Executive Summary

JASCO Applied Sciences (JASCO) performed a numerical modelling study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic impacts on key regional receptors including marine mammals, fish, turtles, benthic invertebrates, sponges, coral, plankton and divers. The modelling considered a seismic source in triple configuration with a 2820 in^3 total volume, towed at a 7 m depth behind a single vessel, with a 12.5 m impulse interval (inter-pulse interval) and a 37.5 m crossline array separation.

JASCO's specialised airgun array source model was used to predict the acoustic signature of the seismic source and complementary underwater acoustic propagation models were used in conjunction with the modelled array signatures to estimate sound levels over a large area around the sources. Single-impulse sound fields were predicted at 11 sites over the proposed survey line plans, with water depths ranging from 40 to 174 m. Accumulated sound exposure fields were predicted for three representative scenarios for likely survey operations over 24 h. Three animal movement modelling scenarios, to address different line acquisition plans, for likely survey operations over 24 hours were modelled.

The modelling methodology considered source directivity and range-dependent environmental properties likely to be encountered within the proposed survey area. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria. A conservative sound speed profile that would be most supportive of sound propagation conditions for the period of the survey was defined and applied to all modelled sites.

SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 hours, based on the assumption that a receiver (e.g., an animal) is consistently exposed to such noise levels at a fixed position. More realistically, marine animals would not stay in the same location for 24 hours (especially in the absence of location-specific habitat) but rather a shorter period, depending on the animal's behaviour and the source's proximity and movements. Therefore, a reported radius for the SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS)) if it remained at that location for 24 hours.

A more realistic representation of the potential exposures for foraging pygmy blue whales in the foraging Biologically Important Area (BIA) and both migrating and aggregating southern right whales within the known core range area and aggregation BIA was undertaken using animal movement modelling ('animat modelling'). Simulations with animats (i.e., simulated animals) restricted to the BIA provide an understanding of how animats will be exposed given the location and environment-specific context in which they are most likely to occur. Scenarios in which the pygmy blue and southern right whales are seeded in an unrestricted manner allow for the calculation of exposure range across the entire project area. These ranges may then be interpreted to determine BIA action zones for different project options and scenarios. The unrestricted seeding approach is informative in cases where there is very little or no overlap between the BIA and the planned active source area. While acoustic modelling inherently assumes static animals, the JASCO Animal Simulation Model Including Noise Exposure (JASMINE) combines modelled sound fields with realistic animal movements to predict how animals might be impacted through sound exposure. The exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters. JASMINE provides a framework for understanding and predicting sound exposure for species of interest and for calculating ranges to relevant regulatory thresholds. The distribution of distances to the source of simulated animals ('animats') predicted to be exposed to sound levels above relevant thresholds was used to calculate the horizontal distance that includes 95% of the

animat distances that exceeded a given effect threshold ($ER_{95\%}$). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed the threshold criteria. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which the animats are exposed to the sound field over time, both vertically and horizontally. The probability that an animat within the $ER_{95\%}$ was exposed above threshold was also computed (P_{exp}) to provide additional context. Due to insufficient density data availability, the modelling results are not related to real-world density estimates for pygmy blue and southern right whales.

The acoustic analysis considered the distances away from the seismic source at which several effects criteria or relevant sound levels were reached. The results are summarised below considering all the representative single-impulse sites and all accumulated SEL scenarios for both acoustic modelling results and pygmy blue whale and southern right whale animat $ER_{95\%}$ results and probabilities.

Marine Mammals – Acoustic Results

- The maximum distance where the NOAA marine mammal behavioural response criterion of 160 dB re 1 µPa (SPL) for impulsive noise could be exceeded varied between 2.95 and 10.3 km for the 2820 in^3 seismic source, depending on modelled site.
- The results for marine mammal injury considered the criteria from Southall et al. (2019). These criteria contain two metrics (PK and SEL_{24h}), both required for the assessment of marine mammal PTS and TTS. The longest distance associated with either metric is required to be applied for assessment; Table 1 summarises the maximum distances, along with the relevant metric.
- The distance to PTS and TTS was always farthest in the broadside direction, distances are shown in Table 1.

Table 1. Summary of maximum (R_{max}) horizontal distances (in km) from all modelled sites and scenarios to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals showing the relevant metric. Maximum extents are in the broadside direction of the 2820 in^3 seismic source.

Hearing group	Maximum modelled distance to effect threshold (R_{max})						
	Behavioural response[1]	Scenario A		Scenario B		Scenario C	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	10.3 (SPL)	34.0 (SEL_{24h})	4.89 (SEL_{24h})	14.8 (SEL_{24h})	1.65 (SEL_{24h})	43.5 (SEL_{24h})	1.90 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.74 (PK)	0.43 (PK)	0.74 (PK)	0.43 (PK)	0.65 (PK)	0.33 (PK)
Otariid Pinnipeds		0.05 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Animal Movement Modelling

- The exposure ranges predicted using animat modelling are significantly more realistic, due to the incorporation of species-specific realistic movements, rather than conservative approach of calculating ranges using the maximum-over-depth sound fields and receivers which are stationary

for 24 hours. This is because the exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters.

- Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criteria, are typically comparable to the predicted acoustic ranges. Exposure ranges are generally slightly lower than the R_{max} acoustic ranges, which is the case for this study.
- All scenarios resulted in exposures above the behavioural response threshold NOAA (2019). Of these, the maximum $ER_{95\%}$ to the marine mammal behavioural response threshold NOAA (2019) was 8.43 km, with a probability of exposure of 85%. These results are summarised in Table 2.
- Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because of the shorter time ('dwell time') to accumulate sound energy of the moving animats. There were exposures above threshold for all considered scenarios and species. The maximum $ER_{95\%}$ to TTS and PTS thresholds (Southall et al. 2019) were 13.2 and 1.50 km, respectively, with probabilities of exposure of 58 and 50%.

Table 2. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales Maximum Exposure ranges show $ER_{95\%}$ (km) first and probability of exposure of animats travelling within the $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL24h)[3]	PTS (SEL24h)[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	8.09 (86%)	13.2 (58%)	1.40 (51%)
	B	6.82 (93%)	6.05 (60%)	0.53 (50%)
	C	6.77 (92%)	7.60 (60%)	0.34 (47%)
Southern right whale	A	8.43 (85%)	11.6 (60%)	1.50 (50%)
	B	6.81 (92%)	6.04 (52%)	0.54 (49%)
	C	7.58 (85%)	6.71 (37%)	0.25 (37%)

[1] LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 $\mu Pa^2 \cdot s$)
[2] SPL (L_p; dB re 1 µPa)
[3] Southall et al. (2019) criteria for marine fauna.
[4] NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

Sea Turtles

- The PK sea turtle injury criteria of 232 dB re 1 µPa for PTS and 226 dB re 1 µPa for TTS from Finneran et al. (2017) was not exceeded at a distance longer than 20 m from the acoustic centre of the source.
- The maximum distance to the SEL_{24h} metrics of 204 dB re 1 $\mu Pa^2 s$ for PTS and 189 dB re 1 $\mu Pa^2 s$ for TTS (summarised in Table 3) for all scenarios was 0.07 km for PTS onset and 3.43 km for TTS onset for the 2820 in^3 seismic source (Finneran et al. 2017). As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that sea turtles travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- Table 3 summarises the distances to where the criterion for behavioural response of turtles to 166 dB re 1 µPa (SPL) and the 175 dB re 1 µPa (SPL) threshold for behavioural disturbance (McCauley et al. 2000) could be exceeded.

Table 3. Summary of horizontal distances (in km) to turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group	Maximum modelled distance to effect threshold (R_{max})							
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	5.97 (SPL)	2.55 (SPL)	3.43 (SEL_{24h})	0.07 (SEL_{24h})	1.14 (SEL_{24h})	0.07 (SEL_{24h})	0.82 (SEL_{24h})	0.06 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance to the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 μPa^2s was reached between 0.05 and 0.06 km for all scenarios was. PTS and PK thresholds were not resolved withing the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- The maximum distance where the OCW-weighted penguin behavioural response threshold of 120 dB re 1 µPa (SPL) for impulsive noise could be exceeded varied between 9.08 and 52.1 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 4 summarises distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric. Seafloor sound levels were assessed at a set of representative depths related to the planned acquisition lines ranging from 40 to 170 m.

Table 4. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single impulse and 24 hour sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Recoverable injury	SEL_{24h}	0.07
	TTS	SEL_{24h}	7.86
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Recoverable injury	PK	0.22
	TTS	SEL_{24h}	7.86
Fish eggs, and larvae (relevant to plankton)	Injury	PK	0.22

Benthic invertebrates, Sponges, and Coral

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 µPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 295 and 711 m for the 2820 in^3 source.
- Bivalves: The distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was determined for comparing to results presented in Day et al. (2016a). This particle acceleration was reached at a range of 52 m for depth 40 m, 4 m for a depth of 50 m, and was not reached at any greater depth.
- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for sponges and corals (Heyward et al. 2018); the threshold was reached at a range of 2 m for depth 40 m and was not reached at any greater depth.

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 µPa (SPL; LP) derived from (Parvin 2005) was considered for people swimming and diving. At the closest separation between considered modelled sites and receiver locations a sound level of 153.1 dB re 1 µPa (SPL; LP) was predicted at Little River and Taylors Beach. It is important to review the provided contour maps to contextualise levels at coast areas to understand where the human health assessment level may be reached.

1. Introduction

JASCO Applied Sciences (JASCO) performed a numerical estimation study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic effect on receptors including marine mammals, fish, sea turtles, benthic invertebrates, plankton, sponges, corals and divers.

This study considered a 2820 in^3 seismic source array. JASCO's specialised Airgun Array Source Model (AASM) was used to predict acoustic signatures and spectra (see Section 4.2). AASM accounts for individual airgun volumes, airgun bubble interactions, and array geometry to yield accurate source predictions.

Complementary underwater acoustic propagation models were used in conjunction with the array signature and spectra to estimate sound levels considering site-specific environmental influences. Single-impulse sound fields were predicted at eleven unique geographic locations linked to the considered survey line plans and three representative scenarios for accumulated SEL modelling were considered. Accumulated sound exposure fields were predicted for each representative scenario for likely survey operations over 24 hours (see Section 2).

The modelling methodology considered source directivity and range-dependent environmental properties. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria.

The planned seismic acquisition area overlaps the pygmy blue whale foraging BIA as well as the aggregation BIA and known core range area for southern right whales. The acoustic modelling results were also used in conjunction with animal movement modelling ('animat modelling') simulations to predict the distance at which feeding pygmy blue whales (*Balaenoptera musculus brevicauda*), aggregating and migrating southern right whales (*Eubalaena australis*) are expected to be exposed above threshold criteria for PTS, TTS, and behavioural response. Estimates of sound exposure distribution were determined by moving large numbers of simulated animals (animats) through a modelled time-evolving sound field, computed using acoustic models. This approach provides the most realistic prediction of the maximum expected SPL and SEL_{24h} for comparison against the relevant thresholds.

Section 3 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 4 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the seismic source and all environmental parameters the propagation models require. Section 4 also describes the methodology used in the animal movement and exposure modelling simulations. Section 5 presents the results, which are then discussed and summarised in Section 6.

2. Modelling Scenarios

Three nominal acquisition scenarios were considered for both acoustic propagation modelling and animal movement modelling. Acoustic modelling consisted of both source and propagation modelling and was conducted at eleven individual single-impulse sites for SEL and SPL while water column PK was assessed at six sites. The locations of the modelled sites are provided in Table 6 and the acquisition lines for the scenarios are shown in Figure 1. This study considered a 2820 in^3 seismic source towed in a triple array configuration at a speed of 4.5 knots with an impulse interval (inter-pulse interval) of 12.5 m and a crossline array separation of 37.5 m. The acoustic propagation modelling utilised the sound speed profile for December, as this month will likely result in favourable propagation conditions within potential acquisition time window for the proposed survey.

The single impulse sites and the accumulated SEL scenarios were determined based on proposed survey line plans with lines orientated at 113/293°. The single impulse sites and accumulated SEL scenarios were chosen to be representative of the range of water depths and the potential sound propagation characteristics of the considered line plans. Near-field sea-floor PK and PK-PK sound levels were assessed considering eleven water depths chosen to represent the depth range encompassed by the considered line plans. Particle motion modelling was also performed at these representative water depths.

The three scenarios account total number of impulses and acquisition time as shown in Table 5. The total assessment period for accumulated sound exposure level was 24 h and during line turns, the seismic source was not operating for modelling purposes. The time surveying and time on turns combine to a total 24 h period.

All animat simulations were run in two configurations: one with animats restricted to the BIA, and another with unrestricted animat seeding.

Table 5. Key parameters of the two accumulated sound exposure level (SEL) scenarios.

Scenario	Array	Impulse interval (m)	Tow direction (°)	Total impulses	Acquisition period (h)
A	Triple 2820 in^3 seismic source	12.5	113/293	8768	13.15
B				11306	16.96
C				11277	16.91

Table 6. Location details for the single impulse modelled sites. Sites were modelled at the tow azimuths used to model the 24 h scenario.

Site	Scenario(s)	Tow azimuths (°)	Latitude (°S)	Longitude (°E)	MGA[1] Zone 54		Water depth (m)
					X (m)	Y (m)

† FWRAM modelling conducted at these sites.

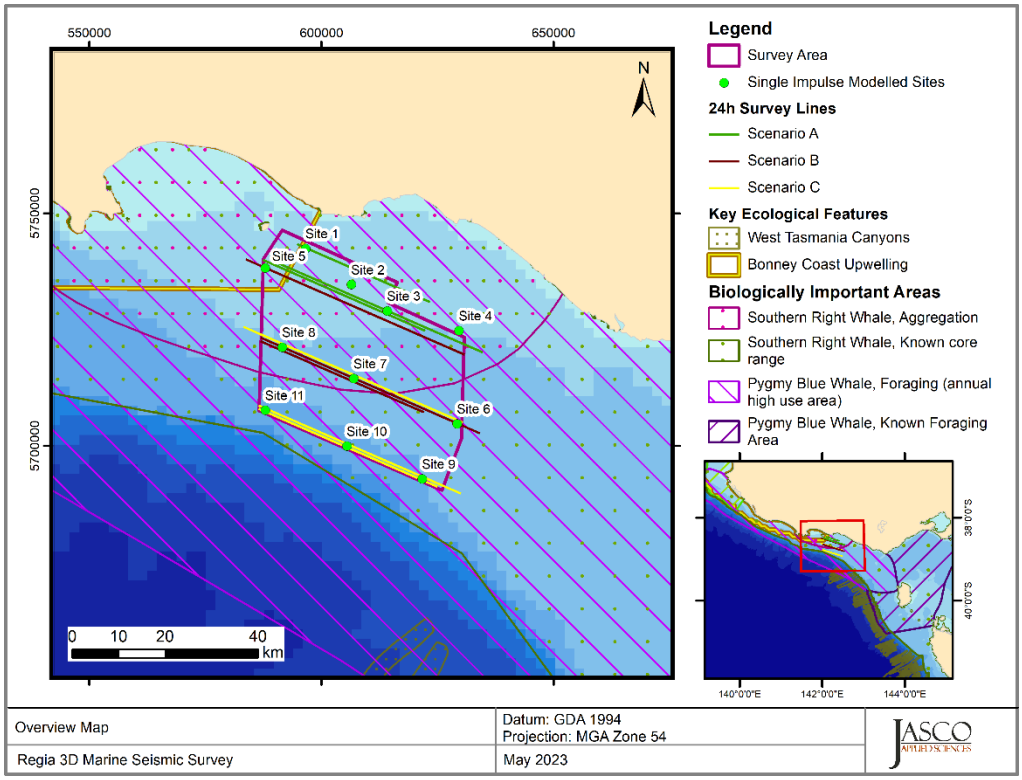

Figure 1. Overview of the modelled sites, acquisition lines, and features for the Regia Marine Seismic Survey.

Animal Movement modelling simulations were run for pygmy blue whales and southern right whales considering the three nominal acquisition scenarios. In general, animats are randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2) within the species preferred depth range. During the simulation, if an animat's movement takes itself outside of its preferred depth range, it will begin to make movements (while still following the parameters within its species behaviour file) back towards its preferred depth range. For all simulations, animats were

seeded at a nominal horizontal sampling density of 4 animats/km^2. Each of the animat simulations were run for a representative 24 h duration.

Figure 2 shows an overview of the animat modelling simulation extents, along with the animat seeding areas for each scenario.

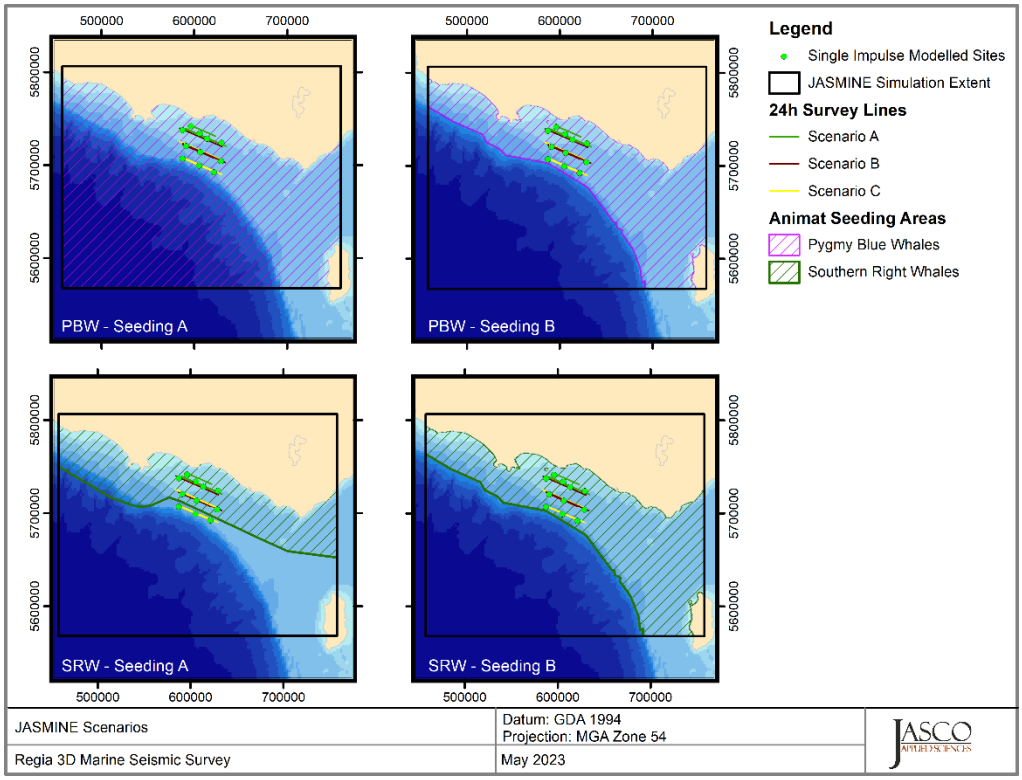

Figure 2. Overview Map of the considered scenarios for animal movement modelling.

2.1. Sensitive receivers

The Regia MSS lies within a foraging BIA for pygmy blue whales and an aggregation BIA for southern right whales. In addition, there are several swimming, diving and surfing beach that are within proximity of the survey. Lady Julia Percy Island, is also an important sensitive location, the closest modelled sites to the edge of the island are Site 1 and Site 5, at respective distances of about 9.3 and 8.4 km. The received acoustic levels at several receiver locations have been calculated and are presented below in Section 5.2.1.4. The receiver locations have been labelled 1–8 and are summarised in Table 7.

Table 7. Location details for the sensitive receiver sites.

Receiver ID	Sensitive receiver location	Receptors	Latitude (S)	Longitude (E)	MGA[1] Zone 54	
					X (m)	Y (m)
1	Lady Julia Percy Island	Seals, White Sharks	38° 25' 27.17"	142° 0' 35.78"	588158	5746633
2	Southern Right Whale Migration and Resting BIA	Southern Right Whales	38° 33' 42.51"	142° 43' 43.45"	650618	5730432

3. Noise Effect Criteria

The perceived loudness of sound, especially impulsive sound such as that from seismic airguns, is not generally proportional to the instantaneous acoustic pressure. Rather, perceived loudness depends on the pulse rise-time and duration, and the frequency content. Several sound level metrics, such as PK, SPL, and SEL, are commonly used to evaluate sound and its effects on marine life (Appendix A). The period of accumulation associated with SEL is defined, with this report referencing either a "per pulse" assessment or over 24 h. The acoustic metrics in this report reflect the updated ISO standard for acoustic terminology, ISO/DIS 18405:2017 (2017).

Whether acoustic exposure levels might injure or disturb marine mammals is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that have investigated the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

The following noise criteria and sound levels for this study were chosen because they include standard thresholds, thresholds suggested by the best available science, and sound levels presented in literature for species with no suggested thresholds (Sections 3.1–3.5 and Appendix A):

1. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from (Southall et al. 2019) for the onset of Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) in marine mammals.
2. Marine mammal behavioural threshold based on the current US National Oceanic and Atmospheric Administration (NOAA 2019) criterion for marine mammals of 160 dB re 1 µPa (SPL; L_p) for impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs and larvae (including plankton) (Popper et al. 2014).
4. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in turtles.
5. Sea turtle behavioural response threshold of 166 dB re 1 µPa (SPL; L_p), (McCauley et al. 2000) as cited in the Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017), along with a sound level associated with behavioural disturbance 175 dB re 1 µPa (SPL; L_p) (McCauley et al. 2000)
6. Diving birds (penguins):
    - Thresholds for otariid pinnipeds are used as a proxy (Section 3.4): Peak pressure levels (PK; L_{pk}) and frequency–weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Southall et al. (2019) for the onset of PTS and TTS in otariids.
    - Behavioural response to impulsive sound of 120 dB re 1 µPa (SPL; L_p) for diving birds based on information from Sørensen et al. (2020).
7. Peak-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$) and particle acceleration (ms^{-2}) at the seafloor to help assess effects of noise on crustaceans through comparing to results in Day et al. (2016a), Day et al. (2019), Day et al. (2016b), Day et al. (2017) and Payne et al. (2008).
8. A sound level of 226 dB re 1 µPa (PK; L_{pk}) reported for comparing to Heyward et al. (2018) for sponges and corals.
9. An SPL human health assessment threshold of 145 dB re 1 µPa (SPL; L_p) for sound exposure to people swimming and diving derived from Parvin (2005), and considering Ainslie (2008).

Additionally, to assess the size of the low-power zone required under the Australian Environment Protection and Biodiversity Conservation (EPBC) Act Policy Statement 2.1, Department of the

Environment, Water, Heritage and the Arts (DEWHA 2008), the distance to an unweighted per-pulse SEL of 160 dB re 1 µPa^2·s (L_E) is reported.

The following subsections (Sections 3.1–3.5, along with Appendix A.4 and A.5), expand on the thresholds, guidelines and sound levels for marine mammals, fish, fish eggs, fish larvae, sea turtles, and benthic invertebrates.

