E60577	29/10/2024	Meeting - online		N/A	N/A	Requested consultation Beach presented the OGV project describing the activities within the Drilling Program and P&A EP and Well Completions EP. Beach focused on activities within Tasmanian waters and how any potential impacts and risks are assessed against a number of sensitivities including commercial fisheries, which included the Tasmanian managed fishers within both EP planning areas. Beach described the operations planning area and used a presentation to show the relevant areas to RP. No concerns were raised but the importance of planning for potential 'poor' outcomes was noted.	N/A no objections or claims made	N/A no objections or claims made

E64986	13/02/2025	Email	Incoming	Other	N/A	Requested consultation RP provided feedback on OGV EP activities, noting potential overlaps with three Tasmanian fisheries and requests further engagement regarding potential impacts on the octopus fishery.	Relevant matter	N/A no objections or claims made	
E67149	14/02/2025	Meeting - online		N/A	N/A	Requested consultation RP requested Beach provide notice of OGV project activities to ensure the Octopus fishers have prior notice of where the activities may overlap with where their pots have been set. Beach confirmed they provide detailed notifications during and ahead of operations, to provide advance notice of where and when the drill rig is moving. Beach showed the planning area and operating area maps of Well	Relevant matter Beach acknowledges the concern about the potential impacts to octopus fishing. Beach has successfully managed communications with all fishers during previous activities to minimise potential impacts and will put similar measures in place for this activity.	N/A no objections or claims made	Existing measures in EP address potential impacts CM03: Consultation for Implementation of EP.

						Completions and Interventions Environment Plan (Completions EP) to confirm the locations of where the Octopus fishers can set their pots. Beach advised as part of ongoing consultation they will provide RP communications to share with their relevant members.

E59905	08/12/2024	Email	Incoming	Other	N/A	Raised objection or claim Beach has not held community engagement sessions in Torquay or on the Surf Coast. Beach's program is inconsistent with Australia's commitment to reduce greenhouse gas emissions. RP raised concerns regarding disruptions or impacts to Southern Right Whales and cultural significance for Traditional Owners.	Relevant matter Beach considered the objection regarding consultation and considers that it has provided an extensive and sufficient period and opportunities for consultation in relation to the Drilling EP and Completions EP. Beach has considered the claim regarding greenhouse gas emissions and advised that Beach's Climate Transition Action Plan outlines the company's ambition to achieve net zero emissions by 2050 and Beach's	See Engagement ID: E60132	No additional measures or controls are required

							operations are also subject to the Federal Government's Safeguard Mechanism. Beach has considered the claim in relation to the operational areas having significant impacts and does not agree with the assertion that the activities will have significant impacts on whales and other marine life. Beach considered the claim regarding cultural considerations and advised that Beach has identified and is aware of the cultural significance of the southern right whale to the Gunditjmara and other Traditional Owner groups in the Otway and Bass Basins.

E62813	12/12/2024	Email	Incoming	Other	N/A	Raised objection or claim RP provided a letter to Beach setting out the RP's concern for the proposed OGV Project, and in relation to the Drilling EP and Well Completions, Interventions and Plugging and Abandonment EP. RP raised the following concerns: 1. RP believes that there is the potential for direct and indirect impacts to arise out of the OGV Project which could harm Wadawurrung warri (sea), dja (Country), plant and animal species and result in negative outcomes for Traditional Owners and Cultural Heritage. 2. One of RP's main areas of concern is the impact of OGV Project's activities on warri (sea) Country, including the seasonal migration of marine and bird species, and species who have a large habitat area. Migratory routes are critical to all the	Objection or claim has merit Beach responded to the RP's letter on 18th December 2024 (see engagement ID: E62814) in which RP raised a number of concerns about the proposed impact of Beach's activities the subject of both the Drilling EP and Well Completions EP. Beach has taken a broad approach to considering objections and claims raised by this relevant person, and has assessed the merits of objections and claims raised which do not strictly concern an adverse impact of an activity to which the EP relates, pursuant to reg 24(b)(iii). 1. Beach acknowledges RP's concerns relating to the potential impacts to Wadawurrung Sea and Country plant and animal species, and considers that this claim has merit. Beach has undertaken a comprehensive assessment of the environment and potential risks to plant and animal species, throughout Section 7 of the	Please refer to Engagement ID E62814 For Titleholder responses to RP's objections or claims. See also the previous column which provides a summary of Beach's response to its consideration of each objection or claim.	

						species that live on, and pass through Wadawurrung dja (Country). Many of these are culturally significant and critical to Whale Dreaming and mobs whose significant species may be Eel or other marine animals. 3. Of particular importance are impacts such as vessel and rig disturbance, strike and discharge; noise interference; habitat modification; light pollution; and chemical and terrestrial discharge. 4. The estimated timeline of activities includes approximately 300 days for the Drilling Program and approximately 145 days for the Well Completion, Well interventions and Plugging and Abandonment Program, over 2025-2028. This constant activity is likely to have negative consequences for certain species, as identified in the Drilling Program Environment Plan. 5. RP urged the proponent to carefully consider the timing of activities, which RP noted is not an adopted control measure. RP referred to the Bonney Coast Upwelling and suggested that, as the Bonney Coast Upwelling occurs in the summer months negative impacts could be alleviated by carrying out the activities in other parts of the year. 6. RP claimed that many of the additional control measures outlined in the Drilling Program Environment Plan which could significantly reduce harm to Wadawurrung warri (sea), dja (Country), plant and animal species and Cultural Heritage have not been adopted. RP encouraged Beach Energy to reconsider and to take greater care, responsibility and accountability. 7. RP stated that the emissions associated with the proposed extraction and supply of gas has not been recognised, and that this is a critical omission when the International Energy Agency found that if we are to meet net zero by 2050, we need to achieve a massive decline in the use of fossil fuels. RP stated that continuing the exploration and extraction of gas is not a viable option if we are to limit warming to	Well Completions EP. Beach confirms it has identified Wadawurrung cultural values and sensitivities in the Well Completions EP, which was confirmed in an in-person meeting with RP in July 2023 and January 2024 as part of consultation undertaken for a previous EP. While Beach notes the merits of RP's concerns, Beach considers that the risks and impacts identified to RP's cultural plant and animal species are reduced to ALARP level. 2. Beach acknowledges RP's claims in relation to the impact of the OGV Project on Sea Country (including marine and bird species), and considers that this claim has merit. Beach confirms that it has incorporated and addressed the potential impacts and risks to marine and bird species in detail in the Completions EP, including sections 6.4, 6.6 and 7.10. Beach has also incorporated and address specific RP cultural values, such as kelp and seagrass beds, Buniya (eels), Kuwiyn (fish traps), Yulluk (waterways and estuaries), Connewarre (black swan), rock lobster and abalone, and whale dreaming and intangible cultural heritage. Beach confirms that all known marine fauna and flora have been identified and described in the Completions EP, and that control measures have been identified, such that Beach's Well Completions EP demonstrates the risks and impacts to RP Sea and Country animal and plant species have been reduced to ALARP level. 3. Beach has acknowledged the impacts of particular importance raised by the RP and that these concerns have merit. Beach confirms it has taken these matters into account in the preparation of the Completions EP and its its environmental and risk assessments. Beach confirms that these items of particular importance to RP have been assessed in the Well Completions EP, and that the risks and impacts to them have been reduced to ALARP level. 4. Beach has noted RP's concerns in relation to the potential impact of the length of time of Beach's activities, and considers that this concern has merit. However, Beach confirms that its environmental impact and risk		

						1.5 degrees in line with The Paris Agreement, which Australia is a signatory to. 8. RP stated that Wadawurrung Traditional Owners are already feeling the disproportionate impacts of climate change and observing significant loss to dja (Country) and Culture, particularly erosion to our cultural heritage sites on warri (sea) Country. To heal dja (Country), including warri (sea) Country, Wadawurrung do not support new gas exploration, extraction or infrastructure activities. 9. RP stated that the OGV Project is taking place for industry to exploit marine resources, and as the custodians of these waters, RP strongly oppose this view of our natural environment, and it is our duty to protect this dja (Country). The vital role of our warri (sea) life has been significantly depleted since the Industrial Age and we cannot afford to risk further impacts. 10. RP stated that as climate change and population growth continues, RP's coastal and warri (sea) Country is undergoing pressure, and that these coastal waters are important to all Australians and millions of tourists.,	assessment incorporates and addresses the extent and duration of Beach's activities on each risk identified in chapter 7 of the Well Completions EP. While Beach acknowledges RP's claims in relation to this point, Beach confirms that this matter has been specifically addressed in the Completions EP and that the potential impacts and risks have been reduced to ALARP level. 5. Beach has noted RP's claims in relation to the timing of activites and in respect of the Bonney Coast Upwelling (BCU), and Beach consider that this claim has merit. Beach has incorporated and addressed the BCU in the Completions EP at sections 6.2.12.1 and 6.3.8. Beach has assessed the overlap of the BCU to the Operational and Planning Areas, and determined that the BCU occurs less than 10% in Beach's Operational Areas and between 10% and 30% within the Planning Area. In addition, the BCU does not intersect potential hydrocarbon spill areas that may occur in the loss of diesel oil from vessels. Beach has conducted an impact assessment at section 7.13.5.3 of the Well Completions EP. Given the large scope of work contemplated by Beach's proposed activities, and the commercial commitments necessary to support those activities (as described in section 3.2 of the Well Completions EP), Beach considers that it is not feasible or practicable to constrain the EP activities to seven months of the year when the BCU is not occurring. Beach has considered the timing of its activities in the Well Completions EP, and has determined that the risk and impacts are reduced to ALARP levels. 6. Beach notes RP's view that some additional control measures identified in Beach's EPs have not been adopted, and RP's request for Beach to reconsider these matters. Beach has assessed its control measures in place and contained in the Well Completions EP, and considers that this claim does not have merit. Beach has undertaken a comprehensive environmental impact and risk assessment in chapter 7 of the Well Completions EP, that also provides a robust evaluation of the potential impacts and risks associated with project		

							activities. The Well Completions EP also includes Beach's EPOs and EPSs and control measure at section 7.15. In ensuring the potential impacts and risks are reduced to ALARP level, Beach has adopted each control measure where required and practicable to do so. Table 7-22 of the Well Completions EP sets out the control measures and associated EPSs Beach has assessed and implemented in the Well Completions EP. Beach has undertaken a detailed assessment of the control measures in place for its activities, and considers that the control measures in place are appropriate, and that the impacts and risks have been reduced to ALARP level. 7. While Beach notes RP's objection in relation to the downstream emissions associated with the extraction and supply of gas, Beach notes that this EP does not include any activities for the extraction or supply of gas. Therefore Beach considers that this objection does not have merit. 8. Beach notes RP's view that they do not support new gas exploration, extraction or infrastructure activities. While RP is entitled to its view on the matter, Beach considers that, in relation to this EP, this objection does not have merit. 9. Beach notes RP's objection and opposition to the use of marine resources (as described by the RP), and RP's view that sea life has been significantly depleted since the industrial age and that further impacts cannot be afforded. While RP is entitled to its view in relation to Beach's proposed activities, Beach considers that this objection does not have merit. 10. Beach acknowledges RP's view that its Country is undergoing pressure, and that the coastal waters are important to all Australians and tourists. Beach has undertaken a detailed environmental impact assessment in relation to this EP, including cultural values and sensitivities. While Beach acknowledges RP's claim, Beach considers that the Well Completions EP demonstrates the potential impacts and risks are reduced to ALARP level, and that this claim does not have merit.		

E62516	13/12/2024	Phone	Outgoing	N/A	N/A	N/A outgoing engagement Follow up call regarding outgoing Engagement ID E60718. Left RP voicemail.	N/A no response received	N/A no response received	
E62814	18/12/2024	Email	Outgoing	Other	Project update - general	Raised objection or claim	Objection or claim does not have merit	Outgoing engagement in response to engagement ID E62813 received on 12 December, Beach confirmed that that the matters raised by RP have been addressed in the Drilling EP and will be addressed in the Well Completions EP which, at the time of this engagement, had not been finalised. Beach has taken a broad approach to considering objections and claims raised by this relevant person, and has assessed the merits of objections and claims raised which do not strictly concern an adverse impact of an activity to which the EP relates, pursuant to reg 24(b)(iii), as follows: 1. Beach acknowledged RP's concerns relating to the potential impacts to Wadawurrung Sea and Country plant and animal species. Beach advised that it has undertaken a comprehensive assessment of the environment and potential risks to plant and animal species, including at section 7.10 of the Drilling EP. Beach confirmed it has identified Wadawurrung cultural values and sensitivities in the Drilling EP, which was confirmed in an in-person meeting with RP in July 2023 and January 2024. Beach considers that the risks and impacts identified to RP's cultural plant and animal species are reduced to ALARP level. 2. Beach acknowledged RP's claims in relation to the impact of the OGV Project on Sea Country (including marine and bird species). Beach confirmed that it has incorporated and addressed the potential impacts and risks to marine and bird species in detail in the Drilling EP, including a sections 6.4, 6.6 and 7.10. Beach advised that it has also incorporated and address specific RP cultural values, such as kelp and seagrass beds, Buniya (eels), Yulluk (waterways and estuaries), Connewarre (black swan), rock lobster and abalone, and whale dreaming and intangible cultural heritage. Beach confirmed that all known marine fauna and flora have been identified and described in the Drilling EP, and that control measures have been identified, such that Beach's drilling EP demonstrates the risks and impacts to Wadawurrong Sea and Country animal and plant species have been reduced to ALARP level. 3. Beach acknowledged the impacts of particular importance raised by the RP. Beach confirmed it has taken the matters raised by the RP into account in the preparation of the Drilling EP and its environmental and risk assessments. Beach confirms that these items of particular importance to Wadawurrung have been assessed in the Drilling EP, and that the risks and impacts to them have been reduced to ALARP level. 4. Beach has noted RP's concerns in relation to the potential impact of the length of time of Beach's activities. Beach confirmed that its	

								environmental impact and risk assessment incorporates and addresses the extent and duration of Beach's activities on each risk identified in chapter 7 of the Drilling EP. While Beach acknowledged RP's claims in relation to this point, Beach confirmed that this matter has been specifically addressed in the Drilling EP and that the potential impacts and risks have been reduced to ALARP level. 5. Beach noted RP's claims in relation to the timing of activities and in respect of the Bonney Coast Upwelling (BCU). Beach advised that it has incorporated and addressed the BCU in the Drilling EP at sections 6.2.13.1 and 6.3.6. Beach has also assessed the overlap of the BCU to the Operational and Planning Areas, and determined that the BCU occurs less than 10% in Beach's Operational Areas and between 10% and 30% within the Planning Area. In addition, the BCU does not intersect potential hydrocarbon spill areas that may occur in the loss of diesel oil from vessels. Beach has conducted an impact assessment at section 7.12.5.3 of the EP. Given the large scope of work contemplated by Beach's proposed activities, and the commercial commitments necessary to support those activities (as described in section 3.2 of the EP), Beach advised that it considers that it is not feasible or practicable to constrain EP activities to seven months of the year when the BCU is not occurring. Beach has considered the timing of its activities in the EP, and has determined that the risk and impacts are reduced to ALARP levels. 6. Beach acknowledged RP's view that some additional control measures identified in the Drilling EP have not been adopted, and RP's request for Beach to reconsider these matters. Beach advised that it has assessed its control measures in place and contained in the EP, and considers that this claim does not have merit. Beach has undertaken a comprehensive environmental impact and risk assessment in chapter 7 of the Drilling EP, that also provides a robust evaluation of the potential impacts and risks associated with project activities. The Drilling EP also includes Beach's EPOs and EPSs and control measure at section 7.15. In ensuring the potential impacts and risks are reduced to ALARP level, Beach has adopted each control measure where required and practicable to do so. Table 7-25 of the EP sets out the EPOs, and control measures and associated EPSs Beach has assessed and implemented in the Drilling EP. Beach has undertaken a detailed assessment of the control measures in place for its activities, and considers that the control measures in place are appropriate, and that the impacts and risks have been reduced to ALARP level. 7. While Beach notes RP's objection in relation to the downstream emissions associated with the extraction and supply of gas, Beach advised that the Drilling EP does not involve gas extraction or supply activities, and referred RP to Beach's OPP for Beach's assessment of greenhouse gas	

								emissions associated with the extraction of activities. 8. Beach notes RP's view that they do not support new gas exploration, extraction or infrastructure activities. Beach advised that the Drilling EP does not involve gas extraction or supply activities, and referred RP to Beach's OPP for Beach's assessment of greenhouse gas emissions associated with the extraction of activities. 9. Beach notes RP's objection and opposition to the use of marine resources (as described by the RP), and RP's view that sea life has been significantly depleted since the industrial age and that further impacts cannot be afforded. Beach confirmed its view that there will be an ongoing role for natural gas in the energy transition, and that in relation to the project the potential impacts and risks will be mitigated to ALARP and Acceptable Levels. 10. Beach acknowledged RP's view that its Country is undergoing pressure, and that the coastal waters are important to all Australians and tourists. Beach has undertaken a detailed environmental impact assessment in relation to this EP, including cultural values and sensitivities. While Beach acknowledges RP's claim, Beach considers that the EP demonstrates the potential impacts and risks are reduced to ALARP level.,

						and time. RP states consultation should be done in accordance with Free prior and informed consent or non-consent. RP claims requests for research funding have been ignored. RP claims their requests to tour the Otway gas plant have been ignored. RP claims requests for environmental effects statements and data have been ignored. RP is concerned about marine mammals and species such as whales. RP claims environmental and cultural impact is too high. RP has objected broadly to offshore gas			
E66123	25/02/2025	Email	Outgoing	Other	Project update - general	N/A outgoing engagement Outgoing response to engagement ID: E66064	Objection or claim does not have merit	In response to RPs claims, Beach responded: Beach consults with RP's In accordance with Regulation 25 of the Offshore Greenhouse Gas Storage (Environment) Regulations (Environment Regulations) and relevant NOPSEMA guidelines, Beach identified RP as a relevant person based on their functions, and activities. Beach does not agree that FPIC is the standard that should apply to any engagement process related to the preparation of Environment Plans involving consultation. Instead, Beach's position is that consultation must be conducted in accordance with the OPGGS(E) Regulations. Advised RP that Beach have not sought to rush consultation, consultation for Completions EP commenced on the 16th of September 2024. Advised RP that Beach provided a range of consultation methods and opportunities including: - an online consultation hub (Engage Beach) - community information sessions including dedicated First Nations sessions, in 3 different locations - online webinars including dedicated First Nations webinars - emails and meetings. Advised RP that Beach is required to comply with all relevant legislation whilst undertaking any offshore activity. This includes (but is not limited to) the Underwater Cultural Heritage Act 2018 (Cth). Advised RP that in the recently approved Drilling and P&A	

								Environment Plan, the assessment of submerged cultural landscapes and heritage is a control measure. Advised RP all Beach activities are carried out in accordance with applicable state and commonwealth regulations. Shared with RP some recent demonstrated examples of successful Beach offshore activities. Advised RP the measures Beach implemented to minimise impacts to whales to ALARP. Advised RP that Beach will not be funding any research outside of what is required for the development of an EP. Asked RP to clarify what data requests they are referring too as Beach has no record of any data requests. Advise RP that Beach previously offered a tour of the Otway Gas plant (email sent 3rd October 2024) and had no response. Beach is willing to facilitate a tour of the OGP and asked RP to nominate three dates. Advised RP that tours of the offshore gas platform are not permitted. Shared links to Beach's website and annual report where RP can learn about community partnerships that Beach supports

1. Information sheets

1.1 Offshore Gas Victoria Program Summary information sheet (May 2023)

Offshore Gas Victoria Project

Program Summary

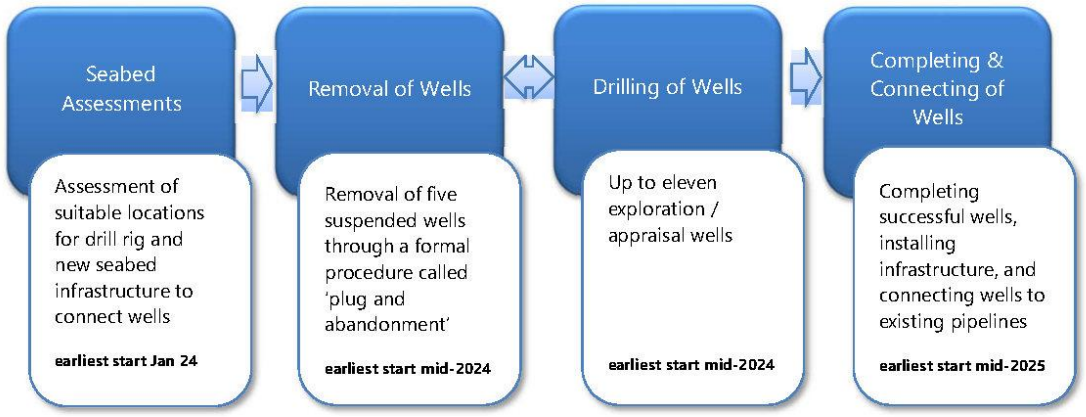
Information Sheet | May 2023

Project Overview

Beach Energy supplies the ongoing natural gas needs of Victorian homes, business and industry, through production at the Otway Gas Plant near Port Campbell and the Lang Lang Gas Plant, 80kms south-east of Melbourne CBD.

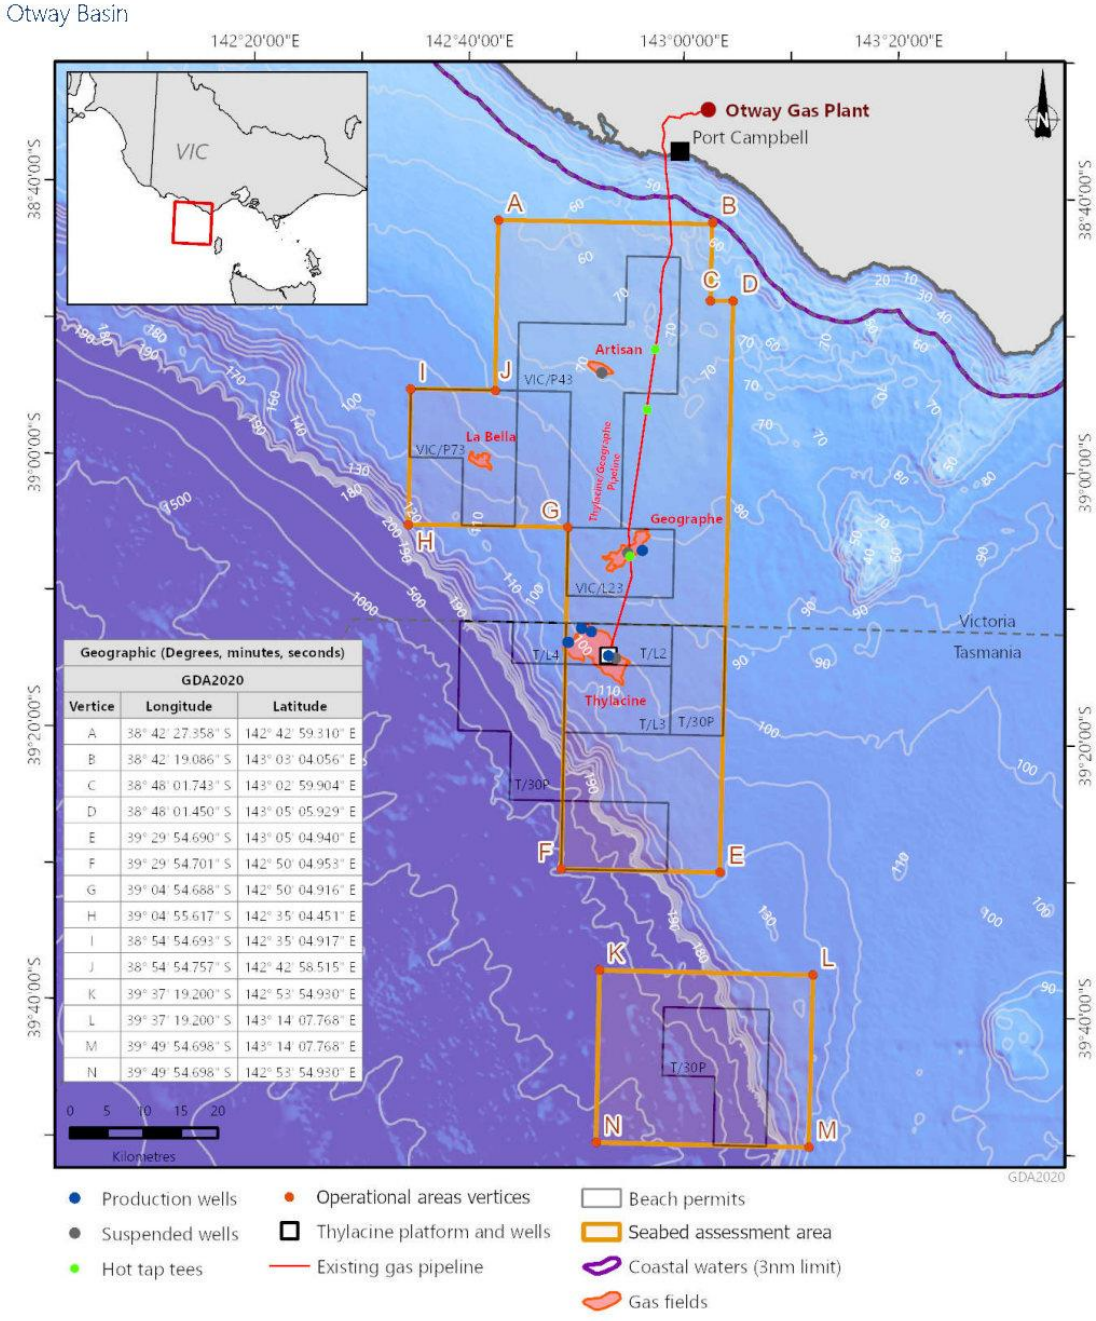
As part of the most recent phase of development of the Otway Basin, Beach successfully drilled one exploration well and six production wells in offshore Commonwealth permits over the past four years. Four production wells have been connected and are now producing gas for the east coast market, with the two remaining wells still to be connected.

Beach is continuing its commitment to supply natural gas to the east coast domestic market and has commenced planning for the *Offshore Gas Victoria* (OGV) Project to deliver the next phases of exploration and development in the Otway and Bass projects (see maps).



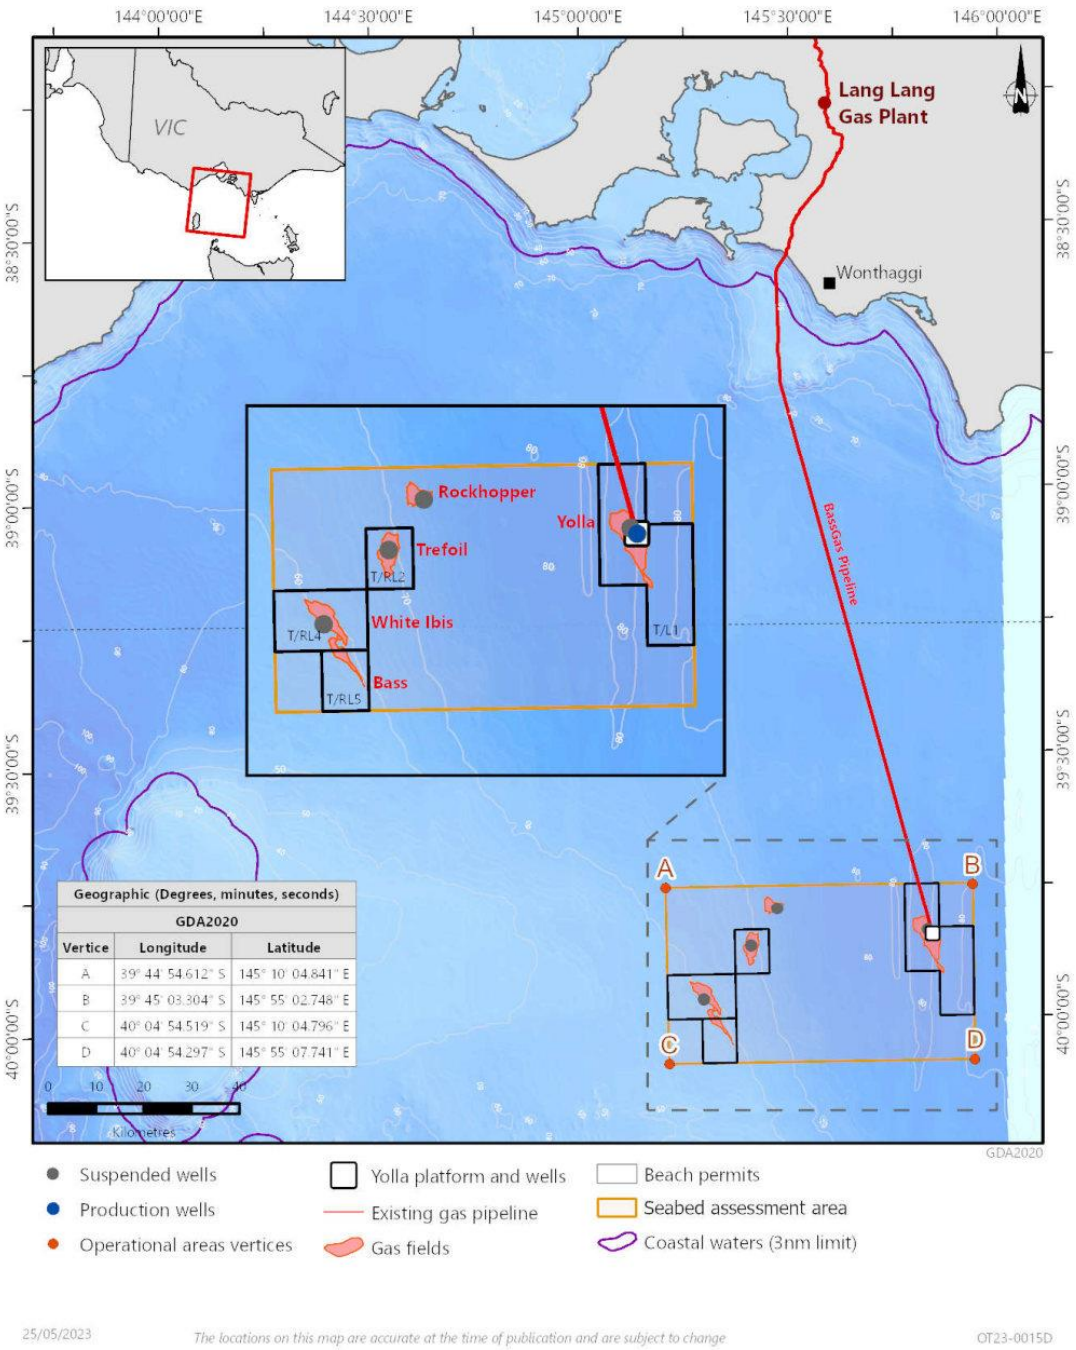
The OGV Project is considering a range of activity across several phases (summarised below). Confirmation of project timings and number of wells to be drilled is subject to internal and external project approvals, confirmation of contractor vessels and drill rig availability.

Environment protection regulations



The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA), regulates activities in accordance with the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations (2009)* (Environment Regulations). The OGV Project will require Environment Plans to be accepted by NOPSEMA before commencement of activities.

Environment Plans must include a description of the existing environment and the proposed activities, an evaluation of the impacts and risks, environmental performance outcomes and controls, implementation strategy, and reporting requirements. They must also demonstrate that consultations with persons or organisations whose functions, interests and activities may be affected by the activities in the Environment Plan ("*relevant persons*"), have been carried out in accordance with the regulations.



For successful gas discoveries that will proceed to development, an Offshore Project Proposal (OPP) will be required and will undergo a public consultation phase. Once an OPP is accepted, further Environment Plans will be required for construction activities and commissioning the new wells.

Questions and Answers

What's Beach's approach to climate change?

Beach recognises that climate change is one of the global challenges of this century and understands the role we must play in managing our carbon emissions.

Beach has an aspiration to reach net zero Scope 1 and 2 emissions by 2050 and a target to reduce emissions intensity by 35% from its entire portfolio by 2030. See further information in Beach's Sustainability Report.

What role is natural gas playing as Australia transitions to renewable energy?

Carbon emissions of natural gas are significantly lower than coal. As old coal fired power stations are removed from Australia's energy mix, electricity powered from natural gas ensures a stable energy supply as our economy transitions to a different mix of energy sources for electricity generation.

The Australian Energy Market Operator (AEMO | 2022 Integrated System Plan (ISP) has forecast more gas-fired generation is required to reach Net Zero by 2050. In its "Step Change" scenario which achieves that objective, 40% more gas-fired generation capacity is required to enable energy from wind and solar to increase nine-fold, and battery storage to increase by a factor of 30.

Beach is committed to reducing emissions from its operations and has targets that are consistent with the changes to the Safeguard Mechanism, introduced from 1 July 2023.

Why do we still need natural gas?

Natural gas has a wide variety of uses in our daily lives. These include generating electricity, residential heating, hot water and cooking. In the industrial sector, gas is a primary heat source for manufacturing glass, steel, cement, bricks, wood, ceramics, tiles, paper and in producing food. Gas is a common ingredient in the manufacturing of fertilisers, plastics, pharmaceuticals and fabrics. The Australian Energy Market Operator's latest Victorian Gas Planning Report in March 2022 forecasts demand shortfall risks as soon as 2023.

Is Beach Energy increasing retail gas prices?

No. Beach Energy is a gas wholesaler and supplies the majority of its gas under contract to energy retailers in Australia. Beach does not set retail prices.

Is Beach exporting gas from the Otway and Bass basins? No. Beach does not export gas from the Otway or Bass basins. The gas processed at the Otway Gas Plant and Lang Lang Gas Plant in Victoria is supplied to the local gas market via an existing pipeline to meet residential, business and industry demand

Consultation and Feedback

Consultation and feedback is an important part of developing Environmental Plans and Offshore Project Proposals.

This information sheet has been prepared to provide a summary of proposed activities and commence consultation with relevant persons whose functions, interests or activities may be affected by the activities to be carried out under the Environment Plan.

Please contact us if you would like further information or to consult with us about how this project may impact your functions, interests or activities.

Beach will consider all feedback, including any concerns or objections and will explore measures to reduce any impacts and risks.

Relevant persons may request that the information they provide not be published, and it will be identified as sensitive information and not published in the Environment Plan.

If there is someone you believe may be affected by the proposed activities, please have them contact us.

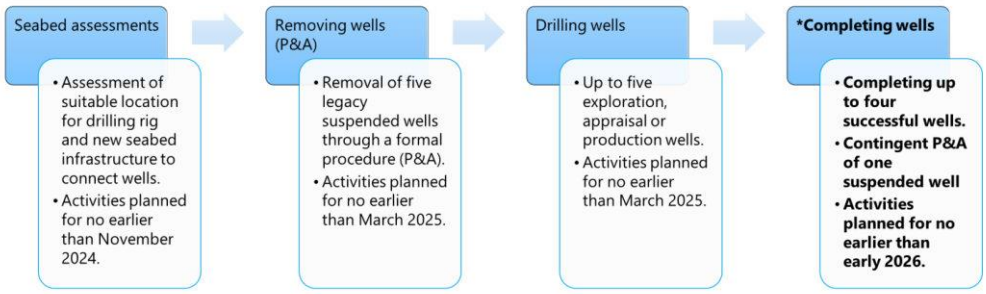
1.2 Offshore Gas Victoria Well Completions, Well Interventions and Plugging and Abandonment EP information sheet (16 September 2024)

Offshore Gas Victoria Project

Well Completions, Well Interventions and Plugging and Abandonment EP

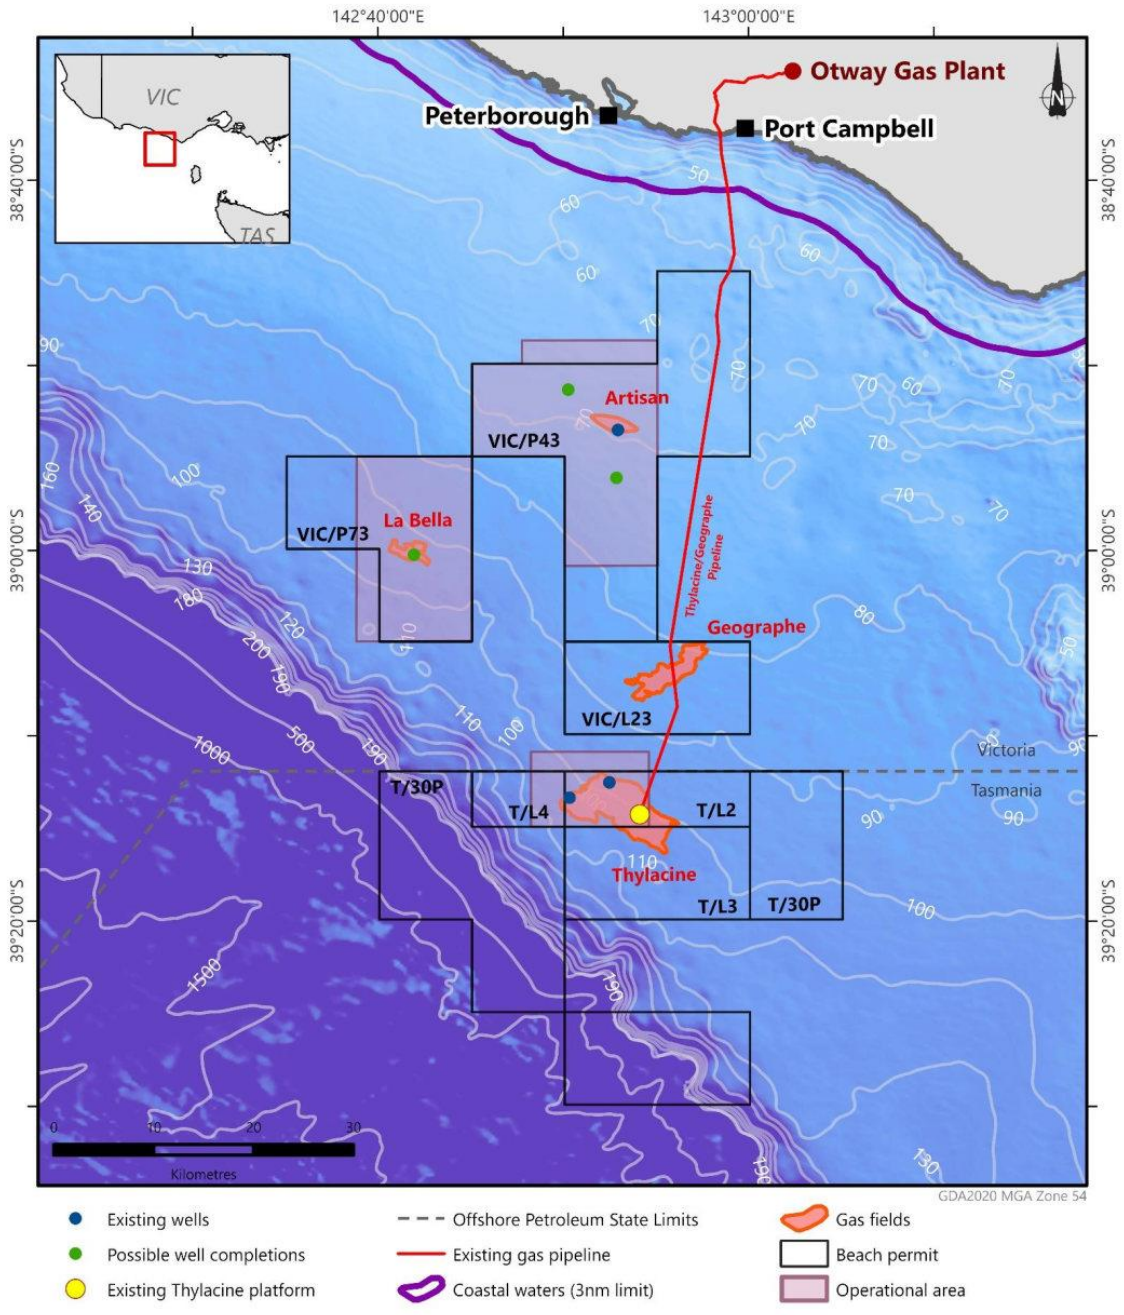
Information Sheet | 16 September 2024

On 16 September 2024, Beach commenced consultation in the course of preparing the Well Completions, Well Interventions and Plugging and Abandonment Activities Environment Plan (**Well Completions and Interventions EP**). This information sheet has been prepared to provide information on the proposed activities under the Well Completions and Interventions EP for the purpose of consultation with relevant persons, in accordance with the regulatory regime.



Project overview

Through production at the Otway Gas Plant near Port Campbell and the Lang Lang Gas Plant, 80 kms south-east of Melbourne CBD, Beach Energy (**Beach**) supplies natural gas to the east coast market, which delivers energy to Victorian homes, business and industry.



Beach safely drilled one exploration well and six production wells in its Otway Basin offshore Commonwealth permits from February 2021 to July 2022. Four production wells from that project have been connected and are now producing gas for the east coast market, with two remaining wells planned for connection in late 2024.

Beach is continuing its commitment to supply natural gas to the east coast gas market and, in June 2023, commenced consultation on Offshore Gas Victoria (**OGV**) Project activities in the course of preparing Environment Plans and an Offshore Project Proposal. OGV consists of a number of activities that would occur in several phases (below) subject to approvals.

Following seabed assessments and drilling phases (including the planned plugging and abandonment (**P&A**) of legacy suspended wells and the drilling of exploration or appraisal wells) the next phase* of activities would include well completions, well interventions, and one potential additional P&A activity. These are summarised in the diagram below.

Location map

12/09/2024

This map is provided as a general reference only and is not intended to be used for any other purpose. No warranty is provided in relation to the accuracy of the information contained in this map.

OT24-0028A_R3

Activity timings

The Well Completions and Interventions EP activities are expected to be undertaken between 1 January and 31 December 2026, and would take approximately 145 days to complete, including:

- 25 days per well for the installation of subsea equipment and well completions activities
- 15 days per well for intervention activities
- 15 days for contingency P&A activities at one location.

All timings are approximate and will be subject to final approvals, the availability of the drilling rig after it completes programs of works for other companies, weather conditions and prior drilling results.

Beach will provide a detailed schedule of times, locations and activities prior to the commencement of the relevant activities.

Activity locations

The activities would be carried out in the Otway Basin in offshore Commonwealth waters, approximately 20 km south of Victoria's mainland and 90 km north-west of Tasmania (King Island) at its closest points, in water depths ranging from 65 m to 190 m. All activities would be within existing Beach permits, the locations of which are shown in the maps on page two of this information sheet.

Seabed assessment activities will occur prior to drilling wells to ensure precise locations for the operation of the drill rig and, ultimately, the wells that will be drilled. Should the location of wells be modified after the seabed assessment activities have been completed (see details here), Beach will advise all Relevant Persons and provide an updated map.

Well completions activities

Well completion is the process of preparing a well for production after it has been successfully drilled. It involves installing production and flow control equipment within the wellbore on the seabed and completing the final construction of the well. Each well will have a wellhead that supports the production well casing. Completions operations are conducted with well control equipment called a blow-out preventer (**BOP**) and a subsea production tree (**subsea tree**) placed on the seabed at or near the site of the well.

The BOP is a highly specialised series of valves used in all offshore drilling, weighing approximately 244 tonnes and measuring 14 m high. The BOP is used to shut-in and seal off a well for planned operations such as pressure testing and in the event of a pressure build up. It ensures well integrity throughout the drilling and completion process, ongoing safety of personnel and prevention of any environmental incidents.

Well completion activities may be undertaken for up to four wells and (for each well) includes:

- installing the subsea tree
- preparing the wellbore for lower and upper completion installation
- installing the completion equipment
- perforating the production casing
- flowing the well back to surface facilities for clean-up.

The subsea tree is a set of valves and fittings installed directly on top of the wellhead that:

- controls the flow of fluids from the well to subsea production facilities and flowlines
- controls chemical injections
- monitors production
- regulates flow rates with hydraulic valves and chokes.

Well flowback and clean-up will be performed on each well that is to be completed. The flowback fluid is expected to consist of (in order of arrival at the rig-based well test package):

- low density fluid
- completion brine
- drilling fluid filtrate
- reservoir fluids (including hydrocarbon gas, condensate, formation and condensed water)

Depending on the hydrocarbon reservoir and well construction process, there could also be minimal

levels of solids such as sand/rock/debris remaining from the drilling process.

Reservoir fluids recovered during well clean-up will be directed to a rig-based well test package where the fluids will be separated, measured and either flared (hydrocarbons) or treated for overboard discharge (non-hydrocarbons) or disposal onshore.

Well intervention activities

Well interventions are carried out to improve the performance of a well that has not been operating to its potential or requires modification or maintenance. Intervention activities would be carried out to:

- allow additional sub-seabed surface geological zones to produce
- close off zones that are no longer required
- repair or replace downhole completion equipment.

Intervention activities will occur at up to two existing well locations located in petroleum title T/L2 (see location map on page two). The activities would include:

- positioning the drilling rig over the existing well and connecting to pre-laid mooring lines and anchors
- installing the BOP
- installing intervention pressure control equipment and de-suspending the well
- accessing a zone of interest and isolating (and potentially reopening) the applicable production zone
- re-suspending the well
- recovering the BOP
- (at the conclusion of the well intervention activities described above) releasing the drilling rig from the mooring spread and leaving the location.

Plugging & abandonment activities

The P&A process is used to:

- close exploration wells that are assessed as unsuccessful immediate after drilling
- decommission operational wells that are no longer commercially viable, or
- remove suspended wells.

Under the Well Completions and Interventions EP, P&A activities might be undertaken at one suspended well that was drilled and suspended in a previous project. This decision has not yet been made by Beach. If undertaken, P&A activities would include installation of multiple cement plugs within the well to permanently seal the well. An additional cement plug would be installed at the seabed and all well casings would be cut and recovered from at least 2 m below the seabed/mudline.

Environment protection regulations

NOPSEMA regulates activities in accordance with the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* **(Regulations)**[1]. The OGV Project requires Environment Plans (**EPs**) to be accepted by NOPSEMA before beginning activities. EPs will typically be prepared for different activity phases; in the present case, Beach is preparing one single EP covering the well completions, well interventions, and P&A activities described in this information sheet.

EPs must include:

- a description of the existing environment
- the proposed activities
- an evaluation of the impacts and risks, environmental performance outcomes and controls, implementation strategy, and reporting requirements.

EPs must also demonstrate that consultations with relevant persons whose functions, interests or activities may be affected by the activities in the EP (**relevant**

[1] Under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth).

persons), have been carried out in accordance with the Regulations.

For successfully drilled gas wells within the OGV Project that will be developed for production, an Offshore Project Proposal (**OPP**) is required. Beach has developed an OPP for the OGV Project, completed the Public Comment Period for the OPP and it is currently under assessment by NOPSEMA.

Environment description

EPs include a detailed description of the Environment that May Be Affected (**EMBA**) by the activities described in the EP. The EMBA is the largest geographic area where operational activities could potentially have a direct or indirect environmental impact under worst-case scenarios.

The EMBA includes both the **operational area** for activities and a **planning area** where emergency response plans must be ready for activation in the unlikely event of an accident. The EMBA map can be found on page seven.

EMBAs are also used to define the broadest area where environmental values and sensitivities are defined, the potential impacts assessed, and control measures to mitigate these impacts are developed.

The defined EMBA for the Well Completions and Interventions EP include the following marine fauna which may be present in the area at various times during the activities described in the EP:

- Blue, humpback and fin whales, particularly during the summer months
- Southern right and minke whales, particularly during the winter months
- Common dolphins and shark species throughout the year
- New Zealand and Australian fur seals throughout the year
- Migratory birds.

Importantly, Beach will not be conducting regulatory activities within marine parks. However, within the broader planning area for emergencies, there are National Marine Parks and State Marine Protected areas (see map).

Socio-economic and cultural values and sensitivities within the EMBA include:

- Commonwealth managed fisheries, including southern and eastern scalefish and shark, Bass Strait zone scallop fishery and southern squid jig fishery
- Victorian, South Australian and Tasmanian managed fisheries, including rock lobster and giant crab
- Commercial shipping activity
- Offshore Wind Industry
- Subsea cables
- Sea Country cultural values and sensitivities held by First Nation peoples
- Shipwrecks, primarily in close shoreline proximity
- Recreational fishing
- Recreational diving focussed on shipwrecks and reefs close to the shoreline
- Significant tourism features and activities associated with the Great Ocean Road, Twelve Apostles and Bay of Islands Coastal Park.

Impacts, performance outcomes and controls

Beach recognises the environmental, cultural, heritage, social and economic values in our operational areas and planning areas.

Beach has a proud track record of successful safety and environmental performance, adhering to performance measures set out in EPs and Safety Cases accepted by regulators.

The Well Completions and Interventions EP will detail potential impacts on the environment, and provide performance outcomes and standards, and control measures to reduce and manage environmental impacts and potential risks to 'As Low As Reasonably Practicable,' known as ALARP, and acceptable levels. They follow the principles of ecologically sustainable development. ALARP is an assessment principle commonly used in the oil and gas industry to assess and reduce potential impacts and risks that cannot be

eliminated. For information on how NOPSEMA assesses ALARP see: ALARP Guidance Note.

A summary of the key impacts, mitigations and management plans can be found here.

Marine mammal protection

The Well Completions and Interventions EP will set out detailed control measures that are consistent with marine mammal management plans that have been produced by the Federal Government under the *Environment Protection and Biodiversity Conservation Regulations 2000* (Cth)[2].

These control measures are based on the avoidance of collision or entanglement of marine mammals, reducing vessel speeds, and minimising length and number of anchor lines. The control measures also focus on the reduction of marine noise from vessel and drilling rig activities, so that any noise produced is managed such that biologically important behaviours can continue while the activity is being undertaken.

Dedicated Marine Mammal Observers will be deployed on vessels to advise vessel captains and the drilling rig operator of protected marine mammals near Beach's activities. All whale sightings will be recorded along with the actions taken to avoid potential impacts.

Commercial fishing control measures

The Well Completions and Interventions EP activities will occur among commercial Commonwealth and State fisheries zones that cover vast areas. Beach's activities will require access to relatively small areas within these fishing zones, and then only for short periods of time. The Well Completions and Interventions EP will set out detailed assessment of fisheries and fishing activity that may overlap with the project activities.

Beach will consult with commercial fishers on arrangements to ensure each other's operational plans are understood, helping to minimise any impacts to fishing activities and to the EP activities.

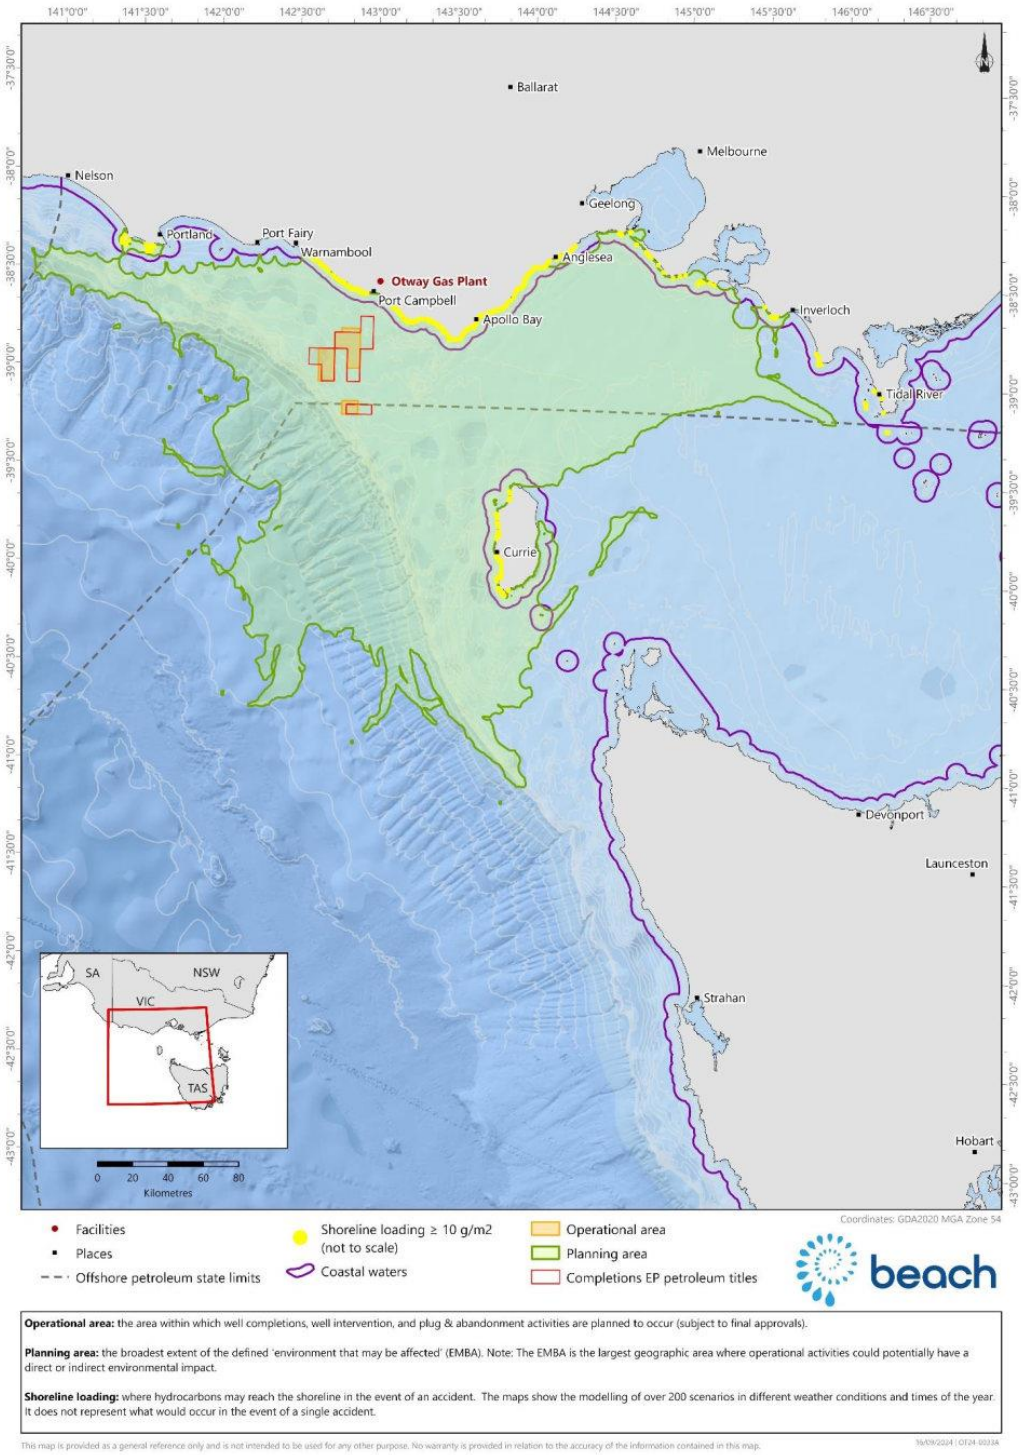
Beach will provide regular updates on its operations to fishing associations throughout the duration of the activities.

Beach has a *Fair Ocean Access* procedure that sets out Beach's commitment to consultation, minimising impacts of its activities, the circumstances when a fisher may claim compensation, the evidence required and the claim process.

Exclusion zones

When the drilling rig is on a well location, all vessels are required to be abide by a 3 km radius cautionary zone around the rig. The cautionary zone is to allow for anchors, mooring chains, and wires to be placed within the operational area during the well completions, well interventions and P&A program. Exact locations of mooring chains and anchors will be made available before the start of activities at each well.

There will also be a Petroleum Safety Zone (**PSZ**) of 500 m around the drilling rig during operations and for each well before and after activities. Beach will communicate new PSZs created for wells and equipment to marine users as part of its ongoing consultation. PSZs are administered by NOPSEMA under Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (**OPGGS Act**). PSZs extend for a radius of up to 500m and are gazetted around wells, structures, and equipment.



Entry into PSZs is prohibited to all except vessels authorised to do so by NOPSEMA (as detailed in the gazetted notice) or exempt under Section 615 of the OPGGS Act. PSZs are shown as a 'Restricted Area' on navigation charts.

Recognising cultural values and sensitivities

Beach has identified and will consult with relevant First Nations groups to identify cultural values of Sea Country so that they can be assessed for any potential impacts and control measures that may be required in the preparation of the Well Completions and Interventions EP.

[2] Under the *Environment Conservation and Biodiversity Protection Act 1999* (Cth)

EMBA map

Operational area: the area within which well completions, well intervention, and plug & abandonment activities are planned to occur (subject to final approvals).

Planning area: the broadest extent of the defined 'environment that may be affected' (EMBA). Note: The EMBA is the largest geographic area where operational activities could potentially have a direct or indirect environmental impact.

Shoreline loading: where hydrocarbons may reach the shoreline in the event of an accident. The maps show the modelling of over 200 scenarios in different weather conditions and times of the year. It does not represent what would occur in the event of a single accident.

This map is provided as a general reference only and is not intended to be used for any other purpose. No warranty is provided in relation to the accuracy of the information contained in this map.

Operating safely

Safety takes precedence in every activity undertaken by Beach. The drilling rig contracted by Beach will have a dedicated Safety Case that must be accepted by NOPSEMA. Marine vessels and the drilling rig will operate in accordance with Australian Maritime Standards, regulated by the Australian Maritime Safety Authority. This includes adherence to the following protocols at sea:

- notifications to the Australian Hydrographic Office before mobilising to the operational area, moving to different well locations, and when demobilising
- communication with other vessels and marine users will occur using standard maritime protocols
- safe operating distances will always be maintained around vessels and the drilling rig
- compliance with Navigational Safety requirements, including lighting and Automatic Identification System.

Emergency planning

When conducting any offshore activity, there is an extremely unlikely risk of a hydrocarbons release from a well (which is primarily gas) during well completions, well interventions or P&A activities or from marine vessel fuel in the event of an accident.

Beach's standard operating procedures include emergency response plans, which are included in all EPs. Preparing emergency response plans involves modelling of all possible hydrocarbon releases in the local area using a worst-case scenario, assuming no control measures are in place. The modelling calculates the transport, spreading, entrainment and evaporation over time, using data on the prevailing metocean conditions (wind, wave, and climate), the volume released and the physical and chemical properties of the hydrocarbons.

The modelling determines the full extent of the EMBA. The Well Completions and Interventions EP will describe the EMBA and include an assessment of the likelihood and consequences of any hydrocarbon release, which must be reduced to ALARP through a range of control measures and include detailed response plans.

An emergency response plan describes the arrangements that must be in place for responding to and monitoring any release of hydrocarbon and include:

- 24/7 on-call team for rapid response clean-up actions, including mobilisation of personnel and equipment
- 24/7 on-call team for modelling and monitoring of a hydrocarbon release to inform response activities, and monitoring of effectiveness of response activities
- control measures necessary for ensuring rapid response and maintenance of capabilities (personnel and equipment).

These arrangements are based on the worst-case event associated with the proposed activities to ensure that Beach has the appropriate level of response arrangements and capability.

Beach maintains a current contract with Australian Marine Oil Spill Centre based in Geelong for access to spill response resources and personnel. The Victorian Department of Transport is the control agency for marine pollution emergencies. Beach also conducts exercises to test the emergency response plans and identify any issues and improvements before, and during operations.

For more information on hydrocarbon release modelling and why it is required for the preparation of EPs, click here to watch a video on the NOPSEMA website.

Consultation with Relevant Persons

Purpose of consultation

Consultation with Relevant Persons is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted because of the consultations.

Beach Energy is providing - and will continue to provide - a range of consultation methods and opportunities including an online consultation hub (Engage Beach) where you can ask questions, as well as information sessions, online webinars, phone calls, emails and meetings. Please contact us if you would like to discuss your preferred approach to consultation.

Relevant Persons

A 'Relevant Person' is defined in the Regulations as including a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under an EP.

Please contact us if you would like to discuss your functions, interest or activities in relation to the activities proposed under the Well Completions & Interventions EP.

If you know of any person or organisation who you believe may be a Relevant Person, please pass on our contact details to them.

Sufficient information

The Regulations also require that Relevant Persons must be provided sufficient information to allow them to make an informed assessment of the possible consequences of the EP activity on their functions, interests or activities.

At the online engagement hub Engage Beach you will find information prepared in a variety of styles including: short summaries; long descriptions; diagrams; maps; questions and answer formats; and detailed information on a range of topics related to the activities.

Please contact us if you would like to discuss information you are seeking in relation to EP activities.

Reasonable period

The Regulations also require that titleholders allow Relevant Persons a reasonable period of time for consultation. What is a reasonable period for consultation will depend on the nature of an activity, the potential impacts and risks on a relevant person's functions, interest or activities, and is considered on a case-by-case basis.

Sensitive information

In accordance with regulations, each EP must include a report on all consultations and a copy of the full text of any response by a Relevant Person.

Relevant Persons may request that the information they provide not be published, and it will be identified as sensitive information and not published in the Environment Plans.

NOPSEMA consultation brochure

For further information regarding consultation, please see NOSPEMA's Brochure titled 'Consultation on offshore petroleum environment plans', found here.

Contact us

Please contact us if you would like further information, have any questions, or feedback, or wish to consult with us about how the activities in the **Well Completions & Interventions EP** may impact your functions, interests or activities.

Beach will take into consideration all feedback, including any concerns or objections and will explore measures to reduce any impacts and risks.

Email: community@beachenergy.com.au

2. Summary table of impacts and risks

Page 1

Summary of impacts and risks – Well completions, well interventions and P&A activities EP

Aspect - Planned	Relevant activities	Potential impact	Summary of Beach control measures
Light emissions	Drill rig and support vessel operations Well intervention and workovers Well clean-up and flowback	Drill rig and vessel lighting is required for navigational and safety purposes. Artificial light may attract light sensitive species such as shorebirds, seabirds and turtles. Flaring/well flowback will occur at up to four wells for up to 24 hours per well.	• Drill rig and vessel lighting complies with Australian Maritime Safety Authority (AMSA) Marine Orders Part 30 (Prevention of Collisions). • Beach Seabird Lighting Management Plan is implemented on the drill rig and vessels, and details: o Non-essential lights are turned off when not in use. o Lighting is directed onto work areas. o Window screens or blinds are closed at night. o Crew environmental induction covers handling and reporting requirements for grounded or injured birds.
Seabed disturbance	Drill rig and support vessel operations Remotely Operated Vehicle (ROV) operations Drill rig positioning Completions/ interventions operations	Temporary and localised seabed disturbance with associated loss of benthic habitat or disturbance to cultural or heritage feature may occur from: • Drill rig positioning/anchoring (semi-submersible) • ROV parking • Completions and interventions operations	• Assessment of the seabed to identify and avoid, where possible, any key environmental, heritage or cultural features. • Drill rig anchoring procedures. • Vessel use of dynamic positioning rather than anchor. • Beach Chemical Management Plan requires that drill fluids, cement and grout are selected to ensure the lowest toxicity, most biodegradable and least accumulative products selected that meet the technical requirements of the application.
Underwater sound	Drill rig and support vessel operations Pre-lay moorings	Temporary disturbance to marine fauna may occur from underwater sound emissions from: • Vessel engines and thrusters	• Engines and thrusters are maintained in accordance with manufacturer's instructions via the Planned Maintenance System to ensure they are operating efficiently. • Vessel and helicopters comply with the EPBC Regulations 2000 – Part 8 Division 8.1 interacting with cetaceans, which details minimum separation distances.

Page 2

Summary of impacts and risks – Well completions, well interventions and P&A activities EP

Aspect - Planned	Relevant activities	Potential impact	Summary of Beach control measures
	Completions/ interventions operations Plug and abandonment (P&A) Helicopter operations	• Helicopters • Drill rig engines and rig equipment • Wellhead cutting – up to six hours for contingent P&A of Artisan 1	• Beach Whale Management Procedure is implemented on vessels and drill rig and requires: o Monitoring undertaken by a Marine Mammal Observer (MMO) of the Pre-survey Zone (PSZ) for 30 minutes to identify whales that may be within the activity area affected by underwater sound. Anchor pre-lay: ▪ Anchor pre-lay can commence when absence of whales (no whales observed for 30 minutes within the PSZ or whales observed leaving the PSZ). ▪ If a whale is observed while anchor deployment is occurring, vessel to reduce thrusters if safe to do so. Anchor deployment will cease as soon as it is safe and will only recommence when absence of whales in the PSV is confirmed. Rig mooring: ▪ Prior to commencing mobilisation of the rig to a new well location (new anchor pattern), monitoring by a MMO will be undertaken of the PSZ. The rig can commence to new location and securely anchor when the absence of whales in the PSZ is confirmed. ▪ Monitoring will commence prior to the rig moving to the new location. If whales are observed within the PSZ while the rig is in transit to a new location, the sighting will be communicated to the Beach Senior Drilling Supervisor (SDSV) and steps taken to allow time for the whales to move away. ▪ Once the move has commenced, if whales have been observed within the PSZ the rig can only enter the PSZ and commence mooring if no whales are observed for 30 minutes or whales observed leaving the PSZ. Completions/Interventions/Resupply: ▪ Survey next positive test of well integrity prior to commencing drilling/resupply, only proceeding when absence of whales is confirmed.

Beach Energy Limited | Summary of impacts and risks – Well completions, well interventions and plug & abandonment EP | 16 September 2024

Page 3

Aspect - Planned	Relevant activities	Potential impact	Summary of Beach control measures
			▪ Drilling/resupply can commence if monitoring cannot be undertaken such as night or low visibility conditions if no more than three whales have been seen three hours prior to sunset or confirmed absence of foraging whales. ▪ At all times, noise producing operations on the rig should be minimised including optimising load on generators, minimising crane movements, continuing monitoring from all in-field vessels, reduce load on mud pumps and rotary drilling equipment. ▪ If drilling has commenced and whales are observed, proceed to the next positive test of well integrity. Once well integrity has been confirmed, reduce load on mud pumps, generators and rotary drilling equipment. ▪ If resupply has commenced and whales are observed within the resupply zone while resupply is occurring, vessel to reduce thrusters if safe to do so and resupply will cease as soon as it is safe and not recommence until absence of whales is confirmed. o When undertaking noise emitting activities, at least one vessel with a MMO on board shall be in the field to carry out whale observations. If only one vessel is observing, it should sail around the rig approximately every six hours to minimise the blind spot behind the rig. If 2 vessels are available, the blind spot shall be minimised by stationing at opposing sides of the rig. o If daylight hours are greater than 12 hours, two MMOs should be on each vessel. MMOs must be trained, experienced and familiar with the activity zones. MMOs will record all observations and track all species of concern while communicating with onshore whale experts and the SDSV and vessel captains.
Physical presence	Drill rig and support vessel operations	The physical presence of Petroleum Safety Zones, pre-laid anchors, vessels and drills rigs can result in the displacement of other marine users and snagging of fishing equipment.	• Consultation with relevant persons that may be affected by the activity is undertaken as part of developing the environment plan and is ongoing prior to and during the activity to avoid or limit any displacement. • Petroleum Safety Zones, administrated by NOPSEMA under the OPGGS Act, are clearly marked on navigational charts.

Page 4

Aspect - Planned	Relevant activities	Potential impact	Summary of Beach control measures
			• Beach's Fair Ocean Access Procedure details the process whereby a commercial fisher can claim compensation for an economic loss associated with Beach's offshore activities where impacts cannot be avoided. • Vessels and drill rigs comply with: o AMSA MO 30: Prevention of collisions requires that onboard navigation, radar equipment, and lighting meets the International Rules for Preventing Collisions at Sea (COLREGs) and industry standards. o AMSA MO 27: Safety of navigation and radio equipment gives effect to SOLAS regulations regarding radiocommunication and safety of navigation and provides for navigation safety measures and equipment and radio equipment requirements. • Pre-laid anchors are equipped with a surface buoy with a navigation light to ensure any marine users know of their presence. • The position of the pre-laid anchor buoys are monitored to ensure that the buoys and anchor chains remain in place. • The Australian Hydrographic Office is notified of the activity at least three weeks prior to commencement to enable the promulgation of Notice to Mariners and AusCoast navigational warnings.
Marine discharges	Drill rig and support vessel operations Completions and intervention operations Subsea tree installation Well clean-up and flowback	Drill rig and vessels may discharge the following, which can result in changes in water quality such as increased temperature, salinity, nutrients, chemicals and hydrocarbons: • Cooling water, brine, bilge water, deck drainage, putrescible waste, sewage, and grey water. • Completion fluids (completion brine and formation water/condensate present in wellbore), packer fluids (brine, corrosion inhibitors, alkalinity control),	• Drill rig and vessels comply with Protection of the Sea (Prevention of Pollution from Ships) Act 1983, which gives effect to MARPOL Annex IV relating to discharge of noxious liquid substances, sewage, and putrescible waste. • Equipment to treat marine discharges are maintained in accordance with manufacturer's instructions via the Planned Maintenance System to ensure they are operating efficiently. • Oil contaminated water is treated via a MARPOL (or equivalent) approved oily water separator and only discharge if oil content less than 15 ppm. • Sewage discharged at sea is treated via a MARPOL (or equivalent) approved sewage treatment system. • Food waste only discharged when macerated to ≤25 mm and at distance greater than 3 nm from land. • Beach Chemical Management Plan requires that any chemicals within marine discharges are selected to ensure the lowest toxicity, most biodegradable and least accumulative products selected which meet the technical requirements of the application.

Page 5

Summary of impacts and risks – Well completions, well interventions and P&A activities EP

Aspect - Planned	Relevant activities	Potential impact	Summary of Beach control measures
		control fluids, reservoir fluids	
Drilling/ Completions discharges	Blow-out Preventer (BOP) installation and testing Completions activities P&A	Discharges of the following can result in localised changes in water and sediment quality: • BOP hydraulic/control fluids • Drill fluids and cuttings • Cement • Brine/sweeps fluids (with drilled cement) • Metal shavings (P&A) • In-situ fluids: inhibited water and NaCl/KCl brine • Suspension fluids with MEG • Viscosifiers and surfactants • Packer fluid (brine with corrosion inhibitors) •	• Drill rig BOP function and pressure testing is a safety requirement and is undertaken in accordance with manufacturer's specifications and in alignment with Drilling Contractors Preventative Maintenance System. • Beach Chemical Management Plan requires that any chemicals within drilling discharges are selected to ensure the lowest toxicity, most biodegradable and least accumulative products selected which meet the technical requirements of the application. • Non-water-based fluids and cuttings are circulated to the drill rig for treatment via the solids control equipment prior to discharge. • Cementing procedures are implemented to minimise the amount of cement discharged to the marine environment, including the minimisation of excess cement discharge upon completion of the drilling program.
Atmospheric emissions	Drill rig and support vessel operations Well intervention and workovers Well clean-up and flowback P&A activities	Combustion of marine diesel oil (MDO) from the vessel and drill rig engines, generators and deck equipment, waste incineration, flaring well test fluids and cold venting during well interventions at up to two wells may cause a localised and temporary decrease in air quality and add greenhouses gas into the atmosphere.	• Drill rig and vessels comply with Marine Orders – Part 97: Marine Pollution Prevention – Air Pollution (appropriate to vessel class) for emissions from combustion of fuel including: o hold a valid International Air Pollution Prevention certificate and a current international energy efficiency certificate. o have a Ship Energy Efficiency Management Plan to reduce emissions. o engine NOx emission levels comply with Regulation 13 of MARPOL 73/78 Annex VI. o low-sulphur (<0.5% m/m) diesel used. • Combustion equipment maintained in accordance with manufacturer's instructions via the Planned Maintenance System to ensure they are operating efficiently.

Page 6

Summary of impacts and risks – Well completions, well interventions and P&A activities EP

Aspect - Planned	Relevant activities	Potential impact	Summary of Beach control measures
	Helicopter operations		• Waste incineration is managed in accordance with MARPOL and AMSA Marine Orders. • For well test flaring the minimum volume of hydrocarbons is used and flared via an efficient test flare burner head.
Aspect - Unplanned	**Relevant Activities**	**Potential Impact**	**Summary of Beach Control Measures**
Introduction and establishment of invasive marine species (IMS)	Drill rig and support vessel operations	The introduction of IMS may occur as a result of discharge of drill rig and vessel ballast water containing foreign species or translocation of foreign species through biofouling on hulls, niches or in-water equipment. The potential impacts of marine pest introduction include: • Change in native marine species diversity and abundance. • Change in commercial fish stocks and associated socio-economic effects. • Changes to conservation values of protected areas.	• Prior to the initial mobilisation for an activity by a vessel, drill rig or submersible equipment, Beach shall undertake a domestic IMS biofouling risk assessment to: o Validate compliance with regulatory requirements (Commonwealth and State) in relation to biosecurity. o Identify the potential IMS risk profile. o Identify potential deficiency of IMS controls and additional controls to manage IMS risk profile at low. o Prevent the translocation and potential establishment of IMS into non-affected environments. • Suspected or confirmed IMS introduction are reported to Agriculture Victoria.
Vessel collision or disturbance of fauna	Support vessels	Vessels have the potential for collision with marine mammals which may cause injury or death. Marine fauna entanglement in drill rig anchor chains is not identified as a risk due to the thick chain links.	• Vessels comply with the EPBC Regulations 2000 – Part 8 Division 8.1 interacting with cetaceans which details minimum separation distances. • Vessels have a dedicated MMO with experience in whale observation, distance estimation and reporting to implement the Beach Whale Management Procedure. • If daylight hours are greater than 12 hours, two MMOs should be on each vessel. MMOs must be trained, experienced and familiar with the activity zones. MMOs will record all observations and track all species of concern while communicating with onshore whale experts and the SDSV and vessel captains.

Page 7

Summary of impacts and risks – Well completions, well interventions and P&A activities EP

Aspect - Unplanned	Relevant Activities	Potential Impact	Summary of Beach control measures
			will record all observations and track all species of concern while communicating with onshore whale experts and the SDSV and vessel captains. • Vessel strike causing injury to, or death of, a cetacean is reported to the Department of Climate Change, Energy, the Environment and Water.
Accidental discharge materials and waste	Drill rig and support vessel operations	The handling and storage of materials and waste on board a vessel or drill rig has the potential to result in accidental overboard release creating marine debris.	• Waste is managed in accordance with the Garbage Management Plan. • Waste with potential to be windblown shall be stored in covered containers. • Solid waste that is accidentally discharged overboard is recovered if reasonably practicable. • Crane handling and transfer procedures implemented to avoid objects being dropped overboard. • Lifting gear is maintained in accordance with the Preventative Maintenance System and inspected regularly to ensure they are operating efficiently.
Minor spills	Drill rig and support vessel operations Helicopter operations ROV operations	Minor spill from vessels and drill rig can occur from: • use, handling and transfer of hydrocarbons and chemicals • hydraulic line failure from equipment • bunkering of material between the drill rig and support vessel A minor spill would be limited to a localised and temporary change in water quality and the potential change to fauna behaviour within surface waters affected by the spill, such as avoidance.	• Bunkering is undertaken in accordance with Drilling Contractor bunkering procedures which include: o Bunkering operation supervised at all times by trained and experienced personnel. o Hoses have dry-break couplings and floats. o Transfer equipment (hoses, pumps) maintained in accordance with manufacturer's instructions via the rig and vessel Planned Maintenance System and inspected prior to use. o Tanks have level indicators and level alarms. o Communications (visual and audio) between vessel and drill rig tested prior to commencing bunkering. • Materials and equipment that have the potential to spill onto decks or marine environment are stored within a contained area. • The following plans are implemented in the event of a spill: o Shipboard Marine Pollution Emergency Plan (SMPEP) or Shipboard Oil Pollution Emergency Plan (SOPEP) (according to class). o Beach Offshore Victoria Oil Pollution Emergency Plan (OPEP). o Project-specific Operational and Scientific Monitoring Program (OSMP).

Page 8

Summary of impacts and risks – Well completions, well interventions and P&A activities EP

Aspect - Unplanned	Relevant Activities	Potential Impact	Summary of Beach control measures
Loss of containment – marine diesel oil (MDO)	Drill rig and support vessel operations	MDO is used in offshore vessels. A collision between a Beach contracted vessel and third-party vessel has the potential to result in a spill of fuel. Causes of a vessel collision may include mechanical failure, loss of dynamic positioning, navigational error or foundering due to weather.	• Vessel collisions are avoided by: o Consultation with relevant person that may be affected by the activity is undertaken as part of developing the environment plan and is ongoing prior to and during the activity to ensure they know where activity vessels are and how to contact. o The Australian Hydrographic Office is notified of the activity at least three weeks prior to commencement to enable the promulgation of Notice to Mariners and AusCoast navigational warnings. o Vessels comply with: ▪ AMSA MO 30: Prevention of collisions requires that onboard navigation, radar equipment, and lighting meets the International Rules for Preventing Collisions at Sea (COLREGs) and industry standards. ▪ AMSA MO 27: Safety of navigation and radio equipment gives effect to SOLAS regulations regarding radiocommunication and safety of navigation and provides for navigation safety measures and equipment and radio equipment requirements. ▪ AMSA MO 21: Safety and emergency arrangements gives effect to SOLAS regulations dealing with life-saving appliances and arrangements, safety of navigation and special measures to enhance maritime safety. • Vessels have an automatic identification system (AIS) transceiver enabling them to receive the data broadcasted by surrounding vessels. • Vessels contracted to conduct activities only carry marine diesel. • The following plans are implemented in the event of a spill: o Shipboard Marine Pollution Emergency Plan (SMPEP) or Shipboard Oil Pollution Emergency Plan (SOPEP) (according to class). o Beach Offshore Victoria Oil Pollution Emergency Plan (OPEP). o Project-specific Operational and Scientific Monitoring Program (OSMP).
Loss of containment – Condensate	Completions operations	A loss of containment resulting in a spill of condensate could occur from:	• Part 5 of the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011 set out the requirements for

3.1 National Indigenous Times (24 September 2024)

Deadly talent to the fore

JARRED CROSS

Queensland were crowned champions at Netball Australia's inaugural First Nations Tournament this month after edging past South Australia in the final to wrap a "dream" debut showcase of the country's best Indigenous talent.

Under-23 sides from each State and Territory took to the court at Naarm's (Melbourne's) State Netball Centre September from September 13-15, with Aboriginal and Torres Strait Islander representation extending to the coaches, officials and umpires.

Both finalists qualified via unbeaten runs through the pool stages, with a 10-6 second quarter helping Queensland set an advantage to hold in the goal-for-goal exchange ending 37-35.

Muruwari goaler Lily Cubby, who clinched team and individual top honours at tournament's end, said the weekend was a cherry on top of a busy year.

Cubby starred in the goal circle for Indigenous national side the First Nations Black Swans' debut showing at the Pacific Series in June, enjoyed premiership success with Ipswich Jets in Queensland's Sapphire Series, and appeared with the Firebirds during the Super Netball Reserves season.

Her Queensland teammates included fellow Black Swans players Jayden Molo, Brooke Lacey and Keira Hefferman.

After the gold medal win, Cubby told National Indigenous Times her feeling was the tournament "is only going to grow from here".

She was ultimately named player of the tournament and goal shooter in team of the tournament.

Queensland coach and former Australian Diamond Sharon Finnan-White said the weekend was a "dream" after two decades driving Indigenous high-performance structures in the sport.

Her squad included two members of her Townsville-based First Nations Academy of Excellence.

"We spent a lot of time on just connections on and off court rather than developing skills because these girls have already got the skills. They've been playing at this high level for such a long time," Finnan-White said.

"I've inherited an exceptional, talented group of athletes. And really my job was just to bring them together and motivate them to come together and win gold here."

South Australian midcourter Miah Jones told National Indigenous Times it was a "special" experience to grab silver with teammates who are like "sisters".

"To be able to play with the girls and represent our communities, I think that makes it just that bit more special," Jones said.

South Australia's team moniker, Yakanarna, means "older sister" in Kaurna language, coach Vanessa Dempsey said.

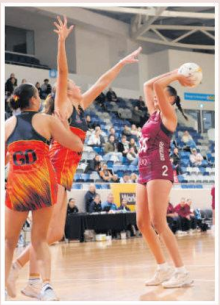
"Within SA, we've been really trying to just get that connection to Country. We've been focused on playing deadly and being deadly, and also really trying to let the rest of the mainstream netball in Australia see what we're made of," Dempsey said.

NSW claimed third spot with a 47-29 win over Victoria, with Jayda Grant shooting 14 of her side's goals en route to selection in the team of the tournament at goal attack.

Mother-daughter, coach-player duo Fiona and Abbey Geappen featured in Tasmania's pursuit to claim fifth place in a comeback win over Western Australia earlier on the final day.

A Commonwealth Bank Trophy winner with Melbourne Phoenix during the early 2000s and Tassie netball stalwart, Geappen hopes the tournament proves an elevation of the pathways she missed out on at stages as a young player.

The sentiment was closely shared by two-time Queensland Firebirds ANZ Championship winner Beryl Friday.



"The last couple of days have just been amazing. I can't believe we're here and to have all eight States and Territories represented. It's honestly a dream come true," Friday said.

Queensland were the champions of Netball Australia's inaugural First Nations Tournament. Pictures: Netball Australia

FIRST NATIONS TEAM OF THE TOURNAMENT

Goal shooter: Lily Cubby, Queensland
Goal attack: Jayda Grant, NSW
Wing attack: Tierrah Miller, South Australia
Centre: Jayden Molo, Queensland
Wing defence: Maryke Babia, Queensland
Goal defence: Kiesha Muckan, Queensland
Goalkeeper: Aaleya Turner, South Australia

Lily Cubby was named player of the tournament.

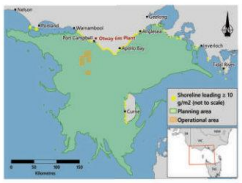
Sea Country Consultation

beach

Consultation for Well Completions and Interventions EP

Beach Energy **(Beach)** supplies natural gas from offshore Victoria to the local market through existing infrastructure including pipelines and onshore production facilities.



At the commencement of consultation for the Offshore Gas Victoria **(OGV)** Project in June 2023, Beach advised that further EPs may be required for activities to complete and connect wells successfully drilled.

Beach is now conducting consultation on a Well Completions, Well Interventions and Plugging and Abandonment Activities Environment Plan **(Well Completions and Interventions EP)** for activities.

Such activities would enable future connection of new gas wells to existing infrastructure, maintain the option to plug and abandon an existing suspended well subject to a further assessment of its viability and enable activities to re-enter up to two existing wells to improve performance.

Invitation to consult with Beach

Beach consults with relevant persons so appropriate measures can be considered in response to objections or information received during consultation. Consultation is now invited with persons and organisations whose functions, interests, or activities may be affected by the activities described in the Well Completions and Connections EP.

This EP consultation will be conducted from 16 September 2024 to 14 February 2025.

The map in this notice shows the planning area, and environment that may be affected.

Beach invites culturally sensitive consultation with First Nations Peoples through the options set out below.

Portland Yacht Club, 55 Lee Breakwater Road, Portland, **Tuesday 22 October**, 11am to 4pm (AEDT) and 6pm to 8pm (AEDT) and **Wednesday 23 October**, 9am to 12pm (AEDT).

Warrnambool RSL, 162 Merri St, Warrnambool, **Thursday 24 October**, 9am to 12pm (AEDT).

General community consultation sessions will be held at Warrnambool RSL on **Wednesday 23 October**, 3pm to 6pm (AEDT) and Port Campbell Surf Lifesaving Club, 1 Cairns St, Port Campbell, on **Thursday 24 October**, 3pm to 6pm (AEDT).

We also invite you to contact us if you wish to discuss other consultation options, including online webinar sessions. Please scan the QR code for further details of the Well Completions and Interventions EP.

3.2 The Beacon Newsletter (4 October 2024)

Public Notice

Consultation for the development of Environment Plans

Beach Energy (Beach) currently supplies natural gas from offshore Victoria to the local market through existing infrastructure, including pipelines and onshore production facilities.

Beach is inviting consultation with relevant persons whose functions, interests or activities may be affected by proposed activities under Environment Plans (EP) for further natural gas development activities.

Drilling EP

As part of its commitment to ongoing local gas production, Beach is proposing to undertake a further phase of drilling operations offshore Victoria. Consultation for activities under the Offshore Gas Victoria (OGV) Drilling and P&A Program EP (Drilling EP) began in June 2023. Beach has now reduced the scope of the activity to be carried out under the Drilling EP.

The original proposal to drill up to 11 wells in the Otway and Bass basins will be modified to a maximum of 5 wells in the Otway Basin only in Commonwealth Waters offshore Port Campbell.

Beach has previously consulted on the Drilling EP from June 2023 to February 2024 and is now carrying out supplementary consultation up to and including 9 December 2024.

Well Completions and Interventions EP

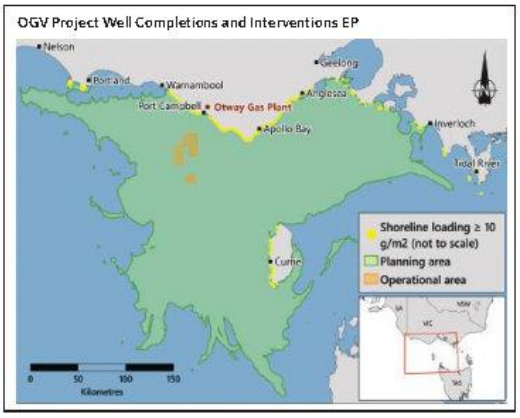
At the commencement of consultation for the OGV Project in June 2023, Beach advised further EPs may be required for activities to complete and connect wells successfully drilled.

Beach is now conducting consultation with relevant persons whose functions, interests or activities may be affected by proposed activities under a Well Completions, Well Interventions and Plugging and Abandonment Activities EP (Well Completions and Interventions EP).

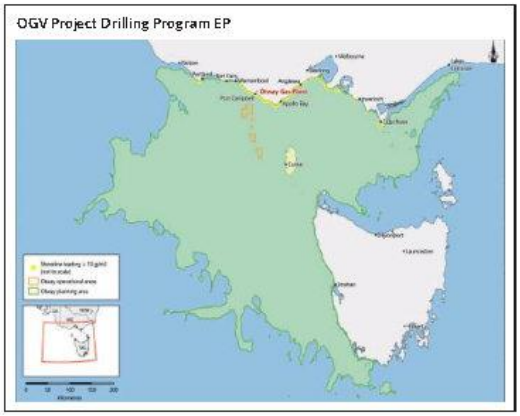
These activities would enable future connection of new gas wells to existing infrastructure, maintain the option to plug and abandon an existing suspended well subject to a further assessment of its viability and enable activities to re-enter up to two existing wells to improve performance.

The Well Completions and Interventions EP consultation is open now and will be conducted up to and including 14 February 2025.

Environment that may be affected (EMBA)



The maps in this notice show the largest geographic area where operational activities under the Drilling EP or the Well Completions and Interventions EP could potentially have a direct or indirect environmental impact under worst-case scenarios. Within the EMBA, the environment values and sensitivities are defined, potential impacts are assessed, and control measures are developed to mitigate impacts. The EMBA is divided into an operational area for activities defined in the EPs, and a planning area where emergency response plans must be ready for activation in the unlikely event of a accident.



Invitation to consult with Beach

Beach invites consultation with persons and organisations whose functions, interests, or activities may be affected by the activities described in the above EPs. Consultation is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted as a result of the consultations.

3.3 South Gippsland Sentinel-Times (8 October 2024)

Germano shakes up farmer advocacy one last time

MIRBOO North vegetable grower and sheep and beef producer, Emma Germano, wasn't making up the numbers when she was elected as the Victorian Farmers Federation's first woman president in 30 years.

She's already challenged many of the practices and conventions of the peak farming organisation in the state, so it wasn't a great surprise to see the VFF give notice it intends to resign from the National Farmers Federation unless significant reforms are made to policy development, advocacy and the costs of affiliation.

Speaking on ABC Country Hour last week, after sending the VFF's letter of resignation, in 12 months' time, to the NFF the previous Thursday, Ms Germano explained why.

Key among the issues is the $220,000 in fees they pay to the NFF and the fact that while the fees were scaled back to $40,000 while the VFF restructured its finances, its voting rights at the NFF were suspended.

The lack of notice and organisation around the recent protest in Canberra didn't help either.

ABC Country Hour presenter Warwick Long asked Ms Germano: "What did it take to get to this?"

"To put it really simply, and you know, the letter has now been made public, essentially that we sent to the NFF, we're saying this has been an unfair system for some time. It no longer serves the VFF essentially paying the lion's share of national advocacy, and it's not fair on our members," Ms Germao said.

"It's not fair on us as an organisation. We've raised it in many forums, looking for some meaningful change, and that hasn't happened.

'And ultimately, we're trying to set up the future board and appreciate that nominations have been called for. We're trying to set a future board up with some choices. And of course, everybody knows that we're in court with ADF, on the basis of whether or not, when we started talking about the unfairness, whether or not it constituted proper notice. And I just don't want the VFF in that same position in 12 months' time."

Nominations are now open for the positions of VFF President, VFF Vice-President, UDV President, Livestock Group President, Livestock Group Vice President and members of the Livestock Commodity Council, closing on October 11 with voting open on November 25, 2024 until December 6, 2024.

Some of the attendees at Sunday's mange information session in Venus Bay after learning how to install a burrow flap, with South Gippsland Landcare Network's Kirby Leary and Simonne Fleming of Rescue to Release. A23_4124

Help in fight against mange

AN INFORMATION session on tackling mange in wombats, held on Sunday at Venus Bay Community Centre proved successful, with those in charge confident it will deliver a much-needed boost to volunteer numbers, enabling more wombats to be treated.

About 25 attendees learned about different approaches to treating the condition that is caused by mange mites rather than a disease.

With mange fatal if not treated in time, the aim is to save as many affected individuals as possible, reducing the spread of mange through the wombat population and to koalas.

South Gippsland Landcare Network (SGLN) organised Sunday's event, with project officer Kirby Leary explaining its involvement in a project to tackle mange that arose through the South Gippsland Landcare Fund.

"Wildlife carers are seeing an increase in mange conditions in koalas and koalas get mange transfer from wombats, so the way for most people to be able to help is to treat wombats," Kirby said.

"We found we need more volunteers doing a small thing, which may be treating wombats or reporting sightings to Mange Management Victoria, so we put together this workshop."

SGLN reached out to Mange Management, which invited Simonne Fleming of Wonthaggi-based Rescue to Release to run the Venus Bay session, something she was happy to volunteer her time to do.

She gives such presentations periodically in various locations but encourages those interested in getting started as a wildlife volunteer to contact relevant organisations directly.

Those keen to help in the fight against mange are urged to visit mangemanagement.org.au to learn more about how they can help or donate and can contact Mange Management by emailing info@mangemanagement.org.au or calling 0431 600 125.

Wildlife Victoria also needs volunteers and people are encouraged to visit wildlifevictoria.org.au to learn more and to register for their chosen role, with the organisation providing training.

The website also offers the chance to make a donation.

Simonne established Rescue to Release last year to support wildlife volunteers around Bass Coast, explaining such volunteers can face significant expenses.

Costs include fuel, equipment and caring expenses such as feed.

Equipment includes cages, poles, and trail cameras,

Rescue to Release has equipment to help locate animals such as mange-affected wombats or an injured kangaroo, as well as lost dogs.

The organisation doesn't receive regular funding, with donations welcome through rescuetorelease.org.au

MINING ACT 1971 (SA) SECTION 63M

TAKE NOTICE that:
1. Valrico Resources Pty Ltd, registered holder of Exploration Licences 7001 and 7003 (***Valrico***); and
2. WRDBD Developments Pty Ltd, registered holder of Exploration Licence 7005 (***WRDBD***),

(the ***Proponents***) both being wholly owned subsidiaries of Australian Rare Earths Ltd of Level 10, 111 Gawler Place, Adelaide, propose to carry out mining operations of an exploratory nature on the following lands located in the State of South Australia:

WRDBD Developments Pty Ltd proposes to carry out mining operations of an exploratory nature on the land identified below (***WRDBD Land***):

The land located in the State of South Australia, approximately 60 km northeast of Morgan, referred to as **Sturt Vale Area** which is bounded as follows:
Commencing at a point being the intersection of latitude 33°12'S and longitude 139°48'E, then east to longitude 140°07'E, south to latitude 33°26'S, west to longitude 139°59'E, south to latitude 33°41'S, west to longitude 139°54'E, north to latitude 33°27'S, west to longitude 139°48'E, and north to the point of commencement.
(AREA: 995 square kilometres approximately)
being the land which is subject to Exploration Licence 7005, but excluding that part of the land that is subject to the Ngadjuri Nation #2 native title application (Federal Court reference SAD84/2022),
all the within latitudes and longitudes are geodetic and expressed in terms of the Australian Geodetic Datum as defined on p. 4984 of the Commonwealth Gazette number 84 dated October 6, 1966 (**AGD66**).

Valrico proposes to carry out mining operations of an exploratory nature on the land identified below (***Valrico Land***):

1. The land located in the State of South Australia, approximately 65 km east-northeast of Burra, referred to as **Warnes Area** which is bounded as follows:
Commencing at a point being the intersection of latitude 33°27'S and longitude 139°24'E, then east to longitude 139°54'E, south to latitude 33°41'S, west to longitude 139°47'E, south to latitude 33°42'S, west to longitude 139°36'E, north to latitude 33°34'S, west to longitude 139°24'E, and north to the point of commencement.
(AREA: 993 square kilometres approximately)
being the land which is subject to Exploration Licence 7001; and

2. The land located in the State of South Australia, approximately 65 km east-southeast of Burra, referred to as **Bunyung Area** which is bounded as follows:
Commencing at a point being the intersection of latitude 33°41'S and longitude 139°47'E, then east to longitude 139°54'E, south to latitude 34°01'S, west to longitude 139°36'E, north to latitude 33°42'S, east to longitude 139°47'E, and north to the point of commencement but excluding White Dam Conservation Park and areas within the area of the licence that is subject to a mineral tenement or comprised in a private mine including (but not limited to) Mineral Lease 730, 731, 732, 733, 734, 5122 and 665 as registered in the Mining Register at the date of the grant of this licence.
(AREA: 992 square kilometres approximately)
being the land which is subject to Exploration Licence 7003,

all the within latitudes and longitudes are geodetic and expressed in terms of the Australian Geodetic Datum as defined on p. 4984 of the Commonwealth Gazette number 84 dated October 6, 1966 (**AGD66**).

The general nature of the proposed mining operations that are to be carried out by Valrico on the land the subject of Exploration Licences 7001, 7003, and by WRDBD on the land the subject of Exploration Licence 7005 is:

Exploratory operations to determine the geology of the Land and presence of mineralisation. Without limiting that general description, those operations may include: reconnaissance; gridding; mapping; aerial and handheld photography; airborne and ground magnetic, electromagnetic, radiometric, seismic, gravity and electrical surveying; soil and other geochemical sampling; water sampling; hydrological studies; hydrogeology surveys; shallow trenching; limited clearing for access and drilling; drilling (including diamond core drilling and other methods); downhole-probing, sampling and radiometric testing of drill core/cuttings; environmental monitoring work (including baseline work, flora/fauna surveys, geotechnical surveys) and establishment of temporary camp/storage sites and access tracks as may be necessary.

The proposed activities are (or will be) authorised by the following exploration authorities under the *Mining Act 1971* (SA):

Exploration Licences 7001 and 7003 (including any extension, replacement, renewal, regrant or other dealings with Exploration Licences 7001 and 7003, and any other exploration authority or interest in any exploration authority for the whole or any part of the Valrico Land).

Exploration Licence 7005 (including any extension, replacement, renewal, regrant or other dealings with Exploration Licence 7005, and any other exploration authority or interest in any exploration authority for the whole or any part of the WRDBD Land).

Each of Valrico and WRDBD seek to negotiate native title mining agreements under Part 9B of the *Mining Act 1971* (SA) in relation to the Valrico Land and WRDBD Land, respectively.

TAKE NOTICE that if, four (4) months after this notice is given as required by the *Mining Act 1971* (SA), there are no persons registered under the law of the State or the Commonwealth as the holders of, or claimants to, native title in whole or part of the Valrico Land or WRDBD Land, the relevant of the **Proponents** (or their successors or assignees) may apply *ex parte* to the Environment, Resources and Development Court for a summary determination authorising entry to the land the subject of their respective exploration licences for the purpose of carrying out mining operations on the Valrico Land and/or WRDBD Land, as applicable, and the conduct of mining operations on that land.

Any person who holds or may hold native title in either the Valrico Land or the WRDBD Land who requires further information regarding this notice is invited to contact the Proponent at:

Public Notice
Consultation for the development of Environment Plans

beach

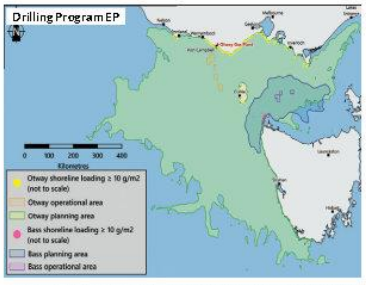
Beach Energy (Beach) currently supplies natural gas from offshore Victoria to the local market through existing infrastructure, including pipelines and onshore production facilities.

Beach is inviting consultation with relevant persons whose functions, interests or activities may be affected by proposed activities under Environment Plans (EP) for further natural gas development activities.

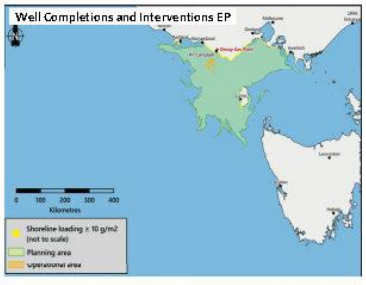
Drilling EP
As part of its commitment to ongoing local gas production, Beach is proposing to undertake a further phase of drilling operations offshore Victoria. Consultation for activities under the Offshore Gas Victoria (OGV) Drilling and P&A Program EP (Drilling EP) began in June 2023. Beach has now reduced the scope of the activity to be carried out under the Drilling EP.

The original proposal to drill up to 11 wells in the Otway and Bass basins will be modified to a maximum of 5 wells in the Otway Basin only in Commonwealth Waters offshore Port Campbell.

Beach has previously consulted on the Drilling EP from June 2023 to February 2024 and is now carrying out supplementary consultation up to and including 9 December 2024.



Well Completions and Interventions EP
At the commencement of consultation for the OGV Project in June 2023, Beach advised further EPs may be required for activities to complete and connect wells successfully drilled.



Beach is now conducting consultation with relevant persons whose functions, interests or activities may be affected by proposed activities under a Well Completions, Well Interventions and Plugging and Abandonment Activities EP (Well Completions and Interventions EP).

These activities would enable future connection of new gas wells to existing infrastructure, maintain the option to plug and abandon an existing suspended well subject to a further assessment of its viability and enable activities to re-enter up to two existing wells to improve performance.

The Well Completions and Interventions EP consultation is open now and will be conducted up to and including 14 February 2025.

We encourage you to access Beach's additional resources, maps, and project details about the environment plans, which can be accessed via the QR code. We also invite you to contact us if you wish to discuss other consultation options or are seeking further information.

For information regarding consultation, please see NOPSEMA's Brochure titled '*Consultation on offshore petroleum environment plans*', at consultation.nopsema.gov.au

Environment that may be affected (EMBA)
The maps in this notice show the largest geographic area where operational activities under the Drilling EP or the Well Completions and Interventions EP could potentially have a direct or indirect environmental impact under worst-case scenarios. Within the EMBA, the environment values and sensitivities are defined, potential impacts are assessed, and control measures are developed to mitigate impacts. The EMBA is divided into an operational area for activities defined in the EPs, and a planning area where emergency response plans must be ready for activation in the unlikely event of an accident.

Invitation to consult with Beach
Beach invites consultation with persons and organisations whose functions, interests, or activities may be affected by the activities described in the EPs outlined in this notice. Consultation is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted as a result of the consultations.

3.6 King Island Courier (10 October 2024)

King Island Courier THURSDAY, OCTOBER 10, 2024 Page - 7

EU regulations concerns

AUSTRALIA'S cattle industry is lobbying for certain agricultural lands to be exempted from the European Union's upcoming deforestation regulations, citing concerns that the new rules could significantly disrupt the nation's beef exports.

By the end of 2024, the EU will prohibit the importation of beef products from properties where deforestation has occurred within the past four years, as part of its broader goal to tackle global deforestation linked to consumption.

Cattle Australia (CA), the body representing the nation's grass fed beef producers, argues that the EU's deforestation regulations are inequitable, stating that "international deforestation definitions are not aligned with Australian legislation".

In response to the impending rules, CA has spent months consulting with stakeholders and has released a policy document calling for a revision of the definition of deforestation.

King Island cattle could soon come under new EU deforestation rules. Picture: MICHAEL LASKEY

The group is advocating for agricultural land that has been legally cleared to be excluded from the EU's deforestation rules.

CA CEO Chris Parker emphasised that Australian agricultural land used for beef production should be exempt from the European Union Deforestation Regulation (EUDR).

"We would maintain, quite simply, that Australian land where beef is grown is agricultural land, and therefore exempt under the EUDR. Simple as that," Parker said.

He also highlighted that Australia's beef producers are already subject to some of the strictest vegetation management laws in the world, pointing out that there are over 136 existing laws at the state, territory, and federal levels in Australia aimed at protecting the environment and biodiversity,.

Environmental groups have pushed back against the cattle industry's stance, labelling Australia as a deforestation hotspot and pointing to beef production as a primary driver of land clearing.

"These definitions are an attempt to label the use of bulldozers to rip down hundreds of thousands of hectares of forest and bushland each year as a sustainable practice," Tim Beshara from the Wilderness Society said.

While the European Union is not a major market for Australian beef compared to other export destinations, with around $140 million worth of beef products exported annually, the EU's deforestation definition could set a precedent affecting the entire beef supply chain.

Supermarkets, financial institutions, and other companies are likely to adopt similar deforestation-free criteria in their supply chains, placing further pressure on producers.

In August, Woolworths announced its commitment to sourcing only deforestation-free beef by the end of 2025 and pledged to work closely with the beef industry to develop a "geographically appropriate definition of deforestation" that would suit Australian conditions.

Environmental organizations, including the Australian Conservation Foundation (ACF), have urged retailers, fast food chains, and banks to adopt a credible definition of deforestation that aligns with global environmental standards.

3.7 Colac Herald (11 October 2024)

Winch survives Cressy scare

NEW LOOK: Former Winchelsea bowler Ernie Andres made his Simpson debut this week.

BY LOUIS DARCY

Winchelsea has kicked off its Midweek Pennant season with a thrilling win over newly-promoted Cressy.

Winchelsea clinched a three-shot victory against Cressy in the opening round of the season, winning two of its three rinks.

A rink win from Raymond Quigley against Ann Keating, 16-13, was enough to get Winch over the line.

Fellow Winchelsea skipper Pip Ward had a big win over Moira Turner, 24-16, but Cressy's Neville Keating responded with a strong win against David Littler, 24-16.

Winchelsea's Julie Johnson said the Division One team was happy to start the season off with a win.

"We were happy with the win because we had a quick change to one rink due to an emergency the night before," she said.

"Cressy were strong competition and they are certainly determined to try and stay in Division One.

"It was pretty cold and windy, but it was great to be back playing and Cressy are always lovely opposition."

Johnson said the team would need to improve their on performance against Camperdown Golf next weekend.

"We were ahead until shortly near the end, and then we were a couple behind, but we just got over the line in the end," she said.

"We still didn't play well together, but it was the first time I had played with Pip before, so we are still just settling.

"The use of rinks is going to be a very decisive factor this year and it proved that on Tuesday, so teams will just have to work out how to find their best combinations."

Meanwhile in other midweek matches, Camperdown Golf downed Colac, 79-68, Cobden defeated Central, 68-55, and City proved too strong for Simpson, 82-52.

MIDWEEK BOWLS

ROUND 1 RESULTS

C'down Golf 2-79 def. Colac 1-68
Winch 2-56 def. Cressy 1-53
City 3-82 def. Simpson 0-52
Cobden 2-68 def. Central 1-55

ROUND 2 FIXTURE

Winch v C'down Golf
Cressy v City
Central v Colac
Simpson v Cobden

READY: Simpson skipper Andrea Swayn prepares to roll in Tuesday's loss to City.

3.8 Portland Observer (11 October 2024)

POLICE are investigating an incident where a car was set on fire at Bridgewater Road early Wednesday morning. Picture: KAREN HODGE 220617ZH09

Car set on fire on Bridgewater Rd while two more vehicles stolen

DETECTIVES were kept busy on Wednesday, with a car set ablaze on Wednesday morning and two other vehicles stolen from the local area.

Portland Crime Investigation Unit detectives are investigating a vehicle fire on Bridgewater Road just before 5am on Wednesday.

The exact circumstances surrounding the fire are yet to be established.

Anyone who witnessed the incident or has dashcam or CCTV footage, are urged to contact Crime Stoppers on 1800 333 000 or visit www.crimestoppersvic.com.au.

Wednesday also saw a Jeep Grand Cherokee stolen from a property in Narrawong and a Holden utility stolen from a property on Holmes and Tallrous Rd in Tyrendarra.

In both cases it appears the keys were in the vehicles and Portland police are urging vehicle owners to ensure their vehicles are locked and keys are secured.

The vehicles were later recovered and are being forensically checked for evidence.

The theft of the two vehicles on Wednesday continues a recent spate of thefts in Portland and the surrounding areas which has seen up to 15 vehicles stolen in three weeks.

Time to enter the Upwelling Festival's shop window display competition

CHARLIE SAWYER-BASSETT

THE Upwelling Festival's shop window display competition is here.

The theme for 2024 is shellfish, which can be crabs, cray fish, lobsters, prawns and more. Marine ecology creatures and plants of the sea are also encouraged in displays.

"The judging will first take into account the theme, which is shellfish, but that won't be compulsory," Upwelling Festival committee's Gordon Stokes said.

"The maritime world is many shapes and colours, so everything's pretty relevant in a way, particularly in the colour area.

"I noticed some people who don't have a lot of time to put it together, , they do hang quite a lot of blue or green cellophane, which is pretty effective, because it does represent the underwater.

"We welcome partnerships. Some businesses contact some of the schools and particular grades within those schools decorate their window."

The competition leads up to the Upwelling Festival set for Saturday, November 2 along the Portland Foreshore, and best entry will be awarded with a whale tail trophy.

To enter, email portlandupwellingfestival@outlook.com stating 'upwelling shop window display entry' business address and name. Entries must be in before Friday, October 25, as judging will be on October 28.

The winner will be announced on Friday, November 1, in the *Portland Observer*.

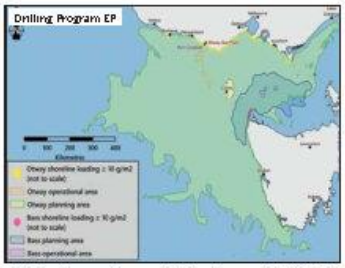
Drilling EP

As part of its commitment to ongoing local gas production, Beach is proposing to undertake a further phase of drilling operations offshore Victoria. Consultation for activities under the Offshore Gas Victoria (OGV) Drilling and P&A Program EP (Drilling EP) began in June 2023. Beach has now reduced the scope of the activity to be carried out under the Drilling EP.

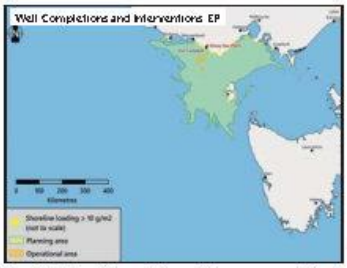
The original proposal to drill up to 11 wells in the Otway and Bass basins will be modified to a maximum of 5 wells in the Otway Basin only in Commonwealth Waters offshore Port Campbell.

Beach has previously consulted on the Drilling EP from June 2023 to February 2024 and is now carrying out supplementary consultation up to and including 9 December 2024.

Well Completions and Interventions EP



At the commencement of consultation for the OGV Project in June 2023, Beach advised further EPs may be required for activities to complete and connect wells successfully drilled.



Beach is now conducting consultation with relevant persons whose functions, interests or activities may be affected by proposed activities under a Well Completions, Well Interventions and Plugging and Abandonment Activities EP (Well Completions and Interventions EP).

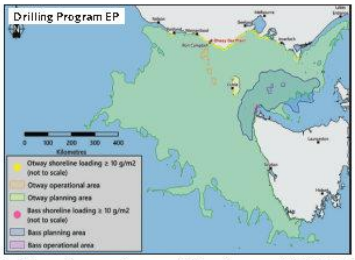
These activities would enable future connection of new gas wells to existing infrastructure, maintain the option to plug and abandon an existing suspended well subject to a further assessment of its viability and enable activities to re-enter up to two existing wells to improve performance.

The Well Completions and Interventions EP consultation is open now and will be conducted up to and including 14 February 2025.



We encourage you to access Beach's additional resources, maps, and project details about the environment plans, which can be accessed via the QR code. We also invite you to contact us if you wish to discuss other consultation options or are seeking further information.

Environment that may be affected (EMBA)

The maps in this notice show the largest geographic area where operational activities under the Drilling EP or the Well Completions and Interventions EP could potentially have a direct or indirect environmental impact under worst-case scenarios. Within the EMBA, the environment values and sensitivities are defined, potential impacts are assessed, and control measures are developed to mitigate impacts. The EMBA is divided into an operational area for activities defined in the EPs, and a planning area where emergency response plans must be ready for activation in the unlikely event of an accident.

For information regarding consultation, please see NOPSEMA's Brochure titled *'Consultation on offshore petroleum environment plans'*, at consultation.nopsema.gov.au

Invitation to consult with Beach

Beach invites consultation with persons and organisations whose functions, interests, or activities may be affected by the activities described in the EPs outlined in this notice. Consultation is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted as a result of the consultations.

WARRNAMBOOL CITY COUNCIL

Noticeboard

October 12, 2024

Public Notice

Notice of an Application for a Planning Permit

Form 2, Section 52(1)

Land affected by the application is located at:	127-137 Merrivale Dr WARRNAMBOOL VIC 3280
Application is for a permit to:	Section 23 (Removal of Restriction)
Applicant for the permit is:	Mr Philip Davis C/o Smith Land Surveyors Pty Ltd
Application reference number is:	PP2024-0155

You may view the applications and any supporting documentation at the office of the responsible authority, Warrnambool City Council, 25 Liebig Street Warrnambool, during office hours, free of charge. Any person who may be affected by the granting of the permit may object or make other submissions to the responsible authority.

An objection must be made to the responsible authority in writing, include the reasons for the objection, and state how the objector would be affected. If you object, the responsible authority will tell you its decision.

The responsible authority will not decide on the applications **before 21 October 2024.**

Air BP deal to supply Avalon

Alexander Blain

An international energy giant has been locked in to supply fuel to Avalon Airport, as the state government announced it would be home to a brand new processing facility.

Air BP – the specialist aviation division of BP – has added Avalon Airport to its list of airports it supplies jet fuel to.

The company will be the airport's sole supplier, replacing Viva Energy, on a five-year deal with an option for mutual extension.

As part of the agreement, Air BP will supply the airport with Jet A-1 fuel and also provide technical services for operations and equipment.

Jet A and Jet A-1 are the most commonly used fuels for commercial aviation, with Jet A-1 having a lower freezing temperature, making it more suitable for longer flights.

Air BP also supplies fuel to multiple Melbourne airports, including Tullamarine and Essendon Fields.

It is hoped the partnership will attract new domestic, international and freight airlines to Avalon, and provide greater connectivity for Geelong and regional Victoria.

Air BP has inked a five-year deal with Avalon Airport.

Avalon served about 900,000 passengers in 2023 but the airport has lofty ambitions and aims to serve upwards of 15 million passengers a year by 2040.

The fuel will be supplied via Quantem's fuel terminal at Corio Wharf, where Air BP has had a commercial arrangement for more than six years.

Air BP's Asia Pacific vice-president Haley Mahoney said the company was thrilled to welcome Avalon to the "Air BP family".

"This region is strategically important for Air BP and our focus is on building enduring relationships with customers and creating value through leveraging our global expertise and leading end-to-end supply capability," she said.

Avalon's acting chief executive Ari Suss said the deal built on a 50-year partnership between BP and airport owner, the Linfox Group.

"The goodwill and trust that comes from this is invaluable and we look forward to building on it here at Avalon," he said.

Viva Energy, operator of the Geelong Refinery, had been Avalon's sole supplier since 2018, after the company took over Shell's aviation business.

The Air BP deal comes on the heels of the Victorian government's announcement of a new dedicated airfreight processing facility at Avalon.

The $8m facility, set to open next year, will operate around the clock and allow the airport to handle 10 times the cargo that currently flows through the airport. Avalon handled more than 10,000 tonnes of cargo in the 2023 financial year and when it opens the facility will be able to process more than 100,000 tonnes.

Unearthing creativity

Search for artists to enliven city

Genevieve Holding

A long-time artistic director and CEO of the West Coast's renowned Unconformity arts festival will breathe new creative air into the Hobart City Council's Hobart Current exhibition program next year.

Travis Tiddy, alongside experienced palawa/Tasmanian Aboriginal artist and project manager Denise Robinson, hope to find the best and brightest in contemporary artists locally and interstate to liven up Hobart's CBD next year as part of the annual arts program.

The exhibition will showcase art in its various forms in the Tasmanian Museum and Art Gallery (TMAG) as well as outdoor sites across Hobart, with the program meeting the theme of 'Here'.

Mr Tiddy said planning was in the early stages, with expressions of interest for 10 artists now opening.

"We might have writers, visual artists, performers, people from all sorts of backgrounds and I think that really expresses what Hobart Current is all about, celebrating the diverse Hobart," he said.

"Our focus this time around would be how do we support artists to develop their creative sense of this city and continue to encourage artists to see Hobart as an arts hub."

Ms Robinson, who has more than 40 years of experience in arts management, said she was looking forward to working with Mr Tiddy to uncover new artists and expressions.

"I'm particularly interested in connectivity and ways of working between institutions and artists, fostering dialogue, exchange and collaboration that re-imagines how we work collectively and meaningfully," she said.

"I think what makes this exhibition so great is that it's quite open to interpretation and invites such a wide field of people to be seen across our capital city."

To express interest as an artist, apply at hobartcurrent.com/here/ by Monday, November 4.

genevieve.holding@news.com.au

Harrods claims explode

LONDON: More than 200 women are now in settlement talks with Harrods over alleged abuse by its former owner Mohamed Al Fayed.

The Egyptian billionaire died last year aged 94. But new allegations have emerged after the BBC last month aired an expose claiming he raped and sexually abused women during his ownership of Harrods.

"Since the airing of the documentary, so far there are 200-plus individuals who are now in the Harrods process to settle claims directly with the business," the store said.

Separately, the BBC said another 65 women told them Fayed abused them, while lawyers for the Justice for Harrods Survivors group representing alleged victims said they now had more than 70 clients.

Harrods is advising new complainants to obtain advice through the Harrods Survivors Group legal team or another legal team.

The new allegations sent to the BBC stretch back to 1977, include sexual harassment, sexual assault and rape; 37 of the 65 new claimants had worked at Britain's most famous shop, the BBC said.

Justice for Harrods Survivors said women felt safe to come forward and accusers were "increasing on a daily basis".

Platypus furry well travelled

Yarra is their 'highway', DNA tracking reveals

EXCLUSIVE
Mitch Clarke

The movements of Melbourne's highly elusive platypus population have been uncovered by local researchers using innovative technology to track the adorable monotreme.

The Melbourne Water-led program involved sampling water at 1800 sites across Melbourne's creeks and waterways – from the Macedon Ranges to the Mornington Peninsula – between 2021 and 2023.

Using eDNA – known as environmental DNA – ecologists were able to detect traces of DNA shed in the water from the mucus, urine, faeces, skin and saliva of a platypus.

Now it can be revealed that the extremely shy animals are living and foraging in dozens of creeks and rivers across Melbourne. A positive data result has even been recorded in the city section of the Yarra River.

Although the data doesn't conclude that platypus are actively living in the waters off Southbank, it could mean they are regularly travelling into the area in search of food.

Melbourne Water manager of waterways and wetland research Dr Rhys Coleman said eDNA provided "crucial insights" into platypus activity because DNA traces stay in the water for days to weeks after the animal has been present.

"Platypus are quite shy, occur in a variety of habitats and are predominantly nocturnal, so it can be difficult to monitor their activity through traditional methods alone – particularly where rivers are wide, deep or fast flowing," Dr Coleman said. "It may surprise many Melburnians to learn that there are platypus in their local creeks and rivers."

Analysis of eDNA also revealed platypus sightings in the inner city municipalities of Melbourne, Yarra, Stonnington, Maribyrnong and Boroondara. Dights Falls in Abbotsford has a confirmed platypus population, while further out they were detected in the Maribyrnong River, Dandenong Creek in Knox and the Mullum Mullum Creek.

Dr Coleman said eDNA readings on the Mornington Peninsula are "particularly interesting" to scientists because a platypus has never been caught in that region.

"With further eDNA surveys, we hope to get a clearer picture about how platypus might use those Mornington streams," he said.

The waters of the Yarra River throughout the city centre aren't ideal conditions for platypus, Dr Coleman said, but the river's highly urbanised inner city sections have long stretches of native vegetation and reliable water flows.

"The Yarra River essentially acts as a 'highway' for platypus to be able to travel to more natural areas," he said.

"Despite the lower Yarra being heavily urbanised, much of the river upstream remains in relatively good condition."

Melbourne Water will conduct more surveys this spring breeding season as part of its 30-year monitoring program.

The intensive eDNA mapping effort helped researchers fill the gaps at deep, fast flowing or hard to access sites that are too difficult to survey with traditional methods – such as capture and release.

Dr Coleman said that in the face of declining numbers, it's more important than ever to monitor where platypus live.

"Climate change and increasing urbanisation are impacting platypus habitats, and we must seize every opportunity to protect our precious waterways to stabilise their numbers," he said.

"With urbanisation comes increased water run-off from hard surfaces such as roofs, driveways, and roads into stormwater drains which flows into waterways destroying platypus habitats."

Platypus are also at risk of being tangled in litter, which can prove deadly, he said.

3.13 King Island Courier (31 October 2024)

King Island Courier THURSDAY, OCTOBER 31, 2024 Page - 9

Key questions that save lives

STORM EASTLEY
MAST Senior Recreational Boating Safety Officer

AS summer approaches, Tasmania's boating population is gearing up for another season on the water.

With one in 17 people owning a boat, Tasmania has the highest rate of boat ownership rate in Australia and Marine and Safety Tasmania (MAST) wants to ensure every boater returns home safely.

Safety on the water requires more than ensuring your boat is in good condition. Many Tasmanians often overlook safety equipment.

MAST officers, in collaboration with Tasmania Police, routinely conduct vessel safety inspections to ensure boaters have the required safety equipment on board.

While most Tasmanians are well-prepared, with the majority carrying the appropriate gear, we've noticed some boaters store their equipment in hard-to-reach places such as lockers or under other items.

In an emergency, every second counts and your safety gear needs to be within easy reach. Having the right equipment is crucial but being able to access it quickly is just as important.

Tasmanians lead the world in life jacket compliance with an impressive 94 per cent of boaters wearing them on the water—a statistic we're extremely proud of.

However, it's vital to ask: Is the rest of your safety gear properly maintained and readily accessible in case of an emergency?

To help boaters assess their preparedness, MAST is promoting the 30-Second Challenge.

The concept is simple-in the event of an emergency, can you access your safety gear and call for help within 30 seconds?

This quick exercise could save lives. Here are some important questions to consider:

- Is everyone on board wearing their life jacket?
- Do all passengers understand how inflatable life jackets work?
- Are your flares or Electronic Visual Distress Signals (EVDS) stored within easy reach?
- Is your Emergency Position Indicating Radio Beacon (EPIRB) close by and ready to activate?
- Do you know how to make a Mayday call?

One area of concern for MAST is the servicing of inflatable life jackets.

Since 2001, Tasmania has had legislation making it compulsory to wear life jackets on boats under six metres.

It's estimated that Tasmania has between 75,000 and 85,000 inflatable life jackets, yet fewer than 3 per cent of these are serviced according to the manufacturer's guidelines.

During vessel checks MAST officers frequently find boaters wearing inflatable life jackets with issues such as poorly fitted or rusted gas cylinders.

If the gas cylinder is compromised, the jacket won't inflate when needed most. Simply put, if a life jacket can't inflate, it's not a life jacket.

Unfortunately, in recent years there have been fatal incidents in Tasmania involving individuals who were wearing inflatable life jackets.

Church news

Do you not know? Have you not heard? The Lord is the everlasting God, the Creator of the ends of the earth. He will not grow tired or weary, and his understanding no one can fathom. Isaiah 40:28 NIV

All Saints Church

WE have been tracking through the Letter to the Hebrews in our second readings and are up to 7:23-38 this weekend

The letter contrasts the Temple priesthood of the old covenant prior to Jesus, with the high priesthood of Jesus in the new and infinitely better covenant.

"He has no need, like those high priests, to offer sacrifices daily, first for his own sins and then for those of the people; he did this once and for all when he offered up himself."

The cruel death of Jesus at Calvary was once only and completely sufficient for our salvation. Yet because Jesus did this to be our eternal mediator his sacrifice transcends time and place.

"Consequently he is able for all time to save those who draw near to God through him, since he always lives to make intercession for them (Heb 7:25)"

This is the language of present and future, the ever-present reality of our salvation. We participate in the re-presentation of Jesus' "once for all" sacrifice in the Eucharist.

In this week's gospel Mark 12:28-34, Jesus is asked what the greatest commandment is. He quotes the daily Jewish prayer from Deuteronomy to "Love the Lord your God with all your heart, with all your soul, with all your mind and with all your strength," adding an element not in the original - "your mind". So our intellect and thoughts are also being called to love. "Love your neighbour as yourself" is from Leviticus; an ancient commandment that never gets old.

Anglican Church

THIS Sunday at Heywood, parishioners will join together at St John's for a special service to thank past Parish Councillors Elaine Burns, Kathie and Garry Butt and Heather McKellar.

This will be followed with lunch at the Heywood Hotel.

Coffee, Chat and Morning Prayer is celebrated each Friday at 9am at Heywood Bakery.

Coffee, cake and chat at Port of Call each Wednesday about 11ish, following Eucharist at St Stephen's.

God is good, and we continue with great hope for the future, as we prepare to give thanks and celebrate the past 190 years of worship here in Portland.

Gardening working bee, held on the first Saturday each month, all volunteers welcome. The next one will be tomorrow, November 2 at 10.00am. This is another example of 'doing' God's work.

The Book group has been moved to the Nankeen on Mondays at 2.30 pm. We commenced 'God is good for you' by Greg Sheridan and are enjoying the discussion the book has provoked.

St Stephen's Ladies Guild, Tuesday November 12, in the Nankeen.

St Stephen's 190th Celebration Combined Eucharist will be Sunday 24 November followed by lunch in the hall. We are praying Bishop Gary will be well enough to share the day with us.

St John's Heywood, welcome all to Coffee, Craft and Chat Wednesday 20 November 10am.

St Stephen's Ladies Happy hour Thursday, 28 November at 5pm, meeting at the Rectory.

Portland Men's Happy Hour next Thursday 28 November, 5pm at the Royal Hotel. All are welcome to join prayer and fellowship.

Our thanks to those who continually help to stock our Parish Pantry. Please consider adding an extra item to your groceries to donate. The need is great at this time.

We pray continually for a lasting peace in the Middle East, Ukraine and throughout our world.

"Hear, O Israel, the Lord our God, the Lord is one; you shall love the Lord your God with all your heart, and with all your soul, and with all your mind, and with all your strength, and you shall love your neighbour as yourself. There is no other commandment greater than these." Mark, 10 29-31

Lutheran Church

AS soon as you realise what I'm talking about, you'll probably skip on to something else. That's understandable - people don't like talking about death.

But sometimes people want to talk about those who have died. While the person may be gone from us, the pain of losing them hasn't. This is especially true for those who have recently experienced the death of a friend or loved one. There's not always the opportunity to discuss those who have died, even if people are comfortable talking about death. For those who have lost a loved one or friend, death is very real, even for those who know they will see them again in heaven.

This Sunday is All Saints Day, a Christian tradition dating back to at least the third century. Historically, it was a day for remembering church martyrs, but in modern times we remember all people of God who have died. This includes the ordinary and everyday person who believes, not just the well-known saints of old who did something significant.

During Sunday's church service, we will have time to remember those who have died, particularly those who have passed more recently (i.e. the last year or two). Everyone is welcome to come along to remember and reflect. Candles will be available if you'd like to light one in memory of your loved one(s).

God understands our grief, which is why he made it possible for anyone to have life forever with him, through Jesus.

Everyone is welcome at church.

Portland Baptist Church

THE story of Philip and the Ethiopian eunuch in Acts 8:26-40 reveals how God reaches people in unexpected ways and invites His church to participate in His plans.

Philip, guided by the Holy Spirit, left a successful ministry in Samaria to journey along a desert road, where he met an Ethiopian official. This official, a devout man seeking God, was reading from Isaiah but needed help understanding it. With humility, he invited Philip to explain, and Philip shared the good news of Jesus, leading to the eunuch's joyful baptism and entrance into the Kingdom of God.

This story teaches us God's love transcends all boundaries. It calls the Christian to obediently share the gospel with others in humility and joy, to trust the Holy Spirit who empowers the Christian to witness, bringing hope to those who seek God. As Philip's obedience led to joy for the Ethiopian, so too can our steps of faith spark joy, renewal and transformation in others. This Sunday Mark Hurkmans will be speaking on God's boundless love and our call to faithfully share the good news of Jesus in order that seekers may come to know God more and be filled with His love and joy.

Portland Baptist Church gathers for worship every Sunday at 10am on the corner of New and Learmonth Street. All people are welcome.

Portland Uniting Church

HELLO, welcome to November. We are fast approaching the end of 2024.

On Sunday we were reminded the value of contributing towards improving our community to the best of our ability.

We can do this in many ways and on differing scales of contributions.

In what ways do you think you can help?

We warmly invite you to join us for Sunday 10:15am Worship in person or via Zoom. Zoom information is available through the Office email (below).

Weekly Activities are held 10am until 12noon.

Tuesdays JC's Craft group - bring a project and join us.

Thursdays Open Door - Everyone is welcome to gather with our Volunteers for a cuppa and conversation.

Op Shop news

Our Volunteers invite you to visit during: Tuesday - Friday 10am - 3pm and Saturday 10am - 12noon.

We are closed Melbourne Cup Day.

Spring Mini-Market on Saturday 16th November, 9:30am - 1:30pm.

Limited site bookings left for: Town Green Market, Stallholder sites and Car Boot Sale sites.

Please see a Manager in store to arrange yours soon.

Postage stamp donations can still be made in-store.

We go knowing that the saints who have been part of our formation in faith continue to live in and through us. Go to bless and be blessed in the name of God: Source, Son and Spirit. Amen. ' Sourced: Tig Tree Worship Resources.

Contact us via: Chairperson Gilbert Wilson, 0431 594 973; Supply Minister Rev Peter Cook, 0488 724 882; Office phone number, 5521 2455; Office email address, office@portland.vicuca.org.au; Facebook, www.facebook.com/PortlandUnitingChurch.

Rock Church

LAST Sunday we had such an incredible service filled with so much joy and family.

We are super excited for this Sunday, with Ps Frank continuing the "Beware of the Devil Snare" series. The aim of our services is to create a space for all of us to connect with God through praise and worship, and the message shared, helps us journey through life. During our church service we offer an amazing program for primary school-aged kids called Rock Kids that is designed to encourage and help kids on their walk with God.

Our youth have been loving Rock Youth, with games, food, fun and always Jesus being our motto. This term we are excited to have grade 6 students joining in on the fun. Rock Youth is run every Friday through the school term from 7pm to 8:30pm at our church building, but doors are open from 6:45. See you guys there for a fun Friday night!

We also offer a food-bank and Café space in Heywood on Wednesday from 10am to 12pm. Feel free to come along, grab a coffee and have a chat. Or if you are in need of a helping hand, or know of someone who is, then come along and grab some non-perishable food.

This is just a little snapshot of what is happening at Rock Church. To stay updated, be sure to follow us on Instagram, Facebook, and YouTube at RockChurch_vic. For more information, visit our website at www.rockchurch.org.au

South West Community Church

WHAT is joy? Biblical joy, a deep and unshakable gladness given by the Holy Spirit, goes beyond what's happening around us and is rooted in God's love and faith fulness.

Nurturing this joy starts by building a close, personal relationship with God through prayer, reading the Bible, and spending time in worship. Galatians 5:22-23 reminds us that joy is one of the beautiful "fruits of the Spirit," and it grows as we walk with God and open our hearts to His guidance.

A wonderful way to experience this joy is through gratitude. Philippians 4:6-7 encourages us to bring our worries to God with a thankful heart, allowing His peace and joy to calm and fill us. When we focus on all God has done, even in the hard times, we begin to see His goodness everywhere, and a resilient joy blossoms.

Trusting that God is in control also fills us with joy, no matter what we face. Romans 8:28 assures us that He is working all things for our good. Even in trials, and remember, joy often comes from blessing others. Acts 20:35 tells us that it's more joyful to give than to receive. By serving and caring for others, we reflect Christ's love, finding joy in lifting others up.

We can all take heart that this joy is a gift that God wants you to experience, and as you trust Him, live gratefully, and care for others, His Spirit will fill you with a joy that lasts.

Consultation for the development of Environment Plans

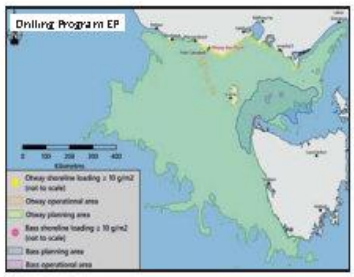
beach

Beach Energy (Beach) currently supplies natural gas from offshore Victoria to the local market through existing infrastructure, including pipelines and onshore production facilities.

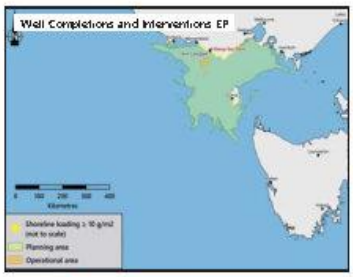
Beach is inviting consultation with relevant persons whose functions, interests or activities may be affected by proposed activities under Environment Plans (EP) for further natural gas development activities.

Consultation is important as it helps identify potential impacts and ensures control measures are included in EPs. If there is someone you believe may be affected by the proposed activities, please assist them to contact us.

Online information webinars



Beach is holding the following online information sessions (webinars) to further explain the project activities and provide an opportunity for Q&A with Beach's technical team.



See table for session times and email community@beachenergy.com.au and advise which session you want to attend, and we will send you registration details.

Consultation dates and information	
Offshore Gas Victoria Project – Drilling Program EP	16 September to 9 December 2024. Supplementary consultation
Offshore Gas Victoria Project – Well Completions and Interventions EP	16 September 2024 to 14 February 2025. Consultation
Open community webinars (AEDT)	
Open community information webinars	Tuesday, 12 November, 6pm to 6.45 pm Wednesday, 13 November, 2.15pm to 3pm
Dedicated cultural sensitive First Nations webinars	Tuesday, 12 November, 2.15pm to 3pm Wednesday, 13 November, 6pm to 6.45 pm

Further information

We encourage you to access Beach's additional resources, maps, and project details about the EPs on our online engagement hub, Engage Beach (engage.beachenergy.com.au) or via the QR code.

For information regarding consultation, please see NOPSEMA's brochure titled 'Consultation on offshore petroleum environment plans' at consultation.nopsema.gov.au

Great value for prescriptions at Kilcunda Discount Chemist

A PHARMACY for all seasons would be one way to describe the new discount chemist in Kilcunda's innovative Sticks retail and community hub.

Another description would be a long-awaited godsend for pensioners, young families, and local people without transport.

"I'm thrilled to see a chemist shop in town," said one longtime Kilcunda resident.

A shared business venture between Sam Shalabi and Alan Elkilany the Kilcunda Discount Chemist follows the establishment of similar successful pharmacies in Nyora in 2016, Fish Creek in 2019 and Meeniyan in 2021.

"We are new to The Sticks in Kilcunda," said Mr Shalabi.

Providing a full dispensary and electronic prescription service seven days a week, Kilcunda Discount Chemist can help you manage your diabetes through the National Diabetes Services Scheme (NDSS), provide home delivery, Webster multi-dose packs for individuals who take multiple medications, and medication reviews.

Open Monday to Friday from 9am to 5.30pm and Saturday and Sunday from 9am to 1pm Kilcunda Discount Chemist provides great value for Kilcunda, San Remo, Dalyston, and Bass residents as well as a convenient stopover for travellers on the Bass Highway.

"We're only a small store at the moment," said Mr Shalabi "but we have plans to expand the business with bigger premises in the future."

Kilcunda Discount Chemist pharmacist Alan Elkilany. B17_0325

Competitive prices with limited waiting times for prescriptions have proved popular.

"We take the time to care for our customers," said pharmacist Alan Elkilany.

"People appreciate the service we provide.

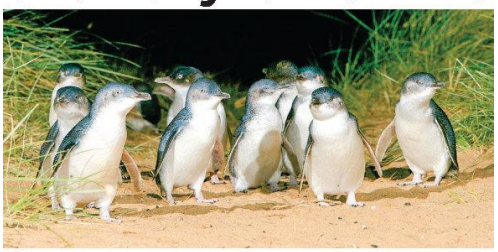
"They are thrilled to have a pharmacy in Kilcunda."

Discover the value and convenience of Kilcunda's new pharmacy for yourself.

You can find Kilcunda Discount Chemist at Shop 6 in the fashionable Sticks complex at 3537 Bass Highway, Kilcunda or phone (03) 7071 2955.

Divorce is not strictly for humans

LIFE isn't always a beach for Phillip Island's beloved penguins, who have been found to divorce their partners and find a new mate if they aren't satisfied with the number of young filling the nest – but it's a risky decision that can lower success in their next breeding attempt.



New research conducted over more than a decade by Monash University and Phillip Island Nature Parks has taken a deep dive into the complicated love lives of the species to determine what it can predict about the colony's reproductive future.

Researchers found the rate of divorce among the penguins is a more reliable predictor of the reproductive success of the colony than environmental factors like habitat change or behavioural traits like the time they spend foraging for prey, with more divorces and re-pairings in a breeding season resulting in lower reproductive success across the colony.

Phillip Island is home to the 37,000 little penguins, the world's largest colony of the species, and the internationally renowned Penguin Parade attracts thousands of visitors each year to watch these amazing seabirds waddle home from the ocean to their burrows at dusk.

Professor Richard Reina, Head of Monash's Ecophysiology and Conservation Research Group in the School of Biological Sciences, has studied penguins on the island for 20 years and said contrary to popular belief, not all penguins partner for life.

"In good times, they largely stick with their partners, although there's often a bit of hanky-panky happening on the side," Professor Reina said.

Love isn't forever for all penguins with divorce rates shaping Phillip Island's colony's reproductive future. *Photo: Phillip Island Nature Parks.*

"However, after a poor reproductive season they may try to find a new partner for the next season to increase their breeding success.

"Our study looked across 13 breeding seasons, tracking which individuals changed partners, or divorced, from one season to the next.

"We recorded nearly 250 penguin divorces from about a thousand pairs throughout the study, and we found that years with a lower divorce rate resulted in higher breeding success."

Phillip Island Nature Parks Marine Scientist Professor Andre Chiaradia said the divorce rate was an accurate predictor of success because it more accurately correlated with breeding rates than other factors impacting the penguins.

"Our findings on lower divorce rates among little penguins at Phillip Island under favourable environmental conditions highlight the importance of considering social dynamics alongside environmental factors when designing strategies to protect vulnerable seabird species," Professor Chiaradia said.

Matt Simpson worked with Professor Reina and Professor Chiaradia on this research as his Honours project while completing a Bachelor of Science at Monash University.

"I'm proud to have been able to make a significant contribution to the conservation of these fascinating birds by helping find new ways of identifying patterns that indicate the health of these bird populations," Simpson said.

"This has been a long time in the making and a lot of work went into it.

"It was also a fantastic opportunity to gain real-world experience in the field while completing my studies."

This research is the latest in a decades-strong collaborative relationship between Monash University and Phillip Island Nature Parks.

The full paper was published this month in the peer-reviewed journal Ecology and Evolution and is available online at doi.org/10.1002/ece3.70787.

Public Notice

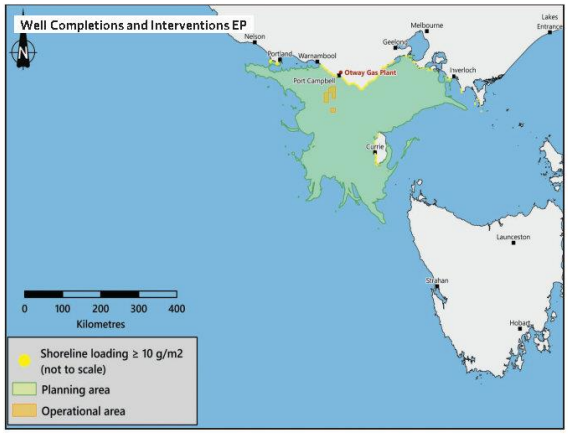
Consultation for the development of Environment Plan

beach

Beach Energy (Beach) currently supplies natural gas from offshore Victoria to the local market through existing infrastructure, including pipelines and onshore production facilities.

Beach is continuing to consult on its Offshore Gas Victoria (OGV) Well Completions, Well Interventions, and Plugging and Abandonment Activities Environment Plan (Well Completions and Interventions EP).

Activities described within the EP would enable future connection of new gas wells to existing infrastructure, maintain the option to plug and abandon an existing suspended well subject to a further assessment of its viability and enable activities to re-enter up to two existing wells to improve performance.



Invitation to consult with Beach

Beach invites consultation with persons and organisations whose functions, interests, or activities may be affected by the activities described in the EP outlined in this notice. Consultation is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted as a result of the consultations.

Consultation for the Well Completions and Interventions EP commenced on 16 September 2024 and will close at **5.00pm AEDT on 14 February 2025.**

Please email community@beachenergy.com.au to register your interest in attending a webinar, advising the session you would like to attend, and we will send you registration details.

Further consultation dates and information	
First Nations online information sessions (webinars)	Wednesday 5 February 2025, 7.00pm to 7.45pm AEDT Thursday 6 February 2025, 2.15pm to 3.00pm AEDT **Please contact us to register for a webinar.**
Open online information sessions (webinars)	Thursday 6 February 2025, 7.00pm to 7.45pm AEDT Friday 7 February 2025, 11.30am to 12.15pm AEDT **Please contact us to register for a webinar.**

For information regarding consultation, please see NOPSEMA's Brochure titled '*Consultation on offshore petroleum environment plans*', at **consultation.nopsema.gov.au**

The map in this notice shows the planning area, and environment that may be affected.

We encourage you to access Beach's additional resources, maps, and project details about the environment plans, which can be accessed via the QR code. We also invite you to contact us if you wish to discuss other consultation options or are seeking further information.

BOWLS

Kerry, Rob claim pairs championship

TIM HENNESSEY
BOWLS CAPTAIN

THE third and final round of the pair's competition got under way on Saturday in windy and challenging conditions.

Tim and Rod got off to a great start for the day with a plus 13, which bumped them up into second place for a short while.

Leaders Kerry and Rob showed Doug and Graham how the younger generation bowl, winning by a huge 13 shots. Rikki and James got up by 5 shots in the play off against them to take out the day's bragging rights.

It was a great three-week series with some stiff competition. Congratulations to the overall winners Kerry and Rob, winning themselves vouchers kindly donated by Island Larder who sponsored the event.

Thanks to everyone who entered.

Next up we have the handicap singles competition kicking off on February 1 so don't forget to come to the King Island Golf and Bowling Club and put your name down.

Rod McGarvie sends down a bowl.

Val McGarvie lines up for a shot.

20 NIT THE INDIGENOUS BUSINESS REVIEW theibr.com.au

Event a chance to network

Carrie Sailor and Hannah Hollis at the LDI event. Picture: Tiffany Garvie

GIOVANNI TORRE

More than 400 First Nations students, interns, alumni, staff and partners from all over Australia gathered from January 21-23 at Marvel Stadium in Naarm (Melbourne) for a three-day Leadership Development Institute conference.

The professional development and leadership conference is a key part of the CareerTrackers program, which supports First Nations university students and links them with employers to participate in paid internships.

After a Welcome to Country and smoking ceremony, CareerTrackers chief executive Taryn Marks opened by saying how proud she was the conference had such a broad representation of First Nations communities, countries and language groups in attendance. The Wotjobaluk woman said the awards ceremony recognising student achievements would be a highlight.

The event's 2025 theme, Connecting For Impact — Because Together We Can Achieve So Much More, was in evidence as CareerTrackers interns and alumni connected and discussed key matters, learning from each other's experiences and skills.

Among the conference workshops was a student session led by Leyla Quartermaine and Drew Paten of the Koorie Youth Council with the theme of The Gift of Responsibility. This drew an enthusiastic response when they opened discussion up to the floor, while alumni were also keen to share their thoughts during a session by Caroline Kell on managing cultural load.

Other workshops included presenting with confidence, leadership, and goal setting.

CareerTrackers deputy CEO Carrie Sailor noted this was the first in-person LDI event since 2019.

"We pivoted to online formats since, but to see our community back together again, networking, learning and supporting one another is always going to be special," the Gomeroi woman said. The conference also celebrated the achievements of its community, with a networking and awards breakfast.

Winners were as follows: intern of the year — Isabella Zdravkovic, intern at IBM; intern manager of the year — Catherine Haintz, GSK; alumni excellence award — Merinda Walters; project excellence award — Macie Lamont and Dr Rhea Longley, WEHI and University of Melbourne; community spirit award — Jiah King, intern at Indigenous Business Australia; and partnering for excellence award — BAE Systems. Students who receive a distinction average receive a gold diary, with 79 given out this year.

Attendees were also treated to a ground pass at the Australian Open and a keynote speech by Matt Tindale, managing director of LinkedIn Australia and New Zealand; and Andrew Krakouer, former AFL player, media personality and author.

3.23 Koori Mail (29 January 2025)

feature

Janice is truth-telling

By JILLIAN MUNDY

TASMANIAN Aboriginal artist Janice Ross is in London this week truth telling and pushing for the return of important objects in British institutions, in particular a doll and pincushion that belonged to stolen Tasmanian Aboriginal girl Mathinna.

Mathinna was born at Wybalenna on Flinders Island, Lutruwita/Tasmania in 1835 during the brutal Black War.

She was stolen from her parents for Tasmanian Governor 'Sir' John Franklin and 'Lady' Jane Franklin when she was just four years old.

Jane Franklin herself wrote that Mathinna was a 'civilising experiment', listing her alongside a collection which included the skulls of Aboriginal people. In her writings Jane Franklin described Mathinna as a 'savage', four years after stealing her the couple dumped Mathinna at an orphanage and returned to England, taking Mathinna's little doll and the pincushion she made with them – part of their disturbing collection.

Janice Ross with her installation in the Tasmanian Museum and Art Gallery, a version on a white wall is currently exhibited in London – it is story that spans centuries.

Mathinna died under mysterious circumstances in her late teens.

A famous 1842 portrait of Mathinna in a red dress by artist and freed convict Thomas Bock has captured the imagination of generations and is symbolic in telling the story of the brutal colonisation of Lutruwita.

It was this painting and then the 2017 discovery of her doll and a pincushion in a box in England that inspired Janice to create an installation reflecting on her own disconnection from her people and culture.

The installation nuratinga milaythina kani mana-mapali (Country holding our stories), first exhibited at the Tasmanian Museum and Art Gallery (TMAG), was part of the 2022 group show laypani milaythina-tu: Return to Country – twenty contemporary Tasmanian Aboriginal artists' responses to cultural treasures held in TMAG and collecting institutions from other parts of Australia and overseas, exhibited alongside some of those objects.

At the time Mathinna's doll and pincushion were on loan to TMAG for the exhibition.

While the loan for the doll has been extended, the pincushion has been returned to England.

Janice herself was adopted into a white family when the forced removal of children from Aboriginal families and single mothers was still happening in Tasmania.

While Janice was adopted into a loving and supportive family, who had no part in taking her from her birth parents, and hers is a much happier story, she feels parallels to Mathinna's life and feels a connection to her.

"I understood from a very young age that I was an Aboriginal child, but Aboriginal to me had no meaning, I didn't know who Aboriginal people were because there was no contact with them," Janice said.

"So when I was growing up the only connection that I made was with the North American tribes – I wrote assignments at school, and I felt like I had this connection with them, it was so good."

3.24 Portland Observer (31 January 2025)

Marking 80 creative years

CHARLIE SAWYER-BASSETT

IN honour of its 80th birthday, Portland CEMA Inc. is bringing four sessions to the Portland Libraries After Dark program in February.

CEMA stands for Council for Encouragement of Music and the Arts and is a volunteer organisation.

All sessions will be hosted at the Portland Library on Thursday evenings, free of charge.

Participants are welcome to consider joining CEMA as a member to continue enjoying the many group activities throughout the year.

Portland CEMA Inc junior vice president Shae Spry said CEMA and Glenelg Libraries are vital to the culture of Portland.

"They provide a space and opportunity for people to come together in community, grow as individuals and explore a variety of interests," she said.

"This collaboration is an opportunity to celebrate CEMA's 80th year by offering people the chance to try something out at our wonderful Portland Library.

"Perhaps for some there has been a passing interest in a potential new hobby; now would be the perfect opportunity to dip a toe in.

"Members of CEMA often reflect on how enriching they find their involvement in the various group activities.

"Here, skills are learnt, confidence is built and friendships are forged."

On Thursday February 6, the CEMA Ukulele Group will host two activities.

Adult Ukulele Beginners, from 6.30pm to 7pm, is an introduction to uke playing led by CEMA president Jan Colliver with the help of group members.

There are a few ukuleles available to use thanks to a recent grant from Pacific Blue, otherwise participants are free to bring their own along.

From 7.15pm to 8.15pm is the Sing and Strum Session, suitable for ukulele players who know a few chords, and anyone keen to sing along or simply listen. Participants must bring their own uke.

On Thursday February 13 a Come and Try Dance session will be held from 6pm until 7pm.

Join Monica Treloar who will guide participants in a easy dance session themed "Dance Around the World."

This session will be a medley of popular world music inspired from Spain, Egypt, Korea and the Caribbean.

Participants are asked to wear comfortable clothing and flat sole shoes (or bare feet if preferred).

The session will be followed by a brief public meeting in which there will be a vote to determine whether Portland CEMA Inc. will officially establish a Dance Group as per the constitution.

On Thursday February 20, from 6pm to 7pm, Poetry Group members will share an array of poems for attendees to appreciate and contemplate.

On Thursday February 27, Theatre Group members will introduce the basic principles of improvisation, for participants to explore and experiment with through theatre games. The first session is 5.30pm to 6.30pm, for ages 12 to 18, and adults are to accompany younger participants. The second session is 7pm to 8pm, for adults aged 18 plus.

Portland CEMA Inc invites the community to try a free session of dance, as well as other arts groups.

Public Notice

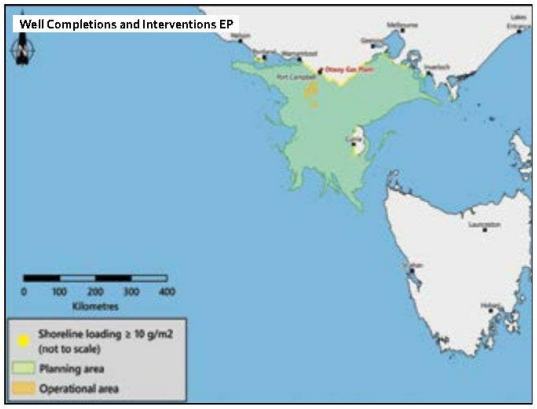
Consultation for the development of Environment Plan

beach

Beach Energy (Beach) currently supplies natural gas from offshore Victoria to the local market through existing infrastructure, including pipelines and onshore production facilities.

Beach is continuing to consult on its Offshore Gas Victoria (OGV) Well Completions, Well Interventions, and Plugging and Abandonment Activities Environment Plan (Well Completions and Interventions EP).

Activities described within the EP would enable future connection of new gas wells to existing infrastructure, maintain the option to plug and abandon an existing suspended well subject to a further assessment of its viability and enable activities to re-enter up to two existing wells to improve performance.



Invitation to consult with Beach

Beach invites consultation with persons and organisations whose functions, interests, or activities may be affected by the activities described in the EP outlined in this notice. Consultation is an important part of developing EPs as its purpose is to ensure that potential impacts have been identified and appropriate measures adopted as a result of the consultations.

Consultation for the Well Completions and Interventions EP commenced on 16 September 2024 and will close at **5.00pm AEDT on 14 February 2025.**

Please email community@beachenergy.com.au to register your interest in attending a webinar, advising the session you would like to attend, and we will send you registration details.

Further consultation dates and information	
First Nations online information sessions (webinars)	Wednesday 5 February 2025, 7.00pm to 7.45pm AEDT Thursday 6 February 2025, 2.15pm to 3.00pm AEDT **Please contact us to register for a webinar.**
Open online information sessions (webinars)	Thursday 6 February 2025, 7.00pm to 7.45pm AEDT Friday 7 February 2025, 11.30am to 12.15pm AEDT **Please contact us to register for a webinar.**

For information regarding consultation, please see NOSPEMA's Brochure titled '*Consultation on offshore petroleum environment plans*', at **consultation.nopsema.gov.au**

The map in this notice shows the planning area, and environment that may be affected.

We encourage you to access Beach's additional resources, maps, and project details about the environment plans, which can be accessed via the QR code. We also invite you to contact us if you wish to discuss other consultation options or are seeking further information.

4. Letter to newly identified South Australian fishers (distributed on 21 October 2024)

Beach Energy Limited | ABN 20 007 617 969
Level 8, 80 Flinders Street, Adelaide, South Australia 5000
GPO Box 175, Adelaide, South Australia 5001
T +61 8 8338 2833 | F +61 8 8338 2336
beachenergy.com.au

[Choose date]

[Name]
[Address line 1]
[Address line 2]

Dear [Sir/Madam or name]

My name is Sharon, and I am the Senior Community Relations Manager for Beach Energy (**Beach**) in Victoria.

Beach currently supplies natural gas from offshore Victoria to the local market through existing infrastructure, including pipelines and onshore production facilities.
The purpose of this letter is to:

- introduce you to Beach and our Offshore Gas Victoria (**OGV**) Project: and
- extend the opportunity to consult with us in the preparation of two environment plans:
  - OGV – Drilling Program Environment Plan (**Drilling EP**)
  - Well Completions, Well Interventions and Plugging and Abandonment Activities Environment Plan (**Well Completions and Interventions EP**).

Beach has been consulting for many years with commercial fishers in our operational areas south of Port Campbell and in Bass Strait. Beach safely drilled one exploration well and six production wells in its Otway Basin offshore Commonwealth permits from February 2021 to July 2022. Four production wells from that project have been connected and are now producing gas for the east coast market, with two remaining wells planned for connection in late 2024.

Beach is continuing its commitment to supply natural gas to the east coast gas market, is preparing Environment Plans (**EPs**) for the OGV Project (including the Drilling EP and the Well Completions and Interventions EP), and is undertaking consultation for the preparation of its EPs.

EP Activities

The Drilling EP and Well Completions and Interventions EP activities are explained in the enclosed information sheets that also shows location maps. Although the activities in each EP are not occurring in South Australian waters, we are now reaching out to you as the EPs include emergency response planning areas that have a small overlap, relative to the area's total size, within South Australian waters. The planning area is also known as the Environment that May Be Affected (**EMBA**), as shown in the enclosed information sheets.

Consultation with Relevant Persons

Purpose of consultation
Consultation with 'Relevant Persons' is an important part of preparing an EP as its purpose is to ensure that potential impacts arising from the EP activities have been identified and appropriate measures adopted as a result of the consultations.

For consultation on each EP, Beach is providing a range of consultation methods and opportunities including an online consultation hub, Engage Beach, (engage.beachenergy.com.au) where you can ask questions, engage in online webinars, arrange meetings and make contact through phone calls and emails.

Relevant Persons

Under the Offshore Petroleum Greenhouse Gas Storage (Environment) Regulations 2023 (**Regulations**), a 'Relevant Person' includes persons or organisations whose functions, interests or activities may be affected by the activities to be carried out under an EP.

From information available on the Fisheries Public Register via Government of South Australia – Department of Primary Industries and Regions, we have identified that you hold a fishery licence in a South Australian commercial fishery that overlaps the EMBA, and therefore may be a Relevant Person. Please contact us if you would like to discuss your functions, interests or activities in relation to the activities proposed under the either EP, seek further information, or consult with us.

Sufficient information

The Regulations also require that Relevant Persons be provided sufficient information to allow them to make an informed assessment of the possible consequences of the EP activity on their functions, interests or activities.

In addition to the enclosed Information Sheets, at our online consultation hub, engage.beachenergy.com.au, you will find information prepared in a variety of styles including short summaries, long descriptions, diagrams, maps, Q&A formats and detailed information on a range of topics related to the activities proposed under each EP. We encourage you to contact us if you would like to discuss information you are seeking about the activities under either EP.

Reasonable period

The Regulations also require that titleholders (such as Beach) allow Relevant Persons a reasonable period of time for consultation. What is a reasonable period will depend on the nature of an activity, the potential impacts and risks on a Relevant Person's functions, interest or activities, and is considered on a case-by-case basis. Beach is consulting on the Drilling EP up to 9 December 2024, and on the Well Completions and Interventions EP up to 14 February 2025.

Sensitive information

In accordance with Regulations, the EP must include a report on all consultations with, and a copy of the full text of any response by, a Relevant Person. Relevant Persons may request the information they provide not be published, and in that case it will be identified as sensitive information and not published in the EP.

NOPSEMA Consultation Brochure

For further information regarding consultation generally, please see NOSPEMA's '*Consultation on offshore petroleum environment plans*' brochure which can be found on NOPSEMA's website (nopsema.gov.au).

Contact us

Please contact us if you would like further information, have any questions, or feedback, or if you wish to consult with us about how the activities in either EP may impact your functions, interests or activities. Beach will take into consideration feedback, including any concerns or objections, and will explore measures to reduce any impacts and risks.

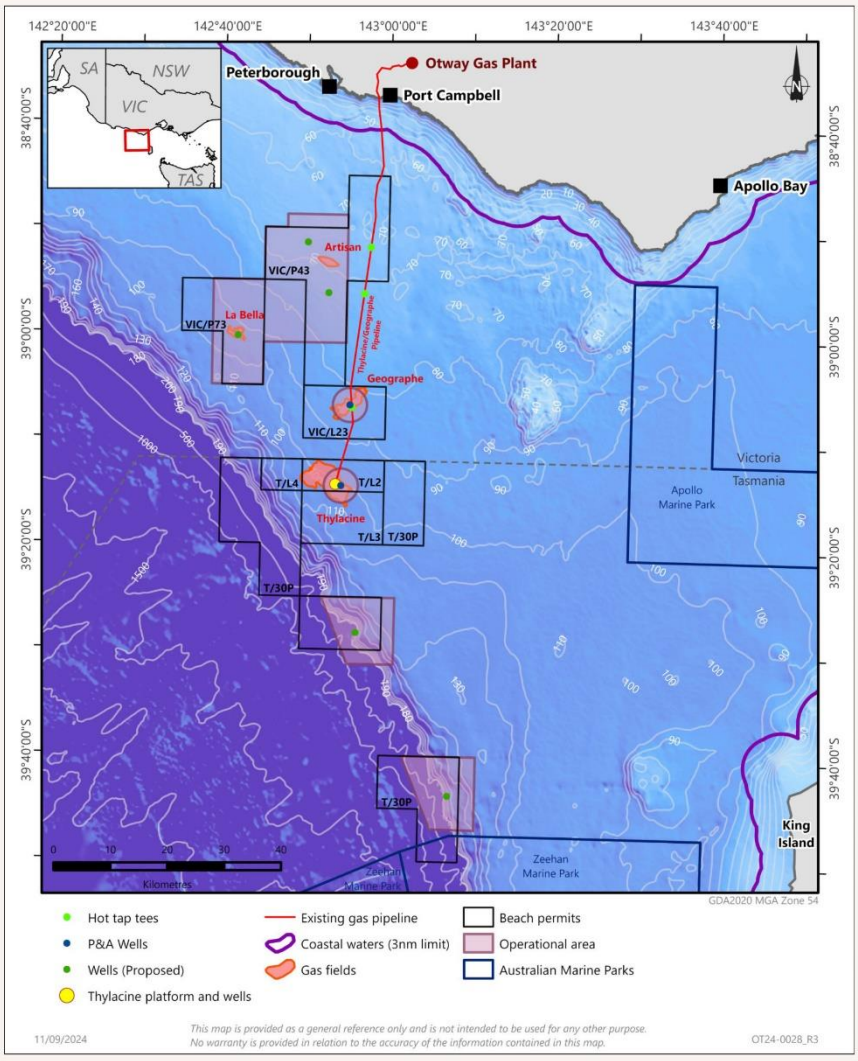
The orange areas show the locations of Beach Energy offshore petroleum permits and licenses.

These are the operating areas of the:

- Offshore Gas Victoria Project - Drilling Program Environment Plan;
- Offshore Gas Victoria Project- Well Completions and Interventions Environment Plan



beach

Offshore Gas Victoria - Locations

Otway Basin

This map references activities in Drilling Program Environment Plan and Well Completions and Interventions Environment Plan.

- The black squares are **our permits**.
- The red line is **our pipeline** and goes back to our onshore gas plants; Otway and Lang Lang.

Offshore Gas Victoria - Phases

Seabed Assessments	Plug and abandonment	Drilling of wells	Completing wells
Activities planned no earlier than November 2024	Activities planned for no earlier than March 2025	Activities planned for no earlier the March 2025	Activities planned for no earlier than early 2026

Seabed assessment

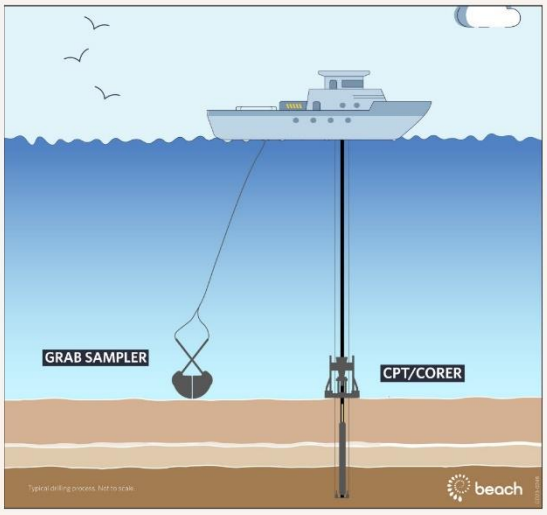
Geophysical and Geotechnical Seabed Survey Environmnent Plan (EP)

EP accepted by NOPSEMA on 16 December 2023.

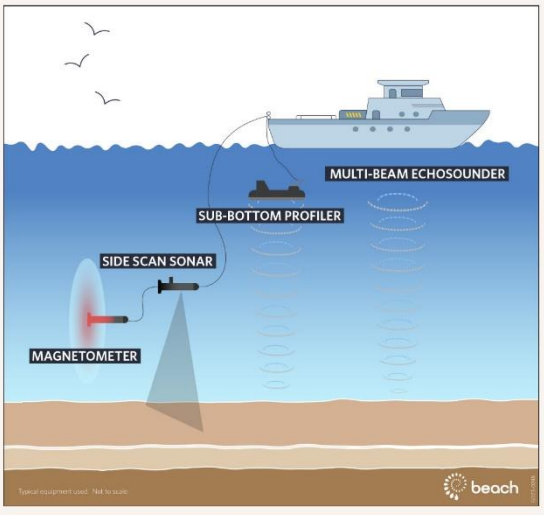
Seabed assessments (non-seismic) are carried out to determine suitable locations for the drill rig and future seabed infrastructure to connect wells.

The seabed surveys are estimated to take on average around 20 days for each required well site location within the Operational Area.

Geotechnical activity description



The geotechnical activities will be undertaken by a vessel with specialised equipment to carry out the following activities:



- Obtaining core samples
- Determining soil strength
- Collecting soil samples
- Collecting sediments
- Using drop and tow cameras to observe the environment

Geophysical activity description

Geophysical activities include:

- Multibeam echosounder for bathymetry mapping
- Side scan sonar for identifying seabed features Magnetometer to detect metallic objects on or below the seabed
- Sub-bottom profiler to identify shallow formation structures below seafloor

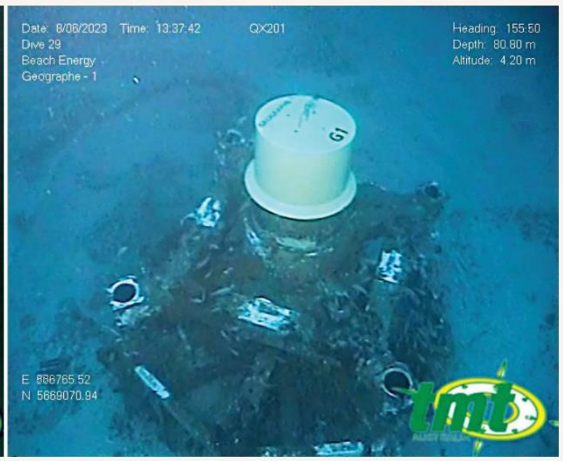
Methods of seabed assessment

beach

Offshore Gas Victoria - Phases

Seabed Assessments	Plug and abandonment	Drilling of wells	Completing wells
Activities planned no earlier than November 2024	**Activities planned for no earlier than March 2025**	Activities planned for no earlier the March 2025	Activities planned for no earlier than early 2026

Plug and abandonment



Drilling Program EP and Well Completions, Well Interventions and P&A EP

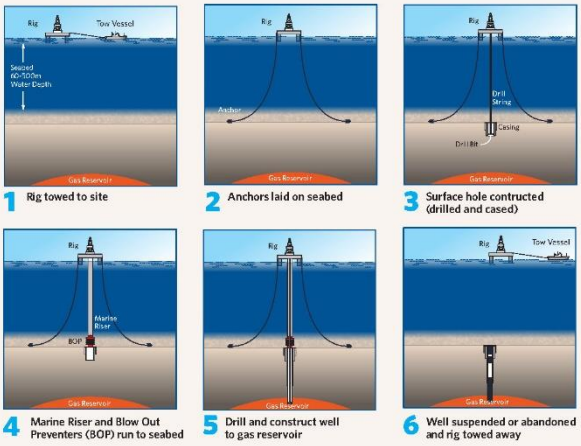
As part of our activities, Beach will be permanently plugging and abandoning five suspended wells (a process called "plug and abandonment"). This activity is done to suspended exploration wells and wells that are no longer producing .

The same drilling rig that undertakes our offshore drilling carries out these activities.

Cement plugs will be installed within the well to permanently seal the well and isolate it from formations. A cement plug will be installed at or close to the seabed and all casings will be cut at least 2 metres below the mudline to ensure that the seabed is returned to the same condition prior to drilling (P&A)

Offshore Gas Victoria - Phases

Seabed Assessments	Plug and abandonment	Drilling of wells	Completing wells
Activities planned no earlier than November 2024	Activities planned for no earlier than March 2025	**Activities planned for no earlier the March 2025**	Activities planned for no earlier than early 2026



Drilling of wells

Drilling Program Environment Plan

Up to five exploration, appraisal or production wells will be drilled. All new wells will be within existing permits

Each well will take between 30 - 40 days to drill depending on whether the well is viable and will be developed for production.

Beach has contracted the Transocean Equinox, which is a modern semi-submersible drilling rig designed for harsh weather and sea conditions.

beach

Offshore Gas Victoria - Phases

Seabed Assessments	Plug and abandonment	Drilling of wells	**Completing wells**
Activities planned no earlier than November 2024	Activities planned for no earlier than March 2025	Activities planned for no earlier the March 2025	**Activities planned for no earlier than early 2026**

Well Completions and Interventions

Well Completions, Well Interventions and Plugging and Abandonment EP

Should drilling be successful the wells would be completed and connected to our existing infrastructure.

In the Otway Basin, they would be tied into the offshore Thylacine platform, which is connected by pipeline to the onshore Otway Gas Plant.

The Well Completions and Interventions activities are expected to be undertaken between 1 January and 31 December 2026, and would take approximately 145 days to complete, including:

- 25 days per well for the installation of subsea equipment and well completions activities;
- 15 days per well for intervention activities to improve performance of two wells; and
- 15 days for contingency P&A activities at one location.

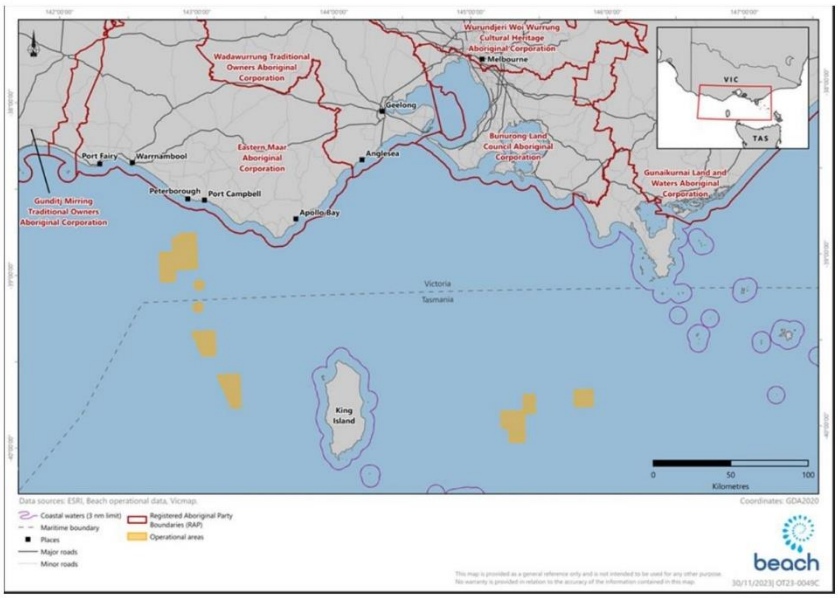
Consultation with First Nations Groups

For the development of the Drilling EP and the Wells Completions, Wells Interventions and P&A EP, Beach has undertaken consultation with First Nations groups within the Operational and Planning Areas of the EP activities:

- Eastern Maar Aboriginal Corporation (EMAC)
- Gunditj Mirring Traditional Owner Aboriginal Corporation (GMTOAC)
- Bunurong Land Council Aboriginal Corporation (BLCAC)
- Wadawurrung Traditional Owners Aboriginal Corporation (WTOAC)
- Gunaikurnai Land and Waters Aboriginal Corporation (GLAWAC)
- Representative First Nations corporations in Tasmania
- Representative First Nations groups in NSW

(although the planning area has since been reduced and no longer includes NSW coastal areas)



Beach has been undertaking consultation for the Drilling Environment Plan (EP) since June 2023.

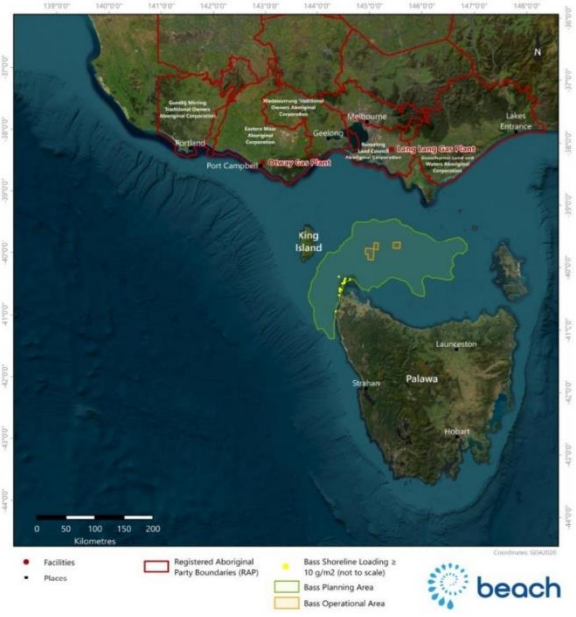
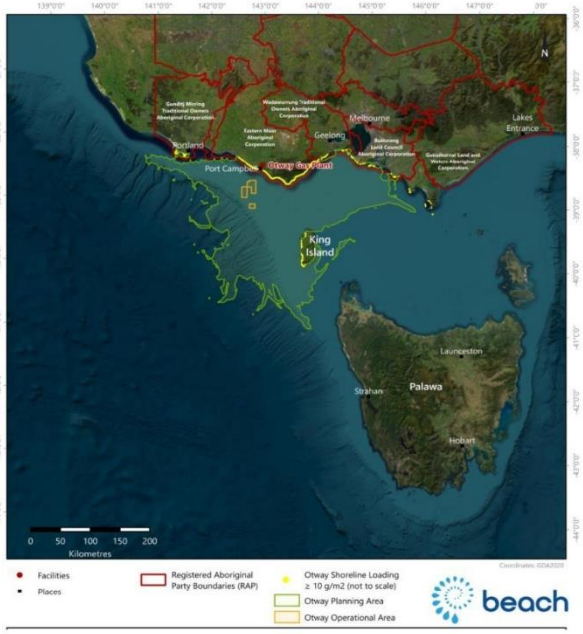
Slide 11

Drilling EMBA Map



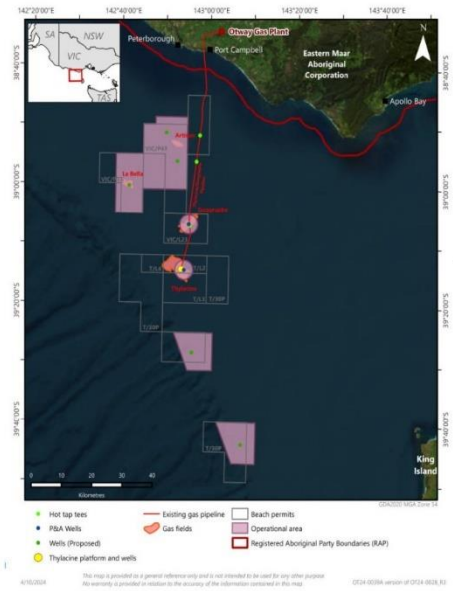
- Map showing the full extent of the possible "Environment that may be affected" (EMBA)
- The EMBA includes the Operational Area and the Planning Area
- The full extent of the EMBA is determined by the perimeter of over 200 spill model scenarios
- The EMBA does not represent the entire area that may be impacted if there was a loss of well control or loss of vessel fuel
- The EMBA is used for:
  - Defining all the environmental features that may be in that area, assessing any impacts and developing control measures
  - Planning for emergency responses in that area, in the event of a worst-case scenario accident

11 Private and confidential – not for distribution

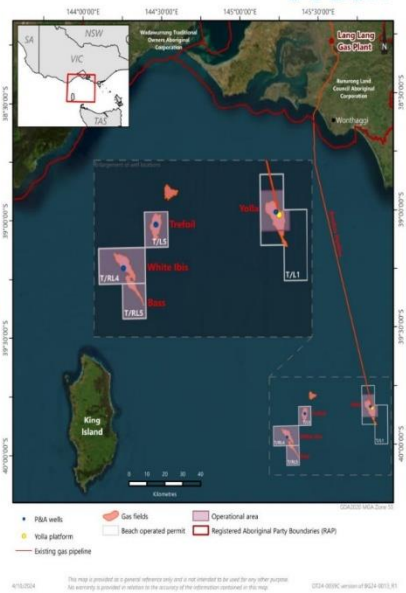


Slide 12

Plug & Abandonment of Suspended Wells Environment Plan EMBA Map



Completions and Interventions Environment Plan EMBA Map



Slide 13

Consultation with First Nations Groups

- The land adjacent the Otway Operational and Planning Area is the traditional land of the Eastern Maar Peoples legally represented by the EMAC.
- EMAC is both a Registered Aboriginal Party and a Recognised Native Title Prescribed Body Corporate.
- Otway gas plant is located on Eastern Maar country

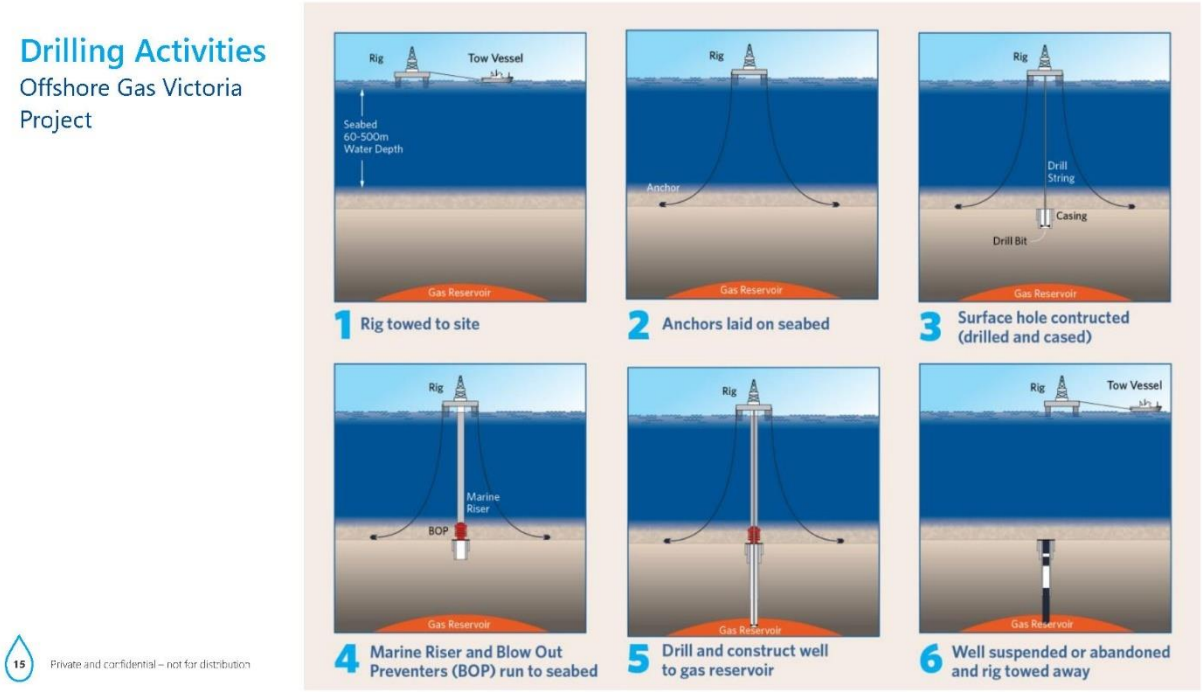
- The Bunurong First Nations peoples are the Traditional Owners of the Victorian land adjacent to the Bass Operational and Planning Areas and the Otway Planning Areas.
- Bunurong are represented by the Bunurong Land Council Aboriginal Corporation (BLCAC).
- Lang Lang Gas plant is located on Bunurong country

Slide 14

Emergency Planning and Environment

Offshore Gas Victoria Project

Beach must have an accepted Emergency Response Plan prior to the activity taking place.



