Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Vanacampus vercoi Verco's Pipefish [66286]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat known to occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Current Scientific Name	Status	Type of Presence
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Foraging, feeding or related behaviour known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Tasmacetus shepherdi Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

EPBC Act Referrals

[Resource Information]

Title of referral	Reference	Referral Outcome	Assessment Status
Apollo Bay to Skenes Creek Coastal Trail	2022/09274		Assessment
Aurora Green Offshore Wind Farm Preliminary Surveys	2024/09968		Completed
Barwon Heads Road Reserve Road to Lower Duneed Road Upgrade Project	2023/09724		Completed
Blue Mackerel North Offshore Wind Farm Marine Surveys	2024/09934		Completed
Blue Marlin Offshore Wind Energy Project	2023/09532		Completed
Cape Winds Offshore Windfarm Geophysical, Geotechnical and Marine Studies	2023/09629		Completed
City Of Greater Geelong Mosquito Control Program 2021-2030, Vic	2020/8782		Approval
Decommissioning of the Minerva Pipeline in Victorian state waters	2024/09879		Completed
Decommissioning of the Minerva Pipeline in Victorian state waters ? May 2025	2025/10138		Referral Decision
Establishment of a 6 turbine windfarm near Wonthaggi	2002/820		Completed
Geographe-A gas exploration well	2000/82		Completed
Gippsland Dawn Offshore Wind Project Geophysical and Geotechnical Investigations	2024/10030		Referral Decision
Gippsland Offshore Wind Farm Marine Survey Investigations	2023/09682		Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Gippsland Skies Offshore Wind Project marine surveys (investigations)	2024/09991		Referral Decision
Greater Gippsland Offshore Wind Project	2022/09379		Assessment
Greater Gippsland Offshore Wind Project Initial Marine Field Investigations	2022/09374		Completed
Great Ocean Road Coastal Trail (GORCT) ? Fairhaven to Grey River	2024/10073		Completed
Hydrocarbon exploration wells	2003/1062		Completed
Marine Route Survey for Subsea Fibre Optic Data Cable System - Australia East	2024/09795		Completed
Navigator North Offshore Wind Farm ? Early Marine Survey Investigations	2024/10093		Referral Decision
Normanville Energy Park	2024/10070		Assessment
Offshore Tidal Energy Facility and Submarine Cable	2008/4480		Completed
Otway Astrolabe 3D Marine Seismic Survey, Otway Basin	2012/6421		Completed
Point Nepean Research & Education Field Station	2024/09963		Completed
Portland Energy Park	2024/09947		Assessment
Preliminary Site Investigations for Great Eastern Offshore Wind Project	2024/09890		Referral Decision
Seadragon Offshore Wind, Early Marine Surveys	2023/09670		Completed
SEA Gas Project transmission pipeline	2001/513		Completed
Shearwater 2D and 3D marine seismic survey	2005/2180		Completed
SMAP telecommunications submarine cable installation	2024/09989		Completed
South East Australia Carbon Capture and Storage Project, Commonwealth waters	2023/09732		Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Southern Winds Offshore Wind Project	2022/09435		Completed
Southern Winds Offshore Wind Project Initial Marine Field Investigations	2022/09436		Completed
Spinifex Offshore Surveys	2022/09359		Completed
Spinifex Offshore Wind Farm - Offshore Investigations	2024/09918		Referral Decision
Strike Oil NL Seismic Surveys	2000/107		Completed
Thylacine-A Exploration Well	2000/81		Completed
Vic-P51 and Vic-P52 3D seismic survey	2002/799		Completed
Controlled action			
Alston-1 petroleum exploration well, permit VIC/P44	2003/1315	Controlled Action	Post-Approval
Bald Hills Wind Farm 80 Turbines	2002/730	Controlled Action	Post-Approval
Casino Gas Field Development	2003/1295	Controlled Action	Post-Approval
Crib Point to Pakenham Gas Pipeline, Vic	2018/8297	Controlled Action	Completed
Establishment of plantation for use of effluent water	2003/1063	Controlled Action	Completed
Gas Import Facility, Crib Point, Vic	2018/8298	Controlled Action	Completed
Glenelg Dolomite Quarry	2017/8021	Controlled Action	Post-Approval

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Big Horseshoe Canyon	South-east
Bonney Coast Upwelling	South-east
Canyons on the eastern continental slope	Temperate east
Shelf rocky reefs	Temperate east
Upwelling East of Eden	South-east
West Tasmania Canyons	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Tursiops aduncus		
Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Likely to occur
Seabirds		
Ardenna carneipes		
Flesh-footed Shearwater [82404]	Foraging	Known to occur
Ardenna grisea		
Sooty Shearwater [82651]	Breeding	Known to occur
Ardenna grisea		
Sooty Shearwater [82651]	Foraging	Likely to occur
Ardenna pacifica		
Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Ardenna tenuirostris		
Short-tailed Shearwater [84292]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Ardenna tenuirostris Short-tailed Shearwater [82652]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Likely to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Eudyptula minor Little Penguin [1085]	Breeding	Likely to occur
Eudyptula minor Little Penguin [1085]	Breeding	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging	Known to occur
Macronectes giganteus Southern Giant Petrel [1060]	Foraging	Known to occur
Macronectes halli Northern Giant Petrel [1061]	Foraging	Known to occur
Morus serrator Australasian Gannet [1020]	Aggregation	Known to occur
Morus serrator Australasian Gannet [1020]	Foraging	Known to occur
Oceanites oceanites Wilsons Storm Petrel [1034]	Migration	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Breeding	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Foraging	Known to occur
Procellaria parkinsoni Black Petrel [1048]	Foraging	Likely to occur
Pterodroma macroptera Great-winged Petrel [1035]	Foraging	Likely to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche cauta steadi White-capped Albatross [82344]	Foraging	Known to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Likely to occur
Thalasseus bergii Crested Tern [83000]	Breeding	Known to occur
Thalasseus bergii Crested Tern [83000]	Foraging	Likely to occur

Scientific Name	Behaviour	Presence
Seals		
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Known to occur
Sharks		
Carcharias taurus Grey Nurse Shark [64469]	Foraging	Known to occur
Carcharias taurus Grey Nurse Shark [64469]	Migration	Known to occur
Carcharodon carcharias White Shark [64470]	Breeding (nursery area)	Known to occur
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	3
Listed Threatened Species:	80
Listed Migratory Species:	51

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	87
Whales and Other Cetaceans:	14
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	2
Regional Forest Agreements:	1
Nationally Important Wetlands:	None
EPBC Act Referrals:	23
Key Ecological Features (Marine):	None
Biologically Important Areas:	10
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia

Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat may occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Migration route likely to occur within area

Scientific Name	Threatened Category	Presence Text
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat may occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Fish		
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus abdominalis Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Histiogamphelus briggsii Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Hypselognathus rostratus Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
Kaupus costatus Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Arctocephalus pusillus Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
Reptile		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area

Referral decision			
The Enterprise 3D Seismic Acquisition Survey, Otway Basin, VIC	2012/6545	Referral Decision	Completed

Biologically Important Areas		[Resource Information]
Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging	Likely to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Thalassarche melanophris impavida		
Campbell Albatross [82449]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda		
Pygmy Blue Whale [81317]	Foraging (annual high use area)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales

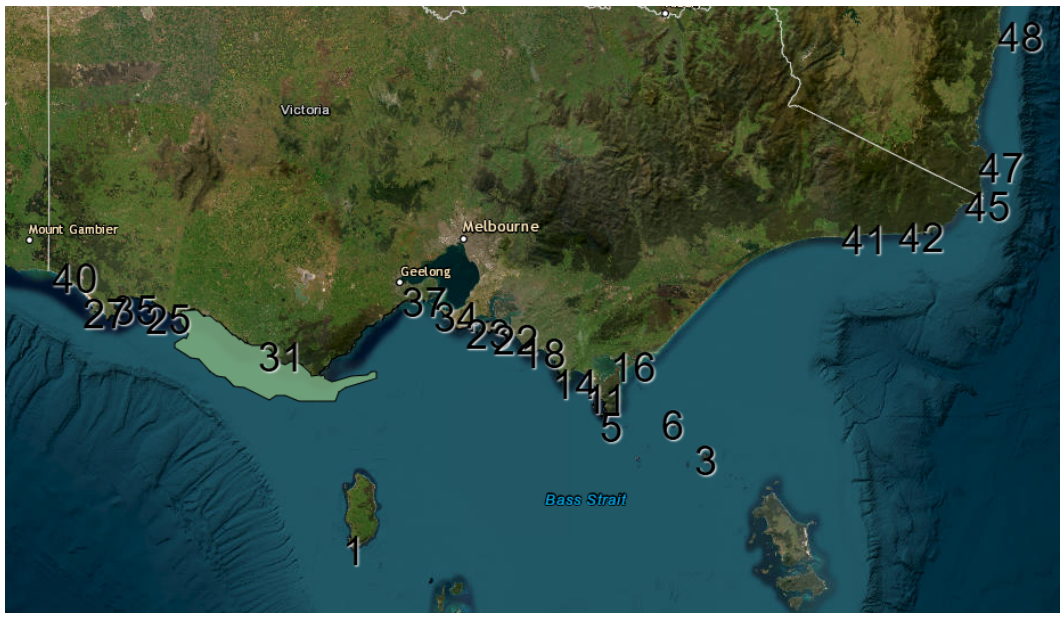
Australian Government

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.



Report created: 26-Aug-2025

Summary

Details

- Matters of NES
- Other Matters Protected by the EPBC Act
- Extra Information

Caveat

Social EMBA

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	7
Listed Threatened Species:	98
Listed Migratory Species:	64

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	3
Commonwealth Heritage Places:	None
Listed Marine Species:	108
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	18
Regional Forest Agreements:	1
Nationally Important Wetlands:	3
EPBC Act Referrals:	64
Key Ecological Features (Marine):	1
Biologically Important Areas:	16
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Great Ocean Road and Scenic Environs	VIC	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community	Endangered	Community likely to occur within area
Giant Kelp Marine Forests of South East Australia	Endangered	Community may occur within area
Grassy Eucalypt Woodland of the Victorian Volcanic Plain	Critically Endangered	Community likely to occur within area
Natural Damp Grassland of the Victorian Coastal Plains	Critically Endangered	Community likely to occur within area
Natural Temperate Grassland of the Victorian Volcanic Plain	Critically Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland	Critically Endangered	Community may occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Species or species habitat likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Callocephalon fimbriatum Gang-gang Cockatoo [768]	Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Climacteris picumnus victoriae Brown Treecreeper (south-eastern) [67062]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Fregetta grallaria grallaria White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Melanodryas cucullata cucullata South-eastern Hooded Robin, Hooded Robin (south-eastern) [67093]	Endangered	Species or species habitat may occur within area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Pedionomus torquatus Plains-wanderer [906]	Critically Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma leucoptera leucoptera Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Stagonopleura guttata Diamond Firetail [59398]	Vulnerable	Species or species habitat known to occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Species or species habitat may occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat known to occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini		
Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thinornis cucullatus cucullatus		
Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
CRUSTACEAN		
Euastacus bispinosus		
Glenelg Spiny Freshwater Crayfish, Pricklyback [81552]	Endangered	Species or species habitat likely to occur within area
FISH		
Hoplostethus atlanticus		
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Nannoperca obscura		
Yarra Pygmy Perch [26177]	Endangered	Species or species habitat likely to occur within area
Prototroctes maraena		
Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
[Seriolella brama](#) Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
FROG		
[Litoria raniformis](#) Southern Bell Frog, Growling Grass Frog, Green and Golden Frog, Warty Swamp Frog, Golden Bell Frog [1828]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
[Antechinus minimus maritimus](#) Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
[Balaenoptera borealis](#) Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
[Dasyurus maculatus maculatus (SE mainland population)](#) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
[Eubalaena australis](#) Southern Right Whale [40]	Endangered	Breeding known to occur within area
[Isoodon obesulus obesulus](#) Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
[Mastacomys fuscus mordicus](#) Broad-toothed Rat (mainland), Tooarrana [87617]	Endangered	Species or species habitat known to occur within area
[Miniopterus orianae bassanii](#) Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Petauroides volans Greater Glider (southern and central) [254]	Endangered	Species or species habitat may occur within area
Petaurus australis australis Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area
Potorous tridactylus trisulcatus Long-nosed Potoroo (southern mainland) [86367]	Vulnerable	Species or species habitat known to occur within area
Pseudomys fumeus Smoky Mouse, Konoom [88]	Endangered	Species or species habitat may occur within area
Pseudomys novaehollandiae New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
PLANT		
Amphibromus fluitans River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat may occur within area
Caladenia concolor Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat may occur within area
Eucalyptus strzeleckii Strzelecki Gum [55400]	Vulnerable	Species or species habitat known to occur within area
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Grevillea infecunda Anglesea Grevillea [22026]	Vulnerable	Species or species habitat likely to occur within area
Haloragis exalata subsp. exalata Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
Leiocarpa gatesii Wrinkled Buttons [76212]	Vulnerable	Species or species habitat known to occur within area
Lepidium aschersonii Spiny Peppercress [10976]	Vulnerable	Species or species habitat may occur within area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area
Prasophyllum spicatum Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
Prasophyllum suaveolens Fragrant Leek-orchid [64956]	Endangered	Species or species habitat may occur within area
Pterostylis chlorogramma Green-striped Greenhood [56510]	Vulnerable	Species or species habitat likely to occur within area
Pterostylis cucullata Leafy Greenhood [15459]	Vulnerable	Species or species habitat likely to occur within area
Pterostylis tenuissima Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
Senecio psilocarpus Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Thelymitra epipactoides Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
Thelymitra matthewsii Spiral Sun-orchid [4168]	Endangered	Species or species habitat known to occur within area
Thelymitra orientalis Hoary Sun-orchid [88011]	Critically Endangered	Species or species habitat may occur within area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Lissolepis coventryi Swamp Skink, Eastern Mourning Skink [84053]	Endangered	Species or species habitat known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Migratory Marine Species		
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caperea marginata		
Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharias taurus		
Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eubalaena australis as Balaena glacialis australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus		
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus		
Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus		
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae		
Humpback Whale [38]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat likely to occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Hirundapus caudacutus		
White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area

Scientific Name	Threatened Category	Presence Text
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State
Defence	
Defence - WARRNAMBOOL TRAINING DEPOT [21111]	VIC
Unknown	
Commonwealth Land - [21492]	VIC
Commonwealth Land - [21583]	VIC

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Anseranas semipalmata		
Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes		
Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna grisea as Puffinus griseus		
Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna tenuirostris as Puffinus tenuirostris		
Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres		
Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago hardwickii Latham's Snipe, Japanese Snipe [863]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Myiagra cyanoleuca Satin Flycatcher [612]		Breeding known to occur within area overfly marine area
Neophema chrysogaster Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Neophema chrysostoma Blue-winged Parrot [726]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna striata White-fronted Tern [799]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]	Vulnerable	Species or species habitat may occur within area
Thalassarche bulleri Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche bulleri platei as Thalassarche sp. nov. Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche chrysostoma Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche salvini Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Thinornis cucullatus cucullatus as Thinornis rubricollis rubricollis Eastern Hooded Plover, Eastern Hooded Plover [90381]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
[Tringa glareola](#) Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
[Tringa nebularia](#) Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
[Tringa stagnatilis](#) Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Fish		
[Heraldia nocturna](#) Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
[Hippocampus abdominalis](#) Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
[Hippocampus breviceps](#) Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
[Hippocampus minotaur](#) Bullneck Seahorse [66705]		Species or species habitat may occur within area
[Histiogamphelus briggsii](#) Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
[Histiogamphelus cristatus](#) Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
[Hypselognathus rostratus](#) Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
[Kaupus costatus](#) Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Kimblaeus bassensis Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys mollisoni Mollison's Pipefish [66260]		Species or species habitat may occur within area
Mitotichthys semistriatus Halfbanded Pipefish [66261]		Species or species habitat may occur within area
Mitotichthys tuckeri Tucker's Pipefish [66262]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus robustus Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
Solegnathus spinosissimus Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Stipecampus cristatus Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Arctocephalus pusillus		
Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat likely to occur within area
Neophoca cinerea		
Australian Sea-lion, Australian Sea Lion [22]	Endangered	Species or species habitat may occur within area
Reptile		
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Species or species habitat may occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata		
Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Current Scientific Name	Status	Type of Presence
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
[Megaptera novaeangliae](#) Humpback Whale [38]		Species or species habitat known to occur within area
[Mesoplodon bowdoini](#) Andrew's Beaked Whale [73]		Species or species habitat may occur within area
[Mesoplodon densirostris](#) Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
[Mesoplodon hectori](#) Hector's Beaked Whale [76]		Species or species habitat may occur within area
[Mesoplodon layardii](#) Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
[Mesoplodon mirus](#) True's Beaked Whale [54]		Species or species habitat may occur within area
[Orcinus orca](#) Killer Whale, Orca [46]		Species or species habitat likely to occur within area
[Physeter macrocephalus](#) Sperm Whale [59]		Species or species habitat may occur within area
[Pseudorca crassidens](#) False Killer Whale [48]		Species or species habitat likely to occur within area
[Tursiops aduncus](#) Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
[Tursiops truncatus s. str.](#) Bottlenose Dolphin [68417]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

EPBC Act Referrals [Resource Information]

Title of referral	Reference	Referral Outcome	Assessment Status
Apollo Bay to Skenes Creek Coastal Trail	2022/09274		Assessment
Decommissioning of the Minerva Pipeline in Victorian state waters	2024/09879		Completed
Decommissioning of the Minerva Pipeline in Victorian state waters ? May 2025	2025/10138		Referral Decision
Great Ocean Road Coastal Trail (GORCT) ? Fairhaven to Grey River	2024/10073		Completed
Marine Route Survey for Subsea Fibre Optic Data Cable System - Australia East	2024/09795		Completed
SMAP telecommunications submarine cable installation	2024/09989		Completed
Spinifex Offshore Wind Farm - Offshore Investigations	2024/09918		Referral Decision
Strike Oil NL Seismic Surveys	2000/107		Completed
Controlled action			
Alston-1 petroleum exploration well, permit VIC/P44	2003/1315	Controlled Action	Post-Approval
Casino Gas Field Development	2003/1295	Controlled Action	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Establishment of plantation for use of effluent water	2003/1063	Controlled Action	Completed
Lorne Golf Course redevelopment	2004/1513	Controlled Action	Post-Approval
Otway Development	2002/621	Controlled Action	Post-Approval
Residential Subdivision & Infrastructure Parish of Belfast	2005/1954	Controlled Action	Completed
Schomberg 3D Marine Seismic Survey	2007/3754	Controlled Action	Completed
Strike Oil Gas Exploration Well, Otway Basin (VIC/P44)	2000/97	Controlled Action	Completed
Twelve Apostles Saddle Lookout	2019/8571	Controlled Action	Post-Approval
VICP61 2D Marine Seismic Survey	2008/4075	Controlled Action	Completed
Not controlled action			
Airey Inlet water reclamation plant to Anglesea sewerage system	2006/2539	Not Controlled Action	Completed
construction of pump station for pump diversion from the Barham River	2003/1242	Not Controlled Action	Completed
Enterprise 1 Exploration Drilling Program, near Port Campbell, Vic	2019/8438	Not Controlled Action	Completed
Exploration drilling for liquid/gaseous hydrocarbons	2004/1681	Not Controlled Action	Completed
Gas Field Development	2006/2635	Not Controlled Action	Completed
Gas Fields Development	2011/5879	Not Controlled Action	Completed
Grevillea infecunda tip cuttings and soil samples	2005/1979	Not Controlled Action	Completed
Halladale and Speculant Gas Pipeline Project, North of Port Campbell, Vic	2015/7551	Not Controlled Action	Completed
Henry-1 Exploration Well, Petroleum Permit Area VIC/P44	2005/2147	Not Controlled Action	Completed
Improving rabbit biocontrol: releasing another strain of RHDV, sthrn two thirds of Australia	2015/7522	Not Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action			
INDIGO Central Submarine Telecommunications Cable	2017/8127	Not Controlled Action	Completed
Maintenance of Access Track and Weed Removal	2009/4973	Not Controlled Action	Completed
Nirranda South Wind Farm Pty Ltd	2002/763	Not Controlled Action	Completed
Offshore exploration drilling within permit area VIC/P 37(v)	2004/1466	Not Controlled Action	Completed
Port Campbell Headland Walking Trail Realignment	2012/6676	Not Controlled Action	Completed
Proposed replacement of existing road culvert	2013/7077	Not Controlled Action	Completed

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Bonney Coast Upwelling	South-east

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica		
Wedge-tailed Shearwater [84292]	Foraging	Likely to occur

Scientific Name	Behaviour	Presence
Ardenna tenuirostris Short-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging	Known to occur
Diomedea exulans (sensu lato) Wandering Albatross [1073]	Foraging	Known to occur
Diomedea exulans antipodensis Antipodean Albatross [82269]	Foraging	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging	Known to occur
Pelecanoides urinatrix Common Diving-petrel [1018]	Foraging	Known to occur
Thalassarche bulleri Bullers Albatross [64460]	Foraging	Known to occur
Thalassarche cauta cauta Shy Albatross [82345]	Foraging likely	Likely to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging	Known to occur
Thalassarche melanophris Black-browed Albatross [66472]	Foraging	Known to occur
Thalassarche melanophris impavida Campbell Albatross [82449]	Foraging	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Likely to be present
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging (annual high	Known to occur

Scientific Name	Behaviour	Presence
	use area)	
[Balaenoptera musculus brevicauda](#)		
Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

Figures

Figure 1.1 Map of the Elanora-1 ST1, Pecten East-2 and Annie-2 release locations. 5
Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability. 6
Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration. 7
Figure 3.1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image). 9

TERMS AND ABBREVIATIONS

AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ASTM	American Society for Testing and Materials
BIA	Biologically Important Area
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
CFSR	Climate Forecast System Reanalysis
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Deterministic oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IMCRA	Integrated marine and coastal regionalisation areas
IOA	Index of Agreement
ITOPF	International Tanker Owners Pollution Federation Limited
KEF	Key Ecological Feature
LGA	Local Government Areas
MAE	Mean Absolute Error
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park

MP	Marine Park
NASA	National Aeronautics and Space Administration (USA)
NCEP	National Centres for Environmental Prediction (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park
NR	Nature Reserve
PAH	Polynuclear Aromatic Hydrocarbons
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
ppb	Parts per billion (concentration)
psu	Practical salinity units
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RSB	Reefs, Shoals and Banks
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
SRTM	Shuttle Radar Topography Mission
State Waters	Low water mark seaward for three nautical miles
STB	Standard Barrel
Stochastic oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the area of hydrocarbon exposure and indicates which locations are more likely to be exposed (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be exposed in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment
Sub-LGA	Sub-Local Government Areas
TOPEX/Poseidon	A joint satellite mission between NASA and CNES to map ocean surface topography using an array of satellites equipped with detailed altimeters
US EPA	United States Environmental Protection Agency
World Ocean Atlas	A collection of physicochemical parameters (e.g. temperature, salinity, oxygen, phosphate, silicate, and nitrate) based on profile data from the World Ocean Database (NCEI, 2021) established by NOAA's National Centers for Environmental Information (NCEI)
WGS 1984	World Geodetic System 1984 (WGS84); reference coordinate system

EXECUTIVE SUMMARY

Background

Cooper Energy (Cooper) is progressing plans to drill the Elanora-1 ST1, Pecten East-2 and Annie-2 wells in the Otway Basin, Victoria.

In order to inform the offshore environmental impact and risk assessments Cooper commissioned RPS to conduct a detailed oil spill modelling study assessing the following hypothetical scenarios:

- **Scenario 1**: A 105,289 bbl (16,740 m^3) subsurface release of condensate over 102 days following a loss of well control (LOWC) incident at Elanora-1 ST1.
- **Scenario 2**: An 83,273 bbl (13,239 m^3) subsurface release of condensate over 102 days following a LOWC incident at Pecten East-2; and
- **Scenario 3**: A 66,430 bbl (10,562 m^3) subsurface release of condensate over 104 days following a LOWC incident at Annie-2.

Note, the 104-day model duration for Scenario 3 relates to slightly more conservative response time for the relief well to kill Annie-2. This duration was carried over from the specifications of the original Annie-2 modelling.

The modelling assessment was undertaken on a seasonal basis (summer – November to April, and winter – May to October), with 100 modelling simulations completed for each season.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a 10-year wind and current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed condensate characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 randomly selected single trajectory simulations per season, per scenario, with each simulation having the same spill information (location, spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.

The SIMAP system, the methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-22 "*Standard Practice for Development and Use of Oil Spill Models*".

Condensate Properties

An exploration well has been drilled within the Annie field with hydrocarbon properties being known for that location. Annie condensate has a higher residuals profile when compared with other offset fields representing a more conservative analogue and therefore Annie condensate was selected for all scenarios

modelled in this assessment. While a comprehensive oil assay for Annie-1 condensate was provided by the client (Core Lab RFL201903231), it should be noted that essential data pertaining to the pour point, dynamic viscosity, and aromatic content for distinct boiling point ranges were absent from the dataset. Consequently, a pragmatic approach was adopted to supplement these missing values by sourcing relevant information from the Minerva condensate assay data. Minerva condensate is found in a nearby reservoir.

The Annie-2 condensate has an API of 41.0, density of 820.0 kg/m^3 (at 16 ºC), with low viscosity (1.063 cP at 20 ºC) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications. The condensate comprises a significant portion of volatiles and semi- to low-volatiles (82.5% total) with 17.5% residual components. This means the condensate will evaporate readily when on the water surface, with the persistent components to remain on the water surface or in the water column over time.

Results

Scenario: 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1

- The maximum distance and corresponding direction from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) floating oil exposure zones was 75.7 km (east, winter) and 11.7 km (east-southeast, summer), respectively. There was no floating oil exposure predicted above the high (>50 g/m^2) threshold.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 100%. The minimum time before oil accumulation at, or above, the low threshold was 1.83 days whilst the maximum total volume ashore for a single spill trajectory was 251.0 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 295.0 km, 48.0 km and 1.0 km, respectively, all occurring during winter.
- Excluding the BIAs that the release location resides within, the highest probabilities of low (10 ppb) dissolved hydrocarbon exposure were 15% (Southern Right Whale – Aggregation BIA, summer) and 21% (Short-tailed Shearwater – Foraging BIA, winter).
- Except for the receptors the release location is located within, during summer the highest probability of low (10 ppb) entrained hydrocarbon exposure was 100% recorded for Southern Right Whale – Aggregation BIA. Additional receptors including LGAs, sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure (refer to Table 11.9). During winter, several receptors, including the Apollo AMP, Southern Right Whale – Aggregation and White-faced Storm-petrel - Foraging BIAs revealed 100% probability of low entrained hydrocarbon exposure.

Scenario: 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2

- The maximum distance and corresponding direction from the release location to the low and moderate exposure zones was 74.4 km (east-southeast, winter) and 15.2 km (east-southeast, winter), respectively. There was no floating oil exposure observed above the high threshold.
- The probability of accumulation to any shoreline at, or above, the low threshold was 100%. The minimum time before oil accumulation at, or above, the low threshold was 1.17 days whilst the maximum total volume ashore for a single spill trajectory was 406.6 m^3, and the maximum length of shoreline accumulation at the low, moderate and high thresholds were 269.0 km (summer), 75.0 km (summer) and 6.0 km (winter), respectively.
- Excluding the BIAs that the release location resides within, the highest probability of low dissolved hydrocarbon exposure was 21% during summer (Short-tailed Shearwater - Foraging) and 59% during winter (Short-tailed Shearwater - Foraging).
- The highest probability of low entrained hydrocarbon exposure was recorded at 100% for receptors that the release location doesn't reside within, including Southern Right Whale – Aggregation BIA and

Warrnambool Plain IBRA. Additional receptors including sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure.

Scenario: 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2

- The maximum distance and corresponding direction from the release location to the low and moderate exposure zones was 55.7 km (east, winter) and 3.2 km (east, winter), respectively. There was no floating oil exposure predicted above the high threshold.
- The probability of accumulation to any shoreline at, or above, the low threshold was 100%. The minimum time before oil accumulation at, or above, the low threshold was 0.96 day whilst the maximum total volume ashore for a single spill trajectory was 312.1 m^3, and the maximum length of shoreline accumulation at the low, moderate and high thresholds were 224.0 km (winter), 62.0 km (winter) and 6.0 km (winter), respectively.
- Excluding the BIAs that the release location resides within, the highest probability of low dissolved hydrocarbon exposure was 10% during summer and 33% during winter at the Short-tailed Shearwater – Foraging BIA receptor.
- The highest probability of low entrained hydrocarbon exposure was recorded at 100% for receptors that the release location doesn't reside within, including Short-tailed Shearwater – Foraging, Southern Right Whale – Aggregation BIAs and Warrnambool Plain IBRA. Additional receptors including sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure.

1 INTRODUCTION

1.1 Background

Cooper Energy (Cooper) is progressing plans to drill the Elanora-1 ST1, Pecten East-2 and Annie-2 wells in the Otway Basin (Figure 1.1).

In order to inform the offshore environmental impact and risk assessments Cooper commissioned RPS to conduct a detailed oil spill modelling study assessing the following hypothetical scenarios:

- **Scenario 1**: A 105,289 bbl (16,740 m^3) subsurface release of condensate over 102 days following a loss of well control (LOWC) incident at Elanora-1 ST1;
- **Scenario 2**: An 83,273 bbl (13,239 m3) subsurface release of condensate over 102 days following a LOWC incident at Pecten East-2; and
- **Scenario 3**: A 66,430 bbl (10,562 m^3) subsurface release of condensate over 104 days following a LOWC incident at Annie-2.

Note, the 104-day model duration for Scenario 3 relates to slightly more conservative response time for the relief well to kill Annie-2. This duration was carried over from the specifications of the original Annie-2 modelling.

The coordinates for the release location used for the above mentioned scenarios are presented in Table 1.1 and are illustrated in Figure 1.1.

The modelling assessment was undertaken on a seasonal basis (summer – November to April, and winter – May to October), with 100 simulations completed for each season.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill, except well kill via a relief well at the specified modelled days. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein uses modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-22 "*Standard Practice for Development and Use of Oil Spill Models*".

Table 1.1 Coordinates of the release locations.

Infrastructure	Latitude	Longitude	Water Depth (m)
Elanora-1 ST1	38° 47' 41.5" S	142° 37' 56.5" E	75
Pecten East-2	38° 37' 59.7" S	142° 40' 9.7" E	55
Annie-2	38° 41' 1.68" S	142° 49' 28.56" E	56

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

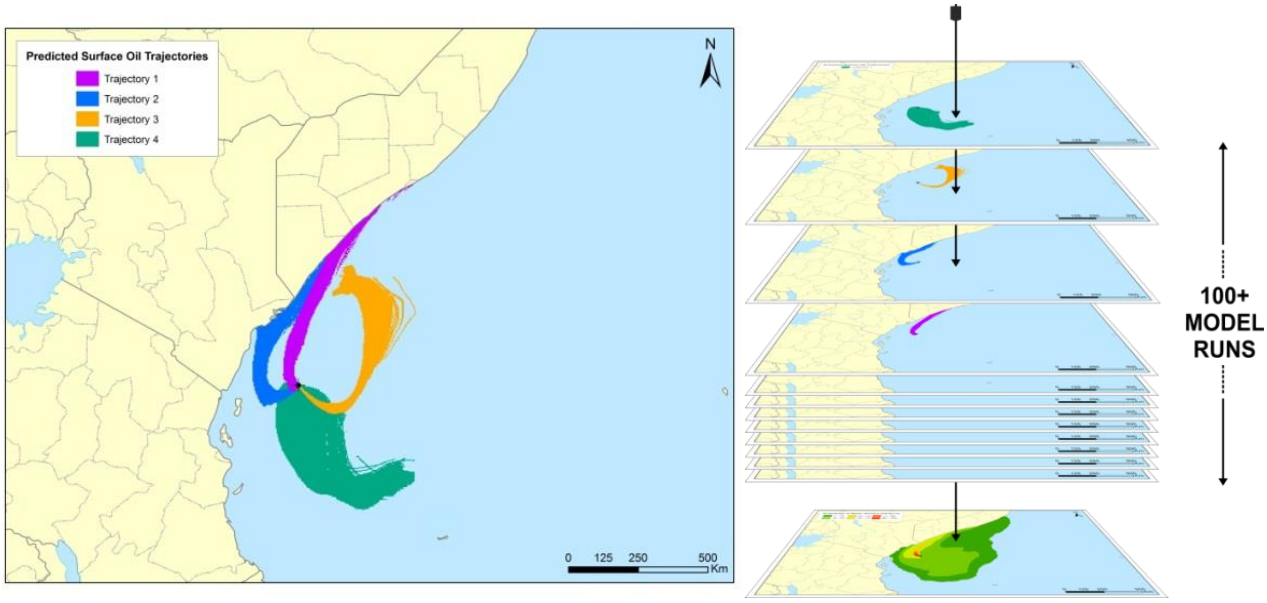

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore, longest length of shoreline contacted by oil or largest area of entrained or dissolved hydrocarbons.

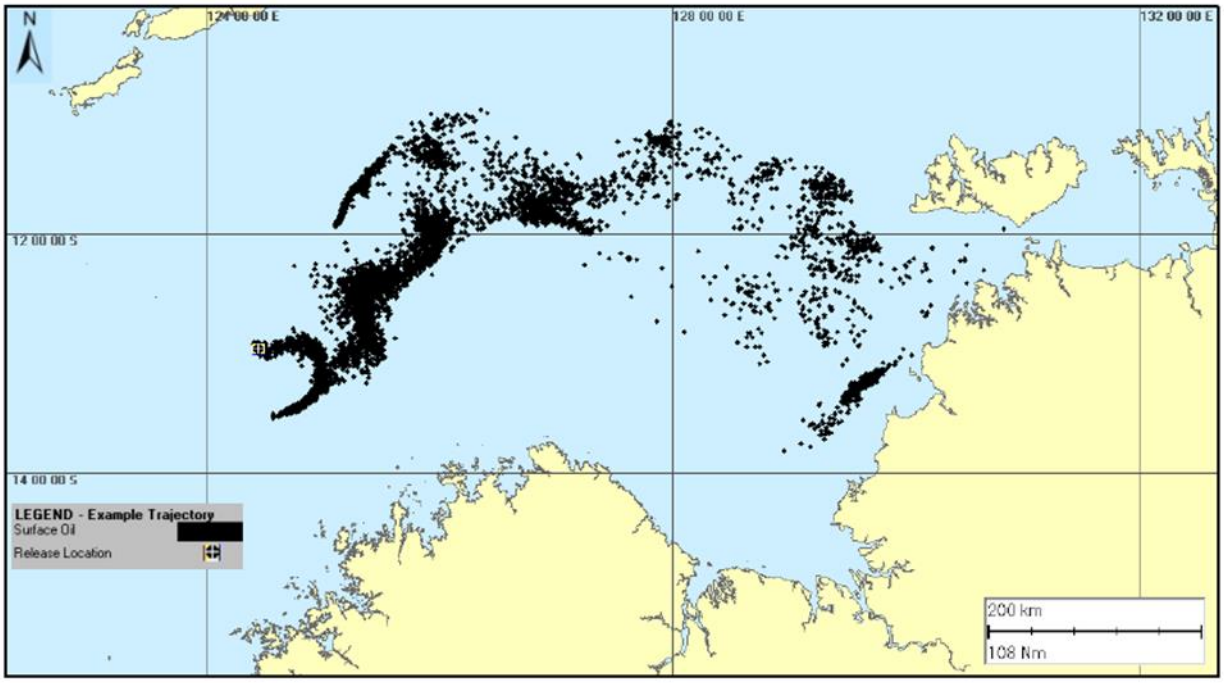

Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10 years of winds and three-dimensional currents from 2010 to 2019 (inclusive). The currents included the combined influence of tidal and ocean currents;
- Include the wind and current data and characteristics of the condensate as input into the three-dimensional oil spill model (SIMAP), to model the movement, spreading, weathering and shoreline contact by hydrocarbons over time;
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surrounding waters and shorelines. This involved running 100 randomly selected single trajectory simulations per scenario (per season), with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions;
- Results were assessed to determine the exposure to surrounding waters and contact to shorelines based upon the thresholds outlined in the NOPSEMA Oil Spill Modelling Bulletin (NOPSEMA, 2019); and
- The stochastic modelling results were reviewed, and the "worst case" deterministic runs were identified and presented based on the following criteria (if applicable):
    a. Largest swept area for surface oil above 10 g/m^2;
    b. Largest volume of oil ashore;
    c. Longest length of shoreline with oil accumulation above 100 g/m^2;
    d. Largest area of entrained hydrocarbon exposure above 100 ppb; and
    e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

3 REGIONAL CURRENTS

The Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3.1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.

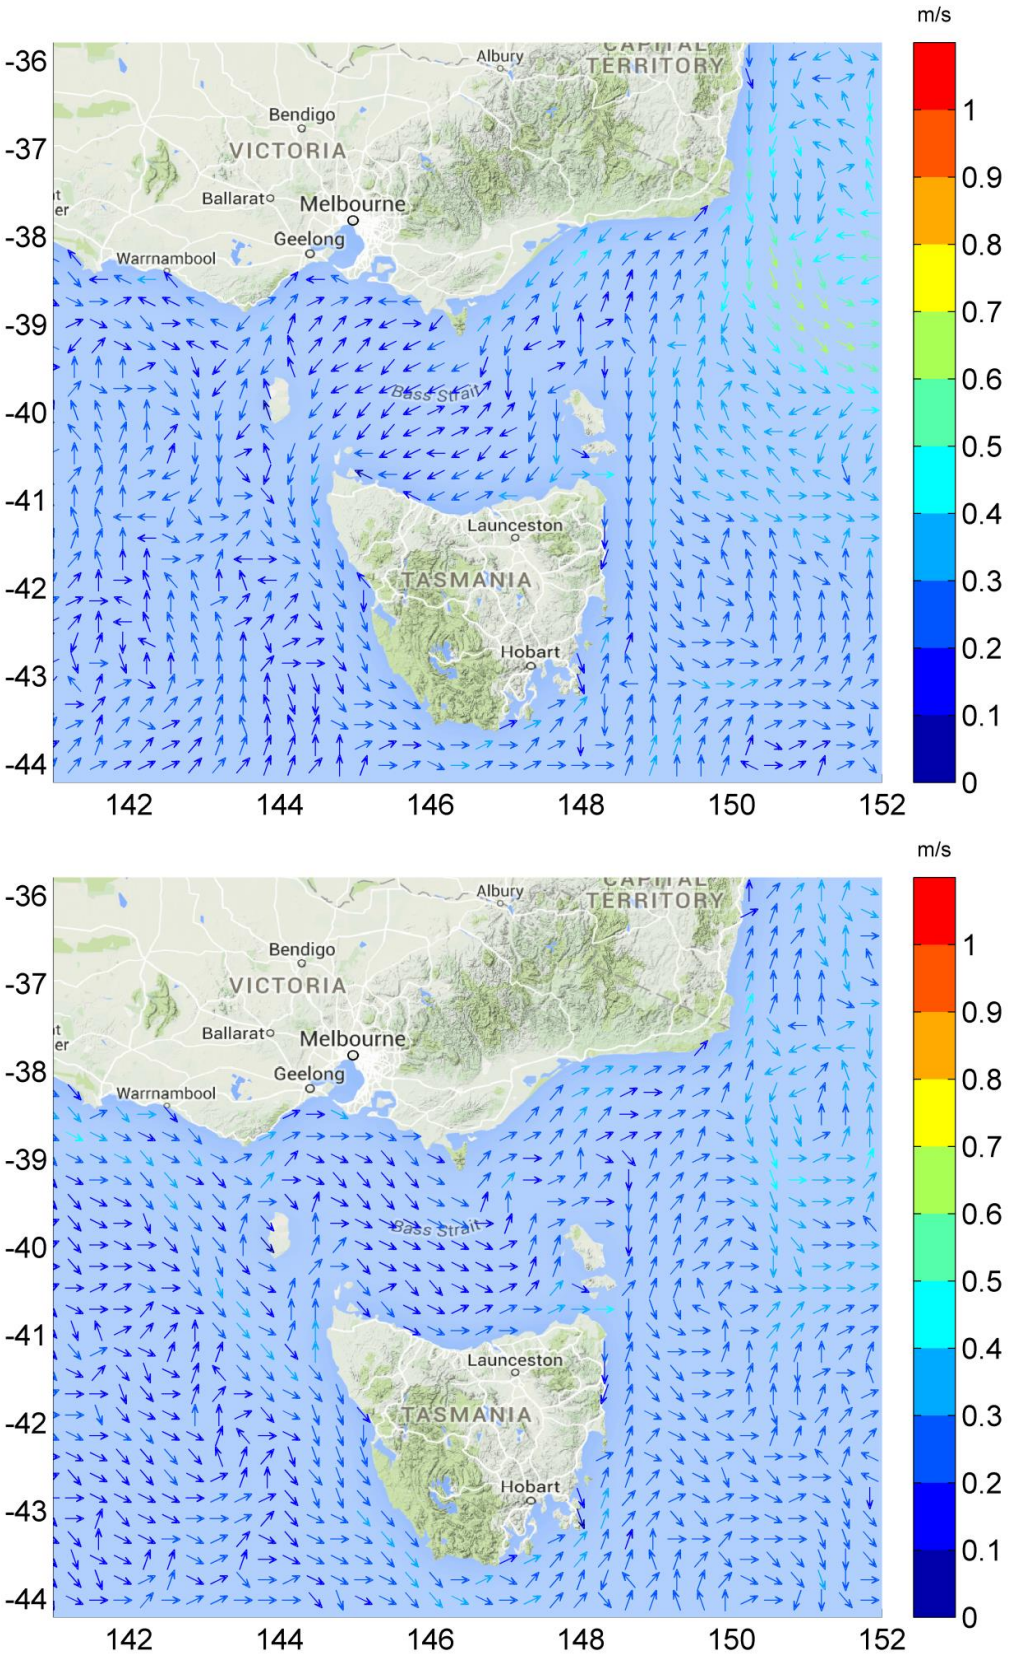

Figure 3.1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).

3.1 Tidal currents

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for more than 30 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

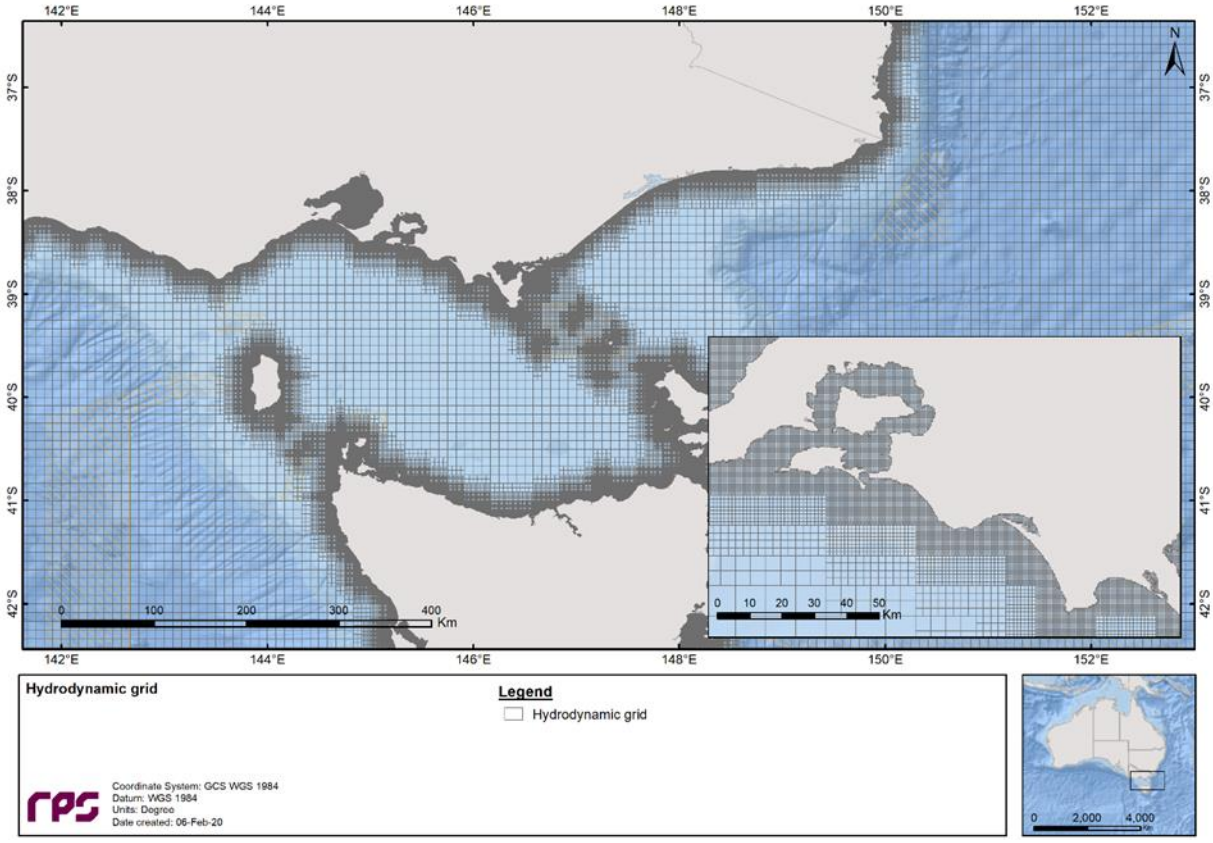

Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

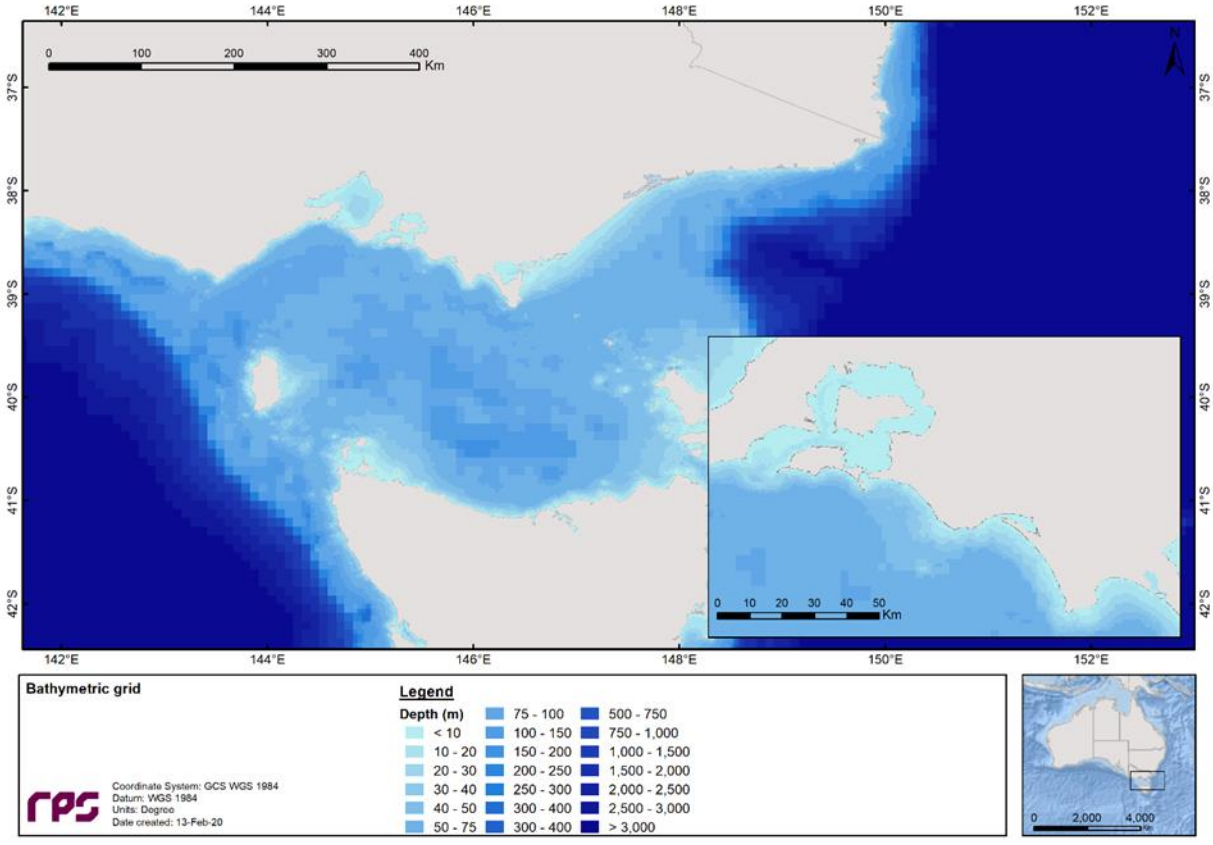

Figure 3.3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex/Poseidon tidal data has been widely used amongst the oceanographic community, being refereced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott & Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

P_i = Model predicted surface elevation

O_i = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: X_{model} = Model predicted surface elevation

X_{obs} = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3.5 and Figure 3.6 illustrate a comparison of the predicted and observed surface elevations in February 2017. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3.1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3.1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Gabo Island	0.98	0.08
Port MacDonnell	0.98	0.05
Port Welshpool	0.92	0.30
Portland	0.97	0.07
Stack Island	0.96	0.22

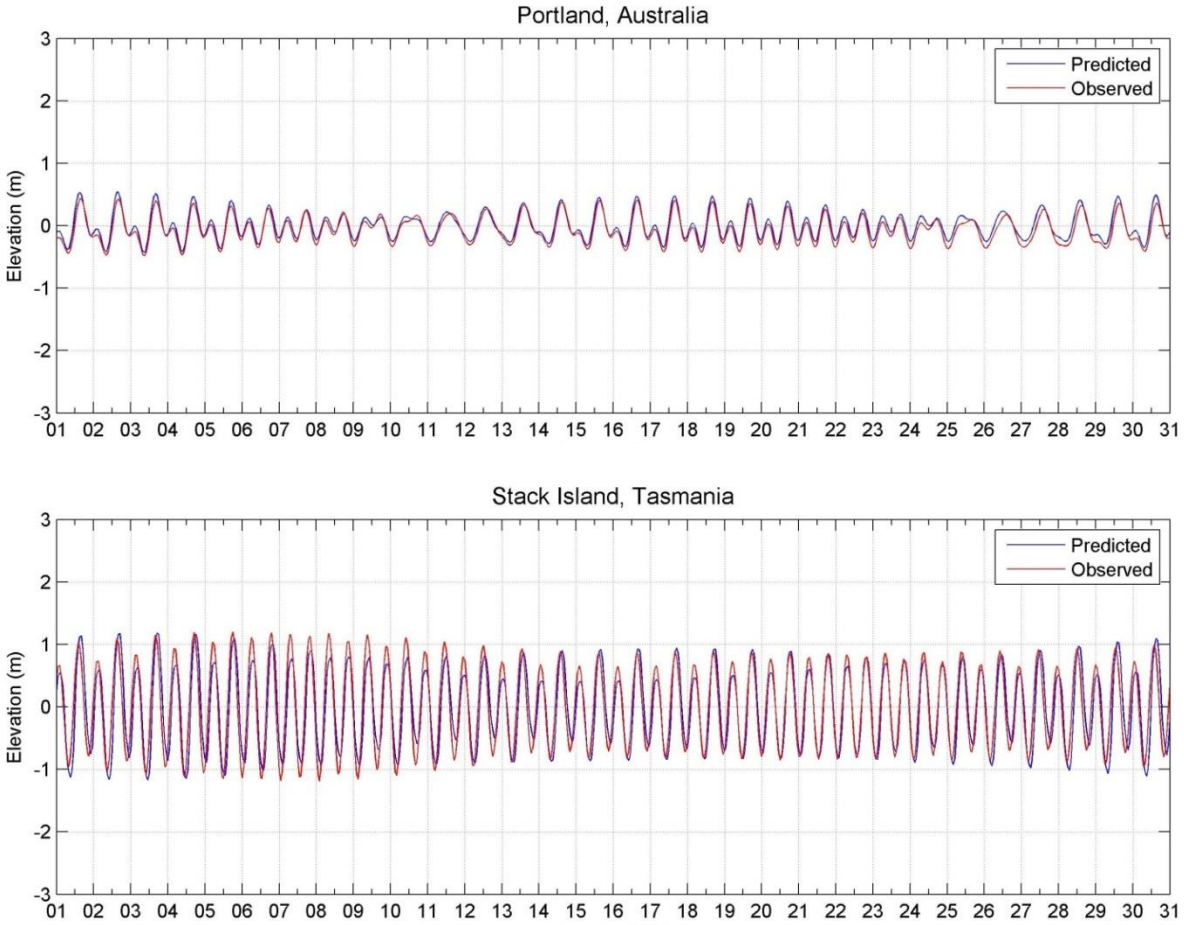

Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).

3.2 Ocean Currents

Data describing the flow of ocean currents for the years 2010 to 2019 (inclusive) was obtained from HYCOM (Hybrid Coordinate Ocean Model, Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of once per day. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

3.3 Surface Currents

Table 3.2 to Table 3.4 present the average and maximum surface current speeds nearby the Elanora-1 ST1 (Isabella), Pecten East-2 and Annie-2 wells by combining the ocean and tidal currents.

Near the Elanora-1 ST1 well current speeds varied throughout the year with maximum current speeds ranging between approximately 0.68 m/s (January) and 1.07 m/s (July). The dominant surface current direction was identified as easterly (towards the east) during the whole year, except for January and February.

Nearby Pecten-East 2, maximum current speeds ranged between 0.66 m/s (February) and 1.08 m/s (September). Current direction varied throughout the year, flowing mostly towards the east-southeast during winter months.

Close to Annie-2, maximum current speeds varied between 0.72 m/s (February) and 1.10 m/s (September). Similar to Pecten-East 2, current directions predominantly flowed east-southeast during winter months.

Figure 3.7 to Figure 3.12 show the monthly and total surface current rose distributions for the selected locations.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3.2 Predicted monthly average and maximum surface current speeds for Elanora-1 ST1 well. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.16	0.68	West
February	0.16	0.71	West
March	0.16	0.93	East

3.4 Currents at 50 m below Surface

Table 3.5 to Table 3.7 present the average and maximum current speeds (at 50m below surface) nearby the Elanora-1 ST1, Pecten East-2 and Annie-2 wells by combining the ocean and tidal currents.

Near the Elanora-1 ST1 well current speeds varied throughout the year with maximum current speeds ranging between approximately 0.36 m/s (January) and 0.59 m/s (July).

Nearby Pecten-East 2, maximum current speeds ranged between 0.21 m/s (February) and 0.36 m/s (July).

Close to Annie-2, maximum current speeds varied between 0.28 m/s (November) and 0.39 m/s (July). Similar to Pecten-East 2.

Figure 3.13 to Figure 3.18 show the monthly and total current rose distributions for the selected locations.

Table 3.5 Predicted monthly average and maximum current speeds (at 50m below surface) for Elanora-1 ST1 well. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

4 WIND DATA

High resolution wind data for the years 2010 to 2019 (inclusive) was sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land, and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals. Figure 4.1 shows the spatial resolution of the wind field used as input into the oil spill model.

Table 4.1 to Table 4.3 present the monthly average and maximum winds derived from a CFSR wind node nearby the Elanora-1 ST1, Pecten East-2 and Annie-2 wells. The wind data demonstrated average monthly wind speeds ranging from 14 knots during summer months to 19 knots during winter months at Elanora-1 ST1 (Isabella), whilst near Pecten East-2 and Annie-2 seasonal wind speeds were 10 knots and 13 knots respectively (same wind node). Maximum monthly speeds ranged between 39 knots (January) and 53 knots (June) at Elanora-ST1 and 30 knots (January and November) and 42 knots (June) nearby Pecten East-2 and Annie-2. The dominant wind direction varied throughout the year, though westerly winds tended to dominate nearby all release locations during September to November.

Figure 4.2 to Figure 4.7 show the monthly and total wind rose distributions derived from the CFSR data for the selected node nearby the release locations.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 5 knots are typically used in these wind roses. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

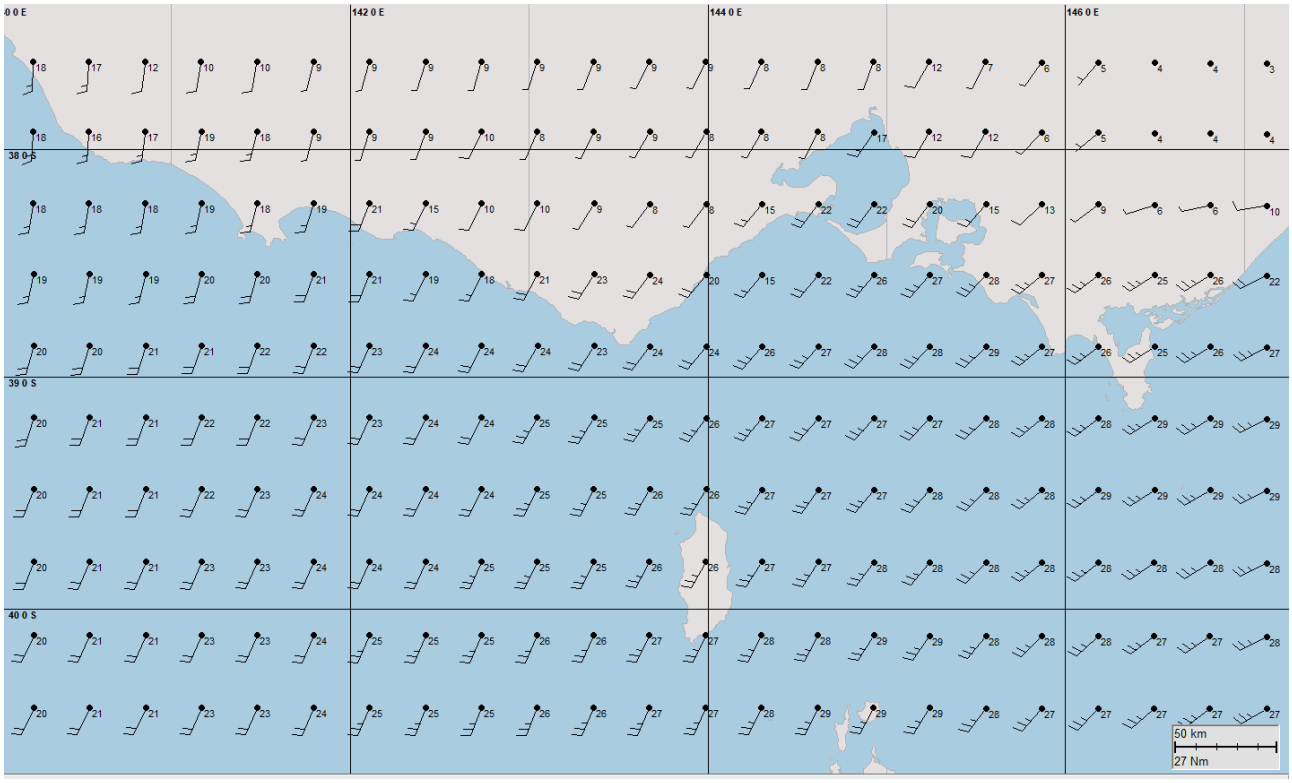

Figure 4.1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

5 WATER TEMPERATURE AND SALINITY

The monthly sea temperature and salinity profiles of the water column within the study was obtained from the World Ocean Atlas 2018 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013). These parameters were used as factors to inform the weathering, movement, and evaporative loss of hydrocarbon spills in the surface and sub-surface layers.

Figure 5.1 to Figure 5.3 illustrate the vertical profile of sea temperature and salinity nearby the release locations.

Table 5.1 to Table 5.3 present the sea temperature and salinity of the surface layer nearby the Elanora-1 ST1, Pecten East-2 and Annie-2 wells, respectively. The monthly average sea surface temperatures ranged between 13.5°C (September) and 18.9°C (February) nearby Elanora-1 ST1, and 13.3°C (September) and 18.3°C (January) nearby Pecten East-2 and 13.3°C (September) and 18.5°C (March) nearby Annie-2. The monthly average surface salinity values remain relatively consistent ranging between 35.3 psu and 35.5 psu across all three release locations.

Table 5.1 Monthly average sea surface temperature and salinity in the Elanora-1 ST1 well area.

6 SUBSEA PLUME MODEL – OILMAP DEEP

In the event of an uncontrolled subsea LOWC, the gas and condensate will initially behave like a jet, which dissipates in the water column over a short distance (<10 m). The escaping condensate shears into small droplets due to turbulence generated by passing through the exit hole and subsequent turbulence generated in the plume jet. The size-distribution of the droplets varies with the exit velocity and viscosity of the condensate. Following this phase, the density and buoyancy difference of the gas and condensate mixture relative to the surrounding waters, forces the plume upward. As the plume rises, the volume of gas will increase due to reduction of water pressure, with gas bubbles dividing into an increasing number of bubbles due to the shearing effect exerted by the water column.

In shallow water (<150 m) the rising plume of gas and condensate will tend to reach the sea surface before deflecting away from the centre of the plume (Spaulding et al., 2000). Figure 6.1 conceptually illustrates the various stages of a subsea release of oil and gas.

OILMAP Deep model (Spaulding et al., 2015) was used to simulate the near-field behaviour of the gas-condensate subsea release in two phases – the initial jet phase and the buoyant plume phase. The initial jet phase is predominately driven by the exit velocity. During this phase, the condensate droplet-size-distributions are calculated for a range of classes or bins. Next, the plume model predicts the rise dynamics of the condensate and gas plumes to calculate at which point gas lift will be lost (i.e. the trapping height).

Outputs which include the plume trapping height, plume diameter and droplet size distribution are used as input to the SIMAP model to simulate the rise and dispersion of the condensate droplets from this point onwards.

More details on the OILMAP-DEEP model, can be found in Spaulding et al. (2015). The model has been validated against observations from Deepwater Horizon as well as small and large-scale laboratory studies on subsurface oil releases (Brandvik et al., 2013, 2014; Belore, 2014; Spaulding et al., 2015; Li et al., 2017).

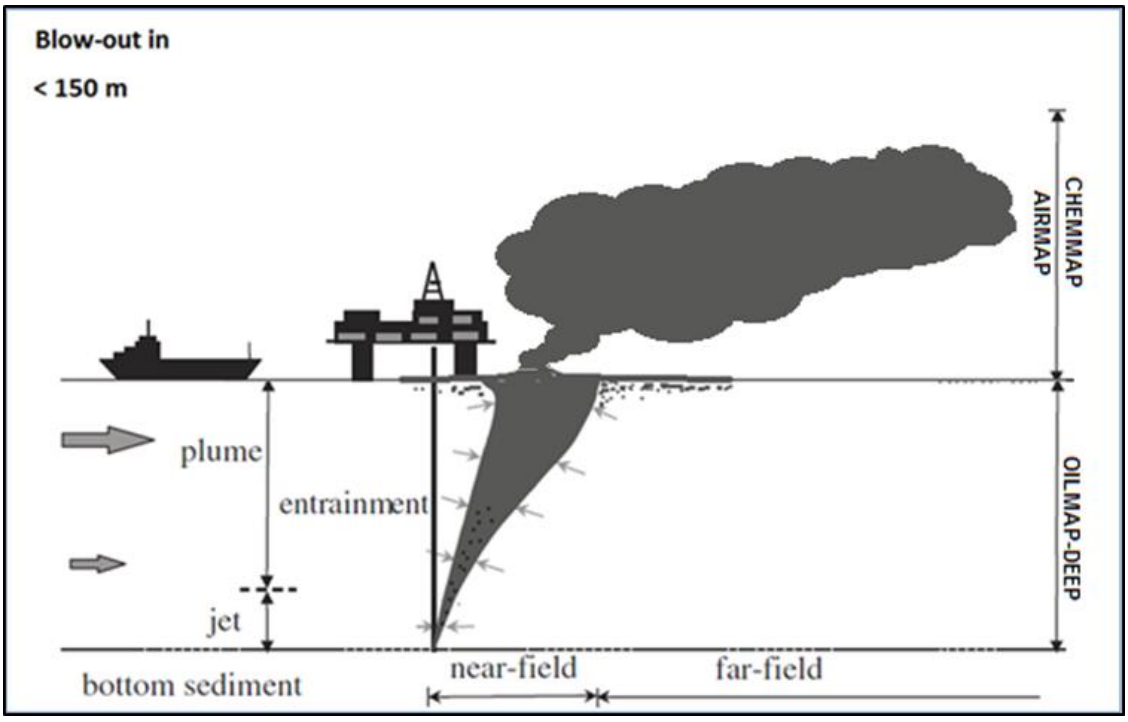

Figure 6.1 Example of a subsea plume and the various stages of the plume in the water column (Source: ASA, 2011).

Table 6.1 presents the input parameters and key results for the subsea plume modelling. Note a depleting release rate was assessed. The subsea modelling showed that in the event of a LOWC, the amalgamated gas and condensate would propel rapidly upward from the seabed and rupture the sea surface at all three locations assessed.

Table 6.1 Input data and key results for the subsea plume modelling.

Input Variable	Value		
Scenario	LOWC at Elanora-1 ST1 (Isabella)	LOWC at Pecten East-2	LOWC at Annie-2
Water depth (m)	56 (from top of the BOP stack)	34 (from top of the BOP stack)	36 (from top of the BOP stack)
Top of release diameter (inch)	18.75	18.75	18.75
Condensate discharge rate (stb/day)	1326 (day 1) depleting to 798 (day 102)	1250 (day 1) depleting to 505 (day 102)	878 (day 1) depleting to 453 (day 104)
Gas rate (MMscf/day)	663 (day 1) depleting to 399 (day 102)	625 (day 1) depleting to 253 (day 102)	438.9 (day 1) depleting to 226.4 (day 104)
Formation water flow rate (stb/day)	356 (day 1) depleting to 293 (day 102)	496 (day 1) depleting to 353 (day 102)	444.9 (day 1) depleting to 298.0 (day 104)
Key results			
Plume execution depth (m BMSL^)	0 (Breach the sea surface)	0 (Breach the sea surface)	0 (Breach the sea surface)
Droplet sizes (µm)	1,399 to 6,044 (day 1) to 1,761 to 7,607 (day 104)	1,268 to 5,479 (day 1) to 1,884 to 8,137 (day 104)	1,584 to 6,843 (day 1) to 2,056 to 8,882 (day 104)

^Below mean sea level

7 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point (BP) ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

7.1 Stochastic Modelling

For the stochastic modelling presented herein, 100 oil spills (per season) were modelled for each scenario using the same spill information (release location, spill volume, duration and oil type) but with varied start dates. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations (per season) were analysed to determine the following statistics for every grid cell:

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Probability of contact above defined concentrations;
- Volume of oil that may accumulate on shorelines from any single simulation;
- Concentration that might occur on sections of individual shorelines;
- Exposure to dissolved hydrocarbons in the water column; and
- Exposure to entrained hydrocarbons in the water column.

7.2 Floating, Shoreline and In-Water Thresholds

The thresholds and their relationship to exposure for the sea surface, shoreline and water column (entrained and dissolved hydrocarbons) are presented in Sections 7.2.1 to 7.2.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of potential exposure are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

7.2.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 7.1). Figure 7.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 7.1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 7.2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 7.1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

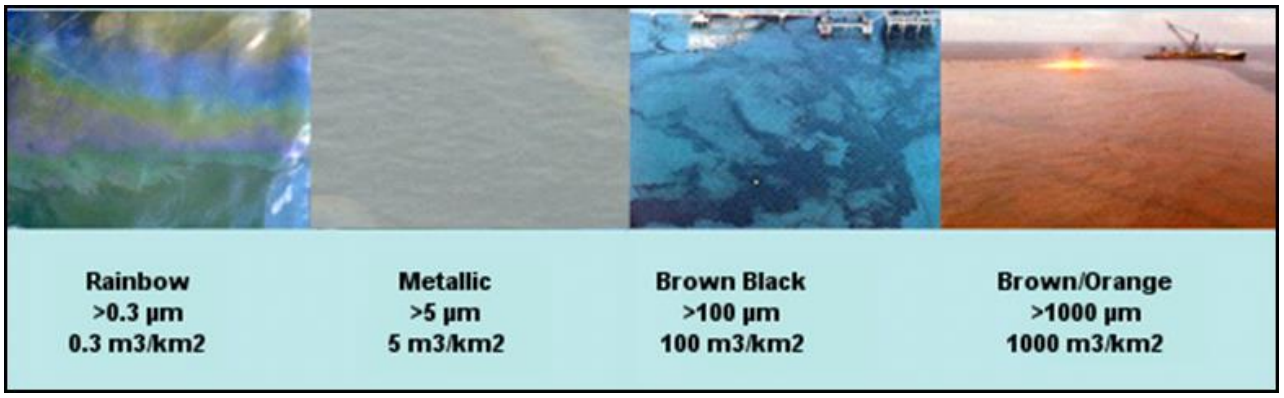

Figure 7.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 7.2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA (2019)).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socioeconomic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

7.2.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling herein, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results contained herein would be indicative of a worst-case scenario, where the highest volume of oil may be stranded on the shoreline (when compared to other shoreline types, such as exposed rocky shores).

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according to the AMSA (2015) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996), demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high shoreline accumulation”. It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

It is worth noting that the shoreline accumulation thresholds derived from extensive literature review (outlined in Table 7.3) agree with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 7.3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline loading (g/m^2)	Description
Low (socioeconomic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

7.2.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

7.2.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1 hour timestep (see Table 7.4) was applied to indicate increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

7.2.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. As such, insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, hence are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC & ARMCANZ (2000) water quality guidelines. Due to the requirement for relatively long exposure times (>24 hours) for these concentrations to be significant, they are likely to be more meaningful for juvenile fish, larvae and planktonic

organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 7.4), to cover the range of thresholds outlined in ANZECC & ARMCANZ (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019).

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 7.4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

	Exposure level	In-water threshold (ppb)	Description
Dissolved hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	Moderate	50	Approximates potential toxic effects, particularly sublethal effects to sensitive species
	High	400	Approximates toxic effects including lethal effects to sensitive species
Entrained hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	High	100	As appropriate given oil characteristics for informing risk evaluation

8 HYDROCARBON PROPERTIES

8.1 Physical Properties

An exploration well has been drilled within the Annie field with hydrocarbon properties being known for that location. Annie condensate has a higher residuals profile when compared with other offset fields representing a more conservative analogue and therefore Annie condensate was selected for all scenarios modelled in this assessment. While a comprehensive oil assay for Annie-1 condensate was provided by the client (Core Lab RFL 201903231), it should be noted that essential data pertaining to the pour point, dynamic viscosity, and aromatic content for distinct boiling point ranges were absent from the dataset. Consequently, a pragmatic approach was adopted to supplement these missing values by sourcing relevant information from the Minerva condensate assay data. Minerva condensate is found in a nearby reservoir.

Table 8.1 and Table 8.2 present the physical properties and boiling point ranges of the condensate used in this study.

The Annie-1 condensate has an API of 41.0, density of 820.0 kg/m^3 (at 16 ºC), with low viscosity (1.063 cP at 20 ºC) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2020) and US EPA/USCG classifications. The condensate comprises a significant portion of volatiles and semi- to low-volatiles (82.5% total) with 17.5% residual components. This means the condensate will evaporate readily when on the water surface, with the persistent components to remain on the water surface over time.

The boiling points (BP) are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate. Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (BP <180°C).
- Up to 24 hours for the C_{11} to C_{15} compounds (BP 180-265°C).
- Several days for the C_{16} to C_{20} compounds (BP 265-380°C).
- Not applicable for the residual compounds (BP >380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

Table 8.1 Physical properties.

Characteristic	Annie-1 Condensate
Density (kg/m^3)	820.0 (@ 16 °C)
API	41.0
Dynamic viscosity (cP)	1.063 (@ 20°C)*
Pour point (°C)	-30*
Wax Content (%)	10.0
Hydrocarbon property category	Group II
Hydrocarbon property classification	Light-Persistent

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-265 C_{11} to C_{15}	265-380 C_{16} to C_{20}	>380 >C_{20}
Annie-1 condensate	% of total	8.0	46.5	28.0	17.5

** data extracted from Minerva condensate assay*

8.2 Weathering Properties

8.2.1 Annie-1 Condensate

A series of model weathering tests were conducted to illustrate the potential behaviour of the condensate when exposed to idealised and representative environmental conditions:

- A 50 m^3 surface release over 1-hour under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (15 °C) and ambient tidal and drift currents; and
- A 50 m^3 surface release over 1-hour under variable wind conditions (1-23 knots, drawn from representative data files), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.

Note, a surface release is used in the weathering test to solely focus on the weathering and fates of the hydrocarbons when exposed to atmospheric conditions.

The first case is indicative conditions that would not generate entrainment, while the second case represents conditions that would likely cause entrainment. Both scenarios provide examples of potential behaviour during a spill once the oil is on the sea surface.

The mass balance for the condensate under the constant 5 knot wind case (Figure 8.1) shows that 52.4% of the condensate is expected to evaporate within 24 hours. Under calm conditions, the majority of the remaining condensate on the water surface will weather at a slower rate due to being comprised of the less volatile, longer-chain compounds. Evaporation shall cease when only the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 8.2), where the winds are of greater strength on average, entrainment of condensate into the water column is shown to increase. Approximately 24 hours after the spill, 70.1% of the mass is shown to have entrained and a further 23.8% has evaporated, leaving only a small proportion floating on the water surface (<1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of ~2.5% per day with 17.8% after 7 days, compared to <0.7% per day and a total of 0.1% after 7 days for the constant-wind case. Given the proportion of entrained condensate and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

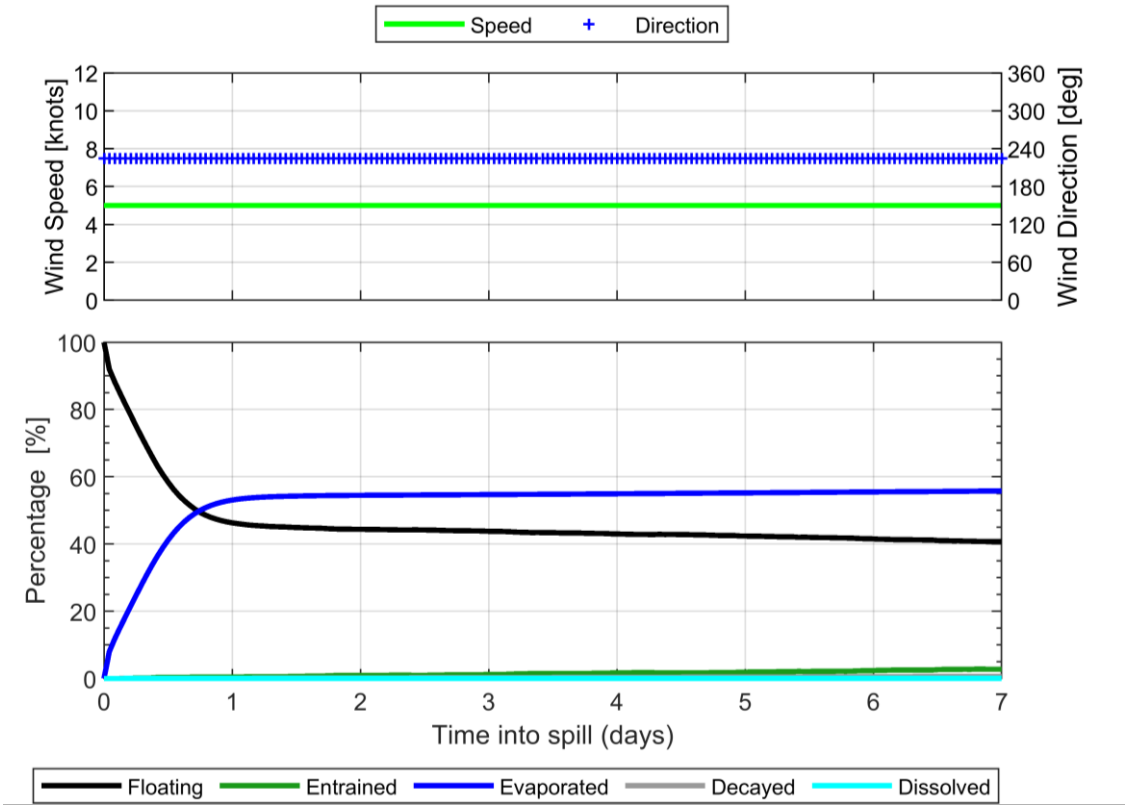

Figure 8.1 Proportional mass balance plot representing the weathering of Annie-1 condensate spilled onto the water surface over 1-hour and subject to a constant 5 knots wind speed at 15°C water temperature.

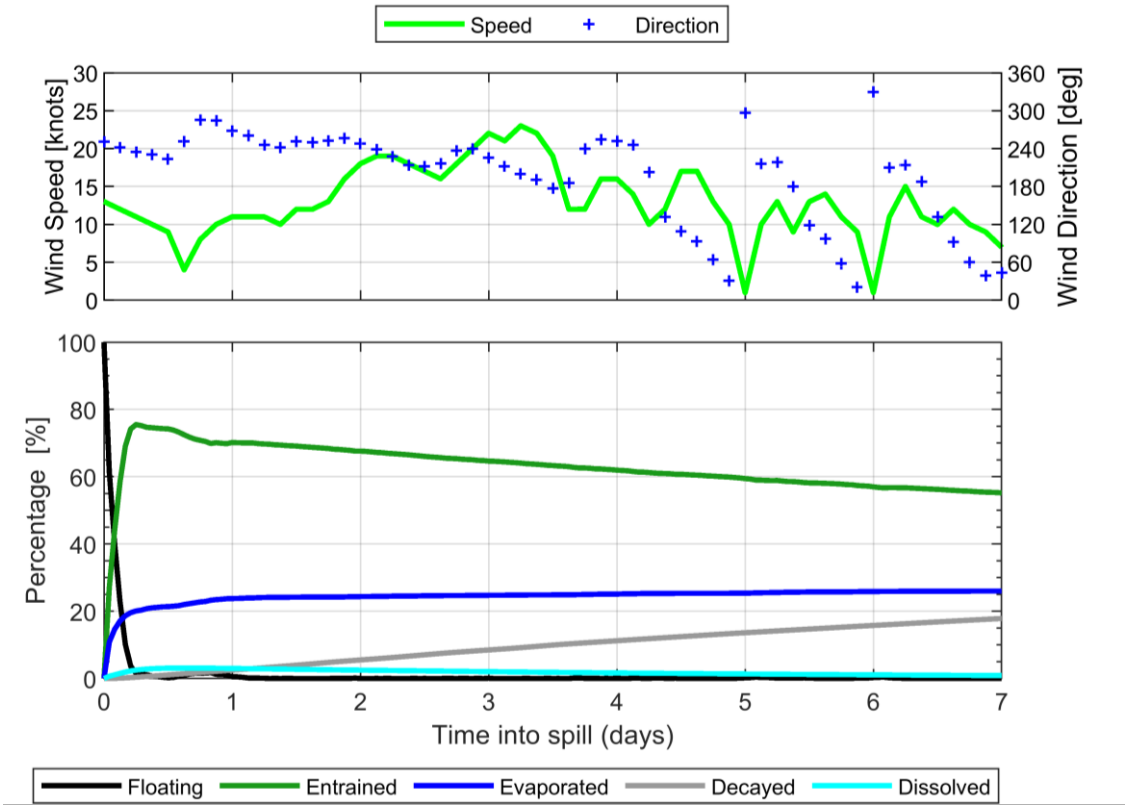

Figure 8.2 Proportional mass balance plot representing the weathering of Annie-1 condensate spilled onto the water over 1-hour and subject to variable wind speeds (1-23 knots) at 15°C water temperature.

9 MODEL SETTINGS

Table 9.1 provides a summary of the oil spill model settings.

Table 9.1 Summary of the oil spill model settings and thresholds used in this assessment.

Parameter	Scenario 1	Scenario 2	Scenario 3
Description	Loss of Well Control at Elanora-1 ST1 (Isabella)	Loss of Well Control at Pecten East-2	Loss of Well Control at Annie-2
Number of randomly selected spill start times	100 per season (200 per scenario)		
Model period	Summer (November to April) Winter (May to October)		
Hydrocarbon type for oil spill modelling only	Annie-1 condensate		
Spill volume	105,289 bbl (16,740 m^3)	83,273 bbl (13,239 m^3)	66,430 bbl (10,562 m^3)
Release type (subsurface, top of BOP stack (depth (m))	54	34	36
Release duration (days)*	102	102	104
Simulation length (days)	116		118
Surface oil concentration thresholds (g/m^2) ^	1 (low); 10 (moderate); 50 (high)		
Shoreline oil accumulation thresholds (g/m^2) ^	10 (low); 100 (moderate); 1,000 (high)		
Dissolved hydrocarbon concentrations (ppb) ^	10 (low); 50 (moderate); 400 (high)		
Entrained hydrocarbon concentrations (ppb) ^	10 (low); 100 (high)		

^Thresholds based on NOPSEMA (2019)

* Note, the 104-day model duration for Scenario 3 relates to slightly more conservative response time for the relief well to kill Annie-2. This duration was carried over from the specifications of the original Annie-2 modelling.

10 PRESENTATION AND INTERPRETATION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of potential sea-surface and water column exposure and shoreline accumulation.

10.1 Annual Analysis

The statistics are based on the following principles:

- The ***greatest distance travelled by a spill trajectory*** – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds;
- The ***probability of oil exposure to a receptor*** – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario;
- The ***minimum time before oil exposure to a receptor*** – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value;
- The ***maximum residence time for oil exposure within a receptor*** – is determined by recording the longest continuous length of time a grid cell is exposed to either floating, entrained or dissolved hydrocarbon above each threshold, within a receptor;
- The ***probability of oil accumulation at a receptor*** – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario;
- The ***maximum (total) volume of oil ashore*** – is the total volume of oil stranded on the shorelines throughout the duration of the simulation;
- The ***maximum potential oil loading within a receptor*** – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario; and
- The ***dissolved and entrained hydrocarbon exposure*** – is determined by recording the maximum instantaneous concentrations at each grid cell.

10.2 Deterministic Trajectories

The stochastic modelling results were assessed for each scenario, and the deterministic runs were identified and are presented in the result section based on the following criteria.

a. Largest swept area for surface oil above 10 g/m^2;

b. Largest (total) volume of oil ashore;

c. Longest length of shoreline with oil accumulation above 100 g/m^2;

d. Largest area of entrained hydrocarbon exposure above 100 ppb; and

e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

10.3 Receptors Assessed

A range of environmental receptors and shorelines were assessed for floating oil exposure, shoreline accumulation and water column exposure as part of the study (see Figure 10.1 to Figure 10.11). Receptor categories (see Table 10.1) include sections of shorelines which are defined by local government areas (LGAs), sub-LGAs and offshore islands. All other sensitive receptors other than submerged reefs, shoals and banks (RSB) were sourced from Australian Government Department of Climate Change, Energy, the Environment and Water (https://www.dcceew.gov.au/).

Risks of exposure were separately calculated for each sensitive receptor area and have been tabulated.

Table 10.2 summarises the receptors that the release locations reside within.

RPS have utilised BIAs for the southern right whale that were delineated within the 2011-2021 Conservation Management Plan for the Southern Right Whale. The NCV Atlas now includes updated BIAs for SRW, though the recently drafted National Recovery Plan for the southern right whale has not been published. The updated BIAs have not been used in this report.

11 RESULTS – SCENARIO 1 – 105,289 BBL (16,740 M^3) SUBSURFACE RELEASE FROM A LOSS OF WELL CONTROL AT ELANORA-1 ST1

This scenario examined a 105,289 bbl (16,740 m^3) subsurface release of condensate over 102 days to represent a LOWC scenario at Elanora-1 ST1 well. A total of 100 spill simulations were run per season (summer and winter) and each simulation was tracked for 116 days. The results are presented on a seasonal basis.

Sections 11.1 and 11.2 present the seasonal stochastic analysis and deterministic analysis results, respectively.

11.1 Stochastic Analysis

11.1.1 Floating Oil Exposure

Table 11.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance and corresponding direction from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones was 75.7 km (east, winter) and 11.7 km (east-southeast, summer), respectively. No high (>50 g/m^2) exposure zones were predicted during either summer or winter conditions.

Table 11.2 summarises the potential floating oil exposure to individual receptors.

During summer, a total of 16 Biologically Important Areas (BIAs) were predicted to be exposed to floating oil at, or above, the low threshold. Excluding the BIAs that the release location resides within (see Section 10.3), the highest probability (40%) of low exposure was predicted at the Southern Right Whale – Aggregation BIA. The minimum time before low exposure to the Southern Right Whale – Aggregation BIA was 3.21 days.

Contrastingly, during winter, excluding the BIAs that the release location resides within (see Section 10.3), the highest probability (54%) of low exposure for any BIA was revealed at the Short-tailed Shearwater - Foraging BIA. Additionally, the minimum time before low exposure to the Southern Right Whale – Aggregation was 1.38 days.

Table 11.3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor.

Figure 11.1 and Figure 11.2 present the zones of potential floating oil exposure per season whilst Figure 11.3 to Figure 11.6 present the maximum residence time of floating oil exposure for the NOPSEMA thresholds.

Table 11.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations per season.

