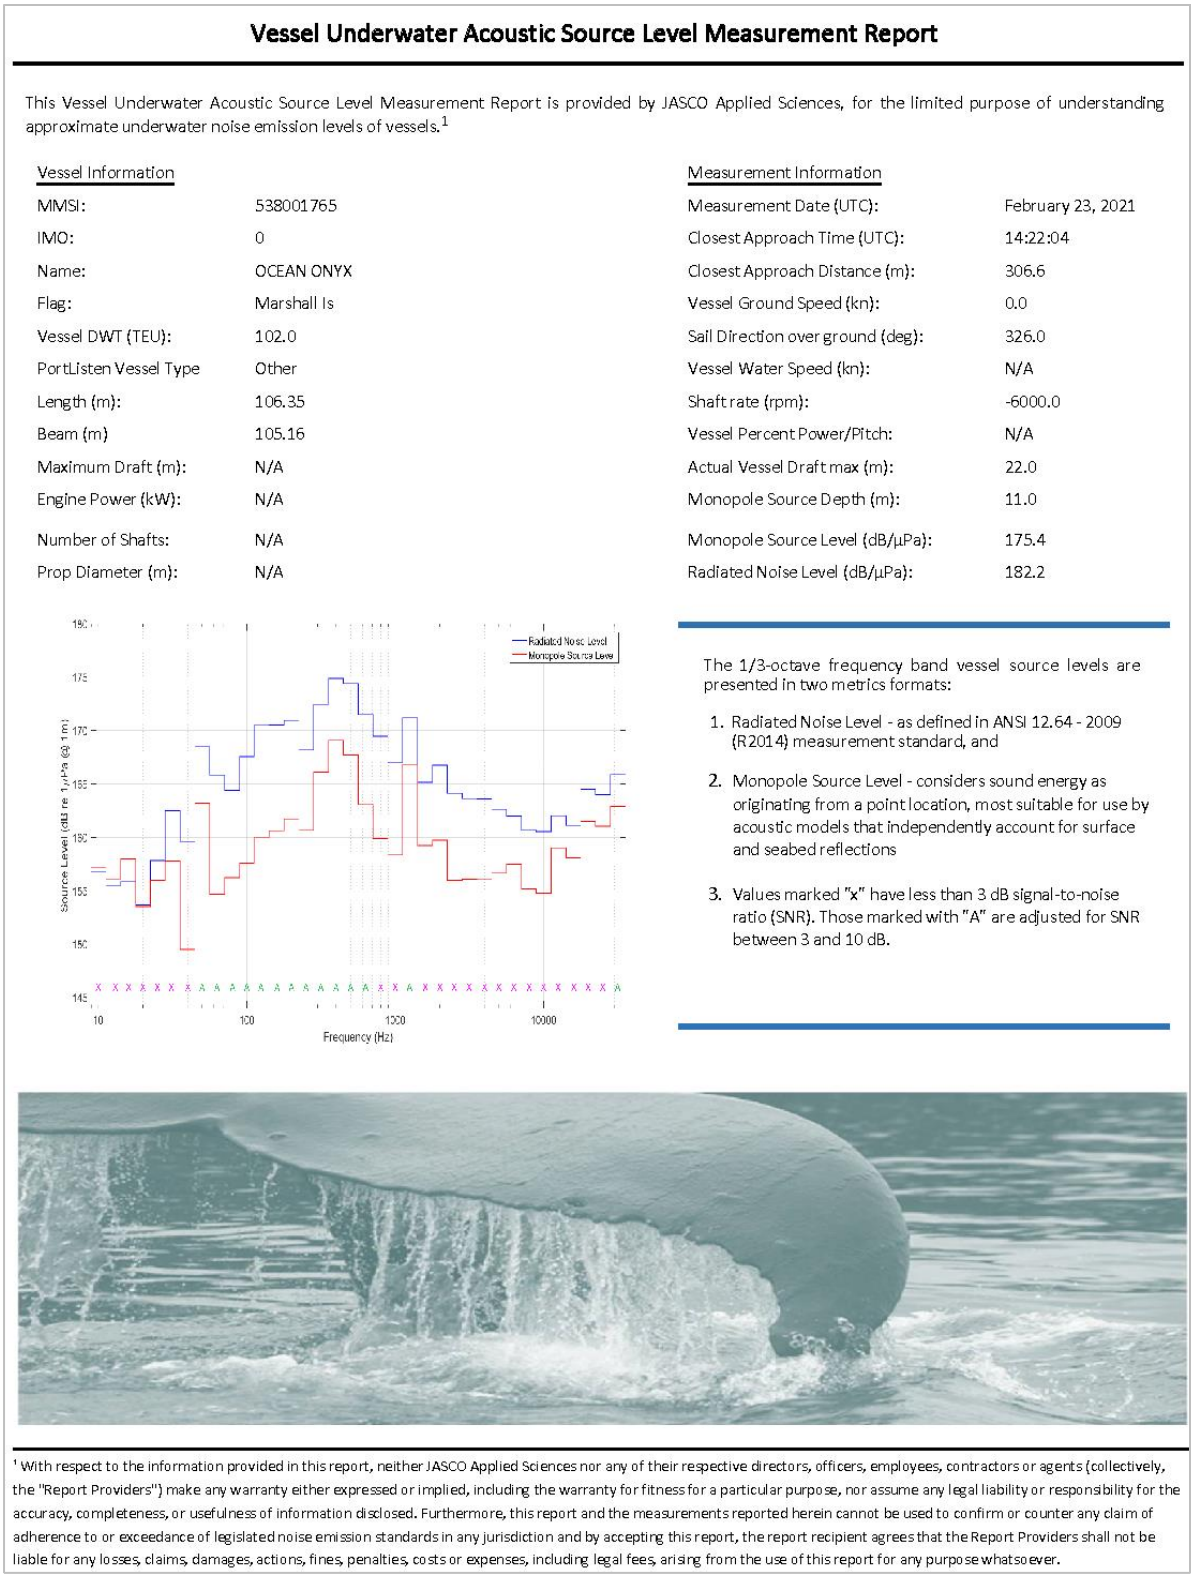
Appendix G. ShipSound Reports

G.1. *Ocean Onyx* Reports

G.1.1. Report 1: 14:22 on 23 Feb 2021



Vessel Underwater Acoustic Source Level Measurement Report

This Vessel Underwater Acoustic Source Level Measurement Report is provided by JASCO Applied Sciences, for the limited purpose of understanding approximate underwater noise emission levels of vessels.[1]

Vessel Information	
MMSI:	538001765
IMO:	0
Name:	OCEAN ONYX
Flag:	Marshall Is
Vessel DWT (TEU):	102.0
PortListen Vessel Type	Other
Length (m):	106.35
Beam (m)	105.16
Maximum Draft (m):	N/A
Engine Power (kW):	N/A
Number of Shafts:	N/A
Prop Diameter (m):	N/A

Measurement Information	
Measurement Date (UTC):	February 23, 2021
Closest Approach Time (UTC):	14:22:04
Closest Approach Distance (m):	306.6
Vessel Ground Speed (kn):	0.0
Sail Direction over ground (deg):	326.0
Vessel Water Speed (kn):	N/A
Shaft rate (rpm):	-6000.0
Vessel Percent Power/Pitch:	N/A
Actual Vessel Draft max (m):	22.0
Monopole Source Depth (m):	11.0
Monopole Source Level (dB/µPa):	175.4
Radiated Noise Level (dB/µPa):	182.2

The 1/3-octave frequency band vessel source levels are presented in two metrics formats:

1. Radiated Noise Level - as defined in ANSI 12.64 - 2009 (R2014) measurement standard, and
2. Monopole Source Level - considers sound energy as originating from a point location, most suitable for use by acoustic models that independently account for surface and seabed reflections
3. Values marked "x" have less than 3 dB signal-to-noise ratio (SNR). Those marked with "A" are adjusted for SNR between 3 and 10 dB.

Furthermore, this report and the measurements reported herein cannot be used to confirm or counter any claim of adherence to or exceedance of legislated noise emission standards in any jurisdiction and by accepting this report, the report recipient agrees that the Report Providers shall not be liable for any losses, claims, damages, actions, fines, penalties, costs or expenses, including legal fees, arising from the use of this report for any purpose whatsoever.

Vessel Underwater Noise Rating - Additional Information

Underwater Noise from vessels has the potential to disturb marine mammals, fish and other marine fauna. JASCO wishes to assist the shipping industry reduce its noise footprint in the marine environment. With this goal in mind, we have developed a vessel noise measurement system and a comparative noise ranking method that allows vessel noise emissions to be characterized relative to those of other vessels of the same class and similar size. The acoustic measurement approach conforms approximately with the protocol defined in ANSI standard 12.64-2009 Grade C, with exceptions as outlined below.

Vessel underwater noise emissions vary with vessel class, size, tonnage, speed, loading and other parameters. The system implements frequency weighting that considers that different marine species have different hearing acuities. For example, humpback whales are believed to be more sensitive to low-frequency sounds than killer whales. To account for these differences, the system calculates frequency-weighted noise metrics based on functions adopted by U.S. National Oceanic and Atmospheric Administration (NOAA) and published in their Marine Mammal Acoustic Technical Guidance[2]. The listening station calculates frequency-weighted noise levels for: Low Frequency Cetaceans (LFC), Mid-Frequency Cetaceans (MFC), and High-Frequency Cetaceans (HFC), Phocid Pinnipeds (PPW) and Otariid Pinnipeds (OPW). The actual rating value is the percentile of the vessel's adjusted and frequency-weighted noise level relative to all vessels of the same class.

RNL with Marine Mammal Weightings (NOAA 2016):

Low Frequency Cetaceans (LFC):	180.4	LFC Rank:	N/A
Mid-Frequency Cetaceans (MFC):	165.9	MFC Rank:	N/A
High-Frequency Cetaceans (HFC):	165.8	HFC Rank:	N/A

Additional Information for this Vessel Measurement:

Name of Vessel:	OCEAN ONYX
Measurement ID:	BEACHOTWAY-stn1-2021-02-538001765202102231422
Date of Measurement:	February 23, 2021

Environmental Information:

Closest Point of Approach location (WGS 84):	-38°53'029"S, 142°52'056"E		
Hydrophone location (WGS-84):	-38°53'024"S, 142°53'008"E		
Water Depth (m):	70.0		
Hydrophone Depth (m):	68.5	Wind Speed (kn):	9.0
Speed of Current (kn):	N/A	Wind Direction (deg):	184.0
Current Direction (deg):	N/A	Sea State Code (WMO):	N/A

Conformance with Standard

The vessel source measurements reported here were acquired using procedures conforming approximately with Grade C - Survey Method - ANSI 12.64-2009 (R2014) Quantities and Procedures for Description and Measurement of Underwater Sound from Ships - Part 1: General Requirements. Notable conformance exceptions are:

1. The standard requires 4 vessel passes, while this measurement is of a single pass.
2. The standard requires vessel Closest Point of Approach (CPA) of the greater of 100 m or one vessel length. This system may admit measurements at other distances.
3. The standard requires the hydrophone subtend depression angles relative to the ship of 20° ± 5° below horizontal, while this system permits angles from 10° to 60°.

Vessel name and dimension information is obtained from Automatic Identification System (AIS) records sent from the vessel at time of measurement and from MarineTraffic.com. Fields not transmitted by these services are marked as N/A in the report. Frequency bands marked with "X" or "A" in the source level graphs are respectively invalid or adjusted, due to being insufficiently above background noise levels as described in the standard.

Mid-Frequency Cetaceans (MFC):	126.5	MFC Rank:	N/A
High-Frequency Cetaceans (HFC):	118.2	HFC Rank:	N/A

Additional Information for this Vessel Measurement:

Name of Vessel:	OCEAN ONYX
Measurement ID:	BEACHOTWAY-stn1-2021-02-538001765202103081752
Date of Measurement:	March 08, 2021

Environmental Information:

Closest Point of Approach location (WGS 84):	-38°53'029"S, 142°52'056"E		
Hydrophone location (WGS-84):	-38°53'024"S, 142°53'008"E		
Water Depth (m):	70.0		
Hydrophone Depth (m):	68.5	Wind Speed (kn):	9.0
Speed of Current (kn):	N/A	Wind Direction (deg):	231.0
Current Direction (deg):	N/A	Sea State Code (WMO):	N/A

Conformance with Standard

The vessel source measurements reported here were acquired using procedures conforming approximately with Grade C - Survey Method - ANSI 12.64-2009 (R2014) Quantities and Procedures for Description and Measurement of Underwater Sound from Ships - Part 1: General Requirements. Notable conformance exceptions are:

1. The standard requires 4 vessel passes, while this measurement is of a single pass.
2. The standard requires vessel Closest Point of Approach (CPA) of the greater of 100 m or one vessel length. This system may admit measurements at other distances.
3. The standard requires the hydrophone subtend depression angles relative to the ship of 20° ± 5° below horizontal, while this system permits angles from 10° to 60°.

Vessel name and dimension information is obtained from Automatic Identification System (AIS) records sent from the vessel at time of measurement and from MarineTraffic.com. Fields not transmitted by these services are marked as N/A in the report. Frequency bands marked with "X" or "A" in the source level graphs are respectively invalid or adjusted, due to being insufficiently above background noise levels as described in the standard.

Furthermore, this report and the measurements reported herein cannot be used to confirm or counter any claim of adherence to or exceedance of legislated noise emission standards in any jurisdiction and by accepting this report, the report recipient agrees that the Report Providers shall not be liable for any losses, claims, damages, actions, fines, penalties, costs or expenses, including legal fees, arising from the use of this report for any purpose whatsoever.

Vessel Underwater Noise Rating - Additional Information

Underwater Noise from vessels has the potential to disturb marine mammals, fish and other marine fauna. JASCO wishes to assist the shipping industry reduce its noise footprint in the marine environment. With this goal in mind, we have developed a vessel noise measurement system and a comparative noise ranking method that allows vessel noise emissions to be characterized relative to those of other vessels of the same class and similar size. The acoustic measurement approach conforms approximately with the protocol defined in ANSI standard 12.64-2009 Grade C, with exceptions as outlined below.

Vessel underwater noise emissions vary with vessel class, size, tonnage, speed, loading and other parameters. The system implements frequency weighting that considers that different marine species have different hearing acuities. For example, humpback whales are believed to be more sensitive to low-frequency sounds than killer whales. To account for these differences, the system calculates frequency-weighted noise metrics based on functions adopted by U.S. National Oceanic and Atmospheric Administration (NOAA) and published in their Marine Mammal Acoustic Technical Guidance[2]. The listening station calculates frequency-weighted noise levels for: Low Frequency Cetaceans (LFC), Mid-Frequency Cetaceans (MFC), and High-Frequency Cetaceans (HFC), Phocid Pinnipeds (PPW) and Otariid Pinnipeds (OPW). The actual rating value is the percentile of the vessel's adjusted and frequency-weighted noise level relative to all vessels of the same class.

RNL with Marine Mammal Weightings (NOAA 2016):

Low Frequency Cetaceans (LFC):	171.5	LFC Rank:	N/A
Mid-Frequency Cetaceans (MFC):	130.5	MFC Rank:	N/A
High-Frequency Cetaceans (HFC):	120.5	HFC Rank:	N/A

Executive Summary

Sound models were used to assess underwater noise levels during the proposed Otway Basin Geophysical Survey by Lattice Energy. The modelling approach accounted for the acoustic emission characteristics of a representative boomer and sub-bottom profiler (SBP) both towed at 3 m depth, along with a 450 in^3 vertical seismic profiler (VSP) array operated at a centroid depth of 6 m. The boomer and SBP geophysical survey sources planned for use had not been decided at the time of the modelling study, therefore JASCO chose commonly-used representative systems for each source, with levels derived from previous JASCO field measurement campaigns of such sources. The modelled per-pulse in-beam SEL and SPL source levels of the boomer were 180.0 dB re 1 µPa^2·s @ 1 m and 200.5 dB re 1 µPa @ 1 m respectively, and for the sub-bottom profiler they were 171.4 dB re 1 µPa^2·s @ 1 m and 191.7 dB re 1 µPa @ 1 m. The modelling considered source directivity and the area's range-dependent environmental properties.

The modelling study assessed six sites for the representative boomer and sub-bottom profiler, and one site for the VSP operations, focusing on the metrics relevant to benthic invertebrates. Accumulated SEL was modelled for four full surveys of the boomer and SBP operating in tandem. The scenarios considered operational periods of either 51 or 40.2 hours, including turn times.

The analysis considered the maximum distances away from a given source or survey lines at which several effects criteria were reached. The results are summarised below for representative single pulse sites and for accumulated sound exposure level (SEL) scenarios.

Benthic Invertebrates and Fish

- Sound fields from the representative boomer and SBP do not reach any of the assessed thresholds for benthic crustaceans or fish at the seafloor for either single pulse or accumulated SEL scenarios. The sound level drops below the lowest relevant peak-to-peak pressure level (PK-PK) isopleth of 202 dB re 1 µPa at a vertical distance of 11 m below the source, and below the lowest relevant peak pressure level (PK) of 207 dB re 1 µPa within 1.6 m, while the maximum per-pulse SEL isopleth predicted to occur at the seafloor is 155 dB re 1 µPa^2·s at a maximum horizontal distance of 1 m from the source.
- The SBP is a higher-frequency, more directional, and lower energy source than the boomer; consequently, the ranges are consistently lower. The PK-PK isopleth of 202 dB re 1 µPa is predicted to occur at 1.4 m vertically below the source, while the maximum per-pulse SEL isopleth predicted to occur at the seafloor is 130 dB re 1 µPa^2·s at a maximum horizontal distance of 6 m.
- The maximum accumulated SEL from the combined operations of the boomer and SBP at the seafloor is not predicted to exceed 170 dB re 1 µPa^2·s for any single survey. This is below any of the relevant isopleths for benthic invertebrates, including the 183 dB re 1 µPa^2·s 'no effect' accumulated SEL (McCauley and Duncan 2016). It is also below the threshold for temporary hearing impairment (TTS) in fish. The predicted ranges for the four surveys modelled at similar, due to the identical sources, sound speed profiles, similar depths and geoacoustics.
- The VSP source was modelled with models capable of accounting for all environmental parameters and high propagation angles. The results show that the lowest PK-PK isopleths of interest derived from Day et al. (2016b), 209 dB re 1 µPa, is not reached at the seafloor; and the horizontal range along the seafloor to the 202 dB re 1 µPa PK-PK level from Payne et al. (2007) is 185 m. PK metrics relevant to the Popper et al. (2014) criteria for fish and turtles are also not reached at the seafloor. The maximum per-pulse SEL on the seafloor below the array is 181 dB re 1 µPa^2·s, below the lowest level from Day et al. (2016b) of 186 dB re 1 µPa^2·s.

Marine Mammals and Turtle Behaviour

- Considering the United States (US) National Marine Fisheries Service (NMFS; 2013) acoustic threshold for behavioural effects in marine mammals of 160 dB re 1 µPa (SPL), the boomer could potentially disturb marine mammals at horizontal distances of up to 145 m, and the SBP at 2 m.
- Considering the US NMFS criterion for behavioural effects in turtles of 166 dB re 1 µPa (SPL), the boomer could potentially disturb turtles are horizontal distances of up to 36 m, while this level is not reached for the SBP.

- For the VSP array, sounds exceeded the unweighted per-pulse SEL criterion for the 1 km low-power zone of 160 dB re 1 µPa^2·s (DEWHA 2008) within 1.03 km of the 450 in^3 array ($R_{95\%}$ distance). The maximum ranges to the marine mammal and turtle behavioural thresholds of 160 and 166 dB re 1 µPa SPL are 2.56 and 1.55 km respectively.

1. Introduction

JASCO Applied Sciences (JASCO) performed a numerical estimation study of underwater sound levels associated with the Otway Basin Geotechnical Operations proposed by Lattice Energy in the Otway Basin. The acoustic modelling evaluated the effects of sounds produced by three sources on marine fauna, with a specific focus on benthic invertebrates. The three sources considered in the modelling were a representative boomer and sub-bottom profiler (SBP) both towed at 3 m, along with a 450 in^3 vertical seismic profiler (VSP) array operated at a centroid depth of 6 m. The boomer and SBP geophysical survey sources planned for use had not been decided at the time of the modelling study, therefore JASCO proposed a commonly used representative for each source, with levels derived from a previous JASCO measurement campaign of such sources. The results are presented as sound pressure levels (SPL), zero-to-peak pressure levels (PK), peak-to-peak pressure levels (PK-PK) and either per-pulse (i.e., per-pulse) or accumulated sound exposure levels (SEL), as appropriate to each scenario.

Single pulse sound fields for each source were modelled at six representative locations (Table 1, Figure 1), although it is likely that the boomer and SBP will not operate at Site 5. The VSP will only be operated at Site 5. Accumulated SEL was modelled for four full surveys of the boomer and SBP operating in tandem, using the single pulse modelling results from Sites 1, 3, 4 and 6.

Table 1. Location details for modelled sites (UTM zone 54S).

2. Noise Effects Criteria

The perceived loudness of sound, especially impulsive noise such as from seismic airguns, is not generally proportional to the instantaneous acoustic pressure. Rather, perceived loudness depends on the time over which the pulse rises, how long this occurs for, and its frequency content. Thus, several sound level metrics are commonly used to evaluate noise and its effects on marine life. The metrics applied in this report, including peak pressure level (PK), peak-peak pressure (PK-PK), sound pressure level (SPL), and sound exposure level (SEL), are defined in Appendix A. Appropriate subscripts indicate any applied frequency weighting; unweighted SEL is defined as required. The acoustic metrics in this report reflect the updated ANSI and ISO standards for acoustic terminology, ANSI-ASA S1.1 (R2013) and ISO/DIS 18405.2:2017 (2016).

Whether acoustic exposure levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have investigated an SEL-based assessment approach for injury in marine mammals, with a handful of key papers published on the topic. The number of studies that investigated the level of disturbance to marine animals by underwater noise has also increased substantially.

We chose the following noise criteria for this study because they include requested thresholds, standard thresholds, thresholds suggested by the best available science (Sections 2.1, 2.2 and 2.3):

1. For comparison to results in Payne et al. (2008), and Day et al. (2016a), the following metrics are reported for benthic crustaceans:
    - Seafloor per-pulse SEL: 186–190 dB re 1 µPa^2.s
    - Seafloor SEL$_{24h}$: 192–199 dB re 1 µPa^2.s
    - Peak-peak pressure: 202, 209–212 dB re 1 µPa
2. ‘No effect on lobster’ accumulated SEL for the Crowes Foot MSS of 183 dB re 1 µPa^2.s (McCauley and Duncan 2016).
3. Per-pulse threshold for cetaceans (unweighted per-pulse SEL of 160 dB re 1 µPa^2·s) outlined in the Australian Environment Protection and Biodiversity Conservation (EPBC) Act Policy Statement 2.1, Department of the Environment, Water, Heritage and the Arts (DEWHA) (2008).
4. Marine mammal behavioural threshold based on the current interim U.S. National Marine Fisheries Service (NMFS) criterion (NMFS 2013) for marine mammals of 160 dB re 1 µPa SPL for impulsive sound sources.
5. Sound exposure guidelines for fish, fish eggs and larvae, and turtles (Popper et al. 2014).
6. Threshold for turtle behavioural response 166 dB re 1 µPa (SPL) (NSF 2011), applied by the US NMFS.

2.1. Benthic Invertebrates (Crustaceans)

Research is ongoing into the relationship between sound and its effects on crustaceans, including the relevant metrics for both effect and impact. Available literature suggests particle motion, rather than sound pressure, is a more important factor for crustacean and bivalve hearing. Water depth and airgun array size are related to the particle motion levels at the seafloor, with larger arrays and shallower water being related to higher particle motion levels, more likely relevant to effects on bivalves. Although some impact assessments have estimated areas of potential impacts from seismic surveys based on the results in Day et al. (2016b), current literature does not clearly define an appropriate metric or identify relevant sound levels for an assessment. This includes the consideration of what particle motion levels lead to a behavioural response, or mortality.

At the seafloor interface bivalves are subject to particle motion stimuli from several acoustic or acoustically-induced waves. These include the particle motion associated with an impinging sound pressure wave in the water column (the incident, reflected, and transmitted portions), substrate acoustic waves, and interface waves of the Scholte type. However, it is unclear which aspect(s) of these waves is/are most relevant to the animals, either when they normally sense the environment or their physiological responses to loud sounds so there is not enough information to establish similar criteria and thresholds as done for marine mammals and fish. Therefore, at this stage, JASCO is not able to define thresholds to inform the impact assessment. Additionally, prediction of particle motion from sources such as low-energy geophysical sources including boomers and sub-bottom profilers is not possible currently due to the lack of source models.

Despite this, the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) has publicly stated that the seafloor levels, sound levels at the seafloor derived from Day et al. (2016b) should be used to assist in the assessment of impacts on scallops and lobster. Therefore, JASCO has used the following metrics in its evaluation:

- Per-pulse SEL: 186–190 dB re 1 µPa^{2}.s
- Accumulated SEL: 192–199 dB re 1 µPa^{2}.s
- Peak-peak pressure: 209–212 dB re 1 µPa

Additionally a PK-PK of 202 dB re 1 µPa from Payne et al. (2007) has been included along with an accumulated SEL of 183 dB re 1 µPa^{2}.s as specified by Lattice Energy based on McCauley and Duncan (2016).

2.2. Marine Mammals

The criteria applied in this study to assess possible effects of impulsive noise on marine mammals are summarised in Table 2 and detailed in Sections 2.2.1 and 2.2.2.

Table 2. The SPL and per-pulse SEL thresholds for acoustic effects on marine mammals.

Hearing group	DEWHA (2008)	NMFS (2013)
	Unweighted per-pulse SEL (dB re 1 µPa^{2}·s)	Behaviour
		SPL (dB re 1 µPa)
Low-frequency cetaceans	160	160
Mid-frequency cetaceans		
High-frequency cetaceans		
Phocid pinnipeds in water	Not Applicable	
Otariid pinnipeds in water	Not Applicable	

2.2.1. Injury and Hearing Sensitivity Changes

There are two categories of auditory threshold shifts representing reduced hearing ability: permanent threshold shift (PTS), considered a physical injury to an animal's hearing organs, and temporary threshold shift (TTS), a temporary reduction in an animal's hearing sensitivity, understood to be partly a result of receptor hair cells in the cochlea becoming fatigued.

For seismic surveys in Australian waters, the EPBC Act Policy Statement 2.1 determines suitable exclusion zones with an unweighted per-pulse SEL threshold of 160 dB re 1 µPa^{2}·s (DEWHA 2008). This threshold minimises the likelihood of TTS in mysticetes and large odontocetes. The Policy Statement does not apply to smaller dolphins and porpoises as DEWHA assessed these cetaceans as having relatively low hearing sensitivity to the low frequencies produced by seismic airgun arrays.

2.2.2. Behavioural Response

Southall et al. (2007) extensively reviewed marine mammal behavioural responses to sounds. Their review found that most marine mammals exhibited varying responses between 140 and

180 dB re 1 µPa SPL, but inconsistent results between studies makes choosing a single behavioural threshold difficult. Studies varied in their lack of control groups, imprecise measurements, inconsistent metrics, and that animal responses depended on study context, which included the animal's activity state. To create meaningful quantitative data from the collected information, Southall et al. (2007) proposed a severity scale that increased with increasing sound levels.

NMFS has historically used a relatively simple sound level criterion for potentially disturbing a marine mammal. For impulsive sounds, this threshold is 160 dB re 1 µPa SPL for pinnipeds and cetaceans (NMFS 2013).

2.3. Fish, Turtles, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and turtles, work begun by a NOAA panel two years earlier. The resulting guidelines included specific thresholds for different levels of effects and for different groups of species (Popper et al. 2014). These guidelines defined quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death.
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma.
- TTS

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. These effects are not assessed in this report. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Turtles, fish eggs, and fish larvae are considered separately.

Table 3 lists relevant effects thresholds from Popper et al. (2014). In general, any adverse effects of seismic sound on fish behaviour depends on the species, the state of the individuals exposed, and other factors. We note that, despite mortality being a possibility for fish exposed to airgun sounds, Popper et al. (2014) do not reference an actual occurrence of this effect. Since the publication of that work, newer studies have further examined the question of possible mortality. Popper et al. (2016) adds further information to the possible levels of impulsive seismic airgun sound to which adult fish can be exposed without immediate mortality. They found that the two fish species in their study, with body masses in the range 200–400 g, exposed to a per-pulse of a maximum received level of either 231 dB re 1 µPa (PK) or 205 dB re 1 µPa^2·s (SEL), remained alive for 7 days after exposure and that the probability of mortal injury did not differ between exposed and control fish.

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long-lasting exposures, it is required to define a time period. This is done for marine mammals in the Southall et al. (2007) criteria, where it is 24 h or the duration of the activity, whichever longer. Popper et al. (2014) recommend a standard period of time should be applied, where this is either defined as a justified fixed period or the duration of the activity, however also include caveats about how long the fish will be exposed because they can move (or remain in location) and so can the source. In the discussion of the criteria, Popper et al. (2014) discuss the complications in determining a relevant period of mobile seismic surveys, as the received levels at the fish change between impulses due to the mobile source, and that in reality a revised guideline based on the closest PK or the per-pulse SEL might be more useful than one based on accumulated SEL. This is because exposures at the closest point of approach are the primary exposures contributing to a receiver's accumulated level (Gedamke et al. 2011). Additionally, several important factors determine the likelihood and duration a receiver is expected to be in close proximity to a sound source (i.e., overlap in space and time between the source and receiver). For example, accumulation time for fast moving (relative to the receiver) mobile sources is driven primarily by the characteristics of source (i.e., speed, duty cycle) (NMFS 2016).

Popper et al. (2014) summaries that in all TTS studies considered, fish that showed TTS recovered to normal hearing levels within 18–24 hours. However in this study the full period of operations has been considered as the accumulation period for SEL.

Table 3. Criteria for seismic noise exposure for fish and turtles, adapted from Popper et al. (2014).

Type of animal	Mortality and potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	> 219 dB SEL_{24h} or > 213 dB PK	> 216 dB SEL_{24h} or > 213 dB PK	>> 186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or > 207 dB PK	203 dB SEL_{24h} or > 207 dB PK	>> 186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or > 207 dB PK	203 dB SEL_{24h} or > 207 dB PK	186 dB SEL_{24h}	(N) Low (I) Low (F) Moderate	(N) High (I) High (F) Moderate
Turtles	210 dB SEL_{24h} or > 207 dB PK	(N) High (I) Low (F) Low	(N) High (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	> 210 dB SEL_{24h} or > 207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low

Notes: Peak sound pressure level dB re 1 µPa; SEL_{24h} dB re 1µPa^2·s. All criteria are presented as sound pressure even for fish without swim bladders since no data for particle motion exist. Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

2.3.1. Turtle Behavioural Response

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. McCauley et al. (2000) observed the behavioural response of caged turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 µPa (SPL), the turtles increased their swimming activity and above 175 dB re 1 µPa they began to behave erratically, which was interpreted as an agitated state. The 166 dB re 1 µPa level has been used as the threshold level for a behavioural disturbance response by NMFS and applied in the Arctic Programmatic Environment Impact Statement (PEIS) (NSF 2011). At that time, and in the absence of any data from which to determine the sound levels that could injure an animal, TTS or PTS onset were considered possible at an SPL of 180 dB re 1 µPa (NSF 2011). Some additional data suggest that behavioural responses occur closer to an SPL of 175 dB re 1 µPa, and TTS or PTS at even higher levels (Moein et al. 1995), but the received levels were unknown and the NSF (2011) PEIS maintained the earlier NMFS criteria levels of 166 and 180 dB re 1 µPa (SPL) for behavioural response and injury, respectively. Popper et al. (2014) suggested injury to turtles could occur for sound exposures above 207 dB re 1 µPa (PK) or above 210 dB re 1 µPa^2·s (SEL_{24h}) (Table 3). Sound levels defined by Popper et al. (2014) show that animals are very likely to exhibit a behavioural response when they are near an airgun (tens of metres), a moderate response if they encounter the source at intermediate ranges (hundreds of metres), and a low response if they are far (thousands of meters) from the airgun. Both the NMFS criteria for behavioural disturbance (SPL of 166 dB re 1 µPa) and the Popper et al. (2014) injury criteria were included in this analysis, although the analysis did not consider the ranges at which an animal could suffer impairment, as defined by Popper et al. (2014).

3. Methods

This section details the methodology for predicting source levels, modelling sound propagation, and assessing distances to the selected impact criteria.

The environmental parameters used in the propagation models are described in detail in Appendix D. A single sound speed profile that provided the greatest propagation across the year was applied, which occurs during the month of September.

3.1. Acoustic Sources

3.1.1. Boomer: AP3000 Dual-Plate Boomer

The representative boomer system for geophysical survey operations is the AP3000 triple-plate boomer (manufactured by Subsea Systems, Inc.). To estimate the sound field for the boomer source, the specifications of the Applied Acoustics AA202 boomer plate (Applied Acoustics Engineering 2013), a suitable approximation, were taken to represent a single plate, three of which comprise the full system. The boomer plate is 38 cm wide by 38 cm long with a circular baffle. Because the boomer source is a circular piston surrounded by a rigid baffle, it cannot be considered a point-like source (Verbeek and McGee 1995). The beam pattern of a boomer plate shows some directivity for frequencies above 1 kHz. Above this frequency, the acoustic wave's emitted length becomes comparable (of the same order of magnitude) with the baffle size (< 150 cm vs. 35 cm).

The input energy for the AP3000 system is up to 600 J per pulse per plate, or up to 1800 J per pulse from all three plates. The width of the pulse calculated based on the 90% SPL (T_{90}) is 8.1 ms.

JASCO performed a source verification study on an AP3000 system (Martin et al. 2012) with a double-plate configuration operating at maximum input energy of 1000 J. During the study, the acoustic data were collected as close as 8 m to the source and directly below it (Figure 2). By assuming a reduction in pressure in line with spherical spreading laws the data showed that the broadband source level for the system was 197.9 dB 1 µPa @ 1 m SPL and 177.4 dB re 1 µPa^2·s @ 1 m SEL.

The increase in the source level of an AP3000 boomer when in triple-plate configuration, instead of double-plate configuration, was estimated at 2.6 dB because a triple-plate configuration could be used with a higher energy input per pulse (up to 1800 J vs. up to 1000 J for double plate configuration). For modelling, the source level of the AP3000 triple-plated boomer operating at 1800 J per pulse energy was calculated to be 200.5 dB 1 µPa @ 1 m SPL and 180.0 dB re 1 µPa^2·s @ 1 m SEL (Table 4). The power spectrum of the boomer signal was determined directly from the measurement of the boomer signal having compensated the signal for geometric spreading and the change in energy (Figure 3). The 1/3-octave frequency boomer source spectra are shown in Figure 4.

The beamwidth of a boomer plate at each 1/3-octave frequency was calculated based on the standard formula for the beam pattern of a circular transducer (Equation 1). Figure 5 shows a vertical slice for the calculated beam pattern at (a) 1.25 and (b) 16.0 kHz. In order to simplify the acoustic propagation calculations, the beam pattern from the triple-plate system was considered to be equal to the beam pattern from a single plate.

Table 4. Specifications of the AP3000 triple-plate boomer system towed at a depth of 2 m used for the modelling

Specification	Specification	Source
Operating frequency (broad band):	200 Hz–16 kHz;	Estimated from field measurements; Martin et al. (2012)
Beam width	omnidirectional –8°	
Beams	1	

Specification	Specification	Source
Tilt angle (below horizontal plane)	90°	System specification document
Maximum energy input (per pulse):	1800 J	
Peak pressure source level	210.8 dB re 1 µPa @ 1 m	Estimated from field measurements; Martin et al. (2012).
Peak-Peak pressure source level	222.7 dB re 1 µPa @ 1 m	
SPL source level	200.5 dB re 1 µPa @ 1 m	
Pulse length (*T*₉₀)	8.1 ms	
Per-pulse SEL source level	180.0 dB re 1 µPa²•s @ 1 m	

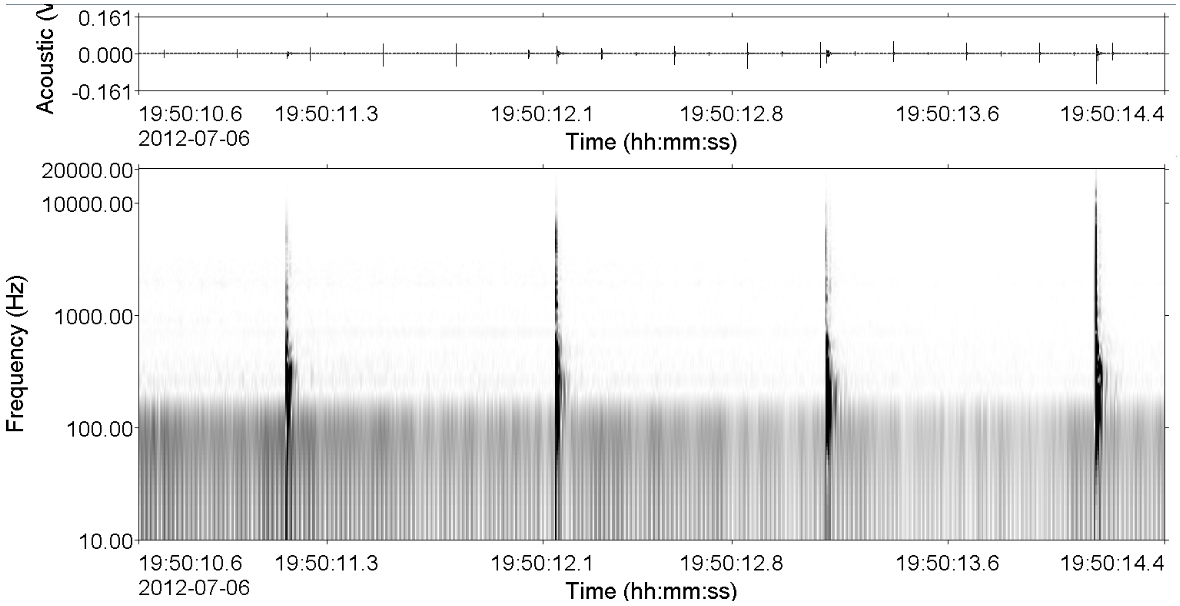

Figure 2. Spectrogram of dual-plate boomer (1000 J) pulses at the closest point of approach. Majority of energy is between 100 and 1000 Hz, with some energy at up to 10 kHz. (131,072 point FFT, 7000 data points, 3500 point overlap, Figure 15 in Martin et al. (2012)).

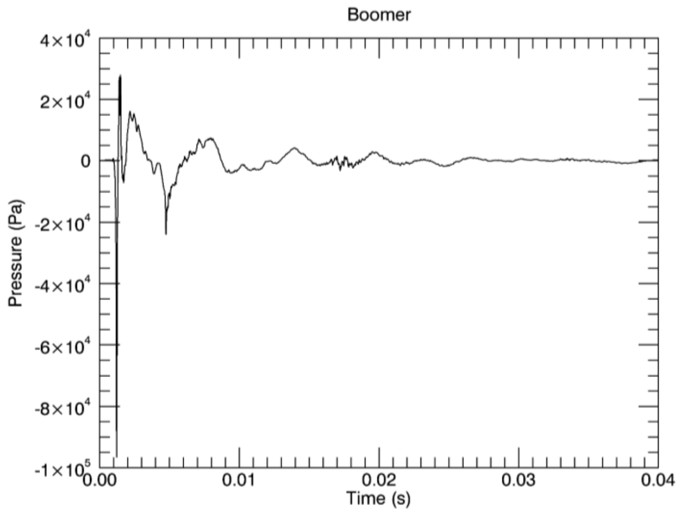

Figure 3. Back-propagated and scaled boomer source signature calculated from measurements (Martin et al. 2012).

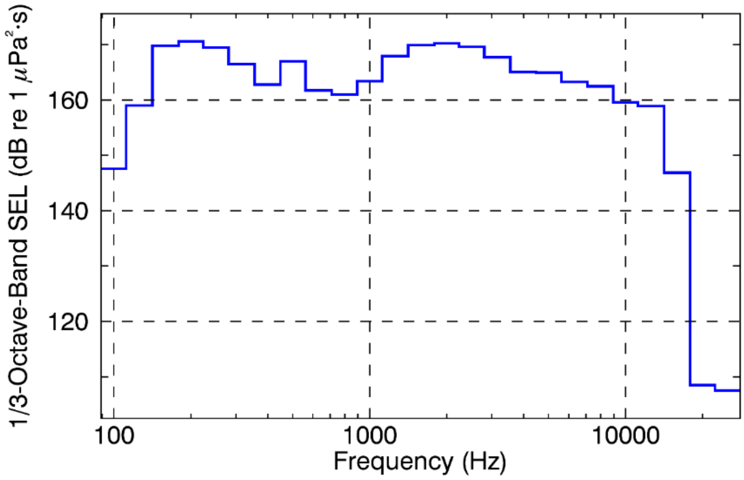

Figure 4. Boomer source spectra calculated from measurements (Martin et al. 2012).

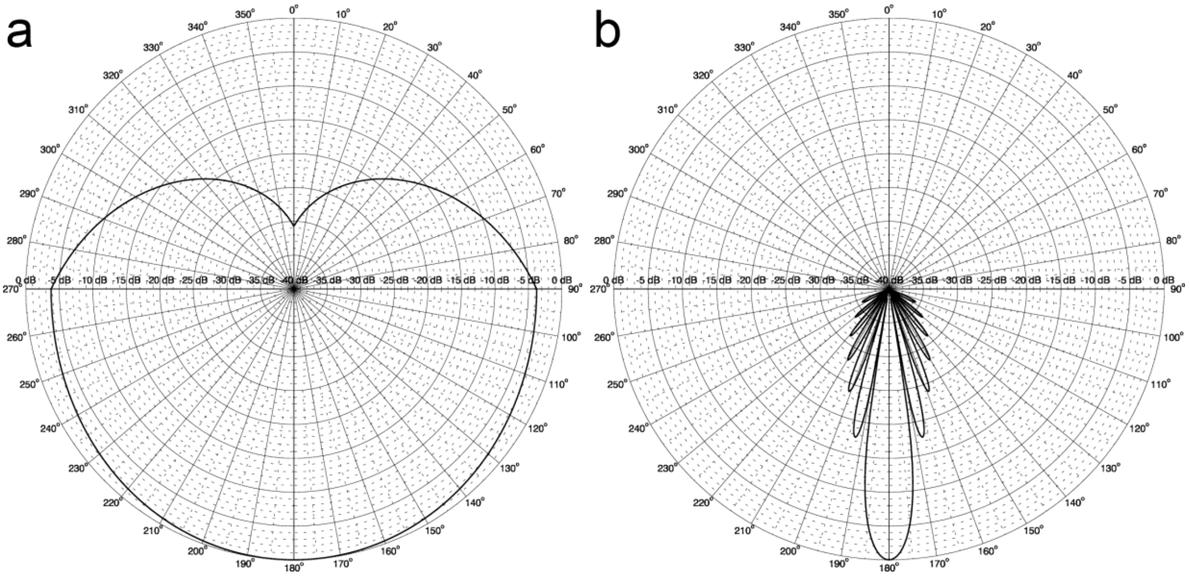

Figure 5. Calculated beam pattern vertical slice for the AA202 boomer plate at (a) 1.25 and (b) 16.0 kHz; across-track direction.

3.1.2. Sub-bottom Profiler: EdgeTech X-Star

The representative sub-bottom profiler system for geophysical survey operations is the EdgeTech X-Star (manufactured by EdgeTech). The system is equipped with a SBP-216 tow-fish. The transducer installed on the SBP-216 tow-fish transmits a chirp pulse that spans an operator-selectable frequency band. The lower and upper limits of the sonar's frequency band are 2 and 16 kHz, respectively. The system projects a single beam directed vertically down. The projected beamwidth depends on the operating frequency, and it can vary in range from 10° to 20°.

The source function was determined by using data obtained from the same measurement campaign as the boomer (Martin et al. (2012).To determine a source function usable for modelling the signal underwent a degree of post-processing. A clip from the recording measured at the closest point of approach was selected for processing (Figure 6). By assuming a point-like source and with no significant reflections or pulse dilation, the source level was determined by back-propagation methods assuming spherical spreading (Figure 7). The SEL band levels were determined from the back-propagated signal and are shown in Figure 8. The calculated source specifications are provided in Table 5. The width of the pulse encompassing 90% of the energy (T_{90}) was 8.1 ms, providing a SPL of 191.7 dB re 1 µPa @ 1 m.

For the purposes of modelling a source depth of 3 m was used, based on the assumed tow depth of a tow-fish. Since the echosounder's transducer projects a circular beam that is aimed vertically down, the source is effectively omnidirectional in the horizontal plane.

Table 5. Specifications of the Edgetech X-Star sub-bottom profiling system towed at a depth of 3 m used for the modelling

Specification	Specification	Source
Operating frequency:	2-16 kHz	System specification document
Beam width	10-20°	
Tilt angle (below horizontal plane)	90°	
Peak pressure source level	197.6 dB re 1 µPa @ 1 m	Estimated from field measurements; Martin et al. (2012).
Peak-Peak pressure source level	204.7 dB re 1 µPa @ 1 m	
SPL source level	191.7 dB re 1 µPa @ 1 m	
Pulse length (T_{90})	8.1 ms	
Per-pulse SEL source level	171.4 dB re 1 µPa^2·s @ 1 m	

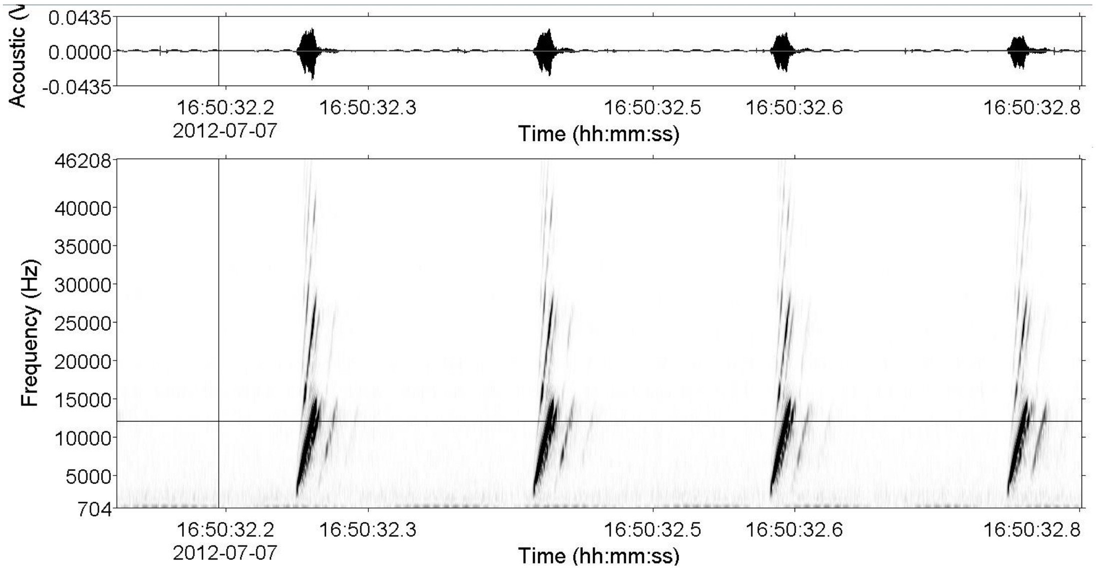

Figure 6. Spectrogram of X-Star SB-216S Sub-Bottom Profiler at closest-point of approach. The centroid frequency of the pulses was approximately 10 kHz, with 90% of the energy between 6 and 13 kHz. Aliased energy is visible above the main pulse. The bottom reflection is visible about 15 ms after the main pulse. (131,072 point FFT, 690 real data points, 345 point overlap.)

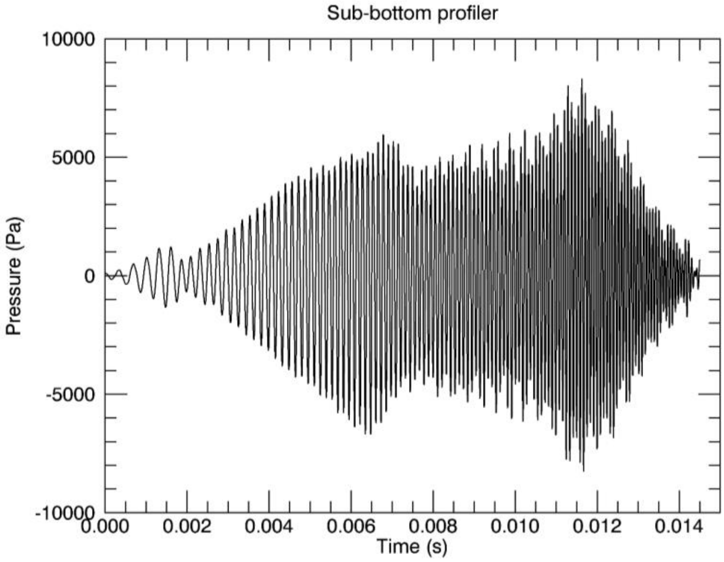

Figure 7. Back-propagated and scaled sub-bottom profiler source signature calculated from measurements (Martin et al. 2012).

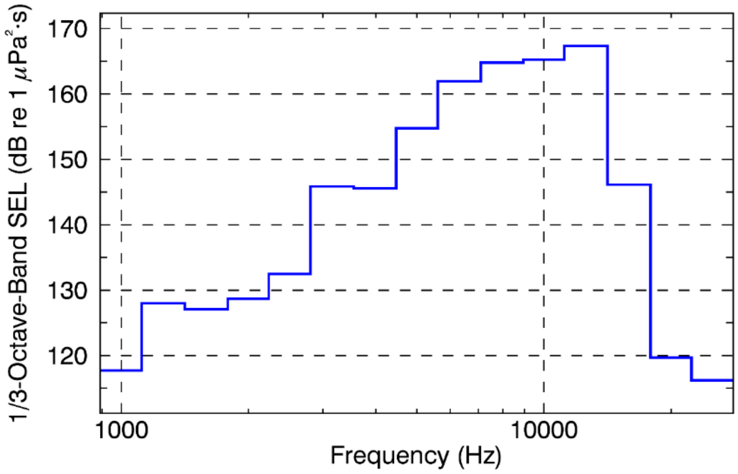

Figure 8. Sub-bottom profiler source spectra calculated from measurements (Martin et al. 2012).

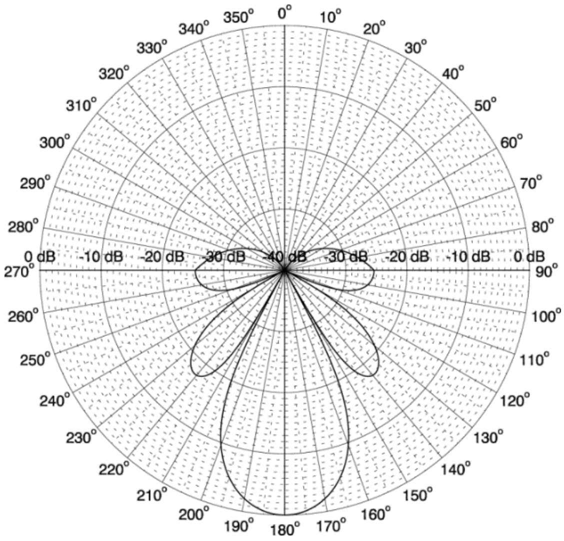

Figure 9. Calculated beam pattern vertical slice for the EdgeTech X-Star sub-bottom profiler at central frequency of 9 kHz.

3.1.3. VSP

The VSP airgun array under consideration is a 450 in^3 array consisting of 3 150 in^3 airguns operated at a centroid depth of 6 m, Figure 10 and Table 6.

The source levels and directivity of the airgun array were predicted with JASCO's Airgun Array Source Model (AASM), which accounts for:

- Array layout
- Volume, tow depth, and firing pressure of each airgun
- Interactions between different airguns in the array

The array was modelled over AASM's full frequency range, up to 25 kHz. Details of the model are described in Appendix B.

The model considered the following specifications:

- A 450 in^3 firing volume seismic airgun array for VSP.
- Airguns operated at a firing pressure of 2000 psi. The type was not specified, however Bolt 1900 LLX were used for the modelling.

- An array layout consisting of three 150 in³ airguns with a centroid depth of 6.0 m.

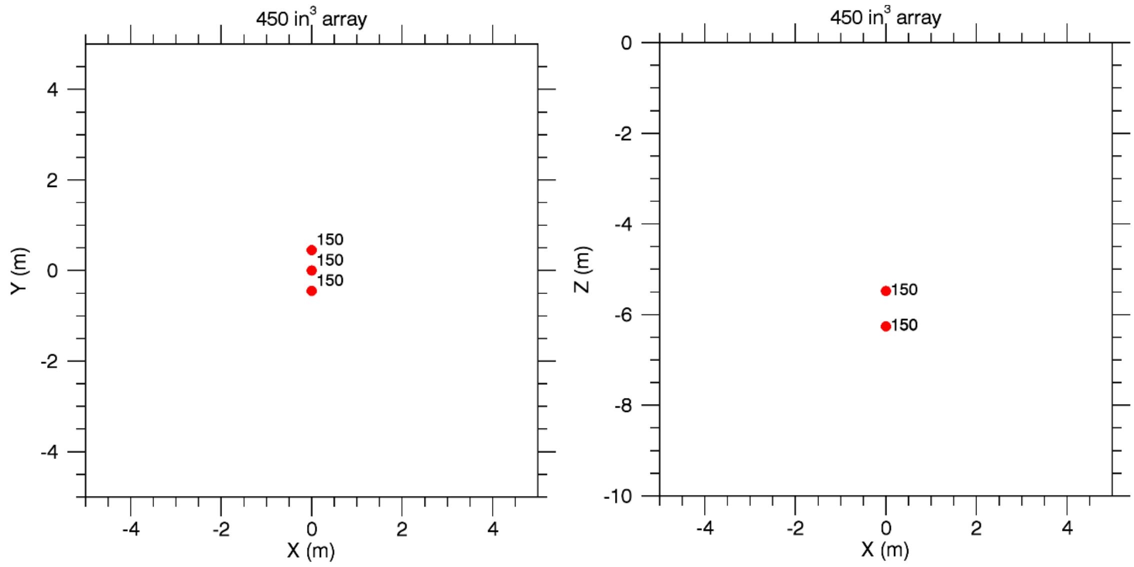

Figure 10. Layout of the modelled 450 in³ VSP array, plan view (left) and side view (right). Centroid operating depth is 6 m. The labels indicate the firing volume (in cubic inches) for each airgun. The convention is that the array is towed in the positive x direction. Also see Table 6.

Table 6. Layout of the modelled 450 in³ VSP array.Centroid operating depth is 6 m. Firing pressure for all guns is 2000 psi. The tow direction is assumed to be in the positive *x* direction.

Gun	*x* (m)	*y* (m)	*z* (m)	Volume (in³)
1	0.0	0	5.48	150
2	0.0	0.45	6.26	150
3	0.0	- 0.45	6.26	150

3.2. Sound Propagation Models

3.2.1. Boomer

The boomer source can be treated as an omnidirectional source for the frequencies of 1000 Hz and lower. For frequencies higher than 1000 Hz, the directionality of the boomer was taken into account. Due The acoustic field projected by the boomer source in 1/3-octave-bands was modelled using two propagation models: for frequencies of 1000 Hz and below MONM-RAM was used, while frequencies above 1000 Hz were modelled using MONM-BELLHOP. These were combined in post processing to determine the acoustic field across the entire frequency range. To determine the maximum range to PK, and PK-PK thresholds, spherical spreading laws were applied to the source level in the downward direction; these are usable due to the short ranges associated with the identified threshold levels within which no appreciable pulse dilation will occur nor reflections.

The acoustic propagation modelling was conducted in terms of PK, PK-PK and SEL units. The conversion to the SPL units was done based on Equation A-5 considering the T_{90} equal to 0.2 ms for the distances from the source less than 20 m, and 10 ms for the distances greater than 20 m from the source.

3.2.2. Sub-bottom Profiler

As the sub-bottom profiler was found only to have significant energy above 1 kHz it was assumed to be directional throughout its operational range. Consequently, MONM-BELLHOP was employed to model the entire frequency range of the SEL acoustic field in terms of 1/3-octave-bands. The ranges to PK and PK-PK levels were determined using spherical spreading laws.

The conversion to the SPL units was done based on Equation A-5 considering the T_{90} equal to 8 ms as determined by the measurement study.

3.2.3. VSP

Four sound propagation models (Appendix C) were used to predict the acoustic field around the VSP array for frequencies from 5 Hz to 25 kHz:

- Range-dependent parabolic equation model (Marine Operations Noise Model, MONM)
- Range-dependent ray tracing model (BELLHOP)
- Full Waveform Range-dependent Acoustic Model (FWRAM)
- Wavenumber integration model (VSTACK).

The models were used in combination to characterise the acoustic fields at short and long ranges in terms of SEL, SPL, PK, and PK-PK.

3.3. Accumulated SEL

3.3.1. Method overview

During a geophysical survey, a new portion of sound energy is introduced into the environment with each pulse from the survey equipment. An accurate assessment of the cumulative acoustic field depends not only on the parameters of each impulse, but also on the number of impulses delivered over a period and the relative position of the impulses. Consideration of the total acoustic energy marine fauna is subjected to over the survey operations is required for comparison to the relevant effect criteria (Section 2).

When there are many pulses, it becomes computationally prohibitive to perform sound propagation modelling for every single event. The offset between the consecutive pulses is small enough, however, that the environmental parameters that influence sound propagation are virtually the same for many impulse points. The acoustic fields can, therefore, be modelled for a subset of pulses and estimated at several adjacent ones. After sound fields from representative impulse locations are calculated, they are adjusted to account for the source position for nearby impulses.

Although estimating the cumulative sound field with the described approach is not as precise as modelling sound propagation at every impulse location, small-scale, site-specific sound propagation features tend to blur and become less relevant when sound fields from adjacent impulses are summed. Larger scale sound propagation features, primarily dependent on water depth, dominate the cumulative field. The accuracy of the present method acceptably reflects those large-scale features, thus providing a meaningful estimate of a wide area SEL field in a computationally feasible framework.

3.3.2. Scenario definition

Four regions were identified for the cumulative study, each requiring many thousands of individual impulses. In each region a representative single pulse noise field for the relevant source is shifted in space and noise fields summed to provide a composite field. For the Thylacine location, two possible surveys were combined into a single scenario, referred to as Thylacine Combined. This scenario included a total of 38 lines each being 7.025 km in length (total estimated time of 51 h including turns). The other three scenarios, Geographe 3 (G3), Artisan (ARTISAN) and VICP69 Meeki (MEEKI), each featured 41 lines, of 4.0 km length (total estimated time of 40.2 h. Along each line the operating sequence was to alternate between the sub-bottom profiler and the boomer with the vessel travelling at 4.5 knots and a turn time of 30 minutes during which no source would be operated. The proposed areas are shown in Figure 11.

To produce maps of cumulative received sound level distribution and calculate distances to specified sound level thresholds at the seafloor, the sound level was calculated at a subset of points within the modelled region. The radial grids of sound levels of the modelled sites at each point were then resampled (by linear triangulation) to produce a regular Cartesian grid. These grids were transposed geographically to each impulse location along the survey lines. The sound field grids from all impulses were summed, using Equation A-4, to produce the cumulative sound field grid. The produced grids had a cell size of 5 m. The contours and threshold ranges were calculated from these flat Cartesian projections of the modelled acoustic fields.

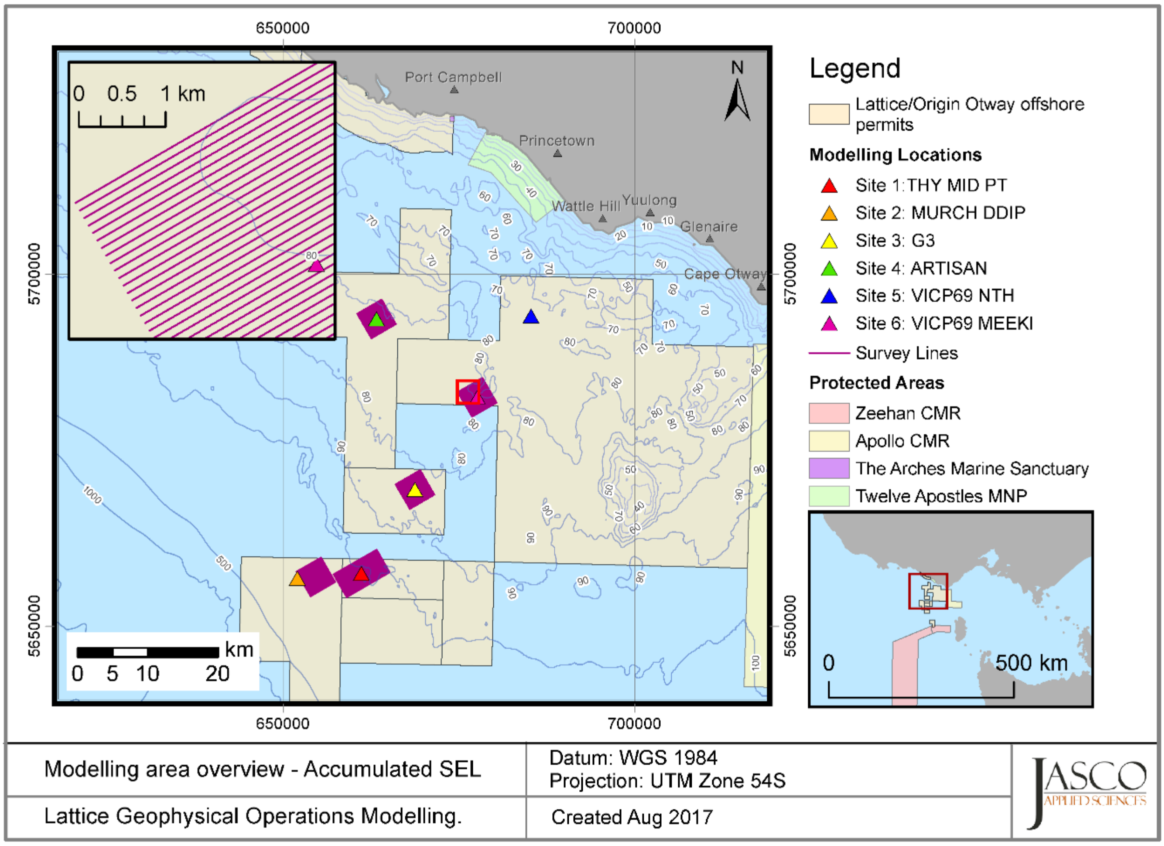

Figure 11. Overview of site surveys (and survey lines) under consideration. The site surveys are referred to by the name of the modelling location located at the same site.

3.4. Geometry and Modelled Regions

The modelled regions were defined based on the anticipated noise footprint of each of the sources. The VSP is significantly louder than either the boomer or the sub-bottom profiler, as well as having greater energy at lower frequencies that would typically propagate further than higher frequencies. The VSP, therefore was modelled in MONM in a series of radial slices with a maximum length of 56 km; the radial slices were 2.5° apart providing a total of 144 individual two-dimensional sound fields that were interpolated onto a regular three-dimensional grid to determine the output metrics. The range step in MONM was 10 m, used across the entire frequency range of 10 to 2000 Hz.

To determine the conversion factor from SEL to SPL, FWRAM was used with four transects modelled (cardinal directions). The Full Waveform Range-dependent Acoustic Model (FWRAM) employs a frequency dependent range step varying from 50 m at 10 Hz to 10 m at 1000 Hz. To calculate the near-field results the VSP was modelled in VSTACK, a wavenumber integration model; results were generated up to a frequency of 1 kHz up to 500 m away. Only a single range-independent transect was modelled using VSTACK.

The boomer and the sub-bottom profiler sources are more strongly directional than the VSP and operate at higher frequencies; consequently, the modelling was principally performed using BELLHOP, the beam-tracing model. The field was modelled in radial slices each 10° apart to provide 36 modelled transects, up to a maximum range of 3.5 km, with a range step of 1 m to provide high-resolution outputs. Where the boomer was omnidirectional (at 1 kHz), MONM was used to generate the contribution; otherwise, BELLHOP was used throughout. These modelling runs were performed separately for each of the six identified single pulse sites.

4. Results

This section presents the model results as distances to sound level thresholds and as sound field contour maps.

4.1. Acoustic Source Levels and Directivity

4.1.1. VSP Array

The pressure signatures of the individual airguns and the composite 1/3-octave-band point-source equivalent directional levels of the arrays were modelled with AASM (Section 3.1). Although AASM accounts for the effects of surface-reflected signals on bubble oscillations and inter-bubble interactions in the notional pressure signatures of each airgun, the signal reflected off the water surface (known as surface ghost) is not included in the far-field source signatures; however, the acoustic propagation models account for those surface reflections because they are a property of the propagating medium rather than the source.

The horizontal and vertical overpressure signatures, corresponding power spectrum levels, and the horizontal directivity plots for array is provided in Appendix B.4.

To help compare these results to the outputs of other airgun array source models, Table 7 presents the vertical source level that accounts for the surface ghost, and lists the broadband PK, and per-pulse SEL source levels of the array in the endfire, broadside, and vertical directions.

Table 7. Source level specifications in the horizontal plane for the 450 in^3 VSP array, for a 6 m centroid depth.

Direction	PK (dB re 1 µPa @ 1 m)	SEL (dB re 1 µPa^2·s @ 1 m)	
		10–2000 Hz	2000–25000 Hz
Broadside	237.6	213.6	167.7
Endfire	237.8	213.7	173.4
Vertical (no ghost)	237.6	213.6	171.1
Vertical (with ghost)	237.6	215.7	174.1

4.2. Single Pulse Sound Fields

4.2.1. Tabulated Results

4.2.1.1. Boomer

The single pulse sound fields for the representative boomer (an AP3000 triple plate boomer) are presented in terms of maximum-over depth SPL for marine mammal and turtle behavioural thresholds (Table 8), maximum-over-depth and seafloor per-pulse SEL (Tables 9 and 10), and water column PK-PK and PK (Tables 11 and 12). Water column PK-PK and PK are included as the levels referenced for benthic invertebrates in Section 2.1 are not reached at the seafloor.

4.2.2. Maps and Graphs

4.2.2.1. Boomer

Maps of the per-pulse SEL at the seafloor along with vertical slices for the representative boomer are shown for two representative sites, Site 1 (Thylacine Midpoint: Figures 12 and 13) and Site 4 (Artisan: Figures 14 and 15). The shape of the footprint at all six modelled sites (Table 1) is almost identical.

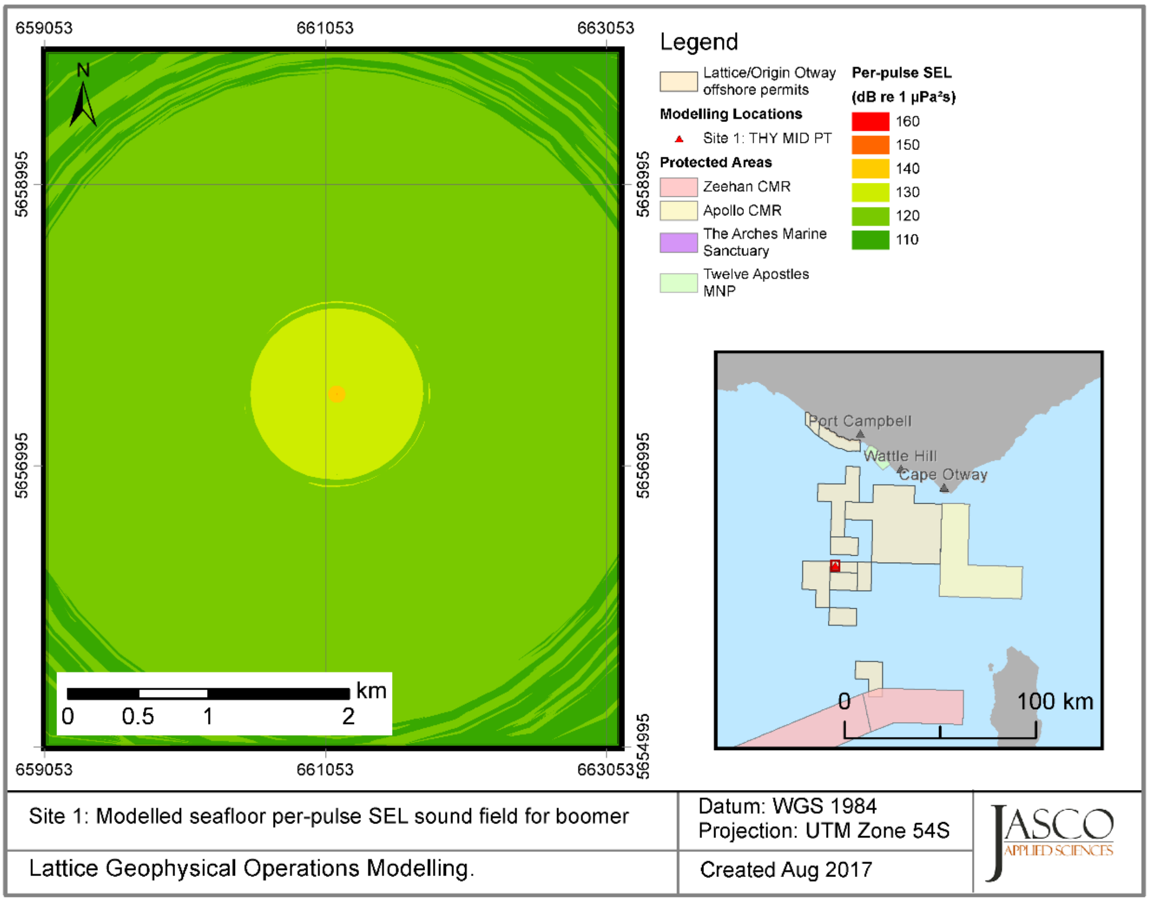

Figure 12. Boomer, Site 1: Sound level contour map showing unweighted seafloor per-pulse SEL results for the boomer towed at 2 m depth.

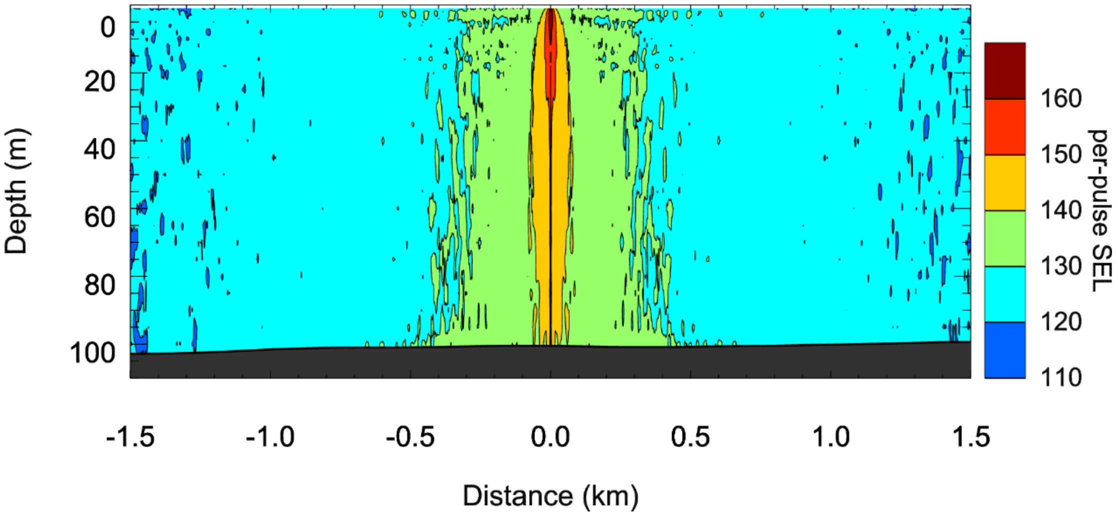

Figure 13. Boomer, Site 1: Predicted unweighted per-pulse SEL for the boomer towed at 2 m depth as vertical slices. Levels are shown from south to north.

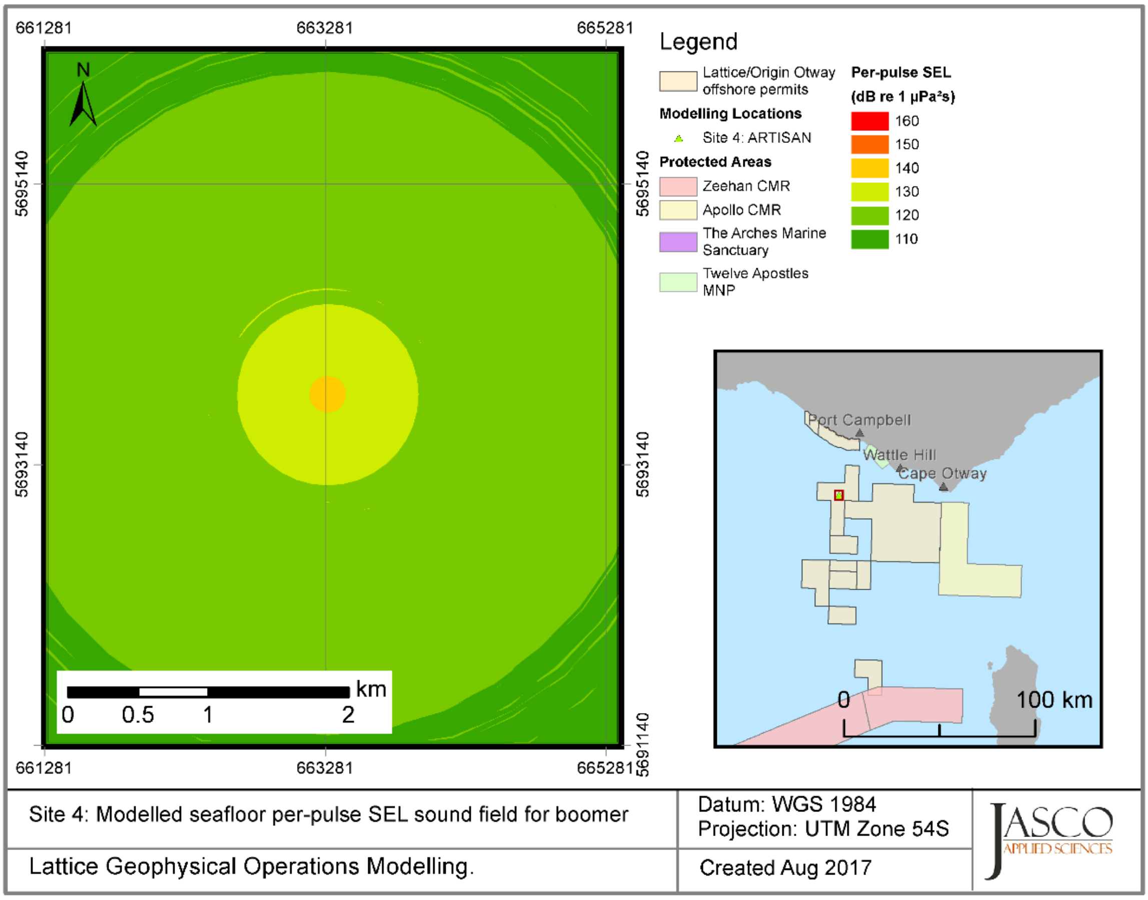

Figure 14. Boomer, Site 4: Sound level contour map showing unweighted seafloor per-pulse SEL results for the boomer towed at 2 m depth.

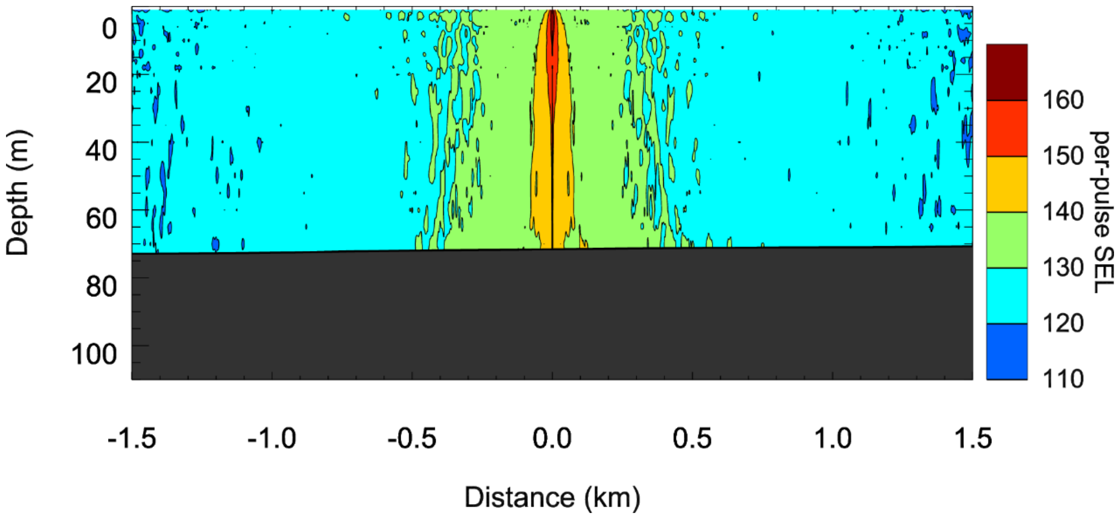

Figure 15. Boomer, Site 4: Predicted unweighted per-pulse SEL for the boomer towed at 2 m depth as vertical slices. Levels are shown from south to north.

4.2.2.2. Sub-bottom Profiler

Maps of the per-pulse SEL at the seafloor along with vertical slices for the representative SBP is shown for two representative sites, Site 1 (Thylacine Midpoint: Figures 16 and 17) and Site 4 (Artisan: Figures 18 and 19). The shape of the footprint at all six modelled sites (Table 1) is almost identical.

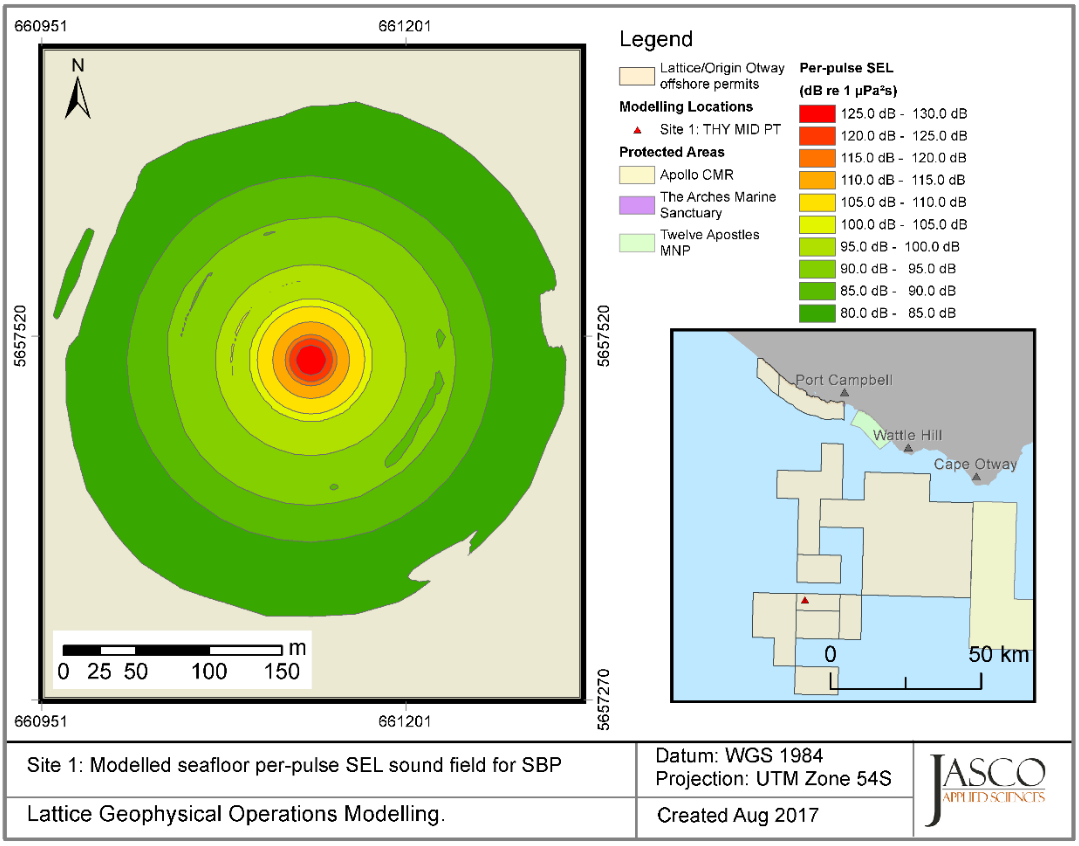

Figure 16. SBP, Site 1: Sound level contour map showing unweighted seafloor per-pulse SEL results for the SBP towed at 3 m depth.

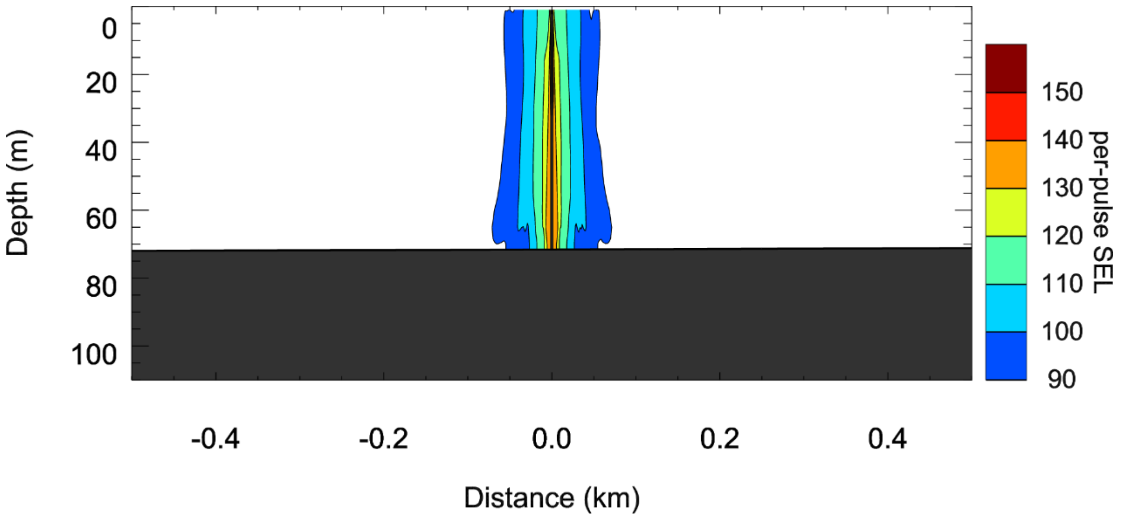

Figure 19. SBP, Site 4: Predicted unweighted per-pulse SEL for the SBP towed at 3 m depth as a vertical slice. Levels are shown from south to north.

4.2.2.3. VSP

Maps of the per-pulse SEL as maximum-over-depth along with vertical slices for the VSP is shown at Site 5, Block VICP69, North (Figures 20 and 21). Additionally, the PK and PK-PK at the seafloor out to 300 m is shown in Figure 22.

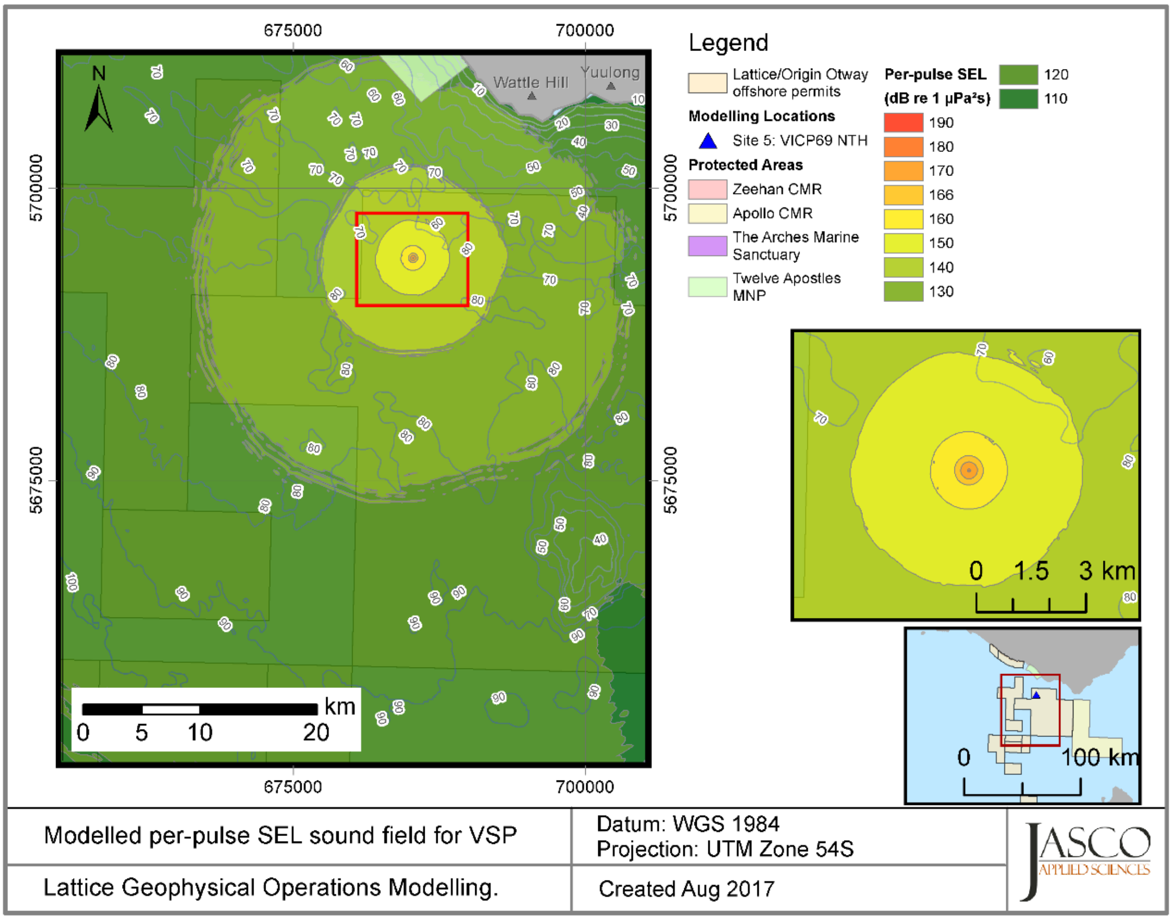

Figure 20. Sound level contour map showing unweighted maximum-over-depth per-pulse SEL results for the 450 in³ VSP array operated at 6 m depth at Site 5.

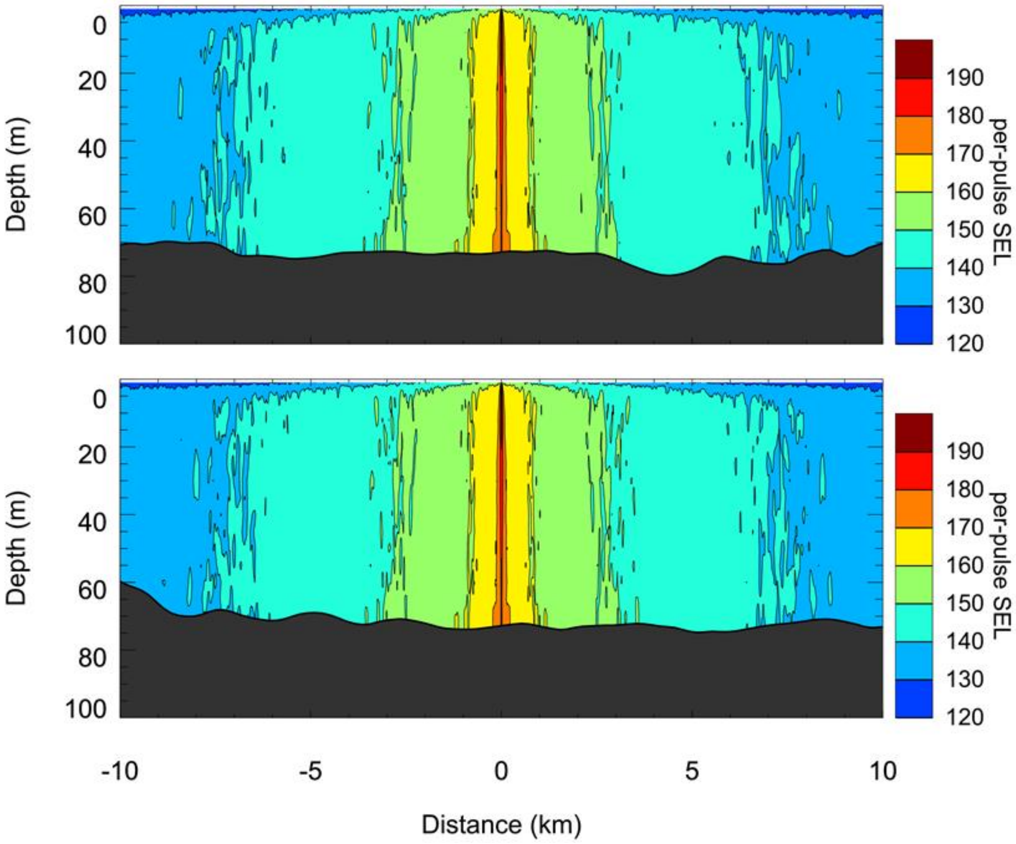

Figure 21. Predicted unweighted per-pulse SEL as vertical slices. Levels are shown in the broadside (top) and endfire directions (bottom). The source depth is 6 m.

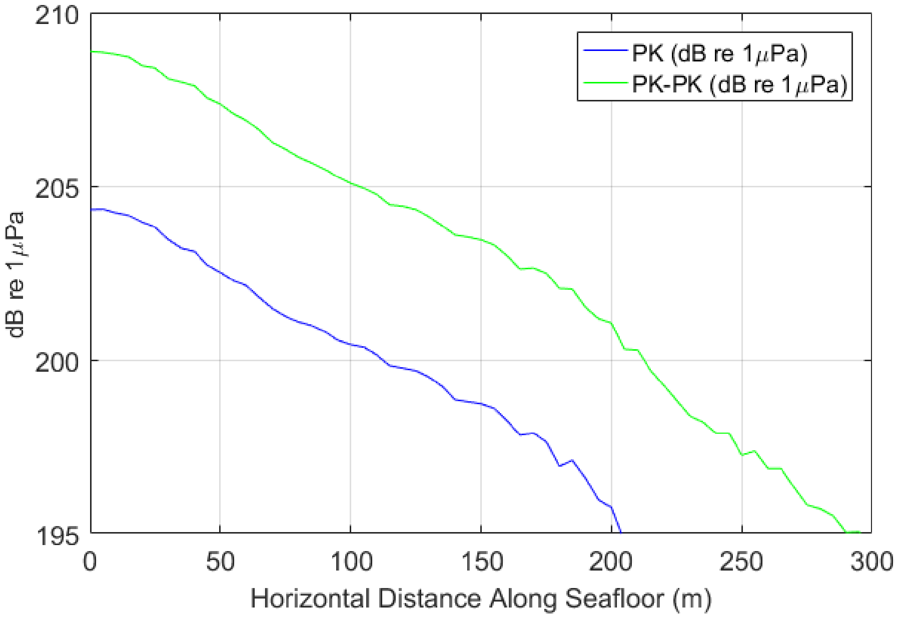

Figure 22. Predicted maximum PK and PK-PK in the endfire direction at the seafloor at Site 5, 72.8 m depth. The source depth is 6 m.

4.3. Accumulated Sound Exposure Levels

4.3.1. Tabulated Results

A cumulative noise study was performed for the four regions, Thylacine Combined, Geographe 3, Artisan, and Block VICP69 Meeki, as indicated in Figure 11. The study involved multiple survey lines with alternating pulses of the boomer and the sub-bottom profiler. Table 23 shows the distances to cumulative SEL thresholds at the seafloor where the accumulation period covers the entire survey.

Table 23. Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) from the survey areas to modelled seafloor cumulative SEL isopleths, and the ensonified area to the specified threshold (in km^2). A dash indicates that the level was not exceeded at the seafloor.

4.3.2. Sound Level Contour Maps

Maps of the accumulated SEL at the seafloor for the combined operations of the boomer and the SBP over the duration of the surveys (described in Section 3.3.2) are shown for the four considered surveys. These are at the Thylacine Combined (Figure 23), Geographe 3 (Figure 24), Artisan (Figure 25) and Block VICP69, Meeki (Figure 26) locations.

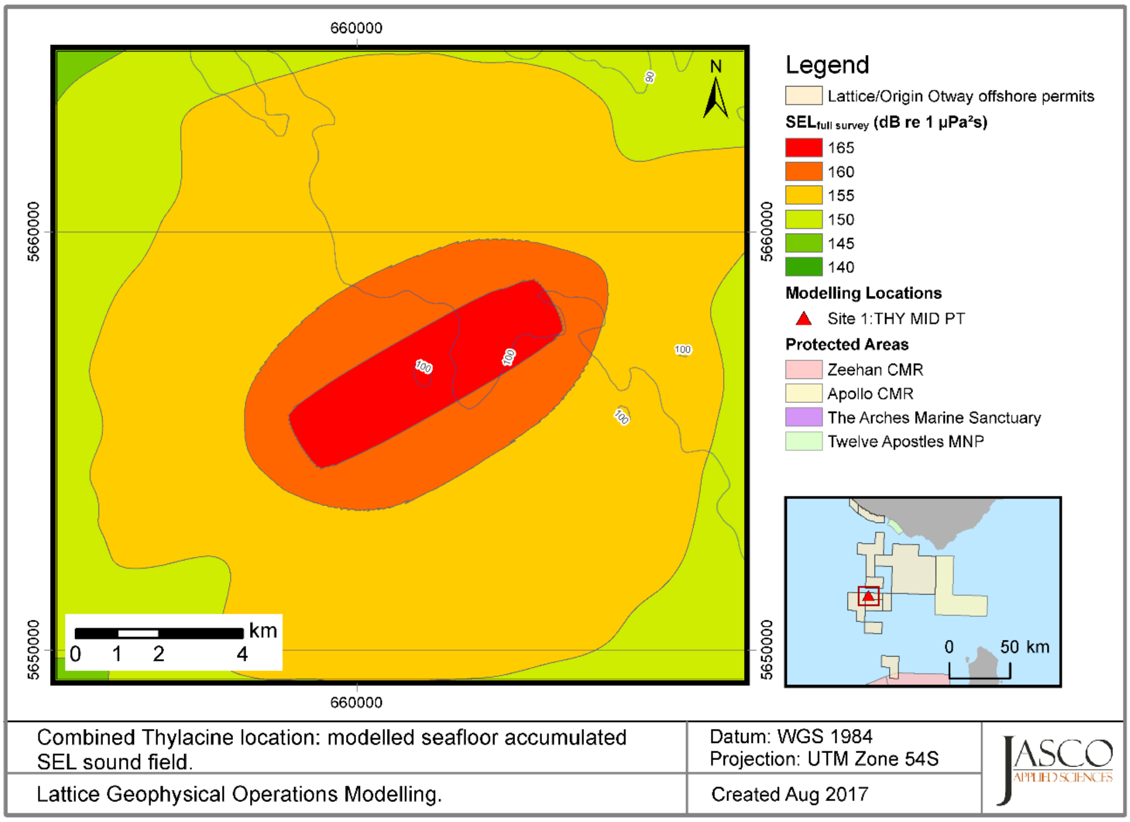

Figure 23. Thylacine Combined location: Sound level contour map of seafloor accumulated SEL over the full survey for the boomer and SBP operations.

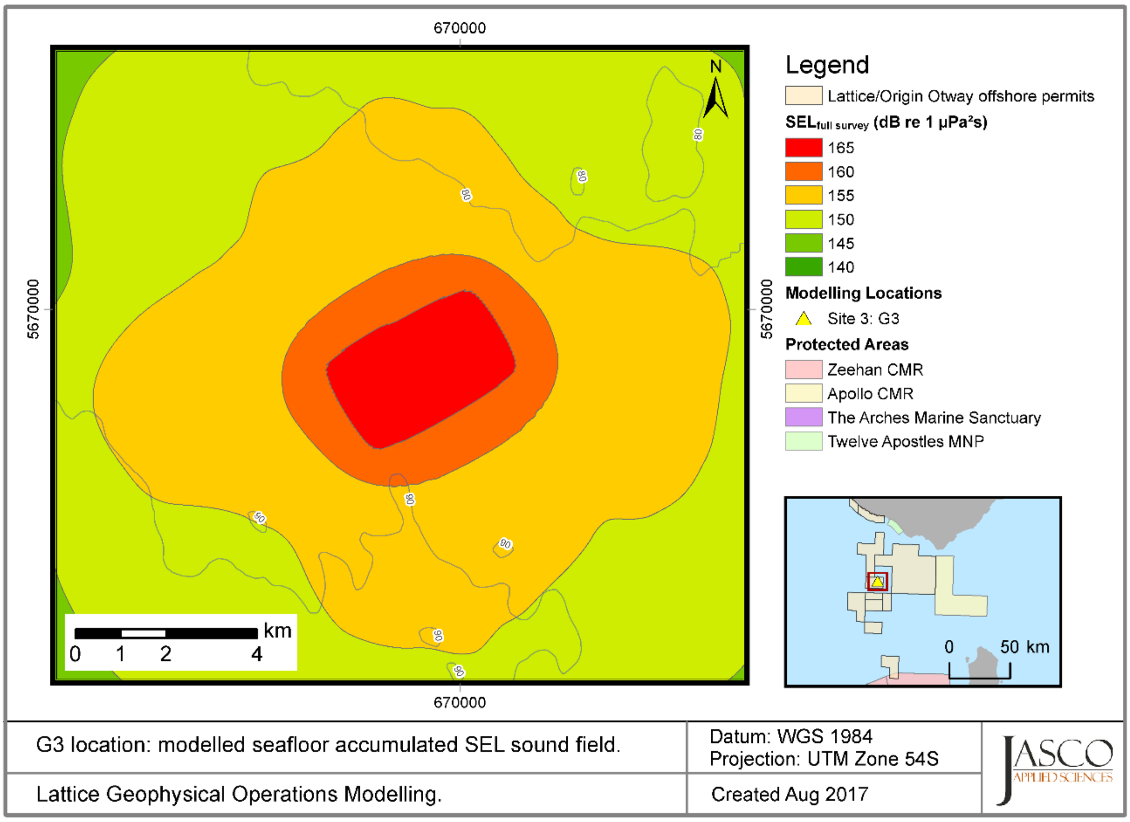

Figure 24. G3 location: Sound level contour map of seafloor accumulated SEL over the full survey for the boomer and SBP operations.

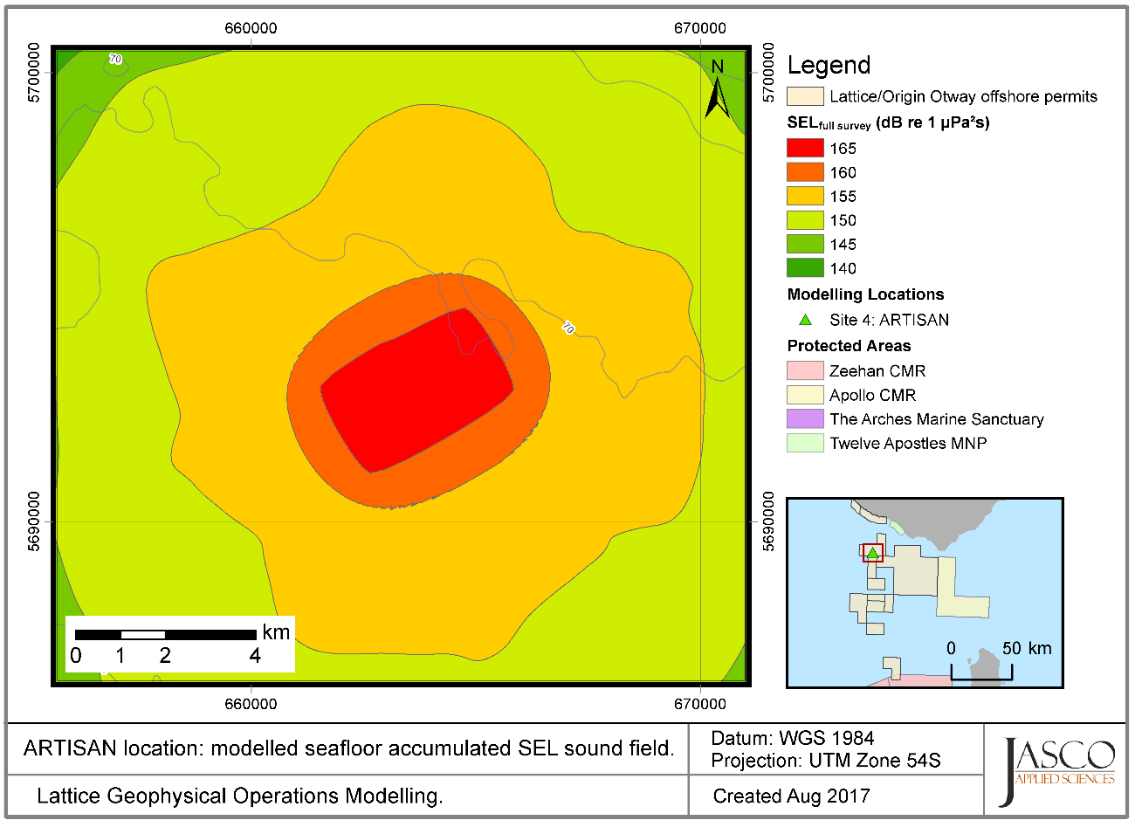

Figure 25. ARTISAN location: Sound level contour map of seafloor accumulated SEL over the full survey for the boomer and SBP operations.

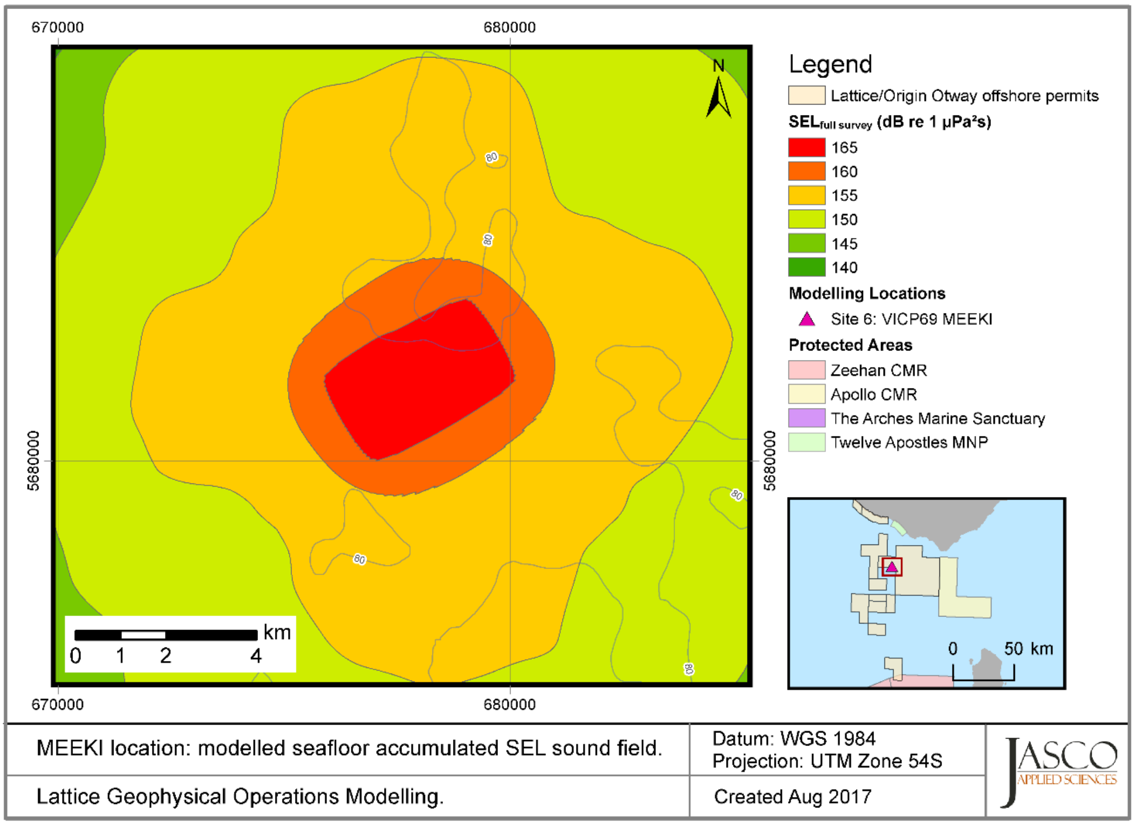

Figure 26. MEEKI location: Sound level contour map of seafloor accumulated SEL over the full survey for the boomer and SBP operations.

5. Discussion and Conclusion

5.1. Overview and source levels

This modelling study predicted underwater sound levels associated with the specified geophysical operations of the VSP, and surveys including boomer and sub-bottom profiler sources. Due to a lack of available literature on source functions for the high-frequency sources, the boomer and the sub-bottom profiler source inputs were determined from a previous JASCO measurement campaign (Sections 3.1.1 and 3.1.2). It was determined that the per-pulse SEL source level of the boomer was 180.0 dB re 1 µPa²·s @ 1 m, and for the sub-bottom profiler it was 171.4 dB re 1 µPa²·s @ 1 m; further metrics for the back propagated source levels are shown in Tables 4 and 5 respectively. The boomer was found to be a relatively broadband source with appreciable energy across the range of 160 Hz to 12.5 kHz (Figure 4). The sub-bottom profiler had the majority of energy at higher frequencies, between 5 kHz and 12.5 kHz.

The 450 in³ VSP was modelled using AASM at a centroid depth of 6 m (Section 3.1.3). The SEL source level of the VSP was 213.7 dB re 1 µPa²·s @ 1 m in the endfire direction, and 213.6 dB re 1 µPa²·s @ 1 m in the broadside direction; further source metrics are shown in Table 7. Most of the acoustic energy is output at lower frequencies, in the tens to hundreds of hertz. Due to the geometry of the array, the VSP is practically an omnidirectional source.

The modelling was performed using a typical September sound speed profile, as the setting most likely to achieve the greatest transmission, such that a precautionary estimation of distances can be made for the surveys (Section D.3.2). The lithography of the regions place Sites 1 & 2 in a region typified by a hard caprock, Sites 3, 4, and 6 in a region with a shallow sand layer over increasingly consolidated calcarenite, and Site 5 with a deeper sand layer over the calcarenite; this is detailed in Section D.3.3. The modelling also accounted for variations in site-specific bathymetry (Section D.3.1)

5.2. Single pulse sound fields

The results for the single pulse sound fields are presented in Section 4.2.

Across all sites, the maximum range for the boomer to exceed the marine mammal behavioural threshold (SPL of 160 dB re 1 µPa) is 145 m (Site 6), and to exceed the turtle behavioural threshold (SPL of 166 dB re 1 µPa) is 36 m, which is consistent across all sites (Table 8). The consistency for the turtle behavioural threshold is due to the levels being reached before influences from the site-dependent environment factors (bathymetry and geoacoustics). The range to the marine mammal behavioural threshold level at Site 2 is significantly shorter than at the other sites; this is due to the greater water depth and consequent lack of constructive noise fields within 150 m horizontally from the source.

The PK-PK ranges for the boomer are shown in Table 11. Due to the high threshold levels, the ranges were calculated assuming an acoustic field that is initially spherically spreading. This is valid where the source can be considered a point source, and there is no influence from reflecting surfaces. Due also to the directionality of the source, the ranges to the thresholds on-axis are going to be significantly greater than those off-axis and thus the vertical ranges from the sources are presented. It is shown that for the triple-plate boomer, the level drops below all relevant isopleths within 11 m of the source. Similar principles apply for PK levels in Table 12; the greatest range to a specified threshold is 1.6 m.

The SBP is a higher-frequency, more directional, and lower energy source than the boomer; consequently, the ranges are consistently lower. Using the generated source levels, the threshold for turtle behaviour is not reached at any horizontal distance from the source, and the marine mammal behavioural threshold is exceeded up to 2 m horizontally from the source (Table 13). Additionally, the ranges to thresholds at the seafloor are accordingly small (Table 15); here it is of note that the 115 and 120 dB re 1 µPa²·s SEL levels are at their greatest ranges at Site 2 due to the greater distance the conical beam may propagate, and thus widen, before reaching the interface.

For the SBP, the PK-PK and PK results were treated in the same way as for the boomer; results are shown for a spherically spreading noise field with the on-axis sound pressure analysed to determine ranges to thresholds. For the identified thresholds of interest for the SBP, the vertical distance does not exceed 1.4 m. In summary, sound fields from the boomer and the SBP do not reach any of the assessed thresholds for benthic crustaceans or fish (Section 2) at the seafloor.

The single pulse results for the VSP operated at Site 5 are shown in Section 4.2.1.3. The source has a significantly higher source level than either the boomer or the sub-bottom profiler. The maximum range to the DEWHA (2008) criterion of 160 dB re 1 µPa²·s SEL is 1.06 km, while the $R_{95\%}$ range is predicted to be 1.03 km. The maximum ranges to the marine mammal and turtle behavioural thresholds of 160 and 166 dB re 1 µPa SPL are 2.56 and 1.55 km respectively. The per-pulse SEL levels at the seafloor were modelled using VSTACK to allow for levels to be determined at high propagation angles. The maximum per-pulse SEL on the seafloor below the array is 181 dB re 1 µPa²·s, therefore the levels from Day et al. (2016b) of 190, 188 and 186 dB re 1 µPa²·s, are not reached at the seafloor.

In the case of the VSP source, PK thresholds of interest are reached at the seafloor and so it was modelled fully with all environmental parameters considered, rather than the spherical spreading approach used for the other two sources. The results show that the lowest isopleth of interest derived from Day et al. (2016b), 209 dB re 1 µPa, is not reached at the seafloor, and the horizontal range along the seafloor to the 202 dB re 1 µPa PK-PK level from Payne et al. (2007) is 185 m. PK metrics relevant to the Popper et al. (2014) criteria for fish are also not reached at the seafloor.

In this modelling study, both the boomer and sub-bottom profiler sources were directed straight down. Consequently, the sound channels constructed as a result of the sound speed profile are unlikely to influence the propagation of sound greatly. It is of note, that if either high-frequency source is directed toward the sea surface then the sound channels are likely to enhance the propagation of these sources. As the VSP is typically a low-frequency source, the fine details in the sound speed profile near the surface are unlikely to influence the propagation.

5.3. Multiple pulse sound fields

The study included modelling to assess the cumulative effect of noise generated for four separate survey areas. The surveys themselves comprise multiple lines along which the boomer and sub-bottom profiler sources are fired alternately. In total, more than 27000 pulses were included for the Thylacine Combined survey over the estimated 51 h of survey, and more than 21000 pulses for each of the other three surveys over the estimated 40.2 h. Sound levels were assessed only at the seafloor with results shown in Table 14. The modelling results show that the SEL at the seafloor did not exceed 170 dB re 1 µPa²·s for any single survey. This is below any of the relevant isopleths for benthic invertebrates, including the 183 dB re 1 µPa²·s 'no effect' accumulated SEL (McCauley and Duncan 2016). Due to the identical sources, and sound speed profiles, and similar depths and geoacoustics, the ranges between the surveys are similar. The greatest ranges are realised for the Thylacine Combined survey; here, the survey is in deeper water than the others as well as featuring the caprock layer that is likely to produce stronger reflections off the sediment layer.

Glossary

3-D
Three-dimensional

1/3-octave-band
Non-overlapping passbands that are one-third of an octave wide (where an octave is a doubling of frequency). Three adjacent 1/3-octave-bands comprise a one octave-band. One-third-octave-bands become wider with increasing frequency. Also see octave.

90% time window
The time interval over which the cumulative energy rises from 5% to 95% of the total pulse energy. This interval contains 90% of the total pulse energy. Symbol: T_{90}.

90% sound pressure level (SPL(T_{90}))
The root-mean-square sound pressure levels calculated over the 90%-energy time window of a pulse. Used only for pulsed sounds.

attenuation
The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

audiogram
A graph of hearing threshold level (sound pressure levels) as a function of frequency, which describes the hearing sensitivity of an animal over its hearing range.

azimuth
A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also called bearing.

bandwidth
The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI/ASA S1.13-2005 R2010).

BIA
Biologically Important Area (http://www.environment.gov.au/marine/marine-species/bias)

broadside direction
Perpendicular to the travel direction of a source. Compare to endfire direction.

cetacean
Any animal in the order Cetacea. These are aquatic, mostly marine mammals and include whales, dolphins, and porpoises.

decibel (dB)
One-tenth of a bel. Unit of level when the base of the logarithm is the tenth root of ten, and the quantities concerned are proportional to power (ANSI S1.1-1994 R2004).

endfire direction
Parallel to the travel direction of a source. Also see broadside direction.

ensonified area
The total area ensonified in conjunction with a specified isopleth.

frequency
The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: *f*. 1 Hz is equal to 1 cycle per second.

functional hearing group
Grouping of marine mammal species with similar estimated hearing ranges. Southall et al. (2007) proposed the following functional hearing groups: low-, mid-, and high-frequency cetaceans, pinnipeds in water, and pinnipeds in air.

geoacoustic
Relating to the acoustic properties of the seafloor.

hearing threshold
The sound pressure level that is barely audible for a given individual in the absence of significant background noise during a specific percentage of experimental trials.

hertz (Hz)
A unit of frequency defined as one cycle per second.

high-frequency cetacean
The functional hearing group that represents odontocetes specialised for using high frequencies.

impulsive sound
Sound that is typically brief and intermittent with rapid (within a few seconds) rise time and decay back to ambient levels (NOAA 2013, ANSI S12.7-1986 R2006). For example, seismic airguns and impact pile driving.

low-frequency cetacean
The functional hearing group that represents mysticetes (baleen whales).

maximum-over-depth (MOD)
The maximum value over all modelled depths above the sea floor.

mid-frequency cetacean
The functional hearing group that represents some odontocetes (dolphins, toothed whales, beaked whales, and bottlenose whales).

mysticete
Mysticeti, a suborder of cetaceans, use their baleen plates, rather than teeth, to filter food from water. They are not known to echolocate, but use sound for communication. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and the grey whale (*Eschrichtius robustus*).

non-impulsive sound
Sound that is broadband, narrowband or tonal, brief or prolonged, continuous or intermittent, and typically does not have a high peak pressure with rapid rise time (typically only small fluctuations in decibel level) that impulsive signals have (ANSI/ASA S3.20-1995 R2008). Marine vessels, aircraft, machinery, construction, and vibratory pile driving are examples.

octave
The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

odontocete
The presence of teeth, rather than baleen, characterises these whales. Members of the Odontoceti are a suborder of cetaceans, a group comprised of whales, dolphins, and porpoises. The toothed whales' skulls are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

parabolic equation method
A computationally-efficient solution to the acoustic wave equation that is used to model transmission loss. The parabolic equation approximation omits effects of back-scattered sound, simplifying the computation of transmission loss. The effect of back-scattered sound is negligible for most ocean-acoustic propagation problems.

peak sound pressure level (PK)
The maximum instantaneous sound pressure level, in a stated frequency band, within a stated period. Also called zero-to-peak sound pressure level. Unit: dB re 1 µPa

permanent threshold shift (PTS)
A permanent loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

pinniped
A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source
A source that radiates sound as if from a single point (ANSI S1.1-1994 R2004).

power spectrum density
The acoustic signal power per unit frequency as measured at a single frequency. Unit: µPa^2/Hz, or µPa^2·s.

power spectrum density level
The decibel level ($10\log_{10}$) of the power spectrum density, usually presented in 1 Hz bins. Unit: dB re 1 µPa^2/Hz.

pressure, acoustic
The deviation from the ambient hydrostatic pressure caused by a sound wave. Also called overpressure. Unit: pascal (Pa). Symbol: p.

pulsed sound
Discrete sounds with durations less than a few seconds. Sounds with longer durations are called continuous sounds.

received level
The sound level measured at a receiver.

signature
Pressure signal generated by a source.

sound
A time-varying pressure disturbance generated by mechanical vibration waves travelling through a fluid medium such as air or water.

sound exposure
Time integral of squared, instantaneous frequency-weighted sound pressure over a stated time interval or event. Unit: pascal-squared second (Pa^2·s) (ANSI S1.1-1994 R2004).

sound exposure level (SEL)
A measure related to the sound energy in one or more pulses. Unit: dB re 1 µPa^2·s.

sound field
Region containing sound waves (ANSI S1.1-1994 R2004).

sound pressure level (SPL)
The decibel ratio of the time-mean-square sound pressure, in a stated frequency band, to the square of the reference sound pressure (ANSI S1.1-1994 R2004).

For sound in water, the reference sound pressure is one micropascal (p_0 = 1 µPa) and the unit for SPL is dB re 1 µPa:

$$\mathrm{SPL} = 10\log_{10}\left(p^2/p_0^2\right) = 20\log_{10}\left(p/p_0\right)$$

Unless otherwise stated, SPL refers to the root-mean-square sound pressure level Unit: dB re 1 µPa.

sound speed profile
The speed of sound in the water column as a function of depth below the water surface.

source level (SL)
The sound pressure level or sound exposure level measured 1 metre from a theoretical point source that radiates the same total sound power as the actual source. Unit: dB re 1 µPa @ 1 m or dB re 1 µPa^2·s.

spectrum
An acoustic signal represented in terms of its power (or energy) distribution versus frequency.

SBP
Sub-bottom profiler.

temporary threshold shift (TTS)
Temporary loss of hearing sensitivity caused by excessive noise exposure.

transmission loss (TL)
Also called propagation loss, this refers to the decibel reduction in sound level between two stated points that results from sound spreading away from an acoustic source subject to the influence of the surrounding environment.

VSP
Vertical Seismic Profiler.

wavelength
Distance over which a wave completes one oscillation cycle. Unit: meter (m). Symbol: λ.

Appendix A. Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of $p_0 = 1$ µPa. Because the perceived loudness of sound, especially impulsive noise such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate noise and its effects on marine life. We provide specific definitions of relevant metrics used in the accompanying report. Where possible we follow the ANSI and ISO standard definitions and symbols for sound metrics, but these standards are not always consistent.

The zero-to-peak sound pressure level, or peak sound pressure level (PK; dB re 1 µPa), is the maximum instantaneous sound pressure level in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$L_{p,pk} = 20 \log_{10} \left[\frac{\max(|p(t)|)}{p_0} \right] \tag{A-1}$$

$L_{p,pk}$ is often included as a criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of a noise event, it is generally a poor indicator of perceived loudness.

The root-mean-square (rms) sound pressure level (SPL; dB re 1 µPa) is the rms pressure level in a stated frequency band over a specified time window (T, s) containing the acoustic event of interest. It is important to note that SPL always refers to an rms pressure level and, therefore, not instantaneous pressure:

$$L_p = 10 \log_{10} \left(\frac{1}{T} \int_T p^2(t) dt \Big/ p_0^2 \right) \tag{A-2}$$

The SPL represents a nominal effective continuous sound over the duration of an acoustic event, such as the emission of one acoustic pulse, a marine mammal vocalisation, the passage of a vessel, or over a fixed duration. Because the window length, T, is the divisor, events with similar sound exposure level (SEL) but more spread out in time have a lower SPL. Throughout this study, a fixed time window of 125 ms is used as the integration period.

The sound exposure level (SEL, dB re 1 µPa²·s) is a measure related to the acoustic energy contained in one or more acoustic events (N). The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T):

$$L_E = 10 \log_{10} \left(\int_T p^2(t) dt \Big/ T_0 p_0^2 \right) \tag{A-3}$$

where T_0 is a reference time interval of 1 s. The SEL continues to increase with time when non-zero pressure signals are present. It therefore can be construed as a dose-type measurement so the integration time used must be carefully considered in terms of relevance for impact to the exposed recipients.

SEL can be calculated over periods with multiple acoustic events or over a fixed duration. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10 \log_{10} \left(\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \right) \tag{A-4}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of M-weighted SEL (e.g., $\mathrm{SEL}_{\mathrm{LFC,24h}}$). The use of fast, slow, or impulse exponential-time-averaging, or other time-related characteristics should else be specified.

Because the SPL and SEL are both computed from the integral of square pressure, these metrics are related by a simple expression, which depends only on the duration of the 90% energy time window T_{90}:

$$L_E = L_{p90} + 10\log_{10}(T_{90}) + 0.458 \tag{A-5}$$

where the 0.458 dB factor accounts for the SPL containing 90% of the total energy from the per-pulse SEL.

Appendix B. Acoustic Source Modelling

B.1. Transducer Beam Theory

Mid- and high-frequency underwater acoustic sources for geophysical measurements create an oscillatory overpressure through rapid vibration of a surface, using either electromagnetic forces or the piezoelectric effect of materials. A vibratory source based on the piezoelectric effect is commonly referred to as a transducer, and may be capable of receiving as well as emitting signals. Transducers are usually designed to produce an acoustic wave of a specific frequency, often in a highly directive beam. The directional capability increases with increasing operating frequency. The main parameter characterizing directivity is the beamwidth, defined as the angle subtended by diametrically opposite "half power" (-3 dB) points of the main lobe (Massa 2003). For different transducers, the beamwidth varies from 180° (almost omnidirectional) to a few degrees.

Transducers are usually built with either circular or rectangular active surfaces. For circular transducers, the beam pattern in the horizontal plane (assuming a downward pointing main beam) is equal in all directions. The beam pattern of a rectangular transducer is variable with the azimuth in the horizontal plane.

The acoustic radiation pattern, or beam pattern, of a transducer is the relative measure of acoustic transmitting or receiving power as a function of spatial angle. Directionality is generally measured in decibels relative to the maximum radiation level along the central axis perpendicular to the transducer surface. The pattern is defined largely by the operating frequency of the device and the size and shape of the transducer. Beam patterns generally consist of a main lobe, extending along the central axis of the transducer, and multiple secondary lobes separated by nulls. The width of the main lobe depends on the size of the active surface relative to the sound wavelength in the medium. Larger transducers produce narrower beams. Figure B-1 shows a 3-dimensional (3-D) visualisation of a typical beam pattern for a circular transducer.

The true beam pattern of a transducer can be obtained only by in situ measurement of the emitted energy around the device. Such data, however, are not always available, and for propagation modelling it is often sufficient to estimate the beam pattern of the source based on transducer beam theory. An example of a measured beam pattern is shown in Figure B-2.

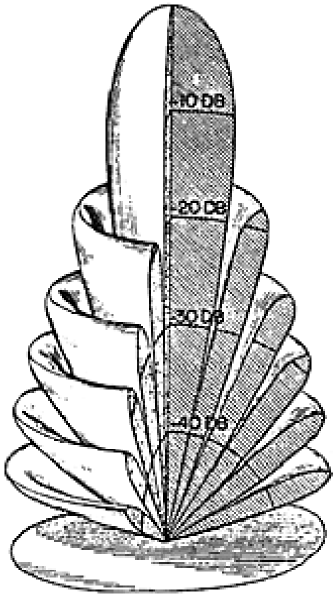

Figure B-1. Typical 3-D beam pattern for a circular transducer (Massa 2003).

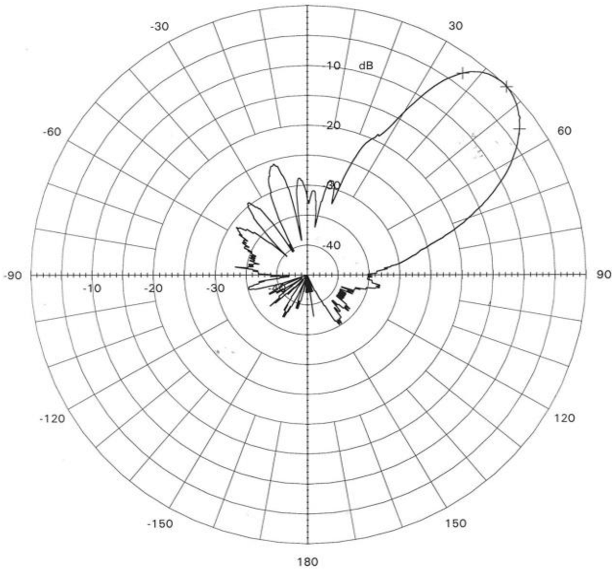

Figure B-2. Vertical cross section of a beam pattern measured in situ from a transducer used by Kongsberg (source: Zykov (2013)).

B.2. Circular Transducers

The beam of an ideal circular transducer is symmetrical about the main axis; the radiated level depends only on the depression angle. In this study, beam directivities were calculated from the standard formula for the beam pattern of a circular transducer (Kinsler et al. 1950, [ITC] International Transducer Corporation 1993). The directivity function of a conical beam relative to the on-axis pressure amplitude is:

$$R(\phi) = \frac{2 \cdot J_1\left(\pi D_\lambda \sin(\phi)\right)}{\pi D_\lambda \sin(\phi)} \text{ and } D_\lambda = \frac{60}{\theta_{bw}}, \qquad (1)$$

where J_1 is the first-order Bessel function, D_λ is the transducer dimension in wavelengths of sound in the medium, θ_{bw} is the beamwidth in degrees, and ϕ is the beam angle from the transducer axis. The beam pattern of a circular transducer can be calculated from the transducer's specified beamwidth or from the diameter of the active surface and the operating frequency. The calculated beam pattern for a circular transducer with a beamwidth of 20° is shown in Figure B-3. The grayscale represents the source level (dB re 1 µPa @ 1 m) and the declination angle is relative to a central vector (0°, 0°) pointing down.

Although some acoustic energy is emitted at the back of the transducer, the theory accounts for the beam power in only the front half-space ($\phi < 90°$) and assumes no energy directed into the back half-space. The relative power at these rearward angles is significantly lower, generally by more than 30 dB, and consequently the emission in the back half-space can be estimated by applying a simple decay rate, in decibels per angular degree, which gives a beam power at $\phi = 90°$ of 30 dB less than that at $\phi = 0°$. This is a conservative estimate of the beam power in the back half-space.

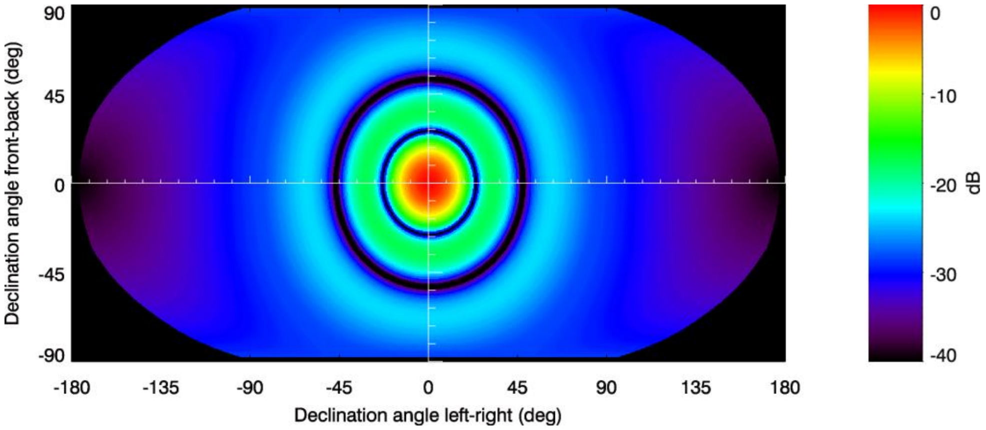

Figure B-3. Calculated beam pattern for a circular transducer with a beamwidth of 20°. The beam power function is shown relative to the on-axis level using the Robinson projection.

B.3. VSP Modelling

The source levels and directivity of the airgun array were predicted with JASCO's Airgun Array Source Model (AASM). AASM includes low- and high-frequency modules for predicting different components of the airgun array spectrum. The low-frequency module is based on the physics of oscillation and radiation of airgun bubbles, as originally described by Ziolkowski (1970), that solves the set of parallel differential equations that govern bubble oscillations. Physical effects accounted for in the simulation include pressure interactions between airguns, port throttling, bubble damping, and generator-injector (GI) gun behaviour discussed by Dragoset (1984), Laws et al. (1990), and Landro (1992). A global optimisation algorithm tunes free parameters in the model to a large library of airgun source signatures.

Whilst airgun signatures are highly repeatable at the low frequencies, which are used for seismic imaging, their sound emissions have a large random component at higher frequencies that cannot be predicted deterministically. Therefore, the high-frequency module of AASM uses a stochastic simulation to predict the sound emissions of individual airguns above 800 Hz, using a multivariate statistical model. The current version of AASM has been tuned to fit a large library of high quality seismic source signature data obtained from the Joint Industry Program (JIP) on Sound and Marine Life (Mattsson and Jenkerson 2008). The stochastic model uses a Monte-Carlo simulation of the random component of the high-frequency spectrum of each airgun in an array. The mean high-frequency spectra from the stochastic model augment the low-frequency signatures from the physical model, allowing AASM to predict airgun source levels at frequencies up to 25,000 Hz.

AASM produces a set of “notional” signatures for each array element based on:

- Array layout
- Volume, tow depth, and firing pressure of each airgun
- Interactions between different airguns in the array

These notional signatures are the pressure waveforms of the individual airguns at a standard reference distance of 1 m; they account for the interactions with the other airguns in the array. The signatures are summed with the appropriate phase delays to obtain the far-field source signature of the entire array in all directions. This far-field array signature is filtered into 1/3-octave-bands to compute the source levels of the array as a function of frequency band and azimuthal angle in the horizontal plane (at the source depth), after which it is considered to be a directional point source in the far field.

A seismic array consists of many sources and the point-source assumption is invalid in the near field where the array elements add incoherently. The maximum extent of the near field of an array (R_{nf}) is:

$$R_{\mathrm{nf}} < \frac{l^2}{4\lambda} \tag{B-2}$$

where λ is the sound wavelength and *l* is the longest dimension of the array (Lurton 2002, §5.2.4). For example, an airgun array length of $l = 21$ m yields a near-field range of 147 m at 2 kHz and 7 m at 100 Hz. Beyond this R_{nf} range, the array is assumed to radiate like a directional point source and is treated as such for propagation modelling.

The interactions between individual elements of the array create directionality in the overall acoustic emission. Generally, this directionality is prominent mainly at frequencies in the mid-range between tens of hertz to several hundred hertz. At lower frequencies, with acoustic wavelengths much larger than the inter-airgun separation distances, the directionality is small. At higher frequencies, the pattern of lobes is too finely spaced to be resolved and the effective directivity is less.

B.4. VSP Acoustic Source Levels and Directivity Results

Figure B-4 shows the broadside (perpendicular to the tow direction), endfire (parallel to the tow direction), and vertical overpressure signatures and corresponding power spectrum levels for the 3090 in^3 array. The signatures consist of a strong primary peak, related to the initial release of high-pressure air, followed by a series of pulses associated with bubble oscillations. Most energy is produced at frequencies below 200 Hz. Frequency-dependent peaks and nulls in the spectrum result from interference among airguns in the array, and correspond with the volumes and relative locations of the airguns to each other.

Horizontal 1/3-octave-band source levels are shown as a function of band centre frequency and azimuth (Figure B-5); directivity in the sound field is most noticeable at mid-frequencies as described in the model detail in Appendix B.3.

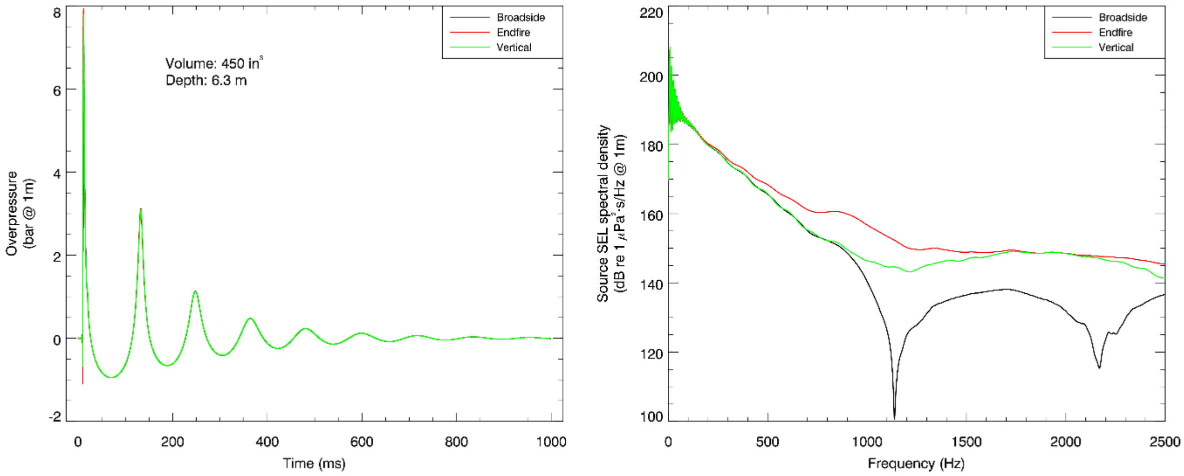

Figure B-4. Predicted source level details for the 450 in^3 VSP array operated at a centroid depth of 6 m. (Left) the overpressure signature and (right) the power spectrum for broadside (perpendicular to tow direction) and endfire (directly aft of the array) directions, and for vertically down.

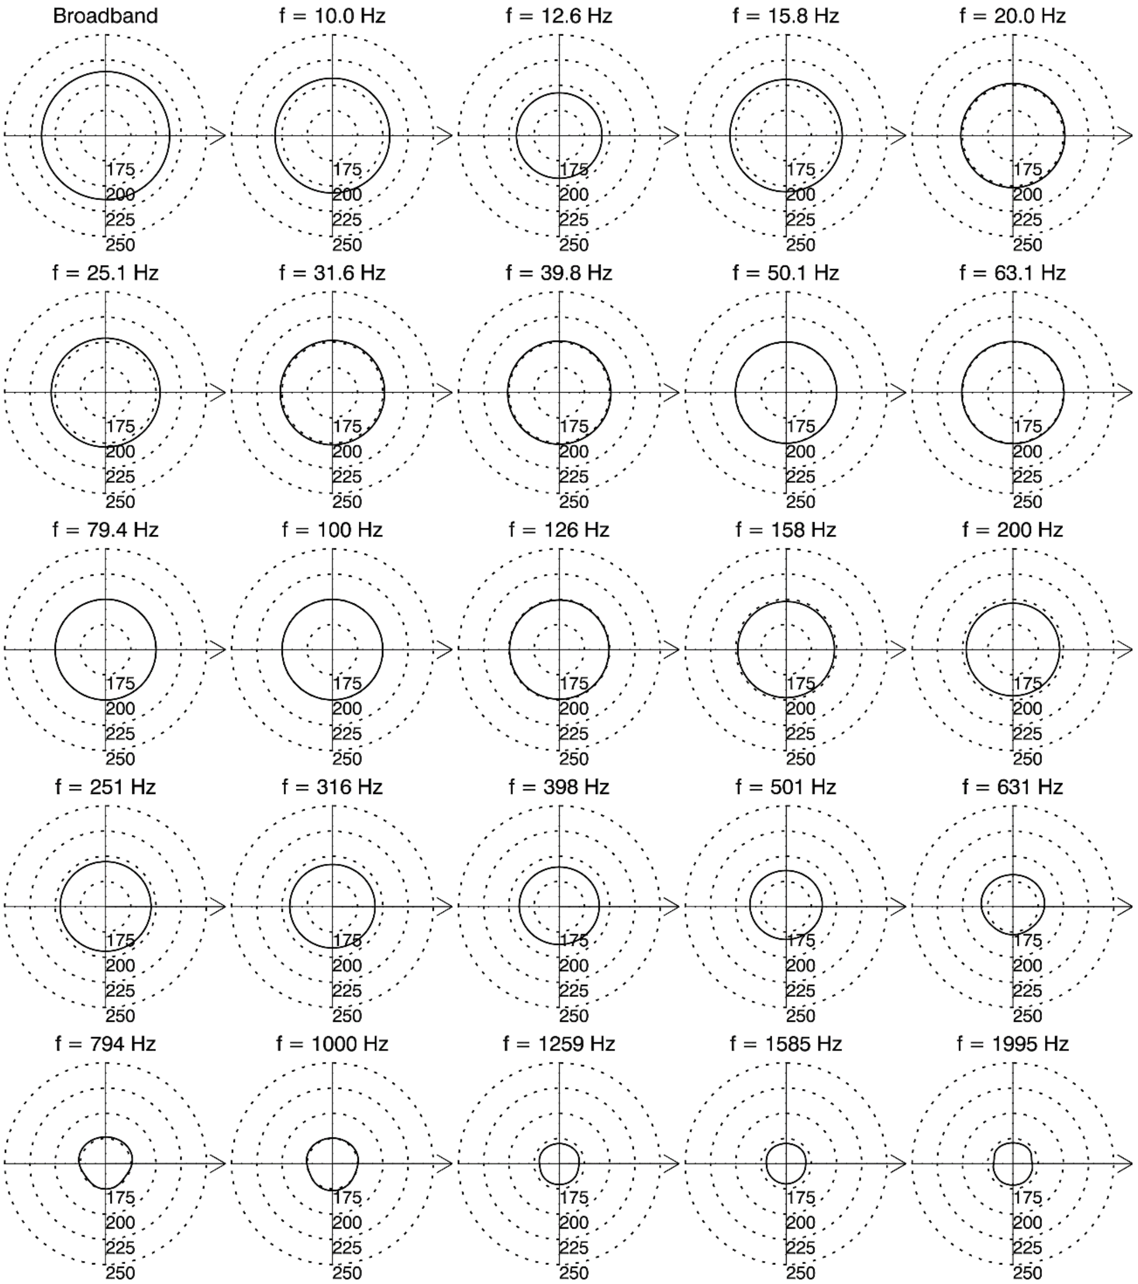

Broadband f = 10.0 Hz f = 12.6 Hz f = 15.8 Hz f = 20.0 Hz f = 25.1 Hz f = 31.6 Hz f = 39.8 Hz f = 50.1 Hz f = 63.1 Hz f = 79.4 Hz f = 100 Hz f = 126 Hz f = 158 Hz f = 200 Hz f = 251 Hz f = 316 Hz f = 398 Hz f = 501 Hz f = 631 Hz f = 794 Hz f = 1000 Hz f = 1259 Hz f = 1585 Hz f = 1995 Hz

Figure B-5. Directionality of the predicted horizontal source levels for the 450 in^3 array, 5–2000 Hz. Source levels (in dB re 1 µPa^2·s) are shown as a function of azimuth for the centre frequencies of the 1/3-octave-bands modelled; frequencies are shown above the plots. Tow direction is to the right. Operating depth is 6 m (see Section 3.1.3).

Appendix C. Sound Propagation Models

C.1. MONM-BELLHOP

Underwater sound propagation (i.e., transmission loss) was predicted with JASCO's Marine Operations Noise Model (MONM). This model computes sound propagation at frequencies of 5 Hz to 1.25 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the U.S. Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies > 1.25 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

This version of MONM accounts for sound attenuation due to energy absorption through ion relaxation and viscosity of water in addition to acoustic attenuation due to reflection at the medium boundaries and internal layers (Fisher and Simmons 1977). The former type of sound attenuation is significant for frequencies higher than 5 kHz and cannot be neglected without noticeably affecting the model results.

MONM computes acoustic fields in three dimensions by modelling transmission loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding $N = 360°/\Delta\theta$ number of planes (Figure C-1).

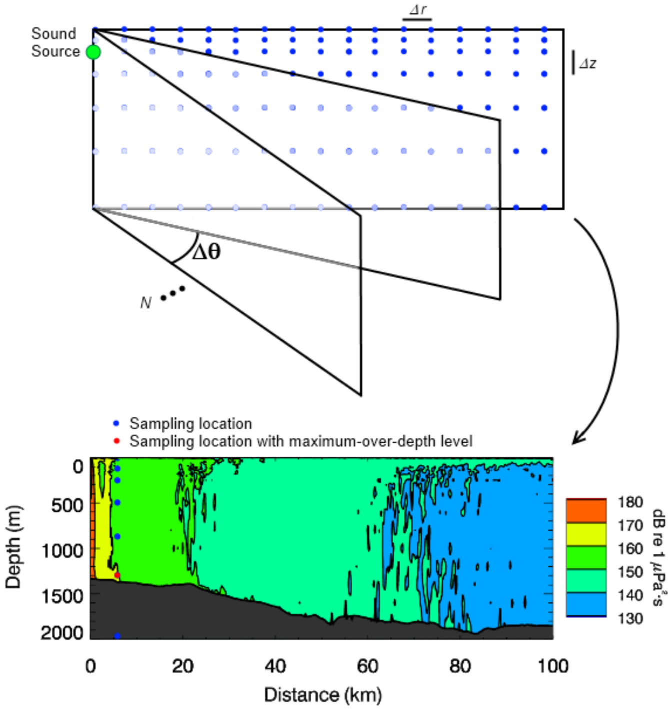

Figure C-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic transmission loss at the centre frequencies of 1/3-octave-bands. Sufficiently many 1/3-octave-bands, starting at 10 Hz, are modelled to include most acoustic energy emitted by the source. At each centre frequency, the transmission loss is modelled within each of the N vertical planes as a function of depth and range from the source.

The 1/3-octave-band received per-pulse SELs are computed by subtracting the band transmission loss values from the directional source level in that frequency band. Composite broadband received SELs are then computed by summing the received 1/3-octave-band levels.

The received per-pulse SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. For areas with deep water, sampling is not performed at depths beyond those reachable by marine mammals. The received per-pulse SEL at a surface sampling receiver location is taken as the maximum value that occurs over all samples within the water column, i.e., the maximum-over-depth received per-pulse SEL. These maximum-over-depth per-pulse SELs are presented as colour contours around the source.

MONM's predictions have been validated against experimental data from several underwater acoustic measurement programs conducted by JASCO (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Martin et al. 2015).

C.2. FWRAM

For impulsive sounds from the seismic array, time-domain representations of the pressure waves generated in the water are required to calculate SPL and peak pressure level. Furthermore, the airgun array must be represented as a distributed source to accurately characterise vertical directivity effects in the near-field zone. For this study, synthetic pressure waveforms were computed using FWRAM, which is a time-domain acoustic model based on the same wide-angle parabolic equation (PE) algorithm as MONM. FWRAM computes synthetic pressure waveforms versus range and depth for range-varying marine acoustic environments, and it takes the same environmental inputs as MONM (bathymetry, water sound speed profile, and seafloor geoacoustic profile). Unlike MONM, FWRAM computes pressure waveforms via Fourier synthesis of the modelled acoustic transfer function in closely spaced frequency bands. FWRAM employs the array starter method to accurately model sound propagation from a spatially distributed source (MacGillivray and Chapman 2012).

Besides providing direct calculations of the peak pressure level and SPL, the synthetic waveforms from FWRAM can also be used to convert the SEL values from MONM to SPL.

C.3. Wavenumber Integration Model

Sound pressure levels near the airgun array were modelled using JASCO's VSTACK wavenumber integration model. VSTACK computes synthetic pressure waveforms versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solving the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. The output of the model can be post-processed to yield estimates of the SEL, SPL, and PK.

VSTACK accurately predicts steep-angle propagation in the proximity of the source, but is computationally slow at predicting sound pressures at large distances due to the need for smaller wavenumber steps with increasing distance. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. VSTACK is thus best suited to modelling the sound field near the source.

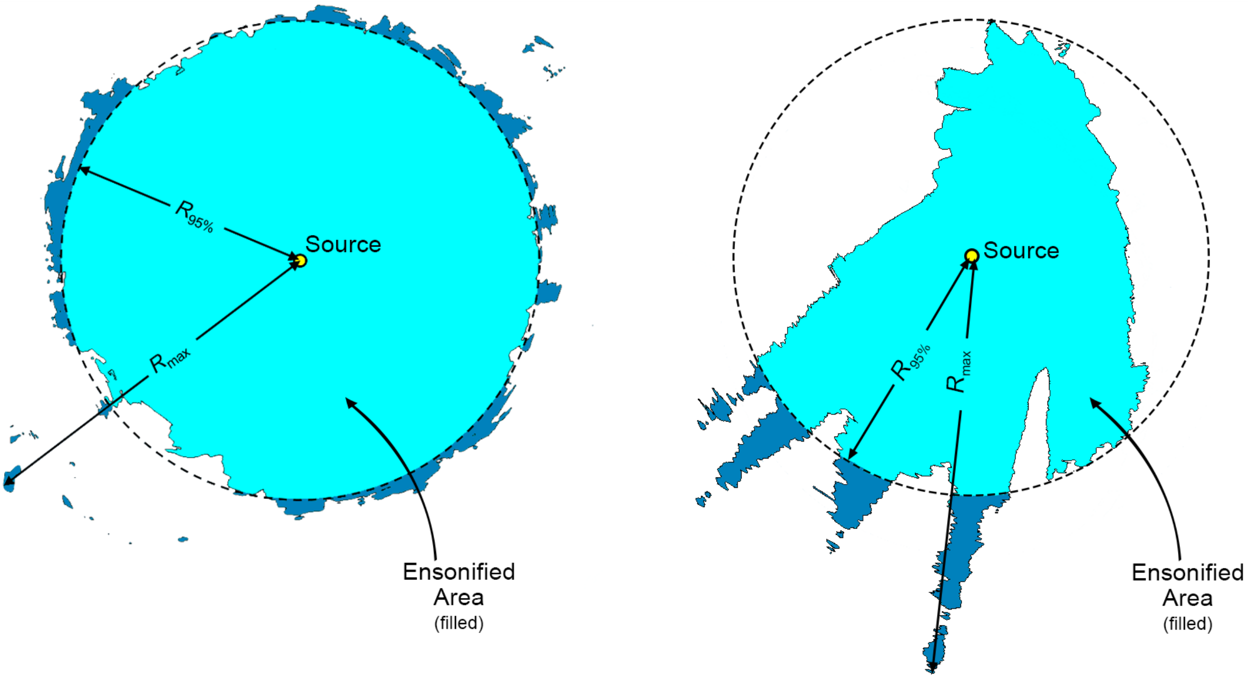
Appendix D. Methods and Parameters

This section describes the specifications of the airgun array source that was used at all sites and the environmental parameters used in the propagation models.