- Highly skilled teams based in Melbourne and Adelaide on 24/7 rosters.
- Practice exercises are held before, during and after the project.
- Supported by international experts based in Geelong (Australian Maritime Oil Spill Centre (AMOSC)
- Worst case modelling is undertaken on possible impact areas based on Australia Maritime Safety Authority (AMSA) guidance.
- Access to aerial and marine support with ground crews being available to mobilise in a short period of time.
- Tactical response plans for specific areas pre-designed to ensure fast and specific response.

- Wadawurrung Traditional Owners Aboriginal Corporation (WTOAC)
- Gunaikurnai Land and Waters Aboriginal Corporation (GLAWAC)
- Representative First Nations corporations in Tasmania

Slide 7

Consultation with First Nations Groups

- Beach recognises that the definition of environment in the Offshore regulations includes:
  - the heritage value of places; and
  - the social, economic, and cultural features of the broader environment.
- Beach understands that Country, including sea country, is the term used by First Nations groups to describe the lands, waterways, and seas to which they are connected.
- The description in the Well Completions, Well Interventions and Plugging and Abandonment Environment Plan of the environment for cultural features and values was developed through:
  - Consultation with First Nations groups with connection to Sea Country in the Operational and Planning Areas
  - Review of available publications by First Nations Groups relating to Sea Country.
  - Engagement of Extent Heritage Pty Ltd (Extent), a specialist archaeological consulting firm, to undertake a literature review and a review of Beach's assessment.

Activity - Location Map

Offshore Gas Victoria Project – Drilling Program and P&A Environment Plan

Operational Area
The area within which well completions, well intervention, and plug & abandonment activities are planned to occur (subject to final approvals).

Planning Area
The broadest extent of the defined 'environment that may be affected' (EMBA). Note the EMBA is the largest geographic area where operational activities could potentially have a direct or indirect environmental impact.

Shoreline Loading
Where hydrocarbons may reach the shoreline in the event of an accident. The maps show the modelling of over 200 scenarios in different weather conditions and times of the year. It does not represent what would occur in the event of a single accident.

Slide 4

Regulation Framework

- NOPSEMA regulates activities in accordance with the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Regulations).
- The OGV Project requires Environment Plans (EPs) to be accepted by NOPSEMA before beginning activities.
- EPs will typically be prepared for different activity phases; in the present case, Beach is preparing two Environment Plans for the Drilling activities (**Drilling Program and P&A Environment Plan**) and Completions and Interventions (**Well Completions and Interventions Environment Plan**)
- EPs must include:
  - a description of the existing environment
  - the proposed activities
  - an evaluation of the impacts and risks, environmental performance outcomes and controls, implementation strategy, and reporting requirements.
  - EPs must also demonstrate that consultations with relevant persons whose functions, interests or activities may be affected by the activities in the EP (**relevant persons**), have been carried out in accordance with the Regulations.

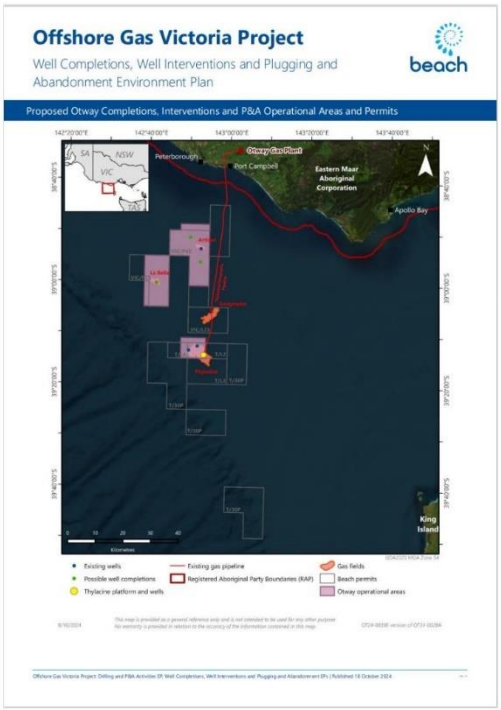
Slide 8

Eastern Maar Sea Country



- A 'Relevant Person' is defined in the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 as including a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under an EP
- Through consultation with Eastern Maar Aboriginal Corporation for Environment Plans, and as identified in your *Meerreengeeye Ngakeepoorryeeyt* Country Plan, Beach understands that the Otway activity area is adjacent to Eastern Maar Sea Country and the infrastructure connects back to the Otway Gas Plant, which is also on Eastern Maar country

Slide 9

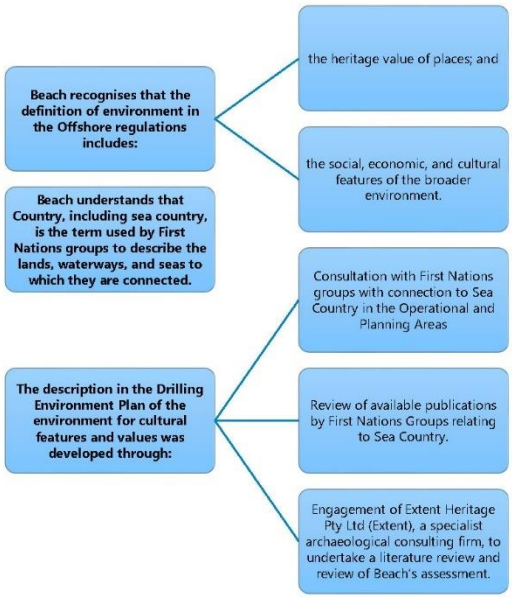
Eastern Maar Sea Country

- A 'Relevant Person' is defined in the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 as including a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under an EP
- Through consultation with Eastern Maar Aboriginal Corporation for Environment Plans, Beach understands that the Otway activity area is adjacent to Eastern Maar Sea Country and the infrastructure connects back to the Otway Gas Plant, which is also on Eastern Maar country

Slide 10

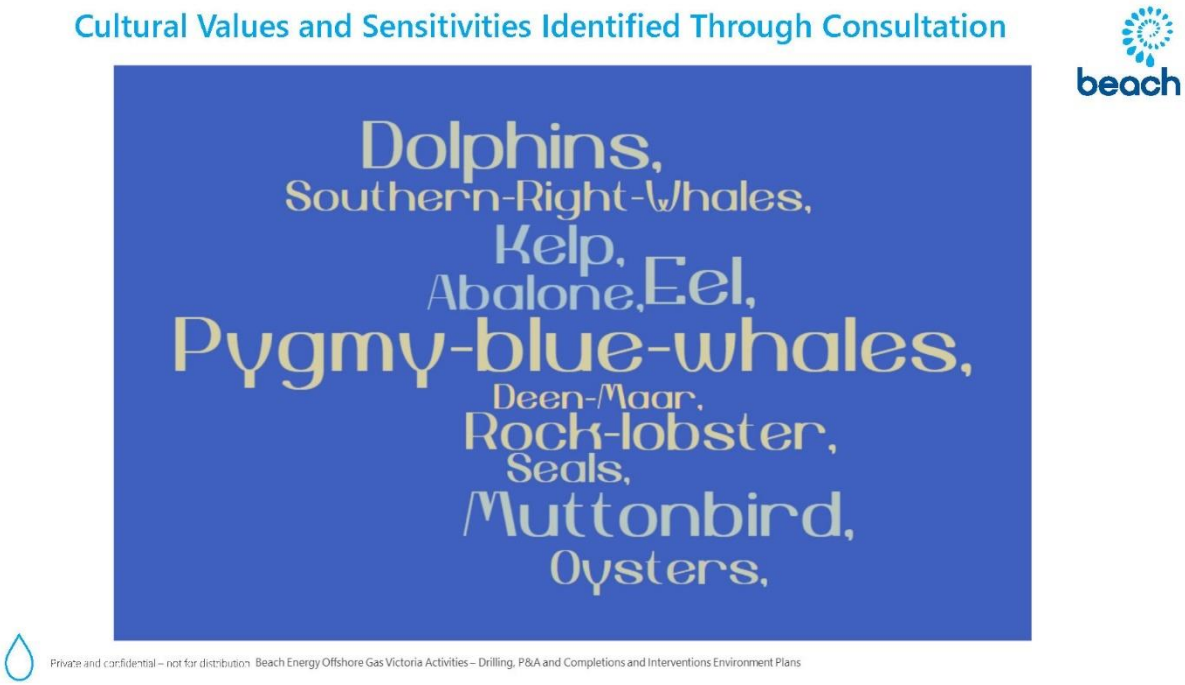
Consultation with First Nations Groups

For the development of the Drilling EP and the Wells Completions, Wells Interventions and P&A EP, Beach has undertaken consultation with First Nations groups within the Operational and Planning Areas of the EP activities:



- Eastern Maar Aboriginal Corporation (EMAC)
- Gunditj Mirring Traditional Owner Aboriginal Corporation (GMTOAC)
- Bunurong Land Council Aboriginal Corporation (BLCAC)
- Wadawurrung Traditional Owners Aboriginal Corporation (WTOAC)
- Gunaikurnai Land and Waters Aboriginal Corporation (GLAWAC)
- Representative First Nations corporations in Tasmania
- Representative First Nations groups in NSW

(although the planning area has since been reduced and no longer includes NSW coastal areas)



Beach has been consulting for the Drilling Environment Plan (EP) between June 2023 and February 2024 and further supplementary consultation between September to December 2024. .

Activity - Location Map

Offshore Gas Victoria Project – Drilling Program and P&A Environment Plan

Operational Area
The area within which Drilling and plug & abandonment activities are planned to occur (subject to final approvals).

Planning Area
The broadest extent of the defined 'environment that may be affected' (EMBA). Note the EMBA is the largest geographic area where operational activities could potentially have a direct or indirect environmental impact.

Shoreline Loading
Where hydrocarbons may reach the shoreline in the event of an accident. The maps show the modelling of over 200 scenarios in different weather conditions and times of the year. It does not represent what would occur in the event of a single accident.

Beach – Previous Drilling campaign

Otway Phase 4 Drilling project

- Assessment of seabed locations (non-seismic) in 2019
- Drilling program from February 2021 to July 2022
- One exploration well and 6 production wells drilled
- Six wells successfully connected to Otway Gas Plant
- 13,500 hours of marine mammal monitoring
- 127 blue whales were observed within 3 km of the drilling rig
- 3 southern right whales were observed migrating past
- Average time whales appeared in the observation area was 27 mins
- No material environment incidents

Completions and Interventions Activities

Offshore Gas Victoria Project – Well Completions and Interventions Environment Plan

- **Well completion** is the process of preparing a well for production after it has been successfully drilled
- It involves installing production and flow control equipment within the wellbore on the seabed and completing the final construction of the well
- Completions operations are conducted with well control equipment called a blow-out preventer (BOP) and a subsea production tree (subsea tree) placed on the seabed at or near the site of the well.
- Well completion activities may be undertaken for up to four wells and (for each well) includes: installing the subsea tree, preparing the wellbore for lower and upper completion installation, installing the completion equipment, perforating the production casing, and flowing the well back to surface facilities for clean-up.
- **Well interventions** are carried out to improve the performance of a well that has not been operating to its potential or requires modification or maintenance

Offshore Gas Victoria Project

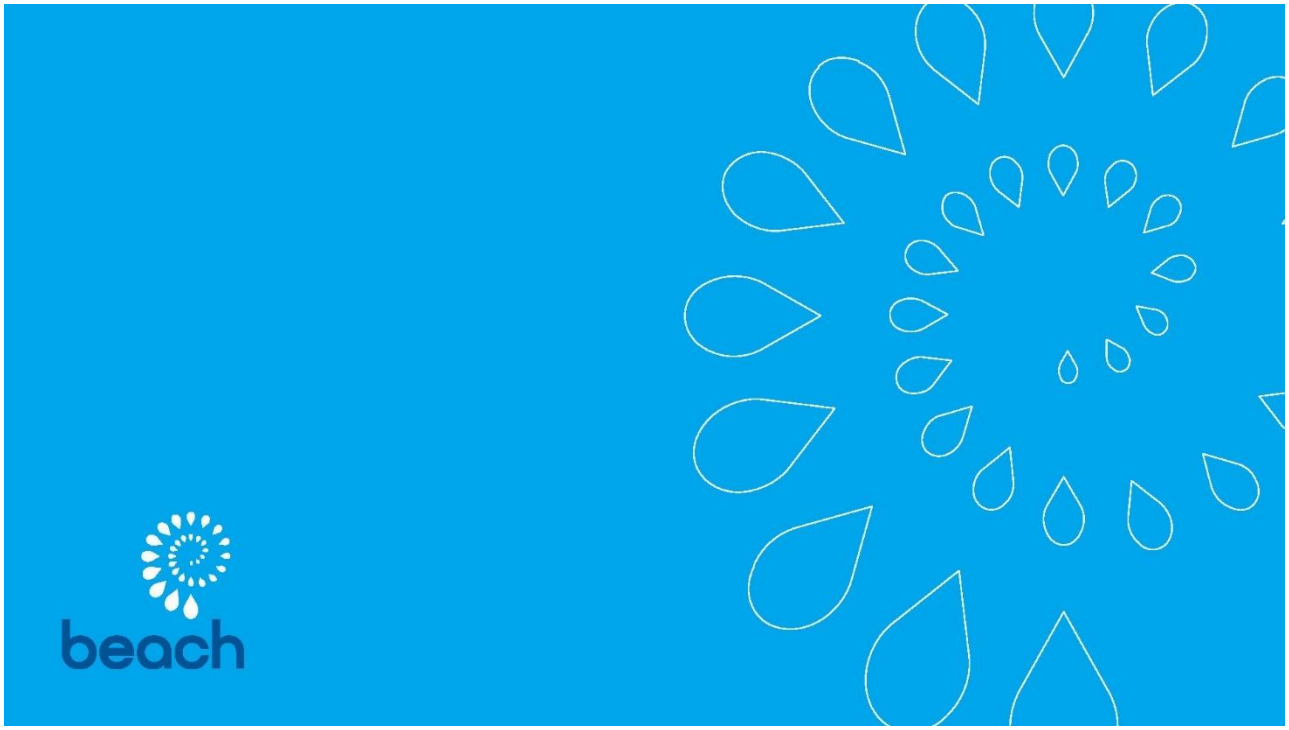
Feedback received through consultation will be used to inform Environment Plans for the industry regulator, NOPSEMA.

Consultation and feedback with anyone whose functions, interests or activities may be affected by the project activities is an important part of developing these Environment Plans.



Beach will consider all feedback, including any concerns or objections and will explore measures to reduce any impacts and risks.

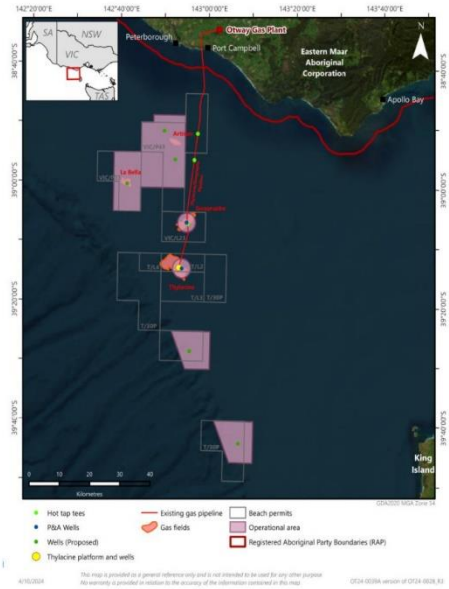
Slide 8



Consultation with First Nations Groups

- Beach recognises that the definition of environment in the Offshore regulations includes:
  - the heritage value of places; and
  - the social, economic, and cultural features of the broader environment.
- Beach understands that Country, including sea country, is the term used by First Nations groups to describe the lands, waterways, and seas to which they are connected.
- The description in the Drilling Environment Plan of the environment for cultural features and values was developed through:
  - Consultation with First Nations groups with connection to Sea Country in the Operational and Planning Areas
  - Review of available publications by First Nations Groups relating to Sea Country.
  - Engagement of Extent Heritage Pty Ltd (Extent), a specialist archaeological consulting firm, to undertake a literature review and review of Beach's assessment.

Slide 9

Consultation with First Nations Groups

- The land adjacent the Otway Operational and Planning Area is the traditional land of the Eastern Maar Peoples legally represented by the EMAC.
- EMAC is both a Registered Aboriginal Party and a Recognised Native Title Prescribed Body Corporate.
- Otway gas plant is located on Eastern Maar country

- The Bunurong First Nations peoples are the Traditional Owners of the Victorian land adjacent to the Bass Operational and Planning Areas and the Otway Planning Areas.
- Bunurong are represented by the Bunurong Land Council Aboriginal Corporation (BLCAC).
- Lang Lang Gas plant is located on Bunurong country

beach

Seabed Assessments

- Assessment of suitable location for drilling rig and new seabed infrastructure to connect wells.
- Activities planned for no earlier than November 2024.

Removing wells (P&A)

- Removal of five legacy suspended wells through a formal procedure (P&A).
- Activities planned for no earlier than March 2025.

Drilling Wells

- Up to five exploration, appraisal or production wells.
- Activities planned for no earlier than March 2025.

Completing Wells

- Completing up to four successful wells.
- Contingent P&A of one suspended well.
- Activities planned for no earlier than early 2026.

Slide 21

APPENDIX D GMTOAC CONSULTATION SUMMARY

Summary of Consultation with Gunditj Mirring Traditional Owners Aboriginal Corporation and Gunditjmara People.

In this Appendix, Beach has described:

1. its consultation with Gunditj Mirring Traditional Owners Aboriginal Corporation ('**GMTOAC'**) and the Gunditjmara People; and
2. why Beach considers that it has carried out the consultation required for the purposes of regulation 25 of the OPGGS(E)R with GMTOAC and the Gunditjmara People in respect of this EP.

The information in this appendix has been provided in the present context that GMTOAC and its legal representative Environment Justice Australia ('**EJA'**) have, in correspondence, raised material objections or concerns with the adequacy of Beach's consultation with GMTOAC and Gunditjmara People. Beach has closely considered its obligations for consultation with GMTOAC and Gunditjmara people under regulation 25 and considers that it has discharged these obligations and that consultation with GMTOAC and Gunditjmara people for the purposes of regulation 25 is complete.

1. Consultation Overview

For the purpose of consultation for the Well Completions and Well Interventions EP, Beach first contacted GMTOAC (via its legal representative, EJA) as the representative body for the Gunditjmara people on 16 September 2024, having previously identified that GMTOAC's Sea Country appears to fall within the Planning Area.[1] Beach has a history of engagement with GMTOAC and the Gundijtmara people, having previously consulted with GMTOAC and the Gunditjmara people in respect of previous EPs spanning 2022 to 2024 (inclusive).

GMTOAC is the representative body of the Gunditjmara people, including Gunditjmara native title holders, and has formal representative functions as both the Prescribed Body Corporate under the *Native Title Act 1993* (Cth) and the Registered Aboriginal Party under the *Aboriginal Heritage Act 2006* (Vic). GMTOAC, through its lawyers, have advised Beach that both GMTOAC and Gunditjmara are relevant persons for the purposes of consultation section 25 of the OPGGS(E)R. Consequently, Beach has identified both GMTOAC and Gunditjmara people as relevant persons for the purposes of this EP.

Relevantly, Beach notes that GMTOAC has advised that it is the first point of contact for consultation and Beach understands it is culturally appropriate to engage with GMTOAC on behalf of Gunditjmara people rather than seeking to engage directly with Gunditjmara people. Beach also notes that GMTOAC has advised that it is the Gunditjmara native title holders' native title rights and interests which may be affected by activities under this EP,[2] and that GMTOAC is the representative body which holds native title interests on trust for Gunditjmara people. Therefore, Beach has consulted with Gunditjmara people through GMTOAC (in addition to offering opportunities for engagement directly with Gunditjmara people, having regard to feedback from GMTOAC).

[2] See letter from EJA (as legal representative of GMTOAC) to Beach dated 15 November 2024 at paragraph 24(a).

Accordingly, in this Appendix, Beach does not distinguish between consultation with GMTOAC and Gunditjmara people.

In accordance with Beach's consultation methodology, Beach ensures it first contacts First Nations peoples' nominated representative entity to engage in consultation. Beach then provides an opportunity for the representative entity to advise if there are other groups or individuals with whom Beach should consult, and to forward Beach's project information sheets and consultation messages to their members or any other persons that the representative entity believes should receive that information.

Beach has had regard to GTMOAC's registered Rule Book.[3] Relevantly, the Rule Book notes, at paragraph 3(g), that GMTOAC may consult with other persons on behalf of the common law holders. Beach has also had regard to the Gunditjmara Consultation & Negotiation Protocol (referred to in this Appendix as the '**Consultation & Negotiation Plan**'), which states that:

- GMTOAC is the first point of contact to identify Gunditjmara who speak for particular knowledge, or an area of Gunditjmara Mirring;[4]
- through GMTOAC, Gunditjmara ensure that their cultural obligations and responsibilities are upheld and recognised; and
- GMTOAC liaises with its members in relation to offshore petroleum matters.

Beach also provided opportunities for Gunditjmara people (including GMTOAC members and native title holders) to self-identity as relevant persons during the consultation period, including through Beach's public newspaper, radio, and social media advertising campaigns (detailed in Table 4-8) and online webinars and specifically tailored First Nations information sessions.

Prior to the commencement of consultation in respect of this EP, EJA indicated to Beach that GMTOAC intended to provide Beach with a consultation plan, which would reflect GMTOAC's position on parameters and minimum standards for consultation with GMTOAC and its members. That consultation plan (the Consultation & Negotiation Protocol) was provided to Beach on 11 November 2024, approximately two months after the commencement of the consultation period for this EP.

Through the consultation period Beach and EJA exchanged a variety of correspondence.. This correspondence included the provision of project and consultation information from Beach, requests for information from the relevant person and responses to those requests, discussion in relation to the Consultation and Negotiation Protocol, and efforts to arrange an in-person meeting between Beach, GMTOAC and the Gunditjmara people. A full summary of Beach's consultation records with GMTOAC is contained in **Report B**.

GMTOAC had previously communicated with Beach that its preferred method of consultation was through in-person meetings with the wider native title group. Accordingly, Beach ensured that it was available to meet with GMTOAC and Gunditjmara people through the consultation period and offered various opportunities to GMTOAC for such a meeting throughout the consultation period, including on 16 September 2024, 11 October 2024, 22 October 2024, 3 December 2024 and 28 January 2025. Ultimately, GMTOAC did not avail itself of

[3] '*The Rule Book of Gunditj Mirring Traditional Owners Aboriginal Corporation (ICN 4672)*', pursuant to the *Corporations (Aboriginal and Torres Strait Islander) Act 2006* (CT), registered on 20 April 2023.
[4] At paragraph 15.

these opportunities and no in-person meetings occurred between Beach and GMTOAC and Gunditjmara people during the consultation period for this EP.

Notwithstanding that no substantive meeting occurred, Beach considers that:

- in accordance with regulation 25(2), Beach has provided GMTOAC and Gunditjmara people with sufficient information to allow GMTOAC and Gunditjmara people to make an informed assessment of the possible consequences of the activity on their functions, interests or activities;

- in accordance with regulation 25(3), Beach has allowed GMTOAC and Gunditjmara people a reasonable period for consultation; and

- in all of the circumstances, Beach has also provided GMTOAC and Gunditjmara people a reasonable opportunity to consult and Beach has consulted in good faith and in a reasonable manner.

2. Reasonable Period

In accordance with regulation 25(3) of the OPGG(E)R, Beach has afforded GMTOAC and Gunditjmara people a reasonable period for consultation in respect of Beach's activities the subject of this EP. In reaching this conclusion, Beach has taken into account the views expressed by GMTOAC, as well as the following:

1. Beach's approach to affording responsive and non-responsive relevant persons a reasonable period for consultation, as described in Sections 4.9 to 4.11.

2. Consideration of benchmark periods for consultation under relevant legislation, and other policy guidelines relevant to consultation with First Nations peoples (as described in Section 4.10).

3. The particular circumstances of GMTOAC and the Gunditjmara people, including the nature of their respective functions or interests (as applicable).

4. The fundamental purpose of consultation under the OPGGS(E)R and as informed by the findings of the relevant Courts,[5] including the opportunity for relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities such that Beach may adopt measures (if any) relating to the environmental impacts and risks of the activity, that are appropriate because of the consultation.

In total, Beach has provided GMTOAC and the Gunditjmara people a period of approximately 7 months for consultation on this EP. Following the conclusion of the formal consultation period between 16 September 2024 and 14 February 2025, Beach continued to seek to meet in person with GMTOAC and the Gunditjmara people, and provided information requested regarding impacts and risks associated with the activities under this EP. Beach remained open to consider additional comments, feedback or concerns raised by GMTOAC until 16 April 2025. Accordingly, Beach is satisfied that regulation 25(3) is satisfied in respect of the relevant persons comprising GMTOAC and the Gunditjmara people. Further detail on consultation is set out below.

[5] *Tipakalippa* at [55-57].

Beach notified GMTOAC's legal representative of the commencement of consultation for this EP in its email and attached letter on 16 September 2024,[6] and requested GMTOAC, its members and the Gunditjmara people advise whether (and how) they would like to engage in further consultation.

On 24 September 2024, Beach invited GMTOAC and the Gunditjmara people to participate in Beach's upcoming dedicated First Nations project information sessions to be held in-person on 22, 23 and 24 October 2024 and online on 12 and 13 November 2024. Beach also offered to support a dedicated information session for GMTOAC and the Gunditjmara people, at a location and time convenient to GMTOAC. Beach repeated these offers on 11, 22 and 31 October 2024. On 22 October 2024, Beach noted that GMTOAC did not attend the first planned First Nations information sessions held earlier that day and advised GMTOAC that there was still an opportunity to attend further First Nations information sessions on 23 and 24 October and offered to assist GMTOAC members with transport, and to arrange a separate meeting with GMTOAC and the Gunditjmara people if those dates were not convenient.

On 22 October 2024, GMTOAC's legal advisors confirmed receipt of Beach's email and attached letter of earlier that day, and advised that GMTOAC representatives were unable to attend the First Nations information sessions and that EJA would be in touch with GMTOAC's instructions for further meetings.

Between 11 November 2024 and 4 April 2025, Beach exchanged further correspondence with GMTOAC's legal advisors regarding consultation on the Well Completions and Interventions EP and regarding the Consultation and Negotiation Protocol provided to Beach on 11 November 2024. Beach extended further opportunities to GMTOAC and Gunditjmara people to consult with Beach during the consultation period, noting that (as with previous opportunities) it was a matter for GMTOAC and Gunditjmara people to accept or decline such opportunities. On 3 December 2024, Beach accepted an offer to attend a February 2025 full group meeting of Gunditjmara native title holders to provide an opportunity for native title holders to speak directly with Beach.

On 24 December 2024, EJA advised Beach that it had scheduled a meeting with a separate proponent on 14 February 2025 and had tentatively scheduled a meeting with Beach to occur in mid-March 2025. On 28 January 2025, Beach confirmed that it was prepared to extend the consultation period to allow for a mid-March 2025 meeting with GMTOAC to go ahead. However, on 3 March 2025, EJA advised that the mid-March 2025 meeting was no longer possible and that GMTOAC had decided to meet with a different proponent in April 2025, rather than Beach. On 4 April 2025, Beach wrote to GMTOAC's legal advisors to provide further information in respect of the impacts and risks of the activities under this EP and extended the opportunity for GMTOAC and Gunditjmara people to raise any comments, feedback or concerns in relation to the information set out in that correspondence until 16 April 2025.

Consistent with NOPSEMA's guidance,[7] Beach has taken into account the extent and severity of potential impacts and risks on GMTOAC and Gunditjmara functions, interests and activities in considering what constitutes a reasonable period for consultation, as discussed in Sections 6.6.3.2. and 6.6.4.

With regard to the analysis of benchmark periods for consultation under other legislative instruments (discussed in Section 4.10.1), Beach identified various different requirements for consultation and comment periods. Beach considers that the formal consultation period of 5 months afforded by Beach to consult with GMTOAC and the Gunditjmara people in the context of this EP represents a reasonable period properly suited to the legislative intent of the OPGGS Act and the OPGGS(E)R.

[6] Engagement ID E45326.
[7] See the final paragraph on page 8 of the NOPSEMA guideline '*Consultation in the course of preparing an environment plan'* (2024).

Beach notes that in *Tipakalippa*, at paragraph 136, Lee J commented that consultation should be a process that must be capable of being discharged within a reasonable time.

Beach has taken care to not to rush, or put undue time pressure on, GMTOAC in relation to its attempts to consult. Consistent with the policy guidelines for consultation with First Nations groups (discussed further in Section 4.10.2, Beach has respected GMTOAC's traditions and the need to allow sufficient time for GMTOAC to accommodate cultural influences, to convene group meetings and to build trust.

Beach also took care to remain respectful of GMTOAC's need to observe and take time for sorry business, as well as to convene Board meetings, to comprehend the information being provided to them and other requests for additional time. Beach has also provided reasonable time for GMTOAC to obtain the technical and other advice it has communicated it required in order to consult. In its letter dated 15 November 2024, EJA advised that it had received technical advice on 12 November 2024.

Taking all of the above into account, Beach considers that the 5 month formal consultation period it provided to GMTOAC and the Gunditjmara people, as well as the brief extension to that period, both for the purposes of a tentatively scheduled meeting (which did not proceed) in March 2025 and to provide further opportunity for consultation with GMTOAC and the Gunditjmara people until 16 April 2025, was sufficient to discharge Beach's obligation to provide a reasonable period to GMTOAC and Gunditjmara people to participate in consultation as required by regulation 25(3).

3. Reasonable Opportunity

In *Tipakalippa,* the Court when considering the requirements for consultation under reg 25 (then reg 11A), had regard to case law concerning the requirements under the *Native Title Act 1993* to provide a 'reasonable opportunity' to participate in decision-making. This echoed the views of the Courts in the way in which consultation under the *Native Title Act 1993* in relation to Indigenous Land Use Agreements should be carried out, highlighted by the Court in *McGlade v South West Aboriginal Land & Sea Aboriginal Corporation (No 2)* [2019] FCACF 238.

In *Tipakalippa*, the Court went on to say that, under the NTA, reasonable notice should be provided to group members, but not any exhaustive communications with each and every person. This approach has been endorsed by NOPSEMA in the context of regulation 25 consultation and can be found in the NOPSEMA guideline '*Consultation in the course of preparing an environment plan*'.

Beach considers that it has provided a reasonable opportunity for GMTOAC and the Gunditjmara people to participate in consultation with Beach over the consultation period.

These opportunities include:

- Beach asking GMTOAC to provide input on how it preferred to be consulted. When GMTOAC informed Beach that an in-person meeting with GMTOAC and the Gunditjmara people would be required, Beach offered a meeting and sought to accommodate GMTOAC's requirements on a regular and consistent basis throughout the consultation period.

- Beach inviting GMTOAC to pass on Beach's information sheets and consultation requests to its members and the Gunditjmara people.

- Beach providing GMTOAC with a link to Beach's online consultation hub, Beach Connect, for further information, and asking GMTOAC to let Beach know if it required any further information in relation to the activities the subject of the EP.

- Beach advising GMTOAC, in September 2024, that it intended to close consultation in February 2025.

- Beach providing opportunities for GMTOAC and its members to attend in-person and online First Nations information sessions in October and November 2024, as well as the numerous general webinars and community information sessions to which GMTOAC and Gunditjmara people were also invited.

- Throughout the consultation period, Beach inviting GMTOAC and Gunditjmara people to meet at a location and time convenient to them for the purposes of consultation.

- Beach offering to attend the full group meetings of Gunditjmara native title holders to provide an opportunity for native title holders to speak directly with Beach.

- Beach offered to extend the consultation period in order to hold meeting with GMTOAC and the Gunditjmara people in March 2025 and continued to provide further opportunity for consultation with GMTOAC and the Gunditjmara people until 16 April 2025.

Beach has provided GMTOAC with reasonable opportunity to consult with Beach, in relation to this EP, over a formal consultation period of approximately 5 months (as extended as outlined above). Those opportunities have been carefully adapted to the nature of GMTOAC's interests, and have taken into account GMTOAC's preferred consultation methods and constraint on resources.

Other opportunities to consult have been considered by Beach but ultimately discounted as inappropriate, having regard to the nature of GMTOAC's functions and interests, Gunditjmara peoples' interests, and the particular circumstances. These include:

- Seeking to contact individual Gunditjmara people who have not expressed an interest in consulting with Beach directly., GMTOAC is the representative body for the Gunditjmara people and, in accordance with GMTOAC's rule book, the Consultation & Negotiation Plan, and the United Nations Declaration on the Rights of Indigenous Peoples, consultation is to take place through the Indigenous Peoples' chosen representative entity.

- Visiting GMTOAC's offices or representatives in person, or 'door-knocking', without a prior agreed meeting in place. Beach respects GMTOAC customs and decision making processes, and the need to take time in its engagement with Beach. Beach has considered that, in accordance with policy guidelines and traditions, meetings with GMTOAC and the Gunditjmara people should not be forced or occur without their consent, which can be inflammatory and insensitive.

- Continuing to seek to communicate with GTMOAC directly, following GMTOAC engaging legal representation. Beach complied with GMTOAC's expressed direction for all consultation correspondence to be sent to EJA, in order to ensure it did not circumvent GMTOAC's wishes.

In summary, Beach has afforded considerable time and reasonable opportunity to GMTOAC and Gunditjmara people to engage in consultation with Beach for this EP. To the extent that it may asserted otherwise, that assertion must be properly contextualised with the opportunities afforded by Beach to GMTOAC and

Gunditjmara people to do so, that GMTOAC and Gunditjmara people have not taken up. A titleholder is not required to wait indefinitely for a relevant person to agree to consultation or to engage in consultation with that titleholder. Otherwise, the purpose and function of the OPGGS Act and the OPGGS(E)R, particularly regulation 25, would be frustrated.

For these reasons, Beach considers that it has provided GMTOAC and Gunditjmara people a reasonable opportunity to participate in consultation.

4. Sufficient Information

During its consultation with GMTOAC, Beach has provided GMTOAC a variety of general and specific project information relevant to Beach's activities the subject of this EP. This includes information:

- about the consultation process, the purpose of consultation and the reasons for consulting with GMTOAC;
- describing the proposed well completions, interventions and P&A activities;
- explaining the location of these activities;
- indicating the timing of the activities;
- describing the risks and impacts Beach has assessed in relation to the activities;
- describing the controls in place to manage these risks to ALARP and an acceptable level; and
- further specific information in response to requests signalled by EJA.

Further details describing the information provided to GMTOAC and other relevant persons is set out at Section4.8.

Consistent with NOPSEMA's guidance, Beach notes that the level of information necessary is likely to vary for different relevant persons and may depend on the degree to which a relevant person is affected by Beach's activities.[8] Beach has taken into account the degree to which GMTOAC and Gunditjmara functions, interests and activities may be affected by the impacts and risks of Beach's activities, noting that although there is no overlap with the Otway Operational Areas, the Otway Planning Area overlaps in part with Gunditjmara Sea Country, as discussed and assessed in Sections 6.6.3.2 and 6.6.4.

Where Beach provided information to GMTOAC, Beach has ensured that this information was provided as early as possible, and in language designed to be clear and easily understood.

Beach provided information to GMTOAC in various formats including consultation information sheets, brief written summaries, maps, project and consultation timelines, and diagrams. Beach also referred GMTOAC to Beach's online consultation hub, Beach Connect, for even more information. When specific information was requested by GMTOAC's legal representative, Beach provided timely responses which summarised this information and advised where further detail could be located amongst materials previously provided.

[8] See page 8 of the NOPSEMA guideline '*Consultation in the course of preparing an environment plan*' (2024).

Beach has also recognised, consistent with NOPSEMA's guidance, that information may need to be provided in an iterative manner during the consultation process, including as and when input is received from relevant persons.[9] Accordingly, information was provided to GMTOAC in stages and as early as possible across the consultation period, including on 16 September 2024, 3 December 2024 and 4 April 2025.

Beach has endeavoured to provide further information where GMTOAC have specifically requested it. For example, Beach provided further information on specific questions that EJA indicated its client may instruct it to request on 15 November 2024. This included information relating to a specific request for GIS and other coordinate information made by EJA on 3 December 2025, as well as project risk assessments, summaries of First Nations cultural values and sensitivities, and cumulative impact assessments provided to EJA on 4 April 2025. The information provided on 4 April 2025 included information that had only been prepared in the final stages of Beach's EP preparation. Beach has not received any follow-up correspondence from EJA, GMTOAC or the Gunditjmara people in response to each of those sets of information provided.

Taking all of the above into account, Beach considers that it has provided GMTOAC and Gunditjmara people with sufficient information to allow them to make an informed assessment of the possible consequences of Beach's activities on their functions, interests or activities. This is because Beach has provided appropriate project information to GMTOAC necessary for GMTOAC to make an assessment on the risks of Beach's activities on their functions, interests or activities, has engaged in genuine two-way dialogue regarding information on this EP, and has provided further information as required and requested by GMTOAC, including information which Beach understands is intended to inform GMTOAC's engagements with the native title holders whom GMTOAC represents.

5. Consultation Plan

In March 2024, GMTOAC's legal representative indicated to Beach that GMTOAC intended to provide Beach with a consultation plan which would reflect GMTOAC's position on parameters and minimum standards for consultation with GMTOAC and its members.

Beach was provided with a copy of the Consultation & Negotiation Plan on 11 November 2024, together with an invitation from EJA to commence consultation with GMTOAC and Gundijtmara native title holders in accordance with this plan, and an assertion that consultation otherwise than in accordance with this plan was not consistent with Beach's obligations under s 25 of the OPGGS(E)R. The EJA's letter explained the reason for the delay in providing the Consultation & Negotiation Plan, that the Plan had been approved by native title holders, and that it would not have been culturally appropriate to release a copy of the Plan until this had occurred.

On 3 December 2024, Beach wrote to EJA (in its capacity as legal representative of GMTOAC) and:

- confirmed that it will have regard to the Consultation & Negotiation Plan in future engagements with GMTOAC and Gunditjmara people;

- noted that consultation will ultimately be undertaken on a case by case basis with reference to Beach's obligations under the OPGGS(E)R and that some aspects of the Consultation & Negotiation Plan appear to relate to negotiation under the *Native Title Act 1993* (Cth) and are not applicable;

[9] See page 8 of the NOPSEMA guideline '*Consultation in the course of preparing an environment plan*' (2024).

- provided its comments on the extent to which Beach considers that consultation on the Well Completions and Interventions EP has in any event been consistent with the Consultation & Negotiation Plan.

On 4 December 2024, GMTOAC's legal representative confirmed receipt of Beach's letter of the previous date, and on 11 December 2024 Beach received correspondence from EJA which (among other things) maintained that Gunditjmara people have the right to be consulted in accordance with the Consultation & Negotiation Plan.

Beach is cognisant of the role that Registered Native Title Bodies Corporate such as GMTOAC play in facilitating engagement between industry and First Nations groups, and in providing advice in relation to who and how First Nations groups prefer to be consulted. Beach is also cognisant of NOPSEMA's guidance that:

> *"where relevant persons have developed guidance detailing their functions, interests or activities and how and when they wish to be consulted on activities, titleholders should take this guidance into account in developing consultation processes with relevant persons."*[10]

Beach does not agree with EJA's view that consultation which is not strictly in accordance with the Consultation & Negotiation Plan is not consistent with Beach's consultation obligations under the OPGGS(E)R. Beach has been cognisant of these obligations throughout its consultation with GMTOAC and the Gunditjmara people, and for the reasons expressed above, remains comfortable that these obligations have been met.

In any event, Beach does not accept that consultation which post-dates the provision of the Consultation & Negotiation Plan but which does not strictly align with the guidance given in that plan, is inconsistent with or does not meet Beach's consultation obligations. While Beach has considered all guidance expressed by relevant persons and will endeavour to accommodate reasonable requests in relation to consultation, Beach notes that:

- the Consultation & Negotiation Plan is not exclusively directed to consultation under OPGGS(E)R, but looks to cover the field for potential engagements between industry and Gunditjmara native title holders, including in relation to agreement making and processes under the *Native Title Act 1993* (Cth); and

- whether as a result of this or otherwise, there are aspects of the Consultation & Negotiation Plan that are not relevant to, or which extend beyond, the consultation requirements in and generally for the purposes of the OPGGS(E)R.

Notwithstanding this, many of the principles expressed in the Consultation & Negotiation Plan are not new to Beach, and Beach has been alive to these principles when developing and implementing its approach to consultation with GMTOAC and Gunditjmara people. Beach considers that many aspects of the plan are in any event substantially consistent with the approach taken by Beach in its consultation with GMTOAC and Gunditjmara people in relation to this EP, as detailed in the table below.

[10] NOPSEMA guideline, '*Consultation in the course of preparing an environment plan'* (2024).

Table: Consultation considered against aspects of GMTOAC Consultation & Negotiation Protocol

Aspect of Protocol	Consultation on Well Completions, Interventions, and P&A EP
What is Gunditjmara Mirring and who are Gunditjmara **The area covered by these Protocols**	Beach acknowledges the Gunditjmara people and their cultural authority to speak for Gunditjmara Mirring and Nyamat Mirring. Beach considers that engagement to date with GMTOAC has been based on respect for this cultural authority.
Gunditjmara cultural values	Beach acknowledges Gunditjmara people's cultural values as expressed in the Protocol and GMTOAC's preferences for who and how consultation should occur. Beach considers that engagement with GMTOAC to date in relation to this EP has been consistent with GMTOAC's position that GMTOAC is the first point of contact for identifying Gunditjmara people who speak for particular knowledge or an area of Gunditjmara Mirring and/or Nyamat Mirring.
Principle – mutual respect	Beach agrees with the principle that consultation should be conducted in an environment of mutual respect. Beach has sought to ensure that its engagement with GMTOAC to date has been based on mutual respect.
Principle – equal relationship building between Gunditjmara and proponents	Beach agrees that consultation is best facilitated through relationship building and meaningful engagement. Beach has sought to develop its relationship and have meaningful engagement with GMTOAC to date.
Principle – accommodating Gunditjmara Mirring and Culture	Beach acknowledges Gunditjmara people's cultural authority in relation to Gunditjmara Mirring and Nyamat Mirring and respects the importance of Gunditjmara Mirring, Nyamat Mirring and culture. Beach has sought to ensure that its engagement with GMTOAC to date has been consistent with this respect.
Objectives and powers of GMTOAC	Beach recognises GMTOAC as the representative of Gunditjmara people and GMTOAC's stated position that it is through GMTOAC that Gunditjmara people ensure their cultural obligations and responsibilities are upheld and recognised. Beach considers that its engagement with GMTOAC to date in relation to EPs has been consistent with GMTOAC's position that GMTOAC is the appropriate representative and first point of contact for the Gunditjmara people. Beach notes that early and ongoing engagement with Gunditjmara people (through GMTOAC) enables informed decision-making and sustainable outcomes, further noting that Beach has been consulting with GMTOAC and the Gunditjmara people in relation to this EP for approximately 5 months during the formal consultation period, and for an extended period until 16 April 2025, as outlined above. Beach also notes that GMTOAC can assist proponents in facilitating and enabling reasonable opportunities for Gunditjmara people to consult. Beach has sought to ensure that its dealings with GMTOAC and Gunditjmara people has been based on principles of early and ongoing engagement, and (through its correspondence with GMTOAC) has requested that information, including regarding community information sessions, be communicated to Gunditjmara people.
Protocols – consultation / negotiation with Gunditjmara	Beach notes Gunditjmara people's preferred approach is to co-design a process. Beach considers that this is consistent with Beach's approach to date in contacting GMTOAC at the commencement of consultation for this EP to give an overview of

Aspect of Protocol	Consultation on Well Completions, Interventions, and P&A EP
	consultation planning and invite feedback on engagement with GMTOAC and Gunditjmara people, and request GMTOAC advise on the manner in which GMTOAC and Gunditjmara people prefer to be consulted.
Protocols – early engagement and timing	Beach agrees that sufficient information and early engagement, and affording a reasonable period of time, are important aspects of consultation under the OPGGS(E)R. Beach considers that this is consistent with Beach's approach to consultation to date.
Protocols – information	(**Information provided by Proponents**) Beach agrees that information ought to be presented to GMTOAC in plain English, and notes that this is consistent with the approach adopted by Beach in its fact sheets and other consultation materials provided to GMTOAC to date. (**Information to include assessment of cumulative risks or impacts**) This is consistent with the approach adopted by Beach, noting that information on this issue was provided on 16 September 2024 and 4 April 2025.

6. Values and Sensitivities Raised and Control Measures Implemented

Notwithstanding the matters above, Beach considers that its consultation with GMTOAC has resulted in the successful identification of values and sensitivities relevant to GMTOAC and Gunditjmara people, and the consideration of control measures in respect of these matters.

From Beach's research of publicly available literature, and information learned through prior consultation with GMTOAC, Beach identified that the Deen Maar (Lady Julia Percy Island) and local whale and eel populations, hold deep and significant cultural association important to GMTOAC and the Gunditjmara people. Further information on these cultural values is discussed further in this EP in sections:

- Section 6.2.9;
- Section 6.4.9.3;
- Section 6.4.9.7;
- Section 6.6.2.1;
- Section 6.6.2.5;
- Section 6.6.3.2; and
- Section 6.6.3.5.

At a meeting held on 17 February 2024 (in relation to consultation undertaken by Beach in respect of a separate, prior EP), Beach advised the Gunditjmara community members in attendance that Beach had identified the Deen Maar, and local whale and eel populations, as significant cultural values important to GMTOAC and the Gunditjmara people. Those attendees confirmed each of those cultural values were of significance to Gunditjmara people, and did not identify any further cultural values and sensitivities relevant to Beach's activities or that Beach ought to consider as part of that EP or future EPs.

As part of consultation in respect of the Well Completions and Interventions EP, Beach has provided EJA with information relating to the cultural values and sensitivities it has identified as significant to GMTOAC and the Gundijtmara people (including by letter on 3 December 2024 and 4 April 2025).

These significant cultural values have been incorporated and addressed in Beach's assessment of the potential impacts and risks to cultural values and sensitivities in Section 6.6.4 and Section 7 of the EP. Control measures adopted by Beach that relate to those cultural values and sensitivities include:

- The development and implementation of a Whale Management Procedure to manage risks to whales associated with activity-related underwater sound and fauna interaction to ALARP and of an acceptable level (Sections 7.4.8.2, 7.4.8.6, 7.11.5.1, and 7.11.5.2).

- The implementation of a Chemical Management Procedure to manage risks to eels and whales associated with planned marine discharges from the rig and vessel to ALARP and of an acceptable level (Section 7.7.5.3).

- Beach's Offshore Oil Pollution Emergency Plan and associated Offshore Operational and Scientific Monitoring Plan to manage risks to cultural values and sensitivities (including whales, eels and Deen Maar) associated with loss of containment to ALARP and of an acceptable level (Section 7.13.5.5).

Further, the Consultation & Negotiation Plan provided to Beach on 11 November 2024 contains sections which detail information about Gunditjmara Mirring, Gunditjmara people, the area managed by GMTOAC, and Gunditjmara cultural values. Beach has had regard to this information and has ensured that it is aligned with the above sections of the EP. Beach considered that the information provided in the Consultation & Negotiation Plan is consistent with the Gunditjmara cultural values previously identified by Beach and incorporated in this EP, including at Sections 6.6.2 and 6.6.3.

In this way, Beach has achieved a positive outcome arising out of its consultation with GMTOAC and the Gunditjmara people, which has been incorporated into this EP.

7. Assertions by GMTOAC and EJA

Where GMTOAC and its legal representative, EJA, have made assertions or complaints in relation to Beach's consultation with GMTOAC and the Gunditjmara people, Beach has addressed the those assertions in full in the Report on Consultation in Appendix B, and has summarised key assertions in Section 4.16.

APPENDIX E FAIR OCEAN ACCESS INFORMATION SHEET

Fair Ocean Access

Minimising fishing impacts from offshore operations

Information Sheet | June 2021

Introduction

Licenced commercial fishers and petroleum title holders have lawful rights and obligations to carry out their activities safely and without interference. Beach is committed to *Fair Ocean Access* by minimising impacts from its offshore activities to commercial fishers.

Beach's *Fair Ocean Access Procedure* sets out commitments by Beach to genuine consultation with fishers to understand and minimise safety, environmental and economic impacts.

Where impacts cannot be minimised by Beach, and a fisher has acted to avoid risks and impacts to a Beach project, Beach's *Fair Ocean Access Procedure* includes a simple and fair process for a fisher to claim compensation for an economic loss, and a rapid approval and payment process.

Safety

Safety is Beach's first priority and operating safely will sometimes require restricted access for relatively small offshore areas over short periods. Beach will consult with fishers to seek to minimise potential disturbance to areas that are regular fishing grounds and where the fisher has no alternative fishing options.

Environmental Protection

Beach's projects are subject to stringent assessment and mitigation of potential environmental impacts. Beach must prepare Environment Plans for its offshore projects. These identify all environmental and socio-economic impacts and set out mitigation measures to reduce impacts, so they are "as low as reasonably practicable" and acceptable by regulators. Mitigation measures may include compensation where impacts on the commercial fishing industry cannot be minimised and where these impacts cause an economic loss.

Assessment of impacts includes identifying State and Commonwealth commercial fisheries that are actively fished in Beach's project areas and any biological or economic impacts to those fisheries. Consultation with commercial fishers is an important part of Beach's environmental assessment process.

Genuine consultation

Beach will consult with openness, transparency and mutual respect with fishers who may be directly impacted by Beach's projects. Beach will use its best endeavours to consult with all potentially impacted fishers during preparation of its Environment Plan for a project, and before projects commence.

Respecting the representative role of fishing associations, Beach will seek engagement with potentially impacted fishers via the relevant association. Beach will also engage directly with a fisher if they are not a member of an association, or where they request direct engagement with Beach.

Where a fishing association or fisher believes they will be impacted by a Beach project, Beach will share its fishing impact assessments, validate that with fishers, and discuss their specific circumstances with the objective of minimising potential impacts.

If project avoidance and impact minimisation is not possible, Beach will provide a copy of its full *Fair Ocean Access Procedure* and discuss mitigation options set out in the procedure, as appropriate to the individual fisher or association.

Economic loss

Beach is committed to the principle that a fisher should not suffer an economic loss as a direct result of a Beach project. Losses may occur for different reasons such as:

- reduced catch from fishing in a new area in order to avoid a Beach project
- reduced catch due to impacts to a fishery from the project activities
- steaming costs to avoid a Beach project area
- costs to repair or replace fishing gear.

Acting in good faith

Beach is committed to a fair, simple and transparent process for a fisher to claim compensation, where the fisher has consulted with Beach in good faith before a project, and provided the fisher has:

- acted to avoid risks and impacts to a Beach project
- acted to mitigate any economic losses to their business that may arise from avoiding risks and impacts to a Beach project
- evidence of fishing in the Beach project area during the same time of year as the project timing, for at least three years within the last five years, unless there are genuine fishery or fishing practice reasons for lesser periods
- historical and current catch and effort evidence and the ability to demonstrate an economic loss, as set out in Beach's *Fair Ocean Access Procedure*.

Making a claim

The *Fair Ocean Access Procedure* sets out a simple claim form and describes the evidence required for a claim, such as historical catch and effort records, current catch and effort records, and fish prices.

Claims must be made within 60 days of completion of a Beach project unless there is evidence that the project has caused an impact to the fishery which has impacted future catch and caused an economic loss.

The *Fair Ocean* Access *Procedure* sets out timeframes for the rapid assessment and payment of successful claims and for ensuring the fisher is kept informed.

Beach will nominate a single point of contact at Beach for a fisher to liaise with.

Claims and evidence will be managed in accordance with Beach's Privacy Policy which can be found on Beach's website.

If a claim is not approved, Beach will provide written reasons for the decision.

Resolving disagreements

Where a fisher and Beach cannot agree on a fisher's claim, the *Fair Ocean Access Procedure* includes steps for appointing an independent expert to resolve the matter. Beach will pay the reasonable costs of the independent expert, as set out in the *Fair Ocean Access Procedure*.

We welcome your questions and feedback

EXECUTIVE SUMMARY

Background

BEACH ENERGY LIMITED is an oil and gas exploration and production company with oil and gas production in five basins across Australia and New Zealand including the Otway and Bass basins in south-east Australia. BEACH ENERGY LIMITED also has a suite of exploration permits including one offshore the Otway Basin.

SETFIA represents stakeholders in the Commonwealth managed fishery called the *Commonwealth Trawl Sector* (CTS). The fishery is the largest supplier of local finfish in Australia. SETFIA has completed four previous commercial fishing projects for BEACH ENERGY LIMITED's operations in the Otway and Bass basins as well as a number of SMS fishing vessel notification campaigns.

BEACH ENERGY LIMITED have engaged SETFIA on previous occasions. Previous projects have focused only on CTS and shark fishery data and have considered the risk of fishing gear types *assumed* to be used in areas of interest.

BEACH ENERGY LIMITED has in this instance requested fishery data from all fisheries in the area – Commonwealth, Tasmanian and Victorian (not just the CTS) and insight on the amount and value of fishing being caught in the area by all these fisheries. This includes the frequency of fishing operations and the seasonality of fishing operations (if any). Further, the scope of this current project includes a risk analysis and fishing gear types confirmed as being used in the area.

For the purposes of this report Beach's areas-of-interest (AOIs) are divided into three logical and self-explanatory divisions called *North Otway, South Otway, and Bass Coast (*Figure 1*).*

Fishery overlap

The number of fisheries overlapping each AOI are;

- seven active fisheries in the North Otway AOI (three Commonwealth and four Victorian)
- six in the South Otway (three Commonwealth, two Victorian and one Tasmanian)
- seven in the Bass Coast (four Commonwealth and three Tasmanian).

Data confirms that there are eleven different Commonwealth, Victorian and Tasmanian fisheries in the three AOIs and that they use ten different types of fishing gear. These are detailed in Table 3 and the fishing gears they use in Table 10.

Three Commonwealth fisheries are common to all three AOIs; they are the CTS, the Gillnet Hook and Trap (GHaT) (shark fishery) and the Southern Squid Jig (SSJF).

The annual average total catch and revenue from commercial fisheries overlapped by the three AOIs is:

- North Otway 54 tonnes, $1.05m (higher values driven by Victorian Rock Lobster)
- South Otway 21 tonnes, $214,000.
- Bass Basin 14 tonnes, $130,000.

Catches, revenues, and other metrics for these fisheries are set down in Table 2.

General information on the fisheries present is set down in Section 3 COMMERCIAL FISHING – GENERAL INFORMATION.

Only the Victorian crab fishery has a very strong overlap of 81% in the North Otway and 61% in the South Otway with other fisheries not significantly overlapped. However, there are significant catches of Victorian Rock Lobster and Abalone in the North Otway AOI. It is likely that abalone fishing occurs at the northern boundary of that AOI.

Seasonality

Seasonality data is only reportable for Commonwealth fisheries due to the nature in which data is provided by State management bodies. However, two the Tasmanian and Victorian-managed Giant Crab and Rock lobster fisheries have open and closed seasons:

Table 1 Seasonality of active fisheries in the three AOIs

Fishery	**Male season open**	**Female season open**
Victorian Rock lobster fishery	16 November to 14 September	16 November to 30 May
Victorian Giant Crab fishery	16 November to 14 September	16 November to 30 May
Tasmanian Rock lobster fishery	Varies see link here	
Tasmanian Giant Crab fishery	All year	15 November to 31 May

The seasonality of the gillnet, hook and shark (GHaT) fishery varies between AOIs, the North Otway AOI has consistent catch across spring, summer and autumn with lower catches in winter, this is the opposite in the Bass Coast AOI where winter yields the highest catch, summer the lowest and spring and autumn in the middle. The South Otway is like the North with the lowest catch in the winter, however, spring through autumn is more varied with summer providing the highest catch. There is a greater change in the shark fishery between moons than there is a seasonal difference.

Seasonality for the CTS is only reportable in the Otway region due to low vessel numbers in the Bass Coast. Additionally, autumn in both the North and South Otway is also confidential due to less than five vessels in the data. However, the seasonal analysis winter through summer shows that winter is the highest catch season for the North Otway with lower (approx. half) catch in spring and summer. In South Otway winter has similar catch to summer, where spring sees the highest catch for the fishery. Generally the seasonality of the CTS is that a few (of 15) board trawl vessels will fish eastern orange roughy and spawning blue grenadier in winter (June and July) and will focus on mixed species at all other times.

The North Otway AOI is the only area where seasonality can be reported for SSJF due to confidentiality. The mean annual catches were much higher in winter than autumn, and no catches were reported in the spring season, data is not presented for summer as catches were reported by fewer than 5 fishers.

The mean annual catch for winter was 10 tonnes and no scallops were caught in summer or autumn. Seasonal catch data is not provided for spring as catches were reported by fewer than 5 fishers. Scallop season in Victoria generally runs between July and December and is driven by scallop condition (yield).

Trawl tracks

The Portland based trawl vessel *Moira Elizabeth* provided a selection of trawl tracks near the two Otway AOIs for the purposes of this report. However, much the same as previous processes the sample size of a single vessel shows where that vessel fishes but does not reliably indicate that other vessels do not fish elsewhere. This chart is not shown because as best it is misleading.

To overcome this the Project has developed a new type of analysis for this report. Data provided by AFMA includes the start position of every trawl fishing operation (shot) for 20 years. Mapping software allows for this data to be gridded in a heat map of fine resolution grids. Given that this methodology may not pass AFMA's five boat test the project made written application to AFMA about the use of this data and they have approved it released by a request that it not be released publicly. Termed a '*blur analysis*' this the finest scale analysis ever undertaken by SETFIA and has huge potential value if there is flexibility in the positioning of wellheads and petroleum safety zones.

The blur analysis is shown for trawl (CTS) in Figure 20 and for all Commonwealth methods combined in Figure 21 (note the confidential watermark requested by AFMA indicating that this cannot be redistributed). It reveals that the CTS and all other Commonwealth fishing generally occurs been 400m and 1,000m meaning that the south-west corner of the North Otway AOI is somewhat exposed to Commonwealth fishing but that the middle of the South Otway AOI is very exposed. Given GHaT shark fishing does not occur deeper than 183m, it is likely that the data presented is from the CTS, the SSJF and various GHaT hook methods.

Relative Risk

The work completed for BEACH ENERGY LTD in July 2021 estimated eight relevant fishing gear types. The data obtained now indicates that there are nine gear types of fishing gear present, they are (in alphabetical order).

1. Danish Seine.
2. Demersal gillnet.
3. Demersal longline.
4. Dredge (scallop).
5. Demersal trawl.
6. Jig (squid).
7. Hand gathering (diving).
8. Handline.
9. Pots/traps (cray, GHaT fish trap and Giant Crab).

The July 21 report considered crab/rock lobster pots and traps separately but within this new report they are considered as the same gear type given their similarities. Thus, this new analysis has added handline and hand gathering to the list of methods present.

The risk review (Table 12) considers five forces: vessel impact, anchor drop, anchor drag, fishing gear drop and the pulling force of snagged gear recovery. Some gear types are not relevant for each force, for instance diving and jigging do not use fishing gear that might fall onto oil/gas infrastructure. A score of 1.00 is assigned to the gear type involved with the greatest forces (demersal trawling) with all other fishing gears the scored as a fraction of this. Each then receives a relative ranking based on the sum of these five scores. It is important to note that trawling's risk score of 5.00 does not mean it is twice as risky or impactful as scallop dredging which score 2.58. Rather, that the sum of scallop dredging's forces is about half that of trawling. The five occurrences will generally not occur together so adding horizontally across Table 12 is meaningless. The table's use is in considering the most forceful fishing method, and the actual forces present, which is all cases is demersal trawling.

Relative gear risk can be broadly grouped into three natural categories:

1. Higher relative risk (1 and 2): Demersal trawling and scallop dredging involve larger forces.
2. Moderate relative risk (3 through 7): Pots/traps, demersal gillnets, (squid) jigging, Danish seine and demersal longline.
3. Low relative risk: Handline and hand gathering are low relative risk gears (ranked 8 and 9), so their addition to this report does not significantly change the risk profile.

The report does not draw a line of acceptable risk and notes all wellheads are protected by PSZs but that pipelines are not.

Discussion:

Section 5 explains the nature of the commercial fishing's industry's property rights and how the loss of grounds reduces the profitability of fishing businesses and in doing so impairs (reduces) the asset values of access and quota rights. The issue for BEACH ENERGY LTD is not so much direct displacement of the fishing industry given their footprint is relatively small. For instance, a 500m exclusion around a wellhead PSZ equates to only 0.2km^2. In the context of potentially 7,000km^2 offshore windfarm feasibility licences being granted in the next 3-24 months across southern-eastern Australia, BEACH ENERGY LTD's activities are minor. Rather's BEACH'S dilemma is its small contribution to the cumulative complexity that many shared marine space developments present to the fishing industry.

Four themes have emerged in a changing marine economy:

1. The complexity and risk (both to fishing and new marine activities) of fishing around multiple shared marine space projects.

2. The cumulative impact of multiple shared marine space ingressions into traditional fishing grounds.

3. Fishing stakeholder consultation fatigue. This is important given NOPSEMA's direction to Proponents for greater consultation following the Barossa offshore gas development court case and more recently the Scarborough seismic environment plan court case.

4. The need for the fishing industry to have the rights to the grounds provided to it by States and the Australian Government recognised by new marine space projects (even small ones).

The recommendations made consider these four themes, the fisheries present and their relative risk.

Recommendations:

A. Consultation for works occurring with an existing PSZ (already closed to fishing) should be the minimum possible and to industry associations (Table 13) rather than fishers and other stakeholders. Direct written communication with vessel permit holders is ineffective given; permit holders only represent a fraction of the fishing stakeholders by number and investment value, fisheries are often geographically very large (the CTS trawl fishery spans four states) meaning most fishing stakeholders will have no interest, and vessel permits are often leased meaning the correspondence never reaches an on-the-water "fisher".

B. The most impacted fisheries are Victorian Rock Lobster and Victorian Giant Crab, and focus should be placed on them. These fisheries are currently in very different positions and BEACH ENERGY LTD should be mindful of the position of each when discussing what are relatively very minor additional impacts:

   - The Rock Lobster fishery relied heavily on a high value live export market to China. This was shut down in 2020 when China applied an import ban following comments by the Australian Government about the origin of Covid and other underlying tensions. The Victorian rock lobster fishery is also potentially very impacted by the proposed Southern Ocean marine windfarm zone. The potential for displacement by the proposed windfarm zone has increased following a recent announcement by the South Australian Premier that they do not want the zone to extend into waters off South Australia increasingly the likelihood that it will be placed further east.

   - The Giant Crab fishery avoided the import ban into China with demand and price remaining very strong. But the fishery has been plagued by reducing catch rates and therefore reduced TACs. TACs have halved in the last decade. Giant crab stock assessment science is complicated by a lack of age data (i.e how long do they live?) because unlike other animals with hard body parts that show seasonal growth rings, crabs periodically shed their shells. Two significant marine seismic surveys are planned in the Otway Basis in 2024-25 (CGG and TGS) and these will significantly impact the Victorian Giant Crab fishery.

C. Efforts should be made to work with the Commonwealth fishery (SSIA and SETFIA) and to possible avoid placing a wellhead in the fishing grounds identified in the blur analysis in the South Otway AOI (Figure 20 and Figure 21).

D. If (C) above is unavoidable then fishers may be due compensation and BEACH ENERGY LTD should develop a policy on this. Of note is that all marine windfarm developers have accepted that they will pay compensation for displaced fishing and impaired quota rights (albeit far more than the displacement caused by BEACH ENERGY LTD).

E. Given the loss of fishing grounds that is occurring at an unprecedented rate BEACH ENERGY LTD should be mindful of the pressures on-the-water fishers face in ensuring they avoid these projects, particularly PSZs. These efforts should consider and perhaps be proportional to, the relative risks of fishing gears set down in Table 12. BEACH ENERGY has already contracted SETFIA's vessel SMS service which covers multiple fisheries in western Victoria. Some eastern oil/gas companies undertake a period risk assessment that considers crew changes, technology changes on vessels and the loss of fishing grounds. Beach might consider the same for the CTS and scallop fishery. New navigational aide technology is emerging, and BEACH ENERGY might consider a project to investigate this.

PROJECT AREA

Table 11. Risk ranking results for eight fishing methods (which are not jurisdictional) operating in the vicinity of the fishing data assessment area. The Risk Score was based on four types of impulse associated with vessel, equipment and fishing gear impacts and a pulling force associated with snagged gear recovery. *57*
Table 12. Key contacts for representative bodies for each affected sector. *63*
Table 13. Beach prices used in value calculations *64*
Table 14. Input data and calculation results for the various Impulses and Pulling force against each fishing method. .. *72*
Table 15 Fishing related input data for each type of impulse. *73*
Table 16 Maximum pulling force associated with snagged fishing gear based on the MBL of the main connecting rope/cable between vessel and fishing gear. Note: the pulling force represented by the tensile load in the connecting rope/cable may be a combination of winch power, propeller thrust and vessel buoyancy. *74*

PROJECT DESCRIPTION

Background

BEACH ENERGY LIMITED (Beach) is an ASX listed, oil and gas exploration and production company headquartered in Adelaide, South Australia. Beach currently has oil and gas production in five basins across Australia and New Zealand and is a key supplier of gas into the Australian East Coast gas market. Beach's asset portfolio includes ownership interests in strategic oil and gas infrastructure and assets across Australia and New Zealand. Beach operates a world-class onshore oil business on the Western Flank of the Cooper Basin and has grown to become Australia's largest onshore oil producer. In addition to its producing assets, Beach has a suite of exploration permits across the onshore Cooper and Perth basins, onshore and offshore Otway Basin as well as offshore acreage in the Bonaparte (Australia) and Taranaki (New Zealand) basins.

Beach's purpose to '*sustainably deliver energy for communities*' means it operates while maintaining the highest health, safety, and environmental standards.

SETFIA represents stakeholders in the Commonwealth managed *Commonwealth Trawl Sector* (colloquially the *South East Trawl Fishery*). The fishery is the largest supplier of local finfish in Australia. Its boundaries run from north of Sydney, though Victoria and Tasmania to Cape Jervis just over the SA border. Through voluntary membership of almost 40 entities SETFIA members own 90% of the assets (quota and vessels) in the sector. SETFIA is incorporated under the Corporations Act, is not-for-profit, and governed by a non-remunerated Board elected by their peers from the membership's ranks.

Previous Projects

Beach has engaged SETFIA several times to assist it meet the objective stated in 0 and also to comply with relevant approval processes particularly the Offshore Petroleum and Greenhouse Gas Storage Act 2006. Some of this work overlaps so a summary of this previous work is useful:

1. A report reviewing information sheets about the *Otway Offshore Project Proposed Seabed Assessment Locations (2 July 2019)* focused on the La Bella field, Atrisan-1 and Geographe 5/4 sites that made several relatively minor recommendations about the communication and also spoke with six fishers and provided feedback from them.

2. A report titled *REPORT TO BEACH ENERGY ON TRAWL AND GILLNET FISHING ACTIVITY AROUND BEACH ENERGY'S PROPOSED OTWAY OFFSHORE PROJECT -1 November 2019.* The report focused on the La Bella, Geographe East/West, Artisan and Thylacine well heads and their pipelines. It used confidential fishing locations (tracks) obtained from trawl and gillnet vessels. The report did not draw data from fishery managers given project time constraints and therefore had several limitations:

   - Data was only obtained from four trawl vessels and one gillnet vessel and that it was possible that other sectors fished in the area.
   - The report concluded that none of the trawl vessels considered fished in the area, but reports have recently emerged that some trawl vessels do fish near this field.
   - The tracks provided by fishing vessels are highly confidential and cannot be reproduced for the purposes of an EP.
   - The report is not quantitative in terms of the amount of fishing occurring in/near the field.

3. A report titled, *Fisheries likely to operate in the area of Beach Energy's Otway Offshore Project and the Relative Risk they Present to Oil and Gas Infrastructure 6 July 2021*. This report considered the fishing methods identified in the November 2019 report (La Bella, Geographe East/West, Artisan and

Thylacine well heads and their pipelines) and then estimated the fisheries and fishing gear types likely to also be present.

The report *estimated* that there were seven fisheries managed by the Commonwealth and Victorian jurisdiction: (Commonwealth Trawl Sector (CTS) CW, Gillnet, Hook and Trap Sector (GHaT) CW, Squig Jig Fishery CW, Bass Strait Central Zone Scallop Fishery CW, Rock Lobster Fishery Vic, Giant Crab Fishery Vic, and the Octopus trap fishery Vic. And that these seven fisheries used seven different types of fishing gear, these being: demersal trawl, Danish seine, Scallop dredging, Gillnet, Cray & Gant Crab pots, demersal longline and jigging. These fishing gear types were assessed for the relative risk they presented to the field finding demersal trawl and scallop dredge to be most risky with other methods presenting far less risk. This report was also limited:

- There was no evidence to confirm that methods other than gillnetting and trawling were present so gear may have been considered that were not present and it is possible (although unlikely) that fishing gear types present in/near the field were omitted.
- The report is not quantitative in terms of the amount of fishing occurring in/near the field.

4. A report titled, *Commercial fishing catch and value in the Beach Energy Operational Area footprint 18 May 2020*. The report considered the fishing around Beach's Rockhopper, Trefoil, White Ibis, and Bass wellheads to the east of the Yolla wellhead. Commercial fishery data showed that six fisheries were active in the area caching on average annually ≈30 tonnes valued at ≈$154,000.

5. Three SMS vessel notification programs:

   - May 2020 about Beach's operations around the Trefoil field.
   - August 2021 about Beach's operations in the Prion field.
   - March 2021 about Beach's seabed assessment operations using the Harvest Shine.

Scope and deliverables of this report

Beach has requested a new report relevant to the OGV Project which has a different spatial scope and timeframe to previous reports. The report needs to reflect the most recent fishing information as it will be reviewed against past information to understand any relevant large-scale trends.

The scope will also address limitations identified by SETFIA in previous work completed (1, 2 and 3). Specifically, significant gaps are present in that data from fisheries has never been considered even though the relative risk of fishing gear *estimated* to be present has been considered.

Beach has requested fishery data and insight on the amount and value of fishing being caught in the area, the frequency of fishing operations, and the seasonality of fishing operations (if any).

Therefore, the scope of work proposed includes:

1.1. To identify all fisheries permitted (holding rights) to work inside Beach's Otway and Bass basins, as shown on the previous maps.

1.2. After agreeing the area-of-interest with the Client the Contractor will submit data requests on fisheries regulators from Tasmania, Victoria, and the Commonwealth and then present aggregated[12] data for these yet to be determined areas of interest within the Otway and Bass basins. This is likely best presented by field but will be agreed with the client. This data will be presented in a table in approximate order of potential annual catch impact by fishery and jurisdiction:

[12] At the highest possible detail while maintaining compliance with Commonwealth, Victorian and potentially Tasmanian confidentiality rules. Some data may therefore not be available.

- number of fishers licensed to operate in the area (by fishery type)
- number of fishers who have operated in the area over the last three years
- seasonal (3 months) catch tonnes[12],
- annual catch tonnes[12],
- catch value[12],
- recent catch limits,
- recent catches[12],
- fishing effort[12] (days fished or fishing operations) and,
- metrics explaining the relative importance of the area.

1.3. A potential update of trawl tracks by merging the existing trawl track data held with that of the new vessels that have raised concerns that they do fish in the area.

And then to put this data analysis in perspective by:

1.4. Providing some general information about commercial fishing sectors identified in 1.1; vessel size, gear types, catches, fishing gears and methods.

1.5. After fishing gears present are confirmed the existing risk analysis will be re-presented. In the unlikely event that a new fishing gear type emerges the chapter's author Dr John Wakeford will expand the analysis.

1.6. Explaining the nature of commercial fishing industry property rights and how these are impacted by loss of productive fishing grounds due to the declaration of PSZs' and reduced prospectivity.

1.7. Discussing the project's overlap with commercial fishing in the context of the seasonality of these fisheries and their operations.

And finally, to make the next step clearer by:

1.8. Providing a comprehensive stakeholder list (with contact details) of associations representing all commercial fishing sectors identified in 1.1 (can fish in area).

1.9. Making recommendations for next steps including:

- ❖ Consultation on potential impacts and mitigation measures
- ❖ Further consultation with fishing associations and ways to facilitate

1.10. The scope of the work excludes:

- Consultation with the commercial fishing industry
- The recreational fishery
- Work on polygons additional and later than that agreed with the Client at the beginning of the Project.

METHODS

Fisheries data

Requests for commercial fishery catch and effort data requests were sent to the Australian Fisheries Management Authority (AFMA) for Commonwealth fisheries, the Victorian Fisheries Authority (VFA) and Department of Natural Resources and Environment Tasmania (Fishing Tasmania) for State managed fisheries. Information on the catch value per kilogram of green weight was obtained for each species from published reports, fishers or fisheries wholesalers where available.

Commonwealth fisheries data confidentiality

The format of the data and spatial resolution of fishing effort reporting differs between jurisdictions and fisheries. Commonwealth-managed fisheries report position by latitude and longitude, usually for each fishing operation (e.g. trawl fishing), or each day by location fished (e.g. scallop fishery). AFMA provides this "raw" data to Atlantis on the proviso that it be aggregated in accordance with the "5-boat rule"[13] for publication. After the final report, the data is then deleted.

Thus, the AFMA data were filtered to select records that overlapped with the HOWZ using the start or end fishing location. Data were then aggregated to as fine a level as possible so as not to break the "5-boat rule", but still be able to address the scope of the work. Raw catch and effort data were requested from all Commonwealth managed fisheries that reported effort in the area. Data fields requested included trip, shot and catch data by species for the time period 1/7/2002 to 30/6/2023.

A new type of analysis called a blur analysis was completed for this project (Figure 20 and Figure 21). AFMA have provided written authorisation for its use albeit with a confidential watermark and request that it is not published. This new analysis is explained in the Executive Summary.

State fisheries data confidentiality

In contrast to AFMA, the VFA and Fishing Tasmania usually require their fishers to record position by reporting grid (abalone divers for example record effort by reef code). Most Victorian fisheries report catch and effort by 10 x 10-minute grid areas (Figure 2). The VFA aggregates and filters data in accordance with the "5-boat-rule" before distributing it. Thus, data requests to the VFA and Fishing Tasmania were for catch and effort from any reporting grids that overlapped with the Beach Energy AOIs (Figure 2).

A range of Victorian fisheries are permitted to operate in the Beach Energy's AOIs (Table 3). but they may not necessarily actually fish in the area due to the size of the reporting grids. Because of the "5-boat rule", data requests submitted at too small a temporal or spatial scale risk being filtered to such coarse level of detail that it is not useful for informing a project such as this. Atlantis therefore requested data across the sum of all overlapping Victorian and Tasmanian reporting grids so that as much of the data could be included as possible, but it is aggregated in a way required by VFA and Fishing Tasmania confidentiality rules.

[13] Fisheries agencies have confidentiality policies that restrict making public data comprising of less than 5 vessels.

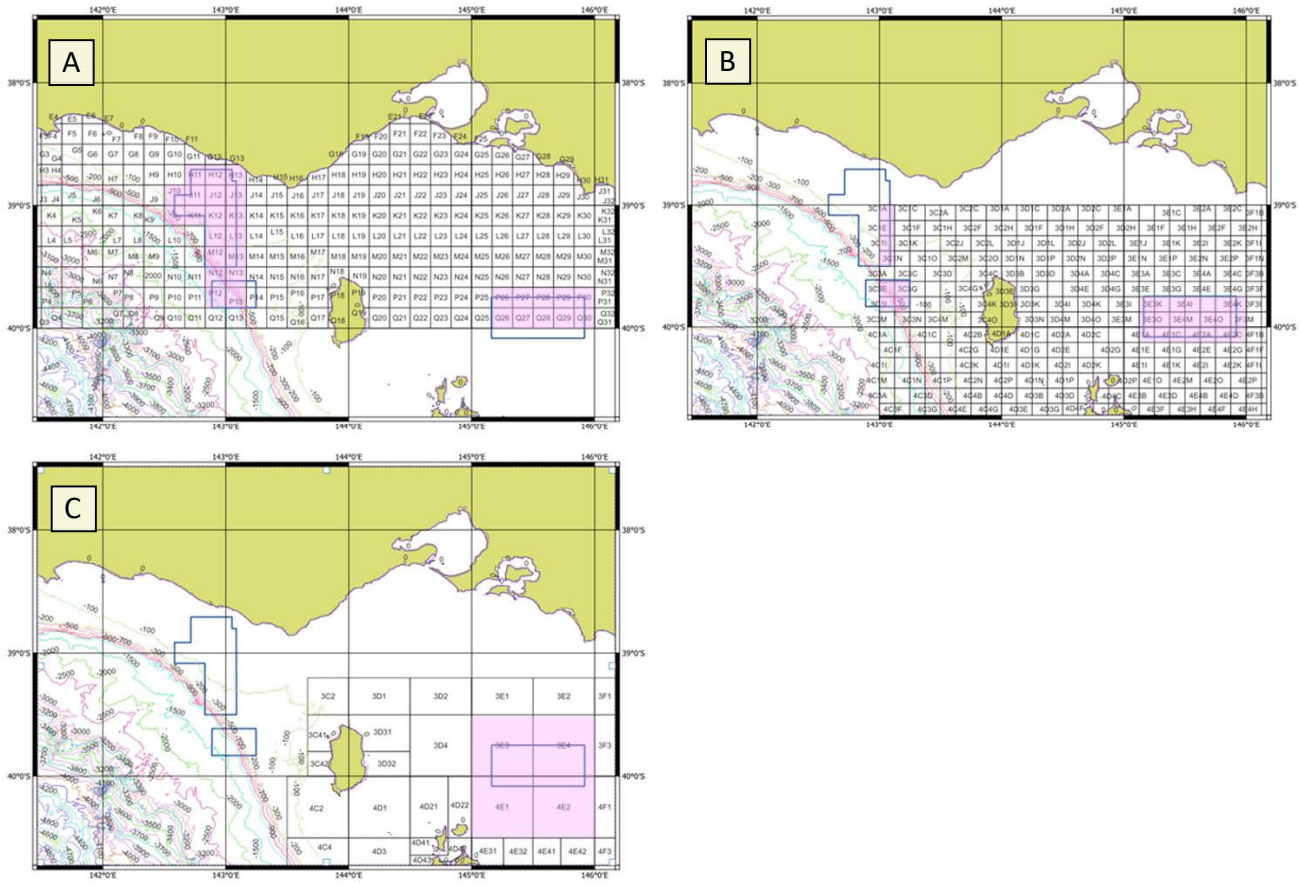

Figure 2. State reporting grids, A) Victorian, B) Tasmanian Rock Lobster and Giant Crab, and C) Tasmanian Scalefish. Pink grids represent those included in analysis.

Data treatment and assumptions

Given the methods used to filter data described above, we expect that data summaries to generally overestimate the catch and effort within the area of interest, but that the method used is appropriate for this project.

As explained Victorian and Tasmanian management agencies require catch reporting from fishers using reporting grids rather than the exact position of each fishing operation or day worked. As such, data from any reporting grid with any partial overlap with the area of investigation is stated.

Table 2 contains data for the value of catch overlapped by the area of interest. Catches by species (from fisheries data explained earlier) are multiplied by prices that are set down in Appendix A to produce overlapping revenue by fishery. Catch values were obtained from a range of sources including the Sydney Fish Market (whose assistance is appreciated), ABARES or directly from fishers and fishing cooperatives.

TERMINOLOGY

- The term "AOI" refers to the three areas-of-interest: North Otway, South Otway and Bass Basin.
- Within this report the term "catch" refers to catch of commercial value landed and excludes fish discarded at sea and not landed for sale.
- Fisheries are sometimes divided into management units for purposes of applying staff, cost accounting and for reasons of legislation. This report refers to these units as both *sectors* and *fisheries*.
- Some data is labelled "*confidential*" which means that there was catch but it was from less than five vessels in the dataset, and it cannot therefore be presented. Special treatment has been given to a new blur analysis – this is explained in the Executive Summary.
- For the purposes of this report, the potential "*impact*" is calculated as the overlap with each of the three AOIs and the reported location of retained commercial catch.

1. COMMERCIAL FISHING & BEACH ENERGY

1.1 Fisheries legally permitted to work in the Beach Energy AOIs

To account for any possible short-term temporal variation in fishing effort, fisheries which recorded effort in the previous 20 years in or near the Beach AOIs were deemed as *active*. Table 3 lists all fisheries *legally permitted* (both active and inactive) to fish in Beach AOIs. Fisheries are separated by management body, as well as if there has been effort recorded in the overlapping area in recent years.

Table 3. List of fisheries legally permitted to fish in the Beach AOIs separated by management body, active fisheries indicated by tick mark, inactive indicated by "x".

1.2 Commercial Fisheries in the North Otway AOI

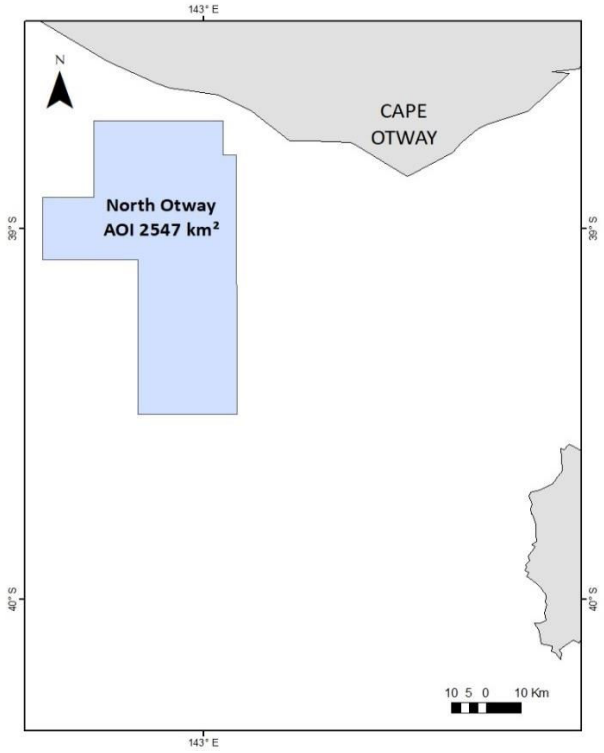

Figure 3. North Otway AOI, position and size.

The North Otway AOI is an irregular shaped zone of 2,547 square kilometres positioned to the west and south of Cape Otway (Figure 3). This report presents data from fishing activity over the past 20 years within the North Otway AOI under Commonwealth (ie. administered by the Australian Fisheries Management Authority) and State (Victorian and Tasmanian) jurisdictions.

See Table 2 for data summary, further detail is provided below.

1.2.1 Commonwealth Fisheries

Commonwealth fisheries active in the AOI within the period from 1/7/2002 to 30/6/2023 were the Southern Squid Jig Fishery (SSJF), the Gillnet Trap and Hook Fishery (GHaT), and the Commonwealth Trawl Fishery (CTS). While this fishing activity yielded approximately $353,000 in average annual revenue, catches within the AOI accounted for less than 1% of total catches in the GHaT and CTS Commonwealth fisheries and 3.1% in the SSJF fishery (Table 2).

Effort varied between sectors with the most effort being from the GHaT with 1,204 shots across the data period (Table 4). This was reflective of the highest number of vessels (35) and the highest catch weight over the period, of 331 t. Whilst the SSJF caught the next highest amount, both in tonnes (199 t) and value ($2.6 million) the CTS had a higher effort with 116 shots across the data period, compared to 99 shots by the SSJF.

Table 4. Summary of number of shots and catch reported from 1/7/2002 to 30/6/2023 from the North Otway AOI by Commonwealth fisheries.

	GHaT	CTS	SSJF
Gear Type	Demersal gillnet Demersal longline Auto longline, Dropline	Bottom otter trawl Danish seine	Squid jigs
Number of shots	1,204	116	99
Catch weight (t)	331	79	199
Catch value $million	2.8	0.4	2.6
Number of vessels	35	14	21

1.2.1.1 Gillnet Trap and Hook Sector (GHaT)

Demersal gillnet, auto longline, dropline, and demersal longline gears have been deployed in the AOI every year of the past twenty. For these methods combined, 35 vessels exerted 1,204 fishing events, which yielded a total catch of 331.4 tonnes for an approximate value of $2.8m (Table 3).

Catches were diverse with gummy shark comprising 34%, school shark 24%, common sawshark 14%, and other species combined 28% (Figure 4). Mean annual catches were consistent in spring, summer, and autumn, but were much lower in winter (Figure 5). Seasonal catch data is not presented for summer as catches were reported by fewer than 5 fishers.

While fishing effort, catches, and subsequent revenue has varied over the past 20 years, it has been yielded by a consistently small fleet of fewer than 8 vessels in every year (Figure 6). Note, GHaT fishing activity in the 2008, 2009, 2013, 2015, and 2016 financial years is not presented in Figure 6 because catches in these years were reported by fewer than 5 vessels. Fishing over the past 20 years in the AOI accounted for 0.9% of total catches in the GHaT fishery (Table 2).

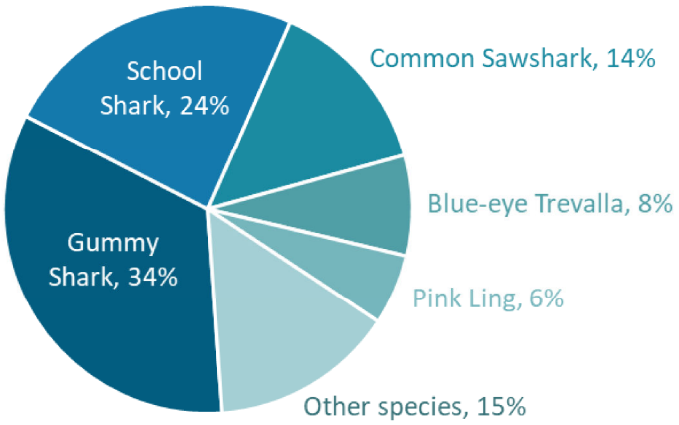

Figure 4. Pie chart showing the top species caught from the North Otway AOI by the GHaT. Note the minimum number of vessels that caught any of the species shown was 7.

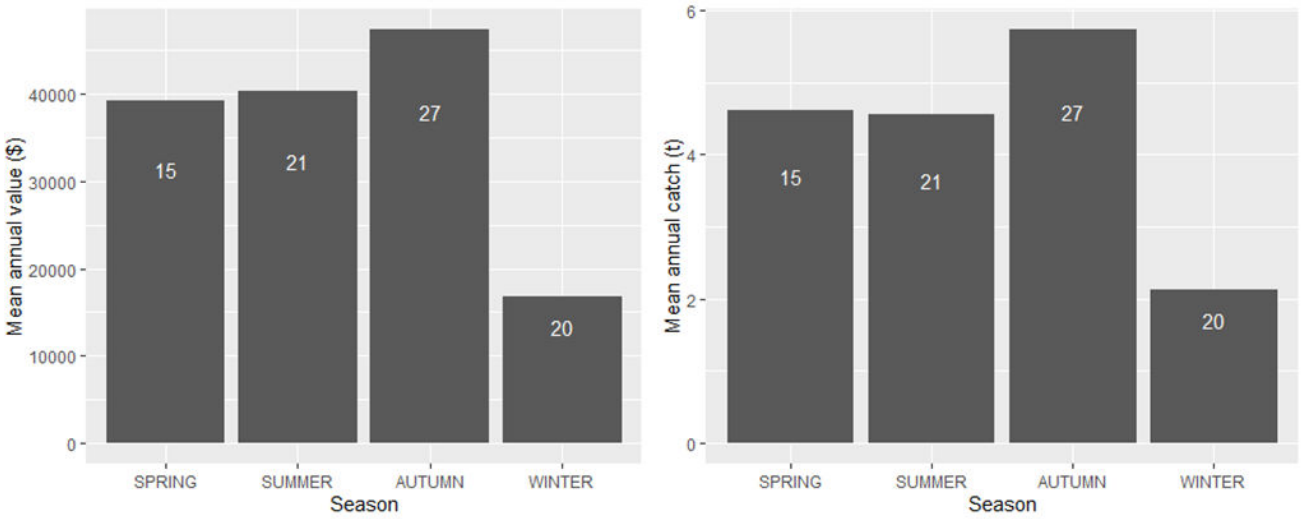

Figure 5. Mean annual catch (left), value (right) per season for the GHaT within the North Otway AOI. Bar labels are the total number of vessels operational by season (years pooled).

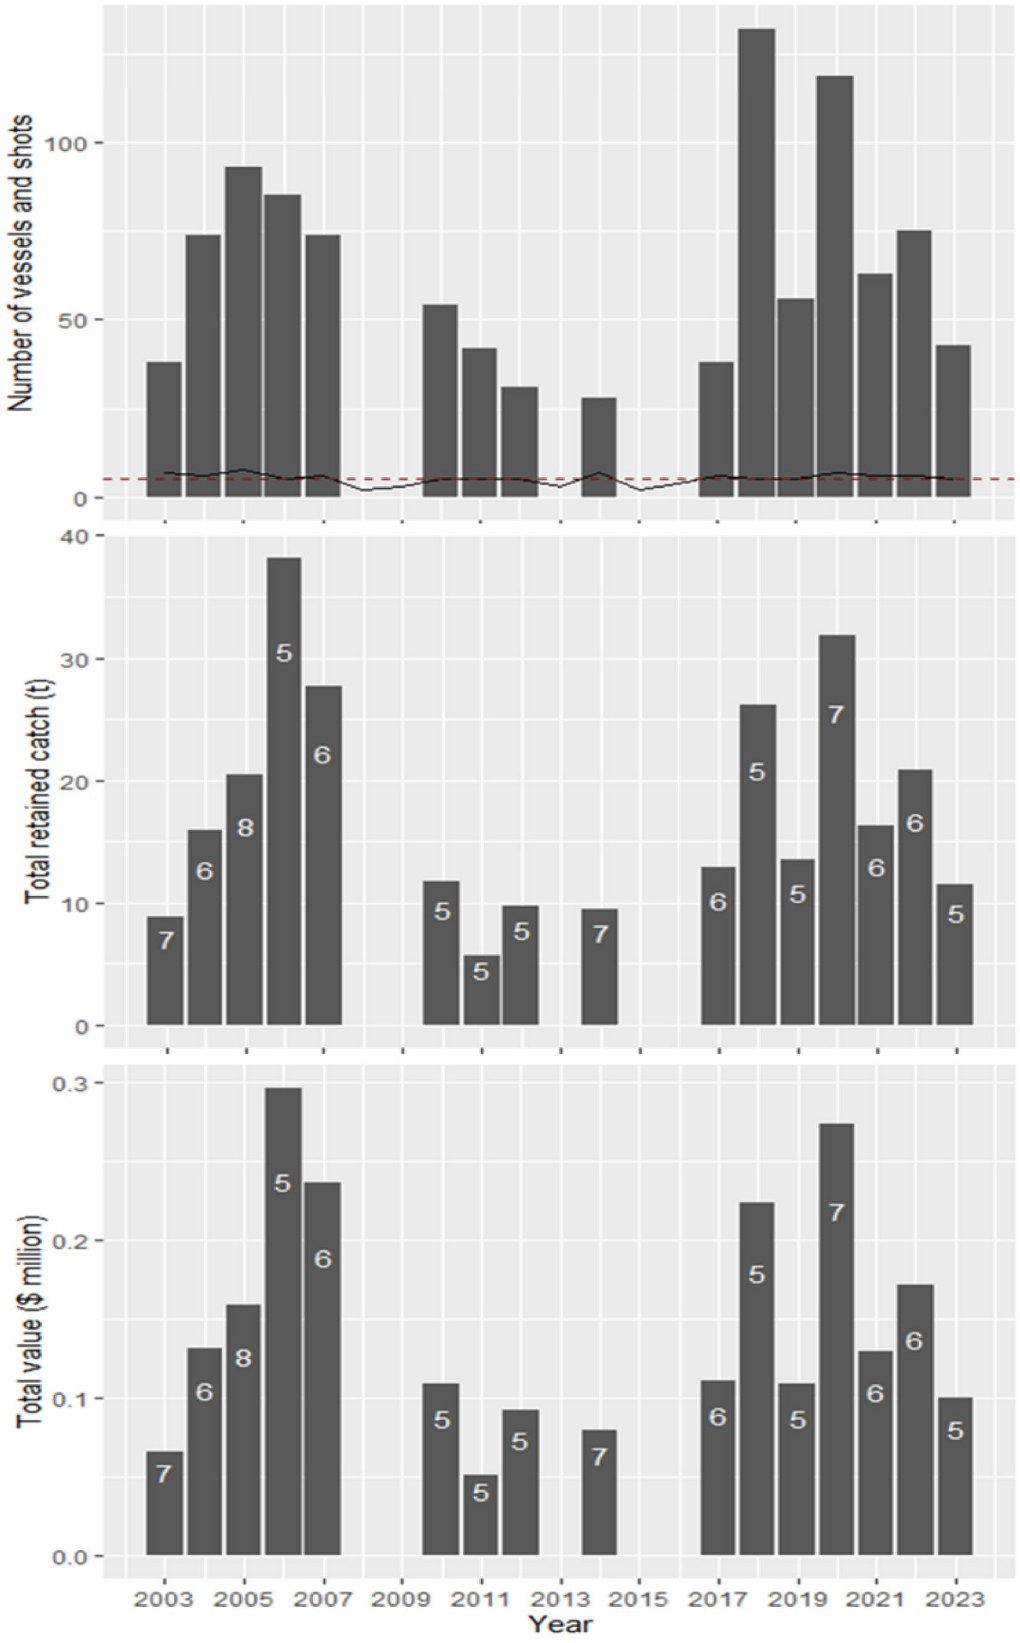

Figure 6. Effort, retained catch and annual value of vessels in the North Otway AOI by the GHaT. A) Number of vessels with effort (black line) and number of shots (bars), the red line intercepts the y-axis at 5. B) Annual retained catch within the fishing data assessment area represented by bars. C) Estimated annual values ($ million) landed within the fishing data assessment area in each year. Number of vessels annotated on bars in B and C.

1.2.1.2 Commonwealth Trawl Sector (CTS)

Bottom otter trawl gear and Danish seine gear have been deployed in the North Otway AOI in the past twenty years by 14 vessels that exerted 116 fishing events yielding a total catch of 79 tonnes for an approximate value of $374,000 (Table 4). Orange roughy accounted for 42% of catches, king dory 11%, and other species 47% (Figure 7).

Mean annual catches were consistent in spring and summer at around half the level of winter catches (Figure 8). Seasonal catch data is not presented for autumn as catches were reported by fewer than 5 fishers.

Annual CTS fishing activity cannot be presented due to confidentiality rules. Five or more vessels were only reported in the data for 2004. Fishing in 2004 was accomplished by 5 vessels that exerted 18 fishing events yielding catches of 12.8 tonnes for an approximate value of $50,000.

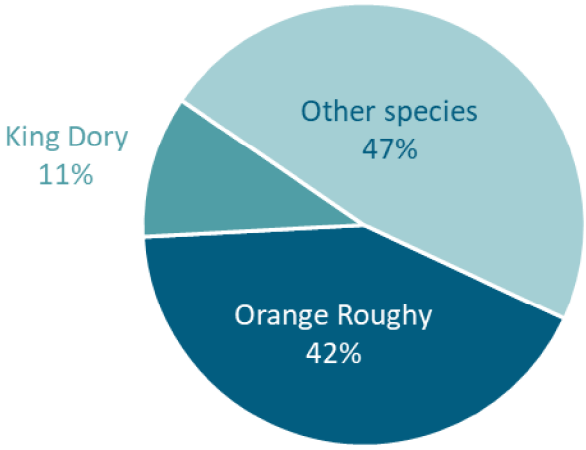

Figure 7. Pie chart showing the top species caught from the North Otway AOI by the CTS. Note the minimum number of vessels that caught any of the species shown was 6.

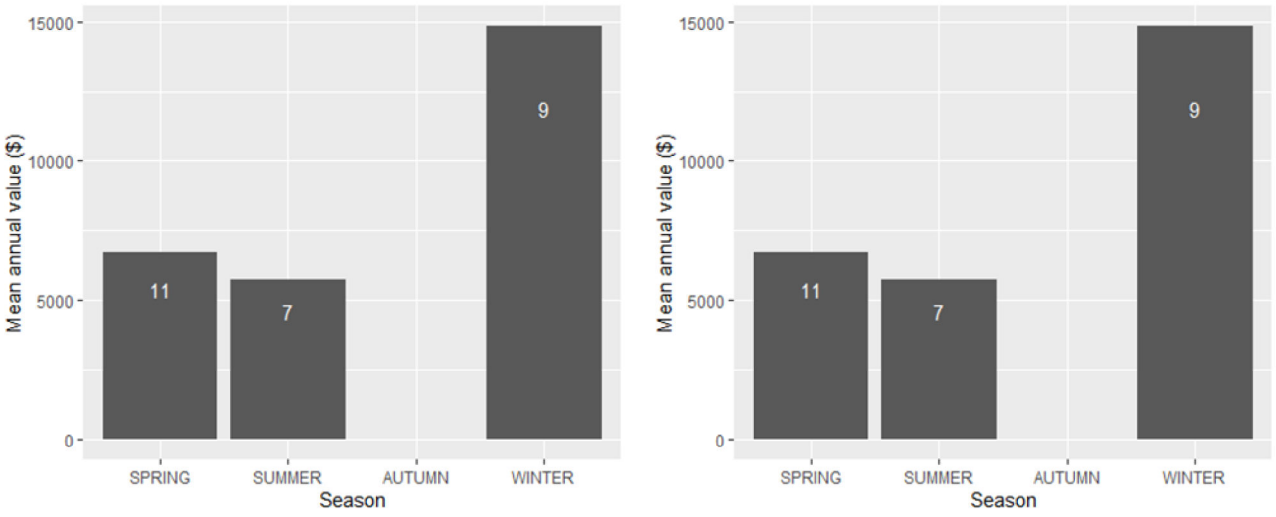

Figure 8. Mean annual catch (left), value (right) per season for the CTS within the North Otway AOI. Bar labels are the total number of vessels operational by season (years pooled).

1.2.1.3 Southern Squid Jig Fishery

Catch form the SSJF consisted entirely of Gould's squid, caught via squid jig. Mean annual catches were much higher in winter than autumn, and no catches were reported in the spring season (Figure 9). Seasonal catch data is not presented for summer as catches were reported by fewer than 5 fishers. Fishing over the past 20 years in the AOI accounted for 3.1% of total catches in the SSJF (Table 2).

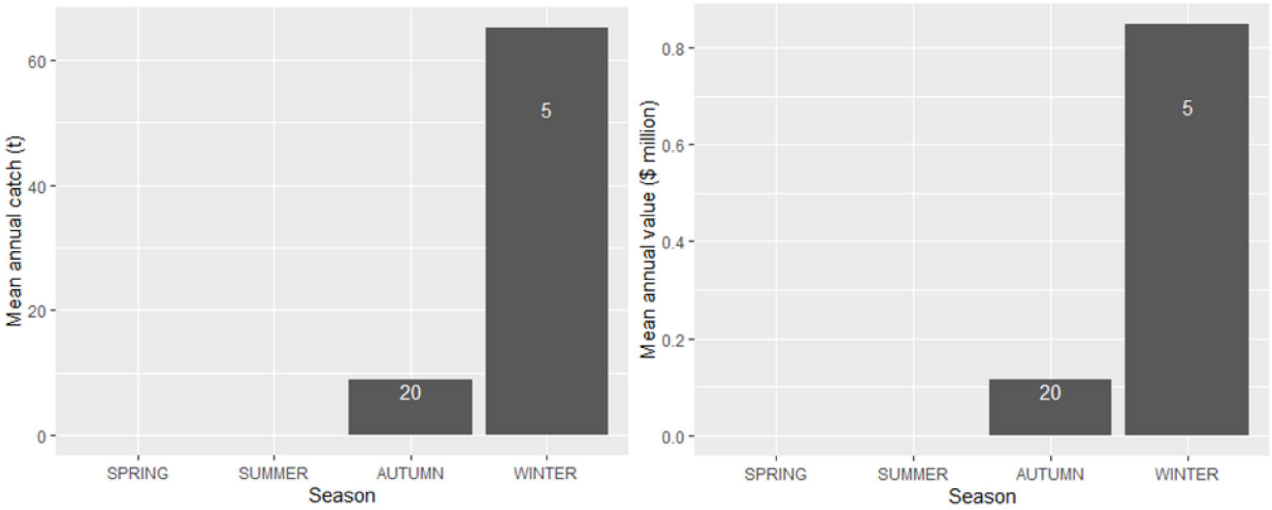

Figure 9. Mean annual catch (left), value (right) per season for the SSJF within the North Otway AOI. Bar labels are the total number of vessels operational by season (years pooled).

1.2.2 State Fisheries Victoria

1.2.2.1 Southern Rock Lobster Fishery

Rock lobster trapping gear has been deployed in the AOI in the past twenty years by 47 fishers with a total effort of 3,516 days fished (Table 5 A total catch of 216 tonnes yielded revenue of approximately $382,654 (Table 5). The average annual catch over the past 20 years of rock lobster within the North Otway AOI accounts for 4.2% of total catches of rock lobster in the 2020/21 fishing season (Table 5).

1.2.2.2 Abalone (blacklip) Fishery

Blacklip abalone were taken in the AOI in the past twenty years by 40 fishers with a total effort of 303 days fished (Table 5). A total catch of 144.1 tonnes yielded revenue of approximately $259,693 (Table 5). The average annual catch over the past 20 years of blacklip abalone within the North Otway AOI accounts for 3% of total catches of blacklip abalone in the 2020/21 fishing season (Table 5)

1.2.2.3 Giant Crab Fishery (Western Zone)

Giant crab trapping gear has been deployed in the AOI in the past twenty years by 18 fishers with a total effort of 1,361 days fished (Table 5). A total catch of 145 tonnes yielded revenue of approximately $135,678 (Table 5). Fishery data are not presented for all other species captured in this fishery because catches were reported by fewer than 5 vessels (Table 5). The average annual catch over the past 20 years of giant crab within the North Otway AOI accounts for 81% of total catches of giant crab in the 2020/21 fishing season (western management zone) (Table 5).

Table 5. Summary of catch by species, percent of total catch, number of vessels, number of days fished and number of fishers from 1/1/2003 to 31/12/2022 in Victorian reporting grids that overlapped with the AOI (excluding Pipis).

Species	Catch (t)	Number of Vessels	Percent of total fishery catch	Number of Days Fished	Number of Fishers

1.2.3 State Fisheries Tasmania

There are four Giant Crab and Rock Lobster fishery reporting grids which overlap with the North Otway AOI, however, there has been no effort reported within these grids from 2003-2022.

1.3 Commercial Fisheries in the South Otway AOI

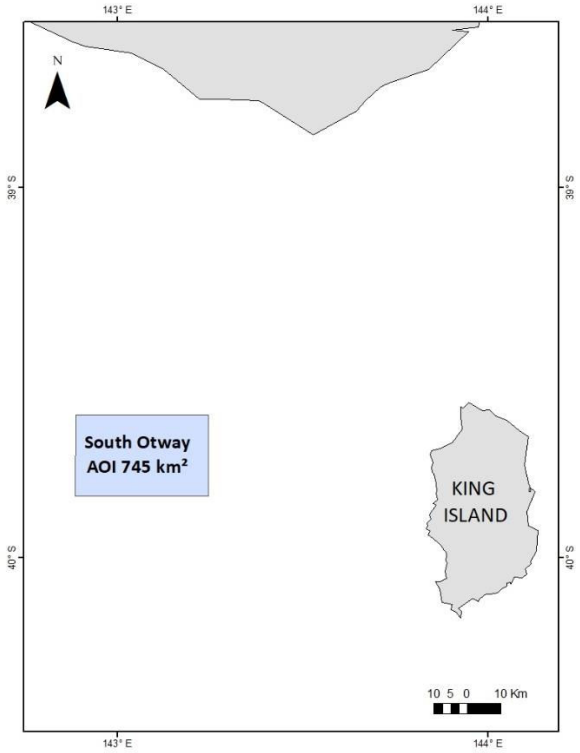

Figure 10. South Otway AOI position and size

The South Otway AOI is a rectangular zone of 745 square kilometres positioned to the west of King Island (Figure 10). This report presents data from fishing activity over the past 20 years within the South Otway AOI under both Commonwealth (ie. administered by the Australian Fisheries Management Authority) and State jurisdictions (Victoria and Tasmania).

See Table 2 for data summary, further detail is outlined below.

1.3.1 Commonwealth Fisheries

Commonwealth fisheries active in the AOI within the period from 1/7/2002 to 30/6/2023 were the Gillnet Trap and Hook Fishery (GHaT), the Commonwealth Trawl Fishery (CTS), and the Southern Squid Jig Fishery (SSJF). While this fishing activity yielded approximately $111,550 in revenue, catches within the AOI accounted for less than 0.5% of total catches in each Commonwealth fishery (Table 2).

Table 6. Summary of number of shots and catch reported from 1/7/2002 to 30/6/2023 from the South Otway AOI by Commonwealth fisheries.

	GHaT	CTS	SSJF
Gear Type	Demersal gillnet Demersal longline Auto longline, Dropline	Bottom otter trawl	Squid jigs
Number of shots	199	135	*Confidential*
Catch weight (t)	159	164	*Confidential*
Catch value $million	1.3	0.7	*Confidential*
Number of vessels	12	9	<5

1.3.1.1 Gillnet Trap and Hook Sector (GHaT)

Demersal gillnet, auto longline, dropline and demersal longline gears have been deployed in the South Otway AOI in the past twenty years. For these methods combined, 12 vessels exerted 199 fishing events, which yielded a total catch of 159.2 tonnes for an approximate value of $1.3m (Table 2). Blue-eye trevalla dominated catches (58%), with smaller catches of pink ling (16%), and other species combined (26%) ().

Mean annual catches were highest in summer and lowest in winter (Figure 3, Figure 4).

Annual GHAT effort and catches are not presented because catches were reported by fewer than 5 vessels. Fishing over the past 20 years in the AOI accounted for 0.5% of total catches in the GHAT fishery (Table 2).

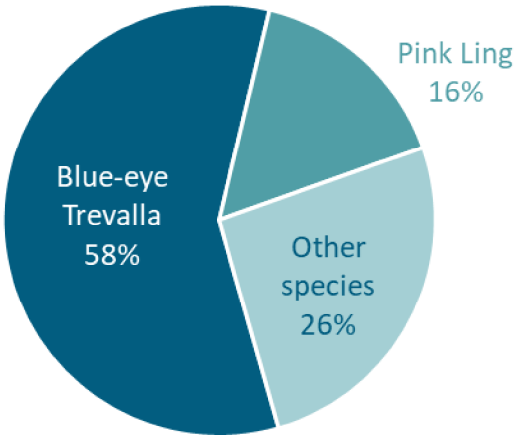

Figure 11. Pie chart showing the top species caught from the South Otway AOI by the GHaT. Note the minimum number of vessels that caught any of the species shown was 6.

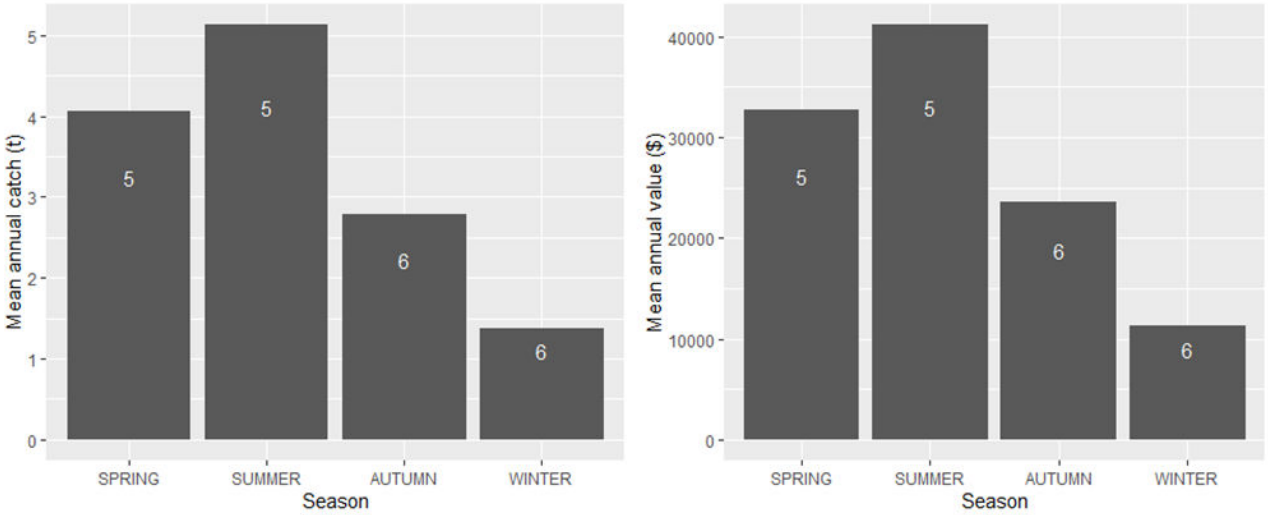

Figure 12. Mean annual catch (left), value (right) per season for the GHaT within the South Otway AOI. Bar labels are the total number of vessels operational by season (years pooled).

1.3.1.2 Commonwealth Trawl Sector (CTS)

Bottom otter trawl gear has been deployed in the AOI in the past twenty years by 9 vessels that exerted 135 fishing events yielding a total catch of 164.4 tonnes for an approximate value of $647,000 (Table 3). Orange roughy accounted for 31.9% of catches (Figure 5). Further catch composition detail is confidential due to fewer than 5 vessels reporting for every other species caught.

Mean annual catches were consistent by season (Figure 6, Figure 7). Seasonal catch data is not presented for Autumn as catches were reported by fewer than 5 fishers.

Yearly CTS fishing activity is only reported for 2004 because in every other year catches were reported by fewer than 5 vessels. Fishing in 2004 was accomplished by 5 vessels that exerted 36 fishing events that yielded catches of 34.4 tonnes for an approximate value of $136,000. Fishing over the past 20 years in the AOI accounted for 0.04% of total catches in the CTS fishery (Table 2).

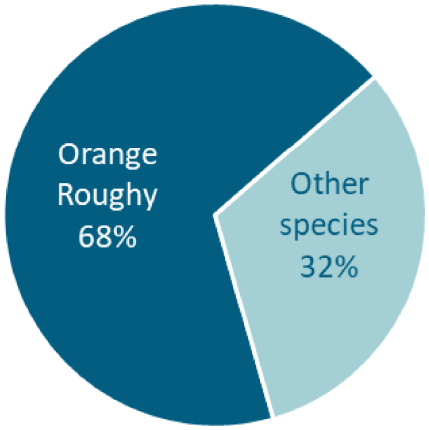

Figure 13. Pie chart showing the top species caught from the South Otway AOI by the CTS. Note the minimum number of vessels that caught any of the species shown was 6.

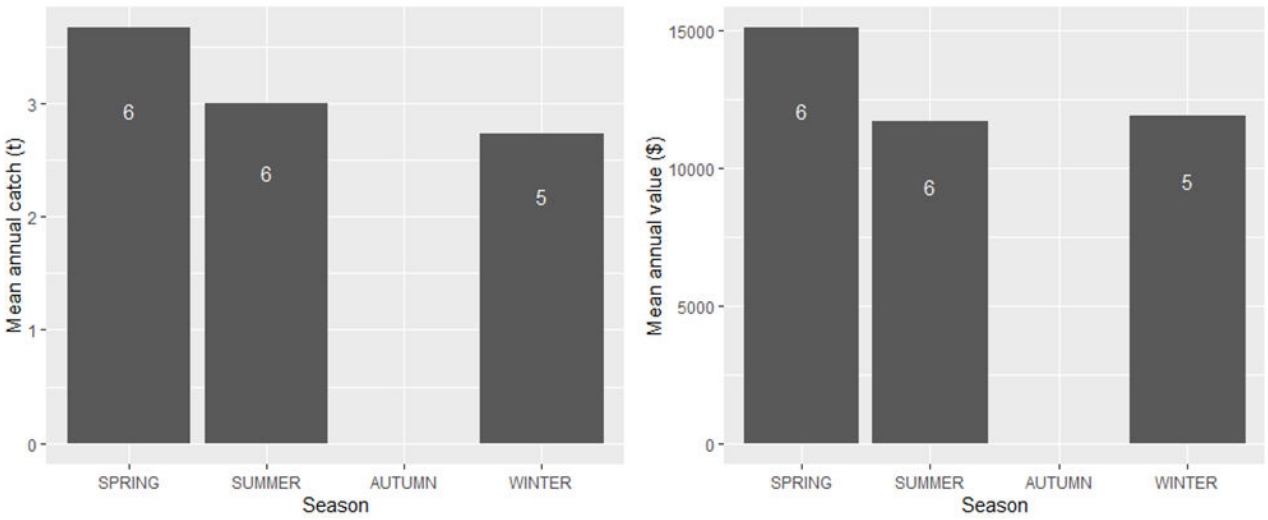

Figure 14. Mean annual catch (left), value (right) per season for the CTS within the South Otway AOI. Bar labels are the total number of vessels operational by season (years pooled).

1.3.1.3 Southern Squid Jig Fishery

Squid jig gears have been deployed in the AOI in the past twenty years. Summary, annual and seasonal squid jig effort and catch data are not presented because catches were reported by fewer than 5 vessels (Table 6). Squid fishing over the past 20 years in the AOI accounted for 0.2% of total catches in the SQJ fishery (Table 2).

1.3.2 State Fisheries Victoria

1.3.2.1 Giant Crab Fishery (Western Zone)

Giant crab trapping gear has been deployed in the South Otway AOI in the past twenty years by 12 fishers with a total effort of 646 days fished (Table 7). A total catch of 111 tonnes yielded revenue of approximately $103,329 (Table 2).

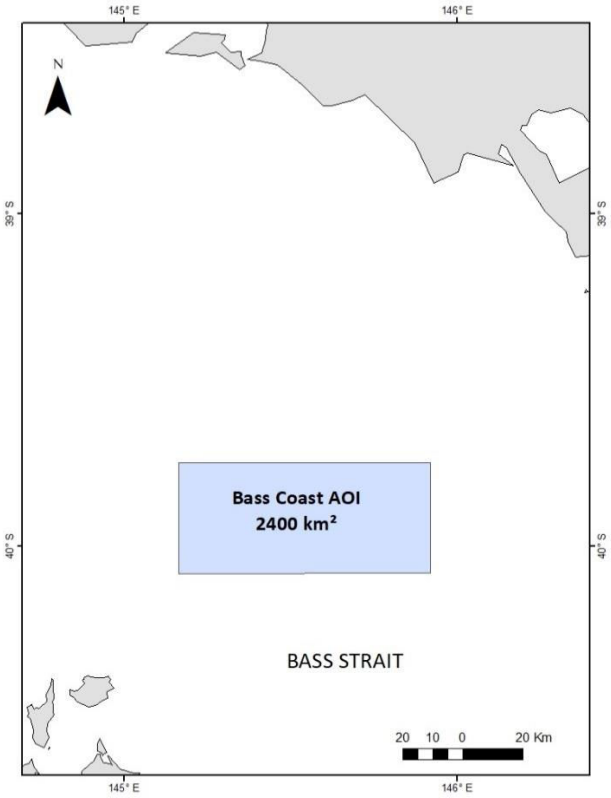
The average annual catch over the past 20 years of giant crab within the South Otway AOI accounts for 61% of total catches of giant crab in the 2020/21 fishing season (western management zone) (Table 7).

1.3.2.2 Southern Rock Lobster Fishery

Rock lobster trapping gear has been deployed in the South Otway AOI in the past twenty years by 16 fishers with a total effort of 304 days fished (Table 7). A total catch of 9.5 tonnes yielded revenue of approximately $16,760 ().

The average annual catch over the past 20 years of rock lobster within the South Otway AOI accounts for 0.2% of total catches of rock lobster in the 020/21 fishing season (Table 7).

Table 7. Summary of catch by species, percent of total catch, number of vessels, number of days fished and number of fishers from 1/7/2003 to 30/6/2023 in Victorian reporting grids that overlapped with the AOI (excluding Pipis).



Species	Catch (t)	Number of Vessels	Percent of total catch	Number of Days Fished	Number of Fishers
Crab, giant	111	17	61%	646	12
Rock lobster, Southern	9.5	19	0.2%	304	16
Octopus	0.12	8	NA	39	6
Trumpeter, Striped	*Confidential*	2	*Confidential*	6	2
Leatherjacket	*Confidential*	2	*Confidential*	7	2
Shark, school	*Confidential*	1	*Confidential*	4	1

Crab, Hermit	*Confidential*	1	*Confidential*	1	1
Ling, Banded	*Confidential*	2	*Confidential*	3	2
Ling, Rock	*Confidential*	1	*Confidential*	1	1
Shells	*Confidential*	1	*Confidential*	1	1
Snapper	*Confidential*	1	*Confidential*	1	1

1.3.3 State Fisheries Tasmania

1.3.3.1 Tasmanian Rock Lobster & Giant Crab Fisheries

There are four Tasmanian Giant Crab and Rock Lobster fishery reporting grids which overlap with the South Otway AOI (Figure 2). Data from the giant crab fishery comes from less than five vessels so cannot be reported. The Rock Lobster fishery reported catch from eight vessels in these four grids from 2003 – 2022, these vessels had 10 days of effort catching 0.25 t at a value of approximately $20,000.

1.4 Commercial Fisheries in the Bass Coast AOI

The Bass Coast AOI is a rectangular zone of 2,400 square kilometres positioned between Port Phillip Bay and the north-western extremity of Tasmania in western Bass Strait (Figure 15). This report presents data from fishing activity over the past 20 years within the Bass Coast AOI under Commonwealth jurisdiction (ie. administered by the Australian Fisheries Management Authority) and Tasmanian State jurisdiction. Fishing activity under Victorian State jurisdiction was not conducted within the AOI over this period as the reporting grids do not overlap.

See Table 2 for data summary, further detail is provided below.

Figure 15. Bass Coast AOI, position and size.

1.4.1 Commonwealth Fisheries

Commonwealth fisheries active in the AOI within the period from 1/7/2002 to 30/6/2023 were the Gillnet Trap and Hook Fishery (GHAT), the Bass Strait Scallop Fishery (SCA), the Southern Squid Jig Fishery (SQJ) and the Commonwealth Trawl Fishery (CTS). While this fishing activity yielded approximately $132,312 in revenue, catches within the AOI accounted for less than 1% of total catches in each fishery (Table 2).

Table 8. Summary of number of shots and catch reported from 1/7/2002 to 30/6/2023 from the Bass Coast AOI by Commonwealth fisheries

	CTS	GHaT	SSJF	BSCZSF
Gear Type	Bottom otter trawl Danish seine	Demersal gillnet Demersal longline Auto longline Dropline	Squid jigs	Scallop dredge
Number of shots	*Confidential*	713	*Confidential*	12
Catch weight (t)	*Confidential*	188	*Confidential*	88
Catch value $million	*Confidential*	1.8	*Confidential*	0.2
Number of vessels	<5	39	<5	5

1.4.1.1 Gillnet Trap and Hook Sector (GHaT)

Demersal gillnet and demersal longline gears have been deployed in the Bass Coast AOI every year of the past twenty. For these methods combined, 39 vessels exerted 713 fishing events, which yielded a total

catch of 188 tonnes for an approximate value of $1.8 (Table 8). Gummy shark dominated catches (73%), with smaller catches of school shark (17%), and other species combined (17.1%) (Figure 16).

Mean annual catches were variable by season with highest catches in winter and lowest in summer (Figure 17).

Fishing effort has been consistent over the last decade (around 50 to 75 fishing events) exerted by a fleet of 5 to 13 vessels (Figure 18) with annual catches and revenue also consistent with the exception of particularly high yields in 2020 and 2021 (Figure 18). GHaT fishing activity in the 2005, 2006, 2008, 2009, and 2011 financial years are not presented in Figures 3 to 5 because catches in these years were reported by fewer than 5 vessels. Fishing over the past 20 years in the AOI accounted for 0.5% of total catches in the GHaT fishery (Table 2).

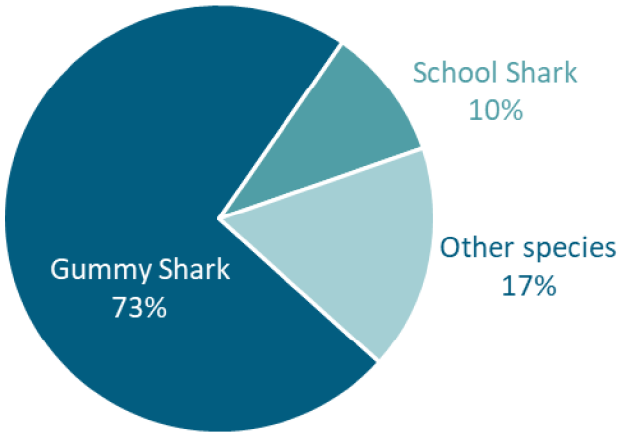

Figure 16. Pie chart showing the top species caught from the Bass Coast AOI by the GHaT. Note the minimum number of vessels that caught any of the species shown was 31.

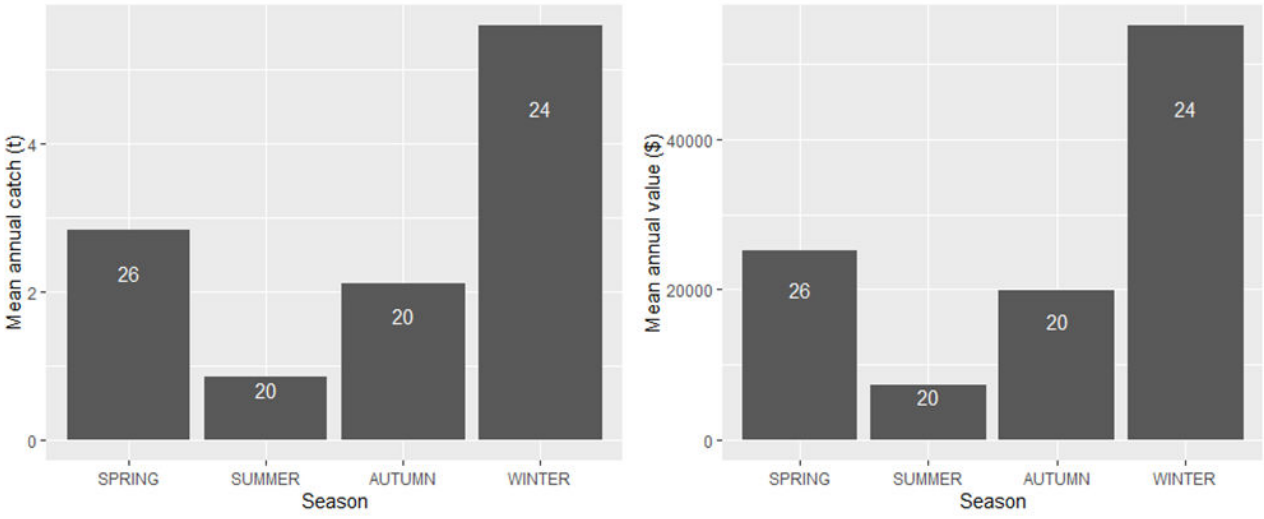

Figure 17. Mean annual catch (left), value (right) per season for the GHaT within the Bass Coast AOI. Bar labels are the total number of vessels operational by season (years pooled).

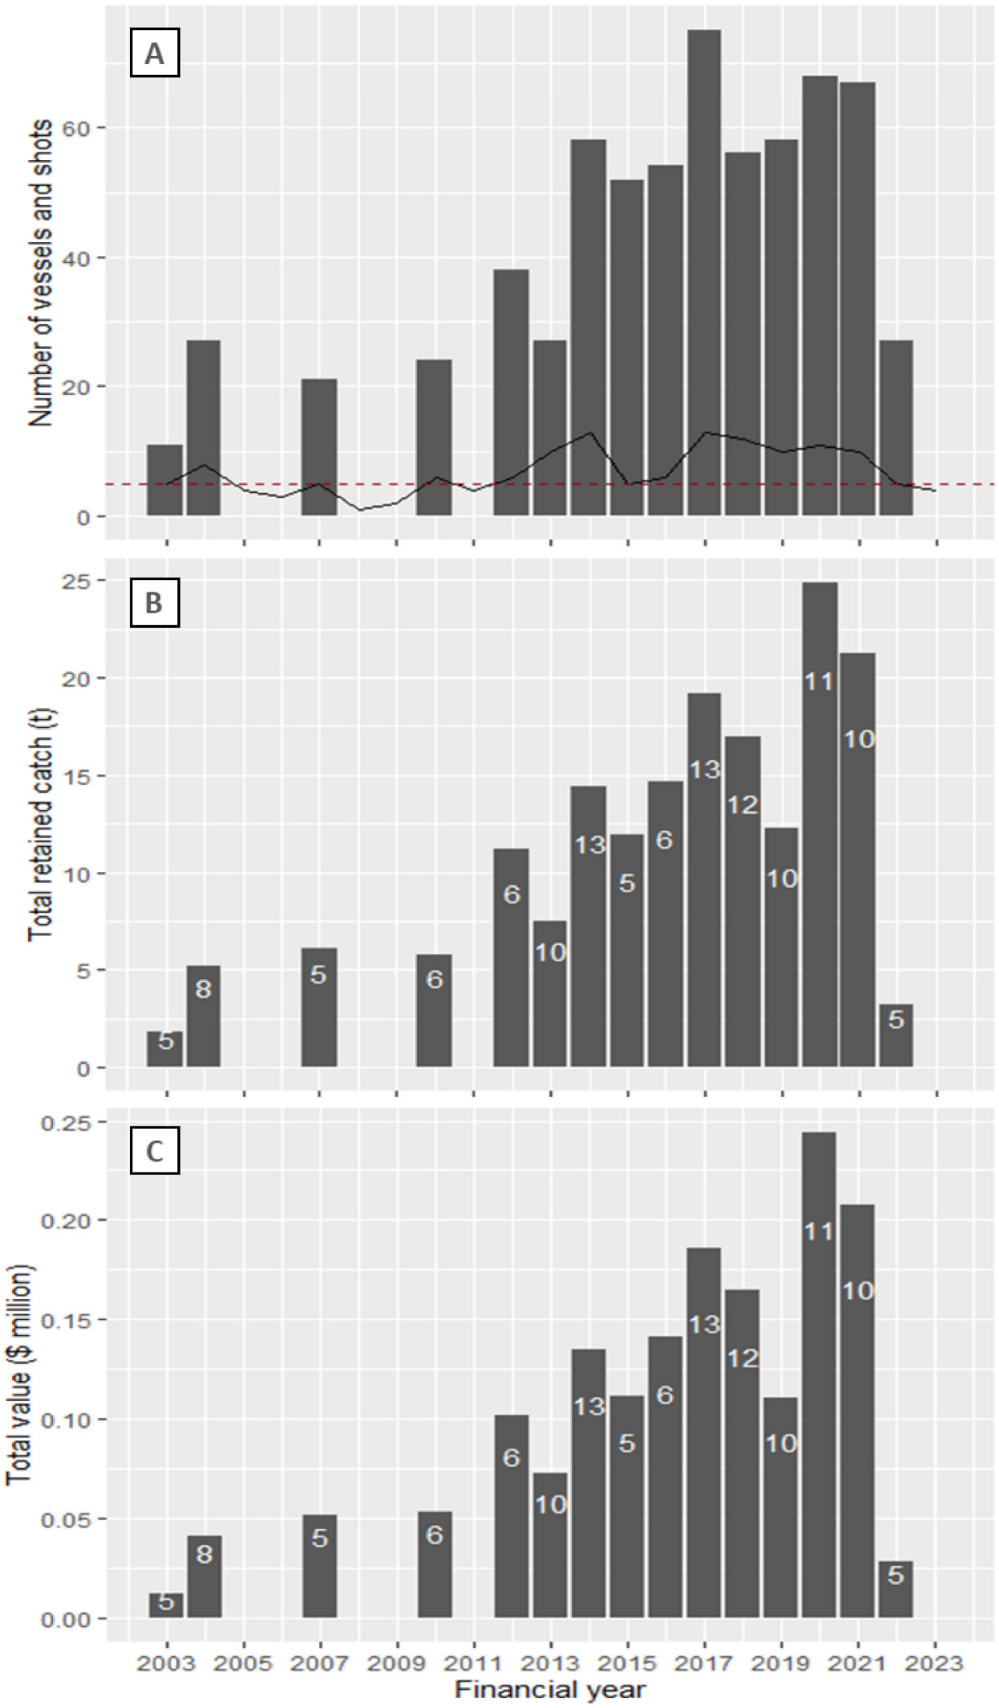

Figure 18. Effort, retained catch and annual value of vessels in the Bass Coast AOI by the GHaT. A) Number of vessels with effort (black line) and number of shots (bars), the red line intercepts the y-axis at 5. B) Annual retained catch within the fishing data assessment area represented by bars. C) Estimated annual values ($ million) landed within the fishing data assessment area in each year. Number of vessels annotated on bars in B and C.

1.4.1.2 Commonwealth Trawl Sector (CTS)

Bottom otter trawl and Danish seine gears have been deployed in the AOI in four of the past twenty years. For these methods combined, summary and annual effort and catches are not presented because catches were reported by fewer than 5 vessels. No fishing was reported in spring and seasonal catch data cannot be presented for summer, autumn and winter as catches were reported by fewer than 5 vessels.

Catches from bottom otter trawl and Danish seine gears combined over the past 20 years in the AOI accounted for less than 0.01% of total catches in the CTS fishery (Table 2).

1.4.1.3 Southern Squid Jig Fishery (SSJF)

Whilst the SSJF was active in the Bass Coast AOI during the data period (four of the past 20 years reported data), data is confidential as it comes from less than 5 vessels.

1.4.1.4 Bass Strait Central Zone Scallop Fishery (BSCZSF)

Scallop dredge gears have been deployed in the AOI in five of the past twenty years. Five vessels exerted 12 fishing events which yielded a total catch of 88.2 tonnes of scallops for an approximate value of $214,000 (Table 2). Retained catches comprised of 100% commercial scallops. Annual dredge effort and catches are not presented because catches were reported by fewer than 5 vessels.

The mean annual catch for winter was 10 tonnes and no scallops were caught in summer or autumn (Figure 19). Seasonal catch data is not provided for spring as catches were reported by fewer than 5 fishers.

Scallop fishing over the past 20 years in the AOI accounted for 0.6% of total catches in the SCA fishery (Table 2).

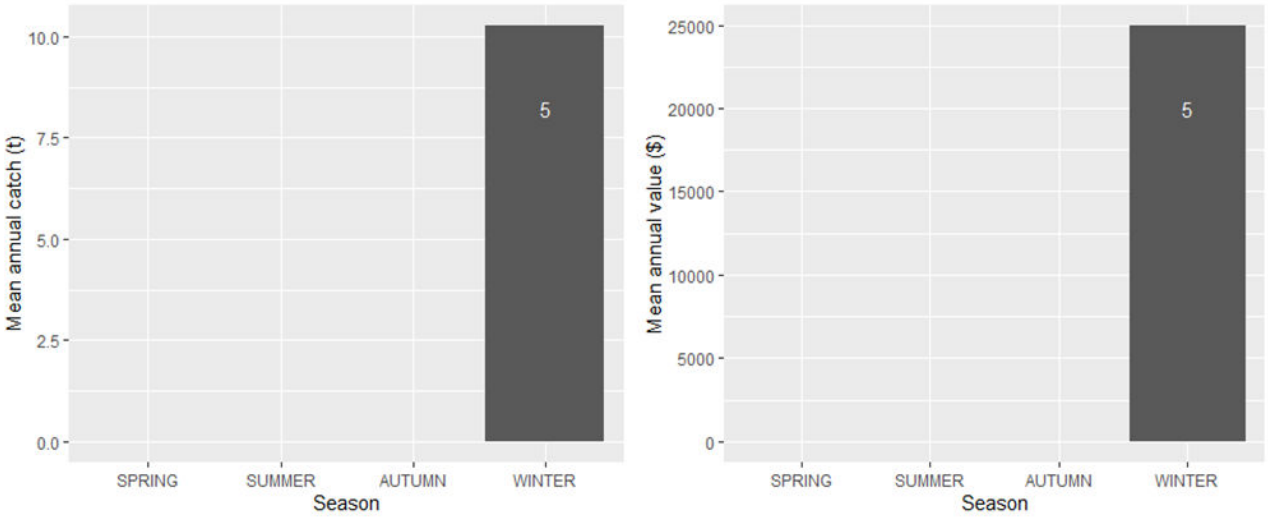

Figure 19. Mean annual catch (left), value (right) per season for the BSCZSF within the Bass Coast AOI. Bar labels are the total number of vessels operational by season (years pooled).

1.4.2 State Fisheries Tasmania

1.4.2.1 Tasmanian Giant Crab and Rock Lobster Fishery

There are four Tasmanian Giant Crab and Rock Lobster fishery reporting grids which overlap with the South Otway AOI (Figure 2). Less than 5 fishers reported effort in the Tasmanian Giant Crab Fishery, and so data can not be reported. Five different fishers reported 18 days of Rock Lobster Fishery effort in the Bass Strait AOI, catching 0.539 t of Southern Rock Lobster valued at $0.038m.

1.4.2.2 Tasmanian Scalefish Fishery

There were 14 different fishing vessels within the Tasmanian Scalefish Fishery that recorded effort from within the Bass Strait AOI during 2003–2022. They reported 365 days of fishing, catching 149 t of fish valued at $0.8 m. A wide variety of fishing gears were used, with octopus pots/traps catching the most of all gears. Whilst there were several different species caught within the fishery most were caught by less than 5 vessels and so more details cannot be reported. However, there was a total of 896 kg of Southern Calamari reported by 7 fishers.

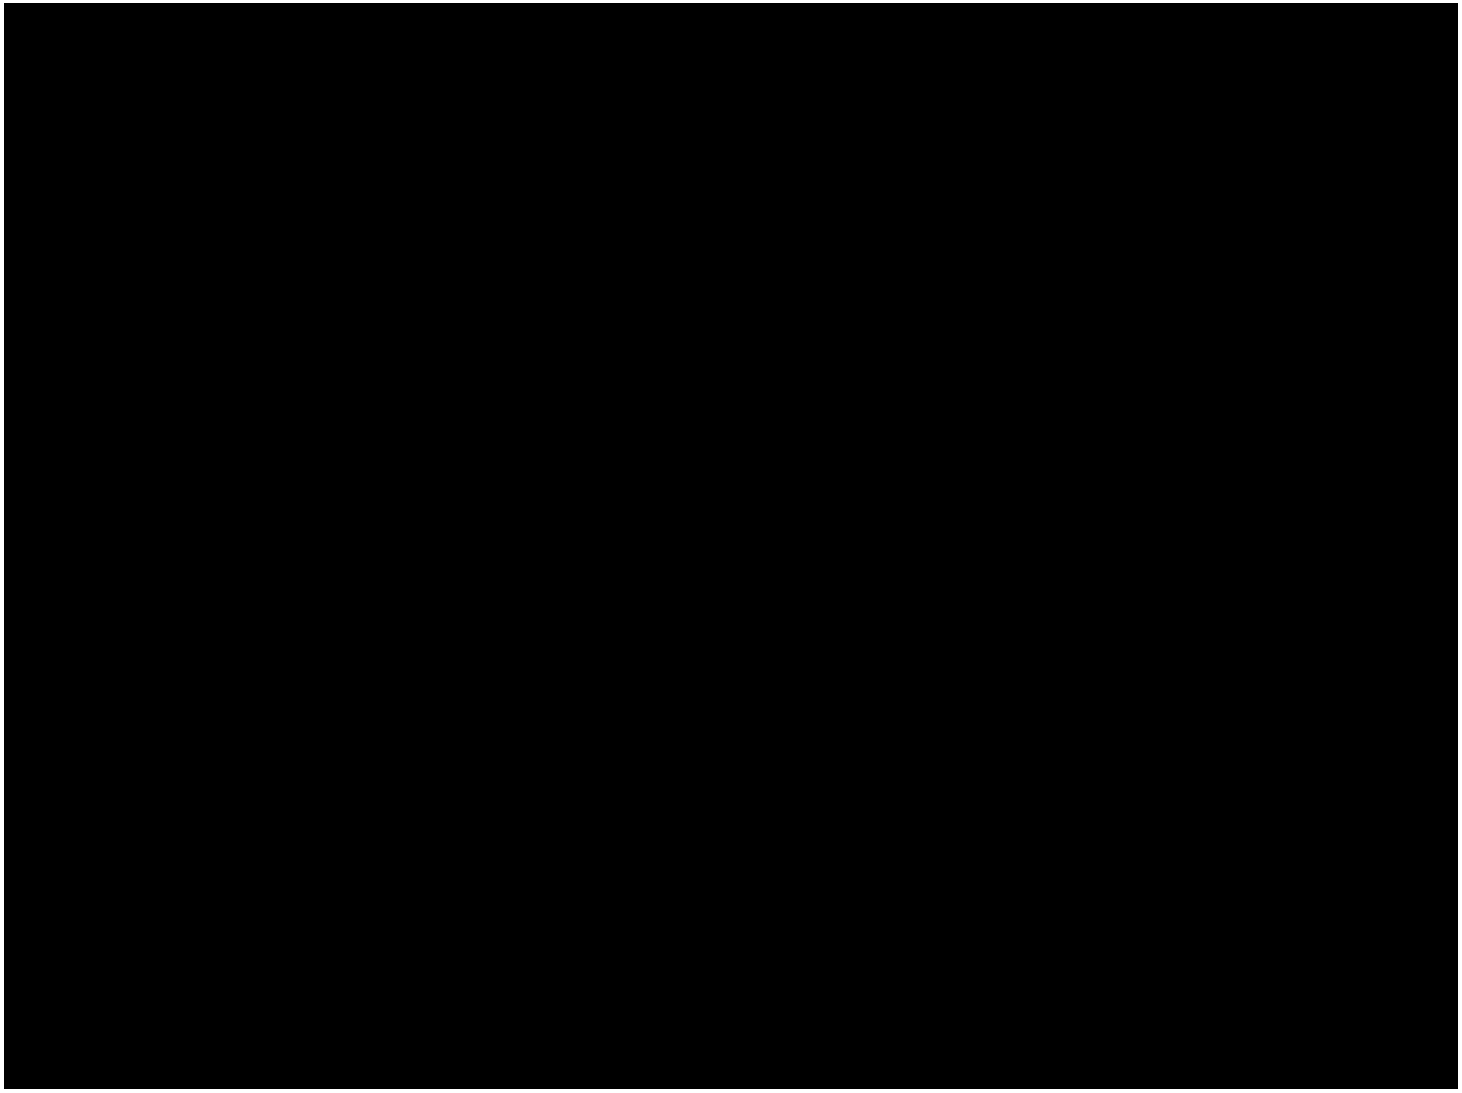

Table 9. Summary of number of shots and catch reported from Tasmanian state fisheries overlapping with the Bass Coast AOI

	Rock Lobster Fishery	Scalefish Fishery
Gear Type	Rock Lobster Pot	Shark Net, Octopus Pot/Trap, Troll, Hand Line, Small Mesh Net, Beach Seine, Hand Squid Jig, Automatic Squid Jig, Shark Longline
Number of days	18	365
Catch weight (t)	0.54 t	149 t
Catch value $million	$0.04 m	$0.8 m
Number of vessels	5	14

2. CTS TRAWL TRACKS AND THE OTWAYS REGION

All trawl data from the past twenty years has been combined to show trawl effort in the Otway Basin in relation to the Beach AOIs. It is evident from the maps in Figure x and x that most fishing effort, particularly trawl is between the 400 and 1,000m isobath. This does not significantly impact the North Otway AOI, cutting across the south-western corner, however, the South Otway AOI is directly over this relatively high traffic area. It is a recommendation of this report for Beach Energy to avoid depths between the 400-100m isobaths to minimise the impact on fishing, particularly the CTS.

3. COMMERCIAL FISHING – GENERAL INFORMATION

There are eleven different Commonwealth, Victorian and Tasmanian fisheries with recent fishing activity in the study area. Table 10 outlines the fisheries, management authority and fishing methods used in each fishery.

Table 10. Operation of Commonwealth and State managed fisheries who have actively fished within the study area in the past 20 years.

		Fishery			Fishing methods
Commonwealth- managed	SESSF	Commercial Trawl Sector			Otter-board trawl (mid-water and demersal)
					Danish seine
		GHAT	Shark Gillnet and Shark Hook Sector		Demersal gillnet
					Demersal longline
			Scalefish hook sectors		Demersal longline
		Southern Squid Jig Fishery			Squid jig
		Bass Straight Central Zone Scallop fishery			Scallop dredge
State- managed	Victoria	Abalone and Sea Urchin			Diving
		Ocean General Fishery			Demersal longline; Demersal Gillnet; Squid Jig; Minor line; Purse seine
		Rock Lobster Fishery			Rock Lobster Pots
		Giant Crab Fishery			Crab Pots
	Tasmania	Giant Crab Fishery			Crab Pots
		Rock Lobster Fishery			Rock Lobster Pots
		Scalefish Fishery			Various methods including; pot; hook and line (handline), Gillnet; Squid Jig; beach seine; Danish seine; Purse seine

SOUTHERN AND EASTERN SCALEFISH AND SHARK FISHERY (SESSF)

The Southern and Eastern Scalefish and Shark Fishery (SESSF) extends from Cape Leeuwin in Western Australia to Fraser Island in Queensland (QLD) and is comprised of five sectors: the Commonwealth Trawl Sector (CTS), Great Australian Bight Trawl Sector (GABTS), East Coast Deepwater Trawl Sector (ECDTS), Gillnet and Shark Hook Sector (SGSHS) and Scalefish Hook Sector (SHS) (Figure 22). The SESSF gross value of production (GVP) was $110 million in the 2020-21 financial year accounting for almost 30% of Commonwealth fisheries GVP.

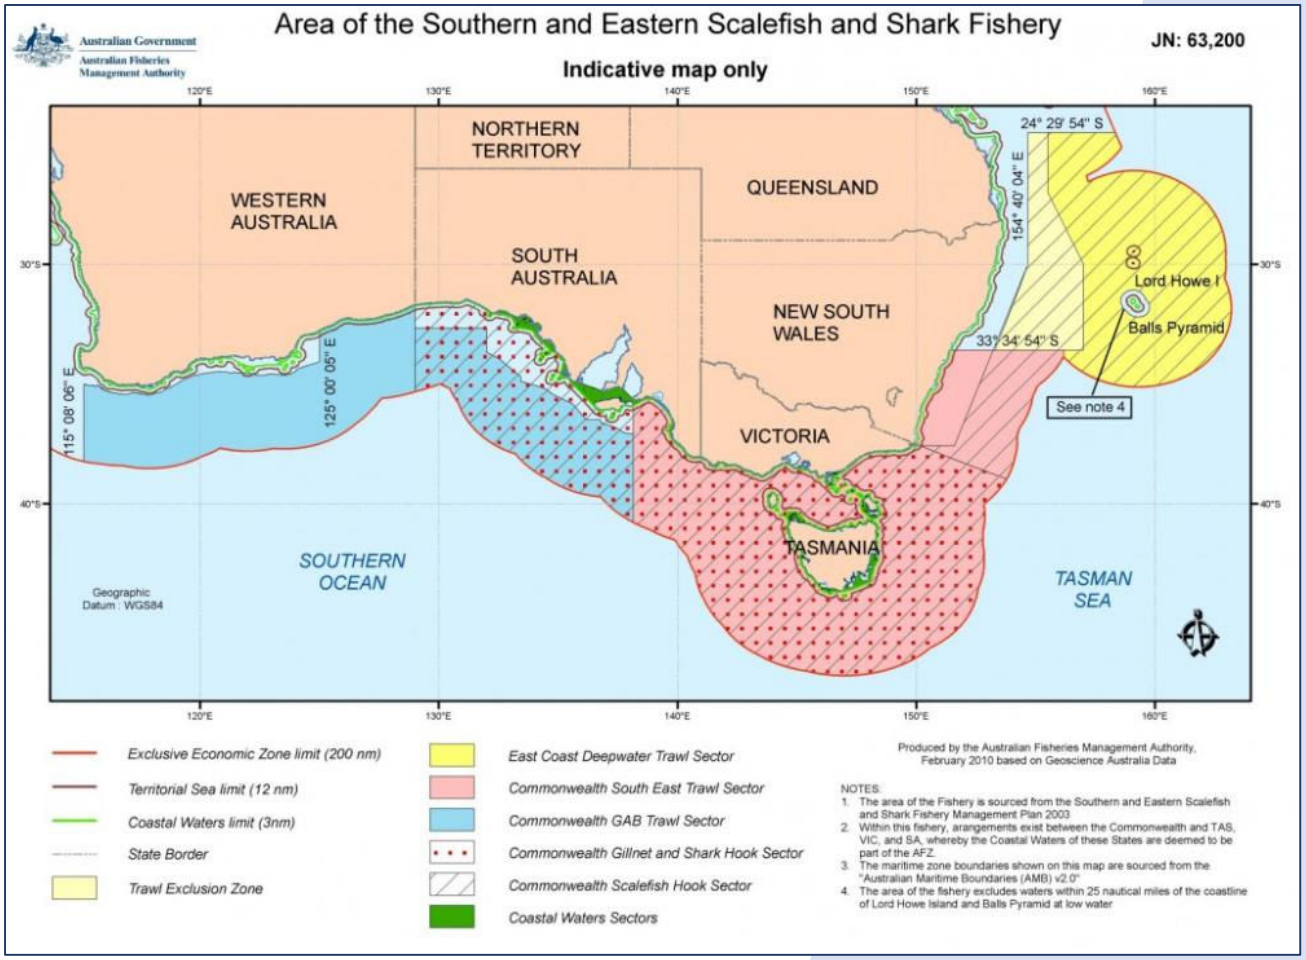

Figure 22. The Commonwealth managed Southern and Eastern Scalefish and Shark Fishery (SESSF) showing the areas of the Commonwealth Trawl Sector (CTS, pink) and Gillnet and Shark Hook sectors (GHAT, dotted),

The Australian Fisheries Management Authority (AFMA) manages fisheries to maintain stocks at ecologically sustainable levels, while maximising the net economic returns to the Australian community. The main management measures used in the SESSF include limited entry, gear restrictions, closed areas and Total Allowable Catch (TAC) limits. A limited number of statutory fishing right (SFR) vessel permits exist and one is required on each vessel operating in the fishery. Additionally, any fish species managed under quota must be landed against quota SFRs. Annual TACs are set based on outcomes of stock assessments conducted for each quota species. Quota SFRs are converted to tonnes of quota (TAC) each year depending on the annual TAC that is set.

More than 100 species are regularly landed in the SESSF but only the main species are managed under quotas. At present, there are 34 fish stocks subject to total allowable catches (TACs, Table 11).

SESSF

Table 11. List of 2022–23 TACs (whole fish unless otherwise stated) for SESSF quota species (AFMA SESSF Management Arrangement Booklet, 2022).

Species	TAC (t)	Species	TAC (t)
Alfonsino	1,017	Orange Roughy – (GAB)	50
Bight Redfish (GAB)	890	Orange Roughy – (Cascade)	397
Blue Eye Trevalla	241	Orange Roughy – (east)	1,072
Blue Grenadier	18,275	Orange Roughy – (south)	113
Blue Warehou	50	Orange Roughy – (west)	60
Deepwater Flathead (GAB)	1,238	Oreo (smooth Cascade)	150
Deepwater Shark (east)	24	Oreo (smooth other)	90
Deepwater Shark (west)	235	Oreo (basket)	137
Elephant Fish	114	Pink Ling	1,568
Flathead (Tiger)	2,333	Redfish	30
Gemfish East	100	Ribaldo	397
Gemfish West	340	Royal Red Prawn	651
Gummy Shark	1,672[14]	Sawshark	519
Jackass Morwong	20	School Shark	250
John Dory	60	School Whiting	917
Mirror Dory	129	Silver Trevally	51
Ocean Perch	305	Silver Warehou	350

SESSF

COMMONWEALTH TRAWL SECTOR

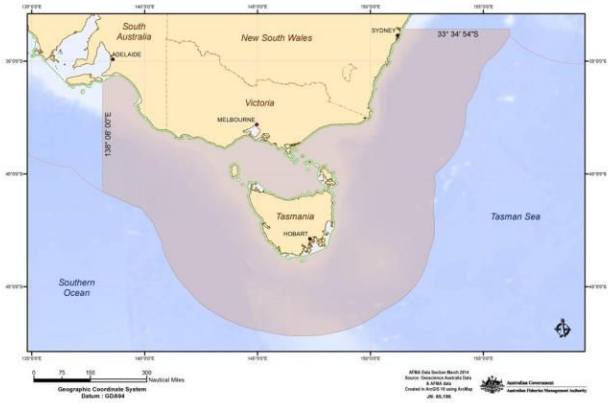

Figure 23. Map of the Commonwealth Trawl Sector (CTS)

The Commonwealth Trawl Sector (CTS) is one of the oldest commercial fisheries in Australia with more than 100 years of catch history. The fishery extends from Barrenjoey Point in NSW to Cape Jervis in SA (Figure 23) and is managed by quota across 34 species/groups.

All Commonwealth licensed vessels must carry Vessel Monitoring Systems (VMS), which provide the exact location of trawl vessel tracks in real time. There were 34 otter board trawl vessels and 20 Danish seine vessels active in the fishery in 2020-21, with effort of over 50,000 trawl hours and 10,758 Danish seine shots.

Target species for the CTS board trawl subsector include Blue Grenadier, Mirror Dory and Pink Ling. Total annual catch (fishery wide) in the CTS peaked in 1990 at just over 60,000 t, but fell to 20,000–30,000 t during the late 1990s (Figure 25), mainly as a result of overfishing Orange Roughy. Catches again fell from about 30,000 t in 2000 to below 10,000 t in 2014, but increased to more than 18,000 t in 2020–21 (Figure 25). This catch equated to $64m in GVP (inclusive of scalefish hook subsector), a 38% increase compared to 2019-20.

Methods used:

- Otter board trawl
- Danish seine

Trawl fishers typically fish to a maximum depth of 1,200m. Otter-board trawl vessels are typically 18-28 m and are powered by 250–700 HP engines (Figure 24). CTS Danish seine vessels are typically 15–20 m long and powered by 250–300 HP engines.

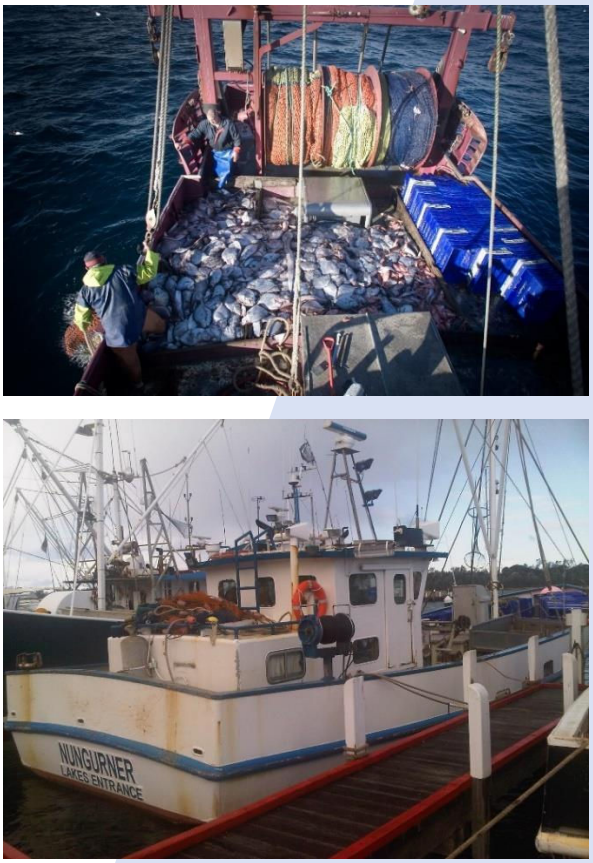

Figure 24. Rear of vessel on typical otter board trawl (above), typical Danish seine vessel (below).

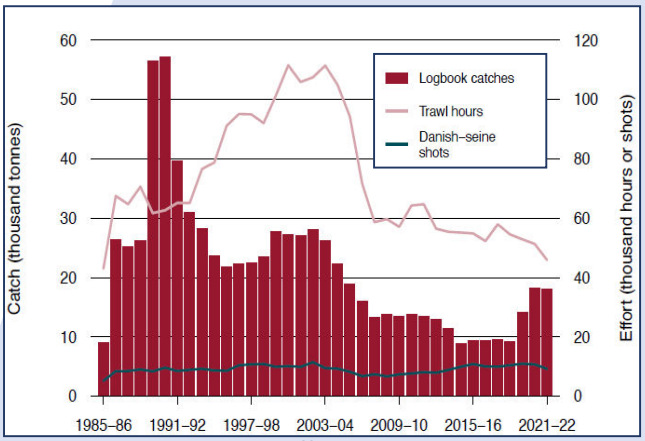

Figure 25. CTS catch and effort data

SESSF

SHARK HOOK AND SHARK GILLNET SECTOR

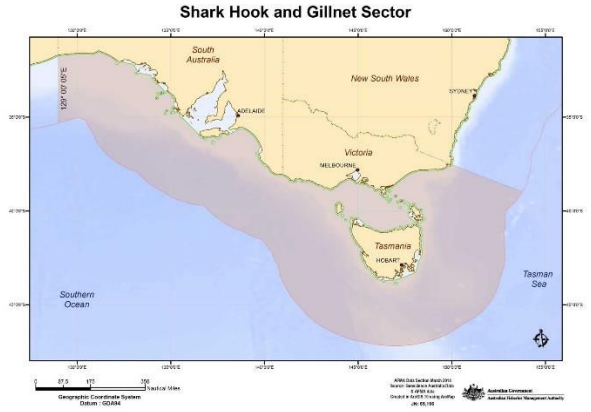

Figure 26. Map of the Shark Hook and Shark Gillnet

The Shark Hook and Shark Gillnet Sector (SHSGS) includes waters of the AFZ between the NSW/VIC border to the SA/WA border (Figure 26). Gillnetting is limited by marine parks, fishery closures, unfishable grounds, unproductive grounds and other fishery closures. Currently, gillnetting is not permitted in Commonwealth waters deeper than 183 m (equivalent to 100 fathoms) to protect certain deeper-water species.

The SHSGS is managed by TACs, however, the maximum gillnets length that can be used in 6,000 m (provided video monitoring is present onboard) but most use between 4,000 m and 6,000 m.

Catch in the SGSHS peaked at more than 4,000 t during 1986, and effort peaked in the following year at more about 120,000 km-lifts (Figure 28). Catch and effort has decreased by more than 50% since, mainly due to declining stocks of School Shark, conservative School Shark management and removal of effort through Government-led structural adjustments and closures. Despite this decrease, Gummy Shark landings have increased from 1,288 t in 2012–2013 to 1,695 t in 2020–2021. Main target species are Elephantfish, gummy shark, school shark and sawshark.

During 2020–2021 there were 31 active shark gillnet and shark hook sector vessels operating gillnets and 38 vessels using demersal longlines hauling 27,820 km of net and setting 2,881,959 hooks (Figure 29). This landed 1,970 t of shark and $22.61 m in GVP.

Shark gillnetters may lay-up at anchor during bad weather or while fishing gear soaks. A prime example of a medium sized aft wheelhouse shark gillnetter vessel (15m in length) is seen in Figure 27.

Methods used:

- Demersal gillnets
- Demersal longline and auto longline

Figure 27. FV Erin Jay - a Commonwealth shark gillnetter fishing out of Lakes Entrance.

sustainable fishing practices protect our future

SOUTHERN SQUID JIG FISHERY

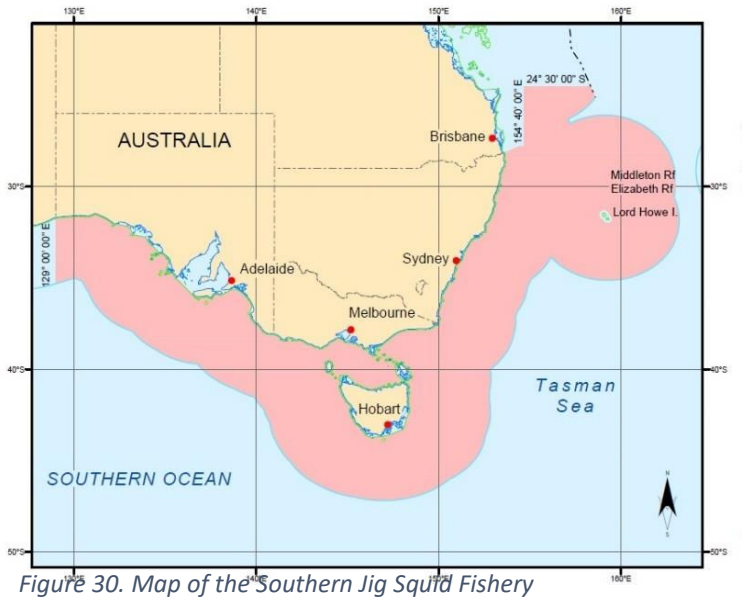

Figure 30. Map of the Southern Jig Squid Fishery

The Southern Squid Jig Fishery operates in Commonwealth waters off SA, VIC, TAS, NSW and parts off QLD (Figure 30), with most of the fishing effort occurring off the south-east of Australia. This fishery targets a single species — Gould's squid — using either hand operated or mechanically powered jigs.

Squid jigging typically occurs midwater at depths between 50 and 100 m at night using large lights that illuminate the waters around a boat. Once a suitable site has been chosen, it is common for vessels to deploy a drogue or sea anchor to reduce the vessel's drift while fishing

Effort in the sector was highest in the 1990's and early 2000s, with an average annual fishing effort of 8,878 jig hours between 1996 and 2005 (Figure 31). This declined to just 50 jig hours in 2014, and since the effort has fluctuated between 1,304 and 2,899 jig hours (Figure 31). Whilst the squid sector is unpredictable in nature wish boom and bust cycles the lowered effort in more recent years has been attributed to a combination of variable biomass and or/ stock availability, trouble locating stock, as well as high costs.

Fishing methods

- Squid jig

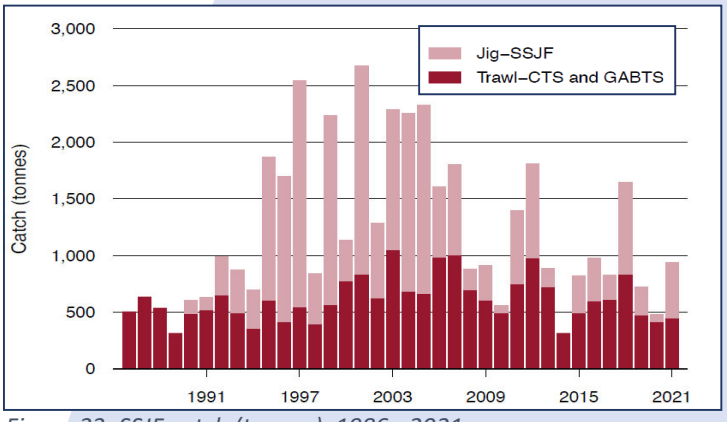

Figure 33. SSJF catch (tonnes), 1986 - 2021

OCEAN (GENERAL) FISHERY

The Victorian Ocean General Fishery is a mixed use multispecies fishery which extends throughout the states marine waters other than Port Philip Bay, Western Port Bay, Gippsland Lakes and any inlet of the sea. This fishery can land fish (mostly snapper, octopus and gummy shark) other than abalone, pipis, jellyfish, Southern Rock Lobster, Giant Crab, Commercial Scallop and sea urchins. The main management methods are input controls including limited access and gear restrictions. The fishery usually conducts day trips operating out of small vessels (<10 m), and may fish at anchor or underway.

Fishing methods:

- Line methods (dropline, long line, hand line)
- Dip and landing nets
- Fish traps
- Octopus traps
- Gaffs
- Seine nets
- Mesh nets
- Bait pumps

ROCK LOBSTER & GIANT CRAB FISHERY

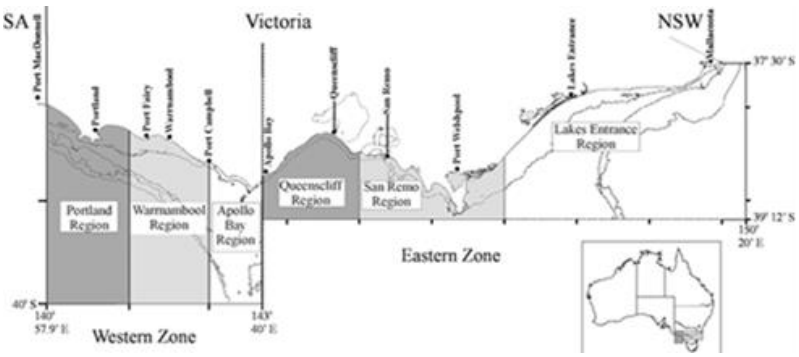

Figure 34. Map of the Rock Lobster and Giant Crab Fishery zones

The area of the Victorian Rock Lobster Fishery and the Giant Crab Fishery extends along the Victorian coast, out into Commonwealth waters (>3 nm offshore). The Rock Lobster fishery targets Southern Rock Lobster and is divided into two management zones (Eastern and Western, Figure 34), each managed through input and output controls, limited entry, gear restrictions, effort limits and a separate TAC. The fishing season is open from 16 November to 14 September each year. The Giant Crab Fishery targets the Giant Crab and is linked to the Rock Lobster Fishery, but is limited to the western zone. Only fishers who hold a Rock Lobster Fishery License can obtain a Giant Crab Fishery Licence, and both pot entitlements and quota are linked to their Rock Lobster licence.

Figure 35. Typical Rock Lobster vessel

Fishing method:

- Lobster / crab pots

ABALONE FISHERY

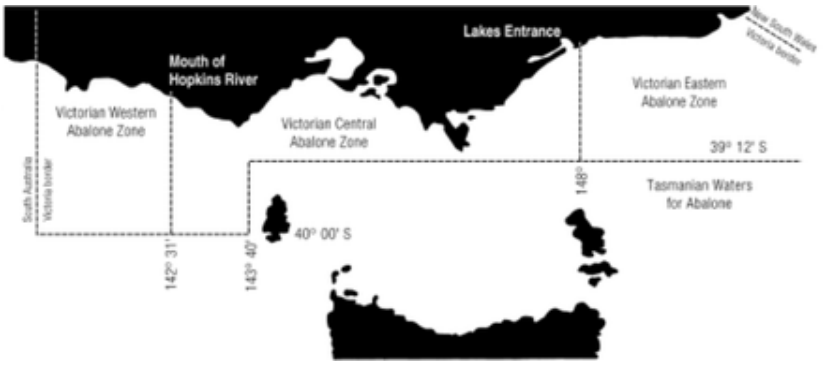

Figure 36. Map of the Abalone Fishery zones in Victoria

The abalone fishery in Victoria is one of the most valuable state managed commercial fishery, and is split into three zones for management, the Eastern Zone, Central Zone and Western Zone (Figure 36). Each zone has individual TACs, and SFR. In the Eastern zone there are 23 permits available and an annual TAC of blacklip abalone only. The Central and Western zones have 14 and 34 permits respectively and TACs for both blacklip and greenlip abalone. There are further restrictions on size limits which also apply to both species of abalone.

Abalone are caught by hand while diving, usually with the use of hookah breathing apparatus (see fishing methods. Abalone inhabit rocky reefs and are removed using an abalone knife. Boats used in the fishery are generally small (6–8m) and do not anchor while working. Abalone divers generally make single day trips. Abalone divers are generally restricted to depths less than 30 m.

Fishing method:

- Hand harvest

GIANT CRAB & ROCK LOBSTER FISHERY

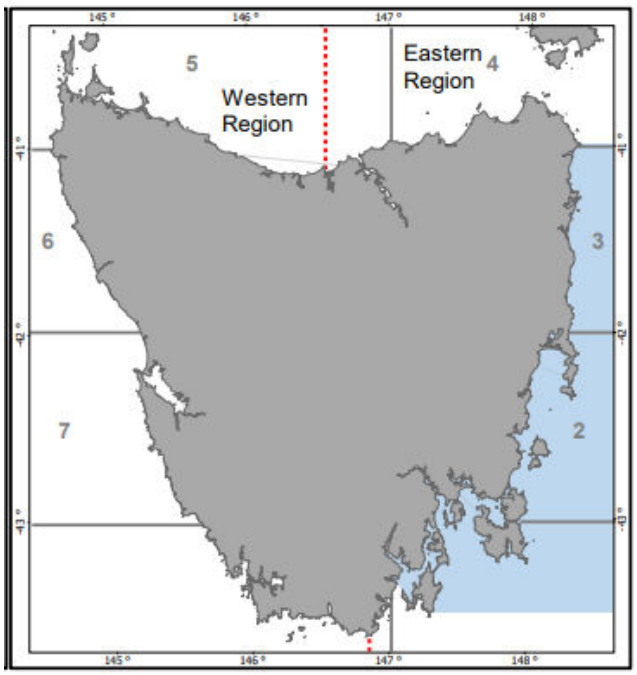

Figure 37. Tasmanian rock lobster fishery zones, Western and Eastern regions separated by red dotted line, assessment areas numbered, stock rebuilding areas shaded blue.

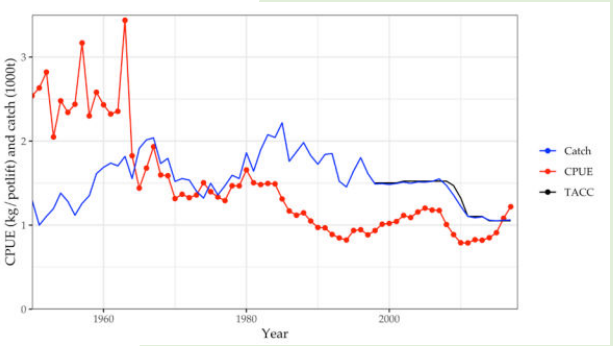
Fishing method:

- Lobster pots / Crab pots

Figure 39. Typical Giant Crab and Rock Lobster vessel

Whilst catch data, quota and seasons remain separate the regions and management areas are the same for Giant Crab and Rock Lobster in Tasmania. There are two broad regions; Eastern and Western, with eight management areas (Figure 37).

The Rock Lobster fishery targets Southern Rock Lobster managed through input and output controls, limited entry, gear restrictions, effort limits and a separate TAC. The fishing season differs each year, in 2020/21 opened on the 1st of November and closed on the 30th April. Annual catch has decreased from nearly 1,500 t in 2008–09, to just over 1000 t during the 2017–18 quota year (Figure 38). Percent of TAC caught dropped to 91% in 2010–11, but has since been about 98% with the exception of the 2019–20 season when the TAC was about 8.5% under caught. Most of the catch comes from 0–40 m depth, some catch is taken from as deep as 200 m.



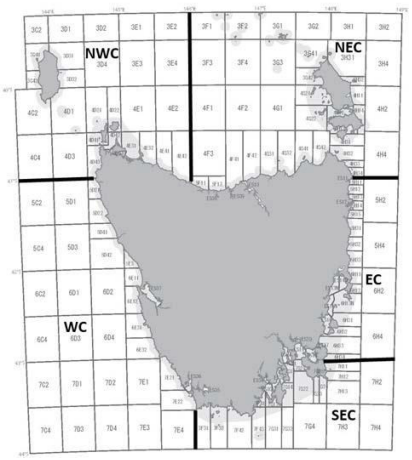


Figure 38. Annual catch, TAC and catch per unit effort (CPUE) of Southern Rock Lobster by the Tasmanian Rock Lobster Fishery since the inception of the ITQ system.

Giant Crab fishery is a small fishery with the annual TAC set at 20.7 tonnes, however, is high value at approximately $2 million in value. The fishery is managed by limited entry, gear restrictions, effort limits and a separate TAC. The fishing season differs each year and often mimics the Rock lobster season, however in 2023/24 Males will be open all year and Females will be open from 15 November to 31 May.

SCALEFISH FISHERY

More than 90 different species are reported in the TAS Scalefish Fishery catch logbook. Catch of scalefish has been declining since the late 1990s from about 1,300 t to 178 t in 2019–20 (Fraser, *et al*., 2021). Catch of cephalopods (mostly Southern Calamari and Gould's squid) has fluctuated annually, being as high as 1140 t in 2012–13 and as low as 27 t in 1996–97. Annual catch of small pelagics has also fluctuated largely from year to year. In 2008–09, 1,456 t of small pelagics (mostly Jack Mackerel and Redbait) was landed, while in 2018–19 only 0.4 t was landed. These numbers are likely from Danish seine, since there is no state licensed trawling. Shark catch has decreased from 1,221 t in 1995–96 to less than 20 t since 2007–08.

TRAWL

Otter board trawl

Otter board trawl can be performed either along the seabed (demersal trawling) or in the water column (midwater trawl) (Figure 40). Demersal trawling involves towing two otter-boards (boards) behind the fishing vessel using two long steel cables called *warps*. Warps are set and hauled using hydraulic net drums on the deck of the vessel. At the other end, each warp is attached to one of the otter-boards, which are large, rectangular steel *boards* that are attached at an angle designed to provide the outward force needed to spread (open) the mouth of the net. While being towed, otter-boards can spread as wide as 100–120m. The otter-boards connect to the net via sweeps and bridles, which act to herd the fish into the wings, then the mouth of the net and eventually to the cod-end. The trawl, the boards and the cable connecting the boards to the trawl (sweeps) all contact the bottom. The vertical opening of the mouth is maintained using floats on the headline. In demersal trawling the lower edge of the net is weighted and uses bobbins or rollers to help the net move across the seabed and protect it from damage.

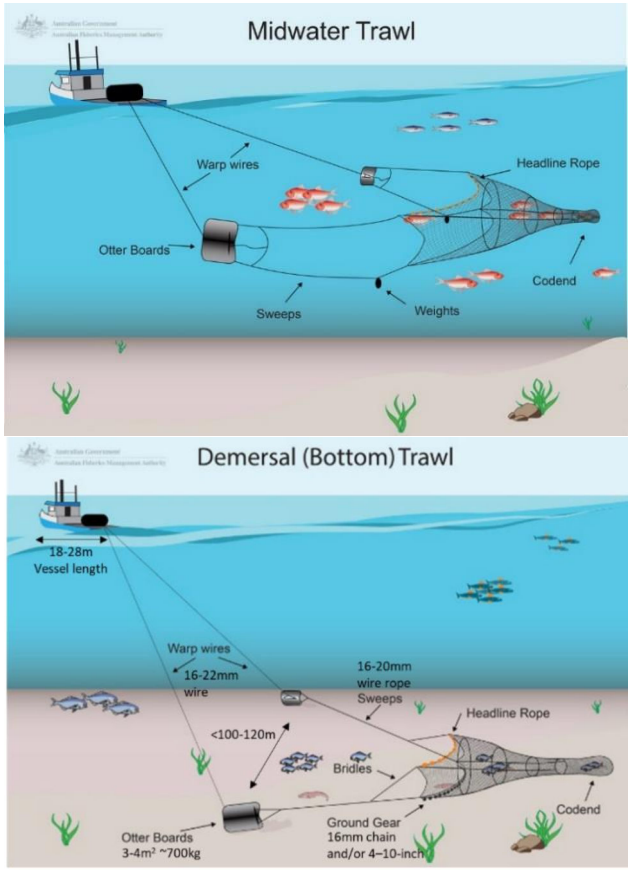

Figure 40. Demersal and midwater otter board trawl diagrams

SUROUNDING NETS

Danish seine

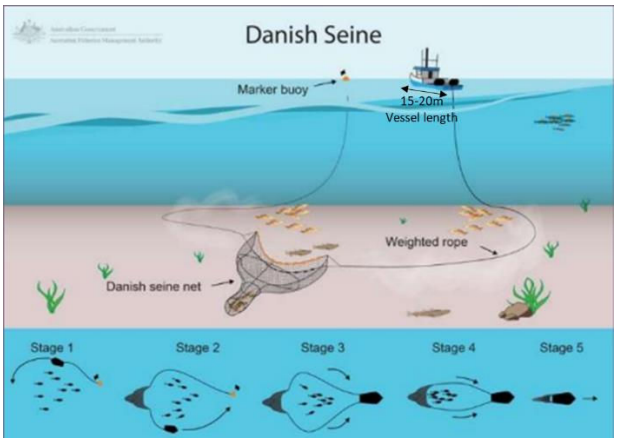

Figure 41. Danish seine diagram

Danish seine nets are conical in shape with two long wings, a bag where fish collect and warps that connect the net to the vessel and to surround an area fished (Figure 41).

The gear is set in a circle over relatively flat seabeds and hauled slowly back to the vessel, only moving about 1 nm (1.85 km) while it surrounds a large, pear-shaped area. A Danish seine shot usually lasts around 70 minutes and can be described by three distinct phases: setting, towing and retrieval. Danish seine vessels can complete eight or more shots in a day.