3.1. Marine Mammals

There are two categories of auditory threshold shifts or hearing loss: permanent threshold shift (PTS), a physical injury to an animal's hearing organs; and Temporary Threshold Shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued.

To help assess the potential for the possible injury and hearing sensitivity changes in marine mammals, this report applies the criteria recommended by Southall et al. (2019), considering both PTS and TTS. These criteria, along with the applied behavioural criteria (NOAA 2019), are summarised in Table 8, with descriptions included in Appendix A.4.1 (auditory impairment) and Appendix A.4.2 (behavioural response), with frequency weighting explained in Appendix A.5. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

Table 8. Unweighted sound pressure level (SPL), 24-hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds for acoustic effects on marine mammals.

Hearing group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS onset thresholds[1] (received level)		TTS onset thresholds[1] (received level)	
	SPL (L_p; dB re 1 µPa)	Weighted SEL (L_E; dB re 1 µPa^2 s)	PK (L_{pk}; dB re 1 µPa)	Weighted SEL (L_E; dB re 1 µPa^2 s)	PK (L_{pk}; dB re 1 µPa)
Low-frequency cetaceans (baleen whales)	160	183	219	168	213
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)		185	230	170	224
Very-high-frequency cetaceans (*Kogia*, cephalorhynchid, and *L. australis*)		155	202	140	196
Pinnipeds[2] (Australian sea lion, Australian fur seal, New Zealand fur seal)		203	232	188	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

[2] Listed as pinnipeds but equivalent to other marine carnivores in water in the Southall et al. (2019) criteria. Also equivalent to Otariid pindipeds listed in NMFS (2018).

L_p denotes sound pressure level period and has a reference value of 1 µPa.

$L_{pk,\,flat}$ peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.

L_E denotes cumulative sound exposure over a 24-hour period and has a reference value of 1 µPa^{2}s.

3.2. Fish, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and turtles, work begun by a panel convened by NOAA two years earlier. The resulting guidelines included specific thresholds for different levels of effects and for different groups of species (Popper et al. 2014). These guidelines defined quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death.
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma.
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges, these effects are not addressed in this report and are included in Table 9 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Turtles, fish eggs, and fish larvae are considered separately. Table 9 lists relevant effects thresholds from Popper et al. (2014).

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long-lasting exposures, it is required to define a time. Popper et al. (2014) recommend applying a standard period, where this is either defined as a justified fixed period or the duration of the activity; however, Popper et al. (2014) also included caveats about how long the fish will be exposed because they can move (or remain in location) and so can the source. Popper et al. (2014) summarises that in all TTS studies considered, fish that showed TTS recovered to normal hearing levels within 18–24 hours. Due to this, a period of accumulation of 24 hours has been applied in this study for SEL, which is similar to that applied for marine mammals in NMFS (2016, 2018).

In the discussion of the criteria, Popper et al. (2014) discuss the complications in determining a relevant period of mobile seismic surveys, as the received levels at the fish change between impulses because the source is moving, and that in reality a revised guideline based on the closest PK or the per-pulse SEL might be more useful than one based on accumulated SEL. This is because exposures at the closest point of approach (CPA) are the primary exposures contributing to a receiver's accumulated level (Gedamke et al. 2011). Additionally, several important factors determine the likelihood and duration a receiver is expected to be in close proximity to a sound source (i.e., overlap in space and time between the source and receiver). For example, accumulation time for fast moving (relative to the receiver) mobile sources is driven primarily by the characteristics of the source (i.e., speed, duty cycle; NMFS 2016, 2018).

As discussed in Popper (2018), many fish species move around, some over large distances. The author suggests that it is reasonable to think that if the sound of a seismic source becomes too loud, the fish will move away from the source because they are able to determine the direction of a sound source. If the fish moves away, the amount of energy to which it is exposed is likely to be one or a few seismic pulses, and these would not likely be loud enough to result in any effect because the fish would move away at a much lower level signal than could cause harm. Data on TTS for fish are very limited, with the only study that examined recovery from seismic impulses being Popper et al. (2005). Popper (2018) states that if this study had been conducted on wild, free-swimming fish instead of caged ones, there would have been no effect whatsoever because they were likely to have moved

away from the source as it approached them, as would happen with normally free-moving demersal and pelagic fish species associated with a 3-D seismic survey in northern Australian waters, extrapolating from the Bethany 3-D assessed in Popper (2018).

Therefore, the time over which energy should be accumulated in each individual fish in the survey area should be limited to the time over which fish receives the maximum exposure, and 24 h is likely too long a period for calculating the accumulation of energy in determining potential harm (e.g., damage or TTS) (Popper 2018). Even if fish do show some TTS, recovery will start as soon as the most intense sounds end, and recovery is likely to even occur, to a limited degree, between seismic pulses. Based on very limited data, recovery within 24 h (or less) is very likely. If TTS does occur, the duration of exposure to the most intense sounds that could result in TTS will be over just a few hours. Thus, energy accumulating over longer periods than a few hours is probably inappropriate (Popper 2018).

Table 9. Criteria for seismic noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	>219 dB SEL_{24h} or >213 dB PK	>216 dB SEL_{24h} or >213 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	186 dB SEL_{24h}	(N) Low (I) Low (F) Moderate	(N) High (I) High (F) Moderate
Fish eggs and fish larvae (relevant to plankton)	>210 dB SEL_{24h} or >207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low

Peak sound level (PK) dB re 1 µPa; SEL_{24h} dB re 1µPa^2·s. All criteria are presented as sound pressure, even for fish Without swim bladders, since no data for particle motion exist. Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

3.3. Sea Turtles

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles).

Finneran et al. (2017) presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

McCauley et al. (2000) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 µPa (SPL), the sea turtles increased their swimming activity, and above 175 dB re 1 µPa they began to behave erratically, which was interpreted as an agitated state. The

Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017) acknowledges the 166 dB re 1 µPa SPL reported (McCauley et al. 2000) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1 µPa level from McCauley et al. (2000) is recommended as a criterion for behavioural disturbance. These thresholds are shown in Table 10.

Table 10. Acoustic effects of impulsive noise on sea turtles: Unweighted sound pressure level (SPL), 24 hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds

Effect type	Criterion	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	PK (L_{pk}; dB re 1 µPa)
Behavioural response	McCauley et al. (2000)	166	NA	
Behavioural disturbance		175		
PTS onset thresholds[1] (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds[1] (received level)			189	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

L_p denotes sound pressure level period and has a reference value of 1 µPa.

$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.

L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa²s.

3.4. Diving Birds

There are no regulatory thresholds with regard to onset of hearing impairment for penguins, any other bird species, or phylogenetically or anatomically related species. The only scientifically robust thresholds in this context exist for marine mammals. To allow for assessing the noise–induced impact risk of impulsive airgun signals on penguins, the least sensitive marine mammal hearing group, other carnivores in water (OCW), from Southall et al. (2019), is recommended as a proxy. This hearing group has been selected due to similar hearing sensitivity in the frequency band of underwater hearing for diving birds and otariid pinnipeds, which are included in the group. This provides a conservative approach, as otariids are considered more sensitive to underwater sound at higher frequencies than penguins.

There are also no regulatory thresholds or criteria established to assess potential behavioural responses by penguins or flying seabirds to underwater noise. To allow for assessing the potential for such impacts, an onset criterion for behavioural responses of penguins and flying seabirds of 120 dB re 1 µPa (SPL) for impulsive sources was chosen based on information from Sørensen et al. (2020). They exposed gentoo penguins (*Pygoscelis papua*) in a controlled exposure experiment to underwater noise bursts (impulsive signals) and demonstrated that the animals show a graded reaction depending on received sound levels. For consistency with the approach to assess PTS and TTS, the behavioural response threshold is applied as OCW weighted.

3.5. Invertebrates

3.5.1. Benthic Invertebrates (Crustaceans and Bivalves)

Research is ongoing into the relationship between sound and its effects on crustaceans, including the relevant metrics for both effect and impact. Available literature suggests particle motion, rather than sound pressure, is a more important factor for crustacean and bivalve hearing. Water depth and

seismic source size are related to the particle motion levels at the seafloor, with larger arrays and shallower water being related to higher particle motion levels, more likely relevant to effects on crustaceans and bivalves.

At the seafloor interface, crustaceans and bivalves are subject to particle motion stimuli from several acoustic or acoustically induced waves. These include the particle motion associated with an impinging sound pressure wave in the water column (the incident, reflected, and transmitted portions), substrate acoustic waves, and interface waves of the Scholte type. However, it is unclear which aspect(s) of these waves is/are most relevant to the animals, either when they normally sense the environment or their physiological responses to loud sounds so there is not enough information to establish similar criteria and thresholds as done for marine mammals and fish. Including recent research, such as Day et al. (2016b), current literature does not clearly define an appropriate metric or identify relevant levels (pressure or particle motion) for an assessment. This includes the consideration of what particle motion levels lead to a behavioural response, or mortality. Therefore, at this stage, we cannot propose authoritative thresholds to inform the impact assessment. However, levels can be determined for pressure metrics presented in literature to assist the assessment.

The pressure and acceleration examples provided in Day et al. (2016a) (Figures 11 and 12) indicate that the acceleration and pressure signals occurred simultaneously, which was interpreted as an indication that the waterborne sounds were responsible for the accelerations measured by the geophones. For clarity, it is important to distinguish that the acceleration from waterborne sound energy is *not* ground roll, which Day et al. (2016a) correctly define as the sound that propagates along the interface at a speed lower than the shear wave speed of the sediment. However, the report subsequently uses ground roll for all further discussions of particle acceleration. While Day et al. (2016a) discuss that they chose the simplest measure of ground roll, it should have been referring to as ‘the acceleration from waterborne sound energy’, or ‘waterborne acceleration’ for short.

For crustaceans, a PK-PK sound level of 202 dB re 1 µPa (Payne et al. 2008) is considered to be associated with no effect, and therefore applied in the assessment. Additionally for context related to different levels of potential impairment, the PK-PK sound levels determined for crustaceans in Day et al. (2016b), 209–212 dB re 1 µPa and 213 dB re 1 µPa from Day et al. (2019), are also included.

For bivalves, PK-PK sound levels of 212, and 213 are presented to allow comparison to the maximum sound levels measured in Day et al. (2016a) and Day et al. (2017) for scallops and pearl shell oyster.

Literature does not present a sound level associated with no impact, and as particle motion is the more relevant metric, particle acceleration from the seismic source has been presented for comparing the results in Table 7 of Day et al. (2016a). The maximum particle acceleration assessed for scallops was 37.57 ms^{-2}.

3.5.2. Plankton

To assess effects on plankton, there are only a few studies to base threshold criteria on. Popper et al. (2014) cites many of the references and studies on potential impacts of noise emissions on fish eggs and larvae prior to 2014. Results presented in Day et al. (2016b) for embryonic lobsters and Fields et al. (2019) for copepods align with those presented in Popper et al. (2014), which is that mortality and sub-lethal injury are limited to within tens of metres of seismic sources. Additionally, the Popper et al. (2014) criteria (Table 9), are extrapolated from simulated pile driving signals which have a more rapid rise time and greater potential for trauma than pulses from a seismic source.

Other research, such as McCauley et al. (2017), has indicated the potential for effects at longer range and at levels of 178 dB PK-PK, however, Fields et al. (2019) noted that it was difficult to reconcile the high mortality reported by McCauley et al. (2017) with the low mortalities reported in the greater previous body of earlier research and their experiment. They recommended further research into whether it is the sound pulse itself (i.e., the energy, peak pressures, or particle acceleration), the

(turbulent) fluid flow occurring more slowly (i.e., not related to the sound pulse), or other effects such as the bubble cloud that which might cause higher mortality near the seismic source.

4. Methods

4.1. Parameter Overview

The specifications of the seismic sources and the environmental parameters used in the propagation models are described in additional detail in Appendix D. A single sound speed profile for December was considered in this modelling study (Appendix D.3.2). This was identified as the seasonal period that would provide the farthest propagation by comparing model predictions for a subset of months identified when the survey could be in operation.

The modelled sites in spanned water depths of 40–174 m. In shallower waters, less than 150 m, seabed geologic profile was characterised as a layered limestone, variable cemented with a thin lay of overlying sand for water depth less than 50 m. For sites in deeper water, greater than 150 m, the seabed geologic profile was characterised as a thick package of unconsolidated sediments. Three geological profiles were defined to represent the different geo-acoustic properties across the area encompassed by the considered line plans, and are representative of the different zones within the entire Survey Area (Appendix D.3.3).

4.2. Acoustic Source Model

The pressure signature of the individual airguns and the composite decidecade-band point-source equivalent directional levels (i.e., source levels) of the 2820 in^3 seismic source were modelled with JASCO's Airgun Array Source Model (AASM). Although AASM accounts for notional pressure signatures of each seismic source with respect to the effects of surface-reflected signals on bubble oscillations and inter-bubble interactions, the surface-reflected signal (known as surface ghost) is not included in the far-field source signatures. The acoustic propagation models account for those surface reflections, which are a property of the propagating medium rather than the source.

AASM considers:

- Array layout.
- Volume, tow depth, and firing pressure of each airgun.
- Interactions between different airguns in the array.

All seismic sources considered were modelled over AASMs full frequency range, up to 25 kHz. Appendix B.1 details this model.

4.3. Sound Propagation Models

Three sound propagation models were used to predict the acoustic field around the seismic source:

- Combined range-dependent parabolic equation and Gaussian beam acoustic ray-trace model (MONM-BELLHOP, 10 Hz to 25 kHz).
- Full Waveform Range-dependent Acoustic Model (FWRAM, 10 to 1024 Hz).
- Wavenumber integration model (VSTACK, 10 to 1024 Hz).

The models were used in combination to characterise the acoustic fields at short and long ranges in terms of SEL, SPL, PK, and PK-PK. Appendix C details each model. MONM-BELLHOP was used to calculate SEL of a 360° area around each source location. FWRAM was used to model synthetic seismic pulses and to generate a generalised range-dependent SEL to SPL conversion function for

the considered modelled sites. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM-BELLHOP to estimate SPL values. FWRAM was also used to calculate water column PK and PK-PK levels.

VSTACK was used to calculate near field PK and PK-PK levels along 4 transects at the seafloor along the endfire and broadside directions considering a set of 11 unique water depths at 40, 50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m. This model was also used to model the peak particle acceleration magnitude considering the same 11 unique water depths. For modelled sites where the seabed is likely to be composed of outcropping limestone (Appendix D.3.3), an additional correction factor was applied to predictions to better estimate loss characteristics of the seabed (see Appendix C.3.2).

4.4. Geometry and Modelled Regions

To predict sound levels with MONM-BELLHOP was used to calculate propagation losses up to distances of 100 km from the source, with a horizontal separation of 20 m between receiver points along all modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta$ = 2.5° for a total of N = 144 radial planes. Receiver depths were chosen to span the entire water column over the modelled area, from 2 m to a maximum of 2700 m, with step sizes that increased with depth. To supplement the MONM results, high-frequency results for propagation loss were modelled using BELLHOP for frequencies from 1.25 to 25 kHz. The MONM and Bellhop results were combined to produce results for the full frequency range of interest.

FWRAM was run to 100 km along four radials (fore and aft endfire, and port and starboard broadside) for computational efficiency. This was done to compute SEL-to-SPL conversions (Appendix D.2) and also to quantify water column PK and PK-PK. The horizontal range step begins at 20 m and increases with range from the source.

The maximum modelled range for VSTACK was 1000 m, and a variable receiver range increment that increased away from the source was used, which increased from 10 to 25 m. The final tabulated distances were obtained through interpolating predicted received levels. Received levels were computed for receivers at 5 and 50 cm above the seafloor to assist in the assessment on invertebrates and fish respectively.

4.5. Accumulated SEL

New sound energy is introduced into an environment with each pulse from the seismic source. While some impact criteria are based on the per-pulse energy released, others, such as the marine mammal and fish SEL criteria (Section 3), account for the total acoustic energy marine fauna is subjected to over a specified duration, defined in this report as 24 h. An accurate assessment of the accumulated sound energy depends not only on the parameters of each seismic impulse but also on the number of impulses delivered in a duration and the relative positions of the impulses.

When there are many seismic impulses, it becomes computationally prohibitive to perform sound propagation modelling for every single event. The distance between the consecutive seismic impulses is small enough, such that the environmental parameters that influence sound propagation are virtually the same for many impulse points. The acoustic fields can, therefore, be modelled for a subset of seismic pulses and estimated at several adjacent ones. After sound fields from representative impulse locations are calculated, they are adjusted to account for the source position for nearby impulses.

Although estimating the cumulative sound field with the described approach is not as precise as modelling sound propagation at every impulse location, small-scale, site-specific sound propagation features tend to blur and become less relevant when sound fields from adjacent impulses are

summed. Larger scale sound propagation features, primarily dependent on water depth, dominate the cumulative field. The accuracy of the present method acceptably reflects those large-scale features, thus providing a meaningful estimate of a wide area SEL field in a computationally feasible framework.

To produce the map of accumulated received sound level distributions and calculate distances to specified sound level thresholds, the maximum-over-depth were calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth and seafloor sound levels for each impulse were then resampled (by linear triangulation) to produce a regular Cartesian grid. The sound field grids from all impulses were summed (see Equation A-5) to produce the cumulative sound field grid with cell sizes of 20 m. The contours and threshold ranges were calculated from these flat Cartesian projections of the modelled acoustic fields.

The unweighted (fish) and frequency-weighted SEL_{24h} results were rendered as contour maps, including contours that focus on the relevant criteria-based thresholds. Only contours at ranges larger than the nearfield of the seismic source were rendered.

4.6. Animal Movement and Exposure Modelling

4.6.1. Methodology

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was used to predict the exposure of animats to sound arising from the seismic activity. JASMINE integrates the predicted sound field with biologically meaningful movement rules for each marine mammal species (pygmy blue whales and southern right whales for the current analysis) that results in an exposure history for each animat in the model. An overview of the exposure modelling process using JASMINE is shown in Figure 4.

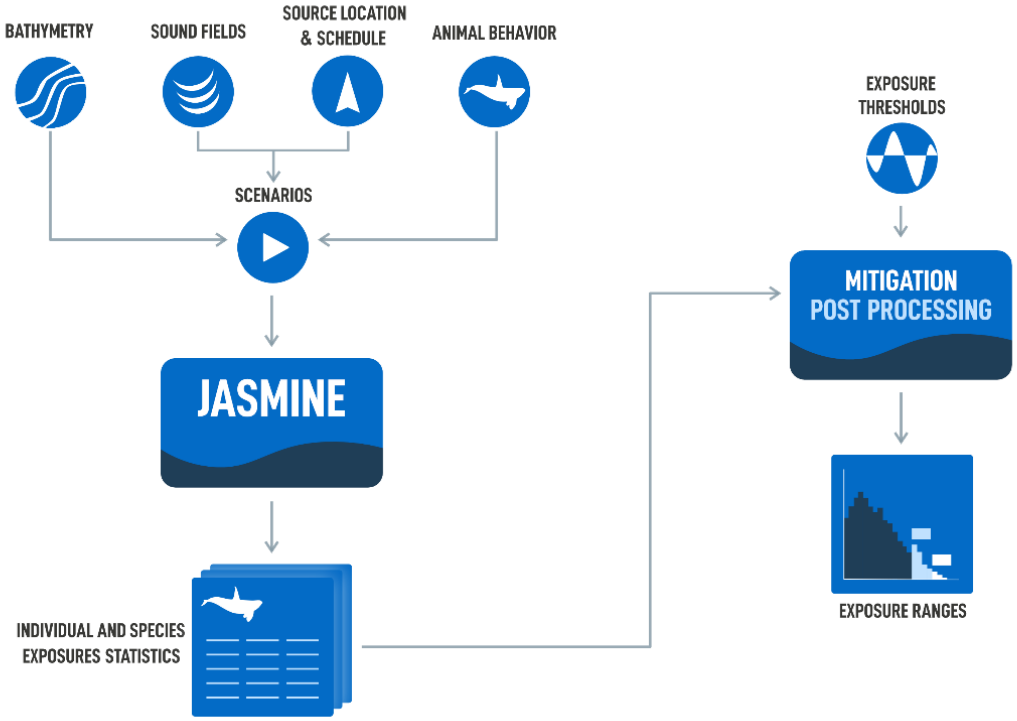

Figure 4. Exposure modelling process overview.

In JASMINE, the sound received by the animats is determined by the proposed seismic operations. As illustrated in Figure 5, animats are programmed to behave like the marine animals that may be present in an area. The parameters used for forecasting realistic behaviours (e.g., diving and foraging depth, swim speed, surface times) are determined and interpreted from marine mammal studies (e.g., tagging studies) where available, or reasonably extrapolated from related or comparable species. For cumulative metrics, an individual animats sound exposure levels are summed over a 24 h duration to determine its total received energy, and then compared to the relevant threshold criteria. For single-exposure metrics, the maximum exposure is evaluated against threshold criteria for each 24 h period. For additional information on JASMINE, see Appendix D.4.

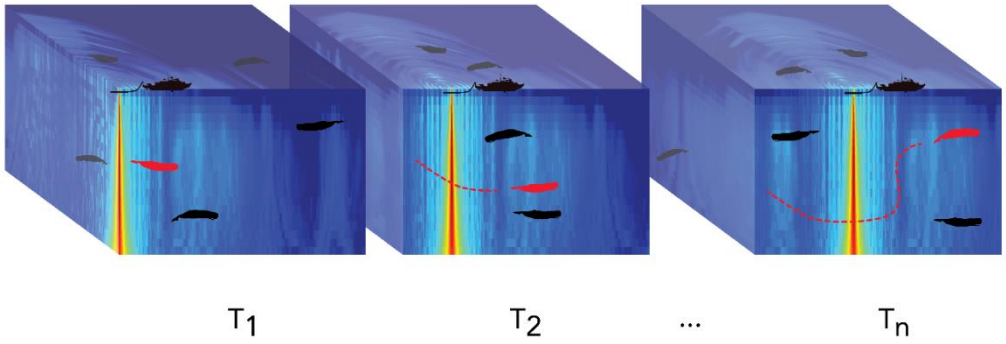

Figure 5. Depiction of animats in a moving sound field. Example animat (red) shown moving with each time step (T_n). The acoustic exposure of each animat is determined by where it is in the sound field, and its exposure history is accumulated as the simulation steps through time.

The exposure criteria for impulsive sounds (described in Section 3) were used to determine the number of animats that exceeded thresholds. To generate statistically reliable probability density functions, model simulations were run with animat sampling densities of 4 animats/km^2. The modelling results are not related to real-world density estimates for pygmy blue whales and southern right whales within BIAs or known core range area, as the number of animals potentially exposed is not calculated. To evaluate PTS, TTS and behavioural response, exposure results were obtained using detailed behavioural information for pygmy blue whales and southern right whales (described in Sections 4.6.3.1 and 4.6.3.2). Figure 2 illustrates the differences between the corresponding seeding areas.