D.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) $R_{\max}$, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure D-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure D-1(a). In cases such as this, where relatively few points are excluded in any given direction, $R_{\max}$ can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure D-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases $R_{\max}$ might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between $R_{\max}$ and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.



(a) (b)

Figure D-1. Sample areas ensonified to an arbitrary sound level with $R_{\max}$ and $R_{95\%}$ ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine $R_{\max}$.

D.2. Estimating SPL from Modelled SEL Results

The SEL of individual sound pulses is an energy-like metric related to the dose of sound received over the pulse's duration. The SPL on the other hand is related to the pulses intensity over a specified time interval (Appendix A). The time interval applied in this report is fixed at 125 ms.

Seismic pulses typically lengthen in duration as they propagate away from their source due to seafloor and surface reflections and other waveguide dispersion effects. The changes in pulse length affect the numeric relationship between SPL and SEL because the amount of pulse energy within the specified time interval changes. Full-waveform modelling is necessary to estimate SPL, but this type of modelling is computationally intensive and can be prohibitively time consuming when run at high spatial resolution over large areas.

The current study, modelled synthetic seismic pulses from 5–1024 Hz with FWRAM (Appendix C.2).

FWRAM uses Fourier synthesis to recreate the signal in the time domain so that both the SEL and SPL can be calculated from the propagated signal. SPL was calculated using a 125 ms fixed time window positioned to maximise the SPL over the pulse duration. The difference between the SEL and SPL was extracted for all ranges and depths corresponded to those generated in the high spatial-resolution MONM results. The resulting SEL-to-SPL offsets were then averaged in 0.5 km range bins. The final range-dependent conversion function for each site correspond to the 90th percentile curve derived from the SEL-to-SPL offsets along all radials at that site. These range-dependent conversion functions were applied to predicted per-pulse SEL results from MONM and BELLHOP to model SPLs. The range-dependent conversion function for the VSP at Site 5 is shown in Figure D-2.

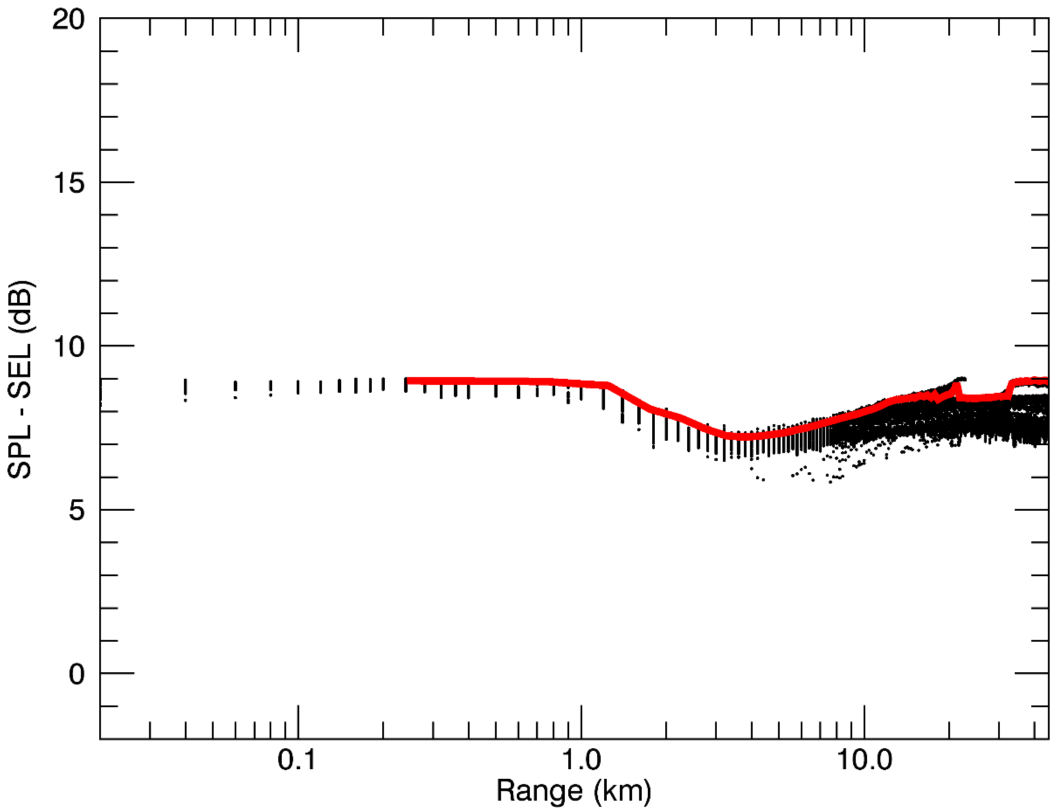


Figure D-2. Conversion Factor applied: Range-dependent conversion function for converting single-pulse SEL to SPL for the 450 in^3 VSP array.

D.3. Environmental Parameters

D.3.1. Bathymetry

Water depths throughout the modelled area were supplied by the client. The bathymetric data was re-gridded onto a Cartesian grid with a regular grid spacing of 50 × 50 m; this grid was used for all modelled sites in this study.

D.3.2. Sound speed profile

The sound speed profiles for the modelled sites were derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office's *Generalized Digital Environmental Model V 3.0* (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The temperature and salinity profiles were converted to sound speed profiles according to the equations of Coppens (1981).

The sound speed profiles across the year were calculated across the area encompassing all sites, with the median sound speed at each depth retained for comparison. It was found that the sound speed profile for September provided the greatest propagation and is consequently used for the modelling. Since the profiles did not extend to the maximum water depth in the modelling area, they were supplemented with a deeper nearby offshore profile.

The final profile features a sound channel at 70 m, as well as a surface duct that may allow for enhanced high frequency propagation. Due to the bathymetry of the modelling region, most propagation is within the top two-hundred metres. At greater depths, the profile is downwardly refracting until 1300 m depth. The sound speed profile used throughout the modelling is shown in Figure D-3.

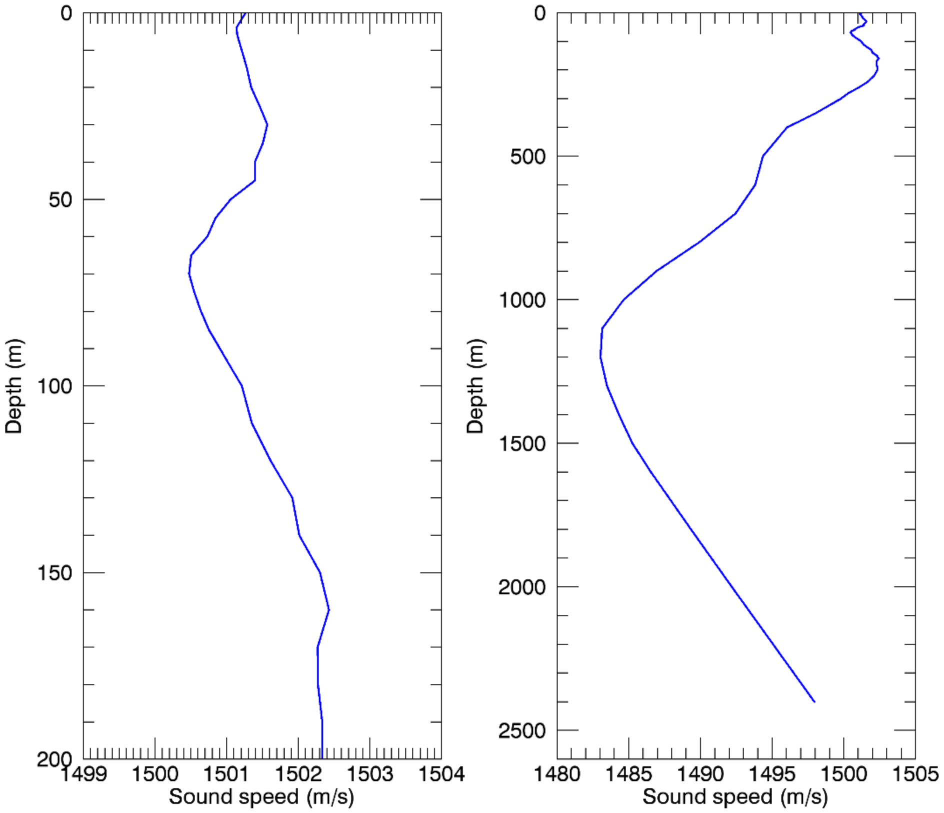

Figure D-3. The sound speed profile for September across the modelling region for the first 200 m (left), and over the entire range of depths (right). The profile was calculated from temperature and salinity profiles from GDEM V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

D.3.3. Geoacoustics

Each of the models used in this study utilise a single geoacoustic profile for each site. The geoacoustics determine how sound is reflected from the seabed, as well as how it is coupled into the sediment layers. The geoacoustic description for Site 5 are taken from a ground truthing report due to its proximity to the location (Duncan 2017). The geoacoustic profiles for the other sites were generated using lithographic descriptions from the geotechnical reports supplied by the client. Sites 1 and 2 located towards the south of the region were found typically to feature a well-cemented calcarenite caprock over a softer calcarenite layer. Sites 3, 4, and 6 typically exhibited a sand layer that sat above increasingly cemented calcarenite. In all cases, the calcarenite layer was found to extend to many hundreds of metres below the seafloor.

Geoacoustic values for Calcarenite have been taken from Duncan et al. 2013; where the calarenite is indicated to be increasingly consolidated with depth, the properties have been linearly interpolated. The geoacoustic parameters for sand are generated using models proposed by Hamilton (Hamilton 1980). The three final geoacoutics profiles used for the modelling are presented in Tables D-1 to D-3.

Table D-1. Geoacoustic profile used as the input to the models at Sites 1 & 2.

Depth below seafloor (m)	**Material**	**Density (g/cm³)**	**P-wave speed (m/s)**	**P-wave attenuation (dB/λ)**	**S-wave speed (m/s)**	**S-wave attenuation (dB/λ)**

Appendix J Sound Modelling Report – Wood and McPherson 2019

Technical Note

Supplemental modelling results for *Otway Basin Geophysical Operations Acoustic Modelling: Acoustic Modelling for Assessing Marine Fauna Sound Exposures*

From: Michael Wood and Craig McPherson
JASCO Applied Sciences (Australia) Pty Ltd

Date: 02 April 2019

Document: 01777

This technical note provides additional modelling results that supplement the original report: *Otway Basin Geophysical Operations Acoustic Modelling: Acoustic Modelling for Assessing Marine Fauna Sound Exposures* (McPherson and Wood 2017).

Tabulated ranges are provided to impact thresholds defined by NMFS (2018) for cetaceans and pinnipeds from operations involving the boomer and sub-bottom profiler (SBP) sound sources, and from the 450 in³ vertical seismic profiling (VSP) array.

The sound exposure level (SEL) results for the different auditory classes of marine mammal are frequency-weighted in accordance with NMFS (2018); the weighting functions are described in Appendix A; peak pressure levels (PK) are unweighted.

Results are presented for the Boomer and SBP in Section 1, and for the VSP in Section 2, while Section 3 discusses potential alternative sources for the study.

1. Boomer and SBP

1.1. Impact ranges from PK for high-frequency cetaceans

The ranges to identified impact thresholds for high-frequency cetaceans from the PK levels of the Boomer and SBP are shown in Table 1. The threshold levels for the equivalent effect in low- and mid-frequency cetaceans are appreciably higher, and thus were not reached.

Table 1. Maximum ranges to identified impact thresholds due to PK levels defined by NMFS for high-frequency cetaceans from SBP and Boomer operations.

PK Threshold Level dB re 1 µPa	Effect	SBP Range (m)	Boomer AP3000 Range (m)
202	PTS	0.6	2.8
196	TTS	1.2	5.5

1.2. Maximum ranges to impact thresholds from SEL_{24h} for marine mammals

The ranges to recommended impact thresholds from the Boomer and SBP are presented in Table 2. In all cases, the frequency-weighted levels are not high enough to reach the impact thresholds except for TTS in low-frequency cetaceans; the maximum range in this case is 10 m from the acoustic centre of the source.

Table 2. Maximum ranges to identified impact thresholds due to frequency-weighted SEL_{24h} levels defined by NMFS from SBP and Boomer operations.

Auditory group	Effect	Frequency-weighted Threshold Level dB re 1 µPa²·s	Artisan Range (m)	G3 Range (m)	Meeki Range (m)	Thy Comb Range (m)
Low-frequency Cetaceans	PTS	183	—	—	—	—
	TTS	168	10	<10	<10	<10
Mid-frequency Cetaceans	PTS	185	—	—	—	—
	TTS	170	—	—	—	—
High-frequency Cetaceans	PTS	155	—	—	—	—
	TTS	140	—	—	—	—
Phocid pinnipeds	PTS	185	—	—	—	—
	TTS	170	—	—	—	—
Otariid pinnipeds	PTS	203	—	—	—	—
	TTS	188	—	—	—	—

2. VSP

The ranges to recommended impact thresholds resulting from the VSP are presented in Table 3. Results assume both stationary source and receivers. Results are frequency-weighted in accordance with NMFS (2018). Maximum ranges are shown for 1, 5, 10, 15, 25, 144, and 360 impulses within a 24-hour period. Ranges up to 2.5 km calculated using 1 m resolution modelling on 5 m resolution gridded sound fields; ranges greater 2.5 km calculated using 10 m resolution modelling on 25 m resolution gridded sound fields.

Table 3. Maximum ranges to identified impact thresholds due to frequency-weighted SEL_{24h} defined by NMFS from VSP operations assuming different numbers of impulses during a 24-hour period.

Auditory group	Effect	Frequency-weighted Threshold Level dB re 1 µPa²·s	Number of impulses						
			1 R_{max} (m)	5 R_{max} (m)	10 R_{max} (m)	15 R_{max} (m)	25 R_{max} (m)	144 R_{max} (m)	360 R_{max} (m)
Low-frequency Cetaceans	PTS	183	11	30	45	56	72	323	738
	TTS	168	81	335	625	924	1227	3051	4743
Mid-frequency Cetaceans	PTS	185	—	—	—	—	—	—	—
	TTS	170	—	—	—	—	—	<10	<10
High-frequency Cetaceans	PTS	155	—	—	—	<10	<10	18	32

3. Comparison of sources

Beach Energy solicited tenders for the geophysical survey, and received three responses which proposed alternative equipment to that considered in McPherson and Wood (2017). These three responses have been evaluated, with the findings summarised below.

The primary sources of concern are the boomer and sub-bottom profiler, with other the potential sources for this project such as multi-beam echo sounders and side-scan-sonars being high frequency devices only, with centre frequencies over 100 Hz. As no mid-frequency multi-beam sonars are being considered, the potential for overlap between marine fauna hearing ranges and multi-beam sonar signals of concern is extremely limited.

The proposed sub-bottom profiler is the Edgetech X-star system, which is the same source as considered in the modelling study. Alternative boomers suggested as potential sources instead of the AP3000 include the AA251, AA300 and AA301. The modelled AP3000 signature was based upon scaling the signature of an AA202 single boomer plate. The frequency spectrum components of these potential sources are very similar to the modelled AP3000, and they will also exhibit a similar beam pattern. The peak source pressure level of the alternative boomers is slightly higher than the AP3000, which has a peak source pressure level of 210.8 dB re 1 μPa^{2}m^2, with that for the AA251 being of 212 dB re 1 μPa^{2}m^2 and AA301's 215 dB re 1 μPa^{2}m^2. This results in slightly greater ranges to PK thresholds for high-frequency cetaceans (Table 4), however criteria for other mammal auditory groups are not reached. There is also an increase in distance to PK-PK sound levels of interest, however the resulting ranges are still small, with no PK-PK sound level applied in the impact assessment exceeded more than 18 m from the source (Table 5). However, as both the Boomer and SBP are both towed at 3 m, the maximum depth at which the sound level of 202 dB re 1 μPa will be reached will be 21 m. As the shallowest modelling site of interest (Artisan, Table 1 in McPherson and Wood (2017)) has a depth of 71 m, no PK-PK sound levels of interest for benthic invertebrates will be reached at the seafloor.

Despite the differences in peak source pressure level between the modelled and potential alternative boomers, there is estimated to be only a very minor change in the per-pulse source sound exposure level (SEL), partly due to the length of the impulse from these alternative sources. Due to minor changes expected in term of per-pulse SEL, the modelling results presented in McPherson and Wood (2017) for SEL_{24h} are considered to be appropriate approximations of the potential sound fields and ranges to SEL_{24h} impact criteria.

Table 4. Maximum ranges to identified impact thresholds due to PK levels defined by NMFS for high-frequency cetaceans for the modelled boomer (AP3000) and two potential alternative boomers.

PK Threshold level dB re 1 µPa	Effect	Boomer AP3000 Range (m)	Boomer AA251 Range (m)	Boomer AA301 Range (m)
202	PTS	2.8	3.2	4.5
196	TTS	5.5	6.3	8.9

Table 5. Maximum ranges to identified PK-PK sound levels for the modelled boomer (AP3000) and two potential alternative boomers.

PK-PK dB re 1 µPa	Boomer AP3000 Range (m)	Boomer AA251 Range (m)	Boomer AA301 Range (m)
215	2.4	2.8	3.9
212	3.4	3.9	5.5
210	4.3	4.9	7.0
209	4.8	5.5	7.8
205	7.6	8.7	12.4
202	10.8	12.4	17.5

NMFS (2018) Frequency weighting functions

In 2015, a U.S. Navy technical report by Finneran (2015) recommended new auditory weighting functions. The auditory weighting functions for marine mammals are applied in a similar way as A-weighting for noise level assessments for humans. The new frequency-weighting functions are expressed as:

$$G(f) = K + 10\log_{10}\left\{\frac{(f/f_1)^{2a}}{[1+(f/f_1)^2]^a[1+(f/f_2)^2]^b}\right\} \tag{A-1}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA’s technical guidance that assesses noise impacts on marine mammals (NMFS 2018). Table A-1 lists the frequency-weighting parameters for each hearing group. Figure A-1 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions recommended by NMFS (2018).

Functional hearing group	***a***	***b***	***f*₁ (Hz)**	***f*₂ (Hz)**	**K (dB)**
Low-frequency cetaceans	1.0	2	200	19,000	0.13
Mid-frequency cetaceans	1.6	2	8,800	110,000	1.20
High-frequency cetaceans	1.8	2	12,000	140,000	1.36
Phocid pinnipeds in water	1.0	2	1,900	30,000	0.75
Otariid pinnipeds in water	2.0	2	940	25,000	0.64

1 INTRODUCTION

1.1 Foreword

Revision 5 of the report and recalculation of the GHG inventory was carried out under Xodus Assignment P100383-S04. Revision 5 is an update with new production information and the inclusion of downstream distribution emissions.

1.2 Background

Beach Energy Limited ('Beach') has engaged Xodus to develop a Greenhouse Gas (GHG) emissions study ('this report') for the Otway Offshore Gas Victoria Project ('the Project') to inform the Offshore Project Proposal (OPP). The key activities and sources of emissions for the Project are as follows:

- Drilling of up to 8 wells between 2025 and 2026 (Note Artisan has been drilled, making a total of 9 wells in scope of the Project).
- Completions of up to 9 wells in 2027.
- Installation of associated infrastructure and flowlines for up to 9 wells in 2028.
- Production from existing wells and new wells from the Project to year 2045. The wells from the Project is forecasted to produce hydrocarbons from 2028 to 2045.
- Operations, and decommissioning of up to 9 wells and associated infrastructure from the Project by 2049.

The characteristics of the hydrocarbons, including CO_2 content, from the La Bella and Artisan fields were based on samples from these fields. Compositions from nearby fields targeting similar geological formations (Artisan and Thylacine) were used as representative samples for the future prospects for this inventory assessment. Note that the assumptions and boundary conditions for the GHG emissions inventory assumed that all wells will be developed.

1.3 Boundary and source emissions

The Project boundary and its relationship to the Otway Development is outlined in Figure 1. The Project involves the drilling and completions of new hydrocarbon wells from different fields that will be tied back to the Otway Gas Plant (OGP) for processing. Details of the identified activities and source emissions resulting in GHG emissions and relevant assumptions are tabulated in Appendix A.

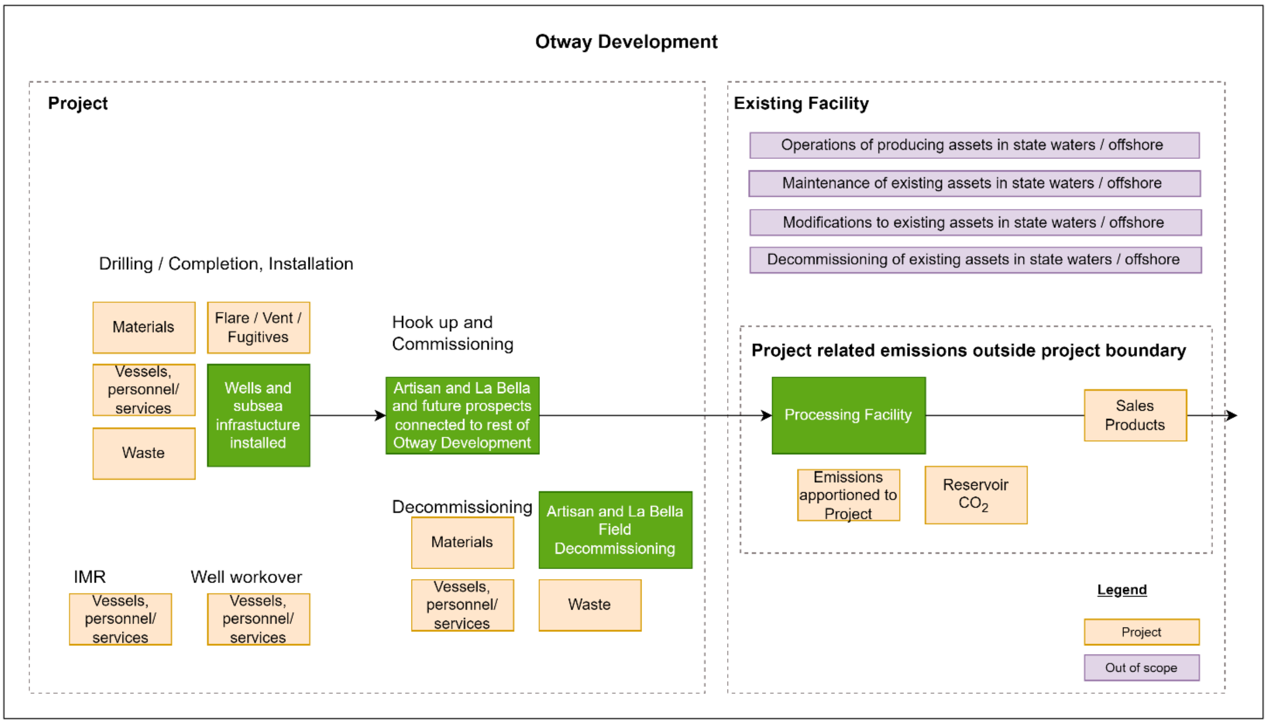

Figure 1: Boundary showing the Otway Development, and relationship between the Project and Existing Otway Facilities.

The Project GHG emissions inventory ('this report') describes the GHG contributions from the Project to the overall Otway Development. The GHG emissions are categorised as follows:

- Scope 1: Direct emissions from the combustion of fuel from owned or controlled sources. This is further categorised as follows:
  - Scope 1: Emitted within the Project Boundary, i.e., scope of OPP
  - Scope 1*: Emitted outside Project Boundary.
- Scope 2: Indirect emissions from the generation of purchased electricity, steam, heating, and cooling consumed by the company.
- Scope 3: All other indirect emissions not covered in scope 2, which occur in the value chain.

Table 1 summarises the activities and sources that emit GHG emissions over the lifecycle of the Project.

Table 1: GHG emissions categorisation. Refer to Appendix B for a full list of source emissions included.

GHG Scope	Phase	Sub-Category	Source / Activities
1 (Emitted within Project Boundary. Scope of OPP)	Drilling and Completions; Production	Flaring & Venting	Well clean-up and completion, well testing. Well intervention.
	Production	Fugitive Emissions	Fugitive emissions from wells and flowlines.
1* (Emitted outside Project Boundary)	Production	Reservoir CO_2	Reservoir CO_2 from Artisan, La Bella and future prospects emitted at Otway Gas Plant (OGP).
	Production	Onshore gas processing	Estimated fuel use apportioned to the processing of well fluids from Artisan, La Bella and prospects.
	Production	Onshore gas processing (fugitive emissions)	Fugitive emissions from OGP apportioned to throughput from Artisan, La Bella and prospects.
3	Support Activities (all stages)	Vessels / Helicopters	Variations of fleet including Mobile Offshore Drilling Unit (MODU) and support vessels and helicopters required for • Drilling • Installation • Inspection, Maintenance and Repair (IMR) • Well workover • Decommissioning
	Production	Sales Product	Use of sales gas, condensate from Artisan, La Bella and future prospects.
	Drilling and Completions, Installation, Decommissioning	Embodied carbon	Materials and equipment required to construct and decommission facilities, e.g., wells, flowlines, subsea equipment, cement, drilling mud.

2 METHODOLOGY

2.1 Source and activity identification

The assumptions list (Appendix A) co-developed by Beach and Xodus defines the activities and sources GHG emissions included in the GHG emissions inventory for Project. Justifications were provided where sources were identified and excluded from the inventory.

2.2 Calculations

2.2.1 Fuel use and related emissions

The National Greenhouse and Energy Reporting (Measurement) Determination 2008 (Compilation 18) emission factors for Method 1 were applied for combustion related calculations across the Otway Development. No site-specific emissions factors were available for the existing facility. In general, the calculation for combustion related emissions is as follows:

$$\text{Emissions } [CH_4, CO_2, N_2O] \text{ (tonnes } CO_2e) = \text{Activity / Source [e.g., condensate product]} \times \text{EF } [CH_4, CO_2, N_2O]$$

2.2.2 Embodied carbon

No supplier / reference dataset for materials and equipment, or design basis was available. Thus, the embodied carbon emissions were estimated a range of Xodus propriety tools and methodologies, and publicly available databases. Note that the embodied carbon is based on the assumptions stated in Appendix A.

The general calculation approach for embodied carbon is as follows:

$$\text{Emissions (tonnes } CO_2e) = \text{Material / Equipment} \times \text{EF [material, equipment]}$$

2.2.3 Project well fluid onshore processing

The OGP fuel use for processing reservoir fluids was apportioned to the OPP by ratio of existing field and new field reservoir fluids for the forward estimates provided.

The general calculation approach for apportionment of fuel use is as follows:

$$\text{Emissions (tonnes } CO_2e \text{ apportioned to OPP)} = \text{Fuel use} \times \%$$
$$\text{[OPP reservoir fluids at OGP inlet / total reservoir fluid at inlet]} \times \text{EF [material, equipment]}$$

2.2.4 Transmission and distribution losses

Product from Beach at 60 PJ/year is sold into the Victorian Market (300 PJ/year). It is assumed that all the OGP product is sold into the Victorian Market, transmitted, and distributed by the following entities. The publicly available information from the Safeguard Mechanism (SGM) for 2022/23 is stated.

- Ausnet Gas Services (AGS): 185,486 tonnes CO_2-e
- Ausnet Gas Networks (AGN): 172, 611 tonnes CO_2-e
- Multinet Principal Distribution Network and South Gippsland Pipeline (MPDN) - 182,383 tonnes CO_2-e

It is further assumed:

- the Market is static.
- the reported SGM values from these entities is representative of the Market transmission and distribution losses.

Thus, transmission and distribution losses attributable from the Project saleable product entering the Victorian Market post sales gate can be directly apportioned based on the energy content of Project gas entering the market.

2.2.5 Sold product

Losses in the transmission and distribution system is subtracted, and the product usage by the customer is assumed to be fully combusted.

3 RESULTS

The results presented are credible high estimates, which account for extended contingencies beyond a typical schedule. The inventory covers the period from 2025 to 2056.

3.1 Project lifecycle GHG emissions summary

Table 2 is a summary of the GHG emissions over the Project lifecycle.

Table 2: GHG emissions forward estimates for the Project over its lifecycle in tonnes CO_2-e.

GHG Scope	Phase	Sub-Category	CO_2-e (tonnes)
1 (Emitted within Project Boundary. Scope of OPP)	Drilling and Completions; Production (well work over)	Flaring	103,505
	Drilling and Completions; Production (well work over)	Venting	1,507
	Production	Fugitive Emissions	14,560
		Scope 1 OPP boundary, Sub-total	**119,572**
1* (Emitted outside Project Boundary)	Production	Reservoir CO_2	318,645
	Production	Onshore gas processing	751,162
	Production	Onshore gas processing (fugitive emissions)	20,235
		Scope 1* outside OPP boundary,, Sub-total	**1,090,043**
3	Support Activities (all stages)	Vessels	393,296
	Support Activities (all stages)	Helicopters	1,287
	Drilling and Completions, Installation, Decommissioning	Embodied carbon	124,322
		Scope 3 upstream	**517,532**
	Production	Transmission and distribution losses	**366,203**
		Scope 3 sales product	**10,954,872**

3.2 Embodied carbon emissions

Table 3 details the estimated embodied carbon emissions for identified materials and equipment for the Project.

Table 3: Embodied carbon emissions of material / equipment including waste, per phase, over Project lifecycle.

Phase	Material / Equipment	CO_2-e (tonnes)	Notes
Drilling	Cement	3,200	
	Well casing	18,360	Steel / CRA
	WBDF	737	20% Bentonite/ Polymer
Installation	8" flowlines	57,448	API 17J flexible flowlines
	Umbilicals	28,943	Estimated as 8” nominal diameter type
	Subsea equipment	11,205	Estimated per piece equipment as weights not available
	Oily water discharge	<<1	15ppmv; negligible
Decommissioning	Cement	3,600	
	WBDF	829	20% Bentonite/ Polymer

3.3 Annualised emissions related to the Project

Table 4 details the annualised GHG emissions forward estimates for the Project. Note that emissions from existing fields processed at OGP is not accounted for here, which together, extends overall life (production at OGP) to 2055.

Table 4: GHG emissions related to the Project calculated for the Project lifecycle from fuel use and emissions from production in tonnes CO_2-e.

Year	Scope 1 (Inside Project Boundary)			Scope 3				Scope 1* (Outside Project Boundary)

4 CONCLUSIONS

Table 5 summarises the estimates of GHG forward GHG emissions related to the Project.

Table 5: Summary of GHG emissions related to the Project.

GHG Scope		CO_2-e (tonnes)
1 (Emitted within Project Boundary. Scope of OPP)	Upstream	119,572
1* (Emitted outside Project Boundary)	Upstream	1,090,043
3	Upstream	518,905
	Downstream (transmission and distribution losses)	366,203
	Downstream (product use)	10,954,872

APPENDIX A BOUNDARY AND ASSUMPTION LIST

Phase	Assumptions / Givens	Information Source
All	Chartered support vessel emissions project-wide considered as scope 3 emissions.	Beach inputs aligned to GHG Protocol.
	Existing facilities: Onshore gas processing & Thylacine platform. These values are used to apportion fuel gas use only. OPP (this scope): Artisan, La Bella, and prospects with up to 9 wells in total. GHG emissions inventory assumed all 9 wells and associated infrastructure developed.	Beach inputs based on project concept design.
	Electricity is not purchased or sold; all generated electricity is consumed.	Confirmed by Beach.
	No bunkering of vessels is required for all phases.	Beach inputs based on operational experience in the region.
	Physical Properties (for conversions and calculations): • Marine Diesel Oil: 38.6 MJ/l • Aviation Kerosene: 36.8 MJ/l • Condensate: 46.5GJ/tonne • LPG: 25.7 GJ/kl; 46 GJ/tonne • Natural gas (fuel gas, sales gas): 39.3MJ/m^3	Aligned with NGER and agreed with Beach.
	• CO_2: 1.847 g/l • Condensate: 0.8 g/l • Reservoir gas: 0.68 g/l	Xodus assumptions agreed with Beach.
Activity schedule	The input values provided are considered “credible high” values – credible high values account for extended contingencies beyond a typical schedule of an activity.	Beach inputs.
	Expected duration of activities with emissions. • Drilling: 33 days per well + 7 days contingency – Total of up to 8 wells (excluding the drilled Artisan well) • Completions: 25+5 contingency days per well, 9 wells total • Installation: 25 days +5 days contingency for each associated well flowline / umbilical / subsea infrastructure.	Beach inputs based on project concept design.

Phase	Assumptions / Givens	Information Source
	– All fields connected via a single hot tap. • Production – Products, fuel use etc., per production profile for OPP scope. – IMR: 180 days. – Well workover: 30 days • Decommissioning: – P&A: 15 days +5 days contingency per well. – Infrastructure: 30 days for each associated well flowline/umbilical/subsea infrastructure.	
	Expected schedule of activities with emissions. • Drilling: – La Bella: 2025 – Prospects: 2026 • Completions: – Artisan La Bella, & prospects: 2027. • Installation: – Artisan, La Bella and prospects: 2028. • Production: – IMR: every 5 years from 2027. – Well workover: 1 well requiring workover every 7 years. – Flaring and venting for well workover: same as well completion. • Decommissioning: – Artisan: 2038/39 (well/ infrastructure). – La Bella: 2035/36. – Prospects: 2048/49.	Drilling, completions, and installation timing based on the 2025/2026 Equinox drilling programme inclusive of assumptions around timing of future drilling, completions and installation activities. IMR & workover frequency based on Beach operational experience in offset fields, workover to be carried out as required, assuming 1 every 7 years as a credible high value, accounting for extended contingencies beyond a typical schedule of an activity. Progressive well & infrastructure decommissioning to comply with decommissioning guidelines and policies.
Fuel consumption rate	Fuel consumption on daily rate basis. • MODU: 15m^3 MDO. • AHTS: 15m^3 MDO. • ISV/DSV: 15m^3 MDO. • PSV: 15m^3 MDO. • Multicat: 5m^3 MDO. • PLV: 56m^3 MDO. • Helicopters (Transport): 13m^3 Aviation kerosene.	Beach inputs based on operational experience in the region.

Phase		Assumptions / Givens	Information Source
Drilling and completions		Artisan drilling has finished and is not included.	Beach inputs – Artisan already drilled and suspended pending completion and future connection.
	Vessels (including supply and services, and transport)	- 1× MODU - 3× AHTS - Helicopter flights: 8 flights a week.	Beach inputs based on operational experience in the region.
	Materials per well basis	- Cement: 400 tonnes dry basis - Well casing/conductor: API 280m 36”, 1700m 13 3/8”, 3850m 9 5/8”, rest to 4,430m MD 5””. - Water based drilling fluid: 1500m^3.	Beach inputs as per OGV Drilling and P&A Environment Plan under assessment with NOPSEMA.
	Waste	Water based drilling fluid and waste cement all disposed at sea with no further treatment. Negligible GHG emissions.	Beach inputs as per OGV Drilling and P&A Environment Plan under assessment with NOPSEMA.
Well clean up and completion	Flaring	Flare rate of 65MMscfd for up to 2 days. In the unlikely event that SBM is required, SBM will be recovered and not flared.	Beach inputs reviewed by Xodus for consistency with light modelling.
Per well basis	Venting	To estimate using NGER 3.46AB Method 1. Item 4.	Xodus assumptions agreed with Beach.
	Vessels (including supply and services, and transport)	- 1× MODU - 3× AHTS - Helicopter flights: 8 flights a week.	Beach inputs based on operational experience in the region.
	Materials	N/A	Beach inputs.
	Waste	N/A	Beach inputs.
Installation	Flaring and venting	No changes to production requirements.	Beach inputs, and Xodus assumptions agreed with Beach.
Including hook up and commissioning	Stabilisation material	Not included.	Beach inputs based on operational experience in the region.
	Flowline (material)	Flowlines are all API 17J.	Beach inputs based on operational experience in

Phase		**Assumptions / Givens**	**Information Source**
			the region and project concept design.
	Flowline (main)	8" flowline from La Bella to hot tap tee - 21km; 8" flowline Artisan to hot tap tee, 10km.	Beach inputs based on project concept design.
	Flowlines (to each prospective well, 7 in addition to the 2 above)	8" flowline connecting each well to hot tap tee - 10 km. Note that the hot tap tee referred to are the same hot tap tee.	Beach inputs based on project concept design.
	Umbilical (main)	Umbilical from Thylacine to La Bella and Artisan - 45 km.	Beach inputs based on project concept design.
	Umbilical (7, to each prospective well, in addition to main)	Umbilical - 10km	Beach inputs based on project concept design
	Vessels (including supply and services, and transport)	• 1× ISV/CSV • 1× PLV • 1× Multicat • 1x DSV (hot tap assembly - 5 days) • Helicopter flights: 1 flight a week.	Beach inputs based on operational experience in the region.
	Materials (other infrastructure)	For each well, • 2× FLEM • 1× diverless interface skid • 1× SVS • 2x SDU	Beach inputs based on operational experience in the region and project concept design,
	Waste	Oily water discharged. Assume volume of discharge at 1.5× flowline volume with hydrocarbon concentration of 15ppmv. Considered immaterial <<1 tonne CO_2-e.	Beach inputs based on operational experience in the region and project concept design.
Production	Product	All products are assumed to be combusted as end-use. Fugitive emissions post sales gate not included.	Xodus assumptions agreed with Beach.
	Processing	Fuel gas and diesel usage accounts for onshore and offshore (Thylacine platform) consumption.	Beach inputs.
	Processing	The emissions from gas processing at OGP is estimated based on the ratio of throughput for the Project and existing facility.	Xodus estimate based on Beach production profile for total OGP throughput, agreed with Beach.

Phase		Assumptions / Givens	Information Source
	Fugitive emissions (offshore)	For wells proposed in OPP, 104 tonnes per annum CO_2-e each.	Beach inputs based on existing facility reporting.
	Fugitives (OGP, Thylacine, and existing wells)	GHG emissions of 3,522 tonnes CO_2-e per annum for all fugitive emissions reported for NGER. Given estimated emissions from each existing well of 104 tonnes CO_2-e, (10 existing wells) fugitive emissions related to processing is 2,482 tonnes CO_2-e per annum.	Beach inputs based on existing facility reporting.
	Materials	N/A.	Beach inputs.
	Waste	N/A.	Beach inputs.
IMR	Vessels (including supply and services, and transport)	• 1× ISV/CSV • 1× PSV • 1× Multicat • Helicopter flights: 1 flight a week.	Beach inputs based on operational experience in the region.
Well intervention	Vessels	• 1× MODU • 3× AHTS • Helicopter flights: 6 – 8 flights a week. • Flaring and venting	Beach inputs based on operational experience in the region.
Decommissioning		Assume decommissioning requires the same equipment for drilling and installation / commissioning. Durations are based on previous decommissioning campaigns.	Beach inputs based on operational experience in the region.
	Flaring and venting	No flaring and venting during decommissioning.	Beach inputs based on operational experience in the region.
	Materials	• Cement: 400 tonnes dry basis. • Water based drilling fluid: 1500m^3.	Beach inputs as per OGV Drilling and P&A Environment Plan under assessment with NOPSEMA.
	Waste	Water based drilling fluid and waste cement all disposed at sea with no further treatment. Negligible GHG emissions.	Beach inputs as per OGV Drilling and P&A Environment Plan under assessment with NOPSEMA.

APPENDIX B INPUTS TO INVENTORY

This table abstracts from Appendix A, sources of emissions related to the Project considered in the GHG inventory. Unless stated, all input sources were included in the inventory.

Activity	Source	Details	Notes
Drilling	Vessels	Combustion emissions from vessels. • 1× MODU • 3× AHTS • Drilling duration of 40 days per well, including 7 days contingency per well.	Artisan has been drilled and suspended pending completion, a further 8 wells to be drilled.
	Helicopters	Combustion emissions from helicopters for personnel transport. • 8 flights a week.	
	Drilling fluid	Embodied GHG emissions. • 1500 m^3 per well. This is the total drilling fluid and completion fluid per well. • The inventory accounted for water based fluids.	Similar embodied carbon values for the categories i.e., water based, or oil based.
	Cement	Embodied GHG emissions. • 400 tonnes, dry basis, per well.	
	Well string	Embodied GHG emissions. • API 280m 36", 1700m 13 3/8", 3850m 9 5/8", rest to 4,430m MD 5"". • It is assumed that all wells are the same design.	
	Waste	Water based drilling fluids and cement waste disposed at sea is not considered to breakdown or react resulting in further GHG emissions.	
Completions	Vessels	Combustion emissions from vessels. • 1× MODU • 3× AHTS Completions duration of 30 days per well, including 5 days contingency per well.	Total of 9 wells to be completed.
	Helicopters	Combustion emissions from helicopters for personnel transport. • 8 flights a week.	
	Completion fluid	Embodied GHG emissions. Total volume accounted as drilling and completions, and assuming similar category of fluid, i.e., water based.	
	Venting	Reservoir gas released to atmosphere arising from well completions activities. Venting losses from well completions per event, total 9 wells.	Completions with flare package on MODU.
	Flaring	Flaring emissions arising from well completions activities. Estimated flaring from well completions including cleaning and testing. • 130 MMscf, total flow per well.	

Activity	Source	Details	Notes
Installation	Vessels	Combustion emissions from vessels. - 1× ISV/CSV - 1× PLV - 1× Multicat Installation duration of 25 days, including 5 days contingency.	Duration per set of associated flowline / umbilical / subsea infrastructure.
	Vessels	Combustion emissions from vessels. Single connection for connecting all new flowlines to existing infrastructure. - 1x DSV Hot tap assembly duration of 5 days.	
	Helicopters	Combustion emissions from helicopters for personnel transport. - 1 flight a week.	
	Flaring and venting	Considered production and activity impacts. No material flaring and venting emissions identified from hot tap activity.	
	Stabilisation material	Stabilisation materials not included in inventory.	
	Flowlines	Embodied GHG emissions. - Total length of flowlines at 101 km.	
	Umbilicals	Embodied GHG emissions. - Total length of umbilicals at 105 km.	
	Other infrastructure	Embodied GHG emissions. For each well, the following set of associated infrastructure: - 2x FLEM - 1x diverless interface skid - 2x SDU - 1x SVS	
	Waste	Oily water discharges from hook up and commissioning considered immaterial.	Estimated << 1 tonne CO_2-e at 15ppmv.
Production	Gas plant	- Emissions during production were estimated on a deterministic mid case of the expected reservoirs' performance and sequencing, the actual emissions may vary based on the actual reservoir performance and production sequencing. [1]	
	Gas plant equipment	Combustion emissions from fuel gas driven equipment, relevant to the processing of gas from Project. The major equipment / system are: - Power generation - Boilers	The fuel gas forecast for the gas plant on an annual basis was provided for the existing wells, and gas from the proposed wells.
	Gas plant equipment	Combustion emissions from diesel gas driven equipment, relevant to the processing of gas from Project. The diesel usage for production is zero and excludes auxiliary aspects of	The total diesel use forecast for the gas

---

[1] *The EOFL of Project fields is revised in R05 to align the EOFL in the GHG Assessment with the EOFL in the OPP Project Description (i.e. 2045).*

Activity	Source	Details	Notes
		the gas plant requiring diesel, e.g., backup systems that may be tested from time to time.	plant on an annual basis was provided.
	Gas plant equipment and offshore facilities for existing facility	Fugitive emissions for the existing facility. Total fugitive emissions was given at 3,522 tonnes CO_2-e. This included all fugitives for the existing 10 wells to the gas plant to the sales gas boundary. • Fugitive emissions from each well (and associated infrastructure): 104 tonnes CO_2-e. • Attributable fugitive emissions to the onshore facilities: 2,482 tonnes CO_2-e.	
	Gas plant equipment and offshore facilities for attributable to Project	Fugitive emissions was estimated for the Project from gas plant and offshore facilities. • Fugitive emissions from the onshore facilities was apportioned to the Project on a raw gas volume basis. • Fugitive emissions from each well (and associated infrastructure): 104 tonnes CO_2-e.	Ratio of raw gas derived from the production forecast provided on an annual basis.
Production - IMR	Vessels	Combustion emissions from vessels for IMR activities. • 1× ISV/CSV • 1× PLV • 1× Multicat Planned IMR campaign duration of 180 days every 5 years.	
	Helicopter	Combustion emissions from helicopters for personnel transport. • 1 flight a week. Planned IMR campaign duration of 180 days every 5 years.	
	Replacement equipment	Replacement of major equipment is not considered a likely scenario and has not been included. Replacement of minor items e.g., seals, may take place during IMR, but the embodied GHG emissions from the replacement equipment are considered immaterial.	
Production – Well intervention	Vessels	Combustion emissions from vessels. • 1× MODU • 3× AHTS Planned well workover activities of 1 well every 7 years, lasting 30 days per event.	It is assumed that the workover events will have the same fugitive emissions and flaring requirements as a well completion event. This is likely conservative.
	Helicopter	Combustion emissions from helicopters for personnel transport. • 8 flights a week. Planned well workover activities of 1 well every 7 years, lasting 30 days per event.	
	Replacement equipment	Replacement of major equipment is not considered a likely scenario and has not been included. Replacement of well control equipment e.g., loggers, may take place during well	

Activity	Source	Details	Notes
		intervention, but the embodied GHG emissions from the replacement equipment are considered immaterial.	
Production – Transport	Transmission and distribution pipeline fugitive emissions	GHG emissions from downstream transmission and distribution losses. Estimates of the fugitive emissions from NG downstream of the sales gate, i.e., from Beach owned assets to non-Beach owned assets to customers in the Victoria market are based on the following assumptions: • All gas sold from Otway is to the Victorian Market. • The Market is static at 300 PJ / year. • The Market GHG Scope 1 emissions are reported under the SGM, and these reported values from the entities AGS, AGN and MPDN are representative of the Market transmission and distribution losses. • The publicly available information for year 2022/23 as follows: – AGS: 185,486 tonnes CO_2-e – AGN: 172, 611 tonnes CO_2-e – MPDN - 182,383 tonnes CO_2-e • The GHG emissions apportioned to the Project is by energy supplied by the OPP into the Market.	
Production – Sales gas	Sales gas usage at customer location	Assumed to be 100% combusted, less downstream transmission and distribution losses.	
De-commissioning	Vessels	Combustion emissions from vessels. Assumed the same vessels and schedule required for decommissioning of wells, flowlines and associated subsea infrastructure.	
	Flaring and venting	No requirement for flaring or venting identified.	
	Materials	Embodied GHG emissions related to well plug and abandonment, same as drilling.

EXECUTIVE SUMMARY

Background

Beach Energy Limited (Beach) has plans for development within the Otway Basin.

In order to support the environmental approvals, Beach commissioned RPS to undertake a detailed discharge modelling study of chemically treated seawater used to undertake system hydrotesting of the infield subsea facilities before being used to deliver the product.

The principal aim of the study was to determine the potential area of exposure from the preservation chemical within the treated seawater discharge. A detailed dewater discharge modelling study was commissioned, which examined a 6,000 m^3 discharge of treated seawater over a period of 42.9 hours (140 m^3/hr), 2 m above the seafloor. The initial concentration of the preservation chemical was assumed to be 550 mg/L (or parts per million (ppm)). The treated seawater will have the same water temperature and salinity as the surrounding seawater.

The predicted extent of the preservation chemical is reported as an annual assessment (i.e. any time of year).

Methodology

The modelling study was carried out in stages. Firstly, a 10-year current dataset (2010–2019) that includes the combined influence of large-scale ocean and tidal currents was prepared. Secondly, the near-field plume dynamics based on the discharge configuration and treated seawater characteristics was assessed under weak, moderate, and strong static current speeds. This step assessed the initial dilution of the treated water plume, which was then followed by an investigation of the far-field mixing. Different modelling approaches are required for calculating the near-field and far-field dilutions due to the differing hydrodynamic scales.

A total of 100 far-field simulations were run, with each simulation having a different start time to ensure a range of current conditions were sampled to assess the mixing and dispersion (i.e. dilution) of the preservation chemical. Once the simulations were complete, the individual outputs were combined to determine the maximum distances to achieved dilutions of the preservation chemical as an annual assessment, based on the 95th, 99th and 100th percentiles.

Summary of Modelling Results

- The near-field modelling revealed the results showed that treated seawater would initially project upward at a 45-degree angle due to the diffuser orientation and the high exit velocity. Once the plume lost its momentum, the plume descended slightly till it was neutrally buoyant with the ambient water and then mixed laterally due to ambient currents.
- The far-field modelling results indicate that for the 99th and 100th percentile analysis (i.e. 99% and 100% of the time), the maximum distances from the Release Location to the predicted dilutions of 1:550 (i.e. 1 mg/L which represents the impact threshold concentration/trigger value) contour were 20 m and 156 m, respectively. Based on the 95th percentile analysis (or 95% of the time), the 1:550 dilution was achieved very close to the release location (20 m).

1 INTRODUCTION

1.1 Background

Beach Energy Limited (Beach) has plans for development within the Otway Basin.

In order to support the environmental approvals, Beach commissioned RPS to undertake a detailed discharge modelling study of chemically treated seawater used to undertake system hydrotesting of the infield subsea facilities before being used to deliver the product.

The principal aim of the study was to determine the potential area of exposure from the preservation chemical within the treated seawater discharge. A detailed dewater discharge modelling study was commissioned, which examined a 6,000 m^3 discharge of treated seawater over a period of 42.9 hours (140 m^3/hr), 2 m above the seafloor. The initial concentration of the preservation chemical was assumed to be 550 mg/L (or parts per million (ppm)). The treated seawater will have the same water temperature and salinity as the surrounding seawater.

The coordinates of the Release Location is presented in Table 1-1 and illustrated in Figure 1-1.

The predicted extent of the preservation chemical is reported as an annual assessment (i.e. any time of year).

Table 1-1 Coordinates Release Location used for the treated seawater discharge modelling assessment.

Release Location	Latitude*	Longitude*	Water depth (m)
Release Location South	39.7485° S	143.1637° E	~155

*Datum: WGS 1984

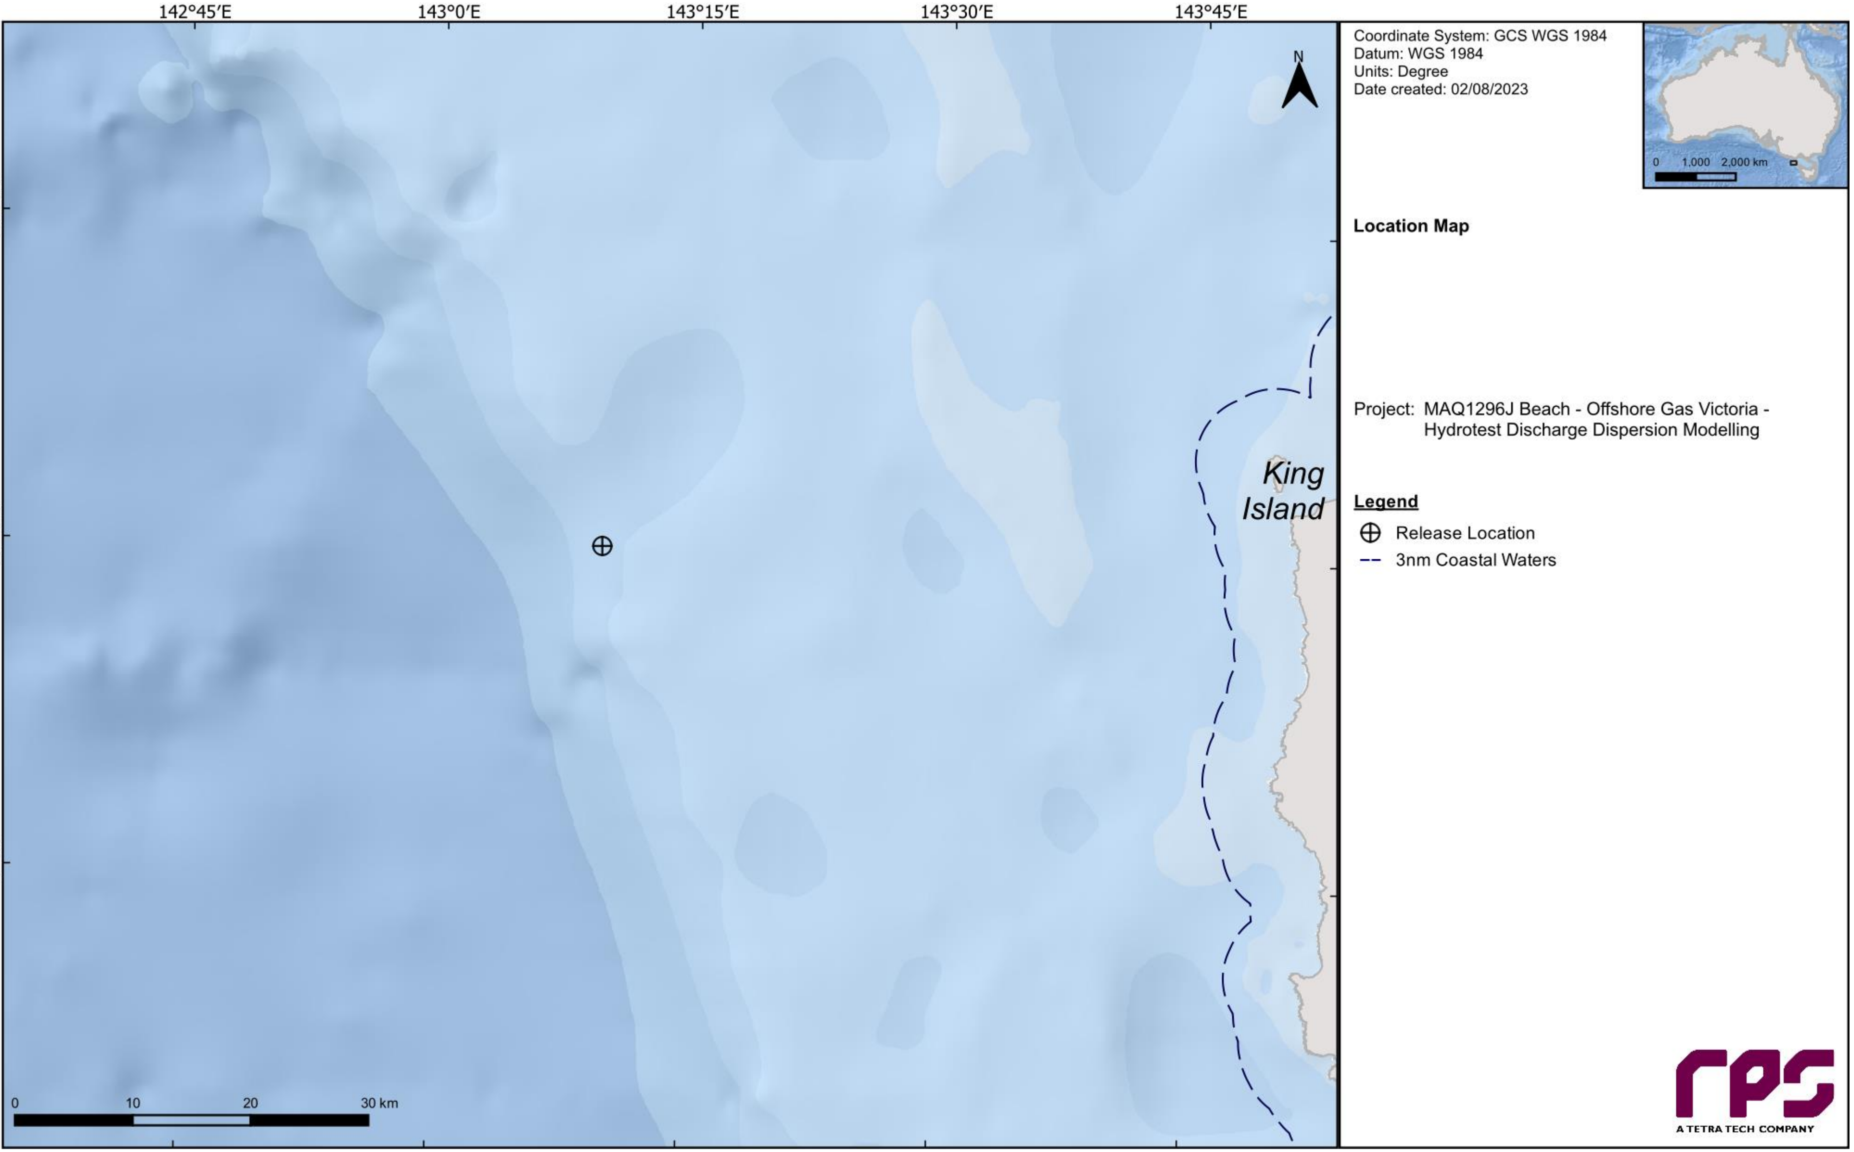

Figure 1-1 Location of the release site used for the treated seawater discharge modelling assessment.

2 SCOPE OF WORK

The physical mixing of the discharge can be separated into two distinct zones: near-field and far-field. The near-field zone focusses on the mixing of the treated seawater; while the mixing of the preservation chemical is assessed in the far-field. The near-field zone is defined by the region that is controlled by the plume's initial jet momentum and the static current. Normally, the buoyancy difference is considered in the near-field, however, it is negligible in this instance given that the treated seawater has the same density as the surrounding seawater. Once the near-field assessment is complete, the far-field phase examined the transport and mixing of the corrosion inhibitor by the ambient currents. Therefore, the scope of work included the following components:

1. Generate 10-years (2010-2019) of three-dimensional current data, that includes the combined influence of drift and tidal currents and is suitably long to be indicative of interannual variability in ocean currents;
2. Analyse the 10-year current dataset and identify the weak (5th percentile), moderate (50th percentile) and strong (95th percentile) current speeds, which were used as inputs in the near-field model;
3. Calculate the near-field plume dynamics (or initial dilution) based on the diffuser configuration and treated seawater characteristics under weak, moderate and strong static current speeds;
4. Run 100 far-field simulations, with each simulation having randomly selected start dates and times between 2010-2019 to ensure a range of current conditions were sampled to assess the mixing and dispersion of the preservation chemical; and
5. Combine the results for all 100 simulations and determine the maximum distances from the Release Location and total areas of exposure for the achieved far-field dilutions of the preservation chemical, including a dilutions equivalent to the impact threshold of 1 ppm (equivalent to 1 mg/L), based on 95th, 99th and 100th percentile outcomes.

3 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3-1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.

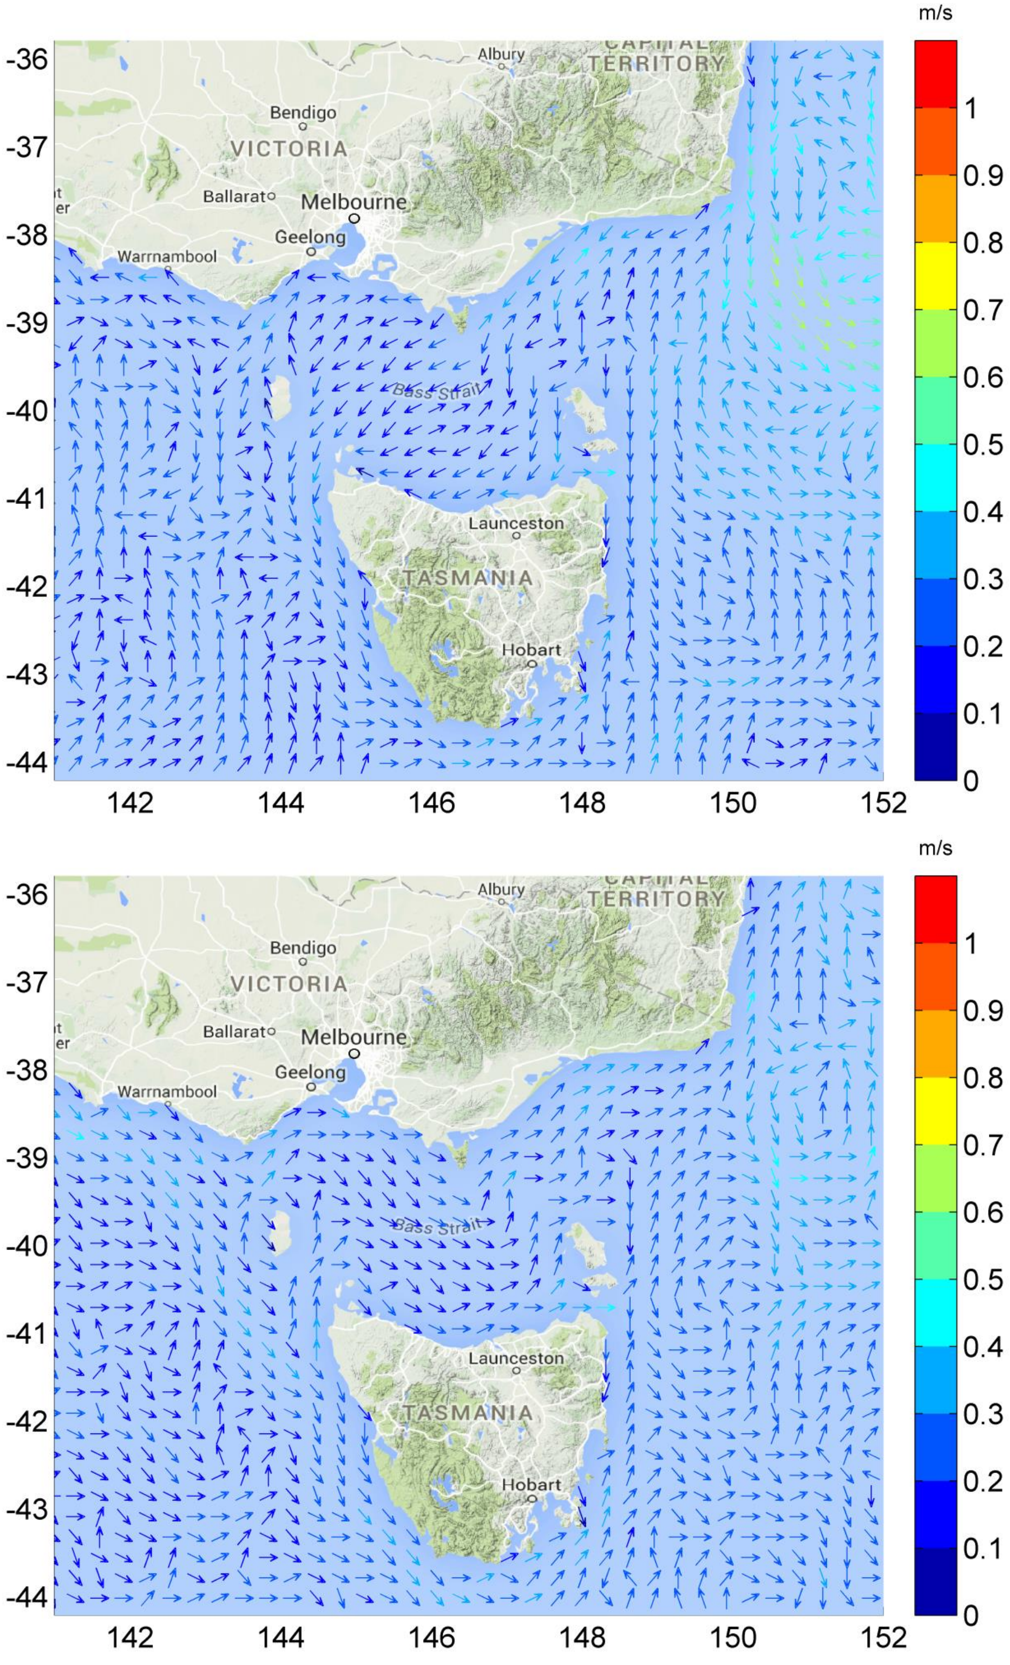

Figure 3-1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).

3.1 Tidal Currents

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world over the past 38 years (Isaji & Spaulding, 1984; Isaji et al., 2001; Zigic et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of particular interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji & Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain was sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3-2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3-3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

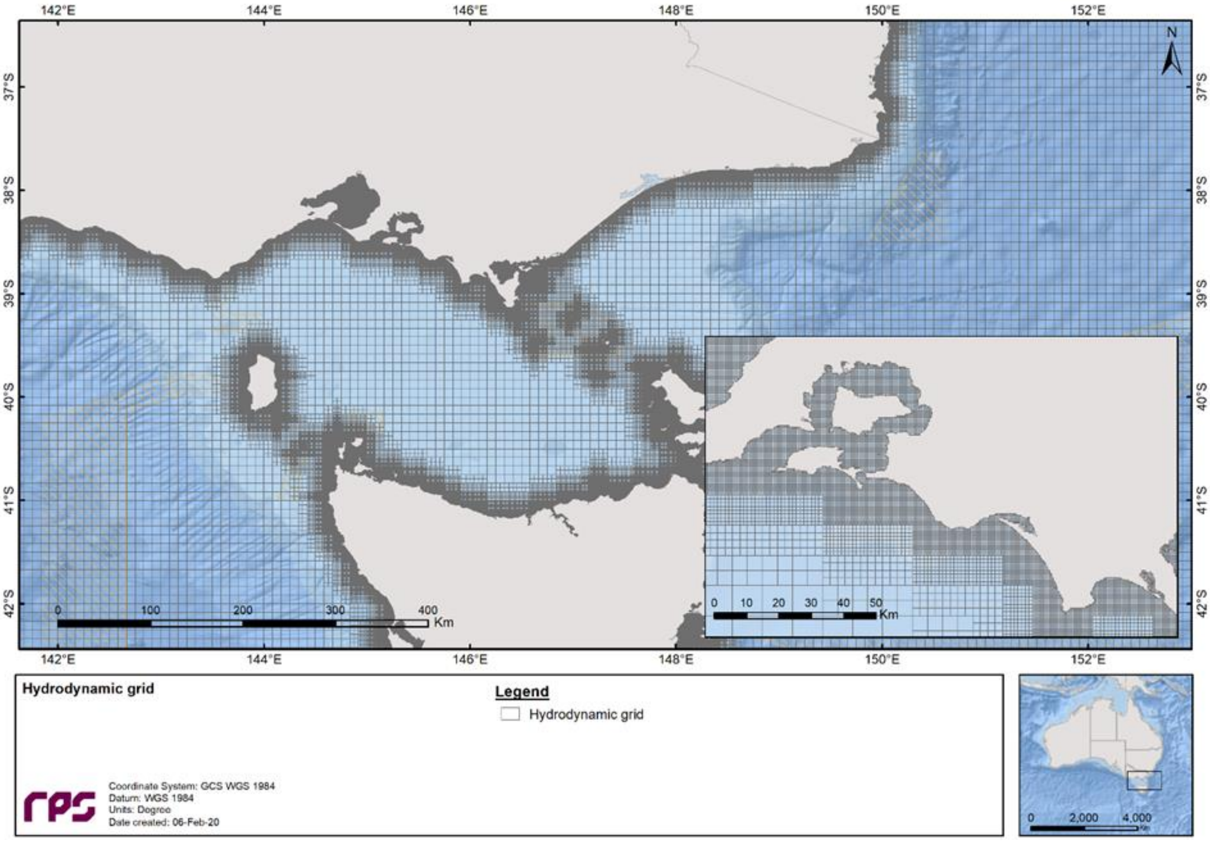

Figure 3-2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

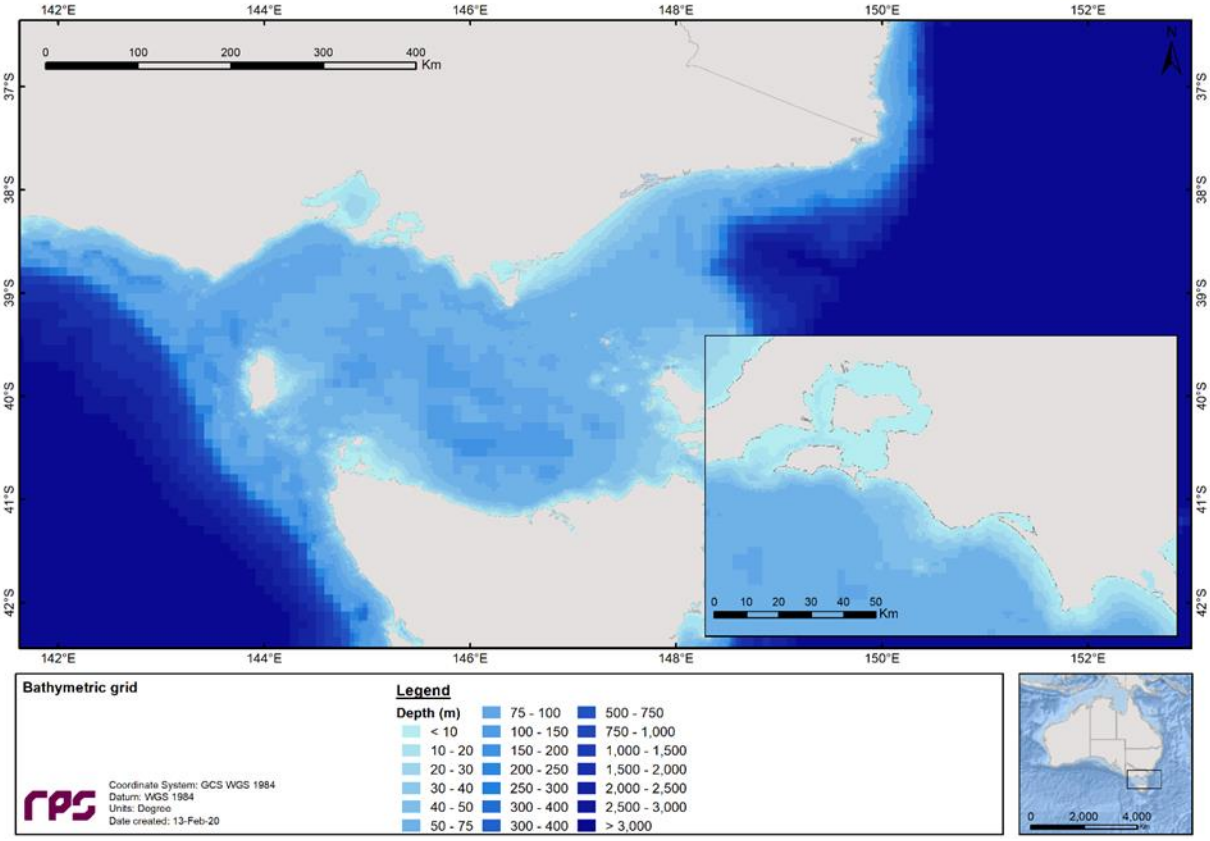

Figure 3-3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 7.2) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, surface heights were firstly calculated along the open boundaries, at each time step in the model.

The TOPEX/Poseidon satellite data has a global resolution of 0.25 degrees and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The satellites equipped with two highly accurate altimeters and capable of taking sea level measurements with an accuracy of ± 5 cm measured oceanic surface elevations (and the resultant tides) for over 13 years (1992–2005). In total, these satellites carried out 62,000 orbits of the planet.

The TOPEX/Poseidon tidal data has been widely used amongst the oceanographic community, being included in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). As such the TOPEX/Poseidon tidal data is considered suitably accurate for this study.

3.2 Ocean Currents

Data describing the flow of ocean currents was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the National Ocean Partnership Program (NOPP), as part of the U.S. Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of every 3 hours. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

For this study, the HYCOM hindcast currents were obtained for the years 2010 to 2019 (inclusive).

3.3 Near-seabed Currents

Figure 3-4 and Figure 3-5 present the monthly and annual current rose plots, respectively, in the vicinity of the Release Location based on combined tidal and ocean currents.

Note the convention for defining current direction throughout this report is the direction the current flows towards. Each branch of the current rose distribution represents the currents flowing to that direction, with north to the top of the diagram. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.2 m/s are typically used in these current roses. The length of each coloured segment within a branch is proportional to the frequency of currents flowing within the corresponding speed and direction.

The data showed that the currents predominantly flowed along the southwest–northeast axis. Average monthly current speeds ranged between 0.08 m/s and 0.11 m/s. Additionally, the maximum monthly near-seabed current speeds ranged between 0.20 m/s (December) and 0.39 m/s (July, Table 3-1).

Table 3-1 Predicted monthly average, maximum and percentile near-seabed currents at the Release Location South. Data were based on conditions between 2010 and 2019.

Month	Maximum current speed (m/s)	Average current speed (m/s)	5th Percentile current speed (m/s)	50th Percentile current speed (m/s)	95th Percentile current speed (m/s)

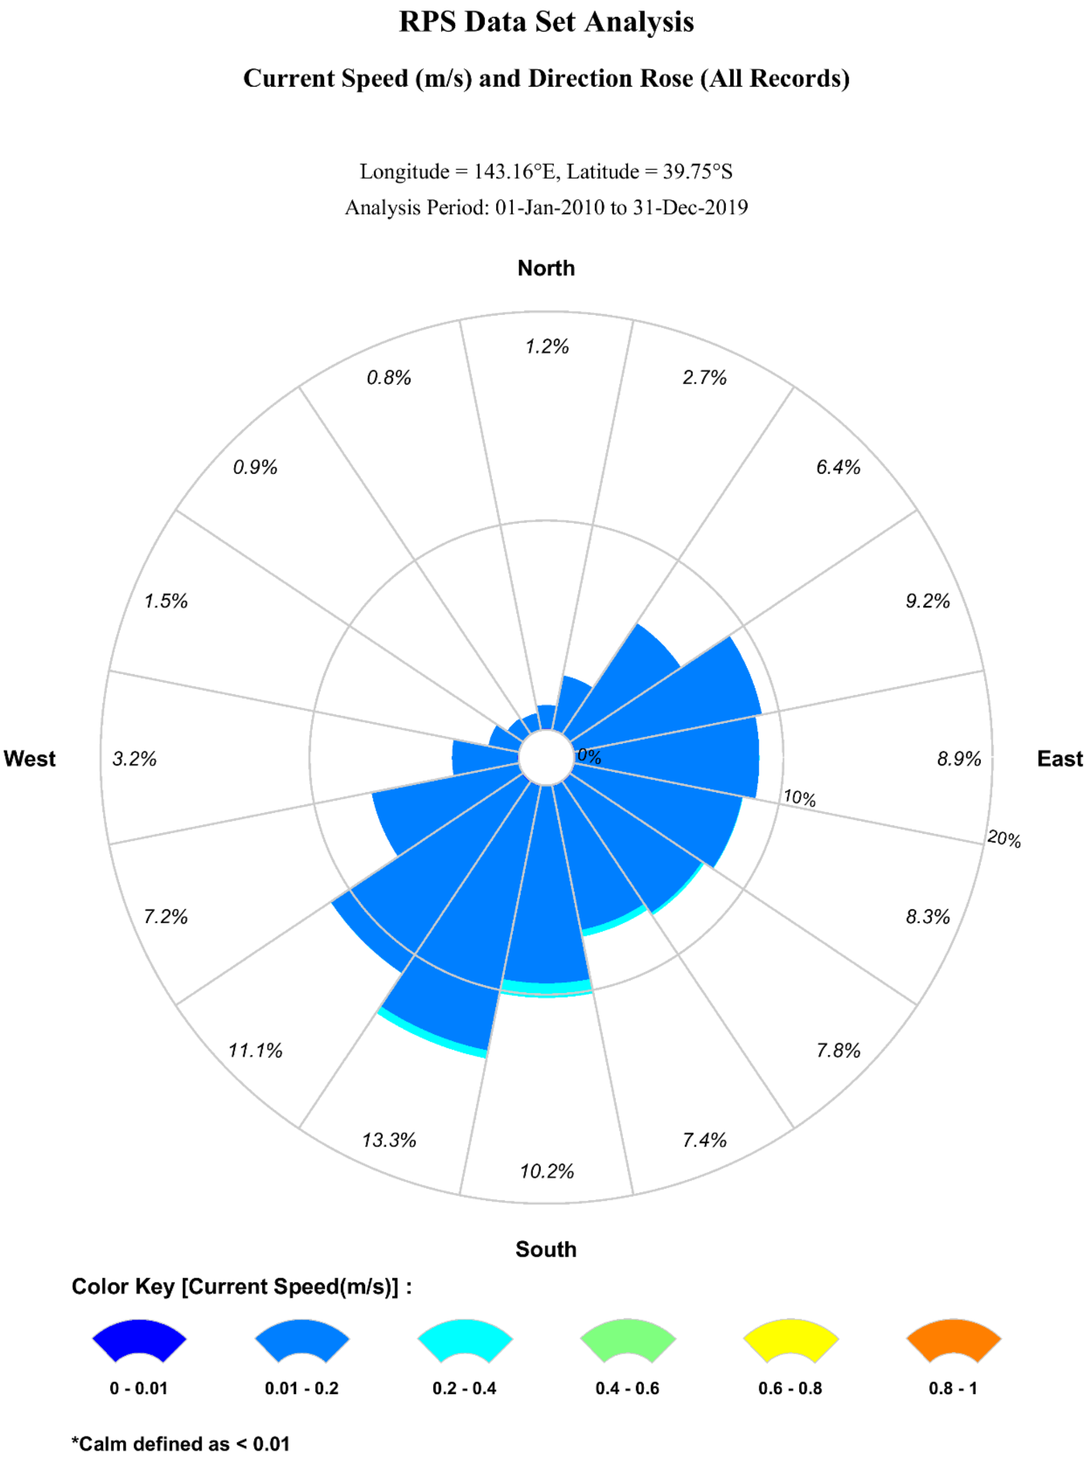

Figure 3-5 Annual near-seabed current rose plots adjacent to the Release Location, derived from the 2010 to 2019 modelled dataset.

4 WATER TEMPERATURE AND SALINITY

Table 4-1Table 4-1 shows the temperature and salinity data used as part of the near and far field modelling, which was obtained from the World Ocean Atlas 2018 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (Levitus et al., 2013). March and October conditions were used to represent summer and winter condition, as these were the months which revealed the highest and lowest temperatures, respectively.

Near-seabed (150 m) temperatures ranged between 11.5 ˚C (winter) and 12.7 ˚C (summer). Additionally, the summer and winter temperature profile exhibits reducing temperature with increasing depth (e.g. ~7 ˚C difference between the surface and bottom water layers). Salinity levels are generally consistent with season, and depth indicating a vertically well-mixed water body ranging between 35.3-35.4 psu through the water column.

Table 4-1 Summer and winter water temperature and salinity through the water column adjacent to the release location. March and October conditions were used to represent summer and winter condition, as these were the months which revealed the highest and lowest temperatures, respectively.

Water Depth (m)	Temperature (°C) Summer	Salinity (psu) Summer	Temperature (°C) Winter	Salinity (psu) Winter
0	18.4	35.4	13.3	35.4
2	18.4	35.4	13.3	35.4

150	11.5	35.1	12.7	35.3

5 ENVIRONMENTAL REPORTING CRITERIA

Beach plan to use a preservation chemical such as Hydrosure 0-3670R to treat the seawater that will be potentially discharged from the flowline. As per the ConocoPhillips Barossa OPP (ConocoPhillips, 2017) and Shell Crux OPP (Shell Australia Pty Ltd, 2020) an impact threshold concentration/trigger value of 1 ppm (equivalent to 1 mg/L) of the preservation chemical was used as part of this study. According to both OPPs, an impact threshold of 1 mg/L for the preservation chemical was defined as it was considered that concentrations below this threshold would not result in significant environmental impacts. It is a threshold, which is consistent with published acute toxicity test data for aquatic species for typical biocides including the Wheatstone Project Offshore Facilities and Produced Formation Water Discharge Management Plan: Stage 1 (Chevron Australia, 2015) which had identified an acute toxicity threshold of 1 ppm for Hydrosure, a representative preservation product. The Safety Data Sheet for Hydrosure O-3670R states the 96-hour LC_{50} as 3.09 mg/L for fish in marine waters, with a 48-hour EC_{50} of 5.66 mg/L for aquatic invertebrates (Champion Technologies, 2013). Note that ecotoxicological studies are typically undertaken using constant doses for periods ranging from 24 to 96 hours under controlled conditions when establishing ecotoxicological threshold of interest.

This approach is in contrast to the natural environment, where the concentration and exposure durations can vary widely. For the purpose of this assessment, selection of an impact threshold of 1 ppm provides a conservative basis to evaluate the potential effects of biocide in the receiving environment.

6 MODELLING METHODOLOGY

6.1 Near-Field Modelling

6.1.1 Description of the Near-Field Model: CORMIX

The near-field mixing and dispersion of the treated water discharge was simulated using the three-dimensional flow model, CORMIX. CORMIX is a mixing zone model and decision support system for environmental impact assessment of regulatory mixing zones. CORMIX contains a series of elements for the analysis and design of single or multi-port discharges. Discharges may be submerged or above surface, buoyant or denser than receiving water and the receiving water may be stratified or unstratified. The emphasis of the model is the influence of the geometry and dilution characteristics on the initial mixing zone (Doneker & Jirka, 1990; Jirka et al., 1991). CORMIX is widely applied worldwide and has been validated in many independent studies (http://www.cormix.info/validations.php).

CORMIX is a collection of analytic solutions to simplified forms of the mathematical equations describing transport and dispersion of water borne constituents. The simplifications are established through a range of assumptions about the source configuration, source characteristics (discharge and buoyancy) and the ambient environment. These assumptions effectively limit the domain within which the analytic solutions apply.

Although CORMIX does calculate far-field dispersion, the assumptions of the algorithms limit application to homogeneous environments with no eddies in the ambient flow and little recirculation. For this reason, the CORMIX component of the calculations for this study were limited to the near-field zone.

CORMIX specifies the average dilution or bulk dilution (flux averaged) as 1.7 times the centreline dilution. The centreline is defined by the points of maximum concentration (maximum temperature, minimum dilution etc) at each vertical section along the longitudinal axis. Accordingly, centreline depth is defined as the depth of the maximum concentration point (maximum temperature, minimum dilution) along the longitudinal axis.

6.1.2 Near-Field Model Setup

Summary of the treated seawater discharge characteristics are presented in Table 6-1. The discharge was anticipated to occur 2 m above the seabed through a single outlet from a diffuser orientated vertically upwards at 45 degrees with a 2 inch diameter. The discharge was anticipated to have a salinity and temperature as per ambient waters (see Section 4 Water Temperature and Salinity).

Table 6-1 Summary of the treated seawater discharge characteristics.

Parameter	Inputs
Total Discharge Volume	6,000 m^3
Discharge flow rate	140 m^3/hr
Diameter of discharge pipe	2"
Depth of discharge (below MSL)	153 m
Discharge Configuration (i.e. up, down, horizontal, number of ports)	Vertical upwards at 45 degrees
Surrounding water depth	155 m
Discharge temperature	Ambient
Discharge salinity	Ambient

Inputs to the CORMIX model also included constant current speeds. The 10-year data was statistically analysed to determine the 5th, 50th and 95th percentile current speeds at varying depths (Table 6-2) for input to the near-field model to reflect contrasting mixing and advection cases:

- 5th percentile current speed: weak currents, low mixing and slow advection;
- 50th percentile (median) current speed: average currents, moderate mixing and advection; and
- 95th percentile current speed: strong currents, high mixing and rapid advection to nearby areas.

The 5th, 50th and 95th percentile values are referenced as weak, medium and strong current speeds, respectively.

Table 6-2 Adopted ambient current conditions adjacent to the Release Location.

Depth (m)	5th percentile (weak) current speed (m/s)	50th percentile (medium) current speed (m/s)	95th percentile (strong) current speed (m/s)
Near-seabed	0.02	0.08	0.16

6.2 Far-Field Modelling

6.2.1 Overview

The far-field modelling expands on the near-field work by allowing the time-varying nature of currents to be included and for the potential for localised build-up when current speeds are low (e.g. at the turning of the tide) and recirculation of the plume back to the discharge location might occur. In this case, concentrations near the discharge point can be increased due to the discharge plume mixing with the remnant plume from an earlier time. This may be a potential source of episodic increases in pollutant concentrations in the receiving waters.

6.2.2 Description of Far-Field Model: MUDMAP

The mixing and dispersion of the preservation chemical was predicted using the three-dimensional discharge and plume behaviour model, MUDMAP. The far-field calculation (passive dispersion stage) employs a particle-based, random walk procedure. Any chemicals (constituents) within the discharge stream are represented by a sample of Lagrangian particles. These particles are moved in three dimensions over each subsequent time step according to the prevailing local current data as well as horizontal and vertical mixing coefficients.

MUDMAP treats the Lagrangian particles as conservative tracers (i.e. they are not removed over time to account for chemical interactions, decay or precipitation). Predicted concentrations will therefore be conservative overestimates where these processes actually do occur. Each particle represents a proportion of the discharge, by mass, and particles are released at a given rate to represent the rate of the discharge (mass per unit time). Concentrations of constituents are predicted over time by counting the number of particles that occur within a given depth level and grid square and converting this value to mass per unit volume.

The system has been extensively validated and applied for discharge operations in Australian waters (e.g. Burns et al., 1999; King & McAllister, 1997, 1998).

6.2.3 Far-Field Model Setup

Table 6-3 presents a summary of the far-field model inputs used to calculate the transport and mixing of the preservation chemical by the ambient currents. 100 simulations were run and each simulation had randomly selected (different) start dates and times (between 2010–2019), which ensured a range of current conditions were sampled.

Table 6-3 Summary of the chemical preservation far-field discharge characteristics.

Parameter	Inputs
Hindcast modelling period	2010–2019
Seasons	Annual
Total volume of treated water released (m^3)	6,000
Duration of release (hours)	42.9
Preservation chemical (mg/L or ppm)	550
Simulated period (days)	3

6.2.3.1 Mixing Parameters

The horizontal and vertical dispersion coefficients represent the mixing and diffusion caused by turbulence, both of which are sub-grid-scale processes. Both coefficients are expressed in units of rate of area change per second (m^2/s). Increasing the horizontal dispersion coefficient will increase the horizontal spread of the discharge plume and decrease the centreline concentrations faster. Increasing the vertical dispersion coefficient spreads the discharge across the vertical layers (or depths) faster.

Spatially constant, conservative dispersion coefficients of 0.15 m^2/s and 0.001 m^2/s were used to control the spreading of the plume in the horizontal and vertical directions, respectively. Each of the mixing parameters was selected following extensive sensitivity testing to recreate the plume characteristics predicted by the near-field modelling. It would be expected that the in-situ mixing dynamics would be greater under average and high energy conditions by a factor of 10 (King & McAllister, 1997; 1998) and thus the far-field model results are designed to produce a conservative result for concentration extents.

6.2.3.2 Grid Configuration

MUDMAP uses a three-dimensional grid to represent the geographic region under study (water depth and bathymetric profiles). A resolution of 10 m x 10 m was to track the movement and fate of the preservation chemical horizontally. The vertical resolution (z-axis) was set to 10 m. It is important to note, that the grid cell sizes were selected following extensive sensitivity testing in order to achieve similar dilution rates reflecting those predicted for the end of near-field mixing.

6.2.4 Interpretation of Percentile Dilution Contours

Once the simulations were complete, the individual outputs were combined and a statistical analysis performed to produce percentile dilutions. In the following sections, outcomes are presented for 95th 99th percentile and 100th (maximum) percentile dilution.

Note that the percentile figures represent concentrations that had occurred at each grid cell derived from 100 simulations and all time steps.

Moreover, the dilutions presented assume the background concentration of the preservation chemical in the receiving waters is zero and there is no biodegradation.

7 MODELLING RESULTS

7.1 Near-Field Modelling

Table 7-1 summarises the near-field modelling results. The near-field results showed that the treated seawater would initially propel upward at a 45 degree angle due to the diffuser orientation and the high exit velocity. The high exit velocity is also responsible for the initial mixing of the discharge plume and receiving waters that takes place. Once the plume lost its momentum, the plume descended slightly till it was neutrally buoyant with the ambient water and then mixed laterally due to ambient currents.

Within 30 m of the discharge, the predicted dilutions resulted in reductions of the initial concentration (550 mg/L) of the preservation chemical from to 3.6 mg/L (1:154.7 dilution), 2.6 mg/L (1:212.5 dilution) and 2.5 mg/L (or ppm; 1:222.5 dilution) under weak, medium and strong current conditions, respectively. Note that the required dilution corresponding to the impact threshold concentration/trigger value of 1 mg/L is 1:550 (see Section 5 Environmental Reporting Criteria). Importantly, the reported near-field predictions (Table 7-1) rely on the persistence of constant current speed(s) and direction over time and do not account for the build-up of the plume under time-varying hydrodynamic conditions (e.g. recirculation of the plume back to the Release Location).

Vertical cross-section and plan views of the predicted dilutions for the discharge under the modelled low, moderate and high currents are presented in Figure 7-1 to Figure 7-3, respectively.

Table 7-1 Predicted treated seawater near-field plume characteristics at 10 m and 30 m from the Release Location under weak, medium and strong current speeds during annualised conditions.

Surface current speed (m/s)	Distance from the Release Location (m)	Minimum centreline dilution (1:x)	Plume centre concentration (mg/L) following initial concentration of 550 mg/L	Plume diameter (m)
Weak (0.02)	10	55.1	10.0	3.2
	30	154.7	3.6	9.0
Medium (0.08)	10	66.6	8.3	3.4
	30	212.5	2.6	7.8
Strong (0.16)	10	75.1	7.3	3.0
	30	222.5	2.5	6.2

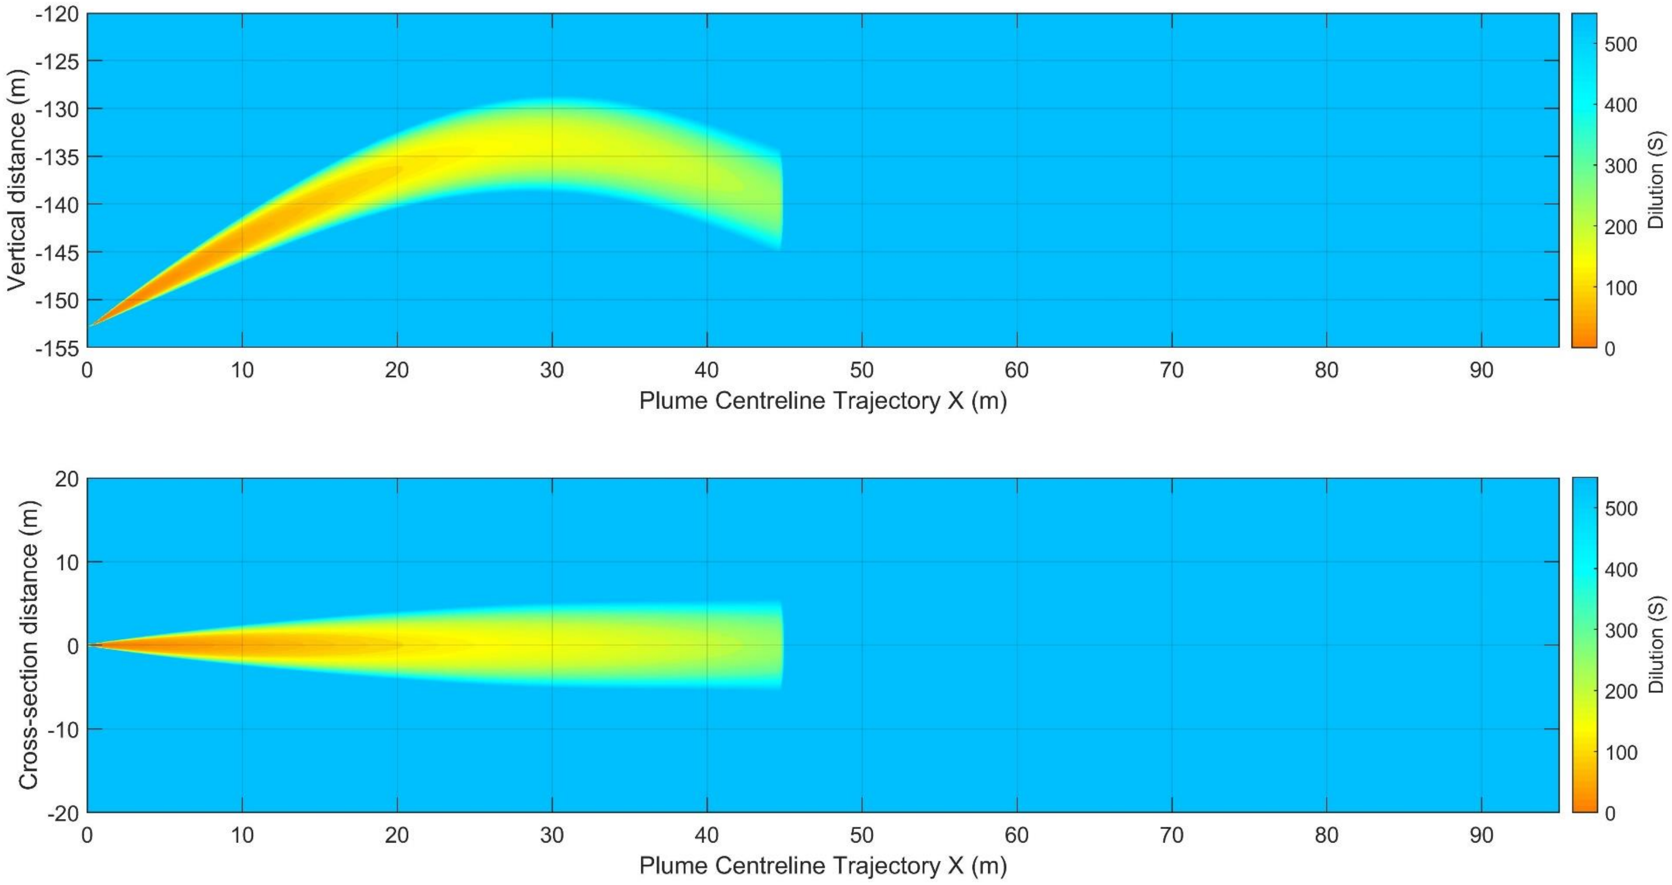

Figure 7-1 Vertical cross-section (top panel) and plan view (bottom panel) dilutions (1:S) for the discharge under low currents.

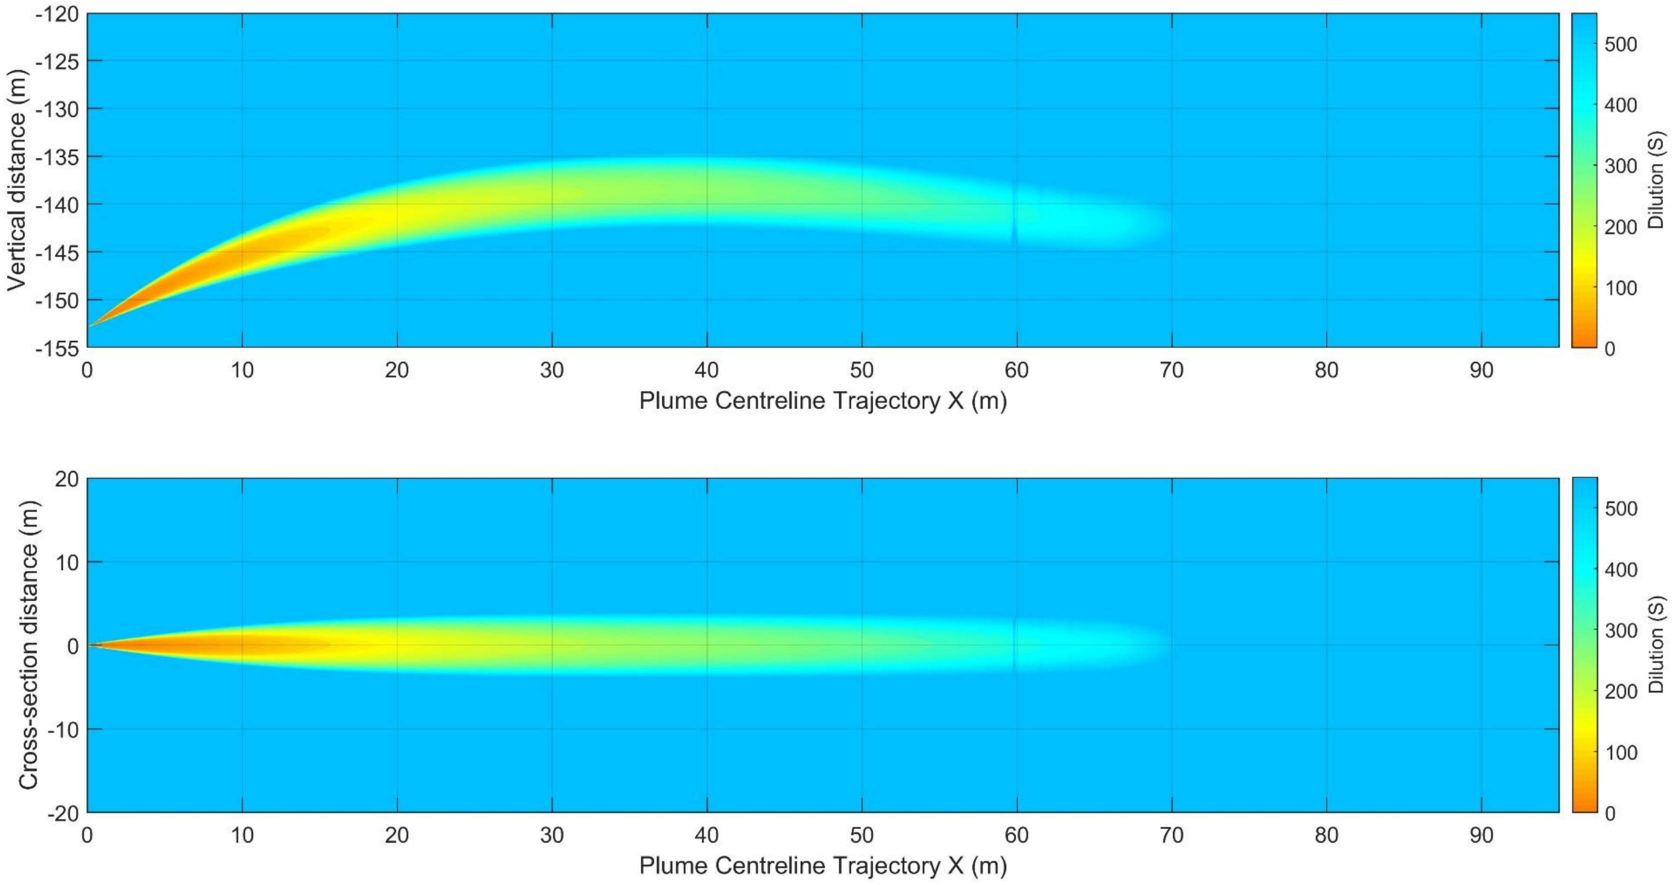

Figure 7-2 Vertical cross-section (top panel) and plan view (bottom panel) dilutions (1:S) for the discharge under moderate currents.

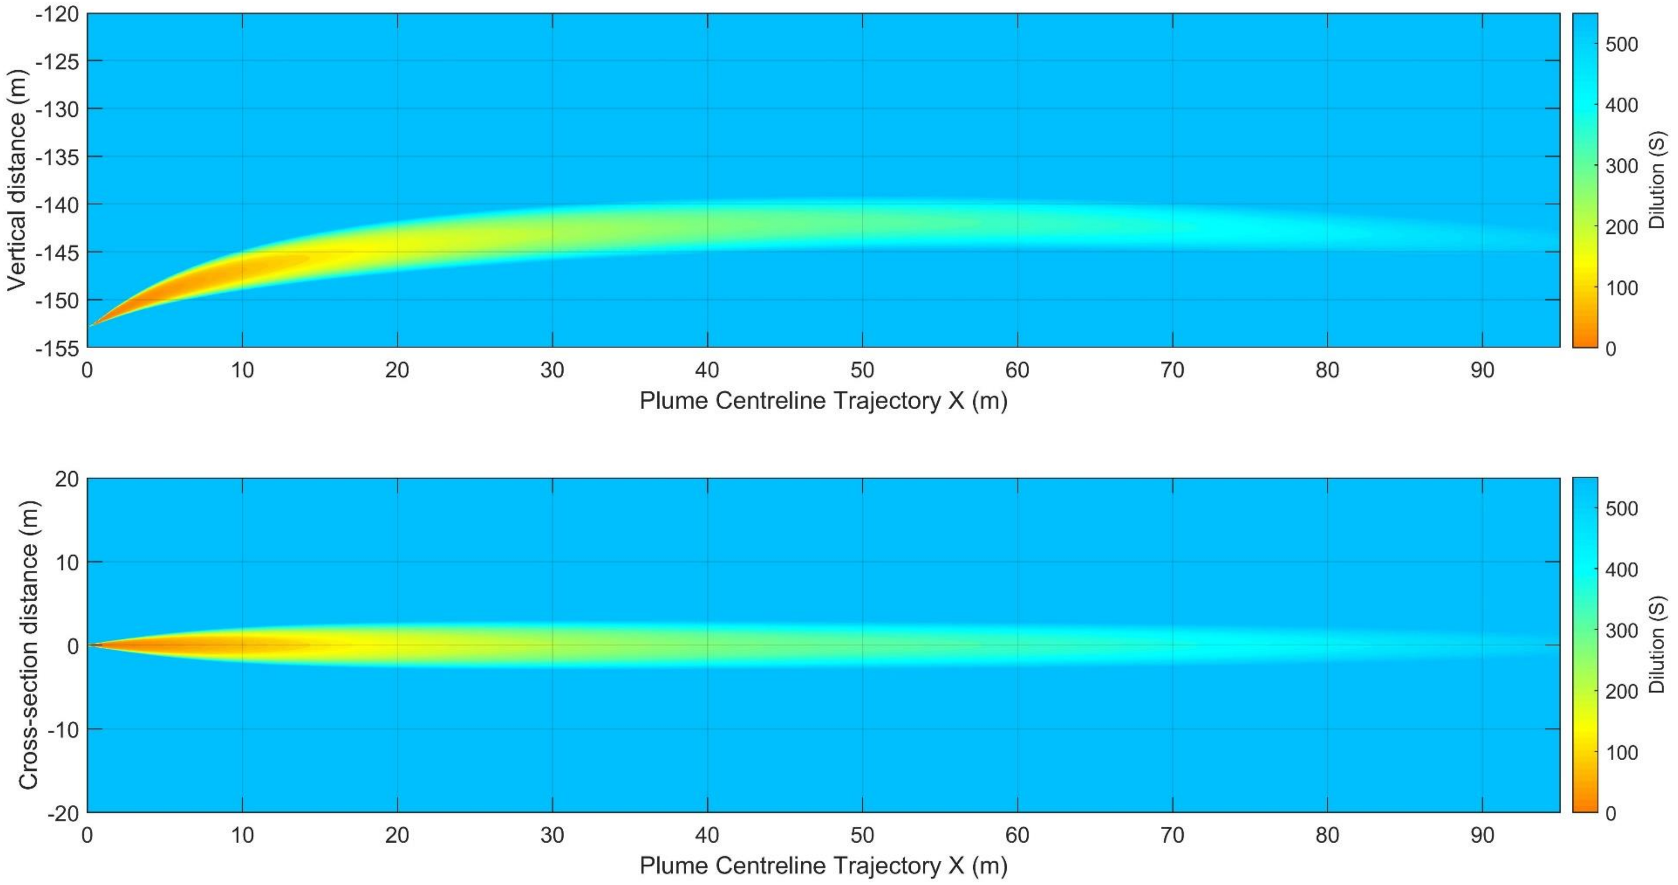

Figure 7-3 Vertical cross-section (top panel) and plan view (bottom panel) dilutions (1:S) for the discharge under high currents.

7.2 Far-Field Modelling

7.2.1 General Observations

Figure 7-4and Figure 7-5 present snapshots of predicted concentrations for a single simulation at +3, +6, +12 and +24 hours. The intention of the snapshots is to illustrate the spatially-varying orientation of the plume and the rapidly-varying nature of the achieved dilutions that could be observed under general conditions.

The far-field results demonstrated the dewatering discharge plume drifted horizontally through the water column in all directions from the Release Locations, whilst maintaining a low profile above the seafloor.

The snapshots illustrate that the dilutions became more variable over time because of changes in current speed and direction. Higher dilutions (i.e. lower concentrations) were predicted during periods of increased current speed, whereas patches of lower dilutions (i.e. higher concentrations) tended to accumulate during the turning of the tide or during periods of weak currents. During prolonged periods of lowered current speeds, the plume had a more continuous appearance, with higher-concentrated patches moving as a unified group.

Findings are agreeable with the research of King & McAllister (1997; 1998) who noted that concentrations within discharge plumes generated from offshore releases were patchy and likely to peak around the reversal of the tides.

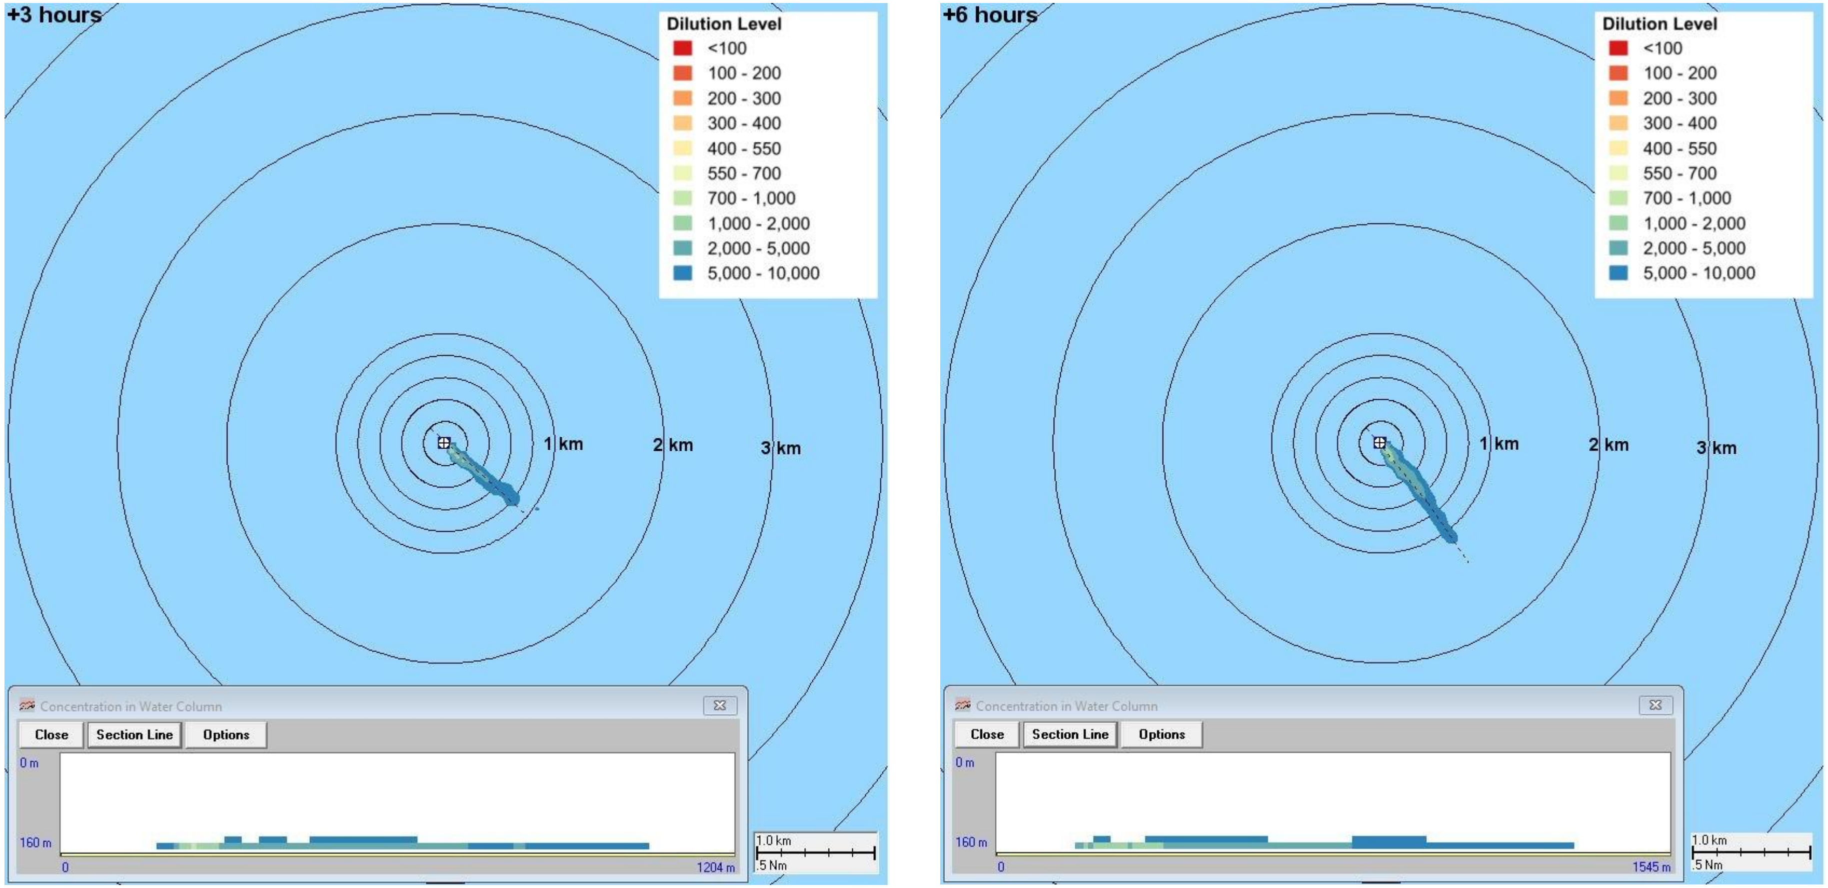

Figure 7-4 Example snapshots of predicted maximum concentrations, at +3 and +6 hours for a single simulation.

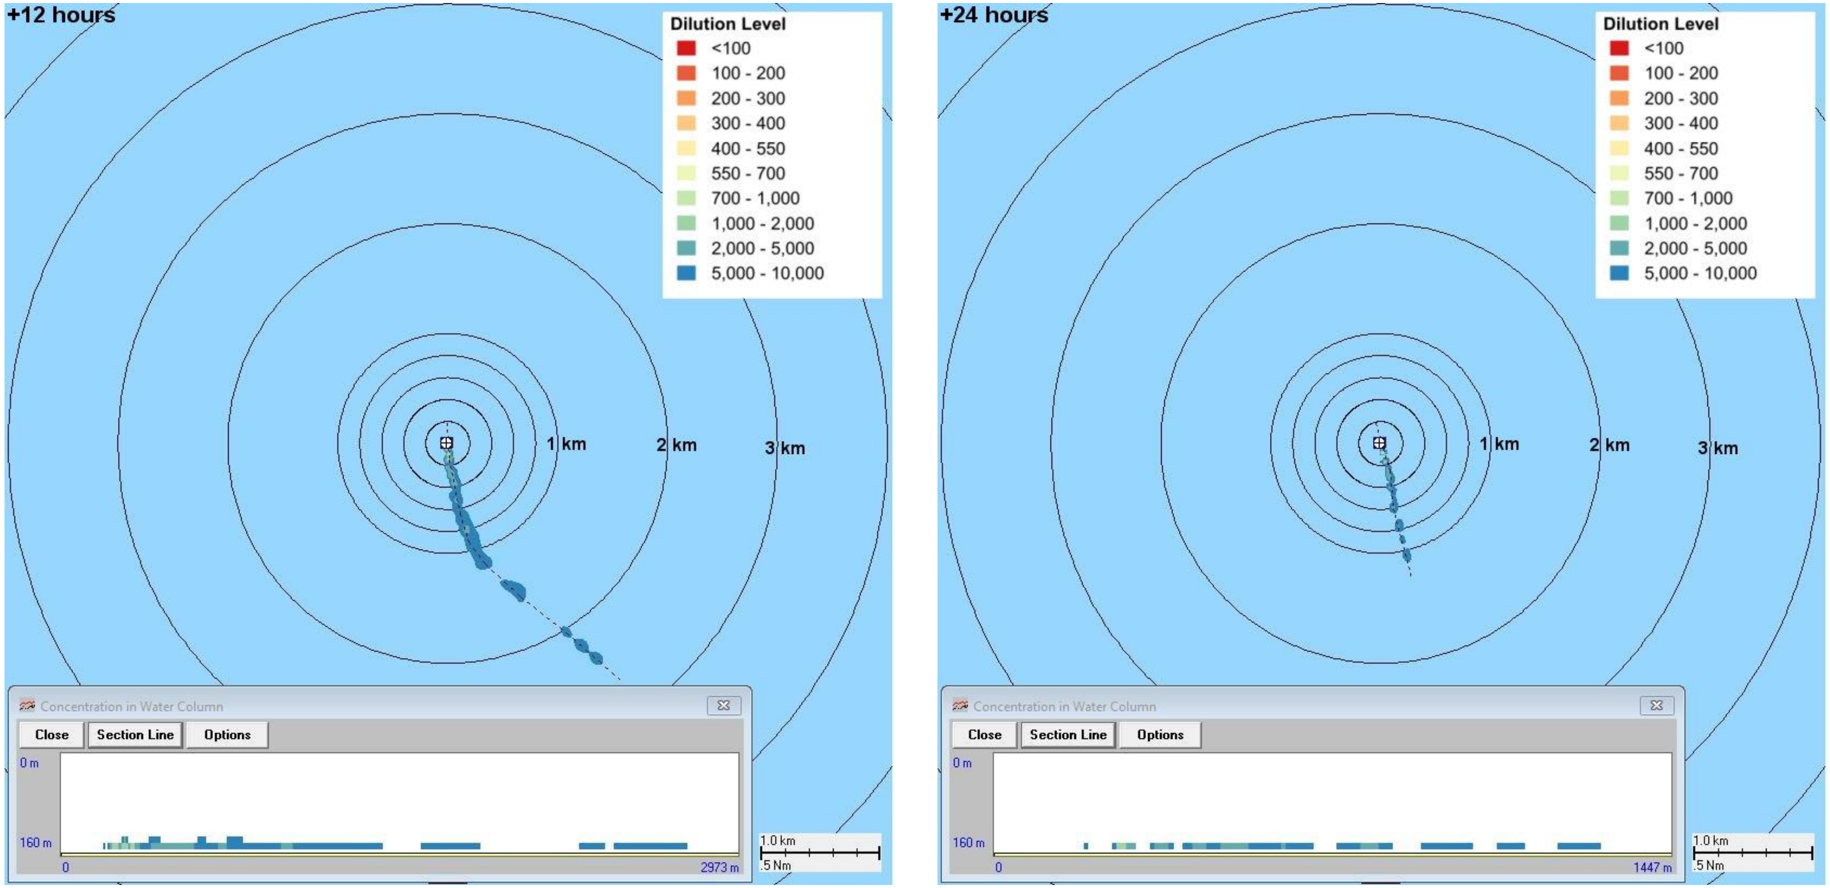

Figure 7-5 Continuing example snapshots of predicted maximum concentrations, at +12 and +24 hours for the single simulation presented in Figure 7-4.

7.2.2 Annualised Results

The results from all 100 simulations were combined and presented on an annualised basis.

Table 7-2 summarises the maximum distances from the discharge location to achieving dilutions up to 1:10,000. The results indicate that for the 99th and 100th percentiles, the maximum distances from the Release Location to instances of achieved dilutions of 1:550 (i.e. 1 mg/L which represents the impact threshold concentration/trigger value) were predicted to occur 20 m and 156 m from the Release Location, respectively. For the 95th percentile 1:550 dilutions are reached very close to the Release Location (20 m).

Figure 7-6 to Figure 7-10 present the results for the 95th, 99th and 100th percentile concentrations.

Table 7-2 Maximum distances from the Release Location to achieve selected dilutions. The results were calculated from 100 simulations and presented as an annual assessment.

Dilutions	Maximum distance (m) from discharge location to achieve selected dilutions		
	95th percentile	99th percentile	100th percentile
0-100	<10	<10	<10
100-200	<10	<10	<10
200-300	<10	<10	24
300-400	<10	<10	45
400-550	<10	20	156
550-700	<10	43	227
700-1,000	<10	112	231
1,000-2,000	125	201	819
2,000-5,000	344	592	5,779
5,000-10,000	782	1,389	6,253

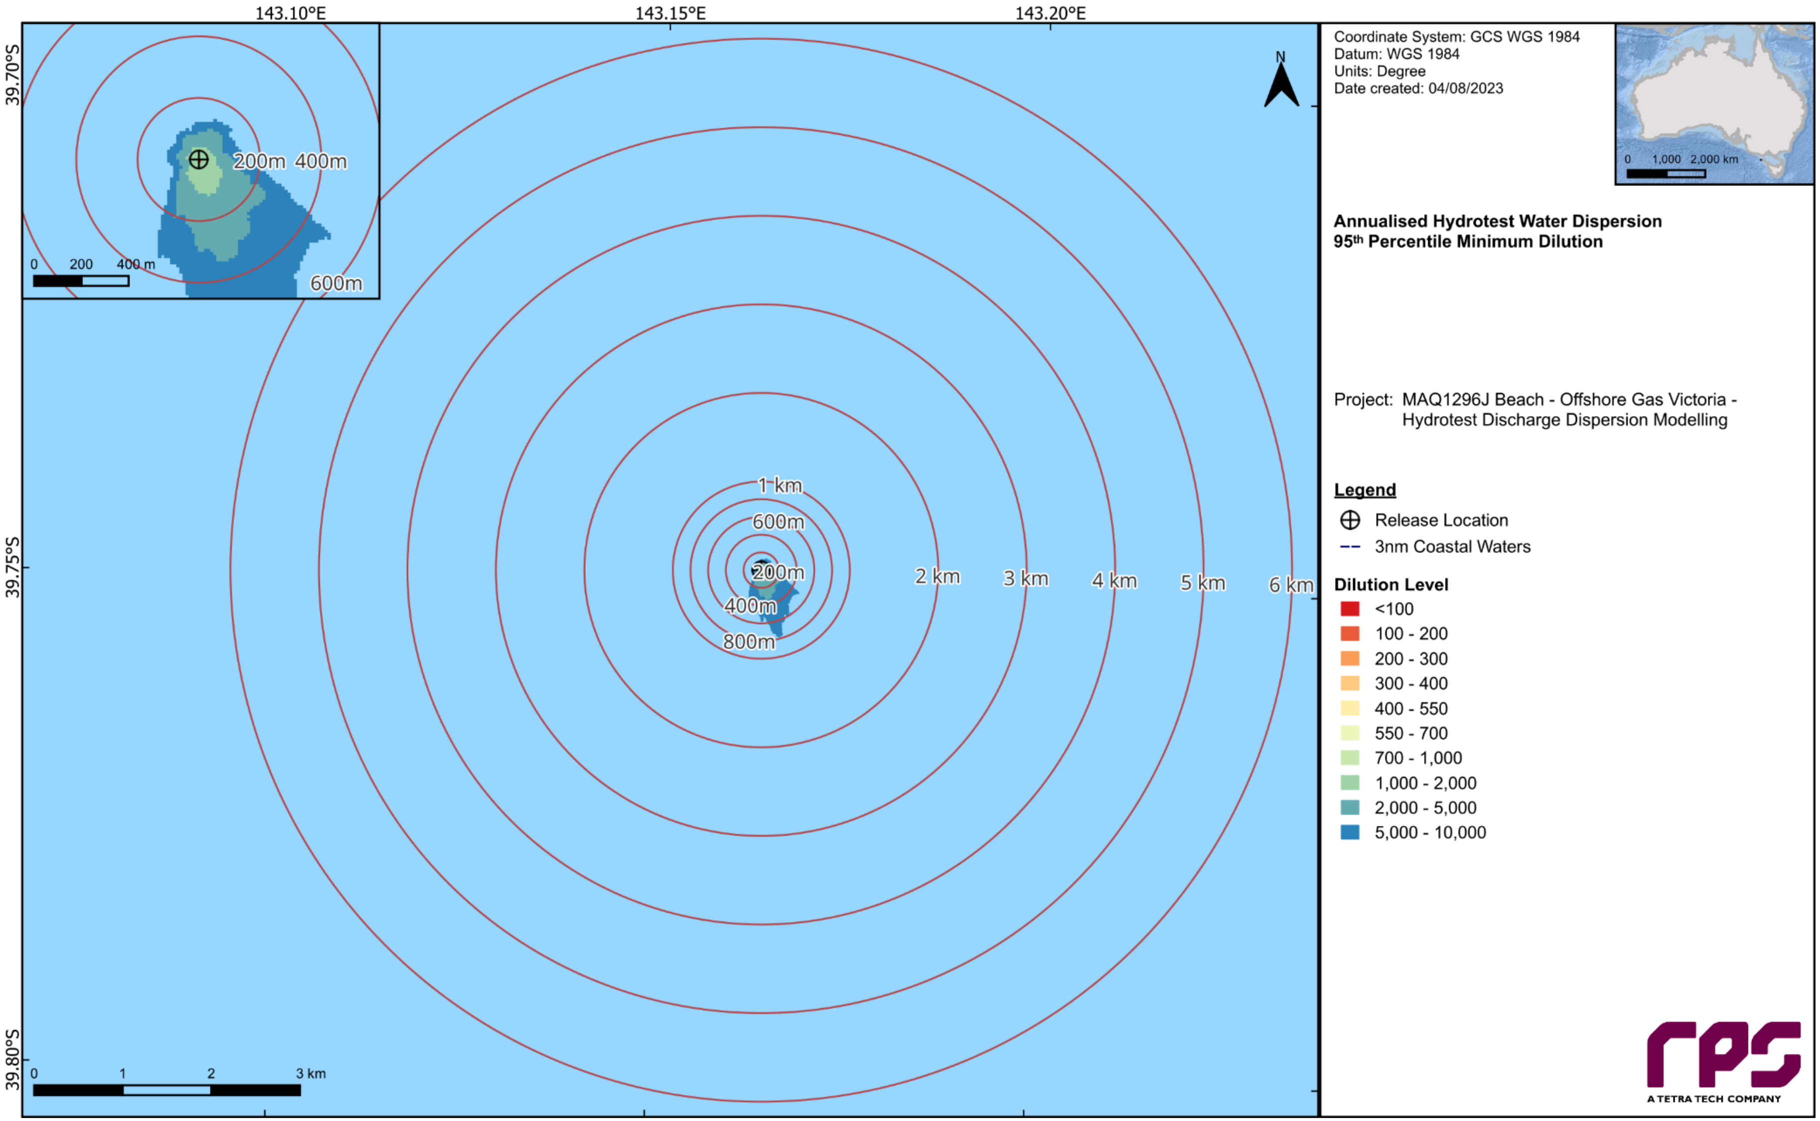

Figure 7-6 Predicted 95th percentile concentrations of the preservation chemical. The results were calculated from 100 simulations and presented as an annual assessment.

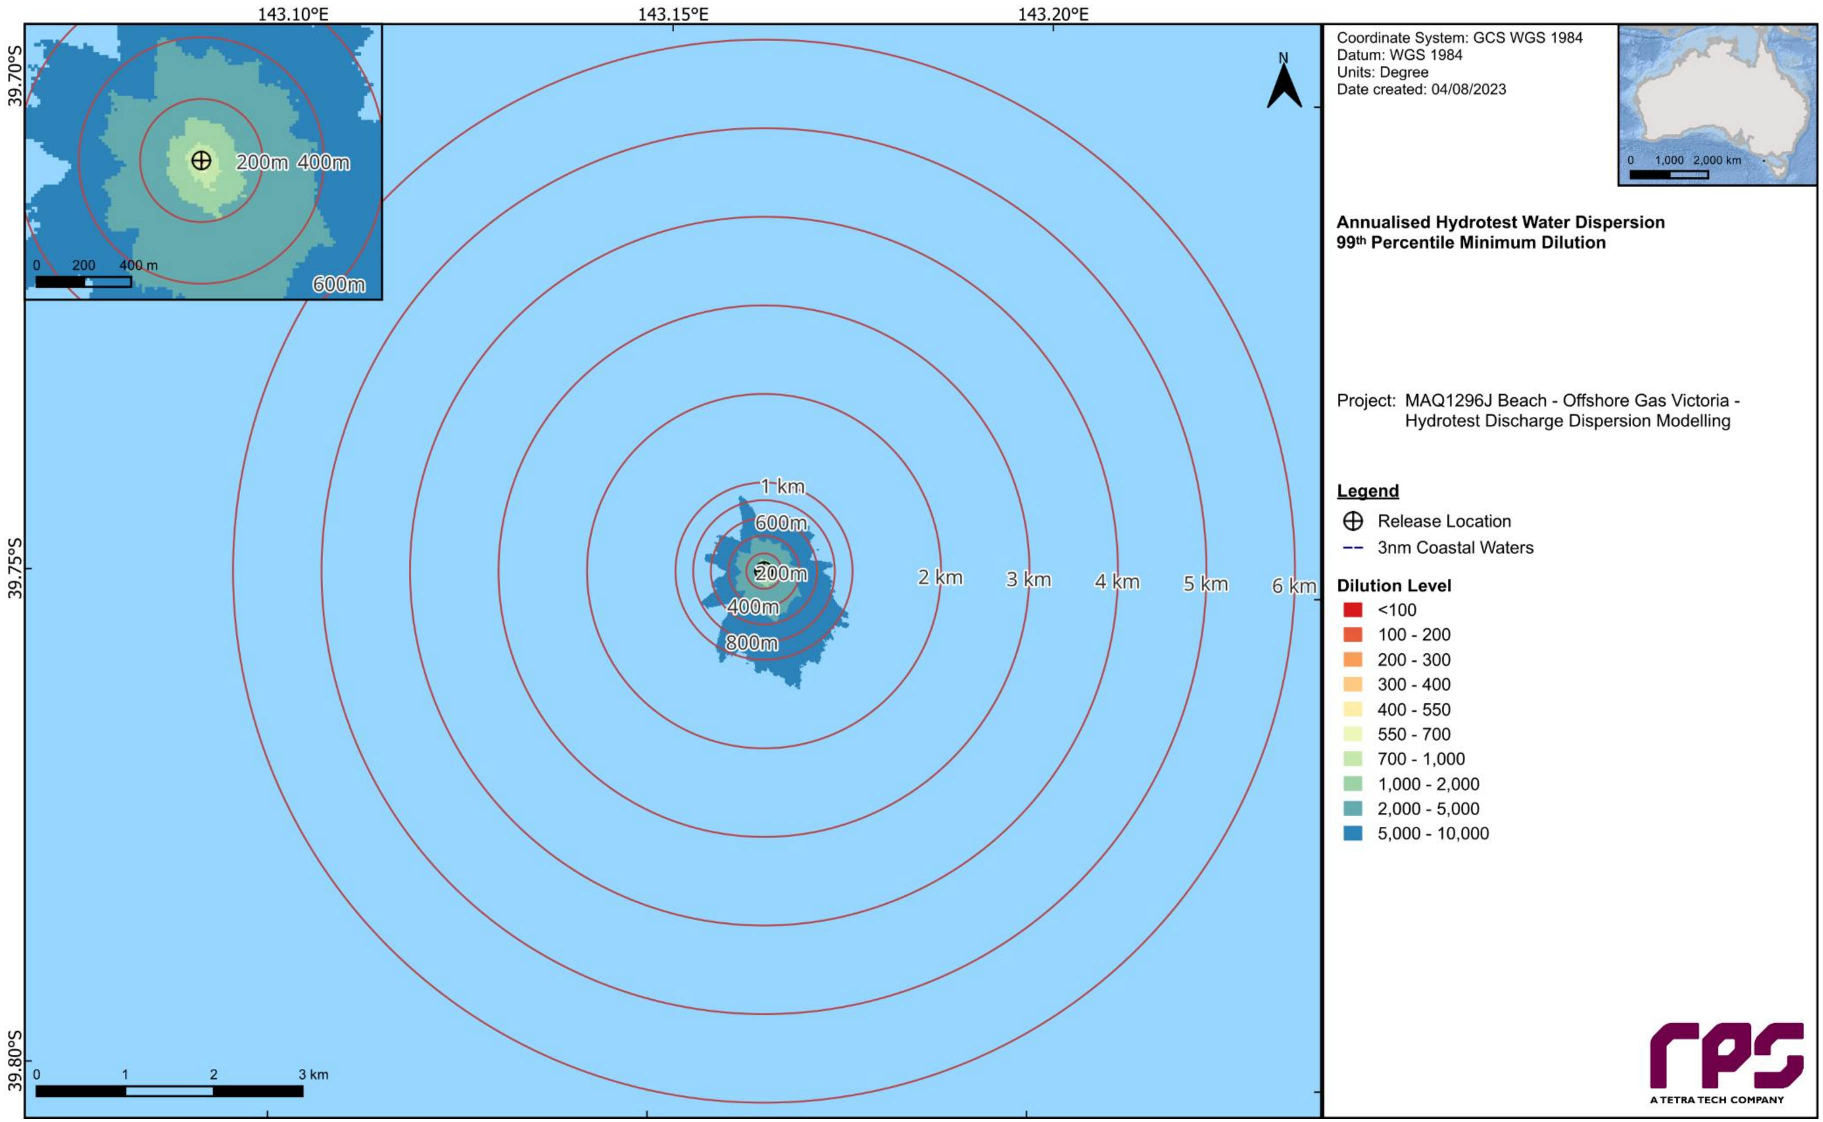

Figure 7-7 Predicted 99th percentile concentrations of the preservation chemical. The results were calculated from 100 simulations and presented as an annual assessment.

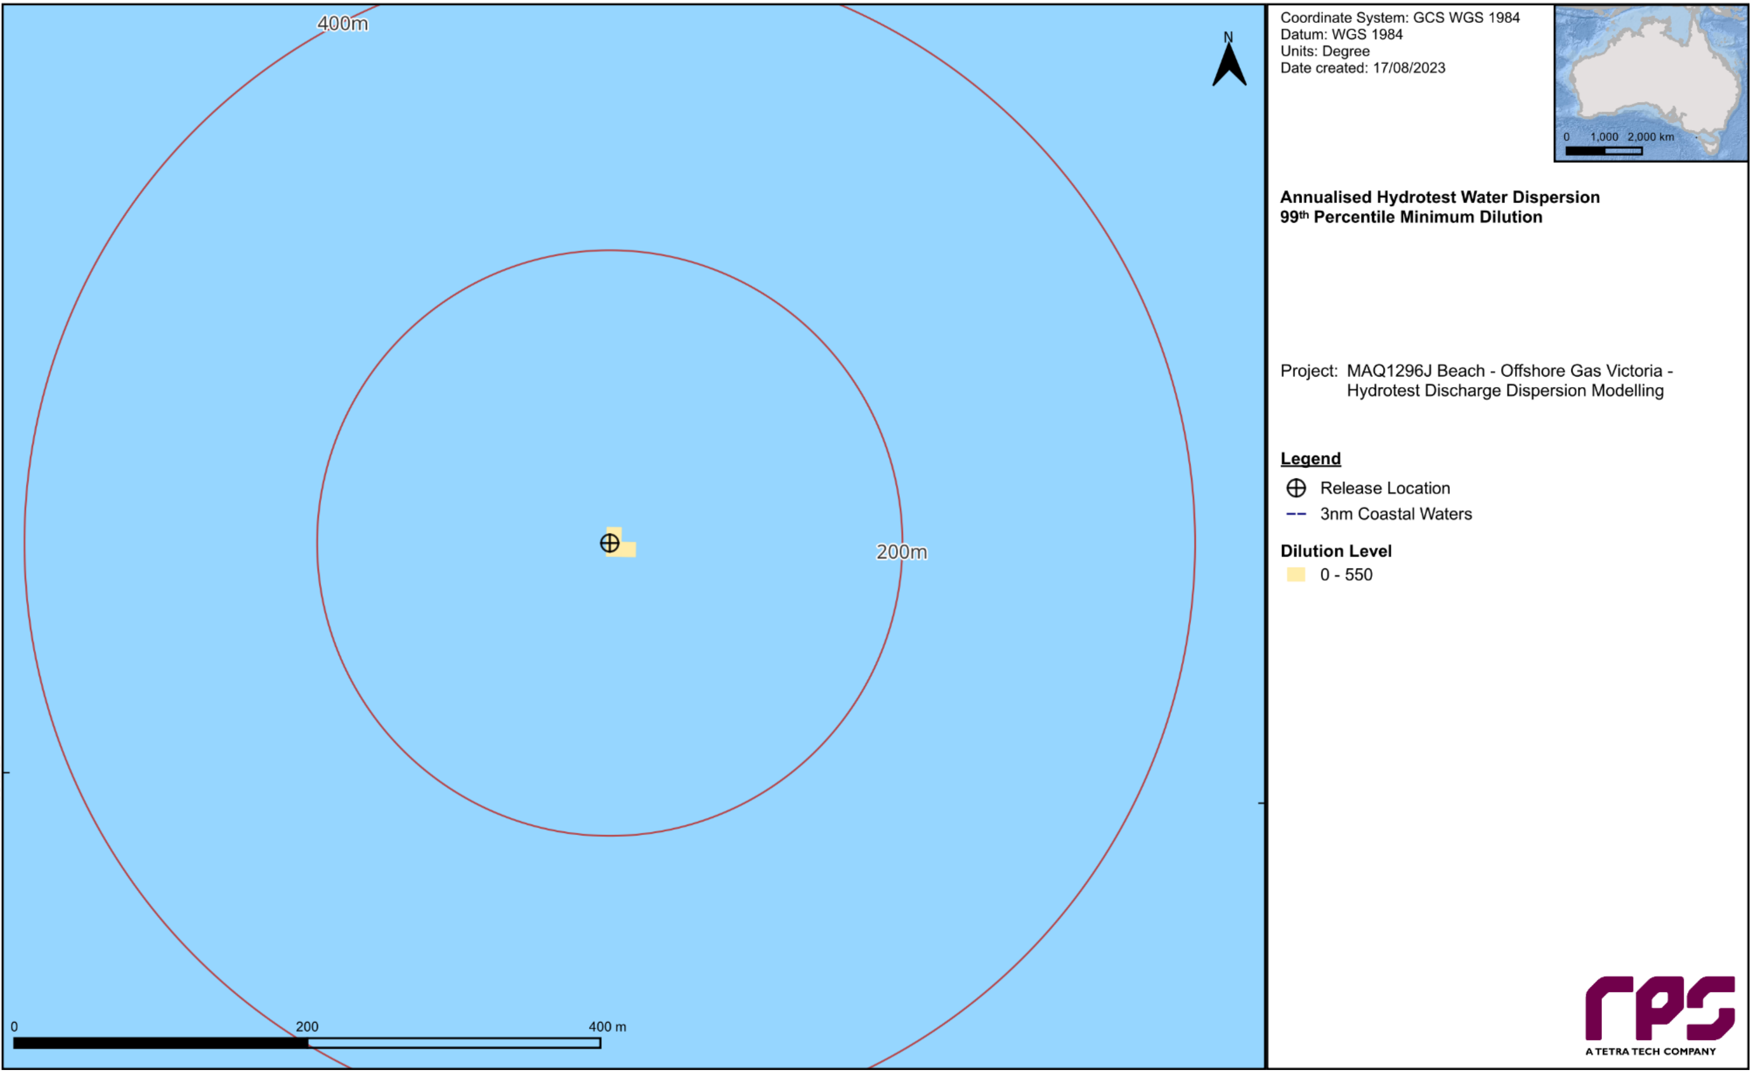

Figure 7-8 Predicted 99th percentile concentrations of the preservation chemical up until 550 dilutions (1 ppm). The results were calculated from 100 simulations and presented as an annual assessment.

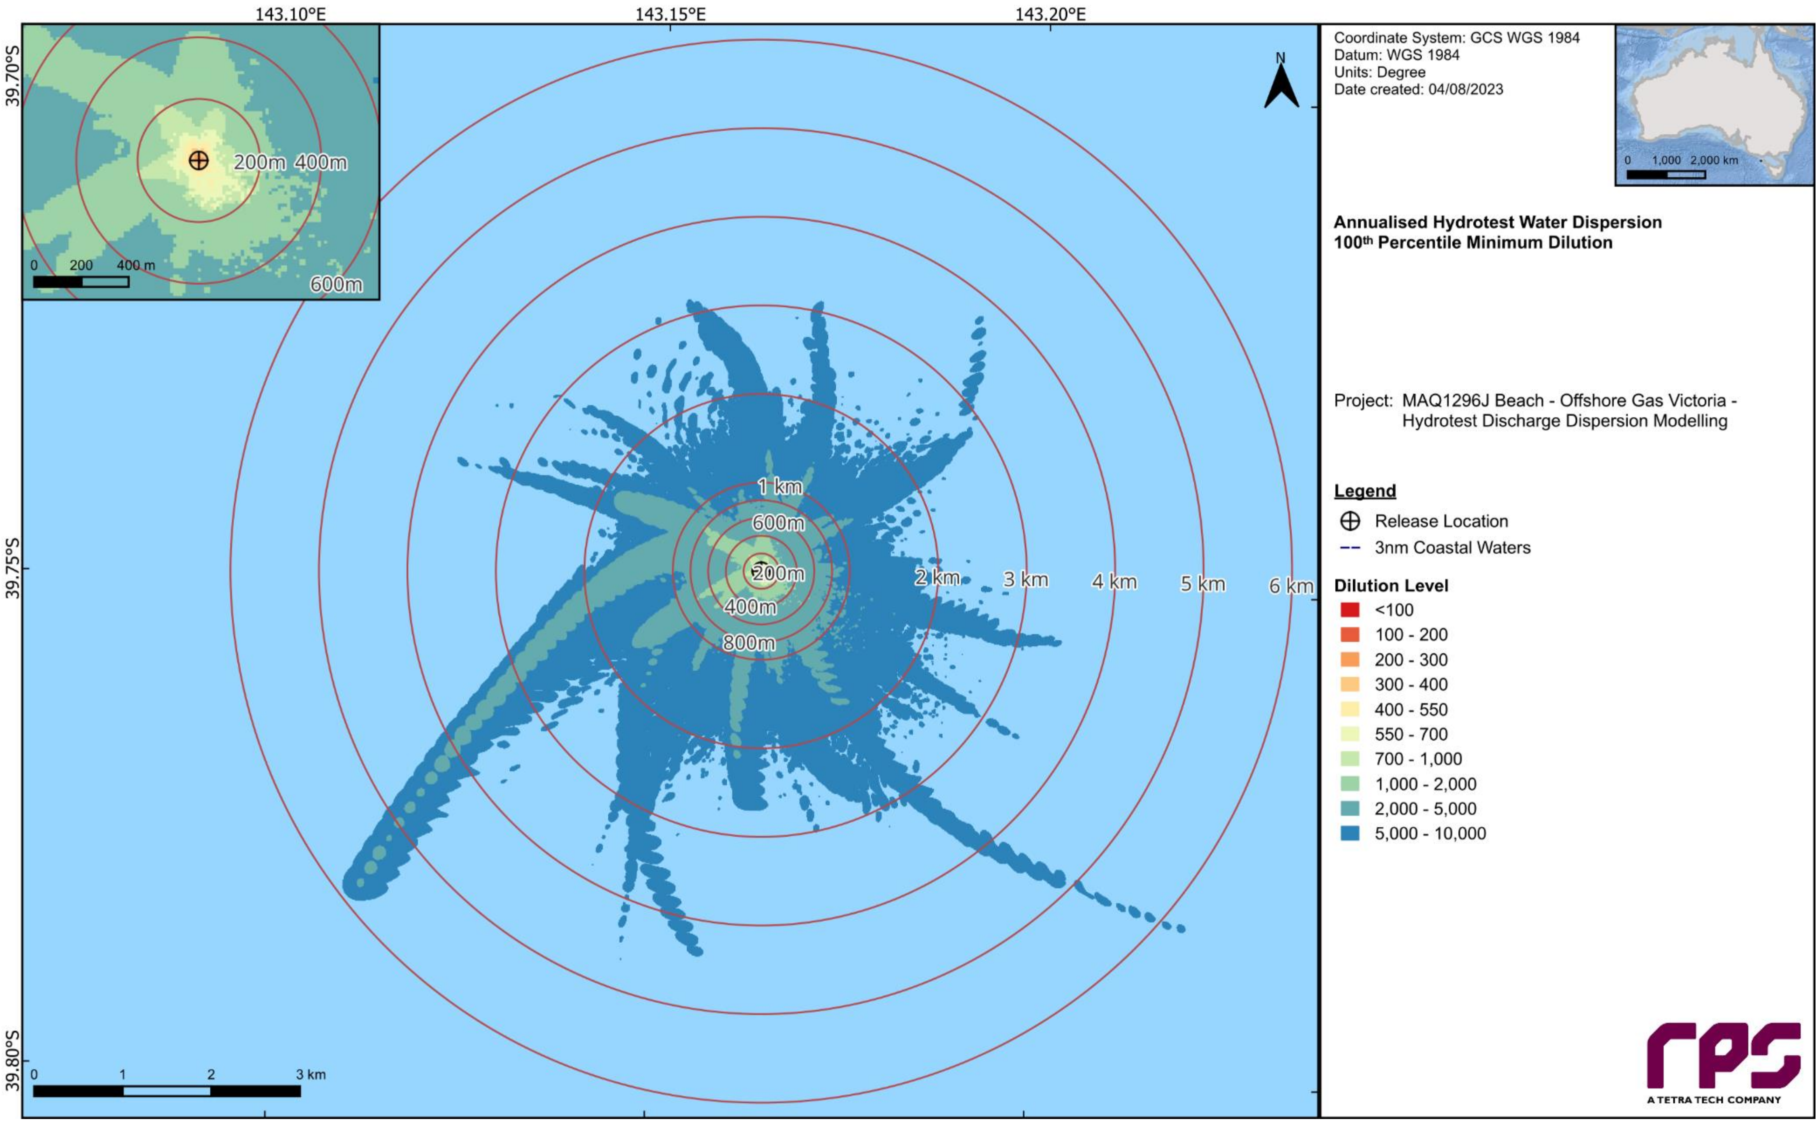

Figure 7-9 Predicted 100th percentile concentrations of the preservation chemical. The results were calculated from 100 simulations and presented as an annual assessment.