The setting phase of the Danish seine trawl takes longer duration than for an otter trawl. For the first ~45 minutes of the shot, the tow ropes and wings of the net are let out in a pear shape and the ropes and net sink to the sea floor; the codend only moves very slowly through the water during this phase. The shoulders and wings of the net are vertically aligned for the first 15 minutes, before becoming concaved as the ropes start to tighten and the ropes and net starts to move on the seabed. The towing phase is characterised by the ropes moving across the seabed, herding the fish into the path of the now moving codend. The wings of the net are bowed over, and are being pulled forwards, as well as being drawn in towards the opposite wing. As the retrieval phase begins, the net begins to lift off the sea floor and is then retrieved and emptied on board the towing boat.

Danish seine warps are initially 22 mm lead core rope with a breaking strain of 3.5 t but taper down to lighter 12 mm rope with a breaking strain of 1.7 t under the net, with the same 22 mm rope at the other end of the gear.

Most Danish seining occurs shallower than 100 m and is not a suitable method for working over rocky seabeds. By nature of the operation of Danish seining (i.e., the seine ropes are dragged along the ocean bottom) this method is at higher risk of becoming fast on seabed obstructions and is used to catch species that primarily occur on sandy/muddy bottom such as flathead and School Whiting.

Purse seine

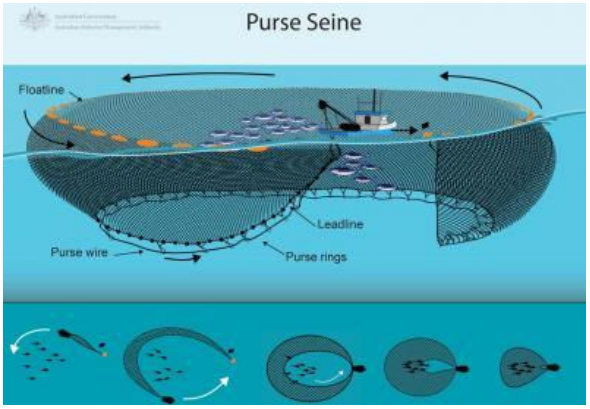

Figure 42. Diagram of purse seine fishing method

Purse seines are generally used to target schools of pelagic fish. A purse seine is comprised of a long wall of net framed by float line and lead line set in a circle to surround a school of fish. The bottom is then closed using wire threaded through the bottom of the net. Catch is brought onboard with the net, lifted out with small nets or pumped out. The fishing gear generally does not touch the sea floor.

PASSIVE NETS

Demersal gillnets

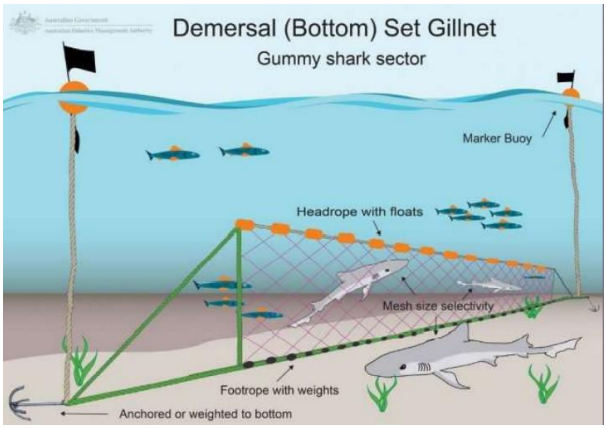

Figure 43. Diagram of demersal gillnet

Demersal gillnets are a passive fishing gear (i.e., they are not towed — the fish have to swim into the gear) comprising a series of long panels of diamond shaped mesh anchored at each end and weighted along the bottom rope to keep the net on the sea floor. It is held upright in the water column by a series of floats. They are sometimes referred to as mesh nets.

Gillnets generally have the headline (top horizontal rope) set 2 m above the seafloor. The headline is typically a 16 mm rope, as previously stated this is floated vertically using small floats. The monofilament net is connected to a ground rope on the lower horizontal edge. The ground rope is usually a 14 mm weighted (lead core) rope with a breaking strain of 1.4 t.

At either end of the gillnet, a 10 mm down-line with a breaking strain of 1.1 t runs from floats that indicate the position of the net on the surface, to 2.0 m of chain attached to a 100 kg J anchor or lead weights. Depending on tide and sea conditions there are often three or four other anchors set along the ground rope. The chain is attached to the anchor mid-way down the anchor shaft, and a lighter break-away cord is usually used.

Like trawl nets, gillnets are susceptible to snagging on rough bottom. However, they are not as sensitive to snagging as towed trawls, so although operators record all start and end tows on electronic navigational software, they generally have known safe areas (*grounds*) that they work.

Much like trawl fishing gillnet fishing is limited by marine parks, fishery closures, unfishable grounds, unproductive grounds and other closures. Gillnet fishing does not occur deeper than 183m (equivalent to 100 fathoms) because waters deeper than 183 m are closed by Commonwealth rules in order to limit catches of some deeper water fish stocks that are less productive than those targeted in shallower waters.

LINE METHODS

Demersal longline and auto longline

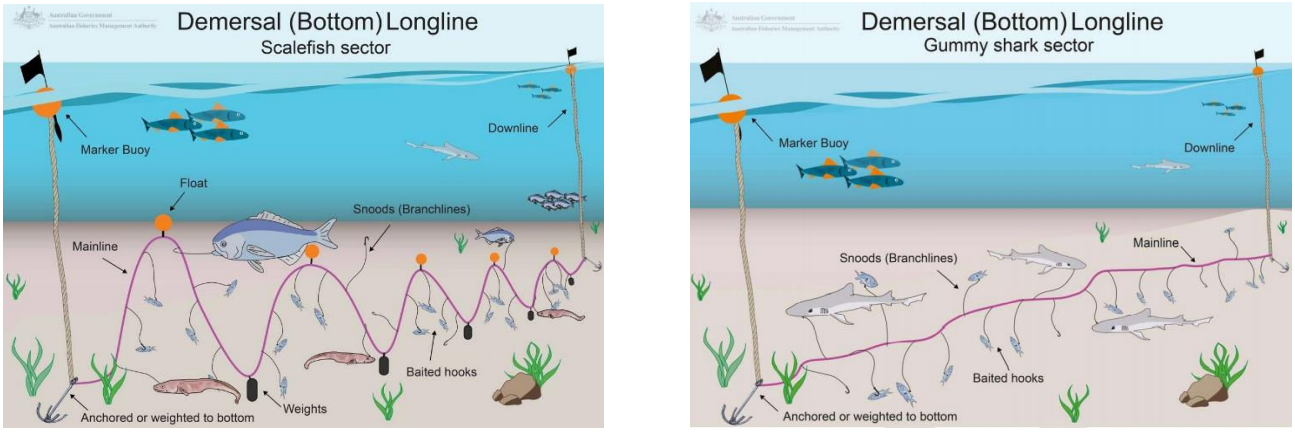

Figure 44. Demersal longline diagrams, scalefish (left), shark (right).

Bottom (demersal) longlines are set horizontally along the ocean floor and are held in place using anchors (Figure 44). There are two main methods used in the longline fishery: bottom longline fishing and auto longline fishing. The primary difference between bottom longline fishing and auto longline fishing is that hooks are baited by hand rather than a machine.

When set, the longline can be many kilometres in length (typically 1.5 – 5 km) and may have several thousand hooks. Bottom longline gear consists of a rope mainline with baited hooks spaced every 2 to 5 m on monofilament or braided cord snoods. The mainline is attached at both ends to downlines which have a large buoy on the surface for locating gear, and anchors at the bottom to hold the gear in place. Some vessels use radio beacons to be able to find gear in low visibility or if it drifts in heavy current. Each line is normally left to 'soak' for around 6 to 8 hours before being hauled. Hauling is done using hydraulic winches which are fixed to the deck of the boat. The gear can be hauled from either end by retrieving the downline.

Downlines (ropes connecting floats and the mainline) are generally made of 8 – 10 mm rope with a breaking strain of 0.8 to 1.1 t. Mainlines are thinner (e.g. 7 mm) but are more abrasion resistant. Snoods are usually monofilament with very low breaking strain (approximately 50 kg). Anchors are only large enough to manage onboard by hand (~15–25 kg). The number of anchors used depends on many factors including, currents, sea condition, ground fished, and species targeted. Bottom longline fishing causes very little disturbance to the sea floor and has only a very limited level of bycatch. Gear can become snagged on the bottom and get broken off, although this is not a common occurrence.

Like other fishing vessels, longliners may lay-up at anchor during bad weather or while fishing gear soaks (is deployed).

Auto-longlining is a variation of demersal longlining in which some of the functions (for example baiting the hooks) are automated. Many "autoliners" set, haul and steam between lines on a continual basis.

Bottom longlines and to a lesser extent auto-longlines are used to catch shark species that live on or near the sea floor in shelf waters generally less than 100 m deep. Although some auto-longlines and bottom longlines are used to target deep water species such as Blue Eye Trevalla and Pink Ling.

FISHING METHODS

Pelagic Longlining

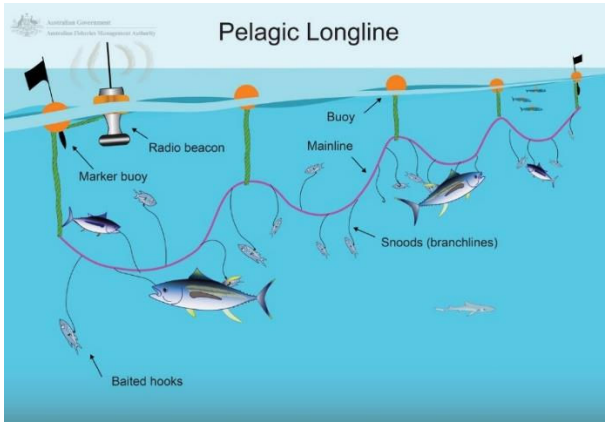

Figure 45. Pelagic longline diagram

Pelagic longline fishing is the main method used in the ETBF and involves the use of branch lines attached to a mainline (Figure 45). Each branch line (snood) has one or more baited hooks. The longline is set so that the mainline, branch lines and hooks are suspended in the water column by floats at the sea surface. By setting a different number of hooks between floats, longer float lines and varying line setter and boat speed, fishers can set gear at different depths in the water column allowing them to target different species. Radio beacons are attached to the longlines to make finding them for retrieval easier.

Minor line

Figure 46. Polling (left) and Trolling (right) fishing method diagrams

Minor lines are general short lines with a small number of hooks (sometimes just one), and can be either in the form of poling or trolling. Trolling involves lures or baits attached to the hooks and are dragged behind the vessels at a slow speed, and may be reeled in. Poling is similar, however when a fish is caught on the hook it is flicked onto the boat, and is not reeled in.

Drop line

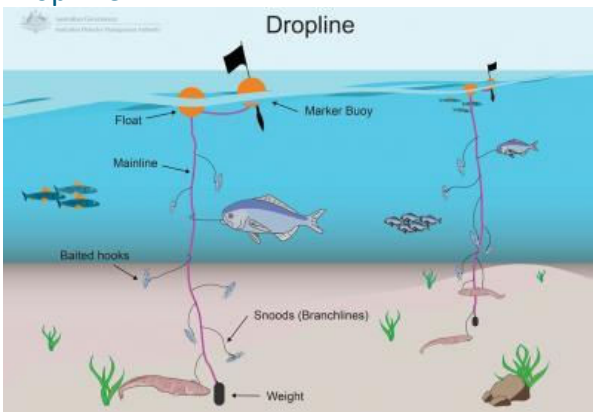

Figure 47. Diagram of dropline arrangement

Droplines consist of a mainline with a weight at the bottom and float at the top. Snoods, are off-shoots of monofilament from the main line which terminate in baited hooks. The number of hooks on each mainline varies but is typically between 20 to 100. Drop liens are left to soak for approximately 6 hours, and is hauled on deck by hydraulic winches.

The vessel size usually determines the number of lines set each day with larger vessels setting ten or more, whereas smaller vessels often only set 5 at most. Droplines can be used in shallow or deep water, but are typically used in depths from 250 – 600m.

FISHING METHODS

Hand lines

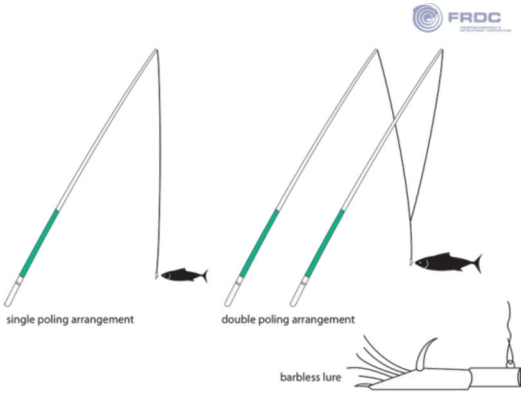

Figure 48. Illustration of typical hand line arrangement

Handlines are usually lowered and retrieved using fishing rod and reel equipped with 20 lb breaking strain monofilament of braided nylon mainline and 40 – 50 lb leader. Small 6 – 8 m vessels undertaking day trips, may anchor while fishing, and typically use a reef anchor attached to 3 – 5 m of chain (typically 8 mm link) and 12 mm polypropylene rope. Hand lines are used primarily to target finfish. By definition the gear consists of one or more baited hooks attached to a line which is deployed and retrieved by hand. Handlines may be attached to a rod, and may be mounted on the side of a vessel. They may be used singly or several at a time.

SCALLOP DREDGING

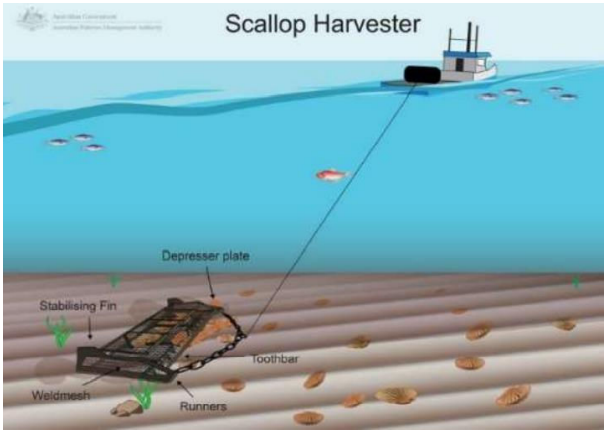

Figure 49. Diagram of scallop harvester

The average scallop vessel is 18 – 25 m long, weighs ~100 t, and is powered by 200–400 HP engines. Scallop dredges are a rigid steel cage that weigh about 600 kg. They have a tooth bar on the leading edge with teeth (tynes) that range 75 – 100 mm long, which penetrate the seabed (on muddy to coarse sand substrates) to depths to around 10 cm, depending on the compactness of the seabed, scooping scallops into the basket. The gear is towed along the seabed behind the vessel at a speed of ~3 to 5 knots using a 16–18 mm steel wire warp (6 x 19 ply) with a breaking strain of 15.3 to 19.3t.

Scallops sit either on top of the seabed, or semi-buried with just the upper valve exposed. Scallops are mobile and can swim short distances in response to stimuli in an attempt to escape the dredge.

HAND COLLECTION

Hand harvest methods usually involve divers collecting species by hand. Hookah equipment is often used. Hookah involves the diver receiving air from the surface (rather than a tank like in scuba), which allows them to stay underwater without breathing compressed air. Divers are often restricted to depths of 30m.

FISHING METHODS

SQUID JIGGING

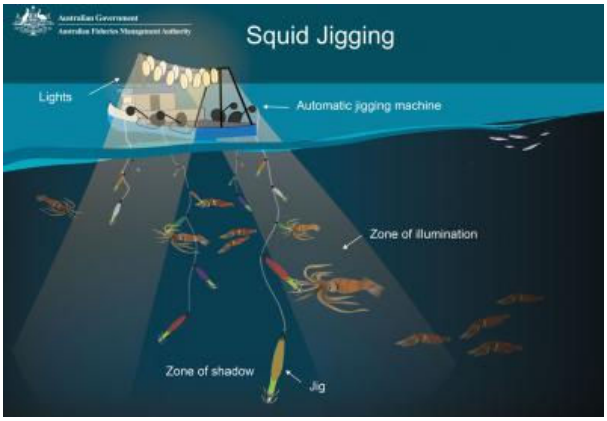

Figure 50. Diagram of squid jigging

The light attracts small marine creatures and in turn the squid are attracted to the concentration of these prey species. One or more lines of hooks are then jigged up and down in the water column using a rotating elliptical spool. The jigging devices are fully automated running on a timed cycle of setting, jigging and then hauling. Squid attack the jigs as they are being retrieved and become caught on the barbless hooks. As the squid are hauled onto the boat the barbless hooks allow them to easily fall off the jig into a holding container.

Squid jigs are used in the water column and do not interact with the seafloor. The line used for the squid jig is monofilament with a low breaking strain of 100 – 200kg. Jig vessels sometimes use anchors during the day (rest periods) that are typical of those described for other fisheries; 20-22mm rope with breaking strain of 4.7t.

POTS

Lobster and Crab pots

Figure 51. Diagram of lobster pot placement.

Lobster or Crab pots are designed in the form of cages, made from various materials (wood, wicker, metal rods, wire netting, plastic etc., Figure 52) and weighing about 40 kg. Pot size is regulated and must not be more than 150 cm long by 150 centimetres wide by 120 cm high.

Figure 52. metal, plastic and synthetic netting (left), and beehive pots (right) made from wood/wire.

Pots are usually set on rocky/hard bottom, normally set singularly and marked with a 3-strand 9-14 mm rope (14mm PP MBL 2.1t) and surface buoys. Pots are usually left to soak overnight, although on productive grounds they may be "pulled" at midnight and reset. Pots are hauled onboard using a mechanised rope-hauler, and some vessel may have a simple tipper arrangement for ergonomic and OH&S reasons.

4. FISHING METHOD RISK ASSESMENT

The results for the risk ranking of fishing methods (which are not jurisdictional) confirmed as actively present in the three AOIs are presented in Table 12. These Risk scores are based on four types of impulse attributable to:

1. Fishing vessel impact,
2. Vessel anchor drop impact,
3. Vessel anchor drag impact,
4. Descending fishing gear impact, and a Pulling force associated with snagged gear recovery.

Table 12. Risk ranking results for eight fishing methods (which are not jurisdictional) operating in the vicinity of the fishing data assessment area. The Risk Score was based on four types of impulse associated with vessel, equipment and fishing gear impacts and a pulling force associated with snagged gear recovery.

Fishing method	Risk Ranking	Risk Score (= T1 + T2 + T3 + T4 + PF)	Impulse Type 1 Vessel impact		Impulse Type 2 Anchor drop		Impulse Type 3 Anchor drag		Impulse Type 4 Gear drop impact		Pulling force Snagged gear recovery	
			Impulse (KN.s)	Relative Score [T1]	Impulse (N.s)	Relative Score [T2]	Impulse (N.s)	Relative Score [T3]	Impulse (N.s)	Relative Score [T4]	Max. (KN)	Relative Score [PF]
Demersal trawl	**1**	**5.00**	1,000	1.00	528	1.00	73	1.00	1400	1.00	283	1.00

4.1 Risk Review Methodology

The methodology followed is summarised below, for a full explanation of methodology see Appendix B.

4.1.1 Commercial fishing methods overlapping with the Beach AOIs

The results from the earlier sections identified that at least eight fishing methods operate in the vicinity of the Beach AOIs.

The ten fishing methods covered in the RA, together with the key representative vessel data for each method are presented below:

- Demersal trawl; typical vessel length 20m capable of 5 m/s
- Scallop dredger; typical vessel length 20m capable of 5 m/s
- Demersal gillnet; typical vessel length 20m capable of 5 m/s
- Danish Seine; typical vessel length 20m capable of 5 m/s
- Demersal longline; typical vessel length 20m capable of 5 m/s
- Squid jigging; typical commonwealth sector vessel used as representative vessel, 20m aft wheelhouse vessel, capable of 5 m/s
- Craypot; representative vessel of 20m displacement hull form, capable of 5 m/s
- Trolling; dedicated multi-hull trolling vessel used as representative vessel, length 8m, maximum speed 10m/s
- Handline; representative handlining vessel of 8m in length and capable of 10m/s
- Hand gathering; representative vessel 8m in length and capable of 10 m/s

4.1.2 Impulse Theory

To assess the potential physical impact that commercial fishing vessels, their fishing gear, as well as their anchor(s), may have on the Beach Energy infrastructure, the magnitude of the Impulse associated with each interaction (i.e., collision) was determined.

Impulse was seen an appropriate quantity to use in this instance since it contains the key variables governing the forces that may be produced (i.e., the body's mass and velocity) and is relatively simple to calculate. It provides a simple means to show in a relative context the different degree of severity associated with each interaction.

4.1.3 Impulse categories and Pulling Force definition

In relation to potential interactions between commercial fishing vessel/gear and Beach Energy infrastructure, a total of four different situations capable of causing a change in momentum (i.e., Impulse) were identified:

1. Impulse type 1 - fishing vessel collision
2. Impulse type 2 – vessel anchor drop impact
3. Impulse type 3 – vessel anchor drag impact
4. Impulse type 4 – descending fishing gear impact

Also considered in addition to the four forms of Impulse was a pulling force, the latter being associated with an operator trying to free up snagged fishing gear.

4.1.4 Impulse Interaction Assumptions and Approximations

To facilitate the Impulse calculation process certain assumptions and approximations were made regarding the interactions involving fishing vessels, fishing gear and anchor systems. These assumptions and approximations are presented in Appendix E.

4.2 Results and Discussion

The Impulse and Pulling Force results, together with the Risk score and Ranking, are presented in Table 12 above for each of the relevant fishing methods. Note the order of fishing methods is in descending order, with higher Risk scores and therefore Rankings at the top.

4.2.1 High risk fishing methods

Evidently, the larger vessels with more momentum, heavier anchors and utilising bulkier/heavier gear, namely demersal trawl and scallop dredge, posed the greatest risk of damaging Beach Energy infrastructure. Whereas smaller craft with less momentum, lighter anchors, and less bulky/heavier gears, such as handline and hand gathering posed the least risk. This outcome was very much governed by these three key characteristics, namely; vessel momentum, the mass of the vessel's anchor, and the momentum of the largest fishing gear ballast component.

4.2.2 Relative Risk score variation

The Risk scores showed great variation across the fishing methods assessed, with the risk scores ranging from 5 to 0.27 (Table 12). As stated above, the risk posed to Beach Energy infrastructure was heavily tied to the vessel size and speed, as well as the weight and momentum of the main equipment/gear components it deploys. Noteworthy was the three distinct groupings in overall risk score, namely Ranking 1-2, Ranking 3-7, and Ranking 8-10, which was largely dictated by the pulling force and gear drop impact associated with the representative fishing vessels used with that fishing method.

4.2.3 The type of interaction that poses the greatest risk

An analysis of the Impulse results for each fishing vessel/method revealed that Impulses associated with gear drop and snagged gear recovery, particularly of trawl and scallop dredge were much greater than the other forms of Impulse considered with 1400 and 1200 N.s respectively.

For the remainder of the fishing methods, vessel impact presented the greatest risk. The vessel induced Impulses also showed considerable variation across the ten fishing methods under consideration (1000 to 123KN.s), and this variation was primarily attributable to the variation in vessel size.

4.2.4 Pulling forces

The Pulling Force results (refer Table 10, far right column) showed that demersal trawl and scallop dredging with the heavier fishing year and stronger connecting rope and tackle between vessel and gear, had the greatest potential to damage Beach Energy infrastructure should the fishing gear become snagged. Vessels using other fishing gears with lighter connecting ropes to the vessel showed a substantial step-down in maximum pulling force.

5. NATURE OF THE COMMERCIAL FISHING INDUSTRY

5.1.1 Property rights

In Australia fishing rights generally exist in two forms:

1. The first is the *access right* which allows a fisher to access fishing grounds. Sometimes this is the only right in a fishery. Access rights vary in what they allow and are sometimes called licences, permits, concessions and statutory fishing rights.

2. The second fishing right, and this does not exist in all fisheries, is the right to take at set portion of the commercial catch for sale. This type of right is usually called a *quota right* (in the case of the Commonwealth system it is called a quota statutory fishing right). It is known as an output control. If quota management is not used as a management tool in a fishery the value of the rights will flow to the access right. Quota management is best practice in contemporary fishery management because it allows the Manager to limit catches to sustainable limits and/or economic goals. The alternative to output controls is to add operational inefficiencies such as limited net size, fishing times or vessel power to limit catch. As such, most fisheries developing now do so under an output control and usually this is a quota system. Many existing fisheries have introduced quota as a management tool. In Australia, most Commonwealth fisheries use quota as a management tool and many state-run fisheries have already moved, or are moving to, quota systems.

Fishing right values are determined by many factors (some of which have interwoven relationships) including but not limited to:

a. Revenue - market price, ease of catch, demand, variability of demand, competing products etc.
b. The cost to catch - distance from port to fishing grounds, availability of fishing grounds, fishing method, degree of stock aggregation, other fixed and variable costs.
c. Profit (a-b).
d. Biological risk - variation in the target stock.
e. Science - certainty bounds of the science, and the availability of data.
f. Environmental issues - social licence and the emergence of 3rd party sustainability accreditations.

Perhaps the clearest example of how reduced access to fishing grounds negatively impacts the fishing right occurred in the Commonwealth managed gillnet shark fishery. This fishery is managed using access and quota rights. Following a number of interactions between gillnet vessels from this sector with endangered Australian sea lions the fishery manager AFMA implemented a range of area closures totalling 18,500km^2 which prevented gillnets from being set in the areas of key sea lion habitat and in close proximity to breeding colonies (Figure 53). No data is available about the catch or revenue taken from within these closures but fishermen report that it was a significant fishing area. When grounds were closed, Gummy Shark became more difficult to catch (catch costs increased) and there were less fishermen (reduced demand) therefore lease prices dropped[15]. There was then a significant drop in catch (quota utilisation) and Gummy Shark quota capital value fell from more than $40,000/tonne to $30,000/tonne. Based on the size of the quota this represented a capital loss of approximately $20m (see Figure 54). Figure 54 also shows that this value drop occurred even through the retail price of gummy shark continued to climb.

[15] Fishermen either lease quota from the owners of quota, or own quota, in which case there's an internal transfer cost.

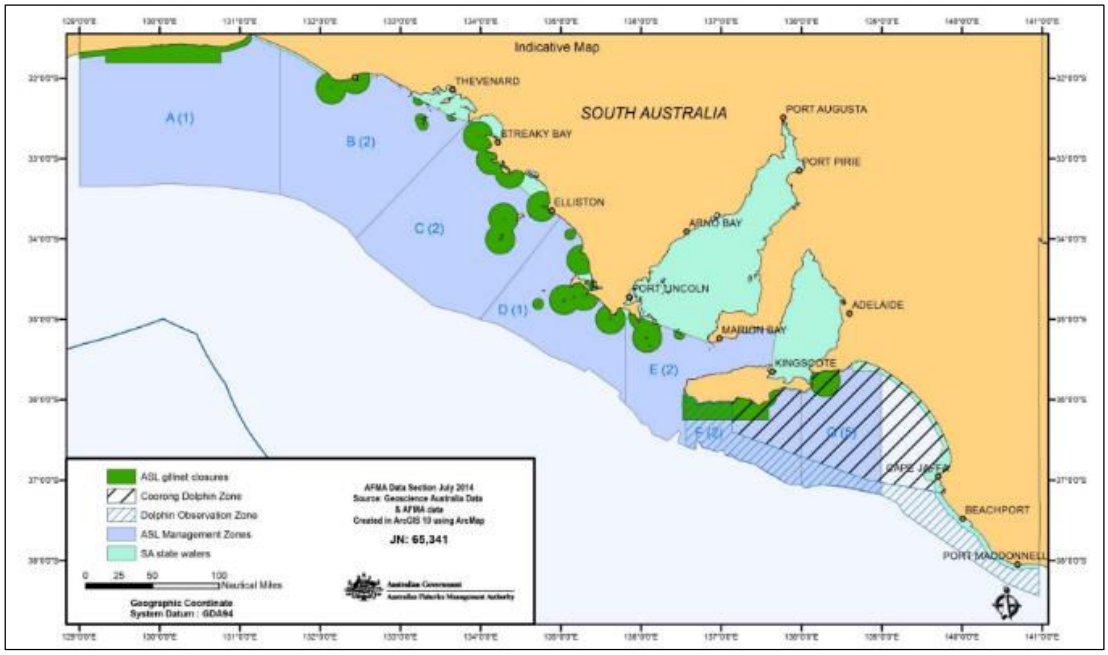

Figure 53. Gillnet closures for the protection on marine mammals in South Australia – Australian sea lion closures shown in green.

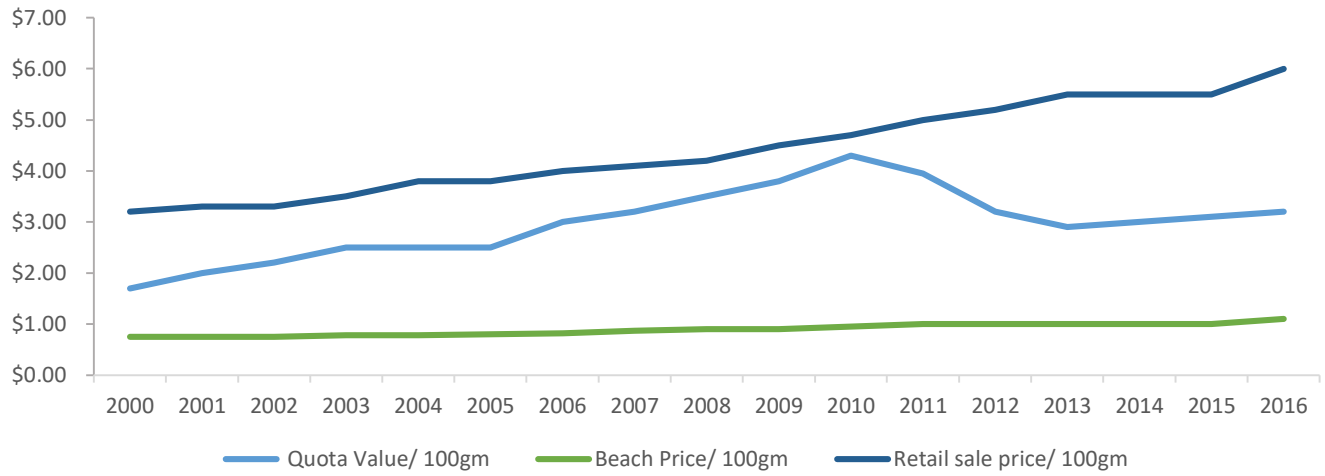

Figure 54. Gummy shark quota value, beach rice and retail price – all per 100g.

This example demonstrates the complex nature of fishing rights and why the value of all fishing rights in a fishery are likely to be negatively impacted by any restriction on these five factors; confidence in the right will decrease, fishers will not fish or will move to other fisheries and impacted fishing vessels will move to other areas (within the same fishery) increasing competition in those areas.

Fishers often mention consultation fatigue and the stress that uncertainty about the future of their business brings. Recent studies into the declining state of mental health in fishing communities called this *livelihood insecurity*. At its worst, impact on the fishery by the offshore exploration only represents a small displacement. However, fishers will want to know whether they are displaced and what compensation might, or might not, be payable as soon as possible.

5.1.2 Cumulative impact and reduced prospectivity

Commercial fishing methods that drag gear (active methods) are particularly sensitive to fuel price, under normal circumstances fuel can be 30% of the cost of running a board trawl vessel. The fishing industry is

facing record high fuel prices and they have doubled over the previous 12 months. As small businesses fishing companies do not hedge fuel price.

Beach Energy is not the only energy proponent expressing interest in marine areas. There are a number of declared and proposed renewable energy zones, including a large area off Gippsland, the *Gippsland Renewable Energy Zone*, and a proposed area to the west of Beach Energy's Otway region; the *Southern Ocean Offshore Renewable Energy Zone.* With these declarations, the most impacted fisheries are likely to be the Commonwealth's: Commonwealth Trawl Sector (CTS) and Gillnet, Hook and Trap Sector (GHaT). Several smaller fisheries managed by the Victorian authority will also likely be impacted.

6. FISHERIES STAKEHOLDER LIST

Table 13 provides a list of key contacts for representative bodies for each fishery identified as being legally able to fishing in the three AOIs.

Table 13. Key contacts for representative bodies for each affected sector.

FISHERIES	REPRESENTATIVE ORGANISATIONS	CONTACT NAME	PHONE NUMBER	KEY CONTACT EMAIL
All Australian wildcatch fisheries and aquaculture	Seafood Industry Australia (SIA)			
All Australian Commonwealth managed fisheries	Commonwealth Fisheries Association (CFA)			
SESSF Commonwealth Trawl Sector (CTS)	South East Trawl Fishing Industry Association (SETFIA)			
Southern Squid Jig Fishery (SSJF)	*No formal association*			
SESSF Shark Gillnet & Shark Hook Sector (GHaT)	Southern Shark Industry Alliance (SSIA)			
Bass Strait Central Zone Scallop Fishery (BSCZSF)	Bass Strait Scallop Industry Alliance			
Victorian Rock Lobster Fishery	Sub-committee of SIV			
Victorian Rock Lobster Fishery	Eastrock			
All Victorian Fisheries	Seafood Industry Victoria (SIV)			
All Tasmanian Fisheries	Tasmanian Seafood Industry Council			

[16] Significant stakeholder who has agreed to release her details.

APPENDIX A – BEACH PRICES

Table 14. Beach prices used in value calculations

CAABcode	SpeciesName	CommonName	Beach Price 2018 $/kg	Beach Price 2022 $/Kg
37224900	Lotella & Pseudophycis spp	A Morid Cod	10.56	10.56
37441005	Thunnus alalunga	Albacore	2.99	2.99
37258002	Beryx splendens	Alfonsino	2.55	2.55
37024000	Squatinidae	Angel Sharks	4.95	
37114013	Alepocephalus antipodianus	Antipodean Slickhead	0.34	0.34
37024001	Squatina australis	Australian Angelshark	2.12	4.95
37441020	Sarda australis	Australian Bonito	5.58	5.58
37259001	Cleidopus gloriamaris	Australian Pineapplefish	0.33	0.33
37085002	Sardinops neopilchardus	Australian Sardine	2.90	2.90
24207000	Volutidae - undifferentiated	Bailer shells	11.00	11.00
37377006		Banded Morwong	3.85	3.85
37439001	Thyrsites atun	Barracouta	1.34	1.34
37378002	Latridopsis forsteri	Bastard Trumpeter	3.96	3.96
37326901		Bigeyes (mixed)	2.20	2.20
37258004	Centroberyx gerrardi	Bight Redfish	4.15	4.15
37367004	Pentaceros decacanthus	Bigspine Boarfish	4.91	4.91
37353003	Acanthopagrus butcheri	Black Bream	6.64	6.64
37254001	Diretmichthys parini	Black Spinyfin	2.51	2.51
37337053	Caranx lugubris	Black Trevally	4.31	4.31
37288012	Satyrichthys cf moluccense	Blackfin armour gurnard	4.73	4.73
37367005	Zanclistius elevatus	Blackspot Boarfish	4.91	4.91
37120001	Paraulopus nigripinnis	Blacktip Cucumberfish	2.25	2.25
37255001	Hoplostethus intermedius	Blacktip sawbelly	2.71	2.71
37018901		Blacktip shark (mixed)	7.15	7.15
37227001	Macruronus novaezelandiae	Blue Grenadier	3.75	3.75
37441001	Scomber australasicus	Blue Mackerel	2.24	2.24
37377004	Nemadactylus valenciennesi	Blue Morwong	3.85	3.85
37018004	Prionace glauca	Blue Shark	0.72	0.72
37445005	Seriolella brama	Blue Warehou	3.36	3.36
37445001	Hyperoglyphe antarctica	Blue-eye Trevalla	8.99	8.99
37355001	Upeneichthys lineatus	Bluestriped Goatfish	6.91	6.91
37367000	Pentacerotidae - undifferentiated	Boarfishes	4.91	4.91
37020003	Deania calcea	Brier Shark	2.82	2.82
37005002	Notorynchus cepedianus	Broadnose Shark	1.32	4.00
37018001	Carcharhinus brachyurus	Bronze Whaler	1.10	1.10
28821000	Scyllaridae	Bugs - Shovel nosed & slipper lobsters	18.70	18.70
37018021	Carcharhinus leucas	Bull Shark	2.20	2.20
37288007	Lepidotrigla vanessa	butterfly gurnard	2.20	2.20
37288901		Butterfly gurnard (mixed)	2.20	2.20
37311002	Caesioperca lepidoptera	Butterfly Perch	1.48	1.48

APPENDIX B – RISK REVIEW METHODOLOGY

The methodology followed is outlined below:

1. Present the commercial fisheries and associated fishing methods that overlap with the Beach infrastructure
2. Explain why Impulse is an appropriate parameter to assess the danger/risk in this situation
3. Categorise the various Impulse situations associated with specific types of interactions
4. Present the simplifications, assumptions and approximations used in the analysis
5. Assemble the necessary data (mass, velocity change and interaction duration) on vessel, gear, and anchor, for Impulse determination
6. Complete the Impulse calculations and present the results in an appropriate format
7. Discuss the findings and formulate conclusions

Impulse Theory

To assess the potential physical impact that commercial fishing vessels, their fishing gear, as well as their anchor(s), may have on Beach infrastructure in the fishing data assessment area, the magnitude of the Impulse associated with each interaction (i.e., collision) was determined.

Impulse was seen an appropriate quantity to use in this instance since it contains the key variables governing the forces that may be produced (i.e., the body's mass and velocity) and is relatively simple to calculate. It provides a simple means to show in a relative context the different degree of severity associated with each interaction.

The Impulse-Momentum theorem states that a body's momentum change is proportional to the impulse applied to it (Elert 1998).

The change in momentum (Δp) is determined with equation [1].

$$\text{Change in momentum } (\Delta p) = M \times \Delta v \qquad [1]$$

The key variables being mass (M) of the body involved in the interaction and the change in velocity (Δv) of that body during the interaction period. Note: the subscript M_v, M_g, and M_a was used for vessel, fishing gear or anchor respectively.

The impulse (J) is determined with equation [2].

$$\text{Impulse } (J) = F \times \Delta t \qquad [2]$$

The key variables in this case are average net force (F) and the duration that this force acts (Δt).

The units for Δp and J are therefore $kg.m.sec^{-1}$ and N.s

Note that both Δp and J are vector quantities due to the presence of the Δv and F vector quantities in equations [1] and [2] respectively, and since these equations are dimensionally similar, it is possible to equate the RHS of equation [1] and [2] to show the key variables of this Impulse-Momentum relationship.

$$F \times \Delta t = M \times \Delta v \qquad [3]$$

Noting that if the data for the three key variables, namely Δt, M, and Δv , are available then the Impulse (J), as well as the average net force (F) responsible for the change in momentum, can be determined.

Impulse categories and calculation methodology

In relation to interactions between commercial fishing vessel/gear and Beach infrastructure, a total of four different situations capable of causing a change in momentum (i.e., Impulse) were identified:

1. Impulse type 1 – vessel only collision
2. Impulse type 2 – vessel anchor drop impact
3. Impulse type 3 – vessel anchor drag impact
4. Impulse type 4 – descending fishing gear component collision

Impulse type 1 – vessel only collision

This interaction was about gauging the maximum Impulse that a vessel may impart to Beach surface structure should a collision occur. To simplify the calculation, all vessels were assumed to be travelling at constant velocity (v) prior to the collision, and subsequently came to a standstill over the same distance (i.e., 1m) and time period (t) (i.e., 1 second).

By making the change in momentum occur over the same time period, the resultant net average force (refer Equation [3]) was kept relative between vessels. Noting that this may not always be the case due to differences in vessel construction, operator reaction time, collision characteristics, amongst other things.

Impulse type 2 – vessel anchor drop impact

This interaction was concerned with determining the maximum Impulse that an anchor deployed from a fishing vessel may impart to Beach infrastructure on the seabed (e.g., submarine cable or mooring). The key variables in this case were anchor mass (M_a), the velocity of the descending anchor (v) and the deceleration period (t) (i.e., to determine the average net force).

For this assessment every anchor was assumed to reach a terminal velocity prior to impact and to have a similar deceleration period of one second, with the magnitude of the velocity governed by the anchor's mass (M_a), drag coefficient (CD) and projected area (A).

$$\text{Terminal velocity} = [(M_a \times g)/(CD \times 0.5 \times p_w \times A)]^{0.5} \quad [4]$$

where

g = gravitational constant i.e., 9.81 $m.s^{-2}$

p_w = mass density of seawater at 1025 $Kg.m^{-3}$

To simplify the analysis each anchor was assumed to be of the stockless type (since admiralty 'stock' type anchors are rarely used nowadays) and geometrically similar despite the possible variation in design (refer Fig. 5.), with a similar drag coefficient of 0.9 based on a stockless anchor (Woo & Na 2014). According to Woo & Na (2014), the influence of Reynolds number and initial velocity on this drag coefficient was negligible, which supports the above simplification.

The projected area used was based on two circular cross-sectional rods of similar dimensions (length /diameter = 4) and aligned so that the two rods intersect at 90° to form a T-shaped anchor. The anchor was assumed to descend as an inverted T through the water i.e., the projected area was equivalent to the product of a single rod's length and diameter. To find the key variable in this instance, namely the rod diameter (d), the volume (V) was firstly found using the required mass (Ma) and equation [5], and then the rod diameter was found using the rearranged form of equation [6]. Lastly, the projected area (A) was deduced using equation [7], that being the area of a single horizontal rod at 90° to the relative flow.

$$Ma = V \times p_s \quad [5]$$

where p_s = mass density of steel at 7400 Kg.m^{-3}

$$V_{rods} = 2 \times L \times (\pi \cdot d^2)/4$$

or in this case where L = 4d

$$= 2 \times 4d \times (\pi \cdot d^2)/4 \quad [6]$$

Rearranging to find d

$$d = (V_{rods}/2\pi)^{1/3}$$

$$A_{rod} = L \times d$$

or in this case where L = 4d

$$= 5d \quad [7]$$

Anchor mass requirement for a given vessel can be determined with the Equipment Number, Holding Power and Anchor Mass formulas provided by National Standard for Commercial Vessels Part C, Design and Construction, Subsection 7D – Anchoring Systems (refer Appendix C).

Alternatively, Tables provided for each Class of vessel can be used (refer Appendix D). Commercial fishing vessels fall under Class 3. For the area of interest, the category would be mostly C, making most of the commercial fishing vessels in this area a Class 3C vessel, or 3C restricted vessel if venturing further offshore.

For this investigation, a nominal anchor mass was assigned to each type of fishing vessel based on its assigned length and by using data in Tables prescribed by AMSA (refer Appendix E) to generate the following relationship between vessel length and anchor mass; $M_a = 0.0247 \times L^{2.8597}$

Note, in the derivation of this formula the corresponding height for each vessel was assumed to be 1/5th of the vessel's length (i.e., a L:H ratio of 5:1 was used).

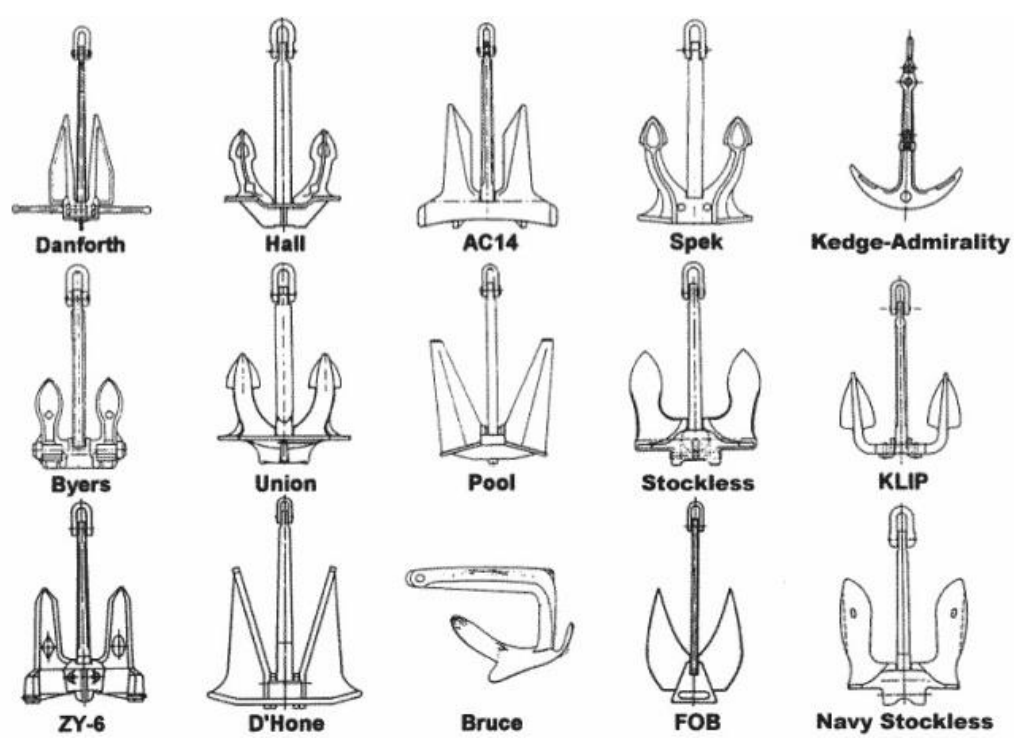

Figure 55 Types of Stockless anchor (source: www.gratitudesailingnw.com/sailing-lessons.html)

Impulse type 3 – vessel anchor drag impact

This interaction was about gauging the maximum Impulse that a dragging anchor may impart to Beach infrastructure on the seabed (e.g., a pipeline). For this assessment, all anchors were assumed to be dragging at similar constant velocity (v) prior to the collision, and subsequently came to a standstill over the same distance and time period (t). By making the change in momentum (mass x velocity) occur over the same time period, the resultant average net force caused by the impulse was kept relative to differences in anchor mass (M_a) (refer equation [3]). Noting that for various reasons, such as how much the farm component may shift during the interaction, this may not always be the case in reality.

To assign a representative anchor drag speed to this situation tidal current data from nearby environmental current meters in 47 and 70m water depth (refer Appendix F) was analysed together with wind speed data from the Bureau of Meteorology. Tidal current was found to be reasonably low, whereas surface generated current from wind coupled with the drag this wind imposes on the above water portion of a vessel could at times be very high. So much so that most craft would be making for sheltered waters, which was not far away in this case. With this in mind an anchor drag speed of 1 m/s was assigned to all fishing methods for unfavourable environmental conditions.

Impulse type 4 – descending fishing gear component collision

This interaction was about gauging how much of an Impulse a descending fishing gear component may produce when it collides with Beach infrastructure and comes to a standstill, for example when a cray pot eventually reaches the seabed and strikes a length of cable located there.

For this assessment every anchor/fishing gear component was assumed to have a similar deceleration period and to reach a terminal velocity prior to impact, with the magnitude of the velocity governed by the anchor's/gear's mass (M_a or M_g), drag coefficient (CD) and projected area (A).

$$\text{Terminal velocity} = [(Ma \times g)/(CD \times 0.5 \times p_w \times A)]^{0.5} \quad [4]$$

where

g = gravitational constant i.e. 9.81 $m.s^{-2}$

p = mass density of seawater at 1025 $Kg.m^{-3}$

For anchors and ballast the same drag coefficient value of 0.9 was used. The terminal velocity and projected area were then found using the same approach and assigning a representative steel mass for the fishing gear in question. For a craypot, a terminal velocity of 0.95 m/s was used based on experimental data gathered in a flume tank (Wakeford 2000).

The assigned masses to anchors and other gear components can be seen in Table 15 below.

Table 15. Input data and calculation results for the various Impulses and Pulling force against each fishing method.

Pulling Force and Calculation Methodology

Pulling force to free snagged gear

When fishing gear becomes entangled/snagged on a seabed obstacle, the vessel will at some stage attempt to release it by applying a pulling force (via the connecting ropes between vessel and fishing gear) in an attempt to recover it.

On most occasions a vessel with snagged fishing gear will draw itself closer to the snag on the premise that the additional uplift will pull the gear free. Under certain circumstances (undercut obstacles like large rocks or vehicles) the vessel may opt to circle the snag and try pulling in a different direction. If these measures fail then the vessel will move progressively closer to directly overhead and use a combination of thrust, winch haul force, and vessel buoyancy to apply more of a load. Understandably, this procedure heightens the risk level. However, if the breaking load of the fishing gear and connecting tackle is relatively low, then the gear will normally fail without jeopardising vessel stability to any great extent. Whereas with some trawlers, especially the smaller vessels towing relatively large gear, the risk of capsizing is very real. Under certain circumstances it may be prudent for the vessel to cut the gear free (i.e., cut the wire(s)) to release the vessel, and then return later and use a grapple (similar to an anchor) to recover the gear. Grappling lost fishing gear usually involves towing a modified form of anchor across the seabed to reconnect the vessel to some part of the gear, and then applying a pulling force to drag it free of the snag. The pulling procedure followed is similar to what is adopted when the gear is snagged whilst fishing, with the difference being that the grapple is often pulled in the opposite direction to when the gear became snagged. For these pulling situations, the minimum breaking load (MBL) of the connecting rope between vessel and fishing gear equates to the maximum applied pulling force, and from a worst case scenario perspective, this force may well be applied from directly overhead if pulling initially at shallower angles proves unsuccessful. To reflect this situation, the maximum pulling force for each fishing method was based on the MBL of the connecting rope (synthetic rope or twine) between vessel and gear. In the case of squid jiggers, the gear analysed was the large sea anchor that is deployed from the bow to reduce vessel drift and improve stability. MBL values for typical connecting rope(s) on each type of fishing gear used in the relevant area are presented in Table 17.

Table 17 Maximum pulling force associated with snagged fishing gear based on the MBL of the main connecting rope/cable between vessel and fishing gear. Note: the pulling force represented by the tensile load in the connecting rope/cable may be a combination of winch power, propeller thrust and vessel buoyancy.

Handline	2mm PA twine	0.18 (1.75)

Impulse Interaction Assumptions and Approximations

To facilitate the Impulse calculation process certain assumptions and approximations were made regarding the interactions involving fishing vessels, fishing gear and anchor systems. These assumptions and approximations are presented below, together with a reference #. Note: some of these assumptions and approximations were presented and discussed in earlier sections.

A#1 Constant velocity assumption – vessel, gear or anchor was travelling at uniform velocity (speed and direction) just prior to the interaction taking place.

A#2 Vessel anchor drag velocity assumption – under severe environmental conditions whereby vessel anchor(s) drag across the seabed, the resultant velocity was 1m/s.

A#3 Maximal change in velocity assumption – whenever vessel/gear had an interaction with beach infrastructure, a maximal change in velocity would transpire i.e., the body would always come to a standstill

A#4 Interaction period assumption – the interaction period was constant for each of the various types of interaction identified.

A#5 Anchor design assumption – every anchor was of the stockless type, and was T-shaped and made from cylindrical bar. The stock to cross-bar ratio was constant (4:1) between anchors, and the diameter of the rod was kept in proportion to the anchor size (i.e., every anchor despite the size was geometrically similar).

A#6 Anchor mass assumption – Using the AMSA table provided in Appendix E the following relationship between anchor mass Ma and vessel length (L) was derived $Ma = 0.0247x\ L^{2.8597}$. Note: this formula was derived from a line of best (LOB) fit for plotted data obtained from the table, and this LOB fit had a correlation coefficient of 0.9994.

A#7 Anchor material assumption – every anchor was made of steel

A#8 Anchor dimensional assumption – based on the design, mass and material assumptions, it was possible to manipulate the anchor size (stock and cross-member lengths, and rod diameter) to acquire a given volume necessary to meet a total anchor mass target.

A#9 Anchor orientation assumption - every anchor descended with the stock vertical so that the projected area was equivalent to the product of the cross-bar's length and diameter.

A#10 Anchor terminal velocity assumption - every anchor reached a terminal velocity prior to impact.

A#11 Anchor drag coefficient assumption - a representative drag coefficient for every anchor descending was 0.9. i.e., based on a stockless anchor (Woo & Na 2014).

A#12 Reynolds number effect on anchor drag coefficient assumption – due to the relatively high Reynolds numbers associated with each anchor descending through the water, it was reasonable to assume the drag coefficient was independent of Reynolds number (Woo & Na 2014).

A#13 Fishing vessel loading condition assumption – all vessels had a similar loading condition based on a departing port condition (i.e., fluid tanks full, hold empty, full array of fishing gear and supplies onboard). Note: this assumption ensured each vessel was at, or very close to, its maximum displacement i.e., mass

A#14 Fishing vessel prismatic coefficient similarity assumption – all vessels were geometrically similar (i.e., shared a similar length to breadth to depth ratio) despite differences in overall length.

A#15 Steel Fishing vessel assumption - all vessels were made from steel, even though in some fisheries wood and composite materials were evident.

A#16 Vessel length to weight relationship assumption - All vessels were made from steel, and because they were "geosims", a vessel weight (W) to length (L) relationship existed; represented by $W = 0.0602 \times L^{2.5572}$ Note: this expression was based on data from nine steel trawlers ranging between 22.5 and 39.9m LOA and with a displacement range of 141 and 670t, respectively.

A#17 Vessel displacement mono hullform assumption – all vessels had displacement mono hullforms, even though in some fisheries multi-hull designs were present.

A#18 Vessel uniform transit speed assumption – all vessels were assumed to have a transit speed of 5 m/s (i.e., c. 10 knots) or 10m/s (trolling, handline, hand gathering), irrespective of size.

A#19 scenario where a vessel tows with a relatively strong tidal current (evident in this

A#19 Uniform vessel length to height ratio assumption – every vessel was geometrically similar and shared a length to height ratio of 5:1.

APPENDIX C – DETERMINANTION OF ANCHOR MASS

Determination of Anchor Mass for Australian Commercial Vessels

3.2 EQUIPMENT NUMBER

Equipment number is a function of displacement, frontal area and profile area
It shall be calculated by the following equation:

$$EN = \{(\Delta^{2/3}. f_h) + 2(B.a + \Sigma b.h.\cos\theta_f) + 0.1(A_h + A_{ss} . \cos\theta_p)\} f_o \quad \ldots\ldots\ldots (3.1)$$

where

EN = equipment number
Δ = vessel displacement, in tonnes
B = moulded breadth, in metres
a = Freeboard, in metres
b = breadth of deckhouse tier if greater than B/4, in metres
h = height of deckhouse tier if greater than B/4, in metres
A1 | A_h = the hull profile above waterline, in square metres
A_{ss} = superstructure profile area, in square metres
θ_f = slope of superstructure front to the vertical, in degrees
θ_p = slope of superstructure side to the vertical, in degrees
f_h = factor for hull type:
1.0 for monohulls
1.26 for catamarans
1.33 for trimarans
f_o = factor for operational area:
1.0 for area A, B and C
0.8 for area D
0.54 for area E

3.3 HOLDING POWER

The holding power (force) of an anchor is related to the equipment number by the following equation:

$$P_h = 3\,(0.002\,EN^2 + 2.3\,EN + 9) \times 9.81 \quad \ldots\ldots\ldots (3.2)$$

where

P_h = holding power (force), in newtons
EN = equipment number

3.4 ANCHOR MASS

The required anchor mass is related to the anchor holding power by the following equation:

$$M_a = P_h/(F_t \times 9.81) \quad \ldots\ldots\ldots (3.3)$$

where

M_a = required anchor mass, in kilograms
P_h = holding power (force), in newtons
F_t = factor for anchor type:
3.00 for standard anchors
4.29 for high holding power anchors
5.45 for super high holding power anchors

Regulations concerning anchor shackle strength and permissible anchor cable types

CHAPTER 4 REQUIREMENT FOR COMPONENTS

4.1 ANCHOR SHACKLE

The anchor shackle provides the link between the anchor and the anchor cable. The basic requirements of the anchor shackle are:

The strength of the anchor shackle shall be equal to or more than that of the anchor cable it is connected to.

NOTE: As the shape of the anchor shackle is inherently weaker than stud-link anchor cable this will require a larger diameter for the shackle leg and pin.

The proof load for the anchor shackle shall be greater than the certified holding power of the anchor it is connected to.

4.2 ANCHOR CABLE

4.2.1 Cable type

A1 The anchor cable shall be of stud-link chain, short-link chain, wire rope or fibre rope, subject to the requirements of this Chapter.

4.2.2 Design requirements

The anchor cable shall be designed such that the following applies:

a) It provides a connection between the anchor and the vessel of sufficient length so that the anchor is able to provide maximum holding power.

b) It provides a measure of elasticity to reduce the response loads on the vessel and anchor caused by the variation in the applied loads on the vessel due to wind, wave and current forces.

To satisfy the design requirements, the anchor cable shall have a working strength greater than the holding power of the anchor to be used. The anchor cable shall be able to absorb the design accelerations without exceeding the holding power of the anchor. This may be achieved by the use of mass, the elastic properties of the anchor cable, cable length or some combination of these characteristics.

4.2.3 Steel chain

The diameter of the chain shall be as per Clause 3.5 or Table 4.1.

Chain shall be manufactured, tested and certified in accordance with one of the following:

a) ISO 1704 or equivalent National or International Standard.

b) AS 2321 or equivalent National or International Standard.

c) recognised organisation.

4.2.4 Steel wire rope

It is permitted to replace chain by steel wire rope where the equivalent anchor mass does not exceed that of a 130 kg standard anchor and the breaking load of the steel wire rope is at least equal to that of chain cable. The minimum length of chain at the end of wire rope shall be as per Table 4.1.

SETFIA SOUTH EAST TRAWL FISHING INDUSTRY ASSOCIATION sustainable fishing practices protect our future

Wire ropes shall be manufactured, tested and certified in accordance with one of the following:

a) AS 3569 or equivalent National or International Standard.

NOTE: For information on the operation and maintenance of steel wire ropes, refer to AS 2759.

b) The requirements of a recognised organisation.

4.2.5 Fibre rope

Fibre rope is allowed for any anchor excepting anchors on vessels operating in A, B and C Class waters where the equivalent anchor mass exceeds that of a 130 kg standard anchor. The minimum breaking load of the fibre rope shall be equal to or more than that of a chain cable. The rope shall be in good condition, free from sunlight damage, abrasions, and hockles. The minimum length of chain at the end of fibre rope shall be as per Table 4.1.

NOTE: For guidance, rope diameters are given in Table 4.1.

The fibre ropes shall be manufactured as per AS 4142.2 or equivalent National or International Standard and tested as per AS 4143.1 or equivalent National or International Standard.

NOTE: For information on care and safe usage of fibre ropes, refer to AS 4142.1.

Fibre ropes that have been certified by a recognised organisation shall be deemed to comply with this National Standard.

SETFIA SOUTH EAST TRAWL FISHING INDUSTRY ASSOCIATION sustainable fishing practices protect our future

4.2.6 Windlass, capstan or winch

Mechanical lifting devices shall be fitted if the combined mass of anchor and one third of the cable exceeds the local Occupational Health and Safety (OHS) requirements for manual lifting. Cable stoppers, claws or similar fastenings shall be provided as necessary between the windlass or capstan and the hawse pipe. The windlass or capstan shall be designed for immediate dropping of the anchor and shall have an efficient brake.

Means shall be provided to secure the cable at the required length. The means shall be of strength sufficient to withstand loads not less than the breaking strength of the cable, including shock loading.

The bitter end of the cable shall be permanently secured to the vessel by an attachment of strength sufficient to withstand loads not less than the breaking strength of the cable.

SETFIA SOUTH EAST TRAWL FISHING INDUSTRY ASSOCIATION sustainable fishing practices protect our future

APPENDIX D – AMSA VESSEL CLASS AND SURVEY CATEGORY

Vessel use	Indicated by
Passenger vessel (13 or more passengers)	1
Non-passenger vessel (up to 12 passengers)	2
Fishing vessel	3
Hire and drive vessel used by the hirer only for recreational purposes	4

Operational area	Indicated by
Unlimited domestic operations (no longer available to domestic commercial vessels). Vessels operating in A waters must be Australian regulated vessels under the *Navigation Act 2012*.	A
Extended offshore operations (beyond 200 nautical miles from the baseline of the Australian mainland, Tasmania, a recognised island but within the exclusive economic zone)	B Extended
Offshore operations (within 200 nautical miles from the baseline of the Australian mainland, Tasmania, a recognised island but within the exclusive economic zone)	B
Restricted offshore operations (within 30 nautical miles from the baseline of the Australian mainland, Tasmania, a recognised island; within 50 nautical miles of the baseline of Queensland, within the Great Barrier Reef Region or the Torres Strait Zone; whilst remaining within the exclusive economic zone)	C
Restricted offshore operations—specified areas	C Restricted
Partially smooth water operations	D
Smooth water operations	E

APPENDIX G EPBC ACT PROTECTED MATTERS SEARCH TOOL REPORT – OPERATIONAL AREA

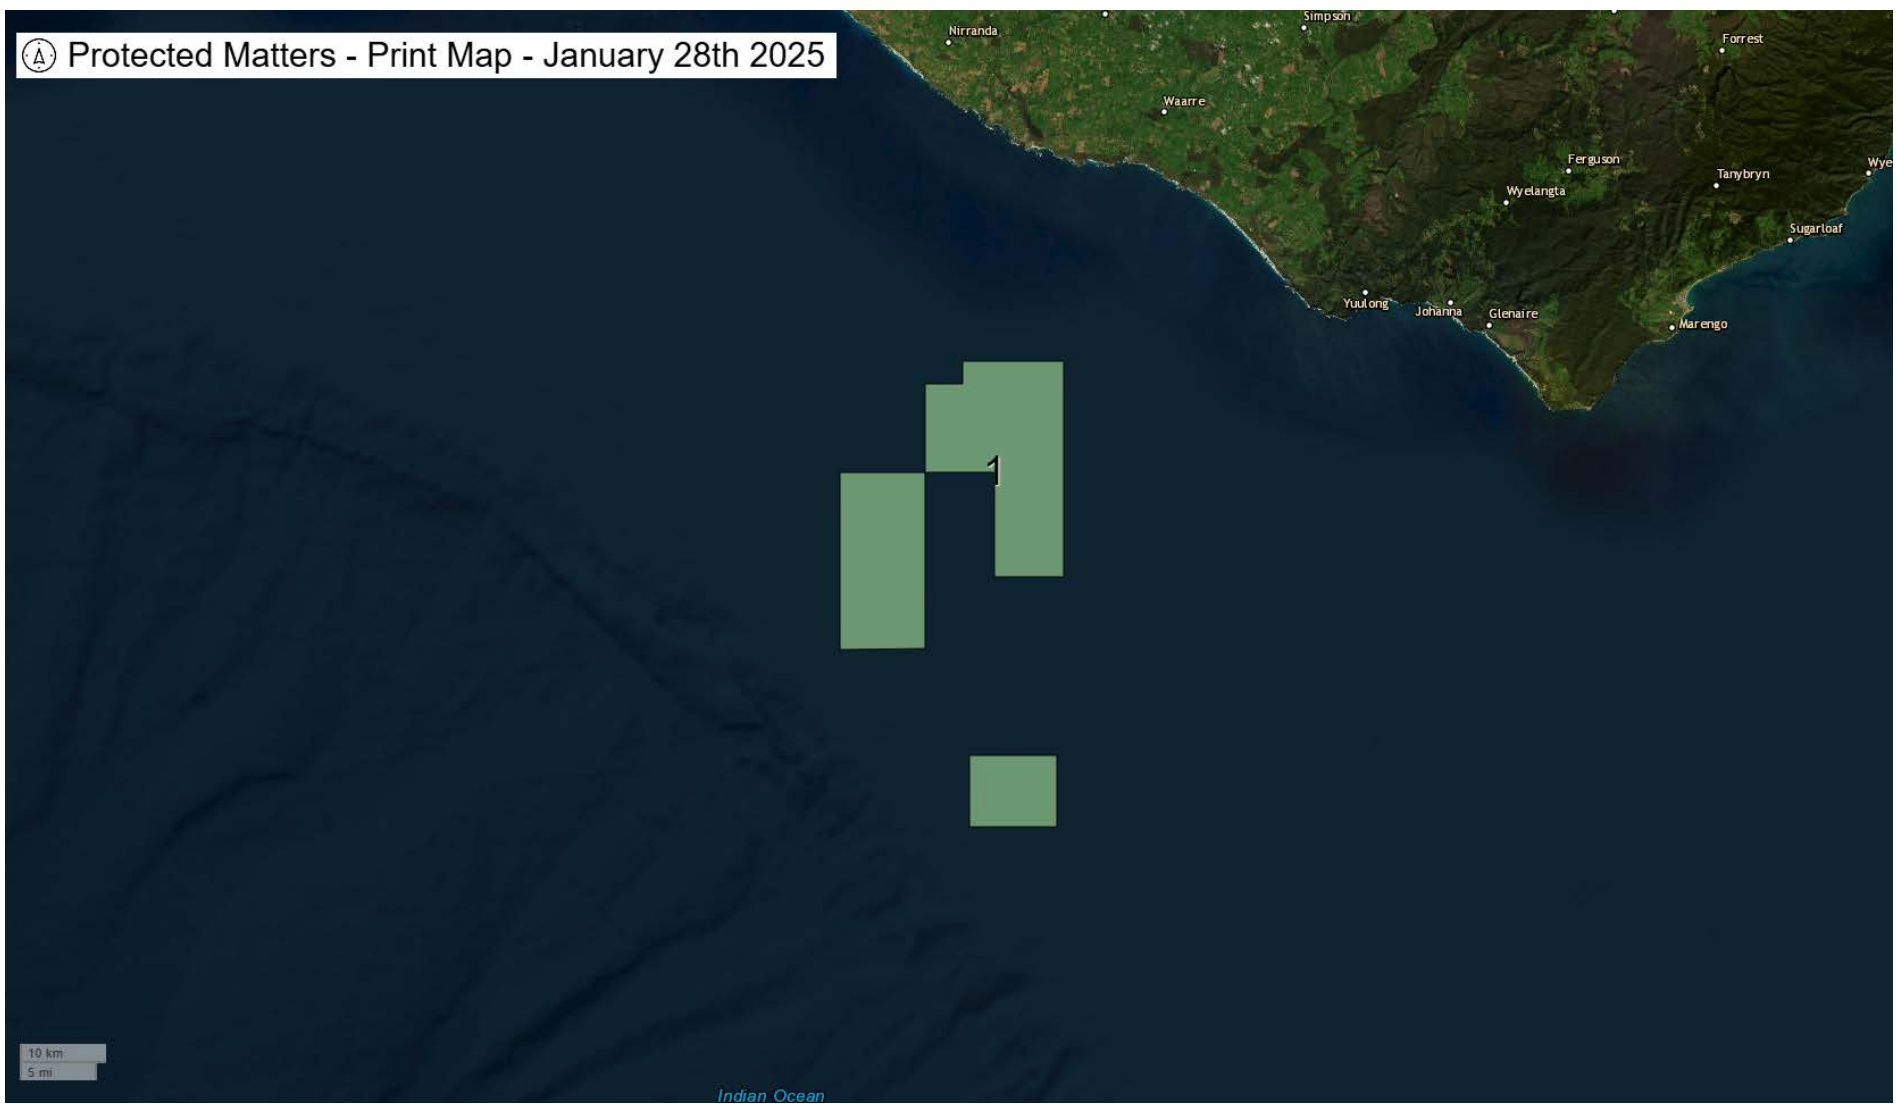
Australian Government

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 28-Jan-2025



[Summary](#)

[Details](#)

- [Matters of NES](#)
- [Other Matters Protected by the EPBC Act](#)
- [Extra Information](#)

[Caveat](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	39
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	60
Whales and Other Cetaceans:	27
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	23
Key Ecological Features (Marine):	1
Biologically Important Areas:	12
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Thalassarche steadi](#) White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

[Balaenoptera borealis](#) Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Eubalaena australis](#) Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
REPTILE		
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
[Chelonia mydas](#) Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Carcharias taurus Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Migration route known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna tenuirostris		
Short-tailed Shearwater [82652]	Foraging	Likely to occur

Scientific Name	Behaviour	Presence
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

APPENDIX H EPBC ACT PROTECTED MATTERS SEARCH TOOL REPORT – PLANNING AREA

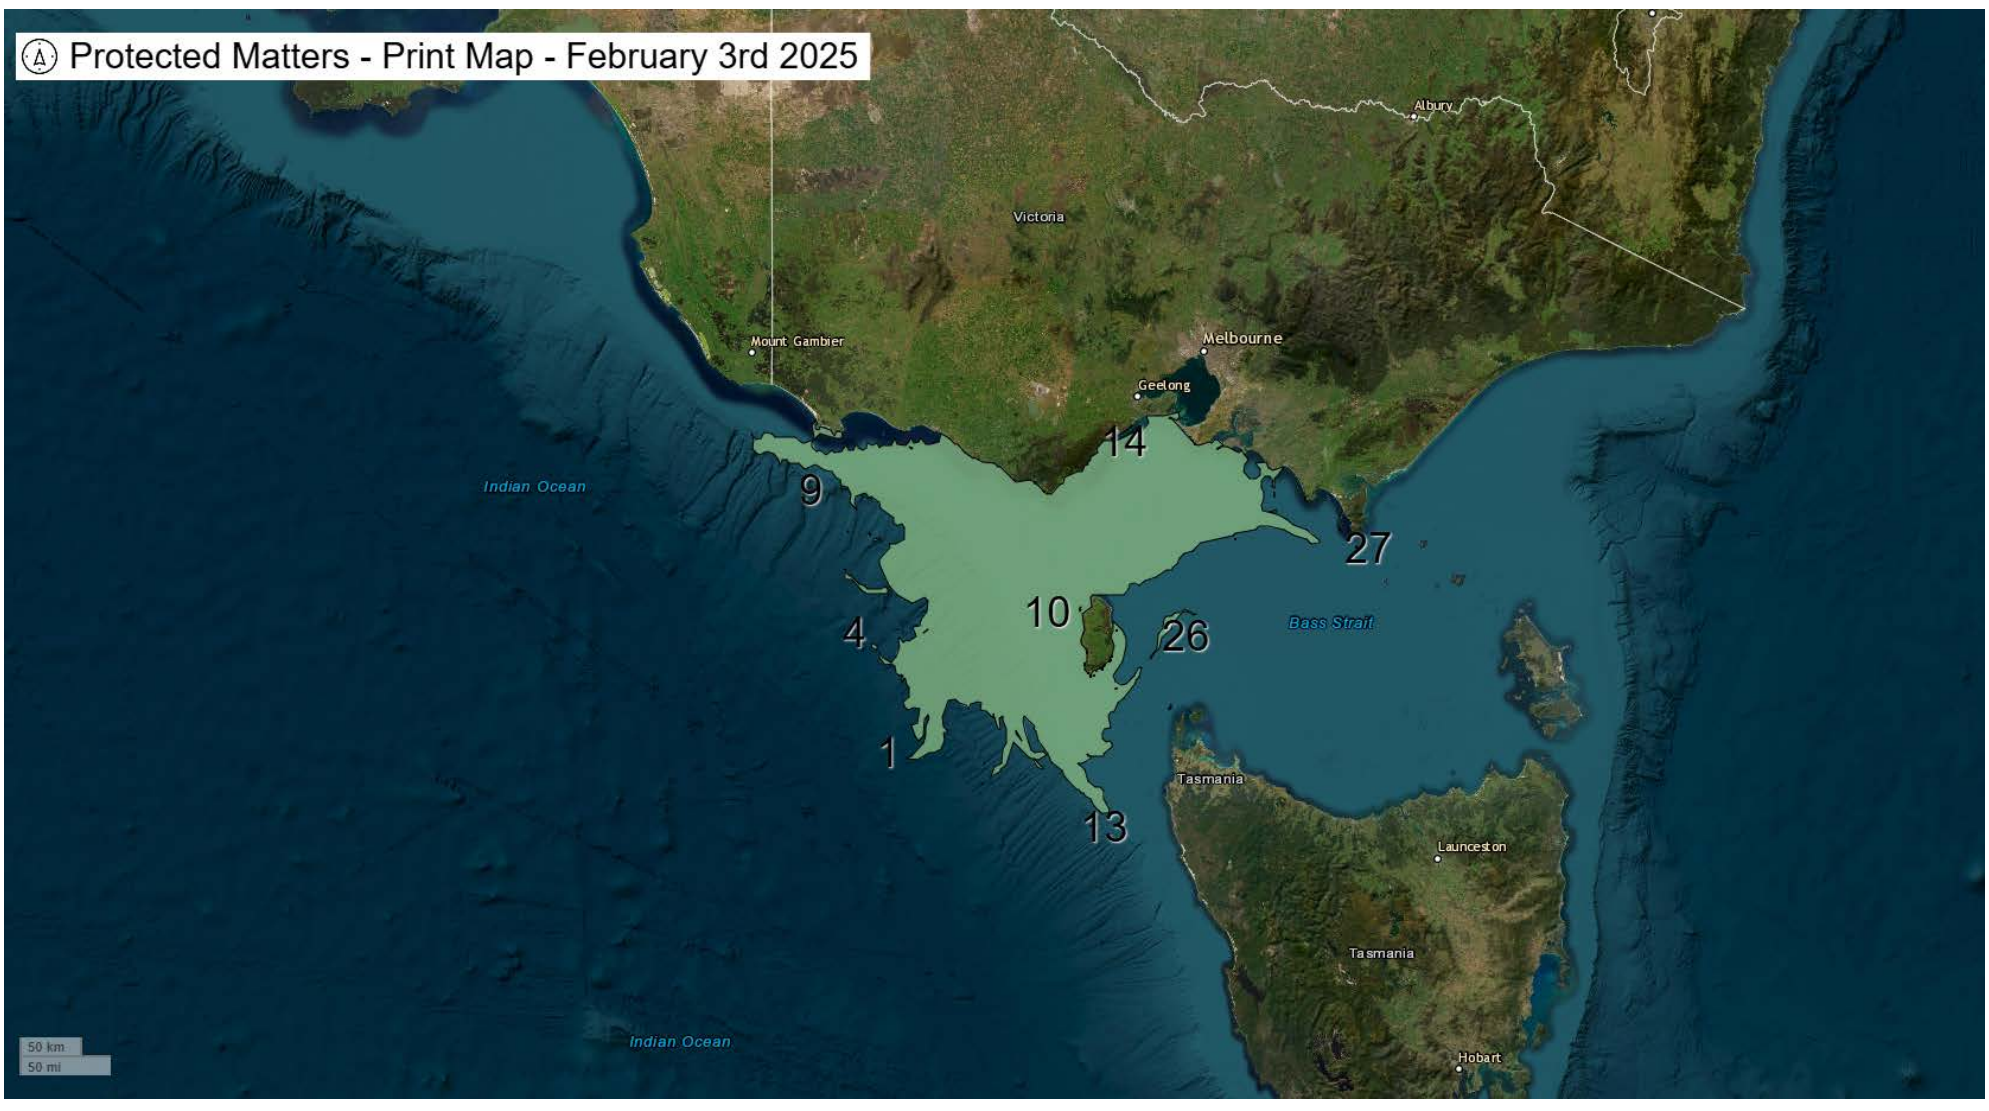
Australian Government

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 03-Feb-2025



[Summary](#)

[Details](#)

- [Matters of NES](#)
- [Other Matters Protected by the EPBC Act](#)
- [Extra Information](#)

[Caveat](#)

[Acknowledgements](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	3
Wetlands of International Importance (Ramsar	4
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	12
Listed Threatened Species:	132
Listed Migratory Species:	71

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	25
Commonwealth Heritage Places:	5
Listed Marine Species:	124
Whales and Other Cetaceans:	31
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	4
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	78
Regional Forest Agreements:	3
Nationally Important Wetlands:	14
EPBC Act Referrals:	152
Key Ecological Features (Marine):	2
Biologically Important Areas:	25
Bioregional Assessments:	1
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places		[Resource Information]
Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place
Point Nepean Defence Sites and Quarantine Station Area	VIC	Listed place
Quarantine Station and Surrounds	VIC	Within listed place

Wetlands of International Importance (Ramsar Wetlands)	[Resource Information]
Ramsar Site Name	Proximity
Glenelg estuary and discovery bay wetlands	Within Ramsar site
Lavinia	Within Ramsar site
Port phillip bay (western shoreline) and bellarine peninsula	Within Ramsar site
Western port	Within 10km of Ramsar site

Commonwealth Marine Area	[Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities		[Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area

Community Name	Threatened Category	Presence Text
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area
Karst springs and associated alkaline fens of the Naracoorte Coastal Plain Bioregion	Endangered	Community may occur within area
King Island scrub complex	Endangered	Community may occur within area
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community likely to occur within area
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
Tasmanian Forests and Woodlands dominated by black gum or Brookers gum (Eucalyptus ovata / E. brookeriana)	Critically Endangered	Community likely to occur within area
Tasmanian white gum (Eucalyptus viminalis) wet forest	Critically Endangered	Community may occur within area
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Acanthiza pusilla magnirostris		
King Island Brown Thornbill, Brown Thornbill (King Island) [91709]	Endangered	Species or species habitat known to occur within area
Acanthornis magna greeniana		
King Island Scrubtit, Scrubtit (King Island) [82329]	Critically Endangered	Species or species habitat known to occur within area
Anthochaera phrygia		
Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Aphelocephala leucopsis Southern Whiteface [529]	Vulnerable	Species or species habitat may occur within area
Aquila audax fleayi Tasmanian Wedge-tailed Eagle, Wedge-tailed Eagle (Tasmanian) [64435]	Endangered	Species or species habitat may occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Calyptorhynchus banksii graptogyne South-eastern Red-tailed Black-Cockatoo [25982]	Endangered	Species or species habitat likely to occur within area
Ceyx azureus diemenensis Tasmanian Azure Kingfisher [25977]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea antipodensis gibsoni Gibson's Albatross [82270]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Fregetta grallaria grallaria White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area

Scientific Name	Threatened Category	Presence Text
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Platycercus caledonicus brownii Green Rosella (King Island) [67041]	Vulnerable	Species or species habitat known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Pycnoptilus floccosus Pilotbird [525]	Vulnerable	Species or species habitat likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Strepera fuliginosa colei Black Currawong (King Island) [67113]	Vulnerable	Breeding likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Xenus cinereus		
Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area
CRUSTACEAN		
Euastacus bispinosus		
Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat may occur within area
FISH		
Galaxiella pusilla		
Eastern Dwarf Galaxias, Dwarf Galaxias [56790]	Endangered	Species or species habitat likely to occur within area
Hoplostethus atlanticus		
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Nannoperca obscura		
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Rexea solandri (eastern Australian population)		
Eastern Gemfish [76339]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis		
Southern Bell Frog,, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
INSECT		
Synemon plana		
Golden Sun Moth [25234]	Vulnerable	Species or species habitat may occur within area
MAMMAL		
Antechinus minimus maritimus		
Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dasyurus maculatus maculatus (SE mainland population)		
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon obesulus obesulus		
Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mastacomys fuscus mordicus Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
Miniopterus orianae bassanii Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Perameles gunnii Victorian subspecies Eastern Barred Bandicoot (Mainland) [88020]	Endangered	Translocated population known to occur within area
Petauroides volans Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pseudomys shortridgei Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat known to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
PLANT		

Scientific Name	Threatened Category	Presence Text
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat likely to occur within area
Astelia australiana Tall Astelia [10851]	Vulnerable	Species or species habitat may occur within area
Caladenia calcicola Limestone Spider-orchid [10065]	Vulnerable	Species or species habitat likely to occur within area
Caladenia colorata Coloured Spider-orchid, Small Western Spider-orchid, Painted Spider-orchid [54999]	Endangered	Species or species habitat likely to occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Caladenia hastata Melblom's Spider-orchid [16118]	Endangered	Species or species habitat likely to occur within area
Caladenia orientalis Eastern Spider Orchid [83410]	Endangered	Species or species habitat known to occur within area
Caladenia ornata Ornate Pink Fingers [76213]	Vulnerable	Species or species habitat may occur within area
Caladenia tessellata Thick-lipped Spider-orchid, Daddy Long-legs [2119]	Vulnerable	Species or species habitat known to occur within area
Dodonaea procumbens Trailing Hop-bush [12149]	Vulnerable	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Euphrasia collina subsp. muelleri Purple Eyebright, Mueller's Eyebright [16151]	Endangered	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Grevillea infecunda Anglesea Grevillea [22026]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Hiya distans listed as Hypolepis distans Scrambling Ground-fern [92548]	Endangered	Species or species habitat known to occur within area
Ixodia achillaeoides subsp. arenicola Sand Ixodia, Ixodia [21474]	Vulnerable	Species or species habitat known to occur within area
Lachnagrostis adamsonii Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area
Leiocarpa gatesii Wrinkled Buttons [76212]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat known to occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat likely to occur within area
Pimelea spinescens subsp. spinescens Plains Rice-flower, Spiny Rice-flower, Prickly Pimelea [21980]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Prasophyllum frenchii Maroon Leek-orchid, Slaty Leek-orchid, Stout Leek-orchid, French's Leek-orchid, Swamp Leek-orchid [9704]	Endangered	Species or species habitat known to occur within area
Prasophyllum litorale listed as Prasophyllum littorale Coastal Leek Orchid [55234]	Critically Endangered	Species or species habitat known to occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat known to occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat likely to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
Thelymitra matthewsii Spiral Sun-orchid [4168]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharias taurus Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
[Motacilla flava](#) Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
[Actitis hypoleucos](#) Common Sandpiper [59309]		Species or species habitat known to occur within area
[Arenaria interpres](#) Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
[Calidris acuminata](#) Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
[Calidris alba](#) Sanderling [875]		Roosting known to occur within area
[Calidris canutus](#) Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
[Calidris ferruginea](#) Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
[Calidris melanotos](#) Pectoral Sandpiper [858]		Species or species habitat known to occur within area
[Calidris ruficollis](#) Red-necked Stint [860]		Roosting known to occur within area
[Calidris tenuirostris](#) Great Knot [862]	Vulnerable	Roosting known to occur within area
[Charadrius bicinctus](#) Double-banded Plover [895]		Roosting known to occur within area
[Charadrius leschenaultii](#) Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
[Pluvialis squatarola](#) Grey Plover [865]	Vulnerable	Roosting known to occur within area
[Thalasseus bergii](#) Greater Crested Tern [83000]		Breeding known to occur within area
[Tringa brevipes](#) Grey-tailed Tattler [851]		Roosting known to occur within area
[Tringa nebularia](#) Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
[Tringa stagnatilis](#) Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
[Xenus cinereus](#) Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea antipodensis gibsoni as Diomedea gibsoni Gibson's Albatross [82270]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus dominicanus Kelp Gull [809]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Macronectes halli](#) Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Merops ornatus](#) Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
[Monarcha melanopsis](#) Black-faced Monarch [609]		Species or species habitat known to occur within area overfly marine area
[Morus capensis](#) Cape Gannet [59569]		Breeding known to occur within area
[Morus serrator](#) Australasian Gannet [1020]		Breeding known to occur within area
[Motacilla flava](#) Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
[Myiagra cyanoleuca](#) Satin Flycatcher [612]		Breeding known to occur within area overfly marine area
[Neophema chrysogaster](#) Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area overfly marine area
[Neophema chrysostoma](#) Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
[Numenius madagascariensis](#) Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area
Pelecanoides urinatrix Common Diving-Petrel [1018]		Breeding known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area overfly marine area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
[Tringa nebularia](#) Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
[Tringa stagnatilis](#) Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
[Xenus cinereus](#) Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area overfly marine area
Fish		
[Heraldia nocturna](#) Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
[Hippocampus abdominalis](#) Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
[Hippocampus breviceps](#) Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
[Hippocampus minotaur](#) Bullneck Seahorse [66705]		Species or species habitat may occur within area
[Histiogamphelus briggsii](#) Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
[Histiogamphelus cristatus](#) Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
[Hypselognathus rostratus](#) Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
[Kaupus costatus](#) Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys mollisoni Mollison's Pipefish [66260]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Arctocephalus pusillus		
Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area
Neophoca cinerea		
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata		
Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tasmacetus shepherdi Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Bonney Coast Upwelling	South-east
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Eudyptula minor Little Penguin [1085]	Breeding	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Morus serrator Australasian Gannet [1020]	Aggregation	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Breeding	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Breeding	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Breeding	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Bioregional Assessments [Resource Information]

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales

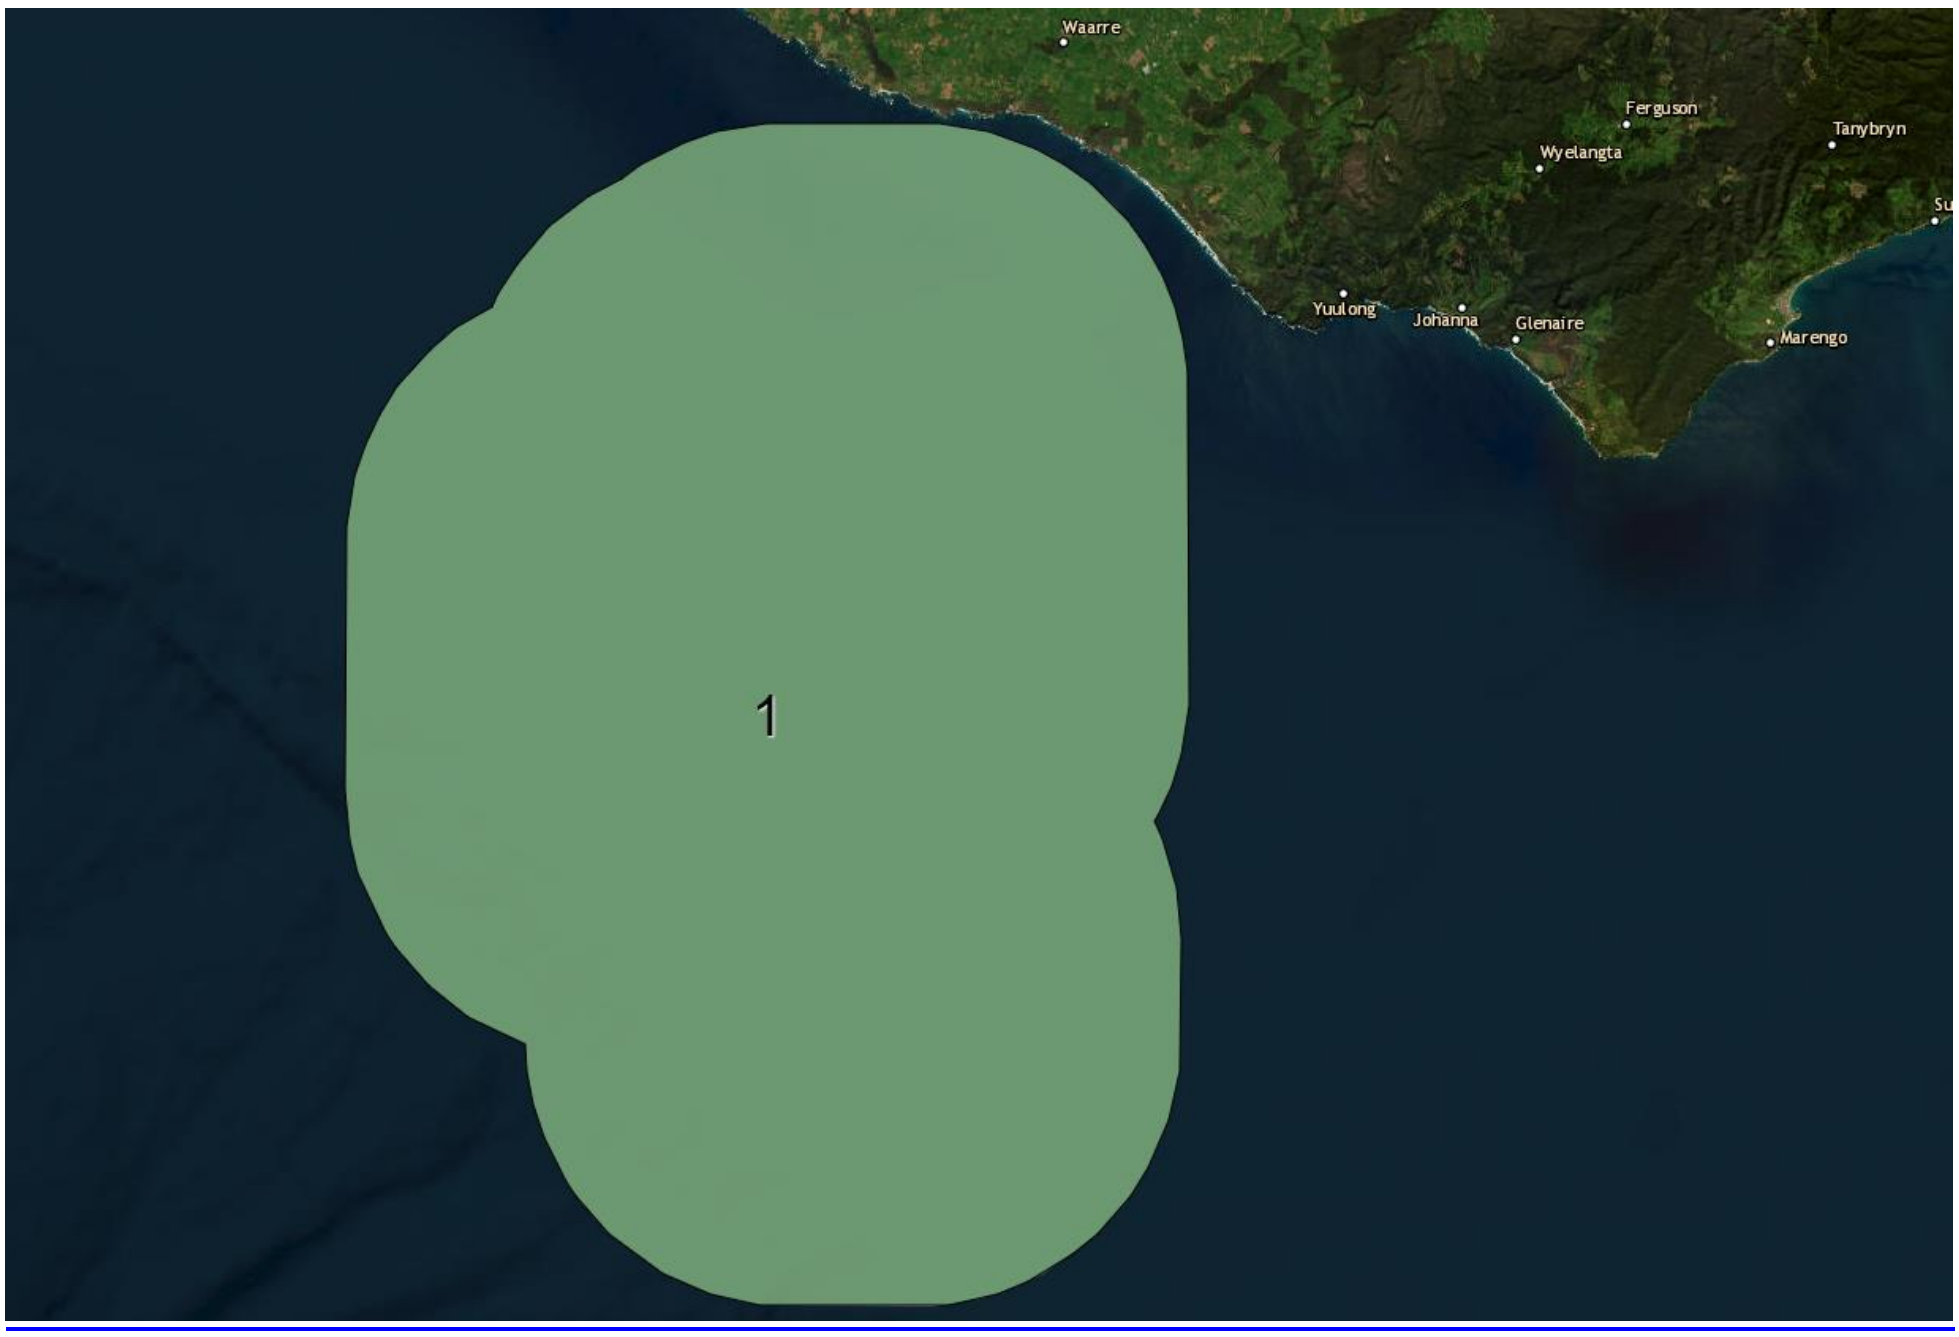
APPENDIX I EPBC ACT PROTECTED MATTERS SEARCH TOOL REPORT – LIGHT AND FLARING EMBAS

Australian Government



Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 26-Feb-2025

Summary
Details
Matters of NES
Other Matters Protected by the EPBC Act

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	43
Listed Migratory Species:	43

Other Matters Protected by the EPBC Act

State and Territory Reserves:	2
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	42
Key Ecological Features (Marine):	1
Biologically Important Areas:	17
Bioregional Assessments:	None

Geological and Bioregional Assessments:	None

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	67
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)

Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within

		area
[Halobaena caerulea](#) Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
[Limosa lapponica baueri](#) Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat may occur within area
[Macronectes giganteus](#) Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
[Macronectes halli](#) Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Neophema chrysogaster](#) Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area
[Numenius madagascariensis](#) Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Pachyptila turtur subantarctica](#) Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
[Phoebetria fusca](#) Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
[Pterodroma leucoptera leucoptera](#) Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area

[Pterodroma mollis](#) Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
[Sternula nereis nereis](#) Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur
Carcharodon carcharias White Shark [64470]		Known to occur
	Known distribution	
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;

- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 26-Feb-2025

Summary
Details
Matters of NES
Other Matters Protected by the EPBC Act
Extra Information
Caveat
Acknowledgements

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	7
Listed Threatened Species:	98
Listed Migratory Species:	63

Other Matters Protected by the EPBC Act

State and Territory Reserves:	33
Regional Forest Agreements:	1
Nationally Important Wetlands:	4
EPBC Act Referrals:	71
Key Ecological Features (Marine):	1
Biologically Important Areas:	22

Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	3
Commonwealth Heritage Places:	None
Listed Marine Species:	105
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	4
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Western district lakes	10 - 20km upstream from Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name

Commonwealth Marine Areas (EPBC Act)

Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community known to occur within area
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community may occur within area
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area
Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains	Critically Endangered	Community likely to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour may occur within area

Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Thalassarche chrysostoma](#) Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
[Thalassarche impavida](#) Campbell Albatross, Campbell Blackbrowed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Thalassarche melanophris](#) Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Thalassarche salvini](#) Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Thalassarche steadi](#) White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
[Thinornis cucullatus cucullatus](#) Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
[Tringa nebularia](#) Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
FISH		
[Hoplostethus atlanticus](#) Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area

Nannoperca obscura Yarra Pygmy Perch [26177]	Endangered	Species or species habitat known to occur within area
Prototroctes maraena Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
Scientific Name	Threatened Category	Presence Text
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
Litoria raniformis Southern Bell Frog, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
INSECT		
Synemon plana Golden Sun Moth [25234]	Vulnerable	Species or species habitat may occur within area
MAMMAL		
Antechinus minimus maritimus Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area

[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Dasyurus maculatus maculatus (SE mainland population)](#) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
[Eubalaena australis](#) Southern Right Whale [40]	Endangered	Breeding known to occur within area
[Isoodon obesulus obesulus](#) Southern Brown Bandicoot (southeastern) [68050]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
[Mastacomys fuscus mordicus](#) Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
[Miniopterus orianae bassanii](#) Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area
[Neophoca cinerea](#) Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
[Petauroides volans](#) Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area
[Petaurus australis australis](#) Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area

Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area

PLANT

River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area
Astelia australiana Tall Astelia [10851]	Vulnerable	Species or species habitat

Scientific Name	Threatened Category	Presence Text
		known to occur within area
Amphibromus fluitans		
Caladenia concolor Crimson Spider-orchid, Maroon Spiderorchid [5505]	Vulnerable	Species or species habitat may occur within area
Dianella amoena Matted Flax-lily [64886]	Endangered	Species or species habitat likely to occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat likely to occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area

Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat may occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
Scientific Name	Threatened Category	Presence Text
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat may occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
Thelymitra matthewsii Spiral Sun-orchid [4168]	Endangered	Species or species habitat may occur within area
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		

Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar Striped Legless Lizard, Striped Snakelizard [1649]	Vulnerable	Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eulamprus tympanum marnieae Corangamite Water Skink, Dreeite Water Skink [64487]	Endangered	Species or species habitat may occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat likely to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat may occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453] Foraging, feeding or related behaviour known to occur within area	Conservation Dependent

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica		

Wedge-tailed Shearwater [84292]	Breeding	Known occur	to
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur	
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known occur	to
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known occur	to
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known occur	to
Morus serrator Australasian Gannet [1020]	Foraging	Known occur	to
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known occur	to
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known occur	to
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known occur	to
Scientific Name	Behaviour	Presence	
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur	
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur	
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur	
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur	
Sharks			

Carcharodon carcharias White Shark [64470]	Distribution	Likely to occur
Carcharodon carcharias White Shark [64470]	Distribution	Known to occur
Carcharodon carcharias White Shark [64470]	Distribution (low density)	Likely to occur
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral

of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

TECHNICAL ADDENDUM

DATE: 27 August 2021
FROM: Matthew Koessler, Craig McPherson (JASCO Applied Sciences (Australia) Pty Ltd)
TO: Phil Wemyss (Beach Energy)

SUBJECT: Beach Otway Project: Additional and Revised Modelling Study

1. Summary

JASCO Applied Sciences (JASCO) performed modelling study of underwater sound levels associated with the Beach Energy Otway Development, to supplement drilling and construction results previously presented in Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021).

The results have been revised due to better understanding of the propagation loss in the region gained through the validation monitoring of drilling operations at Artisan-1 McPherson et al. (2021). A significant finding of this study was lack of a thin layer of sand overlying the carbonate seabed structure near Artisan-1, which has a significant influence on propagation loss.

This monitoring project also characterised Monopole Source Levels (MSL) for project vessels (during transit and under dynamic positioning (DP)) and the *Ocean Onyx* Mobile Offshore Drilling Unit (MODU). These source levels are considered in the revised modelling.

Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), and as accumulated sound exposure levels (SEL, L_E) as appropriate for non-impulsive (continuous) noise sources. For the non-time dependent scenarios, the modelled maximum and 95th percentile distances to the marine mammal behavioural threshold based on the current interim NOAA (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources are summarised in Table 1.

For the time-dependent scenarios, the modelled maximum distances to permanent threshold shift (PTS) and temporary threshold shift (TTS) criteria for low-frequency cetaceans (NMFS 2018), which are based on SEL accumulated over a period of time are summarised in Table 2.

Table 1. Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL) from the most appropriate location for considered sources per scenario. MCR: Maximum Continuous Rating, MODU: Mobile Offshore Drilling Unit, OSV: Offshore Supply Vessel, ROV: Remotely Operated Vehicle.

Applicable Scenario number	Well Area	Description	R_{max} (km)	$R_{95\%}$ (km)

2. Introduction

JASCO Applied Sciences (JASCO) performed modelling study of underwater sound levels associated with the Beach Energy Otway Development, to supplement drilling and construction results previously presented in Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021).

The results have been revised due to better understanding of the propagation loss in the region gained through the validation monitoring of drilling operations at Artisan-1 McPherson et al. (2021) as described in Section 2.1. An overview of the modelling scenarios considered is provided in Section 2.2, with results presented in Section 4, and briefly discussed in Section 5.

For noise effect criteria and explanations on methodologies applied, refer to Koessler et al. (2020), Matthews et al. (2020), Matthews et al. (2021) and McPherson et al. (2021).

2.1. Validation Monitoring Study Summary

The monitoring study (McPherson et al. 2021) was completed in relation to the exploration drilling activities at the Artisan-1 well with the aim of completing an acoustic characterisation of the drilling and associated vessel activity within the Otway Basin. Through this characterisation, validation of the modelling predictions used in Beach Energy Otway Environment Plans (EPs) for the development drilling activities was required.

The exploration well Artisan-1, drilled by the *Ocean Onyx*, was selected for the monitoring program because the predicted distances to thresholds for effects on marine mammals, including pygmy blue whales, were farthest at

this location in the modelling study used for the EP (Koessler et al. 2020), as well as because it was the first well in the Otway drilling campaign.

Four JASCO Autonomous Multichannel Acoustic Recorders (AMARs) in C-lander moorings were deployed in February and retrieved in early April. Stations 1 through 4 were deployed at distances of 0.336, 1.13, 5.11, and 25 km from the *Ocean Onyx*. The AMARs recorded continuously at 24-bit resolution and 64 kHz sample rate for the entire deployment. The three stations closest to the *Ocean Onyx* were configured with a single hydrophone, whilst the station 25 km away was configured with three hydrophones to provide directional processing of received sounds.

To assist in the characterisation of *Ocean Onyx* and attendant support vessels, the vessels conducted specific activities under dynamic positioning and followed a nominated transit track between the *Ocean Onyx* and Geelong Supply Base. No specific operational requests were made of the *Ocean Onyx* and vessels during normal drilling activities due to the complexity of operationally meeting any requests. Over the course of the monitoring program, the MODU and support vessels engaged in different operational states with different uncontrollable contributors, such as variable drilling operations, resupply and support operations, weather conditions, and merchant shipping.

A summary of the findings of the monitoring study are described in the following sections.

Source Levels

The Monopole Source Levels determined through the measurement study differed from those either estimated for use in the modelling study or those determined using proxy sources. The key differences are as follows:

- The support vessels are quieter than estimated when they are under slow transit speeds, such as 7 knots.
- The support vessels are louder than estimated when they are travelling at faster transit speeds, with 9 knots used to represent these speeds and the associated MSL.
- The support vessels are louder than estimated when holding station or moving under dynamic positioning.
- The drilling operations of the *Ocean Onyx* are both louder at some frequencies and quieter at others than those for the proxy rig the *Polar Pioneer* (Austin et al. 2018), although the results presented for the *Polar Pioneer* did not examine the changes in level with increased drilling depth (over time) as completed within this study.

Comparison of Results

The results from the measurement study could not be directly compared to the modelling presented in Koessler et al. (2020) due to the differences in actual events compared to the nominal representative scenarios developed and evaluated as part of the EP assessment process. Additionally, the measurements were obtained at a receiver located 1.2 m off the seafloor, which is not the maximum-over-depth results reported in the modelling study. The ranges obtained from the measurement study were reported in relation to the Artisan-1 well location, and thus the centre of the *Ocean Onyx*. The ranges in project related modelling studies are reported from a range of locations, including the centroids of multiple sources, thus it was not possible to report the measurement results in a similar fashion using the small number of recording locations used in this study.

Geological Environment Representation

Previous modelling studies for Beach Energy, Koessler et al. (2020), Matthews et al. (2020) and Matthews et al. (2021), used MONM with the assumption of a 1 m thick layer of sand overlaying the carbonate seabed structure at the Artisan-1 well location. This assumption was made due to the lack of available information, and is similar to other inshore work in the Otway Basin, such as (Duncan et al. 2012), who represented the shelf as two zones, an in-shore zone out to a water depth of about 70 m in which the sand layer has a thickness of between 4–10 m, and an off-shore zone of effectively bare calcarenite probably due to scouring by current and swell. The transition between these two zones is ill-defined due to a lack of datapoints, and lies close to the Artisan-1 location, and a balanced approach of assuming 1 m thick layer of sand overlaying the carbonate seabed structure was judged to be appropriate given available information.

The measurement study has increased the understanding of the geological environment in the region and indicates that the sand overlay is thinner (or non-existent) at shallower water depths. The different environment required the use of an alternate configuration of numerical models to represent the propagation loss.

Propagation Loss

The accuracy of the broadband calculated propagation loss for the Otway Basin continental shelf environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on carbonate seabed (calcarenite) likely to occur within the region. In general, the thinner the sand layer, the greater the overall propagation loss.

When comparing SPL data fits for Stations 1–3 in McPherson et al. (2021), the loss rate is higher than what would have been expected in this environment, considering the higher monopole source levels for the support vessel on DP derived from trial measurements. The differences are likely attributable to the potential absence of a sand veneer.

Comparisons were conducted using JASCO's Marine Operations Noise Model (MONM), a wide-angle parabolic equation model which applies the BELLHOP Gaussian beam acoustic ray-trace model at higher frequencies, and JASCO's wavenumber integration model (VSTACK) which can fully account for the elasto-acoustic properties of the sub-bottom. The agreement between the models was excellent when only a comparatively thin (1 m thick) layer of sand overlies the carbonate seabed structure. In an environment such as this, MONM could have been used without correction. However, the comparisons indicate a much higher rates of loss, as would be expected if no (or only a very thin) sand layer were present.

A better understanding of the propagation loss environment, and the revision of the representation and treatment of it through the measurement study, enabled the modelling scenarios for the activities at Artisan-1 presented in Koessler et al. (2020) to be recalculated (Section 6.3 in McPherson et al. (2021)).

2.2. Scenario Details

The scenarios considered within this assessment are detailed below and in Table 3, with the associated modelling sites provided in Table 4. An overview of the scenarios is as follows:

1. Otway Offshore Project Development Drilling Campaign, Thylacine North-1 Operations:
    a. Mobile Offshore Drilling Unit (MODU) conducting normal drilling operations
    b. MODU with Offshore Supply Vessel (OSV) in attendance, standing by and conducting resupply operations under Dynamic Positioning (DP)
2. Otway Offshore Project Operations scenarios:
    1. Operations of the Thylacine platform (at Thylacine-A)
    2. OSV vessel resupply at Thylacine platform for periods of 2, 4, 6 and 8 hrs.
    3. OSV vessel on standby at Thylacine platform for periods of 8 and 24 hrs
4. Otway Offshore Project Construction scenarios: A single nominated pipelay/construction vessel, the Skandi Singapore, was considered for these scenarios. Each scenario was considered with a sound speed profiles for the 'worst case over the year' and for the period pygmy blue whales are present in the region, between November and January:
    a. Pipelay vessel (PLV) both stationary and laying pipe at Thylacine North-1 and Artisan-1 operating at 20% of its Maximum Continuous Rating (MCR).
    b. Pipelay vessel operating a Remotely Operated Vehicle (ROV) and cutting tool at Geographe-4. The vessel at Geographe-4 was also modelled operating at 20% and 40% of its Maximum Continuous Rating (MCR).
    c. Quantitively assess the combined sound levels of drilling activities and the construction vessel(s) at the emerging SRW aggregation area at Port Campbell. This scenario considered the drilling activities at

Thylacine North-1 presented in Koessler et al. (2020) and the nominated construction vessel (Skandi Singapore) operating at Geographe-4.

5. Simultaneous assessment for drilling, operations and construction operations were considered for key scenarios:
   a. Drilling at Thylacine while doing Thylacine platform resupply
   b. Drilling at Thylacine while doing installation of Thylacine skid near Thylacine platform. The construction vessel installing the skid was modelled operating at 20% and 40% of its Maximum Continuous Rating (MCR).

Table 3. Description of modelled scenarios. MCR: Maximum Continuous Rating, MODU: Mobile Offshore Drilling Unit, OSV: Offshore Supply Vessel, ROV: Remotely Operated Vehicle.

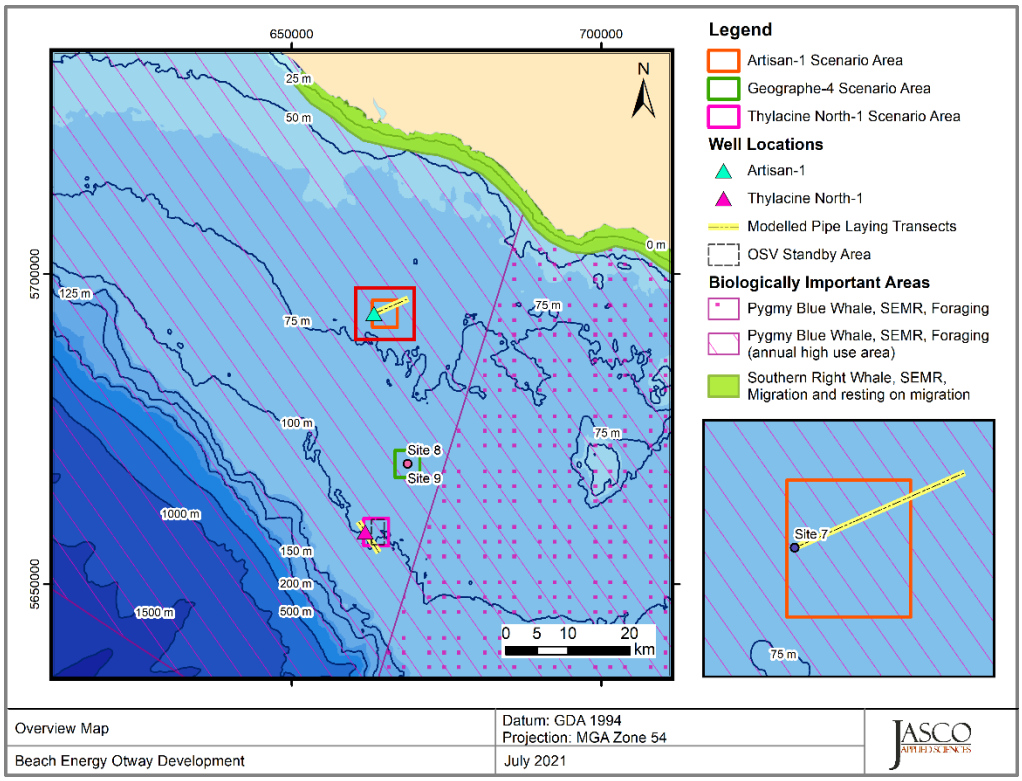

Figure 2. Overview of the modelled area (focus on Artisan-1 Scenario Area) and local features within the South East Marine Region (SEMR).

3. Methods and Parameters

A details description of the employed modelling method and input parameters can be found in refer to Koessler et al. (2020), Matthews et al. (2020), Matthews et al. (2021), Connell et al. (2021) and McPherson et al. (2021). A brief a summary of key elements used in this addendum are provided as follows.

The measured monopole source levels (MSLs) and spectra for the MODU and OSV were used here from McPherson et al. (2021):

- For the MODU drilling, mean levels from Section 5.5.1 in McPherson et al. (2021) were used.
- For scenarios where the OSV was under dynamic positioning (DP) the average spectrum from Section 5.5.2 in McPherson et al. (2021) was used.
- For scenarios where the OSV was transiting or standing by the average slow transit (7 knots) spectrum in McPherson et al. (2021) was used.

For the construction phase scenarios, estimates of the energy source levels (ESLs) for the pipelay/construction vessel were based on the specifications of the *Skandi Singapore* and an ESL derived from recordings of the TechnipFMC flexible lay and construction vessel *Deep Orient*. The specifications of proxy vessel and details on scaling can be found in Matthews et al. (2020), Matthews et al. (2021) and Connell et al. (2021).

Fixed structures such as the WHP have lower radiated sound levels than floating platforms (Spence et al. 2007). Equipment operating onboard floating platforms can contribute to marine environment sound however, airborne and structure-borne (vibration) pathways are considered more significant on these facilities, where equipment can be located below the water line. Underwater noise produced from platforms standing on metal jack-up legs is relatively low given the small surface areas available for sound transmission and also given the location of machinery above the waterline. It is therefore expected that the dominant pathway for sound generation is structure-borne (i.e., vibration from machinery passing through the legs) (Spence et al. 2007).

A study involving the Endeavour Jack-up Rig, operating in Cook Inlet, was conducted by Illingworth and Rodkin (2014) during drilling activities. The results from the sound source verification indicated that sound generated from drilling or generators were below ambient sound levels. The generators used on the Endeavour are mounted on pedestals specifically to reduce sound transfer through the infrastructure, and they are enclosed in an insulated engine room, which may have reduced further underwater sound transmission to levels below those generated by the Spartan 151. The sound source verification revealed that the submersed deep-well pumps that charge the fire-suppression system and cool the generators (in a closed water system) were the most likely dominant contributor the sound field. The measurements are reported as near-source levels recorded close to the bow leg pump system (at 10 m range) (Figure 3-5 in Illingworth and Rodkin Inc. (2014). These were backpropagated using spherical spreading to determine an energy source level (ESL) spectrum. Considering the similarities between a Jack-up Rig and a static WHP the decidecade band spectrum is shown in Figure 3 was used in modelling noise emissions from the Thylacine-A platform.

Furthermore, as discussed by (McPherson et al. 2021) and discussed above in Section 2.1, significant rates of propagation loss were found when analysing the data from the measurement study. As part of the model-measurement validation an adjustment factor was applied broadband received level predictions to account for the loss associated with a cemented limestone seabed (calcarenite) (Section 6.2 in McPherson et al. (2021)). A similar adjustment, which only differed by accounting for sources in different water depths, was applied to broadband level predictions in this addendum as a very similar type of seabed environment is expected at the Thylacine scenario area

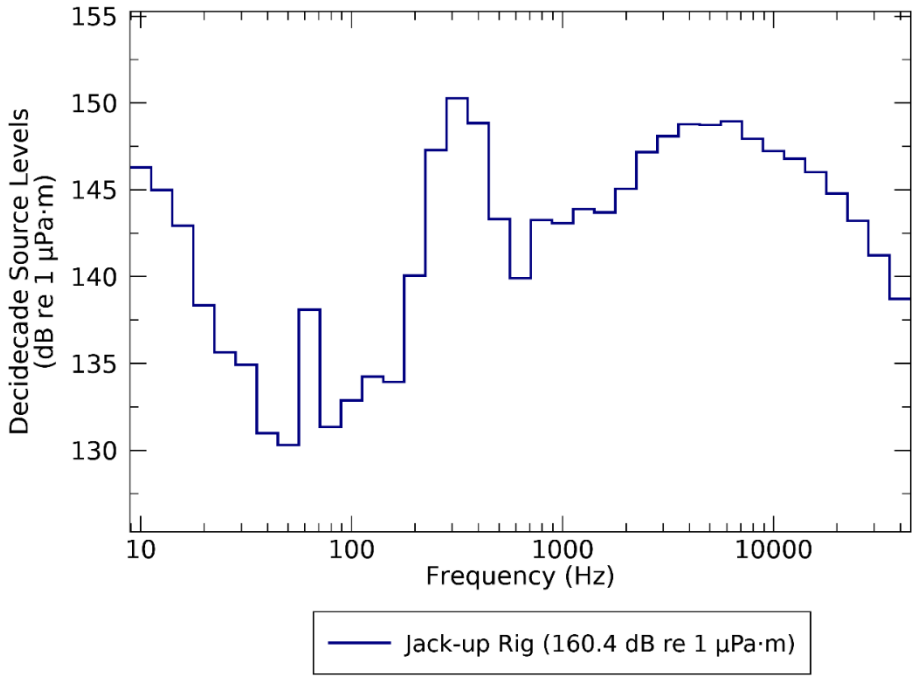

Figure 3. Energy source level (ESL) spectra (in decidecade frequency-band) for the Jack-up Rig considered as a proxy source for the Thylacine WHP.

4. Results

For the considered scenarios (described in Section 2.2), the maximum-over-depth sound fields for the modelled scenarios are presented below in two formats: as tables of distances to sound levels and, where the distances are long enough, as contour maps showing the directivity and distance to various sound levels. Distances to isopleths/thresholds were reported from either the centroid of several sources or from the most dominant single source. When an isopleth completely envelopes multiple sources the centroid was used. When several closed isopleths exist the most dominant source was used.

Tables 5–7 present the maximum and 95% distances (defined in Appendix B.1) to SPL isopleths. Since the SPL metric does not depend on the duration of the operation, these estimates are valid for both, stationary and non-stationary scenarios. Tables 11–16 present the distances to frequency-weighted SEL_{24h} threshold, as well as the total ensonified area for all scenarios.

The maximum-over-depth sound fields for nine scenarios (described in Section were extracted at the emerging SRW aggregation area at Port Campbell, and can be compared to the 120 dB re 1 µPa threshold for marine mammal behavioural response to continuous noise (NOAA 2019).

4.1. Tabulated Results

4.2. Sound Field Maps

4.2.1. SPL Maps

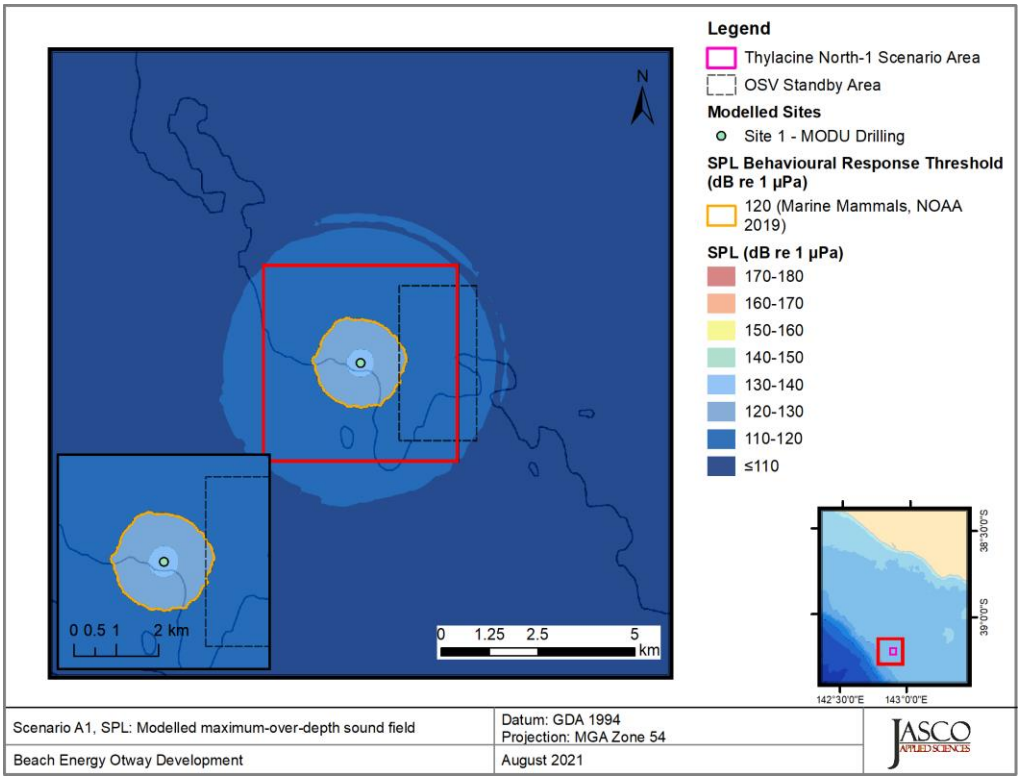

Figure 4. *Thylacine North-1, MODU Drilling (Scenario A1) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

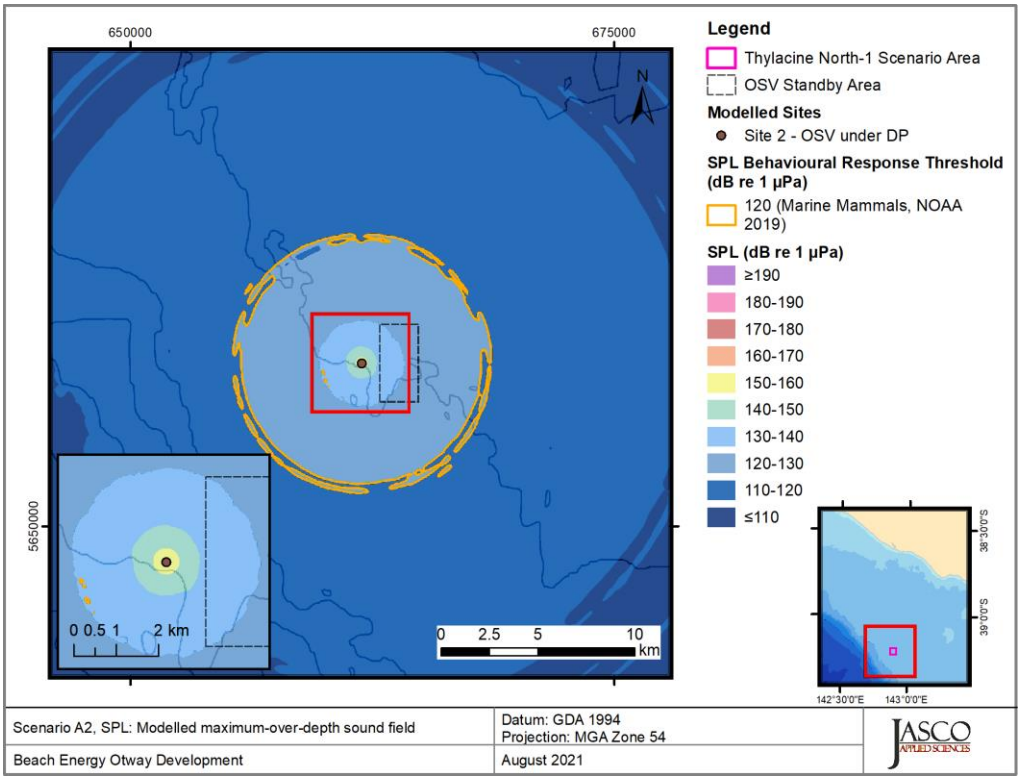

Figure 5. *Thylacine North-1, OSV on DP (Scenario A2) :* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

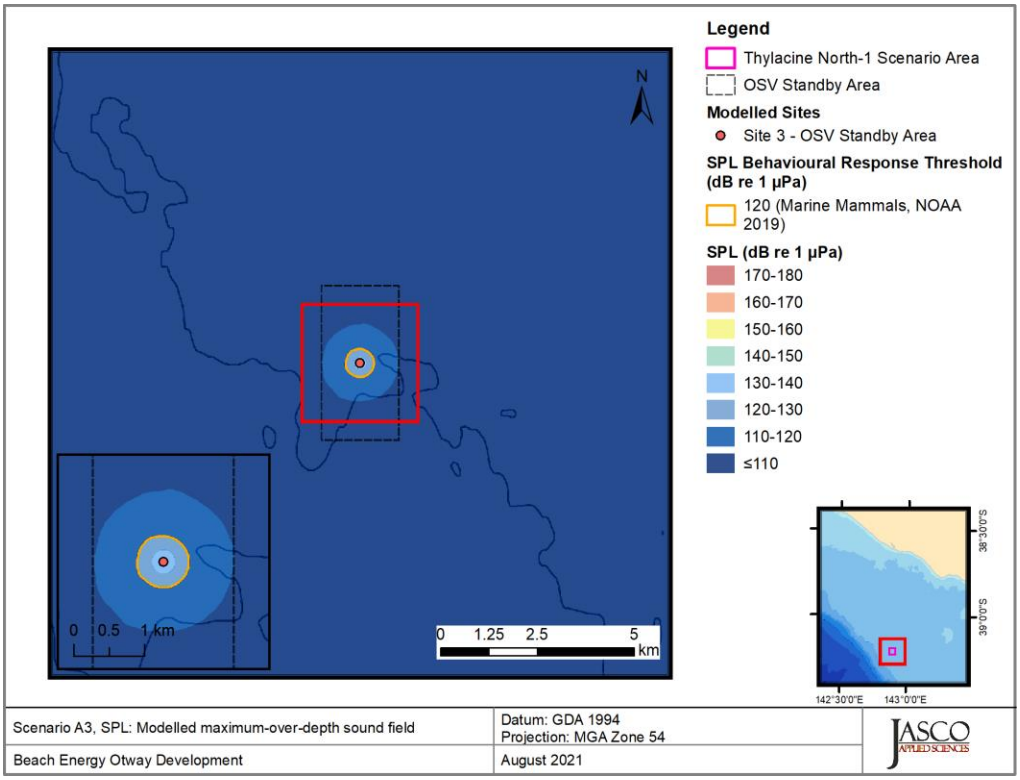

Figure 6. *Thylacine North-1, OSV Standby (Scenario A3) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

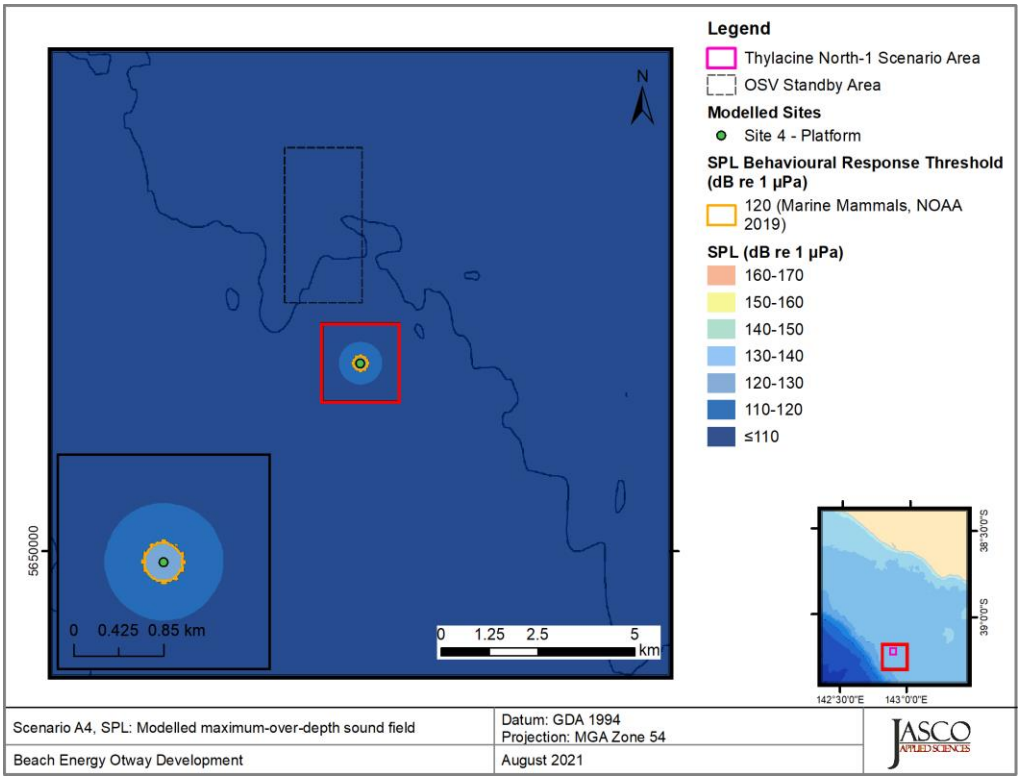

Figure 7. *Thylacine A, Platform Operations (Scenario A4) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

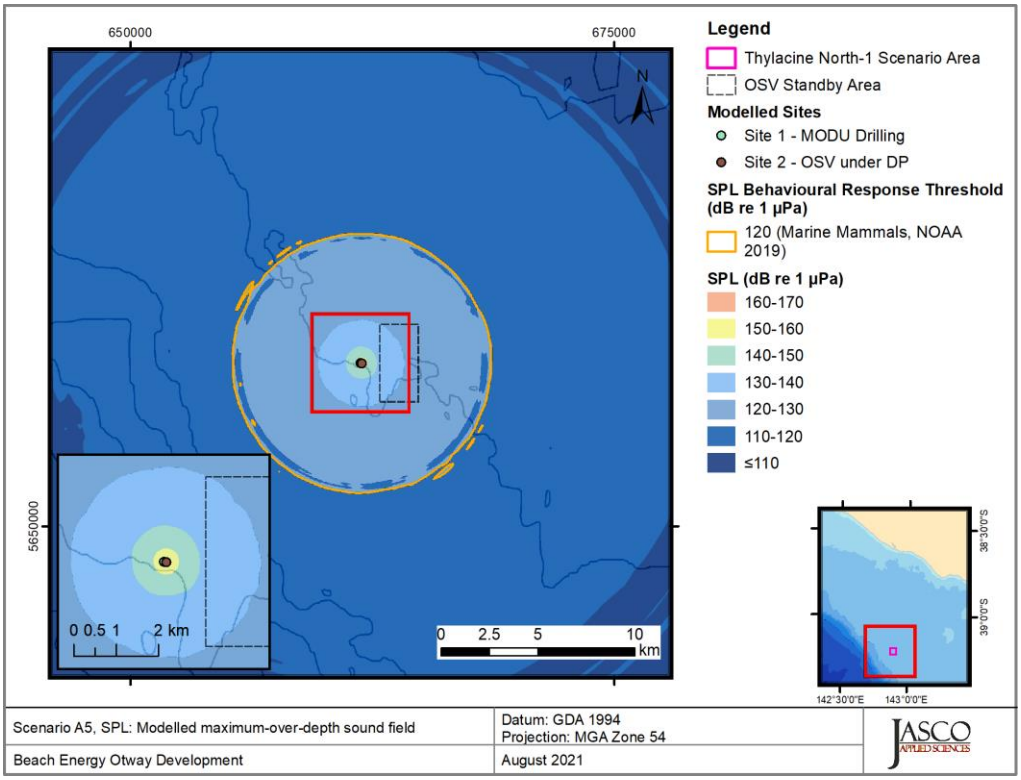

Figure 8. *Thylacine North-1, MODU Drilling and OSV Resupply (Scenario A5) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

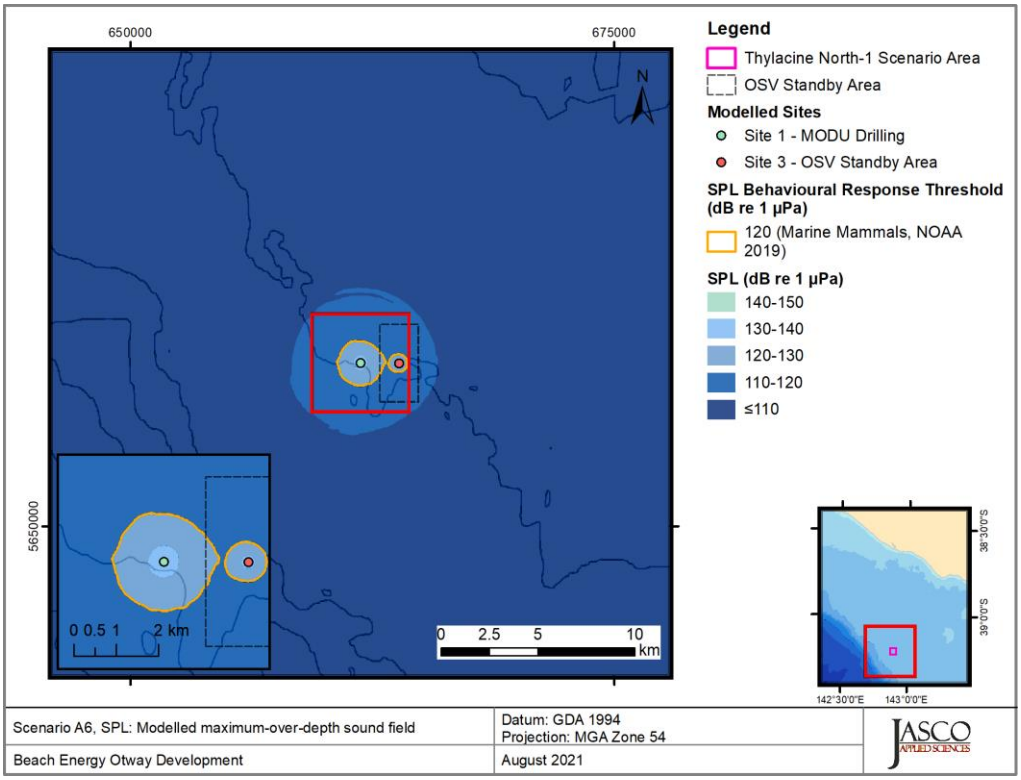

Figure 9. *Thylacine North-1, MODU Drilling and OSV Standby (Scenario A7) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

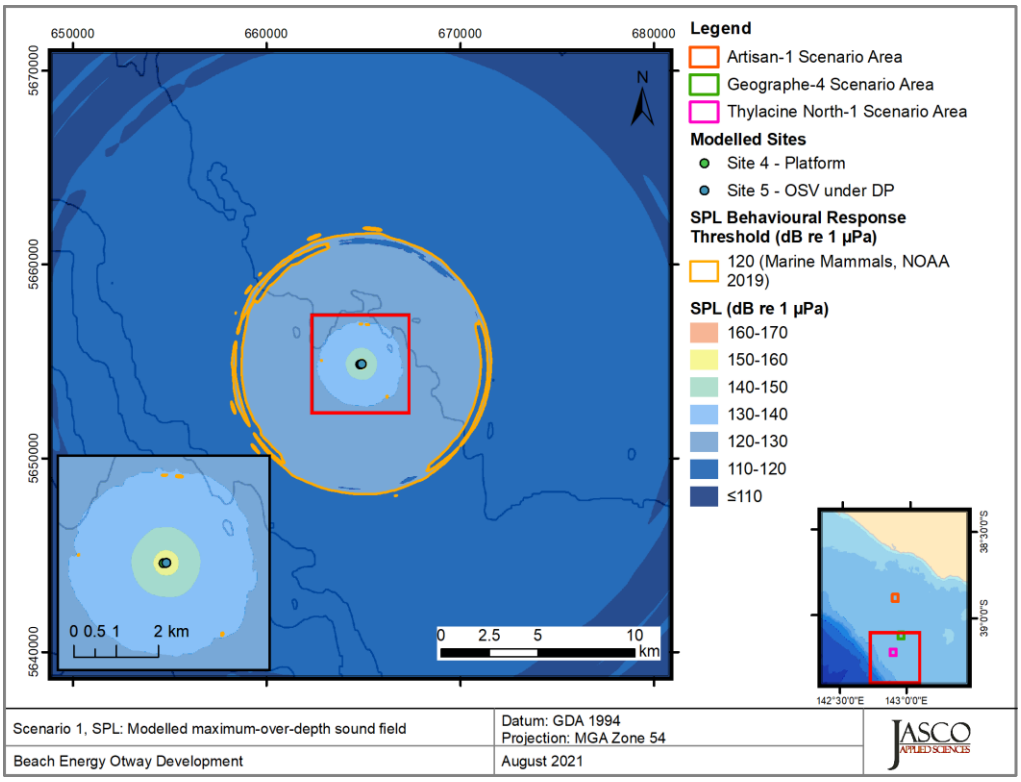

Figure 10. *Thylacine A Platform, Platform Resupply (Scenario 1) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

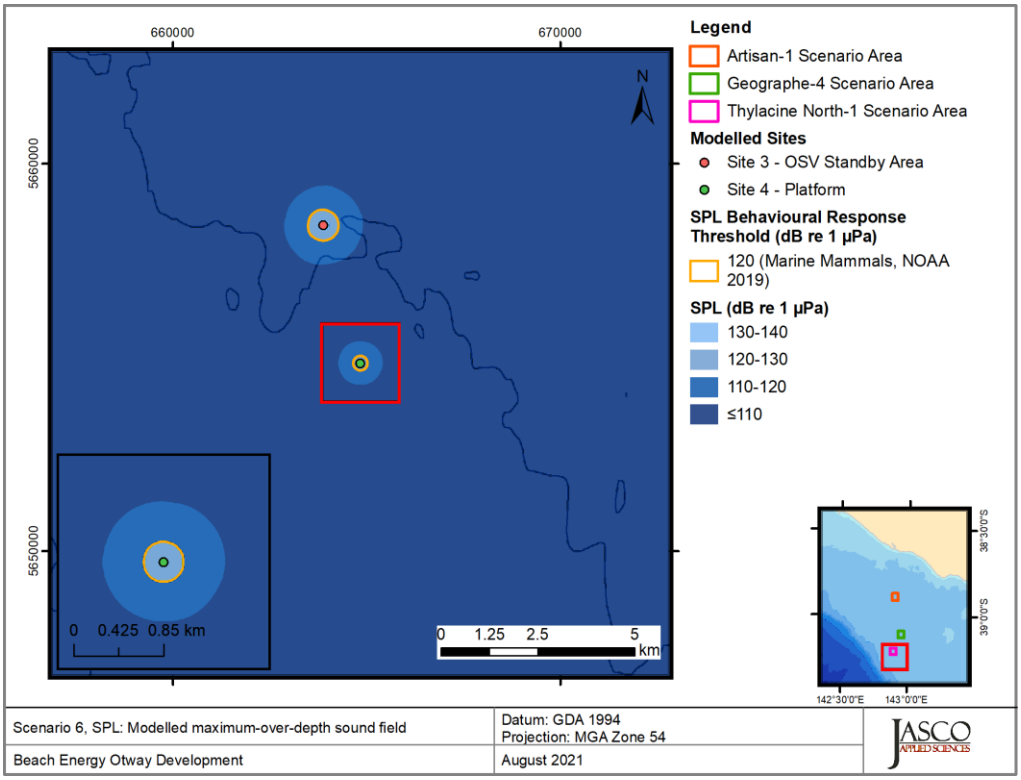

Figure 11. *Thylacine A Platform, OSV standby (Scenario 6) SPL :* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

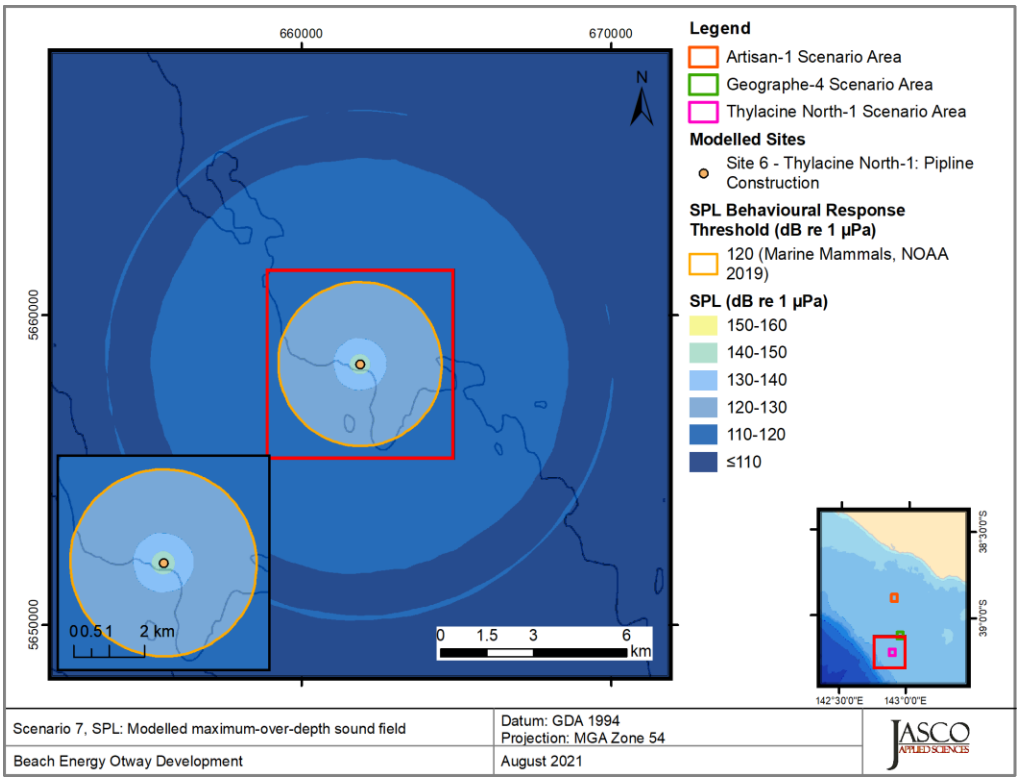

Figure 12. *Thylacine North-1, PLV stationary 20% MCR -June (Scenario 7) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

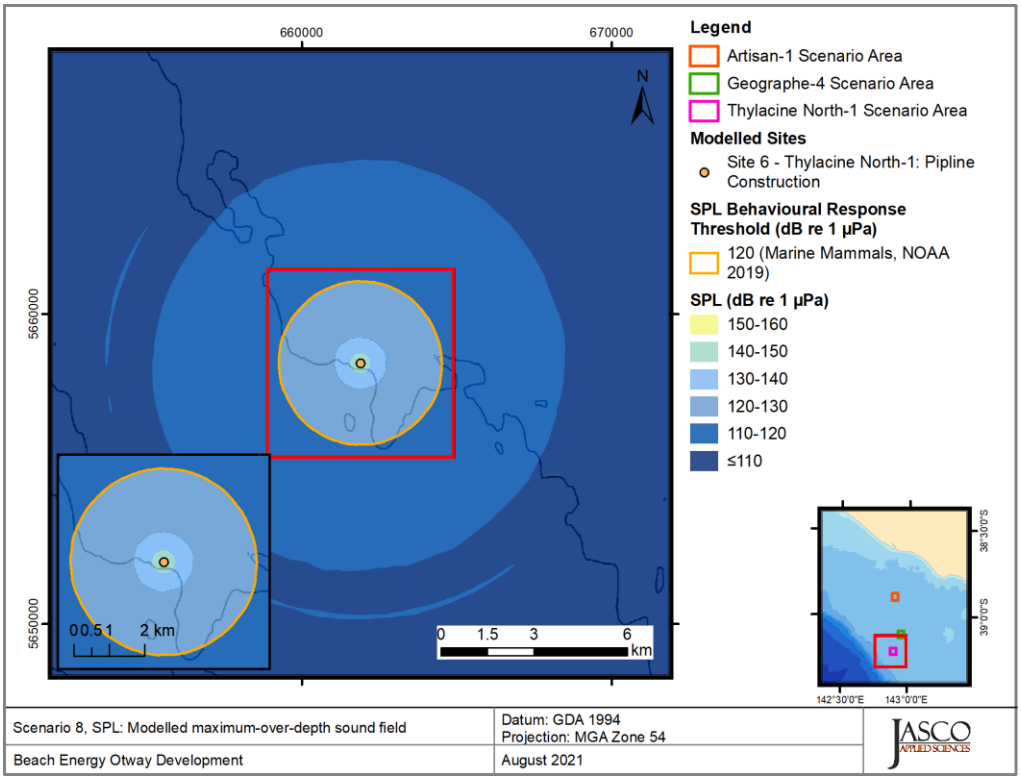

Figure 13. *Thylacine North-1, PLV stationary 20% MCR -November (Scenario 8) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

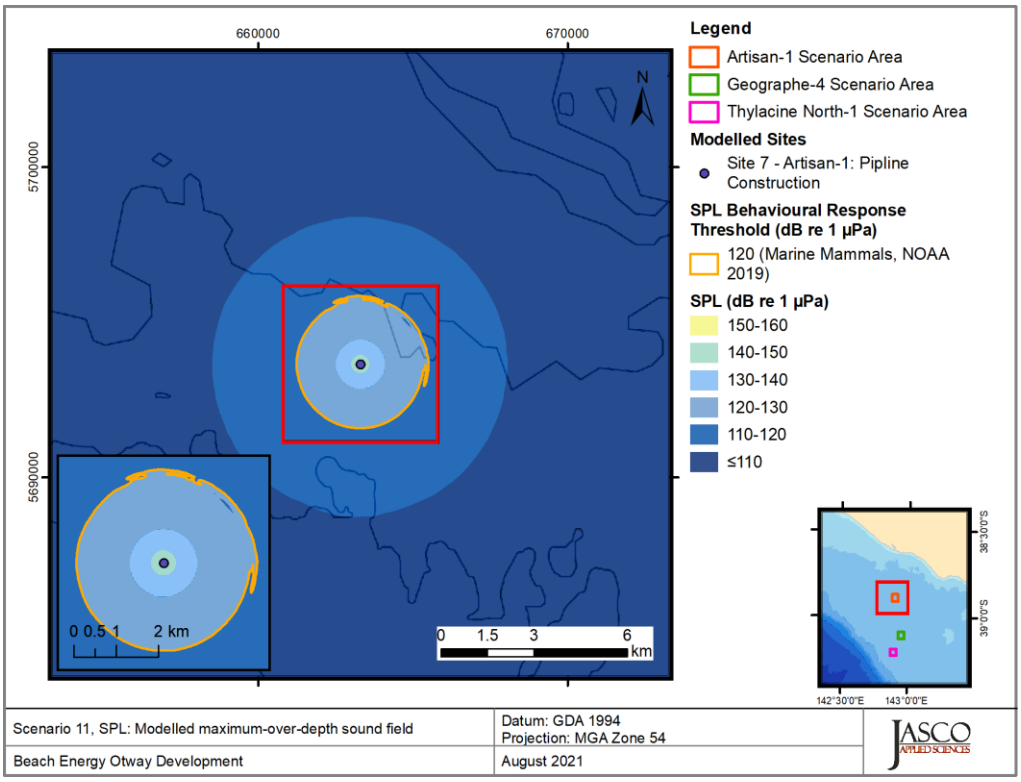

Figure 14. *Artisan-1, PLV stationary 20% MCR -June (Scenario 11) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

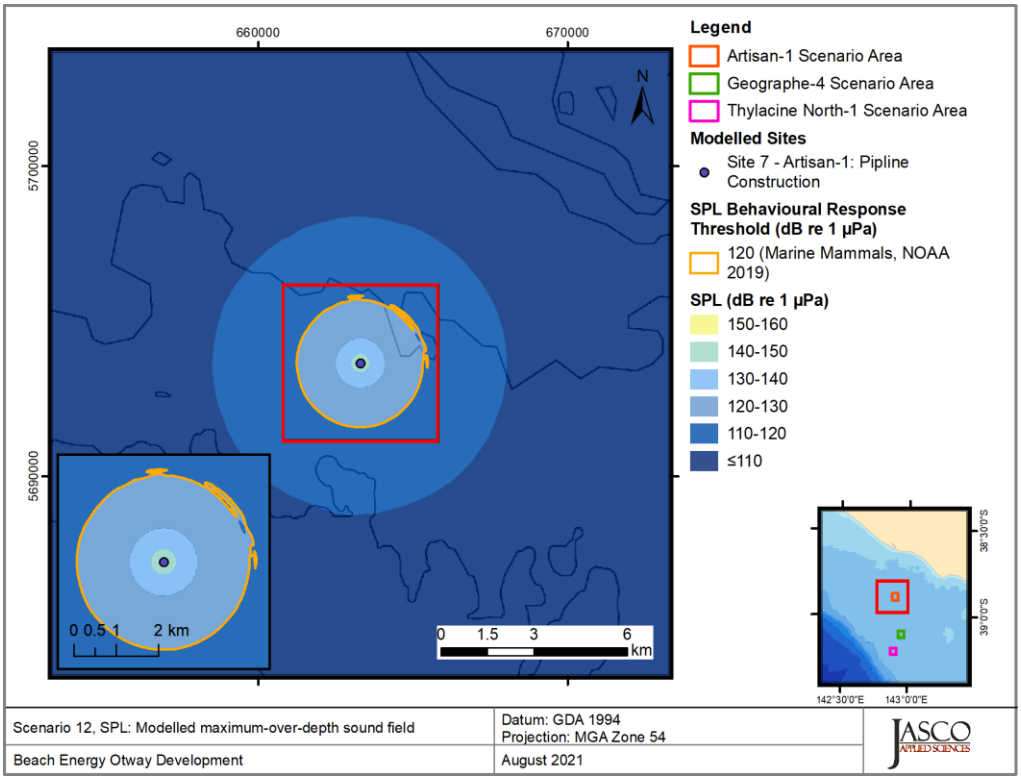

Figure 15. *Artisan-1, PLV stationary 20% MCR - November (Scenario 12) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

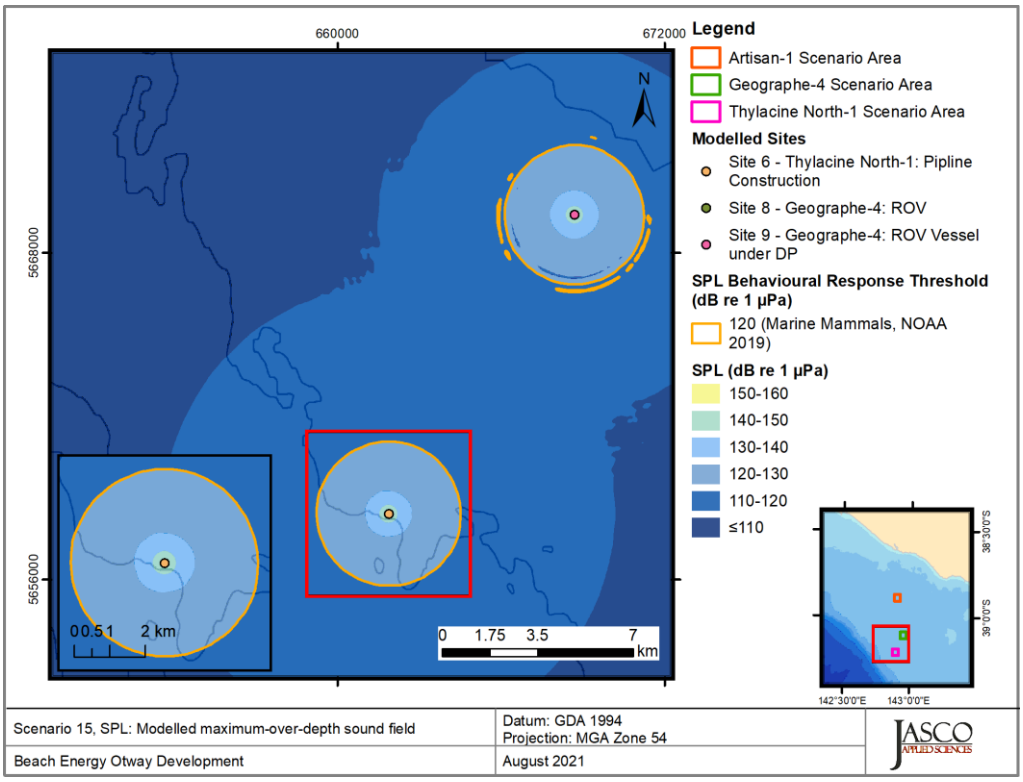

Figure 16. *Thylacine North-1, PLV stationary and ROV operations at Geographe-4 (20% MCR) - June (Scenario 15) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is s hown as an orange contour line.

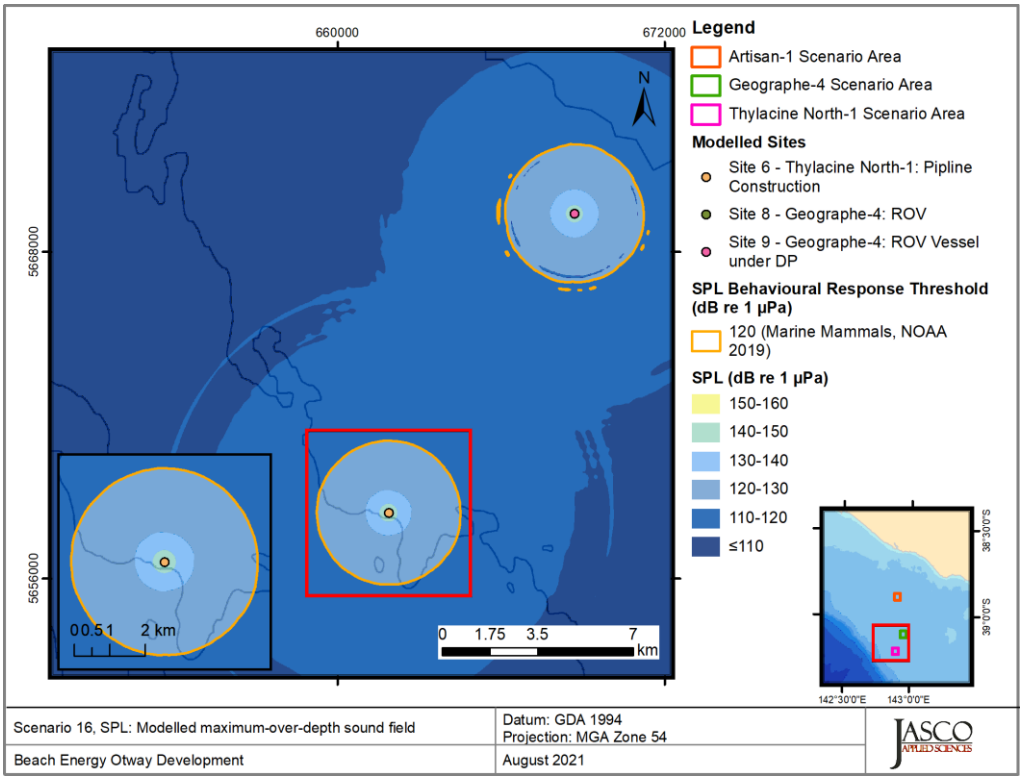

Figure 17. *Thylacine North-1, PLV stationary and ROV operations at Geographe-4 (20% MCR) – November (Scenario 16) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

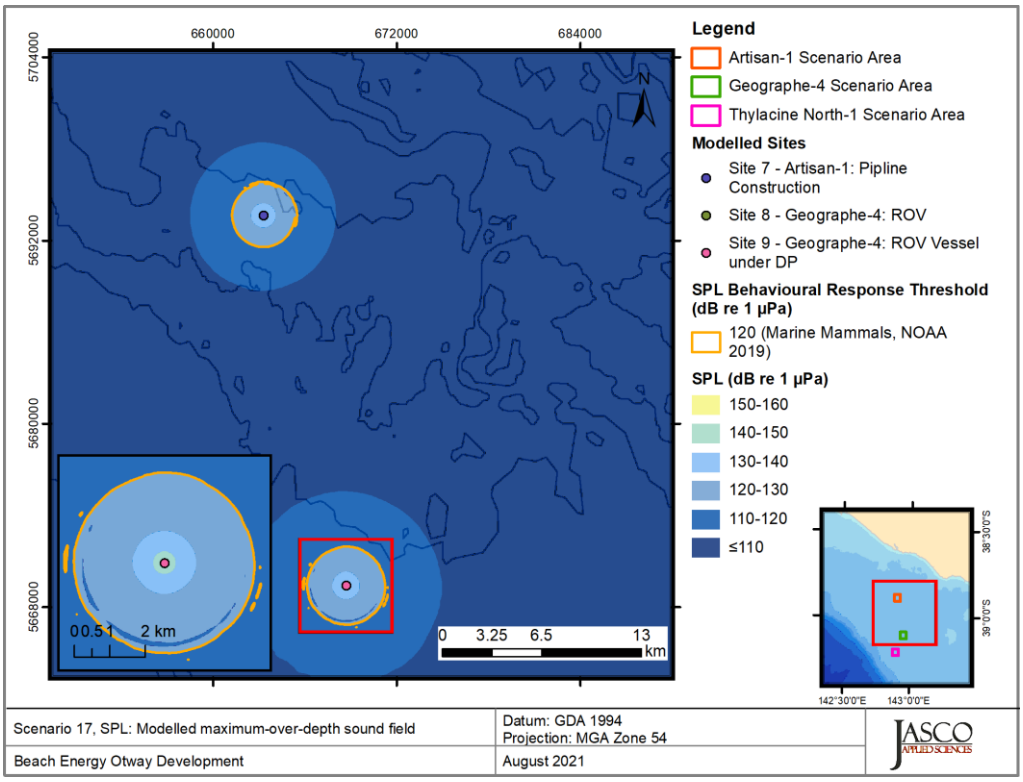

Figure 18. *Artisan-1, PLV stationary and ROV Operations at Geographe-4 (20% MCR) – June (Scenario 17) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

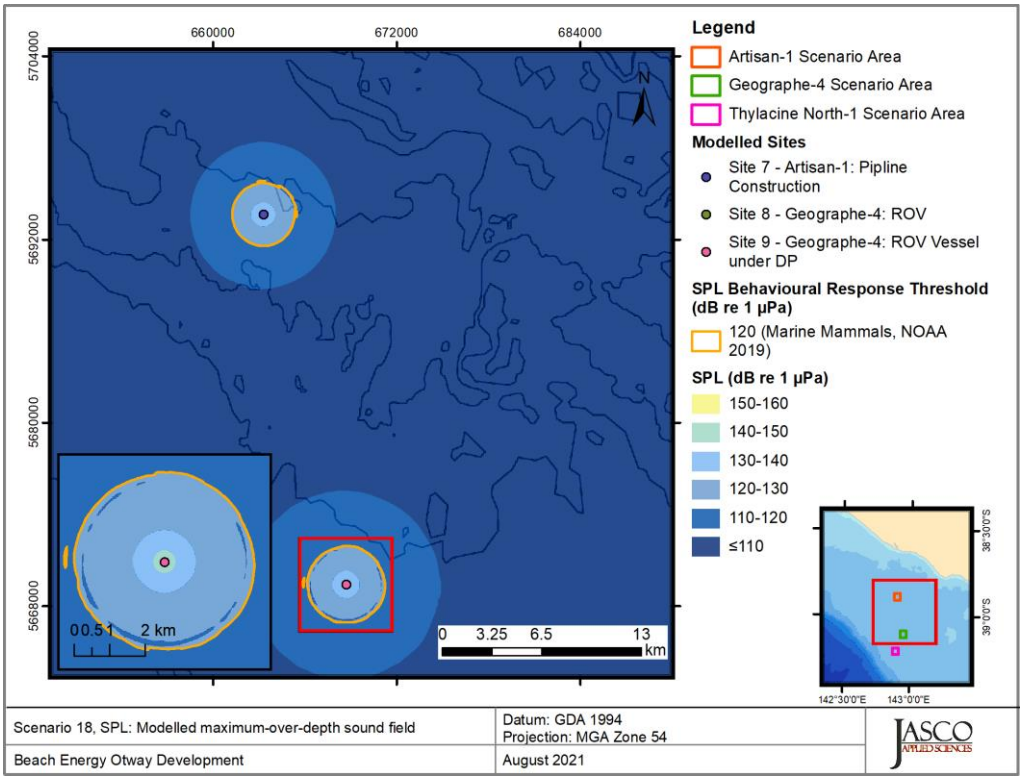

Figure 19. *Artisan-1, PLV stationary and ROV Operations at Geographe-4 (20% MCR) – November (Scenario 18) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

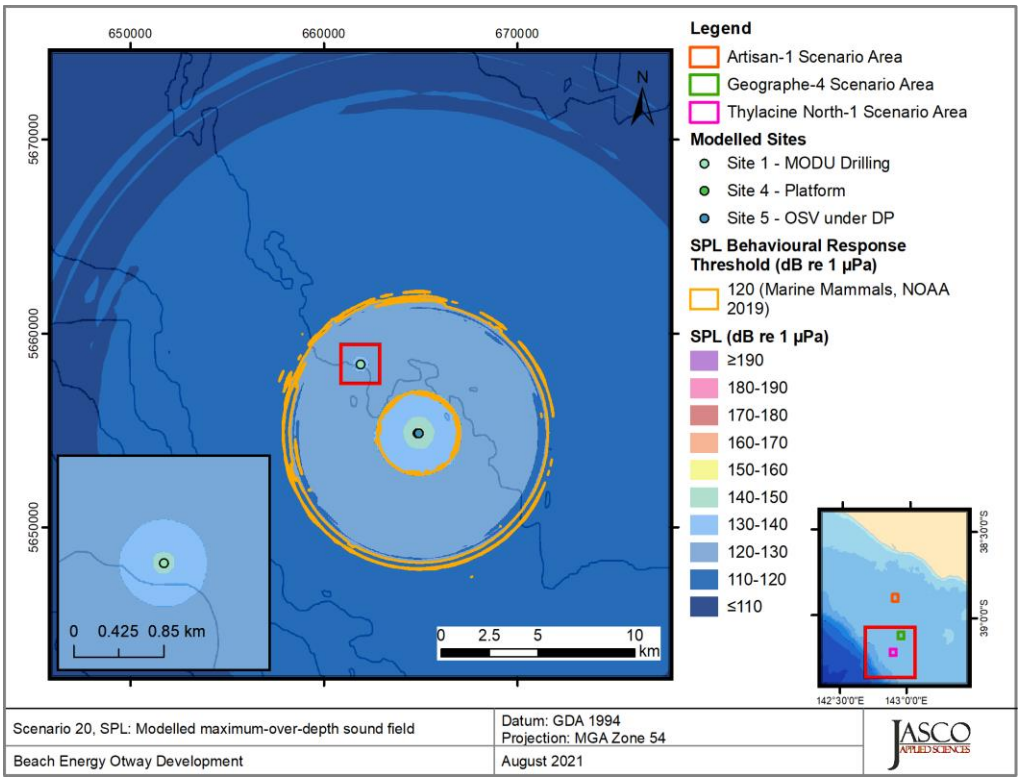

Figure 20. *Thylacine A Platform, Platform Resupply and MODU Drilling (Scenario 20) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

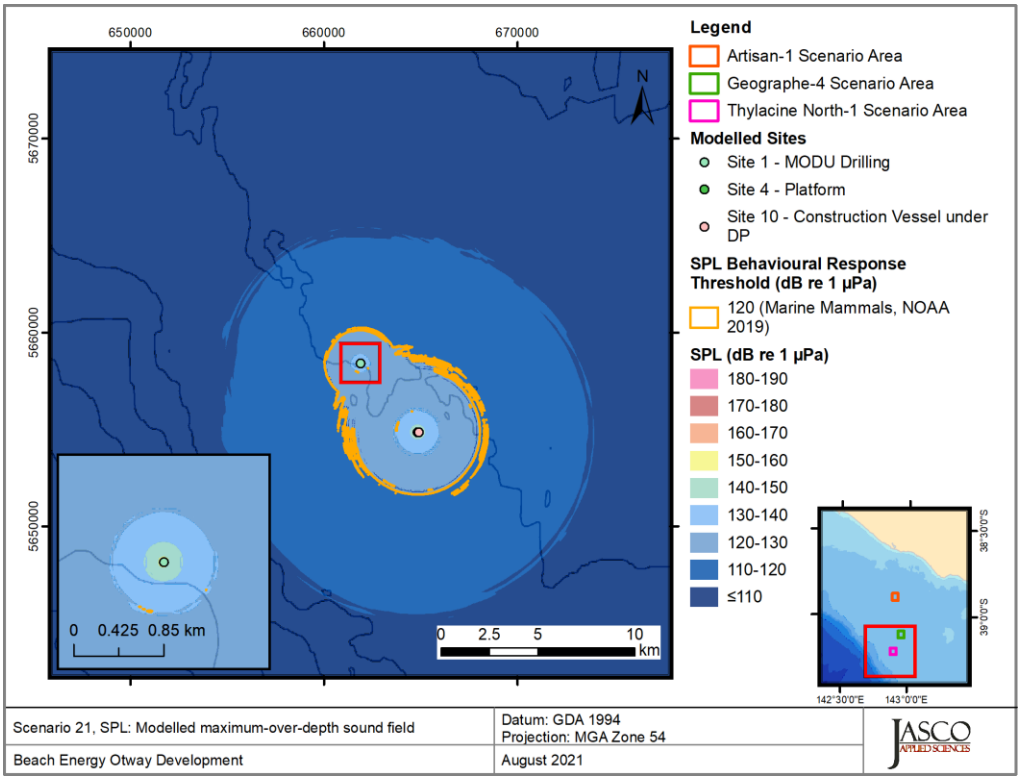

Figure 21. *Thylacine A Platform, Platform operations and skid installation* at 20% MCR *(Scenario 21) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

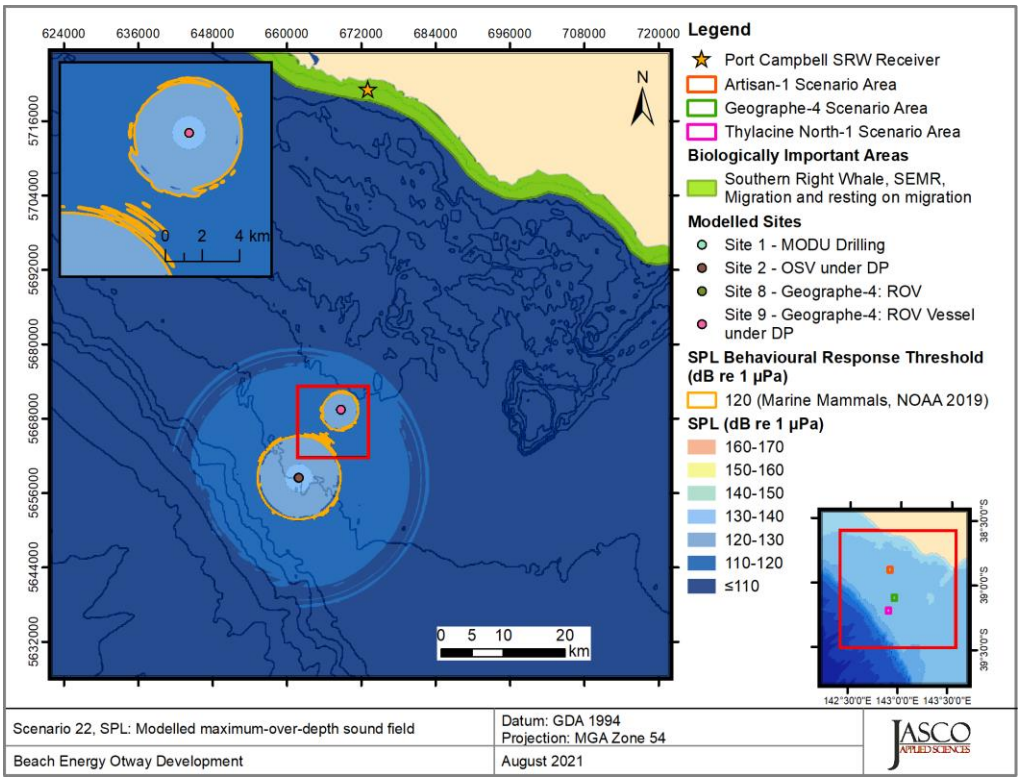

Figure 22. *Concurrent drilling operations at Thylacine North-1 and construction operations (20% MCR) at Geographe-4 (Scenario 22) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

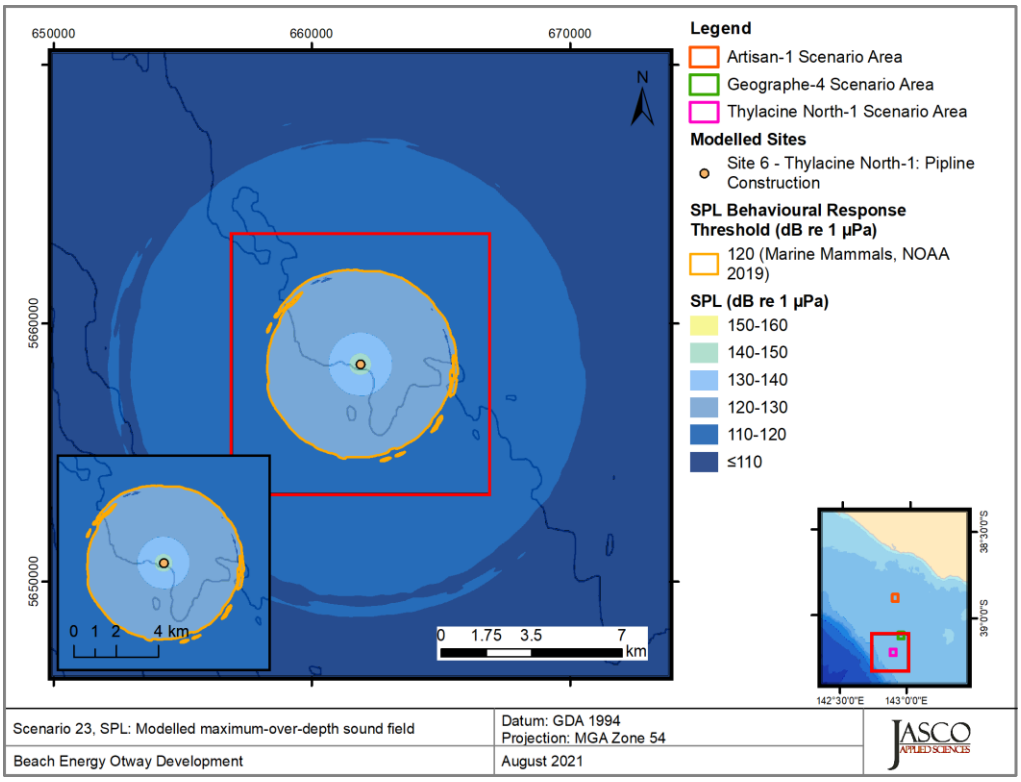

Figure 23. *Thylacine North-1, PLV stationary 40% MCR -June (Scenario 23) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

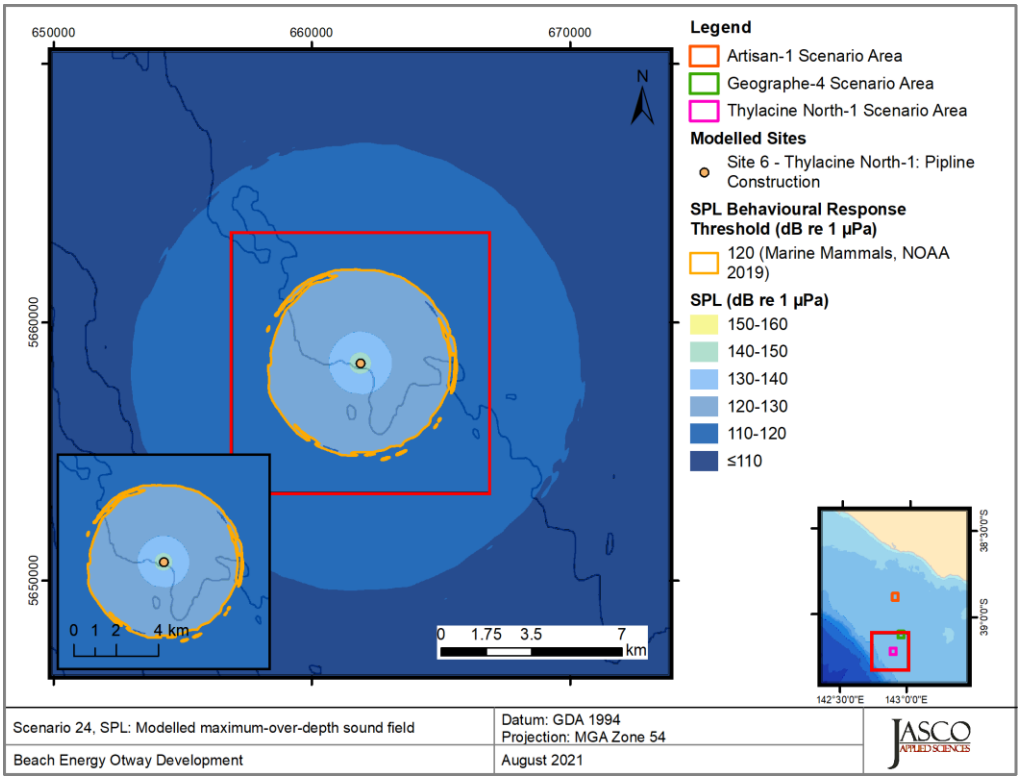

Figure 24. *Thylacine North-1, PLV stationary 40% MCR -November (Scenario 24) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

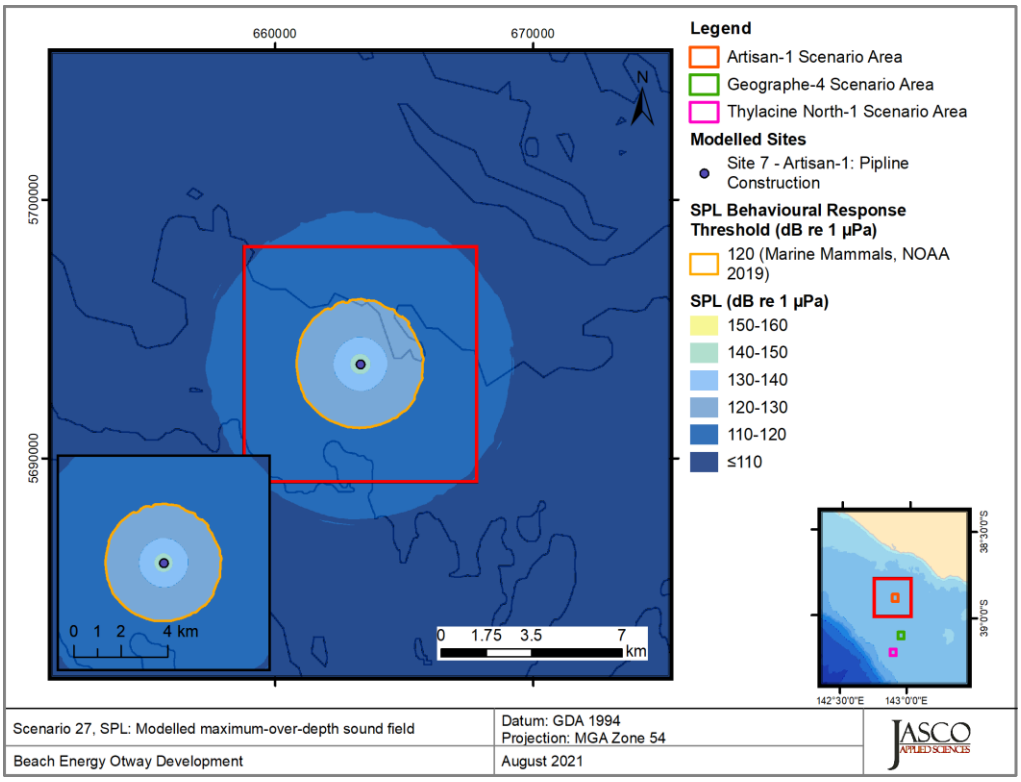

Figure 25. *Artisan-1, PLV stationary 40% MCR -June (Scenario 27) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

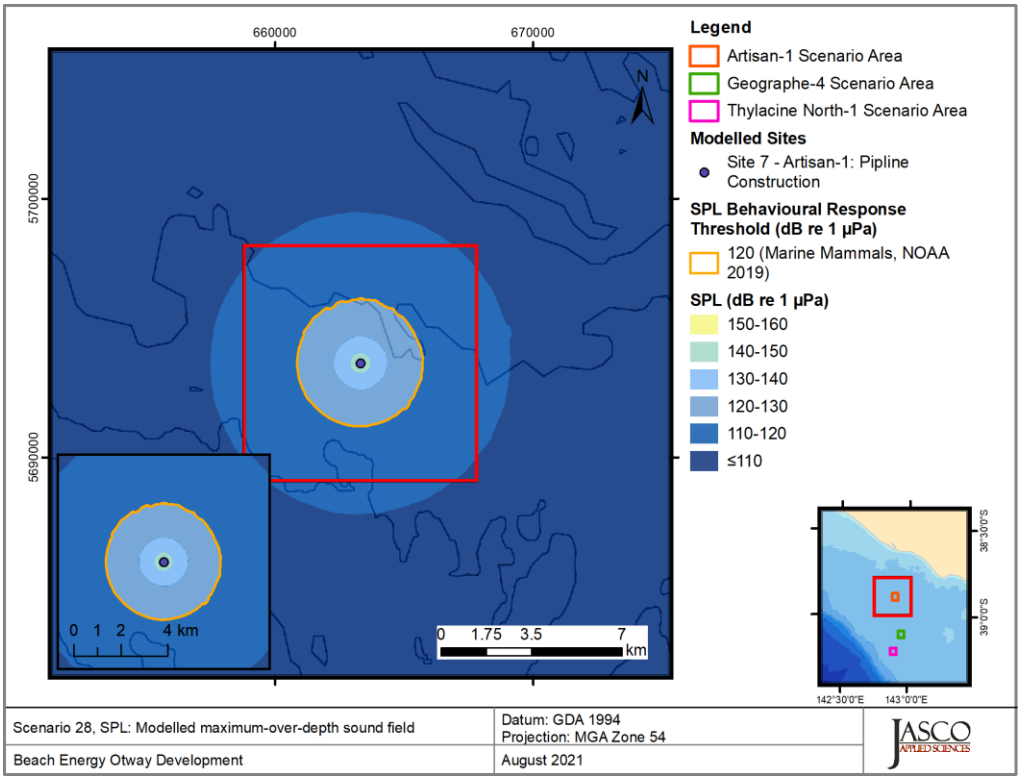

Figure 26. *Artisan-1, PLV stationary 40% MCR -November (Scenario 28) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

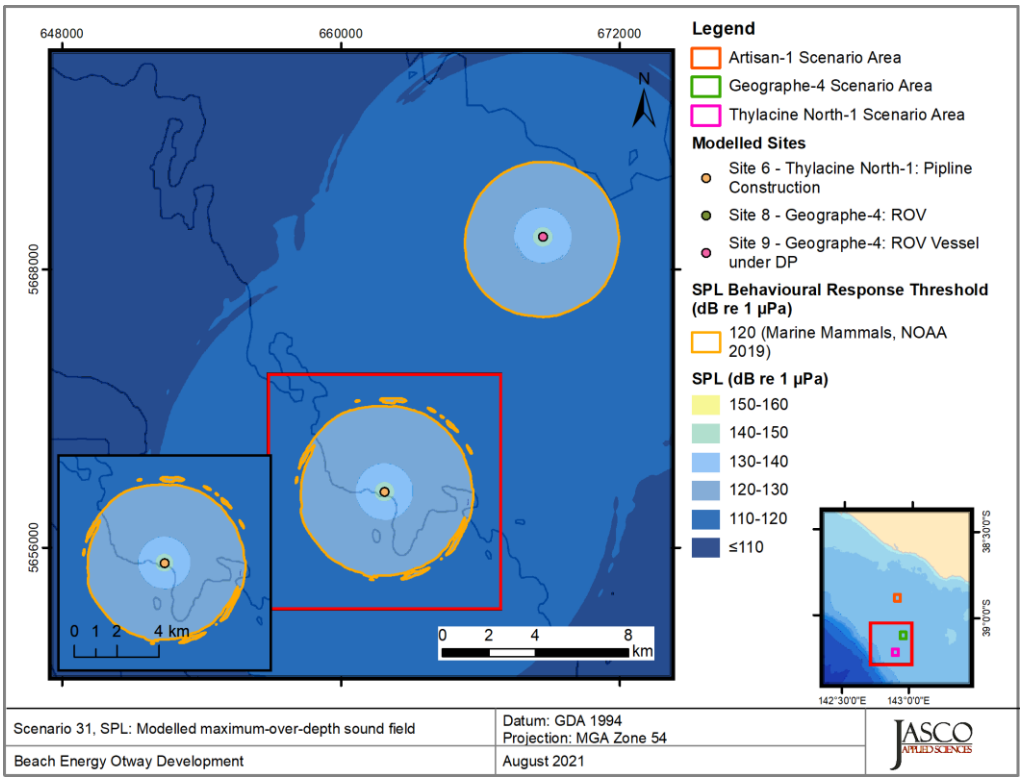

Figure 27. *Thylacine North-1, PLV stationary 40% MCR and ROV operations at Geographe-4 - June (Scenario 31) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

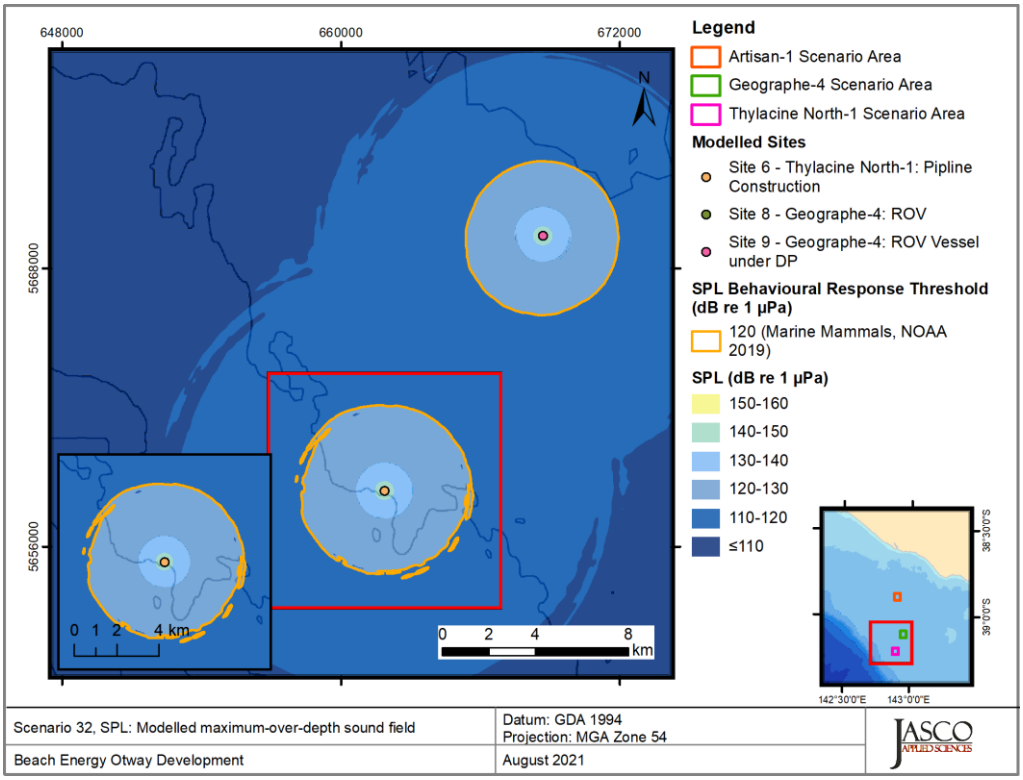

Figure 28. *Thylacine North-1, PLV stationary 40% MCR and ROV operations at Geographe-4 – November (Scenario 32) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

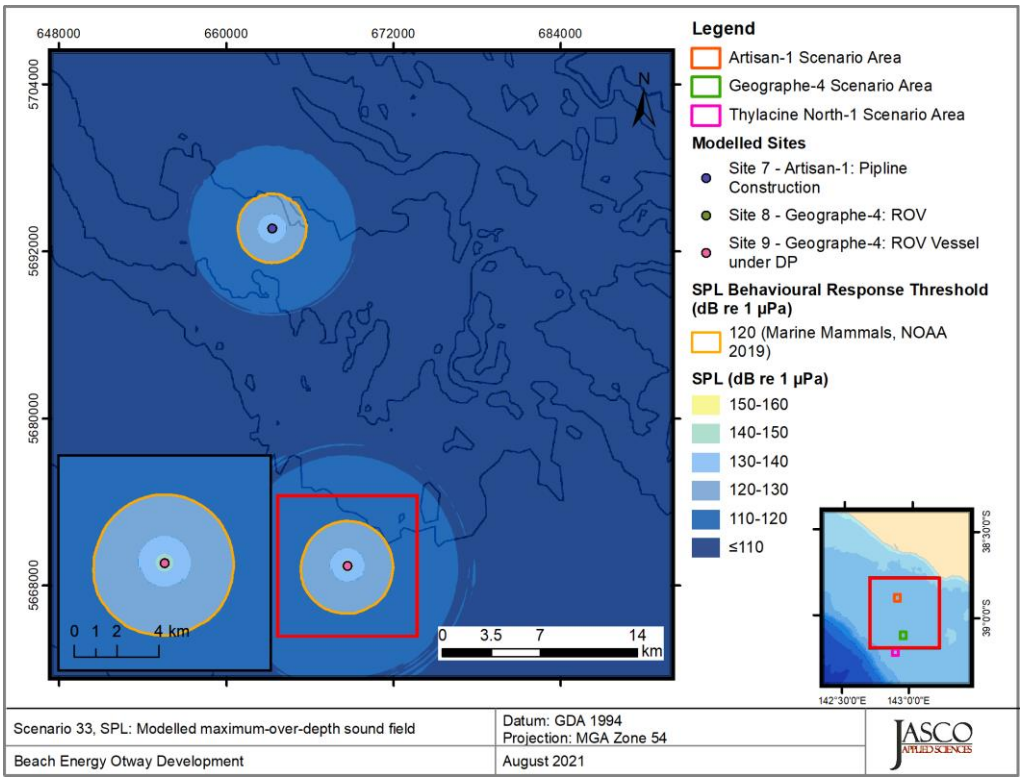

Figure 29. *Artisan-1, PLV stationary 40% MCR and ROV Operations at Geographe-4 – June (Scenario 33) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

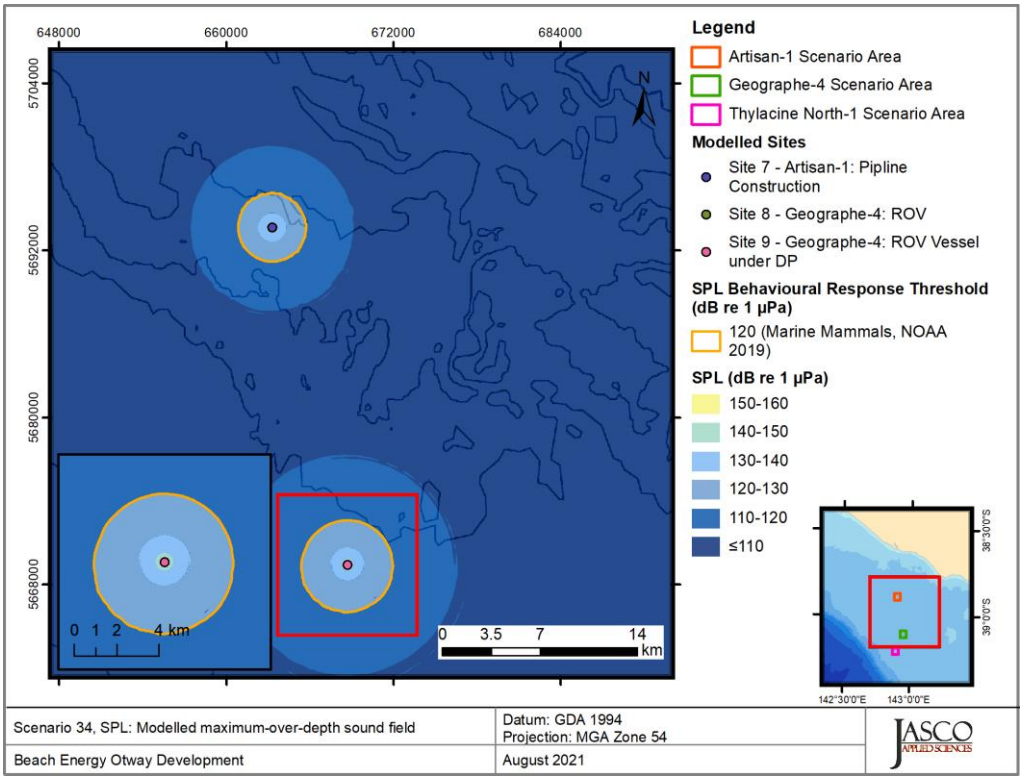

Figure 30. *Artisan-1, PLV stationary 40% MCR and ROV Operations at Geographe-4 – November (Scenario 34) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

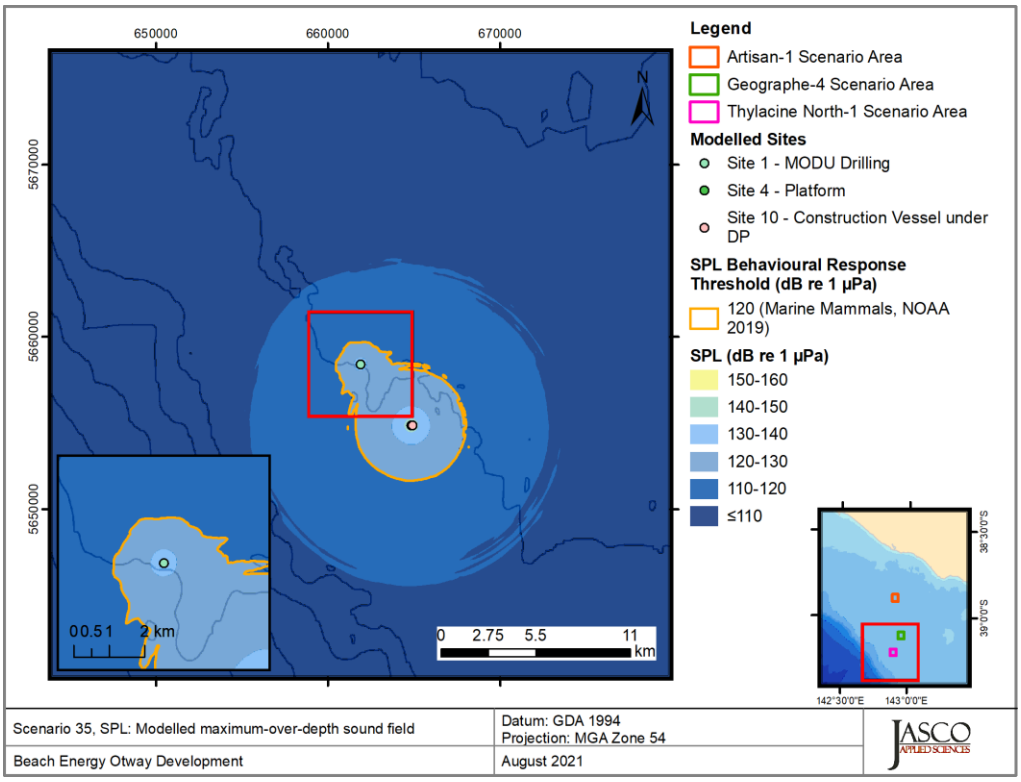

Figure 31. *Thylacine A Platform, Platform operations and skid installation at 40% MCR (Scenario 35) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

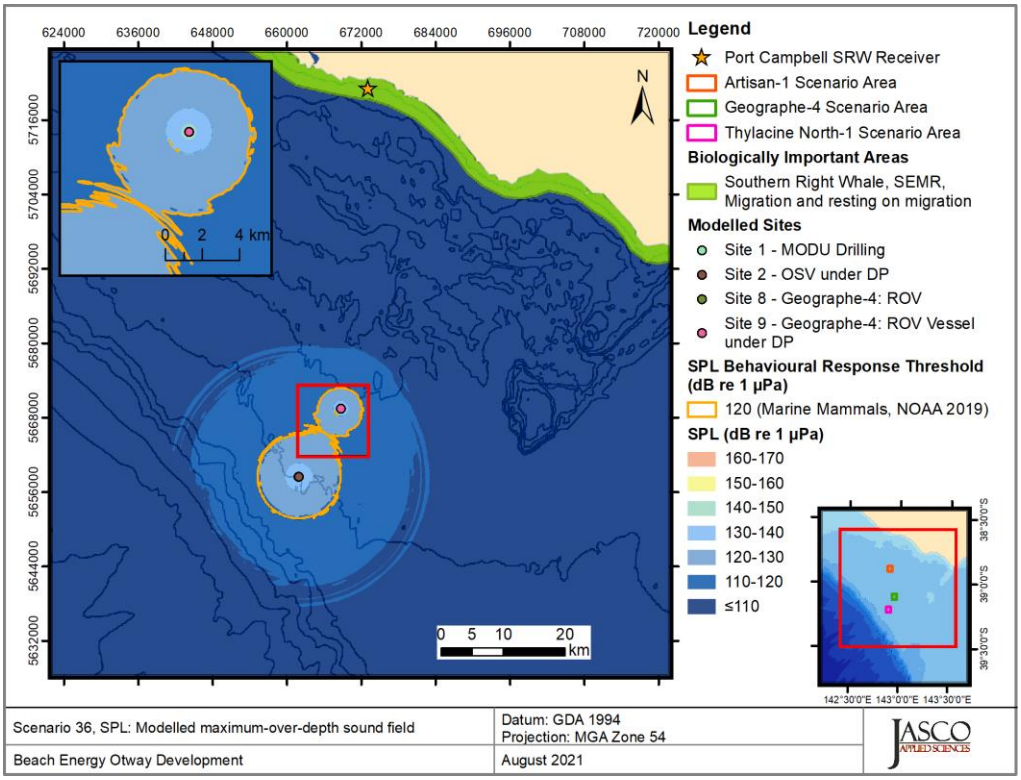

Figure 32. *Concurrent drilling operations at Thylacine North-1 and construction operations (40% MCR) at Geographe-4 (Scenario 36) SPL:* Sound level contour map, showing unweighted maximum over-depth SPL results. Isopleth for marine mammal (120 dB re 1 µPa) behavioural criteria is shown as an orange contour line.