The seismic source was modelled as a vessel towing an airgun array at a speed of 4.5 knots, with an impulse interval of 12.5 m. The simulated source tracks followed a racetrack configuration with acquisition not occurring on turns. At the time and location of each seismic pulse, the modelled source location with the closest distance was selected for exposure modelling. The track lines along with the acoustic modelling locations are shown in Figure 1.

Figure 6 shows an example animat track (generated for information purposes only and not related to the results presented in this report) with associated received levels from a stationary point source. The top panel displays the animat track relative to the point source, and the bottom panel displays the accumulation of SEL_{24h} for TTS and PTS criteria. At approximately 50 seconds, the animat is exposed so that the TTS threshold is exceeded, and at approximately 700 seconds the animat is exposed so that the PTS threshold is exceeded.

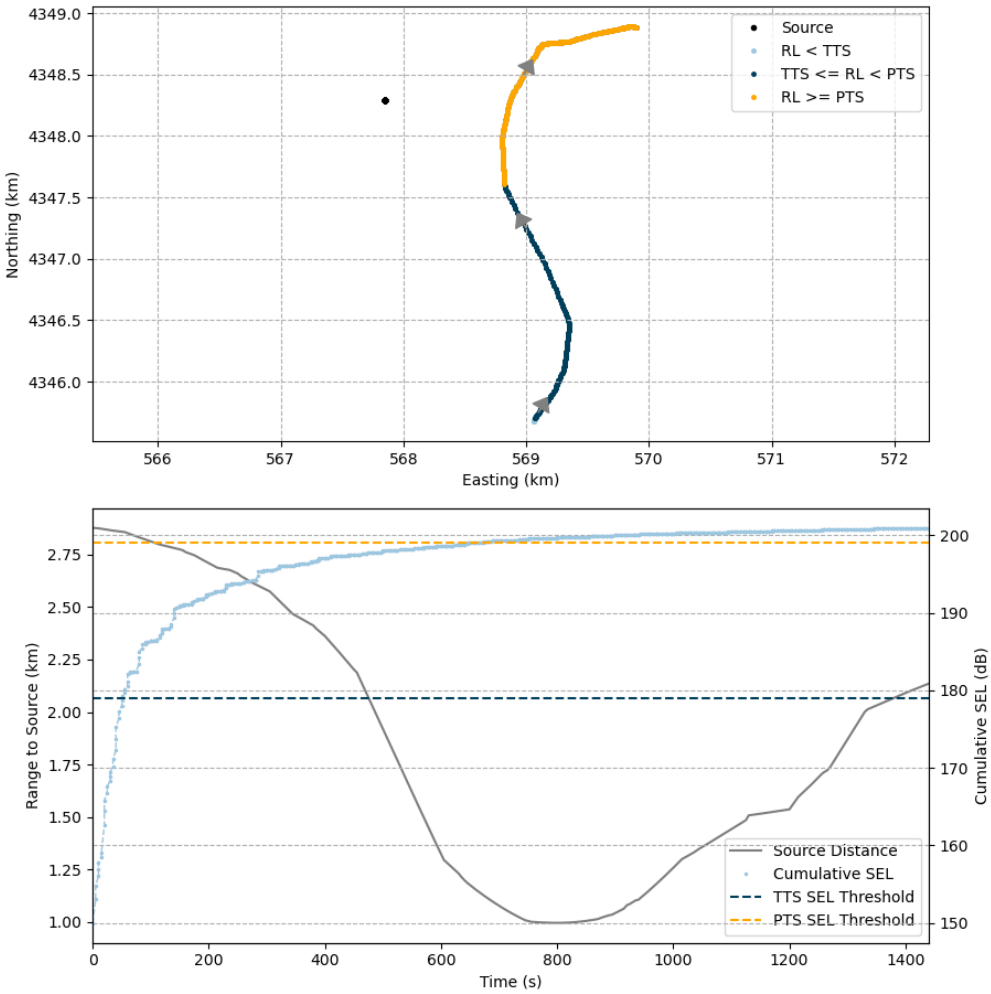

Figure 6. Animat track from an example simulation showing northward movement over a 1400 s duration. The upper panel shows a plan view of both a stationary point source and a foraging animat. Animat steps are coloured to indicate whether the accumulated sound energy at that point has exceeded either TTS or PTS threshold criteria. The lower panel shows horizontal distance in kilometres to the source (grey line; left y-axis) and cumulative 24-h SEL ($L_{E,24h}$, dB re 1 µPa²·s; right y-axis) as a function of time. Note that this example does not use data from the current study.

4.6.2. Exposure–based Radial Distance Estimation

The results from the animal movement and exposure modelling provided a way to estimate radial distances to effect thresholds. The distance to the closest point of approach (CPA) for each of the animats was recorded. The $ER_{95\%}$ (95% Exposure Range) is the horizontal distance that includes 95% of the animat CPAs that exceeded a given effect threshold (see Section 3). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed threshold criteria. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which animats sample the sound field over time, both vertically and horizontally. The sound field varies as a function of range, depth, and azimuth based on a variety of factors such as bathymetry, sound speed profile, and geoacoustic parameters. The way the animats sample the sound field depends upon species-typical swimming and diving characteristics (e.g., swim speed, dive depth, surface intervals, and reversals). Furthermore, even within a particular species definition, these characteristics vary with behavioral state (e.g., feeding, migrating). As this results in some animats not exceeding threshold criteria even within the $ER_{95\%}$, the probability that an animat within that distance was exposed above threshold within the $ER_{95\%}$ was also computed (P_{exp}) to provide additional context.

Acoustic ranges are reported for both $R_{95\%}$ and R_{max}, however, exposure ranges are reported for $ER_{95\%}$ only since, statistically, ER_{max} is not defined. JASMINE is a Monte Carlo simulation, and the results are probabilistic in nature. This is in contrast with acoustic modelling, where there is a specific maximum isopleth range for a given source/environment setup.

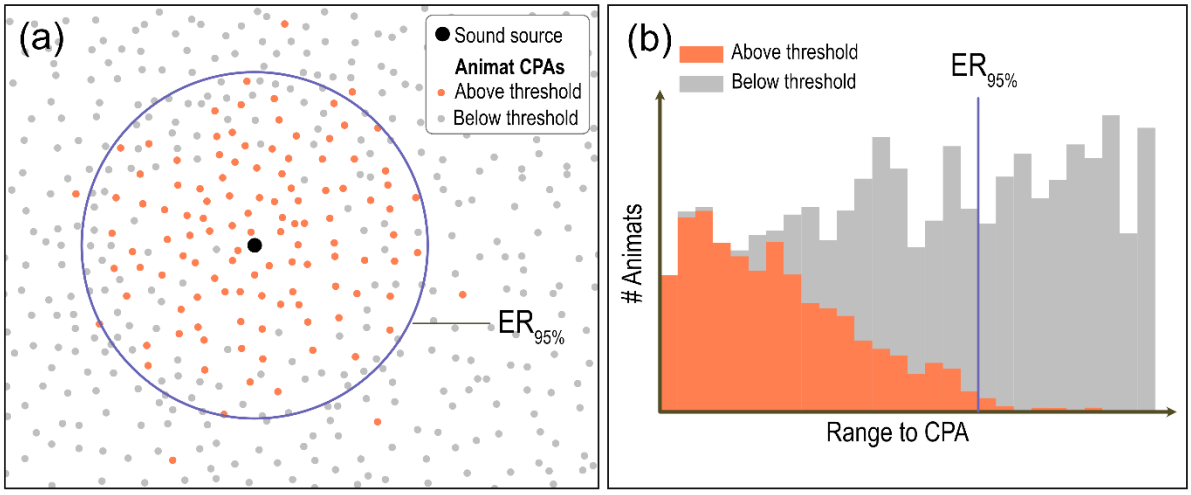

Figure 7. Example distribution of animat closest points of approach (CPAs). Panel (a) shows the horizontal distribution of animats near a sound source. Panel (b) shows the distribution of distances to animat CPAs. The 95% exposure range ($ER_{95\%}$) is indicated in both panels.

4.6.3. Species Specific Behaviour Profile Parameterisation

4.6.3.1. Pygmy Blue Whale Behaviour Profile

The project area overlaps with a known foraging BIA for pygmy blue whales (DoE (AU) 2015-2025). Therefore, only foraging behaviours were considered in the species profile.

Data on fine-scale foraging behaviour are not currently available for pygmy blue whales. Therefore, data from multi-sensor tags deployed on blue whales from the North Pacific were used to inform the feeding behaviours. Irvine et al. (2019) used intermediate-duration archival tags (SPLASH MK10) attached to eight blue whales off the coast of California and was able to determine two feeding modes based on depth: shallow and deep. These two feeding behaviours differed further between males and females, with females generally diving deeper than males during both shallow and deep feeding. In order to account for these differences, female and male pygmy blue whales were modelled separately, with values derived from Irvine et al. (2019). The remaining parameters for feeding behaviour were primarily sourced from Goldbogen et al. (2011), who deployed 25 multi-sensor suction cup tags (DTAGs) on blue whales off the coast of California. The exceptions were the values for travel speed, which was derived from satellite tags deployed on pygmy blue whales off southern Australia (Möller et al. 2020), and surface interval, which was derived from a satellite tag deployed on a pygmy blue whale off western Australia (Davenport et al. 2022).

4.6.3.2. Southern Right Whale Behaviour Profile

The project area is located in the known core range for southern right whales, and overlaps with a coastal aggregation BIA for this species. In aggregation areas, southern right whales concentrate from days to weeks before continuing to migrate along the coast (DCCEEW 2022). Animals of all demographics use these areas, including mothers with new calves. As such, two behavioural profiles were considered for southern right whales: migrating and aggregating.

The end of the year corresponds closest to the end of their calving/breeding season and the start of their migration (McCauley 2021). At this time, most pregnant females will likely have given birth, and sightings of mother/calf pairs have been documented in this area (Stamation et al. 2020). The behaviour of southern right whale mother/calf pairs can be dramatically different from other demographics, particularly in regards to the amount of time spent resting at the surface (Cusano et al. 2019, Nielsen et al. 2019). Therefore, separate behavioural profiles were modelled for mother/calf pairs and for all other demographics, resulting in four behavioural profiles for southern right whales: mother/calf migrating, mother/calf aggregating, non-mother/calf migrating, and non-mother/calf aggregating.

The behaviour of migrating southern right whales was modelled to reflect animats transiting through the known core range area on a 293º track to correspond with the tow direction. This reflects the animals migrating along the southern coast of Australia in a westerly or counter-clockwise direction (Burnell et al. 2001). Fine-scale behavioural data on southern right whales are limited, however migrating travel speed was derived from satellite-tagged southern right whales (Mackay et al. 2020). The remaining parameters used for the migrating species profiles were primarily sourced from multi-sensor tags (DTAGs and/or TDRs) deployed on North Atlantic right whales (Baumgartner and Mate 2003) (Dombroski et al. 2021).

Reproductive BIAs for southern right whales act as aggregation areas for mothers with new calves and for other demographics between additional known habitats. For the aggregating behavioural profiles, behaviours reflect those observed in North Atlantic right whales on calving grounds due to limited data on southern right whales: resting, travelling, and surface active. Additionally, the mother/calf profile includes nursing behaviour. The parameters used for the aggregating species profiles were again primarily sourced from North Atlantic right whales with the exception of behavioural probabilities, which were available from studies of southern right whales in South America (Thomas et al. 1984 and Lundquist et al. 2008).

5. Results

5.1. Acoustic Source Levels and Directivity

AASM (Section 4.2) was used to predict the horizontal and vertical overpressure signatures and corresponding power spectrum levels for the seismic sources, with results provided in Appendix B.3 along with the horizontal directivity plots for the selected source.

Table 11 shows the PK and per-pulse SEL source levels in the horizontal-plane broadside (perpendicular to the tow direction), endfire (along the tow direction), and vertical directions for the modelled array signature (2820 in^3 source). The vertical source level that accounts for the "surface ghost" (the out of phase reflected pulse from the water surface) is also presented to make it easier to compare the output of other seismic source models.

Figure B-2 in Appendix B.3 shows the broadside, endfire, and vertical overpressure signature and corresponding power spectrum levels for the source. The signature consists of a strong primary peak, related to the initial release of high-pressure air, followed by a series of pulses associated with bubble oscillations. Most energy was produced at frequencies below 500 Hz. Frequency-dependent peaks and nulls in the spectrum result from interference among airguns in the source and correspond with the volumes and relative locations of the airguns to each other.

Table 11. Far-field source level specifications for 2820 in^3 source, for 7 m tow depth. Source levels are for a point-like acoustic source with equivalent far-field acoustic output in the specified direction. Sound level metrics are per-pulse and unweighted.

Direction	Peak source pressure level ($L_{S,pk}$; dB re 1 µPa m)	Per-pulse source SEL ($L_{S,E}$; dB 1 µPa²m²s)	
		10–2000 Hz	2000–25000 Hz
Broadside	248.6	224.2	185.8
Endfire	244.7	222.7	186.3
Vertical	254.8	227.8	194.0
Vertical (surface affected source level)	254.8	230.5	196.9

5.2. Per-pulse Sound Fields

This section presents the per-pulse sound fields in terms of maximum-over-depth SPL, SEL, PK, and seafloor PK and PK-PK. The different metrics are presented for the following reasons:

- SPL sound fields were used to determine the distances to marine mammal and turtle behavioural thresholds (see Sections 3.1 and 3.3).
- Per-pulse SEL sound fields are used as inputs into the 24 h SEL scenario and to provide context for the range to 160 dB re 1 $\mu Pa^2 \cdot s$, relevant for the EPBC Act Policy Statement 2.1 (DEWHA 2008).
- PK metrics within the water column are relevant to thresholds and guidelines for marine mammals, sea turtles, fish, fish eggs and larvae (as well as plankton; Sections 3.1–3.3).
- PK metrics at the seafloor are relevant to guidelines for fish, fish eggs and larvae (Section 3.3) and the sound level for no effect on corals and sponges.

- PK-PK metrics at the seafloor are relevant to sound levels used in the assessment of effect on benthic invertebrates (Section 3.5.1).

The maximum and 95% distances to per-pulse SEL and SPL metrics are presented in Tables12–13. The SPL sound fields, and distances to relevant isopleths can be visualised on the contour maps presented in Figures 8–18. The SPL sound fields are also presented as vertical slices for selected azimuths along the endfire and broadside directions out to 50 km, with the airgun array in the centre (Figures 19–23).

Maximum distances to maximum-over-depth water column PK thresholds were calculated for five modelled single impulse sites, Sites 2, 3, 5, 8, and ,10, this was done at the sites where FWRAM was applied to calculate the SEL-SPL conversion (Appendix C.2 and D.2), and presented in Table 15. Seafloor sound levels were assessed considering eleven different representative water depths (40, 50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m). Tables 16 and 17 present the PK and PK-PK result Particle motion was also calculated considering these water depths, results are presented in Table 18.

5.2.1. Tabulated Results

5.2.1.1. Entire Water Column

Table 12. *Sites 1-11, 2820 in³ source*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) from the seismic source to modelled maximum-over-depth and maximum-over-tow direction unweighted per-pulse sound exposure level (SEL) isopleths from the modelled single impulse sites, with water depth indicated. The results presented are the maximum ranges from the set of modelled tow directions for each site, as described in Table 6.

Per-pulse SEL (L_E; dB re 1 µPa²·s)	Site 1 (40 m)		Site 2 (50 m)		Site 3 (55 m)		Site 4 (58 m)		Site 5 (45 m)		Site 6 (81 m)		Site 7 (71 m)		Site 8 (62 m)		Site 9 (125 m)		Site 10 (174 m)		Site 11 (167 m)

A dash indicates the threshold is not reached within the limits of the modelling resolution (20 m).

5.2.1.2. Seafloor

Ranges presented for seafloor receptors are provided in Tables 16 and 17 for receiver depths of 50 and 5 cm above the seafloor. As an example, the seafloor PK results in Table 16 differ from the maximum-over-depth modelled results presented in Table 15. This is because the model used for the water column results, calculated using FWRAM do not represent the maximum sound levels at the seafloor close to the array. FWRAM is based on a wide-angle parabolic equation (PE) algorithm which is valid to only approximately 70° down angle from the horizontal, and while it provides accurate predictions in the horizontal direction, it cannot predict sound levels directly under the array. VSTACK was used to determine the levels at the seafloor directly under the array and is valid in the very nearfield directly under the source.

Table 16. *2820 in³ source*: Maximum (R_{max}) horizontal distances (in m) from the seismic source to modelled seafloor (receiver located 50 cm above seafloor) peak pressure level thresholds (PK) at eleven representative water depths.

Hearing group/animal type	PK threshold (L_{pk}; dB re 1 µPa)	Water Depth										
		40 m	50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)										
Sound levels for sponges and corals[1]	226	2	*	*	*	*	*	*	*	*	*	*
Fish: No swim bladder (also applied to sharks)	213	102	110	74	73	73	70	67	56	46	9	*
Fish: Swim bladder not involved in hearing, Swim bladder involved in hearing Fish eggs, and larvae	207	179	190	139	147	152	150	149	148	148	127	122

[1] Heyward et al. (2018)
An asterisk indicates that the sound level was not reached.

Table 17. 2820 *in³ source*: Maximum (R_{max}) horizontal distances (in m) from the seismic source to modelled seafloor (receiver located 5 cm above seafloor) peak-peak pressure levels (PK-PK) at seven representative water depths. Results included in relation to benthic invertebrates.

PK-PK ($L_{pk\text{-}pk}$; dB re 1 µPa)	Water Depth										
	40 m	50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
	Distance R_{max} (m)										
213[1,2,3]	157	172	132	140	143	146	146	146	140	120	113

5.2.1.3. Particle Motion Metrics

The modelling considered receivers positioned at 5 cm off the seafloor. The maximum distance in metres to a peak particle acceleration magnitude of 37.57 ms^{-2} are presented in Table 18. The ranges for the particle acceleration threshold for invertebrates defined by Day et al. (2016a).

Table 18. Maximum (R_{max}) horizontal distances (in m) from the 2820 in^3 to particle motion threshold: Peak acceleration magnitude level (m/s^2) threshold for benthic invertebrates 5 cm above the seafloor, with water depth indicated. Results included in relation to benthic invertebrates (Section 3.5.1).

Hearing group/animal type	Peak Acceleration Magnitude (m/s^2)	Water Depth										
		40 m	50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)										
Benthic invertebrates	37.57	52	4	*	*	*	*	*	*	*	*	*

An asterisk indicates that the sound level was not reached.

5.2.1.4. Sound Levels at Sensitive Receivers

The received per-pulse SPL sound levels at the sensitive receiver sites identified in Section 2.1 are provided in Table 19. For each receiver location, the maximum level from all modelled sites is shown below. The distance between the receiver and the modelled site that produced the maximum level are also shown.

Table 19. Maximum-over-depth received sound levels (SPL) at the sensitive receivers outlined in Section 2.1 along with the distance between the receiver and associated modelled site.

Receiver ID	Sensitive receiver	SPL (L_p; dB re 1 µPa)	Distance between receiver location and modelled site (km)	Associated Modelled Site
1	Lady Julia Percy Island	153.4	9.35	1
2	Southern Right Whales Migration and resting BIA	133.9	44.5	2
3	Discovery Bay	113.2	72.1	11
4	Portland	87.4	58.6	2
5	Little River and Taylors Beach	153.1	9.58	1
6	Port Fairy Bay	121.5	23.9	3
7	Twelve Apostles Marine Park	124.6	91.7	1
8	Aire River Beach	107.5	103.5	3

5.2.2. Sound Field Maps and Graphs

5.2.2.1. Sound Level Contour Maps

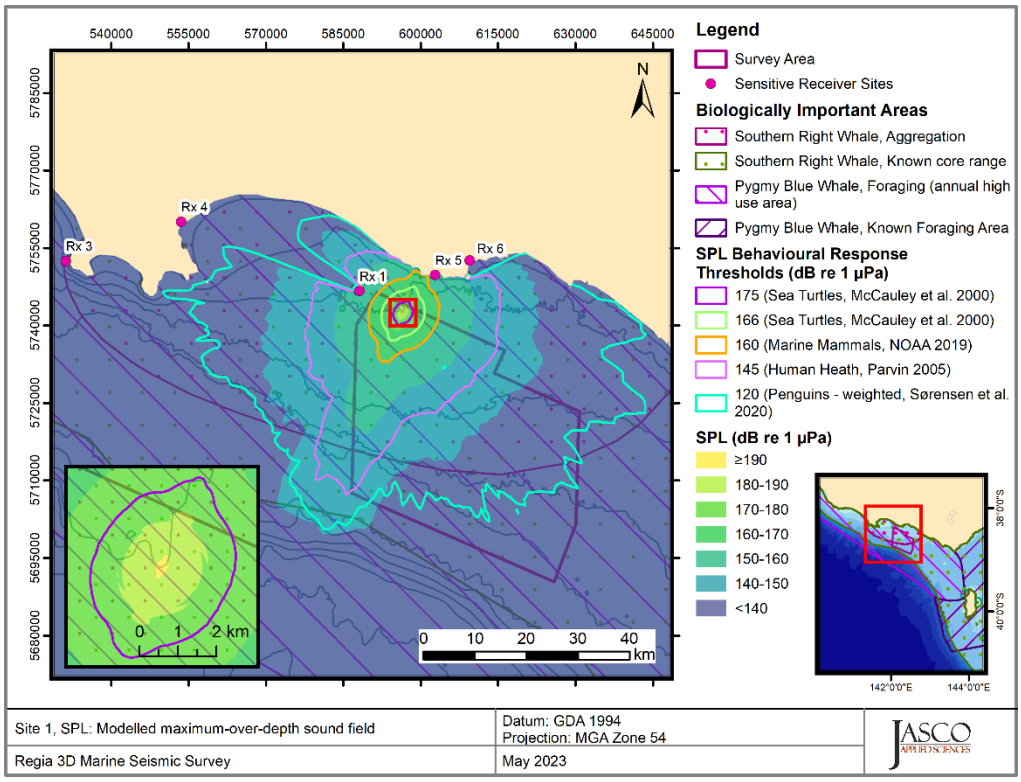

Figure 8. *Site 1, SPL, 2820 in^3 source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