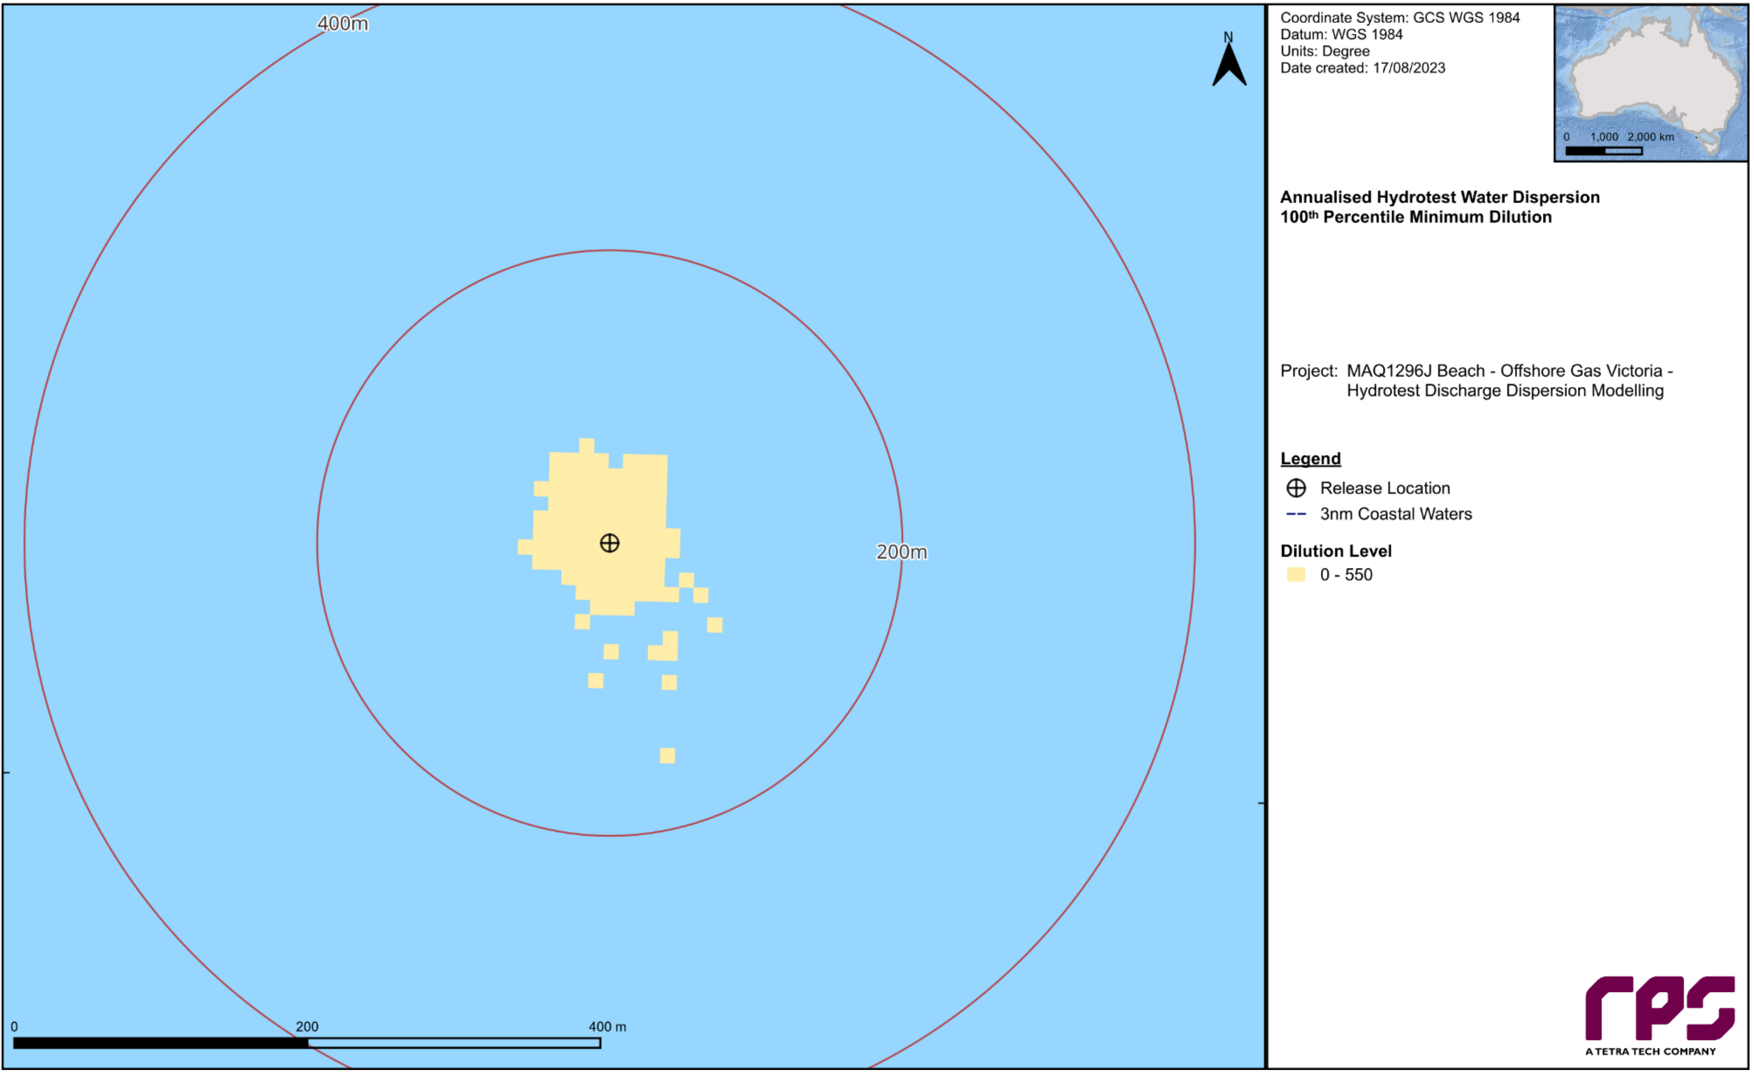

Figure 7-10 Predicted 100th percentile concentrations of the preservation chemical up until 550 dilutions (1 ppm). The results were calculated from 100 simulations and presented as an annual assessment

TERMS AND ABBREVIATIONS

AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
BIA	Biologically Important Areas
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Deterministic (single) oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IMCRA	Integrated marine and coastal regionalisation areas
KEF	Key Ecological Feature
LGA	Local Government Areas
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park
MP	Marine Park
MS	Marine Sanctuary
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park

NR	Nature Reserve
PAH	Polynuclear Aromatic Hydrocarbons
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RSB	Reefs, Shoals and Banks
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
Stochastic (multiple) oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the environment that maybe affected (EMBA) and indicates which locations are more likely to be affected (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be affected in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment
Sub-LGA	Sub-Local Government Areas
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations.

EXECUTIVE SUMMARY

Background

To support the Offshore Gas Victoria EP, Beach commissioned a detailed oil spill modelling study assessing the following hypothetical scenarios:

- A 434,752 stb [69,118 m^3] subsea release of condensate over 86 days from a loss of well control at the Northern Release Location;
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the Northern Release Locatio;
- A 102,576 stb [16,308 m^3] subsea release of condensate over 86 days from a loss of well control at the TW1; and
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the TW1.

The modelling assessment was undertaken on a seasonal basis as follows:

- Summer (November through to March); and
- Winter (April to October)

The purpose of the modelling is to provide an understanding of a conservative ‘outer envelope’ of the potential area that may be affected in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response strategies that would be implemented in response to a spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbon may influence.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a 10-year wind and current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled hydrocarbons.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 randomly selected single trajectory simulations per season, with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.

The SIMAP system, the methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-13 “*Standard Practice for Development and Use of Oil Spill Models*”.

Oil Properties

Thylacine condensate has an API of 44.3 and a density of 804.6 kg/m^3 (at 15ºC) with a viscosity value (0.87.0 cP) classifying it as a Group I (not-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications.

The condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, 64.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C), a further 19.0% is expected to evaporate within the first 24 hours (180°C < BP < 265°C) and a further 16.0% should evaporate over several days (265°C < BP < 380°C). Approximately 1.0% of the condensate is shown to be persistent.

Marine diesel (MDO) has an API of 37.6 and a density of 829.1 kg/m^3 (at 25ºC) with a viscosity value (4.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The MDO is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, about 6.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C); a further 34.6% should evaporate within the first 24 hours (180°C < BP < 265°C); and a further 54.4% should evaporate over several days (265°C < BP < 380°C). Approximately 5.0% of the oil is shown to be persistent.

Results

Scenario 1: 86-day Loss of Well Control at the Northern Release Location

- The maximum distances from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones were 54.03 km (east) and 5.83 km (east-southeast), both during winter conditions. No contact was predicted for the high threshold (> 50 g/m^2).
- Outside of the receptors that the Northern Release Location resides within, floating oil exposure above the low threshold was predicted at the Short-tailed Shearwater - Foraging (Buffer around Tasmania including Bass Strait), being 6% and 9% during summer and winter respectively.
- The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 99% during summer conditions and 96% during winter conditions.
- The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 67.91 m^3 and 87.54 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 104.17 km and 114.39 km, respectively.
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of dissolved hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) BIA and Corangamite (VIC) NRMR (summer – 570.15 ppb, winter – 1,332.51 ppb).
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of entrained hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) (summer – 358.93 ppb, winter – 527.26 ppb).

Scenario 2: Loss of Marine Diesel Containment at the Northern Release Location

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 32.65 km (east-southeast), 19.85 km (southeast) and 10.53 km (southeast) all during winter conditions.
- The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 30.86 m^3 and 58.33 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 29.23 km and 43.19 km, respectively.
- Only the receptors that the Northern Release Location resides within were contacted by dissolved hydrocarbon at the low threshold. The maximum dissolved hydrocarbon concentration was 101.35 ppb and 65.67 ppb during summer and winter respectively.

- Outside of the receptors that the Northern Release Location resides within, the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 745.77 ppb, winter – 1,391.43 ppb), which also presented the highest probability of low entrained hydrocarbon exposure (summer – 60%, winter – 97%).

Scenario 3: 86-day Loss of Well Control at TW1

- The maximum distance from the release location to the low (1–10 g/m^2) exposure zone was 24.49 km (southeast) during summer conditions and 18.35 km (south) during winter conditions, respectively. No contact was predicted for the moderate (10–50 g/m^2) or high (> 50 g/m^2) thresholds.

- Outside of the receptors that the Northern Release Location resides within, the highest probability of floating oil exposure above the low threshold was predicted at the Pygmy Blue Whale – Foraging BIA (28% summer, 25% winter).

- The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 32% during summer conditions and 57% during winter conditions.

- The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 6.15 m^3 and 8.36 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 12.62 km and 13.90 km, respectively.

- Outside of the receptors that the Northern Release Location resides within, the highest concentration of dissolved hydrocarbon was 553.15 ppb during summer and 528.54 ppb during winter.
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of entrained hydrocarbon was predicted for White Shark – Distribution (Between 120 – 1,000 m depth contour) (summer – 338.67 ppb, winter – 328.89 ppb).

Scenario 4: Loss of Marine Diesel Containment at TW1

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 64.97 km (southeast), 49 km (southeast) and 10.08 km (south-southeast) all during winter.

- No shoreline contact was forecast during summer conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 9% during winter conditions.

- The maximum volume ashore for a single spill trajectory was 9.67 m^3, whilst the maximum length of shoreline accumulation at the low threshold was 17.67 km.

- Outside of the receptors that the Northern Release Location resides within, the highest concentration of dissolved hydrocarbon was predicted for the White Shark - Distribution (Between the 120 - 1,000m depth contour) BIA, being 23.94 ppb in summer and 23.23 ppb in winter.

- Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 6,692.22 ppb, winter – 6,075.03 ppb).

1 INTRODUCTION

1.1 Background

To support the Offshore Gas Victoria EP, Beach commissioned a detailed oil spill modelling study assessing the following hypothetical scenarios:

- A 434,752 stb [69,118 m^3] subsea release of condensate over 86 days from a loss of well control at the Northern Release Location;
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the Northern Release Location;
- A 102,576 stb [16,308 m^3] subsea release of condensate over 86 days from a loss of well control at the TW1; and
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the TW1.

The modelling assessment was undertaken on a seasonal basis as follows:

- Summer (November through to March); and
- Winter (April to October)

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area that may be affected in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response strategies that would be implemented in response to a spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbon may influence.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Table 1-1 Location of assessed release site.

Well	Latitude	Longitude	Water Depth (m)
Northern Release Location	38.8552° S	142.8381° E	71.5
TW1	39.2223° S	142.8386° E	105

GCS: WGS84

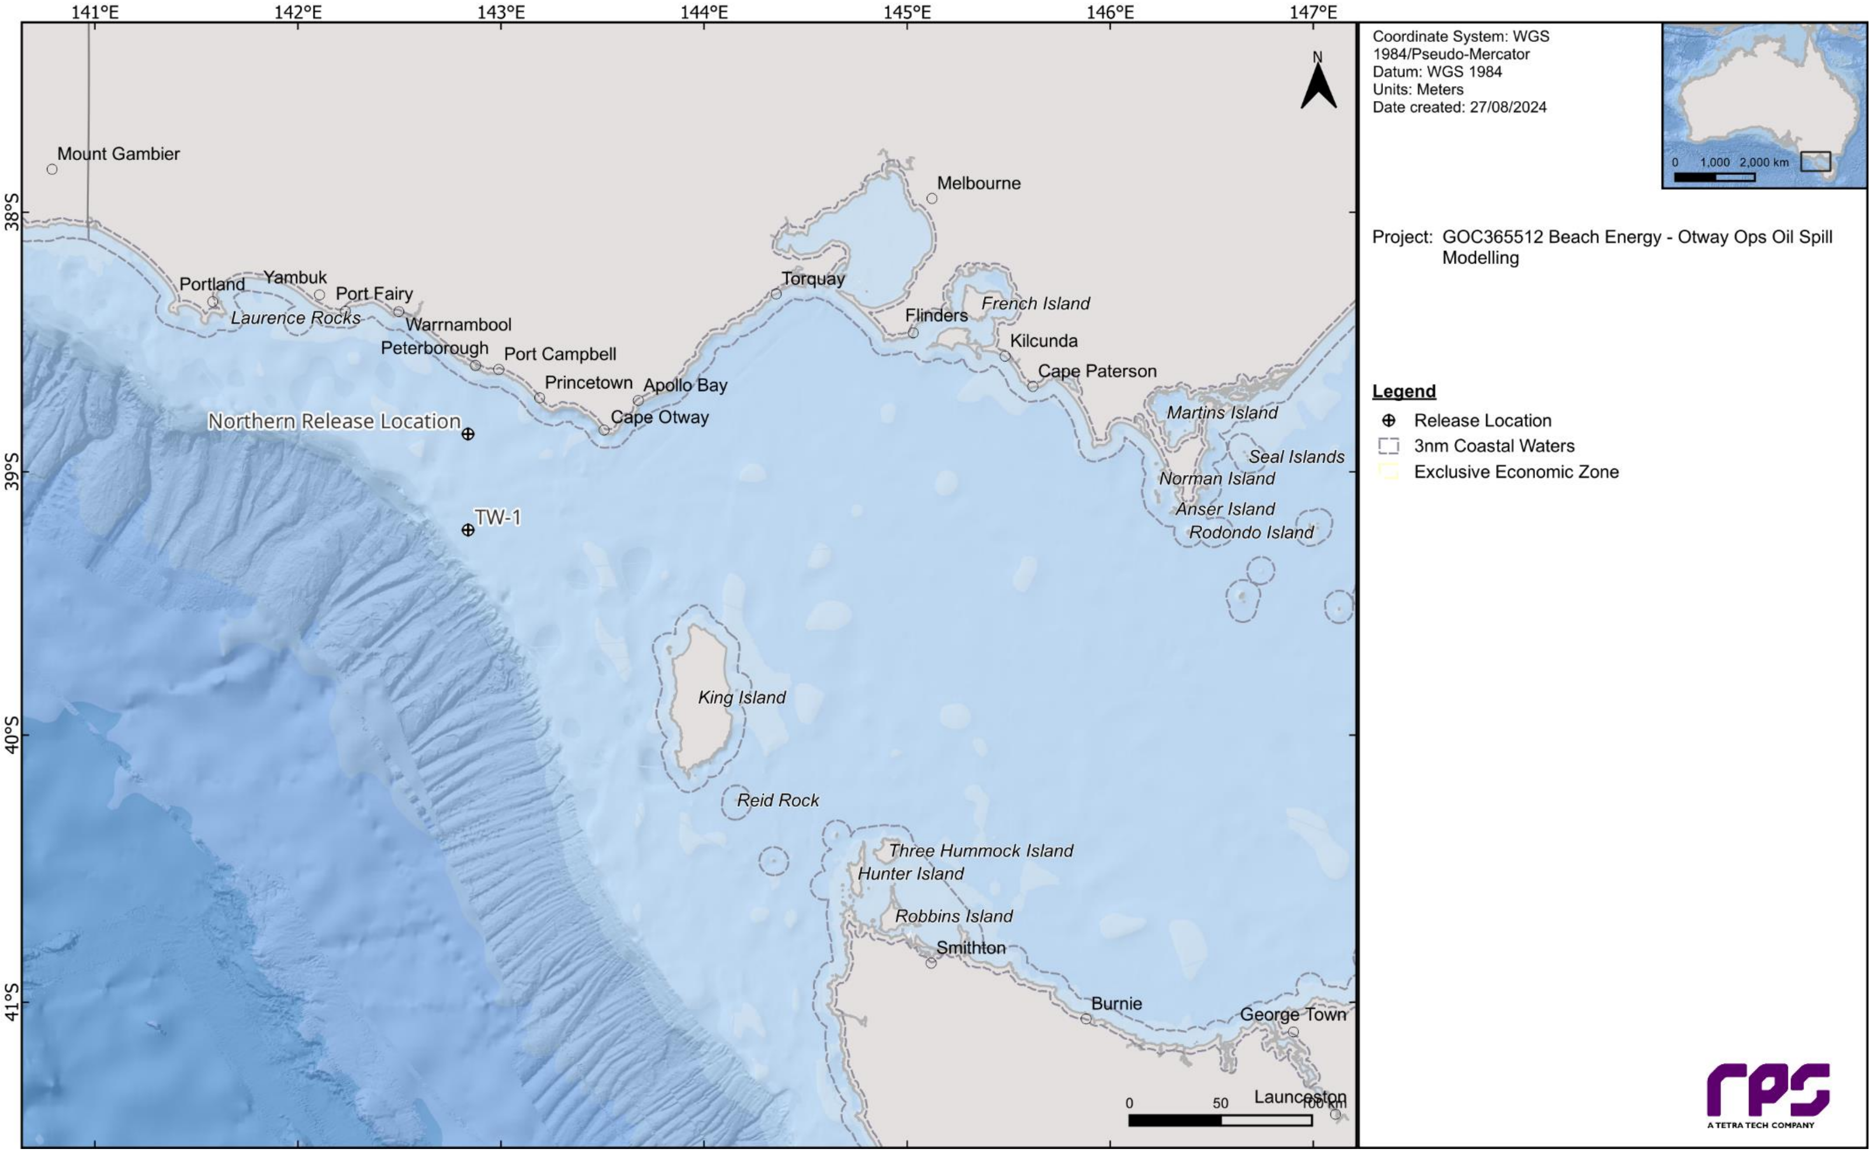

Figure 1-1 Map of the assessed release location.

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

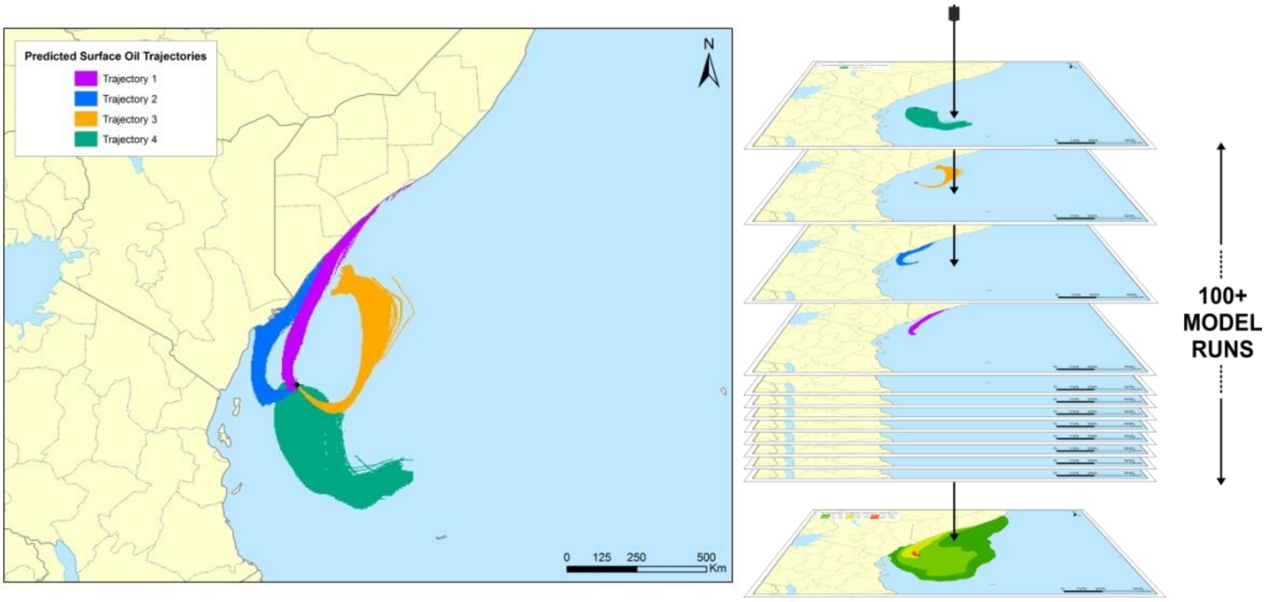

Figure 1-2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1-3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore, longest length of shoreline contacted by oil or largest area of entrained or dissolved hydrocarbons.

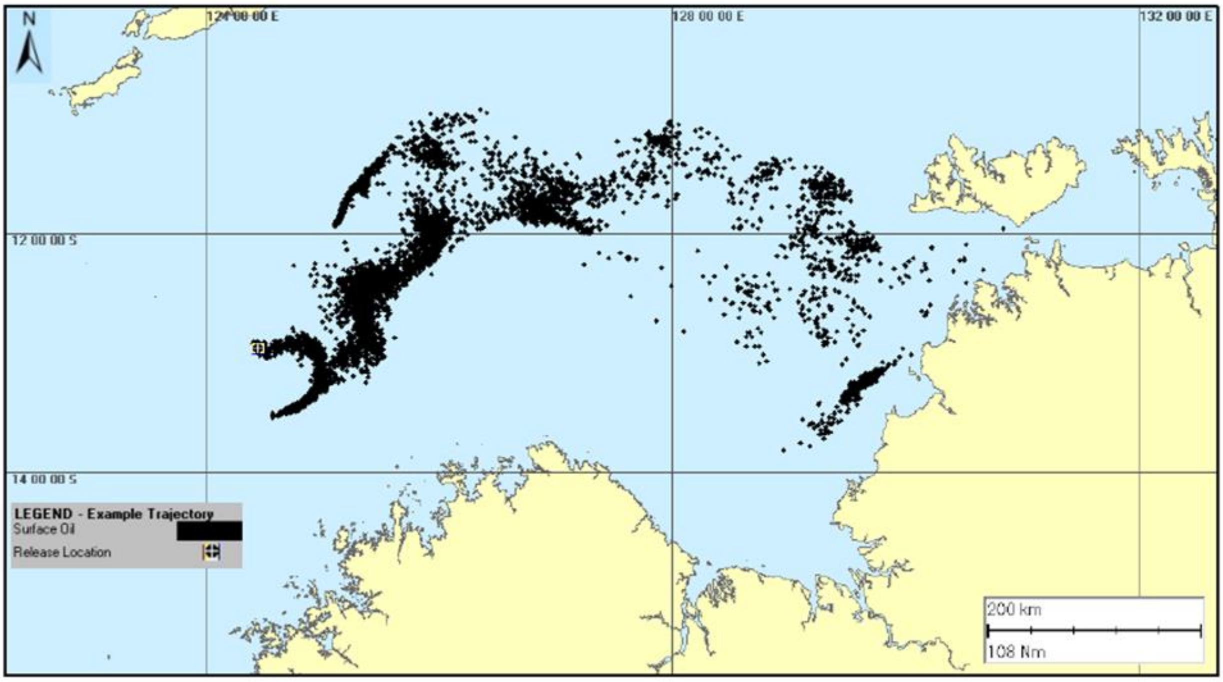

Figure 1-3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

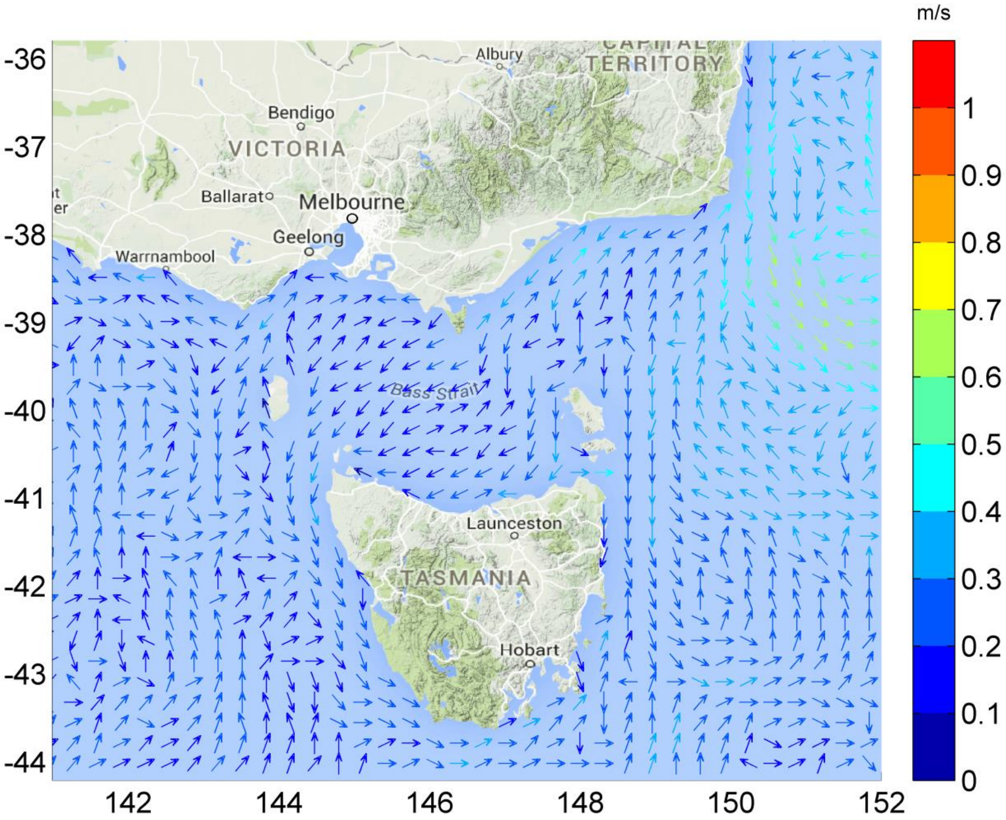
- Generate 10-years of winds and three-dimensional currents from 2010 to 2019 (inclusive). The currents included the combined influence of tidal and ocean currents.
- Include the wind and current data and characteristics of the released hydrocarbons as input into the three-dimensional oil spill model (SIMAP), to model the movement, spreading, weathering and shoreline contact by hydrocarbons over time.
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surrounding waters and shorelines. This involved running 100 randomly selected single trajectory simulations per season, with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.
- Results were assessed to determine the exposure to surrounding waters and contact to shorelines based upon the NOPSEMA thresholds.

3 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3-1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.



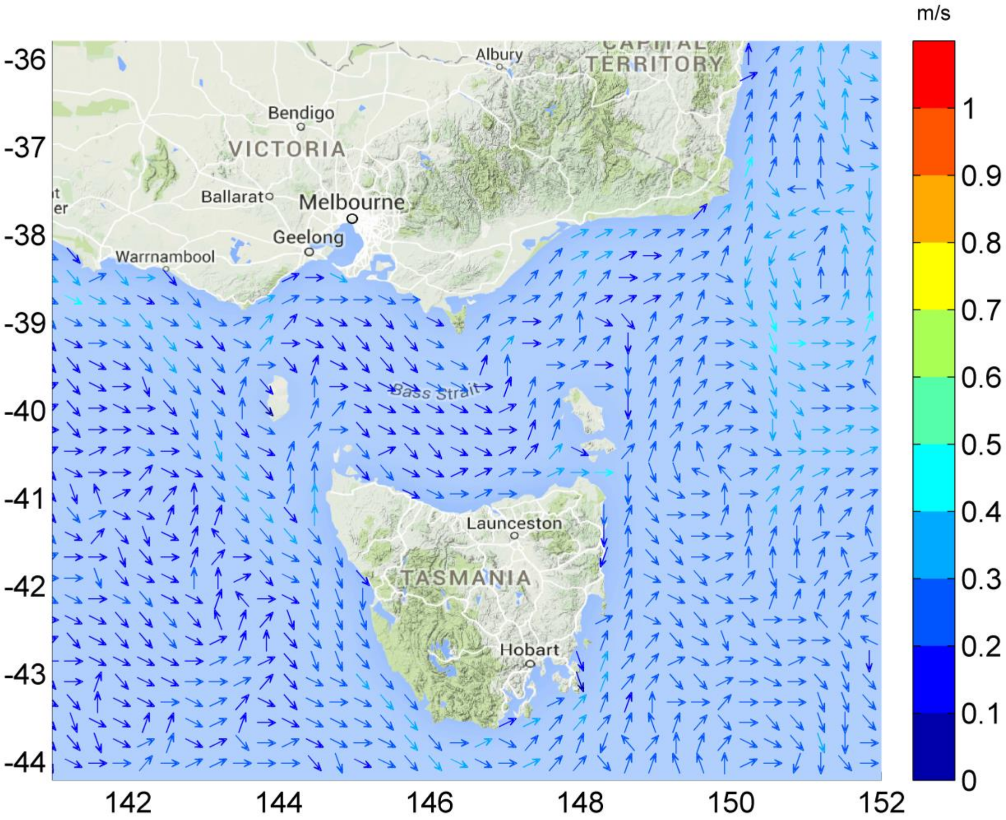


Figure 3-1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).

3.1 Tidal Current Model

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for more than 30 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3-2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3-3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

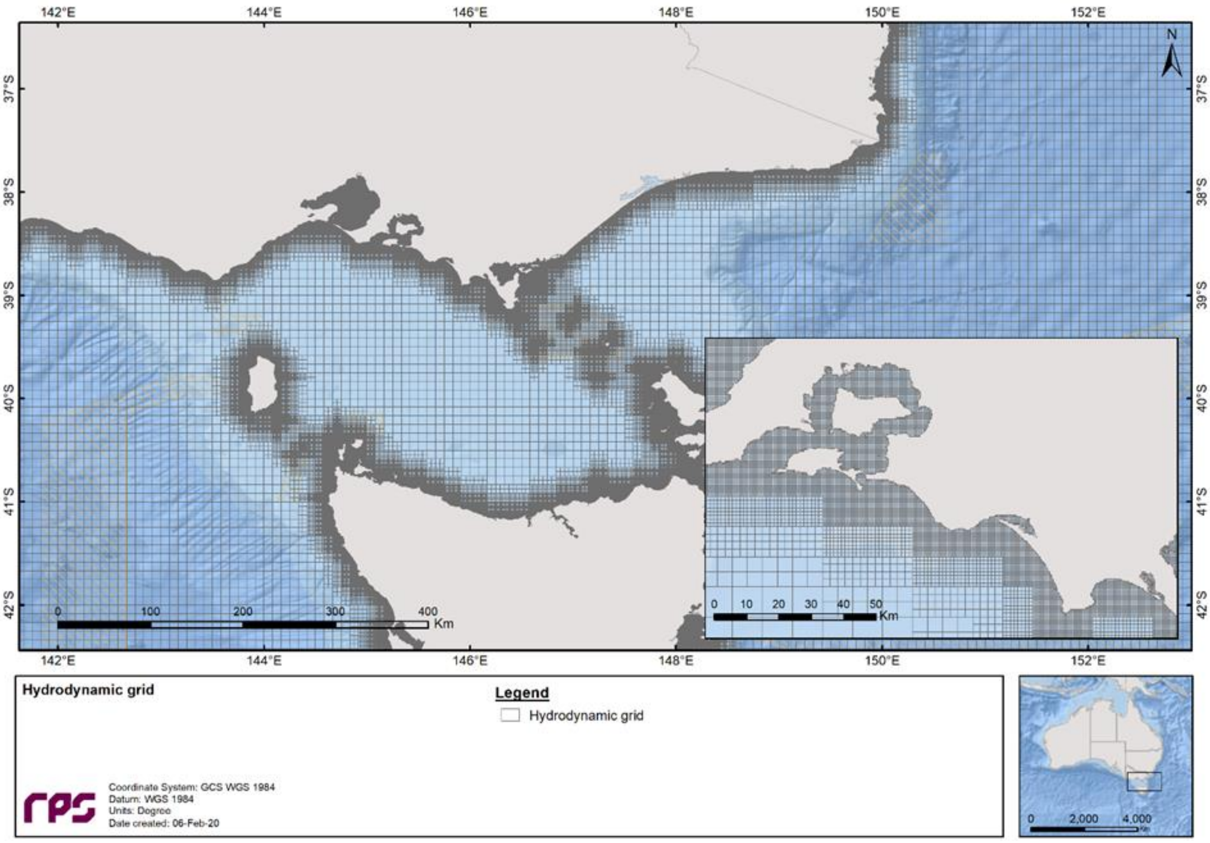

Figure 3-2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

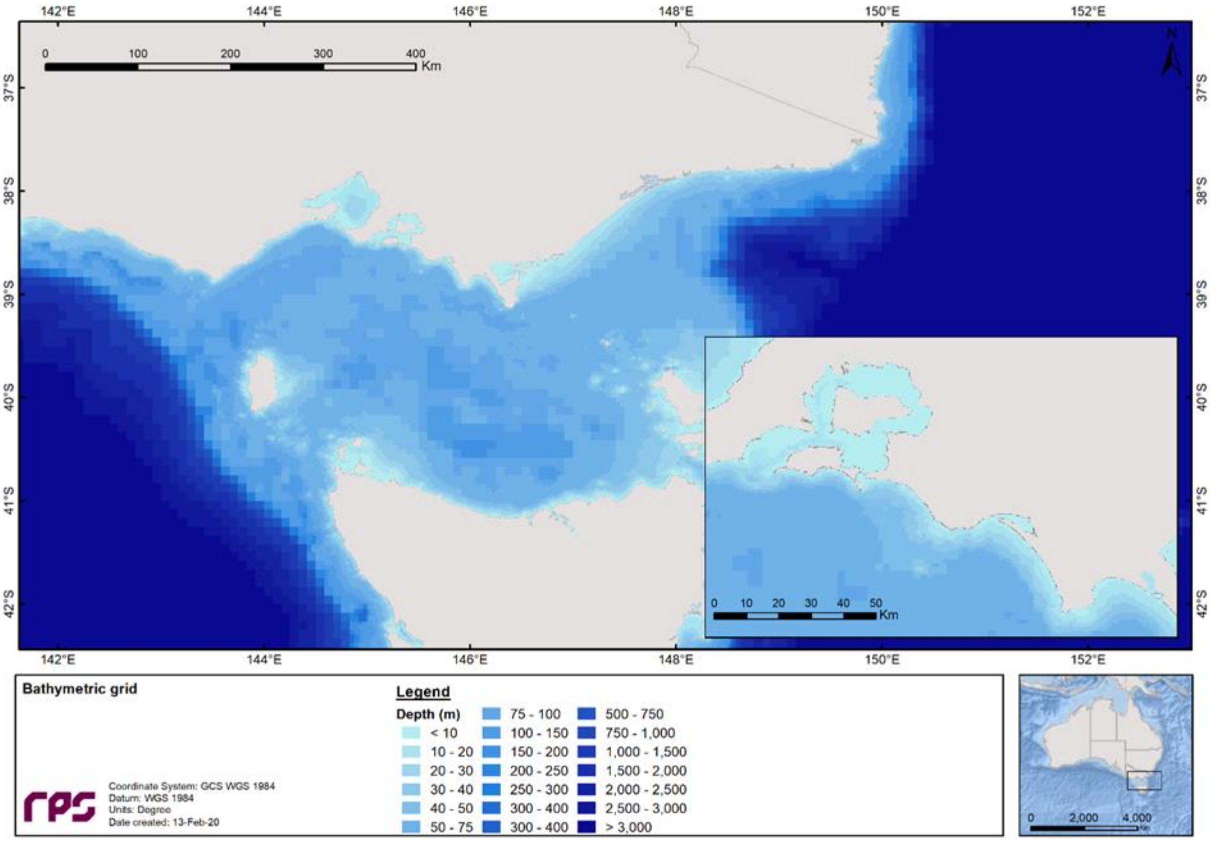

Figure 3-3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex/Poseidon tidal data has been widely used amongst the oceanographic community, being referenced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3-4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

P_i = Model predicted surface elevation

O_i = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: X_{model} = Model predicted surface elevation

X_{obs} = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3-5 and Figure 3-6 illustrate a comparison of the predicted and observed surface elevations in February 2017. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3-1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3-1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Gabo Island	0.98	0.08
Port MacDonnell	0.98	0.05
Port Welshpool	0.92	0.30
Portland	0.97	0.07
Stack Island	0.96	0.22

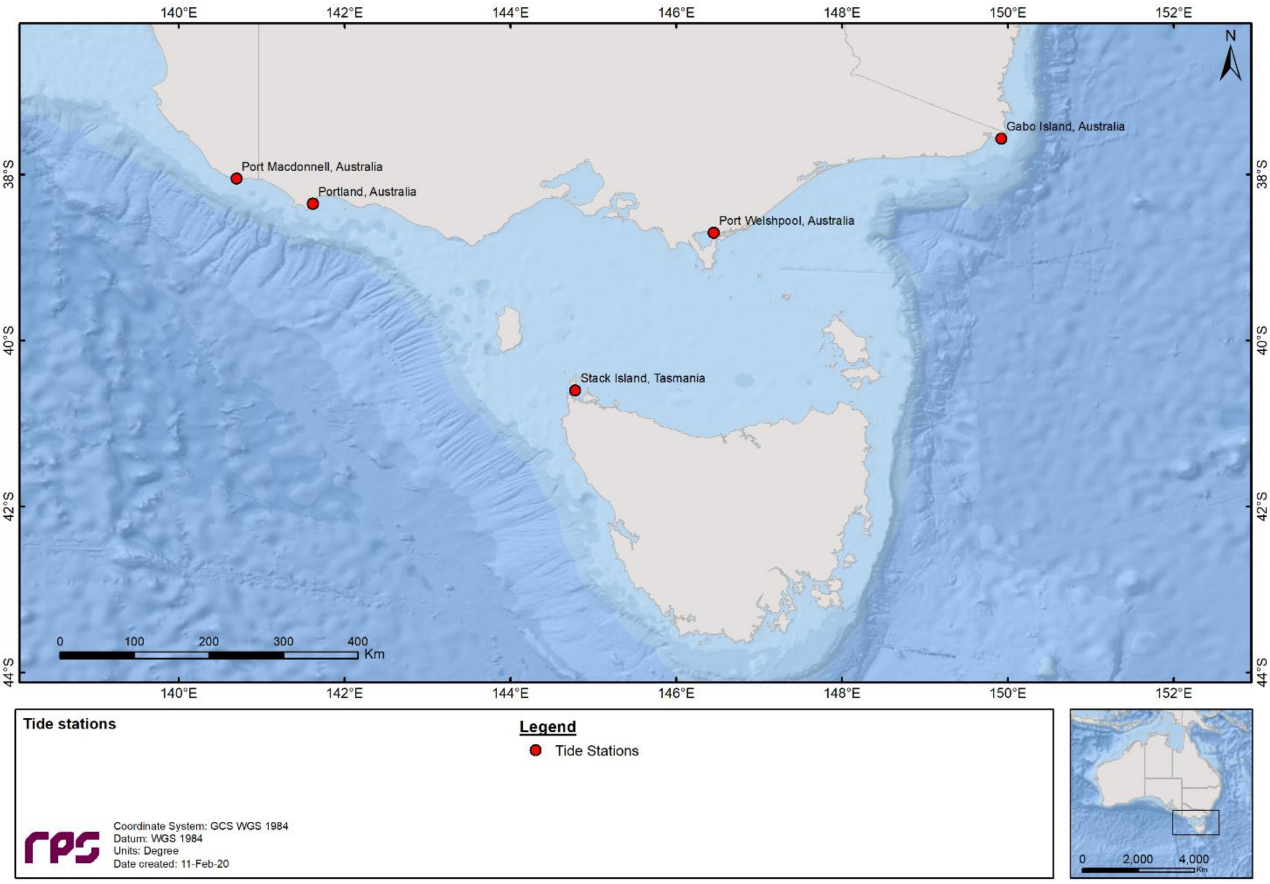

Figure 3-4 Location of the tide stations used in the surface elevation validation.

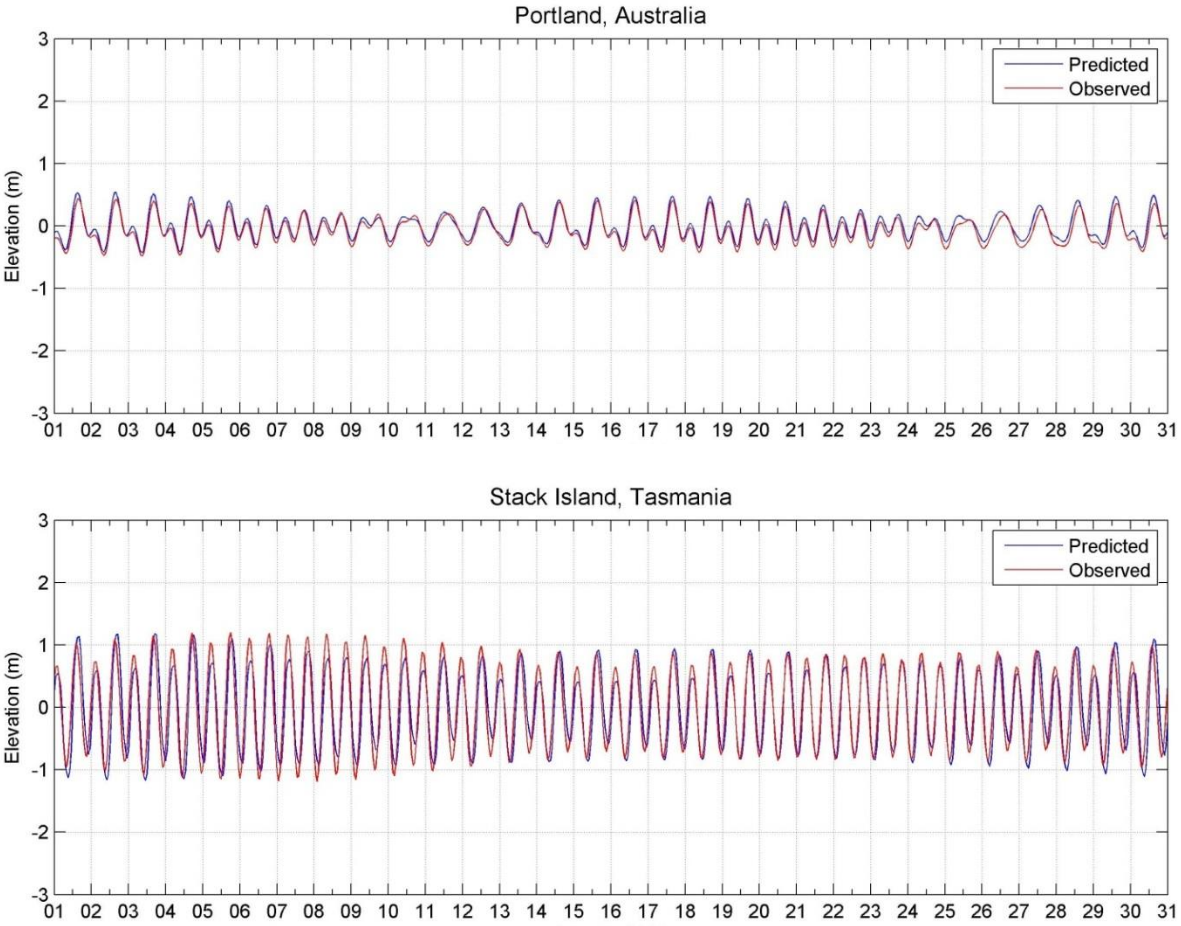

Figure 3-6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).

3.2 Ocean Current Model

Data describing the flow of ocean currents for the years 2010 to 2019 (inclusive) was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of every 3 hours. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

3.3 Surface Currents

Table 3-2 and Table 3-3 present the monthly average and maximum net surface current speeds nearby the Northern Release Location and TW1, respectively, by combining the ocean and tidal currents.

Current speeds near the Northern Release Location varied throughout the year with monthly maximum current speeds ranging between 0.69 m/s (December) and 1.21 m/s (July). The dominant surface current directions throughout the year were identified as (towards) east.

Current speeds near TW1 varied throughout the year with maximum current speeds ranging between approximately 0.81 m/s (October) and 1.15 m/s (August). The dominant surface current directions throughout the year were identified as (towards) east-southeast and west-northwest.

Figure 3-7 and Figure 3-8 show the monthly and total surface current rose distributions nearby the Northern Release Location.

Figure 3-9 and Figure 3-10 show the monthly and total surface current rose distributions nearby TW1.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3-2 Predicted monthly average and maximum surface current speeds nearby the Northern Release Location. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (towards)
January	0.15	0.73	West
February	0.16	0.70	West
March	0.16	0.96	West
April	0.15	0.94	East
May	0.20	1.12	East
June	0.21	1.05	East
July	0.26	1.21	East
August	0.25	1.11	East
September	0.21	1.01	East
October	0.19	0.98	East
November	0.17	0.83	East
December	0.18	0.69	East
Minimum	0.15	0.69	-
Maximum	0.26	1.21	-

Table 3-3 Predicted monthly average and maximum surface current speeds nearby TW1. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (towards)
January	0.20	0.90	East-northeast and West-southwest
February	0.21	1.00	East-northeast and West-southwest
March	0.22	1.14	East-northeast and West-southwest
April	0.22	0.90	East
May	0.27	1.03	East
June	0.25	0.99	East
July	0.29	0.94	East
August	0.26	1.15	East
September	0.23	0.98	East

4 WIND DATA

High resolution wind data for the years 2010 to 2019 (inclusive) was sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals. Figure 4-1 shows the spatial resolution of the wind field used as input into the oil spill model.

Table 4-1 and Table 4-2 present the monthly average and maximum winds derived from a CFSR wind node nearby the Northern Release Location and TW1, respectively.

The wind data demonstrated for the Northern Release Location the average monthly wind speeds ranging from 13.75 knots (January) and 19.35 knots (July), whilst maximums ranged from 38.87 knots (January) to 52.61 knots (June).

The wind data demonstrated for TW1 the average monthly wind speeds ranging from 14.2 knots (January) to 20.1 knots (July) with maximums ranging between 58.9 knots (February) and 65.8 knots (December).

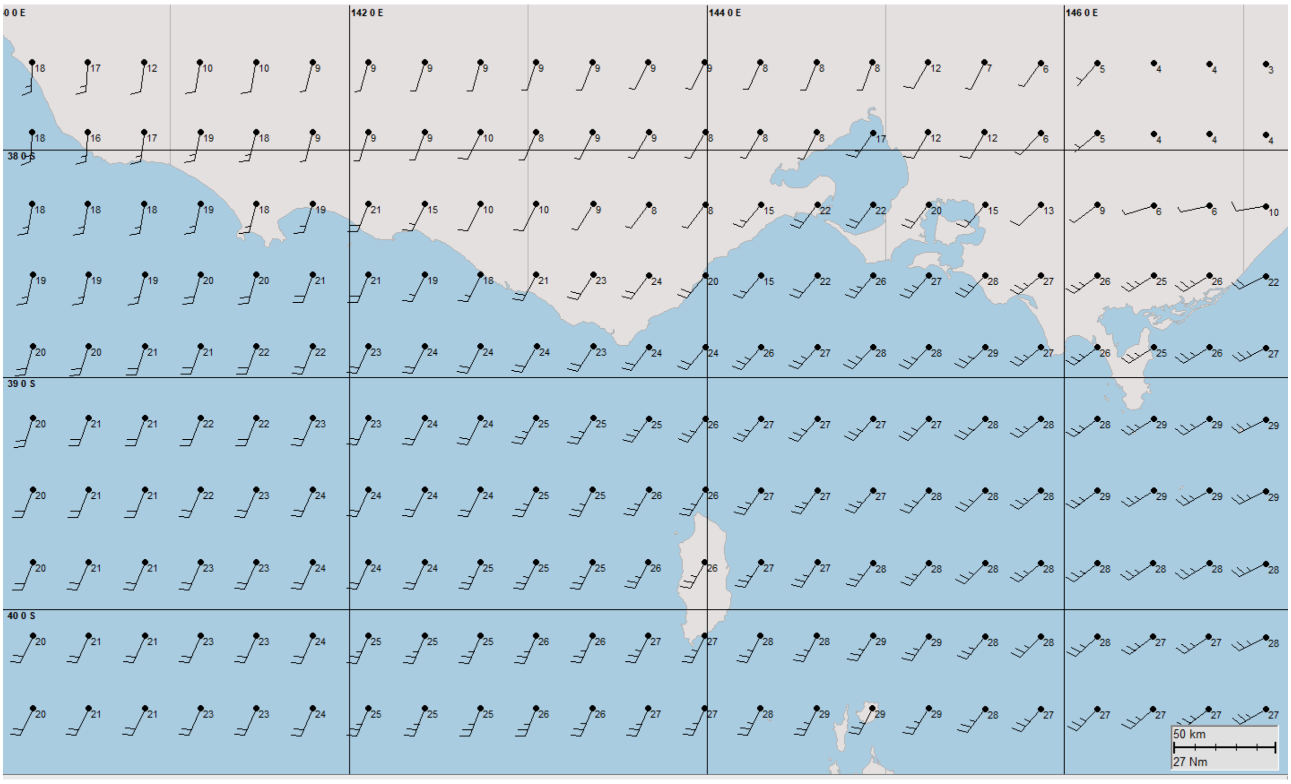

Figure 4-1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

Figure 4-2 and Figure 4-3 show the monthly and total wind rose distributions derived from the CFSR data for the node closest to the Northern Release Location.

Figure 4-4 and Figure 4-5 show the monthly and total wind rose distributions derived from the CFSR data for the node closest to TW1.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 5 knots are predominantly used in these wind roses. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

Table 4-1 **Predicted average and maximum winds representative for the selected node closest to the Northern Release Location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).**

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (from)
January	13.75	38.87	South
February	14.28	41.67	Southeast
March	14.25	44.22	West

5 WATER TEMPERATURE AND SALINITY

The monthly spatially varying water temperature and salinity profiles across the model domain were obtained from the HYCOM model (Section 3.2).

Figure 5-1 and Figure 5-2 illustrate the vertical profile of sea temperature and salinity at the Northern Release Location and TW1, respectively.

Table 5-1 and Table 5-2 present the sea temperature and salinity of the surface layer nearby the Northern Release Location and TW1, respectively.

At the Northern Release Location temperatures varied from 13.5°C (September) to 19.0°C (February) while the monthly average salinity values remain relatively consistent ranging between 35.3 psu and 35.5 psu.

At TW1 temperatures varied from 13.2°C (September) to 17.8°C (February) while the monthly average salinity values remain relatively consistent ranging between 35.1 psu and 35.6 psu.

Table 5-1 Monthly average sea surface temperature and salinity at the Northern Release Location.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (ºC)	18.2	19.0	18.9	17.1	15.9	15.2	14.7	14.1	13.5	13.9	14.6	15.9
Salinity (psu)	35.4	35.4	35.4	35.3	35.4	35.4	35.5	35.5	35.4	35.4	35.4	35.3

Table 5-2 Monthly average sea surface temperature and salinity at TW1.

6 SUBSEA PLUME MODEL – OILMAP DEEP

In the event of a subsea release, the gas and condensate will initially behave like a jet, which dissipates in the water column over a short distance (<10 m). The escaping condensate shear into small droplets due to turbulence generated by passing through the exit hole and subsequent turbulence generated in the plume jet. The size-distribution of the droplets will vary with the exit velocity and viscosity of the condensate. Following this phase, the density and buoyancy difference of the gas and condensate mixture relative to the surrounding waters, forces the plume upward. As the plume rises, the volume of gas will increase due to reduction of water pressure, with gas bubbles dividing into an increasing number of bubbles due to the shearing effect exerted by the water column.

In shallow water (<200 m) the rising plume will tend to reach the sea surface before deflecting away from the centre of the plume (Spaulding et al., 2000). Figure 6-1 conceptually illustrates the various stages of a subsea release of oil and gas.

The OILMAP Deep model (Spaulding et al. 2015) was used to simulate the near-field behaviour of the gas-condensate subsea release in two phases – the initial jet phase and the buoyant plume phase. The initial jet phase is predominately driven by the exit velocity. During this phase, the condensate droplet-size-distributions are calculated for a range of classes or bins. Next, the plume model predicts the rise dynamics of the condensate and gas plume to calculate at which point gas lift will be lost (i.e., the trapping height).

Outputs which include the plume trapping height, plume diameter and droplet size distribution are used as input to the SIMAP model to simulate the rise and dispersion of the condensate droplets from this point onwards.

More details on the OILMAP-DEEP model, can be found in Spaulding et al. (2015). The model has been validated against observations from Deepwater Horizon as well as small and large-scale laboratory studies on subsurface oil releases (Brandvik et al 2013, 2014; Belore 2014; Spaulding et al. 2015; Li et al. 2017).

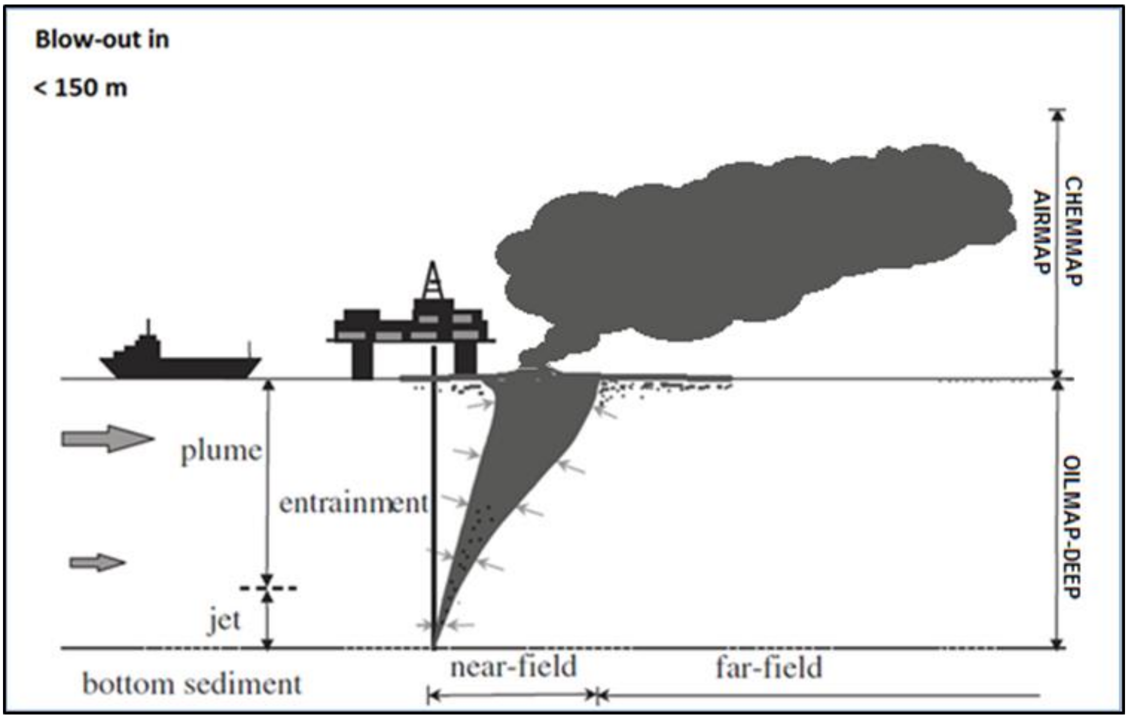

Figure 6-1 Schematic of the various stages of the plume in the water column (Source: ASA, 2011).

Table 6-1 presents the input parameters and key results for the subsea plume modelling.

Figure 6-2 and Figure 6-3 illustrate the time-varying release rate used for the LOWC scenarios for Northern Release Location and TW1, respectively.

The blowout modelling showed that in the event of a loss of well control at the Northern Release Location (Scenario 1), the amalgamated gas and condensate would propel rapidly upward from the seabed and breach the sea surface. Droplet sizes would initially range from 108 µm to 466 µm on day-1 and increase in size to 203 µm to 878 µm by day-86.

The blowout modelling showed that in the event of a loss of well control at TW1 (Scenario 3), the amalgamated gas and condensate would propel rapidly upward from the seabed and breach the sea surface. Droplet sizes would initially range from 81 µm to 351 µm on day-1 and increase in size to 102 µm to 442 µm by day-86.

Table 6-1 Input data and key results for the subsea plume modelling.

Input Variable	Northern Release Location	TW1
Scenario	Loss of well control	Loss of well control
Water depth	71.5 m	105 m
Tubing diameter	8.5”	8.5”
Condensate discharge rate	Day-1: 6,813 STB/day Day-86: 3,592 STB/day	Day-1: 1,337 STB/day Day-86: 1,071 STB/day
Gas discharge rate	Day-1: 407 MMscf/day Day-86: 224 MMscf/day	Day-1: 138 MMscf/day Day-86: 111 MMscf/day
Formation water discharge rate	Day-1: 363 STB/day Day-86: 267 STB/day	NIL
Key Results		
Plume execution depth (m BMSL)	0 (Breach the sea surface)	0 (Breach the sea surface)
Droplet sizes (µm)	Day-1: 108 to 466 Day-86: 203 to 878	Day-1: 81 to 351 Day-86: 102 to 442

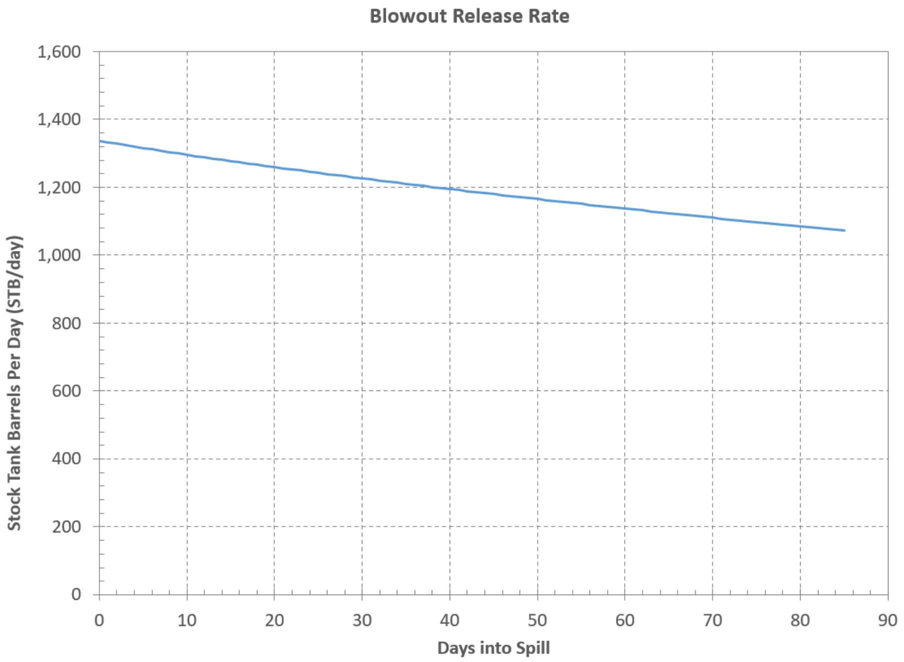

Figure 6-3 **Plot of time-varying release rate for TW1.**

7 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Model Application Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point (BP) ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

7.1 Stochastic Modelling

For the stochastic modelling presented herein, 200 simulations (100 per season) were modelled for each of the scenarios using the same spill information (release location, spill volume, duration and oil type) but with varied start dates per scenario. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations per season (per scenario) were analysed to determine the following statistics for every grid cell:

- Exposure load (concentrations).
- Minimum time before exposure.
- Maximum duration of exposure.
- Probability of contact above defined concentrations.
- Volume of oil that may accumulate on shorelines from any single simulation.
- Concentration that might occur on sections of individual shorelines.
- Exposure (instantaneous) to dissolved hydrocarbons in the water column.
- Exposure (instantaneous) to entrained hydrocarbons in the water column.
- Residence time, or the longest continuous period floating oil, and dissolved and entrained hydrocarbons persisted at a point above a threshold.

8 THRESHOLDS

The thresholds and their relationship to exposure for the sea surface, shoreline and water column (entrained and dissolved hydrocarbons) are presented in Sections 8.1 to 8.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of influence are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

8.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 8-1). Figure 8-1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 8-1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn

Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 8-2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 8-1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

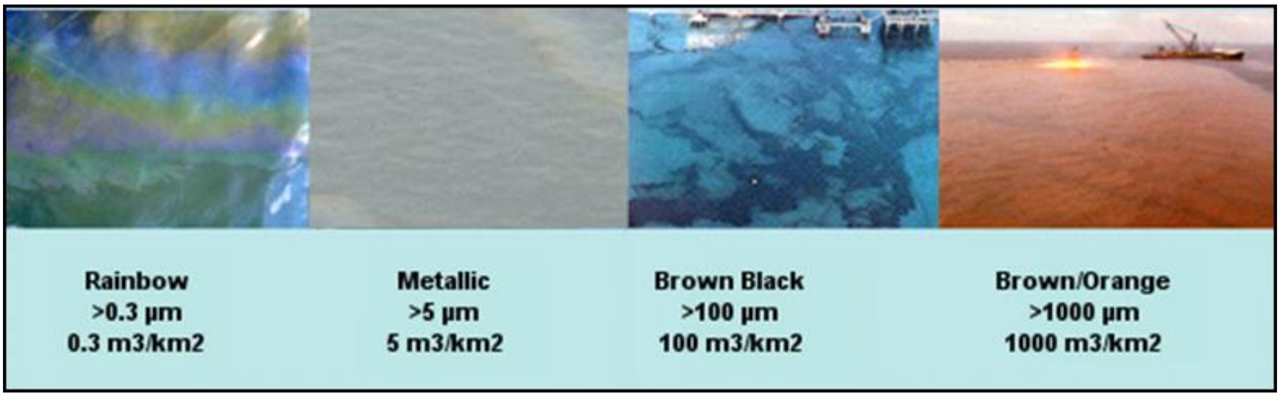

Figure 8-1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 8-2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA, 2019).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates area of potential socioeconomic effects and establishes planning area for scientific monitoring and determination of any effects.
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

8.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling herein, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results contained herein would be indicative of a worst-case scenario, where the highest volume of oil may be stranded on the shoreline (when compared to other shoreline types, such as exposed rocky shores).

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according to the AMSA (2015) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996) demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high shoreline accumulation”. It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

It is worth noting that the shoreline accumulation thresholds derived from extensive literature review (outlined in Table 8-3) agree with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 8-3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline loading (g/m^2)	Description
Low (socioeconomic/sublethal)	10	Loading predicts potential socio-economic impact
Moderate	100	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

8.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

In addition to presenting the maximum instantaneous concentrations across the model domain, there are also figures presented for the residence time, which is the longest continuous period of exposure above each threshold. This helps provide context when considering exposure to sensitive receptors.

8.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1-hour timestep (see Table 8-4) was applied to indicate increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

8.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. As such, insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, hence are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC & ARMCANZ (2000) water quality guidelines. Due to the requirement for relatively long exposure times (> 24 hours) for these concentrations to be significant, they are likely to be more meaningful for juvenile fish, larvae and planktonic organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 8-4), to cover the range of thresholds outlined in ANZECC & ARMCANZ (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019). Additionally, a threshold of 1,000 ppb (French-McCay, 2023) was applied over a 1-hour time exposure.

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 8-4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

Threshold level	Dissolved hydrocarbon concentration (ppb)	Entrained hydrocarbon concentrations (ppb)
Low	10	10
Moderate	50	100
High	400	1,000

9 DISPERSION COEFFICIENTS AND MIXED LAYER DEPTH

A horizontal dispersion coefficient of 10 m^2/s was used to account for dispersive processes acting on the floating oil that are at scales finer than the modelled wind and currents, based on typical values for open waters (Okubo, 1971).

Vertical dispersion coefficients (*Dv)* of 115 cm^2/s and 120 cm^2/s were used to represent the turbulent mixing and diffusion processes in the wave-mixed layer in the upper water column at Northern Release Location and TW1, respectively. Those are site-specific values computed using the 50th percentile wind speed at each of the release sites, derived from the 10-year dataset (at 10 m above the sea surface, W_{10}) based on French-McCay (2004).

The mixed layer depth corresponds to the top layer of the water column, where vertical mixing is strong enough to cause uniform temperature and salinity, and is influenced by factors like wind, ocean currents and waves. The 50th percentile value at the site was calculated using Copernicus' 10 years (2010 to 2019) of monthly-averaged mixed layer depth data and were found to be 32 m and 42 m for Northern Release Location and TW1, respectively.

10 OIL PROPERTIES

10.1 Oil Characteristics

Table 10-1 and Table 10-2 present the physical properties and boiling point ranges of Marine Diesel and Thylacine condensate, which was used as the proxy for the study.

Thylacine condensate has an API of 44.3 and a density of 804.6 kg/m^3 (at 15ºC) with a viscosity value (0.87.0 cP) classifying it as a Group I (not-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications.

The condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, about 64.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C), a further 19.0% should evaporate within the first 24 hours (180°C < BP < 265°C) and a further 16.0% should evaporate over several days (265°C < BP < 380°C). Approximately 1.0% of the oil is shown to be persistent.

Marine diesel (MDO) has an API of 37.6 and a density of 829.1 kg/m^3 (at 25ºC) with a viscosity value (4.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications.

The MDO is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, about 6.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C); a further 34.6% should evaporate within the first 24 hours (180°C < BP < 265°C); and a further 54.4% should evaporate over several days (265°C < BP < 380°C). Approximately 5.0% of the oil is shown to be persistent.

Table 10-1 Physical properties for Thylacine condensate.

Characteristic	Thylacine Condensate	MDO
Density (kg/m^3)	804.6 (at 15°C)	829.1 (at 25 °C)
API	44.3	37.6
Dynamic viscosity (cP)	0.87 (at 20°C)	4.0 (at 25 °C)
Pour point (°C)	-50	-14
Hydrocarbon property category	Group I	Group II
Hydrocarbon property classification	Not – Persistent	Light - Persistent

Table 10-2 Boiling point ranges for Thylacine condensate.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatile (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-265 C_{11} to C_{15}	265-380 C_{16} to C_{20}	>380 $>C_{20}$
Thylacine Condensate	% of total	64.0	19.0	16.0	1.0
Marine Diesel	% of total	6.0	34.6	54.4	5.0

The BP are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate.

Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (or <180°C BP).
- Up to 24 hours for the C_{11} to C_{15} compounds (180–265°C BP).
- Several days for the C_{16} to C_{20} compounds (265–380°C BP).
- Not applicable for the residual compounds (BP >380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

The actual fate of oil will depend greatly on the amount that reaches the surface.

10.2 Weathering Characteristics

A series of model weather tests were conducted to illustrate the potential behaviour of Thylacine condensate and marine diesel when exposed to idealised and representative environmental conditions:

- A 50 m^3 surface release over 1-hour under calm wind conditions (constant 5 knots or 2.6 m/s), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents; and

- A 50 m^3 surface release over 1-hour under variable wind conditions (1-12 knots or 1.9-23 m/s, drawn from representative data files), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.

Note, a surface release is used in the weathering test to solely focus on the weathering and fates of the hydrocarbons when exposed to atmospheric conditions.

The first case is indicative conditions that would not generate entrainment, while the second case may represent conditions that could cause a minor degree of entrainment. Both scenarios provide examples of potential behaviour during a spill once the oil reaches the surface.

Thylacine Condensate Mass Balance Forecasts

The mass balance for the condensate under the constant 5 knot wind case (Figure 10-1) shows that 82.5% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation shall cease when the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 10-2), where the winds are of greater strength on average, entrainment of the condensate into the water column is predicted to increase. Approximately 24 hours after the spill, 22.1% of the oil mass is forecast to have entrained and a further 69.4% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<0.1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of 1.9% per day with or ~10.9% after 7 days, compared to <0.1% per day and a total of 0.8% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

Marine Diesel Mass Balance Forecasts

The mass balance for the MDO under the constant 5 knot (~2.5 m/s) wind case (Figure 10-3) shows that 40.3% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation shall cease when the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 10-4), where the winds are of greater strength on average, entrainment of MDO into the water column is predicted to increase. Approximately 24 hours after the spill, 60.1% of the oil mass is forecast to have entrained and a further 38.4% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<0.1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of 1.5% per day with or ~10.5% after 7 days, compared to <0.1% per day and a total of 0.9% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

11 OIL SPILL SCENARIOS

Table 11-1 provides a summary of the oil spill model settings.

Table 11-1 Summary of the oil spill model settings and thresholds used in this assessment.

Parameter	Northern Release Location		TW1	
Description	Loss of well control	Loss of containment	Loss of well control	Loss of containment
Number of randomly selected spill start times	100 per season	100 per season	100 per season	100 per season
Model period	Summer (November through to March) and Winter (April to October)			
Oil type	Thylacine condensate	Marine Diesel	Thylacine condensate	Marine Diesel
Spill volume	434,752 stb	603.7 m^3	102,576 stb	603.7 m^3
Release type	Subsea (71.5 m)	Surface	Subsea (105 m)	Surface
Release duration	86 days (variable release rate)	6 hours	86 days (variable release rate)	6 hours
Simulation length	100 days	30 days	100 days	30 days
Surface oil concentration thresholds (g/m^2)^	1 (low); 10 (moderate); 50 (high)			
Shoreline oil accumulation thresholds (g/m^2)^	10 (low); 100 (moderate); 1,000 (high)			
Dissolved hydrocarbon concentrations (ppb)^	10 (low); 50 (moderate); 400 (high)			
Entrained hydrocarbon concentrations (ppb)^	10 (low); 100 (moderate); 1,000 (high)			

^Thresholds based on NOPSEMA (2019)

12 PRESENTATION AND INTERPRETATION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of the predicted sea-surface and water column (subsurface) exposure and shoreline accumulation (if predicted).

12.1 Annual Analysis

12.1.1 Statistics

The statistics are based on the following principles:

- The ***greatest distance travelled by a spill trajectory*** – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds.

- The ***probability of oil exposure to a receptor*** – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.

- The ***minimum time before oil exposure to a receptor*** – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value.

- The ***maximum residence time for oil exposure within a receptor*** – is determined by recording the longest continuous length of time a grid cell is exposed to either floating, entrained or dissolved hydrocarbon above each threshold, within each receptor.

- The ***probability of oil accumulation at a receptor*** – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.

- The ***maximum potential oil loading within a receptor*** – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario.

- The ***dissolved and entrained hydrocarbon exposure*** – is determined by recording the maximum instantaneous concentrations at each grid cell.

- ***Maximum total volume ashore*** (found in shoreline statistics table) – is the total volume of oil stranded on the shorelines throughout the duration of the simulation, regardless of timing.

- ***Maximum instantaneous peak volume ashore*** (found in the deterministic analysis section and derived from the histogram) – is the peak volume of oil accumulated on shorelines at a single point in time. This peak value does not include oil that came ashore earlier in the simulation and was subsequently lost through evaporative or other weathering processes.

12.2 Receptors Assessed

A range of environmental receptors and shorelines were assessed for floating oil exposure, shoreline accumulation and water column exposure as part of the study. Receptors assessed include the Australian Government receptors, made available through the Protected Matters Search Tool (PMST), in addition to Biologically Important Areas (BIAs), State Waters and the Victorian Marine Pollution Risk Assessment shoreline segments. Some of these receptor groups are depicted in Figure 12-1 to Figure 12-11.

Risks of exposure were separately calculated for each receptor area and have been tabulated. Table 12-1 summarise the receptors that the Northern Release Location and TW1 reside within.

Table 12-1 Summary of the receptors that the release locations reside within.

Receptor Type	Receptor Name	Northern Release Location	TW1

13 RESULTS – LOSS OF WELL CONTROL AT THE NORTHERN RELEASE LOCATION

This scenario examined a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 100 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

13.1 Stochastic Analysis

13.1.1 Area of Exposure

Figure 13-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

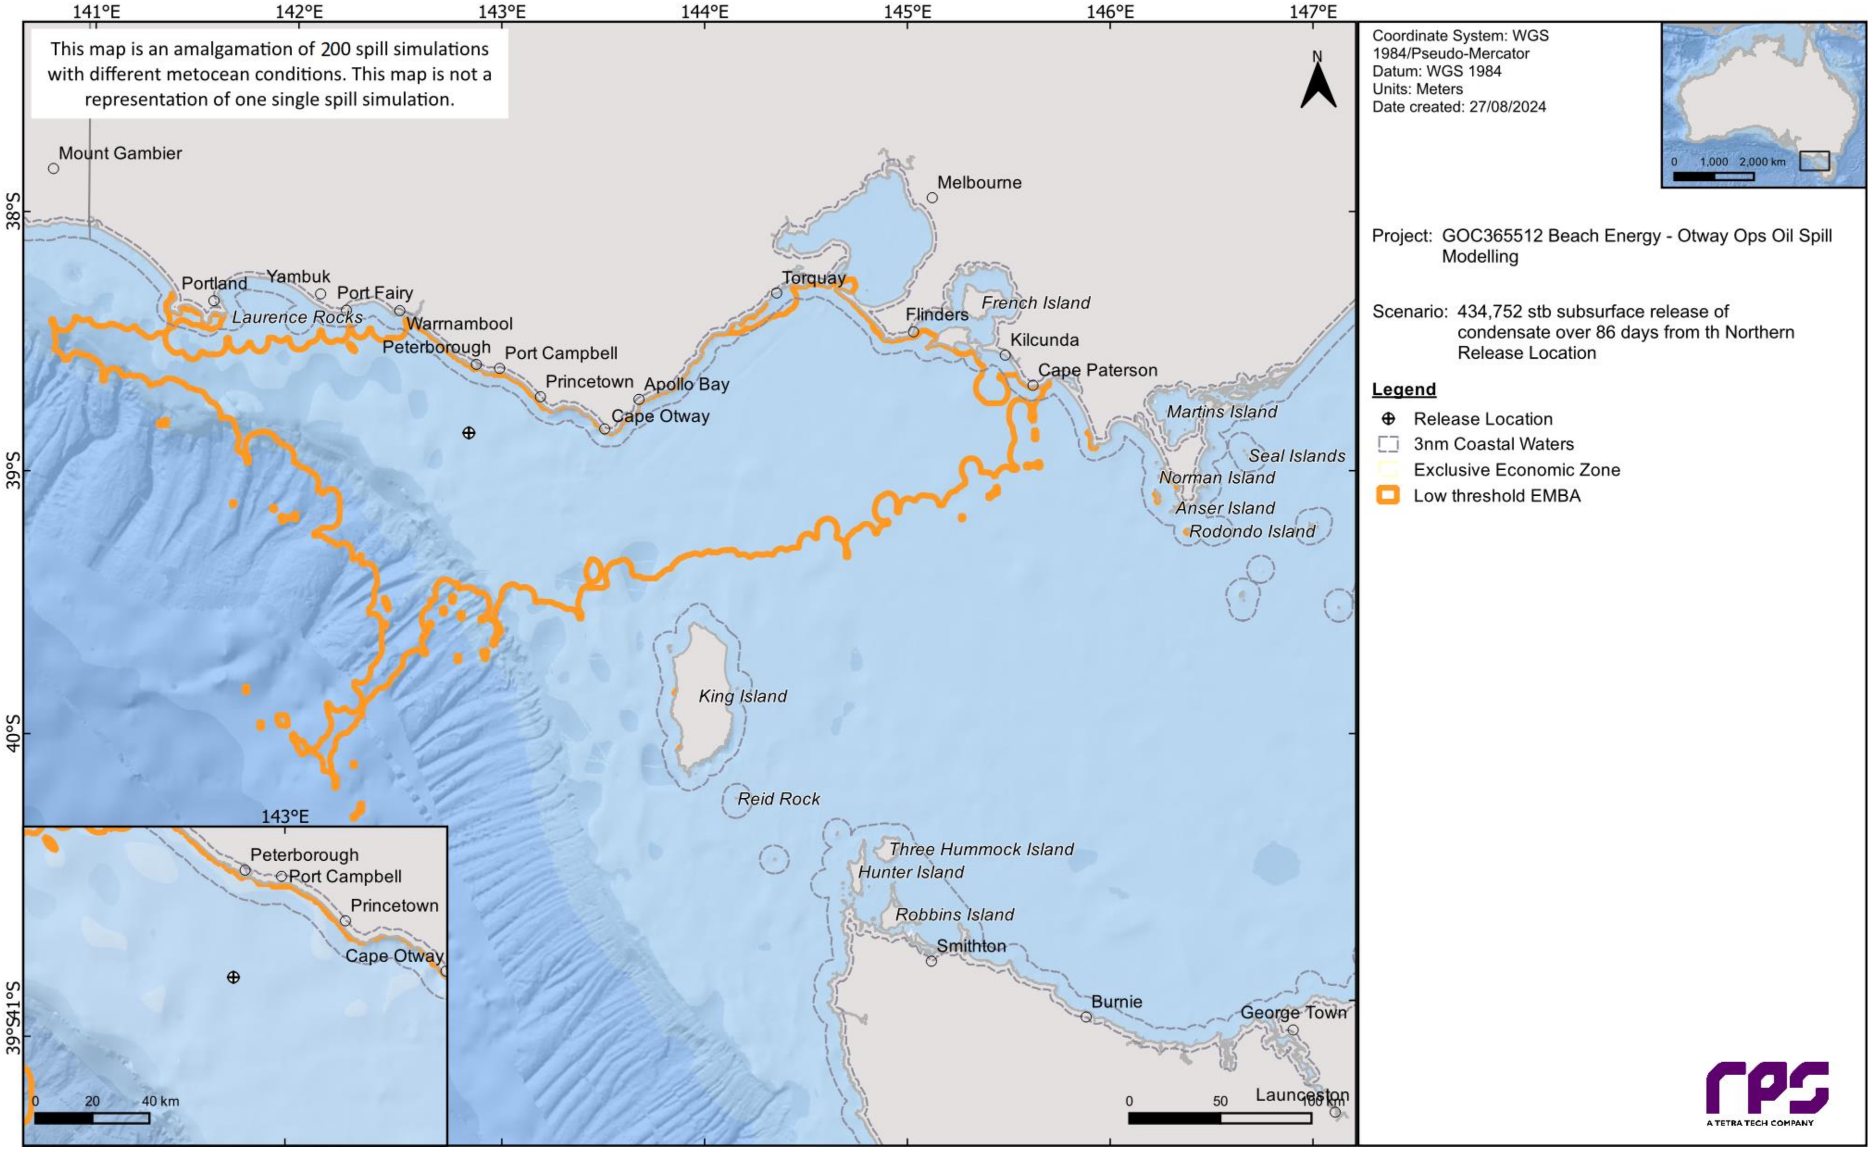

Figure 13-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location during summer and winter conditions.

13.1.2 Floating Oil Exposure

Table 13-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones were 54.03 km (east) and 5.83 km (east-southeast), both during winter conditions. No contact was predicted for the high threshold (> 50 g/m^2).

Table 13-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), floating oil exposure above the low threshold was predicted at the Short-tailed Shearwater - Foraging (Buffer around Tasmania including Bass Strait), being 6% and 9% during summer and winter respectively.

Table 13-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 13-2 and Figure 13-3 present the zones of potential floating oil exposure for all thresholds under summer and winter conditions, respectively.

Figure 13-4 to Figure 13-7 present the minimum time before floating oil exposure for the NOPSEMA thresholds during summer and winter.

Table 13-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	31.4	3.93	-
	Direction	East	West	-
Winter	Maximum distance (km) from release location	54.03	5.83	-
	Direction	East	East-Southeast	-

Table 13-2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Receptor		Summer (November through March)						Winter (April to October)

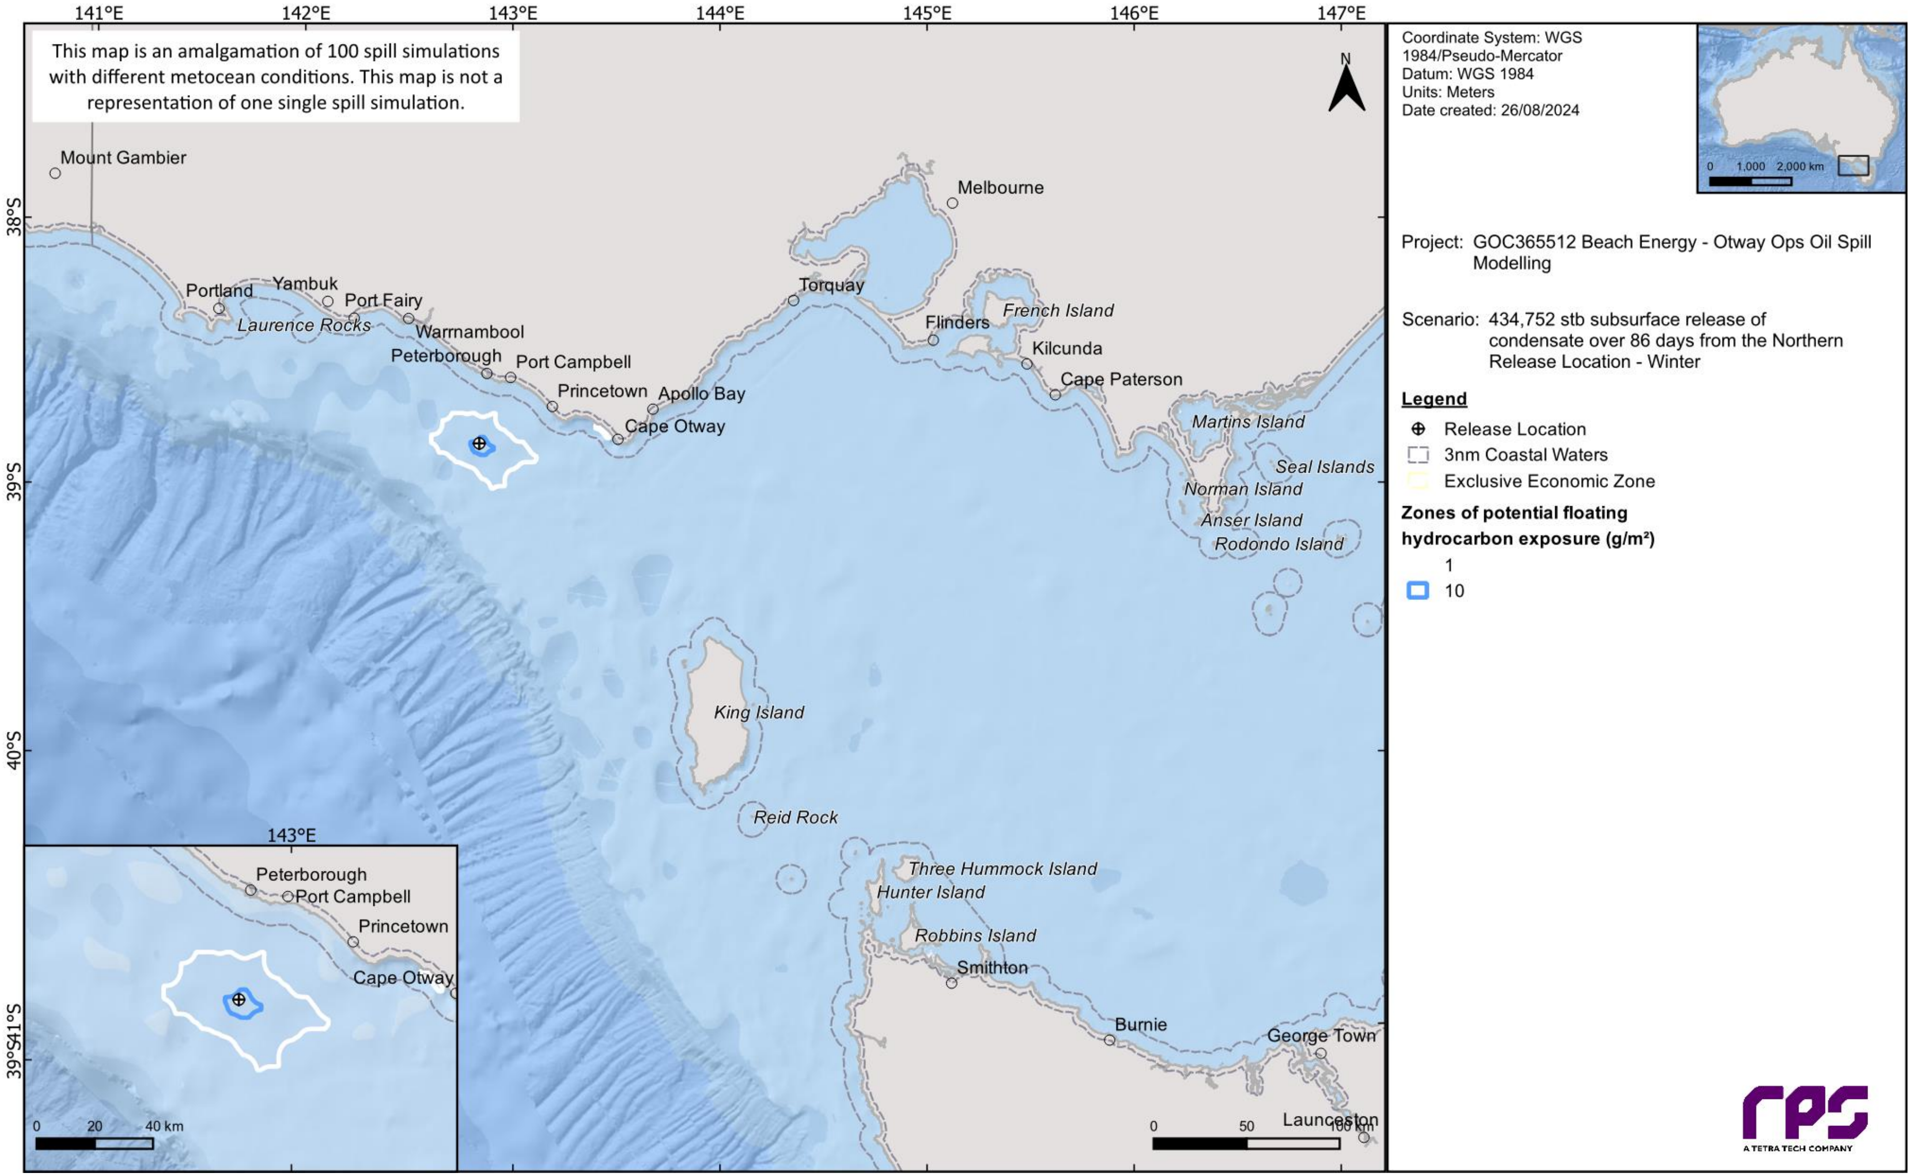

Figure 13-3 Zones of potential floating oil exposure in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

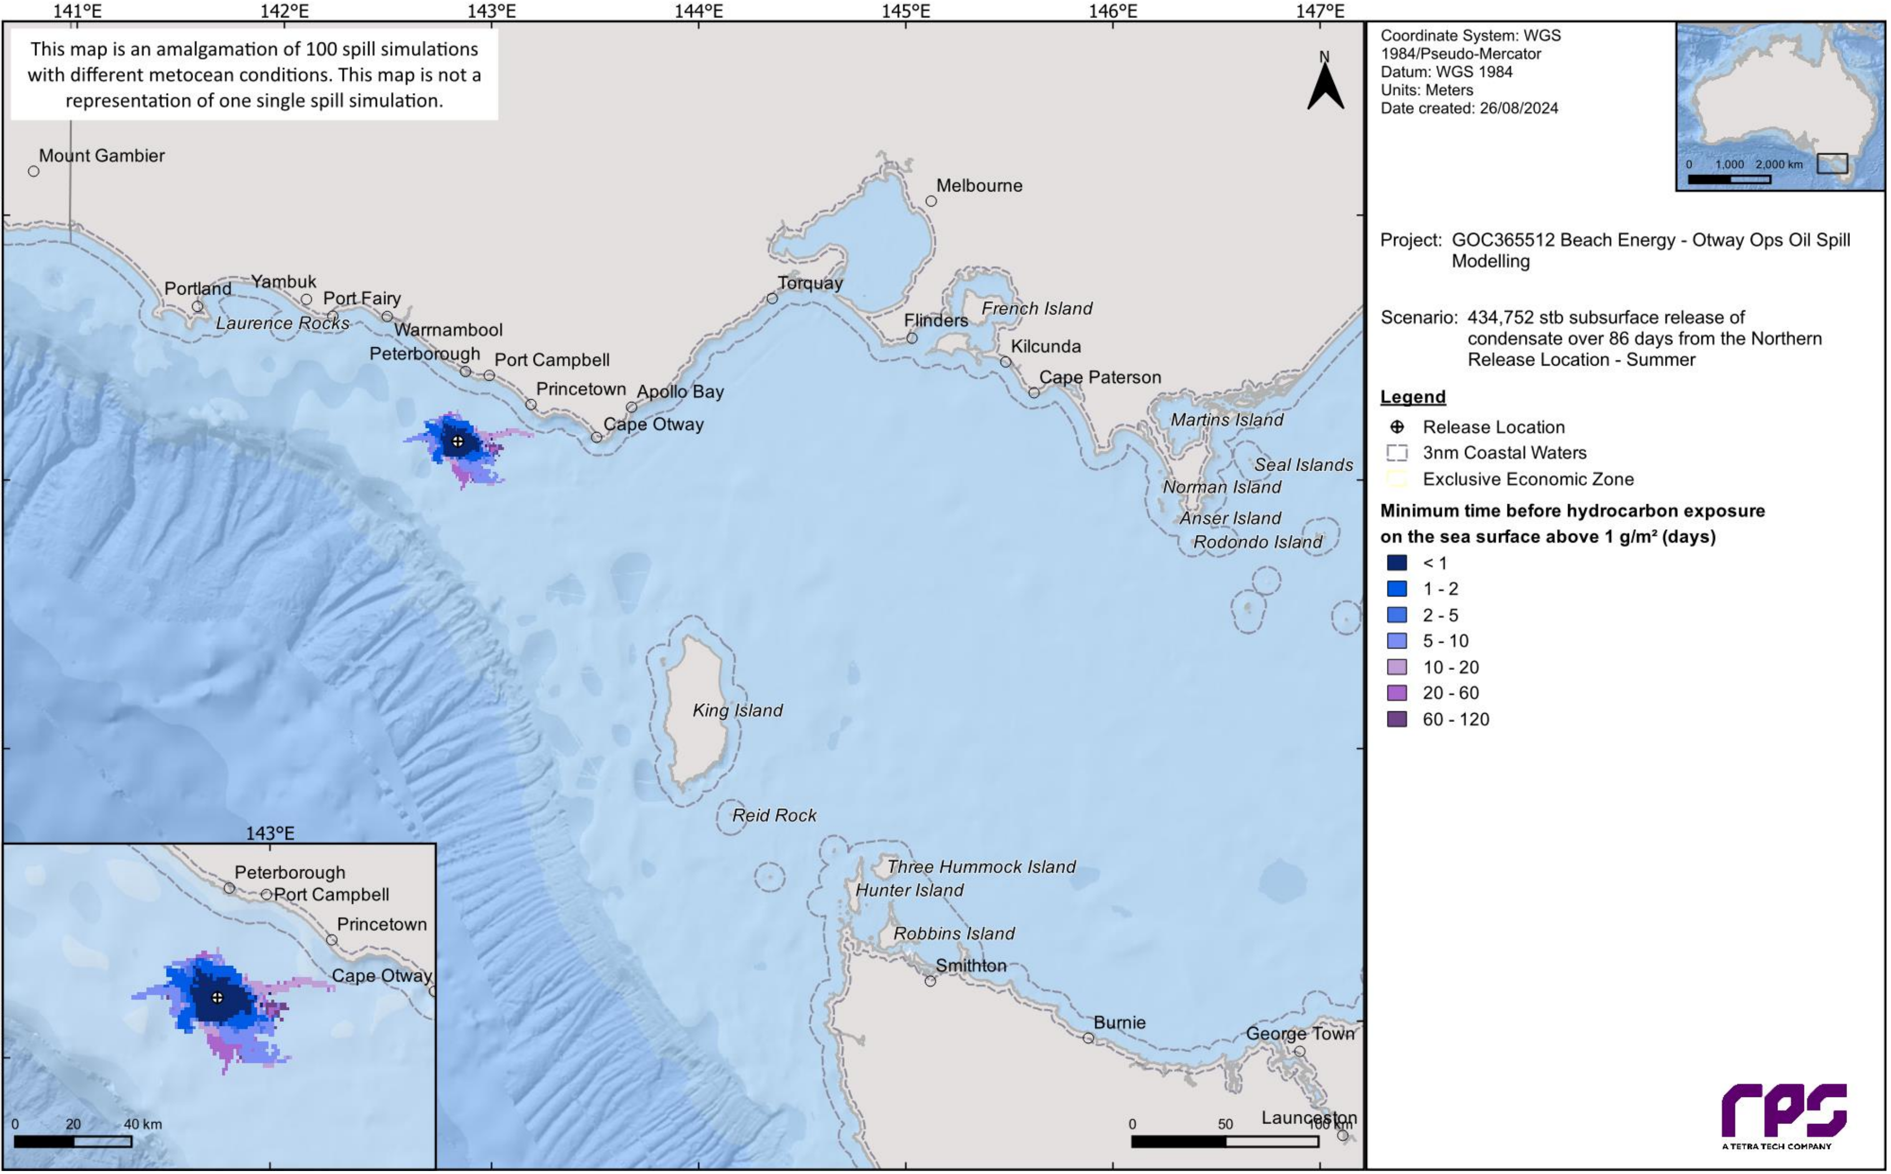

Figure 13-4 Minimum time before floating oil exposure above 1 g/m^2, in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

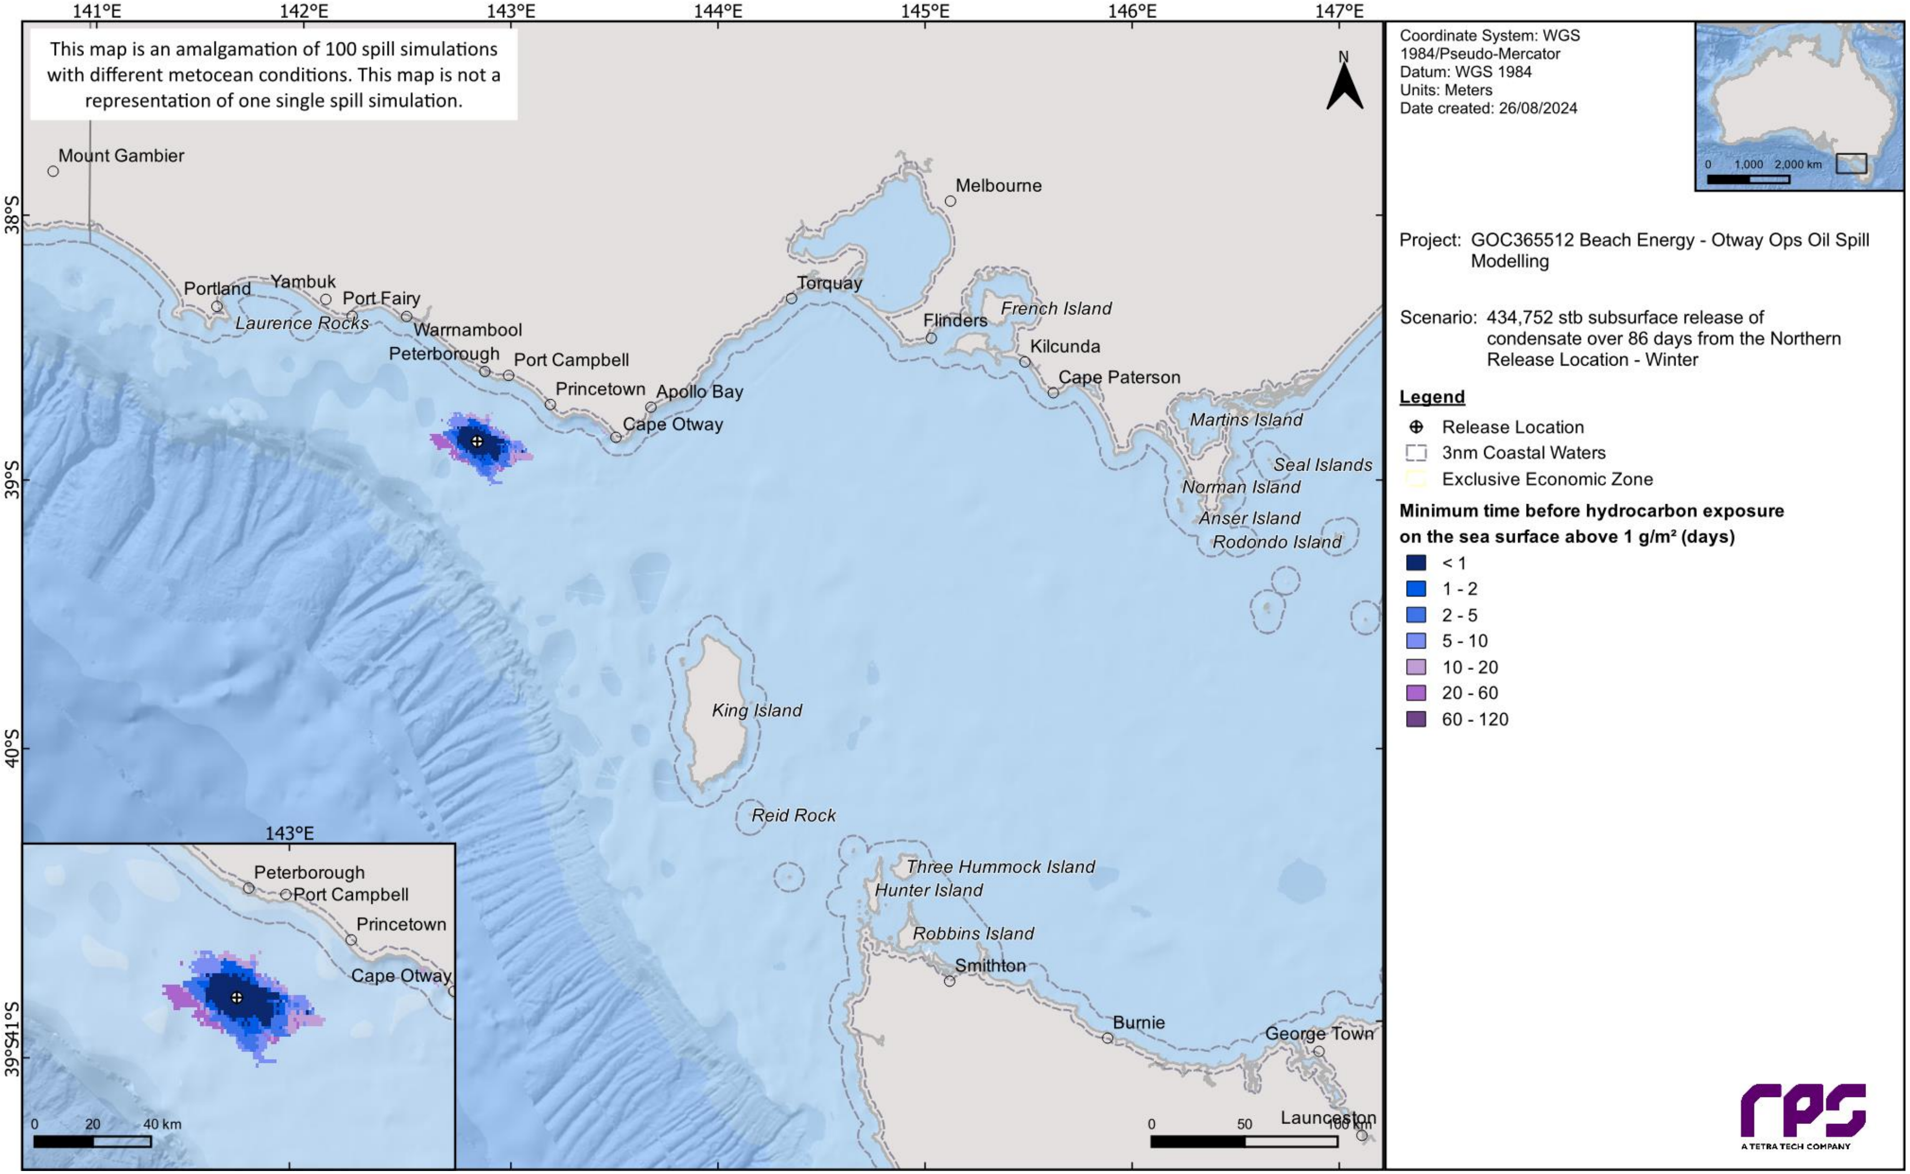

Figure 13-5 Minimum time before floating oil exposure above 1 g/m^2, in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

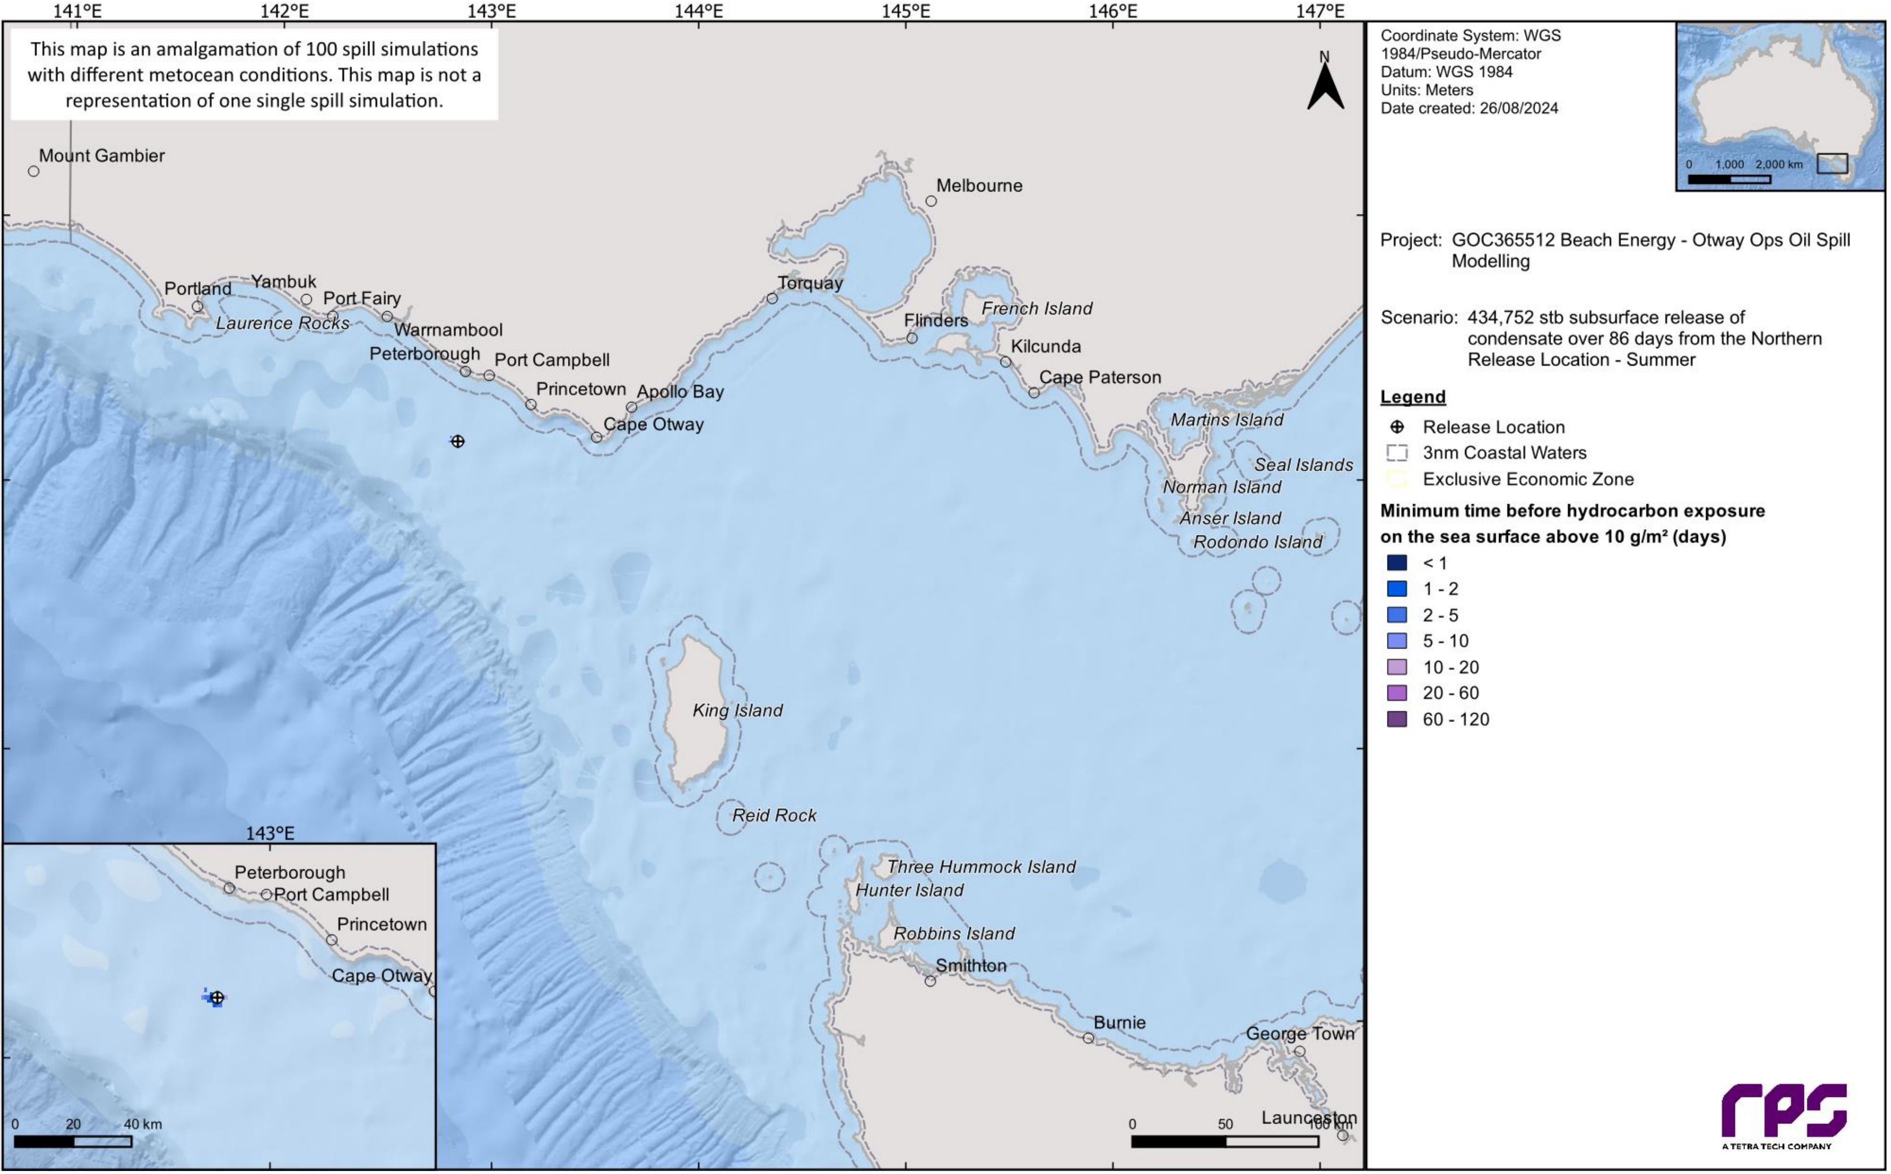

Figure 13-6 Minimum time before floating oil exposure above 10 g/m^2, in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

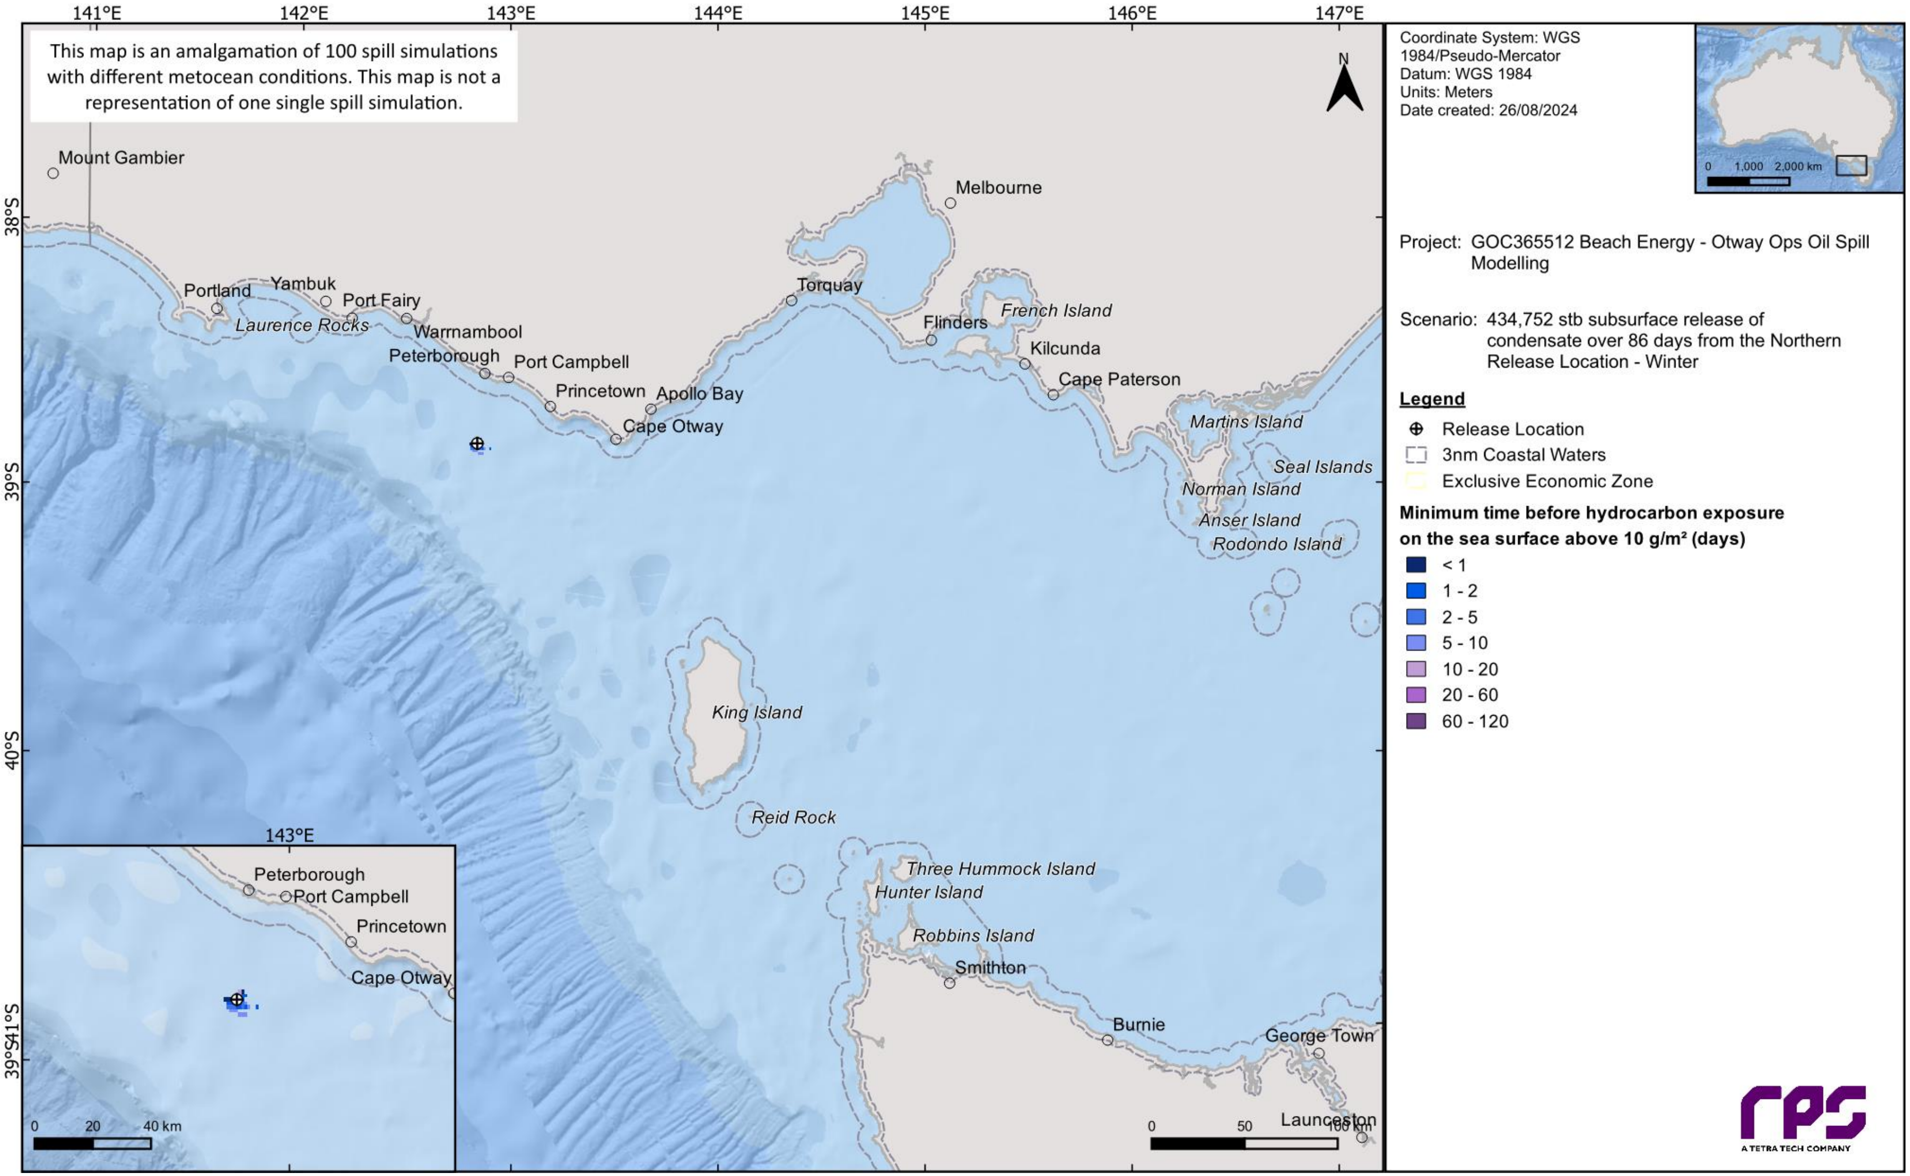

Figure 13-7 Minimum time before floating oil exposure above 10 g/m^2, in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

13.1.3 Shoreline Accumulation

Table 13-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 99% during summer conditions and 96% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 5.7 days during summer conditions, and 3.7 days during winter conditions. The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 67.91 m^3 and 87.54 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 104.17 km and 114.39 km, respectively. For the moderate threshold (100 g/m^2), the maximum length of shoreline accumulation predicted was 15.24 km (summer) and 22.86 km (winter). No shoreline accumulation was predicted for the high (1,000 g/m^2) threshold.

Table 13-5 summarises the shoreline accumulation on individual receptors during the summer and winter conditions. Cape Otway West shoreline recorded the highest probability of shoreline accumulation at the low threshold, being 96% and 92% for summer and winter respectively. The minimum time before shoreline accumulation above the low threshold was forecast for the same receptor (5.7 and 3.7 days during summer and winter respectively).

The summer and winter conditions maximum potential shoreline loading above the low and moderate shoreline thresholds are presented in Figure 13-8 and Figure 13-9, respectively.

Table 13-4 Summary of oil accumulation across all shorelines. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	99	96
Absolute minimum time for visible oil to shore (days)	5.7	3.7
Maximum total volume of hydrocarbons ashore (m^3)	67.91	87.54
Average volume of hydrocarbons ashore (m^3)	21.24	28.61
Maximum length of the shoreline at **10 g/m^2** (km)	104.17	114.39
Average shoreline length (km) at **10 g/m^2** (km)	30.98	37.36
Maximum length of the shoreline at **100 g/m^2** (km)	15.24	22.86
Average shoreline length (km) at **100 g/m^2** (km)	1.82	3.74

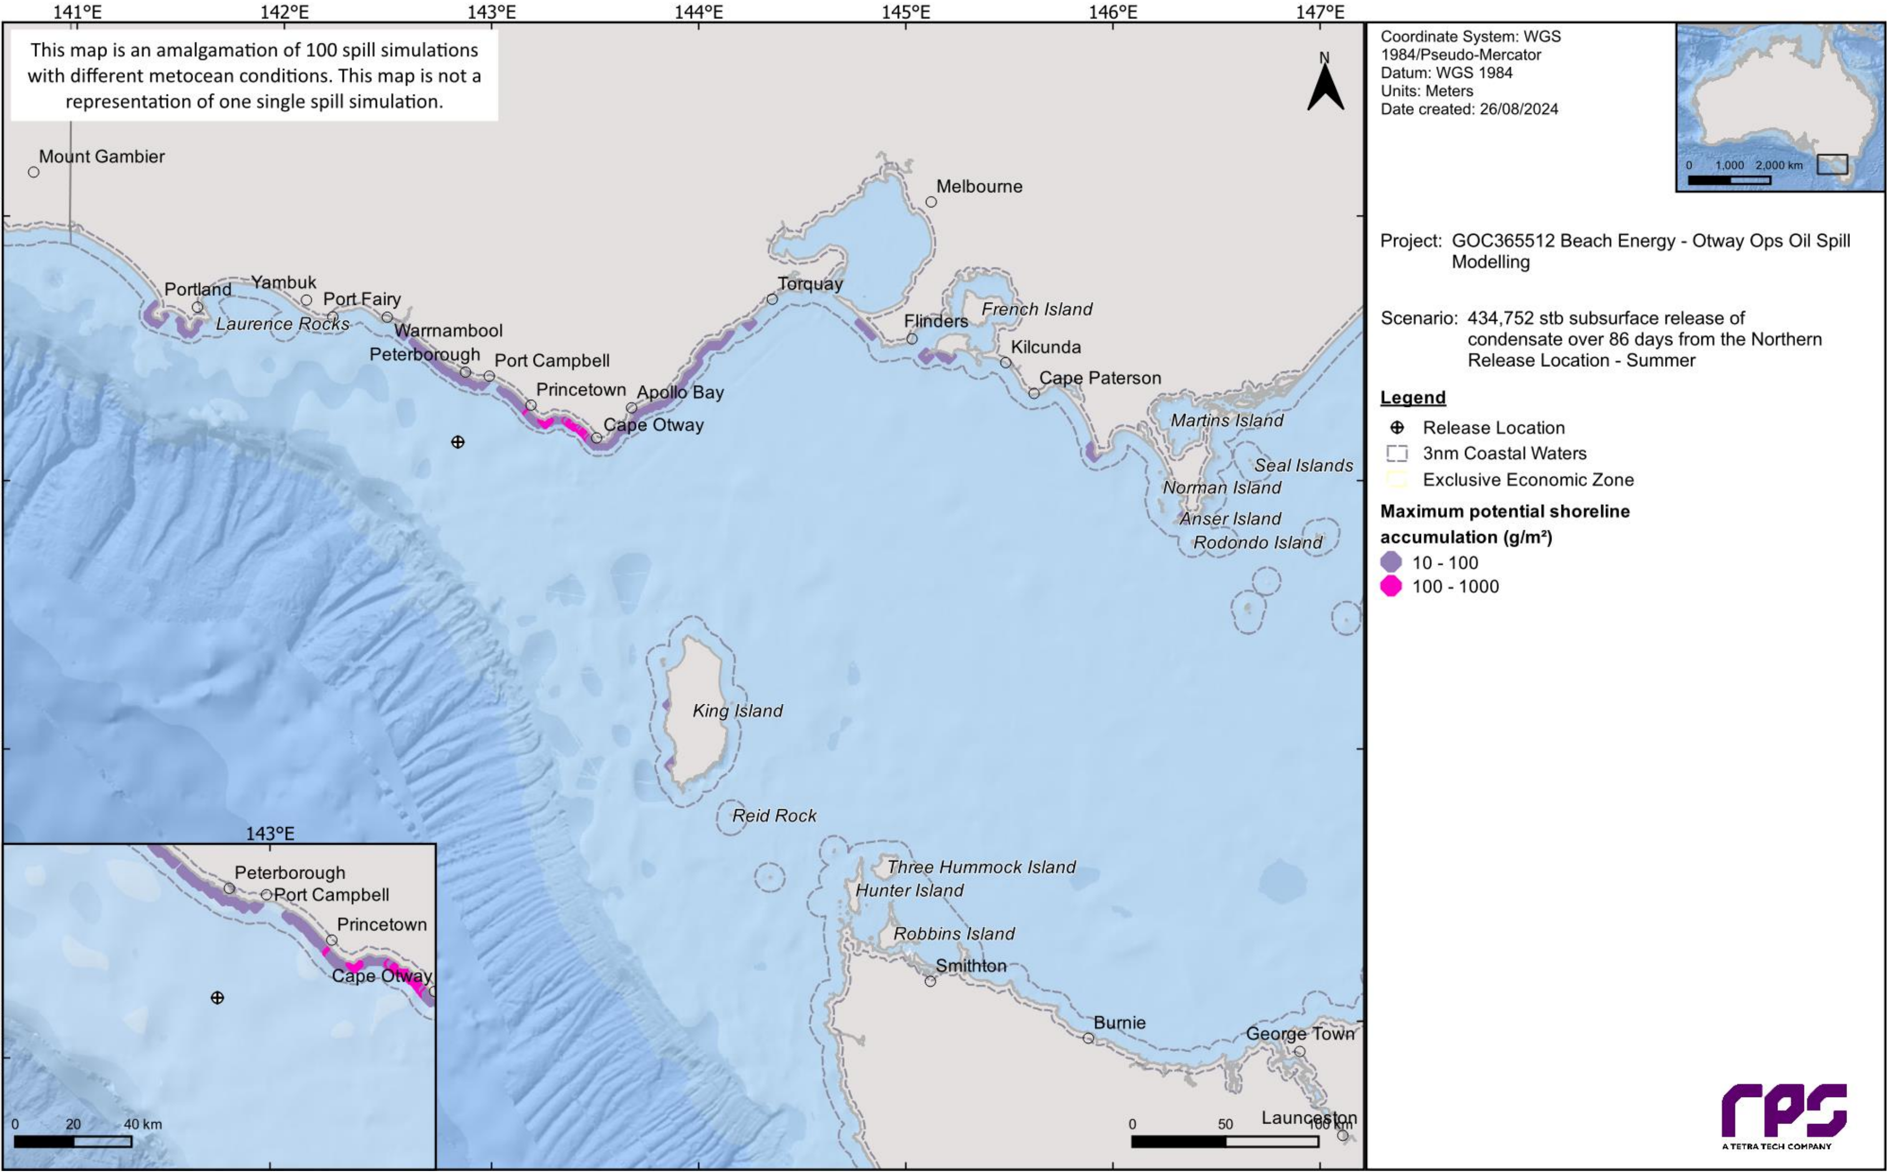

Figure 13-8 Maximum potential shoreline loading in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

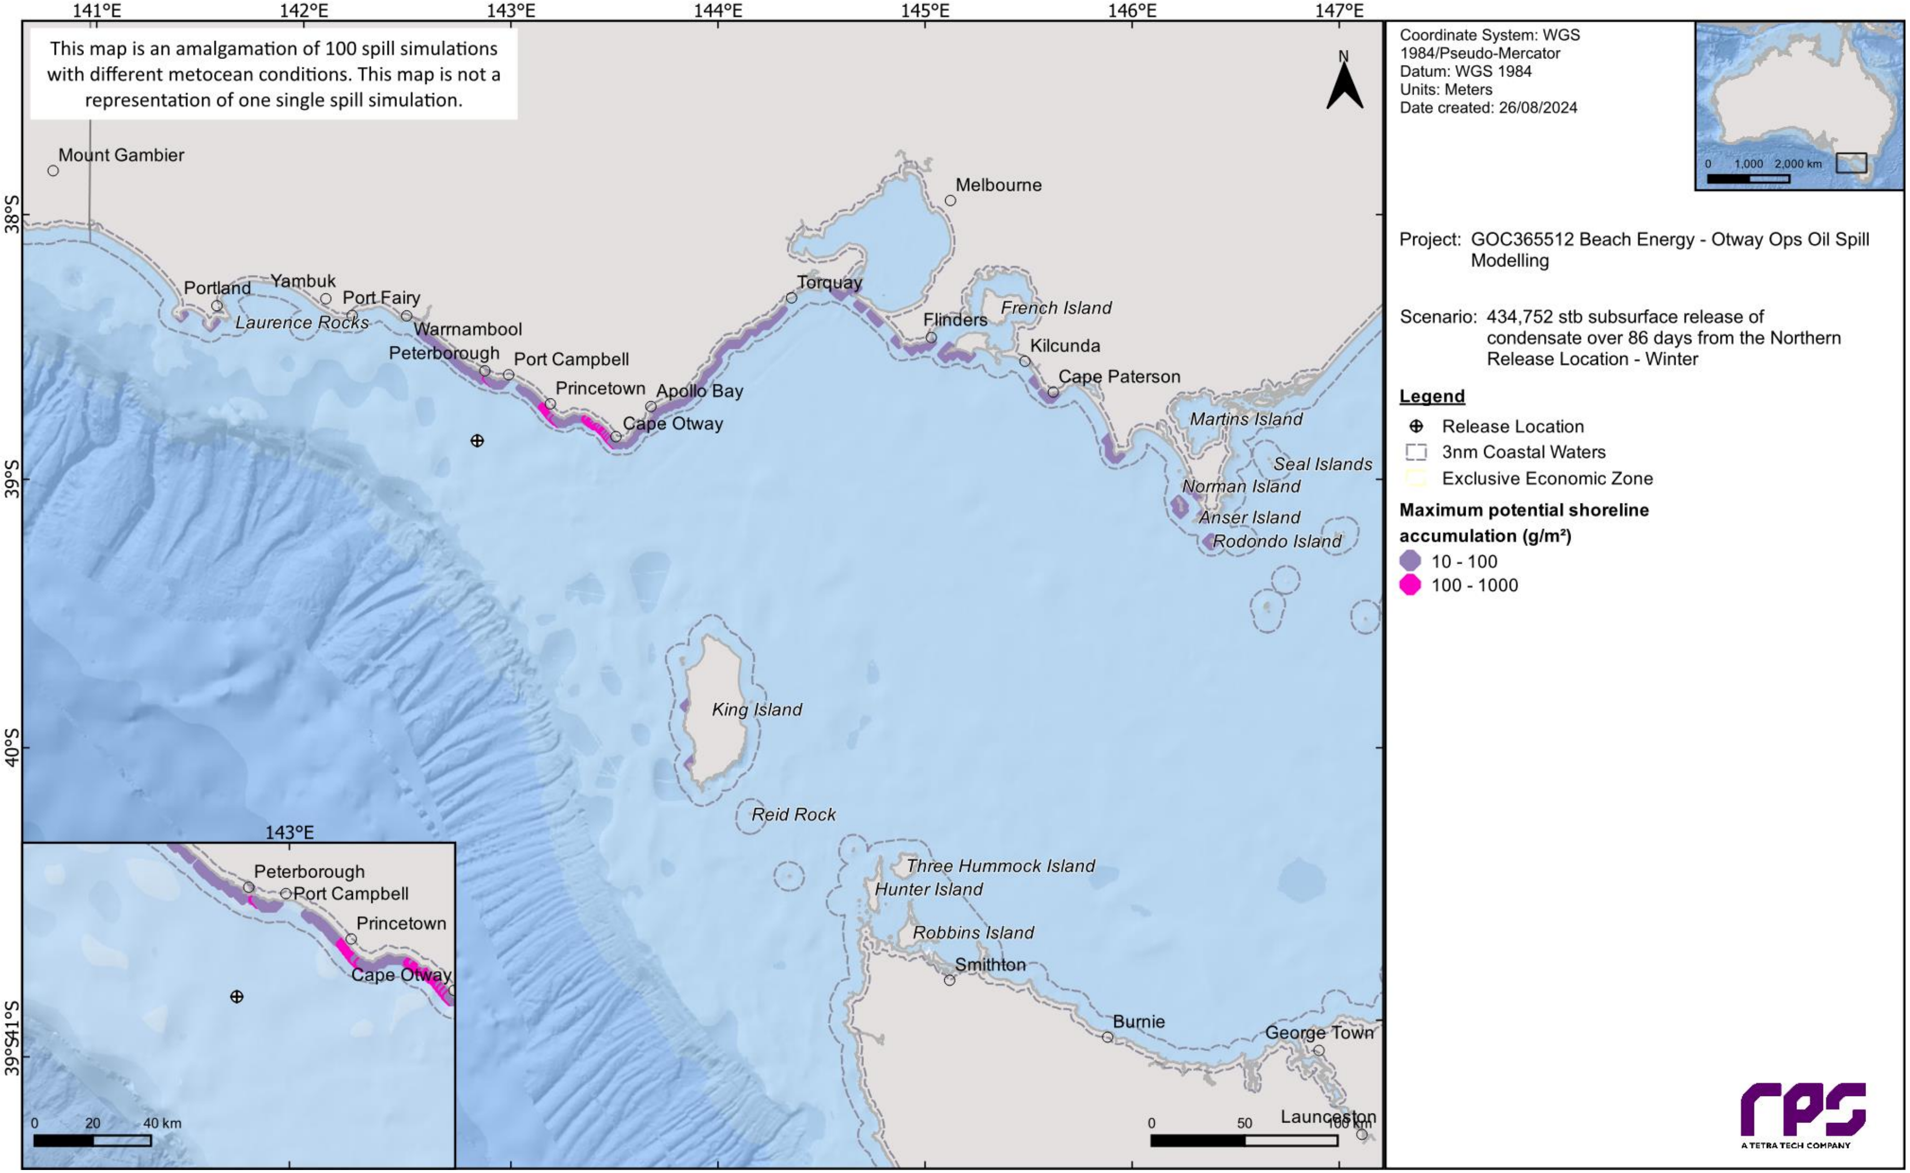

Figure 13-9 Maximum potential shoreline loading in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

13.1.4 In-water exposure

13.1.4.1 Dissolved Hydrocarbons

Table 13-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of dissolved hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) BIA and Corangamite (VIC) NRMR (summer – 570.15 ppb, winter – 1,332.51 ppb).

Table 13-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed. The minimum time before dissolved hydrocarbon exposure at the low threshold predicted for receptors which the release location does not reside within was 0.6 day (summer) and 0.47 day (winter) for the Short-tailed Shearwater - Foraging (Buffer around Tasmania including Bass Strait) BIA.

Figure 13-10 and Figure 13-11 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 13-12 to Figure 13-17 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 13-6 **Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.**

*The release location resides within the receptor boundaries.