Distance and direction travelled	Zones of potential floating oil exposure					
	Summer			Winter		
	Low	Moderate	High	Low	Moderate	High
Maximum distance (km) from release location	74.0	11.7	-	75.7	9.8	-
Maximum distance (km) from release location (99th percentile)	48.0	11.3	-	68.4	9.3	-
Direction	E	ESE	-	E	NW	-

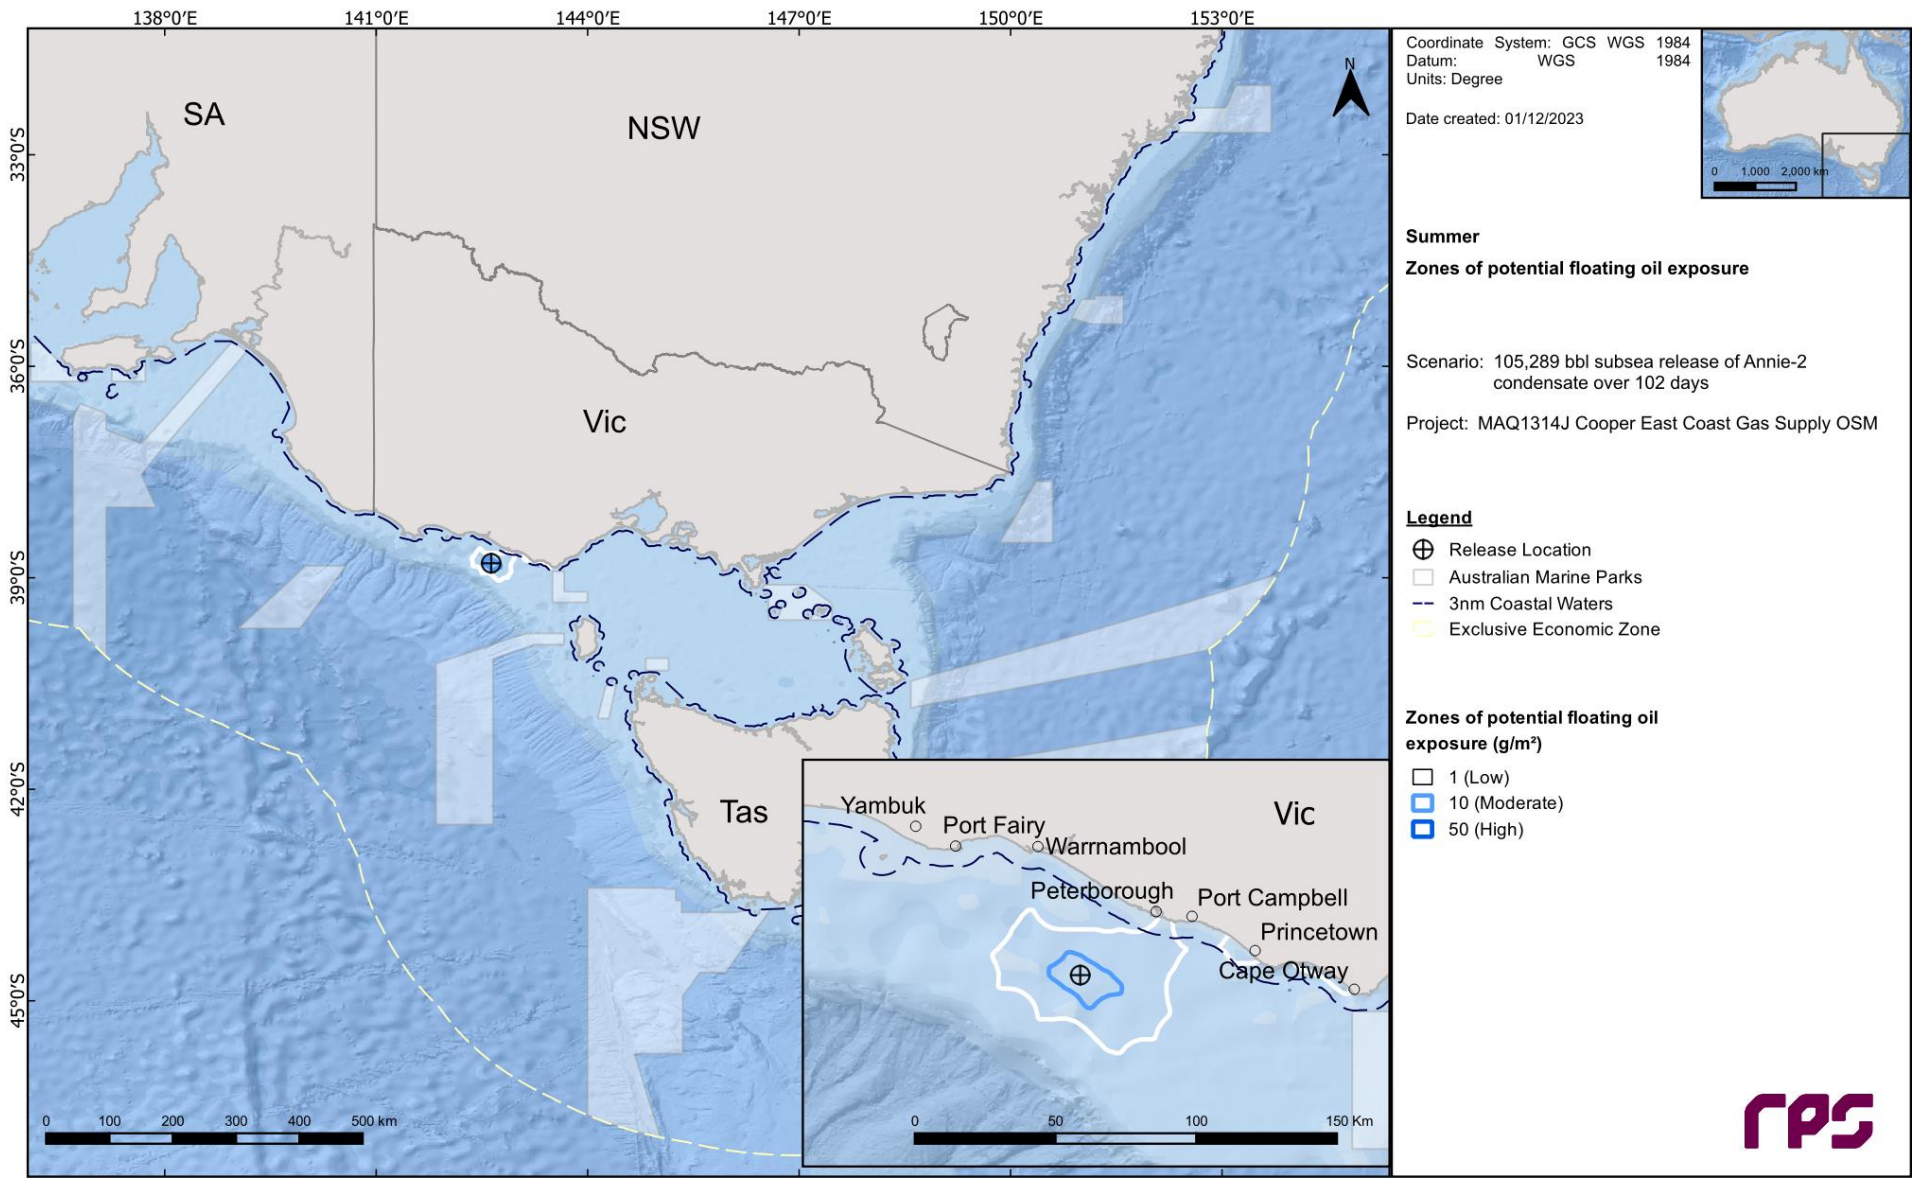

Figure 11.1 Zones of potential floating oil exposure in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

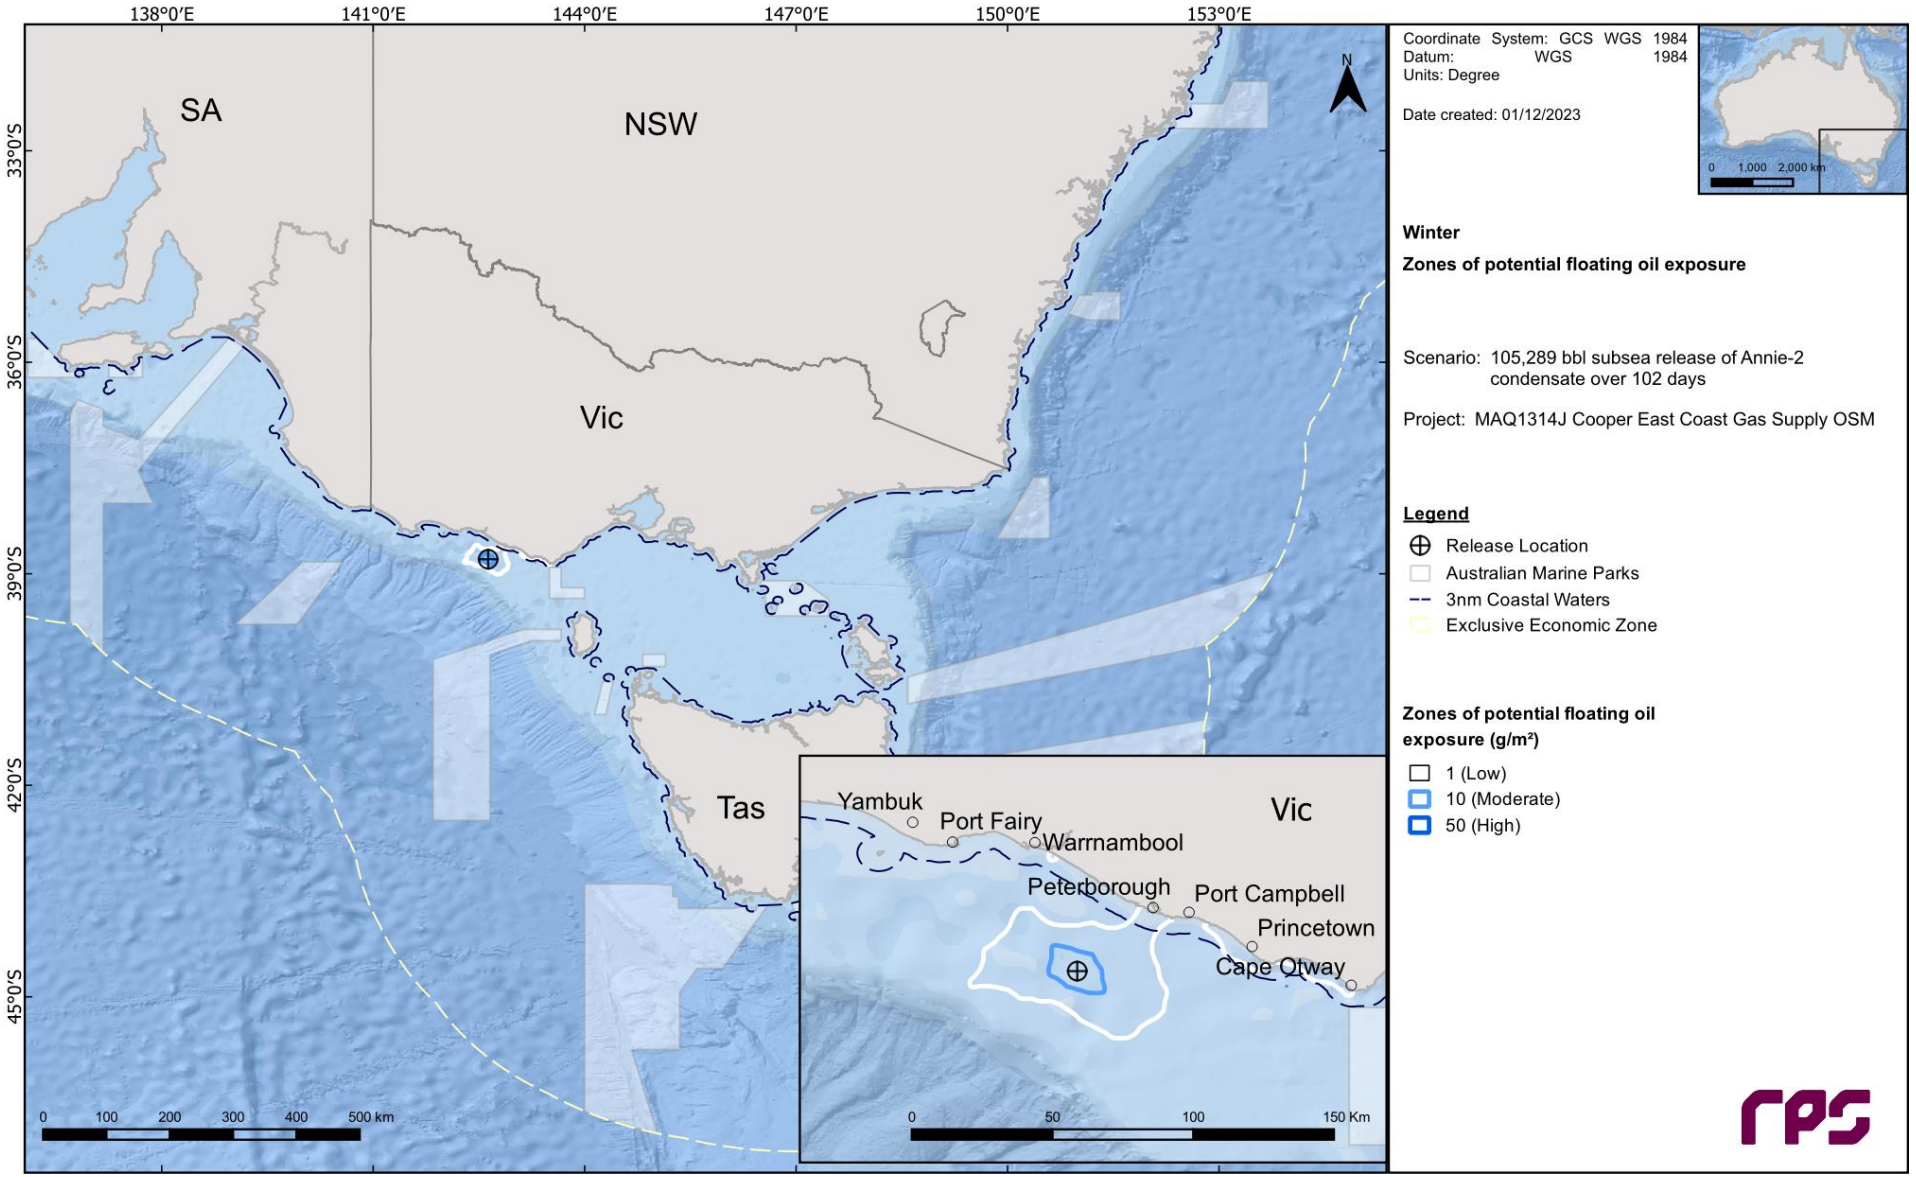

Figure 11.2 Zones of potential floating oil exposure in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

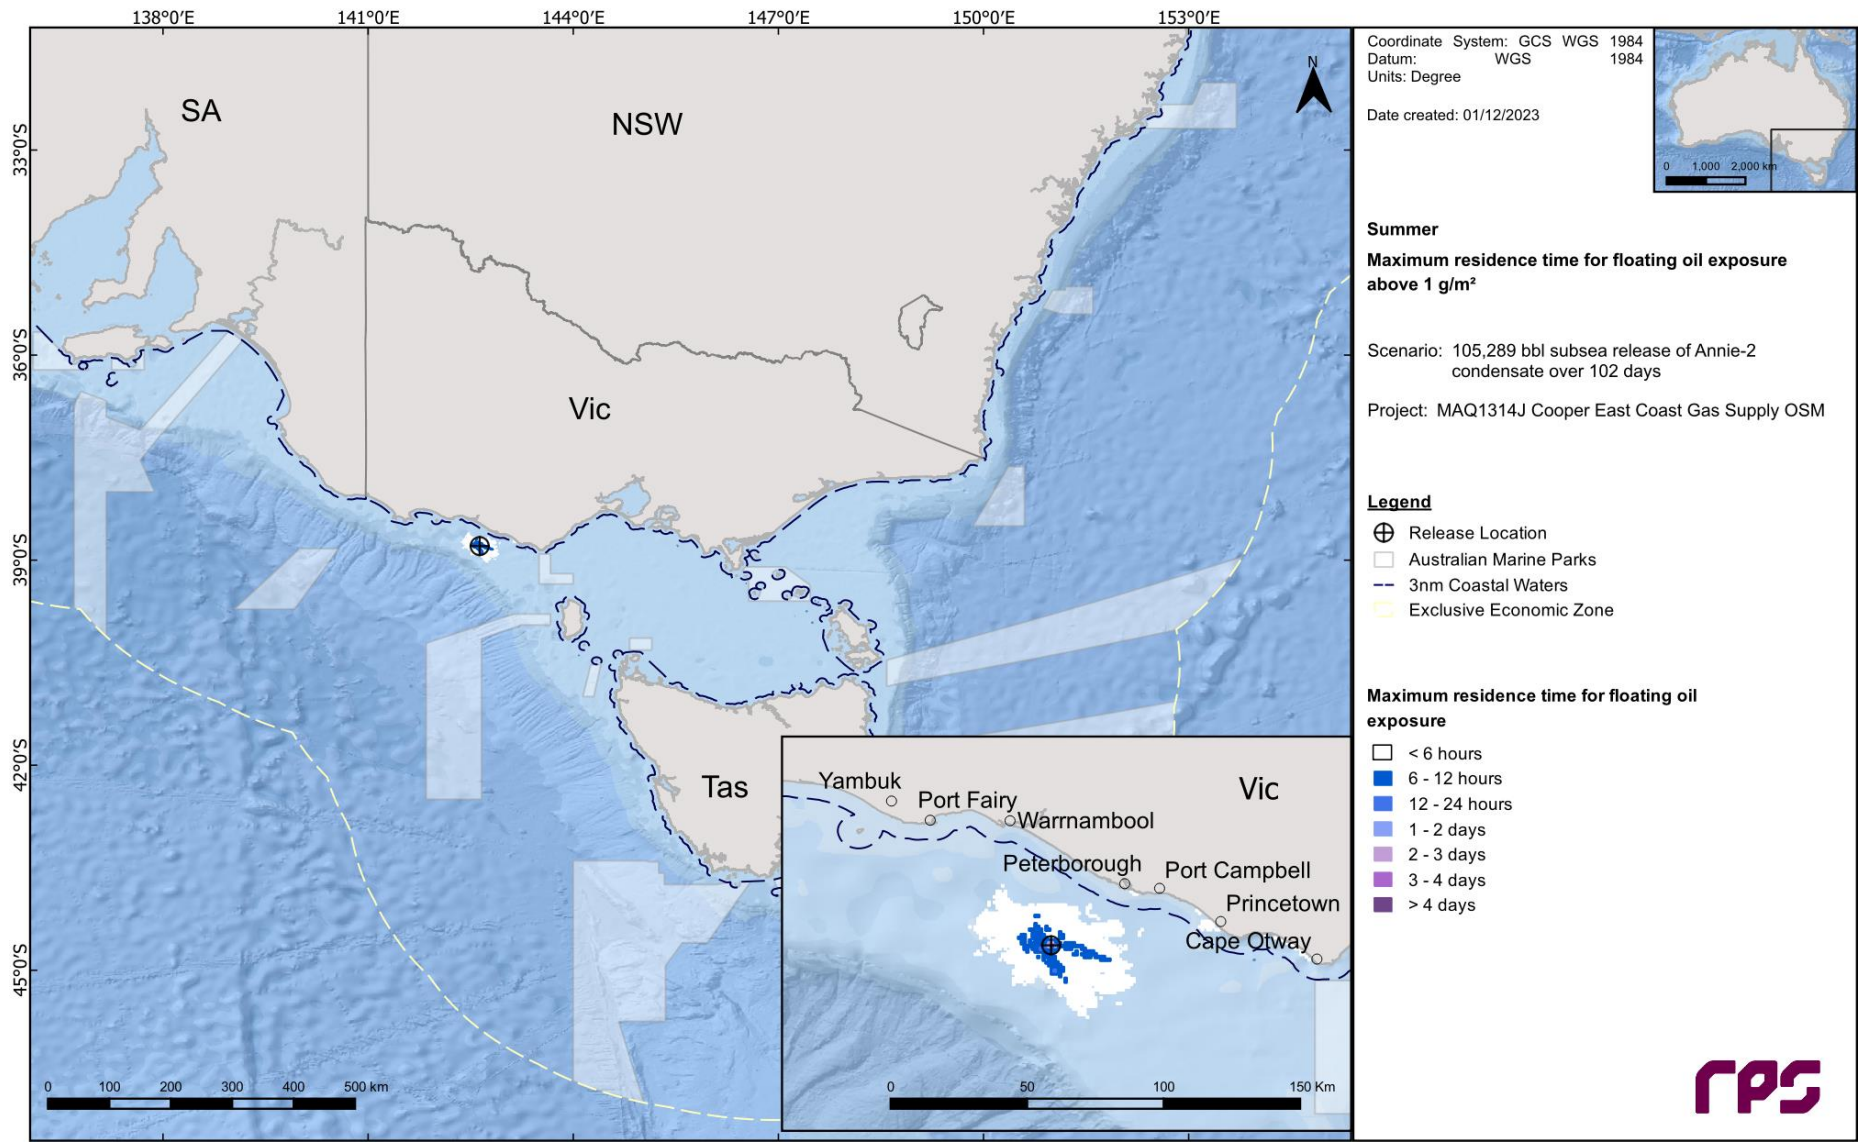

Figure 11.3 Maximum residence time of floating oil exposure above 1 g/m^2, in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

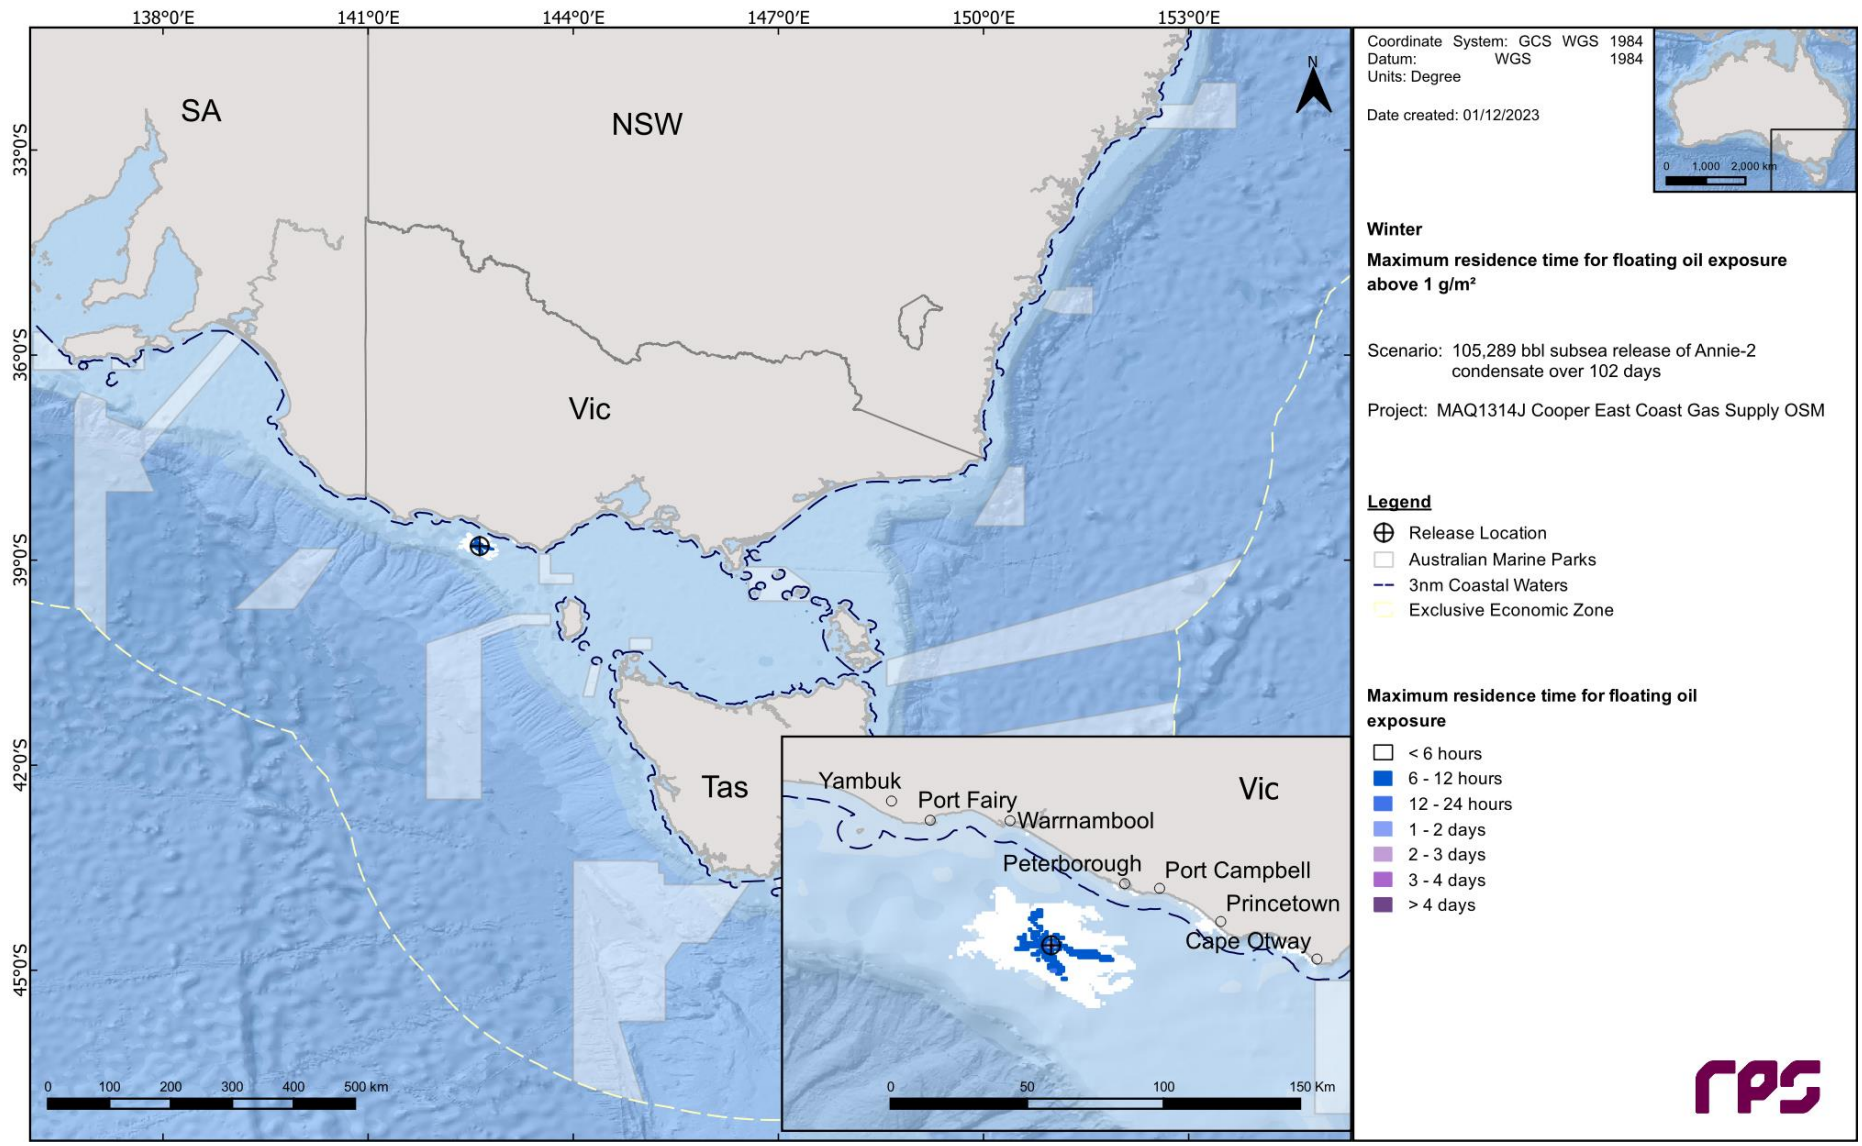

Figure 11.4 Maximum residence time of floating oil exposure above 1 g/m^2, in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

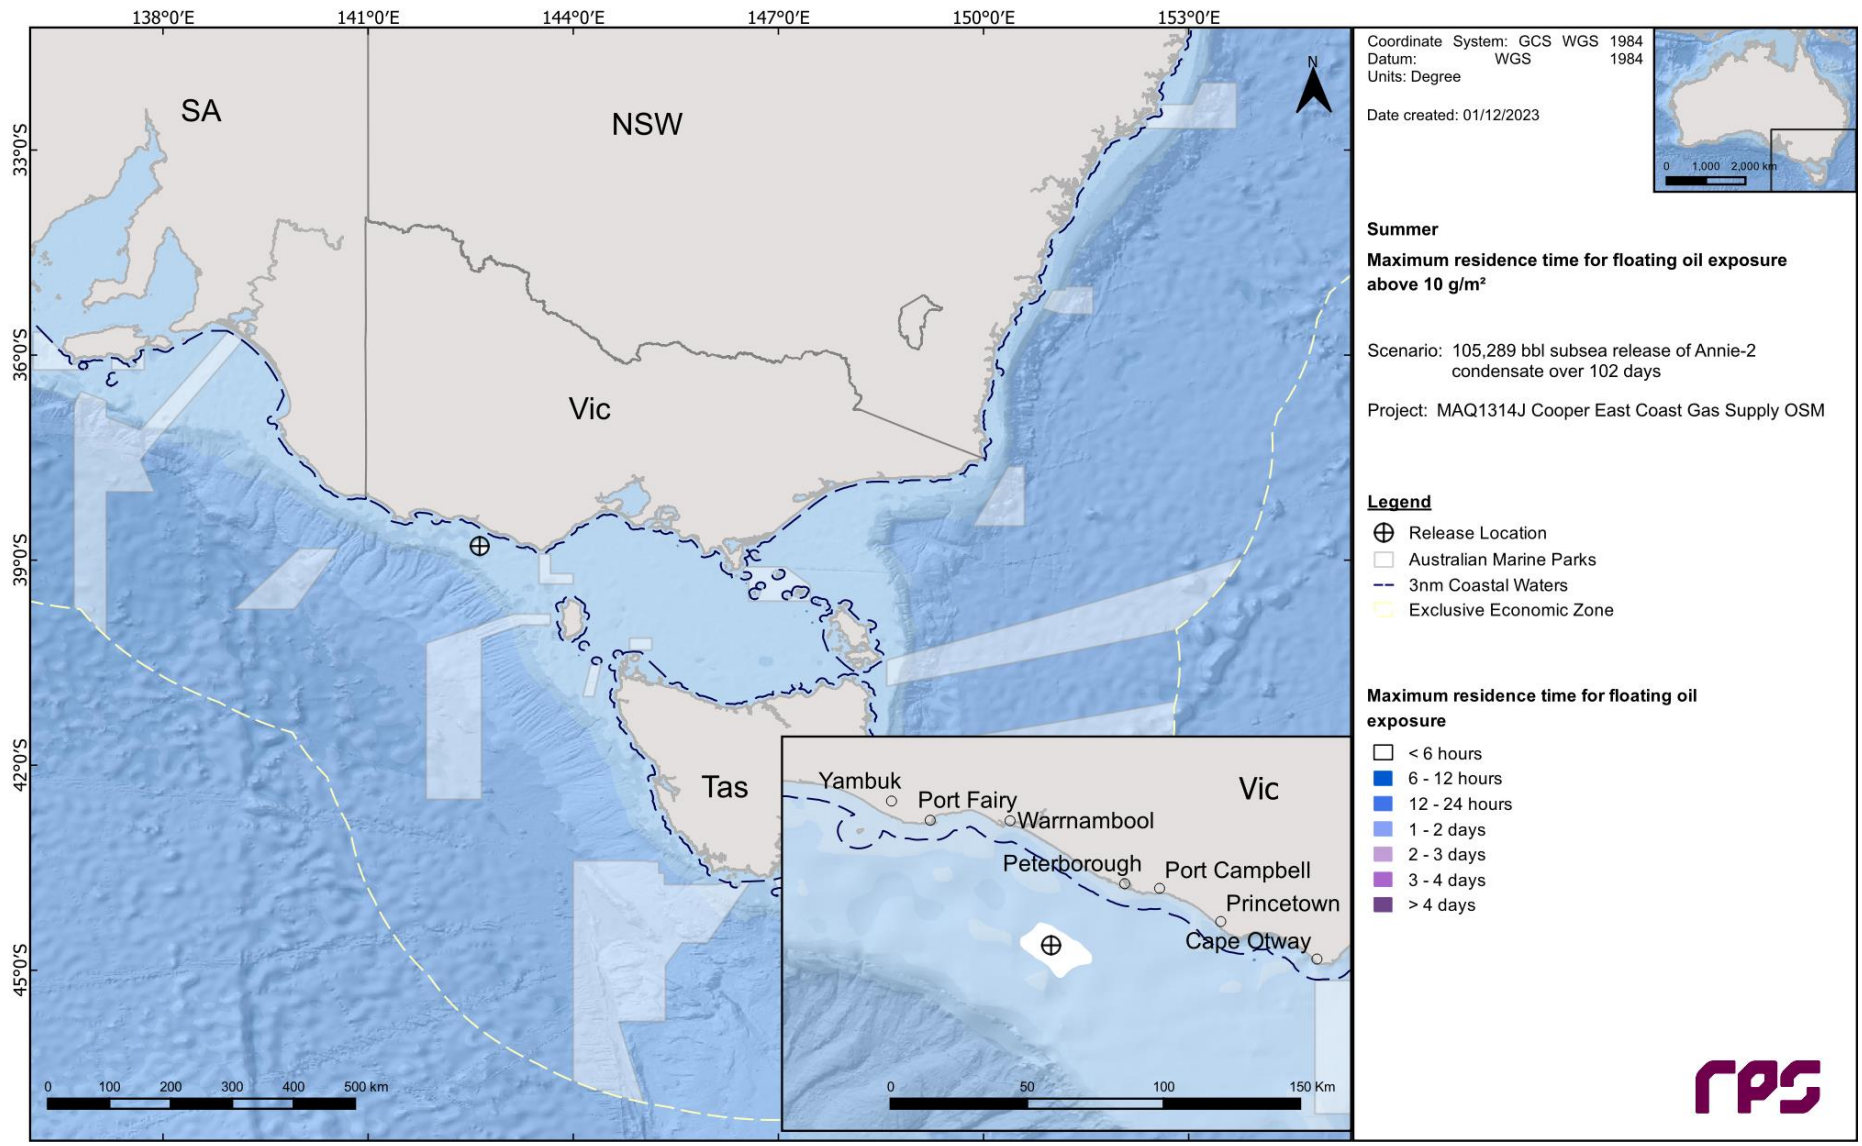

Figure 11.5 Maximum residence time of floating oil exposure above 10 g/m^2, in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

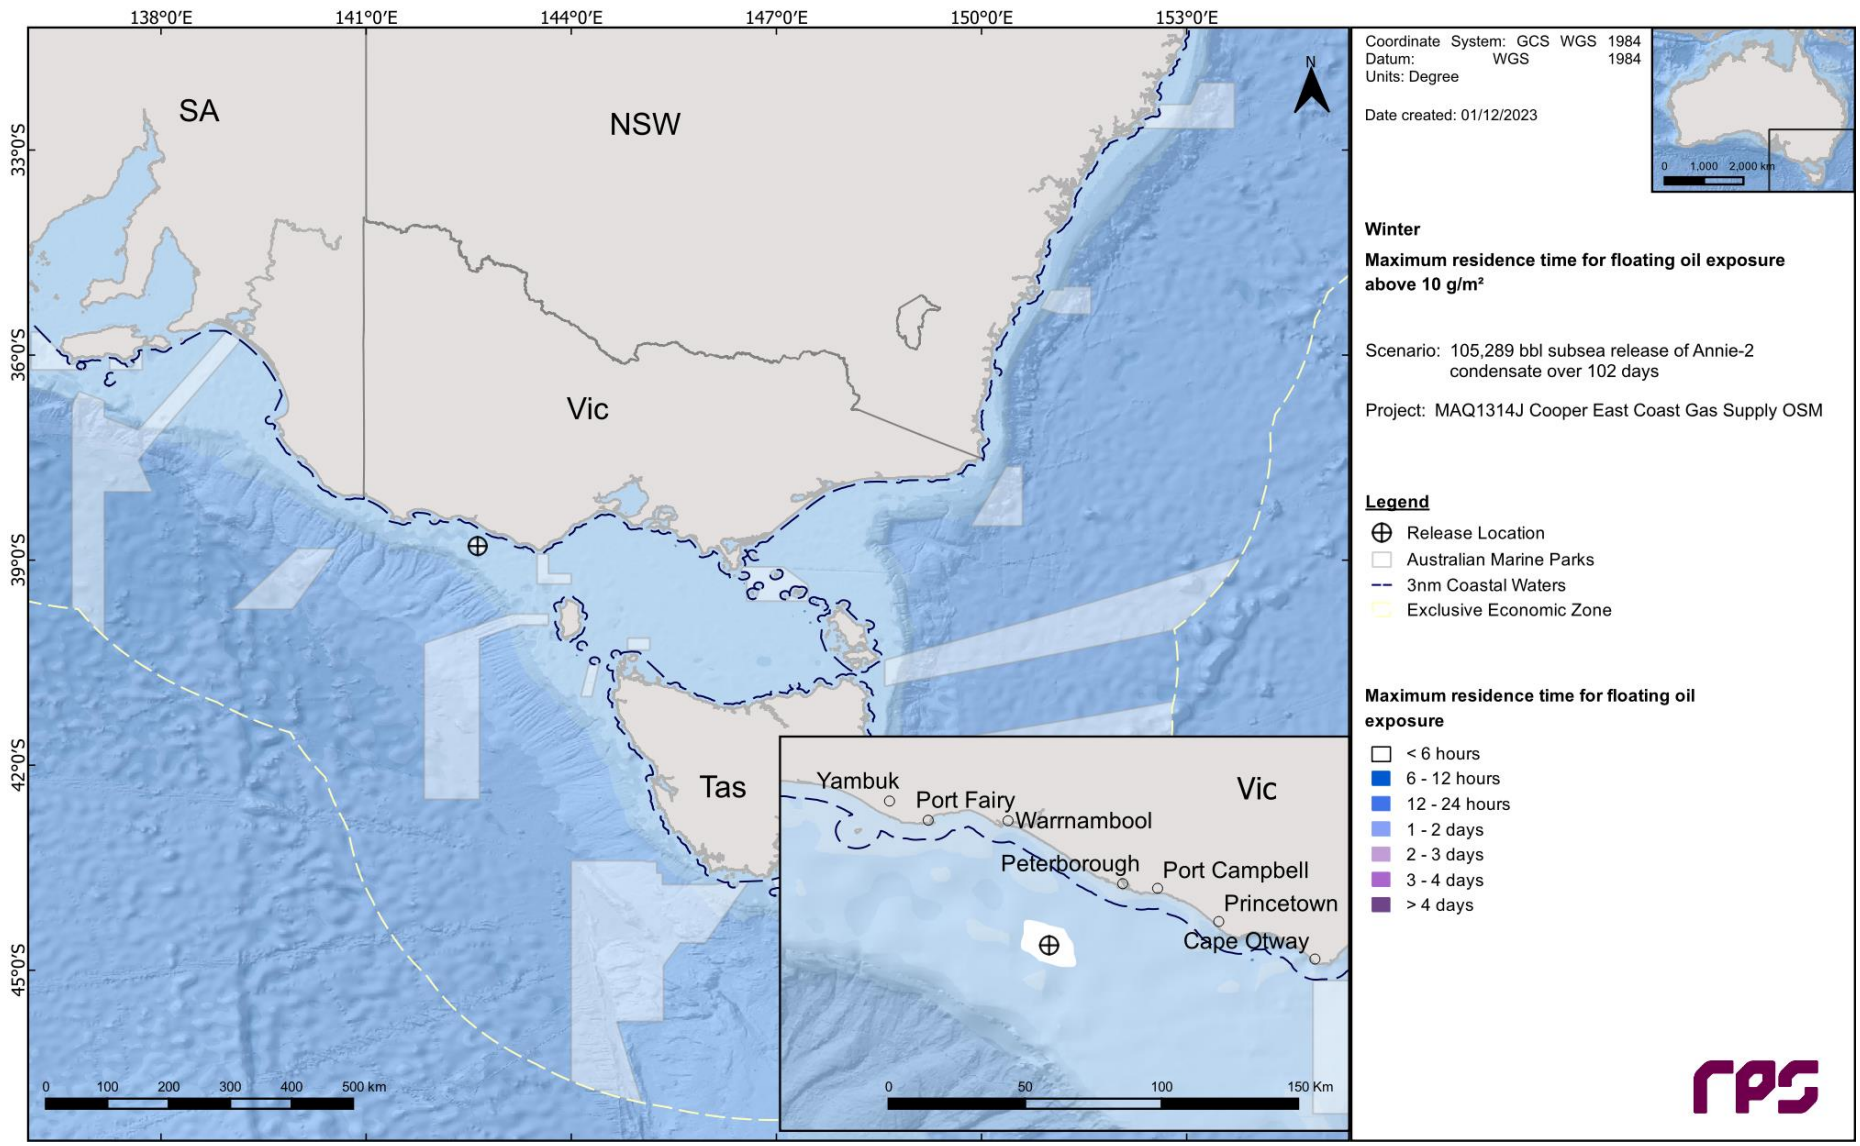

Figure 11.6 Maximum residence time of floating oil exposure above 10 g/m^2, in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

11.1.2 Shoreline Accumulation

Table 11.4 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 100% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 1.83 days (winter). The maximum total volume ashore for a single spill trajectory was 251.0 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 295.0 km, 48.0 km and 1.0 km, respectively, all occurring during winter.

Table 11.5 and Table 11.6 summarises the shoreline accumulation on individual receptors during summer and winter, respectively.

During summer, the shoreline segment of Colac Otway LGA as well as the Cape Otway West sub-LGA had the highest probability of accumulation above the low (99%) and moderate (69%) thresholds. Bay of Islands and Moyne also revealed a 1% probability of accumulation above the high threshold. The minimum time for low threshold shoreline accumulation was 3.38 days for the Corangamite shoreline segment.

Through winter, the shoreline segment of Colac Otway as well as the Cape Otway West sub-LGA had the highest probability of accumulation above the low and moderate thresholds (100% and 85%, respectively). Again, only few receptors revealed a 1% probability of accumulation above the high threshold. The minimum time for low threshold shoreline accumulation was 1.83 days for the Bay of Islands and Moyne shoreline segments.

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 11.7 and Figure 11.8 for summer and winter, respectively.

Table 11.4 Summary of oil accumulation across all shorelines. Results are based on a 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	100	100
Absolute minimum time for visible oil to shore (days)	3.38	1.83
Maximum total volume of hydrocarbons ashore (m^3)	189.6	251.0
Average total volume of hydrocarbons ashore (m^3)	68.0	98.8
Maximum length of the shoreline at **10 g/m^2** (km)	264.0	295.0
Average shoreline length (km) at **10 g/m^2** (km)	109.8	142.2
Maximum length of the shoreline at **100 g/m^2** (km)	37.0	48.0
Average shoreline length (km) at **100 g/m^2** (km)	12.4	18.3
Maximum length of the shoreline at **1,000 g/m^2** (km)	1.0	1.0
Average shoreline length (km) at **1,000 g/m^2** (km)	1.0	1.0

Table 11.5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

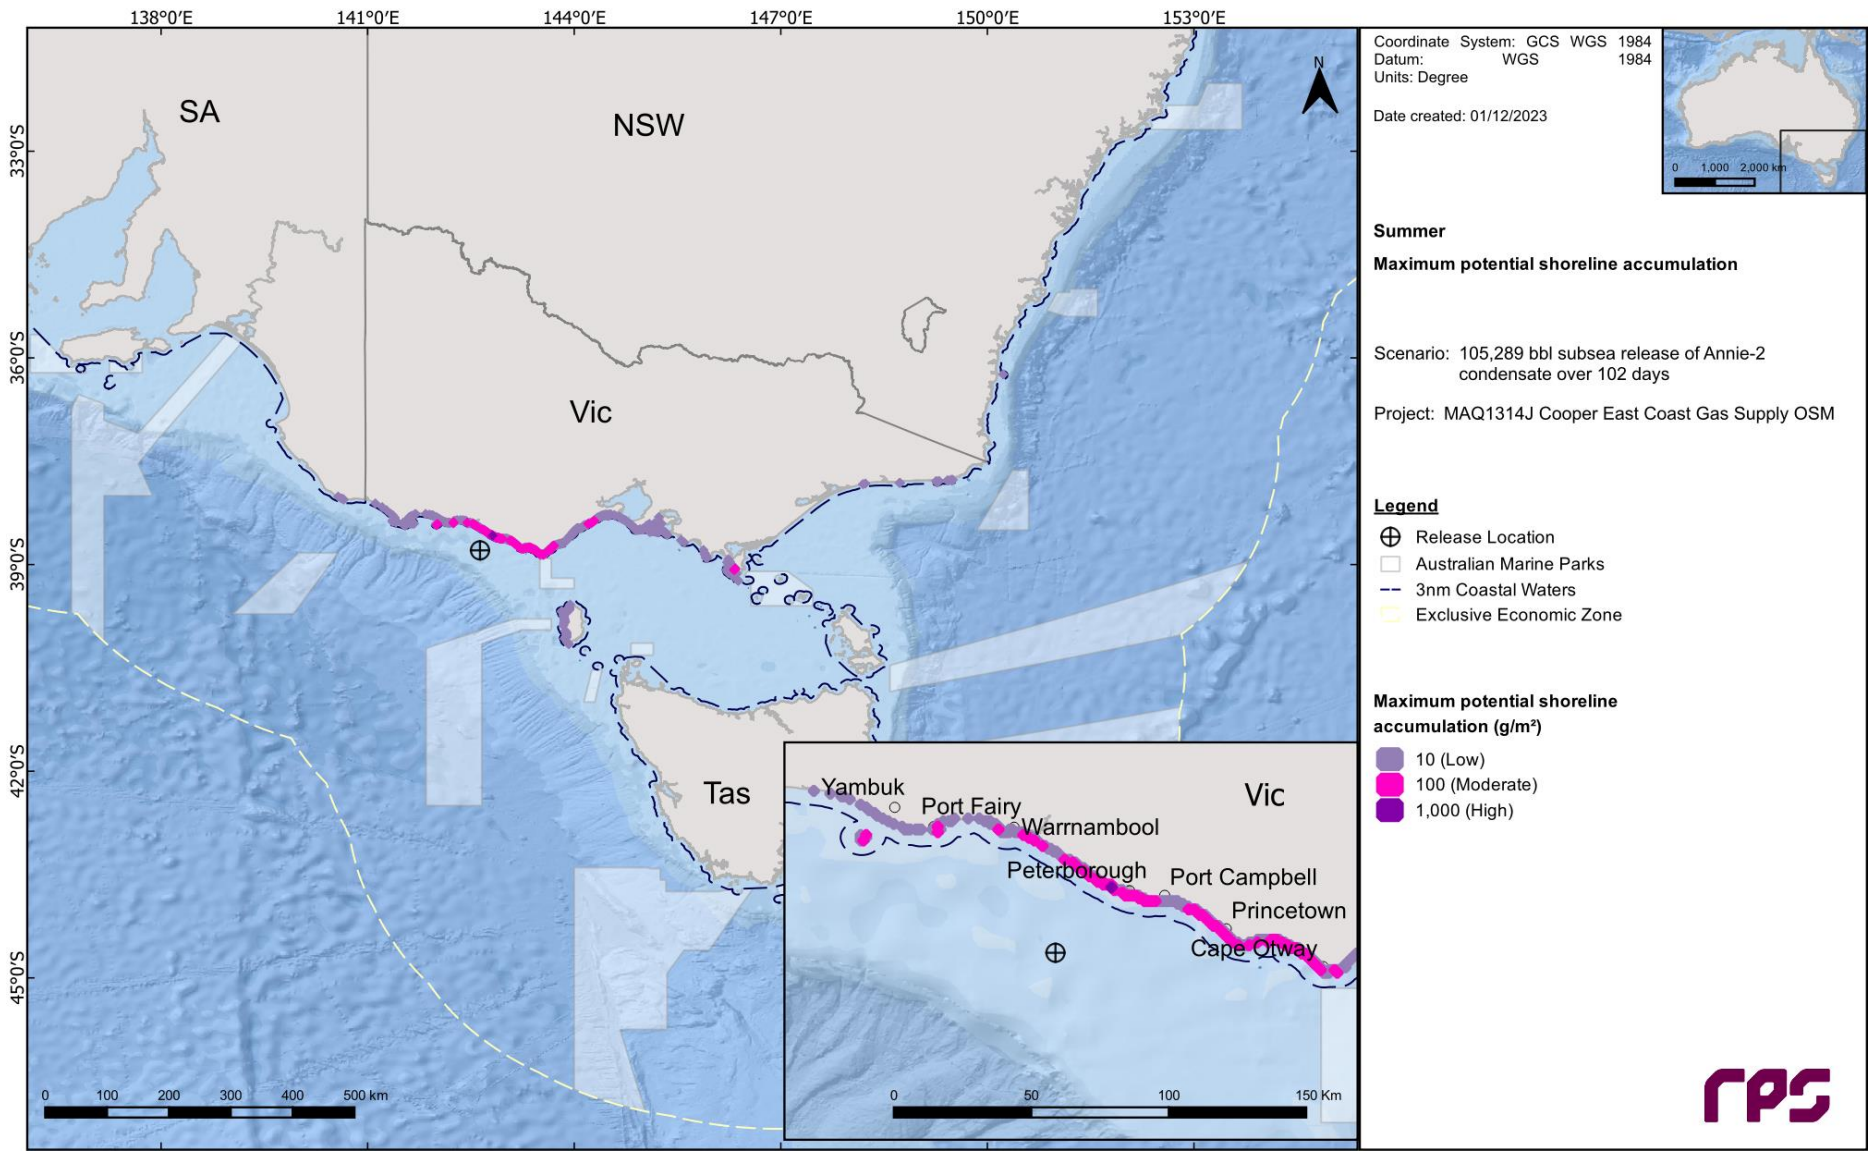

Figure 11.7 Maximum potential shoreline accumulation in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

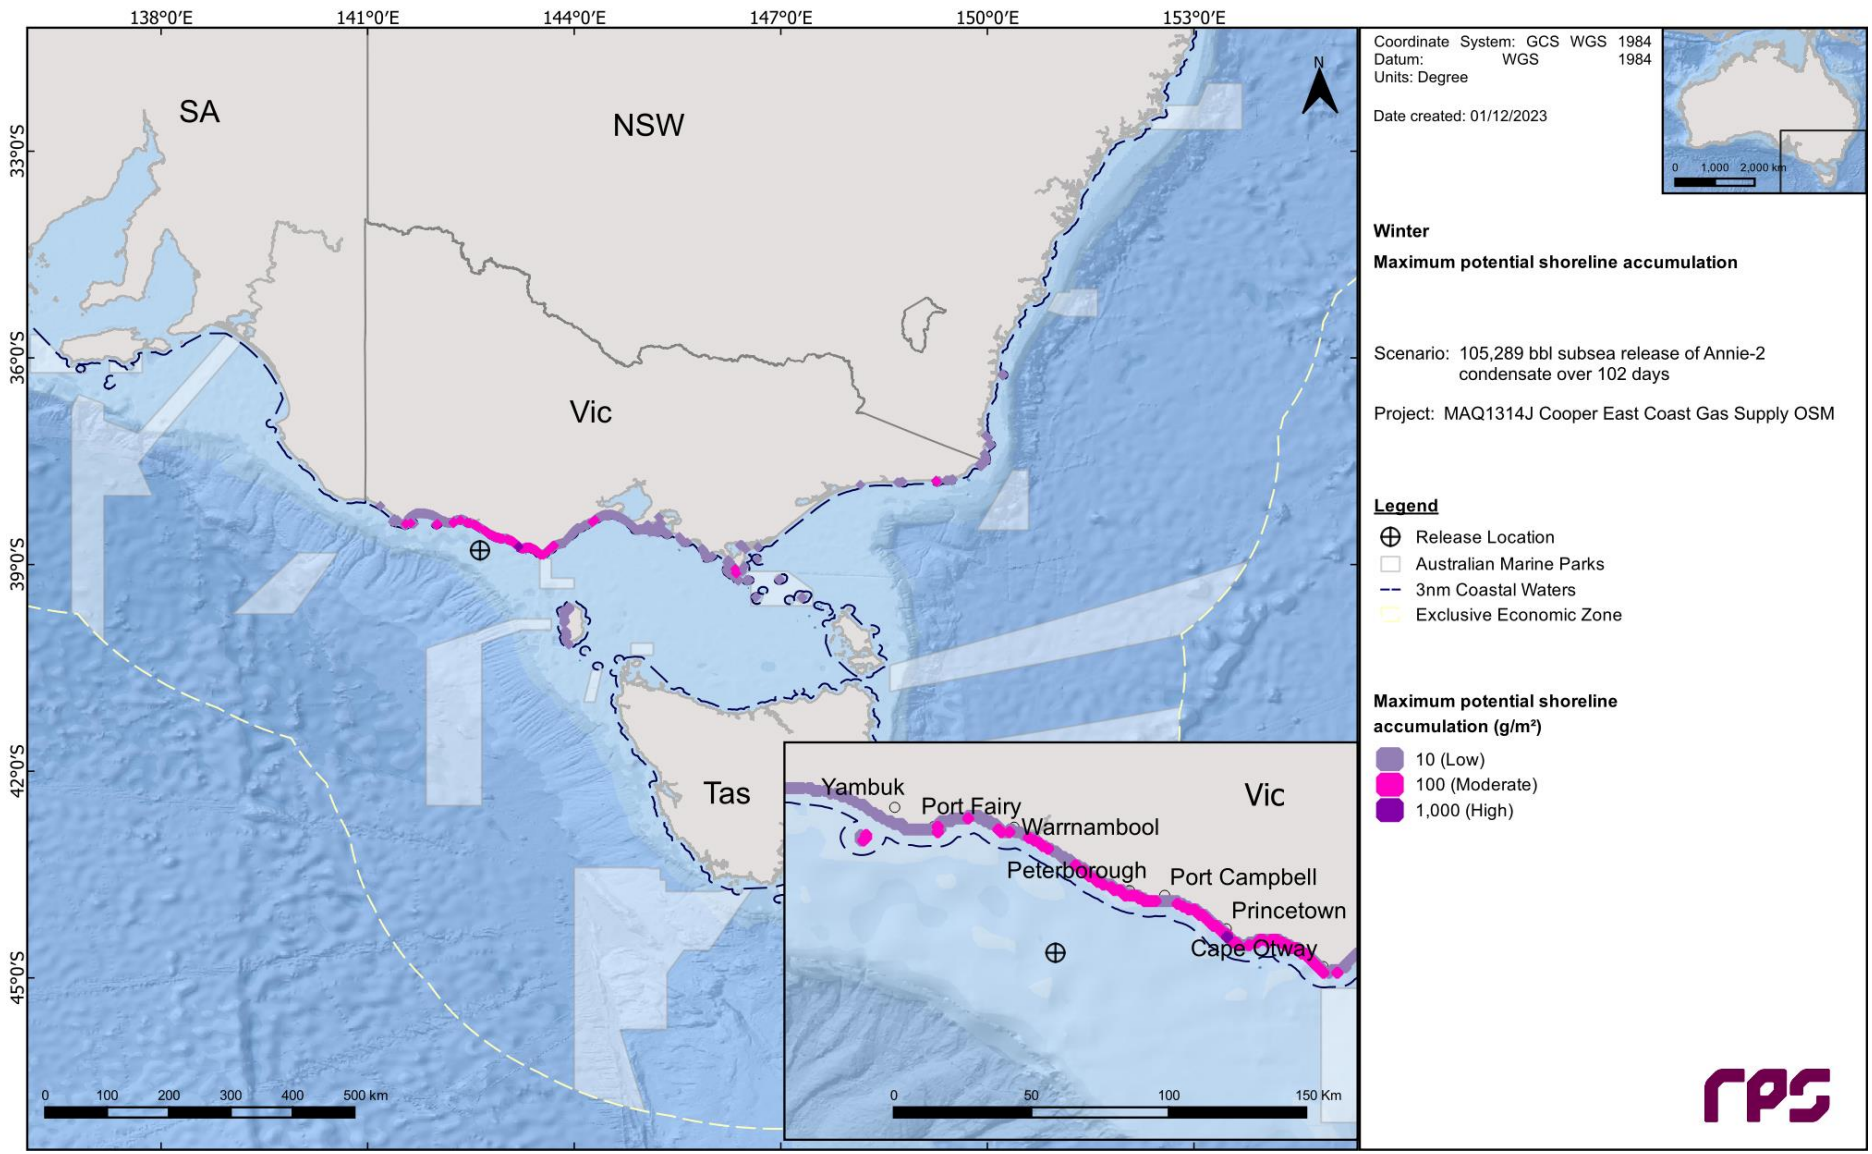

Figure 11.8 Maximum potential shoreline accumulation in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

11.1.3 In-water exposure

11.1.3.1 Dissolved Hydrocarbons

Table 11.7 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer.

During summer conditions, a total of 20 BIAs were predicted to be exposed to dissolved hydrocarbon at, or above, the low threshold. Excluding the BIAs that the release location resides within (see Section 10.3), the highest probability of low exposure ranged between 2% (Australasian Gannet - Foraging) and 15% (Southern Right Whale - Aggregation).

Alternatively, during winter, excluding the BIAs that the release location resides within (see Section 10.3), the probability of low exposure ranged between 1% (Australasian Gannet - Foraging) and 21% (Short-tailed Shearwater - Foraging).

The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 51.8 ppb and 60.2 ppb for summer and winter conditions, respectively.

Table 11.8 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all thresholds assessed.

Figure 11.9 and Figure 11.10 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer for each season whilst Figure 11.11 Figure 11.12 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds.

Table 11.7 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations per season.

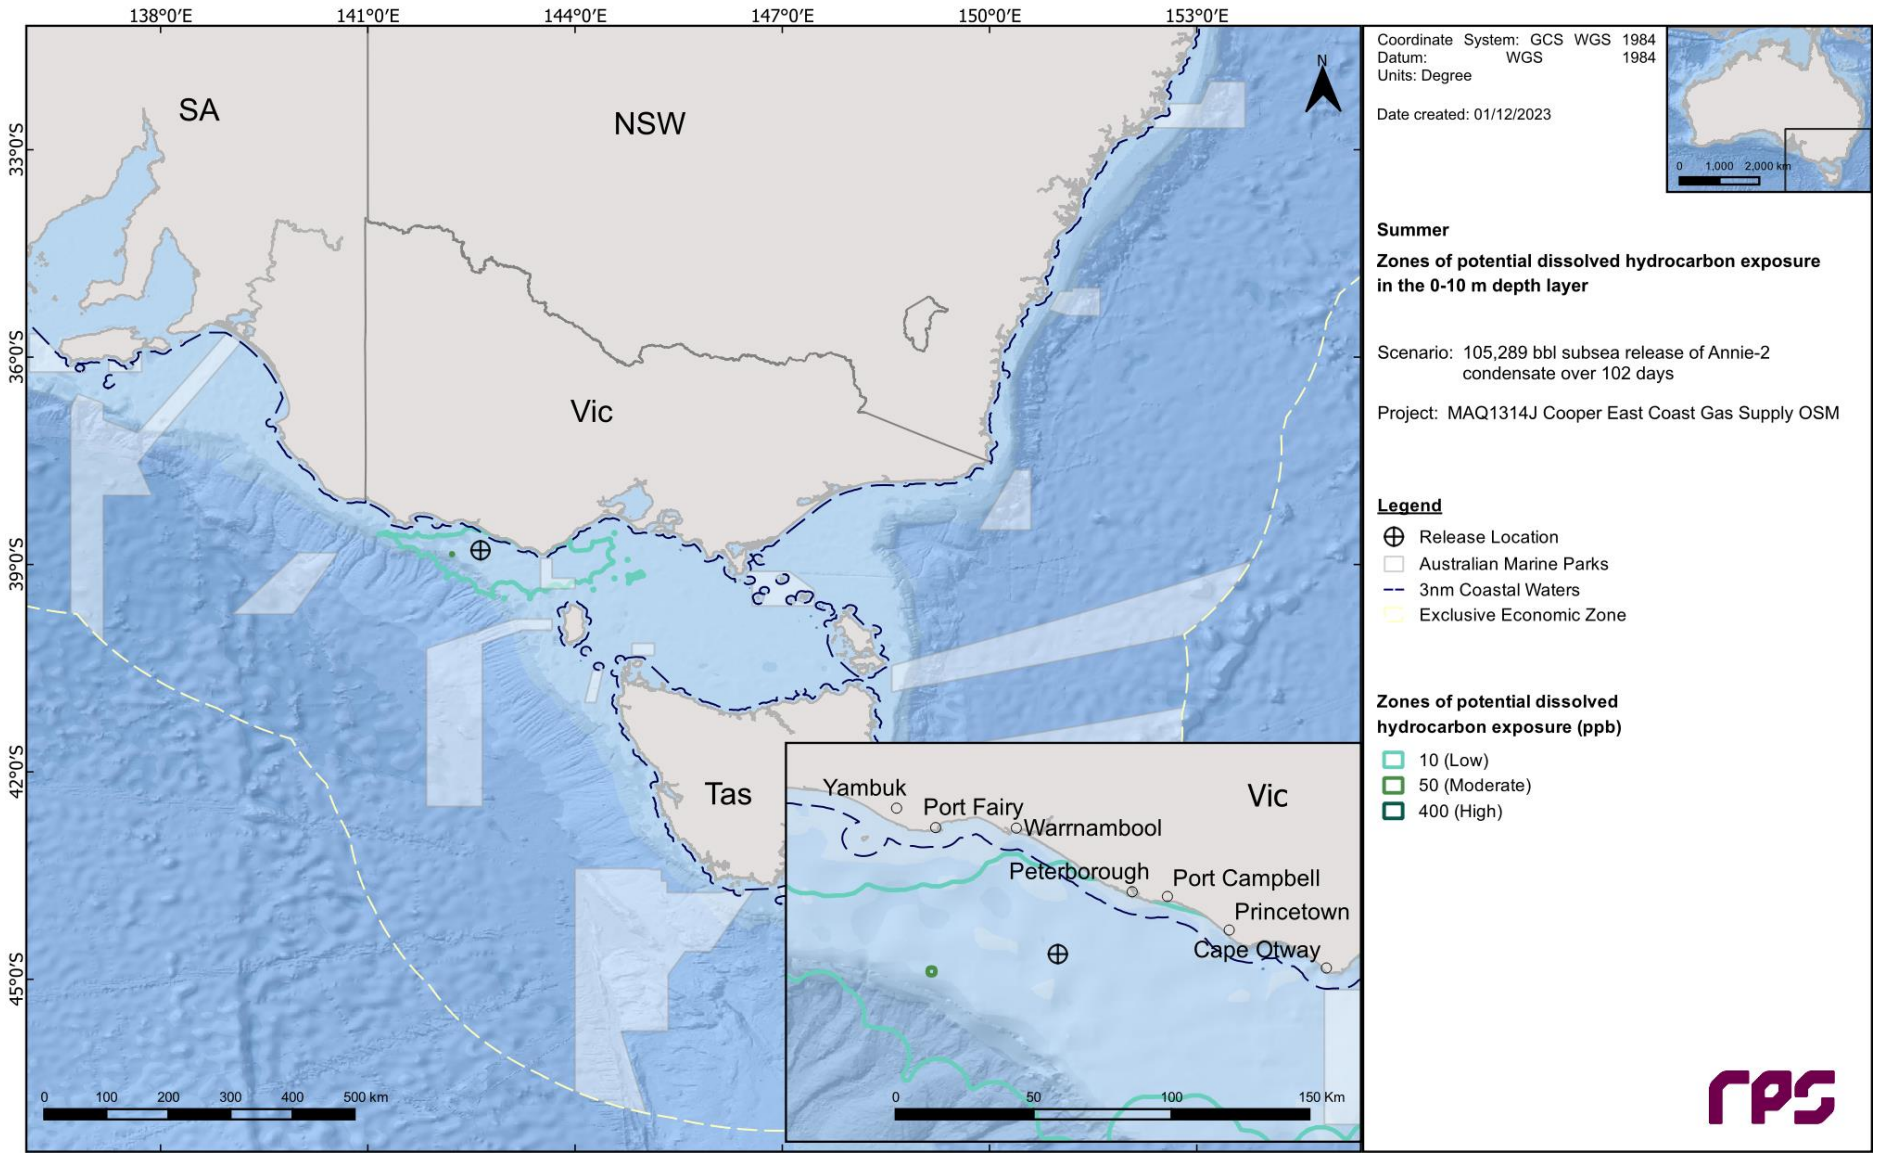

Figure 11.9 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

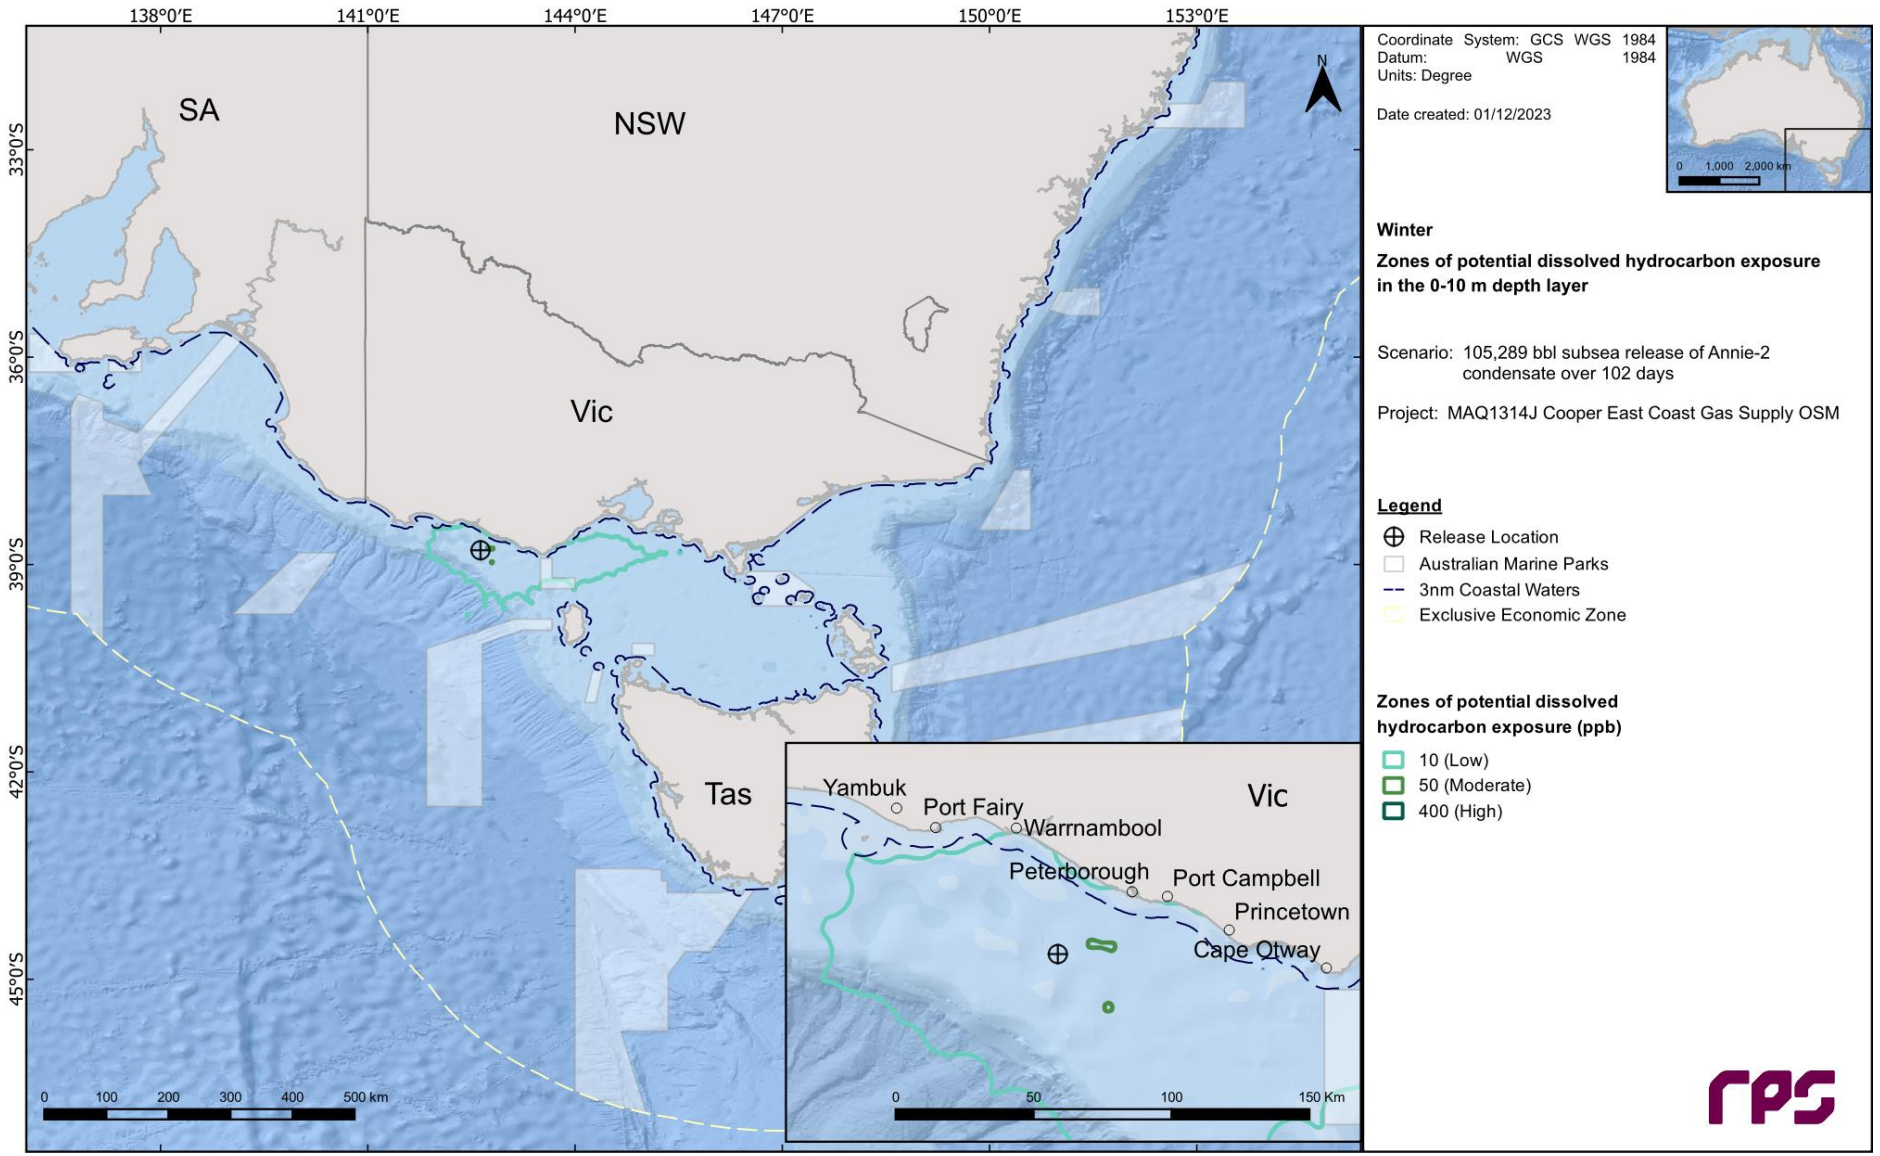

Figure 11.10 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

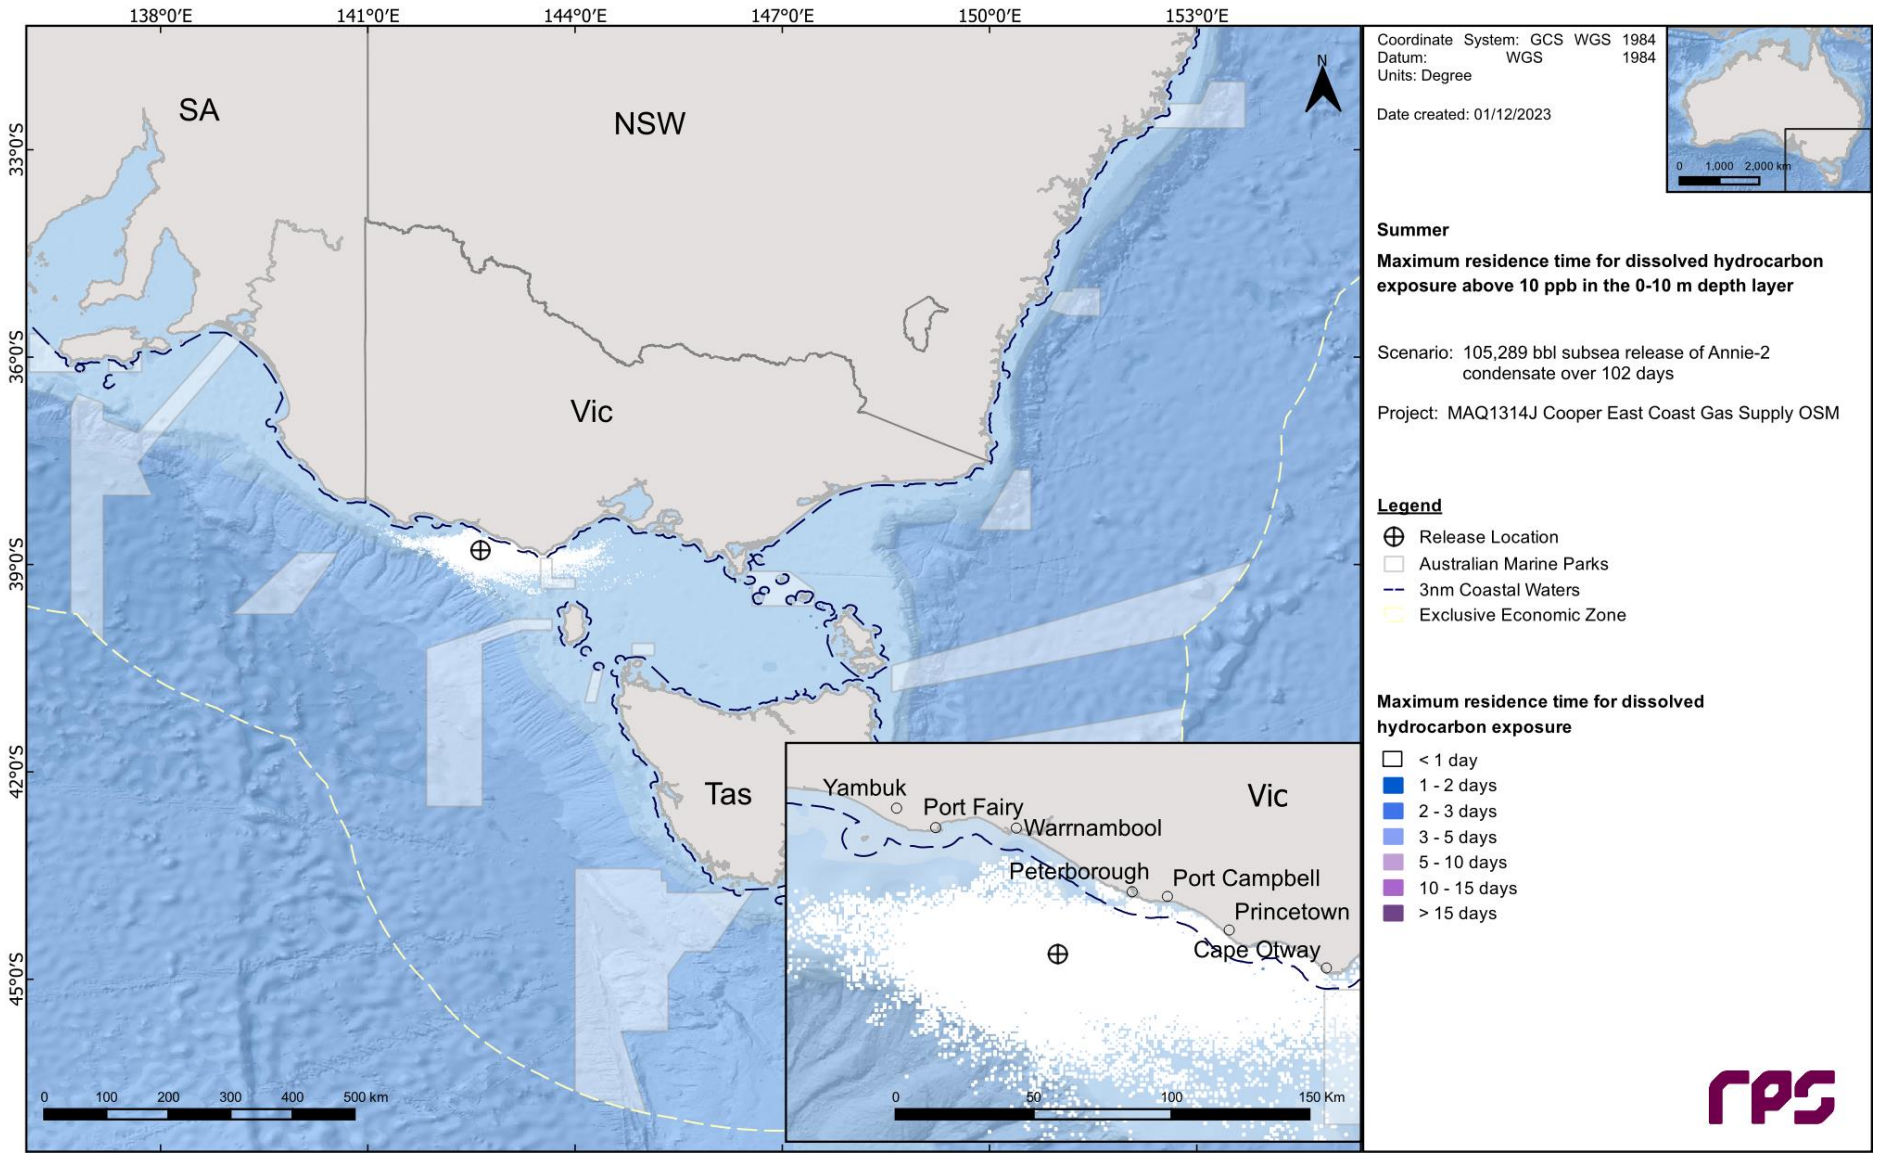

Figure 11.11 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

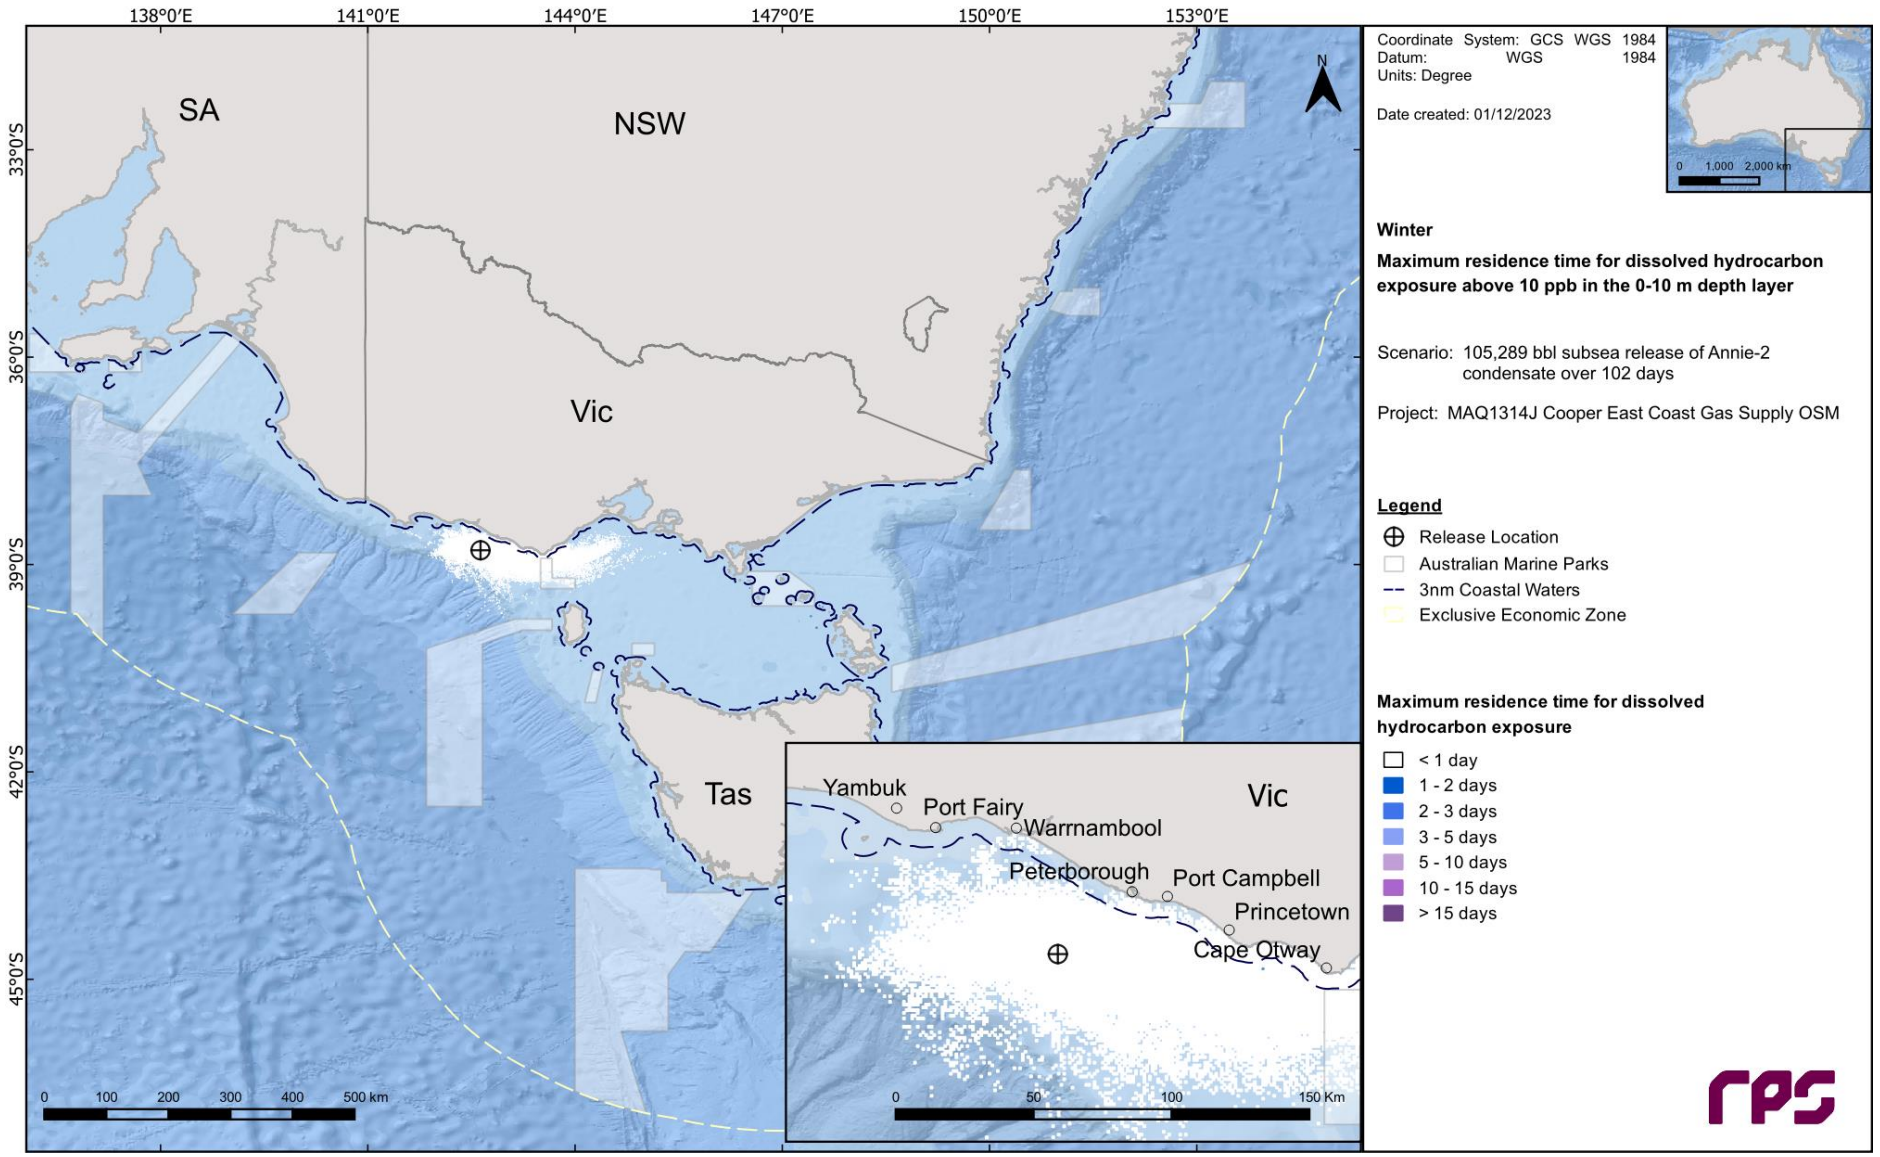

Figure 11.12 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

11.1.3.2 Entrained Hydrocarbons

Table 11.9 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer.

Except for the receptors the release location is within, during summer the highest probability of low entrained hydrocarbon exposure was 100% recorded for Southern Right Whale - Aggregation. Additional receptors including LGAs, sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure (refer to Table 11.9).

During winter, several receptors, including the Apollo AMP, Southern Right Whale – Aggregation and White-faced Storm-petrel - Foraging BIAs revealed a 100% probability of low entrained hydrocarbon exposure.

Table 11.10 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all thresholds assessed.

Figure 11.13 and Figure 11.14 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer for each season whilst Figure 11.15 and Figure 11.18 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds.

Table 11.9 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations per season.

Receptor		Summer			Winter

*The release location resides within the receptor boundaries.^ RPS have utilised BIA's for the southern right whale that were delineated within the 2011-2021 Southern Right Whale. The NCV Atlas now includes updated BIA's for SRW, though the recently drafted National Recovery Plan for the southern right whale has not been published. The updated BIA's have not been used in this report.

Table 11.10 Predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer. Results are based on a 105,289 bbl (16,740 m^3) subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries. ^ RPS have utilised BIA's for the southern right whale that were delineated within the 2011-2021 Southern Right Whale. The NCV Atlas now includes updated BIA's for SRW, though the recently drafted National Recovery Plan for the southern right whale has not been published. The updated BIA's have not been used in this report.

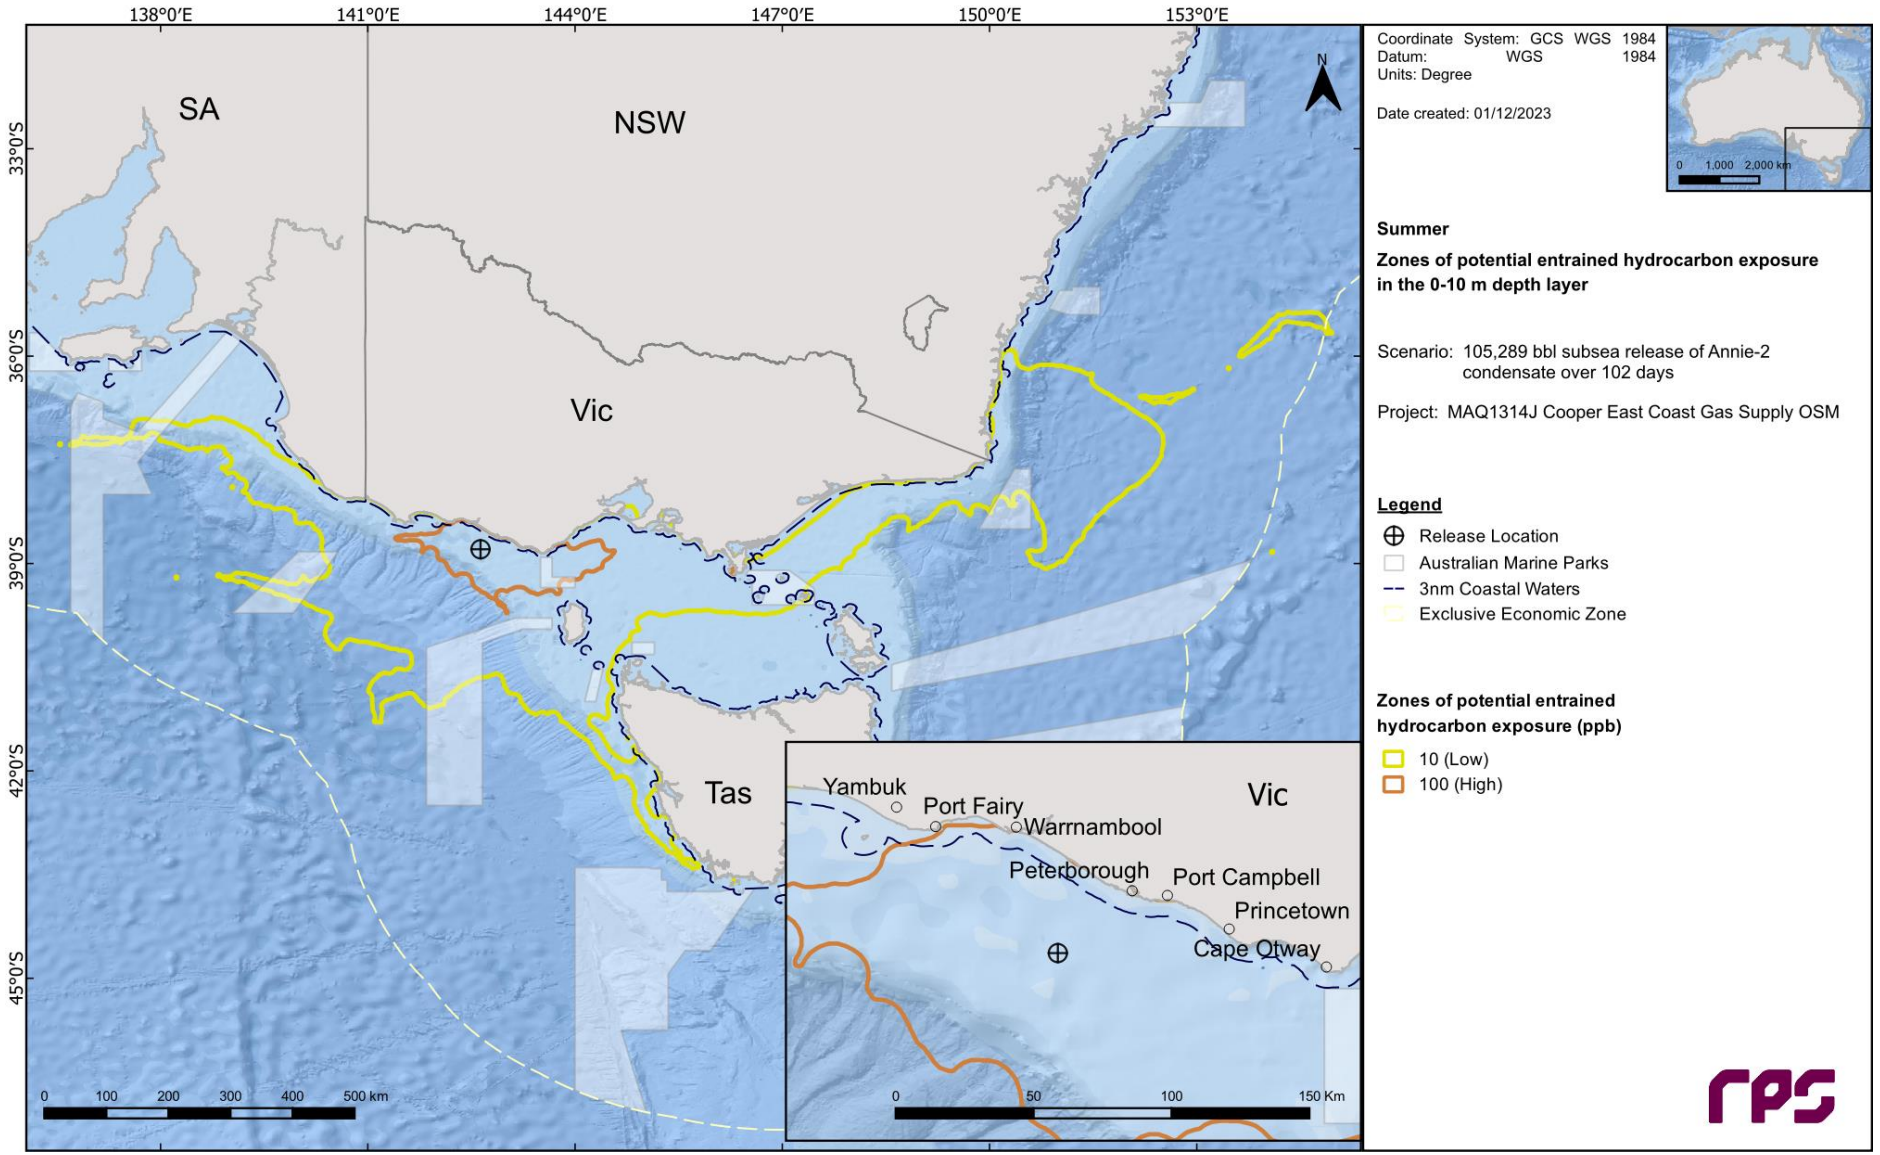

Figure 11.13 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

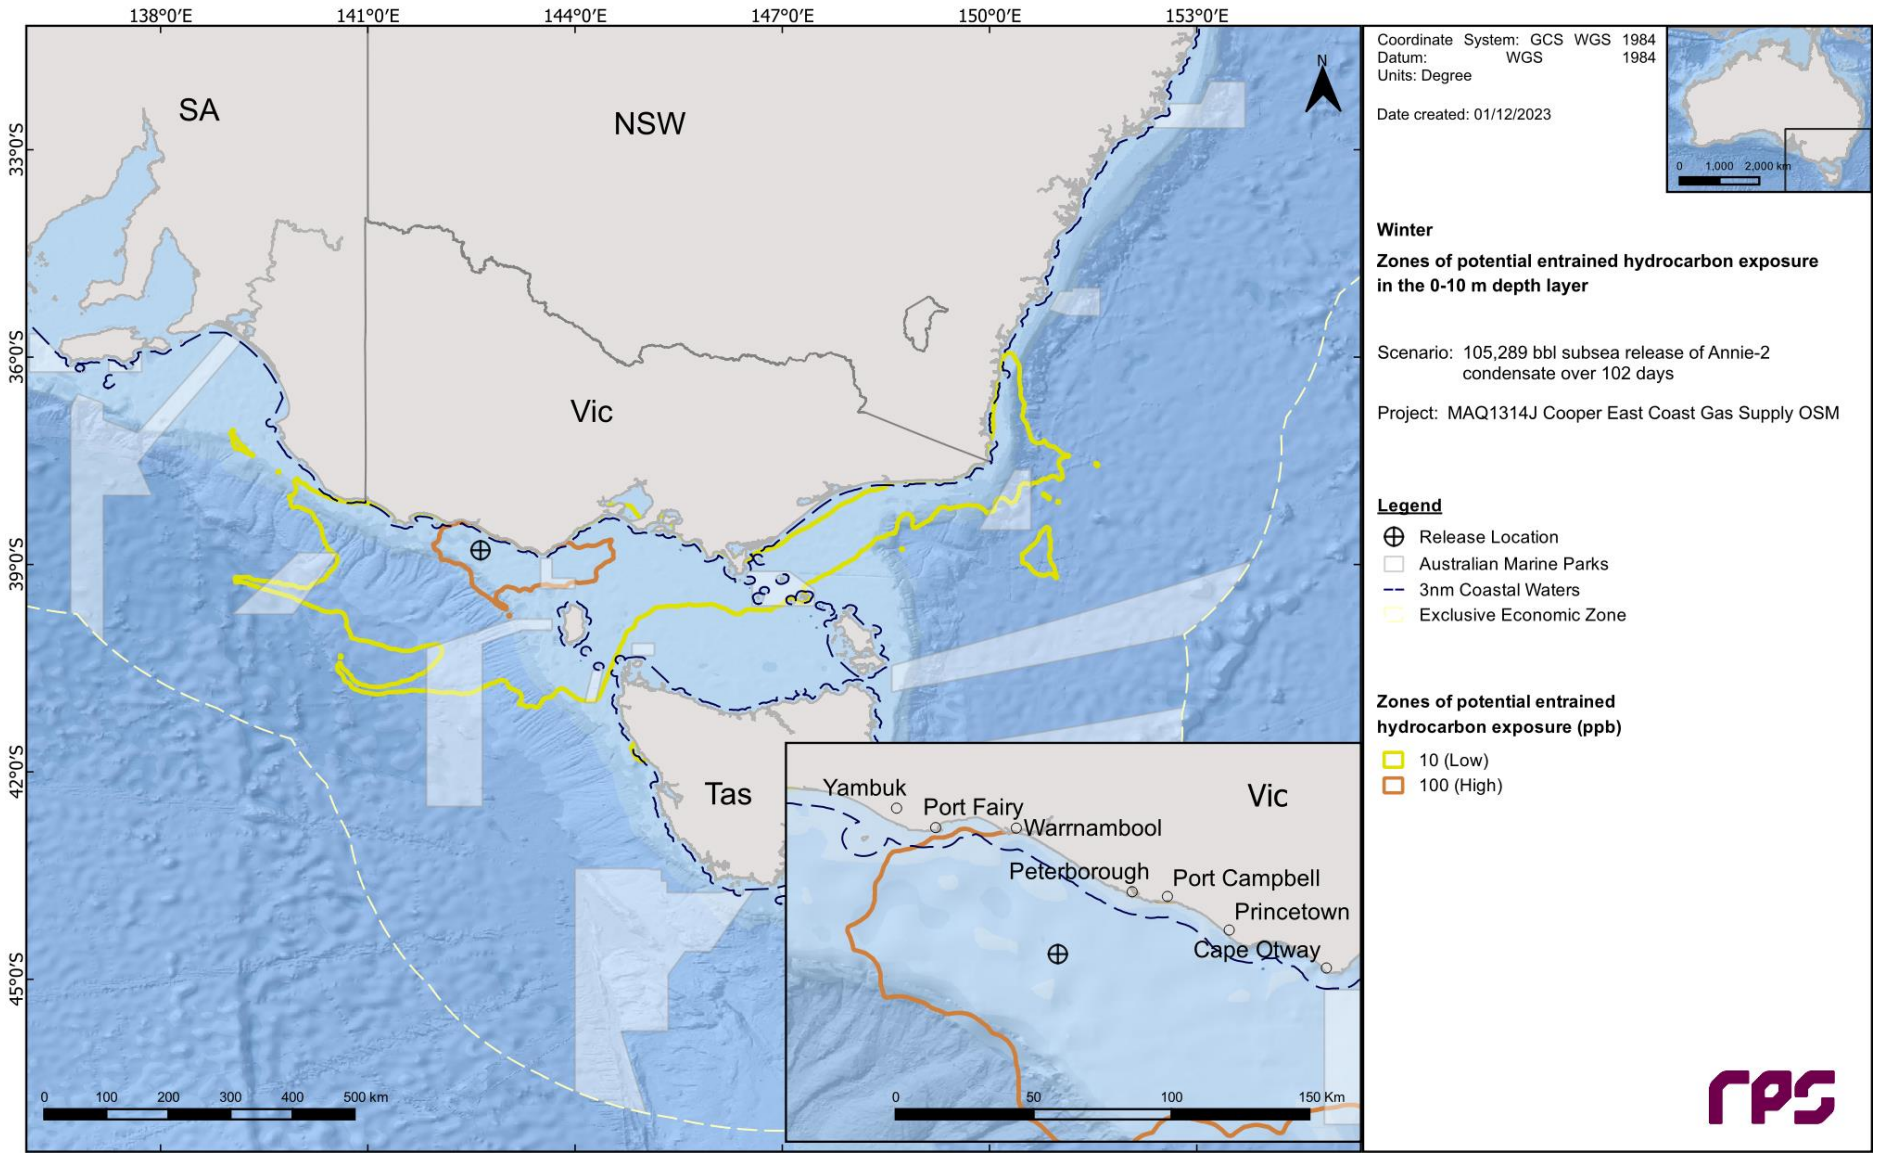

Figure 11.14 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

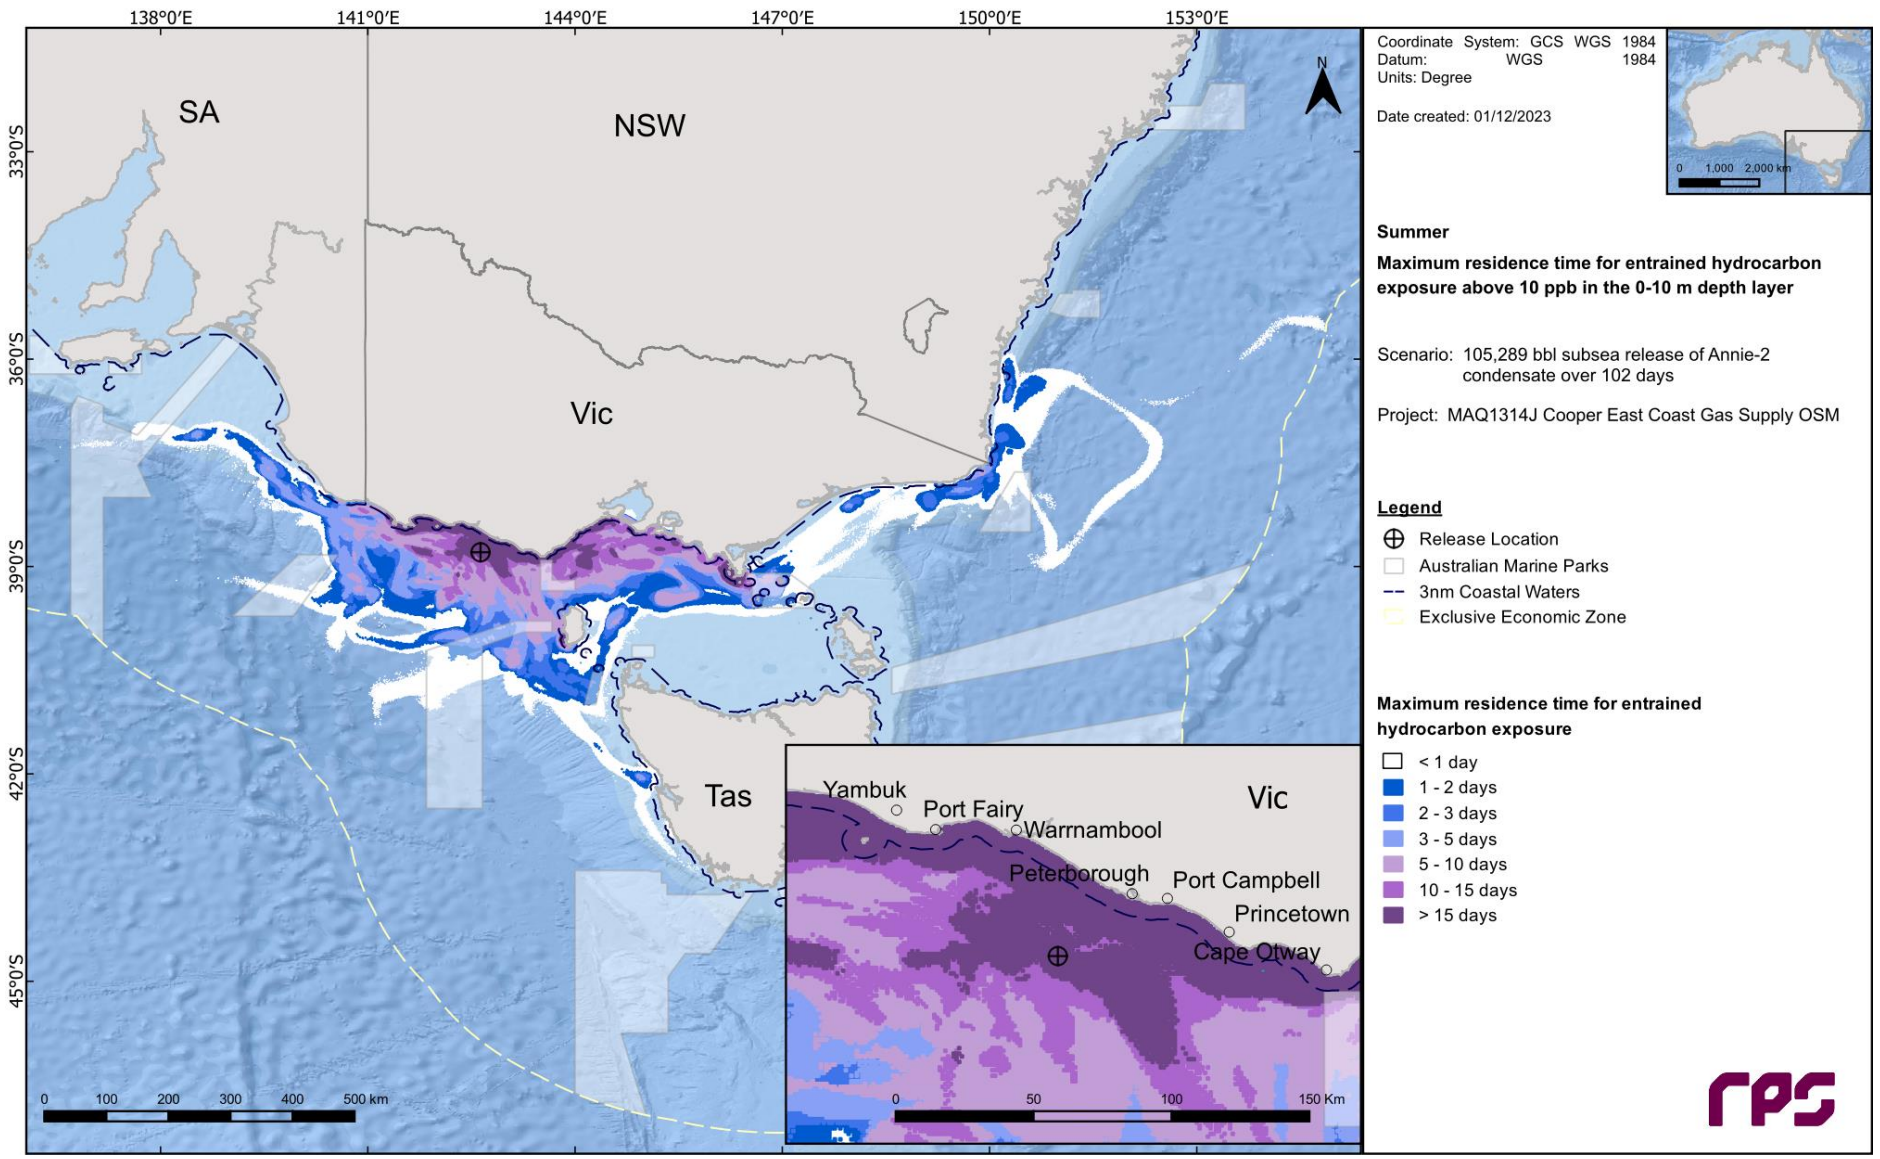

Figure 11.15 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

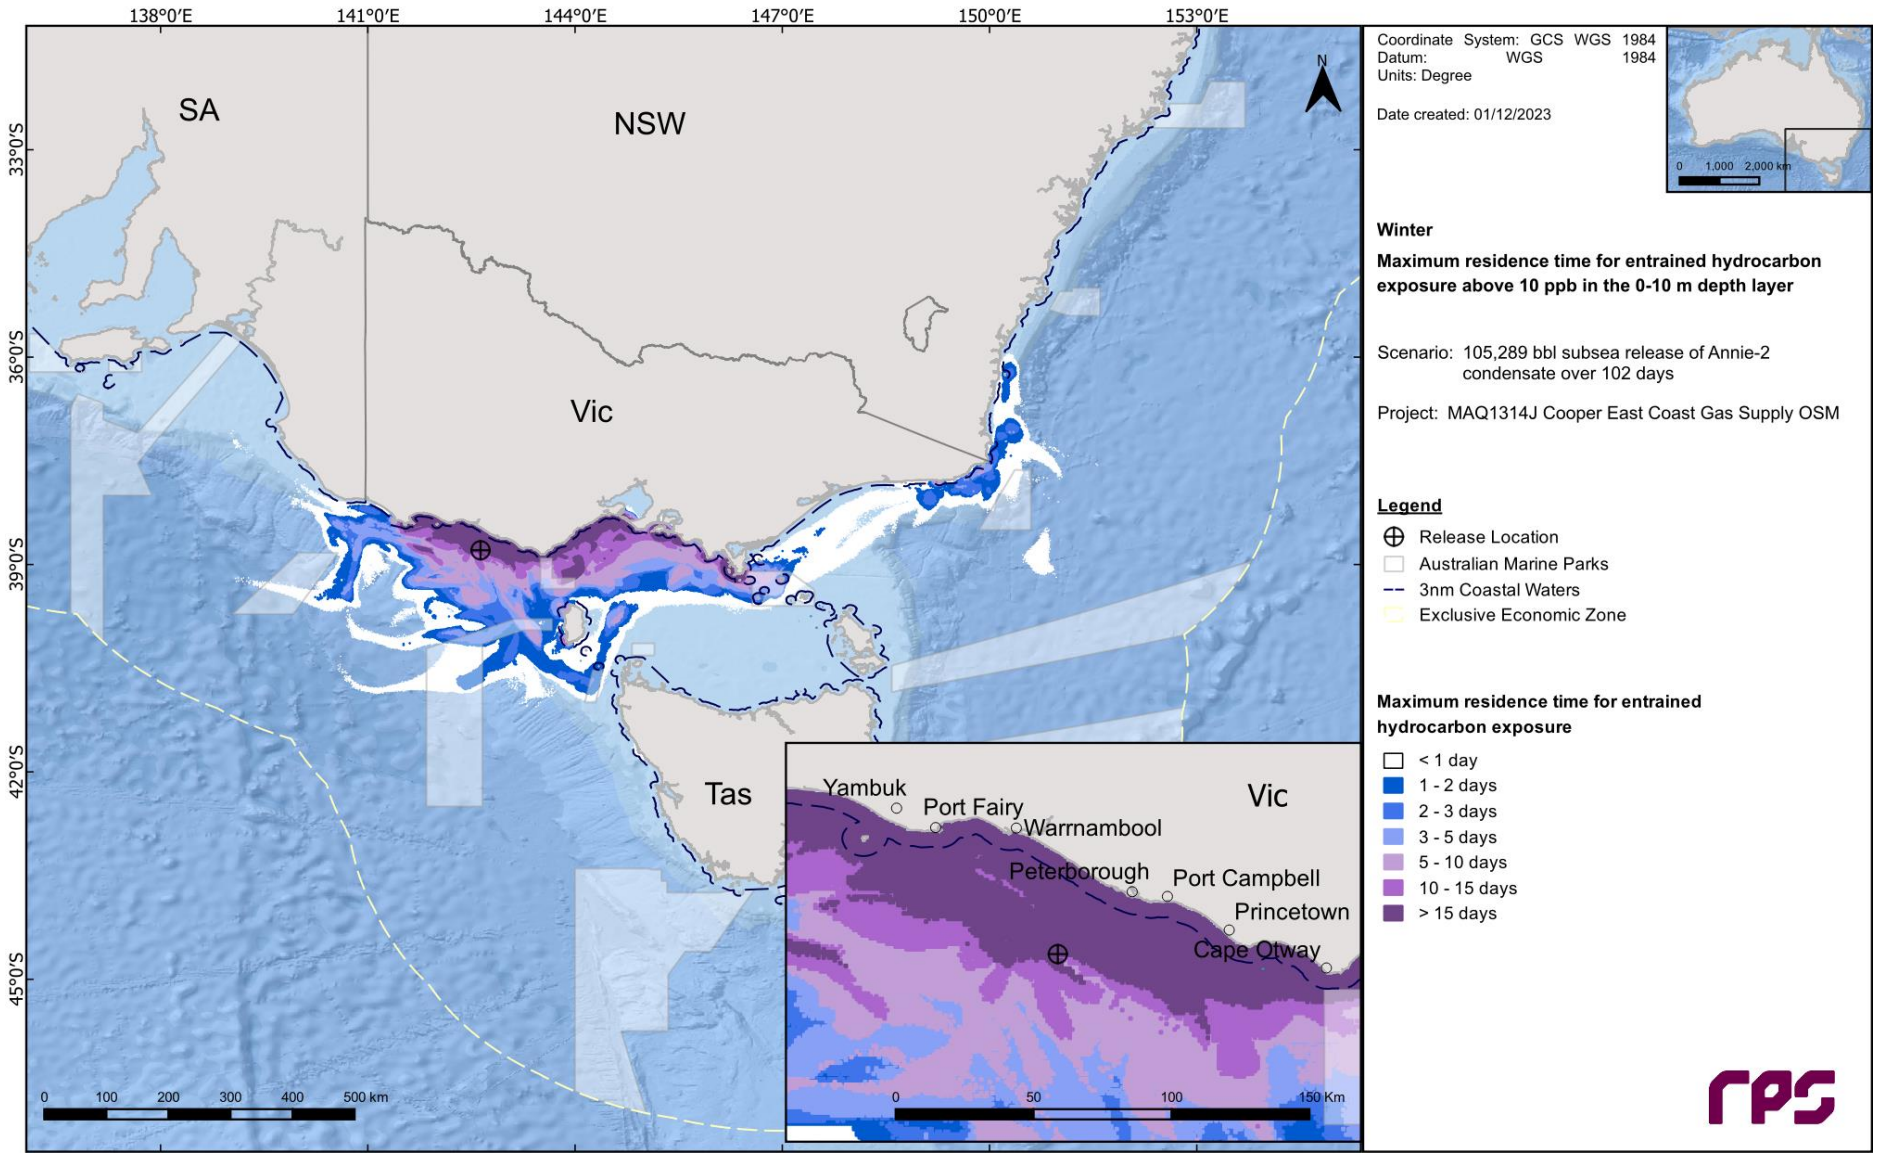

Figure 11.16 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

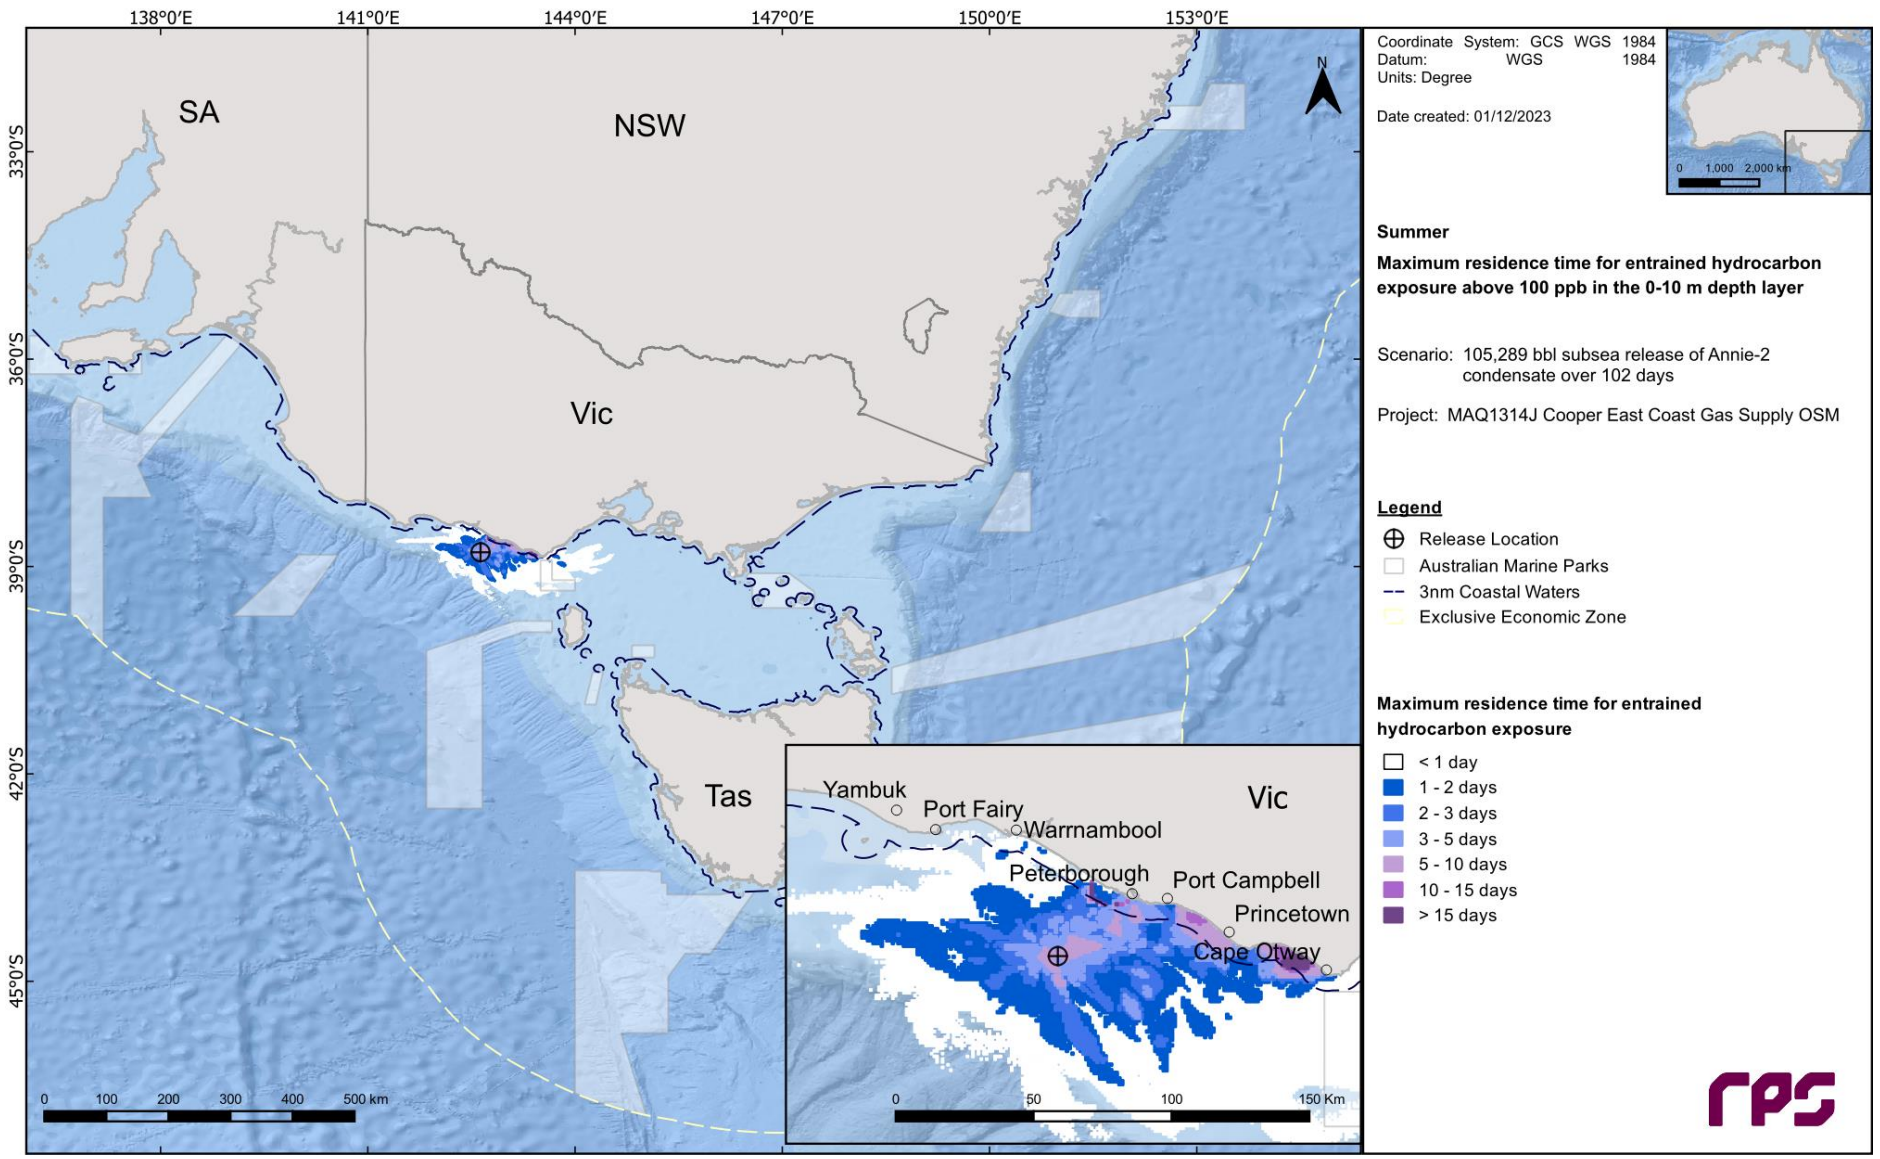

Figure 11.17 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during summer conditions.