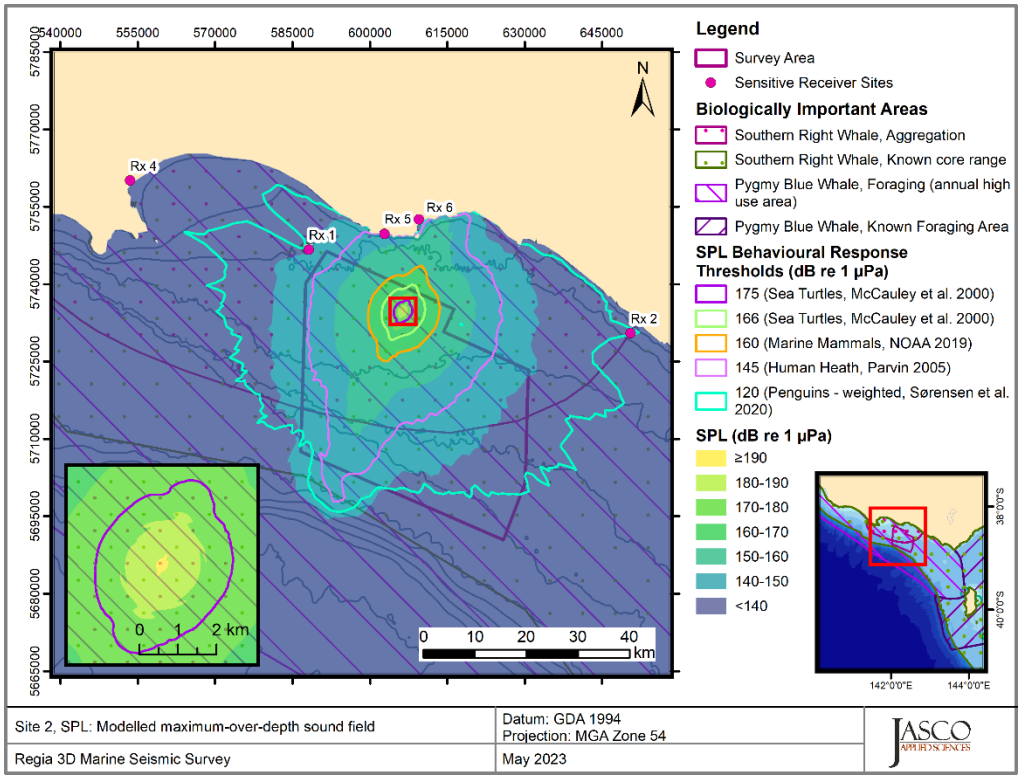

Figure 9. *Site 2, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

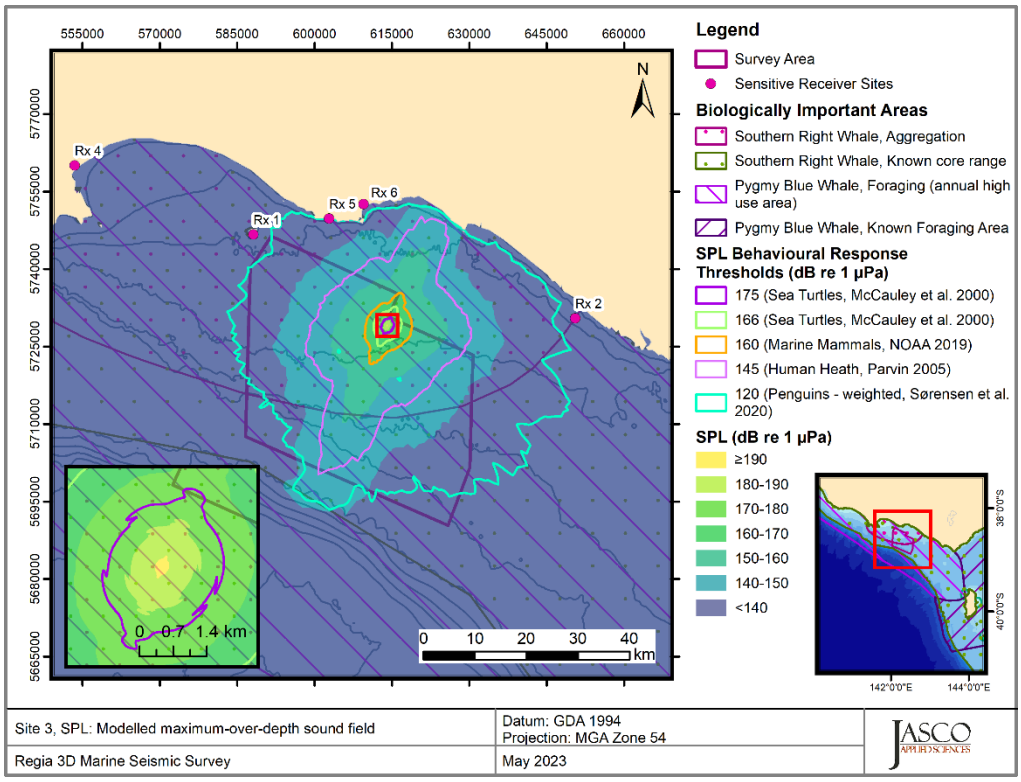

Figure 10. *Site 3, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

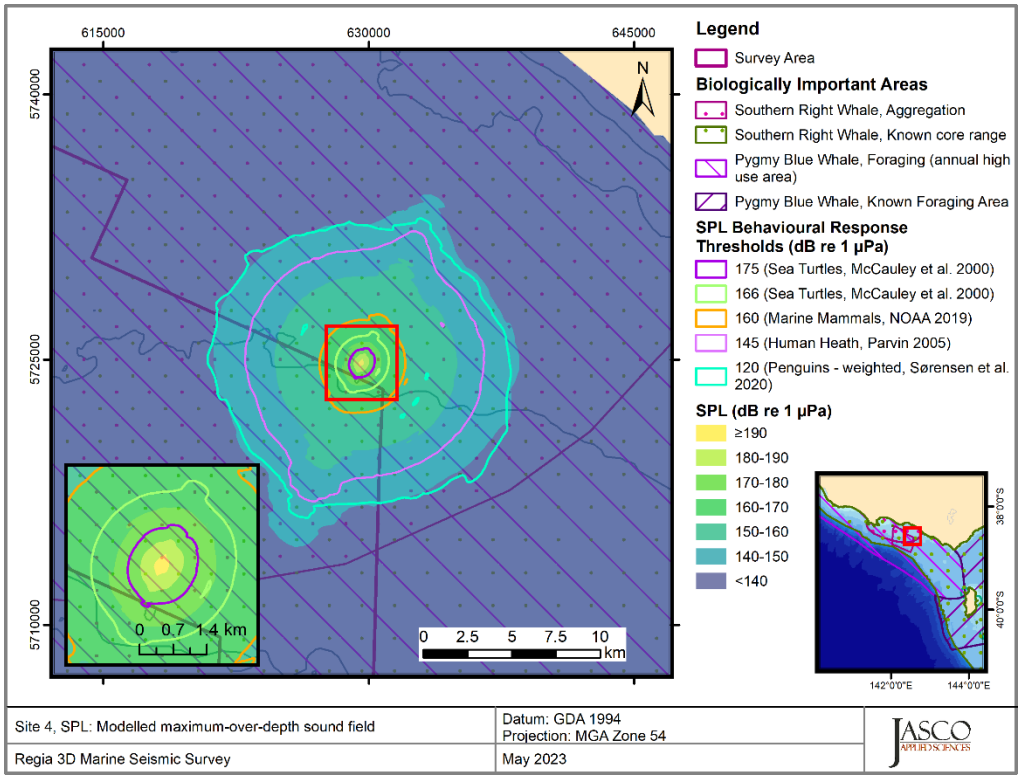

Figure 11. *Site 4, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

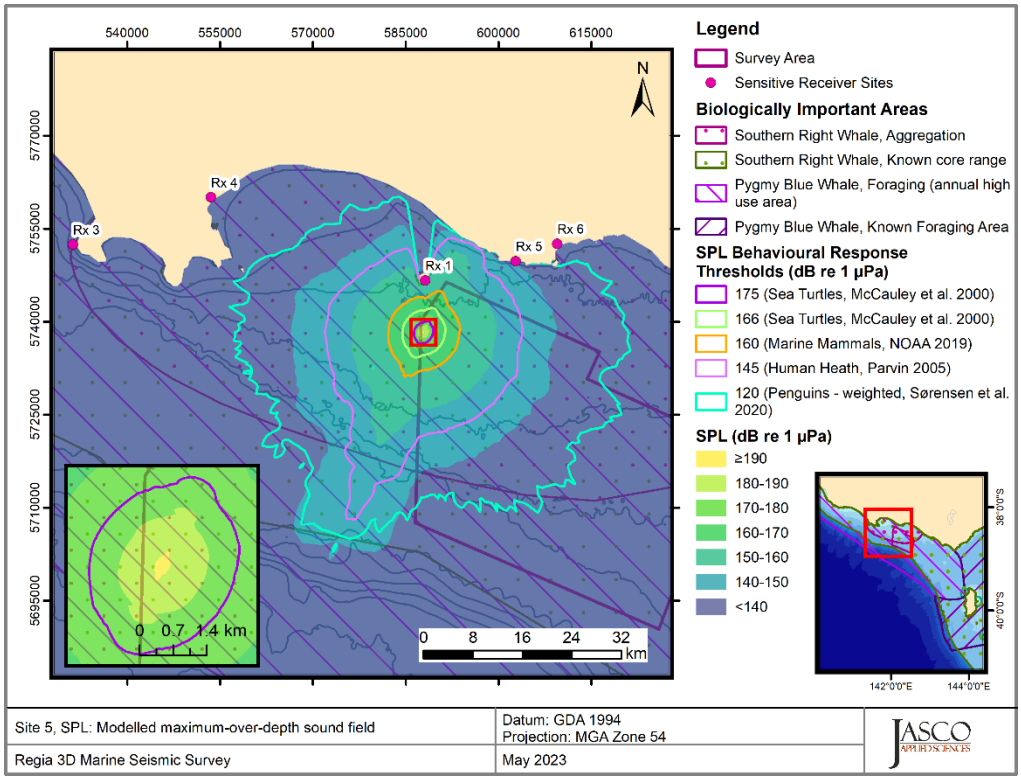

Figure 12. *Site 5, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

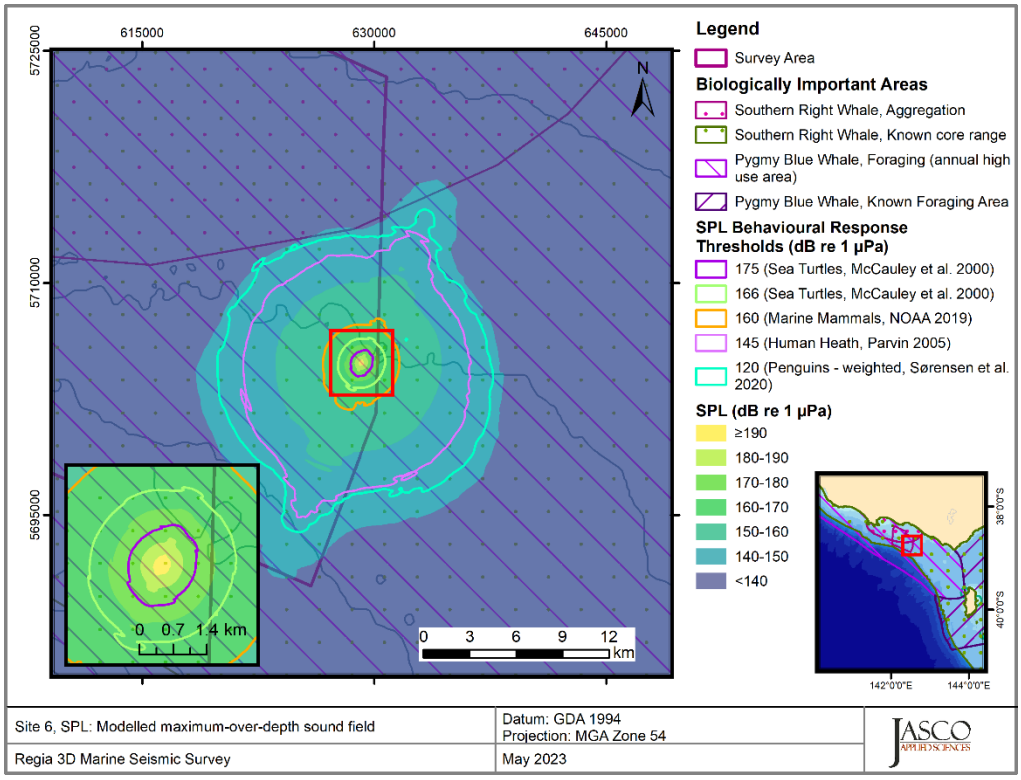

Figure 13. *Site 6, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

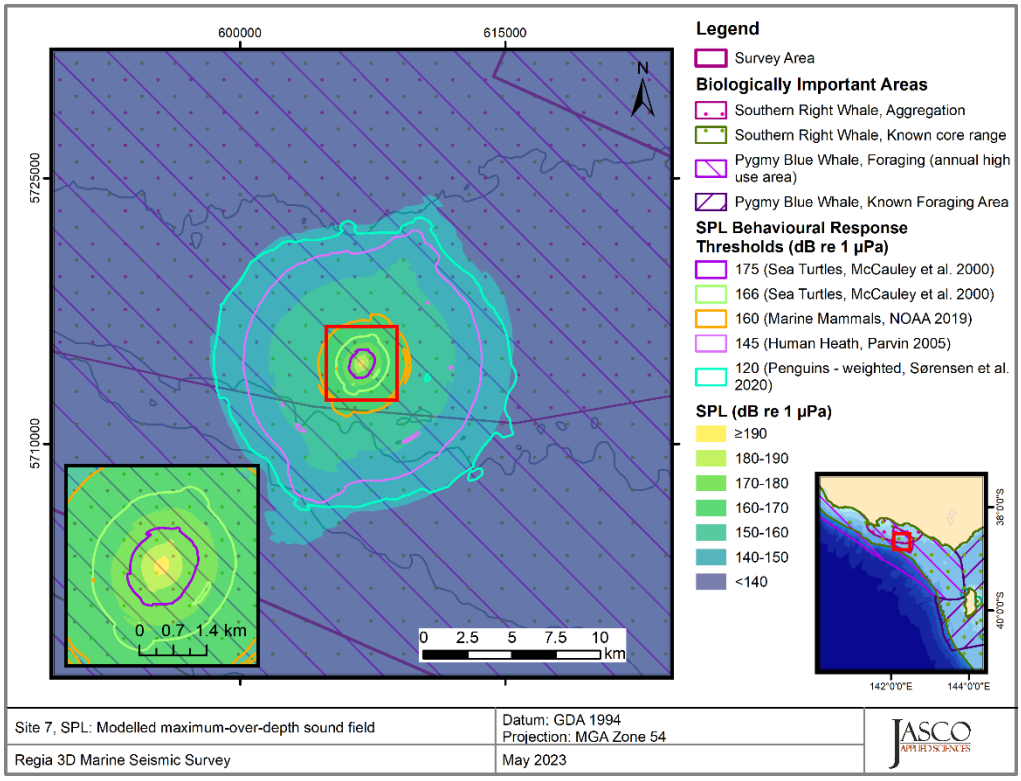

Figure 14. *Site 7, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

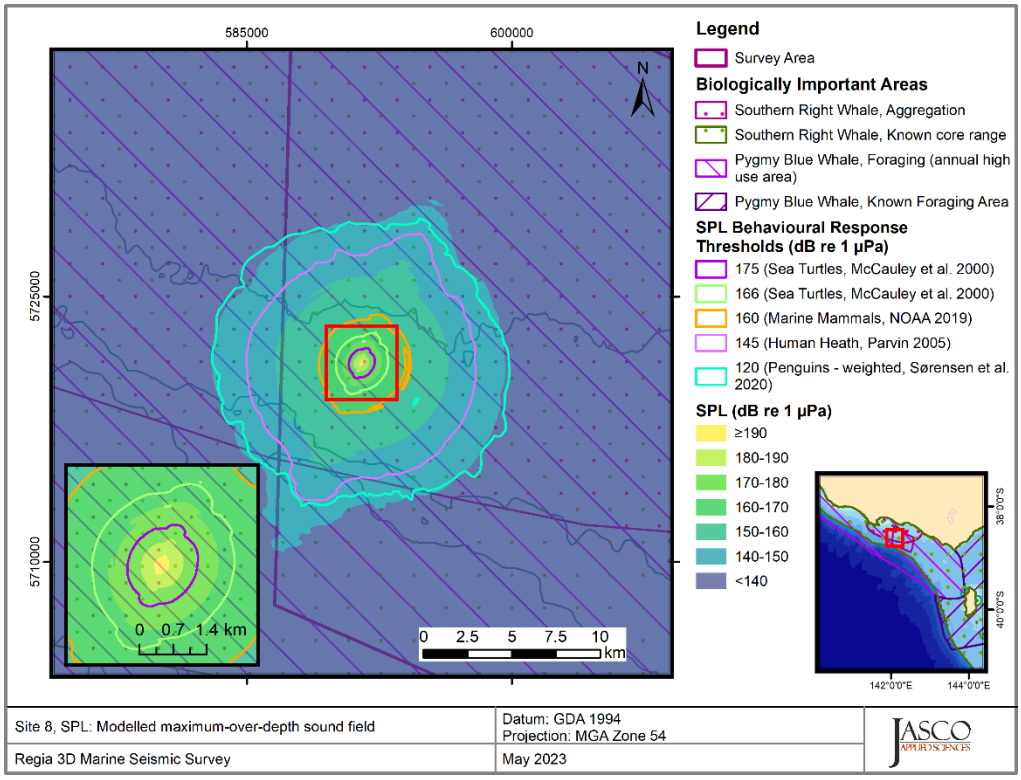

Figure 15. *Site 8, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

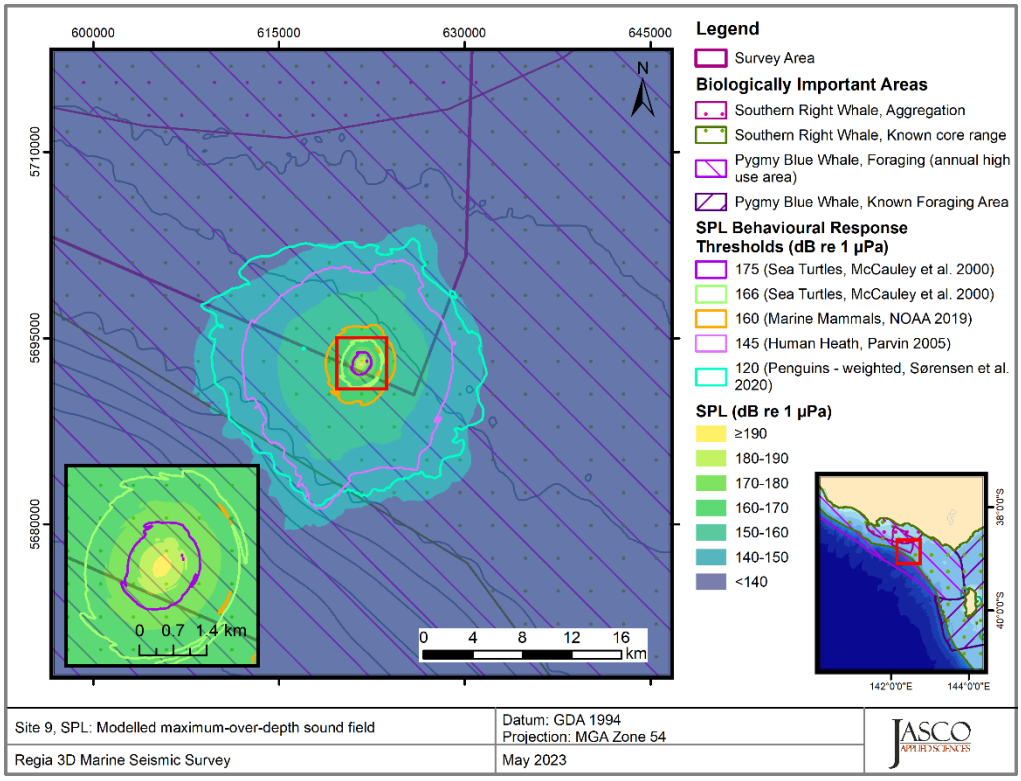

Figure 16. *Site 9, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

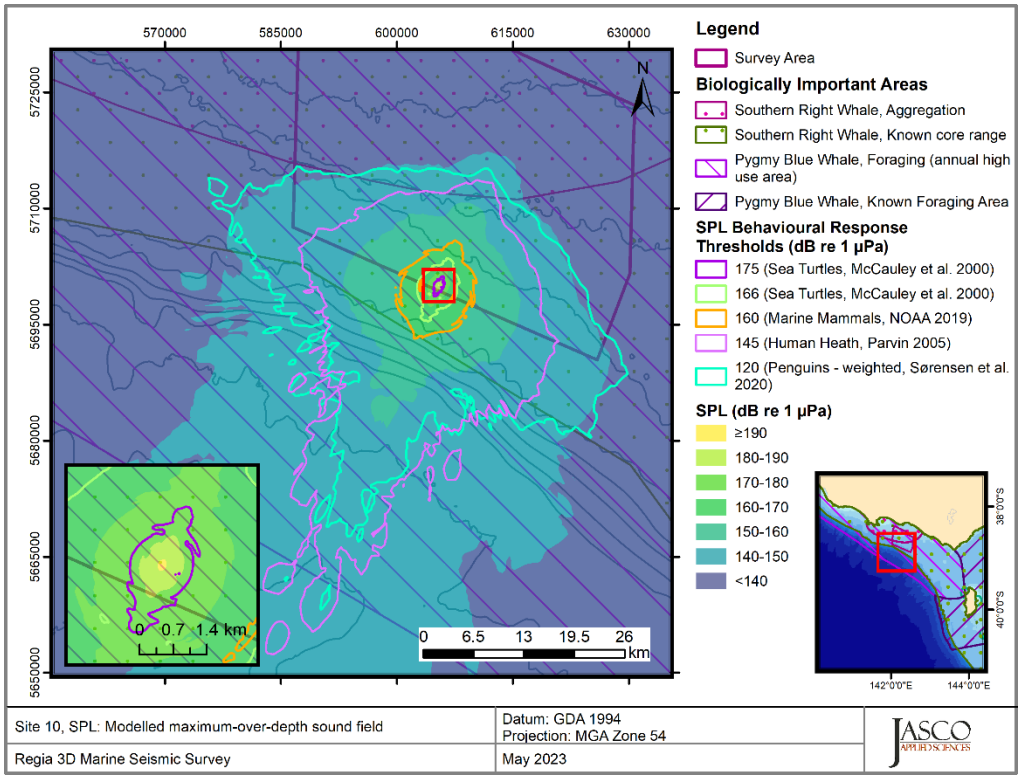

Figure 17. *Site 10, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

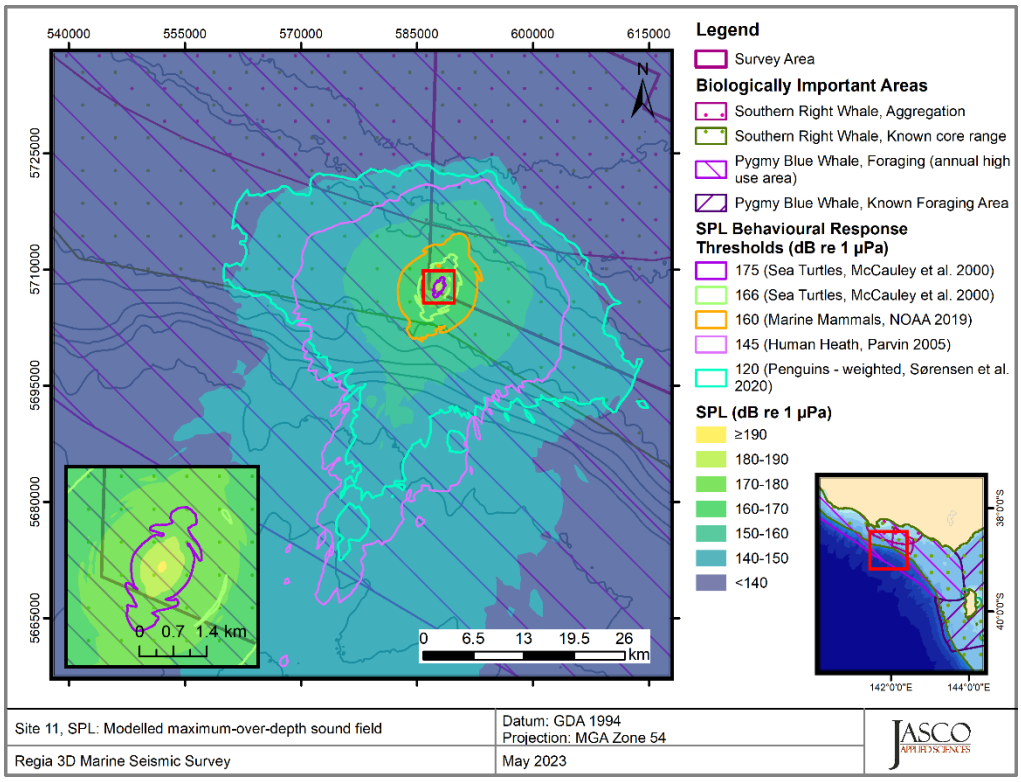

Figure 18. *Site 11, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

5.2.2.2. Vertical Slices of Modelled Sound Fields

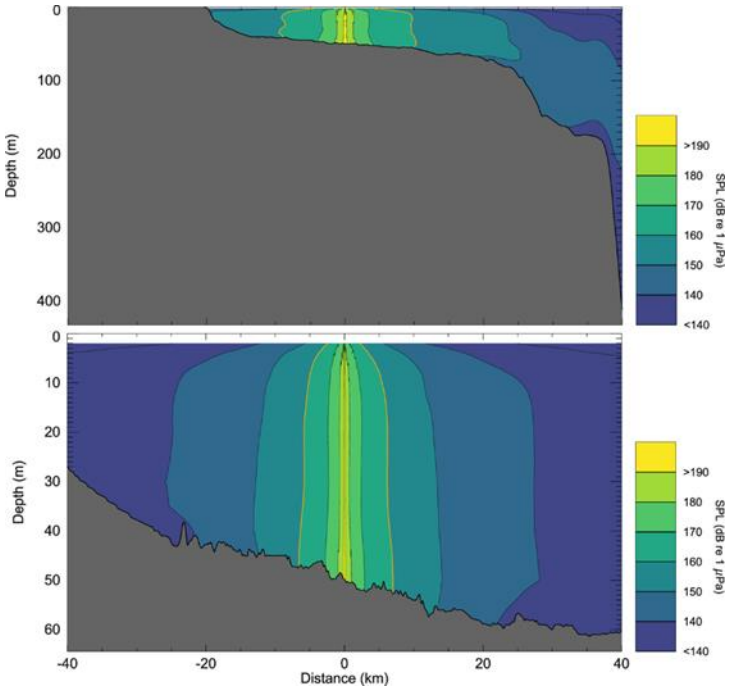

Figure 19. *Site 2, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

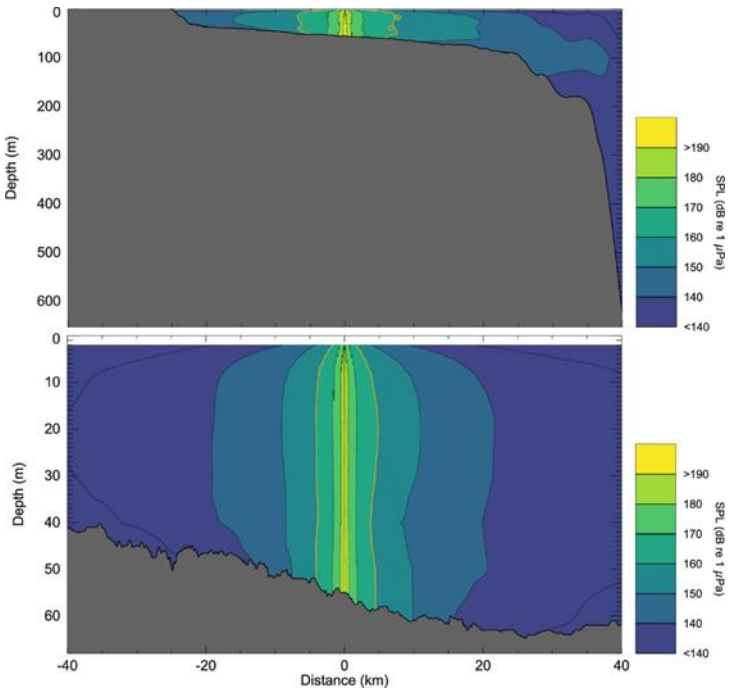

Figure 20. *Site 3, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

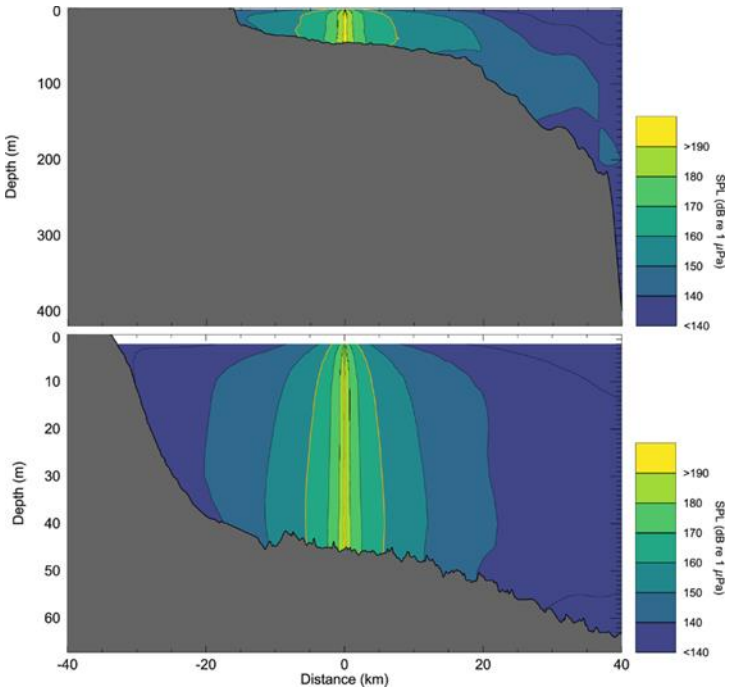

Figure 21. *Site 5, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

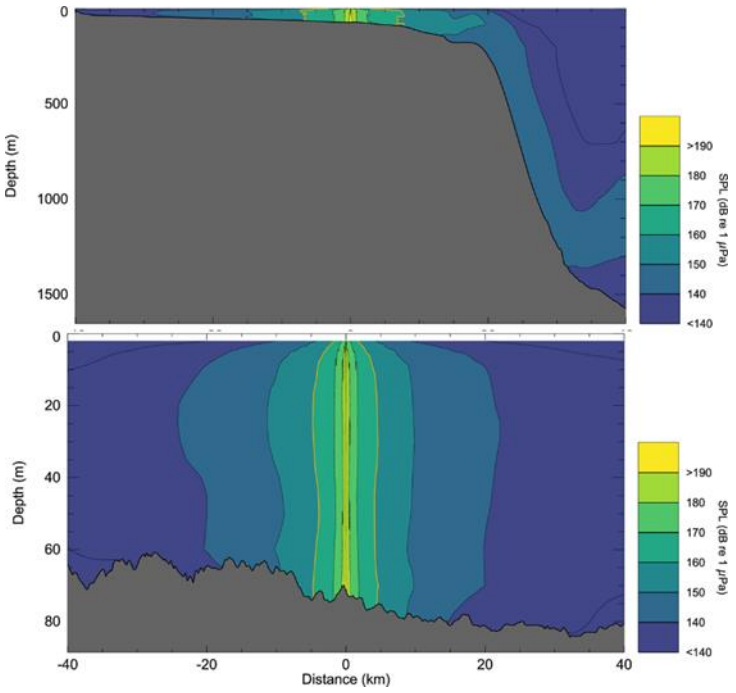

Figure 22. *Site 7, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

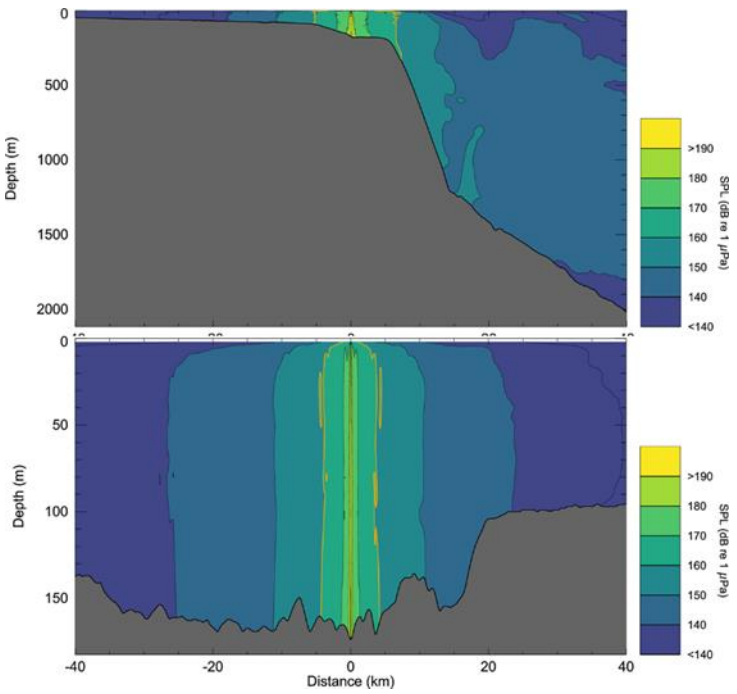

Figure 23. *Site 10, SPL, 2820 in³ source, tow azimuth 113°*: Sound level contours in vertical slice of the sound field, perpendicular to (broadside, top) and along the tow direction (endfire, bottom). The positive distance direction in each slice is 90° clockwise from the tow azimuth for broadside, and the tow azimuth for the endfire slice.

5.3. Multiple Source Fields

This section presents the sound fields in terms of SEL accumulated over 24 h for the modelled scenarios (Section 2). Frequency-weighted SEL_{24h} sound fields were used to estimate the maximum horizontal distances (R_{max}) to marine mammal and sea turtle PTS and TTS thresholds (listed in Table 20), and to estimate maximum distance and the area for injury and TTS guidelines for fish (Table 21).

The SEL_{24h} sound fields are presented as contour maps in Figures 24–26. These figures present the unweighted SEL_{24h} in 10 dB steps, as well as the isopleths corresponding to thresholds or guidelines that are large enough to be resolved on a map.

5.3.1. Tabulated Results

Table 20. Maximum-over-depth distances (in km) to frequency-weighted 24 h sound exposure level (SEL_{24h}) based permanent threshold shift (PTS) and temporary threshold shift (TTS) for marine mammals Southall et al. (2019) and sea turtles (Finneran et al. 2017) using the 2820 in^3 seismic source for all scenarios. Maximum extents are in the broadside direction.

Hearing group	Threshold for SEL_{24h} ($L_{E,24h}$; dB re 1 $\mu Pa^2 \cdot s$)	Scenario A		Scenario B		Scenario C	
		R_{max} (km)	Area (km^2)	R_{max} (km)	Area (km^2)	R_{max} (km)	Area (km^2)
PTS							
LF cetaceans	183	4.89	401	1.65	232	1.90	186
HF cetaceans	185	–	–	–	–	–	–

5.3.2. Sound Level Contour Maps

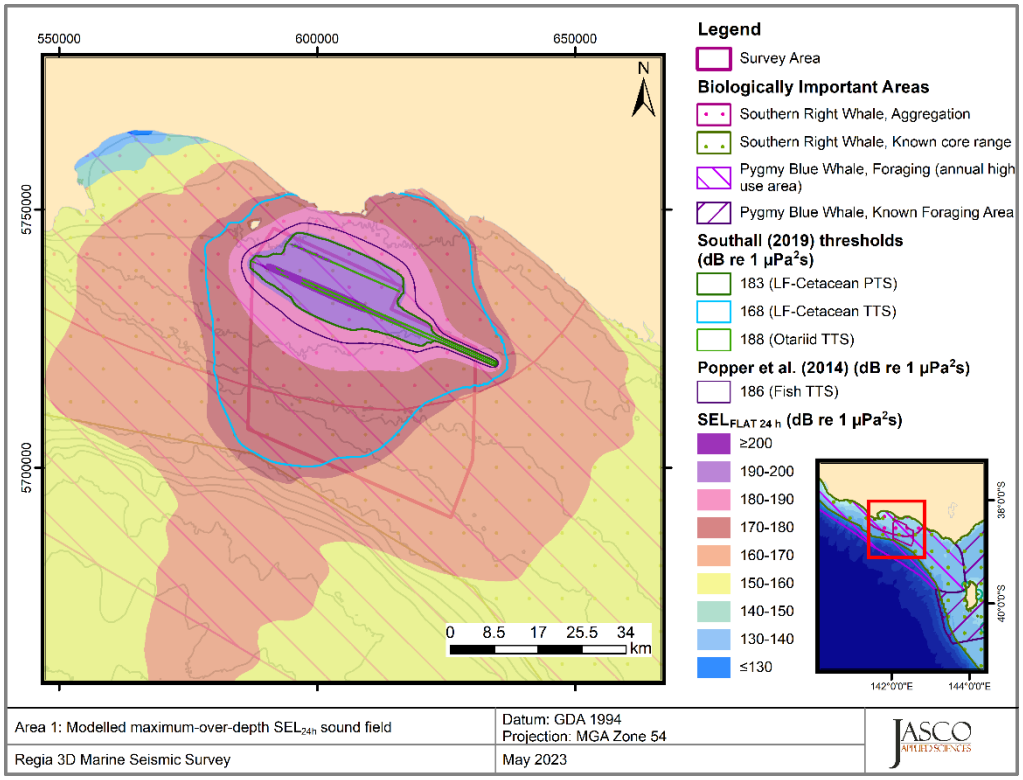

Figure 24. *Scenario A*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

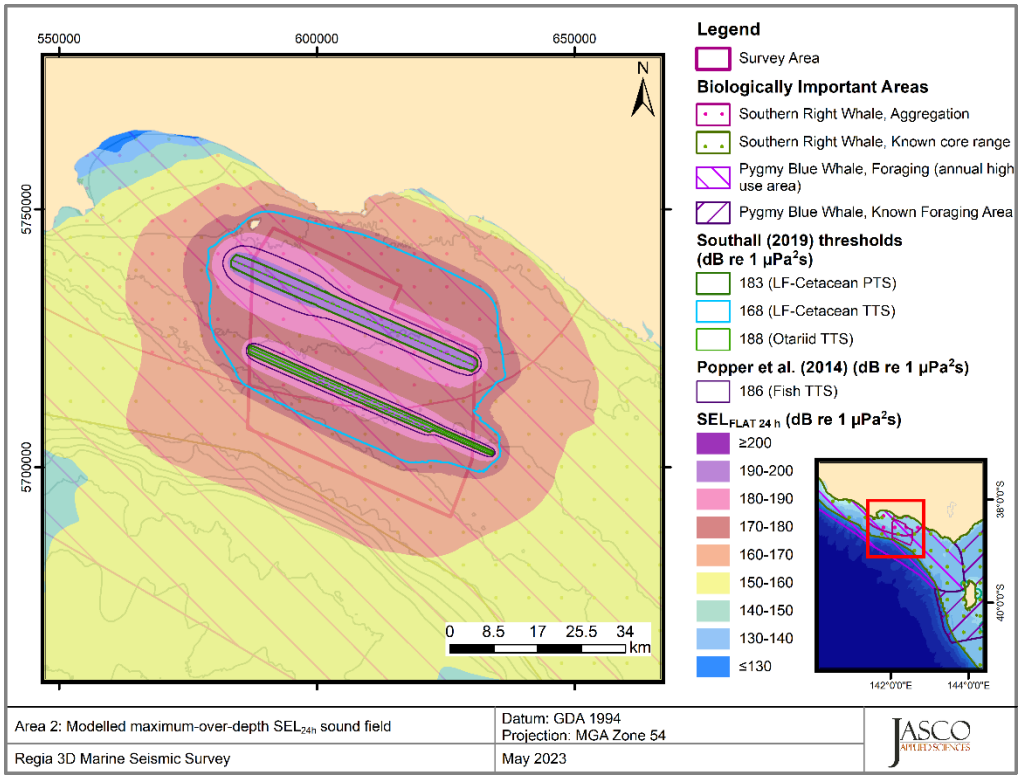

Figure 25. *Scenario B*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

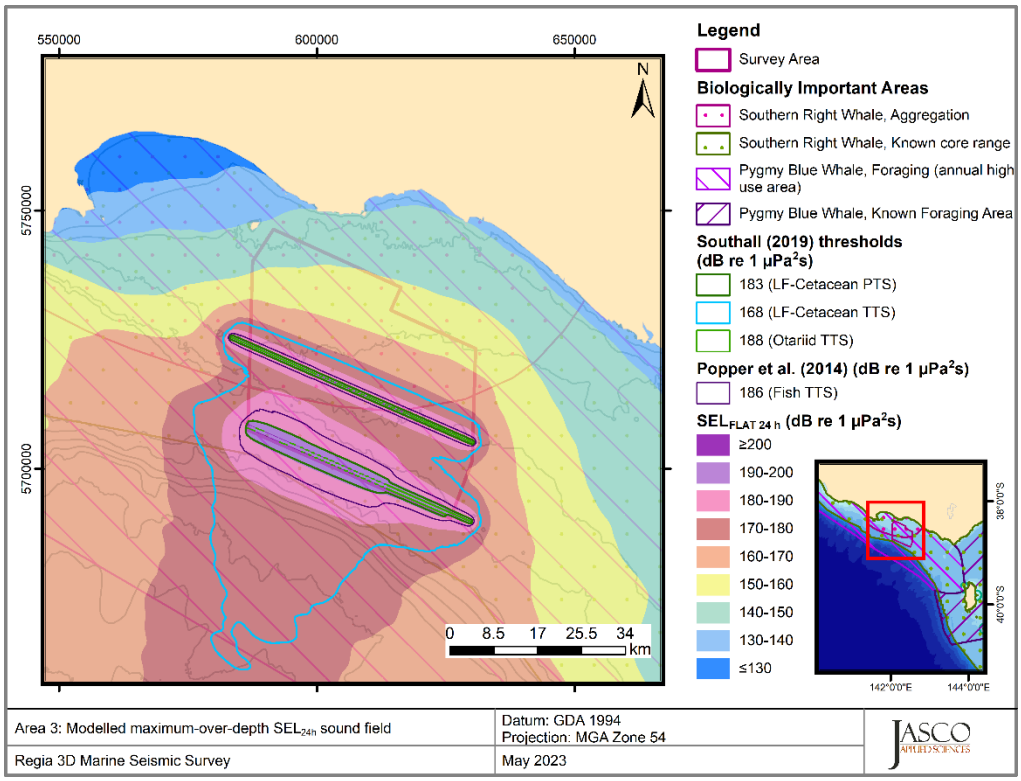

Figure 26. *Scenario C*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

5.4. Animal Movement Exposure Ranges