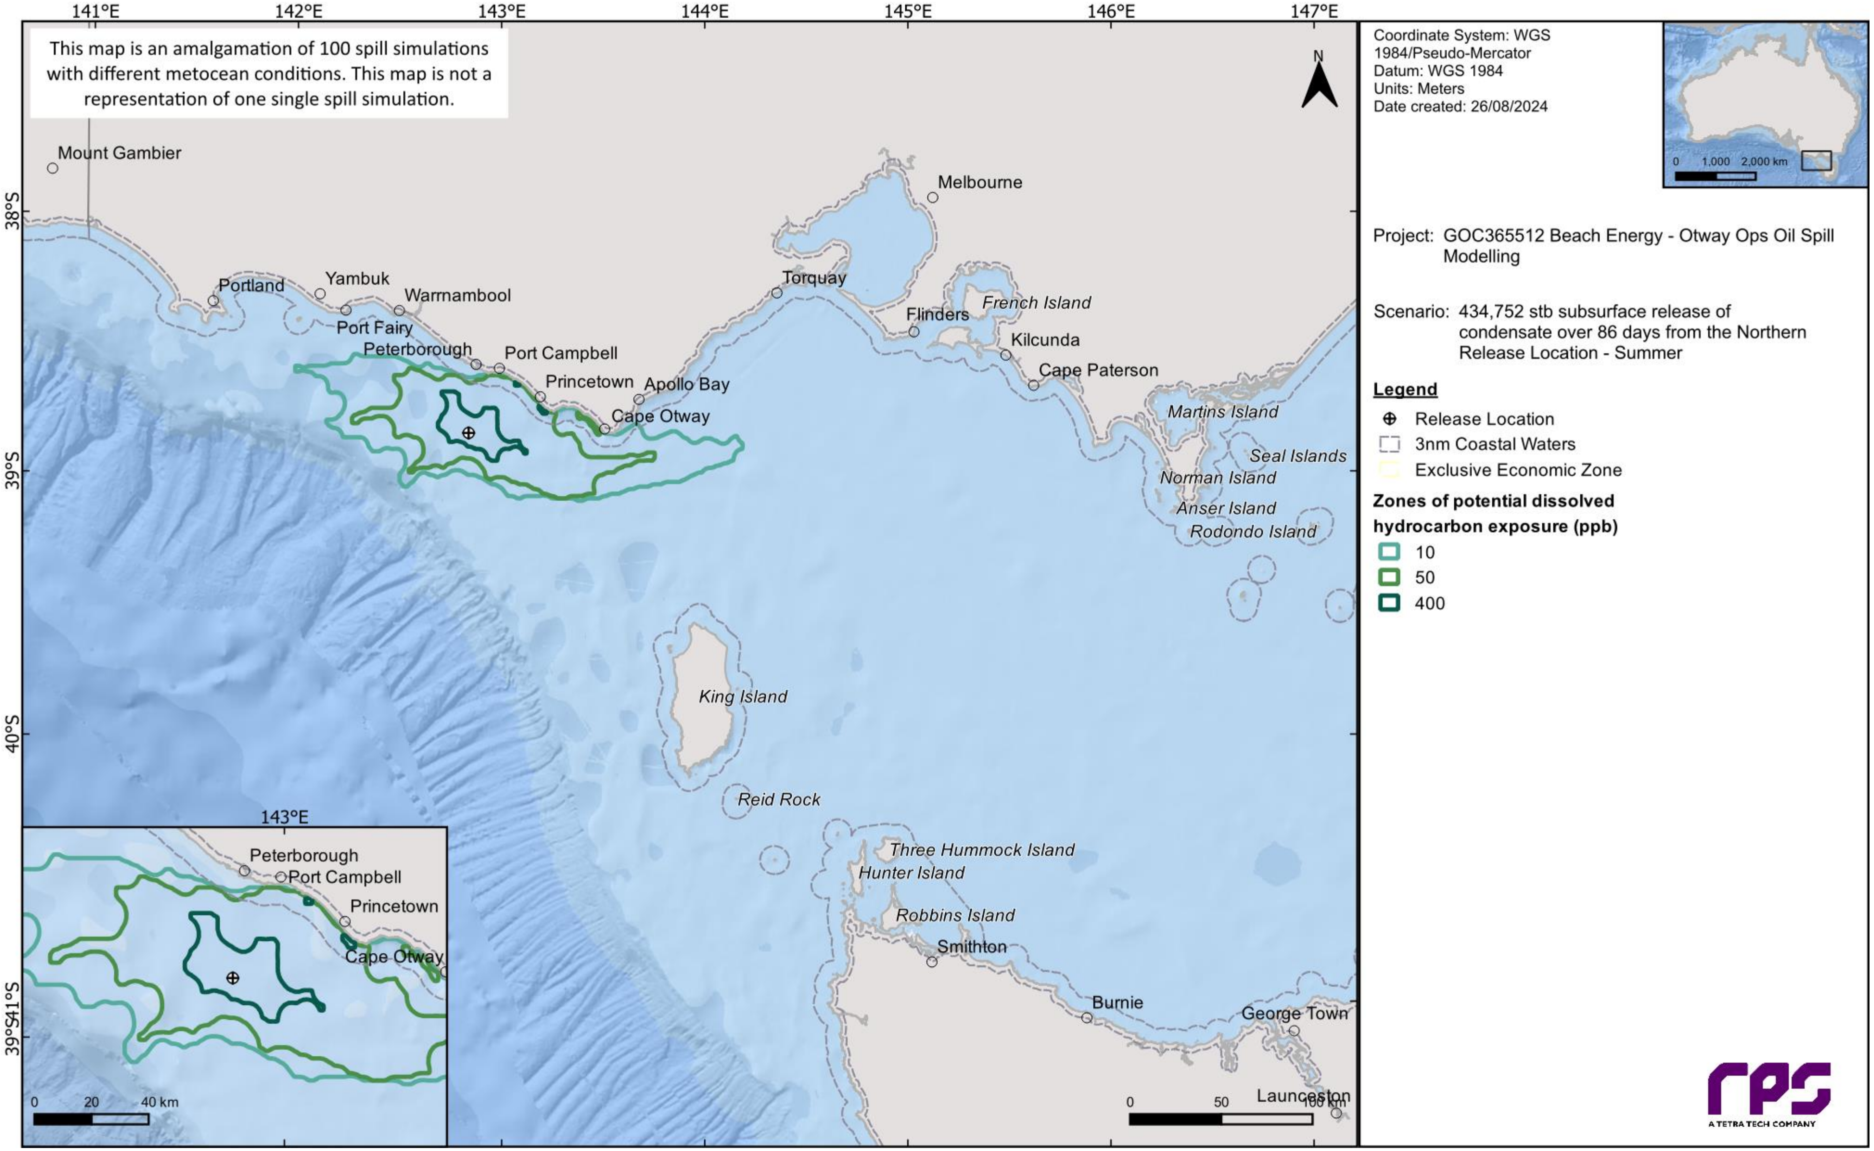

Figure 13-10 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

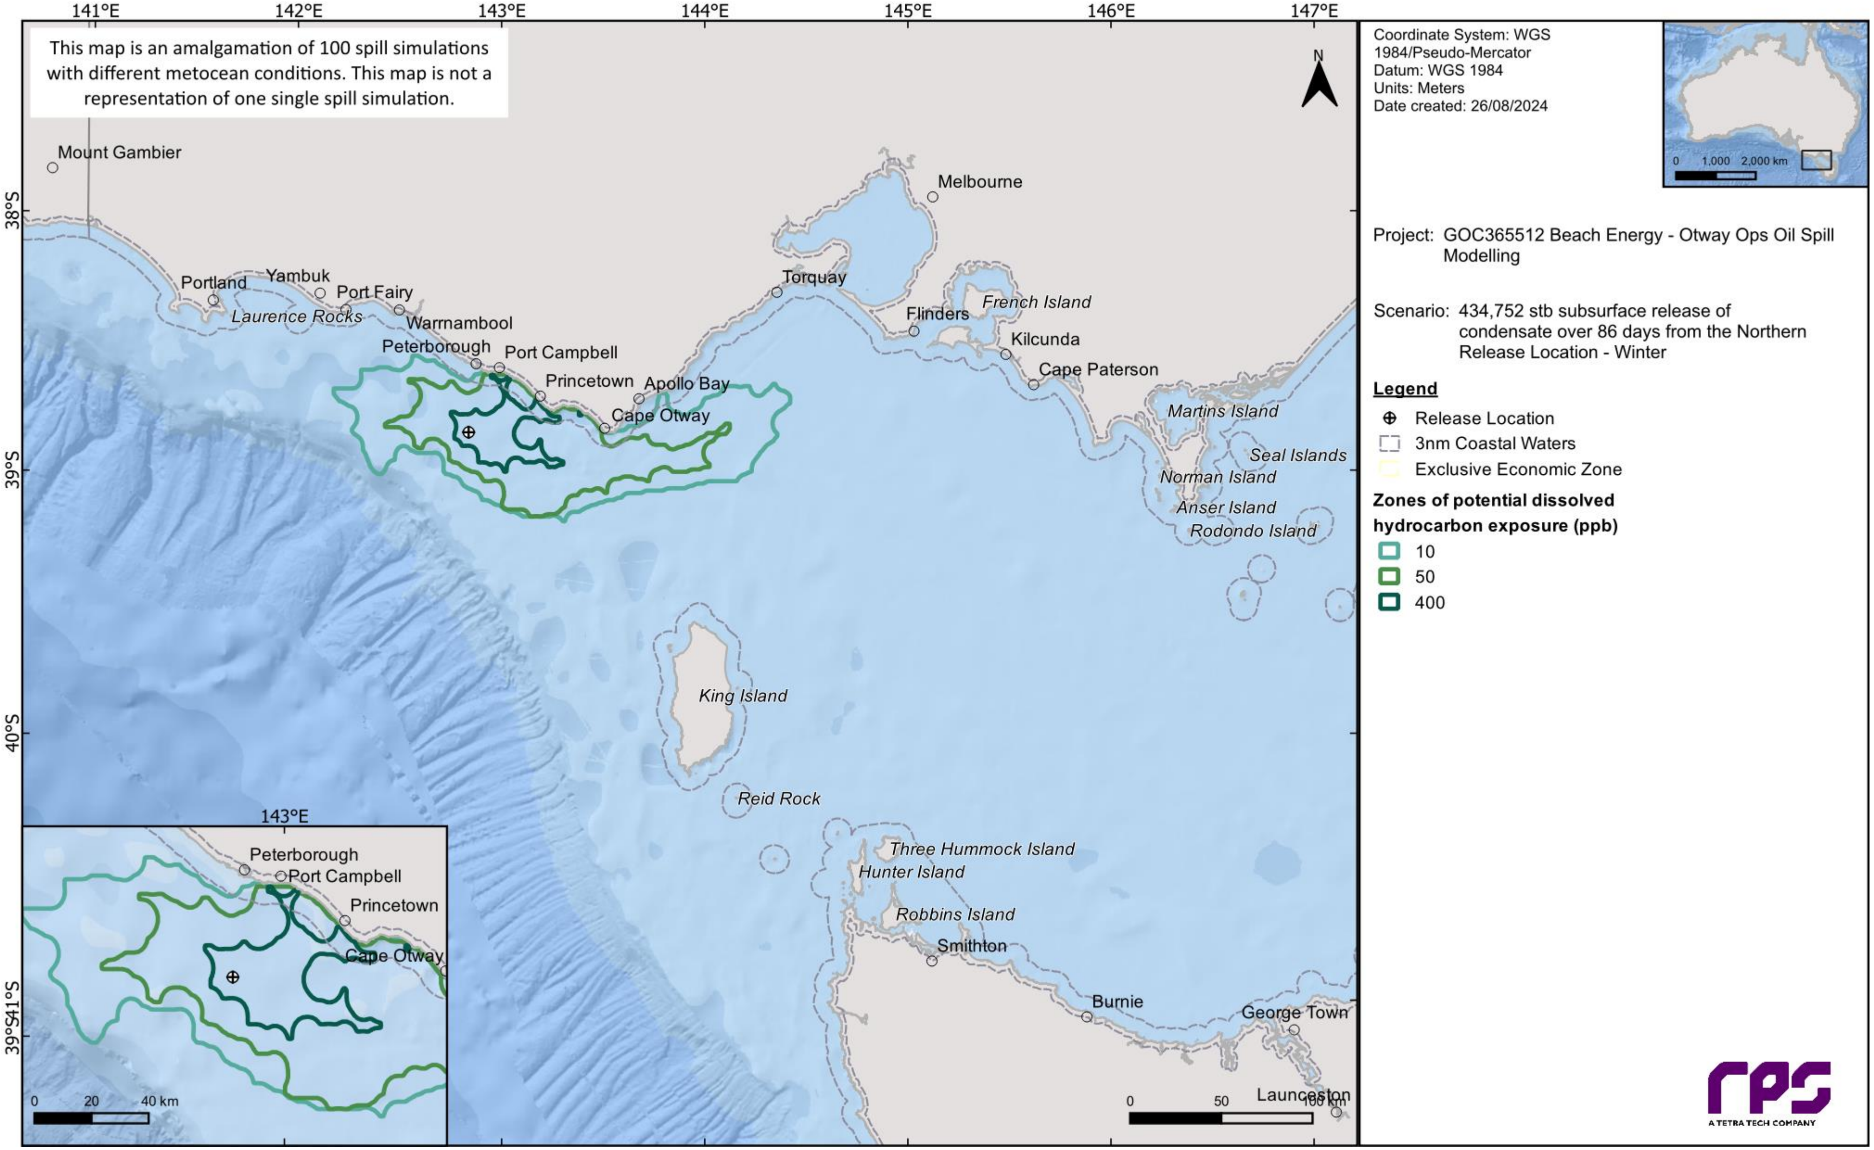

Figure 13-11 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

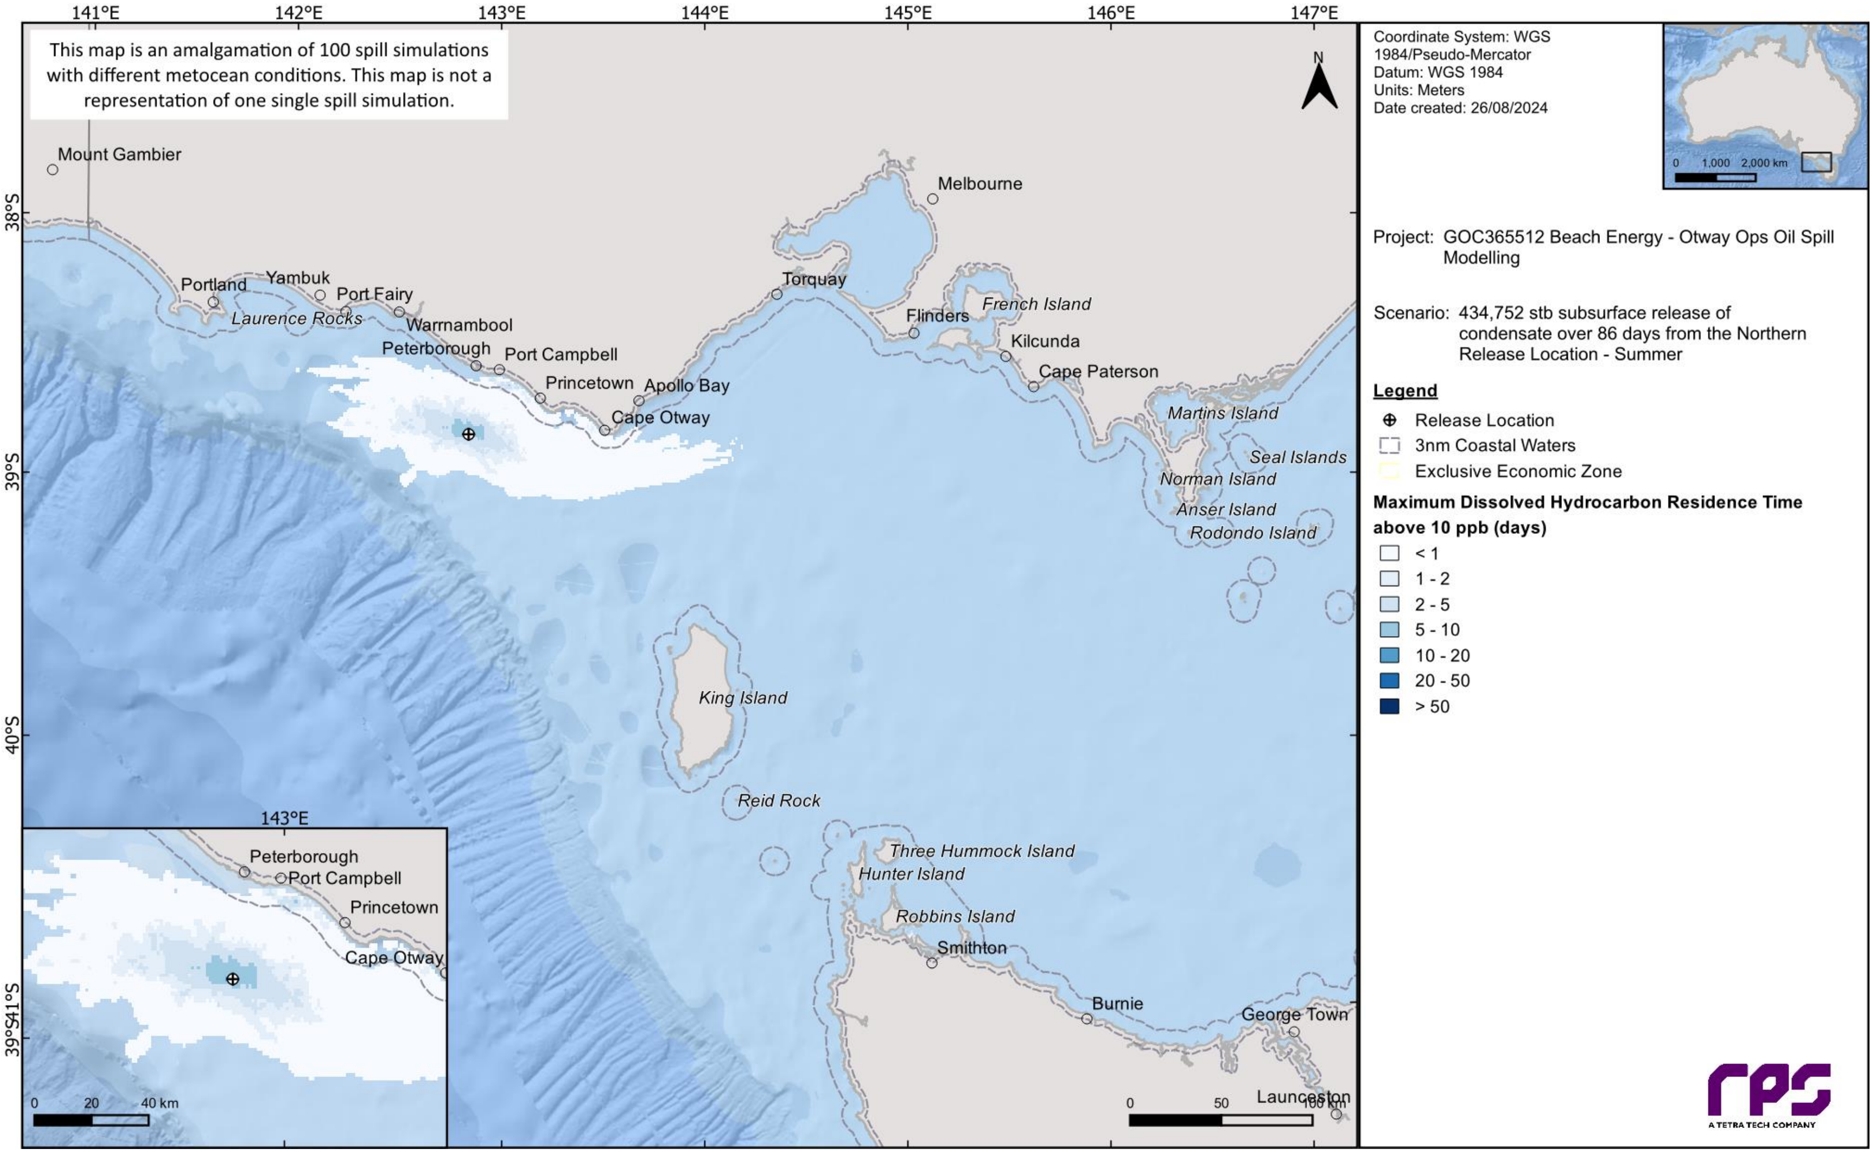

Figure 13-12 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

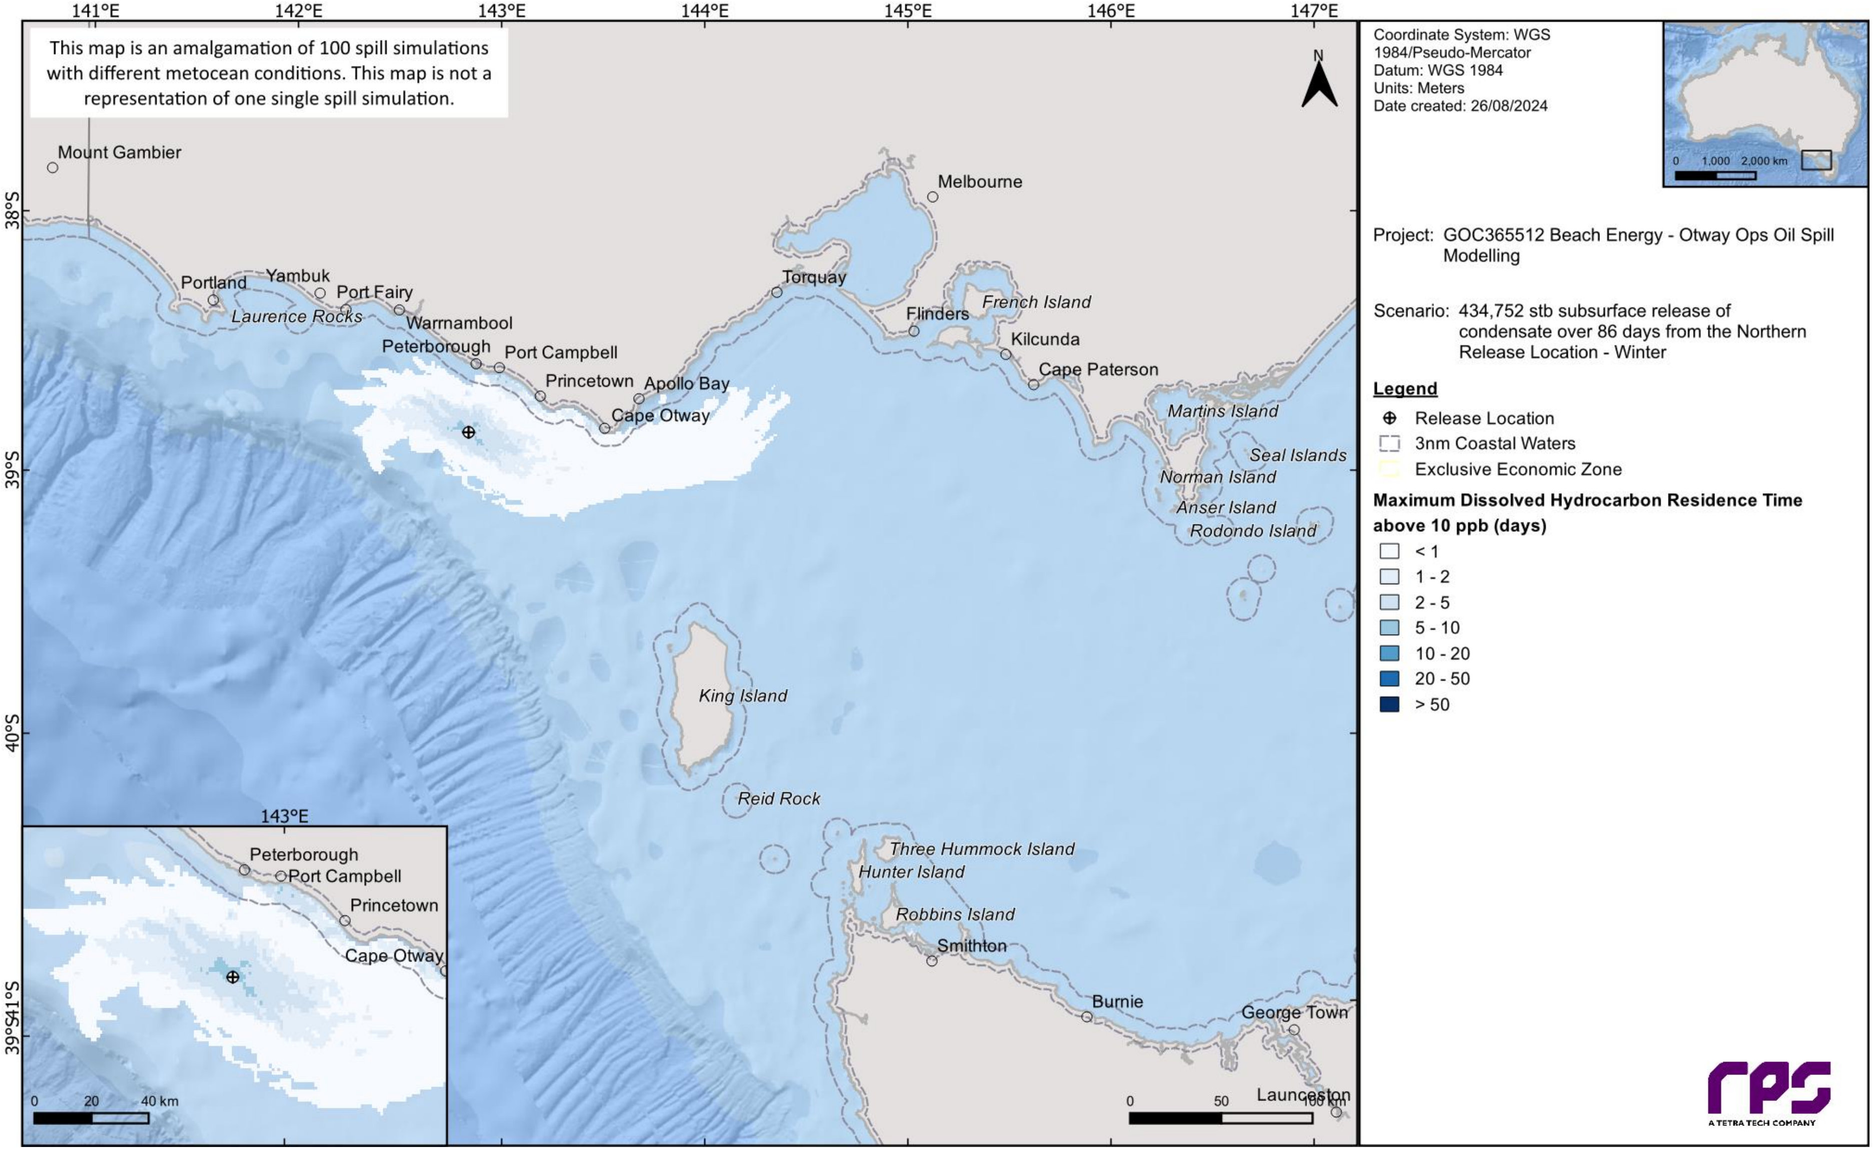

Figure 13-13 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

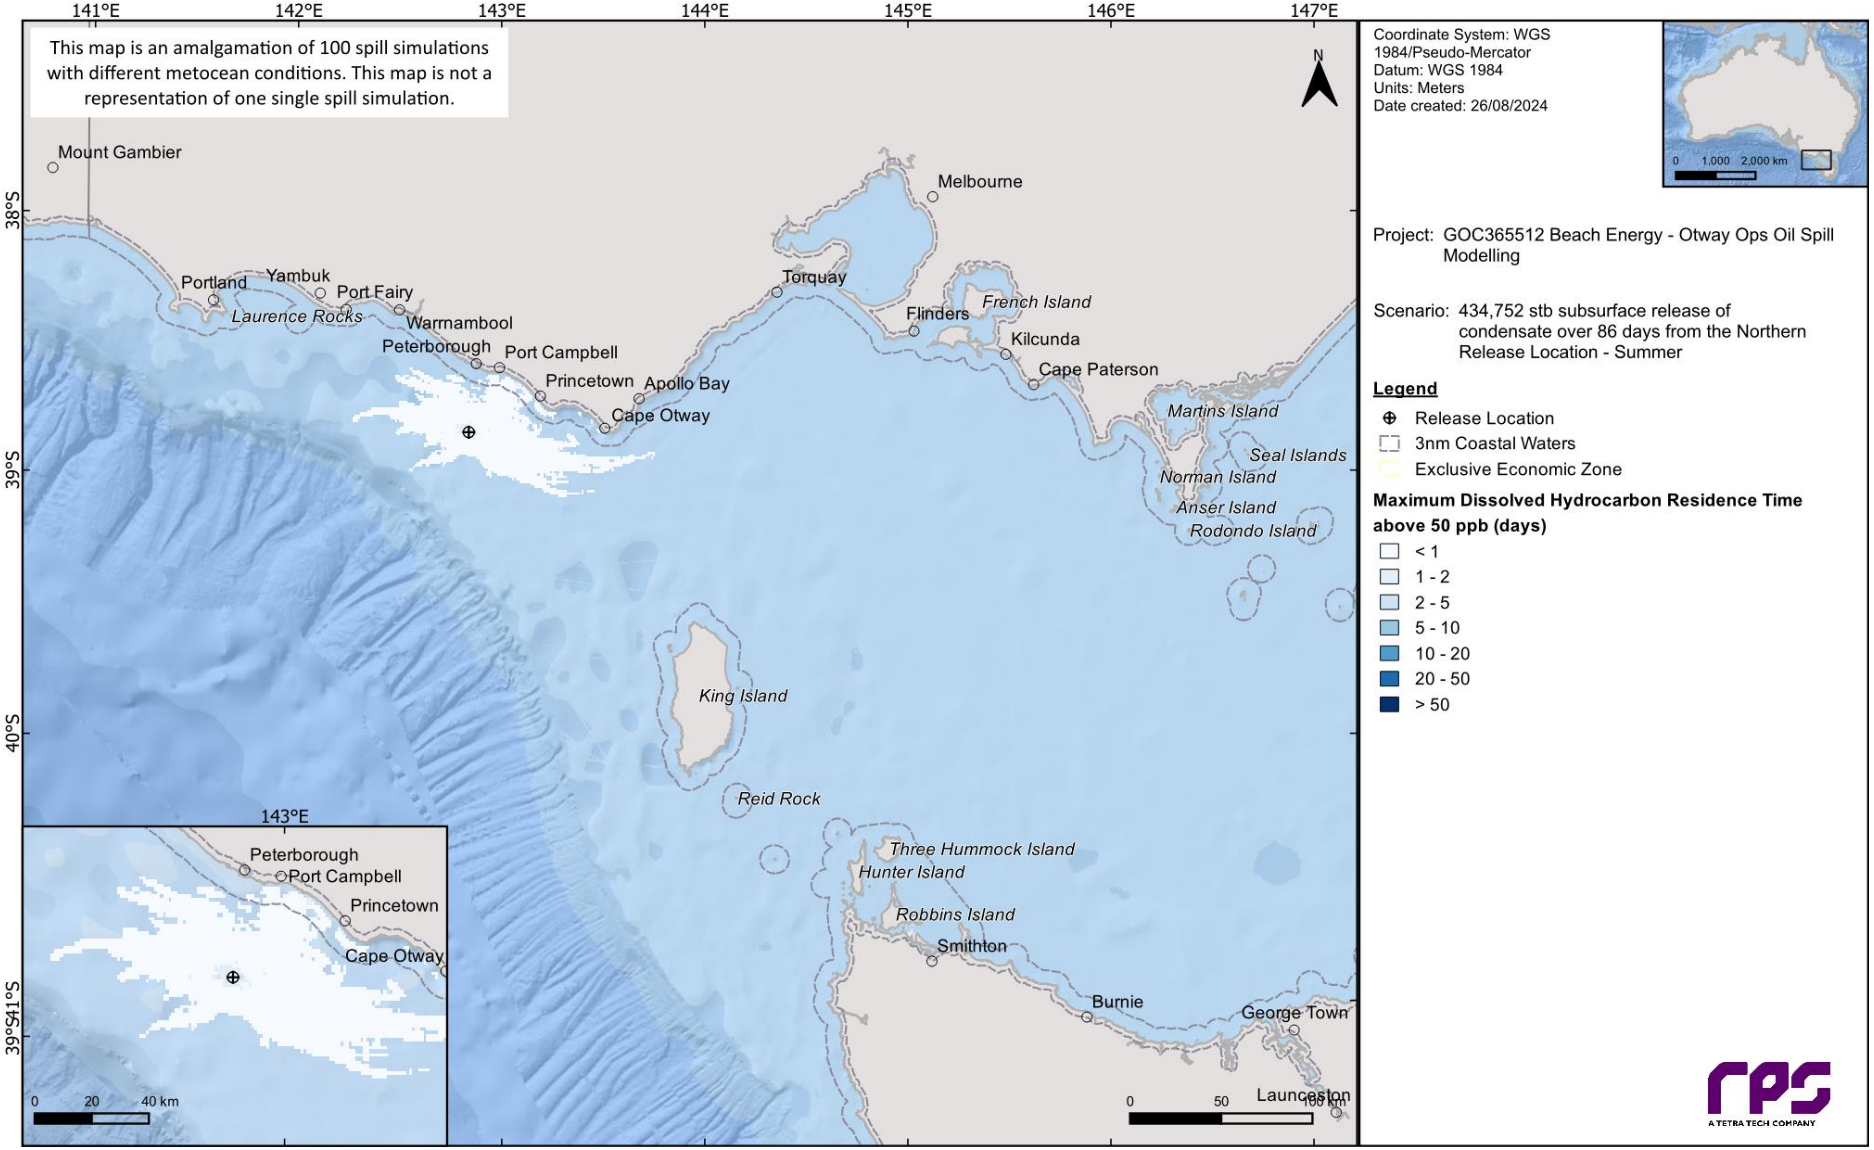

Figure 13-14 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

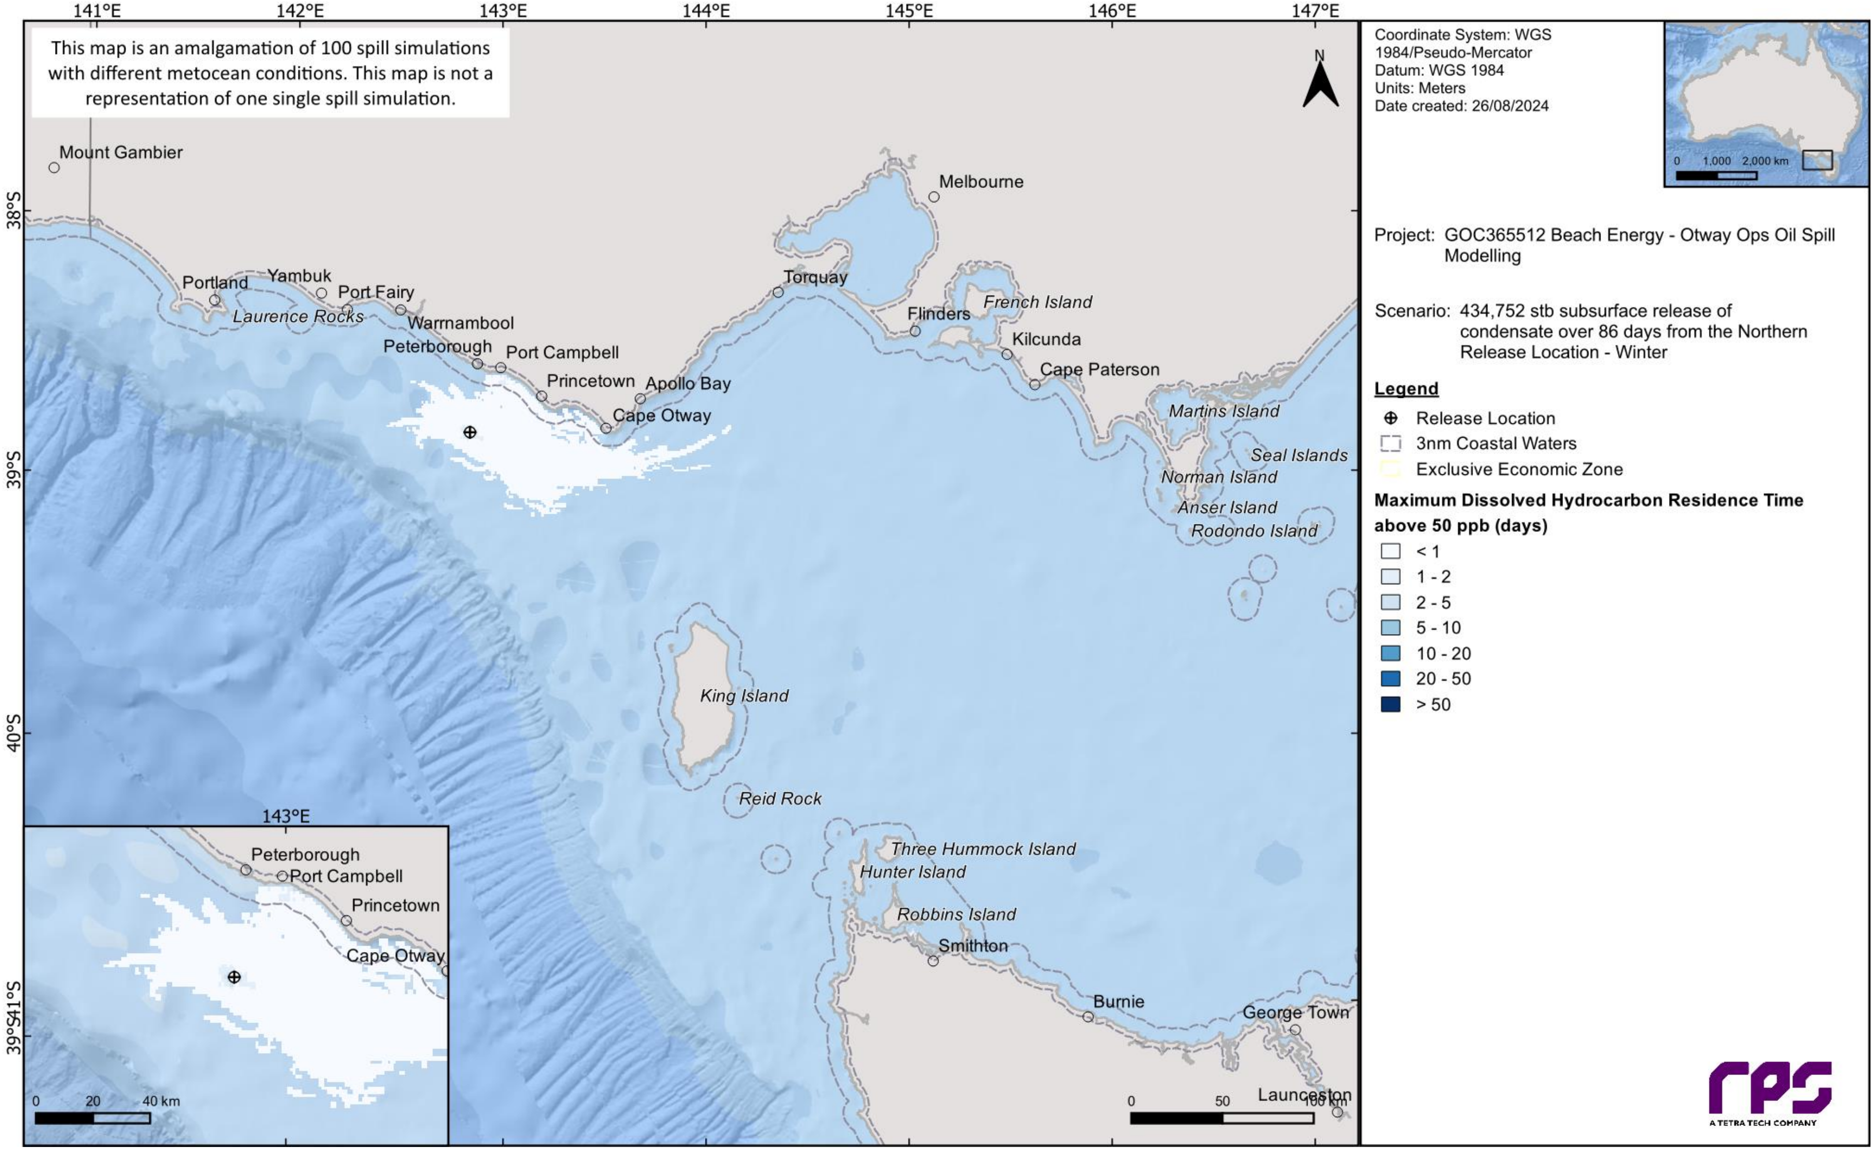

Figure 13-15 **Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.**

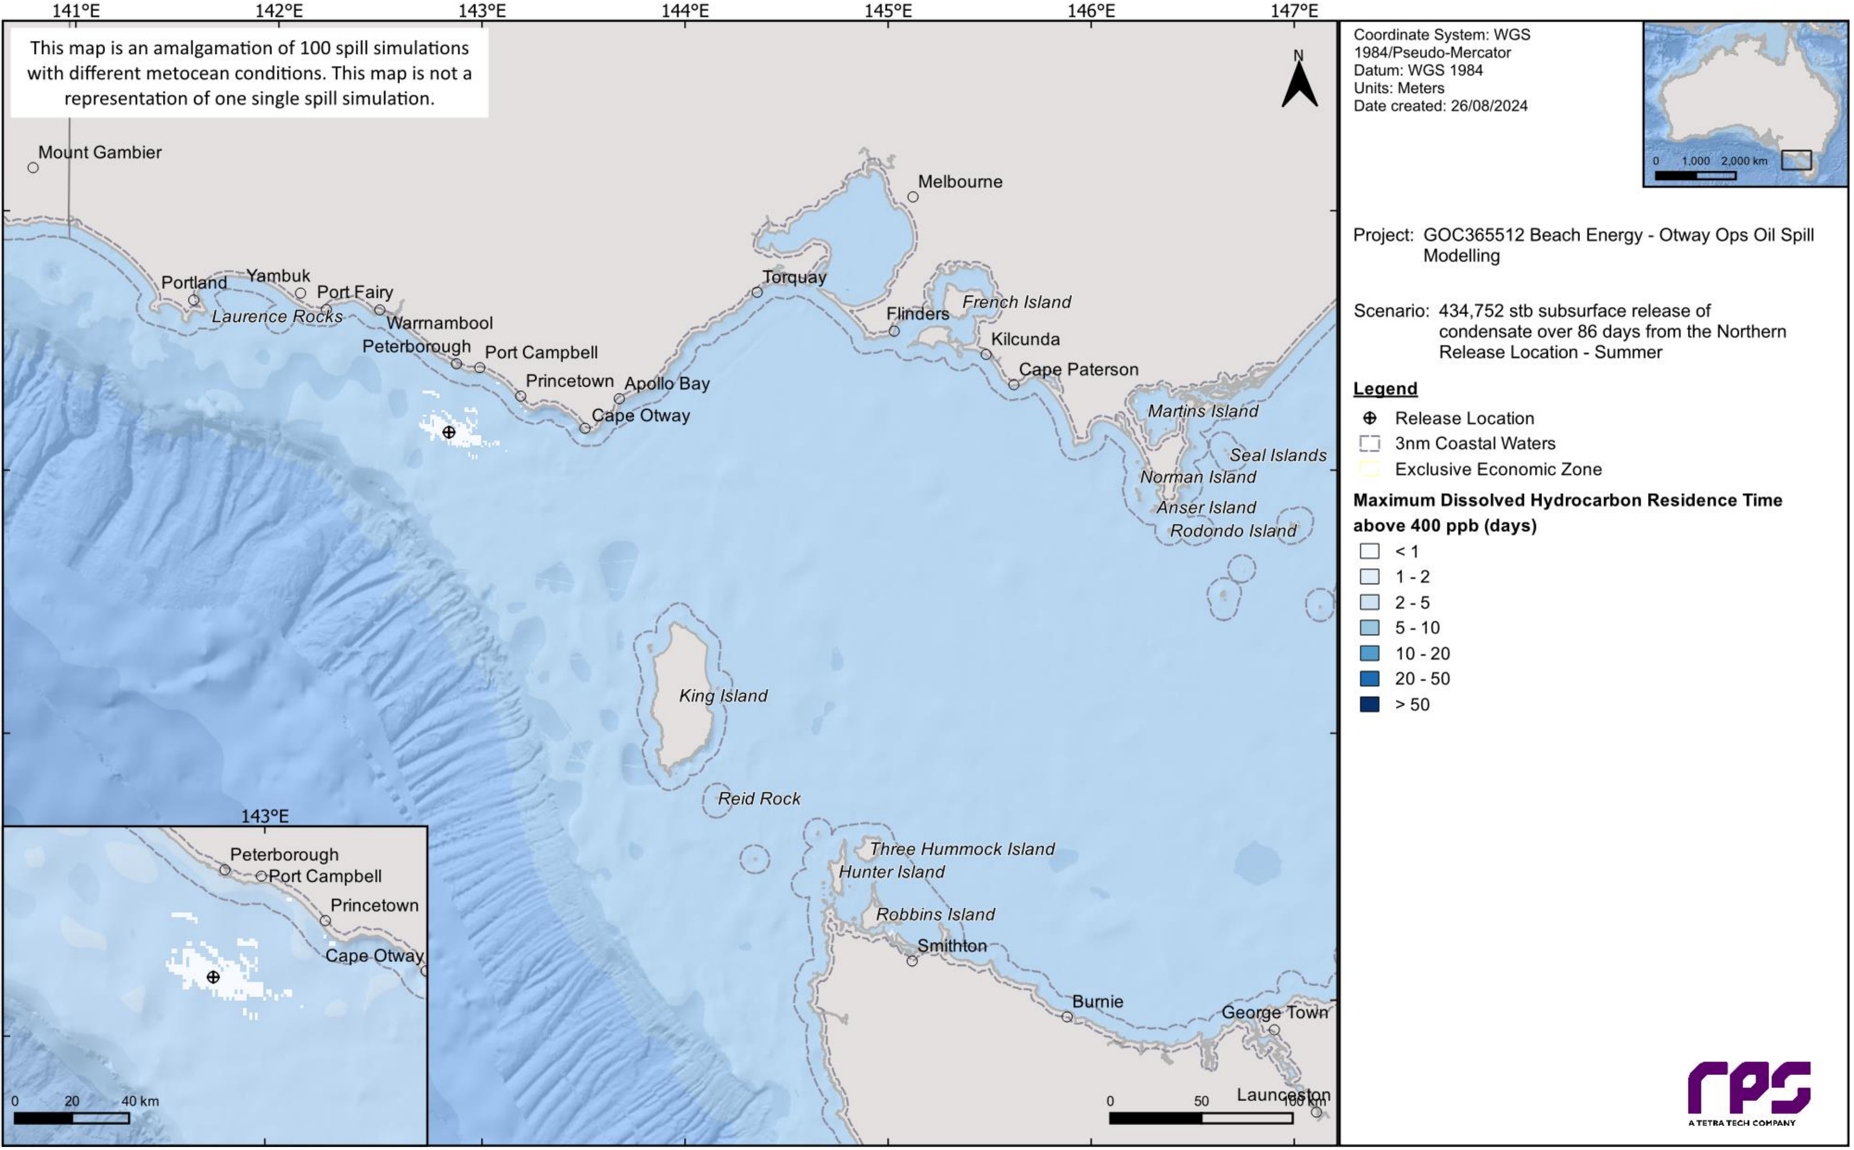

Figure 13-16 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

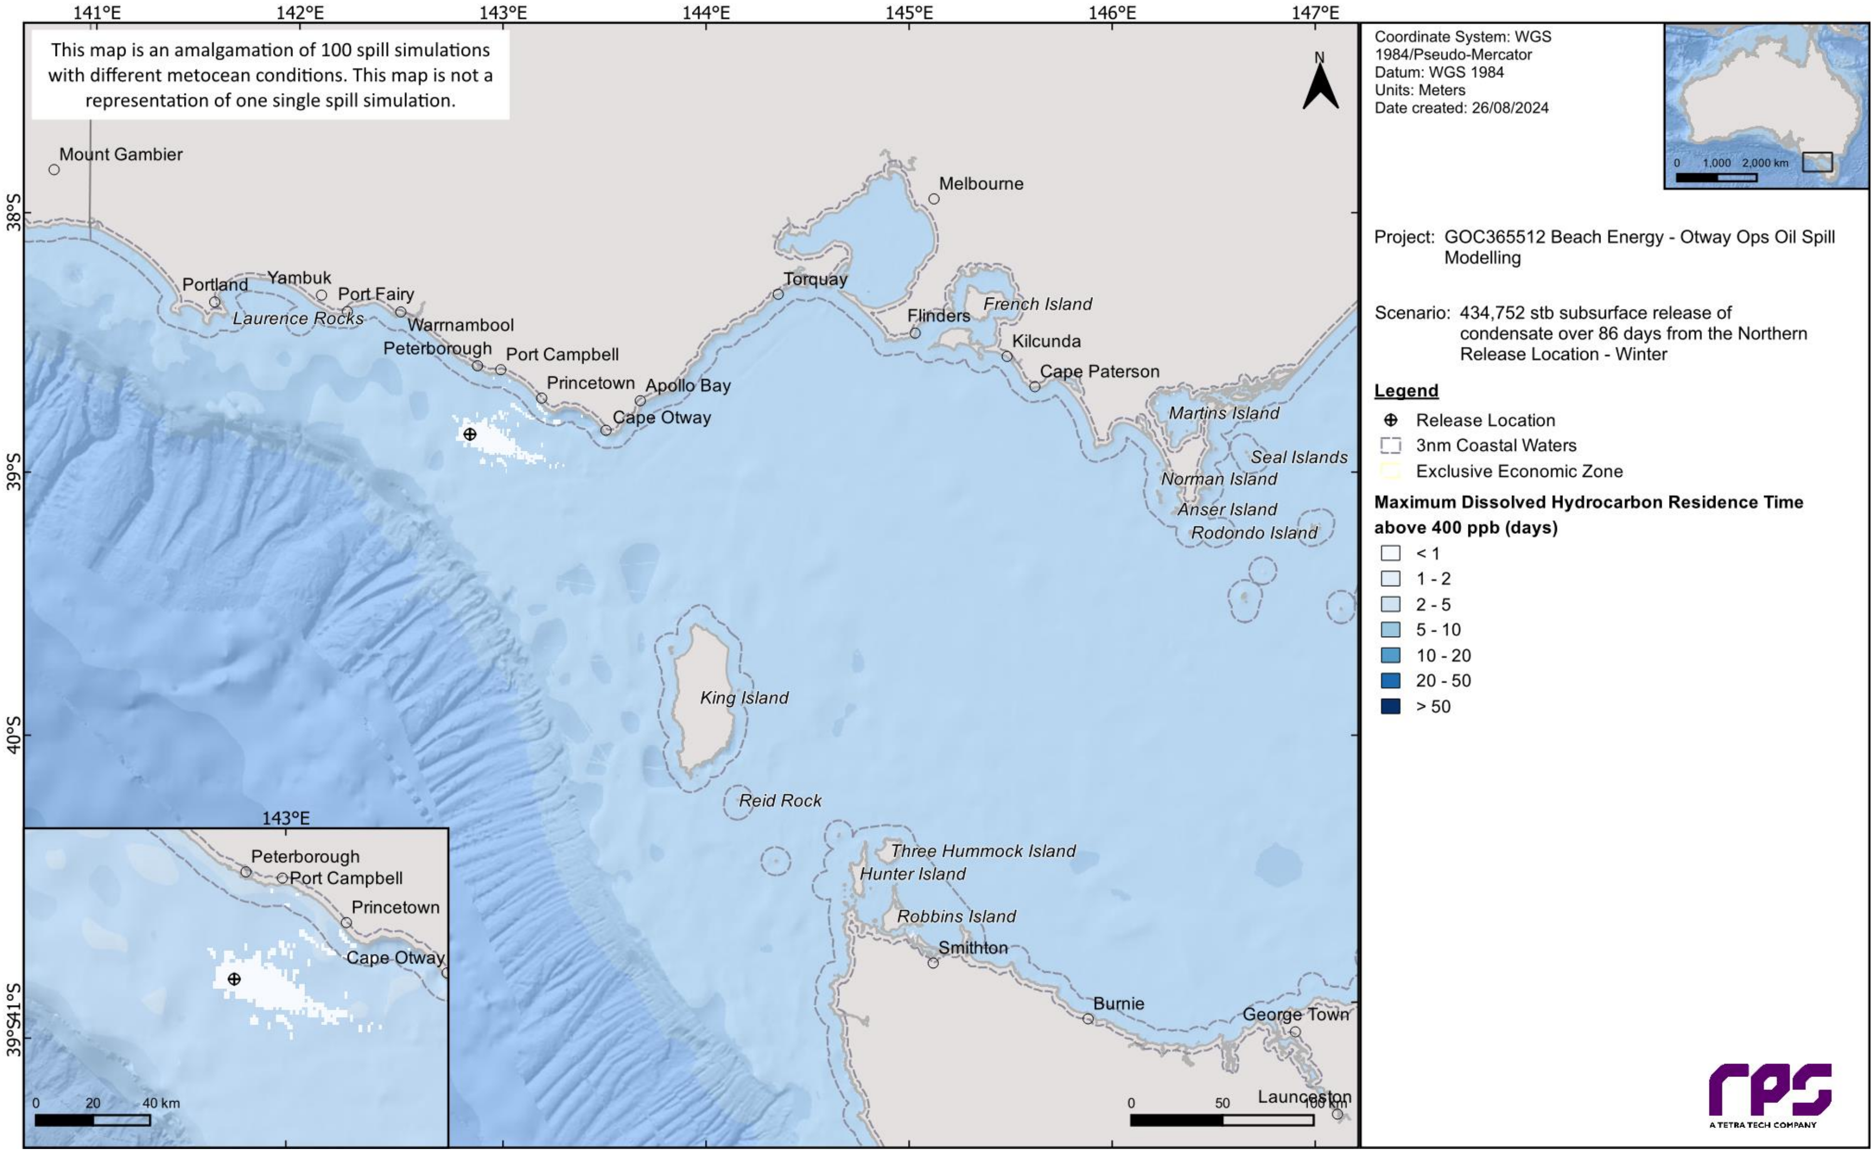

Figure 13-17 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

13.1.4.2 Entrained Hydrocarbons

Table 13-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) and Short-tailed Shearwater - Foraging BIAs (summer – 358.93 ppb, winter – 527.26 ppb).

Table 13-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 13-18 and Figure 13-19 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 13-20 to Figure 13-25 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 13-8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

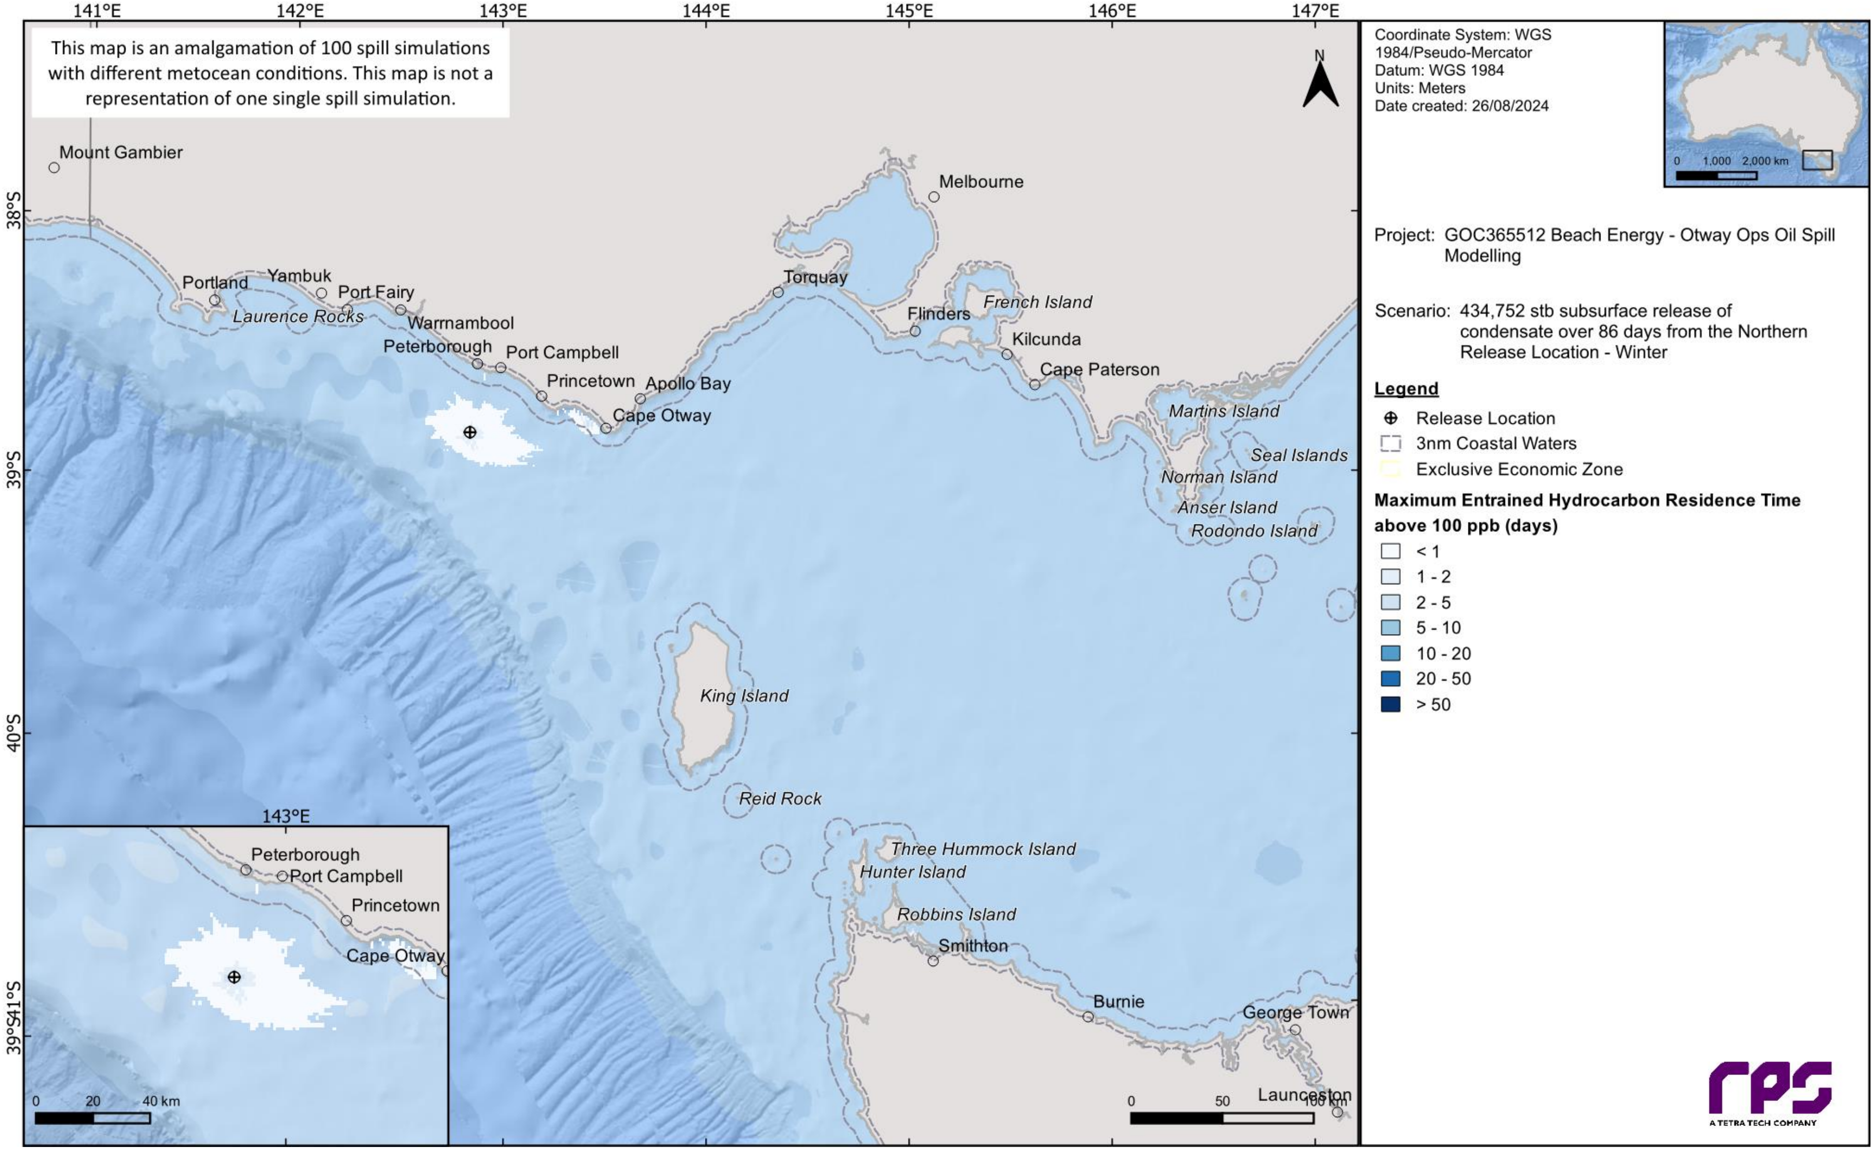

Figure 13-23 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

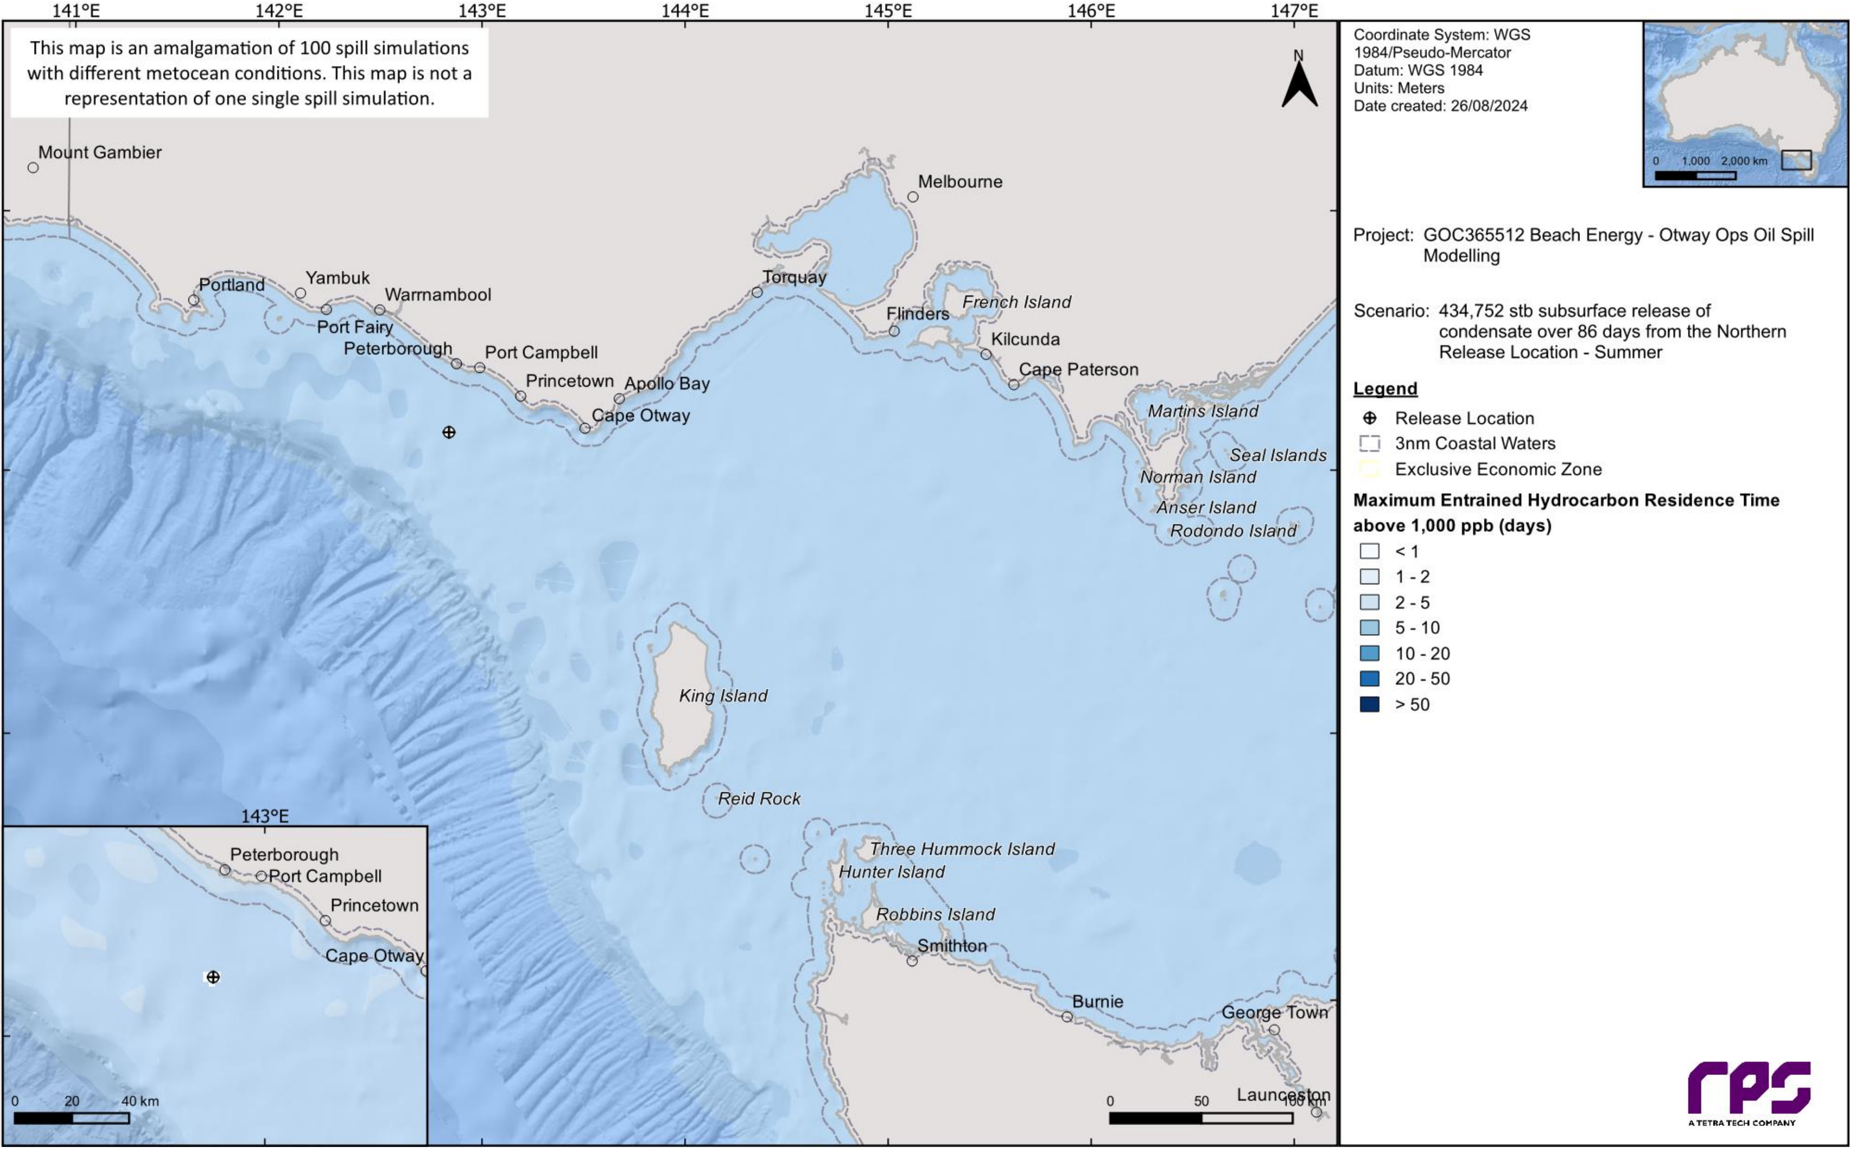

Figure 13-24 Maximum residence time for entrained hydrocarbon exposure above 1,000 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

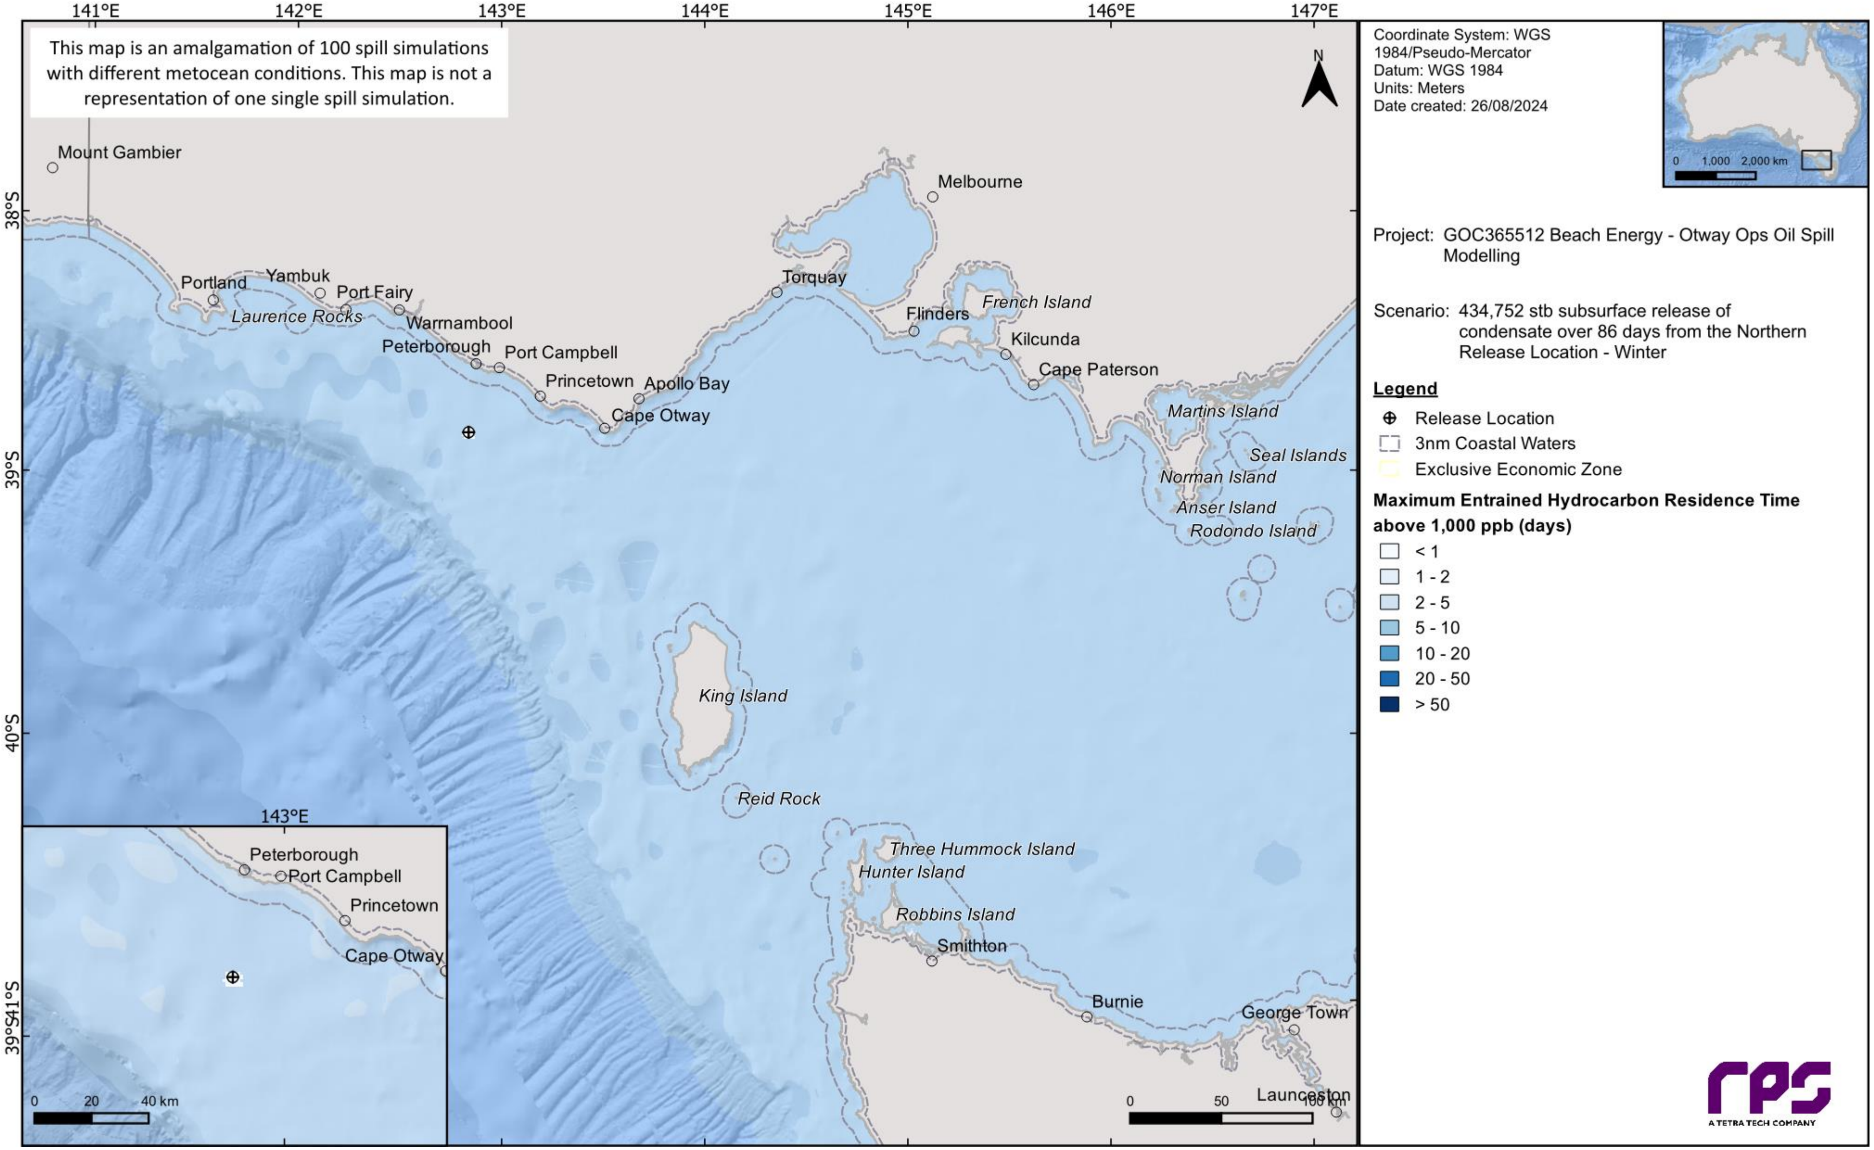

Figure 13-25 Maximum residence time for entrained hydrocarbon exposure above 1,000 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

14 RESULTS – LOSS OF CONTAINMENT FROM VESSEL COLLISION AT THE NORTHERN RELEASE LOCATION

This scenario examined a 603.7 m^3 surface release of marine diesel for a loss of containment from a vessel collision at the Northern Release Location. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 30 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

14.1 Stochastic Analysis

14.1.1 Area of Exposure

Figure 14-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

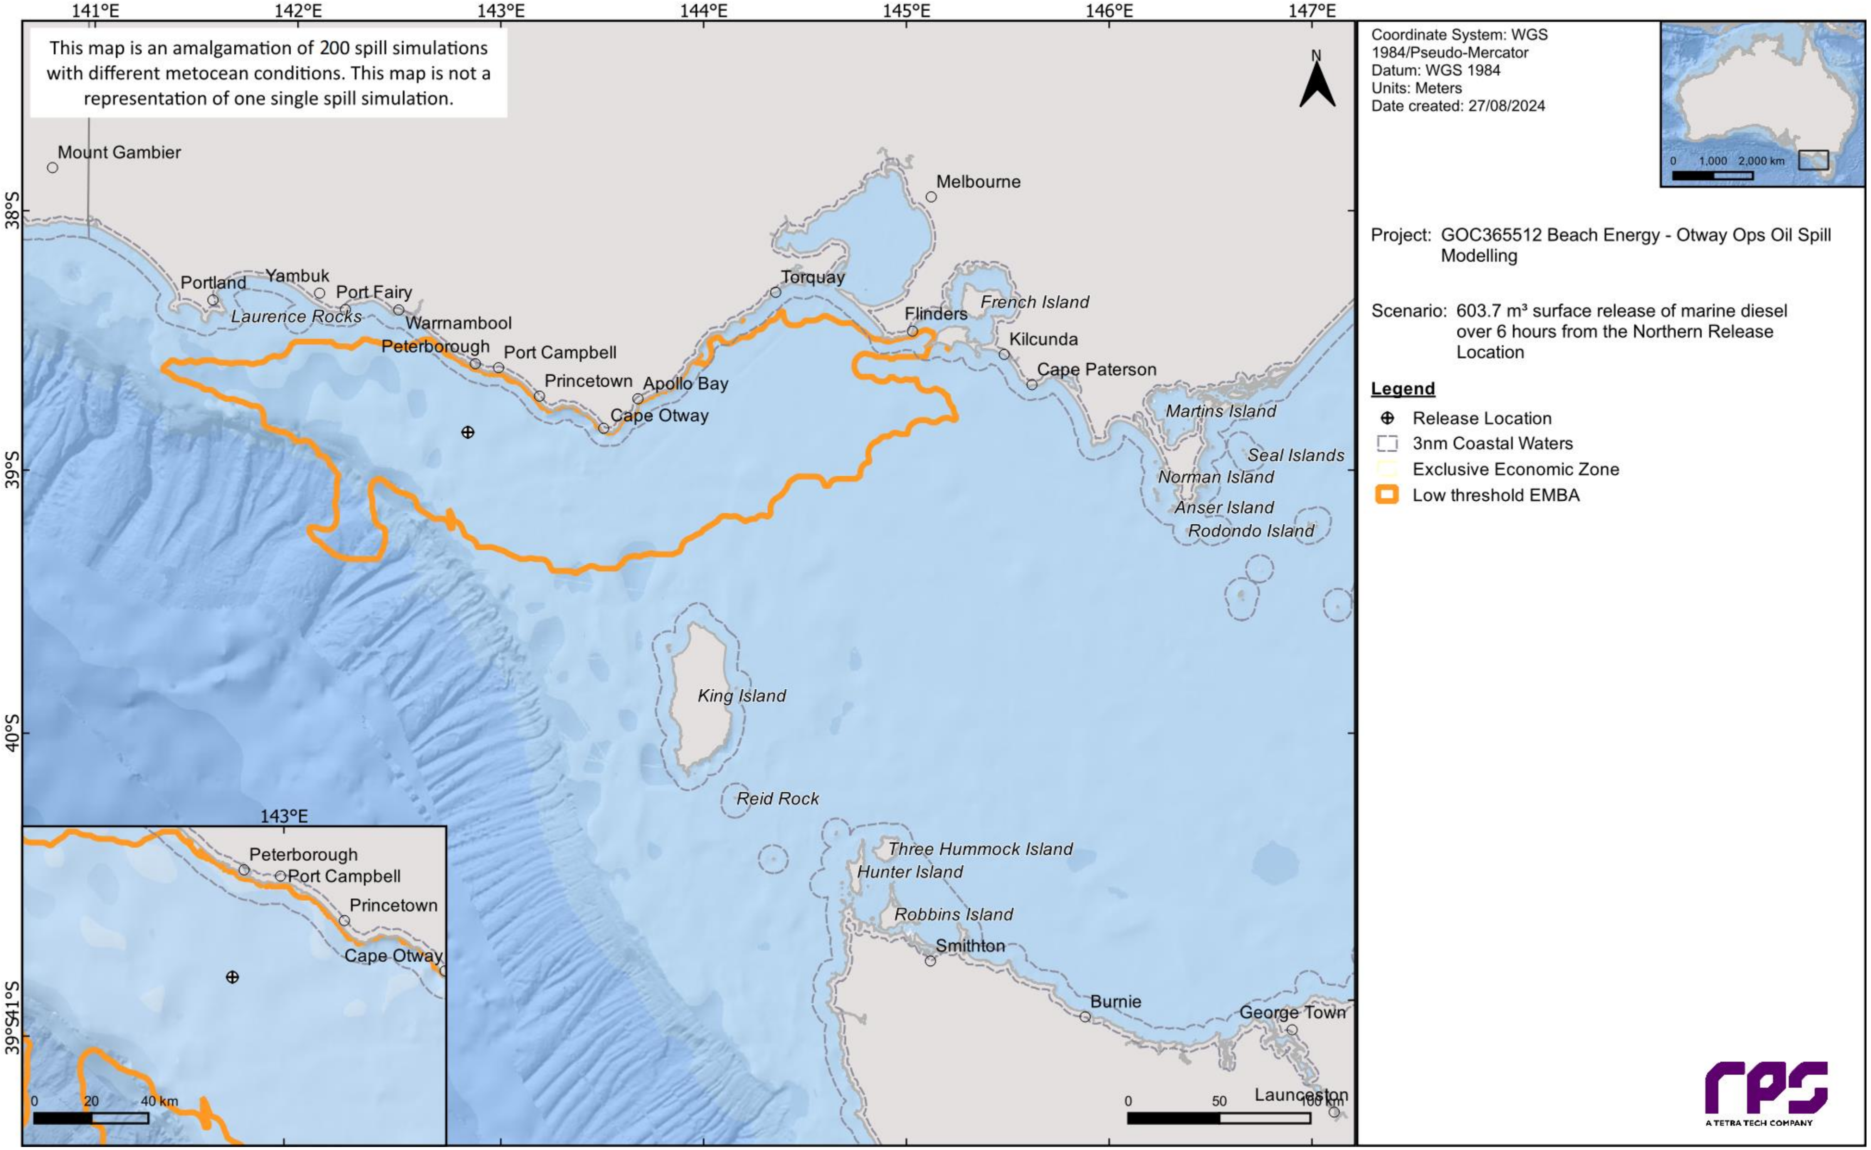

Figure 14-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location during summer and winter conditions.

14.1.2 Floating Oil Exposure

Table 14-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 32.65 km (east-southeast), 19.85 km (southeast) and 10.53 km (southeast) all during winter conditions.

Table 14-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), floating oil exposure above the low threshold was predicted at the Pygmy Blue Whale – Foraging (2% winter) and Short-tailed Shearwater - Foraging (2% summer, 3% winter) BIAs.

Table 14-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 14-2 and Figure 14-3 present the zones of potential floating oil exposure for all thresholds under summer and winter conditions, respectively.

Figure 14-4 to Figure 14-9 present the minimum time before floating oil exposure for the NOPSEMA thresholds during summer and winter, respectively.

Table 14-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	25.26	16.96	9.76
	Direction	West-Northwest	Northwest	North-Northwest
Winter	Maximum distance (km) from release location	32.65	19.85	10.53
	Direction	East-Southeast	Southeast	Southeast

Table 14-2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at the Northern Release Location. The results were calculated from 100 spill simulations per season.

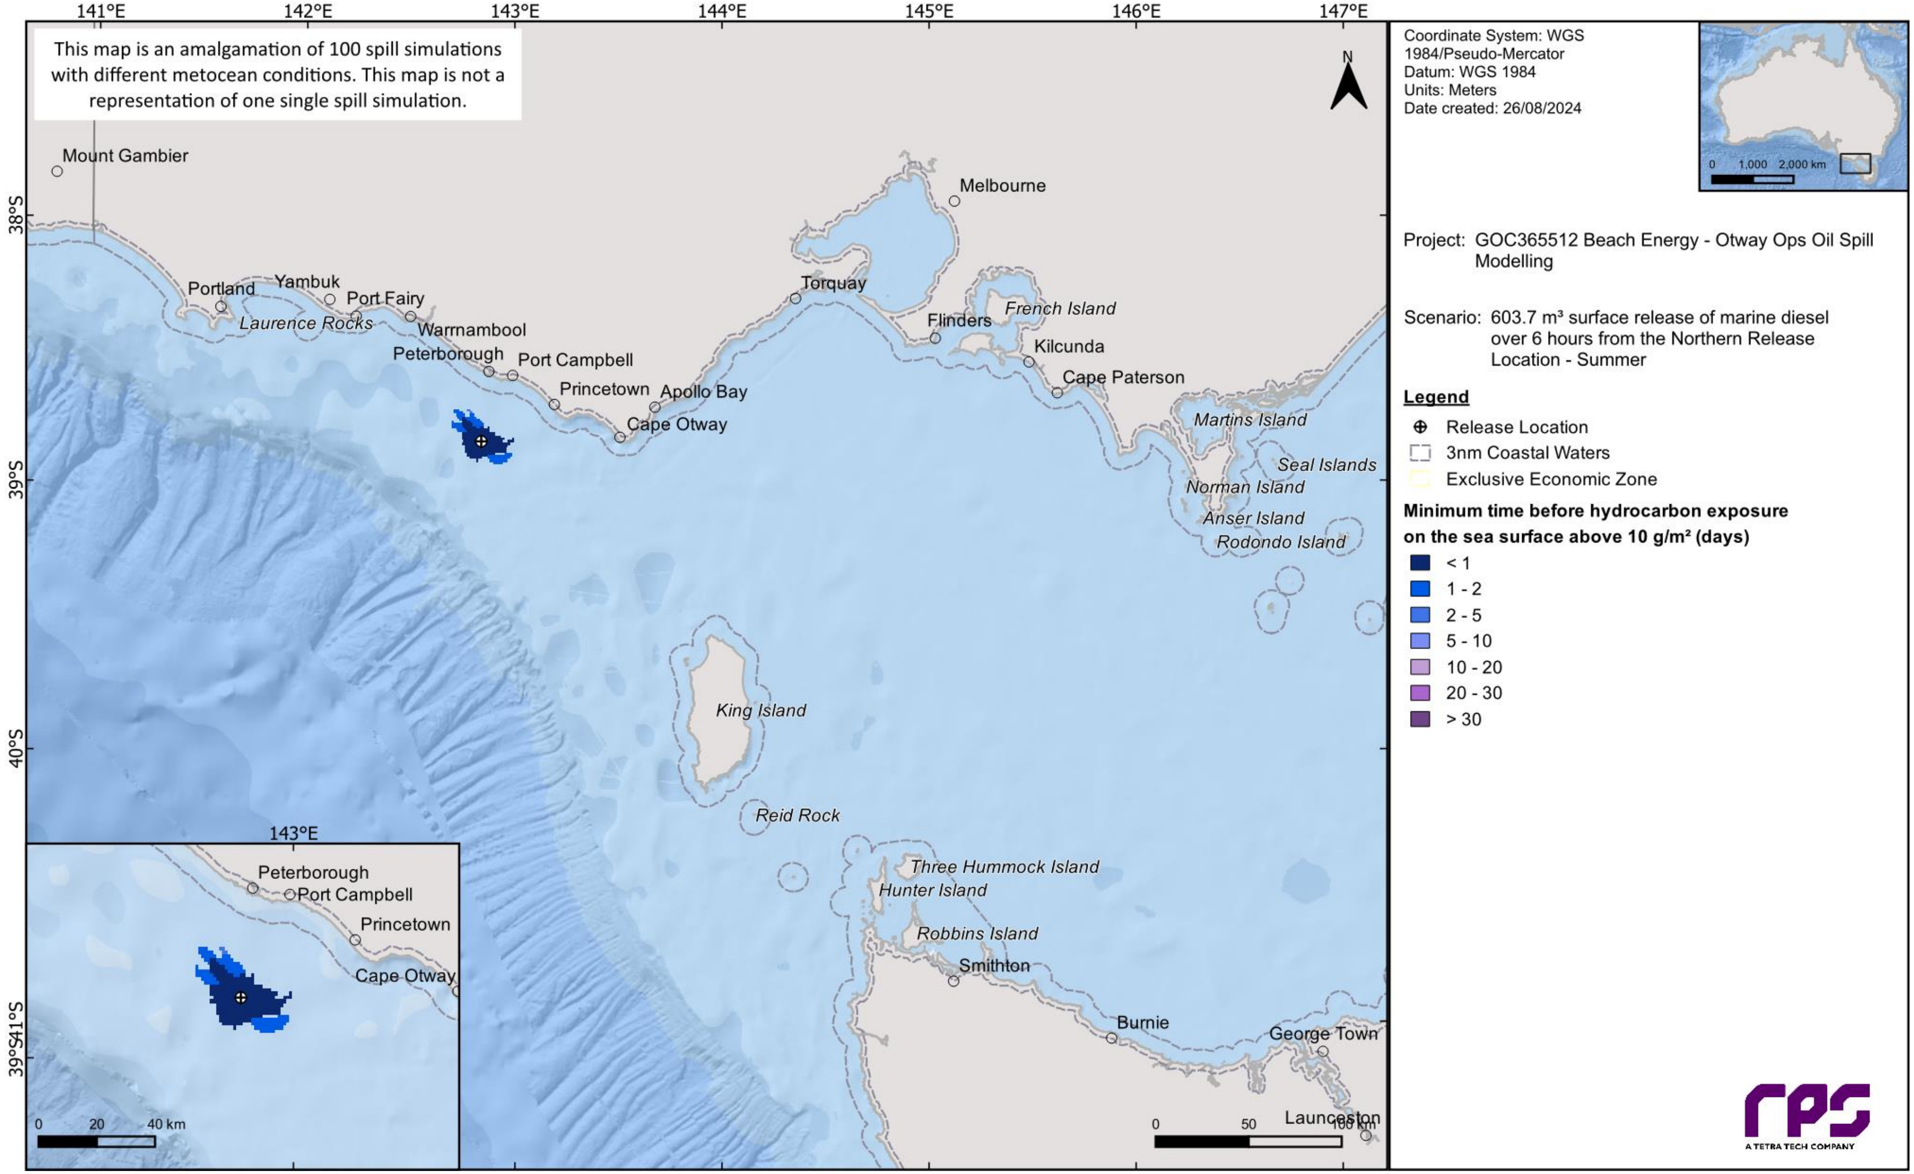

Figure 14-6 **Minimum time before floating oil exposure above 10 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.**

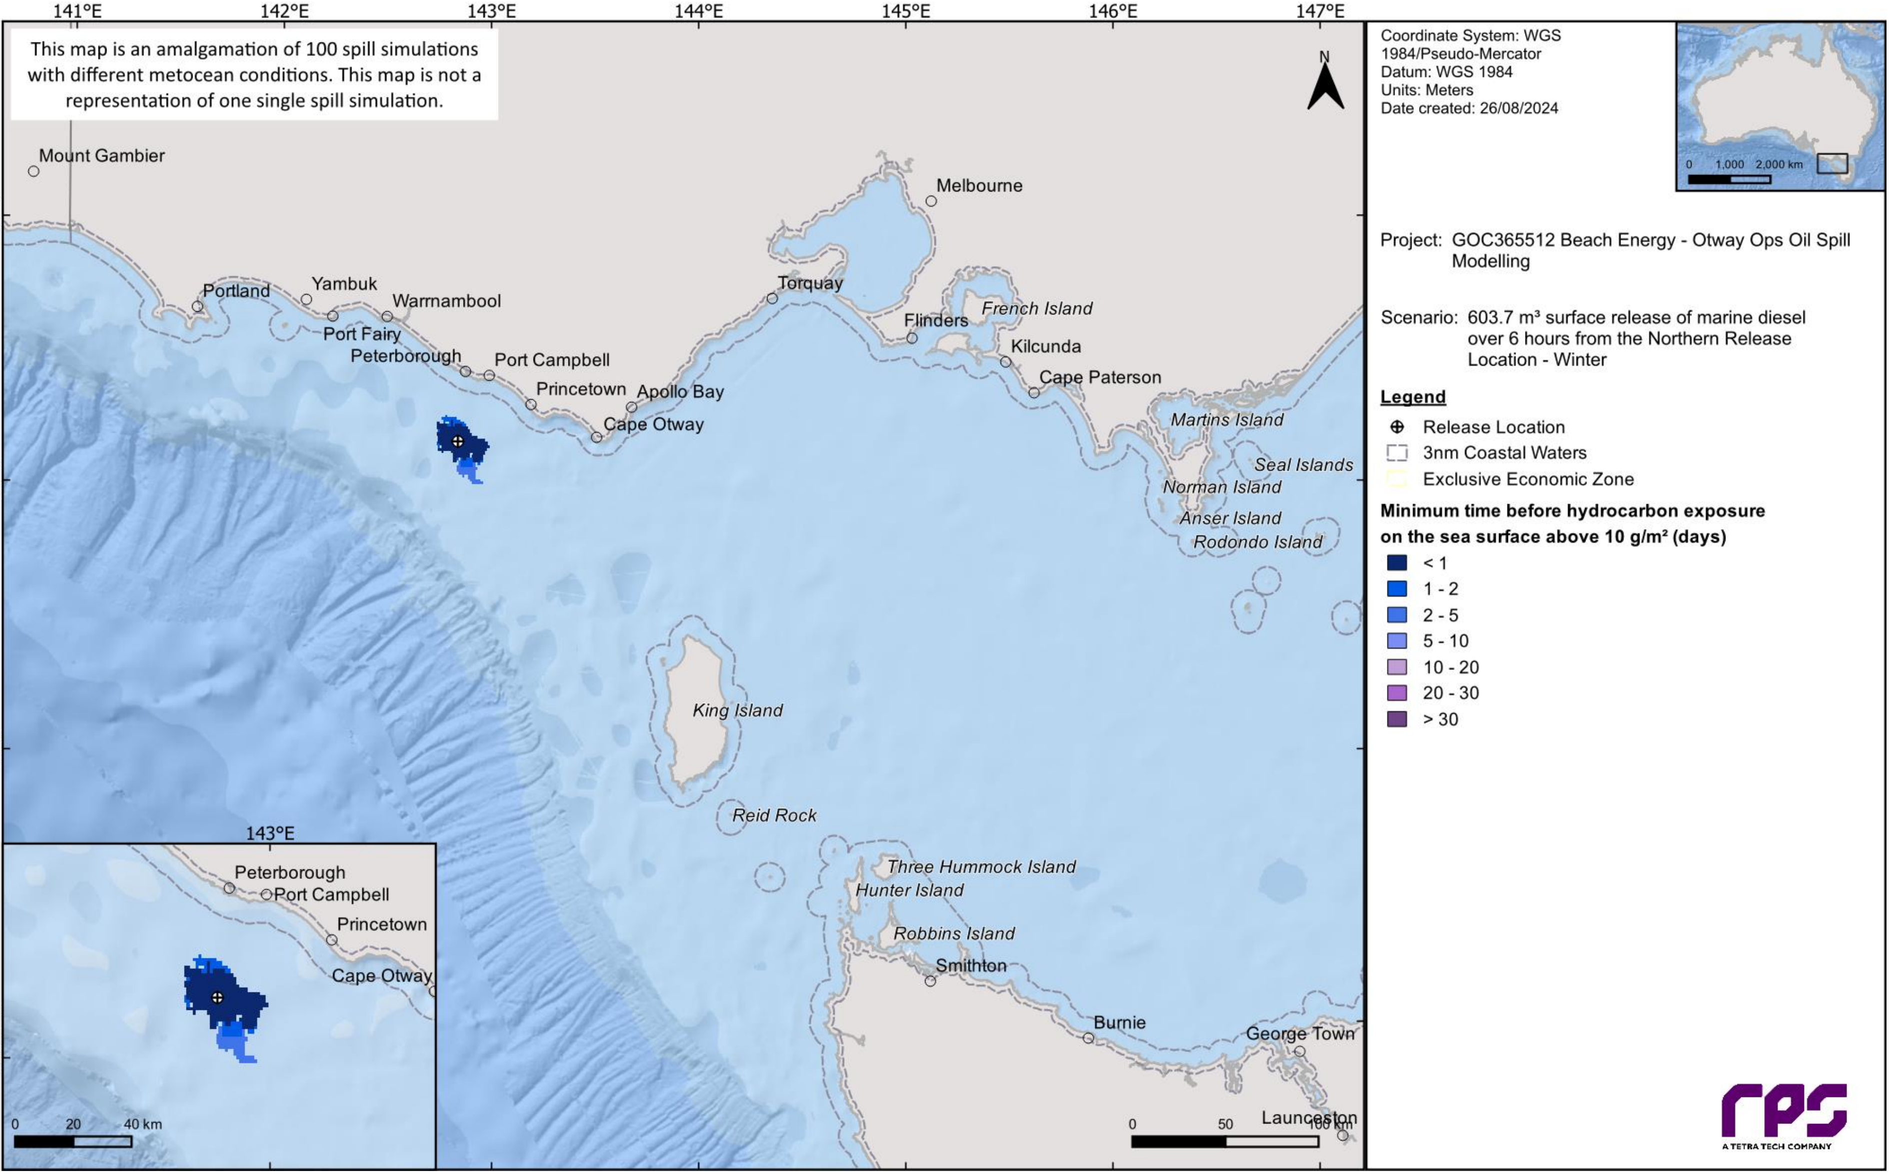

Figure 14-7 Minimum time before floating oil exposure above 10 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

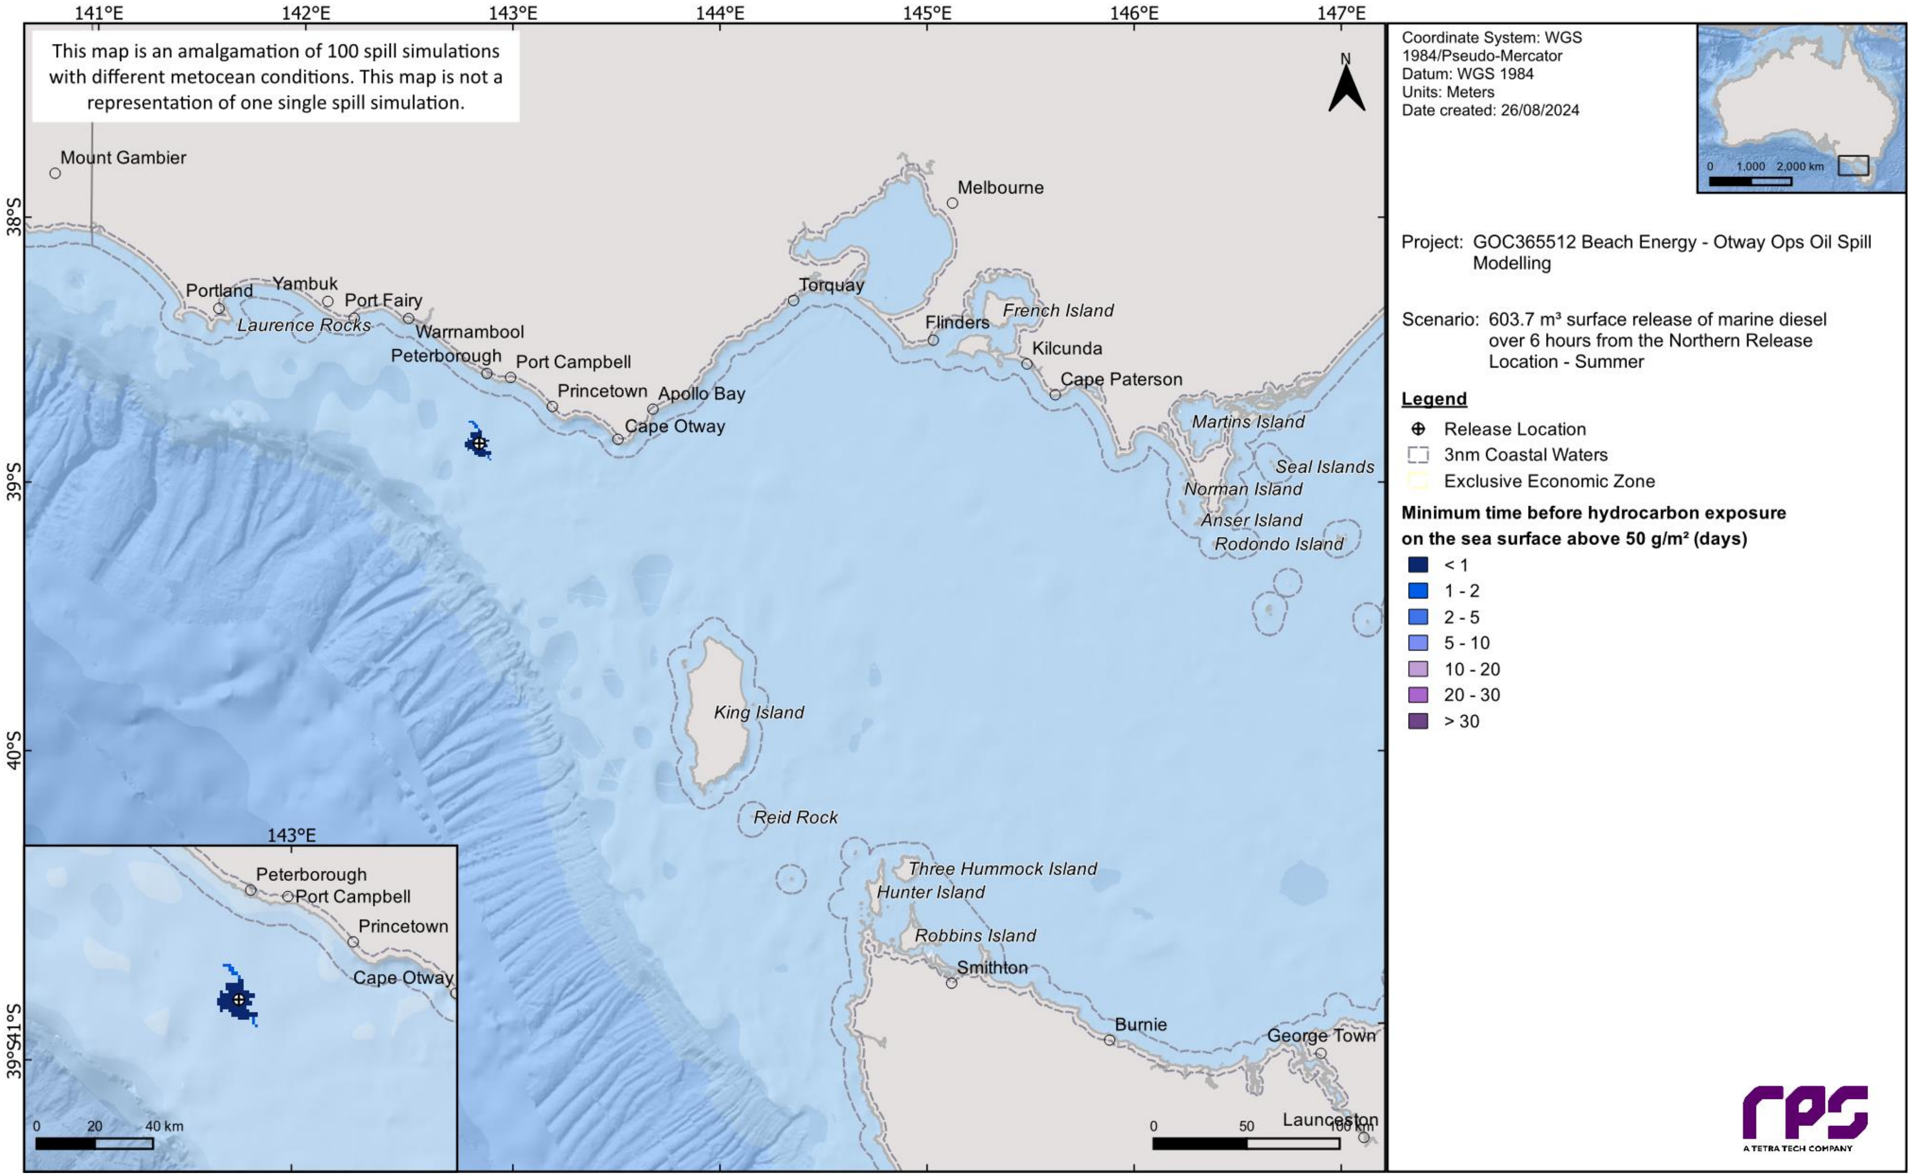

Figure 14-8 Minimum time before floating oil exposure above 50 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

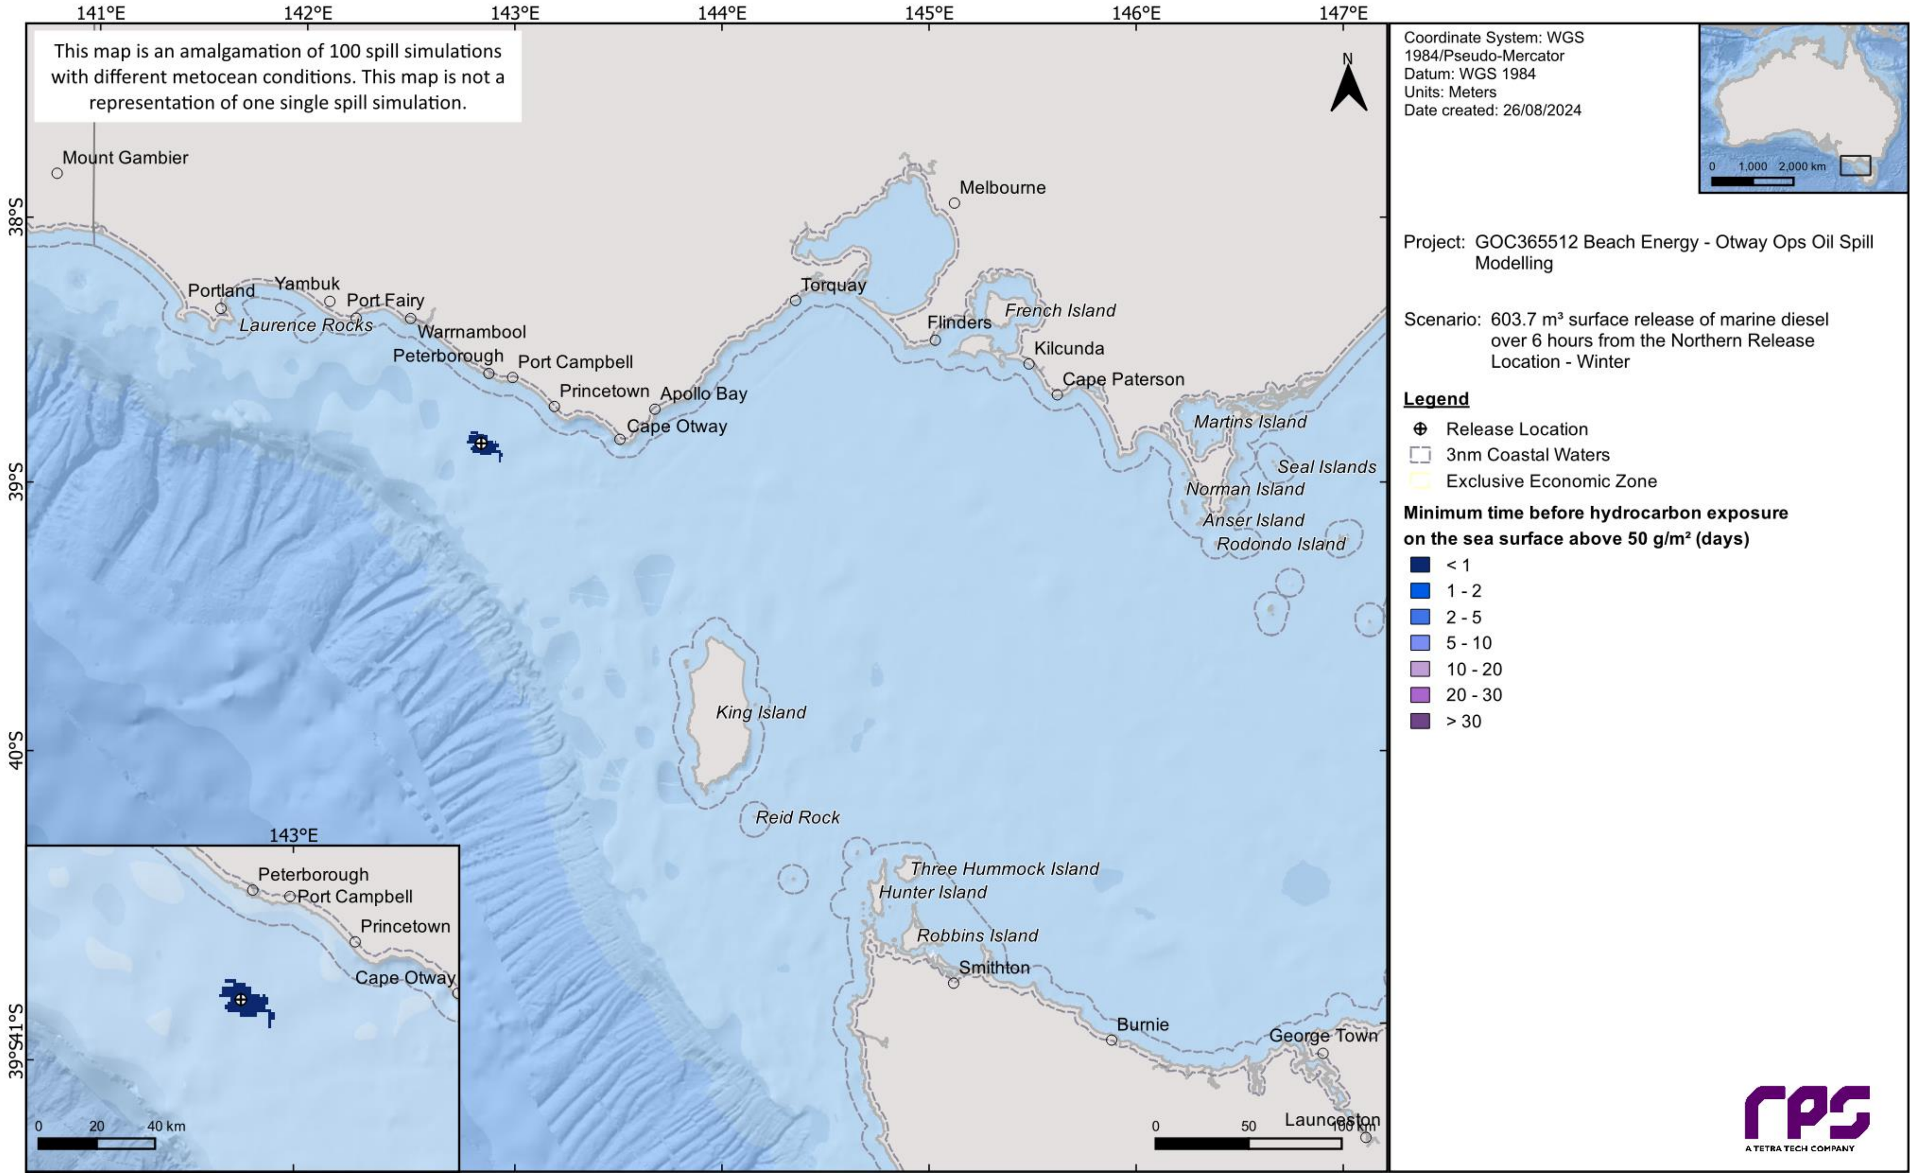

Figure 14-9 Minimum time before floating oil exposure above 50 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

14.1.3 Shoreline Accumulation

Table 14-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 31% during summer conditions and 27% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 4.5 days during summer conditions, and 2.0 days during winter conditions. The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 30.86 m^3 and 58.33 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 29.23 km and 43.19 km, respectively. For the moderate threshold (100 g/m^2), the maximum length of shoreline accumulation predicted was 10.16 km and 12.70 km during summer and winter respectively. No shoreline accumulation was predicted for the high (1,000 g/m^2) threshold.

Table 14-5 summarises the shoreline accumulation on individual receptors during the summer and winter conditions. Cape Otway West recorded the highest probability of shoreline accumulation at the low threshold with 24% (summer) and 20% (winter) and the largest shoreline accumulation with 4.46 m^3 and 9.28 m^3, respectively. The minimum time before shoreline accumulation above the low threshold was predicted for the same receptor as 4.5 and 2.03 days during summer and winter respectively.

The summer and winter conditions maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented in Figure 14-10 and Figure 14-11, respectively.

Table 14-4 Summary of oil accumulation across all shorelines. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	31	27
Absolute minimum time for visible oil to shore (days)	4.5	2.0
Maximum total volume of hydrocarbons ashore (m^3)	30.86	58.33
Average volume of hydrocarbons ashore (m^3)	2.13	2.92
Maximum length of the shoreline at **10 g/m^2** (km)	29.23	43.19
Average shoreline length (km) at **10 g/m^2** (km)	3.2	3.38
Maximum length of the shoreline at **100 g/m^2** (km)	10.16	12.70
Average shoreline length (km) at **100 g/m^2** (km)	0.27	0.5
Maximum length of the shoreline at **1,000 g/m^2** (km)	-	-
Average shoreline length (km) at **1,000 g/m^2** (km)	-	-

Table 14-5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations per season.

14.1.4 In-water exposure

14.1.4.1 Dissolved Hydrocarbons

Table 14-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions. No dissolved hydrocarbon exposure at the high (400 ppb) threshold was predicted,

Only the receptors that the Northern Release Location resides within (refer to Table 12-1) were contacted by dissolved hydrocarbon at the low threshold. The maximum dissolved hydrocarbon concentration was 101.35 ppb and 65.67 ppb during summer and winter respectively.

Table 14-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 14-12 and Figure 14-13 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 14-14 to Figure 14-17 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 14-6 **Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations per season.**

14.1.4.2 Entrained Hydrocarbons

Table 14-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 745.77 ppb, winter – 1,391.43 ppb), which also presented the highest probability of low entrained hydrocarbon exposure (summer – 60%, winter – 97%).

Table 14-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 14-18 and Figure 14-19 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 14-20 to Figure 14-25 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 14-8 **Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. The results were calculated from 100 spill simulations during winter conditions.

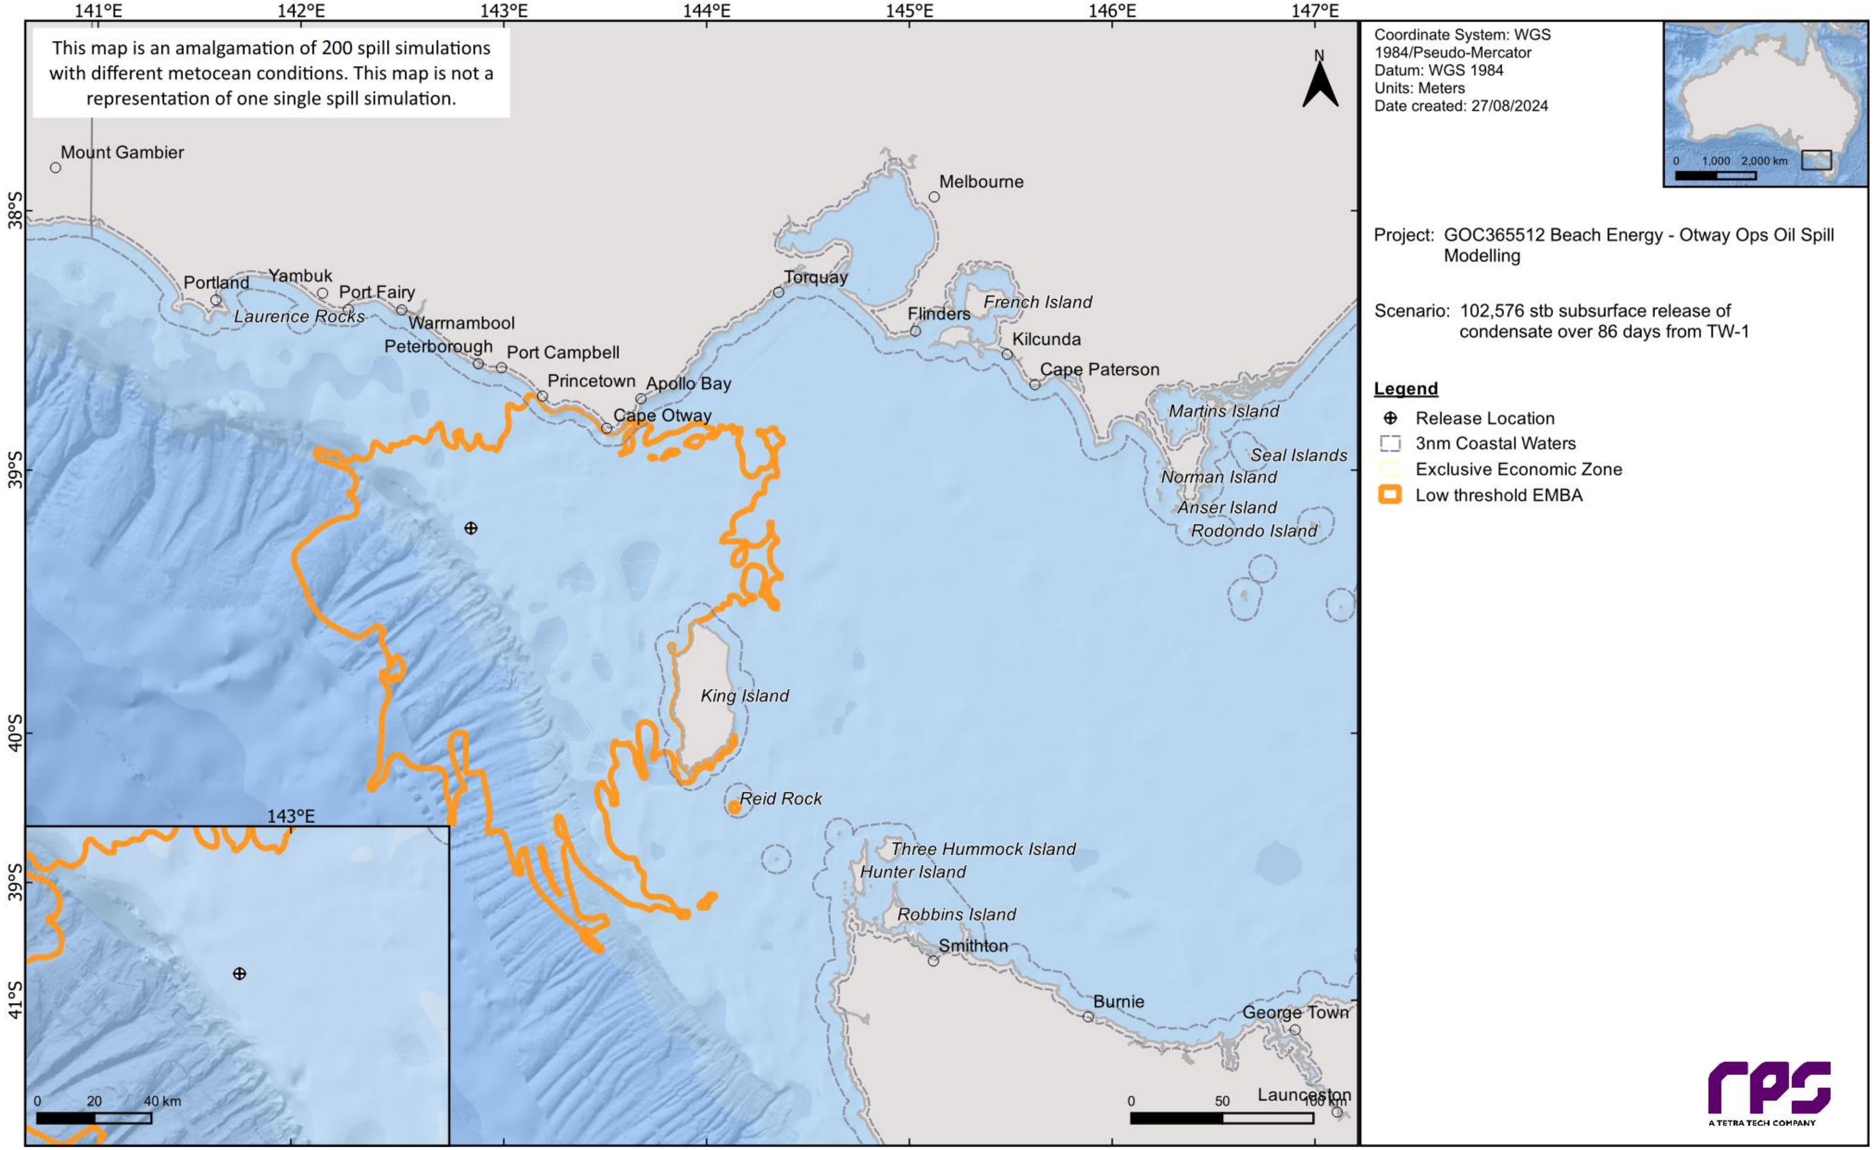
15 RESULTS – LOSS OF WELL CONTROL AT TW1

This scenario examined a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 100 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

15.1 Stochastic Analysis

15.1.1 Area of Exposure

Figure 15-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.



Coordinate System: WGS 1984/Pseudo-Mercator
Datum: WGS 1984
Units: Meters
Date created: 27/08/2024

Project: GOC365512 Beach Energy - Otway Ops Oil Spill Modelling

Scenario: 102,576 stb subsurface release of condensate over 86 days from TW-1

Legend

- ⊕ Release Location
- ☐ 3nm Coastal Waters
- ☐ Exclusive Economic Zone
- ☐ Low threshold EMBA

Figure 15-1 **Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1 during summer and winter conditions.**

15.1.2 Floating Oil Exposure

Table 15-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2) exposure zone was 24.49 km (southeast) during summer conditions and 18.35 km (south) during winter conditions, respectively. No contact was predicted for the moderate (10–50 g/m^2) or high (> 50 g/m^2) thresholds.

Table 15-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest probability of floating oil exposure above the low threshold was predicted at the Pygmy Blue Whale – Foraging BIA (28% summer, 25% winter).

Table 15-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 15-2 and Figure 15-3 present the zones of potential floating oil exposure for all relevant thresholds under summer and winter conditions, respectively.

Figure 15-4 and Figure 15-5 present the minimum time before floating oil exposure for the low NOPSEMA threshold during summer and winter, respectively.

Table 15-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	24.49	-	-
	Direction	Southeast	-	-
Winter	Maximum distance (km) from release location	18.35	-	-
	Direction	South	-	-

Table 15-2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

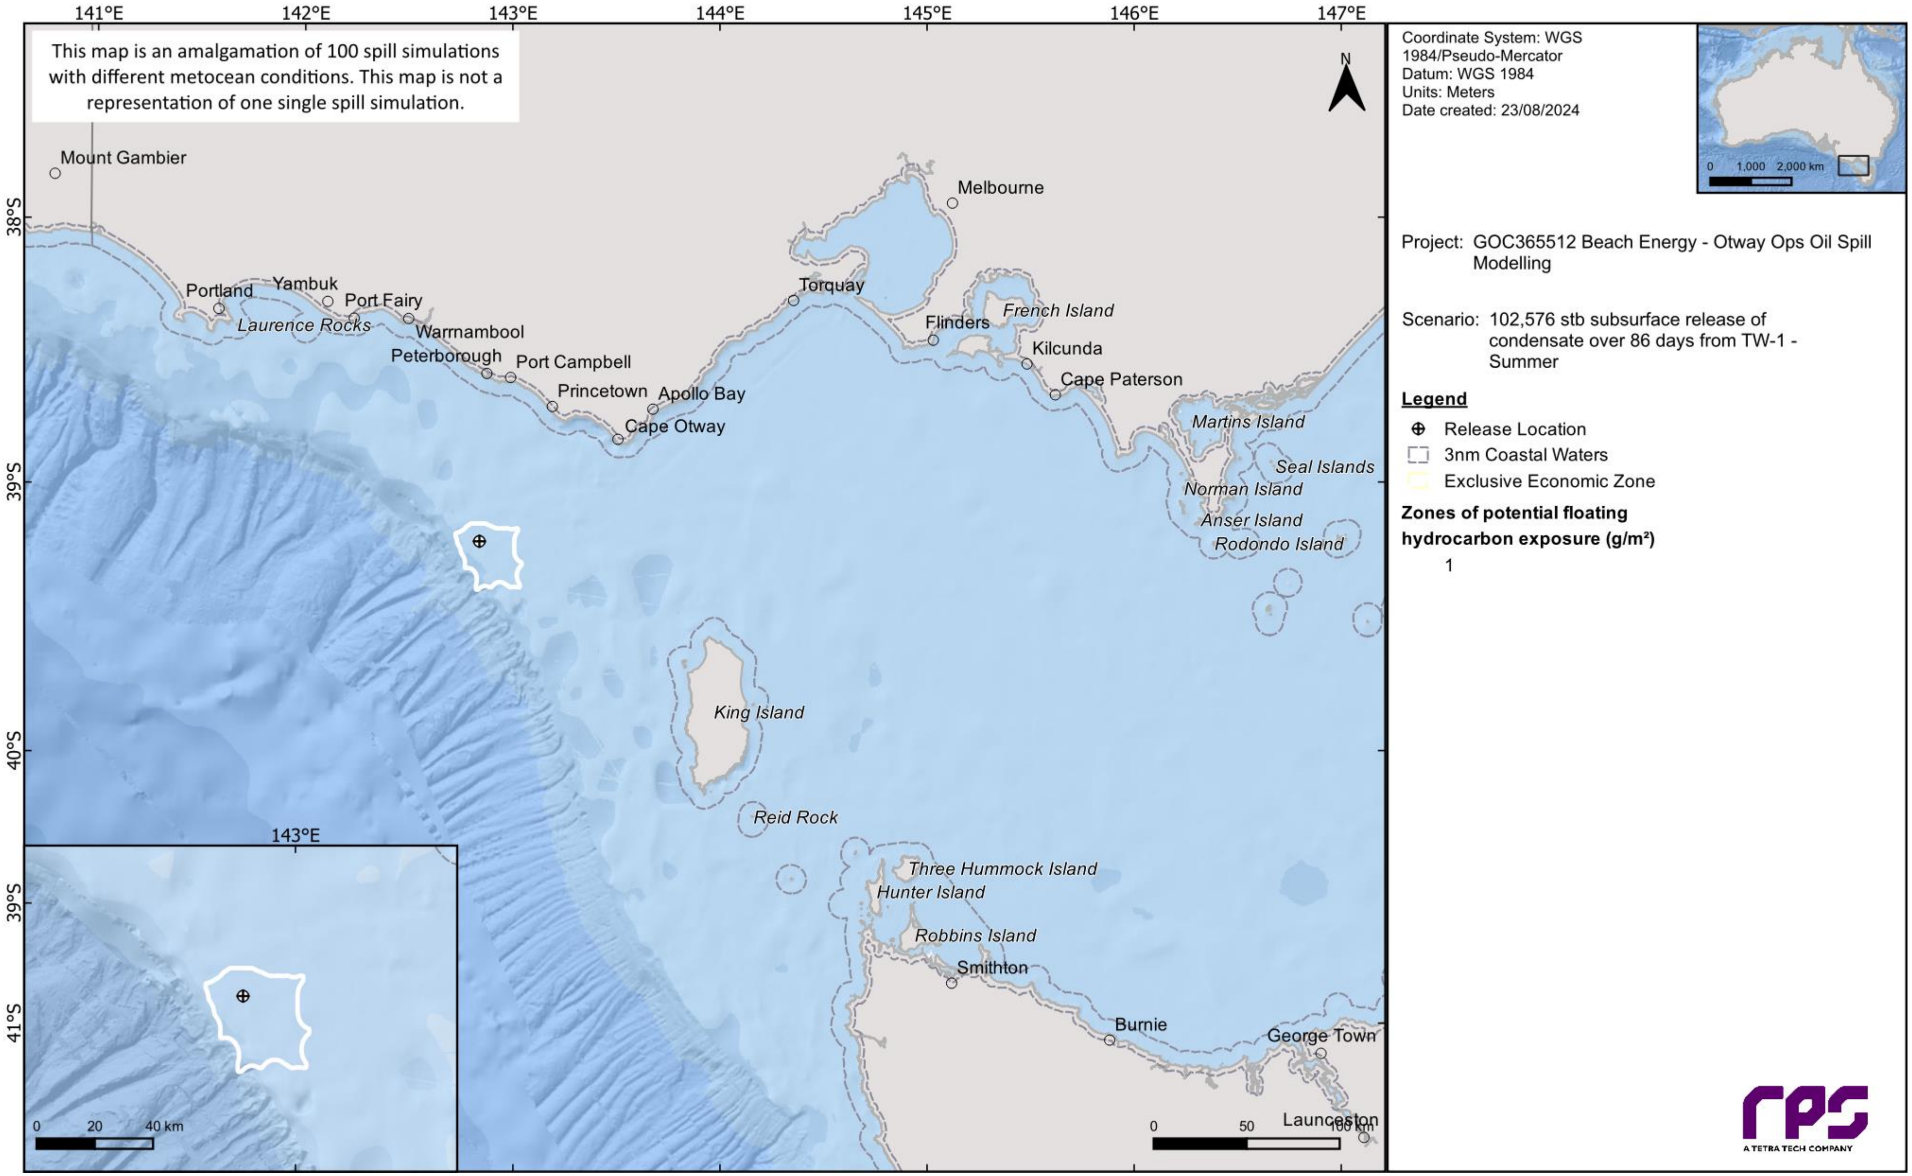

Figure 15-2 Zones of potential floating oil exposure in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

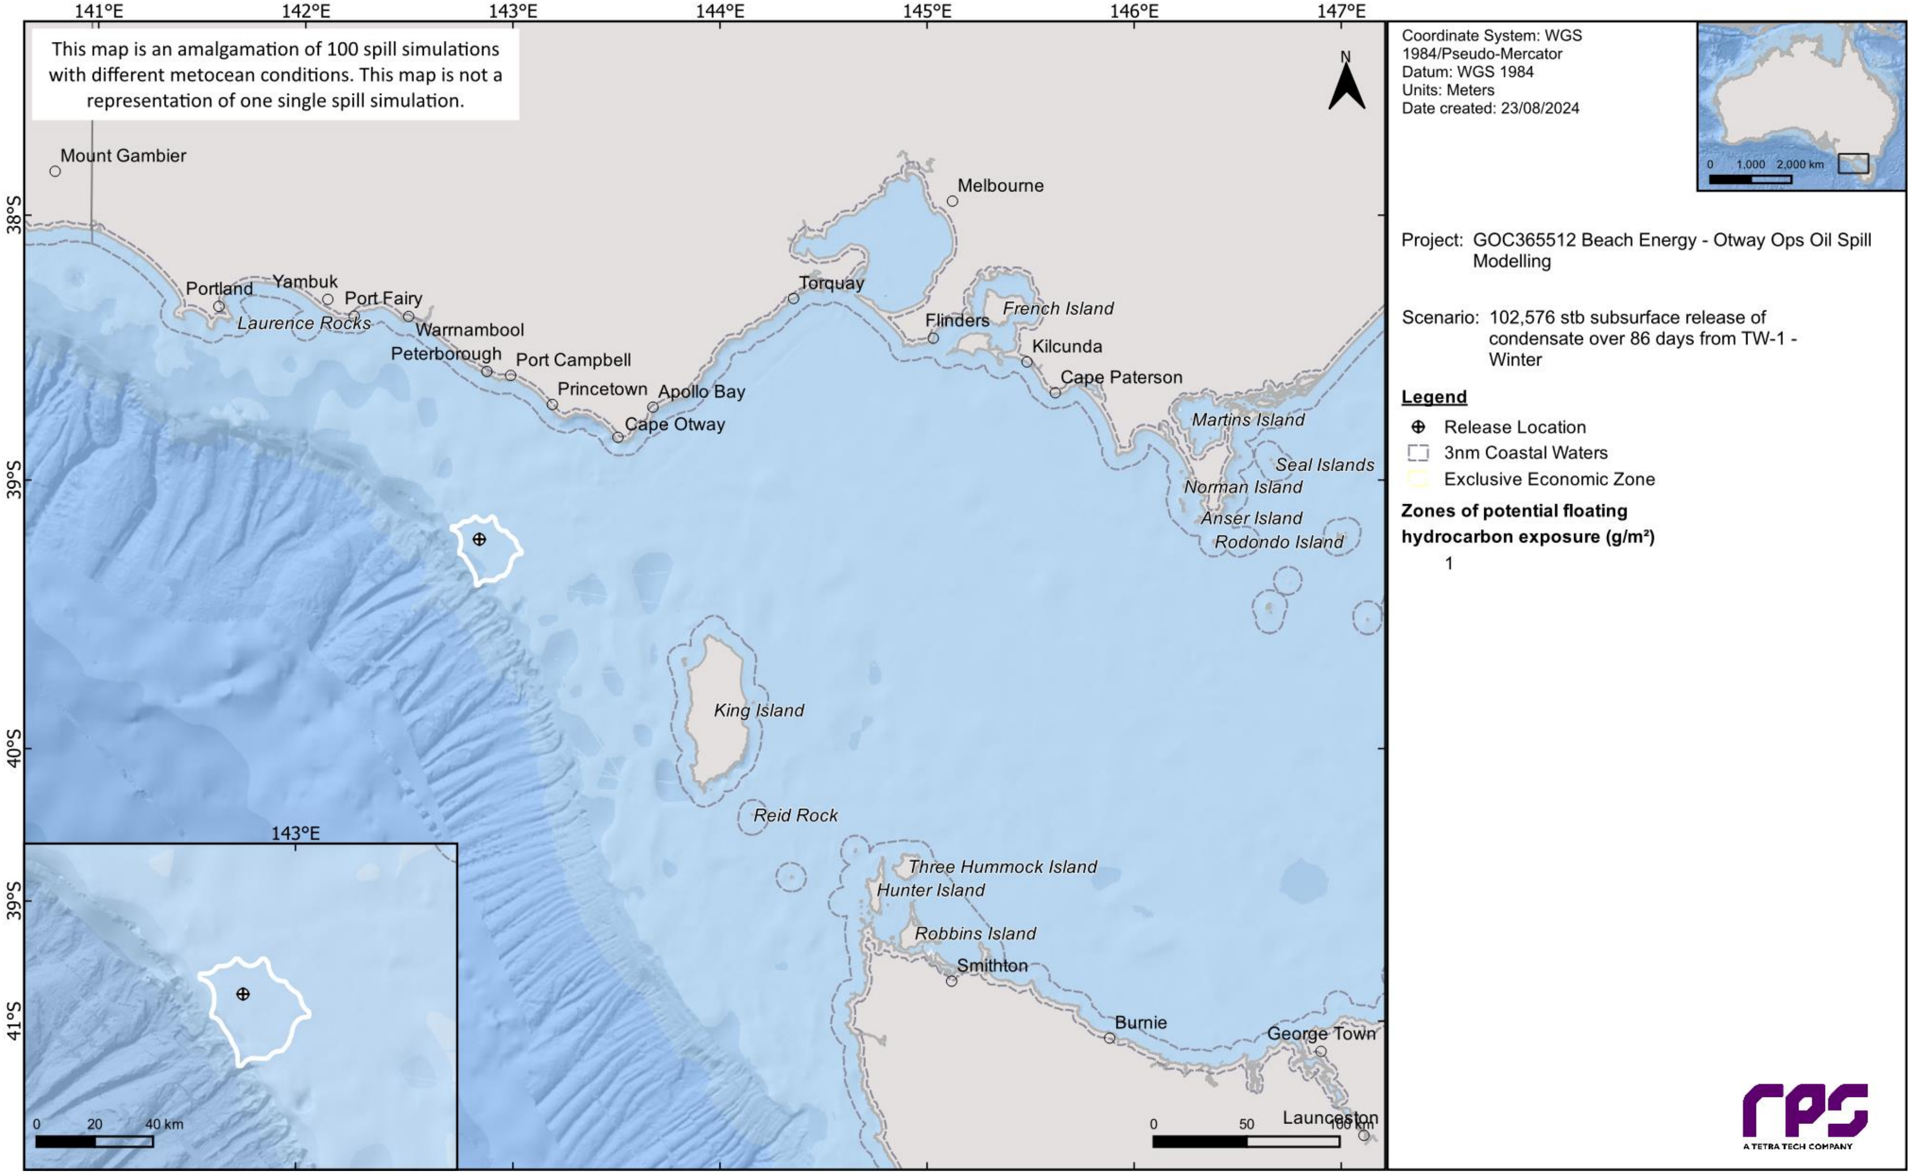

Figure 15-3 Zones of potential floating oil exposure in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

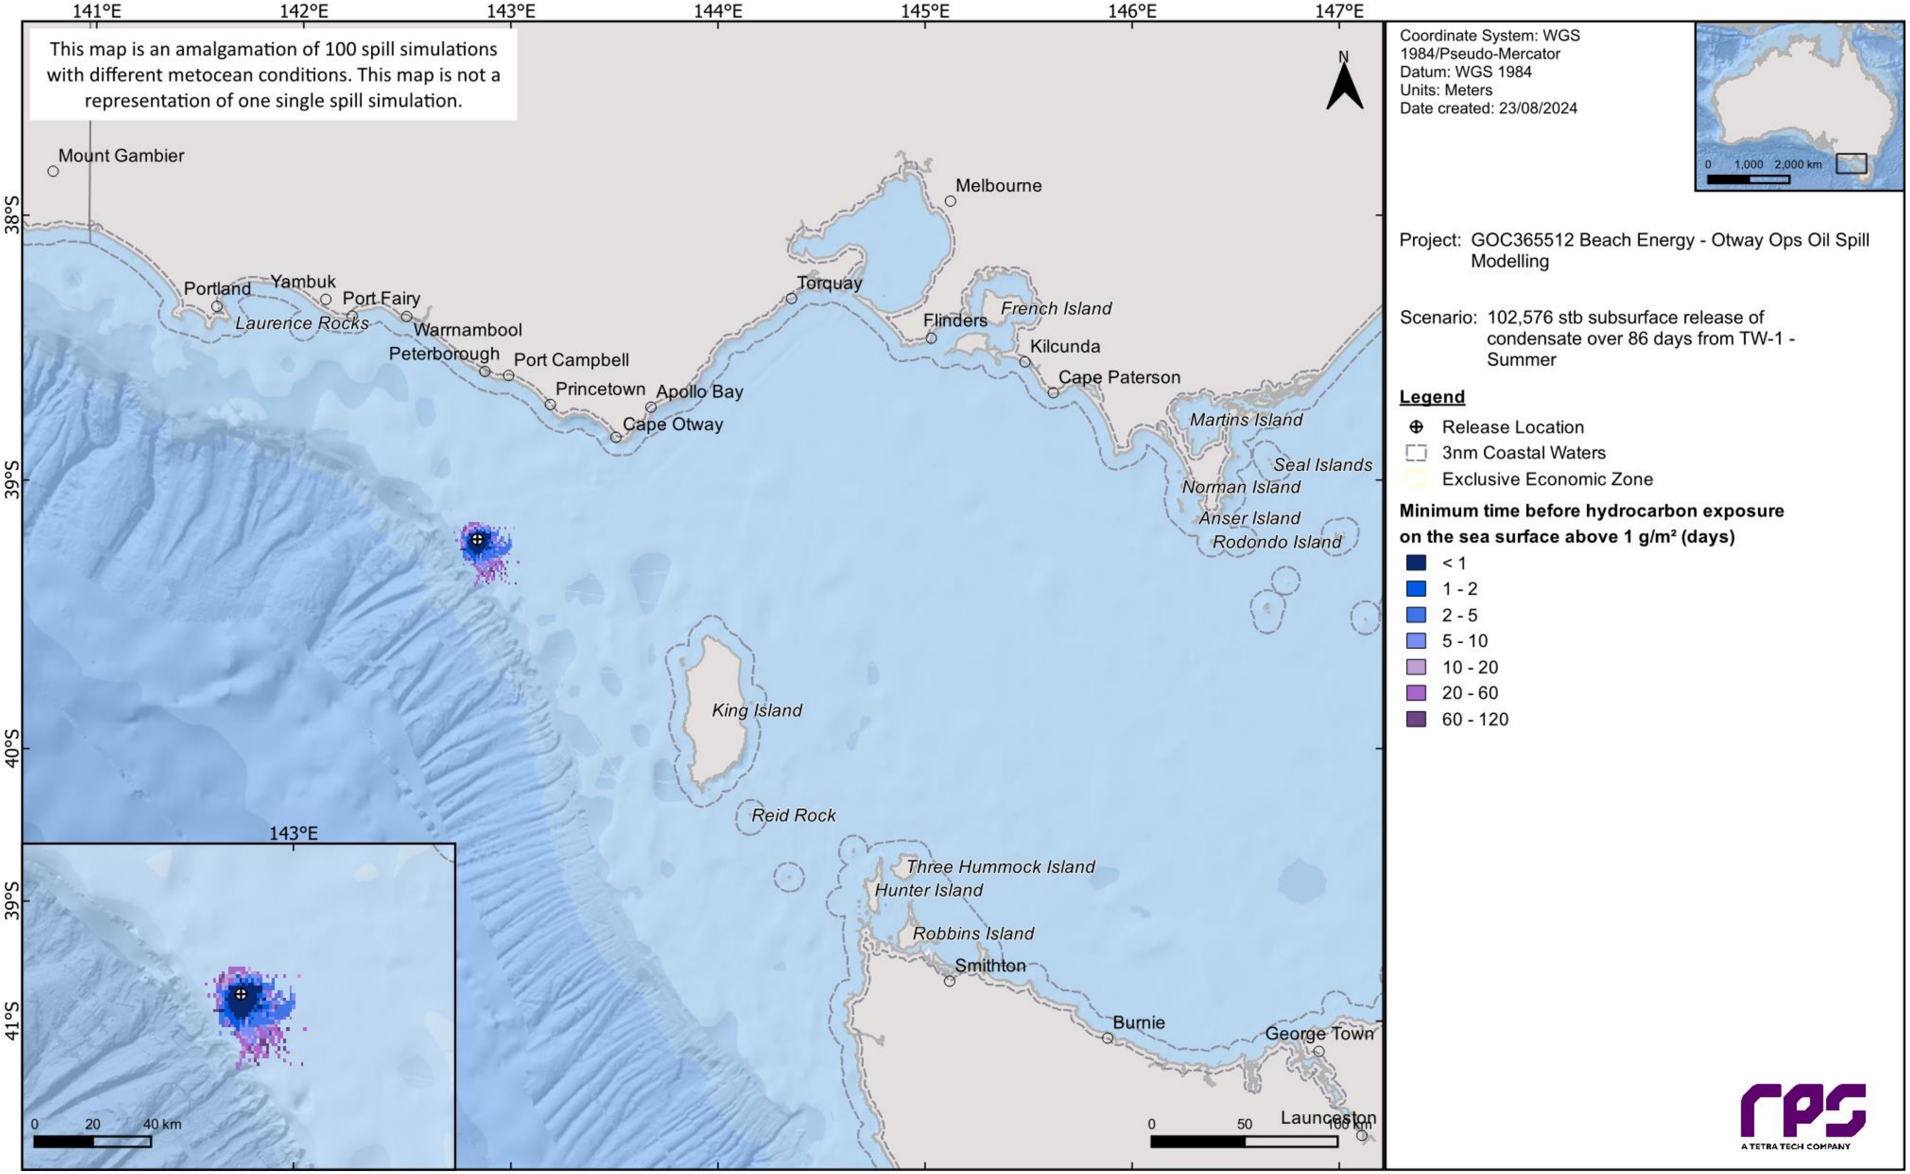

Figure 15-4 Maximum residence time of floating oil exposure above 1 g/m^2, in the event of 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

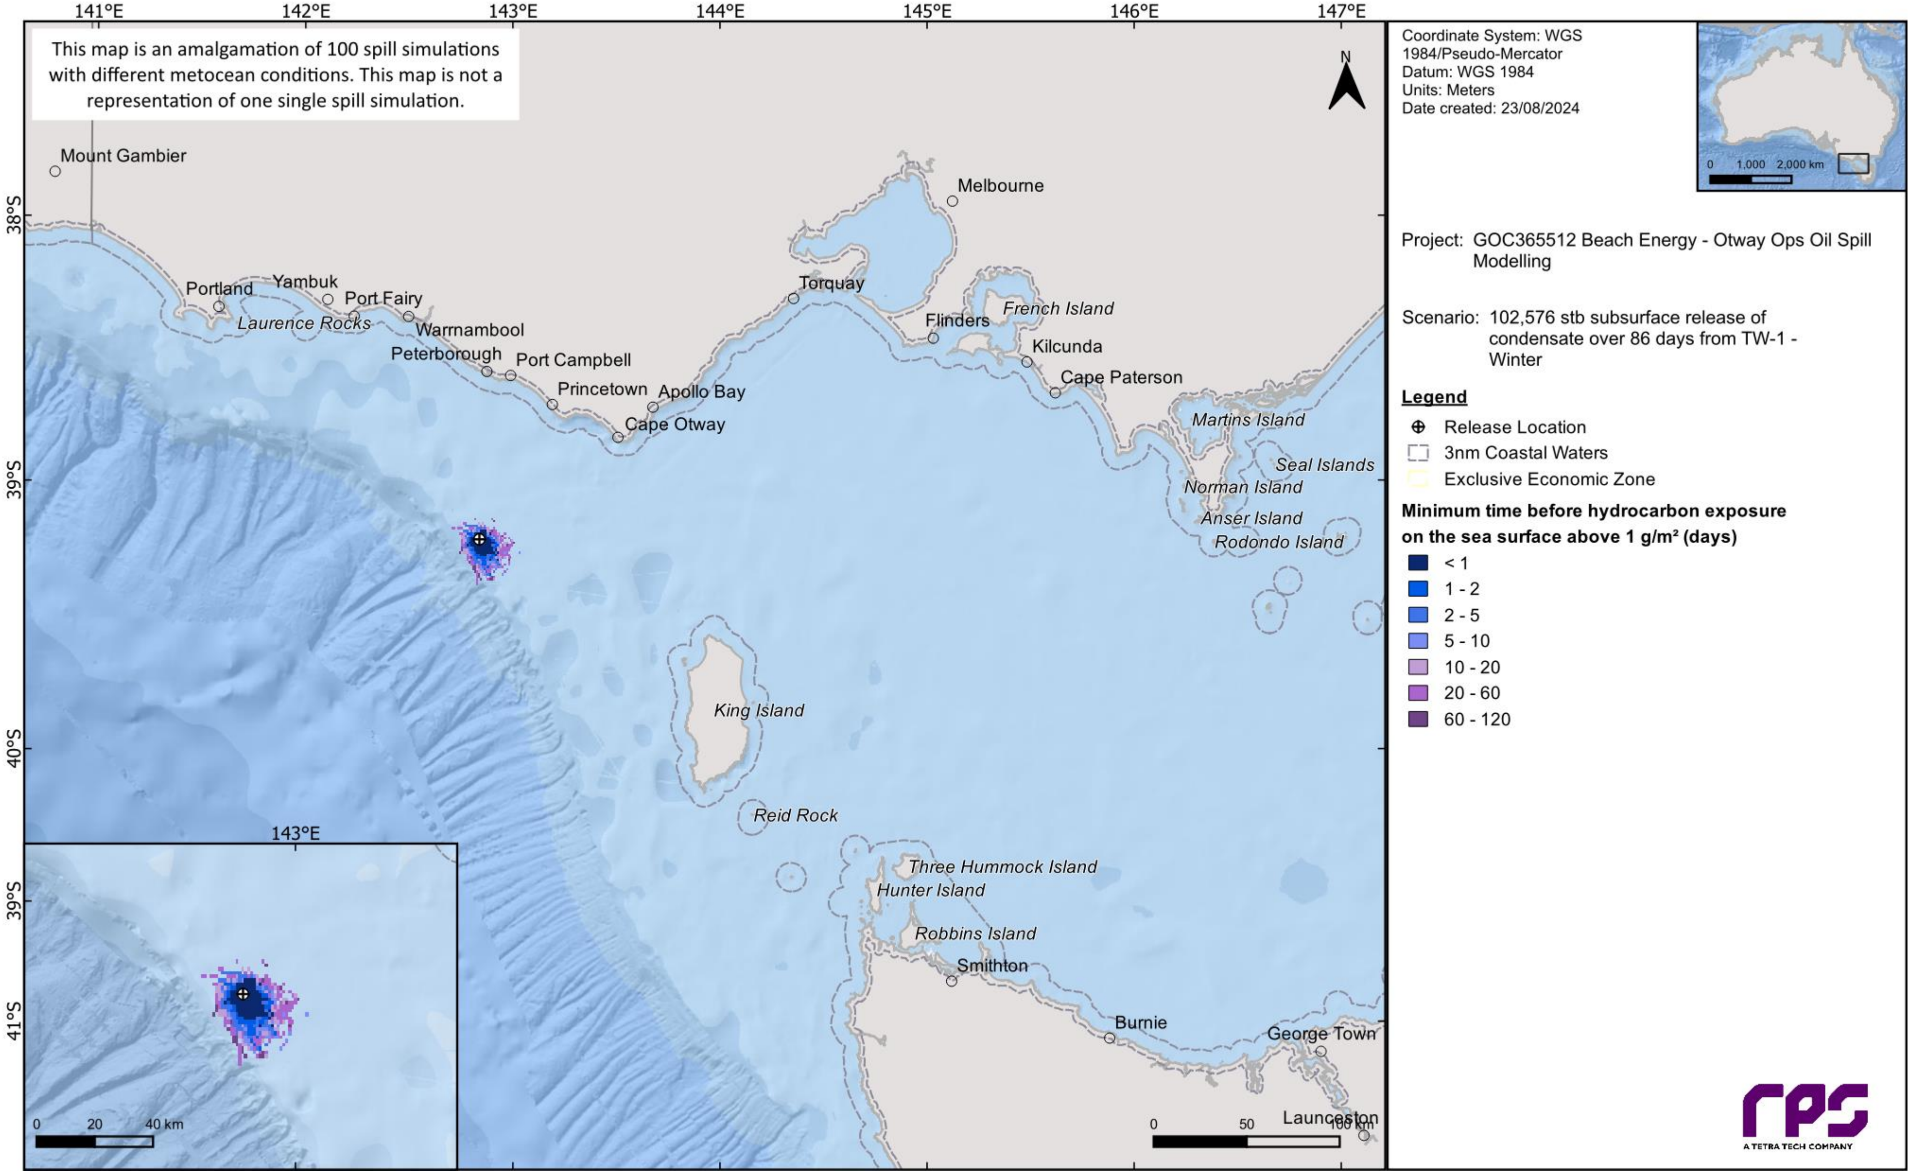

Figure 15-5 Maximum residence time of floating oil exposure above 1 g/m^2, in the event of 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

15.1.3 Shoreline Accumulation

Table 15-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 32% during summer conditions and 57% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 25.38 days during summer conditions, and 21.93 days during winter conditions. The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 6.15 m^3 and 8.36 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 12.62 km and 13.90 km, respectively. No shoreline accumulation was predicted for the moderate (100 g/m^2) and high (1,000 g/m^2) thresholds.

Table 15-5 summarises the shoreline accumulation on individual receptors during the summer and winter conditions. The King Island Council (TAS) shoreline recorded the highest probability of shoreline accumulation at the low threshold, being 26% and 48% during summer and winter respectively. The minimum time before shoreline accumulation above the low threshold was 25.38 and 21.93 days during summer and winter, predicted for the same receptor.

The summer and winter conditions maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented in Figure 15-6 and Figure 15-7, respectively.

Table 15-4 Summary of oil accumulation across all shorelines. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	32	57
Absolute minimum time for visible oil to shore (days)	25.38	21.93
Maximum total volume of hydrocarbons ashore (m^3)	6.15	8.36
Average volume of hydrocarbons ashore (m^3)	2.52	3.78
Maximum length of the shoreline at **10 g/m^2** (km)	12.62	13.90
Average shoreline length (km) at **10 g/m^2** (km)	1.21	2.16
Maximum length of the shoreline at **100 g/m^2** (km)	-	-
Average shoreline length (km) at **100 g/m^2** (km)	-	-
Maximum length of the shoreline at **1,000 g/m^2** (km)	-	-
Average shoreline length (km) at **1,000 g/m^2** (km)	-	-

Table 15-5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at the TW1. The results were calculated from 100 spill simulations per season.

15.1.4 In-water exposure

15.1.4.1 Dissolved Hydrocarbons

Table 15-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of dissolved hydrocarbon was 553.15 ppb during summer and 528.54 ppb during winter.