4.2.2. Accumulated SEL_{24h} Maps

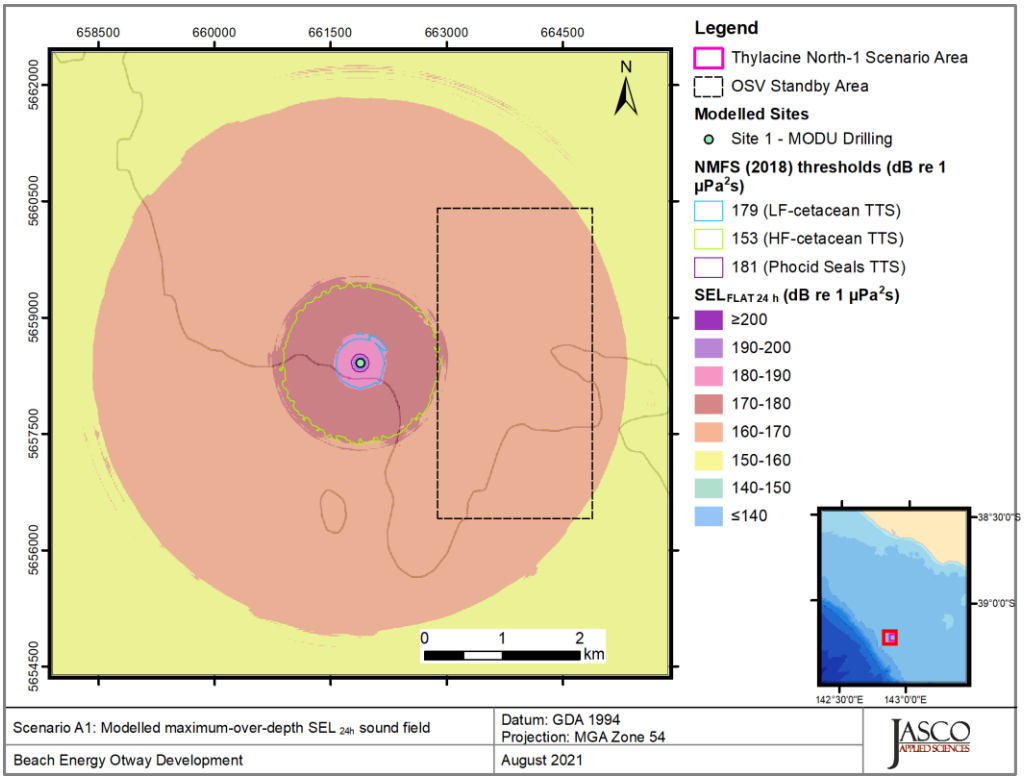

Figure 33. *Thylacine North-1, MODU Drilling (Scenario A1) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

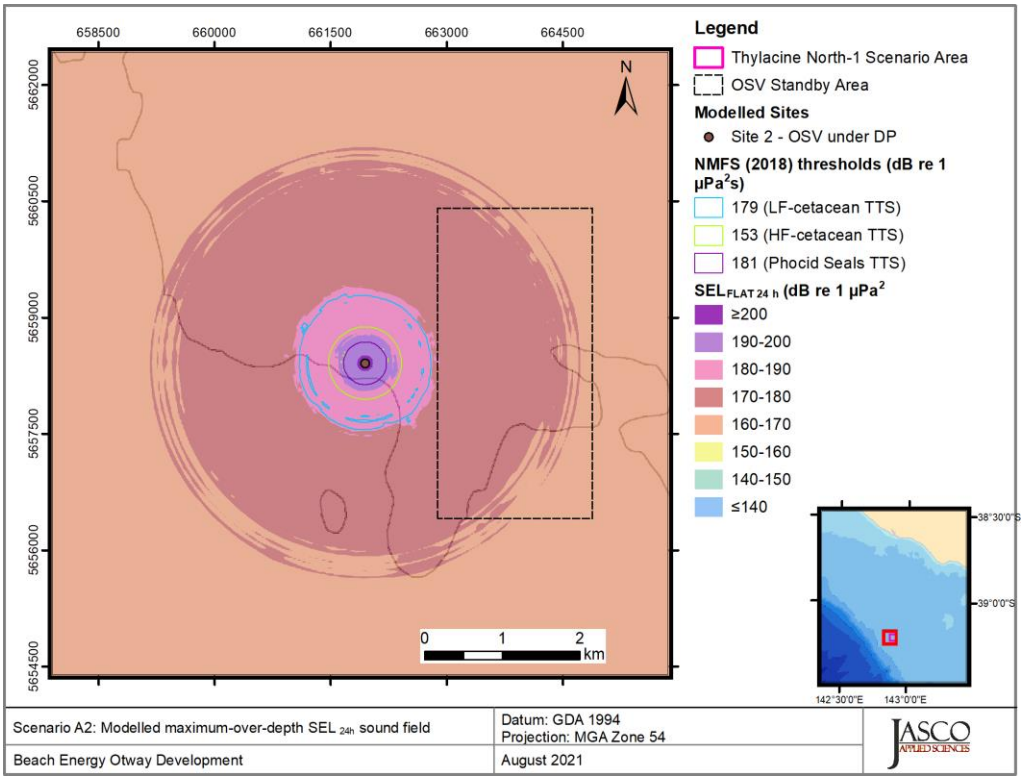

Figure 34. *Thylacine North-1, OSV on DP (4h) (Scenario A2) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

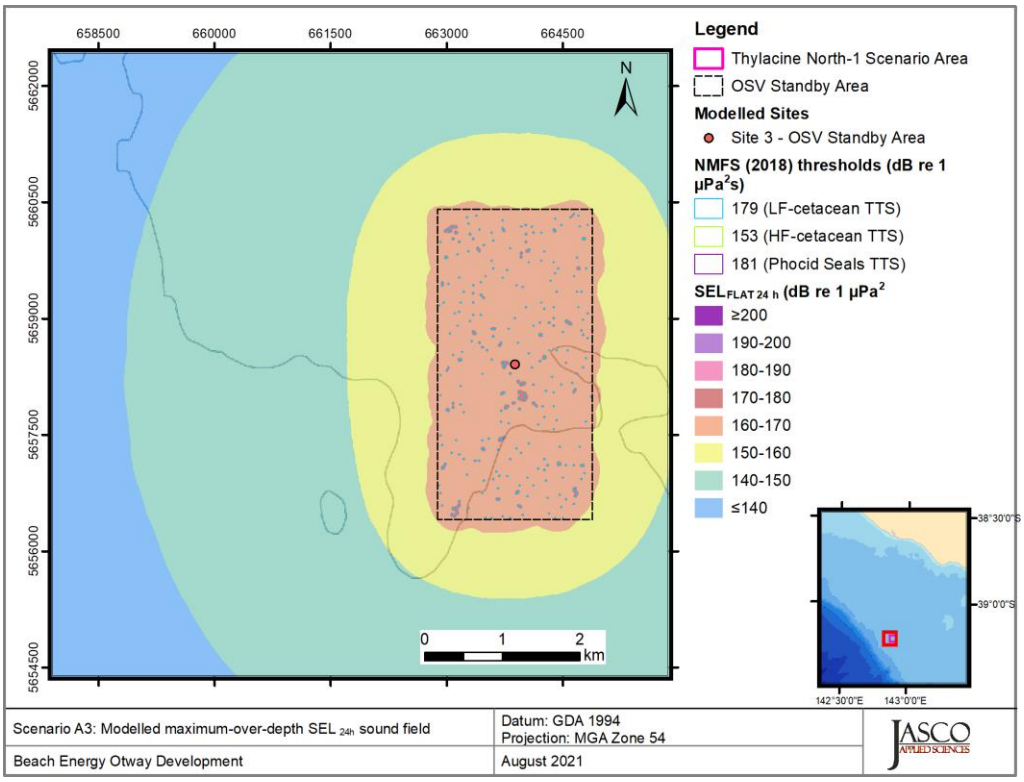

Figure 35. *Thylacine North-1, OSV Standby (Scenario A3) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

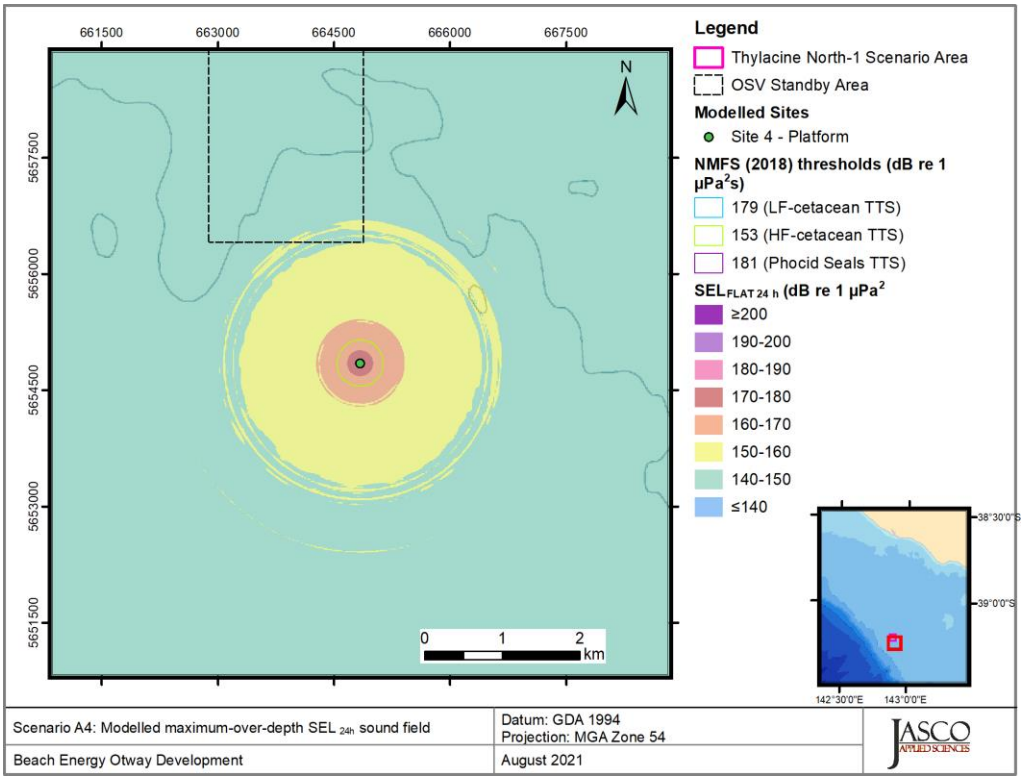

Figure 36. *Thylacine A, Platform Operations (Scenario A4) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

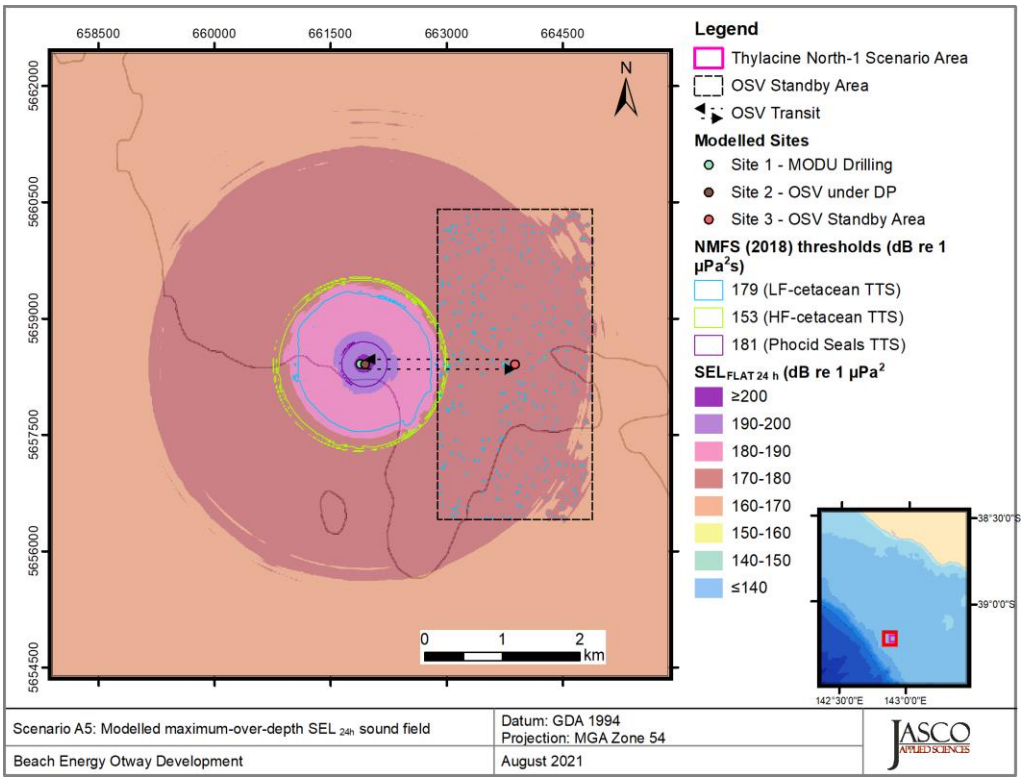

Figure 37. *Thylacine North-1, MODU 4h Resupply Operations (Scenario A5) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

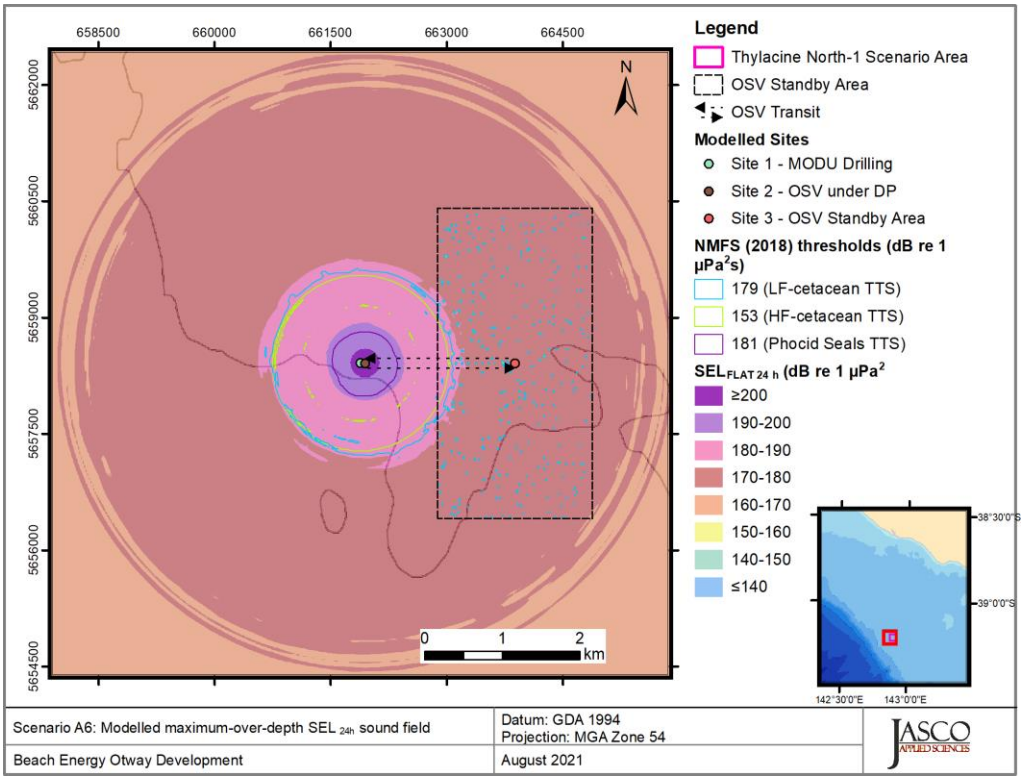

Figure 38. *Thylacine North-1, MODU 8h Resupply Operations (Scenario A6) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.*SEL24h:*

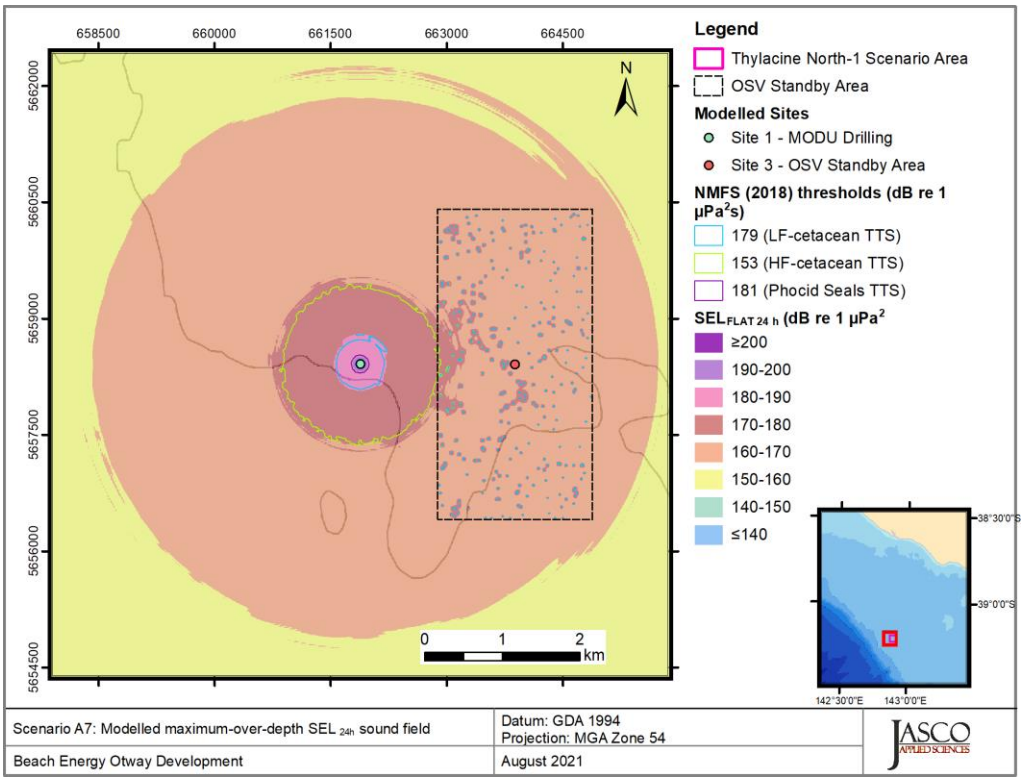

Figure 39. *Thylacine North-1, MODU Drilling and OSV standby (Scenario A7) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

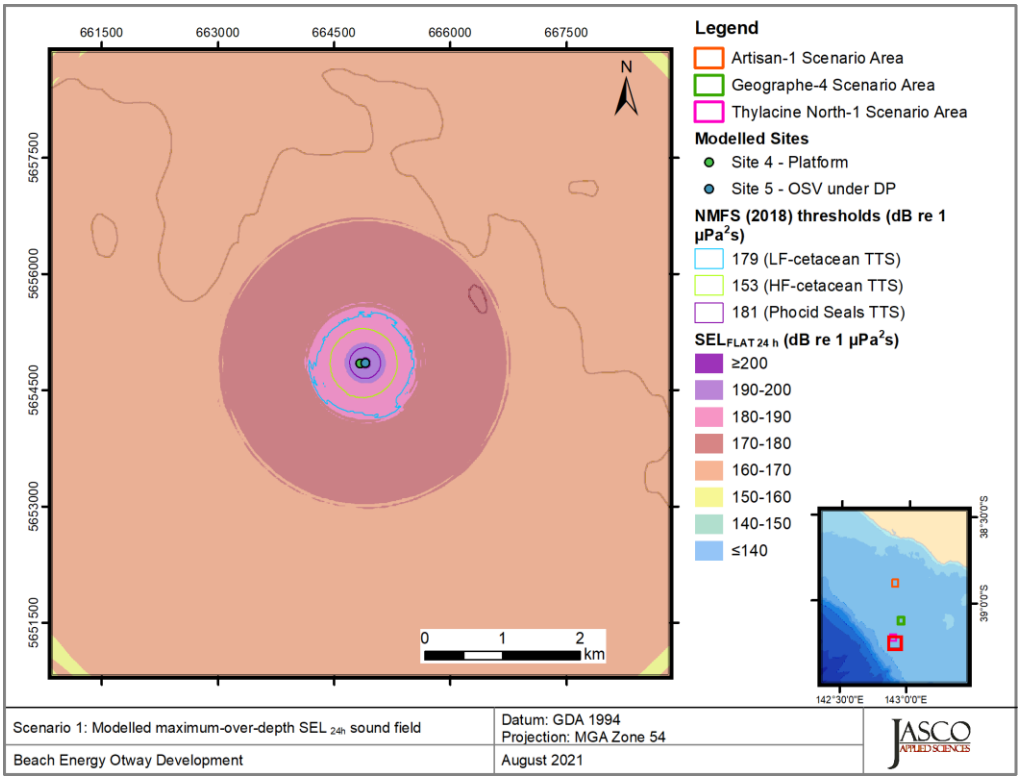

Figure 40. *Thylacine A Platform, 2 h Platform Resupply (Scenario 1) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

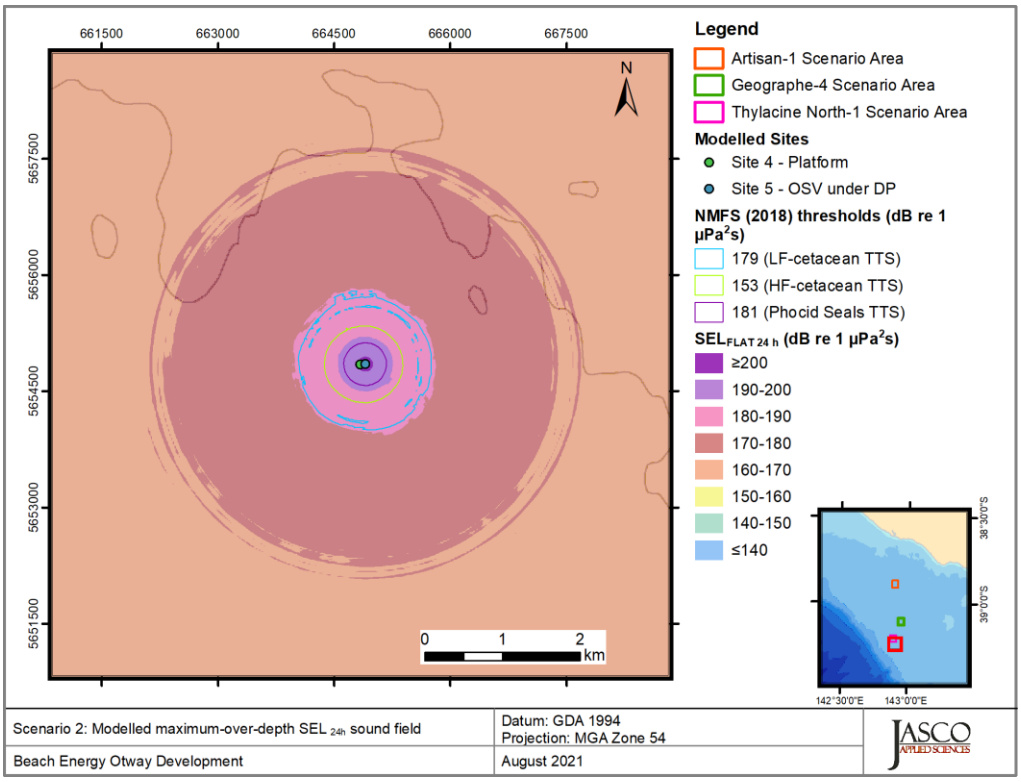

Figure 41. *Thylacine A Platform, 4 h Platform Resupply (Scenario 2) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

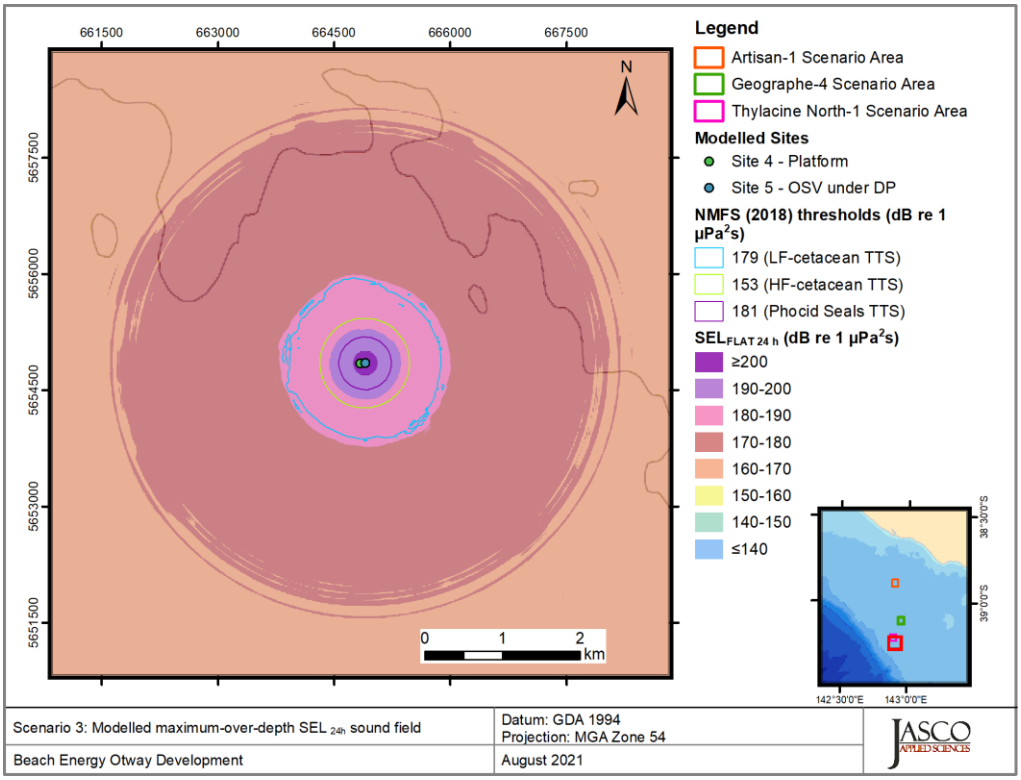

Figure 42. *Thylacine A Platform, 6 h Platform Resupply (Scenario 3) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

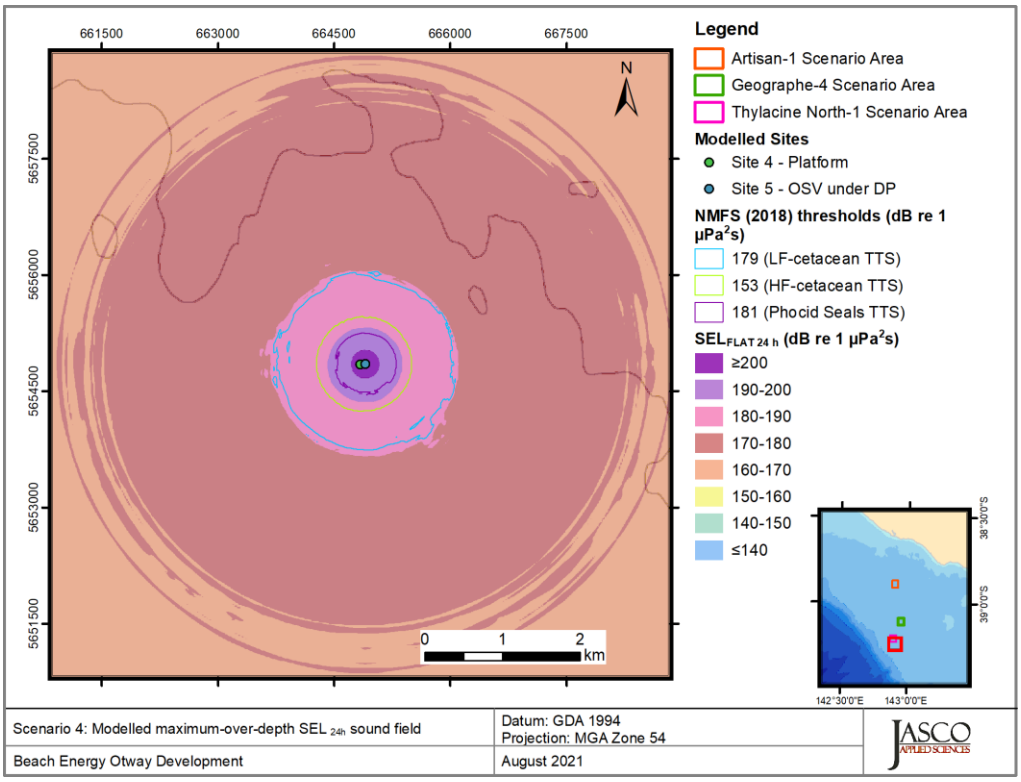

Figure 43. *Thylacine A Platform, 8 h Platform Resupply (Scenario 4) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

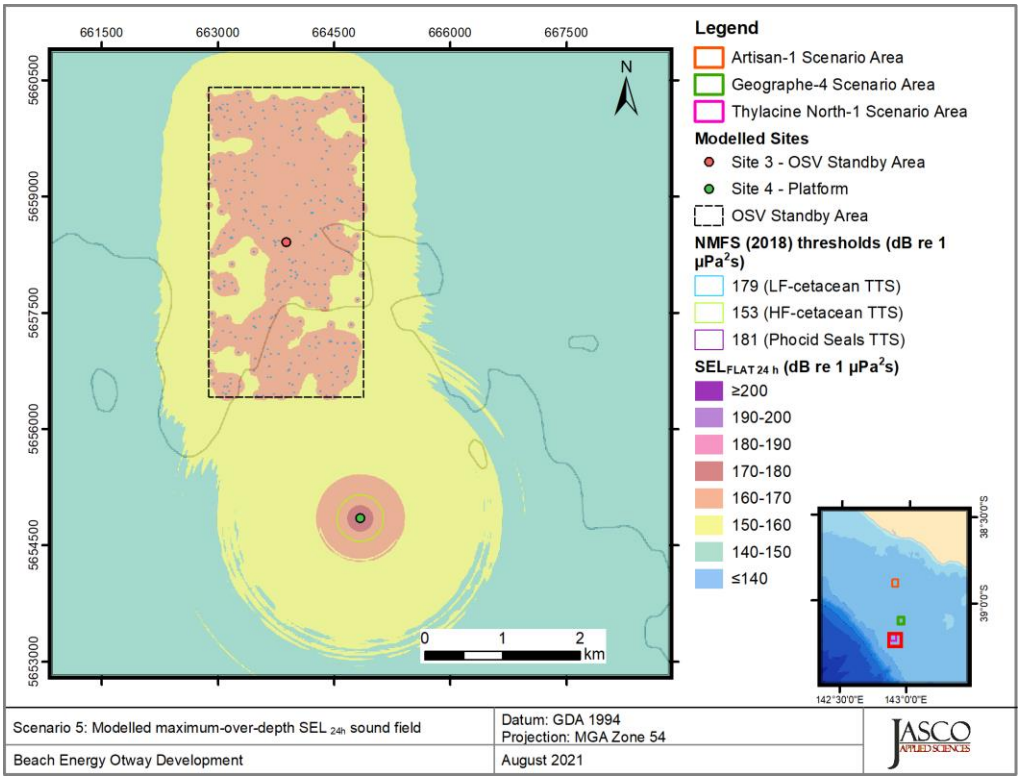

Figure 44. *Thylacine A Platform, 8h OSV standby (Scenario 5) SEL24h:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

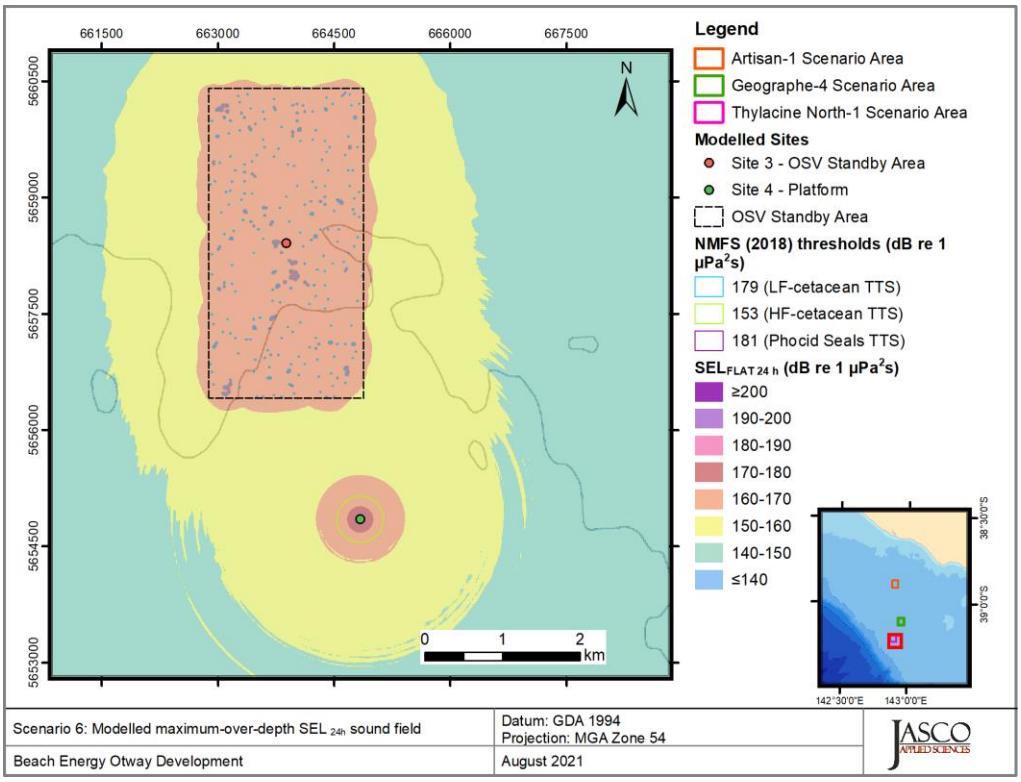

Figure 45. *Thylacine A Platform, 24h OSV standby (Scenario 6) SEL24h:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

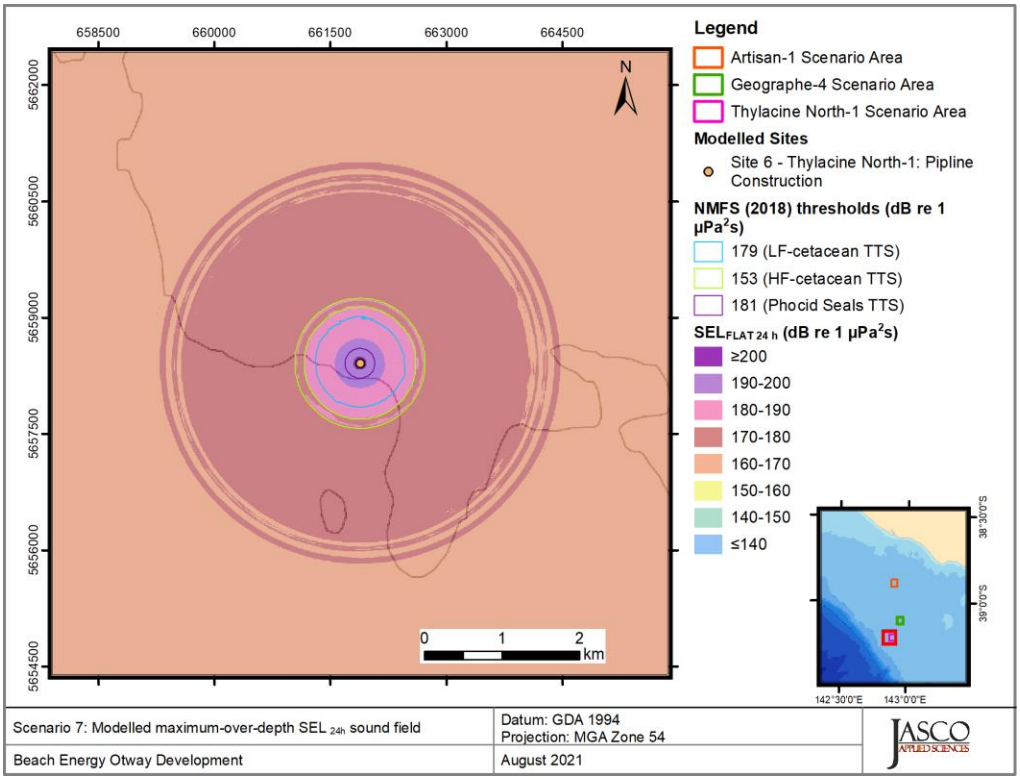

Figure 46. *Thylacine North-1, PLV stationary 20% MCR - June (Scenario 7) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL24h results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

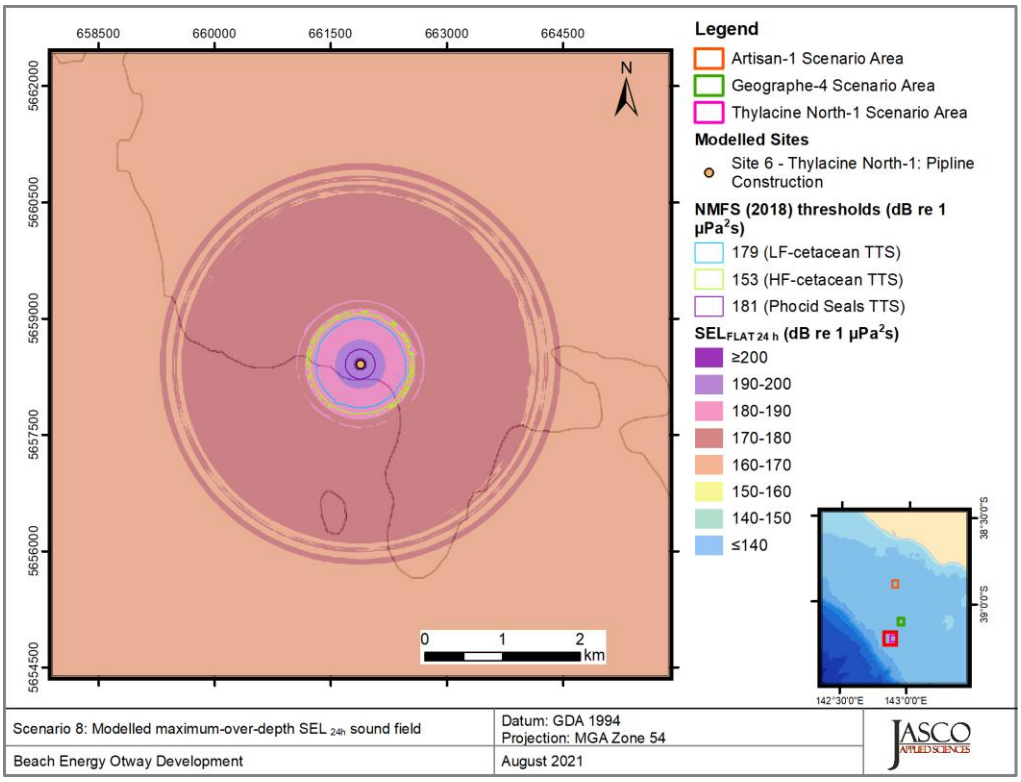

Figure 47. *Thylacine North-1, PLV stationary 20% MCR - November (Scenario 8) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

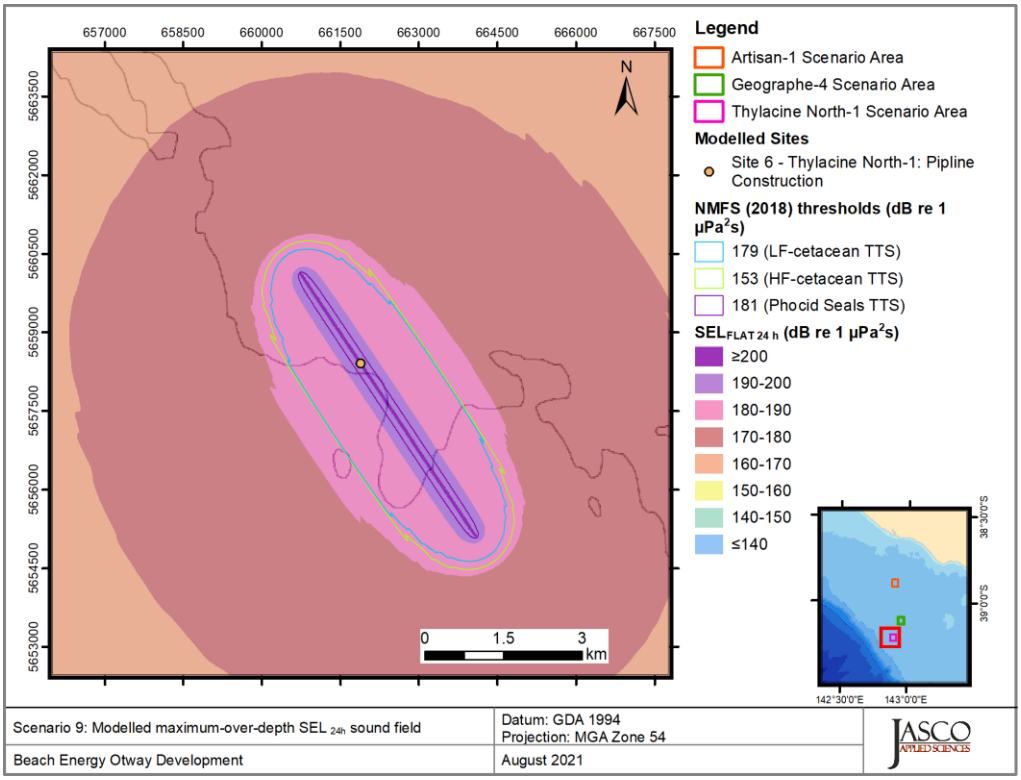

Figure 48. *Thylacine North-1, PLV pipe laying operations 20% MCR - June (Scenario 9) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

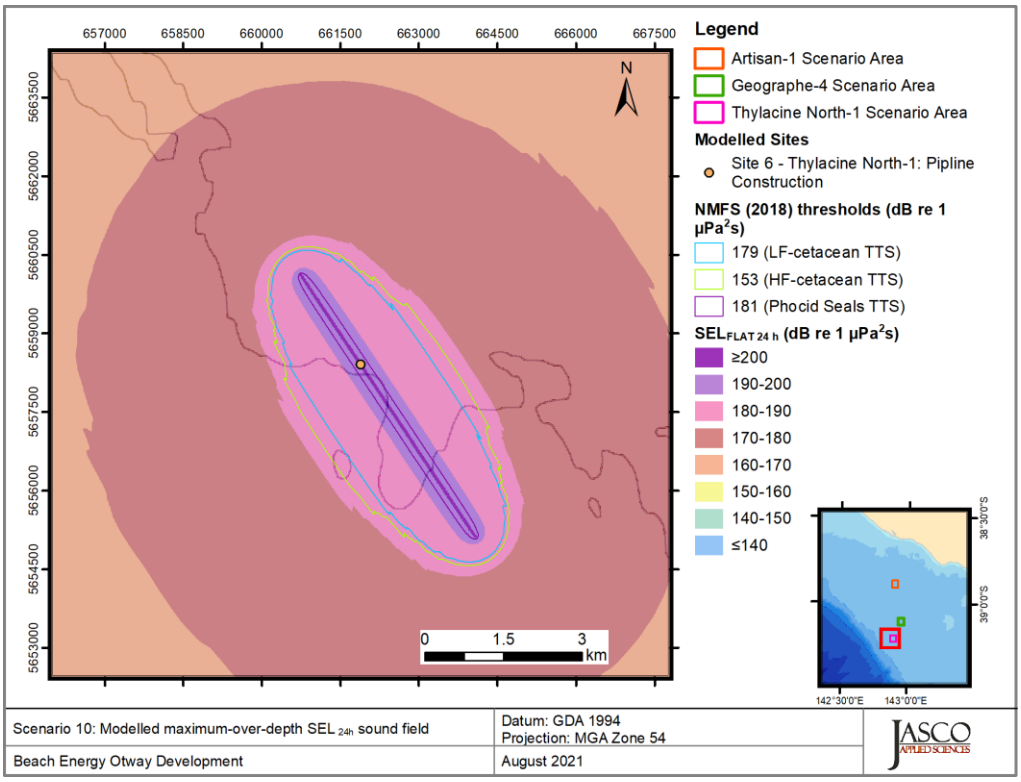

Figure 49. *Thylacine North-1, PLV pipe laying operations 20% MCR - November (Scenario 10) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL24h results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

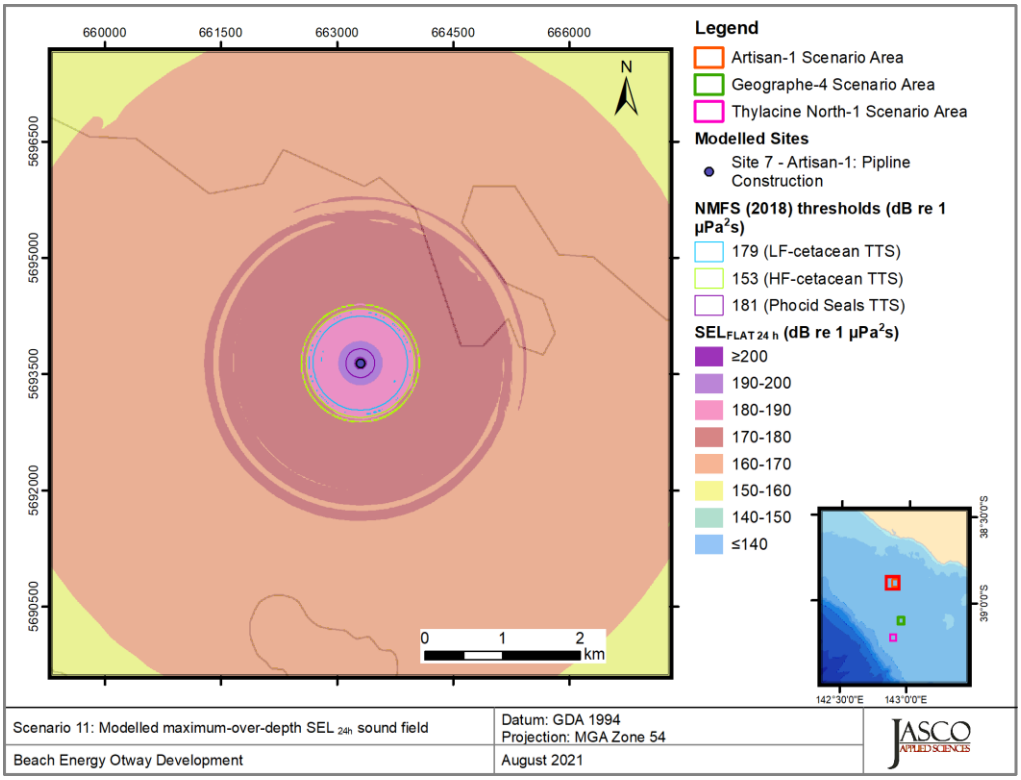

Figure 50. *Artisan-1, PLV stationary 20% MCR - June (Scenario 11) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

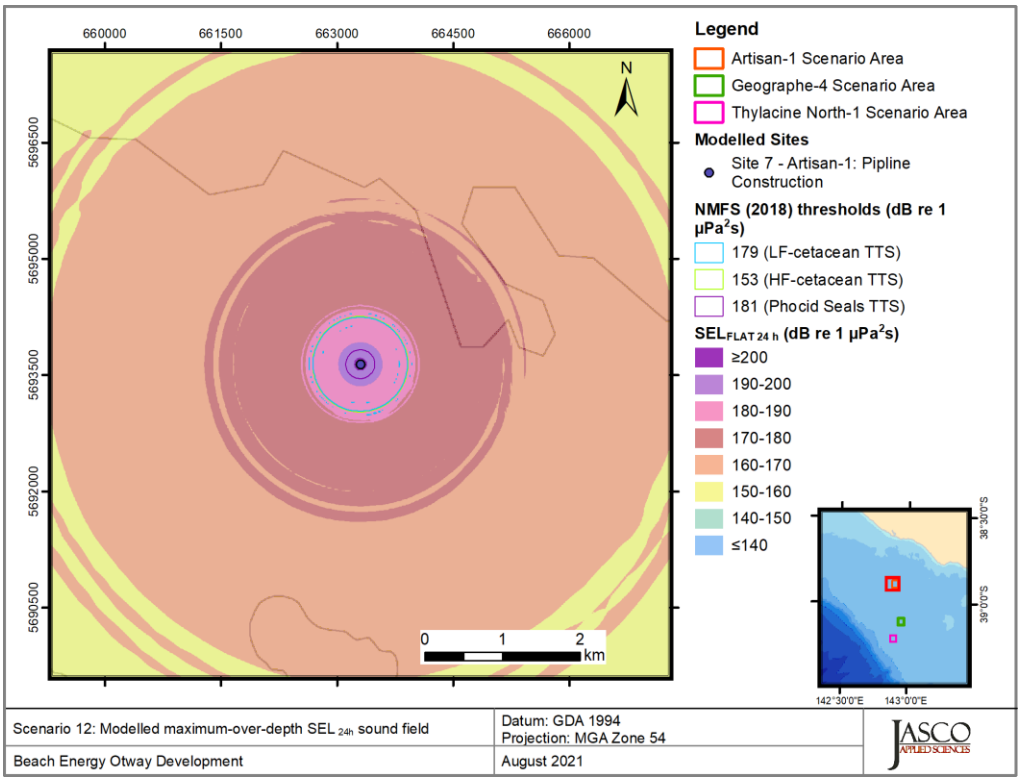

Figure 51. *Artisan-1, PLV stationary 20% MCR - November (Scenario 12) SEL_{24h}:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

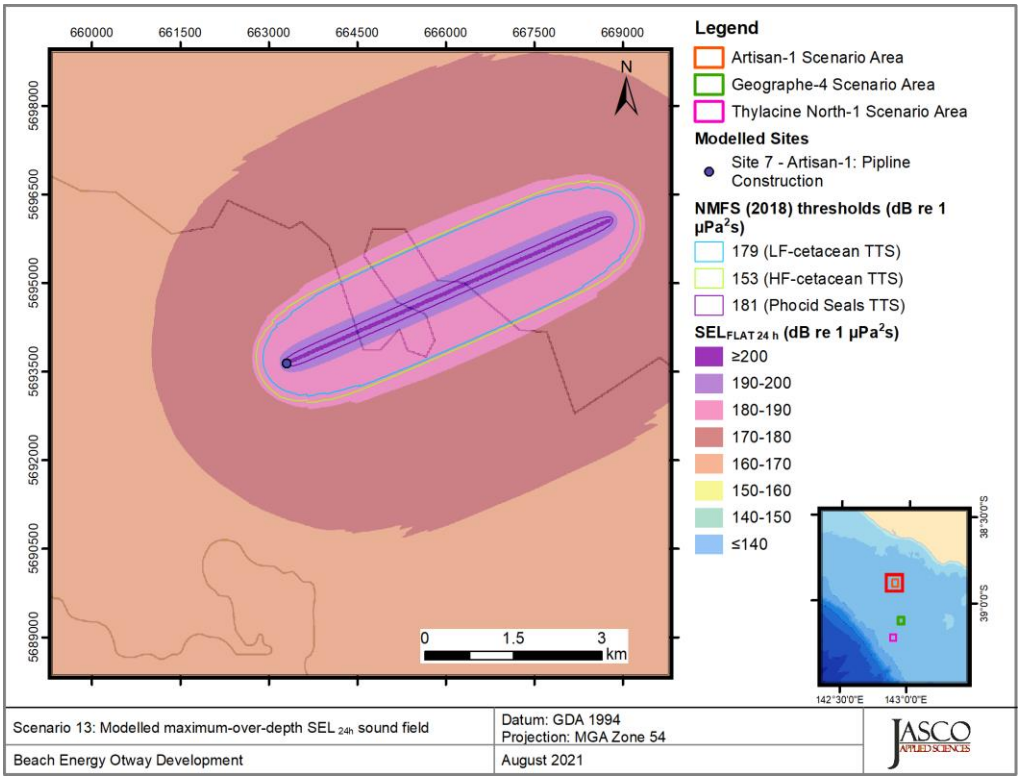

Figure 52. *Artisan-1, PLV pipe laying operations 20% MCR - June (Scenario 13) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

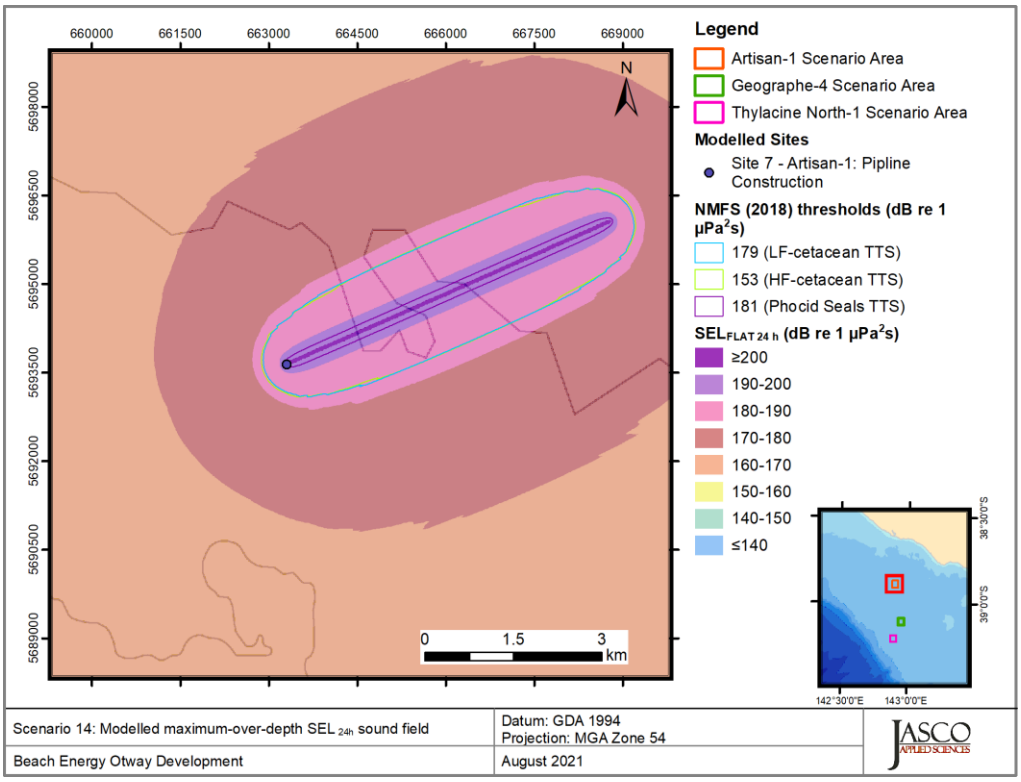

Figure 53. *Artisan-1, PLV pipe laying operations 20% MCR - November (Scenario 14) SEL$_{24h}$:* Sound level contour map showing unweighted maximum-over-depth SEL$_{24h}$ results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

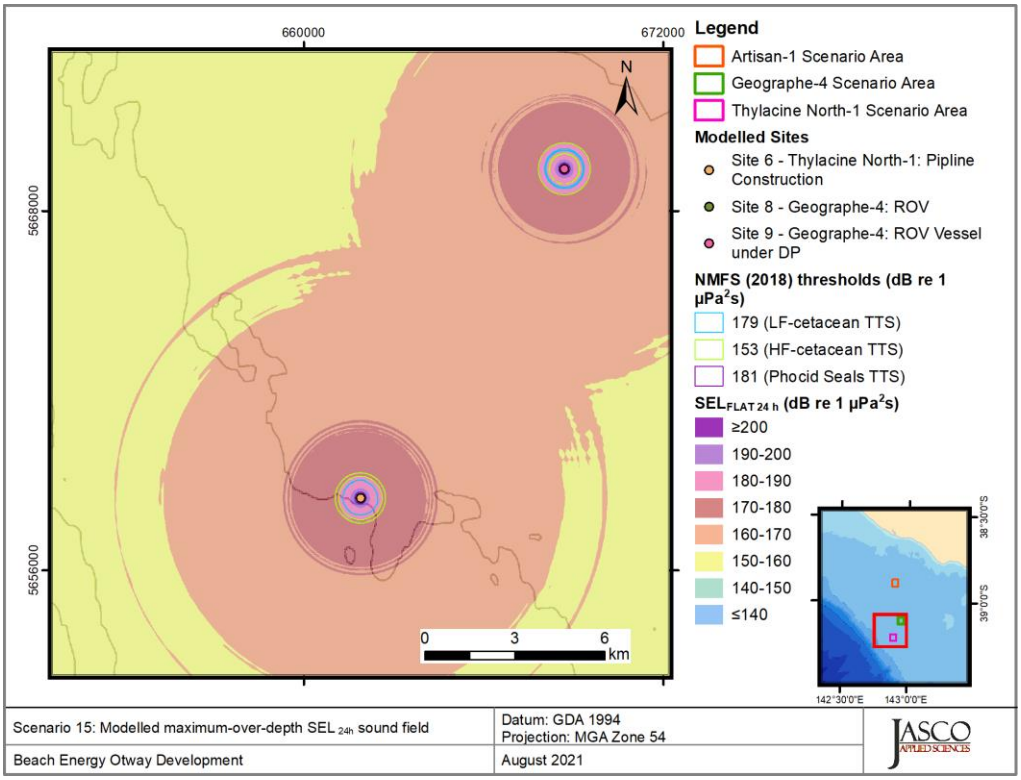

Figure 54. Thylacine North-1, PLV stationary and ROV Operations at Geographe-4 (*20% MCR*) - June (Scenario 15) SEL_{24h}: Sound level contour map showing unweighted maximum-over-depth SEL24h results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

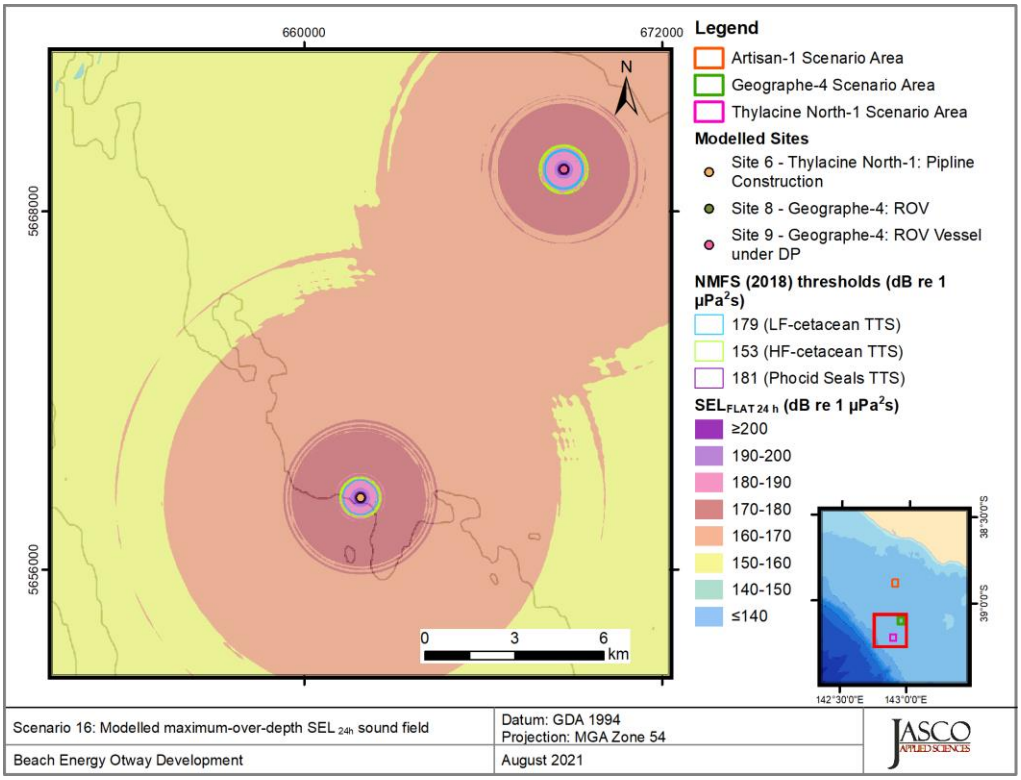

Figure 55. *Thylacine North-1, PLV stationary 20% MCR and ROV Operations at Geographe-4 (20% MCR) - November (Scenario 16) SEL24h:* Sound level contour map showing unweighted maximum-over-depth SEL_{24h} results, along with isopleths for TTS thresholds. Thresholds for PTS and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map.

5. Discussion

The approach applied here to model the propagation loss was based is suitable for other locations within the continental shelf portion of the Otway Basin because it is supported by measurements of very similar operational activities (McPherson et al. 2021). However, the accuracy of the modelling propagation loss within this environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on the calcarenite seabed within Otway region. In general, for these types of sources (i.e., vessels and other sources with a significant amount of energy above a few hundred Hertz) the thinner the sand layer, the greater the propagation loss. Having accurate source and site-specific information reduces the amount of uncertainty results due to model inputs uncertainty particularly when seemingly small changes in parametrisation can have reasonable significant changes in predicted results.

The distances to the effect thresholds based on modelling conducted here and supported by the results of the measurement study McPherson et al. (2021) are generally smaller when compared to those originally presented in Koessler et al. (2020). The understanding of the environment gained through the measurement study allowed for the geological environment to be represented in a site-specific fashion, and a more appropriate configuration of numerical models to represent the environmental propagation loss particularly with the layered calcarenite seabed. The application of the revised modelling approach to represent other Beach Energy activities on the continental shelf of the Otway Basin would be appropriate.

The maximum-over-depth sound field maps presented above show a few instances where threshold contours form concentric ‘rings’ around a source. These are likely the product of propagation interference patterns and the calculations method to account for the loss associated with the cemented limestone seabed (Section 6.2 in McPherson et al. (2021)). Variations in the sound field can produce local maxima and minima in loss which can results in specific levels dipping below thresholds before reaching a maximum extent. Moreover, the near constant bathymetry around most sources produces axial symmetry around a given source. Together these two

factors can form the observed ‘rings’. Nevertheless, the maximum extent of these contours and associated tabulated radii are a valid prediction of the effect ranges that can be expected from the modelled operations.

The effect of different seasonality on predicted distances to the effect thresholds was minor but present. Considering the modelled Otway Offshore Project Construction scenarios, each scenario was modelled with a sound speed profiles for the ‘worst case over the year’ and for a period pygmy blue whales are present in the region, between November and January. These sound speed profiles were respectively selected as June and November. The effect thresholds applied to pygmy blue was the low-frequency cetacean SEL_{24h} thresholds based on NMFS (2018). The sound speed profile of November generally produced small distances to the low-frequency cetacean PTS and TTS threshold for the same operational activities modelled with a June SSP, see Tables 13–15. The seasonal differences were at most a few hundred metres. The receiver SPL level at the Port Campbell receiver locations presented in Table 10 are therefore expected to be lower in in November.

The SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding SEL_{24h} radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) are unlikely to stay in the same location for 24 hours. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained in that location for 24 hours.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially impulsive noise such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate noise and its effects on marine life. We provide specific definitions of relevant metrics used in the accompanying report. Where possible we follow the ANSI and ISO standard definitions and symbols for sound metrics, but these standards are not always consistent.

The sound pressure level (SPL; L_p; dB re 1 µPa) is the rms pressure level in a stated frequency band over a specified time window (T, s) containing the acoustic event of interest. It is important to note that SPL always refers to a rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T p^2(t)dt \Big/ p_0^2\right) \quad \text{(A-1)}$$

The SPL represents a nominal effective continuous sound over the duration of an acoustic event, such as the emission of one acoustic pulse, a marine mammal vocalization, the passage of a vessel, or over a fixed duration. Because the window length, T, is the divisor, events with similar sound exposure level (SEL) but more spread out in time have a lower SPL.

The sound exposure level (SEL; L_E; $L_{E,p}$; dB re 1 µPa^2·s) is a measure related to the acoustic energy contained in one or more acoustic events (N). The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T):

$$L_E = 10\log_{10}\left(\int_T p^2(t)dt \Big/ T_0 p_0^2\right) \quad \text{(A-2)}$$

where T_0 is a reference time interval of 1 s. The SEL continues to increase with time when non-zero pressure signals are present. It therefore can be construed as a dose-type measurement, so the integration time used must be carefully considered in terms of relevance for impact to the exposed recipients.

SEL can be calculated over periods with multiple acoustic events or over a fixed duration. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, SEL can be computed by summing (in linear units) SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\left(\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}}\right). \quad \text{(A-3)}$$

Appendix B. Methods and Parameters

This section describes the specifications of the seismic source that was used at all sites and the environmental parameters used in the propagation models.

B.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure B-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure B-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure B-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

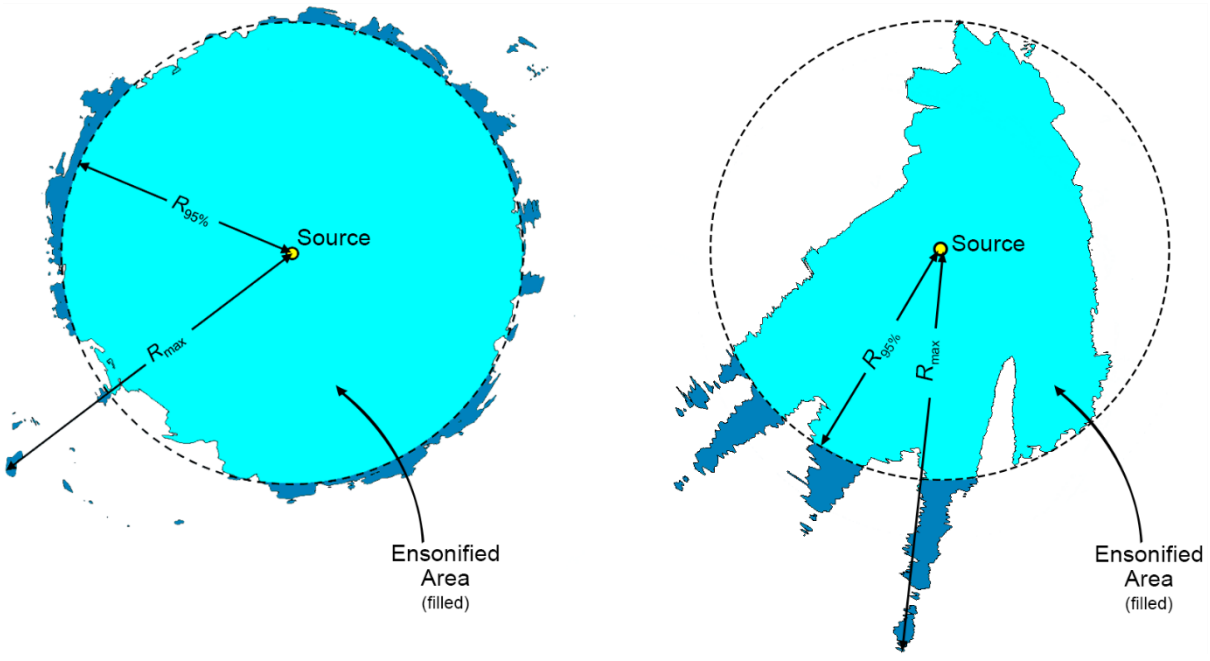

Figure B-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

B.2. Environmental Parameters

B.2.1. Bathymetry

Water depths throughout the modelled areas were extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 100 × 100 m.

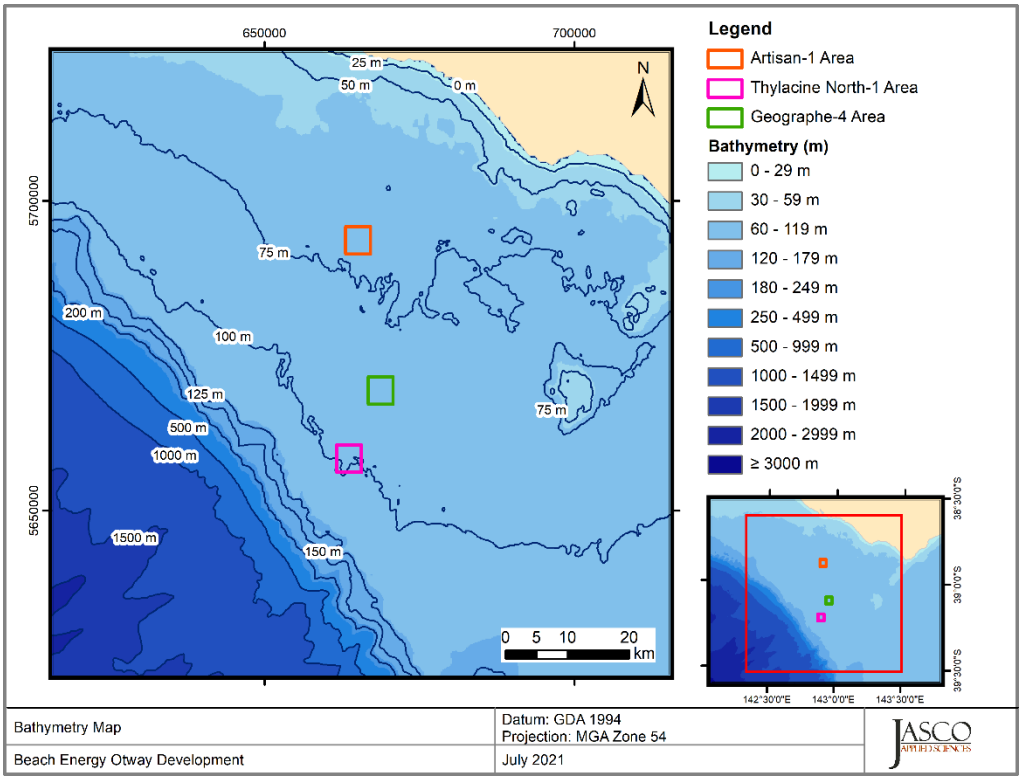

Figure B-2. Bathymetry in the modelled area.

B.2.2. Sound speed profile

The sound speed profile in the area was derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office's *Generalized Digital Environmental Model V 3.0* (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles at distances less than 7 km around the modelled site. The June sound speed profile is expected to be most favourable to longer-range sound propagation across the entire year. As such, June was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. For the pygmy blue whale period between November and January November is expected to be most favourable to longer-range propagation in that period. Figure B-3 shows the resulting profiles, which were used as input to the sound propagation modelling.

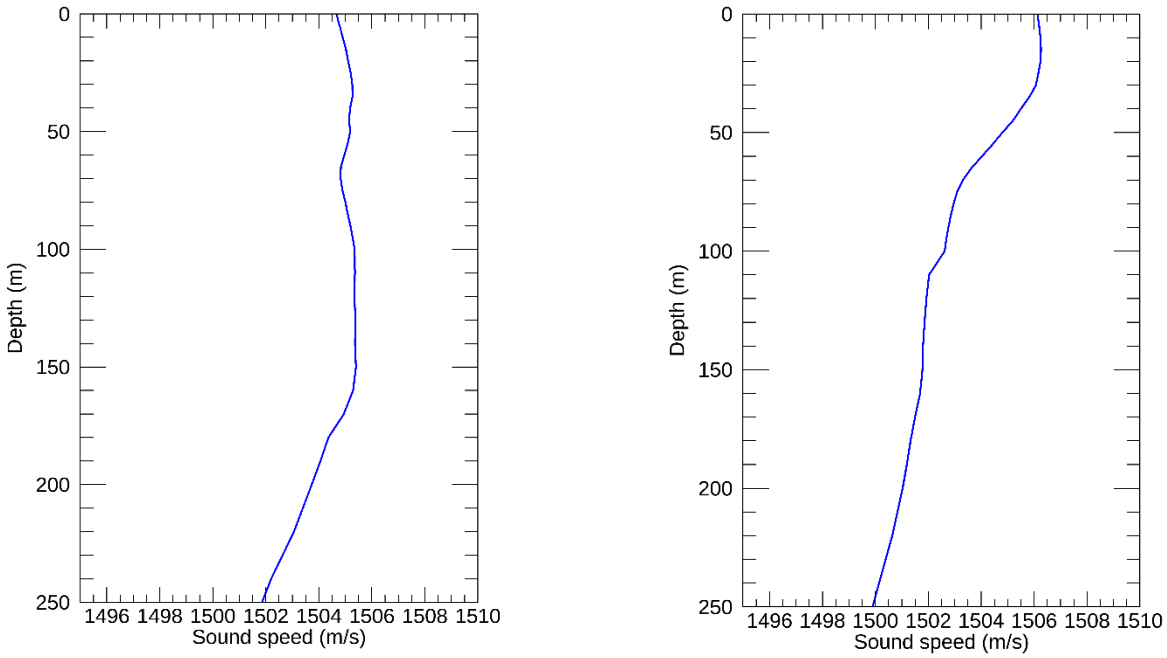

Figure B-3. The modelling sound speed profile corresponding to June (left) and November (right) Profiles are calculated from temperature and salinity profiles from *Generalized Digital Environmental Model* V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

B.2.3. Geoacoustics

The propagation model used in this study consider a single geoacoustic profile for each development area. These profiles determine how sound is reflected from the seabed, as well as how it is transmitted, reflected and absorbed into the sediment layers. As in previous acoustic studies in the area, the modelling area was divided into two seabed types (Wood and McPherson 2018). Both areas are located on the continental shelf, however the seabed in the Thylacine North-1 and were modelled as being characterised by well-cemented carbonate caprock (calcarenite), overlying semi-cemented carbonate rock (calcarenite). This contrast in seabed environment is consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010). Table B-1 present the geoacoustic profile used at the modelled sites in each respective development area.

Table B-1. *Thylacine North-1*: Geoacoustic profile. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–0.5	Well-cemented carbonate caprock	2.7	2600	0.50	1200	0.5
0.5–20	Increasingly cemented calcarenite	2.2	2000	0.30	900	0.27
20-40		2.3	2120	0.34	960	0.32
40-60		2.4	2240	0.38	1020	0.41
60-80		2.5	2360	0.42	1080	0.45
80–100		2.6	2480	0.46	1140	0.5

Executive Summary

Overview

JASCO Applied Sciences (Australia), JASCO, completed a monitoring study for Beach Energy (Operations) Ltd (Beach Energy) in relation to the exploration drilling activities at the Artisan-1 well with the aim of completing an acoustic characterisation of the drilling and associated vessel activity within the Otway Basin. Through this characterisation, validation of the modelling predictions used in Beach Energy Otway Environment Plans (EPs) for the development drilling activities was required.

The exploration well Artisan-1, drilled by the *Ocean Onyx*, was selected for the monitoring program because the predicted distances to thresholds for effects on marine mammals, including pygmy blue whales, were farthest at this location in the modelling study used for the EP (Koessler et al. 2020), as well as because it was the first well in the Otway drilling campaign.

Four JASCO Autonomous Multichannel Acoustic Recorders (AMARs) in C-lander moorings were deployed in February and retrieved in early April. Stations 1 through 4 were deployed at distances of 0.336, 1.13, 5.11, and 25 km from the *Ocean Onyx*. The AMARs recorded continuously at 24-bit resolution and 64 kHz sample rate for the entire deployment. The three stations closest to the *Ocean Onyx* were configured with a single hydrophone, whilst the station 25 km away was configured with three hydrophones to provide directional processing of received sounds.

To assist in the characterisation of *Ocean Onyx* and attendant support vessels, the vessels conducted specific activities under dynamic positioning and followed a nominated transit track between the *Ocean Onyx* and Geelong Supply Base. No specific operational requests were made of the *Ocean Onyx* and vessels during normal drilling activities due to the complexity of operationally meeting any requests. Over the course of the monitoring program, the MODU and support vessels engaged in different operational states with different uncontrollable contributors, such as variable drilling operations, resupply and support operations, weather conditions, and merchant shipping.

Data Analysis

The data was analysed to determine total ocean sound levels, which presented the expansive data in a manner that documented the underwater sound conditions near Artisan-1 and allowed a comparison over time, and with external factors that affect sound levels, such as weather and human activities. The data was presented using a range of graphical and statistical representations. JASCO's ShipSound software was used to determine the source levels for the Ocean Onyx during drilling activities and the support vessels whilst under dynamic positioning and transit.

ShipSound calculates two kinds of vessel source levels from the data window: Radiated Noise Level (RNL) and Monopole Source Level (MSL). RNL is equal to the measured sound pressure level, back-propagated according to the distance between a source and the hydrophone using an empirical propagation loss approach. MSL is equal to the measured sound pressure level scaled according to a numerical acoustic propagation loss (PL) model that accounts for the effect of the local environment on sound propagation (i.e., sea-surface reflection, water column refraction and absorption, and bottom loss).

The presence of sounds produced by marine mammals were searched for using a combination of automated detector-classifiers (referred to as automated detectors) and manual review by experienced analysts. The manual review was limited to only a subset (0.5%) of acoustic data, as this was not the primary aim of the project.

Results

The analysis of data at the two stations furthest from the Ocean Onyx, 3 and 4 (5 and 25 km), found a positive correlation between wind speeds and wave heights and sound levels for frequencies over 100 Hz, with the relationship with wind speed being stronger than that for wave height. For both of these stations shipping is a strong contributor. Most days recorded a significant number of vessel detections, with the contributions at Station 4 typically between 40 and approximately 100 Hz. The station most representative of a typical ambient soundscape within the region, Station 4, had a median broadband ambient noise of 104.5 dB re 1 µPa. Dolphins and pygmy blue whales were identified in the data. The data for pygmy blue whales indicates an apparent trend in the animals early in the recording being more to the east and later in the recording being more to the west, through the directional analysis of data from Station 4, but the data were too sparse (and the analysis too limited) to confirm anything about animal movements. Extended analysis may provide more details about their presence and movements during the drilling activities.

The provided drill logs for the Artisan-1 well were reviewed to identify periods of activity defined as drilling, as this was the activity considered in the modelling study Koessler et al. (2020). Seventy ten-minute time periods were deemed suitable for use, which resulted in the MSL being calculated over three different drilling depth ranges and presented as mean and maximum levels. MSL's were calculated for support vessels during dynamic positioning trials and transit, with results summarised in Table 1.

Table 1. Project drill rig and support vessel monopole source levels (MSLs).

Vessel	Measurement	Monopole source level (dB re 1 µPa m)	
		Mean	Maximum
Ocean Onyx	Drilling 26”x42” hole from 95-172 m	175.2	180.0
	Drilling 17.5” hole from 365-621 m	169.3	171.0
	Drilling 12.25” hole up to 1851 m	162.7	170.6
Siem *Sapphire*	Dynamic Positioning Trial	193.9	194.2
	Transit at 7 kn	171.6	173.6
	Transit at 9 kn	185.0	—*
Siem *Aquamarine*	Transit at 9 kn	182.8	—*
Siem *Topaz*	Transit at 9 kn	185.2	—*

* Not reported.

Validation

The Monopole Source Levels determined through the measurement study differed from those either estimated for use in the modelling study or those determined using proxy sources. The key differences are as follows:

- The support vessels are quieter than estimated when they are under slow transit speeds, such as 7 kn.
- The support vessels are louder than estimated when they are travelling at faster transit speeds, with 9 kn used to represent these speeds and the associated MSL.
- The support vessels are louder than estimated when holding station or moving under dynamic positioning.
- The drilling operations of the *Ocean Onyx* are both louder at some frequencies and quieter at others than those for the proxy rig the *Polar Pioneer* (Austin et al. 2018), although the results presented for the *Polar Pioneer* did not examine the changes in level with increased drilling depth (over time) as completed within this study.

The results from the measurement study could not be directly compared to the modelling presented in Koessler et al. (2020) due to the differences in actual events compared to the nominal representative scenarios developed and evaluated as part of the EP assessment process. Additionally, the measurements were obtained at a receiver located 1.2 m off the seafloor, which is not the maximum-over-depth results reported in the modelling study. The ranges obtained from the measurement study are reported in relation to the Artisan-1 well location, and thus the centre of the *Ocean Onyx*. The ranges in the modelling study are reported from a range of locations, including the centroids of multiple sources, thus it is not possible to report the measurement results in a similar fashion using the small number of recording locations used in this study.

The accuracy of the broadband calculated propagation loss for the Otway Basin continental shelf environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on carbonate seabed (calcarenite) likely to occur within the region. In general, the thinner the sand layer, the greater the overall propagation loss.

When comparing SPL data fits for Stations 1–3, the loss rate is higher than what would have been expected in this environment, considering the higher monopole source levels for the support vessel on DP derived from trial measurements. The differences are likely attributable to the potential absence of a sand veneer.

Comparisons were conducted using JASCO's Marine Operations Noise Model (MONM), a wide-angle parabolic equation model which applies the BELLHOP Gaussian beam acoustic ray-trace model at higher frequencies, and JASCO's wavenumber integration model (VSTACK) which can fully account for the elasto-acoustic properties of the sub-bottom. The agreement between the models was excellent when only a comparatively thin (1 m thick) layer of sand overlies the carbonate seabed structure. In an environment such as this, MONM could have been used without correction. However, the comparisons indicate a much higher rates of loss, as would be expected if no (or only a very thin) sand layer were present.

A better understanding of the propagation loss environment, and the revision of the representation and treatment of it through the measurement study, enabled the modelling scenarios for the activities at Artisan-1 presented in Koessler et al. (2020) to be recalculated. The revised results for distances to maximum-over-depth SPL isopleths are presented in Table 2, and the revised results for distances to maximum-over-depth SEL thresholds presented in Table 3.

The understanding of the environment gained through the measurement study allowed for both the geological environment to be represented in a site-specific fashion and the use of a more appropriate configuration of numerical models to represent the propagation loss. The application of the revised modelling approach to represent other Beach Energy activities on the continental shelf of the Otway Basin would be appropriate.

Table 2. Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to the marine mammal behavioural response threshold of 120 dB re 1 µPa sound pressure level (SPL) from the most appropriate location for considered sources per scenario (see table footnotes).

1. Introduction

JASCO Applied Sciences (Australia), JASCO, completed a monitoring study for Beach Energy (Operations) Ltd (Beach Energy) in relation to the exploration drilling activities at the Artisan-1 well with the aim of completing an acoustic characterisation of the drilling and associated vessel activity within the Otway Basin. Through this characterisation, it was then required to validate the modelling predictions used in Beach Energy Otway Environment Plans (EPs) for the development drilling activities. These validation results are applicable for drilling, construction, and operational activities within the Otway Basin.

The exploration well Artisan-1 was selected for the monitoring program, because the predicted distances to thresholds for effects on marine mammals, including pygmy blue whales, were farthest at this location in the modelling study used for the EP (Koessler et al. 2020), as well as because it was the first well in the Otway drilling campaign.

This report presents an overview of the operations, environment, and measurement approaches (Section 2); general information about the marine acoustic environment (Section 3); the methods used for the data analysis, presentation, and modelling validation (Section 4); results of the monitoring program (Section 5); the validation analysis (Section 6); and a discussion of the program results and findings (Section 7).

The location of the four acoustic recording stations and the Artisan-1 well are provided in Table 4 and shown in Figure 1. One JASCO Autonomous Multichannel Acoustic Recorders (AMAR) was deployed at each recording station.

Table 4. Artisan-1 well and acoustic recording stations, including distance to Artisan-1.

2. Background Information

2.1. Operational Overview and Logs

The Otway Development Drilling Campaign being undertaken by Beach Energy utilises the *Ocean Onyx* Mobile Offshore Drilling Unit (MODU) (Figure 2). It is held in position via anchors and chains, as opposed to using thrusters, and has dimensions of approximately 100 m in length and width, and a draft of 22.7 m.

Figure 2. *Ocean Onyx* semi-submersible platform.

The following information was provided by Beach Energy:

- Drilling activity logs for the *Ocean Onyx,*
- Daily operational logs for the Development Drilling program,
- Daily vessel activity logs, and
- Vessel locations in ~15-minute increments from the Siem navigation systems.

The operational and activity logs used local time, which was Australian Eastern Daylight Time (AEDT), UTC+11 until 4 Apr 2021 at 3:00 am, when they changed over to Australian Eastern Standard Time (AEST), UTC+10. Therefore, AEDT is considered local time for the monitoring program. Vessel location data, including and Automated Identification System (AIS) data, as well as other ancillary environmental data and JASCO's recorders use UTC as the time zone. Thus, to avoid potential confusion, all timestamps were converted to UTC.

The *Ocean Onyx* anchoring operation commenced on 11 Feb 2021 and completed on 12 Feb 2021 local time; therefore, 01:00 12 Feb 2021 UTC was considered the start of data with the *Ocean Onyx* moored and in location after all anchor handling was complete. The *Ocean Onyx* departed Artisan-1 on 28 Mar 2021, after commencing disconnect operations on 26 Mar 2021 local time; therefore, 00:00 25 Mar 2021 UTC was considered the end of drilling or rig operations for analysis purposes.

2.2. Vessel Traffic

Regional vessel movement information, including for the project vessels, was obtained from MarineTraffic (www.marinetraffic.com), with data supplied for the time range between 1 Feb 2021 and 5 Apr 2021 in the region. The requested area was 11,003 km^2, with the vertices shown in Table 5.

The supplied data used a one-hour timestamp for vessel locations and all data were derived from satellites, with no terrestrial reporting stations in the vicinity. Figure 3 shows the marine traffic in the project area, derived from vessels broadcasting on the Automated Identification System (AIS), with a map focused on Artisan-1 shown in Figure 4.

Table 5. MarineTraffic data request bounds.

Vertex	Latitude (S)	Longitude (E)	MGA Zone 54 (GDA94)	
			X (m)	*Y* (m)
1	38° 38.71418'	142° 15.17165'	609029.0	5721846.24
2	38° 36.92154'	143° 55.51902'	754698.76	5721846.24
3	39° 17.70699'	143° 57.20532'	754698.76	5646313.77
4	39° 19.54340'	142° 15.89490'	609029.0	5646313.77

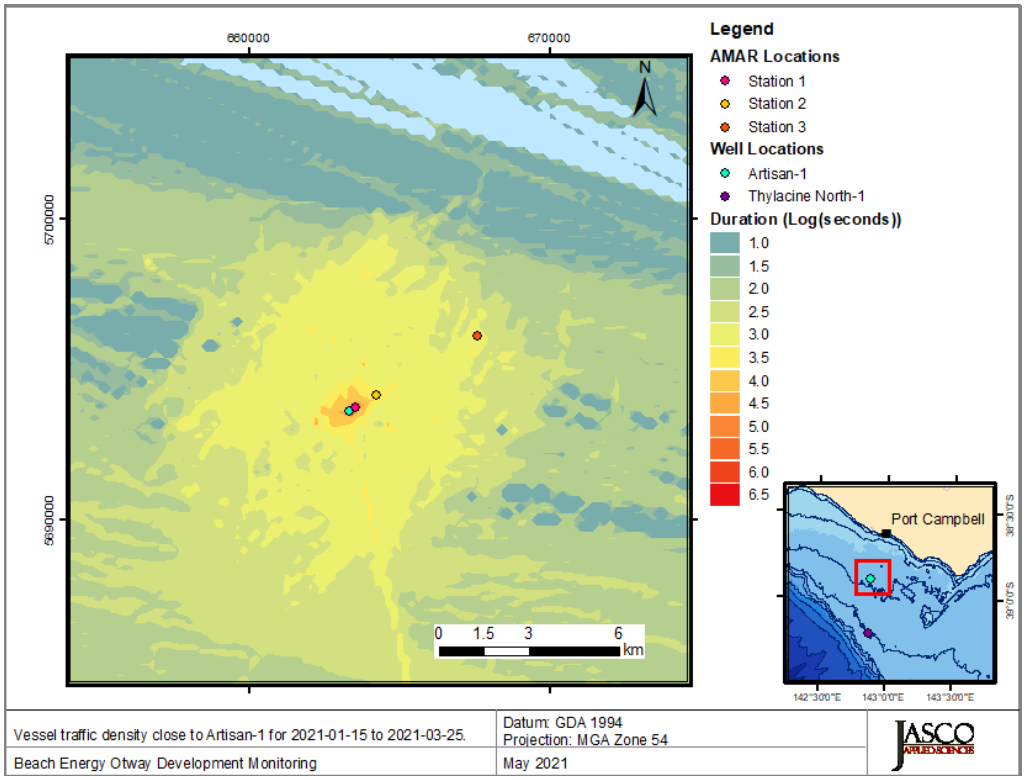

Figure 4. Vessel traffic density near Artisan-1 for 15 Jan to 25 Mar 2021.

2.3. Weather Conditions

Weather conditions at Artisan-1 were quantified through nowcast data provided by MetraWeather (Australia) for the period 00:00 on 1 Feb through until 24:00 6 Apr 2021 (UTC). The data included the following parameters:

- Significant wave height,
- Peak wave period,
- Peak wave direction,
- Significant wave height of swell >8 second period,
- Average wind speed,
- Wind direction, and
- Maximum wind gust speed.

Figure 5 shows the wave and swell weight, and Figure 6 shows the wind and gust speeds.

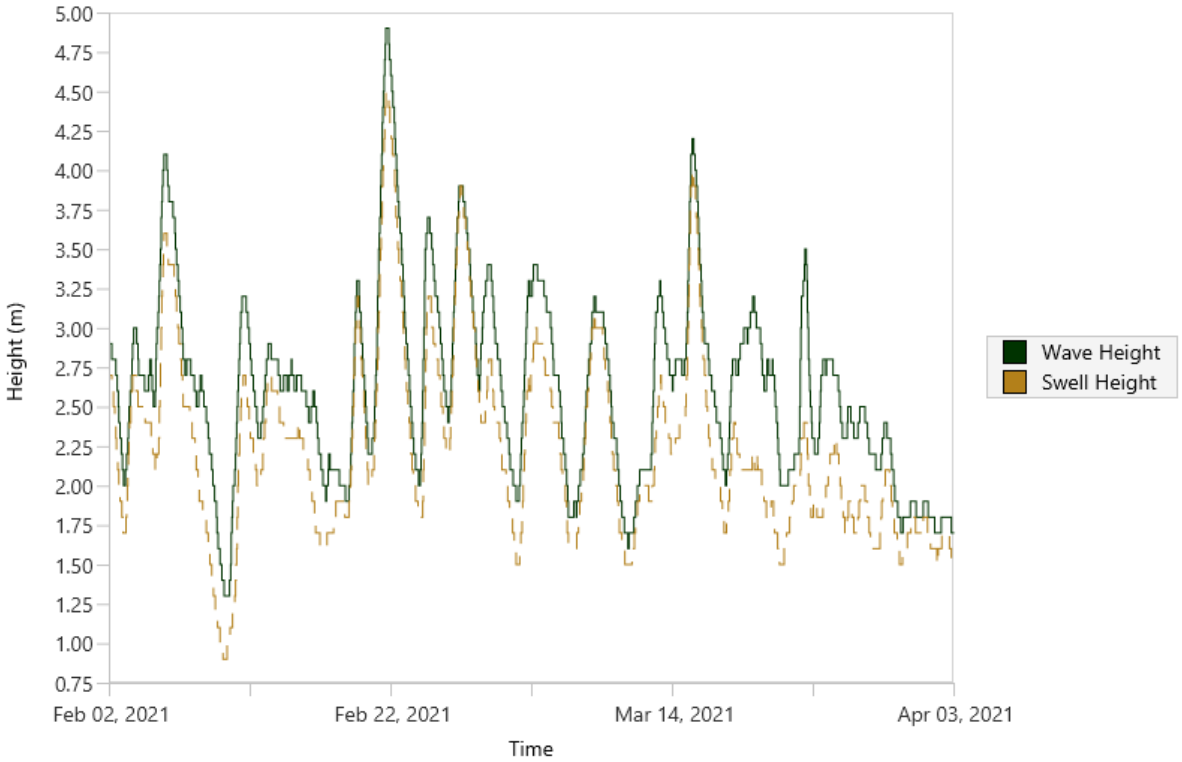

Figure 5. Hourly significant wave height (m) and significant swell height (m), with a period of greater than 8 seconds.

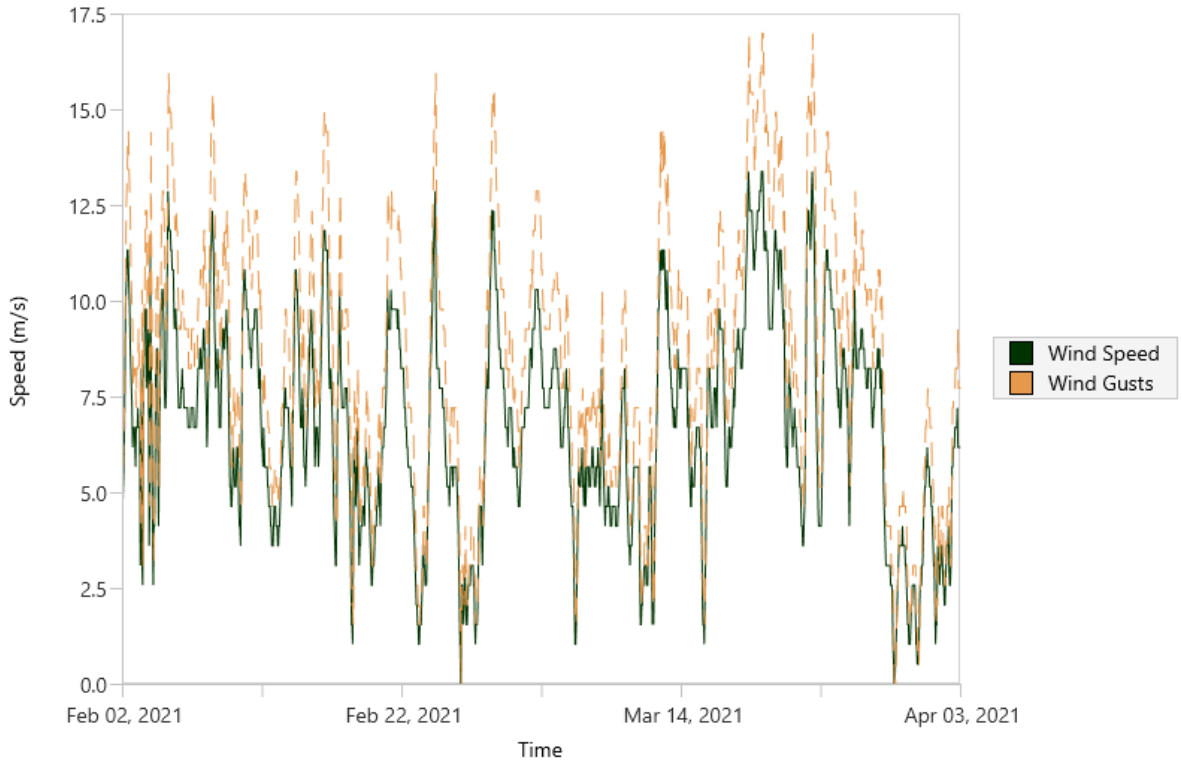

Figure 6. Hourly average wind speed (m/s) and maximum gust speed (m/s).

2.4. Geology

The propagation model used in this study considers a single geologic seabed profile for the Artisan area. The previous work by Koessler et al. (2020) considered two geologic and associated geoacoustic profiles. For deeper areas closer to the continental shelf edge, a profile characterised by well-cemented carbonate caprock (calcarenite) overlying semi-cemented calcarenite was used. Closer to the Artisan area the seabed, located in shallower waters, was characterised by a thin veneer of coarse sand/gravel overlying cemented and semi-cemented carbonate rock. This profile was selected based on a mixture of previous modelling studies (Wood and McPherson 2018) and client supplied geologic reports.

All these sources support a generalised geologic structure within the first 100 m seabed consisting of cemented or semi-cemented calcareous rock ('calcarenite') on the continental shelf within Artisan area. Collated information also indicated that there was the potential for a thin layer of coarse sand that could overlay the more cemented calcarenite. This was also indicated by seafloor sediment grab samples from the MARS sediment database (Heap 2009). The seabed environment was considered to be consistent with larger scale geological data and interpretations of the Australian continental shelf environment as summarised by James and Bone (2010), who indicated that the sediments along the continental shelf may be subject to transport and erosion yielding non-uniform distributions of seafloor sediment thickness.

2.5. Specific Source Measurement Operations

2.5.1. MODU Measurements

No operational requirements were requested of the *Ocean Onyx* or attendant support vessels while conducting resupply or standby operations during the drilling program due to the complexity of operationally meeting any requests. Over the course of the monitoring program, the MODU and support vessels engaged in different operational states, with different uncontrollable contributors, such as variable drilling operations, resupply and support operations, weather conditions, and merchant shipping. Operational details were obtained from the provided logs (Section 2.1).

2.5.2. Support Vessel Measurements

Specific operations were defined for the characterisation of the support vessels prior to the *Ocean Onyx* being moored, and while in transit to and from Geelong. For transit measurements, vessels were requested to pass along a defined track line according to ANSI S12.64 (R2014), with the vessel maintaining the straightest track possible and a requested separation from the AMAR of 150 m at the closest point of approach (CPA), with a water depth of 70 m. In deep water vessel noise measurements, it is a requirement for the vessels to be a minimum of either 100 m or one vessel length away from the recorder; in this case the typical vessel length is 91 m. Whilst there are standards for deep water source level measurements, there are none for shallow water environments. Methods to make accurate shallow water measurements of vessel source levels are currently being investigated by JASCO and DW Ship Consult for Transport Canada, with the findings to contribute to standard development (Ainslie et al. 2020); these methods were considered during the design of this study where possible.

The transit measurement track defined at Station 4 is shown in Figure 7, and in increased detail in Figure 8.

For measurements of dynamic positioning (DP), three exercises were defined, with *Exercise Two* completed twice. The three exercises all commenced at a horizontal separation of 150 m from the AMAR:

- *Exercise One*: Vessel to hold station, broadside to AMAR and operate at weather determined power levels for a minimum of 5 minutes.
- *Exercise Two*: Vessel to hold station, broadside to AMAR, then induce maximum reasonable thrust level and move in a perpendicular direction away from the AMAR in the up current direction for two minutes, reset and repeat exercise.
- *Exercise Three*: Vessel to hold station, broadside to AMAR, then using DP, step the vessel to the corners of a 10 × 10 m box using weather determined thruster levels.

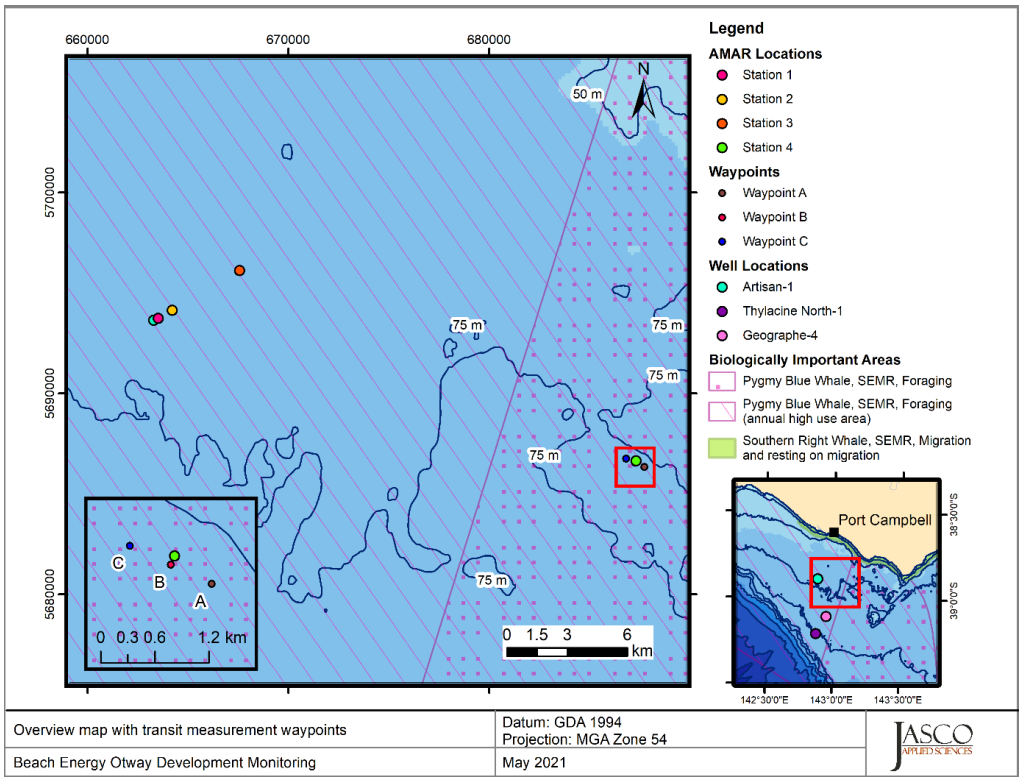

Figure 7. Map showing AMAR locations along with the three waypoints for the measurement track at Station 4 for transit vessels, Waypoints A, B, and C.

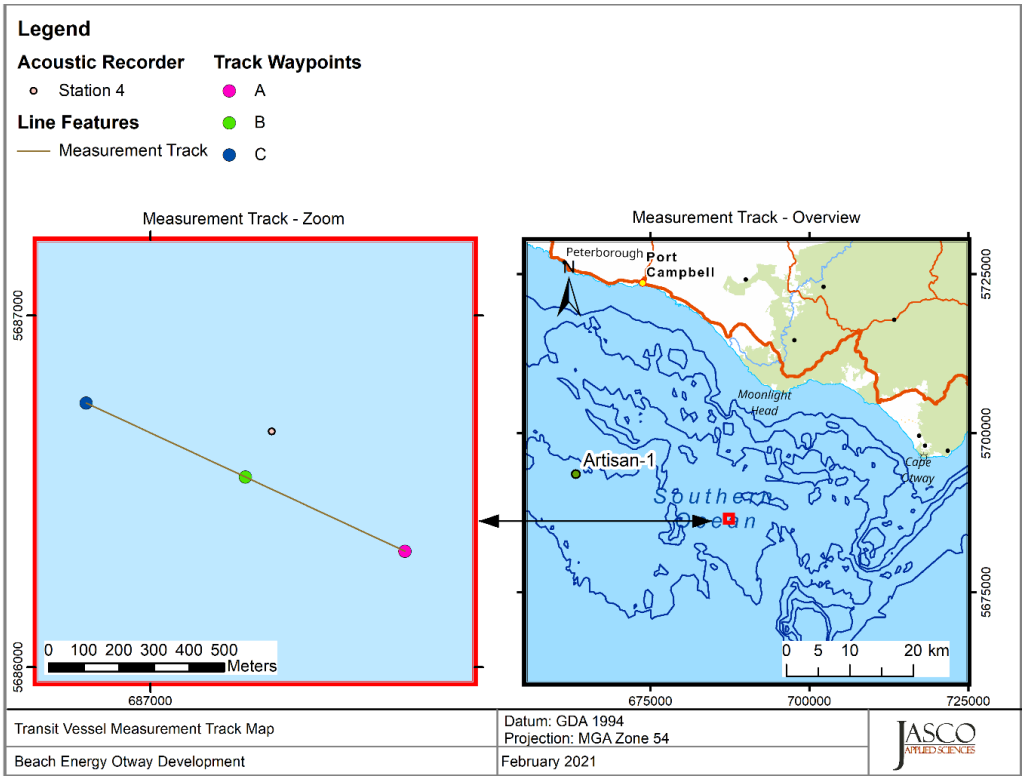

Figure 8. Zoom in of measurement track at Station 4 for transit vessels, as shown in Figure 7.

2.6. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is first necessary to establish exposure criteria (thresholds) for which sound levels may be expected to have a negative effect on animals. Whether acoustic exposure levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed sound exposure level (SEL) based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, sound pressure level (SPL), and SEL (Appendix A), are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over a 24 h time period. Appropriate subscripts indicate any applied frequency weighting applied. The acoustic metrics in this report reflect the amended ANSI and ISO standards for acoustic terminology, ANSI S1.1 (S1.1-2013), and ISO 18405:2017 (2017a).

The following thresholds and guidelines for this study were chosen because they represent the best available science, and sound levels presented in literature for fauna with no defined thresholds:

1. Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from the US National Oceanic and Atmospheric Administration (NOAA) Technical Guidance (NMFS 2018) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals for non-impulsive sources.
2. Marine mammal behavioural threshold based on the current interim U.S. National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources.

The criteria applied in this study to assess possible effects of vessel noise on marine mammals are summarised in Table 6, with frequency weighting explained in Appendix E.

Table 6. Criteria for effects of continuous noise exposure, including vessel noise, for marine mammals: Unweighted sound pressure level (SPL) and 24 h sound exposure level (SEL_{24h}) thresholds.

Hearing group	NOAA (2019)	NMFS (2018)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 μPa^2 s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 μPa^2 s)
Low-frequency (LF) cetaceans	120	199	179
High-frequency (HF) cetaceans		198	178
Very high-frequency (VHF) cetaceans		173	153
Phocid seals		201	181
Otariid seals		219	199

L_p denotes sound pressure level period and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 $\mu Pa^2 s$.

3. Marine Acoustic Environment

3.1. Ambient Ocean Soundscape

The ambient acoustic environment, or soundscape, consists of cumulative contributions from abiotic (geophonic), biotic (biophonic), and man-made (anthrophonic) sound sources (Krause 2008). Variation in soundscape characteristics over time and space can act as proxies for geographical, biological, and anthropogenic events occurring within an environment.

In the marine environment, geophonic elements of the soundscape commonly correlate with oceanographic conditions. Increased sea state and wind speed lead to higher sound intensities across frequencies ranging from 500 Hz to 30 kHz, via sound produced by breaking waves, cavitation, surface flow noise, and pressure changes (Knudsen et al. 1948, Wenz 1962) (Figure 9). Rainfall elevates sound levels in the 1–15 kHz frequency range, via surface impacts and bubble entrainment (Heindsmann et al. 1955, Bom 1969, Scrimger et al. 1987). The specific frequency band affected by rainfall depends on rain strength and droplet size. Abiotic acoustic contributions are often unpredictable or irregular (Urick 1983). For example, significant low frequency acoustic energy can be contributed to marine soundscapes by earthquakes and sea ice movement (Urick 1974, Matsumoto et al. 2014). On the other hand, biophonic contributions often feature seasonal and diel activity patterns (Hannay et al. 2013, Erbe et al. 2017). Water movement, or flow noise, is considered to be a pseudo-noise that results from eddies and vortices forming as water flows past an acoustic receiver, and is not considered to be part of a marine soundscape (Strasberg 1979).

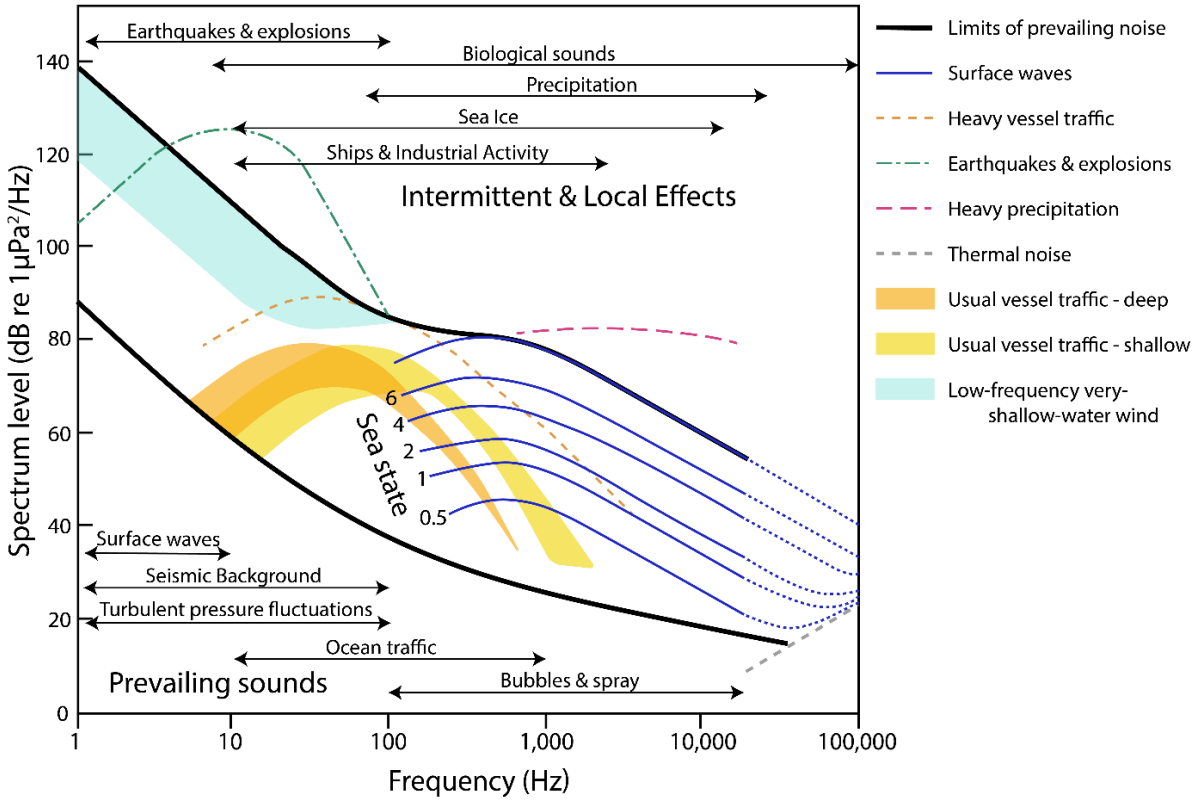

Figure 9. Wenz curves describing pressure spectral density levels of marine ambient sound from weather, wind, geologic activity, and commercial shipping (adapted from NRC 2003, based on Wenz 1962). Thick lines indicate limits of prevailing ambient sound.

3.2. Anthropogenic Contributors to the Soundscape

Anthropogenic (human-generated) sounds are relatively recent additions to soundscapes and, unlike biophonic contributors, often overlap in frequency, space, or time (Cato 1997, van Opzeeland and Boebel 2018). Anthrophonic contributors to global ocean noise include vessel traffic (commercial and recreational) at frequencies mainly in the frequency band 50–500 Hz. This sound can be a by-product of vessel operations, such as engine sound radiating through vessel hulls and cavitating propulsion systems, or it can be a product of active acoustic data collection with seismic surveys, military sonar, and depth sounding as the main contributors.

Marine construction projects involve vessel operations and project specific noise sources that can produce a range of both impulsive and non-impulsive noise. The contribution of anthropogenic sources to the ocean soundscape has increased from the 1950s to 2010, largely due to greater maritime shipping traffic (Ross 1976, Andrew et al. 2011). Oil and gas exploration with seismic airguns, marine pile driving, and oil and gas production platforms elevate sound levels over significant ranges when present (Bailey et al. 2010, Miksis-Olds and Nichols 2016, Delarue et al. 2018).The extent of seismic survey sounds has increased substantially following the expansion of oil and gas exploration into deep water, and seismic sounds have been detected across ocean basins (Nieukirk et al. 2004). Recent trends suggest that global sound levels are leveling off or potentially decreasing in some areas (Andrew et al. 2011, Miksis-Olds and Nichols 2016).

A recent paper examining seasonal fluctuations of ambient sound level in the Pacific Ocean (Ainslie et al. 2021) determined that a 5 dB increase in ambient sound level in the frequency range 63–125 Hz was caused by increases in vessel traffic and vessel size in the second half of the 20th century. A larger (approximate 10 dB) increase at lower frequencies (~16–32 Hz), often attributed incorrectly to shipping, occurs in bands dominated by baleen whale vocalisations. This paper also found that the seasonal dependence in ambient sound level is explained by seasonal changes in average sea surface temperature. This work provides a holistic and valuable examination of long-term trends.

3.3. Soniferous Marine Life

Biophonic contributors to marine soundscapes include tonal and pulsive vocalisations produced by marine mammals, fish, and invertebrates to communicate, orientate, and feed. Seasonal trends in biophonic sounds can act as proxies for behaviours, such as the migration of whales (e.g., Leroy et al. 2016, Gavrilov et al. 2018, Jolliffe et al. 2019). Other sounds of animal origin that contribute to marine soundscapes include by-products of behaviour, such as the snaps produced by snapping shrimp (*Alpheus heterochaelis*) during agonistic or foraging behaviours (Versluis et al. 2000). Snapping shrimp can increase background sound levels by a factor of 10 (20 dB) in the 500 Hz to 20 kHz frequency band (Hildebrand 2009). When a large number of sound-producing animals are present, both voluntary and involuntary sounds can combine to generate choruses where individual sounds cannot be distinguished. Chorusing fish can temporarily elevate the background sound levels by greater than tenfold in the 100 and 2000 Hz frequency band (Cato 1992, Zelick et al. 1999).

Diel trends in choruses can be indicative of time-specific behaviours, such as crepuscular or nocturnal fish activity (McCauley and Cato 2000, D'Spain and Batchelor 2006, McCauley and Cato 2016), with a variety of different species contributing the to the soundscape (Parsons et al. 2016, Parsons et al. 2017).

Many fish species produce sound during the breeding season or when engaged in agonistic behaviours (Amorim 2006). Several species of gadids (cod family), such as Northern cod (*Gadus morhua*) and haddock (*Melanogrammus aeglefinus*), form spawning aggregations that have been detected acoustically (Nordeide and Kjellsby 1999, Hawkins et al. 2002). The acoustic monitoring of fish is hindered by a limited understanding of their acoustic repertoire and behaviour. Nevertheless,

the stereotypical nature of acoustic signals produced by some species have led to the development of dedicated acoustic detectors (e.g., cod; see Urazghildiiev and Van Parijs 2016). These detectors allow for a more systematic analysis of acoustic data for fish occurrence. Irrespective of species identity, fish choruses can raise ambient noise levels and therefore influence local soundscapes (Erbe et al. 2015).

The main, best documented, biological contributors to the ocean soundscape are marine mammals. All studied cetacean and pinniped species produce sounds ranging in frequency from ~8 Hz for blue whale (*Balaenoptera musculus*) and fin whale (*B. physalus*) vocalisations to 150 kHz for some porpoise and dolphin vocalisations (Richardson et al. 1995).

Baleen whale sounds can double background sound levels within their frequency bands and persist for extended periods of time (McDonald et al. 2008), such as species off southern Australia, including pygmy blue and southern right whales, that are all notable contributors when present (Cato 1991, McCauley et al. 2001, Gavrilov and McCauley 2013, Erbe et al. 2016, McPherson et al. 2017). For instance, fin whale songs can raise noise levels in the 18–25 Hz band by 15 dB for extended durations (Simon et al. 2010).

Marine mammals, cetaceans in particular, rely almost exclusively on sound for navigating, foraging, breeding, and communicating (Clark 1990, Edds-Walton 1997, Tyack and Clark 2000). Although species differ widely in their vocal behaviour, most can be reasonably expected to produce sounds on a regular basis. Passive acoustic monitoring is therefore increasingly preferred as a cost-effective and efficient survey method. Seasonal and sex- or age-biased differences in sound production, as well as signal frequency, source level, and directionality, all influence the applicability and success rate of acoustic monitoring, thus its effectiveness must be considered separately for each species.

In most cases, baleen whale signals can be reliably identified to the species level, although, seasonal variation in the types of vocalisations produces results in seasonal differences in our ability to detect these species acoustically. For example, the tonal signals produced by blue, fin, and sei (*B. borealis*) whales tend to show lots of similarities in late spring and summer, but they are markedly different from September to April. These issues are considered and discussed on a case-by-case basis.

Knowledge of the acoustic signals of the marine mammals expected in the study area varies across species. These sounds can be split into two broad categories: Tonal signals, including baleen whale moans and delphinid whistles, and echolocation clicks produced by all odontocetes mainly for foraging and navigating. Although the signals of most species have been described to some extent, these descriptions are not always sufficient for reliable, systematic identification, let alone to design automated detectors to process large data sets.

3.4. Changes to Sound as it Travels in the Ocean

A key question in the study of underwater sound is how a sound changes in nature as it propagates from its source to a receiver some distance away. Understanding and modelling sound propagation in the ocean is a complex topic that is the subject of numerous studies. This section provides a descriptive overview of key sound propagation concepts to assist with the results presented in this report. These concepts are integral to interpreting how sounds emitted by a source are transformed into those received some distance away. The sounds are transformed by 1) geometric spreading losses; 2) reflection, scattering, and absorption at the seabed and sea surface; 3) refraction due to changes in sound speed with depth; and 4) absorption by sea water. This section does not address point 3), as sound refraction plays only a minor role in shallow water, such as the Otway Development area.

At one extreme, the echolocation clicks of porpoises at 130 kHz travel only 500 m before becoming inaudible (Au et al. 1999). At the other extreme, sounds from fin whales (20 Hz) and low frequency energy from seismic airguns (5–100 Hz) can be detected thousands of km away under the right conditions (Nieukirk et al. 2012).

Geometric spreading losses: Sound levels from an omnidirectional point source in the water column are reduced with range, a process known as *geometric spreading loss*. As sound leaves the source, each spherical sound wave propagates outward and the sound energy is spread out over this ever-expanding sphere. The farther you are from the source, the lower the sound level you will receive. The received sound pressure levels at a recorder located a distance R (in m) from the source are $20\log_{10}R$ dB lower than the source level (SL) referenced to a standard range of 1 m. However, the sound cannot spread uniformly in all directions forever. Once the waves interact with the sea surface and seabed, the spreading becomes cylindrical rather than spherical and is limited to the cylinder formed by the surface and seabed with a lower range-dependent decay of $10\log_{10}R$ dB. Thus, the water depth is a key factor in predicting spreading losses and thus received sound levels. These spherical and cylindrical spreading factors provide limits for quick approximations of expected levels from a given source. In very shallow waters, sound rapidly attenuates if the water depth is less than a quarter of a wavelength (Urick 1983).

Reflection, scattering, absorption at the sea surface and seabed: If geometric spreading were the only factor governing sound attenuation in water, then at a given distance from a source, sound levels in shallow waters would almost always be higher than those in deep waters. In shallow water, however, the sound interacts with the seabed and sea surface more often than sound travelling in deep waters does, and these interactions reflect, absorb, and scatter the sounds. The sea surface behaves approximately as a pressure release boundary, where incident sound is almost completely reflected with opposite phase. As a result, the sum of the incident and reflected sounds at the sea-surface is zero. At the seabed, many types of interactions can occur depending on the composition of the bottom. Soft silt and clay bottoms absorb sound, sand and gravel bottoms tend to reflect sound like a partially reflective mirror, and some hard yet elastic bottoms, such as limestone, reflect some of the sound while absorbing some of the energy by converting the compressional waves to elastic shear waves.

Absorption by sea water: As sound travels through the ocean, some of the energy is absorbed by molecular relaxation in the seawater, which turn the acoustic energy into heat. The amount of absorption that occurs is quantified by an attenuation coefficient, expressed in units of decibels per kilometre (dB/km). This absorption coefficient depends on the temperature, salinity, pH, and pressure of the water, as well as the sound frequency. In general, the absorption coefficient increases with the square of the frequency, so low frequencies are less affected. The absorption of acoustic wave energy has a noticeable effect (>0.05 dB/km) at frequencies above 1 kHz. For example, at 10 kHz the absorption loss over 10 km distance can exceed 10 dB, as computed according to the formulae of François and Garrison (1982a, b).

4. Methods

4.1. Acoustic Data Acquisition

Underwater sound was recorded with four Autonomous Multichannel Acoustic Recorders (AMARs, JASCO; Figure 10). The AMARs were each fitted with M36 omnidirectional hydrophones (GeoSpectrum Technologies Inc., −164 re 1 V/µPa at 1 kHz sensitivity) and recorded continuously at 24-bit resolution at 64 kHz. Three AMARs stored acoustic data with three SD cards with 512 GB memory each (1.5 TB total), and one AMAR (Station 4) used seven SD-cards with 512 GB memory each (3.5 TB total). Appendix C provides details about the calibration procedure.

The deployment of the AMARs coincided with an inspection trip of the pre-laid anchors at the Artisan 1 drilling location by the Siem *Sapphire*. They were deployed on 3 Feb 2021, for an intended deployment duration of approximately 60 days. The deployment of one of the moorings is shown in Figure 11. The mooring at Station 3 released upon contact with the seafloor, potentially due to the lander striking a rock on the seafloor. It was immediately retrieved, and after sourcing a new weight plate and being re-configured, it was re-deployed on 24 Feb 2021. The retrieval of the moorings was conducted by Beach under guidance from JASCO on 3 Apr 2021.

The AMARs were deployed as part of a JASCO C-lander, with tandem acoustic releases (Figure 10). Each mooring consisted of:

- An AMAR G4 and battery packs,
- A Xeos Apollo Locator Beacon,
- Custom syntactic foam,
- A tandem acoustic release system (EdgeTech), and
- An anchor weight.

The AMAR hydrophones were protected by a hydrophone cage, which was covered with a nylon shroud to minimise noise artifacts from water flow (described in Section 3.1). The AMAR at Station 4 was configured with three hydrophones to allow for directional analysis (Thode et al. 2019).

Figure 10. The four C-Lander bottom moorings with Autonomous Multichannel Acoustic Recorders (AMAR G4s; JASCO) used for the project prior to loading onto the Siem *Sapphire*.

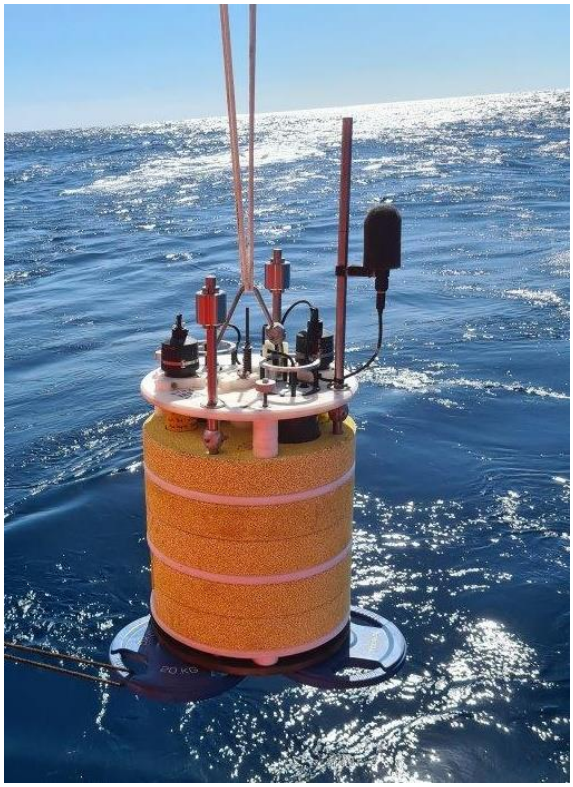

Figure 11. A single hydrophone C-Lander bottom mooring during deployment.

Table 7. Operation period, location, and depth of the Autonomous Multichannel Acoustic Recorders (AMARs) deployed at the Otway Project Area

Station	AMAR	Deployment	Recording duration (days)	Retrieval	Deployment duration (days)	Hydrophone details
1	628	3 Feb 2021	63	3 Apr 2021	58	One M36-V35-900
2	626	3 Feb 2021	63	3 Apr 2021	58	
3	627	24 Feb 2021	42	3 Apr 2021	37	
4	629	3 Feb 2021	63	3 Apr 2021	58	Three M36-V35-900

4.2. Data Analysis

The AMARs collected approximately 10.46 TB of acoustic data during this study, the equivalent of 1 year and 85 days JASCO used a specialised computing platform (PAMlab; JASCO) capable of processing acoustic data hundreds of times faster than real time. The system performed automated analysis of total ocean noise and sounds from vessels, other anthropogenic sources, and marine mammal vocalisations to provide context for the ambient ocean soundscape, anthropogenic contributors, and soniferous marine life (Section 3). Appendix D outlines the stages of the automated analysis.

4.2.1. Total Ocean Sound Levels

The data collected for the project spanned a frequency band between 10 Hz and 32 kHz. The goal of the total ocean sound analysis was to present the expansive data in a manner that documented the underwater sound conditions near Artisan-1 and allowed a comparison over time, along with external factors that change sound levels, such as weather and human activities.

The first stage of the total sound level analysis involves computing the peak sound pressure level and root-mean-square sound pressure level (SPL) for each minute of data collected. This reduced the data to a manageable size without compromising the value for characterising the soundscape (ISO 2017b, Ainslie et al. 2018, Martin et al. 2019). The SPL analysis was performed by averaging 120 fast-Fourier transforms (FFTs) that each include 1 s of data with a 50% overlap and that use the Hann window to reduce spectral leakage. The 1-minute average data were stored as power spectral densities (1 Hz resolution up to 455 Hz and millidecades frequency bands above 455 Hz) and summed over frequency to calculate decidecade band SPL levels. The millidecade band analysis approach is described in Martin et al. (2021). Millidecades are logarithmically spaced frequency bands but have a bandwidth equal to 1/1000th of a decade. The use of millidecades instead of 1 Hz frequency bands reduces the size of the spectral data by a large factor without compromising the use of the data.

Decidecade band levels are very similar to 1/3-octave-band levels. Table B-1 lists the decidecade band frequencies, and Table B-2 lists the decade-band frequencies. The decidecade analysis sums the frequency range from the millidecade bands (representing the frequency range 10 Hz to 32 kHz) in the power spectral density data to a manageable set of 45 bands. The decade bands further summarise the sound levels into four frequency bands for manageability. Detailed descriptions of the acoustic metrics and decidecade analysis can be found in Appendices B.1 and B.2.

In Section 5, the total sound levels are presented as:

- **Band-level plots**: These strip charts show the averaged received sound pressure levels as a function of time within a given frequency band. We show the total sound levels (across the entire recorded bandwidth from 10–32,000 Hz) and the levels in the decade bands of 10–100 (Decade A), 100–1000 (Decade B), 1000–10,000 (Decade C). The 10–100 Hz band is associated with pygmy blue whales, large shipping vessels, flow (or pseudo-noise) and mooring noise, and seismic survey impulses. Sounds within the 100–1000 Hz band are generally associated with the physical environment such as wind and wave conditions but can also include both biological and anthropogenic sources such as minke and humpback whales, fish, nearby vessels, seismic surveys, and pile driving. Sounds above 1000 Hz include high-frequency components of humpback whale sounds, odontocete whistles and echolocation signals, wind- and wave-generated sounds, and sounds from human sources at close range including pile driving, vessels, seismic surveys, and sonars.

- **Long-term Spectral Averages (LTSAs)**: These colour plots show power spectral density levels as a function of time (*x*-axis) and frequency (*y*-axis). The frequency axis uses a logarithmic scale, which provides equal vertical space for each decade increase in frequency and allows the reader to equally see the contributions of low and high-frequency sound sources. The LTSAs are excellent summaries of the temporal and frequency variability in the data.
- **Decidecade box-and-whisker plots**: In these figures, the 'boxes' represent the middle 50% of the range of sound pressure levels measured, so that the bottom of the box is the sound level 25th percentile (L_{25}) of the recorded levels, the bar in the middle of the box is the median (L_{50}), and the top of the box is the level that exceeded 75% of the data (L_{75}). The whiskers indicate the maximum and minimum range of the data.
- **Spectral density level percentiles**: The decidecade box-and-whisker plots are representations of the histogram of each band's sound pressure levels. The power spectral density data has too many frequency bins for a similar presentation. Instead, coloured lines are drawn to represent the L_{eq}, L_5, L_{25}, L_{50}, L_{75}, and L_{95} percentiles of the histograms. Shading is provided underneath these lines to provide an indication of the relative probability distribution. It is common to compare the power spectral densities to the results from Wenz (1962), which documented the variability of ambient spectral levels off the US Pacific coast as a function of frequency of measurements for a range of weather, vessel traffic, and geologic conditions. The Wenz levels are appropriate for approximate comparisons only because the data were collected in deep water, largely before an increase in low-frequency sound levels due to human activities (Andrew et al. 2011).
- **Daily sound exposure levels (SEL; $L_{E,24h}$)**: The SEL represents the total sound energy received over a 24 h period, computed as the linear sum of all 1-minute values for each day. It has become the standard metric for evaluating the probability of temporary or permanent hearing threshold shift in marine mammals. Long-term exposure to sound impacts an animal more severely if the sounds are within its most sensitive hearing frequency range. Therefore, during SEL analysis, recorded sounds are typically filtered by the animal's auditory frequency weighting function (Appendix E) before integrating to obtain SEL. For this analysis, the 10 Hz and above SEL were computed as well as the SEL weighted by the marine mammal auditory filters (NMFS 2018).

4.2.2. Directional Processing: Maximum Likelihood Beamforming

A maximum likelihood beamformer was applied to direction finding of the Station 4 acoustic data. For random continuous and impulsive signals, such as ship noise, anthropogenic noise, and marine animal vocalisations, the beamforming technique is reduced to Distance of Arrival (DOA) estimation. The sufficient statistic for random signals is the sampled covariance matrix,

$$\boldsymbol{C}(f,t) = \sum_{t}^{t+T_C} \boldsymbol{x}(f,t)\boldsymbol{x}^{+}(f,t)\,, \tag{1}$$

computed using N-dimensional DFT spectrums of array outputs, $\boldsymbol{x}(f,t) = [x_1(f,t), \ldots, x_N(f,t)]^T$; where $x_n(f,t) = DFT\{x_n(t)\}$ is the short-time discrete Fourier Transform of the output of the *n*th hydrophone, $x_n(t)$. The output of the beamformer can be represented as:

$$P(f,t,\theta,\varepsilon) = \boldsymbol{w}^{+}(f,\theta,\varepsilon)\boldsymbol{C}(f,t)\boldsymbol{w}(f,\theta,\varepsilon)\,, \tag{2}$$

where $\boldsymbol{w}(f,\theta,\varepsilon) = [w_1(f,\theta,\varepsilon), \ldots, w_N(f,\theta,\varepsilon)]^T$ is the N-dimensional vector of weighting coefficients of the array; and symbol "+" denotes transpose and complex conjugation, θ is the azimuth angle and ε is the estimation error. Figure 12 shows an example of the beamformer output in azimuth domain, $P(f,t,\theta,\varepsilon = 0)$. In this figure, colour represents the azimuth. The azimuth and elevation estimates of random signals can be computed for each frequency f and time slice t as:

$$\{\hat{\theta}(f,t), \hat{\varepsilon}(f,t)\} = arg\max_{\theta,\varepsilon} P(f,t,\theta,\varepsilon)\,. \tag{3}$$

An example of the directional information we obtain from this approach is shown in Figure 12. The performance of the beamformer is presented in Urazghildiiev and Hannay (2017). This method is most effective between 50 and 3000 Hz. The direction of true North was obtained using AIS data compared to vessel movements observed in the acoustic data.

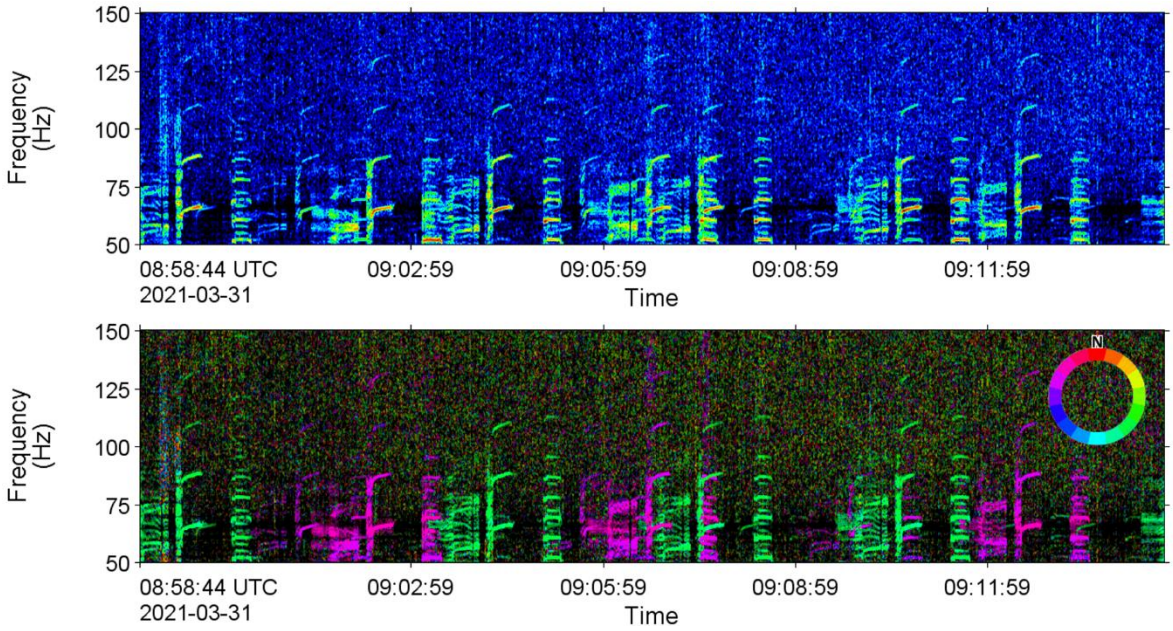

Figure 12. Spectrogram (top) versus directogram (bottom) of same data. In the directogram, colour represents the direction of arrival, with the colour legend shown in the top right corner. In the spectrogram, we cannot tell how many pygmy blue whales are vocalising; however, the directional information allows us to see that there were two animals singing.

4.2.3. Source Level Measurements with ShipSound

4.2.3.1. Overview

JASCO's ShipSound software monitors sound level measurements and AIS broadcasts from passing vessels. For vessel transiting scenarios, it identifies vessels that traverse a predefined transit area and then automatically extracts the corresponding acoustic data for analysis. It uses a vessel's broadcast speed together with a cepstral analysis of the Lloyd mirror pattern to determine the timing and location of closest point of approach (CPA) of the vessel's acoustic centre. For stationary sources, such as MODU or vessels in DP, it processes acoustic data within the specified period for the activity. ShipSound can analyse streaming data from a hydrophone in real time or, as in the case of the Beach Otway recorders, analyse archival hydrophone data downloaded from autonomous recorders. The vessel AIS data were based on Marine Traffic AIS data, vessel measurement logs, as well as client-provided data. AIS data were fed into the ShipSound system for vessel source level analysis. Environmental conditions, such as wind speed, were also recorded for each measurement. Ocean current data can be used to calculate speed through water (STW) from speed over ground (SOG) information received via AIS for each vessel measurement. However, current speed was not available in this project area, so STW was not calculated.

For transiting vessel measurements, the ANSI/ASA S12.64 data window is defined by the period over which the acoustic centre is within ±30° of the CPA. ShipSound can automatically determine the data window. For stationary sources, ShipSound determines the data window based on input specified time. ShipSound processes a single acoustic channel in 1-second periods stepped in 0.5-second intervals (Figure 13). Spectrum measurements are calculated using 1-second fast Fourier transforms, shaded using a Hanning window.

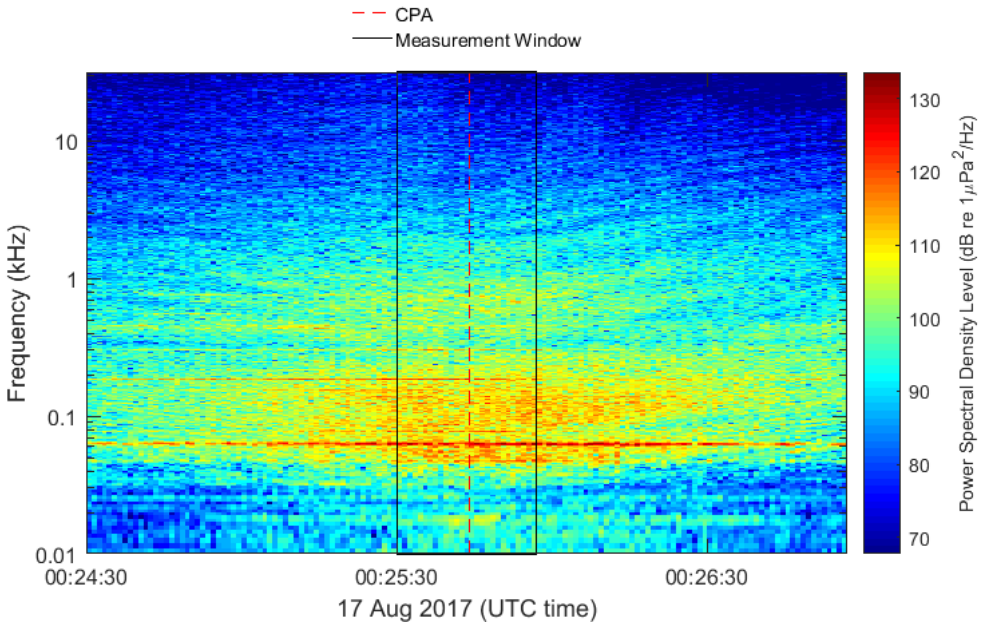

Figure 13. Spectrogram of a single transiting vessel measurement from ShipSound, showing the closest point of approach (CPA) time (dashed red line) and the measurement window (black box) used for calculating vessel source levels. The spectrogram shows the spectrum of the underwater sound pressure recorded on the hydrophone versus time and frequency.

ShipSound calculates two kinds of vessel source levels from the data window: Radiated Noise Level (RNL) and Monopole Source Level (MSL). RNL is equal to the measured sound pressure level, back-propagated according to the distance between a source and the hydrophone. The software applies the ANSI/ASA S12.64 Grade-A method for back-propagation distance: it determines instantaneous vessel range (R) in metres from the measurement hydrophone for each 1-second step within the data window. The RNL back propagation method of $20 \times \mathrm{Log}_{10}(R)$ is applied to the spectra of each step separately. MSL is equal to the measured sound pressure level scaled according to a numerical acoustic propagation loss (PL) model that accounts for the effect of the local environment on sound propagation (i.e., sea-surface reflection, water column refraction and absorption, and bottom loss). Since no single acoustic model is applicable at all sampled ranges and frequencies, a hybrid TL model was used to calculate MSL as follows:

1. At frequencies less than 4 kHz and ranges less than 120 m, PL was calculated using a wavenumber integration model (Hannay et al. 2010, Jensen et al. 2011), which computes reflection coefficients for layered elastic media (Brekhovskikh 1980).
1. At frequencies less than 4 kHz and ranges greater than 240 m, PL was calculated using a wide-angle parabolic equation model (Collins 1993), modified to treat reflection losses for an elastic seabed using a complex-density equivalent fluid approximation (Zhang and Tindle 1995).
2. At frequencies less than 4 kHz and ranges between 120 m and 240 m, PL was calculated from the average of the parabolic equation and wavenumber integration models.
3. At frequencies greater than 4 kHz, PL was calculated using an image-method model (Brekhovskikh and Lysanov 2003), which accounts for surface and seabed reflection coefficients and frequency-dependent absorption (François and Garrison 1982b).

Average TL in each decidecade band was based on the mean propagation factor calculated at 50 frequencies, which were spaced logarithmically between the minimum and maximum band limits. Mean source depth for the MSL calculation was taken to be:

1. For vessel transit, source depth is defined as shaft depth minus 0.7 of the propeller radius. The stern propeller diameter of 4.2 m was used for the calculation.
2. For vessel in DP, since all the thrusters were operating and each are at different depths, the source depth is defined as 0.7 times vessel static draft reported on AIS.
3. For the MODU, the source depth is defined as half the static draft reported on AIS, which gives 11 m of the source depth.

The TL was smoothed by assuming the source depth had a Gaussian distribution, in a manner similar to Wales and Heitmeyer (2002), where the standard deviation was taken to be 30% of the source depth. Additional details regarding the automated source level measurement system are given in Hannay et al. (2016b). ShipSound also calculates background noise in each frequency band. For vessel measurements, ShipSound only accepts measured source band levels if they exceed the background levels by 3 dB or more. ShipSound corrects the band levels if they exceed background levels by 3–10 dB but rejects them if they are less than 3 dB above background. Adjusted and rejected levels are flagged in the database. Figure 14 summarises this approach.

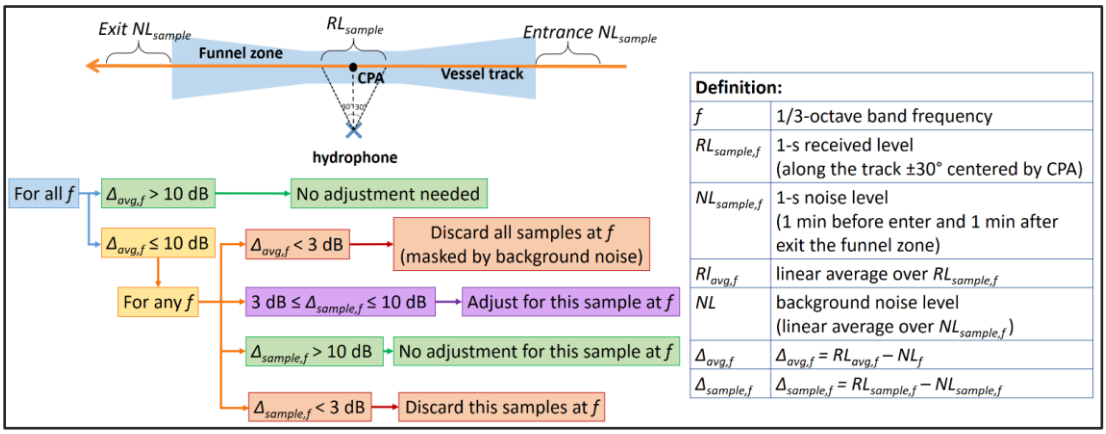

Figure 14. Background noise comparison and adjustment process.

PortListen includes a web-based user interface to access vessel and measurement information. A table view screen lets the user select and view multiple measurements by vessel criteria. This information, including broadband MSL and RNL source levels, can be exported as a spreadsheet. Vessel measurements are summarised in PDFs, presenting vessel and environment information, and the 1/3-octave-band MSL and RNL source levels. A manual quality review of every measurement was performed by an experienced analyst using the web-based interface. An analyst may reject a measurement because it contains interference from other vessels, has high levels of background noise, or if a vessel does not have constant speed and a straight track inside the data window.

MSL was the preferred metric for noise modelling because MSL back-propagation better accounts for the effect of the environment on vessel source levels (e.g., from absorption, surface, and seabed reflections) than RNL back-propagation. Measurements for vessel transits were obtained at different speeds, Ross's classical power law model (Ross 1976) was used to adjust the source levels to a reference speed. The change in source level (SL) to relative changes in speed:

$$\mathrm{SL} - \mathrm{SL}_{\mathrm{ref}} = C_v \times 10 \log_{10}\left(\frac{v}{v_{\mathrm{ref}}}\right). \quad (4)$$

In this equation, SL is the source level at speed v, $\mathrm{SL}_{\mathrm{ref}}$ is the source level at some reference speed v_{ref}, and $\mathrm{C_v}$ = 6, which is a coefficient corresponding to the slope of the curve.

4.2.3.2. MODU

The provided drill logs for the Artisan-1 well were reviewed to identify periods of activity defined as drilling, as this was the activity considered in the modelling study Koessler et al. (2020). Activities associated with mooring operations, cementing, installation of the Blow Out Preventer (BOP), or running casing were not considered. Twenty time periods for drilling were identified, and Long-term Spectral Averages (LSTAs) were created to review the data. From these data, 115 ten-minute time periods were identified as suitable or of interest for processing with ShipSound, listed in Table 8. Of these measurements, 70 were accepted (i.e., passed a manual quality review). Some measurements were rejected by the contamination of nearby vessels in DP (by checking both AIS data and noise spectrum). Source level measurements were matched with drill logs and the source levels were grouped by the drilling activities. The MSL was calculated over three different drilling depth ranges and presented as mean and maximum levels.

Table 8. Details of selected measurement periods for the *Ocean Onyx* mobile offshore drilling unit (MODU) and corresponding drill activities.

Drill activity	Date	Start	End	QC status
Spudded Artisan 1 at 2100 h. Drilled from 94.7 m (seabed) to 115 mMDRT. Pumped 100 bbl PHG sweep and took MWD survey at connection. Survey at 95.62 mMDRT: 0.82 deg inc, 13.97 deg azimuth. *Parameters*: 10–40 rpm, 3–5 kft-lbs torq, 8–10 klbs WOB, 600 gpm, 170 psi SPP	2021 Feb 23	10:05:00	10:15:00	Rejected

4.2.3.3. Vessels

ShipSound was used to process a total of 4 vessel DP measurements collected from Station 2, five vessel transit measurements collected from Station 2, and 16 vessel transit measurements collected from Station 4. All these measurements were accepted measurements. Details of the measurements were shown in Table 9. The classical power law model of Ross (1976) was used to calculate source levels to a referenced speed (Section 4.2.3.1), with the speed scaling coefficients C_v = 6 proposed by Ross (1976).

Table 9. Vessel measurements collected from Stations 2 and 4.

4.2.4. Fit Equations

For each minute of data at each station, the analysis provided the range and received sound levels, with the metric of interest being SPL. To be able to understand the trends of the change in sound levels with range, and to interpolate the sound levels in between the measurement locations, it is required to obtain equations which represent the measurement data. The data were fit using linear models from 'R' (R Core Team 2020) of the form:

$$\text{model} = lm(\text{SPL} \sim \log(range) + range)\,. \quad (5)$$

The tilde (~) is used to separate the left- and right-hand sides in a model formula. The models provide the following values that fit the data:

- An intercept,
- Coefficients multiplied by log10(range), and
- Range.

The coefficient of log10(range) may be interpreted as the average geometric spreading for the environment. The coefficient of range may be interpreted as an additional loss term that models the effects of reflection and scattering when the sound interacts with the surface and seabed. This simple model formulation is valid when:

- There are no systematic changes to the geometric spreading–i.e., it is not valid very close to the Ocean Onyx and associated vessel movements within the 500 m zone where DP is required,
- The seabed geoacoustic properties are approximately constant, and
- The water depth does not significantly vary.

The models were used to predict the most likely data values for ranges of 20 to 6000 m, as well as the 90% prediction interval. The top of the prediction interval corresponds to the value that is greater than 95% of the measured data. The distance to 95% of the measured data is not the same as the $R_{95\%}$ range determined through modelling.

The coefficient of determination (r2) was used to assess the validity of the fit, with fits where r2 was less than 0.85 being flagged as suspect.

The per-minute SPL at each station was influenced by both the operations centred on the Ocean Onyx and sound sources close to each station. To create a model which focuses on understanding the trends of the change in sound level with range in relation to activities closes to Station 1, the data was split into three different sets. The data was therefore presented in the following ways:

- All per-minute SPL data from Station 1–3 while the Ocean Onyx was operational (01:00 12 Feb through until 00:00 25 Mar)
- Per-minute SPL data for per-minute SPL at Station 1 between 130 and 150 dB re 1µPa, thereby excluding periods when high noise levels, likely due to a close support vessel, or support vessels operating at high thrust levels which might skew the fit.
- Per-minute SPL data for per-minute SPL at Station 1 over 150 dB re 1µPa, to examine the trends in change in sound level with range for notably loud period at Station 1.
- The low-frequency weighted per-minute SPL can be adjusted by $10*\log_{10}(T)$, where T is 1440 (the number of minutes in 24 h) to determine the daily SEL for each of the three data sets.

4.2.5. Vessel Noise Detection

Outside of the specific individual vessel analysis requirements, vessels are detected in two steps (Martin 2013):

1. Detect constant, narrowband tones produced by a vessel's propulsion system and other rotating machinery (Arveson and Vendittis 2000). These sounds are also referred to as tonals. We detect the tonals as lines in a 0.125 Hz resolution spectrogram of the data (8 s of data, Hann window, 2 s advance).
2. Assess the SPL for each minute in the 40–315 Hz shipping frequency band, which commonly contains most sound energy produced by mid-sized to large vessels. Background estimates of the shipping band SPL and system-weighted SPL are then compared to their mean values over a 12 h window, centred on the current time.

Vessel detections are defined by the following criterion (Figure 15):

1. SPL in the shipping band (40–315 Hz) is at least 3 dB above the 12 h mean for the shipping band for at least 5 min.
2. AND at least three shipping tonals (0.125 Hz bandwidth) are present for at least 1 min per 5 min window. Tonals are difficult to detect during turns and near the closest points of approach (CPA) due to Lloyds' mirror and Doppler effects.
3. AND SPL in the shipping band is within 12 dB of the system weighted SPL.

The duration where these constraints are valid is identified as a period with shipping present. A 10 min shoulder period before and after the detection period is also included in the shipping period. The shipping period is searched for the highest 1 min SPL in the vessel detection band, which is then identified as the CPA time. This algorithm is designed to find detectable shipping, meaning situations where the vessel noise can be distinguished from the background. It does not identify cases of two vessels moving together or cases of continuous noise from stationary platforms, such as oil and gas drilling and dynamic positioning operations. Those situations are easily identified from tools such as the daily SEL and long-term spectral average figures.

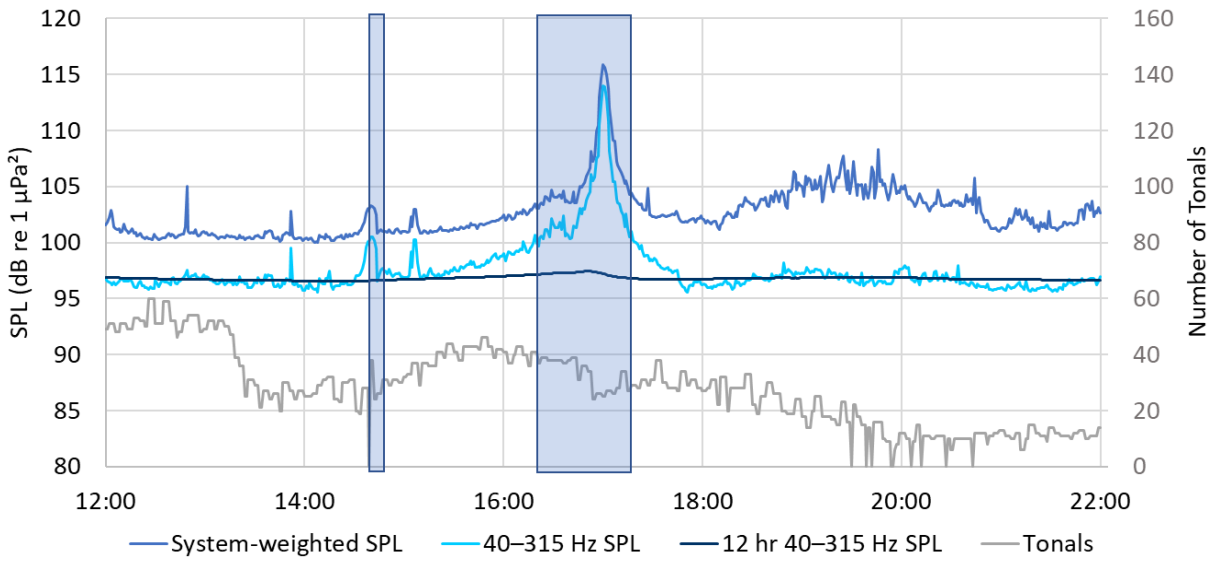

Figure 15. Example of broadband and 40–315 Hz band sound pressure level (SPL), as well as the number of tonals detected per minute as a vessel approached a recorder, stopped, and then departed. The shaded area is the period of shipping detection. Fewer tonals are detected at the vessel's closest point of approach (CPA) at 17:00 because of masking by broadband cavitation noise and due to Doppler shift, that affects the tone frequencies.

4.2.6. Seismic Survey Event Detection

Seismic pulse sequences were looked for using correlated spectrogram contours. The processing calculated spectrograms using a 300 s long window with 4 Hz frequency resolution and a 0.05 s time resolution (Reisz window). All frequency bins were normalised by their medians over window the 300 s window. The detection threshold was set to three times the median value at each frequency. If pulses were found, contours were created by joining the time-frequency bins above threshold in the 7–1000 Hz band using a 5 × 5 bin kernel. Contours 0.2–6 s in duration with a bandwidth of at least 60 Hz are then further analysed.

The process is used to create an "event" time series by summing the normalised value of the frequency bins in each time step that contained detected contours. The event time series is auto correlated to look for repeated events. The correlated data space was normalised by its median, and a detection threshold of 3 was applied. Peaks larger than their two nearest neighbours can be identified, and the list of peaks searched for entries with a set repetition interval. The allowed spacing between the minimum and maximum time peaks was 4.8–65 s, which captures the normal range of seismic pulse periods. If at least six regularly spaced peaks occur, the original event time series is searched for all peaks that match the repetition period within a tolerance of 0.25 s. The duration of the 90% SPL window of each peak can be determined from the originally sampled time series, and pulses more than three second long were rejected.

Despite the flexibility of the detection process, no impulses were detected, and thus no results are presented for seismic survey impulses.

4.2.7. Marine Mammal Detection Overview

We used a combination of automated detector-classifiers (referred to as automated detectors) and manual review by experienced analysts to determine the presence of sounds produced by marine mammals in the acoustic data. First, a suite of automated detectors was applied to the full data set (Appendices D.1 and D.2). Second, a subset (0.5%) of acoustic data was selected for manual analysis of marine mammal acoustic occurrence. The subset was selected based on automated detector results via our Automatic Data Selection for Validation (ADSV) algorithm (Kowarski et al. 2021) (Appendix D.3). Third, manual analysis results were compared to automated detector results to determine automated detector performance (Appendix D.4). Finally, hourly marine mammal occurrence plots were created that incorporated both manual and automated detections as well as automated detector performance metrics to provide a reliable representation of marine mammal presence in the acoustic data (Section 5.7). These marine mammal analysis steps are summarised here and described in detail in Appendix D.

4.2.7.1. Automated Click Detection

Odontocete clicks are high-frequency impulses ranging from 5 to over 150 kHz (Au et al. 1999, Møhl et al. 2000). We applied an automated click detector to the acoustic data to identify clicks from sperm whales and delphinids. This automated detector is based on zero-crossings in the acoustic time series. Zero-crossings are the rapid oscillations of a click's pressure waveform above and below the signal's normal level (e.g., Figure D-1). Zero-crossing-based features of automatically detected events are then compared to templates of known clicks for classification (see Appendix D.1 for details).

4.2.7.2. Automated Tonal Signal Detection

Tonal signals are narrowband, often frequency-modulated, signals produced by many species across a range of taxa (e.g., baleen whale moans and delphinids whistles). They range predominantly between 15 Hz and 20 kHz (Steiner 1981, Berchok et al. 2006, Risch et al. 2007). The automated tonal signal detector identified continuous contours of elevated energy and classified them against a library of marine mammal signals (see Appendix D.2 for details).

4.2.7.3. Evaluating Automated Detector Performance

JASCO's suite of automated detectors are developed, trained, and tested to be as reliable and broadly applicable as possible. However, the performance of marine mammal automated detectors varies across acoustic environments (e.g., Hodge et al. 2015, Širović et al. 2015, Erbs et al. 2017, Delarue et al. 2018). Therefore, automated detector results must always be supplemented by some level of manual review to evaluate automated detector performance. Here, we manually analysed a subset of 5 min acoustic files for the presence/absence of marine mammal acoustic signals via spectrogram review in JASCO's PAMlab software. A subset (0.5%) of acoustic data from each station was selected via ADSV for manual review (Appendix D.3).

To determine the performance of the automated detectors at each station per 5 min acoustic file, the automated and manual results (excluding files where an analyst indicated uncertainty in species occurrence) were fed into an algorithm that calculates precision (*P*), recall (*R*), and Matthew's Correlation Coefficient (*MCC*) (see Appendix D.4 for formulas). *P* represents the proportion of files with detections that are true positives. A *P* value of 0.90 means that 90% of the files with automated detections truly contain the targeted signal, but it does not indicate whether all files containing acoustic signals from the species were identified. *R* represents the proportion of files containing the signal of interest that were identified by the automated detector. An *R* value of 0.90 means that 90% of files known to contain a target signal had automated detections, but it says nothing about how many files with automated detections were incorrect. An MCC is a combined measure of *P* and *R*, where an MCC of 1.00 indicates perfect performance–all events were correctly detected. The algorithm determines a per file automated detector threshold (the number of automated detections per file at and above which automated detections were considered valid) that maximizes the MCC.

The acoustic occurrence of each species (both automated and manual results) was plotted using JASCO's Ark software as time series showing presence/absence by hour over each day of the recording period. Automated detector performance metrics are provided alongside these figures and should be considered wen interpreting results.

4.3. Modelling Validation

In order to validate the modelled predictions presented in Koessler et al. (2020), the calculated Monopole Source Levels (MSLs), which were computed from measured data using the method outlined in Section 4.2.3, were used to update the acoustic model inputs for the scenarios from Koessler et al. (2020). This process yielded new ranges to thresholds based on in-situ measured data. Only the scenarios for Artisan (i.e., Scenario 5 – 8 in Koessler et al. (2020)) were consider for a validation exercise.

The following process was implemented for updating the inputs to the acoustic model.