A summary of radial distances to exposure thresholds for pygmy blue whales and southern right whales, along with probability of exposure for each modelled scenario (Section 2) are included below. Tables 22 and 23 show results for scenarios with pygmy blue whale animats unrestricted (Seeding A) and restricted to the shelf (Seeding B), respectively, whilst Tables 24 and 25 show results for scenarios with southern right whale animats restricted to the extended aggregation BIA (Seeding A) and known core range area (Seeding B), respectively. Results include $ER_{95\%}$ exposure ranges calculated for the 160 dB behavioural response threshold and SEL_{24h} thresholds for both TTS and PTS, and the probability of an animat being exposed above the threshold within the $ER_{95\%}$.

Exposure ranges for TTS and PTS PK thresholds were not included in the exposure analysis since acoustic modelling predicted no PTS PK exceedance and ranges of less than 150 m for TTS PK (see Table 15). For the per-pulse PK metric, the exceedance distances are small and close enough to the source such that only minor differences are expected between acoustic and animat exposure predictions.

Sections 5.4.1 and 5.4.2 includes histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenario A, with results in Tables 22 to 25. Additional histograms for the remaining scenarios can be found in Appendix F.

Table 22. Summary of animat simulation results for pygmy blue whales with animats not restricted to the BIA (Seeding A). The 95th percentile exposures ranges ($ER_{95\%}$) in km and probability of animats being exposed above threshold within the $ER_{95\%}$ (P_{exp} (%)) are provided.

6. Discussion and Summary

The modelling study predicted underwater sound levels associated with the planned Regia MSS. The underwater sound field from a 2820 in^3 seismic source was modelled (Appendix B.2). An analysis of seasonal sound speed profiles and associated sensitivity comparison indicated that December was likely to be the month most conductive to sound propagation. Only a subset of months when the survey could occur were consisted in the comparison. As such December was selected to ensure a conservative estimation of distances to received sound level thresholds over the potential survey periods (Appendix D.3.2). Modelling also accounted for site-specific bathymetric variations (Appendix D.3.1) and local geoacoustic properties (Appendix D.3.3).

Most acoustic energy from a seismic source is output at lower frequencies, in the tens to hundreds of hertz. The modelled array had a pronounced broadside directivity for decidecade bands between ~100 to 400 Hz (Appendix B.3), which caused a noticeable axial bulge in the modelled acoustic footprints. The overall broadband (10–25000 Hz) unweighted per-pulse SEL and peak pressure source levels of the seismic source operating at 7 m depth are detailed in Table 11.

6.1. Per-Pulse Sound Fields

The per-pulse modelled sites span water depths from about depths of 40–174 m across three different geological regions. The bathymetry within the vicinity of the survey varied between approximately 20–150 m; however, along a south-westward transect the environment generally transitions from shallower water of the Otway Shelf to the significantly deeper waters of the continental slope and abyssal plane (>1000 m). The frequency content of the seismic sources coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters. The maximum-over-depth sound footprint maps and vertical slice plots (Sections 5.2.2.1 and 5.2.2.2) assist in demonstrating the influence of the bathymetry and seabed composition on the sound field.

For the sites modelled in shallow water, less than 50 m depth, where the seabed was modelled as a sand layer underlain by variably cemented limestone (calcarenite). Literature suggests that this layer likely begins to thin as water depths increase in an offshore direction, and for water depths greater than 50 m it was considered absent with only the variably cemented calcarenite present at the seafloor interface. Modelled sites located in environments where the seabed was modelled as bare calcarenite generally displayed higher rates of loss at distance away from the source as compared to sites where a layer of sand overlies calcarenite.