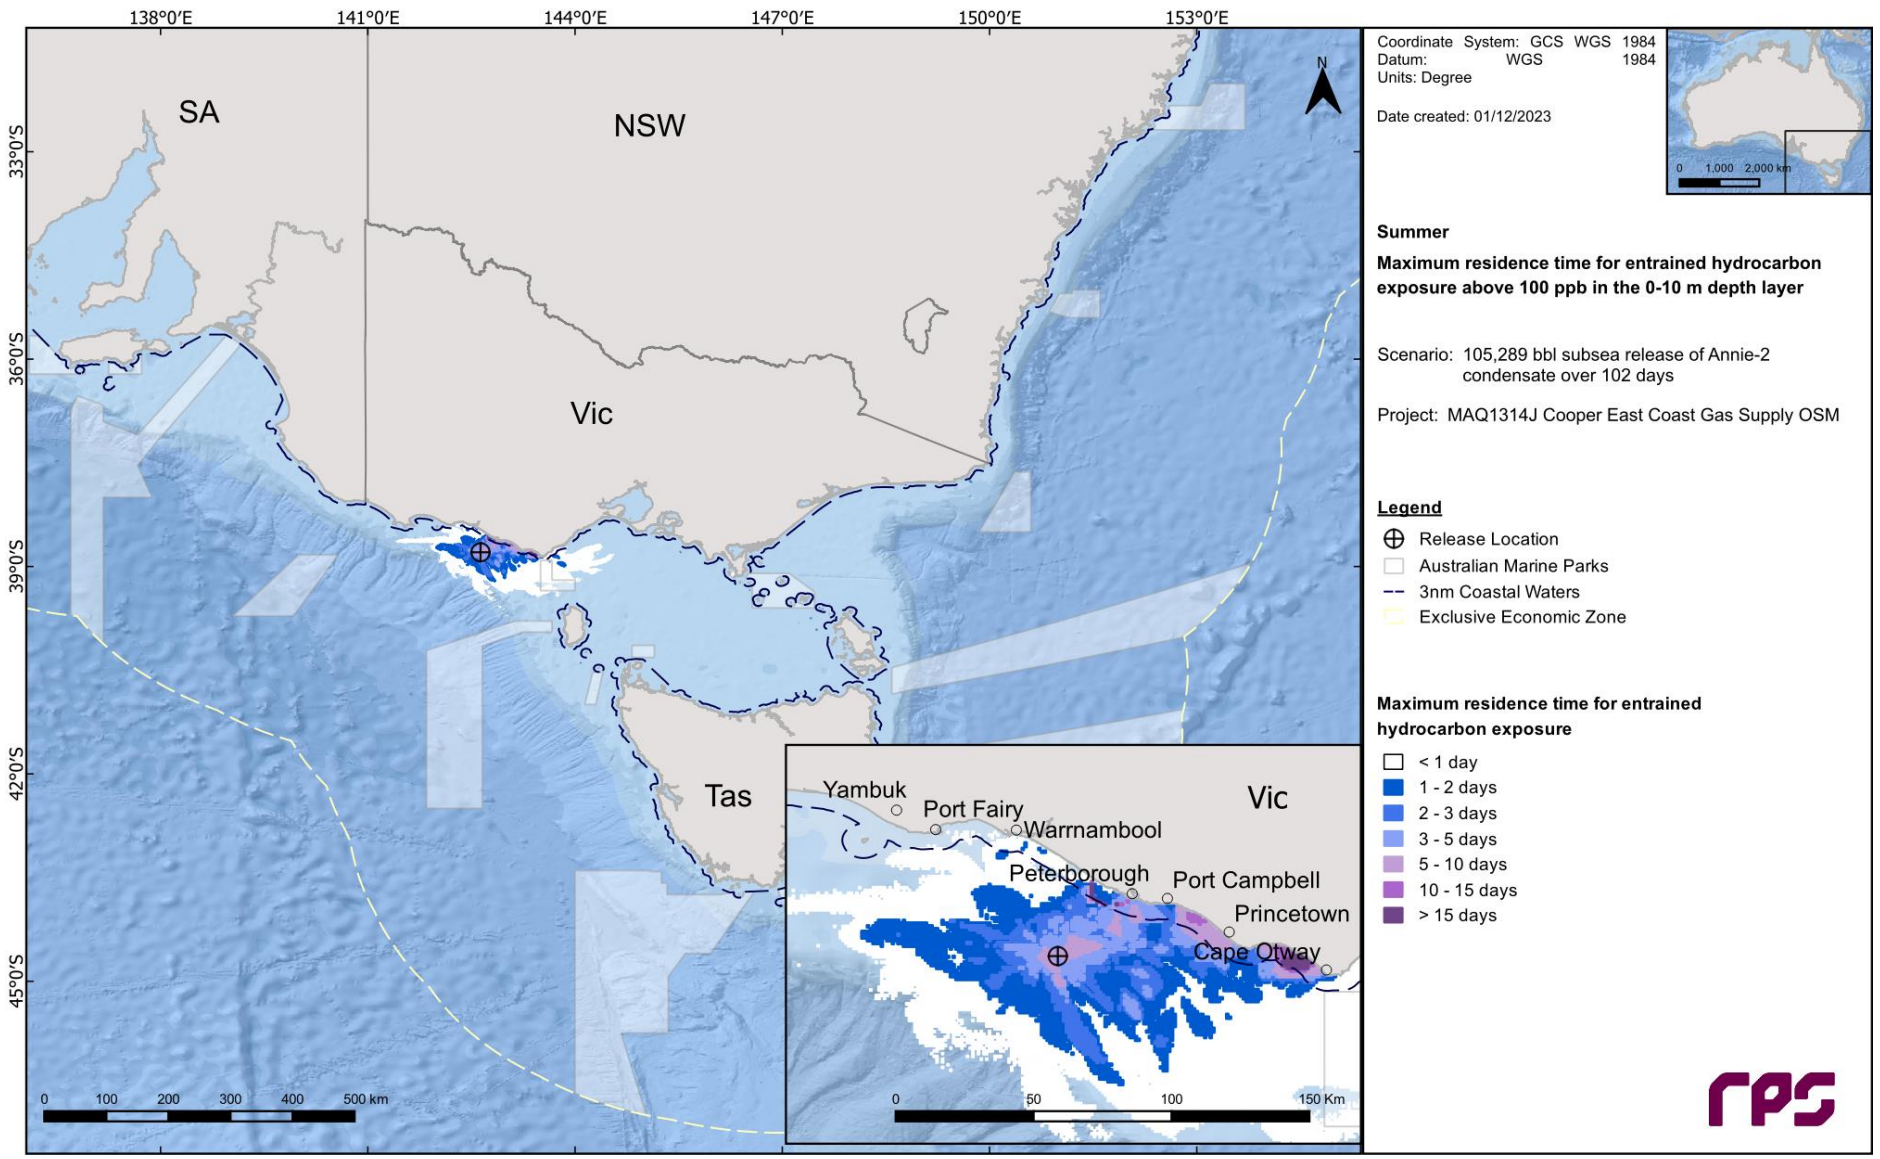

Figure 11.18 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea in the event of a 105,289 bbl subsurface release from a loss of well control at Elanora-1 ST1 (Isabella) over 102 days. The results were calculated from 100 spill simulations during winter conditions.

11.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2;
b. Largest (total) volume of oil ashore;
c. Longest length of shoreline with oil accumulation above 100 g/m$^{2;}$
d. Largest area of entrained hydrocarbon exposure above 100 ppb; and
e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

Table 11.11 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 11.11 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria				
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore	Longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Season		Summer	Winter	Winter	Summer	Summer
Run Number		5	92	17	44	29
Total area of floating Oil exposure (km²)	1 g/m²	360	251	293	276	341
	10 g/m²	**40**	7	5	16	9
	50 g/m²	-	-	-	-	-
Total length of shoreline accumulation (km)	10 g/m²	166	189	268	34	158
	100 g/m²	15	43	**44**	5	12
	1,000 g/m²	-	0	**-**	-	-
Minimum time before accumulation on any shoreline (hours)	10 g/m²	335	44	269	1035	366
	100 g/m²	994	296	619	1073	436
	1,000 g/m²	-	-	**-**	-	**-**
Total volume of oil ashore (m³)		82	**212**	189	22	74
Total area of entrained hydrocarbon exposure (km²)	10 ppb	49,508	24,945	24,641	60,183	48,694
	100 ppb	5,196	5,084	3,596	**6,272**	5,835
Total area of dissolved hydrocarbon exposure (km²)	10 ppb	141	413	400	273	319
	50 ppb	-	-	-	-	**1**
	400 ppb	-	-	-	-	-
Start Date		3rd April 2018 5 am	1st August 2010 1 am	24th September 2013 7 pm	4th January 2018 10 am	12th March 2015 2 pm

NC = No contact at, or above the specified shoreline accumulation threshold.

11.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as summer run number 5, which started on 3rd April 2018.

Figure 11.19 illustrates the floating oil exposure and shoreline accumulation over the 116-day simulation.

Figure 11.20 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 116-day simulation.

Figure 11.21 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.12 summarises the mass balance peaks and at the end of the simulation.

Table 11.12 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116
Surface (m^3)	260.3	26.8	6.4
Entrained (m^3)	2,515.2	96.7	2,002.1
Dissolved (m^3)	8.9	33.8	0.5
Evaporation (m^3)	9,881.7	116.0	9,881.7
Decay (m^3)	4,047.6	116.0	4,047.6
Ashore (m^3)	84.7	101.0	82.0

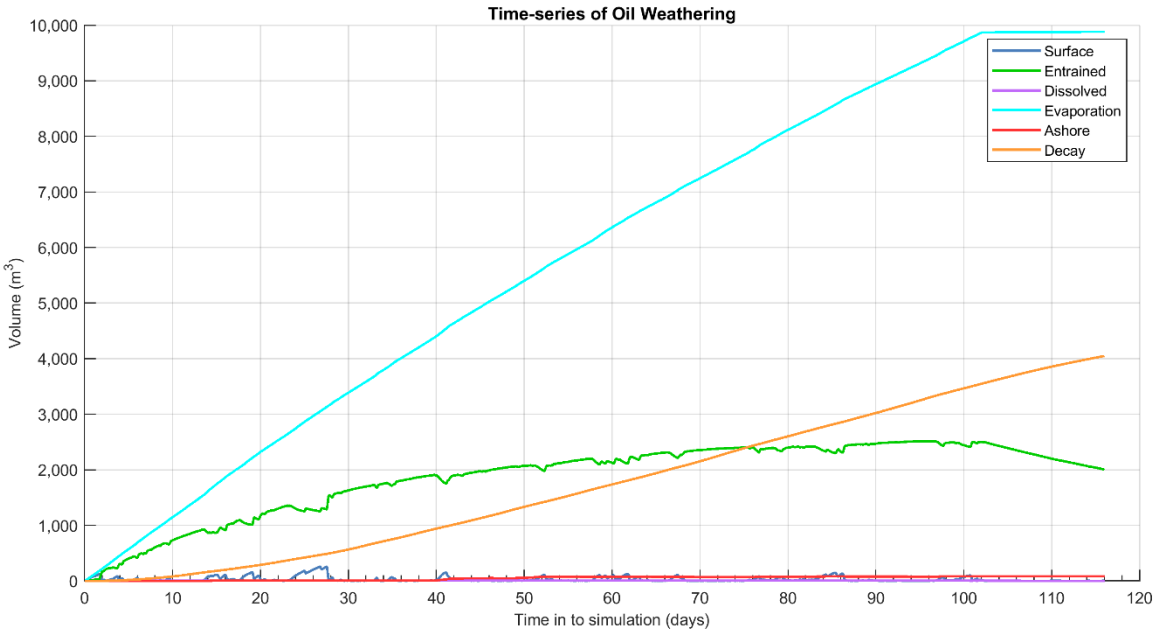

Figure 11.21 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 10 g/m^2.

11.2.2 Deterministic Case: Largest volume of oil ashore

The deterministic trajectory that resulted in the largest volume of oil ashore was identified as winter run number 92, which started on 1st August 2010.

Figure 11.22 illustrates the floating oil exposure and shoreline accumulation over the 116-day simulation.

Figure 11.23 displays the time series of the shoreline accumulation above the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 116-day simulation.

Figure 11.24 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.13 summarises the mass balance peaks and at the end of the simulation.

Table 11.13 Summary of the mass balance for the trajectory with the largest volume of oil ashore.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116
Surface (m^3)	194.2	28.4	0.8
Entrained (m^3)	2,506.9	99.3	1,990.3
Dissolved (m^3)	10.1	24.8	0.7
Evaporation (m^3)	9,748.3	116.0	9,748.3

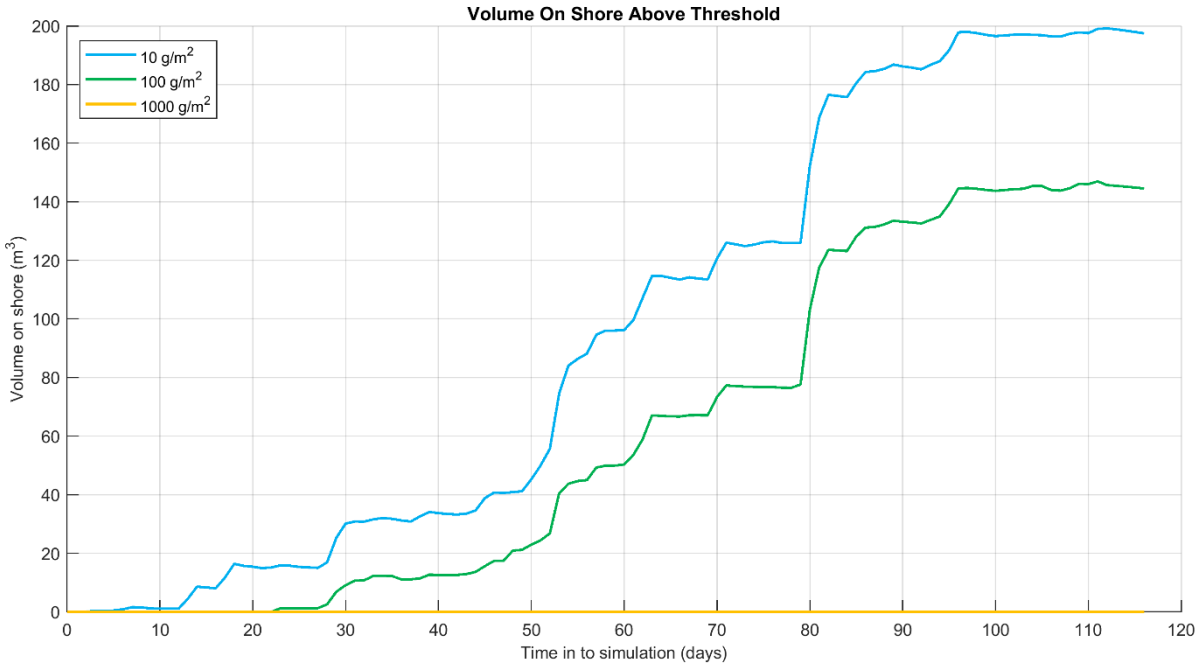

Figure 11.23 Time series of oil accumulation on the shoreline above each threshold for the trajectory with the largest volume of oil ashore.

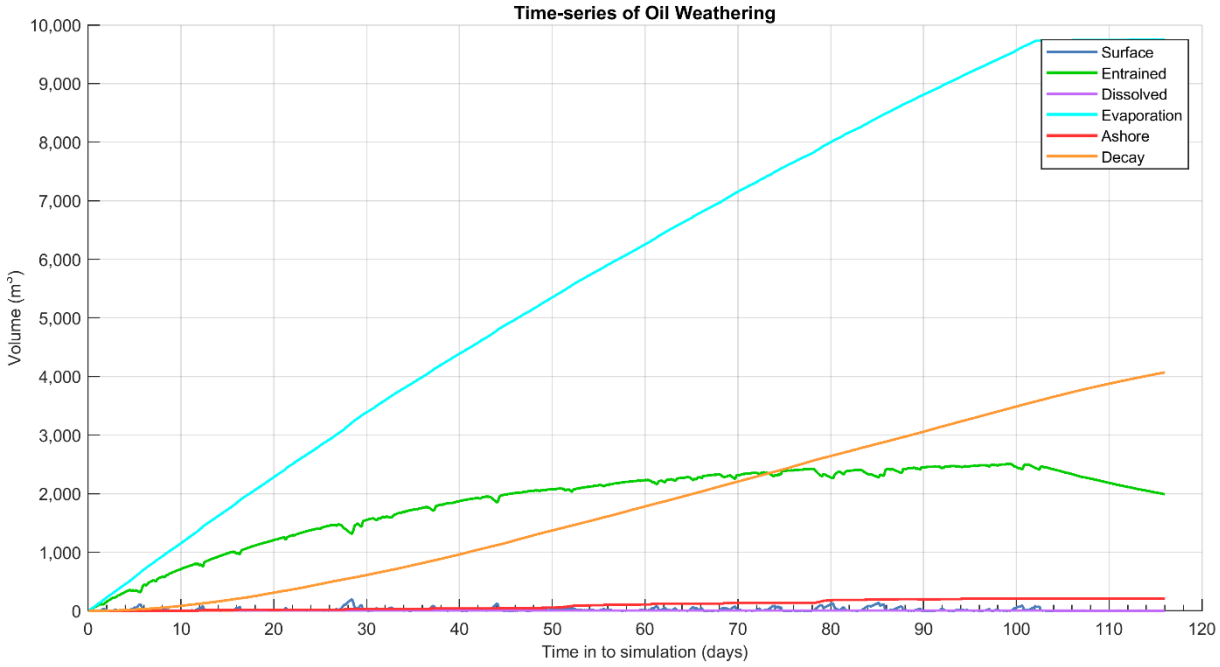

Figure 11.24 Predicted weathering and fates graph for the trajectory with the largest volume of oil ashore.

11.2.3 Deterministic Case: Longest length of shoreline with accumulation above 100 g/m^2

The deterministic trajectory that resulted in the longest length of shoreline with accumulation above 100 g/m^2 was identified as winter run number 17, which started on 24th September 2013.

Figure 11.25 illustrates the floating oil exposure and shoreline accumulation over the 116-day simulation.

Figure 11.26 displays the time series of the length of shoreline with accumulation at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 116-day simulation.

Figure 11.27 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.14 summarises the mass balance peaks and at the end of the simulation.

Table 11.14 Summary of the mass balance for the trajectory with the longest length of shoreline with accumulation above 100 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116
Surface (m^3)	192.1	37.9	0.1

11.2.4 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified as summer run number 44, which started on 4th January 2018.

Figure 11.28 illustrates the zones of potential entrained hydrocarbon exposure over the 116-day simulation.

Figure 11.29 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 116-day simulation.

Figure 11.30 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.15 summarises the mass balance peaks and at the end of the simulation.

Table 11.15 Summary of the mass balance for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116
Surface (m^3)	183.0	19.8	2.2
Entrained (m^3)	2,654.6	100.1	2,087.2
Dissolved (m^3)	9.7	29.7	0.5
Evaporation (m^3)	9,778.9	116.0	9,778.9

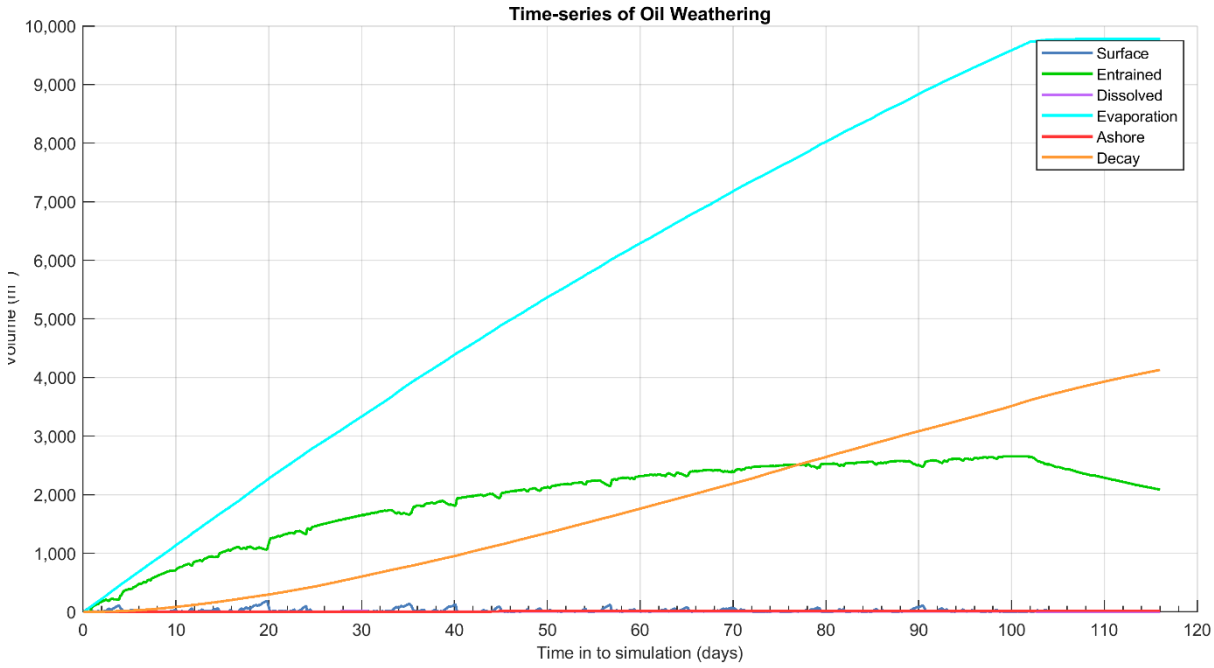

Figure 11.30 Predicted weathering and fates graph for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb.

11.2.5 Deterministic Case: Largest area of dissolved hydrocarbon exposure above 50 ppb

The deterministic trajectory that resulted in the largest area of dissolved hydrocarbon exposure above 50 ppb was identified as summer run number 29, which started on 12th March 2015.

Figure 11.31 illustrates the zones of potential dissolved hydrocarbon exposure over the 116-day simulation.

Figure 11.32 displays the time series of the area of dissolved hydrocarbon exposure at the low (10 ppb), moderate (50 ppb) and high (400 ppb) thresholds over the 116-day simulation.

Figure 11.33 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.16 summarises the mass balance peaks and at the end of the simulation.

Table 11.16 Summary of the mass balance for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116

12 RESULTS – SCENARIO 2 – 83,273 BBL (13,239 M^3) SUBSURFACE RELEASE FROM A LOSS OF WELL CONTROL AT PECTEN EAST-2

This scenario examined an 83,273 bbl (13,239 m^3) subsurface release of condensate over 102 days to represent a LOWC scenario at Pecten East-2 well. A total of 100 spill simulations were run per season (summer and winter) and each simulation was tracked for 116 days. The results are presented on a seasonal basis.

Sections 12.1 and 12.1.1 present the seasonal stochastic analysis and deterministic analysis results, respectively.

12.1 Stochastic Analysis

12.1.1 Floating Oil Exposure

Table 12.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance and corresponding direction from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones was 74.4 km (east-southeast, winter) and 15.2 km (east-southeast, winter), respectively. No high (>50 g/m^2) exposure zones were predicted during either summer or winter conditions.

Table 12.2 summarises the potential floating oil exposure to individual receptors.

In summer conditions, a total of 18 BIAs were predicted to be exposed to floating oil at, or above, the low threshold. Excluding the BIAs that the release location resides within (see Section 10.3), the highest probability (8%) of low exposure was predicted at the Short-tailed Shearwater – Foraging BIA. The minimum time before low exposure to the Short-tailed Shearwater – Foraging BIA was 11.63 days.

Additionally, during winter, a total of 18 BIAs were predicted to be exposed to floating oil at, or above, the low threshold. Again, the highest probability (20%) of low exposure for any BIA was predicted at the Short-tailed Shearwater – Foraging BIA. The minimum time before low exposure to the Short-tailed Shearwater – Foraging BIA was 8.46 days.

Table 12.3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor.

Figure 12.1 and Figure 12.2 present the zones of potential floating oil exposure for each season whilst Figure 12.3 to Figure 12.6 present the maximum residence time of floating oil exposure for the NOPSEMA thresholds.

Table 12.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on an 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations per season.

Distance and direction travelled	Zones of potential floating oil exposure					
	Summer			Winter		
	Low	Moderate	High	Low	Moderate	High
Maximum distance (km) from release location	67.4	12.7	-	74.4	15.2	-
Maximum distance (km) from release location (99th percentile)	45.5	12.4	-	49.7	14.9	-
Direction	ESE	ESE	-	ESE	ESE	-

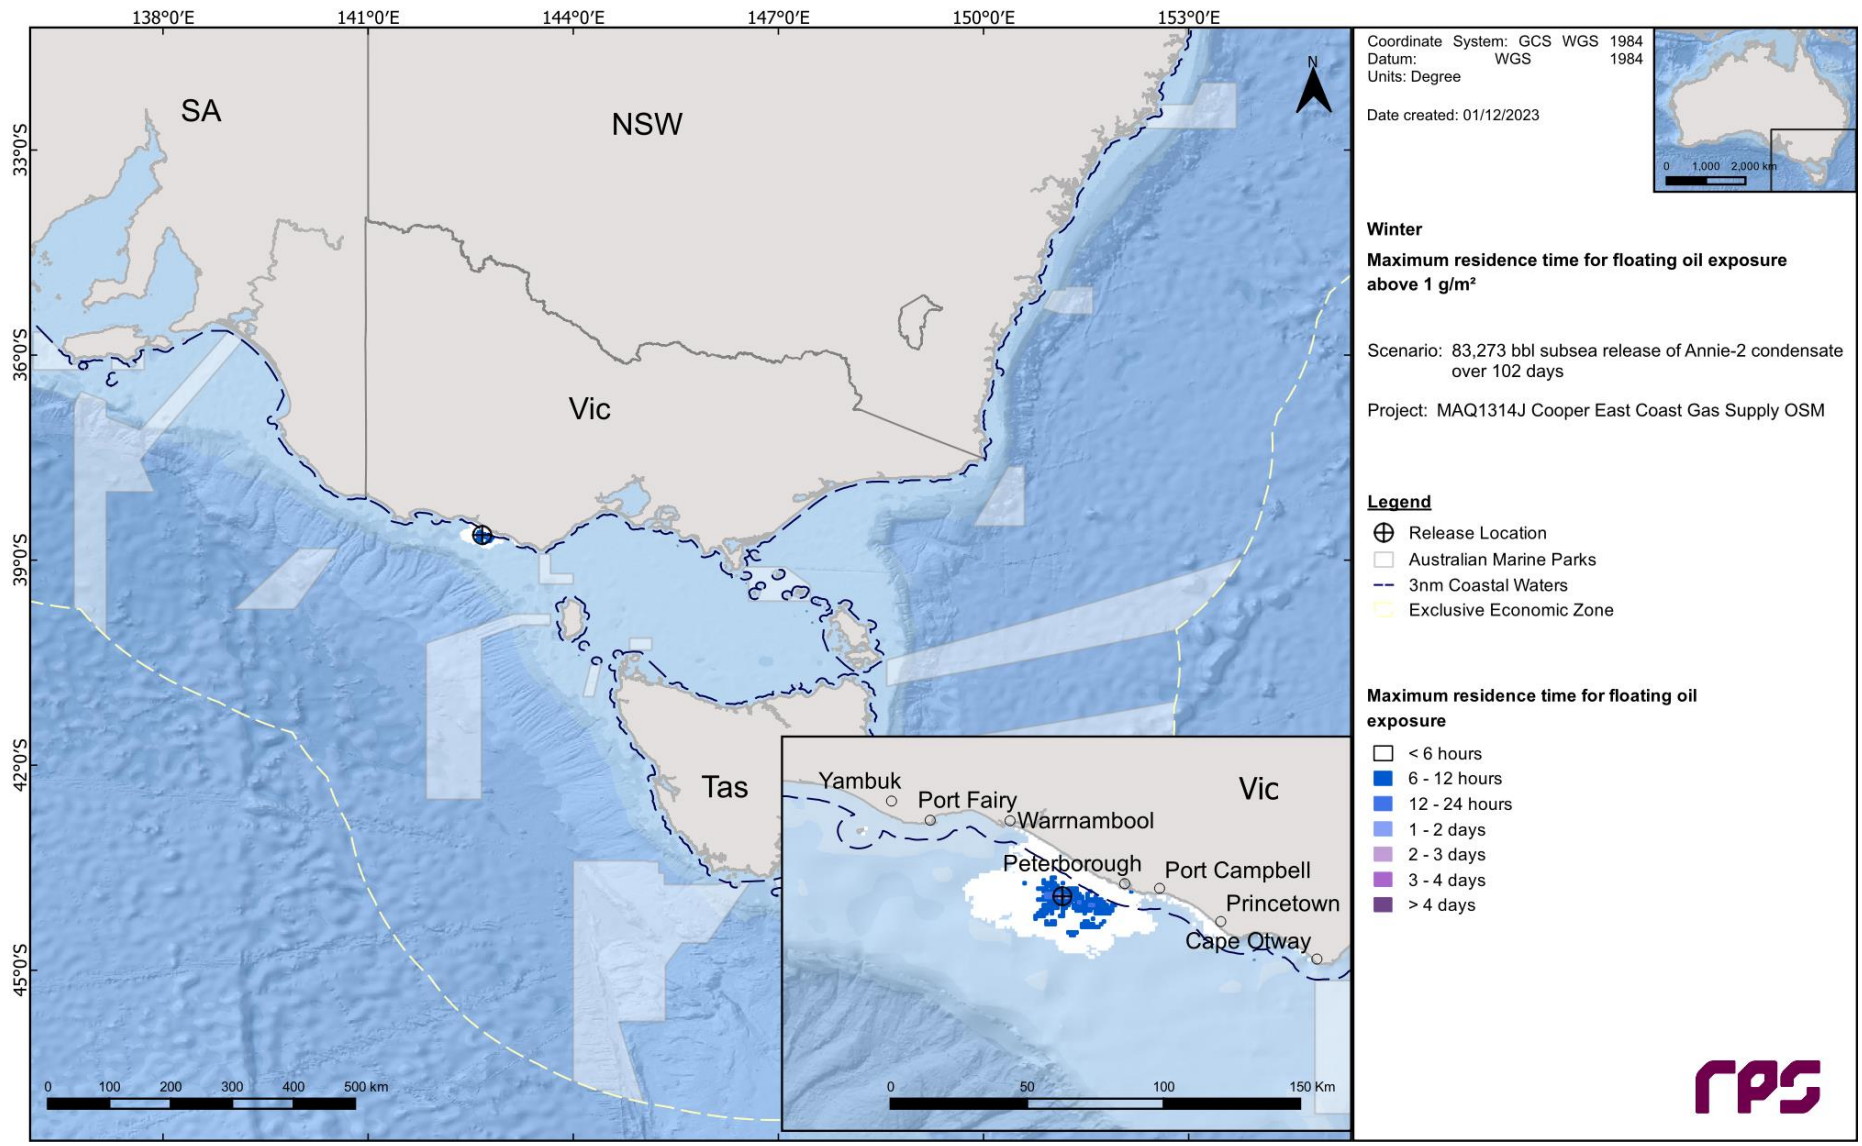

Figure 12.4 Maximum residence time of floating oil exposure above 1 g/m^2, in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during winter conditions.

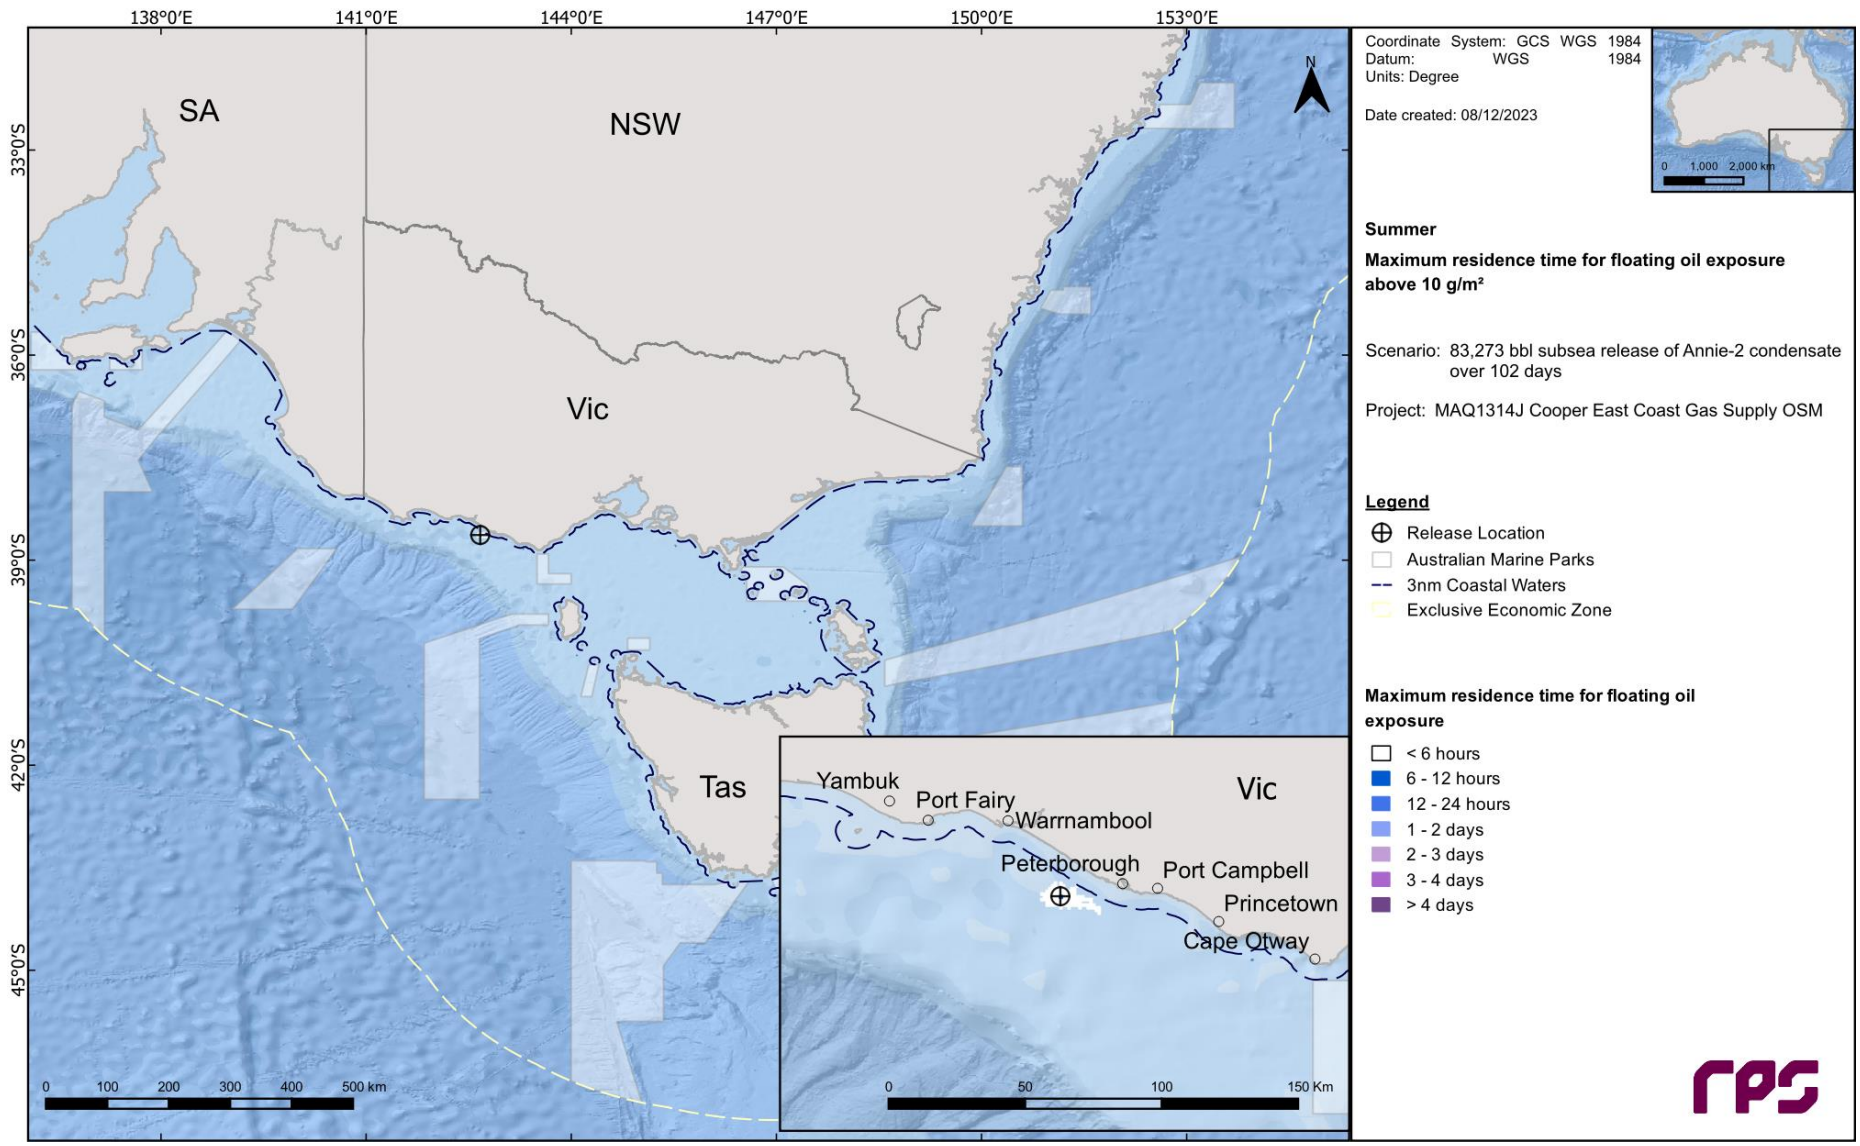

Figure 12.5 Maximum residence time of floating oil exposure above 10 g/m^2, in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during summer conditions.

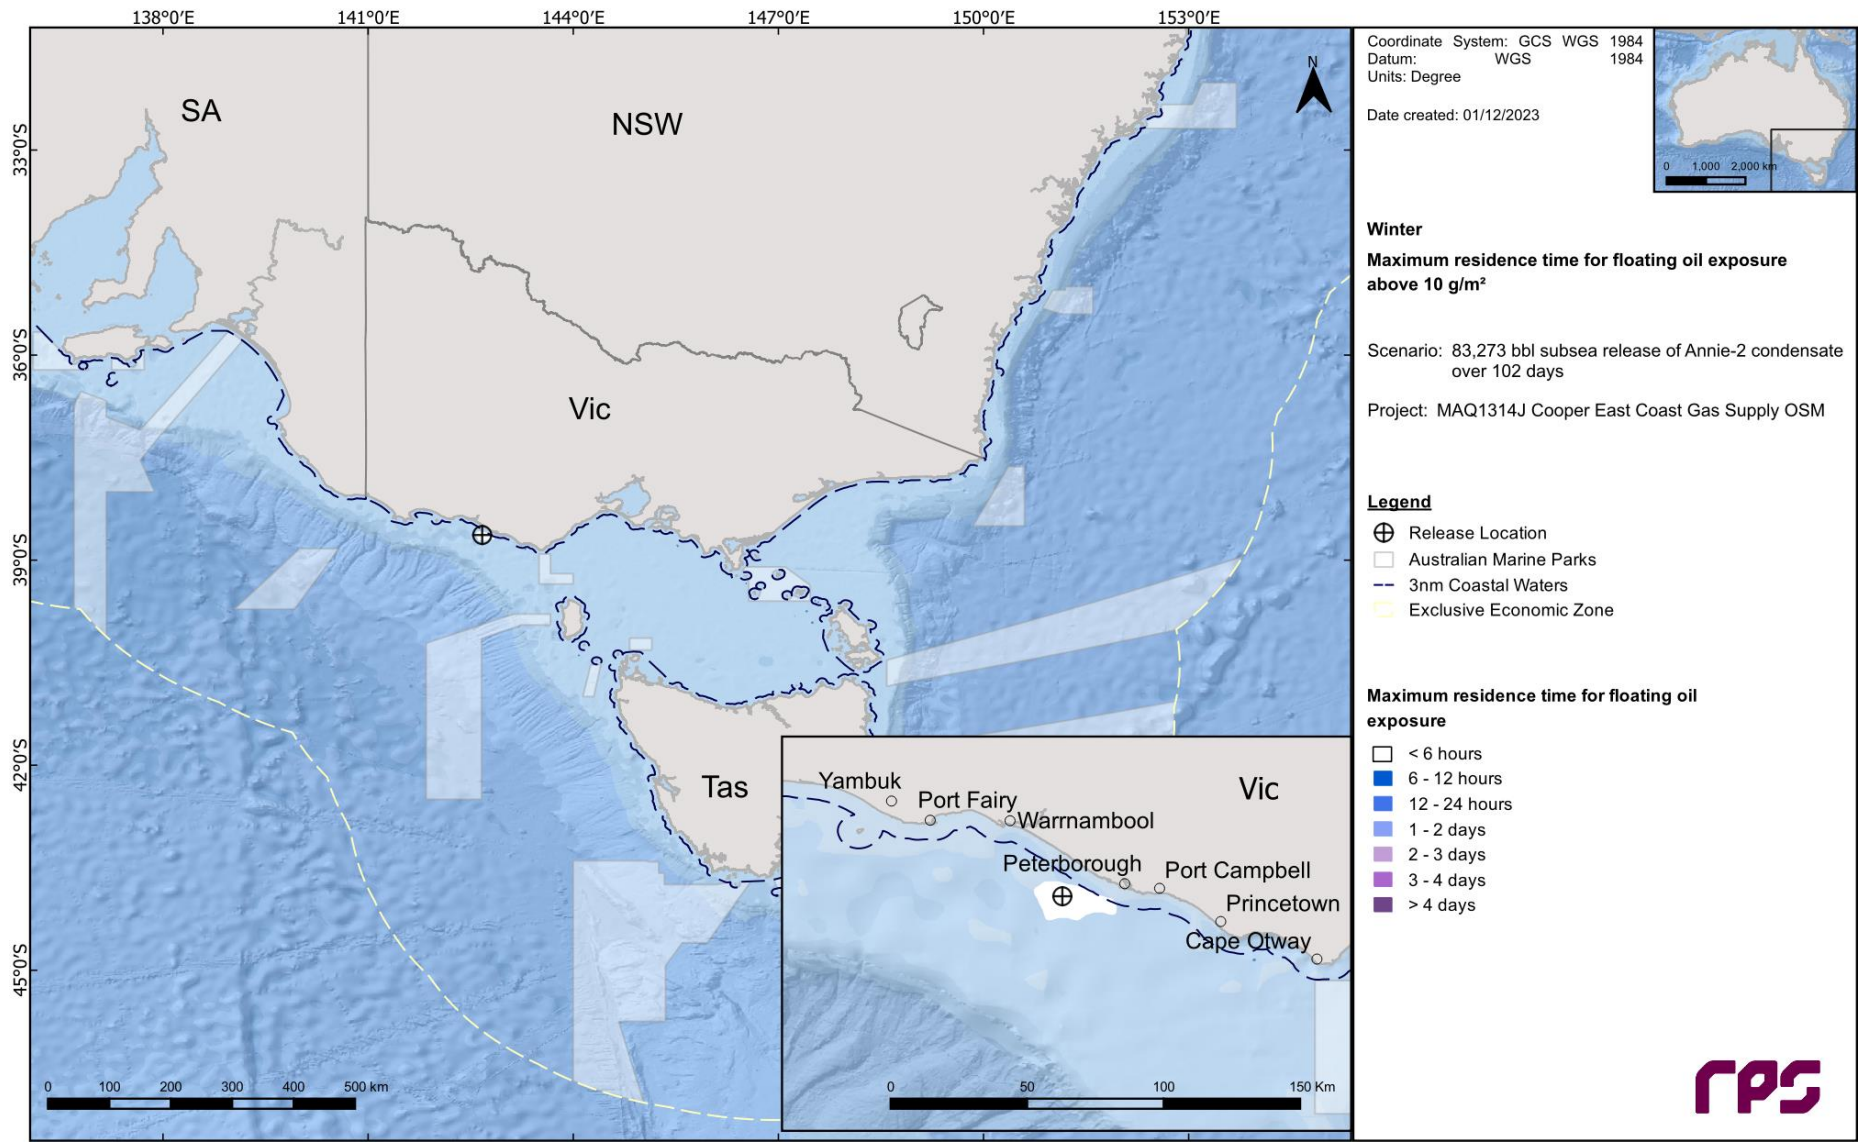

Figure 12.6 Maximum residence time of floating oil exposure above 10 g/m^2, in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during winter conditions.

12.1.2 Shoreline Accumulation

Table 12.4 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 100% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 1.17 days. The maximum total volume ashore for a single spill trajectory was 406.6 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 269.0 km (summer), 75.0 km (summer) and 6.0 km (winter), respectively.

Table 12.5 and Table 12.6 summarises the shoreline accumulation on individual receptors during summer and winter, respectively.

During summer conditions, the shoreline segment of Bay of Islands and Moyne had the highest probabilities of accumulation above all three thresholds with probabilities of 100%, 99% and 14% for the low, moderate and high thresholds. It is acknowledged that Corangamite and Moyne LGA and Port Campbell sub-LGA demonstrated 100% for low threshold shoreline accumulation. The minimum time for low threshold shoreline accumulation at these receptors was 1.21 days (Bay of Islands and Moyne LGAs).

Alternatively, in winter the shoreline segment with the highest probability of accumulation above all three thresholds was Corangamite with probabilities of 100%, 100% and 23% for the low, moderate and high thresholds. The minimum time for low threshold shoreline accumulation at Bay of Islands and Moyne LGA was 1.17 days.

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 12.7 and Figure 12.8 for summer and winter respectively.

Table 12.4 Summary of oil accumulation across all shorelines. Results are based on an 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	100	100
Absolute minimum time for visible oil to shore (days)	1.21	1.17
Maximum total volume of hydrocarbons ashore (m^3)	347.3	406.6
Average total volume of hydrocarbons ashore (m^3)	169.8	204.1
Maximum length of the shoreline at **10 g/m^2** (km)	269.0	251.0
Average shoreline length (km) at **10 g/m^2** (km)	150.8	154.0
Maximum length of the shoreline at **100 g/m^2** (km)	78.0	76.0
Average shoreline length (km) at **100 g/m^2** (km)	37.9	42.5
Maximum length of the shoreline at **1,000 g/m^2** (km)	4.0	6.0
Average shoreline length (km) at **1,000 g/m^2** (km)	2.4	2.0

Table 12.5 Summary of oil accumulation on individual shoreline receptors. Results are based on an 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during summer conditions.

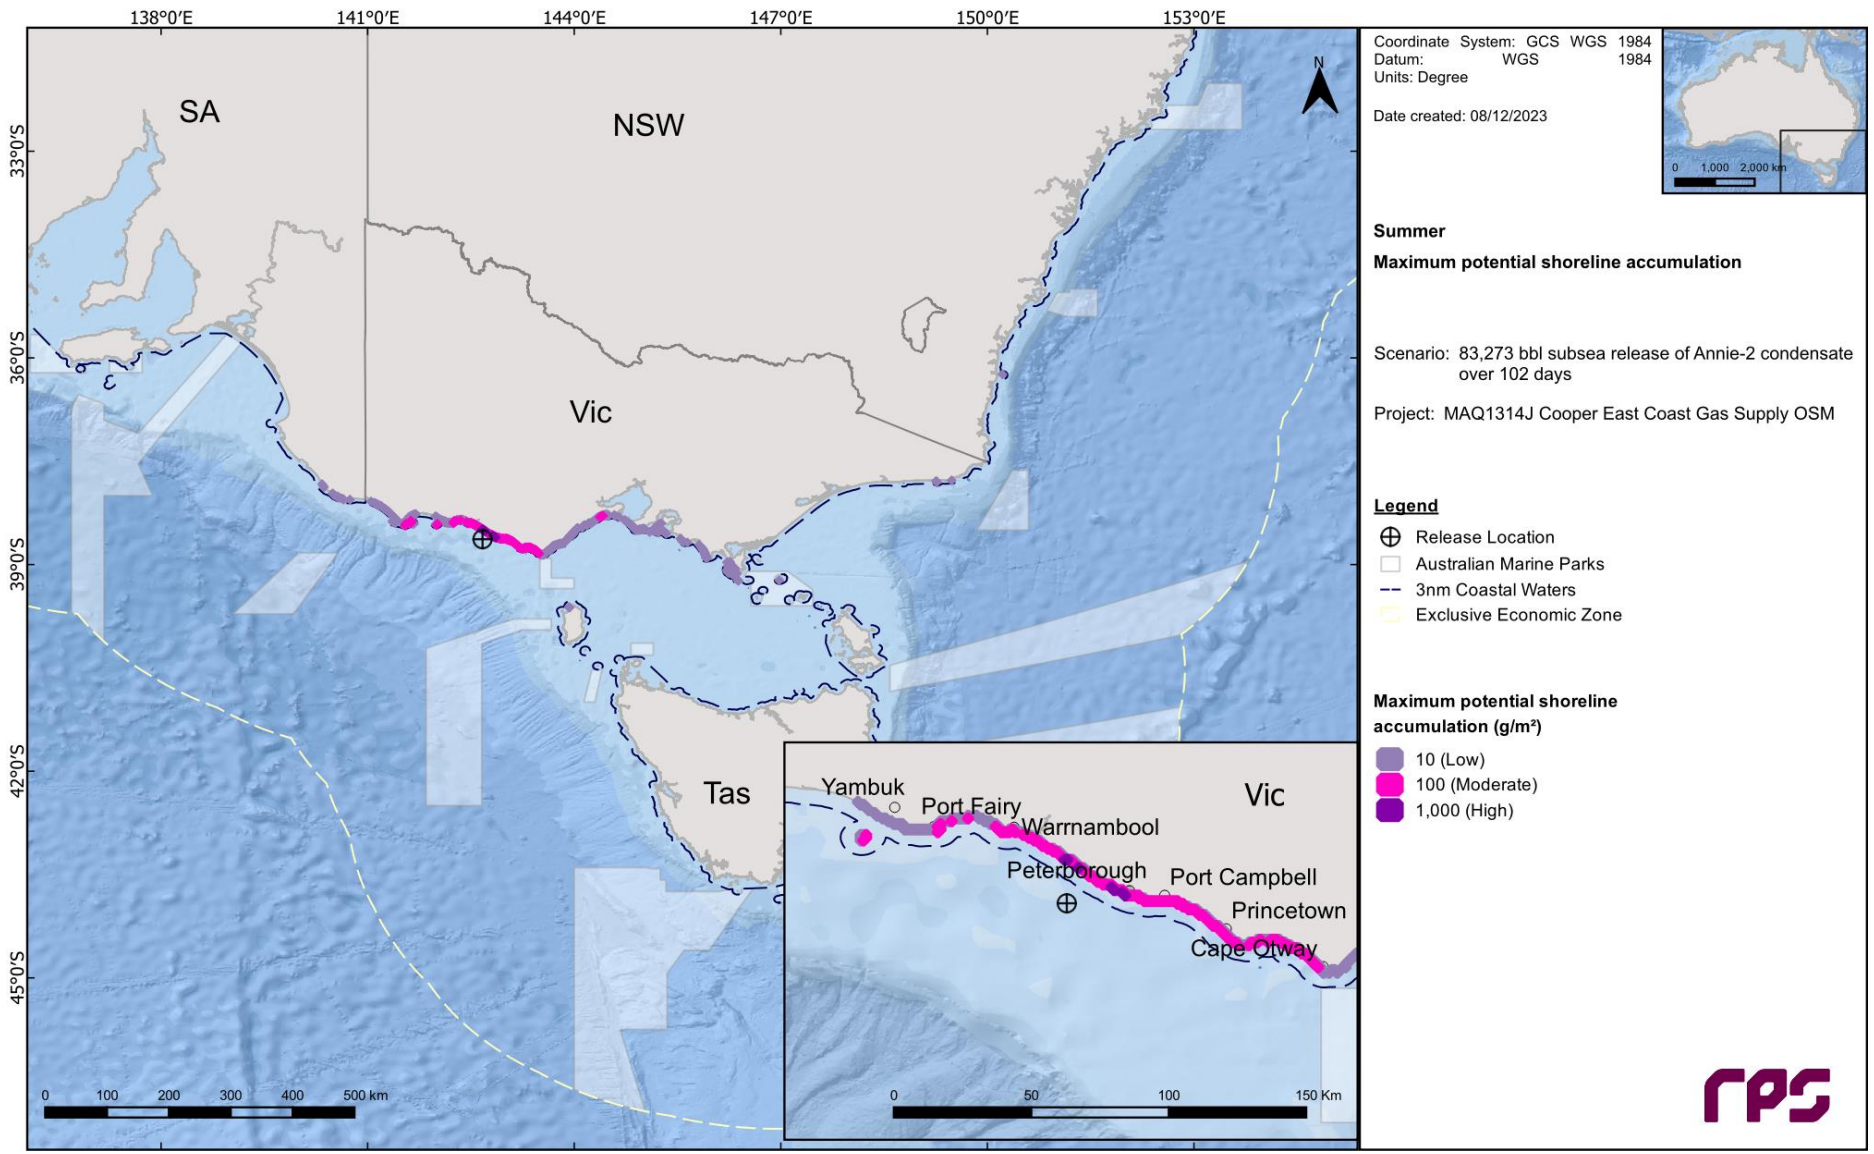

Figure 12.7 Maximum potential shoreline accumulation in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during summer conditions.

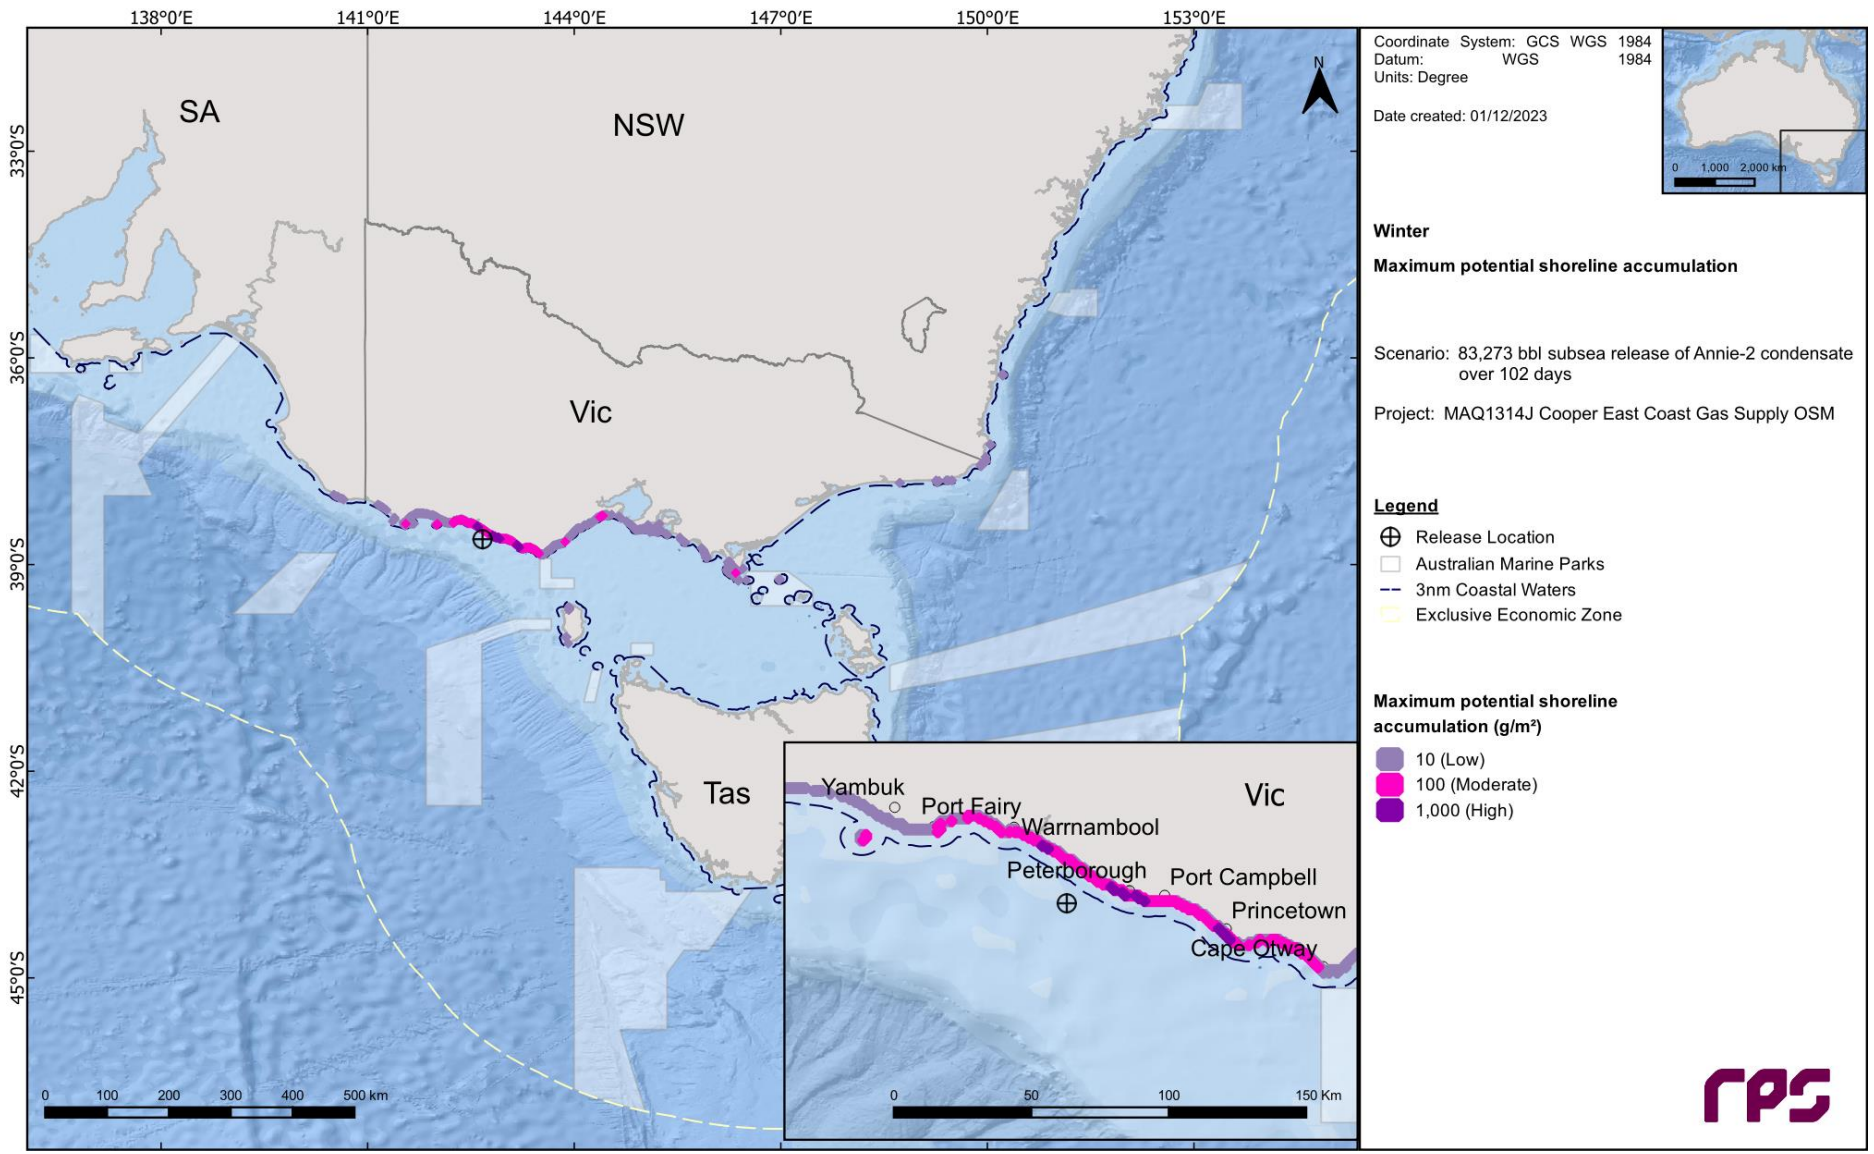

Figure 12.8 Maximum potential shoreline accumulation in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during winter conditions.

12.1.3 In-water exposure

12.1.3.1 Dissolved Hydrocarbons

Table 12.7 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer.

A total of 20 BIAs were predicted to be exposed to dissolved hydrocarbon at, or above, the low threshold during both winter and summer. Excluding the BIAs that the release location resides within (see Section 10.3), the highest probability of low exposure was 21% during summer (Short-tailed Shearwater - Foraging,) and 59% during winter (Short-tailed Shearwater - Foraging).

The maximum dissolved hydrocarbon concentration at any given receptor(s) was predicted to be 50.1 ppb and 51.7 ppb during summer and winter respectively.

Table 12.8 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all thresholds assessed.

Figure 12.9 and Figure 12.10 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer for each season whilst Figure 12.11to Figure 12.12 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds.

Table 12.7 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on an 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

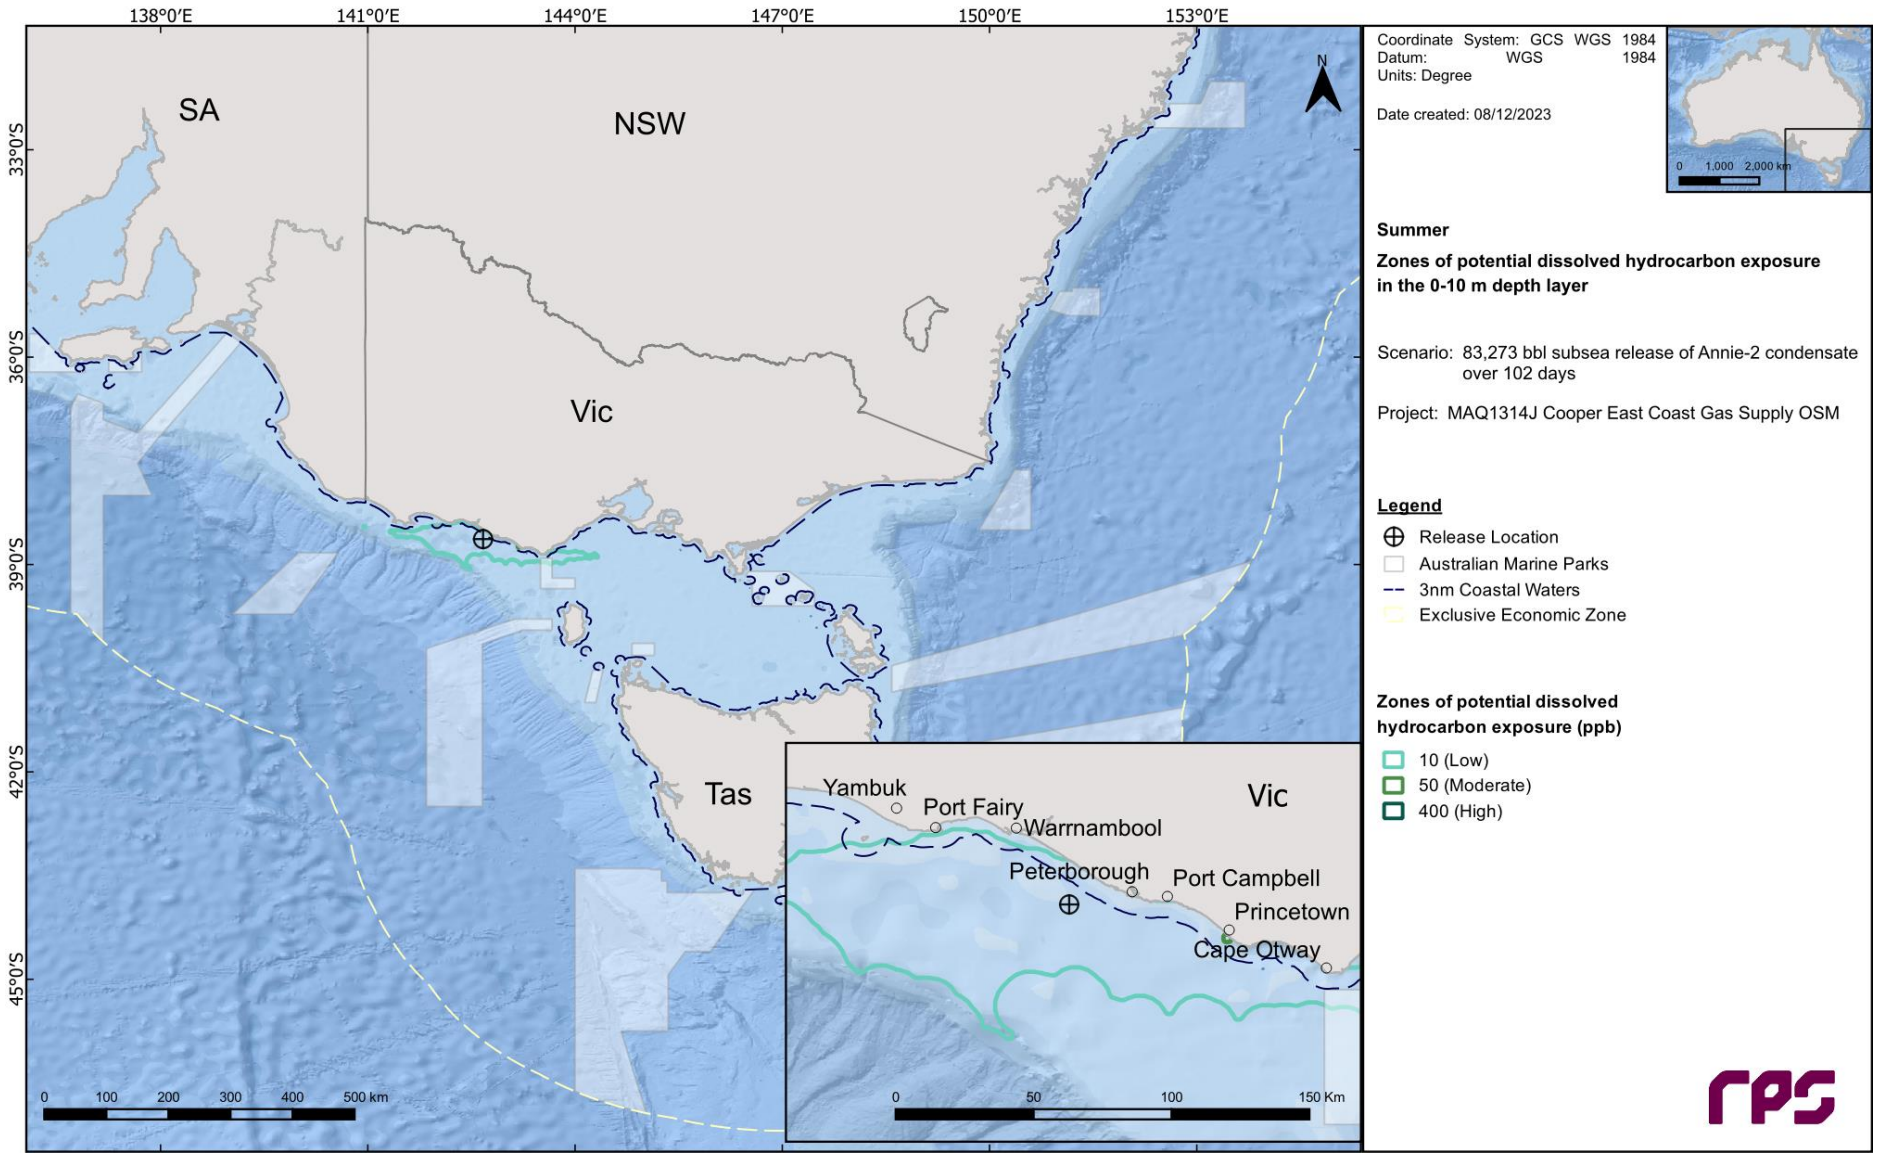

Figure 12.9 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during summer conditions.

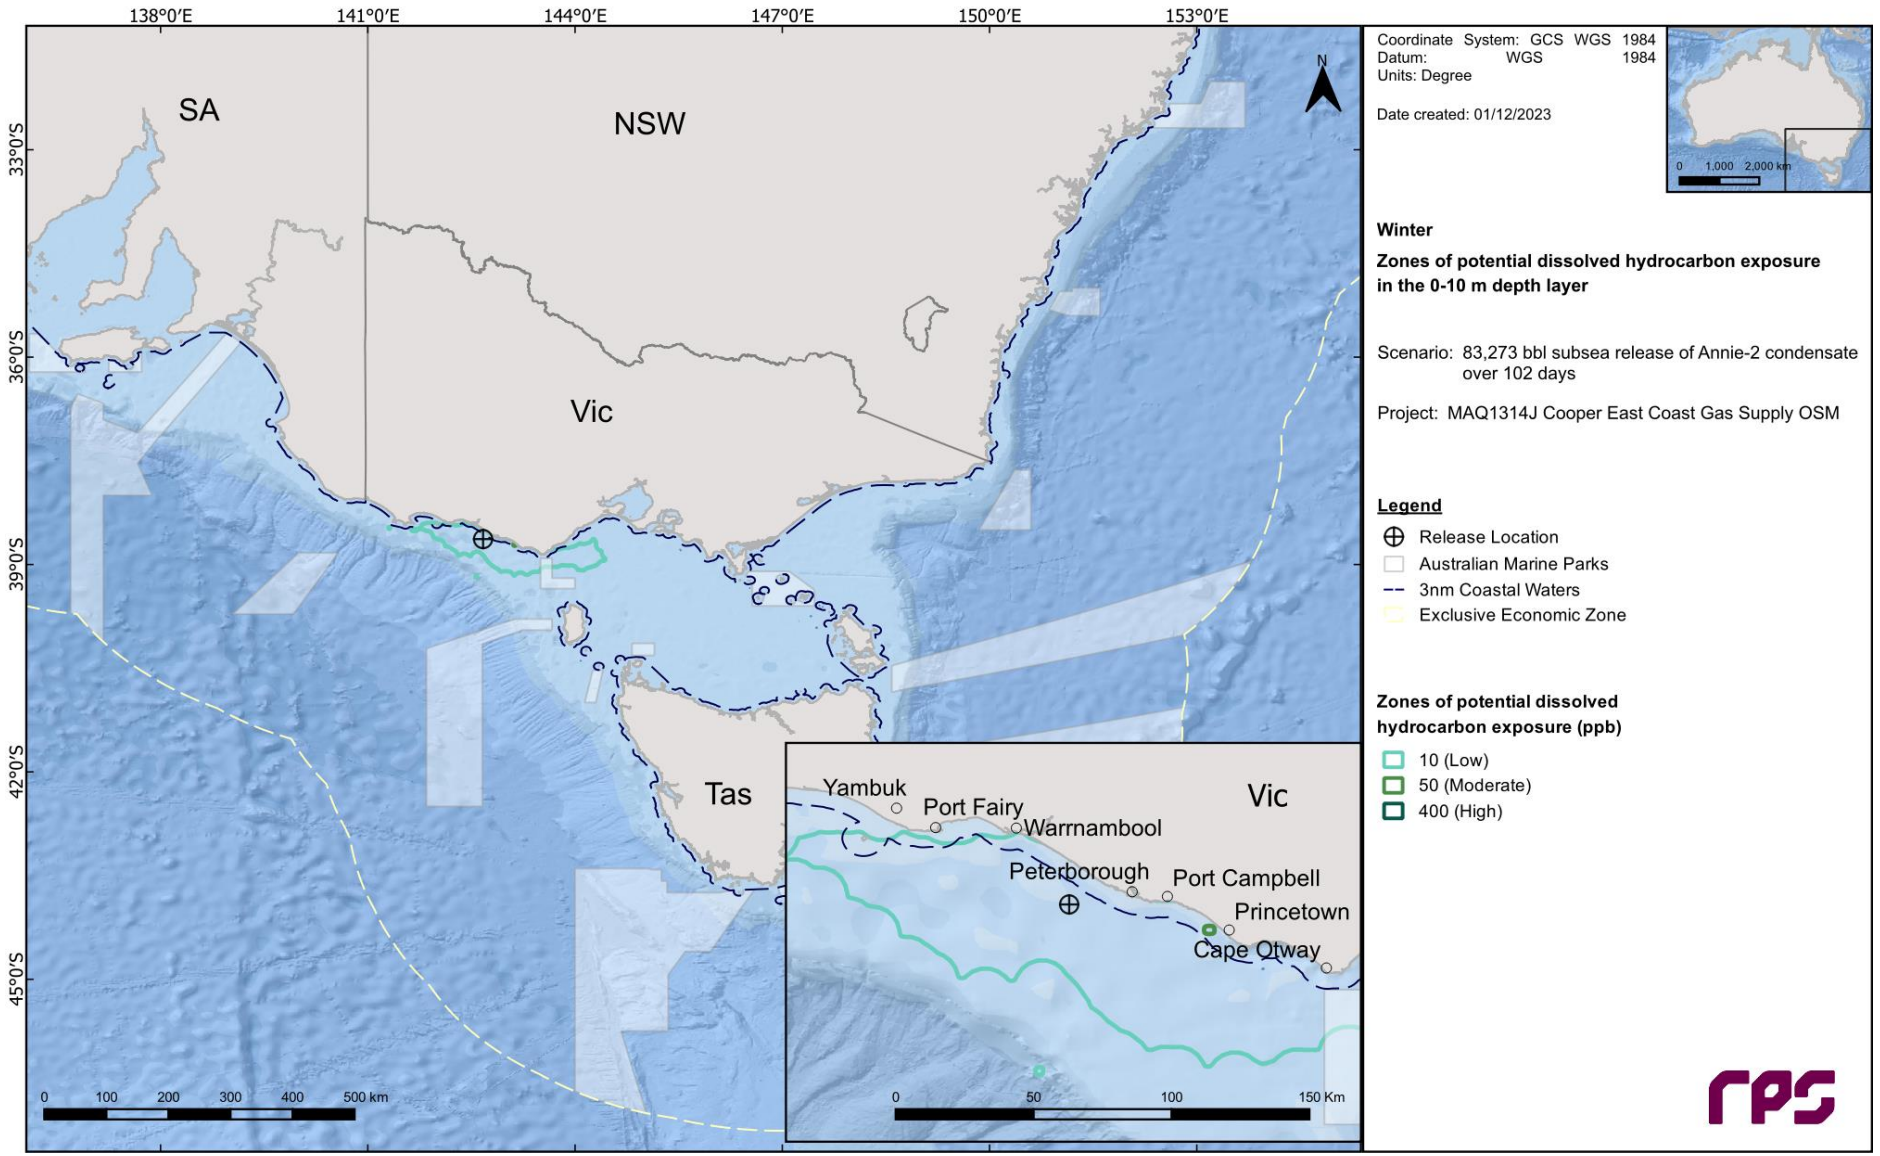

Figure 12.10 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during winter conditions.

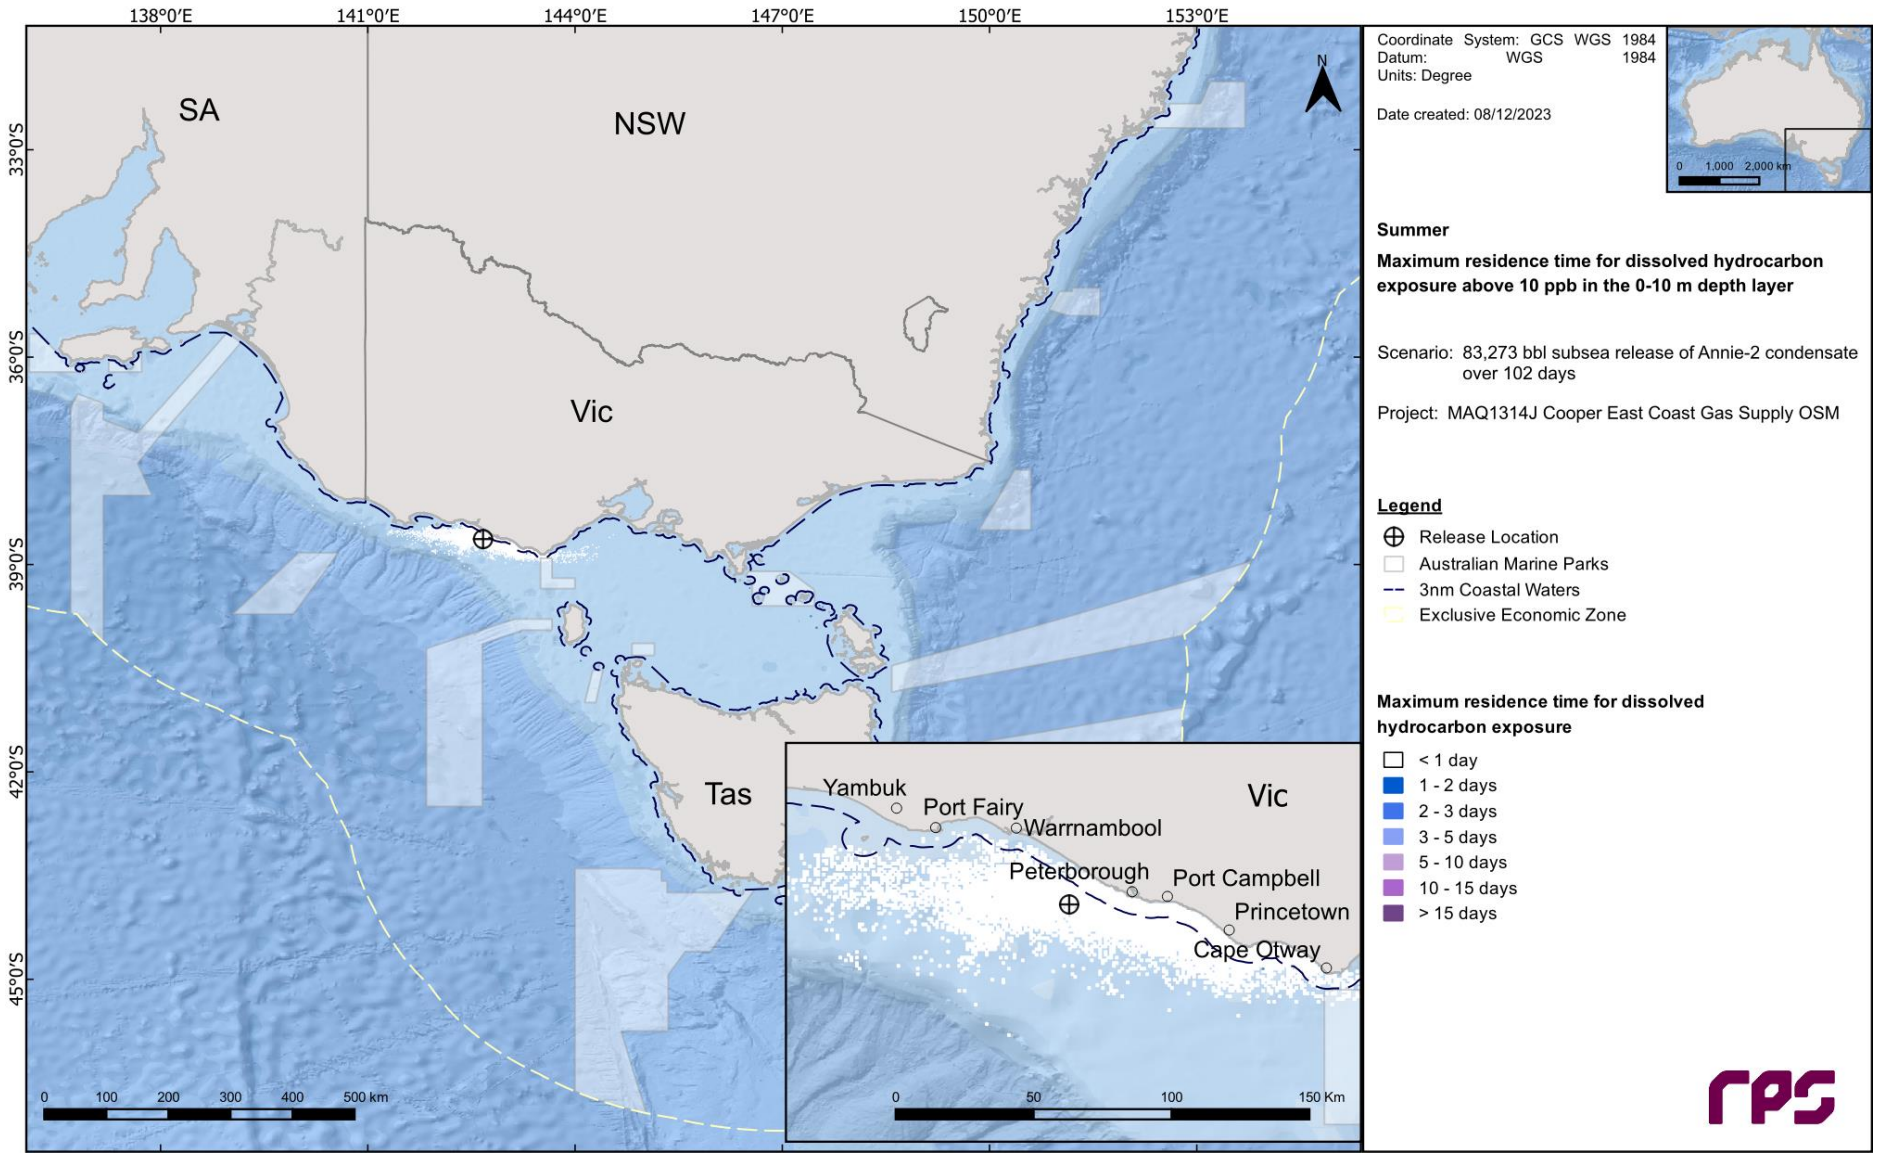

Figure 12.11 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during summer conditions.

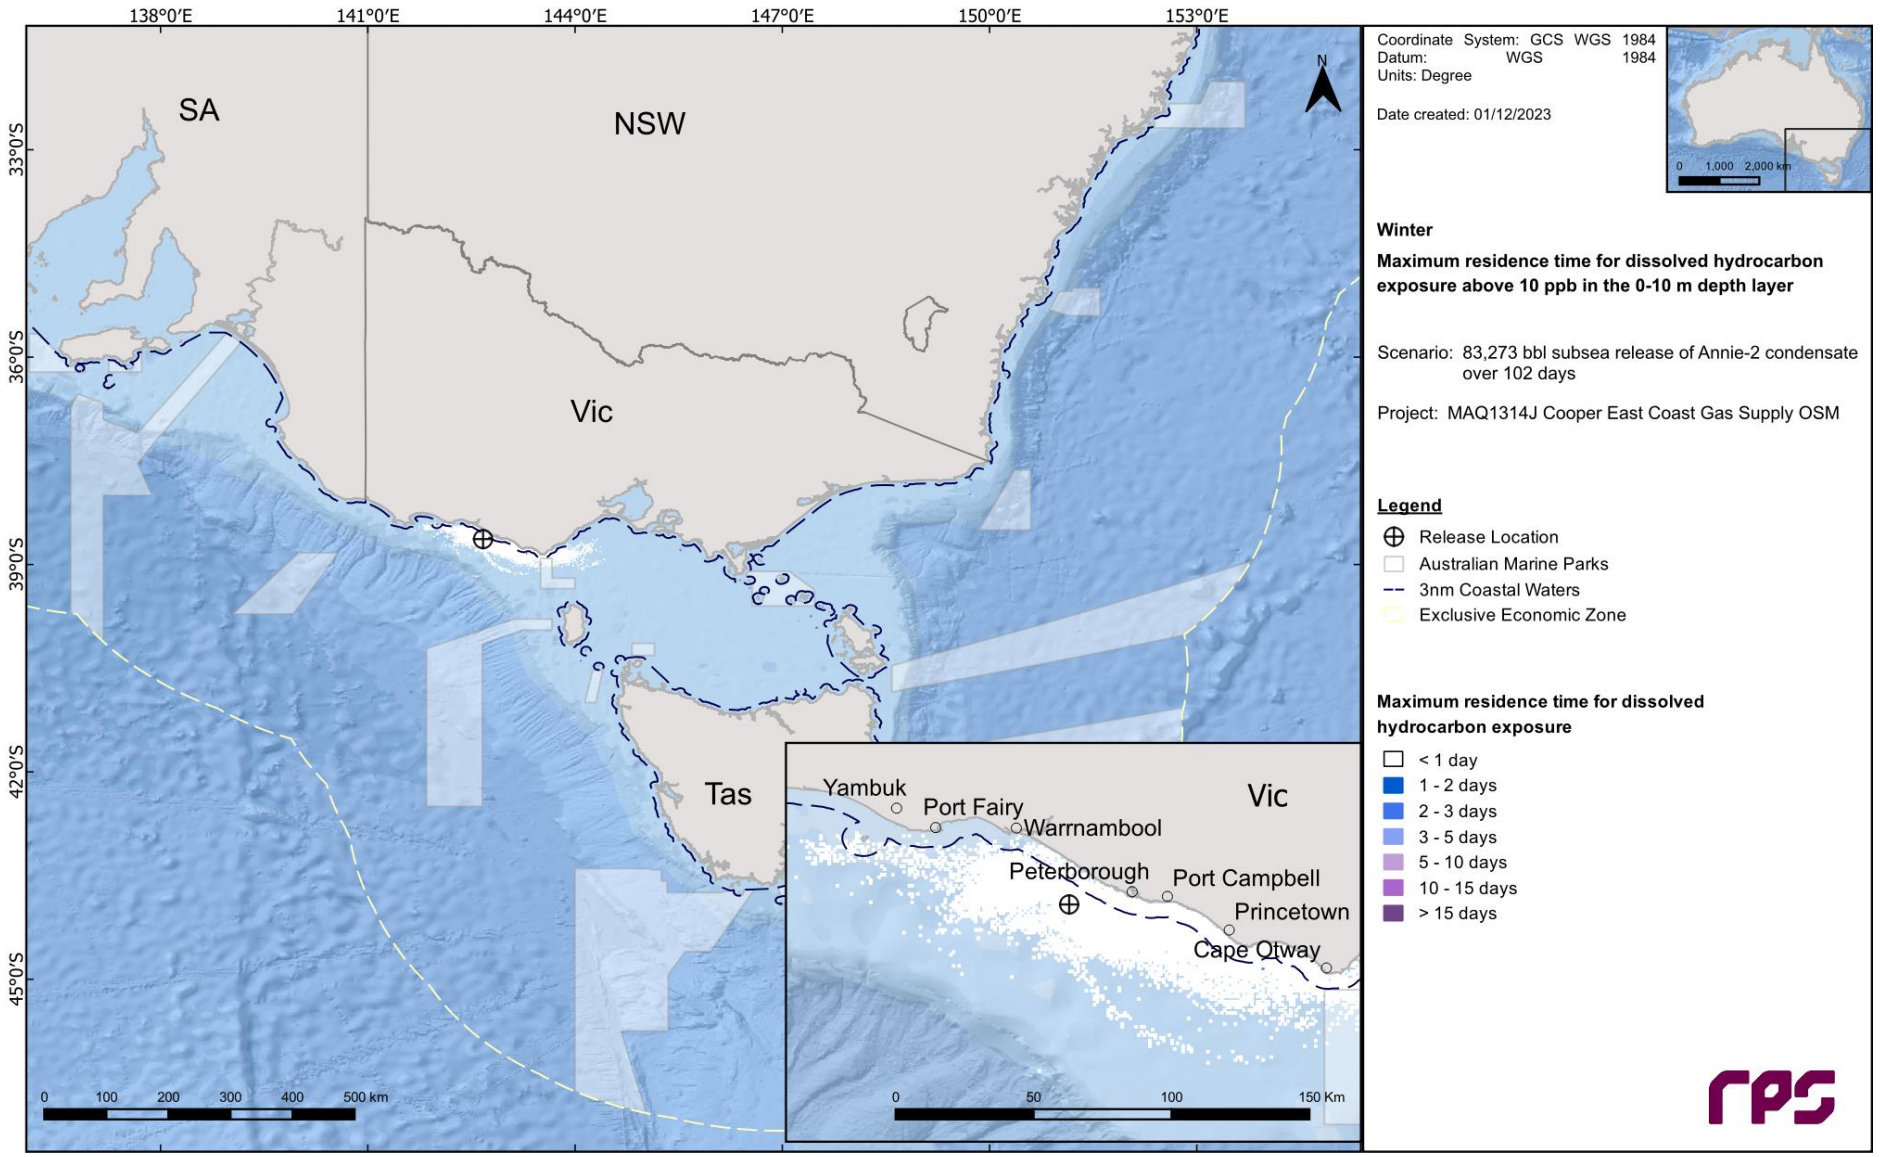

Figure 12.12 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of an 83,273 bbl subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations during winter conditions.

12.1.3.2 Entrained Hydrocarbons

Table 12.9 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer.

Many receptors were exposed above the low and high thresholds, however most of these receptors (predominantly BIAs) coincided with the release location.

In summer conditions, the highest probability of low entrained hydrocarbon exposure was recorded at 100% for receptors that the release location doesn't reside within, including Southern Right Whale – Aggregation BIA and Warrnambool Plain IBRA. Additional receptors including sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure (refer to Table 11.9). Similarly, during winter several receptors that the release location doesn't reside within revealed probabilities of 100% for low entrained hydrocarbon exposure.

Table 12.10 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all thresholds assessed.

Figure 12.13 and Figure 12.14 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer for each season whilst Figure 12.15 to Figure 12.18 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds.

Table 12.9 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on an 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

Table 12.10 Predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer. Results are based on an 83,273 bbl (13,239 m^3) subsurface release from a loss of well control at Pecten East-2 over 102 days. The results were calculated from 100 spill simulations per season.

The results were calculated from 100 spill simulations during winter conditions.

12.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2;
b. Largest (total) volume of oil ashore;
c. Longest length of shoreline with oil accumulation above 100 g/m^2;
d. Largest area of entrained hydrocarbon exposure above 100 ppb; and
e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

Table 12.11 presents a summary of in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 12.11 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria				
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore	Longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Season		Summer	Winter	Summer	Winter	Summer
Run Number		61	13	57	58	68

	50 ppb	-	-	-	-	**1**
	400 ppb	-	-	-	-	-
Start Date		27th April 2010 3 pm	23rd July 2010 4 am	19th March 2012 11 am	3rd August 2014 2 am	29th April 2016 11 am

NC = No contact at, or above the specified shoreline accumulation threshold.

12.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as summer run number 61, which started on 27th April 2010.

Figure 11.19 illustrates the floating oil exposure and shoreline accumulation over the 116-day simulation.

Figure 11.20 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 116-day simulation.

Figure 11.21 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.12 summarises the mass balance peaks and at the end of the simulation.

Table 12.12 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116
Surface (m^3)	382.3	20.3	0.1
Entrained (m^3)	1,925.8	78.0	1,476.6
Dissolved (m^3)	8.1	14.1	0.5
Evaporation (m^3)	7,868.8	116.0	7,868.8
Decay (m^3)	3,154.7	116.0	3,154.7
Ashore (m^3)	199.6	107.8	195.9

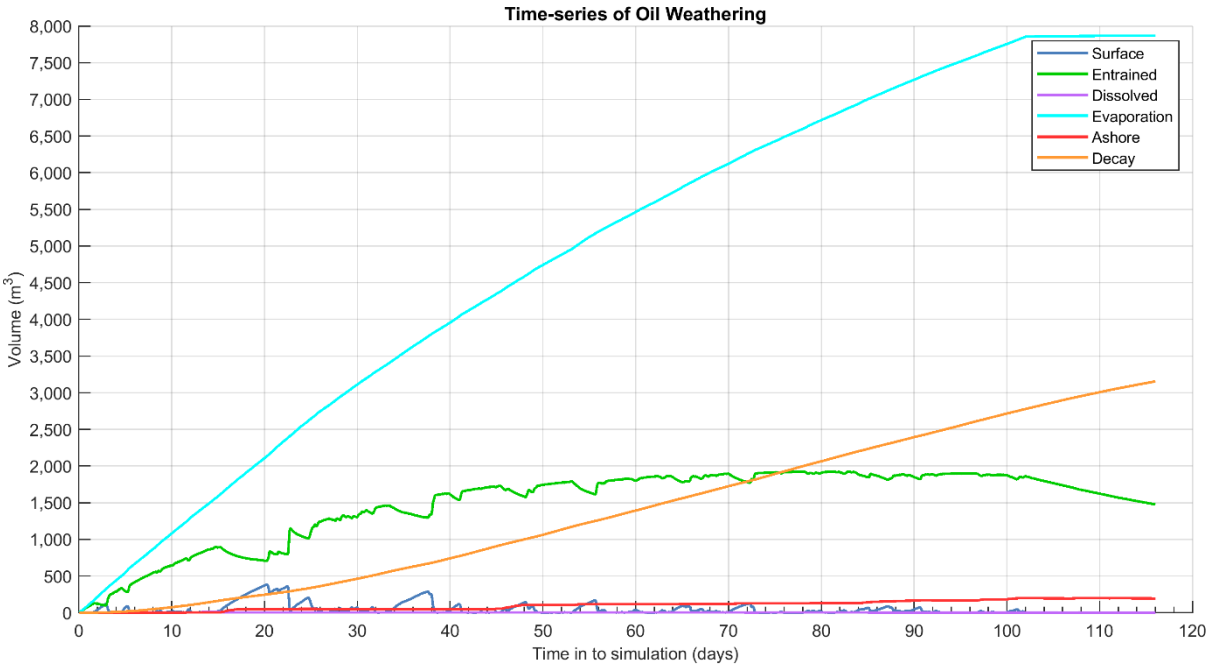

Figure 12.21 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 10 g/m^2.