1. Update the sound speed profile to use predictions from the Global Ice Ocean Prediction System (GIOPS) forecasting system for the period when the data was acquired. Determine and median profile to best represent potential propagation conditions over the February 2021 – March 2021 periods.
2. Update the decidecade MSLs and MSL source depth based on the results of the ShipSound analysis presented in Section 5.5.
3. Re-run all propagation modelling, gridding and radii calculations as detailed in Koessler et al. (2020) with these updated input parameters for all scenarios.

During this process, the data fit plots discussed in Section 4.2.4 and presented Section 5.3 were reviewed in the context of results from previous modelled scenarios and newly acquired MSLs to infer the appropriateness of the seabed selection for the Artisan development area and its effect on the distances to thresholds. Further detail can be found in Section 6.2.

5. Results

5.1. Soundscape Characterisation

Long-term spectra averages, power spectral density, and decidecade band box plots are shown in Figure 16 for all stations during the period the *Ocean Onyx* was moored (01:00 12 Feb through 00:00 25 Mar 2021), with the decade band percentile levels presented in Table 10.

The same plots are presented for two examples of operational activity at the *Ocean Onyx* (Table 8), Figure 17, from 5 Mar 2021, which included resupply and drilling operations, and Figure 18, from 26 Feb 2021, for a drilling operations with support vessels further from the *Ocean Onyx*.

5.1.1. Spectrograms and Statistical Analysis

The spectrogram and band-level plots for all stations (Figure 16) provide an overview of the sound variability in time and frequency presenting an overview of presence and level of contribution from different sources. Short-term events appear as vertical stripes on the spectrograms and spikes on the band level plots. Long-term events affect (increasing or decreasing accordingly) the band level over the event period and appear in the spectrograms as horizontal bands of colour.

The most prominent feature to note is the decrease in sound level with distance from the drill rig. Stations 1 and 2, located 336 m and 1132 m from the platform respectively, demonstrate elevated sound levels across all frequencies, but particularly at frequencies under approximately 2000 Hz. This is consistent with the bands most typically impacted by seismic and pressure fluctuations, as well as vessel noise, as can be seen in the Wenz curves of Figure 9. At these two stations, the L_{50} and above, as well as the L_{mean} percentiles exceed the upper limit of the Wenz curve across all frequencies. At Stations 3 and 4, located 5 km and 25 km from the platform respectively, the sound levels are much reduced. Station 3 still receives some sound energy emitted from the platform and associated operations, whereas these contributions are not notable within Station 4's soundscape, as can be seen in the two right side panels of Figure 16. The soundscape of these two stations is more influenced by vessel traffic, apparent by the 'ripples' in the L_{mean} percentiles between 40 and approximately 100 Hz, which are due to narrowband tones produced by vessel propulsion systems.

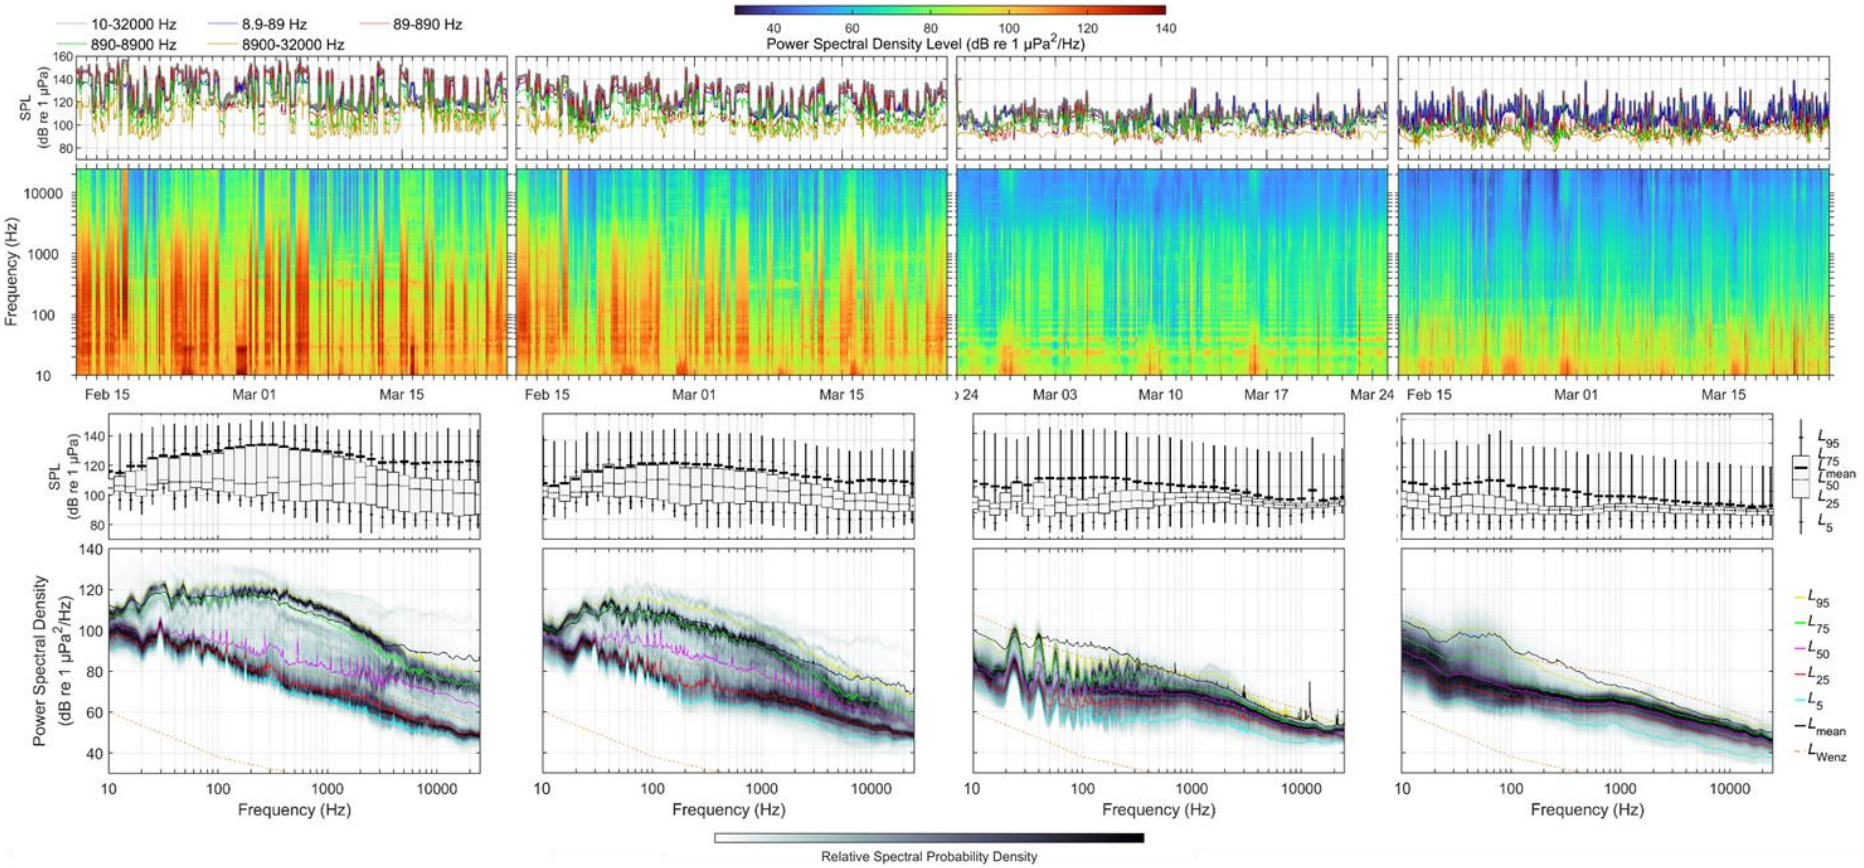

Figure 16. *Entire Ocean Onyx moored period*: (Top row) In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound, (bottom row) percentiles and mean of decidecade sound pressure level (SPL) and percentiles and probability density (grayscale) of 1-min power spectral density levels, by station compared to the Wenz curve limits (coloured lines) of prevailing noise (Wenz 1962), for 01:00 12 Feb through until 00:00 25 Mar, for Stations 1, 2 and 4, or from 12:00 24 Feb for Station 3.

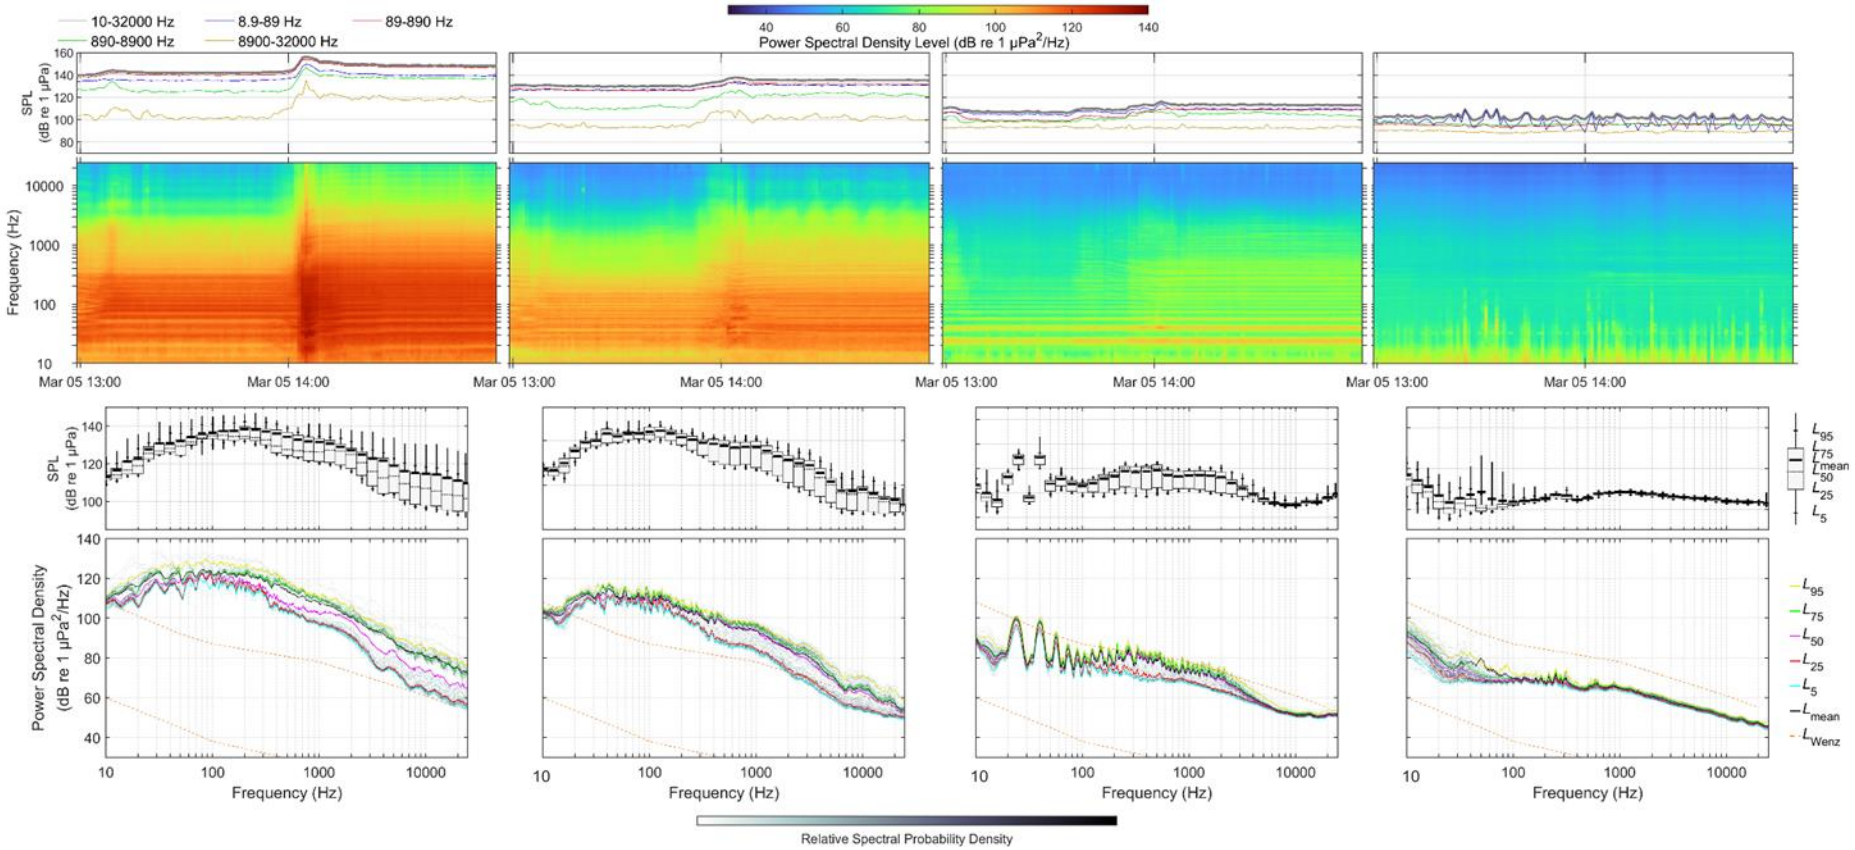

Figure 17. *Drilling and vessel operation 5 Mar 2021*: (Top row) In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound, (bottom row) percentiles and mean of decidecade sound pressure level (SPL) and percentiles and probability density (grayscale) of 1-min power spectral density levels, by station for a drilling period on 5 Mar 2021 (Table 8) which included resupply and support vessels, compared to the Wenz curve limits (coloured lines) of prevailing noise (Wenz 1962).

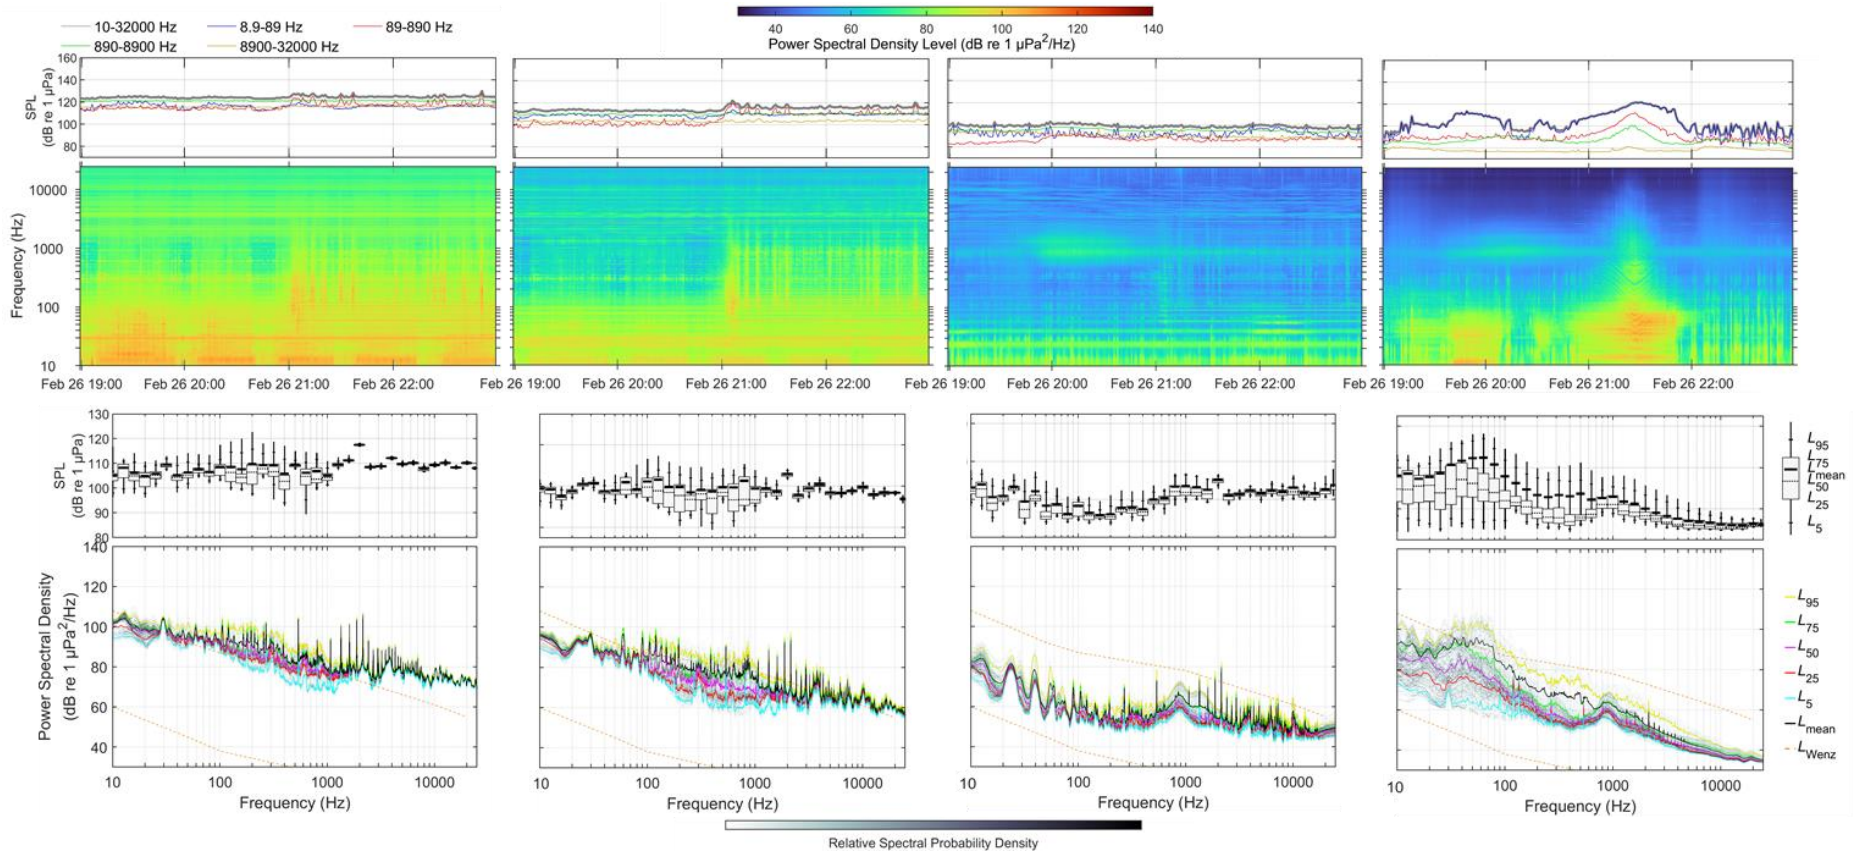

Figure 18. *Drilling operations 26 Feb 2021*: (Top row) In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound, (bottom row) percentiles and mean of decidecade sound pressure level (SPL) and percentiles and probability density (grayscale) of 1-min power spectral density levels, by station for a drilling period on 5 Mar 2021 compared to the Wenz curve limits (coloured lines) of prevailing noise (Wenz 1962).

Table 10. Statistical a0nalysis of sound levels while *Ocean Onyx* was moored, 01:00 12 Feb through until 00:00 25 Mar 2021, for Stations 1, 2, and 4, or from 12:00 24 Feb 2021 for Station 3. SPL units: dB re 1 µPa.

5.1.2. Frequency Weighted Sound Exposure Levels

The perception of underwater sound depends on the hearing sensitivity of the receiving animal in the frequency bands of the sound. Hearing sensitivity in animals, however, varies over the frequency band of their hearing (the hearing curve (audiogram) usually resembling a U-shaped form). The frequency range of hearing and hearing sensitivity differ between species, resulting in the fact that different species will perceive underwater sound differently. Auditory (frequency) weighting functions (Appendix E) are applied to account for this difference as they reflect an animal's ability to hear a sound, emphasising the frequency band of best sensitivity over frequencies animals do not hear well. Figure 19 shows the difference between perceived ambient noise by low-, mid- and high frequency cetaceans. Similar to the figures in Section 5.1.1, Figure 19 demonstrates the decrease in sound levels with distance from the drilling platform. Station 4 is more exposed to general shipping traffic within the shipping lanes when compared to Station 3 (Figure 3), and thus its daily SEL were more variable, being less influenced or driven by activity close to the *Ocean Onyx* more by the frequency of shipping traffic. The low-frequency cetacean weighted daily SEL for all stations, along with the thresholds for PTS and TTS (Section 2.6) are shown in Figure 20.

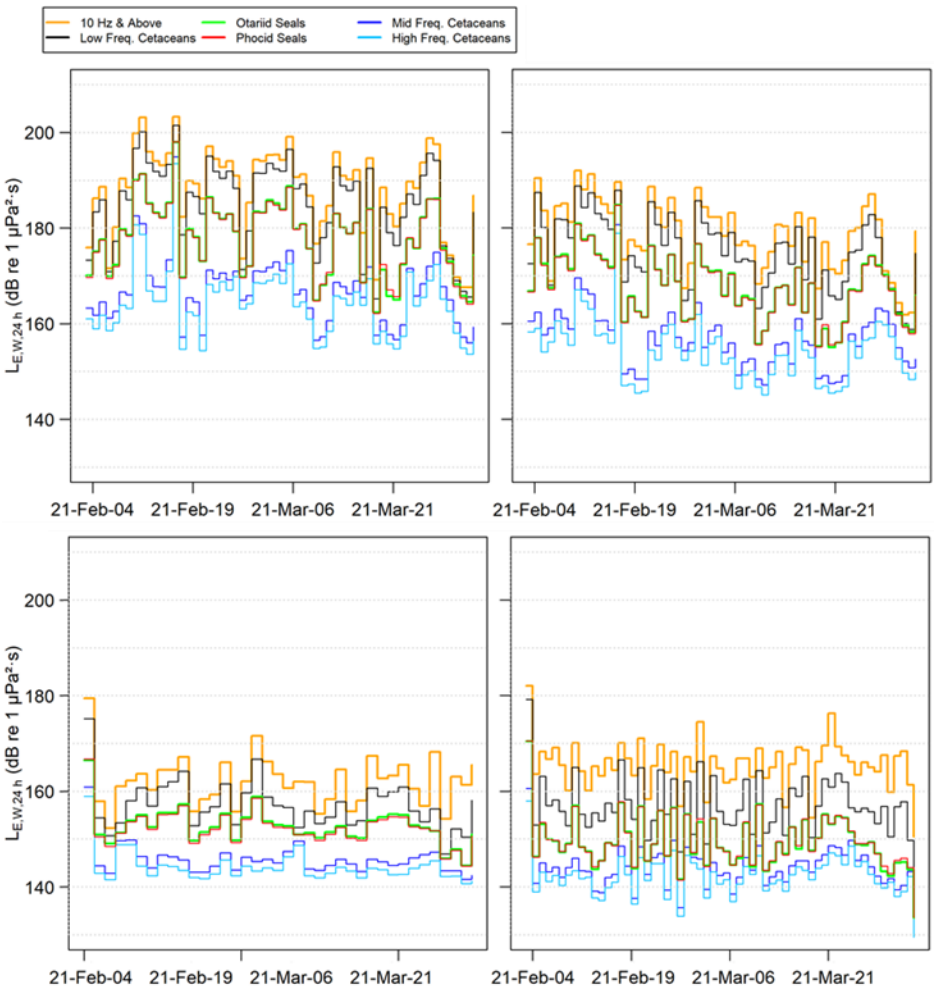

Figure 19. Auditory frequency weighted ambient noise (10 Hz and above) over the measurement period shown as daily sound exposure levels (SEL) (NMFS 2018). (Top left to right) Stations 1 and 2 and (bottom left to right) Stations 3 and 4. Locations are provided in Table 4.

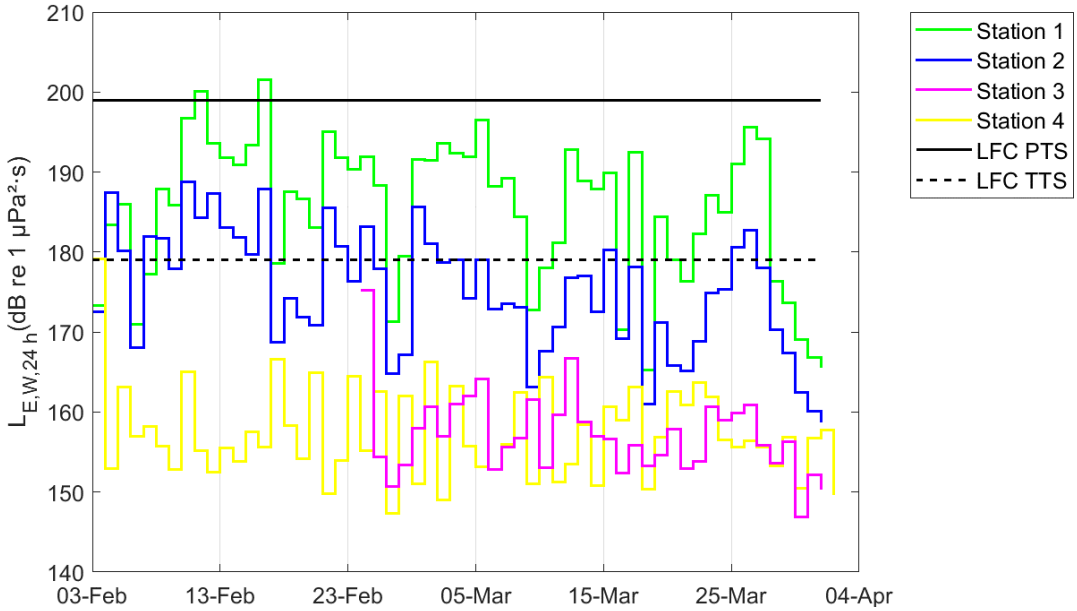

Figure 20. Daily low-frequency cetacean (LFC) weighted sound exposure levels (SEL) (NMFS 2018) at each station (composite created from Figure 19, station locations provided in Table 4), including thresholds for permanent threshold shift (PTS) and temporary threshold shift (TTS) (Table 6).

5.2. Environmental Correlations

The environmental conditions during the drilling period, specifically the wave height and wind speed, were compared to sound pressure levels during the drilling period in the 20 Hz, 80 Hz, 630 Hz, 3150 Hz, and 125000 Hz decidecade bands in the correlograms in Figure 21. Correlograms offer two ways to visualise correlations between two variables: the upper right panels show the scatter plot between each variable pair, and the bottom left show the strength of the correlation both by amount of the circle filled and depth of the colour. Blue represents a positive correlation, and red a negative. The four panels show Stations 1 to 4, respectively. The impact of wind and wave conditions on underwater soundscape is generally above 100 Hz, as shown in Figure 9 (Wenz 1962).

Stations 1 and 2, at 336 and 1132 m from the drill rig respectively, show very little correlation of sound level at any band with wind or wave conditions. At these stations, the soundscape was dominated by drilling operations. As the distance to the station increases, i.e., for Stations 3 and 4 at 5 and 25 km, the wind speeds and wave heights have a positive correlation with sound levels, although the relationship with wind speed is much stronger than that for wave height.

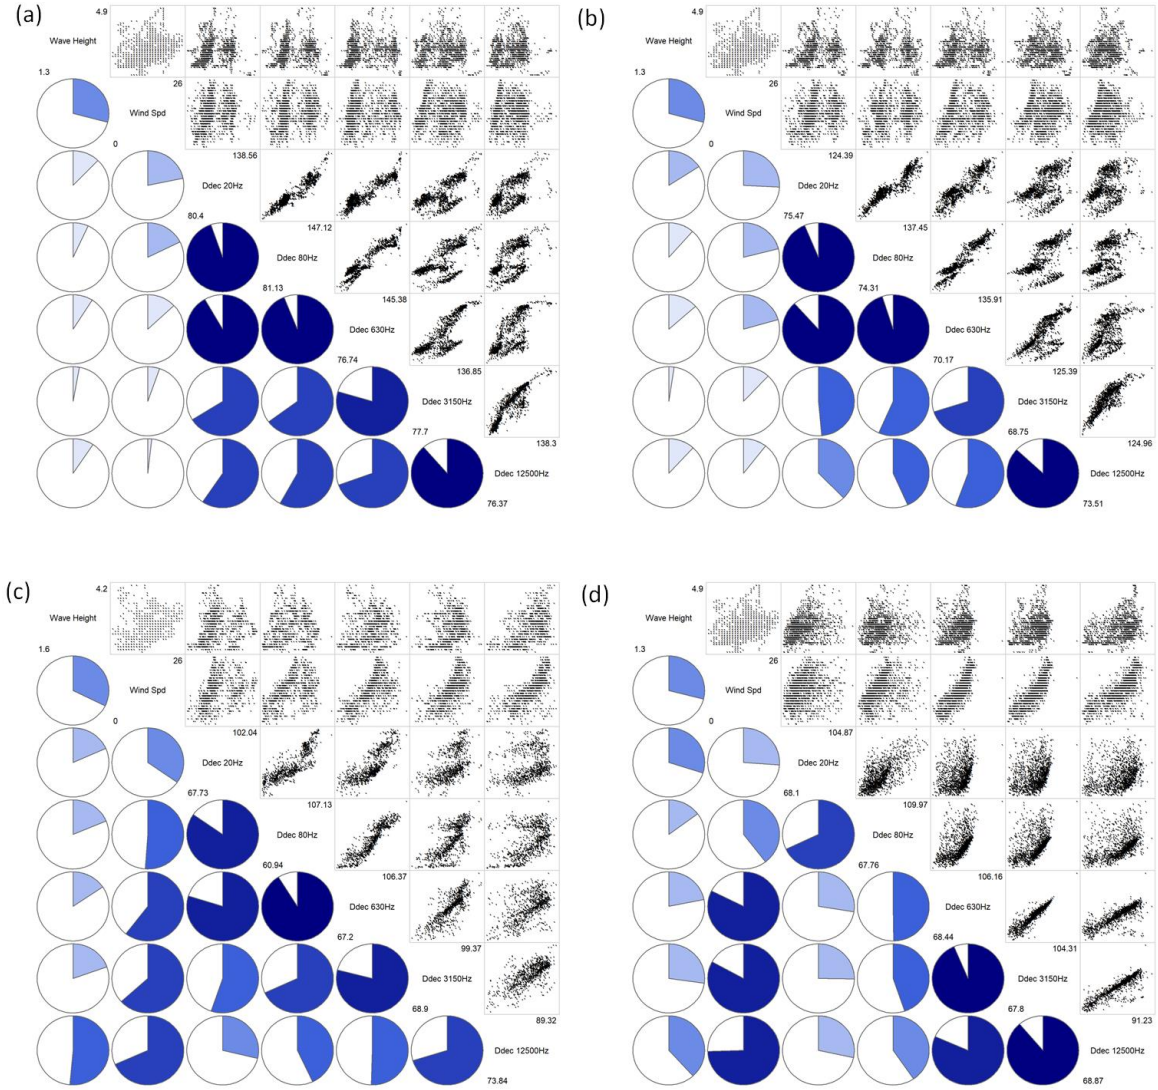

Figure 21. Correlogram comparing weather conditions to sound levels in five specified decidecade bands for (a) Station 1 at 300 m; (b) Station 2 at 1 km; (c) Station 3 at 5 km; and (d) Station 4 channel 1 at 25 km.

5.3. Data Fits

The per-minute SPL data from Station 1–3 while the Ocean Onyx was moored (01:00 12 Feb through until 00:00 25 Mar 2021) was analysed according to the methods detailed in Section 4.2.4, with the results presented in Figures 22 and 23. These fits were used to gain an understanding of the propagation loss environment, and to complete the validation analysis (Section 4.3), as discussed in Section 6.2.

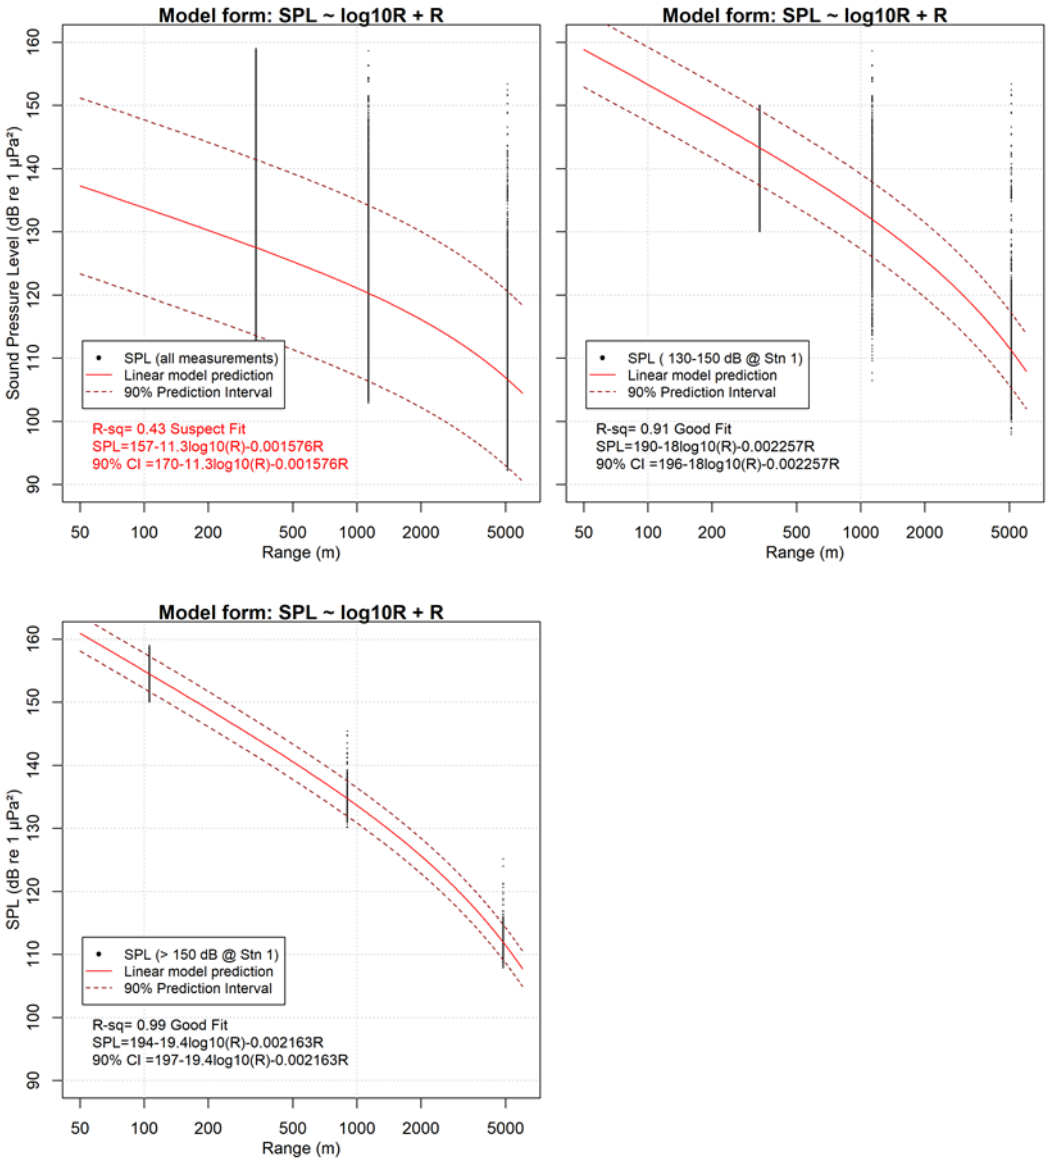

Figure 22. Per-minute sound pressure level (SPL) plotted against range for Stations 1–3, for the entire period the *Ocean Onyx* is present (top-left), levels at Station 1 between 130 and 150 dB re 1µPa (top-right), and levels at Station 1 above 150 dB re 1µPa (bottom-left).

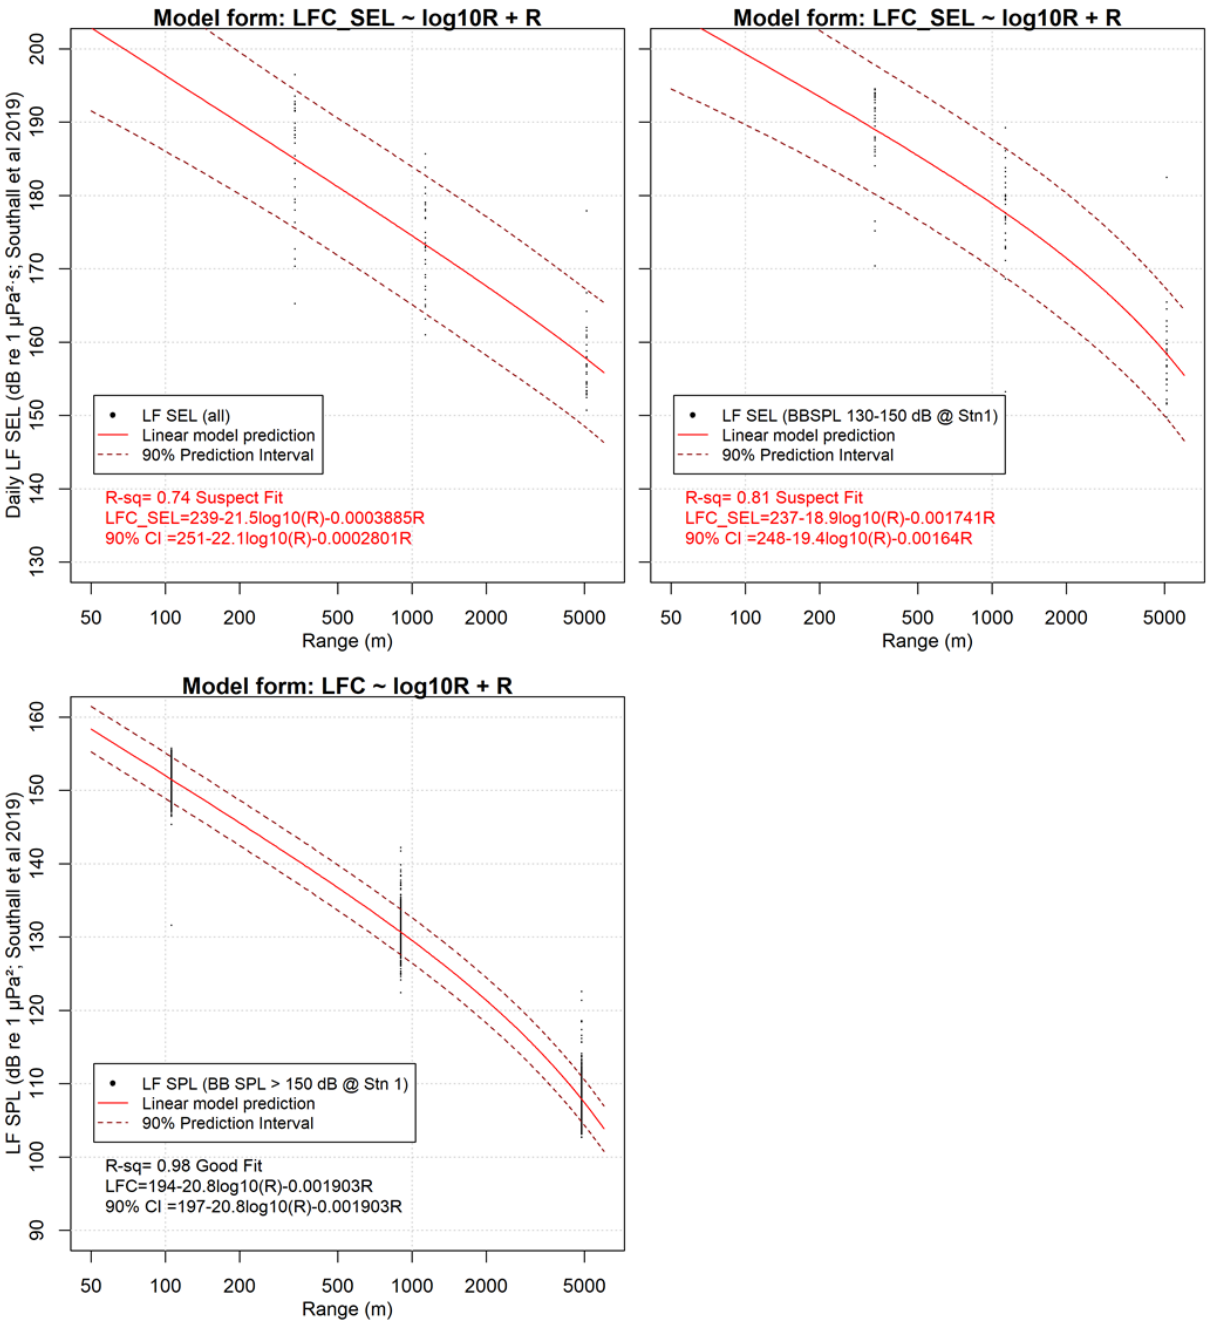

Figure 23. Daily low-frequency cetacean weighted sound exposure level (SEL) (calculated from frequency weighted per-minute sound pressure level (SPL)) plotted against range for Stations 1–3, for the entire period the *Ocean Onyx* is present (top-left), levels at Station 1 between 130 and 150 dB re 1µPa (top-right), and levels at Station 1 above 150 dB re 1µPa (bottom-left).

5.4. Drilling Operations

A detailed analysis was undertaken on two file snippets from Station 1, focused on correlating the acoustic signals to the drilling logs, and providing details on some of the signals observed in the acoustic data.

5.4.1. Snippet 1

A snippet of data from Station 1 for 22 Feb 2021 from 14:14:37 was examined to look for alignment between the acoustic data and the drilling logs to provide a detailed insight into the noise producing sources. The drilling log for this period stated:

> Continued drilling 26" x 42" hole from 115m to 171m (SectionTD). Several small stringers encountered at 140m and 157m. Pumped 100bbl PHG sweep and took MWD survey at connection. Survey @ 135mMDRT: 0.5deg inc.
>
> Parameters: 60rpm, 3-5kft-lb tq, 10klbs WOB, 800-1,100gpm, 400-550psi SPP

The spectrogram of the entire wav file is shown in Figure 24, with a shorter timescale and more focused frequency range shown in Figure 25, both showing components above 10 Hz only. In this data, drilling tonals with a spacing of 155 Hz were identified (Figure 26), and the analysis of the very low frequency tonals (Figure 27) clearly shows a 1 Hz tonal, which aligns with the 60 rpm drilling speed in the logs. A steady state pump operating at centre frequencies of 2992 Hz and 3062 Hz, with a strong correlation to high frequency harmonics (Figure 28). In this snippet there were three unstable narrowband noise sources present which are likely due to the drilling operations. This is considered likely due to their harmonic spacing under varying loads of operations. Tonals indicate that something, potentially the drill bit or the main aperture rod, is rotating between 52 and 74 RPM. This appears unrelated to the steady state pumps, which are likely high pressure pumps that fluctuate very little over time or load. During this recording, a vessel was also present although it did not appear to be operating under DP.

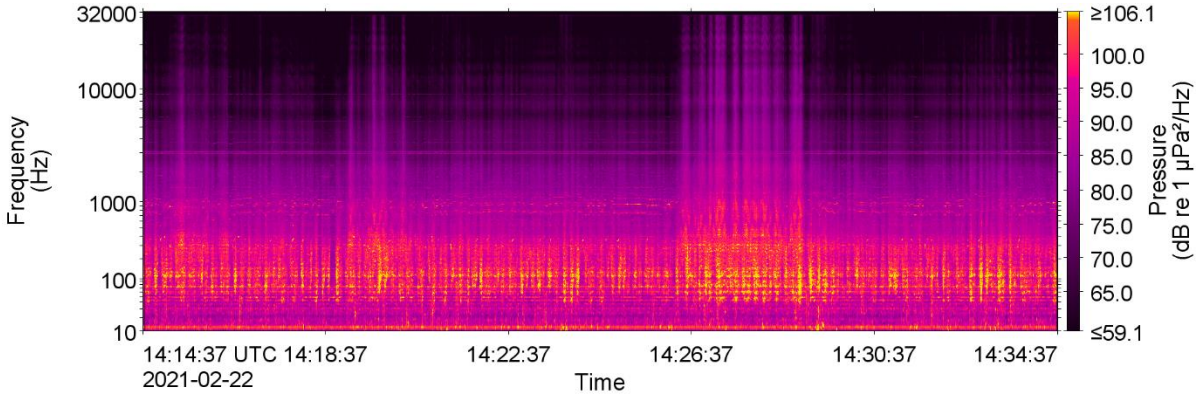

Figure 24. Spectrogram of 20 minutes of drilling operations on 22 Feb 2021 from 14:14:37 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

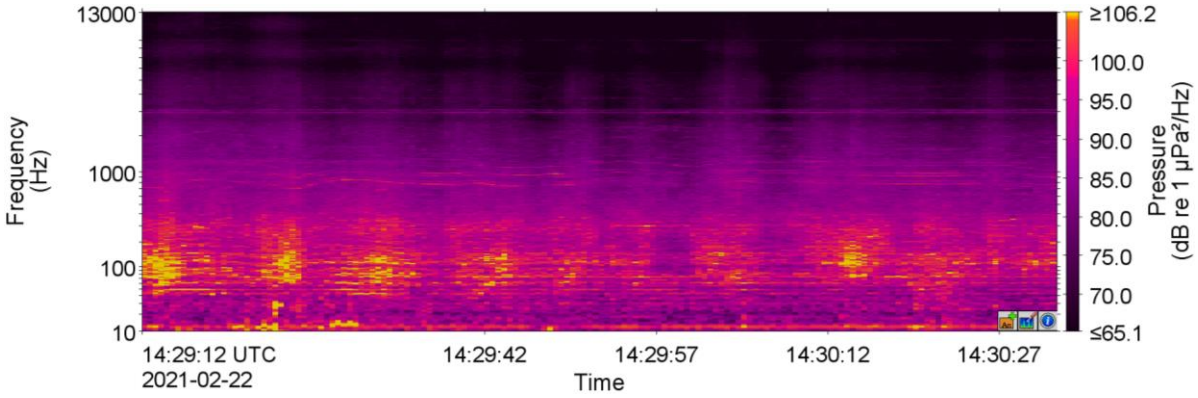

Figure 25. Spectrogram of 80 s minutes of drilling operations on 22 Feb 2021 from 14:29:12 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

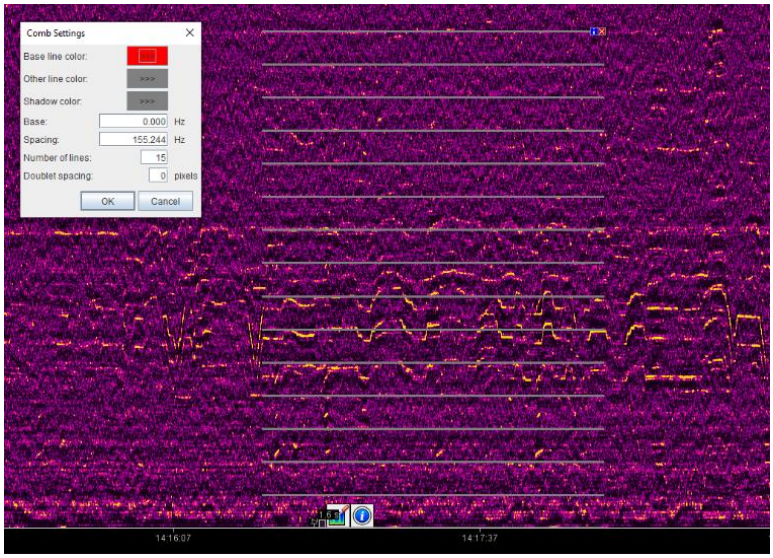

Figure 26. Drilling tonals, spaced at 155 Hz

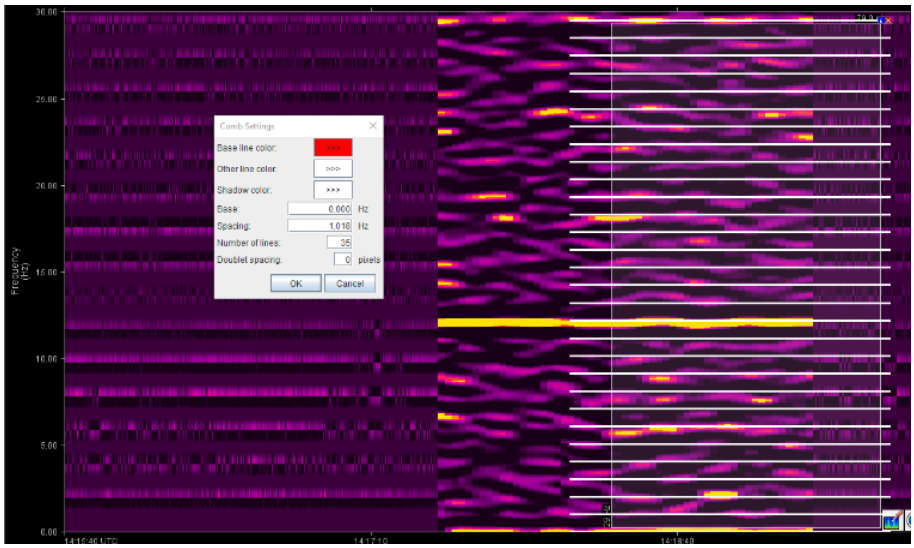

Figure 27. Very low frequency tonal analysis correlates with 60 rpm drilling speed

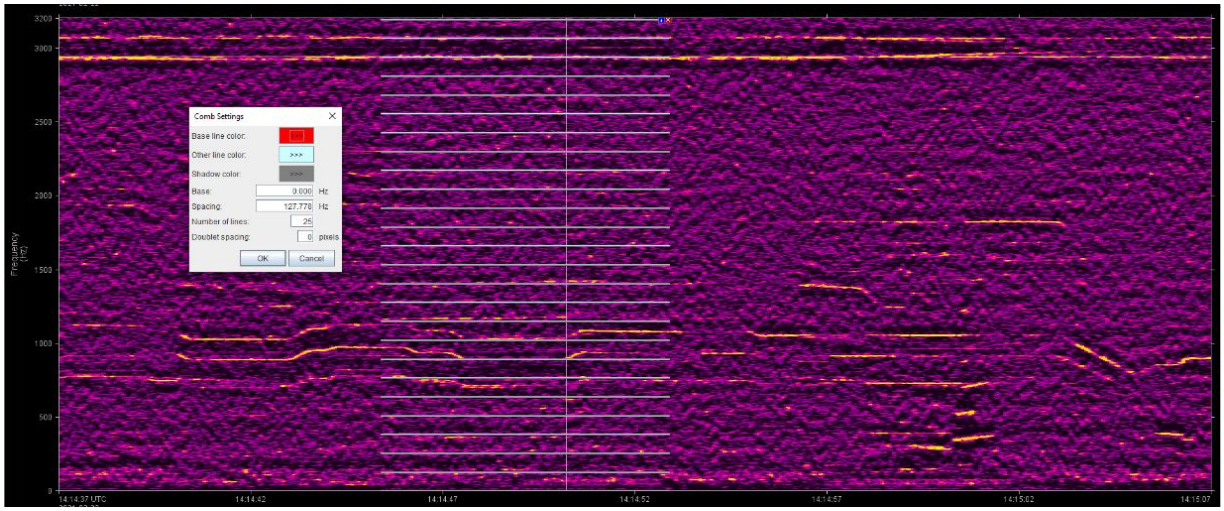

Figure 28. Example of correlation between harmonics and load on main pump with centre frequencies of 2992 and 3062 Hz. The example also shows the diesel generators with engine firings rates fluctuating between 149 and 152 Hz while under hotel load from *Ocean Onyx*.

5.4.2. Snippet 2

A snippet of data from Station 1 for 08 Mar 2021 from 18:14:40 was examined to look for alignment between the acoustic data and the drilling logs to provide a detailed insight into the noise producing sources. The drilling log for this period stated:

> Drilled ahead 12-1/4" hole from 1,433m to 1,545m.
> Parameters:
> Flow: 1,000gpm, Boost Pump-250gpm, SPP: 3,000psi, RPM: 120 surface/217 bit
> Tq: Off 1-2kft-lbs/On 5-10kft-lbs. WOB: 5-15klbs P/U wt: 300klbs, S/O wt: 325klbs, Rot: 315klbs. Average ROP: 18.6m/hr
> ESD: 11.18ppg, ECD: 11.37ppg
> Offline: Displaced the Boost line and flushed the MGS utilising the boost pump - total of 20 strokes pumped (10bbls).
> At 1,510m MW over the shakers recorded at 10.7ppg (ESD-10.88ppg).
> Ceased centrifuging and weighted up the mud with additions of barite. MW at 1543m recorded at 11.1ppg.

The spectrogram of the entire wav file is shown in Figure 29, with a shorter timescale and more focused frequency range shown in Figure 30, both showing components above 10 Hz only. In this snippet there is no secondary source, such as a support vessel, present, just the *Ocean Onyx*. The narrowband tonals below 200 Hz indicate that the revolutions-per-minute fluctuate between 178 and 220 rpm, this aligns with data pins 9, 13 and 16 in Figure 31, along with various higher frequency harmonics. A second low-frequency rotating source, with a speed of 120.6 rpm was detected, Figure 32, and it demonstrates no apparent relationship between the 1.63:1 reduction ratio present in the low frequency spectrum to the other source. These frequencies align with information provided in the drill logs.

The data indicates various generator (diesel gensets and pumps) running in multiple configurations. All appear to be running in a steady-state fashion with varying loads, apparent through the fluctuations in frequency. Two distinct gensets are noted in particular as running hotel load, as they are more stable than the others which are likely being used for the *Ocean Onyx* drilling operations, and thus having changing requirements which changes their load. The tone at 3 kHz which is consistent without fluctuation, shown clearly in Figure 34, is probably a high-pressure pump which does not fluctuate with power draw, as no banding (harmonics) are observed, the motor is not a pole motor.

Figure 35 shows three distinct gensets (one tonal each) with accompanying cylinder firing rates throughout the spectrogram. These appear related to *Ocean Onyx* drilling operations as there are no secondary contacts on spectrogram (such as vessels) and the tonals fluctuate with power draw over time.

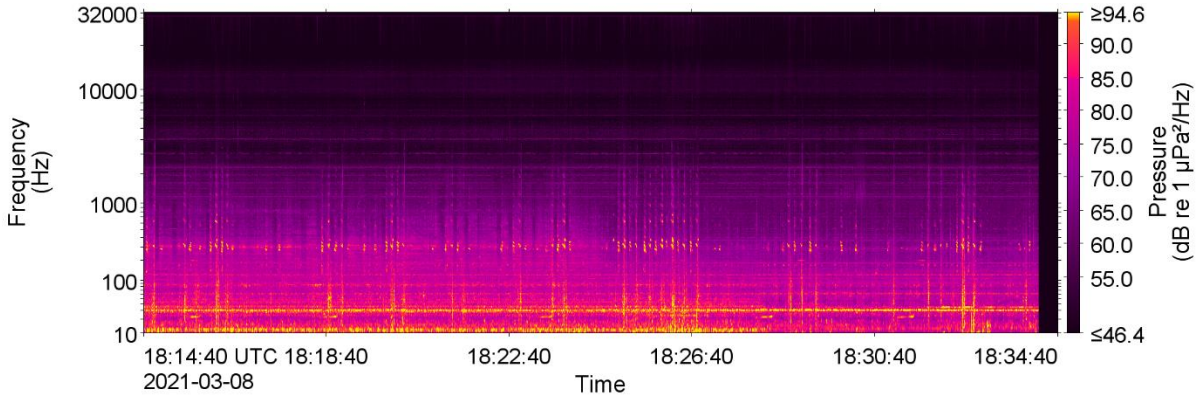

Figure 29. Spectrogram of 20 minutes of drilling operations on 08 Mar 2021 from 18:14:40 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

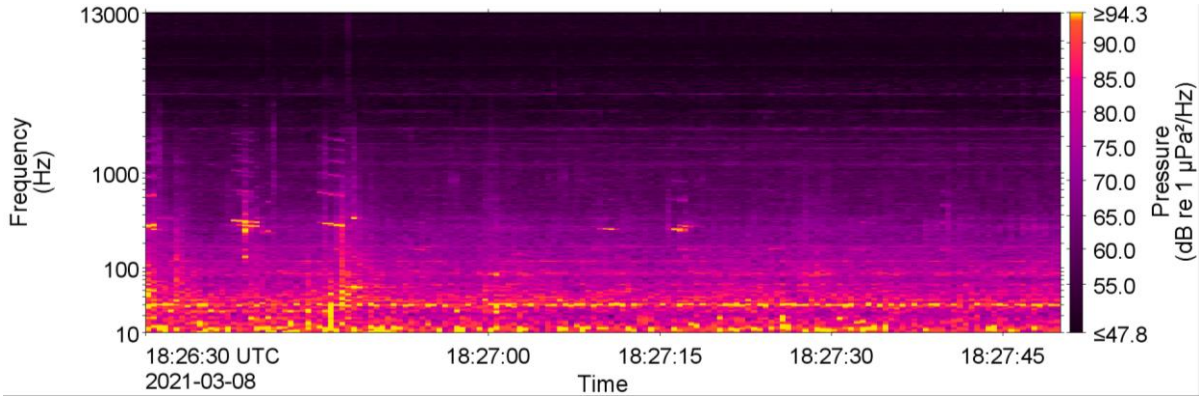

Figure 30. Spectrogram of 80 s of drilling operations on 08 Mar 2021 from 18:26:30 at Station 1(0.2 Hz frequency resolution, 1 s time window, 0.5 s time step, Hamming window).

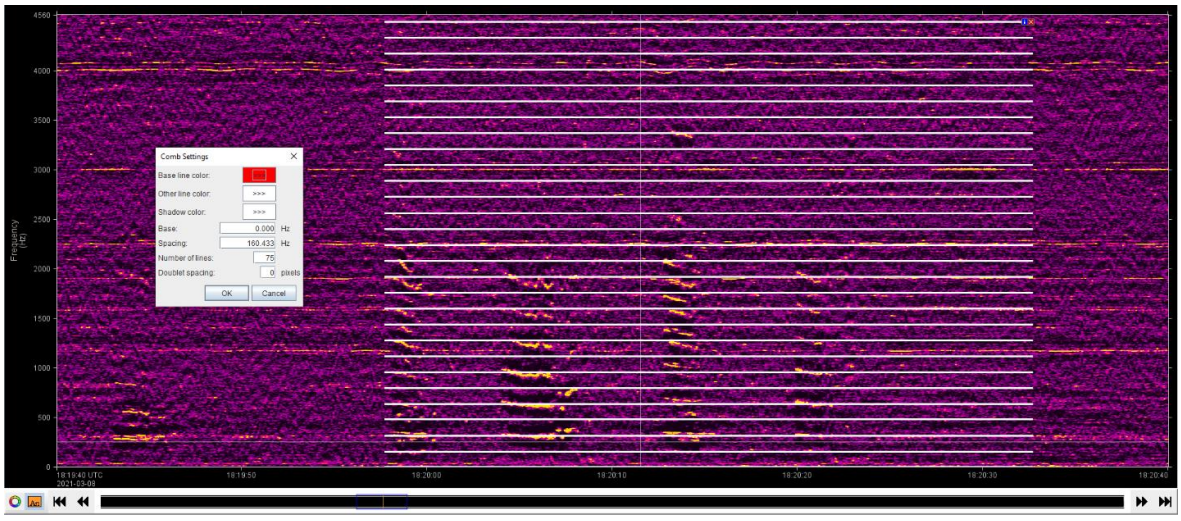

Figure 34. Generator analysis showing hotel load tonals.

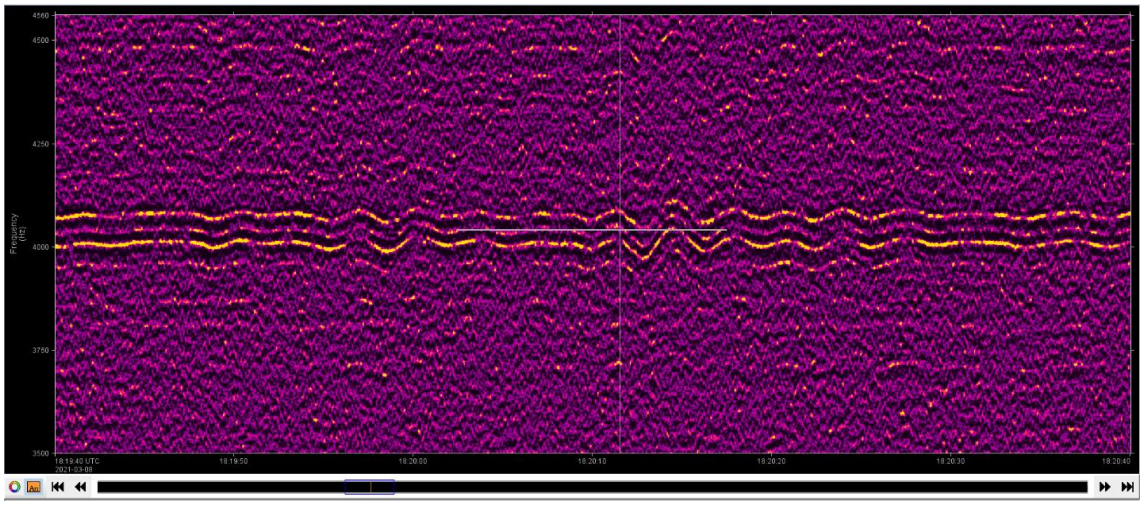

Figure 35. Three distinct gensets with accompanying cylinder firing rates throughout the spectrogram. These appear related to MODU operations as there are no secondary contacts on spectrogram and the tonals fluctuate with power draw.

5.5. Source Levels

ShipSound was used to determine the source levels for the *Ocean Onyx* and support vessels under dynamic positioning and during transits using the methods detailed in Section 4.2.3 and the operations described in Section 2.5. The following sections detail the Monopole Source Levels for each of these sources.

5.5.1. MODU

Following the method detailed in Section 4.2.3.2 and the periods specified in Table 8, the mean and maximum MSL for the *Ocean Onyx* was determined for three drilling depth ranges (Figure 36). The mean MSL is more representative of typical levels for each drilling depth and therefore suitable for comparison to the levels used in Koessler et al. (2020). Three example ShipSound reports are provided in Appendix G.1, and a spectrogram of drilling activities extracted from the ShipSound report included in Appendix G.1.2 is shown in Figure 37.

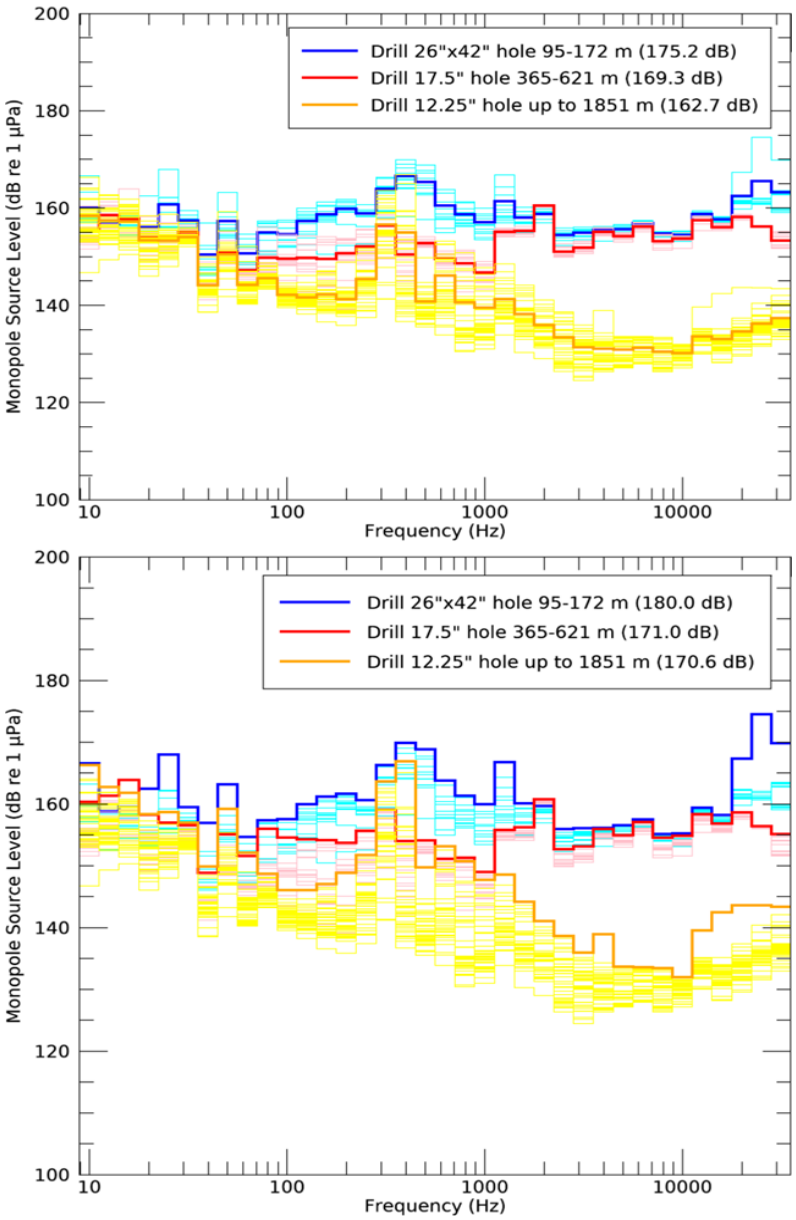

Figure 36. Monopole Source Level (MSL) and spectra for *Ocean Onyx* Mobile Offshore Drilling Unit (MODU) from Station 1 ShipSound processing, averaged over a ShipSound measurements over three different drilling depths, mean (top) and maximum (bottom).

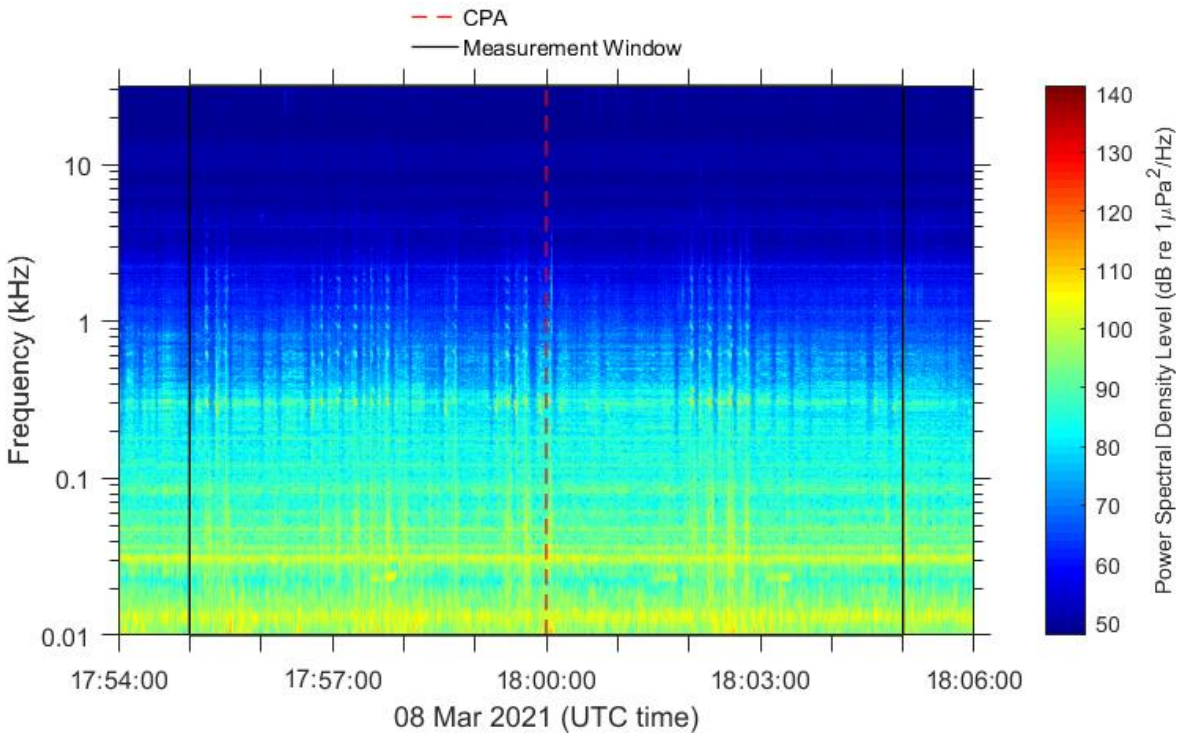

Figure 37. Spectrogram from ShipSound report included in Appendix G.1.2, with a calculated Monopole Source Level (MSL) of 159.6 dB re 1µPa m.

Table 11. *Ocean Onyx* monopole source levels (MSLs) from Figure 36.

Measurement	Monopole source level (dB re 1 µPa m)	
	Mean	Maximum
Drilling 26”x42” hole from 95–172 m	175.2	180.0
Drilling 17.5” hole from 365–621 m	169.3	171.0
Drilling 12.25” hole up to 1851 m	162.7	170.6

5.5.2. Vessels under Dynamic Positioning

Following the method detailed in Section 4.2.3 for vessels under dynamic positioning, the mean MSL was determined to be 193.9 dB re 1 µPa (Figure 38). The mean representative of typical levels from the trials of dynamic positioning is therefore suitable for comparison to the levels used in Koessler et al. (2020). One example ShipSound report is provided in Appendix G.2.

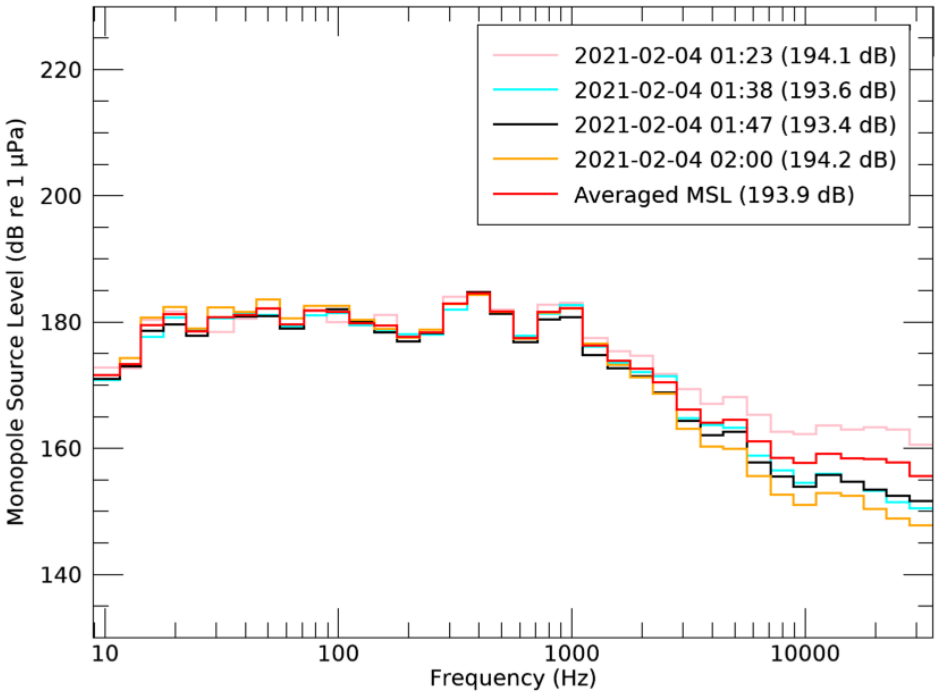

Figure 38. Monopole Source Level (MSL) and spectra for Siem *Sapphire* in dynamic positioning (DP) from Station 2 ShipSound processing. The MSL was averaged over all ShipSound measurements.

5.5.3. Vessels during Transit

Following the method detailed in Section 4.2.3 for vessels under transit, the mean MSL was determined for each vessel, the Siem *Sapphire* under transit at both 7 and 9 kn (Figures 39 and 40), and the Siem *Aquamarine* and *Topaz* at 9 kn (Figures 41 and 42). The two transit speeds are therefore suitable for comparison to the levels used in Koessler et al. (2020). One example ShipSound report is provided in Appendix G.3.

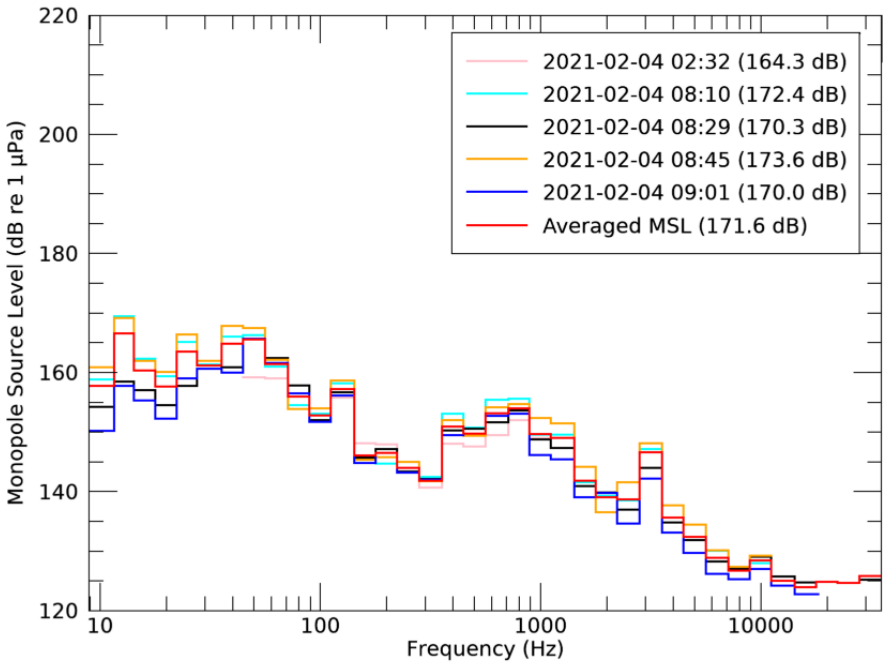

Figure 39. Monopole Source Level (MSL) and spectra for Siem *Sapphire* from Station 2 ShipSound processing. The MSL was converted to 7 kn and averaged over a few ShipSound measurements.

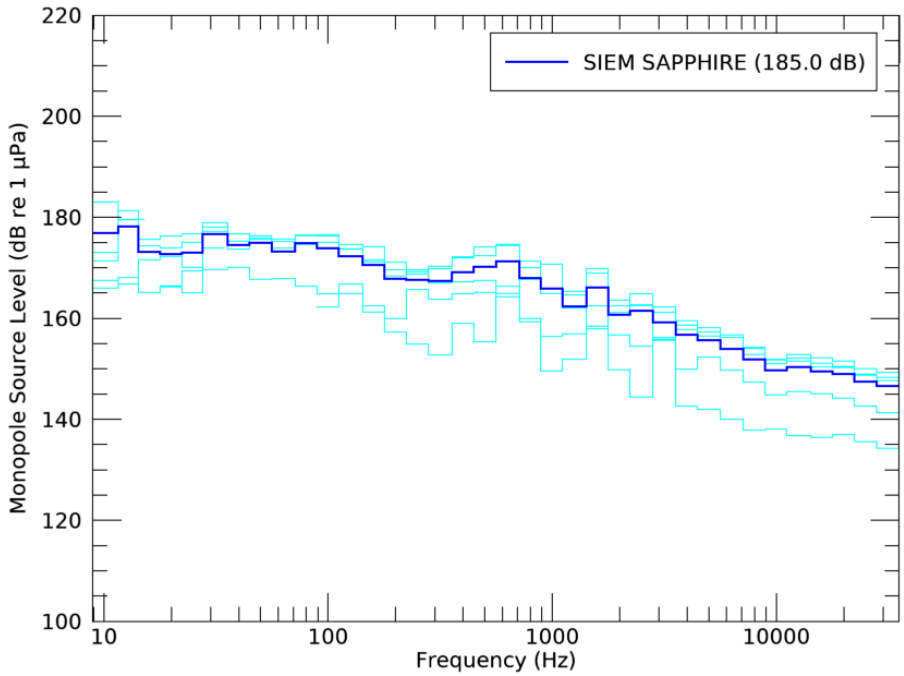

Figure 40. Monopole Source Level (MSL) and spectra for Siem *Sapphire* from Station 4 ShipSound processing. The MSL was converted to 9 kn and averaged over a few ShipSound measurements.

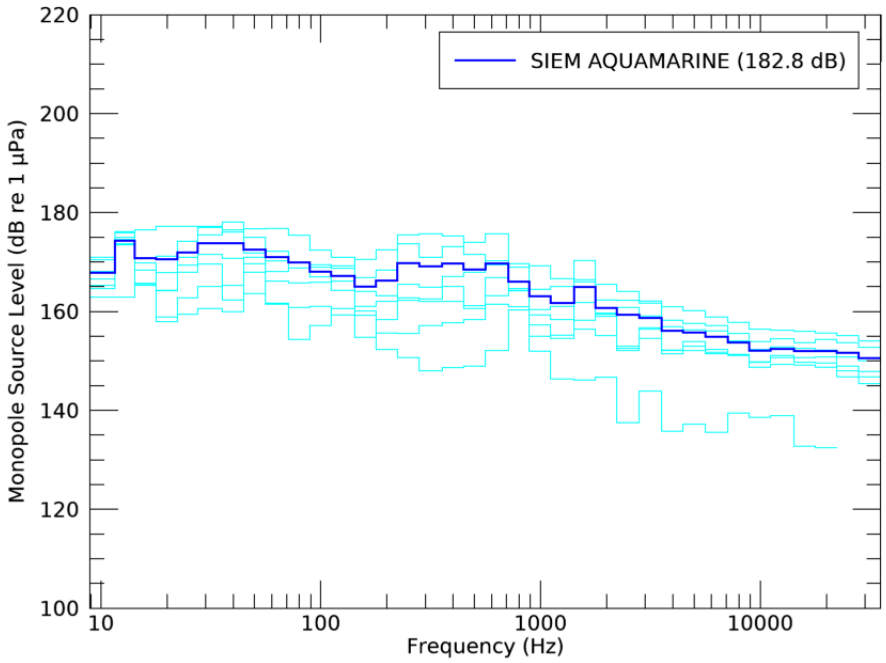

Figure 41. Monopole Source Level (MSL) and spectra for Siem *Aquamarine* from Station 4 ShipSound processing. The MSL was converted to 9 kn and averaged over a few ShipSound measurements.

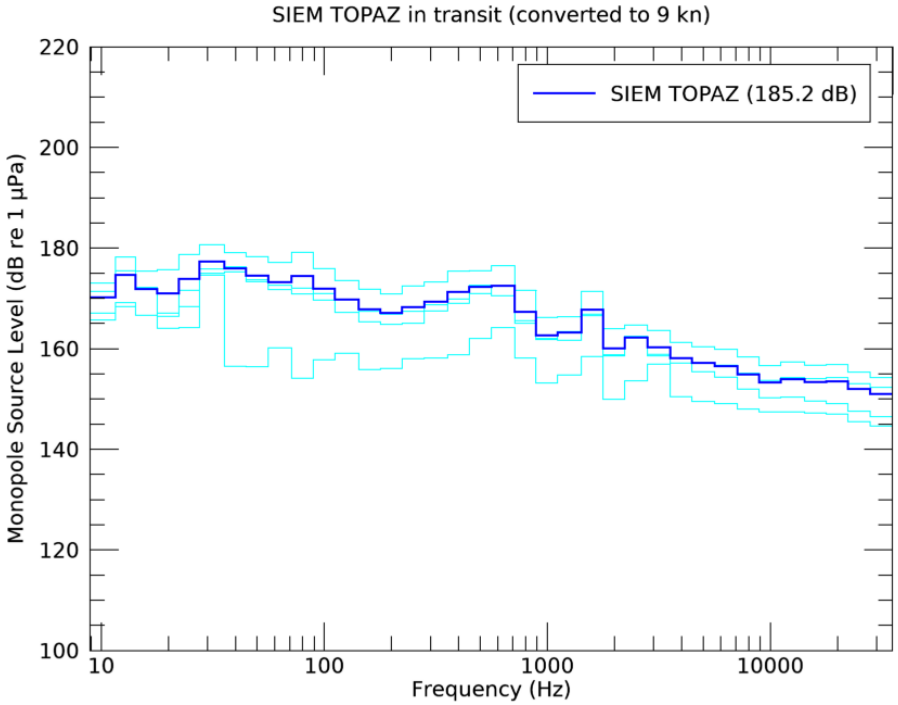

Figure 42. Monopole Source Level (MSL) for Siem *Topaz* from Station 4 ShipSound processing. The MSL was converted to 9 kn and averaged over a few ShipSound measurements.

5.6. Vessel Detections

Vessels were detected throughout the entire recording period using the automated detection algorithm described in Section 4.2.2. Results are shown for the two stations farthest from the *Ocean Onyx*, Stations 3 and 4 (Figure 43). Figure 44 shows an example of a large container vessel passing with a Lloyd's mirror pattern, and the map of the pass is shown in Figure 45, along with less defined contributions from vessel operations at the *Ocean Onyx* to the north-west (purple) between 100 and 1000 Hz. A spectrogram of a closer vessel pass and associated map are shown in Figures 46 and 47.

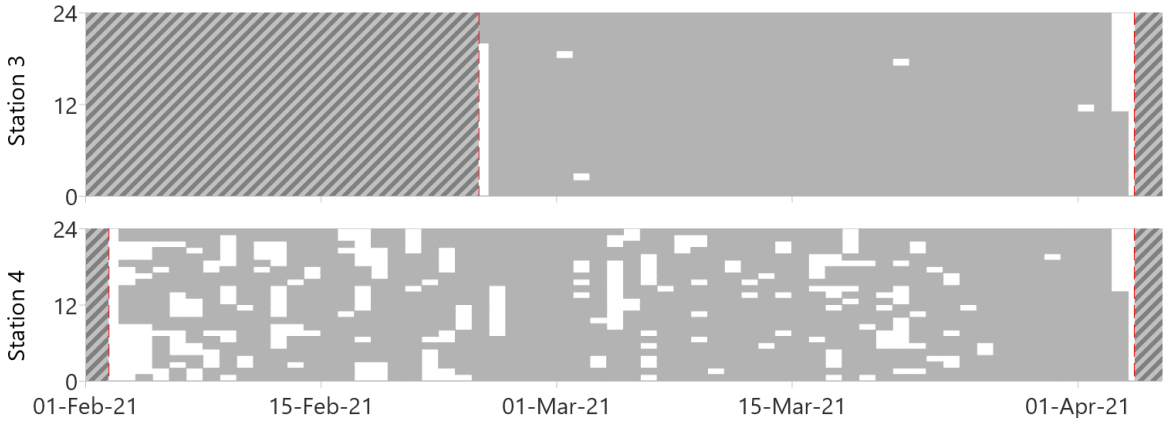

Figure 43. Vessel detections each hour (vertical axis) compared to date (horizontal axis) over the entire recording period at Stations 3 and 4. Vertical dashed lines (red) indicate AMAR deployment and retrieval dates.

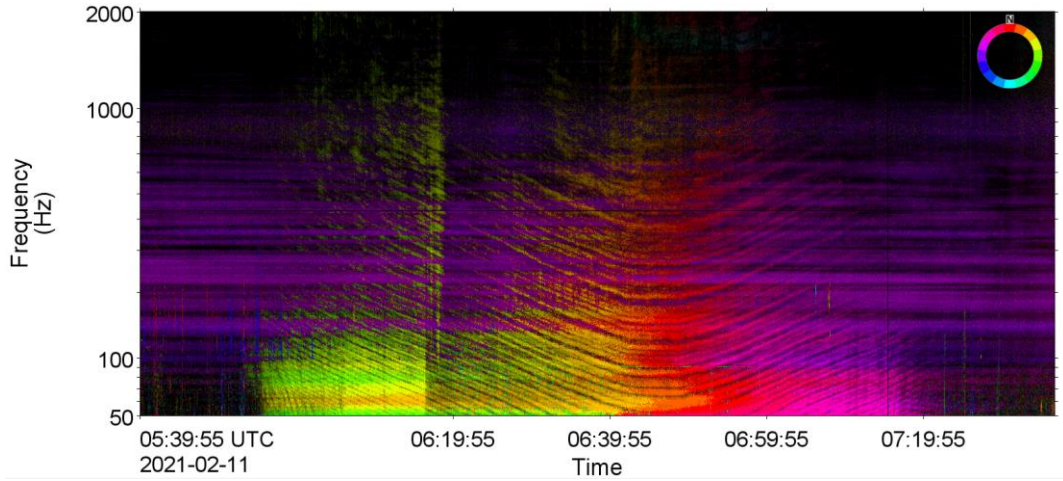

Figure 44. Example of a 334 m long container ship (*E.R. Tokyo*) travelling at 16 kn passing within 5.9 km north of Station 4 from east to west (green/yellow through to purple) that illustrates the Lloyd's mirror, or bathtub pattern over 2 h, with less defined contributions from vessel operations at the *Ocean Onyx* to the north-west (purple) between 100 and 1000 Hz. This pattern is caused by constructive and destructive interference between direct and reflected paths of sound (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

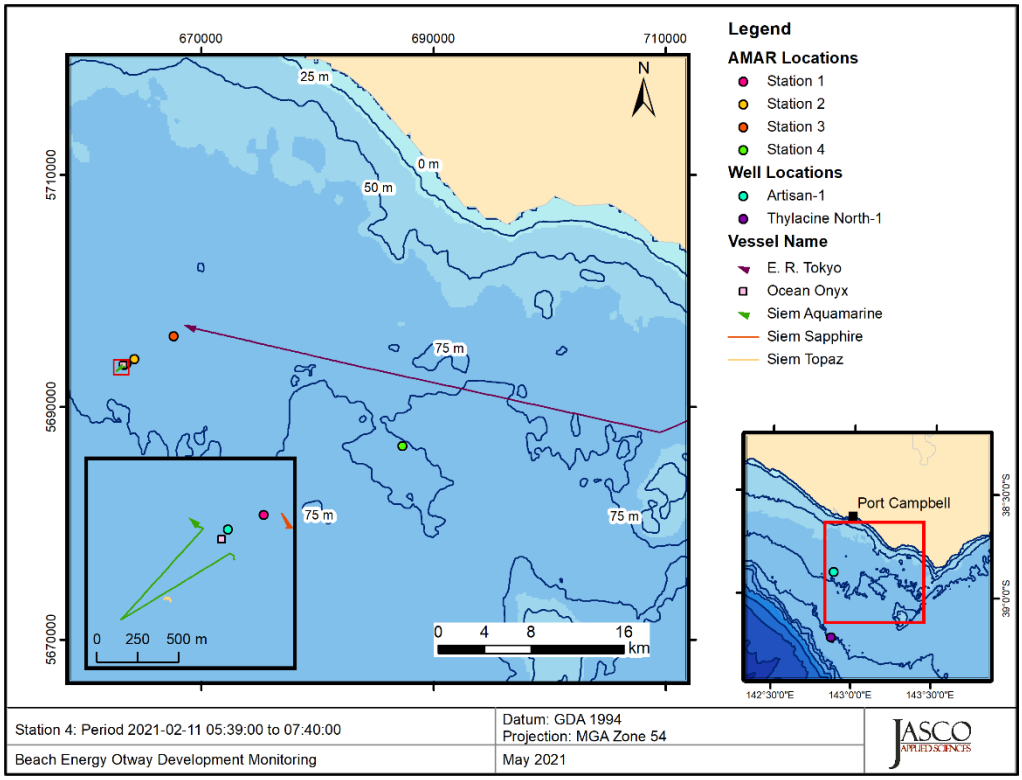

Figure 45. Map of automatic identification system (AIS) reported vessel locations for the spectrogram shown in Figure 44.

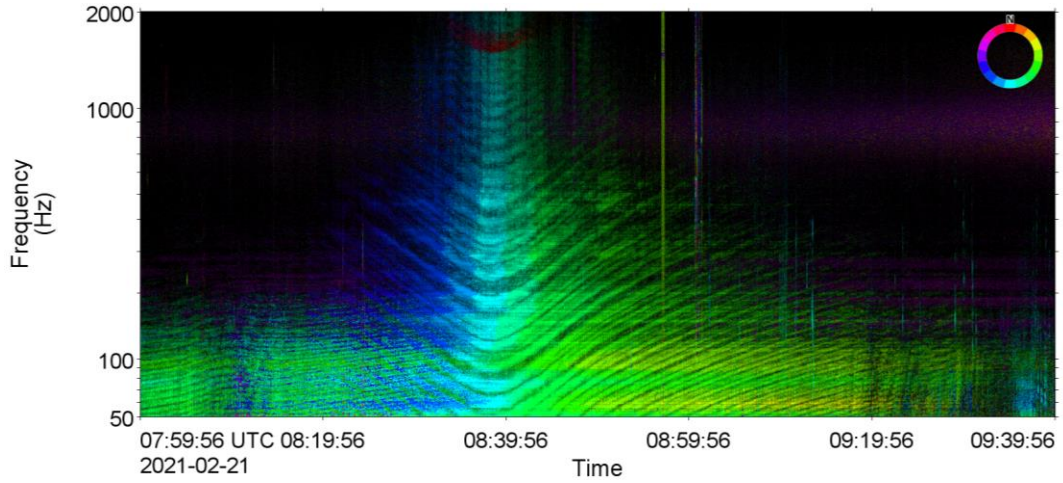

Figure 46. Example of a 200 m long vehicle carrier (*Tombarra*) travelling at 13 kn passing within 2.6 km south of Station 4 from east to west (green/yellow through to purple) that illustrates the Lloyd's mirror, or bathtub pattern over 2 h, with less defined contributions from vessel operations at the *Ocean Onyx* to the north-west (purple) between 100 and 1000 Hz. This pattern is caused by constructive and destructive interference between direct and reflected paths of sound (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

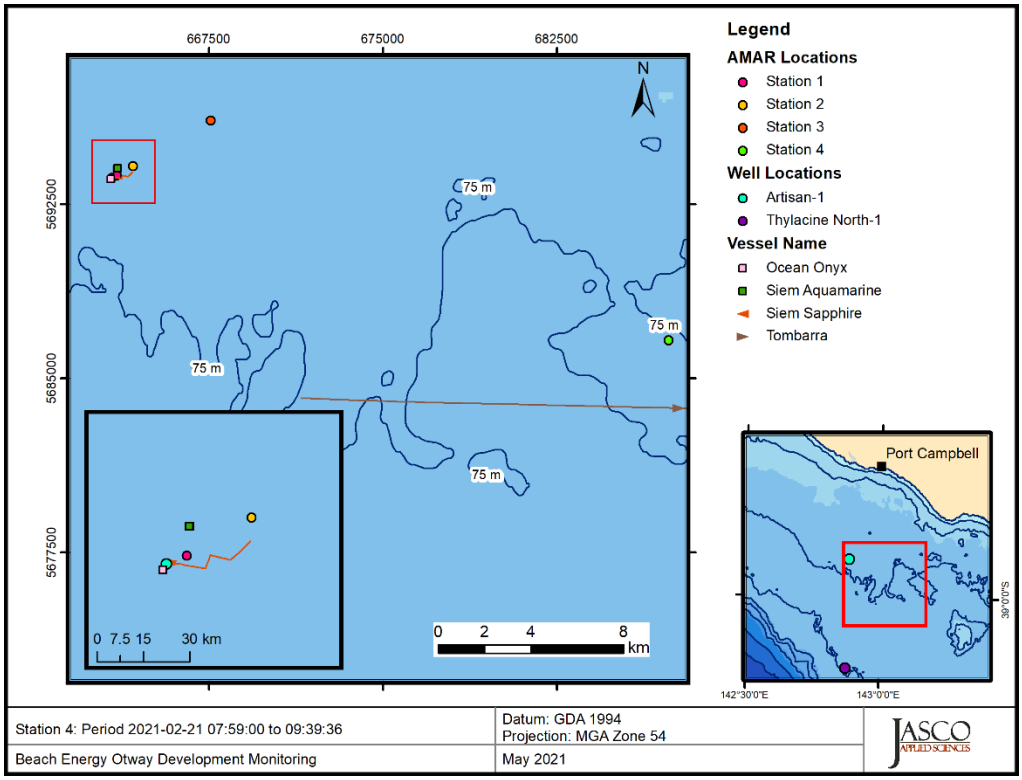

Figure 47. Map of automatic identification system (AIS) reported vessel locations for the spectrogram shown in Figure 46.

5.7. Marine Mammals

The acoustic presence of marine mammals was identified automatically by JASCO's detectors (Section 4.2.7.3) and validated via the manual review of 0.5% of the data, which represents 312 of the 5 min sound files, or 26 h worth of data. Acoustic signals of pygmy blue whales and dolphins were identified and vocalisations of other mysticetes, such as humpback and southern right whales, were not detected by the detectors (D.2), or observed during the 0.5% manual review.

5.7.1. Dolphins

Dolphins produce both impulsive (click) and tonal (whistle) sounds that show less species-level specificity than other marine mammal signals and are therefore more difficult to distinguish acoustically. Due to the directionality of impulsive clicks and the associated degradation of their spectral features when recorded at increasing angles away from the longitudinal axis of the vocalising animal, delphinid clicks cannot be confidently assigned to individual species. Furthermore, because the audible frequency of the acoustic data only reached 32 kHz, much of the energy from dolphin clicks (which can reach over 150 kHz) was not captured. Because of the overlap in spectral features of tonal signals from different dolphin species (Steiner 1981) and the expected but unquantified variability of these signals around the few described vocalisation types, we were unable to distinguish dolphin whistles by species.

The dolphin clicks and whistles observed in the data (Figure 48) were likely produced by short-beaked common dolphins (*Delphinus delphis*), and/or bottlenose dolphins (*Tursiops sp.*) (Bilgmann et al. 2007, Bilgmann et al. 2014, Charlton-Robb et al. 2015). These signals were observed at all stations throughout the recording period with detections highest at Station 4 and through the month of March

at Stations 1, 2, and 3 (Figures 49 and 50). It was apparent that dolphin clicks occurred more at night than during the day, particularly at Stations 1–3 (Figure 49).

A third vocalisation type believed to be produced by dolphin calves was also observed in March at Station 3 alongside whistles (Figure 51). These lower frequency patterns of ‘chirps’ and ‘quacks’ have previously been attributed by JASCO analysts to young bottlenose dolphins.

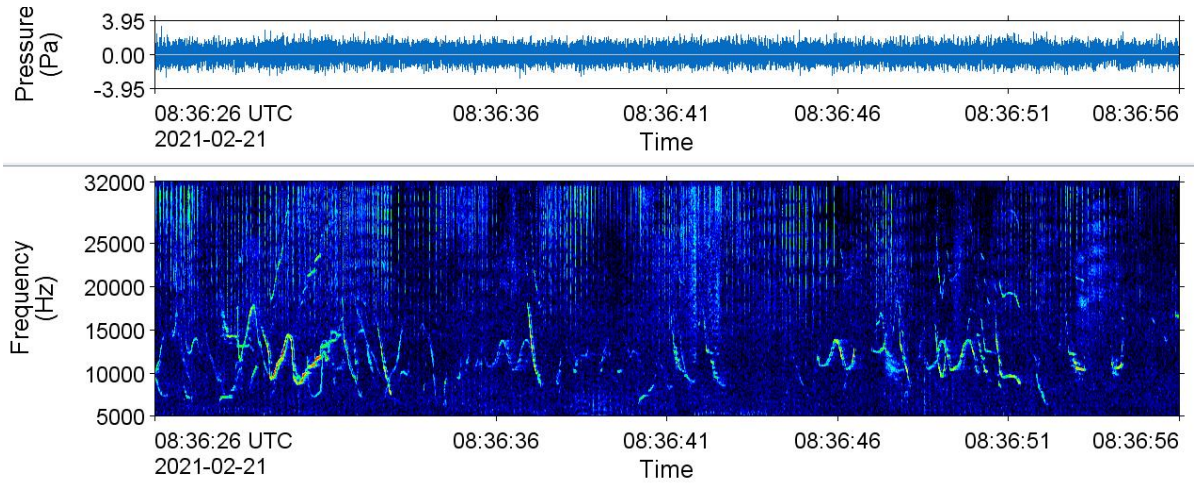

Figure 48. Spectrogram of dolphin clicks and whistles recorded on 21 Feb 2021 at Station 4 (64 Hz frequency resolution, 0.01 s time window, 0.005 s time step, Hamming window, normalised across time). The window length is 30 s.

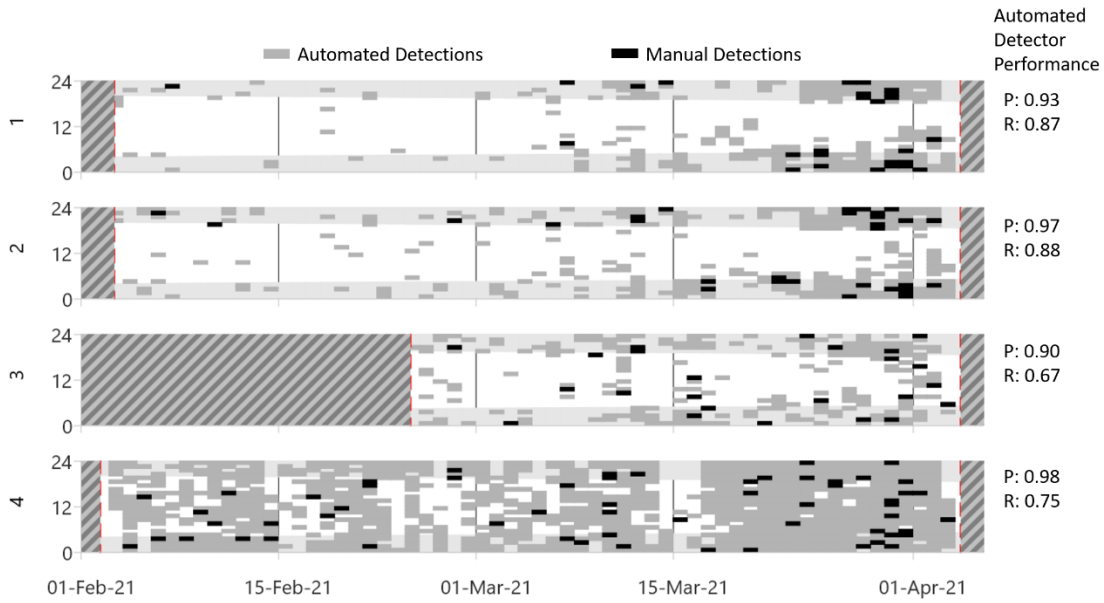

Figure 49. Daily and hourly occurrence of dolphin click detections recorded at Stations 1–4 (top – bottom) with automated detector performance metrics included along right side. The grey areas indicate hours of darkness from sunset to sunrise (Ocean Time Series Group 2009). Hashed areas indicate when there was no acoustic data and red dashed lines indicate the start and end of recordings. Automated detector results are for the dolphin click train detector.

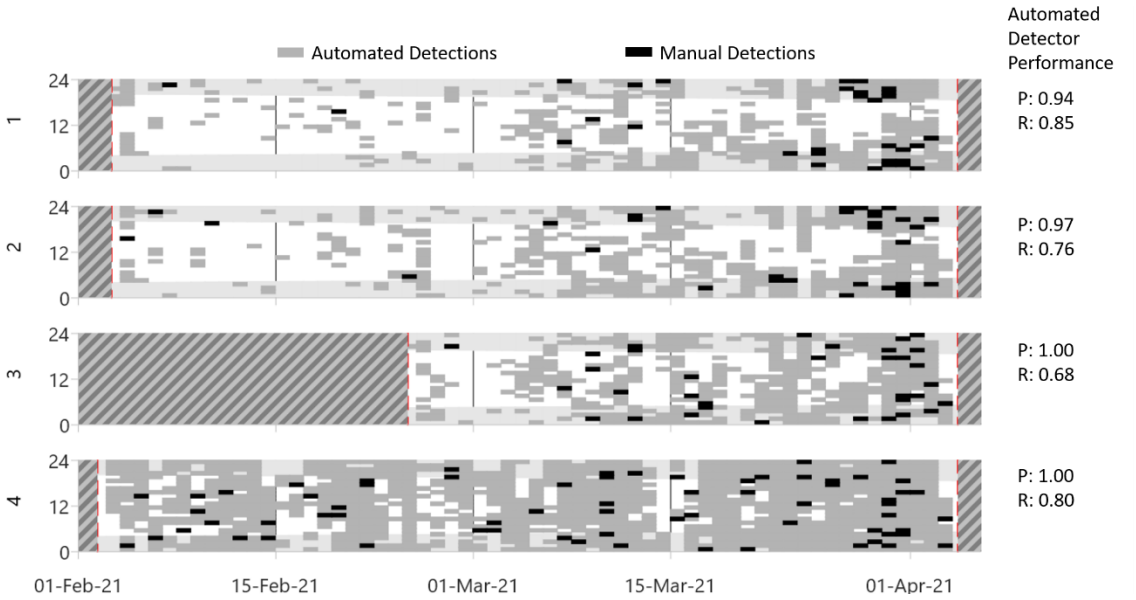

Figure 50. Daily and hourly occurrence of dolphin whistle detections recorded at Stations 1–4 (top – bottom) with automated detector performance metrics included along right side. The grey areas indicate hours of darkness from sunset to sunrise (Ocean Time Series Group 2009). Hashed areas indicate when there was no acoustic data and red dashed lines indicate the start and end of recordings. Automated detector results are for the WhistleHigh detector.

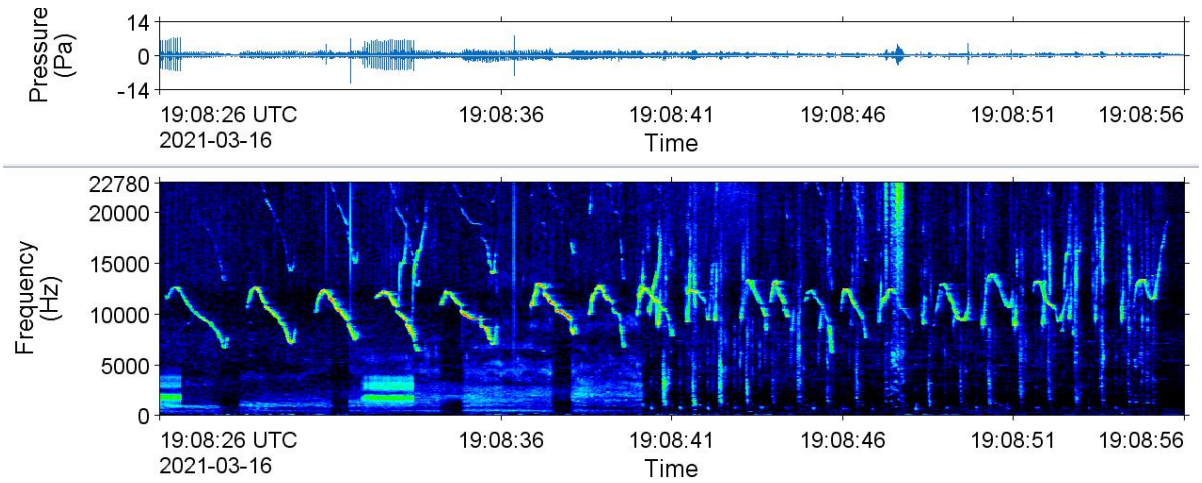

Figure 51. Spectrogram of dolphin whistles (above 5000 Hz) and sounds from young dolphins (majority present under 5000 Hz) recorded on 16 Mar 2021 at Station 3 (2 Hz frequency resolution, 0.125 s time window, 0.03125 s time step, Hamming window, normalised across time). The window length is 30 s.

5.7.2. Pygmy Blue Whales

Songs of pygmy blue whales (*Balaenoptera musculus brevicauda*; Figures 52 and 53) were detected sporadically through February and the first half of March. By the end of March, the signals were present in almost every hour of recording (Figure 54). This pattern of occurrence was reflected across all recording stations (Figure 54). In addition to the songs containing A, B, and C notes (Figures 52 and 53) (McDonald et al. 2006, Gavrilov and McCauley 2013, McCauley et al. 2018) that were the most common blue whale vocalisation in the data, blue whale D calls (Figure 55) (Recalde-Salas et al. 2014) were also present at the end of March and into April.

At Station 4, the direction of the blue whale acoustic signals relative to the recorder position was observed. An example of this is provided in Figure 52, where one blue whale is singing to the northwest, and one is singing to the southeast. Similarly, in Figure 55, the blue whale is calling from south of the recorder. When manually analysing blue whales at Station 4, an annotation was created for every direction of calling animals and the direction saved with the annotation. Figure 56 summarises these blue whale directional results from manual analysis. Blue whales occurred in all directions relative to Station 4, and there were 1–3 individuals confirmed vocalising at a time (Figure 56). Early in the recording, there is an apparent trend in the animals being more to the east and, later in the recording, being more to the west. However, the data were too sparse to confirm anything about animal movements.

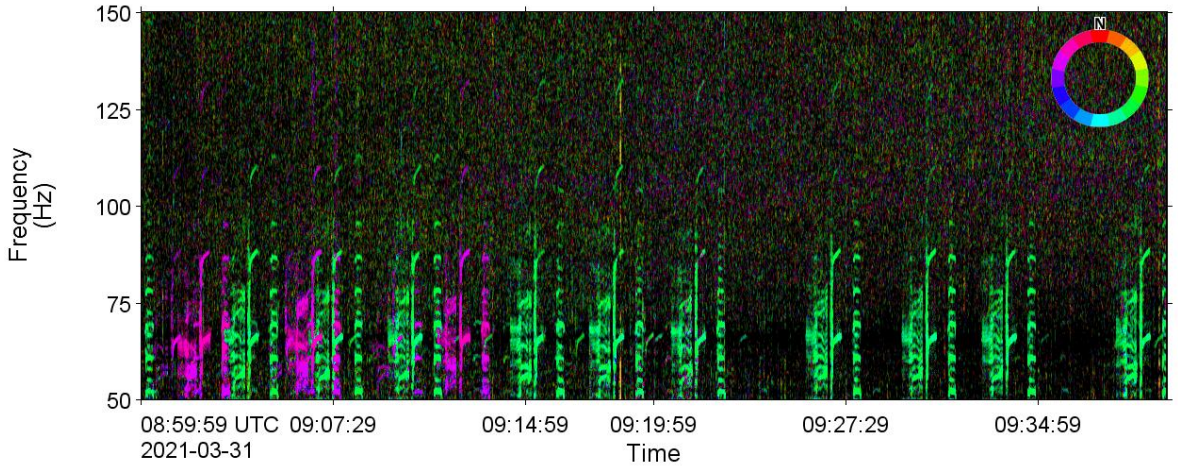

Figure 52. Directogram of pygmy blue whale songs recorded on 31 Mar 2021 at Station 4 (UTC) (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time). Displaying ~40 min of data. One blue whale is singing to the northwest of Station 4 (pink) and one is singing to the southeast of Station 4 (green).

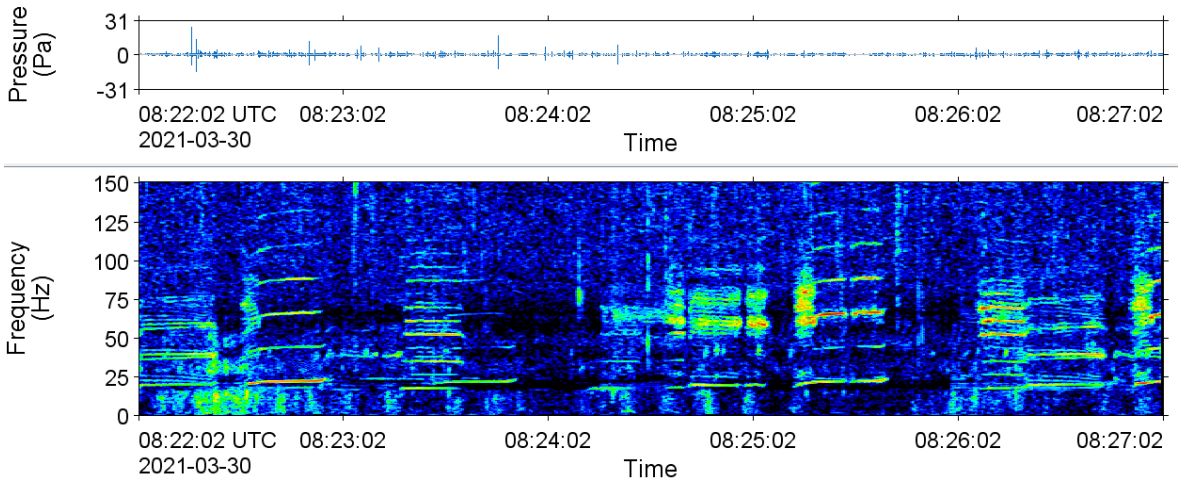

Figure 53. Spectrogram of pygmy blue whale songs recorded on 30 Mar 2021 at Station 3 (UTC) (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time). Displaying 5 min of data.

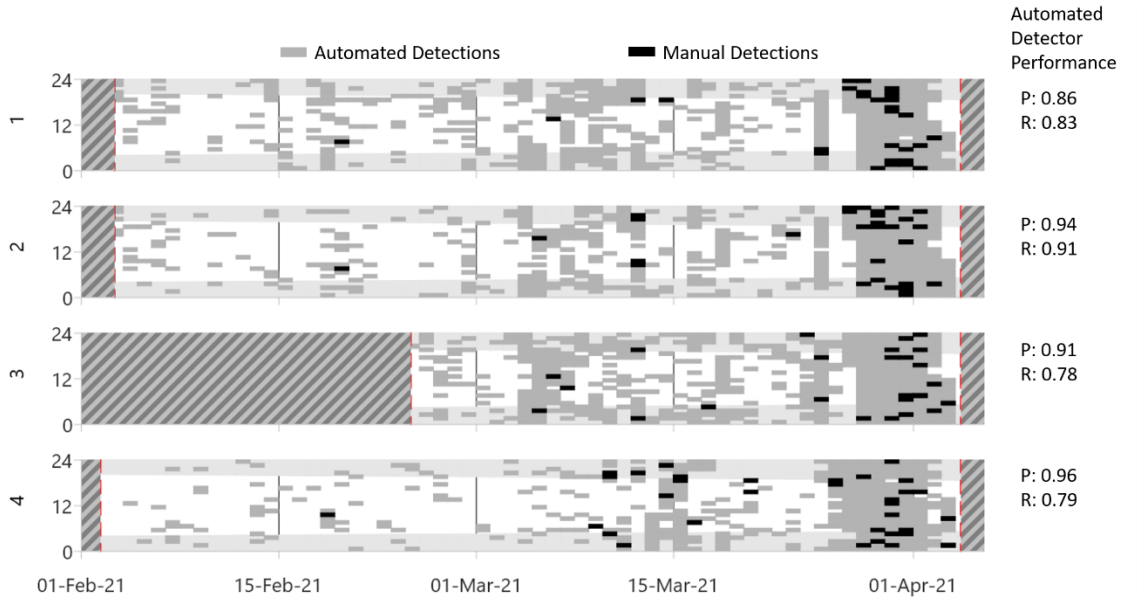

Figure 54. Daily and hourly occurrence of pygmy blue whale vocalisations recorded at Stations 1–4 (top – bottom) with automated detector performance metrics included along right side. The grey areas indicate hours of darkness from sunset to sunrise (Ocean Time Series Group 2009). Hashed areas indicate when there was no acoustic data and red dashed lines indicate the start and end of recordings. Automated detector results are for the AUS_BW_BH20 detector.

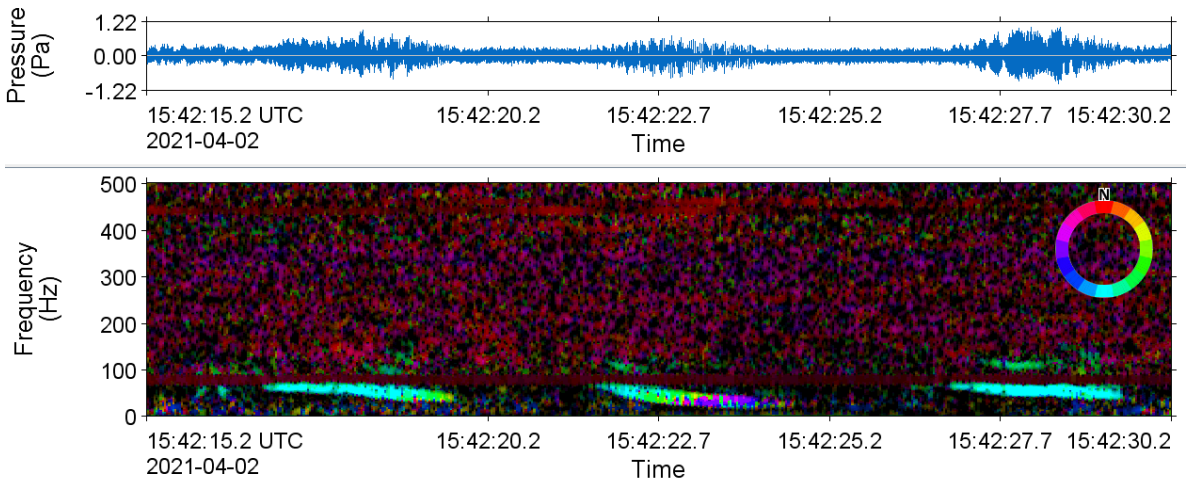

Figure 55. Directogram of pygmy blue D calls recorded on 2 Apr 2021 at Station 4 (UTC) (2 Hz frequency resolution, 0.125 s time window, 0.03125 s time step, Hamming window, normalised across time). Displaying 16 s of data. The blue whale is vocalising to the south of Station 4 (teal). In the second call, the frequencies fall below those which can be accurately determined with the hydrophone spacing using, with the colour of the signal changing from teal to purple and navy blue.

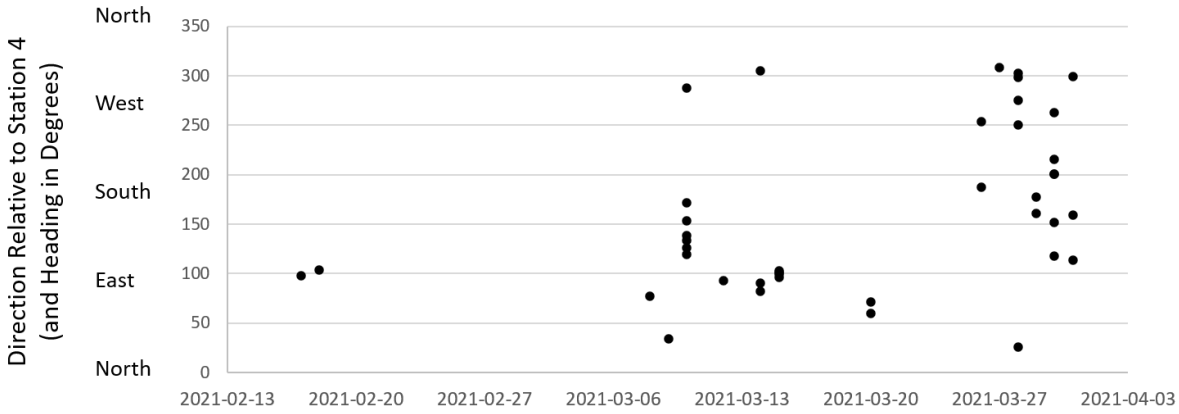

Figure 56. Plot of direction of blue whale vocalisations relative to Station 4 over the recording period where each point is a calculated from a manual annotation created during the 0.5% manual validation analysis (one annotation per direction per 5 min file analysed).

5.7.3. Other Potential Biological Sounds

Occasionally during manual analysis, pulses ranging from ~750 to 1250 Hz (Figure 57) were observed that may have been produced by fish. Alternatively, these signals could be a result of some anthropogenic activity, noises from which were noted through much of the data during manual review, particularly at Stations 1 and 2. Fish chorusing activity was apparent in the LTSAs, in particular at Station 4, with examples provided in Figures 58–60.

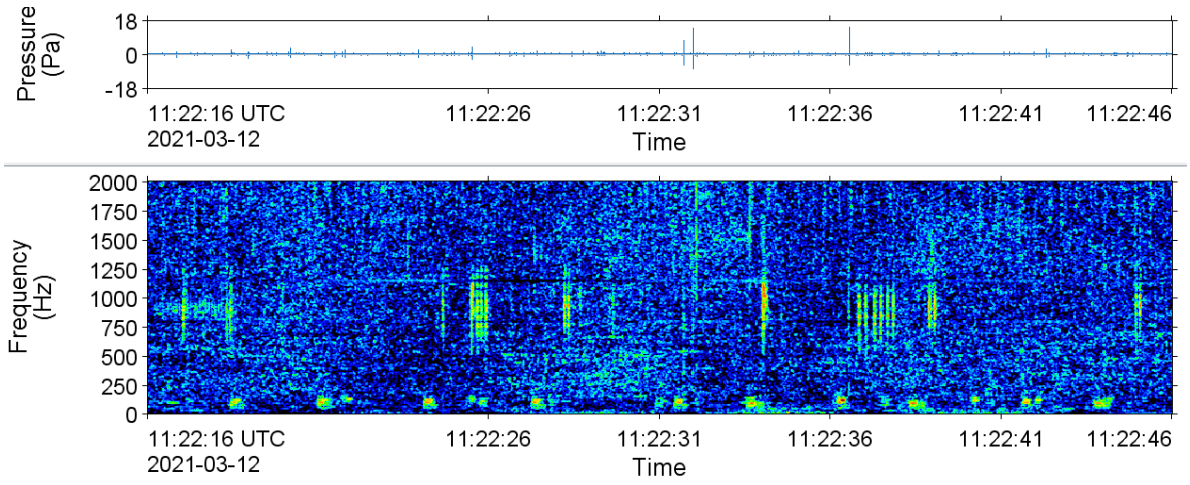

Figure 57. Spectrogram of unknown signals potentially produced by fish (pulses at 500–1250 Hz) recorded on 12 Mar 2021 at Station 3 (UTC) (2 Hz frequency resolution, 0.125 s time window, 0.03125 s time step, Hamming window, normalised across time). Displaying 30 s of data.

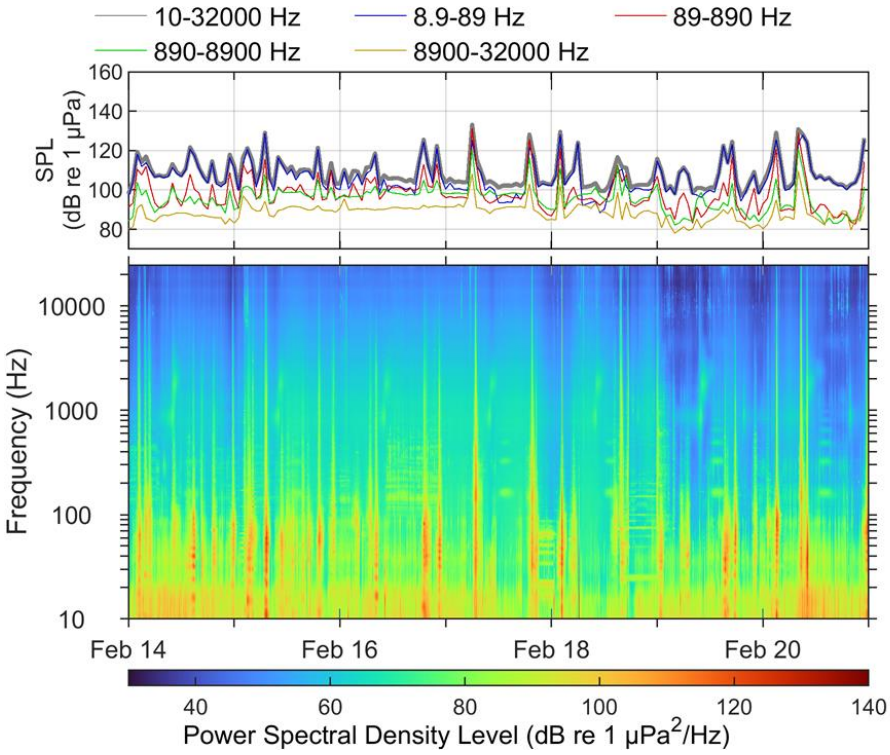

Figure 58. In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound for one week of data at Station 4, showing daily fish chorus's between 700 and 2000 kHz, and between 150 and 450 Hz, more obvious after 17 Feb 2021.

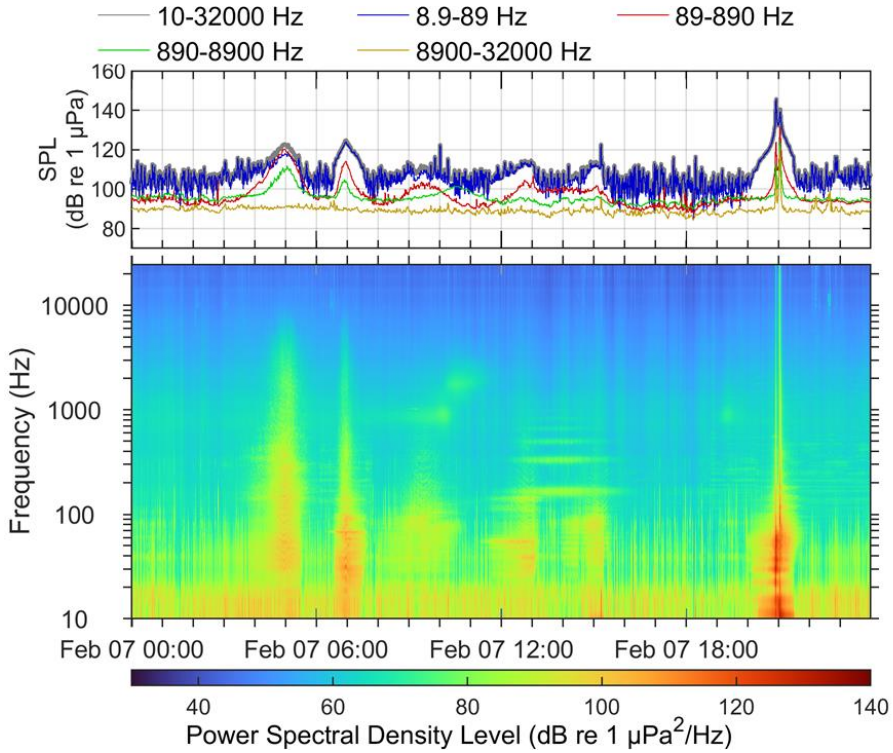

Figure 59. In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound for one day of data at Station 4, showing the daily fish chorus between 700 and 2000 kHz, and between 150 and 450 Hz, apparent in Figure 58, and six vessel transits.

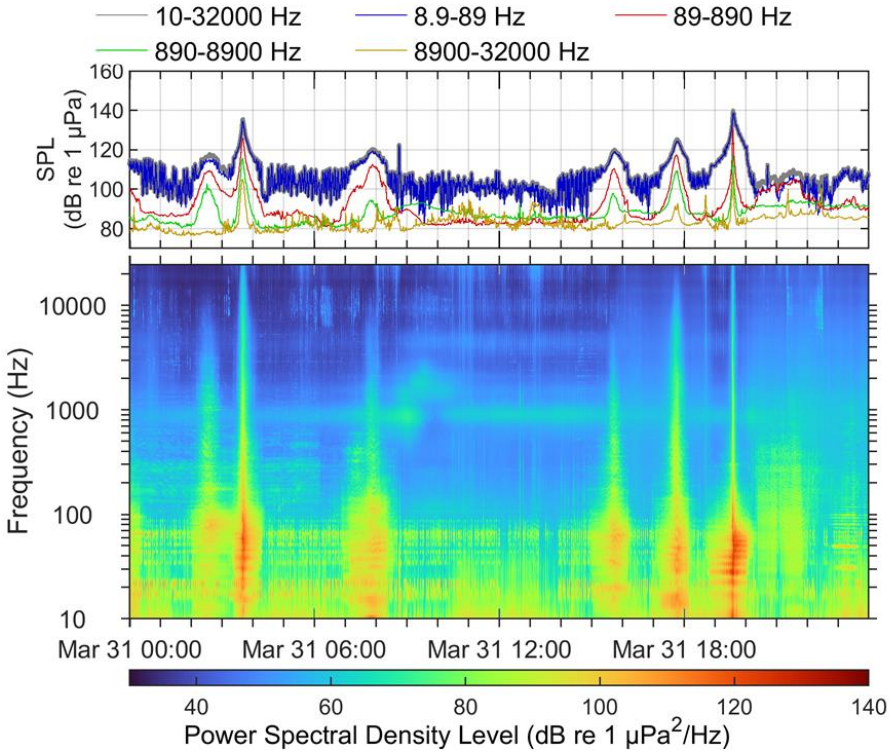

Figure 60. In-band sound pressure level (SPL) and spectrogram (or long-term spectral average; LTSA) of underwater sound for one day of data at Station 4, showing the daily fish chorus between 700 and 2000 kHz, lasting almost the entire day, along with six vessel transits.

6. Validation Analysis

Table 12 presents the four scenarios that need to be considered to validate the pre-measurement modelling presented in Koessler et al. (2020) for the Artisan-1. The scenarios are described in Table 12, with the modelling site locations and descriptions provided in Table 13.

Table 12. Description of modelling scenarios for the Artisan-1 development area from Koessler et al. (2020)

Well	Scenario number	Description	Associated modelled sites
Artisan-1	5	MODU, normal drilling operations	4
	6	OSV standby, independent of MODU, for 24 h	6
	7	MODU with OSV during resupply operations (including 4 hours alongside the MODU)	4, 5 and 6
	8	MODU with OSV standby (combination of Scenarios 5 and 6)	4 and 6

Table 13. Location details for the validation modelled sites.

Well	Site	Source	Latitude (S)	Longitude (E)	MGA Zone 54 (GDA94)		Water depth (m)
					X (m)	*Y* (m)	
Artisan-1	4	MODU	38° 53' 27.4106"	142° 52' 58.4450"	663300	5693640	71.5
	5	OSV	38° 53' 27.4021"	142° 53' 01.0962"	663364	5693639	71.6
	6	OSV standby	38° 53' 26.1553"	142° 54'21.4165"	665300	5693637	70.2

6.1. Source Level Comparison

The modelled source levels used in Koessler et al. (2020) are shown in Figures 61–63 alongside MSLs from the measurement program.

The mean estimated source levels for the vessels under transit used in the modelling study, which were derived based on the scaling of the power level, were similar to the MSL determined through the measurement study, which varied significantly with vessel speed (between 171.6 and 185.2 dB re µPa m). The trend of decreased MSL with speed follow those from studies on commercial shipping and ferries (MacGillivray et al. 2019). The measured MSL under dynamic positioning was different to that used in Koessler et al. (2020), in part due to the vessel power levels applied, but also because the approach used to estimate sound levels under dynamic positioning is based upon vessels under transit and is an approximation based on the Maximum Continuous Rating (MCR). Limited measurements of vessels under dynamic positioning using standardised measurement approaches are reported in literature, and there are significant differences between the thruster models and specifications, depths, and vessel dynamic positioning systems which control thruster operations. Therefore, this characterisation is a valuable contribution to understanding the MSLs for systems installed in anchor handling vessels.

The mean MSLs for the *Ocean Onyx* Figure 63 decrease as the drilling depth increases. The estimate of the *Ocean Onyx* source level spectrum was based on the Transocean *Polar Pioneer*, a similarly sized MODU. The *Polar Pioneer* was measured by JASCO while anchored and drilling, and had a broadband (10 Hz to 35 kHz) source level of 170.1 dB re 1 µPa m (Austin et al. 2018), although the

source level used in the modelling was 178.7 dB re 1 µPa m. The mean maximum MSL from the measurement program was 175.2 re 1 µPa m, associated with shallowest drilling depths.

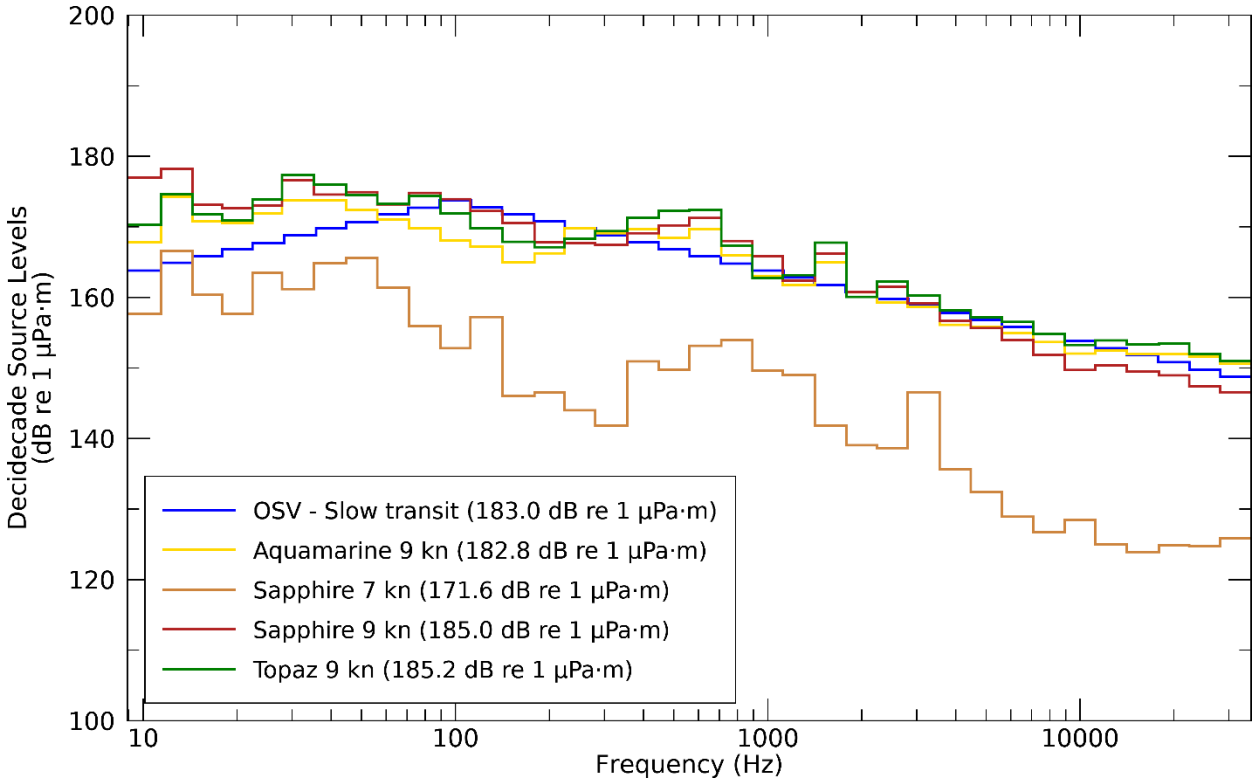

Figure 61. *Offshore Support Vessel (OSV)*: Decidecade source level spectra of the modelled OSV, slow transit (15% MCR) and Monopole source levels (MSLs) determined through the measurement program.

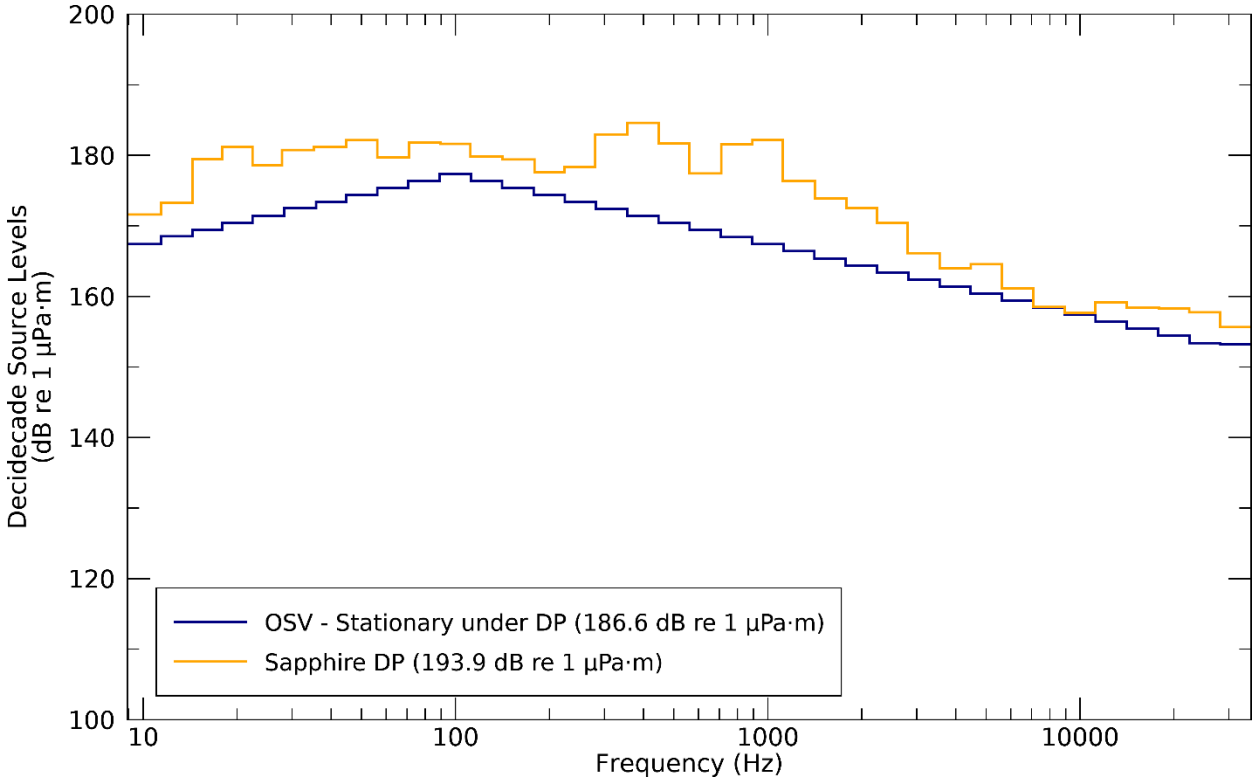

Figure 62. *Offshore Support Vessel (OSV)*: Decidecade source level spectra of the modelled DP (20% MCR) and MSLs determined through the measurement program.

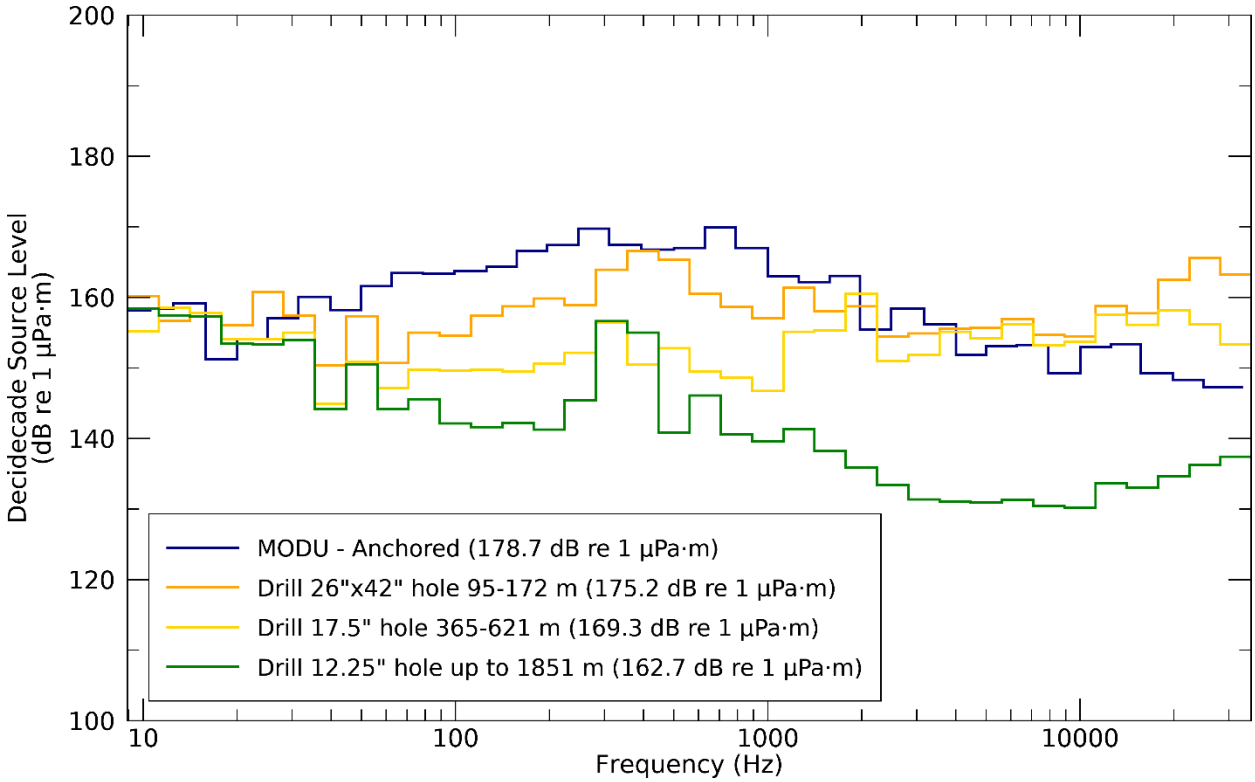

Figure 63. *Mobile Offshore Drilling Unit (MODU)*: Decidecade source level spectra of the modelled MODU, and the mean MSLs determined through the measurement program of the *Ocean Onyx* for three stages of drilling.

6.2. Understanding Propagation Loss

The plotted data and curve fits, as discussed in Section 4.2.4 and presented in Section 5.3, provide substantial detail on the environmental effects on the propagation of acoustic energy in the water column. In comparing SPL data fits for Stations 1–3, the loss rate is higher than what would have been expected in this environment, considering the higher MSLs for the support vessel on DP derived from measurements. In consideration of the potential variations in the seabed geologic compositions as indicated in Section 2.4, any difference may be attributed to the existence or absence of a thin veneer of sand.

A comparison exercise was conducted using JASCO's Marine Operations Noise Model (MONM) and JASCO's wavenumber integration model (VSTACK; Hannay et al. 2010, Jensen et al. 2011). VSTACK computes propagation loss versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. It is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom.

A simple range-independent isovelocity water column (1500 m/s) was modelled considering a calcarenite seabed with and without a thin layer of sand as detailed in the Appendix of Koessler et al. (2020). The decidecade spectra of the measured MODU in Section 6.1 were combined with the modelled propagation loss from MONM and VSTACK to produce received level (SPL; L_p) scatter plots with range. Receivers were chosen to span the water column and the MSL source depth was located at 11 m. The results are shown below in Figures 64 and 65 when considering the mean maximum decidecade MSL presented above in Section 6.1 .

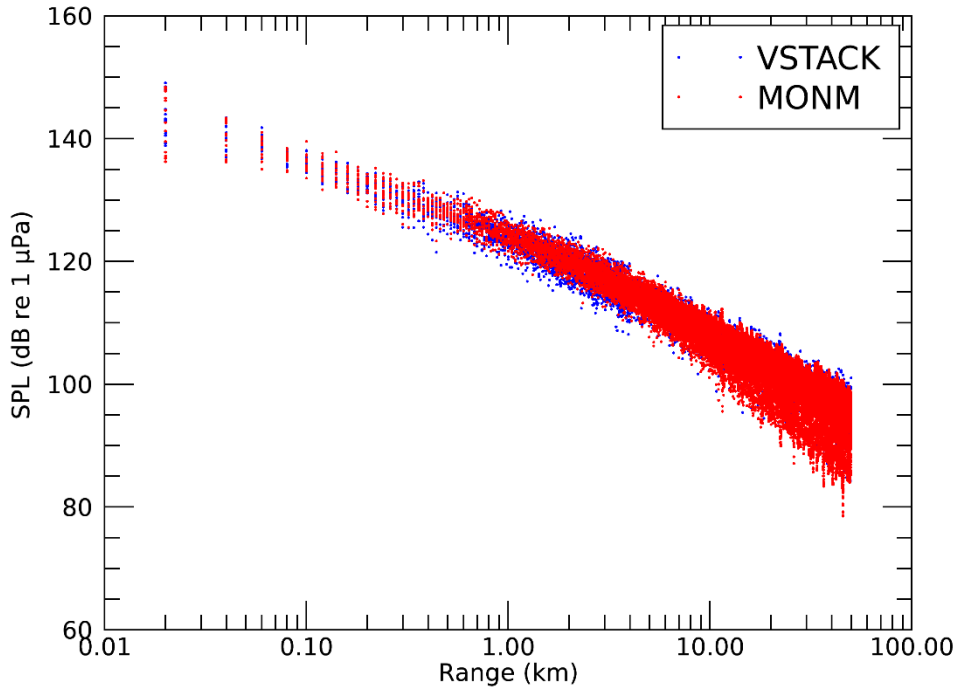

Figure 64 *Mobile Offshore Drilling Unit (MODU)*: Predicted received levels (SPL) for a simplified range independent environment with a calcarenite seabed with a thin overlying veneer of sand.

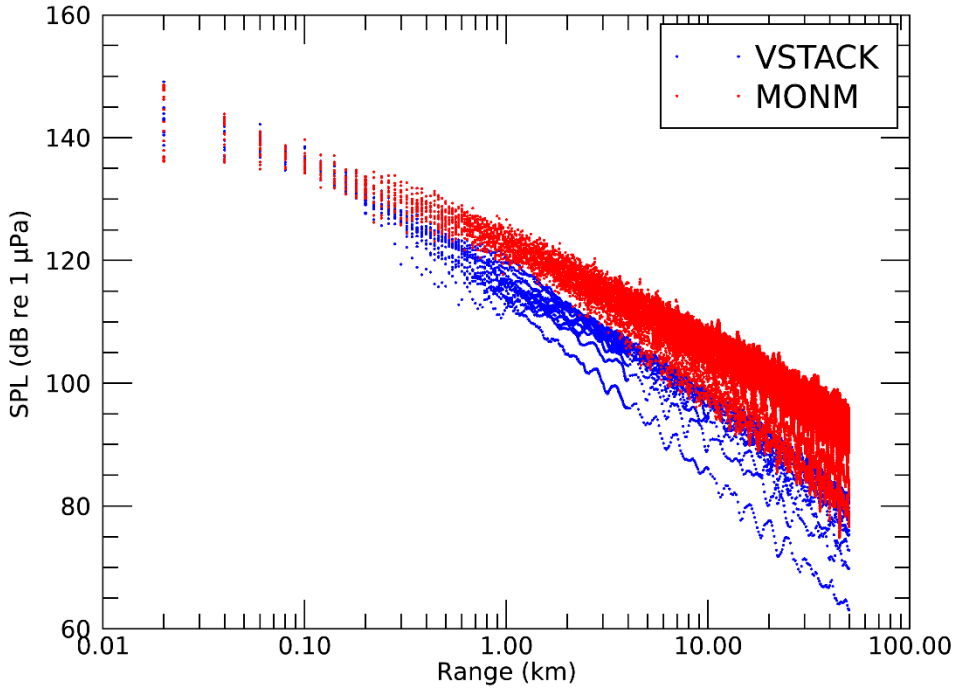

Figure 65 *Mobile Offshore Drilling Unit (MODU)*: Predicted received levels (SPL) for a simplified range independent environment with a calcarenite seabed with no sand layer.

When considering the results from VSTACK, the indication is that much higher rates of loss would be expected if no sand layer were present. Considering the variably of the distribution of seafloor sediments within the wider region, the higher rates of loss indicate that that the any overlaying sand is much thinner than or completely absent at the seafloor. In consideration of these modelled results and the SPL curve fits in in Section 5.3, the validation exercise was therefore carried out with the geoacoustic model consisting of well-cemented carbonate caprock, overlying semi-cemented carbonate rock.

An additional broadband correction was applied to the propagation loss results from MONM to account for the higher rates of loss when the full for the elasto-acoustic properties of the sub-bottom are consider. The differences between the broadband SPL from MONM and VSTACK were extracted at the same modelled ranges and depths that corresponded range independent predictions. The 90th percentile of the resultant dB differences was selected at each range to generate a generalised conversion function for each individual site to be modelled. The conversion functions were applied after the propagation loss calculation from MONM but before summing decidecade band levels, gridding, and radii calculations for each modelled site in each modelled scenario considered. Figure 66 shows an example comparison of the re-modelled results for Scenario 7 (MODU with OSV during resupply operations), at a receiver depth of 70.5 m (the median depth of measurement Stations 1–3) and an azimuth of 60°, against the data and 90th percentile data fit bounds for when the levels at Station 1 are above 150 dB re 1µPa (Figure 22). It is inferred that the data plotted here is associated with operational activity in the vicinity of the MODU and therefore may be similar to the modelled resupply operations scenario, at least for comparative purposes. The similar decay rates between the modelling and measured data indicate that re-modelled results presented here are broadly within measured range of levels for similar operations.

However, these data contain many different operations that will not exactly align with nominal representative scenarios for modelling, due to the time varying nature of the operations and associated produced sound levels. The modelled scenario produces levels that intersect the upper bound of the measured data, and therefore it is likely conservative through using the static MSL and operational representations – whilst a more detailed scenario is possible to be created (Quijano et al. 2019), that was beyond the scope of this study.

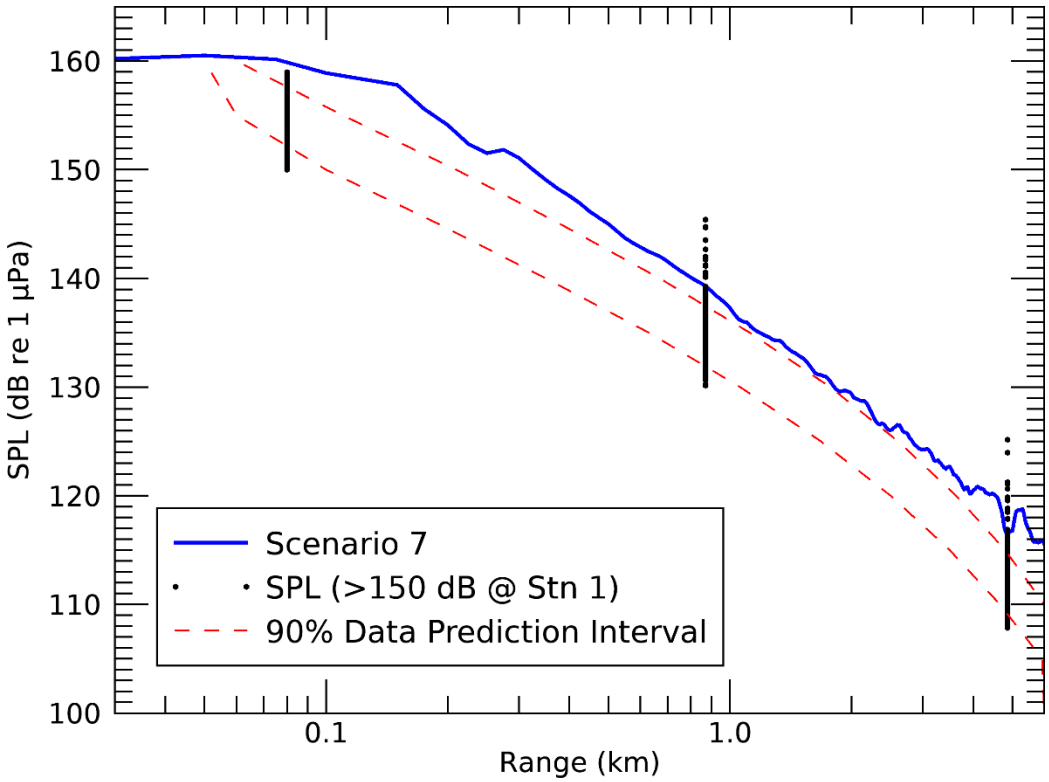

Figure 66. Generalised model validation plot.

6.3. Revised Threshold Distances

The results from the measurement study cannot be directly compared to the modelling presented in Koessler et al. (2020) due to the differences in actual events compared to the nominal representative scenarios developed and evaluated as part of the EP assessment process. Additionally, the measurements were obtained at a receiver 1.2 m off the seafloor, not at the maximum-over-depth results reported in the modelling study. The ranges obtained from the measurement study are reported in relation to the Artisan-1 well location, and thus the centre of the *Ocean Onyx*. The ranges in the modelling study are reported from a range of locations, including the centroids of multiple sources, thus it is not possible to report the measurement results in a similar fashion using the small number of recording locations used in this study.

However, the understanding of the propagation loss environment, and the revision of the representation and treatment of it as detailed in Section 6.2, enabled the modelling scenarios for activities at Artisan-1 presented in Koessler et al. (2020) to be recalculated. The revised results for distances to maximum-over-depth SPL isopleths are presented in Table 14 and compared in Table 15 to the original modelling. The revised results for distances to maximum-over-depth SEL thresholds are presented in Table 16 and compared in Table 17 to the original modelling.

7. Discussion and Conclusion

7.1. Ambient Soundscape

The insights into ambient soundscape within the Otway Basin and in the vicinity of the Development Drilling program can be obtained through the data recorded at Station 4, and in part, Station 3. Stations 1 and 2 are too close to the location of the Artisan-1 well and associated activity to provide any information about ambient noise while the *Ocean Onyx* is present. Whilst data exists outside the period in which the *Ocean Onyx* is present, this data includes noise from the moored rig anchor chains, which are not a typical soundscape contributor.

The correlograms (Section 5.2) show a positive correlation between wind speeds and wave heights and sound levels for frequencies over 100 Hz, with the relationship with wind speed being stronger than that for wave height. For both stations shipping is a strong contributor: most days recorded a significant number of vessel detections (Section 5.6), with the contributions at Station 4 apparent in the power spectral density and percentile plot (Figure 16), between 40 and approximately 100 Hz. If the support vessels for the Development Drilling program did not pass near Station 3 as often while under station keeping, the number of close vessel passes would have been less, and thus it is likely that the statistics presented in Table 10 would have reflected a soundscape with quieter sound levels on average.

In terms of monitoring work with the Otway and Bass Strait regions, between 2009 and 2016 the Integrated Marine Observing System (IMOS) has been recording underwater sound south of Portland, Victoria (38°32.5' S, 115°0.1'E). Prominent sound sources identified in recordings include blue and fin whales at frequencies below 100 Hz, ship noise at 20 to 200 Hz, and fish at 1 to 2 kHz (Erbe et al. 2016). In the broader region, primary contributors to background sound levels were wind, rain and currents-and waves-associated sound at low frequencies under 2 kHz (Przeslawski et al. 2016), and biological sound sources including dolphin vocalisations were also recorded.

To gain an understanding of the existing marine acoustic environment to inform the impact assessment for the Otway Gas Development, acoustic monitoring was undertaken by Woodside (2003). During April-May 2001, two underwater noise loggers were placed (5.1 km and 2.9 km) south-west of an exploration petroleum drilling vessel at the Thylacine site to measure underwater noise before, during, and after drilling activity. Only one of the loggers (5.9 km) was able to be recovered. A further logger was placed in the shipping lane approximately 60 kms due south of Port Fairy to measure ambient noise produced by physical, man-made and biological sources between late November 2001 and early March 2002.

A summary of the report states that the following features were noted with respect to underwater noise environment at the Thylacine location:

- Relatively quiet with only the passage of several boats (about ten) evident.
- The rig tender and drill rig noise show clearly from 13:00 on the 3 May 2001.
- Drill rig noise was evident as sharp tones.
- Rig tender noise was evident either at a low but persistent level for days or in short bursts of high level noise for several hours associated with manoeuvring, use of thrusters or as a close passage by the receiver.
- The horizontal banding characteristic of persistent calling by pygmy blue whales was not evident, rather these call types occurred infrequently and at low levels indicating the respective sources were at long range.
- Evidence of low-level, distant evening fish choruses only.

However, at the shipping lane location, it was noted:

- Regular passages of boats evident.
- Regular evening fish choruses, there were also dawn choruses and persistent low level calling by these sources over daytime.
- Blue whale calling persisted over many hours, an example is the first close passage for the season just before midday on 4 January 2002 followed by several more animals a day later.
- Evidence of calling from at least three other whale species.
- Baseline broadband underwater noise for the period was in the order of 93 to 97 dB re 1 µPa with shipping raising the averaged noise level above 105 dB re 1 µPa for 6% of the deployment time.

An acoustic monitoring program was also undertaken during exploratory drilling of the Casino-3 well. A sound logger located 28.03 km from the drill site did not detect drilling noise and recorded ambient noise that ranged between 90 and 110 dB re 1 µPa (McCauley 2004). Passive acoustic monitoring commissioned by Origin from April 2012 to January 2013, 5 km offshore from the coastline east of Warrnambool, identified that ambient underwater noise in coastal areas is generally higher than further offshore, with a mean of 110 dB re 1 µPa and maximum of 161 dB re 1 µPa.

JASCO has not reviewed these historical reports and the associated activity descriptions within them, or information on the vessels and MODU used, therefore direct comparison between the data collected during exploratory drilling of the Casino-3 well and the Artisan-1 well should be conducted with caution.

Comparing the results from a recorder 28.3 km from drilling operations at Casino 3 with Station 4, the results for Station 4 were a median broadband ambient noise of 104.5 dB re 1 µPa, a mean of 118.3 dB re 1 µPa, a minimum of 86.6 dB re 1 µPa, and a maximum of 153.6 dB re 1 µPa, which is both quieter and louder than those for Casino 3. The mean levels at Station 4 are 8.3 dB higher than those recorded 5 km offshore of Warrnambool, while the maximum recorded at Station 4 is lower by 7.4 dB. The use of percentiles, as provided in Section 5.1.1, Figure 16 and Table 10, in the context of contributors such as weather (Section 5.2), shipping (Section 5.6), and marine mammals (Section 5.7), provides a more nuanced understanding of sound levels received at a recording station. Local variations in ambient noise and received levels can depend upon water depth and the proximity to contributors In this case, the shipping lanes (Section 2.2) and the frequency and proximity of vessel passes are strong drivers of the ambient noise at Station 4. The use of Station 4 as a dedicated measurement location for the support vessels (Section 2.5.2) does not change the relevance of the results from this measurement location, as those vessels would still have been transiting at similar speeds and along similar tracks on trips between Geelong and Artisan-1. The quieter levels reported at Thylacine in Lattice Energy (2017) are likely due to the placement of the monitoring station at a distance from the shipping lanes (Figure 3), which limited their contributions to the data set and thus resulted in a lower reported range of received sound levels.

7.2. Modelling Validation

The Monopole Source Levels determined through the measurement study differed from those either estimated for use in the modelling study or those determined using proxy sources. The key differences are as follows:

- The support vessels are quieter than estimated when they are under slow transit speeds, such as 7 kn.
- The support vessels are louder than estimated when they are travelling at faster transit speeds, with 9 kn used to represent these speeds and the associated MSL.
- The support vessels are louder than estimated when holding station or moving under dynamic positioning.
- The drilling operations of the *Ocean Onyx* are both louder at some frequencies and quieter at others than those for the proxy rig the *Polar Pioneer* (Austin et al. 2018), although the results presented for the *Polar Pioneer* did not examine the changes in level with increased drilling depth (over time) as completed within this study.

The relationship between vessel speed and MSL is well known, with recent detailed examinations on shipping traffic associated with the Port of Vancouver (Joy et al. 2019, Trounce et al. 2019, JASCO Applied Sciences and SMRU Consulting 2020). Conducting the measurement campaign in deeper water, along with higher time resolution location reporting systems for the vessels, automated high time resolution engine information reporting, and a greater number of vessel passes at a range of speeds would further develop this dataset to allow for more accurate predictions of sound level in relation to vessel speed or operations. Predictions of sound levels using speed and operational state is preferred to estimates determined using scaling of power levels, particularly when considering the range of propulsion systems on the vessels.

The measurement of sound levels for vessels under DP is complex and time consuming. It requires dedicated operations in the absence of other activities, which is a challenge considering the task requirements of typical support and anchor handling vessels. Few studies have reported the MSL of support vessels under DP, with the majority estimating the RNL rather than MSL. The large range of thrusters and operational control systems and the variable source depths of each individual thruster contribute to the complexity of estimating source levels. Measurement studies are complicated by environmental conditions and the specifics of each vessel. The MSLs calculated from each of the three DP exercises defined (Section 2.5.2) were very similar. However, the ability to replicate these across different weather conditions and position holding constraints would likely provide valuable information which could help contextualise future modelling studies.

The MSLs reported within this study can be used as inputs to modelling studies for other operations for the same or similar vessels or MODU's. However, the reported ranges to thresholds are specific to the Artisan-1 well location, and not transferrable to other locations, particularly in different water depths, geologic environments, and sound speed profiles. The approach developed to represent the propagation loss based upon the measurement results is suitable for other locations within the continental shelf portion of the Otway Basin. However, the accuracy of the representation of the propagation loss within this environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on the calcarenite seabed within the region. In general, the thinner the sand layer, the greater the propagation loss.

The agreement between VSTACK and MONM would be expected depend on the level and frequency content of the modelled source and the thickness of any unconsolidated sediments at the seafloor as low frequency energy will be less sensitive to thin layers. For the comparison conducted here in Section 6.2, the comparison between VSTACK and MONM is excellent when only a comparatively thin 1 m thick layer of sand overlies the carbonate seabed structure. If the data decay rates were more

indicative of propagation over a layer of sediment, then MONM could have been used without correction.

The distances to the effect thresholds based on the measurement study results (Section 6.3) are reduced compared to those presented in Koessler et al. (2020). The understanding of the environment gained through the measurement study allowed for the geological environment to be represented in a site specific fashion, and a more appropriate configuration of numerical models to represent the propagation loss. The application of the revised modelling approach to represent other Beach Energy activities on the continental shelf of the Otway Basin would be appropriate.

7.3. Development Drilling Program Contributions

Soundscape contributions of the Development Drilling operations were activity-dependent and depended upon proximity to both the *Ocean Onyx* and associated support vessels. At the three closest stations, the relative contributions are demonstrated through the LTSAs and percentiles for the entire period the *Ocean Onyx* was operational at Artisan-1, and two presented example periods. One of the presented example periods involved significant contributions to the sound fields at the three stations close to the rig presented in Section 5.1.1, as well as considering the per station daily SELs (Section 5.1.2).

A better understanding of the contributions from the Development Drilling operations on a regional scale is provided through the data recorded at Station 4, 25 km from the *Ocean Onyx* (whilst drilling operations were being conducted at Artisan-1), and they did not appear to be a significant contributor to the overall soundscape. While the operational contributions were not significant at Station 4, they were apparent throughout different stages of the activity. At long ranges, the contribution from the drilling itself is hard to distinguish from associated vessel operations, complicated by support vessels manoeuvring over an area greater than 100 km^2. The support vessels operating under dynamic position while completing tasks at Artisan-1 which required high thrust levels, such as anchor handling and accurate station keeping in high sea states, were apparent at Station 4 (for example Figure 44). The configuration of Station 4 to be able to present received signals with the context of direction allowed for the attribution of signals to specific sources. Whilst the recording station 28 km from the Casino 3 drilling operation reported in Lattice Energy (2017) was not able to detect drilling noise, the analysis would not have been able to attribute detected vessel noise to the support vessels for the rig. Therefore, it is likely that the Casino 3 monitoring program recorded noise associated with the drilling program but was unable to attribute it due to the lack of context provided by single omni-directional hydrophone recorder configurations (similar to Stations 1–3).

Periods with less dynamic positioning utilisation, such as between 17:00 and 18:39 on 8 Mar 2021, ShipSound report in Appendix G.1.2, with the spectrogram shown in Figure 37, had only faint potential contributions noticeable at Station 4 (Figure 67). In this figure, long tonals which originate in a north-west direction (the direction of Artisan-1) are apparent between 100 and 250 Hz. However, these are not apparent in data at Station 1 (Figure 37), and thus potentially do not originate close to the rig. In addition to these tonals, the spectrogram shown in Figure 67 shows periods of rain, the approach of the 17 m long sailing boat *Zatara* (Figure 68), which passes within 686 m of Station 4 at a speed of 8 kn, and a likely fish chorus between 800 and 1000 Hz from the north-west.

The rig move operations were apparent, similarly to other periods of high thrust levels, with contributions from the support vessels throughout the tow period matching the relative direction received at Station 4 (Figures 69 and 70). The frequency range, which was still typically detectable at long ranges, 100 to up to 1000 Hz, is above the frequency range for the fundamentals and primary harmonics for pygmy blue whale vocalisations (Section 5.7.2), as shown in Figure 69. Therefore, the potential effect on the communication and listening space (Hannay et al. 2016a), and thus masking, at

longer ranges is less apparent than it is for seismic survey activity, or regions in which low frequency signals experience less loss then they do in locations with highly absorptive seabeds.

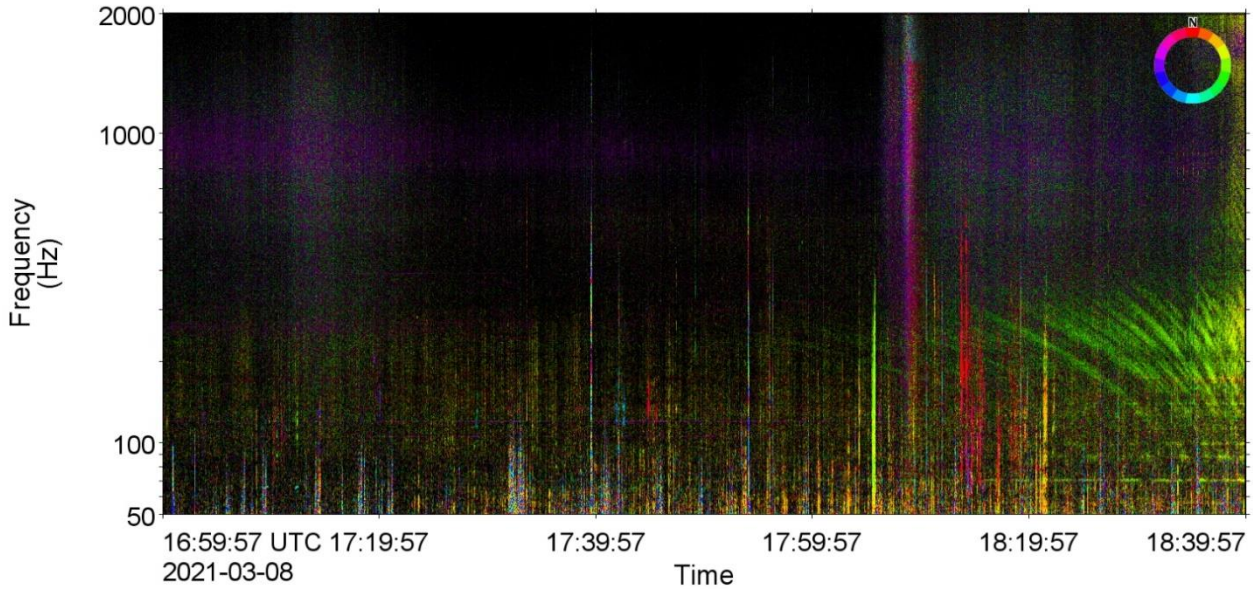

Figure 67. Data recorded on Station 4 including *Ocean Onyx* ShipSound analysis reports between 17:00 and 18:39 on 8 Mar 2021, ShipSound report in Appendix G.1.2, with the spectrogram shown in Figure 37 (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

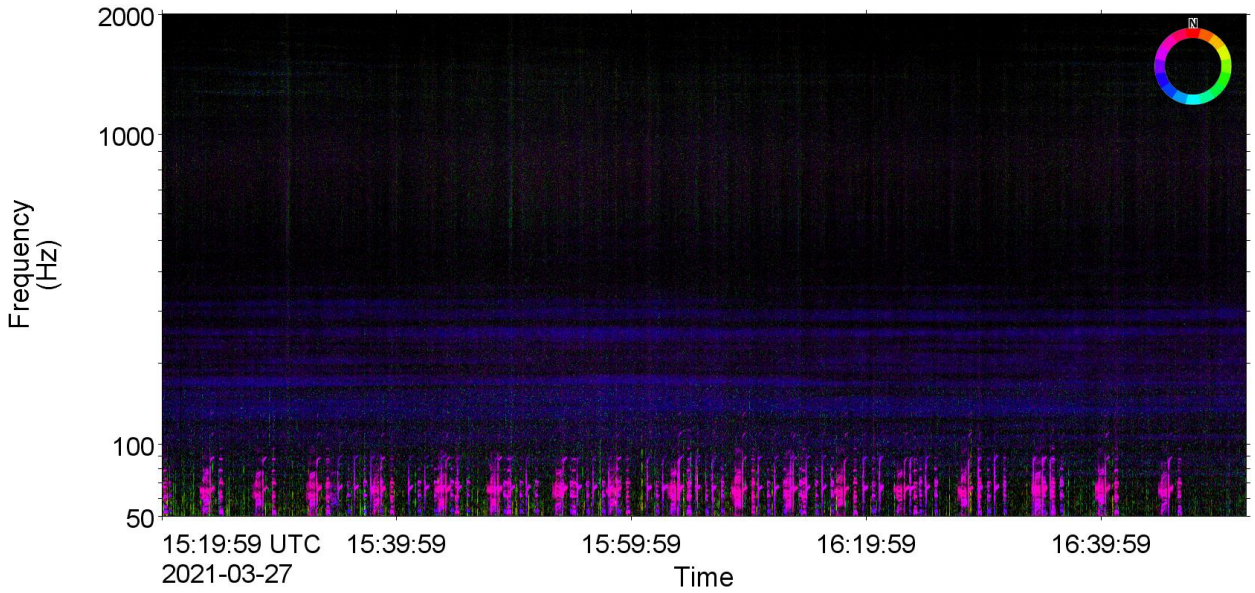

Figure 69. Example of the contribution of the three support vessels and the *Ocean Onyx* while ~23 km away in a south-west direction under tow from Artisan-1 to Geographe, apparent via the blue horizontal striations between 100 and 500 Hz, along with multiple pygmy blue whales in a west to north-west direction of Station 4 (0.4 Hz frequency resolution, 2 s time window, 0.5 s time step, Hamming window, normalised across time).

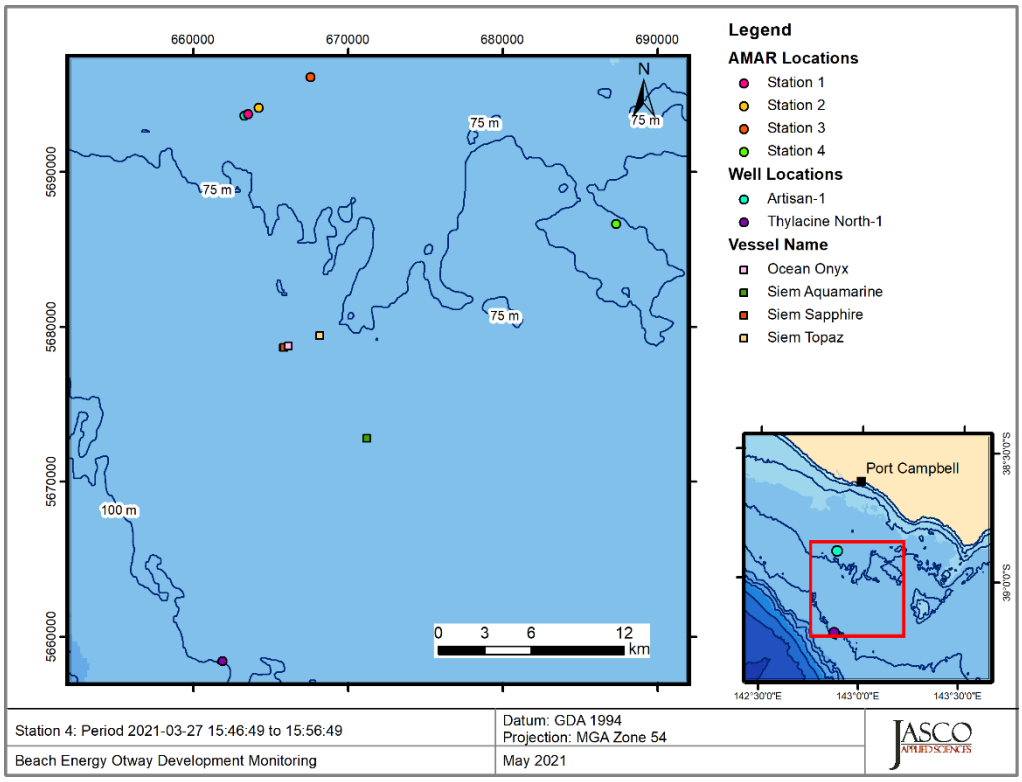

Figure 70. Map of automatic identification system (AIS) reported vessel locations for the spectrogram shown in Figure 69.

7.4. Marine Mammals

The marine mammal acoustic detection results presented in this report provide an index of acoustic occurrence for each species. Although they can be used to describe the relative occurrence of a species, several factors influence the detectability of the targeted signals. Although acoustic detection does indicate presence, an absence of detections (automated or manual) does not necessarily indicate an absence of animals. An animal may be present but not detected if no individuals were vocalising near the recorder, their signals were masked by environmental and/or anthropogenic noise sources, or a combination of these factors. Different sound propagation environments and different seasonal effects will impact the detection range of a given signal over time and, therefore, influence the number of detectable signals. The acoustic signals of both dolphins and pygmy blue whales were present in the acoustic data. vVcalisations of other mysticetes, such as humpback and southern right whales, were not detected by the detectors (D.2), or observed during the 0.5% manual review.

7.4.1. Dolphins

Dolphin species reported in offshore Victorian waters include the short-beaked common and bottlenose dolphins (Bilgmann et al. 2007, Bilgmann et al. 2014). Burrunan dolphins (*Tursiops australis*) can also occur in the region (Charlton-Robb et al. 2015), although they are likely more coastal. While it would be ideal to discriminate between species, success has been limited using automated detectors, and the detailed manual analysis required to attempt to identify individual species is beyond the scope of this report (Steiner 1981, Rendell et al. 1999, Oswald et al. 2003, Baron et al. 2008).

Based on the occurrence of echolocation clicks and whistles, dolphins occurred in the area throughout the recording period at all stations. Dolphin acoustic occurrence was low in February and increased through March at Stations 1, 2, and 3. In contrast, dolphins were consistently present at an almost hourly basis at Station 4. It is impossible to say whether the sparsity of dolphins at Stations 2 and 3 in February is a result of the animals not being common or of their signals being masked by the high noise environment (Figure 16).

The predominance of delphinid clicks during hours of darkness could correspond to foraging on prey species that follow the diel vertical migrations of zooplankton. Similar patterns have been observed in studies of a number of whale species (Víkingsson 1997, Au et al. 2000, Wiggins et al. 2005, Baumgartner and Fratantoni 2008, Sayigh et al. 2013) and by JASCO in studies conducted in northern Australian waters (McPherson et al. 2012, McPherson et al. 2014, McPherson et al. 2016). However, recent research suggests that though such patterns are common, they may not be as closely linked to prey as previously thought (Osiecka et al. 2020).

The presence of sounds believed to be produced by young bottlenose dolphins suggests that not only were dolphins using this region to socialize (indicated by presence of whistles) and forage (indicated by presence of clicks), but they also care for their young.

7.4.2. Pygmy Blue Whales

The acoustic occurrence of pygmy blue whale vocalisations in the acoustic data was unsurprising as they have previously been reported in the region and the Bonney Upwelling is a known foraging area for this species (Garcia-Rojas et al. 2018, McCauley et al. 2018, Möller et al. 2020). Tag data indicates that blue whales are most common in the recording area between January and July, coinciding with the upwelling season of the region (Möller et al. 2020). The lack of clear directional movement during the recording period is unsurprising given both the small sample size and that this area is believed to be a location where blue whales aggregate, as opposed to a migratory corridor where a more consistent pattern in direction over time would be expected. The data does indicate an apparent trend in the animals early in the recording being more to the east and later in the recording being more to the west, but the data were too sparse to confirm anything about animal movements. A monitoring program with directional stations distributed across the Otway Basin would be able to provide this information.

The presence of songs indicates the presence of male pygmy blue whales and the increased regularity of songs at the end of March at all stations corresponds with the onset of the winter singing season for this species (McCauley et al. 2018). Indeed, we cannot say whether the increased vocal activity in March is a result of increased animals in the region or a shift in acoustic behaviour. The blue whale occurrence results were extremely similar across recording stations which is unsurprising given the close vicinity of the recorders that were likely simultaneously recording the same blue whale vocalisations which can propagate great distances, as demonstrated for both pygmy and Antarctic blue whales (Gavrilov and McCauley 2013, Miller et al. 2013, Warren et al. 2021). It is believed that non-song D calls can be produced by male or female blue whales, and it may be a social call (Recalde-Salas et al. 2014).

Acknowledgements

The authors would like to thank the captain and crew of the Siem vessels *Sapphire*, *Aquamarine* and *Topaz*, as well as Klaus Lucke from JASCO for performing the fieldwork.

Glossary

1/3-octave

One third of an octave. Note: A one-third octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec; ISO 2017a).

1/3-octave-band

Frequency band whose bandwidth is one one-third octave. Note: The bandwidth of a one-third octave-band increases with increasing centre frequency.

90%-energy time window

The time interval over which the cumulative energy rises from 5 to 95% of the total pulse energy. This interval contains 90% of the total pulse energy. Symbol: T_{90}.

90% sound pressure level (90% SPL)

The root-mean-square sound pressure levels calculated over the 90%-energy time window of a pulse. Used only for pulsed sounds.

absorption

The reduction of acoustic pressure amplitude due to acoustic particle motion energy converting to heat in the propagation medium.

ambient noise

All-encompassing sound at a given place, usually a composite of sound from many sources near and far (ANSI S1.1-1994 (R2004)), e.g., shipping vessels, seismic activity, precipitation, sea ice movement, wave action, and biological activity.

annotation

A labelled selection of a period of time and frequency within a spectrogram as created by a human analyst during **manual analysis**.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

audiogram

A graph of hearing threshold level (sound pressure levels) as a function of frequency, which describes the hearing sensitivity of an animal over its hearing range.

audiogram weighting

The process of applying an animal's audiogram to sound pressure levels to determine the sound level relative to the animal's hearing threshold (HT). Unit: dB re HT.

Auditory frequency weighting (auditory weighting function, frequency-weighting function)

The process of band-pass filtering sounds to reduce the importance of inaudible or less-audible frequencies for individual species or groups of species of aquatic mammals (ISO 2017a). One example is M-weighting introduced by Southall et al. (2007) to describe "Generalised frequency weightings for various functional hearing groups of marine mammals, allowing for their functional bandwidths and appropriate in characterizing auditory effects of strong sounds".

automated detection

The output of an **automated detector**.