The presence of unconsolidated coarse sand overlying semi-cemented calcarenite led to a more reflective seabed and likely led to large isopleths for low level thresholds, particularly in the offshore direction. This is most evident for the marine mammal behavioural threshold of 160 dB re 1 µPa (SPL) for impulsive sound sources. However, the distribution of sand layer is not well known and if the thickness of the sand layer is not as uniform as modelled then this variability could potentially lead to smaller radii.

The array directionality and frequency content coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters for all modelled sites. This is particularly evident for modelled Sites 9, 10 and 11 which are situated along the continental shelf break and continental slope. For source locations close to the continental shelf break modelling indicates that significant amounts energy reflected from the seabed slope can be trapped in the deep sound channel and propagate for large distances within the ocean interior. This phenomenon is evident in the slice plots showing the sound field in the broadside direction, where greater ranges to all isopleths are predicted to occur in the downward sloping

offshore direction. The vertical slice plots in Section 5.2.2.2 assist in demonstrating the influence of the sloping bathymetry on the sound field.

6.2. Multiple Pulse Sound Fields

The accumulated SEL over 24 hours of seismic source operation was modelled considering three acoustic scenarios and three animal movement modelling scenarios, each with a realistic acquisition pattern based on provided survey designs. The modelling predicted the accumulation of sound energy, considering the change in location and the azimuth of the source at each pulse point, which was used to assess possible injury in marine mammals and the SEL_{24h} based fish criteria. The results were presented as maps of the accumulated exposure levels and tabulated values of ranges to threshold levels and exposure areas for the given effects criteria (Section 3).

The footprints and range maxima for all accumulated SEL thresholds are influenced by the seabed compositions along acquisition lines. The discussion above regarding ranges to isopleths also applies to the accumulated SEL calculations. The farthest ranges to thresholds for PTS and TTS were driven by the source orientation and bathymetry, particularly in the broadside and offshore directions.

6.3. Acoustic Results Summary

This section presents summary of the distances to the noise effect criteria applied in this study (Section 3) as relevant to the impact assessment. The effect criteria for impairment of marine mammals, fish and sea turtles use dual metrics (PK and SEL_{24h}), and the longest distance associated with either metric is required to be applied, and thus is presented in this summary.

The SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 h based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. Where the corresponding SEL_{24h} radii are larger than those for peak pressure criteria, they often represent an unlikely worst-case scenario. More realistically, marine mammals, fish, and sea turtles would not remain in the same location for 24 hours, but rather a shorter period, depending upon their behaviour, the proximity and movements of the source. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained in that location for 24 h. A more realistic representation of the potential exposures was undertaken using animal movement modelling (‘animat modelling’), with the results summarised separately below.

A summary of predicted distances to criteria from acoustic modelling are presented below.

Marine Mammals

Table 26 summarises the distances to criteria for marine mammals, note that these distances are primarily associated with the broadside aspect of the array. Results for PK are presented in Table 15, while SEL_{24h} results are in Table 20.

Table 26. Summary of maximum (R_{max}) horizontal distances (in km) from modelled sites or scenarios to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. Maximum extents are in the broadside direction of the 2820 in^3 seismic source.

Hearing group	Maximum modelled distance to effect threshold (R_{max})						
	Behavioural response[1]	Scenario A		Scenario B		Scenario C	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	10.3 (SPL)	34.0 (SEL_{24h})	4.89 (SEL_{24h})	14.8 (SEL_{24h})	1.65 (SEL_{24h})	43.5 (SEL_{24h})	1.90 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.74 (PK)	0.43 (PK)	0.74 (PK)	0.43 (PK)	0.65 (PK)	0.33 (PK)
Otariid Pinnipeds		0.05 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Sea Turtles

Table 27 summarises the distances to criteria for sea turtles, with the results for behavioural thresholds presented in Table 3 while SEL_{24h} results are in Table 20.

Table 27. Summary of horizontal distances (in km) to turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group	Maximum modelled distance to effect threshold (R_{max})							
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	5.97 (SPL)	2.55 (SPL)	3.43 (SEL_{24h})	0.07 (SEL_{24h})	1.14 (SEL_{24h})	0.07 (SEL_{24h})	0.82 (SEL_{24h})	0.06 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance to the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 μPa^2s was reached between 0.05 and 0.06 km for all scenarios was. PTS and PK thresholds were not resolved withing the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.

- The maximum distance where the OCW-weighted penguin behavioural response threshold of 120 dB re 1 µPa (SPL) for impulsive noise could be exceeded varied between 9.08 and 52.1 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 28 summarises distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric. Results for PK are presented in Tables 15 whilst SEL_{24h} results are in Tables 21.

Table 28. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single impulse and 24 hour sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Recoverable injury	SEL_{24h}	0.07
	TTS	SEL_{24h}	7.86
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Recoverable injury	PK	0.22
	TTS	SEL_{24h}	7.86
Fish eggs, and larvae (relevant to plankton)	Injury	PK	0.22

Benthic invertebrates, Sponges, and Coral

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 µPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 295 and 711 m for the 2820 in^3 source.
- Bivalves: The distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was determined for comparing to results presented in Day et al. (2016a). This particle acceleration was reached at a range of 52 m for depth 40 m, 4 m for a depth of 50 m, and was not reached at any greater depth.
- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for

sponges and corals (Heyward et al. 2018); the threshold was reached at a range of 2 m for depth 40 m and was not reached at any greater depth.

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 µPa (SPL; L_P) derived from (Parvin 2005) was considered for people swimming and diving. At the closest separation between considered modelled sites and receiver locations a sound level of 153.1 dB re 1 µPa (SPL; L_P) was predicted at Little River and Taylors Beach. It is important to review the provided contour maps to contextualise levels at coast areas to understand where the human health assessment level may be reached.

6.4. Animal Movement Modelling

The estimated sound fields produced by source and propagation models for the planned Regia MSS were incorporated into an animat sound exposure model for pygmy blue whales to estimate the radial distance within which 95% of the exposure exceedances occur ($ER_{95\%}$), along with the probability that an animat with the closest point of approach within that distance would be exposed above the relevant threshold (P_{exp}).

For the exposure analysis, all three acquisition scenarios were run with different animat seeding approaches. Survey lines from all nominal acquisition scenarios overlap with the foraging BIA for pygmy blue whales. Survey lines from Scenario A fully and from Scenarios B and C partially overlap with the aggregation BIA for southern right whales.

Sections 6.4.1 and 6.4.2 summarise the PTS, TTS, and behavioural exposure range results, with the tabulated results presented in Tables 22 to 25. Table 29 summarises the maximum exposure range results for pygmy blue whales and southern right whales across the different species profiles considered. Figure 39 summarises results for each modelled scenario and species profile, with pygmy blue and southern right whales considered.

Table 29. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales Maximum Exposure ranges show $ER_{95\%}$ (km) first and probability of exposure of animats travelling within the $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL24h)[3]	PTS (SEL24h)[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	8.09 (86%)	13.2 (58%)	1.40 (51%)
	B	6.82 (93%)	6.05 (60%)	0.53 (50%)
	C	6.77 (92%)	7.60 (60%)	0.34 (47%)
Southern right whale	A	8.43 (85%)	11.6 (60%)	1.50 (50%)

	C	7.58 (85%)	6.71 (37%)	0.25 (37%)

[1] LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)
[2] SPL (L_p; dB re 1 µPa)
[3] Southall et al. (2019) criteria for marine fauna.
[4] NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

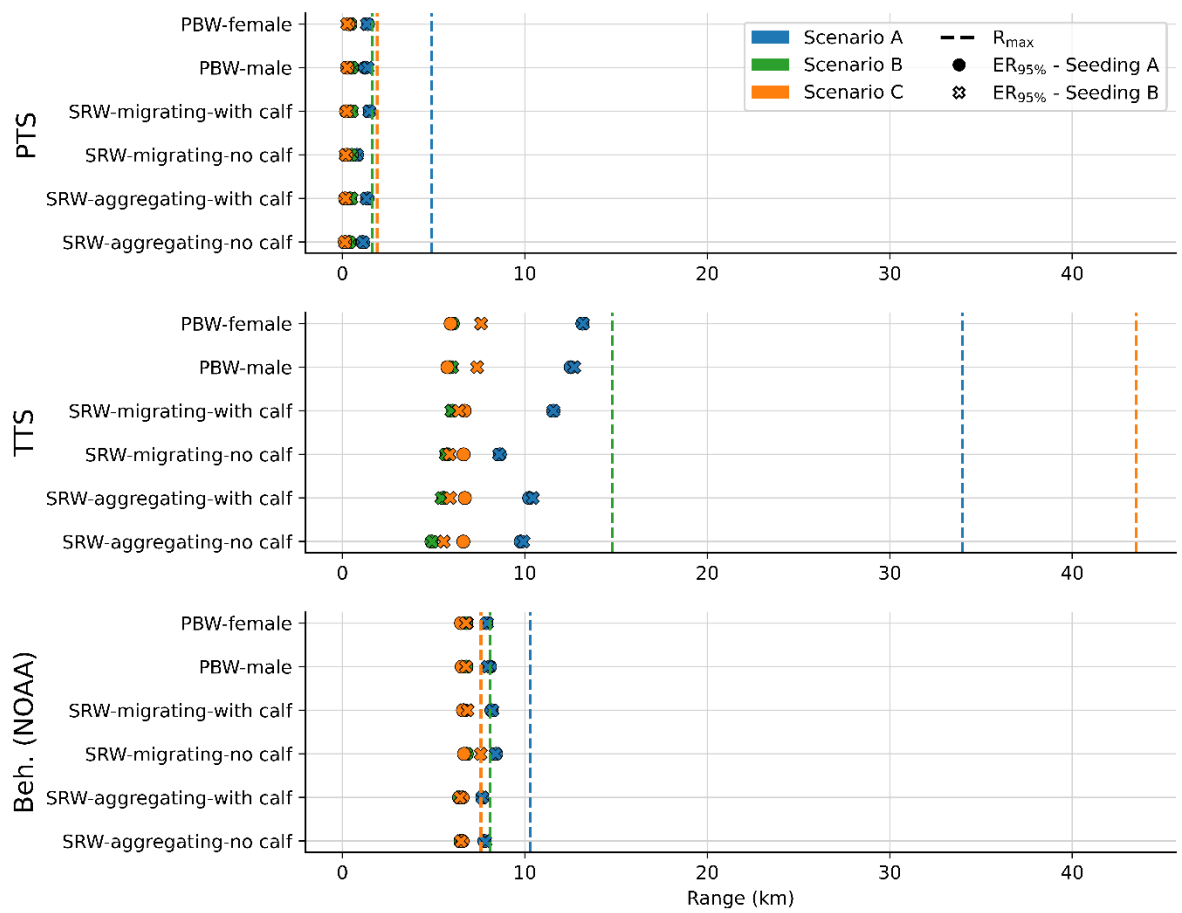

Figure 39. Acoustic (R_{max}) and exposure ranges ($ER_{95\%}$) for TTS/PTS and the behavioural thresholds (NOAA), shown for each species. Colour represents the acoustic modelled scenario. Seeding A and B refer to the different seeding areas for pygmy blue whales and southern right whales, presented in Figure 2.

6.4.1. PTS and TTS

Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because of the generally shorter time ('dwell time') to accumulate sound energy of the moving animats. In this study, PTS and TTS exposure ranges were substantially shorter than acoustic ranges to threshold, as shown in Figure 39.

All considered scenarios resulted in exposures above the PTS and TTS thresholds, and therefore exposure ranges.

The maximum $ER_{95\%}$ for pygmy blue whale scenarios was 13.2 and 1.4 km for TTS and PTS, respectively. The probability of exposure within $ER_{95\%}$ varied between 47 and 68%. For southern right whales, the maximum $ER_{95\%}$ for TTS and PTS were 11.6 and 1.5 km, respectively, with probability of exposure varying between 36 and 80%. The range of probabilities indicates that some, but not all, animats exposed within the 95th percentile range were exposed above threshold. This is because animats can move in and out of the modelling range as well as their vertical position in the water column, thus potentially limiting the length of time they are within the exposure radius. For example, an animat might approach within the predicted exposure range but if they are traveling more quickly on average than other animats, they may not accumulate as much exposure, or they may be spending more time at depths with quieter sound levels.

For this reason, female pygmy blue whale scenarios resulted in slightly larger exposure ranges than the corresponding male pygmy blue whale scenarios. Based on the vertical distribution of the sound

field (see Section 5.2.2.2), female pygmy blue whale animats accumulate more exposures than the males since females generally dive deeper than males (Section 4.6.3.1) and therefore spend more time at depths with higher sound levels.

Exposure ranges are, on average, slightly longer for TTS and PTS for unrestricted vs restricted pygmy blue whale scenarios because unrestricted animats have more opportunities to be seeded in deeper water and further away from the sources, whereas restricted animats have more opportunities to be exposed to sound fields closer to the sources and for a longer time, which effectively lengthens their dwell time. This becomes apparent for the nominal acquisition lines of Scenario C, which are located close to the edge of the shelf. Any restricted foraging pygmy blue whale animats travelling close the survey lines and close to the border of Seeding Area B are forced to stay within the bounds, whereas unrestricted animats can move in and out of the modelling range.

Exposure ranges are, on average, slightly longer for TTS and PTS for mother and calf pair versus no calf southern right whale scenarios as well. This is primarily due to the inclusion of nursing behaviour, where animals spend time stationary at the surface (Thomas et al. 1984), and the long duration of resting periods with slow travel speeds for mother/calf pairs (Hain et al. 2013). As a result, they accumulate more sound energy and are exposed for a longer time.

The animat modelling was included in the scope of work to provide context to possible exposures to pygmy blue and southern right whales over an entire day. The distances to isopleths associated with the effect thresholds for PTS and TTS are more realistic than those from the static sound fields as they consider potential animal movements passing through the operational region.

6.4.2. Behavioural Effects

Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criteria, are typically comparable to the predicted acoustic ranges. Maximum acoustic ranges (e.g., R_{max}) are conservatively calculated using the maximum-over-depth sound fields and assuming static receivers, while exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving parameters, so exposure ranges are generally slightly lower than the R_{max} acoustic ranges. In this case, exposure ranges were slightly shorter than acoustic ranges to threshold for most modelled scenarios.

Overall, ranges were longest for Scenario C. For all considered pygmy blue whale scenarios, the $ER_{95\%}$ to behavioural threshold ranged from 6.50–8.09 km for pygmy blue whales, with P_{exp} varying between 87 and 93%. For southern right whales, the $ER_{95\%}$ to behavioural threshold ranged from 6.39-8.43 km, with P_{exp} varying between 81 and 92%.

Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 80000-3 (2017).

1/3-octave

One third of an octave. *Note*: A one-third octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

1/3-octave-band

Frequency band whose bandwidth is one one-third octave. *Note*: The bandwidth of a one-third octave-band increases with increasing centre frequency.

A-weighting

Frequency-selective weighting for human hearing in air that is derived from the inverse of the idealized 40-phon equal loudness hearing function across frequencies.

absorption

The reduction of acoustic pressure amplitude due to acoustic particle motion energy converting to heat in the propagation medium.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

auditory frequency weighting

The process of applying an auditory frequency weighting function. In human audiometry, C-weighting is the most commonly used function, an example for marine mammals are the auditory frequency weighting functions published by Southall et al. (2007).

auditory frequency weighting function

Frequency weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity. Example hearing groups are low-, mid-, and high-frequency cetaceans, phocid and otariid pinnipeds.

azimuth

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also called bearing.

bandwidth

The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI S1.13-2005 (R2010)).

bar

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to 10^5 Pa or 10^{11} µPa.

boxcar averaging

A signal smoothing technique that returns the averages of consecutive segments of a specified width.

broadband level

The total level measured over a specified frequency range.

broadside direction

Perpendicular to the travel direction of a source. Compare with endfire direction.

cetacean

Any animal in the order Cetacea. These are aquatic species and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called primary wave or P-wave.

conductivity-temperature-depth (CTD)

Measurement data of the ocean's conductivity, temperature, and depth; used to compute sound speed and salinity.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006).

decidecade

One tenth of a decade. *Note*: An alternative name for decidecade (symbol ddec) is "one-tenth decade". A decidecade is approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct) and for this reason is sometimes referred to as a "one-third octave".

decidecade band

Frequency band whose bandwidth is one decidecade. *Note*: The bandwidth of a decidecade band increases with increasing centre frequency.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Unit: dB.

duty cycle

The time when sound is periodically recorded by an acoustic recording system.

endfire direction

Parallel to the travel direction of a source. Also see **broadside direction**.

energy source level

A property of a sound source obtained by adding to the sound exposure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2m^2s.

energy spectral density source level

A property of a sound source obtained by adding to the energy spectral density level of the sound pressure measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2m^2s/Hz$.

ensonified

Exposed to sound.

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

Fourier transform (or Fourier synthesis)

A mathematical technique which, although it has varied applications, is referenced in the context of this report as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as fast Fourier transform (FFT).

flat weighting

Term indicating that no frequency weighting function is applied. Synonymous with unweighted.

frequency

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: *f*. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function. For sound of a given frequency, the frequency weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency weighting function*: compensatory frequency weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency weighting function*: frequency weighting function describing the sensitivity of an acoustic acquisition system, typically consisting of a hydrophone, one or more amplifiers, and an analogue to digital converter.

geoacoustic

Relating to the acoustic properties of the seabed.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For example, the second harmonic of a sound has a frequency that is double the fundamental frequency of the sound.

hearing group

Category of animal species when classified according to their hearing sensitivity and to the susceptibility to sound. Examples for marine mammals include very low-frequency (VLF) cetaceans, low-frequency (LF) cetaceans, mid-frequency (MF) cetaceans, high-frequency (HF) cetaceans, very high-frequency (VHF) cetaceans, otariid pinnipeds in water (OPW), phocid pinnipeds in water (PPW), sirenians (SI), other marine carnivores in air (OCA), and other marine carnivores in water (OCW) (NMFS 2018, Southall et al. 2019). See **auditory frequency weighting functions**, which are often applied to these groups. Examples for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual for specified background noise during a specific percentage of experimental trials.

hertz (Hz)

A unit of frequency defined as one cycle per second.

high-frequency (HF) cetacean

See **hearing group**.

intermittent sound

A sound whose level abruptly drops below the background noise level several times during an observation period.

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 second), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Examples of impulsive sound sources include explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some quantity.

knot

One nautical mile per hour. Symbol: kn.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. Examples include sound pressure level, sound exposure level, and peak sound pressure level. For example, a value of sound exposure level with reference to 1 μPa^2 s can be written in the form *x* dB re 1 μPa^2 s.

low-frequency (LF) cetacean

See **hearing group**.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetacean

See **hearing group**.

M-weighting

See **auditory frequency weighting function** (as proposed by Southall et al. 2007).

mysticete

A suborder of cetaceans that use baleen plates to filter food from water. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. A non-impulsive sound is not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

otariid

A common term used to describe members of the Otariidae, eared seals, commonly called sea lions and fur seals. Otariids are adapted to a semi-aquatic life; they use their large fore flippers for propulsion. Their ears distinguish them from phocids. Otariids are one of the three main groups in the superfamily Pinnipedia; the other two groups are phocids and walrus.

otariid pinnipeds in water (OPW)

See **hearing group**.

other marine carnivores in air (OCA)

See **hearing group**.

other marine carnivores in water (OCW)

See **hearing group**.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of back-scattered sound, simplifying the computation of propagation loss. The effect of back-scattered sound is negligible for most ocean-acoustic propagation problems.

peak sound pressure level (zero-to-peak sound pressure level)

The level ($L_{p,pk}$ or L_{pk}) of the squared maximum magnitude of the sound pressure (p_{pk}^2).
Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa^2.

$$L_{p,\mathrm{pk}} := 10\log_{10}\left(p_{\mathrm{pk}}^2/p_0^2\right)\mathrm{dB} = 20\log_{10}\left(p_{\mathrm{pk}}/p_0\right)\mathrm{dB}$$

The frequency band and time window should be specified. Abbreviation: PK or L_{pk}.

peak-to-peak sound pressure

The difference between the maximum and minimum sound pressure over a specified frequency band and time window. Unit: pascal (Pa).

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

phocid

A common term used to describe all members of the family Phocidae. These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves. Phocids are one of the three main groups in the superfamily Pinnipedia; the other two groups are otariids and walrus.

phocid pinnipeds in water (PPW)

See **hearing group**.

pinniped

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source

A source that radiates sound as if from a single point.

pressure, acoustic

The deviation from the ambient pressure caused by a sound wave. Also called sound pressure. Unit: pascal (Pa).

pressure, hydrostatic

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, PL(x) = SL − L(x). Also see **transmission loss**.

received level

The level measured (or that would be measured) at a defined location. The type of level should be specified.

reference values

standard underwater references values used for calculating sound **levels**, e.g., the reference value for expressing sound pressure level in decibels is 1 µPa.

Quantity	Reference value
Sound pressure	1 µPa
Sound exposure	1 μPa^2 s
Sound particle displacement	1 pm
Sound particle velocity	1 nm/s
Sound particle acceleration	1 $\mu m/s^2$

rms

abbreviation for root-mean-square.

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media,

such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium.

sound exposure

Time integral of squared sound pressure over a stated time interval. The time interval can be a specified time duration (e.g., 24 hours) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: Pa^2 s.

sound exposure level

The level (L_E) of the sound exposure (E). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 μPa^2 s.

$$L_E := 10 \log_{10}(E/E_0)\,\mathrm{dB} = 20 \log_{10}\left(E^{1/2}/E_0^{1/2}\right)\,\mathrm{dB}$$

The frequency band and integration time should be specified. Abbreviation: SEL.

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum. Unit: Pa^2 s/Hz.

sound field

Region containing sound waves.

sound intensity

Product of the sound pressure and the sound particle velocity. The magnitude of the sound intensity is the sound energy flowing through a unit area perpendicular to the direction of propagation per unit time.

sound particle acceleration

The rate of change of sound particle velocity. Unit: metre per second squared (m/s^2). Symbol: *a*.

sound particle motion

smallest volume of a medium that represents its mean physical properties.

sound particle displacement

Displacement of a material element caused by the action of sound, where a material element is the smallest element of the medium that represents the medium's mean density.

sound particle velocity

The velocity of a particle in a material moving back and forth in the direction of the pressure wave. Unit: metre per second (m/s). Symbol: *v*.

sound pressure

The contribution to total pressure caused by the action of sound.

sound pressure level (rms sound pressure level)

The level ($L_{p,\mathrm{rms}}$) of the time-mean-square sound pressure (p^2_{rms}). Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa^2.

$$L_{p,\mathrm{rms}} := 10\log_{10}(p^2_{\mathrm{rms}}/p_0^2)\ \mathrm{dB} = 20\log_{10}(p_{\mathrm{rms}}/p_0)\ \mathrm{dB}$$

The frequency band and averaging time should be specified. Abbreviation: SPL or Lrms.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

soundscape

The characterization of the ambient sound in terms of its spatial, temporal, and frequency attributes, and the types of sources contributing to the sound field.

source level (SL)

A property of a sound source obtained by adding to the sound pressure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^{2}m^2.

spectrum

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

surface duct

The upper portion of a water column within which the sound speed profile gradient causes sound to refract upward and therefore reflect off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity. TTS can be caused by noise exposure.

thermocline

The depth interval near the ocean surface that experiences temperature gradients due to warming or cooling by heat conduction from the atmosphere and by warming from solar heating.

transmission loss (TL)

The difference between a specified level at one location and that at a different location, TL(x1,x2) = L(x1) − L(x2). Also see **propagation loss**.

unweighted

Term indicating that no frequency weighting function is applied. Synonymous with flat weighting.

very high-frequency (VHF) cetacean

See **hearing group**.

very low-frequency (VLF) cetacean

See **hearing group**.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol: λ.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow the American National Standard Institute and International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI R2013), but these standards are not always consistent.