12.2.2 Deterministic Case: Largest volume of oil ashore

The deterministic trajectory that resulted in the largest volume of oil ashore was identified as winter run number 13, which started on 23rd July 2010.

Figure 12.22 illustrates the floating oil exposure and shoreline accumulation over the 116-day simulation.

Figure 12.23 displays the time series of the volume of oil accumulating on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 116-day simulation.

Figure 12.24 presents the fates and weathering graph for the corresponding single spill trajectory and Table 12.13 summarises the mass balance peaks and at the end of the simulation.

Table 12.13 Summary of the mass balance for the trajectory with the largest volume ashore.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 116
Surface (m^3)	156.7	37.3	0.2
Entrained (m^3)	1,857.0	87.0	1,433.1
Dissolved (m^3)	7.9	18.5	0.5
Evaporation (m^3)	7,697.1	116.0	7,697.1

13 RESULTS – SCENARIO 3 – 66,430 BBL (10,562 M^3) SUBSURFACE RELEASE FROM A LOSS OF WELL CONTROL AT ANNIE-2

This scenario examined a 66,430 bbl (10,562 m^3) subsurface release of condensate over 104 days to represent a LOWC scenario at Annie-2 well. A total of 100 spill simulations were run per season (summer and winter) and each simulation was tracked for 118 days. The results are presented on a seasonal basis.

Sections 13.1 and 13.2 present the seasonal stochastic analysis and deterministic analysis results, respectively.

13.1 Stochastic Analysis

13.1.1 Floating Oil Exposure

Table 13.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance and corresponding direction from the release location to the low (1–10 g/m^2) and moderate (10–50 g/m^2) exposure zones was 55.7.0 km (east, winter) and 3.2 km (east, winter), respectively. No high (>50 g/m^2) exposure zones were predicted during either summer or winter conditions.

Table 13.2 summarises the potential floating oil exposure to individual receptors.

During summer, a total of 16 BIAs were predicted to be exposed to floating oil at, or above, the low threshold. Excluding the BIAs that the release location resides within (see Section 10.3), the highest probability (38%) of low exposure was predicted at the Southern Right Whale – Aggregation BIA. The minimum time before low exposure to the Southern Right Whale – Aggregation was 0.83 days.

Similarly, during winter, a total of 16 BIAs were predicted to be exposed to floating oil at, or above, the low threshold. Again, the highest probability (8%) of low exposure was predicted at the Southern Right Whale – Aggregation BIA. The minimum time before low exposure to the Southern Right Whale – Aggregation was 2.17 days.

Table 13.3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor.

Figure 13.1 and Figure 13.2 present the zones of potential floating oil exposure for each season whilst Figure 13.3 to Figure 13.6 present the maximum residence time of floating oil exposure for the NOPSEMA thresholds.

Table 13.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

Distance and direction travelled	Zones of potential floating oil exposure					
	Summer			Winter		
	Low	Moderate	High	Low	Moderate	High
Maximum distance (km) from release location	53.0	1.6	-	55.7	3.2	-
Maximum distance (km) from release location (99th percentile)	30.0	1.6	-	33.1	3.2	-
Direction	E	W	-	E	E	-

Table 13.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

Table 13.3 Summary of the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

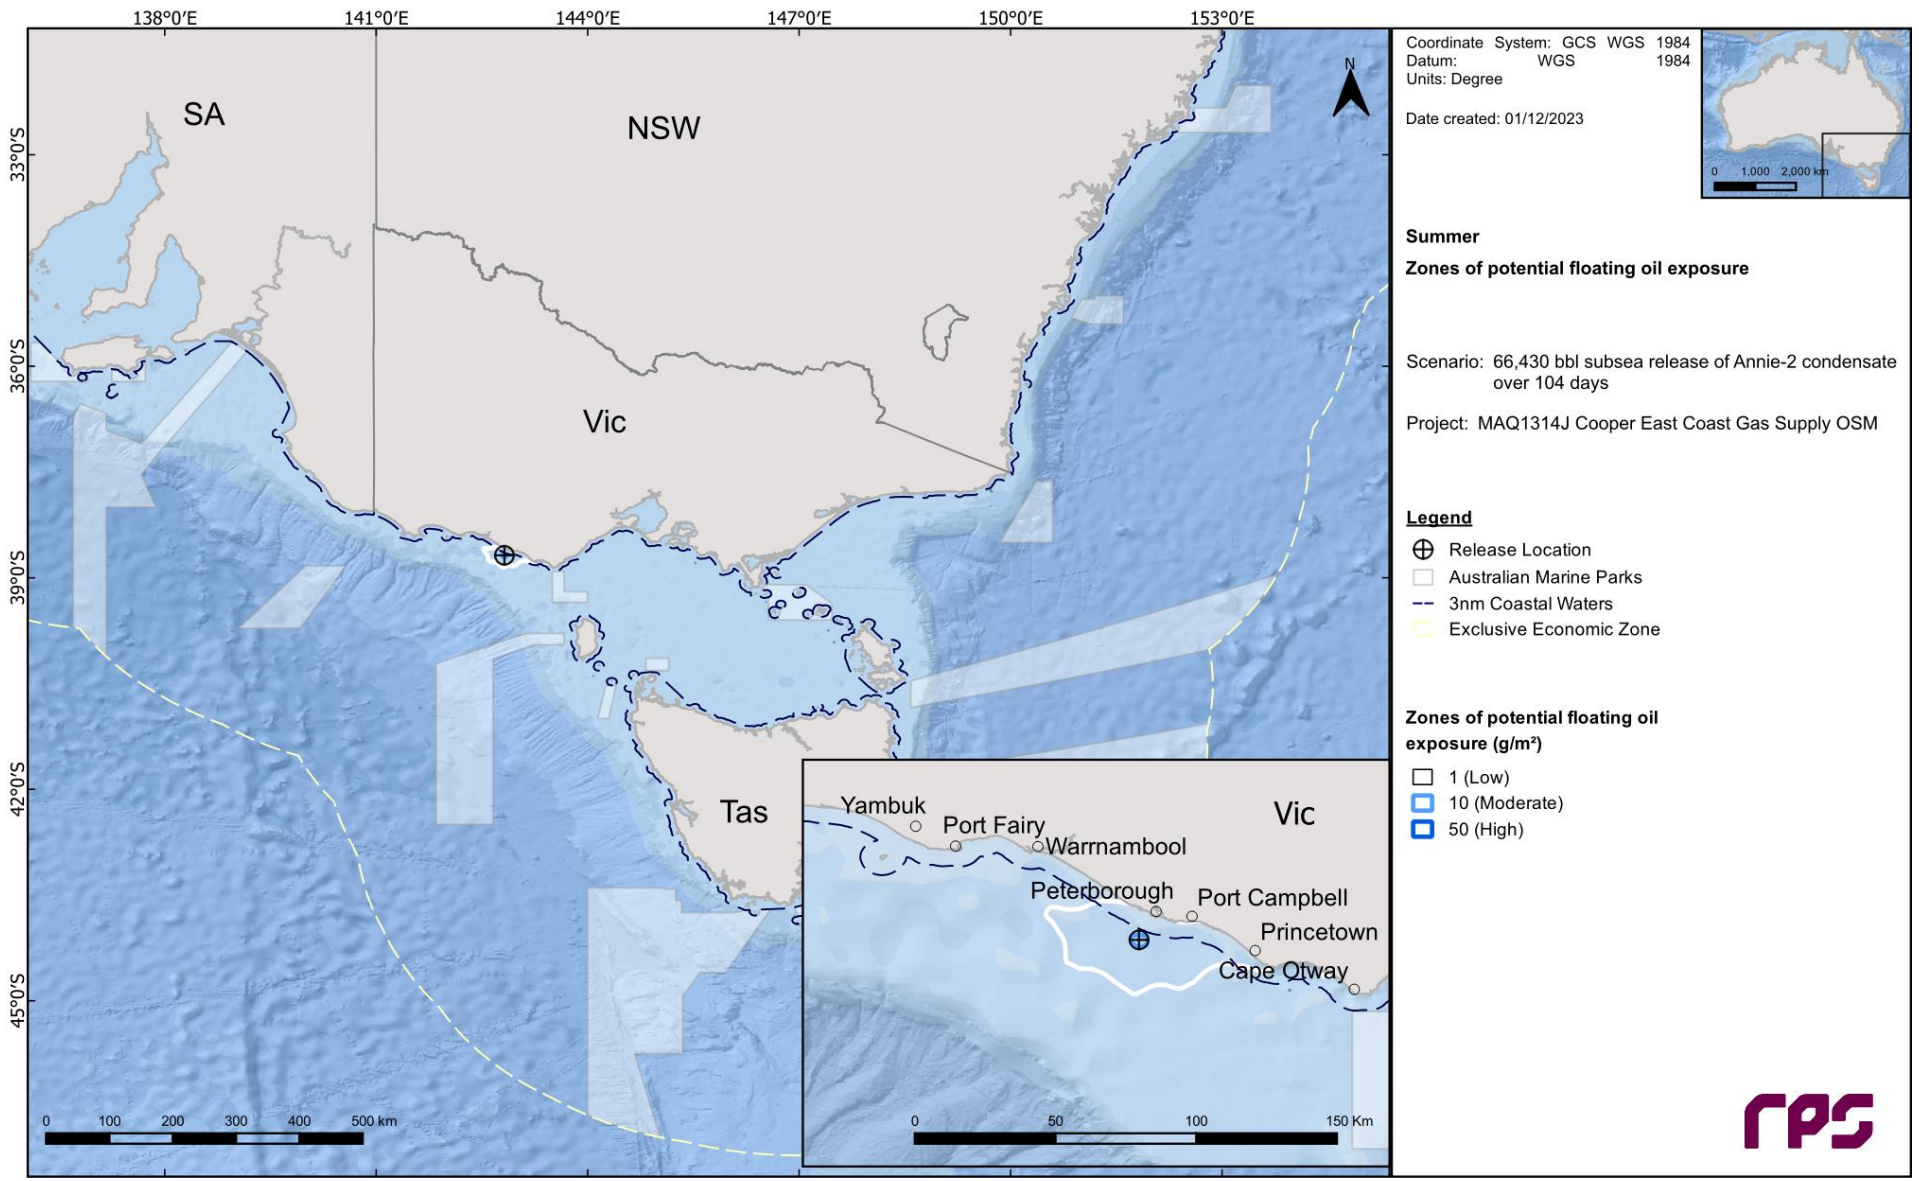

Figure 13.1 Zones of potential floating oil exposure in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

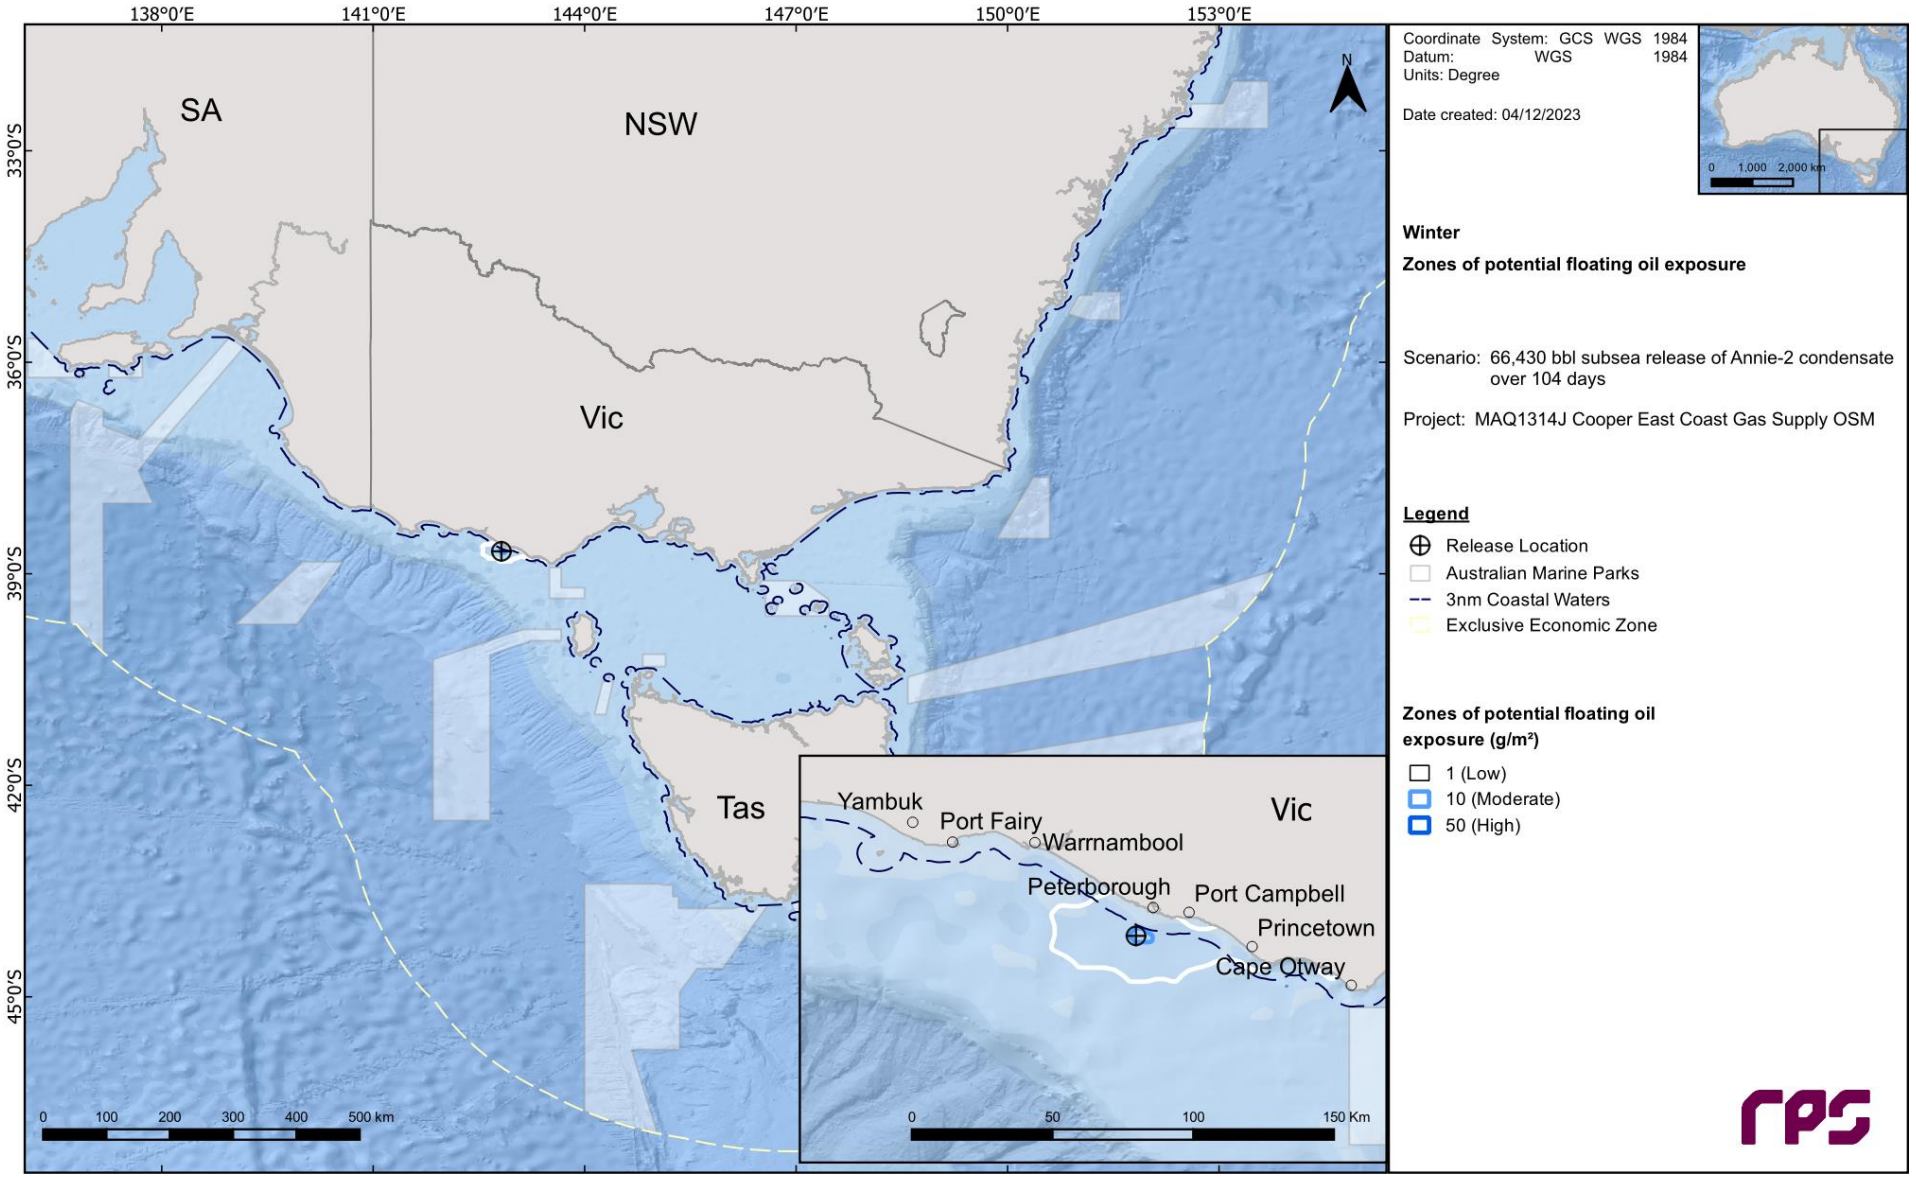

Figure 13.2 Zones of potential floating oil exposure in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

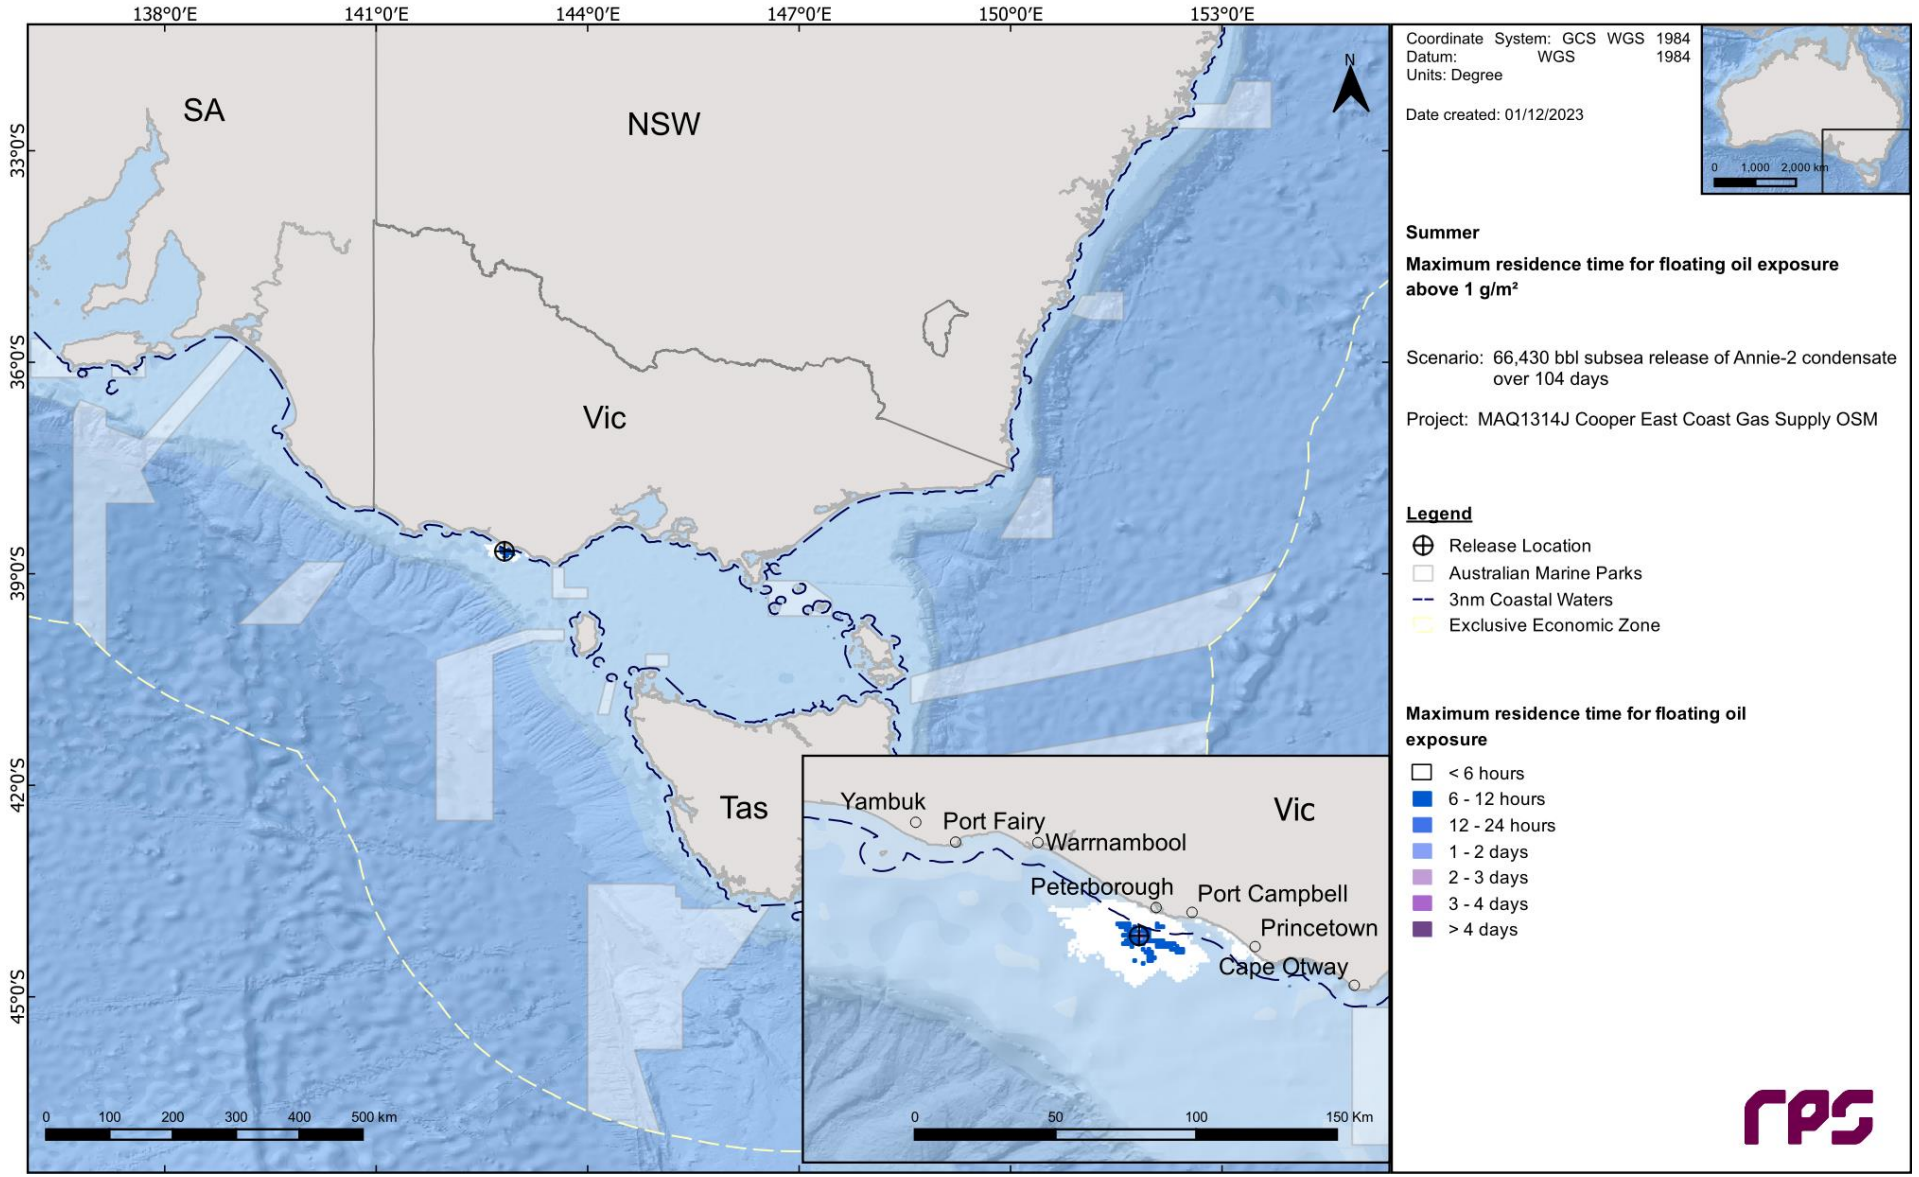

Figure 13.3 Maximum residence time of floating oil exposure above 1 g/m², in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

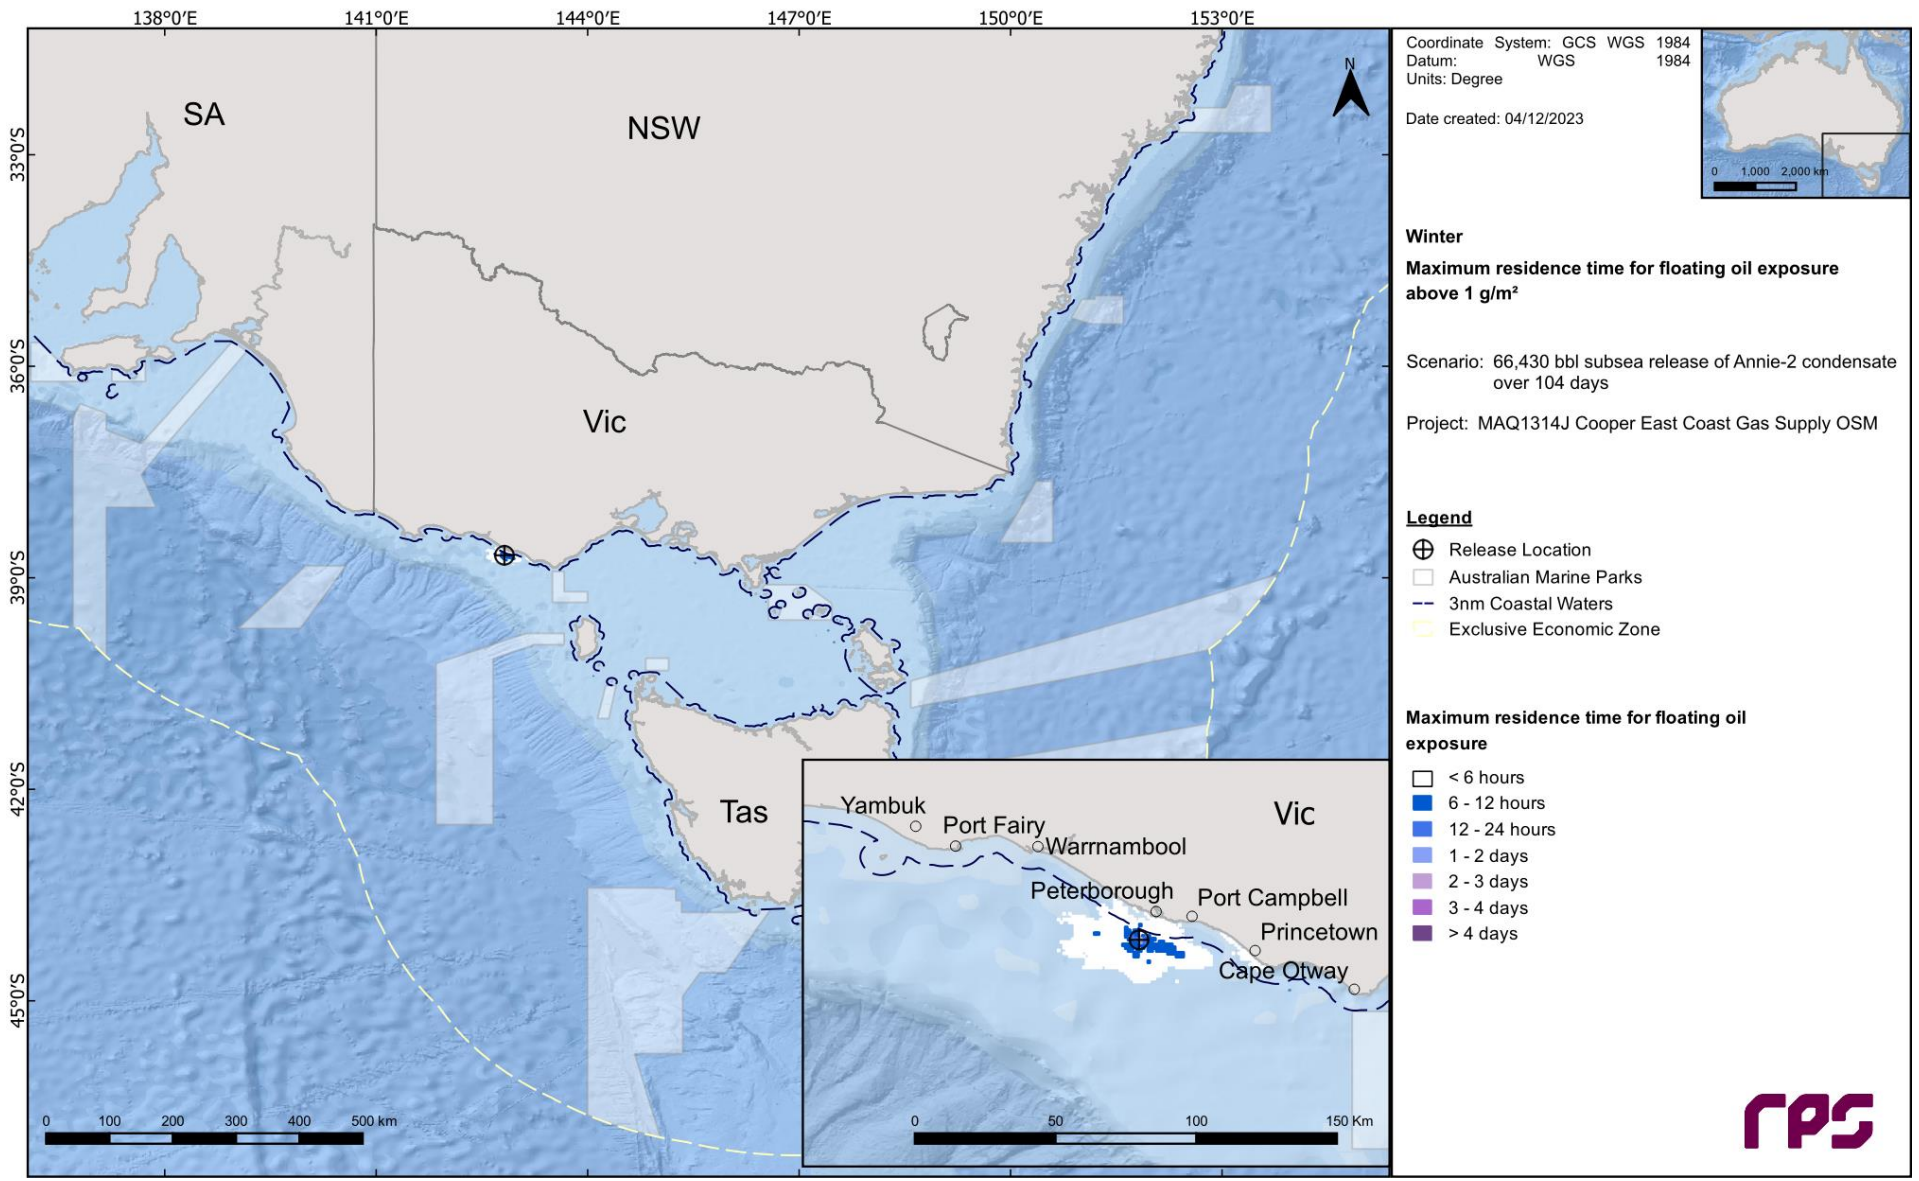

Figure 13.4 Maximum residence time of floating oil exposure above 1 g/m², in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

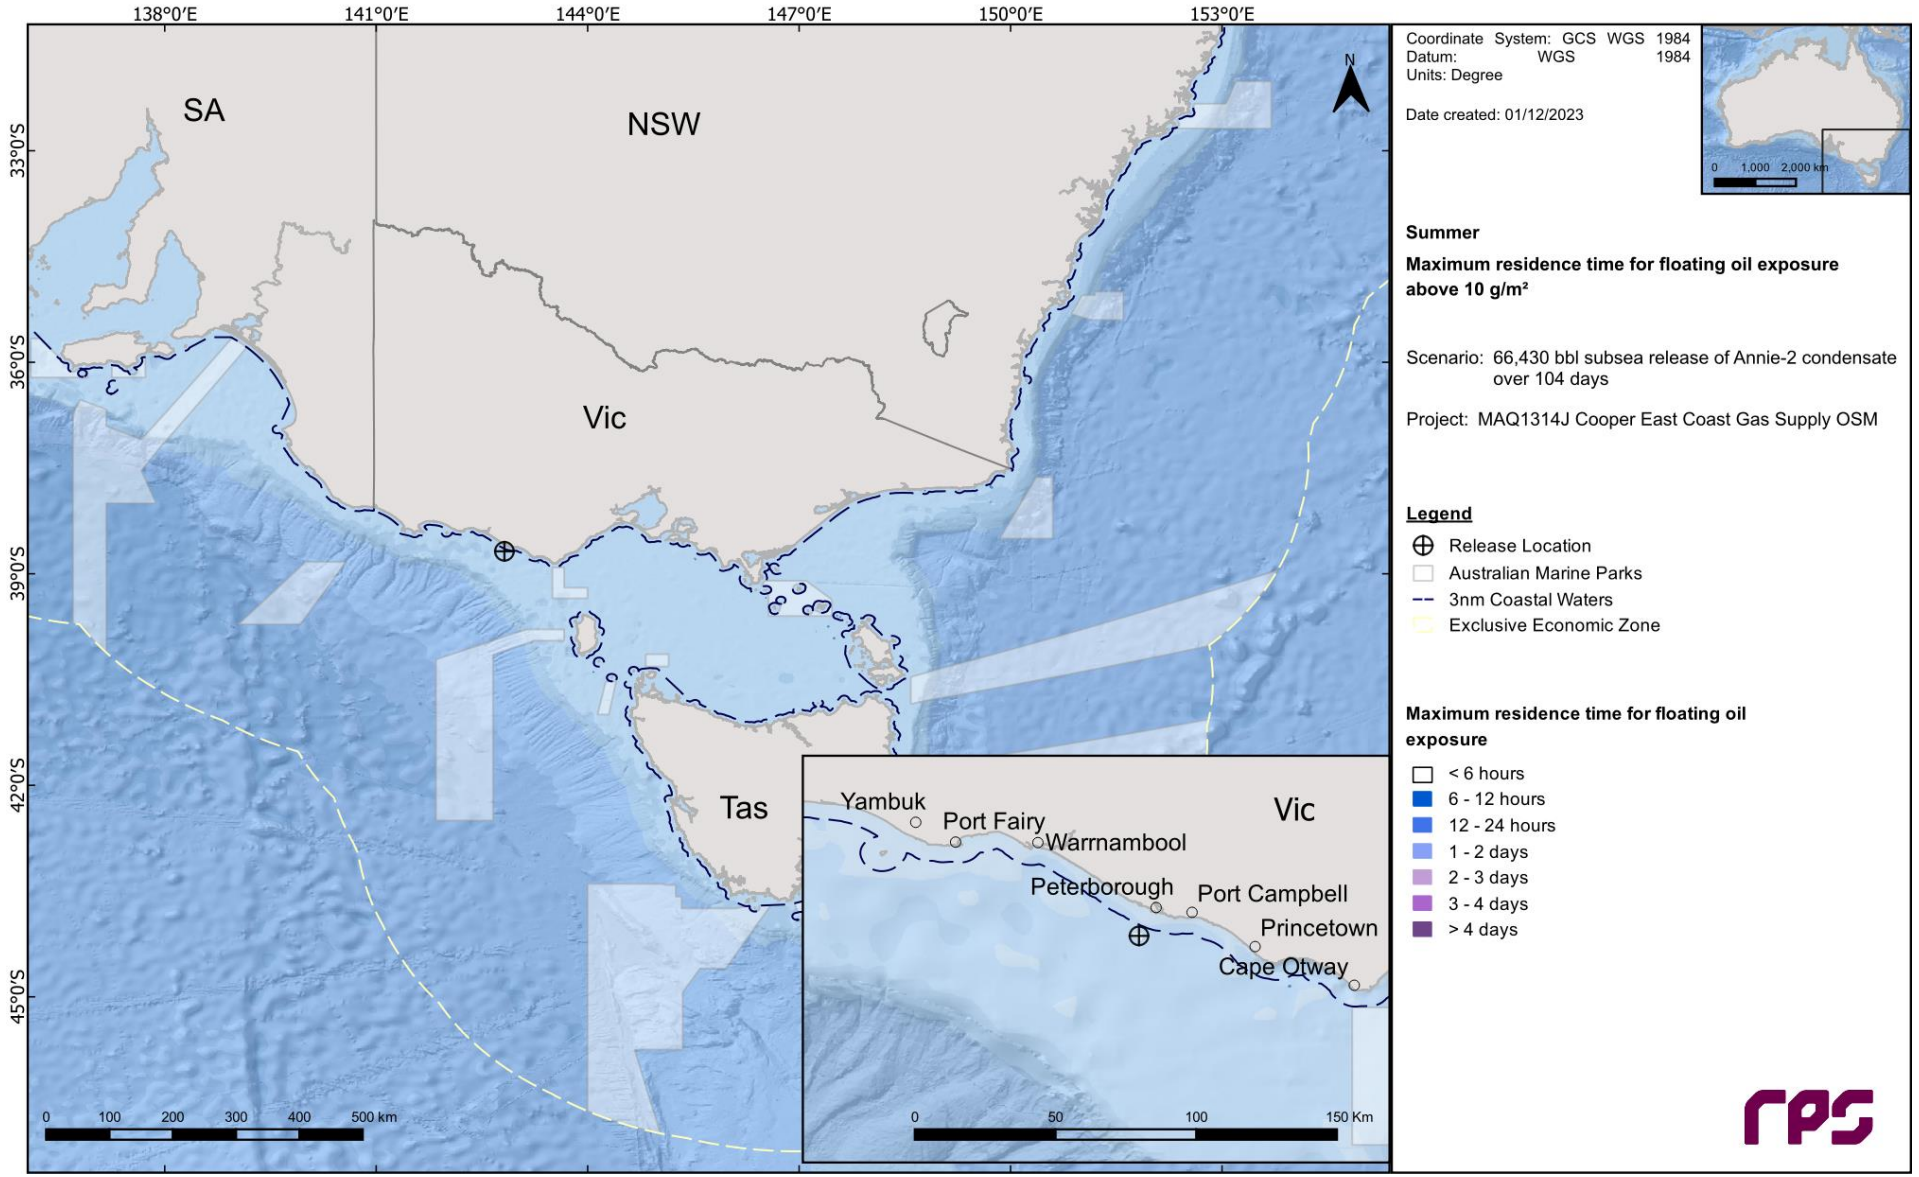

Figure 13.5 Maximum residence time of floating oil exposure above 10 g/m², in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

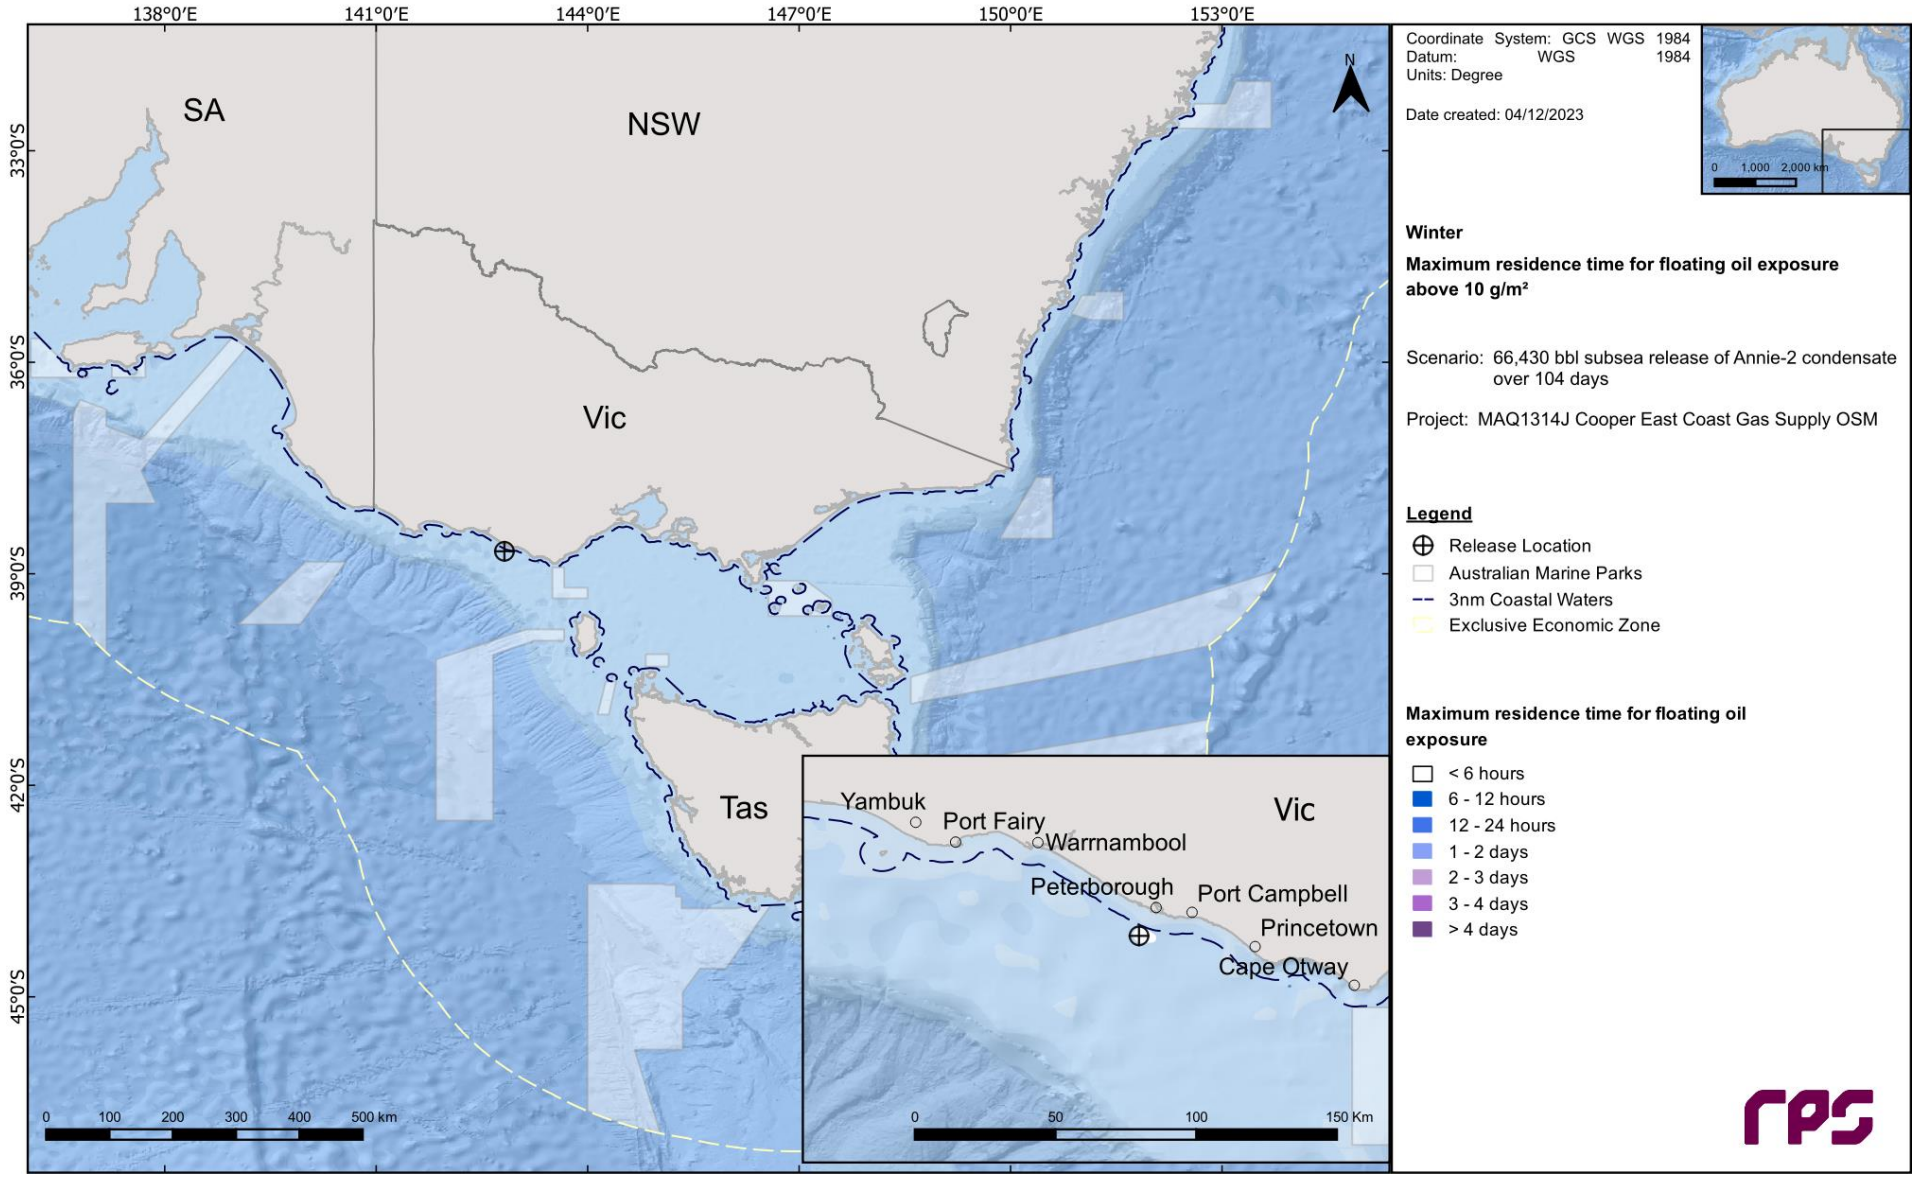

Figure 13.6 Maximum residence time of floating oil exposure above 10 g/m², in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

13.1.2 Shoreline Accumulation

Table 13.4 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 100% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 0.96 day. The maximum total volume ashore for a single spill trajectory was 312.1 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 224.0 km (winter), 62.0 km (winter) and 6.0 km (winter), respectively.

Table 13.5 and Table 13.6 summarises the shoreline accumulation on individual receptors during summer and winter, respectively.

During summer conditions, the shoreline segment of Corangamite LGA had the highest probability of accumulation above the low and moderate thresholds (100% and 99% respectively), whilst Moyne LGA and Bay of Islands sub-LGA shoreline had the highest probability of accumulation above the high threshold (5%). The minimum time for low threshold shoreline accumulation at Moyne was 0.96 days.

Alternatively, in winter the shoreline segment with the highest probability of accumulation above all three thresholds was Corangamite LGA (100%, 100% and 27% for low, moderate and high, respectively). The minimum time for low threshold shoreline accumulation at the Corangamite LGA receptor was 1 day.

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 13.7 and Figure 13.8 for summer and winter respectively.

Table 13.4 Summary of oil accumulation across all shorelines. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

Shoreline Statistics	Summer	Winter
Probability of accumulation on any shoreline (%)	100	100
Absolute minimum time for visible oil to shore (days)	0.96	1.00
Maximum total volume of hydrocarbons ashore (m^3)	206.3	312.1
Average total volume of hydrocarbons ashore (m^3)	124.1	161.7
Maximum length of the shoreline at **10 g/m^2** (km)	220.0	224.0
Average shoreline length (km) at **10 g/m^2** (km)	124.9	131.7
Maximum length of the shoreline at **100 g/m^2** (km)	58.0	62.0
Average shoreline length (km) at **100 g/m^2** (km)	28.6	33.3
Maximum length of the shoreline at **1,000 g/m^2** (km)	2.0	6.0
Average shoreline length (km) at **1,000 g/m^2** (km)	1.2	1.6

Table 13.5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

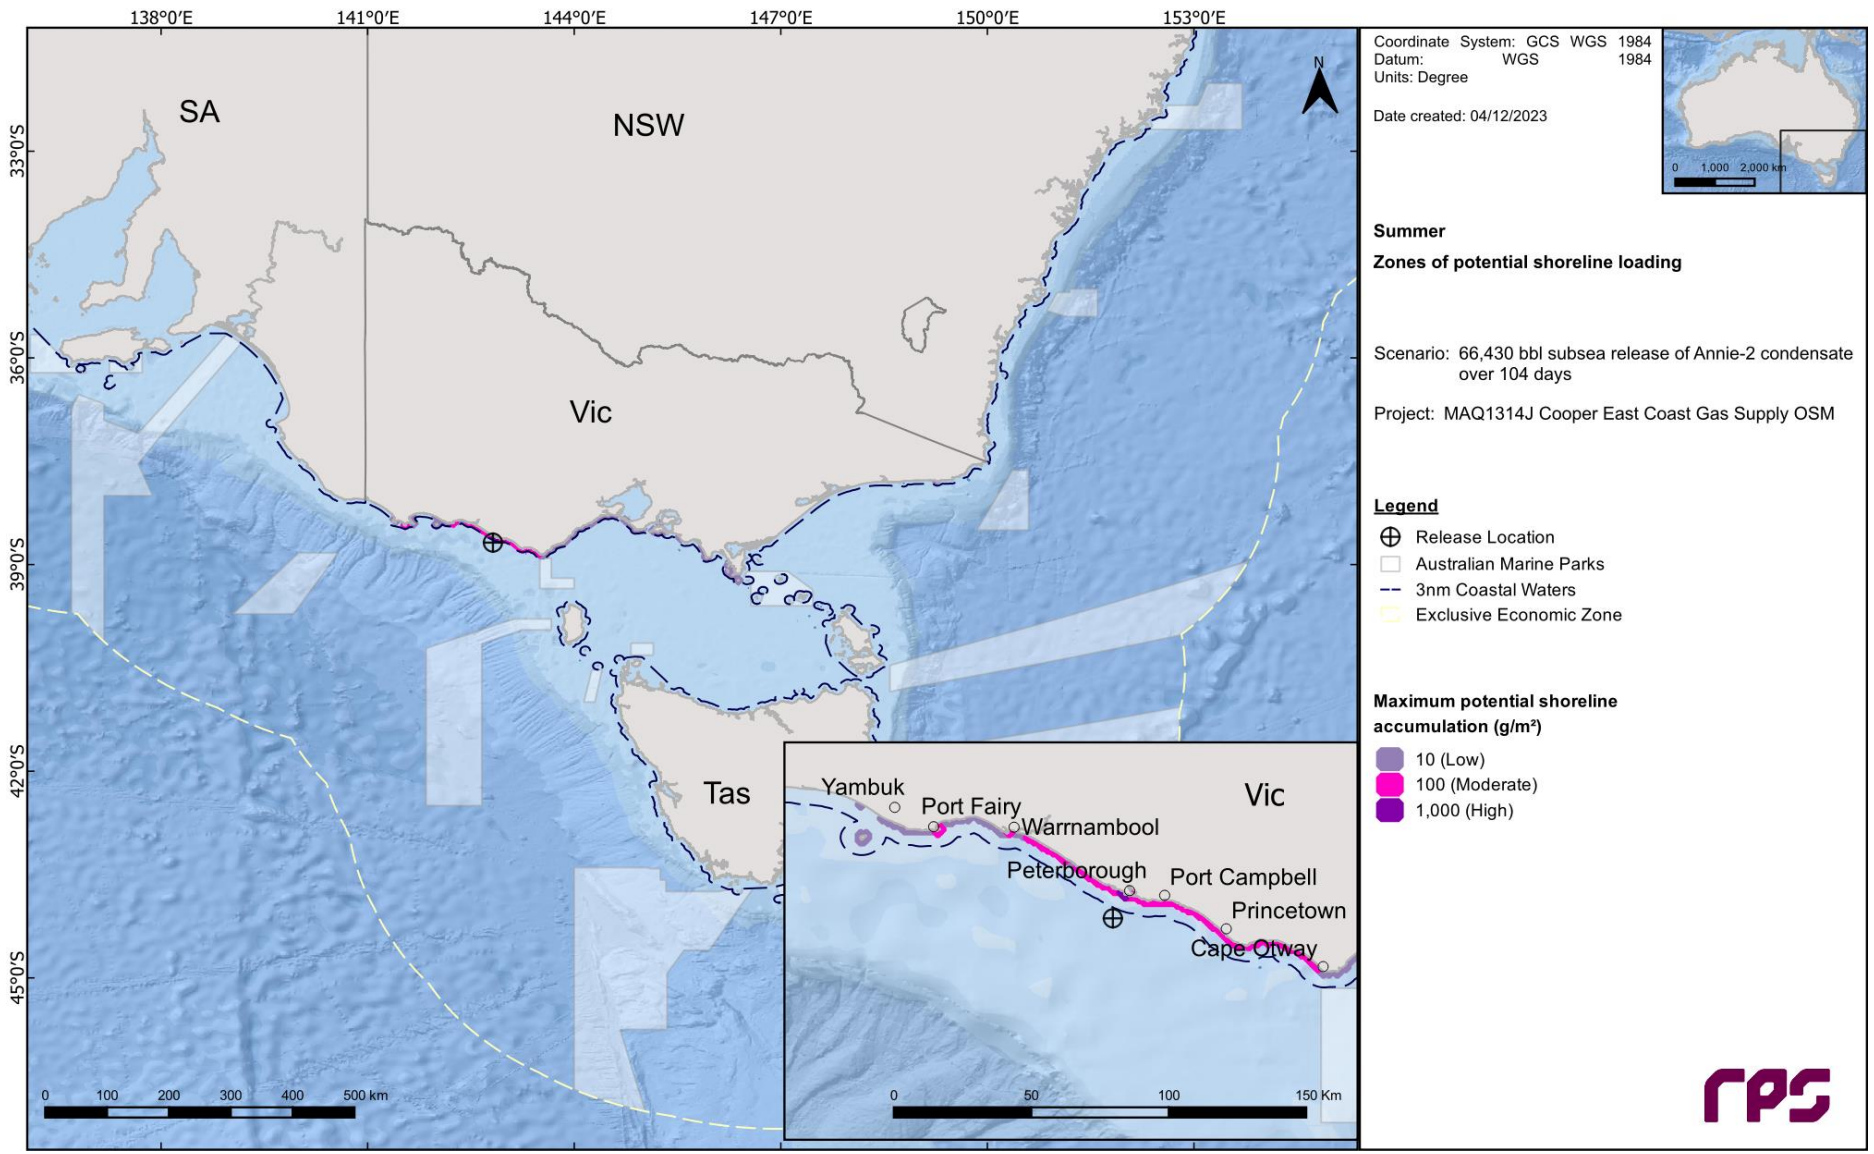

Figure 13.7 Maximum potential shoreline accumulation in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

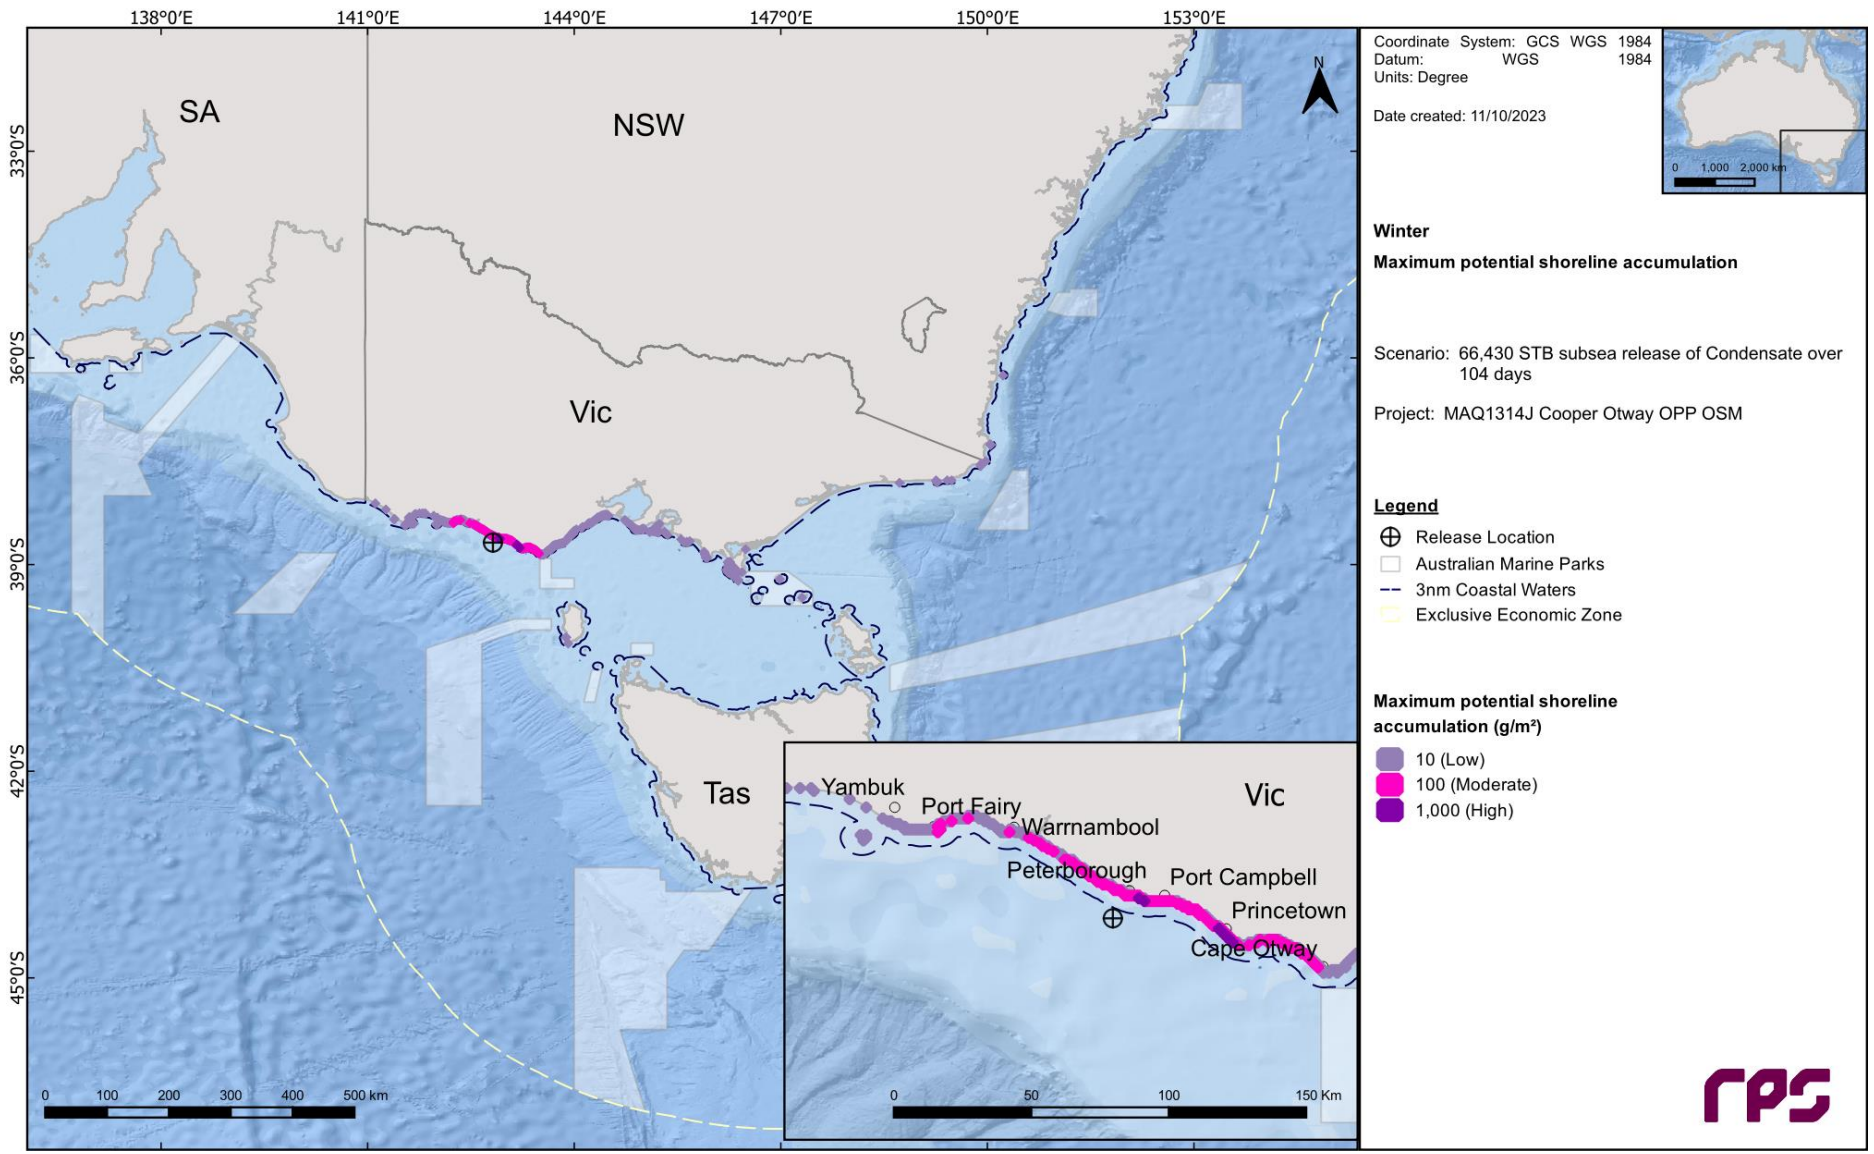

Figure 13.8 Maximum potential shoreline accumulation in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

13.1.3 In-water exposure

13.1.3.1 Dissolved Hydrocarbons

Table 13.7 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer.

A total of 20 BIAs were predicted to be exposed to dissolved hydrocarbon at, or above, the low threshold. Excluding the BIAs that the release location resides within (see Section 10.3), the highest probability of low exposure was 10% during summer and 33% during winter at the Short-tailed Shearwater - Foraging BIA receptor.

The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 35.3 ppb and 41.0 ppb during summer and winter respectively.

Table 13.8 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all thresholds assessed.

Figure 13.9 and Figure 13.10 present the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer for each season whilst Figure 13.11 and Figure 13.12 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds.

Table 13.7 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

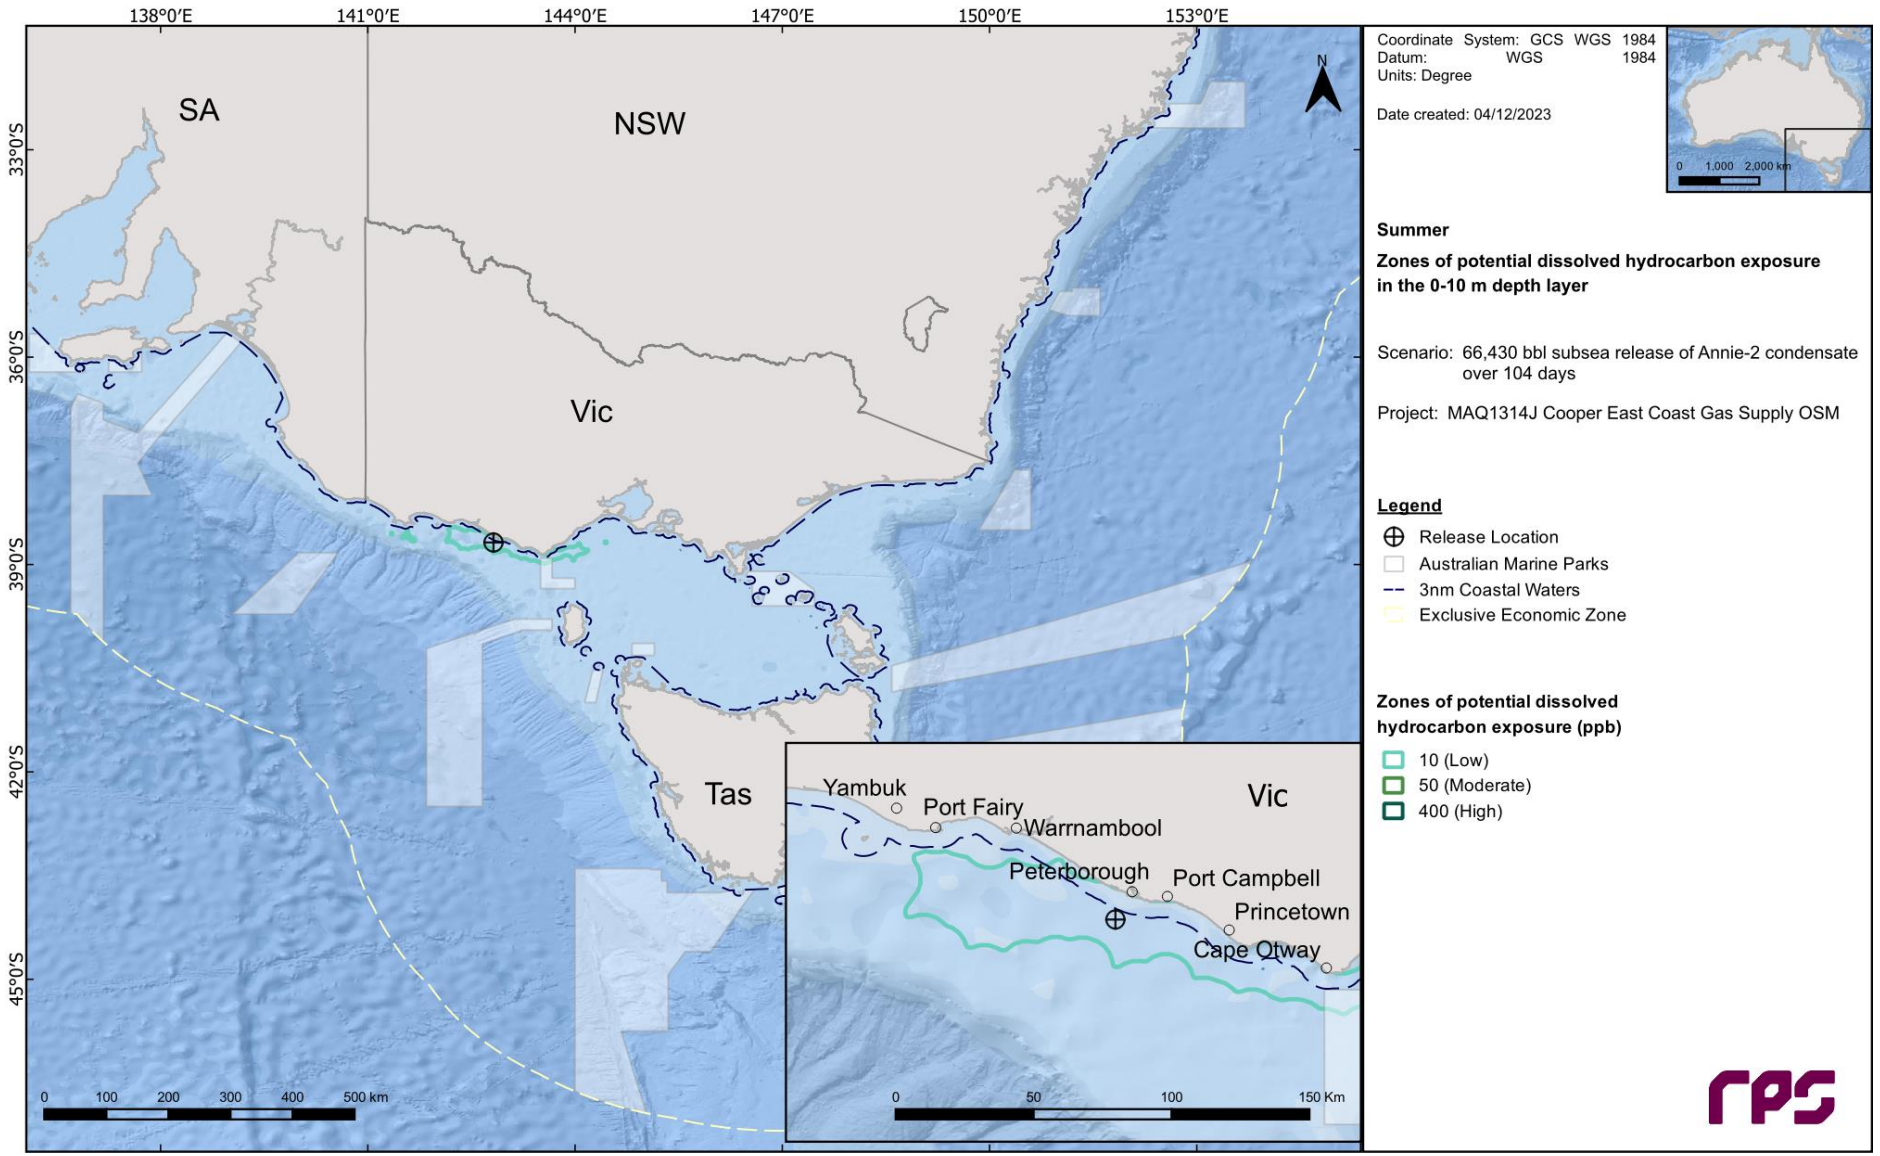

Figure 13.9 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

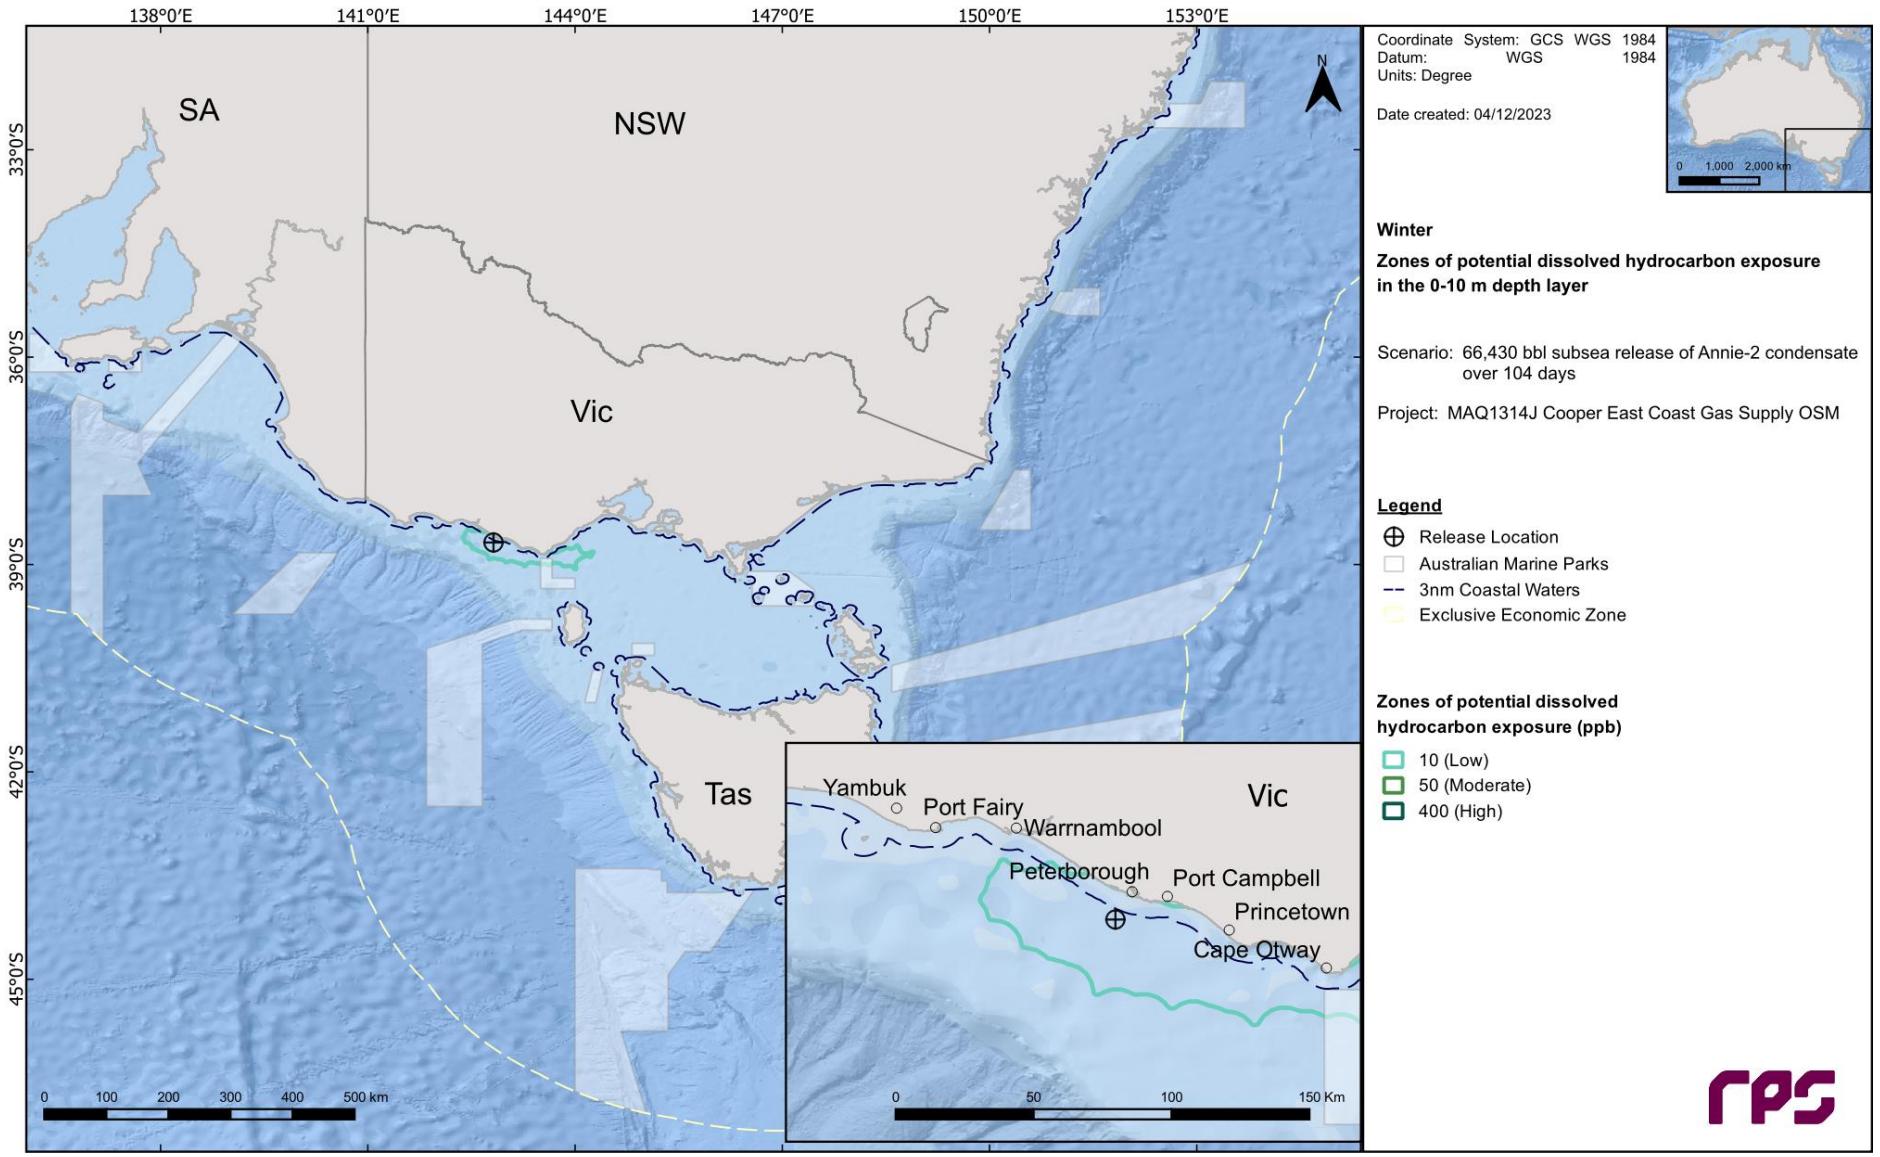

Figure 13.10 Zones of potential dissolved hydrocarbon exposure at 0-10 m below the sea in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

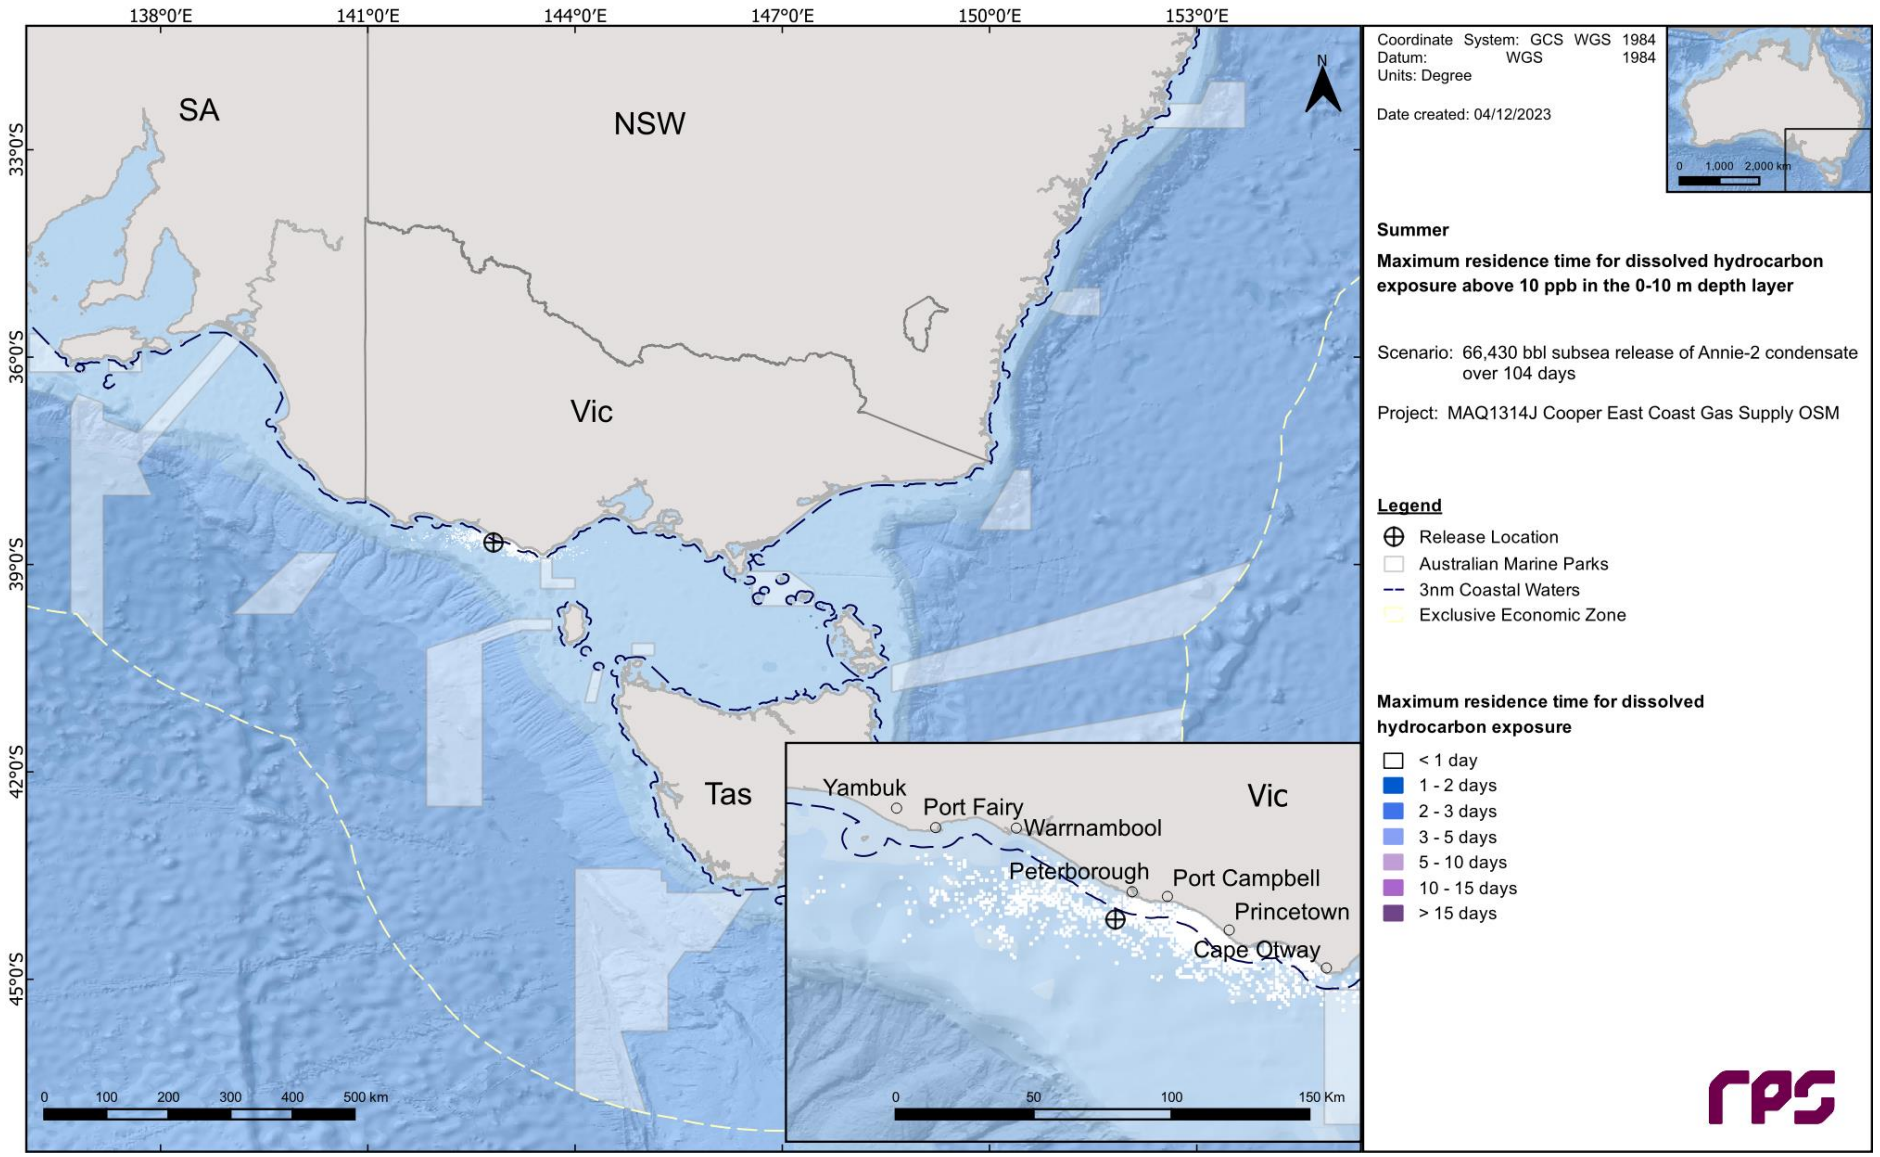

Figure 13.11 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

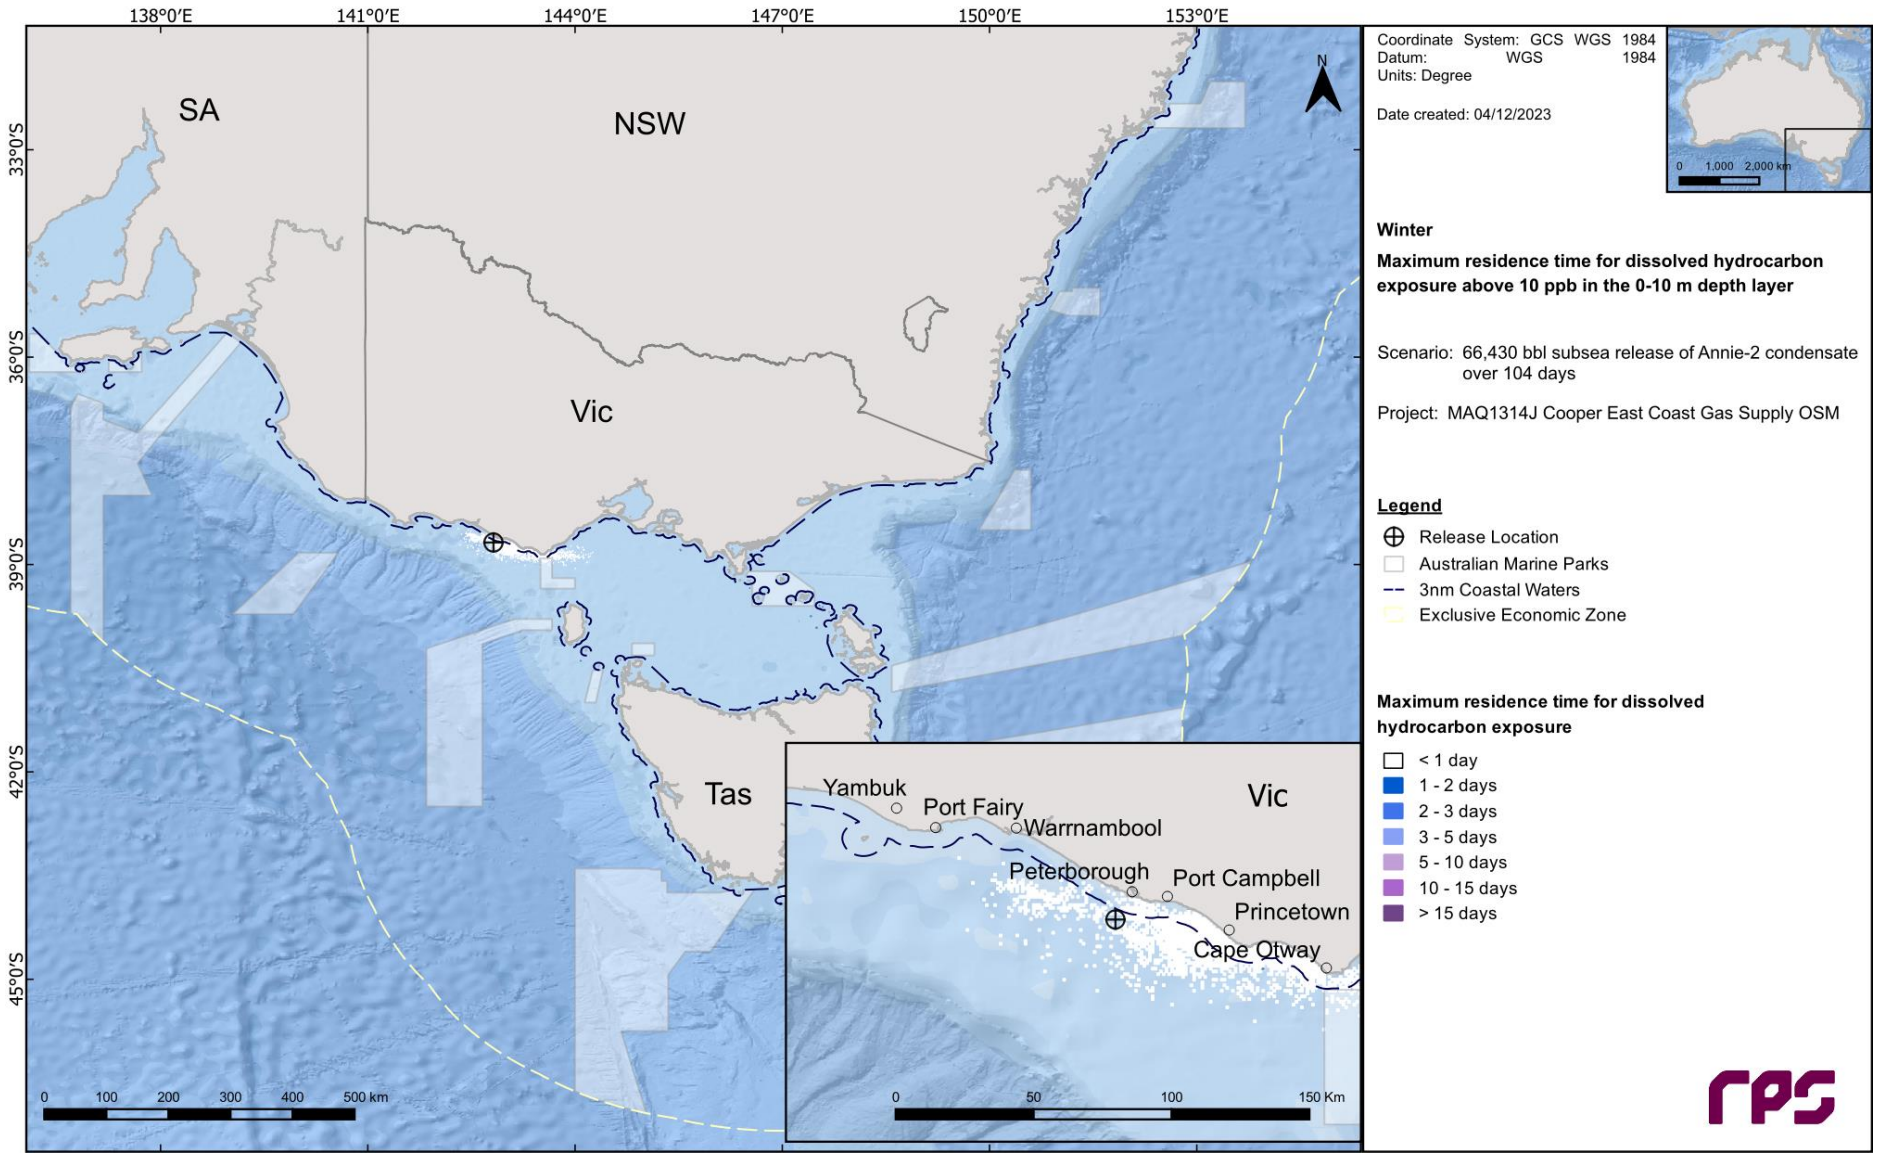

Figure 13.12 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

13.1.3.2 Entrained Hydrocarbons

Table 13.9 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer.

Many receptors were exposed above the low and high thresholds, however most of these receptors (predominantly BIAs) coincided with the release location.

In summer conditions, the highest probability of low entrained hydrocarbon exposure was recorded at 100% for receptors that the release location doesn't reside within, including Short-tailed Shearwater – Foraging, Southern Right Whale – Aggregation BIAs and Warrnambool Plain IBRA. Additional receptors including near-shore sub-LGA waters, and AMPs were predicted with entrained hydrocarbon exposure (refer to Table 13.9). Similarly, during winter several receptors that the release location doesn't reside within revealed probabilities of 100% for low entrained hydrocarbon exposure.

Table 13.10 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all thresholds assessed.

Figure 13.13 and Figure 13.14 present the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer for each season whilst Figure 13.15 to Figure 13.18 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds.

Table 13.9 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

*The release location resides within the receptor boundaries.

Table 13.10 Predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer. Results are based on a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations per season.

Receptor		Summer				Winter

*The release location resides within the receptor boundaries.