Table 15-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 15-8 and Figure 15-9 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 15-10 to Figure 15-15 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 15-6 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

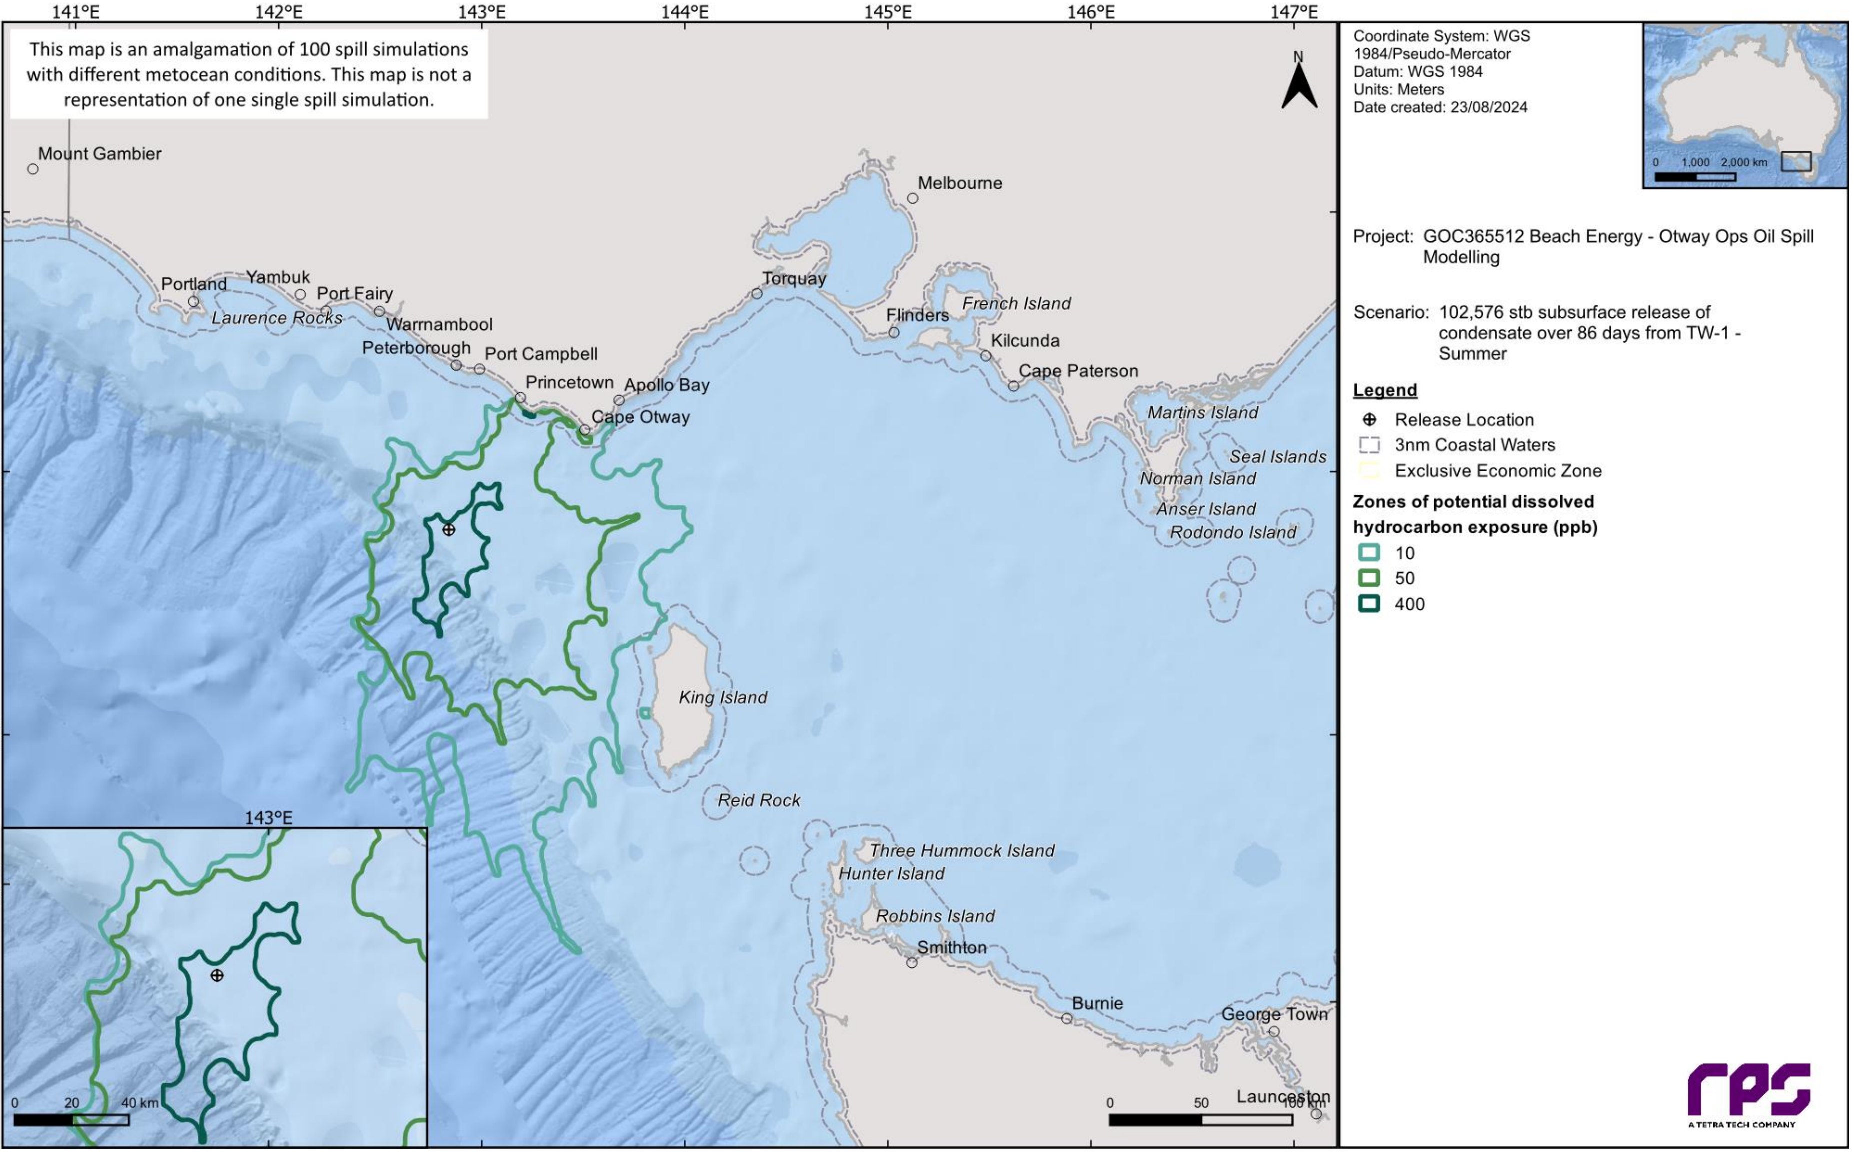

Figure 15-8 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

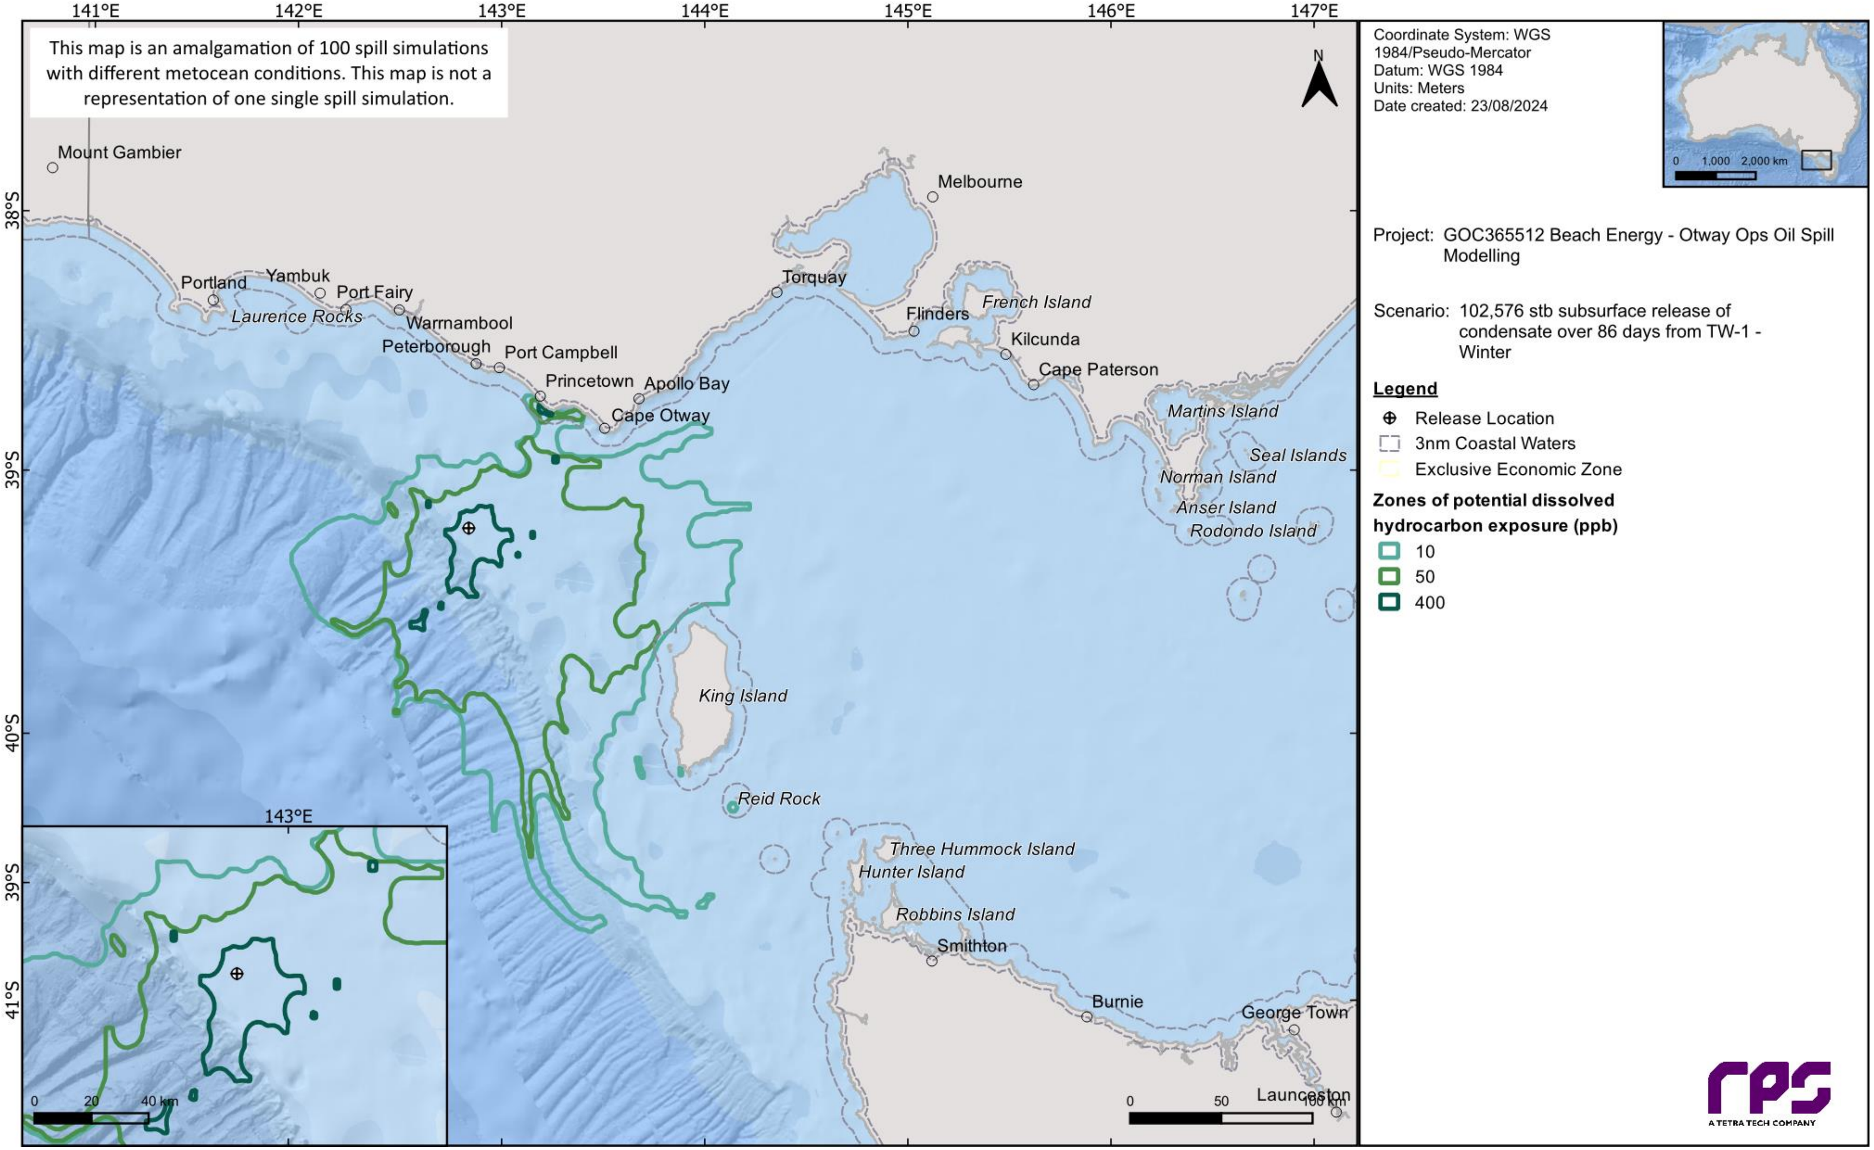

Figure 15-9 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

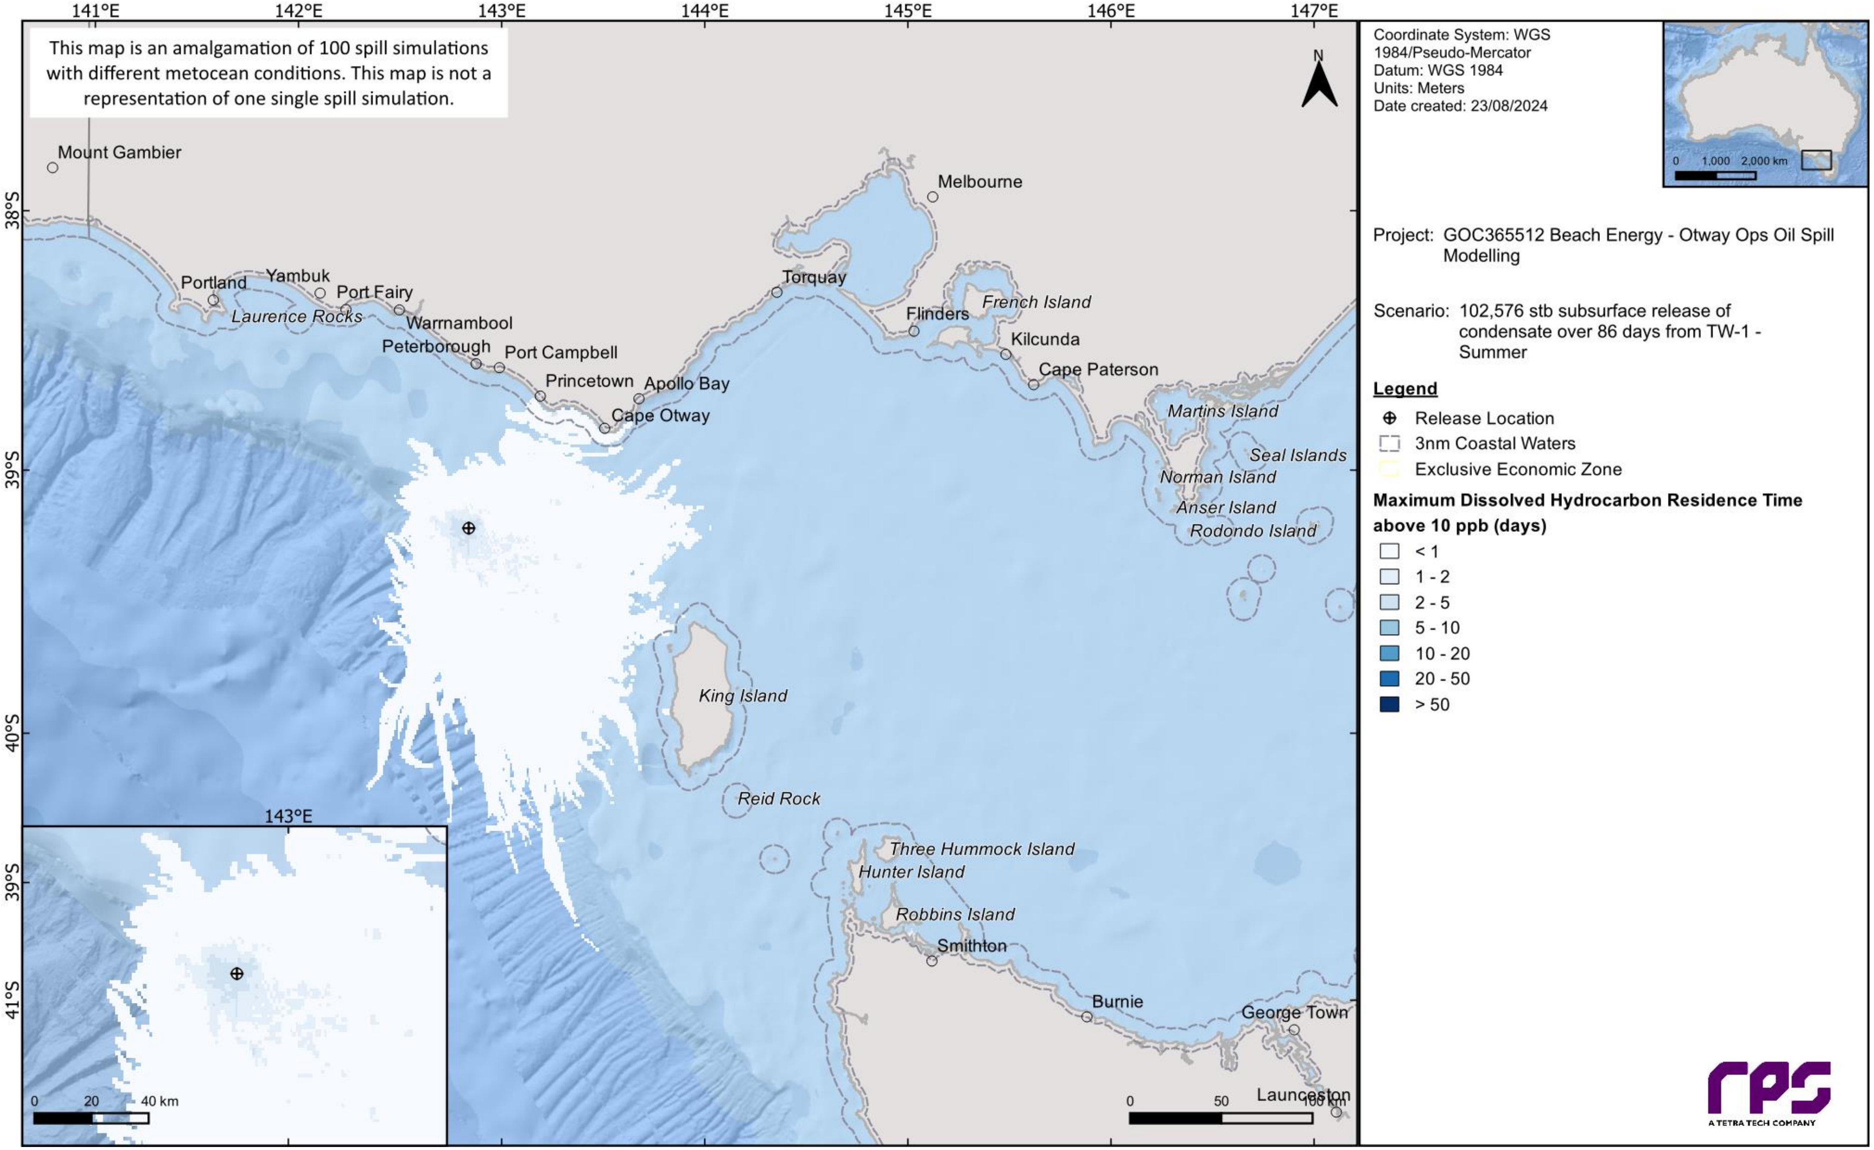

Figure 15-10 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

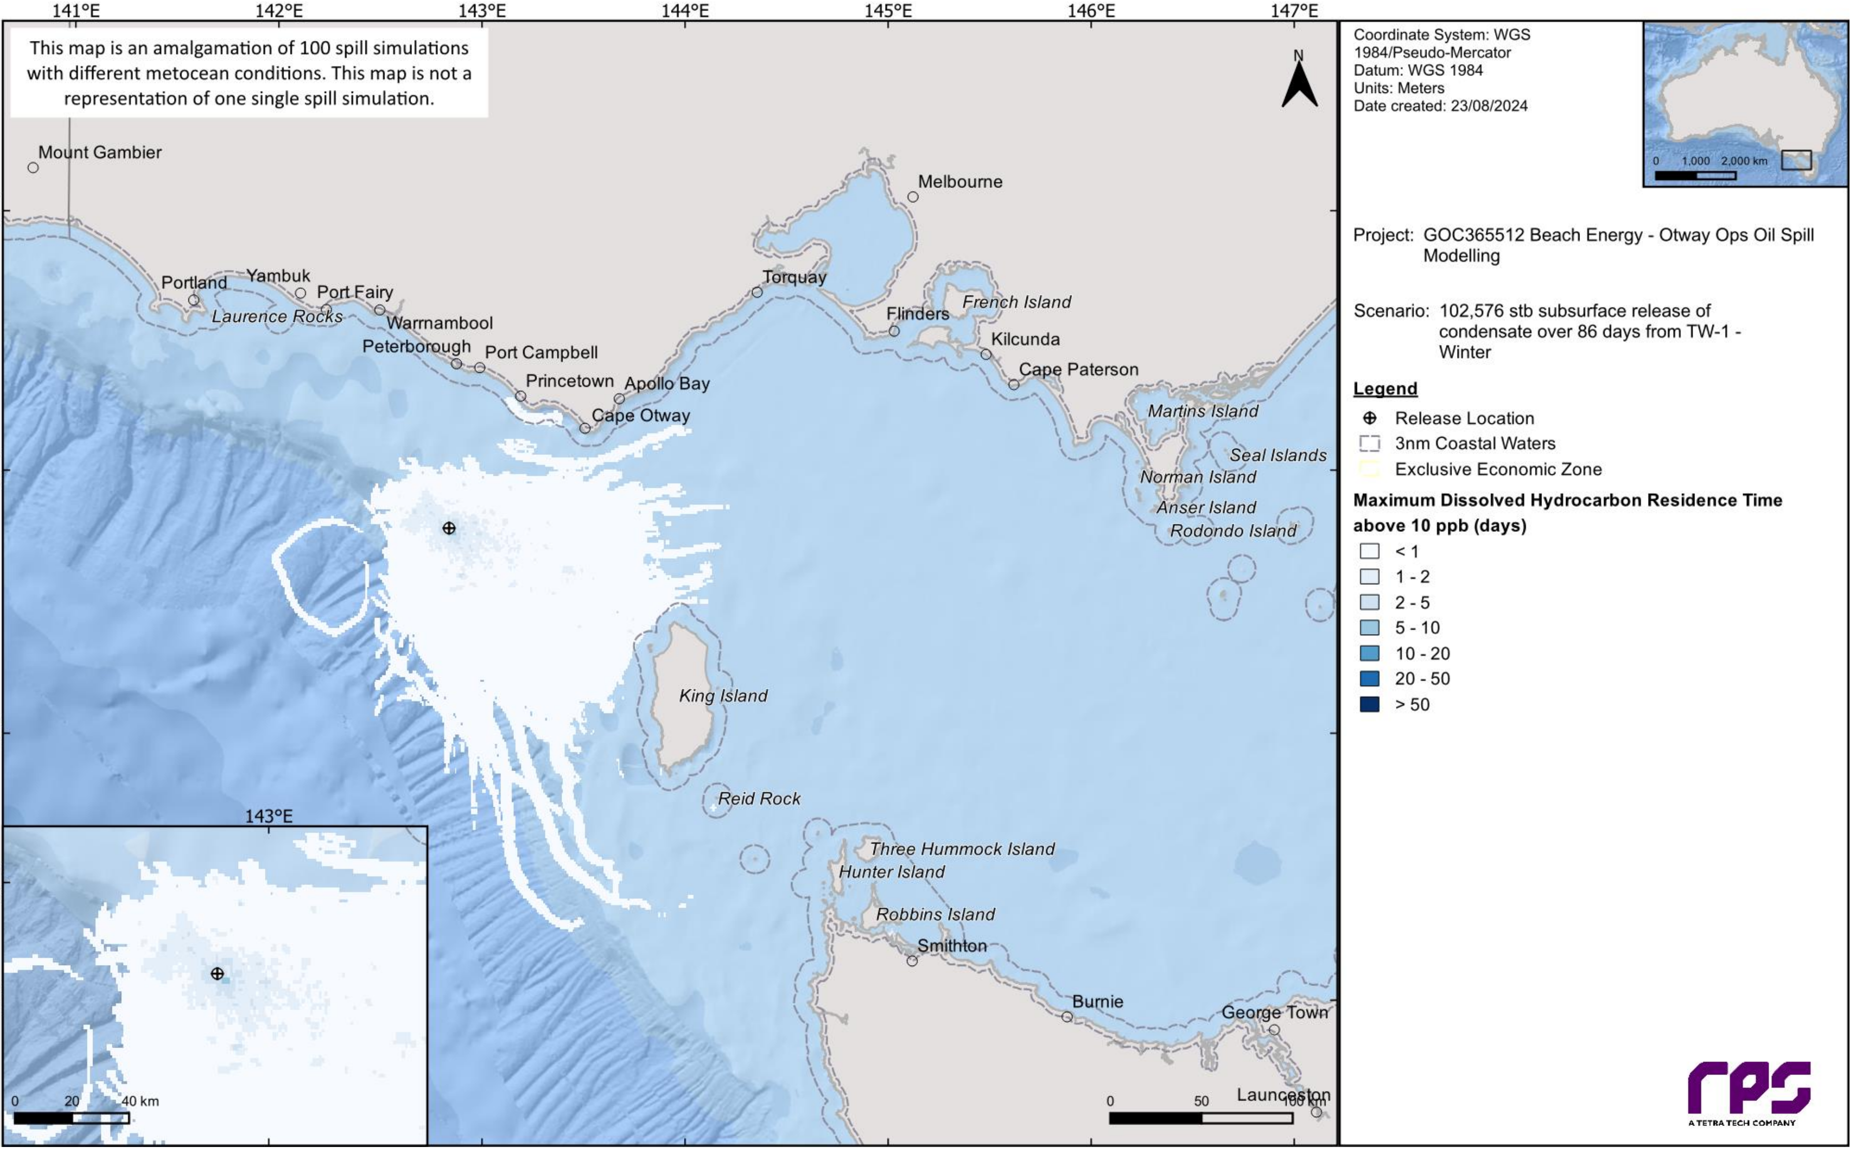

Figure 15-11 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

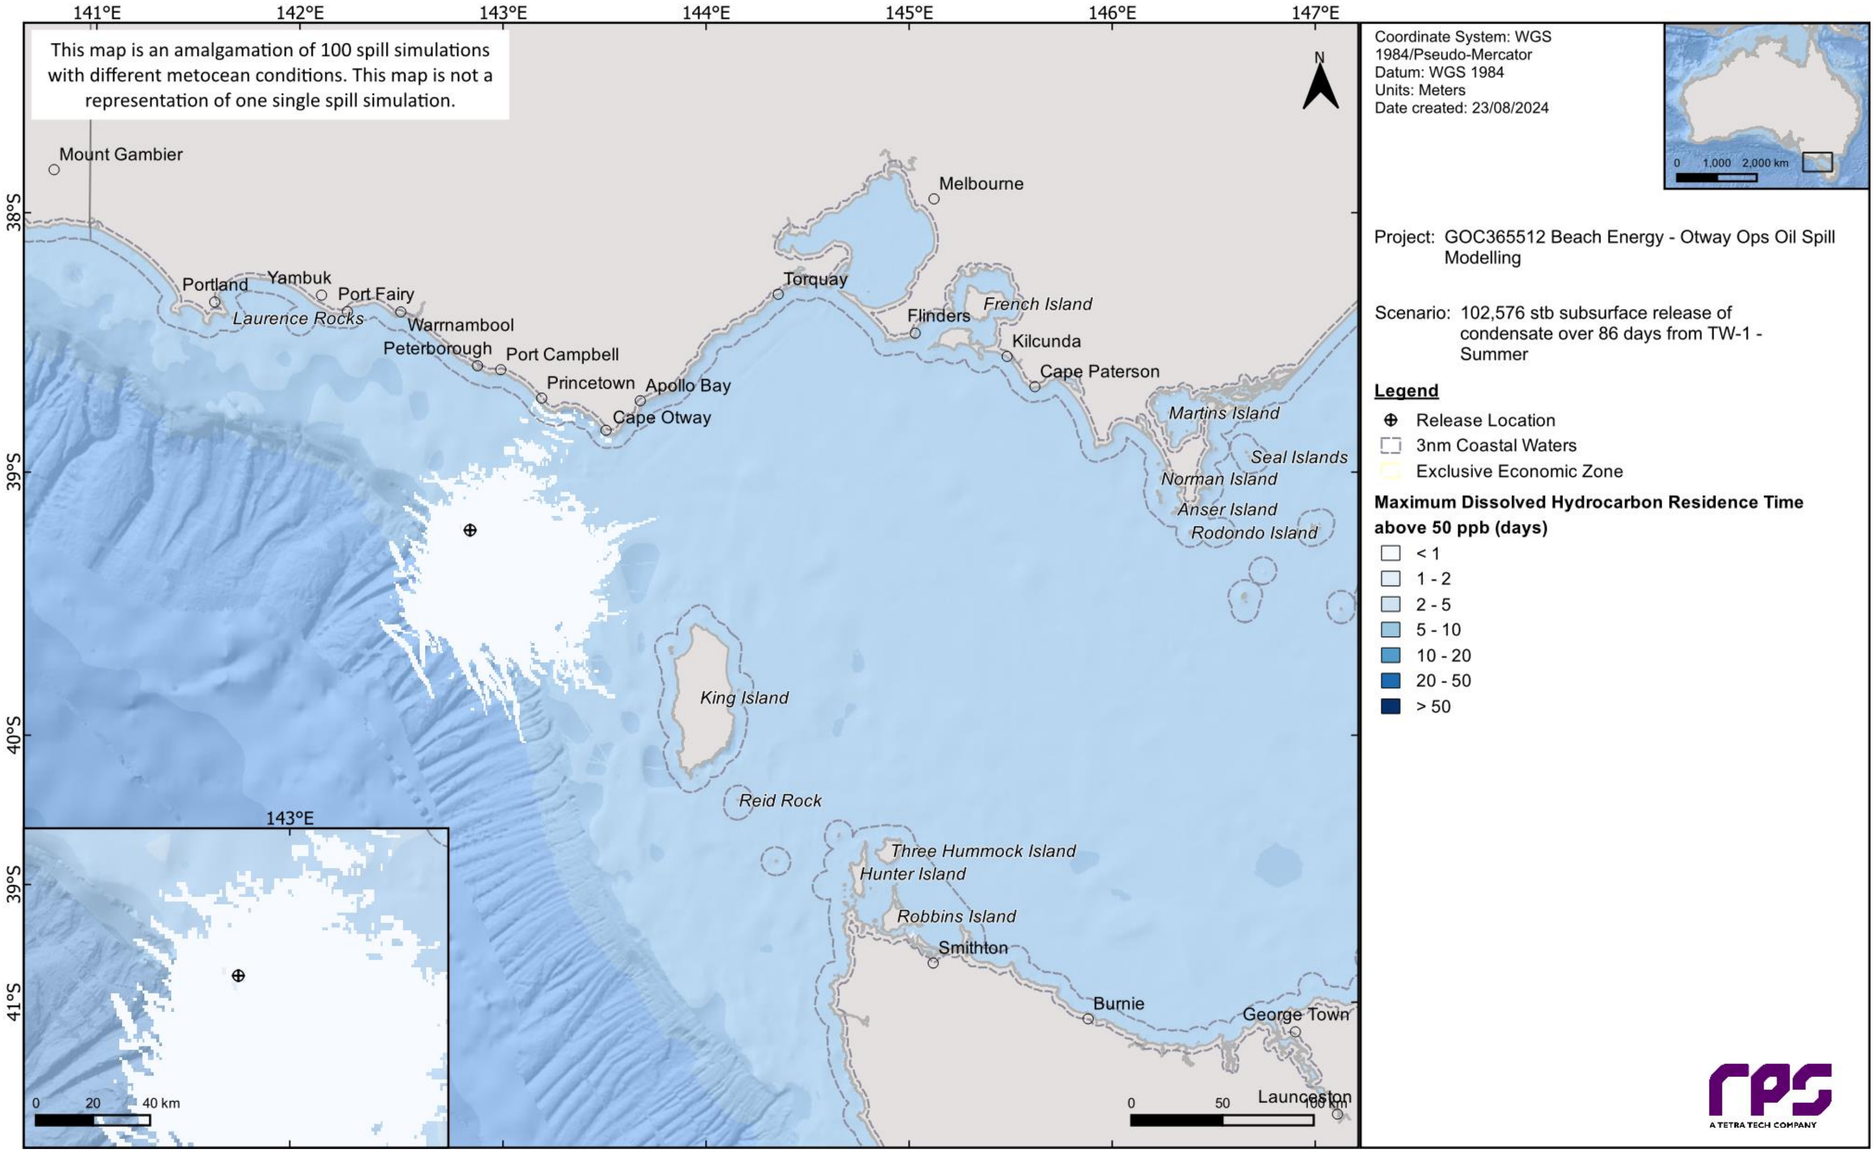

Figure 15-12 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

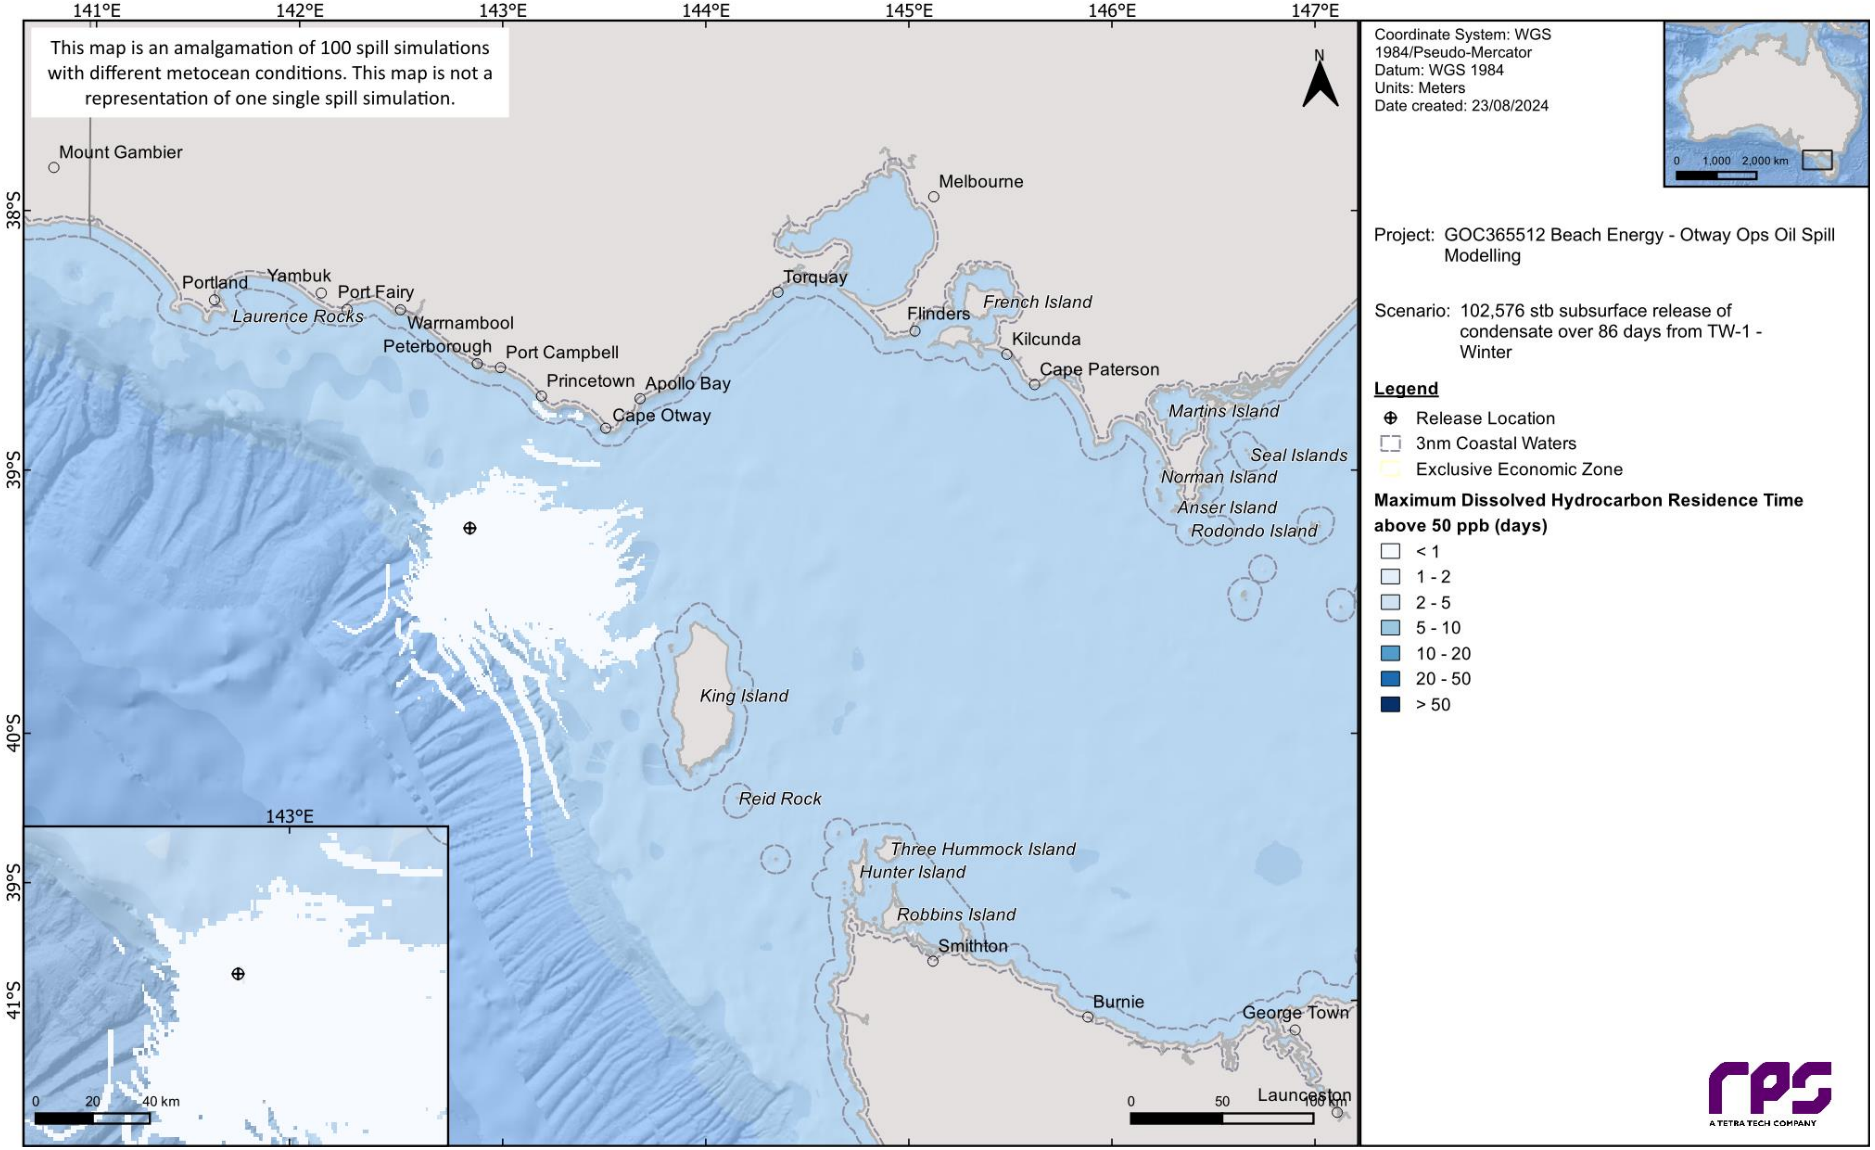

Figure 15-13 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

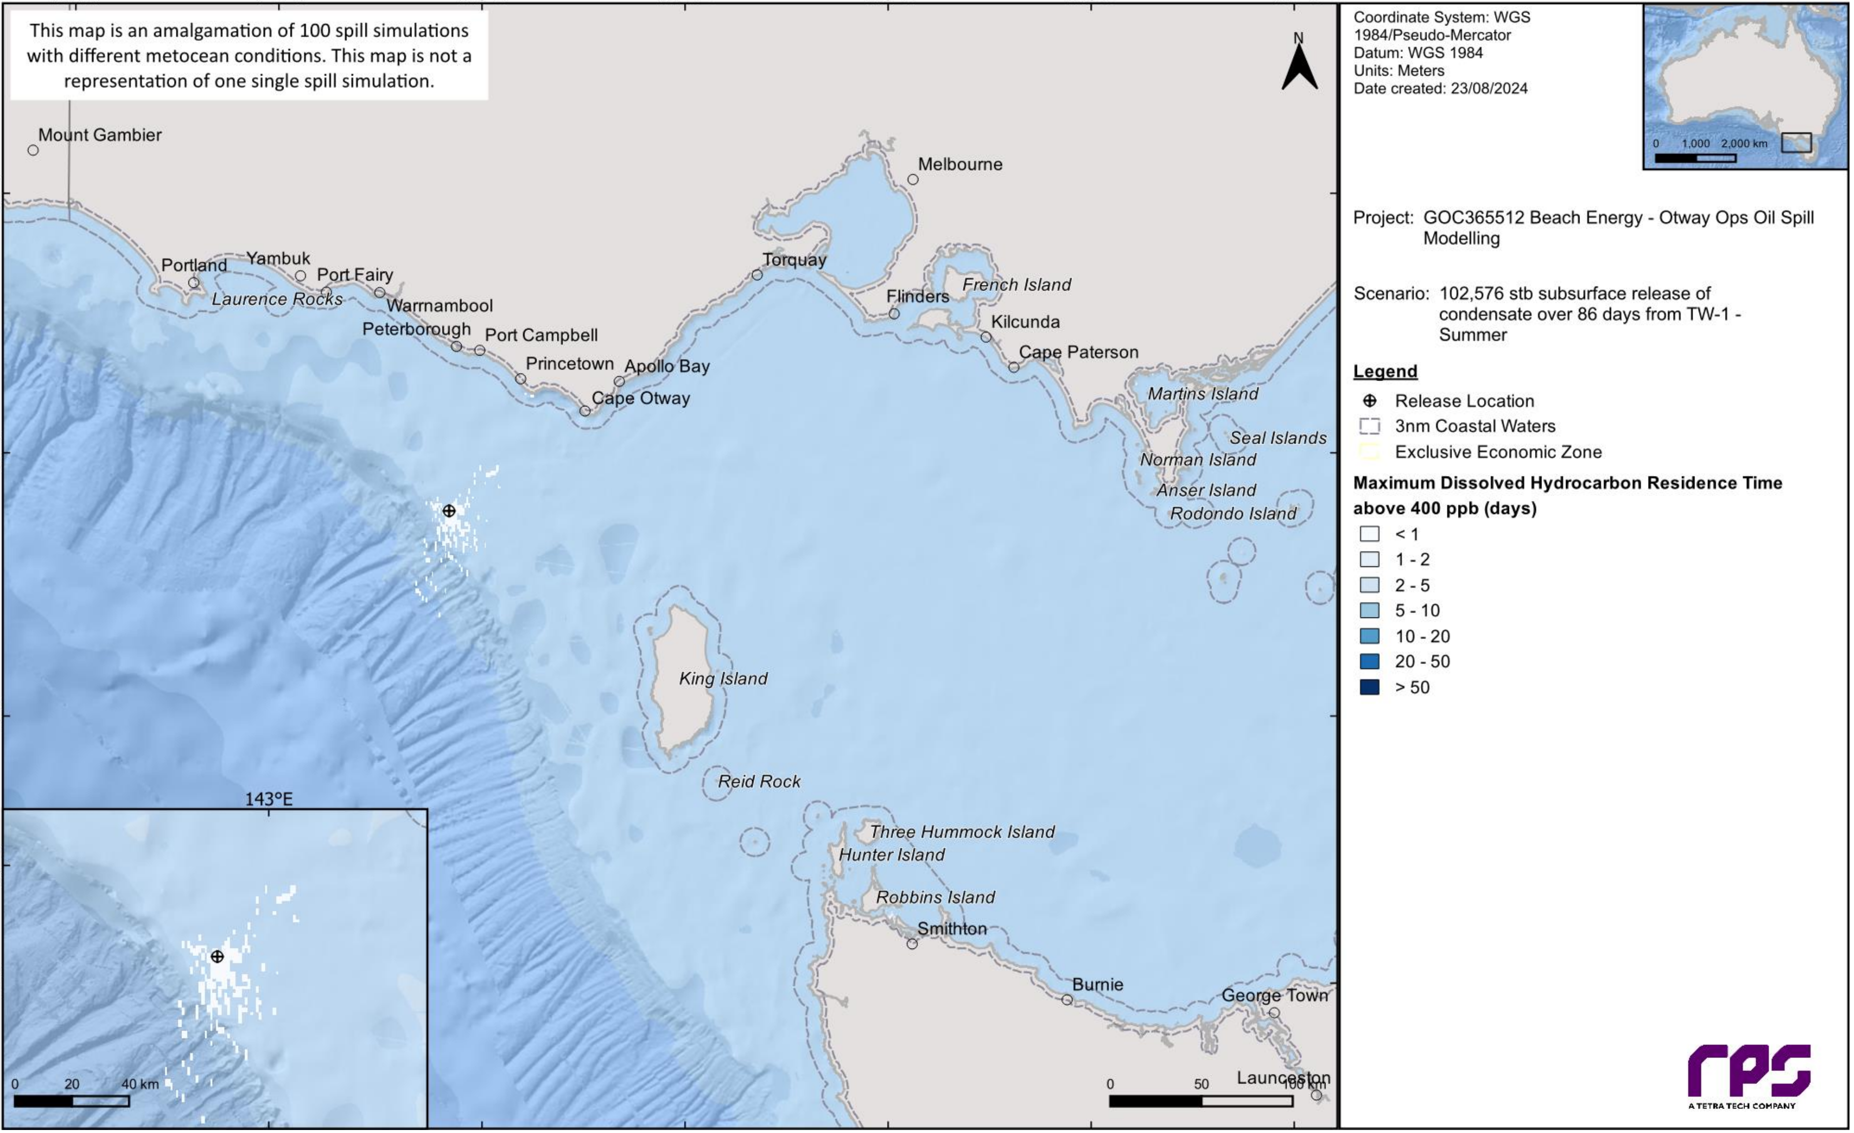

Figure 15-14 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

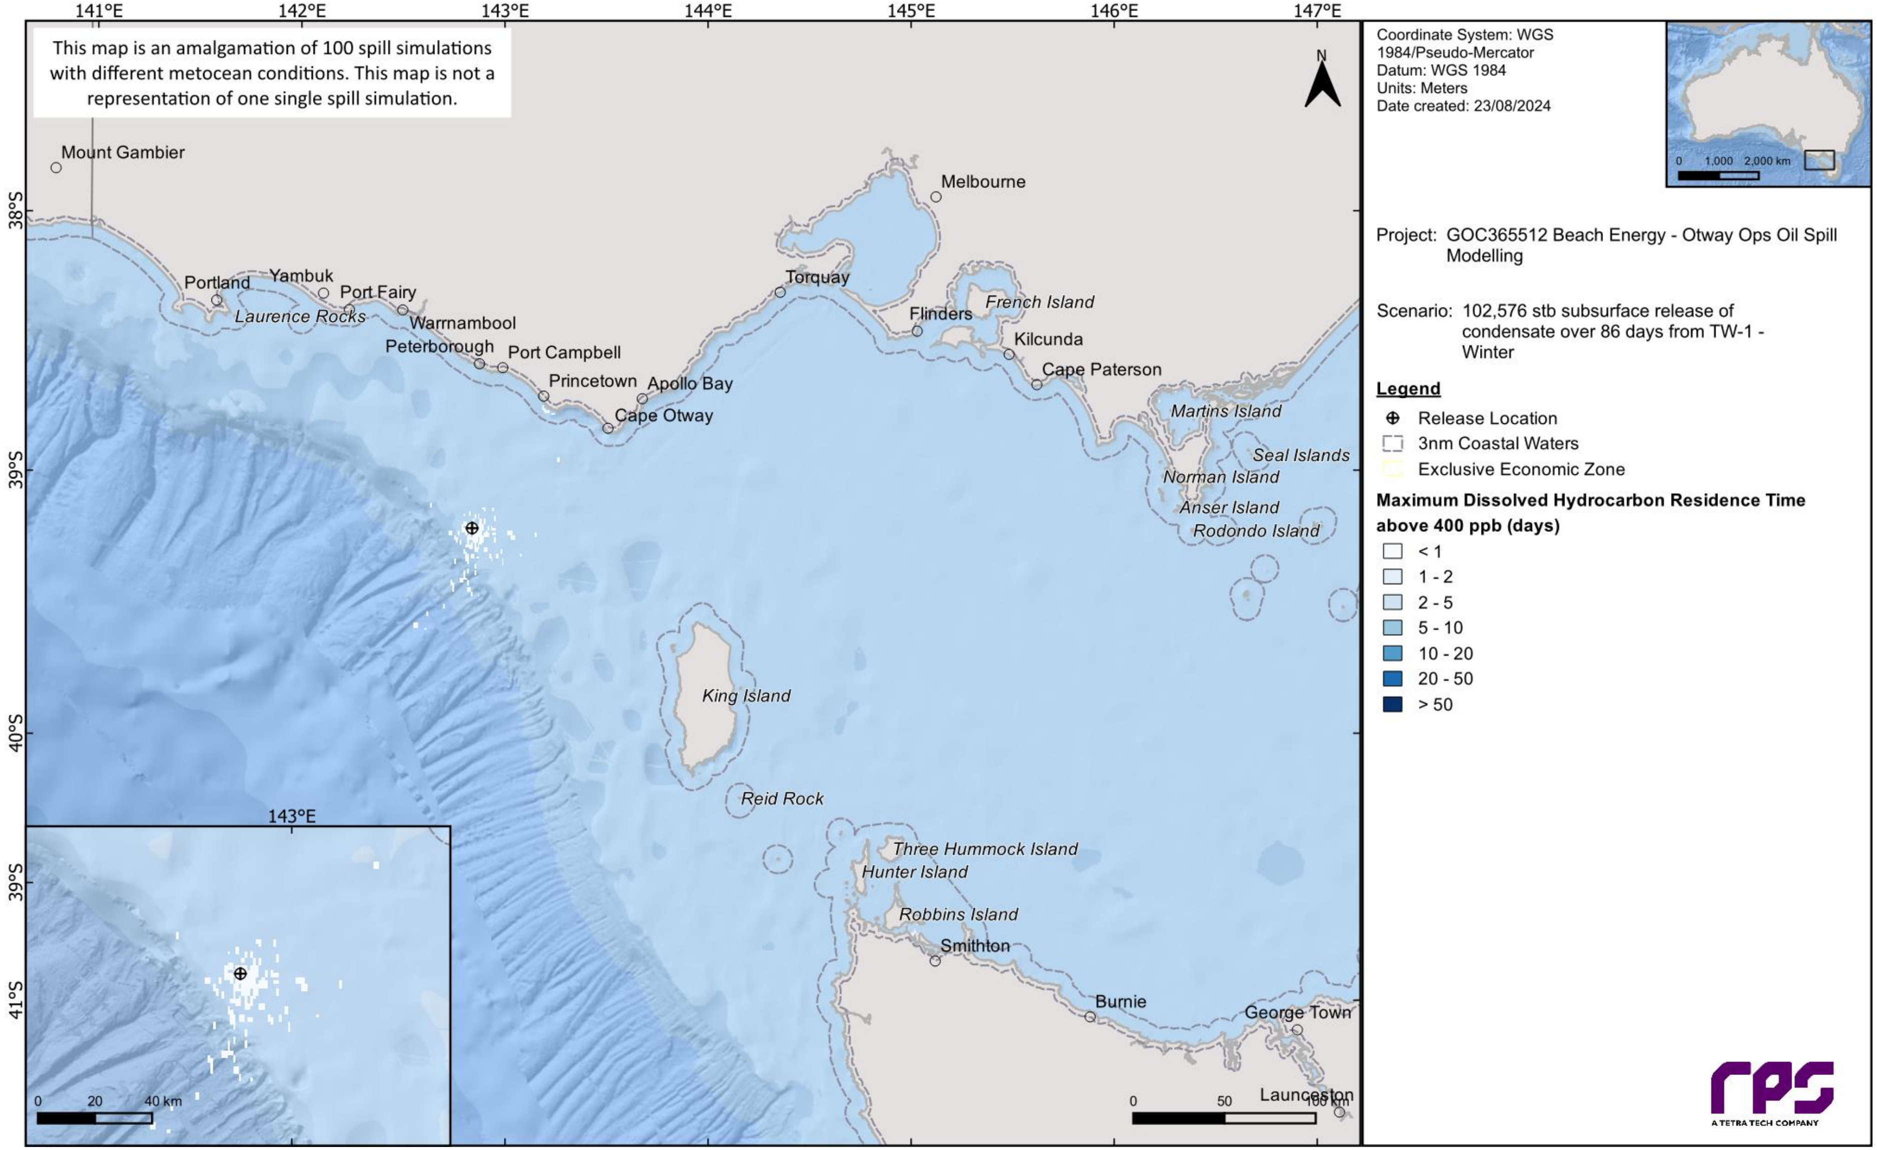

Figure 15-15 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

15.1.4.2 Entrained Hydrocarbons

Table 15-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for White Shark – Distribution (Between 120 – 1,000 m depth contour) (summer – 338.67 ppb, winter – 328.89 ppb).

Table 15-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 15-16 and Figure 15-17 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 15-18 to Figure 15-21 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 15-8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

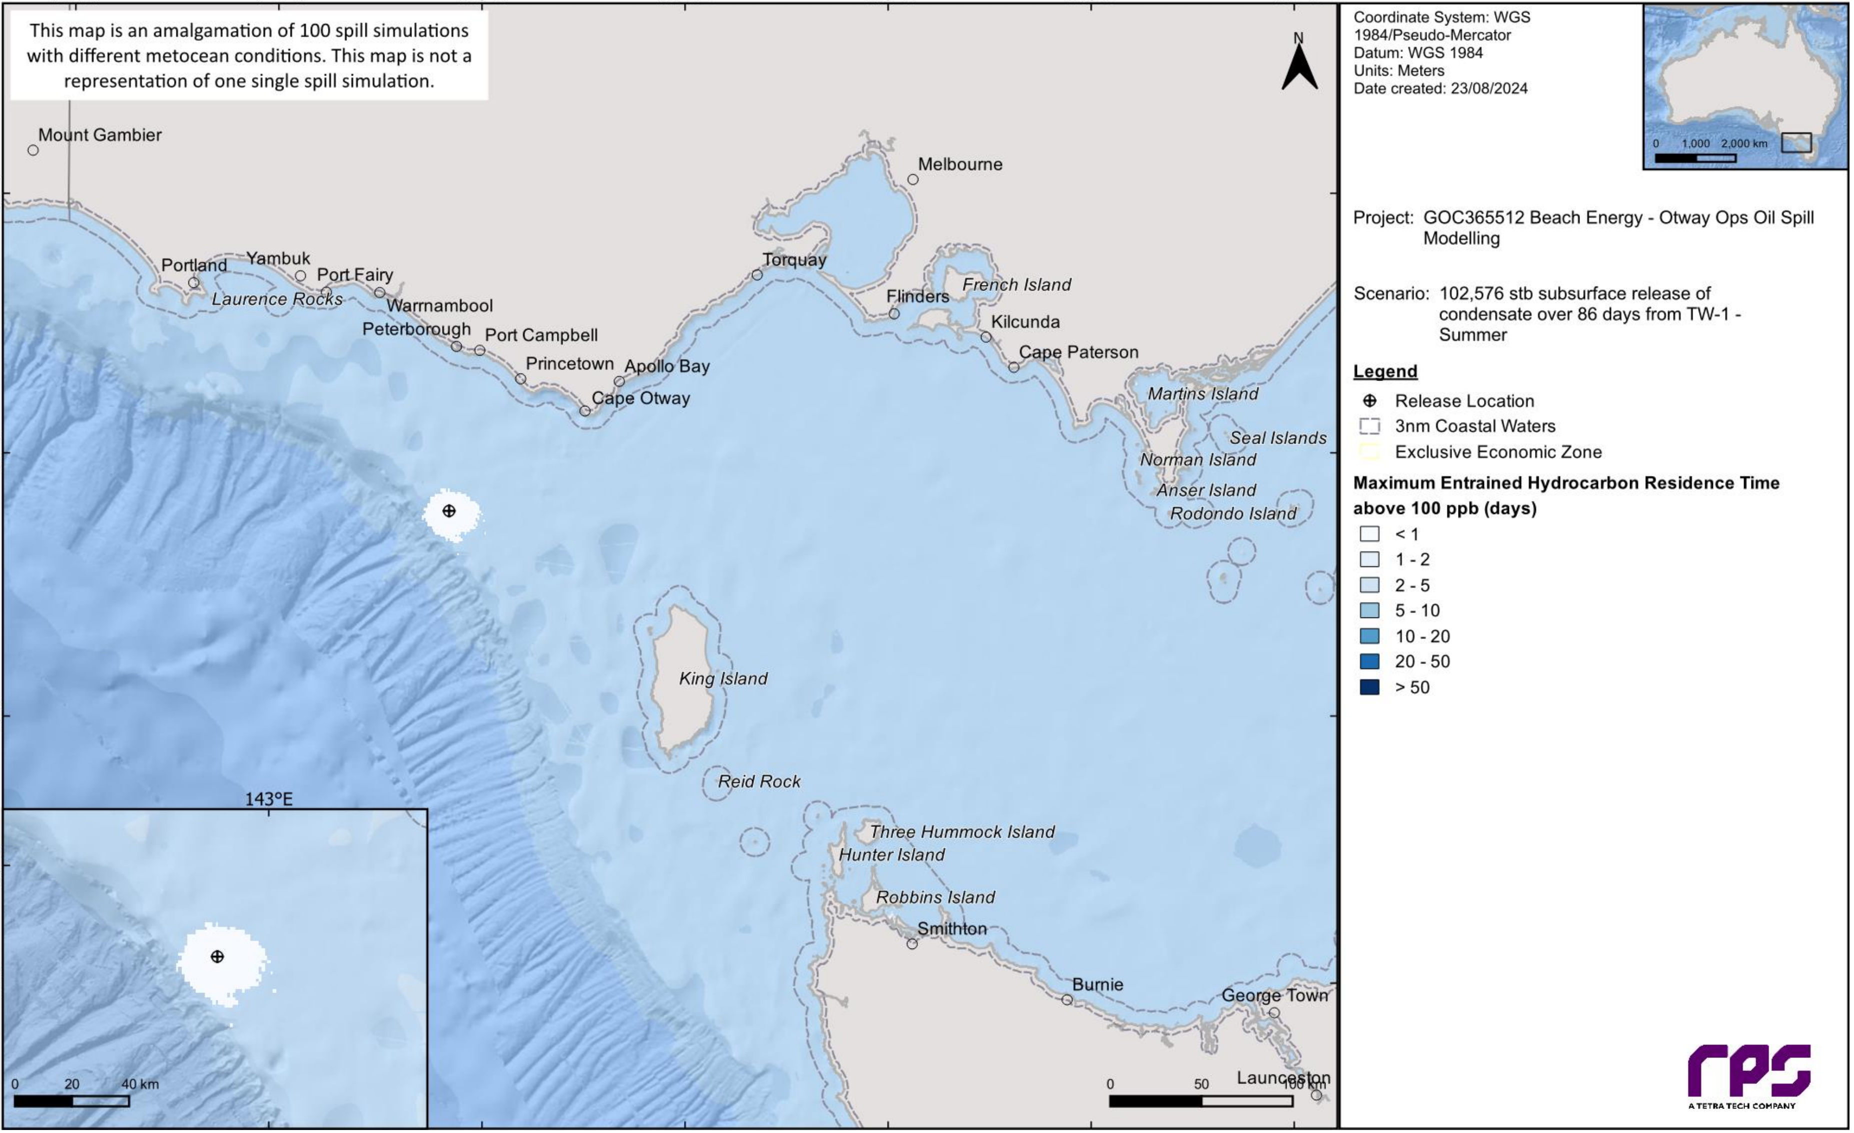

Figure 15-20 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

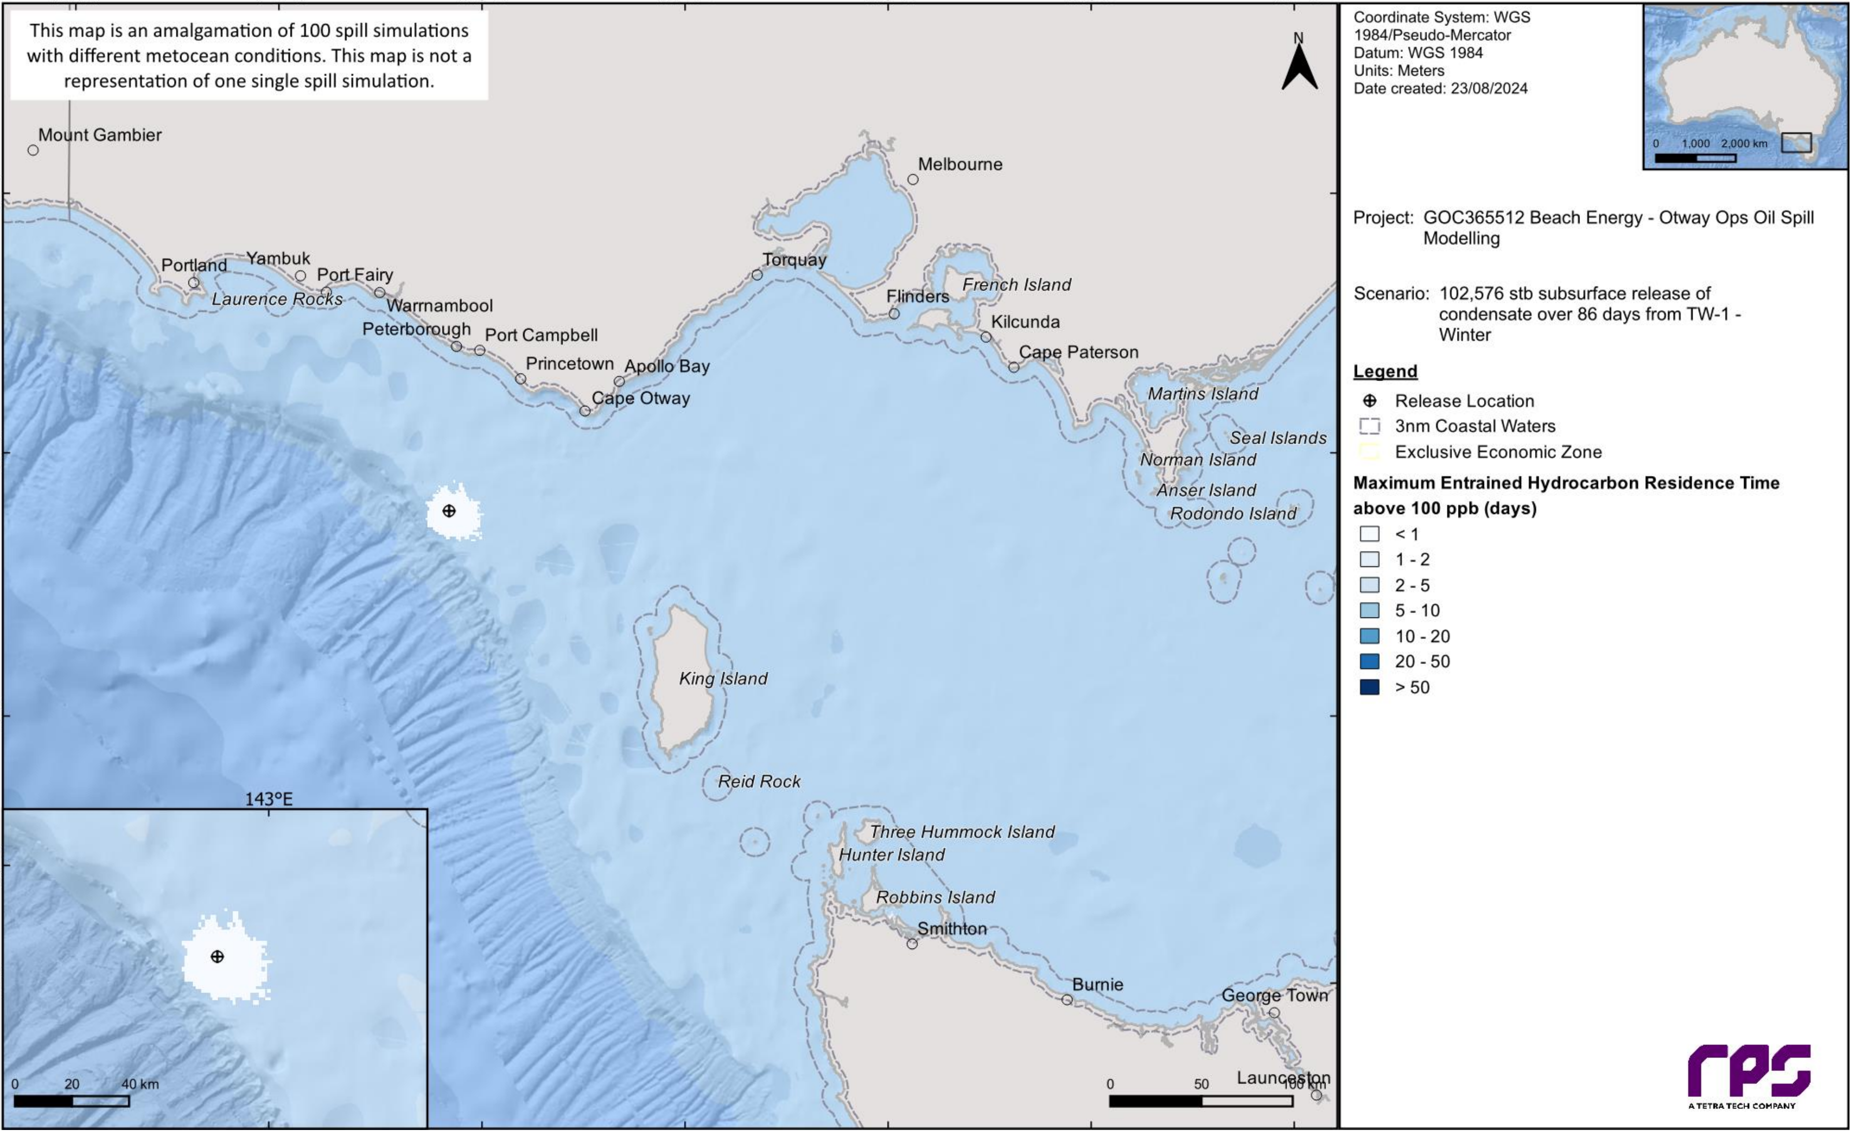

This map is an amalgamation of 100 spill simulations with different metocean conditions. This map is not a representation of one single spill simulation.

Figure 15-21 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

16 RESULTS – LOSS OF CONTAINMENT FROM VESSEL COLLISION AT TW1

This scenario examined a 603.7 m^3 surface release of marine diesel for a loss of containment from a vessel collision at TW1. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 30 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

16.1 Stochastic Analysis

16.1.1 Area of Exposure

Figure 16-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

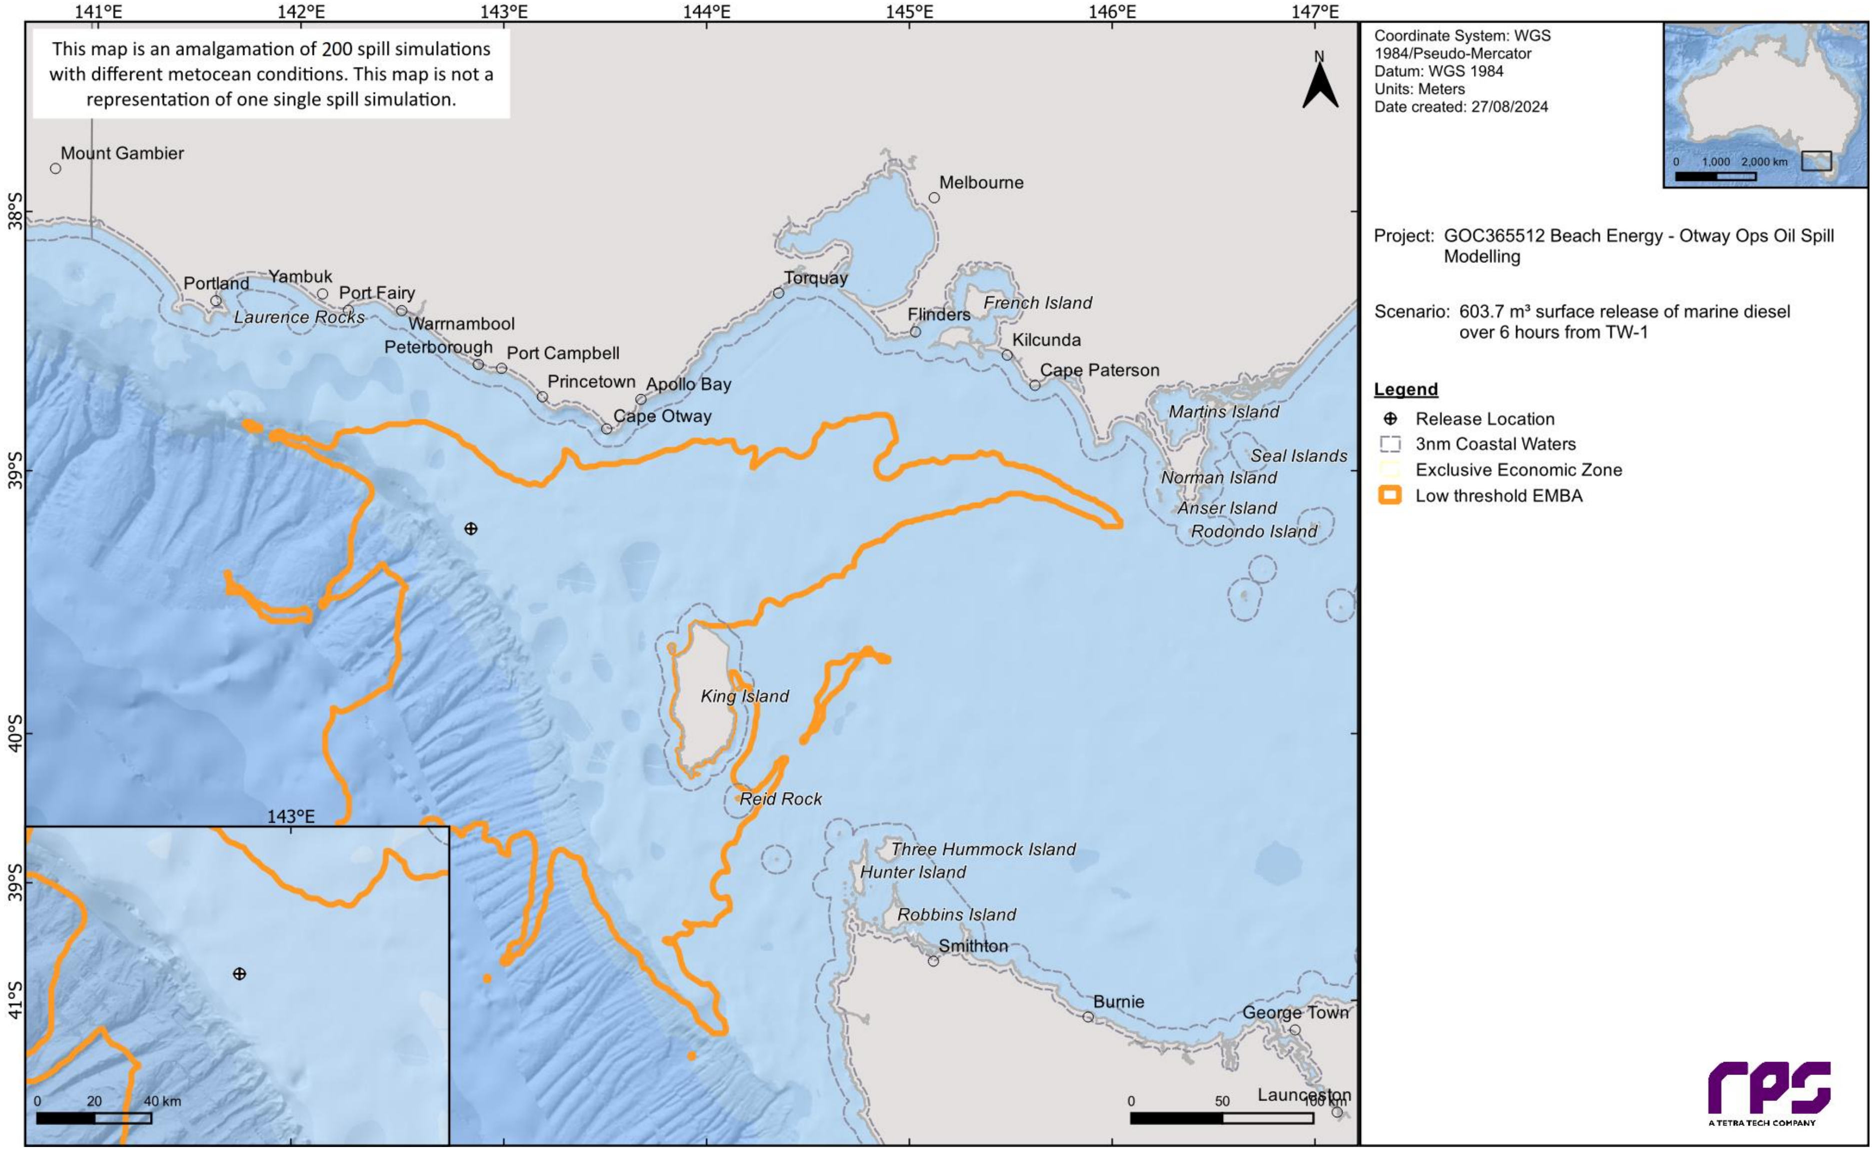

Figure 16-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1 during summer and winter conditions.

16.1.2 Floating Oil Exposure

Table 16-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 64.97 km (southeast), 49 km (southeast) and 10.08 km (south-southeast) all during winter.

Table 16-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest probability of floating oil exposure above the low threshold was predicted at the White Shark - Distribution (Between the 120 - 1,000m depth contour) BIA (25% in summer and 14% in winter).

Table 16-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 16-2 and Figure 16-3 present the zones of potential floating oil exposure for all thresholds under summer and winter conditions, respectively.

Figure 16-4 to Figure 16-9 present the minimum time before floating oil exposure for the NOPSEMA thresholds during summer and winter, respectively.

Table 16-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	32.39	28.56	9.47
	Direction	Southeast	Southeast	South-Southwest
Winter	Maximum distance (km) from release location	64.97	49	10.08
	Direction	Southeast	Southeast	South-Southeast

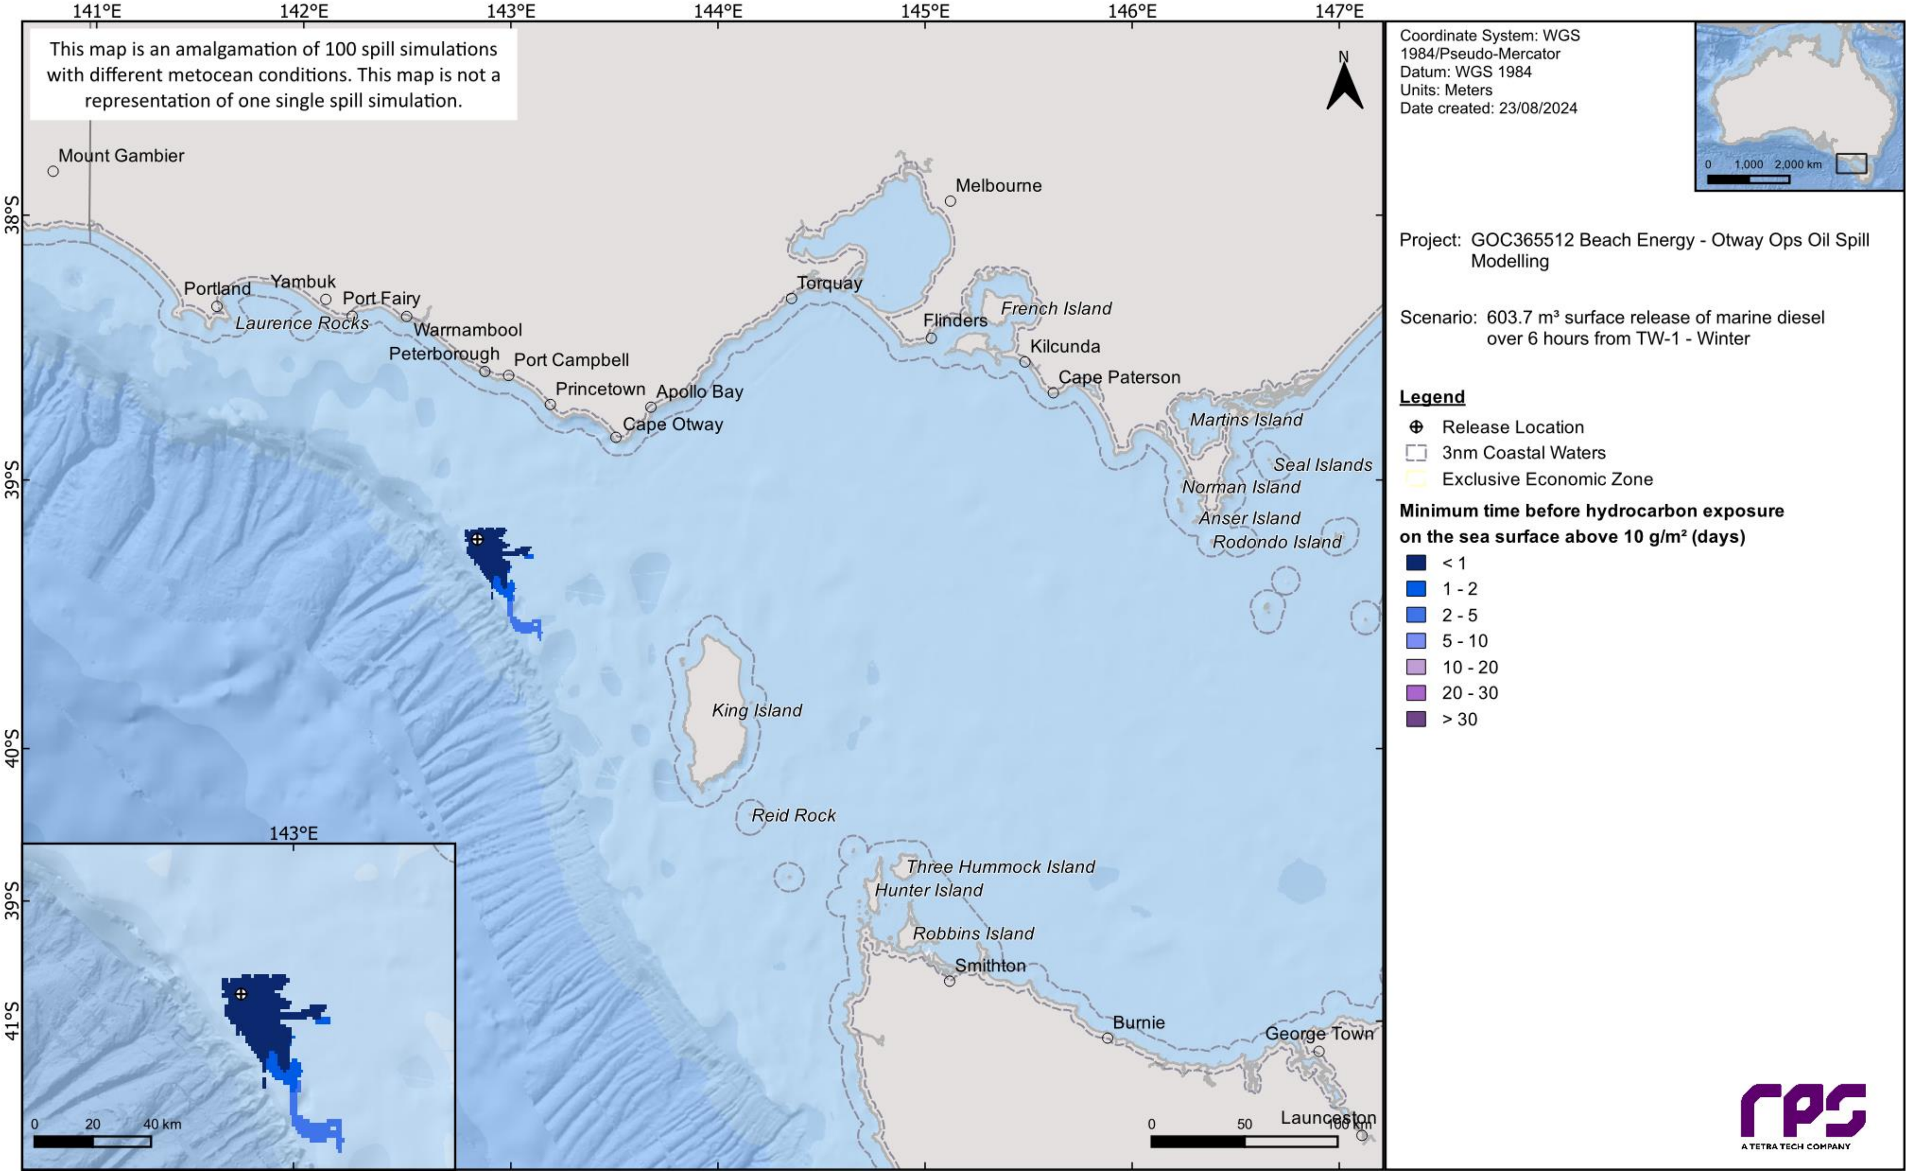

Figure 16-7 Minimum time before floating oil exposure above 10 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during winter conditions.

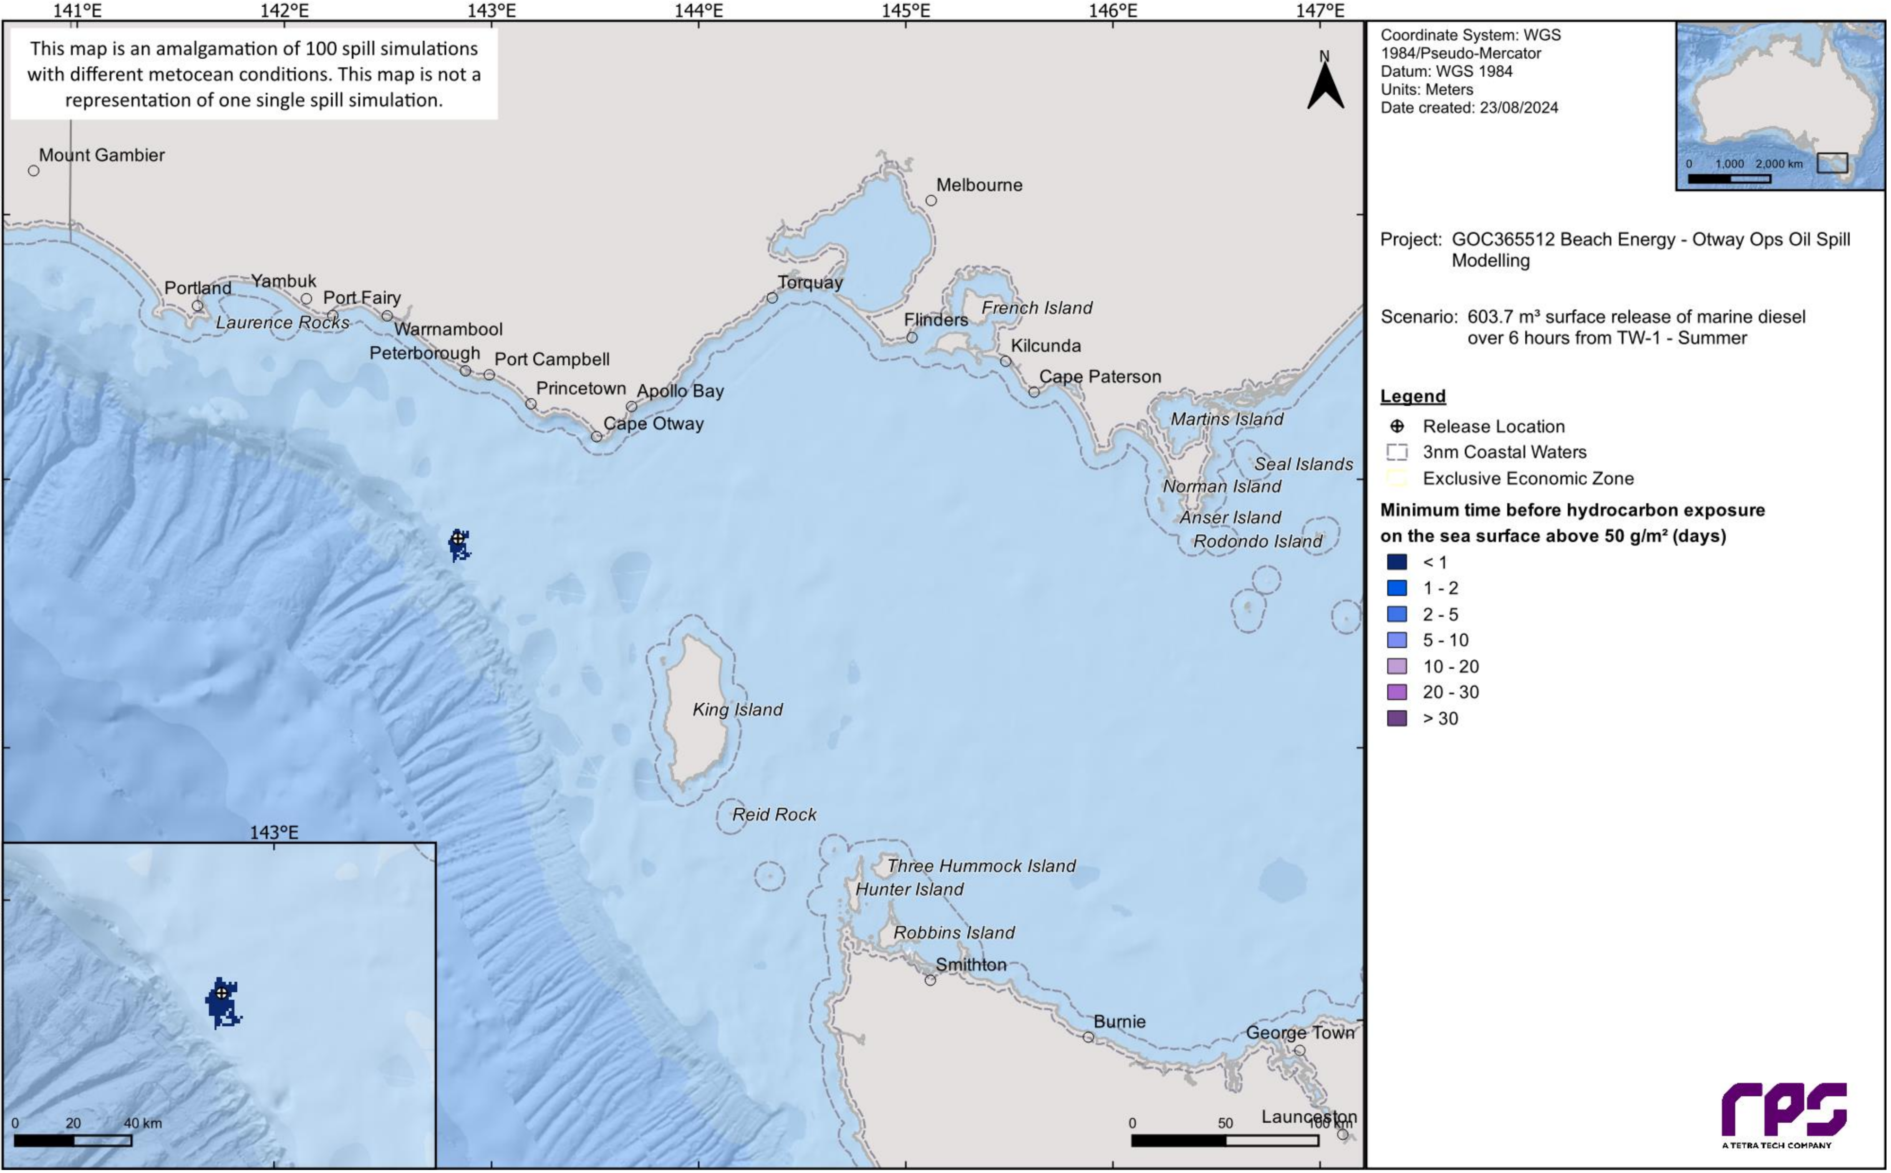

Figure 16-8 Minimum time before floating oil exposure above 50 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during summer conditions.

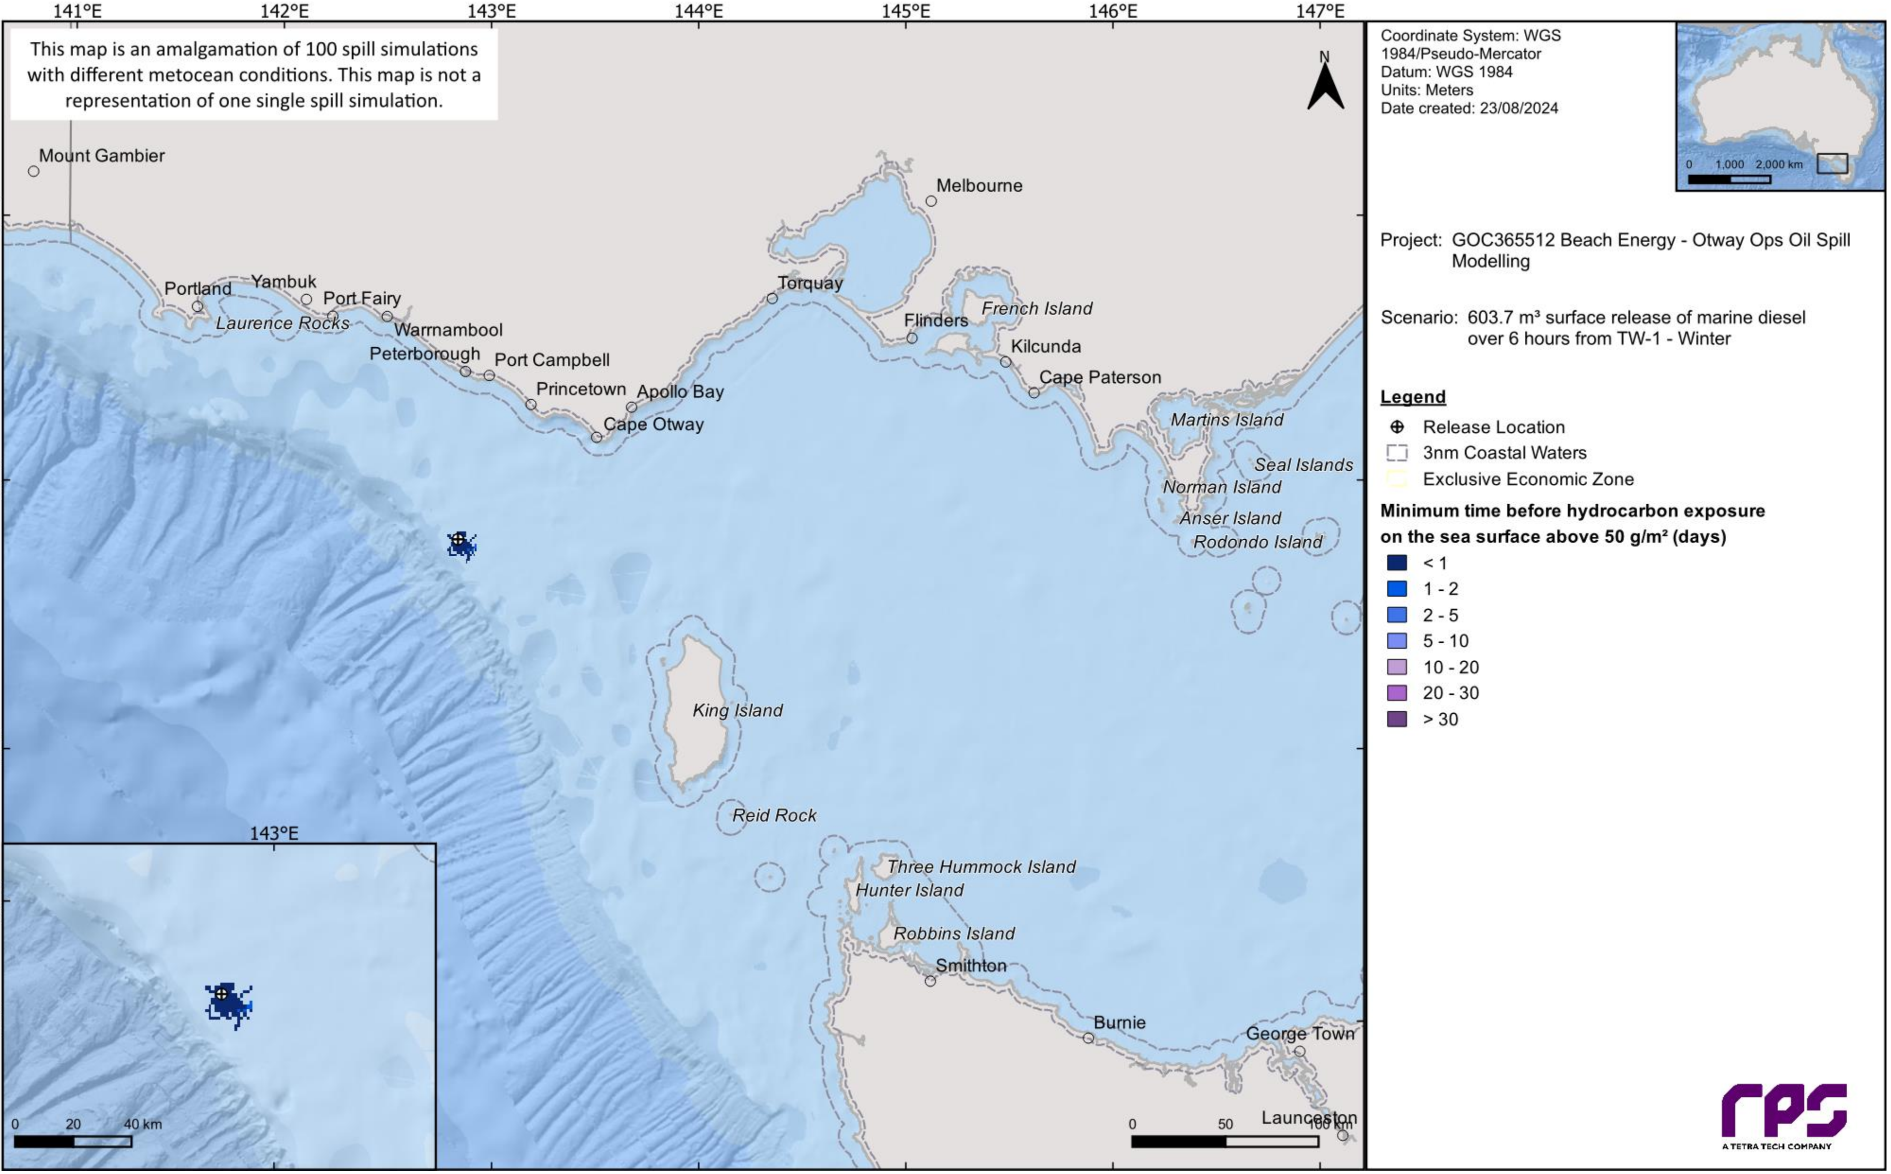

Figure 16-9 Minimum time before floating oil exposure above 50 g/m^2, in the event of 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during winter conditions.

16.1.3 Shoreline Accumulation

Table 16-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. No shoreline contact was forecast during summer conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 9% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 15.02 days. The maximum volume ashore for a single spill trajectory was 9.67 m^3, whilst the maximum length of shoreline accumulation at the low threshold was 17.67 km. No shoreline accumulation was predicted for the moderate (100 g/m^2) or high (1,000 g/m^2) thresholds.

Table 16-5 summarises the shoreline accumulation on individual receptors during winter conditions. The only receptor recording a probability of shoreline accumulation at the low threshold was King Island Council (TAS) with 9% and the maximum shoreline accumulation was 1.38 m^3. The minimum time before shoreline accumulation above the low threshold was 15.02 days.

The winter conditions maximum potential shoreline loading is presented in Figure 16-10.

Table 16-4 Summary of oil accumulation across all shorelines. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	-	9
Absolute minimum time for visible oil to shore (days)	-	15.02
Maximum total volume of hydrocarbons ashore (m^3)	-	9.67
Average volume of hydrocarbons ashore (m^3)	-	0.45
Maximum length of the shoreline at **10 g/m^2** (km)	-	17.67

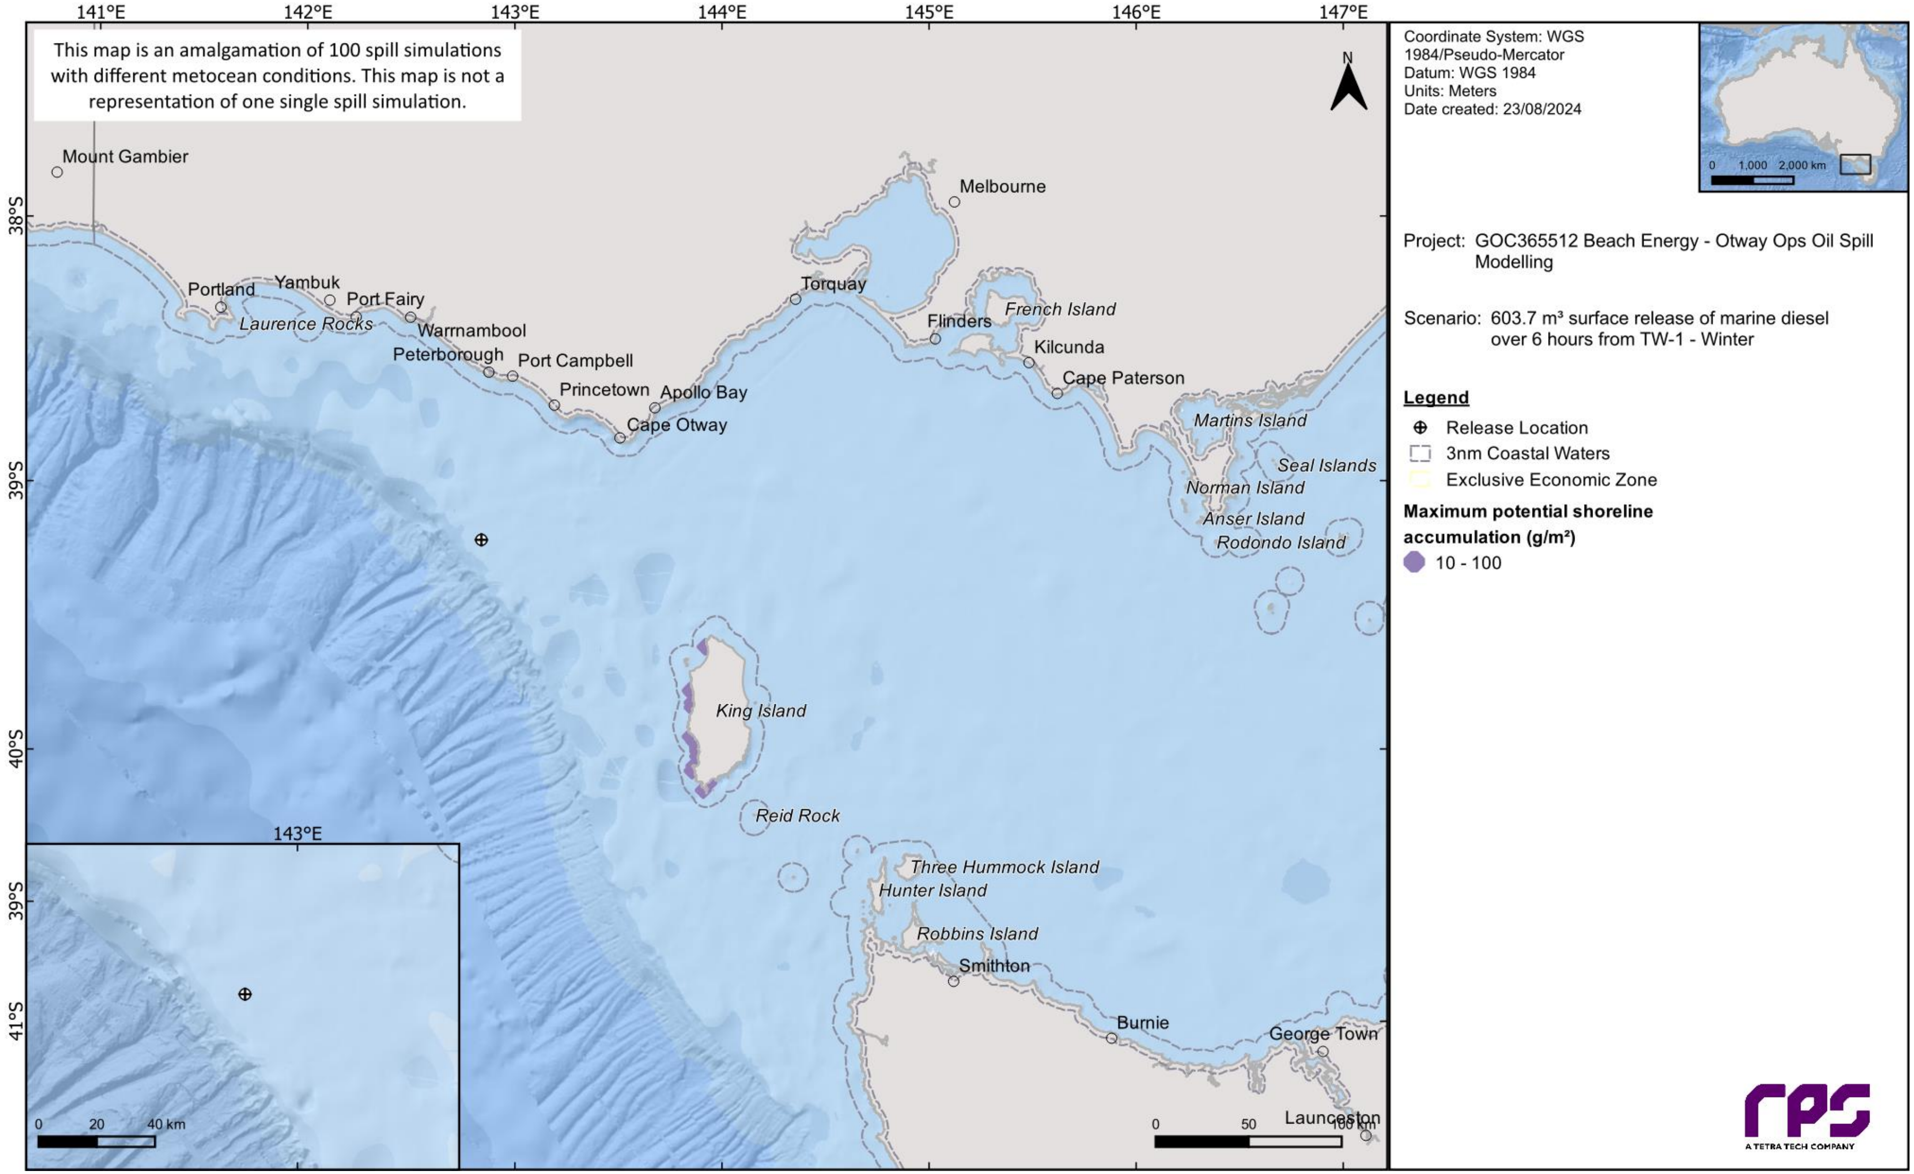

Figure 16-10 Maximum potential shoreline loading in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during winter conditions.

16.1.4 In-water exposure

16.1.4.1 Dissolved Hydrocarbons

Table 16-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions. No dissolved hydrocarbon exposure at the high (400 ppb) threshold was predicted,

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of dissolved hydrocarbon was predicted for the White Shark - Distribution (Between the 120 - 1,000m depth contour) BIA, being 23.94 ppb in summer and 23.23 ppb in winter. The highest probability of low dissolved hydrocarbon exposure was recorded for Pygmy Blue Whale - Foraging BIA (summer – 3%, winter – 14%).

Table 16-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed. The maximum residence time of dissolved hydrocarbon exposure at the low threshold was 11 hours during winter.

Figure 16-11 and Figure 16-12 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 16-13 to Figure 16-16 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 16-6 **Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.**

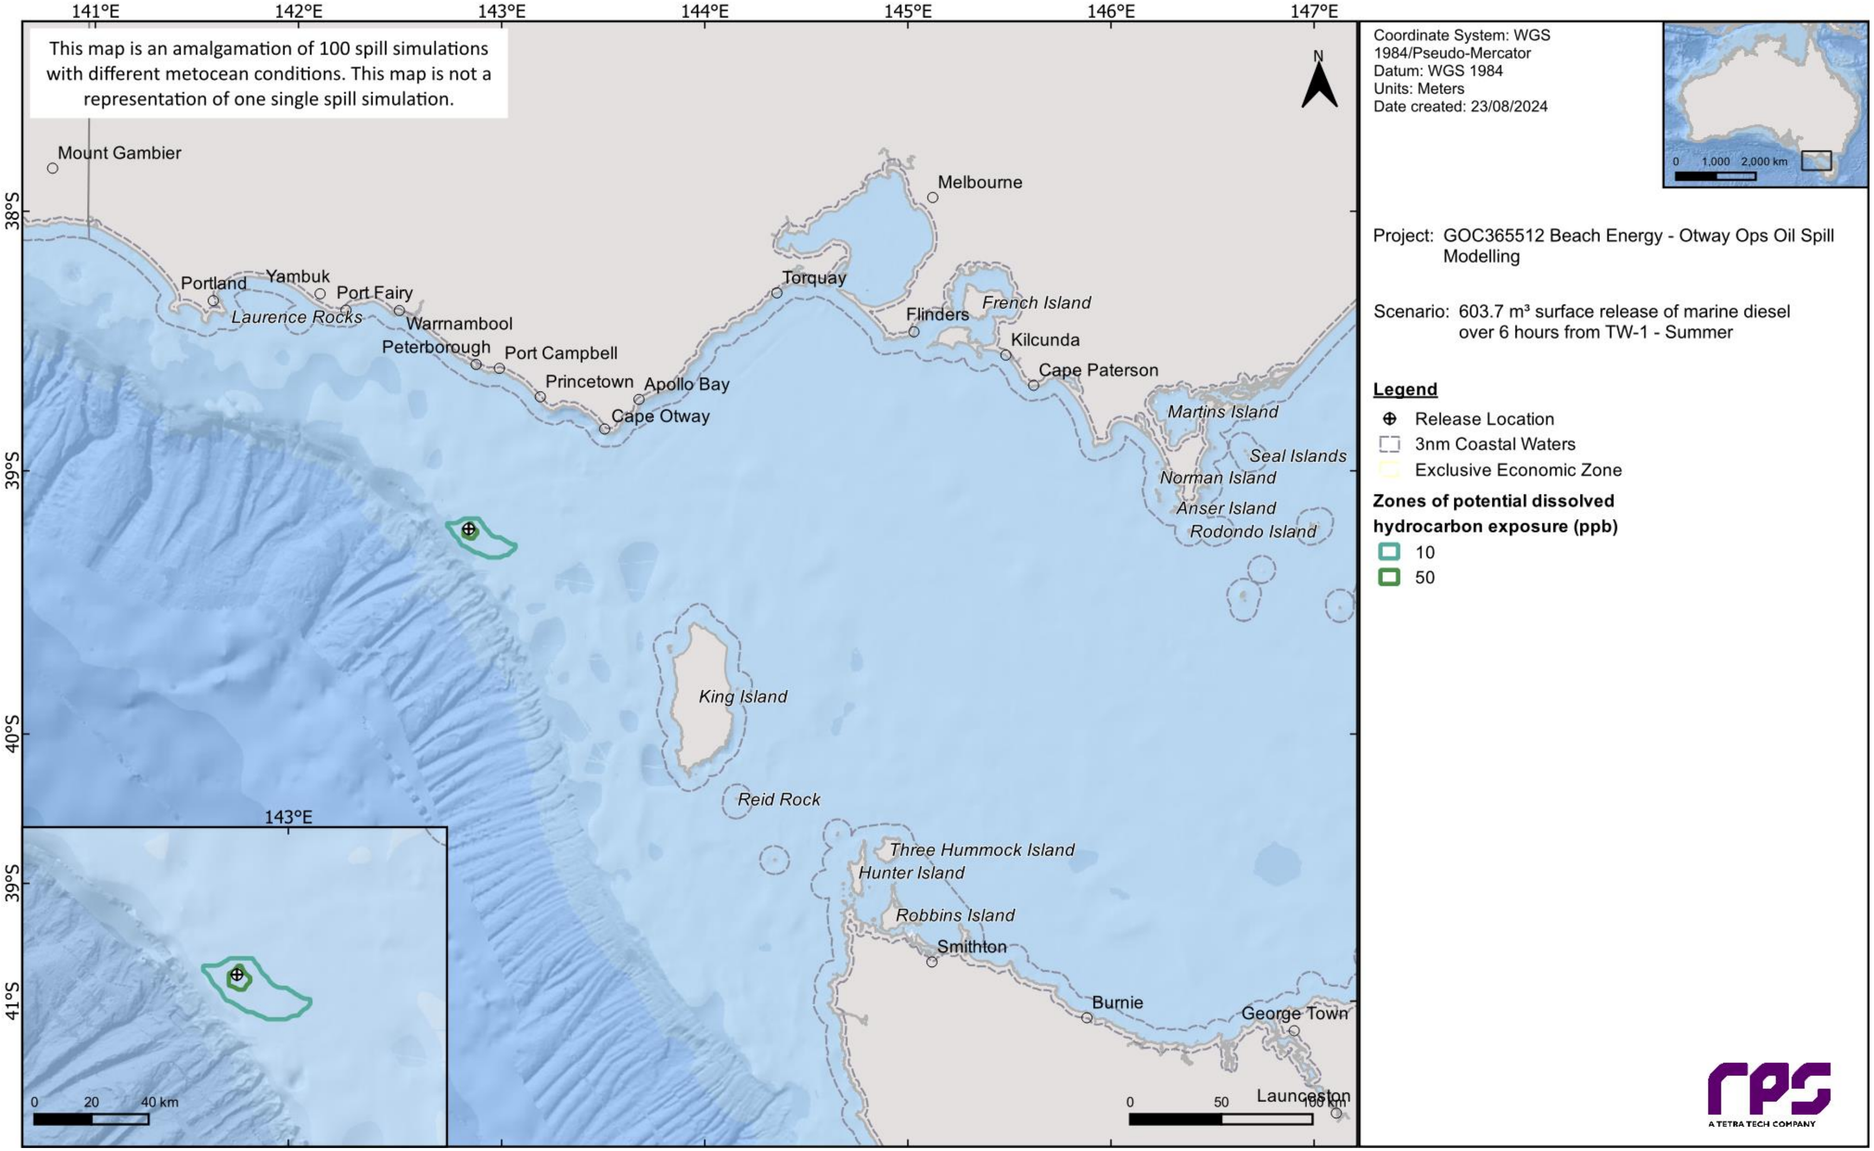

Figure 16-11 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during summer conditions.

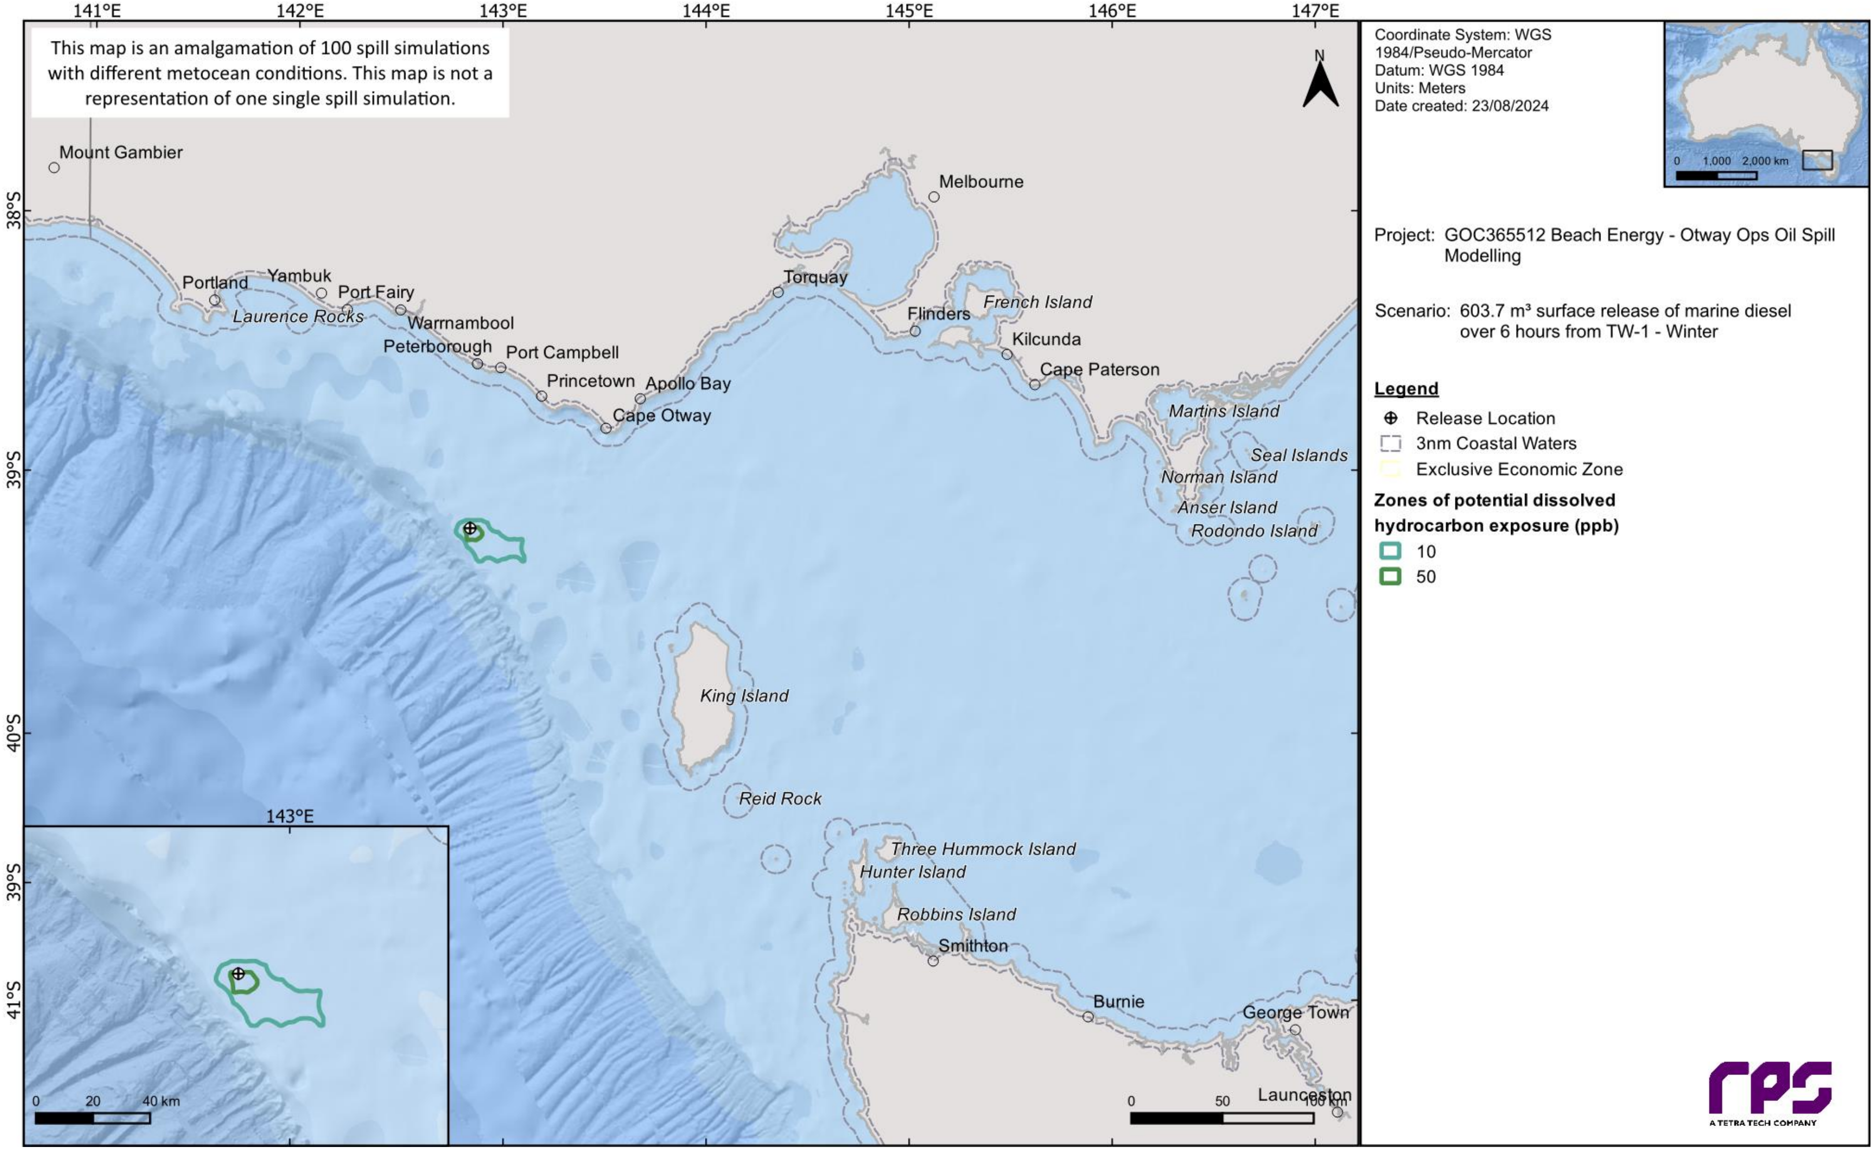

Figure 16-12 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during winter conditions.

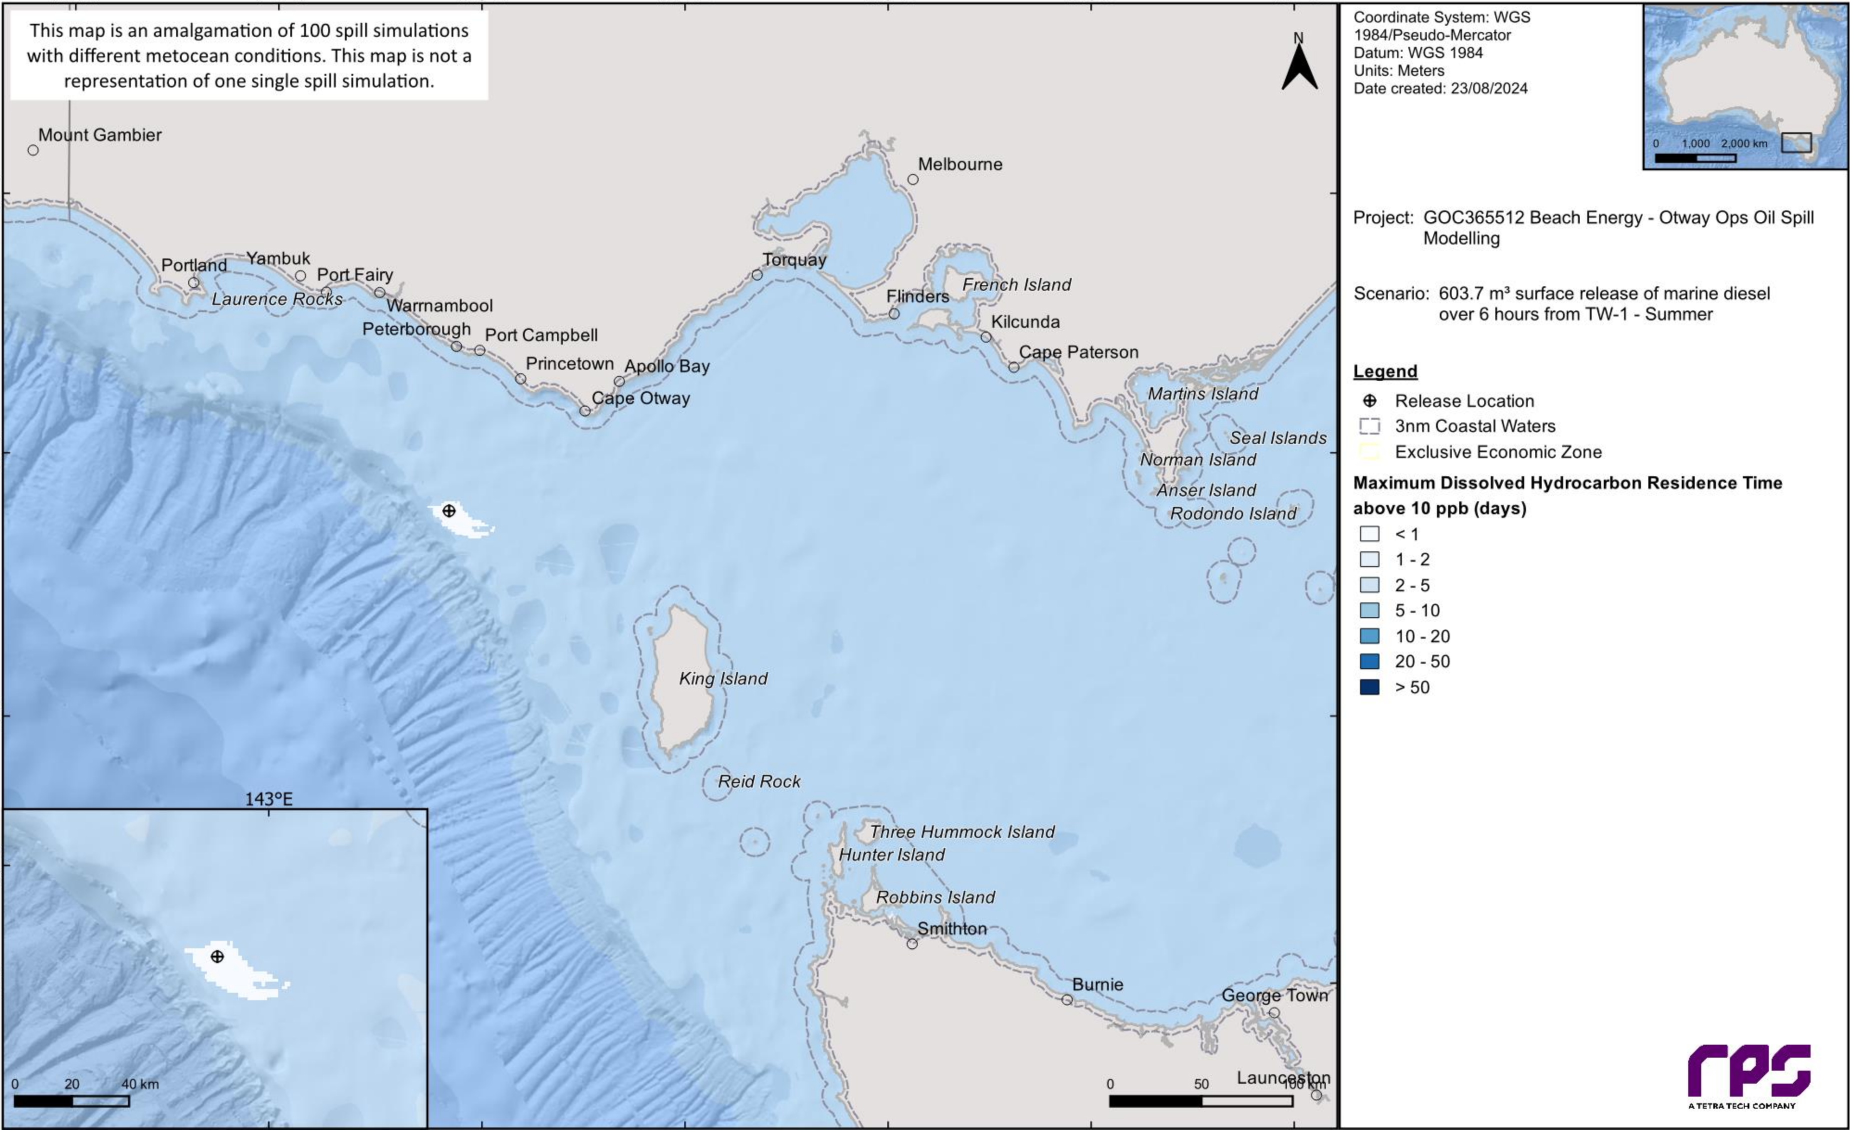

Figure 16-13 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during summer conditions.

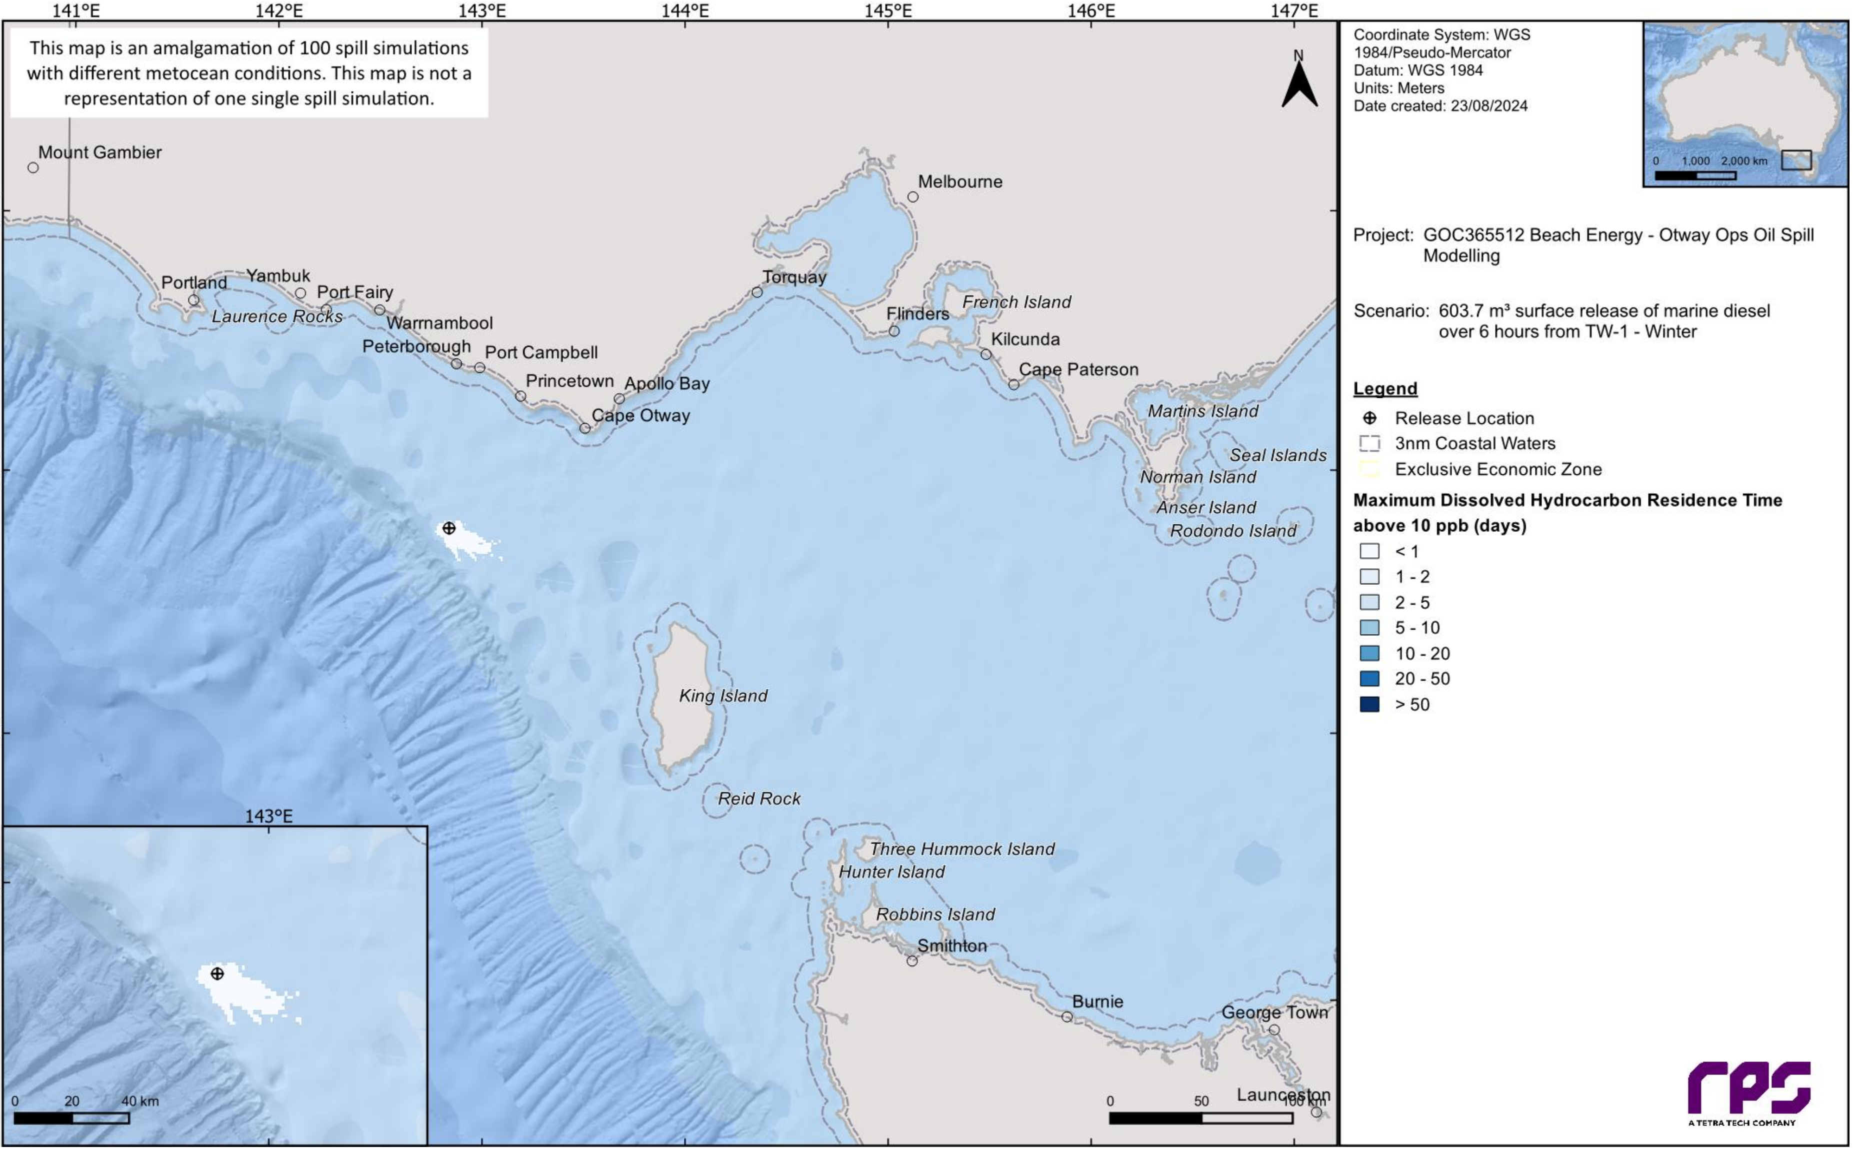

Figure 16-14 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during winter conditions.

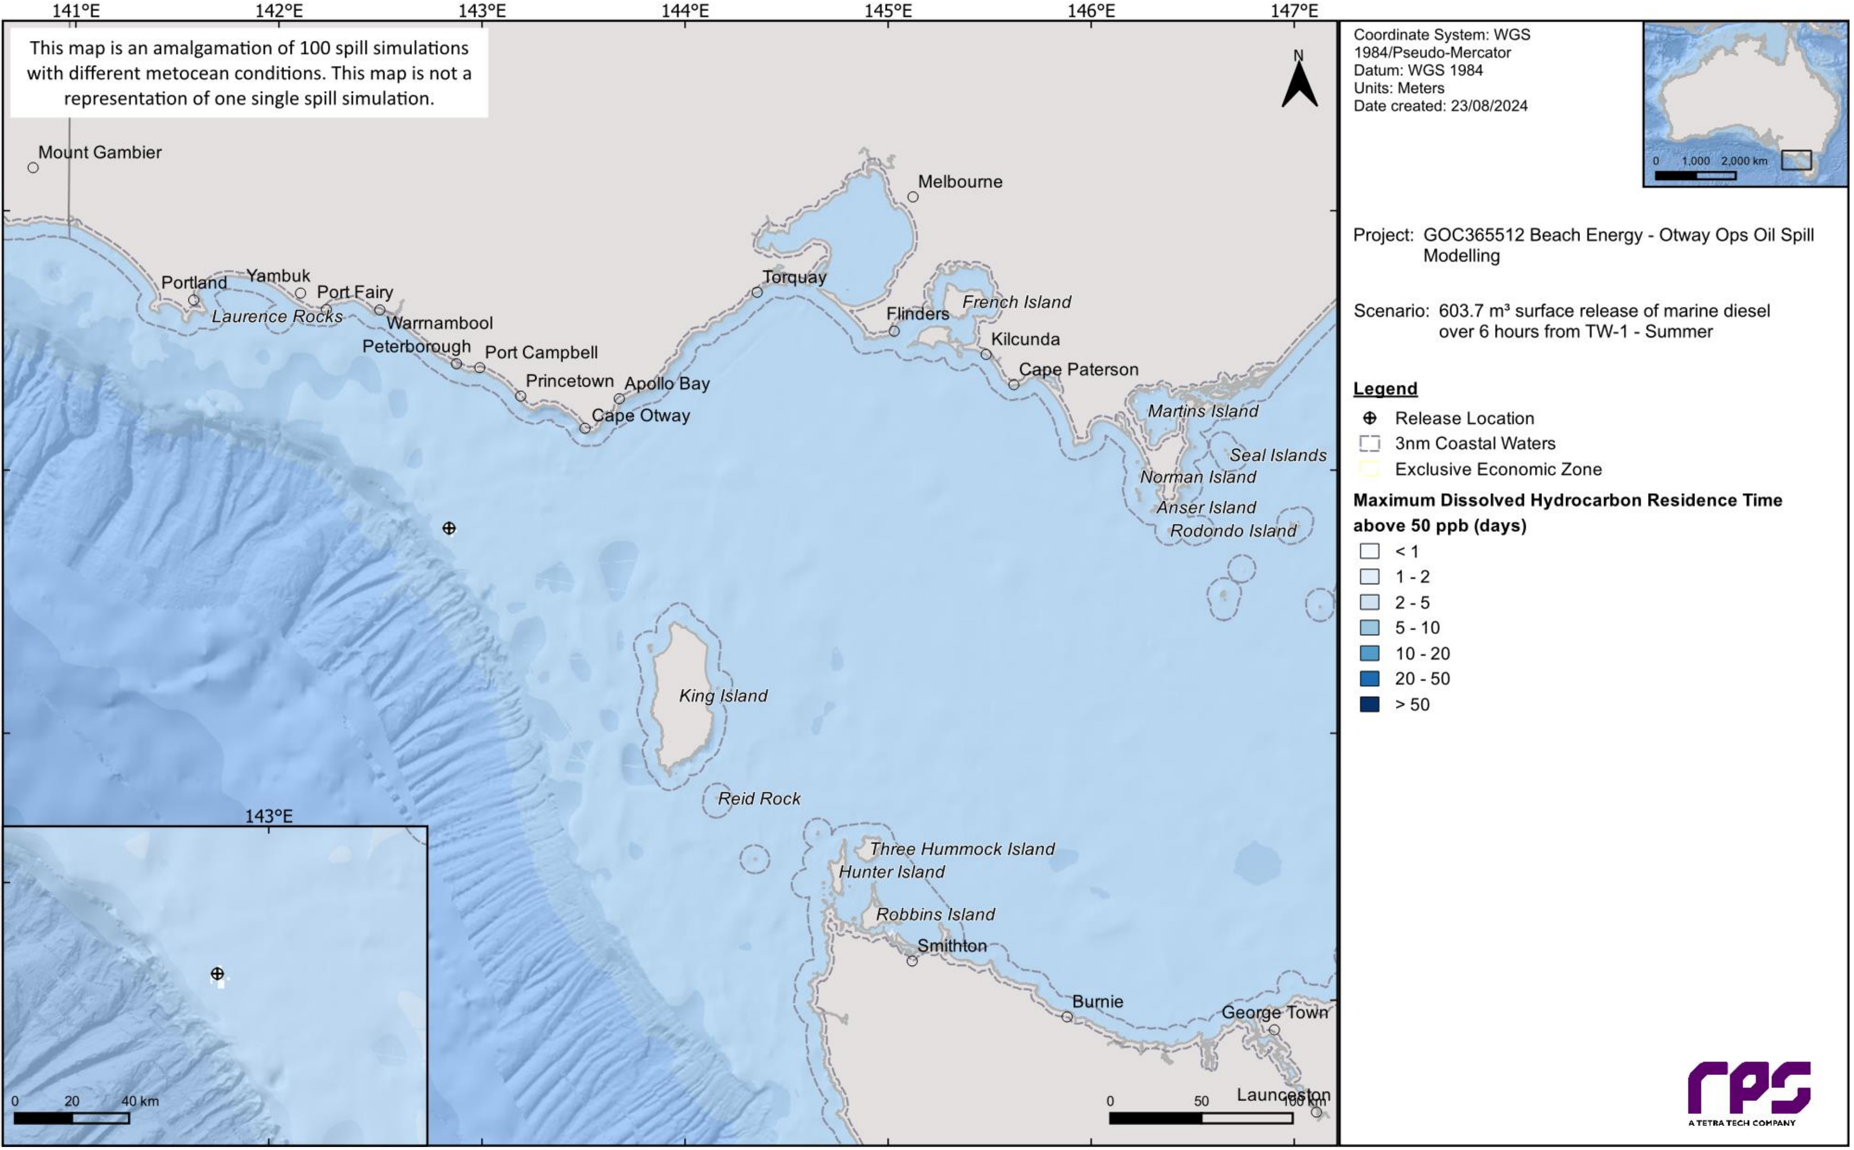

Figure 16-15 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during summer conditions.

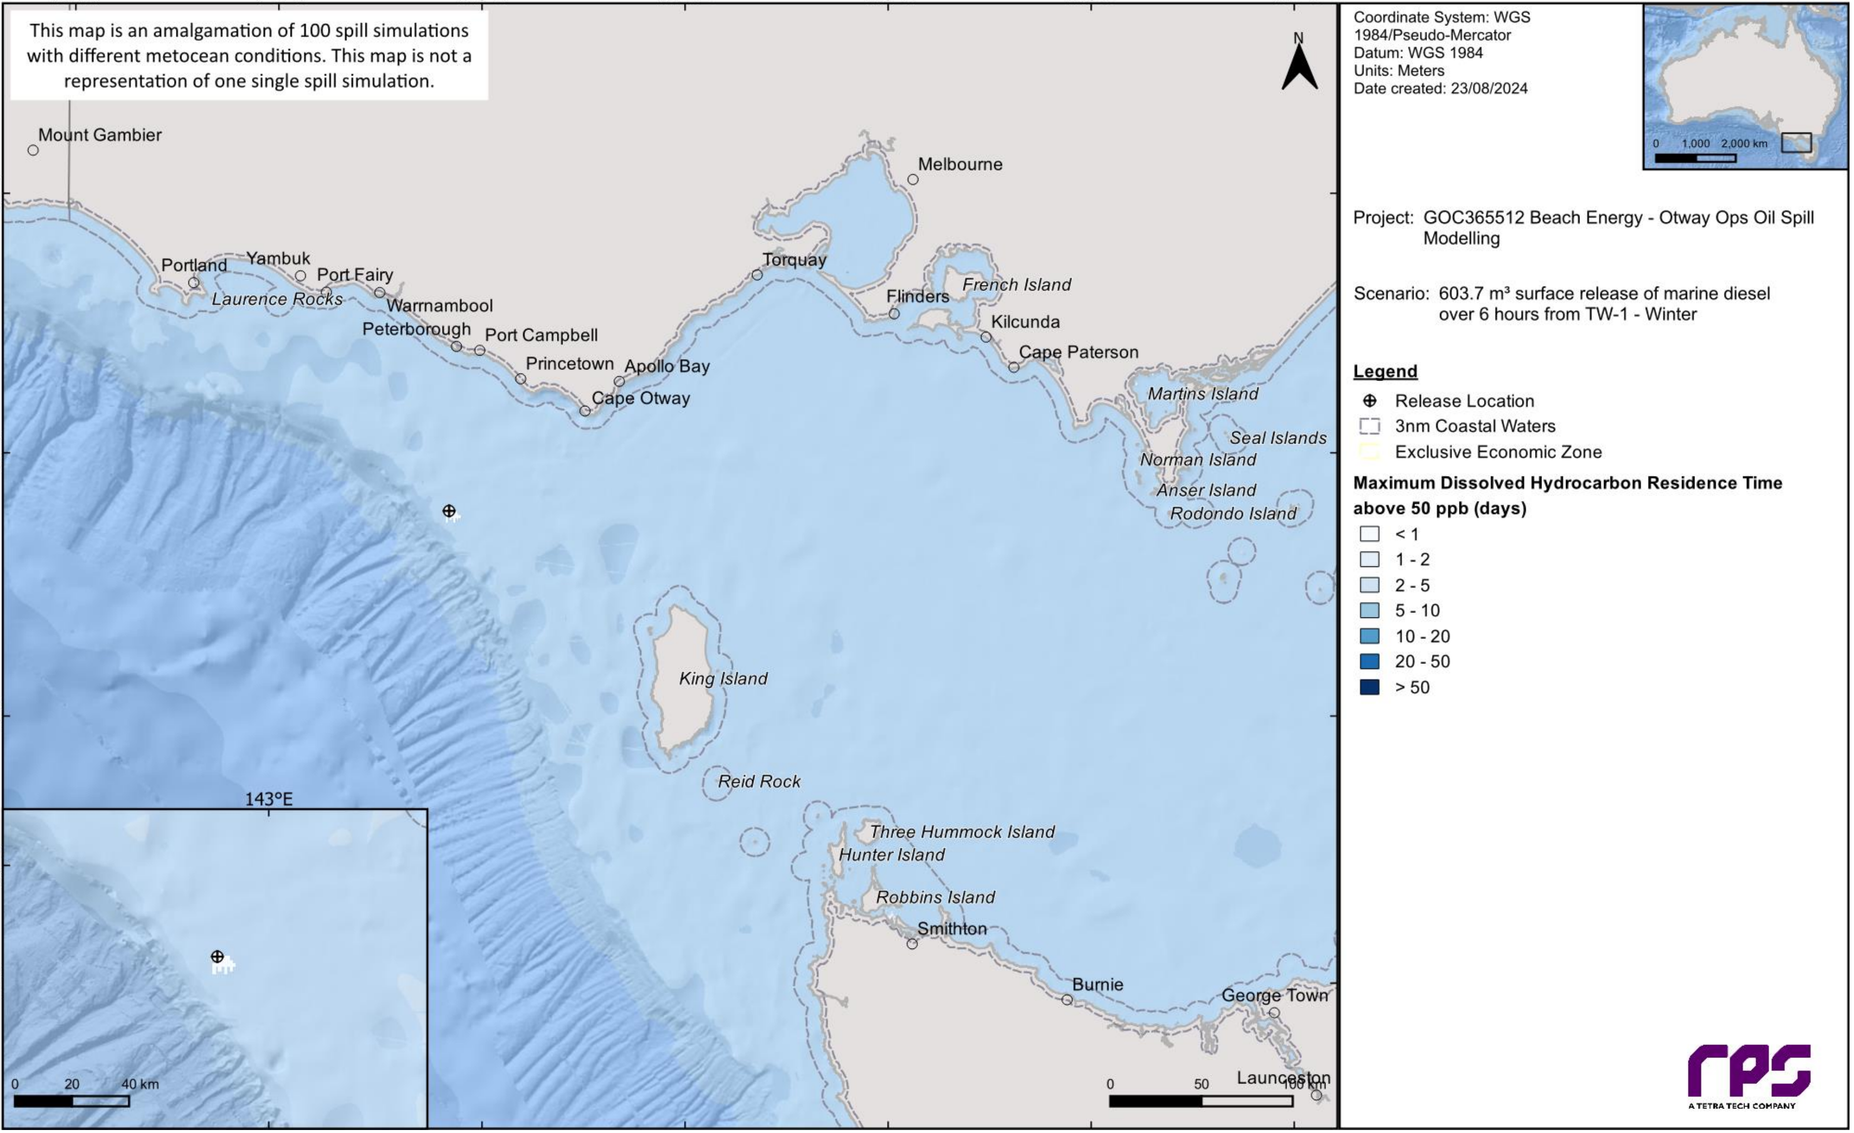

Figure 16-16 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations during winter conditions.

16.1.4.2 Entrained Hydrocarbons

Table 16-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 6,692.22 ppb, winter – 6,075.03 ppb).

Table 16-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 16-17 and Figure 16-18 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 16-19 to Figure 16-24 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 16-8 **Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.**

Appendix N Stakeholder Consultation Information Sheets

Offshore Gas Victoria Project

Drilling Program EP

Drilling activities | 16 September 2024

Project overview

Through production at the Otway Gas Plant near Port Campbell and the Lang Lang Gas Plant, 80 kms south-east of Melbourne CBD, Beach Energy (**Beach**) supplies natural gas to the east coast market, which delivers energy to Victorian homes, business and industry.

Beach safely drilled one exploration well and six production wells in its Otway Basin offshore Commonwealth permits from February 2021 to July 2022. Four production wells from that project have been connected and are now producing gas for the east coast market, with two remaining wells planned for connection in late 2024.

Beach is continuing its commitment to supply natural gas to the east coast gas market and, in June 2023, commenced consultation on Offshore Gas Victoria (**OGV**) Project activities in the course of preparing Environment Plans and an Offshore Project Proposal. OGV consists of a number of activities that would occur in several phases subject to approvals.

Following seabed assessments, the next phase of activities is the drilling phase (including the planned plugging and abandonment (**P&A**) of legacy suspended wells and the drilling of exploration or appraisal wells). The project phases are summarised in the diagram below.

Seabed assessments

- Assessment of suitable location for drilling rig and new seabed infrastructure to connect wells.
- Activities planned for no earlier than November 2024.

Removing wells (P&A)

- **Removal of five legacy suspended wells through a formal procedure (P&A).**
- **Activities planned for no earlier than March 2025.**

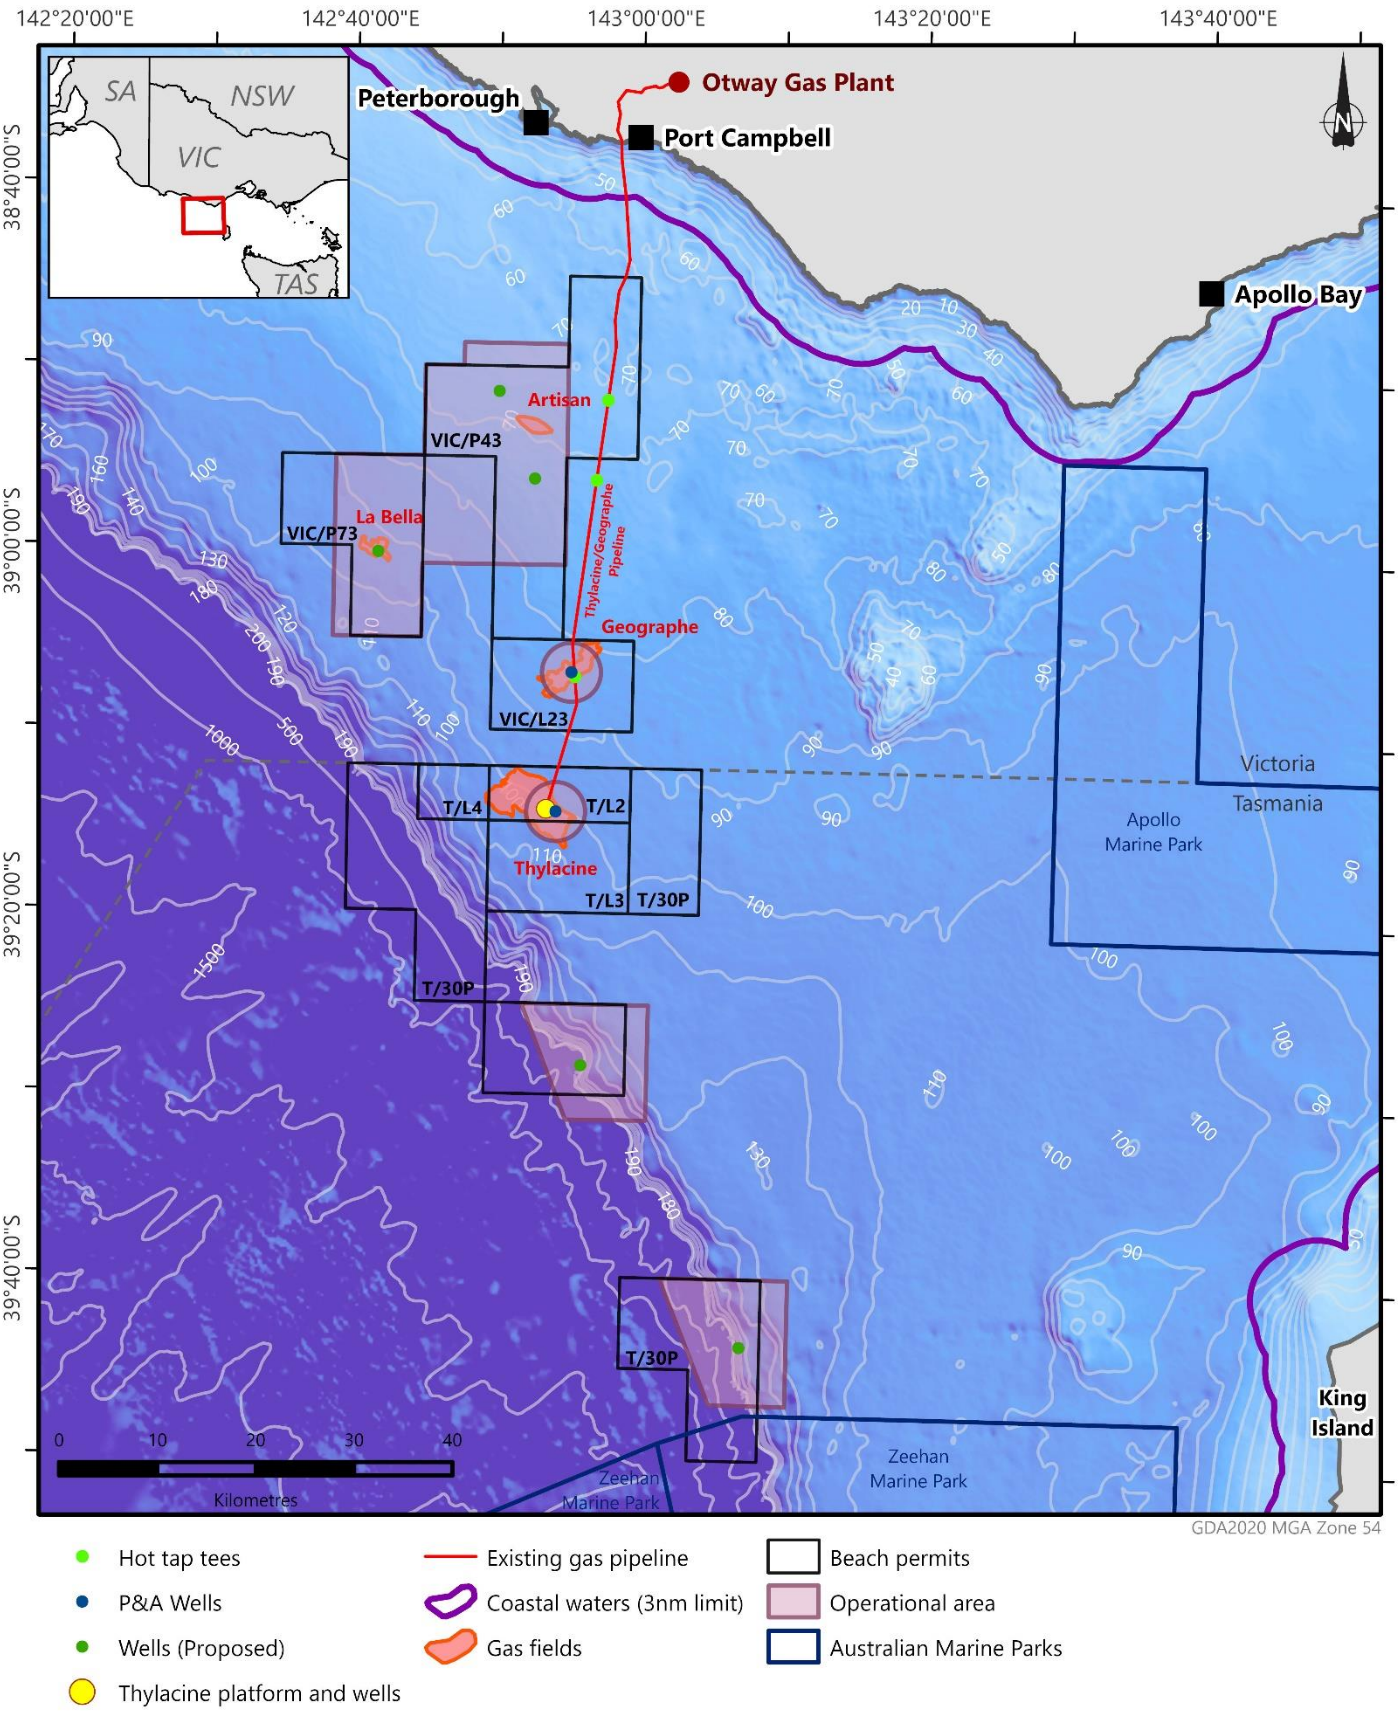
Drilling wells

- **Up to five exploration, appraisal or production wells.**
- **Activities planned for no earlier than March 2025.**

Completing wells

- Completing up to four successful wells.
- Contingent P&A of one suspended well
- Activities planned for no earlier than early 2026.