The zero-to-peak sound pressure, or peak sound pressure (PK or $L_{p,pk}$; dB re 1 µPa), is the decibel level of the maximum instantaneous acoustic pressure in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$L_{p,\mathrm{pk}} = 10\log_{10}\frac{\max|p^2(t)|}{p_0^2} = 20\log_{10}\frac{\max|p(t)|}{p_0} \tag{A-1}$$

PK is often included as a criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of an acoustic event, it is generally a poor indicator of perceived loudness.

The peak-to-peak sound pressure (PK-PK or $L_{p,pk\text{-}pk}$; dB re 1 µPa) is the difference between the maximum and minimum instantaneous sound pressure, possibly filtered in a stated frequency band, attained by an impulsive sound, $p(t)$:

$$L_{p,\mathrm{pk\text{-}pk}} = 10\log_{10}\frac{[\max(p(t)) - \min(p(t))]^2}{p_0^2} \tag{A-2}$$

The sound pressure level (SPL or L_p; dB re 1 µPa) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T g(t)\,p^2(t)\,dt \Big/ p_0^2\right) \tag{A-3}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function. For short acoustic events, such as sonar pulses and marine mammal vocalizations, it is important to choose an appropriate time window that matches the duration of the signal. For in-air studies, when evaluating the perceived loudness of sounds with rapid amplitude variations in time, the time weighting function $g(t)$ is often set to a decaying exponential function that emphasizes more recent pressure signals. This function mimics the leaky integration nature of mammalian hearing. For example, human-based fast time-weighted SPL ($L_{p,fast}$) applies an exponential function with time constant 125 ms. A related simpler approach used in underwater acoustics sets $g(t)$ to a boxcar (unity amplitude) function of width 125 ms; the results can be referred to as $L_{p,boxcar\ 125ms}$. Another approach, historically used to evaluate SPL of impulsive signals underwater, defines $g(t)$ as a boxcar function with edges set to the times corresponding to 5% and 95% of the cumulative square pressure function encompassing the duration of an impulsive acoustic event. This calculation is applied individually to each impulse signal, and the results are referred to as 90% SPL ($L_{p,90\%}$).

The sound exposure level (SEL or L_E; dB re 1 µPa²·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10 \log_{10} \left(\int_T p^2(t)\, dt \Big/ T_0 p_0^2 \right) \quad \text{(A-4)}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10 \log_{10} \sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \quad \text{(A-5)}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LF,24h}$; see Appendix A.5) or auditory-weighted SPL ($L_{p,ht}$). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Particle Acceleration and Velocity Metrics

Since sound is a mechanical wave, it can also be measured in terms of the vibratory motion of fluid particles. Particle motion can be measured in terms of three different (but related) quantities: displacement, velocity, or acceleration. Acoustic particle velocity is the time derivative of particle displacement, and likewise acceleration is the time derivative of velocity. For the present study, acoustic particle motion has been reported in terms of acceleration and velocity.

The particle velocity (v) is the physical speed of a particle in a material moving back and forth in the direction of the pressure wave. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium:

$$v = -\int \nabla p(t) dt / \rho_0 \quad \text{(A-6)}$$

The particle acceleration (a) is the rate of change of the velocity with respect to time, and it can be obtained from equation A-6 as:

$$a = \frac{dv}{dt} = -\frac{\nabla p(t)}{\rho_0} \quad \text{(A-7)}$$

Unlike sound pressure, particle motion is a vector quantity, meaning that it has both magnitude and direction: at any given point in space, acoustic particle motion has three different time-varying components (x, y, and z). Given the particle velocity in the x, y, and z, directions, v_x, v_y, and v_z, the particle velocity magnitude $|v|$ is computed per the Pythagorean equation:

$$|v| = \sqrt{v_x + v_y + v_z} \quad \text{(A-8)}$$

The magnitude of particle acceleration is calculated similarly from the particle acceleration in the *x*, *y*, and *z* directions.

A.3. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. They are approximately one third of an octave (base 2) wide and are therefore often referred to as 1/3-octave-bands. Each octave represents a doubling in sound frequency. The centre frequency of the ith band, $f_c(i)$, is defined as:

$$f_c(i) = 10^{\frac{i}{10}} \text{ kHz} \tag{A-9}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i) \tag{A-10}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 7 (f_c (7) = 5 Hz) to band 44 ($f_c(44)$ = 25 kHz).

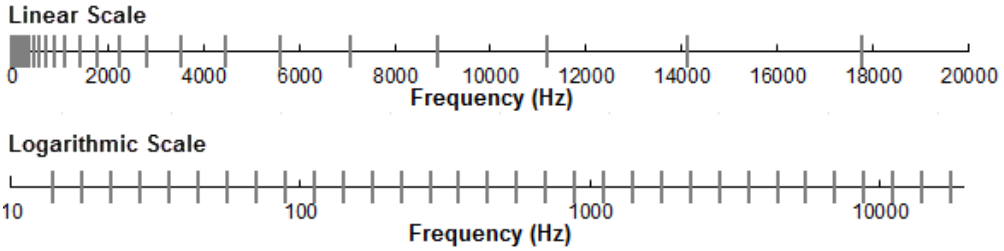

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{lo,i}$ and $f_{hi,i}$:

$$L_{p,i} = 10 \log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f)\, df \tag{A-11}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_i 10^{\frac{L_{p,i}}{10}} \tag{A-12}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

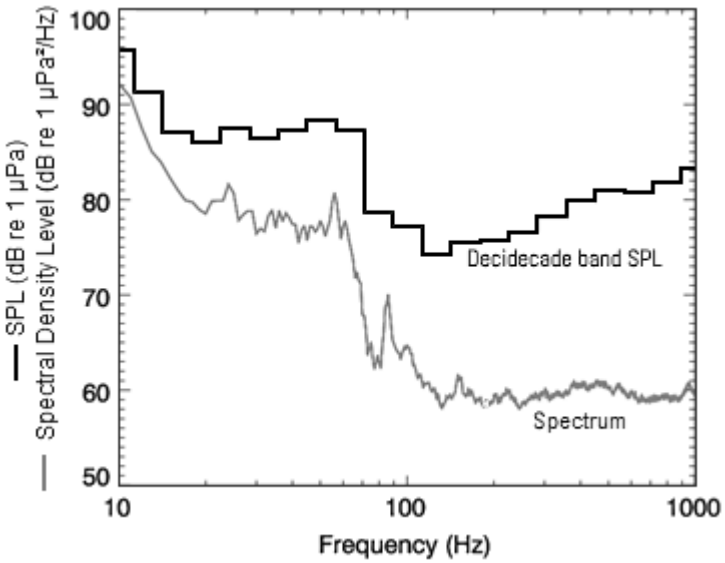

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.

A.4. Marine Mammal Impact Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggested that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for both injury and disturbance. The following sections summarize the recent development of thresholds; however, this field remains an active research topic.

A.4.1. Injury

In recognition of shortcomings of the SPL-only based injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual acoustic injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas the SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for human; Appendix A.5). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower injury values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 $\mu Pa^2 \cdot s$. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 $\mu Pa^2 \cdot s$.

As of present, an optimal approach is not apparent. There is consensus in the research community that an SEL-based method is preferable either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018; with the criteria defined in NMFS (2018). The latest criteria are from Southall et al. (2019) which is applied in this report.

A.4.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1 µPa SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). The HESS team recognised that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above a SPL of 140 dB re 1 µPa. Southall et al. (2007) found varying responses for most marine mammals between a SPL of 140 and 180 dB re 1 µPa, consistent with the HESS (1999) report, but lack of convergence in the data prevented them from suggesting explicit step functions.

A.5. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.5.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^{2}\right]^{a}\left[1+(f/f_{hi})^{2}\right]^{b}}\right)\right] \quad \text{(A-13)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values. Table A-1 lists the frequency-weighting parameters for each hearing group. Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	f_{lo} (Hz)	f_{hi} (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very-high-frequency cetaceans (true porpoises, *Kogia*, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Other marine carnivores in water (Australian sea lion, Australian fur seal, New Zealand fur seal, Penguins)	2.0	2	940	25,000	0.64

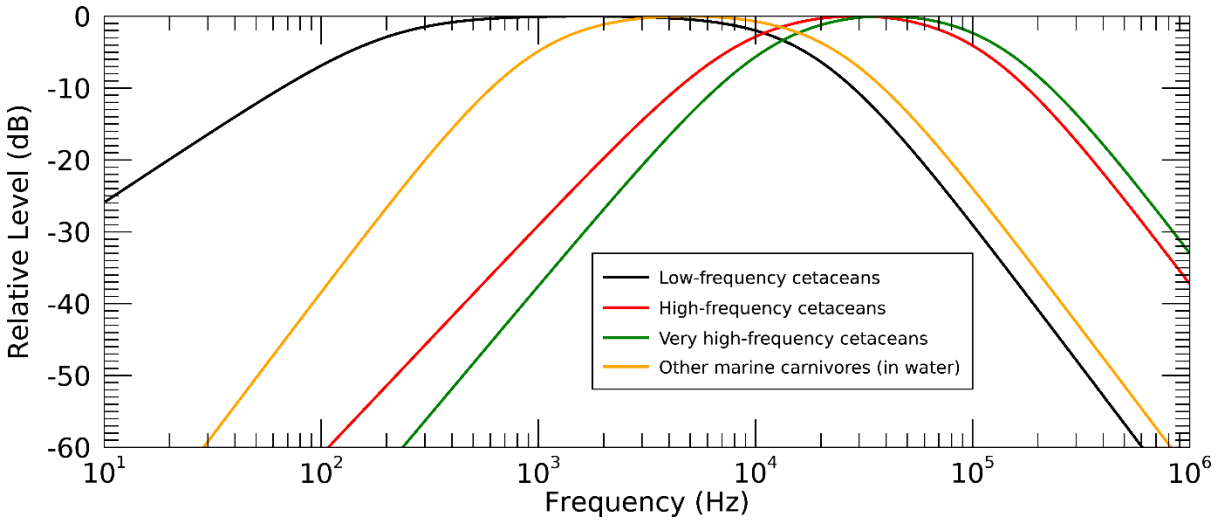

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

Appendix B. Acoustic Source Model

B.1. Airgun Array Source Model

The source levels and directivity of the seismic source were predicted with JASCO's Airgun Array Source Model (AASM). AASM includes low- and high-frequency modules for predicting different components of the seismic source spectrum. The low-frequency module is based on the physics of oscillation and radiation of airgun bubbles, as originally described by Ziolkowski (1970), that solves the set of parallel differential equations that govern bubble oscillations. Physical effects accounted for in the simulation include pressure interactions between airguns, port throttling, bubble damping, and generator-injector (GI) gun behaviour discussed by Dragoset (1984), Laws et al. (1990), and Landrø (1992). A global optimisation algorithm tunes free parameters in the model to a large library of airgun source signatures.

While airgun signatures are highly repeatable at the low frequencies, which are used for seismic imaging, their sound emissions have a large random component at higher frequencies that cannot be predicted using a deterministic model. Therefore, AASM uses a stochastic simulation to predict the high-frequency (800−25,000 Hz) sound emissions of individual airguns, using a data-driven multiple-regression model. The multiple-regression model is based on a statistical analysis of a large collection of high quality seismic source signature data recently obtained from the Joint Industry Program (JIP) on Sound and Marine Life (Mattsson and Jenkerson 2008). The stochastic model uses a Monte-Carlo simulation to simulate the random component of the high-frequency spectrum of each airgun in an array. The mean high-frequency spectra from the stochastic model augment the low-frequency signatures from the physical model, allowing AASM to predict airgun source levels at frequencies up to 25,000 Hz.

AASM produces a set of "notional" signatures for each array element based on:

- Array layout
- Volume, tow depth, and firing pressure of each airgun
- Interactions between different airguns in the array

These notional signatures are the pressure waveforms of the individual airguns at a standard reference distance of 1 m; they account for the interactions with the other airguns in the array. The signatures are summed with the appropriate phase delays to obtain the far-field source signature of the entire array in all directions. This far-field array signature is filtered into decidecade-bands to compute the source levels of the array as a function of frequency band and azimuthal angle in the horizontal plane (at the source depth), after which it is considered a directional point source in the far field.

A seismic array consists of many sources and the point source assumption is invalid in the near field where the array elements add incoherently. The maximum extent of the near field of an array (R_{nf}) is:

$$R_{\mathrm{nf}} < \frac{l^2}{4\lambda} \tag{B-1}$$

where λ is the sound wavelength and l is the longest dimension of the array (Lurton 2002, §5.2.4). For example, a seismic source length of l = 21 m yields a near-field range of 147 m at 2 kHz and 7 m at 100 Hz. Beyond this R_{nf} range, the array is assumed to radiate like a directional point source and is treated as such for propagation modelling.

The interactions between individual elements of the array create directionality in the overall acoustic emission. Generally, this directionality is prominent mainly at frequencies in the mid-range between

tens of hertz to several hundred hertz. At lower frequencies, with acoustic wavelengths much larger than the inter-airgun separation distances, the directionality is small. At higher frequencies, the pattern of lobes is too finely spaced to be resolved and the effective directivity is less.

B.2. Seismic Source

The layout of the 2820 in^3 seismic sources used for modelling in this study is provided in Figure B-1. Details of the airgun parameters are provided in Table B-1.

For the modelled array, the layout is presented in a nominal cartesian coordinate system. In this coordinate system the direction of vessel travel determines the relative position of the array elements as plotted and tabulated. The layout used for acoustic modelling was produced by transforming the coordinates of client supplied layouts such that the resultant layouts correspond to a vessel travel direction along the positive X-axis and the array is centred on the X-Y origin. When used with an acoustic model the positive X-axis in this nominal coordinate system aligns with the vessel tow direction or survey line azimuth.

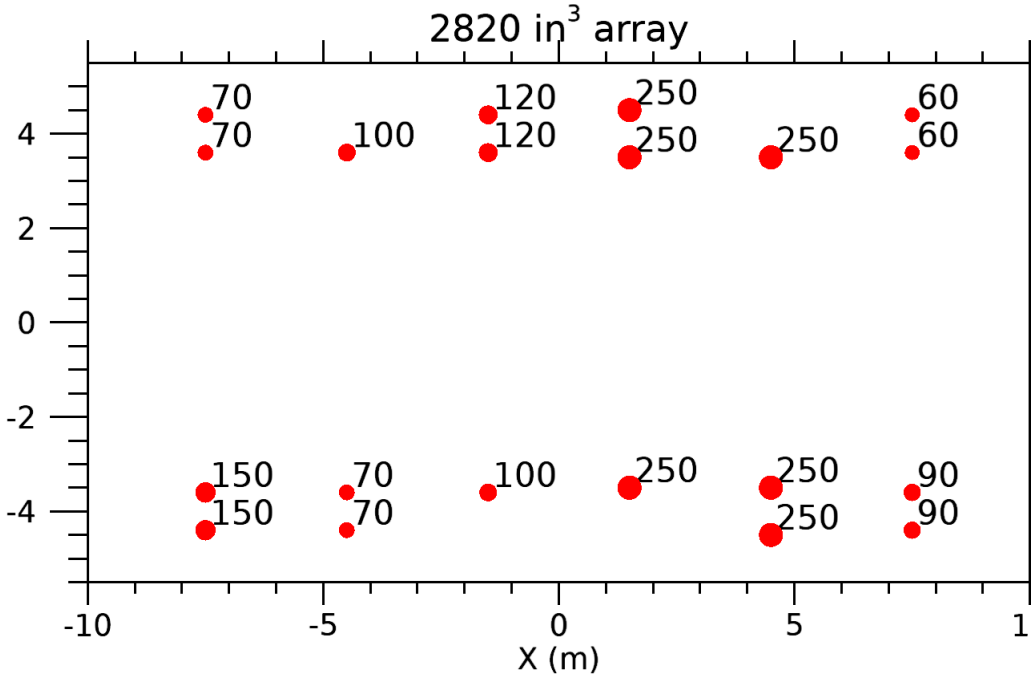

Figure B-1. Layout of the modelled 2820 in^3 seismic source where the plotted layout is such that the array is centred on the origin and vessel travel direction is in the positive x-direction. Tow depth was 7 m. The labels indicate the firing volume (in cubic inches) for each airgun. Also see Table B-1.

Table B-1. Layout of the modelled 2820 in^3 seismic source. Tow depth was 7 m. Firing pressure for all guns was 2000 psi. Greyed out values indicate spares. Also see Figure B-1.

String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)	String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)
1	1	7.5	-4.4	7	90	2	13	7.5	3.6	7	60
	2	7.5	-3.6	7	90		14	7.5	4.4	7	60
	3	4.5	-4.5	7	250		15	4.5	3.5	7	250
	4	4.5	-3.5	7	250		16	4.5	4.5	7	220
	5	1.5	-4.5	7	250		17	1.5	3.5	7	250
	6	1.5	-3.5	7	250		18	1.5	4.5	7	250
	7	-1.5	-4.4	7	100		19	-1.5	3.6	7	120
	8	-1.5	-3.6	7	100		20	-1.5	4.4	7	120
	9	-4.5	-4.4	7	70		21	-4.5	3.6	7	100
	10	-4.5	-3.6	7	70		22	-4.5	4.4	7	100
	11	-7.5	-4.4	7	150		23	-7.5	3.6	7	70
	12	-7.5	-3.6	7	150		24	-7.5	4.4	7	70

B.3. Array Source Levels and Directivity

Figure B-2 shows the broadside (perpendicular to the tow direction), endfire (parallel to the tow direction) and vertical overpressure signature and corresponding power spectrum levels for the 2820 in^3 seismic source (Appendix B.2). Horizontal decidecade-band source levels are shown as a function of band centre frequency and azimuth in Figure B-3.

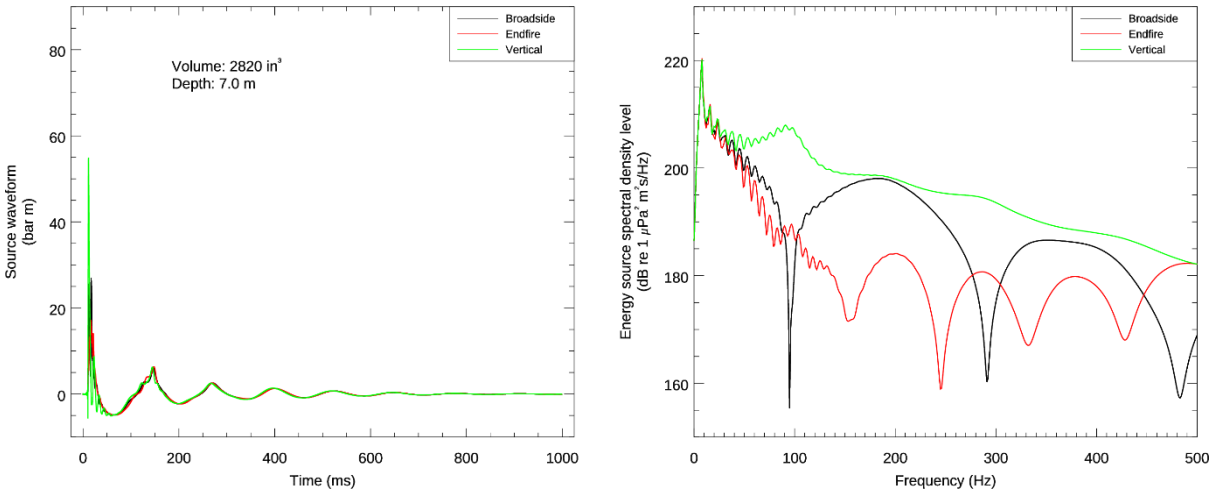

Figure B-2. Predicted source level details for the 2820 in^3 seismic source with a 7 m tow depth. (Left) the overpressure signature and (right) the power spectrum for in-plane horizontal (broadside), perpendicular (endfire), and vertical directions (no surface ghost).