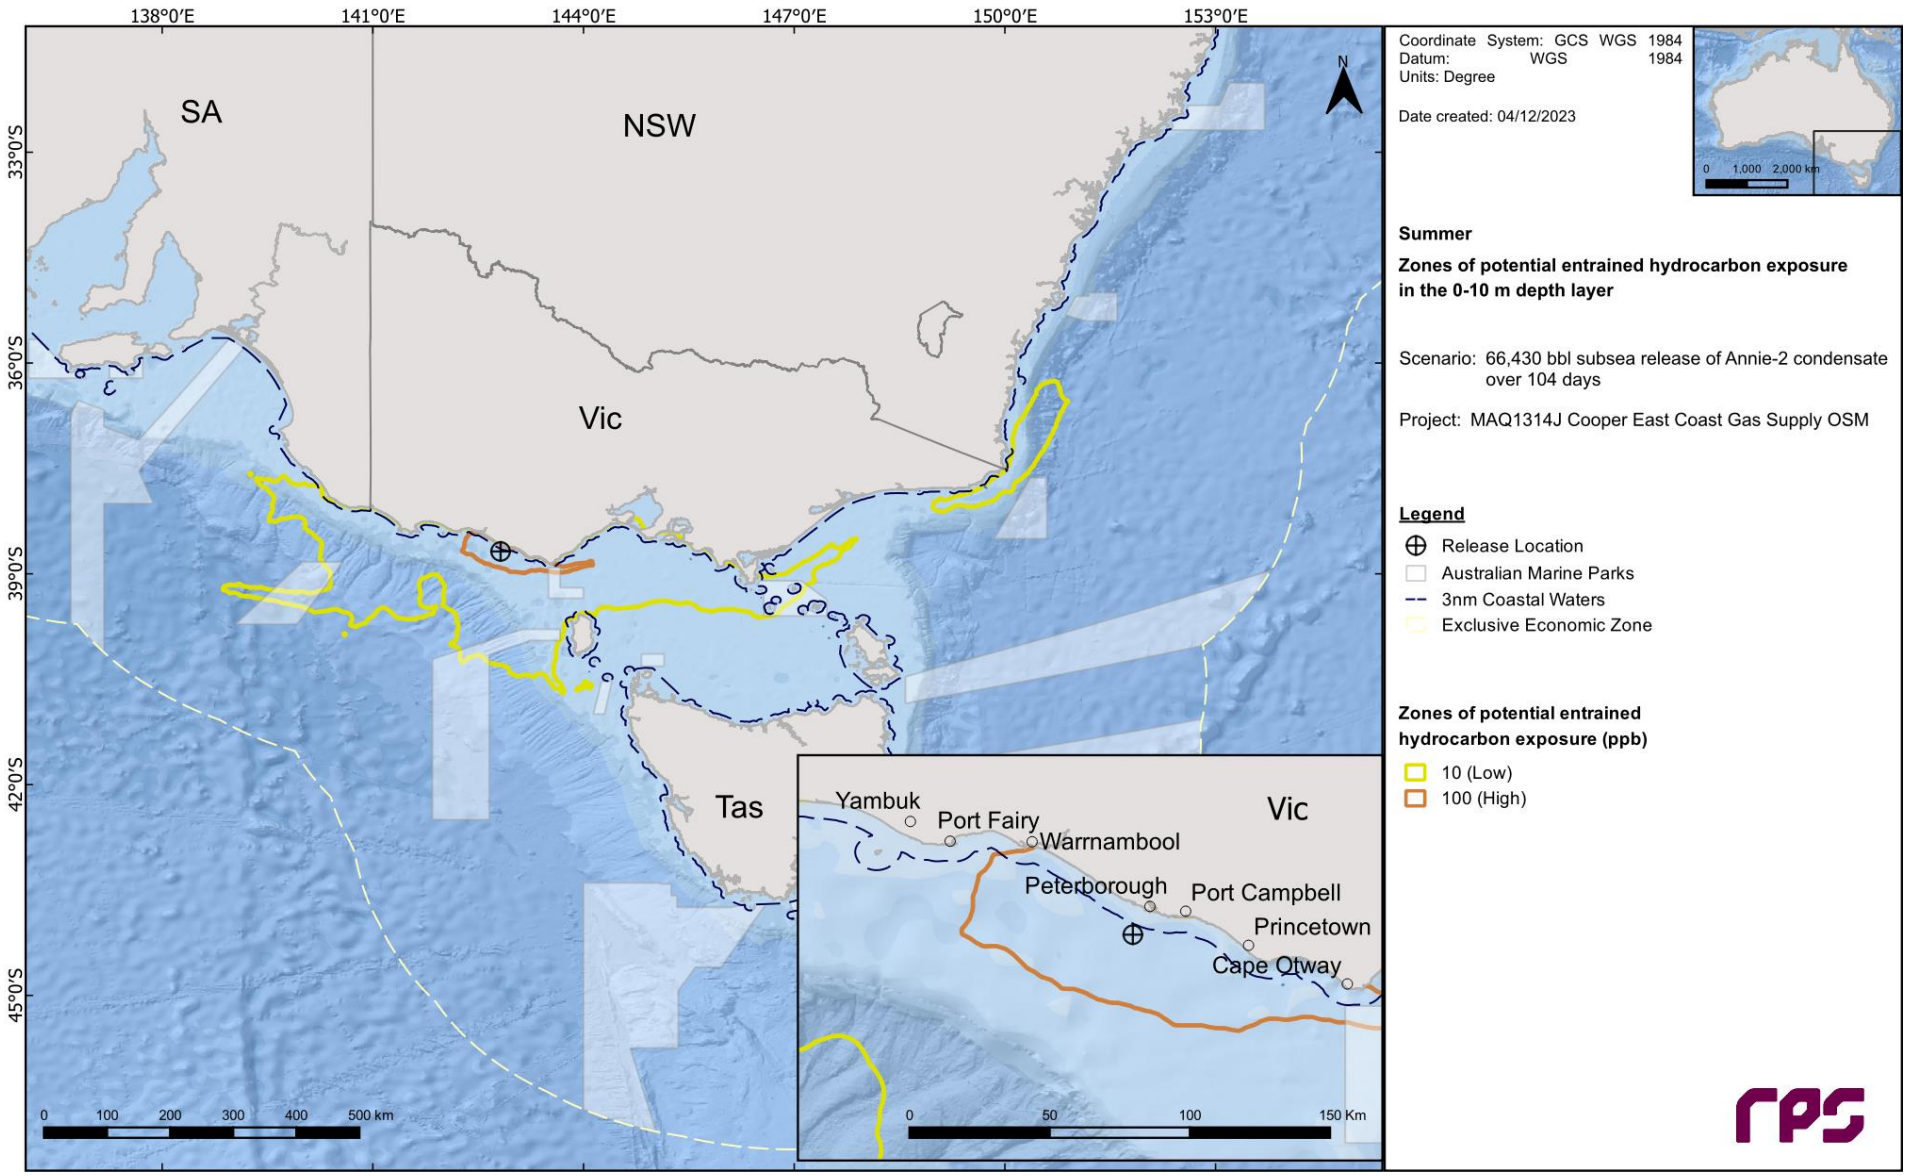

Figure 13.13 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

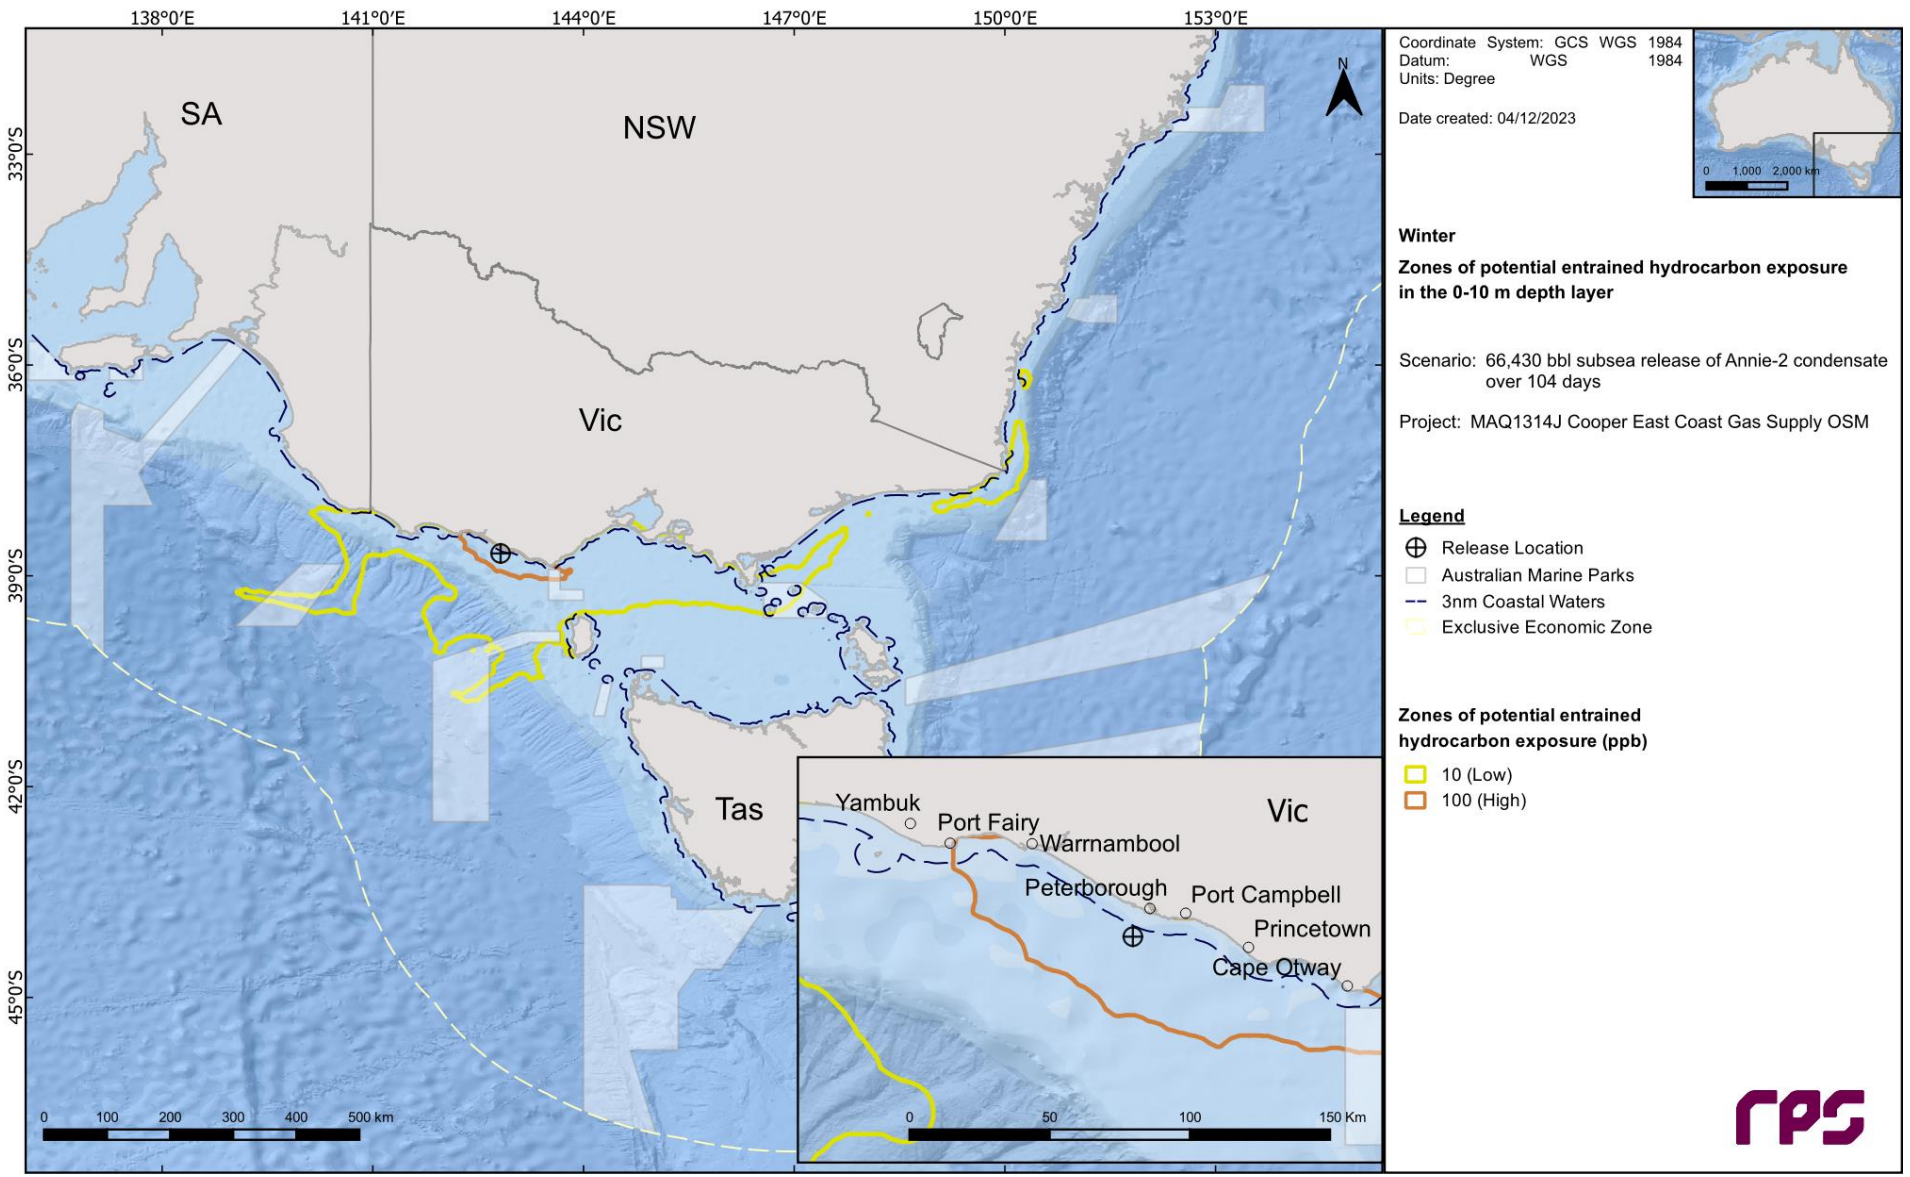

Figure 13.14 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

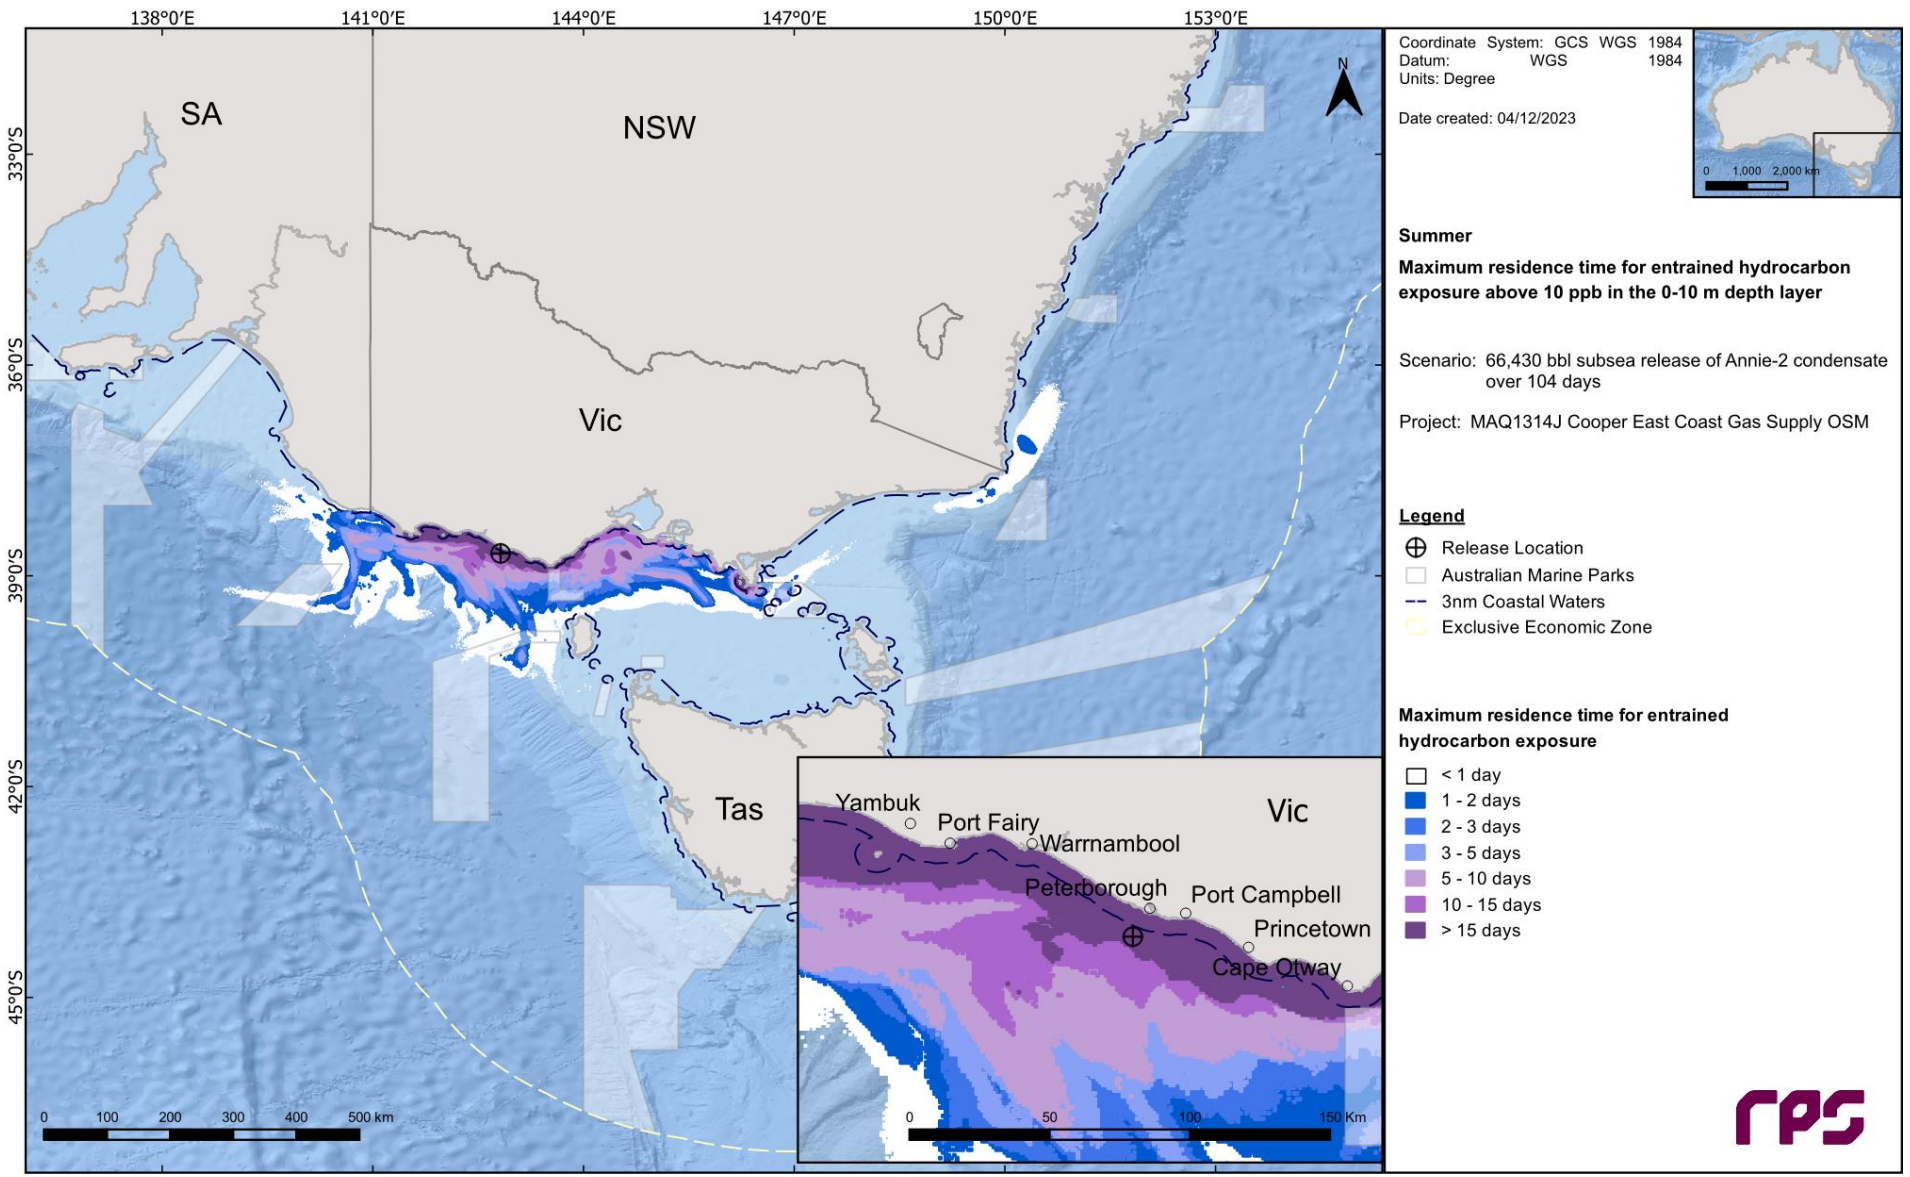

Figure 13.15 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

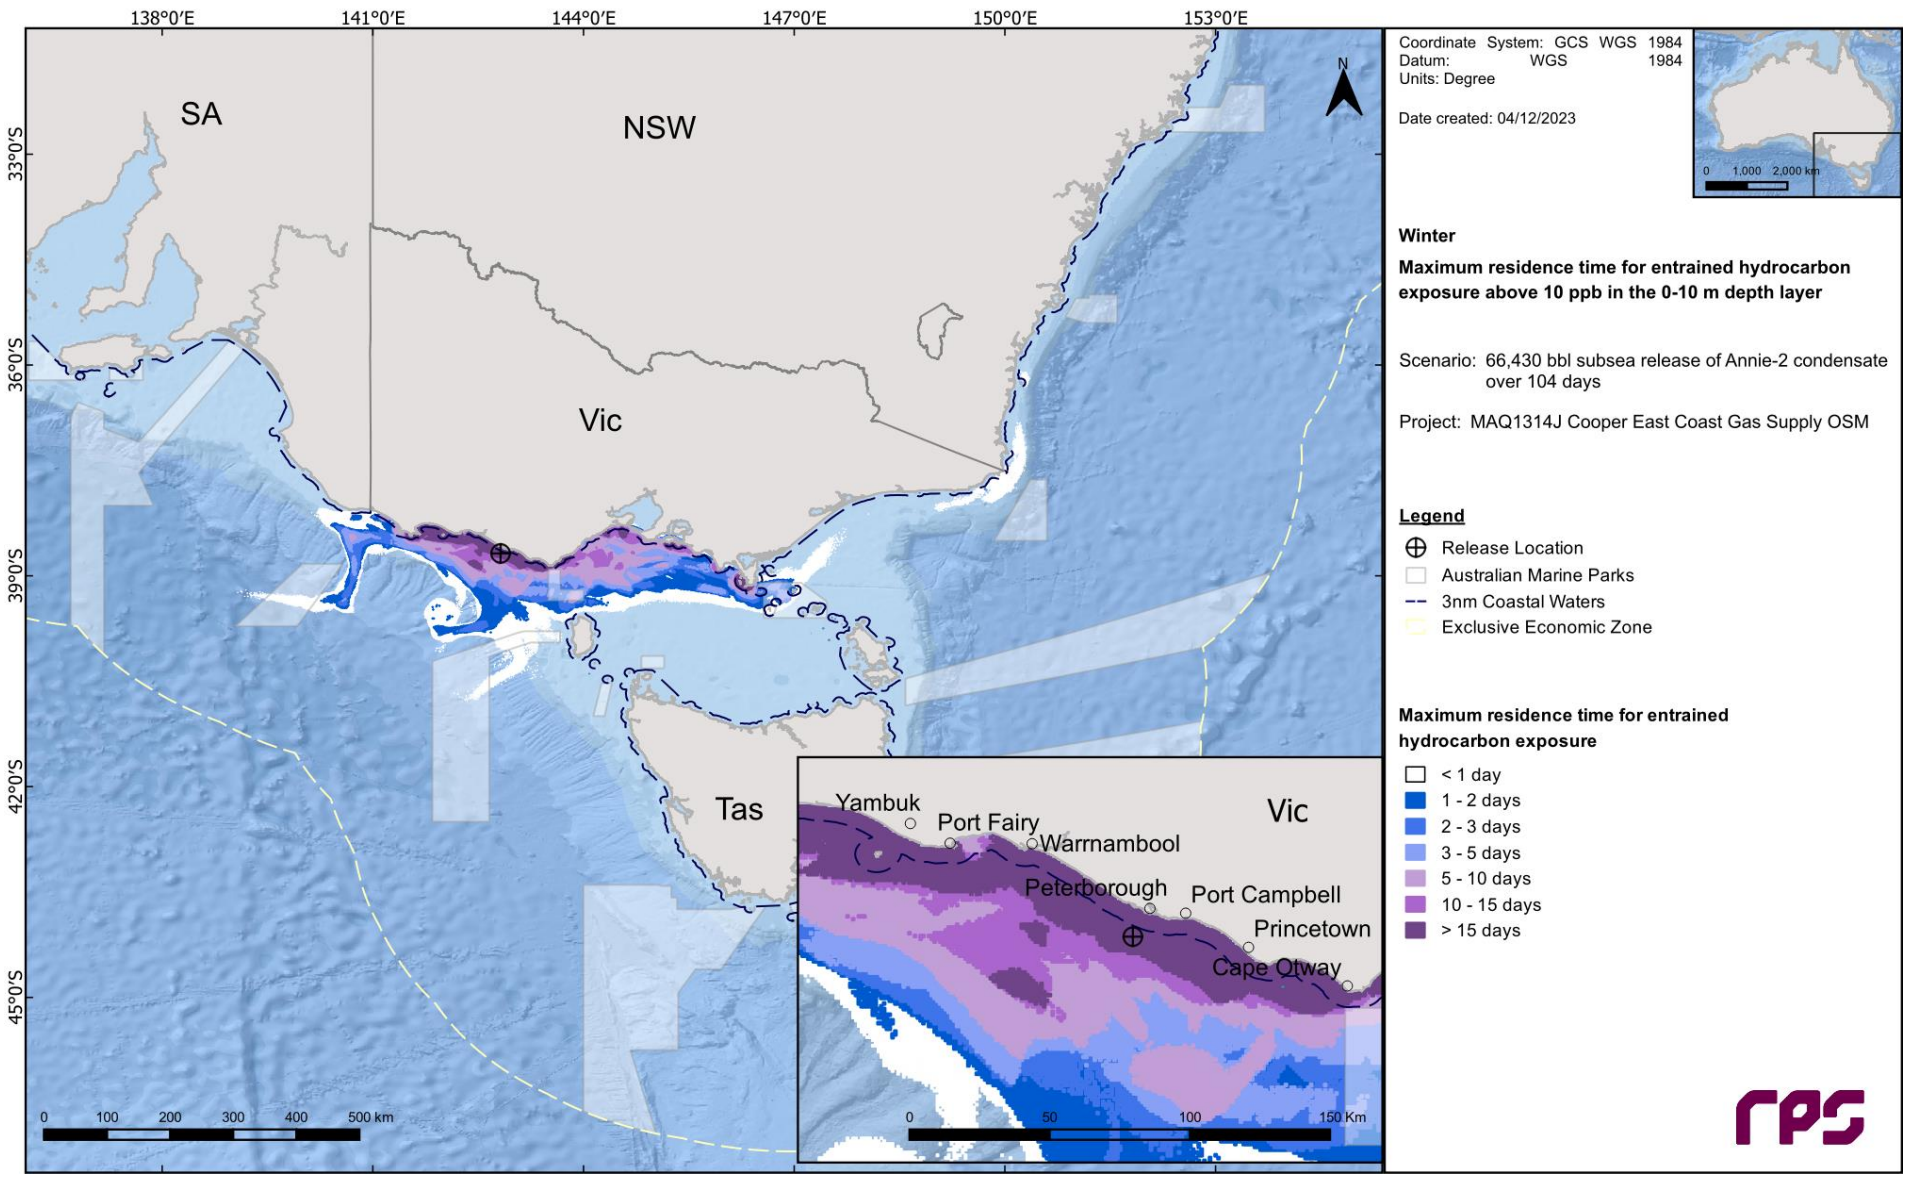

Figure 13.16 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea in the event of a 66,430 bbl subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

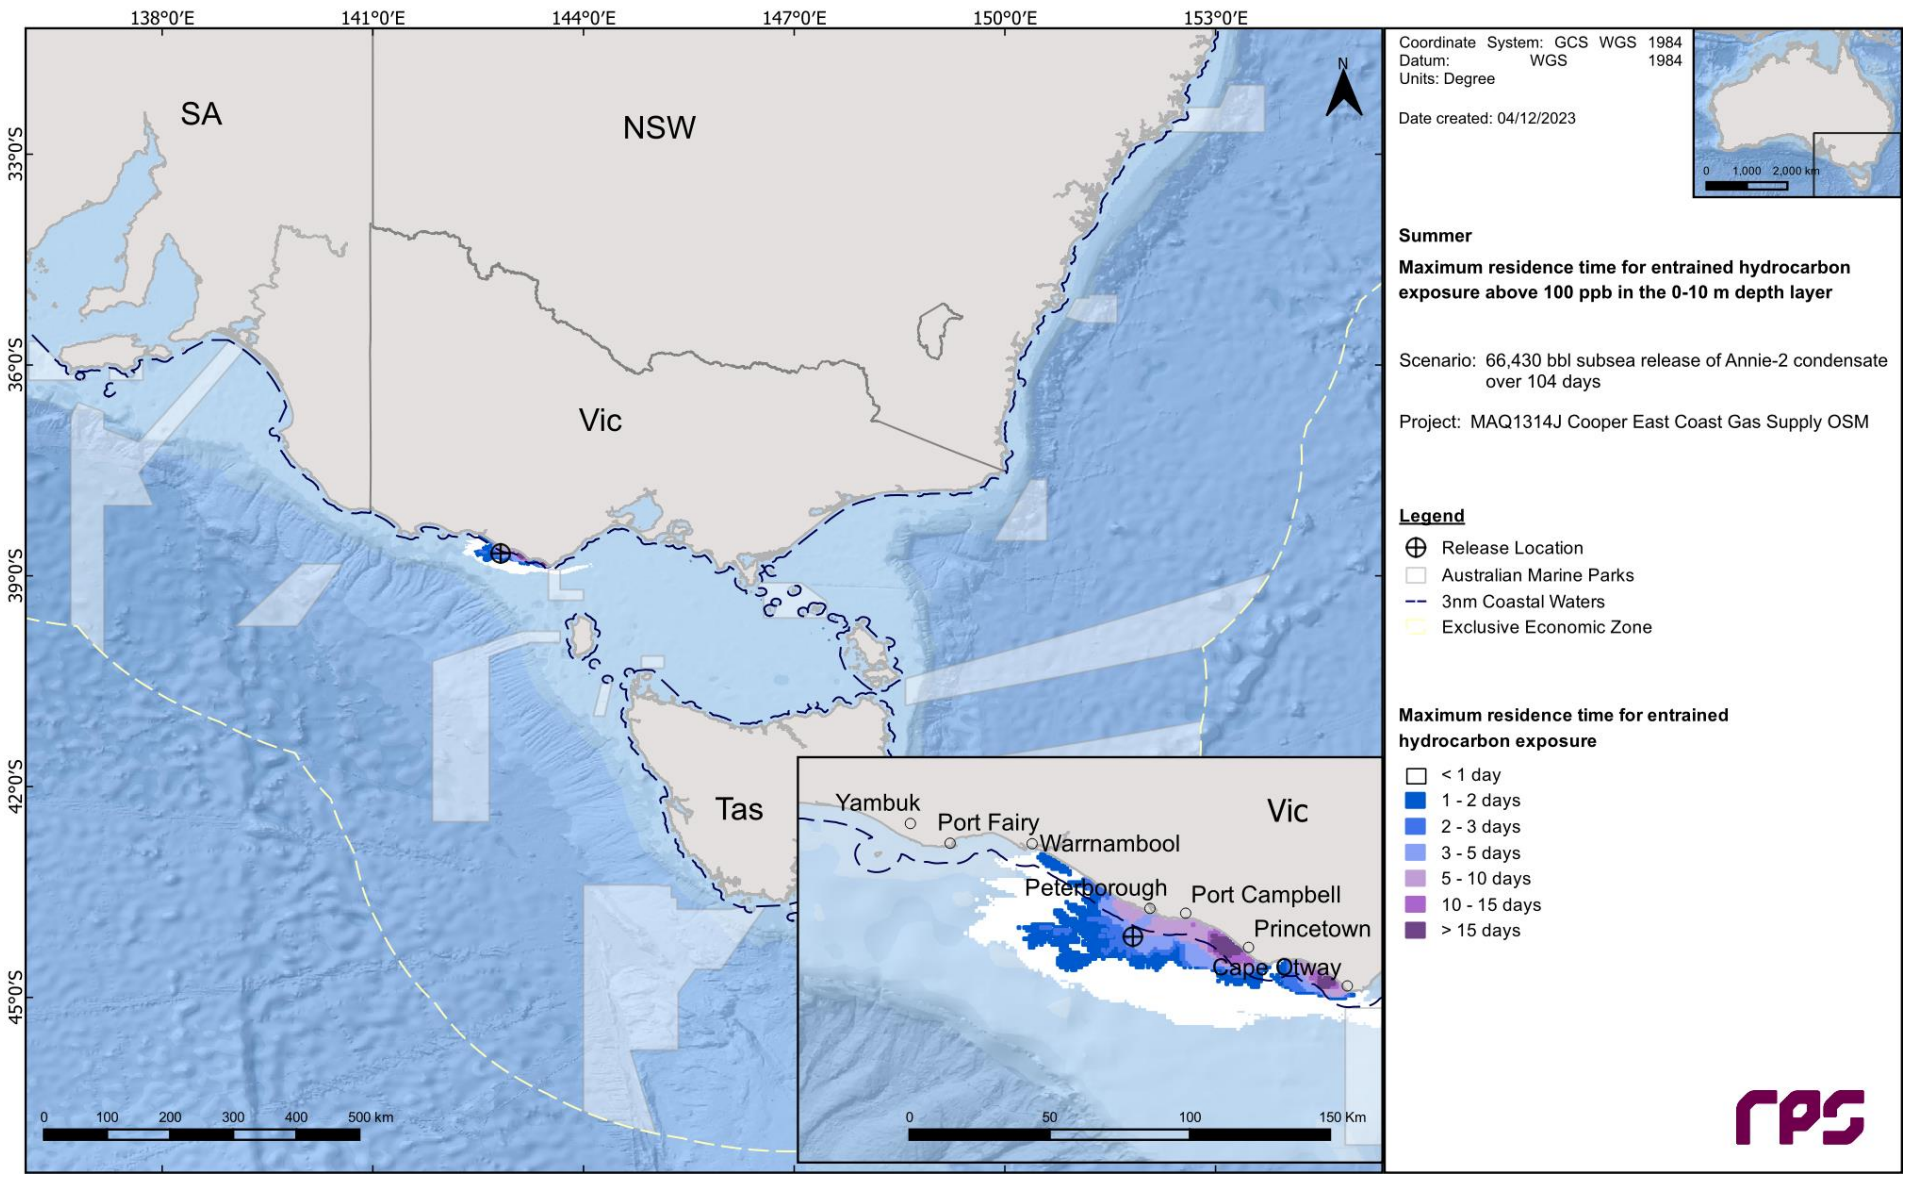

Figure 13.17 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea in the event of a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during summer conditions.

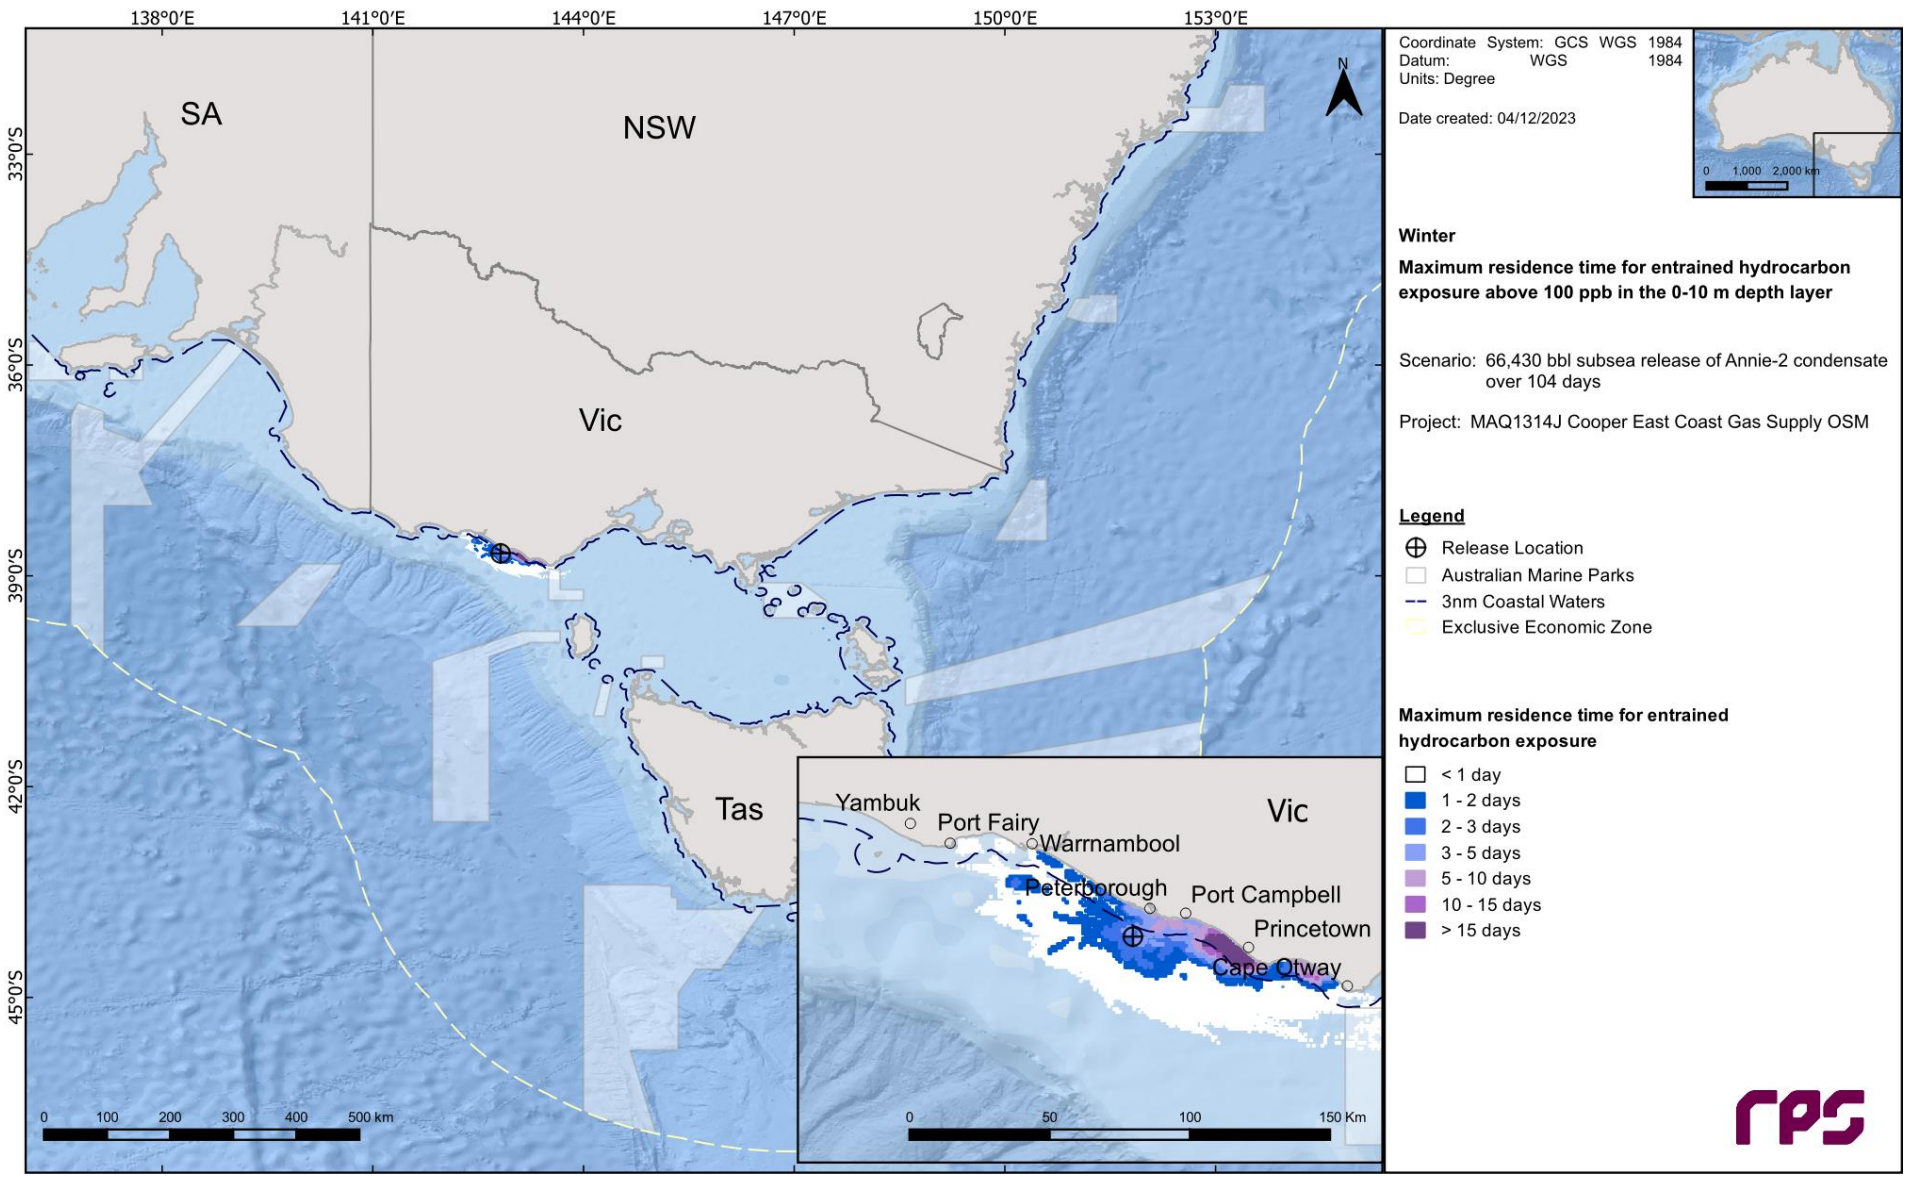

Figure 13.18 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea in the event of a 66,430 bbl (10,562 m^3) subsurface release from a loss of well control at Annie-2 over 104 days. The results were calculated from 100 spill simulations during winter conditions.

13.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2;
b. Largest (total) volume of oil ashore;
c. Longest length of shoreline with oil accumulation above 100 g/m^2; and
d. Largest area of entrained hydrocarbon exposure above 100 ppb.
e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

Note, no dissolved hydrocarbon concentrations above 50 ppb were predicted for this scenario.

Table 13.11 presents a summary of in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 13.11 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria				
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore	Longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Season		Winter	Winter	Winter	Winter	-
Run Number		61	88	88	77	-
Total area of floating Oil exposure (km²)	1 g/m²	291.7	190.4	190.4	251.6	-
	10 g/m²	**4.9**	0.8	0.8	0.8	-
	50 g/m²	-	-	-	-	-
Total length of shoreline accumulation (km)	10 g/m²	175	149	149	114	-
	100 g/m²	25	56	**56**	40	-
	1,000 g/m²	-	3	3	1	-
Minimum time before accumulation on any shoreline (hours)	10 g/m²	272	101	101	102	-
	100 g/m²	380	389	389	284	-
	1,000 g/m²	-	2,020	2,020	2,100	-
Total volume of oil ashore (m³)		125	**263**	263	154	-
Total area of entrained hydrocarbon exposure (km²)	10 ppb	28,379	17,526	17,526	17,586	-
	100 ppb	1,449	1,581	1,581	**2,295**	-
Total area of dissolved hydrocarbon exposure (km²)	10 ppb	11	29	29	20	-

	400 ppb	-	-	-	-	-
Start Date		28th May 2011	3rd July 2010	3rd July 2010	14th May 2013	-

NC = No contact at, or above the specified shoreline accumulation threshold.

13.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified during winter as run number 61, which started on 28th May 2011.

Figure 13.19 illustrates the floating oil exposure and shoreline accumulation over the 118-day simulation.

Figure 13.20 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 118-day simulation.

Figure 13.21 presents the fates and weathering graph for the corresponding single spill trajectory and Table 13.12 summarises the mass balance peaks and at the end of the simulation.

Table 13.12 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 118
Surface (m^3)	194.4	3.8	0.0
Entrained (m^3)	1451.7	95.2	1131.7
Dissolved (m^3)	4.5	14.5	0.2
Evaporation (m^3)	5695.9	118.0	5695.9
Decay (m^3)	2402.3	118.0	2402.3
Ashore (m^3)	126.3	113.4	125.1

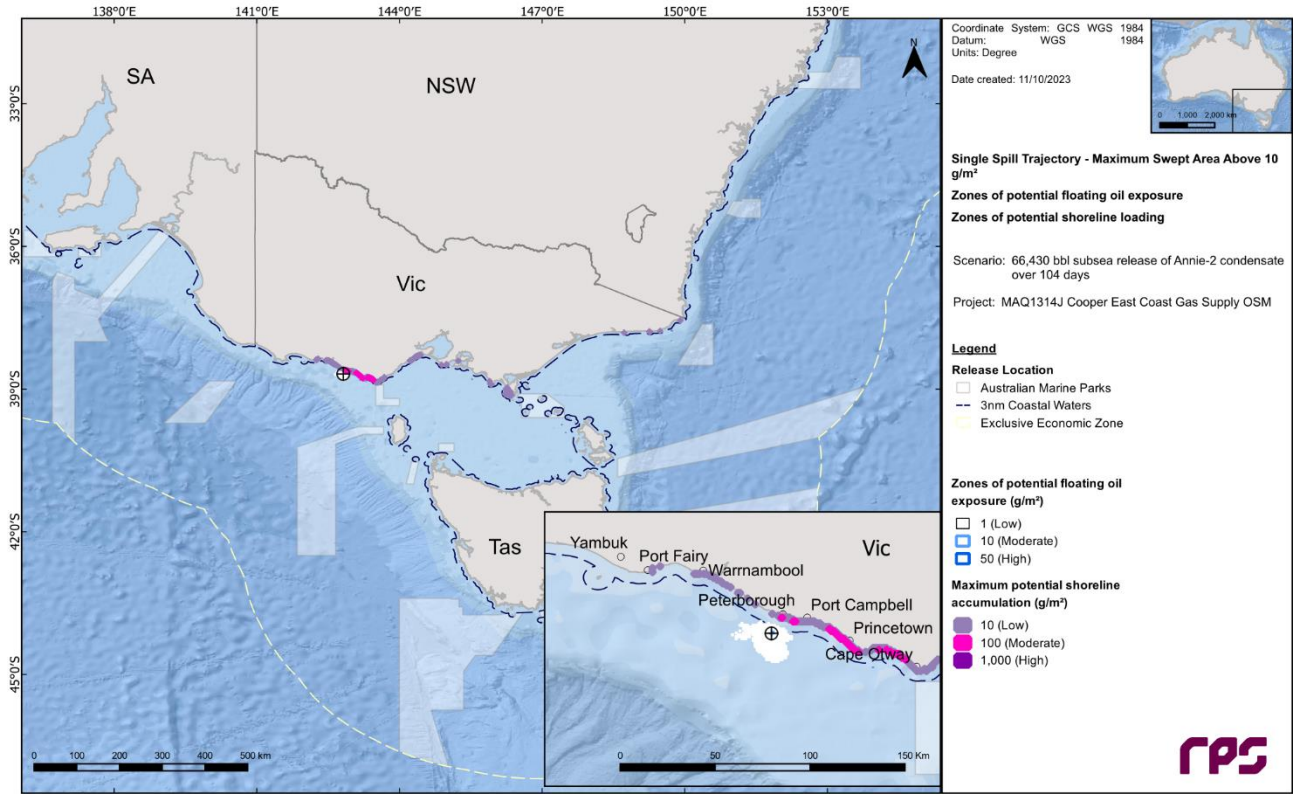

Figure 13.19 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the largest swept area of floating oil above 10 g/m^2.

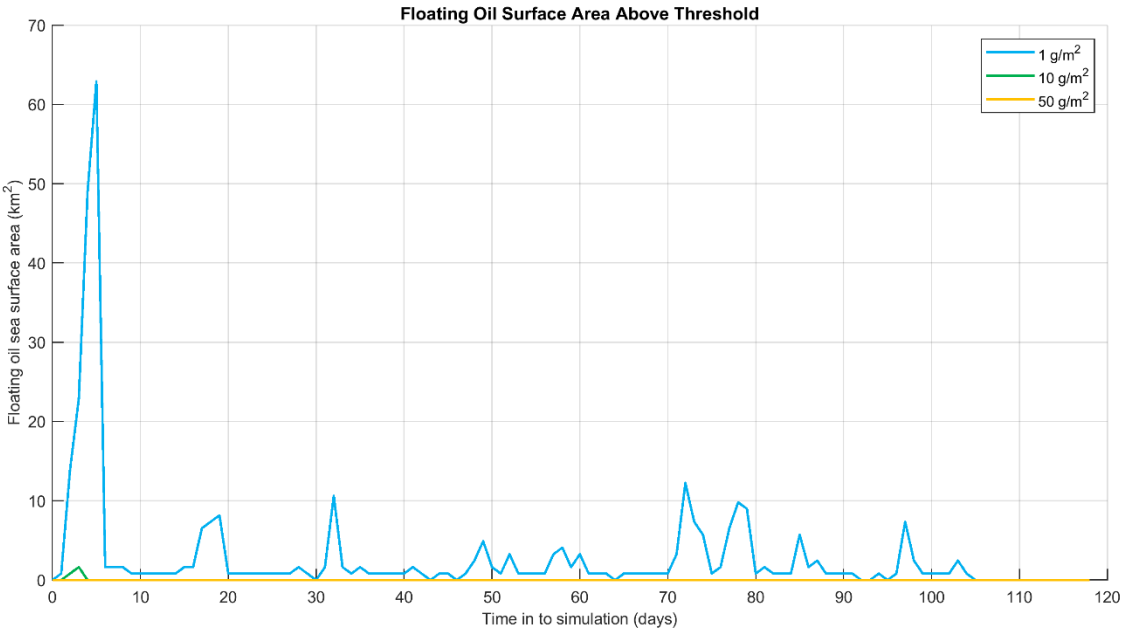

Figure 13.20 Time series of the sea surface exposure above each threshold for the trajectory with the largest swept area of floating oil above 10 g/m^2.

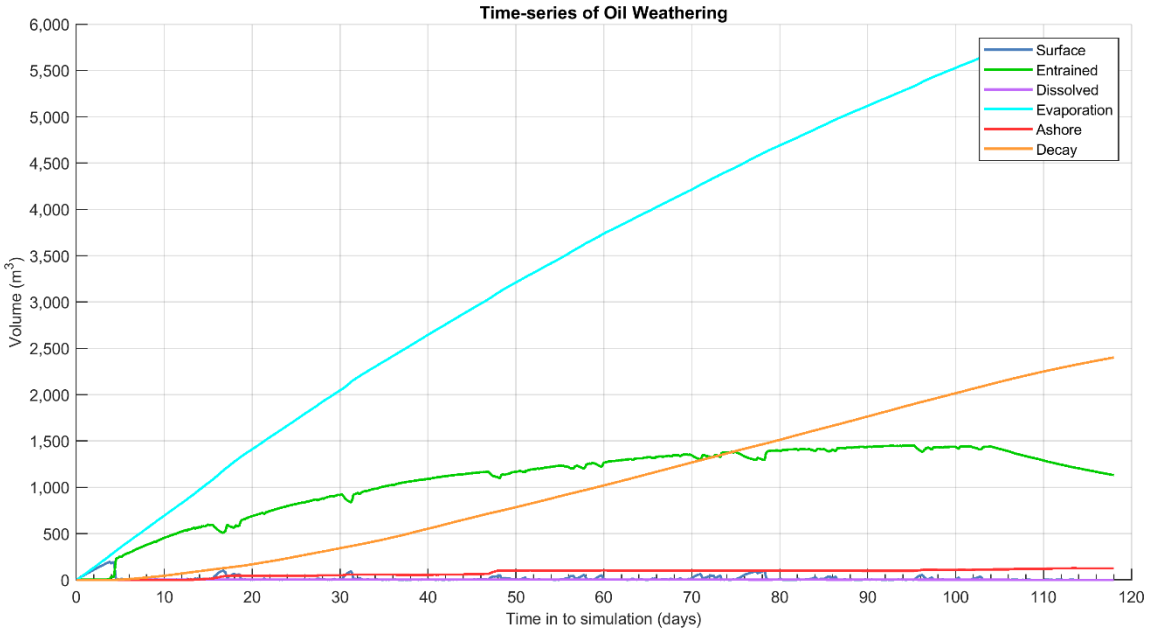

Figure 13.21 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 10 g/m^2.

13.2.2 Deterministic Case: Largest volume of oil ashore and longest length of shoreline with accumulation above 100 g/m^2

The deterministic trajectory that resulted in the largest volume of oil ashore and the longest length of shoreline with accumulation above 100 g/m^2 was identified during winter as run number 88, which started on 3rd July 2010.

Figure 13.22 illustrates the floating oil exposure and shoreline accumulation over the 118-day simulation.

Figure 13.23 displays the time series of the volume of oil accumulating on shorelines at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 118-day simulation.

Figure 13.24 presents the fates and weathering graph for the corresponding single spill trajectory and Table 13.13summarises the mass balance peaks and at the end of the simulation.

Table 13.13 Summary of the mass balance for the trajectory with the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 118
Surface (m^3)	137.4	5.2	0.3
Entrained (m^3)	1363.9	96.2	1057.9
Dissolved (m^3)	4.8	28.3	0.4
Evaporation (m^3)	5695.2	118.0	5695.2
Decay (m^3)	2338.5	118.0	2338.5
Ashore (m^3)	264.9	113.0	263.0

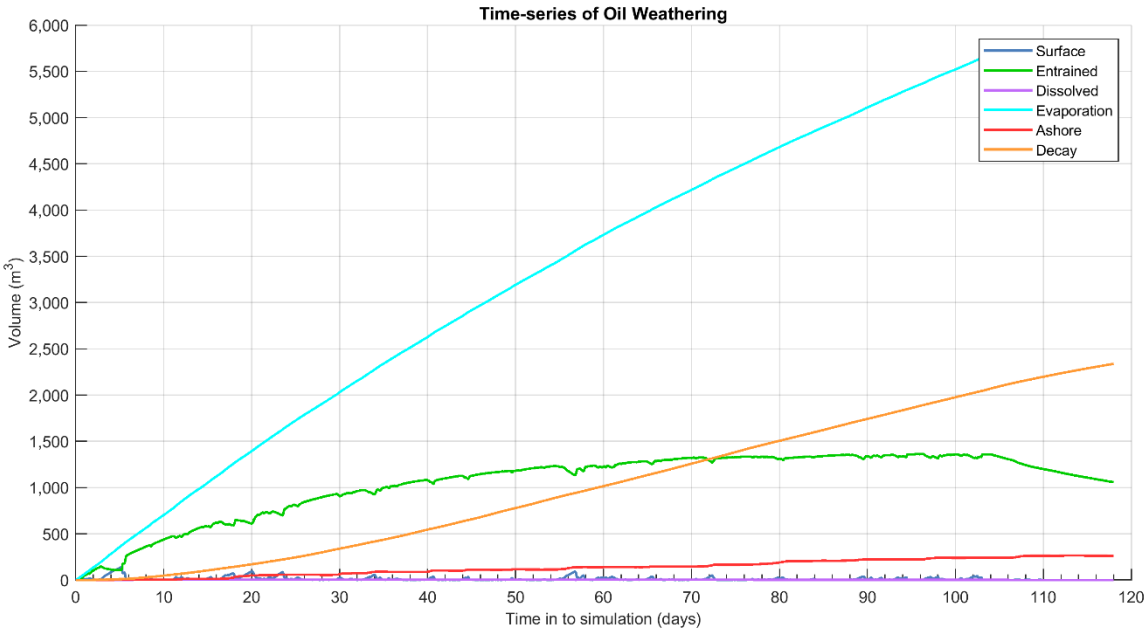

Figure 13.24 Predicted weathering and fates graph for the trajectory with the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m^2.

13.2.3 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified during winter as run number 77, which started on 14th May 2014.

Figure 13.25 illustrates the zones of potential entrained hydrocarbon exposure over the 118-day simulation.

Figure 13.26 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 118-day simulation.

Figure 13.27 presents the fates and weathering graph for the corresponding single spill trajectory and Table 13.14 summarises the mass balance peaks and at the end of the simulation.

Table 13.14 Summary of the mass balance for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 118
Surface (m^3)	169.6	21.9	0.1
Entrained (m^3)	1417.1	102.2	1120.2
Dissolved (m^3)	5.2	17.9	0.4
Evaporation (m^3)	5736.8	118.0	5736.8
Decay (m^3)	2344.2	118.0	2344.2
Ashore (m^3)	154.9	111.7	153.5

TERMS AND ABBREVIATIONS ..... **VII**

EXECUTIVE SUMMARY **1**
Background 1
Methodology 1
Oil Properties 1
Results 2
Scenario: 250 m³ loss of containment from a vessel collision 2

1 INTRODUCTION **3**
1.1 Background 3
1.2 What is Oil Spill Modelling? 5
1.2.1 Stochastic Modelling (Multiple Spill Simulations) 5
1.2.2 Deterministic Modelling (Single Spill Simulation) 6

2 SCOPE OF WORK **7**

3 REGIONAL CURRENTS **7**
3.1 Tidal currents 9
3.1.1 Grid Setup 9
3.1.2 Tidal Conditions 11
3.1.3 Surface Elevation Validation 11
3.2 Ocean Currents 15
3.3 Surface Currents 15

4 WIND DATA **18**

5 WATER TEMPERATURE AND SALINITY **22**

6 OIL SPILL MODEL – SIMAP **23**
6.1 Stochastic Modelling 23
6.2 Floating, Shoreline and In-Water Thresholds 23
6.2.1 Floating Oil Exposure Thresholds 24
6.2.2 Shoreline Accumulation Thresholds 25
6.2.3 In-water Exposure Thresholds 26

7 HYDROCARBON PROPERTIES **28**
7.1 Physical Properties 28
7.2 Weathering Properties 29
7.2.1 MDO 29

8 MODEL SETTINGS **31**

9 PRESENTATION AND INTERPRETATION OF MODEL RESULTS **32**
9.1 Annual Analysis 32
9.2 Deterministic Trajectories 32
9.3 Receptors Assessed 32

10 RESULTS – 250 M³ LOSS OF CONTAINMENT FROM A VESSEL COLLISION **45**
10.1 Stochastic Analysis 45
10.1.1 Area of Exposure 45
10.1.2 Floating Oil Exposure 47
10.1.3 Shoreline Accumulation 54
10.1.4 In-water exposure 57

Table 10.14 Summary of the mass balance for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days. 79
Table 10.15 Summary of the mass balance for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours. 81

Figures

Figure 1.1 Map of the Annie-2 release location. 4
Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability. 5
Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration. 6

Figure 10.28 Predicted weathering and fates graph for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days. 82

TERMS AND ABBREVIATIONS

AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ASTM	American Society for Testing and Materials
BIA	Biologically Important Area
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
CFSR	Climate Forecast System Reanalysis
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Deterministic oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as "deterministic modelling" provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of 'worst-case' oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IMCRA	Integrated marine and coastal regionalisation areas
IOA	Index of Agreement
ITOPF	International Tanker Owners Pollution Federation Limited
KEF	Key Ecological Feature
LGA	Local Government Areas
MAE	Mean Absolute Error
MAHs	Monoaromatic Hydrocarbons
MDO	Marine diesel oil
MNP	Marine National Park
MP	Marine Park

MS	Marine Sanctuary
NASA	National Aeronautics and Space Administration (USA)
NCEP	National Centres for Environmental Prediction (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park
NR	Nature Reserve
PAH	Polynuclear Aromatic Hydrocarbons
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
ppb	Parts per billion (concentration)
psu	Practical salinity units
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RSB	Reefs, Shoals and Banks
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
SRTM	Shuttle Radar Topography Mission
State Waters	Low water mark seaward for three nautical miles
STB	Standard Barrel
Stochastic oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the area of hydrocarbon exposure and indicates which locations are more likely to be exposed (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be exposed in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment
Sub-LGA	Sub-Local Government Areas
TOPEX/Poseidon	A joint satellite mission between NASA and CNES to map ocean surface topography using an array of satellites equipped with detailed altimeters
US EPA	United States Environmental Protection Agency
US CG	United States Coast Guard
World Ocean Atlas	A collection of physicochemical parameters (e.g. temperature, salinity, oxygen, phosphate, silicate, and nitrate) based on profile data from the World Ocean Database (NCEI, 2021) established by NOAA's National Centers for Environmental Information (NCEI)
WGS 1984	World Geodetic System 1984 (WGS84); reference coordinate system

EXECUTIVE SUMMARY

Background

Cooper Energy (Cooper) plans to drill and operate the Annie-2 well in the Otway Basin (Figure 1.1).

In order to inform the offshore environmental impact and risk assessments Cooper commissioned RPS to conduct a detailed oil spill modelling study assessing a 250 m^3 surface release of marine diesel oil over 6 hours following a vessel collision.

The modelling assessment was undertaken on an annual basis.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a ten-year wind and current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 randomly selected single trajectory simulations per scenario, with each simulation having the same spill information (location, spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions

The SIMAP system, the methods and analysis presented herein, use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Oil Properties

The marine diesel oil (MDO) used for the scenario has an API of 24 and a density of 890 kg/m^3 (at 25 ºC) with a viscosity value (14.0 cP at 25 ºC) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The MDO is a mixture of volatile and persistent hydrocarbons with high proportions of semi- and low-volatile components. In favourable evaporation conditions, about 4.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C), a further 32% should evaporate within the first 24 hours (180°C < BP < 265°C) and a further 54% should evaporate over several days (265°C < BP < 380°C). Approximately 10% of the oil is shown to be persistent.

Results

Scenario: 250 m³ loss of containment from a vessel collision

- The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) floating oil exposure zones was 32.5 km (west), 10.3 km (west) and 2.8 km (east-southeast), respectively.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 60%. The minimum time before oil accumulation at, or above, the low threshold was 22 hours whilst the maximum total volume ashore for a single spill trajectory was 43.2 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 32 km, 11 km and 1 km, respectively.
- Excluding the 13 BIAs that the release location resides within, the highest probability of low dissolved hydrocarbon exposure ranged between 1% (Short-tailed Shearwater - Foraging) and 2% (Southern Right Whale - Aggregation).
- The highest probability of low entrained hydrocarbon exposure was recorded for the Twelve Apostles MNP (65%) and Short-tailed Shearwater – Foraging BIA (64%). Additional receptors including LGAs, sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure.

1 INTRODUCTION

1.1 Background

Cooper Energy (Cooper) plans to drill and operate the Annie-2 well in the Otway Basin (Figure 1.1).

In order to inform the offshore environmental impact and risk assessments Cooper commissioned RPS to conduct a detailed oil spill modelling study assessing a 250 m^3 surface release of marine diesel oil over 6 hours following a vessel collision.

The modelling assessment was undertaken on an annual basis.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein uses modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Table 1-1 Coordinates of the release location.

Infrastructure	Latitude	Longitude	Water Depth (m)
Annie-2	38.68375° S	142.82456° E	36

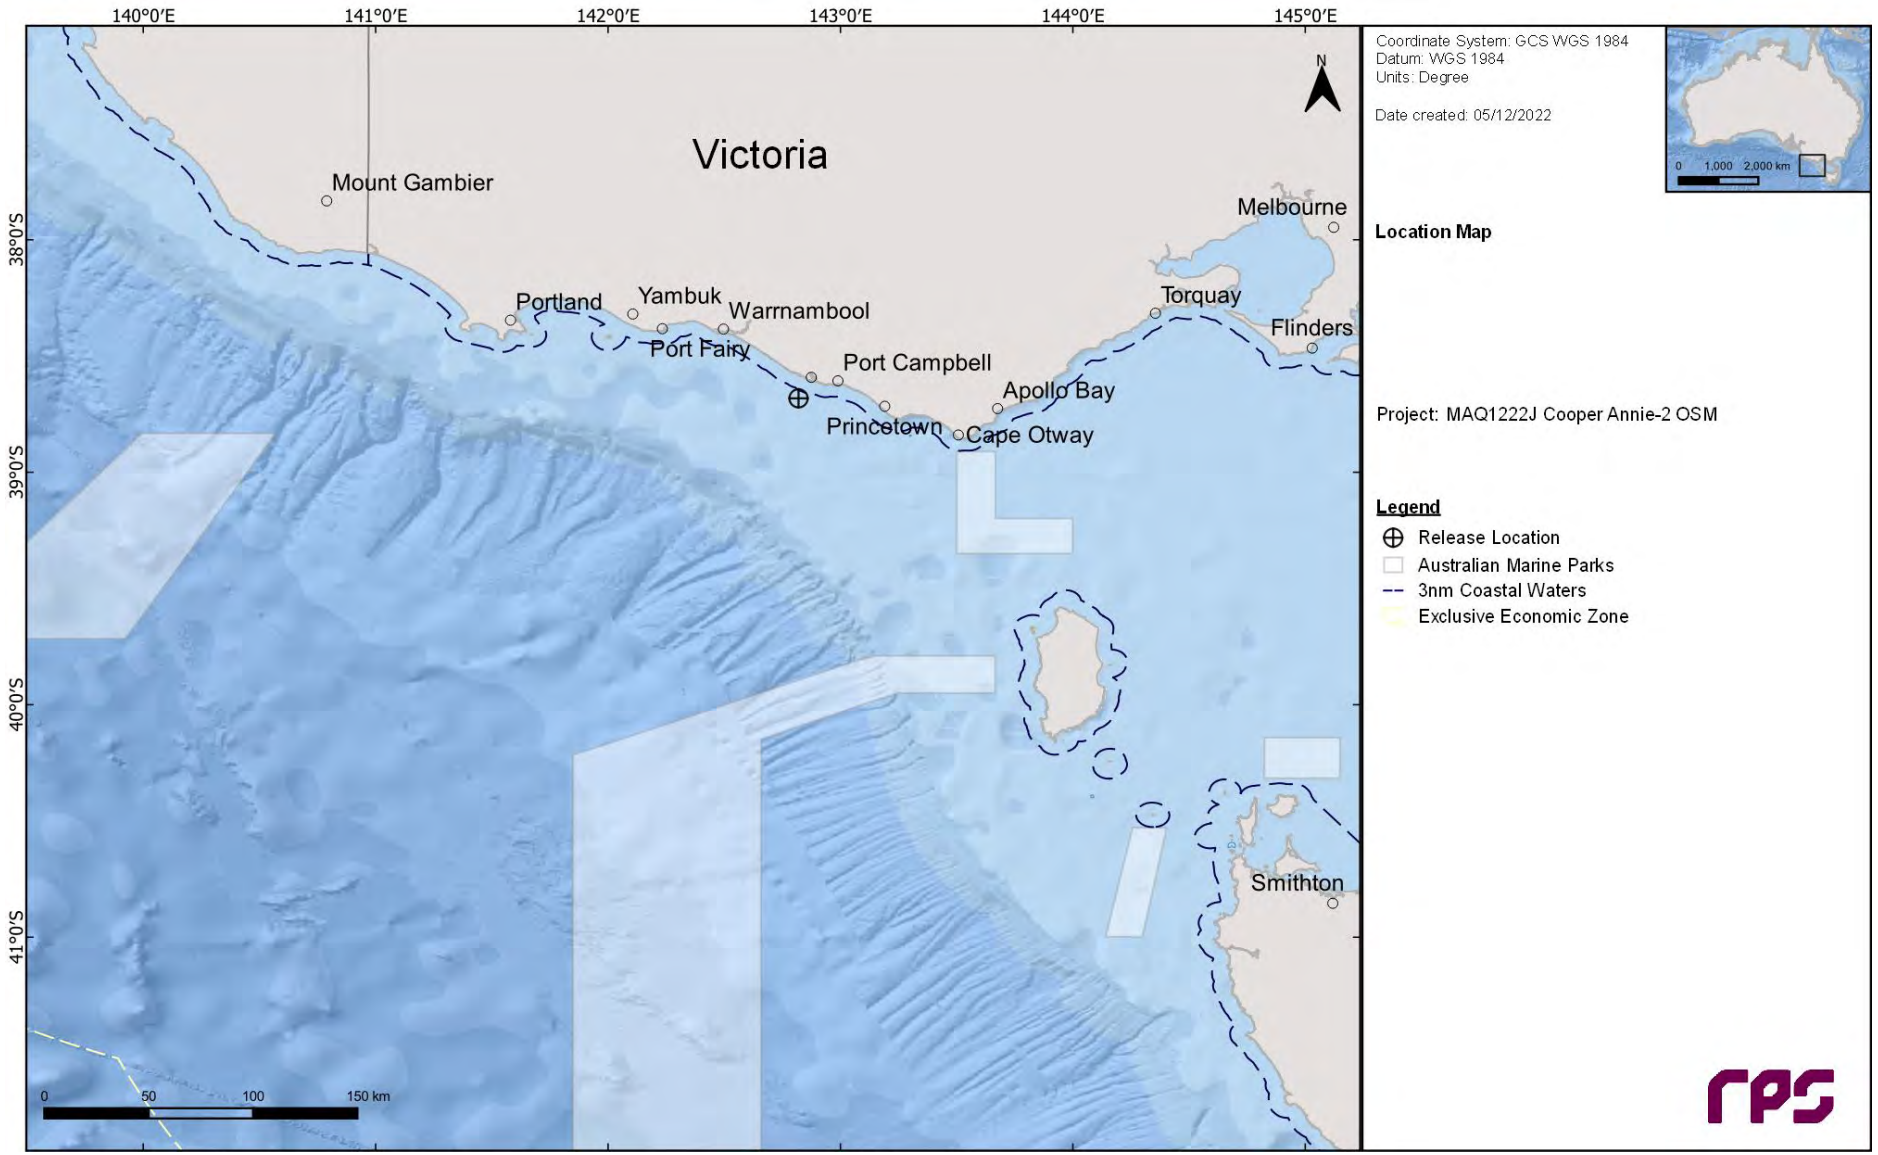

Figure 1.1 Map of the Annie-2 release location.

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

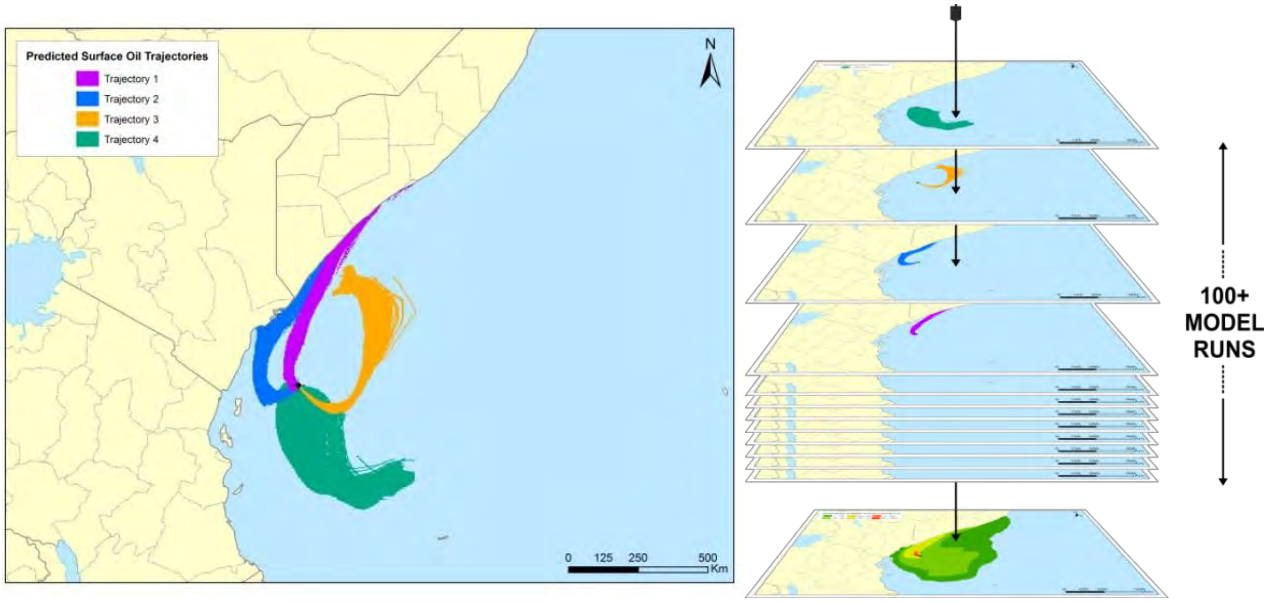

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore, longest length of shoreline contacted by oil or largest area of entrained or dissolved hydrocarbons.

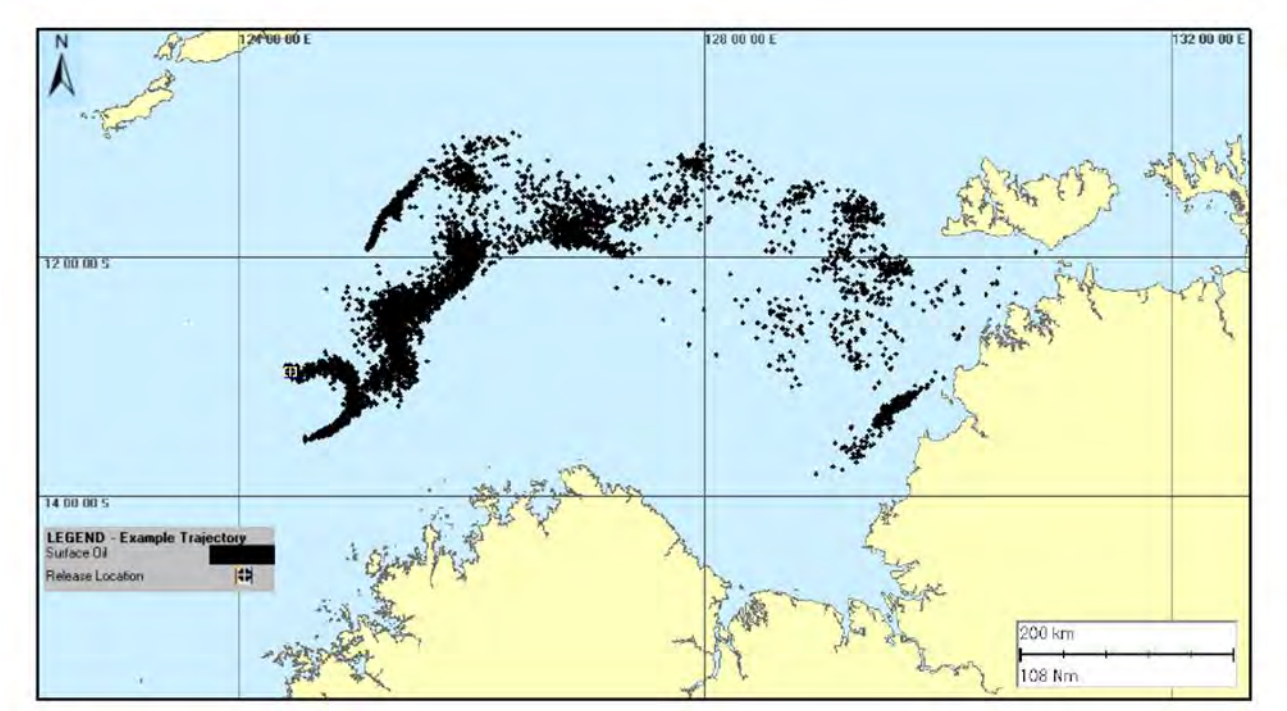

Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10 years of winds and three-dimensional currents from 2010 to 2019 (inclusive). The currents included the combined influence of tidal and ocean currents.
- Include the wind and current data and characteristics of the MDO as input into the three-dimensional oil spill model (SIMAP), to model the movement, spreading, weathering and shoreline contact by hydrocarbons over time.
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surround waters and shorelines. This involved running 100 randomly selected single trajectory simulations for the scenario, with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.
- Results were assessed to determine the exposure to surrounding waters and contact to shorelines based upon the thresholds outlined in the NOPSEMA Oil Spill Modelling Bulletin (NOPSEMA 2019).
- The stochastic modelling results were reviewed, and the "worst case" deterministic runs were identified and presented based on the following criteria (if applicable):
    a. Largest swept area for surface oil above 10 g/m^2
    b. Largest swept area for surface oil above 50 g/m^2
    c. Largest volume of oil ashore
    d. Longest length of shoreline with oil accumulation above 100 g/m^2
    e. Largest area of entrained hydrocarbon exposure above 100 ppb
    f. Largest area of dissolved hydrocarbon exposure above 50 ppb

3 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3.1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.

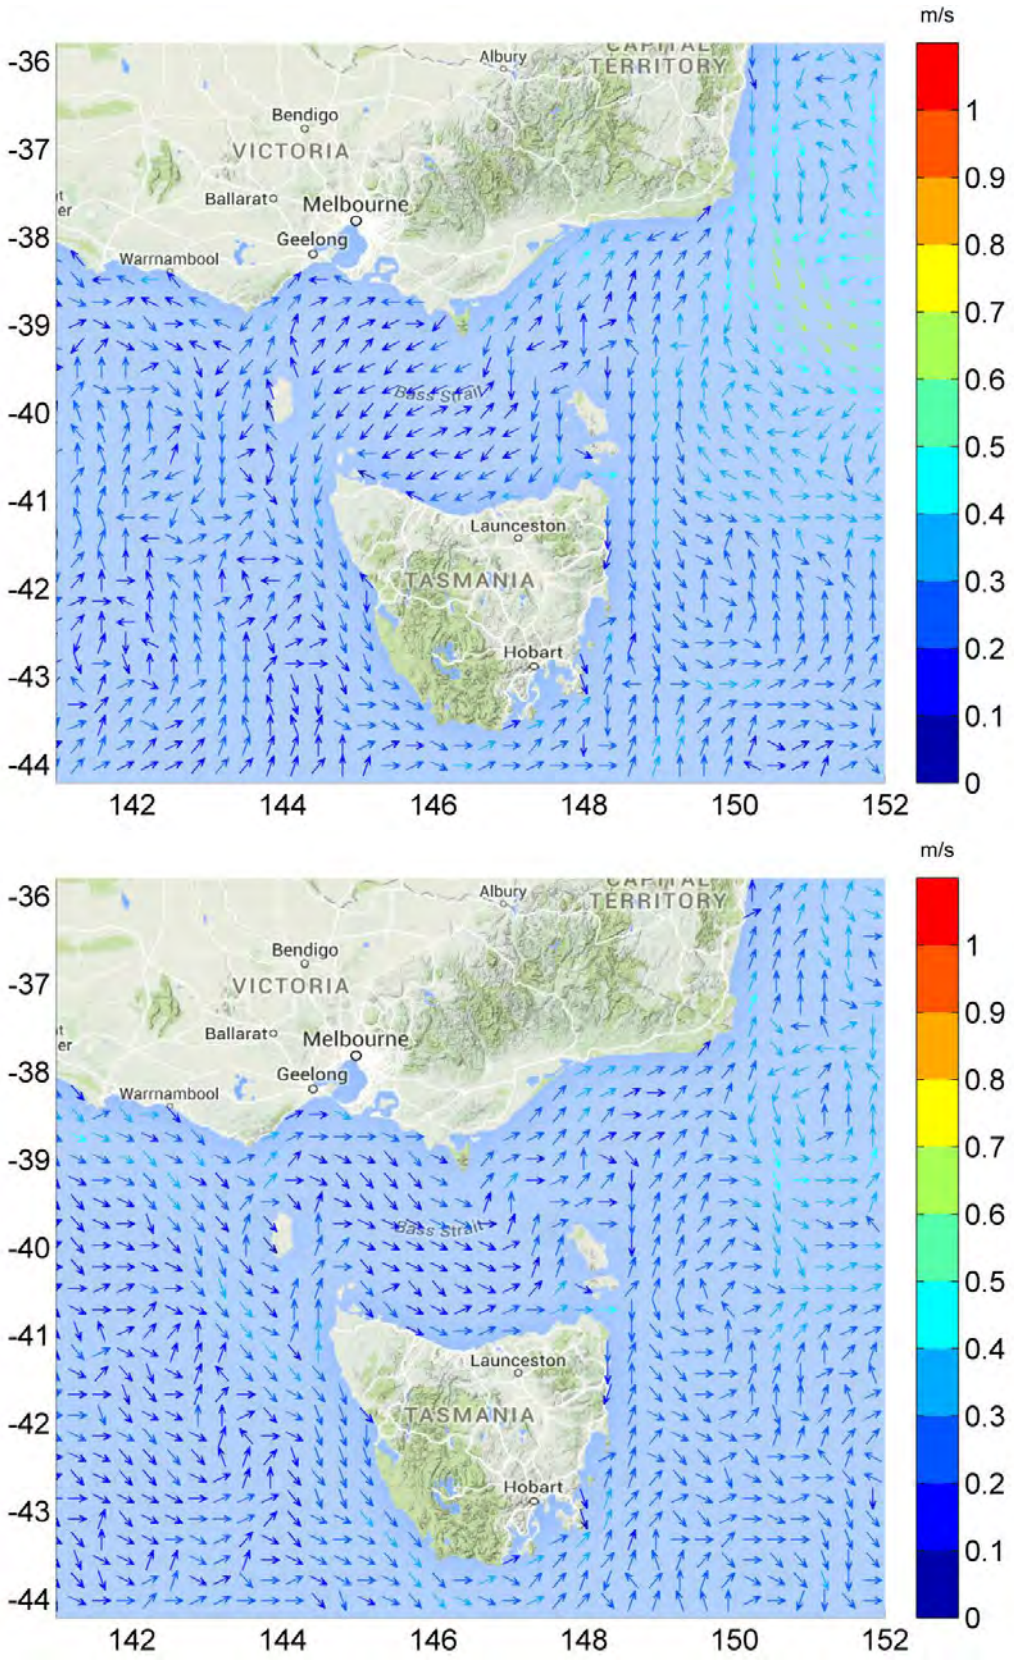

Figure 3.1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).

3.1 Tidal currents

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for more than 30 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

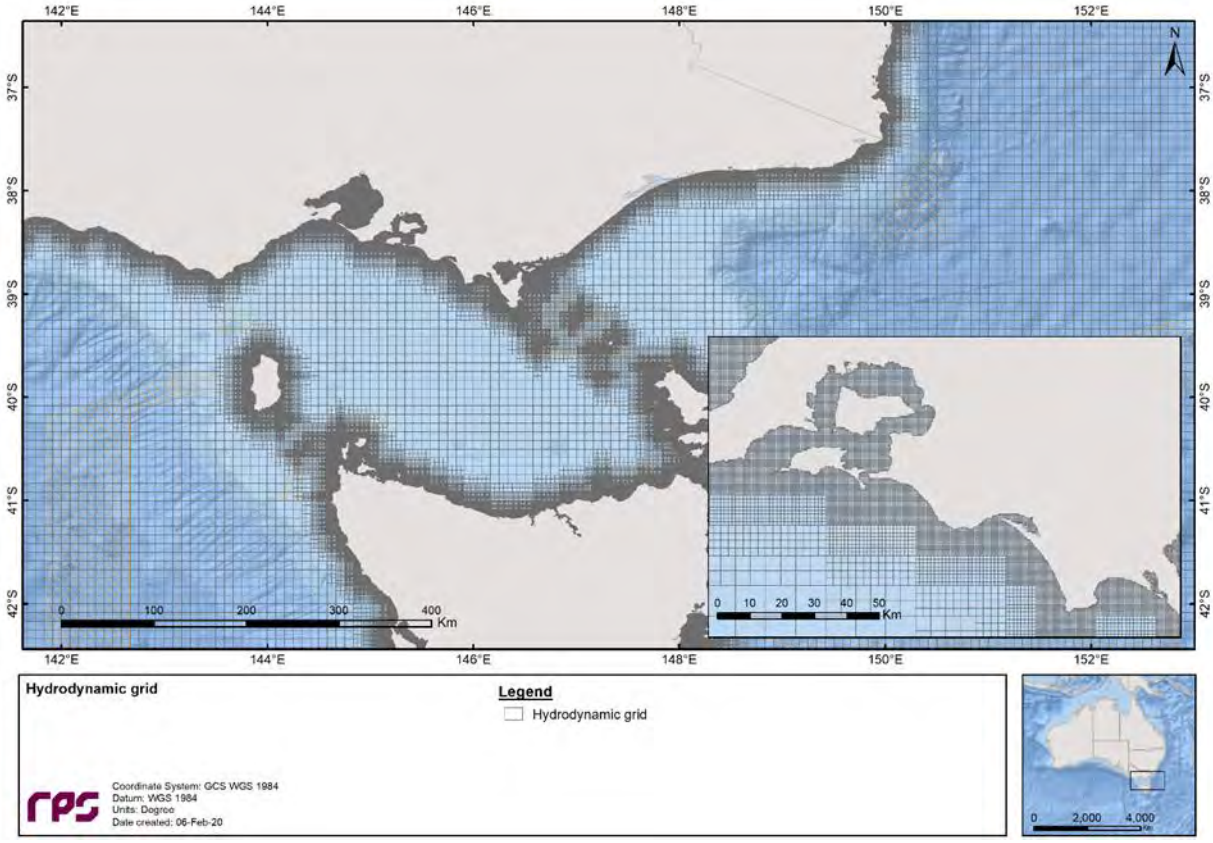

Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

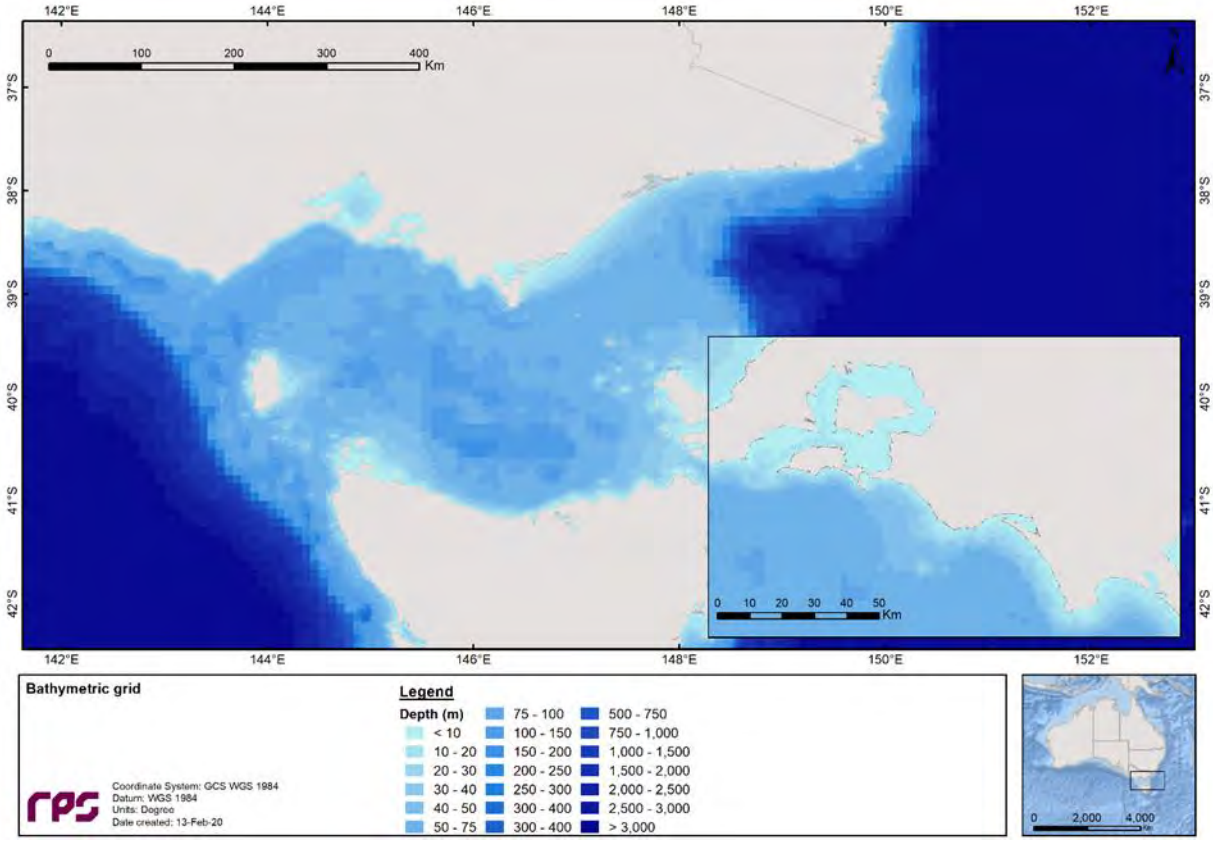

Figure 3.3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex/Poseidon tidal data has been widely used amongst the oceanographic community, being refereced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

P_i = Model predicted surface elevation

O_i = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: X_{model} = Model predicted surface elevation

X_{obs} = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3.5 and Figure 3.6 illustrate a comparison of the predicted and observed surface elevations in February 2014. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3-1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3-1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Gabo Island	0.98	0.08
Port MacDonnell	0.98	0.05
Port Welshpool	0.92	0.30
Portland	0.97	0.07
Stack Island	0.96	0.22

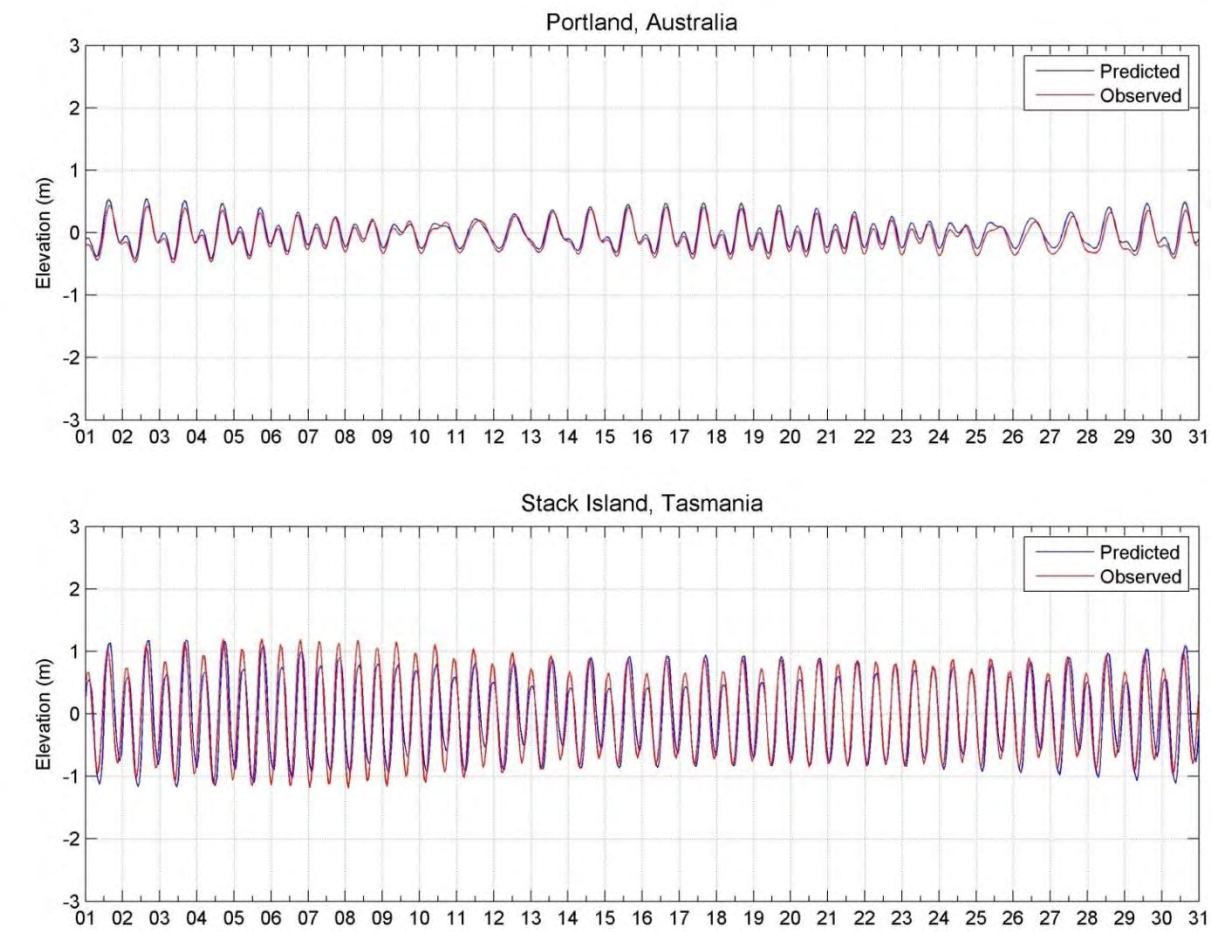

Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).

3.2 Ocean Currents

Data describing the flow of ocean currents for the years 2010 to 2019 (inclusive) was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of once per day. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

3.3 Surface Currents

Table 3-2 presents the average and maximum net surface current speeds nearby the release location by combining the ocean and tidal currents. Current speeds varied throughout the year with maximum current speeds ranging between approximately 0.72 m/s (February) and 1.10 m/s (September). The dominant surface current directions throughout the year were identified as (towards) the west during summer months and east during the winter months.

Figure 3.7 and Figure 3.8 show the monthly and total surface current rose distributions for the selected location.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3-2 Predicted monthly average and maximum surface current speeds for the selected location. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.17	0.77	West
February	0.19	0.72	West
March	0.18	0.92	West
April	0.15	0.83	East and West
May	0.19	0.90	East
June	0.19	1.07	East
July	0.24	1.07	East
August	0.23	1.05	East
September	0.20	1.10	East
October	0.19	0.88	East
November	0.18	0.82	East and West
December	0.18	0.92	East and West
Minimum	**0.15**	**0.72**	
Maximum	**0.24**	**1.10**	

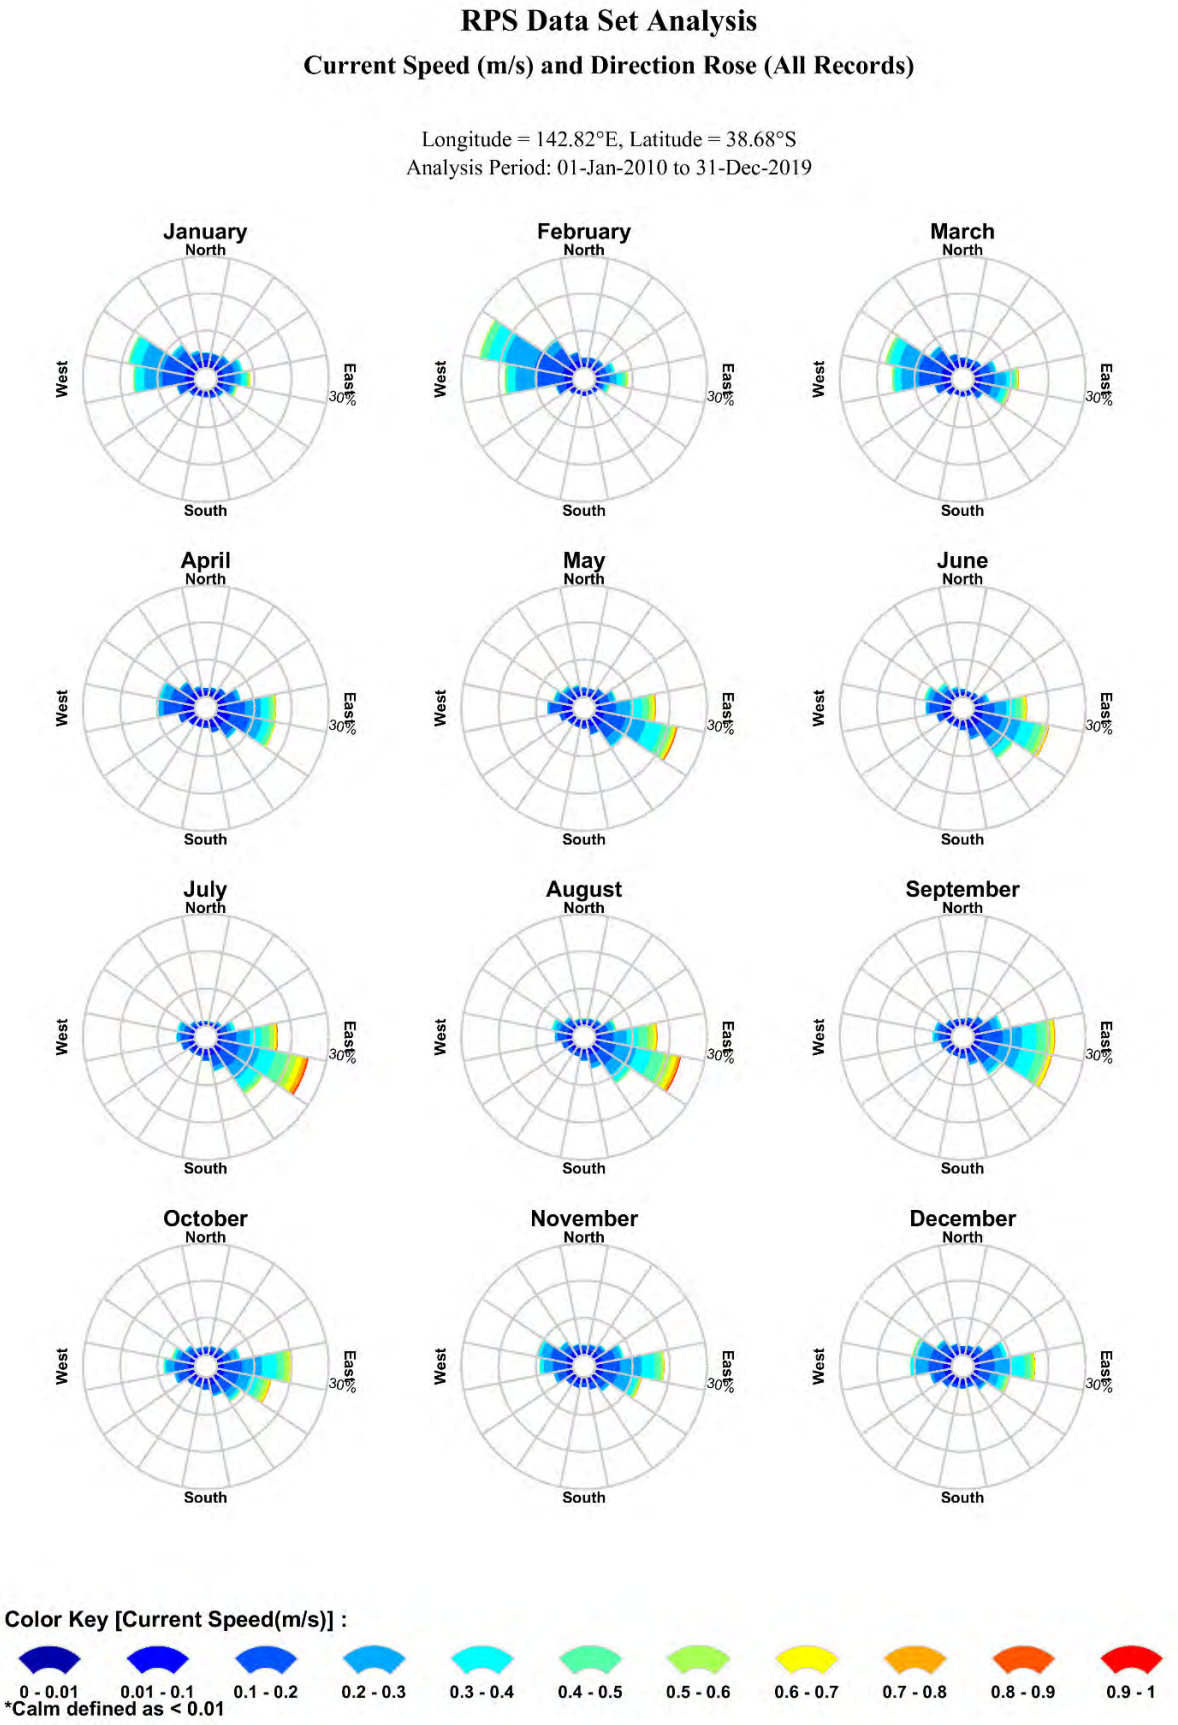

Figure 3.7 Monthly surface current rose plots nearby the release location (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2010–2019 (inclusive).

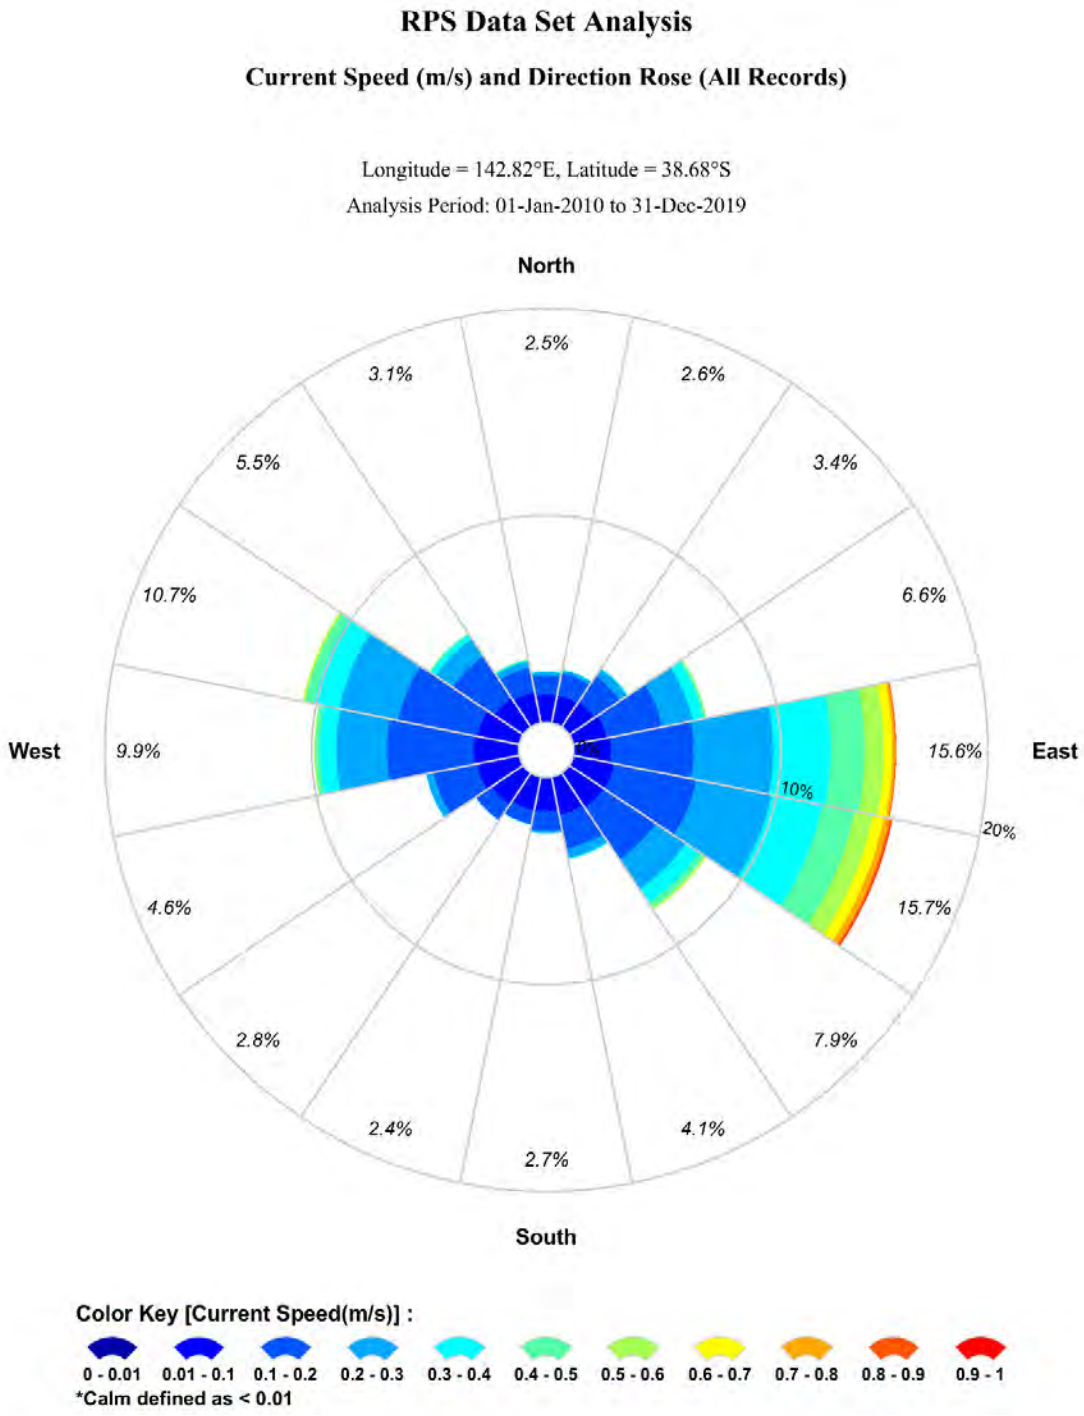

Figure 3.8 Total surface current rose plot nearby the release location (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2010–2019 (inclusive).

4 WIND DATA

High resolution wind data for the years 2010 to 2019 (inclusive) was sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals. Figure 4.1 shows the spatial resolution of the wind field used as input into the oil spill model.

Table 4-1 presents the monthly average and maximum winds derived from a CFSR wind node nearby the release location. The wind data demonstrated average monthly wind speeds ranging from 10 knots during summer to 13 knots during winter, with maximums ranging between 30 knots (January and November) and 42 knots (June). The dominant wind direction throughout the year ranged from the southeast in summer, through the westerly sectors to the northwest for winter, before returning to the southeast at the end of the year.