Otway Basin activity location map



11/09/2024

This map is provided as a general reference only and is not intended to be used for any other purpose.
No warranty is provided in relation to the accuracy of the information contained in this map.

OT24-0028_R3

Project timing

Preliminary activities would start from November 2024 with seabed assessments to determine suitable drilling and infrastructure locations. Subject to internal and external approvals, P&A of suspended legacy wells and drilling of new wells would commence from March 2025 and may continue up to January 2026.

Each well would take between 30 to 40 days to drill depending on whether the well is viable and will be developed for production. Each P&A well would take approximately 15 to 20 days.

The timing of activities will be subject to final approvals, the availability of the drilling rig after it completes programs of works for other companies and weather conditions. Beach will provide a detailed activity schedule prior to commencement.

Project locations

The OGV Project includes both the Otway and Bass offshore basins. In the Otway Basin two legacy wells would be P&A and up to five wells would be drilled. In the Bass Basin three legacy wells would be P&A. At this stage (and for purpose of the Environment Plan) no exploration or appraisal drilling is planned in the Bass Basin. All new wells will be within existing permits and the indicative well locations are shown in the map on page 2.

Environment protection regulations

The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA), regulates activities in accordance with *the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations (2023)* (Environment Regulations). The OGV Project will require Environment Plans (EPs) to be accepted by NOPSEMA before commencement of activities. EPs will be prepared for different activity phases, including one EP covering drilling and P&A activities.

EPs must include a description of the existing environment, the proposed activities, an evaluation of the impacts and risks, environmental performance outcomes and controls, implementation strategy, and reporting requirements. They must also demonstrate that consultations with relevant persons whose functions, interests or activities may be affected by the activities in the EP ('relevant persons'), have been carried out in accordance with the regulations.

For successful gas wells that would be developed for production, an Offshore Project Proposal (OPP) will be required and will undergo a public consultation phase. Once an OPP is accepted, further EPs will be required for construction activities and commissioning the new wells.

Environment description

EPs will include a detailed description of the existing environment in the immediate operational area and in the broader emergency planning area where there is a variety of marine fauna, including the presence of:

- Blue, humpback and fin whales, particularly during the summer months.
- Southern right and minke whales, particularly during the winter months.
- Common dolphins and shark species throughout the year.
- New Zealand and Australian fur seals throughout the year.
- Migratory birds.

There will be no drilling within marine parks. However, within the broader emergency planning area, there are National Marine Parks and State Marine Protected areas (see map).

Socio-economic and cultural values and sensitivities within the activity and emergency planning areas include:

- Commonwealth managed fisheries, including southern and eastern scalefish and shark, and southern squid jig fishery.
- Victorian managed fisheries, including rock lobster and giant crab.
- Commercial shipping activity.
- Sea Country cultural values and sensitivities held by First Nation peoples.
- Shipwrecks, primarily in close shoreline proximity.
- Recreational fishing.
- Recreational diving focussed on shipwrecks and reefs close to the shoreline.
- Signficant tourism features and activities associated with the Great Ocean Road, Twelve Apostles and Bay of Islands Coastal Park.

Impacts, performance outcomes and controls

Beach recognises the environmental, cultural, heritage, social and economic values in our activity and planning areas.

We have a proud track record for safety and environmental performance, adhering to performance measures set out in EPs and Safety Cases accepted by regulators.

EPs will detail potential impacts on the environment, and provide performance outcomes and standards, and control measures to reduce and manage environmental impacts and potential risks to ALARP and acceptable levels, and follows the principles of ecologically sustainable development. ALARP stands for 'As Low As Reasonably Practicable'. It is an assessment principle commonly used in the oil and gas industry to assess and reduce potential impacts and risks that cannot be eliminated. For information on how NOPSEMA assesses ALARP see: ALARP Guidance Note (nopsema.gov.au).

A summary of the key impacts, mitigations and management plans can be found here.

Marine mammal protection

EPs will set out detailed control measures that are consistent with marine mammal management plans that have been produced by the Federal Government under the *Environment Protection and Biodiversity Conservation (EPBC) Regulations (2000)*.

These control measures are based on the avoidance of collision or entanglement of marine mammals, reducing vessel speeds, and minimising any anchor lines. The control measures also focus on the reduction of marine noise from vessel and drilling rig activities, so any noise produced does not impact the behaviour of a protected marine mammal.

Dedicated Marine Mammal Observers will be deployed on vessels to advise vessel captains and the drilling rig of protected marine mammals near our activities.

All whale sightings will be recorded along with the actions taken to avoid potential impacts.

Commercial fishing control measures

The project activities would occur among commercial Commonwealth and State fisheries, which cover vast areas. The drilling activities require access to relatively small areas for short periods of time as described in the Project Timing section. EPs will set out detailed assessment of fisheries and fishing activity that may overlap the project activities.

Beach will consult with commercial fishers on arrangements to ensure each other's operational plans are understood, helping to minimise any impacts to fishing activities and to the OGV Project.

Beach will provide regular updates on its operations to fishing associations throughout the duration of the activities.

Beach has a *Fair Ocean Access* procedure, which sets out Beach's commitment to consultation, minimising impacts of its activities, the circumstances in which a fisher may claim compensation, the evidence required and the claim process.

Recognising cultural values and sensitivities

The project operations would occur in the Sea Country adjacent to coastal First Nations groups including: Eastern Maar Aboriginal Corporation; Gunditj Mirring Traditional Owner Corporation; Wadawurrung Traditional Owners Corporation; Bunurong Land Council Aboriginal Corporation; Gunaikurnai Aboriginal Land Council Tasmania; Flinders Island Aboriginal Association; and Tasmanian Aboriginal Centre.

Beach is consulting with these groups to identify cultural values of Sea Country so that they can be assessed for any potential impacts and control measures that may be required in the preparation of the drilling EP (and other EPs).

In addition to cultural values identified through consultation, Beach has engaged a suitably qualified maritime archaeologist who will assess data gathered in the seabed assessment surveys. For any identified cultural landscape values and sensitivities within the activity area an underwater cultural landscape management plan will be developed.

Operating safely

At Beach, safety takes precedence in everything we do. The drilling rig would have a dedicated Safety Case that requires approval from NOPSEMA. Marine vessels and the drilling rig contracted by Beach will operate in accordance with Australian Maritime Standards, regulated by the Australian Maritime Safety Authority (AMSA). This includes adherence to the following protocols at sea:

- Notifications to the Australian Hydrographic Office before mobilising to the operational area, moving to different drilling locations, and when demobilising.
- Communication with other vessels and marine users will occur using standard maritime protocols.
- Safe operating distances will be maintained around all vessels and the drilling rig at all times.
- Compliance to Navigational Safety requirements, including lighting and Automatic Identification System.

Exclusion zones

When the drilling rig is on a well location, all vessels are required to be abide by a 3 km radius cautionary zone around the drilling rig. The cautionary zone is to allow for anchors, mooring chains, and wire to be placed within the operational area during the drilling program. Exact locations of mooring chains and anchors would be made available before the start of drilling each well.

There will also be a Petroleum Safety Zone (PSZ) of 500 m around the drilling rig during operations and for each well before and after drilling. Beach will communicate new PSZs created for wells and equipment to marine users as part of its ongoing consultation. PSZs are administered by NOPSEMA under Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act). PSZs extend for a radius of up to 500 m and are gazetted around wells, structures, and equipment.

Entry into PSZs is prohibited to all except those vessels authorised to do so by NOPSEMA (as detailed in the gazetted notice) or exempt under Section 615 of the OPGGS Act. PSZs are shown as a 'Restricted Area' on navigation charts.

Emergency planning

When conducting any offshore activity, there is an extremely unlikely risk of release of hydrocarbon (which is primarily gas) from a well during drilling or from marine vessel fuel in the event of an accident.

Beach standard operating procedures include emergency response plans, which are included in EPs. Preparing emergency response plans involves modelling of all possible hydrocarbon releases in the local area using a worst-case scenario, assuming no control measures are in place. The modelling calculates the transport, spreading, entrainment and evaporation over time, using data on the prevailing metocean conditions (wind, wave, and climate), the volume released, and the physical and chemical properties of the hydrocarbons.

The modelling determines the full extent of the ‘Environment that may be affected’ known as the EMBA. EPs must describe the EMBA (see map) and include an assessment of the likelihood and consequences of any hydrocarbon release, which must be reduced to ALARP through a range of control measures and include detailed response plans.

An emergency response plan describes the arrangements that must be in place for responding to and monitoring any release of hydrocarbon and include:

- 24/7 on-call team for rapid response clean-up actions, including mobilisation of personnel and equipment.
- 24/7 on-call team for modelling and monitoring of a hydrocarbon release to inform response activities, and monitoring of effectiveness of response activities.
- Control measures necessary for ensuring rapid response and maintenance of capabilities (personnel and equipment).

These arrangements are based on the worst-case event associated with the proposed activities to ensure that Beach has the appropriate level of response arrangements and capability.

Beach maintains a current contract with Australian Marine Oil Spill Centre (AMOSC) based in Geelong for access to spill response resources and personnel. In Victoria, the Department of Transport is the control agency for marine pollution emergencies. Beach also conducts exercises to test the emergency response plans and identify any issues and improvements before, and during, operations.

For more information on hydrocarbon release modelling and why it is required for the preparation of EPs, click here to watch a video on the NOPSEMA website.

Transocean Equinox Semi-submersible drill rig

Offshore drilling approach

Depending on the size and geological structure of hydrocarbon reservoirs, the sequence of drilling often involves:

1. an exploration well into a prospective hydrocarbon reservoir identified in a previous seismic survey.
2. an appraisal well to establish the size of the reservoir.

then completing a well to become a production well that would be tied back to a platform and/or pipeline.

Beach’s program of work would be optimised in well design and equipment so that exploration and appraisal wells would be drilled to the same specifications as a production well. By taking this approach, if the wells are assessed as viable for production, at the end of drilling they would be completed ready for connection. If they are assessed as unviable, they would immediately undergo the formal P&A process.

This approach will reduce the number of drilling activities and the time taken to explore, appraise and convert a well through to production, thereby also reducing environmental impacts from the activities.

Key steps in the drilling program

The approach to drilling is summarised in the following key steps *(see diagram over page)*.

- Using an approved shipping route specialist anchor handling vessels (AHSVs) will manoeuvre the drilling rig into place.
- Mooring equipment will be pre-laid by the AHSVs and the rig will be connected at sites determined as suitable by the seabed assessments.
- Conductor and surface hole sections will be drilled and cased, then a marine riser and Blow-out Preventer (BOP) installed.
- The well would then be drilled to reach the gas reservoir beneath the seabed.
- The rig would be moved from one well to the next, repeating the anchoring and drilling process.

Drilling methodology

Beach would use the Transocean Equinox, which is a modern semi-submersible drilling rig designed for harsh weather and sea conditions. It can operate in waters up to 500 m deep, drill for gas at up to 8,500 m deep and accommodate 130 crew.

This type of drilling rig is commonly used for operations on the Norwegian Continental Shelf. Its design incorporates the latest technologies that mechanise hazardous operations enhancing the safety of personnel, improves fuel efficiency and utilises emissions reduction and monitoring systems.

The rig is equipped with a marine riser and Blow Out Preventer (BOP) which is a highly specialised valve unit weighing approximately 244 tonnes and measuring 14 m high. A BOP is used in all drilling operations however the offshore rig BOP is more robust with 100% duplication of functionality.

The BOP is used to shut-in and seal off a well in the event of an unplanned pressure build up or ‘kick’. Beach engineers use a rigorous process for the design of construction and operation of wells which, when combined with the rig contractor procedures and BOP equipment, ensures:

- well integrity throughout the drilling process and, in the case of production wells throughout the well lifecycle.
- ongoing personnel safety.
- prevention of any environmental incidents.

The drilling process would run over several stages starting with a top-hole section of approximately 91 centimetres in diameter, then reducing in diameter to consecutively smaller sizes until the well reaches the final target depth. For each section, a casing (steel pipe) would be placed in the hole and cemented in place, then a smaller drill bit would be run through the casing to drill a smaller hole to the next target depth and the process repeated to reach the final depth. This is usually several kilometres below the seabed.

Drilling muds

Beach OGV Project drilling operations would use only water-based fluids called ‘muds’ to lubricate and stabilise the wellbores in each section and remove drilling cuttings. Drill cuttings are rock chips from the sedimentary layers that emerge from the drilling process and would range from very fine to coarse in size.

Water based muds are recycled as much as possible during the drilling process. The cuttings would be processed on the drilling rig before they are discharged overboard, where they will settle rapidly on the seafloor around the well site. This is standard industry practice in Australia.

Marine mammals and fish may transit through these areas but will usually avoid the temporary disturbance. Any exposure to suspended sediment before it settles on the seabed will be highly localised and temporary due to high dilution and fast dispersal in the water column.

Production well connections

When the production wells have been completed, they would be connected to seabed infrastructure and the existing offshore to onshore pipeline.

Some seabed infrastructure for tying in the new wells is already in place and connected to the existing pipelines.

Additional infrastructure for any new production wells would also be installed to tie-in to the existing pipeline.

New infrastructure would typically include:

- Diving Integration Skid, which is a module that is installed on the seabed by divers from a dive support vessel and connected to an existing pipeline connection (hot tap) or offshore platform, ready for later connection of flowlines from the wells.
- Flowlines and various subsea connection modules to connect the production wells to the existing platform and pipeline.
- Electrical and hydraulic controls within cables that enable remote monitoring and control of the production wells.
- Concrete mattresses will be installed over the flowlines and/or umbilicals for stabilisation and protection as required.

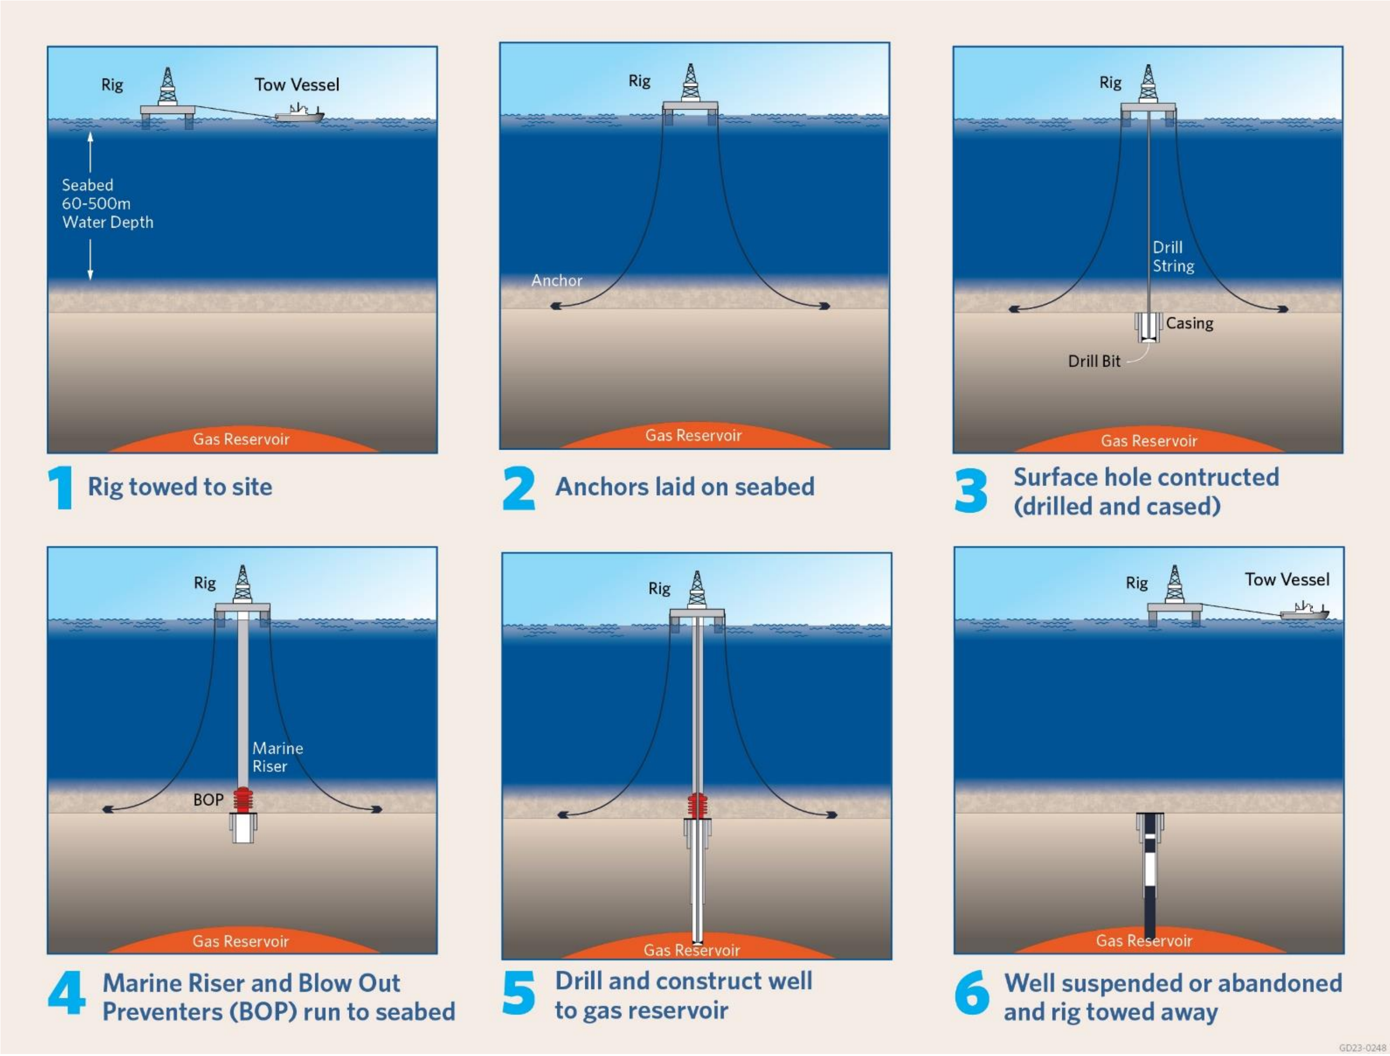
A construction support vessel using an ROV would install the equipment and commission the production wells after they are connected.

Plug and abandonment process

If a well is commercially unviable, and for the removal of existing suspended wells, a formal plug and abandonment process would be carried out. Beach engineers design the well abandonment in compliance with the Norwegian Norsok and Oil and Gas UK standards industry best practice and guidelines, for example the Oil and Energy UK (OEUK) guidelines; standards that are recognised by NOPSEMA as current industry best.

Multiple cement plugs would be installed within the well to permanently seal the well and isolate any productive or water bearing formations reservoirs or hydrocarbon bearing zones.

An additional cement plug would be installed at the seabed and all casings will be cut and recovered from at least 2 m below the mudline to ensure that the seabed is returned to the same condition as it was prior to drilling operations commencing.



1 Rig towed to site

2 Anchors laid on seabed

3 Surface hole contructed (drilled and cased)

4 Marine Riser and Blow Out Preventers (BOP) run to seabed

5 Drill and construct well to gas reservoir

6 Well suspended or abandoned and rig towed away

Consultation with Relevant Persons

Purpose of consultation

Consultation with Relevant Persons is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted because of the consultations.

Beach Energy is providing - and will continue to provide - a range of consultation methods and opportunities including an online consultation hub (Engage Beach) where you can ask questions, as well as information sessions, online webinars, phone calls, emails and meetings. Please contact us if you would like to discuss your preferred approach to consultation.

Relevant Persons

A 'Relevant Person' is defined in the Regulations as including a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under an EP.

Please contact us if you would like to discuss your functions, interest or activities in relation to the activities proposed under the Well Completions & Interventions EP.

If you know of any person or organisation who you believe may be a Relevant Person, please pass on our contact details to them.

Sufficient information

The Regulations also require that Relevant Persons must be provided sufficient information to allow them to make an informed assessment of the possible consequences of the EP activity on their functions, interests or activities.

At the online engagement hub Engage Beach you will find information prepared in a variety of styles including short summaries; long descriptions; diagrams; maps; questions and answer formats; and detailed information on a range of topics related to the activities.

Please contact us if you would like to discuss information you are seeking in relation to EP activities.

Reasonable period

The Regulations also require that titleholders allow Relevant Persons a reasonable period of time for consultation. What is a reasonable period for consultation will depend on the nature of an activity, the potential impacts and risks on a relevant person's functions, interest or activities, and is considered on a case-by-case basis.

Sensitive information

In accordance with regulations, each EP must include a report on all consultations and a copy of the full text of any response by a Relevant Person.

Relevant Persons may request that the information they provide not be published, and it will be identified as sensitive information and not published in the Environment Plans.

NOPSEMA consultation brochure

For further information regarding consultation, please see NOSPEMA's Brochure titled 'Consultation on offshore petroleum environment plans', found here.

Contact us

Please contact us if you would like further information, have any questions, or feedback, or wish to consult with us about how the activities in the Drilling Program EP may impact your functions, interests or activities.

Beach will take into consideration all feedback, including any concerns or objections and will explore measures to reduce any impacts and risks.

Phone: 1800 797 011

Email: community@beachenergy.com.au

Offshore Gas Victoria Project

Well Completions, Well Interventions and Plugging and Abandonment EP

Information Sheet | 16 September 2024

On 16 September 2024, Beach commenced consultation in the course of preparing the Well Completions, Well Interventions and Plugging and Abandonment Activities Environment Plan (**Well Completions and Interventions EP**). This information sheet has been prepared to provide information on the proposed activities under the Well Completions and Interventions EP for the purpose of consultation with relevant persons, in accordance with the regulatory regime.

Project overview

Through production at the Otway Gas Plant near Port Campbell and the Lang Lang Gas Plant, 80 kms south-east of Melbourne CBD, Beach Energy (**Beach**) supplies natural gas to the east coast market, which delivers energy to Victorian homes, business and industry.

Beach safely drilled one exploration well and six production wells in its Otway Basin offshore Commonwealth permits from February 2021 to July 2022. Four production wells from that project have been connected and are now producing gas for the east coast market, with two remaining wells planned for connection in late 2024.

Beach is continuing its commitment to supply natural gas to the east coast gas market and, in June 2023, commenced consultation on Offshore Gas Victoria (**OGV**) Project activities in the course of preparing Environment Plans and an Offshore Project Proposal. OGV consists of a number of activities that would occur in several phases (below) subject to approvals.

Following seabed assessments and drilling phases (including the planned plugging and abandonment (**P&A**) of legacy suspended wells and the drilling of exploration or appraisal wells) the next phase* of activities would include well completions, well interventions, and one potential additional P&A activity. These are summarised in the diagram below.

Seabed assessments

- Assessment of suitable location for drilling rig and new seabed infrastructure to connect wells.
- Activities planned for no earlier than November 2024.

Removing wells (P&A)

- Removal of five legacy suspended wells through a formal procedure (P&A).
- Activities planned for no earlier than March 2025.

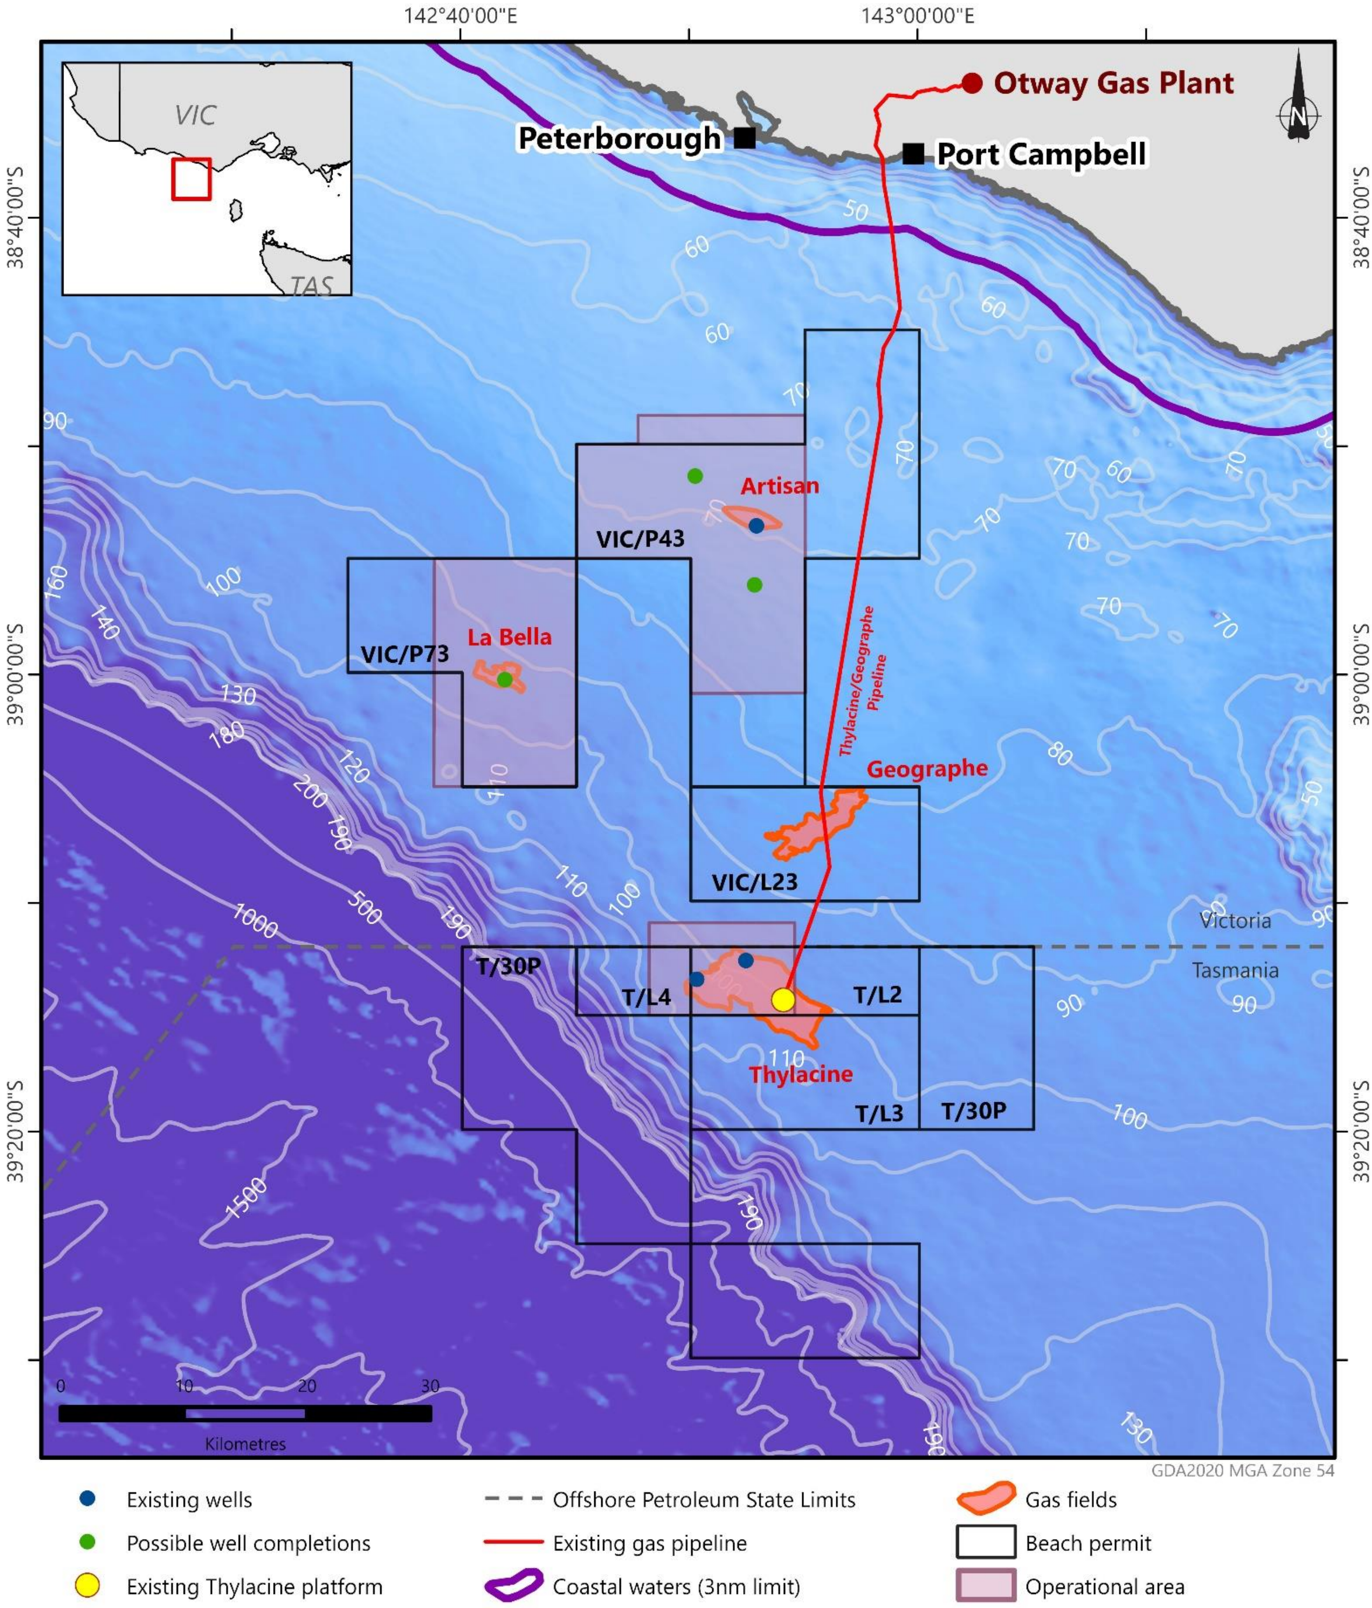
Drilling wells

- Up to five exploration, appraisal or production wells.
- Activities planned for no earlier than March 2025.

***Completing wells**

- **Completing up to four successful wells.**
- **Contingent P&A of one suspended well**
- **Activities planned for no earlier than early 2026.**

Location map



12/09/2024

This map is provided as a general reference only and is not intended to be used for any other purpose.
No warranty is provided in relation to the accuracy of the information contained in this map.

OT24-0028A_R3

Activity timings

The Well Completions and Interventions EP activities are expected to be undertaken between 1 January and 31 December 2026, and would take approximately 145 days to complete, including:

- 25 days per well for the installation of subsea equipment and well completions activities
- 15 days per well for intervention activities
- 15 days for contingency P&A activities at one location.

All timings are approximate and will be subject to final approvals, the availability of the drilling rig after it completes programs of works for other companies, weather conditions and prior drilling results.

Beach will provide a detailed schedule of times, locations and activities prior to the commencement of the relevant activities.

Activity locations

The activities would be carried out in the Otway Basin in offshore Commonwealth waters, approximately 20 km south of Victoria's mainland and 90 km north-west of Tasmania (King Island) at its closest points, in water depths ranging from 65 m to 190 m. All activities would be within existing Beach permits, the locations of which are shown in the maps on page two of this information sheet.

Seabed assessment activities will occur prior to drilling wells to ensure precise locations for the operation of the drill rig and, ultimately, the wells that will be drilled. Should the location of wells be modified after the seabed assessment activities have been completed (see details here), Beach will advise all Relevant Persons and provide an updated map.

Well completions activities

Well completion is the process of preparing a well for production after it has been successfully drilled. It involves installing production and flow control equipment within the wellbore on the seabed and completing the final construction of the well. Each well will have a wellhead that supports the production well casing. Completions operations are conducted with well control equipment called a blow-out preventer (**BOP**) and a subsea production tree (**subsea tree**) placed on the seabed at or near the site of the well.

The BOP is a highly specialised series of valves used in all offshore drilling, weighing approximately 244 tonnes and measuring 14 m high. The BOP is used to shut-in and seal off a well for planned operations such as pressure testing and in the event of a pressure build up. It ensures well integrity throughout the drilling and completion process, ongoing safety of personnel and prevention of any environmental incidents.

Well completion activities may be undertaken for up to four wells and (for each well) includes:

- installing the subsea tree
- preparing the wellbore for lower and upper completion installation
- installing the completion equipment
- perforating the production casing
- flowing the well back to surface facilities for clean-up.

The subsea tree is a set of valves and fittings installed directly on top of the wellhead that:

- controls the flow of fluids from the well to subsea production facilities and flowlines
- controls chemical injections
- monitors production
- regulates flow rates with hydraulic valves and chokes.

Well flowback and clean-up will be performed on each well that is to be completed. The flowback fluid is expected to consist of (in order of arrival at the rig-based well test package):

- low density fluid
- completion brine
- drilling fluid filtrate
- reservoir fluids (including hydrocarbon gas, condensate, formation and condensed water)

Depending on the hydrocarbon reservoir and well construction process, there could also be minimal levels of solids such as sand/rock/debris remaining from the drilling process.

Reservoir fluids recovered during well clean-up will be directed to a rig-based well test package where the fluids will be separated, measured and either flared (hydrocarbons) or treated for overboard discharge (non-hydrocarbons) or disposal onshore.

Well intervention activities

Well interventions are carried out to improve the performance of a well that has not been operating to its potential or requires modification or maintenance. Intervention activities would be carried out to:

- allow additional sub-seabed surface geological zones to produce
- close off zones that are no longer required
- repair or replace downhole completion equipment.

Intervention activities will occur at up to two existing well locations located in petroleum title T/L2 (see location map on page two). The activities would include:

- positioning the drilling rig over the existing well and connecting to pre-laid mooring lines and anchors
- installing the BOP
- installing intervention pressure control equipment and de-suspending the well
- accessing a zone of interest and isolating (and potentially reopening) the applicable production zone
- re-suspending the well
- recovering the BOP
- (at the conclusion of the well intervention activities described above) releasing the drilling rig from the mooring spread and leaving the location.

Plugging & abandonment activities

The P&A process is used to:

- close exploration wells that are assessed as unsuccessful immediate after drilling
- decommission operational wells that are no longer commercially viable, or
- remove suspended wells.

Under the Well Completions and Interventions EP, P&A activities might be undertaken at one suspended well that was drilled and suspended in a previous project. This decision has not yet been made by Beach. If undertaken, P&A activities would include installation of multiple cement plugs within the well to permanently seal the well. An additional cement plug would be installed at the seabed and all well casings would be cut and recovered from at least 2 m below the seabed/mudline.

Environment protection regulations

NOPSEMA regulates activities in accordance with the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (**Regulations**)[1]. The OGV Project requires Environment Plans (**EPs**) to be accepted by NOPSEMA before beginning activities. EPs will typically be prepared for different activity phases; in the present case, Beach is preparing one single EP covering the well completions, well interventions, and P&A activities described in this information sheet.

EPs must include:

- a description of the existing environment
- the proposed activities
- an evaluation of the impacts and risks, environmental performance outcomes and controls, implementation strategy, and reporting requirements.

EPs must also demonstrate that consultations with relevant persons whose functions, interests or activities may be affected by the activities in the EP (**relevant**

---

[1] Under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth).

persons), have been carried out in accordance with the Regulations.

For successfully drilled gas wells within the OGV Project that will be developed for production, an Offshore Project Proposal (**OPP**) is required. Beach has developed an OPP for the OGV Project, completed the Public Comment Period for the OPP and it is currently under assessment by NOPSEMA.

Environment description

EPs include a detailed description of the Environment that May Be Affected (**EMBA**) by the activities described in the EP. The EMBA is the largest geographic area where operational activities could potentially have a direct or indirect environmental impact under worst-case scenarios.

The EMBA includes both the **operational area** for activities and a **planning area** where emergency response plans must be ready for activation in the unlikely event of an accident. The EMBA map can be found on page seven.

EMBAs are also used to define the broadest area where environmental values and sensitivities are defined, the potential impacts assessed, and control measures to mitigate these impacts are developed.

The defined EMBA for the Well Completions and Interventions EP include the following marine fauna which may be present in the area at various times during the activities described in the EP:

- Blue, humpback and fin whales, particularly during the summer months
- Southern right and minke whales, particularly during the winter months
- Common dolphins and shark species throughout the year
- New Zealand and Australian fur seals throughout the year
- Migratory birds.

Importantly, Beach will not be conducting regulatory activities within marine parks. However, within the broader planning area for emergencies, there are National Marine Parks and State Marine Protected areas (see map).

Socio-economic and cultural values and sensitivities within the EMBA include:

- Commonwealth managed fisheries, including southern and eastern scalefish and shark, Bass Strait zone scallop fishery and southern squid jig fishery
- Victorian, South Australian and Tasmanian managed fisheries, including rock lobster and giant crab
- Commercial shipping activity
- Offshore Wind Industry
- Subsea cables
- Sea Country cultural values and sensitivities held by First Nation peoples
- Shipwrecks, primarily in close shoreline proximity
- Recreational fishing
- Recreational diving focussed on shipwrecks and reefs close to the shoreline
- Significant tourism features and activities associated with the Great Ocean Road, Twelve Apostles and Bay of Islands Coastal Park.

Impacts, performance outcomes and controls

Beach recognises the environmental, cultural, heritage, social and economic values in our operational areas and planning areas.

Beach has a proud track record of successful safety and environmental performance, adhering to performance measures set out in EPs and Safety Cases accepted by regulators.

The Well Completions and Interventions EP will detail potential impacts on the environment, and provide performance outcomes and standards, and control measures to reduce and manage environmental impacts and potential risks to ‘As Low As Reasonably Practicable,’ known as ALARP, and acceptable levels. They follow the principles of ecologically sustainable development. ALARP is an assessment principle commonly used in the oil and gas industry to assess and reduce potential impacts and risks that cannot be eliminated. For information on how NOPSEMA assesses ALARP see: ALARP Guidance Note.

A summary of the key impacts, mitigations and management plans can be found here.

Marine mammal protection

The Well Completions and Interventions EP will set out detailed control measures that are consistent with marine mammal management plans that have been produced by the Federal Government under the *Environment Protection and Biodiversity Conservation Regulations 2000* (Cth)[2].

These control measures are based on the avoidance of collision or entanglement of marine mammals, reducing vessel speeds, and minimising length and number of anchor lines. The control measures also focus on the reduction of marine noise from vessel and drilling rig activities, so that any noise produced is managed such that biologically important behaviours can continue while the activity is being undertaken.

Dedicated Marine Mammal Observers will be deployed on vessels to advise vessel captains and the drilling rig operator of protected marine mammals near Beach's activities. All whale sightings will be recorded along with the actions taken to avoid potential impacts.

Commercial fishing control measures

The Well Completions and Interventions EP activities will occur among commercial Commonwealth and State fisheries zones that cover vast areas. Beach's activities will require access to relatively small areas within these fishing zones, and then only for short periods of time. The Well Completions and Interventions EP will set out detailed assessment of fisheries and fishing activity that may overlap with the project activities.

Beach will consult with commercial fishers on arrangements to ensure each other's operational plans are understood, helping to minimise any impacts to fishing activities and to the EP activities.

Beach will provide regular updates on its operations to fishing associations throughout the duration of the activities.

Beach has a *Fair Ocean Access* procedure that sets out Beach's commitment to consultation, minimising impacts of its activities, the circumstances when a fisher may claim compensation, the evidence required and the claim process.

Exclusion zones

When the drilling rig is on a well location, all vessels are required to be abide by a 3 km radius cautionary zone around the rig. The cautionary zone is to allow for anchors, mooring chains, and wires to be placed within the operational area during the well completions, well interventions and P&A program. Exact locations of mooring chains and anchors will be made available before the start of activities at each well.

There will also be a Petroleum Safety Zone (**PSZ**) of 500 m around the drilling rig during operations and for each well before and after activities. Beach will communicate new PSZs created for wells and equipment to marine users as part of its ongoing consultation. PSZs are administered by NOPSEMA under Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (**OPGGS Act**). PSZs extend for a radius of up to 500m and are gazetted around wells, structures, and equipment.

Entry into PSZs is prohibited to all except vessels authorised to do so by NOPSEMA (as detailed in the gazetted notice) or exempt under Section 615 of the OPGGS Act. PSZs are shown as a 'Restricted Area' on navigation charts.

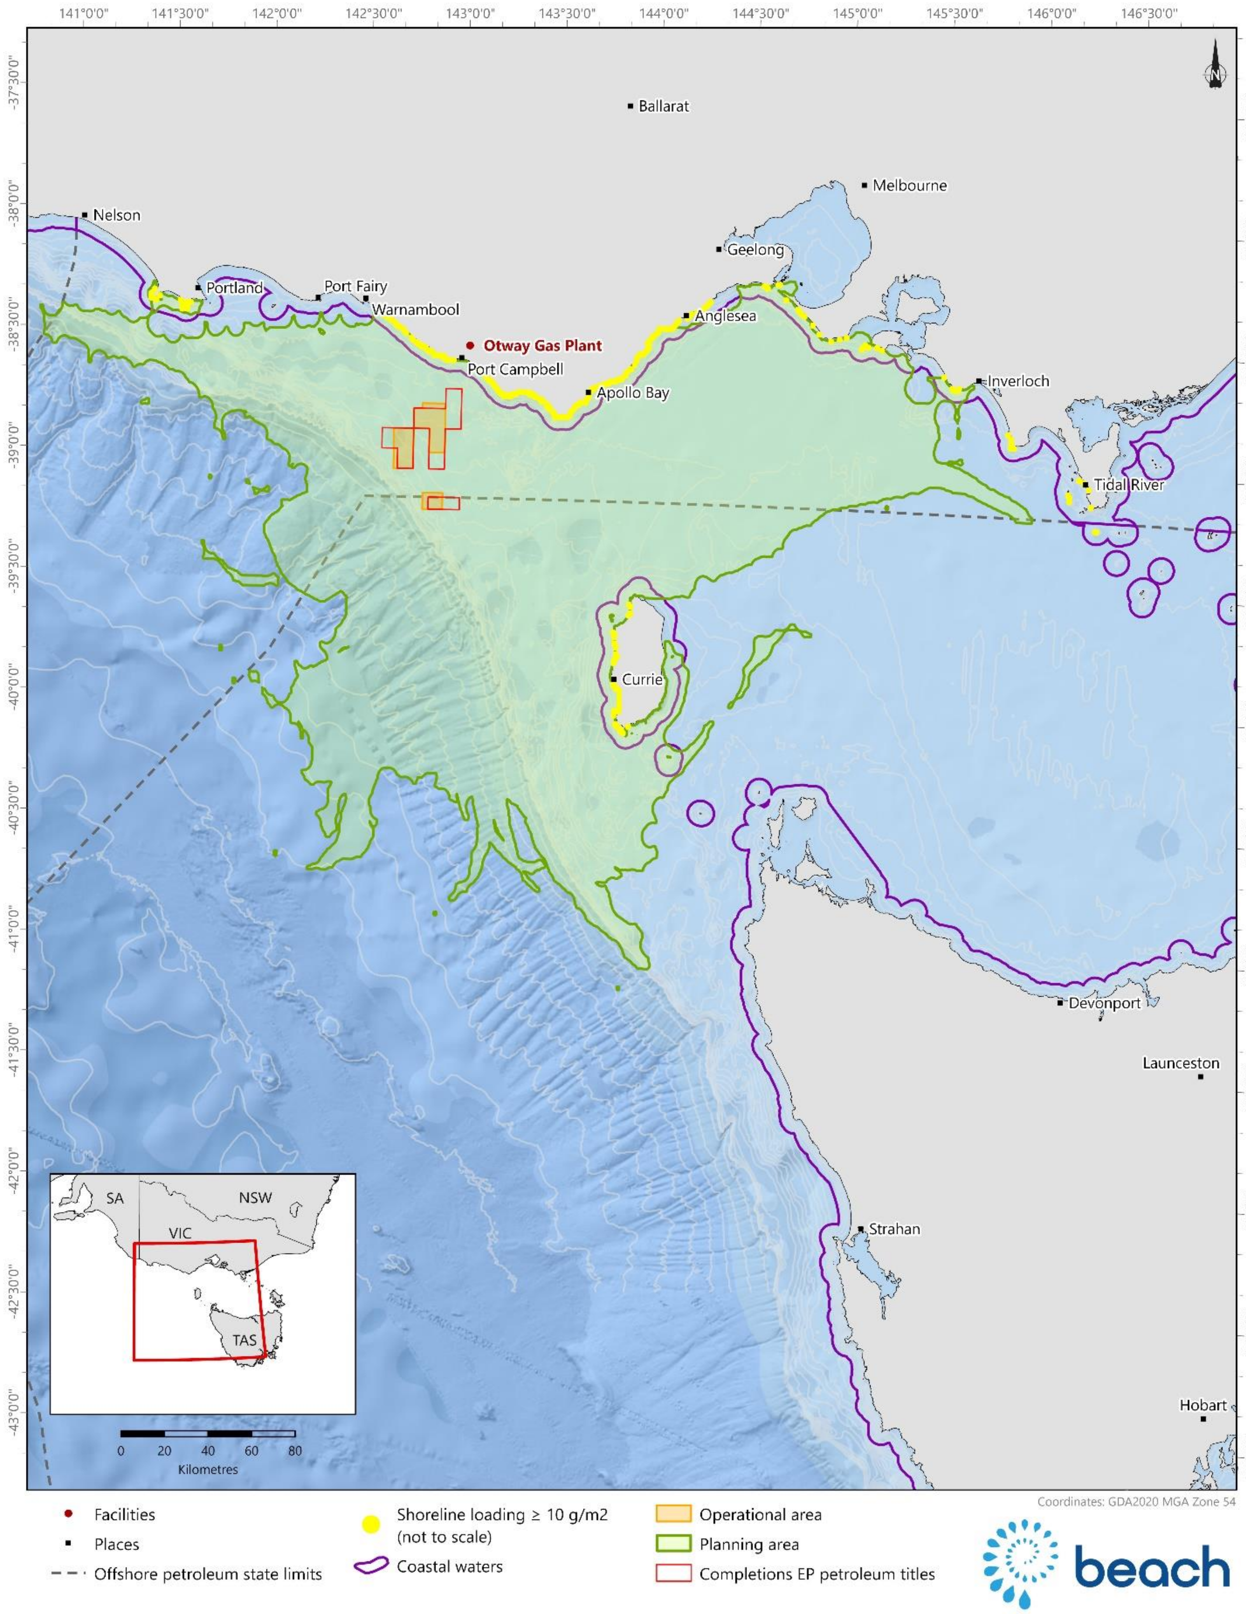
Recognising cultural values and sensitivities

Beach has identified and will consult with relevant First Nations groups to identify cultural values of Sea Country so that they can be assessed for any potential impacts and control measures that may be required in the preparation of the Well Completions and Interventions EP.

---

[2] Under the *Environment Conservation and Biodiversity Protection Act 1999* (Cth)

EMBA map



Operational area: the area within which well completions, well intervention, and plug & abandonment activities are planned to occur (subject to final approvals).

Planning area: the broadest extent of the defined 'environment that may be affected' (EMBA). Note: The EMBA is the largest geographic area where operational activities could potentially have a direct or indirect environmental impact.

Shoreline loading: where hydrocarbons may reach the shoreline in the event of an accident. The maps show the modelling of over 200 scenarios in different weather conditions and times of the year. It does not represent what would occur in the event of a single accident.

This map is provided as a general reference only and is not intended to be used for any other purpose. No warranty is provided in relation to the accuracy of the information contained in this map.

16/09/2024 | OT24-0033A

Operating safely

Safety takes precedence in every activity undertaken by Beach. The drilling rig contracted by Beach will have a dedicated Safety Case that must be accepted by NOPSEMA. Marine vessels and the drilling rig will operate in accordance with Australian Maritime Standards, regulated by the Australian Maritime Safety Authority. This includes adherence to the following protocols at sea:

- notifications to the Australian Hydrographic Office before mobilising to the operational area, moving to different well locations, and when demobilising
- communication with other vessels and marine users will occur using standard maritime protocols
- safe operating distances will always be maintained around vessels and the drilling rig
- compliance with Navigational Safety requirements, including lighting and Automatic Identification System.

Emergency planning

When conducting any offshore activity, there is an extremely unlikely risk of a hydrocarbons release from a well (which is primarily gas) during well completions, well interventions or P&A activities or from marine vessel fuel in the event of an accident.

Beach's standard operating procedures include emergency response plans, which are included in all EPs. Preparing emergency response plans involves modelling of all possible hydrocarbon releases in the local area using a worst-case scenario, assuming no control measures are in place. The modelling calculates the transport, spreading, entrainment and evaporation over time, using data on the prevailing metocean conditions (wind, wave, and climate), the volume released and the physical and chemical properties of the hydrocarbons.

The modelling determines the full extent of the EMBA. The Well Completions and Interventions EP will describe the EMBA and include an assessment of the likelihood and consequences of any hydrocarbon release, which must be reduced to ALARP through a range of control measures and include detailed response plans.

An emergency response plan describes the arrangements that must be in place for responding to and monitoring any release of hydrocarbon and include:

- 24/7 on-call team for rapid response clean-up actions, including mobilisation of personnel and equipment
- 24/7 on-call team for modelling and monitoring of a hydrocarbon release to inform response activities, and monitoring of effectiveness of response activities
- control measures necessary for ensuring rapid response and maintenance of capabilities (personnel and equipment).

These arrangements are based on the worst-case event associated with the proposed activities to ensure that Beach has the appropriate level of response arrangements and capability.

Beach maintains a current contract with Australian Marine Oil Spill Centre based in Geelong for access to spill response resources and personnel. The Victorian Department of Transport is the control agency for marine pollution emergencies. Beach also conducts exercises to test the emergency response plans and identify any issues and improvements before, and during operations.

For more information on hydrocarbon release modelling and why it is required for the preparation of EPs, click here to watch a video on the NOPSEMA website.

Consultation with Relevant Persons

Purpose of consultation

Consultation with Relevant Persons is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted because of the consultations.

Beach Energy is providing - and will continue to provide - a range of consultation methods and opportunities including an online consultation hub (Engage Beach) where you can ask questions, as well as information sessions, online webinars, phone calls, emails and meetings. Please contact us if you would like to discuss your preferred approach to consultation.

Relevant Persons

A 'Relevant Person' is defined in the Regulations as including a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under an EP.

Please contact us if you would like to discuss your functions, interest or activities in relation to the activities proposed under the Well Completions & Interventions EP.

If you know of any person or organisation who you believe may be a Relevant Person, please pass on our contact details to them.

Sufficient information

The Regulations also require that Relevant Persons must be provided sufficient information to allow them to make an informed assessment of the possible consequences of the EP activity on their functions, interests or activities.

At the online engagement hub Engage Beach you will find information prepared in a variety of styles including: short summaries; long descriptions; diagrams; maps; questions and answer formats; and detailed information on a range of topics related to the activities.

Please contact us if you would like to discuss information you are seeking in relation to EP activities.

Reasonable period

The Regulations also require that titleholders allow Relevant Persons a reasonable period of time for consultation. What is a reasonable period for consultation will depend on the nature of an activity, the potential impacts and risks on a relevant person's functions, interest or activities, and is considered on a case-by-case basis.

Sensitive information

In accordance with regulations, each EP must include a report on all consultations and a copy of the full text of any response by a Relevant Person.

Relevant Persons may request that the information they provide not be published, and it will be identified as sensitive information and not published in the Environment Plans.

NOPSEMA consultation brochure

For further information regarding consultation, please see NOSPEMA's Brochure titled 'Consultation on offshore petroleum environment plans', found here.

Contact us

Please contact us if you would like further information, have any questions, or feedback, or wish to consult with us about how the activities in the **Well Completions & Interventions EP** may impact your functions, interests or activities.

Beach will take into consideration all feedback, including any concerns or objections and will explore measures to reduce any impacts and risks.

CONTENTS

EXECUTIVE SUMMARY

This technical report presents the results of the visible line of sight and illuminance assessments for the initial drilling campaign in the Offshore Gas Victoria Project ('the Drilling Campaign') operated by Beach Energy's ('Beach'). The light modelling study was conducted for the Drilling Campaign within Beach's exploration permits – VIC/P43 and VIC/P73 located in the offshore Otway Basin. The Project Area of the Drilling Campaign is located approximately 20 km south of the Victorian mainland and 85 km north-west of Tasmania (King Island) at its closest points.

The sources of light emissions considered were the navigation lights on the derrick and the working lights on the main deck of the mobile offshore drilling unit (MODU). The light resulting from flaring from the MODU during well testing and completion was also included. A peak flare rate of 65 MMscfd was used with flaring occurring from a horizontal boom. The heights of the MODU infrastructure were assumed to be 84 m derrick height, 49 m flare location (32 m helideck height plus 17 m horizontal boom) and 21 m deck height above sea-level.

The threshold for the spatial extent of visible light (the Visible Light Exposure Area) that is predicted to occur from the Drilling Campaign was defined as whether any part of the facility is visible as a dot on the horizon (via visible line of sight assessment). The threshold for the spatial extent of a measurable change in ambient light that is predicted to occur from the Drilling Campaign (the Potential Impact Area) was defined as an illuminance equivalent to ambient light on a moonless clear night sky/new moon (<0.001 lux). The area within these thresholds is considered relevant to the impact assessment for planned light emissions from the Drilling Campaign.

The results of the visible line-of-sight assessment conclude that the MODU lights and flare will be visible from a distance of 38 km from receptors at sea level while, due to elevations on the mainland, the MODU will be visible from the Victorian mainland adjacent to the Project Area.

Illuminance assessment indicates that during flaring, a measurable change will occur up to 63 km from the expected position of the MODU and reduces to 10 km from the MODU when not flaring. At the selected receptor locations of Port Campbell National Park (19 km), Cape Otway Light Station Lookout (37 km), Warrnambool (53 km), and Currie (King Island, 102 km), the illuminance levels when flaring have been estimated to be approximately 0.0111, 0.0029, 0.0014, and 0.0004 lux respectively. These illuminance levels are comparable to the ambient light levels between a quarter moon and a new moon, except for Port Campbell National Park with a slightly higher illuminance level due to closer proximity to the Project Area of the Drilling Campaign, and Currie which is farthest away with an ambient light level between the new moon and moonless overcast night sky. When not flaring, the illuminance levels of all selected receptor locations are less than 0.001 lux, comparable to the ambient light levels less than a moonless clear night sky (new moon).

1 INTRODUCTION

1.1 Project Overview

The Offshore Gas Victoria Project ('the Project') operated by Beach Energy Limited ('Beach') focuses on exploration, appraisal and development of existing and future gas discoveries in Beach's exploration permits – VIC/P43 and VIC/P73 located in the offshore Otway Basin. The Project covers an area that is located approximately 20 km south of the Victorian mainland and 85 km north-west of Tasmania (King Island) at its closest points (Figure 1-1). The Project is adjacent to Beach's current production operations at the Geographe and Thylacine gas fields in the offshore Otway Basin.

The development concept for the Project is the subsea development. The stages of the Project will include an initial drilling campaign ('the Drilling Campaign') operated by a semi-submersible mobile offshore drilling unit (MODU). Successful wells will be tied back to existing Otway Gas Production Pipeline (OGPP) and/or Thylacine A platform via installation of new subsea flowlines and facilities. Recovered gas will be transported through the OGPP to the onshore Otway Gas Plant (OGP) located onshore near Port Campbell, Victoria. The OGP supplies gas to the domestic market in south-east Australia.

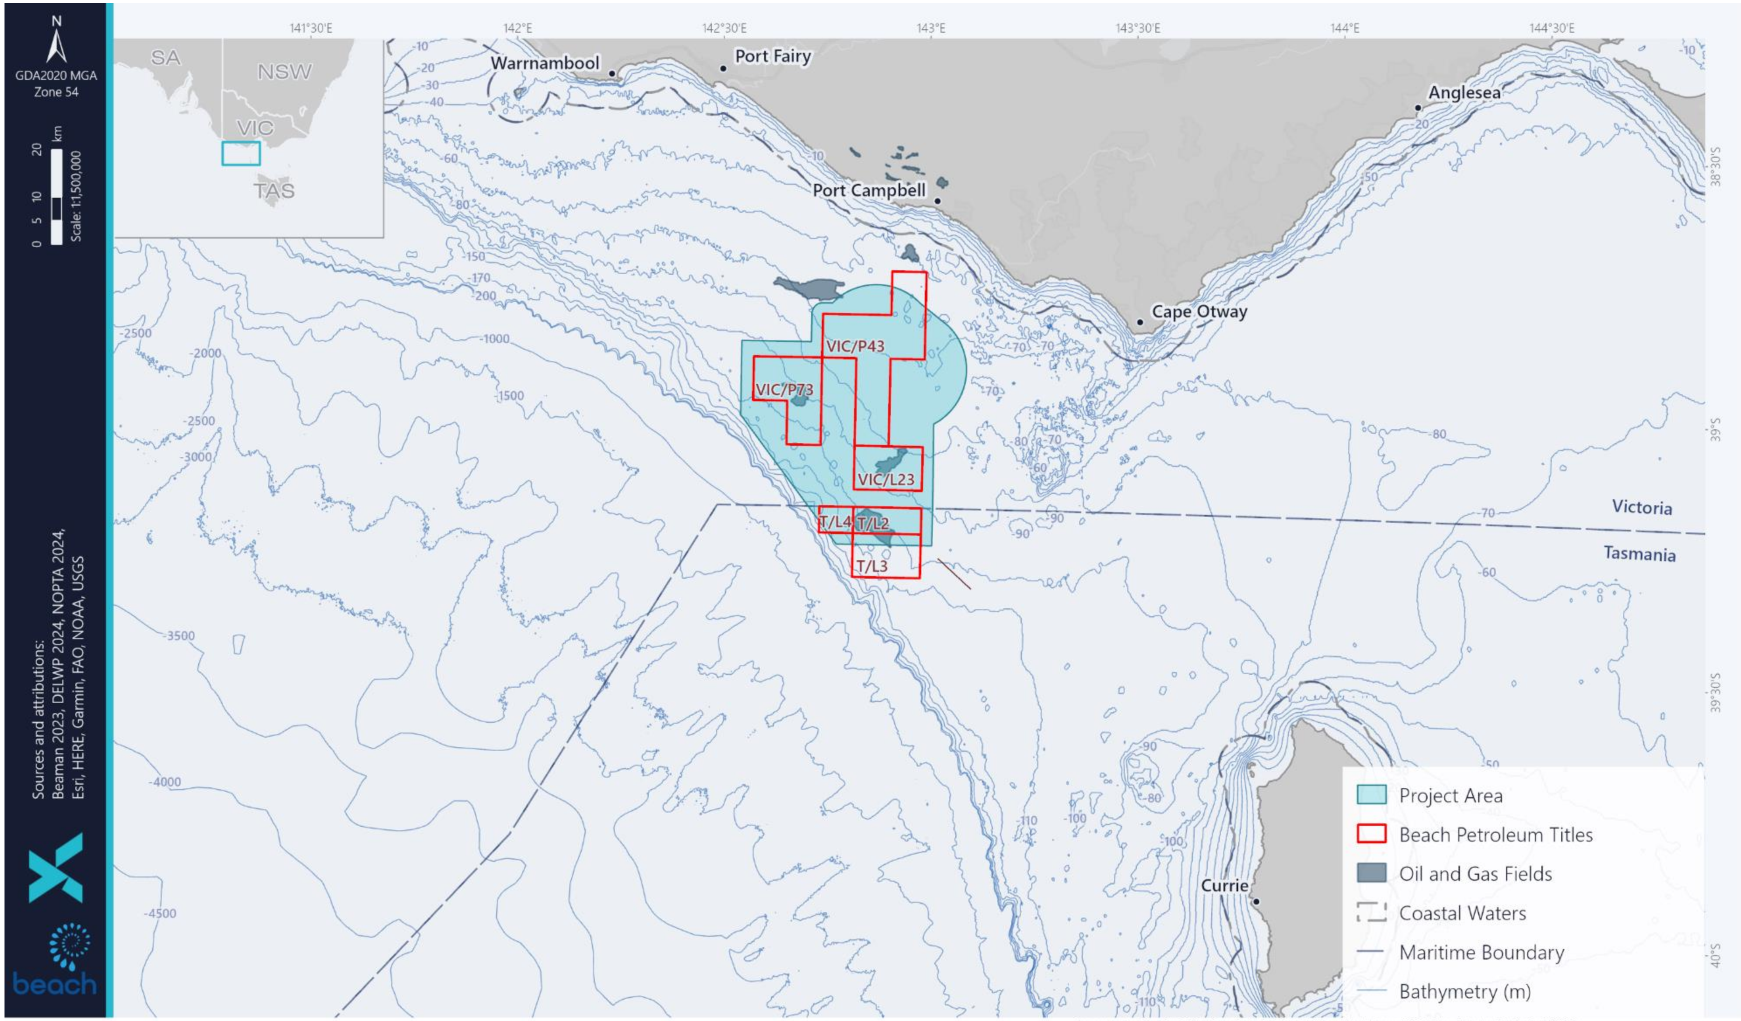

Figure 1-1: Project location.

1.2 Aim and Objectives

Beach has engaged Xodus to develop a Light Emissions study ('this study') for the Drilling Campaign to inform the Offshore Project Proposal (OPP), with the following objectives:

- Estimation of the visible line exposure area from the MODU.
- Estimation of the potential light impact area from the Drilling Campaign.
- Estimation of the illuminance level at the selected receptor locations.

1.3 Motivations and Constraint

Wildlife, particularly nocturnal species, are commonly sensitive to high-energy, short-wavelength ultraviolet (UV)/violet/blue light (Figure 1-2). There is mounting evidence that exposure to these wavelengths at night may affect human and wildlife physiological functions (DCCEEW, 2023).

Radiometric light measurements, which can detect and quantify all wavelengths from UV to infrared (IR), is a biologically relevant measure for understanding wildlife perception of light. The measurements include terms such as radiant flux, radiant intensity, irradiance and radiance. Photopic light measurements, on the other, is weighted to the sensitivity of the human eye. These measurements include terms such as illuminance and luminance. Table 1-1 shows the summary of the terms used for each measurement approach.

To date, light monitoring equipment has predominantly used photopic measurements. Although there are a few radiometric light measurement techniques available, most of them are still under experimental stage (DCCEEW, 2023). Therefore, in this study, photometric measures are used for the light emissions modelling to inform the potential impact of artificial light on wildlife. The limitation of this approach, however, should be acknowledged and considered as it may not accurately weight the blue and red wavelengths to which animals can be sensitive (DCCEEW, 2023).

Table 1-1: Typical radiometric and photometric terms.

RADIOMETRIC		PHOTOMETRIC	
Radiant power	W	**Luminous flux**	lm
Radiant intensity	W/sr	**Luminous intensity**	lm/sr (or cd)
Irradiance	W/m^2	**Illuminance**	lm/m^2 (or lux)
Radiance	W/m^{2}sr	**Luminance**	lm/m^{2}sr

W = watt; sr = steradian; lm = lumen; cd = candela

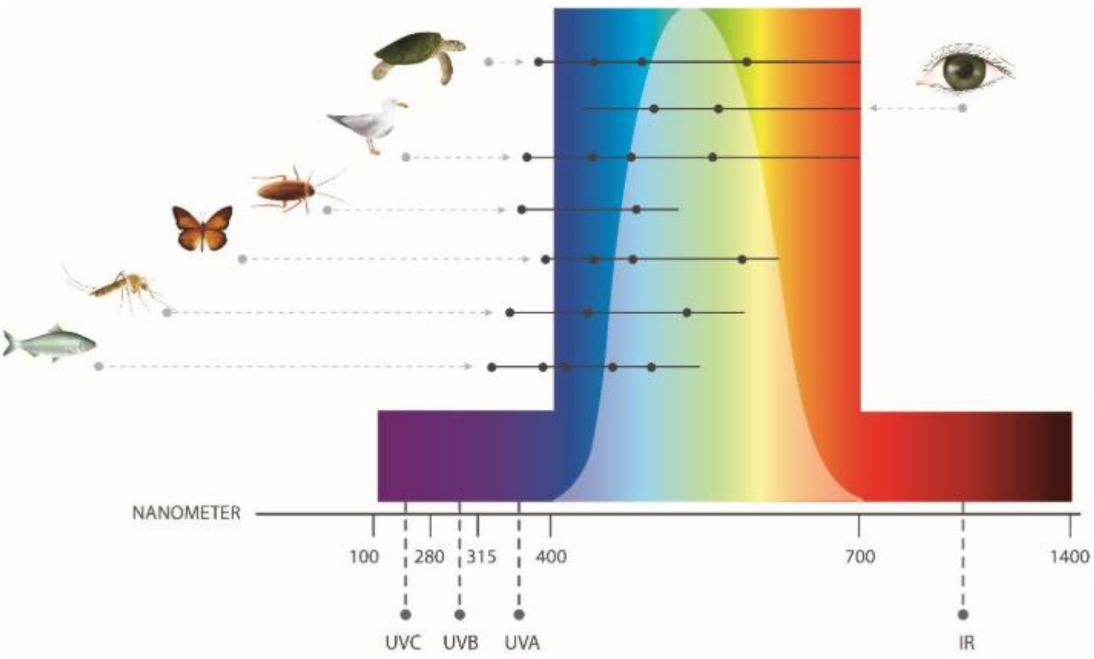

Figure 1-2: Comparative light perception among different species groups (Campos, 2017; DCCEEW, 2023).

2 SCOPE AND METHODOLOGIES

2.1 Scope

The light emissions sources considered in this study include:

- Flaring that will take place on the MODU at a maximum flare rate of 65 MMscfd/well and up to 24 hours/well.
- Facility lighting which includes navigation and working lights on the MODU.

Note that MODU was used as the basis for light modelling as it is the largest and tallest piece of infrastructure that will be infield for the Drilling Campaign. Other vessels were not included in the assessment due to their much smaller scale and/or temporary and transient nature.

Two sets of light modelling have been conducted – Line of Sight and Illuminance, to develop the Visible Light Exposure Area and the Potential Impact Area, respectively (Table 2-1).

Table 2-1: Indication of the predicted potential impact area and visible light exposure area.

ARTIFICIAL LIGHT ASSESSMENT AREAS	INIDICATION
Visible Light Exposure Area	The spatial extent of visible light that is predicted to occur from the Drilling Campaign. The threshold for this area is whether any part of the facility is visible as a dot on the horizon.
Potential Impact Area	The spatial extent of a measurable change in ambient light that is predicted to occur from the Drilling Campaign. The threshold for this area is an illuminance equivalent to ambient light on a moonless clear night sky/new moon (<0.001 lux). This is the area relevant to the impact assessment for planned light emissions from the Drilling Campaign.

2.2 Visible Light Exposure Area

2.2.1 Threshold

The Visible Light Exposure Area, as defined in Table 2-1, refers to the spatial extent of visible light that is predicted to occur from the Drilling Campaign. The threshold for this area is whether any part of the facility is visible as a dot on the horizon.

2.2.2 Basis

Equation

The Visible Light Exposure Area from the MODU was estimated based on the methodology in Stallings (2005) to determine the worst-case potential extent of visible light for the Drilling Campaign. Note that the visibility of an artificial light does not imply a measurable change in ambient light (and therefore a potential environmental impact), the potential environmental impact is estimated though change to illuminance as discussed in Section 2.2.

Line-of-sight modelling utilises the following equation to estimate the total line-of-sight ($\boldsymbol{d}$):

$$d = \left(2 \cdot \frac{4}{3} R h_1 + h_1^2\right)^{0.5} + \left(2 \cdot \frac{4}{3} R h_2 + h_2^2\right)^{0.5}$$

Where $\boldsymbol{d}$ = total line of sight; $\boldsymbol{h_1}$ = height of infrastructure; $\boldsymbol{h_2}$ = height of receptor; and $\boldsymbol{R}$ = radius of Earth.

Inputs and Assumptions

To estimate the Visible Light Exposure Area, the heights of the infrastructure on the MODU were assumed (Table 2-2), with final designs being confirmed during FEED. Varying elevations of the receptor at the mainland from 5 to 525 m were also modelled to determine the actual line-of-sight distances subject to elevations.

Table 2-2: Assumed heights of the MODU facility infrastructure utilised in the Drilling Campaign.

FACILITY INFRASTRUCTURE	HEIGHT ABOVE SEA LEVEL (m)
Derrick (Navigation Lights)	84
Deck Flare (Horizontal Boom)	49
Deck (Working Lights)	21

2.2.3 Calculations and Post-processing

The line-of-sight model was built in Microsoft Excel utilising Stallings equation (Section 2.2.2) by considering the height of the infrastructure and height (elevation) of the receptor. The Visible Light Exposure Areas for different infrastructure were then overlaid in geographic information system (GIS) to identify geospatial contours.

2.3 Potential Impact Area

2.3.1 Threshold

The Potential Impact Area, as defined in Table 2-1, refers to the spatial extent of a measurable change in ambient light that is predicted to occur from the Drilling Campaign.

Table 2-3 shows the typical light illuminance values from natural light sources and its corresponding moon phases are shown graphically in Figure 2-1. These light illuminance values are considered representative of ambient light levels in the vicinity of the Drilling Campaign.

As there are currently no published or accepted thresholds at which artificial light may impact fauna, the minimum threshold used to describe a change in ambient light conditions within this artificial light assessment is an illuminance equivalent to a new moon/moonless clear night sky (0.001 lux). It was assumed that beyond this threshold, there will be no impact to light sensitive faunas. This threshold (0.001 lux) was selected on the basis that fauna undertake nocturnal activities under the natural range of full moon (0.1 lux) to new moon (0.001 lux) without known adverse impacts.

Table 2-3: Summary of natural light illuminance (Environmental Resources Management, 2010).

NATURAL LIGHT SOURCE	LIGHT ILLUMINANCE (LUX)
Direct sunlight	100,00–130,000
Full daylight, indirect sunlight	10,000–20,000
Overcast day	1,000
Very dark day	100
Twilight	10
Deep twilight	1
Full moon	0.1
Quarter moon	0.01
Moonless clear night sky (new moon)[1]	0.001
Moonless overcast night sky	0.0001

---

[1] *Impact threshold utilised in this report is 0.001 lux, beyond this threshold no impact to light sensitive fauna is assumed.*

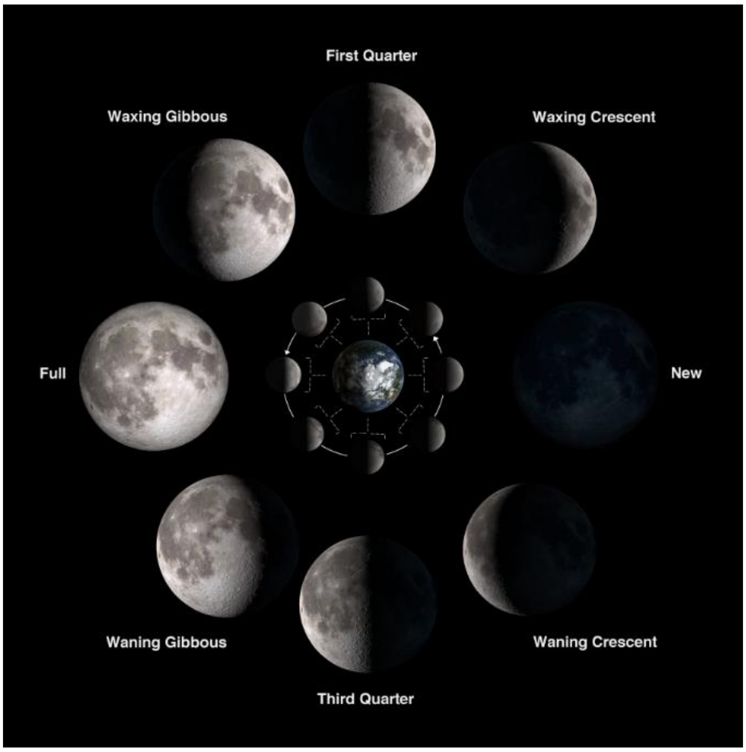

Figure 2-1: The moon phases. Credit: NASA/Bill Dunford (Johnston, 2020).

2.3.2 Basis

Equation

The illuminance modelling used the inverse square law of illuminance which states that *a doubling of distance results in a reduction in illuminance by four times*, i.e., as a surface that is illuminated by a light source moves away from the light source, the surface appears dimmer. Light emitted becomes dimmer in an inverse square relationship to distance as represented in and in the mathematical equation below:

$$E = \frac{I}{D^2}$$

where E = illuminance (in lux), I = luminous intensity (in candela), and D = the distance from the light source in meters.

Light sources

The luminous intensity (I) has included both flare light and facility lighting. It is noted at this preliminary stage that, the type of the light fitting, quantity, and exact location of light sources are not yet fixed. As such, to conduct the illuminance modelling, the use of analogues was adopted to determine the approximate luminous intensities of the flare light and facility lighting (Table 2-4). This is also considered a conservative approach as it does not include any best practice or additional mitigation measures that may be adopted by Beach during the front-end engineering design (FEED) of the Project.

Table 2-4: Analogues selected for the flare light and facility lighting used in the Drilling Campaign.

LIGHT SOURCE	ANALOGUE AND REFERENCE	DESCRIPTION
Flare light	Nigeria Obigbo Oil Production Facility, continuous flaring at 30 MMscfd (European Commission, 2014; Isichei & Sanford, 1976; Nwaobi, 2005)	Light illuminance levels at varying distances were measured, therefore reducing uncertainty in calculating luminous intensity from a flare
Facility lighting	The MODU facility lighting used in Woodside Torosa drilling campaign on Browse reef (Environmental Resources Management, 2010)	Light characteristics and modelling of light sources for the Torosa assessment were based on measured lighting data obtained

Obtaining the luminous intensity of a flare is not straightforward as flares are not designed to be luminous. To reduce the uncertainties, published potential analogue natural gas flares were compared (e.g., Tamarind operated FPSO oil facility, Chevron-operated onshore LNG facility, Proposed Santos-operated onshore gas production facility and Shell-operated Obigbo oil production facility in Nigeria). The Obigbo facility was finally selected as the appropriate analogue for the Drilling Campaign mainly due to the availability of a detailed light assessment study that provided measured lux levels at varying distances (European Commission, 2014; Isichei & Sanford, 1976; Nwaobi, 2005). This information allows for the characteristics of the Obigbo flare to be scaled and provides the basis for the illuminance modelling in this study.

For the facility lighting, it was assumed that the MODU for the Drilling campaign will have a similar lit surface area as the drill rig utilised for the Woodside Torosa drilling campaign on Browse reef for which published data is available (Environmental Resources Management, 2010). Therefore, the measured illuminance level was extracted for use in the illuminance modelling for the Drilling Campaign.

Inputs and Assumptions

To estimate the illuminance from the flare light, a peak flare rate of 65 MMscfd was modelled. The flare will be a horizontal boom extending out horizontally from the MODU deck. The resulting length of the flare flame was calculated to be approximately 14 m based on Gas Processors Suppliers Association (2004). The following assumptions were used in the illuminance modelling:

- The flare and its combustion were assumed to have similar characteristics as that used in the Nigeria Obigbo Oil Production Facility (Table 2-4).
- No allowance was made for atmospheric or topographic interactions including shadowing, absorption or scattering, as such the model is conservative and likely to overestimate illuminance at distance.
- Flare luminous intensity is calculated directly proportional to flare flow rate.

2.3.3 Calculations and Post-processing

The illuminance model was built in Microsoft Excel utilising the inverse law of illumination (Section 2.3.2) by considering the total luminous intensity resulted from the flare and facility lighting. Illuminance was calculated every 100 m from the light source in lux, and the illuminance levels including the Potential Impact Area (at 0.001 lux) were overlaid in geographic information system (GIS) to identify geospatial contours.

3 LIGHT ASSESSMENT RESULTS

3.1 Visible Light Exposure Area

The estimated line-of-sight distances for the infrastructure on the MODU are summarised in Table 3-1. The navigation lights of the MODU on the derrick are expected to be visible within 38 km at sea level; and the flare flame above the main deck level would be visible within approximately 29 km at sea level. The line-of-sight modelling also indicates that the MODU may be visible as a dot on the horizon from the adjacent mainland, extending inland up to 140 km for elevated receptor locations.

Note that this is a conservative estimation as the model has not considered the atmospheric interactions or obstacles. A zone of theoretical visibility analysis is recommended as it provides allowance for the luminance range of human vision, the curvature of the Earth, and atmospheric refraction.

Figure 3-1 shows the Visible Light Exposure Areas for the MODU infrastructure – Deck, Deck flare and Derrick from the horizon. At higher elevation on the mainland, the MODU may be visible.

Matters protected by the EPBC Act 1999 within the Visible Light Exposure Areas are provided in Appendix A: A.2 (Deck Flare), A.3 (Derrick) and A.4 (Deck). Biologically important areas (BIAs) within these areas are presented in Appendix B.

Table 3-1: Visual line of sights for MODU infrastructure from sea level and from various receptor elevations.

VISIBILITY OF MODU INFRASTRUCTURE FROM SEA LEVEL			
MODU INFRASTRUCTURE	HEIGHT OF INFRASTRUCTURE (M)	RECEPTOR ELEVATION (M)	LINE OF SIGHT (KM)
Derrick (Navigation Lights)	84	0 (sea level)	38
Deck Flare (Horizontal Boom)	49	0 (sea level)	29
Deck (Working Lights)	21	0 (sea level)	19

VISIBILITY OF MODU DERRICK FROM VARIOUS RECEPTOR ELEVATIONS							
Highest Infrastructure	Height (m)	Line of Sight at Various Receptor Elevations (km)					
		5 m	10 m	50 m	100 m	300 m	525 m
Derrick (Navigation lights)	84	47	51	67	79	109	132

Document details: G:\CheckOuts\P100447\Output\02_Bass_OPP\P100447_00_Bass_OPP_Working.aprx, P100447_LightExposure_Otway, P-UWS-132, 28/08/2024

Figure 3-1: Predicted Visible Light Exposure Areas for the MODU infrastructure (19~38 km from the horizon).

3.2 Potential Impact Area

Table 3-2 shows the illuminance results including the analogue case. As presented in Table 3-2 and also graphically in Figure 3-2, the Potential Impact Area (with an illuminance level at/less than 0.001 lux) when flaring occurs is expected to be approximately 63 km and reduce to 10 km when there is no flaring.

Table 3-2: Illuminance modelling results for the Drilling Campaign.

SCENARIO	LUMINANCE INTENSITY (CD)	LIGHT ILLUMINANCE (LUX)							
		Distance from Facility (km)							
		0.5	1	5	10	20	30	60	70
Analogue Case									
Obigbo Oil Production Facility (with flaring)	~1,805,000	7.2	1.8	0.072	0.018	0.004	0.002	<0.002	<0.001
Modelled Cases									
Facility lighting from the MODU (no flaring)	~100,000	0.4	0.1	0.004	0.001	0.0002	<0.0001	<0.0001	0
Combined facility lighting and flaring from the MODU	~4,000,000	16.0	4.0	0.160	0.04	0.01	0.004	0.0011	<0.001

To further evaluate the light emissions impact, a list of selected receptor locations has been chosen to determine the illuminance (light intensity) levels. The results are presented in Table 3-3.

At the selected receptor locations of Port Campbell National Park (19 km), Cape Otway Light Station Lookout (37 km), Warrnambool (53 km), and Currie (King Island, 102 km), the illuminance levels when flaring have been estimated to be approximately 0.0111, 0.0029, 0.0014, and 0.0004 lux respectively. These illuminance levels are comparable to the ambient light levels between the quarter moon and the new moon phases in Figure 2-1, except for Port Campbell National Park with a slightly higher illuminance level due to closer proximity to the Project Area of the Drilling Campaign, and Currie which is farthest away with an ambient light level between the new moon and moonless overcast night sky.

When not flaring, the illuminance levels of all selected receptor locations are less than 0.001 lux, comparable to the ambient light levels less than a moonless clear night sky (new moon).

Matters protected by the EPBC Act 1999 within the Light EMBA and Potential Impact Areas are provided in Appendix A: A.1 (Light EMBA), A.5 (Flaring) and A.6 (No Flaring). Biologically important areas (BIAs) within these areas are presented in Appendix B.

Table 3-3: Selected receptor locations and their illuminance levels resulted from the Drilling Campaign.

RECEPTOR	COORDINATES	ELEVATION (m)	CLOSEST OA POINT	MIN. DISTANCE TO MODU POSITION [km]	ILLUMINANCE WHEN FLARING (LUX)	ILLUMINANCE WHEN NOT FLARING (LUX)
Port Campbell National Park	-38.6597, 143.1049	62	-38.7979, 142.9724	19	0.0111	0.0002
Cape Otway Light Station Lookout	-38.8504, 143.5143	99	-38.9133, 143.1013	37	0.0029	<0.0001
Warrnambool	-38.3818, 142.488	22	-38.8129, 142.7395	53	0.0014	<0.0001
Currie (King Island)	-39.9281, 143.8522	35	-39.2697, 143.0286	102	0.0004	~0

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 29-Aug-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	3
Listed Threatened Species:	85
Listed Migratory Species:	55

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	89
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	7
Regional Forest Agreements:	1
Nationally Important Wetlands:	1
EPBC Act Referrals:	47
Key Ecological Features (Marine):	1
Biologically Important Areas:	13
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places

[Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Commonwealth Marine Area

[Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities

[Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species

[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area

Scientific Name	Threatened Category	Presence Text
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Nannoperca obscura		
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat may occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis		
Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Antechinus minimus maritimus		
Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Dasyurus maculatus maculatus (SE mainland population)		
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Species or species habitat likely to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat likely to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat likely to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat may occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat likely to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat may occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 29-Aug-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	4
Listed Threatened Species:	87
Listed Migratory Species:	55

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	91
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	10
Regional Forest Agreements:	1
Nationally Important Wetlands:	1
EPBC Act Referrals:	57
Key Ecological Features (Marine):	1
Biologically Important Areas:	13
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
FISH		

Scientific Name	Threatened Category	Presence Text
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Nannoperca obscura Yarra Pygmy Perch [26177]	Endangered	Species or species habitat likely to occur within area
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Dasyurus maculatus maculatus (SE mainland population) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Species or species habitat likely to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petauroides volans Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area
PLANT		

Scientific Name	Threatened Category	Presence Text
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat may occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
Thelymitra matthewsii Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pandion haliaetus		
Osprey [952]		Species or species habitat known to occur within area
Phalacrocorax fuscescens		
Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca		
Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis		
Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua		
Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata		
White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons		
Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri		
Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche bulleri platei as Thalassarche sp. nov.		
Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma		
Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus as Thinornis rubricollis		
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus minotaur Bullneck Seahorse [66705]		Species or species habitat may occur within area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas

[Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present

Scientific Name	Behaviour	Presence
Balaenoptera musculus brevicauda		
Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 29-Aug-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	6
Listed Threatened Species:	91
Listed Migratory Species:	55

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	2
Commonwealth Heritage Places:	None
Listed Marine Species:	92
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	18
Regional Forest Agreements:	1
Nationally Important Wetlands:	3
EPBC Act Referrals:	58
Key Ecological Features (Marine):	1
Biologically Important Areas:	15
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Astelia australiana Tall Astelia [10851]	Vulnerable	Species or species habitat likely to occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Dianella amoena Matted Flax-lily [64886]	Endangered	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat may occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
Thelymitra matthewsii Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area

Scientific Name	Threatened Category	Presence Text
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Migratory Terrestrial Species

Scientific Name	Threatened Category	Presence Text
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State
Unknown	
Commonwealth Land - [21492]	VIC
Commonwealth Land - [21583]	VIC

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Breeding likely to occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus minotaur Bullneck Seahorse [66705]		Species or species habitat may occur within area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus margaritifer		
Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi		
Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus		
Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri		
Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus		
Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area
Neophoca cinerea		
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata		
Minke Whale [33]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		

Scientific Name	Behaviour	Presence
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 29-Aug-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	3
Listed Threatened Species:	85
Listed Migratory Species:	55

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	89
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	7
Regional Forest Agreements:	1
Nationally Important Wetlands:	1
EPBC Act Referrals:	47
Key Ecological Features (Marine):	1
Biologically Important Areas:	13
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat may occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area

Scientific Name	Threatened Category	Presence Text
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Nannoperca obscura		
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat may occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis		
Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Antechinus minimus maritimus		
Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Dasyurus maculatus maculatus (SE mainland population)		
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Species or species habitat likely to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat likely to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat likely to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat may occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat likely to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat may occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Species or species habitat known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat likely to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus as Thinornis rubricollis		
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Heraldia nocturna		
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis		
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps		
Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 29-Aug-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	2
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	8
Listed Threatened Species:	107
Listed Migratory Species:	66

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	3
Commonwealth Heritage Places:	1
Listed Marine Species:	108
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	3
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	53
Regional Forest Agreements:	1
Nationally Important Wetlands:	8
EPBC Act Referrals:	85
Key Ecological Features (Marine):	2
Biologically Important Areas:	17
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Port phillip bay (western shoreline) and bellarine peninsula	50 - 100km upstream from Ramsar site
Western district lakes	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community may occur within area
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area

Community Name	Threatened Category	Presence Text
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour may occur within area
Aphelocephala leucopsis Southern Whiteface [529]	Vulnerable	Species or species habitat may occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Fregetta grallaria grallaria White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
CRUSTACEAN		
Euastacus bispinosus Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat likely to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Nannoperca obscura Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
INSECT		
Synemon plana Golden Sun Moth [25234]	Vulnerable	Species or species habitat likely to occur within area
MAMMAL		
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dasyurus maculatus maculatus (SE mainland population) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon obesulus obesulus Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petauroides volans Greater Glider (southern and central) [254]	Endangered	Species or species habitat likely to occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Astelia australiana Tall Astelia [10851]	Vulnerable	Species or species habitat known to occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Dianella amoena Matted Flax-lily [64886]	Endangered	Species or species habitat likely to occur within area
Dodonaea procumbens Trailing Hop-bush [12149]	Vulnerable	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lachnagrostis adamsonii Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area
Leiocarpa gatesii Wrinkled Buttons [76212]	Vulnerable	Species or species habitat may occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat likely to occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pimelea spinescens subsp. spinescens Plains Rice-flower, Spiny Rice-flower, Prickly Pimelea [21980]	Critically Endangered	Species or species habitat may occur within area
Poa sallacustris Salt-lake Tussock-grass [24424]	Vulnerable	Species or species habitat likely to occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Rutidosis leptorhynchoides Button Wrinklewort [67251]	Endangered	Species or species habitat may occur within area
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat may occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra matthewsii Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eulamprus tympanum marnieae Corangamite Water Skink, Dreeite Water Skink [64487]	Endangered	Species or species habitat known to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eubalaena australis as Balaena glacialis australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus		
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus		
Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus		
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae		
Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus		
White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Monarcha melanopsis		
Black-faced Monarch [609]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State
Defence	
Defence - WARRNAMBOOL TRAINING DEPOT [21111]	VIC
Unknown	
Commonwealth Land - [21492]	VIC
Commonwealth Land - [21583]	VIC

Commonwealth Heritage Places [Resource Information]

Name	State	Status

Camperdown Post Office	VIC	Listed place

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Breeding likely to occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Thalasseus bergii as Sterna bergii		
Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis		
Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes		
Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola		
Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis		
Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Fish		
Heraldia nocturna		
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis		
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps		
Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus minotaur		
Bullneck Seahorse [66705]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys mollisoni Mollison's Pipefish [66260]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Bonney Coast Upwelling	South-east
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia
-Department of Land and Resource Management, Northern Territory

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 29-Aug-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	41
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	63
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	34
Key Ecological Features (Marine):	1
Biologically Important Areas:	12
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
FISH		
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat may occur within area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
REPTILE		

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area

Scientific Name	Threatened Category	Presence Text
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Migratory Wetlands Species

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche bulleri platei as Thalassarche sp. nov.		
Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma		
Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Fish		
Heraldia nocturna		
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis		
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

THE THREE WHATS
What can go wrong?
What could cause it to go wrong?
What can I do to prevent it?

Contents

1. Introduction

The Otway Offshore Gas Victoria Project (the Project) intends to develop gas reserves for use in the east coast domestic gas market. These reserves and potential resources are adjacent to existing Beach Energy (Operations) Limited (Beach) permits and infrastructure. The Project would be undertaken through integrated subsea drilling and installation campaigns.

The Project involves exploration, appraisal and development of existing and future gas discoveries in Beach's exploration permits, VIC/P43 and VIC/P73 located in the offshore Otway Basin. It covers an area that is located approximately 17 km south of the Victorian mainland and 80 km west of Tasmania (King Island) at its closest points.

The proposed scope of the Project consists of:

- Seabed surveys (geotechnical and geophysical)
- Drilling and Completions
- Subsea infrastructure installation
- Commissioning
- Operations and maintenance
- Future tiebacks
- Decommissioning

Beach is planning the initial drilling campaign to commence in 2025, with installation of new subsea facilities commencing in 2028 and the earliest achievable date for commissioning and first gas subject to final investment decision, joint venture and regulatory approvals. Production from successful prospects may have an operational life of up to 30 years, dependent upon resource size, well pressure and other factors.

Beach submitted the Offshore Project Proposal (OPP) to National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for Stage 1 assessment on 11 September 2023 (with revisions submitted on 21 December 2023 and 15 February 2024). On 8 March 2024, NOPSEMA advised that the OPP was suitable for publication for public comment in accordance with Section 9 of the OPGGS (Environment) Regulations 2023. The OPP (Revision 2) was published and opened for comment for nine weeks from 18 March 2024 to 20 May 2024.

Beach promoted the public comment process by publishing a public notice in seven different newspapers, emailing the project stakeholder list, and prominently featuring information about the public comment period and links to NOPSEMA's website on Engage Beach, Beach's online consultation hub.

Eleven public submissions were received. Beach acknowledges all those who took time to compile and submit their written comments regarding the OPP. One submission (Submission 3) provided comments that had no merit and were not relevant to the OPP and was not considered further in the OPP public comment process. One submission (Submission 4) was made in response to a public comment process for a separate environmental approval and, by agreement with the submitter, was accepted and managed as part of the public comment process for the environmental approval and excluded from the OPP public comment process.

This report on Public Comment (the Report) relates to the Project's Offshore Project Proposal (OPP) and is a requirement following the completion of the public comment process.

Beach has reviewed the comments and undertook an assessment of the OPP to determine whether comments are adequately addressed in the OPP. Where Beach was satisfied that the comments were adequately addressed in the OPP, the relevant sections of the OPP were referenced and summarised as appropriate and submitted to NOPSEMA for assessment on 21 June 2024 (Revision 3 of OPP). Where Beach updated the OPP in response to comments, these responses are referenced in the OPP.

Beach has subsequently undertaken further reviews of the OPP (Revision 4 submitted on 31 October 2024 and Revision 5 submitted on 7 March 2025) in response to requests for further information from NOPSEMA and to reflect changes made by the proponent to the scope of activity described in the OPP. Beach has removed the development of potential gas fields located in T/30P from this OPP. The T/30P blocks are located in the southern Otway Basin located near Tasmania. The revised OPP has reduced the planned activities, the Project and Planning areas, the affected environment and, related impacts and risks. As a result, revisions to the OPP have been made and are summarised below including reference to specific public comments:

- No proposed development in T/30P (PC288)
- Reduced number of proposed wells (PC200, PC201, PC222, PC244, PC278, PC288) and end of field life of 2045.
- New quantitative spill modelling was undertaken to model the loss of well control in the southern well location to replace T/30P well location (now outside the Project Area) with Thylacine West 1 location (within the Project Area) (see Appendix M, Figure 7-1 and Table 7-17 of OPP) (PC298, PC277, PC279, PC284)
- Zeehan Marine Park – closest proximity to Project Area is 58 km (formerly 1km) (PC182, PC287, PC288, PC289, PC339). The Zeehan Marine Park remains within the Planning Area.
- World Heritage Properties - Tasmania World Heritage Wilderness - not within the Planning Area (or Project Area) (PC345, PC349, PC290, PC291, PC333)
- Key Ecological Features - West Tasmanian Canyon - not within the Project Area (remains in the Planning Area) (PC331)
- New Greenhouse Gas GHG) Emissions Report (Appendix K) was prepared to model the reduced Project scope. The GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e (formerly estimated to be 34.6 million tonnes CO_2-e) contributing to approximately 0.19% of the Australian carbon budget (PC326, PC197, PC218, PC207)
- New light EMBA modelling for flaring (from 50km to 63km) (PC232, PC163, PC228, PC238, PC239, PC240, PC242, PC243, PC244, PC245, PC247, PC249, PC250).

3. Proponent's Report on Public Comments

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
3.1 Submitter No. 1 & 2		
PC343	I am deeply concerned about the gas energy crisis that is happening in Victoria that I saw on the news -I think that this project will impact me and all Victorian's because we all need access to gas for heating or for products that are manufactured using gas energy. I support the approval of this project as hopefully it will give us a bit more gas and time to transition to other energy sources.	Beach Energy (Operations) Limited (Beach) agrees with the comment that natural gas has an important role to play in providing affordable, reliable, and secure energy to the community as we move through the energy transition.
PC158	Comment: I am unsure why so many wells are going to be closed, surely, we need to keep these wells open to extract any remaining gas left in them if there is a big gas crisis looming.	Beach Energy (Operations) Limited (Beach) agrees with the comment that natural gas has an important role to play in providing affordable, reliable, and secure energy to the community as we move through the energy transition. The comment received appears to be in reference to the plug and abandonment of existing suspended wells that has been addressed in Beach's OGV Drilling and P&A Activities Environment Plan. Under the *Offshore Petroleum Greenhouse Gas Storage Act 2006* and regulations, Beach is required to progressively decommission and remove all property and plug and abandon wells. The plug and abandonment activities in the Offshore Project Proposal (OPP) are relevant for decommissioning of future production wells at the end of commercial production and where an exploration well is confirmed to have no commercial hydrocarbon potential after drilling and evaluation. No change has been made to the OPP in response to this comment.
PC159	Comment: Has Beach identified all relevant areas and protected marine species? I am a bit concerned that I don't see a lot of discussion or analysis of Biologically	Beach Energy (Operations) Limited (Beach) has prepared the Offshore Project Proposal (OPP) to include a comprehensive assessment of the existing environment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Important Areas - I thought this would be a specific heading. The NOPSEMA website has a thing about it from 24 Feb onwards (https://www.nopsema.gov.au/blogs/industry-proposals-and-nopsema-assessments-have-consideration-changes-biologically-important). Maybe this is something that will be added into the Environmental Plan in more detail down the track. It would be helpful for us members of the public to see the BIA geospatial data overlayed onto the proposed project/impact areas, so it is easier to understand if Beach has identified all the relevant areas and is doing its best to mitigate any negative impacts on protected marine species.	Section 4 of the OPP describes the ecological, socioeconomic, and cultural features of the environment. The assessment includes conservation values and sensitivities for protected areas, heritage areas and key ecological features identified within the Operational and Planning Areas using Environment Protection and Biodiversity Conservation Protected Matters Search Tool Reports. The Biological Important Areas (BIAs) are included in the OPP. While a specific section heading for BIAs is provided in the OPP (Section 2.3.2) to define the importance of BIA, the OPP is structured under headings identifying the relevant species and ecological environment and within each of these headings an assessment of the BIA is included. In this regard, there are over 100 references to BIAs in the OPP. Several figures are included in the OPP showing the overlay of BIAs and the project and planning areas for white sharks (Figure 4-38), birds (Figures 4-39 to 4-41 and 6-1 to 6-3), blue whales (Figures 4-44, 6-6 and 6-8), and southern right whale (Figures 4-56, 6-7 and 6-9). Further to the OPP, Environment Plan(s) (EPs) prepared for specific activities will also identify and assess the BIAs within the existing environment. National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA's) announcement, published on 26 February 2024, advised that the Department of Climate Change, Energy, the Environment and Water is reviewing the BIAs. The most up to date information on BIAs is provided in the OPP, including the recent update for southern right whale BIA. Further EPs that may be developed pursuant to the OPP will also consider BIAs and current relevant research and applicable regulations. Beach is satisfied that the OPP adequately addressed BIAs and no change has been made to the OPP in response to this comment.
PC155	Comment: While I recognise that we need this project to go ahead to help Victorian's like me stay warm in the winter, I am of course worried about the effect of the drilling on marine life as the noise of drilling would be very high, but I am glad that no seismic activity is required.	Beach Energy (Operations) Limited (Beach) agrees with the comments that natural gas has an important role to play in providing affordable, reliable, and secure energy to the community. The Offshore Project Proposal (OPP) includes drilling campaign(s) as part of the Project and has provided an assessment of the potential impacts and risks of drilling on various marine fauna. Drilling is identified as a source of low-intensity continuous sound (Section 6.4.2.3). Section 6.4 of the OPP includes a detailed assessment of the possible disruption to marine fauna from noise.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Tables 6-29 to 6-31 summarise the impact evaluation for underwater noise assessed as Moderate , and the control measures acceptable levels and environmental performance outcomes. A key control to reduce the impact of noise on whales are various Whale Management Procedures. For drilling this includes having independent and trained Marine Mammal Observers (MMOs) or Marine Fauna Observers (MFO) involved in the drilling program to ensure the proper implementation of a Whale Management Procedure. The monitoring and reporting requirements for MMO under the Whale Management Procedure are important control measures designed to comply with various government reporting for vessel strikes or injury of cetaceans. For further information, the Whale Management Procedure to be implemented during the Offshore Gas Victoria (OGV) Drilling and P&A activities is provided as part of the Environment Plan (EP) (Appendix H), which is currently under assessment by NOPSEMA. Beach has successfully used similar whale management procedures in past EPs and would continue to use such procedure in future EPs, adapted as applicable to the activities in EPs and any further relevant studies that may be applicable. In relation to seismic activity, Beach confirms that marine seismic acquisition is not included in the OPP. The OPP does include an option to carry out vertical seismic profiling (VSP) – also known as check shot survey – in wells for future drilling campaigns, if applicable (Section 3.8.3.3). VSP is a potential source of non-continuous or impulsive underwater noise with the potential impacts summarised in Table 6-29 (Section 6.4.4) of the OPP. As above, a key control to reduce the impact of underwater noise on whales is the Whale Management Procedure (Table 6-30). Beach is satisfied that the OPP adequately considers the potential noise impacts of drilling on marine fauna and no change to the OPP has been made in response to this comment.
PC156	Comment: I hope that enough studies have been done on what the impact of drilling for over a year will have on whale migration and that surveillance will be carried on during this process to keep studying the impact it has. Maybe I am mistaken, but it seems that according to your Environmental Plan it is impossible to not be drilling during the migration of some species of whale as the migration dates all overlap.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the potential impact of drilling activities on whales. The Offshore Project Proposal (OPP) includes drilling campaign(s) as part of the project and Beach has provided an assessment of the potential impacts and risks of drilling on various marine fauna. Beach has undertaken significant research and compiled over 13,500 hours of observations to determine the presence of whales in the area. Beach describes the potential noise impacts from the activity in detail in Section 6.4 of the OPP. This describes all the potential noise sources that could be generated during the drilling activity.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach engaged a noise expert in 2021 (JASCO) to deploy acoustic (noise) monitoring buoys on the seabed during our previous drilling campaign (3 February 2021 – 3 April 2021). These buoys monitored noise generated from all the activities associated with drilling a well. The results from this monitoring were incorporated in sophisticated acoustic models to determine the potential impact on whales (cetaceans). The results from this modelling are shown in Section 6.4 of the OPP. As described in Section 6.4.3 of the OPP, impacts to whales, which may occur from continuous noise emissions associated with the drilling program. The continuous noise source sound behaviour EMBAs for marine mammals of 7.98 km and for marine mammals on shelf edge of 19.6 km intersect the migration BIA for the southern right whale (**Error! Reference source not found.**). These EMBAs are based on the greatest distances from the activity where noise effect criteria are reached for continuous noise sources. Section 6.4.3 of the OPP describes the potential for marine mammal species to experience injury or mortality through Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) or express a behaviour response because of sound emissions. The PTS and TTS 24-hour criteria are only relevant to those receptors that are likely to be present in the area of sonification for a period of 24 hours. Sound sensitive marine mammal species and behaviours that could occur within the relevant environment that may be affected (EMBA) were identified through Protected Matters Search Tool (PMST). Biologically Important Area (BIAs) were identified from the National Conservation Values Atlas. Section 6.4.3 of the OPP includes an impact assessment specific to each species on published sound exposure criteria thresholds. The largest impact on underwater noise is from the movement of vessels. The propellers from the vessels generated significantly more noise than drilling activities. A key control to reduce the impact of noise on whales is having independent and trained Marine Mammal Observers (MMOs) or Marine Fauna Observers involved in the drilling program to ensure the proper implementation of a Whale Management Procedure. The monitoring and reporting requirements for MMO under the Whale Management Procedure are important control measures that are designed to comply with various government reporting for vessel strikes or injury of cetaceans. For more information, the Whale Management Procedure to be implemented during the Offshore Gas Victoria Drilling and P&A Activities is included in the Environment Plan (Appendix H), which is currently under assessment by National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach considers that Section 6.4 of the OPP demonstrates sufficient justification that there will be Moderate (2) residual consequences with no associated population level impacts and no potential to result in serious or irreversible environmental damage. As detailed in the OPP, the assessment considers control measures such as the development of a Whale Management Procedure, include specific measures to minimise anthropogenic noise threats to relevant species, such as, the implementation of safe operating distances between vessels and whales, pre-activity surveys for specific activities, night-time and low visibility controls and establishment of safe points for operational activities in accordance with the Safety Case and Well Integrity requirements. Impacts and risk to threatened and migratory species are thoroughly assessed throughout the OPP in Sections 6 and 7. BIAs for species are taken into consideration and inform the assessment of impact and risk. Environmental Performance Outcomes (EPOs) and control measures ensure that these impacts and risks are reduced to acceptable levels. EPOs and Control Measures are included in the OPP for planned activities relevant to the protection of species undertaking biologically important behaviours such as: • EPO7 No death or injury to marine fauna, including listed threatened or migratory species, from Project activities. • EPO8 Biologically important behaviours can continue while Project activities are being undertaken. • EPO8 Underwater sound emissions in biologically important areas will be managed such that any whale, including blue and southern right whales, continue to utilise the area without injury, and are not displaced from a foraging area. • EPO10: Anthropogenic noise in biologically important areas and habitat critical to the survival of a species will be managed such that: ○ Any blue whale continues to utilise biologically important areas without injury, and is not displaced from a foraging area. ○ It does not prevent any southern right whale from utilising biologically important areas or habitat critical to the survival of a species or cause auditory impairment (TTS and PTS). • EPO11: Implement various control measures for Whale Management Procedures to ensure impacts and risks to whales from underwater sound are managed in accordance with relevant recovery plans. Measures to minimise anthropogenic threats to Southern Right Whales and Pygmy Blue Whales include (but are not limited to) whale management procedures for geophysical surveys, drilling,

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		vertical seismic profiling (VSP) and vessel management. These management procedures include the implementation of pre-start-up visual observations, processes for delayed start up should whales be sighted, nighttime/ low visibility procedures and the use of trained personnel and/or Marine Mammal Observers. Other measures relevant to the protection of species undertaking biologically important behaviours are outlined in the OPP in Section ES6 (Environmental Performance Outcomes, Standards and Control Measures). These measures are in place ensure impacts and risks are reduced to acceptable levels. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC160 PC161	Comment: I don't see a lot of info about seals and seabirds either, and how they will be kept safe if they climb (or int he case of birds, fly) onto drilling platforms. If they are protected species then that is of interest to me as an avid bird watcher and lover of nature.	The Offshore Project Proposal (OPP) provides comprehensive information on marine species, *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) status, and habitat and behaviour within the Project and Planning Areas. Beach Energy (Operations) Limited (Beach) has reviewed the OPP on receipt of these comments and confirms that the OPP identifies the protected species within the Project and Planning Areas to include the EPBC listed pinniped (seals) species or habitats (Table 4-24) and the EPBC listed seabirds and shorebirds (Table 4-22). An assessment of seabirds (Section 4.4.9.4) and seals (Section 4.4.9.6) within the existing environment is also provided in the OPP. Beach acknowledges the activities planned for the OPP may have potential environmental impacts and risks on various marine fauna, including seabirds and seals. The OPP includes drilling campaign(s) as part of the project and as such Beach has provided an assessment of the potential impacts and risks of drilling on seabirds and an assessment that impacts are of an acceptable level. Section 6.3 of the OPP includes a detailed assessment of the possible disruption to seabirds from light sources associated with the drilling activities. Light emissions are assessed as having a Minor (1) consequence, which is not considered as having the potential to result in serious or irreversible environmental damage. Beach has assessed various controls to minimise light emissions and in consultation with suitably qualified specialists, will develop and implement a Light Management Plan. The Light

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Management Plan will assist in managing environmental impacts and risks of light emissions in compliance with the National Light Pollution Guidelines for Wildlife (CoA 2023). Further information on the Light Management Plan will be provided in the relevant Environment Plan(s). The potential impact of underwater noise on seals (pinnipeds) is assessed in Section 6.4 with the potential impacts of impulsive noise to pinnipeds considered to be Minor. Interactions with marine fauna, such as seals, is also assessed in the OPP (Section 7.2). A key Environmental Performance Objective (EPO7) contained within the OPP is no death or injury listed threatened or migratory species from Project activities. Beach has reviewed the OPP and is confident it adequately addresses the comments for the reasons outlined above. No change has been made to the OPP in response to these comments.
PC162	Comment: Balance between need for gas and environment protection. Some of the risk scenarios regarding spilling of foul water are a bit scary as the modelling says it is medium risk and the imagery covers a lot of the coast.	Beach Energy (Operations) Limited (Beach) acknowledge concerns about potential spills and discharges to the marine environment. The comment mentions 'foul water,' which appears to be a reference to oil spills, however, may also refer to marine discharges in relation to activities. The potential impacts and risks for discharges and hydrocarbon spill have been assessed in Sections 6.7 to 6.10 and Section 7 of the Offshore Project Proposal (OPP). Beach has modelled the worst-case scenario for a loss of containment from a marine diesel spill and a loss of well control. The loss of containment from unplanned hydrocarbon spill is evaluated in section 7.4 as medium risk. Medium risks are considered lower-order risks that is acceptable with the application of good industry practice (Table 7-26). Under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023*, an Oil Pollution Emergency Plan (OPEP) is required as part of the implementation strategy for the activity-specific EP. The OPEP must include comprehensive and adaptable arrangements for responding to and monitoring oil pollution. The OPEP will be supported by an Operational and Scientific Monitoring Program that provides a detailed strategy for responding to large-scale releases to the marine environment. Beach's review of the OPP finds that it adequately addresses the comments for the reasons outlined above and no change has been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC163	Comment: Also, will the lights from drilling have any negative effects on hatching turtles if they are going to be having big lights on all night for a year? The plan says it won't affect them, but I don't understand how the mitigations help to stop them being affected and not all flocking to the drilling sites lights thinking it is the moon. I know they are a long way offshore but those baby turtles head from the beach into the open water for hundreds of kilometres. More information about this would be helpful in the detail for the environment plan, are the lights just a special colour or are they very low and so that is why it is not a problem.	Beach Energy (Operations) Limited (Beach) acknowledge the Offshore Gas Victoria Project (the Project) may have potential environmental impacts and risks on various marine fauna, including turtles, from light sources associated with the drilling activities. Section 6.3.3.3 of the Offshore Project Proposal (OPP) assesses the impact of light on hatching turtles. Artificial light can disrupt turtle nesting and hatching behaviours and is listed as a key threat in the Recovery Plan for Marine Turtles in Australia (CoA 2017). Although listed turtle species may occur within the routine light and flaring Environment that May Be Affected (EMBAs), no biologically important behaviours (BIAs) or habitat critical to the survival for marine turtles were identified (Appendix E). Consequently, population level impacts to marine turtles from routine light and flaring emissions are not predicted to occur. The consequence severity of light and flaring impacts for marine reptiles is assessed as Minor. Beach has reviewed the OPP and is confident it adequately addresses the comments about turtles for the reasons outlined above. No change has been made to the OPP in response to this comment.
3.2 Submitter No. 5		
PC164	Comment: [First Nation], its staff and its community are not trained or experienced in this area and a lack of qualifications could reveal concerns unknown to us at this time, which is a concern. Making recommendations without adequate training, this significant and concerning gap continues to ensure Aboriginal people continue to face the loss of cultural heritage to large corporates and governments.	Beach Energy (Operations) Limited (Beach) understands that the Offshore Project Proposal (OPP) is a technical and complex document, primarily as it was developed in accordance with the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act) for assessment by the regulator National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA). The public comment process for an OPP provides the opportunity for members of the public to comment on matters of concern to them and requires the titleholder to assess and address (as applicable) those comments in the OPP in accordance with the regulations. While it is open to the public to make any comments in relation to any matters of concern with the offshore project, additional training is not necessary to make these comments. NOPSEMA, as the regulator tasked with assessing the OPP for approval, is resourced with suitably experienced and qualified personnel that are best placed for assessing the contents of the OPP overall. In preparing an Environment Plan, Beach consults with First Nations groups and other persons with offshore functions, interests or activities that may be affected by the Project. Beach provides information in a variety of formats to First Nations groups and other persons that may be affected,

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		to enable different persons and groups to understand the activities, risks and impacts and control measures in a more constructive manner. Beach will continue to engage with First Nation Groups in accordance with the regulations. No change has been made to the OPP in response to this comment.
PC165	Comment: [First Nation] priority is that Sea Country is protected and cared for and that we are part of the process. The 912 tribes of NW were saltwater people.	Beach Energy (Operations) Limited (Beach) acknowledges the cultural significance of Sea Country, which is assessed in detail in Section 4.6 of the Offshore Project Proposal (OPP). Beach has assessed the impact and risk of the project to Sea Country throughout the OPP. Beach is unable to identify a specific comment that merits a change to the OPP.
PC166	Comment: For [First Nation] the continued protection of the ecology of sea country is pivotal to [First Nation] success as we begin to explore business opportunities into sea kelp.	Beach Energy (Operations) Limited (Beach) acknowledges the cultural and socio-economic significance of Sea Country. Beach also acknowledges concerns held by communities about how projects such as the Offshore Gas Victoria Project (the Project) described in the Offshore Project Proposal (OPP) may impact cultural values and sensitives (such as kelp) of First Nations groups. In Chapter 4 of the OPP (Description of the Environment), Beach recognises the importance of Sea Country (Section 4.4.3) and discusses the abundance of kelp in marine environments particular to coastal Victoria and Tasmania and the importance of Kelp to several First Nations groups and the seaweed industry (Section 4.5.14). The OPP identifies and assesses the risk to ecological communities, such as the Giant Kelp Marine Forests, within the Planning Area. The Planning Area is much more expansive than the Project Area. The Project Area is where all infrastructure and activities associated with the Project will be undertaken and the Planning Area is based on the wider environment that may be affected by a spill (based on spill modelling). In the Planning Area the largest extent of Giant Kelp marine forests resides along the South Australian coastline (section 4.4.8.2), with patches around the Victorian coastline as well as King Island. Much of the giant kelp in Tasmania is found in the Tasman Peninsula, which is not within the Planning Area (Figure 4-36). The OPP must assess the environmental impact in the very unlikely event of a spill. As part of the OPP, Beach has modelled the worst-case scenario for a loss of containment from a marine diesel spill and a loss of well control.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		The environmental impact of an unplanned spill on the ecological function of the Giant Kelp Marine Forests of southeast Australia was assessed to be at the low threshold and are not predicted to have an impact (Table 7-25). In addition, Beach is required to have an accepted Environment Plan for all petroleum activities, which must have an Offshore Oil Pollution Emergency Plan in place in the unlikely event that there is a spill. No threatened ecological communities were identified in the Project Area. Beach has reviewed the OPP considering this comment and is satisfied that the OPP adequately addresses the risk to sea kelp and the potential impact on this ecosystem within the Planning Area, without the need for further amendment.
PC167	Comment: [First Nation] would be willing to co-design a process with Beach to facilitate capacity development initiatives.	Beach Energy (Operations) Limited (Beach) welcomes ongoing communication with First Nation groups to ensure that all current and future activities appropriately consider matters of importance to First Nation groups. Beach will continue to communicate and consult with First Nation groups where their functions, interests and activities may be affected by Beach's activities, however discussions around capability development is a matter that is not relevant to Beach's activities as described in the Offshore Project Proposal (OPP) and therefore outside the scope of this response. No changes have been made to the OPP in response to the comment.
PC168	Comment: [First Nation] consider the protection of underwater cultural heritage is of great importance. Challenging as little to no archaeological research in Tasmania.	Beach Energy (Operations) Limited (Beach) recognises the importance of protecting underwater cultural heritage and the statement that there is limited archaeological research in Tasmania. In undertaking project activities, Beach must comply with all relevant legislation and regulations, including the *Underwater Cultural Heritage Act 2018* and *Aboriginal Heritage Act 1975* (Tas). Beach has reviewed the Offshore Project Proposal (OPP) and has updated Section 2.4 of the OPP, in Table 2-4 (Relevant Tasmanian Legislation) to include the *Aboriginal Heritage Act 1975* (Tas).
PC169	Comment: Any artefacts found should be returned to the Aboriginal community.	Beach Energy (Operations) Limited (Beach) acknowledges the importance of preserving cultural heritage artefacts in all its activities. Underwater cultural heritage is protected under the *Underwater Cultural Heritage Act 2018* (Cth), and, under Section 40, the discovery of underwater cultural heritage must be notified to the Minister within 21 days of discovery.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		In Tasmania, cultural heritage is also protected under the *Aboriginal Heritage Act 1975* (Tas), which requires proponents to report an unexpected discovery to Aboriginal Heritage Tasmania who will provide further advice in accordance with the legislation. Beach has reviewed the Offshore Project Proposal (OPP) and updated Table 2-4 (Relevant Tasmanian Legislation) to include the *Tasmanian Aboriginal Heritage Act 1975*. Should any artefacts be found, Beach will act in accordance with all relevant legislation and regulatory requirements.
PC170	Comment: The Aboriginal community should be involved and given opportunity upskill during marine archeaological projects and certainly any repatriation efforts. Should be a condition of the project.	Beach Energy (Operations) Limited (Beach) acknowledges and appreciates the comments around development opportunities for First Nations communities, and their path to self-determination. However, this is not a matter for Beach to comment on or address in relation to the activities in the Offshore Project Proposal in accordance with the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*. No changes have been made to the OPP in response to the comment.
PC171	Comment: No native title areas in Tasmania so there must be allowances for [name] to catch-up in the way of native title comments.	Beach Energy (Operations) Limited (Beach) acknowledges the comment made in relation to the standing of Native Title claims and determinations in Tasmania. However, this is not a matter for Beach to comment on or address in relation to the activities in the Offshore Project Proposal in accordance with the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*. No changes have been made to the OPP in response to the comment.
3.3 Submitter No. 6		
PC320 Heritage Victoria	Comment: The table starting page 58 and listing legislation and regulations is omitting the *Aboriginal Heritage Act 2006* which protects Aboriginal heritage sites to 3nm offshore. Although not administered by Heritage Victoria, this Act is part of the regulatory framework this Project must adhere to.	Beach Energy (Operations) Limited has reviewed the Offshore Project Proposal (OPP) in response to this comment and has amended Table 2-3 - Relevant Victorian Legislations of the OPP to include the *Aboriginal Heritage Act 2006*.
PC321	Comment: On page 62, the table listing legislation and regulations describes the *Underwater Cultural Heritage Act*	Beach Energy (Operations) Limited has reviewed the Offshore Project Proposal in response to this comment and has amended Table 2-2 (Other relevant Commonwealth legislation) to include that

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	2018 with a focus on historic heritage. This act also covers "any trace of human existence" including submerged Aboriginal archaeological sites. The identification, assessment, protection, and regulation of submerged Aboriginal heritage sites in Commonwealth waters should be considered by the Project.	the scope of the *Underwater Cultural Heritage Act 2018* includes submerged Aboriginal archaeological sites.
PC322	Comment: Section 4.2.5 Maritime Archaeological Heritage – this section mentions the Tasmanian government authority responsible for the management of the State's historic shipwrecks and maritime heritage sites but does not mention Heritage Victoria as the Victorian government authority.	Beach Energy (Operations) Limited has reviewed the Offshore Project Proposal in response to this comment and has provided additional text to Section 4.2.5 (Maritime Archaeological Heritage) to state that the *Victorian Heritage Act 1995* is administered by Heritage Victoria.
PC323	Comment: Section 4.2.5 Maritime Archaeological Heritage – the last paragraph mentions use of sub-bottom profiler to identify buried objects, but shipwrecks, aircraft wrecks and objects can also sit on the surface. Has any surveying been done or been planned to identify surface anomalies that may be cultural material? It mentions that sand patches were only 20-30cm, but what sediments lay below, and could they have been deposited on shipwreck material? Could they have been deposited on submerged Aboriginal archaeological sites? Sub-bottom profiler alone cannot exclude the presence of cultural material.	Beach Energy (Operations) Limited (Beach) acknowledge the potential for underwater cultural heritage and recognised that there is a 130 km stretch of coastline in the Otway Basin known as the 'Shipwreck Coast'. Beach currently conducts petroleum operations in the Otway Basin and has previously undertaken geotechnical and geophysical seabed surveys (Surveys) prior to drilling wells and installing seabed infrastructure. One of the purposes of the Surveys is to assess the presence on any geohazards. For the Otway Offshore Gas Victoria (OGV) Project (the Project), Beach is also proposing to undertake further Surveys. National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) has accepted the Environment Plan (EP) for the OGV Project seabed assessment survey, which includes an Environmental Performance Standard for Survey data to be obtained in a manner that can be utilised to obtain information on First Nations underwater cultural heritage. This will be determined in consultation with the appropriate First Nations groups, where engagement can be obtained, and cultural heritage researchers or consultants. No change has been made to the Offshore Project Proposal in response to this comment.
PC324	Comment: Section 4.2.5 Maritime Archaeological Heritage addresses known maritime archaeological sites but does not discuss the potential for unknown archaeological sites, including up to 100 unfound aircraft wrecks that may be	Beach Energy (Operations) Limited (Beach) acknowledge the potential for maritime archaeological sites in the offshore environment in which it operates.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	within the Project and Planning Areas. This should be one of the main reasons to engage an appropriately qualified maritime archaeologist who can review geophysical and visual data to identify any potential maritime archaeological heritage, as noted in CM11.	The Offshore Project Proposal (OPP) includes new geotechnical and geophysical seabed surveys and cultural heritage assessments (the later as a control measure, CM11 - Cultural heritage assessments to identify any maritime archaeological and submerged cultural heritage and landscapes to inform protection priorities, , and develop and implement management measures and reporting requirements, where required, to prevent potential impacts). Beach is satisfied that the OPP adequately considers the potential for maritime archaeological heritage. No change has been made to the OPP.
3.4 Submitter No. 7		
PC325 Executive Summary	Comment: The Project is inconsistent with Australia's emissions reduction commitments under the Paris Agreement, and is contrary to scientific consensus regarding the steps that need to be taken in response to the threats associated with climate change.	Beach Energy (Operations) Limited (Beach) recognise that action to address climate change is necessary and that all energy systems must contribute to meet the targets set out in the Paris Agreement. As an energy company, Beach must play a role in managing its carbon emissions. Beach aspires to reach net zero Scope 1 and 2 emissions by 2050. Beach has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35 per cent by 2030. This is aligned with the Australian Government's target of a 43 per cent reduction in carbon emissions from a 2005 base. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. The proposed management of the impact is aligned with the Beach Environment Policy, Climate Change Policy, Sustainability Policy, Risk Management Standard, Environment Management Standard and Sustainability Standard as detailed in Section 6.6.3.3 (part 6) of the Offshore Project Proposal (OPP) (Table 6-43). Gas and condensate from OGP is supplied into the domestic Australian market. The scope 3 emissions associated with the processing, transmission/transport and end use of the gas and condensation will occur within Australian Commonwealth jurisdiction. Therefore, the scope 3 emissions will be managed in accordance with Australia's regulatory regime including NGER and the Safeguard Mechanism, which is designed "to deliver emissions reductions consistent with Australia's [NDC] under the Paris Agreement" (DCCEEW, 2023i) and the *Climate Change Act 2022*. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 MtCO2-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Further, Beach has calculated the carbon budget for the period of the Project (2025 to 2049) of 6,729 MtCO2-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. No change has been made to the OPP in response to this comment.
PC298 Executive Summary, Impacts on recreational activities and tourism, and Conclusions	Comment:[Name] is concerned that planned and unplanned events associated with the Project may also affect physical, ecological and socio-economic environments beyond the Planning Area, and that the potential impacts from planned and unpanned events, both within and outside the Planning Area, have been understated by Beach Energy. In particular, unplanned spills could have devastating consequences for the health of surfers, the ability of surfers to utilise the Shipwreck Coast and the West Coast of Tasmania, and could also cause disruption to other recreational users and tourism operators who rely upon the environments and coastlines in those areas.	Beach Energy (Operations) Limited (Beach) acknowledge the potential of impacts and risks associated with the Otway Offshore Gas Victoria Project. The comment specifically references the impact of hydrocarbon spills. A hydrocarbon spill is an unplanned event meaning it is not expected to occur but must be assessed to plan for and manage risk. An assessment of risks and impacts of planned and unplanned events is provided in Sections 6 and 7 of the Offshore Project Proposal (OPP). The Planning Area is based on modelling of worst-case scenarios, namely a combination of loss of containment and potential extent of condensate exposure modelled at north and south location within the Project Area. The Planning Area (Figure 4-1) represents the lowest threshold level for a spill which, for shoreline contact, is 10g/m3. The spill model (and report in Appendix M) was prepared by an independent expert, RPS, and represents hundreds of hypothetical individual spill scenarios that are simulated to show where hydrocarbon from a spill could go under different metocean conditions (such as currents, wind, waves and temperature). In this regard, Beach does not consider the spill event is understood to or likely to extend and have consequences outside of the Planning Area. It is important to note that spill modelling does not consider any mitigation activity or response plans. For example, Beach is required by Australia's offshore energy regulator, the National Offshore Petroleum Safety and Environmental Management Authority, to have in place for all relevant project activities, accepted Oil Pollution Emergency Plans and Operations and Scientific Monitoring Plans. The socio-economic impacts from a hydrocarbon spill are evaluated in Section 7.4.4 of the OPP (see Tables 7-20 to 7-25). Beach is satisfied the OPP provides sufficient information on the potential impact of a hydrocarbon spill and has made no change to the OPP in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC297 Impacts on recreational activities and tourism	Comment: Beach Energy asserts that the Planning Area represents the physical, ecological and socio-economic environment that may be affected from planned and unplanned events associated with the Project. Such project activities would directly impact surfers and other recreational users of the environments within the Planning Area, and [Name] is understandably concerned about such activities and particularly the risk of spills. In that regard, the OPP notes at section 7.4.2.4.3 that the probability of hydrocarbon accumulation to any shoreline at, or above, the low level (10 g/m2) threshold from the loss of well control at Release Location North would be 100% during summer conditions and 98% during winter conditions.	Beach Energy (Operations) Limited (Beach) acknowledge the potential environmental impact of a hydrocarbon spill. The comment relates to Section 7.4 of the Offshore Project Proposal (OPP) that assesses the consequence of an unplanned spill from a loss of containment from a well or marine diesel spill from a vessel. A hydrocarbon spill is an unplanned event meaning it is not expected to occur but must be assessed to plan for and manage risk. The Planning Area is based on a combination of loss of containment and potential extent of condensate exposure to shorelines at the low-level threshold of 10 g/m2 (see Table 4-1 and 7-19). The low threshold levels are considered to be below levels that would cause environmental harm. Typically, low exposure thresholds of 10 g/m2 predict potential for some socio-economic impact such as visible on the sea surface. In the unlikely event of a spill, the potential impact of shoreline exposure on socio-economic receptors (including recreation and tourism) is summarised in Table 7-24. The National Offshore Environmental and Safety Management Authority (NOPSEMA) and Australian Maritime Safety Authority (AMSA) guidance indicates that the low threshold shoreline hydrocarbon contact would not initiate a clean-up response. The socio-economic impact for recreational activities is ranked as Moderate, reflecting short-term and localised consequences. Based on the modelling (currents, winds, waves, temperature), in the unlikely event of loss of containment of condensate from the well, there is a 96 per cent chance in winter and 99 per cent chance in summer (section 7.4.3.6), of the low threshold levels accumulating on the shoreline. It is important to note the spill model does not take into account any mitigation activity or response plans. Beach is required by NOPSEMA to have in place for all relevant project activities, accepted Oil Pollution Emergency Plans and Operations and Scientific Monitoring Plans. The socio-economic impacts from a hydrocarbon spill are evaluated in Section 7.4.4 of the OPP (see Tables 7-20 to 7-25). Beach is satisfied the OPP provides sufficient information on the potential impact of a hydrocarbon spill and has made no change to the OPP in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC326 Climate impacts	Comment: Beach Energy's OPP includes at section 6.6.4 an Impact Evaluation Summary which asserts that emissions related to the Project will be a minor contributor to global GHG emissions and climate change, and that impact solely from the Project emissions will be minor. However, the basis upon which Beach Energy asserts that the Project will only be a minor contributor to global GHG emissions and climate change and that the impact solely from the Project emissions will only be minor is not clear.	Beach Energy (Operations) Limited (Beach) commissioned a report on the greenhouse gas (GHG) emissions from the Otway Offshore Gas Victoria Project over the life of the Project (Appendix K of the Offshore Project Proposal (OPP)). Over the life of the project, the GHG estimate is 13.05 million tonnes CO_2-e. The emissions are discussed in Section 6.6.3.1 and represents the emissions as a percentage of both Australian (0.19%) and global carbon budgets (0.0025%). All comparisons indicate the project is a minor contributor to global (and Australian) carbon budget. Beach has considered this claim and has revised Section 6.6.3 of the OPP to consistently state the percent contribution of emissions from the Project relative to Australian and global carbon budgets.
PC344 Matters of National Environmental Significance	Comment: Beach Energy asserts that the outer boundary of the Planning Area is the worst-case and largest spatial extent where unplanned hydrocarbon releases from Project activities could have an environmental consequence. Despite Beach Energy's assertion, Surfrider is concerned that planned and unplanned events associated with the Project may also affect physical, ecological and socio-economic environments beyond the Planning Area.	Beach Energy (Operations) Limited (Beach) acknowledge the potential impact of an unplanned hydrocarbon spill. The comment relates to Section 7.4 of the Offshore Project Proposal (OPP) that assesses the consequence of an unplanned spill from a loss of containment from a well or marine diesel spill from a vessel. The Planning Area is based on a combination of loss of containment and potential extent of condensate exposure to shorelines at the low-level threshold of 10 g/m2 (see Table 4-1 and 7-19). The low threshold levels are considered to be below levels that would cause environmental harm. Typically, low exposure thresholds of 10 g/m2 predict potential for some socio-economic impact such as visible on the sea surface. Beach is satisfied the OPP provides sufficient information on the potential impact of a hydrocarbon spill. As the comment has not provided any additional information not already assessed in the OPP, no change has been made to the OPP.
PC345 Matters of National Environmental Significance	The Tasmanian Wilderness World Heritage Area (TWWHA) falls within the Planning Area. The TWWHA is a globally significant temperate wilderness area and contains outstanding examples of ongoing geological, biological and ecological processes in addition to numerous rare	The Offshore Project Proposal (OPP) provides an assessment of ecosystems and environments as well as the potential environmental impacts and risks for the Project. As summarised in the Introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the following areas are no longer within the Planning Area of the OPP: • Tasmania World Heritage Wilderness

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	flora and fauna species. It is also rich in cultural heritage, with archaeological sites dating back to the Pleistocene. The Planning Area encompasses 3 Threatened Ecological Communities (TECs) that have coastal components: assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria; giant kelp marine forests of south east Australia (Endangered); and subtropical and temperate coastal saltmarsh (Critically Endangered). There are 4 Ramsar wetlands that overlap with the Planning Area: Glenelg Estuary, Lavinia, Port Phillip Bay, and Westernport Bay. These areas play vital ecological roles, providing nursery habitat for birds, fish, reptiles, invertebrates and other species, as well as maintaining water quality and shoreline structure. Wetlands are also powerful carbon sinks, trapping atmospheric carbon dioxide in sediments and vegetation.	• Glenelg Estuary and Discovery Bay Wetlands, Port Phillip Bay (Western Shoreline) and Bellarine Peninsula and Western Port Ramsar wetlands Section 4 of the OPP provides a description of the existing environment including threatened ecological communities, Ramsar wetland and marine parks as habitats for many species. As the comment does not contain any new information about the content of the OPP, no change is made to the OPP.
PC328 Matters of National Environmental Significance	Comment: Australian Marine Parks provide habitat for myriad species and ecological communities, including EPBC-listed species such as blue and pygmy blue whales, southern right whales, humpback whales, fin whales, sei whales, wandering albatross, shy albatross, little penguins, white sharks, New Zealand fur seals, and others. These unique and highly biodiverse ecosystems should be protected from the damaging effects of offshore fossil fuel exploration and operation, such as leaks and spills, planned discharges of hazardous substances, and abandonment of derelict infrastructure at the end of the operational period.	Beach Energy (Operations) Limited (Beach) acknowledge the potential for environmental impact and risk from the proposed drilling activities in the Otway Offshore Gas Victoria Project (the Project). The Offshore Project Proposal (OPP) provides for a detailed description of the existing environment including conservation values and sensitivities and ecological environment (see Chapter 4). The OPP also assesses the environmental impacts and risks to these receptors. These environmental risks and impacts include the potential impact of spills (Section 7.4) and planned discharges (Sections 6.7 to 6.10). Identification and implementation of relevant control measures will ensure that potential environmental impact and risk are of an acceptable level. As the comment has not presented additional information not already included in the OPP, no changes have been made to the OPP. Further, the OPP includes content on the decommissioning phase of the Project (Section 3.8.5), including Beach's responsibility to remove all structures, equipment and property for the title area in accordance with Section 572(3) of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		(OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach has reviewed the OPP considering this comment and is satisfied it adequately addresses the decommissioning requirements in accordance with Section 7 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023*. No change has been made to the OPP in response to this comment.
PC315 Key Ecological Features	Comment: As with Marine Parks, KEFs and the species and ecosystems they support should be protected from the impacts of the offshore fossil fuel industry, in both the short and long term.	Beach Energy (Operations) Limited (Beach) acknowledge concerns about the potential environmental impacts and risks of its Otway Offshore Gas Victoria Offshore Project (the Project) on Australian Marine Parks (AMP) and Key Environmental Features (KEF). The AMPs within the Planning Area include the Apollo and Zeehan marine parks. No AMPS are within the Project Area. The KEFs within the Planning Area include the Bonney Coast Upwelling and West Tasmanian Canyons. No KEFs are within the Project Area. The AMP and KEF are environmental receptors that are assessed for potential environmental impacts and risks (See Sections 6 and 7). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC346 Protected Species and Biologically Important Areas	Comment: Protected species There are 159 threatened species and 81 migratory species listed under the EPBC Act that occur within the Planning Area, including: • 45 fish species • 122 bird species • 32 cetacean species • 4 pinniped species • 3 marine turtle species	Beach Energy (Operations) Limited (Beach) agrees that threatened and migratory species listed under the *Environmental Protection and Biodiversity Conservation Act 1999* may be present within the Planning Area of the Otway Offshore Gas Project (the Project). As summarised in the Introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the threatened, migratory, marine or cetacean species protected under the EPBC Act identified within the Project Area and revised Planning Area, now include: • 12 fishes (including sharks) (9 within the Project Area and another 3 within the Planning Area beyond the Project Area) • 111 birds (33 within the Project Area and another 78 within the Planning Area beyond the Project Area)

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Biologically Important Areas (BIAs) There are 18 species that have BIAs within the Planning Area: 15 bird species, 1 fish species, and 2 cetacean species. Of these 18 species, 13 have BIAs overlapping the smaller Project Area, within which the exploration and development activities are to take place: the antipodean albatross, black-browed albatross, Buller's albatross, Campbell albatross, common diving-petrel, Indian yellow-nosed albatross, short-tailed shearwater, shy albatross, wandering albatross, wedge-tailed shearwater, white shark, pygmy blue whale and southern right whale.	• 34 marine mammals (29 within the Project Area and another 5 within the Planning Area beyond the Project Area) • 3 marine reptiles (within both the Project Area and Planning Area beyond the Project Area) The Offshore Project Proposal (OPP) provides a comprehensive review of threatened and migratory species within the Project and Planning Areas (Section 4.4.9). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC299 Cetaceans	Comment: There are 32 species of cetacean that are known to occur, likely to occur, or may occur within the Project Area and/or Planning Area. The southern right whale (listed as Endangered under the EPBC Act) is known to occur within the Project and Planning Areas, with a peak from May to October as the whales visit their calving areas near Warrnambool. Pygmy blue whales (Endangered) occur in the Project and Planning Areas and can arrive in their seasonal foraging areas (in the eastern segment of the Bonney Upwelling in western Victoria) as early as November and stay until March and as late as May. Previous research on pygmy blue whale habitat use in the Bonney Upwelling has found that pygmy blue whales utilise habitat areas within and surrounding the proposed Project Area in the Otway Basin (Gill, 2020; Moller et al. 2020)	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding seasonal presence of southern right whale and pygmy blue whale in the Project and Planning Areas and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Section 4.4.9.7 of the OPP describes pygmy blue whale presence and behaviours within the Project and Planning Areas. Beach has reviewed the references provided in the comment (Gill, 2020; Moller et al. 2020) in the context of the information provided. Gill (2020) is used extensively to support the description of pygmy blue whale in the Project and Planning Areas, whilst tagging studies conducted by Moller et al (2020) (noting that in the OPP the reference is quoted as Möller et al. (2015)) are described in detail in a dedicated sub-section, including figures (e.g. Figure 4-51). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC300 Fish	Comment: Numerous EPBC-listed fish species fall within the Project and/or Planning Areas, including the red handfish (Critically Endangered), Maugean skate (Endangered), oceanic whitetip shark (Migratory), school shark (Conservation Dependent), whale shark (Vulnerable),	Beach Energy (Operations) Limited (Beach) acknowledge concerns about threatened fish species and the potential environmental impacts and risks from the Otway Offshore Gas Victoria Project (the Project).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	and the white shark (Vulnerable). Shortfin and longfin eels occur in Victorian waters, beginning their life cycle in estuaries before migrating to their oceanic spawning grounds in the Coral Sea. Shortfin eels hold cultural significance to First Nations people, such as the Gunditjmara in south-western Victoria. Offshore fossil fuel development has been identified as a potential threat to eels during their lifecycle.	Section 4.4.9.3, in particular Table 4-21, of the Offshore Project Proposal (OPP) lists threatened fish species that are likely to be present in the Project and Planning Areas. The OPP also identifies the Biologically Important Areas (BIAs) critical to the survival of a species within the Project and Planning Areas. Revisions to the scope of the Otway Gas Victoria (OGV) Project and mean that the EPBC-listed fish species of Maugean Skate, Red Handfish, Oceanic Whitetip Shark and Whale Shark are no longer within the Project Area and revised Planning Area. For fish species, only the White Shark has foraging BIA overlapping the Planning Area (Table 4-19 and Figure 4-38). Section 4.4.9.3, in particular Table 4-21, of the Offshore Project Proposal (OPP) lists threatened fish species that are likely to be present in the Project and Planning Areas. Beach also recognises the presence of eels in the Planning Area and the cultural significance of eels for First Nations Groups (Section 4.4.9.3.2). The comment states that fossil fuel development has been identified as a potential threat to eels during their lifecycle. The impacts to First Nations values and sensitivities are assessed throughout the OPP. The environmental impacts to eels for light emissions, were assessed as having a residual impact of Minor (Section 6.3.3.6) and migrating eels are unlikely to be impacted by noise emissions (section 6.4.3.1.3). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC351 Birds & Pinnipeds	Birds Six Endangered seabird species and 10 Endangered bird species are found within the Planning Area. There are also 8 Critically Endangered bird species found within these areas, including the swift parrot, regent honeyeater, plains-wanderer, orange-bellied parrot, King Island scrubtit, eastern curlew, and curlew sandpiper. Pinnipeds The Australian fur seal and long-nosed fur seal are known to breed within the Planning Area and may occur within the Project Area. The Australian sea lion (Endangered) and	Beach Energy (Operations) Limited (Beach) acknowledge concerns about threatened species and the potential environmental impacts and risks from the Otway Offshore Gas Victoria Project (the Project). A description of birds and pinnipeds that may be in the Planning Area are summarised in the Offshore Project Proposal (OPP). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	southern elephant seal (Vulnerable) can be found within the Planning Area.	
PC301 Marine turtles	Comment: Three EPBC-listed marine turtle species are known to occur within the Project and/or Planning Areas: the green (Vulnerable), leatherback (Endangered) and loggerhead turtle (Endangered). These species use the area for migration and foraging and are susceptible to vessel strike and entanglement.	Beach Energy (Operations) Limited (Beach) acknowledge the Otway Offshore Gas Victoria Project (the Project) may have potential environmental impacts and risks on various marine fauna, including turtles. Considering the comment, Beach has reviewed the Offshore Project Proposal (OPP) and confirms that Section 4 describes the behaviours of the turtle species and Section 7.2.3.2 summarises the risk of vessel collision with turtles. The assessment (Table 7-8) concludes that project vessel collisions with turtles are inherently unlikely due to the offshore location (and resultant low densities of turtles), slow speeds of vessels and diving startle response of turtles. The OPP requires details and evaluation of the environmental impacts and risks of the Project appropriate to the nature and scale of each impact or risk. In light of comment, Beach has provided further detail in the OPP about the presence of turtles in the planning and project area, and the impacts and risks (please refer to PC229 for further detail).
PC329 Cultural heritage	Comment: In Victoria, Registered Aboriginal Parties (RAPs) are legally recognised in accordance with the *Aboriginal Heritage Act 2006* (Vic) as the traditional owner corporation to manage and protect First Nations cultural heritage over their country, including coastal and inshore waters. There are 4 RAPs within the Planning Area: Indigenous Protected Areas (IPAs) are managed by First Nations groups in recognition of their deep and continuing cultural connections to land and sea country. IPAs also contain sites of cultural significance, such as middens, artefacts, engravings, and sacred sites. The IPAs within the Planning Area include the Preminghana IPA and three Future Sea Country IPAs.	Beach Energy (Operations) Limited (Beach) agrees that cultural heritage should be protected. In undertaking all its project activities, Beach must comply with all relevant legislation and regulations, including the *Underwater Cultural Heritage Act 2018* and *Aboriginal Heritage Act 1975* (Tas) and the *Aboriginal Heritage Act 2006* (Vic). The OPP provides a description of native title, Registered Aboriginal Parties and Indigenous Protected Areas within the Planning Area. Cultural heritage is assessed in the Offshore Project Proposal (OPP). It will also be assessed in future Environment Plan(s) through consultation with relevant persons to identify cultural values and sensitivities of First Nations groups. No changes have been made to the OPP in response to the comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	First Nations groups within the Planning Area have enduring cultural connections with numerous species, ecosystems and landscapes. These are elaborated within the OPP, and taken together represent incredible tangible and intangible cultural heritage that deserves to be protected.	
PC302 Consultation and assessment process	Comment: According to the assessment process detailed by NOPSEMA on its website, the requirement for an OPP such as this one was introduced in 2014 "to allow for public scrutiny and comment on offshore petroleum developments early in the project lifecycle". Further on that website it is stated that "an OPP for a project must be accepted by NOPSEMA before the proponent can submit environment plans that make up the project". This suggests that an OPP should be the first step in regulatory assessment and public consultation on offshore petroleum projects. However, the public comment period for this OPP came after Beach Energy had closed public comment on 2 April 2024 for an Environment Plan (EP) detailing a drilling program on the same titles as the OPP, as well as additional titles in the Bass Basin. The OPP addresses this: "[t]his OPP includes description of exploration and appraisal drilling activity which is an activity that does not require an accepted OPP as part of the environmental permitting framework".	Beach Energy (Operations) Limited (Beach) acknowledges that offshore environmental approvals including those for Offshore Project Proposals (OPP) and Environment Plans (EP) are technical and complex documents with bespoke legislative requirements. Beach confirms that the OPP and Offshore Gas Victoria Drilling and P&A Activities EP (Drilling EP) have been accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) in accordance with all regulatory requirements. Specifically, we note that Beach's Drilling EP covers exploration and appraisal drilling, and plug and abandonment activities and those activities – including exploration drilling – do not require an OPP. Beach refers to the guidance note published on NOPSEMA's website, titled *Offshore environmental approvals*. It states "Exploration activities, such as seismic surveys and exploration drilling, do not require an OPP, but do require an EP." While Beach notes your concern, for the reasons outlined above the Drilling EP does not need to be part of an accepted OPP for Beach to submit an EP to NOPSEMA for assessment. The environmental approvals for the offshore project are summarised in Section 1.5 (OPP Purpose and Scope), Section 2.2 (Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023) of the OPP. Beach has provided additional information in the OPP to describe the environmental approval process in section 3.3.1 of the OPP: <u>An OPP is needed for most new offshore petroleum development projects in Commonwealth waters. An 'offshore project' is defined in the OPGGS (Environment) Regulations as 'one or more activities that are undertaken for the purpose of the recovery of petroleum…".</u> <u>As described in section 1.5.1 of the OPP, section 15 of Environment Regulations allows a proponent to use the OPP arrangements for exploration and appraisal activities. While an OPP must be accepted by NOPSEMA before the proponent can submit EPs for activities that make up</u>

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		an offshore project, this pre-requisite does not apply to exploration and appraisal activities such as exploratory drilling. As such, Beach has submitted an EP to NOPSEMA for the exploration and appraisal drilling activities. The initial exploration and appraisal drilling campaign described in this OPP is part of the OGV Drilling and P&A Activities EP. Activities in the EP include exploration drilling and depending on well results, either P&A or temporary well suspensions.
PC303 Consultation and assessment process	Comment: Further explanation and clarity is required concerning the requirements for OPP approval prior to EP submission. OPPs open for public comment are located in a different section of the NOPSEMA website than EPs open for public comment. This adds an extra layer of complexity to engaging with the OPP for relevant persons and community members who may have an interest in the OPP but are not able to locate the OPP or its public comment portal, as these are not in the same online location as the EPs.	Beach Energy (Operations) Limited (Beach) acknowledge that the environmental approvals for offshore petroleum activities are complex. Further explanation and clarity on the requirements for Offshore Project Proposal (OPP) and Environment Plans (EPs) is provided in above PC302. The remainder of the comments relates to the public comment process and National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) website. NOPSEMA is responsible for managing the public comment process for OPPs and EPs and provides information on its website on the public submission process. In addition to NOPSEMA's website, Beach provides information and invitation for public comment. As outlined in various NOPSEMA policies, Beach promoted the public comment process for the OPP (and its Offshore Gas Victoria Drilling and P&A Activities EP) by publishing a public notice in eight different newspapers, emailing the project stakeholder list, and prominently featuring information about the public comment period and links to NOPSEMA's website on Engage Beach, Beach's online consultation hub. Beach has made no change to the OPP in response to this comment.
PC304 Other concerns	Comment: Transit of vessels to and from the project locations is excluded from the OPP as this is outside the scope of the OPGGS Act. To service the proposed activities, the project will utilise existing support facilities at Geelong and Portland. Vessel traffic needs to be explicitly quantified and included in the risk assessment framework, as vessel strike is a threat to marine megafauna, including cetaceans and marine turtles.	Beach Energy (Operations) Limited (Beach) acknowledge that offshore activities may have potential environmental impacts and risks on marine fauna. The Offshore Project Proposal (OPP) provides for the consideration of whole-of-project environmental impacts and risks. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. In this regard, vessel traffic will depend on the type of activity carried out in the offshore environment and will be considered in the relevant EPs. The OPP assesses the potential risk for vessel collision with megafauna (Section 7.2).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Common controls implemented in relevant EPs to minimise the risk of vessel strikes include Marine Fauna Observers under the Whale Management Procedure for monitoring and reporting, designed to comply with various government reporting for vessel strikes or injury on marine life. The relevant EPs will also highlight that reducing vessel speed has been shown to be an effective measure to reduce vessel strikes for marine species. By implementing these types of control measures, the risk assessment of vessel strike with marine fauna is rated as Low and to be of an acceptable level. Beach is satisfied the OPP adequately addresses the impact of vessel traffic on marine fauna. No change has been made to the OPP.
PC305 Other concerns	Comment: Hydraulic valves in the blowout preventer infrastructure will be vented to sea when closed, releasing an estimated 22-66 litres of hydraulic fluid into the ocean. The OPP comments that this fluid is water soluble and "readily disperses in the receiving waters" but the type of hydraulic fluid is not specified so that this comment of water solubility can be verified. To be water soluble, the hydraulic fluid would need to be one of the following types: water-oil emulsion (such as Shell's polyalkylene glycol (PAG)); water glycol; or biodegradable with a base of soybean, rapeseed, or sunflower oil.	Beach Energy (Operations) Limited (Beach) acknowledge that discharge of hydraulic fluid from blow-out preventers during drilling operations and production operations may occur as part of the Otway Offshore Gas Victoria Project. Beach has reviewed the Offshore Project Proposal (OPP) considering this comment and confirms that the OPP has identified that routine petroleum activities may result in the discharge of glycol based hydraulic fluids into the marine environment to be about 4m^3 per year (Section 3.8.6.1). Hydraulic control fluids are typically low toxicity, readably biodegradable, low potential for bioaccumulation and would rapidly disperse and dilute in the within the marine environment (Section 6.9.2.1). The OPP provides for the consideration of whole-of-project environmental impacts and risks of the project appropriate to the nature and scale of each impact or risk. In the case of discharge of hydraulic fluids, the extent of the discharge is within tens of meters (of the point of discharge) and the impact consequence is assessed as less than Minor. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. EPs include more detailed information on chemicals and hazardous materials for use offshore with regards to Beach's Chemical Management Procedure and the Offshore Chemical Notification Scheme, which evaluates all production and drilling chemicals in terms of environmental impact. Beach is satisfied the OPP adequately addresses the impact of discharges to the marine environment. No change has been made to the OPP.