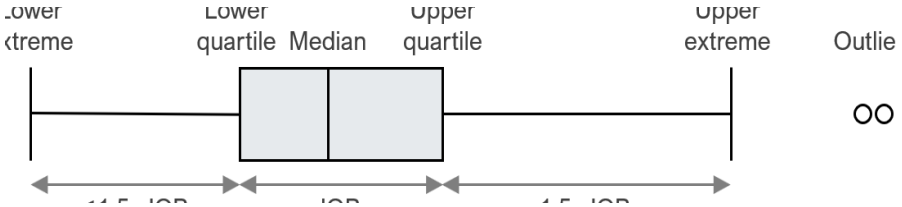
automated detector

An algorithm that includes both the **automated detection** of a sound of interest based on how it stands out from the background and its automated classification based on similarities to templates in a library of reference signals.

background noise

Total of all sources of interference in a system used for the production, detection, measurement, or recording of a signal, independent of the presence of the signal (ANSI S1.1-1994 (R2004)). Ambient noise detected, measured, or recorded with a signal is part of the background noise.

bandwidth



The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI and ASA S1.13-2005 (R2010)).

bar

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to 10^5 Pa or 10^{11} µPa.

box-and-whisker plot

A plot that illustrates the centre, spread, and overall range of data from a visual 5-number summary. The box is the interquartile range (IQR), which shows the middle 50% of the data—from the lower quartile (25th percentile) to the upper quartile (75th percentiles). The line inside the box is the median (50th percentile). The whiskers show the lower and upper extremes excluding outliers, which are data points that fall more than 1.5 × IQR beyond the upper and lower quartiles.

broadband sound level

The total sound pressure level measured over a specified frequency range. If the frequency range is unspecified, it refers to the entire measured frequency range.

cavitation

A rapid formation and collapse of vapor cavities (i.e., bubbles or voids) in water, most often caused by a rapid change in pressure. Fast-spinning vessel propellers typically cause cavitation, which creates a lot of noise.

cetacean

Any animal in the order Cetacea. These are aquatic, mostly marine mammals and include whales, dolphins, and porpoises.

continuous sound

A sound whose sound pressure level remains above ambient sound during the observation period (ANSI and ASA S1.13-2005 (R2010)). A sound that gradually varies in intensity with time, for example, sound from a marine vessel.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 2006).

decidecade

One tenth of a decade (ISO 2017a). Note: An alternative name for decidecade (symbol ddec) is “one-tenth decade”. A decidecade is approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct) and for this reason is sometimes referred to as a “one-third octave”.

decidecade band

Frequency band whose bandwidth is one decidecade. Note: The bandwidth of a decidecade band increases with increasing centre frequency.

decibel (dB)

One-tenth of a bel. Unit of level when the base of the logarithm is the tenth root of ten, and the quantities concerned are proportional to power ([ANSI] American National Standards Institute S1.1-1994 (R2004)).

delphinid

Family of oceanic dolphins, or Delphinidae, composed of approximately thirty extant species, including dolphins, porpoises, and killer whales.

duty cycle

The time when sound is periodically recorded by an acoustic recording system.

far-field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point. The distance to the acoustic far-field increases with frequency.

fast-average sound pressure level

The time-averaged sound pressure levels calculated over the duration of a pulse (e.g., 90%-energy time window), using the leaky time integrator from Plomp and Bouman (1959) and a time constant of 125 ms. Typically used only for pulsed sounds.

fast Fourier transform (FFT)

A computationally efficiently algorithm for computing the discrete Fourier transform.

frequency

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: *f*. 1 Hz is equal to 1 cycle per second.

hearing group

Groups of marine mammal species with similar hearing ranges. Commonly defined functional hearing groups include low-, mid-, and high-frequency cetaceans, pinnipeds in water, and pinnipeds in air.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For example, the second harmonic of a sound has a frequency that is double the fundamental frequency of the sound.

hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual in the absence of significant background noise during a specific percentage of experimental trials.

hertz (Hz)

A unit of frequency defined as one cycle per second.

high-frequency (HF) cetacean

The functional cetacean hearing group that represents those odontocetes (toothed whales) specialised for hearing high frequencies.

hydrophone

An underwater sound pressure transducer. A passive electronic device for recording or listening to underwater sound.

intermittent sound

A level of sound that abruptly drops to the background noise level several times during the observation period.

impulsive sound

Sound that is typically brief and intermittent with rapid (within a few seconds) rise time and decay back to ambient levels (NOAA 2013, ANSI S12.7-1986 (R2006)). For example, seismic airguns and impact pile driving.

low-frequency (LF) cetacean

The functional cetacean hearing group that represents mysticetes (baleen whales) specialised for hearing low frequencies.

manual analysis

Human examination of acoustic data via visual review of spectrograms and/or aural inspection of data.

manual detection

The output of **manual analysis** as recorded in an **annotation**.

masking

Obscuring of sounds of interest by sounds at similar frequencies.

mean-square sound pressure spectral density

Distribution as a function of frequency of the mean-square sound pressure per unit bandwidth (usually 1 Hz) of a sound having a continuous spectrum (ANSI S1.1-1994 (R2004)). Unit: $\mu Pa^2/Hz$.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetacean

The functional cetacean hearing group that represents those odontocetes (toothed whales) specialised for mid-frequency hearing.

mysticete

Mysticeti, a suborder of cetaceans, use their baleen plates, rather than teeth, to filter food from water. They are not known to echolocate, but they use sound for communication. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is broadband, narrowband or tonal, brief or prolonged, continuous or intermittent, and typically does not have a high peak pressure with rapid rise time (typically only small fluctuations in decibel level) that impulsive signals have (ANSI S3.20-1995 (R2008)). For example, marine vessels, aircraft, machinery, construction, and vibratory pile driving (NIOSH 1998, NOAA 2015).

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

odontocete

The presence of teeth, rather than baleen, characterizes these whales. Members of the Odontoceti are a suborder of cetaceans, a group comprised of whales, dolphins, and porpoises. The skulls of toothed whales are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

peak pressure level (PK)

The maximum instantaneous sound pressure level, in a stated frequency band, within a stated period. Also called zero-to-peak pressure level. Unit: decibel (dB).

percentile level, exceedance

The sound level exceeded *n* % of the time during a measurement.

permanent threshold shift (PTS)

A permanent loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

pinniped

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

power spectrum density

Generic term, formally defined as power in W/Hz, but sometimes loosely used to refer to the spectral density of other parameters such as square pressure or time-integrated square pressure.

pressure, acoustic

The deviation from the ambient hydrostatic pressure caused by a sound wave. Also called overpressure. Unit: pascal (Pa). Symbol: *p*.

received level (RL)

The sound level measured (or that would be measured) at a defined location.

rms

root-mean-square.

signature

Pressure signal generated by a source.

sound

A time-varying pressure disturbance generated by mechanical vibration waves travelling through a fluid medium such as air or water.

sound exposure

Time integral of squared, instantaneous frequency-weighted sound pressure over a stated time interval or event. Unit: pascal-squared second ($Pa^2 \cdot s$) (ANSI S1.1-1994 (R2004)).

sound exposure level (SEL)

A cumulative measure related to the sound energy in one or more pulses. Unit: dB re 1 $\mu Pa^2 \cdot s$. SEL is expressed over the summation period (e.g., per-pulse SEL [for airguns], single-strike SEL [for pile drivers], 24-hour SEL).

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum (ANSI S1.1-1994 (R2004)). Unit: $\mu Pa^2 \cdot s/Hz$.

sound pressure level (SPL)

The decibel ratio of the time-mean-square sound pressure, in a stated frequency band, to the square of the reference sound pressure (ANSI S1.1-1994 (R2004)).

For sound in water, the reference sound pressure is one micropascal (p_0 = 1 µPa) and the unit for SPL is dB re 1 μPa^2:

$$L_p = 10 \log_{10}(p^2/p_0^2) = 20 \log_{10}(p/p_0)$$

Unless otherwise stated, SPL refers to the root-mean-square (rms) pressure level. See also 90% sound pressure level and fast-average sound pressure level. Non-rectangular time window functions may be applied during calculation of the rms value, in which case the SPL unit should identify the window type.

source level (SL)

The sound level measured in the far-field and scaled back to a standard reference distance of 1 metre from the acoustic centre of the source. Unit: dB re 1 $\mu Pa \cdot m$ (pressure level) or dB re 1 $\mu Pa^2 \cdot s \cdot m$ (exposure level).

spectral density level

The decibel level ($10 \cdot \log_{10}$) of the spectral density of a given parameter such as SPL or SEL, for which the units are dB re 1 $\mu Pa^2/Hz$ and dB re 1 $\mu Pa^2 \cdot s/Hz$, respectively.

spectrogram

A visual representation of acoustic amplitude compared with time and frequency.

spectrum

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

validated detection

The output of an **automated detector** that has been subsequently validated by a human analyst.

Appendix A. Underwater Acoustics

A.1. Acoustic Metrics

Sound levels with individual metrics defined below, are presented as:

- Broadband and approximate-decade-band SPL over time for these frequency bands for the low sample rate: 10 Hz–32 kHz (Nyquist), 10–100 Hz, 100 Hz to 1 kHz, 1–10 kHz, and 10–32 kHz. For the high sample rate, the Nyquist is 256 kHz.
- Spectrograms: Ambient noise at each station was analysed by Hamming-windowed fast Fourier transforms (FFTs), with 1 Hz resolution and 50% window overlap. The 120 FFTs performed with these settings are averaged to yield 1 min average spectra.
- Statistical distribution of SPL in each decidecade. The boxes of the statistical distributions indicate the first (L_5), second (L_{50}), and third (L_{75}) quartiles. The whiskers indicate the maximum and minimum range of the data. The solid line indicates the sound pressure level (SPL) or L_{eq} in each decidecade.
- Spectral level percentiles: Histograms of each frequency bin per 1 min of data. The L_{eq}, L_5, L_{25}, L_{50}, L_{75}, and L_{95} percentiles are plotted. The L_5 percentile curve is the frequency-dependent level exceeded by 95% of the 1 min averages. Equivalently, 5% of the 1 min spectral levels are above the 95th percentile curve.
- Daily cumulative sound exposure levels (SEL (24 h)): computed for the total received sound energy. The SEL (24 h) is the linear sum of the 1 min sound exposure levels (SEL). These SEL values were weighted to mimic different functional hearing groups according to the marine mammal frequency-weighted curves described in Appendix E.

Sound is most commonly described using the sound pressure level (SPL) metric. Underwater sound amplitude levels are commonly measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa.

SPL (dB re 1 µPa) is the decibel level of the rms pressure in a stated frequency band over a time window (*T; s*) containing the acoustic event:

$$\mathrm{SPL} = 10 \log_{10} \left(\frac{1}{T} \int_T p^2(t)\, dt \Big/ p_0^2 \right) \quad \text{(A-1)}$$

The SPL is a measure of the effective pressure level over the duration of an acoustic event, such as the emission of one acoustic pulse or sweep. Because the window length, T, is the divisor, events more spread out in time have a lower SPL even though they may have similar total acoustic energy density.

Power spectral density (PSD) level is a description of how the acoustic power is distributed over different frequencies within a spectrum. It is expressed in dB re 1 µPa²/Hz.

The sound exposure level (SEL, dB re 1 µPa²·s) is a measure of the total acoustic energy contained in one or more acoustic events. The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T_{100}):

$$\mathrm{SEL} = 10 \log_{10} \left(\int_{T_{100}} p^2(t)\, dt \Big/ T_0 p_0^2 \right) \quad \text{(A-2)}$$

where T_0 is a reference time interval of 1 s. The SEL represents the total acoustic energy received at a location during an acoustic event; it measures the total sound energy an organism at that location would be exposed to.

Because the SPL and SEL are both computed from the integral of square pressure, these metrics are related by the following expression, which depends only on the duration of the energy time window T:

$$\mathrm{SPL} = \mathrm{SEL} - 10\log_{10}(T) \quad \text{(A-3)}$$

Sound level statistics, namely percentiles, were used to quantify the distribution of recorded sound levels. The *n*th percentile level (L_n) is the level (i.e., PSD level, SPL, or SEL) *n*% of the data are below this level. L_{eq} is the linear arithmetic mean of the sound power, which can be substantially different from the median sound level L_{50}. SPL can also be referred to as L_{eq}, which stands for 'equivalent level'. The two terms are used interchangeably throughout. L_{95}, the level exceeded by only 5% of the data, represents the highest typical sound levels measured. Sound levels between L_5 and L_{99} are generally from very close passes of vessels, very intense weather events, and other infrequent conditions. L_5 represents the quietest typical conditions.

Appendix B. Acoustic Data Analysis Methods

The data sampled at 64 kHz and 512 kHz was processed for ambient sound analysis, vessel noise detection, and detection of all marine mammal vocalisations. This section describes the ambient, vessel, and marine mammal detection algorithms employed (Figure B-1).

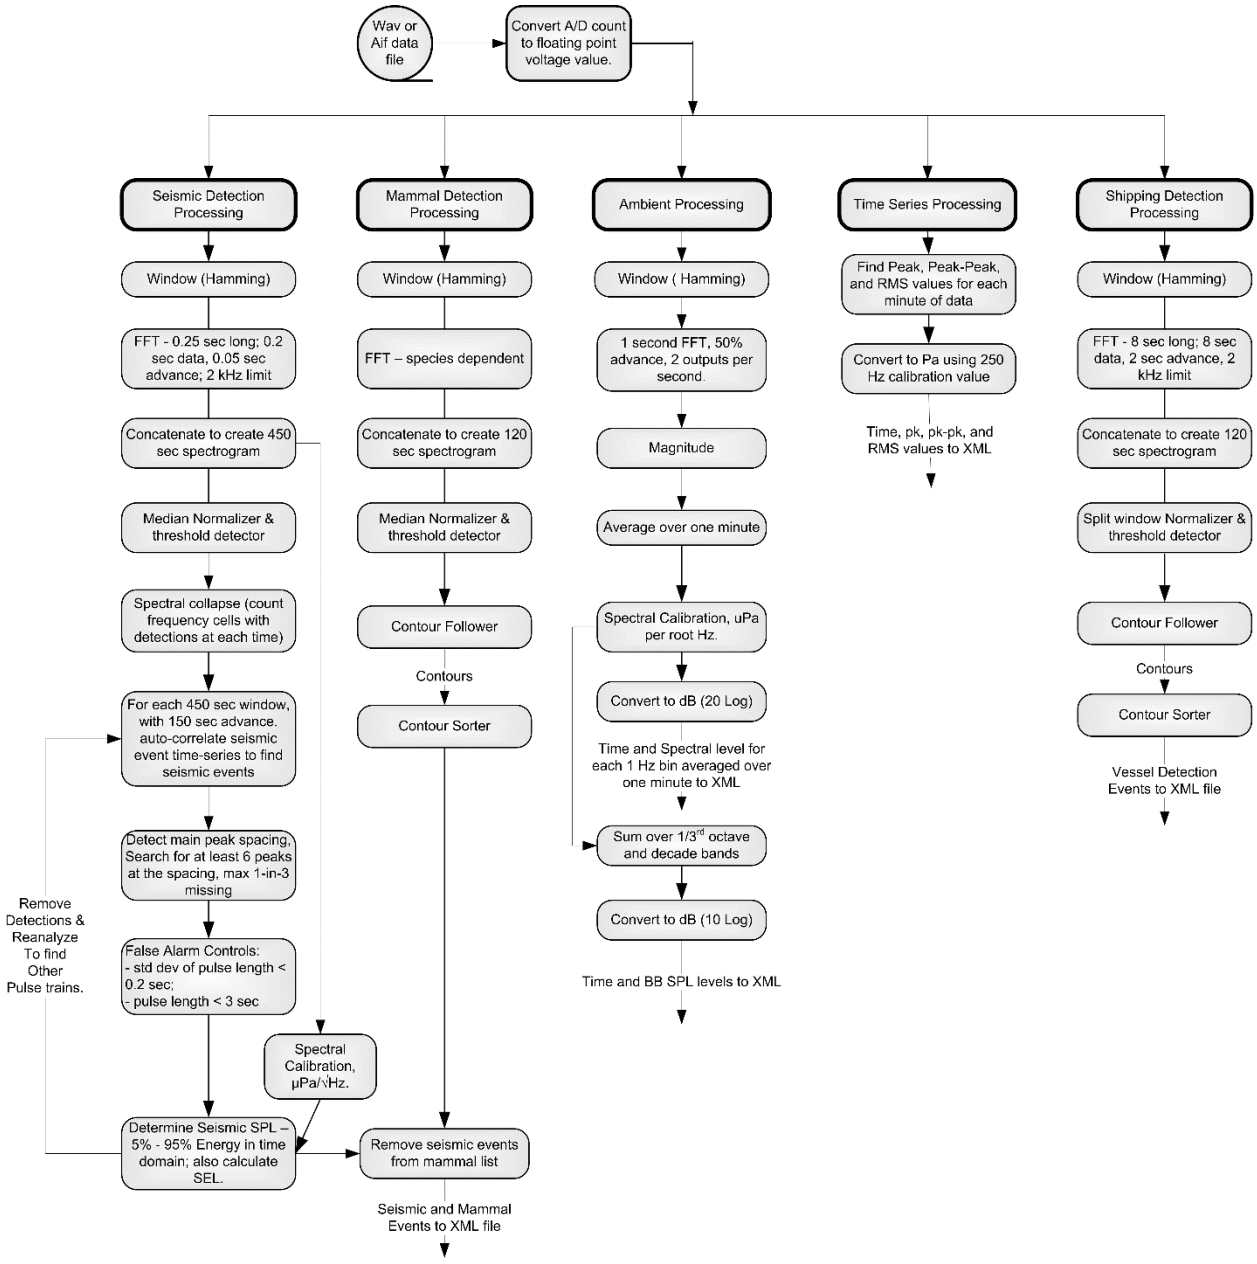

Figure B-1. Major stages of the automated acoustic analysis process performed with JASCO's custom software suite.

B.1. Total Ambient Sound Levels

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially impulsive noise such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate noise and its effects on marine life. We provide specific definitions of relevant metrics used in this report. Where possible we follow the ANSI and ISO standard definitions and symbols for sound metrics, but these standards are not always consistent.

The zero-to-peak pressure level, or peak pressure level (PK or $L_{p,pk}$; dB re 1 µPa), is the decibel level of the maximum instantaneous sound pressure level in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$\mathrm{PK} = L_{p,\mathrm{pk}} = 10\log_{10}\frac{\max|p^2(t)|}{p_0^2} \tag{B-6}$$

PK is often included as criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of a noise event, it is generally a poor indicator of perceived loudness.

The sound pressure level (SPL or L_p; dB re 1 µPa) is the decibel level of the root-mean-square (rms) pressure in a stated frequency band over a specified time window (T; s) containing the acoustic event of interest. It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$\mathrm{SPL} = L_p = 10\log_{10}\left[\frac{1}{T}\int_T p^2(t)\,dt \Big/ p_0^2\right] \tag{B-7}$$

The SPL represents a nominal effective continuous sound over the duration of an acoustic event, such as the emission of one acoustic pulse, a marine mammal vocalisation, the passage of a vessel, or over a fixed duration. Because the window length, T, is the divisor, events with similar sound exposure level (SEL), but more spread out in time have a lower SPL.

The sound exposure level (SEL or L_E, dB re 1 µPa^2·s) is a measure related to the acoustic energy contained in one or more acoustic events (N). The SEL for a single event is computed from the time-integral of the squared pressure over the full event duration (T):

$$\mathrm{SEL} = L_E = 10\log_{10}\left[\int_T p^2(t)\,dt \Big/ T_0 p_0^2\right] \tag{B-8}$$

where T_0 is a reference time interval of 1 s. The SEL continues to increase with time when non-zero pressure signals are present. It therefore can be construed as a dose-type measurement, so the integration time used must be carefully considered in terms of relevance for impact to the exposed recipients.

SEL can be calculated over periods with multiple events or over a fixed duration. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10\log_{10}\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \tag{B-9}$$

To compute the SPL(T_{90}) and SEL of acoustic events in the presence of high levels of background noise, equations B-6 and B-7 are modified to subtract the background noise contribution:

$$\mathrm{SPL}(T_{90}) = L_{p90} = 10\log_{10}\left[\frac{1}{T_{90}}\int_{T_{90}}\left(p^2(t) - \overline{n^2}\right)dt \Big/ p_0^2\right] \quad \text{(B-10)}$$

$$L_E = 10\log_{10}\left[\int_{T}\left(p^2(t) - \overline{n^2}\right)dt \Big/ T_0 p_0^2\right] \quad \text{(B-11)}$$

where $\overline{n^2}$ is the mean square pressure of the background noise, generally computed by averaging the squared pressure of a temporally-proximal segment of the acoustic recording during which acoustic events are absent (e.g., between pulses).

Because the SPL(T_{90}) and SEL are both computed from the integral of square pressure, these metrics are related numerically by the following expression, which depends only on the duration of the time window T:

$$L_p = L_E - 10\log_{10}(T) \quad \text{(B-12)}$$

$$L_{p90} = L_E - 10\log_{10}(T_{90}) - 0.458 \quad \text{(B-13)}$$

where the 0.458 dB factor accounts for the 10% of SEL missing from the SPL(T_{90}) integration time window.

Energy equivalent SPL (dB re 1 µPa) denotes the SPL of a stationary (constant amplitude) sound that generates the same SEL as the signal being examined, $p(t)$, over the same period of time, T:

$$L_{\mathrm{eq}} = 10\log_{10}\left[\frac{1}{T}\int_{T} p^2(t)\,dt \Big/ p_0^2\right] \quad \text{(B–14)}$$

The equations for SPL and the energy-equivalent SPL are numerically identical; conceptually, the difference between the two metrics is that the former is typically computed over short periods (typically of 1 s or less) and tracks the fluctuations of a non-steady acoustic signal, whereas the latter reflects the average SPL of an acoustic signal over times typically of one minute to several hours.

B.2. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. These values directly compare to the Wenz curves, which represent typical deep ocean sound levels (Figure 9) (Wenz 1962). This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a "1/3-octave" because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the ith band, $f_c(i)$, is defined as:

$$f_c(i) = 10^{\frac{i}{10}}\ \mathrm{kHz} \quad \text{(B-1)}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{\mathrm{lo},i} = 10^{\frac{-1}{20}} f_{\mathrm{c}}(i) \quad \text{and} \quad f_{\mathrm{hi},i} = 10^{\frac{1}{20}} f_{\mathrm{c}}(i) \tag{B-2}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure B-2).

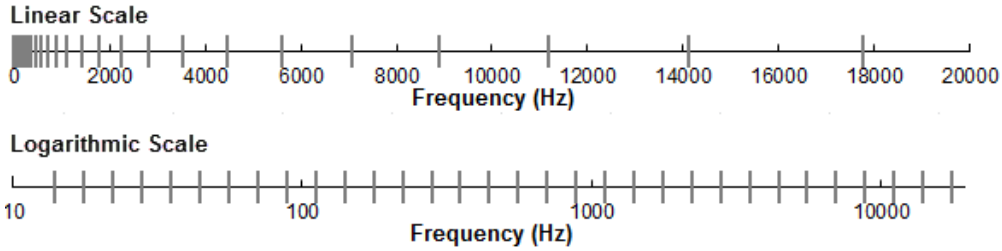

Figure B-2. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{\mathrm{lo},i}$ and $f_{\mathrm{hi},i}$:

$$L_{p,i} = 10 \log_{10} \int_{f_{\mathrm{lo},i}}^{f_{\mathrm{hi},i}} S(f)\, df \tag{B-3}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_{i} 10^{\frac{L_{p,i}}{10}} \tag{B-4}$$

Figure B-3 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the spectral levels at higher frequencies. Decidecade band analysis is applied to continuous and impulsive noise sources. For impulsive sources, the decidecade band SEL is typically reported.

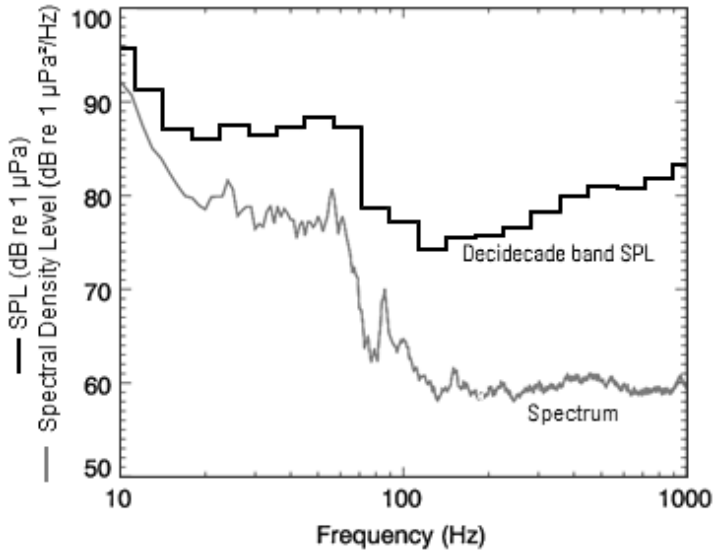

Figure B-3. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.

Table B-1. Decidecade band frequencies (Hz)

Band	Lower frequency	Nominal centre frequency	Upper frequency
10	8.9	10.0	11.2
11	11.2	12.6	14.1
12	14.1	15.8	17.8
13	17.8	20.0	22.4
14	22.4	25.1	28.2
15	28.2	31.6	35.5

39	7079	7943	8913
40	8913	10000	11220
41	11220	12589	14125
42	14260	16000	17952
43	17825	20000	22440
44	22281	25000	28050
45	28074	31500	35344

Table B-2. Decade-band frequencies (Hz)

Decade band	Lower frequency	Nominal centre frequency	Upper frequency
A	10	50	100
B	100	500	1,000
C	1,000	5,000	10,000

B.3. Millidecade Band Analysis

JASCO Applied Sciences has adopted a hybrid millidecade spectrum system to store and exchange passive acoustic spectral data to optimize data resolution while minimising data size, described in Martin et al. (2021).

Millidecades are logarithmically spaced frequency bands but have a bandwidth equal to 1/1000th of a decade. This frequency resolution is high enough to support many types of analysis, including analysing different types of soundscapes, computing weighted sound exposure levels, and summing the millidecades to find decidecades, 1/3-octave, and other desired frequency bands. The size of the millidecade files greatly compresses the acoustic data compared to 1 Hz resolution, such that data from long-term, multiple-station, high-sampling frequency projects can easily be stored at a single location. For example, there are 1,000 millidecades in each frequency decade, where a decade is an increase in the frequency by a factor of 10. A pure millidecade presentation of a spectrum from 1–100,000 Hz has 5,000 bands rather than 100,000 1 Hz bands, which results in a 20:1 decrease in the amount of data required for storage or exchange. For a 256 kHz spectrum, which is becoming a common size for recorders sampling at 512 kHz, there are 3,206 hybrid millidecades resulting in a compression ratio of 80:1.

The format uses 1-Hz resolution up to 455 Hz and millidecades frequency bands above 455 Hz. The lowest millidecades over-resolve (bin sizes <1 Hz) the space between 1–435 Hz for nearly all soundscape applications. To address this, a hybrid solution was applied that uses 1 Hz bands up to 455 Hz, where the millidecades are 1 Hz wide.

Similar to decidecades, the centre frequency for the ith millidecade (f_{c_i}) is defined as

$$f_{c_i} = 10^{i/1{,}000} \text{ (Hz)} \tag{15}$$

and the lower (f_{lo_i}) and upper (f_{hi_i}) bounds for each millidecade are

$$f_{lo_i} = f_{c_i} \cdot 10^{-1/2{,}000} \text{ (Hz)} \tag{16}$$

$$f_{hi_i} = f_{c_i} \cdot 10^{1/2{,}000} \text{ (Hz)} . \tag{17}$$

Appendix C. Recorder Calibration

The AMAR was calibrated before deployment with a pistonphone type 42AC precision sound source (G.R.A.S. Sound & Vibration A/S; Figure C-1). Due to the unforeseen delay of the retrieval the battery life was exhausted which prevented a calibration after retrieval. The pistonphone calibrator produces a constant tone at 250 Hz at a fixed distance from the hydrophone sensor in an airtight space with known volume. The recorded level of the reference tone on the AMAR yields the system gain for the AMAR and hydrophone. To determine absolute sound pressure levels, this gain was applied during data analysis. Typical calibration variance using this method is less than 0.7 dB absolute pressure.

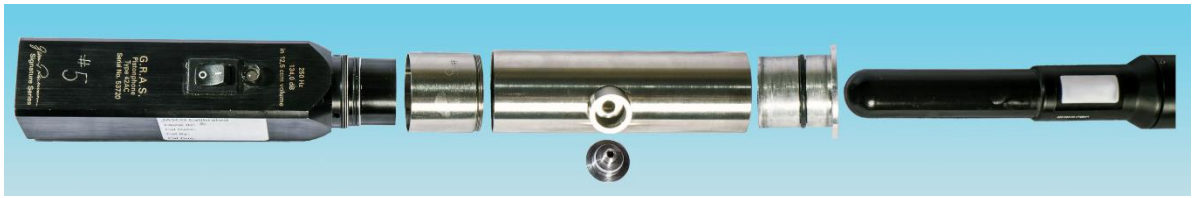

Figure C-1. Split view of a G.R.A.S. 42AC pistonphone calibrator with an M36 hydrophone.

Appendix D. Marine Mammal Detection Methodology

D.1. Automated Click Detector for Odontocetes

We applied an automated click detector/classifier to the data to detect clicks from odontocetes (Figure D-1.). This detector/classifier is based on the zero-crossings in the acoustic time series. Zero-crossings are the rapid oscillations of a click's pressure waveform above and below the signal's normal level (e.g., Figure D-1.). Clicks are detected by the following steps (Figure D-1.):

1. The raw data is high-pass filtered to remove all energy below 5 kHz. This removes most energy from other sources such as shrimp, vessels, wind, and cetacean tonal calls, yet allows the energy from all marine mammal click types to pass.
2. The filtered samples are summed to create a 0.334 ms rms time series. Most marine mammal clicks have a 0.1–1 ms duration.
3. Possible click events are identified with a split-window normaliser that divides the 'test' bin of the time series by the mean of the 6 'window' bins on either side of the test bin, leaving a 1-bin wide 'notch'.
4. A Teager-Kaiser energy detector identifies possible click events.
5. The high-pass filtered data is searched to find the maximum peak signal within 1 ms of the detected peak.
6. The high-pass filtered data is searched backwards and forwards to find the time span where the local data maxima are within 9 dB of the maximum peak. The algorithm allows for two zero-crossings to occur where the local peak is not within 9 dB of the maximum before stopping the search. This defines the time window of the detected click.
7. The classification parameters are extracted. The number of zero crossings within the click, the median time separation between zero crossings, and the slope of the change in time separation between zero crossings are computed. The slope parameter helps to identify beaked whale clicks, as beaked whales can be identified by the increase in frequency (upsweep) of their clicks.
8. The Mahalanobis distance between the extracted classification parameters and the templates of known click types is computed. The covariance matrices for the known click types, computed from thousands of manually identified clicks for each species, are stored in an external file. Each click is classified as a type with the minimum Mahalanobis distance unless none of them are less than the specified distance threshold.

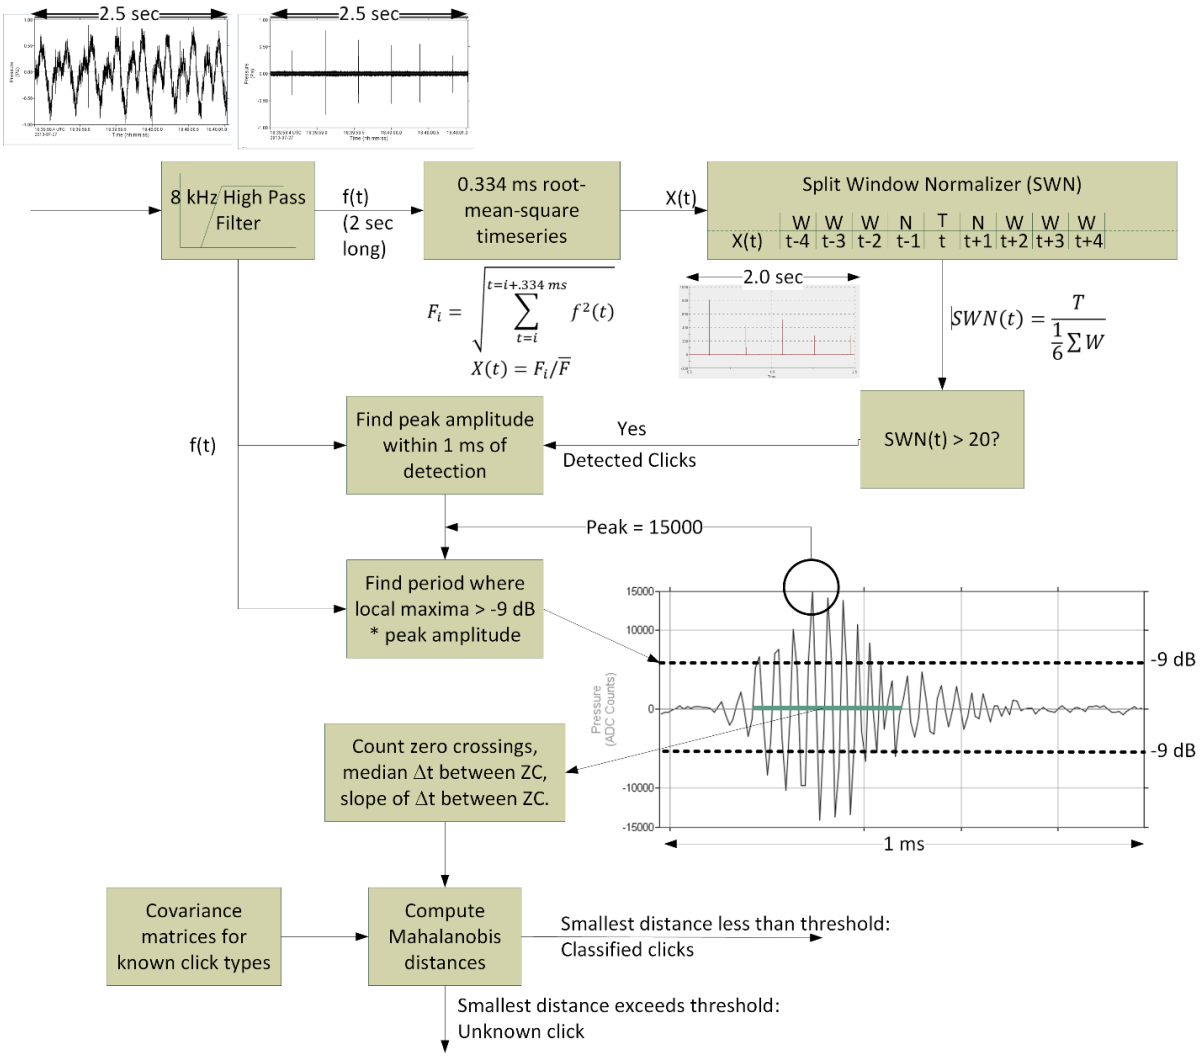

Figure D-1. The automated click detector/classifier block diagram.

Odontocete clicks occur in groups called click trains. Each species has a characteristic inter-click-interval (ICI) and number of clicks per train. The automated click detector includes a second stage that associates individual clicks into trains (Figure D-2). The steps of the click train associator algorithm are:

1. Queue clicks for N seconds, where N is twice the maximum number of clicks per train times the maximum ICI.
2. Search for all clicks within the window that have Mahalanobis distances less than 11 for the species of interest (this gets 99% of all clicks for the species as defined by the template).
3. Create a candidate click train if:
   a. The number of clicks is greater or equal to the minimum number of clicks in a train;
   b. The maximum time between any two clicks is less than twice the maximum ICI, and
   c. The smallest Mahalanobis distance for all clicks in the candidate train is less than 4.1.
4. Create a new ‘time-series’ that has a value of 1 at the time of arrival of each clicks and zeroes everywhere else.
5. Apply a Hann window to the timeseries then compute the cepstrum.
4. A click train is classified if a peak in the cepstrum with amplitude > 5 times the standard deviation of the cepstrum occurs at a quefrency between the minimum maximum ICI.
5. Queue clicks for N seconds

6. Search for all clicks within the window that have Mahalanobis distances less than 10 (equal to the extent of the variance in the training data set).
7. If the number of clicks is greater than or equal to 3 and dT is less than 2 * max ICI, make a new time-series at the 0.333 ms rate; where the value is 1 when the clicks occurred and 0 for all other time bins. Perform the following processing on this time series:
   a. Compute cepstrum
   b. ICI is the peak of the cepstrum with amplitude > 5 * stdev and searching for quefrency between minICI and maxICI.
   c. For each click related to the previous Ncepstrum, create a new time series and compute ICI; if we get a good match, extend the click train; find a mean ICI and variance.
8. If the click features, total clicks and mean ICI match the species, output a species_click_train detection.

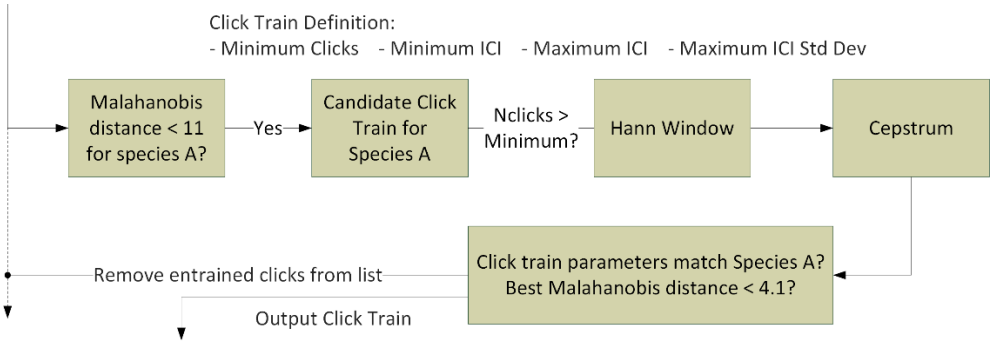

Figure D-2. The click train automated detector/classifier block diagram.

D.2. Automated Tonal Signal Detection

Marine mammal tonal acoustic signals are automatically detected by the following steps:

1. Spectrograms of the appropriate resolution for each mammal vocalisation type that were normalised by the median value in each frequency bin for each detection window Table D-1 were created.
2. Adjacent bins were joined, and contours were created via a contour-following algorithm (Figure D-3).
3. A sorting algorithm determined if the contours match the definition of a marine mammal vocalisation (Table D-2).

Due to the available time, a limited validation of the detections was performed by opening files with detections to check if actual calls were present.

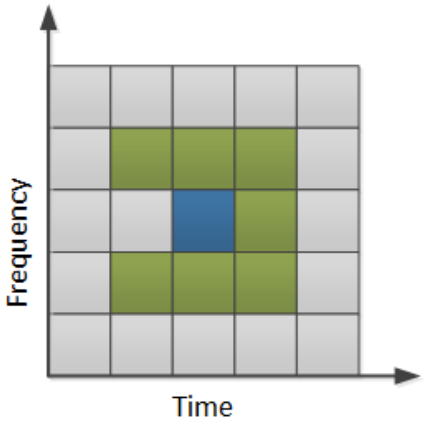

Figure D-3. Illustration of the search area used to connect spectrogram bins. The blue square represents a bin of the binary spectrogram equalling 1 and the green squares represent the potential bins it could be connected to. The algorithm advances from left to right so grey cells left of the test cell need not be checked.

Table D-1. Fast Fourier Transform (FFT) and detection window settings for all automated contour-based detectors used to detect tonal vocalisations of marine mammal species expected in the data. Values are based on JASCO's experience and empirical evaluation on a variety of data sets.

D.3. Automatic Data Selection for Validation (ADSV)

To standardise the file selection process for the selection of data for manual analysis, we applied our Automated Data Selection for Validation (ADSV) algorithm. Details of the ADSV algorithm are described in Kowarski et al. (2021) and a schematic of the process is provided in Figure D-4. ADSV computes the distribution of three descriptors that describe the automated detections in the full data set: the Diversity (number of automated detectors triggered per file), the Counts (number of automated detections per file for each automated detector), and the Temporal Distribution (spread of detections for each automated detector across the recording period). The algorithm removes files from the temporary data set that have the least impact on the distribution of the three descriptors in the full data set. Files are removed until a pre-determined data set size (*N*) is reached, at which point the temporary data set becomes the subset to be manually reviewed.

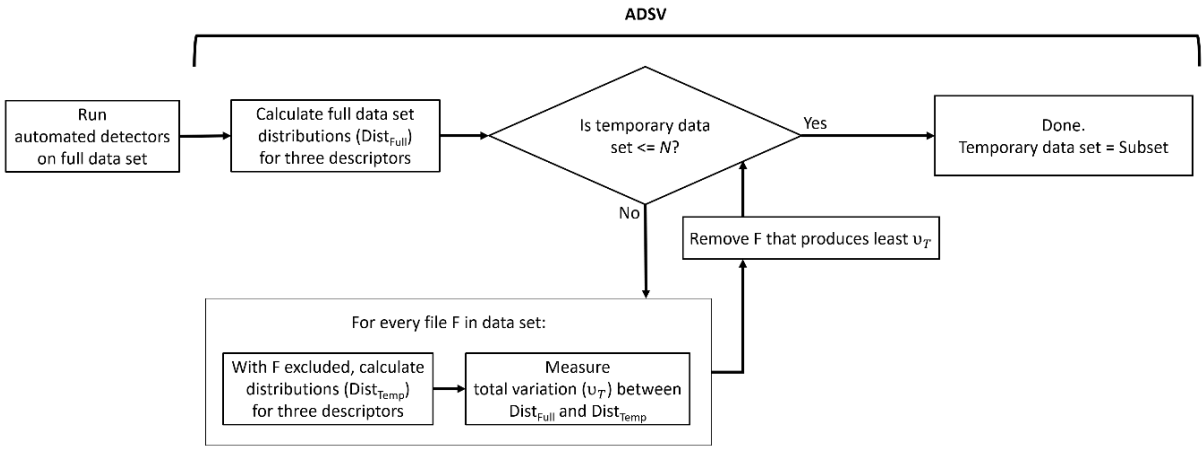

Figure D-4. Automated Data Selection for Validation (ADSV) process Figure 1 from Kowarski et al. (2021).

For the present work, an *N* of 0.5% was selected, largely due to limited scope for this project and marine mammal analysis. Even with limited manual review, the results presented here can be considered reliable, but some caveats should be considered. It is important to note that with such limited data manually reviewed, very rare species may have been missed or their occurrence underestimated. If the 0.5% subset of data manually analysed was not sufficiently large to capture the full range of acoustic environments in the full data set, the resulting automated detector performance metrics may be inaccurate and therefore should be taken as an estimate.

D.4. Automated Detector Performance Calculation and Optimization

All files selected for manual validation were reviewed by one of two experienced analysts using JASCO's PAMlab software to determine the presence or absence of every species, regardless of whether a species was automatically detected in the 5 min file. Although the automated detectors classify specific signals, we validated the presence/absence of species at the file level, not the detection level. Acoustic signals were only assigned to a species if the analyst was confident in their assessment. When unsure, analysts would consult one another, peer reviewed literature, and other experts in the field. If certainty could not be reached, the file of concern would be classified as possibly containing the species in question or containing an unknown acoustic signal. Next, the validated results were compared to the automated detector results in three phases to refine the results and ensure they accurately represent the occurrence of each species in the study area.

In phase 1, the human validated versus automated detector results were plotted as time series and critically reviewed to determine when and where automated detections should be excluded. Questionable detections that overlap with the detection period of other species were scrutinized. By restricting detections spatially and/or temporally where appropriate, we can maximize the reliability of the results. No temporal restrictions were necessary for our automated detector results.

In phase 2, the performance of the automated detectors was calculated and optimized for each species using a threshold, defined as the number of automated detections per file at and above which detections of species were considered valid.

To determine the performance of each automated detector and any necessary thresholds, the automated and validated results (excluding files where an analyst indicated uncertainty in species occurrence) were fed to a maximum likelihood estimation algorithm that maximizes the probability of detection and minimizes the number of false alarms using the Matthews Correlation Coefficient (MCC):

$$MCC = \frac{TPxTN - FPxFN}{\sqrt{(\mathrm{TP}+\mathrm{FP})(\mathrm{TP}+\mathrm{FN})(\mathrm{TN}+\mathrm{FP})(\mathrm{TN}+\mathrm{FN})}}$$

$$P = \frac{TP}{TP+FP}; R = \frac{TP}{TP+FN}$$

where *TP* (true positive) is the number of correctly detected files, *FP* (false positive) is the number of files that are false detections, and *FN* (false negatives) is the number of files with missed detections. No thresholds were necessary for our automated detector results.

In phase 3, detections were further restricted to include only those where *P* was greater than or equal to 0.75. When *P* was less than 0.75, only validated results were used to describe the acoustic occurrence of a species. All species in the present data set had automated detectors that performed sufficiently well. The occurrence of each species was plotted using JASCO's Ark software as time series showing presence/absence by hour over each day.

Appendix E. Auditory Frequency Weighting Functions

The potential for anthropogenic sounds to impact marine mammals is largely dependent on whether the sound occurs at frequencies that an animal can hear well, unless the sound pressure level is so high that it can cause physical tissue damage regardless of frequency. Auditory (frequency) weighting functions reflect an animal's ability to hear a sound (Nedwell and Turnpenny 1998, Nedwell et al. 2007). Houser et al (2017) provide an example illustrating the effect of applying a weighting function to a (hypothetical) sound (Figure E-1).

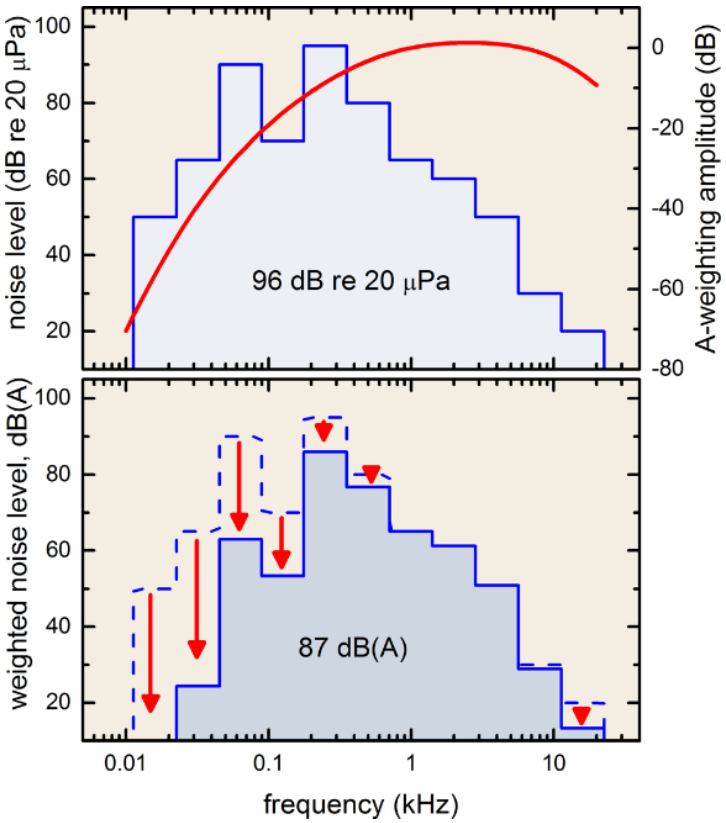

Figure E-1. Application of an auditory weighting function. Blue line shows a hypothetical, octave-band sound pressure spectrum in air, with a total sound pressure level (integrated over all octave-bands) of 96 dB re 20 µPa (This example uses in air-noise levels; therefore, a different reference pressure (20 µPa) applies. The principle is identical to underwater sound where a reference pressure of 1 µPa applies). (Top) Red line shows the human A-weighting function amplitude (A-weighting applies only to human hearing). (Bottom) To determine the weighted exposure level, the A-weighting amplitude at each frequency is added to the sound pressure level at each frequency (red arrows). The weighted spectrum has lower amplitude at the frequencies where the A-weighting function amplitudes are negative. The values from 1–4 kHz do not change substantially, because the weighting function is flat (i.e., the weights are near zero). The weighted SPL is calculated by integrating the weighted spectrum across all octave-bands; the result is 87 dBA, meaning a sound pressure level of 87 dB re 20 µPa after applying the human A-weighting function (Source: Houser et al. 2017).

To better reflect the auditory similarities between phylogenetically closely related species, but also significant differences between species groups among the marine mammals, the extant marine mammal species are assigned to functional hearing groups based on their hearing capabilities and sound production (NMFS 2018) (Table E-1). This division into broad categories is intended to provide a realistic number of categories for which individual noise exposure criteria were developed and the categorisation as such has proven to be a scientifically justified and useful approach in developing auditory frequency weighting functions and deriving noise exposure criteria for marine mammals.

Table E-1. Marine mammal hearing groups (NMFS 2018).

Hearing group	Generalised hearing range*
Low-frequency (LF) cetaceans (mysticetes or baleen whales)	7 Hz to 35 kHz
Mid-frequency (MF) cetaceans (odontocetes: delphinids, beaked whales)	150 Hz to 160 kHz
High-frequency (HF) cetaceans (other odontocetes)	275 Hz to 160 kHz
Phocid pinnipeds (PW) (underwater)	50 Hz to 86 kHz
Otariid pinnipeds (OW) (underwater)	60 Hz to 39 kHz

* The generalised hearing range for all species within a group. Individual hearing will vary.

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

In 2015, a U.S. Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^{2}\right]^{a}\left[1+(f/f_{hi})^{2}\right]^{b}}\right)\right] \quad \text{(E-1)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid-, and high-frequency cetaceans, phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses noise impacts on marine mammals (NMFS 2016, NMFS 2018). Table E-2 lists the frequency-weighting parameters for each hearing group; Figure E-2 shows the resulting frequency-weighting curves.

Table E-2. Parameters for the auditory weighting functions used in this project as recommended by NMFS (2018).

Hearing group	a	b	f_{lo} (Hz)	f_{hi} (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
Mid-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
High-frequency cetaceans (true porpoises, *Kogia*, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Phocid seals in water	1.0	2	1,900	30,000	0.75
Otariid seals in water	2.0	2	940	25,000	0.64

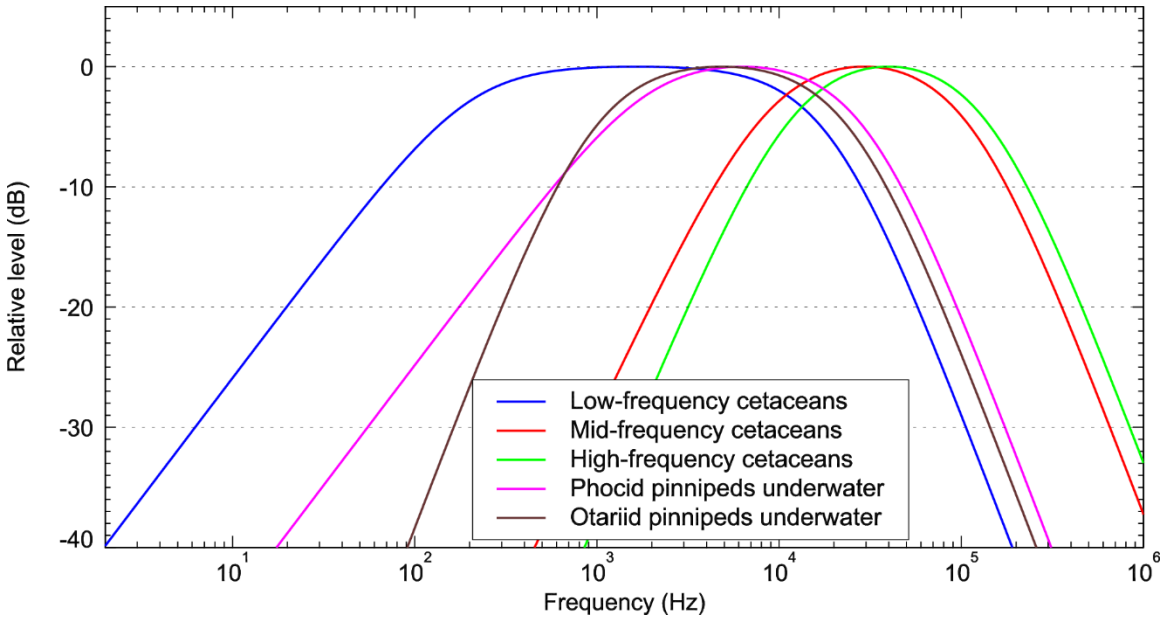

Figure E-2. Auditory weighting functions for functional marine mammal hearing groups as recommended by NMFS (2018).

Appendix F. Methods and Parameters

This section describes the specifications of the seismic source that was used at all sites and the environmental parameters used in the propagation models.

F.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure F-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure F-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure F-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

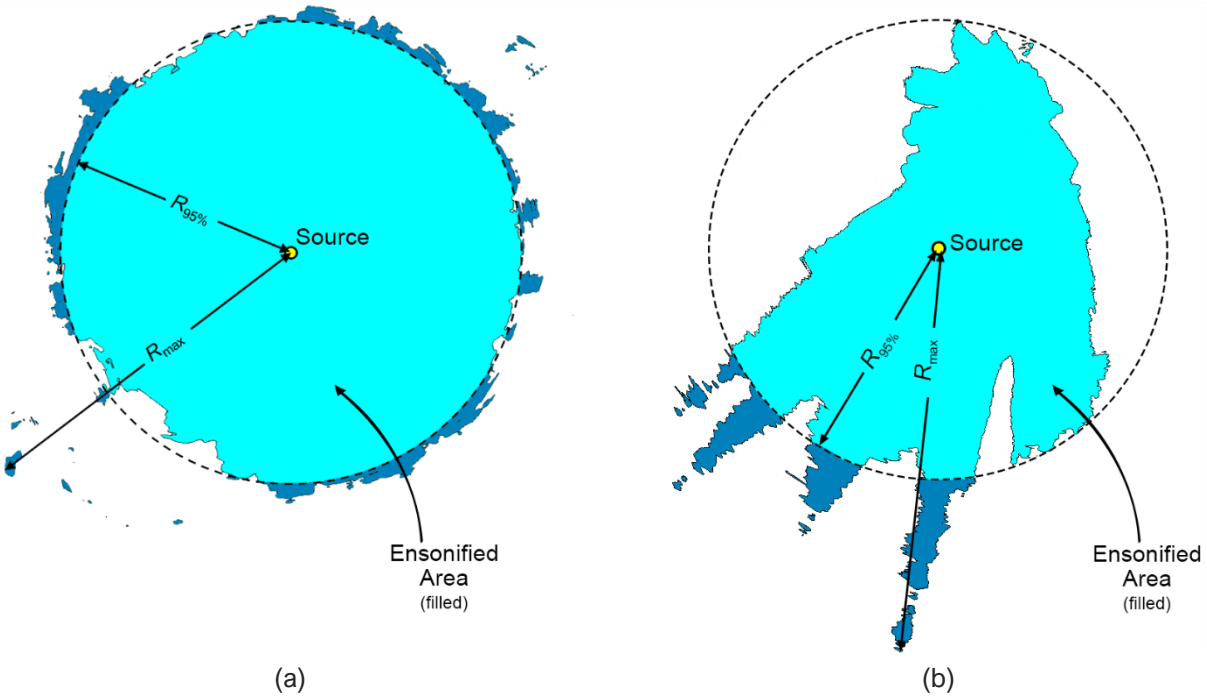

Figure F-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

F.2. Environmental Parameters

F.2.1. Bathymetry

Water depths throughout the modelled areas were extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 100 × 100 m.

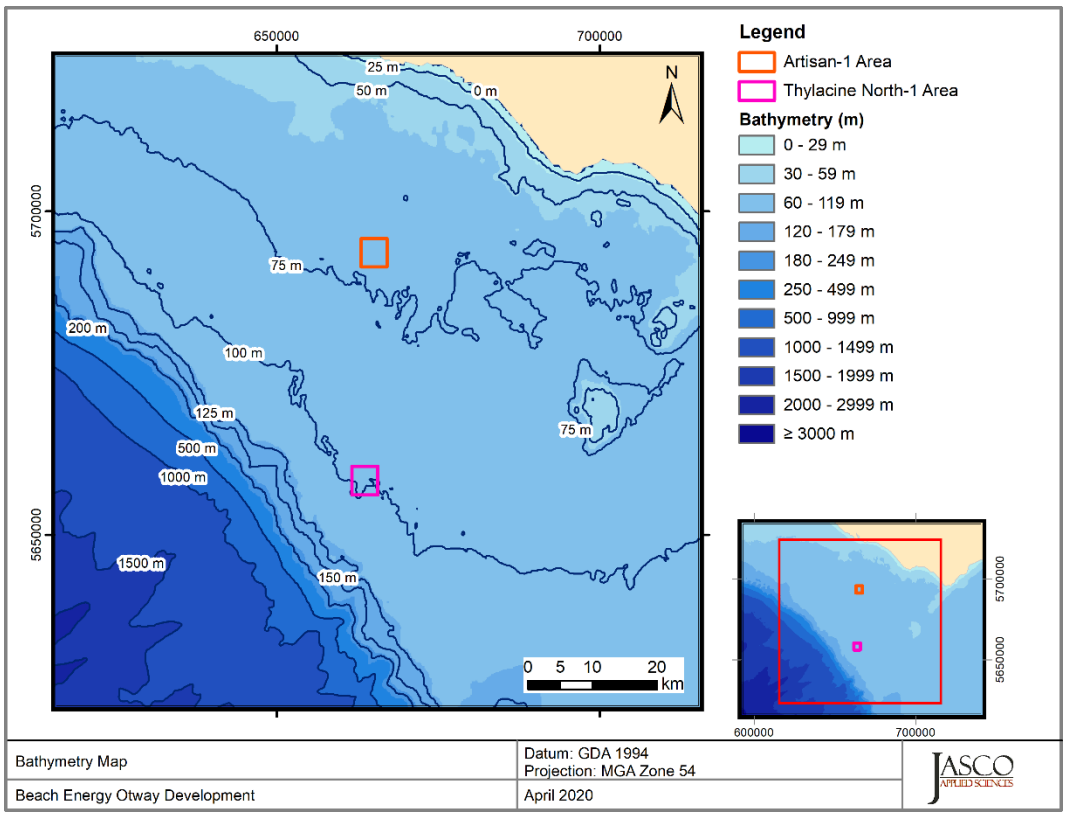

Figure F-2. Bathymetry in the modelled area.

F.2.2. Sound speed profile

Between 0–77 m water depth, mean daily sound speed profiles were derived from the Global Ice Ocean Prediction System (GIOPS) forecasting system for the period when the measurement data was acquired (February 2021 to March 2021 inclusive). A median profile determined to best represent potential propagation conditions over the periods. For deeper water depths below 77 m the sounds speed profile was combined with the sound speed profiles from GDEM (GDEM; Teague et al. 1990, Carnes 2009).

The GIOPS is a data assimilation system that combines satellite and in-situ measurements for ice and ocean analyses and forecasts. Available sea ice analysis products are generated from sea ice concentration data and other satellite measurements from the Canadian Ice Service. For oceanographic variables, GIOPS assimilates a variety of satellite and in-situ observations (Argos profiling floats, ice buoys, moorings, ship observations, and others) to provide a 3-d representation of ocean temperature and salinity, water velocity, sea surface height and mixed layer depth. Meant primarily as a forecasting tool, the daily reported results are not archived long term for general use, but JASCO started caching GIOPS output in 2017 to support Arctic programs.

GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

The February and March were selected for sound propagation modelling to ensure to align with the measurement period. Figure F-3 shows the resulting profile, which was used as input for the sound propagation modelling.

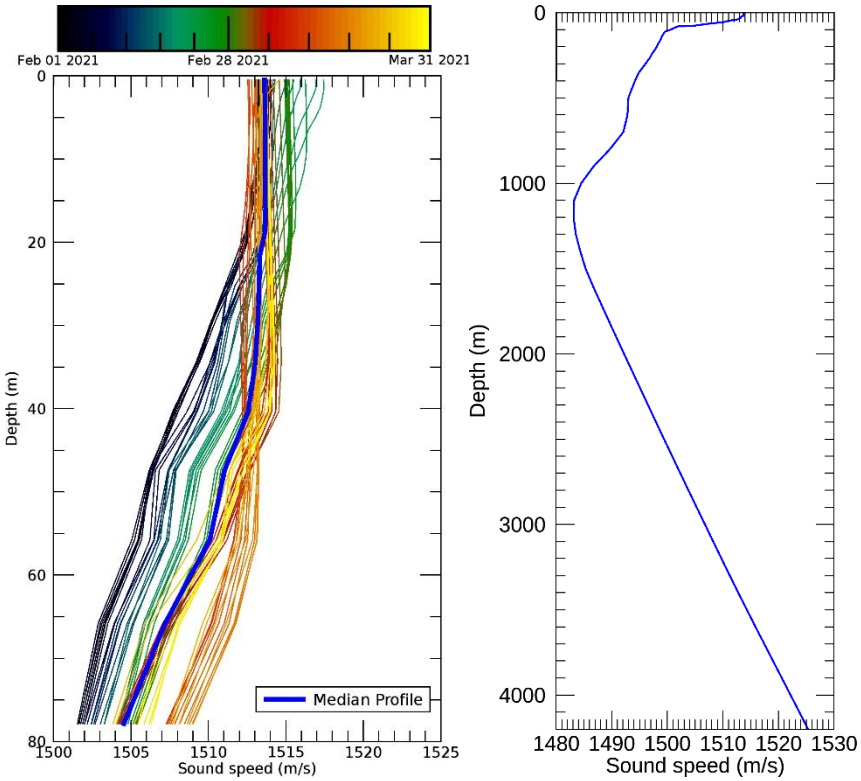

Figure F-3. The sound speed profile used for modelling: The daily and median profiles for the first 77 m from Global Ice Ocean Prediction System (GIOPS) (left) and full depth (right).

F.2.3. Geoacoustics

The propagation model used in this study consider a single geoacoustic profile for the modelled area. These profiles determine how sound is reflected from the seabed, as well as how it is transmitted, reflected, and absorbed into the sediment layers. The seabed in the Artisan-1, located in shallower waters, was characterised by cemented and semi-cemented carbonate rock (calcarenite). semi-cemented carbonate rock with the potential for a thin overlying veneer of coarse sand. This geologic model of the seabed environment is consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010). Tables F-1 and F-2 present the geoacoustic profiles used modelled sites for each seabed type considered.

Table F-1. *Artisan-1*: Carbonate rock geoacoustic profile. Each parameter varies linearly within the stated range.

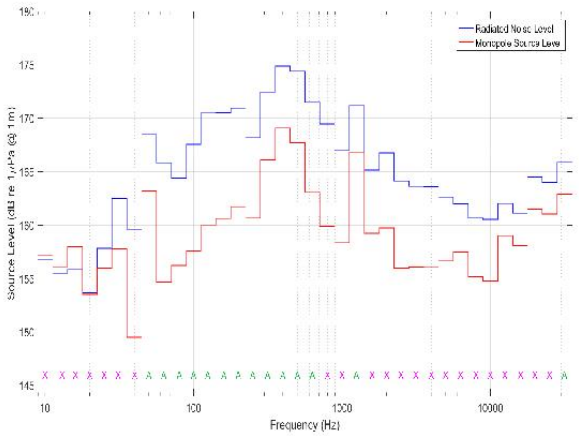
Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–0.5	Well-cemented carbonate caprock	2.7	2600	0.50	500	0.4
0.5–20	Increasingly cemented calcarenite	2.2	2000	0.30		
20–40		2.3	2120	0.34		
40–60		2.4	2240	0.38		
60–80		2.5	2360	0.42		
80–100		2.6	2480	0.46		
>100	Well-cemented calcarenite	2.7	2600	0.5		

Table F-2. *Artisan-1*: Carbonate rock geoacoustic profile with overlying sand veneer. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–1	Coarse carbonate sand	2.03	1800	0.85	300	3.68
1–20	Increasingly cemented calcarenite	2.2	2000	0.30		
20–40		2.3	2120	0.34		
40–60		2.4	2240	0.38		
60–80		2.5	2360	0.42		
80–100		2.6	2480	0.46		
>100	Well-cemented calcarenite	2.7	2600	0.5		

Appendix G. ShipSound Reports

G.1. *Ocean Onyx* Reports



G.1.1. Report 1: 14:22 on 23 Feb 2021

Vessel Underwater Acoustic Source Level Measurement Report

This Vessel Underwater Acoustic Source Level Measurement Report is provided by JASCO Applied Sciences, for the limited purpose of understanding approximate underwater noise emission levels of vessels.[1]

Vessel Information	
MMSI:	538001765
IMO:	0
Name:	OCEAN ONYX
Flag:	Marshall Is
Vessel DWT (TEU):	102.0
PortListen Vessel Type	Other
Length (m):	106.35
Beam (m)	105.16
Maximum Draft (m):	N/A
Engine Power (kW):	N/A
Number of Shafts:	N/A
Prop Diameter (m):	N/A

Measurement Information	
Measurement Date (UTC):	February 23, 2021
Closest Approach Time (UTC):	14:22:04
Closest Approach Distance (m):	306.6
Vessel Ground Speed (kn):	0.0
Sail Direction over ground (deg):	326.0
Vessel Water Speed (kn):	N/A
Shaft rate (rpm):	-6000.0
Vessel Percent Power/Pitch:	N/A
Actual Vessel Draft max (m):	22.0
Monopole Source Depth (m):	11.0
Monopole Source Level (dB/µPa):	175.4
Radiated Noise Level (dB/µPa):	182.2

The 1/3-octave frequency band vessel source levels are presented in two metrics formats:

1. Radiated Noise Level - as defined in ANSI 12.64 - 2009 (R2014) measurement standard, and
2. Monopole Source Level - considers sound energy as originating from a point location, most suitable for use by acoustic models that independently account for surface and seabed reflections
3. Values marked "x" have less than 3 dB signal-to-noise ratio (SNR). Those marked with "A" are adjusted for SNR between 3 and 10 dB.

[1] With respect to the information provided in this report, neither JASCO Applied Sciences nor any of their respective directors, officers, employees, contractors or agents (collectively, the "Report Providers") make any warranty either expressed or implied, including the warranty for fitness for a particular purpose, nor assume any legal liability or responsibility for the accuracy, completeness, or usefulness of information disclosed. Furthermore, this report and the measurements reported herein cannot be used to confirm or counter any claim of adherence to or exceedance of legislated noise emission standards in any jurisdiction and by accepting this report, the report recipient agrees that the Report Providers shall not be liable for any losses, claims, damages, actions, fines, penalties, costs or expenses, including legal fees, arising from the use of this report for any purpose whatsoever.

Vessel Underwater Noise Rating - Additional Information

Underwater Noise from vessels has the potential to disturb marine mammals, fish and other marine fauna. JASCO wishes to assist the shipping industry reduce its noise footprint in the marine environment. With this goal in mind, we have developed a vessel noise measurement system and a comparative noise ranking method that allows vessel noise emissions to be characterized relative to those of other vessels of the same class and similar size. The acoustic measurement approach conforms approximately with the protocol defined in ANSI standard 12.64-2009 Grade C, with exceptions as outlined below.

Vessel underwater noise emissions vary with vessel class, size, tonnage, speed, loading and other parameters. The system implements frequency weighting that considers that different marine species have different hearing acuities. For example, humpback whales are believed to be more sensitive to low-frequency sounds than killer whales. To account for these differences, the system calculates frequency-weighted noise metrics based on functions adopted by U.S. National Oceanic and Atmospheric Administration (NOAA) and published in their Marine Mammal Acoustic Technical Guidance[2]. The listening station calculates frequency-weighted noise levels for: Low Frequency Cetaceans (LFC), Mid-Frequency Cetaceans (MFC), and High-Frequency Cetaceans (HFC), Phocid Pinnipeds (PPW) and Otariid Pinnipeds (OPW). The actual rating value is the percentile of the vessel's adjusted and frequency-weighted noise level relative to all vessels of the same class.

RNL with Marine Mammal Weightings (NOAA 2016):

Low Frequency Cetaceans (LFC):	180.4	LFC Rank:	N/A
Mid-Frequency Cetaceans (MFC):	165.9	MFC Rank:	N/A
High-Frequency Cetaceans (HFC):	165.8	HFC Rank:	N/A

Additional Information for this Vessel Measurement:

Name of Vessel:	OCEAN ONYX
Measurement ID:	BEACHOTWAY-stn1-2021-02-538001765202102231422
Date of Measurement:	February 23, 2021

Environmental Information:

Closest Point of Approach location (WGS 84):	-38°53'029"S, 142°52'056"E		
Hydrophone location (WGS-84):	-38°53'024"S, 142°53'008"E		
Water Depth (m):	70.0		
Hydrophone Depth (m):	68.5	Wind Speed (kn):	9.0
Speed of Current (kn):	N/A	Wind Direction (deg):	184.0
Current Direction (deg):	N/A	Sea State Code (WMO):	N/A

Conformance with Standard

The vessel source measurements reported here were acquired using procedures conforming approximately with Grade C - Survey Method - ANSI 12.64-2009 (R2014) Quantities and Procedures for Description and Measurement of Underwater Sound from Ships - Part 1: General Requirements. Notable conformance exceptions are:

1. The standard requires 4 vessel passes, while this measurement is of a single pass.
2. The standard requires vessel Closest Point of Approach (CPA) of the greater of 100 m or one vessel length. This system may admit measurements at other distances.
3. The standard requires the hydrophone subtend depression angles relative to the ship of 20° ± 5° below horizontal, while this system permits angles from 10° to 60°.

Vessel name and dimension information is obtained from Automatic Identification System (AIS) records sent from the vessel at time of measurement and from MarineTraffic.com. Fields not transmitted by these services are marked as N/A in the report. Frequency bands marked with "X" or "A" in the source level graphs are respectively invalid or adjusted, due to being insufficiently above background noise levels as described in the standard.

Flag:	Marshall Is	Vessel Ground Speed (kn):	0.0
Vessel DWT (TEU):	102.0	Sail Direction over ground (deg):	326.0
PortListen Vessel Type	Other	Vessel Water Speed (kn):	N/A
Length (m):	106.35	Shaft rate (rpm):	-6000.0
Beam (m)	105.16	Vessel Percent Power/Pitch:	N/A
Maximum Draft (m):	N/A	Actual Vessel Draft max (m):	22.0
Engine Power (kW):	N/A	Monopole Source Depth (m):	11.0
Number of Shafts:	N/A	Monopole Source Level (dB/µPa):	166.5
Prop Diameter (m):	N/A	Radiated Noise Level (dB/µPa):	172.5

The 1/3-octave frequency band vessel source levels are presented in two metrics formats:

1. Radiated Noise Level - as defined in ANSI 12.64 - 2009 (R2014) measurement standard, and
2. Monopole Source Level - considers sound energy as originating from a point location, most suitable for use by acoustic models that independently account for surface and seabed reflections
3. Values marked "x" have less than 3 dB signal-to-noise ratio (SNR). Those marked with "A" are adjusted for SNR between 3 and 10 dB.

[1] With respect to the information provided in this report, neither JASCO Applied Sciences nor any of their respective directors, officers, employees, contractors or agents (collectively, the "Report Providers") make any warranty either expressed or implied, including the warranty for fitness for a particular purpose, nor assume any legal liability or responsibility for the accuracy, completeness, or usefulness of information disclosed. Furthermore, this report and the measurements reported herein cannot be used to confirm or counter any claim of adherence to or exceedance of legislated noise emission standards in any jurisdiction and by accepting this report, the report recipient agrees that the Report Providers shall not be liable for any losses, claims, damages, actions, fines, penalties, costs or expenses, including legal fees, arising from the use of this report for any purpose whatsoever.

Vessel Underwater Noise Rating - Additional Information

Underwater Noise from vessels has the potential to disturb marine mammals, fish and other marine fauna. JASCO wishes to assist the shipping industry reduce its noise footprint in the marine environment. With this goal in mind, we have developed a vessel noise measurement system and a comparative noise ranking method that allows vessel noise emissions to be characterized relative to those of other vessels of the same class and similar size. The acoustic measurement approach conforms approximately with the protocol defined in ANSI standard 12.64-2009 Grade C, with exceptions as outlined below.

Vessel underwater noise emissions vary with vessel class, size, tonnage, speed, loading and other parameters. The system implements frequency weighting that considers that different marine species have different hearing acuities. For example, humpback whales are believed to be more sensitive to low-frequency sounds than killer whales. To account for these differences, the system calculates frequency-weighted noise metrics based on functions adopted by U.S. National Oceanic and Atmospheric Administration (NOAA) and published in their Marine Mammal Acoustic Technical Guidance[2]. The listening station calculates frequency-weighted noise levels for: Low Frequency Cetaceans (LFC), Mid-Frequency Cetaceans (MFC), and High-Frequency Cetaceans (HFC), Phocid Pinnipeds (PPW) and Otariid Pinnipeds (OPW). The actual rating value is the percentile of the vessel's adjusted and frequency-weighted noise level relative to all vessels of the same class.

RNL with Marine Mammal Weightings (NOAA 2016):

Low Frequency Cetaceans (LFC):	171.5	LFC Rank:	N/A
Mid-Frequency Cetaceans (MFC):	130.5	MFC Rank:	N/A
High-Frequency Cetaceans (HFC):	120.5	HFC Rank:	N/A

Additional Information for this Vessel Measurement:

Name of Vessel:	OCEAN ONYX
Measurement ID:	BEACHOTWAY-stn1-2021-02-538001765202103081822
Date of Measurement:	March 08, 2021

Environmental Information:

Closest Point of Approach location (WGS 84):	-38°53'029"S, 142°52'056"E		
Hydrophone location (WGS-84):	-38°53'024"S, 142°53'008"E

Hydrophone Depth (m):	68.5	Wind Speed (kn):	9.0
Speed of Current (kn):	N/A	Wind Direction (deg):	231.0
Current Direction (deg):	N/A	Sea State Code (WMO):	N/A

Conformance with Standard

The vessel source measurements reported here were acquired using procedures conforming approximately with Grade C - Survey Method - ANSI 12.64-2009 (R2014) Quantities and Procedures for Description and Measurement of Underwater Sound from Ships - Part 1: General Requirements. Notable conformance exceptions are:

1. The standard requires 4 vessel passes, while this measurement is of a single pass.
2. The standard requires vessel Closest Point of Approach (CPA) of the greater of 100 m or one vessel length. This system may admit measurements at other distances.
3. The standard requires the hydrophone subtend depression angles relative to the ship of 20° ± 5° below horizontal, while this system permits angles from 10° to 60°.

Vessel name and dimension information is obtained from Automatic Identification System (AIS) records sent from the vessel at time of measurement and from MarineTraffic.com. Fields not transmitted by these services are marked as N/A in the report. Frequency bands marked with "X" or "A" in the source level graphs are respectively invalid or adjusted, due to being insufficiently above background noise levels as described in the standard.

1 Purpose and Scope

This Whale Management Procedure (WMP; the Procedure) details how Beach Energy (Operations) Limited (Beach) will avoid and minimise anthropogenic noise to whales undertaking biologically important behaviours during the well completions, well interventions and contingent plug and abandonment (P&A) activities within Commonwealth waters of the Otway Basin (the Program).

This Procedure applies to whales undertaking biologically important behaviours, with a focus on **blue whales** and **southern right whales** as these species respectively have Conservation Management Plan (CMP) and National Recovery Plans (NRP) under the *Environment Protection and Biodiversity Conservation Act 1999* and Beach cannot undertake an activity that is inconsistent with these plans.

The activity is proposed to be undertaken in a pygmy blue whale Foraging Area (Annual high use area) and known foraging area as defined under the CMP.

In addition, during consultation, Beach identified that additional species of concern should be protected even though they are not currently covered by a CMP or NRP. These are **fin, pygmy right** and **sei whales. This Procedure also applies to these species of concern.**

As baleen whales such as blue whale, southern right whale, fin, pygmy right and sei whales can be hard to distinguish from other baleen whales the following will apply.

A blue whale, southern right whale, fin, pygmy right or sei whale is a whale that:

- Is confirmed to be a blue whale, southern right whale, fin, pygmy right or sei whale; or
- If some uncertainty exists, is 'like a blue whale, fin or sei whale' or 'like a southern right whale'.

This Procedure will ensure that the Environmental Performance Outcomes (EPOs) from the Program EP relevant to whales will be achieved such that:

- EPO2: No death or injury to listed threatened or migratory species from the activity.
- EPO3: Biologically important behaviours can continue while the activity is being undertaken.
- EPO4: Anthropogenic noise in biologically important areas and habitat critical to the survival of a species will be managed such that:
    - Any blue whale continues to utilise biological important areas without injury and is not displaced from a foraging area.
- It does not prevent any southern right whale from utilising biologically important areas or habitat critical to the survival of a species or cause auditory impairment (TTS and PTS).

This Procedure provides the details of the control measures required by Section 21(5)(c) of the OPGGS Environment Regulations and sets out the Environmental Performance Objectives (EPOs), Environmental Performance Standards (EPSs) and measurement criteria relevant to underwater sound impacts to whales from the Program (OPGGS Environment Regulations Section 21(7)).

All vessels and helicopters must comply with the separation distances to whales as detailed in the EPBC Regulations 2000 – Part 8 Division 8.1 interacting with cetaceans (see Section 8 below).

2 Assumptions

Several assumptions have been made in creating this Procedure as noise mitigation measures from Australian offshore activities have only recently been required, with Beach's Artisan-1 Exploration Well Drilling Environment Plan being one of the first to require these controls when it was accepted by NOPSEMA on 12 January 2021.

The Whale Management Procedure developed for the Artisan-1 campaign was subject to a continual review and revision process during the 2021 /22 Onyx campaign and has been further refined based on lessons learned, engagement with Marine Fauna Observers (MFOs), blue whale experts and offshore operators to reduce the number of assumptions and provide clearer directions.

Important assumptions have been listed below to assist in the interpretation and implementation of this Procedure. If an aspect of this procedure is unclear, users must consider these assumptions in determining what action, if any, to take.

1. Vessel Captains and the Beach Senior Drilling Supervisor will follow the procedures detailed in this document taking into account MFO advice to minimise underwater sound impacts to whales.

2. Conservatism has been built into how the Activity Zone distances have been determined which accounts for MFO distance judgement accuracy, weather conditions, uncertainty in the impact assessment, and whale behaviour.

3. The distances-to-sound criteria and Activity Zones (Section 5.8) have been developed using acoustic modelling, which is described in the Program EP. This modelling has been calibrated using in-field monitoring from a previous drilling campaign (JASCO 2021).

4. All blue whales are considered to be foraging regardless of whether the activity of foraging is observed. This assumption was added during the previous drilling campaign on advice from Blue Whale Study to ensure greater protection for blue whales in the area.

5. Any fin, pygmy right, sei or unidentified whale is assumed to be foraging from 1 November to 30 June. Outside of this time foraging to be observed.

If there is a lack of clarity, or residual uncertainty, about the instructions in this procedure users are required to take actions in a manner that i) minimises noise threats to whales, ii) are precautionary and, iii) will keep impacts within the defined acceptable levels specified in the Environment Plan.

3 Context

This Procedure relates to the Program and the Program EP to ensure compliance with the EP EPOs, EPSs and control measures, as noted above.

The Program activities have been divided into five sub-activities to define sub-activity specific measures described in this procedure:

1. Anchor pre-lay & MODU moves to new well location.

2. Well P&A.

3. Vessel resupplying the rig.
4. Concurrent scenario – anchor pre-lay (Thylacine West 1) and MODU mooring/resupply (Thylacine North 1)
5. Vessel operations, well suspension and well intervention.

Each of these sub-activities have been assessed in the Program EP. Relevant details from the impact assessment in the EP are included in this Procedure.

4 Observation of Whales

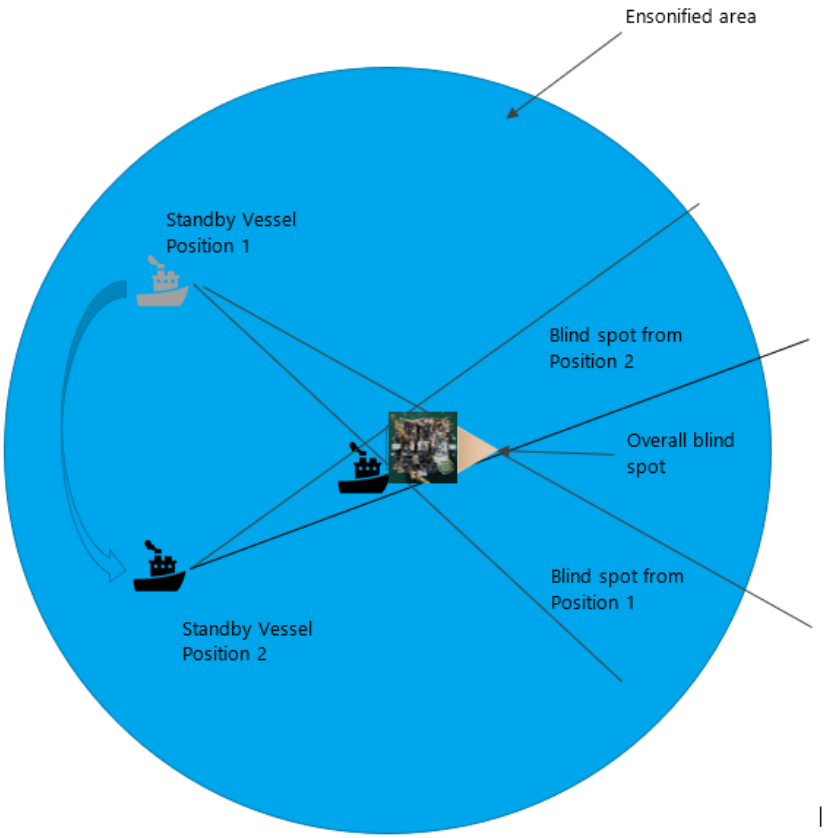
Many species of whales are present in the offshore area covered by the Program. Whale species of concern have been noted above and have been seen in the activity area during previous campaigns.

Whale species that have been observed in the area include blue whales, southern right whales, pilot whales, minke whales, humpback whales, and Bryde's whales.

Blue whales may occur in the area at any time of year; however, peak periods for foraging tend to be from Nov / Dec to May / Jun each year.

Southern right whales may migrate through the area to their nearshore nursery grounds from April / October.

During the previous drilling campaign (2 February 2021 to 11 July 2022) over 13,500 hours of observations were undertaken.



These observations only identified three (3) southern right whales migrating through the area.

A total of 127 blue whales were identified within 3 km of the drilling MODU during this campaign. Of these 70 (55%) were observed moving towards the MODU (following first detection) and 57 (45%) were observed moving away from the rig, indicating that the management measure in place for the campaign were effective in not displacing a foraging blue whale. Noting that:

- Published detection functions (Williams et al. 2016) and conservative assumptions were used to estimate blue whale densities in the management zones applied (0-500, 501-1,500, 1,501-2,000, 2,001-3,000, >3,000 m). If underwater noise was displacing blue whales, it would be expected less whales would be observed in the zones closest to the underwater noise. The expected densities of blue whales based on the detection function most closely matching the Lead MFOs advice indicated there was no difference in expected densities between any of the management zones (mean of 6.21 blue whales/km^2).
- The expected densities of blue whales based on the conservative detection functions showed similar results for the 0-500 and 501-1,500 m zones (means of 7.27 and 7.73 blue whales/km^2). However, they showed mean expected densities of 18.70 blue whales/km^2 and 22.91 blue whales/km^2 for the 1,501-2,000 and 2,001-3,000 m zones. Even if the conservative functions are used there is still no detectable difference in expected densities of blue whales in the 0-500 and 501-1,500 m zones, which conservatively means that blue whales are not displaced within 1,500 m of the noise source.

During the previous campaign the following adjustments were made to observations based on learnings from the MFO, independent experts and Operations Crew:

- Removal of MFO from rig. Originally an MFO was placed on the rig; however, there were significant issues relating to accurate observations due to the drilling derrick obscuring the view. Additionally, there were no 'safe places' for observation, with the MFO having to use the helideck when it was not in use. The following procedure was developed for vessel observations:

- When intending to undertake noise emitting activities (in this case *anchor pre-lay, well P&A* and *resupply* sub-activities), at least one vessel with a MFO on board shall be in the field to carry out whale observations.

- A vessel-based pre-activity survey will be implemented within the 24 hours prior to the commencement of the following sub-activities:

    1. Anchor pre-lay & MODU moves to new well locations
    2. Well P&A
    3. Vessel resupplying the rig
    4. Concurrent scenario – anchor pre-lay (Thylacine West 1) and MODU mooring/resupply (Thylacine North 1)

- The vessel-based pre-activity survey will utilise transect lines to ensure that the entire potential impact area is observed. If any foraging blue, southern right, fin, pygmy right or sei whales are sighted, then the activity will not commence/move to the next phase until such time as the potential impact area has been declared clear of the aforementioned whales by a subsequent vessel survey. These subsequent vessel surveys (if required) will be undertaken as part of continuous surveillance of the ensonified area.

- The surveillance vessel shall endeavour to provide full observation coverage around the MODU to minimise the blind spot behind the rig. When only one vessel is in the field, this shall include sailing around the MODU approximately every 6 hours (daylight hours) to minimise the blind spot behind the rig. When two vessels are in the field, the blind spot shall be minimised by stationing each vessel at opposing sides of the rig.

- Increase in number of MFOs assigned to the support vessels. Originally one MFO was proposed for the support vessels; however, during increased daylight hours; observational hours were considerable (in excess of 15 hours a day). An additional, MFO was therefore provided on each vessel when daylight hours were greater than 12 hours.

- All blue whales are foraging. As noted above, MFOs found it difficult to detect the activity of foraging. It was, therefore, considered that all blue whales observed should be considered to be foraging.

- MFOs to provide advice to Senior Drilling Supervisor (see below) on whales entering the Activity Zones. This was one of the first activities that engaged MFOs for whale observations. The experienced MFOs were used to working on seismic surveys where an activity could be stopped immediately. During the Program there can be a significant risk to the environment and crew if Program activities are stopped immediately. The MFOs, therefore, advised the Senior Drilling Supervisor of the presence of whales. The Senior Drilling Supervisor would then instigate a shutdown unless it was unsafe to do so. The SDSV would document the action taken and the reason behind this in the daily report.

- MFOs to track whale movements. MFOs commenced triangulating whale movements once observed within the action area to determine direction and time in the area.

5 Roles and Responsibilities

5.1 Beach Senior Drilling Supervisor (SDSV).

- Maintain open communication with MFOs.

- Regularly (daily or more often as operational changes dictate) communicate the status of the activities (i.e. commencing, underway, or at Safe Point) to MFOs.

- Liaise with the MFO and decide whether actions within this Procedure can safely be implemented and take action accordingly.

- Document reasons for not following this Procedure in the daily report and report to the Beach Drilling Superintendent and the Beach Environmental Advisor why the activity could not be safely shut down.

5.2 Vessel Master

- Maintain open communication with MFOs.
- Liaise with the MFO and decide whether actions within this procedure can safely be implemented and take action accordingly.
- Document reasons for not following this procedure in the daily report and report same to the Beach SDSV and Beach Environment Advisor.
- Provides input into the review of effectiveness and compliance with the Whale Management Procedure.

5.3 Marine Fauna Observers (MFOs)

- The MODU will be supported by one to three support vessels throughout the activity.
- One to two MFOs will be stationed on each of the MODU support vessels at all times whilst Program activities are occurring.
- An additional MFO will be stationed on each of the MODU support vessels when daylight hours (between sunset and sunrise) are greater than 12 hours (i.e. – from September to March, refer Table 5-1)

Table 5-1: Daylight hours at Cape Otway (source: https://www.timeanddate.com/sun/@2154120?month=12&year=2024)

Month	Cape Otway Daylight Hours
January	>14
February	13 – 14
March	11 – 12
April	10 – 11
May	9 – 10
June	9
July	9 – 10
August	10 – 11
September	11 – 12
October	12 – 13
November	13 – 14
December	14

- When only one MFO is present (i.e. from April to August), the vessel Officer of the Watch (OOW) will support the MFO during breaks, during their duties period. The OOW will be trained in sighting requirements.
- MFOs must be trained and experienced in marine mammal observations.
- MFOs are to be familiar with the activity zones and actions as per this Procedure.
- Record all whale observations and track any species of concern whenever possible.
- Communicate with onshore whale experts whenever further clarification is required. (Dr P Gill at Blue Whale Study).
- Maintain whale observation watch throughout daylight hours.
- Communicate whale sightings and advise on actions per this Procedure to Beach Senior Drilling Supervisor and Vessel Captains.

5.4 Beach Drilling Superintendent

- Ensure this procedure is communicated to all MFOs, Beach Senior Drilling Supervisor, other Beach personnel offshore and all third party and drilling contractor personnel on the MODU, all helicopter crew and all Vessel Captains and vessel crew.

5.5 All Vessel, Helicopter and MODU Crew

- Share information on whale sighting with MFOs.
- Understand the importance of whales in the area and complete an induction of the requirements of this Procedure and how it relates to their activities.
- Communicate whale sighting to MFOs as soon as possible.

5.6 GM Drilling and Completions

- Ensuring that the WMP is communicated to all personnel working on the MODU, vessels and helicopters.
- Ensuring that the WMP is fully implemented.
- Ensuring that all reporting required by the WMP is completed in a timely and accurate manner.
- The WMP utilisation is regularly audited for compliance.

5.7 Beach Environmental Advisor

- Ensure this Procedure is updated. Communicate any changes to all MFOs, Drilling Superintendent, Beach Senior Drilling Supervisor and Vessel Masters.
- Accountable for ensuring that appropriately trained MFOs are available for all the associated vessels.
- Audit compliance against this procedure.

- Report non-compliance to the regulator.

5.8 Distance to Sound Criteria and Activity Zones

This Procedure is designed on a principle of escalating mitigation actions based on the proximity of the whale to the activity – the closer the whale to the activity the greater mitigation required. This principle has led to the creation of zones at distance intervals from the sound sources. These distances change for each activity and are based on the predicted sound levels received in the environment at the relevant sound criteria which are detailed in the Program EP.

Table 5-2 specifies the distances to the modelled sound criteria and the link to the sub-activity zones. The resultant distance for each activity zone is emphasised in bold type. Distances have been rounded up from the Behavioural Response prediction to conservatively cater for observer inaccuracy in distance estimation and uncertainties in the impact prediction.

Table 6-1 provides details on the Actions that should be undertaken based on the Activity that is being performed.

Table 5-2: Distance to Modelled Sound Criteria and Link to Activity Zones

Activity	Activity Zone	Activity Zone Distance from well location	PTS 24 hr	TTS 24hr	Behavioural Response
VIC/L35 (Doris-1, Artisan-1), VIC/L36 (La Bella-2), VIC/P43 (Hercules-1)					
Anchor pre-lay & MODU mooring	Pre-survey Zone	7.5 km	Not reached	0.95 km	7.02 km
P&A including support vessel transit	MODU Safe Point Zone	2.5 km	Not reached	0.31 km	2.09 km
Resupply	Resupply Zone	7.5 km	Not reached	0.95 km	7.02 km
T/L2 (Thylacine North-1, Thylacine West-1)					
Anchor pre-lay & MODU mooring	Pre-survey Zone	8 km	0.12 km	1.06 km	7.89 km
Resupply	Resupply Zone	8 km	0.12 km	1.06 km	7.89 km
Concurrent scenario anchor pre-lay and intervention including resupply	Pre-survey zone	12.5 km from the mid-point between Thylacine North-1 and Thylacine West-1	0.18 km	1.62 km	12.2 km

6 Activity Actions and Mitigation Measures

Table 6-1: Activity and Actions to minimise noise

Activity	Pre-start actions and start criteria	Safe Point	Actions to minimise noise and maintain safety and well integrity after the Activity has commenced if whales are observed
Anchor pre-lay	Prior to commencing anchor pre-lay, visual monitoring will be undertaken of the **Pre-survey Zone** (See Section 5.8 for distances based on well location) for 30 min by support vessels with MFOs onboard. Anchor pre-lay can commence to next Safe Point when absence of whales[1] in the **Pre-survey Zone** is confirmed[2].	Anchor deployed	If a whale[1] is observed within the **Pre-survey Zone** while anchor deployment is occurring, vessel to reduce thrusters if safe to do so. Anchor deployment will cease as soon as it is safe and will only recommence when absence of whales[2] in the **Pre-survey Zone** is confirmed.
Notes: 1: Whale means blue, fin, pygmy right, sei and southern right whales. 2: Absence of whales means: • No whales observed for 30 min within the **Pre-survey Zone**. • Whales observed leaving the **Pre-survey Zone**.			
MODU mooring	Prior to commencing mobilisation of the MODU to a *new well location*[1], visual monitoring will be undertaken of the **Pre-survey Zone** (See Section 5.8 for distances based on well location) by support vessels with MFOs onboard. Commence MODU move to next Safe Point when absence of whales[2] in the **Pre-survey Zone** is confirmed[3].	MODU on location and securely anchored	If whales[2] are observed within the **Pre-survey Zone** whilst the MODU is in transit to a new well location, the sighting will be communicated to the Beach SDSV and steps taken to allow time for the whales to move away, such as slowing transit speed, stopping transit, or minor changes in course. The safety of the MODU and other marine users necessitates such action. In this situation the decision will be made by the Beach SDSV in consultation with the Beach Drilling Superintendent and reasons documented. Vessels involved will comply with EPBC Regulations 8.1 Part 8 Division 8.1 interacting with cetaceans as per Section 8.
Notes: 1: A new well location does not include when the MODU remains on the same anchor pattern and moves (kedges) to a new well as there is no additional sound source. 2: Whale means blue, fin, pygmy right, sei and southern right whales.			

Activity	Pre-start actions and start criteria	Safe Point	Actions to minimise noise and maintain safety and well integrity after the Activity has commenced if whales are observed
3: Absence of whales means: • No whales observed for 30 min within the **Pre-survey Zone**. • Whales observed leaving the **Pre-survey Zone**.			
Well plug & abandonment	Survey **MODU Safe Point Zone** (See Section 5.8 for distances) prior to commencing P&A activities and at each Safe Point. Only proceed to next Safe Point when absence of whales is confirmed[1] from the **MODU Safe Point Zone**. P&A Activity can commence to the next Safe Point if monitoring cannot be undertaken of the **MODU Safe Point Zone**, such as at night or low visibility conditions, if: • no more than three whales[1] have been seen in the Activity Zone in the 3 hours prior to sunset (using sunset times provided the Bureau of Meteorology); or • confirmed absence of foraging whales[1] from **MODU Safe Point Zone**.	Next positive test of well integrity (e.g. – last barriers installed and validated)	At all times noise producing operations on the MODU should be minimised such as: • Optimising load on generators. • Reducing crane movements to minimum required for safety. • Continue monitoring from all in-field vessels for whales. If P&A activities have commenced and *whales*[2] are observed within the **MODU Safe Point Zone** proceed to next Safe Point. Once well integrity has been confirmed implement the following noise minimisation actions as relevant and safety requirements allow: • Reduce load on mud pumps and rotary drilling equipment. • Reduce load on generators.
Notes: 1: Whale means blue, fin, pygmy right, sei and southern right whales. 2: Absence of whales means: • No whales observed for 30 min within the **MODU Safe Point Zone**. • Foraging whales observed leaving the **MODU Safe Point Zone**.			
Resupply	Prior to commencing resupply of the rig, visual monitoring will be undertaken of the **Resupply Zone** (See Section 5.8 for	Resupply complete	Continue monitoring from all in-field vessels for whales.

Activity	Pre-start actions and start criteria	Safe Point	Actions to minimise noise and maintain safety and well integrity after the Activity has commenced if whales are observed
	distances) by support vessels with MFOs onboard. Resupply can proceed to next Safe Point when *absence of whales*[3] is confirmed from the **Resupply Zone**. Resupply can commence to the next Safe Point if monitoring cannot be undertaken of the **Resupply Zone**, such as at night or low visibility conditions, if: • no more than three whales[1] have been seen in the Activity Zone in the 3 hours prior to sunset (using sunset times provided the Bureau of Meteorology); or • confirmed absence of foraging whales[1] from MODU Safe Point Zone.		If resupply has commenced and whales[1] are observed within the **Resupply Zone** while resupply is occurring vessel to reduce thrusters if safe to do so. Resupply will cease as soon as it is safe, and not recommence until absence of whales[2] is confirmed.

Notes:

1: *Whale* means blue, fin, pygmy right, sei and southern right whales.

2: *Absence of whales* means:

- No whales observed for 30 min within the **Resupply Zone**.
- Foraging whales observed leaving the **Resupply Zone**.

Concurrent scenario – anchor pre-lay (Thylacine North 1) and MODU mooring/ resupply (Thylacine West 1) (or vice versa)	Prior to commencing concurrent activities at the Thylacine wells, visual monitoring will be undertaken of the **Pre-survey Zone** (See Section 5.8 for distances based on well location) by support vessels with MFOs onboard. Commence concurrent activities when absence of whales[1] in the **Pre-survey Zone** is confirmed[2].	Anchor deployed (Thylacine North 1) MODU on location and securely anchored or resupply complete (Thylacine West 1)	**For anchor pre-lay at Thylacine North 1:** If a whale[1] is observed within the **Pre-survey Zone** while anchor deployment is occurring, vessel to reduce thrusters if safe to do so. Anchor deployment will cease as soon as it is safe and will only recommence when absence of whales[2] in the **Pre-survey Zone** is confirmed. **For MODU mooring at Thylacine West 1:**

Activity	Pre-start actions and start criteria	Safe Point	Actions to minimise noise and maintain safety and well integrity after the Activity has commenced if whales are observed
Notes: 1: Whale means blue, fin, pygmy right, sei and southern right whales. 2: Absence of whales means: • No whales observed for 30 min within the **Pre-survey Zone**. • Whales observed leaving the **Pre-survey Zone**.			If whales[2] are observed within the **Pre-survey Zone** whilst the MODU is in transit to a new well location, the sighting will be communicated to the Beach SDSV and steps taken to allow time for the whales to move away, such as slowing transit speed, stopping transit, or minor changes in course. The safety of the MODU and other marine users necessitates such action. In this situation the decision will be made by the Beach SDSV in consultation with the Beach Drilling Superintendent and reasons documented. Vessels involved will comply with EPBC Regulations 8.1 Part 8 Division 8.1 interacting with cetaceans as per Section 8. **For resupply at Thylacine West 1:** Continue monitoring from all in-field vessels for whales. If resupply has commenced and whales[1] are observed within the **Pre-survey Zone** while resupply is occurring vessel to reduce thrusters if safe to do so. Resupply will cease as soon as it is safe, and not recommence until absence of whales[2] is confirmed. If concurrent activities have commenced and *whales*[1] are observed within the **Pre-Survey Zone** proceed to next Safe Point. Once Safe Point has been reached, implement the following noise minimisation actions as relevant and safety requirements allow: • Reduce load on mud pumps and rotary drilling equipment. • Reduce load on generators.

7 Procedural Flowchart during Activities

The following flowchart provides a decision tree to support the intentions built into Table 6-1. It covers how to make decisions when activities are underway. For pre-start actions refer to Table 6-1.

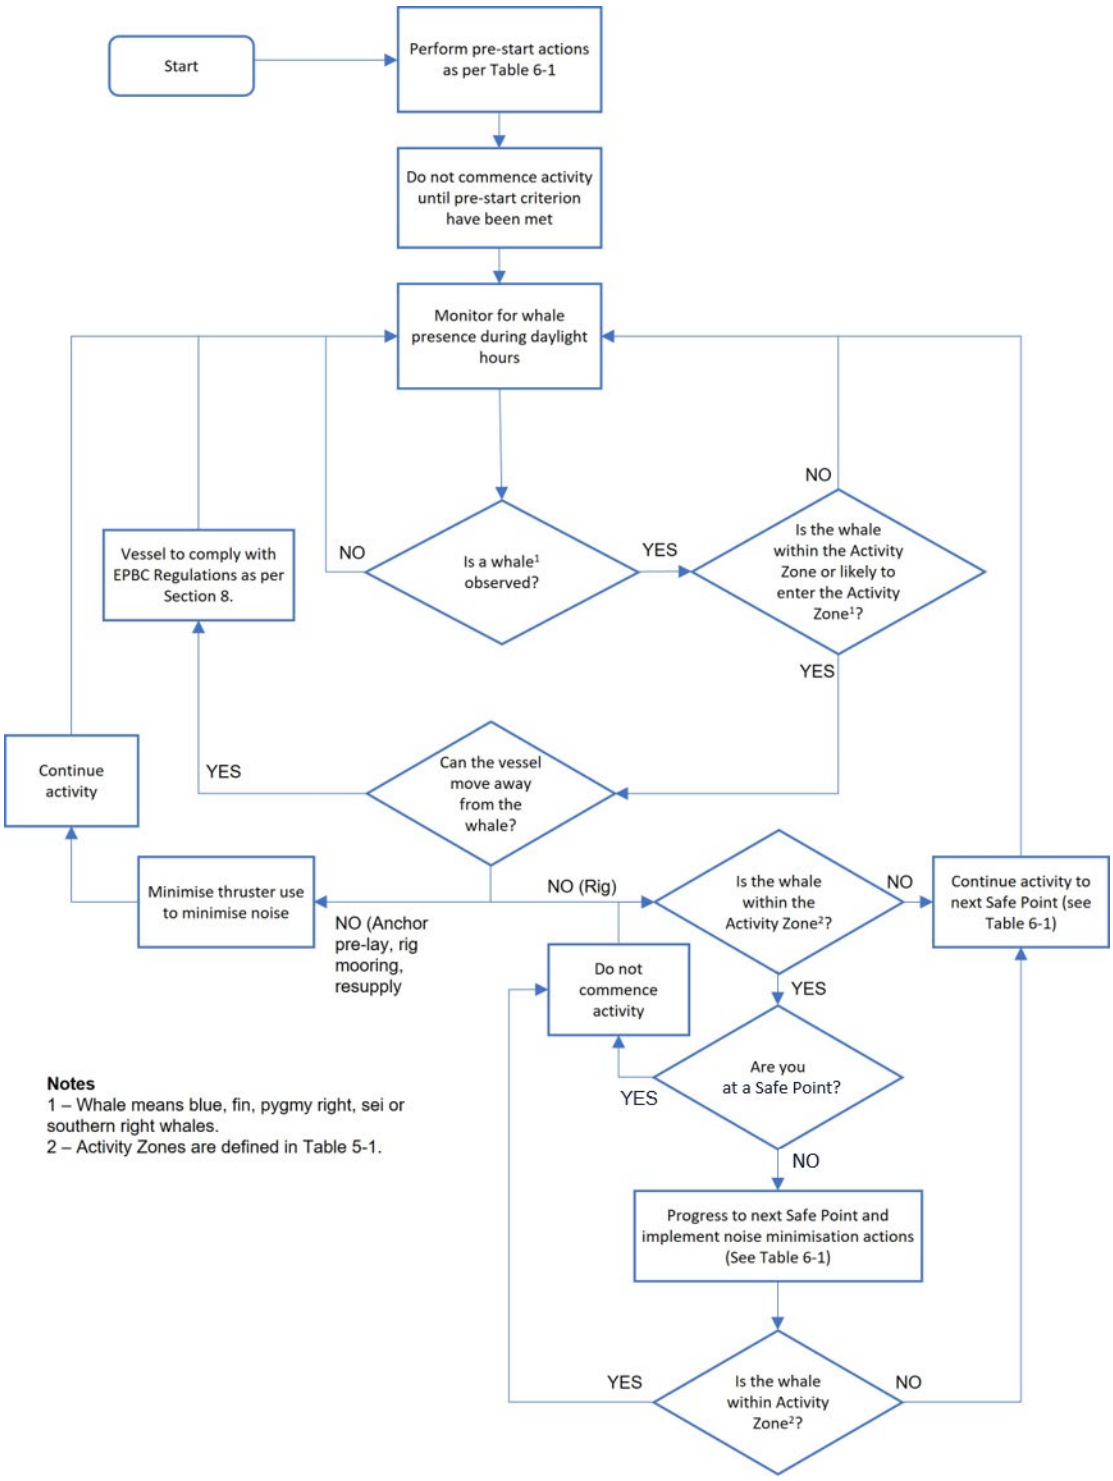


Figure 7.1: Procedural Flowchart during Activities

8 EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with Cetaceans Requirement

8.1 Vessels and Whales

Vessel operators during vessel operations, well suspension and well intervention sub-activities shall adhere to the distances and vessel management practices of EPBC Regulations (Part 8) and report vessel interactions with whales, specifically:

- Do not approach a whale.
- Maintain a distance of 300m from a blue, fin or sei whale.
- All activity vessels will implement an extended 500 m buffer zone for southern right whale cows and calves to minimize the risk of disturbance to migrating cows and calves within the migratory BIA. To manage uncertainty, for the purposes of this control pygmy right whales will be assumed to be southern right whales.
- If a whale approaches the vessel try to maintain the separation distances without changing direction or moving into the path of the animal.

8.2 Vessels and Dolphins

Vessel operators during vessel operations, well suspension and well intervention sub-activities shall adhere to the distances and vessel management practices of EPBC Regulations (Part 8) and report vessel interactions with dolphins specifically:

- Do not approach a dolphin.
- Maintain a distance of 150m from a dolphin.
- If a dolphin approaches the vessel try to maintain the separation distances without changing direction or moving into the path of the animal.

8.3 Helicopters and Whales and Dolphins

Helicopters will not fly lower than 1650 ft when within 500 m horizontal distance of a cetacean except when landing or taking off and will not approach a cetacean from head on.

9 Managing Uncertainty

Beach have undertaken an impact assessment of the potential impacts of underwater sound emissions on whales in accordance with its internal company procedures, international standards, and regulatory requirements. This utilised internationally accredited modelling and infield monitoring to further improve knowledge in this area.

Whale detection is currently based on observations from professionals based on vessels in the field. These observations are the main control measure with subsequent mitigation measures cascading from these observations. Other forms of whale detection (specifically for low frequency cetaceans) using passive acoustic monitors (PAM) are not currently proven for offshore drilling activities.

Underwater hydrophones (PAM) have historically been used to monitor underwater noise over a period of time prior to being retrieved. This method does not provide a 'real-time' measure for detecting cetaceans and is not therefore useful as a mitigation measure.

Trials have been undertaken using PAM that are tethered to a buoy on the surface that can transmit acoustic data back to shore-based MFOs.

In addition to these tethered systems, research is also underway with mobile hydrophones that use underwater gliders and surface vessels.

To manage this uncertainty Beach proposes to undertake the following:

- Use of Experts – Beach and the MFOs will communicate with experts, such as Dr P Gill at the Blue Whale Study, whenever further clarification is required on subjects such as identification. Additionally, in conjunction with other Titleholders where relevant, expert(s) will be used to provide advice on, for example, new whale detection technologies.
- Acoustic Trials – Based on advice from experts, Beach will liaise with other Titleholders to support trials and potential testing of new and novel whale detection systems (as discussed above).

APPENDIX L EPBC ACT PROTECTED MATTERS SEARCH TOOL REPORT – SOUND EMBA

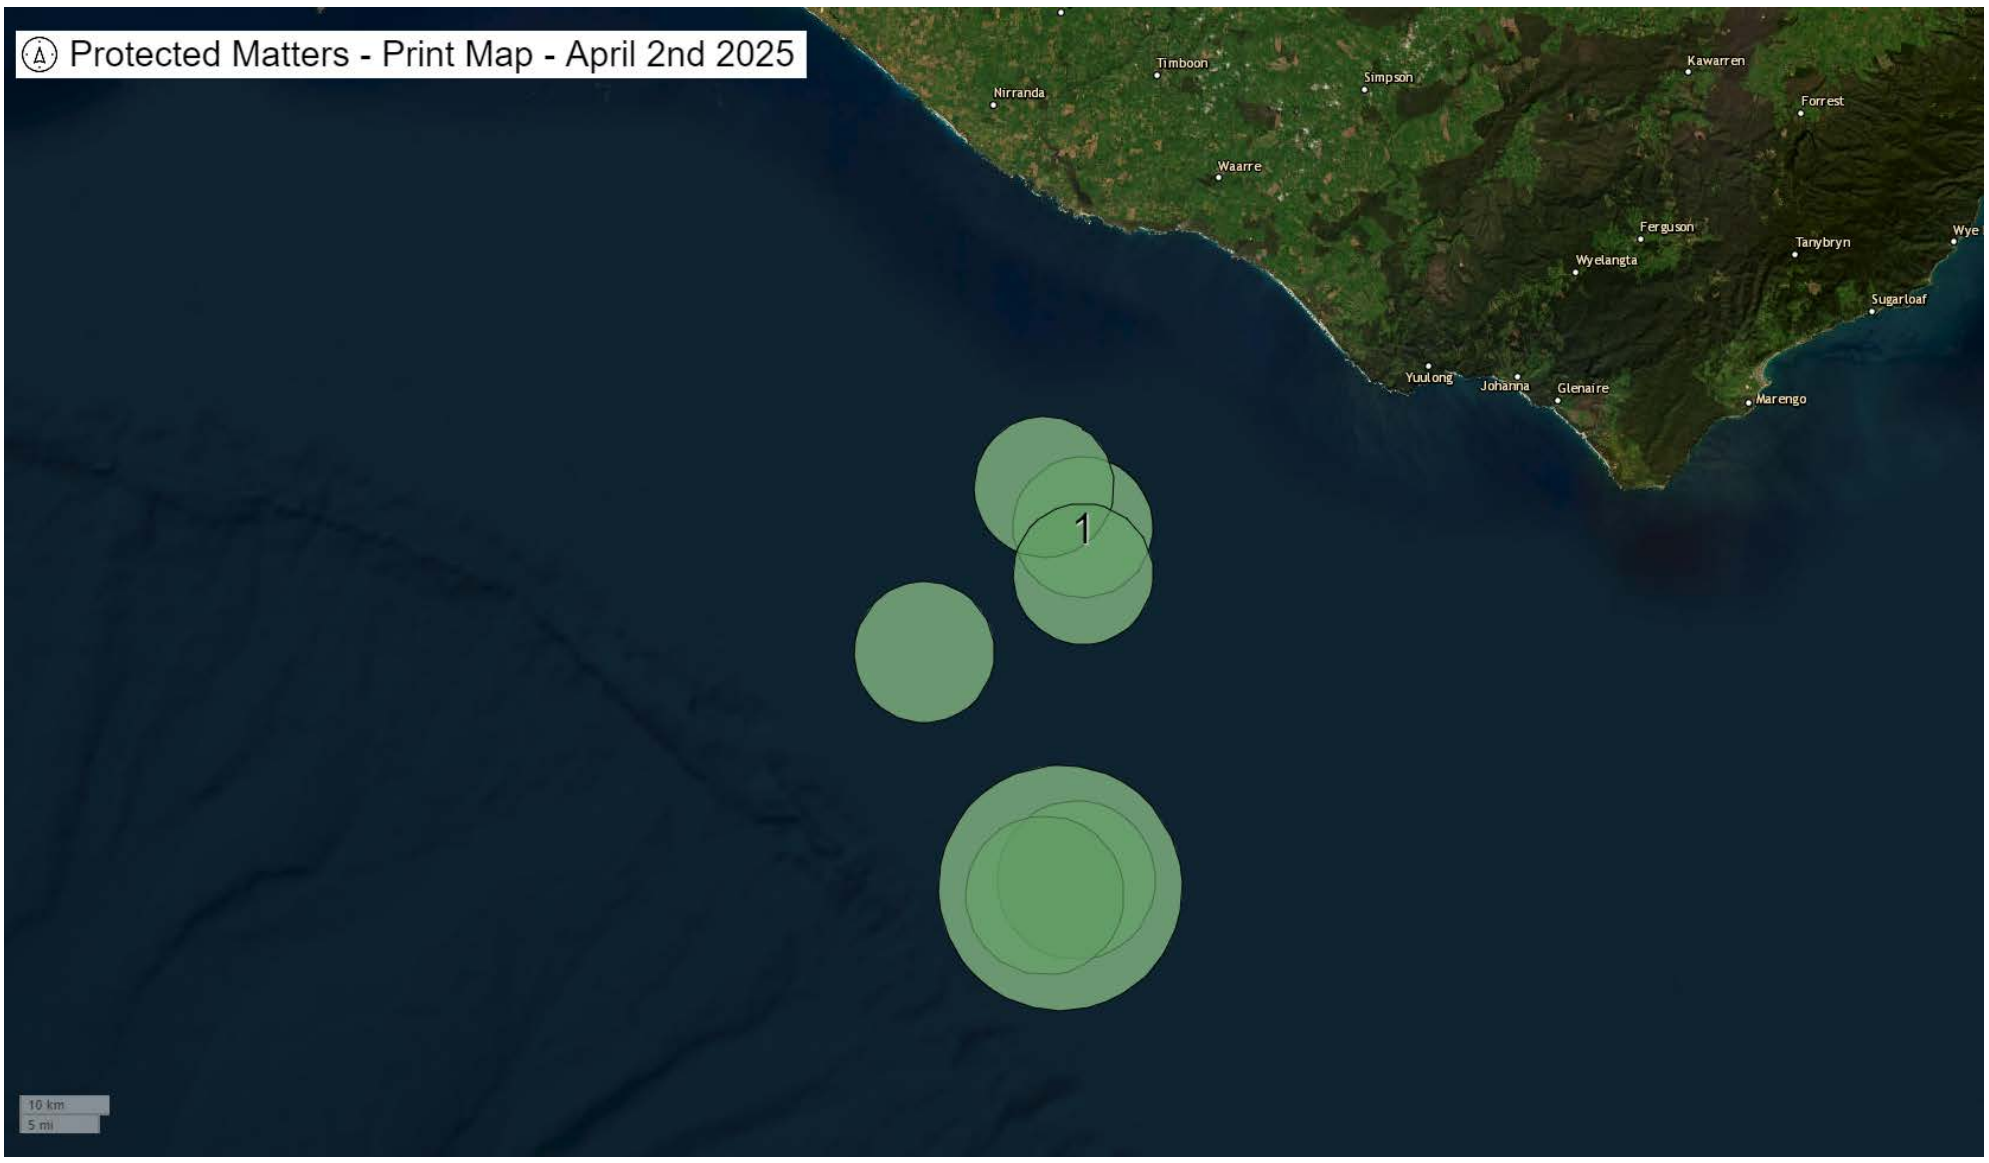
Australian Government

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 02-Apr-2025



[Summary](#)

[Details](#)

- [Matters of NES](#)
- [Other Matters Protected by the EPBC Act](#)
- [Extra Information](#)

[Caveat](#)

[Acknowledgements](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	39
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	60
Whales and Other Cetaceans:	27
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	25
Key Ecological Features (Marine):	1
Biologically Important Areas:	12
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Thalassarche steadi](#) White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
[Actitis hypoleucos](#) Common Sandpiper [59309]		Species or species habitat may occur within area
[Ardenna carneipes as Puffinus carneipes](#) Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
[Ardenna grisea as Puffinus griseus](#) Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
[Calidris acuminata](#) Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
[Calidris canutus](#) Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pachyptila turtur Fairy Prion [1066]		Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Migration route may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Thalassarche melanophris](#) Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Thalassarche salvini](#) Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Thalassarche steadi](#) White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Fish		
[Heraldia nocturna](#) Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area

[Histiogamphelus briggsii](#) Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
[Histiogamphelus cristatus](#) Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
[Hypselognathus rostratus](#) Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
[Kaupus costatus](#) Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Solegnathus spinosissimus](#) Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
[Stigmatopora argus](#) Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
[Stigmatopora nigra](#) Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
[Stipecampus cristatus](#) Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
[Urocampus carinirostris](#) Hairy Pipefish [66282]		Species or species habitat may occur within area
[Vanacampus margaritifer](#) Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
[Vanacampus phillipi](#) Port Phillip Pipefish [66284]		Species or species habitat may occur within area
[Vanacampus poecilolaemus](#) Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
[Arctocephalus forsteri](#) Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
[Arctocephalus pusillus](#) Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
Reptile		
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica		
Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Ardenna tenuirostris		
Short-tailed Shearwater [82652]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

Figures

Figure 1-1 Map of the assessed release location. 2
Figure 1-2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability. 3
Figure 1-3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration. 4

TERMS AND ABBREVIATIONS

AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
BIA	Biologically Important Areas
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Deterministic (single) oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IMCRA	Integrated marine and coastal regionalisation areas
KEF	Key Ecological Feature
LGA	Local Government Areas
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park
MP	Marine Park
MS	Marine Sanctuary
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park

NR	Nature Reserve
PAH	Polynuclear Aromatic Hydrocarbons
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RSB	Reefs, Shoals and Banks
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
Stochastic (multiple) oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the environment that maybe affected (EMBA) and indicates which locations are more likely to be affected (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be affected in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment
Sub-LGA	Sub-Local Government Areas
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations.

EXECUTIVE SUMMARY

Background

To support the Offshore Gas Victoria EP, Beach commissioned a detailed oil spill modelling study assessing the following hypothetical scenarios:

- A 434,752 stb [69,118 m^3] subsea release of condensate over 86 days from a loss of well control at the Northern Release Location;
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the Northern Release Locatio;
- A 102,576 stb [16,308 m^3] subsea release of condensate over 86 days from a loss of well control at the TW1; and
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the TW1.

The modelling assessment was undertaken on a seasonal basis as follows:

- Summer (November through to March); and
- Winter (April to October)

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area that may be affected in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response strategies that would be implemented in response to a spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbon may influence.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a 10-year wind and current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled hydrocarbons.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 randomly selected single trajectory simulations per season, with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.

The SIMAP system, the methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Oil Properties

Thylacine condensate has an API of 44.3 and a density of 804.6 kg/m^3 (at 15ºC) with a viscosity value (0.87.0 cP) classifying it as a Group I (not-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications.

The condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, 64.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C), a further 19.0% is expected to evaporate within the first 24 hours (180°C < BP < 265°C) and a further 16.0% should evaporate over several days (265°C < BP < 380°C). Approximately 1.0% of the condensate is shown to be persistent.

Marine diesel (MDO) has an API of 37.6 and a density of 829.1 kg/m^3 (at 25ºC) with a viscosity value (4.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The MDO is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, about 6.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C); a further 34.6% should evaporate within the first 24 hours (180°C < BP < 265°C); and a further 54.4% should evaporate over several days (265°C < BP < 380°C). Approximately 5.0% of the oil is shown to be persistent.

Results

Scenario 1: 86-day Loss of Well Control at the Northern Release Location

- The maximum distances from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones were 54.03 km (east) and 5.83 km (east-southeast), both during winter conditions. No contact was predicted for the high threshold (> 50 g/m^2).
- Outside of the receptors that the Northern Release Location resides within, floating oil exposure above the low threshold was predicted at the Short-tailed Shearwater - Foraging (Buffer around Tasmania including Bass Strait), being 6% and 9% during summer and winter respectively.
- The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 99% during summer conditions and 96% during winter conditions.
- The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 67.91 m^3 and 87.54 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 104.17 km and 114.39 km, respectively.
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of dissolved hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) BIA and Corangamite (VIC) NRMR (summer – 570.15 ppb, winter – 1,332.51 ppb).
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of entrained hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) (summer – 358.93 ppb, winter – 527.26 ppb).

Scenario 2: Loss of Marine Diesel Containment at the Northern Release Location

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 32.65 km (east-southeast), 19.85 km (southeast) and 10.53 km (southeast) all during winter conditions.
- The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 30.86 m^3 and 58.33 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 29.23 km and 43.19 km, respectively.
- Only the receptors that the Northern Release Location resides within were contacted by dissolved hydrocarbon at the low threshold. The maximum dissolved hydrocarbon concentration was 101.35 ppb and 65.67 ppb during summer and winter respectively.

- Outside of the receptors that the Northern Release Location resides within, the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 745.77 ppb, winter – 1,391.43 ppb), which also presented the highest probability of low entrained hydrocarbon exposure (summer – 60%, winter – 97%).

Scenario 3: 86-day Loss of Well Control at TW1

- The maximum distance from the release location to the low (1–10 g/m^2) exposure zone was 24.49 km (southeast) during summer conditions and 18.35 km (south) during winter conditions, respectively. No contact was predicted for the moderate (10–50 g/m^2) or high (> 50 g/m^2) thresholds.
- Outside of the receptors that the Northern Release Location resides within, the highest probability of floating oil exposure above the low threshold was predicted at the Pygmy Blue Whale – Foraging BIA (28% summer, 25% winter).
- The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 32% during summer conditions and 57% during winter conditions.
- The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 6.15 m^3 and 8.36 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 12.62 km and 13.90 km, respectively.
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of dissolved hydrocarbon was 553.15 ppb during summer and 528.54 ppb during winter.
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of entrained hydrocarbon was predicted for White Shark – Distribution (Between 120 – 1,000 m depth contour) (summer – 338.67 ppb, winter – 328.89 ppb).

Scenario 4: Loss of Marine Diesel Containment at TW1

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 64.97 km (southeast), 49 km (southeast) and 10.08 km (south-southeast) all during winter.
- No shoreline contact was forecast during summer conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 9% during winter conditions.
- The maximum volume ashore for a single spill trajectory was 9.67 m^3, whilst the maximum length of shoreline accumulation at the low threshold was 17.67 km.
- Outside of the receptors that the Northern Release Location resides within, the highest concentration of dissolved hydrocarbon was predicted for the White Shark - Distribution (Between the 120 - 1,000m depth contour) BIA, being 23.94 ppb in summer and 23.23 ppb in winter.
- Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 6,692.22 ppb, winter – 6,075.03 ppb).

1 INTRODUCTION

1.1 Background

To support the Offshore Gas Victoria EP, Beach commissioned a detailed oil spill modelling study assessing the following hypothetical scenarios:

- A 434,752 stb [69,118 m^3] subsea release of condensate over 86 days from a loss of well control at the Northern Release Location;
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the Northern Release Location;
- A 102,576 stb [16,308 m^3] subsea release of condensate over 86 days from a loss of well control at the TW1; and
- A 603.7 m^3 surface release of marine diesel over 6 hours from a loss of containment from vessel collision at the TW1.

The modelling assessment was undertaken on a seasonal basis as follows:

- Summer (November through to March); and
- Winter (April to October)

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area that may be affected in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response strategies that would be implemented in response to a spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbon may influence.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Table 1-1 Location of assessed release site.

Well	Latitude	Longitude	Water Depth (m)
Northern Release Location	38.8552° S	142.8381° E	71.5
TW1	39.2223° S	142.8386° E	105

GCS: WGS84

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

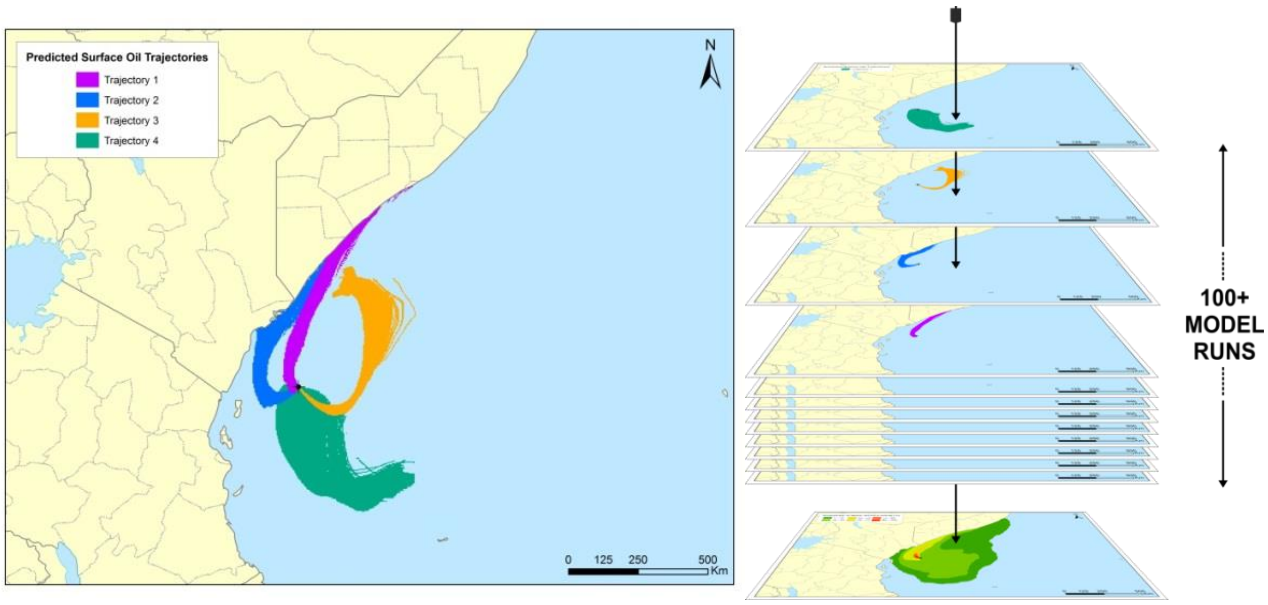

Figure 1-2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1-3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore, longest length of shoreline contacted by oil or largest area of entrained or dissolved hydrocarbons.

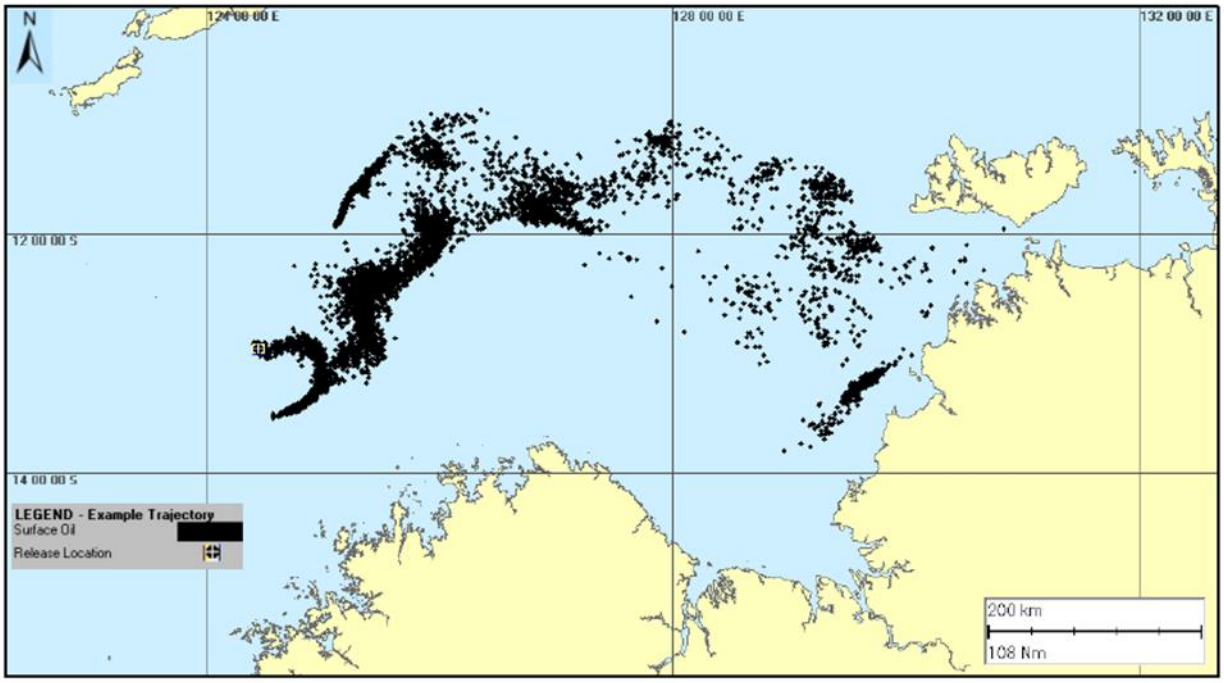

Figure 1-3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10-years of winds and three-dimensional currents from 2010 to 2019 (inclusive). The currents included the combined influence of tidal and ocean currents.
- Include the wind and current data and characteristics of the released hydrocarbons as input into the three-dimensional oil spill model (SIMAP), to model the movement, spreading, weathering and shoreline contact by hydrocarbons over time.
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surrounding waters and shorelines. This involved running 100 randomly selected single trajectory simulations per season, with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.
- Results were assessed to determine the exposure to surrounding waters and contact to shorelines based upon the NOPSEMA thresholds.

3 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3-1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.

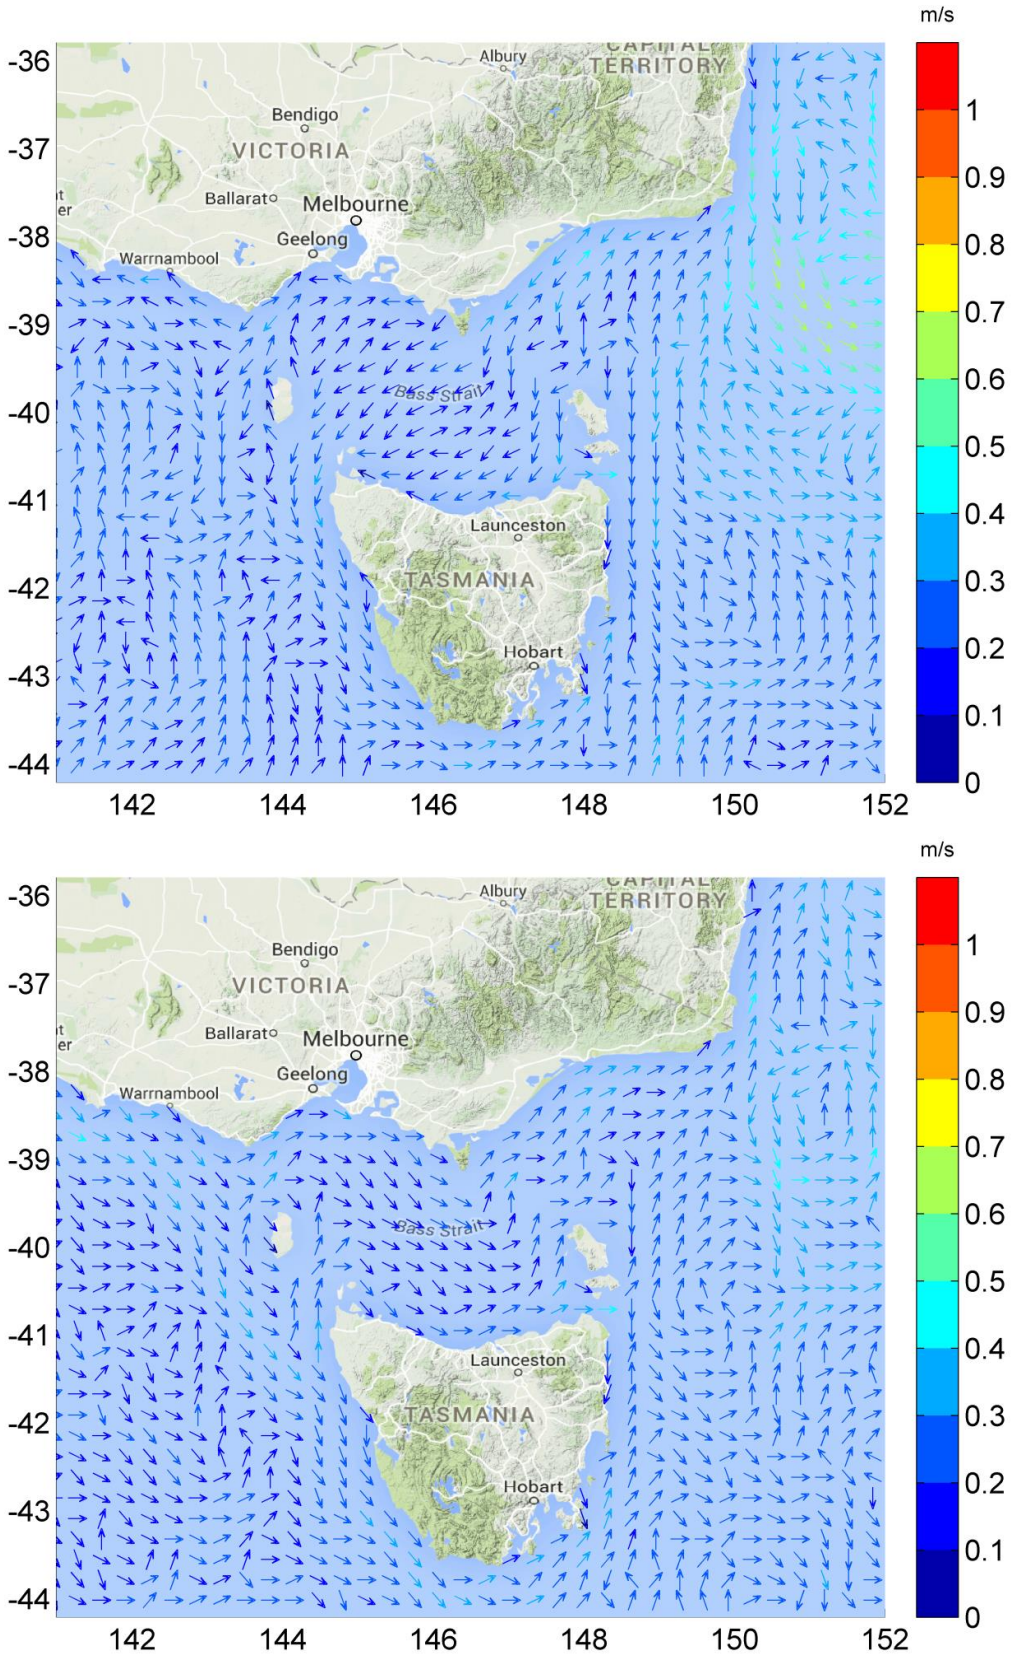

Figure 3-1 **HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).**

3.1 Tidal Current Model

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for more than 30 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3-2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3-3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

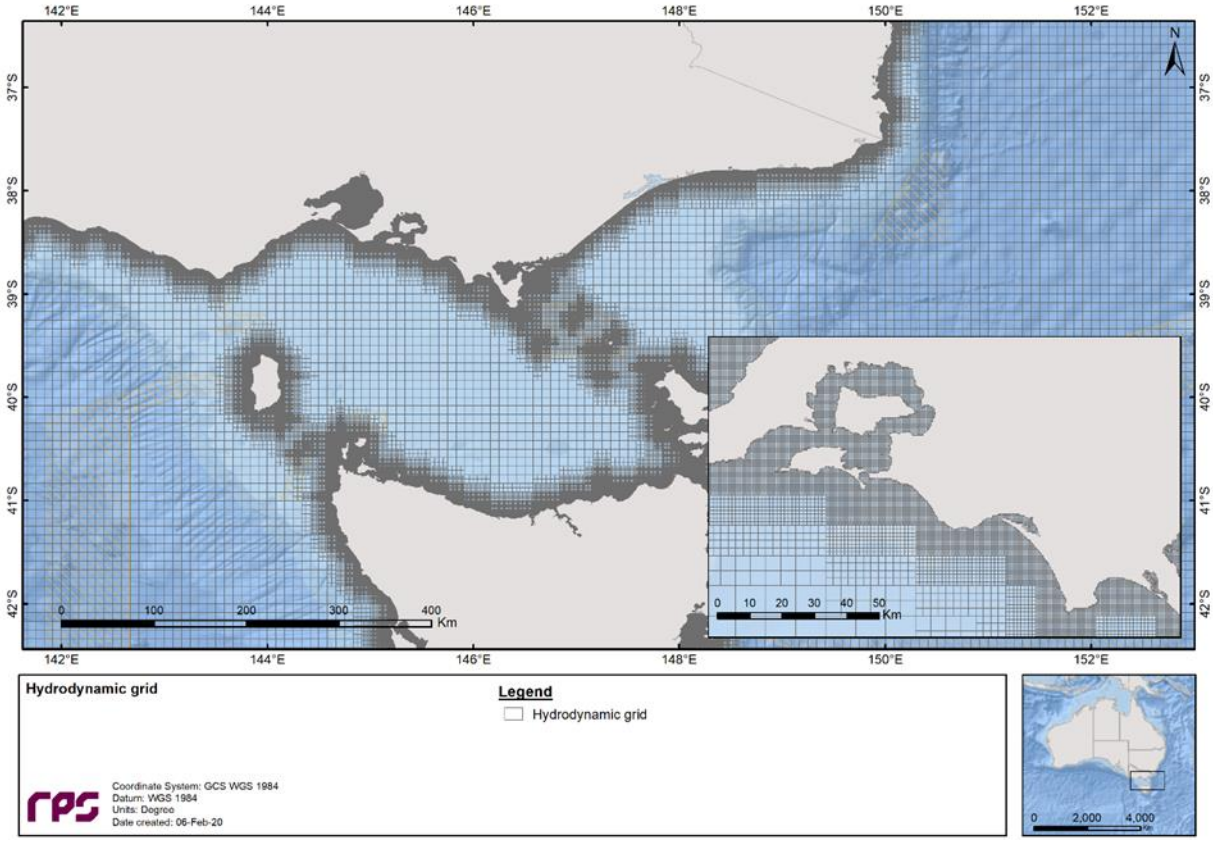

Figure 3-2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

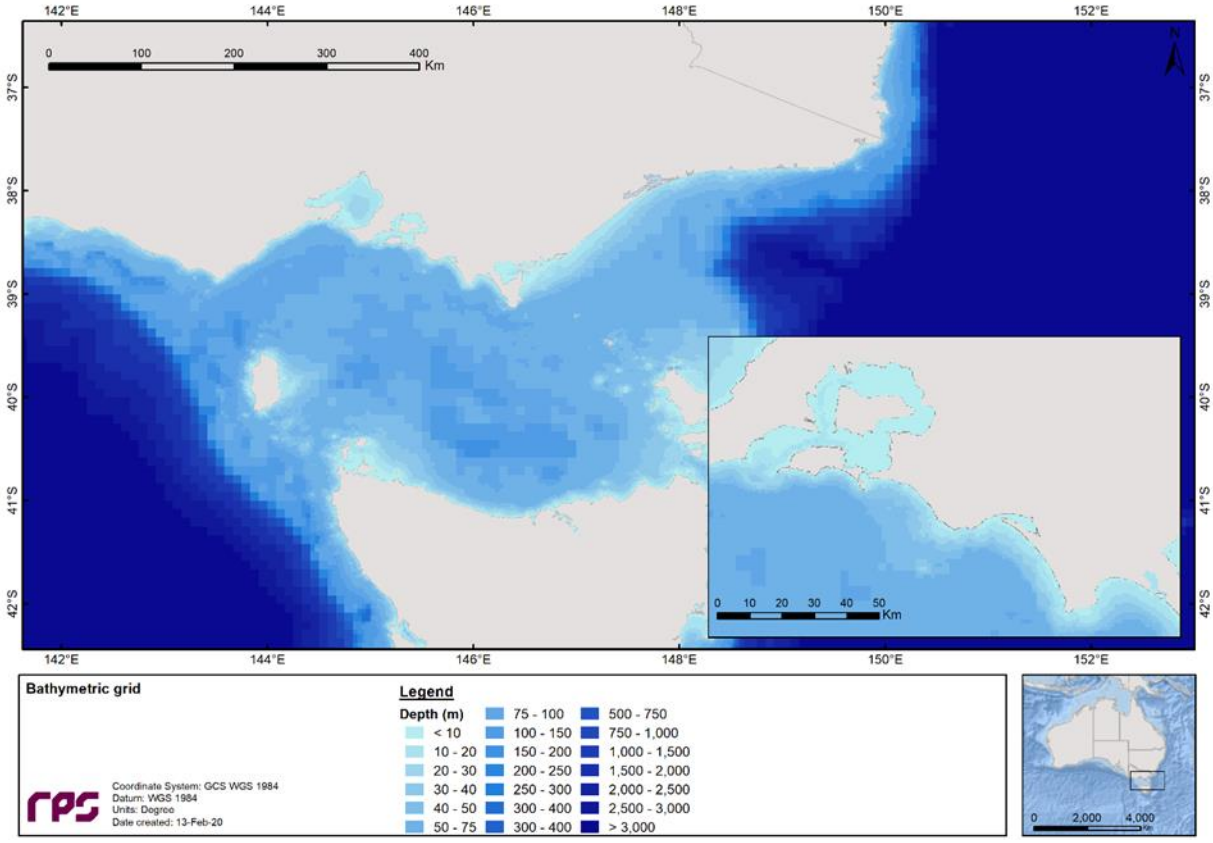

Figure 3-3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex/Poseidon tidal data has been widely used amongst the oceanographic community, being referenced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3-4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1}\sum_{i=1}^{N}|P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

P_i = Model predicted surface elevation

O_i = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum|X_{model} - X_{obs}|^2}{\sum(|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: X_{model} = Model predicted surface elevation

X_{obs} = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3-5 and Figure 3-6 illustrate a comparison of the predicted and observed surface elevations in February 2017. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3-1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3-1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Gabo Island	0.98	0.08
Port MacDonnell	0.98	0.05
Port Welshpool	0.92	0.30
Portland	0.97	0.07
Stack Island	0.96	0.22

3.2 Ocean Current Model

Data describing the flow of ocean currents for the years 2010 to 2019 (inclusive) was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of every 3 hours. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

3.3 Surface Currents

Table 3-2 and Table 3-3 present the monthly average and maximum net surface current speeds nearby the Northern Release Location and TW1, respectively, by combining the ocean and tidal currents.

Current speeds near the Northern Release Location varied throughout the year with monthly maximum current speeds ranging between 0.69 m/s (December) and 1.21 m/s (July). The dominant surface current directions throughout the year were identified as (towards) east.

Current speeds near TW1 varied throughout the year with maximum current speeds ranging between approximately 0.81 m/s (October) and 1.15 m/s (August). The dominant surface current directions throughout the year were identified as (towards) east-southeast and west-northwest.

Figure 3-7 and Figure 3-8 show the monthly and total surface current rose distributions nearby the Northern Release Location.

Figure 3-9 and Figure 3-10 show the monthly and total surface current rose distributions nearby TW1.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3-2 Predicted monthly average and maximum surface current speeds nearby the Northern Release Location. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (towards)
January	0.15	0.73	West
February	0.16	0.70	West
March	0.16	0.96	West
April	0.15	0.94	East
May	0.20	1.12	East
June	0.21	1.05	East
July	0.26	1.21	East
August	0.25	1.11	East
September	0.21	1.01	East
October	0.19	0.98	East
November	0.17	0.83	East
December	0.18	0.69	East
Minimum	0.15	0.69	-
Maximum	0.26	1.21	-

Table 3-3 Predicted monthly average and maximum surface current speeds nearby TW1. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (towards)
January	0.20	0.90	East-northeast and West-southwest
February	0.21	1.00	East-northeast and West-southwest
March	0.22	1.14	East-northeast and West-southwest
April	0.22	0.90	East
May	0.27	1.03	East
June	0.25	0.99	East
July	0.29	0.94	East
August	0.26	1.15	East
September	0.23	0.98	East
October	0.22	0.81	East
November	0.21	0.83	East

4 WIND DATA

High resolution wind data for the years 2010 to 2019 (inclusive) was sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals. Figure 4-1 shows the spatial resolution of the wind field used as input into the oil spill model.

Table 4-1 and Table 4-2 present the monthly average and maximum winds derived from a CFSR wind node nearby the Northern Release Location and TW1, respectively.

The wind data demonstrated for the Northern Release Location the average monthly wind speeds ranging from 13.75 knots (January) and 19.35 knots (July), whilst maximums ranged from 38.87 knots (January) to 52.61 knots (June).

The wind data demonstrated for TW1 the average monthly wind speeds ranging from 14.2 knots (January) to 20.1 knots (July) with maximums ranging between 58.9 knots (February) and 65.8 knots (December).

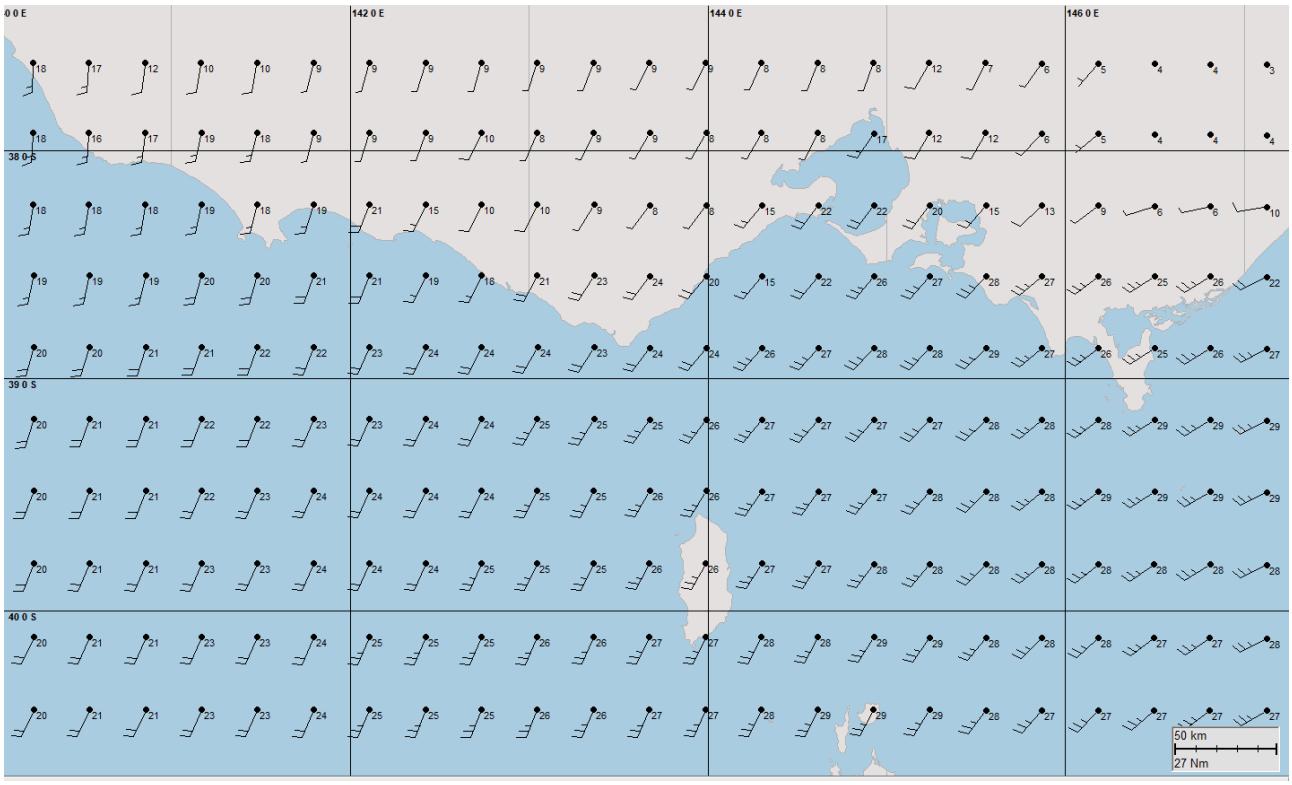

Figure 4-1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

Figure 4-2 and Figure 4-3 show the monthly and total wind rose distributions derived from the CFSR data for the node closest to the Northern Release Location.

Figure 4-4 and Figure 4-5 show the monthly and total wind rose distributions derived from the CFSR data for the node closest to TW1.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 5 knots are predominantly used in these wind roses. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

Table 4-1 **Predicted average and maximum winds representative for the selected node closest to the Northern Release Location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).**

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (from)
January	13.75	38.87	South
February	14.28	41.67	Southeast
March	14.25	44.22	West

Figure 4-5 Modelled total wind rose distributions from 2010–2019 (inclusive) for the node nearby TW1.

5 WATER TEMPERATURE AND SALINITY

The monthly spatially varying water temperature and salinity profiles across the model domain were obtained from the HYCOM model (Section 3.2).

Figure 5-1 and Figure 5-2 illustrate the vertical profile of sea temperature and salinity at the Northern Release Location and TW1, respectively.

Table 5-1 and Table 5-2 present the sea temperature and salinity of the surface layer nearby the Northern Release Location and TW1, respectively.

At the Northern Release Location temperatures varied from 13.5°C (September) to 19.0°C (February) while the monthly average salinity values remain relatively consistent ranging between 35.3 psu and 35.5 psu.

At TW1 temperatures varied from 13.2°C (September) to 17.8°C (February) while the monthly average salinity values remain relatively consistent ranging between 35.1 psu and 35.6 psu.

Table 5-1 Monthly average sea surface temperature and salinity at the Northern Release Location.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (ºC)	18.2	19.0	18.9	17.1	15.9	15.2	14.7	14.1	13.5	13.9	14.6	15.9
Salinity (psu)	35.4	35.4	35.4	35.3	35.4	35.4	35.5	35.5	35.4	35.4	35.4	35.3

Figure 5-2 Temperature and salinity profiles at TW1.

6 SUBSEA PLUME MODEL – OILMAP DEEP

In the event of a subsea release, the gas and condensate will initially behave like a jet, which dissipates in the water column over a short distance (<10 m). The escaping condensate shear into small droplets due to turbulence generated by passing through the exit hole and subsequent turbulence generated in the plume jet. The size-distribution of the droplets will vary with the exit velocity and viscosity of the condensate. Following this phase, the density and buoyancy difference of the gas and condensate mixture relative to the surrounding waters, forces the plume upward. As the plume rises, the volume of gas will increase due to reduction of water pressure, with gas bubbles dividing into an increasing number of bubbles due to the shearing effect exerted by the water column.

In shallow water (<200 m) the rising plume will tend to reach the sea surface before deflecting away from the centre of the plume (Spaulding et al., 2000). Figure 6-1 conceptually illustrates the various stages of a subsea release of oil and gas.

The OILMAP Deep model (Spaulding et al. 2015) was used to simulate the near-field behaviour of the gas-condensate subsea release in two phases – the initial jet phase and the buoyant plume phase. The initial jet phase is predominately driven by the exit velocity. During this phase, the condensate droplet-size-distributions are calculated for a range of classes or bins. Next, the plume model predicts the rise dynamics of the condensate and gas plume to calculate at which point gas lift will be lost (i.e., the trapping height).

Outputs which include the plume trapping height, plume diameter and droplet size distribution are used as input to the SIMAP model to simulate the rise and dispersion of the condensate droplets from this point onwards.

More details on the OILMAP-DEEP model, can be found in Spaulding et al. (2015). The model has been validated against observations from Deepwater Horizon as well as small and large-scale laboratory studies on subsurface oil releases (Brandvik et al 2013, 2014; Belore 2014; Spaulding et al. 2015; Li et al. 2017).

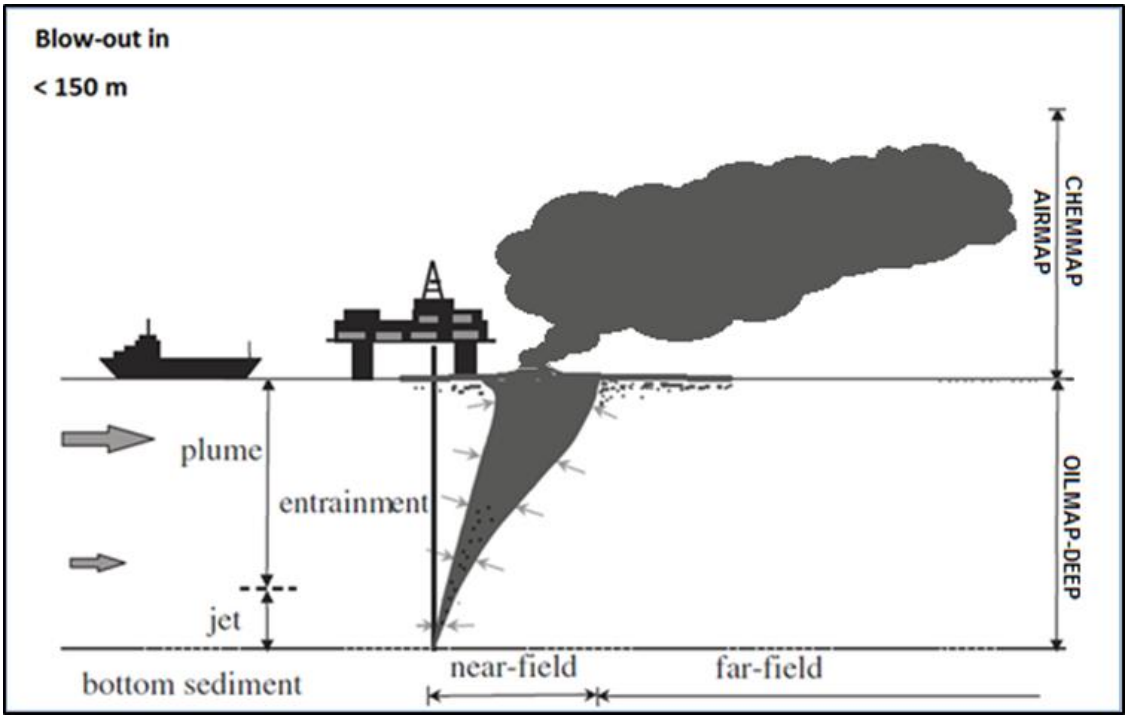

Figure 6-1 Schematic of the various stages of the plume in the water column (Source: ASA, 2011).

Table 6-1 presents the input parameters and key results for the subsea plume modelling.

Figure 6-2 and Figure 6-3 illustrate the time-varying release rate used for the LOWC scenarios for Northern Release Location and TW1, respectively.

The blowout modelling showed that in the event of a loss of well control at the Northern Release Location (Scenario 1), the amalgamated gas and condensate would propel rapidly upward from the seabed and breach the sea surface. Droplet sizes would initially range from 108 µm to 466 µm on day-1 and increase in size to 203 µm to 878 µm by day-86.

The blowout modelling showed that in the event of a loss of well control at TW1 (Scenario 3), the amalgamated gas and condensate would propel rapidly upward from the seabed and breach the sea surface. Droplet sizes would initially range from 81 µm to 351 µm on day-1 and increase in size to 102 µm to 442 µm by day-86.

Table 6-1 Input data and key results for the subsea plume modelling.

Input Variable	Northern Release Location	TW1
Scenario	Loss of well control	Loss of well control
Water depth	71.5 m	105 m
Tubing diameter	8.5”	8.5”
Condensate discharge rate	Day-1: 6,813 STB/day Day-86: 3,592 STB/day	Day-1: 1,337 STB/day Day-86: 1,071 STB/day
Gas discharge rate	Day-1: 407 MMscf/day Day-86: 224 MMscf/day	Day-1: 138 MMscf/day Day-86: 111 MMscf/day
Formation water discharge rate	Day-1: 363 STB/day Day-86: 267 STB/day	NIL
Key Results		
Plume execution depth (m BMSL)	0 (Breach the sea surface)	0 (Breach the sea surface)
Droplet sizes (µm)	Day-1: 108 to 466 Day-86: 203 to 878	Day-1: 81 to 351 Day-86: 102 to 442

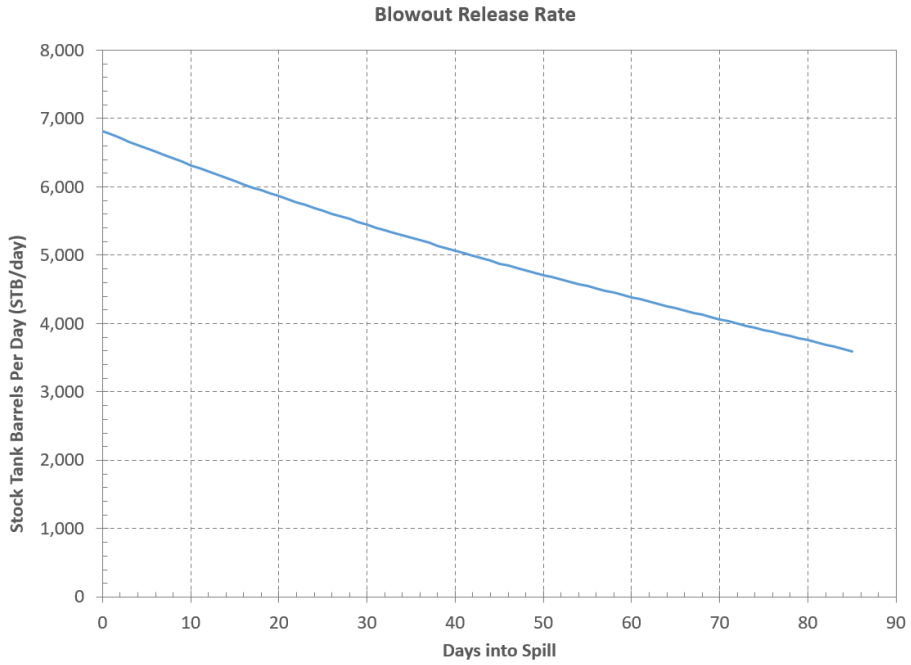

Figure 6-2 Plot of time-varying release rate for the Northern Release Location.

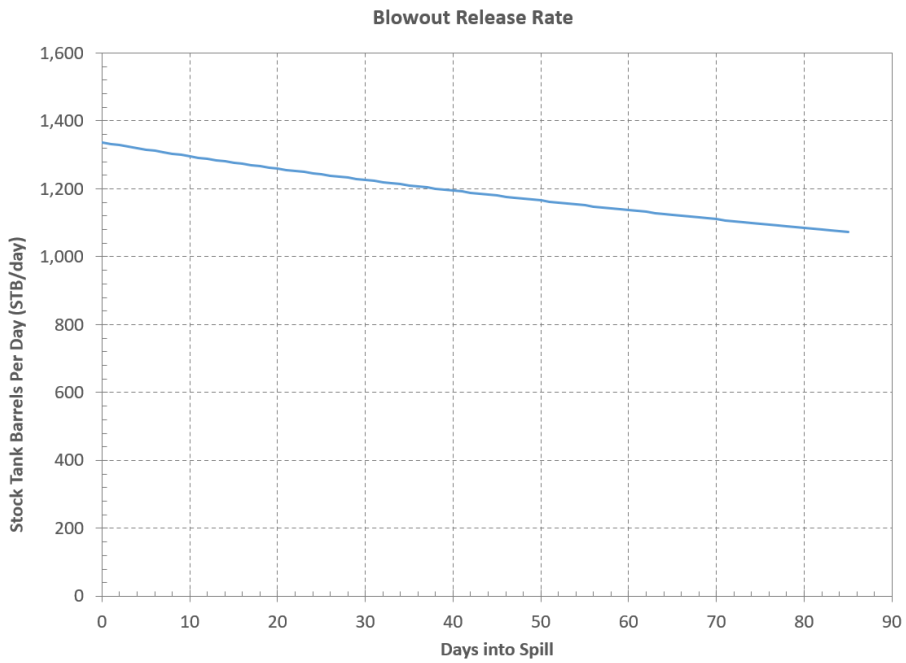

Figure 6-3 Plot of time-varying release rate for TW1.

7 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Model Application Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point (BP) ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

7.1 Stochastic Modelling

For the stochastic modelling presented herein, 200 simulations (100 per season) were modelled for each of the scenarios using the same spill information (release location, spill volume, duration and oil type) but with varied start dates per scenario. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations per season (per scenario) were analysed to determine the following statistics for every grid cell:

- Exposure load (concentrations).
- Minimum time before exposure.
- Maximum duration of exposure.
- Probability of contact above defined concentrations.
- Volume of oil that may accumulate on shorelines from any single simulation.
- Concentration that might occur on sections of individual shorelines.
- Exposure (instantaneous) to dissolved hydrocarbons in the water column.
- Exposure (instantaneous) to entrained hydrocarbons in the water column.
- Residence time, or the longest continuous period floating oil, and dissolved and entrained hydrocarbons persisted at a point above a threshold.

8 THRESHOLDS

The thresholds and their relationship to exposure for the sea surface, shoreline and water column (entrained and dissolved hydrocarbons) are presented in Sections 8.1 to 8.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of influence are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

8.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 8-1). Figure 8-1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 8-1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn

Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 8-2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 8-1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

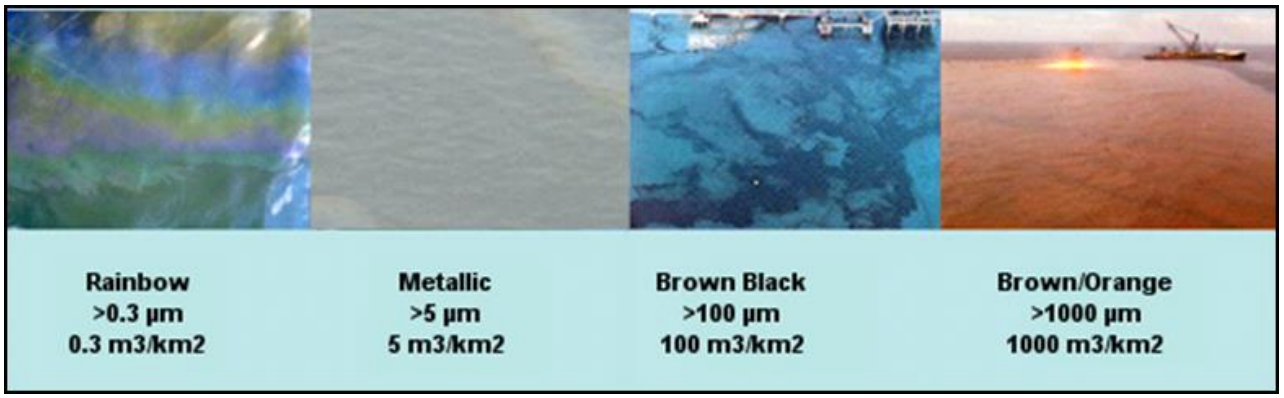

Figure 8-1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 8-2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA, 2019).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates area of potential socioeconomic effects and establishes planning area for scientific monitoring and determination of any effects.
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

8.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling herein, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results contained herein would be indicative of a worst-case scenario, where the highest volume of oil may be stranded on the shoreline (when compared to other shoreline types, such as exposed rocky shores).

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according to the AMSA (2015) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996) demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high shoreline accumulation”. It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

It is worth noting that the shoreline accumulation thresholds derived from extensive literature review (outlined in Table 8-3) agree with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 8-3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline loading (g/m^2)	Description
Low (socioeconomic/sublethal)	10	Loading predicts potential socio-economic impact
Moderate	100	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

8.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons

specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

In addition to presenting the maximum instantaneous concentrations across the model domain, there are also figures presented for the residence time, which is the longest continuous period of exposure above each threshold. This helps provide context when considering exposure to sensitive receptors.

8.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1-hour timestep (see Table 8-4) was applied to indicate increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

8.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. As such, insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, hence are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC & ARMCANZ (2000) water quality guidelines. Due to the requirement for relatively long exposure times (> 24 hours) for these concentrations to be significant, they are likely to be more meaningful for juvenile fish, larvae and planktonic organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not

define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 8-4), to cover the range of thresholds outlined in ANZECC & ARMCANZ (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019). Additionally, a threshold of 1,000 ppb (French-McCay, 2023) was applied over a 1-hour time exposure.

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 8-4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

Threshold level	Dissolved hydrocarbon concentration (ppb)	Entrained hydrocarbon concentrations (ppb)
Low	10	10
Moderate	50	100
High	400	1,000

9 DISPERSION COEFFICIENTS AND MIXED LAYER DEPTH

A horizontal dispersion coefficient of 10 m^2/s was used to account for dispersive processes acting on the floating oil that are at scales finer than the modelled wind and currents, based on typical values for open waters (Okubo, 1971).

Vertical dispersion coefficients (*Dv)* of 115 cm^2/s and 120 cm^2/s were used to represent the turbulent mixing and diffusion processes in the wave-mixed layer in the upper water column at Northern Release Location and TW1, respectively. Those are site-specific values computed using the 50th percentile wind speed at each of the release sites, derived from the 10-year dataset (at 10 m above the sea surface, W_{10}) based on French-McCay (2004).

The mixed layer depth corresponds to the top layer of the water column, where vertical mixing is strong enough to cause uniform temperature and salinity, and is influenced by factors like wind, ocean currents and waves. The 50th percentile value at the site was calculated using Copernicus' 10 years (2010 to 2019) of monthly-averaged mixed layer depth data and were found to be 32 m and 42 m for Northern Release Location and TW1, respectively.

10 OIL PROPERTIES

10.1 Oil Characteristics

Table 10-1 and Table 10-2 present the physical properties and boiling point ranges of Marine Diesel and Thylacine condensate, which was used as the proxy for the study.

Thylacine condensate has an API of 44.3 and a density of 804.6 kg/m^3 (at 15ºC) with a viscosity value (0.87.0 cP) classifying it as a Group I (not-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications.

The condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, about 64.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C), a further 19.0% should evaporate within the first 24 hours (180°C < BP < 265°C) and a further 16.0% should evaporate over several days (265°C < BP < 380°C). Approximately 1.0% of the oil is shown to be persistent.

Marine diesel (MDO) has an API of 37.6 and a density of 829.1 kg/m^3 (at 25ºC) with a viscosity value (4.0 cP) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications.

The MDO is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi- to low-volatile components. In favourable evaporation conditions, about 6.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C); a further 34.6% should evaporate within the first 24 hours (180°C < BP < 265°C); and a further 54.4% should evaporate over several days (265°C < BP < 380°C). Approximately 5.0% of the oil is shown to be persistent.

Table 10-1 Physical properties for Thylacine condensate.

Characteristic	Thylacine Condensate	MDO
Density (kg/m^3)	804.6 (at 15°C)	829.1 (at 25 °C)
API	44.3	37.6
Dynamic viscosity (cP)	0.87 (at 20°C)	4.0 (at 25 °C)
Pour point (°C)	-50	-14
Hydrocarbon property category	Group I	Group II
Hydrocarbon property classification	Not – Persistent	Light - Persistent

Table 10-2 Boiling point ranges for Thylacine condensate.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatile (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-265 C_{11} to C_{15}	265-380 C_{16} to C_{20}	>380 >C_{20}
Thylacine Condensate	% of total	64.0	19.0	16.0	1.0
Marine Diesel	% of total	6.0	34.6	54.4	5.0

The BP are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate.

Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (or <180°C BP).
- Up to 24 hours for the C_{11} to C_{15} compounds (180–265°C BP).
- Several days for the C_{16} to C_{20} compounds (265–380°C BP).
- Not applicable for the residual compounds (BP >380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

The actual fate of oil will depend greatly on the amount that reaches the surface.

10.2 Weathering Characteristics

A series of model weather tests were conducted to illustrate the potential behaviour of Thylacine condensate and marine diesel when exposed to idealised and representative environmental conditions:

- A 50 m^3 surface release over 1-hour under calm wind conditions (constant 5 knots or 2.6 m/s), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents; and
- A 50 m^3 surface release over 1-hour under variable wind conditions (1-12 knots or 1.9-23 m/s, drawn from representative data files), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.

Note, a surface release is used in the weathering test to solely focus on the weathering and fates of the hydrocarbons when exposed to atmospheric conditions.

The first case is indicative conditions that would not generate entrainment, while the second case may represent conditions that could cause a minor degree of entrainment. Both scenarios provide examples of potential behaviour during a spill once the oil reaches the surface.

Thylacine Condensate Mass Balance Forecasts

The mass balance for the condensate under the constant 5 knot wind case (Figure 10-1) shows that 82.5% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation shall cease when the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 10-2), where the winds are of greater strength on average, entrainment of the condensate into the water column is predicted to increase. Approximately 24 hours after the spill, 22.1% of the oil mass is forecast to have entrained and a further 69.4% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<0.1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of 1.9% per day with or ~10.9% after 7 days, compared to <0.1% per day and a total of 0.8% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

Marine Diesel Mass Balance Forecasts

The mass balance for the MDO under the constant 5 knot (~2.5 m/s) wind case (Figure 10-3) shows that 40.3% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation shall cease when the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 10-4), where the winds are of greater strength on average, entrainment of MDO into the water column is predicted to increase. Approximately 24 hours after the spill, 60.1% of the oil mass is forecast to have entrained and a further 38.4% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<0.1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of 1.5% per day with or ~10.5% after 7 days, compared to <0.1% per day and a total of 0.9% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

11 OIL SPILL SCENARIOS

Table 11-1 provides a summary of the oil spill model settings.

Table 11-1 Summary of the oil spill model settings and thresholds used in this assessment.

Parameter	Northern Release Location		TW1	
Description	Loss of well control	Loss of containment	Loss of well control	Loss of containment
Number of randomly selected spill start times	100 per season	100 per season	100 per season	100 per season
Model period	Summer (November through to March) and Winter (April to October)			
Oil type	Thylacine condensate	Marine Diesel	Thylacine condensate	Marine Diesel
Spill volume	434,752 stb	603.7 m^3	102,576 stb	603.7 m^3
Release type	Subsea (71.5 m)	Surface	Subsea (105 m)	Surface
Release duration	86 days (variable release rate)	6 hours	86 days (variable release rate)	6 hours
Simulation length	100 days	30 days	100 days	30 days
Surface oil concentration thresholds (g/m^2)^	1 (low); 10 (moderate); 50 (high)			
Shoreline oil accumulation thresholds (g/m^2)^	10 (low); 100 (moderate); 1,000 (high)			
Dissolved hydrocarbon concentrations (ppb)^	10 (low); 50 (moderate); 400 (high)			
Entrained hydrocarbon concentrations (ppb)^	10 (low); 100 (moderate); 1,000 (high)			

^Thresholds based on NOPSEMA (2019)

12 PRESENTATION AND INTERPRETATION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of the predicted sea-surface and water column (subsurface) exposure and shoreline accumulation (if predicted).

12.1 Annual Analysis

12.1.1 Statistics

The statistics are based on the following principles:

- The ***greatest distance travelled by a spill trajectory*** – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds.
- The ***probability of oil exposure to a receptor*** – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The ***minimum time before oil exposure to a receptor*** – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value.
- The ***maximum residence time for oil exposure within a receptor*** – is determined by recording the longest continuous length of time a grid cell is exposed to either floating, entrained or dissolved hydrocarbon above each threshold, within each receptor.
- The ***probability of oil accumulation at a receptor*** – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The ***maximum potential oil loading within a receptor*** – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario.
- The ***dissolved and entrained hydrocarbon exposure*** – is determined by recording the maximum instantaneous concentrations at each grid cell.
- ***Maximum total volume ashore*** (found in shoreline statistics table) – is the total volume of oil stranded on the shorelines throughout the duration of the simulation, regardless of timing.
- ***Maximum instantaneous peak volume ashore*** (found in the deterministic analysis section and derived from the histogram) – is the peak volume of oil accumulated on shorelines at a single point in time. This peak value does not include oil that came ashore earlier in the simulation and was subsequently lost through evaporative or other weathering processes.

12.2 Receptors Assessed

A range of environmental receptors and shorelines were assessed for floating oil exposure, shoreline accumulation and water column exposure as part of the study. Receptors assessed include the Australian Government receptors, made available through the Protected Matters Search Tool (PMST), in addition to Biologically Important Areas (BIAs), State Waters and the Victorian Marine Pollution Risk Assessment shoreline segments. Some of these receptor groups are depicted in Figure 12-1 to Figure 12-11.

Risks of exposure were separately calculated for each receptor area and have been tabulated. Table 12-1 summarise the receptors that the Northern Release Location and TW1 reside within.

Table 12-1 Summary of the receptors that the release locations reside within.