Figure 4.2 and Figure 4.3 show the monthly and total wind rose distributions derived from the CFSR data for the selected node nearby the release location.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. Speed ranges of 5 knots are typically used in these wind roses. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

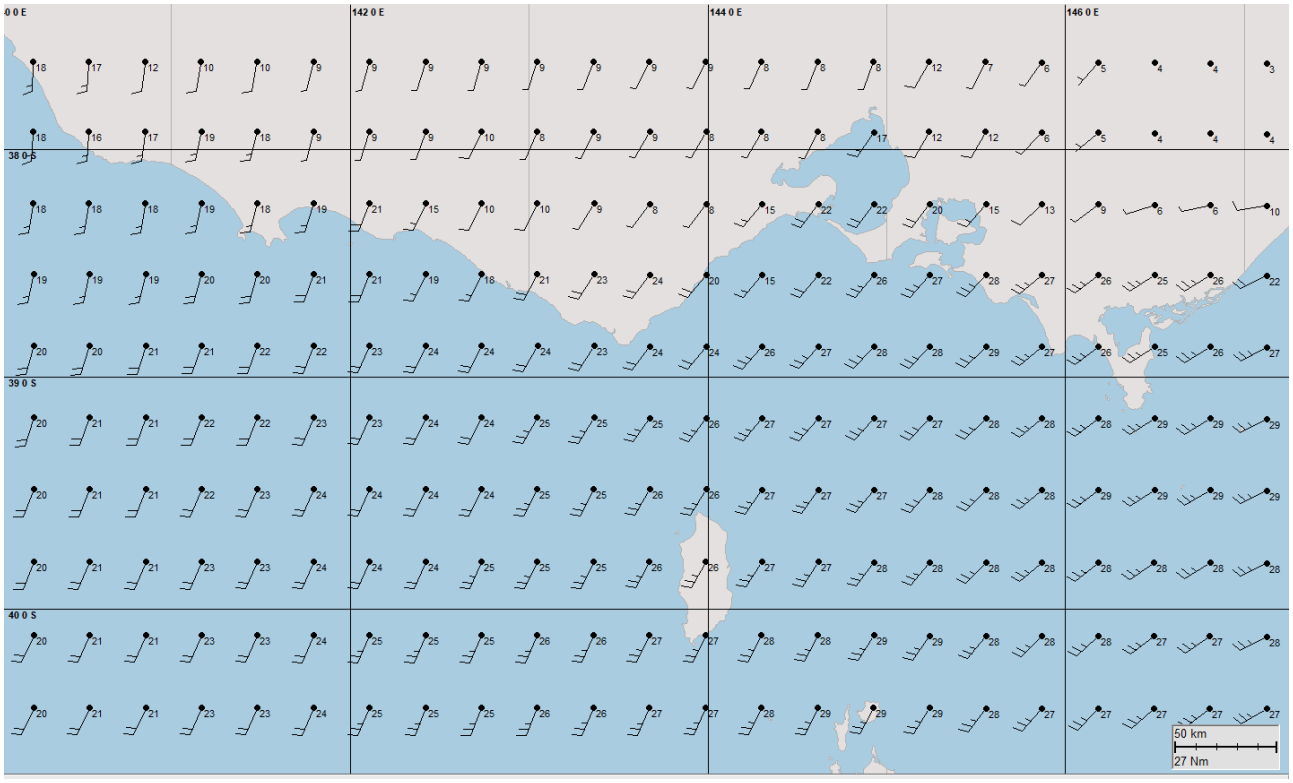

Figure 4.1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

Table 4-1 Predicted average and maximum winds representative for the selected node nearby the release location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (From)
January	10	30	South-Southeast
February	10	31	South-Southeast
March	10	34	Southeast
April	10	33	West
May	11	32	West
June	11	42	Northwest
July	13	35	Northwest
August	13	39	Northwest
September	12	41	West
October	11	31	West
November	10	30	West
December	10	31	West and Southeast
Minimum	**10**	**30**	
Maximum	**13**	**42**	

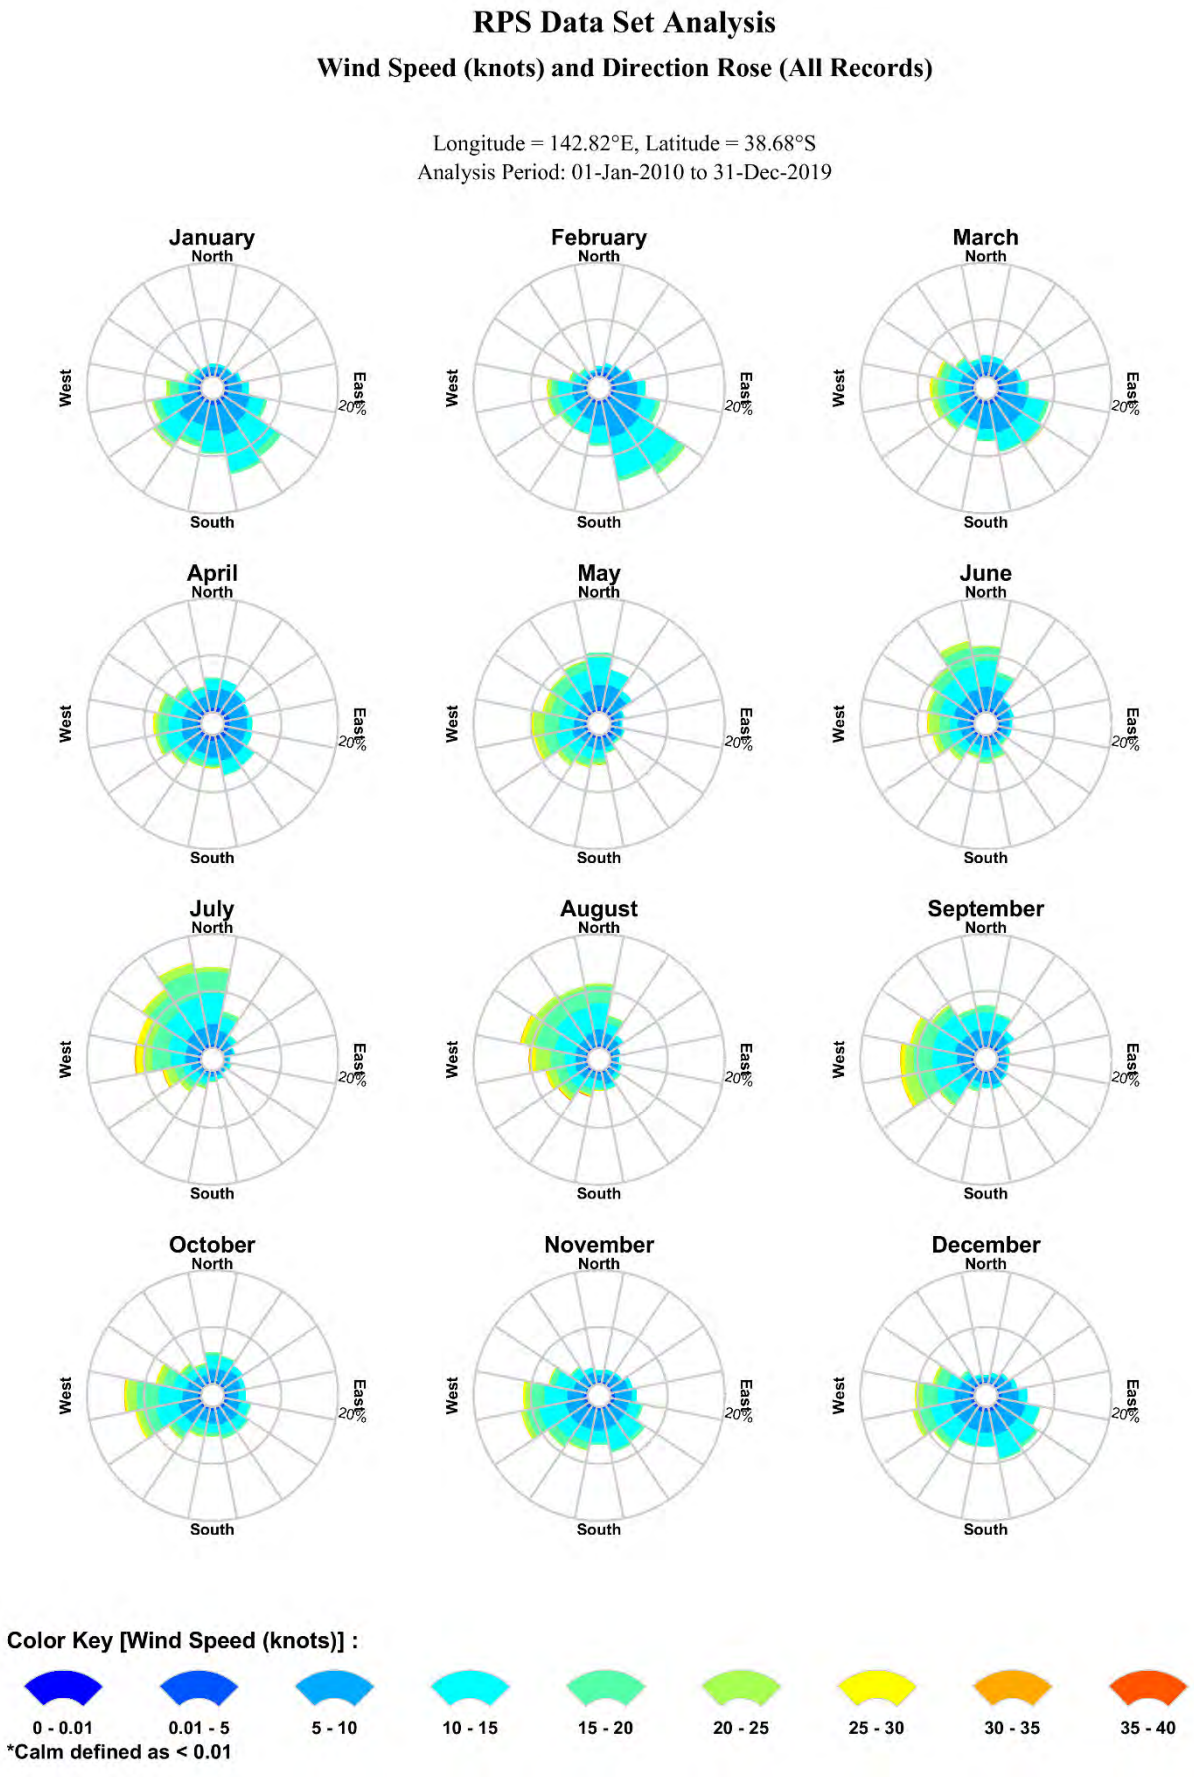

Figure 4.2 Modelled monthly wind rose distributions from 2010–2019 (inclusive) for the node nearby the release location.

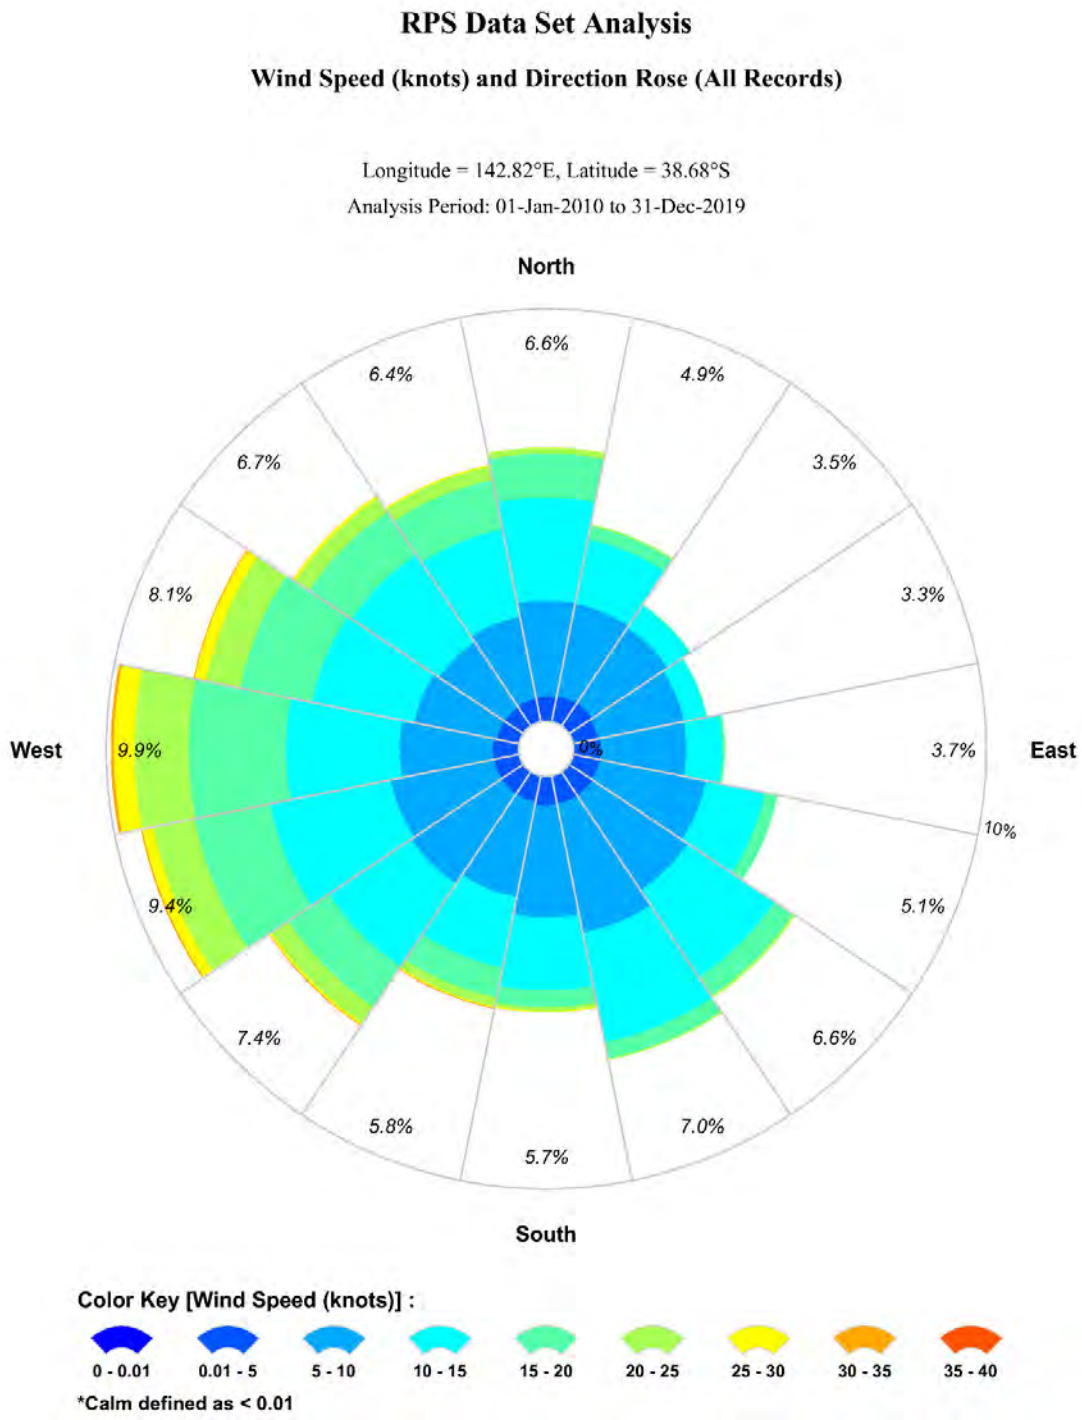

Figure 4.3 Modelled total wind rose distributions from 2010–2019 (inclusive) for the node nearby the release location.

5 WATER TEMPERATURE AND SALINITY

The monthly sea temperature and salinity profiles of the water column within the study was obtained from the World Ocean Atlas 2013 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013). These parameters were used as factors to inform the weathering, movement and evaporative loss of hydrocarbon spills in the surface and sub-surface layers.

Table 5-1 presents the sea temperature and salinity of the surface layer nearby the selected location. The monthly average sea surface temperatures ranged between 13.4°C (September) and 18.2°C (March). The monthly average surface salinity values remain relatively consistent ranging between 35.4 psu and 35.6 psu.

Table 5-1 Monthly average sea surface temperature and salinity in the study area.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (°C)	18.0	17.8	18.2	16.7	16.4	15.8	15.0	14.7	13.4	14.6	15.2	17.5
Salinity (psu)	35.5	35.4	35.6	35.4	35.5	35.5	35.6	35.5	35.4	35.4	35.5	35.5

6 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point (BP) ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

6.1 Stochastic Modelling

For the stochastic modelling presented herein, 100 oil spills were modelled for the scenarios using the same spill information (release location, spill volume, duration and oil type) but with varied start dates. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations were analysed to determine the following statistics for every grid cell:

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Probability of contact above defined concentrations;
- Volume of oil that may accumulate on shorelines from any single simulation;
- Concentration that might occur on sections of individual shorelines;
- Exposure (instantaneous and/or over a specified duration) to dissolved hydrocarbons in the water column; and
- Exposure (instantaneous and/or over a specified duration) to entrained hydrocarbons in the water column.

6.2 Floating, Shoreline and In-Water Thresholds

The thresholds and their relationship to exposure for the sea surface, shoreline and water column (entrained and dissolved hydrocarbons) are presented in Sections 6.2.1 to 6.2.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of potential exposure are also provided. It is important to note that the thresholds herein are based on NOPSEMA (2019).

6.2.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 6-1). Figure 6.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 6-1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 6-2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 6-1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

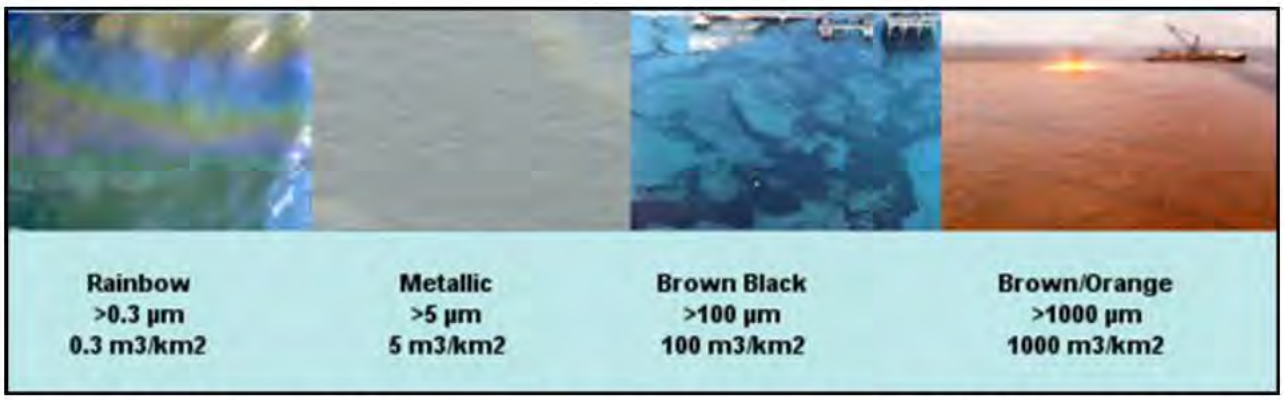

Figure 6.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 6-2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA (2019)).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socioeconomic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

6.2.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling herein, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results contained herein would be indicative of a worst-case scenario, where the highest volume of oil may be stranded on the shoreline (when compared to other shoreline types, such as exposed rocky shores).

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential "low shoreline accumulation".

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according to the AMSA (2015) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential "moderate shoreline accumulation".

Observations by Lin & Mendelssohn (1996), demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential "high shoreline accumulation". It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

It is worth noting that the shoreline accumulation thresholds derived from extensive literature review (outlined in Table 6-3) agree with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 6-3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline loading (g/m^2)	Description
Low (socioeconomic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

6.2.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

6.2.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1 hour timestep (see Table 6-4) was applied to indicate increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

6.2.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. As such, insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, hence are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC & ARMCANZ (2000) water quality guidelines. Due to the requirement for relatively long exposure times (> 24 hours) for these concentrations to be significant, they are likely to be more meaningful for juvenile fish, larvae and planktonic

organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 6-4), to cover the range of thresholds outlined in ANZECC & ARMCANZ (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019).

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 6-4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

	Exposure level	In-water threshold (ppb)	Description
Dissolved hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	Moderate	50	Approximates potential toxic effects, particularly sublethal effects to sensitive species
	High	400	Approximates toxic effects including lethal effects to sensitive species
Entrained hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	High	100	As appropriate given oil characteristics for informing risk evaluation

7 HYDROCARBON PROPERTIES

7.1 Physical Properties

Table 7-1 and Table 7-2 present the physical properties and boiling point ranges of the MDO.

The MDO has an API of 24 and a density of 890 kg/m^3 (at 25 ºC) with a viscosity value (14.0 cP at 25 ºC) classifying it as a Group II (light-persistent) oil according to the International Tankers Owners Pollution Federation (ITOPF, 2014) and US EPA/USCG classifications.

The MDO is a mixture of volatile and persistent hydrocarbons with high proportions of semi- and low-volatile components. In favourable evaporation conditions, about 4.0% of the oil mass should evaporate within the first 12 hours (BP < 180°C), a further 32% should evaporate within the first 24 hours (180°C < BP < 265°C) and a further 54% should evaporate over several days (265°C < BP < 380°C). Approximately 10% of the oil is shown to be persistent.

The boiling points (BP) are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate. Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (BP <180 °C).
- Up to 24 hours for the C_{11} to C_{15} compounds (BP 180-265 °C).
- Several days for the C_{16} to C_{20} compounds (BP 265-380 °C).
- Not applicable for the residual compounds (BP >380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

Table 7-1 Physical properties of MDO.

Characteristic	MDO
Density (kg/m^3)	890 (@ 25 °C)
API	24
Dynamic viscosity (cP)	14.0 (@ 25 °C)
Pour point (°C)	-9
Hydrocarbon property category	Group II
Hydrocarbon property classification	Light - Persistent

Table 7-2 Boiling point ranges of MDO.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-265 C_{11} to C_{15}	265-380 C_{16} to C_{20}	>380 >C_{20}
MDO	% of total	4.0	32.0	54.0	10.0

7.2 Weathering Properties

7.2.1 MDO

A series of model weathering tests were conducted to illustrate the potential behaviour of the MDO when exposed to idealised and representative environmental conditions:

- A 50 m^3 surface release over 1-hour under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.
- A 50 m^3 surface release over 1-hour under variable wind conditions (1-23. knots, drawn from representative data files), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.

The first case is indicative conditions that would not generate entrainment, while the second case represents conditions that would likely cause entrainment. Both scenarios provide examples of potential behaviour during a spill once the oil is on the sea surface.

The mass balance for the MDO under the constant 5 knot wind case (Figure 7.1) shows that 34.3% of the oil is shown to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the low volatile, longer-chain compounds. Evaporation shall cease when the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 7.2), where the winds are of greater strength on average, entrainment of MDO into the water column is shown to increase. Approximately 24 hours after the spill, 83.1% of the oil mass is shown to have entrained and a further 11.4% is shown to have evaporated, leaving only a small proportion of the oil floating on the water surface (1.3%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of 3% per day with 22% after 7 days, compared to 0.4% per day and a total of 2.6% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

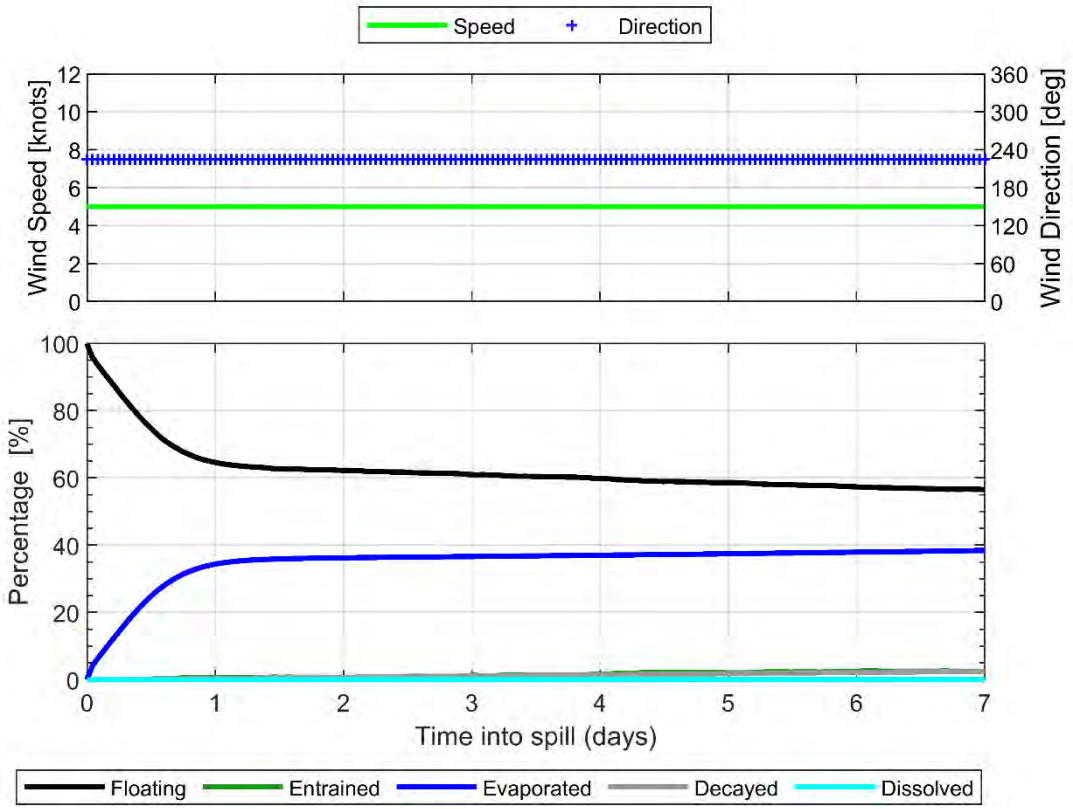

Figure 7.1 Proportional mass balance plot representing the weathering of MDO spilled onto the water surface over 1 hour and subject to a constant 5 knots wind speed at 15°C water temperature.

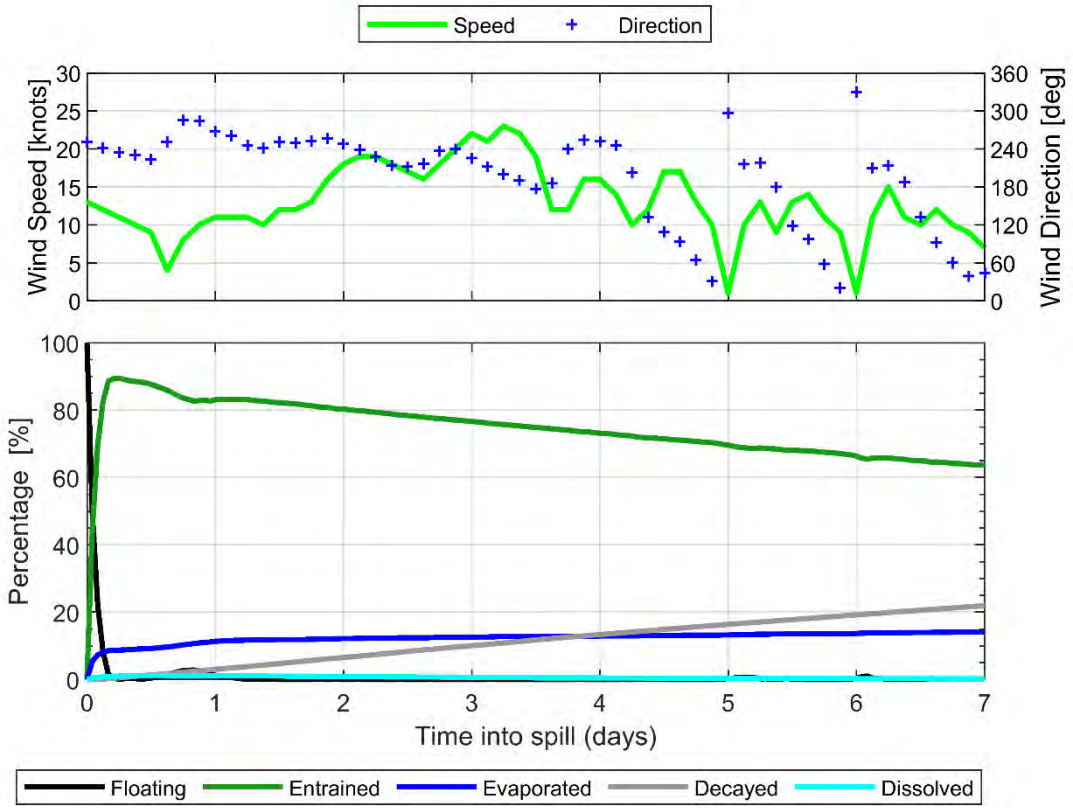

Figure 7.2 Proportional mass balance plot representing the weathering of MDO spilled onto the water over 1 hour and subject to variable wind speeds (1-23 knots) at 15°C water temperature.

8 MODEL SETTINGS

Table 8-1 provides a summary of the oil spill model settings.

Table 8-1 Summary of the oil spill model settings and thresholds used in this assessment.

Parameter	Scenario
Description	Vessel Collision
Number of randomly selected spill start times	100
Model period	Annual
Oil type	MDO
Spill volume	250 m^3
Release type	Surface
Release duration	6 hours
Simulation length (days)	30
Surface oil concentration thresholds (g/m^2) ^	1 (low); 10 (moderate); 50 (high)
Shoreline oil accumulation thresholds (g/m^2) ^	10 (low); 100 (moderate); 1,000 (high)
Dissolved hydrocarbon concentrations (ppb) ^	10 (low); 50 (moderate); 400 (high)
Entrained hydrocarbon concentrations (ppb) ^	10 (low); 100 (high)

^Thresholds based on NOPSEMA (2019)

9 PRESENTATION AND INTERPRETATION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of potential sea-surface and water column exposure and shoreline accumulation.

9.1 Annual Analysis

The statistics are based on the following principles:

- The ***greatest distance travelled by a spill trajectory*** – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds.
- The ***probability of oil exposure to a receptor*** – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The ***minimum time before oil exposure to a receptor*** – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value.
- The ***maximum residence time for oil exposure within a receptor*** – is determined by recording the longest continuous length of time a grid cell is exposed to either floating, entrained or dissolved hydrocarbon above each threshold, within a receptor.
- The ***probability of oil accumulation at a receptor*** – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The ***maximum (total) volume of oil ashore*** – is the total volume of oil stranded on the shorelines throughout the duration of the simulation.
- The ***maximum potential oil loading within a receptor*** – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario.
- The ***dissolved and entrained hydrocarbon exposure*** – is determined by recording the maximum instantaneous concentrations at each grid cell.

9.2 Deterministic Trajectories

The stochastic modelling results were assessed for each scenario, and the deterministic runs were identified and are presented in the result section based on the following criteria;

a. Largest swept area for surface oil above 10 g/m^2
b. Largest swept area for surface oil above 50 g/m^2
c. Largest (total) volume of oil ashore
d. Longest length of shoreline with oil accumulation above 100 g/m^2
e. Largest area of entrained hydrocarbon exposure above 100 ppb
f. Largest area of dissolved hydrocarbon exposure above 50 ppb

9.3 Receptors Assessed

A range of environmental receptors and shorelines were assessed for floating oil exposure, shoreline accumulation and water column exposure as part of the study (see Figure 9.1 to Figure 9.11). Receptor categories (see Table 9-1) include sections of shorelines which are defined by local government areas (LGAs), sub-LGAs and offshore islands. All other sensitive receptors other than submerged reefs, shoals and banks (RSB) were sourced from Australian Government Department of Climate Change, Energy, the Environment and Water (http://www.environment.gov.au/).

Risks of exposure were separately calculated for each sensitive receptor area and have been tabulated.

Table 9-2 summarises the receptors that the release locations reside within.

Table 9-1 Summary of receptors used to assess floating oil, shoreline and in-water exposure to hydrocarbons.

10 RESULTS – 250 m³ LOSS OF CONTAINMENT FROM A VESSEL COLLISION

This scenario examined a 250 m^3 surface release of MDO over 6 hours to represent a loss of containment from a vessel collision. A total of 100 spill simulations were run and tracked for 30 days. The results for all 100 simulations were combined and are presented on an annual basis.

Sections 10.1 and 10.2 present the annual stochastic analysis and deterministic analysis results, respectively.

10.1 Stochastic Analysis

10.1.1 Area of Exposure

Figure 10.1 presents the area of exposure based on the low thresholds produced by overlaying the results from all 100 simulations.

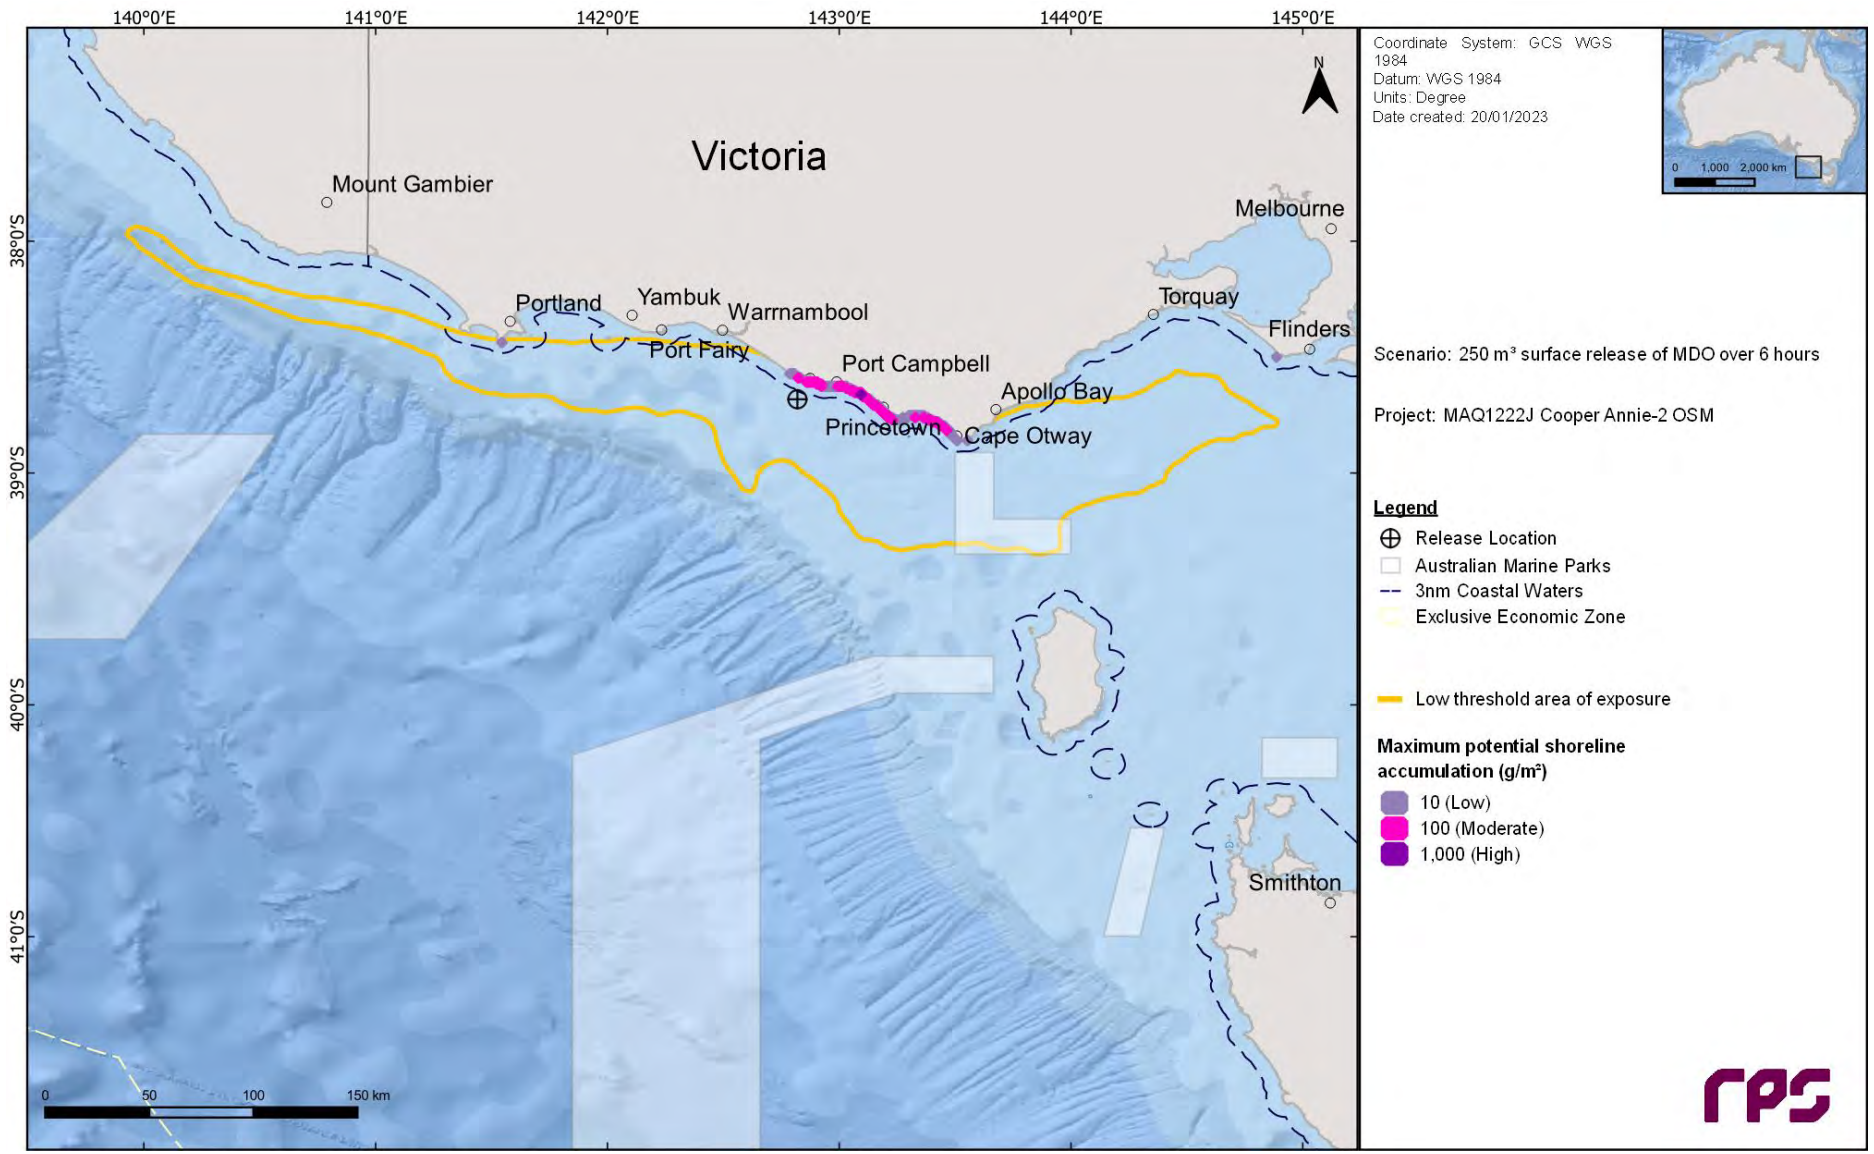

Figure 10.1 Predicted area of exposure for low thresholds produced by overlaying the results from 100 simulations of a 250 m³ surface release of MDO over 6 hours.

10.1.2 Floating Oil Exposure

Table 10-1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (> 50 g/m^2) exposure zones was 32.5 km (west), 10.3 km (west) and 2.8 km (east-southeast), respectively.

Table 10-2 summarises the potential floating oil exposure to individual receptors.

A total of 14 Biologically Important Areas (BIAs) were predicted to be exposed to floating oil at, or above, the low threshold. Excluding the 13 BIAs that the release location resides within (see Section 9.3), the highest probability (3%) of low exposure were predicted at the Southern Right Whale – Aggregation BIA. The minimum time before low exposure to the Southern Right Whale – Aggregation ranged between 28 hours.

Additionally, Twelve Apostles MNP, Corangamite LGA and Moonlight Head sub-LGA recorded a probability of low floating oil exposure of 2%.

Table 10.3 presents the maximum residence time of floating oil exposure for each individual grid cell within each individual receptor.

Figure 10.2 presents the zones of potential floating oil exposure whilst Figure 10.3 to Figure 10.4 present the maximum residence time of floating oil exposure for the NOPSEMA thresholds.

Table 10-1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 250 m^3 surface release of MDO over 6 hours. The results were calculated from 100 spill simulations.

Distance and direction travelled	Zones of potential floating oil exposure		
	Low	Moderate	High
Maximum distance (km) from release location	32.5	10.3	2.8
Maximum distance (km) from release location (99th percentile)	30.3	10.3	2.8
Direction	W	W	ESE

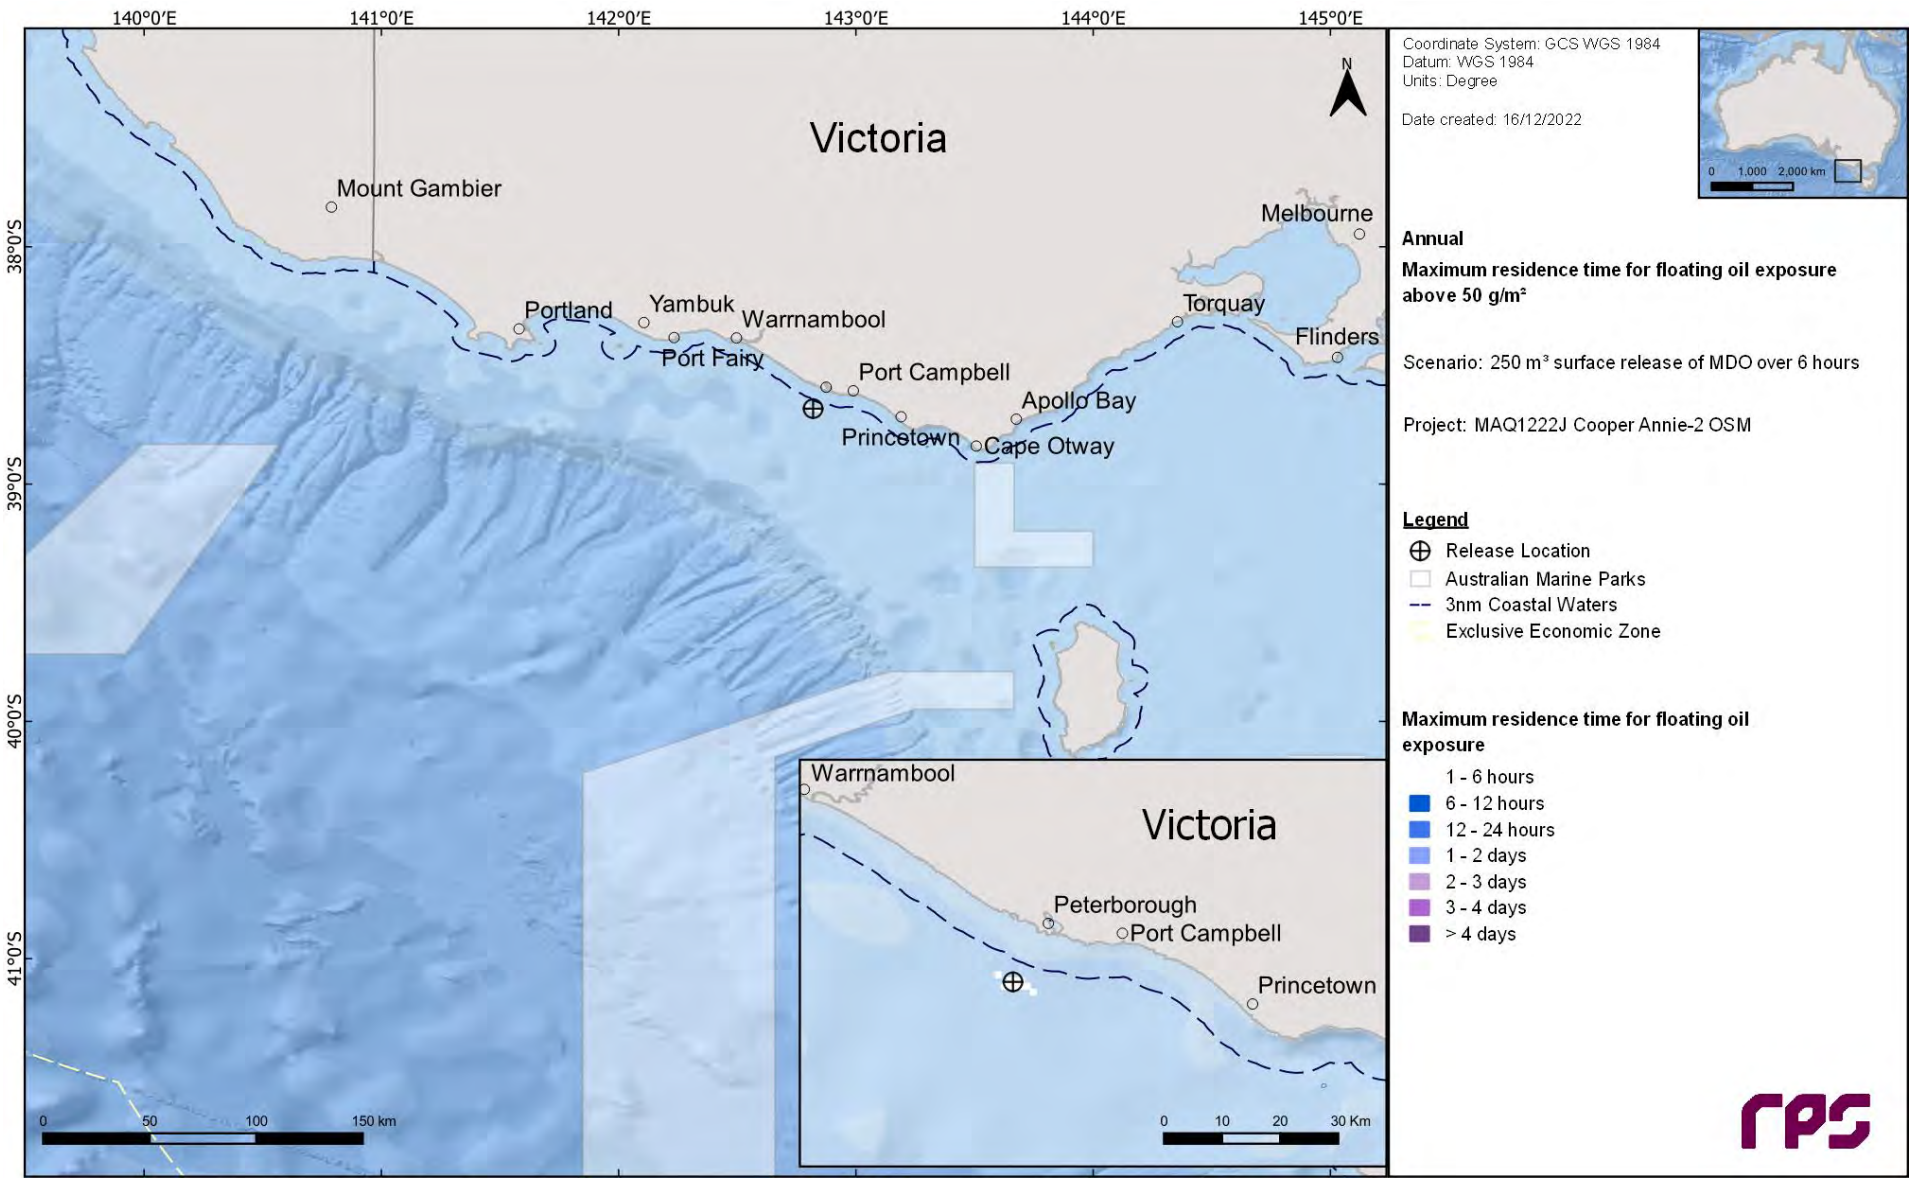

Figure 10.5 Maximum residence time of floating oil exposure above 50 g/m², in the event of a 250 m³ of MDO containment loss over 6 hours tracked for 30 days. The results were calculated from 100 spill simulations.

10.1.3 Shoreline Accumulation

Table 10-4 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 60%. The minimum time before oil accumulation at, or above, the low threshold was 22 hours. The maximum total volume ashore for a single spill trajectory was 43.2 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 32 km, 11 km and 1 km, respectively.

Table 10-5 summarises the shoreline accumulation on individual receptors.

The shoreline segment of Corangamite had the highest probability of accumulation above all three thresholds. The minimum time for low threshold shoreline accumulation was less than 1 day for several shoreline segments and Sub-LGAs.

The maximum potential shoreline loading above each shoreline thresholds is presented in Figure 10.6.

Table 10-4 Summary of oil accumulation across all shorelines. Results are based on a 250 m^3 surface release of MDO over 6 hours. The results were calculated from 100 spill simulations.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	60
Absolute minimum time for visible oil to shore (hours)	22
Maximum total volume of hydrocarbons ashore (m^3)	43.2
Average total volume of hydrocarbons ashore (m^3)	7.5
Maximum length of the shoreline at **10 g/m^2** (km)	32
Average shoreline length (km) at **10 g/m^2** (km)	13
Maximum length of the shoreline at **100 g/m^2** (km)	11
Average shoreline length (km) at **100 g/m^2** (km)	4.8
Maximum length of the shoreline at **1,000 g/m^2** (km)	1
Average shoreline length (km) at **1,000 g/m^2** (km)	1

Table 10-5 Summary of oil accumulation on individual shoreline receptors. Results are based on a 250 m^3 surface release of MDO over 6 hours. The results were calculated from 100 spill simulations.

Shoreline Receptor		Maximum probability of shoreline loading (%)			Minimum time before shoreline accumulation (days)			Load on shoreline (g/m^2)		Volume on shoreline (m^3)		Mean length of shoreline accumulation (km)			Maximum length of shoreline accumulation (km)

10.1.4 In-water exposure

10.1.4.1 Dissolved Hydrocarbons

Table 10-6 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer.

A total of 15 BIAs were predicted to be exposed to dissolved hydrocarbon at, or above, the low threshold. Excluding the 13 BIAs that the release location resides within (see Section 9.3), the highest probability of low exposure ranged between 1% (Short-tailed Shearwater - Foraging) and 2% (Southern Right Whale - Aggregation).

Additionally, the Twelve Apostles MNP recorded a probability of low dissolved hydrocarbon exposure of 1%.

The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 77 ppb.

Table 10.7 presents the predicted minimum time to dissolved hydrocarbon exposure and maximum residence time for dissolved hydrocarbon exposure to individual receptors, in the 0-10 m depth layer, for all thresholds assessed.

Figure 10.7 presents the zones of potential dissolved hydrocarbon exposure for the 0-10 m depth layer whilst Figure 10.8 to Figure 10.9 present the maximum residence time of dissolved hydrocarbon exposure for the NOPSEMA thresholds.

Table 10-6 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days. The results were calculated from 100 spill simulations.

10.1.4.2 Entrained Hydrocarbons

Table 10-8 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer.

Many receptors were exposed above the low and high thresholds, however the majority of these receptors coincided with the release location.

The highest probability of low entrained hydrocarbon exposure was recorded for the Twelve Apostles MNP (65%) and Short-tailed Shearwater – Foraging BIA (64%). Additional receptors including LGAs, sub-LGAs, and AMPs were predicted with entrained hydrocarbon exposure (refer to Table 10-8).

Table 10.9 presents the predicted minimum time to entrained hydrocarbon exposure and maximum residence time for entrained hydrocarbon exposure to individual receptors in the 0-10 m depth layer, for all thresholds assessed.

Figure 10.10 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer whilst Figure 10.11 and Figure 10.12 present the maximum residence time of entrained hydrocarbon exposure for the NOPSEMA thresholds.

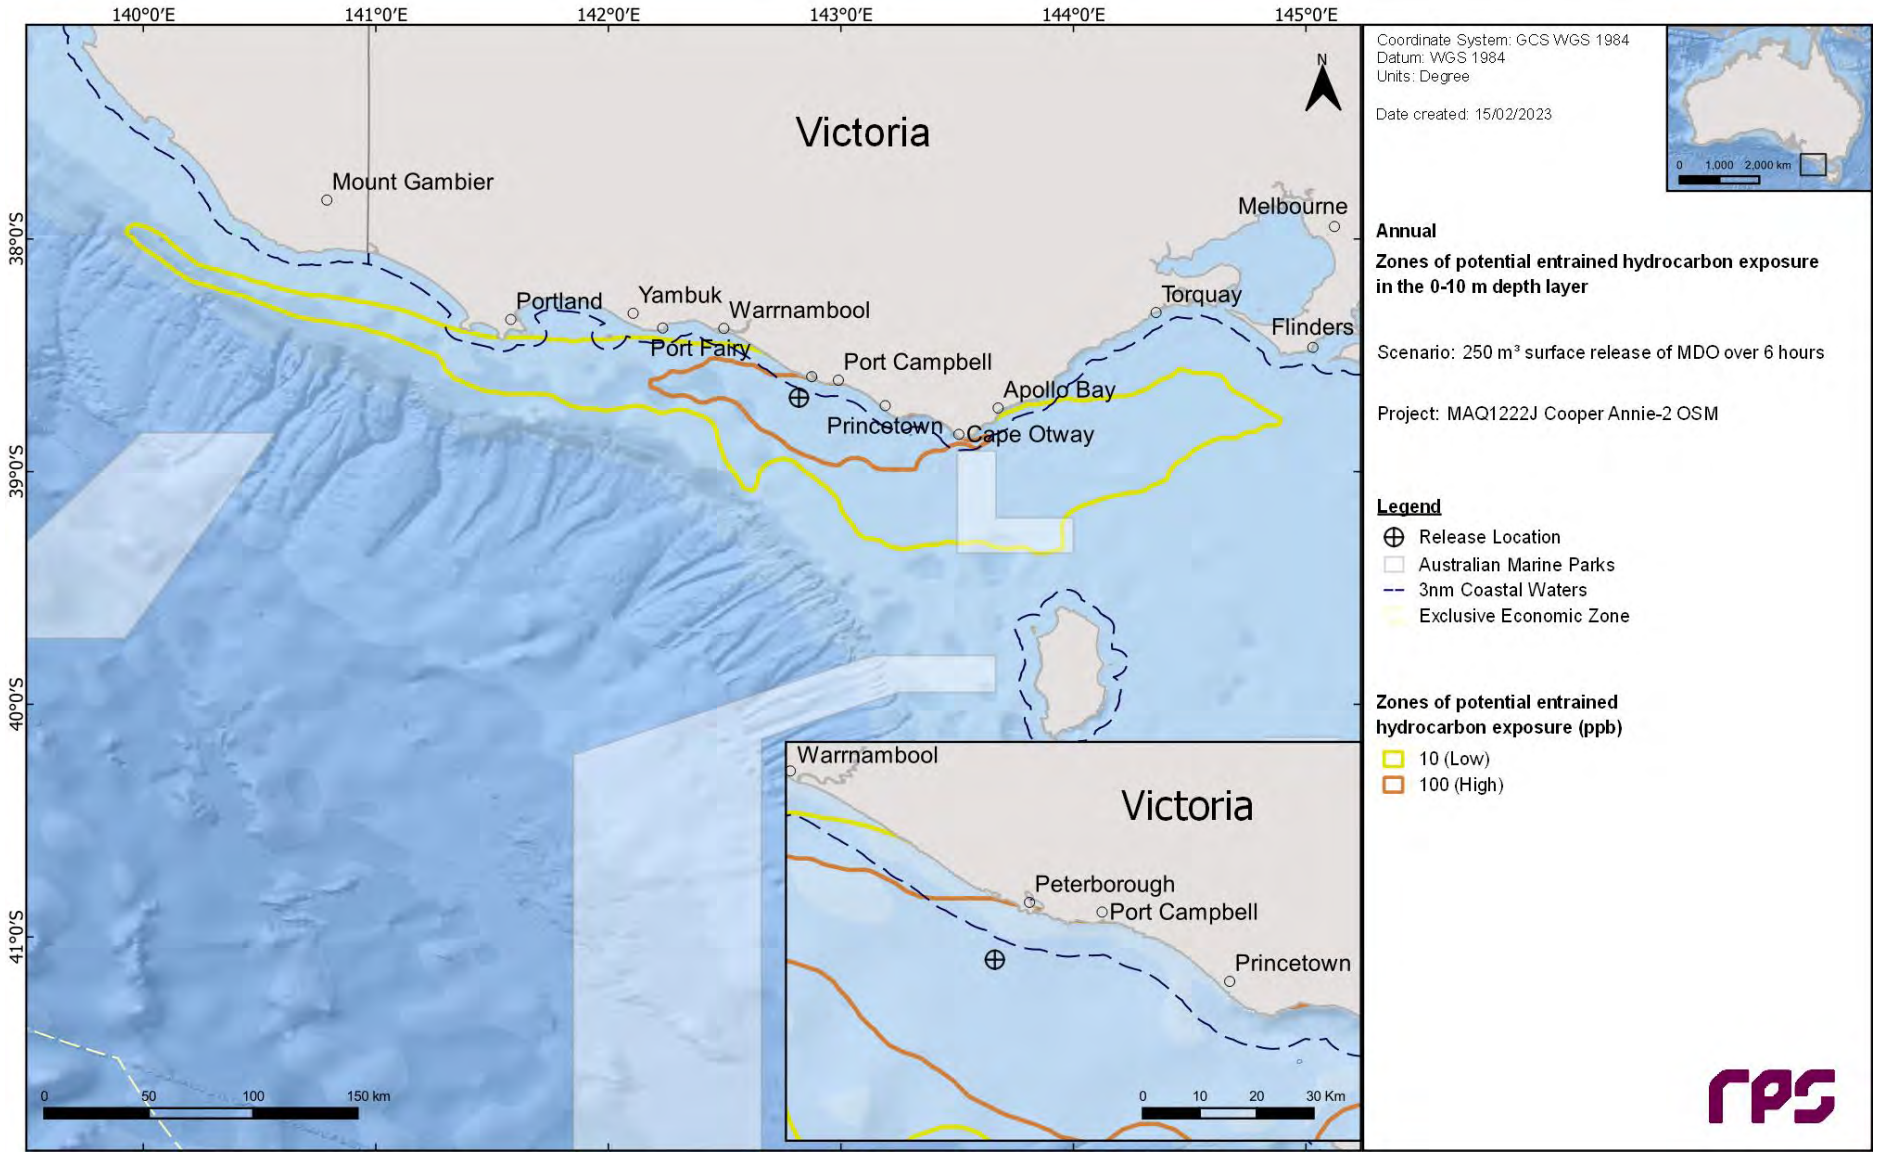

Figure 10.10 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 250 m³ of MDO containment loss over 6 hours tracked for 30 days. The results were calculated from 100 spill simulations.

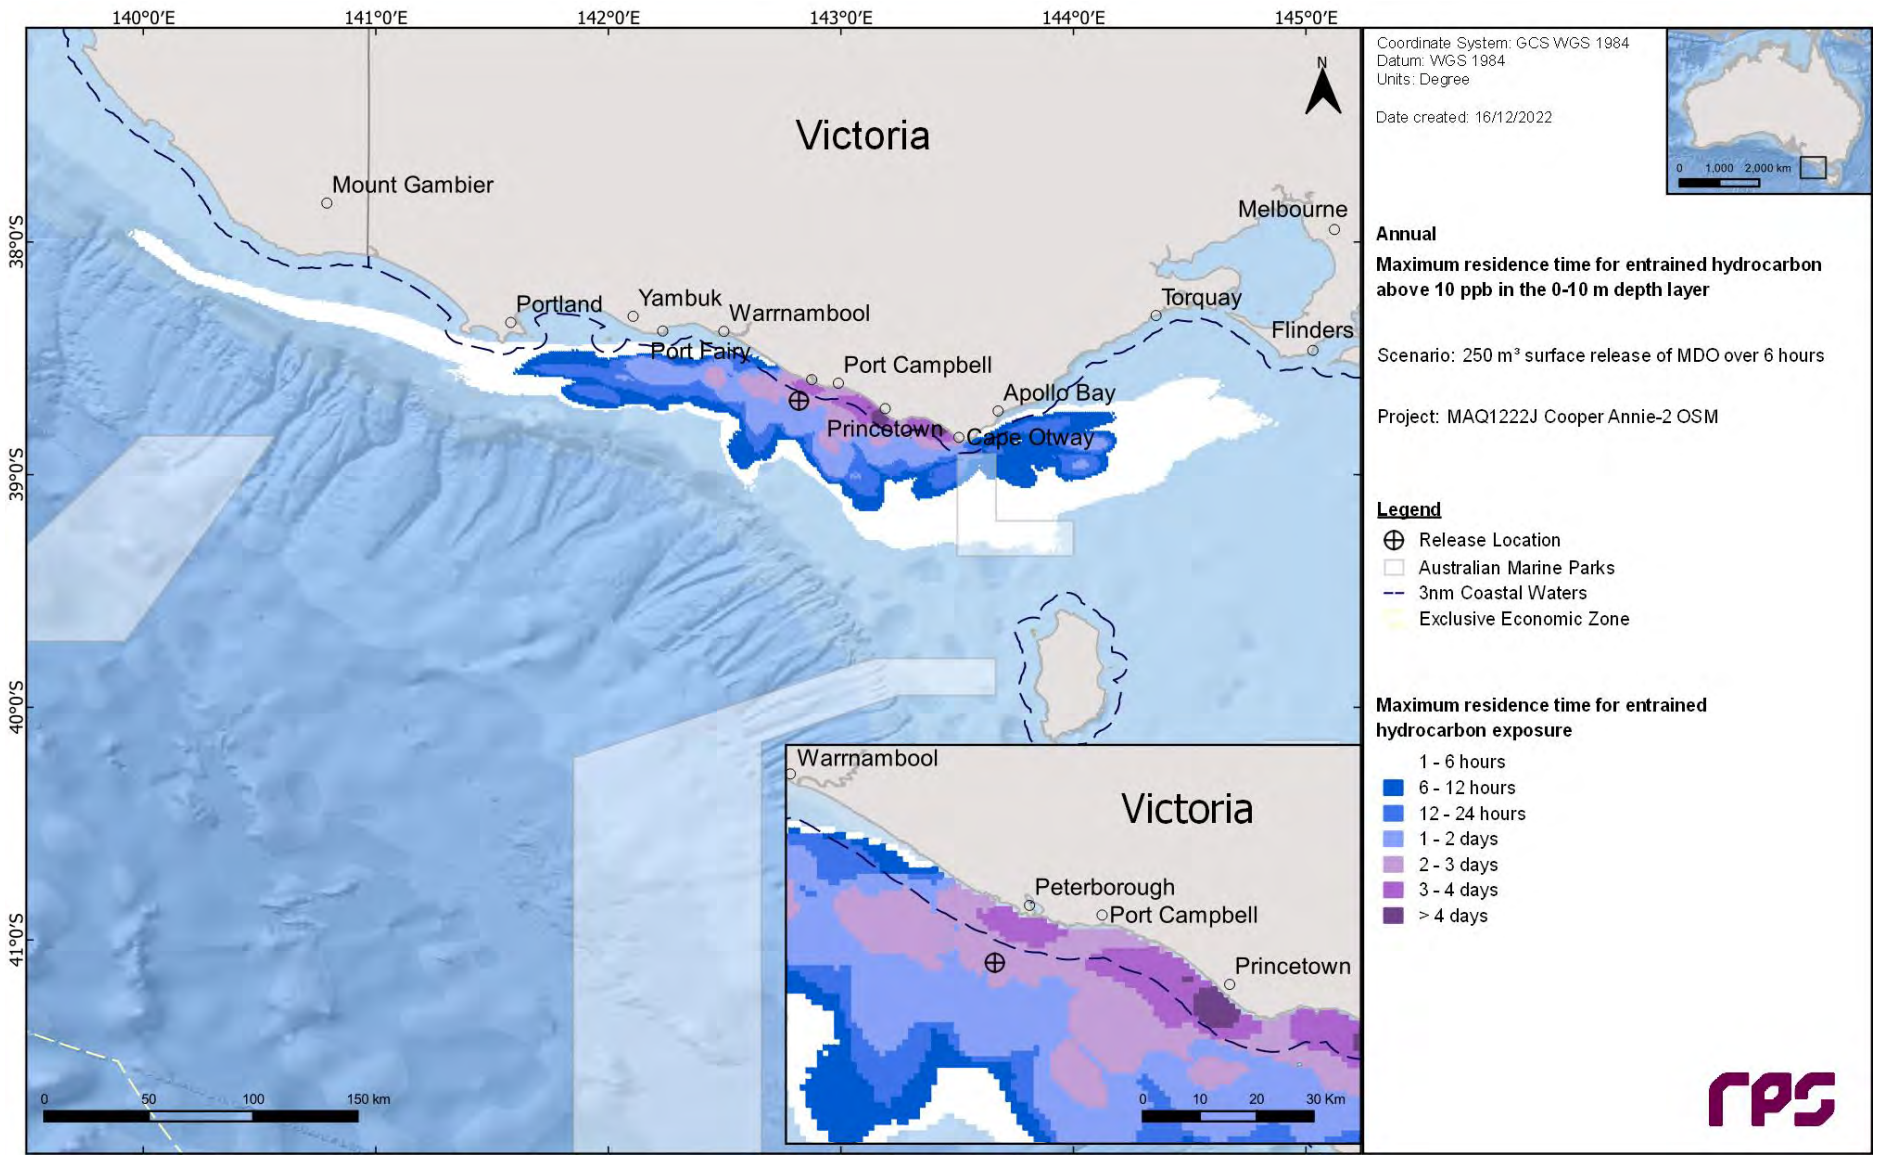

Figure 10.11 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea in the event of a 250 m³ of MDO containment loss over 6 hours tracked for 30 days. The results were calculated from 100 spill simulations.

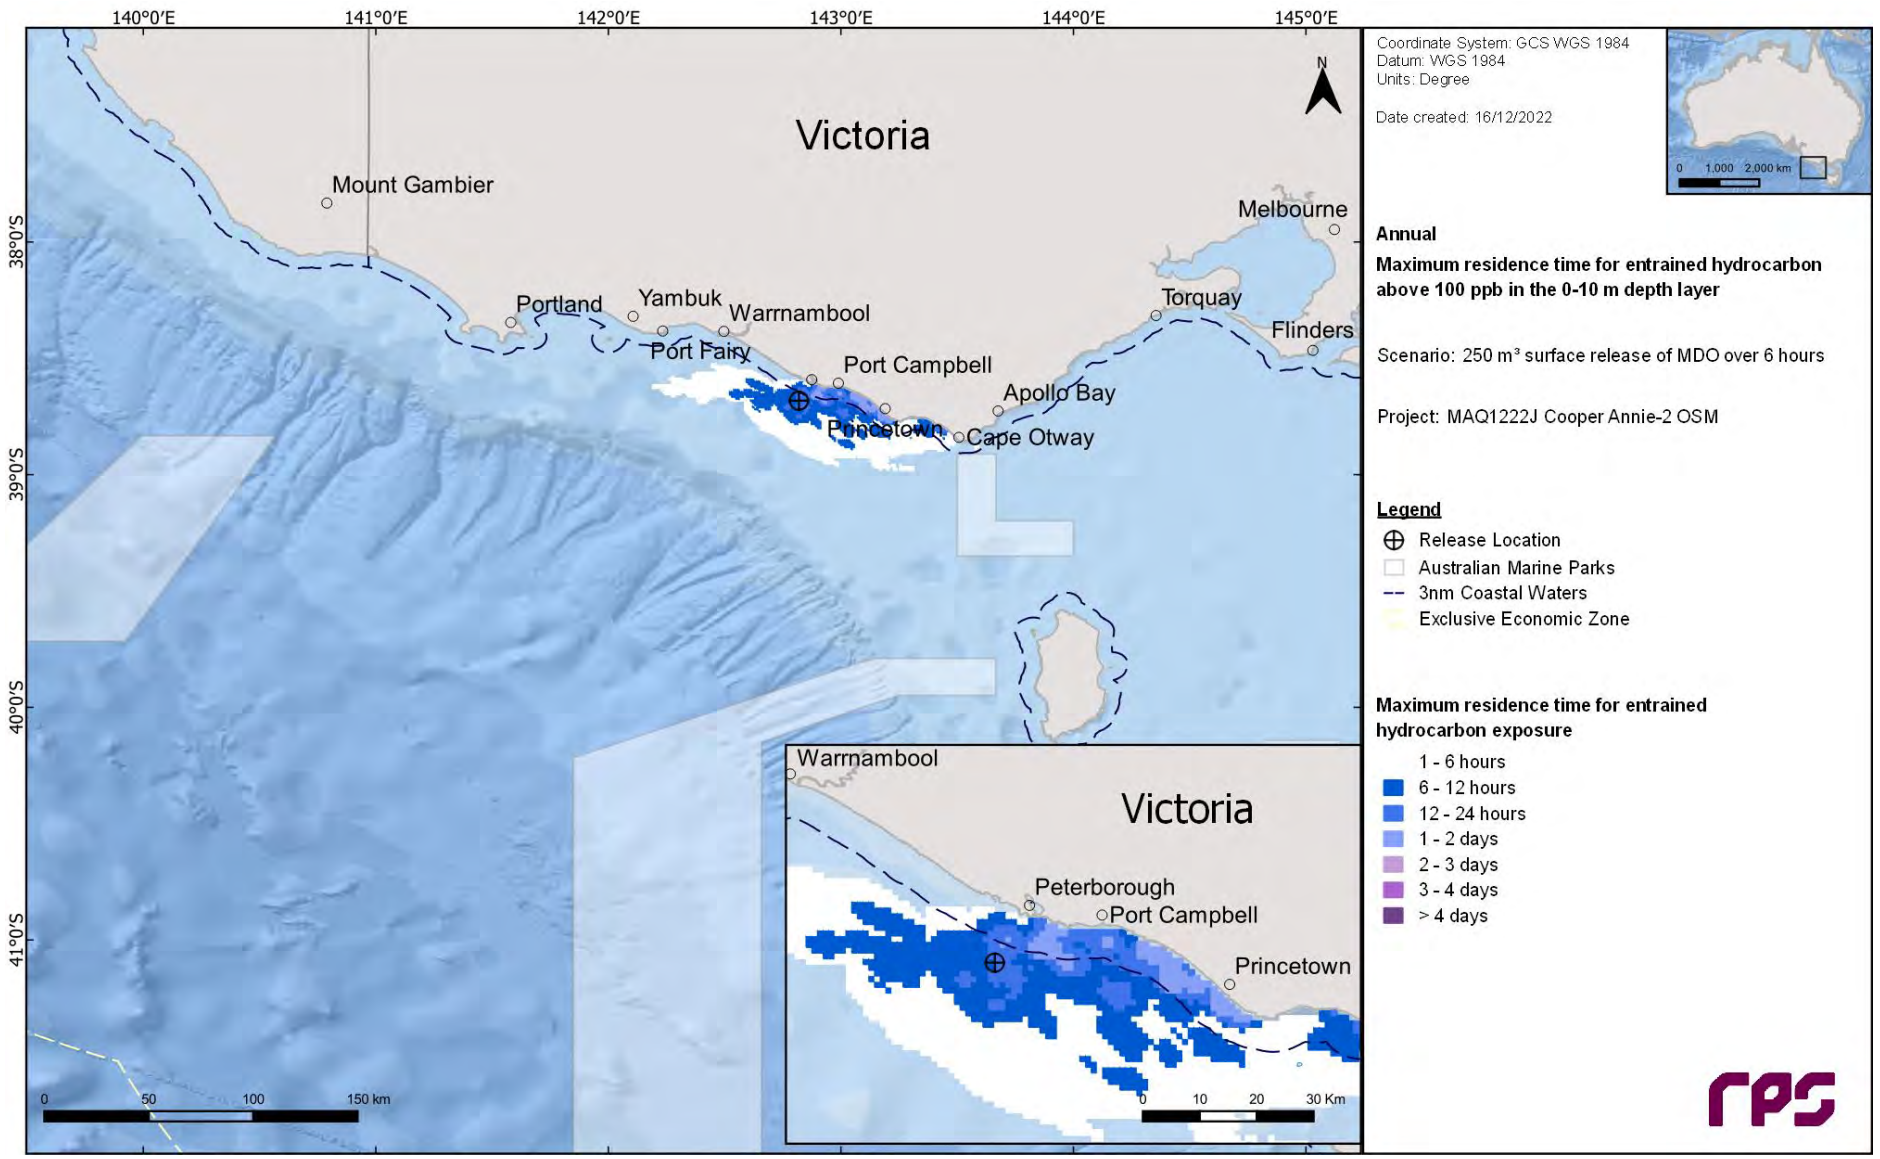

Figure 10.12 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea in the event of a 250 m³ of MDO containment loss over 6 hours tracked for 30 days. The results were calculated from 100 spill simulations.

10.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2
b. Largest swept area for surface oil above 50 g/m^2
c. Largest (total) volume of oil ashore
d. Longest length of shoreline with oil accumulation above 100 g/m^2
e. Largest area of entrained hydrocarbon exposure above 100 ppb
f. Largest area of dissolved hydrocarbon exposure above 50 ppb

Table 10-10 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 10-10 Summary of the worst-case deterministic analysis based on the scenario presented in the Stochastic Analysis Section.

Variable	Threshold	Deterministic Analysis Criteria					
		Largest swept area of floating oil >10 g/m²	Largest swept area of floating oil >50 g/m²	Largest volume of oil ashore	Longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Run Number		**91**	**20**	**50**	**50**	**36**	**39**

Start Date		21 July 2012	9 January 2017	11 May 2012	11 May 2012	28 June 2016	18 September 2016

NC = No contact at, or above the specified shoreline accumulation threshold.

10.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as run number 91, which started on 21st July 2012.

Figure 10.13 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 10.14 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation.

Figure 10.15 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.11 summarises the mass balance peaks and at the end of the simulation.

Table 10.11 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2. Results are based on a 250 m^3 surface release of MDO over 6 hours.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	168.6	0.3	0.0
Entrained (m^3)	124.4	2.8	41.1
Dissolved (m^3)	0.3	4.7	0.0
Evaporation (m^3)	123.8	29.7	123.8
Decay (m^3)	86.8	30.0	86.8
Ashore (m^3)	0.5	11.2	0.1

10.2.3 Deterministic Case: Largest volume of oil ashore and longest length of shoreline with accumulation above 100 g/m^2

The deterministic trajectory that resulted in the largest volume ashore and longest length of shoreline with accumulation above 100 g/m^2 was identified as run number 50, which started on 11th May 2012.

Figure 10.19 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 10.20 displays the time series of the length of shoreline with accumulation at the low (10 g/m^2), moderate (100 g/m^2) and high (1,000 g/m^2) thresholds over the 30-day simulation.

Figure 10.22 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.13 summarises the mass balance peaks and at the end of the simulation.

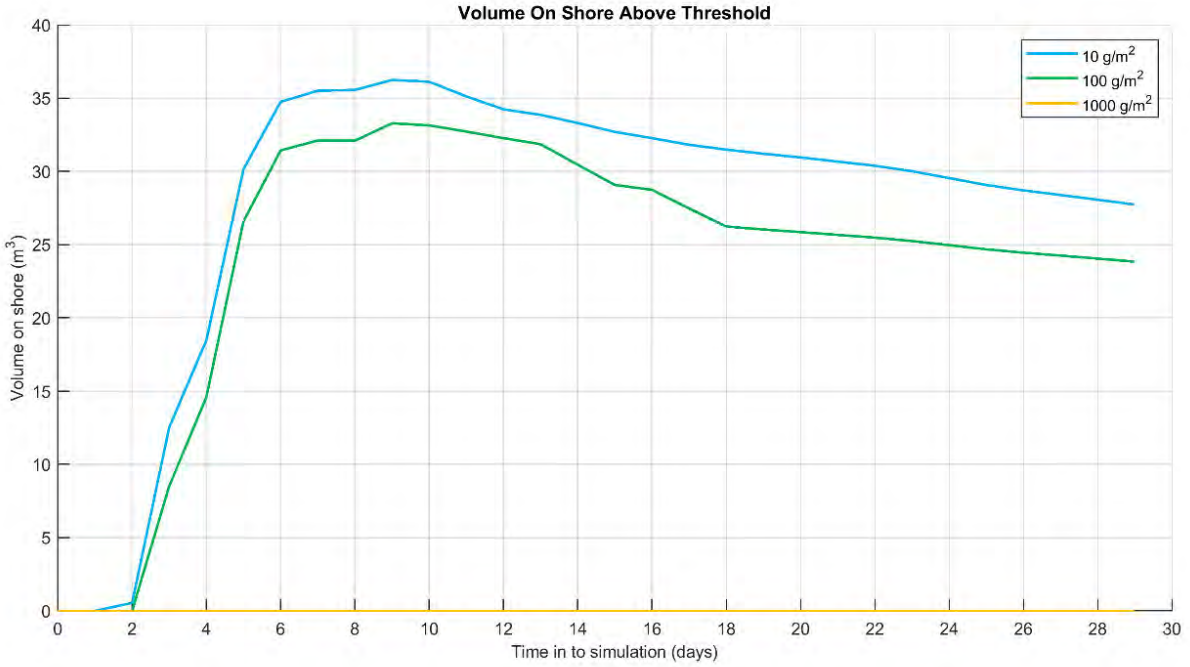

Figure 10.21 Time series of oil accumulation on the shoreline above each threshold for the trajectory with the largest volume ashore and longest length of shoreline with accumulation above 100 g/m^2. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

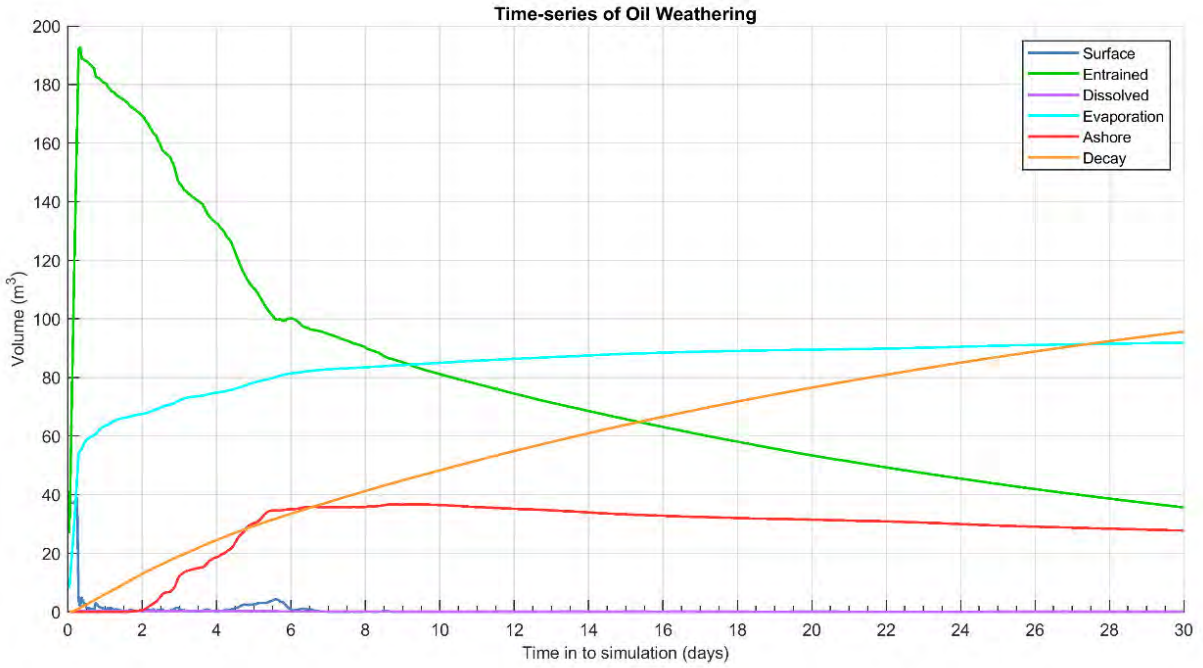

Figure 10.22 Predicted weathering and fates graph for the trajectory with the largest volume ashore and longest length of shoreline with accumulation above 100 g/m^2. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

10.2.4 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified as run number 36, which started on 28th June 2016.

Figure 10.23 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 10.24 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 30-day simulation.

Figure 10.25 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.14 summarises the mass balance peaks and at the end of the simulation.

Table 10.14 Summary of the mass balance for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	59	0	0
Entrained (m^3)	209	0	52
Dissolved (m^3)	2	0	0
Evaporation (m^3)	65	30	65
Decay (m^3)	134	30	134
Ashore (m^3)	0	5	0

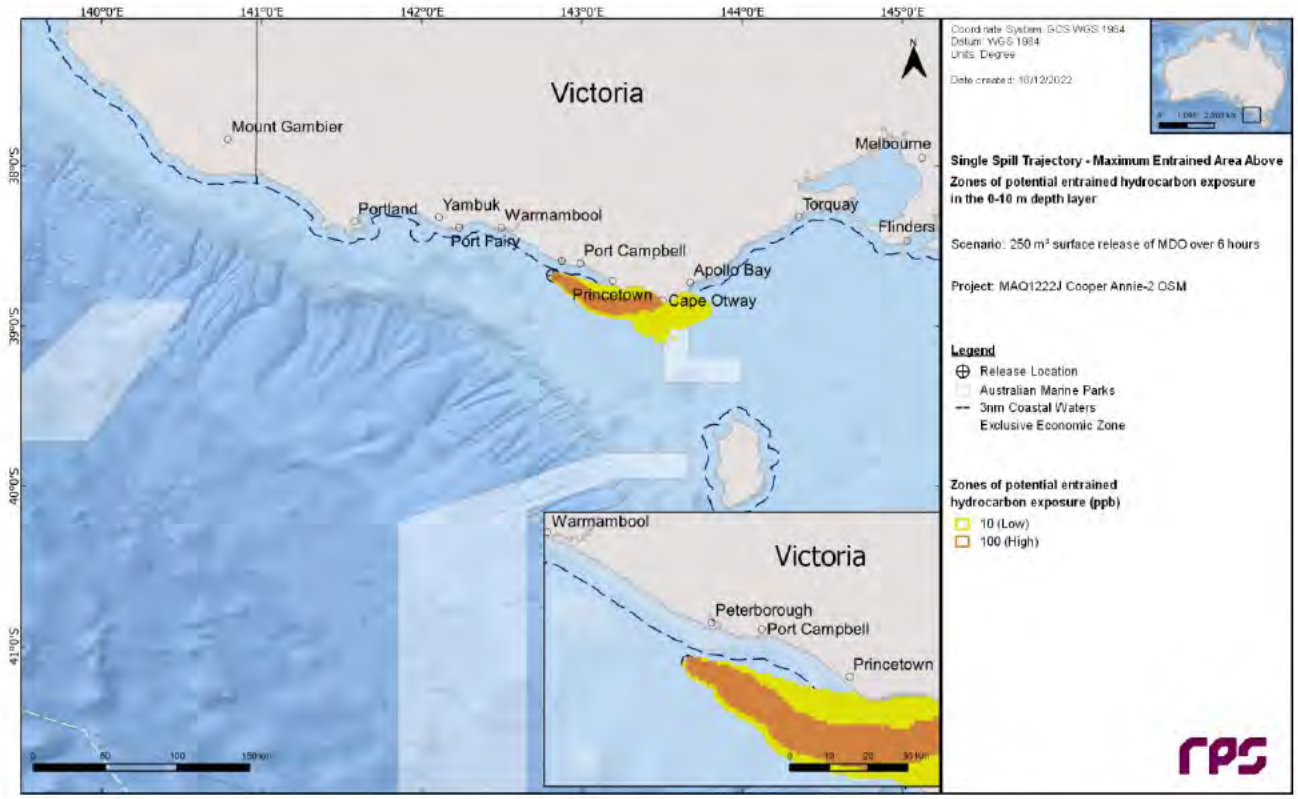

Figure 10.23 Zones of potential entrained hydrocarbon exposure, for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

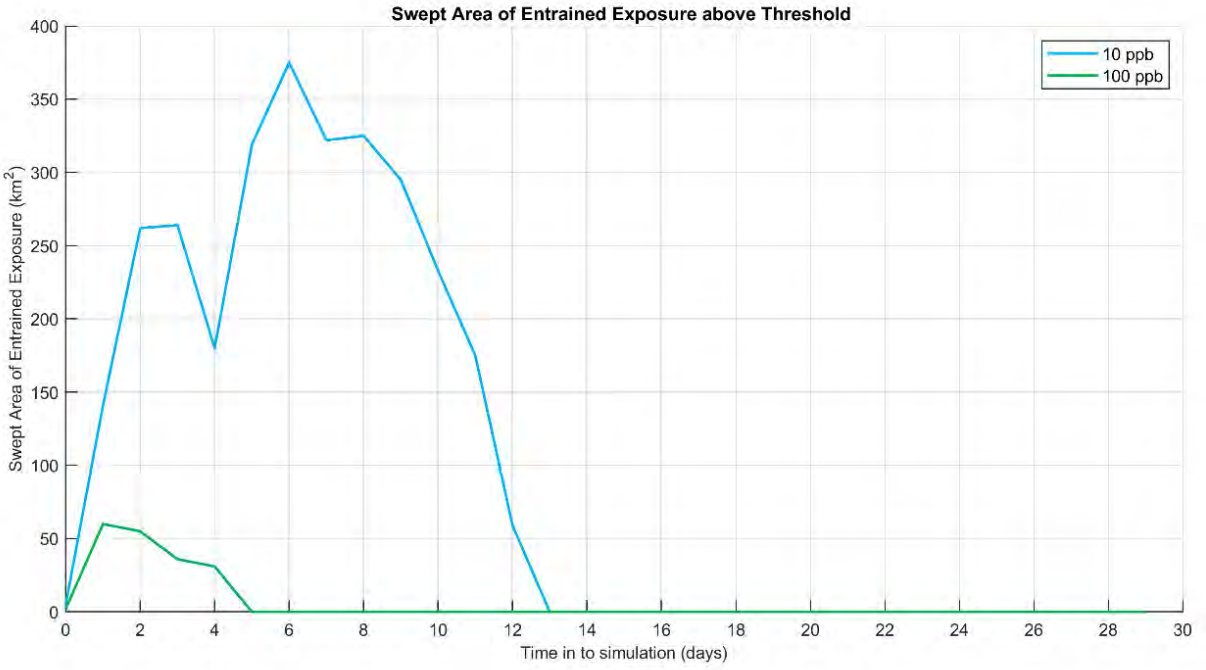

Figure 10.24 Time series of the entrained hydrocarbon exposure area above each threshold for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

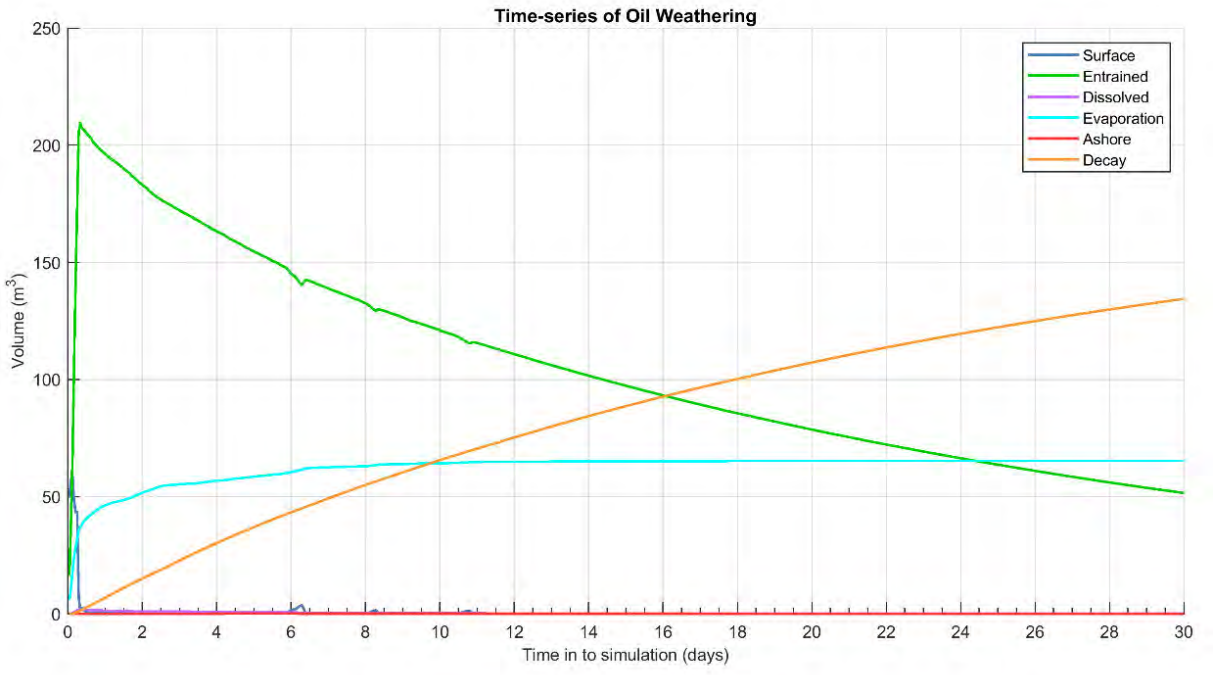

Figure 10.25 Predicted weathering and fates graph for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

10.2.5 Deterministic Case: Largest area of dissolved hydrocarbon exposure above 50 ppb

The deterministic trajectory that resulted in the largest area of dissolved hydrocarbon exposure above 50 ppb was identified as run number 39, which started on 18th September 2016.

Figure 10.26 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 10.27 displays the time series of the area of dissolved hydrocarbon exposure at the low (10 ppb), moderate (50 ppb) and high (400 ppb) thresholds over the 30-day simulation.

Figure 10.28 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.15 summarises the mass balance peaks and at the end of the simulation.

Table 10.15 Summary of the mass balance for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	61	0	0
Entrained (m^3)	210	0	49
Dissolved (m^3)	2	0	0
Evaporation (m^3)	83	30	83
Decay (m^3)	120	30	120
Ashore (m^3)	0	10	0

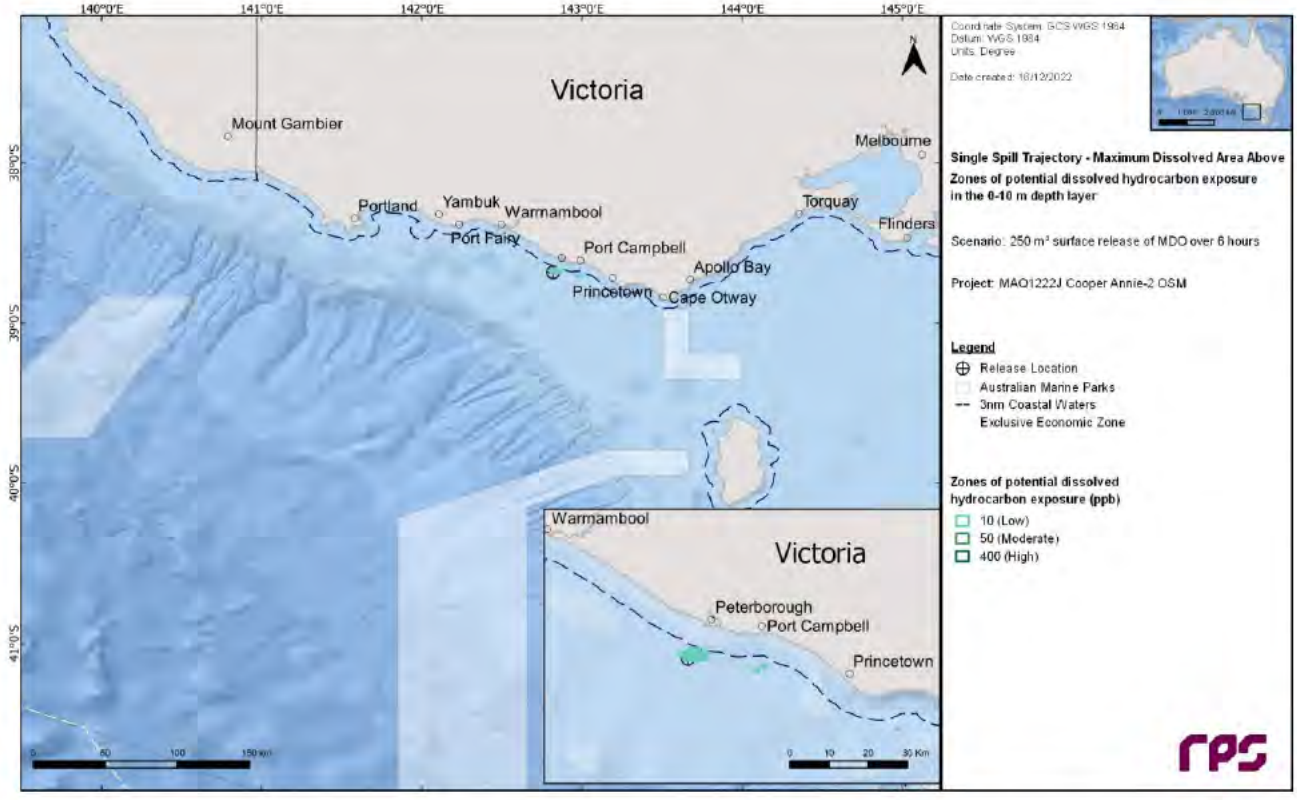

Figure 10.26 Zones of potential dissolved hydrocarbon exposure, for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

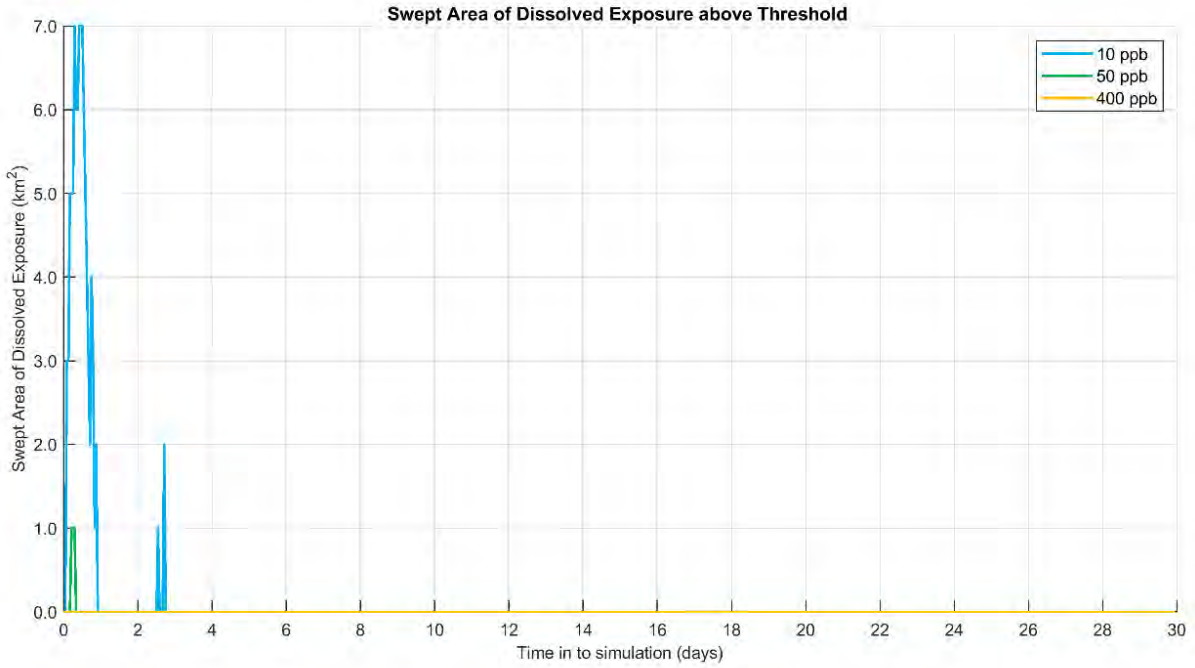

Figure 10.27 Time series of the dissolved hydrocarbon exposure area above each threshold for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

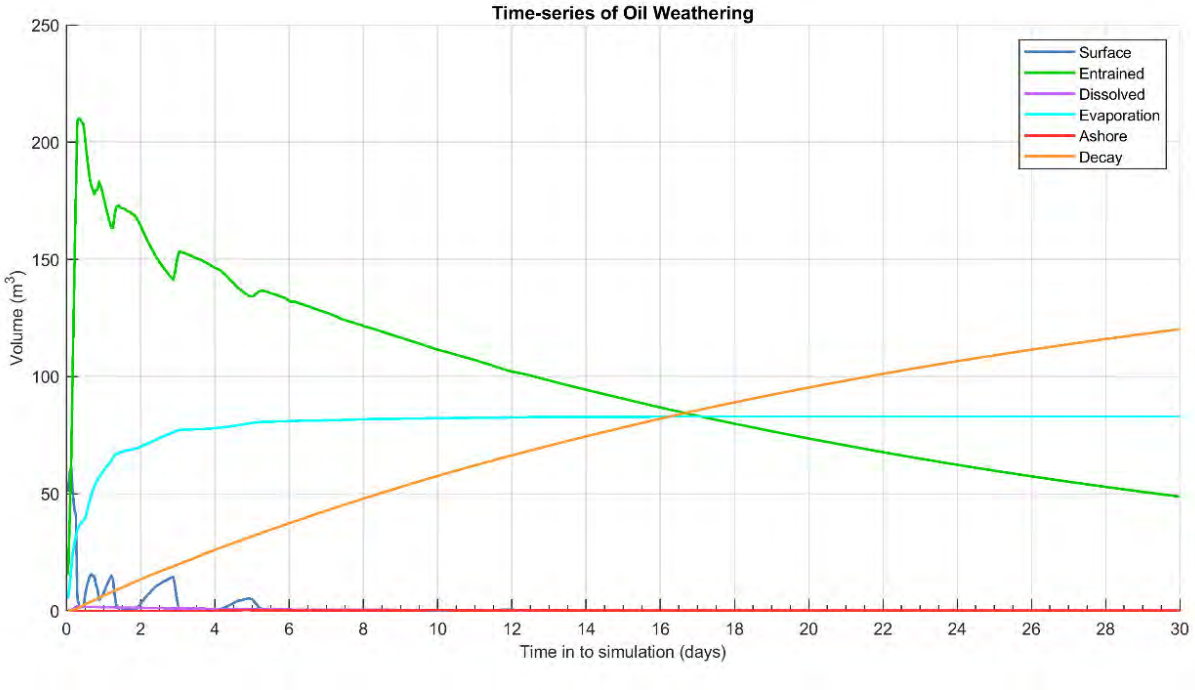

Figure 10.28 Predicted weathering and fates graph for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb. Results are based on a 250 m^3 surface release of MDO over 6 hours, tracked for 30 days.

Executive Summary

JASCO Applied Sciences (JASCO) performed a modelling study of underwater sound levels associated with Amplitude Energy's Otway current and potential future offshore activities.

The modelling study considers the activities associated with drilling and vessel operations. These operations include a Mobile Offshore Drilling Unit (MODU) under dynamic positioning (DP), an anchored MODU conducting drilling operations, and an associated Anchor Handling Tug and Supply Vessel (AHTS), conducting re-supply of the MODU under DP, and standing by near the MODU, as well as pre-lay, pipelaying and dive support scenarios. This study considered scenarios to represent operations, which could occur within Amplitude Energy's Title holdings. The representative modelled scenarios are located at the Annie-2 and Elanora-1 locations along with pipelay between Annie-2 and Casino-5. A concurrent operations scenario was also considered involving simultaneous drilling activities at Elanora-1 and pipelay operations between Annie-2 and Casino-5.

The study assessed distances from operations to where underwater sound levels reached thresholds corresponding to various levels of potential impact to marine fauna. The animals considered here included marine mammals, turtles, and fish. Due to the variety of species considered, there are several different thresholds for evaluating effects, including: mortality, injury, temporary reduction in hearing sensitivity, and behavioural disturbance.