ID	Summary of comments received	Beach’s assessment of merit of comment(s) and response(s) to comments and/or objections
PC316 Other concerns	Comment: The OPP says that materials used as additives during drilling (i.e. dry bulk barite, bentonite, cement) will be discharged to the marine environment. Other planned discharges include condensate, brine, amine-type corrosion inhibitors, and suspension fluids. An explanation of the potential volumes of material, as well as the potential impacts of this dumping on the physical and biological environment, is required in order for relevant persons to make an informed assessment of the impacts of these activities.	Beach Energy (Operations) Limited (Beach) agree that discharge of materials from drilling operations and production operations may occur as part of the Otway Offshore Gas Victoria Project (the Project). Beach has reviewed the Offshore Project Proposal (OPP) considering this comment and confirms that planned discharges (e.g. drill cuttings, drill fluids, cement, commissioning and operational fluids, waste) are assessed in Sections 6.7 to 6.10 of the OPP. The OPP provides for the consideration of whole-of-project environmental impacts and risks. The OPP must provide details and evaluation of the environmental impacts and risks of the project appropriate to the nature and scale of the potential impact and risk. In the case of discharges from drilling activities, the impact consequence is assessed to be minor consequence and of an acceptable level. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. For example, the EP for the OGV Drilling and P&A Activities provides the level of detail suggested in the comment in relation to volumes and types of discharges and assessment of potential impacts and risks. For the purpose of the OPP, Beach is satisfied adequate information is provided on discharges and potential impacts and risks. No change has been made to the OPP in response to this comment.
PC327 Conclusions	Comment: The proposed drilling operations threaten these species and habitats through the risk of habitat degradation via condensate and MDO spills, vessel strike of marine fauna, and planned discharges of industrial products at every phase of production.	Beach Energy (Operations) Limited acknowledge the potential for environmental impact and risk from the proposed drilling activities in the Otway Offshore Gas Victoria Project (the Project). The Offshore Project Proposal (OPP) provides for the consideration of whole-of-project environmental impacts and risks. These environmental risks and impacts are assessed in the OPP, including the potential impact of spills (Section 7.4), vessel strike of marine fauna (Section 6.1) and planned discharges (Sections 6.7 to 6.10). In each case, the risk consequence is assessed to be of an acceptable level. The Environment Plan(s) that will be required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
3.5 Submitter No. 8		
PC317 Introduction	Comment: According to the International Energy Agency (IEA), any new fossil fuel projects are incompatible with efforts to reach net zero by 2050 and put our oceans and climate at risk of irreversible harm. Moreover, the opening up of new fossil fuel developments is contrary to the globally-agreed imperative to limit warming to 1.5 degrees Celsius. In this OPP, production from Artisan, La Bella and unidentified future prospects is estimated to occur for up to 30 years, until 2055. The OPP notes that this may be extended "subject to future investment and developments in surrounding fields."	Beach Energy (Operations) Limited (Beach) recognise that action to address climate change is necessary and that all energy systems must contribute to meet the targets set out in the Paris Agreement. As an energy company, Beach must play a role in managing its carbon emissions. Beach aspires to reach net zero Scope 1 and 2 emissions by 2050. Beach has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35% by 2030. This is aligned with the Australian Government's target of a 43% reduction in carbon emissions from a 2005 base. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. The Australian Government released the Future Gas Strategy in May 2024, mapping out its plan for how gas will support the economy's transition to net zero. A key principle of the gas strategy recognises that new sources of gas supply are needed to meet demand during the economy-wide transition to net zero. The Otway Basin is one of several basins identified as possible sources of additional domestic gas supply to the east coast market. The Otway Offshore Gas Victoria Project is consistent with the Future Gas Strategy. Importantly, for the Future Gas Strategy, the need for new gas supply is consistent with principles for emissions reductions, energy affordability and energy transition in Australia and globally. As summarised in the introduction to this Report, the scope of the OPP is revised resulting in a change in the end of field life to 2045.
PC319 Introduction	Comment: This proposal poses significant risk to our oceans, First Nations cultural heritage, and climate.	Beach Energy (Operations) Limited (Beach) acknowledges the Offshore Gas Victoria Project may have potential environmental impacts and risks on marine fauna and ecosystems, as well as potential impacts and risks on cultural values and sensitivities assessed in Section 4.6 of the Offshore Project Proposal (OPP). Sections 6 and 7 of the OPP assess the potential environmental impacts and risks.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		As the comment does not raise any new information or apparent comment about the content of the OPP, no change has made to the OPP.
PC347 Impacts of proposed activities – Cultural heritage	Comment: In Victoria, Registered Aboriginal Parties (RAPs) are legally recognised as the Traditional Owner Corporation to manage and protect First Nations cultural heritage over their Country, including coastal and inshore waters. There are 4 RAPs within the Planning Area: Eastern Maar Aboriginal Corporation; Gunaikurnai Land and Waters Aboriginal Corporation; Gunditj Mirring Traditional Owners Aboriginal Corporation; and Wadawurrung Traditional Owners Aboriginal Corporation. Indigenous Protected Areas (IPAs) are managed by First Nations groups in recognition of their deep and continuing cultural connections to land and sea Country. IPAs also contain sites of cultural significance, such as middens, artefacts, engravings, and sacred sites. The IPAs within the Planning Area include the Preminghana IPA and three Future Sea Country IPAs: Gunditjmara Sea Country IPA, Nanjit to Mallacoota Sea Country IPA, and Tayaritja (Bass Strait Islands) Sea Country IPA. First Nations groups within the Planning Area have enduring cultural connections with numerous species, ecosystems and landscapes. These are elaborated within the OPP, and taken together represent incredible tangible and intangible cultural heritage that deserves to be protected from toxic spills and damage to significant ecosystems and species.	Beach Energy (Operations) Limited (Beach) agrees that cultural heritage should be protected. The OPP provides a description of native title, Registered Aboriginal Parties and Indigenous Protected Areas within the Planning Area and cultural values and sensitivities (see Section 4.6 of OPP). Beach acknowledges the statement summarising the concerns of the potential impact of the Otway Offshore Gas Victoria Project on the cultural heritage values and sensitivities. Sections 6 and 7 of the Offshore Project Proposal (OPP) evaluate the environmental impacts and risks of the Project and identifies where First Nations cultural values and sensitivities may be potentially affected. As the comment does not raise any new information or apparent comment about the content of the OPP, no change has made to the OPP.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC318 Impacts of proposed activities - Protected species	Comment: There are 159 threatened species and 81 migratory species listed under the EPBC Act that occur within the Planning Area, including: - 45 fish species - 122 bird species - 32 cetacean species - 4 pinniped species - 3 marine turtle species Biologically Important Areas There are 18 species that have Biologically Important Areas (BIAs) within the Planning Area: 15 bird species, 1 fish species, and two cetacean species. Of these 18 species, 13 have BIAs overlapping the smaller Project Area, within which the exploration and development activities are to take place: the antipodean albatross, black-browed albatross, Buller's albatross, Campbell albatross, common diving-petrel, Indian yellow-nosed albatross, short-tailed shearwater, shy albatross, wandering albatross, wedge-tailed shearwater, white shark, pygmy blue whale and southern right whale.	Beach Energy (Operations) Limited (Beach) agrees that threatened and migratory species listed under the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) may be present within the Planning Area of the Otway Offshore Gas Project (the Project). As summarised in the Introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the threatened, migratory, marine or cetacean species protected under the EPBC Act identified within the Project Area and revised Planning Area, now include: - 12 fishes (including sharks) (9 within the Project Area and another 3 within the Planning Area beyond the Project Area) - 111 birds (33 within the Project Area and another 78 within the Planning Area beyond the Project Area) - 34 marine mammals (29 within the Project Area and another 5 within the Planning Area beyond the Project Area) - 3 marine reptiles (within both the Project Area and Planning Area beyond the Project Area) The Offshore Project Proposal (OPP) provides a comprehensive review of threatened and migratory species within the Project and Planning Areas (Section 4.4.9). The OPP provides a comprehensive review of Biologically important Areas for species within the Project area and Planning area. As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC311 Impacts of proposed activities - Cetaceans	Comment: The southern right whale (listed as Endangered under the EPBC Act) is known to occur within the Project and Planning Areas, with a peak from May to October as the whales visit their calving areas near Warrnambool. Pygmy blue whales (Endangered) occur in the Project and Planning Areas and can arrive in their seasonal foraging areas (in the eastern segment of the Bonney Upwelling in western Victoria) as early as November and stay until March and as late as May.	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding seasonal presence of southern right whale and pygmy blue whale in the Project and Planning Areas and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Section 4.4.9.7.4 of the OPP describes pygmy blue whale presence and behaviours within the Project and Planning Areas. Beach has reviewed the references provided in the comment (Gill, 2020; Moller et al. 2020) in the context of the information provided. Gill (2020) is used extensively to support the description of pygmy blue whale in the Project and Planning Areas, whilst tagging

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Previous research on pygmy blue whale habitat use in the Bonney Upwelling has found that pygmy blue whales utilise habitat areas within and surrounding the proposed Project Area in the Otway Basin (Gill, 2020; Moller et al. 2020)	studies conducted by Moller et al (2020) (noting that in the OPP the reference is quoted as Möller et al. (2015)) are described in detail in a dedicated sub-section, including figures (e.g. Figure 4-51). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC312 Impacts of proposed activities - Fish	Comment: Numerous EPBC-listed fish species fall within the Project and/or Planning Areas, including the red handfish (Critically Endangered), Maugean skate (Endangered), oceanic whitetip shark (Migratory), school shark (Conservation Dependent), whale shark (Vulnerable), and the white shark (Vulnerable). Shortfin and longfin eels occur in Victorian waters, beginning their life cycle in estuaries before migrating to their oceanic spawning grounds in the Coral Sea. Shortfin eels hold cultural significance to First Nations people, such as the Gunditjmara in south-western Victoria. Offshore fossil fuel development has been identified as a potential threat to eels during their lifecycle.	Beach Energy (Operations) Limited (Beach) acknowledge concerns about threatened fish species and the potential environmental impacts and risks from the Otway Offshore Gas Victoria Project (the Project). Section 4.4.9.3, in particular Table 4-21, of the Offshore Project Proposal (OPP) lists threatened fish species that are likely to be present in the Project and Planning Areas. The OPP also identifies the Biologically Important Areas (BIAs) critical to the survival of a species within the Project and Planning Areas. Revisions to the scope of the Otway Gas Victoria (OGV) Project and mean that the EPBC-listed fish species of Maugean Skate, Red Handfish, Oceanic Whitetip Shark and Whale Shark are no longer within the Project Area and revised Planning Area. For fish species, only the White Shark has foraging BIA overlapping the Planning Area (Table 4-19 and Figure 4-38). Section 4.4.9.3, in particular Table 4-21, of the Offshore Project Proposal (OPP) lists fish species that may, or are likely to be present in the Project and Planning Areas. Beach also recognises the presence of eels in the Planning Area and the cultural significance of eels for First Nations Groups (Section 4.4.9.3.2). The comment states that fossil fuel development has been identified as a potential threat to eels (migration and spawning) during their lifecycle. The impacts to First Nations values and sensitivities are assessed throughout the OPP. The environmental impacts to eels for light emissions, were assessed as having a residual impact of Minor (Section 6.3.3.6) and migrating eels are unlikely to be impacted by noise emissions (section 6.4.3.1.3). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC348 Impacts of proposed activities - Birds and Pinnipeds	Six Endangered seabird species and 10 Endangered bird species are found within the Planning Area. There are also 8 Critically Endangered bird species found within these areas, including the swift parrot, regent honeyeater, plains-wanderer, orange-bellied parrot, King Island scrubtit, eastern curlew, and curlew sandpiper. The Australian fur seal and long-nosed fur seal are known to breed within the Planning Area and may occur within the Project Area. The Australian sea lion (Endangered) and southern elephant seal (Vulnerable) can be found within the Planning Area.	Beach Energy (Operations) Limited (Beach) acknowledge concerns about threatened species and the potential environmental impacts and risks from the Otway Offshore Gas Victoria Project (the Project). A description of birds and pinnipeds that may be in the Project and Planning Areas are assessed in the OPP. As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC314 Impacts of proposed activities - Marine turtles	Comment: Three EPBC-listed marine turtle species are known to occur within the Project and/or Planning Areas: the green (Vulnerable), leatherback (Endangered) and loggerhead turtle (Endangered). These species use the area for migration and foraging and are susceptible to vessel strike and entanglement.	Beach Energy (Operations) Limited (Beach) acknowledge the Otway Offshore Gas Victoria Project (the Project) may have potential environmental impacts and risks on various marine fauna, including turtles. Considering the comment, Beach has reviewed the Offshore Project Proposal (OPP) and confirms that Section 4 describes the behaviours of the turtle species and Section 7.2.3.2 summarises the risk of vessel collision with turtles). The OPP identifies the Recovery Plan for Marine Turtles in Australia 2017-2027 and threat of vessel strikes. The assessment concludes that project vessel collisions with turtles are highly unlikely as the presence of turtles in the Project Area is considered unlikely. The OPP requires details and evaluation of the environmental impacts and risks of the Project appropriate to the nature and scale of each impact or risk. In light of comment, Beach has provided further detail in the OPP about the presence of turtles in the planning and project area, and the impacts and risks (please refer to PC229 for further information).
PC313 Matters of National	Comment: There are multiple protected and ecologically-significant ecosystems that could be contaminated by a	Beach Energy (Operations) Limited (Beach) acknowledge the potential impact of a hydrocarbon spill.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
Environmental Significance	hydrocarbon spill or an accidental release of marine diesel oil during drilling operations under the OGV Project.	The comment relates to Section 7.4 of the Offshore Project Proposal (OPP) that assesses the consequence of an unplanned spill from a loss of containment from wells or marine diesel spills from a vessel. Beach is satisfied the OPP provides sufficient information on the potential impact of a hydrocarbon spill. As the comment has not provided any additional information not already assessed in the OPP, no change has been made to the OPP.
PC349 Matters of National Environmental Significance	The Tasmanian Wilderness World Heritage Area (TWWHA) falls within the Planning Area. The TWWHA is a globally significant temperate wilderness area and contains outstanding examples of ongoing geological, biological and ecological processes in addition to numerous rare flora and fauna species. It is also rich in cultural heritage, with archaeological sites dating back to the Pleistocene. The Planning Area encompasses 3 Threatened Ecological Communities (TECs) that have coastal components: assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria; giant kelp marine forests of south east Australia (Endangered); and subtropical and temperate coastal saltmarsh (Critically Endangered). There are 4 Ramsar wetlands that overlap with the Planning Area: Glenelg Estuary, Lavinia, Port Phillip Bay, and Westernport Bay. These areas play vital ecological roles, providing nursery habitat for birds, fish, reptiles, invertebrates and other species, as well as maintaining water quality and shoreline structure. Wetlands are also powerful carbon sinks, trapping atmospheric carbon dioxide in sediments and vegetation. A total of 8 Australian Marine Parks overlap with the Planning Areas (Table 1). These parks provide habitat for myriad species and ecological communities, including	The Offshore Project Proposal (OPP) provides an assessment of ecosystems and environments as well as the potential environmental impacts and risks for the Project. The comment summarises the information provided in Section 4 (Description of the Environment) of the OPP in relation to Tasmanian World Heritage Area, threatened ecological communities, Ramsar wetland and marine parks and habitats for many species. As summarised in the Introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the following areas are no longer within the Planning Area of the OPP: • Tasmania World Heritage Wilderness • Glenelg Estuary and Discovery Bay Wetlands, Port Phillip Bay (Western Shoreline) and Bellarine Peninsula and Western Port Ramsar wetlands Section 4 of the OPP provides a comprehensive assessment of the existing environment which includes the receptors provided in the commentary. As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	EPBC-listed species such as blue and pygmy blue whales, southern right whales, humpback whales, fin whales, sei whales, wandering albatross, shy albatross, little penguins, white sharks, New Zealand fur seals, and others.	
PC330 Matters of National Environmental Significance	Comment: These unique and highly biodiverse ecosystems should be protected from the damaging effects of offshore fossil fuel exploration and operation, such as leaks and spills, planned discharges of hazardous substances, and abandonment of derelict infrastructure at the end of the operational period.	Beach Energy (Operations) Limited (Beach) acknowledge the potential for environmental impact and risk from the proposed drilling activities in the Otway Offshore Gas Victoria Project (the Project). The Offshore Project Proposal (OPP) provides for the consideration of whole-of-project environmental impacts and risks. These environmental risks and impacts are assessed in the OPP, including the potential impact of spills (Section 7.4) and planned discharges (Sections 6.7 to 6.10). As the comment has not presented additional information not already included in the OPP, no changes have been made to the OPP. Further, the OPP includes content on the decommissioning phase of the Project (Section 3.8.5), including Beach's responsibility to remove all structures, equipment and property for the title area in accordance with Section 572(3) of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach has reviewed the OPP considering this comment and is satisfied it adequately addresses the decommissioning requirements in accordance with Section 7 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023*. No change has been made to the OPP.
PC331 Key Ecological Features	Comment: The project area overlaps with the West Tasmania Canyons Key Ecological Feature (KEF). This KEF is considered to be of regional importance for biodiversity and/or ecosystem integrity. As with Marine Parks, KEFs and the species and ecosystems they support should be protected from the impacts of the offshore fossil fuel industry, in both the short and long term.	Beach Energy (Operations) Limited (Beach) acknowledge concerns about the potential environmental impacts and risks of its Otway Offshore Gas Victoria Offshore Project (the Project) on Australian Marine Parks (AMP) and Key Environmental Features (KEF). The AMP and KEF within the existing environment are described in Section 4 of the Offshore Project Proposal (OPP) and potential environmental impacts and risks for these receptors is evaluated in Sections 6 and 7 of the OPP. As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC309 Consultation and assessment process	Comment: According to the assessment process detailed by NOPSEMA on its website, the requirement for an OPP such as this one was introduced in 2014 "to allow for public scrutiny and comment on offshore petroleum developments early in the project lifecycle". Further on that website it is stated that "an OPP for a project must be accepted by NOPSEMA before the proponent can submit environment plans that make up the project". This suggests that an OPP should be the first step in regulatory assessment and public consultation on offshore petroleum projects. However, the public comment period for this OPP came after Beach Energy had closed public comment on 2 April 2024 for an Environment Plan (EP) detailing a drilling program on the same titles as the OPP, as well as additional titles in the Bass Basin. The OPP addresses this: "[t]his OPP includes description of exploration and appraisal drilling activity which is an activity that does not require an accepted OPP as part of the environmental permitting framework".	Beach Energy (Operations) Limited (Beach) acknowledges that offshore environmental approvals including those for Offshore Project Proposals (OPP) and Environment Plans (EP) are technical and complex documents with bespoke legislative requirements. Beach confirms that the OPP and Offshore Gas Victoria Drilling and P&A Activities EP (Drilling EP) have been accepted by National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) in accordance with all regulatory requirements. Specifically, we note that Beach's Drilling EP covers exploration and appraisal drilling, and plug and abandonment activities and those activities – including exploration drilling – do not require an OPP. Beach refers to the guidance note published on NOPSEMA's website, titled *Offshore environmental approvals*. It states "Exploration activities, such as seismic surveys and exploration drilling, do not require an OPP, but do require an EP." While Beach notes your concern, for the reasons outlined above the Drilling EP does not need to be part of an accepted OPP for Beach to submit an EP to NOPSEMA for assessment. The environmental approvals for the offshore project are summarised in Section 1.5 (OPP Purpose and Scope),Section 2.2 (Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023) of the OPP. Beach has provided additional information in the OPP to describe the environmental approval process in section 3.3.1 of the OPP: An OPP is needed for most new offshore petroleum development projects in Commonwealth waters. An 'offshore project' is defined in the OPGGS (Environment) Regulations as 'one or more activities that are undertaken for the purpose of the recovery of petroleum…". As described in section 1.5.1 of the OPP, section 15 of Environment Regulations allows a proponent to use the OPP arrangements for exploration and appraisal activities. While an OPP must be accepted by NOPSEMA before the proponent can submit EPs for activities that make up an offshore project, this pre-requisite does not apply to exploration and appraisal activities such as exploratory drilling. As such, Beach has submitted an EP to NOPSEMA for the exploration and appraisal drilling activities. The initial exploration and appraisal drilling campaign described in this OPP is part of the OGV Drilling and P&A Activities EP. Activities in the EP include exploration drilling and depending on well results, either P&A or temporary well suspensions.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC310 Consultation and assessment process	Comment: Further explanation and clarity is required concerning the requirements for OPP approval prior to EP submission. OPPs open for public comment are located in a different section of the NOPSEMA website than EPs open for public comment. This adds an extra layer of complexity to engaging with the OPP for relevant persons and community members who may have an interest in the OPP but are not able to locate the OPP or its public comment portal, as these are not in the same online location as the EPs.	Beach Energy (Operations) Limited (Beach) acknowledge that the environmental approvals for offshore petroleum activities are complex. Section 1.6 (OPP Purpose and Scope) and Section 2.2 (Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023) of the Offshore Project Proposal (OPP) summarises the environmental approvals, including the requirements for OPP and Environment Plan(s) (EP) for the Offshore Gas Victoria Project. Further explanation and clarity on the requirements for Offshore Project Proposal (OPP) and Environment Plans (EPs) is provided in above PC309. The remainder of the comments relates to the public comment process and NOPSEMA's website. The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) is responsible for managing the public comment process and provides information on its website on the public submission process for OPPs and EPs. In addition to NOPSEMA's website, Beach provides information and invitation for public comment. As outlined in various NOPSEMA policies, Beach promoted the public comment process for the OPP (and its Offshore Gas Victoria Drilling and P&A Activities EP) by publishing a public notice in eight different newspapers, emailing the project stakeholder list, and prominently featuring information about the public comment period and links to NOPSEMA's website on Engage Beach, Beach's online consultation hub. Beach has made no change to the OPP in response to this comment.
PC308 Other concerns	Comment: Transit of vessels to and from the project locations is excluded from the OPP as this is outside the scope of the OPGGS Act. To service the proposed activities, the project will utilize existing support facilities at Geelong and Portland. Vessel traffic needs to be explicitly quantified and included in the risk assessment framework, as vessel strike is a threat to marine megafauna, including cetaceans and marine turtles.	Beach Energy (Operations) Limited (Beach) acknowledge that offshore activities may have potential environmental impacts and risks on marine fauna. The OPP provides for the consideration of whole-of-project environmental impacts and risks. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. In this regard, vessel traffic will depend on the type of activity carried out in the offshore environment and will be considered in the relevant EPs. The Offshore Project Proposal (OPP) assessed the potential risk for vessel collision with megafauna (Section 7.2).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Common controls implemented in relevant EPs to minimise the risk of vessel strikes include Marine Fauna Observers under the Whale Management Procedure for monitoring and reporting, designed to comply with various government reporting for vessel strikes or injury on marine life. The relevant EPs will also highlight that reducing vessel speed has been shown to be an effective measure to reduce vessel strikes for marine species. By implementing these types of control measures, the risk assessment of vessel strike with marine fauna is rated as Low and to be of an acceptable outcome. Beach is satisfied the OPP adequately addresses the impact of vessel traffic on marine fauna. No change has been made to the OPP.
PC307 Other concerns	Comment: Hydraulic valves in the blowout preventer infrastructure will be vented to sea when closed, releasing an estimated 22-66 litres of hydraulic fluid into the ocean. The OPP comments that this fluid is water soluble and "readily disperses in the receiving waters" but the type of hydraulic fluid is not specified so that this comment of water solubility can be verified. To be water soluble, the hydraulic fluid would need to be one of the following types: water-oil emulsion (such as Shell's polyalkylene glycol (PAG)); water glycol; or biodegradable with a base of soybean, rapeseed, or sunflower oil.	Beach Energy (Operations) Limited (Beach) acknowledge that discharge of hydraulic fluid from blow-out preventers during drilling operations and production operations may occur as part of the Otway Offshore Gas Victoria Project. Beach has reviewed the Offshore Project Proposal (OPP) considering this comment and confirms that the OPP has identified that routine petroleum activities may result in the discharge of glycol based hydraulic fluids into the marine environment to be about 4m^3 per year (Section 3.8.6.1). Hydraulic control fluids are typically low toxicity, readably biodegradable, low potential for bioaccumulation and would rapidly disperse and dilute in the within the marine environment (Section 6.9.2.1). The OPP provides for the consideration of whole-of-project environmental impacts and risks of the project appropriate to the nature and scale of each impact or risk. In the case of discharge of hydraulic fluids, the extent of the discharge is within tens of meters (of the point of discharge) and the impact consequence is assessed as less than Minor. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. EPs include more detailed information on chemicals and hazardous materials for use offshore with regards to Beach's Chemical Management Procedure and the Offshore Chemical Notification Scheme, which evaluates all production and drilling chemicals in terms of environmental impact. Beach is satisfied the OPP adequately addresses the impact of discharges to the marine environment. No change has been made to the OPP.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC350 Other concerns	The OPP says that materials used as additives during drilling (i.e. dry bulk barite, bentonite, cement) will be discharged to the marine environment. Other planned discharges include condensate, brine, amine-type corrosion inhibitors, and suspension fluids. An explanation of the potential volumes of material, as well as the potential impacts of this dumping on the physical and biological environment, is required in order for relevant persons to make an informed assessment of the impacts of these activities.	Beach Energy (Operations) Limited (Beach) agree that discharge of materials from drilling operations and production operations may occur as part of the Otway Offshore Gas Victoria Project (the Project). Beach has reviewed the Offshore Project Proposal (OPP) considering this comment and confirms that planned discharges (e.g. drill cuttings, drill fluids, cement, commissioning and operational fluids, waste) are assessed in Sections 6.7 to 6.10 of the OPP. The OPP provides for the consideration of whole-of-project environmental impacts and risks. The OPP must provide details and evaluation of the environmental impacts and risks of the project appropriate to the nature and scale of the potential impact and risk. In the case of discharges from drilling activities, the impact consequence is assessed to be minor consequence and of an acceptable level. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. For example, the EP for the OGV Drilling and P&A Activities provides the level of detail suggested in the comment in relation to volumes and types of discharges and assessment of potential impacts and risks. For the purpose of the OPP, Beach is satisfied adequate information is provided on discharges and potential impacts and risks. No change has been made to the OPP in response to this comment.
3.6 Submitter No. 9		
PC172 Climate impacts of gas production	Comment: Methane gas is ~eighty-four times more damaging to the climate than carbon dioxide over a twenty year period. This is a critical consideration for all planetary ecosystems and species.	Beach Energy (Operations) Limited (Beach) recognises that action to address climate change is necessary and that all energy systems must contribute to meet the targets set out in the Paris Agreement. As an energy company, Beach must play a role in managing our carbon emissions. Beach aspires to reach net zero Scope 1 and 2 emissions by 2050. Beach has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35 per cent by 2030. This is aligned with the Australian Government's target of a 43 per cent reduction in carbon emissions from a 2005 base. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		The proposed management of greenhouse gas (GHG) emissions is aligned with the Beach Environment Policy, Climate Change Policy, Sustainability Policy, Risk Management Standard, Environment Management Standard and Sustainability Standard, and Climate Transition Action Plan (CTAP) as detailed in Table 6-43 of the Offshore Project Proposal (OPP). Beach released its CTAP in April 2024. In the CTAP, Beach announced a new target of <0.2 per cent methane emissions intensity by 2025 for its operated assets, calculated on reported methane emissions. The target is in support of the Global Methane Pledge to reduce methane emissions by 30 per cent by 2030 (on 2020 levels), which the Australian government became a signatory of in 2022. Beach's commitment to address methane emissions is reflected in the annual Leak Detection and Repair program, which is in place at all onshore and offshore facilities. This allows Beach to ensure potential leak sources are addressed with priority. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP for the reasons outlined above. Additional information has been added to Table 6-43 of the OPP regarding Beach's CTAP.
PC173 Climate impacts of gas production	Comment: We write in flat opposition to any project which further industrialises marine ecosystems, in order to produce fossil methane which will further exacerbate and accelerate cataclysmic climate change.	Beach Energy (Operations) Limited (Beach) recognise the submitters opposition to gas projects and the impact on climate change; however, this comment is not considered relevant to the content of the Offshore Project Proposal.
PC174 Climate impacts of gas production	Comment: At the COP 26 meeting the Australian Government signed this country on to the Global Methane Pledge… we pledged to the international community to reduce Australia's methane emissions by 30% from 2020 levels by 2030… We urge methane producers to be ready in the event that future resources ministers and the Federal Government recognise that this means no more gas production in Australia from this moment forward.	Beach Energy (Operations) Limited (Beach) recognise the comments on gas strategy and policy. As an energy company, Beach must play a role in managing our carbon emissions. Beach aspires to reach net zero Scope 1 and 2 emissions by 2050. Beach has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35 per cent by 2030. This is aligned with the Australian Government's target of a 43 per cent reduction in carbon emissions from a 2005 base. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. The proposed management of greenhouse gas emissions is aligned with the Beach Environment Policy, Climate Change Policy, Sustainability Policy, Risk Management Standard, Environment

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Management Standard and Sustainability Standard, and Climate Transition Action Plan (CTAP) as detailed in Table 6-43 of the Offshore Project Proposal (OPP). Beach released its CTAP in April 2024. In the CTAP, Beach announced a new target of <0.2 per cent methane emissions intensity by 2025 for its operated assets, calculated on reported methane emissions. The target is in support of the Global Methane Pledge to reduce methane emissions by 30 per cent by 2030 (on 2020 levels), which the Australian government became a signatory of in 2022. Beach's commitment to address methane emissions is reflected in the annual Leak Detection and Repair program, which is in place at all onshore and offshore facilities. This allows Beach to ensure potential leak sources are addressed with priority. Further, the Australian Government released the Future Gas Strategy in May 2024, mapping out its plan for how gas will support the economy's transition to net zero. A key principle of the gas strategy recognises that new sources of gas supply are needed to meet demand during the economy-wide transition to net zero. Victoria released its Economic Growth Statement in December 2025 acknowledging the importance of natural gas produced locally to enable more renewables in the electricity network and to support manufacturing jobs, No change has been made to the OPP in response to this comment. <u>Additional information has been added to Table 6-43 of the OPP regarding Beach's CTAP.</u>
PC175 Climate impacts of gas production	Comment: The OPP lists Environmental Performance Outcomes including: *EPO10: Gas is provided to communities sustainably in a manner which is consistent with the objectives of the Paris Agreement and the global response to the threat of climate change.* Unless existing, incidental methane emissions are captured in order to prevent their release into the atmosphere there can be no sustainable provision of gas as a fuel to communities. Certainly producing and releasing currently stored gas from beneath the ocean	Beach Energy (Operations) Limited (Beach) recognise that action to address climate change is necessary and that all energy systems must contribute to meet the targets set out in the Paris Agreement. As an energy company, Beach must play a role in managing our carbon emissions. Beach aspires to reach net zero Scope 1 and 2 emissions by 2050. Beach has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35 per cent by 2030. This is aligned with the Australian Government's target of a 43 per cent reduction in carbon emissions from a 2005 base. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. The proposed management of greenhouse gas emissions is aligned with the Beach Environment Policy, Climate Change Policy, Sustainability Policy, Risk Management Standard, Environment

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	floor is a disaster for the climate and is in opposition to the stated aims of the Global Methane Pledge.	Management Standard and Sustainability Standard, and Climate Transition Action Plan (CTAP) as detailed in Table 6-43 of the Offshore Project Proposal (OPP). Beach released its CTAP in April 2024. In the CTAP, Beach announced a new target of <0.2 per cent methane emissions intensity by 2025 for its operated assets, calculated on reported methane emissions. The target is in support of the Global Methane Pledge to reduce methane emissions by 30 per cent by 2030 (on 2020 levels), which the Australian government became a signatory of in 2022. Beach's commitment to address methane emissions is reflected in the annual Leak Detection and Repair program, which is in place at all onshore and offshore facilities. This allows Beach to ensure potential leak sources are addressed with priority. The Environmental Performance Outcome relevant to GHG emissions from Project activities is: • EPO15: GHG emissions related to the Project, including (scope 1 [Inside Project Boundary, scope 1* [Outside Project Boundary] and scope 3) emissions are consistent with Australia's international GHG emissions commitments, as outlined in the *Climate Change Act 2022*. Emissions are to be determined based on the NGER scheme and managed by the Safeguard Mechanism. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP.
PC176 Options under consideration	Comment: The OPP put forward for public comment, on page 103, section 3.9.2.1 entertains the prospect of not proceeding with the project currently under consideration. This can be the only sensible way forward from the perspective of the climate, marine health and economically. The OPP under consideration in this submission acknowledges that this would relegate current Beach Energy infrastructure and gas wells to being stranded assets. This submission suggests that it would be wise to cut your losses rather than adding to them.	Section 7(2)(f) of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023, requires proponents to consider feasible alternate project options in its Offshore Project Proposal (OPP). Alternate options include alternate design concepts (e.g. subsea and platform development options and floating production facility) and a 'do nothing' option (Option 4 in Section 3.9.4 of the OPP). The latter is considered in the context of the gas supply-demand outlook for Victoria – including residential, commercial, and industrial customers – from the Australian Energy Market Operator's (AEMO) March 2024 publication Victorian Gas Planning Report Update. Beach notes that AEMO's new 2024 Victorian Gas Planning Report Update was published in March 2024. It considers the government's new policies and schemes, such as the new residential gas connections ban and gas substitution road map. Notwithstanding these new policies, the gas

ID	Summary of comments received	Beach’s assessment of merit of comment(s) and response(s) to comments and/or objections
		supply-demand balance over the five-year period (2024-28) again highlights the need for more gas supply in Victoria as the forecast supply declines faster than forecast consumption. The comment refers to stranded assets in the Otway Basin. The term ‘stranded asset’ is used in the OPP to describe the new gas reserves in the Otway Basin that are not currently developed. The OPP described subsea development option is to connect the currently stranded gas reserves to existing production infrastructure in the Otway Basin. Beach is committed to the development of gas from its Otway Basin acreage. Beach recognises the submitter’s opposition to all oil and gas projects; however, this comment is not considered relevant to the content of the OPP.
PC177 Options under consideration	Comment: We acknowledge that the Australian Energy Market Operator in their Gas Statement of Opportunities March 2024 forecast gas shortfalls for Victoria during winter peaks by 2027. This submission is written in the knowledge that gas policy in Victoria is progressive in terms of gas demand reduction in practical terms, with new mandated policy measures announced since the release of the GSOO 2024.	Beach Energy (Operations) Limited (Beach) acknowledge several resources that forecast gas shortfalls in Victoria, including Australian Energy Market Operator (AEMO). AEMO's new 2024 Victorian Gas Planning Report Update was published in March 2024. It considers the government's new policies and schemes, such as the new residential gas connections ban and gas substitution road map. Notwithstanding these new policies the gas supply-demand balance over the five-year period (2024-28) again highlights the need for more gas supply in Victoria as the forecast supply declines faster than forecast consumption. Beach recognises the submitter’s support for gas demand side management policies in Victoria; however, this comment is not considered relevant to the content of the Offshore Project Proposal.
PC178 Options under consideration	Comment: It has never been more expensive to connect to, or cheaper to disconnect from fossil gas through the gas distribution system in Victoria. This alongside the Victorian Energy Upgrades Program and the unaffordability of mains gas during a cost of living crisis mark the beginning of an economic death spiral for gas in Victoria.	Beach recognises the submitter’s opposition to gas projects; however, this comment is not considered relevant to the content of the Offshore Project Proposal.
PC179 Options under consideration	Comment: As more households switch to electric appliances, the business model for any gas production that Beach Energy proposes to sell on the domestic market looks increasingly threadbare.	Beach recognises the submitter’s opposition to gas projects; however, this comment is not considered relevant to the content of the Offshore Project Proposal.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC180 Options under consideration	Comment: The Victorian Government estimates that each home in Victoria would save on average $1000/year, rising to $2200/year for renewably powered homes (DEECA, 2023). As this news spreads across the public awareness we predict an exponential stampede away from gas heating.	Beach recognises the submitter's concern about the cost of energy for residential homes; however, this comment is not considered relevant to the content of the Offshore Project Proposal.
PC181 Options under consideration	Comment: We urge Beach Energy to abandon this project and any further gas production expansion, and instead pivot to renewable energy industries. That's certainly where the money will be going forward, with far reduced potential and actual marine environment impacts	Beach Energy (Operations) Limited (Beach) has rights and obligations to explore, appraise and develop gas under its petroleum titles granted and administered under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006.* Beach is committed to the development of gas from its Otway Basin assets. Beach recognises the submitter's opposition to gas projects; however, this comment is not considered relevant to the content of the Offshore Project Proposal (OPP). Similarly, comments about adopting alternatives (to fossil fuels) such as renewable energy sources are not relevant to the content of the OPP and are not considered further.
PC182 Marine Parks	Comment: The project planning area footprint encompasses eight marine parks, established to: help conserve marine habitats and the marine species that live within and rely on these habitats. There is nothing about offshore gas exploration, production or transportation which supports this aim. Of concern in particular is the 1km proximity of the Zeehan Marine Park from the production area. Zeehan Marine Park – along with all of the marine parks within the planning area - is already under application for a Special Prospecting Authority by joint partners TGS and Schlumberger (SLB) and has repeatedly been subject to seismic blasting operations.	Beach Energy (Operations) Limited (Beach) acknowledges concerns regarding marine habitats and species. Section 4.2.2 of the Offshore Project Proposal (OPP) identifies three Australian Marine Parks (AMP) based on PMST reports, however further refinement identifies two AMPs within the Planning Area – Apollo and Zeehan Marine Parks., There are no AMPs within the Project Area. The closest AMP to the Project Area is the Zeehan Marine Park Multiple Use Zone (classified by the International Union for Conservation of Nature (IUCN) VI). As summarised in the introduction to this report, the revision of the OPP means that the Zeehan Marine Park is approximately 58 km from the Project Area. The Commonwealth Director of National Parks (DNP) manages the AMP including compliance with provisions of the South-East Commonwealth Marine Reserves Network Management Plan 2013 – 2023. In preparation of the OPP, Beach consulted with the DNP in accordance with the National Offshore Petroleum Safety and Environmental Management Authority's (NOPSEMA) guidance note (NOPSEMA and Parks Australia Petroleum Activities and Australian Marine Parks June 2023). Further consultation with DNP will be undertake as part of preparation of future Environment Plan(s).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		The cumulative environmental impacts of the offshore petroleum activities are assessed in Section 8 of the OPP. The proposed marine seismic survey(s) by other proponents in the Otway Basin are considered in the cumulative impact assessment (Table 8-1). Beach is satisfied that the OPP adequately addresses both the AMP and cumulative environmental impacts. As the comment does not introduce new information, no change has been made to the OPP in response.
PC183 Marine Parks	Comment: We appreciate that other abutting or overlapping projects are not the responsibility of the proponent for consideration in the drafting of the associated OPP or EP. However for those of us who have whole-of-marine ecosystem concerns these are certainly projects which cannot be considered in isolation.	Beach Energy (Operations) Limited (Beach) acknowledge concerns relating to the cumulative environmental impacts of offshore petroleum activities. The National Offshore Petroleum Safety Environment Management Authority (NOPSEMA) defines cumulative environmental impacts in the context of offshore petroleum activities, as "successive, additive, or synergistic impacts of collectively significant activities or projects with material impacts on the environment that have the potential to accumulate over temporal and spatial scales" (NOPSEMA Environment Plan Decision Making Guideline, N-04750-GL1721 A524696, Dec 2022). Section 8 of the Offshore Project Proposal (OPP) defines Beach's cumulative impact assessment process. It focuses on building on the planned impact assessments considered in the OPP by further considering the impacts of the proposed activity on key receptors (or key matters) in conjunction with the impacts from other reasonably foreseeable future projects within the spatial and temporal extent of the Project. Beach considers the cumulative environmental impacts are adequately assessed in the OPP and no change has been made to the OPP in response to this comment.
PC184 Threatened ecological communities	Comment: Three threatened ecological communities are also captured within the project planning area, including the endangered Giant Kelp Marine Forest which is subject to a restoration plan under partnership with the Tasmanian Seafood Industry and NRM South$_5$. The Giant Kelp Marine Forest is home to a greater density of endemic species than any other ocean ecosystem on Earth, including some that are endangered and critically endangered including the Victorian ocean faunal emblem, the weedy sea dragon. This forest area has so far showed	Beach Energy (Operations) Limited (Beach) acknowledges concerns regarding threatened ecological communities. Section 4.4.8 of the Offshore Project Proposal (OPP) identifies the threatened ecological communities, the Giant Kelp Marine Forests, within the Planning Area. The largest extent of Giant Kelp Marine Forest is along the South Australian coastline with patches around the Victorian coastline. The Planning Area is defined in Table 4-1 of the OPP as a combination of the marine diesel oil (MDO) Planning Area and Condensate Planning Area based on the spill modelling to the low thresholds. The Planning Area is distinct from the Project Area, as the latter is where all

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	resilience through a marine heatwave (ABC News, 2024[6]) and should be spared further stressors.	infrastructure and activities associated with the Project will be undertaken. No threatened ecological communities were identified in the Project Area. The OPP must assess the environmental impact in the very unlikely event of a spill. Beach has modelled the worst-case scenario for a loss of containment from a marine diesel spill and a loss of well control. The environmental impact of an unplanned condensate on the ecological function of the Giant Kelp Marine Forests of southeast Australia was assessed to be at the Low threshold and not predicted to have an impact (see Table 7-25). In addition, Beach is required by Australia's offshore energy regulator, the National Offshore Petroleum Safety and Environmental Management Authority, to have in place for all relevant project activities, accepted Oil Pollution Emergency Plans and Operational and Scientific Monitoring Plans. Beach recognises the importance of kelp both as an ecosystem – including a habitat for the weedy sea dragon (Section 4.4.8.2) – and seaweed industry (Section 4.5.14). Beach has identified and referenced two research projects on seaweed in Tasmania. In response to the comment, <u>Beach has updated the OPP (Section 4.5.13) to include the Giant Kelp Marine Forest Restoration Project by the Tasmanian Smart Seafood Partnership</u>. Beach has reviewed the information in the comment and the OPP regarding the impact of marine heatwave on giant kelp in the Tasman Peninsula (reference ABC News). As the comment relates to areas outside of the Planning Area for this Project, no change is made to the OPP in response to this comment.
PC185 Threatened ecological communities	Comment: Both the subtropical and temperate coastal saltmarsh communities are critically endangered and EPBC listed. The conservation advice for management of these communities includes: Provide appropriate buffer zones around patches of Coastal Saltmarsh to increase resilience.	Beach Energy (Operations) Limited (Beach) acknowledges concerns regarding subtropic and coastal saltmarsh. Section 4.4.8 of the Offshore Project Proposal (OPP) identifies the Subtropical and Temperate Coastal Saltmarsh as threatened ecological communities within the Planning Area of the Victorian coastline. The OPP includes an assessment of the potential impact to ecological environments in the unlikely event of a spill. The potential consequence evaluation for saltmarsh exposed to shoreline hydrocarbon is assessed to be Moderate as they are expected to be short-term and localised

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		(Table 7-24), while entrained hydrocarbons at the low threshold are not predicted to impact on the ecological function of the Threatened Ecological Communities (Table 7-25). In response to the comment, Beach has reviewed the Conservation Advice (issued under the *Environment Protection and Biodiversity Conservation Act 1999*) for Subtropical and Temperature Coastal Saltmarsh. The Conservation Advice recommends that oil spill contingency planning consider Coastal Saltmarsh as important habitat in all oil spill contingency planning. As the potential risk to the Subtropical and Temperate Coastal Saltmarsh is evaluated to be from a spill, the conversation advice for management of these communities such as buffer zones are not applicable. No change to the OPP is made in response to this comment. In addition, Beach is required by Australia's offshore energy regulator, the National Offshore Petroleum Safety and Environmental Management Authority, to have in place for all relevant project activities, accepted Oil Pollution Emergency Plans and Operational and Scientific Monitoring Plans. Beach has reviewed the information in the comment and the OPP regarding the impact of threatened ecological communities. As the comment relates to areas outside of the Planning Area for this Project, no change is made to the OPP in response to this comment.
PC186 Impacted species	Comment: Of the impacted species, 159 are threatened. For a responsible global citizen this would be enough to ensure that this project never came under serious consideration.	Beach Energy (Operations) Limited (Beach) agrees that threatened and migratory species listed under the *Environmental Protection and Biodiversity Conservation Act 1999* may be present be within the Planning Area of the Otway Offshore Gas Project (the Project). The Offshore Project Proposal (OPP) provides a comprehensive review of threatened and migratory species within the Project and Planning Areas (Section 4.4.9). The OPP also provides an assessment of potential environmental impacts and risks on marine species (including threatened and migratory species) and demonstration of acceptability (Section 6 and 7). The Acceptable levels of impacts for for environmental receptors are defined in Table 5-4 of the OPP. As the comment has not presented additional information not already included in the OPP, no change has been made to the OPP.
PC187 Impacted Species	Comment: Under section 2.3 of the OPP, consideration is made of some of the likely impacts on specific threatened species, with applicable threats and conservation actions	Beach Energy (Operations) Limited (Beach) has reviewed Section 2.3 of the Offshore Project Proposal (OPP) in response to this comment about the use of undefined terms.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	listed in terms of mitigation where appropriate and feasible. However the terms "appropriate" and "feasible" are highly subjective and undefined within the scope of the OPP. Where the stated action is to "evaluate risks" on impacted species there is no definition of the practices involved or the extent to which this evaluation will be undertaken by an independent, credible third party.	Section 2.3 of the OPP summarises the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act). The term 'feasible' is used in Table 2-1, page 59, in describing climate change mitigation actions identified in the National Recovery Plan for Albatrosses and Petrels 2022 (CoA, 2022) and the term 'appropriate' is used throughout Table 2-1. In some cases this reflects the language used in the relevant recovery plan and conservation advice. Section 5 of OPP describes the risk assessment methodology and provides information on identification, analysis, evaluation and uncertainty of risks. Beach, as the proponent of the project, prepares the OPP with expert advice from third parties on the environment as well as the review of scientific literature. Australia's offshore energy regulator, the National Offshore Petroleum Safety and Environmental Management Authority, reviews and assesses the OPP to ensure compliance with the relevant environmental regulations. It is not practical for Beach to define all terms used in the OPP, however, certain terms are defined through the OPP. Generally, terms not defined would rely on the normal dictionary meaning. Beach has not changed the OPP in response to this comment.
PC188 Birds	Comment: Sixteen endangered birds and eight critically endangered birds occur within the planning area for this project. Included in the critically endangered bird species likely to be impacted are the iconic orange bellied parrot, of which only fifty were found to have occurred in the wild eight years ago (Australian Government, 20168). Of the impacts on the survival of the orange bellied parrot, the Australian Government assessed climate change to be a very high risk rating. We note that the OPP states that it will manage climate change impacts by the following means: Minimise the impacts of climate change by reducing greenhouse gas concentrations. We believe that producing a powerful climate change accelerant is distinctly at odds with this action. The swift parrot, another critically endangered species, has this year been recorded to have a population of 500 (ANU, 20249).	Beach Energy (Operations) Limited (Beach) acknowledge the comment about threatened bird species and the potential environmental impacts and risks from the Otway Offshore Gas Victoria Project (the Project). Section 4.4.9.4, in particular Table 4-22, lists threatened bird species that are likely to be present in the Planning Area. The orange-bellied parrot is listed as a critically endangered species with a migratory route likely to occur within the Project Area. The National Recovery Plan for the orange-bellied parrot identifies barriers to migration and movement resulting from illuminated boats and structures, and climate change as threats. A review of the Offshore Project Proposal (OPP) confirms the potential impact of light emissions on orange-bellied parrots has been assessed (both in terms of the Project and the cumulative impacts of offshore petroleum activities). The OPP considers the impact of light emission on marine fauna, such as seabirds, to be Minor with the implementation of Light Management Procedure as per the National Light Pollution Guidelines (Commonwealth of Australia, 2020) for the Project activities. The Light Management Procedure will detail mitigations to manage light based on the information in the Seabird Light Mitigation Toolbox and Beach's Vessel Light Management Procedure Guidance.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	We urge Beach Energy to withdraw this project application in the interest of maintaining healthy ecosystems and migration pathways for the significant numbers of bird species occurring within the planning area.	The environmental impact of greenhouse gas (GHG) emissions from the Project is assessed for ecosystems, and species (including threatened and migratory bird species). As emissions from the Project will be a minor contributor to GHG emissions, the impacts are assessed as having a Minor consequence. The comment also refers to Swift Parrots, which are identified in the OPP as a critically endangered species likely to inhabit the Planning Area (Table 4-22). The OPP provides a comprehensive assessment of potential impacts on seabirds in Section 6.3.3.2.2. As the comment does not present additional information not already included in the OPP, no change has been made to the OPP in response to the comments on endangered seabirds.
PC189 Fish species	Comment: Numerous EPBC-listed fish species fall within the Project and/or Planning Areas, including the red handfish (Critically Endangered), Maugean skate (Endangered), oceanic whitetip shark (Migratory), school shark (Conservation Dependent), whale shark (Vulnerable), and the white shark (Vulnerable). Shortfin and longfin eels occur in Victorian waters, beginning their life cycle in estuaries before migrating to their oceanic spawning grounds in the Coral Sea. Shortfin eels hold cultural significance to First Nations people, such as the Gunditjmara in south-western Victoria. Offshore fossil fuel development has been identified as a potential threat to eels during their lifecycle.	Beach Energy (Operations) Limited (Beach) acknowledge concerns about threatened fish species and the potential environmental impacts and risks from the Otway Offshore Gas Victoria Project (the Project). Section 4.4.9.3, in particular Table 4-21, of the Offshore Project Proposal (OPP) lists threatened fish species that are likely to be present in the Project and Planning Areas. The OPP also identifies the Biologically Important Areas (BIAs) critical to the survival of a species within the Project and Planning Areas. Revisions to the scope of the Otway Gas Victoria (OGV) Project and mean that the EPBC-listed fish species of Maugean Skate, Red Handfish, Oceanic Whitetip Shark and Whale Shark are no longer within the Project Area and revised Planning Area. For fish species, only the White Shark has foraging BIA overlapping the Planning Area (Table 4-19 and Figure 4-38). The OPP considers the potential impact of an oil spill on zooplankton (including krill). For example, Table 7-25 assessed the potential consequence to plankton from condensate spill as Minor (1), as the consequence could be expected to result in localised low-level short-term and recoverable impacts. Beach is satisfied that the potential impacts on fish, including foraging BIAs, is adequately addressed in the OPP and no change has been made to the OPP in response to the comment. Section 4.4.9.3, in particular Table 4-21, of the Offshore Project Proposal (OPP) lists threatened fish species that are likely to be present in the Project and Planning Areas. Beach also recognises the presence of eels in the Planning Area and the cultural significance of eels for First Nations Groups (Section 4.4.9.3.2). The comment states that fossil fuel development has been identified as a

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		potential threat to eels during their lifecycle. The impacts to First Nations values and sensitivities are assessed throughout the OPP. The environmental impacts to eels for light emissions, were assessed as having a residual impact of Minor (Section 6.3.3.6) and migrating eels are unlikely to be impacted by noise emissions (section 6.4.3.1.3). As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC340 Cetaceans	Comment: Included in the 32 cetaceans are the endangered pygmy blue whales, of which only 2000 are reported to exist in the Southern Ocean at the time that this submission is written These can occur between November to May for seasonal foraging	Beach Energy (Operations) Limited (Beach) acknowledge comments regarding the pygmy blue whale. Beach has reviewed the Offshore Project Proposal (OPP) and confirms that a detailed review of the existing environment (Section 4) adequately describes the existing habitat and behaviours of the pygmy blue whales, Biologically Important Areas (BIAs) overlapping the Project and Planning Areas, previous surveys of whales in the Otway Basin, and an assessment of the potential impacts and risks. As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC341 Pinniped species	Comment: The vulnerable southern elephant seals travel huge distances from their Antarctic breeding grounds to forage, including in the planning area (Threatened Species Scientific Committee, 201611). The Australian sea lion is listed as endangered both under the EPBC Act and in Victoria under the *Flora and Fauna Guarantee Act 1988* (Department of Climate Change, the Environment, Energy and Water, 202012). Identified threats to the Australian sea lion include pollution from oil spills, sewage, land run-off and toxic contaminants that may bioaccumulate. Both of these species, particularly southern elephant seals, can occur within the planning area. In the interests of precaution we urge Beach Energy to withdraw its application for this project.	The Offshore Project Proposal (OPP) provides comprehensive information on the species, *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) status, and habitat and behaviour within the Project and Panning areas. Beach Energy (Operations) Limited (Beach) has reviewed the OPP considering the comments on seals and confirms that the OPP identifies the protected species (Australian fur seal, Australian sea lion) within the Project and Planning Areas to include the EPBC listed pinniped species or habitats (Tables 4-24 and Section 4.4.9.6), although no Biologically Important Areas (BIAs) overlap either area. Beach acknowledges the activities planned for the OPP may have potential environmental impacts and risks on various marine fauna, including seals, which are assessed in Sections 6 and 7 of the OPP. Beach acknowledges concerns raised about the potential impact of oil spills and other discharges on seals. Section 6 of the OPP assesses the impact of the discharge of routine operational wastes

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		from vessels. All wastewater discharges must comply with various legislation, international (MARPOL) convention and marine orders summarised in Table 4 and Table 6-63. Section 6.9 of the OPP assessed the potential impact of planned discharges from operations as Minor with little or no risk of bioaccumulation, bioconcentration or trophic transfer of chemicals (Table 6-57). Section 6.10 of the OPP assessed the potential impact consequence of discharge of operational wastes (e.g. sewage) as minor as these discharges will result in a low-level decrease in water quality in the vicinity of the discharge with the duration being intermittent and temporary (Table 6-62). Section 7 of the OPP assesses the potential risk of unplanned events such as discharge of materials, and loss of containment of hydrocarbons or chemicals. The consequence of an oil spill on seals is assessed in Table 7-20 as having a Moderate consequence as there could be expected to be minor short-term impacts and some impact on valued species or habitats. The OPP provides for the consideration of whole-of-project environmental impacts and risks. The Environment Plan(s) that will be required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. As the comment has not presented additional information not already included in the OPP, no change has been made to the OPP.
PC190 Marine turtle species	Comment: All three marine turtle species found to occur within the planning and/or project area are recognised under the EPBC Act as either vulnerable or endangered. The Recovery Plan for for Marine Turtles in Australia 2017-2027 (Department of Environment and Energy, 201713) lists many threats to the continuing survival of marine turtles in Australia. These include climate change - which will certainly be accelerated by this project's output, marine debris through entanglement and ingestion, chemical discharge, light pollution, habitat modification, dredging, vessel disturbance, noise interference and diseases and pathogens resulting in disturbance to their	Beach Energy (Operations) Limited (Beach) acknowledge the Otway Offshore Gas Victoria Project (the Project) may have potential environmental impacts and risks on various marine fauna including turtles. Beach has reviewed the content of the Offshore Project Proposal (OPP) and confirms that threatened species of turtles may be present in the Project and Planning Areas (Section 4.4.9.5, in particular Table 4-23), although no Biological Important Areas (BIAs) or habitat critical to the survival of marine turtles overlap the Project Area or Planning Area. The Recovery Plan for Marine Turtles in Australia, (CoA, 2017) includes several potential impacts such as light, noise, vessel collision, oil spill, marine debris and entanglement, and discharges (Table 2-1). The potential impact or risk from light emissions (Section 6.3) and noise emissions (Section 6.4) were assessed with the impact consequence ranked as Minor and of an acceptable

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	habitat areas. All of these impacts are likely to be present in the project area specifically and may occur within the planning area	level (see Tables 6-15 and 6-16 for light emissions and Section 6.4.3.2.2 for noise emissions). The potential risk from vessel interactions (Section 7.2) was assessed to have a low-risk rating (Table 7-8). While the Recovery Plan for Marine Turtles in Australia, (CoA, 2017) identifies chemical and terrestrial discharge as a threat, this is mostly in relation to pollution from agricultural, terrestrial industrial and domestic sources. Based on the low toxicity of chemicals and the absence of BIAs or habitat critical for turtles within the Project Area, further assessment of the impact was not undertaken. In light of comment, Beach has provided further detail in the OPP about the presence of turtles in the planning and project area, and the impacts and risks (please refer to PC229 for further information).
PC191 Discharge actual and potential	Comment: The OPP under consideration for this project states that "about 4m^3 per year" of an unspecified "glycol based" hydraulic fluid will be discharged to the marine environment by the actuation of subsea valves. In order to accurately determine the likely impacts of this discharge we believe that the fluid planned for use be specified	Beach Energy (Operations) Limited (Beach) acknowledge that discharge of hydraulic fluid from blow-out preventers during drilling operations and production operations may occur as part of the Otway Offshore Gas Victoria Project. Beach has reviewed the Offshore Project Proposal (OPP) considering this comment and confirms that the OPP has identified that routine petroleum activities may result in the discharge of glycol based hydraulic fluids into the marine environment to be about 4m^3 per year (Section 3.8.6.1). Hydraulic control fluids are typically low toxicity, readably biodegradable, low potential for bioaccumulation and would rapidly disperse and dilute in the within the marine environment (Section 6.9.2.1). The OPP provides for the consideration of whole-of-project environmental impacts and risks of the project appropriate to the nature and scale of each impact or risk. In the case of discharge of hydraulic fluids, the extent of the discharge is within tens of meters (of the point of discharge) and the impact consequence is assessed as less than Minor. The Environment Plan(s) (EP) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. EPs include more detailed information on chemicals and hazardous materials for use offshore with regards to Beach's Chemical Management Procedure and the Offshore Chemical Notification Scheme, which evaluates all production and drilling chemicals in terms of environmental impact.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach is satisfied the OPP adequately addresses the impact of discharges to the marine environment. No change has been made to the OPP.
PC192 Discharge actual and potential	Comment: This submission also raises concerns about potential unintended spills from the umbilicals of mono ethylene glycol (MEG) and methanol and its possible impacts on marine species.	Beach Energy (Operations) Limited (Beach) acknowledges that loss of containment of monoethylene glycol (MEG) or methanol from subsea umbilicals or flowlines is identified as a potential risk of the Otway Offshore Gas Victoria Project. Hydrate inhibitors (e.g. MEG or methanol) are mentioned in the Offshore Project Proposal (OPP) as chemicals that may potentially be injected into wells. These fluids operate in a closed loop system, with no planned discharges to the marine environment. The worst-case release volume of umbilical loss of containment and MEG spill is in the order of 400m^3 (Table 7-16). The umbilical loss of containment scenario was not modelled in the OPP due to the relatively small volume and MEG being a Category 'E' Offshore Chemical Notification Scheme chemical with no substitution warning, readily biodegradable with a low potential for bioaccumulation and a Minor potential impact consequence ranking. The OPP provides for the consideration of whole-of-project environmental impacts and risks appropriate to the nature and scale of each impact or risk. The Environment Plan(s) required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. No change to the OPP is made in response to this comment.
PC193 Decommissioning	Comment: Importance of a clear plan to meet the legislated required that all offshore oil and gas infrastructure be removed once it is no longer in use. This means not only having a plan in place to remove all infrastructure, but to ensure that Beach Energy has allowed for the significant expense, at the full cost projected for the end of the life of the project, to be covered. This submission believes that full disclosure of the projected cost of decommissioning be made public, including the modelling used to arrive at the disclosed cost, to create public confidence that this won't be yet another example of heavy industry leaving the Australian	The Offshore Project Proposal (OPP) for the Otway Offshore Gas Victoria Project (the Project) summarises the decommissioning phase of the Project (Section 3.8.7 and Sections 9.4). This includes Beach's responsibility to remove all structures, equipment and property for the title area in accordance with Sections 572(3) and 270(3) of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach acknowledges the concern about the cost of decommissioning and ensuring the financial liability for decommissioning is borne by the petroleum industry and does not become the responsibility of government and taxpayers. The OPGGS Act was amended in 2021 to include new provisions referred to as trailing liability for decommissioning of offshore oil and gas infrastructure to ensure the titleholders (current and former, as well as related entities) are liable for

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	taxpayer to foot the bill for their failure to meet their legislative requirements at the end of life for the project.	decommissioning. For the OPP, there is no requirement to provide the cost to decommission and Beach has not made this suggested inclusion to the OPP. Beach has reviewed the OPP considering this comment and is satisfied the OPP adequately addresses the decommissioning requirements for an OPP in accordance with Section 7 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023*.
PC194 Consultation	Comment: We are concerned that the process of consultation undertaken by Beach Energy appears to fail the requirements stipulated by NOPSEMA (NOPSEMA, 202117). Under NOPSEMA requirements, the release of the OPP for public comment is the first step in public engagement, and only after a rigorous and iterative process concluding in approval can the proponent proceed to release of their associated environment plan (EP). In this case, however, the EP closed for public submission on 2 April 2024, a full 48 days after the public comment period for the OPP concludes. That EP is currently listed as under assessment by NOPSEMA. This submission is written in the belief that this constitutes inadequate adherence to the requirements of consultation for offshore petroleum titles.	Beach Energy (Operations) Limited (Beach) acknowledges that offshore environmental approvals including those for Offshore Project Proposals (OPP) and Environment Plans (EP) are technical and complex documents with bespoke legislative requirements. Beach confirms that the OPP and Offshore Gas Victoria Drilling and P&A Activities EP (Drilling EP) have been accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) in accordance with all regulatory requirements. Specifically, we note that Beach's Drilling EP covers exploration and appraisal drilling, and plug and abandonment activities and those activities – including exploration drilling – do not require an OPP. Beach refers to the guidance note published on NOPSEMA's website, titled *Offshore environmental approvals*. It states "Exploration activities, such as seismic surveys and exploration drilling, do not require an OPP, but do require an EP." While Beach notes your concern, for the reasons outlined above the Drilling EP does not need to be part of an accepted OPP for Beach to submit an EP to NOPSEMA for assessment. The environmental approvals for the offshore project are summarised in Section 1.5 (OPP Purpose and Scope), Section 2.2 (Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023) of the OPP. Beach has provided additional information in the OPP to describe the environmental approval process in section 3.3.1 of the OPP: An OPP is needed for most new offshore petroleum development projects in Commonwealth waters. An 'offshore project' is defined in the OPGGS (Environment) Regulations as 'one or more activities that are undertaken for the purpose of the recovery of petroleum…". As described in section 1.5.1 of the OPP, section 15 of Environment Regulations allows a proponent to use the OPP arrangements for exploration and appraisal activities. While an OPP must be accepted by NOPSEMA before the proponent can submit EPs for activities that make up an offshore project, this pre-requisite does not apply to exploration and appraisal activities such as

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		exploratory drilling. As such, Beach has submitted an EP to NOPSEMA for the exploration and appraisal drilling activities. The initial exploration and appraisal drilling campaign described in this OPP is part of the OGV Drilling and P&A Activities EP. Activities in the EP include exploration drilling and depending on well results, either P&A or temporary well suspensions.
3.7 Submitter No. 10		
PC195 Paragraph 3	Comment: Beach comments that this Project will produce gas for use in the east coast domestic market and will repurpose an existing pipeline and gas processing plant through "tie-backs." In fact, the Project will require the buildout of substantial fossil fuel infrastructure and will support expansion of offshore gas production in the Otway Basin.	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the scope and purpose of the Otway Offshore Gas Victoria Project (the Project). The Project considers the subsea development of gas fields adjacent by utilising the existing gas infrastructure in the Otway Basin. Beach is unable to identify a comment within this statement.
PC196 Paragraph 4	Comment: Beach proposes to undertake the Project in Nyamat Mirring, the Sea Country of the Gunditjmara people[2]. Nyamat Mirring is connected to the rest of Gunditjmara Country as part of a continuous, connected landscape[3]. Nyamat Mirring holds values that are fundamental to the wellbeing of Gunditjmara and other people who live on Country. The customary obligations of Gunditjmara to Country, Ceremony, language (Wurrung), lore, relationships, and identities are inter-connected with Nyamat Mirring[4]. [2] *Gunditj Mirring Traditional Owners Aboriginal Corporation (GMTOAC), Gunditjmara Nyamat Mirring Plan 2023-2033 (2023) (Gunditjmara Nyamat Mirring Plan), p. 8.* [3] *Gunditjmara Nyamat Mirring Plan, p. 11.* [4] *Gunditjmara Nyamat Mirring Plan, p. 8.*	Beach Energy (Operations) Limited (Beach) acknowledge the statement on the location of the Otway Offshore Gas Victoria Project as Sea Country of the Gunditjmama people. Beach understands the importance of Sea Country for First Nations Groups including the the intangible cultural values and sensitivities that exist for other First Nations groups that are not directly adjacent to the Project Area, due to the interconnectedness of marine ecosystems and existences of various marine fauna and flora and intangible cultural values (see section 4.6.3 of the OPP). While Beach is unable to identify a comment within this statement, we do recognise reference to the Gunditjmara Sea Country Plan which has been added to the OPP: Section 4.6.3.2 of the OPP has been updated to include the Gunditjmara Sea Country Plan - The Gunditjmara published their Sea Country Plan, Gunditjmara Nyamat Mirring Plan 2023-2033, on 13 March 2024 (GMTOAC 2023). This plan details Gunditjmara's values and species of cultural significance in the Sea Country.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC197 Paragraph 5a	Comment: In summary, the Project raises the following concerns for the Gunditjmara people: a. Contribution to climate change: In increasing greenhouse gas (GHG) emissions and prolonging fossil fuel production, the Project is not consistent with the pathway to a safe climate. Climate change is a major threat to the cultural and natural values of Nyamat Mirring. This Project locks in substantial GHG emissions from the production of fossil gas over its 30-year lifespan, amounting to over 2% of Australia's remaining carbon budget for securing a safe climate. At a time when Australia should be phasing out fossil fuels completely and rapidly cutting emissions, this Project is indefensible.	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the concerns of the potential impact of the Otway Offshore Gas Victoria Project on the cultural heritage values and sensitivities of the Gunditjmara People. Sections 6 and 7 of the Offshore Project Proposal (OPP) evaluate the environmental impacts and risks of the Project and identifies where First Nations cultural values and sensitivities may be potentially affected. Section 4.6.3.2 of the OPP has been updated to include the Gunditjmara Sea Country Plan - The Gunditjmara published their Sea Country Plan, Gunditjmara Nyamat Mirring Plan 2023-2033, on 13 March 2024 (GMTOAC 2023). This plan details Gunditjmara's values and species of cultural significance in the Sea Country. Beach considers this to be a general statement with specific comments addressed throughout this public comment report. The greenhouse gas (GHG) emissions for the Project are assessed in Section 6.6 and Appendix K of the Offshore Project Proposal (OPP). Subsequent to the revision of the scope of activities proposed in the OPP, the GHG emissions report for the Project and section 6.6 of the OPP were revised. As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 $MtCO_2$-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) to be 6,729 $MtCO_2$-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. No change is made to the OPP in response to this comment.
PC198 Paragraph 5b	Comment: Risks to culturally significant species: Gunditjmara people are spiritually connected with the rich biodiversity of species in Nyamat Mirring. The Project threatens endangered whale, bird, and turtle species, since drilling, subsea installation, and production operations carry risks of noise pollution, light pollution, and vessel interactions with marine fauna. The OPP fails to provide	Beach Energy (Operations) Limited (Beach) acknowledge the potential environmental impacts and risks of the Otway Offshore Gas Victoria Project (the Project) on the marine species. Beach has also included an assessment of the First Nations Groups values and sensitivities and where relevant included in the risk and impact assessments of the Otway Offshore Project Proposal (OPP). In this regard, sections 6 and 7 of the OPP assess the potential impacts and risks of the Project on the marine environment. The OPP provides for the consideration of whole-of-project environmental impacts and risks. The OPP requires details and evaluation of the environmental impacts and risks

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	sufficient information to determine the significance of such impacts	of the project appropriate to the nature and scale of each impact or risk. The Environment Plan(s) that will be required to authorise activities are intended to address environmental impacts and risks at an activity-level, which would typically be a finer scale of detail than the OPP. The statement does not provide any specific example of where the OPP fails to provide sufficient information. Beach considers this to be a general statement with specific comments addressed throughout this public comment report.
PC199 Paragraph 5c	Comment: Risks to the marine environment: Through Nyamat Mirring, the Gunditjmara are interconnected with the marine environment. Other risks to the environment include toxic discharges from Project activities and potential hydrocarbon spills, which could affect benthic communities and marine species across the food chain. The OPP evaluates the risk of a spill which cover large tracts of the southern coast of mainland Australia and the western coast of Tasmania, impacting marine parks, wetlands, and heritage sites, as well as countless species. Even so, it has failed to model the worst-case spill scenario. The gaps and errors in the OPP suggest that this Project should not proceed to the next stage of approval	Beach Energy (Operations) Limited (Beach) acknowledge the potential environmental impacts and risks of the Otway Offshore Gas Victoria Project (the Project) on the marine environment. The Offshore Project Proposal (OPP) provides for the consideration of whole-of-project environmental impacts and risks. The OPP requires details and evaluation of the environmental impacts and risks of the project appropriate to the nature and scale of each impact or risk. The statement specifically references the risk of hydrocarbon spills. Beach commissioned an independent expert, RPS Group, to prepare a spill model and report (Appendix M). The statement does not provide any specific comment or example of gaps or errors or failures relating to the spill model. Beach considers this to be a general statement with specific comments addressed throughout this public comment report.
PC200 Paragraph 7	Comment: Beach proposes to undertake drilling and completion of up to 17 wells[5], using a semisubmersible drilling rig (Mobile Offshore Drilling Unit or MODU), commencing in 2025[6]. Assuming the drilling campaigns are successful, the Project will require subsea installation and move to the production phase. The estimated duration for operations and production spans up to 34 years, with decommissioning to be completed by 2058[6]. 5 *One well, Artisan 1, will be re-entered and completed (since it has already been drilled). See Beach Energy (Operations) Limited, Otway Offshore Gas Victoria Project:*	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the scope and purpose of the Otway Offshore Gas Victoria Project (the Project). Beach considers this to be a general statement with specific comments addressed throughout this public comment report. As summarised in the introduction to this Report, the scope of the Project has been revised which is reflected throughout the OPP. In particular Chapter 3 for the description of activities is updated to for a reduction in total well number and end of field life.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Offshore Project Proposal (Revision 2, 15 Feb. 2024) (OPP), p. 394. [6] *OPP, p. 37.* [7] *OPP, p. 394.*	
PC201 Paragraph 8	Comment: The production of fossil gas from the 17 prospects could be significant. Beach intends to transport recovered gas through the existing Otway Gas Production Pipeline (Otway Pipeline) to the Otway Gas Plant near Port Campbell, Victoria. The Project presupposes the viability of using the Otway Pipeline, already approaching 20 years old, for another 30 years	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the scope and purpose of the Otway Offshore Gas Victoria Project (the Project). Beach considers this to be a general statement with specific comments addressed throughout this public comment report.
PC202 Paragraph 9	Comment: Beach proposes "tie-backs" to this existing pipeline. Subsea infrastructure would need to be installed, including wellheads, flowlines, umbilicals, and facilities that will connect any producing wells to the current infrastructure. There would be tie-backs of two gas discoveries near the Thylacine platform, known as Artisan and La Bella, to the existing infrastructure, plus "future tie-backs" of any other gas discoveries made during the drilling campaigns[8] [8] *OPP, p. 37.*	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the scope and purpose of the Otway Offshore Gas Victoria Project (the Project). Beach considers this to be a general statement with specific comments addressed throughout this public comment report.
PC203 Paragraph 10	Comment: This Project enables the expansion of offshore gas production in the region by setting up infrastructure that will connect "future campaigns" to the Otway Pipeline and Plant, and locks in substantial GHG emissions for decades to come.	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the scope and purpose of the Otway Offshore Gas Victoria Project (the Project). Beach considers this to be a general statement with specific comments addressed throughout this public comment report.
PC204 Paragraph 11	Comment: The Project is not consistent with greenhouse gas emissions reduction targets and securing a safe climate	Beach Energy (Operations) Limited (Beach) acknowledge the statement about greenhouse gas emissions reduction targets. Beach considers this to be a general statement with specific comments addressed throughout this public comment report.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC205 Paragraph 12	Comment: Climate change is a leading concern for the Gunditjmara people. Climate change impacts threaten the cultural and natural values of Nyamat Mirring; for example, increased ocean acidification undermines the abundance of culturally significant marine species, while sea level rise affects the habitat of intertidal species (such as limpets) on which Gunditjmara people rely for harvesting.[9] Ensuring a safe climate is essential to the survival of Gunditjmara and all First Nations communities. This Project should not be allowed, first and foremost, because of its contribution to climate change. [9] *Gunditjmara Nyamat Mirring Plan, p. 22.*	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding climate change and impacts on marine and intertidal species in the Planning Area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach acknowledges the cultural significance to the Gunditjmara people of marine species including shellfish such as limpets (GMTOAC 2023). It is noted in the OPP (Tables 6-40 and 6-42), that most threatened invertebrate species are suffering as a result from largescale habitat degradation and loss of biodiversity. However, no invertebrate species including limpets are listed as threatened under the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) or under the *Victorian Flora and Fauna Guarantee Act 1988* Threatened List. Whilst changes in regional temperature, humidity and rainfall may impact invertebrate distribution, development, and reproduction, as outlined in Section 6.6.3, invertebrates are expected to be more responsive to habitat changes than vertebrates due to short generation times, high reproduction rates and sensitivity to climatic variables. Beach does not expect activities associated with the Project to impact invertebrate species within local intertidal areas. Beach Energy has considered this comment and has updated Table 6-40 to clarify that no invertebrate species including limpets are listed as threatened under the EPBC Act or under the Victorian Flora and Fauna Guarantee Act 1988 Threatened List. Section 6.6.3 of the OPP provides an evaluation of potential impact of greenhouse gas emissions and climate change, including sea level rise and acidification. As these comments do not introduce new information not already included in the OPP, no further changes are made. *Reference:* *GMTOAC (2023). Gunditjmara Nyamat Mirring Plan 2023-2033 (2023) Gunditj Mirring Traditional Owners Aboriginal Corporation (GMTOAC), Gunditjmara Nyamat Mirring Plan 2023-2033 (2023) (Gunditjmara Nyamat Mirring Plan)*
PC206 Paragraph 13	Comment: Beach comments that the impacts from the Project's GHG emissions are aligned with the principles of ecologically sustainable development, on the basis that "[g]as will be sold into the domestic market and will provide a clean energy source to allow the transition from	Beach Energy (Operations) Limited (Beach) acknowledge the comment about greenhouse gas emissions and the role of energy sources in the energy transition. The comment makes reference to Section 6.6 of the Offshore Project Proposal (OPP) and specifically the Ecologically Sustainable Development (ESD) Principles in Table 6-45 of the OPP.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	coal to renewables to occur in an orderly fashion."[10] However, the International Energy Agency estimates that the burning of natural gas globally contributed around 7.5 billion tonnes of carbon dioxide to the atmosphere in 2021, which equates to approximately 21% of global carbon dioxide emissions.[11] The notion that fossil gas is a "clean energy source" is plainly false, and a concerning misstatement to find within Beach's analysis of GHG emissions impacts. [10] *OPP, p. 409 (emphasis added).* [11] *International Energy Agency, Global Energy Review: CO2 Emissions in 2021 (2022).*	Beach has reviewed the Section 6.6 and the ESD principles and has amended the ESD principles presented in Table 6-45 of the OPP, notably: <u>"Gas and condensate from OGP is supplied into the domestic Australian market. The scope 3 emissions associated with the processing, transmission/transport and end use of the gas and condensation will occur within Australian Commonwealth jurisdiction. Therefore the scope 3 emissions will be managed in accordance with Australia's regulatory regime including NGER and the Safeguard Mechanism, which is designed "to deliver emissions reductions consistent with Australia's [NDC] under the Paris Agreement" (DCCEEW, 2023i) and the Climate Change Act 2022."</u>
PC207 Paragraph 14	Comment: In its stakeholder consultation information sheets, Beach spreads further misinformation on the role of fossil gas in addressing climate change. Even if "[c]arbon emissions of natural gas are significantly lower than coal" when the product is burned, this does not account for the methane emissions from gas production and transport. Methane is a more potent GHG source and driver of climate change.[12] Methane leaks and purposeful venting of methane from gas developments alone contribute 1.2 billion tonnes of carbon dioxide equivalent (CO2-e) to the atmosphere every year.[13] Beach estimates that its proposed Project will emit over 34.6 million tonnes of CO2-e in its lifetime [12] *According to the IPCC Sixth Assessment Report, fugitive and production methane from fossil fuel is 29.8 times more potent as a GHG source than carbon dioxide over a 100-year period. IPCC, Sixth Assessment Report, Annex II: Definitions, Units & Conversions (2021), p. 1831. (We also note with concern that Beach used a lower conversion*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding emissions and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach reports its Australian scope 1 and scope 2 emissions in accordance with the National Greenhouse and Energy Reporting Act 2007 (NGER Act), the National Greenhouse and Energy Reporting Regulations 2008 (NGER Regulations) and National Greenhouse and Energy Reporting (Measurement) Determination 2008. The NGER Regulations define the global warming potentials (GWP) which are used to calculate the carbon dioxide equivalence of various substances for compliance with the NGER Act. This was last amended in 2020 and reflects the values specified by the IPCC in the Fifth Assessment Report AR5 (https://www.ipcc.ch/) of the GWP of methane as 28. The proposed management of the impact of GHG emissions is aligned with the Beach Environment Policy, Climate Change Policy, Sustainability Policy, Risk Management Standard, Environment Management Standard, Sustainability Standard and Climate Transition Action Plan (CTAP) as detailed in Section 6.6 8 of the OPP (Table 6-43). In Beach's CTAP, released in April 2024, Beach announced a new target of <0.2% methane emissions intensity by 2025 for our operated assets, calculated on reported methane emissions. The target is in support of the Global Methane Pledge to reduce methane emissions by 30% by 2030 (on 2020 levels), which the Australian government became a signatory to in 2022. Our commitment to address methane emissions is reflected in the annual Leak Detection and Repair

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	factor of 28, citing NGER Regulations (Compilation 26) (see OPP, p. 1234), potentially [13] *International Energy Agency, Global Methane Tracker 2022: Overview (2022). In converting fugitive fossil methane to CO2-e, see: Intergovernmental Panel on Climate Change, Sixth Assessment Report, Annex II: Definitions, Units & Conversions (2021), p. 1833.*	(LDAR) program that is in place at all onshore and offshore facilities, allowing us to ensure potential leak sources are addressed with priority. As per previous comments and responses, Beach has updated Table 6-43 of the OPP to include the CTAP. Subsequent to the revision of the scope of activities proposed in the OPP, the GHG emissions for the Project were revised. As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 $MtCO_2$-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) to be 6,729 $MtCO_2$-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC208 Paragraph 15	Comment: Beach comments that gas has an important role in Australia's transition to renewable energy: "As old coal fired power stations are removed from Australia's energy mix, electricity powered from natural gas ensures a stable energy supply as our economy transitions to a different mix of energy sources for electricity generation."[14] However, Beach provides no evidence to support its implicit assertions that this new gas Project will displace coal power in Australia's electricity mix, and that there are no cleaner and more feasible renewable energy alternatives that will provide a stable power supply [14] *OPP, Appendix N, p. 4.*	Beach Energy (Operations) Limited (Beach) has reviewed the comment, in particular the reference to the Information Sheet dated September 2023 (Appendix N). The comment relates to the role natural gas will play as Australia transition to renewable energy. The full context of the statement in the Information Sheet about the role of gas as an energy source in the energy transition includes reference to the Australian Energy Market Operator's (AEMO) Integrated System Plan (ISP) of 2022 for the National Electricity Market which forecast that more gas-fired generation is required to reach Net Zero by 2050. Consistent with the ISP 2022, the Draft ISP 2024 demonstrates the important role that gas will play in Australia's transition to a net zero economy. The Draft ISP 2024 was published by AEMO in December 2023, with the final report due out in June 2024. The Australian Government's Future Gas Strategy (FGS) highlights that gas will be a transition fuel that firms renewable power generation and is required for manufacturing and minerals processing until such time as alternatives are viable. (Page 4, FGS).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		No change is made to the OPP in response to this comment.
PC209 Paragraph 16	Comment: It is misleading to suggest that fossil gas has a role in the clean energy transition. Continued use of fossil gas will not allow global emissions to reduce consistently within the carbon budget for limiting warming to 1.5°C. Instead, energy demand will need to be met by renewable, zero-emissions sources. Meeting this demand by increasing gas supply will produce emissions that cannot credibly fit within the carbon budget	Beach Energy (Operations) Limited (Beach) is of the opinion that there will be an ongoing role for natural gas in the energy transition in enabling the greater penetration of renewable energy. As stated above (e.g. PC 208), both the Australian Energy Market Operator's (AEMO) Integrated System Plan (ISP) Reports and the Australian Government's Future Gas Strategy (FGS) confirm natural gas will continue to be critical to ongoing economic prosperity as lower emissions technologies are developed and integrated into energy supply systems. As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 $MtCO_2$-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) to be 6,729 $MtCO_2$-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. No change is made to the OPP in response to this comment.
PC210 Paragraph 17	Comment: The Project will compromise efforts to keep the global average temperature increase below 1.5°C.This Project will expand gas production at a time when new and expanded fossil fuel development must end. It will compromise Australia's emission reduction targets and contribute to the climate crisis, exacerbating climate-related harms to First Nations' cultural heritage, communities, and the environment.	Beach Energy (Operation) Limited (Beach) acknowledge the statement about global temperatures and emissions reduction targets. Section 6.6 of the Offshore Project Proposal assess the greenhouse gas emissions of the Otway Offshore Gas Victoria Project. As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 $MtCO_2$-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) of 6,729 $MtCO_2$-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. Table 6-45 of the OPP summarises the acceptability of the Project in relation to GHG emissions.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach is unable to identify a specific comment within this statement that merits an amendment to the OPP the Offshore Project Proposal (OPP). Beach acknowledges the statements about First Nations' cultural heritage. Section 4.6 of the OPP describes the cultural values and sensitives of the environment, while Sections 6 and 7 of the OPP assess potential impacts and risks. Beach is unable to identify a specific comment within this statement that merits an amendment to the OPP.
PC211 Paragraph 18	Comment: The need to limit the global average temperature to below 1.5°C is reflected in the Paris Agreement ratified by Australia. In the Sharma case, the Federal Court of Australia relevantly made the finding (not disturbed on appeal[15]) that, if the carbon budget for 2°C or even 1.5°C is exceeded, it will lead to severe, irreversible, and potentially cascading climate change harm[16] [15] *See Minister for the Environment v Sharma [2022] FCFCA 35.* [16] *Sharma v Minister for Environment [2021] FCA 560 at [74]-[90], [249]. "[T]he risk of harm … from climatic hazards brought about by increased global average surface temperatures … is on a continuum in which both the degree of risk and magnitude of the potential harm will increase exponentially if the Earth moves beyond a global average surface temperature of 2°C, towards 3°C and then to 4°C above the pre-industrial level": Sharma v Minister for Environment [2021] FCA 560 at [75].*	Beach Energy (Operations) Limited (Beach) notes the statement regarding the Paris Agreement, the international agreement that aims to strengthen the global response to the threat of climate change. Beach also note that Article 2 of the Paris Agreement states that the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, includes "Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change". Australia's commitment to the Paris Agreement is reflected in the *Climate Change Act 2022*, which describes these same goals, and informs matters such as the Safeguard Mechanism and Australia's Nationally Determined Contribution. <u>In response to this comment, Beach has reviewed sections 6.6.3.3.1 and 6.6.3.3.5 of the OPP and has amended these section to provide further clarity of the Paris Agreement and the International Energy Agency (IEA) World Energy Outlook.</u> Beach notes the references to the Sharma v Minister for Environment. Beach considers this is a general statement and does not relate Beach's obligations in respect of the OPP.
PC212 Paragraph 19	Comment: There is an emerging international consensus that it will be impossible to keep global average temperatures below 1.5°C without stopping the expansion of new fossil fuel development. The International Energy Agency has concluded that the scientifically credible pathway to limiting warming to 1.5°C – the goal of the	Beach Energy (Operations) Limited (Beach) notes the statement regarding the Paris Agreement, the Intergovernmental Panel on Climate Change (IPCC) and International Energy Agency (IEA). Section 6.6 of the Offshore Project Proposal assess the greenhouse gas emissions of the Otway Offshore Gas Victoria Project, in the context of various Australian and international instruments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Paris Agreement – requires that no new gas and oil fields be approved for development after 2021. The Intergovernmental Panel on Climate Change (IPCC), the leading international scientific authority on climate change, has recently made clear that even emissions from existing fossil fuel infrastructure will push the world beyond 1.5°C of warming, and that "[g]lobal warming is more likely than not to reach 1.5°C between 2021 and 2040 even under the very low GHG emission scenarios."[18] The IPCC report states: "Pathways consistent with 1.5°C and 2°C carbon budgets imply rapid, deep, and in most cases immediate GHG emission reductions in all sectors (high confidence)."[19] In that context, the United Nations Secretary-General has warned that "[i]nvesting in new fossil fuel infrastructure is moral and economic madness[20] [17] *International Energy Agency, 'Net Zero by 2050: A Roadmap for the Global Energy Sector – Summary for Policymakers' (May 2021), p. 11.* [18] *Hoesung Lee et al., Synthesis Report of the IPCC Sixth Assessment Report (AR6) (2023), p. 56 (Figure 3.5).* [19] *Hoesung Lee et al., Synthesis Report of the IPCC Sixth Assessment Report (AR6) (2023), p.46.* [20] *UN Secretary-General Antonio Guterres, 'Secretary-General Warns of Climate Emergency, Calling Intergovernmental Panel's Report 'a File of Shame', While Saying Leaders 'Are Lying', Fuelling Flames' (Media Release SG/SM/21228, 4 April 2022).*	Beach also notes the detail regarding Article 2 of the Paris Agreement as provided in the response to PC211. Beach is unable to identify a specific comment within this statement that merits an amendment to the Offshore Project Proposal.
PC213 Paragraph 20	Comment: There is no budget for new and expanded gas production. According to the United Nations Environment Programme (UNEP), in carbon budgets consistent with 1.5°C of warming, gas production must decline	Beach Energy (Operations) Limited (Beach) notes the statement regarding the global carbon budget. Section 6.6 of the Offshore Project Proposal assess the greenhouse gas emissions of the Otway Offshore Gas Victoria Project, in the context of various Australian and international instruments and global (see Table 6-39) and Australian carbon budgets.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	significantly after 2020. If gas production rises at all, it is inconsistent with limiting warming to even 2°C, let alone 1.5°C. Similarly, the IPCC finds that in carbon pathways consistent with a 50% chance of limiting warming to 1.5°C with no or limited overshoot, there is a major reduction in demand for fossil gas, with net zero emissions from the global energy sector required between 2033 and 2057.[21] [21] *IPCC Sixth Assessment Working Group III, Chapter 3, Section 3.4.2 (2022).*	Beach is unable to identify a specific comment within this statement that merits an amendment to the Offshore Project Proposal.
PC214 Paragraph 21	Comment: Figure 1 below shows a stark difference between countries' current plans/projections of GHG emissions (or even their production implied by current climate pledges), and reductions needed to limit warming to 1.5°C (the so-called "production gap"	Beach Energy (Operations) Limited (Beach) notes the comment about various countries greenhouse gas emissions. Beach is unable to identify a comment within this statement.
PC215 Paragraph 22	Comment: Current global commitments would produce a mid-range estimate of warming of 2.8°C by the end of the century[23], and there are increased risks of human and environmental harm in all warming scenarios. As the global temperature rises above 1.5°C, Australia has rapidly increasing likelihood of severe heatwaves, coral bleaching, bushfires, droughts, and other extreme events[24] [23] *United Nations Environment Programme., Emissions Gap Report 2022 (2022), p. iv.* [24] *A. King et al., 'Australian Climate Extremes at 1.5°C and 2°C of Global Warming' (2017) 7 Nature Climate Change 412. See also Australian Climate Council, 'Impacts at 1.5 and 2 Degrees of Warming', Resources (15 April 2023).*	Beach Energy (Operations) Limited (Beach) note the statement about global temperatures and extreme climate events. Section 6.6.3 and Appendix K of the OPP provides an analysis and evaluation of GHG emissions and climate change. Beach is unable to identify a comment within this statement that merits change to the OPP.
PC216 Paragraph 23	Comment: Given that immediate and deep emissions reductions are required to limit warming and avoid catastrophic impacts on Australia's people and	Beach Energy (Operations) Limited (Beach) recognises that action to address climate change is necessary and that all energy systems must contribute in order to meet the targets set out in the Paris Agreement. As an energy company, Beach must play a role in managing our carbon

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	environment, and the Project does not reduce current emissions but instead contributes at least 34.6 million tonnes of additional emissions, then it simply cannot follow that the Proposal is environmentally acceptable. The basic mathematics of carbon budgets cannot be ignored. Australia and Australian corporations are not exempt from the global obligation to reduce gas production in line with a 1.5°C compatible pathway	emissions. Beach has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35% by 2030. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. This target is aligned with the Australian Government's Nationally Determined Contribution., a 2030 target of a 43% reduction in carbon emissions from a 2005 base, and falls within the envelope of pathways to limit warming to 2˚C. Section 6.6.3 and Appendix K includes an assessment of GHG emissions from the Project. The GHG emissions are presented throughout this section by source (Table 6-37), quantity (Table 6-38) and in relation to percent of global carbon budgets (Table 6-39). As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 $MtCO_2$-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) of 6,729 $MtCO_2$-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC217 Paragraph 24	Comment: The Project could consume four times more of Australia's carbon budget than the OPP comments	Beach Energy (Operations) Limited (Beach) acknowledge the statement about the Otway Offshore Gas Victoria Project (the Project) and Australia's carbon budget. This is a general statement with specific comments about carbon budgets are addressed throughout this public comment report (see PC218 to 220).
PC218 Paragraph 25	Comment: According to Beach's calculations, the Project will emit over 34.6 million tonnes of carbon dioxide equivalent, or 0.531% of Australia's remaining carbon budget of 6,428 million tons CO2-e, consistent with keeping global average temperatures below 1.5°C.25 However, according to leading climate scientists Prof. Malte Meinshausen and Dr. Zebedee Nicholls, as of 2021,	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding emissions and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Section 6.6.3 and Appendix K includes an assessment of GHG emissions from the Project. The GHG emissions are presented throughout this section by source (Table 6-37), quantity (Table 6-38) and in relation to percent of global carbon budgets (Table 6-39). As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO_2-e.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Australia's share of the remaining global carbon budget, for a 50% likelihood of staying below 1.5°C of warming, was only 4,010 million tons CO2-e as of January 2021, and was being depleted at an average rate of 609 million tonnes CO2-e per year (over the previous seven years).26 Assuming the same emissions rate going forward, by January 2025, Australia's carbon budget would have been reduced by 2,430 million tonnes to 1,580 million tonnes CO2-e. Thus the Project would comprise over 2% of Australia's budget remaining in 2025 [25] *OPP, p. 394-395.* [26] *M. Meinshausen and Z. Nicholls, 'Updated assessment of Australia's emission reduction targets and 1.5°C pathways', Climate Resource (June 2023), p. 11 (calculating that Australia's emissions were 4,260 million tons between 2013 and 2020, or an average of 609 million tons per year over 7 years; 609 million tons x 4 years of 2021, 2022, 2023, and 2024 = 2,430 million tons to subtract from the budget; 4,010 million tons as of January 2021 – 2430 million tons emitted between 2021 through 2024 = 1580 million tons remaining as of January 2025. 34.6 million tons is 2.19% of 1,580 million tons.)*	The Australian carbon budget over the period of the Project (2025 to 2049) was calculated to be 6,729 MtCO$_2$e. The total direct and indirect GHG emissions from the Project are estimated to be approximately 0.19% of the Australian carbon budget. We note the typographical error of 6428 MtCO$_2$-e stated in the previous revision of the OPP published for public comment.
PC219 Paragraph 26	Comment: Beach Energy irresponsibly suggests that "discernible impact on GHG concentrations in the atmosphere" is the benchmark by which this Project should be evaluated.[27] While we disagree that this should be a benchmark, 2% of Australia's carbon budget is not only "discernible", but it is a significant percentage that can and must be avoided by reducing gas production, use, and export in Australia [27] *OPP, p. 395.*	Beach Energy Operations (Limited) (Beach) acknowledges comments regarding emissions and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The greenhouse gas (GHG) emissions for the Project are assessed in Section 6.6 and Appendix K of the OPP. Subsequent to the revision of the scope of activities proposed in the OPP, the GHG emissions report for the Project and section 6.6 of the OPP were revised. As described in the Introduction of this report, the GHG emissions for the Project are estimated to be 13.05 million tonnes CO$_2$-e.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 $MtCO_2$-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) of 6,729 $MtCO_2$-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC220 Paragraph 27	Comment: Beach comments that it has an "equity emissions reduction target" to reduce Scope 1 and 2 emissions intensity by 35% by 2030. This means that it will reduce emissions only in accordance with its "share of equity in the operation."[28] This is essentially window dressing and relatively insignificant from a climate perspective. Scope 1 and 2 emissions are only 13% of this Project's emissions, and the emissions from the Project may not be reduced at all. Instead, Beach uses a net zero approach that promises emissions reduction only from the Moomba Carbon Capture and Storage Project, which has yet to prove its viability[29] [28] *Beach Energy, Reducing Emissions (Web Page, 2024).* [29] *Beach Energy, Reducing Emissions (Web Page, 2024).*	Beach Energy (Operations) Limited (Beach) has an equity emissions reduction target to reduce our Scope 1 and 2 emissions intensity by 35% by 2030. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. This target is aligned with the Australian Government's target of a 43% reduction in carbon emissions from a 2005 base, and falls within the envelope of pathways to limit warming to 2˚C. Beach Energy (Operations) Limited acknowledge the importance of emissions abatement measures in ensuring that energy is supplied to meet the needs of society, while reducing emissions intensity. Beach is doing its share to reduce its emissions whilst supporting the orderly transition to a lower emissions energy sector. We are reducing the carbon emissions from natural gas production through carbon capture and storage and continued pursuit of emissions abatement projects at our existing facilities. We are proud of our investment in the Moomba Caron Capture Storge (CCS) project, operated by our joint venture partner Santos. Constructed adjacent to the Moomba Gas Plant in the Cooper Basin, the project is one of the world's largest CCS projects and will deliver a material greenhouse gas reduction for Beach's portfolio. Upon its completion, Moomba CCS will safely store up to 1.7 million tonnes per annum of carbon emissions in the depleted reservoirs near the Moomba Gas Plant. (FY23 Sustainability Report, CTAP). Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC221 Paragraph 28	Comment: The Project will require a substantial infrastructure buildout and drive the expansion of fossil fuel production	Beach Energy (Operations) Limited (Beach) acknowledge the statement summarising the Otway Offshore Gas Victoria Project (the Project). The Project considers the subsea development of gas fields adjacent by utilising the existing gas infrastructure in the Otway Basin. This is a general statement with specific comments addressed in this public comment report (see PC222 to 223).
PC222 Paragraph 29	Comment: Beach appears to downplay the new fossil fuel infrastructure required for the Project, instead emphasising that it will utilise existing infrastructure.[30] However, the Project will lead to a substantial infrastructure buildout in the region as it includes, among other things, "tie-backs", including flowlines, umbilicals, and other subsea infrastructure, connecting up to 17 wells with existing infrastructure. [31] In addition, it could also necessitate a new gas pipeline to replace the ageing Otway Gas Pipeline, which is nearly 20 years old[32]. There is considerable data to show that offshore gas pipelines decline after 20 years, and the risk of pipeline failure steadily increases with age[33]; the recommended lifetime is no more than 40 years [30] *See for example OPP, pp. 39, 72.* [31] *OPP, pp. 72-73.* [32] *Since the plant started processing natural gas piped from the Geographe and Thylacine offshore production wells in 2006, it is assumed the pipeline began operating prior to 2006: see Beach, Otway Basin Victoria (Web Page, 2024).* [33] *See U.S. Department of Transportation, Pipelines and Hazardous Materials Safety Administration, Pipeline Replacement Background (8 April 2024).*	The Otway Offshore Gas Victoria Project is the development of gas resources in the Otway Basin utilising existing infrastructure at the Thylacine platform and Otway gas pipeline (offshore) as well as existing onshore pipelines and the Otway gas plant. The development of gas fields will require new subsea flowlines and umbilicals to existing infrastructure. The OPP for the Otway OGV Project does not include the construction or operation of a new gas pipeline. The ongoing operation and maintenance of the Otway Gas Pipeline is managed in the relevant pipeline Safety Case, and the potential environmental impacts and risks are assessed in the five-yearly reviews of the accepted Environment Plan as required under the relevant Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations and Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations, respectively. The Otway pipeline is maintained and inspected on a regular basis to ensure the pipeline integrity. The Otway pipeline has a design life of 35 years and if an extension to the operating life is required, the appropriate approvals to demonstrate the pipeline integrity will be undertaken. No change is made to the OPP in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC223 Paragraph 30	Comment: It would be inconceivable for Beach to continue to use the Otway Gas Pipeline for another 34 or so years, as proposed. Decommissioned pipelines would generally need to be replaced with new lines, rather than repurposed. As such, Beach must address and evaluate the potential environmental and health impacts of both continuing to use an aging pipeline and constructing a new pipeline	The Otway Offshore Gas Victoria Project is the development of gas resources in the Otway Basin utilising existing infrastructure at the Thylacine platform and Otway gas pipeline (offshore) as well as existing onshore pipelines and the Otway gas plant. The development of gas fields will require new subsea flowlines and umbilicals to existing infrastructure. The OPP for the Otway OGV Project does not include the construction or operation of a new gas pipeline. The ongoing operation and maintenance of the Otway Gas Pipeline is managed in the relevant pipeline Safety Case, and the potential environmental impacts and risks are assessed in the five-yearly reviews of the accepted Environment Plan as required under the relevant Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations and Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations, respectively. The Otway pipeline is maintained and inspected on a regular basis to ensure the pipeline integrity. The Otway pipeline has a design life of 35 years and if an extension to the operating life is required, the appropriate approvals to demonstrate the pipeline integrity will be undertaken. No change is made to the OPP in response to this comment.
PC224 Paragraph 31	Comment: The Project poses significant risk of harm to culturally important marine species	This is general statement with specific comments summarised and addressed in PC225.
PC225 Paragraph 32	Comment: The Gunditjmara people are closely connected with many coastal and marine species that may be affected by the Project. Several species in Nyamat Mirring serve as an ongoing source of food and hold strong cultural value for Gunditjmara. Special dreaming stories, ceremonies, and traditional livelihood practices are associated with important species including Karntubul (Whales), Kooyang (Eels), and Koorn Moorn (Seals).[34] As traditional custodians of Nyamat Mirring, Gunditjmara are concerned by direct impacts from the proposed Project on threatened species, as well as indirect impacts from its contribution to climate change	The cultural values and sensitivities of First Nations groups is reviewed in section 4.6 of the OPP. The Offshore Project Proposal (OPP) provides for the consideration of whole-of-project environmental impacts and risks. The OPP requires details and evaluation of the environmental impacts and risks of the project appropriate to the nature and scale of each impact or risk. An assessment of risks and impacts of planned and unplanned events is provided in section 6 and 7 of the Offshore Project Proposal (OPP). Section 4.6.3.2 of the OPP has been updated to include the Gunditjmara Sea Country Plan - The Gunditjmara published their Sea Country Plan, Gunditjmara Nyamat Mirring Plan 2023-2033, on 13 March 2024 (GMTOAC 2023). This plan details Gunditjmara's values and species of cultural significance in the Sea Country. See also additional changes to the OPP in response to PC274 and PC230

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[34] *Gunditjmara Nyamat Mirring Plan, pp. 18-9.*	
PC226 Paragraph 33	Comment: The OPP identifies species with biologically important areas (BIAs) that overlap with the Project Area: 10 birds, one fish (White Shark), and two cetaceans (Pygmy Blue Whale and Southern Right Whale).[35] The Southern Right Whale, an endangered[36] and migratory species, has a biologically important migration route through the Project Area. The Pygmy Blue Whale, also an endangered and migratory species (as a subspecies of the Blue Whale), has annual high-use foraging BIAs that are "known to occur" within both the Project Area and Planning Area[37] [35] *See OPP, p. 55 (Table 6). BIAs are defined as "spatially defined areas where aggregations of individuals of a species are known to display biologically important behaviour such as breeding, foraging, resting or migration": OPP, p. 54.* [36] *"Endangered" means that the species is facing a "very high risk of extinction in the wild in the near future": Environment Protection and Biodiversity Conservation Act 1999 (Cth), s 179(4).* [37] *OPP, p. 55 (Table 6).*	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding the presence of Biologically Important Areas (BIAs) in the Project and Planning Area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The BIAs mentioned in this comment have been identified in each respective species section of the Description of the Environment (Section 4). Impacts and risk to threatened and migratory species are thoroughly assessed throughout the OPP in Sections 6 and 7. BIAs for species are taken into consideration and inform the assessment of impact and risk. Environmental Performance Outcomes (EPOs) and control measures ensure that these impacts and risks are of an acceptable level. As the comment does not contain new information, no change to the OPP is made in response to this comment.
PC227 Paragraph 34	Comment: The Protected Matters Search Tool (PMST) has a significantly longer list of protected species, including critically endangered, endangered, vulnerable, and migratory species, which are known to occur or likely to occur in the Project and/or Planning Area[38] [38] *OPP, Appendix A (PMST Report for the Project Area); Appendix B (PMST Report for the Planning Area).*	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding the inclusion of protected species and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The OPP Description of Environment (Section 4) includes all species with an *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) listing those that have a presence in the Project or Planning Area, as identified in the Protected Matters Search Tool (PMST) Report. As described in Section 4.4.9. (Threatened and Migratory Species), species listed as threatened or migratory under the EPBC Act and known or likely to occur in the Project or Planning Areas and/or

ID	Summary of comments received	Beach’s assessment of merit of comment(s) and response(s) to comments and/or objections
		have an intercepting Biologically Important Areas (BIAs) with the Project or Planning Areas are discussed in more detail. The description of environment is the basis for the impact and risk assessment. Species with higher status of protection, or those engaging in biologically important behaviours, are assessed in the greatest detail to account for nature and scale of impacts. The PMST tool detects all EPBC Act listed species with an occurrence in the area. Due to the grid sizes used in the PMST search tool, species outside of the actual input area can be detected, including terrestrial species. Species that only occur in terrestrial habitat are not included in the OPP as they do not have potential to be impacted by the activities. Terrestrial/ freshwater species that appear in the PMST and were not included in the OPP are: • Giant Freshwater Crayfish/ Tasmanian Giant Freshwater Lobster • Glenelg Spiny Freshwater Crayfish/ Pricklyback • Green and Golden Bell Frog • Growling Grass Frog • Insects • Swamp Atechinus (mainland) • Spot-tailed Quoll (SE mainland and Tasmanian populations) • Southern Brown Bandicoot • Eastern Barred Bandicoot • Broad-toothed Rat (mainland) • Southern Bent-wing Bat (mainland and Tasmanian populations) • Greater Glider (southern and central) • Yellow-bellied Glider (south-eastern) • Long-nosed Potoroo • Smoky Mouse • New Holland Mouse • Heath Mouse • Grey-headed Flying-fox • Tasmanian Devil • Striped Legless Lizard

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		- Swamp Skink These species occur in terrestrial habitat or freshwater only and do not have the potential to be impacted by activities associated with the Project (DCCEEW, 2024a). As such they have not been included in the OPP. Other species that appeared in the PMST and were not included in the OPP: - Southern Bluefin Tuna (Conservation Dependent, species or species habitat likely to occur within the Project Area and Planning Area). The Southern Bluefin Tuna had been included in the list of commercial fisheries as a target species, however, was missing from the section on fish within the Project and Planning Area. The OPP has been updated to include the Southern Bluefin Tuna in Section 4.4.9.7- Fish. *References* *DCCEEW. (2024a) Species Profile and Threats Database- SPRAT Profile. Department of Climate Change, Energy, the Environment and Water. Accessed May 2024 at: https://www.environment.gov.au/cgi-bin/sprat/public/sprat.pl.*
PC228 Paragraph 35	Comment: Notably, the PMST Report indicates that the critically endangered Orange-bellied Parrott is likely to have a migration route within the Project Area. "Critically endangered" species warrant protection under the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act), as these species are at "extremely high risk of extinction in the wild in the immediate future."[39] Even impacts on purportedly low numbers of those species (such as light impacts, discussed below) could be significant and should not be disregarded. [39] *Environment Protection and Biodiversity Conservation Act 1999 (Cth), s 179(3) (emphasis added).*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the Orange-bellied parrot and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The Orange-bellied parrot is listed in Table 4-22 and described in detail in Section 4.4.9.4.4, including details of probable migration behaviour within the Project and Planning Areas (see Figure 4-42). Potential impacts to Orange-bellied parrots from light emissions are identified and assessed in Section 6.3.3.2.5 with migration route likely to occur with the light EMBAs (Table 6-12 and Figure 6-4). The control measures associated with industry best practice are considered appropriate to ensure the environmental impacts relating to light emissions from vessels and the Mobile Offshore Drilling Unit (MODU) and at acceptable levels. These control/mitigation measures are provided in Table 6-15. Beach has taken into consideration the National Light Pollution Guidelines for Wildlife (DCCEEW 2023). These guidelines recommend using Best Practice Lighting Design and undertaking an environmental risk assessment (i.e. the impact and risk assessment within the OPP)

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		where there is important habitat within light EMBAs. In addition, Beach has committed to the development of a Light Management Plan that will assist in managing environmental impacts and risks of light emissions to acceptable levels and is legally required to be completed prior to commencement of activity. Beach will contract a suitably qualified specialist to develop and support the implementation of the Plan as per the National Light Pollution Guidelines for Wildlife (DCCEEW 2023). The National Recovery Plan for the Orange-bellied parrot (DELWP 2016) identifies that the behaviour of this species may be modified by the presence of barriers such illuminated structure and boats, with the impacts of barriers greatest where they occur on migration routes, though there is little more than anecdotal evidence to support this. The Project Area, as detailed in Section 3.5 (Project Area Definition), overlaps an area of probably migration by <0.01 per cent and as such, the activities of the MODU and vessels when undertaking the petroleum activity do not present the same barrier risk as that associated with illuminated structures or illuminated boats within the migration route. The light and flaring EMBA overlaps the probable migration route of the orange-bellied parrot by 2.2% and 8.6%, respectively. Impacts associated with flaring, which will not occur within the migration route but rather may change ambient light in the area, will be temporary and of short duration. Therefore, a change in ambient light is unlikely to cause behavioural changes or result in injury/mortality to the Orange-bellied parrot. Project activities, as detailed in Section 3 (Description of the Project and Alternatives Analysis) involve seabed surveys through to decommissioning of wells and infrastructure installed as part of the Project. These activities will involve the use of either a semi-submersible or jack-up MODU and appropriate support vessels. The presence of the MODU and support vessels will be short term and temporary as detailed in Section 3.8 (Description of Activities) and will not be permanently present over the 30-year life of the Project as commented. Successfully drilled wells will be tied back to existing infrastructure, which may include the existing, normally unmanned, Thylacine A platform. The Thylacine A platform is situated ~33 km from an area of probably migration according to DELWP (2016). This is greater than the 20 km threshold to undertake an environmental risk assessment (as detailed within the National Light Pollution Guidelines (DCCEEW 2023)) with a change of ambient light in the area of probably migration not expected. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments, however <u>references to the National Light</u>

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Pollution Guidelines for Wildlife (DCCEEW 2023) have been amended throughout to ensure the correct revision is referenced. *References:* *DELWP (2016). CC BY 4.0*
PC229 Paragraph 36	Comment: In addition to the Blue Whale and Southern Right Whale, several other endangered species are also likely or known to occur in the Project Area, including the Northern Royal Albatross; Southern Giant Petrel; Shy Albatross; Loggerhead Turtle; and Leatherback Turtle.[40] As these species have habitat in the Project Area, they are susceptible to impacts from noise pollution, light pollution, and vessel traffic related to Project activities such as drilling, production operations, and subsea installation (discussed below) [40] *OPP, Appendix A (PMST Report for the Project Area).*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the presence of endangered species and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. All species listed under the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) that may be impacted by activities associated with the Project have been assessed in the OPP. These species are determined through a Protected Matters Search Tool (PMST) Report for each relevant area. As the PMST is run on large grid sizes, determination of the likelihood of species occurring in relevant areas is also supported by peer reviewed scientific literature and/or management plans. The Northern Royal Albatross, Southern Giant Petrel and Shy Albatross are identified as light sensitive species in the OPP, as described in Section 6.3.3 and Table 6-12 (Emissions- Light, Impact Analysis and Evaluation). This accurately reflects the PMST search for light EMBAs (Appendix E). Seabirds (including the Northern Royal Albatross, Southern Giant Petrel and Shy Albatross) are not assessed for underwater sound or vessel interaction in the OPP as they are not vulnerable to these aspects. Noise emitted to air dissipates rapidly and is not a concern due to the distance offshore (Section 6.4.1 Hazard Description, Emissions- Underwater Sound). The National Recovery Plan for Albatrosses and Petrels (2022) (CoA, 2022) identifies light emissions as a threat, though classifies marine infrastructure interactions including those associated with artificial light as having no risk category priority and affecting 'Nil' species in Australian jurisdiction (Section 6.3.3.1.2). Receptors that may be impacted underwater sound and vessel interaction are described in Section 6.4 (Emissions- Underwater Sound) and Section 7.2 (Physical Presence- Interaction with Marine Fauna).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Impacts to marine reptiles from underwater sound, light and vessel interactions associated with the Project have been assessed in the OPP. The PMST Reports identified three marine turtle species with potential to occur in the Project Area and/or Planning Area (Table 4-23, Section 4.4.9 – Threatened and Migratory Species). The Leatherback and Loggerhead turtles are 'likely' to occur within the project area and the Green Turtle 'may occur' within the Project Area (Table 4-23, Section 4.4.9-Threatened and Migratory Species). The PMST tool uses large grid sizes in offshore waters and hence peer reviewed scientific information and management plans are used to verify the presence of species. Risk of interaction with marine fauna (vessel strike) associated with the Project is assessed in Section 7.2 (Physical Presence – Interaction with Marine Fauna). The impact assessment described the likely presence of turtles as 'remote'. Section 7.2.3.2 (Physical Presence – Interaction with Marine Fauna, Potential Impacts) has been updated to include further explanation of the presence of turtles in the Project Area: 'The presence of turtles in the Project Area and surrounds is considered unlikely, based on the following information provided in Section 4.4.9.5: • Green Turtles are predominantly found in Australian waters off the Northern Territory, Queensland, and Western Australian coastlines, with limited numbers in New South Wales, Victoria, and South Australia. There are no known nesting or foraging grounds for Green Turtles offshore Victoria; they occur only rarely in these waters (DoE 2023m) (Section 4.4.9.5.1). • This species (Leatherback Turtle) is an occasional visitor to the Otway shelf and has been sighted on a number of occasions during aerial surveys undertaken by the Blue Whale Study Group, particularly to the southwest of Cape Otway (CoA 2017a). (Section 4.4.9.5.2). • Loggerhead Turtles forage in all coastal states and the Northern Territory, but are uncommon in South Australia, Victoria, and Tasmania (CoA 2017a). Due to water depths, it is unlikely Loggerhead Turtle would be present in the Project Area but may be occasional visitors to the Planning Area (Section 4.4.9.5.3 Loggerhead Turtle).' Impacts to turtles from underwater sound associated with the Project are assessed in Section 6.4 (Emissions- Underwater Sound). The furthest distance to noise effect criteria for turtles is 3.9 km (behavioural), within the Project Area. As such, the predicted occurrence of turtle species that may be impacted by noise is based on the PMST search for the Project Area, supported by peer reviewed literature.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Section 6.4.3.2.2 (Emissions- Underwater Sound, Marine Turtles) has been updated to provide further explanation of the presence of turtle species: Three marine turtle species are 'known' or 'likely' to occur within the Project Area based on the PMST search, however no BIAs or habitat critical to the survival of the species are present. The PMST presence for the Loggerhead Turtle is classified as 'breeding likely to occur'. The presence of turtles in the Project Area and surrounds is considered unlikely, based on the following information provided in Section 4.4.9.5: • Green Turtles are predominantly found in Australian waters off the Northern Territory, Queensland, and Western Australian coastlines, with limited numbers in New South Wales, Victoria, and South Australia. There are no known nesting or foraging grounds for Green Turtles offshore Victoria; they occur only rarely in these waters (DoE 2023m) (Section 4.4.9.5.1). • This species (Leatherback Turtle) is an occasional visitor to the Otway shelf and has been sighted on a number of occasions during aerial surveys undertaken by the Blue Whale Study Group, particularly to the southwest of Cape Otway (Section 4.4.9.5.2). • Loggerhead Turtles forage in all coastal states and the Northern Territory, but are uncommon in South Australia, Victoria, and Tasmania (CoA 2017a). Due to water depths, it is unlikely Loggerhead Turtle would be present in the Project Area but may be occasional visitors to the Planning Area (Section 4.4.9.5.3 Loggerhead Turtle).' Impacts to turtles from light emissions associated with the Project are assessed in Section 6.3 (Emissions- Light). Section 6.3.3 (Light Emissions- Impact Analysis and Evaluation) states 'Although listed turtle species may occur within the routine light and flaring EMBAs, no biologically important behaviours, BIAs, or habitat critical to survival for marine turtles were identified (Appendix E)'. Section 6.3.3.1.3 (Light Emissions- Impact Analysis and Evaluation) has been updated to include the presence of loggerhead turtle as 'breeding likely to occur;' within the light EMBAs: 'The PMST identified that the loggerhead turtle has a presence of 'breeding likely to occur'. Although the PMST presence indicates potential breeding, there are no designated BIAs overlapping the Light EMBAs and the main Australian breeding areas are generally confined to southern Queensland and Western Australia (Cogger et al. 1993). Loggerhead turtles show a strong fidelity to their breeding areas (Limpus 2008). They forage in all coastal states, though are uncommon in Victoria and hence are expected to be occasional visitors in the Light EMBA (CoA 2017a). Species or habitat is 'known to occur' for the leatherback turtle and 'may occur' for the

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		green turtle within the light EMBAs (OPP Appendix E: Protected Matters Report for the Light EMBAs). No designated BIAs, or habitat critical to survival for marine turtles were identified (Appendix E). Consequently, population level impacts to marine turtles from routine light and flaring emissions are not predicted to occur. The consequence severity of light and flaring impacts for marine reptiles is assessed as Minor based on: • Artificial light is listed as a key threat in the Recovery Plan for Marine Turtles in Australia (CoA 2017), however, no BIAs, or habitat critical to survival for marine turtles were identified within the light or flaring EMBAs. • All turtle species are expected to be occasional visitors to the light EMBAs.' Beach has reviewed the OPP and is satisfied that impacts and risks to species have been adequately addressed. The sections described above have been updated to accurately reflect the determination of likelihood of turtle species.
PC230 Paragraph 37	Comment: The Gunditjmara people maintain a strong spiritual connection with all species of whales that travel through Gunditjmara Country; "[p]rotection of this species is paramount to Gunditjmara spiritual, physical wellbeing."[41] As mentioned, there are two endangered and migratory whale species with BIAs in the Project Area: the Southern Right Whale and Pygmy Blue Whale. The Blue Whale's annual high-use foraging BIA along the southern coast of Australia, which directly overlaps with the entire Project Area, appears to be the largest high-use foraging zone for Blue Whales in/near Australia by far;[42] it is an extremely unique and vital foraging area for these endangered whale species in Australian waters. The majority of that special zone also overlaps with the proposed Planning Area[43] [41] *Gunditjmara Nyamat Mirring Plan, p. 19.* [42] *OPP, p. 240 (Figure 53).*	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding the cultural significance of whales and protection of their Biologically Important Areas (BIAs) and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach acknowledges the Gunditjmara people maintain a strong spiritual connection with all species of whales that travel through Gunditjmara Country. The OPP currently includes a description of sea country values, including whales (Section 4.6.3.4 Sea Country Values-Resources- Whales). Beach has revised the provided reference and the following text has been added to the Section 4.6.3.4: 'Karntubul (Whales) have featured in dreaming stories, ceremony, song and dance of Gunditjmara people for millennia. Gunditjmara maintain a strong spiritual connection to all species of whales that travel through Gunditjmara country (GMTOAC RNTBC, 2023). Karntabul yarkeen (whale dreaming) stories connect Aboriginal groups all along the coasts of Australia, neighbouring groups in Victoria, including Gunditjmara, still gather today to strengthen the connection of groups to whales and their stories. The arrival of Karntabul in Gunditjmara waters also signifies the beginning of the 'big wet' season (May-Oct), 1 of 6 Gunditjmara seasons. Whales are also a food source, in traditional times, tribes would send up smoke signals and gather when whales got

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[43] *OPP, p. 238 (Figure 52).*	beached. Protection of whales is paramount to Gunditjmara spiritual, physical wellbeing (GMTOAC RNTBC, 2023).' Impacts and risks to Southern Right Whales and Pygmy Blue Whale BIAs have been assessed in detail throughout the OPP • Section 6.4 Emissions – Underwater Sound • Section 6.7 Planned Discharge – Drill Cuttings and Fluids • Section 6.8 Planned Discharge – Cement • Section 6.9 Planned Discharge – Commissioning and Operational Fluids • Section 6.10 Planned Discharge – Routine Operational Wastes from Vessels • Section 7.2 Physical Presence – Interaction with Marine Fauna • Section 7.3 Accidental Discharge – Hazardous and Non-Hazardous Material • Section 7.4 Loss of Containment – Hydrocarbons and Chemicals • Section 8- Cumulative Impact Assessment). BIAs for these species that overlap the Project Area and Planning Area are identified in the OPP (Table 4-19) and included in the assessment of impacts and risks. Cultural values and sensitivities that are identified as potentially being affected by activities associated with the Project have been identified in each impact and risk assessment section. Beach has considered this comment and included additional information to OPP Section 4.6.3.4 (Sea Country Values- Resources- Whales**)** as described above. Beach is satisfied that impacts and risks to whales have been adequately assessed. *References* *Gunditj Mirring Traditional Owners Aboriginal Corporation RNTBC. 2023. Gunditjmara Nyamat Mirring Plan 2023-2033. Report prepared by Helen Arundel.*
PC231 Paragraph 38	Comment: The Planning Area also intersects with Bonney Coast Upwelling in Nyamat Mirring, which provides critical sustenance for Blue Whales and many culturally significant species.[44] This upwelling is a Key Ecological Feature, "considered to be of regional importance for either the region's biodiversity or ecosystem function and integrity	Beach Energy (Operations) Limited (Beach) acknowledges the statement regarding the Bonney Coast Upwelling Key Ecological Feature (KEF) and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these statements. As mentioned in this comment, the ecological values of the Bonney Coast Upwelling KEF are described in Section 4.2.12.1 (Conservation Values and Sensitivities- Bonney Coast Upwelling) and Section 4.3.8 (Physical Environment- Bonney Coast Upwelling).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	of a Commonwealth Marine Area."[45] It brings a seasonal upwelling of nutrient-rich water to the sea surface and supports high productivity and species diversity, and hosts foraging areas for whales.[46] The OPP provides detailed factual background on the ecological importance of the Bonney Coast Upwelling; it is noted as "one of 12 known Blue Whale feeding aggregation areas globally." [47] The OPP notes that Pygmy Blue Whales have foraging BIAs which are "associated with the timing of the Bonney Coast Upwelling and the presence of the kril[48] [44] Gunditjmara Nyamat Mirring Plan, p. 19. [45] *OPP, p. 145.* [46] *OPP, p. 146.* [47] *OPP, p. 364.* [48] *OPP, p. 364.*	No amendments to the OPP are required in response to this statement.
PC232 Paragraph 39	Comment: However, despite the recognised ecological significance, Beach fails to fully review the potential impacts of the Project on the Bonney Coast Upwelling and related ecosystem effects, including on Blue Whale species. The only discussion of impacts on this upwelling in the OPP concerns noise emissions. Direct impacts on whales from noise pollution from the Project are considered below. In relation to impacts on zooplankton, the OPP contends that even if noise from geophysical surveys causes mortality or mortal injury effects on zooplankton, that "does not impact on pygmy blue whales being able to feed on them as the krill will still be available within the water column."[49] This is an illogical argument. It does not consider how increasing mortality or mortal injury could lead to a decline in the population of	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding the Bonney Coast Upwelling Key Ecological Feature (KEF) and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The ecological values of the Bonney Coast Upwelling KEF are described in Section 4.2.12.1 (Conservation Values and Sensitivities- Bonney Coast Upwelling) and Section 4.3.8 (Physical Environment- Bonney Coast Upwelling). The Bonney Coast upwelling is defined as a key ecological feature as it is an area of enhanced pelagic productivity and has high aggregations of marine life (DCCEEW 2023a). In addition to whales, many endangered and listed species frequent the area, possibly also relying on the abundance of krill that provide a food source to many seabirds and fish. The high productivity of the Bonney Coast upwelling is also capitalised on by other higher predator species such as little penguins and Australian fur-seals feeding on baitfish (CoA 2015c) (OPP Section 4.2.13.1 (Conservation Values and Sensitivities- Bonney Coast Upwelling)). Beach has reviewed the assessment of impacts to plankton from impulsive noise associated with the Project. Impacts of underwater acoustic emissions on plankton, associated with the geophysical survey and vertical seismic profiling (VSP) have been assessed in Section 6.4.3.2. The

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	zooplankton, which will in turn affect the foraging habits of whale species. [49] *OPP, p. 364*	effect criteria for injury to plankton for the boomer was predicted at a maximum distance of 4 m and 0.8 m for the sub-bottom profiler (SBP) for the peak sound pressure level (PK) while the noise effect criteria based on the sound exposure level (SEL) was not reached. Neither noise effect criteria were reached for VSP. This extent does not overlap the Bonney Coast Upwelling, however, does overlap pygmy blue whale (PBW) high density, known and possible foraging Biologically Important Areas (BIAs). PBW foraging is associated with the timing of the Bonney Coast Upwelling and the presence of krill, hence it is assessed. Section 6.4.3.2.1 (Impulsive Noise Sources- Plankton) comprehensively assesses potential impacts to plankton from impulsive noise, as summarised: Impacts to the Bonney Coast Upwelling and its role it plays in ecosystem function and productivity is not predicted as: • Impacts to phytoplankton are not predicted • Mortality or mortal injury effects to zooplankton are within natural mortality rates and zooplankton communities can begin to recover during the geophysical survey such that a continuous decline in zooplankton throughout the duration of the survey is not anticipated and parts of the survey area would be replenished as the survey progressed • Mortality or mortal injury effects to zooplankton, including krill, does not impact on marine fauna being able to feed on them as they will still be available within the water column. Section 6.4.3.2.1 (Impulsive Noise Sources- Plankton) has been updated to provide further description and references for effects to zooplankton: "Mortality or mortal injury effects to krill does not impact on pygmy blue whales being able to feed on them as they will still be available within the water column. If zooplankton are impacted, they may remain in the water column for several days and are likely scavenged or otherwise sink to the seafloor to be consumed by benthic organisms (Krillin et. al. 2012, Tang et al. 2014, Dubovskaya et al. 2015).' Impacts to blue whale foraging from continuous noise is described in Section 6.4.3.3.3 (Continuous Noise Sources- Marine mammals). The impact assessment describes that the largest sound EMBA is ~50 km from the Bonney Coast Upwelling KEF, which is a known feeding aggregation area (Gill et al. 2011; McCauley et al. 2018). The sound EMBAs are within an area where the occurrence of an upwelling event between 2002 and 2016 was assessed as very unlikely with an upwelling frequency of <10 per cent (Huang and Wang 2019). Thus, blue whale foraging is likely to be opportunistic within the sound EMBAs.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Controls have been implemented to ensure that any impacts to blue whales and their biologically important behaviours are mitigated and reduced to acceptable levels. These include whale management procedures and noise assessments (Table 6-30). The Bonney Coast Upwelling intersects the Planning Area and has been assessed for the risk of an accidental large-scale release of hydrocarbons or chemicals (Section 7.4 Loss of Containment – Hydrocarbons and impact Chemicals). The Bonney Coast Upwelling is predicted to be exposed at the Low threshold of in water hydrocarbons (moderate reached for dissolved in-water exposure only). This is identified in Section 7.4.2.3 (Loss of Well Control at Release Location North- Potential extent of in-water dissolved hydrocarbon exposure). The Bonney Coast Upwelling KEF may be exposed to entrained hydrocarbons at low thresholds within the upper 0-10 m water column with no impacts predicted (see Table 7-22 and 7-25). The Bonney Coast Upwelling KEF does not intersect with the Project Area or light EMBAs hence has not been assessed for any other impacts or risks within these extents. Beach has considered these comments and updates have been made to the OPP as outlined above. *References* *CoA (2015c). PC233 Paragraph 40	Comment: Beach's self-assessment indicates that the residual impacts of underwater noise emissions, after applying mitigation measures, is "moderate."[50] This is concerning to Gunditjmara people, given their special relationship with marine mammals such as whales. Cetaceans are highly vulnerable to underwater noise as species that primarily rely on auditory senses for their basic biological functions [51]. The endangered Blue Whale is particularly susceptible to auditory impacts. [52] [50] *OPP, p. 31.* [51] *See OSPAR Commission, Underwater Noise (Web Page, 2023).* [52] *Risks to Blue Whales include tissue rupture, hearing loss, disruption of echolocation, inability to detect important sounds, habitat abandonment, aggression, calf abandonment, and behavioural disturbance: Department of the Environment, Australian Government, Conservation Management Plan for the Blue Whale: A Recovery Plan*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the assessment of underwater noise, specifically related to culturally significant marine mammal species, and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The evaluation for underwater noise concludes that the potential for continuous underwater sound emissions to cause PTS, TTS and displacement impacts to blue whales and southern right whales results in a Moderate (2) consequence for these receptors. As a result, potential impacts to cultural values and sensitivities are also considered to be Moderate (2) consequences. With the adoption of controls to prevent the onset of injury and displacement to blue whales and southern right whales, these impacts will not have significant impacts on individuals or at impacts to population levels. With no potential impacts to the abundance or distribution of marine fauna including species of commercial value, impacts to socio-economic values are not expected. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	under the Environment Protection and Biodiversity Conservation Act 1999 (2015), p. 24.	
PC234 Paragraph 41	Comment: Underwater noise from Project activities can affect aquatic species' ability to communicate, navigate, avoid predators, mate, and locate food.[53] As the OPP notes, sound emissions can impact marine fauna by inducing stress, masking other biologically important sounds, leading to behavioural changes, and leading to temporary hearing loss (TTS) or permanent hearing loss/threshold shift (PTS)—and even mortality.[54] In addition, acoustic harms are not limited to individual species; they can have ecosystem- and population-level effects [55] [53] *C. Erbe, 'Underwater Passive Acoustic Monitoring and Noise Impacts on Marine Fauna: A Workshop Report' (2013) 41(1) Acoustics Australia 113, pp. 116-7.* [54] *OPP, p. 361. See also C. Erbe, 'Underwater Passive Acoustic Monitoring and Noise Impacts on Marine Fauna: A Workshop Report' (2013) 41(1) Acoustics Australia 113, pp. 116-7.* [55] *See C. Erbe, 'Underwater Passive Acoustic Monitoring and Noise Impacts on Marine Fauna: A Workshop Report' (2013) 41(1) Acoustics Australia 113, pp. 116-7.*	Beach Energy (Operations) Limited (Beach) acknowledges comments related to potential effects to marine fauna from underwater noise emissions and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Section 6.4.3 describes in detail the potential effects to marine fauna from continuous and impulsive underwater sound emissions expected during the Project. These are listed in the overview (Section 6.4.3.1). As mentioned in the comment, if species effects are above a certain threshold, then population-level and ecosystem effects can occur. The potential for population-level and ecosystem effects is assessed in the inherent impact assessment (Section 6.4.3.2 and 6.4.3.3). Additionally, the impact evaluation summary (Table 6-30) considers the risks and impacts with the principles of Ecologically Sustainable Development (ESD) and defined acceptable levels. No population-level or ecosystem effects are predicted for any species as a result of the Project. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC235 Paragraph 42	Comment: The proposed Project will produce impulsive (short, pulsed, broadband) noise emissions from geophysical surveys and vertical seismic profiling; as well as continuous (nonpulsed) noise emissions from drilling and completions using the MODU, subsea installations, well plugging and abandonment (including subsea cutting and removal of wellheads), and vessel operations (including from pipelaying, construction and support	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the continuous noise from vessel activity and the impacts on blue whales and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Impacts from continuous noise sources on marine mammals, including blue whale, are discussed and evaluated in detail in Section 6.4.3. Based on independent underwater sound modelling, the continuous noise source sound behaviour Environment that May Be Affected (EMBA) for marine mammals is predicted to be 7.98 km / 19.6 km on the shelf edge. This behaviour EMBA intersects

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	vessels).[56] Ship noise is likely to be the main source of acoustic disturbance, as a continuous and chronic source in areas with regular vessel traffic.[57] Ship noise has been shown to impact the communication of Blue Whales, and construction activities like drilling and pipelaying are known to lead to avoidance of the area or habitat changes[58] [56] *OPP, pp. 354-5.* [57] *C. Erbe, 'Underwater Passive Acoustic Monitoring and Noise Impacts on Marine Fauna: A Workshop Report' (2013) 41(1) Acoustics Australia 113, p. 114.* [58] *Department of the Environment, Australian Government, Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (2015), p. 25.*	the foraging Biologically Important Areas for blue whale. The EMBA is based on individual whales remaining in the same position (and therefore receiving a continuous intensity and frequency of sound) for 24 hours during drilling activities, which are predicted to be short-term (30-40 days). For all other activities, such as installation, Inspection Maintenance and Repair, Offshore Support Vessel (OSV) standby and transit, the behavioural EMBA is significantly smaller. Beach acknowledges reference made to Erbe (2013) and DOA (2015). Erbe (2013) states that "ship noise is a continuous and chronic source", however it also describes how the marine soundscape is site-specific, due to both the variation in sound sources and the sound transmission regime. This is why independent, site-specific modelling was undertaken by experts in the underwater noise emissions field, to ensure that a site-specific understanding of potential noise footprints was used in the OPP to support the assessment of inherent impacts. The OPP also references site specific ambient noise monitoring undertaken in the Otway (Section 4.3.7), published by Erbe et al. (2016). As described in DOA (2015) and the OPP (Section 6.4.3.2.3), shipping and industrial noise are classed as 'minor' consequence (defined as: individuals are affected but no effect at a population level). Section 5 of DOA (2013) goes on to clarify that industrial noise for offshore industries is at its peak when activities such as pile-driving and trenching are required, both of which are not within the scope of the Project. References made to avoidance of an area or habitat changes resulting from industrial noise relate to bowhead whale in the Alaskan Beaufort Sea (Schick 2000), which are not a suitable comparison for blue whale in the Otway Basin due to the significant differences in anthropogenic sound sources and marine soundscape. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References* *Schick RS, Urban DL (2000) Spatial components of bowhead whale (Balaena mysticetus) distribution in the Alaskan Beaufort Sea. Canadian Journal of Fisheries and Aquatic Sciences 57:2193–2200.*
PC236 Paragraph 43	Comment: The OPP states that noise emissions from seabed surveys will travel relatively short distances compared to emissions from other sources such as vessel traffic. However, the duration of the activities is important. The OPP suggests that noise from geophysical surveys	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the duration of geophysical surveys and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As described in Section 3.8.1, geophysical techniques (which include impulsive sound sources) will be undertaken at various stages of the Project. In the initial phase of the project, there will be

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	alone could last for up to 1,020 days or 146 weeks in total;[59] drilling, installation, and inspection, maintenance and repair activities will take similar periods of time[60] [59] OPP, p. 384. Elsewhere, the OPP states that these surveys could take "up to in the order of forty days to complete, depending on the length of the flowline routes"; or that surveys could take "10-20 days duration per tie-back", which means up to 340 days in total: see OPP, p. 85. [60] OPP, p. 384.	seven locations where seabed surveys are required and seven potential tie-backs. Seabed surveys for these locations would happen sequentially, with no potential for two seabed surveys to be undertaken concurrently within the Operational Area. During installation and commissioning, seabed surveys will be required for pre-lay of infrastructure and flowlines, whilst during decommissioning seabed surveys may require the use of geotechnical techniques. Seabed surveys typically take 10-20 days to complete; <u>the OPP has been updated to remove ambiguity surrounding duration</u>. Impulsive sound emissions generated by seabed surveys will cease immediately when the surveys complete, with no lasting change to the ambient sound levels in the localised or regional area. Therefore, it is appropriate to assess the individual survey campaigns discretely instead of combining them, as they will be undertaken as separate events. At no point will there be 1,020 days of noise emissions, as mentioned in the comment. Seabed surveys will be undertaken in very short, discrete campaigns of 10-20 days per flowline, over the course of the Project. Beach has considered this comment and <u>updated the OPP to clarify the duration of seabed surveys included in the Project (Section 3.8.1)</u>.
PC237 Paragraph 44	Comment: Given the significant duration and number of activities producing noise pollution, it is concerning that the OPP overlooks cumulative and chronic noise impacts on marine fauna. Impulsive noise produced by geophysical surveys and seismic profiling not only results in harm from the acute shock of individual pulses, but can also harm species through repeated exposure over time and the corresponding increase in ambient noise. Chronic noise exposure increases stress and changes behaviour, which may lead to decreased reproductive activity, decreased foraging,[61] decreases in predator avoidance,[62] immunosuppression,[63] and ultimately reductions in survivorship.64 These chronic and cumulative impacts have not been adequately addressed. [61] *See C. Magnhagen et al., 'Effects of motorboat noise on foraging behaviour in Eurasian perch and roach: a field*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding cumulative and chronic noise impacts on marine fauna and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach notes that 'seismic profiling,' as mentioned in this comment, is not planned as part of the Project. As stated in Section 3.8 (Description of Activities) certain short-term, temporary activities, often misinterpreted as seismic surveys, are included within the scope of the OPP including Vertical Seismic Profiling (VSP) and geophysical surveys. While VSP is not expected to be required for the initial drilling campaign, VSP may be performed at some stage in the Project, such as during future drilling campaigns within the in-field development area. VSP provides a seismic image of the geology in the immediate vicinity of the well, with the survey operating over a very short time, approximately 8 to 24 hours per well. VSP noise is not continuous. Each discharge of the seismic source generates a short, discrete, low frequency sound impulse. Seismic impulses during VSP are typically much lower than those generated during typical marine seismic surveys.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	experiment' (2017) 564 Marine Ecology Progress Series, 115-125. [62] *See S. Filiciotto et al., 'Impact of aquatic acoustic noise on oxidative status and some immune parameters in gilthead sea bream Sparus aurata (Linnaeus, 1758) juveniles' (2017) 48(4) Aquaculture Research 1895-1903; see also M. Vazzana et al., 'Noise elicits hematological stress parameters in Mediterranean damselfish (Chromis chromis, Perciformes): A mesocosm study' (2017) 62 Fish & Shellfish Immunology 147-152.* [64] *S. Simpson et al., 'Anthropogenic noise increases fish mortality by predation' (2016) 7 Nature Communications 10544.*	Geotechnical and geophysical surveys may be required to be undertaken to assess the suitability of the seabed for drilling, infrastructure or surveys may be needed along the length of proposed flowlines routes. These surveys would be expected to take up to in the order of 10 to 20 days. Impulsive sound sources generated by the Project are limited to discreet activities, which will occur throughout the lifecycle of the Project. Based on the proposed project schedule, Beach can confirm that there will be no instances where more than one impulsive sound source is present within the operational area. Each activity generating impulsive sound is short, with a maximum duration of 10 to 20 days occurring during pre-lay survey along flowline routines. All other activities will have a shorter duration. Following cessation of each activity, ambient noise in the operational area will return to background levels, with no long-term change to the ambient noise levels as a result of the Project. Cumulative environmental impacts in the context of offshore petroleum activities are successive, additive, or synergistic impacts of collectively significant activities or projects with material impacts on the environment that have the potential to accumulate over temporal and spatial scales (NOPSEMA Environment Plan Decision Making Guideline, N-04750-GL1721 A524696, Dec 2022) (OPP Section 8.1). Cumulative impacts to marine fauna are considered in detail in Section 8.3 of the OPP. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC238 Paragraph 45	Comment: Despite the known presence of endangered birds, endangered turtles and other light sensitive species in and around the Project area, the OPP dismisses the potential risks of light pollution on these fauna.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding risks to protected species from light pollution and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach has provided detailed assessment of the potential risks to light sensitive species from light pollution. Section 4 (Description of the Environment) of the OPP describes the physical, biological, and socio-economic environment that may be affected by the project including light sensitive species. Section 6.3 of the OPP evaluates the impacts to the environment from light emissions resulting from activities associated with the Project. For the light assessment, the identification of light sensitive receptors was undertaken within two light Environment that May Be Affected (EMBAs), 20 km for routine light and 63 km for flaring

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		light. These EMBAs cover routine light emissions from both MODU and vessels, and light emissions from flaring during drilling from any location in the Project Area. As stated within the OPP, the EMBA for routine light emissions is based on the National Light Pollution Guidelines for Wildlife (the Guidelines) (DCCEEW 2023). The Guidelines recommend undertaking a light impact assessment where important habitat for listed species that are sensitive to light are located within 20 km of the light source. The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings demonstrated to occur at 15 to 18 km and fledgling seabirds grounded in response to artificial light 15 km away (DCCEEW 2023). Seabird grounding, as described in Rodriguez et al (2014), relates to impacts of onshore fixed light sources such as streetlights and buildings and the effect this can have on young fledgling birds making their first flight from their nests to the open ocean. The 20 km light EMBA adopted is highly conservative based on the following studies. These studies used a Mobile Offshore Drilling Unit (MODU) as the basis for assessing routine light emissions from MODU and vessels given the MODU would be the largest and tallest piece of infrastructure used: • A light assessment study was undertaken for the Otway Exploration Drilling Campaign (Xodus, 2024, Appendix O). The study predicted that the area of potential impact from lighting would be up to 10 km from the MODU as there was no measurable changes to ambient light intensity levels beyond this distance. • A light assessment study was undertaken for the Browse FLNG development (Woodside, 2014) to assess the likely light density levels from a MODU. This study predicted light density levels at representative of background levels beyond 12.6 km from the MODU. The EMBA for flaring light emissions of 63 km was based on the following: The light assessment study undertaken for the Otway Exploration Drilling Campaign (Xodus, 2024, Appendix O). Table 6-12 lists bird species with BIAs or behaviours within the light EMBAs. A summary of the impact assessment for light emissions from the Project are presented in Table 6-14 of the OPP. The potential consequence (residual) of light emissions is assessed as minor within the OPP. Wildlife potentially vulnerable to light (i.e. seabirds and marine turtles) are highly unlikely to be disrupted, nor displaced from important habitat and will be able to continue critical behaviours such as foraging and reproduction. Project activities will be short term and temporary with flaring also occurring for only short periods of time with no permanently lit structures installed. In addition, during MODU and vessel

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		operations lighting levels will be reduced to acceptable levels through implementation of controls and limiting of light to only that required for navigational, safety and emergency requirements. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC239 Paragraph 46	Comment: It is well established that artificial lighting can have disturbing impacts on coastal species such as birds and turtles, and accordingly on ecosystem health as a whole.[65] Projects with potentially significant increases in light pollution are required to comply with recommendations under the National Light Pollution Guidelines for Wildlife, including to evaluate the risk of artificial light on wildlife and, if required, implement appropriate mitigation measures.[66] *[65] See, e.g., T. Davies et al., 'The Nature, Extent, and Ecological Implications of Marine Light Pollution' (2014) 12(6) Frontiers in Ecology and the Environment 347.* *[66] These guidelines recommend a long-term management plan for turtles, given the risks of artificial light, including from gas developments: Department of the Environment and Energy, Australian Government, National Light Pollution Guidelines for Wildlife: Including Marine Turtles, Seabirds and Migratory Shorebirds (Guidelines, January 2020) p. 18. See also OPP, p. 48.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding light pollution plus the requirements to comply with recommendations under the National Light Pollution Guidelines for Wildlife and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach acknowledges the statement within Davies et al (2004) that artificial light at night is globally widespread. Davies et al (2004) also states that sources of artificial light in the marine environment vary, with shipping and light fisheries contributing as temporary sources in nearshore and offshore waters. Land-based developments such as towns, cities, and harbours are also listed as permanent sources that can increase night-time light intensities across large geographical areas. Whilst Davies et al (2004) also includes offshore oil platforms as a permanent source of light pollution, surface activities and flaring as part of the Project will be short term and temporary with no permanently lit structures installed. Section 6.3 of the OPP evaluates the impacts to the environment from light emissions resulting from activities associated with the Project. The EMBA for routine light emissions is based on the National Light Pollution Guidelines for Wildlife (the Guidelines) (DCCEEW 2023). The Guidelines recommend undertaking a light impact assessment where important habitat for listed species that are sensitive to light are located within 20 km of the light source. The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings demonstrated to occur at 15 to 18 km and fledgling seabirds grounded in response to artificial light 15 km away (DCCEEW 2023). This 20 km light EMBA adopted is considered to be highly conservative based on a light assessment study undertaken for the Project (Xodus 2023) and a previous study undertaken for the Browse FLNG development (Woodside 2014). The National Light Pollution Guidelines for Wildlife identify marine turtles, seabirds and migratory shorebirds as potentially being impacted by artificial light to a level significant enough to require assessment within the OPP. In addition to this, impacts on fish/plankton and coastal communities are also assessed in the OPP.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		A summary of the impact assessment for light emissions from the Project are presented in Table 6-14 of the OPP. The potential consequence (residual) of light emissions is assessed as minor within the OPP. Wildlife potentially vulnerable to light (i.e. seabirds and marine turtles) are highly unlikely to be disrupted, nor displaced from important habitat and will be able to continue critical behaviours such as foraging and reproduction. In addition, Control Measure (CM) 13 (light management procedure) within the OPP states that the Mobile Offshore Drilling Unit and vessels will implement a Light Management Procedure as per the National Light Pollution Guidelines (DCCEEW 2023) for Project activities. The Light Management Procedure will detail mitigations to manage light based on the information in the Seabird Light Mitigation Toolbox and Beach Energy's Vessel Light Management Procedure Guidance (CDN/ID 19012450). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC240 Paragraph 47	Comment: Bird strandings are more common around coastal and offshore industrial sites such as gas developments than at other locations.[67] Light pollution could cause harm to the critically endangered Orange-bellied Parrot, which is likely to migrate through the Project Area. The National Recovery Plan for this species indicates that the parrots may be killed by flying into barriers, which include "illuminated structures and illuminated boats"; both will be present in the parrot's habitat over the 30-year life of this Project.[68] [67] *See, e.g., C. Gjerdrum, 'Bird Strandings and Bright Lights at Coastal and Offshore Industrial Sites in Atlantic Canada' (2021) 16(1) Avian Conservation and Ecology 22.* [68] *Australian Government, National Recovery Plan for the Orange-bellied Parrot, Neophema chrysogaster (2016), p. 16.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding light pollution and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The control measures associated with industry best practice are considered appropriate to ensure the environmental impacts relating to light emissions from vessels and the Mobile Offshore Drilling Unit (MODU) and are of an acceptable level. These control/mitigation measures are provided in the OPP Table 6-15. In particular, Beach has taken into consideration the National Light Pollution Guidelines for Wildlife (DCCEEW 2023) (the Guidelines). The Guidelines recommend using Best Practice Lighting Design and undertaking an environmental risk assessment (i.e. the impact assessment within the OPP) where there is important habitat within 20 km of a project. In addition, Beach has committed to the development of a Light Management Plan that will assist in managing environmental impacts and risks of light emissions to acceptable levels and is legally required to be completed prior to commencement of activity. Beach will contract a suitably qualified specialist to develop and support the implementation of the Plan as per the Guidelines. The National Recovery Plan for the Orange-bellied parrot (DELWP 2016) identifies that the behaviour of this species may be modified by the presence of barriers such as illuminated structure and boats, with the impacts of barriers greatest where they occur on migration routes,