Receptor Type	Receptor Name	Northern Release Location	TW1
BIA	Antipodean Albatross – Foraging	Yes	Yes
	Black-browed Albatross – Foraging	Yes	Yes
	Buller's Albatross – Foraging	Yes	Yes
	Campbell Albatross – Foraging	Yes	Yes

13 RESULTS – LOSS OF WELL CONTROL AT THE NORTHERN RELEASE LOCATION

This scenario examined a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 100 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

13.1 Stochastic Analysis

13.1.1 Area of Exposure

Figure 13-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

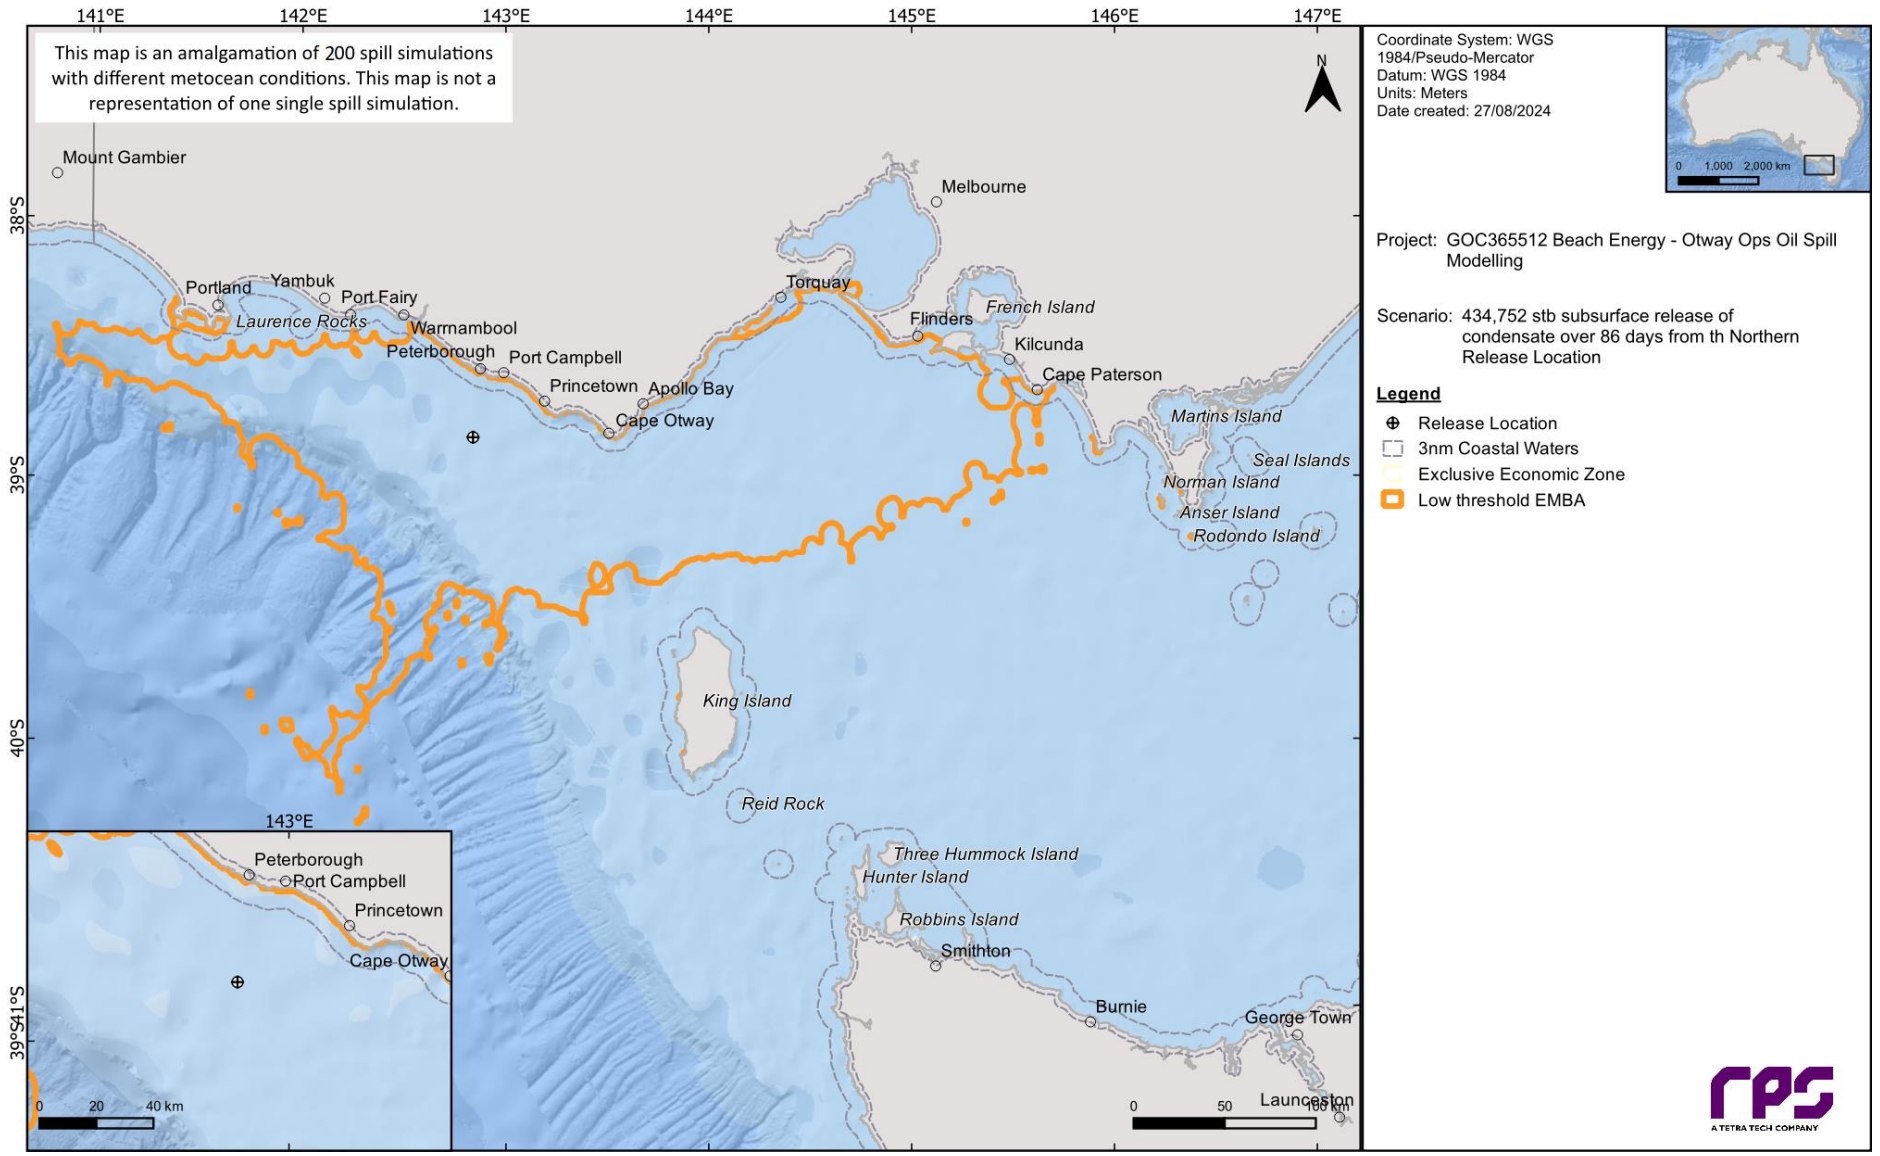

Figure 13-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location during summer and winter conditions.

13.1.2 Floating Oil Exposure

Table 13-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones were 54.03 km (east) and 5.83 km (east-southeast), both during winter conditions. No contact was predicted for the high threshold (> 50 g/m^2).

Table 13-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), floating oil exposure above the low threshold was predicted at the Short-tailed Shearwater - Foraging (Buffer around Tasmania including Bass Strait), being 6% and 9% during summer and winter respectively.

Table 13-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 13-2 and Figure 13-3 present the zones of potential floating oil exposure for all thresholds under summer and winter conditions, respectively.

Figure 13-4 to Figure 13-7 present the minimum time before floating oil exposure for the NOPSEMA thresholds during summer and winter.

Table 13-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	31.4	3.93	-
	Direction	East	West	-
Winter	Maximum distance (km) from release location	54.03	5.83	-
	Direction	East	East-Southeast	-

Table 13-2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Receptor		Summer (November through to March)						Winter (April to October)					
		Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)			Probability of floating oil exposure (%)			Minimum time before floating oil exposure (days)

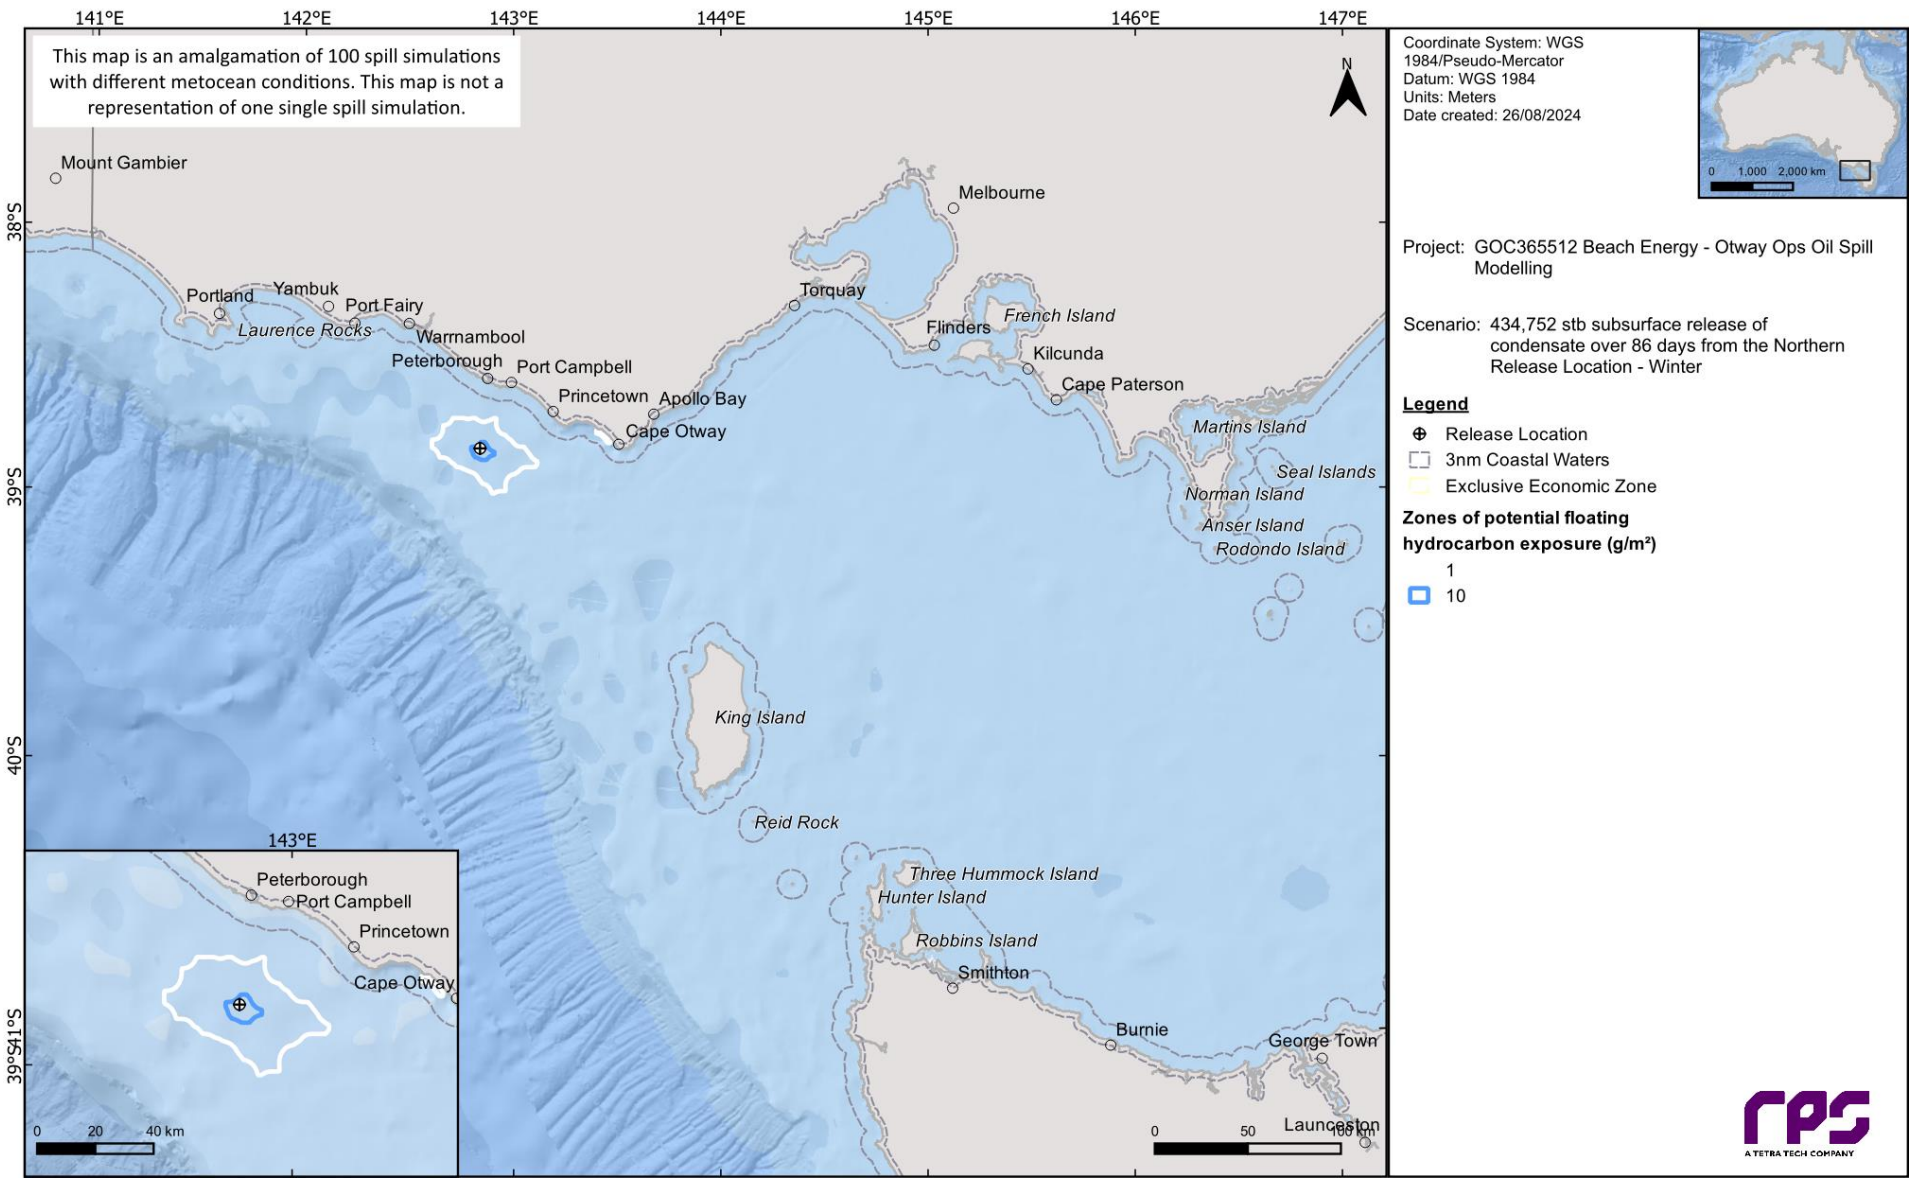

Figure 13-3 Zones of potential floating oil exposure in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

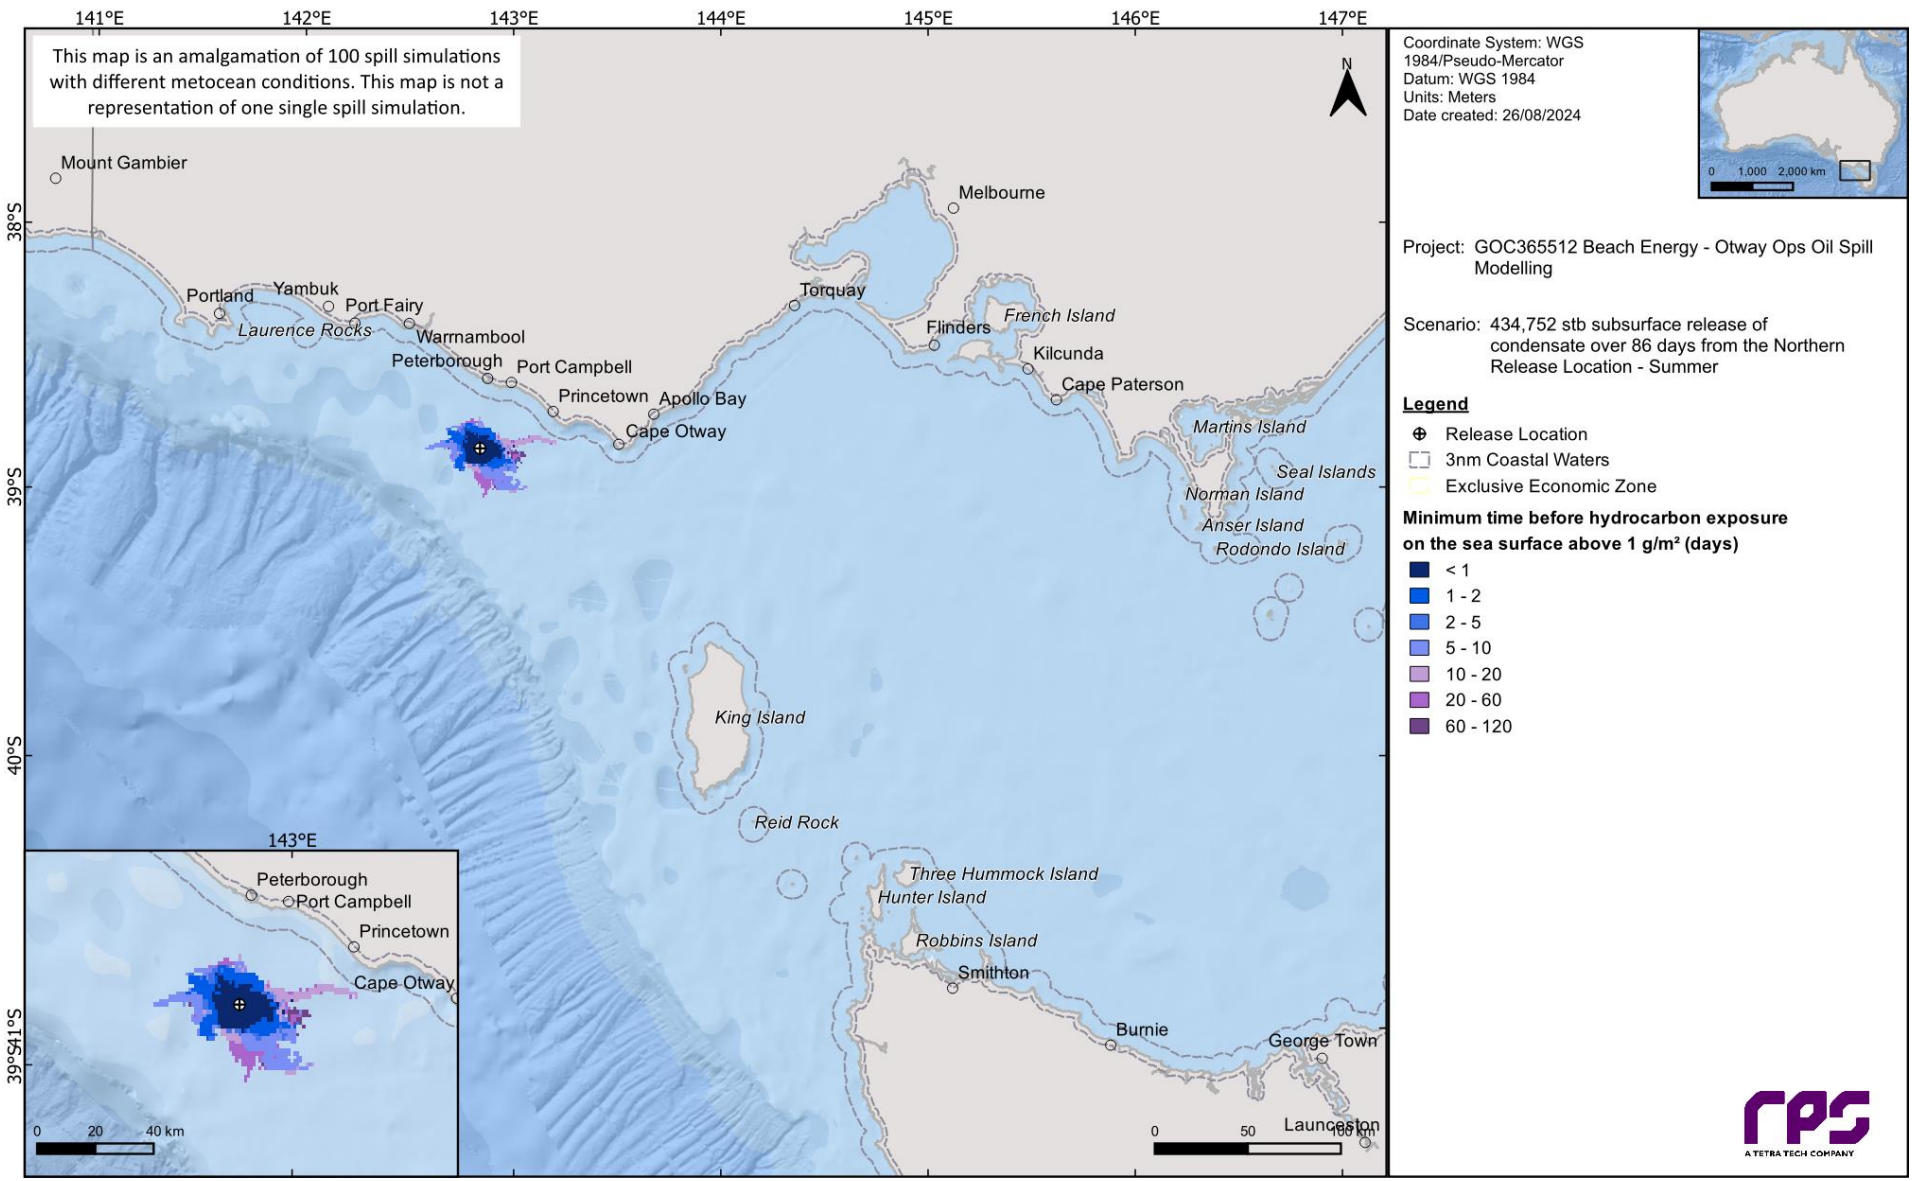

Figure 13-4 Minimum time before floating oil exposure above 1 g/m², in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

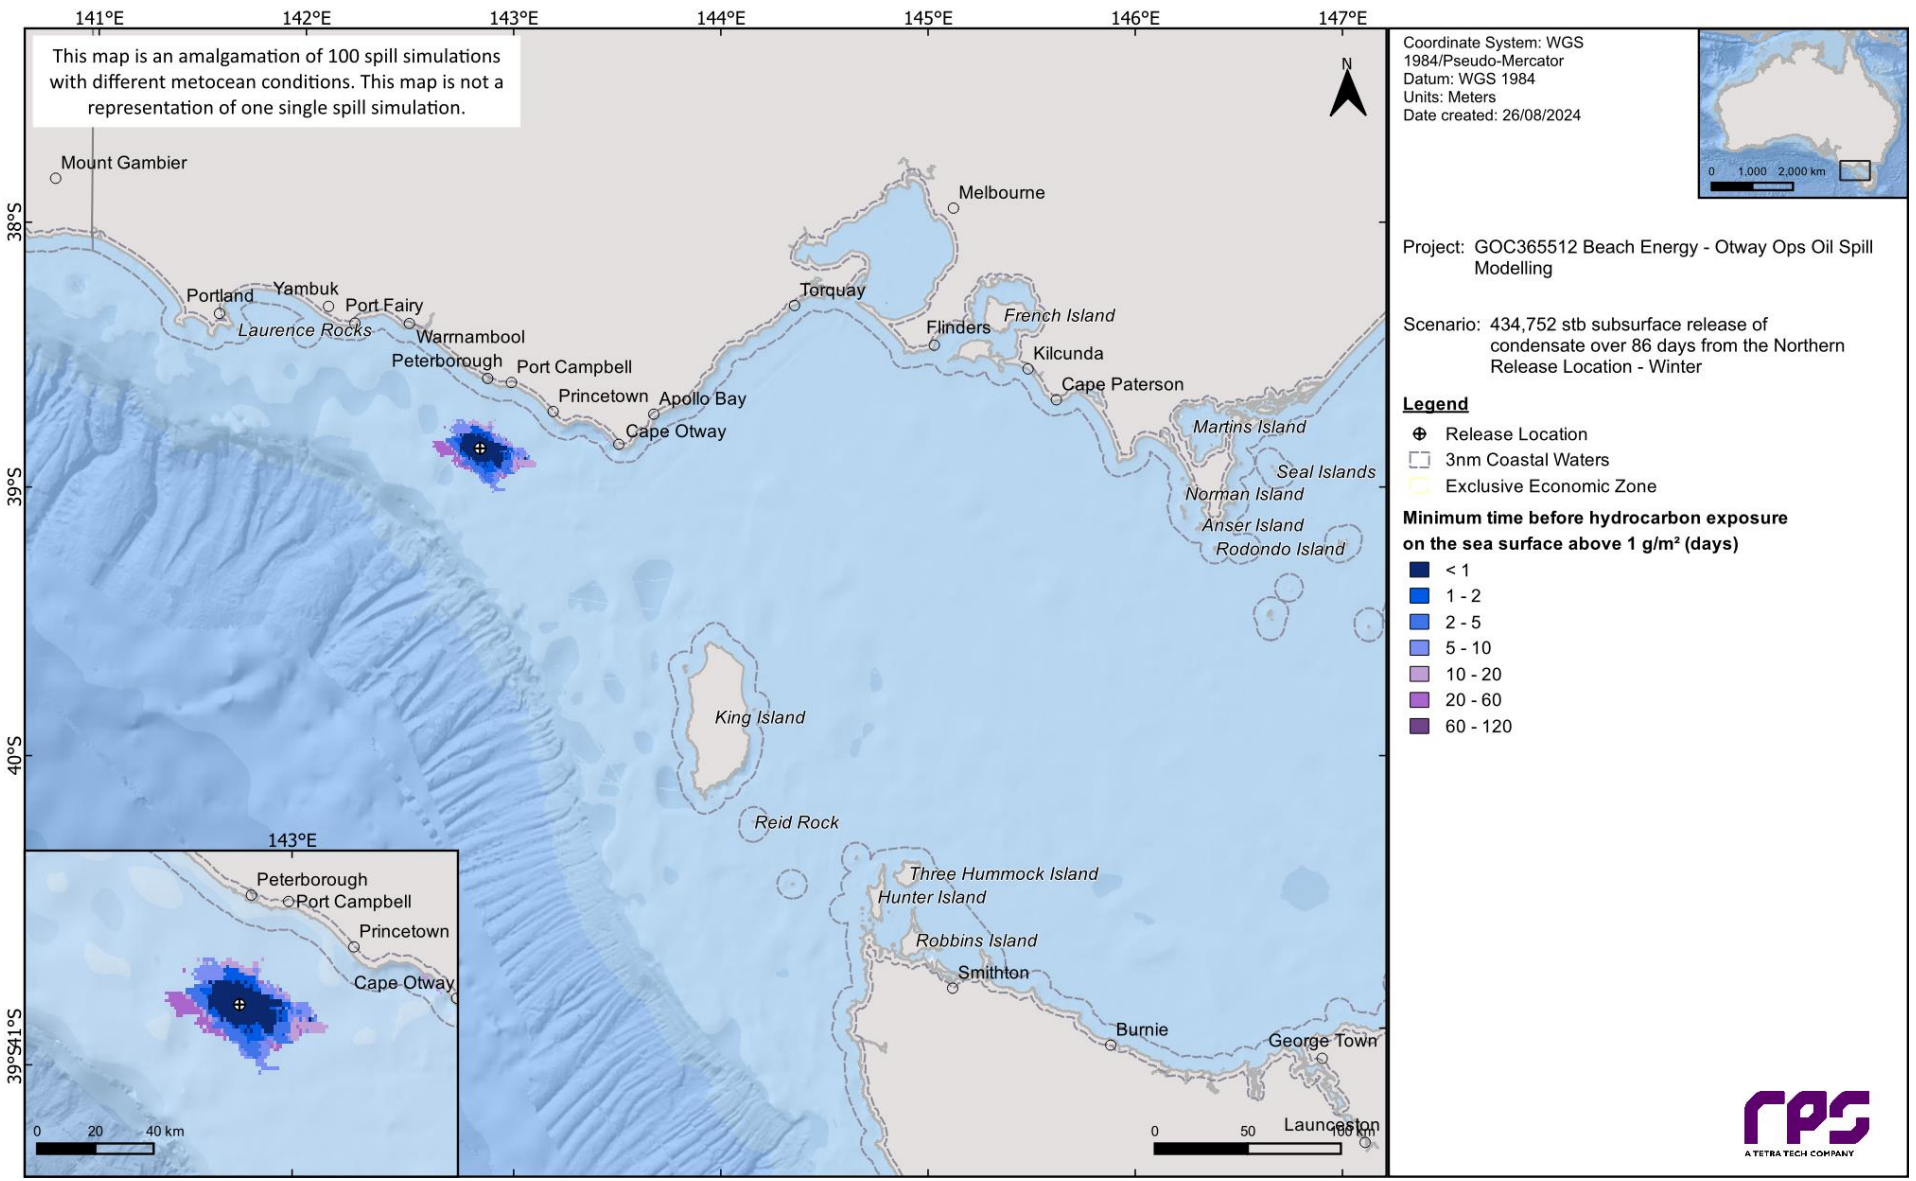

Figure 13-5 Minimum time before floating oil exposure above 1 g/m^2, in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

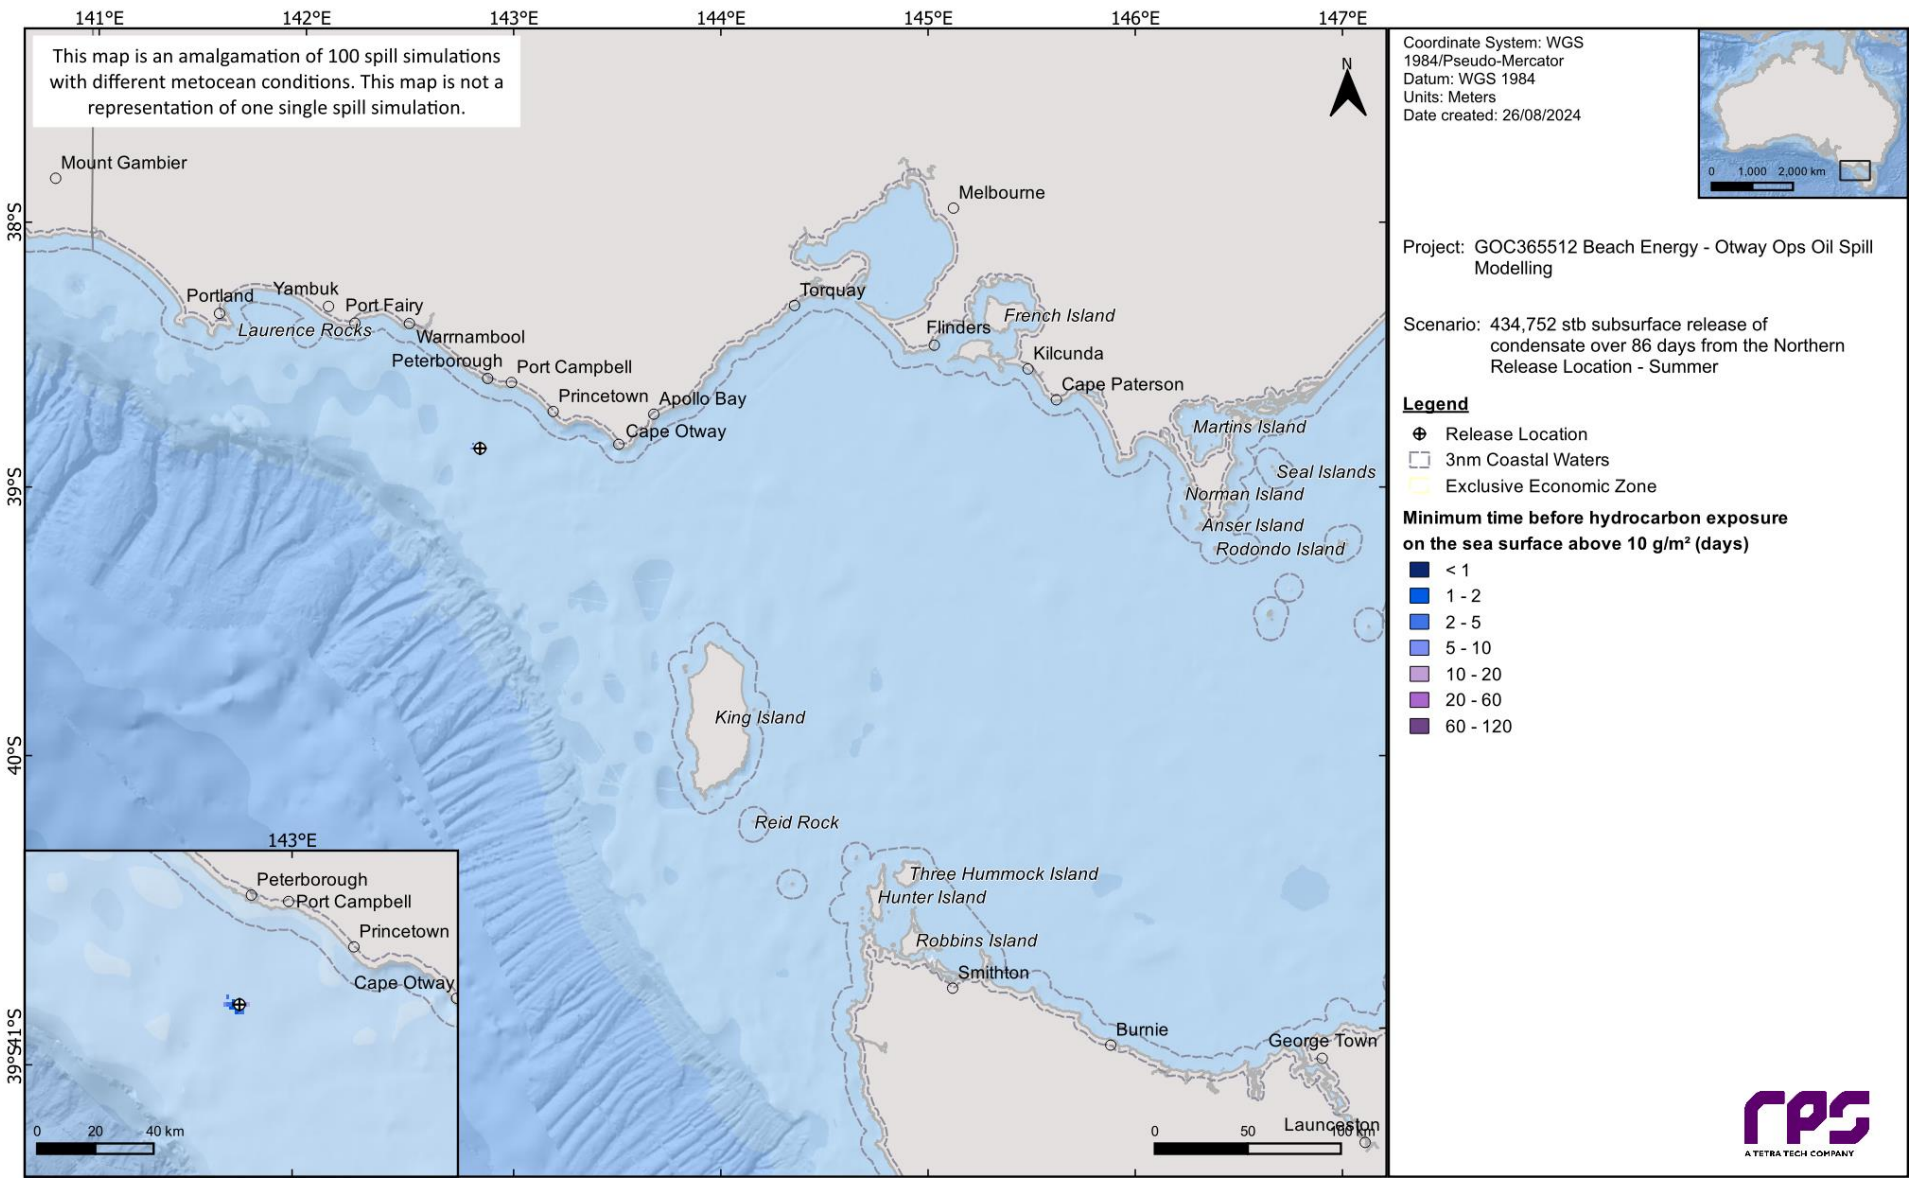

Figure 13-6 Minimum time before floating oil exposure above 10 g/m², in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

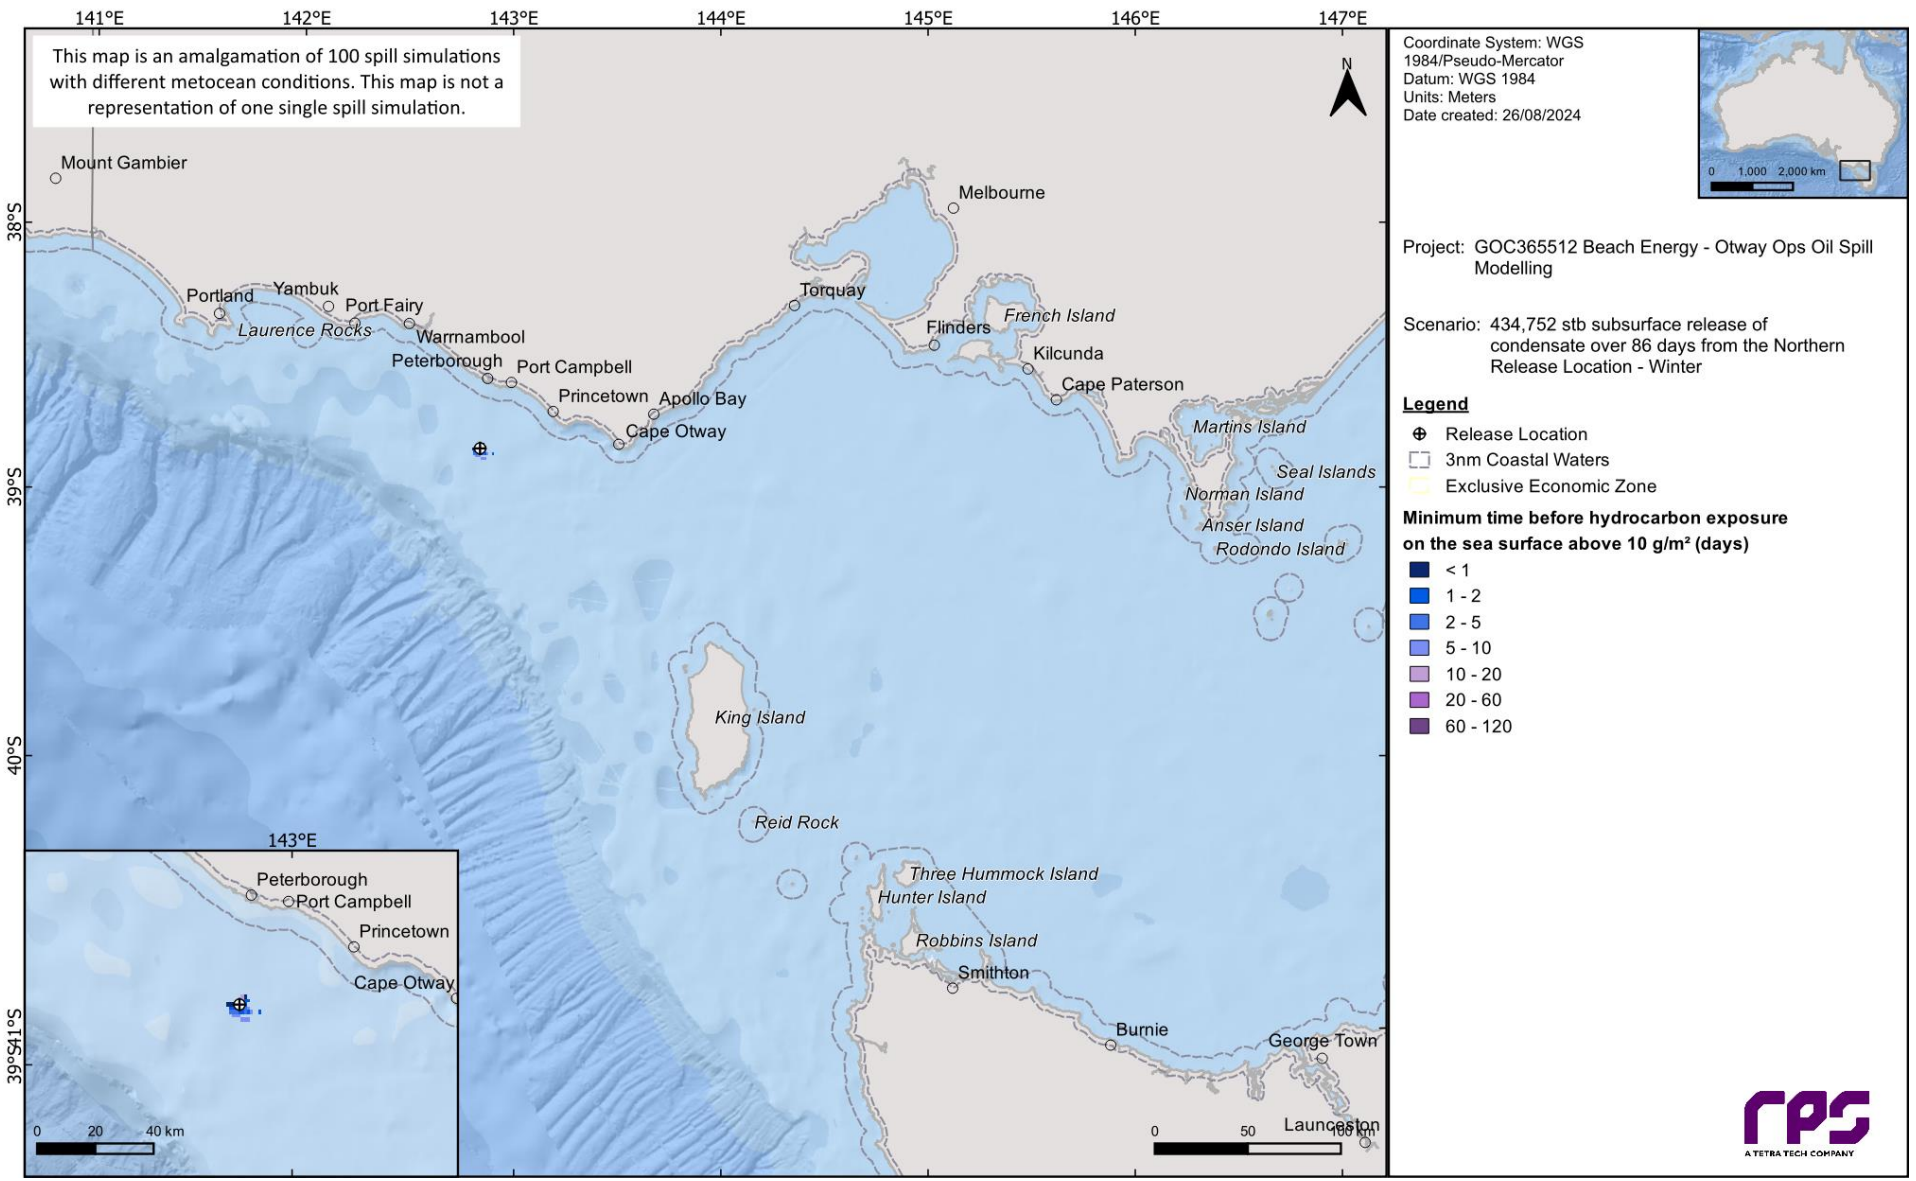

Figure 13-7 Minimum time before floating oil exposure above 10 g/m², in the event of 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

13.1.3 Shoreline Accumulation

Table 13-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 99% during summer conditions and 96% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 5.7 days during summer conditions, and 3.7 days during winter conditions. The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 67.91 m^3 and 87.54 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 104.17 km and 114.39 km, respectively. For the moderate threshold (100 g/m^2), the maximum length of shoreline accumulation predicted was 15.24 km (summer) and 22.86 km (winter). No shoreline accumulation was predicted for the high (1,000 g/m^2) threshold.

Table 13-5 summarises the shoreline accumulation on individual receptors during the summer and winter conditions. Cape Otway West shoreline recorded the highest probability of shoreline accumulation at the low threshold, being 96% and 92% for summer and winter respectively. The minimum time before shoreline accumulation above the low threshold was forecast for the same receptor (5.7 and 3.7 days during summer and winter respectively).

The summer and winter conditions maximum potential shoreline loading above the low and moderate shoreline thresholds are presented in Figure 13-8 and Figure 13-9, respectively.

Table 13-4 Summary of oil accumulation across all shorelines. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	99	96
Absolute minimum time for visible oil to shore (days)	5.7	3.7
Maximum total volume of hydrocarbons ashore (m^3)	67.91	87.54
Average volume of hydrocarbons ashore (m^3)	21.24	28.61
Maximum length of the shoreline at **10 g/m^2** (km)	104.17	114.39
Average shoreline length (km) at **10 g/m^2** (km)	30.98	37.36
Maximum length of the shoreline at **100 g/m^2** (km)	15.24	22.86
Average shoreline length (km) at **100 g/m^2** (km)	1.82	3.74
Maximum length of the shoreline at **1,000 g/m^2** (km)	-	-
Average shoreline length (km) at **1,000 g/m^2** (km)	-	-

Table 13-5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

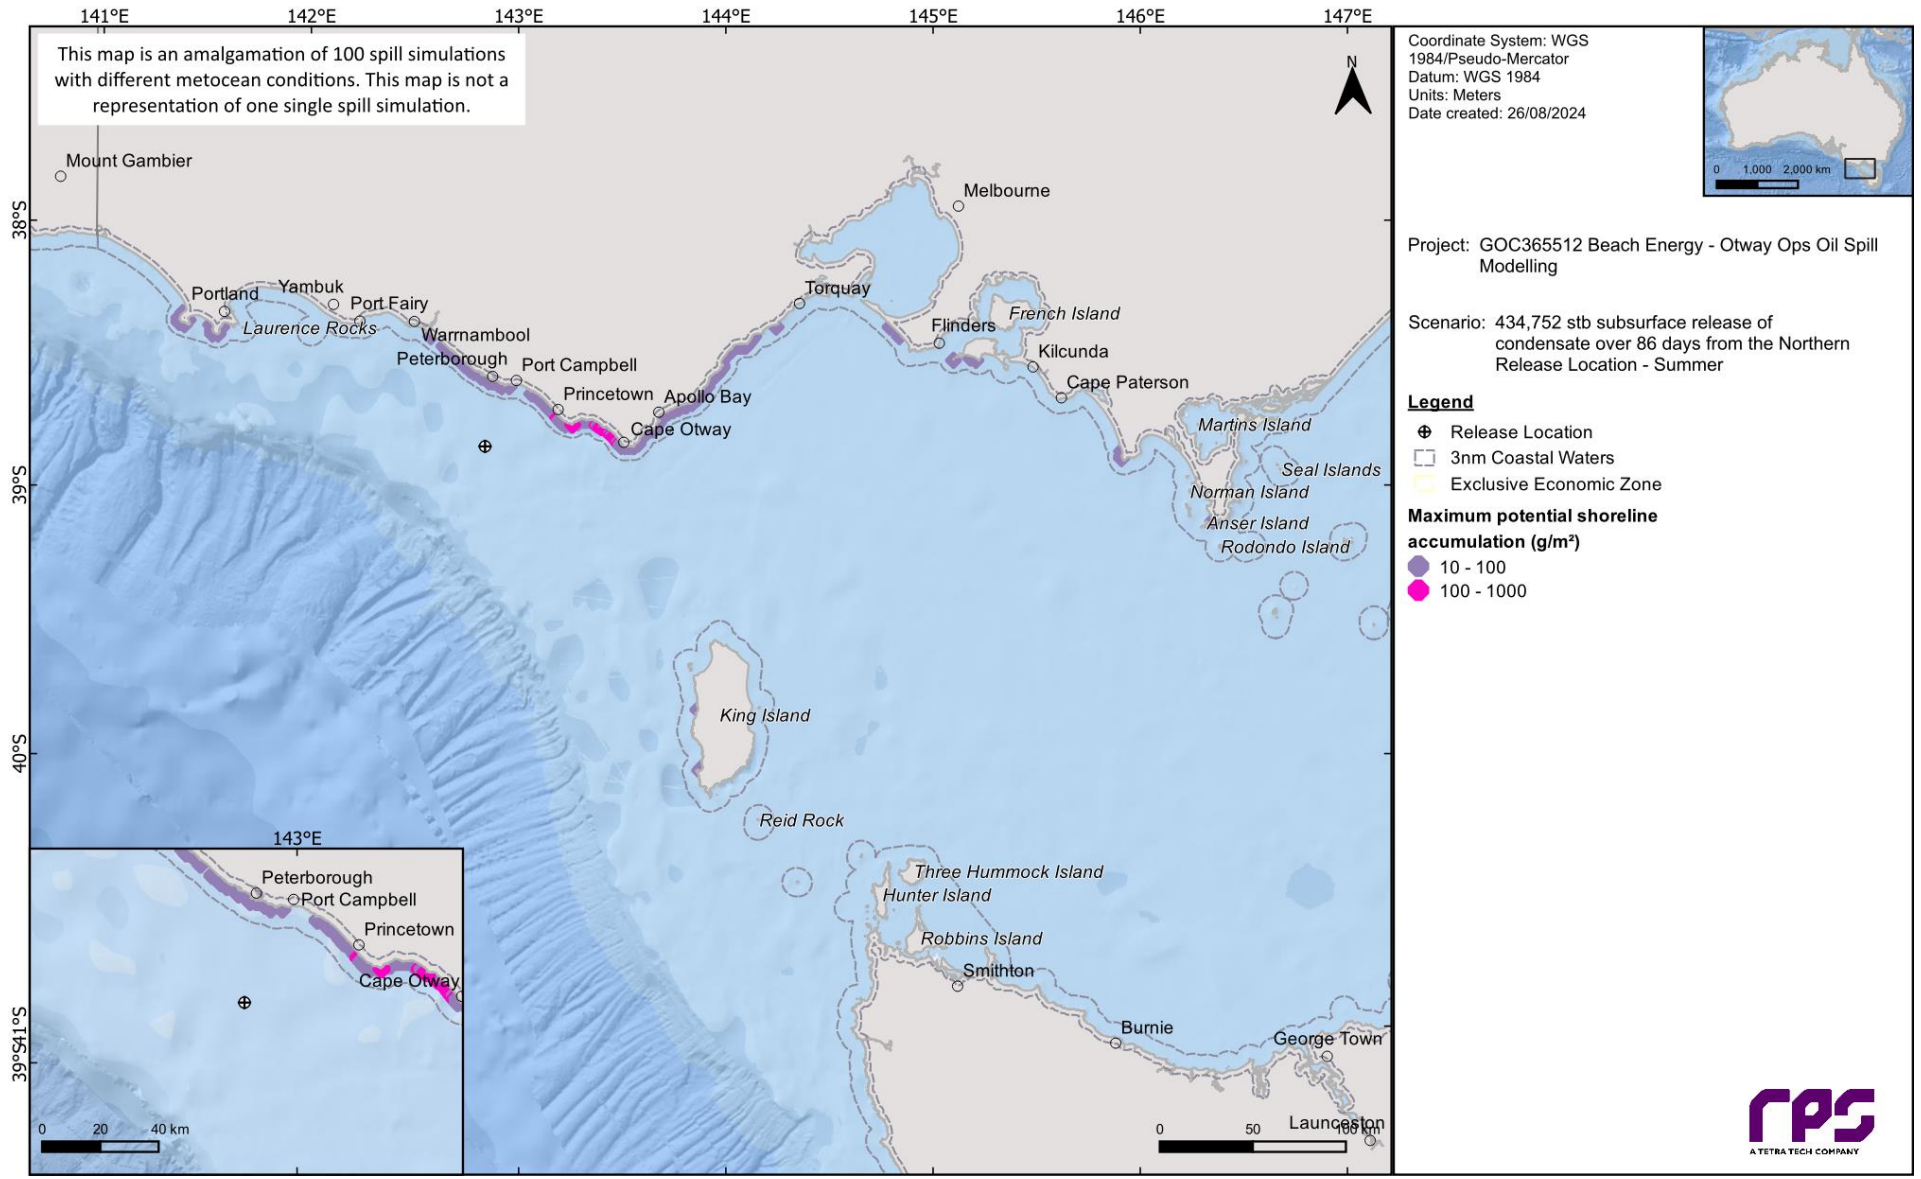

Figure 13-8 Maximum potential shoreline loading in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

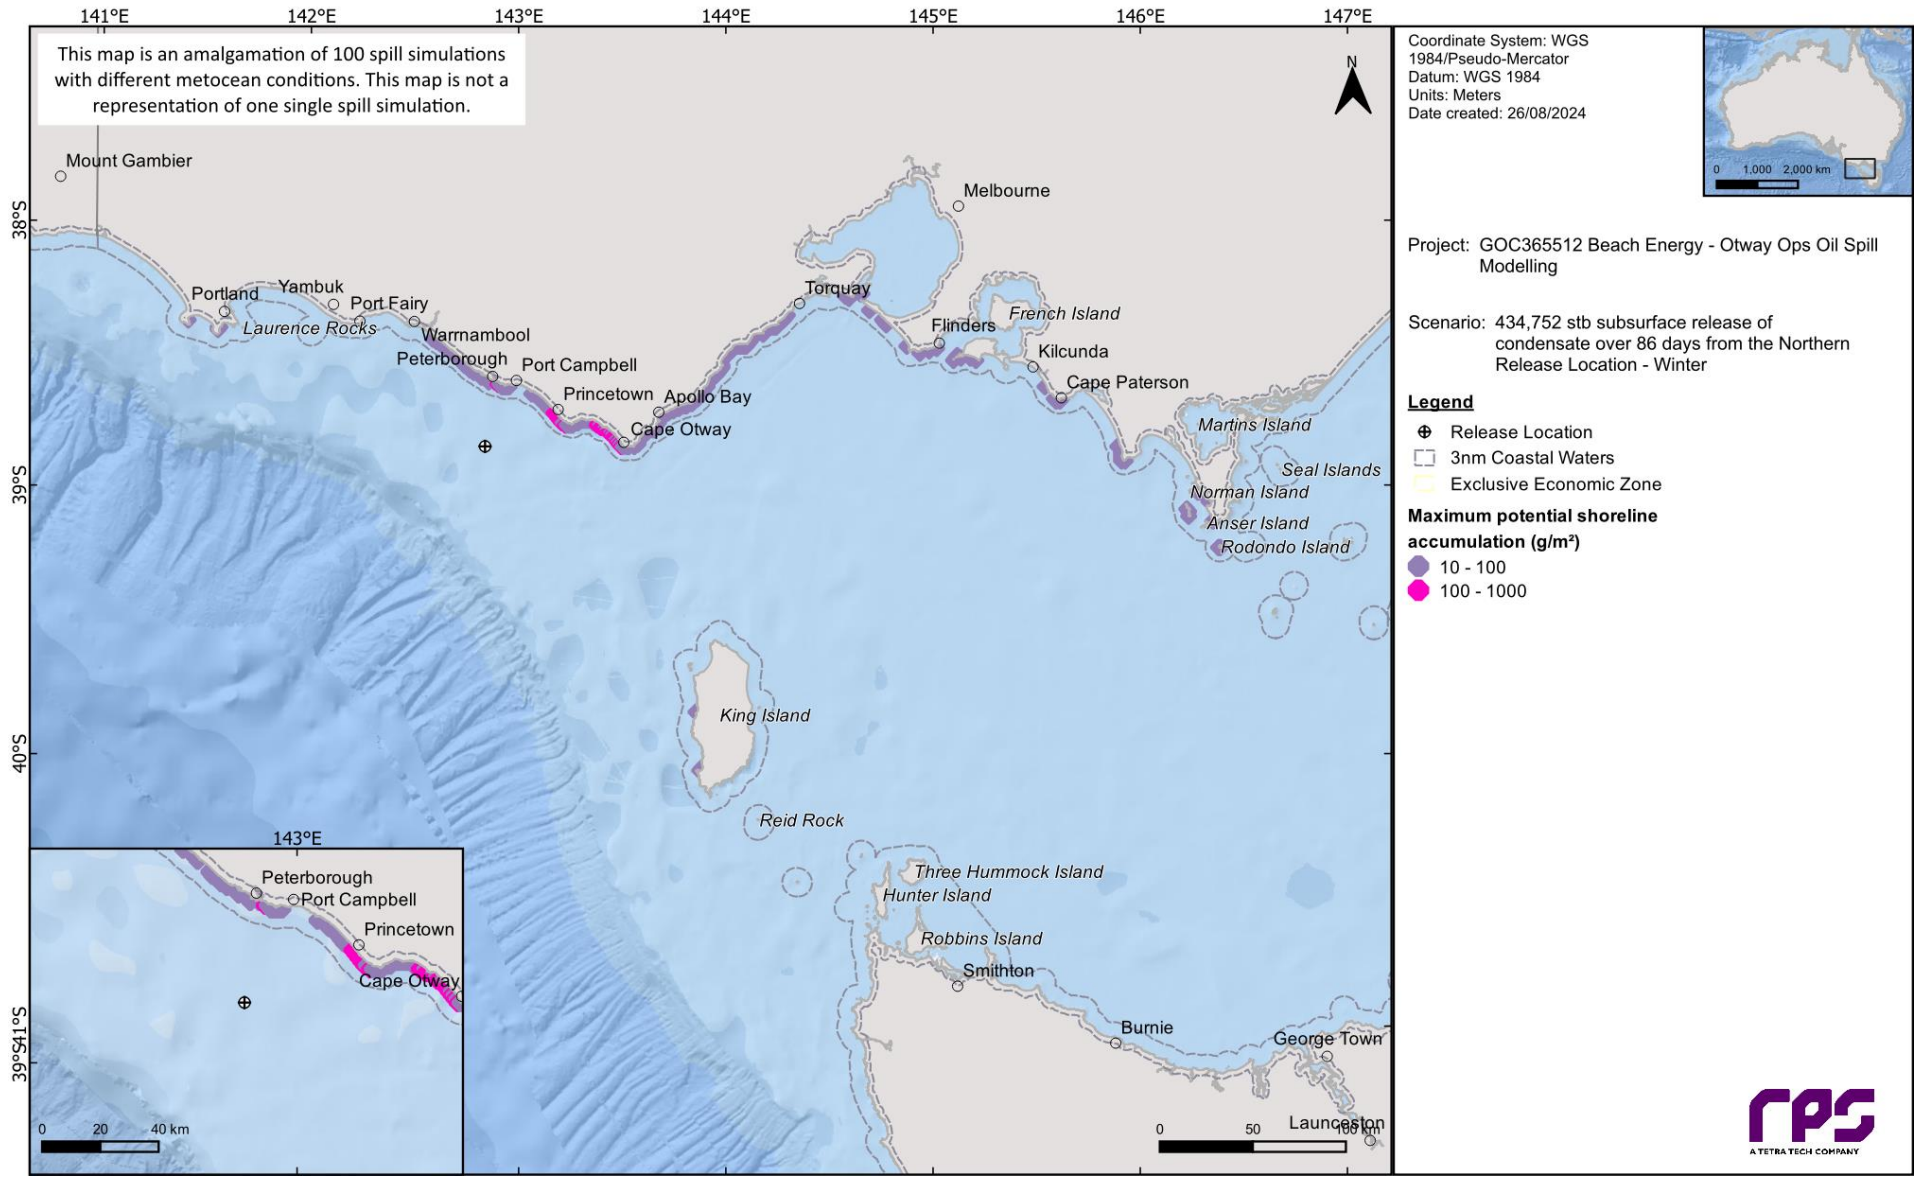

Figure 13-9 Maximum potential shoreline loading in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

13.1.4 In-water exposure

13.1.4.1 Dissolved Hydrocarbons

Table 13-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of dissolved hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) BIA and Corangamite (VIC) NRMR (summer – 570.15 ppb, winter – 1,332.51 ppb).

Table 13-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed. The minimum time before dissolved hydrocarbon exposure at the low threshold predicted for receptors which the release location does not reside within was 0.6 day (summer) and 0.47 day (winter) for the Short-tailed Shearwater - Foraging (Buffer around Tasmania including Bass Strait) BIA.

Figure 13-10 and Figure 13-11 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 13-12 to Figure 13-17 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 13-6 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

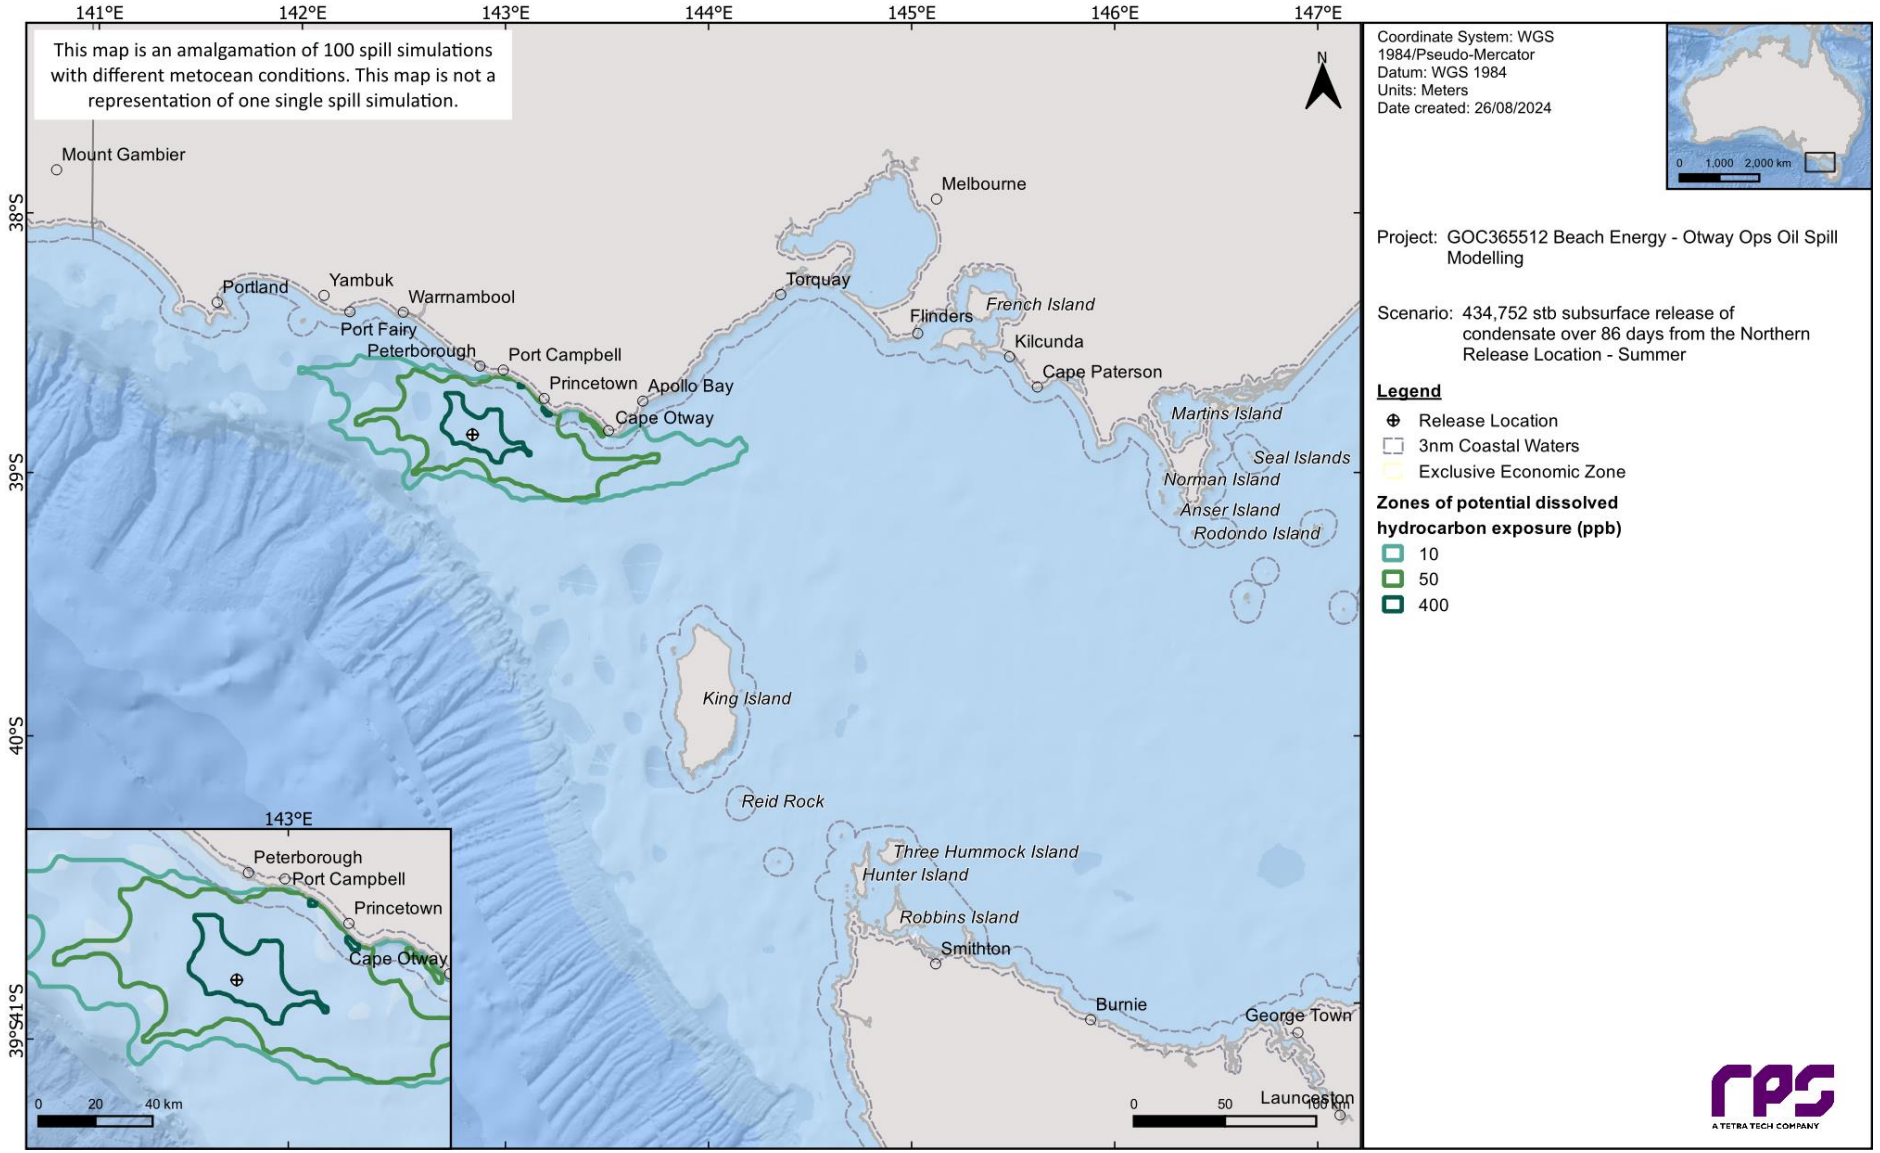

Figure 13-10 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

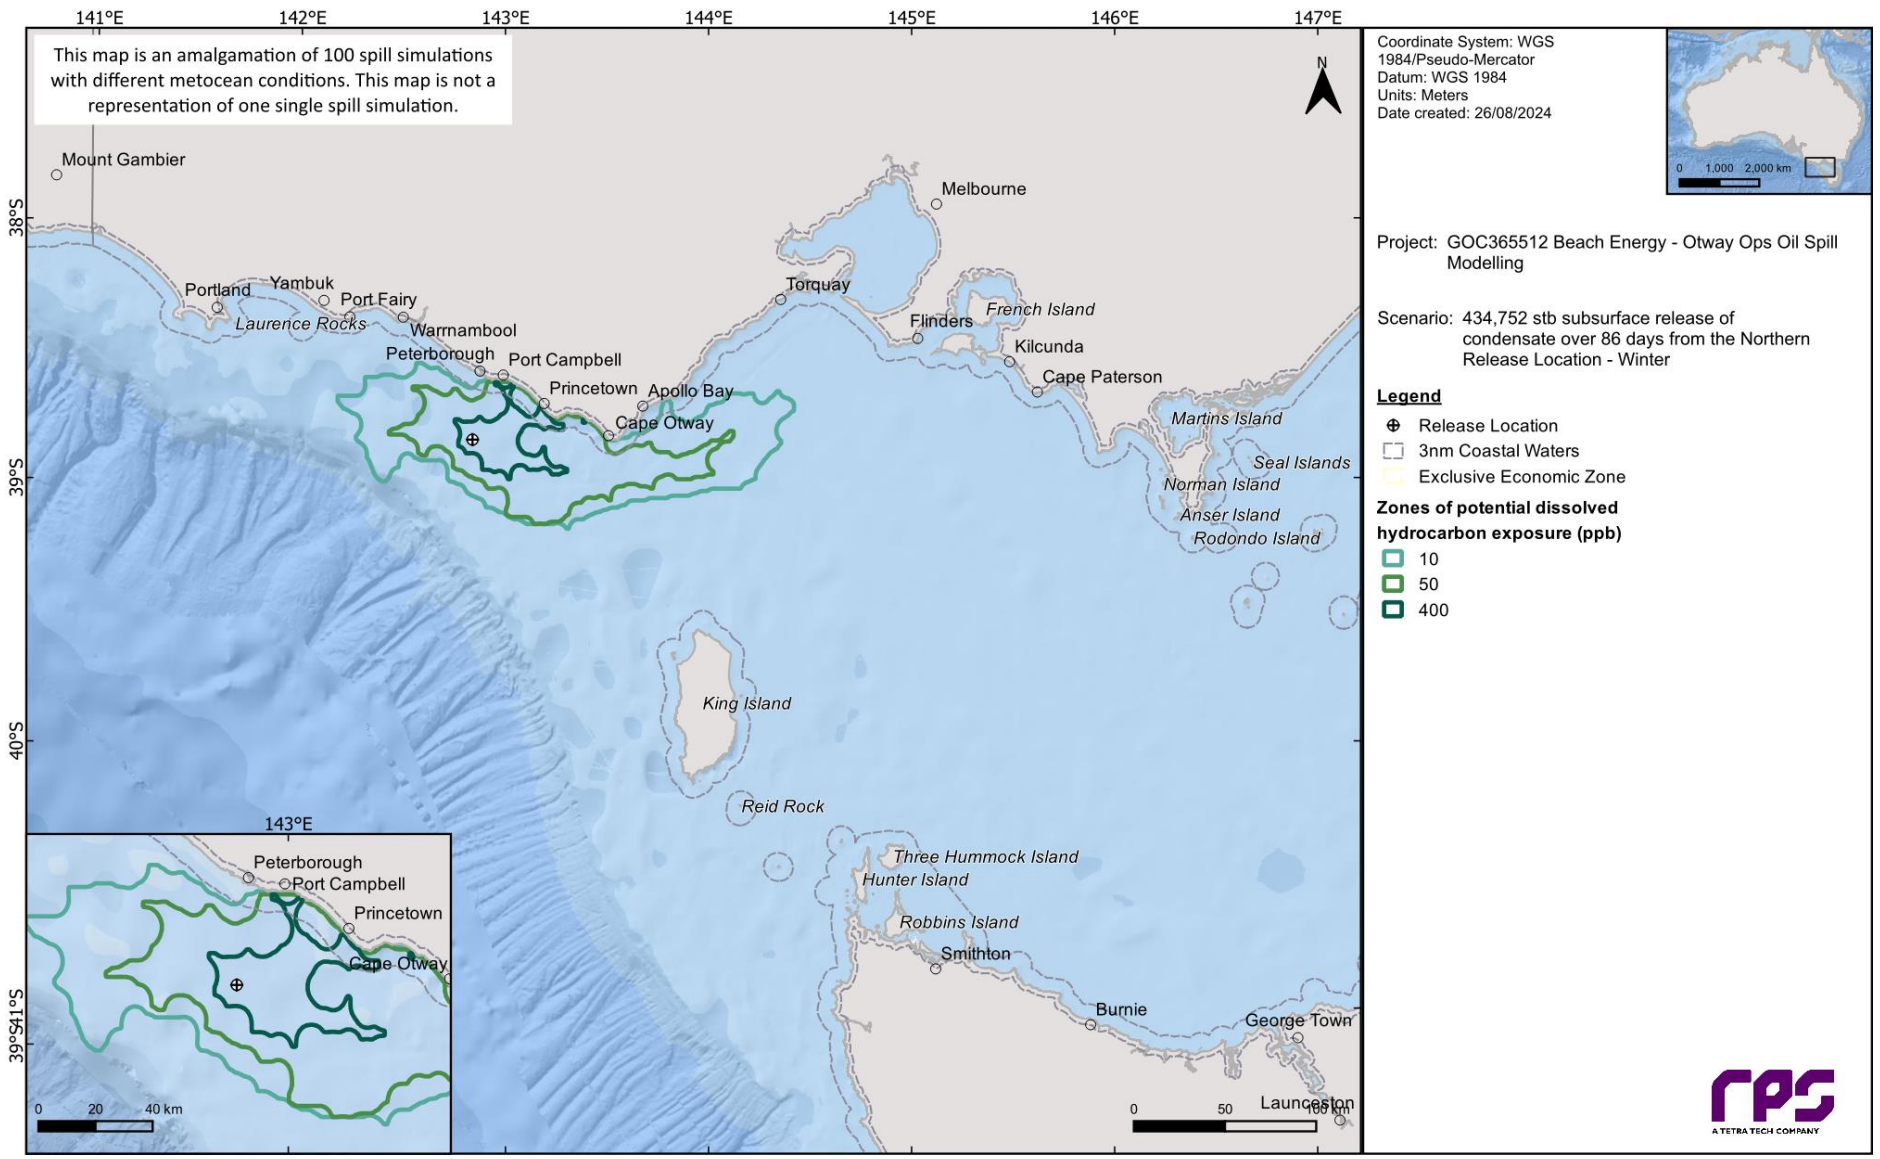

Figure 13-11 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

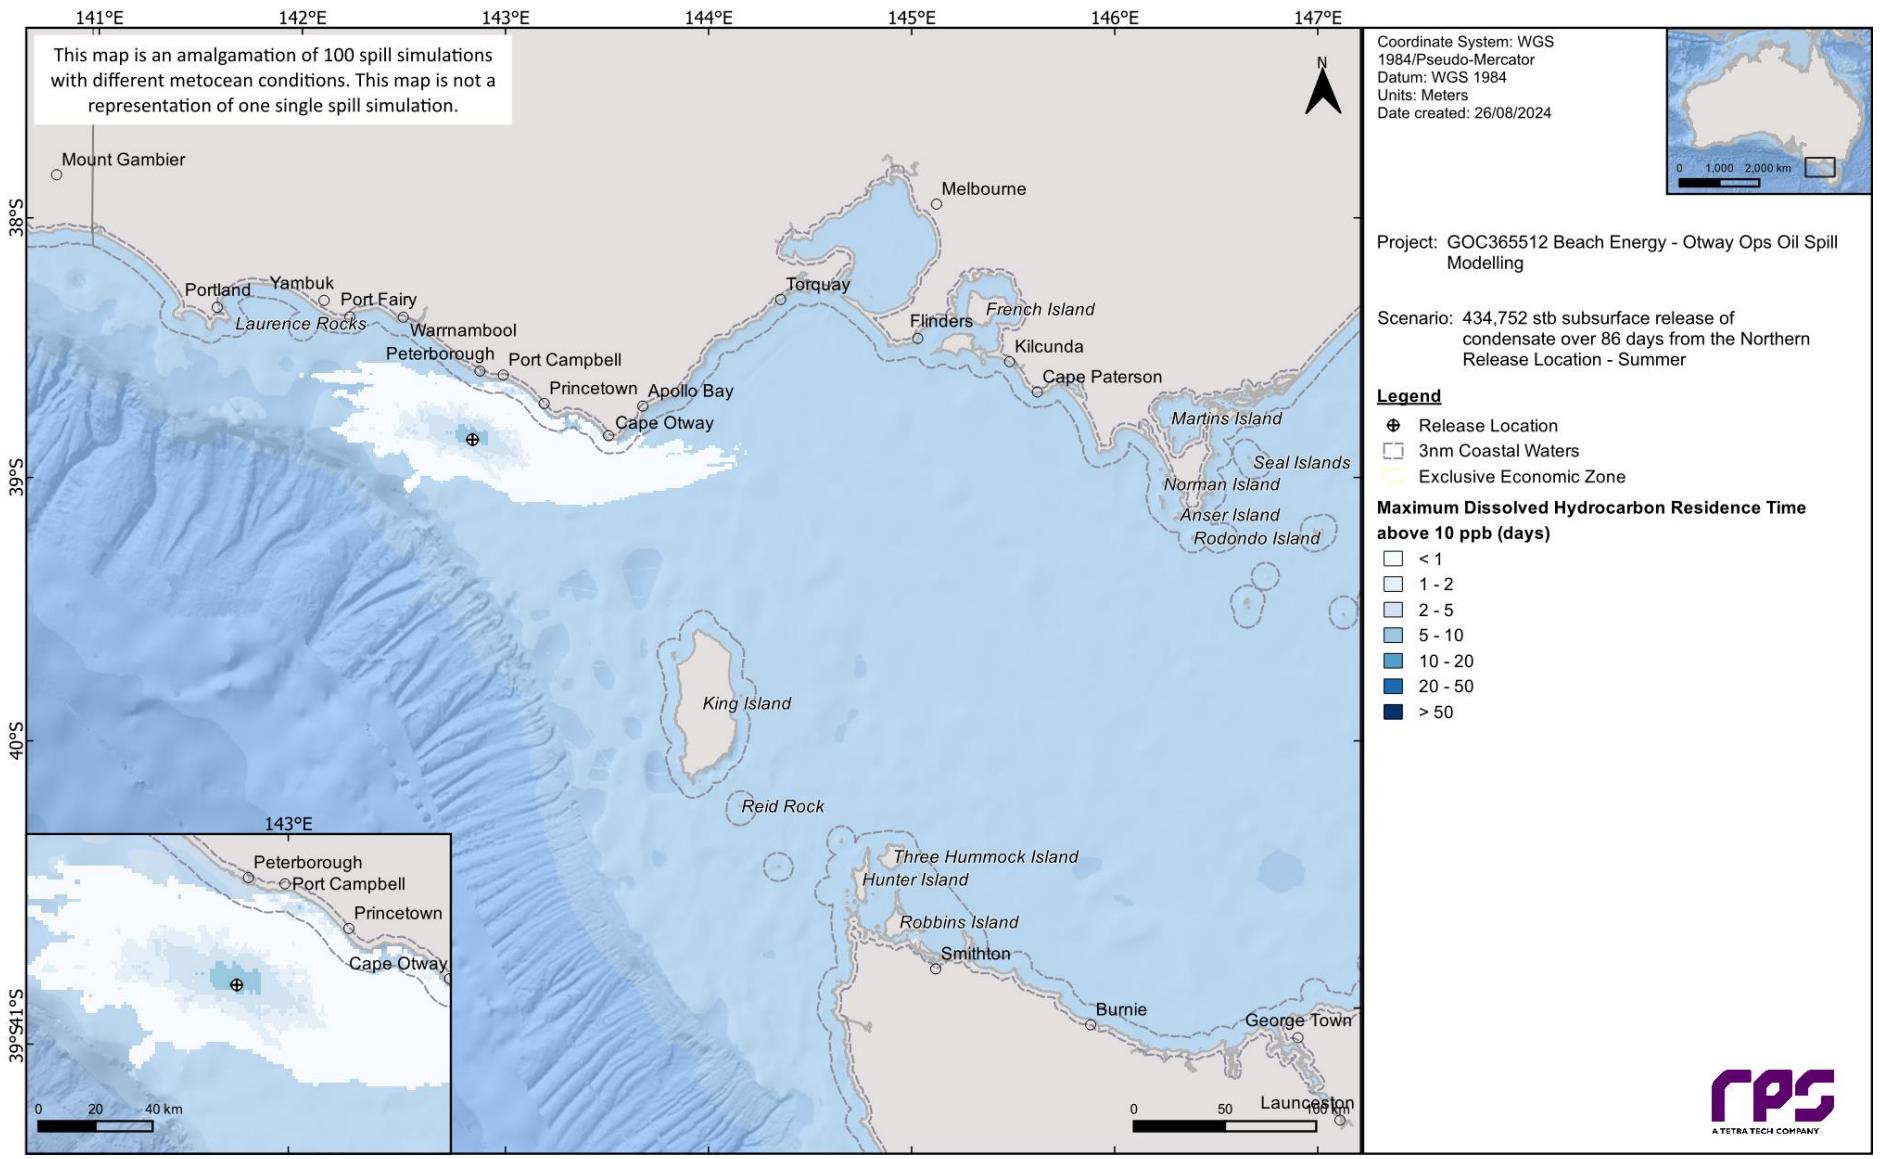

Figure 13-12 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

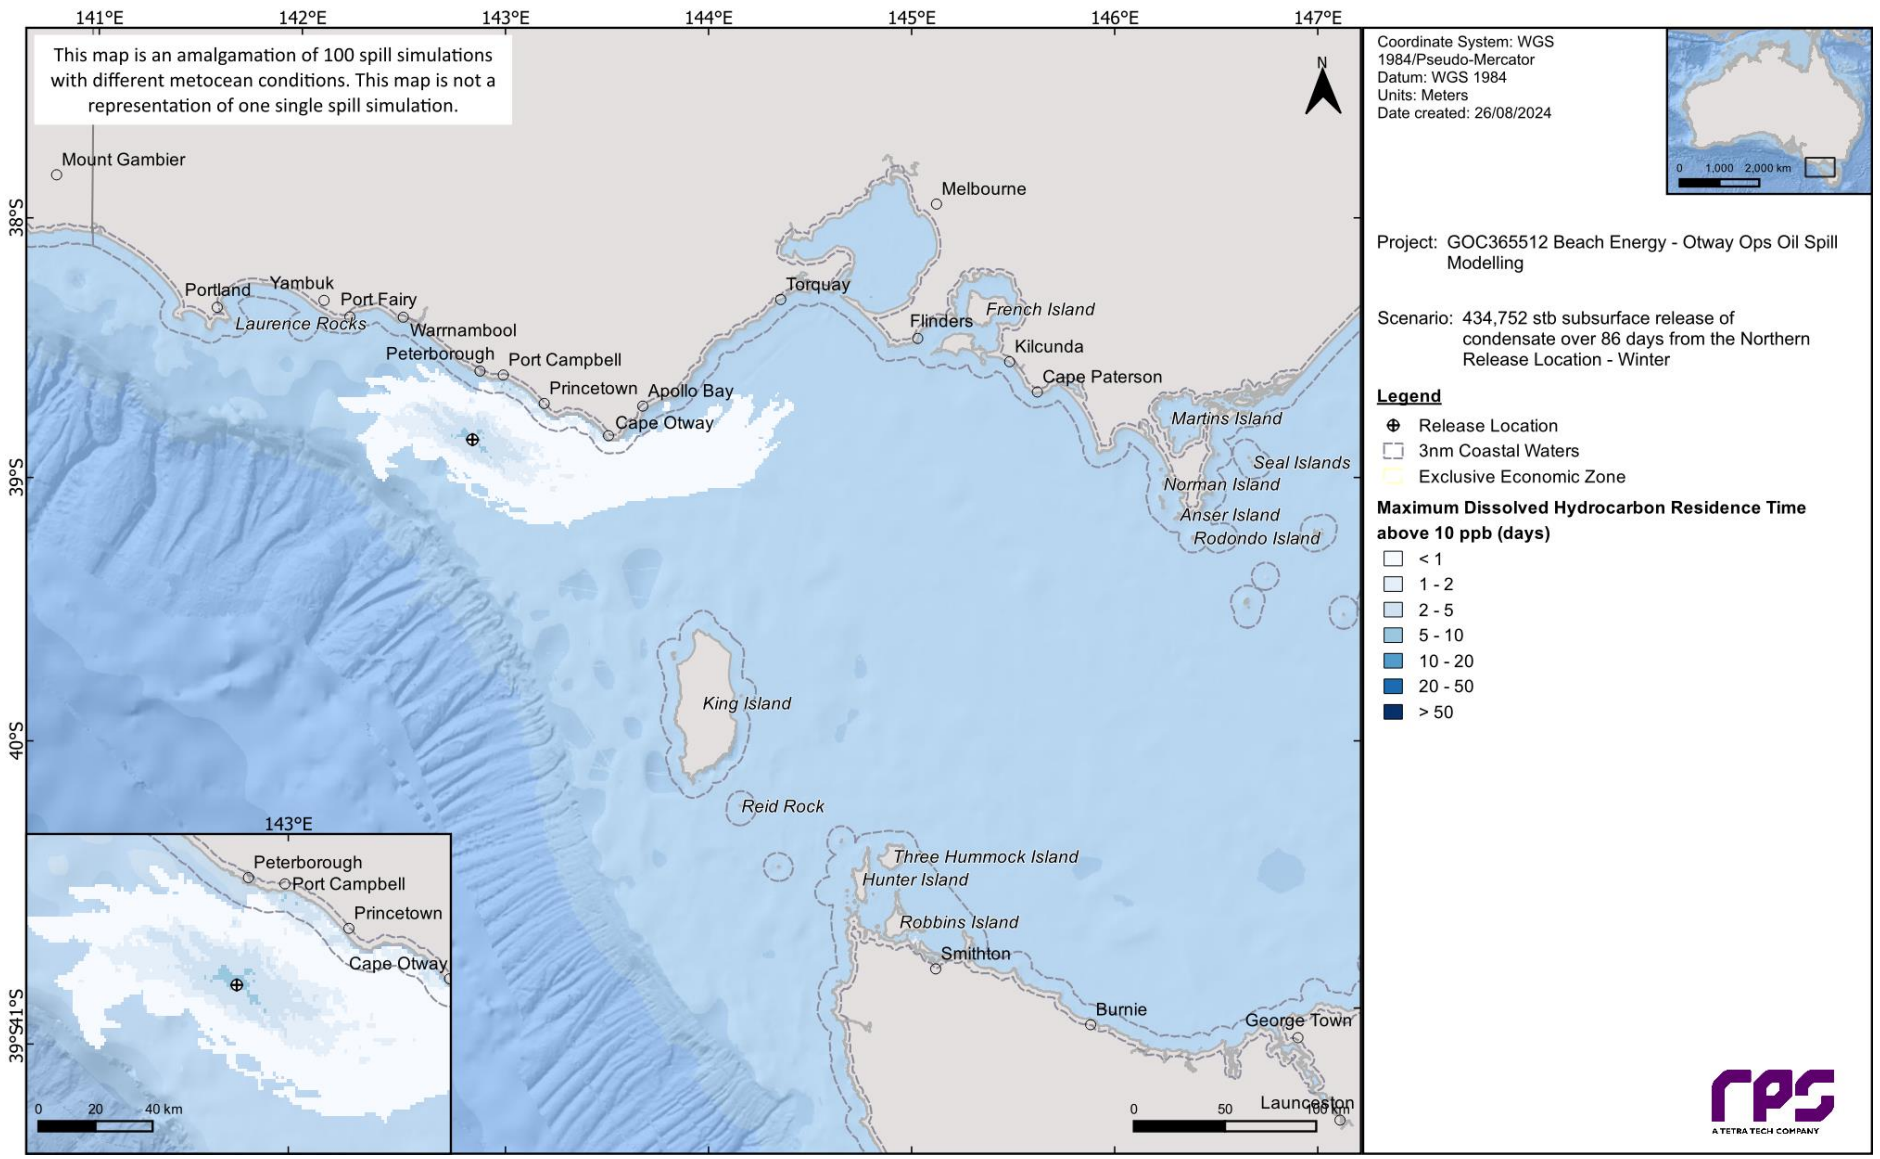

Figure 13-13 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

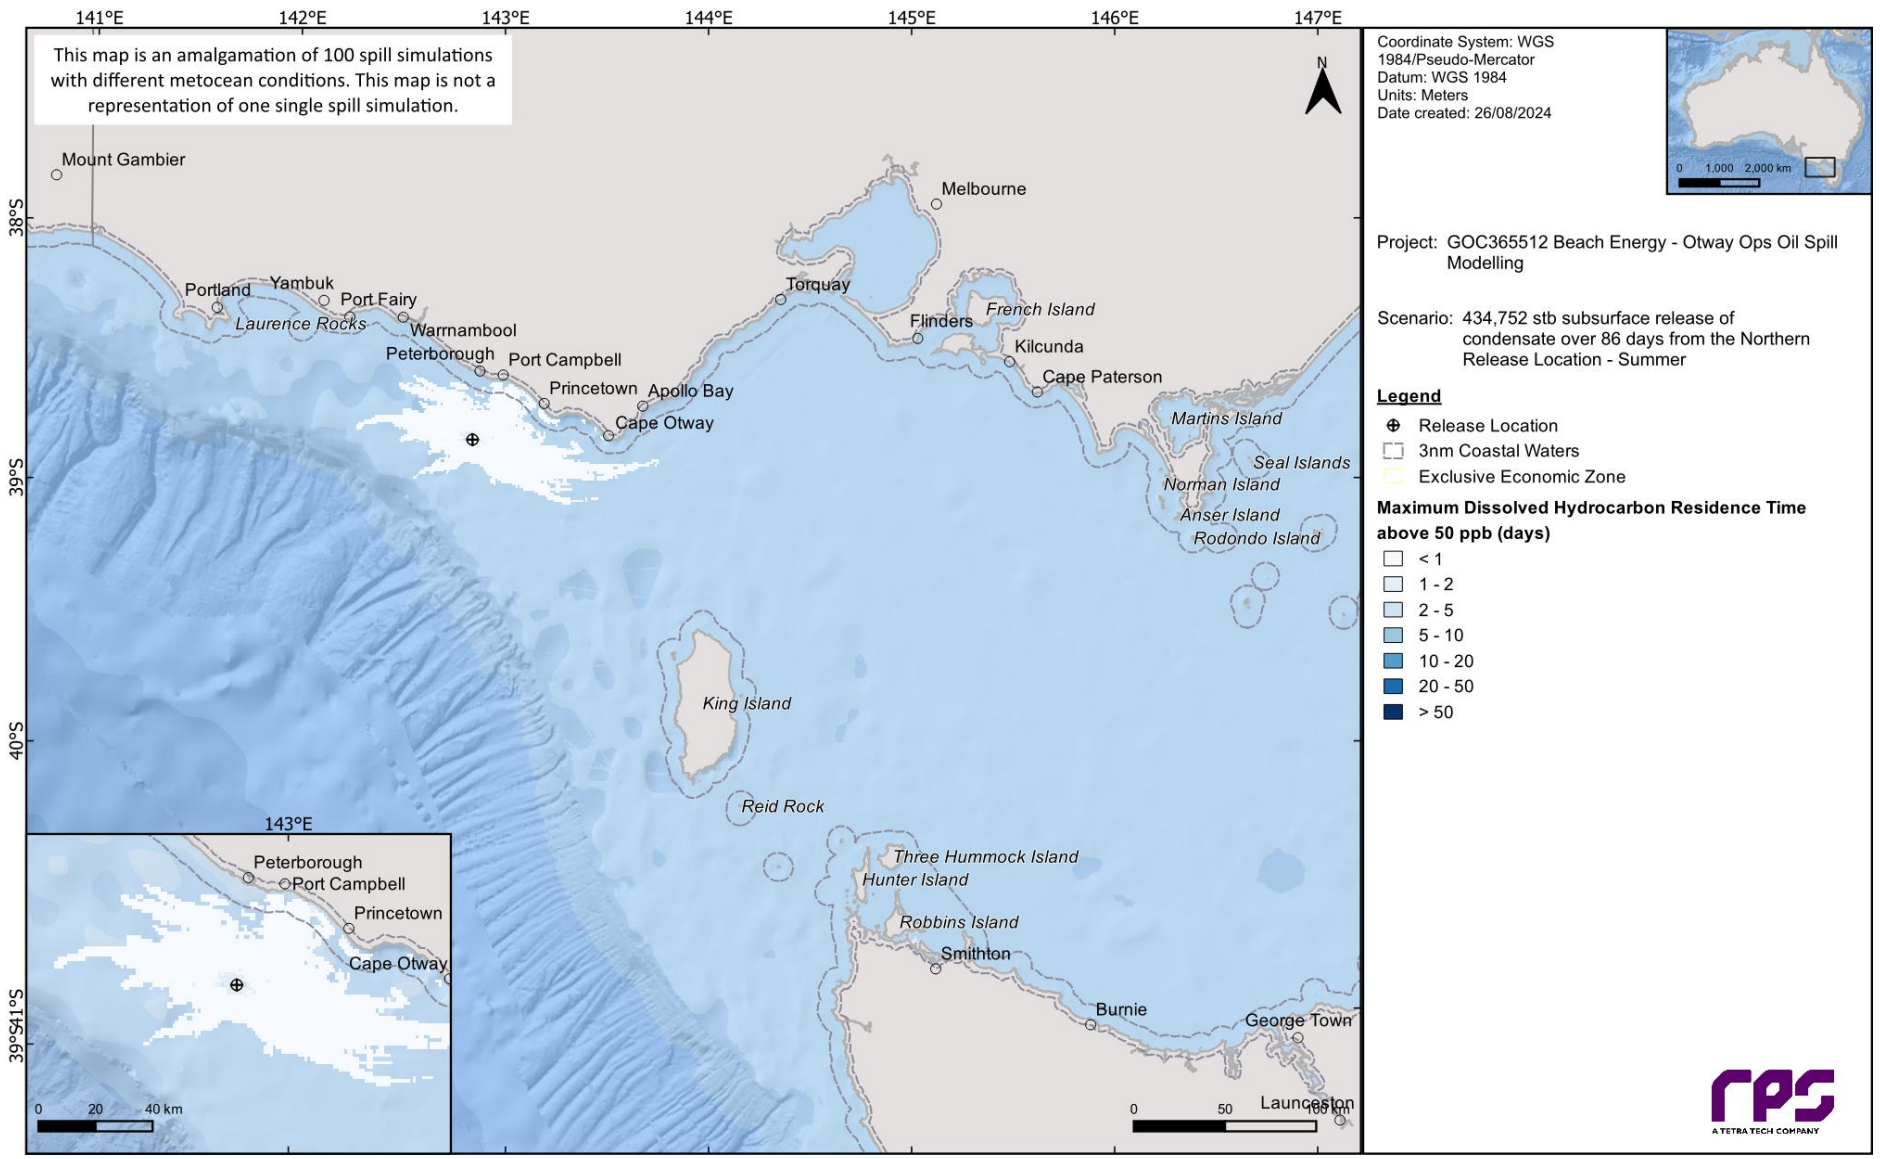

Figure 13-14 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

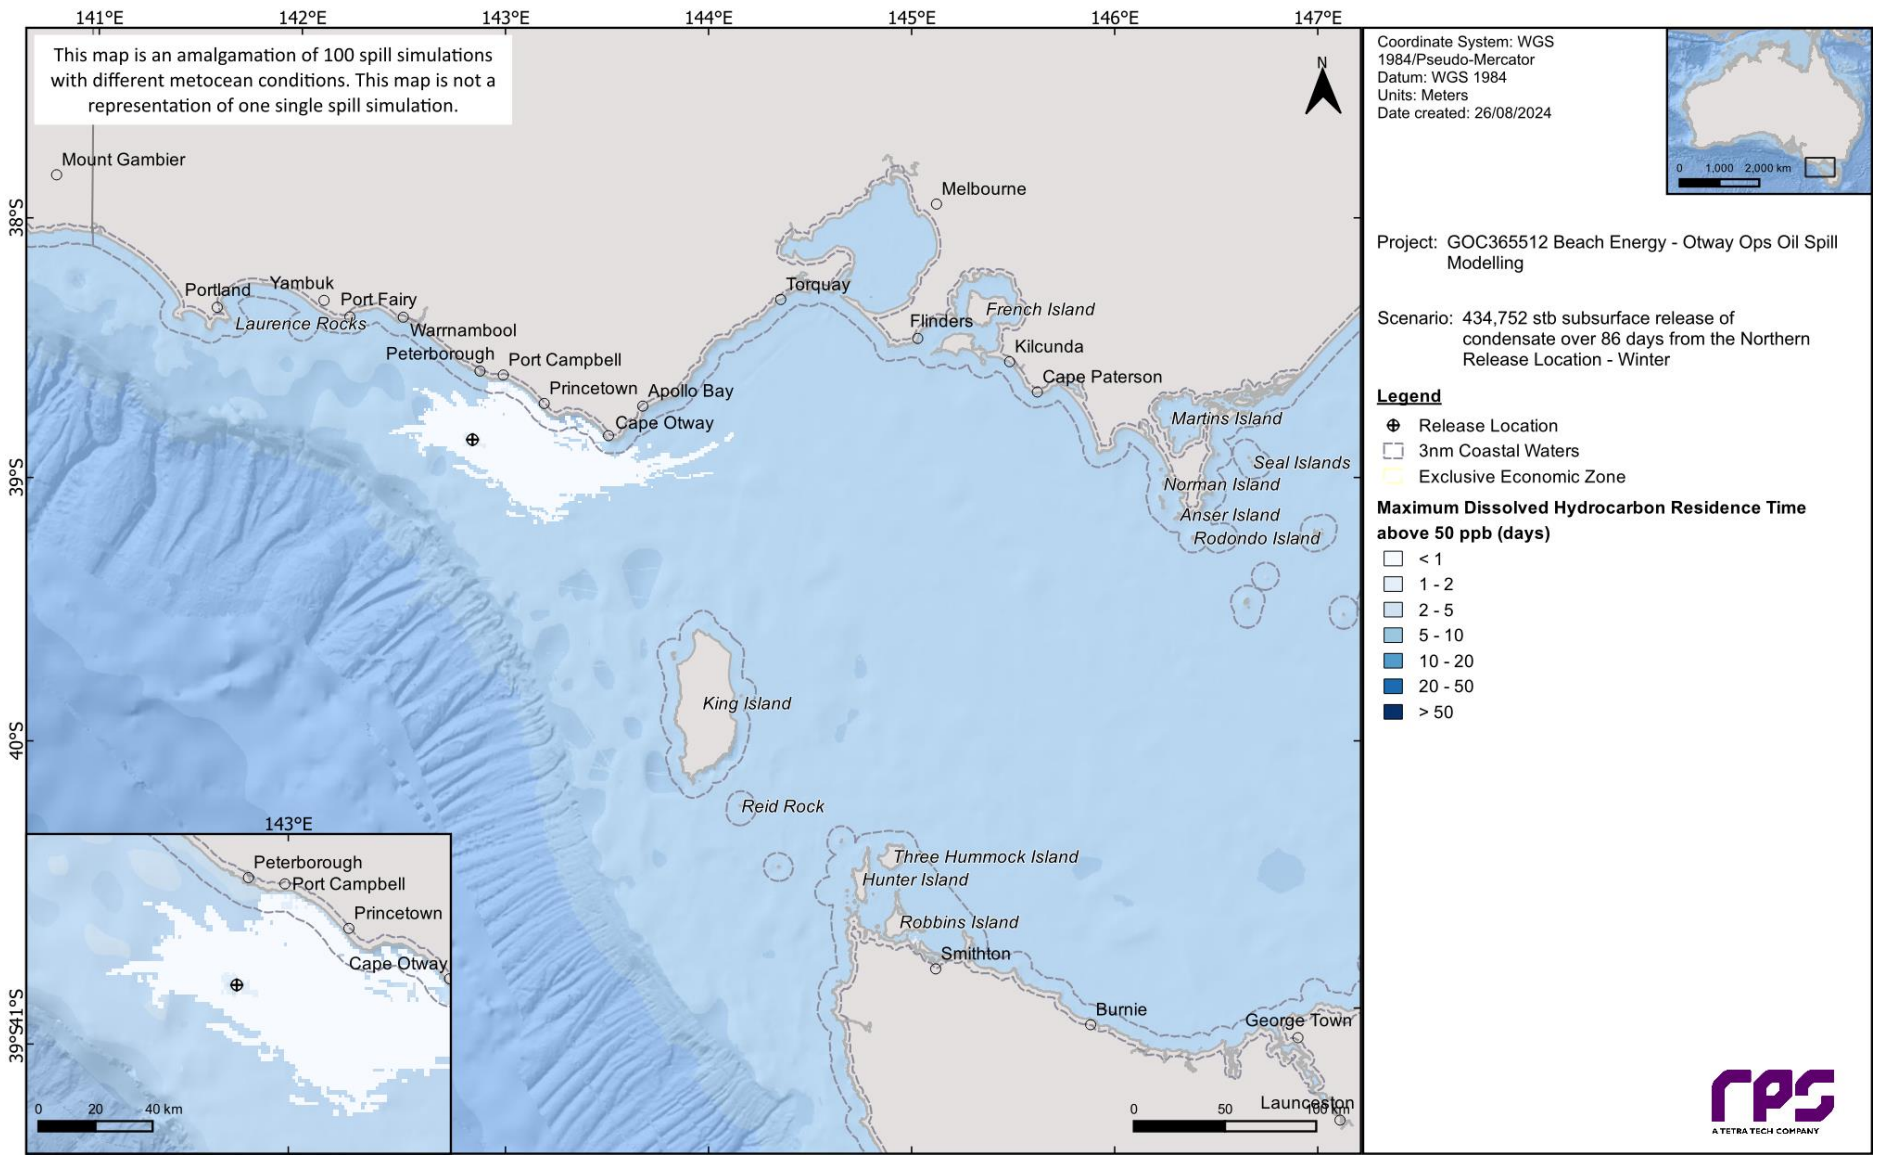

Figure 13-15 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

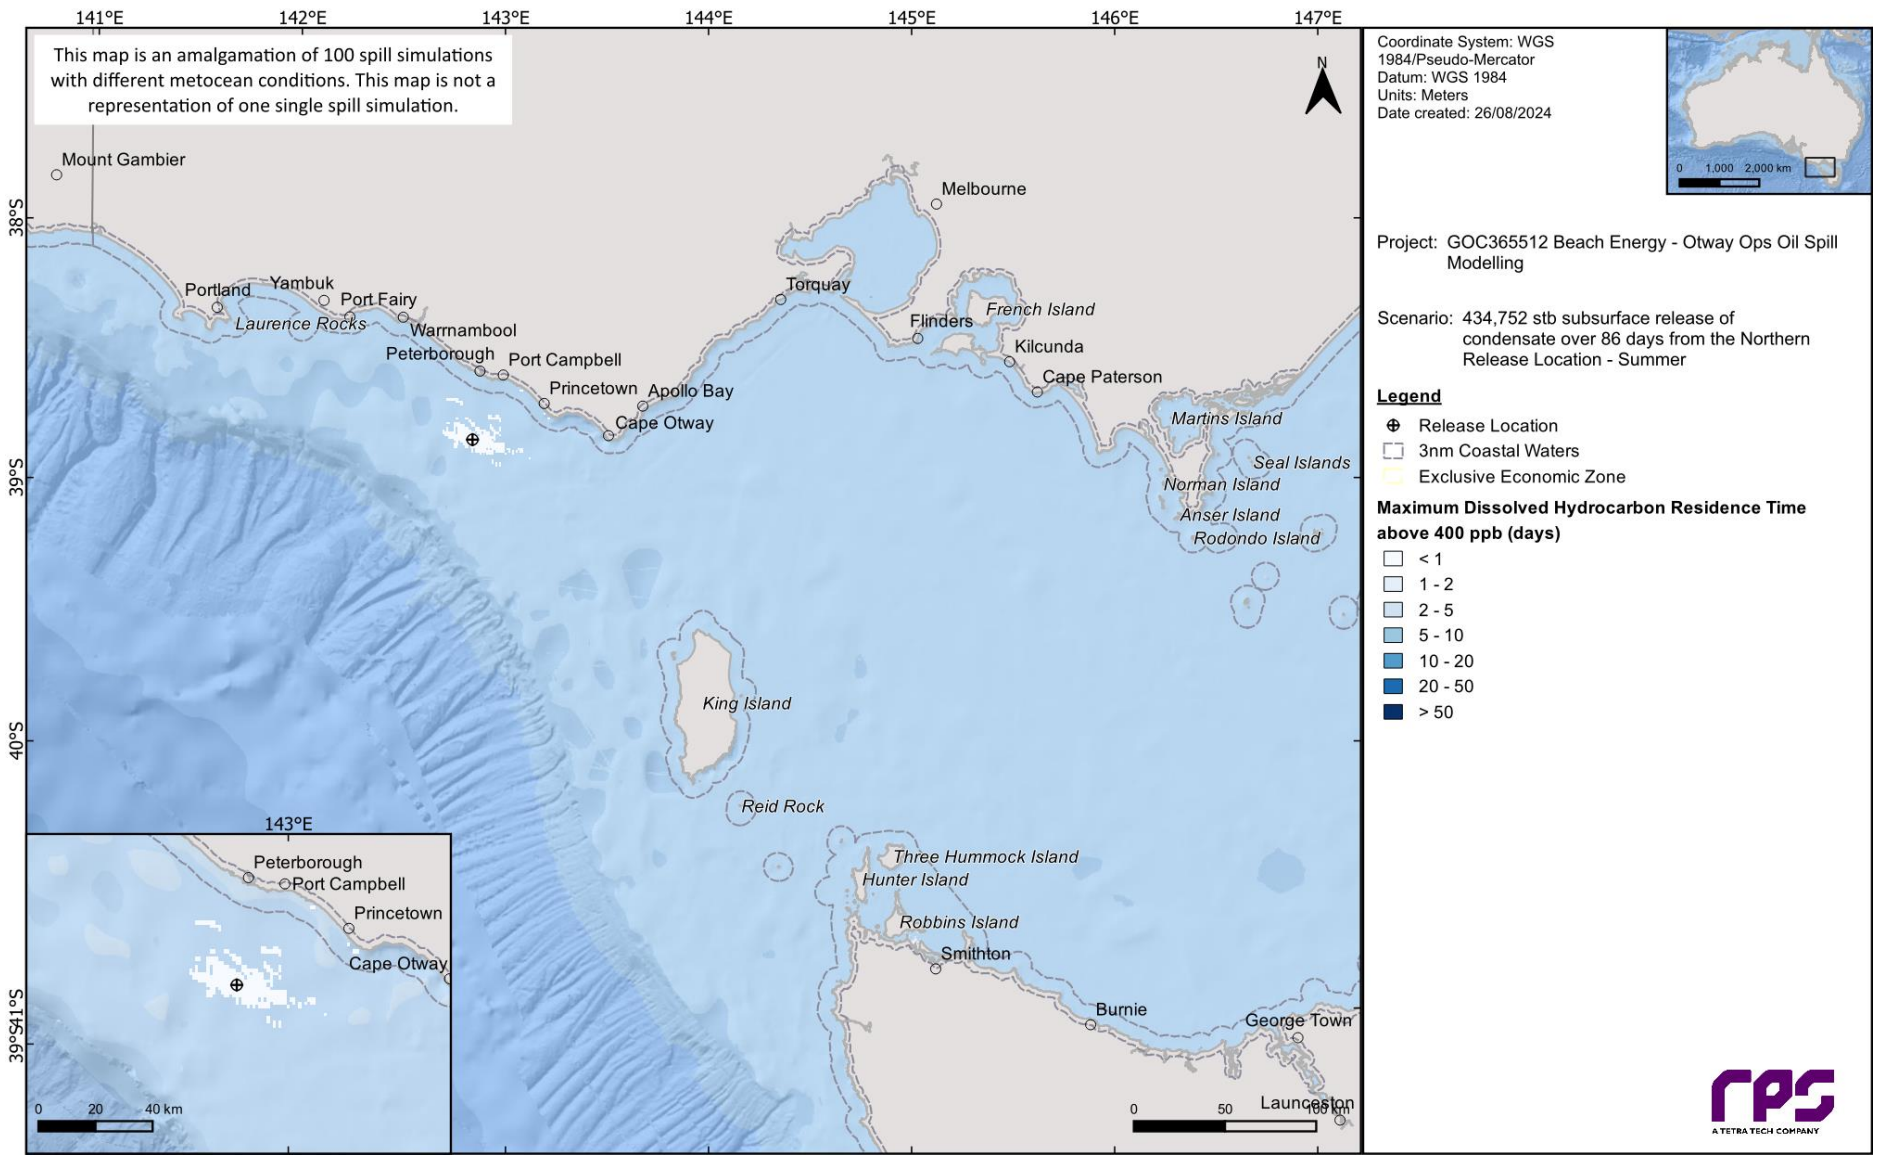

Figure 13-16 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

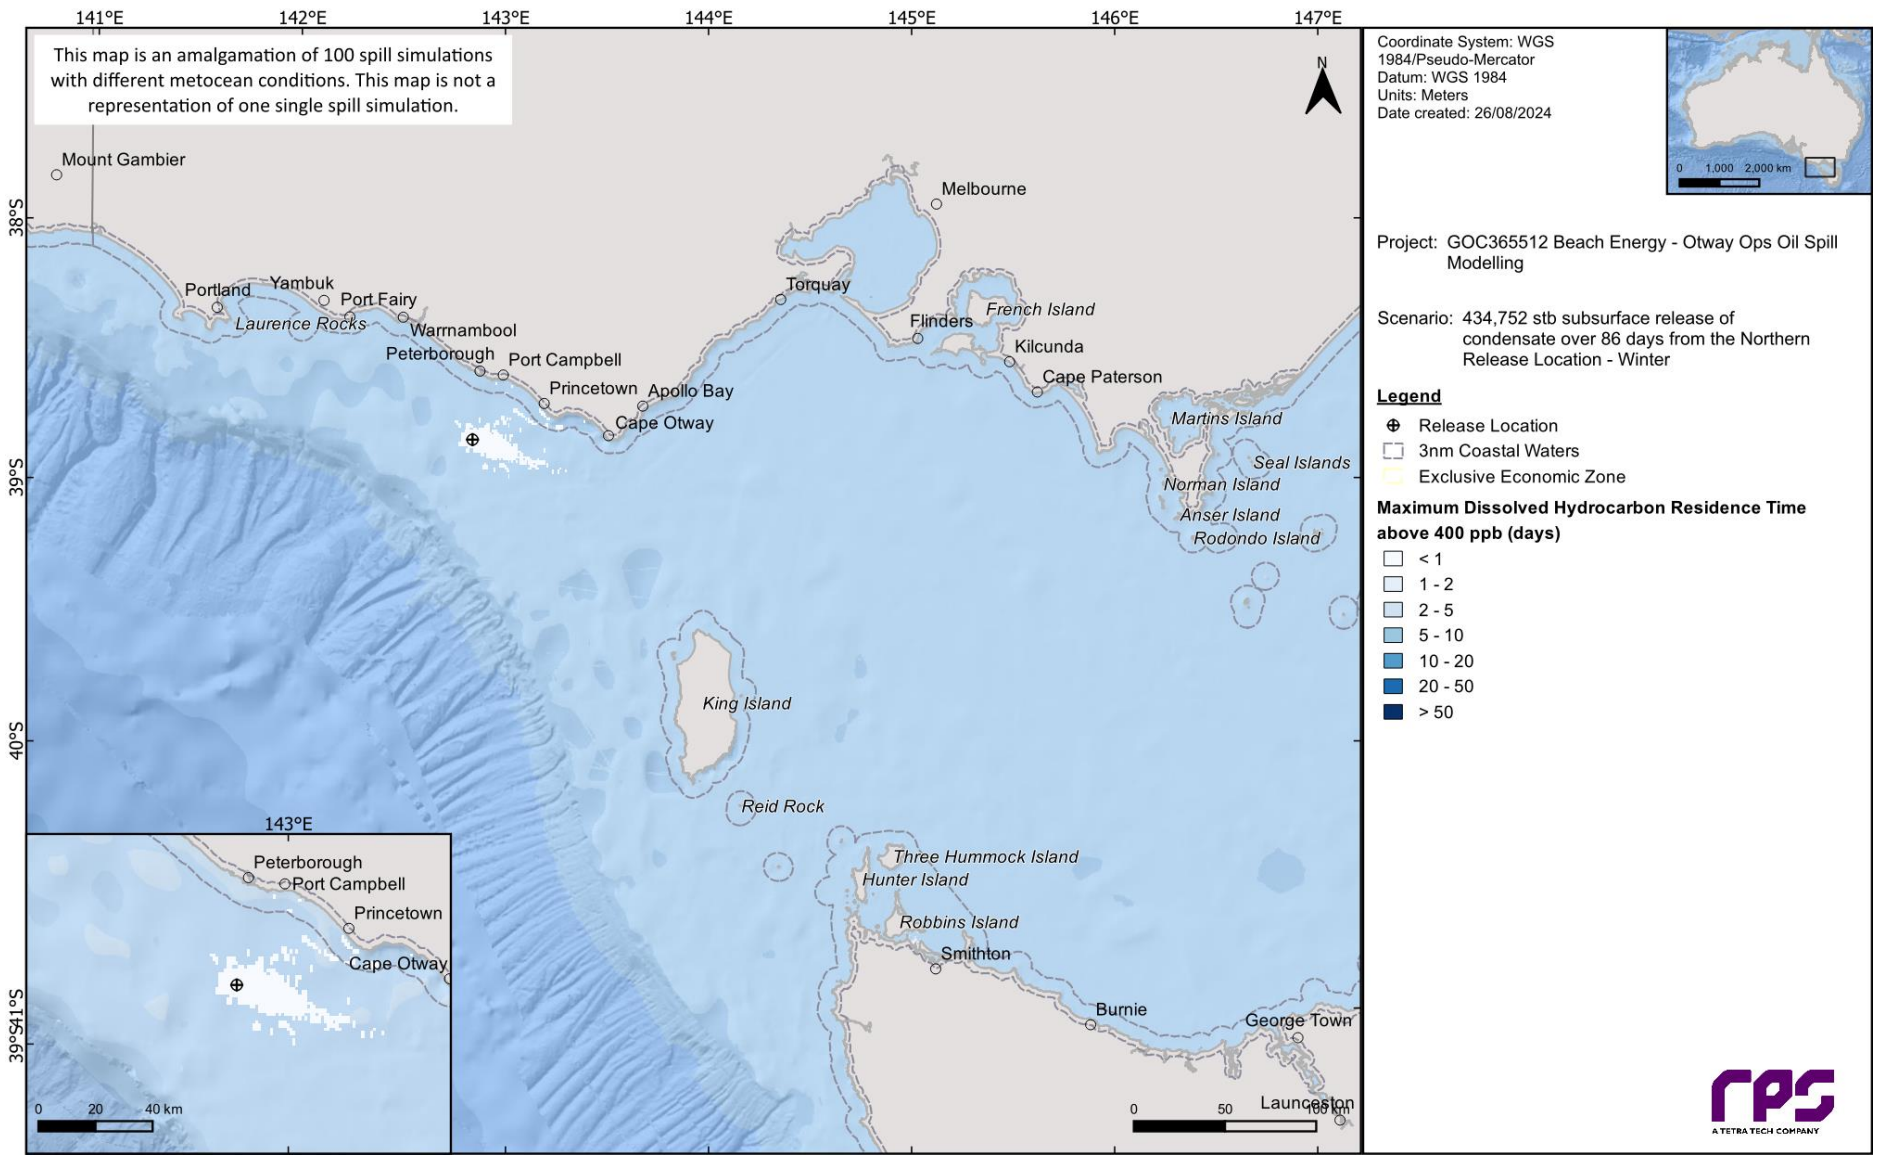

Figure 13-17 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

13.1.4.2 Entrained Hydrocarbons

Table 13-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Southern Right Whale - Migration and resting on migration (E of Warrnambool to Philip Island area) and Short-tailed Shearwater - Foraging BIAs (summer – 358.93 ppb, winter – 527.26 ppb).

Table 13-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 13-18 and Figure 13-19 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 13-20 to Figure 13-25 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 13-8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

Table 13-9 Predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer. Results are based on a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill trajectories per season.

The results were calculated from 100 spill simulations during winter conditions.

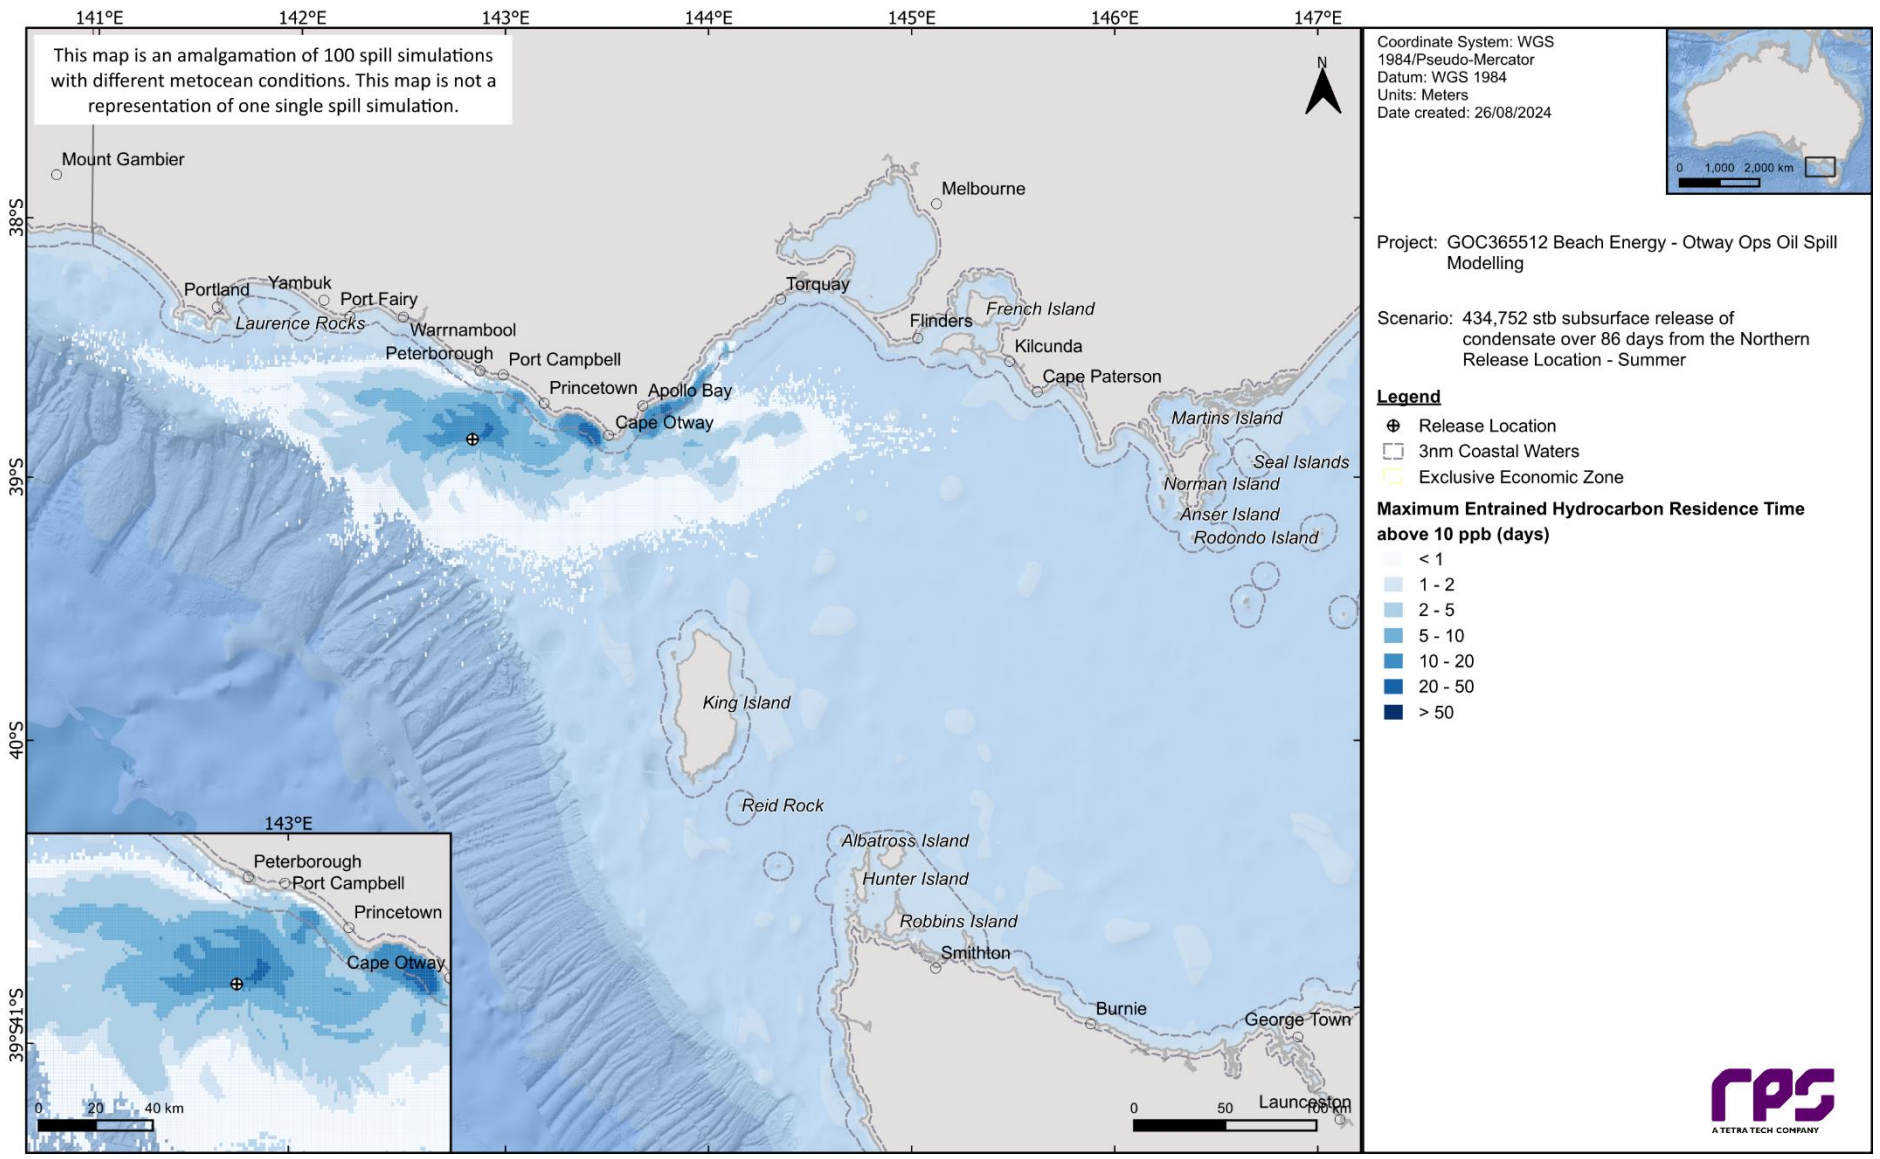

Figure 13-20 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

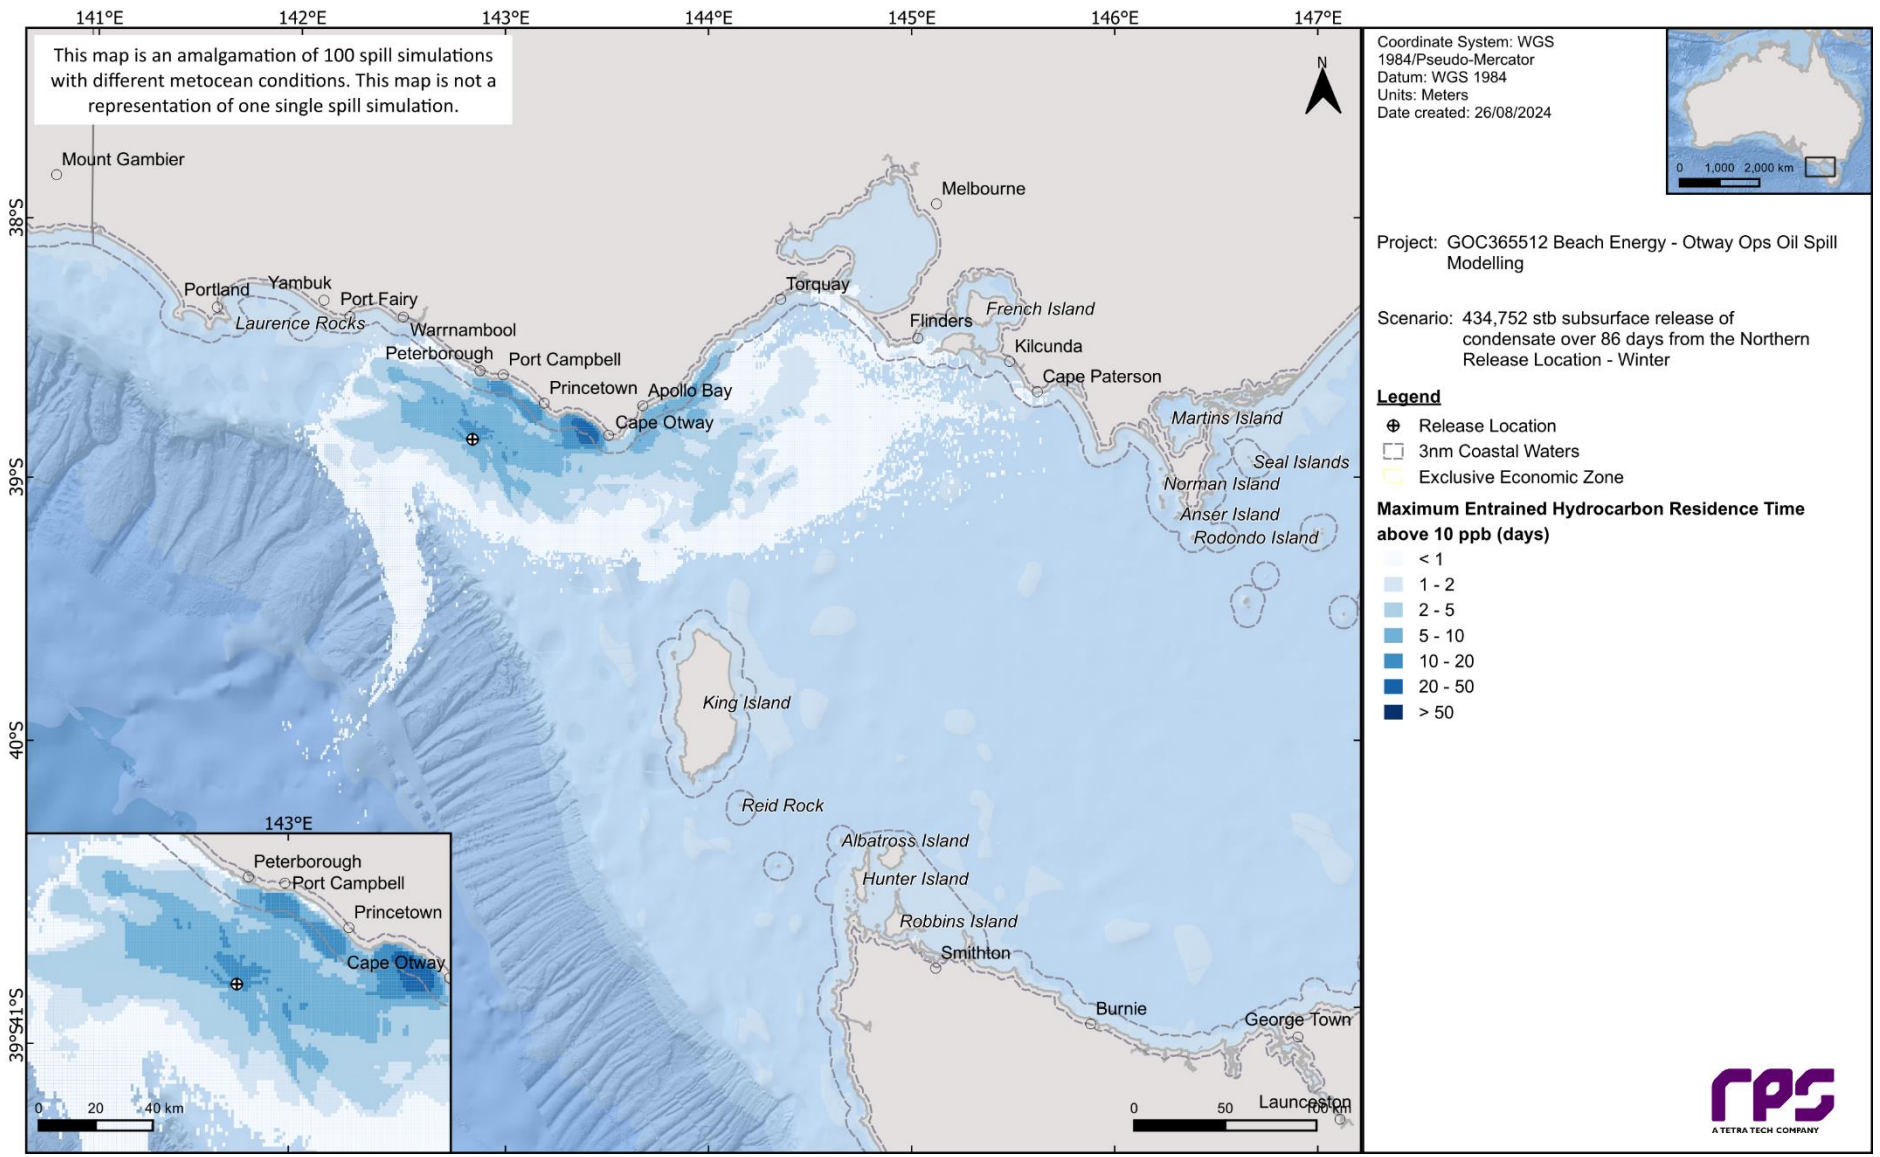

Figure 13-21 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

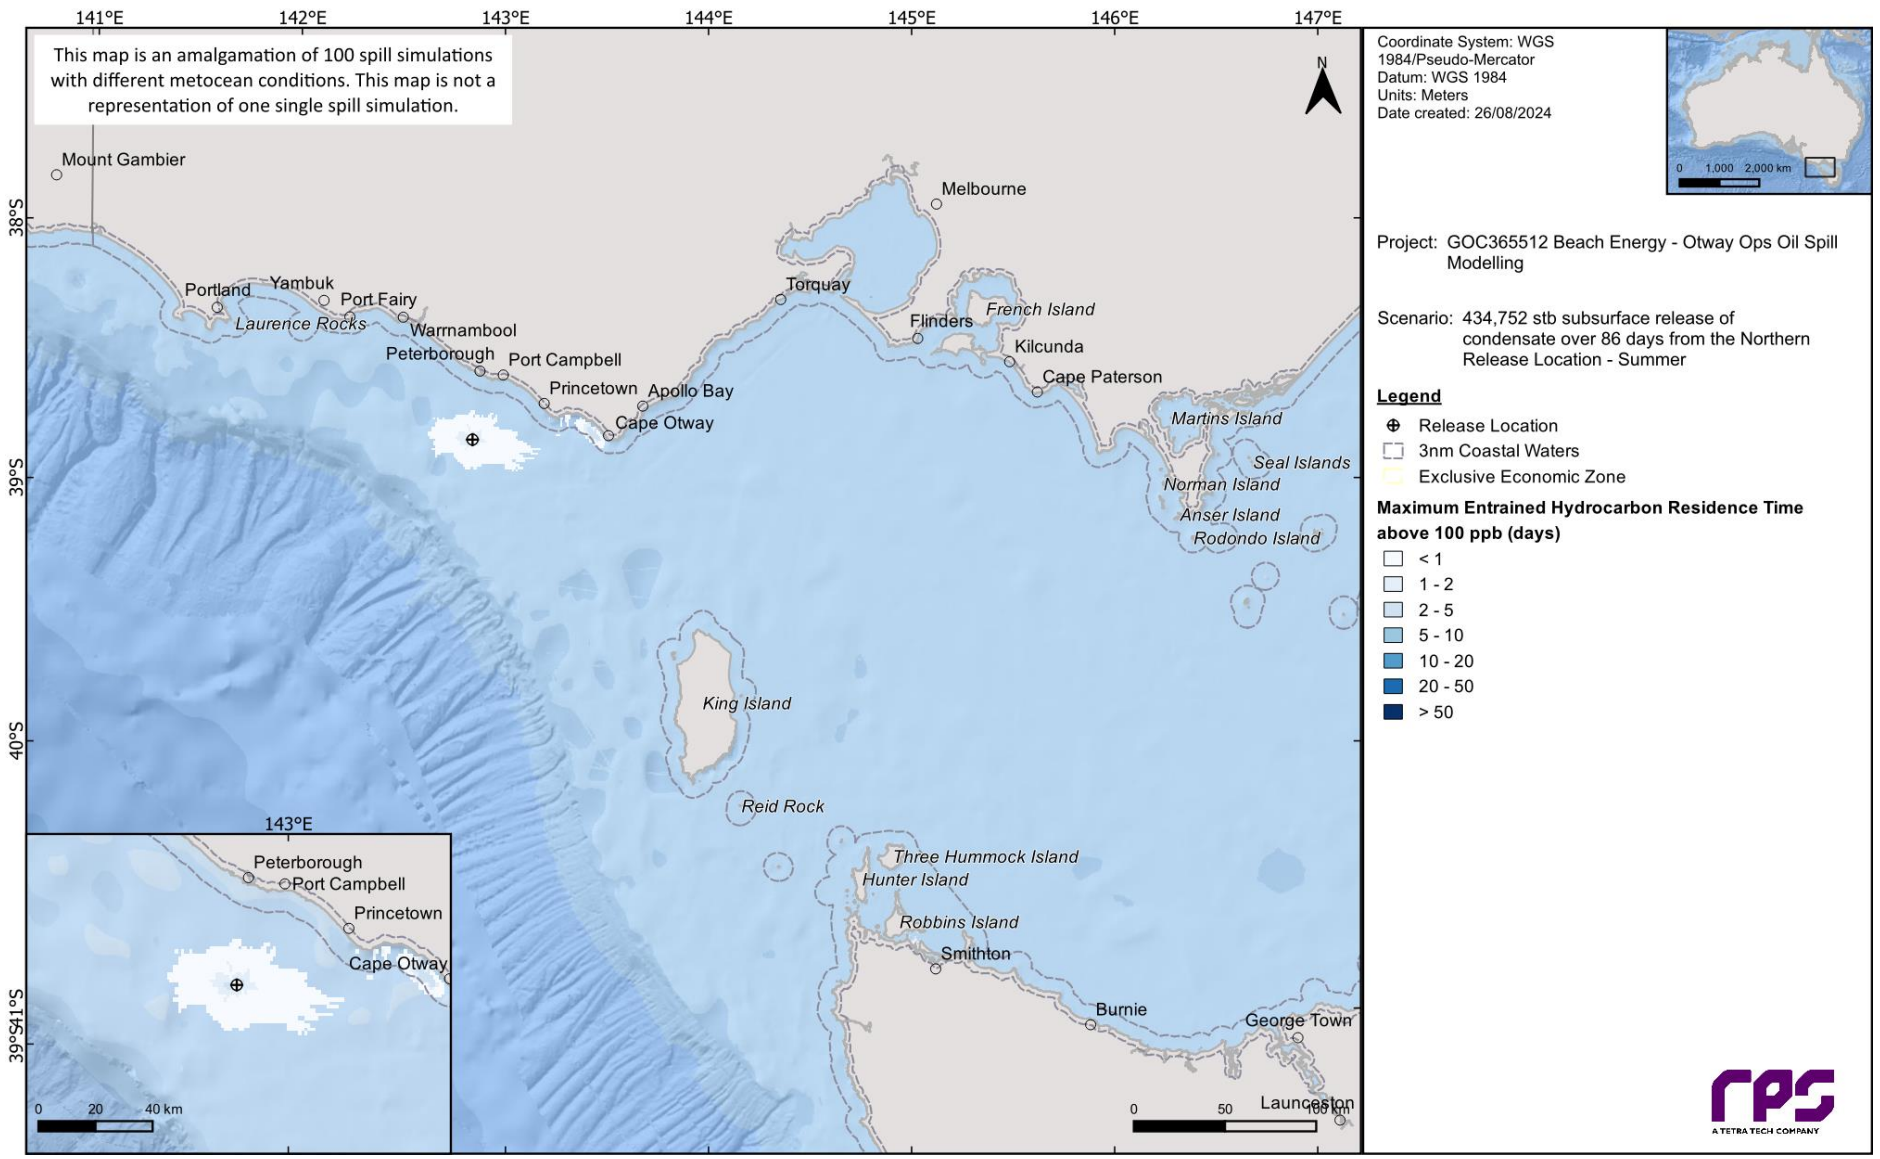

Figure 13-22 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

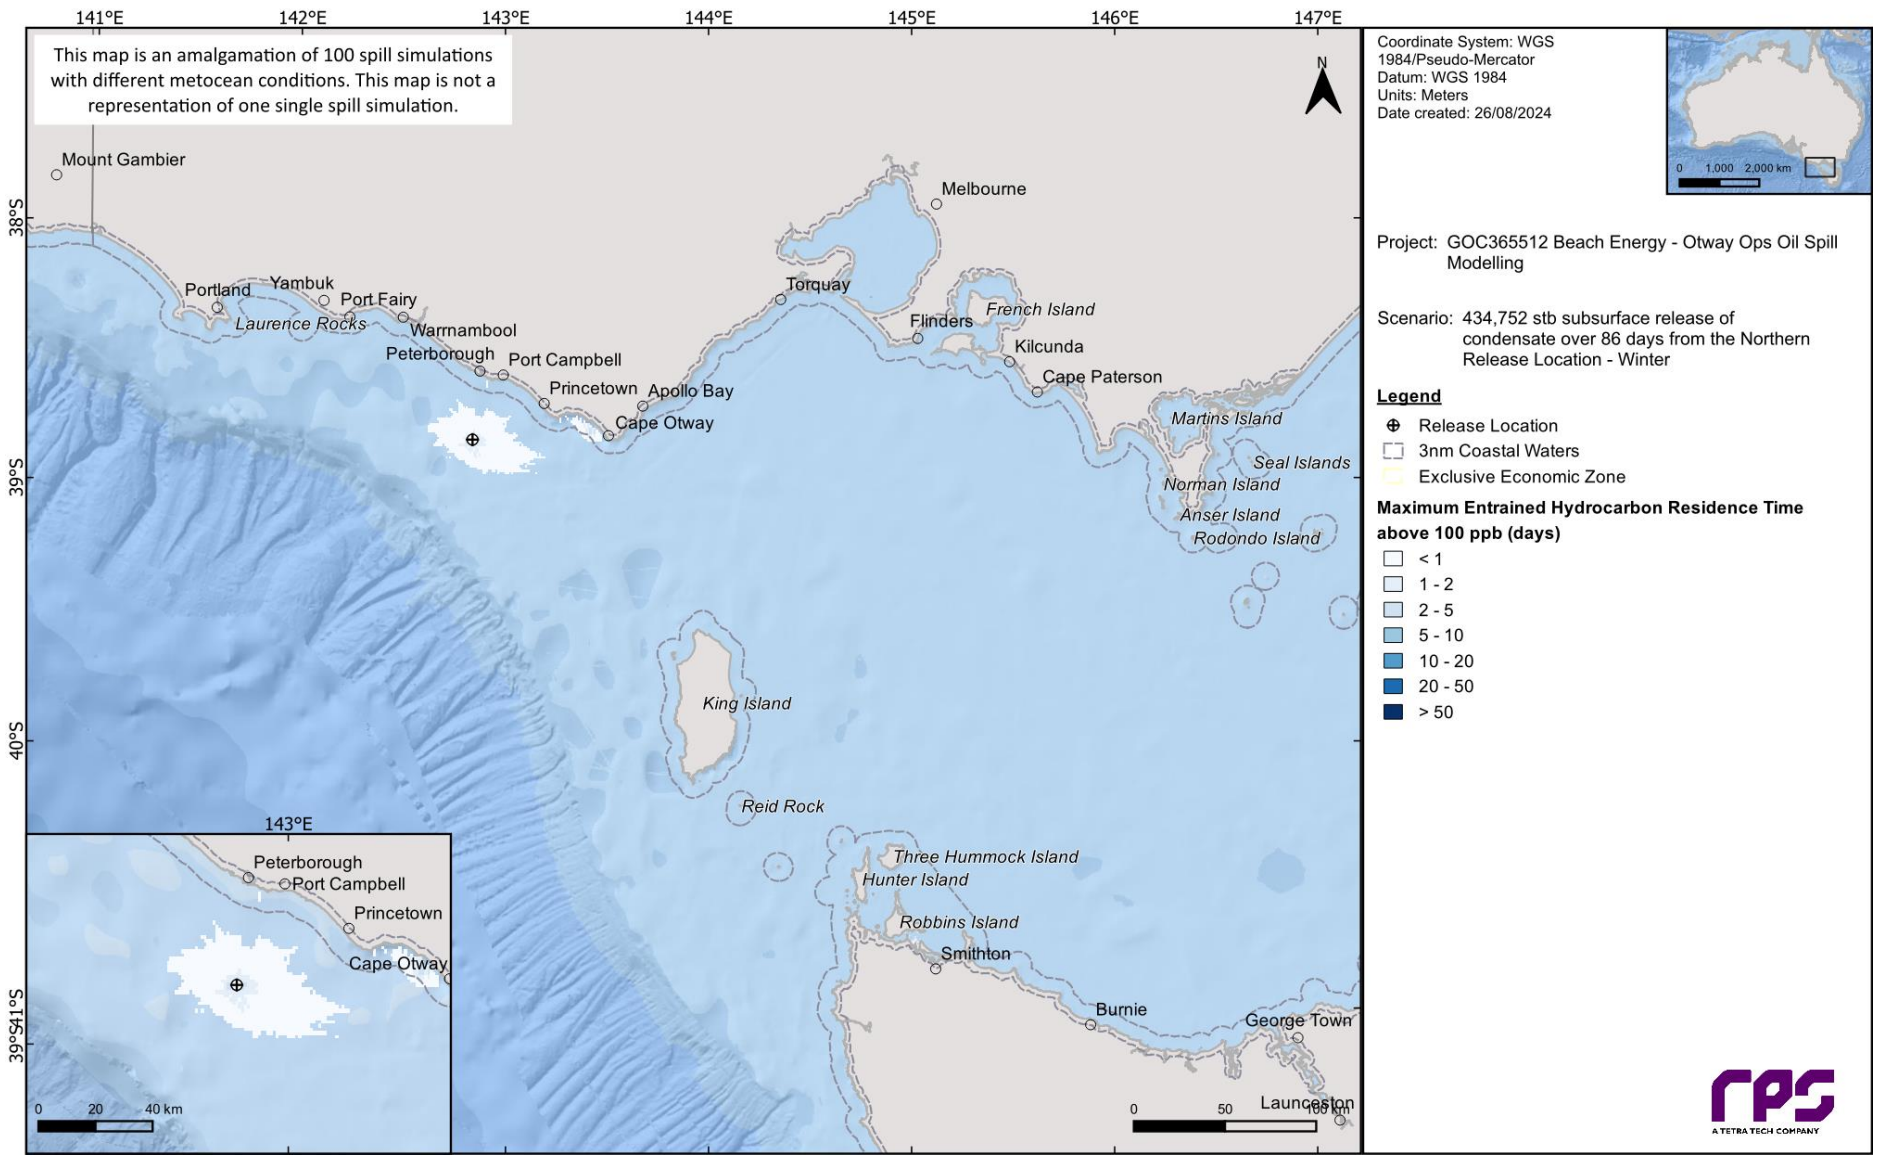

Figure 13-23 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

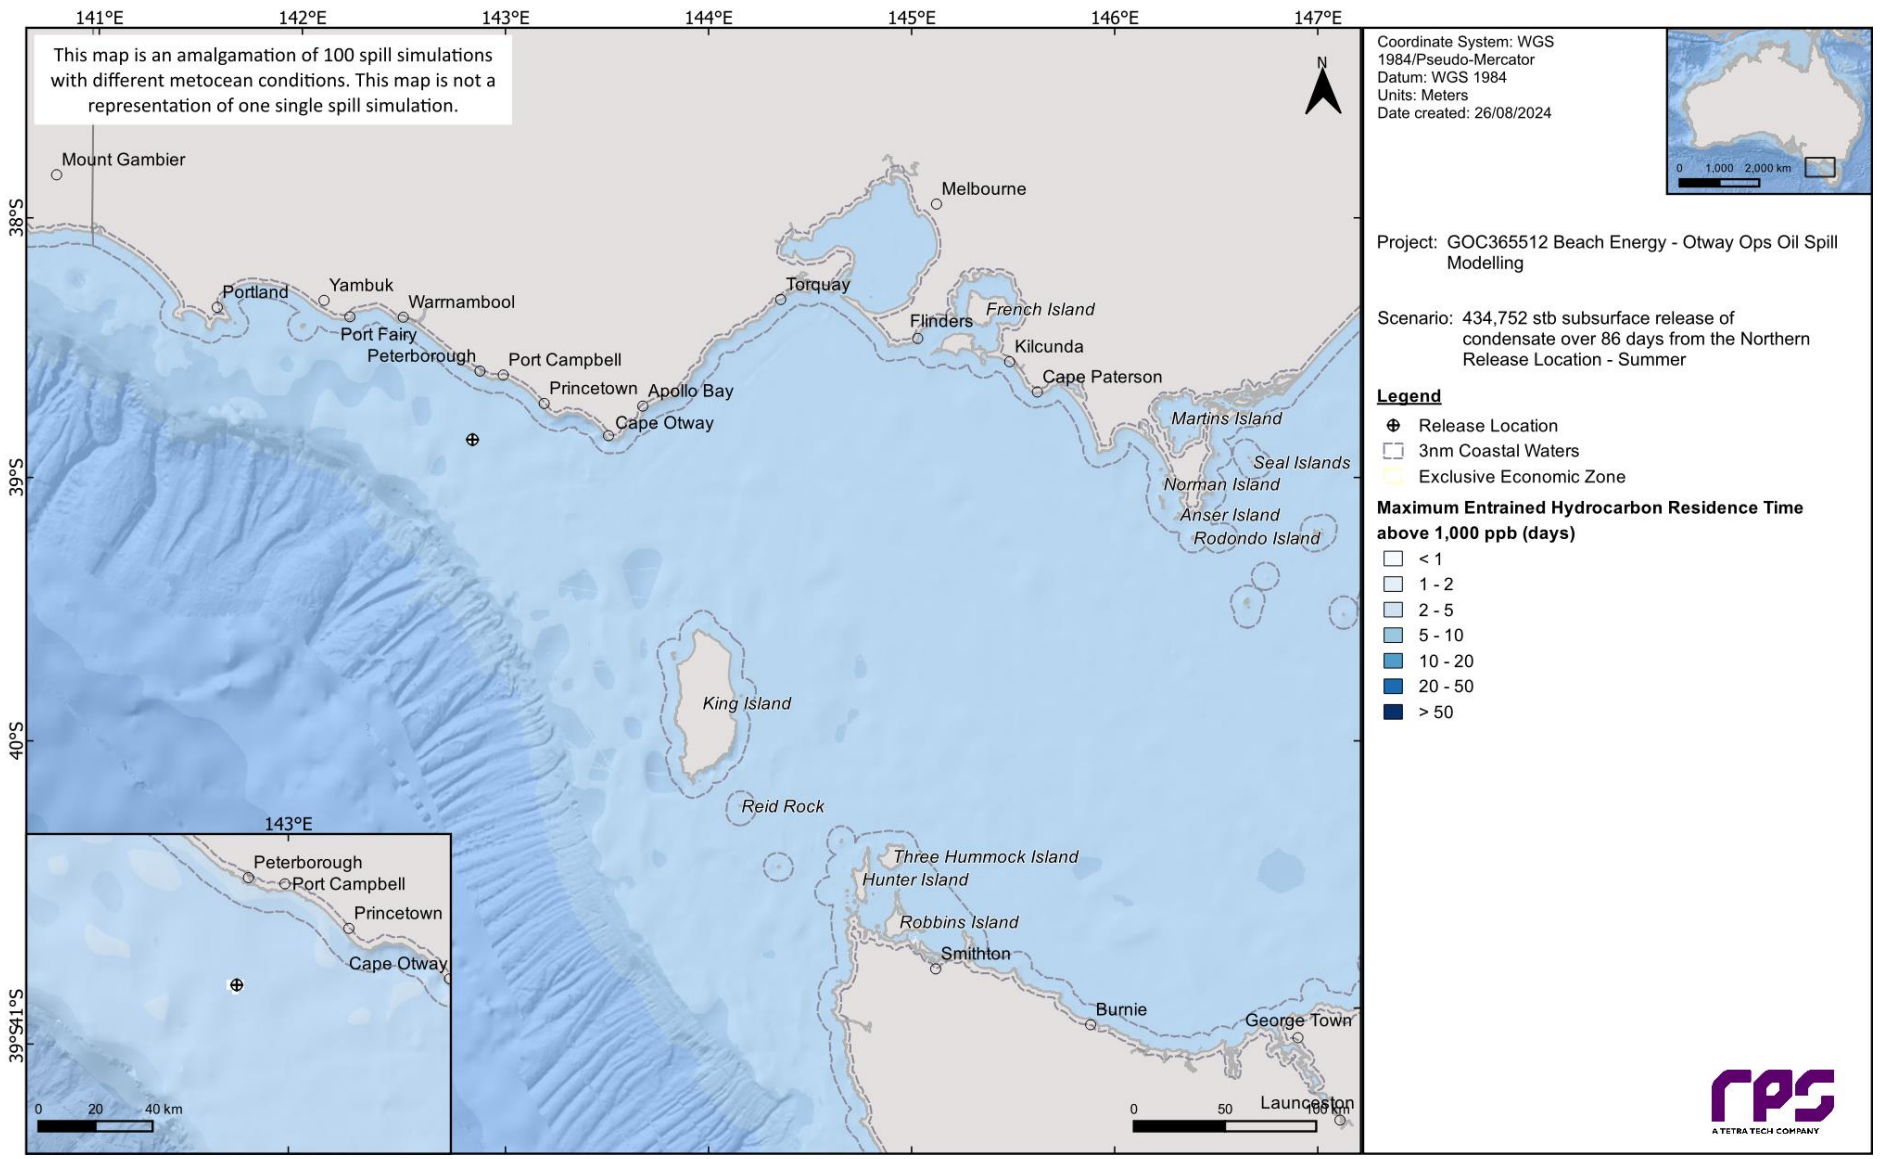

Figure 13-24 Maximum residence time for entrained hydrocarbon exposure above 1,000 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

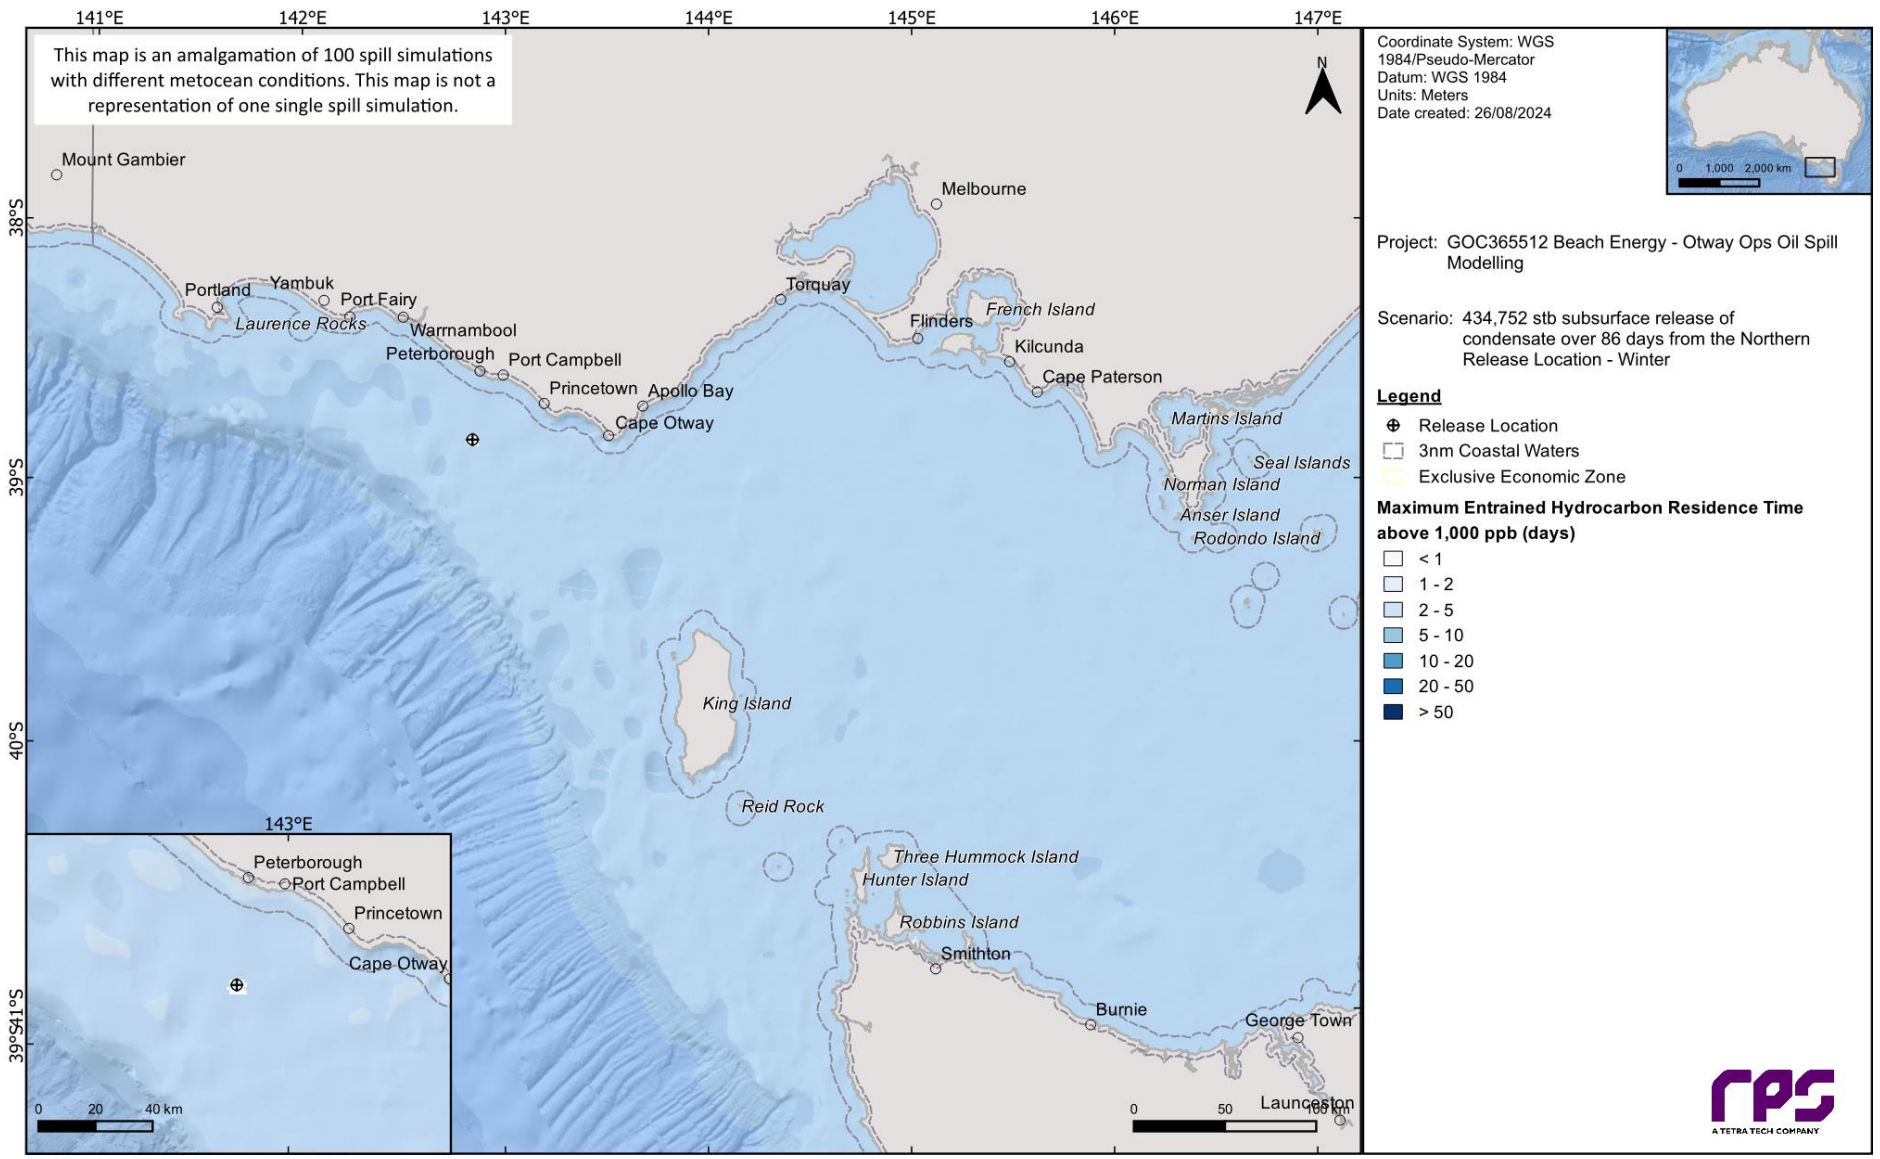

Figure 13-25 Maximum residence time for entrained hydrocarbon exposure above 1,000 ppb, at 0-10 m below the sea surface in the event of a 434,752 stb subsea release of condensate over 86 days from a loss of well control at the Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

14 RESULTS – LOSS OF CONTAINMENT FROM VESSEL COLLISION AT THE NORTHERN RELEASE LOCATION

This scenario examined a 603.7 m^3 surface release of marine diesel for a loss of containment from a vessel collision at the Northern Release Location. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 30 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

14.1 Stochastic Analysis

14.1.1 Area of Exposure

Figure 14-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

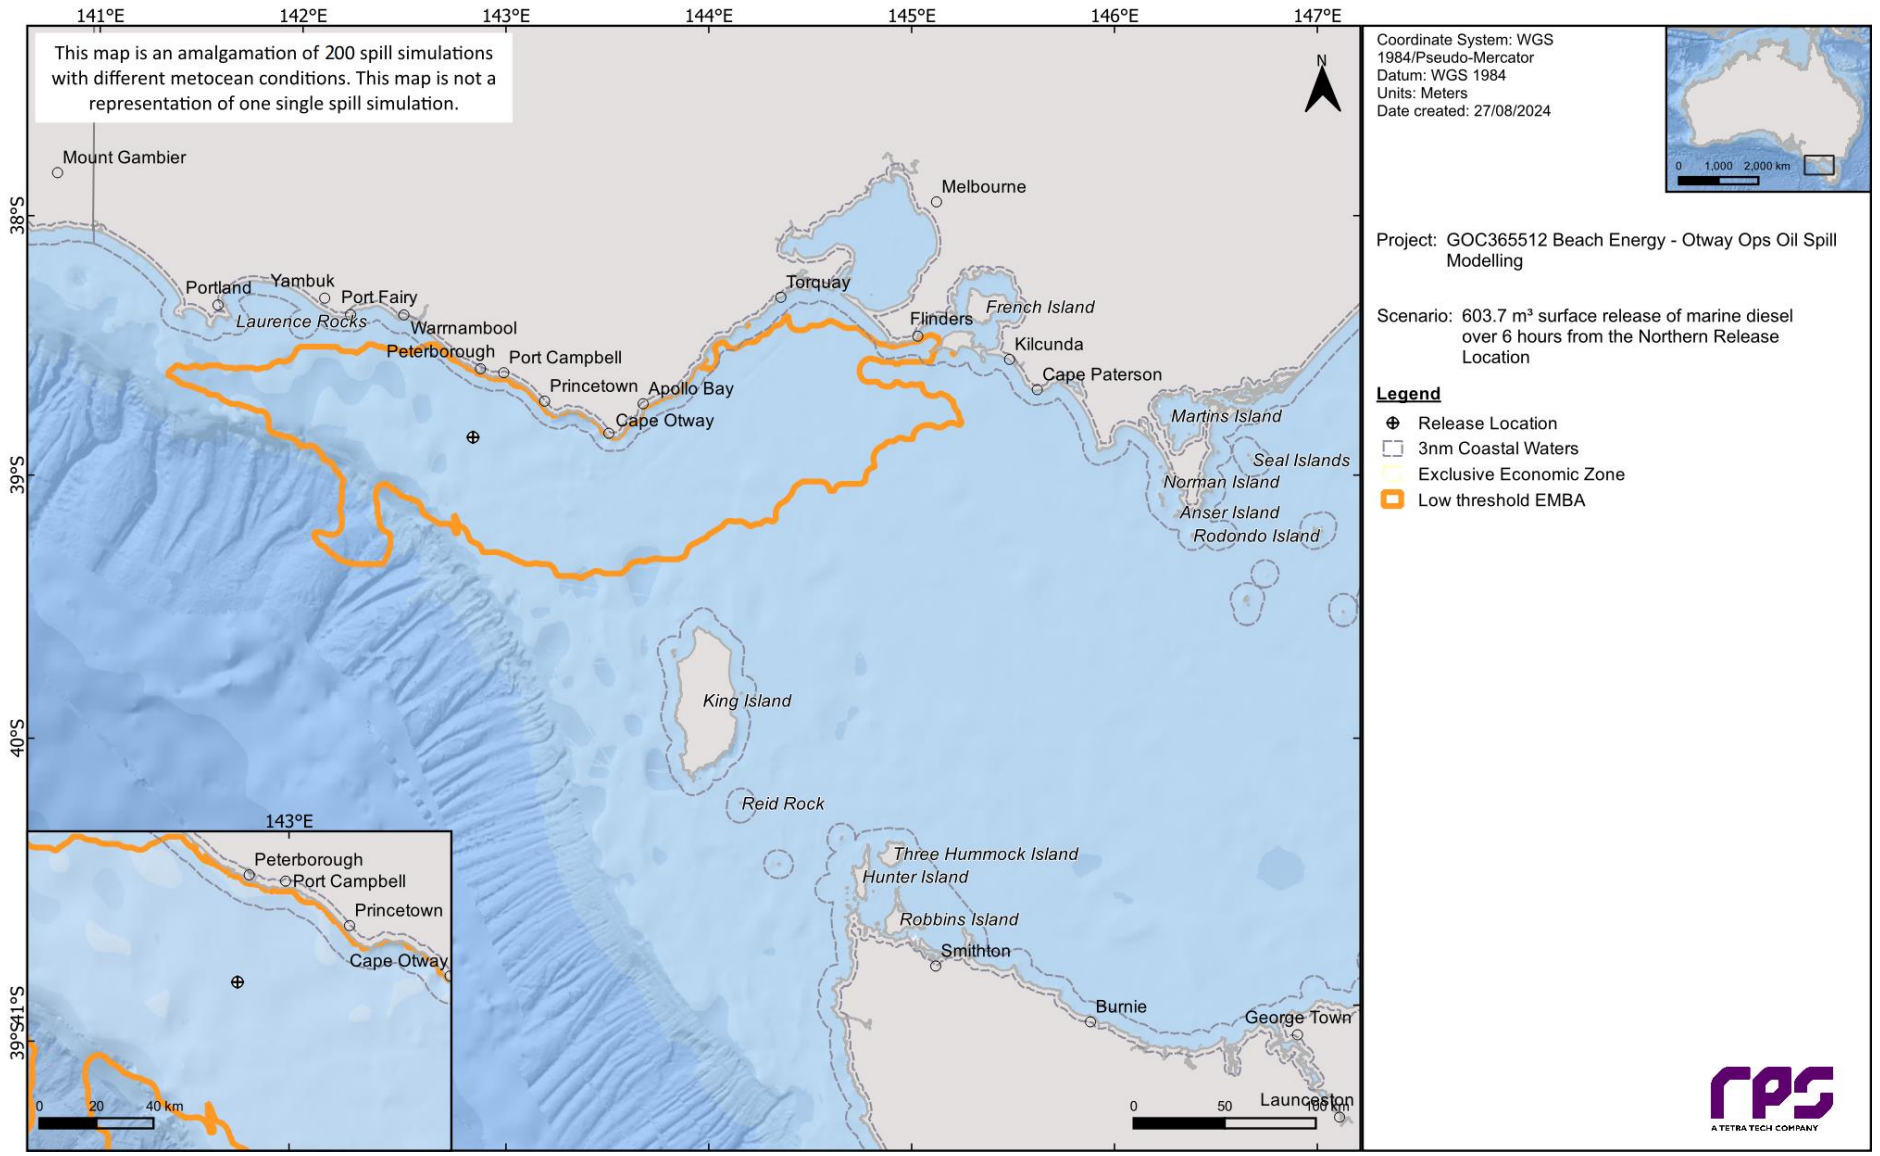

Figure 14-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location during summer and winter conditions.

14.1.2 Floating Oil Exposure

Table 14-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 32.65 km (east-southeast), 19.85 km (southeast) and 10.53 km (southeast) all during winter conditions.

Table 14-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), floating oil exposure above the low threshold was predicted at the Pygmy Blue Whale – Foraging (2% winter) and Short-tailed Shearwater - Foraging (2% summer, 3% winter) BIAs.

Table 14-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 14-2 and Figure 14-3 present the zones of potential floating oil exposure for all thresholds under summer and winter conditions, respectively.

Figure 14-4 to Figure 14-9 present the minimum time before floating oil exposure for the NOPSEMA thresholds during summer and winter, respectively.

Table 14-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at the Northern Release Location. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	25.26	16.96	9.76
	Direction	West-Northwest	Northwest	North-Northwest
Winter	Maximum distance (km) from release location	32.65	19.85	10.53
	Direction	East-Southeast	Southeast	Southeast

Table 14-2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at the Northern Release Location. The results were calculated from 100 spill simulations per season.

14.1.3 Shoreline Accumulation

Table 14-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 31% during summer conditions and 27% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 4.5 days during summer conditions, and 2.0 days during winter conditions. The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 30.86 m^3 and 58.33 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 29.23 km and 43.19 km, respectively. For the moderate threshold (100 g/m^2), the maximum length of shoreline accumulation predicted was 10.16 km and 12.70 km during summer and winter respectively. No shoreline accumulation was predicted for the high (1,000 g/m^2) threshold.

Table 14-5 summarises the shoreline accumulation on individual receptors during the summer and winter conditions. Cape Otway West recorded the highest probability of shoreline accumulation at the low threshold with 24% (summer) and 20% (winter) and the largest shoreline accumulation with 4.46 m^3 and 9.28 m^3, respectively. The minimum time before shoreline accumulation above the low threshold was predicted for the same receptor as 4.5 and 2.03 days during summer and winter respectively.

The summer and winter conditions maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented in Figure 14-10 and Figure 14-11, respectively.

Table 14-4 Summary of oil accumulation across all shorelines. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	31	27
Absolute minimum time for visible oil to shore (days)	4.5	2.0
Maximum total volume of hydrocarbons ashore (m^3)	30.86	58.33
Average volume of hydrocarbons ashore (m^3)	2.13	2.92
Maximum length of the shoreline at **10 g/m^2** (km)	29.23	43.19

14.1.4 In-water exposure

14.1.4.1 Dissolved Hydrocarbons

Table 14-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions. No dissolved hydrocarbon exposure at the high (400 ppb) threshold was predicted,

Only the receptors that the Northern Release Location resides within (refer to Table 12-1) were contacted by dissolved hydrocarbon at the low threshold. The maximum dissolved hydrocarbon concentration was 101.35 ppb and 65.67 ppb during summer and winter respectively.

Table 14-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 14-12 and Figure 14-13 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 14-14 to Figure 14-17 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 14-6 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations per season.