The modelling methodology considered scenario specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels for non-impulsive (continuous) noise sources presented as sound pressure levels (SPL, L_p), and as accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria. In this report, the duration of the SEL accumulation is defined as integrated over an 8- or 24-hour period.

The SPL metric is the root-mean-square pressure level over a stated frequency band over a specified time window. In this study, for continuous noise, a time window of 1 s was used. An animal travelling within the threshold can be exposed to a sound level could be exposed to behavioural disturbance. The SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding SEL_{24h} radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for 24 hours. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for 24 hours.

Maps are provided in the report to assist with contextualising tabulated distances. The key results of this modelling study are summarised in Tables 1 and 6.

Marine mammals:

The maximum distances to the (NOAA) (2024) marine mammal behavioural response criterion of 120 dB re 1 µPa (SPL) are presented in Table 1. The results for the criteria from NMFS (2024) for marine mammal Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) for MODU and vessel operations are assessed at in-field, the maximum distances and total ensonified areas are presented in Table 2. PTS is a form of auditory injury as it is referred to in NMFS (2024) (using the acronym AUD INJ), however in this report for consistency with previous work the term PTS is used.

Table 1. Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to the marine mammal behavioural response criterion of 120 dB re 1 µPa (SPL) from the most appropriate location for considered sources per scenario. MODU: Mobile Offshore Drilling Unit, OSV: Offshore Supply Vessel

Location	Operation	Description	R_{max} (km)	$R_{95\%}$ (km)

† This scenario is a combination of Scenario 5 at Elanora-1 and Scenario 6 to represent concurrent operations.

Sea Turtles:

The threshold criteria from Accomando et al. (2025) was used to assess PTS and TTS for sea turtles. Similar to marine mammals, PTS is a form of auditory injury as it is referred to in Accomando et al. (2025) (using the acronym AINJ), however in this report for consistency with previous work the term PTS is used. Across all scenarios the maximum distance to threshold for Annie and Elanora is shown in Table 3.

Table 3. Summary, SEL_{24h}: Maximum (R_{max}) horizontal distances (in km) to sound pressure level (SPL) criteria (Accomando et al. 2025) from most appropriate location for considered sources per scenario.

Location	Maximum (R_{max}) distance to threshold (km)	
	TTS	PTS
Annie-2	2.26	0.50
Elanora-1	4.45	0.49

Fish:

Sound produced by the MODU and/or vessel operations reach the sound levels associated with physiological effects, recoverable injury, and TTS for some fish species in close proximity to the sound sources (Table 4), but in order for the thresholds to be exceeded, the fish must remain at those distances for either 12 or 48 h.

Table 4. Summary: *SPL*: Maximum (R_{max}) horizontal distances (in km) to sound pressure level (SPL) criteria (Popper et al. 2014) from most appropriate location for considered sources per scenario.

Location	Maximum (R_{max}) distance to threshold (km)	
	TTS (12 h)	Recoverable injury (48 h)
Annie-2	0.13	0.03
Elanora-1	0.13	0.03

1. Introduction

JASCO Applied Sciences (JASCO) performed a modelling study of underwater acoustic noise levels associated with Amplitude Energy's Otway activities. The modelling study specifically predicted the distances from operations at which underwater sound levels reached noise effect thresholds and criteria. The corresponding marine mammal thresholds include levels associated with behavioural response, permanent threshold shift (PTS) and temporary threshold shift (TTS). The marine mammal functional hearing groups considered were low-, high-, very high-frequency cetaceans, and otariid seals. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), and accumulated sound exposure levels (over 24 hours) (SEL_{24h}, $L_{E,24h}$), as appropriate for non-impulsive (continuous) noise sources.

This report is further structured as follows, the remainder of Section 1 provides details on the scenarios considered for modelling, Section 2 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 3 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the considered sound sources and the environmental parameters. Section 4.1 presents the acoustic results as tabulated ranges to thresholds, Section 4.2 provides sound level contour maps. The acoustic modelling results are then discussed in Section 5.

1.1. Modelling Scenarios

Three well locations, Elanora-1, Annie-2, and Casino-5, were considered in this report to capture, and be representative of, the different geographic locations where activities may occur. Figure 1 displays an overview of the modelling area showing locations, the southern right whale BIA, the pygmy blue whale BIA, and the regional bathymetry. This study considered the following sound-producing activities:

- Drilling noise from an anchored Mobile Offshore Drilling Unit (MODU),
- Thruster noise from a MODU under dynamic positioning (DP),
- Vessel noise from an Anchor Handling Tug Supply (AHTS) on slow transit in prelay and hookup operations which was modelled as following a random track in a 2x2 km box centred around either Annie-2 or Elanora-1,
- Vessel noise from an Anchor Handling Tug Supply (AHTS) on slow transit in standby operation which was modelled as following a random track and was confined to a 2x4 km area approximately 2 km from either Annie-2 or Elanora-1,
- Vessel noise from an AHTS conducting resupply operations under DP,
- Vessel noise from an Infield Support Vessel (ISV) conducting pipelay operations following a track and making headway at a rate 600 m/hr,
- Vessel noise from a Dive Support Vessel (DSV) under DP and a Hyperbaric Rescue Vessel (HRV). . After reviewing the vessel specifications, the HRV was considered to be significantly quieter than the DSV such that noise from the DSV would dominate the sound field. Hence the HRV is listed here for completeness but was not modelled.
- Concurrent operations involving drilling activities at Elanora-1 and pipelay operations between Annie-2 and Casino-5.

These activities are typical and representative of operations that may be conducted within Amplitude Energy's Title areas. Table 5 and Table 6 outline the modelling locations and scenarios. The scenario

numbering in Table 6 refers to a unique activity, which may occur at a stated location. Hence results are presented with the scenario number together with a location as a unique identifier.

2. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is necessary to first establish exposure criteria (thresholds) for which sound levels may be expected to have an adverse effect on animals. Whether acoustic levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012a), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018), Southall et al. (2019), and NMFS (2024). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, SPL and SEL, are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over a 24-hour period. Appropriate subscripts indicate any frequency weighting applied (see Appendix 0). The acoustic metrics in this report reflect the ANSI and ISO standards for acoustic terminology, ANSI S1.1 (S1.1-2013) and ISO 18405:2017 (2017).

The following thresholds and guidelines for this study were chosen because they represent the best available science:

- Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from NMFS (2024) for the onset of temporary threshold shift (TTS) and permanent threshold shift (PTS) in marine mammals for non-impulsive sound sources. PTS is a form of auditory injury as it is referred to in NMFS (2024) (using acronym AUD INJ), however in this report for consistency with previous work the term PTS is used.
- Marine mammal behavioural threshold based on the current US National Oceanic and Atmospheric Administration (NOAA) (2024) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources.
- Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014).
- Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from (Accomando et al. 2025) for the onset of temporary threshold shift (TTS) and permanent threshold shift (PTS) (a form of auditory injury referred to as AINJ in Accomando et al. (2025)) in sea turtles.

Section 2.1, along with Appendices A.3 and A.4, expand on the relevant thresholds, guidelines, and sound levels applicable to marine mammals. Section 2.2 expands on the guidelines for fish and sea turtles.

2.1. Marine Mammals

The criteria applied in this study to assess possible effects of non-impulsive noise sources on marine mammals are summarised in Table 7. Cetaceans and otariids were identified as the marine mammals requiring assessment. As discussed within Accomando et al. (2025) and NMFS (2024), intense noise exposures can cause auditory injury (represented by either AUD INJ or AINJ) without PTS occurring. In this report, the terms PTS and auditory injury can be considered to be used interchangeably, however it is acknowledged that auditory injury may occur without PTS. Details on thresholds related to auditory threshold shifts or hearing loss and behavioural response are provided in Appendix A.3, with frequency weighting explained in detail in Appendix A.4.

Table 7. Criteria for effects of non-impulsive noise exposure, including vessel noise, for marine mammals: unweighted SPL and weighted SEL_{24h} thresholds.

Hearing group	NOAA (2024)	NMFS (2024)	
	Behaviour	TTS onset thresholds (received level)	PTS onset thresholds (received level)
	SPL (L_p; dB re 1 µPa)	Weighted SEL24h (LE,24h; dB re 1 µPa²·s)	Weighted SEL24h (LE,24h; dB re 1 µPa²·s)
Low-frequency (LF) cetaceans	120	177	197
High-frequency (HF) cetaceans		181	201
Very High-frequency (VHF) cetaceans		161	181
Otariid Seals		179	199

L_p denotes sound pressure level and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa²·s.

2.1.1. Behavioural Response

The NOAA continuous noise criterion was selected for this assessment because it represents the most commonly applied behavioural response criterion by regulators. The distances at which behavioural responses could occur are therefore determined by areas ensonified above an unweighted SPL of 120 dB re 1 µPa (NOAA 2024). Appendix A.3 provides more information about the development of this criterion.

2.1.2. Injury and Hearing Sensitivity Changes

There are two categories of auditory threshold shifts or hearing loss: temporary threshold shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued; and permanent threshold shift (PTS), a physical injury to an animal's hearing organs.

To assist in assessing the potential for effect on marine mammals, this report applies the criteria recommended by NMFS (2024), considering both TTS and PTS (see Table 7). Appendix A.3 provides more information about the NMFS (2024) criteria.

2.2. Fish, Sea Turtles, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and sea turtles based on work began by a NOAA panel two years earlier. The Working Group developed guidelines with specific thresholds for different levels of effects for several species groups (Popper et al. 2014). The guidelines define quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death;
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma;
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges,

these effects are not addressed in this report, and are included in Table 8 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish susceptibility to injury from noise exposure depends on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Sea turtles, fish eggs, and fish larvae are considered separately.

Table 8 lists the relevant effects thresholds from Popper et al. (2014) for shipping and continuous noise. Some evidence suggests that fish sensitive to acoustic pressure show a recoverable loss in hearing sensitivity, or injury when exposed to high levels of noise (Scholik and Yan 2002, Amoser and Ladich 2003, Smith et al. 2006); this is reflected in the SPL thresholds for fish with a swim bladder involved in hearing (shaded cells in Table 8). Accomando et al. (2025) presented revised thresholds for sea turtle TTS and PTS onset from continuous noise sources, considering frequency weighted SEL, which have been applied in this study (Table 9).

Table 8. Criteria for vessel noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Sea Turtles	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Sound pressure level dB re 1 µPa.
Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N) – tens of metres, intermediate (I) – hundreds of metres, and far (F) – thousands of metres.

Table 9. Acoustic effects of continuous noise on sea turtles, weighted SEL_{24h}, Accomando et al. (2025).

TTS onset thresholds (received level)	PTS onset thresholds (received level)
Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²s)
178	198

L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa²s.

3. Methods and Parameters

The modelled sites for the operations considered in this study were located on the continental shelf of south-eastern Australian (refer to wide regional bathymetry in Appendix B.1.1). The modelled sites were situated in water depths of approximately 56 – 77 m and represent or are considered representative of Amplitude Energy's Otway activity locations.

To allow for operational flexibility, the sound speed profile considered for modelling was selected through a sensitivity analysis considering all months. The month of August was found to be the most favourable for sound propagation and was selected for modelling. Additional detail can be found in Appendix B.1.2.

The seabed beneath the modelled sites will likely consist of variably cemented calcarenite (Port Campbell Limestone), for some sites a thin veneer of overlying coarse sand on top of the variably cemented calcarenite may be present. The geologic and geoacoustic profiles of the seabed were generated using lithographic descriptions from geotechnical and geophysical reports supplied by the client and considering previous underwater acoustic modelling and measurement studies. Appendix B.1.3 provides additional detail.

The following sections provided a description of the inputs used for this underwater noise modelling study. The sections are divided into subsections detailing the source inputs for the MODU, AHTS, ISV and DSV (Section 3.1) with Sections 3.2–3.3 providing details on the applied modelling techniques and model configuration information.

3.1. Vessel and Drilling Noise Sources

For the MODU on DP, MODU Drilling, AHTS on DP, AHTS standby transiting, the ISV conducting pipelay operations and the DSV and HRV on DP, Figure 2 presents a summary plot of considered source spectra for comparison purposes; additional detail on the sources is provided in Sections 3.1.1–3.1.2.3.

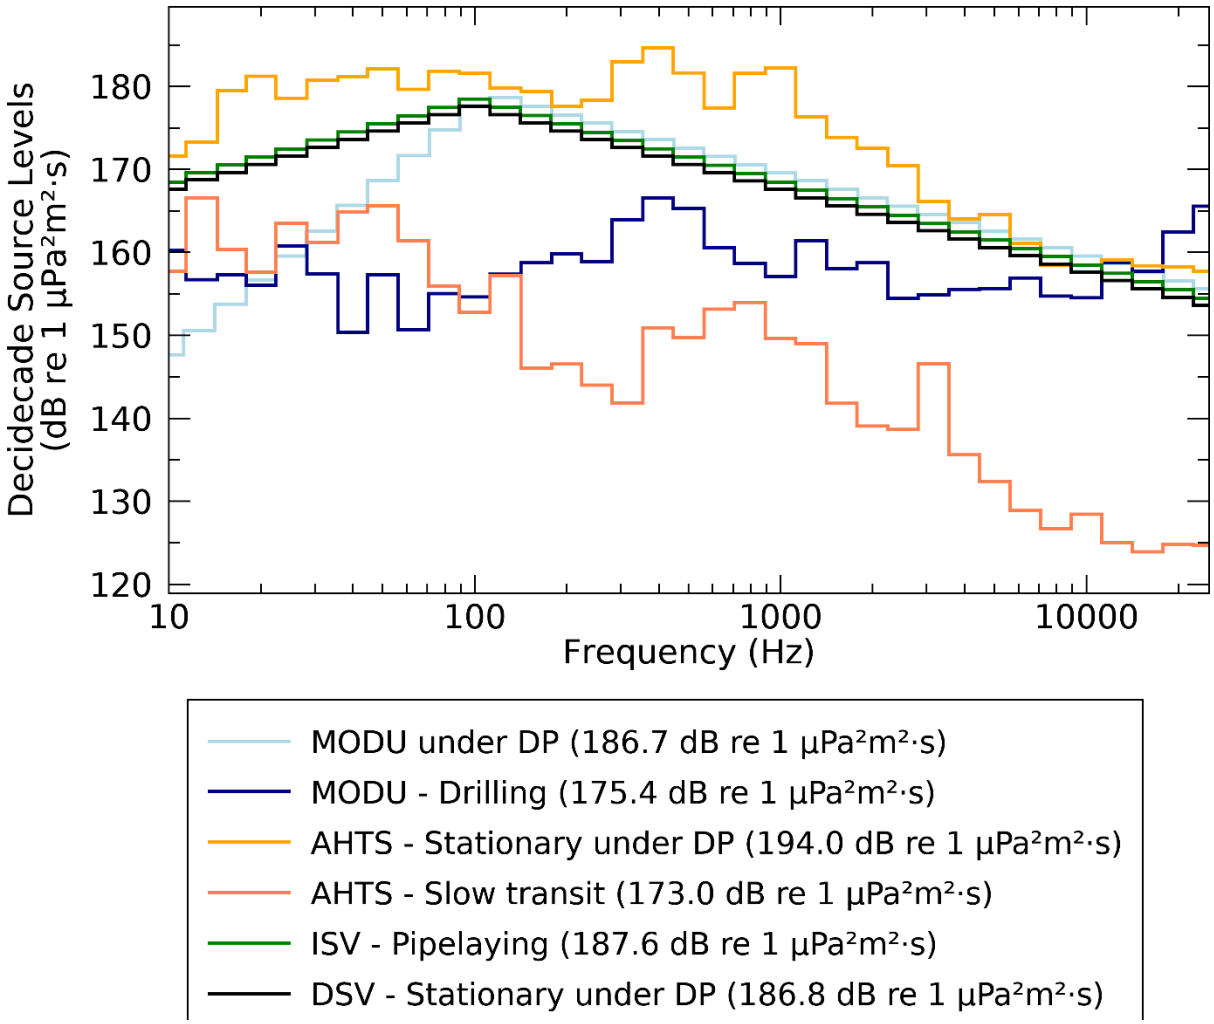

Figure 2. Source level (SL) spectra (in decidecade frequency-band) for all sound sources.

3.1.1. Mobile Offshore Drilling Unit (MODU)

The MODU, or semi-submersible platform, considered in this study is likely similar to the *Transocean Equinox*. While in operation, it will be held in position via anchors and chains, as opposed to using thrusters. Underwater sound from the MODU while drilling is expected to originate primarily from onboard equipment vibrations, while a smaller portion of the sound is expected to be transmitted directly into the water via the rotating drill string (Austin et al. 2018). Since the dominant vibration sources (e.g. pumps, generators, and machinery) are located on or below the main deck of the platform, the modelled depth of the point source representing the MODU was set to 11.6 m.

For drilling operations, the *Ocean Onyx* has been considered as a representative MODU for the *Transocean Equinox*. The *Ocean Onyx* (Figure 3) was measured by JASCO while anchored and drilling (McPherson et al. 2021), and had a broadband (10 Hz to 31 kHz) source level of 175.4 dB re 1 µPa m.

Figure 3. *Ocean Onyx* semi-submersible platform.

3.1.2. Vessel Radiated Noise

Underwater sound that radiates from vessels is produced mainly by propeller and thruster cavitation, with a smaller fraction of noise produced by sound transmitted through the hull, such as by engines, gearing, and other mechanical systems. Sound levels tend to be the highest when thrusters are used to position the vessel and when the vessel is transiting at high speeds. A vessel's sound signature depends on the vessel's size, power output, propulsion system (e.g., conventional propellers vs. Voith Schneider propulsion), and the design characteristics of the given system (e.g., blade shape and size). A vessel produces broadband acoustic energy with most of the energy emitted below a few kilohertz. Sound from onboard machinery, particularly sound below 200 Hz, dominates the sound spectrum before cavitation begins (Spence et al. 2007).

3.1.2.1. MODU under DP

While the MODU is positioning and anchors are being setup it is expected to be under DP where the primary source of noise is expected to originate from thrusters. Estimates of the source levels for the MODU is based on the *Transocean Equinox* from Woodside Energy Limited (2024). This had a broadband (10 Hz to 25 kHz) source level of 186.7 dB re 1 µPa m.

3.1.2.2. Anchor Handling Tug Supply (AHTS)

At this stage, the exact vessel specifications as well as the precise operational scenarios are not known. As such, estimates of the source levels for the Anchor Handling Tug Supply (AHTS) operations were based on a generic design AHTS vessel. The AHTS was based on the Siem VS491 CD design AHTS vessel (Figure 4) and it's specifications (Siem Offshore 2010) were used to form a basis for vessel source level estimation and source depth for acoustic modelling purposes. The general specification of these vessels is that they have a bollard pull of 285-310 t, and an overall length, beam, and draft of 91.0 m, 22.0 m and 7.95 m respectively.

The measured monopole source levels (MSLs) and spectra for the AHTS were taken from McPherson et al. (2021). For scenarios where the AHTS was under dynamic positioning (DP), the spectra from Section 5.5.2 in McPherson et al. (2021) were used.

Figure 4. Photo of an Anchor Handling Tug Supply (AHTS) vessel (Siem Offshore 2010).

3.1.2.3. Infield Support Vessel (ISV) and Dive Support Vessel (DSV)

As with the AHTS, at this stage the exact vessel specifications are not known. As such, estimates of the source levels for the ISV and DSV were based on a generic source spectrum and scaled based on thruster power comparisons.

3.1.2.3.1. Generic Offshore Vessel Source Spectrum

At the time of this study, the ISV and DSV vessels to be used in the project were unconfirmed and generic source spectrum used the estimate of the acoustic source levels for the ISV and DSV. These were estimated by scaling the spectrum based on the maximum utilised thruster power. The modelled source levels or the ISV and DSV were adjusted using Equation (1).

$$\mathrm{SL} = \mathrm{SL}_{\mathrm{ref}} + 10\log_{10}\left(\frac{P}{P_{\mathrm{ref}}}\right) \quad (1)$$

Here the modelled broadband source level (SL) was estimated from the broadband source level of the generic source ($\mathrm{SL}_{\mathrm{ref}}$) and the utilised thruster powers of the modelled ISV (or DSV) and generic sources (P and P_{ref}, respectively). The generic source spectrum for the was determined by the method described in Appendix B.2.

3.1.2.3.2. Infield Support Vessel (ISV)

The estimates of the source levels for the ISV were based on a proxy vessel, the Skandi Acergy (Figure 5) which has a total installed thruster power rating of 16,840 kW, and overall length, beam and draft of 156.9 m, 27.0 m and 8.5 m respectively. The propulsion system of the Skandi Acergy contains the following:

- 2 x 1,920 kW tunnel thrusters,
- 2 x 1,500 kW retractable azimuths,
- 2 x 3,000 kW contra-rotating azimuths,

- 1 x 4,000 kW shaft propeller + rudder.

However, while under DP the single rear main is not likely to be in use; therefore, for power scaling it was omitted. The total maximum thruster power while the ISV was on DP of 12,840 kW was used with Equation (1) for scaling.

Figure 5. Photo of the Skandi Acergy - proxy for an Infield Support Vessel (ISV).

3.1.2.3.3. Dive Support Vessel (DSV)

The estimates of the source levels for the ISV were based on a proxy vessel, the Skandi Singapore (Figure 6) which has a total installed thruster power rating of 10,500 kW, and overall length, beam and draft of 107.1 m, 21.0 m, and 6.6 m respectively. The propulsion system of the Skandi Singapore contains the following:

- 2 x 1500 kW bow tunnel thrusters,
- 1 x 1,500 kW retractable azimuth thruster,
- 2 x 3,000 kW stern azimuths thruster.

The total maximum thruster power while the DSV was on DP of 10,500 kW was used for with Equation (1) for scaling.

Figure 6. Photo of the Skandi Singapore proxy for a Dive Support Vessel (DSV).

3.2. Geometry and Modelled Regions

JASCO's Marine Operations Noise Model (MONM-BELLHOP; see Appendices B.3.2 and B.3.4) was used to predict the acoustic field at frequencies of 10 Hz to 25 kHz for all vessels. To supplement the MONM results, high-frequency results for propagation loss were modelled using Bellhop for frequencies from 1.26 to 25 kHz. The sound field modelling calculated propagation losses up to 80 km from the source, with a horizontal separation of 20 m between receiver points along the modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta = 2.5°$ for a total of N = 144 radial planes. Receiver depths were chosen to span the entire water column over the modelled areas, from 2 m to a maximum of 2600 m. To supplement the MONM results, high-frequency results for propagation loss were modelled using BELLHOP (Porter and Liu 1994) for frequencies from 1.25 to 10 kHz. The MONM and BELLHOP results were combined to produce results for the full frequency range of interest. For sites where the seabed geoacoustic model consisted of bare calcarenite, an additional broadband correction was applied to the results from MONM-BELLHOP to better account for the additional propagation loss associated with a limestone (calcarenite) seabed (see Appendix B.3.4).

To produce the maps of received sound level isopleths, and to calculate distances to specified sound level thresholds, the maximum-over-depth level was calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth levels were then resampled (by linear triangulation) to produce a regular Cartesian grid. The contours and threshold ranges were calculated from these grids of the modelled acoustic fields.

3.3. Accumulated SEL

In this study, the sound sources were considered to be continuously operating with new sound energy constantly being introduced to the environment. The reported source levels are usually in terms of sound pressure levels (SPL), representing the average instantaneous acoustic level of a considered source. The evaluation of the cumulative sound field (i.e., in terms of SEL_{24h}) depends on the number of seconds of operation during the accumulation period.

For all stationary source (MODU and vessels), the SPL modelling results were converted to SEL by the duration of the measurement, which is appropriate for a non-impulsive noise source. As SEL was assessed over 24 h and for a stationary vessel over a day, the conversion from SPL was obtained by increasing the levels by $10*\log_{10}(T)$, where T is 86,400 (the number of seconds in 24 h). For scenarios where a vessel was transiting along a track a similar adjustment to the SPL was applied, however the time factor was determined based on the step size along the track and the vessel's speed. See Appendix B.2.2 for detail.

4. Results

The maximum-over-depth sound fields for the modelled scenarios are presented below in two formats: as tables of distances to sound levels and, where the distances are long enough, as contour maps showing the directivity and range to various sound levels.

For the results below, the distances to isopleths/thresholds were reported from either the centroid of several sources or from the most dominant single source. When an isopleth completely envelopes multiple sources the centroid was used. When several closed isopleths exist the most dominant source was used. Maps and are provided in Section 4.2 to assist in with contextualising tabulated distances.

4.1. Tabulated Results

Tables 10–13 present the maximum and 95% distances to SPL. The SPL sound footprints presented represent the instantaneous sound field and do not depend on time accumulation. Tables 14–17 present the maximum distances to frequency-weighted SEL_{24h} thresholds, as well as total ensonified area.

Table 10. *Annie-2, SPL*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL) from most appropriate location for considered sources per scenario. Scenario descriptions are given in Table 5.

4.2. Sound Field Maps

Maps of the estimated sound fields, threshold contours, and isopleths of interest for SPL and SEL_{24h} sound fields are presented for the modelled vessel scenarios. In some cases, the isopleths had several contours. This can occur as a result of the reflection of the sound field off the seafloor, creating an additional ring around the initial isopleth. The first isopleth is generally axially symmetric since it spreads without the influence of the bathymetry, while the second isopleth is more complex due to the interaction between the sound field and the seabed.

4.2.1. SPL Sound level Contour Maps

Maps of the estimated sound fields, threshold contours, and isopleths of interest for SPL and SEL_{24h} sound fields are presented for the Amplitude Energy Otway subsea noise modelling.

Thresholds omitted here were not reached or not long enough to display graphically.

5. Discussion and Conclusion

The sound speed profile (Appendix B.1.2) was derived from data from the U.S. Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). The month of August was chosen based on an analysis of the temperature, salinity, and sound speed profiles extracted from this database. The final profile consisted of a combination of three representative profiles from within the modelled area to capture the propagation effects associated with shallow and deep-water areas.

The August sound speed profile was primarily upward refracting between the sea surface and 160 m water depth. The upward refracting section of the profile may result in energy being refracted away from the seabed and back into the water column, which can lead to large distances to isopleths compared to other months. The upward refracting sound speed profile has the potential trap frequencies above 93 Hz based on the thickness of the refracting layer (Jensen et al. 2011). These frequencies also correspond to the majority of the highest spectral levels for the considered sources detailed in Section 3.1, which can further enhance large distances to isopleths and criteria compared to other months.

Considering activity locations are situated on the continental shelf, variations in bathymetry were generally gradual within the modelled areas. Any variations in the bathymetry had a small effect on the predicted sound field footprints as manifested in the generally symmetric sound field footprints. However, the composition of the seabed used for modelling had a more substantial influence when comparing the threshold radii and sound field footprints between the Annie-2 and Elanora-1 areas. The presence of a thin veneer of un-consolidated coarse sand overlying semi-cemented carbonate rock at Elanora-1 led to a more reflective seabed and likely led to larger isopleths for low level thresholds than Annie-2. This is most evident for the marine mammal behavioural threshold of 120 dB re 1 µPa (SPL) for non-impulsive sound sources, where the Elanora-1 radii and areas are larger than Annie-2 radii and areas. However, the distribution of sand over cemented carbonate appears to be variable in the Otway Basin; (McPherson et al. 2021). Towards the Elanora-1 area, for simplicity, modelling has assumed a sand layer throughout the area. In reality, the sand layer may be present or absent depending on exact location and hence radii may be smaller than predicted. In general, the sediment cover along the continental shelf of the Otway region is minimal and non-uniform (James and Bone 2010).

The modelled scenarios generally considered activities at either Elanora-1 or Annie-2. The exception are, pipelay between Annie-2 and Casino-5 and the concurrent operations with drilling activities at Elanora-1 occurring at the same time as pipelay between Annie-2 and Casino-5 (Scenario 8). The concurrent operations scenario (Scenario 8) was considered to capture what may be a worst-case occurrence, with multiple simultaneous operations occurring. Figures 21–23 show the potential difference in the SPL contours when the pipelay may occur simultaneously but at different locations along the route with drilling activities at Elanora-1. These contours can be compared to Figure 15 for the same drilling activities at occurring only at Elanora-1. Whilst the total ensonified area and isopleth contours do increase when activities at Elanora-1 are considered with pipelay between Annie-2 and Casino-5, the resultant contours to isopleths like the behavioural response criteria of 120 dB re 1 µPa (SPL) do not significantly change. This is likely due to the activities at Elanora-1 occurring over a more reflective seabed, as discussed above, and containing louder sources than the pipelay activity. Within this modelled scenario activities at Elanora-1 are predicted to be the dominant contributor to the sound field. For PTS and TTS thresholds, for all considered hearing groups, Figure 40 show the result of the concurrent operations scenario. The additional energy that is included by considering both sets of operations simultaneously is not substantial enough to increase the size of contours such that they join. As such, for the considered concurrent scenario, the distances to PTS and TTS thresholds are approximately the same whether activities occur independently or simultaneously.

For the tables presented in Section 4.1, where a dash is used in place of a horizontal distance, these thresholds may or may not be reached. Due to the discretely sampled 20 m calculation grids of the modelled sound fields, distances to these levels could not be estimated for practicable computational purposes. It is likely that SPL isopleths could be reached at distances between the source and the modelled horizontal resolution (20 m); however, distances to injurious accumulated SEL thresholds may not be reached at any range greater than the source due the species-specific frequency weighing functions. Additionally, if close-to-source radii are comparable to the dimensions of the modelled vessel (MODU, AHTS, ISV or DSV) then they may only be reached within close proximity to a vessel, if at all.

The key results of this modelling study are summarised in Tables 18 and 19 below. These tables present the maximum distances to relevant criteria and/or thresholds. Table 18 summarises scenarios 1–7 and associated operations which may occur at Annie-2, Elanora-1, and pipelay between Annie-2 and Casino-5. Table 19 summarises potential concurrent drilling operations at Elanora-1 and pipelay operations between Annie-2 and Casino-5.

Table 18. Summary of maximum (R_{max}) horizontal distances (in km) to the behavioural response threshold, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. The maximum across scenarios 1–7 at Annie-2, Elanora-1, and pipelay between Annie-2 and Casino-5 are reported here.

Hearing group	Modelled distance to effect threshold (R_{max})					
	Behavioural response[a]	TTS[b]	PTS[b]	Behavioural response[a]	TTS[b]	PTS[b]
	Annie-2			Elanora-1		
Low-frequency (LF) cetaceans	7.87	3.60	0.40	21.7	7.54	0.50
High-frequency (HF) cetaceans		0.47	0.03		0.66	0.04
Very High-frequency (VHF) cetaceans		0.69	0.11		0.88	0.09
Otariid Seals		0.44	0.03		0.56	0.03

Noise exposure criteria: [a] NOAA (2024) and [b] NMFS (2024).

Table 19. Summary of maximum (R_{max}) horizontal distances (in km) to the behavioural response threshold, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. For the concurrent scenario (Scenario 8) with drilling at Elanora-1 and pipelay between Annie-2 and Casino-5

Hearing group	Modelled distance to effect threshold (R_{max})		
	Behavioural response[a]	TTS[b]	PTS[b]
	Concurrent		
Low-frequency (LF) cetaceans	30.7	7.50	0.48
High-frequency (HF) cetaceans		0.90	0.03
Very High-frequency (VHF) cetaceans		1.14	0.12
Otariid Seals		0.57	0.03

Noise exposure criteria: [a] NOAA (2024) and [b] NMFS (2024).
This scenario is a combination of Scenario 5 at Elanora-1 and Scenario 6 to represent concurrent operations.

Table 20. Summary of maximum (R_{max}) horizontal distances (in km) to the behavioural response threshold, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. The maximum across scenarios 9 and 10 at Annie-2 and Elanora-1 are shown.

Hearing group	Modelled distance to effect threshold (R_{max})					
	Behavioural response[a]	TTS[b]	PTS[b]	Behavioural response[a]	TTS[b]	PTS[b]
	Annie-2			Elanora-1		
Low-frequency (LF) cetaceans	8.02	3.88	0.61	24.8	7.92	0.67
High-frequency (HF) cetaceans		0.71	0.03		0.88	0.04
Very High-frequency (VHF) cetaceans		0.87	0.07		1.15	0.06
Otariid Seals		0.68	0.03		0.82	0.03

Noise exposure criteria: [a] NOAA (2024) and [b] NMFS (2024).

Appendix A. Acoustic Metrics

This section describes in detail the acoustic metrics, impact criteria, and frequency weighting relevant to the modelling study.

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI S1.1-2013).

The sound pressure level (SPL or L_p; dB re 1 µPa) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10 \log_{10} \left(\frac{1}{T} \int_T g(t)\, p^2(t)\, dt / p_0^2 \right) \text{ dB} \tag{A-1}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function.

The sound exposure level (SEL or L_E; dB re 1 µPa^2·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10 \log_{10} \left(\int_T p^2(t)\, dt / T_0 p_0^2 \right) \text{ dB} \tag{A-2}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10 \log_{10} \left(\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \right) \text{ dB}\,. \tag{A-3}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LFC,24h}$; Appendix 0). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a "1/3 octave" because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the ith band, $f_c(i)$, is defined as:

$$f_c(i) = 10^{\frac{i}{10}} \text{ kHz} \tag{A-4}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i) \tag{A-5}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 10 (f_c (10) = 10 Hz) to band 44 ($f_c(44)$ = 25 kHz).

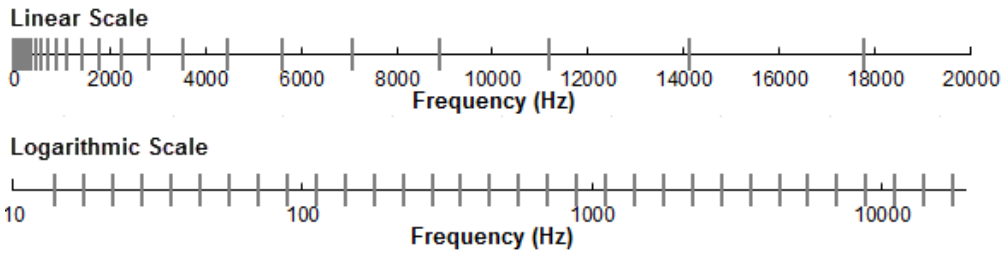

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{lo,i}$ and $f_{hi,i}$:

$$L_{p,i} = 10\, log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f)\, \mathrm{d}f \text{ dB} \tag{A-6}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_i 10^{\frac{L_{p,i}}{10}} \text{ dB} \tag{A-7}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient sound signal. Because the decidecade bands are wider than 1 Hz, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

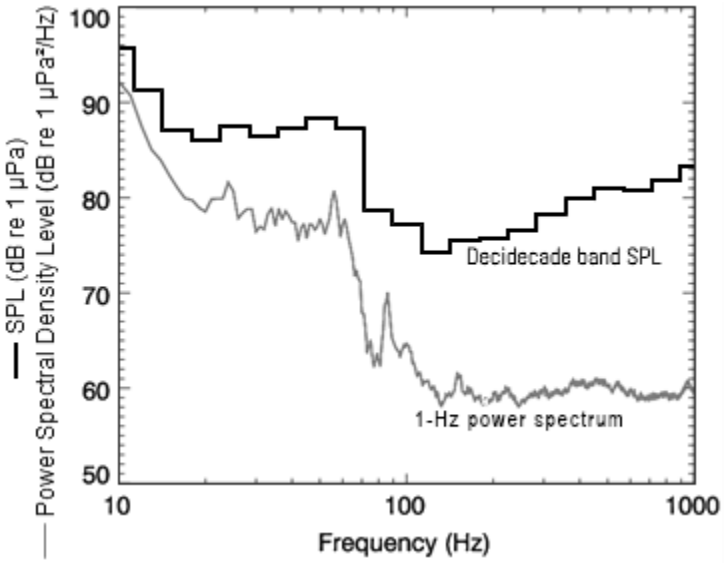

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the power spectrum.

A.3. Marine Mammal Noise Effect Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggest that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for auditory injury, impairment, and disturbance. The following sections summarise the recent development of thresholds; however, this field remains an active research topic.

A.3.1. Injury and Hearing Sensitivity Changes

In recognition of shortcomings of the SPL-only based auditory injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual auditory injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for humans; see Appendix A.4). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower PTS and TTS values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 $\mu Pa^2 \cdot s$. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced the Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 $\mu Pa^2 \cdot s$.

As of present, a definitive approach is still not apparent. There is consensus in the research community that an SEL-based method is preferable, either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes auditory injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012b). The latest revision to this work was published in 2024 (NMFS 2024).

A.3.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

NMFS currently uses a step function (all-or-none) threshold of 120 dB re 1 µPa SPL (unweighted) for non-impulsive sounds to assess and regulate noise-induced behavioural impacts on marine mammals (NOAA 2024). The 120 dB re 1 µPa threshold is associated with continuous sources and was derived based on studies examining behavioural responses to drilling and dredging (NOAA 2018), referring to Malme et al. (1983), Malme et al. (1984), and Malme et al. (1986), which were considered in Southall et al. (2007). Malme et al. (1986) found that playback of drillship noise did not produce clear evidence of disturbance or avoidance for levels below 110 dB re 1 µPa (SPL), possible avoidance occurred for exposure levels approaching 119 dB re 1 µPa. Malme et al. (1984) determined that measurable reactions usually consisted of rather subtle short-term changes in speed and/or heading of the whale(s) under observation. It has been shown that both received level and proximity of the sound source is a contributing factor in eliciting behavioural reactions in humpback whales (Dunlop et al. 2017, Dunlop et al. 2018).

A.4. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.4.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^{2}\right]^{a}\left[1+(f/f_{hi})^{2}\right]^{b}}\right)\right] \quad \text{(A-8)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by NMFS (2024). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values, however, the terminology for mid- and high-frequency cetaceans was changed to high- and very high-frequency cetaceans (VHF cetaceans). Table A-1. lists the frequency-weighting parameters for each hearing group relevant to this assessment, and Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by NMFS (2024).

	NMFS (2024)				
Functional Hearing group	**a**	**b**	**flo (kHz)**	**fhi (kHz)**	**C (dB)**
Low-frequency cetaceans (baleen whales)	0.99	5	0.168	26.6	0.12
High-frequency cetaceans (most dolphins, plus sperm, beaked, and bottlenose whales)	1.55	5	1.73	129	0.32
Very high-frequency cetaceans (true porpoises, *Kogia*, river dolphins, *Cephalorhynchus* spp., *Lagenorhynchus cruciger* and *L. australis*)	2.23	5	5.93	186	0.91
Otariid Seals in water	1.58	5	2.53	43.8	1.37

* The 'C' parameter in NMFS (2024) is equivalent to the 'K' parameter in Finneran (2015).

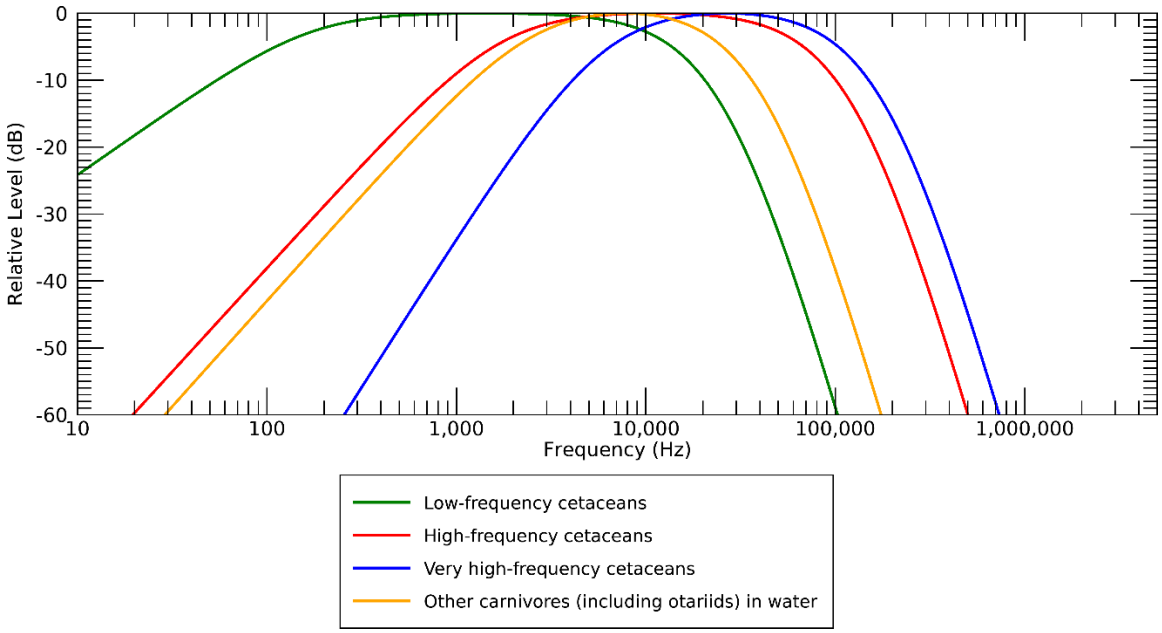

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by NMFS (2024).

Appendix B. Methods and Parameters

B.1. Environmental Parameters

B.1.1. Bathymetry

Bathymetry throughout the modelled area was extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded and combined onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 250 × 250 m (Figure B-1).

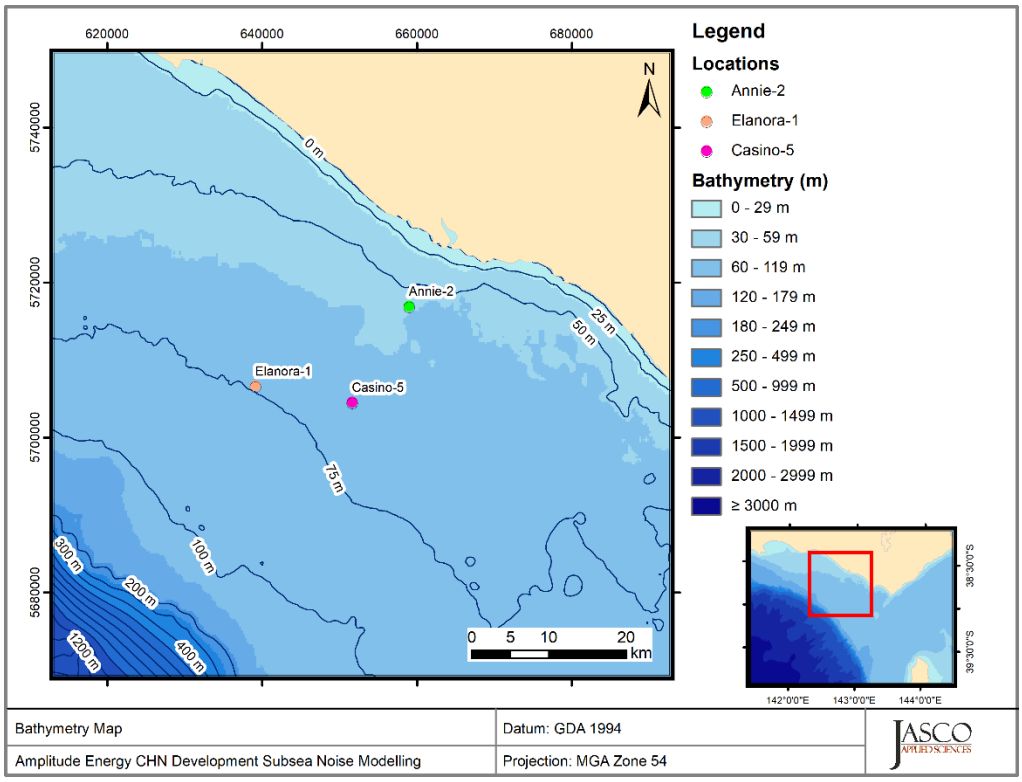

Figure B-1. Bathymetry in the modelled area.

B.1.2. Sound Speed Profile

The sound speed profile in the area was derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles at distances less than 40 km around the modelled site. The August sound speed profile is expected to be most favourable to longer-range sound propagation across the entire year which was determined by modelling a reduced number of transects for every month and comparing the ranges to thresholds. As such, August was

selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure B-2 shows the resulting profile, which was used as input to the sound propagation modelling.

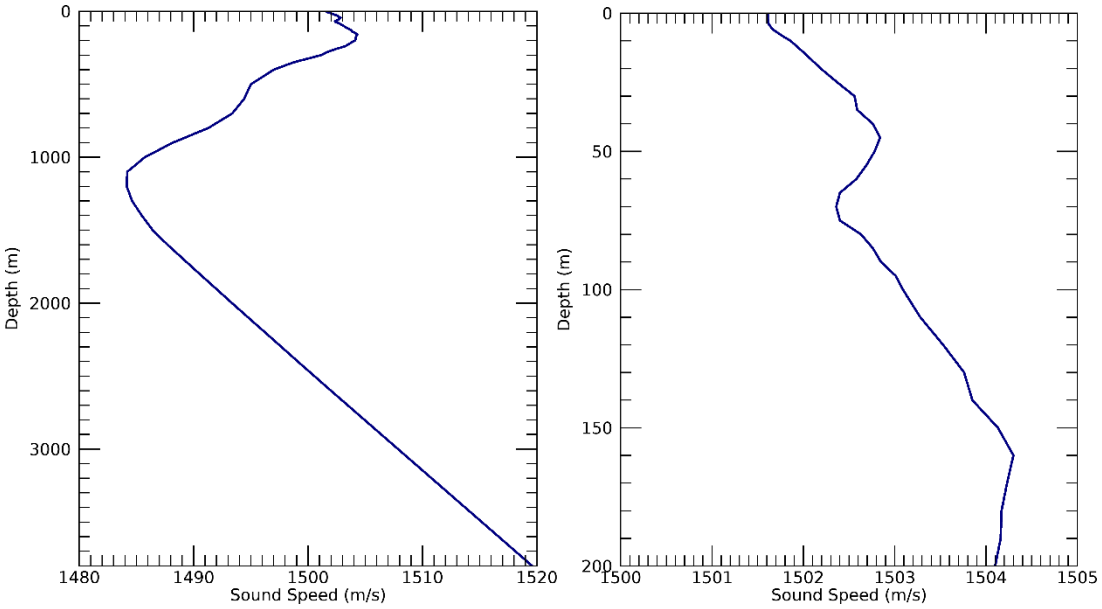

Figure B-2. The modelling sound speed profile corresponding to August: full profile (left) and top 200 m (right) Profiles are calculated from temperature and salinity profiles from Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

B.1.3. Geoacoustics

The propagation model used in this study consider a single geoacoustic profile for each well site area. Similar to previous modelling studies in the region (Wood and McPherson 2018, Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), two seabed types were considered for modelling. Both seabed profiles are indicative of seabed environments located on the continental shelf of the Otway region and are consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010).

The geoacoustic profiles Elanora-1, Casino-5 and Annie-2 well sites were generated using lithographic descriptions from the geotechnical and geophysical reports supplied by the client and considering previous underwater acoustic modelling and measurement studies (Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021). Within the vicinity of Annie-2 the seabed is likely to consist of a well-cemented calcarenite caprock over a semi-cemented calcarenite. Near the Elanora-1 and Casino-5 locations, the seabed is likely to consist of a thin layer of coarse sand overlying a similar calcarenite structure. This sand layer may not be consistently present. In all cases, the calcarenite layering likely extended to many hundreds of metres below the seafloor.

Table B-1 and Table B-2 present the geoacoustic profiles used modelled sites in each respective development area.

Table B-1. Geoacoustic profile for Annie-2 associated modelled sites.

Depth below seafloor (m)	Material	Density (g/cm^3)	P-wave speed (m/s)	P-wave attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-1	Well-cemented carbonate caprock	2.7	2600	0.5	1200	0.5
1-20	Increasingly cemented calcarenite	2.2	2000	0.30	900	0.27
20-40		2.3	2120	0.34	960	0.31
40-60		2.4	2240	0.38	1020	0.36
60-80		2.5	2360	0.42	1080	0.41
80-10		2.6	2480	0.46	1140	0.45
>100	Well-cemented calcarenite	2.7	2600	0.50	1200	0.50

Table B-2. Geoacoustic profile for Elanora-1 and Casino-5 associated modelled sites.

Depth below seafloor (m)	Material	Density (g/cm^3)	P-wave speed (m/s)	P-wave attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-1.5	Coarse carbonate sand	2.0	1800	0.85	300	3.68
1.5-2.5	Well-cemented carbonate caprock	2.7	2600	0.50	1200	0.50
2.5-22.5	Increasingly cemented calcarenite	2.2	2000	0.3	900	0.27
22.5-42.5		2.3	2120	0.34	960	0.31
42.5-62.5		2.4	2240	0.38	1020	0.36
62.5-82.5		2.5	2360	0.42	1080	0.41
82.5-102.5		2.6	2480	0.46	1140	0.45
>102.5	Well-cemented calcarenite	2.7	2600	0.50	1200	0.50

B.2. Estimated Vessel Source Levels

At the time of this study, the Platform Support Vessel (ISV) and Dive Support Vessel (DSV) to be used in the project were unconfirmed and a generic source level was proposed. Similar to the approach detailed Connell et al. (2021) in different vessels were identified as either potential ISV or RDSV vessels, therefore the source level and spectrum used to represent any of these four vessels was based on the nominal specifications for all indicated vessels, due to similarity in dimensions and total installed power ratings. This nominal vessel has an 89.2 m overall length, 20 m breadth, and 7.6 m maximum draft.

A main propulsion system is this generic vessel comprised of the following specifications.

Two stern propellers with

- 3.2 m propeller diameter,
- 165 rpm nominal propeller speed,

- 2,200 kW maximum continuous power input, and
- Typical DP operation at 26% MRC.

Additional thruster modules active during DP operations may include bow tunnel thrusters and a bow azimuth thruster. The two bow tunnel thrusters for the generic vessel were comprised of:

- 2.0 m propeller diameter,
- 318 rpm nominal propeller speed,
- 1,000 kW maximum continuous power input, and
- Typical DP operation at 17% MRC.

The bow azimuth thruster generic vessel was comprised of:

- 1.65 m propeller diameter,
- 373 rpm nominal propeller speed,
- 830 kW maximum continuous power input, and
- Typical DP operation at 21% MRC

Estimates of the acoustic source levels were based on the parameters of the propulsion system together with the method descripted in Appendix B.2.1, and the percent of Maximum Continuous Rating (MCR) for the vessel operating at during typical DP operations, as provided by the potential vessel operators.

B.2.1. Thruster Source Level Estimation

A vessel equipped with propellers/thrusters has two primary sources of sound that propagate from the unit: the machinery and the propellers. For thrusters operating in the heavily loaded conditions, the acoustic energy generated by the cavitation processes on the propeller blades dominates (Leggat et al. 1981). The sound power from the propellers is proportional to the number of blades, the propeller diameter, and the propeller tip speed.

Based on an analysis of acoustic data, Ross (1976) provided the following formula for the sound levels from a vessel's propeller, operating in calm, open ocean conditions:

$$L_{100} = 155 + 60\log(u/25) + 10\log(B/4)\,, \qquad \text{(B-1)}$$

where L_{100} is the spectrum level at 100 Hz, u is the propeller tip speed (m/s), and B is the number of propeller blades. Equation B-1 gives the total energy produced by the propeller cavitation at frequencies between 100 Hz and 10 kHz. This equation is valid for a propeller tip speed between 15 and 50 m/s. The spectrum is assumed to be flat below 100 Hz. Its level is assumed to fall off at a rate of −6 dB per octave above 100 Hz (Figure B-3).

Another method of predicting the source level of a propeller was suggested by Brown (1977). For propellers operating in heavily loaded conditions, the formula for the sound spectrum level is:

$$\mathrm{SL}_B = 163 + 40\log D + 30\log N + 10\log B + 20\log f + 10\log(A_c/A_D)\,, \qquad \text{(B-2)}$$

where D is the propeller diameter (m), N is the propeller revolution rate per second, B is the number of blades, A_C is the area of the blades covered by cavitation, and A_D is the total propeller disc area. Similar to Ross's approach, the spectrum below 100 Hz is assumed to be flat. The tests with a naval propeller operating at off-design heavily loaded conditions showed that Equation B-2 should be used with a value of $(A_c/A_D) = 1$ (Leggat et al. 1981).

The combined source level for multiple thrusters operating together can be estimated using the formula:

$$\mathrm{SL}_{\mathrm{total}} = 10\log_{10}\sum_{i} 10^{\frac{SL_i}{10}}, \tag{B-3}$$

where $SL_{1,\ldots,N}$ are the source levels of individual thrusters. If the vessel is equipped with the same type of thrusters, the combined source level can be estimated using the formula:

$$\mathrm{SL}_N = \mathrm{SL} + 10\log N \tag{B-4}$$

where N is the total number of thrusters of the same type.

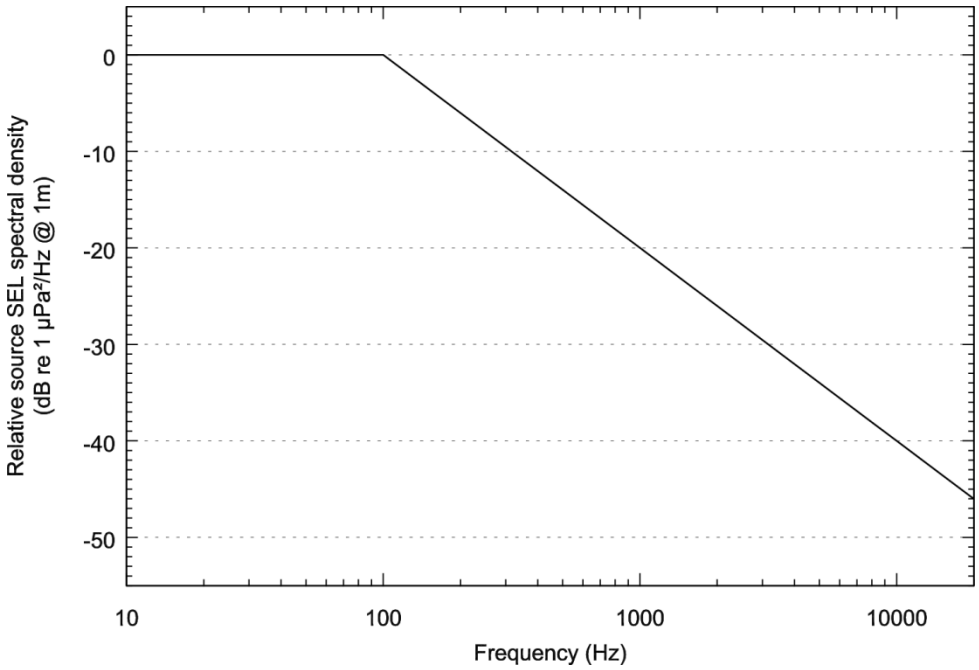

Figure B-3. Estimated sound spectrum from cavitating propeller (Leggat et al. 1981).

B.2.2. Estimating Sound Field from Moving Vessels

During vessel transit, new sound energy is constantly being introduced to the environment. The noise footprint for the transiting vessels considered in this report were estimated by modelling the 1-s SEL for the vessel at one location, and by translating and summing these footprints along the vessel transit routes. The vessel locations along the tracks were spaced uniformly, with an approximate step of $\Delta s \approx 100$ m.

The SEL sound field at any given point along the path is dependent upon the duration of exposure, which with a fixed footprint spacing depends upon the speed of the vessel during each segment of the transit. The 1-s SEL footprint at each vessel location (i) were therefore scales based on the speed of the vessel following:

$$\mathrm{SEL}_i = \mathrm{SEL}_{1s} + 10\log_{10}\left(\frac{\Delta s}{v}\right). \tag{B-5}$$

where v represents the vessel speed in m/s.

The present method acceptably reflects large-scale sound propagation features, primarily dependent on water depth, which dominate the cumulative field and is thus considered to provide a meaningful estimate of the SEL_{24h} field.

B.3. Sound Propagation Models

B.3.1. Propagation Loss

The propagation of sound through the environment was modelled by predicting the acoustic propagation loss—a measure, in decibels, of the decrease in sound level between a source and a receiver some distance away. Geometric spreading of acoustic waves is the predominant way by which propagation loss occurs. Propagation loss also happens when the sound is absorbed and scattered by the seawater, and absorbed scattered, and reflected at the water surface and within the seabed. Propagation loss depends on the acoustic properties of the ocean and seabed; its value changes with frequency.

If the acoustic energy source level (ESL), expressed in dB re 1 $\mu Pa^2 \cdot s\ m^2$, and propagation loss (PL), in units of dB, at a given frequency are known, then the received level (RL) at a receiver location can be calculated in dB re 1 $\mu Pa^2 \cdot s$ by:

$$RL = SL - PL. \tag{B-6}$$

B.3.2. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). While other models may be more accurate for steep-angle propagation in high-shear environment, MONM is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 10 Hz to 1.6 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the U.S. Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies > 1.6 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

MONM computes acoustic fields in three dimensions by modelling propagation loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure B-4).

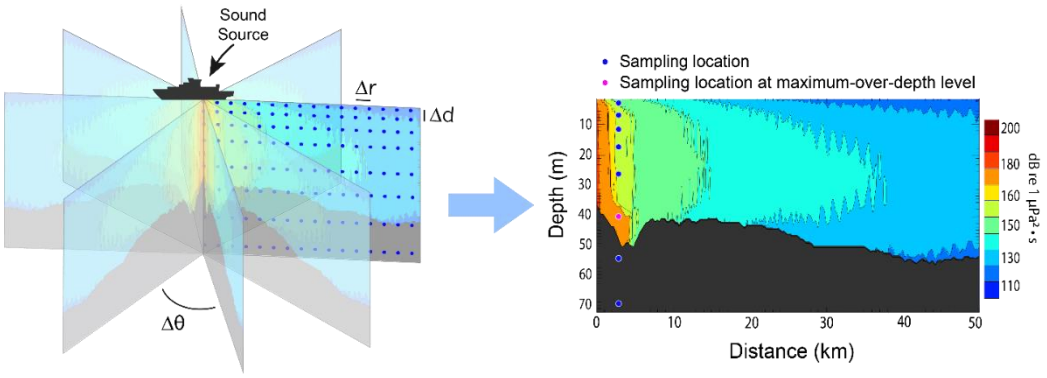

Figure B-4. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic propagation loss at the centre frequencies of decidecade bands. Sufficiently many decidecade frequency-bands, starting at 10 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the propagation loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade received per-second SEL are computed by subtracting the band propagation loss values from the directional source level in that frequency band. Composite broadband received per-second SEL are then computed by summing the received decidecade levels.

The received 1-s SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. For areas with deep water, sampling is not performed at depths beyond those reachable by marine mammals. The received per-second SEL at a surface sampling location is taken as the maximum value that occurs over all samples within the water column, i.e., the maximum-over-depth received per-second SEL. These maximum-over-depth per-second SEL are presented as colour contours around the source.

B.3.3. Wavenumber Integration Model

VSTACK computes propagation loss versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. Typically, VSTACK is best suited to modelling the sound field near the source; however, it can also be used in conjunction with MONM to account for additional bottom loss in high shear speed seabeds as described in Section B.3.4.

B.3.4. Limestone Seabed Propagation Loss

For sites where the seabed geoacoustic model consisted of bare calcarenite, an additional broadband correction was applied to the propagation loss results from MONM to better account for the additional

propagation loss associated with a limestone (calcarenite) seabed (Duncan et al. 2009). The accuracy of the broadband calculated propagation loss for the South-eastern continental shelf of Australia depends significantly upon the frequency content of the radiating sound source together with thickness of any overlying layers of unconsolidated sediment (e.g. sand) on top of calcarenite likely to occur within the region.

In general, the thinner the sand layer, the greater the overall propagation loss. When comparing SPL data McPherson et al. (2021), higher rates of propagation loss were observed and were attributed to, an absorptive carbonate (calcarenite) seabed. In this study, comparisons were conducted using JASCO's Marine Operations Noise Model (MONM), a wide-angle parabolic equation model which applies the BELLHOP Gaussian beam acoustic ray-trace model at higher frequencies, and JASCO's wavenumber integration model (VSTACK, Appendix B.3.3) which can fully account for the elasto-acoustic properties of the sub-bottom.

To account for the additional propagation loss associated with a cemented calcarenite seabed, an additional broadband correction was applied to the propagation loss results from MONM to account for the higher rates of loss when the full for the elasto-acoustic properties of the sub-bottom are consider. The differences between the broadband SPL from MONM and VSTACK were extracted at the same modelled ranges and depths that corresponded range independent predictions. The 90th percentile of the resultant dB differences in 250 m range bins were selected to generate a correction function for each individual site/source to be modelled. The conversion functions were applied after the propagation loss calculation from MONM but before summing decidecade band levels, gridding, and radii calculations for each modelled site in each modelled scenario considered.

B.4. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure B-5).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure B-5(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure B-5(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

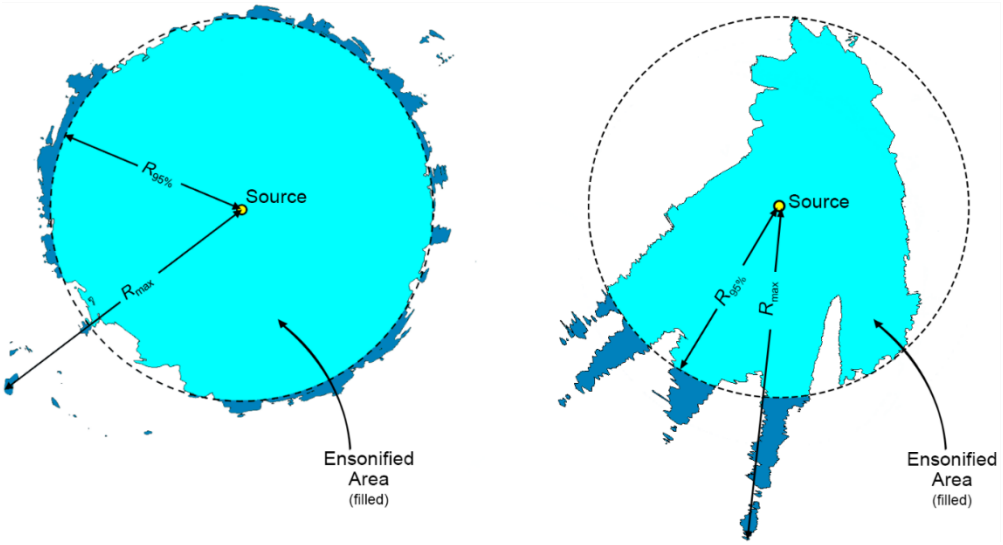

Figure B-5. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

B.5. Model Validation Information

Predictions from JASCO's propagation models (MONM, FWRAM, and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Artic, Canadian and southern United States waters, Greenland, Russia and Australia (e.g. Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018, Quijano et al. 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities that have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016, Austin et al. 2018, Beach Energy Limited 2020).

1.0 Identification of Relevant Persons – 25(1)(a) and (b)

Table 1-1: Identification of Relevant Persons – 25(a) and (b)

ID	Relevant person	Relevant persons category	Primary group	Sub-group	General description	Why relevant persons for ASP	Level of effort	How found
Commonwealth or State agency or authority 25(1)(a)								
26	Australian Border Force (ABF) (Maritime Border Command-MBC))	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	Responsible for coordinating maritime security	Activities in offshore Australian waters may be relevant to the ABF as security issues may evolve in any offshore location.	2	Existing database
29	Australian Communications and Media Authority (ACMA)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	Regulator for communications and media services.	Activities may be relevant to ACMA as there may be potential impacts and risks to submarine cables.	2	Existing database
97	Australian Department of Agriculture, Fisheries and Forestry (DAFF) - Biosecurity (marine pests)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	DAFF has primary policy and regulatory responsibility for managing marine pest biosecurity through administering the Biosecurity Act.	Activities may be relevant to DAFF as they may present a biosecurity risk.	2	Existing database
98	Australian Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries (Note- during consultation for the ASP EP, email for DAFF Biosecurity (vessels, aircraft and personnel was also directed to the DAFF Fisheries address)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	The Department of Agriculture, Fisheries and Forestry (DAFF) has primary policy responsibility for promoting the biological, economic and social sustainability of Australian fisheries.	Activities may be relevant to DAFF as they will be carried out over numerous Commonwealth fisheries, potentially impacting Commonwealth fishery licenced operators, and/or commercial fish stock. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
101	Department of Climate Change, Energy, the Environment and Water (DCCEEW) - Sea Dumping Section	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	DCCEEW has responsibility for the Environment Protection (Sea Dumping) Act 1981 (Sea Dumping Act), which implements Australia's commitments as a contracting party to the 1996 Protocol to the Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972.	Activities may be relevant to DCCEEW with respect to waste disposal and/or any plug and abandonment activities. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
102	Department of Climate Change, Energy, the Environment and Water (DCCEEW) - Underwater Cultural Heritage	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	DCCEEW administers the Underwater Cultural Heritage Act 2018 (UCH Act). DCCEEW regulates activities in relation to protected underwater cultural heritage (UCH) within Australian waters including the Commonwealth marine area.	Activities may be relevant to DCCEEW as there is potential impact to underwater cultural heritage. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
105	Australian Department of Defence (DOD)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	Responsible for defending Australia and its national interests. DoD's role requires not only naval warfare capabilities but also disaster relief, search and rescue, fisheries protection and border patrol training capabilities.	Activities may be relevant to DoD as there is potential for overlap with defence activities such as training or other exercises, or there may be potential for UXO. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database

ID	Relevant person	Relevant persons category	Primary group	Sub-group	General description	Why relevant persons for ASP	Level of effort	How found
31	Australian Fisheries Management Authority (AFMA)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	Responsible for managing Commonwealth fisheries	Activities may be relevant to AFMA as they will be carried out over numerous Commonwealth fisheries, potentially impacting Commonwealth fishery licenced operators and/or commercial fish stock. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	The Australian Hydrographic Office (AHO) is part of DoD and is the entity responsible for the provision of hydrographic services to Australia, under the Safety of Life at Sea (SOLAS) Convention and the Navigation Act 2012. This includes the publication and distribution of nautical products and other information required for the safety of ships navigating in Australian waters.	Activities may be relevant to AHO as there are vessel activities that would require notices to mariners, and there may be requirements for chart updates. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
33	Australian Maritime Safety Authority (AMSA)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	Statutory agency for vessel safety and navigation in Commonwealth waters.	Activities may be relevant to AMSA as vessel operations are involved, there is potential for interactions with other vessels, and AMSA have a role in maritime emergency response. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
459	Corangamite Catchment Management Authority	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	The Corangamite Catchment Management Authority manages the Corangamite Regional Catchment Strategy (RCS) - a high-level blueprint for catchment health. It provides a strategic, integrated framework for natural resource management in the Corangamite Catchment Management Authority's region of Victoria.	The Corangamite RCS overlaps the Consultation Focus Area.	2	Other operator Otway EP
130	Director of National Parks (DNP)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	The Director of National Parks (DNP) is the statutory authority responsible for administration, management and control of Australian marine parks (AMPs).	Activities may be relevant to the DNP as in the unlikely event of a hydrocarbon release, there may be impacts on Australian Marine Parks. Listed as a relevant Commonwealth agency in NOPSEMA's guideline "Consultation with Commonwealth agencies with responsibilities in the marine area" dated 10 January 2024.	2	Existing database
157	Fisheries Research and Development Corporation (FRDC)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	Commonwealth dept or agency	The Corporation is a co-funded partnership between the Australian Government and fisheries and aquaculture. It is a statutory corporation under the Primary Industries Research and Development Act 1989 (the PIRD Act) and is responsible to the Minister for Agriculture, Fisheries and Forestry.	Activities may be relevant to FRDC as they will be carried out over numerous Commonwealth fisheries, potentially impacting Commonwealth fishery licenced operators, and/or commercial fish stock. Activities could also affect any research being conducted in the area.	2	Existing database

ID	Relevant person	Relevant persons category	Primary group	Sub-group	General description	Why relevant persons for ASP	Level of effort	How found
460	Heritage Victoria	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	Heritage Victoria regulates and enforces the Victorian Heritage Act 2017 and also serves as the Commonwealth delegate. for DCCEEW for heritage matters in Commonwealth waters offshore Victoria.	Activities may be relevant to Heritage Victoria due to potential interactions with submerged cultural heritage.	2	Other operator Otway EP
458	SA Department for Infrastructure and Transport (DIT)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	The Department for Infrastructure and Transport (DIT) is the Control Agency for Marine Pollution (Coastal) and is responsible for the management of marine pollution incidents in coastal waters.	Activities may be relevant to SA DIT due to their key role in emergency response, including oil spill response in the unlikely event of a hydrocarbon release that may threaten South Australian waters.	2	Existing database
366	Tasmanian EPA	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	Responsible for preparedness and responding to oil and chemical spills in Tasmanian waters. Spill Response 'Control Agency' for any spill that enters (or threatens to enter Tasmanian coastal waters). Where relevant the OPEP sets out arrangements for working with the EPA in the event of a spill.	Activities may be relevant to Tasmanian EPA due to their key role in emergency response, including oil spill response in the unlikely event of a hydrocarbon release that may threaten Tasmanian waters.	2	Existing database
380	Transport for NSW	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	Is NSW Statutory Authority for coordination of spill response in NSW waters. Is responsible for responding to any shipping incident or marine oil or chemical spill along the coast of NSW.	Activities may be relevant to Transport for NSW due to their key role in emergency response, including oil spill response in the unlikely event of a hydrocarbon release that may threaten NSW waters.	2	Existing database
156	Victorian Department of Premier and Cabinet (DPC) First Peoples - State Relations	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	First Peoples – State Relations is a group within the Department of Premier and Cabinet, responsible for nation-leading work in the areas of cultural rights, self-determination, treaty and truth – an extensive program of priority work with First Peoples.	Activities may be relevant to the DPC First Peoples-State Relations due to potential impacts on submerged cultural heritage.	2	Existing database
127	Victorian Department of Transport and Planning (DTP)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	Responsible for marine pollution response arrangements in Victorian jurisdiction. Coordinate advice with other state agencies involved in marine pollution response including Department of Energy, Environment and Climate Action and Port Authorities.	Activities may be relevant to Victorian DTP due to their key role in emergency response, including oil spill response in the unlikely event of a hydrocarbon release that may threaten Victorian waters.	2	Existing database
393	Victorian Fisheries Authority (VFA)	25(1)(a) State and Cth	Commonwealth or State Agency or Authority	State dept or agency	Independent statutory authority established to effectively manage Victoria's state managed fisheries resources.	Activities may be relevant to the VFA due to overlap with state managed fisheries. In addition, in the unlikely event of a hydrocarbon spill, fishing, marketability of catch and fish stocks may be affected in state managed fisheries.	2	Existing database
The Department of the responsible State Minister 25(1)(b)								

ID	Relevant person	Relevant persons category	Primary group	Sub-group	General description	Why relevant persons for ASP	Level of effort	How found
272	Parks Victoria	25(1)(a) State and Cth	The Department of the Responsible Minister	State dept or agency	Parks Victoria is a statutory authority of the Victorian Government, within the DEECA portfolio, acting in accordance with the Parks Victoria Act 2018. Parks Victoria is responsible for managing a diverse estate of more than 4 million hectares including 3,000 land and marine parks and reserves making up 18 per cent of Victoria's landmass, 75 per cent of Victoria's wetlands and 70 per cent of Victoria's coastline.	Activities may be relevant to Parks Victoria, as in the unlikely event of a hydrocarbon release Victorian marine parks may be affected.	2	Existing database
115	Victorian Department of Energy, Environment and Climate Action (DEECA) - Biosecurity and Agriculture Services	25(1)(a) State and Cth	The Department of the Responsible Minister	State dept or agency	Manages and advises on biosecurity within Victoria including vessels in state waters/calling into ports.	Activities may be relevant to DEECA due to potential biosecurity and environmental risks.	2	Existing database
107	Victorian Department of Energy, Environment and Climate Action – Earth Resources Regulation (DEECA ERR)	25(1)(b) Resp State	The Department of the Responsible Minister	State dept or agency	Joint Authority Member for offshore Victorian waters including granting, refusal or renewal of offshore petroleum titles, variation of titles and title terms, etc. Regulate petroleum activities in Victorian State waters.	Under Regulation 25(1)(b) they are the Department of the responsible Minister.	2	Existing database
573	Victorian Department of Energy, Environment and Climate Action - Planning and Environment (DEECA PEA)	25(1)(a) State and Cth	The Department of the Responsible Minister	State dept or agency	DEECA planning and environment assessment – energy team is a statewide team, that can provide key contacts for environmental responses for various referrals and approvals in the regions for planning related to marine, native vegetation, marine and coastal act consents, land owner and public land manager consents.	Activities may be relevant to DEECA PEA as in the unlikely event of a hydrocarbon release Victorian coastal areas may be affected.	2	Existing database

197	International Fund for Animal Welfare (IFAW)	25(1)(d)	Interest group	Environmental-Conservation	Global non-profit helping animals and people thrive together. Run various programmes including marine mammal rescue and research, and marine conservation	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
220	Life Saving Victoria	25(1)(d)	Interest group	Recreation-Surf Life Saving Club	Independent organisation that works with communities, educational institutions, governments, businesses and the broader aquatic industry to achieve new lifesaving and water safety initiatives	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
227	Marine Mammal Foundation	25(1)(d)	Interest group	Environmental-Conservation	Protects the marine environment for marine mammals through research, community engagement, and education.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
586	No Offshore Windfarm Zone - Warrnambool and District	25(1)(d)	Interest group	Environmental-Conservation	General concerns around offshore windfarms and effects on marine life.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Self-identified during community sessions
262	Ocean Racing Club of Victoria	25(1)(d)	Interest group	Recreation-Other	Club which conducts regular offshore racing in Victoria. Home of blue water classic Melbourne to Hobart and Rudder Cup yacht races (noting route goes along west coast of Tasmania)	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
263	Ocean Watch	25(1)(d)	Interest group	Fisheries advocacy/sustainability/research	Not-for-profit environmental company that works to advance sustainability in the Australian seafood industry and operates community-based coastal habitat restoration programs.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
266	Otway Climate Emergency Action Network (OCEAN)	25(1)(d)	Interest group	Environmental-Conservation	OCEAN is an environmental activist and campaign group based in Apollo Bay and the Otway ranges. We support non-violent civil disobedience to demand urgent action to halt the climate and ecological crisis.	Activities may contribute to global emissions.	2	Existing database
271	Paddle Victoria	25(1)(d)	Interest group	Recreation-Other	Members organisation to support the paddling community	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
273	Peterborough Golf Club	25(1)(d)	Interest group	Recreation-Other	Local golfing club.	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be impacted, affecting local amenity.	2	Existing database
281	Port Campbell Community Group	25(1)(d)	Interest group	Local community	Volunteer group focussed on environment protection of local fauna	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
285	Port Campbell Rifle Club	25(1)(d)	Interest group	Recreation-Other	Rifle club for local members and tourists.	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be impacted, affecting local amenity.	2	Existing database

ID	Relevant person	Relevant persons category	Primary group	Sub-group	General description	Why relevant persons for ASP	Level of effort	How found
286	Port Campbell Surf Life Saving Club	25(1)(d)	Interest group	Recreation-Surf Life Saving Club	Community club undertaking beach patrols, surf sport, events and community social functions	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
470	Port Fairy Angling Club	25(1)(d)	Interest group	Recreation-Fishing	Local angling club	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Other operator Otway EP
289	Port Fairy Yacht Club	25(1)(d)	Interest group	Recreation-Other	Port Fairy based yacht club offering sailing and social events.	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
718	Protect the West	25(1)(d)	Interest group	Environmental-Conservation	Protect the West is primarily focussed on environmental issues that may impact upon areas in western Victoria.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
576	Relevant Person ID 576	25(1)(d)	Interest group	Individual-local community	Individual with an interest in having a choice in energy consumption.	Self-identified with an interest in well managed ongoing gas exploration.	2	Self-identify
322	Scuba Divers Federation of Victoria	25(1)(d)	Interest group	Recreation-Other	Amateur organisation representing diving clubs throughout Victoria.	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
325	Sea Shepherd	25(1)(d)	Interest group	Environmental-Conservation	Sea Shepherd fights to defend, conserve and protect our ocean. They use direct action to defend marine wildlife and protect their habitat in the world's oceans.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
352	Surfers for Climate	25(1)(d)	Interest group	Environmental-Conservation	A sea-roots movement dedicated to positive climate action and heads the campaign 'Don't Drill the Otways'.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
354	Surfrider Foundation Australia	25(1)(d)	Interest group	Environmental-Conservation	Not-for-profit dedicated to the protection of Australia's waves and beaches through conservation, activism, research and education.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
389	Victoria Game Fishing Club	25(1)(d)	Interest group	Recreation-Fishing	The premier game fishing club in the southern states of Australia	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
394	Victorian Recreational Fishing Peak Body (VRFish)	25(1)(d)	Interest group	Recreation-Fishing	Peak body representing recreational fishing interests in Victorian waters.	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
402	Warrnambool Coastcare Landcare Network	25(1)(d)	Interest group	Environment-Local conservation	Improve biodiversity in Warrnambool and district and advocate for the protection of our natural environment	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
469	Warrnambool Offshore & Light GFC	25(1)(d)	Interest group	Recreation-Fishing	Local game fishing club	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Project web search
404	Warrnambool Surf Life Saving Club	25(1)(d)	Interest group	Recreation-Surf Life Saving Club	Community club undertaking beach patrols, surf sport, events and community social functions	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database

ID	Relevant person	Relevant persons category	Primary group	Sub-group	General description	Why relevant persons for ASP	Level of effort	How found
407	Warrnambool Yacht Club	25(1)(d)	Interest group	Recreation-Other	Warrnambool based family-oriented yacht club offering sailing and social events.	Activities may result in short term loss of access to operational areas, or impact visual amenity. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
412	Whale and Dolphin Conservation Australia	25(1)(d)	Interest group	Environmental-Conservation	Leading charity dedicated to the protection of whales and dolphins	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
413	Wilderness Society Melbourne	25(1)(d)	Interest group	Environmental-Conservation	A community-based, not-for-profit non-governmental environmental advocacy organisation.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
418	Windsurfing Victoria	25(1)(d)	Interest group	Recreation-Other	Represents the community of windsurfers in Victoria and promotes all aspects of the sport locally. Windsurfing Victoria is the public voice promoting windsurfing and lobbying to protect access to preferred spots around the State.	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
423	World Wildlife Fund	25(1)(d)	Interest group	Environmental-Conservation	WWF partners with governments, businesses, communities, and individuals to catalyse change for a range of pressing environmental issues.	Activities may impact local fauna and flora. In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
425	Wye River Surf Life Saving Club	25(1)(d)	Interest group	Recreation-Surf Life Saving Club	Community club undertaking beach patrols, surf sport, events and community social functions	In the unlikely event of a hydrocarbon spill, marine and coastal areas may be affected.	2	Existing database
Local government and elected officials 25(1)(d)								
79	Colac Otway Shire	25(1)(d)	Local government and elected officials	Local Govt	Victorian local government authority.	Local government authority that overlaps the Consultation Focus Area. Residents and ratepayers may be affected by the activities.	2	Existing database
86	Corangamite Shire Council	25(1)(d)	Local government and elected officials	Local Govt	Victorian local government authority.	Local government authority that overlaps the Consultation Focus Area. Residents and ratepayers may be affected by the activities.	2	Existing database
177	Glenelg Shire Council	25(1)(d)	Local government and elected officials	Local Govt	Victorian local government authority.	Local government authority that overlaps the Consultation Focus Area. Residents and ratepayers may be affected by the activities.	2	Existing database
243	Moyne Shire Council	25(1)(d)	Local government and elected officials	Local Govt	Victorian local government authority.	Local government authority that overlaps the Consultation Focus Area. Residents and ratepayers may be affected by the activities.	2	Existing database
401	Warrnambool City Council	25(1)(d)	Local government and elected officials	Local Govt	Victorian local government authority.	Local government authority that overlaps the Consultation Focus Area. Residents and ratepayers may be affected by the activities.	2	Existing database

3.0 Identification of Relevant Persons – 25(1)(e)

No persons were identified under regulation 25(1)(e) of the OPGGS(E)R as all persons identified as relevant persons have qualities consistent with 25(1)(a), (b) or (d).

4.0 Identification of other stakeholders

Table 4-1 Other stakeholders

ID	Stakeholder	Category	Primary group	Sub group	General description
52	Bev McArthur MP, Member for Western Victoria Region	Other stakeholder	Local government and elected officials	State MP	Victorian MP - Member for Western Victoria Region. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons. Information also provided for awareness.
90	Dan Tehan MP, Federal Member for Wannon	Other stakeholder	Local government and elected officials	Commonwealth MP	Federal MP - Member for Wannon. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons. Information also provided for awareness.
151	Federation of Victorian Traditional Owner Corporations	Other stakeholder	First Nations	Peak body	Peak body for Victorian Traditional Owner corporations. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons.
155	First Nations Legal & Research Services (Vic)	Other stakeholder	First Nations	Other organisation	First Nations Legal & Research Services is the native title services provider for Victorian Traditional Owners. It separated from FVTOC and was renamed from Native Title Services Vic Ltd. Govt funded, independent org. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons.
193	Gunditjmara Aboriginal Cooperative Ltd	Other stakeholder	First Nations	Other organisation	The Cooperative was incorporated in 1982 and now delivers a wide range of culturally appropriate health and well-being services at all life stages from cradle to grave. The Cooperative has more than 300 members and more than 60 staff members. Many members likely represented by EMAC and/or GMTOAC. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons.
571	Jacinta Ermacora MP - Member for Western Victoria	Other stakeholder	Local government and elected officials	State MP	Victorian MP - Member for Western Victoria Region. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons. Information also provided for awareness.

ID	Stakeholder	Category	Primary group	Sub group	General description
202	Joe McCracken MP- Member for Western Victoria Region	Other stakeholder	Local government and elected officials	State MP	Victorian MP - Member for Western Victoria Region, Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons. Information also provided for awareness.
310	Richard Riordan MP-Member for Polwarth	Other stakeholder	Local government and elected officials	State MP	Victorian MP - Member for Polwarth. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons. Information also provided for awareness.
233	Roma Britnell MP - Member for South West Coast	Other stakeholder	Local government and elected officials	State MP	Victorian MP - Member for South West Coast. Not considered a Relevant person as an organisation itself, but may assist in identifying relevant persons. Information also provided for awareness.
414	Winda Mara Aboriginal Corporation	Other stakeholder	First Nations	Other organisation	The corporation was established in 1991, providing community support services for First Nations people in the area. Not considered a relevant person as an organisation but may help in identifying relevant persons amongst its community. Many members likely represented by EMAC and/or GMTOAC.

5.0 Summary of consultation

This consultation report summarises the consultation activities undertaken by Amplitude Energy with each relevant person, for this EP.

This report further reflects that:

1. Amplitude Energy has discharged its obligations for consultation under regulation 25, by providing all relevant persons listed in Table 1-1 and Table 2-1 with:
   - sufficient information to make an informed assessment of the possible consequences of the activity on their functions, interests or activities; a reasonable period for consultation; and
   - a reasonable opportunity to consult.

2. Amplitude Energy has assessed and responded to all claims and objection raised about the adverse impacts of each activity to which this EP relates, by the relevant persons in Table 1-1 and Table 2-1.

Table 5-1 and Table 5-2 provide further summaries of how Amplitude Energy has discharged its consultation obligations with respect to the relevant persons listed in Table 1-1 and Table 2-1.

Table 4-1 identifies other stakeholders that Cooper Energy contacted about this EP, but not for the purposes of consultation under regulation 25.

Table 5-1 Relevant persons consultation report

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
Commonwealth or State agency or authority 25(1)(a)								
2025 0513 145452 3606	26	Australian Border Force (ABF) (Maritime Border Command-MBC))	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0809 154349 2782	26	Australian Border Force (ABF) (Maritime Border Command-MBC))	2025-08-09	Email	Out	Bulk mailout #3 - notification this phase of consultation is closing	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0513 152109 3717	29	Australian Communications and Media Authority (ACMA)	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4) Noted earlier advice on an EP in the same area your recommendation to consult the following, and we will endeavour to do so. **BW Digital - Hawaiki Nui cable** **SUBCO - SMAP cable** **Vocus and Google - Pacific Connect cable**. Noted that we will also consult with AHO. Also note that based on current mapping, there are no submarine cables in close proximity to our proposed activities area.	N/A	N/A
2025 0514 084431 5800	29	Australian Communications and Media Authority (ACMA)	2025-05-14	Email	In	Noted that the project area located in the Otway Basin, Victoria is not in the vicinity of any **submarine cables protection zones** declared by the ACMA. However, noted that the project area may be located in the vicinity of the Indigo Central submarine cable and provided relevant website links. Noted list of telecommunications submarine cable owners we provided that we were contacting, and confirmed we should consult with owners of cables in vicinity of the project area. No more consultation is required by ACMA on these projects.	No objection or claim of adverse impact. Reasonable request to consult with owners of submarine cables in vicinity of project area.	Consulted with listed submarine cable owners.
2025 0514 084531 6215	29	Australian Communications and Media Authority (ACMA)	2025-05-14	Email	Out	Passed on thanks for quick response.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received. ACMA advised no further consultation required.								
2025 0513 154951 7846	97	Australian Department of Agriculture, Fisheries and Forestry (DAFF) - Biosecurity (marine pests)	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A

2025 0513 154255 7972	31	Australian Fisheries Management Authority (AFMA)	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0527 085206 5365	31	Australian Fisheries Management Authority (AFMA)	2025-05-27	Email	Out	Passed on thanks for email regarding the 2 ECSP EPs, and acknowledged we intended to consult with SETFIA, SSIA, Tuna Australia, ASBTIA and CFA. Noted proposed activities were close to the Cth Bass Strait Scallop Fishery, and encouraged Amplitude Energy to consult with them via the following bodies: Bass Strait Scallop Industry Association Tasmanian Seafood Industry Council Seafood Industry Victoria Advised of AFMA's new email address for future correspondence: **OffshoreEnergy@afma.gov.au**.	No objection or claim of adverse impact. Reasonable request as to which fisheries bodies to consult. Reasonable request to update contact details.	Consulted with fisheries as described in Event ID 2025 0529 113719 7151, noting that we would go direct to individual licence holders of the Cth Bass Strait Central Zone Scallop Fishery, as the peak body appears to have ceased operations. AFMA email contact details updated in database.

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
2025 0529 113719 7151	31	Australian Fisheries Management Authority (AFMA)	2025-05-29	Email	Out	Passed on thanks for response, noting response is also reflected on AFMA"s website. Noted that we had contacted Bass Strait Central Zone Scallop Fishery members direct thanks to AFMA recently providing a list of Cth fisheries license holders. Suggested some updates to the advice provided, noting that the Bass Strait Scallop Industry Association was no longer functioning, and that with respect to Tasmanian members, the Scallop Fishermen's Association of Tasmania was probably a better option for Tasmanian based members of the Cth fishery.	N/A	N/A
2025 0603 153940 1740	31	Australian Fisheries Management Authority (AFMA)	2025-06-03	Email	Out	Passed on thanks for the response and updates which will assist in their planned review of the information on their website.	No objection or claim of adverse impact.	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0513 160350 4726	106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0514 132913 5800	106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	2025-05-14	Email	In	Passed on thanks. Noted there were no concerns with proposed activities. Only require further updates once activities are due to begin. Provided link to AHO"s standard notification requirements.	No objection or claim of adverse impact. Reasonable request for notifications.	Confirmed we would follow the notification requirements as per Event ID 2025 0514 140050 3106. Annie-2 EP stakeholder notifications register updated accordingly.
2025 0514 140050 3106	106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	2025-05-14	Email	Out	Passed on thanks, and confirmed we will follow the reporting requirements.	N/A	N/A
2025 0522 131114 5679	106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	2025-05-22	Email	Out	Queried as to whether 3 working weeks' notice was sufficient notice ahead of activities commencing, noting NtMs are issued fortnightly.	N/A	N/A
2025 0522 132733 1225	106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	2025-05-22	Email	In	Confirmed 3 working weeks' notice is fine, and that they also typically check in with us a couple of days prior to publication to check things are on schedule.	No objection or claim of adverse impact. Confirmed 3 weeks' notice for requesting NtM is sufficient time.	Will request NtM with at least 3 weeks' notice.
2025 0522 132753 5302	106	Australian Hydrographic Service (AHS) (sits under Australian Hydrographic Office (AHO) - (DoD)	2025-05-22	Email	Out	Passed on thanks.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0513 154456 1126	33	Australian Maritime Safety Authority (AMSA)	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0520 142220 7349	33	Australian Maritime Safety Authority (AMSA)	2025-05-20	Email	In	Passed on thanks for the information on the activities proposed under the two ECSP EPs. Noted future correspondence should include the **NavSafety@amsa.gov.au** address. Provided vessel plot and noted that heavy vessel traffic likely in the area. Requested that associated survey and support vessels notify JRCC through **rccaus@amsa.gov.au** to provide for radio-navigation warnings 24-48 hours prior to commencement of operations. The RC will require the vessel details (including name, callsign and Maritime Mobile Service Identity (MMSI)), satellite communications details (including	No objection or claim of adverse impact. Reasonable requests for notifications. Reasonable requests made to exhibit appropriate lighting and shapes, and to comply with COLREGs. Reasonable requests to evaluate and implement adequate anti-collision measures.	Section 6.2.1 updated to reflect heavy vessel traffic. Confirmed adherences to navigation and anti collison requirements. Annie-2 EP stakeholder notifications register updated accordingly.

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						INMARSAT-C and satellite telephone), area of operation, requested clearance from other vessels and need to be advised when operations start and end. AHO should be notified no less than 4 working weeks prior to commencement of operations for issuance of NtMs. Vessels should exhibit appropriate lights and shapes to reflect the nature of operations and comply with the International Rules for Preventing Collisions at Sea (**COLREGs**), in particular, the use of appropriate lights and shapes to reflect the nature of operations (e.g. restricted in the ability to manoeuvre). Vessels should also ensure their navigation status is set correctly in the ship's Automatic Identification System (AIS) unit. Amplitude Energy should evaluate and implement adequate anti-collision measures, including additional warnings and/or lights to attract attention, installation of AIS units, and offshore guard vessel/s. Provided links to AMSA"s spatial data gateway and showed how customised information could be requested.	Reasonable request to update contact details.	
2025 0522 131114 1245	33	Australian Maritime Safety Authority (AMSA)	2025-05-22	Email	Out	Passed on thanks for the quick response. Confirmed we will have the associated survey vessel/s and support craft notify AMSA's **Joint Rescue Coordination Centre** (JRRC) in the time and manner requested Will notify **Australian Hydrographic Office** (AHO) through **datacentre@hydro.gov.au**, no less than four working weeks before operations commence for the promulgation of related notices to mariners, or as otherwise advised by AHO. Noted and accepted the following advice: *Vessels should exhibit appropriate lights and shapes to reflect the nature of operations -we remind vessels of their obligation to comply with the International Rules for Preventing Collisions at Sea (**COLREGs**), in particular, the use of appropriate lights and shapes to reflect the nature of operations (e.g restricted in the ability to manoeuvre). Vessels should also ensure their navigation status is set correctly in the ship's Automatic Identification System (AIS) unit.* *Amplitude Energy should evaluate and implement adequate anti-collision measures. Whereby collision avoidance measures may include but are not limited to:* *Additional warnings and/or lights to attract attention.* *Installation of AIS units.* *Offshore guard vessel/s that can monitor traffic and take early action to alert a vessel approaching the area of operations* Passed on thanks for the plot provided, and noted appreciation of the links to the spatial data portal. Also noted on future use of the **NavSafety@amsa.gov.au** email address. Also suggested that they notify NOPSEMA regarding email address, as different to that shown in the relevant NOPSEMA guidance.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.

2025 0809 210941 9503	459	Corangamite Catchment Management Authority	2025-08-09	Email	Out	Bulk mailout #3 - notification this phase of consultation is closing	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0520 095559 5800	130	Director of National Parks (DNP)	2025-05-20	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4) Noted these two EPs were under the East Coast Gas Supply Project Offshore Project Proposal (OPP) and proximate to the Athena Supply Project EP area that they had recently commented on. Noted the only change to the relevant data provided for those was a small increase in the noise EMBA, and provided shape files for that EMBA. Provided copies of prior correspondence for the ECSP OPP and ASP EP for reference.	N/A	N/A
2025 0619 100603 7349	130	Director of National Parks (DNP)	2025-06-19	Email	In	Passed on thanks for opportunity to comment. No authorisations required from the DNP as no overlap with noise EMBA with AMPs. Noted new management plan for the South-east Marine Parks Network came into effect on 13 February 2025 **South-east Marine Parks Network Management Plan 2025** . In line with the management plan's objectives and values, the Environment Plan (EP) must identify and control all risks and impacts to Australian Marine Park values, including ecosystems, to an acceptable level. It must also show that all reasonable measures to avoid or minimise impacts have been considered, and that the activity aligns with relevant legislation referenced in the class approval. No further updates on this activity are required unless there is a change that introduces a new impact or overlap with a marine park, or if there is an emergency response. If an activity takes place in a marine park without authorisation from NOPSEMA or the Director of National Parks (DNP), it would breach the EPBC Act. Emergency Response Requirements: If oil or gas pollution occurs within or threatens a marine park, it must be reported immediately to the 24-hour Marine Compliance Duty Officer (0419 293 465). The report should include: Titleholder and incident details Location and affected marine park Planned response actions from the Oil Pollution Emergency Plan Confirmation that monitoring and evaluation reports will be shared when available Contact details of the response coordinator Depending on the incident's severity, the DNP may request regular Situation Reports (daily or weekly). All future correspondence should be sent to marineparksauthorisations@dcceew.gov.au, and queries are welcome.	No objection or claim of adverse impact. Reasonable requests made for notifications and actions to be taken should emergency events occur.	Standard response – no additional measures adopted. Annie-2 EP stakeholder notifications register updated accordingly.

2025 0709 165410 3590	130	Director of National Parks (DNP)	2025-07-09	Email	Out	Passed on thanks for advice regarding the two East Coast Supply Project (ECSP) EPs (Annie-2 development well EP & the Wells Connection EP) and confirming that DNP do not require further notification of progress made in relation to the activities unless details regarding the activities change and result in an overlap with or new impact to a marine park, or in event of emergency response. Noted on the new South-east Marine Parks Network management plan, and emergency response requirements, and confirmed the EPs will, with respect to management plan objectives and values: identify and manage all impacts and risks on all Australian marine park values (including ecosystem values) to an acceptable level and consider all reasonable options to avoid or reduce them to as low as reasonably practicable. clearly demonstrate that the activities will not be inconsistent with the relevant legislation listed in the class approval, and include notification requirements in event of an oil/gas pollution incident either within a marine park or are likely to impact on a marine park as soon as possible	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 20 May 2025 and no request for additional time has been received. Noted no further consultation required at this point.								
2025 0513 161055 4361	157	Fisheries Research and Development Corporation (FRDC)	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0809 211147 3305	157	Fisheries Research and Development Corporation (FRDC)	2025-08-09	Email	Out	Bulk mailout #3 - notification this phase of consultation is closing	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0519 114106 5800	460	Heritage Victoria	2025-05-19	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0519 131239 9639	460	Heritage Victoria	2025-05-19	Email	In	Out of office auto reply	N/A	N/A
2025 0523 095702 4620	460	Heritage Victoria	2025-05-19	Email	In	Passed on thanks for the email. Queried how prior Heritage Victoria feedback is being implemented under these new EPs, and whether we are engaging with a qualified maritime archaeologist. Requested shapefiles for the projects. Suggested either email or meeting would be fine for further discussions.	No objection or claim of adverse impact. Reasonable query on how prior advice was considered for this EP. Reasonable request for shape files.	Confirmed that prior advice was considered as per Event ID 2025 0609 135820 7349 Provided shapefiles.
2025 0609 135820 7349	460	Heritage Victoria	2025-05-19	Email	Out	Passed on thanks for the response. Advised the name of the Archaeologist who specialises in Maritime and Underwater cultural heritage. Noted they will also review our site survey data for evidence of cultural heritage and will provide us a report including any potential UCH we may need to look at further, or report and avoid during our project activities. In	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						parallel, we are engaging with traditional owners about the projects and cultural sensitivities important to them in the marine environment. Suggested we could meet to run you through the projects and some of our preliminary seabed survey results.		
2025 0610 101539 2996	460	Heritage Victoria	2025-06-10	Email	In	Passed on thanks for response, and appreciated we had retained the services of experienced and trusted maritim4e archaeologists who would provide good advice. Appreciated the shape files and noted the shipwreck "Alfred" was located around 500m outside the operational area, although the estimated position of the Alfred is likely to be very inaccurate. Noted that if it were to be found to be within or adjacent to the operational areas, then the maritime archaeologists could advise on managing potential impacts noting the wreck is protected under Cth legislation. Accepted the offer to meet and provided suggested times.	N/A	N/A
2025 0610 121838 8781	460	Heritage Victoria	2025-06-10	Email	Out	Passed on thanks for the email, and suggested which times would work. Appreciated advice on "the Alfred" and will share with team for awareness.	N/A	N/A
2025 0610 144003 1077	460	Heritage Victoria	2025-06-10	Email	In	Confirmed meeting time.	N/A	N/A
2025 0809 212707 2931	460	Heritage Victoria	2025-08-09	Email	Out	Appreciated their time for the meeting on 18 June, and for the opportunity to provide an overview of activities proposed under the EP. Noted current estimated timing for the start of drilling on Annie-2 had moved from November to December 2025 now. Review of drop camera images has so far not picked up on any anthropogenic objects at the Annie anomaly site mentioned in our meeting (this was 2.8km for the planned Annie-2 well site), but our UCH consultants are continuing their review of the Geophysical data and images this month, and unless they advise otherwise, we plan to retain the 20m mooring buffer around this anomaly which the UCH consultants recommended following their initial review of the magnetometer data. Regarding the mention of Flinders Uni, we would be interested to discuss how the work we do, and data we collect, might be useful for student projects if a contact could be shared. We are now finalising consultation on these EPs, and below is appended a general mailout – Bulk mailout #3	N/A	N/A
2025 0809 212753 3459	460	Heritage Victoria	2025-08-09	Email	In	Auto reply	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 19 May 2025 and no request for additional time has been received.								
2025 0721 130932 9471	458	SA Department for Infrastructure and Transport (DIT)	2025-07-28	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4) Noted spill models showed areas of potential impact within those of the most recently reviewed OPEP. Provided a link to the OPEP that was part of the recently accepted ASP EP. Suggested that a major review was unlikely to be required.	N/A	N/A
2025 0820 153022 6553	458	SA Department for Infrastructure and Transport (DIT)	2025-08-20	Email	Out	Noted we have now completed our draft update of the OPEP which is attached and includes highlighted changes and notes. Upon reflection, we would consider that given the updated assets are in the same general location as the assets already described in the accepted OPEP, and these	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						assets do not increase the likelihood or threat of pollution, and that the worst case spill scenarios modelled in the current version of the OPEP have not increased, no further consultation is likely required.		
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 28 July 2025 and no request for additional time has been received. Considering recent review of OPEP, no further consultation considered necessary.