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		though there is little more than anecdotal evidence to support this. The Project Area, as detailed in Section 3.5 (Project Area Definition), overlaps an area of probably migration by <0.01 per cent and as such, the activities of the MODU and vessels when undertaking the petroleum activity do not present the same barrier risk as that associated with illuminated structures or illuminated boats within the migration route. Impacts associated with flaring, which will not occur within the migration route but rather may change ambient light in the area, will be temporary and of short duration. Therefore, a change in ambient light is unlikely to cause behavioural changes or result in injury/mortality to the Orange-bellied parrot. Project activities, as detailed in Section 3 (Description of the Project and Alternatives Analysis) involve seabed surveys through to decommissioning of wells and infrastructure installed as part of the Project. These activities will involve the use of either a semi-submersible or jack-up MODU and appropriate support vessels. The presence of the MODU and support vessels will be short term and temporary as detailed in Section 3.8 (Description of Activities) and will not be permanently present over the 30-year life of the project as commented. Successfully drilled wells will be tied back to existing infrastructure, which may include the existing, normally unmanned, Thylacine A platform. The Thylacine A platform is situated ~33 km from an area of probably migration according to DELWP (2016). This is greater than the 20 km threshold to undertake an environmental risk assessment (as detailed within the National Light Pollution Guidelines (DCEEW 2023) with a change of ambient light in the area of probably migration not expected. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments, <u>however references to the National Light Pollution Guidelines for Wildlife (DCCEEW 2023) have been amended throughout to ensure the correct revision is referenced</u>. *References:* *DELWP (2016). National Recovery Plan for the Orange-bellied Parrot, Neophema chrysogaster. Department of Environment, Land, Water and Planning, Canberra.* *DCCEEW (2023). ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC241 Paragraph 48	Comment: Similarly, with respect to the endangered albatross species that are likely to occur in the Project Area, the National Recovery Plan for Albatrosses and Petrels highlights the risks of artificial lighting among the threats from interactions with offshore installations and ships. After specifically noting impacts from oil and gas platforms, the Plan notes: "The response of seabirds to marine infrastructure can lead to avoidance behaviours, collisions where the bird may be killed or injured, and fallouts where the bird may be unable to return to the air without assistance."[69] [69] *Australian Government, National Recovery Plan for Albatrosses and Petrels (2022), p. 40.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to albatross and petrel species from light pollution and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Impacts to bird species from light emissions as a result of activities from the Project have been assessed in Section 6.3 (Emissions - Light). Whilst the National Recovery Plan for Albatrosses and Petrels (2022) (DCCEEW 2022a) identifies light emissions as a threat, it classifies marine infrastructure interactions including those associated with artificial light as having no risk category priority and affecting 'Nil' species in Australian jurisdiction. In addition, *The Wildlife Conservation Plan for Seabirds* (DCCEEW 2020b) lists light pollution as a threat with minor consequence (individuals affected but no population level impacts expected). For most species, the threat of light pollution relates to disturbance to critical behaviours (such as nesting or roosting) on land. Section 6.3 (Emission – Light) has assessed the impact consequence (residual) of light emissions to bird species as minor. Wildlife potentially vulnerable to light (i.e. seabirds and marine turtles), are highly unlikely to be disrupted, nor displaced from important habitat and will be able to continue critical behaviours such as foraging and reproduction. Table 6-15 of the OPP also details Control Measures to be implemented including CM12 (Mobile Offshore Drilling Unit and vessel lighting) plus CM13 (Light Management Procedure). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References:* *DCCEEW (2020a). National Recovery Plan for Albatrosses and Petrels. Commonwealth Department of Climate Change, Energy, the Environment and Water formerly DAWE* *DCCEEW (2020b). The Wildlife Conservation Plan for Seabirds. Commonwealth Department of Climate Change, Energy, the Environment and Water formerly DAWE*
PC242 Paragraph 49	Comment: There is also substantial evidence that industrial light pollution affects turtles and reduces their chance of successful nesting and survival.[70] Since artificial light can disrupt critical behaviours of turtles and	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to turtle species from light pollution and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	undermine their recovery, addressing light pollution is considered an important part of the National Recovery Plan for Marine Turtles.[71] In particular, there are obligations to manage light emissions adjacent to critical habitat so marine turtles are not displaced from these habitats, and identify "the cumulative impact on turtles from multiple sources of onshore and offshore light pollution."[72] As above, two endangered turtle species (Leatherback and Loggerhead) are likely or known to occur in the Project Area itself.[73] [70] *See, e.g., R. Kamrowski et al., 'Influence of industrial light pollution on the sea-finding behaviour of flatback turtle hatchlings' (2015) 41(5) Wildlife Research 421.* [71] *Australian Government, Recovery Plan for Marine Turtles in Australia 2017-2027 (2017), pp. 38, 56.* [72] *Australian Government, Recovery Plan for Marine Turtles in Australia 2017-2027 (2017), p. 56.* [73] *OPP, Appendix A (PMST Report for the Project Area).*	Beach acknowledges that artificial light can disrupt turtle nesting and hatching behaviours and is listed as a key threat in the Recovery Plan for Marine Turtles in Australia (CoA 2017). As detailed in Section 6.3 (Emissions – Light), although listed turtle species may occur within the routine light and flaring Environments that May be Affected (EMBAs), no Biologically Important Areas (BIAs), or habitat critical to survival for marine turtles were identified (Section 4.4.9-Threatened and Migratory Species). For all species that may be present in the routine light and flaring EMBAs, nesting habitats are located significant distance away i.e. Queensland or Western Australian coastline. Consequently, population level impacts to marine turtles from routine light and flaring emissions are not predicted to occur. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References:* *CoA (2017). Recovery for Marine Turtles in Australia. Commonwealth of Australia.*
PC243 Paragraph 50	Comment: The main sources of light pollution from the Project are likely to be drilling operations, vessel traffic, and flaring.	Beach Energy (Operations) Limited (Beach) agree with the statement that the main sources of artificial light emissions associated with the Otway Offshore Gas Victoria Project will be drilling and vessel operations and short-term flaring of wells. Section 6.3 of the Offshore Project Proposal (OPP) assess the potential impacts from light on the environment.
PC244 Paragraph 51	Comment: Substantial light emissions are expected during the drilling phase. The MODU drilling rig and vessels will have lighting during the night, with activities "to be conducted 24 hours a day" and operations continuing for up to 60 days per well in the initial drilling campaign. Even though the OPP states that "there are no permanent lit structures",[74] the MODU and vessel operations will continue to emit light for extremely long periods—up to a	Beach Energy (Operations) Limited (Beach) acknowledge the statement that artificial light emissions associated with the the Otway Offshore Gas Victoria Project may pose potential environmental impacts and risks to the marine environment As summarised in the introduction to this Report, the scope of the Project has been revised which is reflected throughout the OPP. In particular Chapter 3 for the description of activities is updated to for a reduction in total well number and end of field life. For clarity, Beach has amended section 6.3.1 and Table 6-14 the OPP to: "There will be no permanent lighting associated with the Project. <u>Temporary light emissions from flaring during drilling and completions and navigational lighting for support operations to comply with</u>

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	total of 107 weeks or 34 months, likely commencing in 2025.[75] [74] *OPP, p. 335.* [75] *This assumes that there will be drilling campaigns for all 17 wells; light impacts will continue "between 30-60 days per* well for MODU and vessel presence for each campaign": OPP, p. 350.	navigational and safety requirements, will be emitted during the Project when the MODU or vessels are on location in the Project Area ".
PC245 Paragraph 52	Comment: It is misleading to call this "temporary" or "short term" emissions of light.[76] In the summary of impacts, the OPP comments "The extent of the area potentially impacted by light emissions has been assessed as up to 50km for flaring and routine light for 20km, however this will only occur on a temporary basis for short periods of time and there are no permanent lit structures associated with this Project."[77] [76] *OPP, pp. 335, 350* [77] *OPP, p. 350 (emphasis added).*	For clarity, Beach has amended section 6.3.1 and Table 6-14 the OPP to: "There will be no permanent lighting associated with the Project. Temporary light emissions from flaring during drilling and completions and navigational lighting for support operations to comply with navigational and safety requirements, will be emitted during the Project when the MODU or vessels are on location in the Project Area ". As noted in responses to other comments above, the light EMBA for flaring has been remodelled based on 65mmscf and a light EMBA of 63 km - this does not change the information about the source of lighting and description as temporary and short-term
PC246 Paragraph 53	Comment: Apart from noting that vessels will be operating for "24 hours a day", the OPP does not provide the specific number and frequency of vessels that will operate during the 30-year life of the Project, so there is insufficient information to evaluate the intensity and duration of light from these vessels and the cumulative impacts on light-sensitive species.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding vessel activity and has reviewed the Offshore Project Proposal (OPP) in response to these comments. The potential impact of light emissions on marine species is assessed in section 6.3 of the OPP. Light emissions are assessed as having a Minor (1) consequence, which is not considered as having the potential to result in serious or irreversible environmental damage and is of an acceptable level. Based on the current level of operational detail, Beach is confident that the impact assessment outcome of minor is correct. The Environment Plan(s) that will be required to authorise specific activities are intended to address environmental impacts and risks at an activity-level, which would typically be at a finer scale of detail than the OPP. For example, an EP for drilling activity would generally include information on number and type of vessel (see section 3.9.1 of the OGV Drilling and P&A Activities EP. No change is made to the OPP in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC247 Paragraph 54	Comment: With respect to turtle species, the most significant risks from light pollution would be from vessels transiting to and from coastal areas where turtles may have nesting, internesting or other critical habitats. However, Beach excises the potentially large area where vessels will travel to and from the offshore locations from its definition of the "Project Area", on the grounds that it is "outside the scope" of the Offshore Petroleum Greenhouse Gas Storage Act 2006 (Cth) (OPGGS Act).[78] It fails to consider NOPSEMA's obligations, endorsed by the Minister for the Environment under s 146B of the EPBC Act, to assess actions that are likely to have a significant impact on Matters of National Environmental Significance (MNES). This review under the EPBC Act is not limited to Commonwealth waters; Beach as the proponent is required to consider any potentially significant impacts on MNES, which include threatened or migratory species which are protected under the EPBC Act. [78] *OPP, p. 75*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to turtle species from light pollution and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach acknowledges that artificial light can disrupt turtle nesting and hatching behaviours and is listed as a key threat in the Recovery Plan for Marine Turtles in Australia (CoA 2017). As detailed in Section 6.3 (Emissions – Light), although listed turtle species may occur within the routine light and flaring Environment that May be Affected (EMBAs), no Biologically Important Areas (BIAs), or habitat critical to survival for marine turtles were identified within the Project Area (Appendix E). Consequently, population level impacts to marine turtles from routine light and flaring emissions are not predicted to occur. The OPP has been prepared by Beach to satisfy the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Environment Regulations). It has been prepared in line with the regulations and with relevant National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) guidelines including the OPP Content Requirements Guidance Note (N-04790-GN1663 A473026) and OPP assessment policy (N-04790-1650). As described in the OPP Content Requirements Guidance Note (NOPSEMA 2020), an OPP is required for most new offshore petroleum development projects in Commonwealth Waters. An 'offshore project' is defined in the Environment Regulations as 'one or more activities that are undertaken for the purpose of the recovery of petroleum, other than on an appraisal basis, including any conveyance of recovered petroleum by pipeline' (NOPSEMA 2020). Therefore, the Project constitutes an 'offshore project', and an OPP is required. The OPP Content Requirements Guidance Note also states that 'Any component of a development project that is undertaken in State or Northern Territory coastal waters or onshore would not be part of an offshore project.' (NOPSEMA 2020). As stated in Section 3.5 (Project Area Definition) of the OPP, vessels transiting to and from the offshore locations are excluded from the OPP as this is outside the scope of the OPGGS Act. Vessels transiting to or from the operational areas are operating under the Commonwealth *Navigation Act 2012* and are not considered to be performing a petroleum activity whilst outside the operational area. Impacts and risks associated with vessels operating within the operational area in Commonwealth waters are assessed throughout the OPP including Section 6.3 (Emissions – Light).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Based on this, it is not within the scope of an OPP to describe or assess potential impacts from vessels not undertaking a petroleum activity on Matters of National Environmental Significance (MNES). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References* *NOPSEMA 2020. Offshore project proposal content requirements Guidance Note. N-04790-GN1663 A473026. August 2020. Accessed online <https://www.nopsema.gov.au/sites/default/files/documents/2021-03/A473026.pdf>*
PC248 Paragraph 55	Comment: This is a serious omission. In excluding from the definition of the Project Area the substantial areas in which vessels will transit between the port and the offshore site, the OPP neglects to evaluate not only potential harms from light pollution, but all potential environmental, social and cultural impacts from these Project activities.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to environmental, social and cultural impacts within the Project Area from light pollution and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As stated in Section 3.5 (Project Area Definition), vessels transiting to and from the offshore locations are excluded from the OPP as this is outside the scope of the OPGGS Act. Vessels transiting to or from the operational areas are operating under the Commonwealth Navigation Act 2012 and are not considered to be performing a petroleum activity whilst outside the operational area. Impacts and risks associated with vessels operating within the operational area in Commonwealth waters are assessed throughout the OPP, including Section 6.3 (Emissions – Light). The OPP has been prepared by Beach to satisfy the requirements of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (Environment Regulations). It has been prepared in line with the regulations and with relevant National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) guidelines, including the OPP Content Requirements Guidance Note (N-04790-GN1663 A473026) and OPP assessment policy (N-04790-1650). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC249 Paragraph 56	Comment: There are also significant risks of harm from light emissions from gas flaring. Ten birds have BIAs in the Project Area, and a larger number of protected bird species are likely or known to be found in the Project Area; all of these species will be exposed to the adverse impacts of flaring.[79] Attraction to gas flares and industrial light sources may pose the "greatest risk to migrating landbirds, and some seabirds, particularly during periods of inclement weather."[80] According to the United States Fish and Wildlife Service, gas flaring poses the following risks to birds: Methane or other gas burner pipes present a hazard to birds from burning, entrapment in pipes or vents, or direct mortality from the flare flame. The flame emitted to burn off gas during a flaring event can attract birds, especially at night. Birds can fly through the superheated gas or flame resulting in feather damage grounding the bird or scalding of lungs or other tissues due to inhalation. Birds can also be killed or injured if they perch on burner pipes[81]. *[79] See OPP, p. 55 (Table 6). BIAs are defined as "spatially defined areas where aggregations of individuals of a species are known to display biologically important behaviour such as breeding, foraging, resting or migration": OPP, p. 54.* *[80] See, e.g., R. Ronconi et al., 'Bird Interactions with Offshore Oil and Gas Platforms: Review of Impacts and Monitoring Techniques' (2015) 147 Journal of Environmental Management 34-45.* *[81] U.S. Fish and Wildlife Service, Incidental Take Beneficial Practices: Gas Flares (Web Page, 2024).*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to bird species from flaring activities and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Impacts and risks to birds associated with flaring as part of the Project's activities within the Project Area are assessed in Section 6.3 (Emissions – Light). This includes terrestrial species that migrate across the area. Flaring associated with well flowback during the potential testing of the wells via the drilling rig may occur in the initial or future drilling campaigns if the base case of unloading the wells to the Otway Gas Plant is not feasible. However, the duration of flaring is only in the order of 1 to 2 days for each well. Following assessment, the Impact Consequence (residual) of light emissions to bird species was assessed as Minor in the OPP. Wildlife potentially vulnerable to light (i.e. seabirds) are highly unlikely to be disrupted, nor displaced from important habitat and will be able to continue critical behaviours such as foraging and reproduction. The comment "greatest risk to migrating landbirds, and some seabirds, particularly during periods of inclement weather" is mostly based on anecdotal evidence (Ronconi et al. 2015). Only a few studies cite weather effects related to seabird attraction. However, there has been no systematic evaluation of bird attraction in relation to specific weather variables except at one offshore wind energy platform in the German Bight (Ronconi et al. 2015). Beach has committed to develop and support the implementation of a Light Management Plan, as per the National Light Pollution Guidelines for Wildlife (DCCEEW 2023), for the activity (Control Measure CM13). Although the interactions with migrating and seabirds from the result of flaring is highly unlikely with the impact assessed as Minor (as detailed in Section 6.3 Emissions – Light), Beach will ensure that within the Light Management Plan, procedures will include that prior to the commencement of the initial flaring event at each well, the area extending from the tip of the flare will be visually confirmed clear of birds. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. However, <u>Beach has included additional detail in the OPP (Table 6-15) to Control Measure 13 (Light Management Procedure) that the plan will include prior to the commencement of an initial flaring event at each well, the area extending from the tip of the flare will be visually confirmed to be clear of birds</u>. *References:*

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		CoA (Commonwealth of Australia) (2020) National Light Pollution Guidelines. Department of the Environment and Energy, Canberra. *Ronconi RA, Allard KA and Taylor PD (2015) 'Bird Interactions with offshore oil and gas platforms: Review of impacts and monitoring techniques', Journal of environmental management, 147: 34-45.*
PC250 Paragraph 57	Comment: The OPP provides that "flaring may be required during well intervention or drilling activities" but comments that it is only "short term" (1-2 days per well). However, the duration of the activity is not the only factor which determines its potential for harm. Where there are critically endangered and endangered species occurring in the Project Area who face the risk of extinction, as is the case here, the exposure of these bird species to flaring cannot be so quickly dismissed. For example, for the critically endangered Orange-bellied Parrot, even mortality or mortal injury impacts on relatively low numbers could have population-level effects.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to bird species from flaring activities and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Impacts and risks to birds associated with the Project have been thoroughly assessed within Section 6.3 (Emissions – Light) of the OPP. This includes the use of a 63 km light Environment that May Be Affected (EMBA) for the impact assessment of flaring activities. Beach acknowledges that the National Recovery Plan for the Orange-bellied parrot, Neophema chrysogaster (DELWP 2016) details that barriers to migration and movement as a threat to the Orange-bellied parrot. It details that highly mobile species may be impacted by barriers to movement (Navarrete 2011), though there is little more than anecdotal evidence for impacts on the Orange-bellied parrot (Holdsworth 2006). In addition, it states that individuals may be killed by flying into barriers, or behaviour may be modified by the presence of barriers, leading to avoidance of some habitat. Barriers may include wind energy turbines, powerlines and associated infrastructure, aircraft including small recreational aircraft, illuminated structures, and illuminated boats. The National Recovery Plan for the Orange-bellied parrot, Neophema chrysogaster (DELWP 2016) does however assess the evidence for impact barriers to migration and movement to be weak. For the Project there will be no temporary (Mobile Offshore Drilling Unit (MODU) or support vessels) or permanent infrastructure within areas classified as the breeding range, infrequent non-breeding range, migration route or non-breeding range as defined in the National Recovery Plan for the Orange-bellied parrot, Neophema chrysogaster (DELWP 2016). The Project Area, as detailed in Section 3.5 (Project Area Definition) of the OPP, where temporary MODU or support vessel activities may occur, does overlap the area classified as probable migration. However, this overlap is <0.01 per cent and as such, the activities of the MODU and support vessels when undertaking Project activities do not present the same barrier risk as those associated with illuminated structures or illuminated boats within the migration route.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		The Flaring EMBA does not intersect areas classified as the breeding range, infrequent non-breeding range, migration route or non-breeding range as defined within the National Recovery Plan for the Orange-bellied parrot, Neophema chrysogaster (DELWP 2016). Whilst the flaring EMBA does overlap the area classified as probable migration, impacts associated with flaring will only result in a temporary and short-term change in ambient light in the probable migration area but not present a barrier or risk of collision. Therefore, a change in ambient light is unlikely to cause behavioural changes or result in injury/mortality to the Orange-bellied parrot. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References.* *DELWP (2016). National Recovery Plan for the Orange-bellied Parrot (Neophema chrysogaster). Australian Government, Canberra.* *Holdsworth M. C. 2006. Reproductive success and demography of the Orange-bellied Parrot Neophema chrysogaster. PC251 Paragraph 58	Comment: Beach's self-assessment posits that the residual impacts of interaction with marine fauna will be "low" overall throughout the Project duration.[82] However, the OPP assessment does not properly account for risks of vessel strikes and collisions, which are particularly hazardous to cetacean populations that spend time near the surface to breathe or forage. [82] *OPP, p. 34.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to fauna resulting from vessel strikes and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach is confident that the risk evaluation in Section 7.2 (Physical Presence – Interaction with Marine Fauna) of the OPP provides a robust evaluation of the potential of collision with megafauna as a result of activities from the Project including identification of hazards, risk analysis, control measures. An unplanned interaction with marine fauna event, resulting in injury or mortality to an individual marine mammal, marine reptiles or seabird or shorebird, has been evaluated as a Low risk (see Table 7-8). The defined acceptable level and environmental performance outcome for the Project is no death or injury to listed threatened or migratory species (Table 7-10).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC252 Paragraph 59	Comment: The OPP acknowledges that "Vessel strike could cause injury or death"*[83]* and that "Collisions between vessels and cetaceans occur more frequently where high vessel traffic and cetacean habitat coincide."*[84]* It is well established that increased vessel traffic heightens the risk of vessel strikes, which can cause severe injury or death.*[85]* In this case, the most impacted marine fauna are likely to be whales and sea turtles (including endangered species) occurring in the area where vessels transit.[86] The available data usually understates the real threat; because vessel collisions often remain unseen and unreported, the danger to marine fauna can be substantially higher than the data demonstrates.[87] *[83] OPP, p. 445.* *[84] OPP, p. 446.* *[85] See, e.g., R. Schoeman et al. 'A Global Review of Vessel Collisions With Marine Animals' (2020) 7 Frontiers in Marine Science 292; Department of the Environment and Energy, Australian Government, National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (Dec. 2017), p. 4.* *[86] R. Schoeman et al. 'A Global Review of Vessel Collisions With Marine Animals' (2020) 7 Frontiers in Marine Science 292.* *[87] International Whaling Commission, 'Ship strikes: collisions between whales and vessels' (2023); F. Ritter et al. 'Collisions of Vessels With Cetaceans – The Underestimated Threat' in C. Sheppard (ed), World Seas: An Environmental Evaluation (2019).*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to fauna resulting from vessel strikes and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As referenced in the claim, Schoeman et al (2020), DoEE (2017) and the IWC (2024) highlight successful measures to mitigate collisions with marine fauna which include a reduction in vessel speed. DoEE (2017) states that large, high-speed vessels, in particular, have become a major concern as they are capable of travelling at speeds of up to 35 to 40 knots. As stated in Section 7.2 (Physical Presence – Interaction with Marine Fauna) of the OPP, vessels operating within the Project Area will be moving very slowly or be stationery, so the risk associated with fast moving vessels not credible. The lack of reporting of vessel strikes, as detailed in the claim, is likely a result of ship personnel being inexperienced with reporting procedures, fear of penalties if incidents are reported and species interactions going undetected due to large vessel size or vessel speed (Laist et al. 2001). Control Measure 14 (CM14) requires that vessel personnel are aware of and will adhere to *Environmental Protection and Biodiversity Conservation Act 1999* and Regulations 2000 – Part 8 Division 8.1 interacting with cetaceans in relation to distances to cetaceans and vessel speeds within caution zones. In addition, vessel movements will be aligned to Objective 3 of the National Strategy for Reducing Vessel Strikes on Cetaceans and other Marine Megafauna (DoEE 2017) by: • maintaining separation of vessels and whales • maintaining slow vessel speeds • avoidance manoeuvres Commercial vessels in Commonwealth waters involved in a collision with marine fauna are required to report the incident under several acts and guidelines. These include *The Navigation Act 2012* and the *Marine Safety (Domestic Commercial Vessel) National Law Act 2012* plus reporting the incident to AMSA and the Australian Marine Mammal Centre. Details of guidelines and industry practice that support vessels will adhere to are listed in Section 7.2.3 (7.2.3 - Risk Evaluation Summary) of the OPP.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach is confident that the risk evaluation in Section 7.2 (Physical Presence – Interaction with Marine Fauna) of the OPP provides a robust evaluation of the potential of collision with megafauna as a result of activities from the Project. This includes Environmental Performance Outcomes (EPO's) and control measures ensuring that these impacts and risks of an acceptable level. The risk assessment (residual) assessed the consequence of an interaction as moderate but highly unlikely with a risk rating of low. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References:* *CoA (2017) National Strategy for Reducing Vessel Strikes on Cetaceans and other Marine Megafauna. PC253 Paragraph 60	Comment: However, Beach downplays the risk of collision with vessels, commenting that vessels within the Project Area "will be moving very slowly or will be stationery, so the risk associated with fast moving vessels is not an issue."[88] [88] *OPP, p. 446.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to fauna resulting from vessel strikes and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach is confident that the risk evaluation in Section 7.2 (Physical Presence – Interaction with Marine Fauna) of the OPP provides a robust evaluation of the potential of collision with megafauna as a result of activities from the Project. This includes Environmental Performance Outcomes (EPO's) and control measures ensuring that these impacts and risks are of an acceptable level. The risk assessment (residual) assessed the consequence of an interaction as moderate but highly unlikely with a risk rating of low.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC254 Paragraph 61	Comment: Yet, as the OPP previously stated, it is not only the speed but the volume of vessel traffic which increases risks of strikes. As noted with respect to light pollution, this Project could involve significant vessel traffic, operating "24 hours a day" and continuing for up to 34 months, during the drilling period alone.[89] If the Project progresses to the production stage and/or if further construction is required, there will be additional traffic from pipelay and support vessels. As argued previously, the OPP fails to account for vessels transiting between the coast and the offshore sites, as these activities are not captured in the Project Area. All of these factors suggest that Beach is underestimating the risks of interactions with marine fauna, especially endangered and vulnerable whale species [89] *See OPP, p. 350.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impacts to fauna resulting from vessel strikes and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach is confident that the risk evaluation in Section 7.2 (Physical Presence – Interaction with Marine Fauna) of the OPP provides a robust evaluation of the potential of collision with megafauna as a result of activities from the Project. This includes Environmental Performance Outcomes (EPOs) and control measures ensuring that these impacts and risks are of an acceptable level. The risk of an unplanned interaction with marine fauna event has been evaluated to be Low. Low risks are considered lower-order risks that is acceptable with the application of good industry practice. As provided in comment and response (PC247), Section 3.5 (Project Area Definition) of the OPP, vessels transiting to and from the offshore locations are excluded from the OPP as this is outside the scope of the OPGGS Act. Vessels transiting to or from the operational areas are operating under the Commonwealth *Navigation Act 2012* and are not considered to be performing a petroleum activity whilst outside the operational area. Impacts and risks associated with vessels operating within the operational area in Commonwealth waters are assessed throughout the OPP. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC255 Paragraph 62	Comment: The Project poses significant risks to the marine environment	Beach Energy (Operations) Limited (Beach) acknowledges comments of risks to the marine environment and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach is confident that the OPP provides a robust evaluation of the potential impact and risks to ecological and social receptors. In accordance with Environment Performance Outcomes (EPOs) and control measures set out within the OPP, the Project will be managed so that the potential

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		impacts and risks will be mitigated to acceptable levels in accordance with environmental regulatory requirements. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC256 Paragraph 63	Comment: Risks from planned toxic discharges The OPP identifies numerous planned toxic discharges to the marine environment: drill cuttings and drilling fluids, cement, and commissioning and operational fluids, and routine operational wastes from vessels. It concludes that all impacts from these discharges are minor and acceptable.[90] However, for the following reasons, the OPP fails to support these conclusions.	Beach Energy (Operations) Limited (Beach) acknowledges comments of risks from planned discharges and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. This is a general statement with specific comments about carbon budgets are addressed throughout this public comment report (see PC 257 to 260).
PC257 Paragraph 64	Comment: Drill cuttings and drilling fluids The OPP provides that discharges of drill cuttings and drilling and completion fluids will occur throughout the life of the Project.[91]	Beach Energy (Operations) Limited (Beach) acknowledges comments concerning planned discharges and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach rejects the comment that Table 6-47 of the OPP (reference 91) provides that "discharges of drill cuttings and drilling and completion fluids will occur throughout the life of the Project". Tables 6-47 and 6-48 (in section 6.7.2) of the OPP describes total expected volumes of drill cuttings and fluids discharged for discrete activities within the Project. Beach has considered these comments and is satisfied that the comment has no merit and no changes have been made to the OPP in response to these comments.
PC258 Paragraph 65a	Comment: Risks from planned toxic discharges Drill cuttings and drilling fluids Although the OPP acknowledges that discharges of drill cuttings and fluids may cause changes in water quality, sediment quality, and habitat, potentially resulting in injury and mortality to fauna,[92] it fails to adequately	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding drill cuttings and drilling fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As described in the comment, the OPP provides a description of drill cuttings and drilling fluid discharges in the following sections: • Section 3.8.3 describes the type of fluids to be used during drilling and expected discharge volumes per well.

ID	Summary of comments received	Beach’s assessment of merit of comment(s) and response(s) to comments and/or objections
	support its conclusion that the impacts will be minor and acceptable: a. The OPP fails to identify which substances will be discharged, their chemical composition, concentration, or toxicity. It only lists a range of substances which the discharges “can include” or “are estimated to consist of”, and many of these substances can cause harm to the marine environment. For example: i. Drilling fluids “are planned to be” water based (WBDF), which uses “pre-hydrated bentonite gel sweeps and will be discharged directly to the seabed with cuttings. The seawater may be treated with caustic soda (NaOH) and/or soda ash (Na2CO3) to increase pH and alkalinity.”[93] ii. Synthetic based drilling fluids (SBDF) will be used “where technical requirements preclude the use of WBDF” and “assessed should their use be required.” The base fluid is “typically a hydrocarbon, ether, ester, or acetal,” and additives include organophilic clays, barite, lime, aqueous chloride, rheology modifiers fluid loss control agents, and emulsifiers.[94] iii. Drill cuttings can “contain toxic materials, such as heavy metals, that can leach into the water and harm marine life.”[95] iv. Completions fluids “can include” chlorides, bromides, hydrate inhibitors [monoethylene glycol] (MEG), biocides, oxygen scavengers, viscosifiers, and surfactants, as well as produced/formation water.[96] v. Suspension fluids “are estimated to consist of” corrosion inhibitor (soluble oil) and suspension fluid (treated with dilute oxygen scavenger, preservative (glutaraldehyde), and caustic soda). Well annular fluids may include small amounts of hydrocarbons.[97] [92] *OPP, p. 415.* [93] *OPP, p. 412.*	• Section 3.8.4 describes well completion fluid discharges. • Section 3.8.4 describes well P&A during decommissioning, which includes the discharge of annulus fluid. Potential impacts from these discharges are collectively assessed in Section 6.7 (Planned Discharge – Drill Cuttings and Fluids). The impact assessment is based on the current level of planning, which in this case means the type of expected volume of fluids, however details such as specific chemical composition, concentrations, dilutions and frequency of discharges are operational details which are determined much closer to the start of the activity. Subsequently, the OPP relies upon an understanding of what is typical in the industry. Throughout the impact assessment, peer-reviewed literature is cited to support the assessment of potential consequences. Justification is provided throughout as to why these literature sources are considered relevant to the Project, for example comparison in location and water depth or composition of discharge is provided. Through this process, Beach is able to confidently provide an assessment of impacts without refining the specifics of the planned discharges at this early stage. In response to specific points in the comment: i) Water based drilling fluids (WBDF) will be used exclusively for the initial drilling campaign. WBDF will be discharged directly to the seabed during top-hole drilling, and then from the MODU once the riser has been installed. WBDF composition will be industry standard. ii) For future drilling campaigns, it is possible that operational requirements will mean that synthetic-based drilling fluids (SBDF) will be used. Typically SBDF are only used for the bottom-hole / reservoir section of the well. There will be no bulk discharge of SBDF; instead all SBDF remaining at the end of the well either being reused on the next well, passed onto the next operator or returned to the vendor for reprocessing or appropriate disposal. This will be detailed in the relevant activity specific Environment Plans. iii) It is accurate to state that drill cuttings can contain toxic materials, which can harm marine life. However, WBDF which will be used for the majority of drilling activities have very low toxicity, and are generally composed of low impact / PLONOR chemicals. iv) Completion fluids can include the chemicals listed; however these are typically in very small concentrations. The majority of completion fluid is brine. Completion fluids are pumped into the wellbore during completions and clean-up, with all returns processed through the on-board package on the MODU prior to discharge.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[94] *OPP, pp. 412, 422.* [95] *OPP, p. 411.* [96] *OPP, pp. 89, 412-413.* [97] *OPP, p. 413.*	v) Suspended fluids are those retained in the wellbore while the well is suspended, and will be discharged during P&A when the wellhead is removed. Volumes of discharge will be low (approx. 100 m^3 per well) and will mostly consist of brine with some additives (as listed). All chemicals used during the Project which have the potential for planned discharge to the marine environment are assessed using the Beach chemical selection process (CM29). Beach will provide full details of the Beach Hazardous Chemicals Management Procedure and Hazardous Materials Risk Assessment which will be used to assess all chemicals used as part of the Project in the associated EPs. The procedure considers aquatic toxicity, bioaccumulation, and persistence data for each chemical, along with the discharge concentration, duration, frequency, rate, and volume to assess chemicals that may or will be discharged to the marine environment. This approach aligns with international industry best practise for chemical assessment and will ensure that discharges to the marine environment are of an acceptable level. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC259 Paragraph 65b	b. Instead of providing adequate information to support its conclusion, the OPP states there will be a process for chemical selection to ensure chemicals are "environmentally acceptable"98 – without indicating what that means for each potentially-impacted species and ecosystem. The OPP also assumes discharges will have low or no toxicity, and low bioaccumulation.[99] However, many of the substances listed above can be toxic (for example, MEG and biocides are toxic,[100](discussed below)), and also have bioaccumulation potential (for example, heavy metals and petroleum hydrocarbons101). [98] *OPP, p. 422.* [99] *OPP, pp. 416-420.* [100] *Department of Climate Change, Energy, the Environment and Water, Ethylene glycol (1,2-ethanediol) (Web Page, 30 June 2022) (noting that ethylene glycol (1,2-*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding drill cuttings and drilling fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Unlike an Environment Plan (EP), an OPP is not required to provide details of the implementation strategy i.e. arrangements which are in place to ensure that control measures are met, planned and unplanned emissions and discharges are recorded etc. Beach has provided detail of their Environmental Management System (Section 9) which provides a high-level overview of Beach's approach to implementation and a summary of the systems, practices and procedures used to ensure implementation of activities in accordance with the OPP. Regarding chemical assessment, Beach will provide full details of the Beach Hazardous Chemicals Management Procedure and Hazardous Materials Risk Assessment which will be used to assess all chemicals used as part of the Project in the associated EPs. The procedure considers aquatic toxicity, bioaccumulation, and persistence data for each chemical, along with the discharge concentration, duration, frequency, rate, and volume to assess chemicals that may or will be discharged to the marine environment. This approach aligns with international industry best

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	ethanediol) is a synonym for "monoethylene glycol"); United States Environment Protection Agency, Reregistration eligibility decision for alkyl dimethyl benzyl ammonium chloride (ADBAC) (3 August 2006), p. 45. *101 Several scientific studies have shown for over a decade that petroleum hydrocarbons bioaccumulate in a range of species, including aquatic worms and oysters. B. Muijs et al., 'A Closer Look at Bioaccumulation of Petroleum Hydrocarbon Mixtures in Aquatic Worms' (2010) 29(9) Environmental Toxicology and Chemistry 1943; N. Gan et al., 'Impact of Polycyclic Aromatic Hydrocarbon Accumulation on Oyster Health' (2021) 12 Frontiers in Physiology.*	practise for chemical assessment and will ensure that discharges to the marine environment are of an acceptable level. Regarding toxicity and bioaccumulation, these factors are integral in the Beach Hazardous Chemicals Management Procedure and Hazardous Materials Risk Assessment. Where chemicals are proposed for use which do not meet the criteria for discharge, as described in the chemical assessment process, Beach will follow the plan to identify alternative chemicals or adjust the dosage and / or discharge volume until discharges meet the criteria required. Chemicals will not be discharged if they do not meet discharge criteria. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC260 Paragraph 65c	c. Further, the OPP provides no detail about the chemical composition of the formation water that will be discharged or the basis on which to conclude its impact will be minor, although produced/formation water can include toxic contaminants.[102] It also contains no assessment of the potential impacts of heavy metals in the discharges, despite acknowledging that drill cuttings and drilling fluids may contain heavy metals such as mercury and cadmium.[103] [102] *J. Beyer et al., 'Environmental effects of offshore produced water discharges: A review focused on the Norwegian continental shelf' (2020) 162 Marine Environmental Research 105155.* [103] *OPP, pp. 411, 422.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding formation water discharges and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Sections 3.8.3 (Drilling) and 3.8.4 (Completions) of the OPP explains the formation water will only be discharged during drilling and completions as part of completion fluids discharges. There will be no ongoing discharge of produced formation water as part of the project. Completion fluids consist of completion brine, and any formation water or condensate in the well bore. Total discharge volume of completion fluids from well completion, unloading and testing will be up to approximately 300 m^3. Approximately 100 bbls (16 m^3) of produced water may be generated and discharged per well. Completion fluids will be treated to reduce the oil in water content to below 30 ppm prior to overboard discharge. Fluid not meeting this criterion will be stored in tanks for later onshore disposal. This low volume of 16m3 is due to the low formation water content in formation gas. The chemical composition of formation water discharged together with completion fluids depends on the formation and well construction process. To prevent uncertainty of impacts from unknown chemical composition of completion fluids, Beach is committed to test and treat completion fluids prior to discharge to ensure minor impacts to the environment. Section 6.7 details the impact analysis and evaluation which concludes discharge of drill cutting and fluids (including completion fluids) will result in reduction in water quality in the near vicinity of the discharge. The temporary,

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		low volume discharges of completion fluids will be diluted and dispersed by wave action and local currents which will reduce contaminant concentrations to levels below which could possibly result in acute or chronic toxic effects. As a result, there is little or no risk of bioaccumulation, bioconcentration or trophic transfer of chemicals. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC261 Paragraph 65d	d. The OPP's conclusions as to minor impacts rely on general data about settling, dispersion, and dilution of discharges. It does not provide modelling specific to the discharges that would take into account – for example – concentrations, dilution, period and frequency of the discharges, ocean conditions, and currents.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impact assessment of drill cuttings and fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Section 6.7 of the OPP provides a detailed assessment of planned discharges of drill cuttings and fluids. The impact assessment is based on the current level of planning, which in this case means the type of expected volume of fluids, however details such as specific chemical composition, concentrations, dilutions and frequency of discharges (as mentioned in the comment) are operational details which are determined much closer to the start of the activity. Subsequently, the OPP relies upon an understanding of what is typical in the industry. Throughout the impact assessment, peer-reviewed literature is cited to support the assessment of potential consequences. Justification is provided throughout as to why these literature sources are considered relevant to the Project, for example comparison in location and water depth or composition of discharge is provided. Through this process, Beach is able to confidently provide an assessment of impacts without refining the specifics of the planned discharges at this early stage. Beach has a high level of certainty on the predicted impacts from drill cuttings and fluids. Potential impacts from planned discharges of drill cuttings and fluids have been evaluated to result in Minor (I) consequences. Minor consequences are considered lower-order impacts that is acceptable with the application of good industry practice (Table 6-49). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC262 Paragraph 65e	e. The OPP uses its unsupported conclusion that discharges will have negligible impact on fish, marine mammals, and marine reptiles as the basis for not further evaluating impacts.[104] However, as noted above, the conclusion is based on unsupported assertions regarding toxicity, bioaccumulation, and dispersion of contaminants, as well as unsupported statements about the transience of species in the region. This is despite several species, such as the blue whale and southern right whale, identified as threatened by chronic and acute chemical discharges.[105] [104] *OPP, p. 420.* [105] *OPP, p. 420.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impact assessment of drill cuttings and fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As stated in the comment, several categories of receptor are scoped out of the assessment on the basis that impacts will be negligible. Fish, marine mammals and marine reptiles (as listed in the comment) are all species which live in the water column and are therefore potentially affected by changes in water quality. As described in the OPP (Section 6.7.3.1.1), a change in water quality is expected to be localised and temporary. This is based upon the current understanding of the nature of discharges (such as the type of fluids which will be used and expected volumes discharged), and peer-reviewed literature. Literature is selected where the discharge parameters or receiving environment is comparable to the Project and therefore can be used as a direct example of what the consequences from the Project will be. Impacts to water quality from planned discharges of drill cuttings and fluids are assesses as minor and will be controlled through implementation of industry best practise control measures. Motile fauna actively avoid discharge plumes and turbidity within the water column, reducing exposure time and therefore preventing acute and chronic consequence to receptors. Based on the assessment of minor impacts to water quality, the potential impact of these minor changes in water quality to individuals which will actively avoid area of disturbance is assessed to be below minor i.e. negligible. The comment refers to threats to marine mammal species from chronic and acute chemical discharges. The Conservation Management Plans for the Blue Whale (CoA, 2015b) and Southern Right Whale (DSEWPaC, 2012a) identify acute and chronic chemical discharges as a threat mainly in relation to hydrocarbon spills and bioaccumulation of pollutants. As bioaccumulation is not expected (based on the implementation of the chemical risk assessment) and hydrocarbons are not present in drill fluids and cuttings, acute and chronic chemical exposure are not predicted. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC263 Paragraph 65f	f. In assessing impacts on benthic communities, the OPP fails to account for accretion of sediments over time resulting from the multiple discharges over the life of the Project or to assess how the temporal aspect of sedimentation occurring multiple times can harm benthic communities. This is despite the OPP assuming a 2 km exposure radius for drilling discharges on the seabed.[106] [106] *OPP, p. 418.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding impact assessment of drill cuttings and fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Section 6.7.3.1.2 describes the changes in sediment quality from drill cuttings and fluids discharged during drilling operations. The deposition of sediments is expected to be highly localised around the well site. A study by Terrens et al (1998) of drilling impacts in the Bass Strait, described in Section 6.7.3.1.2, found after 11 months from drilling synthetic based drilling fluids were not detectable in the sediments indicating recovery of the seabed, and after one to two years recolonisation of benthic infauna and epifauna was observed. Section 6.7.3.1.3 also describes that the studies reviewed by Jones et al (2012) indicate that benthic infauna and epifauna recover relatively quickly after impacts from discharges of drill cuttings and fluids. Studies (Balcom et al., 2012; IOGP, 2016) have concluded that impacts to benthic habitats and communities as a result of drill cuttings and fluids discharges are minimal, resulting in highly localised impacts with benthic environments rapidly recovering to post-drilling conditions. A change in benthic habitats and communities as a result of planned discharges of drill cuttings and fluids is unlikely. Given that epifaunal communities are likely well represented in the region and that the footprint of the potential impact is small in comparison with the spatial extent of these communities in the Southeast Marine Region, there is a high level of confidence that drill cuttings and fluids will not destroy, fragment or isolate these communities nor modify or disturb substantial areas of habitat. Section 8 details the cumulative impact assessment method. As part of CIA scoping it is highlighted that "key environmental matters that could be materially affected by the cumulative impacts of the project and other reasonably foreseeable future projects and require a detailed CIA." Details of CIA scoping assessment Table 8-2 assessed cumulative impacts on benthic habitat and did not identify impacts that would warrant further detailed assessment for cumulative impact assessment outcomes. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC264 Paragraph 66	Comment: Commissioning and operational fluids Fluids associated with commissioning and operations will be discharged to the marine environment throughout the life of the Project, during drilling, installation, operations, and decommissioning: a. Hydraulic control fluids will be released during blow-out preventer functioning and pressure testing. Function tests are generally undertaken every 7 days and will release ~2200L of potable water with 1-3% water-soluble control fluids. Pressure tests are generally undertaken every 21 days and may release small volumes of water-soluble fluids. In addition, blow-out preventer fluids are released whenever the riser is unlatched.[107] b. Hydrotesting will result in the release of inhibited/treated seawater to the marine environment. Chemicals "may include" biocides, dyes, corrosion inhibitors, and scale inhibitors.[108] [107] *OPP, p. 429.* [108] *OPP, p. 429.*	Beach Energy (Operations) Limited (Beach) acknowledges this statement regarding commissioning and operational fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to the statement. Beach confirms that the quoted sections of the activity description are correct. Hydraulic control fluid and hydrotest fluid are industry standard fluids used during all phases of an offshore development project. Hydraulic control fluid discharges occur as a result of safety critical testing, whilst hydrotesting (and subsequent discharge of hydrotest fluid) is an essential part of installation and commissioning which ensures that new infrastructure is successfully connected, reducing the likelihood of unplanned releases of fluid or reservoir hydrocarbons. No changes are required in response to this statement.
PC265 Paragraph 67	Comment: Although the OPP acknowledges that discharges of commissioning and operational fluids may cause localised changes to water quality that may impact the marine environment,[109] it fails to adequately support its conclusion that the impacts will be minor and acceptable: a. The OPP does not identify which chemicals will be used in hydrotesting, in what concentration and level of toxicity, and how often these discharges will occur. Without this information, the OPP cannot support its conclusions that chemicals will not persist in the environment or	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding discharges of commissioning and operational fluids and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. A description of fluids used and discharged during the Project is provided in Section 3.8 of the OPP, and a detailed assessment of planned discharges of commissioning and operational fluids is provided in Section 6.9. Chemicals used and discharged during the Project. In response to specific points raised in the comment: a. Specific fluids to be used for treating seawater during hydrotesting will be finalised and assessed in detail in the activity-specific EP. At this early stage, the assessment is based on typical chemicals expected to be used, i.e. Hydrosure 0-3670R as described in Appendix M of

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	bioaccumulate, and that any impacts on the marine environment will be minor. b. For example, the OPP fails to specify the biocide to be used. The modelling report commissioned by Beach (Appendix L to the OPP) assumes the use of Hydrosure 0-3670R, with an impact threshold of 1 ppm (equivalent to 1 mg/L), based on an assumption that concentrations below this level would not result in significant environmental impact.[110] It is from this assumption that conclusions about the minor significance of impacts from discharges is based. However, we understand that the biocide in Hydrosure is alkyl dimethyl benzyl ammonium chloride (ADBAC),[111] which the United States EPA has categorised as "highly toxic to fish" and "very highly toxic to aquatic invertebrates … on an acute exposure basis."[112] Even relatively low levels of ADBAC in treated seawater can be lethal at very short time periods; studies have found ADBAC is lethal to aquatic invertebrates over 48 hours with a no observable concentration level as low as 0.006 mg/L.[113] c. In any event, the modelling report indicates that chemicals within the discharge plume could well be at concentrations above the 1 mg/L threshold over a range of distances from the release point,[114] which may result in harm to species including plankton, benthic communities, and motile animals passing through the plume. d. Despite the frequency of discharges of hydraulic control fluids, the OPP does not identify the components of these fluids, model their dispersion, or provide any support for its conclusion that the fluid discharges will result in minor impacts. *[109] OPP, p. 429.* *[110] OPP, pp. 430, 1263 (Appendix L).*	the OPP. The exact discharge location, volume and duration will depend on the final flowline layout. b. Hydrosure 0-3670R is included as a typical biocide used in the offshore industry during hydrotest, and therefore a good proxy for the assessment at this early stage when chemical selection has not been finalised. Biocide is essential during hydrotest, as it aids in leak detection. As stated in the OPP, and in the Crux OPP (as referenced in the OPP), an impact threshold of 1 ppm of biocide was defined, which is consistent with published acute toxicity test data for aquatic species for typical biocides that may be used. The metrics typically used to measure toxicity are LC50 – the lethal concentration required to kill 50% of a population in the given time; and EC50 - the concentration at which 50% immobilisation of the test organism is observed in the given time. The Safety Data Sheet for Hydrosure 0-3670R states the 96-hour LC50 as 3.09 mg/L (3.09 ppm) for fish in marine waters, with a 48-hour EC50 of 5.66 mg/L (5.66 ppm) for aquatic invertebrates. Both of these levels are above the impact threshold set of 1ppm, meaning that the modelling is conducted to a conservative level. The OPP also notes that ecotoxicological studies are typically undertaken using constant doses for periods ranging from 24 to 96 hours under controlled conditions. This approach is in contrast to the natural environment, where the concentration and exposure durations can vary widely. c. The modelling replicates the behaviour of planned discharges in a range of environmental conditions (such as currents) and provides a prediction as to the area where exposure will be above the impact threshold of 1ppm. The far-field modelling results indicate that for the 99th and 100th percentile analysis (i.e. 99% and 100% of the time), the maximum distances from the Release Location to the predicted dilutions of 1:550 (i.e. 1 mg/L which represents the impact threshold concentration/trigger value) contour were 20m and 156 m, respectively. This is to say, it is predicted that the plume of fluid where biocide concentration will be above 1ppm is 20-156 m from the release location. Receptors within this boundary would be exposed to higher concentrations of the treatment chemicals (including biocide), however the high energy marine environment means that discharges will quickly dissipate on completion of hydrotest discharges. Effect concentrations and lethal concentrations are based on extended exposure (i.e. LC50 is measured after 96 hours of exposure, EC50 after 48-hours of exposure), which is not expected to occur as a result of hydrotest discharges. Subsequently, even concentrations above the impact threshold are not expected to result in measurable impacts to sensitive receptors, meaning that minor impacts are concluded to occur. d. Hydraulic control fluids are water-based, low toxicity and readily biodegradable (Section 6.9.2.1 of the OPP). This means that their discharge into the marine environment will inherently have a minor impact to receptors, as any exposure will be short-lived and non-toxic, and chemicals will disperse quickly in the marine environment meaning that the potential

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[111] *See Santos, Barossa gas export pipeline installation environment plan (27 Oct. 2023, rev. 3.4), Table 5-24 (p. 247).* [112] *United States Environment Protection Agency, Reregistration eligibility decision for alkyl dimethyl benzyl ammonium chloride (ADBAC) (3 Aug. 2006), p. 45.* [113] *Toxicology Regulatory Services, Inc., Alkyldimethylbenzylammonuim Chloride (ADBAC) Category* *High Production Volume (HPV) Chemicals Challenge Final Test Status and Data Review (1 Mar. 2011), Table 3 (p. 22).* [114] *OPP, pp. 1250, 1267-1279 (Appendix L).*	timeframe for exposure will be short. Section 6.9 of the OPP has been updated to clearly provide justification for the consequence evaluation outcomes for hydraulic control fluids. Having considered these comments, Beach Energy has updated the OPP as described above.
PC266 Paragraph 68	Comment: Routine operational wastes from vessels The routine operational waste discharges will contribute to general water pollution in a marine area that is important to numerous species and ecosystems. The OPP acknowledges that these discharges may include sewage, grey water, putrescible waste, bilge water, deck drainage, cooling water, and desalination unit waste, and contaminants may include hydrocarbons, oil, grease, solvents, chemicals, detergents, drilling fluids, biocides, and any other chemical used in the daily operations of the facility.[115] [115] *OPP, pp. 435-437.*	Beach Energy (Operations) Limited (Beach) acknowledges the comment that routine operational wastes from vessels will contribute to general water pollution in the marine area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. As mentioned in Section 6.10.3.1, these discharges are intermittent, low volume, low toxicity and on release to the environment will rapidly dilute resulting in only localised and temporary impacts to water quality. Section 6.10.1 highlights that these discharges are subject to IMO regulations so most will undergo treatment prior to discharge. The temporary presence of routine discharges in the marine environment will prevent chronic exposure to marine fauna species and ecosystems and therefore injury, mortality or change to marine fauna species populations and ecosystems are not predicted. Section 6.10.3. has been updated to include the following text: "These discharges are intermittent, low volume, low toxicity and on release to the environment will rapidly dilute by prevailing waves and currents to below no effect levels, resulting in only localised and temporary impacts to water quality. The maximum extent of potential impact to water quality is conservatively predicted to be within 500 m of the MODU or vessels ~~and~~ resulting in a Minor (1) consequence.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		As described in Section 4.6, Sea Country connection extends far beyond the current coastline and includes the Project Area. These discharges will be intermittent, localised and without any long-term impacts to sediment or water quality. In addition, impacts to marine fauna (including eels and southern right whales) that have cultural value to First Nations people are not predicted. Discharges to the seabed has the potential to interfere with First Nations submerged cultural heritage. The implementation of underwater cultural heritage assessments within potential areas of disturbance in the Project area (CM11) will ensure any cultural heritage values are not impacted. Thus the consequence is assessed as Minor (1) to water quality and ecological receptors and therefore is assessed as Minor (1) for associated cultural values." Beach has considered these comments and updates have been made to the OPP as outlined above.
PC267 Paragraph 69	Comment: The OPP dismisses the potential impact of these discharges as minor with a "[l]ow level decrease in water quality in the near vicinity of the discharge" with impacts felt up to 500 m of the discharge.[116] However, similarly to its assessment of other types of discharges (discussed above), it ignores the potential harmful and toxic impacts of these discharges on individual species and ecosystems over the life of the project and fails to support the conclusion with adequate information. [116] *OPP, p. 437.*	Beach Energy (Operations) Limited (Beach) acknowledges the comment that routine operational wastes from vessels are potentially harmful and toxic to individual species and ecosystems and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. As mentioned in Section 6.10.3, these discharges are intermittent, low volume, low toxicity and on release to the environment will rapidly dilute resulting in only localised and temporary impacts to water quality and are subject to IMO regulations so most will undergo treatment prior to discharge. The temporary presence of routine discharges in the marine environment will prevent chronic exposure to marine fauna species and ecosystems and therefore injury, mortality or change to marine fauna species populations and ecosystems are not predicted. <u>Section 6.10.3 has been updated to include the following text:</u> "...discharges are subject to IMO regulations so most will undergo treatment prior to discharge. On release to the environment, they will rapidly dilute resulting in only localised and temporary impacts <u>water quality</u>." Beach has considered these comments and updates have been made to the OPP as outlined above.
PC268	Comment: Finally, in relation to all types of planned discharges, there is no cumulative impact assessment. As	Beach Energy (Operations) Limited (Beach) acknowledges the comment that there is no cumulative impact assessment in relation to all types of planned discharges and has reviewed the Otway

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
Paragraph 70	the OPP acknowledges, the objectives of the Project include to "[u]tilise and extend existing infrastructure in the Otway Basin."[117] There is already operating offshore gas infrastructure in the Otway Basin in the Planning Area, as well as Beach infrastructure in the Project Area.[118] Many of the conclusions about the significance of the impact of planned discharges rely on volume, concentration, and dispersion of these discharges. However, because these discharges are not happening in isolation, but rather in the context of other offshore gas operations in the region, the OPP must undertake a cumulative impact assessment. [117] *OPP, p. 41.* [118] *OPP, pp. 74-76, 78-79, 264.*	Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. Section 8 details the cumulative impact assessment method. As part of CIA scoping it is highlighted that "key environmental matters that could be materially affected by the cumulative impacts of the project and other reasonably foreseeable future projects and require a detailed CIA." Details of CIA scoping assessment Table 8-2 did not identify planned discharges (in combination with other aspects) to have the potential to cause material affects to key environmental matters (receptors), therefore planned discharges was not put forward for detailed assessment for cumulative impact assessment outcomes). The context of other offshore operations in the region have also been assessed in detail in Table 8-1 of Section 8 of the cumulative impact assessment. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC269 Paragraph 71	Comment: Culturally important species affected by hydrocarbon spills Hydrocarbon spills threaten Nyamat Mirring[119] in several ways, including posing risks of dissolved oil exposure for the entirety of the Gundatjmara coastal Country stretching from Discovery Bay to the West to Hopkins River mouth/Warnmambool in the East,[120] entrained oil exposure along the coast and Nyamat Mirring,[121] and shoreline oiling approaching or overlapping with the Hopkins River mouth/Warnmambool.122 [119] *Gunditjmara Sea Country includes the coastal land and water from Bocara (Glenelg River) in the West to the Hopkins River in the East (emptying out near Warnmambool), and extends out to sea into Discovery Bay, Portland Bay surrounding Deen Maar Island: see Gunditjmara Nyamat Mirring Plan, p. 11.* [120] *See, for example, OPP, p. 490, Figure 130 (modelled during summer).*	Beach Energy (Operations) Limited (Beach) acknowledges the comment that hydrocarbon spills threaten Gundatjmara Nyamat Mirring and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. Beach has provided details on condensate spill exposure evaluations (Tables 7-24, 7-25) to First Nations Sea Country. The condensate spill exposure evaluations have been updated to specify that Gunditjmara Sea Country is predicted to be exposed to in-water and surface hydrocarbons in the event of a condensate spill. Dissolved hydrocarbon exposure extent for First Nations Sea Country evaluation in Table 7-25 has been updated as follows: "In-water exposure to hydrocarbons is predicted along ~~the Victorian~~ coastal First Nations Sea Country including Victorian coastal waters stretching from Discovery Bay to the west to Hopkins River mouth/Warnambool in the east. Sea Country predicted to be exposed to in-water exposure to hydrocarbons is adjacent to the Eastern Maar Native Title determination (Tribunal File No. VCD2023/001), Gunditjmara Native Title determination (Tribunal File No. VCD2007/001) and Preminghana Indigenous Protected Area. ~~within the planning area which is Sea Country for a~~

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[121] *OPP, p. 492, Figures 132-3.* [122] *OPP, p. 489, Figure 129.*	~~number of First Nations groups and is adjacent to the Eastern Maar Native Title comment and Preminghana Indigenous Protected Area~~." Shoreline hydrocarbon exposure extent for First Nations Sea Country evaluation in Table 7-24 has been updated as follows: "Marine pollution can result in reduced visual aesthetic. The modelling predicts shoreline exposure at the low threshold within Victorian First Nations areas of ~~Eastern Maar Aboriginal Corporation (and Native Title comment)~~ Eastern Maar Native Title determination (Tribunal File No. VCD2023/001), Gunditjmara Native Title determination (Tribunal File No. VCD2007/001), and Bunurong Land Council Aboriginal Corporation. The modelling predicts shoreline exposure at the low threshold, with some limited areas of moderate threshold, on the western side of King Island. Beach have updated the OPP to reflect changes as shown above in Tables 7-24 and 7-25.
PC270 Paragraph 72	Comment: The Planning Area encompasses the environment that may be affected by a potential hydrocarbon spill.[123] Within the Planning Area, the PMST Report finds that the critically endangered King Island Brown Thornbill, King Island Scrubtit, Curlew Sandpiper, Great Knot, Swift Parrot, Orange-bellied Parrot, Eastern Curlew, Southern Bent-wing Bat are known to occur, and the critically endangered Regent Honeyeater and Plains-wanderer bird species are likely to occur in the area. [123] *"The outer boundary of the Planning Area is the worst-case and largest spatial extent where unplanned hydrocarbon releases from Project activities could have an environmental consequence": OPP, p. 26.*	Beach Energy (Operations) Limited (Beach) acknowledges the comment that the mentioned critically endangered species identified by the Protected Matters Search Tool (PMST) as likely or known to occur within the Planning Area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. The OPP Description of Environment (Section 4) includes all species with an *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) listing that have a presence in the Project or Planning Area, as identified in the PMST Report. As described in OPP Section 4.4.9. (Threatened and Migratory Species), species listed as threatened or migratory under the EPBC Act and known or likely to occur in the Project or Planning Areas and/or have an intercepting BIA with the Project or Planning Areas are discussed in more detail. The description of environment is the basis for the impact and risk assessment. Species with higher status of protection, or those engaging in biologically important behaviours, are assessed in the greatest detail to account for nature and scale of impacts. The PMST detects all EPBC Act listed species with an occurrence in the area. Due to the grid sizes used in the PMST, species outside of the actual search area can be detected, including terrestrial species. Species that only occur in terrestrial habitats are not included in the OPP as they do not have potential to be impacted by the activities.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		The southern bent-wing bat (EPBC Act listed as critically endangered) was identified by the PMST as breeding known to occur within the Planning Area (Appendix B). However, this species was not detailed further in the OPP due to its terrestrial ecology. The southern bent-wing bat is an obligate cave-dwelling species which roosts underground in limestone caves, crevices and manmade tunnels and is understood to forage along forested ridgelines, pastures, wetlands and swamps. Southern bent-wing bats feed primarily on moths and foraging occurs primarily in open spaces via fast, direct flight patterns (DELWP 2020). Additionally, no threats directly relevant to the Project were identified in either the Conservation Advice (TSSC 2021) or National Recovery Plan for the species (DELWP 2020). As such, this species is not included in the OPP as it does not have the potential to be impacted by the Project. The following EPBC listed critically endangered terrestrial bird species are identified in the PMST and listed in Table 4-22 of the OPP: • King Island brown thornbill • King Island scrubtit • Plains-wanderer • Regent honeyeater • Swift parrot These species occur in terrestrial habitats and thus do not have the potential to be impacted by a hydrocarbon spill and are not discussed further (DCCEEW 2024a). The following EPBC listed critically endangered bird species which are known to utilise coastal habitats are identified in the PMST and listed in Table 4-22 of the OPP: • Curlew sandpiper • Eastern curlew • Great knot • Orange-bellied parrot The curlew sandpiper, eastern curlew and great knot are described further in Section 4.4.9.4.6 of the OPP and the orange-bellied parrot is described further in Section 4.4.9.4.4. These species are known to occur in coastal habitats and thus have potential to be impacted by a hydrocarbon spill. Seabirds are evaluated against impact and risk aspects for floating oil exposure in Section 7.4.2.4

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		of the OPP. The environmental impact summary tables of the OPP have been updated as follows to include exposure and consequence evaluations against impacts to shorebirds and seabirds from shoreline hydrocarbon exposure. Table 7-21 of the OPP has been updated to include an additional row for seabirds and shorebirds for MDO shoreline exposure: "Exposure evaluation (Column 4)" The modelling predicts potential shoreline exposure at the moderate threshold at Cape Otway West and Moonlight Head from MDO release at the north release location. The moderate threshold is not predicted to be reached based on MDO release at the TW1 release location. Several listed threatened, migratory and/or listed marine seabird and shorebird species have the potential to be foraging at these locations. Shorelines at the Otway coast with the potential to be exposed to moderate hydrocarbon thresholds overlap a foraging BIA and a breeding BIA and therefore may expose birds to shoreline hydrocarbons for the short-tailed and wedge-tailed shearwater at Muttonbird Island. "Consequence evaluation (Column 5)" Shorebird species foraging for invertebrates in intertidal feeding habitats, such as exposed sand and mud flats at lower tides, will be at potential risk of both direct impacts through contamination of individual birds (ingestion or soiling of feathers) and indirect impacts through the contamination of foraging areas that may result in a reduction in available prey items (Clarke 2010). Any direct impact of oil on terrestrial habitats has the potential to contaminate seabirds present at the breeding sites (Clarke 2010). Bird eggs may also be damaged if an oiled adult sits on the nest. Fresh crude was shown to be more toxic than weathered crude, which had a medial lethal dose of 21.3 mg/egg (Clarke 2010). Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos (French-McCay 2009). Shoreline accumulation will be concentrated along the high tide mark while the lower/upper parts are often untouched (IPIECA 1995). As breeding activities of shorebirds and seabirds generally occurs above the high tide mark, exposure to hydrocarbons is considered unlikely to occur.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		However, oiled bird species may track oil into their nests, which may then have subsequent impacts on any eggs present. The little penguin would be the highest-risk species, as they have to traverse through the intertidal area to reach nesting sites. Based on the worst-case scenario, the modelling predicted the maximum probability of shoreline accumulation at, or above, the moderate (100 g/m^2) threshold from MDO release at the northern release location to occur at Cape Otway West (6% probability) with the minimum time for shoreline contact predicted as 6.8 days with a peak volume ashore of 4.46 m^3 and Moonlight Head (2% probability) with the minimum time for shoreline contact predicted as 7.7 days with a peak volume ashore of 2.45 m^3 (RPS 2024). Acute or chronic toxicity impacts (death or long-term poor health) to seabirds and shorebirds is possible, however, with the minimum time for shoreline contact predicted as 6-7 days, potential contamination of nests and eggs from oiled parent bird species is limited to weathered MDO. The Otway coast, including Cape Otway West and Moonlight Head, is exposed to substantial wave action that would further break down any shoreline hydrocarbons. The limited exposure to shoreline hydrocarbons will prevent potential death or long-term poor health to seabirds and shorebirds over multiple breeding seasons, therefore it is expected that shoreline hydrocarbons will only impact a single breeding season at most. Consequently, the potential consequence is considered to be **Serious (3)**, as they could be expected to result in serious impact on valued species or habitat." Table 7-24 of the OPP has been updated to include an additional row for seabirds and shorebirds for condensate shoreline exposure: "Exposure evaluation (Column 4)" The modelling predicts potential shoreline exposure at or above the moderate threshold only along the Otway coast from LOWC condensate release at the northern location. No shoreline exposure at, or above, the moderate threshold was predicted for the southern release locations. Several listed Threatened, Migratory and/or listed marine bird species have the potential to be foraging or nesting at these locations. Shorelines exposed at or above moderate hydrocarbon thresholds include a breeding BIA for the wedge-tailed shearwater as well as breeding BIAs and surrounding foraging BIAs for the black-faced cormorant, common diving-petrel, little penguin and short-tailed shearwater. "Consequence evaluation (Column 5)'

ID	Summary of comments received	Beach’s assessment of merit of comment(s) and response(s) to comments and/or objections
		Shorebird species foraging for invertebrates in intertidal feeding habitats, such as exposed sand and mud flats at lower tides, will be at potential risk of both direct impacts through contamination of individual birds (ingestion or soiling of feathers) and indirect impacts through the contamination of foraging areas that may result in a reduction in available prey items (Clarke 2010). Any direct impact of oil on terrestrial habitats has the potential to contaminate seabirds present at the breeding sites (Clarke 2010). Bird eggs may also be damaged if an oiled adult sits on the nest. Fresh crude was shown to be more toxic than weathered crude, which had a medial lethal dose of 21.3 mg/egg (Clarke 2010). Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos (French-McCay, 2009). Shoreline accumulation will be concentrated along the high tide mark while the lower/upper parts are often untouched (IPIECA, 1995). As breeding activities of shorebirds and seabirds generally occurs above the high tide mark, exposure to hydrocarbons is considered unlikely to occur. However, oiled bird species may track oil into their nests, which may then have subsequent impacts on any eggs present. The little penguin would be the highest-risk species, as they have to traverse through the intertidal area to reach nesting sites. Based on the worst-case scenario, the modelling predicted the maximum probability of shoreline accumulation at, or above, the moderate (100 g/m^2) threshold from a LOWC condensate release at the Northern location at Cape Otway West (34%), followed by Moonlight Head (11%), Point Hicks (10%) and Port Campbell (1%). The minimum time to shore was at Cape Otway West (9 days), followed by Moonlight Head and Port Campbell (both 18 days), then Point Hicks (46 days). Cape Otway West had the maximum peak volume ashore predicted (6.6 m^3), followed by Point Hicks (5.56 m^3), Moonlight Head (4.39 m^3), and Port Campbell (1.76 m^3). The modelling predicted no shoreline accumulation at, or above, the moderate (100 g/m^2) threshold to occur from the southern spill release location. Acute or chronic toxicity impacts (death or long-term poor health) to seabirds and shorebirds is possible, however, with the minimum time for shoreline contact predicted as 9-46 days, potential contamination of nests and eggs from oiled parent bird species is limited to weathered condensate. Also, given the predicted minimum time for oil to reach shorelines within breeding

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		BIAs is 9-46 days. The majority of condensate at sea is likely to have dissipated during that time. The Cape Otway coast is exposed to wave and tidal action that would further breakdown any shoreline hydrocarbons. The limited exposure to shoreline hydrocarbons will prevent potential death or long-term poor health to seabirds and shorebirds over multiple breeding seasons, therefore it is expected that shoreline hydrocarbons will only impact a single breeding season at most. Consequently, the potential consequence is considered to be **Serious (3)**, as they could be expected to result in serious impact on valued species or habitat." Beach has considered these comments and updates have been made to the OPP as outlined above. *References:* *Clarke RH (2010). ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		http://www.environment.gov.au/biodiversity/threatened/species/pubs/87645-conservation-advice-14062021.pdf
PC271 Paragraph 80	Comment: Environmental impact thresholds are not best available science Beach uses thresholds for environmental impacts that rely on outdated science and are not in accord with recent findings since the Deepwater Horizon disaster. Beach's hydrocarbon model relies on studies from 1996 and 2009 to determine that environmental impacts "occur at 10 g/m2 (a film thickness of approximately 10 µm or 0.01 mm)" of hydrocarbon sheens.[144] Deepwater Horizon showed species' mortality rates occurring from sheens as thin as 1 µm.[145] Mortality from thin sheens of 1 µm occurred at rates of 34% even where exposure was limited to 24 hours.[146] The oil spill model assessment is not acceptable until it is re-done with impact assumed to occur at levels of 1 µm. [144] *OPP, Appendix M, p. 32.* [145] *"When exposed to the integrated average dose of UV light in the Gulf of Mexico over the course of the spill, the toxicity (percent mortality) of thin surface sheens to red snapper (embryo), bay anchovy (embryo), spotted seatrout (embryo), and mysid shrimp (juvenile) is 85, 89, 100, and 100 percent mortality, respectively" where thin sheens were defined as 1 µm thick: Deepwater Horizon EIS, pp. 4-169.* [146] *"The results of these studies demonstrated that exposure to even thin sheens of oil were extremely toxic to developing fish. The longer organisms spent in contact with the oil sheen, the more likely they were to die. For example, red drum embryos exposed to sheens made with weathered oil (Slick A) for 24, 48, or 60 hours experienced an average of 34, 68, or 74 percent mortality in excess of controls, respectively": Deepwater Horizon EIS, pp. 4-169.*	Beach Energy (Operations) Limited (Beach) acknowledges the claim that hydrocarbons thresholds used are not in accordance with findings from Deepwater Horizon disaster studies and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this claim. The hydrocarbon exposure thresholds used for the spill modelling and OPP risk analysis and evaluation are based on the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) Bulletin: Oil Spill Modelling (NOPSEMA 2019). The oil spill modelling NOPSEMA Bulletin (2019) was developed after publication of the Deepwater Horizon Oil Spill: Final Programmatic Damage Assessment and Restoration Plan and Final Programmatic Environmental Impact Statement (Westerholm and Rauch 2016) and includes French McCay (2016) references of potential effects thresholds for oil spill risk assessments based on findings from the Deepwater Horizon oil spill. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References* *Westerholm, David A. and Rauch, Samuel Dean, III, 1966- (2016). ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC272 Paragraph 81	Comment: No modelling of routine operational spills Beach assesses impacts of routine discharges from vessels and operations, but the hazards of routine operations do not include hydrocarbons routinely spilled from vessel traffic or other offshore operations.[147] Routine discharge of hydrocarbons can result in chronic exposure for species, and chronic effects can begin at concentrations as low as 7 µg/L total petroleum hydrocarbons (TPH).[148] The amounts of routine spills must be quantified and their impacts assessed. [147] *OPP, p. 435.* [148] Australian and New Zealand Guidelines for Fresh and Marine Water Quality, *Oils and petroleum hydrocarbons in freshwater and marine water* (October 2000).	Beach Energy (Operations) Limited (Beach) acknowledges the claim that hazards of routine operations do not include routine spills from other offshore operations and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this claim. Accidental discharge of small quantities of hydrocarbons, hydraulic oils/fluids and lubricants plus hydrocarbon-contaminated materials (e.g., oily rags, pipe dope, oil filters) are assessed within Section 7.3 (Accidental Discharge – Hazardous and Non-Hazardous Materials) of the OPP. The risk assessment (residual) within Section 7.3 (Table 17-12) of an unplanned loss of hazardous or non-hazardous materials to marine environment from Project activities has been assessed as having a risk rating of Low (Consequence – Minor; Likelihood – Unlikely). In addition, Section 8 details the cumulative impact assessment (CIA) method. As part of CIA scoping it is highlighted that "key environmental matters that could be materially affected by the cumulative impacts of the project and other reasonably foreseeable future projects and require a detailed CIA." Details of CIA scoping assessment Table 8-2 did not identify planned discharges (in combination with other aspects) to have the potential to cause material affects to key environmental matters (receptors), therefore planned discharges was not put forward for detailed assessment for cumulative impact assessment outcomes. The context of other offshore operations in the region have also been assessed in detail in Table 8-1 of Section 8 of the cumulative impact assessment. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC273 Paragraph 82	Comment: Details of oil spill response must be disclosed because the plan may cause significant harm Beach does not appear to have completed its oil spill response plan for the project, stating that "Oil spill response arrangements associated with the Project will be detailed in the relevant Offshore Oil Pollution Emergency Plan (OPEP)."[149] Beach must disclose the details of its OPEP since oil spill response plans can cause additional	Beach Energy (Operations) Limited (Beach) acknowledges the claim that oil spill arrangements have not been assessed and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this claim. Unlike an Environment Plan (EP), an OPP is not required to provide details of the implementation strategy. Under the OPGGS (Environment) Regulations, an Oil Pollution Emergency Plan (OPEP) is required as part of the implementation strategy for the activity-specific EP. Beach will provide a full risk analysis and evaluation of feasible oil spill response options in the associated EPs. Not all response options and tactics are appropriate for every oil spill, such as those oil spill responses

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	environmental harms, which have not been assessed. For example: a. Dispersants used in oil spill response plans are chemicals that can be lethal to marine organisms on their own.[150] In response to the Deepwater Horizon incident, 1.84 million gallons of two dispersants—Corexit 9500A and Corexit 9527A—were applied that "raised concerns about the potential for toxic effects of dispersed oil in the water column, as well as the potential for hypoxia due to bacterial consumption of dispersed oil."[151] b. Synthetic-based muds used in attempts to kill a well blowout can contain petroleum-based chemicals and barium sulphate, which can smother biota on the sea floor when released in sufficient quantity.[152] c. Controlled burns can result in enormous amounts of atmospheric pollution. In response to Deepwater Horizon, personnel conducted 411 controlled burns of surface oil slick that were unprecedented in U.S. history, exceeding any previous in situ burn in both duration and magnitude. Plumes of smoke from burning oil primarily consisted of aerosolised black carbon soot that increased air pollution.[153] [148] *Australian and New Zealand Guidelines for Fresh and Marine Water Quality, Oils and petroleum hydrocarbons in freshwater and marine water (October 2000).* [149] *OPP, p. 543.* [150] *Deepwater Horizon EIS, pp. 4-115.* [151] *Deepwater Horizon EIS, pp. 2-11.* [152] *Deepwater Horizon EIS, pp. 2-11.* [153] *Deepwater Horizon EIS, pp. 2-12.*	listed in points a, b and c. In each associated EP under this OPP, a response option assessment will be undertaken to identify suitable and recommended oil spill responses to be adopted in the event of a spill. In the OPP, Beach has provided detail of their Environmental Management System (Section 9) which provides a high-level overview of Beach's approach to implementation and a summary of the systems, practices and procedures used to ensure implementation of activities. The OPP includes a commitment that accepted EPs will have an OPEP and Operational and Scientific Monitoring Plan (OSMP) in place relevant to the activity and oil spills will be responded to in accordance with the plans. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC274	Comment: There are several culturally important species for Gunditjmara that are also found in the Planning Area,	Beach Energy (Operations) Limited (Beach) acknowledges the comment that hydrocarbon spills threaten Gunditjmara Nyamat Mirring and culturally relevant species and has reviewed the Otway

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
Paragraph 73	including Kooyang (Eels), which have been a valuable resource for thousands of years.[124] Eels at sea may be particularly vulnerable to hydrocarbon spills.[125] Risks of spills and accidents from the Project on Gunditjmara Country and culturally relevant species should be modelled using worst case scenarios (as below) [124] *Gunditjmara Nyamat Mirring Plan, p. 17.* [125] *NWF Blog, Dead Eel found in BP Oil Slick, (May 2010); Japan Times, Sea life around Mauritius dying as Japanese ship oil spill spreads (August 2020).*	Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. Beach have provided details on marine diesel oil (MDO) and condensate spill consequence evaluations (MDO Tables 7-20 to 7-22 and condensate Table 7-23 to 7-25) to First Nations Sea Country. The MDO and condensate spill consequence evaluations have been updated to describe potential impacts to culturally important species for First Nations people in the event of an MDO or condensate spill, namely eels and whales as specified in Sections 4.6.3.4.2 and 4.6.3.4.3. Table 7-20 has been updated as follows, based on potential risk to whales from floating oil exposure: "Consequence Evaluation - Beach understands that First nations people are linked to the marine environment and may be affected by a change in the environment. Although no long term or permanent changes to marine environment are expected it is considered that the visual presence of floating oil may impact Sea Country at a spiritual level (ie rituals, songlines, totem species culturally important species) and could affect culturally important activities such as mutton birding or affect ~~totem fauna~~ culturally important species including whales. There may be short-term and localised consequences, which are ranked as Moderate (2). Refer also to: cetaceans (whales) exposure and consequence evaluation ecological receptors above." Table 7-21 has been updated as follows, based on no risk to eels and whales from shoreline hydrocarbons: "Beach understands that First nations people are linked to the marine environment and may be affected by a change in the environment. Although no long term or permanent changes to marine environment are expected it is considered that the visual presence of shoreline oil may impact Sea Country at a spiritual level (ie rituals, songlines, ~~totem species~~) and could affect culturally important activities such as mutton birding ~~or affect totem fauna~~ The predicted minimum time for oil to reach a shoreline means it is likely to have dissipated during that time. Both Cape Otway and the west side of King Island are exposed to substantial wave action that would further breakdown any shoreline hydrocarbons. The relatively low volume means there may be short-term and localised consequences, which are ranked as Moderate (2)"

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Table 7-22 has been updated as follows, based on potential risk to eels and whales from in-water hydrocarbon exposure: "Section 4 details the connection First Nations people have to Sea Country which could be potentially impacted by in-water exposure to hydrocarbons. The relatively low volume means there may be short-term and localised consequences. Although no long term or permanent changes to marine environment are expected the short-term contamination of Sea Country may result in impacts associated at a spiritual level (ie rituals, songlines, culturally important species) and could affect culturally important activities such as mutton birding or affect culturally important species including eels and whales. The potential short-term and localised consequences are ranked as Moderate (2). Refer also to: fish (including eels) and cetaceans (whales) exposure and consequence evaluations above." Table 7-23 has been updated as follows, based on potential risk to whales from floating oil exposure: "Visible surface hydrocarbons (i.e. a rainbow sheen) have the potential to reduce the visual amenity of the areas of Sea Country. The distance from shore means there may be minor consequences and some impact. Beach understands that First nations people are linked to the marine environment and may be affected by a change in the environment. Although no long term or permanent changes to marine environment are expected it is considered that the visual presence of floating oil may impact Sea Country at a spiritual level (ie rituals, songlines, culturally important species) and could affect culturally important activities such as mutton birding or affect culturally important species including whales. There may be short-term and localised consequences, which are ranked as Moderate (2). Refer also to: cetaceans (whales) exposure and consequence evaluation above." Table 7-24 has been updated as follows, based on no risk to eels and whales from shoreline hydrocarbons: "Visible shoreline hydrocarbons has the potential to reduce the visual amenity of Sea Country. The predicted minimum time for oil to reach a shoreline is 6.54 days for the Victorian coast, 6.92 days for King Island and 33 days for north-west Tasmania and it is likely to have dissipated during that time due to substantial wave action that would breakdown any shoreline hydrocarbons. Although

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		no long term or permanent changes to marine environment are expected it is considered that the visual presence of shoreline oil may impact Sea Country at a spiritual level (ie rituals, songlines) and could affect culturally important activities such as mutton birding. The relatively localised extent and low volume means there may be short-term and localised consequences, which are ranked as Moderate (2)." Table 7-25 has been updated as follows, based on potential risk to eels and whales from in-water hydrocarbon exposure: "Section 4 details the connection First Nations people have to Sea Country which could be potentially impacted by in-water exposure to hydrocarbons. Although no long term or permanent changes to marine environment are expected the short-term contamination of Sea Country may result in impacts associated at a spiritual level (ie rituals, songlines, culturally important species) and could affect culturally important activities such as mutton birding or affect culturally important species including eels and whales. The potential short-term and localised consequences are ranked as Moderate (2). Refer also to: fish (including eels) and cetaceans (whales) exposure and consequence evaluations above. ~~There may be short-term and localised consequences, which are ranked as Moderate (2)~~" Beach has considered these comments and updates have been made to the OPP as outlined above.
PC275 Paragraph 74	Comment: No justification of the probability or likelihood of a spill Beach assumes that the risk of a marine diesel oil spill from vessels is "Highly Unlikely" and a condensate spill is "Remote."[126] Beach provides no information to justify either conclusion. Beach confesses to significant hydrocarbon spills in the Otway basin as recently as Fiscal Year 2021 and 2015;[127] in addition, there are likely ongoing oil spills from maritime vessels in the area.[128] Beach discloses no summary of all incident reports in the Otway basin that would inform an assessment of the likelihood of spills based on these historical numbers, and	Beach Energy (Operations) Limited (Beach) acknowledges the comment that no detailed information has been provided to justify the highly unlikely and remote likelihoods of marine diesel oil (MDO) and condensate spills, respectively, and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. Section 7.4.3 has been updated to include additional information on oil spill incidents in the Otway Basin: Historical LOWC incidents listed in the IOGP Risk Assessment Data Directory (2019) found blowout events during development drilling for a gas well to be at a frequency of 4.2 x 10-5 per drilled well; for development drilling operations on deep, normal wells of North Sea standard (IOGP, 2019). This frequency is based on two blowout incidents occurring in the UK between 1980 and 2014

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	performs no analysis as to how climate change will increase intensity of storms that are likely to increase the risk of collisions or spills. Both NOPSEMA and Beach should provide the public with a list of all hydrocarbon spills in the Otway Basin for the last 30 years and the amounts spilled to inform an assessment of how likely future spills would be over the next 30 years of the life of the project. [126] *OPP, p. 518.* [127] *Beach, Otway Basin Update, (9 Dec. 2021) p. 5.* [128] *See, e.g., Dianne Padley, University of Adelaide, Petroleum Geochemistry of the Otway Basin and the Significance of Coastal Bitumen Strandings on Adjacent Southern Australian Beaches (1995), section 9.2 (analysing bulk composition and alkane parameters of crude oils in oil slicks in Otway Basin to determine that many oil slicks in the area dating back to the 1980s are a "result of maritime pollution").*	during development drilling (IOGP, 2019); and represents the frequency of the cause (i.e. LOWC) that results in the worst-case consequence. Review of Australian Transport Safety Bureau vessel collision type marine investigations in Victorian waters between found only two vessel collision incidents both between container ship and fishing vessel (ATSB 2024). Both collisions did not result in loss of hydrocarbons. To date no incidents relating to LOWC or vessel collision events have occurred during Beach operations in Australia including in the Otway basin. Future spills from LOWC or vessel collision events are considered remote and highly unlikely events based on history of no known MDO or condensate spills in southern Australia from LOWC or vessel collision events. Beach has reviewed the reference 127 (Otway Basin Update of 9 December 2021) and the comment of significant hydrocarbon spills in the Otway Basin. The reference is from a presentation on (onshore) Otway Basin activities in South Australia which included a high-level summary of Beach's Corporate Health, Safety and Environment Performance for the period FY15 to FY22 across its portfolio. As Beach acquired its interest in the Offshore Otway Basin in the beginning of FY18 (1 July 2017) the hydrocarbon spills recorded in Beach's portfolio in FY15 does not relate to the offshore Otway Basin. In FY21, a spill occurred in the offshore environment with the discharge of drilling fluid. Beach complies with its requirements to notify of incidents Under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023. Beach also reports annual on environmental performance, including spills, in its Sustainability Report (publicly available on Beach's website). Beach have reviewed the study conducted by Padley (1995) and will not include findings/reference into the OPP. Padley (1995) does not highlight loss of MDO from vessel collision or Loss of well control (LOWC) as incidents resulting in the bitumen strandings found in southern Australian waters in 1986, 1990 and 1991 Padley (1995) states the sources of waxy bitumen strandings in southern Australian waters are believed to be the result of either accidental discharge or deliberate pumping of oil from tankers and cargo vessels after tank cleaning operations; recreational and commercial fishing boats with fuel leaks or pumped out dirty bilge water; illegal dumping of sludge from bunker fuel tanks and slop tanks; the pumping of dirty bilge and ballast water; or tanker-cleaning operations. Specifically, Section 9.2 of Padley, 1995, highlights those investigations into the geochemistry of oil slicks found the sources to be from maritime oil pollution incidents from: • Spills of mixed marine and terrestrial crude oils from tankers enriched in waxes

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		• Unlawful discharge of oil to sea from MV Arthur Phillip • Natural fractionation of petroleum seeping from submarine reservoirs, followed by long-distance ocean transport • Surfboard wax or residues of tanker cleaning operations Padley (1995) also mentions that crude oils spilled from ships in southern Australian waters, or the last surviving relics of oils that have been transported around Australia by ocean currents may also be sources of bitumen strandings in southern Australian beaches in 1086, 1990 and 1991. Given the sources of bitumen strandings were not found to be the result of LOWC or vessel collision events, Padley (1995) will not be cited in the OPP. Having considered these comments, Beach has included additional information in the OPP as described above. *References* *IOGP (2019). Risk Assessment Data Directory of Blowout Frequencies. PC276 Paragraph 75	Comment: Beach did not provide sufficient information to establish that it has modelled the worst case scenario for the following reasons	Beach Energy (Operations) Limited (Beach) acknowledge the statement about modelling of worst case scenario for hydrocarbon spills for the Otway Offshore Gas Victoria Project. This is a general statement with specific comments about hydrocarbon spills summarised and addressed in this public comment report (see PC277 to PC286).
PC277 Paragraph 76	Comment: First, Beach did not justify why the chosen locations for the well blowouts would cause a worst-case scenario. The locations selected for the hydrocarbon spill model were selected for their northern and most southern positions,[129] not on whether these locations would cause the worst case of environmental harm. For example, there is no description as to why these two locations would generate a worst-case hydrocarbon spill for any sensitive species or ecosystem. The methodology section of the hydrocarbon spill model describes no process that went	Beach Energy (Operations) Limited (Beach) notes the comment about modelling of worst case scenario for hydrocarbon spills for the Otway Offshore Gas Victoria Project. As summarised in the introduction to this Report, new quantitative spill modelling was undertaken to model the loss of well control in the southern well location to replace T/30P well location (now outside the Project Area) with Thylacine West 1 location (within the Project Area) (see Appendix M, Figure 7-1 and Table 7-17 of OPP). National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) Guidance Note on Oil Pollution Risk Management set out the requirement for establishing the context of oil pollution risk. In this context, the worst case scenario or discharge is based on the

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	into selecting the spill sites.[130] A "range of environmental receptors and shorelines were assessed," not for determining which site would cause a worst case hydrocarbon spill, but for how a release of hydrocarbons from chosen sites would impact those receptors.[131] [129] *OPP, p. 457 ("Two release locations for both the MDO and condensate spill scenarios within the Project Area were selected to ensure a conservative assessment. Release Location North is the most northerly potential well location, and nearest to the Victorian coast, and Release Location South is the most southerly well location, nearest to the Tasmanian Coast (King Island) and Zeehan AMP").* [130] *OPP, Appendix M, pp. 1-5.* [131] *OPP, Appendix M, p. 43.*	activity, location, reservoir characteristics and hydrocarbon properties. As stated in section 7.4.1 of the OPP, *Guidance on the identification of worst-case credible spill scenarios is given in AMSA's Technical Guidelines for Preparing Contingency Plans for Marine and Coastal Facilities (AMSA 2015) and Technical Report on Calculation of Worst-Case Discharge (SPE 2016)*. These documents were used to identify the potential significant and credible loss of containment scenarios associated with the Project as detailed in Table 7-16. For the condensate loss of containment scenarios, Beach has a high degree of confidence in the estimated release rates and timing used for the modelling as they are based on known reservoir properties and flow rates. The spill modelling for the release location north and south of the Project Area is based on the reservoir properties of a wells drilled and produced in the Otway Basin. Sensitivities were tested as well to evaluate the worst-case discharge. For example, Condensate Gas Ratio (CGR) is one of the main factors that drives the worst-case discharge result. Beach had modelled this using the highest known CGR and field condensate value of the Otway field to best knowledge which results in the largest condensate discharge and is carried as the worst-case discharge scenario for these wells within the Release Location North and South. Sensitivity analysis was also performed using different combination of OGIP, pressure, IPR, CGR, and worst case was selected. This is in line with the workflow suggested in the *Technical Report on Calculation of Worst-Case Discharge (SPE 2016)*. Beach selected worst case scenarios to model for a hydrocarbon spill for the Project as a loss of containment from a well during the drilling phase, the marine diesel oil spill (at northern and southern location within the Project Area) was modelled but remained within the spill are of the loss of containment scenario. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC278 Paragraph 77	Comment: There are several other proposed well locations for the project whose locations appear to be undisclosed, and no analysis has been done regarding whether they might cause an even worst case scenario. The map of the Project Area shows only the proposed well at La Bella 2, suspended wells at Artisan 1 and Geographe and existing wells;[132] it does not show the "five additional exploration	Beach Energy (Operations) Limited (Beach) notes the comment about modelling of worst case scenario for hydrocarbon spills for the Otway Offshore Gas Victoria Project. The Offshore Project Proposal (OPP) considers the whole life cycle of the Project. Project stages are defined to include an initial exploration and appraisal drilling campaign and future drilling campaign(s). For the OPP the well locations for spill modelling are based on north and south location (corresponding to

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	and appraisal wells drilled and completed (in success case) from a portfolio of prospects in the Project Area" in the initial drilling campaign, nor the 10 additional wells for future tie-backs.[133] Without information on the locations of the total 17 wells, it is unclear whether they would create an even worst case scenario for sensitive receptors. *[132] As shown in OPP, p. 76 (Figure 2).* *[133] OPP, p. 25.*	Thylacine West location – formerly T/30P well location) within the Project Area (see Figure 7-1 and Table 7-17). Based on the current level of operational detail, Beach is confident that the assessment represents the worst case scenario. For each activity, Beach will be required to submit an Environment Plan (EP). Further information about well locations and respective spill models will be assessed in the EPs which must be assessed and accepted by NOPSEMA prior to the commencement of activity. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC279 Paragraph 78	Comment: Second, Beach does not use a worst-case scenario for flow or release rate. Beach estimates 7,547 STB/day and 6,813 STB/day of condensate at Release Location South and North, respectively.[134] This is far short of what government agencies in other jurisdictions recommend in modelling worst case discharge rates of condensate. For example, in modelling of South Louisiana condensate spill from a well blowout for the Central Gulf of Mexico planning area, the U.S. Department of the Interior Bureau of Safety and Environmental Enforcement suggests using a 26,400 bbl/day worst case daily flow rate.[135] The South Louisiana condensate model was based off depths much shallower (42 feet) than those proposed by Beach (155 meters, or ~509 ft), and thus pressures and flow rates from Beach's proposed wells are likely to be higher. Beach provides no information as to why its maximum condensate flow rates in a worst-case scenario should be significantly less than worst-case estimates elsewhere. Beach also fails to provide technical information supporting the flow rate it chose, as flow rates from nearby existing wells have not been provided, nor other information used in calculating condensate worst-case	Beach Energy (Operations) Limited (Beach) notes the comment about hydrocarbon spills for the Otway Offshore Gas Victoria Project. The worst case scenarios for a hydrocarbon spill are summarised in section 7.4 of the OPP. For the OPP the well locations for spill modelling are based on north and south location (corresponding to Thylacine West location – formerly T/30P well location) within the Project Area (see Figure 7-1 and Table 7-17). The worst-case discharge modelling is developed using several inputs such as reservoir depth, reservoir temperature, gas in place, inflow performance, casing sizes, condensate to gas ratio (CGR). In general, the worst-case discharge numbers increases when the numbers of these respective inputs increase. While water depths are also considered in the worst case modelling, Beach does not agree with the comment that applying the Otway water depth (155 meters) to South Louisiana condensate model is an accurate representation of the worst case scenario for the Offshore Project Proposal (OPP). Further, from publicly available resources a field in South Louisiana has reservoir depth double the depth of the proposed wells in the Otway Basin, along with that the gas in place is estimated to be many times more with a much higher CGR. Therefore, it is expected that the worst-case discharge of the South Louisiana condensate spill will be much higher than planned wells in the Otway Basin. The spill modelling for the release location north and south of the Project Area is based on the reservoir properties of a wells drilled and produced in the Otway Basin. Sensitivities were tested as well to evaluate the worst-case discharge. CGR is one of the main factors that drives the worst-case discharge result. Beach had modelled this using the highest known CGR and field condensate

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	flow rates, such as sufficient information on geology, pressure, and sub-surface well-depth.[136] [134] *OPP, Appendix M, p. 30.* [135] *U.S. Department of the Interior Bureau of Safety and Environmental Enforcement, Task 1: Worst Case Discharge Analysis (Volume 1) (2016), p. 55 (modelling a very similar condensate, South Louisiana Condensate, that is a "nonpersistent oil that is very light and thus, tends to evaporate and dissipate quickly").* [136] *U.S. Department of the Interior Bureau of Safety and Environmental Enforcement, Task 1: Worst Case Discharge Analysis (Volume 1) (2016), Section 2.2. See also U.S. Department of Energy, Methods For Determining Vented Volumes During Gas-Condensate and Oil Well Blowouts (1981).*	value of the Otway field to best knowledge which results in the largest condensate discharge and is carried as the worst-case discharge scenario for these wells within the release locations north and south of the Project Area. Sensitivity analysis was also performed using different combination of OGIP, pressure, IPR, CGR, and worst case was selected. This is in line with the workflow suggested in the *Technical Report on Calculation of Worst-Case Discharge (SPE 2016).* For the condensate loss of containment scenarios, Beach has a high degree of confidence in the estimated release rates and timing used for the modelling as they are based on known reservoir properties and flow rates of suitable analogues for all potential new fields within the Project Area of the Otway Basin (e.g. Thylacine well). The hydrocarbon properties of Thylacine condensate are used for modelling (see section 7.4.3.2 and Table 7-18) and discharge volumes (Table 7-17). Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to this comment.
PC280 Paragraph 79	Comment: Third, Beach does not justify why its maximum duration for a spill in the event of loss of well control is a worst-case scenario in light of the harsh weather that could further delay the time to stop a release. Beach estimates a maximum duration of a spill would be 86 days from loss of well control.[137] This is analogous to the Deepwater Horizon spill that lasted 87 days.[138] No storms or rough seas caused the delay of stopping the Deepwater Horizon spill, as delays were due to technical failures.[139] Colder Antarctic temperatures[140] and rough seas *can make spill recovery more difficult and require different containment technologies.[141] The Otway Basin is located in seas that require "harsh environment" equipment,[142] and experience frequent high winds and intense storms and up to 10 m wave heights.[143] Given the difference in conditions, it is not*	Beach Energy (Operations) Limited (Beach) notes the comment about hydrocarbon spills for the Otway Offshore Gas Victoria Project. The comment specifically refers to Appendix M (Oil Spill Modelling Report by RPS Group) models hydrocarbon spill for 86 days. Beach confirms that 86 days is appropriate length of time to mobilise a rig and drill the relief well. Rig broker reports are used to monitor the rig market monthly, if required, assist in sourcing and contracting suitable MODU. The rig broker can be contracted to identify and contract a suitably specified rig (including Australian Safety Case status) within 14 days. The memorandum of understanding in place between the operators in Australia to assist in an emergency well control situation. A MODU mobilised from North West Shelf or Singapore is likely to take 35 days. These periods have been factored into the relief well schedule within the well specific relief well plans. Once a MODU is on location, it is estimated that drilling a relief well will take approximately 21 days, dependent on the intersection point and homing-in method selected. No changes have been made to the OPP in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	appropriate for Beach to rely on the maximum duration in Deepwater Horizon. [137] *OPP, Appendix M, p. xviii.* [138] *The Macondo release "led to 87 days of continuous uncontrolled oil and natural gas discharge into the northern Gulf of Mexico," and the release of 3.19 million barrels of oil and 7.7 billion standard cubic feet of natural gas: Deepwater Horizon Natural Resource Damage Assessment Trustees, Final Programmatic Damage Assessment and Restoration Plan and Final Programmatic Environmental Impact Statement (2016) (Deepwater Horizon EIS), pp. 2-8.* [139] *Deepwater Horizon EIS, pp. 2-4.* [140] *U.S. Department of the Interior Bureau of Safety and Environmental Enforcement, Task 1: Worst Case Discharge Analysis (Volume I), p. 15 (2016) (colder temperatures could be associated with higher rates of human error and can affect ways in which equipment and metal components handle).* [141] *See, for example, U.S. Environmental Protection Agency, Understanding Oil Spills And Oil Spill Response, p. 8-10 (1999).* [142] *OPP, p. 37.* [143] *OPP, Section 4.3.2.1 ("Otway is a high-energy environment exposed to frequent storms and significant wave heights. Winds in the area generally exceed 13 knots (23.4km/h) for more than 50% of the time contributing to the moderate to high wave-energy environment" and "is highly exposed to swell from the Southern Ocean. Wave heights generally range from 1.5m to 2m. Waves up to 10m can occur during winter storm events").*	

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC281 Paragraph 83	Comment: The Hybrid Coordinate Ocean Model has not been validated, which is key to understanding where hydrocarbon spills will have shoreline impacts To construct its hydrocarbon spill model, Beach relied on the Hybrid Coordinate Ocean Model (HYCOM), which contains data describing the flow of ocean currents.[154] It appears that this model has not been validated. Academics have shown that HYCOM can lead to inaccurate understandings of ocean currents, and therefore oil spill impacts. For example, researchers assessing the reliability of HYCOM against other models for studying the Agulhas current found that HYCOM predicted "more early retroflections than are observed which have resulted in its mean eastward location" and "largely overestimate[d] the magnitude of its southwestward flow" because of the model's "misrepresentation of the Current's vertical structure."[155] Predictions of shoreline accumulation of hydrocarbons were substantially less reliable as a result. For this reason, oil spill modellers must validate HYCOM models with local real-world observations before relying on it. [154] *OPP, Appendix M, p. 9.* [155] *Cristina Serena Russo, Jennifer Veitch, Matthew Carr, Giles Fearon, and Christo Whittle, 'An Intercomparison of Global Reanalysis Products for Southern Africa's Major Oceanographic Features' (11 March 2022) 9 Frontiers in Marine Science 837906.*	Beach Energy (Operations) Limited (Beach) acknowledges the comment that Hybrid Coordinate Ocean Model (HYCOM) can lead to inaccurate understandings of ocean currents and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment. RPS (2024) have specified that to accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM with surface tidal currents developed by RPS. Therefore, inshore and offshore currents have been represented by a hybrid regional dataset, not by HYCOM alone. The combination of HYCOM ocean data and HYDROMAP tidal data from 2010 to 2019 ensures reliability of current data used in RPS (2024) spill modelling. Russo et al (2022) highlights that HYCOM's representation of sea surface temperatures are misrepresented. As a result, RPS's use of HYCOM for only deep ocean predictions counters the sea surface misrepresentations by using HYDROMAP for surface tidal currents in the inshore and offshore region for the Otway (RPS 2024). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC282 Paragraph 84	Comment: Reliance on outdated studies, including those from the 1980s that assume cetaceans are not impacted by hydrocarbon spills Beach's assessment of impacts from hydrocarbon spills on sensitive environmental receptors contains many flawed assumptions, only a few of which are highlighted here.	Beach Energy (Operations) Limited (Beach) acknowledges the comment that outdated studies have been used to describe hydrocarbon impacts and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this comment.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Firstly, in assessing impacts from marine diesel oil in the event of a vessel collision, Beach states, "Geraci (1988) found little evidence of cetacean mortality from hydrocarbon spills; however, some behaviour disturbance (including avoidance of the area) may occur."[156] Oil and gas development in the U.S. Gulf of Mexico is recognised as a primary threat to the continued existence of Rice's whale, now at the brink of extinction.[157] Beach also assumes dolphins would not be impacted for their tough skin.[158] However, after Deepwater Horizon, researchers "documented a series of injuries to bottlenose dolphins in oiled areas that were not observed in unoiled reference locations."[159] The project must commit, at a minimum, to pausing activities during the presence of migrating cetaceans to avoid significant impacts. [156] OPP, *p. 473.* [157] *NOAA, Endangered and Threatened Wildlife and Plants: Notice of 12-Month Finding on a Petition To List the Gulf of Mexico Bryde's Whale as Endangered Under the Endangered Species Act (ESA), 81 Fed. Reg. 88,639, at 88,641 (6 December 2016); NOAA, Recovery Outline, Rice's Whale (Sept. 2020). See also NPR, Only 51 of these U.S. whales remain. Little has been done to prevent their extinction (16 November 2023); Yasmin Dahnoun, 'Rare whales face extinction due to oil extraction', Ecologist (14 October 2022).* [158] *"Direct surface hydrocarbon contact may pose little problem to dolphins due to their extraordinarily thick epidermal layer which is effective as a barrier to the substances found in hydrocarbons (Geraci and St. Aubin, 1990; Volkman et al., 1994)": see OPP, p. 474.* [159] *Deepwater Horizon EIS, pp. 4-6.*	Beach has reviewed and updated Section 7.4.2 with additional contemporary references as shown below, however, notes that these additional literature sources do not result in a change in overall impact consequence. Table 7-20 and 7-23 have been updated with the following text: *Consequence Evaluation for cetaceans (whales):* Geraci (1988) found little evidence of cetacean mortality from hydrocarbon spills; however, some behaviour disturbance (including avoidance of the area) may occur. However, observations during spills have recorded whales and dolphins traveling through and feeding in oil slicks. During the Deepwater Horizon spill cetaceans were routinely seen swimming in surface slicks offshore (and nearshore) (Aichinger Dias et al. 2017). Cetaceans observed during the spill response for the Montara oil spill included oceanic species such as false killer whales, bottlenose dolphins, spotted dolphins and spinner dolphins (Watson et al. 2009). Cetaceans exposed to surface hydrocarbons above moderate exposure thresholds may suffer external oiling, ingestion of oil and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees 2016). Table 7-22 and 7-25 have been updated with the following text: *Consequence evaluation for fish:* Environmental monitoring of pelagic and demersal fishes immediately following the Montara oil spill indicated that fish were exposed to hydrocarbons, although no adverse effects were detected (Gagnon and Rawson 2012, 2011). Further sampling and testing over time indicated that fish captured in close proximity to the Montara wellhead were comparable to those collected from reference sites (Gagnon and Rawson 2012, 2011). Beach has considered these comments and updates have been made to the OPP as outlined above.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC283 Paragraph 85	Comment: Secondly, the impact assessment makes a common mistake in assuming that harm will be mitigated by species avoiding the area, without analysing how avoidance of key foraging areas can cause harm. For example, Beach relies on another outdated study to conclude that "Dolphins are highly mobile and are considered to have some ability to detect and avoid oil slicks (Geraci and St. Aubin, 1988; Smith et al, 1983)."[160] [160] *OPP, p. 474.*	Beach Energy (Operations) Limited (Beach) acknowledges the claim regarding key dolphin foraging areas and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this claim. Table 4-25 of the OPP identifies *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) listed cetacean species of dolphin which may occur or are likely to occur within the Project Area and Planning Area according to the Protected Matters Search Tool (PMST) Reports (Appendix A and Appendix B). Only one of these species, the dusky dolphin, is EPBC listed as migratory. No dolphin BIAs have been identified within the Project or Planning Areas. As a result, foraging is not expected to be an important behaviour for dolphins within the area and avoidance of key foraging areas for dolphins is not relevant to the Project and associated impacts are not predicted. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References:* *DCCEEW (2024). National Conservation Values Atlas. http://www.environment.gov.au/webgis-framework/apps/ncva/ncva.jsf*
PC284 Paragraph 86	Comment: No impact analysis for habitat critical to the survival of a species The environmental receptors to assess impacts of floating oil, shoreline accumulation and water column included categories such as biologically important areas, marine marks, and key ecological features.[161] These list of receptors do not include a category for habitat critical to the survival of a species that may be impacted. Albatross Island, which is critical habitat for the Shy Albatross,[162] is located within the low risk threshold area for the release of condensate from the Release Location South during summer and winter conditions,[163] and is within the area that may be affected by dissolved[164] and entrained[165] hydrocarbon exposure, but there was no impact	Beach Energy (Operations) Limited (Beach) acknowledges the claim regarding Albatross Island and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this claim. Albatross Island is classified as habitat critical to the survival of the shy albatross, an *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) listed threatened and migratory species and is located within the Planning Area. Further detail regarding habitat critical to the survival of a species is provided in Section 4.4.9.2 of the OPP and further detail about Albatross Island is provided in Section 4.4.9.4.1. As summarised in the introduction to this Report, new quantitative spill modelling was undertaken to model the loss of well control in the southern well location to replace T/30P well location (now outside the Project Area) with Thylacine West 1 location (within the Project Area) (see Appendix M,

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	assessment on how a hydrocarbon spill would affect this critical habitat. [161] *OPP, Appendix M, p. 43, Table 10-1.* [162] *Department of Climate Change, Energy, the Environment and Water, Listed Critical Habitat, Thalassarche cauta (Shy Albatross) - Albatross Island, The Mewstone, Pedra Branca (Web Page, 01 Jul 2002).* [163] *OPP, Appendix M, p. 57, Figure 11-1.* [164] *OPP, Appendix M, p. 73.* *P, Appendix M, p. 88.*	Figure 7-1 and Table 7-17 of OPP). Revision of the OPP scope and change to the spill modelling mean that Albatross Island is no longer in the Planning Area. Table 7-19 of the OPP lists the exposure and contact threshold values used for the spill modelling study which are based on the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) Bulletin: Oil Spill Modelling (NOPSEMA 2019). The moderate exposure threshold is considered to be the approximate lower limit for harmful exposures to biological receptors such as birds, marine mammals and other sensitive species. The environmental impact summary tables of the OPP have been updated where necessary to include exposure and consequence evaluations against impacts to seabirds (including relevant BIAs and habitats critical) from in-water hydrocarbon exposure. Table 7-25 of the OPP has been updated to include an additional row for seabirds and shorebirds for condensate spill in-water hydrocarbon exposure: "Exposure evaluation" The extent of in-water hydrocarbons at the moderate threshold from a LOWC overlaps foraging BIAs for several seabird species, including various albatross species (i.e. antipodean, black-browed, Bullers, Campbell, Indian-yellow-nosed, shy and wandering), petrels (common-diving, soft-plumaged and white-face storm), shearwaters (short-tailed and wedge-tailed), In-water hydrocarbons at low threshold were predicted to overlap the breeding BIA for the little penguin (at Phillip Island and the buffer around Christmas Island).. "Consequence evaluation" Seabirds could be impacted by in-water hydrocarbon exposure directly (i.e., whilst diving through the water column foraging) or indirectly (i.e. by consuming hydrocarbon-tainted fish, resulting in sub-lethal or toxic impacts). Penguins may be especially vulnerable to oil because they spend a high portion of their time in the water and readily lose insulation and buoyancy if their feathers are oiled. The Iron Baron vessel spill, of 325 tonnes of bunker fuel in Tasmania in 1995, is estimated to have resulted in the death of up to 20,000 penguins (Hook et al. 2016). As seabirds are top order predators, any impact on other marine life (e.g., pelagic fish) from hydrocarbon exposure may disrupt and limit food supply both for the maintenance of adults and the provisioning of young.

ID	Summary of comments received	Beach’s assessment of merit of comment(s) and response(s) to comments and/or objections
		Furthermore, the foraging BIAs are typical over relatively extensive areas, therefore, impacts are not anticipated at a population level due to the localised and temporary exposure of moderate levels of surface hydrocarbons. Breeding shy albatrosses and little penguins oiled by in-water hydrocarbons during foraging may contaminate nests and eggs from oil transfer by parent birds (Clarke 2010). Bird eggs may become damaged from oil contamination if an oiled adult sits on the nest. Fresh crude was found to be more toxic than weathered crude, which had a median lethal dose of 21.3 mg/egg (Clarke 2010). Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos (French-McCay 2009). Acute or chronic toxicity impacts (death or long-term poor health) to seabirds is possible, however, the presence of birds within areas exposed to moderate threshold levels is expected to be limited, due to the transitory nature of foraging individuals, and temporary presence of in-water hydrocarbons in waters surrounding breeding BIAs (moderate dissolved hydrocarbon exposure at Albatross Island maximum residence time is less than 1 day). However, due to the anticipated hydrocarbon weathering and fate of the condensate, the majority is expected to have either evaporated or entrained during that time. Modelling predicted between approximately 69.4% to 82.5% of the volume to evaporate and up to approximately 22.1% to entrain within the first 24 hours, depending on the wind conditions (RPS 2024). Furthermore, tidal and wave action within the area is anticipated to breakdown any shoreline hydrocarbons. Consequently, the potential consequence to seabirds and shorebirds is considered to be Moderate (2), as they could be expected to result in minor, short-term impact to species of recognised conservation value.” For consistency, Table 7-22 has also been updated with the following text: “Exposure evaluation The extent of in-water hydrocarbons at the moderate threshold from a MDO release overlaps foraging BIAs for several seabird species, including various albatross species (i.e. antipodean, black-browed, Bullers, Campbell, Indian-yellow-nosed, shy and wandering), petrels (common-diving and white-face storm) and shearwaters (short-tailed and wedge-tailed). Consequence evaluation:

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Seabirds could be impacted by in-water hydrocarbon exposure directly (i.e., whilst diving through the water column foraging) or indirectly (i.e. by consuming hydrocarbon-tainted fish, resulting in sub-lethal or toxic impacts). As seabirds are top order predators, any impact on other marine life (e.g., pelagic fish) from hydrocarbon exposure may disrupt and limit food supply both for the maintenance of adults and the provisioning of young. Furthermore, the foraging BIAs are typical over relatively extensive areas, therefore, impacts are not anticipated at a population level due to the localised and temporary exposure of moderate levels of surface hydrocarbons. Acute or chronic toxicity impacts (death or long-term poor health) to seabirds is possible, however, the presence of birds within areas exposed to moderate threshold levels is expected to be limited, due to the transitory nature of foraging individuals, and given the absence of offshore aggregation areas in the area. However, due to the anticipated hydrocarbon weathering and fate of the MDO, the majority is expected to have either evaporated or entrained during that time. Modelling predicted between approximately 38% of the volume to evaporate and up to approximately 60% to entrain within the first 24 hours, depending on the wind conditions (RPS 2024). Furthermore, tidal and wave action within the area is anticipated to breakdown any shoreline hydrocarbons. Consequently, the potential consequence to seabirds and shorebirds is considered to be Moderate (2), as they could be expected to result in minor, short-term impact to species of recognised conservation value." *References:* *Clarke RH (2010). PC285 Paragraph 87	Comment: Inadequate assessment of toxic impacts of unplanned releases of monoethylene glycol Beach did not study impacts associated with the accidental release of an estimated 400m3 of monoethylene glycol (MEG) because it did not believe it posed a risk.[166] These assumptions contradict an assessment of the Department of Climate Change, Energy, the Environment and Water of the toxicity of large releases of MEG. [167] Additionally, Beach's assessment fails to acknowledge how MEG depresses dissolved oxygen,[168] which would pose "a threat risk to aquatic ecosystems,"[169] and that is exacerbated by climate change as warmer ocean temperatures can hold less dissolved oxygen.[170] Lastly, MEG also degrades into acids, including acetic acids,[171] that can be harmful to aquatic life.[172] For all these reasons, Beach must model and assess how MEG may impact sensitive environmental receptors before it assumes it will not pose a direct or cumulative harm. [166] *OPP, p. 457.*	Beach Energy (Operations) Limited (Beach) acknowledges the claim regarding the assessment of monoethylene glycol (MEG) release and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this claim. The maximum credible spill volume of MEG, as described in Table 7-16 of the OPP, is 400 m^3 from a loss of containment of an umbilical. Loss of containment from an umbilical from the subsea facilities could occur as a result of erosion, corrosion, or external forces (e.g. dropped object; fishing vessel interactions). As described in Section 7.4.2, MEG is an 'E' category OCNS chemical with no substitution warning, readily biodegradable with a low potential for bioaccumulation. This means that any discharges, even a credible worst-case of 400 m^3, would not be expected to result in environment impacts to receptors greater than a Minor consequence. Beach acknowledge that despite the very low aquatic toxicity of MEG there is potential for the chemical to contribute to hypoxic conditions within the water column (ANZG 2018). However, due to the metocean conditions within the Otway region, which facilitate the rapid dispersion of the discharge throughout the marine environment, it is not anticipated that there would be a noticeable change in dissolved oxygen concentrations to an extent that would result impacts to marine fauna. Beach has updated section 7.4.3.1 of the OPP to include this text.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[167] *Department of Climate Change, Energy, the Environment and Water, Ethylene glycol (1,2-ethanediol), ("The immediate effects of exposure to high concentrations (e.g. resulting from a major spill) of ethylene glycol can mean death of animals, birds or fish and death or low growth rate in plants. Long-term effects on animal life are shortened lifespan, reproductive problems, lower fertility and changes in appearance or behaviour. Ethylene glycol has moderate toxicity to aquatic life on both a short term and long term basis").* [168] *Australian and New Zealand Guidelines for Fresh & Marine Water Quality, Ethylene glycol in freshwater and marine water (October 2000).* [169] *Department of Climate Change, Energy, the Environment and Water, The impacts of low-oxygen water.* [170] *CSIRO, Even temporary global warming above 2℃ will affect life in the oceans for centuries (10 October 2023).* [171] *Hydratech U.K., Ethylene Glycol (Web Page, Undated).* [172] *Department of Climate Change, Energy, the Environment and Water, Acetic acid (Web Page, 30 June 2022).*	Beach has reviewed the various references provided as evidence of the toxicity of MEG. On balance there is no new references to indicate that the MEG release at the indicated volumes and the Otway metocean conditions that would justify further assessment of impacts to receptors.
PC286 Paragraph 88	Comment: Unclear if the spill analysis covers all Project activities Finally, it is unclear from the OPP whether the assessment of hydrocarbon spills covers production activities within the Project scope. Beach should assess whether and to what extent impacts may be more significant during production operations compared to drilling. Further, the OPP fails to assess the risks of a more extensive hydrocarbon spill if poor installation at the subsea infrastructure installation phase led to rupture and an accidental release of gas and condensate products in the	Beach Energy (Operations) Limited (Beach) notes the comment about hydrocarbon spills for the Otway Offshore Gas Victoria Project (the Project). The scenarios for a hydrocarbon spill are summarised in section 7.4 (Table 7-16) of the OPP and include several scenarios associated with stages of the Project. Credible spill scenarios include loss of containment from flowline (Table 7-16). The worst case scenarios modelled for a hydrocarbon spill for Project are a loss of containment from a well during the drilling phase and marine diesel oil spill (at northern and southern location). The loss of containment from a well while drilling is the source of the largest volume of hydrocarbon.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	production phase. As global incidents such as Deepwater Horizon demonstrate, proper installation of risers and other subsea infrastructure is important for reducing subsequent spill risks which could otherwise be devastating to the marine environment	Beach has production operations in the Otway Basin and an accepted Environment Plan. The Otway Offshore Operations EP provides worst case oil spills scenarios that cover a comparatively similar but smaller planning area than the worst case spill scenario provided in the OPP. Subsequent EPs for specific activities such as subsea installations, and production operations will include worst case scenarios for spills as a result of these activities which may include rupture of flowline and accidental release of gas and condensate products. No change is made to the OPP in response to this comment.
PC287 Paragraph 89	Comment: Australian and state marine parks The proposed Project is inconsistent with national and international standards, since it intersects with an Australian Marine Park which is classified as a Marine Protected Area under the International Union for Conservation of Nature (IUCN) system. The OPP states that the "Project Area has been designed to not include the deeper waters off the continental shelf and to avoid potential overlap with the Zeehan Marine Park with a minimum 1km buffer applied."[173] The OPP acknowledges that Zeehan Australian Marine Park (AMP) was identified within the Project Area according to the Commonwealth government's PMST Report, but then denies the result.[174] [173] *OPP, p. 75 (emphasis added).* [174] *"However this is due to the size of the grids used in the PMST and does not actually intersect the Project Area": OPP, p. 110.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding Australian Marine Parks (AMP) and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. The Project Area was originally designed to avoid potential overlap with the Zeehan Marine Park with a minimum 1km buffer applied. As described in the introduction to this Report, the revised Planning Area overlaps two Australian Marine Parks (Zeehan and Apollo) with the Zeehan Marine Park a distance of 58 km from the Project Area. As stated in the OPP (section 4.2.2), PMST Reports may identify AMPs within the Planning Area due to the size of the grids, while further assessment indicates the AMP does not intersect the Planning Area. This applies to Franklin Marine Park (see Table 4-2 and Figure 4-2). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC288 Paragraph 90	Comment: Even though the artificial boundary of the Project Area "avoids" Zeehan AMP, it appears that there are Project activities that would directly overlap with this protected area. Beach has title to permit area T/30P, which appears to intersect with part of Zeehan AMP.[175] The Project description confirms that Beach intends to drill up to 2 wells within the T/30P permit area in the initial drilling	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding Australian Marine Parks (AMP) and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As described in the introduction to this Report, the revised scope of the OPP removes development in T/30P. The Zeehan Marine Park is is now a distance of 58 km from the Project

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	campaign, and up to 4 additional wells in the same permit area in future drilling campaigns covered by the Project scope. This means that there are up to six gas prospects that could be drilled, appraised, and developed within Zeehan AMP. It is therefore not possible for Beach to assert that a "1km buffer" has been applied. Additionally, Beach acknowledges that hydrocarbon spills may impact Zeehan AMP, along with several other sites of environmental importance.[176] [175] *OPP, p. 76 (Figure 2).* [176] *"[F]loating oil exposure above the low threshold was predicted at the Zeehan AMP (38% summer and 39% winter": OPP, Appendix M, p. 101*	Area. The Zeehan Marine Park is within the Planning Area which may be affected by an unplanned hydrocarbon spill. Beach has assessed the risk of a spill event in Section 7.4 (Loss of Containment – Hydrocarbons and Chemicals) of the OPP. Spill modelling conducted for the Project showed that the Zeehan AMP may be exposed to hydrocarbons at the low (condensate) to moderate (MDO) _ thresholds within the upper 0 -10 m of the water column. The Zeehan AMP is located in waters 50 m to 3,000 m deep and thus conservation values such as ecosystems, habitats and communities associated with the Tasmania Province, the West Tasmania Transition and the Western Bass Strait Shelf Transition and associated with the seafloor features are not predicted to be impacted. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC289 Paragraph 91	Comment: Further, Beach has misinterpreted the scope of activities allowed in Marine Protected Areas which have been classified under the IUCN system. The OPP notes that Zeehan AMP is classified as IUCN Category VI,[177] but then incorrectly states that this category "allows for limited mining and low-level extraction of natural resources."[178] The latest guidelines from IUCN indicate that industrial activities including gas extraction "are not compatible with" Marine Protected Areas. Mining (including oil and gas extraction) is explicitly "not permitted" in Category VI areas.[179] Beach thus proposes to undertake extractive activities in a Marine Protected Area, Zeehan AMP, in violation of IUCN guidelines. The assertion in the OPP that "Project activities are not within an AMP"180 is evidently false. [177] *This is correctly stated at OPP, p. 110. Note that Zeehan AMP is mistakenly referred to as category "VII" (which does not exist under the IUCN system) at OPP, p. 55.* [178] *OPP, p. 110.*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding Australian Marine Parks (AMPs) and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach acknowledges that for Zeehan AMP, the IUCN Category Number has, in some instances, been incorrectly labelled as IUCN VII. The Project Area was originally designed to avoid potential overlap with the Zeehan Marine Park with a minimum 1km buffer applied. As described in the introduction to this Report, the revised Planning Area overlaps two Australian Marine Parks (Zeehan and Apollo) with the Zeehan Marine Park a distance of 58 km from the Project Area. IUCN (International Union for the Conservation of Nature) Categories are the internationally recognised set of seven protected area management categories. Within the Guidelines for applying the IUCN protected area management categories to marine protected areas (Day 2019) prohibited activities for IUCN VI states "Industrial fishing, industrial-scale aquaculture, untreated waste discharge, mining and habitation not permitted" as per the comment. However, the IUCN categories are further defined in the Australian IUCN reserve management principles in Schedule 8 of the Environmental Protection and Biodiversity Conservation Regulations 2000. Within the Guide

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[179] *Only sustainable, low-level and non-industrial use of natural resources is regarded as compatible with protection: Jon Day et al., IUCN, Guidelines for applying the IUCN protected area management categories to marine protected areas (2nd edition, 2019), pp. 8, 10.* [180] *OPP, p. 55.*	for users of the south-east Commonwealth marine reserves network (DNP 2013), the Zeehan AMP has two IUCN listings as detailed in Figure 4-2 of the OPP. These are: • Special Purpose Zone (IUCN VI) • Multiple Use Zone (IUCN VI). (Closest section to Project Area) Within DNP (2013), Multiple Use Zone (IUCN VI) states for mining that "activity is allowable in accordance with a class approval from the Director of National Parks". In preparation of the OPP, Beach consulted with the Director of National Parks (DNP) in accordance with National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA's) guidance note (NOPSEMA and Parks Australia Petroleum Activities and Australian Marine Parks June 2023). Further consultation with DNP will be undertake as part of preparation of future Environment Plan(s). Beach would again like to highlight that the Project Area does not overlap the Zeehan and therefore no activities will be undertaken within the Zeehan AMP. Beach rejects the comment that Project activities will occur within the Zeehan AMP as detailed above and as a result. Beach rejects that the activity limitations for the Multiple Use Zone (IUCN VI) have been incorrectly listed as Section 4.2.2 provides a summary of limitations as detailed in DNP (2013) and as a result, no changes have been made to the OPP in response to these comments. Beach acknowledges the IUCN Category Number has, in some instances, been incorrectly labelled as IUCN VII with reference to these AMPs and has updated to IUCN VI throughout the OPP. *References:* *Day, J., Dudley, N., Hockings, M., Holmes, G., Laffoley, D., Stolton, S., Wells, S. and Wenzel, L. (eds.) (2019). Guidelines for applying the IUCN protected area management categories to marine protected areas. Second edition. Gland. Switzerland: IUCN.* *DNP (2013). PC290 Paragraph 92	Comment: World Heritage sites and Ramsar wetlands The internationally recognised Tasmanian Wilderness World Heritage Area falls within the Planning Area.[181] The OPP indicates that shoreline loading of oils along the	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the Tasmanian World Heritage Area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	Tasmanian Wilderness coastline in the case of a spill could exceed 10 g/m^2 (10 µm).[182] This is significant because mortality can begin for some marine species at 1 µm (as noted above). [181] *OPP, p. 26.* [182] *OPP, p. 109 (Figure 16)*	As summarised in the introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the Tasmania World Heritage Wilderness is no longer within the Planning Area of the Project. The Tasmanian World Heritage Area is not at risk of being exposed to hydrocarbons at any of the modelled thresholds.
PC291 Paragraph 93	Comment: Further, the OPP confirms that entrained oil may reach towards the Tasmanian Wilderness,[183] and the area may be impacted by a spill.[184] As discussed above, there are issues with the OPP spill analysis which suggest that potential impacts on this World Heritage site could be more significant than stated. Considering the potential impacts of hydrocarbon spills to seagrass beds, giant kelp forests, and seabirds,[185] the OPP must model and assess the potential impacts of species likely to occur in the Tasmanian Wilderness, including long-term and cumulative impacts from normal operations and worst-case scenarios.186 Australia should also inform the World Heritage Committee of this proposal as it "may affect" the Outstanding Universal Value of the Tasmanian Wilderness.[187] [183] *OPP, p. 471 (Figure 125).* [184] *See for example, Appendix M, Figures 11-1, 11-8, 11-9, 11-19.* [185] *OPP, pp. 472, 481, 482, 500, 510, 511.* [186] *See also UNESCO, Operational guidelines for the implementation of the World Heritage Convention (WHC.23.01, 2023), para. 118bis ("States Parties shall ensure that Environmental Impact Assessments … be carried out as a pre-requisite for development projects and activities that are planned for implementation within or around a World Heritage property.").*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the Tasmanian World Heritage Area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As summarised in the introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the Tasmania World Heritage Wilderness is no longer within the Planning Area of the OPP. The Tasmanian World Heritage Area is not at risk of being exposed to hydrocarbons at any of the modelled thresholds.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[187] *UNESCO, Operational guidelines for the implementation of the World Heritage Convention (WHC.23.01, 2023), para. 172*	
PC292 Paragraph 94	Comment: The Budj Bim Cultural Landscape is one of the oldest and most extensive aquaculture systems in the world.188 Developed over a period of at least 6,600 years by the Gunditjmara, the World Heritage property is dependent on the migration of kooyang (short-finned eel) for its operation.[189] UNESCO's declaration of the cultural landscape as a World Heritage property was dependent on it being an "outstanding representative example of human interaction with the environment".[190] This interaction was described by UNESCO as the Gunditjmara "creating, modifying and maintaining an extensive hydrological engineering system that manipulated water flow in order to trap, store and harvest kooyang that migrate seasonally through the [aquaculture] system."[191] The "life cycle of kooyang" is described by the World Heritage Committee as a key element of this system.[192] [188] *UNESCO World Heritage Convention, Decision 43 COM 8B.14 Budj Bim Cultural Landscape (Australia) <https://whc.unesco.org/en/decisions/7371>.* [189] *Ibid.* [190] *Ibid, criterion (v).* [191] *Ibid* [192] *UNESCO's decision to declare the site as a World Heritage property stated that the site satisfied Criterion (v) as a continuing cultural landscape by Gunditjmara people by their "creating, modifying and maintaining an extensive hydrological engineering system that manipulated water flow in order trap, store and harvest kooyang that migrate seasonally through the system. The key elements of this system are the interconnected clusters of constructed and*	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the Budj Bim Cultural Landscape and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Beach acknowledges that Budj Bim cultural landscape and eels are of cultural significance to the Gunditjmara, however, the Planning Area (and Project Area) does not overlap with the UNESCO World Heritage Listed Budj Bim Cultural Landscape as confirmed by the Protected Matters Search Tool (PMST) Report and additional analysis of publicly available special data in response to this comment. As the area is outside of the Planning area it is outside of the scope of the OPP. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	modified water channels, weirs, dams, ponds and sinkholes in combination with the lava flow, water flow and ecology and life-cycle of kooyang."	
PC293 Paragraph 95	Comment: As part of their life-cycle, kooyang have been shown to migrate to their spawning grounds in the Coral Sea near New Caledonia by travelling from freshwater systems such as those contained in the Budj Bim Cultural Landscape, to the Southern Ocean and then either directly through the Bass Strait or by circumnavigating Tasmania.[193] Once adult kooyang breed, they die and then their larval offspring make the journey back to Victorian waters and into the same freshwater systems as their parents, to begin the life-cycle again.[194] [193] *Wayne M. Koster, Kim Aarestrup, Kim Birnie-Gauvin, Ben Church, David Dawson, Jarod Lyon, Justin O'Connor, David Righton, Denis Rose, Hakan Westerberg, Ivor Stuart, 'First tracking of the oceanic spawning migrations of Australasian short-finned eels (Anguilla australis)' (2021) Scientific Reports 11:22976 p 4.* [194] *Victorian Fisheries Authority, "Short-finned eel". Online. 12 October 2022, <https://vfa.vic.gov.au/education/fishspecies/short-finned-eel>*	Beach Energy (Operations) Limited (Beach) acknowledges the statement regarding the Budj Bim Cultural Landscape and kooyang and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this statement. Beach recognises the presence of eels in the existing environment and the cultural significance of eels for First Nations Groups. Section 4.4.9.3.2 of the OPP assesses eels their ecology and biology, migration and spawning, eel fishery and first nations connections to eels As no additional information not already included in the OPP is presented, no change to the OPP has been made in response to this comment.
PC294 Paragraph 96	Comment: While the Budj Bim Cultural Landscape sits outside of the Project and Planning Areas of the OPP, the OPP acknowledges that migratory pathways of kooyang may intersect with them,[195] and as such, intersect with potential hydrocarbon spill. There appears to be no discussion in the OPP on the impacts of hydrocarbon spill on eels at different stages of the species' life cycle, particularly in their juvenile forms as larvae and glass eels, when they are likely to travel through the OPP's Project and Planning Areas. There is no discussion in the OPP on how the impacts of an adverse event on kooyang would consequently impact the Budj Bim Cultural Landscape.	Beach Energy (Operations) Limited (Beach) acknowledges the comments regarding the Budj Bim Cultural Landscape and kooyang and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this statement. Section 7.4.4 of the OPP details that free-swimming fish (i.e. kooyang) are unlikely to suffer long-term damage from oil spill exposure because dissolved/entrained hydrocarbons in-water are not expected to be sufficient to cause harm (ITOPF 2011). Subsurface hydrocarbons could potentially result in acute exposure to marine biota such as juvenile fish, larvae, and planktonic organisms, although impacts are not expected cause population-level impacts. Impacts on fish eggs and larvae (i.e. glass eels) entrained in the upper water column are not expected to be significant given the temporary nature of the resulting change in water quality. As egg/larvae dispersal is widely distributed in the upper layers of the water column it is expected that current induced drift will

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	[195] *OPP, pp 373, 366*	rapidly replace any oil affected populations. As such, impacts to the Budj Bim Cultural Landscape via an adverse event on kooyang are not expected. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. Beach Energy notes that, in response to a separate comment, <u>Section 7.4.2 (Tables 7-22 and 7-25) is updated to refer to "fish (including eels)" to ensure inclusion of eels is clearly stated.</u> *References:* *ITOPF (2011). Effects of Oil Pollution on the Marine Environment. Technical Information Paper 13. The International Tanker Owners Pollution Federation Ltd. London*.
PC295 Paragraph 97	Comment: Adverse impacts on kooyang populations as a result of possible hydrocarbon spill could have serious repercussions on the function of the Budj Bim World Heritage site and affect the landscape's recognised Outstanding Universal Value. Australia should also inform the World Heritage Committee of this proposal as it may also affect the Outstanding Universal Value of the Budj Bim Cultural Landscape	Beach Energy (Operations) Limited (Beach) acknowledges the comment regarding the Budj Bim Cultural Landscape and kooyang and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to this statement. Section 7.4.2.4 of the OPP details that free-swimming fish (i.e. kooyang) are unlikely to suffer long-term damage from oil spill exposure because dissolved/entrained hydrocarbons in-water are not expected to be sufficient to cause harm (ITOPF 2011). Subsurface hydrocarbons could potentially result in acute exposure to marine biota such as juvenile fish, larvae, and planktonic organisms, although impacts are not expected cause population-level impacts. Impacts on fish eggs and larvae (i.e. glass eels) entrained in the upper water column are not expected to be significant given the temporary nature of the resulting change in water quality. As egg/larvae (i.e. glass eel) dispersal is widely distributed in the upper layers of the water column it is expected that current induced drift will rapidly replace any oil affected populations. As such, impacts to the Outstanding Universal Value of the Budj Bim Cultural Landscape via an adverse event on kooyang are not expected. The Operational Guidelines for the Implementation of the World Heritage Convention states in Paragraph 172: *"The World Heritage Committee invites the States Parties to the Convention to inform the Committee, through the Secretariat, of their intention to undertake or to authorize in an area protected under the Convention major restorations or new constructions which may affect the Outstanding Universal Value of the property. Notice should be given as soon as possible (for instance, before drafting basic documents for specific projects) and before making any decisions that would be difficult to reverse, so*

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		that the Committee may assist in seeking appropriate solutions to ensure that the Outstanding Universal Value of the property is fully preserved." World Heritage properties in Australia are bilaterally managed under the *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act) as a Matters of National Environmental Significance (MNES). As per the above, significant impacts to this MNES are not expected based on the Significant Impact Guidelines. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments. *References:* *ITOPF (2011). Effects of Oil Pollution on the Marine Environment. Technical Information Paper 13. The International Tanker Owners Pollution Federation Ltd. London.* *CoA (2013). Matters of National Environmental Significance: Significant Impact Guidelines 1.1. Commonwealth of Australia. Retrieved from: https://www.dcceew.gov.au/sites/default/files/documents/nes-guidelines_1.pdf* *World Heritage Centre (2023). The Operational Guidelines for the Implementation of the World Heritage Convention. UNESCO World Heritage Centre.*
PC296 Paragraph 98	Comment: Finally, the OPP notes that the PMST identified seven Ramsar-listed wetlands of international importance within the Planning Area, although it excludes three of these sites from its definition of the Planning Area.[196] The OPP indicates that a hydrocarbon spill may impact Ramsar wetlands, including Lavinia and Port Phillip Bay. Although hydrocarbon spills can cause significant harm to wetlands and species that rely on wetlands, the OPP fails to assess such impacts specific to the Ramsar sites. [196] *"The remaining intersections in the PMST Report are due to the size of the grids used in the PMST": OPP, p. 119*	Beach Energy (Operations) Limited acknowledges the comment regarding impacts to Ramsar-listed wetlands in the Planning Area and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. Revision to the scope of the Otway Gas Victoria (OGV) Project mean that one wetland of international importance (Ramsar wetland) is identified within the Planning Area – the Livina wetland located north-east coast of King Island. As stated in the OPP (section 4.2.6), four Ramsar-listed wetlands were identified within the Planning Area according to the Protected Matters Search Tool (PMST) Report, however only the Lavina wetland overlaps the Planning Area. This is due to the size of the analysis grids used in the PMST system which can be up to 32 km by 32 km. Due to the large grid size it is possible for both the Planning Area and a Ramsar-listed wetland to intersect the same analysis grid but not actually intersect each-other.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Beach conducts additional analysis using publicly available spatial data to confirm the presence or absence of sensitive areas, such as Ramsar-listed wetlands within the Project and Planning Areas. OPP Figure 4-5 (Wetlands of International Importance (Ramsar) and Table 4-4 within the Planning Area) shows that one Ramsar-listed wetlands overlap the Planning Area (and with a coastal component) may be potentially exposed to a hydrocarbon spill event. However, as detailed in Appendix M of the OPP, no Ramsar-listed wetlands are exposed to moderate threshold levels in the event of a loss of well control (LOWC) or marine diesel oil (MDO) hydrocarbon spill event based on the detailed oil spill modelling study. As a result, impacts to Ramsar-listed wetlands due to hydrocarbon exposure are not expected, and subsequently have not been assessed in the OPP. Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
3.8 Submitter No. 11		
PC342 Climate Action	Comment: [Name] has functions, interests and activities related to climate protection. Any fossil fuel expansion is inconsistent with Australia's commitment to the Paris agreement and limiting global temperature increases to 1.5 degrees celsius. Further, the International Energy Agency has affirmed that no new oil, gas and coal projects can be built if the energy sector is to reach net-zero emissions by 2050. Beach energy should abandon this project and seek more responsible investments.	Beach Energy (Operations) Limited (Beach) recognises that action to address climate change is necessary and that all energy systems must contribute to meet the targets set out in the Paris Agreement. As an energy company, Beach must play a role in managing our carbon emissions. Beach aspires to reach net zero Scope 1 and 2 emissions by 2050. Beach has an equity emissions reduction target to reduce its Scope 1 and 2 emissions intensity by 35 per cent by 2030. This is aligned with the Australian Government's target of a 43 per cent reduction in carbon emissions from a 2005 base. The emissions reduction is measured against a 2018 baseline, when Beach materially expanded its portfolio through the acquisition of Lattice Energy. The proposed management of the impact is aligned with the Beach Environment Policy, Climate Change Policy, Sustainability Policy, Risk Management Standard, Environment Management Standard and Sustainability Standard as detailed in Section 6.6.3.3 (part 6) of the Offshore Project Proposal (OPP) (Table 6-43). Gas and condensate from OGP is supplied into the domestic Australian market. The scope 3 emissions associated with the transmission/transport and end use of the gas and condensation will occur within Australian Commonwealth jurisdiction. Therefore, the scope 3 emissions will be managed in accordance with Australia's regulatory regime including NGER and the Safeguard

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
		Mechanism, which is designed "to deliver emissions reductions consistent with Australia's [NDC] under the Paris Agreement" (DCCEEW, 2023i) and the *Climate Change Act 2022*. As part of the commitment to the Paris Agreement, Australia has an emissions budget for the 2021-2030 decade of 4,353 MtCO2-e. The Project emissions (including all scopes) during this period is ~ 0.1% of this carbon budget. Beach has calculated the carbon budget for the period of the Project (2025 to 2049) of 6,729 MtCO2-e . The Project emissions (including all scopes) during this period is 0.19% of this carbon budget. The evaluation of GHG emissions confirm the Project is consistent with Australia's commitments under the Paris Agreement. Beach has considered this comment and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no change has been made to the OPP in response to this comment.
PC333 Threat to Tasmania Wilderness World Heritage Area.	Comment: [Name] does not consider oil and gas drilling, associated vessel movement and other activities in such close proximity to the Tasmanian Wilderness World Heritage Area coastline acceptable. Risk of a spill would have a disastrous impact on the unique and recognised world heritage values of this area.	Beach Energy (Operations) Limited (Beach) acknowledges comments regarding the Tasmanian World Heritage Area* and has reviewed the Otway Offshore Gas Victoria Project (the Project) Offshore Project Proposal (OPP) in response to these comments. As summarised in the introduction of this Report, revisions to the scope of the Otway Gas Victoria (OGV) Project mean that the Tasmania World Heritage Wilderness is no longer within the Planning Area of the OPP. Therefore, the Tasmanian World Heritage Area is not at risk of being exposed to hydrocarbons at any of the modelled scenarios (including vessel spill or loss of well control). Beach has considered these comments and is satisfied that the concerns raised have been adequately addressed in the OPP, for the reasons outlined above. As a result, no changes have been made to the OPP in response to these comments.
PC334 Decommissioning	Comment: [Name] has been advocating with oil and gas companies and regulators for a number of years in relation to decommissioning obligations. Given the growing evidence of oil and gas industry failure to decommission, the [Name] expects NOPSEMA to increase regulator oversight of preparation and planning for	The Offshore Project Proposal (OPP) for the Otway Offshore Gas Victoria Project (the Project) summarises the decommissioning phase of the Project (sections 3.8.5 and 9.4). This includes Beach Energy (Operations) Limited's (Beach) responsibility to remove all structures, equipment and property for the title area in accordance with sections 572(3) and 270(3) of the Offshore Petroleum and Greenhouse Gas Storage Act 2006 (OPGGS Act).

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	decommissioning right from the initiation of any new proposal, including this one. Projects should not be approved unless it is absolutely clear that the company has thoroughly planned how and when full removal will occur.	For the Project decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach has reviewed the OPP considering this comment and is satisfied it adequately addresses the decommissioning requirements of the OPGGS Act and Environment Regulations. No change has been made to the OPP in response to this comment.
PC335 Decommissioning	Comment: [Name] expects NOPSEMA will require progressive decommissioning throughout the life of fields to ensure decommissioning occurs as soon as possible and is not left until years in the future when the costs will be higher, environmental impacts and risks greater and there is an increased likelihood of companies cutting and running.	The Offshore Project Proposal (OPP) for the Otway Offshore Gas Victoria Project (the Project) summarises the decommissioning phase of the Project (Sections 3.8.5 and 9.4). This includes Beach Energy (Operations) Limited's (Beach) responsibility to remove all structures, equipment and property for the title area in accordance with sections 572(3) and 270(3) of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach acknowledges the concerns about the cost of decommissioning and ensuring the financial liability for decommissioning is borne by the petroleum industry and does not become the responsibility of government and taxpayers. The OPGGS Act was amended in 2021 to include new provisions referred to as 'trailing liability' for decommissioning of offshore oil and gas infrastructure to ensure the titleholders (current and former as well as related entities) are liable for decommissioning. Beach has reviewed the OPP considering this comment and is satisfied it adequately addresses the decommissioning requirements of the OPGGS Act and Environment Regulations.
PC336 Decommissioning	Comment: Australia has obligations under international law, including as a signatory to The Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter of 1972 (the London Convention) and the subsequent modernised version, the London Protocol, relating to preventing pollution in the sea. Flowing from these international treaties, Australia is bound by International Maritime Organisation guidelines. In particular, IMO guideline 3.13 requests that no installation or structure installed after 1998 should be placed on any	Beach Energy (Operations) Limited (Beach) acknowledges the comment about complying with all relevant environment and marine legislation and regulations for its offshore activities. Sections 2.5 to 2.7 of the Offshore Project Proposal (OPP) summarises the state and federal laws and international agreements that may be applicable to the proposed Otway Offshore Gas Victoria Project (the Project), including the London Convention and London Protocol ratified in the amended *Environment Protection (Sea Dumping) Act 1981*. Beach is cognisant of its requirement to remove all structures, equipment, and property for the title area in accordance with Section 572(3) of the *Offshore Petroleum and Greenhouse Gas Storage*

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
	continental shelf or in any exclusive economic zone unless the design and construction of the installation or structure is such that entire removal upon abandonment or permanent disuse would be feasible. Beach Energy must ensure these activities do not proceed unless entire removal is possible.	*Act 2006* (OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach has reviewed the OPP considering this comment and is satisfied it adequately addresses the decommissioning requirements of the OPGGS Act and Environment Regulations.
PC337 Decommissioning	Comment: [Name] does not consider it acceptable that "Decommissioning of wells and infrastructure installed as part of this Project will occur at the end of field life." We request Beach to properly and genuinely plan for progressive decommissioning and that NOPSEMA should not accept this environment plan until this is the case.	The Offshore Project Proposal (OPP) for the Otway Offshore Gas Victoria Project (the Project) summarises the decommissioning phase of the Project (sections 3.8.5 and 9.4). This includes Beach Energy (Operations) Limited's (Beach) responsibility to remove all structures, equipment and property for the title area in accordance with sections 572(3) and 270(3) of *the Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach considers it is reasonable to describe decommissioning to occur at the end of field life, meaning once production for a field has ceased and well(s) are shut-in. Updates of OPP in subsequent revisions clarifies that decommissioning will be managed in compliance with Sections 572(3) and 270 of the OPGGS Act (unless alternative arrangements are accepted) – (See Table 0-3 and Table 3-2).
PC338 Decommissioning	Comment: We are also concerned by the statement in the Environment Plan that decommissioning "will occur as either a standalone campaign or as part of a wider decommissioning campaign." This suggests Beach Energy has not genuinely planned for decommissioning. We are concerned that decommissioning left very late, and potentially lumped together with other decommissioning activities that may be even later, creates an unacceptable risk to the delivery of decommissioning obligations by Beach Energy.	The Offshore Project Proposal (OPP) for the Otway Offshore Gas Victoria Project (the Project) summarises the decommissioning phase of the Project (sections 3.8.5 and 9.4). This includes Beach Energy (Operations) Limited's (Beach) responsibility to remove all structures, equipment, and property for the title area in accordance with sections 572(3) and 270(3) of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act). For the Project, decommissioning will require plug and abandonment of wells and decommissioning of subsea infrastructure. Beach considers that it is reasonable to describe decommissioning to occur as either a standalone campaign or as part of a wider decommissioning campaign. Beach has reviewed the OPP considering this comment and is satisfied it adequately addresses the decommissioning requirements of the OPGGS Act and Environment Regulations.

ID	Summary of comments received	Beach's assessment of merit of comment(s) and response(s) to comments and/or objections
PC339 Wilderness Society – Environmental Impacts	Comment: [Name] also holds significant concerns that proposed activities will have an unacceptable impact on: • Biologically important areas for 18 species within the planning area • Protected species, including 45 fish species, 122 bird species, 32 cetacean species, 4 pinniped species and 3 marine turtle species within the planning area • 32 species of cetacean that are are or can be found in the project/planning area • 4 Ramsar wetlands that over the planning area • Marine parks that overlap the planning area. In particular, the proposed drilling just 1km from the Zeehan marine park is unacceptable and should be excluded from these activities	Beach Energy (Operations) Limited (Beach) agrees that threatened and migratory species listed under the *Environmental Protection and Biodiversity Conservation Act 1999* may be present within the Planning Area of the Otway Offshore Gas Victoria Project (the Project). Biologically Important Areas (BIAs), wetlands of international importance (Ramsar wetlands) and Australian Marine Parks may also overlap the Planning Area. As summarised in the Introduction of this Report, revisions to the scope of the Otway Gas Victoria Project mean that the threatened, migratory, marine or cetacean species protected under the EPBC Act identified within the Project Area and revised Planning Area, now include: • 12 fishes (including sharks) (9 within the Project Area and another 3 within the Planning Area beyond the Project Area) • 111 birds (33 within the Project Area and another 78 within the Planning Area beyond the Project Area) • 34 marine mammals (29 within the Project Area and another 5 within the Planning Area beyond the Project Area) • 3 marine reptiles (within both the Project Area and Planning Area beyond the Project Area) The revised Planning Area overlaps one 1 Ramsar wetland (Lavinia) and two Australian Marine Parks (Zeehan and Apollo Marine Parks) The Offshore Project Proposal (OPP) provides an assessment of the existing environment (including listed threatened and migratory species and ecosystems) in Section 4 of the OPP. Beach has assessed the impacts and risks to these environmental receptors presented in Sections 6 and 7 of the OPP and has demonstrated the acceptability of the impacts in relation to the acceptable levels defined in Table 5-4 of the OPP. As the comment does not contain any new information about the content of the OPP, no change is made to the OPP.