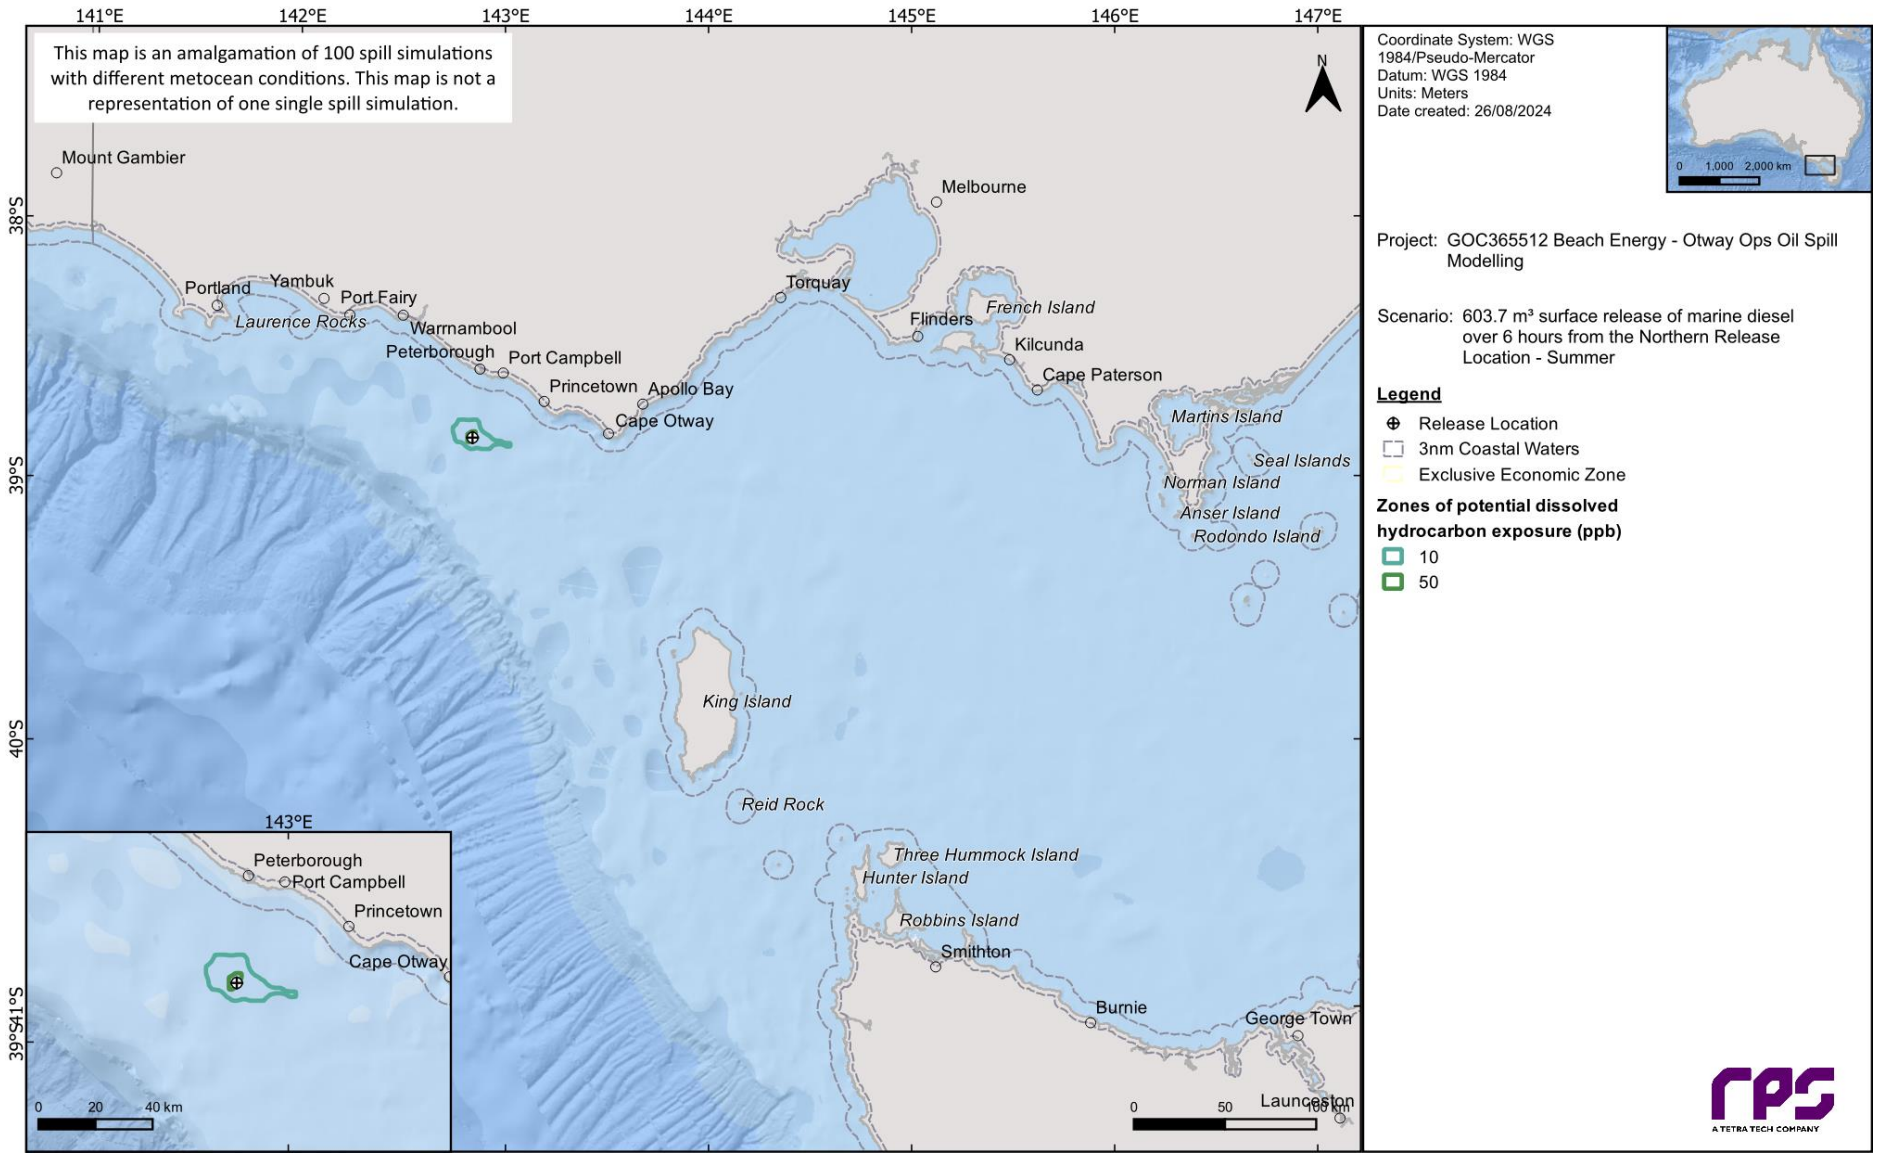

Figure 14-12 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

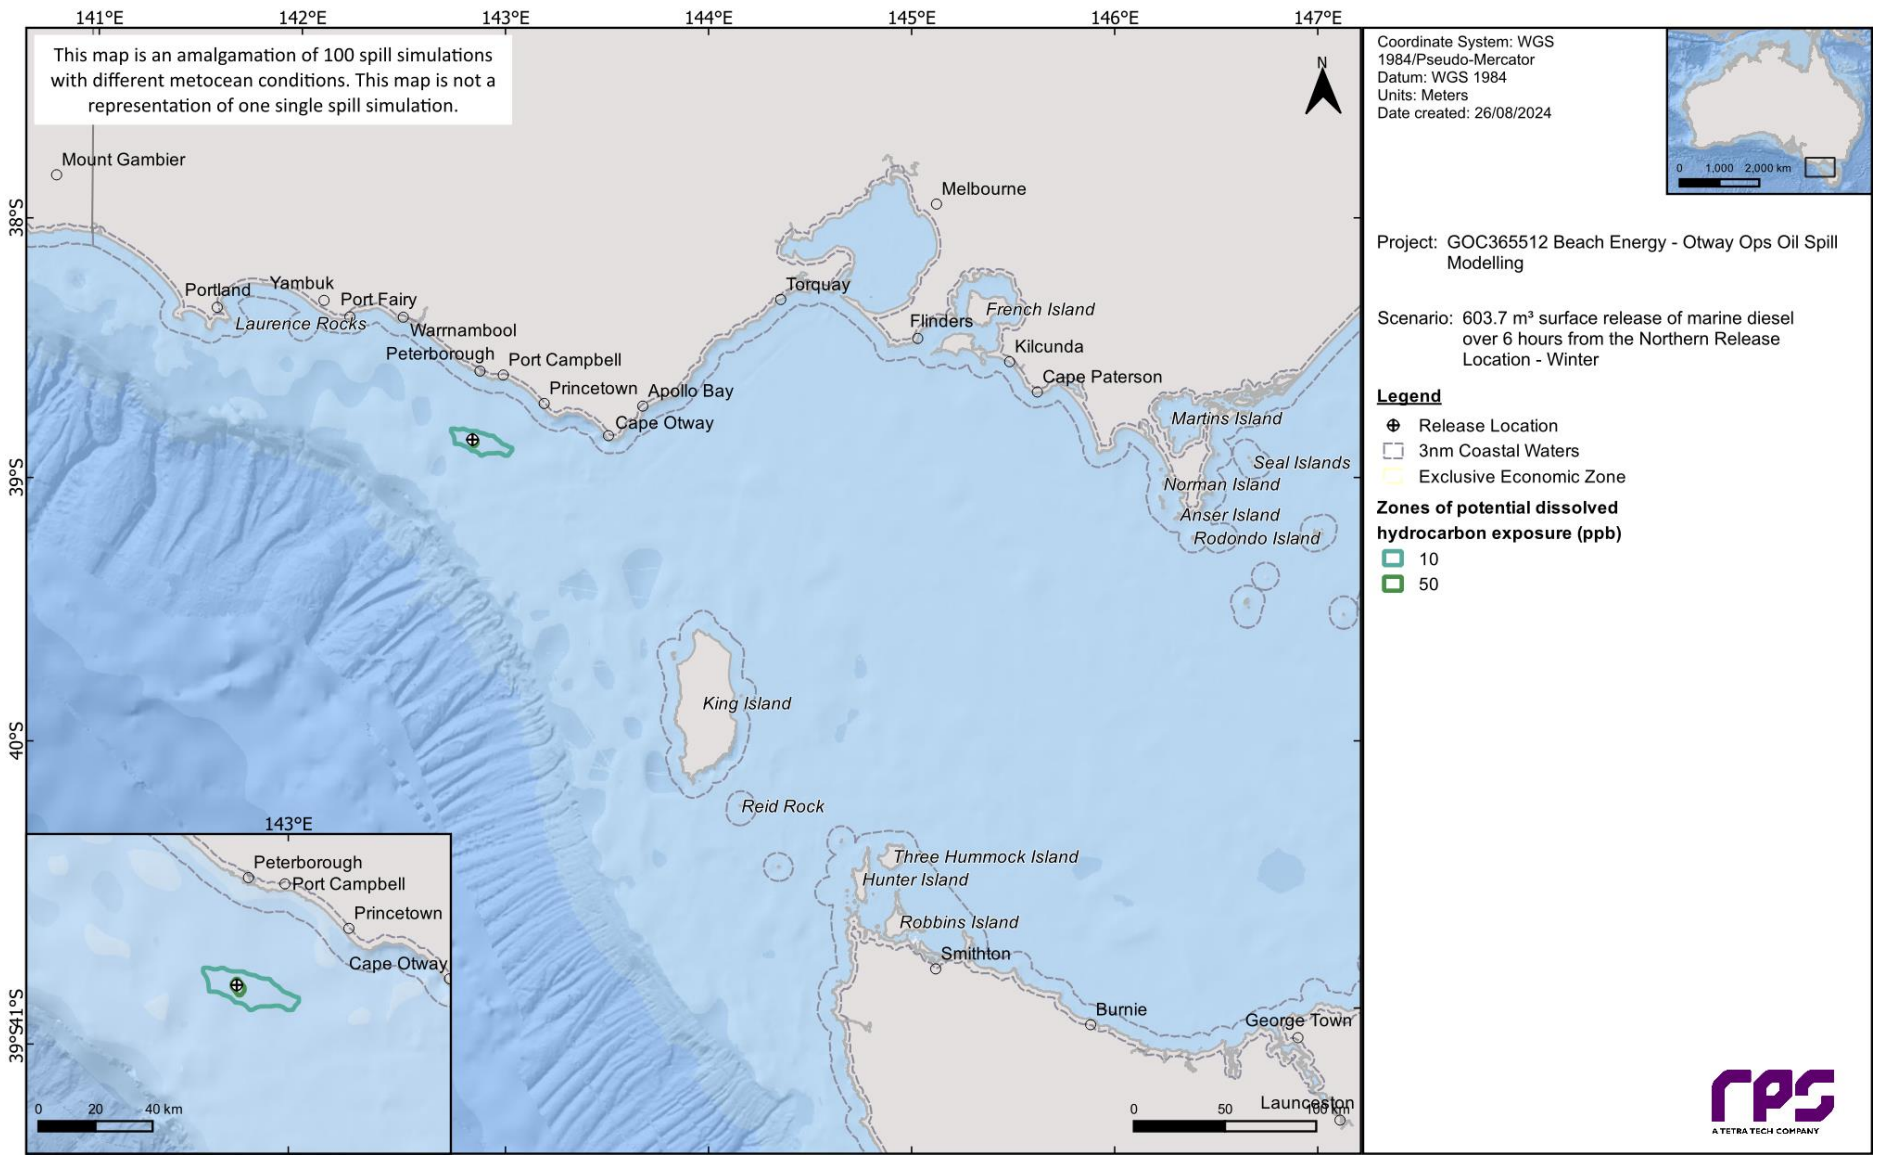

Figure 14-13 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

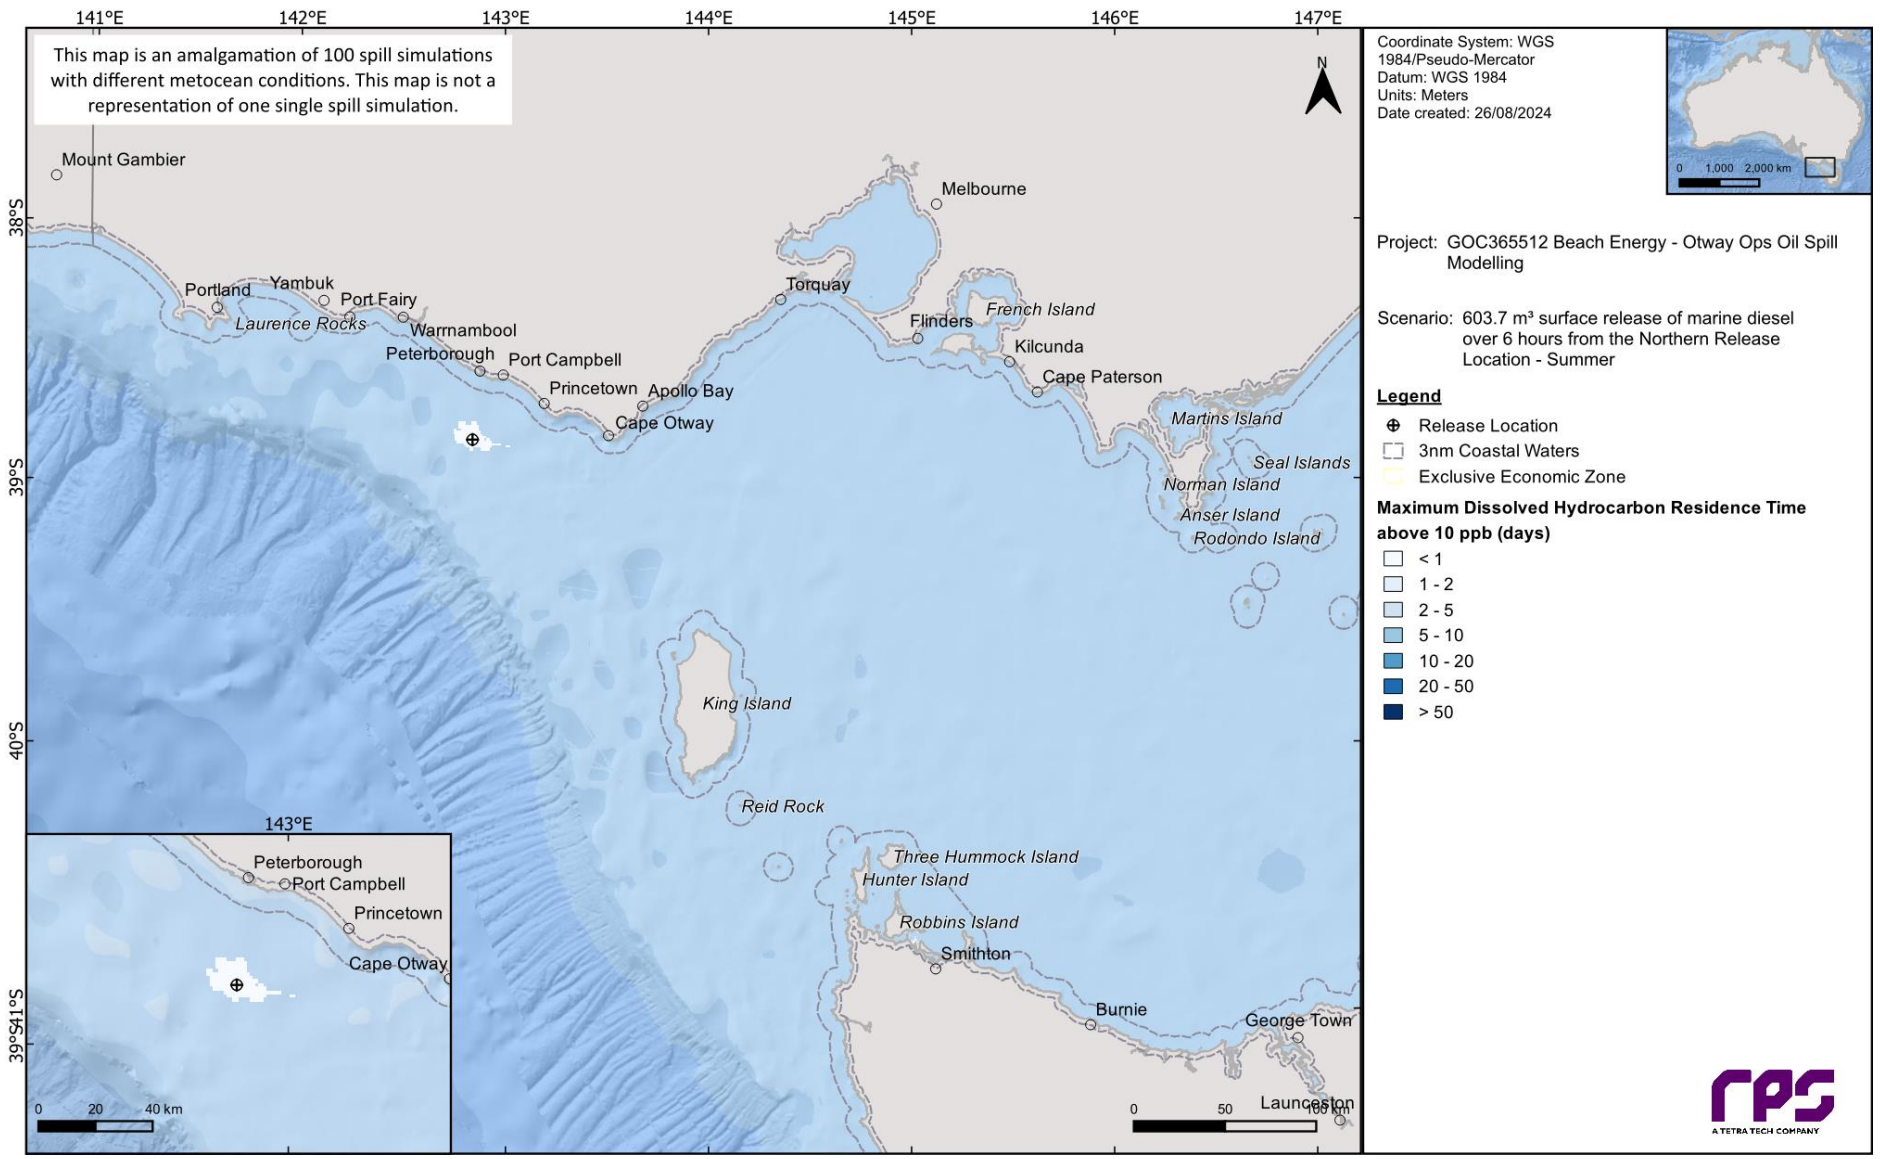

Figure 14-14 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

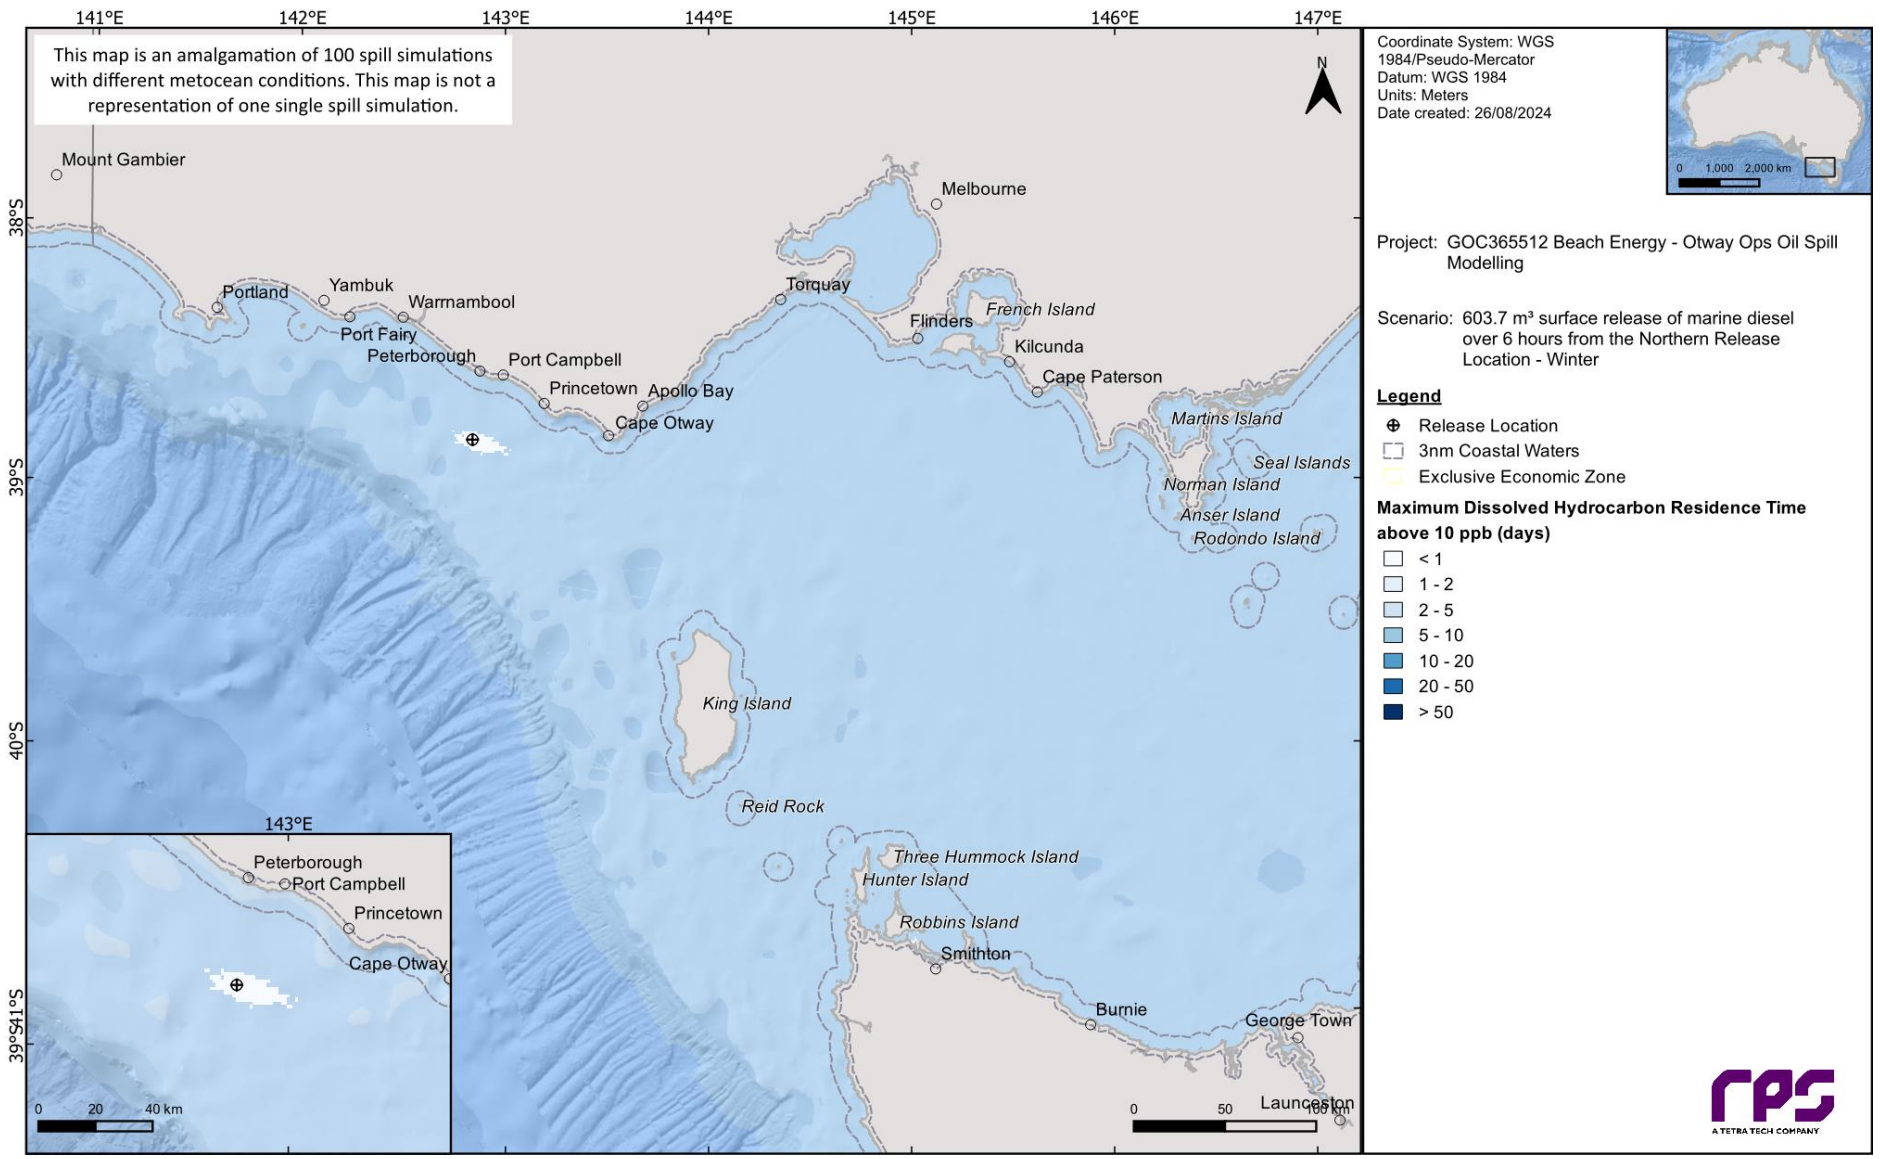

Figure 14-15 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

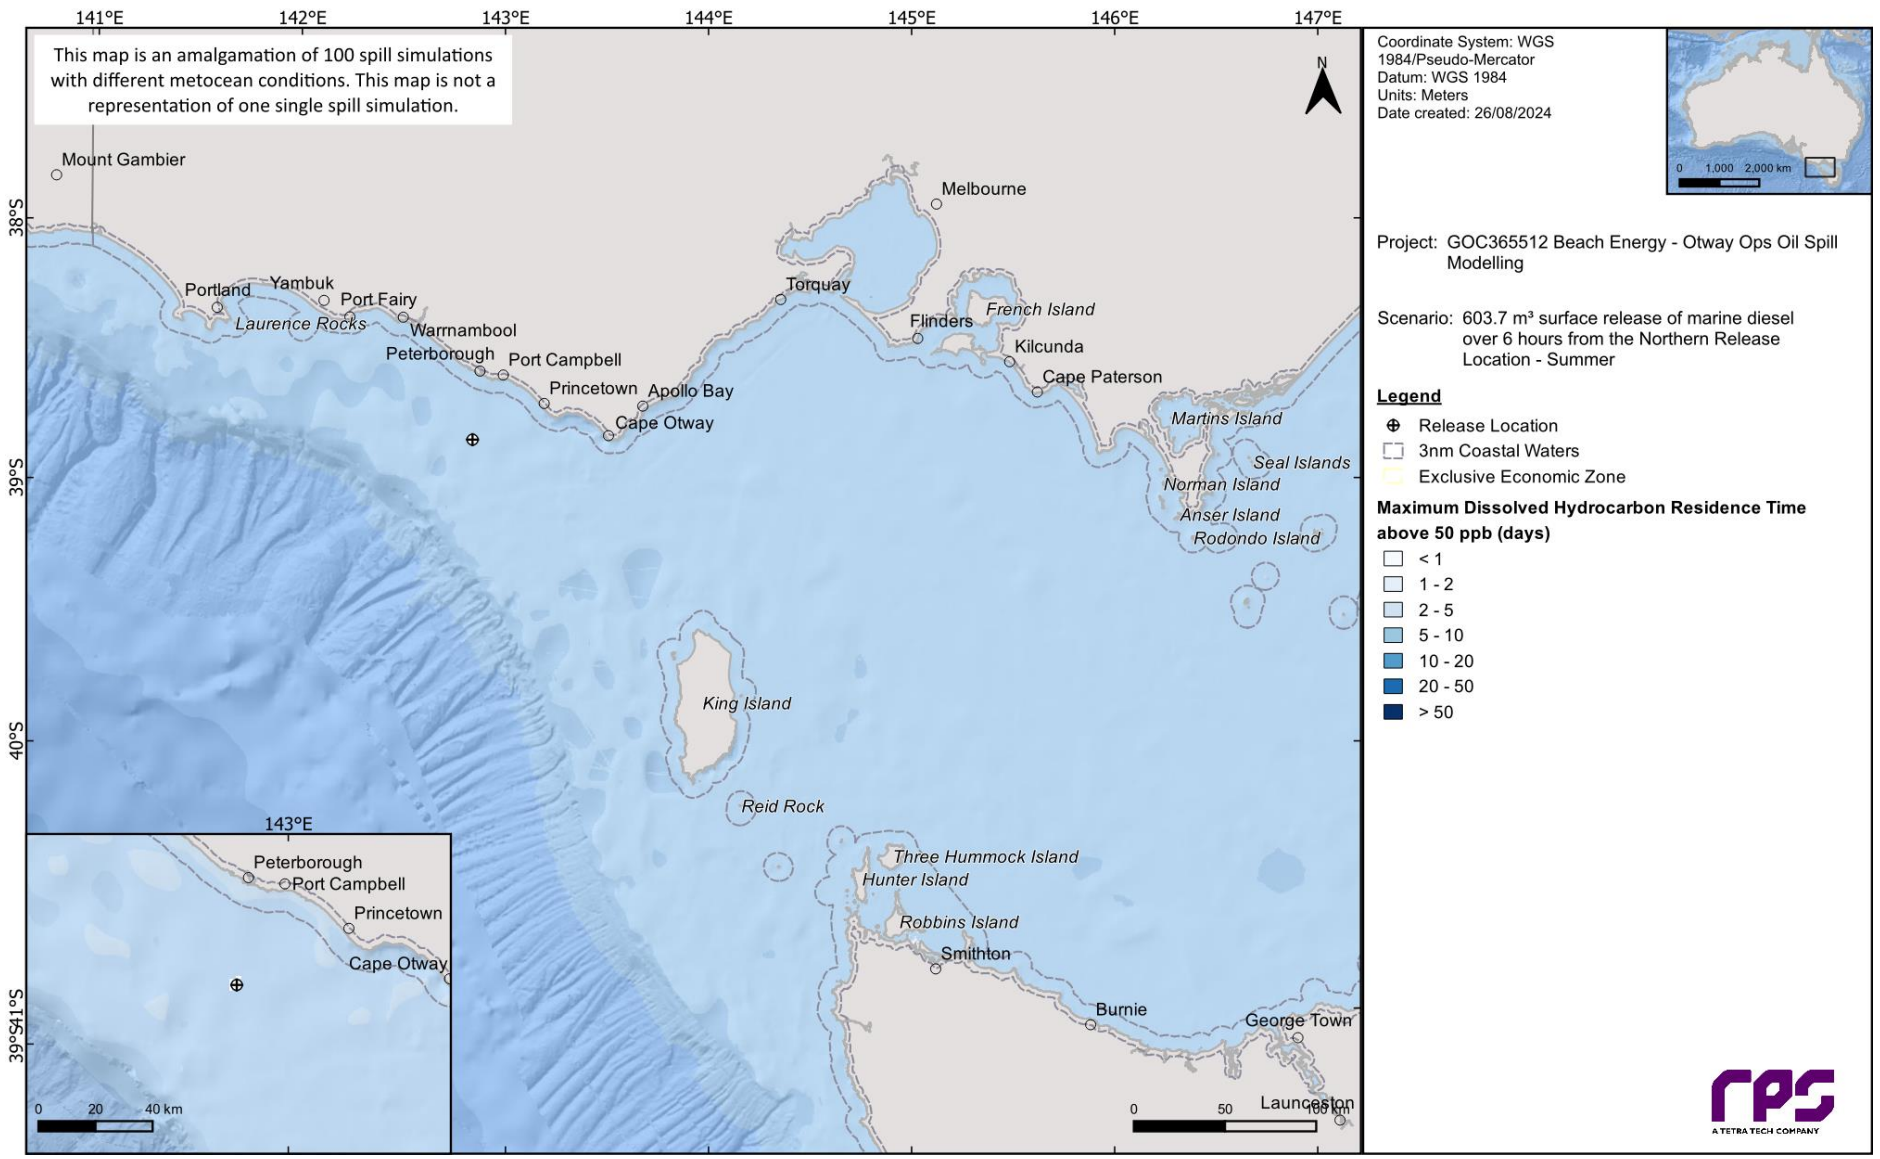

Figure 14-16 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during summer conditions.

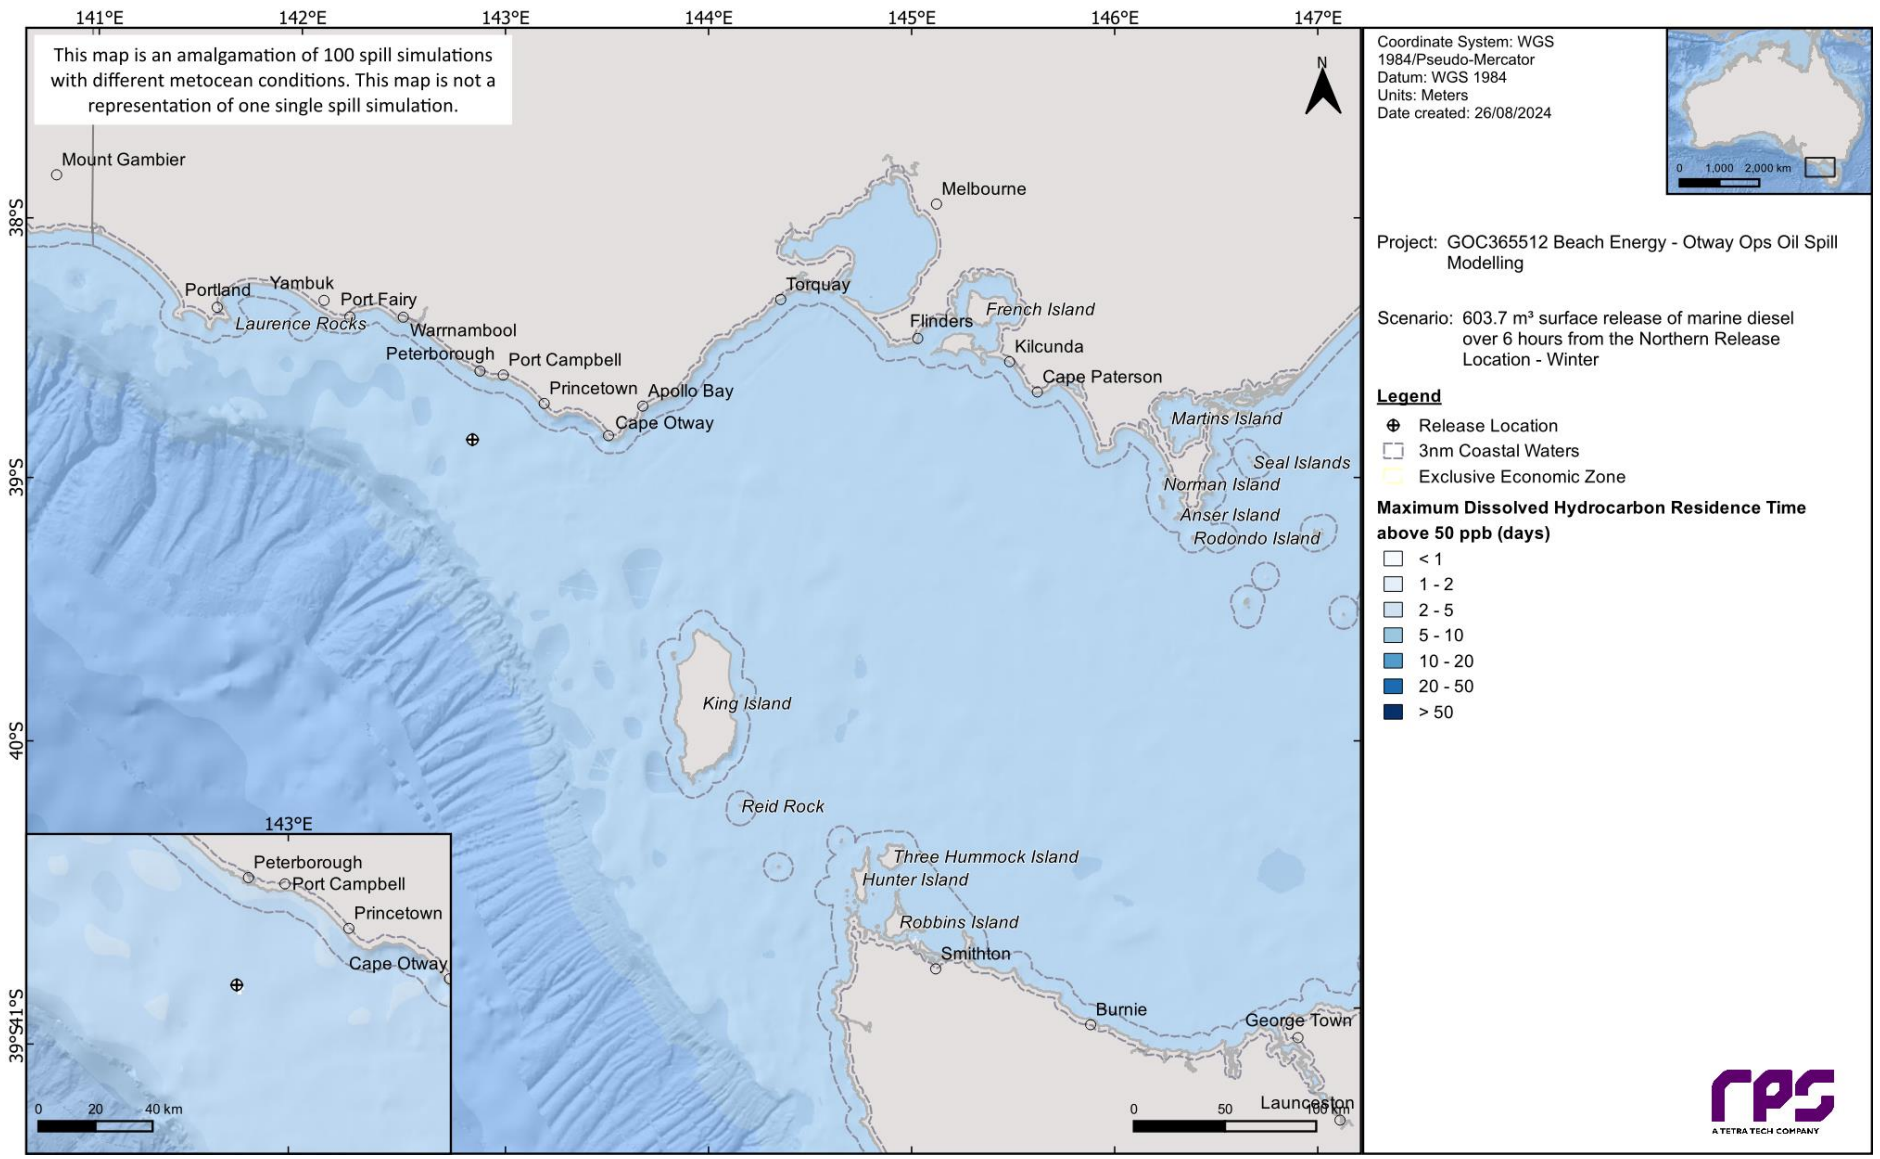

Figure 14-17 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

14.1.4.2 Entrained Hydrocarbons

Table 14-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 745.77 ppb, winter – 1,391.43 ppb), which also presented the highest probability of low entrained hydrocarbon exposure (summer – 60%, winter – 97%).

Table 14-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 14-18 and Figure 14-19 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 14-20 to Figure 14-25 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 14-8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations per season.

The results were calculated from 100 spill simulations during summer conditions.

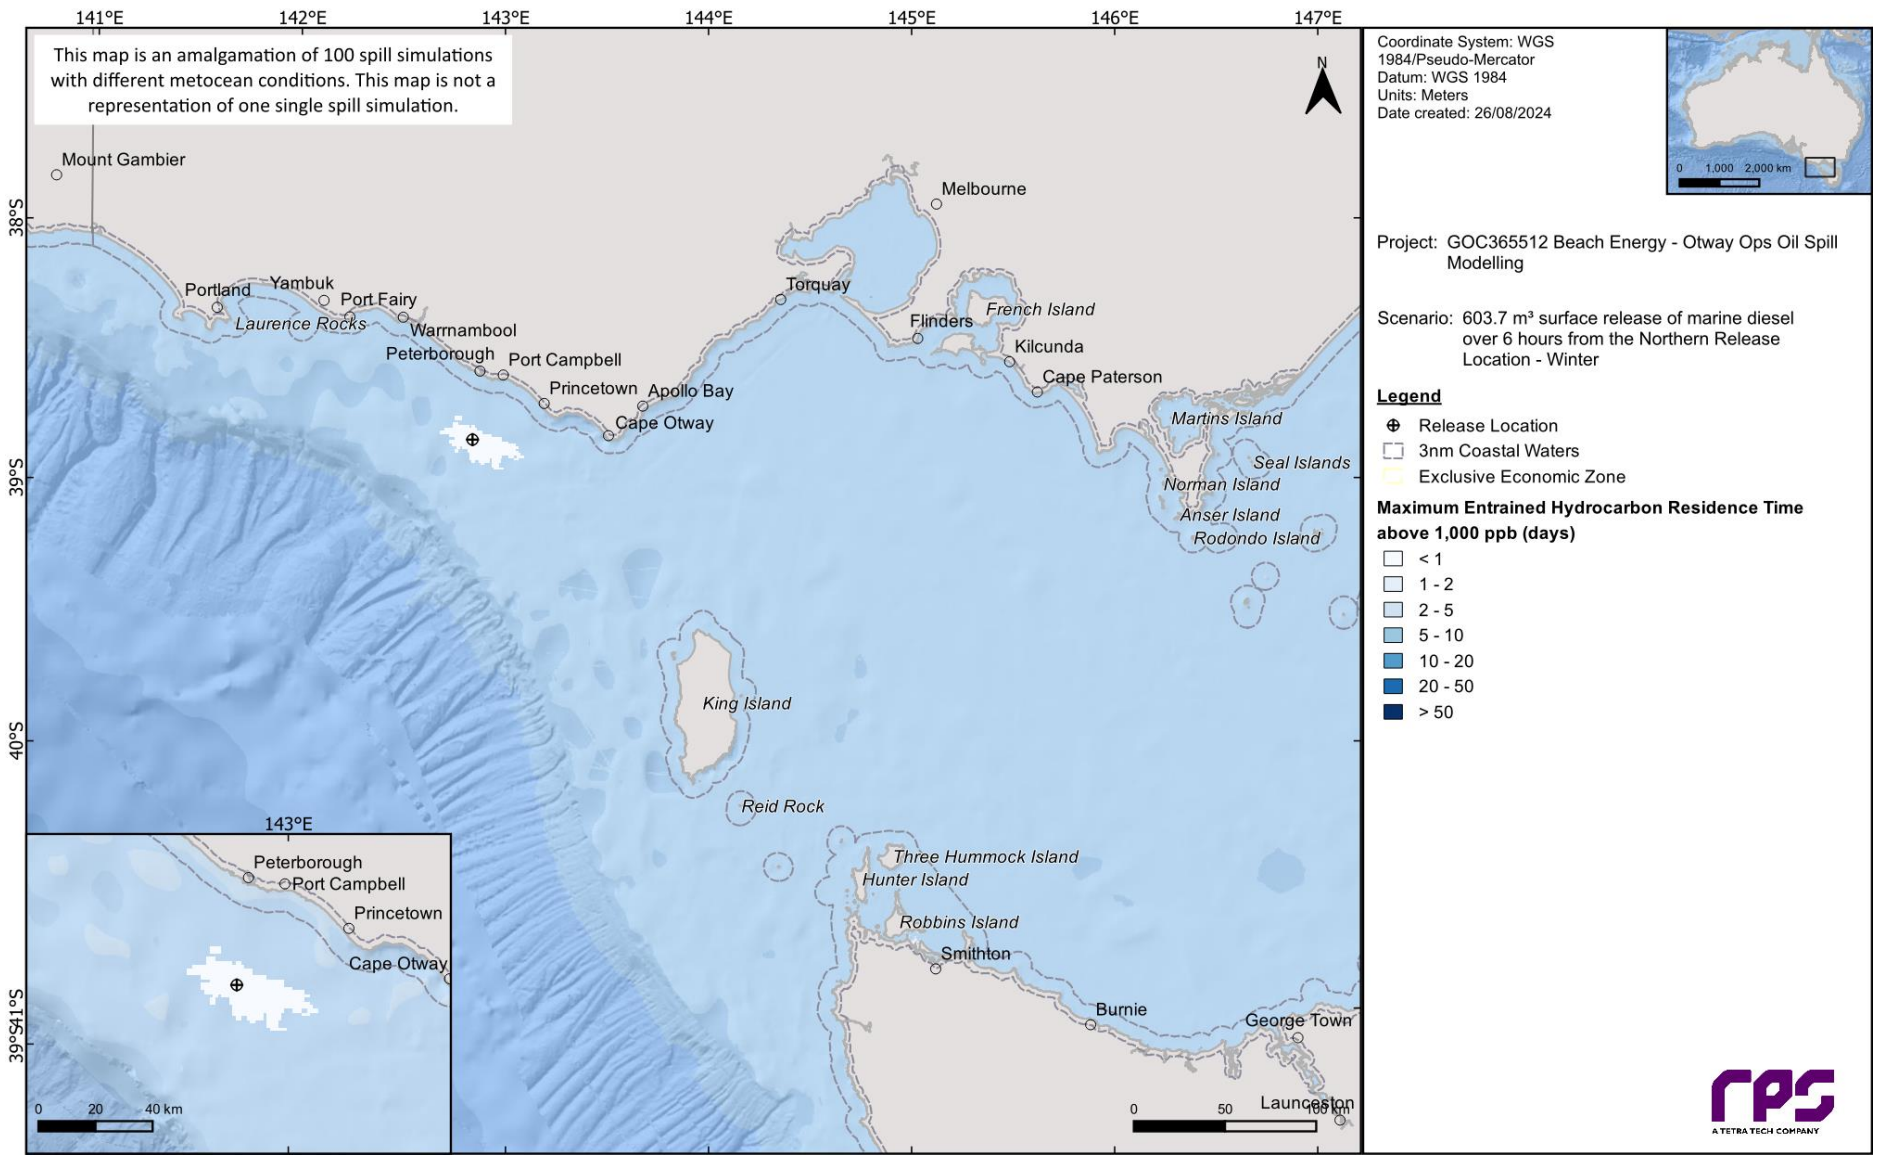

Figure 14-25 Maximum residence time for entrained hydrocarbon exposure above 1,000 ppb, at 0-10 m below the sea surface in the event of a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at Northern Release Location. The results were calculated from 100 spill simulations during winter conditions.

15 RESULTS – LOSS OF WELL CONTROL AT TW1

This scenario examined a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 100 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

15.1 Stochastic Analysis

15.1.1 Area of Exposure

Figure 15-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

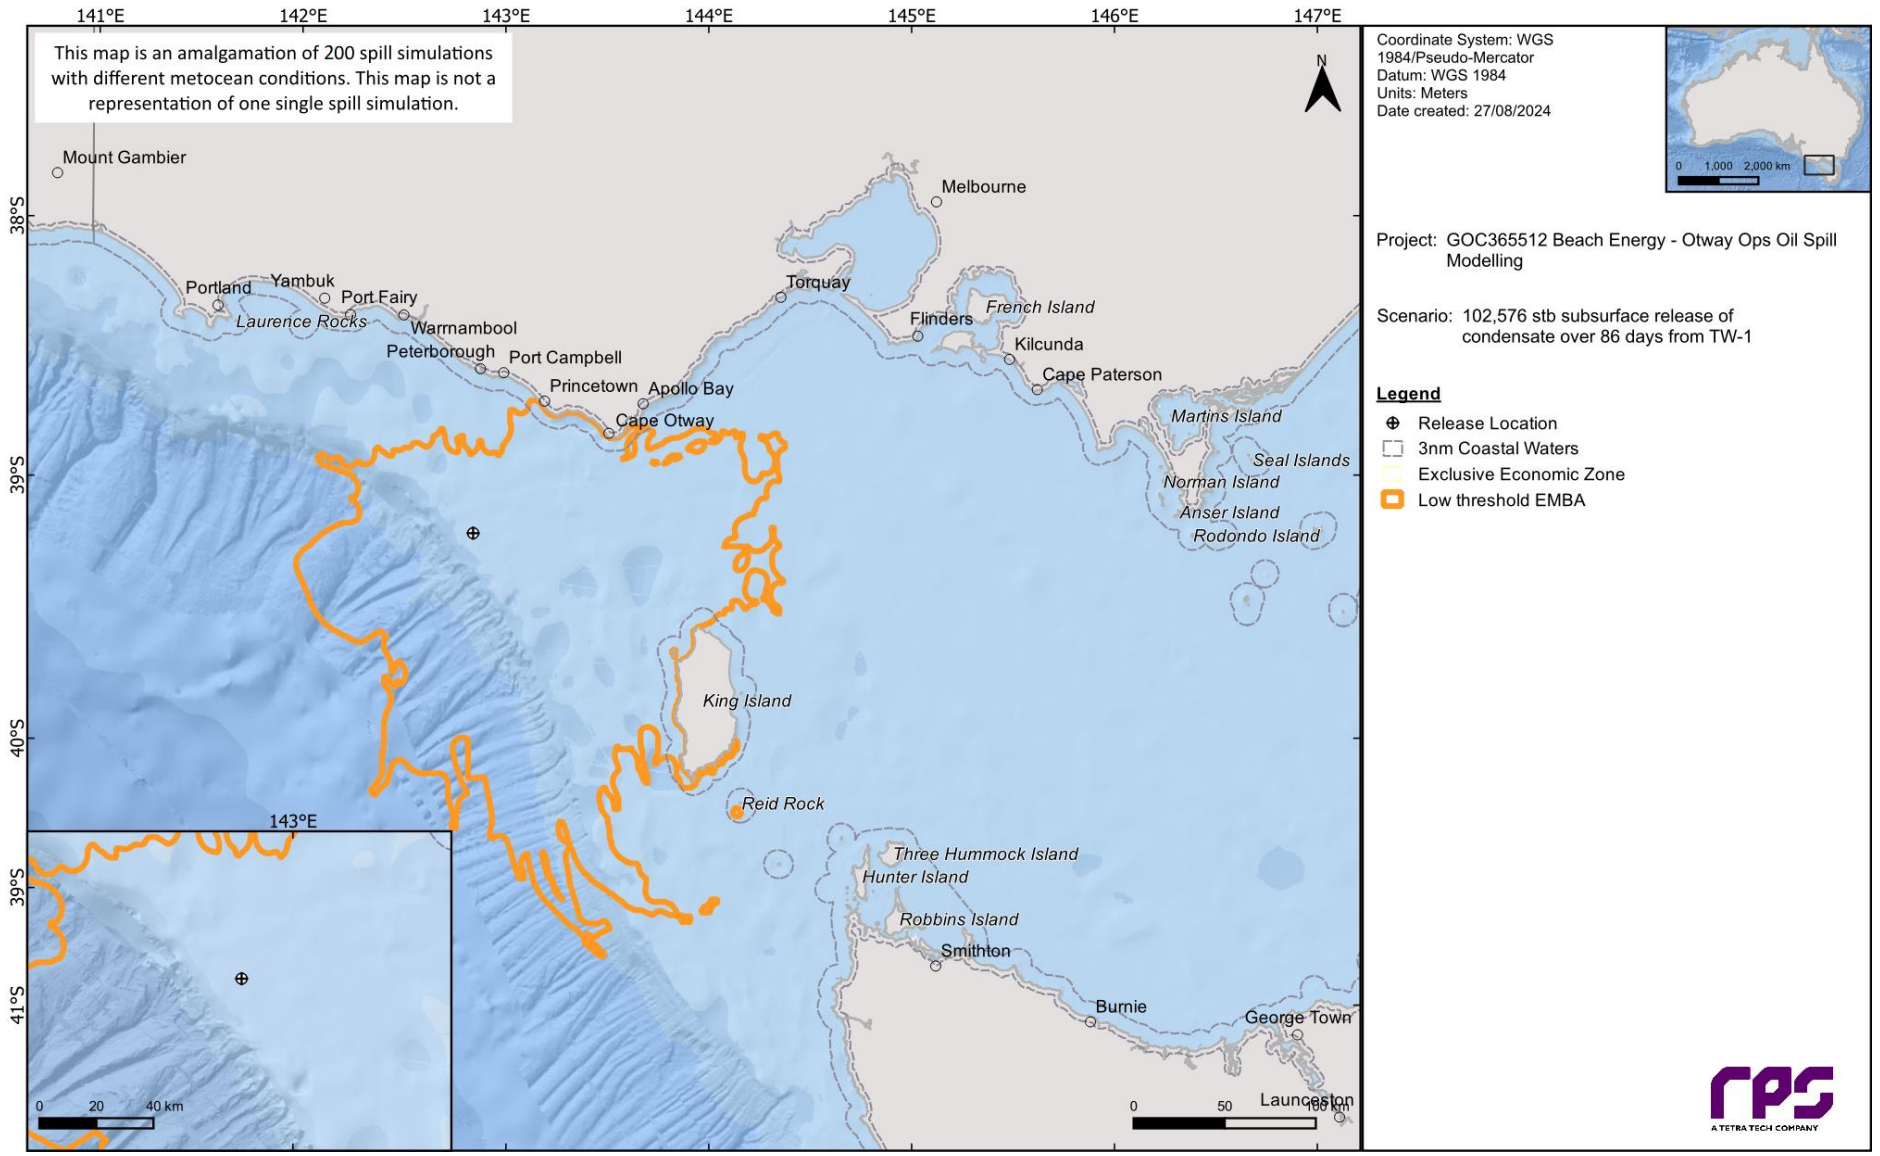

Figure 15-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1 during summer and winter conditions.

15.1.2 Floating Oil Exposure

Table 15-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2) exposure zone was 24.49 km (southeast) during summer conditions and 18.35 km (south) during winter conditions, respectively. No contact was predicted for the moderate (10–50 g/m^2) or high (> 50 g/m^2) thresholds.

Table 15-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest probability of floating oil exposure above the low threshold was predicted at the Pygmy Blue Whale – Foraging BIA (28% summer, 25% winter).

Table 15-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 15-2 and Figure 15-3 present the zones of potential floating oil exposure for all relevant thresholds under summer and winter conditions, respectively.

Figure 15-4 and Figure 15-5 present the minimum time before floating oil exposure for the low NOPSEMA threshold during summer and winter, respectively.

Table 15-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	24.49	-	-
	Direction	Southeast	-	-
Winter	Maximum distance (km) from release location	18.35	-	-
	Direction	South	-	-

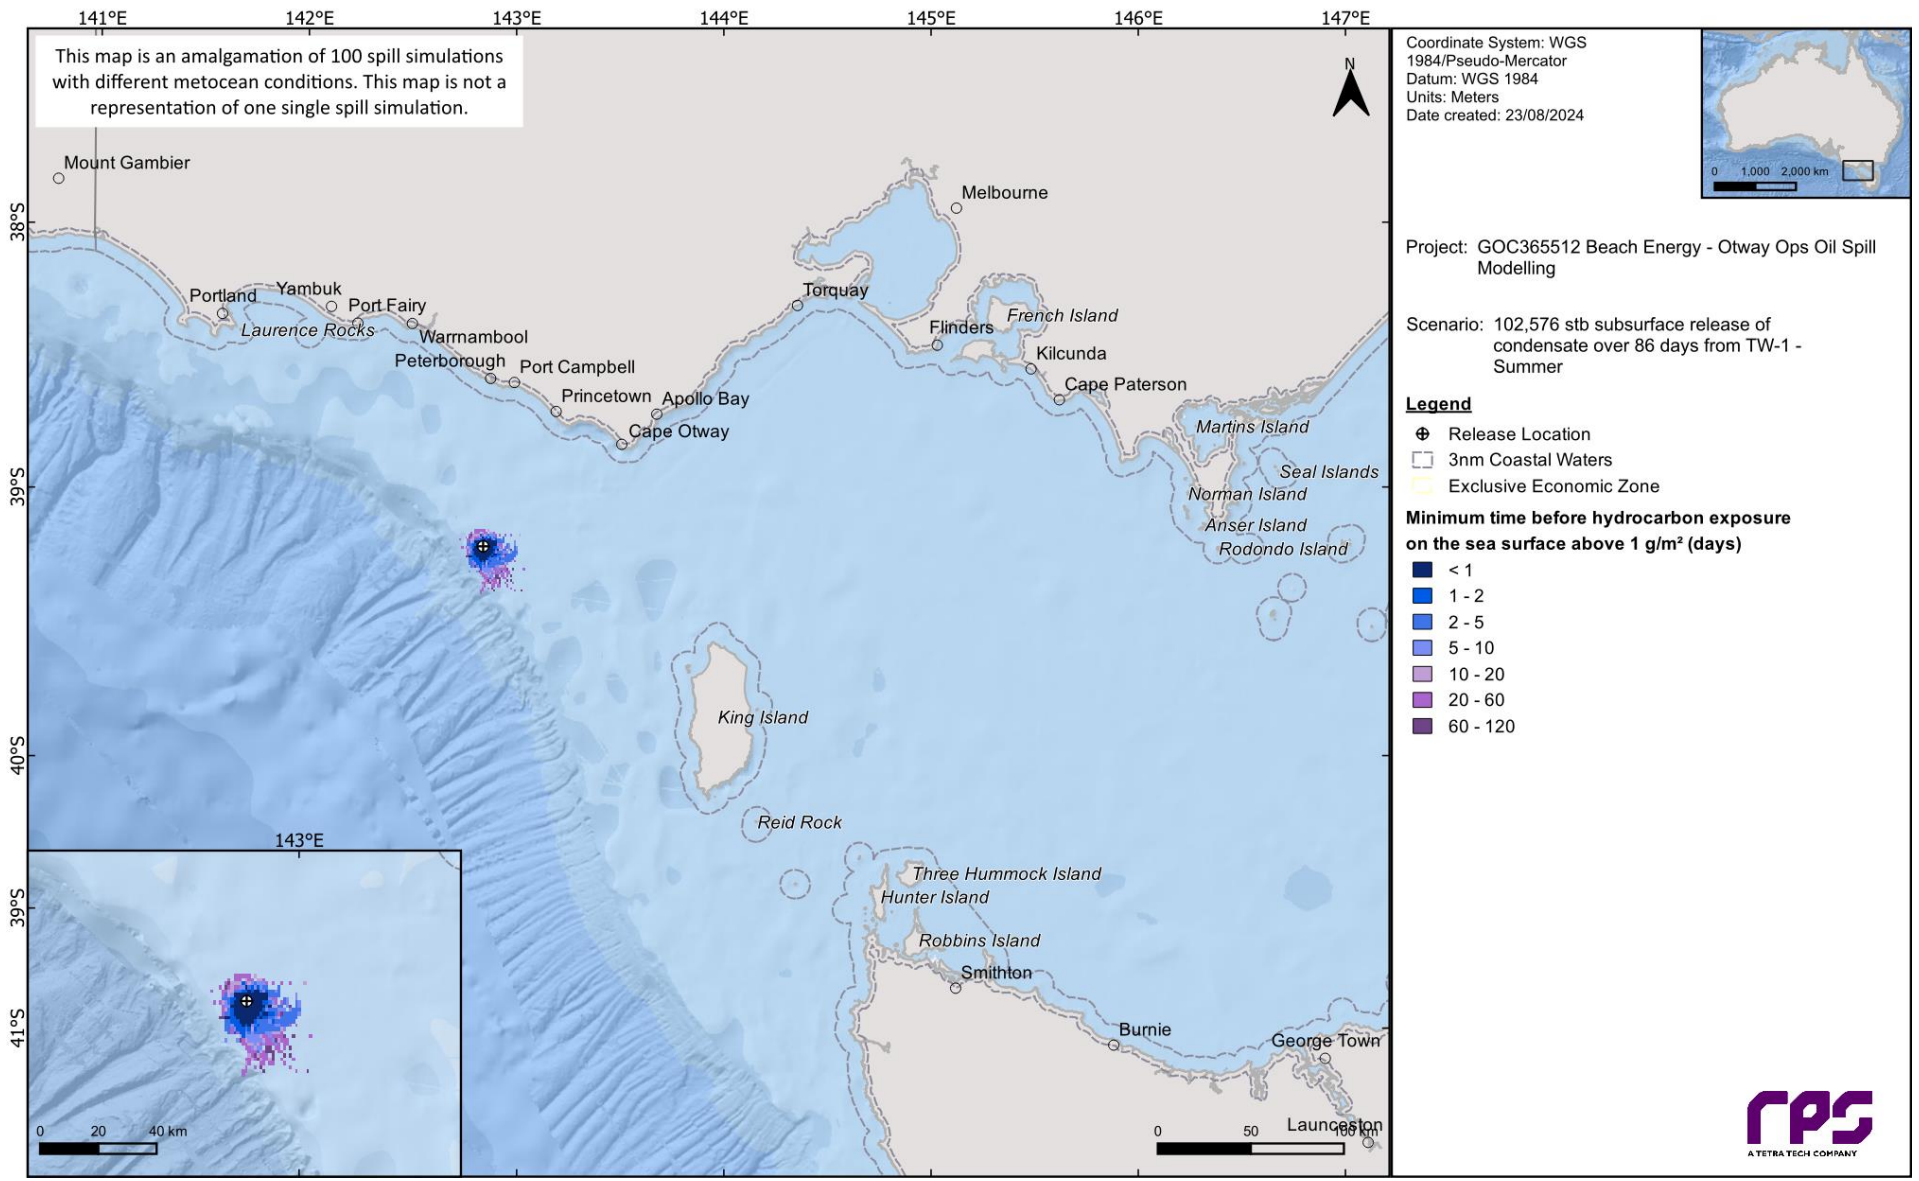

Figure 15-4 Maximum residence time of floating oil exposure above 1 g/m², in the event of 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

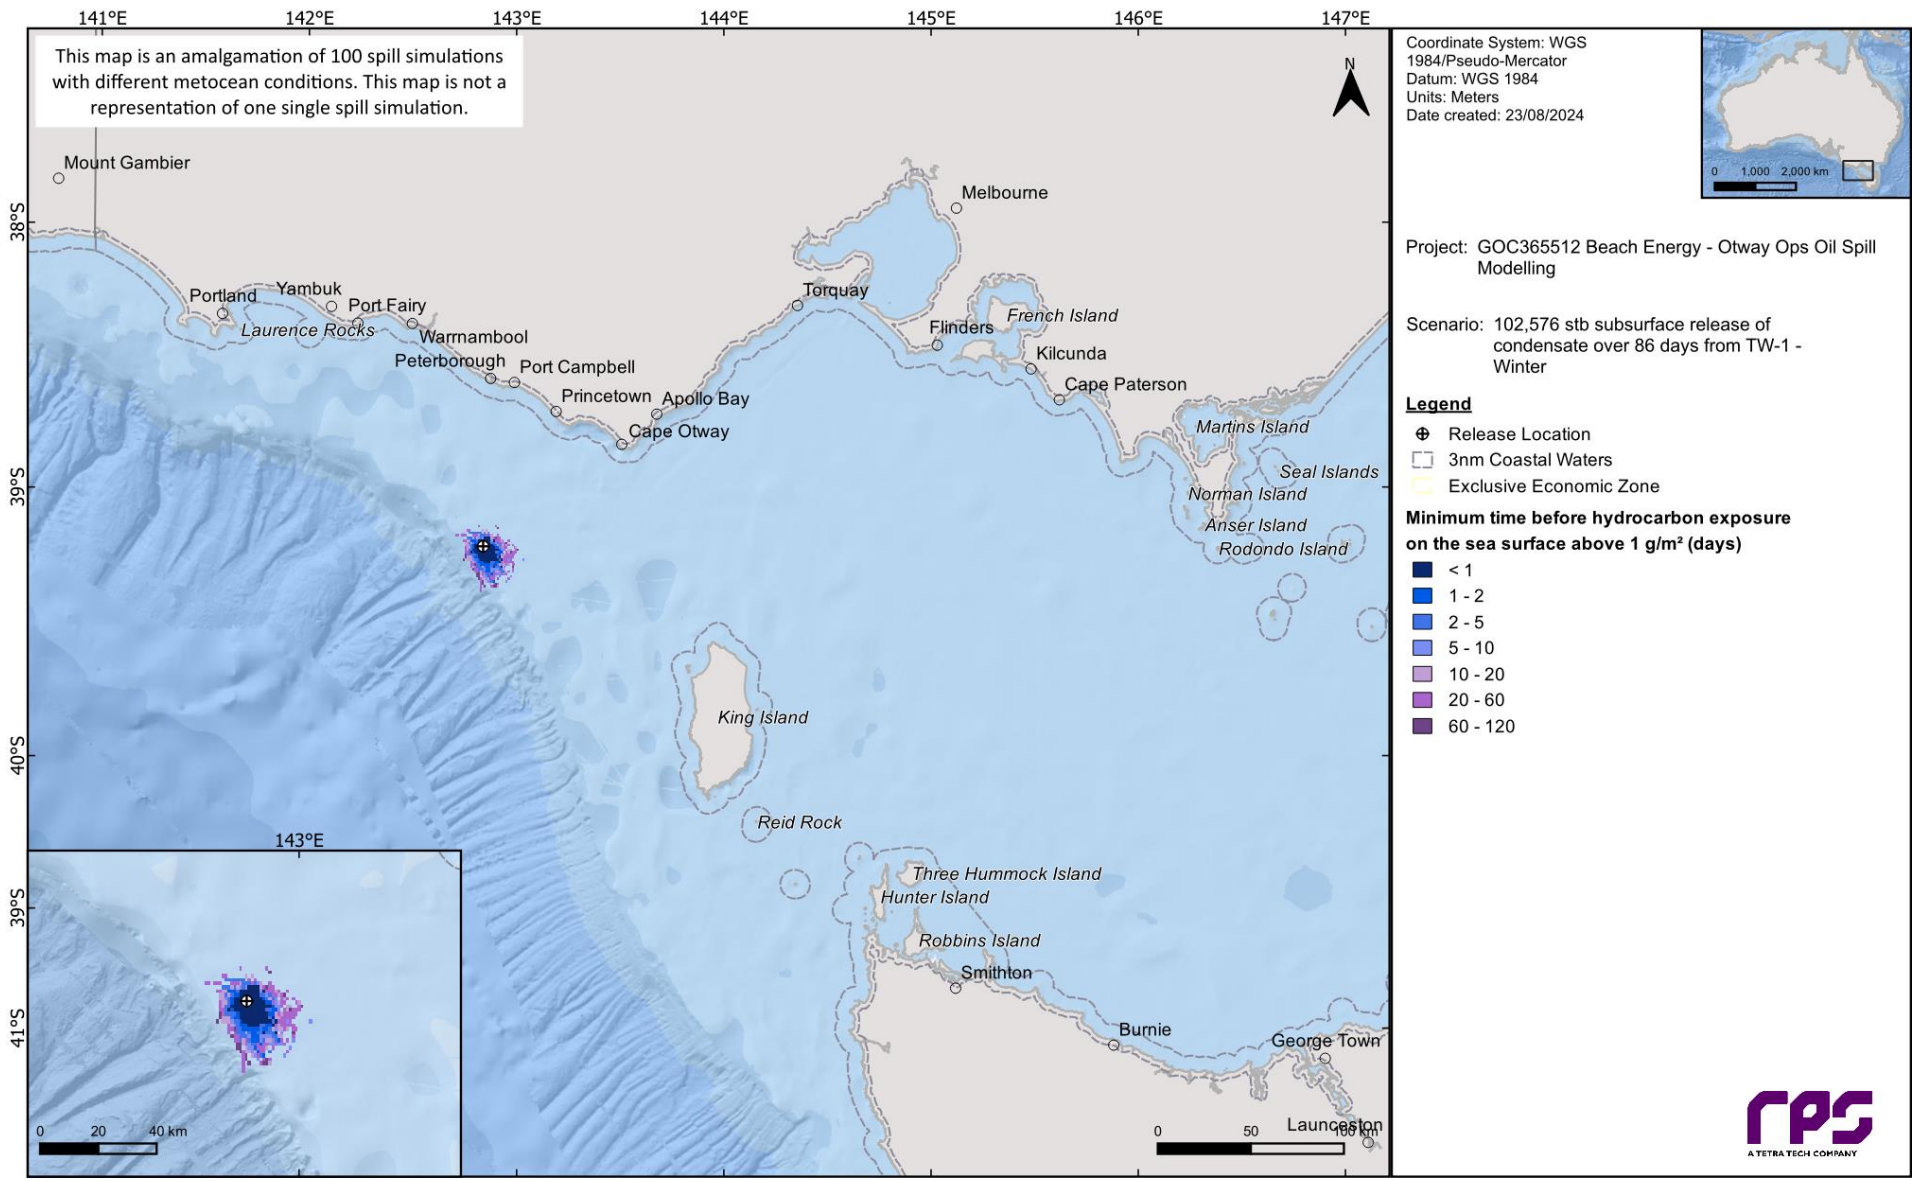

Figure 15-5 Maximum residence time of floating oil exposure above 1 g/m², in the event of 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

15.1.3 Shoreline Accumulation

Table 15-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 32% during summer conditions and 57% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 25.38 days during summer conditions, and 21.93 days during winter conditions. The maximum volume ashore for a single spill trajectory during the summer and winter conditions was 6.15 m^3 and 8.36 m^3, respectively, whilst the maximum length of shoreline accumulation at the low threshold was 12.62 km and 13.90 km, respectively. No shoreline accumulation was predicted for the moderate (100 g/m^2) and high (1,000 g/m^2) thresholds.

Table 15-5 summarises the shoreline accumulation on individual receptors during the summer and winter conditions. The King Island Council (TAS) shoreline recorded the highest probability of shoreline accumulation at the low threshold, being 26% and 48% during summer and winter respectively. The minimum time before shoreline accumulation above the low threshold was 25.38 and 21.93 days during summer and winter, predicted for the same receptor.

The summer and winter conditions maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented in Figure 15-6 and Figure 15-7, respectively.

Table 15-4 Summary of oil accumulation across all shorelines. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	32	57
Absolute minimum time for visible oil to shore (days)	25.38	21.93
Maximum total volume of hydrocarbons ashore (m^3)	6.15	8.36
Average volume of hydrocarbons ashore (m^3)	2.52	3.78
Maximum length of the shoreline at **10 g/m^2** (km)	12.62	13.90
Average shoreline length (km) at **10 g/m^2** (km)	1.21	2.16
Maximum length of the shoreline at **100 g/m^2** (km)	-	-
Average shoreline length (km) at **100 g/m^2** (km)	-	-
Maximum length of the shoreline at **1,000 g/m^2** (km)	-	-
Average shoreline length (km) at **1,000 g/m^2** (km)	-	-

Table 15-5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at the TW1. The results were calculated from 100 spill simulations per season.

15.1.4 In-water exposure

15.1.4.1 Dissolved Hydrocarbons

Table 15-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of dissolved hydrocarbon was 553.15 ppb during summer and 528.54 ppb during winter.

Table 15-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 15-8 and Figure 15-9 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 15-10 to Figure 15-15 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 15-6 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

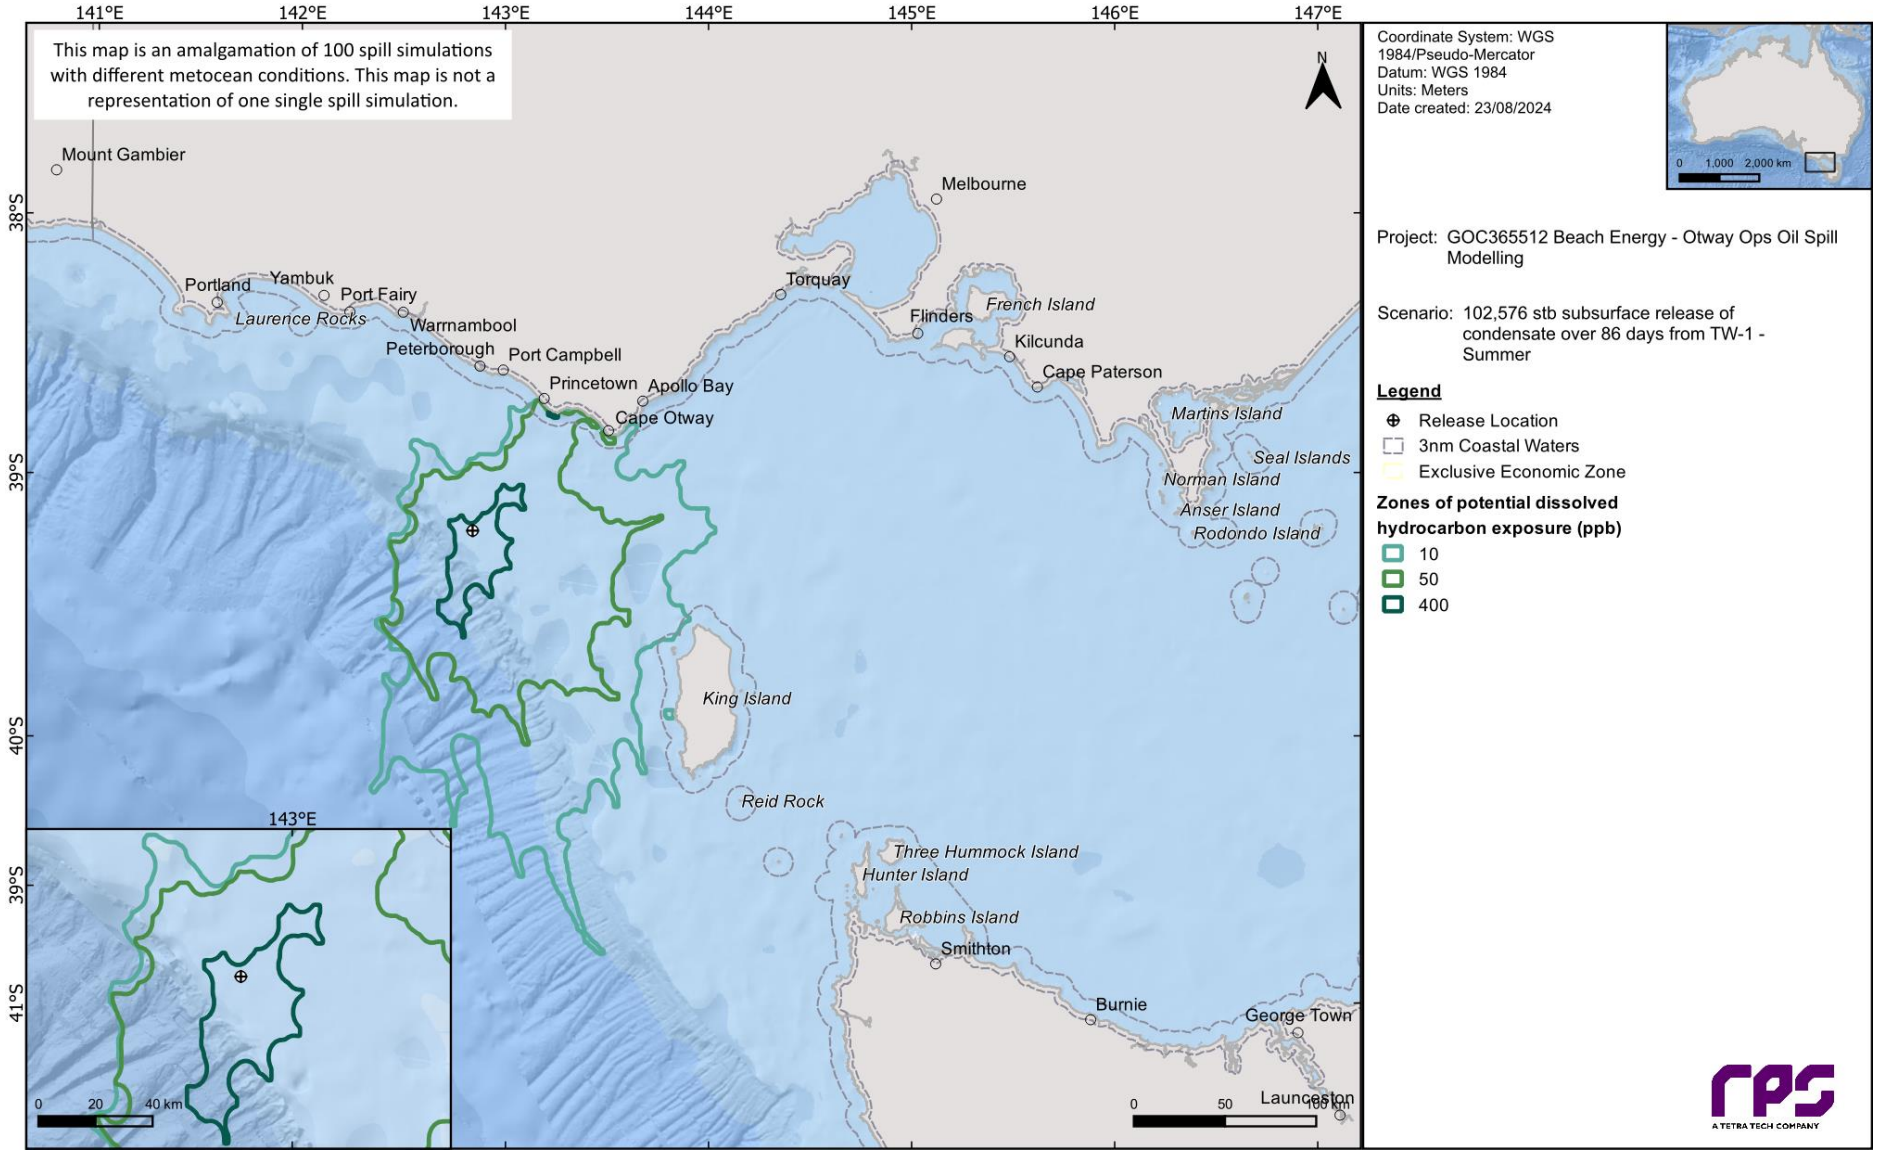

Figure 15-8 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

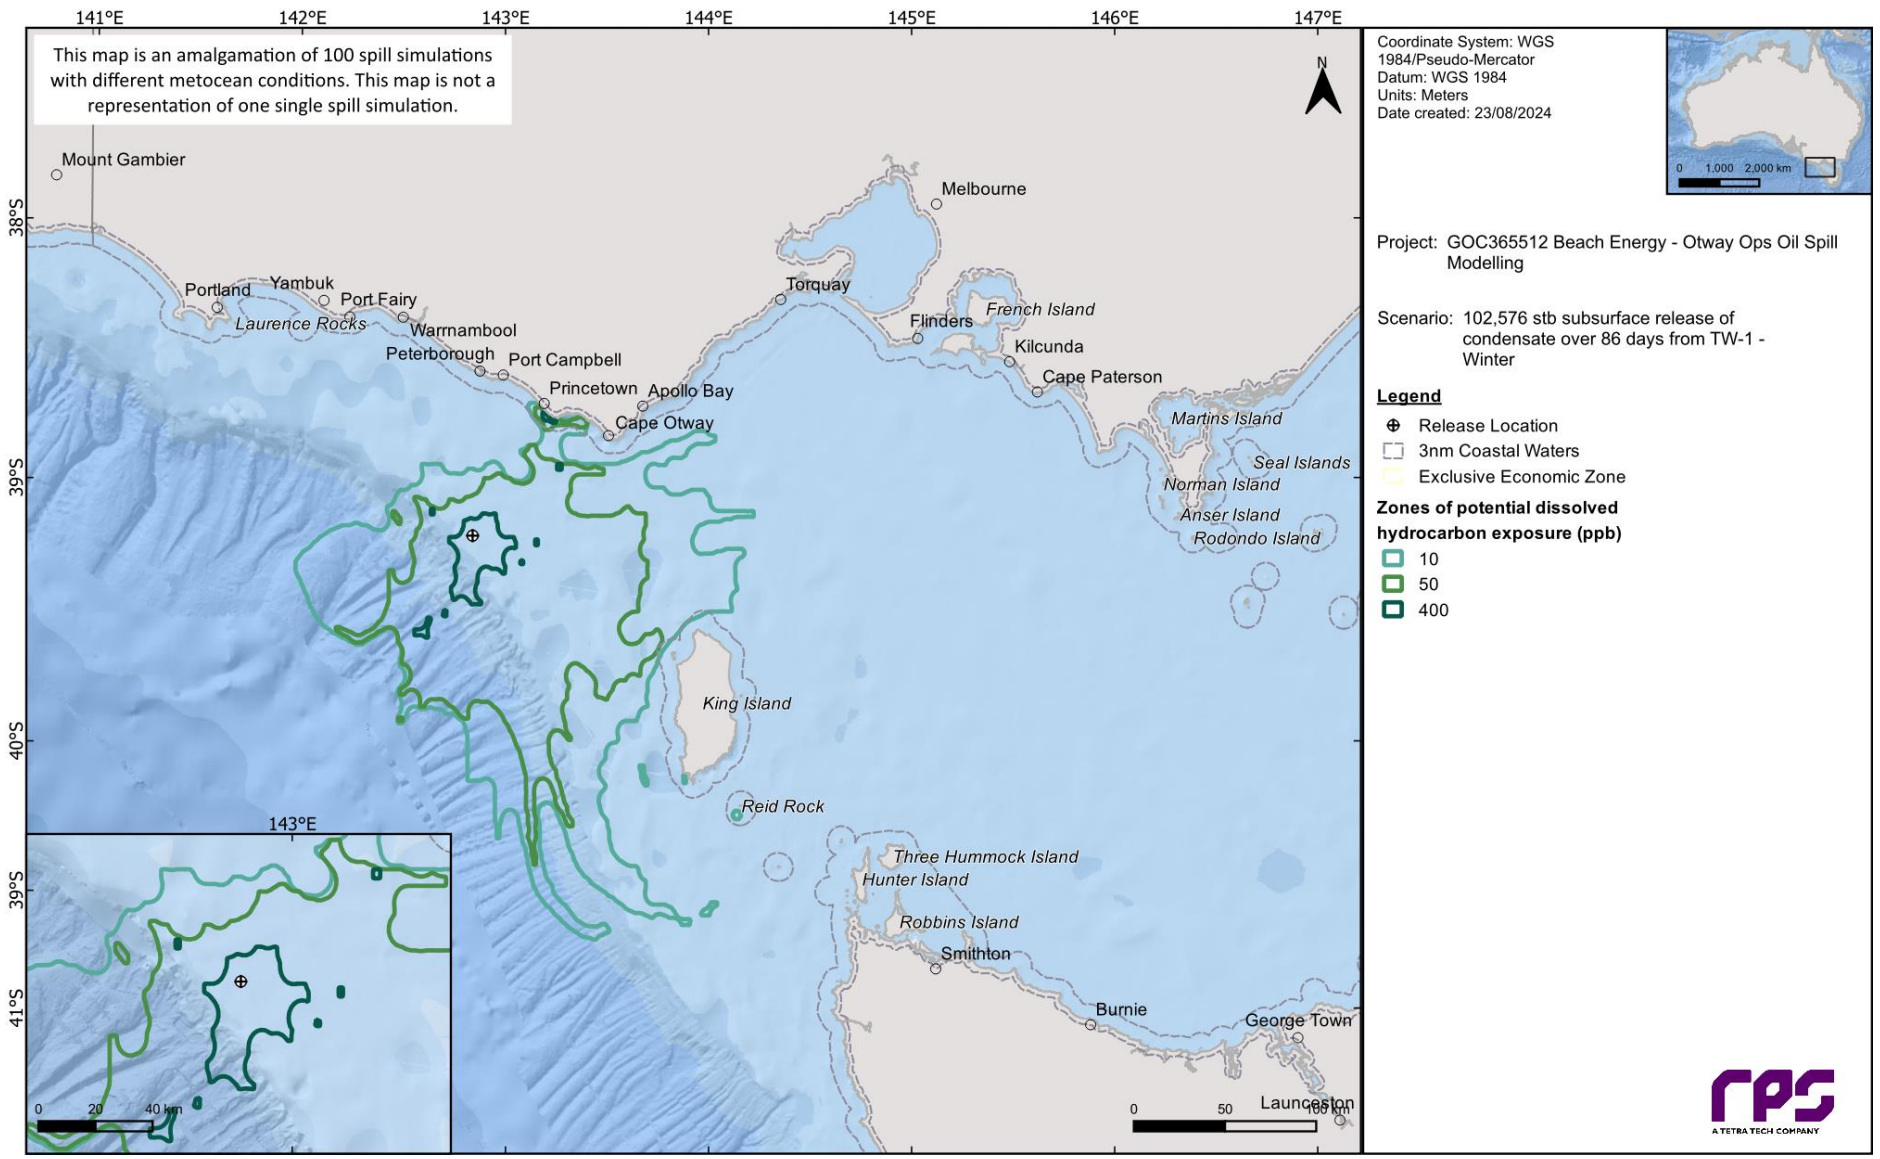

Figure 15-9 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

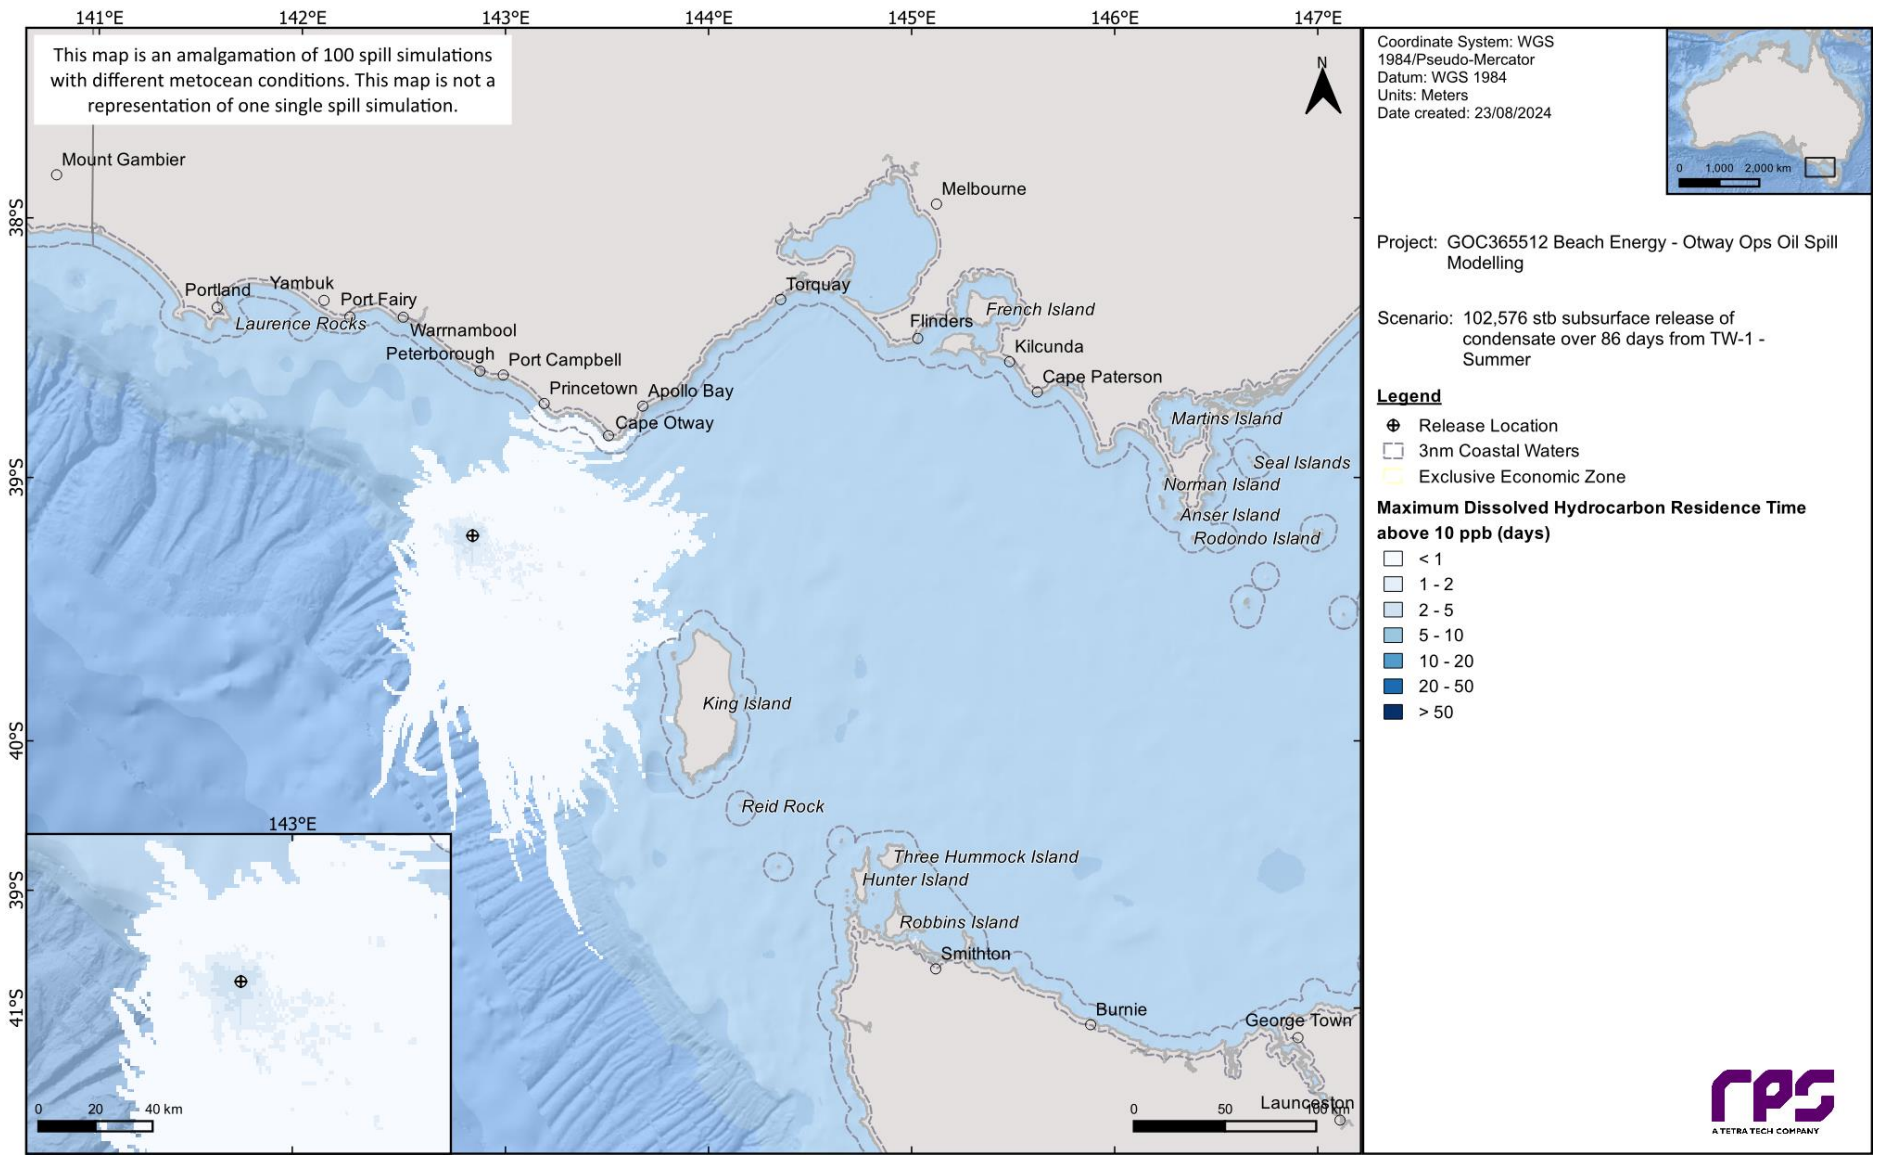

Figure 15-10 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

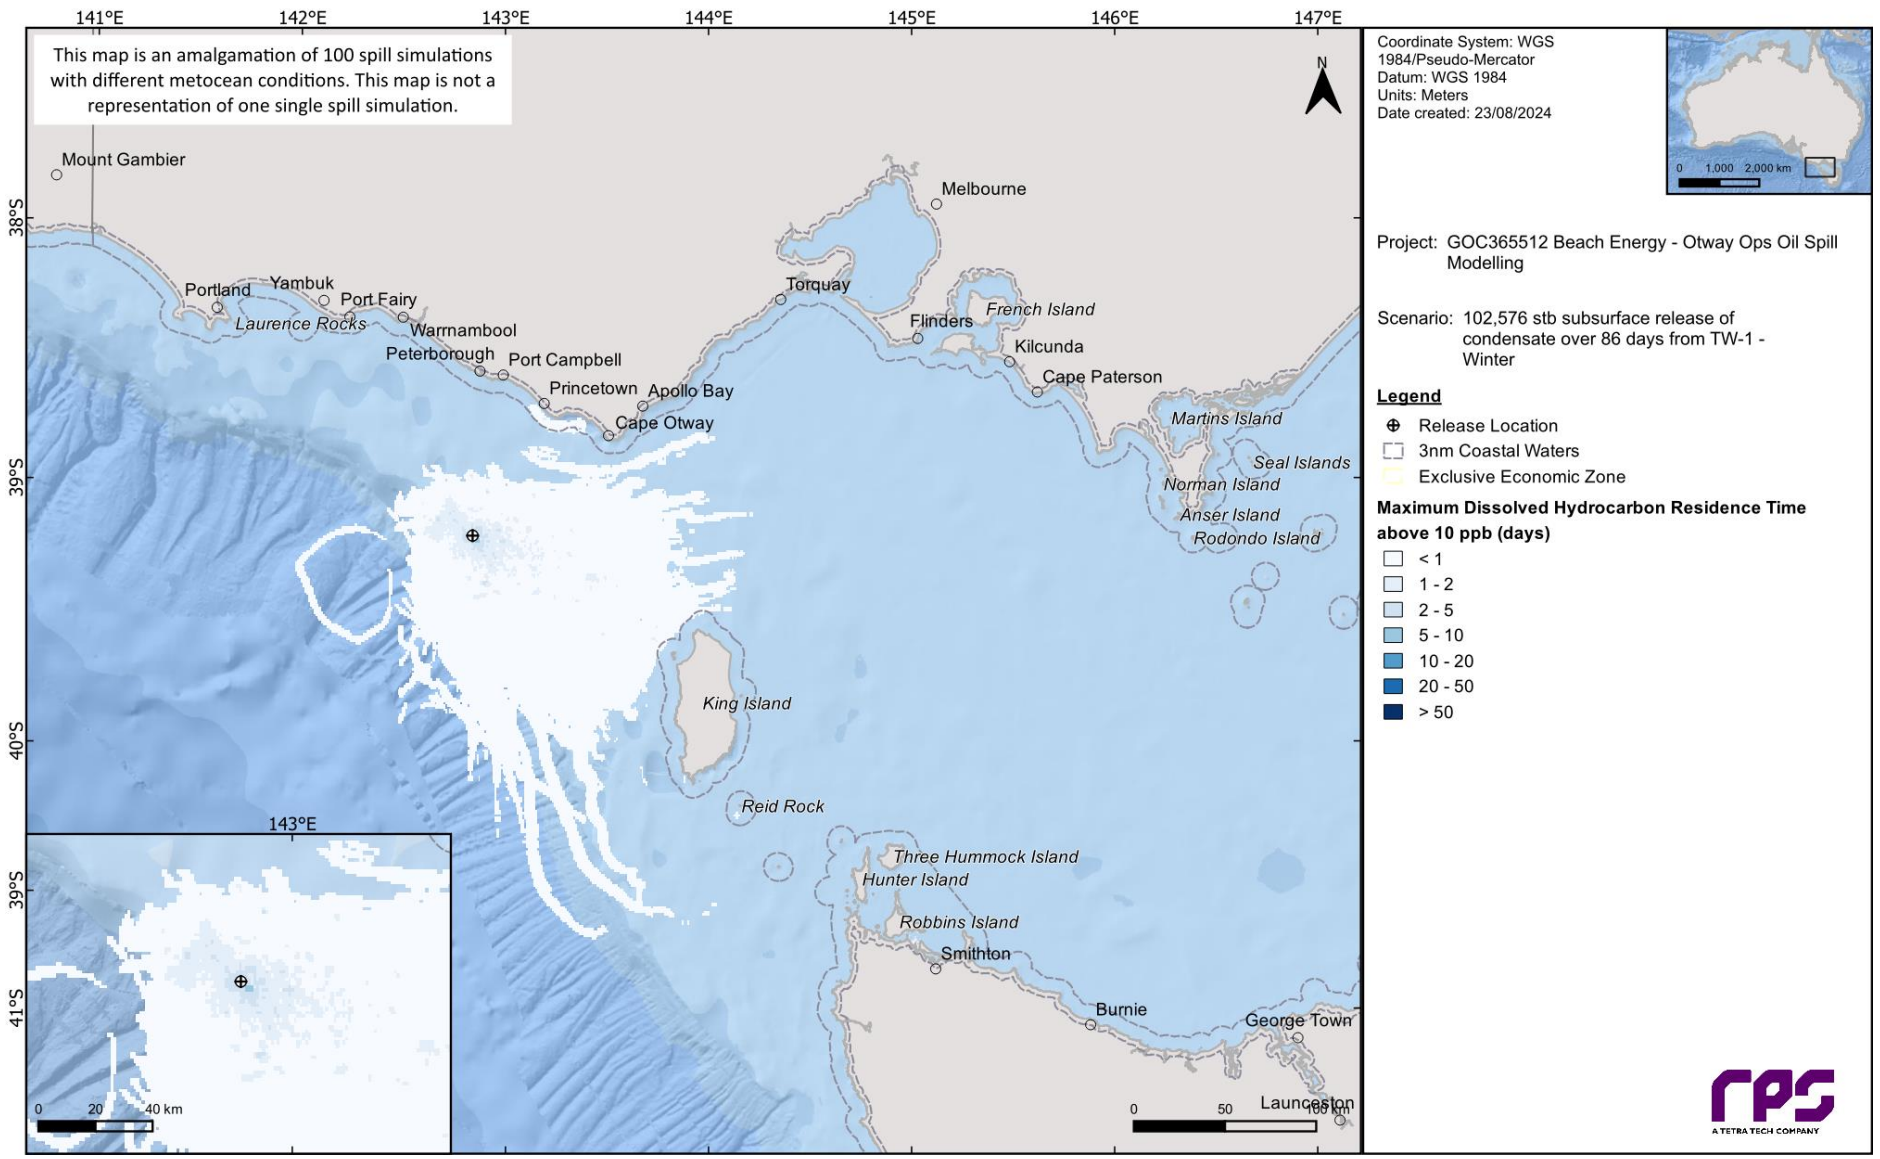

Figure 15-11 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

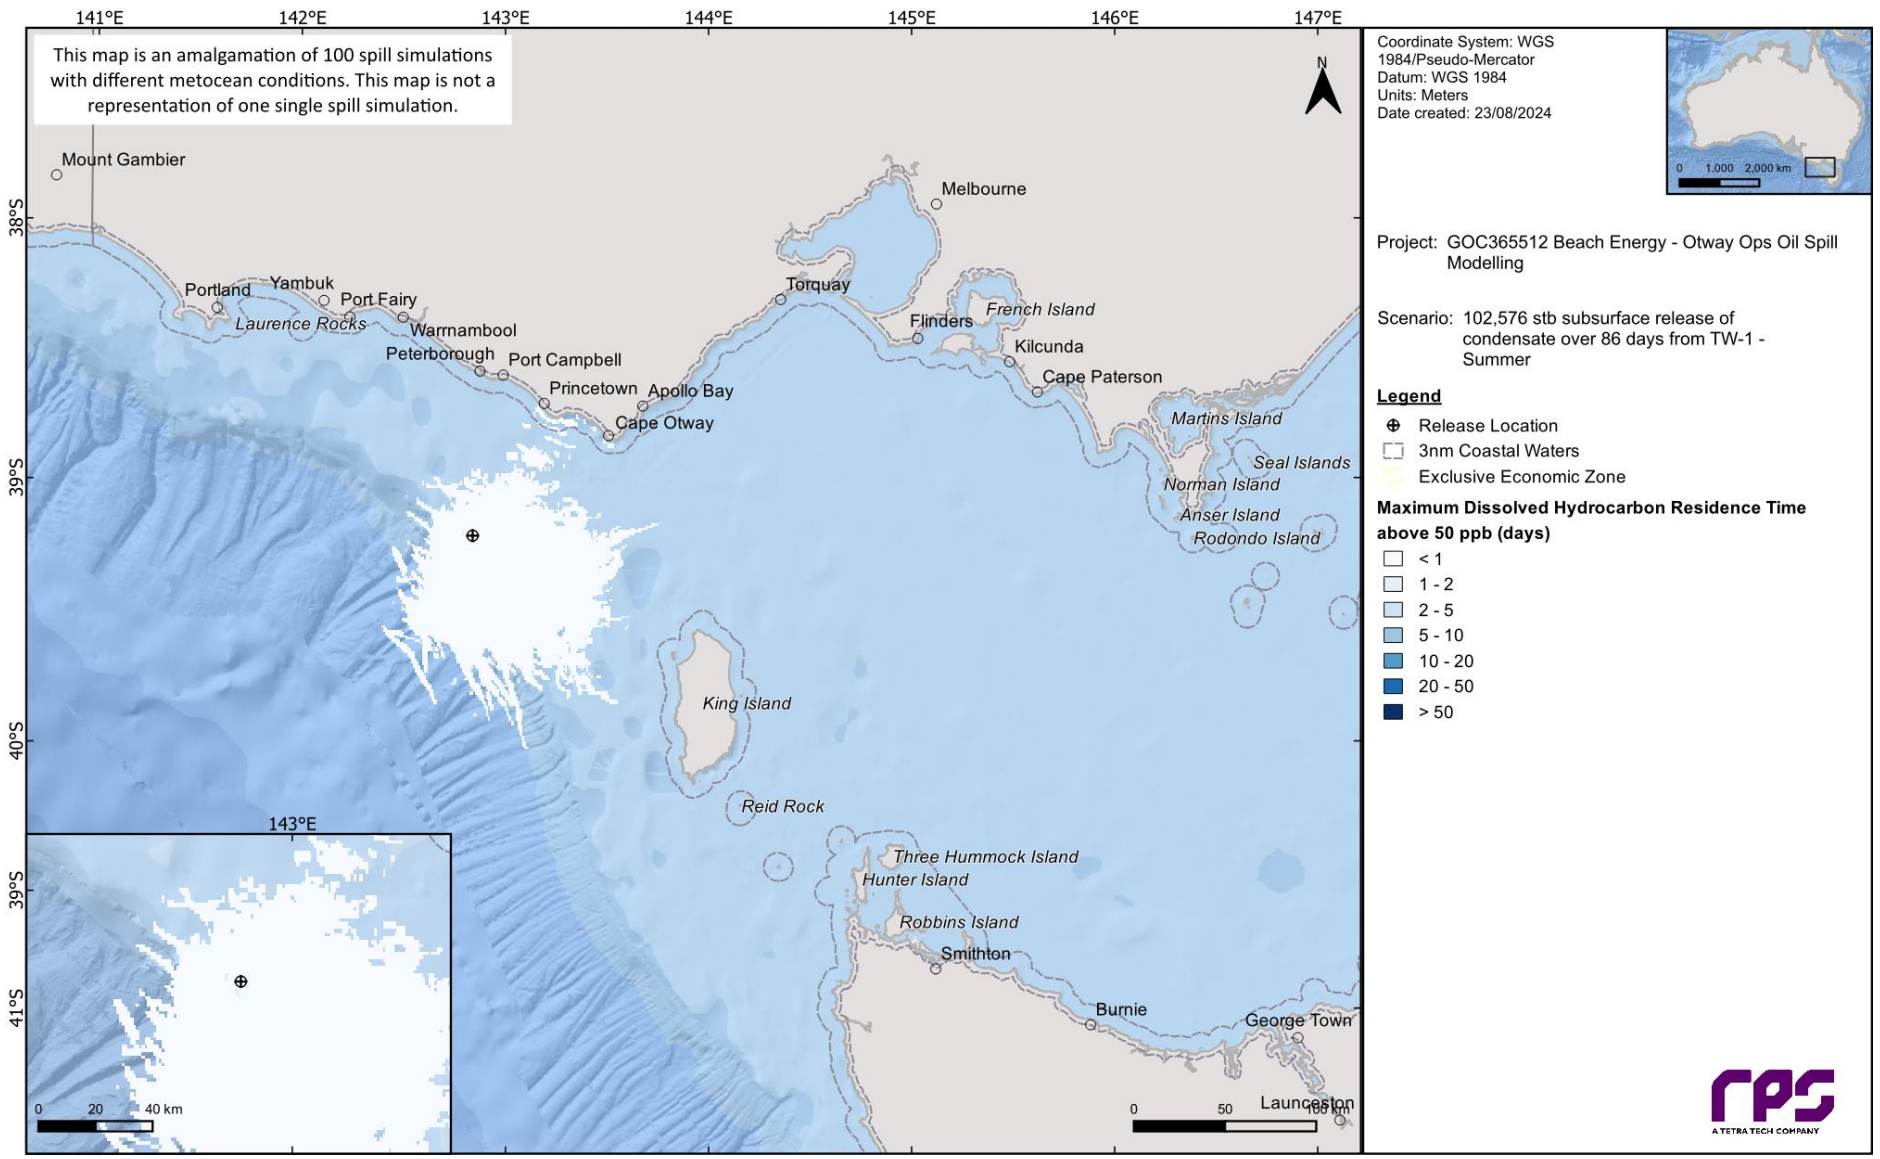

Figure 15-12 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

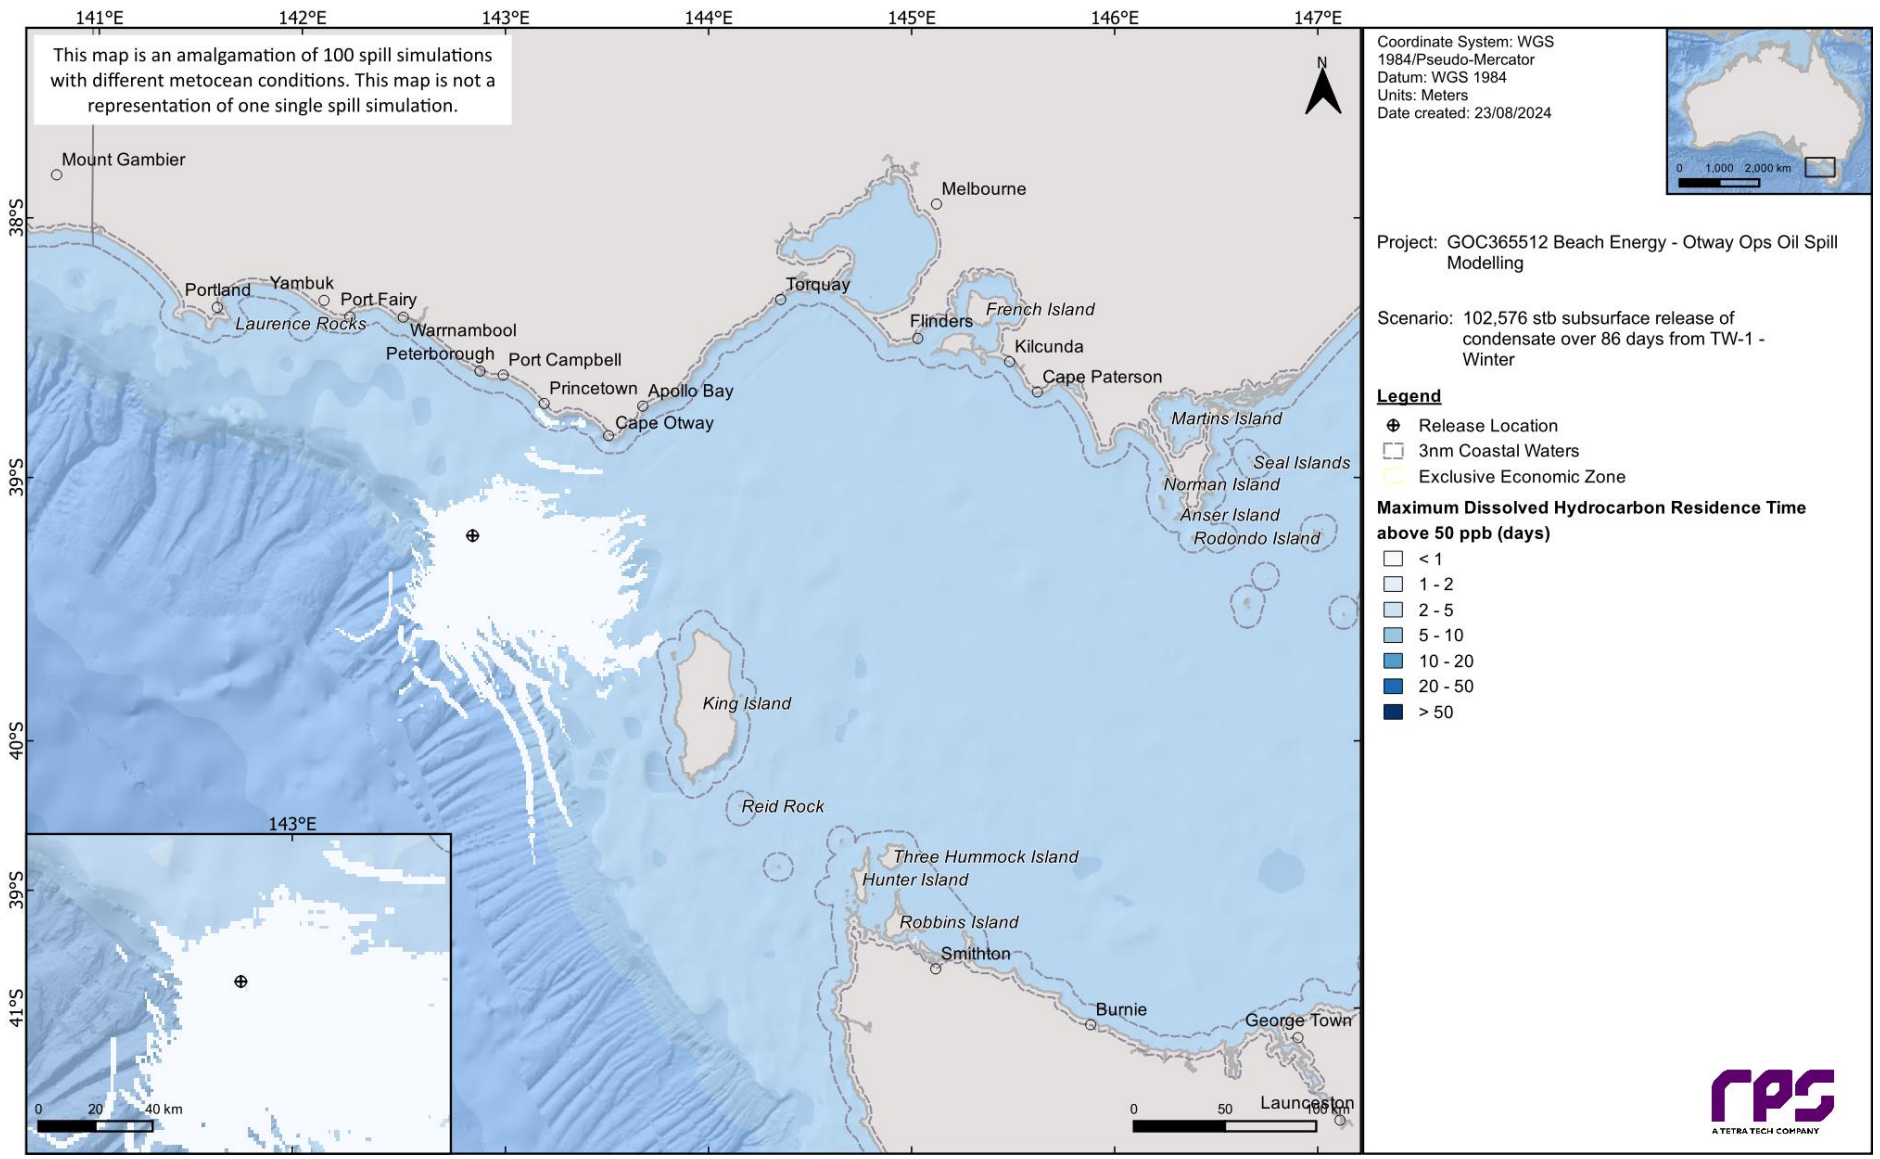

Figure 15-13 Maximum residence time for dissolved hydrocarbon exposure above 50 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

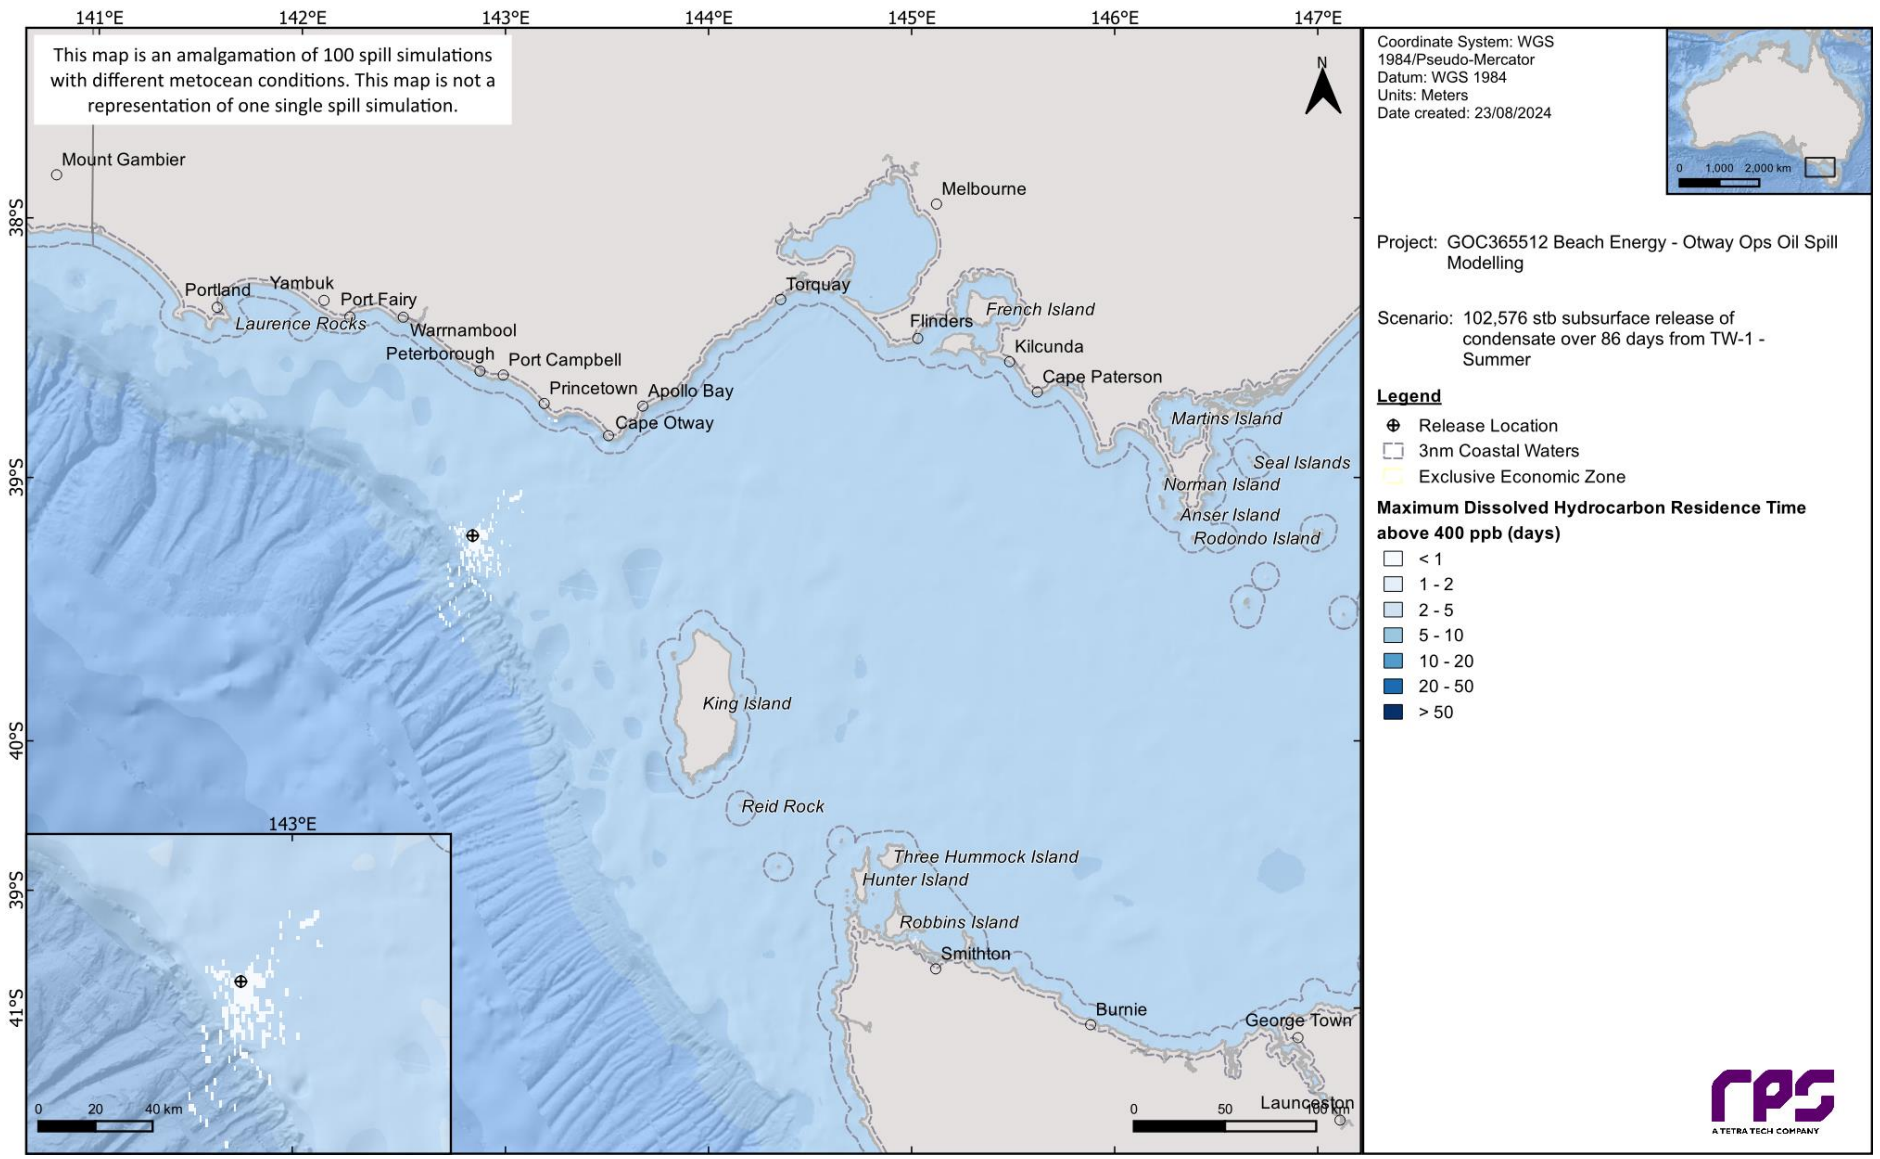

Figure 15-14 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

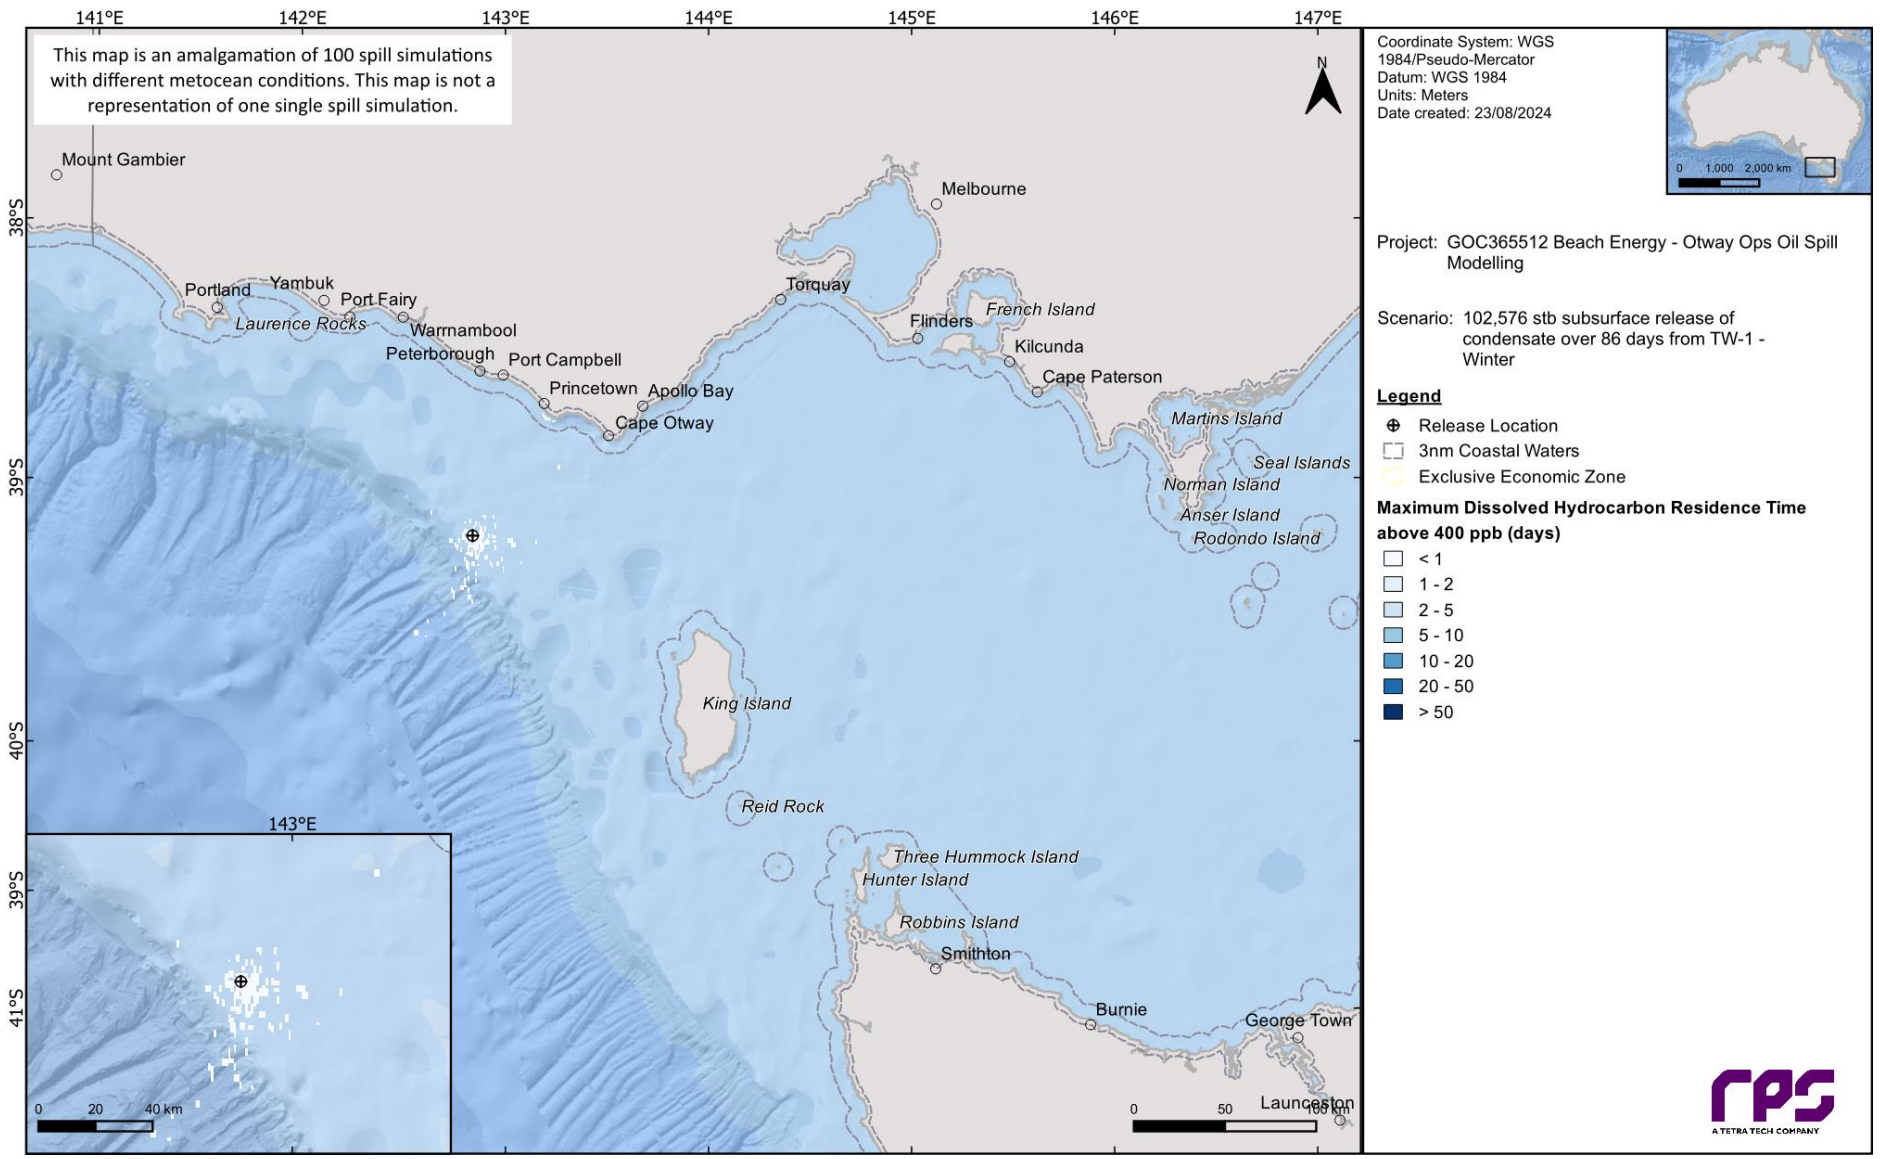

Figure 15-15 Maximum residence time for dissolved hydrocarbon exposure above 400 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

15.1.4.2 Entrained Hydrocarbons

Table 15-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for White Shark – Distribution (Between 120 – 1,000 m depth contour) (summer – 338.67 ppb, winter – 328.89 ppb).

Table 15-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 15-16 and Figure 15-17 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 15-18 to Figure 15-21 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 15-8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations per season.

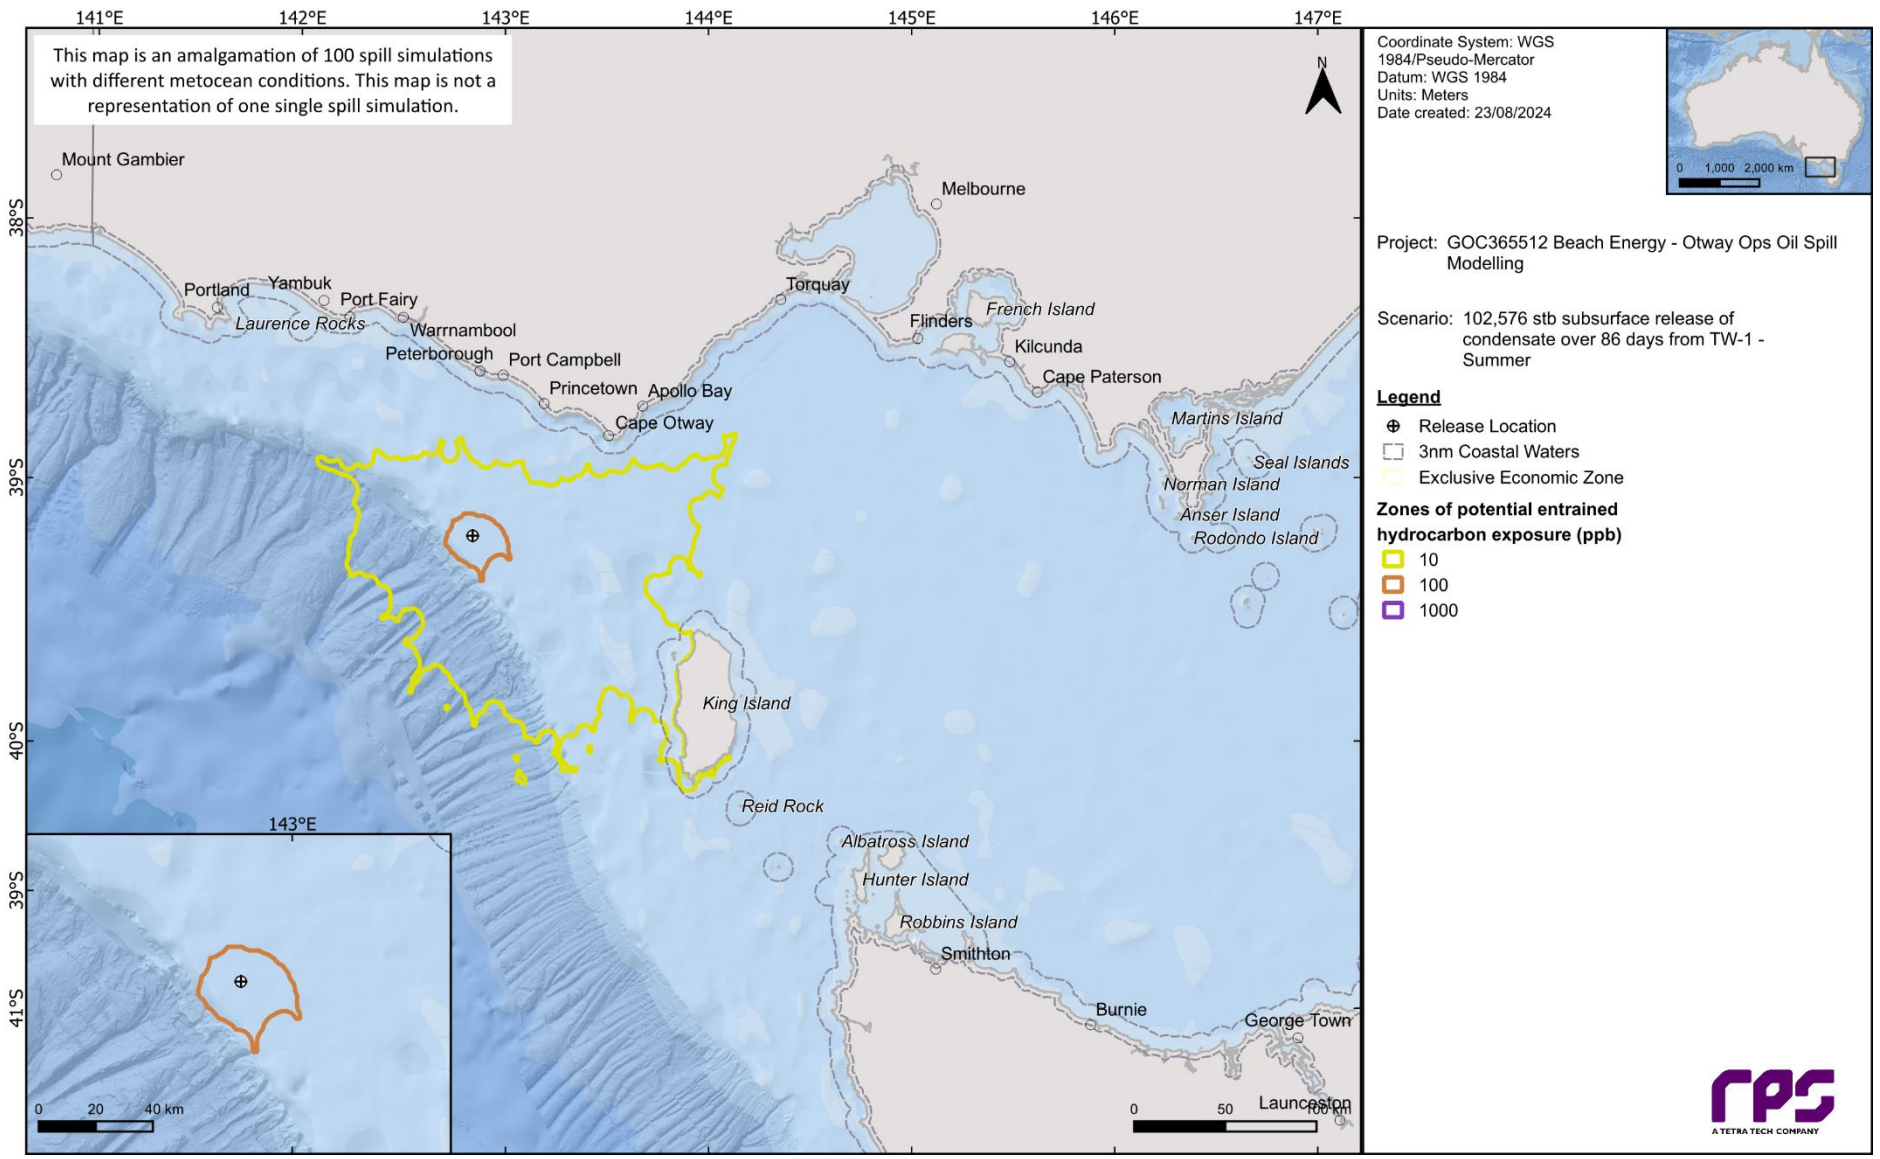

Figure 15-16 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

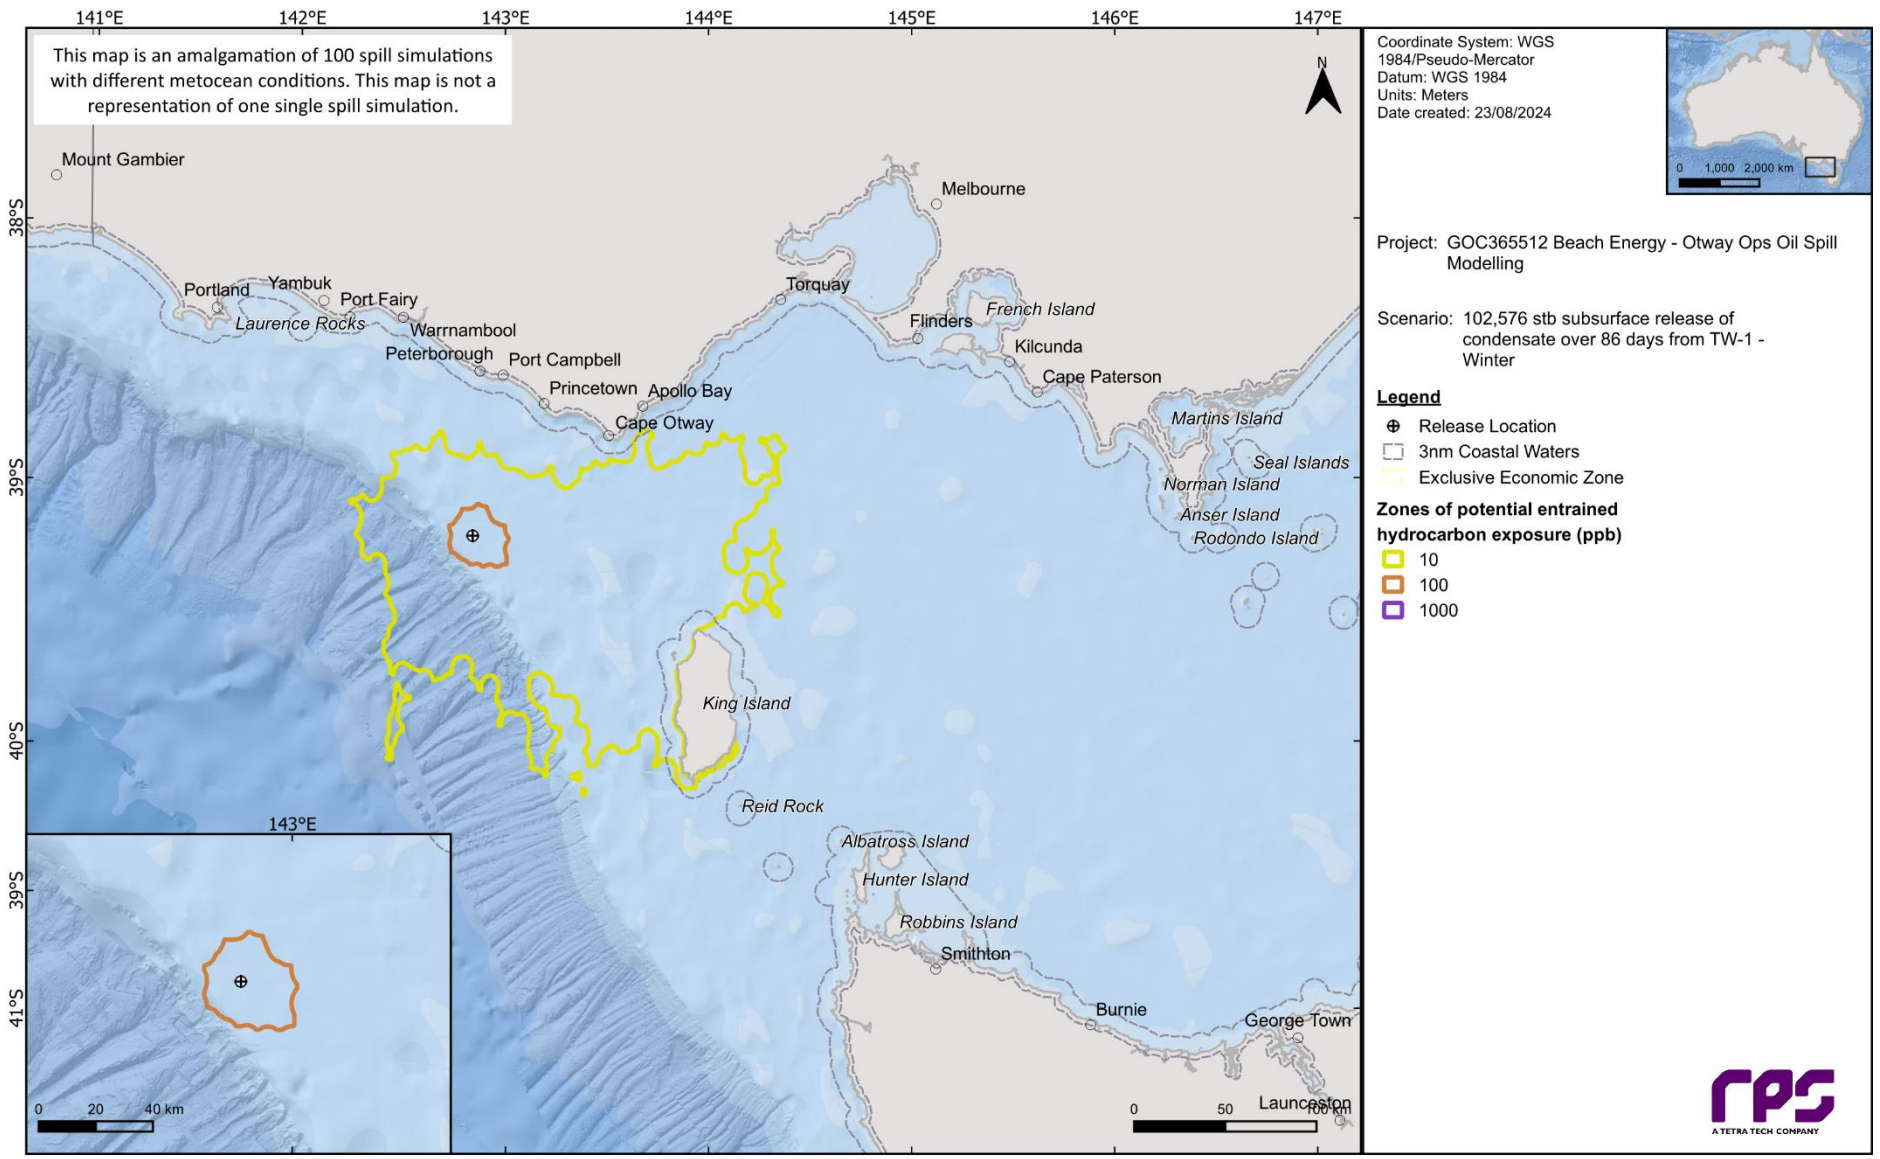

Figure 15-17 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

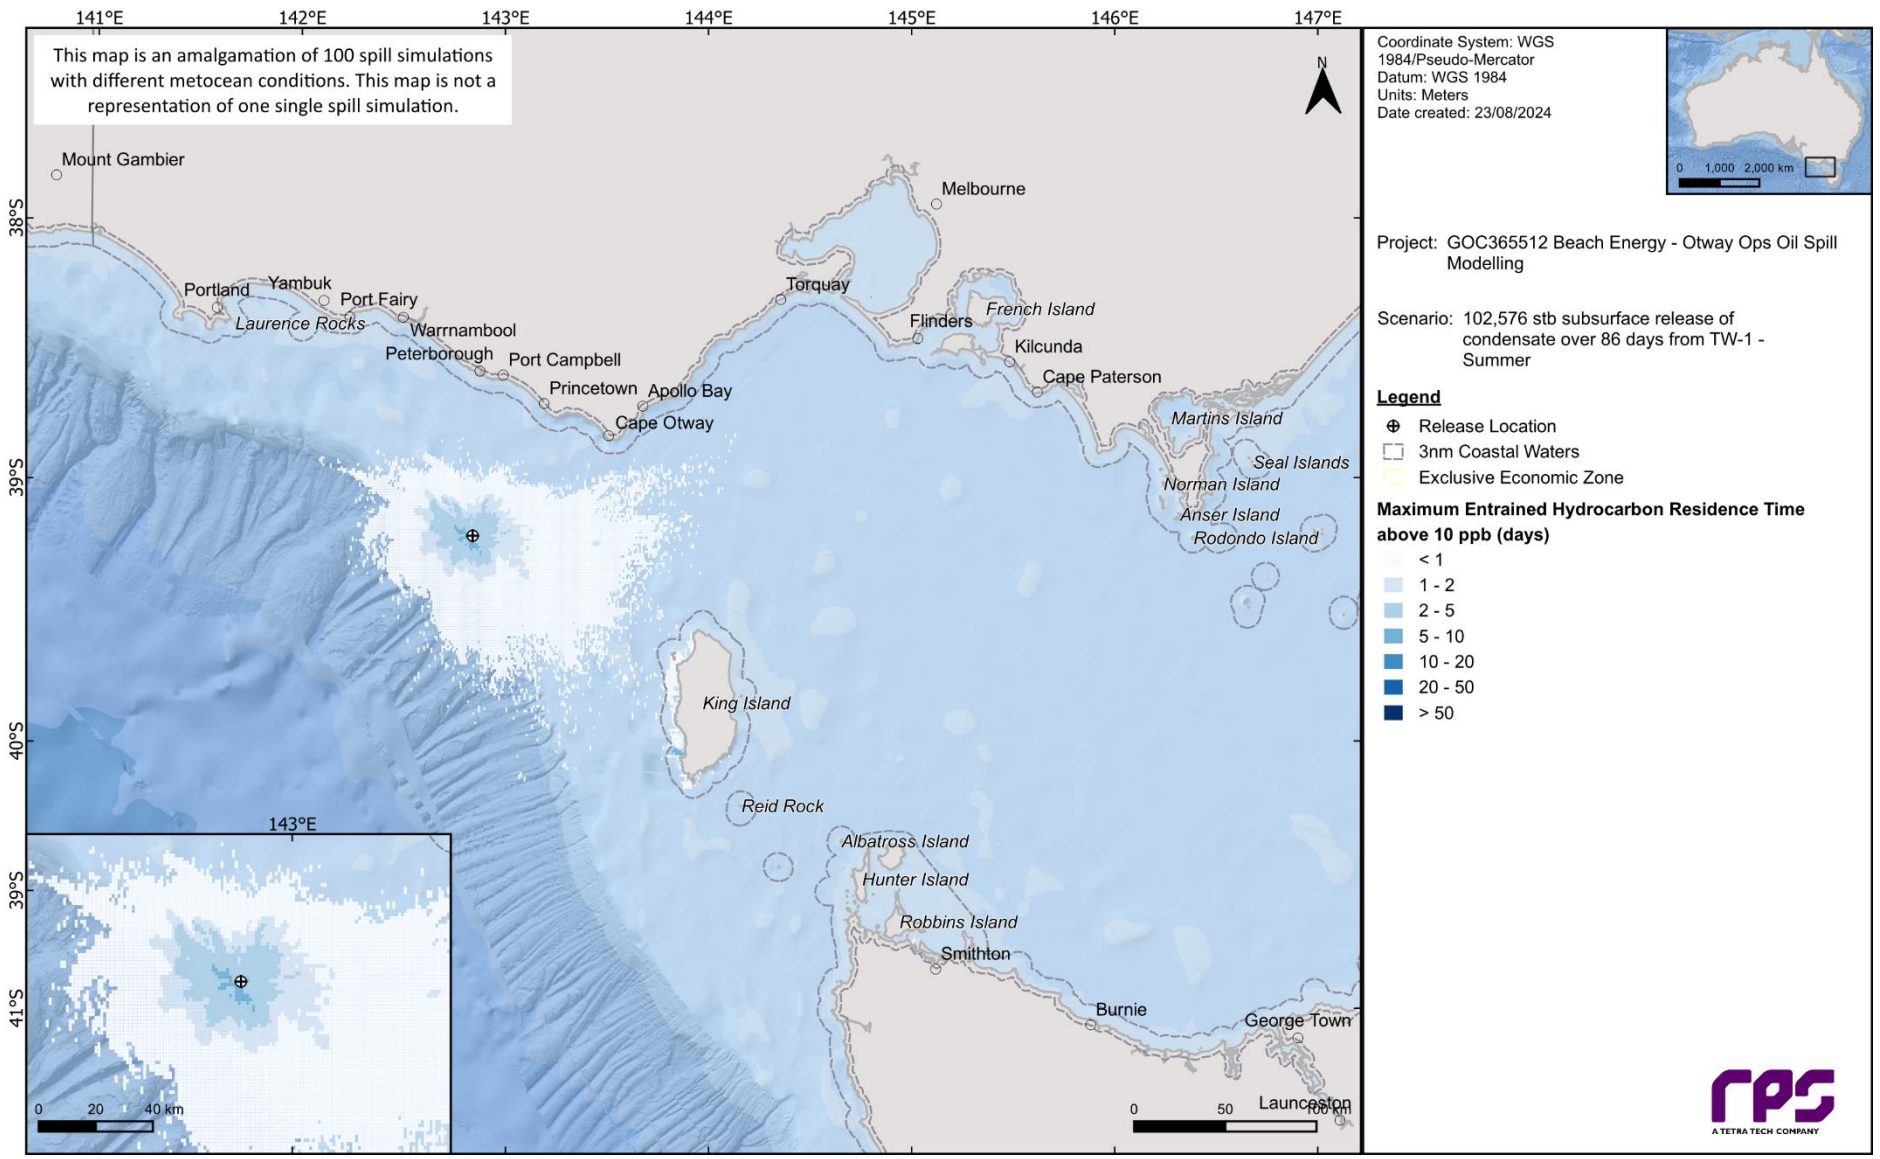

Figure 15-18 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

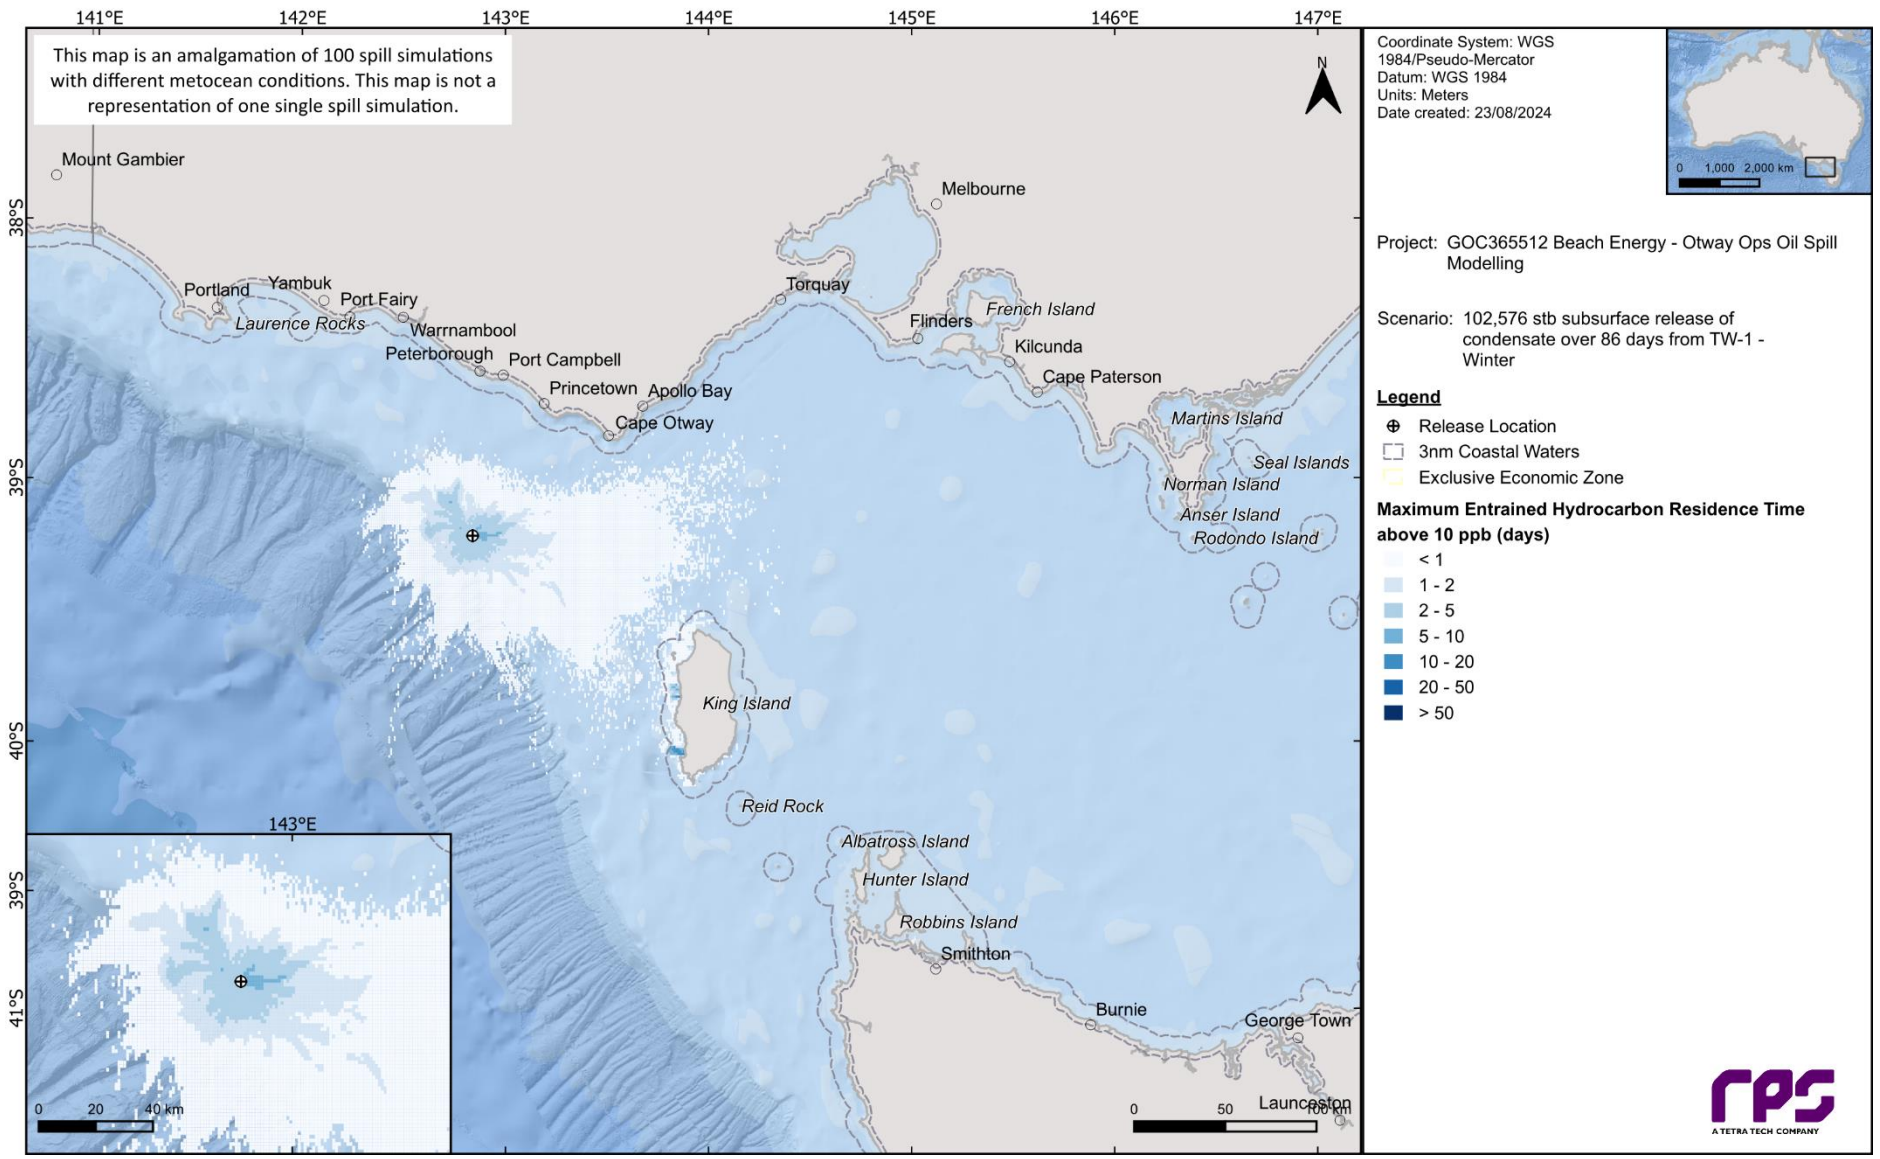

Figure 15-19 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

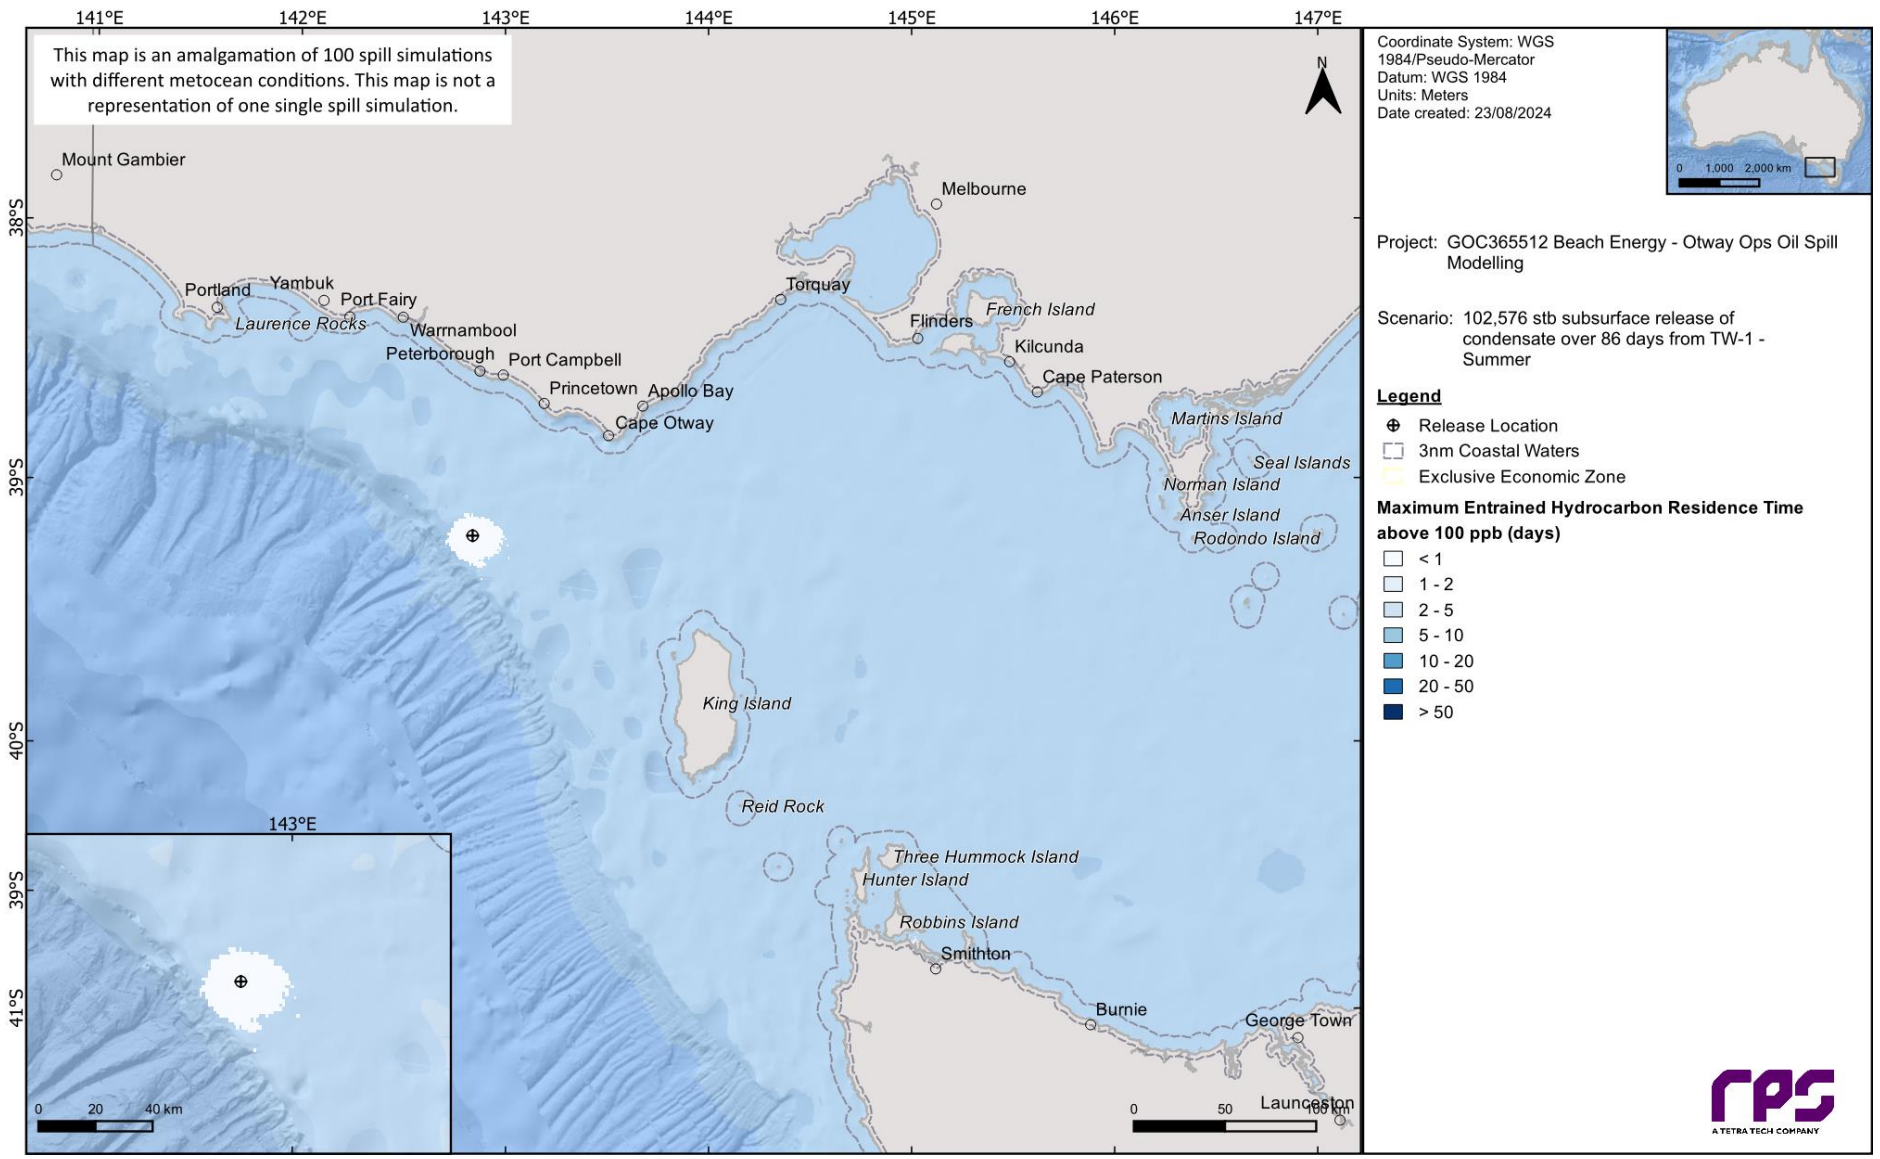

Figure 15-20 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during summer conditions.

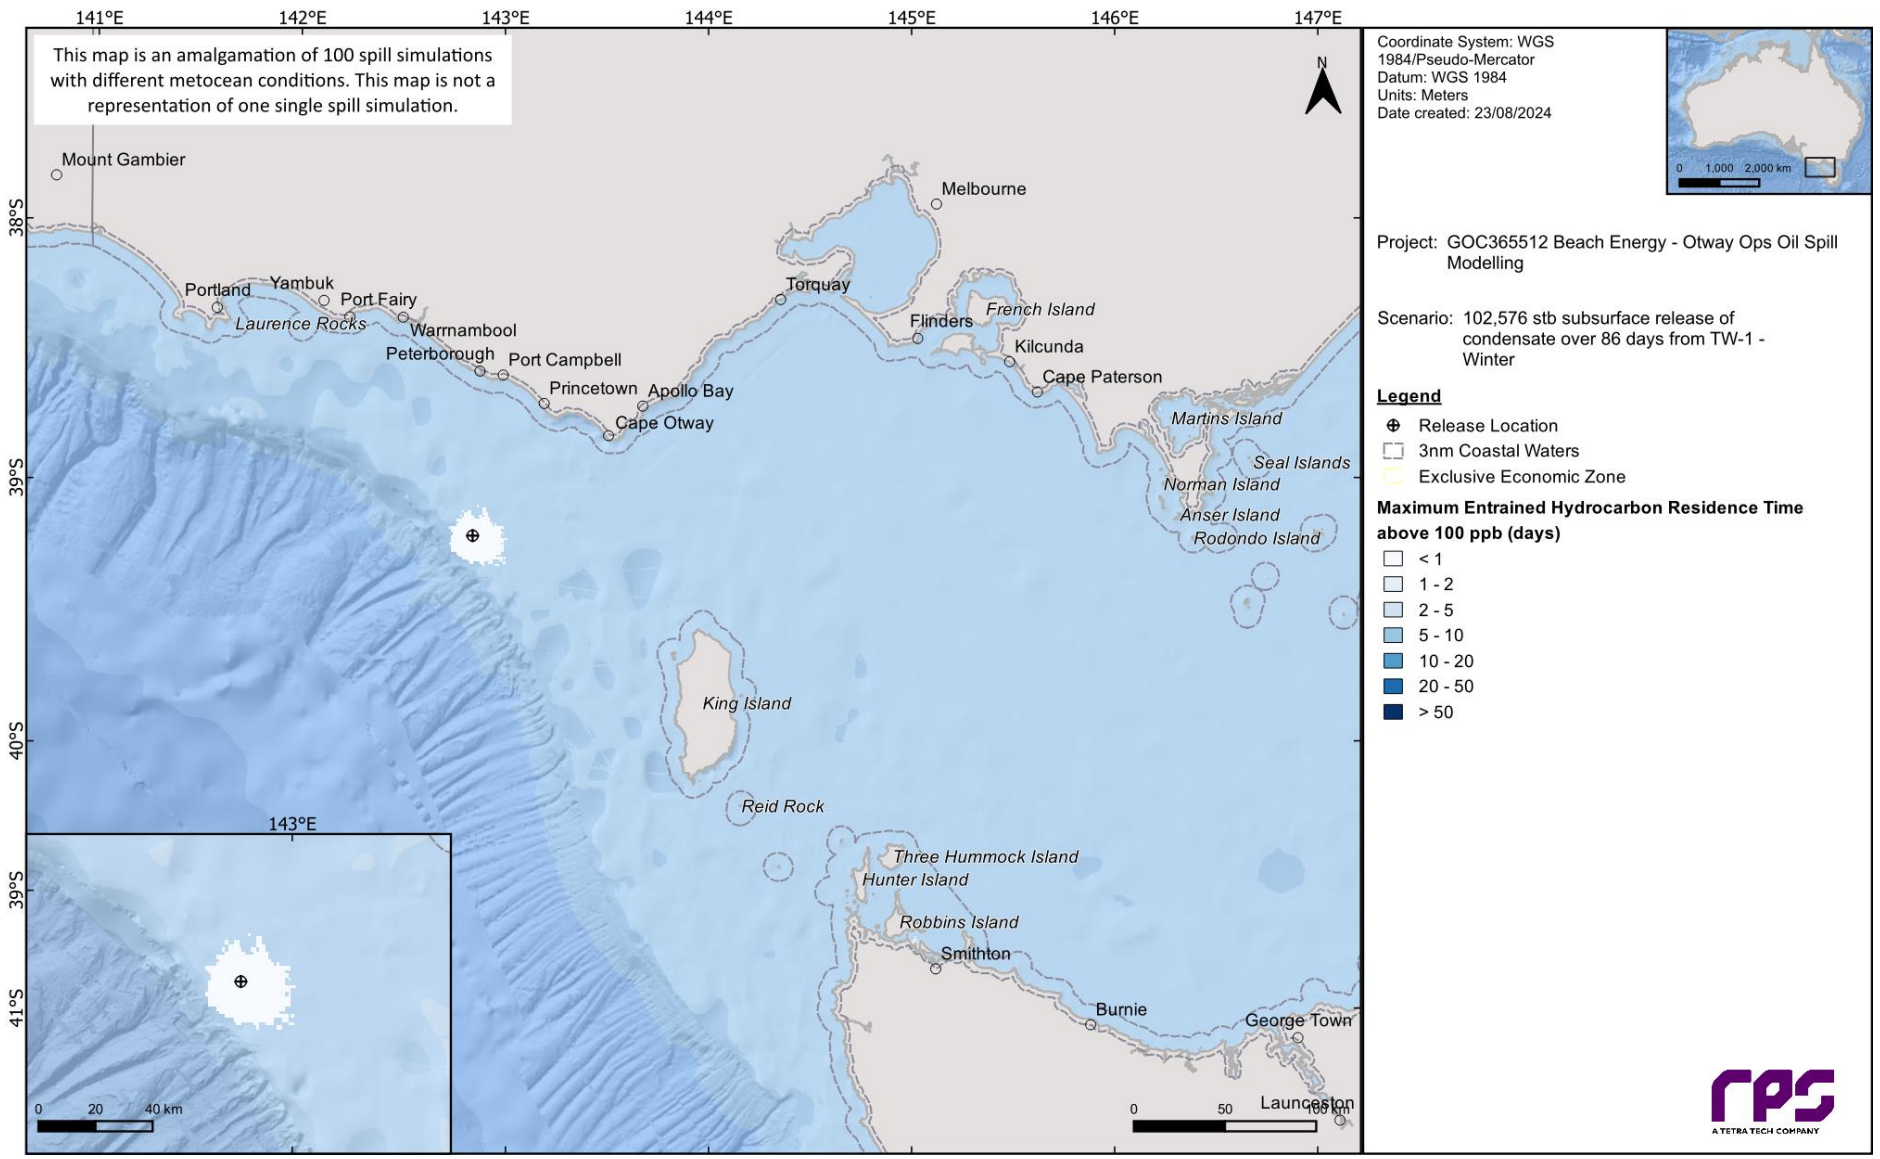

Figure 15-21 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 102,576 stb subsea release of condensate over 86 days from a loss of well control at TW1. The results were calculated from 100 spill simulations during winter conditions.

16 RESULTS – LOSS OF CONTAINMENT FROM VESSEL COLLISION AT TW1

This scenario examined a 603.7 m^3 surface release of marine diesel for a loss of containment from a vessel collision at TW1. A total of 200 spill simulations were run (i.e., 100 spills per season) and tracked for 30 days. The results for all 100 simulations per season were combined and are presented on a seasonal basis (i.e., summer and winter).

16.1 Stochastic Analysis

16.1.1 Area of Exposure

Figure 16-1 presents the combined area of potential exposure for surface, shoreline, entrained and dissolved, by overlaying the results from all 200 simulations (i.e., 100 per season) during summer and winter conditions.

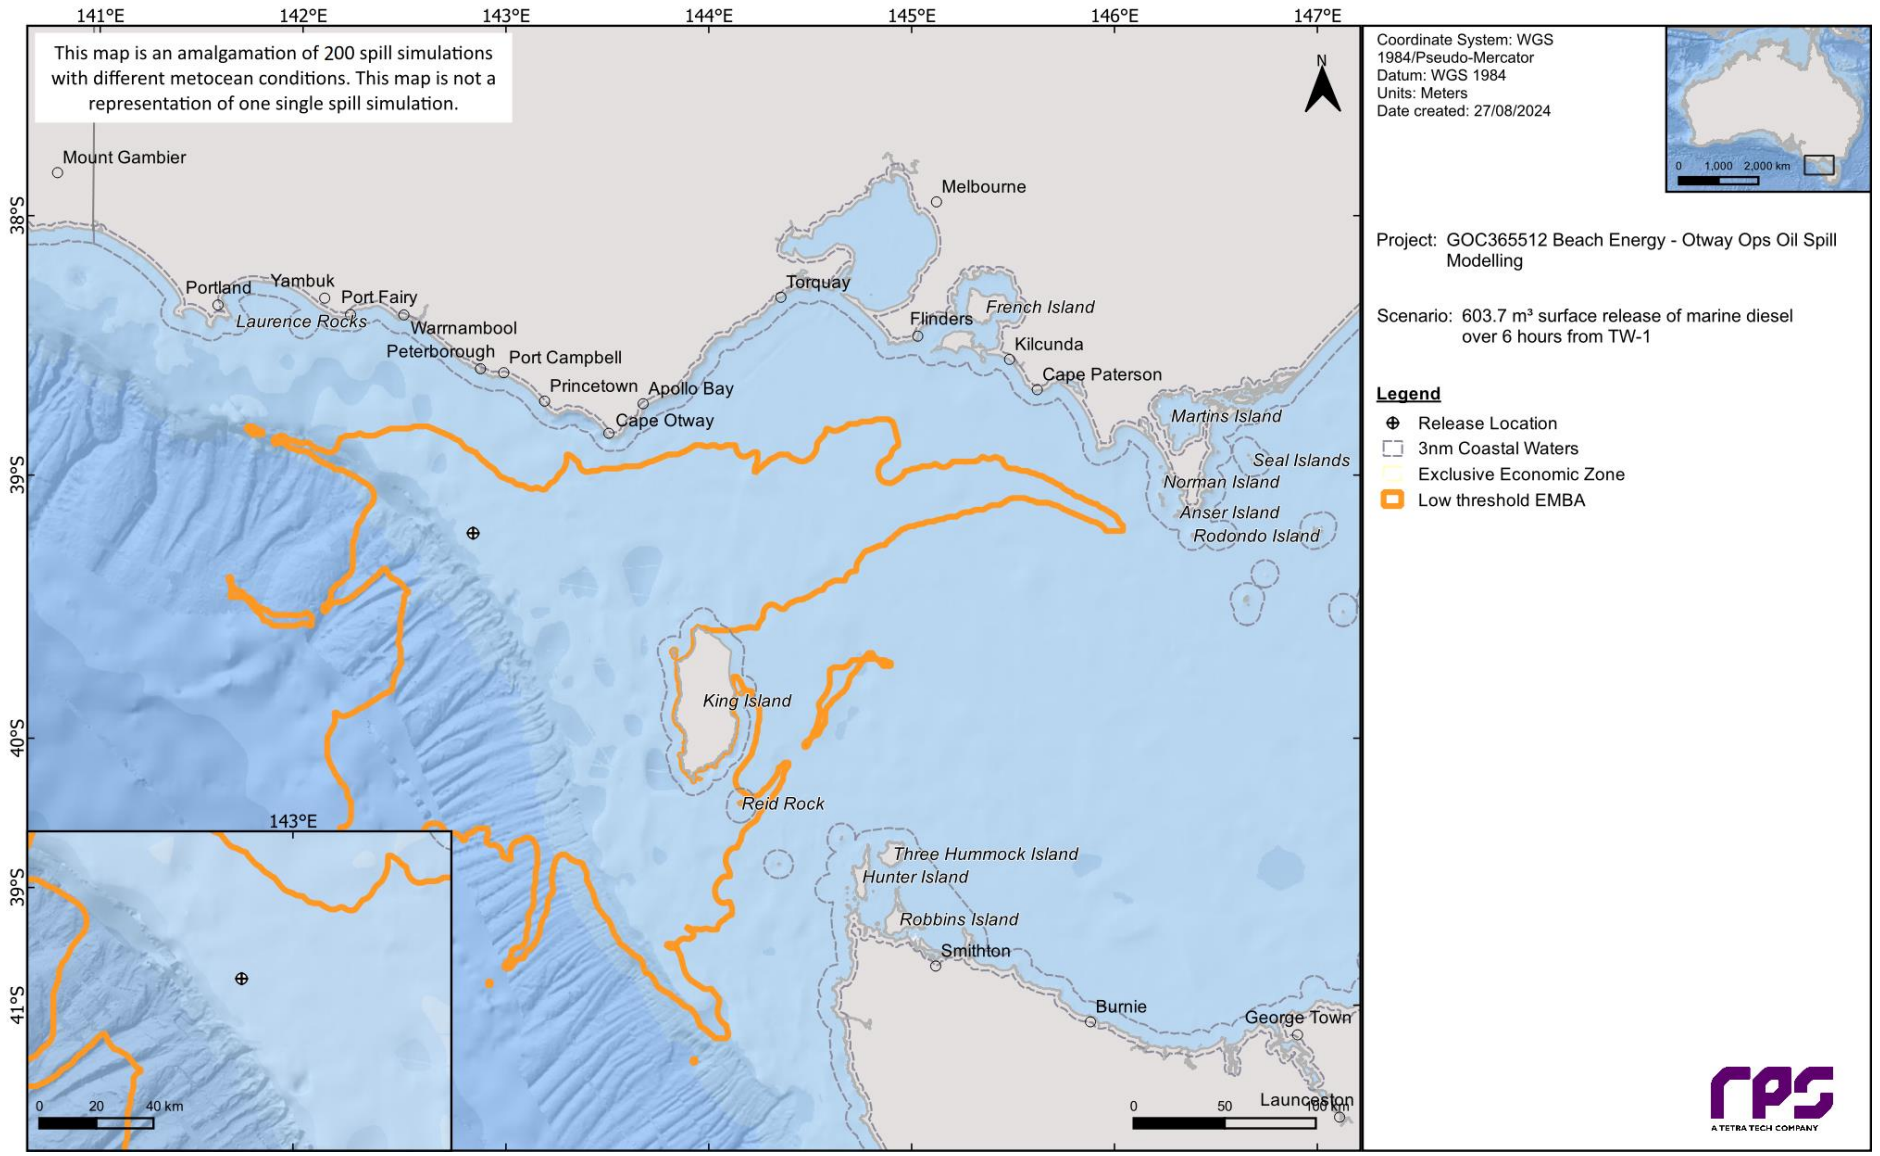

Figure 16-1 Predicted area of exposure for low thresholds produced by overlaying the results from all 200 simulations, resulting from a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at TW1 during summer and winter conditions.

16.1.2 Floating Oil Exposure

Table 16-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 64.97 km (southeast), 49 km (southeast) and 10.08 km (south-southeast) all during winter.

Table 16-2 summarises the potential floating oil exposure to individual receptors during the summer and winter conditions. Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest probability of floating oil exposure above the low threshold was predicted at the White Shark - Distribution (Between the 120 - 1,000m depth contour) BIA (25% in summer and 14% in winter).

Table 16-3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor during summer and winter.

Figure 16-2 and Figure 16-3 present the zones of potential floating oil exposure for all thresholds under summer and winter conditions, respectively.

Figure 16-4 to Figure 16-9 present the minimum time before floating oil exposure for the NOPSEMA thresholds during summer and winter, respectively.

Table 16-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

Season	Distance and direction travelled	Zones of potential floating oil exposure		
		Low	Moderate	High
Summer	Maximum distance (km) from release location	32.39	28.56	9.47
	Direction	Southeast	Southeast	South-Southwest
Winter	Maximum distance (km) from release location	64.97	49	10.08
	Direction	Southeast	Southeast	South-Southeast

Table 16-2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

16.1.3 Shoreline Accumulation

Table 16-4 presents a summary of the predicted potential shoreline accumulation during the summer and winter conditions. No shoreline contact was forecast during summer conditions. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 9% during winter conditions. The minimum time before oil accumulation at, or above, the low threshold was 15.02 days. The maximum volume ashore for a single spill trajectory was 9.67 m^3, whilst the maximum length of shoreline accumulation at the low threshold was 17.67 km. No shoreline accumulation was predicted for the moderate (100 g/m^2) or high (1,000 g/m^2) thresholds.

Table 16-5 summarises the shoreline accumulation on individual receptors during winter conditions. The only receptor recording a probability of shoreline accumulation at the low threshold was King Island Council (TAS) with 9% and the maximum shoreline accumulation was 1.38 m^3. The minimum time before shoreline accumulation above the low threshold was 15.02 days.

The winter conditions maximum potential shoreline loading is presented in Figure 16-10.

Table 16-4 Summary of oil accumulation across all shorelines. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	-	9

16.1.4 In-water exposure

16.1.4.1 Dissolved Hydrocarbons

Table 16-6 summarises the probability of exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer during the summer and winter conditions. No dissolved hydrocarbon exposure at the high (400 ppb) threshold was predicted,

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of dissolved hydrocarbon was predicted for the White Shark - Distribution (Between the 120 - 1,000m depth contour) BIA, being 23.94 ppb in summer and 23.23 ppb in winter. The highest probability of low dissolved hydrocarbon exposure was recorded for Pygmy Blue Whale - Foraging BIA (summer – 3%, winter – 14%).

Table 16-7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed. The maximum residence time of dissolved hydrocarbon exposure at the low threshold was 11 hours during winter.

Figure 16-11 and Figure 16-12 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 16-13 to Figure 16-16 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 16-6 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m dept. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

16.1.4.2 Entrained Hydrocarbons

Table 16-8 presents the probability of exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer for the summer and winter conditions.

Outside of the receptors that the Northern Release Location resides within (refer to Table 12-1), the highest concentration of entrained hydrocarbon was predicted for Short-tailed Shearwater - Foraging BIA (summer – 6,692.22 ppb, winter – 6,075.03 ppb).

Table 16-9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all seasonal conditions and all thresholds assessed.

Figure 16-17 and Figure 16-18 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer, for each threshold assessed under summer and winter conditions, respectively.

Figure 16-19 to Figure 16-24 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds in summer and winter.

Table 16-8 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 603.7 m^3 surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

Table 16-9 Predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer. Results are based on a 603.7 m³ surface release of marine diesel for a loss of containment from vessel collision at TW1. The results were calculated from 100 spill trajectories per season.