2025 0811 081516 6215	115	Victorian Department of Energy, Environment and Climate Action (DEECA) Biosecurity and Agriculture Services	2025-08-11	Email	In	Noted the branch was a relevant person as responsible for marine biosecurity for the State of Victoria. Acknowledges a strong collaborative relationship with Amplitude Energy, which shares vessel import data and risk management practices to prevent invasive marine species (IMS) spread. Agriculture Victoria confirmed the they seek to have this relationship continue, and remain pleased to provide advice on IMS risk and practical steps that can be taken to manage that risk. The department highlighted the presence of the invasive seaweed Undaria pinnatifida in the Port of Portland and advised Amplitude Energy to consider the risk of its transfer to offshore infrastructure via supply vessels Requested updates on activities under these EPs.	No objection or claim of adverse impact. Reasonable request that the nature of the current relationship continue. Reasonable request that we note presence of *Undaria pinnatifida* in the Port of Portland, and consider transfer risk.	Section 3.18 of the Description of the environment has been updated to note the existence of *Undaria pinnatifida* in Portland Harbour, and is noted in Table 4-3 of the EP. (See Event ID 2025 0812 154449 6174.
2025 0811 130256 9070	115	Victorian Department of Energy, Environment and Climate Action (DEECA) Biosecurity and Agriculture Services	2025-08-11	Email	Out	Passed on thanks for the response (via the web form), and that we would respond shortly.	N/A	N/A
2025 0812 154449 6174	115	Victorian Department of Energy, Environment and Climate Action (DEECA) Biosecurity and Agriculture Services	2025-08-12	Email	Out	Appreciated the department had visited the website. Passed on thanks for the comments, and confirmed we also appreciate the good working relationship and look forward to it continuing. Passed on thanks also for highlighting the *Undaria pinnatifida* risk. Noted the proposed Annie 2 development drilling activity, along with the installation of subsea infrastructure including flowlines connecting with the Casino Henry Netherby pipeline are in deeper waters (> 55m water depth which is outside of the preferred establishment range of the species Undaria pinnatifida (up to ~25m water depth). We consider the risk of establishment of invasive marine species in this particular instance to be minimal. Nonetheless, confirmed vessel biofouling and ballast water management is reviewed as part of our pre-mobilisation process to ensure vessels we hire adhere to Australian biofouling management and ballast water management requirements. In addition, noted we undertake reviews of IMS transfer risk (Amplitude IMS Risk Management Protocol) for each of our activities, which are informed by the biofouling management practices for the vessels and ROVs, as well as particular species to be aware of and the suitability of the offshore subsea equipment as potential substrate for establishment. Passed on appreciation for the response, and that we looked forward to catching up on a future visit . Confirmed we will keep Agriculture Victoria updated on these activities.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. 2025 0513 085513 5800	178	Go Surf School	2025-05-12	Email	In	Passed on thanks for reaching out. Acknowledged they were a relevant person, and noted they were engaging on a various projects across a large amount of technical data. Noted there was significant community opposition to these projects, and advocated for permanent removal of these projects. Noted they did not support the gas development under these EPs, Considered there was a lack transparency regarding Victoria's energy usage, and how these projects specifically applied to local demand. The gas supply/demand equation seemed unclear and held a belief most of the gas was destined for overseas. Requested guarantees and evidence regarding risk of accidental hydrocarbon release being minimised, and how we would ensure a rapid and effective response to any spill.	No objection or claim of adverse impact. Noted community opposition to gas development. Expressed concerns regarding gas market transparency in Victoria. This is considered outside scope of EP (see Event ID 2025 0520 090815 7349) Reasonable request for further information regarding mitigating and responding to hydrocarbon spills.	Provided requested further information regarding hydrocarbon spills. (See Event ID 2025 0520 090815 7349). No new measures adopted.

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
2025 0520 090815 7349	178	Go Surf School	2025-05-20	Email	Out	Noted not supportive of our gas development project. Regarding general concerns about transparency of Victoria's energy use, the clarity of supply and demand, and doubts about gas/profits going overseas, noted we can only comment on matters specific to Amplitude Energy and the activities under these EPs, and can confirm that we are an ASX listed company, and all the gas we produce goes into the domestic market. Regarding oil spill risk: We have not had any material spills or leaks of gas or condensate from our facilities (the wells or pipeline) or the vessels we hire for offshore campaigns. Though a spill or leak of gas or condensate from our subsea facilities, or spill of diesel oil from a vessel, is unlikely, there are no guarantees, and we do have response plans in place in case a spill or leak does occur. Our response plans are additional to the current national spill response plans, as are required under the regulations that apply to our industry. Our response plans include consideration of the area where we operate, and the resources we require to respond to a spill. Our plans also outline how our response would integrate with local, state and national response agencies. Our current Oil Pollution Emergency Plan (OPEP) can be found here on the NOPSEMA site: **OPEP**, and further information regarding oil spill risk and response can be found here: **Oil spill risk planning**, We agree that managing spill risk is a very important issue, and both mitigating this risk and being well prepared in our response planning are things we take very seriously.	N/A	N/A
2025 0530 112556 7365	178	Go Surf School	2025-05-30	Email	Out	Bulk mailout #2 - notification of community drop-in sessions and webinars	N/A	N/A
2025 0606 225928 8942	178	Go Surf School	2025-06-06	Email	Out	Passed on thanks for information about the ECSP EP, and invitation to attend community sessions and webinars. Raised community concerns about gas drilling in the Otway Basin, and the potential for companies to profit in what is considered an environmentally sensitive region. Noted they did not support the company operating there. Remain committed to the use only of existing pipelines within Victoria. Also expressed opposition to the export of any gas or oil beyond borders. Concerned about lack of transparency on supply and demand figures.	An objection was raised to the use of new pipelines in Victoria; we confirmed that this project did not require new pipelines onshore Victoria, nor in Victorian state waters. New flowlines would connect to existing pipelines under the ECSP: Wells connection EP. Therefore, we consider there is no merit to the objection. Gas market transparency considered outside the scope of this EP, but confirmed gas produced is destined for the domestic market only. (See Event ID 2025 0709 161003 4693.	Requested information provided to reasonable queries. No new measures adopted.
2025 0709 161003 4693	178	Go Surf School	2025-07-09	Email	Out	Passed on thanks for response. Noted regarding general views on gas drilling in the Otway Basin, and companies profiting from these ventures It was also noted they did not support our company operating in the Otway Basin. With respect to the strong view that Victoria's energy supply should be limited to being through existing pipelines within Victoria, noted our proposed activities under these 2 EPs do not include any additional pipelines in Victorian state waters or onshore Victoria. Our plan is to provide replacement supply through the connecting of new flowlines into	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						existing pipelines in Commonwealth waters. The gas will flow through those existing pipelines to our established onshore gas plant which currently operates below its designed capacity. Confirmed that all our gas is destined for domestic consumption, and not for export. Advised we could not comment on the general concern around market transparency, which is outside the scope of our EP, but did advise that domestic customers have expressed a strong desire to bring on more local gas supply.

2025 0817 155940 7905	191	Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC)	2025-08-17	Email	Out	GLaWAC admin staff introduced Amplitude Energy to new team members, and shared prior correspondence.	N/A	N/A
2025 0818 095520 7425	191	Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC)	2025-08-18	Email	In	New team member passed on thanks for the information. Advised they would review and consult internally, and checked as to whether we could extend the response time.	N/A	N/A
2025 0818 162113 4996	191	Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC)	2025-08-18	Email	Out	Passed on thanks for time taking call earlier same day. Confirmed request for additional time was not unreasonable, but requested that response be received by end of month as discussed during call. Noted the low likelihood of any impacts to GLaWAC Country. Noted GLaWAC's prior advice to us for our offshore projects " that GLaWAC *be contacted in such an emergency so that the right knowledge holders can be consulted. This is to ensure appropriate protection of any cultural heritage sites and cultural values that could be affected by a spill or response activities."* As discussed during consultation on our ongoing offshore operations and previous projects, confirmed our agreement with GLaWAC on the importance of this approach, and that we carry this commitment forward in relevant Environment Plans. We confirm that this commitment has been captured in the ECSP: Annie 2 Development Well EP. Noted intention to submit EP in the next 2-3 weeks, but confirmed that ongoing consultation provided further opportunity in influence how we carry out our activities. Advised we would be pleased to travel to meet in September to introduce team members to Amplitude Energy"s activities. Requested that GLaWAC advise if any further information or clarifications were required.	N/A	N/A
2025 0827 095027 7349	191	Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC)	2025-08-27	Email	Out	Referred to discussion on a potential meeting in September related to a new EP under development, and an overview of Amplitude Energy's activities. (Unrelated to this EP, but included in log for context).	N/A	N/A
2025 0828 141512 7349	191	Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC)	2025-08-28	Email	In	Confirmed prior advice that in the event of an emergency GLaWAC be contacted so that knowledge holders be consulted to ensure appropriate protection of any cultural heritage sites and values that could be affected by a spill or response activities. Looked forward to meeting in September (regarding other EP under development).	No objection or claim of adverse impact. Reasonable request to be notified in the case of an emergency event such as a hydrocarbon spill agreed as per Event ID 2025 0828 151110 5800.	GLaWAC included in emergency response contact register. Sections 7.7 and 8.3 of the EP have been updated to reflect. Annie-2 EP stakeholder notifications register updated accordingly.
2025 0828 151110 5800	191	Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC)	2025-08-28	Email	Out	Appreciated the response, and confirmed we would capture the advice in the EP.	N/A	N/A

2025 0530 112556 7365	17	Apollo Bay Fishermen's Cooperative	2025-05-30	Email	Out	Bulk mailout #2 - notification of community drop-in sessions and webinars	N/A	N/A
2025 0806 141549 4254	17	Apollo Bay Fishermen's Cooperative	2025-08-06	Email	Out	Bulk mailout #3 - notification this phase of consultation is closing	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.3.3. Consultation commenced on 12 May 2025 and no request for additional time has been received.								
2025 0512 150447 3514	37	Australian Southern Bluefin Tuna Industry Association (ASBTIA)	2025-05-12	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0520 121746 6215	37	Australian Southern Bluefin Tuna Industry Association (ASBTIA)	2025-05-20	Email	In	Noted their understanding of the purpose of consultation, but do not need to be consulted further on these activities. Would still like to receive project updates. Would require consultation on any projects that involved exploration activities such as seismic. In general, encouraged responsible use of existing infrastructure as opposed to greenfields developments.	No objection or claim of adverse impact. Reasonable request to receive project updates, and to be consulted on any future seismic data acquisition activities.	Confirmed we will continue to provide project updates, and consult should any projects involve seismic data acquisition. (See Event ID 2025 0520 134839 8306) Annie-2 EP stakeholder notifications register updated accordingly.
2025 0520 134839 8306	37	Australian Southern Bluefin Tuna Industry Association (ASBTIA)	2025-05-20	Email	Out	Passed on thanks for response. Confirmed we will provide project updates and invite further consultation should we consider undertaking seismic surveys.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.3.3. Consultation commenced on 12 May 2025 and no request for additional time has been received. Noted no further consultation needed.

Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 20 May 2025 and no request for additional time has been received.								
2025 0520 151916 8330	677	Relevant Person ID 677	2025-05-20	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0520 192039 1043	677	Relevant Person ID 677	2025-05-20	Email	In	Passed on thanks for the email. Noted that company operates SSJF and the BSCZSF, with operations based out of Portland, and focus area offshore Otway, including areas near Peterborough. 1. Noted overlap of proposed activities area with region that they actively fish for arrow squid, with the main season running from November through to May/June each year. Concerns raised: a) disruption to squid aggregation from noise, traffic and light b) Temporary exclusion areas during activities c) Cumulative pressures on operations if activities prolonged or staggered withing the operating window 2026-2030 2. Noted that currently their scallop fishing activities are east of Cape Otway, so direct impacts would not be expected. But this could change in future seasons. 3. In order to provide an informed response, request: a) Coordinates or shapefiles of activities footprint. b) Information on impact assessments with respect to commercial fisheries, arrow squid in particular.	No objections or claims. Reasonable concerns raised with respect to a) disruption from noise, traffic and light, b) temporary exclusion zones and c) cumulative impacts responded to in Event ID 2025 0609 184241 7349. Reasonable request for further information: a) coordinates or shapefiles, b) impact assessments, and c) outline of mitigations proposed; responded to in Event ID 2025 0609 184241 7349. Reasonable request to continue to be consulted, to meet and to be provided project updates confirmed in response in Event ID 2025 0609 184241 7349. No objection or claim of adverse impact.	Section 4.4.3 -Social Receptors, updated to note likely activity.

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						c) Outline of mitigations proposed, including potential seasonal or operational buffers. 4. Noted they wish to continue to be consulted as relevant persons and would like to be notified on updates to the EPs, and have the opportunity to meet to discuss operational overlap and risk mitigations. Requested confirmation of receipt of the response, and next steps. Noted appreciation in being consulted.		
2025 0523 164505 9337	677	Relevant Person ID 677	2025-05-26	Email	In	Passed on thanks for response. Advised that could not meet in-person while Amplitude Energy in Portland as will be away. Please to continue the discussion over email, and happy to provide information about the fishing operations as needed.	No objection or claim of adverse impact.	N/A
2025 0526 084804 4132	677	Relevant Person ID 677	2025-05-26	Email	Out	Appreciated the response, and noted that the EPs were still under preparation and would revert soon on queries.	N/A	N/A
2025 0529 113606 7290	677	Relevant Person ID 677	2025-05-27	Email	Out	Apologised for getting person's name wrong.	N/A	N/A
2025 0609 184241 7349	677	Relevant Person ID 677	2025-06-09	Email	Out	Provided shapefiles as requested, and the following responses to queries and concerns: Potential Interaction with Squid Fishing Grounds We note that you actively fish in the proposed operational areas, with the main season running from November through to May/June. Concerns a) Disruption to squid aggregation and migration patterns from underwater noise, vessel traffic, and light interference. In the Offshore Project Proposal (**NOPSEMA OPP**), Amplitude have assessed impacts from those aspects as follows: <u>Vessel traffic</u> Our project will result in increased vessel traffic, though not by a great deal. We will use 1-4 vessels (sometimes including a rig) to do our project activities. We hire vessels temporarily when we need them (and when they are available), and we tend to mobilise them out of Portland or Geelong. Our project operational areas overlaps 4.02% of the low intensity area of the Southern Squid Jig Fishery (Figure 6-78 of the OPP), though please note, the operational areas are not an exclusion area, you can still fish throughout most of it (see information on exclusion zones below), it's just you will be more likely to see a vessel we have hired in that area. Once the vessels have completed their scopes, they leave. We then bring a vessel back into the area for inspections and maintenance every ~3-5 years. We have been doing these inspection and maintenance activities in this region over our existing subsea equipment for over 20-years. Once the subsea equipment has reached the end of its useful life, we bring vessels back in to decommission it. <u>Underwater noise</u>	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						Underwater noise will be generated from well construction and installation activities and is similar in nature and scale to other shipping noise in the region. We know that the vessels will generate levels of noise that can disturb marine fauna, though the modelling we have completed indicates that the risk of disturbance to marine fauna is localised around the vessels. For more information please refer to Sections 8.1 and 8.2 of the **Amplitude Energy Offshore Project Proposal**, which assesses the whole development. Impacts associated with the noise emissions from the activities specific to the Annie-2 Development well EP & the ECSP Wells Connection EP currently in preparation will be assessed and described in these EPs bespoke to the location and type of each activity. <u>Light interference</u> Well construction, vessel and MODU operations are expected to introduce additional light into the marine environment from flaring, navigation and safety lighting. This introduces a potential risk of change in fauna behaviour. Water depths within the operational area are suitable for arrow squid, that are highly attracted to artificial light at night hence light being used as a tool by squid fishers to attract squid. Light emissions from the vessels we use would be expected to temporarily attract squid. Behavioural changes to marine invertebrates from artificial light at night is expected to be localised and short term and gone once the vessels have completed their scopes. Light from flaring of gas during well construction can take 24-60-hours and will be an additional light source for that short period. For more information please refer to Section 8.3 of the **Amplitude Energy Offshore Project Proposal**. Impacts associated with the light emissions for each of the activities specific to the Annie-2 Development well EP & the ECSP Wells Connection EP currently in preparation will be assessed and described in these EPs bespoke to the location and type of each activity. b) Temporary exclusion from productive fishing grounds during drilling, installation, or integrity operations. <u>ECSP: Annie-2 development well EP:</u> The development well will take up to 60 days to drill, and a temporary exclusion zone of 3km radius will be in place for safety purposes. While the activity may take place in the window of 2026-2029, this is a discrete activity that will only occur once. The EP also includes provision for plug and abandonment activities, in the event that the targeted reservoir is not commercially viable. <u>ECSP: Wells connection EP</u> The flowline and umbilical laying and connections will be planned for a single activity taking up to 120 days across the project area during that time, and these activities require the completion of the development wells to connect to. There is provision for some additional geophysical survey (not seismic) work that may take up to 60 days. (refer to section 4.3.1 of the **Amplitude Energy Offshore Project Proposal**, for more detail on what these surveys entail) <u>Both EPs:</u> Both EPs provide for routine inspection, maintenance and repair work of up to 60 days. These are only occasional events similar to those activities currently undertaken on our existing infrastructure.		

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						Summary: There appears to be good opportunity to have minimal disruption to fishing activities through the setting up of good communications. If you like, this is something we can explore further when we meet, and it would be good to get an understanding of how interactions with past operations may have affected your fishing, and how we can learn form that experience. c) Cumulative operational pressure if activities are prolonged or staggered over the multi-year window (2026â€“2030). As per b. above, operations are of limited duration over various locations within the operational area defined in the OPP, and different times within that 5-year combined window. They are staggered with significant time periods between successive operations likely, but activities are not prolonged. Request d) We request consideration be given to the seasonal nature of the squid fishery and that operations are scheduled to avoid the key fishing period wherever possible. We will consider the seasonal nature of the squid fishery during our planning for activities, however it's worth being transparent at this stage that avoiding a particular time of year is often impracticable for the activities we do because we are at the mercy of the international markets for specialist vessel availability, and weather windows, which can be few and far between in the Otway as you would know. Avoiding the entire window November through to May would not be possible for our activities, though once the subsea systems are operational, most years we will not have vessel out there. 2. Scallop Fishery Consideration Based on the fishing data from 2016 to present, Amplitude note that you currently don't fish west of Cape Otway, so impacts from our activities would be unlikely. Should this change, our environment plans provide for ongoing consultation throughout the life of the EP, so opportunities to meet with us and understand how our activities may impact you remain available. 3. Requests for Further Information a) Detailed coordinates or shapefiles of the proposed activity footprint, so we can assess any spatial overlap with our known fishing grounds. Shapefiles are attached for both EPs. Please refer to **Figures 6 -66 and 6-76 in the OPP** showing the position of the operational area relative to the fishery reporting grids and relative intensity. b) Clarification on environmental impact assessments relating to commercial fisheries â€" particularly arrow squid. Broad overview of assessment is as follows, and specific elements have been provided in 1.b. above. The OPP assesses the changes to the functions, interests and activities of other marine users as impacts likely to be localised and temporary due to small and temporary exclusion zones, and the low level of use of the operational area by commercial fisheries, the small proportion of fishery management areas covered by the operational area. (See **OPP Section 8.9)**.		

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						The OPP defines acceptable levels for each impact to evaluate acceptability and whether activities are managed to reduce impacts and risks to a low as reasonably practicable. The OPP defines the acceptable level of impact as shown below, and the evaluation concluded that the impacts and risks were acceptable: Social and commercial amenity values of the Commonwealth Marine Area within the region are maintained consistent with the rights of all marine users Impacts and risks to other marine users associated with activities defined in this OPP will not lead to substantial adverse effects on the sustainability of commercial fisheries c) An outline of any specific mitigation strategies proposed to minimise disruption to fishing activities, including potential seasonal restrictions or operational buffers. The likely control measures to be included within the EPs for these activities include: Marine exclusion and caution zones (not exceeding distances needed for safe operations) applied around vessels and the MODU (drilling rig) requested via notice to mariners, issued by the Australian Hydrographic Office (AHO). All installed subsea infrastructure charted on relevant mariners charts as well as petroleum safety exclusion areas Marine Assurance Processes to ensure vessels and MODU adhere to navigational safety requirements Fisheries damages protocol to compensate for fishing equipment damage (if damaged by project infrastructure). Ongoing consultation As touched on above, we consider the best approach is to maintain an ongoing dialogue (consultation) that provides for good planning and communications prior to and during the proposed activities. Ideally upon the conclusion of each activity, discussions with interested commercial fishing operators could be used to improve how future operations would then be coordinated through lessons learned. But the opportunity to meet would allow us to further consider the best approach. 4. Ongoing Consultation We confirm that we will continue to consider you a relevant person under Section 25 of the OPGGS(E) Regulations and that we will: a) Notify you of updates to the proposed activities to be carried out under these environment plans b) Further consultation prior to the first activities to be carried out under these EPs, to establish any on-water communications and cooperation protocols if not established prior. Provision of 14 days' notice prior to commencement of any activities to be carried out under these EPs, or as otherwise agreed under 4.b. above. c) We would be pleased to meet online or via phone, or in person on your return from leave.

						Details can be found here **https://amplitudeenergy.com.au/consultation** RP 681 advised he understood the industry with years of experience working in a refinery. Confirmed he also had trawl and scallop licenses in addition to squid jig. We wished him well with fishing, and thanked him for confirmation on licences held.

2025 0530 155009 6215	717	Relevant Person ID 717	2025-07-30	Email/Phone call	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4) Bulk mailout #2 - notification of community drop-in sessions and webinars Noted from discussions: The Bass Strait Scallop Industry Association doesn't effectively exist There is large overlap in licence holdings across the Cth, Tasmanian and Victorian managed scallop fisheries. The current activity level in the Victorian managed fishery is relatively low Through MSC certification work with them, Relevant Person ID 717 is able to assist in supporting consultation with a small number of licence holders who actually represent around 50% of the Cth quota This should simplify the consultation effort for them	No objection or claim of adverse impact.	N/A

2025 0526 084734 5572	382	Tuna Australia	2025-05-23	Email	Out	Passed on thanks.	N/A	N/A
2025 0530 144826 5163	382	Tuna Australia	2025-05-30	Email	Out	Bulk mailout #2 - notification of community drop-in sessions and webinars	N/A	N/A
2025 0620 102153 1633	382	Tuna Australia	2025-06-20	Email	In	Noted the three tuna fisheries relevant to these activities as being the Eastern Tuna and Billfish (ETBF), the Southern Bluefin Tuna Fishery (SBTF) and the Australian Skipjack Fishery (east) (ASF) Noted the ASF is not active in the area, but members are members of Tuna Australia and were included in consultation. Some Tuna Australia members also hold SBT fishing rights Recommended contacting ASBTIA to ensure consultation with the purse seine sector of the SBF fishery Provided an overview of eastern tuna fisheries excluding SBT Currently 79 Longline SFR holders and 83 Minor Line SFR holders in the ETBF, potentially 162 boats operating in the fishery Provided overview of TACC by species SBT Regarding SBT, noted quota managed by CCSBT who allocate TAC for Australia. 5% of that TAC is allocated to the recreational sector Longline share of SBT has grown markedly over the last 5 years All current longline SBT effort occurs on southeast coast Longline fishing for SBT generally occurs from May to October With increasing biomass and general easterly shift of stock early in the season, effort will likely increase in both longline and minor line. Young adult SBT likely to be prevalent in the operations area. Longliners have increased effort and local port usage off Tasmania, Portland and the Bass Strait, with Portland now one of the primary ports for SBT fishers. Consultation Tuna Australia engaged with all concession holders in the ETBF and permit holders in the ASF (east) There was a 100% delivery rate and a relatively high engagement rate with the material provided. The relatively small number of responses suggested the proposal was not controversial. Concerns raised	No objection or claim of adverse impact. Reasonable concerns raised regarding: 1) Potential exclusion zones/spatial conflict - per Event ID 2025 0721 110532 7349, noted limited risk and view that best managed through good communications. 2) Cumulative impact – per Event ID 2025 0721 110532 7349 responded on these concerns, noting discrete nature of activities and limited impact on long line operations. Reasonable request made for notifications; agreed on variation to notifications as per Event ID 2025 0721 110532 7349 and 2025 0722 111345 1840	Sections 5.1.1.3 and 5.1.1.6 of the Description of the Environment updated to reflect data provided. Agreed notifications to be provided. Annie-2 EP stakeholder notifications register updated accordingly.

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						Potential spatial conflict, noting exclusion zones, support vessels and infrastructure But also noted this would not significantly hinder longline operations, particularly considering location and water depths Advance notice and 48-hour lookaheads are suggested to limit potential spatial conflicts Several concession holders raised concerns about cumulative impact noting multiple exploration proposals. While noting the project was considered relatively low risk, particularly considering pelagic nature of the fishing operations, noted concerns about concurrent and future activities of other oil and gas exploration activities in the area. Noted that adequate commentary was provided by Amplitude Energy about risks and mitigations in respect of these projects Need to also consider cumulative impacts of energy exploitation in the Otway Basin beyond that of Amplitude Energy Welcomed further dialogue to deconflict any possible issues before they arise.		
2025 0721 110532 7349	382	Tuna Australia	2025-07-21	Email	Out	Passed on thanks for the comprehensive consultation report. Noted that no specific objections or claims of adverse impacts are raised, but acknowledged the request for notifications and general concerns by some fishers regarding cumulative impacts. Consultation Appreciated that information was shared with all concession and permit holders within the Eastern Tuna and Billfish Fishery and the Australian Skipjack Fishery, and agreed the rate of engagement with the material was good. Also agreed with their conclusion that response levels were low due to the nature and scale of the activities, noting we also saw generally low levels of response compared with some other activities in the region. Confirmed we have consulted directly with ASBTIA in regards these proposed activities. Navigation and Deconflicting with fishing operations Agreed the best approach to avoiding conflict is through good communications and confirm that we will provide at least 72-hours' notice ahead of any activity commencing under these EPs. Committed to also provide notification after completion of any activities carried out under these EPs. Given the nature of the activities covered by the EPs, considered that the 48-hour look ahead is probably not so beneficial (as it might be for seismic operations where the vessel is moving faster and covering larger areas) due to the limited spatial extent and sequential nature of each activity. For example, for wells connection activities, there is between 5-10 km of flowline laying (slow moving vessel) for each manifold (refer Figure below excerpted from the published approved OPP). Similarly, vessels operating	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						for inspection, maintenance and repair works move slowly over areas of infrastructure. Noted that for the drilling Annie-2 development well, the drilling unit operates in a static location for up to 60 days. For any survey activities, vessels have reasonable manoeuvrability and will work in well-defined areas of limited spatial extent. Cumulative impacts Noted general concerns about cumulative impacts of exploration and energy exploitation in the Otway Basin. These are discussed further below. Development drilling and well connection activities Noted some members raised general concerns about cumulative impacts from the ECSP activities, particularly in relation to other exploration activities proposed in the area. The suggestion that we consider an assessment of our activities in the context of other activities likely to overlap the timeframe and general area of our planned activities, and options for delaying or otherwise deconflicting concurrent activity was noted. Considered that best way to ensure no temporal overlap of drilling activities was through the use of a common drilling rig amongst petroleum operators planning relevant activities in the area. This step has already been taken, and the reasonably foreseeable drilling activities will be carried out using one mobile offshore drilling unit (MODU) in a sequential manner, so the spatial impact at any time is limited from a drilling perspective. Similarly, there are few pipelaying vessels available in the market, so it is unlikely that concurrent pipelaying would occur. The potential for a seismic data acquisition campaign to overlap temporally with drilling or pipelaying activities remains, but our activity footprint is small compared to that of the seismic data acquisition footprint, so the contribution is limited. However, while we cannot speak on behalf of a seismic data acquisition operator, from a practical viewpoint seismic data acquisition is unlikely to occur concurrently with drilling or pipelaying activities in the same area as that would require working around the vessels and leaving a significant gap in the data acquired. Our EP does consider cumulative impacts of our activities and concludes that they are unlikely to have a discernible cumulative impact on commercial fisheries when considered alongside other reasonably known energy related activities such as seismic data acquisition or renewal energy activities, and that our activities will not have a substantial adverse effect on the sustainability of a commercial fishery. Any impacts from the rig, pipe-laying vessel or support vessels will be of a relatively short-term duration and a relatively low footprint compared with some other proposed energy related activities, and as you have noted our resulting infrastructure does not substantially hinder long line fishing that is pelagic in nature. Interaction with Energy Exploitation Activities		

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						We note you have suggested further dialogue in the context of cumulative impacts of energy exploitation activities in the Otway Basin. With respect to the ECSP EPs, these comprise discrete activities during the life of the EPs, the longest being the wells connection activities of up to 120 days (this assumes that the vessel has to travel to & from Port for flowline reels and weather downtime). However, spatially each activity impacts a relatively small area (greatest length of flowline tieback is approx. 10km) in terms of how it could affect long-line fishing, and only the PSZ around the Annie-2 well presents a longer-term impact to access. Based on the rig sequencing, we have assessed it unlikely that the drilling activity will have discernible cumulative impact. We recognise the increasing number of offshore proponents consulting in the area, particularly with the release of offshore wind acreage, and this is something we are considering as part of our longer-term development planning. We addressed this firstly in our East Coast Supply Project Offshore Project Proposal (OPP), which considers what a holistic Otway development could look like following exploration success. We previously consulted with you on the OPP, which has recently been accepted by NOPSEMA, and can be found on NOPSEMA's site here: **Offshore project proposals | NOPSEMA**. The cumulative impact assessment can be found in Section 11 on page 788. Measures adopted or confirmed • We have checked information you provided in the "background" section and confirm that it is consistent with the description of environment for these EPs; • We have reviewed the information provided on the "current activity" of the relevant fisheries. It has provided useful confirmation of our understanding of the tuna fisheries, consistent with that provided last year, and confirms information contained within the "description of the environment". • We will provide 72-hour advance notifications and completion notifications as described above, and/or other notifications as otherwise agreed; and • We confirm that reasonably foreseeable Otway drilling activities are part of a rig-share consortium such that various proposals using the drilling rig will be sequential using the one rig, not concurrent. Noted our appreciation of the effort taken to reach all concession and permit holders in both fisheries, and in preparing a thorough report. Considered this closed out any current concerns regarding proposed activities under the 2 ECSP EPs, but requested they advise if there were any further queries or concerns.		
2025 0722 111345 1840	382	Tuna Australia	2025-07-22	Email	In	Noted that the 48-hour look-ahead was a general request, but confirmed 72 hour notice was more than adequate based on nature of our operations.	No objection or claim of adverse impact.	Agreed on method for notifications.

2025 0605 141549 4254	3	3280-3284 Warrnambool Beach Patrol	2025-06-05	Drop-in session	In	Requested project updates.	No objection or claim of adverse impact. Reasonable request for project updates agreed.	Annie-2 EP stakeholder notifications register updated accordingly.
2025 0611 154748 9024	3	3280-3284 Warrnambool Beach Patrol	2025-06-11	Email	Out	Passed on appreciation for meeting during our community drop-in sessions. We discussed your queries below when we met, and I have summarised our responses as follows: 1. How our pipes/flowlines (and umbilicals) are secured to the sea floor -These are held to the sea floor by their own weight, augmented by regularly spaced overlaid concrete mattresses. 2. Will concrete mattresses be used? -Yes, they are spaced regularly during pipelaying, and additional mattresses may be laid as a result of ongoing inspection work during the life of the operations if needed -for example if any instability or scouring is noted on inspection 3. Plastics were not noted as a key potential impact on our information sheets -Plastics are considered in our environment plans and are assessed under risk impacts associated with loss of materials overboard. As mentioned when we met, through the implementation of the environment plans and assurance against these, Amplitude work closely with the vessel contractors to have no unplanned release of waste/objects to the marine environment. If this occurs it is reported to NOPSEMA and investigated by Amplitude, and if possible the waste/ objects retrieved. 4. Full list of plastics to be used -Plastics are in widespread use across all aspects of operations, so the provision of a full list of where all plastics are used would be quite difficult to provide. As we discussed, more relevant is the release of plastics or any equipment or objects into the marine environment. As one of our staff members outlined during the drop-in session, in spite of the mitigations in place, the dropping of objects, for example, can occasionally happen, and are recordable or reportable incidents in our heavily regulated industry. We would be happy to advise you of any such instances occurring so there are no surprises for your team 5. Bulk drink bottle brands -We do try to limit these types of plastic consumables, but as discussed during the drop-in sessions, would be happy to share a list upon mobilising of vessels for the proposed activities. We also committed to following up on your query related to the blue plastic twine that washed up both recently, and during 2023 (coinciding with timing of another operator's offshore activities). If you could share the photos, we will follow up to try to determine a possible source, and whether it is something we need to consider during our activities. It was considered this covered the queries and discussions, but requested confirmation in case of any corrections or omissions.	N/A	N/A
2025 0611 171332 8764	3	3280-3284 Warrnambool Beach Patrol	2025-06-11	Email	In	Passed on thanks for the response, and shared images of the twine that had been found on the beaches. Noted that another operator had shown images of twine in their old concrete lined pipelines.	No objection or claim of adverse impact. (Discussion related to wells connection EP and another operator's activities.	N/A

2025 0612 115531 1795	3	3280-3284 Warrnambool Beach Patrol	2025-06-12	Email	Out	Passed on thanks for the images, and advised we couldn't be certain where that comes from. Sent images of typical mattresses, and while they used a form of twine, they were much thicker than those found on the beaches. Noted our engineers did not consider that the twine would break free in the same manner as those washed ashore. As such we did not envisage such risk from our mattresses. We noted that similar polypropylene is used in our umbilicals and sent an image of a cutaway umbilical section. This showed how the twine was fully encapsulated in the outer sleeve, so again, it was a highly unlikely source of any twine washed ashore. Offered to collect any similar material found in future for assessment to determine if it could have resulted from any of our activities.	N/A	N/A

2025 0513 132533 1957	586	No Offshore Windfarm Zone - Warrnambool and District	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0513 141808 7085	586	No Offshore Windfarm Zone - Warrnambool and District	2025-05-13	Email	In	Passed on thanks for email and noted they will respond soon. Requested clarity as to whether seismic data acquisition was involved with any of the proposed activities.	N/A	N/A
2025 0513 141957 1141	586	No Offshore Windfarm Zone - Warrnambool and District	2025-05-13	Email	Out	Confirmed no seismic data acquisition will be undertaken under these EPs.	N/A	N/A
2025 0519 131815 7787	586	No Offshore Windfarm Zone - Warrnambool and District	2025-05-15	Email	In	Provided the following feedback on behalf of the network: Passed on thanks for the opportunity to provide feedback. The precautionary principle should guide risk management for potential impacts such as underwater noise, vessel activity, and seabed disturbance, particularly in relation to: 1. The Logans Beach Whale Nursery. 2. Migration, breeding, and feeding areas of marine mammals in the Southern Ocean. 3. Biologically Important Areas (BIAs) and Habitats Critical to the Survival (HCTS) of the endangered Southern Right Whale. 4. The migration routes of short-finned eels to and from the Coral Sea. The National Recovery Plan for the Southern Right Whale (effective 31 July 2024 under the EPBC Act) highlights the importance of applying the precautionary principle in protecting the species, which is also emphasized here. It is understood that neither of the two Environmental Plans (EPs) propose seismic data acquisition. If this changes, immediate notification is requested. The involvement of First Nations groups in consultation should be ensured if they wish to contribute. Finally, ongoing updates are requested, especially regarding future consultation opportunities.	N/A	N/A
2025 0530 142206 3313	586	No Offshore Windfarm Zone - Warrnambool and District	2025-05-30	Email	Out	Bulk mailout #2 - notification of community drop-in sessions and webinars. Noted that we will revert soon on outstanding queries, and offered to meet while in Warrnambool.	N/A	N/A
2025 0606 115344 1967	586	No Offshore Windfarm Zone - Warrnambool and District	2025-06-04	Email	Out	Passed on thanks for feedback. Provided following responses to queries: Application of the precautionary principle The Precautionary Principle (as a component of Ecologically sustainable development) is something that we must and do apply as part of our OPP and EP development, under the OPGGS (Environment) Regulations. The	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						regulator will not accept our plans unless we can demonstrate that we will do our activities not out-with the principles of ESD. To ensure we take appropriate levels of precaution we start by defining our project and potential impact areas, and then undertake EPBC Act protected matters searches. We then review the list of matters and all relevant conservation advice, for every listed species, including the southern right whale recovery plan issued in 2024. We take this advice into account, including the key threats the advice highlight (this might be subsea noise, vessel strike or marine debris for example) to understand the sensitivity of each component of the environment relative to the activities we are undertaking. In our case the main elements of the project which introduce stressors, and which you've started to allude to in your email, are temporary use of vessels, and installing equipment on the seabed. We evaluate the options to either avoid impacts and risks associated with those stressors, or otherwise manage them to acceptable levels, and to as low as reasonably practicable (ALARP). EPBC Act conservations advice and recovery plans also inform what an acceptable level is. Our OPP and EPs demonstrate how we will meet or beat acceptable levels of impact. Then within our EPs we go a step further in our impact and risk reduction efforts by applying the ALARP principle, and reducing impacts and risks to the lowest practicable level. We have applied this standard process while developing the OPP (**OPP - East Coast Supply Project - Rev 2 - December 2024.pdf**). The Environment Plans for proposed the East Coast Supply Project activities, which are in preparation include evaluations for underwater sound (impulsive and continuous), physical presence and seabed disturbance. The OPP evaluates that the East Coast Supply Project is consistent with the precautionary principle (refer to Tables 8-13, 8-33 and 9-9 in the OPP link provided above), and for each of these aspects (with the implementation of control measures) because: The highest ranking consequences and risks did not result in serious or irreversible environmental damage Potential impacts and risks were well-understood, we have confidence that the management measures we have proposed will manage the residual impacts and risks, and both our plans and our performance are closely regulated in Australian waters. The evaluations considered Logans Beach, Southern Right Whale BIAs and HCTS and migration of short-finned eels. Of note: Logans beach is ~24km from the operational area of the OPP (these activities are undertaken within this area). We have commissioned subsea noise modelling by subsea acoustics specialists and scenarios and at no point do our activities result in levels of noise which will disturb whales within the Logans Beach reserve. There are no overlaps with behavioural disturbance (noise associated) contours from activity vessels There is potential that some infrequent vessel activities could result in behavioural disturbance thresholds for noise being exceeded just inside southern right whale HCTS, though not within the shallower preferred calving and nursing habitat. EPOs and control measures have been		

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						developed to ensure that the risk of behavioural disturbance to southern right whales inside BIA's and HTCS, is minimised. The behavioural reaction by eels to subsea noise has been assessed to be minor and local (i.e. if the eels are swimming within tens of metres of the activities) and we have no large electromagnetic fields associated with our project which might influence migration behaviour. We confirm that the objectives, actions and measures described within the OPP, and the activity specific Environment Plans are consistent with the objectives and actions of the 2024 SRW national recovery plan. No seismic data acquisition is contemplated under the OPP or either of these EPs. Should that change, we would necessarily re-consult with all relevant persons, including your organisation. We appreciate and agree with the view that relevant First Nations groups should be consulted, and confirm that we have invited the three closest Registered Aboriginal Parties (RAPs) to consult on these activities. Confirmed we will keep the organisation updated on these activities, and will invite your comment on future EPs in the offshore Otway Basin.		
2025 0605 133757 8883	586	No Offshore Windfarm Zone - Warrnambool and District	2025-06-05	Email	In	Passed on thanks for response. Advised unable to meet during drop-in sessions.	N/A	N/A

2025 0606 115735 1643	718	Protect the West	2025-06-06	Email	In	Registered for webinar for 9 June 2025. Initially contacted us as a result of advertisement in regional press.	N/A	N/A
2025 0625 095132 7349	718	Protect the West	2025-06-25	Email	Out	Passed on thanks for joining the webinar on Friday 20 June; appreciated the interest and time, and the opportunity to learn a little about the organisation's interests. Noted they were primarily concerned with major expansion of long-life oil and/or gas projects such as the recently announced extension to the NW Shelf project. Advised as promised that we had now uploaded a pre-recorded version of the webinar, and provided the link: **ECSP: Annie-2 development well**. Noted the webinar could be found under the drop-in sessions table on that page, or on the **ECSP: Wells connection EP** page. Noted we also added Protect the West as a â€œRelevant Personâ€ with respect to consultation on our environment plans, with you as the primary contact. Requested advice if there was a different preference. Provided a copy of the general mailout sent to other relevant persons. (Bulk mailout #1)	N/A	N/A
2025 0811 190737 9169	718	Protect the West	2025-08-11	Email	Out	Bulk mailout #3 - notification this phase of consultation is closing	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 6 June 2025 and no request for additional time has been received.

Local government and elected officials 25(1)(d)								
2025 0513 161510 9657	79	Colac Otway Shire	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4) It was noted that based on previous advice, shire council only wish to be consulted on seismic data acquisition activities. The proposed activities do not include any seismic, so we are sending this for information purposes only.	N/A	N/A
2025 0522 112443 6127	79	Colac Otway Shire	2025-05-21	Email	In	Passed on thanks for contacting the shire regarding the 2 ECSP EPs. Noted that as there is no seismic involved, would just like to receive project updates. Noted via quick response table: Do not need to be consulted further on these two projects Would still like to receive project updates Only wish to be consulted on any seismic projects.	No objection or claim of adverse impact. Reasonable request for project updates, and noted consultation only required in future for any relevant seismic data acquisition projects – responded to in Event ID 2025 0522 191812 8209.	Confirmed we would provide project updates, and that no seismic was to be acquired under this EP. Event ID 2025 0522 191812 8209, Annie-2 EP stakeholder notifications register updated accordingly.
2025 0522 191812 8209	79	Colac Otway Shire	2025-05-22	Email	Out	Passed on thanks for response, and confirmed we will continue to provide project updates as requested. Confirmed no seismic data acquisition being planned under either of these two EPs.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0513 162028 8843	86	Corangamite Shire Council	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4). Noted from our most recent meeting that council does not need to be consulted on these activities, so sharing for information purposes.	N/A	N/A
2025 0514 120411 7349	86	Corangamite Shire Council	2025-05-14	Email	In	Response via quick response table: No further consultation required on these projects Would still like to receive project updates.	No objection or claim of adverse impact. Reasonable request to receive project updates confirmed in Event ID 2025 0514 120523 5800	Will provide project updates as per event ID 2025 0514 120523 5800. Annie-2 EP stakeholder notifications register updated accordingly.
2025 0514 120523 5800	86	Corangamite Shire Council	2025-05-14	Email	Out	Passed on thanks.	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0515 155818 5800	177	Glenelg Shire Council (Portland)	2025-05-15	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A

Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								
2025 0513 163045 9546	401	Warrnambool City Council	2025-05-13	Email	Out	Bulk mailout #1 – initial invitation to comment, with information sheet (see full summary in EP Table 11-4)	N/A	N/A
2025 0516 105323 9211	401	Warrnambool City Council	2025-05-16	Email	Out	Responded via quick response table: Provide information on: Cetaceans (migration paths) and *Eudyptula minor* Little Penguins Provide information on: requirements/needs of Warrnambool airport May be interested in meeting We would like to know how you manage impacts to the following species: 1. *Eubalaena australis* Southern right whale 2. *Megaptera novaengliae* Humpback whale 3. *Balaenoptera musculus* Blue Whale 4. *Eudyptula minor* Little penguin	No objection or claim of adverse impact. Reasonable request for additional information on 1) Little Penguins, and impact management on 1) Southern Right Whale 2) Humpback Whale 3) Blue Whale and 4) Little Penguin Information provided in Event ID 2025 0604 221247 8160, and offer to meet made in Event ID 2025 0530 121749 2087. Query related to use of Warrnambool Airport outside scope of EP, and responded to via separate correspondence.	Relevant requested information has been provided in Event ID 2025 0604 221247 8160,
2025 0530 121749 2087	401	Warrnambool City Council	2025-05-30	Email	Out	Bulk mailout #2 - notification of community drop-in sessions and webinars. Also advised that we were preparing a response to their earlier email, but were available to meet during the drop-in sessions in Warrnambool.	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
2025 0604 221247 8160	401	Warrnambool City Council	2025-06-04	Email	Out	Noted we were in Warrnambool next day and could meet at the drop-in sessions, or between sessions, at their convenience. Regarding queries: **Cetacean migration paths** Species such as Mink, Sei, Blue, Fin, Pygmy Right, Southern Right and Humpback whales occur in the Otway region at particular times of year, and at those times, may move through the areas we propose to work,. Further information, including their presence and timing in the region, for all of the cetacean species which are known, likely or which may occur are provided within our **Offshore Project Proposal section 6.5.8.1.** We would recommend looking at both the **South East Marine region profile** and the DCCEEW Species Profile and Threats Database - **Australian marine species pages** (within the Movement pattern sections) for more detail on any particular species. Below is an excerpt from the *Seasonality of Key Sensitivities within the Otway Basin* table within the East Coast Supply Project OPP (published here - **OPP - East Coast Supply Project - Rev 2 - December 2024.pdf**). The cetacean species listed below typically occur within the region. Some species may occur year-round, whilst some may be transient, or have a seasonal occurrence. The arrival of some species to the region is linked to physical processes such as seasonal upwellings in the region and may vary from year to year. This information is used to inform the impact and risk assessment, including the likelihood of a particular consequence eventuating. **Little Penguins** Little penguins are the smallest species of penguin, and are endemic, permanent residents on several inshore and offshore Australian and New Zealand islands. Their diet includes small school fish, squid and krill and they are listed as marine under the EPBC act. Our OPP and map below show the Foraging and breeding Biologically Important Areas (BIAs) for the little penguin that are present in the southeast, as defined by the Commonwealth government. We are also aware of the little penguin colony on middle island (Warrnambool) under close management under the Middle Island Project* We describe the rookeries and breeding colonies of the Otway region in **section 6.3.1.1 of the OPP**, and note that Breeding occurs between September and February. The figure below (excerpted from the OPP) shows the Little Penguin BIAs in proximity to the Operational Area for the East Coast Supply Project activities. **side note our environment advisor now has 2 x mini Maremma guardian dogs from the Flagstaff shop which his kids have named oddball.* **Requirements/needs of Warrnambool airport** We understand the interest in this, but being outside the scope of these EPs, our External Affairs Manager, Bindi Gove, will contact you separately to discuss further. **Managing impacts to the following species**	N/A	N/A

Event ID	Relevant Person ID	Relevant Person	Date	Event Method	In/Out	Event Summary	Assessment of Merit	Measures Adopted/Actions taken
						2,3 Southern Right, Humpback, and Blue Whales Attached is an information sheet on potential impacts to whales, including the above three species. **Little penguin** Threats to the Little Penguin include injury and mortality through vessel interaction and oil pollution, in addition to changing ocean conditions that could affect food sources and terrestrial issues such as predation. Impacts from planned operations on Little Penguins are considered unlikely given the limited nature and scale of our activities. We manage the potential stressors from the activity on little penguins and other marine life through a variety of measures including: - minimising lighting and subsea noise as far as practicable to reduce the chance of influencing animal behaviour, and - preventing the release of marine debris such as plastic, into the sea which could cause harm by ingestion. - ensuring we do not have a spill of hydrocarbons. Our entire activity, from its inception to it actually happening is planned to ensure we do not lose containment of the hydrocarbons we access and produce from offshore. Nevertheless, we do have emergency response plans in place, including tactical response plans which outline considerations for little penguins should hydrocarbons overlap with their range, and provisions for long-term monitoring studies to track the impact of a spill on marine fauna and their recovery. For more information please see **Tables 9-21 and 9-24 of the OPP**.		
2025 0811 153539 6267	401	Warrnambool City Council	2025-08-11	Email	Out	Bulk mailout #3 - notification this phase of consultation is closing	N/A	N/A
Per regulation 25(2) of the OPGGS(E)R, sufficient information has been provided as described in Section 11.3.2 of the EP. There are no requests outstanding for additional information. Per regulation 25(3) of the OPGGS(E)R, reasonable period has been provided, being more than that described in Section 11.2.4. Consultation commenced on 13 May 2025 and no request for additional time has been received.								

Table 5-2:Relevant persons consultation report – Gunditj Mirring Traditional Owners Aboriginal Corporation (GMTOAC)

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
2024 1203 123238 7220	2024/12-03	Email	Out				Noted wished to commence consultation on at least two other EPs that are currently in early stages of development, acknowledging the importance of early engagement with GMTOAC and the Gunditjmara people.
2024 1220 102303 6185	2024/12/20	Email	Out		None	None	**Email from NRF attaching letter.** Letter notes items related to other EPs. Notes previous requests for material to be provided in advance and requests details as to when material should be provided, and whether GMTOAC has particular concerns that Cooper Energy can seek to address in that material.
2025 0121 194346 7349	2025/01/21	Email	Out		None	None	**Email from NRF to EJA attach letter which:** Notes that Amplitude Energy would still be willing to meet in mid-March 2025, as part of ongoing engagement on this EP and in respect of 2 further environment plans (this refers to the two ECSP EP, including this Annie-2 EP). Requests confirmation as soon as possible as to the date of the proposed meeting in March, provides a copy of the GMTOAC fee schedule (as previously requested), provides information regarding the technical advice obtained by Cooper Energy and provides confirmation as to any expectations or preferences of GMTOAC for that meeting.
FN-GMTOAC-20250129-Email 2025 0129 082251 6215	2025/01/29	Email	In	Email incoming from EJA to NRF noting that EJA are seeking instructions and will aim to respond by the end of that week.	None	None	
FN-GMTOAC-20250205-Email **2025 0205 065930 7349**	2025/02/05	Email	In	Email incoming from EJA to NRF apologising for delay in response and requesting further information about additional EPs prior to responding.	None	None	
2025 0207 171021 7349	2025-02-07	Email	Out				**Email and letter from Amplitude Energy to GMTOAC** The letter: - notes Amplitude Energy has been in previous correspondence with EJA regarding consultation with GMTOAC and its members on two new EPs. - introduces two new EPs (ECSP - Annie-2 Development Well Ep and ECSP- Wells Connection EP) and notes that Amplitude Energy is reaching out for early engagement (before broader consultation commences) in line with the Consultation & Negotiation Protocol - provides 2 x consultation fact sheets which provide an overview of the proposed activities under each EP - notes that Amplitude Energy has familiarised itself with GMTOAC's published materials (where relevant) including but not

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							limited to the Gunditjmara Sea Country Plan 2022-2033 and GMTOAC's Consultation & Negotiation Protocol - outlines the work that Amplitude Energy has already undertaken to understand the cultural values and sensitivities of GMTOAC, so they can be appropriately considered and proactively addressed in the two new EPs - lists the cultural values that Amplitude Energy understand GMTOAC to have that are relevant to the EPs, i.e. culturally significant species (whales, eels, seals, the Bonney Upwelling and Deen Maar Island; - outlines the work Amplitude Energy has already done to consider the needs and preferences of GMTOAC, so as to plan and tailor the consultation process for the 2 new EPs to the extent appropriate and reasonably practicable - requests that GMTAOC let Amplitude Energy know as soon as possible if they wish to discuss the cultural values and sensitivities or if there are any others To be aware of in the preparation of the EPs - identifies key themes and principles from the Consultation & Negotiation Protocol upon which the consultation process on the 2 new EPs can be adapted. In relation to key themes and principles from the Consultation & Negotiation Protocol: - **Early engagement** – Notes the preference expressed by GMTOAC in the Consultation & Negotiation Protocol regarding early engagement on projects, and that we have prioritised providing information to them ahead of broader consultation activities. Notes our indicative timeline for closing out consultation is 30 June 2025, which allows over 6 months for GMTOAC to consult with us. Explains that we have used this timeframe, having regard to the timeframes provided for in comparable legislative processes. Notes the steps that have been taken by GMTOAC that will hopefully make consultation on the two 2 EPs more effective and efficient. - **Initial meeting –** Notes the preference expressed by GMTOAC in the Consultation & Negotiation Protocol regarding holding an initial meeting to establish a relationship prior to commencing consultation on substantive issues. Notes that we first communicated to GMTOAC on 27.11.2024 our desire to discuss the 2 new EPs at a meeting that was proposed by GMTOAC for mid- February 2025, but this meeting was postponed until mid-March 2025. Reiterates request to meet in relation to the 2 new EPs as soon as possible, and confirms availability to attend initial meeting in mid-March. Requests that a further meeting is scheduled on the 2 new EPs, since the Consultation & Negotiation Protocol suggests that more than one meeting will be required. Requests this meeting occur no later than May 2025, to keep the process moving forward and maintain timelines. Invites GMTOAC to suggest a date and confirms that Amplitude Energy can provide further support and funding to facilitate this second meeting.

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							- **Staggering/co-ordinating consultation** – Notes GMTOAC's suggestion in the Consultation & Negotiation Protocol that proponents may wish to stagger or co-ordinate consultation between proponents and prioritise timing for each proposal amongst them. Explains that there are real-world constraints on the ability of proponents to stagger their projects, including the reasons why they use a rig to perform back-to-back work in a region. Offers to share a meeting with GMTOAC, with Beach, if it reduces the consultation burden and allows for more timely progress of consultation process. - **Funding & support** – Notes that the Consultation & Negotiation Protocol expresses a need for funding and other support from the Proponent to engage with them on projects. Confirms that Amplitude Energy is happy to meet GMTOAC's reasonable costs arising from its participation in the consultation process for the 2 new EPs. Requests a copy of the schedule of fees referred to in the Consultation & Negotiation Protocol.i**Information** – Notes that the Consultation & Negotiation Protocol emphases the need for information to be provided to GMTOAC that is non-technical and in plain English. Notes that Amplitude Energy has familiarised itself with materials on GMTOAC's website and social media pages to get a feel for communication style and emulate it in consultation on the 2 new EPs. Notes that Amplitude Energy plans to prepare an audio presentation for GMTOAC regarding the 2 new EPs to hopefully provide information in a relatable and accessible way. Requests any further guidance or model communications that might be exemplary or instructive for preparing information on the 2 new EPs. - **Cultural value assessments** – Notes the Consultation & Negotiation Protocol states that a cultural values assessment may be required prior to commencement of consultation. Confirms that Amplitude Energy is proactively considering the cultural values and sensitivities based on GMTOAC's published material and previous consultation feedback, and that it has plans to undertake cultural heritage survey. Confirms that we will share updates about this in due course. - **Cumulative impact assessments** – Notes the Consultation & Negotiation Protocol expresses that GMTOAC may require a cumulative impact assessment to be undertaken by the Proponent for activities with a risk to impact upon Country and Sea Country. Confirms that we are currently undertaking a cumulative impact assessment in respect of the activities under the 2 new EPs, in the context of the activities of other proponents, and will share more detailed information with GMTOAC in due course, tailored to this concern. Notes that Amplitude Energy looks forward to hearing from GMTOAC as soon as practicable and asks whether they have any preferences as to how they receive further communications for the 2 new EPs.

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
2025 0207 182536 5800	2025-02-07	Email	Out				Copy of 2025 0207 171021 7349 sent to EJA apologising for direct correspondence to GMTOAC. Hoped the materials would assist EJA's client in considering the proposed new EPs and looked forward to a substantive response and confirmation of the March 2025 meeting
2025 0218 130036 7349	2025/02/18	Email	Out		None	None	Passed on thanks for recent email. Enquired as to update to when we might receive a response to our correspondence dated 21 January 2025. Noted Amplitude Energy remains eager to meet with GMTOAC in March (as part of ongoing engagement on another EP and in relation to 2 new environment plans [ECSP EPs]) and would like to confirm details of that meeting as soon as practicable.
2025 0220 190339 7349	2025/02/20	Email	In	EJA noted it is still waiting for instructions from GMTOAC following their native title meetings on February 14-15, 2025. No decision was made on February 14 regarding a meeting in March. EJA was not present during the February 15 meeting. EJA noted they would follow up for instructions and would aim to respond next week.	None	None	
2025 0227 154143 7349	2025/02/27	Email	In	EJA noted the following relevant points in its correspondence:[1] (Other points noted are related to a different EP) **A1.** Referred to letter from Cooper Energy dated 21 January 225 and subsequent email correspondence from EJA. **Proposed meeting** **A2**. GMTOAC proposed a meeting to progress consultation with Cooper Energy on 12 April 2026. **A5.** Subject to further instructions from Gunditjmara native title holders at a closed meeting in mid-March, EJA and GMTOAC propose to schedule an additional day of meetings for its next native title meeting on 12 April 2025 to meet Cooper Energy and discuss consultation on: a. Athena Supply Project EP (currently under assessment with NOPSEMA; b. Annie-2 Development EP (in development with Cooper Energy); c. Wells Connections EP (in development with Cooper Energy); and d. Otway Offshore Operations EP (accepted by NOPSEMA). **A7.** If Cooper Energy could meet on 12 April 2025, GMTOAC would be grateful to receive as soon as possible requested: a. PowerPoint presentation(s) with slides for the: i. Proposed agenda items at par [8] of the letter,	**A7** – Cooper Energy has considered the information requests made (noting that the requests were made in connection with a number of other EPs in addition to this EP) and provided reasonable and detailed information. The requested information sheets and slides sought to address all of the queries raised by GMTOAC (notwithstanding the extensive nature of the information request submitted and the resources required to fulfil this request).	None	

[1] This correspondence raised issued in respect of other EPs that were being prepared by Amplitude Energy, but those issues are not summarised here as they are not relevant for the purpose of this EP.

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				including Cooper Energy's draft position on such items; ii. Topics identified at par [8] of the letter dated 15 November 2024 and any additional matters identified in par [7](b) of this letter. EJA requested that any such PowerPoint presentation should include, where relevant, images or other visual aids that clearly convey the information requested or topic nominated. Also, wherever possible, the amount of text per slide should be limited so as to avoid key messages being lost. b. Plain English information sheets on these matters, including identification of impacts and risks on, from and/or towards: i. Gunditjmara Nyamat Mirring and Mirring, including due to greenhouse gas emissions and climate change impacts in connection with the EPs; ii. Operational areas and environments that may be affected (EMBA) by the proposed activities within the EPs; iii. Sensitive ecosystems, protected areas (including Commonwealth and/or Victorian marine parks), sites of national significance, sites of international significance (e.g. only, Ramsar Wetlands and the Budj Bim Cultural Landscape, including the latter's integral outstanding values, such as the endangered *Kooyang* which is listed as near threatened under the International Union for Conservation of Nature's Red List of Threatened Species); iv. Totemic, Dreaming, and culturally significant animal species (such as *Kooyang* (short-finned eels), *Karntubul* (whales), and *Koorn Moorn* (seals)); v. All *Karntubul* species, but in particular, the endangered Pygmy Blue Whale and Southern Right Whale, including separate information sheets for both species covering topics such as: A. How the proposed activities are consistent with the EPBC Act Recovery Plan for each *Karntubul*; B. How the EPs address the actions within each Recovery Plan; C. Summaries of the best available scientific literature on the impacts of the proposed activities within the EPs on these species; vi. *Kooyang*, including studies or research on impacts on its lifecycle, its migration through the EMBAs and/or Operational Areas of the EPs, and any associated			

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				impacts on the Budj Bim Cultural Landscape; vii. Noise and light pollution, including but not limited in relation to the above and below matters; viii. Unplanned oil and hydrocarbon spills and/or any other unplanned events (such as vessel collisions or vessel discharge events); ix. Cumulative impacts of the proposed activities (within Cooper Energy's EPs but also across the Otway Basin EPs, and how these have been assessed in accordance with the Objects of the Regulations, including s 3A of the EPBC Act); x. Responses to request for information in Attachment A of this letter. c. copies of correspondence from NOPSEMA to Cooper Energy, including in respect of requests for further information, variations or inclusions required under Pt 4 Div 4 of the Regulations: regs 29-32; and d. the most current version of the EPs (if finalised) listed at par [5]. **A8.** Subject to further instructions, the following draft agenda was proposed: a. Introduction/ Update on the EPs listed in the letter; b. Discussion of the Consultation Protocol; c. Co-design of consultation process (to include consultation milestones and timeframes); d. Consultation costs; e. Confidentiality and intellectual property requirements; f. Strategic regional environmental and cultural assessment; **A9.** Time permitting, a brief discussion about how the materials requested at par [7] above (and any further materials required for consultation) will be addressed in future consultation meetings. **A10**. For those materials outlined at par [7](a)(i) of the letter (including PowerPoint slides on the draft agenda items contained at par [7] above), GMTOAC requested to receive these materials by **14 March 2025**. **A11**. For those materials outlined at pars [7](a)(ii), [7](b) of the letter – [7](d), GMTOAC requested to receive these materials **within 28 days** of the letter, noting that it is unlikely they will be discussed, and if so, only in a cursory fashion, at an initial co-design meeting about consultation between GMTOAC, Gunditjmara and Cooper Energy on 12 April 2025. **Next steps**			

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				A16. As requested by Cooper Energy, enclosed is a cost estimate for the proposed meeting in April 2025 (Attachment B). **A17**. If there are matters for clarification, please contact EJA directly at the earliest opportunity. Otherwise GMTOAC look forward to receiving the requested materials per the timeframes indicated in the letter. **Attachment A – Requests for Information** The letter sets out an attachment which includes requests for information relating to the following matters: **A18.** How are the EPs consistent with r 4 of the Regulations, that is, to ensure that any **petroleum** activity or greenhouse gas activity carried out in an offshore area is: a. Carried out in a manner consistent with the principles of ecologically sustainable development set out in section 3A of the EPBC Act; and b. Carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable; and c. Carried out in a manner by which the environmental impacts and risks of the activity will be of an acceptable level. **A19.** How do the EPs respond to and address the principles of ecologically sustainable development under section 3A of the EPBC Act, including that: a. Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations; b. If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation; c. The principle of intergenerational equity – that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations; d. The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; e. Improved valuation, pricing and incentive mechanisms should be promoted. **A20.** Further to s 3A of the EPBC Act and the Gunditjmara Nyamat Mirring Plan 2023-2033, how do the EPs ensure that the proposed activities are consistent with the best available scientific data and internationally agreed goal of a safe climate			

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				by reducing greenhouse gas emissions? How have the threats identified in the Gunditjmara Nyamat Mirring Plan, including but not limited to Table 1, page 22 "Existing or future threats to Nyamat Mirring – Climate Change", been addressed and mitigated? **A21:** How do the EPs account for and describe Gunditjmara rights, functions, interests and values in relation to the "environment" (as broadly defined under r 5 of the Regulations), including: a) Ecosystems and their constituent parts, including people and communities; and b) Natural and physical resources; and c) The qualities and characteristics of locations, places and areas; and d) The heritage value of places; and which includes social, economic and cultural interests and values in the matters mentioned in paragraphs (a) –(d) above? **A22:** How do the EPs account for and describe Gunditjmara rights, functions, interests and values in relation to the "environment" (as broadly defined under r 5 of the Regulations), including: a) Ecosystems and their constituent parts, including people and communities; and b) Natural and physical resources; and c) The qualities and characteristics of locations, places and areas; and d) The heritage value of places; **A23:** What if anything, does Cooper Energy, require from GMTOAC in order to more accurately describe the "environment" in the EPs as defined under the Regulations? **A24:** How do the proposed activities within the EPs ensure that no adverse action, interference, and/or inconsistency arises in connection with Gunditjmara people, communities, heritage, and/or social, economic and cultural interests? **A25:** Where such impacts are identified, on what basis does Cooper Energy justify that these impacts are of an acceptable level? Similarly, on what basis does Cooper Energy conclude that these impacts are mitigated to as low as reasonably practicable? **A26:** How has Cooper Energy demonstrated to NOPSEMA, that its proposed activities are not inconsistent with and/or do not contravene any recovery plans under the EPBC Act, per s 268 of that Act, including but not limited to the recovery plans for species of Karntubul (whales) such as the Southern Right Whale and the Blue Whale? **A27:** How do the proposed activities in the EPs ensure that no			

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				adverse action, interference, and/or inconsistency arises in connection with recovery actions and/or implementations of the above-mentioned recovery plans? **A28:** Given the nature of the proposed activities and associated impacts, how does Cooper Energy propose to avoid key foraging, breeding/calving and transit to and from BIA for key Karntubul species? **A29:** How has Cooper Energy considered the impact of its proposed activities on Kooyang (shortfinned eel)? How and in what manner do the EPs consider potential impacts of their proposed activities on the Outstanding International Values of the Budj Bim Cultural Landscape, including on the integrity of threatened Kooyang populations (and Kooyang husbandry and associated native title rights and interests concerning aquaculture) on which the World Heritage Area's Outstanding Universal Value is dependent? How will any identified impacts be mitigated to the legal standard required? If not already done, what is Cooper Energy's response to relevant actions, including in respect of Kooyang, within the Budj Bim Indigenous Protected Area Plan of Management 2022-2027 (for example only, see sections 5.5.2 – 5.5.7, Actions 29-31, 43)? What research has been commissioned or conducted in relation to the lifecycle of Kooyang and its migration through the EMBAs and/or Operational Areas for the proposed activities? **A30:** What steps has Cooper Energy taken to avoid impacts from the proposed activities on the Bonney Coast Upwelling and to address the critical cultural heritage values associated with this Upwelling? **A31:** How and in what manner have risks of harm on the cultural (or social) environment been described in the EPs? How and on what basis does Cooper Energy propose that those risks have been reduced to as low as reasonably practicable? **A32:** How and in what ways do measures within the EPs address and respond to cumulative risks and impacts (both direct and indirect) reasonably associated with the proposed activities, in light of the: a) Other activities, be that past, current or anticipated, in the Otway Basin; and b) Best available scientific literature and practice in the design of cumulative impact assessments? To avoid doubt, please identify how and in what ways such cumulative impact assessments adopt and reflect Aboriginal cultural heritage considerations. **A33:** How has Cooper Energy considered the risk of hydrocarbon or other vessel spills and/or collisions in their proposed activities, including from routine vessel traffic and/or rig operations? If so, how have any such environmental impacts been assessed and mitigated?			

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				A34: How and in what manner have all environmental factors within the environment (as defined under r 5) been considered in cumulative impact assessments undertaken by Cooper Energy? **A35:** How and in what manner have acoustic impacts of the proposed activities (including through the use of geophysical surveys) in the EPs on cultural heritage values (including harms to key mammal species, as well as the broader ecosystem and food chain) been considered in the EPs? **A36:** How and to what extent have acoustic impacts been considered in cumulative impact assessments, including cumulative impact assessments of the cultural environment? **A37:** What chemicals does Cooper Energy plan to use in its exploration well drilling and evaluation **ANNEXURE B – FEE SCHEDULE** - A template cost estimate provided.			
2025 0307 081546 5800	2025/03/07	Email	Out		None	None	**Email and letter from NRF to EJA** Confirmed that we appreciate the opportunity to meet with GMTOAC, and accept the invitation to meet on 12 April 2025. Requested confirmation of the proposed venue and time, in order to make travel arrangements. Acknowledged the effort involved in GMTOAC arranging such notified meetings. Requested that one additional item be added to the agenda, in the interests of building a two-way dialogue and common understanding between the parties. The proposed agenda item would be GMTOAC/Gunditjmara providing an overview of cultural values and sensitivities within their Sea Country/Nyamat Mirring associated with our activities offshore near Port Campbell, particularly any additional to those outlined in their published Nyamat Mirring Plan and previous correspondence. Confirmed we are currently reviewing EJA and GMTOAC's requests for information and will endeavour to provide materials within the requested timeframes. Requested confirmation as soon as possible that the proposed meeting on 12 April 2025 will proceed, noting that EJA had indicated in previous correspondence that the proposed meeting may be subject to the outcome of GMTOAC's upcoming meeting in mid-March 2025. Requested confirmation if the fee schedule included in previous correspondence represented the total cost sought for the meeting and a breakdown of those costs.

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							Requested that, to the extent that GMTOAC anticipates that an additional follow-up meeting will be required to progress consultation (i.e. following the 12 April 2025 meeting), then this meeting be scheduled for May 2025. Requested that GMTOAC advise if any date in May 2025 would suit, having regard to their upcoming native title meetings, and confirmed that further funding and support could be provided to facilitate that additional meeting.
2025 0314 163531 5800	2025/03/14	Email	Out		None	None	**Email from NRF to EJA:** Referred to previous correspondence. Attached proposed draft slides for the April meeting. Noted the slides are in draft form, as minor updates will be made before the meeting (e.g. to add in maps showing the relative position of the various EP activities). Noted that previous letter sent to EJA on 7 March 2025 requested confirmation that the April meeting would proceed, and that we are still waiting to receive confirmation. Requested confirmation that the meeting would be going ahead (or failing that, an update on when they expect to be able to confirm) so that travel arrangements can be made.
2025 0318 105249 5800	2025/03/18	Call	Out		None	None	**Phone call from NRF to EJA:** EJA confirmed that Amplitude Energy is invited to a meeting on Friday 11 April 2025, from 1pm to 3.30pm. The venue is to be advised, but will be on country so likely Portland or Hamilton. EJA noted it would send correspondence to confirm the above and respond to previous letters. NRF requested confirmation of who will be in attendance and breakdown of costs for the meeting. EJA confirmed that Amplitude Energy would be the only group meeting with GMTOAC on that day, and it would be attending to its own internal matters in the morning.
2025 0318 122925 6215	2025/03/18	Email	In	Email from EJA: EJA noted call with NRF earlier in the afternoon and confirmed that Cooper Energy would present to GMTOAC/Gunditjmara on 11 April 2025 from 1-3.30pm. EJA noted the location of the meeting was yet to be finalised but would be on Gunditjmara Country. EJA noted GMTOAC would update us with the meeting location as soon as it is confirmed and also contact us with a reply to the letter dated 7 March 2025 and feedback on the proposed PowerPoint slides.	None	None	
2025 0328 114547 3606	2025/03/28	Email	In	Email from GMTOAC attaching a letter dated 21 March 2025: GMTOAC noted the following points: **B1.** Thanked Amplitude Energy for the letter dated 7 March 2025, responding to EJA's letter dated 27 February 2025. Confirmed receipt of draft PowerPoint slides in email dated 15	None	None	

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				March 2025. **B2:** Noted this letter was being sent direct from GMTOAC and not their lawyers at EJA, as a first step towards independently managing consultation with of offshore petroleum proponents in the Otway Basin in accordance with the Gunditjmara Consultation and Negotiation Protocol. **B3:** Noted in response to our letter, GMTOAC confirms that: a. due to operational reasons, the proposed meeting will need to be rescheduled to Friday 11 April, and GMTOAC apologies for this and hopes the date is suitable for Amplitude Energy; b. the meeting will be held at 39 Hammond Street, Hamiton VIC 3300 from 1pm to 3:30pm. c. if there is time, and subject to Gunditjmara's agreement and feeling adequately informed about the d. proposed activities, the additional agenda item suggested in Amplitude Energy's letter is in principle agreed; e. the cost estimates attached to previous correspondence was a generic estimate, and as Amplitude Energy is allocated a 2.5 hour timeslot at the meeting the attendance fee is $13,375, which is inclusive of costs associated with hiring the meeting venue, IT and audiovisual support, catering, postage, staff administration, travel assistance and elders sitting fees; f. the April 2025 meeting will be attended by GMTOAC staff and Gunditjmara native title holders only, with no legal representatives present. It was requested that Cooper Energy has representatives attend at the meeting who have authority to make decisions in relation to consultation and resourcing of consultation on its behalf; and g. in response to Amplitude Energy's request to meet again with GMTOAC and Gunditjmara in May 2025, such further meetings are to be agreed with Gunditjmara, as proposed by the agenda item at paragraph [8](c) of EJA's letter dated 27 February 2025. **B4:** Thanked Amplitude Energy for sending their draft PowerPoint presentation to GMTOAC in advance of the 11 April 2025 meeting. Provided the following feedback and requests for Cooper Energy to incorporate into its final presentation: a. include timeframes when providing GMTOAC with updates on the EPs, including forecast and actual start/end dates for activities; b. reword agenda item 4 from "Co -design of the consultation process" to "Co -design of the consultation process in line with the Gunditjmara Consultation & Negotiation Protocol"; c. noted that based on similar initial meetings held with CGG			

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
				and ConocoPhillips in February 2025, it is unlikely that there will be sufficient time on 11 April 2025 to discuss items 6 - 8 at length in the presentation. It is likely that any discussion of these items, if it occurs on 11 April 2025, will be at a high level only; d. requested that if there is time to address items 6 – 8, Amplitude Energy refers back to the Gunditjmara Consultation and Negotiation Protocol when discussing these items; and e. requested that Cooper Energy not include the image of the Gunditjmara Nyamat Mirring Plan 2023- 2033 in its presentation, as while GMTOAC understand that proponents have used this publicly available document to supplement actual consultation with GMTOAC and Gunditjmara, this document was not created for that purpose. **B5:** Noted that: a. GMTOAC look forward to receiving the remaining materials requested in EJA's previous letter, as well as a final version of the PowerPoint presentation, as soon as possible. b. After receiving those materials and subject to capacity, GMTOAC would endeavour to provide any feedback on the materials to ensure they are appropriate and adapted for the purpose of the meeting. c. Subject to when GMTOAC received the final versions of the materials, there may or may not be enough time to mail them out to native title holders within the 21-day notice period before our native title meeting on 11 April 2025. If that deadline is missed, GMTOAC will explore opportunities to provide documents by other means but note Gunditjmara's strong preference to receive physical copies of materials three weeks prior to scheduled meetings. **B6:** Instructed Amplitude Energy to contact GMTOAC directly with any further questions ahead of the meeting.			
2025 0329 120653 6215	2025/03/29	Email	Out		None	None	**Email from NRF to EJA with 9 attachments** Attached letter dated 29 March 2025 and: a. 4 information sheets setting out information in relation to each of our client's EPs (Athena Supply Project EP, Annie-2 EP, Wells Connection EP and Otway Offshore Operation EP); b. 3 additional information sheets in relation to specific topics (potential impacts on sensitive ecosystems, whales and cultural features); and c. 2 maps (one showing the location of the EPs, and one showing the spatial extent of the EPs). Confirmed that NRF have tried to ensure that the size of these files are manageable, and requested confirmation that GMTOAC was able to receive the information and pass it along to members. **Letter enclosed with the email:**

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							Confirmed NRF continue to act for Cooper Energy for this matter. Referred to previous correspondence in this matter, including letters dated 27 February 2025 and 28 March 2025. Confirmed Amplitude Energy appreciates the opportunity to meet and is looking forward to progressing consultation with GMTOAC and its members on 11 April 2025. Noted the new timing and location of the meeting. Confirmed that Amplitude Energy has been preparing materials in response to the information requests made in EJA's letter dated 27 February 2025. However, the information request contained in that letter was voluminous and while Cooper Energy has been using all reasonable endeavours to prepare the material for GMTOAC, some of the information sheets are not yet finalised, but will be provided shortly. Confirmed that enclosed with this correspondence, to allow GMTOAC to begin to consider the material, is: a. a plain English information sheet regarding the **Athena Supply EP**, setting out planned impacts, unplanned impacts and cumulative impacts (and associated control measures) for the activities proposed under that EP; b. a plain English information sheet regarding the **Otway Offshore Operations EP**, setting out planned impacts, unplanned impacts and cumulative impacts (and associated control measures) for the activities proposed under that EP; c. a plain English information sheet regarding the **ECSP - Wells Connection EP**, setting out proposed planned impacts, proposed unplanned impacts and potential cumulative impacts (and proposed associated control measures) for the activities proposed under that EP (noting that this EP is still in development); d. a plain English information sheet regarding the **ECSP - Annie-2 Development Well EP**, setting out proposed planned impacts, proposed unplanned impacts and potential cumulative impacts (and proposed associated control measures) for the activities proposed under that EP (noting that this EP is still in development); e. an information sheet regarding potential impacts on whales; f. an information sheet regarding potential impacts to sensitive ecosystems; g. an information sheet regarding potential impacts to cultural features; h. a map showing the location of the operational areas of each of the EPs in relation to each other and the GMTOAC RAP area; and i. a detailed map showing the spatial extent of the EPs. Noted these materials will be followed shortly by the provision of: a. a recorded copy of an audio visual presentation containing information about the activities proposed under the EPs; and b. an updated slide pack for the meeting on 11 April 2025, which contains GMTOAC's suggested amendments (as set out in their correspondence dated 28 March 2025) and minor amendments

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	***Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).*** ***Unique reference added where needed for clarity.*** ***(EP references added for context as appropriate)***
							proposed by Amplitude Energy Noted that the purpose of providing this information to GMTOAC is to allow it to consider and assess potential impacts of our proposed activities to their functions, interests and activities. Notes that Amplitude Energy considers that not all of the information requested in your letter dated 27 February 2025 is relevant for this purpose and does not propose to provide such information. Notes the Athena Supply Project EP and Otway Operations EP have been submitted to NOPSEMA for acceptance (and in the case of the Otway Operations EP, approved), but Amplitude Energy has nonetheless provided the requested information in relation to each of those EPs as a demonstration of good faith and genuine engagement with GMTOAC. Provides a table which sets out the information requested, and the status of the provision of that information (including, where appropriate, references to the material provided to assist GMTOAC's consideration of the material). Confirms Amplitude Energy will continue to progress the outstanding information requested, and will provide this in due course. Confirms Amplitude Energy is looking forward to progressing meaningful consultation with GMTOAC on 11 April 2025. Invites GMTOAC to contact NRF with any queries, and that NRF otherwise looks forward to receiving its response.
2025 0329 182445 7349	2025/03/29	Email	Out				**Email from Amplitude Energy to GMTOAC with 9 attachments** Notes that Cooper Energy appreciates the direct correspondence received from GMTOAC on the previous day and looks forward to following up soon. Shares correspondence sent to EJA of the same date (including attachments).
2025 0401 124817 5800	2025/04/01	Email	Out				**Email from Amplitude Energy to EJA:** Notes the below correspondence received direct from GMTOAC on Friday afternoon. Requests that EJA pass on thanks to GMTOAC for their response. Notes that the letter refers to GMTOAC taking steps to self-manage its consultation processes, and that NRF (and Cooper Energy) had previously understood that all correspondence relating to consultation was to be directed to EJA (rather than GMTOAC directly), in accordance with the wishes of GMTOAC. Requests confirmation if EJA are still GMTOAC's appointed lawyers in relation to consultation on these environment plans. Notes that it is not appropriate or ethical for NRF to correspond with a legally represented party without the consent of the appointed lawyers. Requests clarification whether Cooper Energy should correspond directly with GMTOAC, or if GMTOAC's requirements remain that all matters

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							relating to consultation are directed to EJA. Notes that GMTOAC has provided updated details of the meeting on 11 April 2025. Requests that EJA provide: a. a list of attendees; b. a breakdown of the proposed costs; and c. information about what technology will be available in the meeting room so that our client can plan accordingly.
2025 0402 195256 5800	2025/04/02	Email	Out				**Email from NRF to EJA:** Notes previous email from NRF to EJA, and GMTOAC's email on 28 March 2025. Attaches a revised copy of the slides which takes into consideration GMTOAC's feedback.
2025 0402 201811 6215	2025/04/02	Email	Out				**Email from Amplitude Energy to GMTOAC:** Notes correspondence of the same date sent from NRF to EJA. Confirms Amplitude Energy looks forward to meeting in Hamilton the following week.
2025 0403 142541 7349	2025/04/03	Email	Out	**Email from EJA to NRF:** Thanked NRF for its email. Confirmed that Cooper Energy, and NRF on behalf of Cooper Energy, can contact GMTOAC directly in relation to consultation on Cooper Energy's current EPS. Noted EJA is not presently instructed to act for GMTOAC in relation to the Cooper Energy EPs, and that they would let NRF know if these instructions change. Noted that EJA may, from time to time, provide GMTOAC with discrete assistance in relation to consultation on Cooper Energy's EPs, subject to any further instructions from GMTOAC. Confirmed that any questions in relation to the 11 April 2025 meeting with GMTOAC and Gunditjmara, should be directed to GMTOAC.	None	None	
2025 0507 100837 5800	2025-05-07	Email	Out		N/A	N/A	**Email from Amplitude Energy to GMTOAC**: Thanks GMTOAC and the Gunditjmara for their time and engagement at the meeting on 11 April 2025. Requests that GMTOAC advise whether they require any further specific information or would like any written follow up material on any issues raised by members during the meeting, Requests GMTOAC provides any cost estimates they want us to consider, including for cultural value assessments.

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							Requests GMTOAC provides any feedback from members, including whether here are any proposed changes to the format or presentation for further discussions. Requests GMTOAC confirms next steps to progress consultation, and provides cost estimates if further meetings are required. Provides a summary of the matters that were covered at the meeting including what our activities under the EPs are, a status update on each EP, our proposed timing for submission of the 2 new EPs for assessment by NOPSEMA, our willingness to provide support costs to GMTOAC for consultation on our EPs, our commitment to respecting IP and confidentiality in any information GMTOAC provides during consultation, and what GMTOAC's environmental values and sensitivities are. Notes that Amplitude Energy is willing to provide support costs to GMTOAC for the purpose of consultation on this EP, subject to receiving cost estimates for consideration. Confirms Amplitude Energy is committed to respect GMTOAC's intellectual property and confidentiality in any information provided during consultation. Attaches the supplementary slide deck, elements of which were used to support responses to specific queries raised during the meeting. Notes hard copies of the supplementary slides were also left at the meeting venue. Notes we are finalising our response to Attachment A to EJA's letter dated 27 February 2025 and will respond in due course. Notes GMTOAC's request that material be provided in advance of any further meetings and respectfully request that they provide any requests for further written information as early as practicable so that we can meet the requested timeframes Notes that Amplitude Energy's team enjoyed meeting and speaking with members, and looks forward to building a closer relationship based on mutual trust.
2025 0512 120216 7955	2025-05-12	Email	In	Email related to invoicing for the recent meeting.	N/A	N/A

Event ID	Date	Event Method	In/Out	Summary of each response of relevant person response, objection or claim (Reg 24(b)(i))	Amplitude Energy's assessment of merit of general assertions	*Amplitude Energy's assessment of merit of any objection or claim about the adverse impact of each activity to which the EP relates (Reg 24(b)(ii)*	*Amplitude Energy communication, or response to objection or claim (reg 24(b)(iii)) or General Response (Amplitude Energy's response to queries, comments or assertions).* *Unique reference added where needed for clarity.* *(EP references added for context as appropriate)*
							Notes that we would organise a PO for costs associated with recent meeting.
2025 0522 191741 1225	2025-05-22	Email	Out		N/A	N/A	**Email from Amplitude Energy to GMTOAC** Shares dates for planned webinars and community sessions, in case the opportunities are of interest, but notes that Gunditjmara have indicated they prefer to be consulted via planned group meetings. Suggests a general catch up while Amplitude Energy is in the Portland region for these community sessions. Attaches a response to the extensive questions from EJA's letter of 27 February 2025. The response is 13 pages long, addressing all 19 questions contained in EJA's correspondence of 27 February 2025. The responses are presented in a table format, and numbered, for ease of review. Where appropriate, responses direct to relevant sections of the information sheets that were previously provided. Where questions are more specific, detailed response are given that provide new information not previously covered by the information sheets – for example, lists of existing literature that has been considered in relation to whale species, and our responses to various actions from the Budj Bim Indigenous Protected Area Plan of Management.
2025 0620 124140 8749	2025-06-20	Email	Out		N/A	N/A	**Email from Amplitude Energy to GMTOAC** Provides an update on the progress of the ECSP Annie-2 Development Well and ECSP Well Connections EPs. Provides access to our interactive webinar covering the ECSP: Annie-2 Development Well and the ECSP: Wells Connection EPs that was made available to the public for 4 sessions over late May/early June, and a pre-recorded version has been uploaded to our website. Confirms QR codes for the consultation pages were previously included on the information sheets provided during the meeting in April 2025. Confirms the cultural heritage assessment based on public data and geophysical survey data has been progressed. This will be used to inform our preparation of the 2 new EPs. Offers to share an overview at a suitable time if of interest. Confirms the cumulative impact assessment for the purpose of preparing the 2 new EPs was also progressed. Notes this topic was discussed at the April meeting in some detail; requests they advise if any further questions on that is required. Requests confirmation of whether members have confirmed they would like to meet again in August, and that details be provided regarding date, location and proposed agenda. Notes that timing of submission of the two EPs had changed from prior to August to by the end of August for the Annie-2 Development Well EP, and around November 2025 for the ECSP Wells Connection EP. Notes we look forward to hearing from GMTOAC, will keep in touch and remain available to meet.
2025 0722 145431 2053	2025-07-10	Call	Out		N/A	N/A	Called 30 May

2025 0723 165810 1008	2025-07-23	Email	Out		N/A	N/A	Exchanged text messages 3 June and 2 July, but no opportunity to meet or speak emerged.

Table 5-3: Consultation demonstration - GMTOAC

Consultation demonstration			
Item	Regulation/guidance	Description	How achieved
Sufficient information	Regulation 25(2)	For the purpose of the consultation, the titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person.	• Information was provided to GMTOAC about this EP in an iterative manner over a period of more than 6 months. Throughout this period, information was provided to GMTOAC in numerous forms including via detailed correspondence, tailored information sheets, in-person and recorded audio-visual presentations, Q&A responses (both in-person and in writing) and the general consultation website. All information was prepared, having regard to GMTOAC's communication requirements as set out in its Consultation & Negotiation Protocol, i.e. (to the extent possible) in plain English and non-technical language and incorporating visual elements. • We first flagged to GMTOAC that we would be consulting on this EP in December 2024, to allow advanced planning of any in-person meeting(s) they required. • We followed up with more detailed communications in early February 2025, after the holiday period. This included a consultation sheet on this EP, which provided a summary of the proposed activities, their expected timing and duration, and a summary of key potential environmental risks and impacts and how they would be managed. The letter also outlined the cultural values and sensitivities of Gunditjmara that Amplitude Energy was aware of from previous consultation activities and its Sea Country Plan, and that we understood that GMTOAC might want further information about such matters as how significant animal species could be impacted and are being protected, what involvement GMTOAC would want in an oil spill scenario, and what cumulative impacts may arise from cumulative activities in the region. • In this correspondence, we also invited GMTOAC to provide any guidance around communication (e.g. advice or resources, or model communications) so that we could tailor our consultation materials accordingly. We also invited suggestions about information to include on our consultation website and/or the planned pre-recorded video to make it more valuable to the Gunditjmara community. • In March 2025, we prepared additional, bespoke consultation materials for GMTOAC, that were either in response to specific information requests from EJA (who were acting on their behalf at the time) or were prepared for the purpose of attending GMTOAC's native title meeting to consult with members in-person. • The consultation materials provided in response to EJA's requests included maps of the spatial extent and location of our current and proposed activities (including under this specific EP), and a very detailed information sheet on this specific EP which separately summarised: 1) the impacts, risks and control measures for planned activities; 2) the impacts, risks and controls for unplanned activities; and 3) the cumulative impacts and risks and control measures for foreseeable projects and activities. This was accompanied by 3 additional information sheets that were tailored to key areas of concern for GMTOAC, namely: 1) Potential Impacts to Whales 2) Potential Impacts to Sensitive Ecosystems 3) Potential Impacts to Cultural Features

Consultation demonstration			
			• Additionally, a draft agenda and PowerPoint presentation slides were prepared for the Native Title Meeting, and that content was reviewed by, and incorporated feedback from GMTOAC, prior to the meeting. • In April 2025, we attended GMTOAC's native title meeting in Hamilton, Victoria, and held a ~2 hour interactive session with members, utilising the agreed PowerPoint presentation slides, the printed maps and information sheets referred to above, and some supplementary PowerPoint presentation slides. The maps and information sheets appeared to have been distributed to members by GMTOAC, in advance of the meeting, as some members had brought hard copies with them. We also brought hard copies with us, and handed them out during the meeting. • The members meeting allowed us to present information in a verbal format, and there was Q&A discussion throughout the presentation, which allowed for a meaningful two-way dialogue. The Q&A discussion covered a wide range of topics including the specific elements of Sea Country that were of particular importance to, Gunditjmara and the measures being implemented to manage associated risks and impacts of our activities. The volume and quality of the questions raised during this meeting demonstrated that the audience engaged with our presentation, and that they had considered and understood the proposed activities and the potential risks and impacts. The presentation was delivered by subject matter experts from Amplitude Energy, who were able to answer all questions put forward by the audience and no matters remained outstanding at the end of the meeting. • At the Native Title Meeting we also provided members with a handout with a QR code that directed to our consultation website. This website went live a few days after the meeting, and provided further information about the activity, the location and timing of the activity, potential unplanned events, and the associated impacts and risks. The website provided information in a clear and user-friendly format and had contact details available should a visitor to the website seek further information. This website also provided a link to the NOPSEMA brochure "Consultation on offshore petroleum plans- information for the community". • Following the Native Title Meeting, further information was provided to GMTOAC during April and May 2025, in response to requests from GMTOAC and/or EJA (whilst they were still acting on their behalf). This included providing the shape files for the operational area for this EP and preparing a detailed response (of 13 pages) to a list of 19 questions that were received in correspondence from EJA in February 2025. This response was provided to GMTOAC, for completeness, and notwithstanding that they advised that EJA were no longer acting for them in relation to this EP. This response was prepared by subject matter experts from Amplitude Energy, and drew upon and was tied back to the maps and information sheets that had been provided previously to GMTOAC. • In June 2025, further correspondence was sent to GMTOAC that included a link to our pre-recorded audio-visual presentation on this EP and updates on the progress of our cultural heritage assessment and cumulative impact assessments, with offers to share an overview or answer any further questions about them. • We have responded to all questions received in correspondence from GMTOAC, and its legal representatives EJA, that were received during the substantive consultation period. We have also repeatedly checked with GMTOAC, throughout this period, if they require any further information or meetings with us. • No outstanding feedback or requests for additional information from GMTOAC, or individual members, remain as at the time of submission of this EPs. As part of ongoing engagement, Amplitude Energy will continue to provide reasonable and relevant information to GMTOAC about this EP.
Sufficient time	Regulation 25(3)	The titleholder must allow a relevant person a reasonable period for the consultation.	• Amplitude Energy made initial contact with GMTOAC in December 2024 to foreshadow that we were preparing, and consulting on, this EP. • Further information was provided to GMTOAC on 7 February 2025 outlining the proposed activities under this EP, the expected timing and duration, and the key potential environmental risks and impacts and how they would be managed. • There have been multiple communications and interactions between us since this time, as shown in the consultation summary table. GMTOAC have been provided with a reasonable period to engage in consultation, including the opportunity to request further information or meetings, as desired by its members. • We published advertisements in the Koori Mail, the National Indigenous Times, the Australian, the Herald Sun, and in regional media along the western Victorian coastline in early May 2025 advising of the proposed activities, directing readers to our activities website and seeking feedback from relevant persons. Geo-targeted social media was also run. • Our activities website has been published since April 2025, and a link and QR code were included in hard copy materials shared on 11 April 2025, and again via email in June 2025.

Consultation demonstration			
			• We have provided information to, and engaged in discussions with GMTOAC on this specific EP, for over 6 months, demonstrating a reasonable period for consultation. Applicable benchmarks for activities of this nature and scale (and greater than) apply consultation periods typically of between 4-12-weeks. • More than 4 months have passed since our in-person presentation to GMTOAC in April 2025, and consistent contact has been made with GMTOAC over this period, with offers to answer any further questions and/or attend follow up meetings . • We advised GMTOAC on 20 June 2025 of our intention to submit this EP to NOPSEMA by end of August, after initially indicating submission in June 2025, and have not receive any further response to that update.
Sensitive information	Regulation 25(4)(a)	The titleholder must tell each relevant person the titleholder consults that: (a) the relevant person may request that particular information the relevant person provides in the consultation not be published;	• Early in the consultation process, we advised GMTOAC in writing that it could request that particular information provided in the consultation process not be published.
Ongoing consultation	Regulation 22 (15)(b)	15) The implementation strategy must provide for appropriate consultation with: (b) other relevant interested persons or organisations.	• We will engage in ongoing consultation with all relevant persons throughout the life of the project, and this been articulated to GMTOAC.
Summary of each response	Regulation 24(b)(i)	The environment plan must contain the following: b) a report on all consultations under section 25 of any relevant person by the titleholder, that contains: (i) a summary of each response made by a relevant person;	• A summary of each response is included in the EP.
Assessment of claims and objections	Regulation 24(b)(ii)	The environment plan must contain the following: b) a report on all consultations under section 25 of any relevant person by the titleholder, that contains: (ii) an assessment of the merits of any objection or claim about the adverse impact of each activity to which the environment plan relates	• We have assessed the objections and claims (as defined by the Regulations) raised by GMTOAC during the consultation process, and undertaken a merit assessment of each of these objections and claims. GMTOAC raised four specific concerns regarding culturally significant species and cultural heritage, being: ○ Deen Maar Island (Lady Julia Percy Island) ○ Kooyang (short-finned eel) ○ Karntubul (whales) ○ The Bonney upwelling • We have captured our assessment of these claims and objections in the consultation summary tables.
Response to claims and objections	Regulation 24(b)(iii)	The environment plan must contain the following: b) a report on all consultations under section 25 of any relevant person by the titleholder, that contains: (iii) a statement of the titleholder's response, or proposed response, if any, to each objection or claim	• We have responded to all correspondence received from GMTOAC, and its legal representative EJA (when previously acting), and provided our feedback on each objection or claim made therein. • We have captured our responses to GMTOAC in the consultation summary tables.
Full text	Regulation 24(b)(iv)	The environment plan must contain the following: b) a report on all consultations under section 25 of any relevant person by the titleholder, that contains: (iv) a copy of the full text of any response by a relevant person	• The full text record of our exchanges with GMTOAC are contained in the sensitive information file, including all relevant attachments.
Consultation appropriate to relevant person	NOPSEMA Guideline - *Consultation in the course of preparing an environment plan*	…. carefully considering what the appropriate consultation processes are for each relevant person and adapting those processes to the nature of the authority, persons and organisations to be consulted.	• We were guided by GMTOAC's Consultation & Negotiation Protocol and sought advice from GMTOAC on how best to consult with Gundijmara. • We sought to engage with GMTOAC early (i.e. December 2024), in line with the Consultation & Negotiation Protocol, and ahead of consulting with other broader stakeholders. This was also done to allow enough time to hold more than one in-person meeting, if they required. • In our early correspondence to GMTOAC in February 2025, we outlined key themes and principles that we had identified from their Consultation & Negotiation Protocol, and opportunities we had identified to tailor our consultation process accordingly. We invited their feedback on these suggestions and opportunities, and welcomed any further guidance they wished to provide in respect to communication.

Consultation demonstration			

Consultation informs an understanding of the environment	NOPSEMA Guideline - *Consultation in the course of preparing an environment plan*	The requirement to include details of the environmental impacts and risks into an environment plan cannot be met without an understanding of the social, economic and cultural features of the environment.	• We have addressed specific concerns in the EP raised by GMTOAC regarding culturally significant species and cultural heritage, being
			  ○ Deen Maar Island (Lady Julia Percy Island)
			  ○ Kooyang (short-finned eel)
			  ○ Karntubul (whales)
			  ○ The Bonney upwelling
			• We also reviewed the published GMTOAC Gunditjmara Nyamat Mirring (Sea Country) plan to better understand their environmental values and cultural sensitivities, and used this to further inform the impact and risk assessment within the EP.
			• We understood from correspondence with GMTOAC via EJA that GMTOAC are concerned about cumulative impacts of activities within their Sea Country. We took these concerns into account when preparing the EP and have specifically considered cumulative impacts in the EP.

Genuine and meaningful consultation	NOPSEMA Guideline - *Consultation in the course of preparing an environment plan*	Consultation should be a genuine and meaningful two-way dialogue in which relevant persons are given sufficient information and time to allow them to make an informed assessment of the possible consequences of the activity on their functions, interests or activities	• We sought to engage early with GMTOAC, in accordance with the preferences expressed in their Consultation & Negotiation Protocol. We first contacted them in December 2024 to flag the preparation of this EP, and request a meeting to discuss our activities. This was well in advance of commencing consultation with broader stakeholders, which occurred in May 2025. • We consulted with GMTOAC in April 2025 at a Native Title members meeting and materials presented were guided by GMTOAC's requests and preferences. GMTOAC provided us prior notice of the values and sensitivities important to them through EJA's letter dated 27 February 29025; our presentation was developed and delivered in a manner that acknowledged and discussed the activities, impacts and risks in relation to these particular values and sensitivities. The presentation allowed for Q&A throughout, with members online and in person, which provided meaningful two-way dialogue. A copy of the PowerPoint slides was provided to GMTOAC in advance of the meeting, with the agreed content. On the day of the meeting, the presentation was recorded by GMTOAC on video. Amplitude Energy attended the meeting represented by senior team members who were able to address queries raised by GMTOAC members from the floor. • Since the meeting, we have remained co-operative, amicable and open to further meetings, questions or requests for information. • We have also had written exchanges with GMTOAC, and/or their legal representatives EJA, for 8 months which demonstrates a two-way dialogue. In these exchanges, we have answered all questions, objections and claims that have been raised. • We have made numerous attempts over the consultation period to check the appetite for additional meetings and engage in in-person, two-way dialogue. • We have also provided a clear point of contact, in our extended enquiry efforts, should any individual GMTOAC members want to be consulted directly. • Our openness and availability to consult are apparent from the consultation summary report.
Consultation method should be appropriate	NOPSEMA Guideline - *Consultation in the course of preparing an environment plan*	Where interests are held communally, the method of consultation will need reasonably to reflect the characteristics of the interests affected by the proposed petroleum activity	• We have reviewed relevant Country plans, regulatory guidance and case law, in planning our consultation method for First Nations groups with communal interests, to ensure that it is respectful, effective and appropriately adapted. • Emails were sent to GMTOAC requesting advice on how consultation on this EP could be conducted, including whether they had any other guidance around communication that they wanted to share, including any examples they wanted us to consider or model our communications on. • We have attended the GMTOAC members meeting, which was organised by, and set up in a format designed by, GMTOAC. GMTOAC provided us prior notice of the values and sensitivities important to them; these are consistent with the Gunditjmara Nyamat Mirring Plan 2023-2033 that was noted on the GMTOAC website in March 2024. Our presentation was developed and delivered in a manner that acknowledged and discussed the activities, impacts and risks in relation to these particular values and sensitivities.
Demonstration consultation is appropriate and adapted	NOPSEMA Guideline - *Consultation in the course of preparing an environment plan*	A titleholder will need to demonstrate to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons.	• Ahead of our meeting in April 2025, we were aware from long running consultation with GMTOAC, of the values and sensitivities important to them and their members; these are consistent with the since publicly available Gunditjmara Nyamat Mirring Plan 2023-2033. • Our consultation materials were developed and delivered in a manner that acknowledged and discussed our activities and associated impacts and risks in relation to these particular values and sensitivities. • Our presentation allowed ample time for Q&A with members online and in person, which provided meaningful two-way dialogue. We ensured that all Amplitude Energy representatives were sufficiently knowledgeable of the relevant issues so as to ensure that questions could be meaningfully answered on the day. The presentation was provided electronically to GMTOAC in a format requested by them, and we were also informed that the meeting was being recorded on

Consultation demonstration			
			video, to be provided to by GMTOAC to members who may not have been able to attend the meeting. Handouts were provided to members on the day. • Amplitude Energy provided flexibility in making its staff available to meet when and where GMTOAC preferred. • To further ensure that our consultation process was appropriate and adapted to GMTOAC, we also engaged a specific cultural heritage adviser to review the planning and consultation material used for the April meeting and the subsequent drop-in sessions to ensure that materials were culturally appropriate should any Traditional Owners attend. • We were conscious of GMTOAC's role as the representative body for Gunditjmara people and accepted at face value its statements that it was the appropriate body to engage in consultation (noting that individual members of Gunditjmara were always welcome to self-identify outside of the representative structure should they elect to do so). We sought to be respectful of GMTOAC's role as the primary body capable of speaking for Gunditjmara cultural heritage as stated in the Consultation and Negotiation Protocol. • We were understanding of the limited resources of GMTOAC and the potential for delay due to competing demands on their time.. We specifically sought to ensure that we did not apply any undue pressure on GMTOAC over the course of consultation. Noting the limited resources of GMTOAC, we were pleased to assist with funding GMTOAC to participate in consultation.
Obligation to consult discharged	NOPSEMA Guideline - *Consultation in the course of preparing an environment plan*	The obligation to consult with relevant persons must be discharged prior to submitting an environment plan to NOPSEMA.	• Given compliance with the regulations as shown above, and alignment with the Guidelines that were informed by case law, Amplitude Energy considers the obligation to consult with GMTOAC has been discharged in a reasonable and practical manner, that supports the objects of the Regulations.