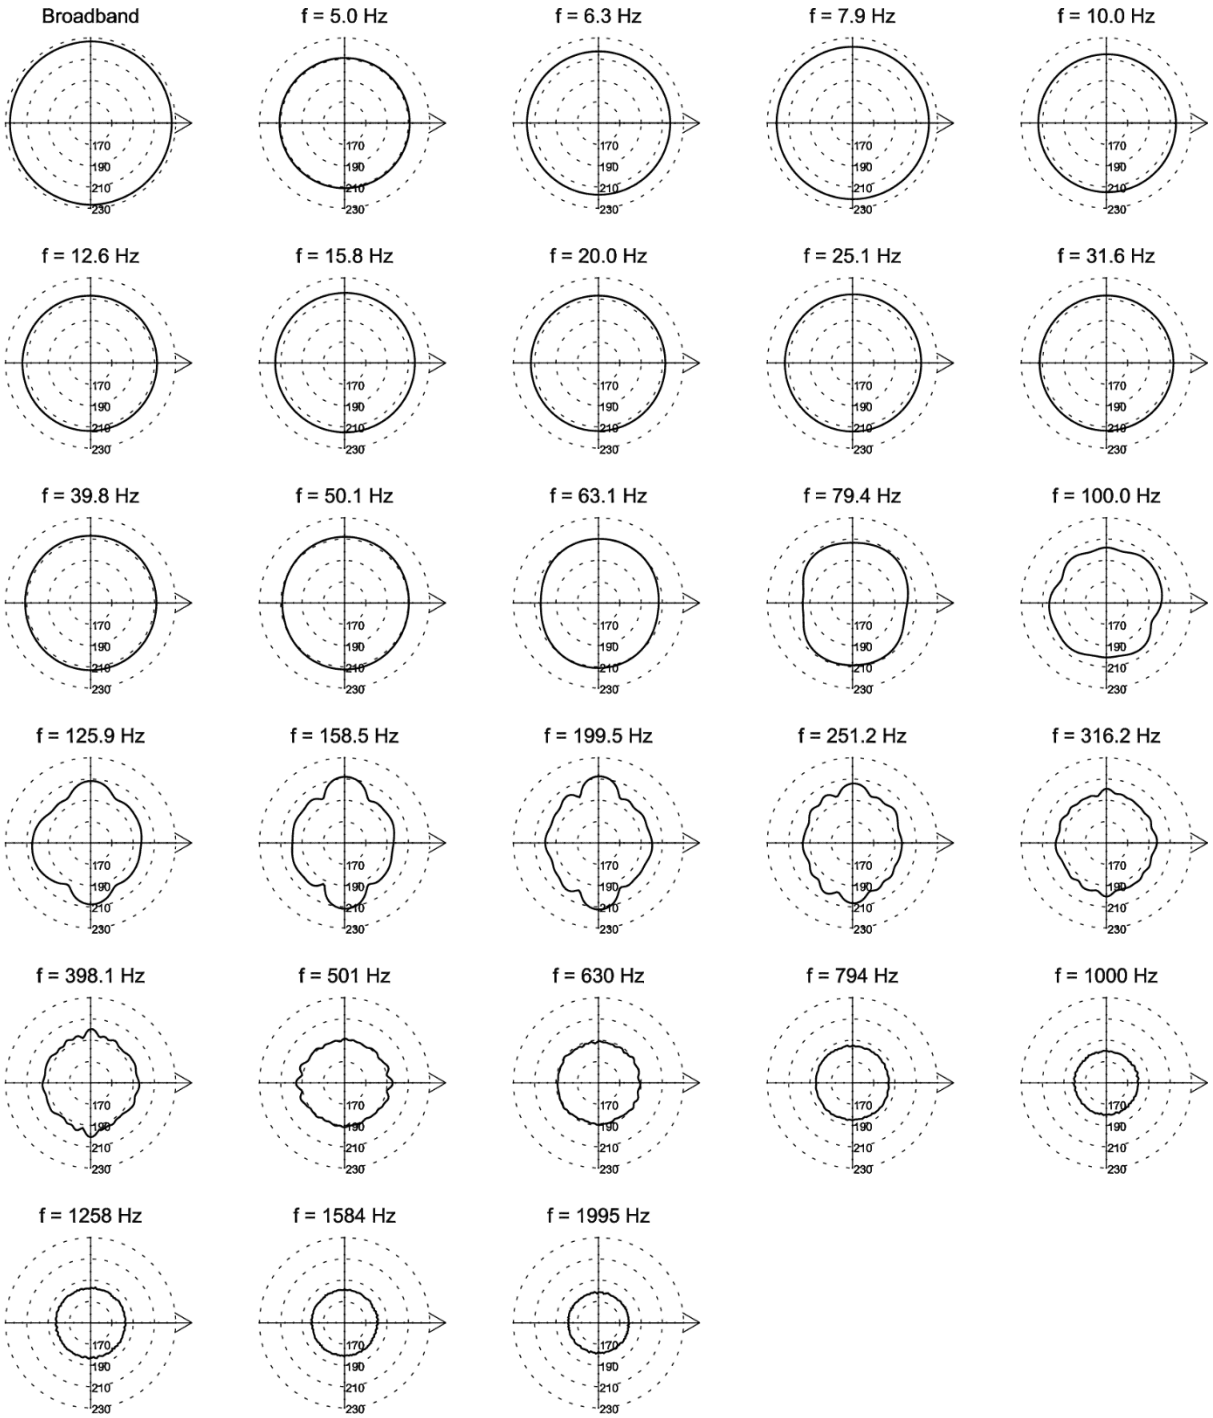

Figure B-3. Directionality of the predicted horizontal source levels for the 2820 in^3 seismic source, 5 Hz to 2 kHz. Source levels (in dB re 1 $\mu Pa^2 \cdot s\ m^2$) are shown as a function of azimuth for the centre frequencies of the decidecade bands modelled; frequencies are shown above the plots. The perpendicular direction to the frame is to the right. Tow depth was 7 m (see Table B-1).

Appendix C. Sound Propagation Models

C.1. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). Compared to VSTACK, MONM less accurately predicts steep-angle propagation for environments with higher shear speed but is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 5 Hz to 1 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies >1 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

This version of MONM accounts for sound attenuation due to energy absorption through ion relaxation and viscosity of water in addition to acoustic attenuation due to reflection at the medium boundaries and internal layers (Fisher and Simmons 1977). The former type of sound attenuation is significant for frequencies higher than 5 kHz and cannot be neglected without noticeably affecting the model results.

MONM computes acoustic fields in three dimensions by modelling transmission loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure C-1).

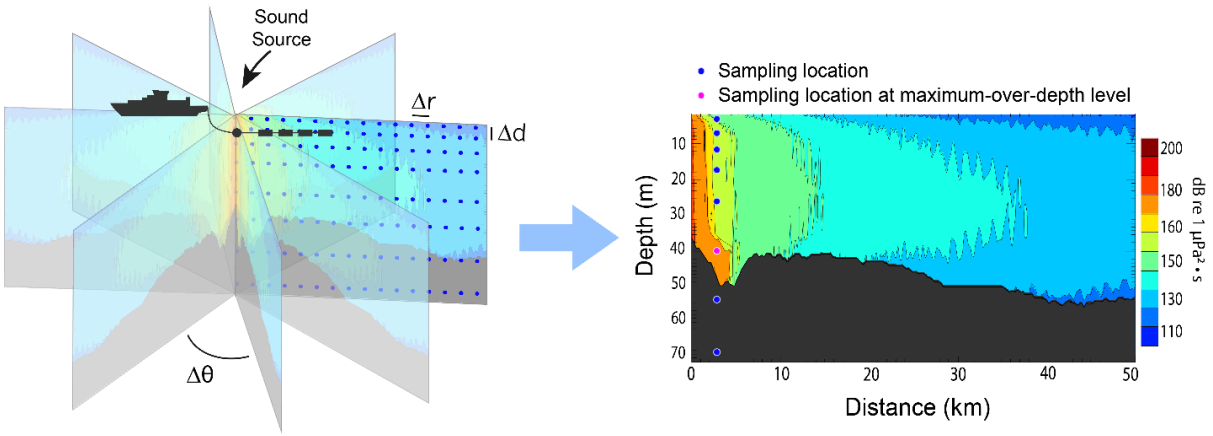

Figure C-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic transmission loss at the centre frequencies of decidecade bands. Sufficiently many decidecade bands, starting at 5 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the transmission loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade band received per-pulse SEL are computed by subtracting the band transmission loss values from the directional source level in that frequency band. Composite

broadband received per-pulse SEL are then computed by summing the received decidecade band levels.

The received per-pulse SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. The maximum received per-pulse SEL at many sampling depths are taken over all samples within the water column, i.e., the maximum-over-depth received per-pulse SEL. These maximum-over-depth per-pulse SEL are presented as contours around the source.

C.2. Full Waveform Range-dependent Acoustic Model: FWRAM

For impulsive sounds from the seismic source, time-domain representations of the pressure waves generated in the water are required to calculate SPL and PK. Furthermore, the seismic source must be represented as a distributed source to accurately characterise vertical directivity effects in the near-field zone. For this study, synthetic pressure waveforms were computed using FWRAM, which is a time-domain acoustic model based on the same wide-angle parabolic equation (PE) algorithm as MONM. FWRAM computes synthetic pressure waveforms versus range and depth for range-varying marine acoustic environments, and it takes the same environmental inputs as MONM (bathymetry, water sound speed profile, and seafloor geoacoustic profile). Unlike MONM, FWRAM computes pressure waveforms via Fourier synthesis of the modelled acoustic transfer function in closely spaced frequency bands. FWRAM employs the array starter method to accurately model sound propagation from a spatially distributed source (MacGillivray and Chapman 2012).

Besides providing direct calculations of the PK and SPL, the synthetic waveforms from FWRAM can also be used to convert the SEL values from MONM to SPL.

C.3. Wavenumber Integration Model

Sound pressure levels near the seismic source were modelled using JASCO's VSTACK wavenumber integration model. VSTACK computes synthetic pressure waveforms versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. The output of the model can be post-processed to yield estimates of the SEL, SPL, and PK.

VSTACK accurately predicts steep-angle propagation in the proximity of the source, but it is computationally slow at predicting sound pressures at large distances due to the need for smaller wavenumber steps with increasing distance. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. VSTACK is thus best suited to modelling the sound field near the source.

C.3.1. Particle Motion

VSTACK was also used to compute estimates of particle acceleration and velocity at four sites for the 2820 in^3 seismic source. Particle motion waveforms were modelled, and pulse metrics were computed from the time-domain traces. VSTACK uses the wavenumber integration approach to solve the exact acoustic wave equation for arbitrarily layered range-independent acoustic environments.

The VSTACK model setup for the particle velocity scenarios was identical to that for the peak pressure scenarios (Section 5.2.1.2) in terms of source treatment, frequency range and environmental model. The particle acceleration and velocity waveforms were computed to a maximum distance of 1000 m in the broadside and endfire directions from the centre of the airgun array for a receiver 5 cm above the seafloor.

As discussed above in Appendix A.2, particle velocity (v) is the physical speed of a particle in a material. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium. Since the wavenumber integration kernel is a product of analytic expressions in terms of range and depth, VSTACK computes particle velocity by computing the spatial gradient of the pressure field analytically in the frequency domain. Fourier synthesis is applied to compute time series synthetic pressure and/or velocity waveforms at depth and range receivers by convolving the source waveforms with the impulse response of the waveguide. Particle velocity metrics at each receiver location were calculated from the modelled particle motion along three perpendicular axes (horizontal and along the source-receiver path, horizontal and perpendicular to the source-receiver path, and vertical).

The particle velocity results were converted to acceleration by time differentiation. The peak particle acceleration and velocity were calculated from the maximum of the predicted acceleration and velocity magnitude, defined as "peak magnitude".

C.3.2. Limestone Seabed Propagation Loss

For all modelled sites, an additional broadband correction was applied to the propagation loss results from MONM to better account for the additional propagation loss associated with a calcarenite/limestone seabed. The differences between the broadband per-pulse SEL from MONM and VSTACK were extracted at the same modelled ranges and depths for corresponded range independent environments. The 90th percentile of the resultant dB differences in range bins were selected to generate a correction function for representative sites to be modelled. The conversion functions were applied after to the summed decidecade band levels from MONM, but before gridding, and radii calculations for each modelled site in each modelled scenario considered.

Appendix D. Methods and Parameters

D.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure D-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure D-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure D-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

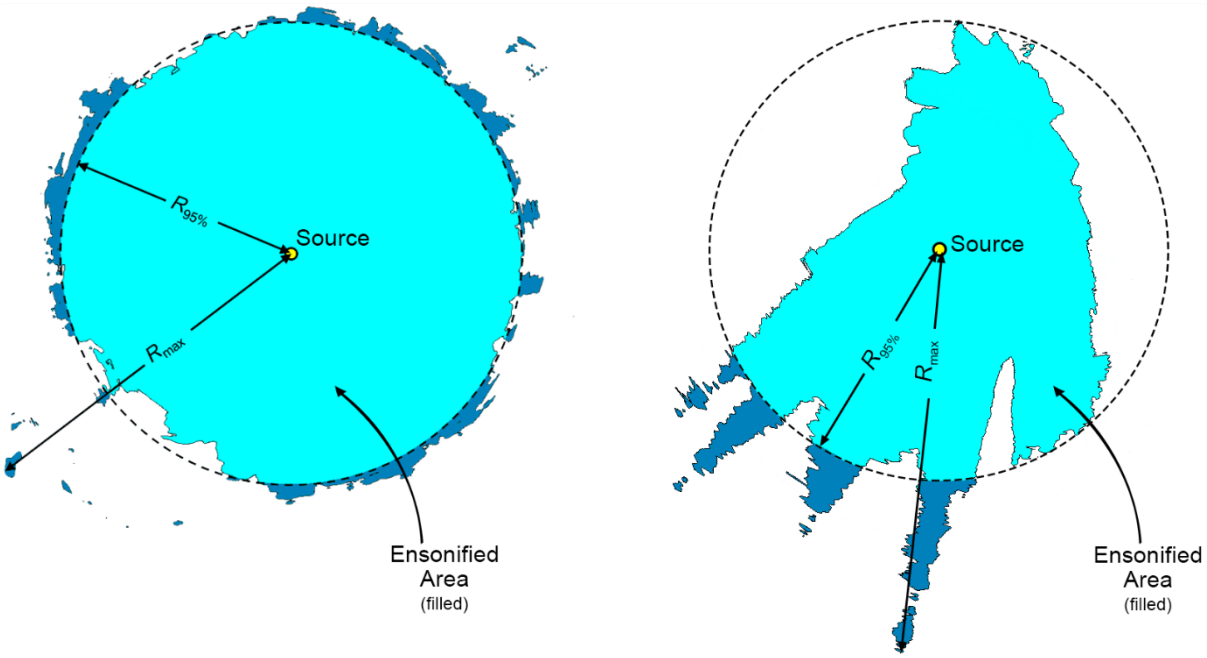

Figure D-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

D.2. Estimating SPL from Modelled SEL Results

The per-pulse SEL of sound pulses is an energy-like metric related to the dose of sound received over a pulse's entire duration. The pulse SPL on the other hand, is related to its intensity over a specified time interval. Seismic pulses typically lengthen in duration as they propagate away from their source, due to seafloor and surface reflections, and other waveguide dispersion effects. The changes in pulse length, and therefore the time window considered, affect the numeric relationship between SPL and SEL. This study has applied a fixed window duration to calculate SPL (T_{fix} = 125 ms; see Appendix A.1), as implemented in Martin et al. (2017b). Full-waveform modelling was used to estimate SPL, but this type of modelling is computationally intensive, and can be prohibitively time consuming when run at high spatial resolution over large areas.

For the current study, FWRAM (Appendix C.2) was used to model synthetic seismic pulses over the frequency range 5–1024 Hz. This was performed along all broadside and endfire radials at five sites. FWRAM uses Fourier synthesis to recreate the signal in the time domain so that both the SEL and SPL from the source can be calculated. The differences between the SEL and SPL were extracted for all ranges and depths that corresponded to those generated from the high spatial-resolution results from MONM. A 125 ms fixed time window positioned to maximize the SPL over the pulse duration was applied. The resulting SEL-to-SPL offsets were averaged in 0.02 km range bins along each modelled radial and depth, and the 90th percentile was selected at each range to generate a generalised range-dependent conversion function for each site. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM to model SPL values. Figures D-2 to D-6 show the conversion offsets for Sites 2, 3, 5, 8, and 10 with the 2820 in^3 array; the spatial variation is caused by changes in the received airgun pulse as it propagates from the source. The conversion to SPL from SEL was conducted considering the water depth and seabed geology at a given modelled site.

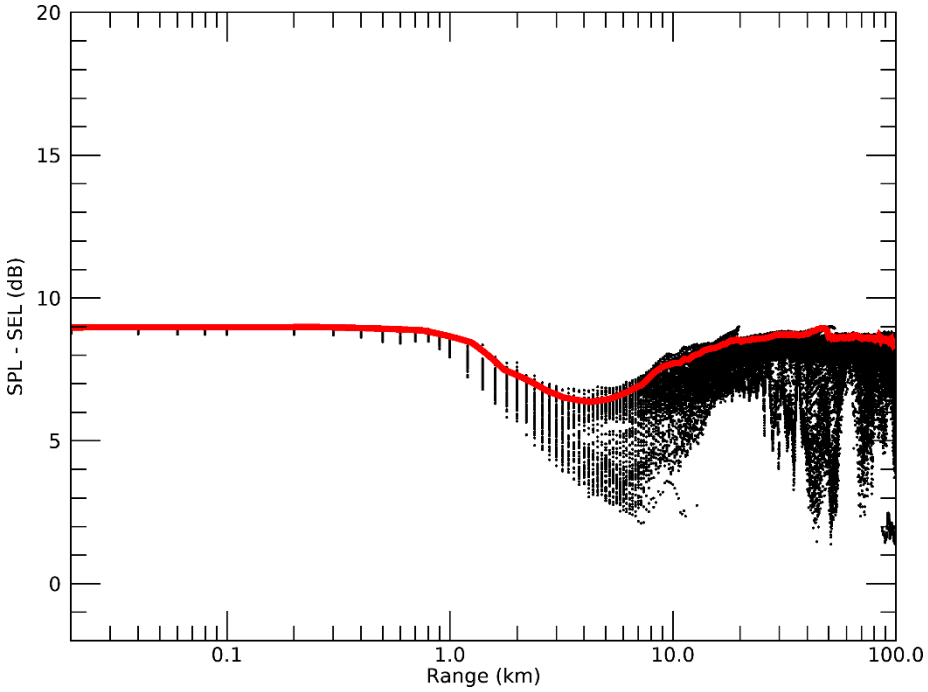

Figure D-2. *Site 2 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

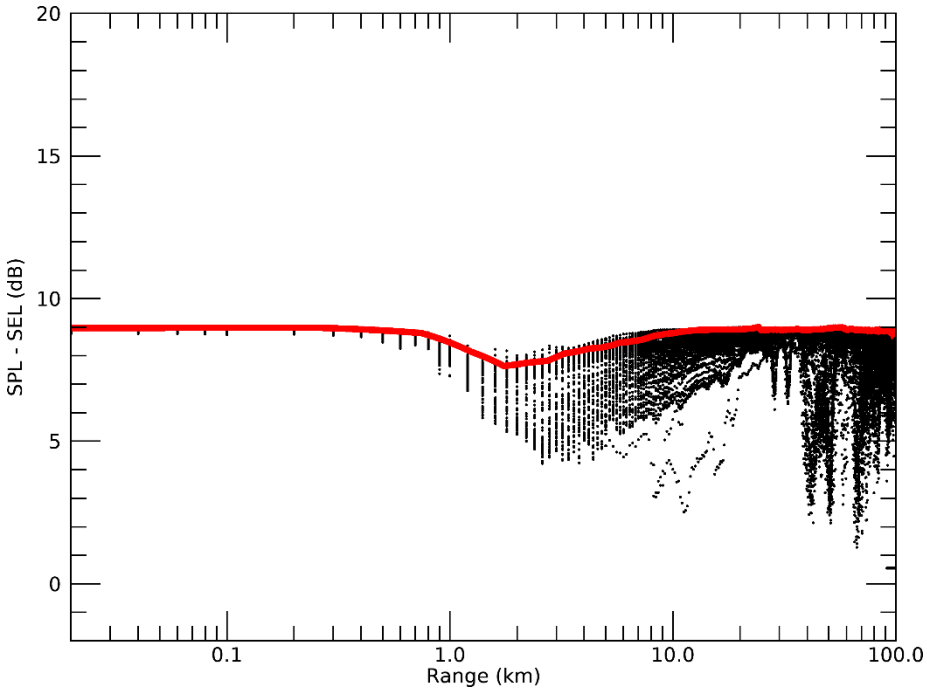

Figure D-3. *Site 3 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

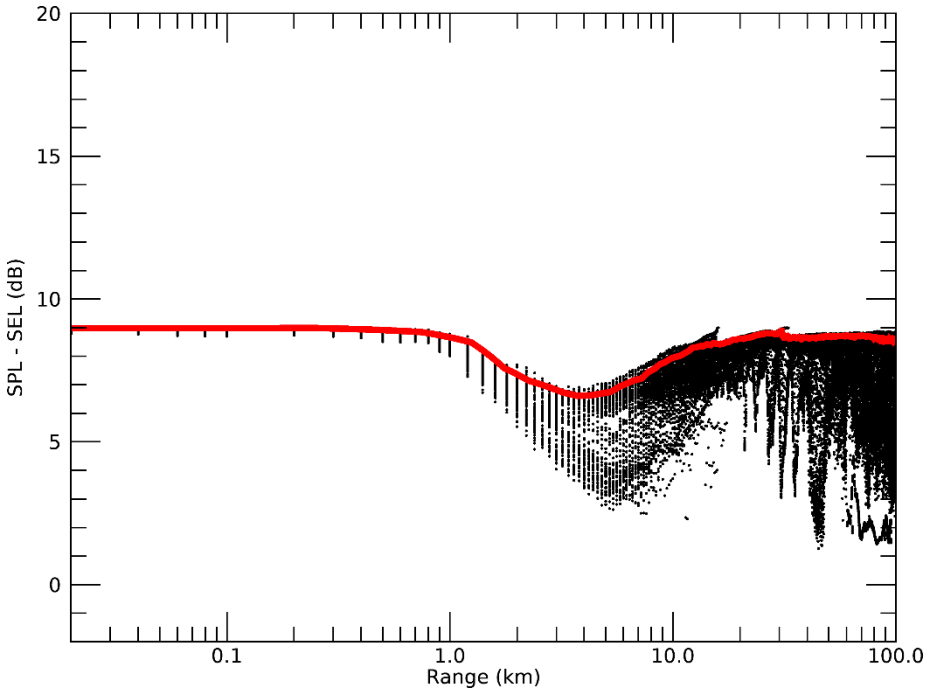

Figure D-4. *Site 5 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

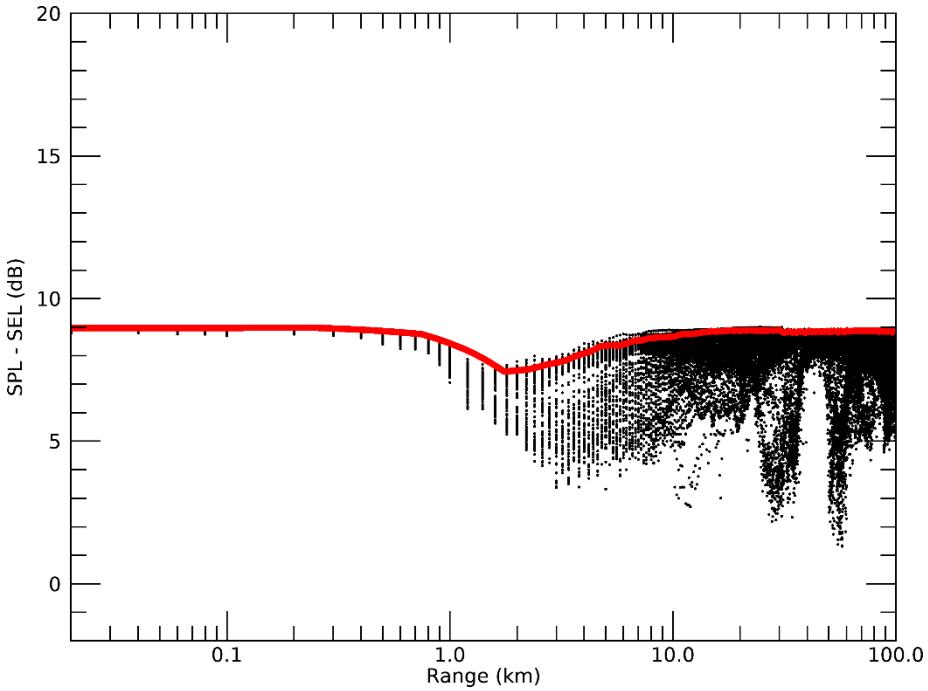

Figure D-5. *Site 8 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

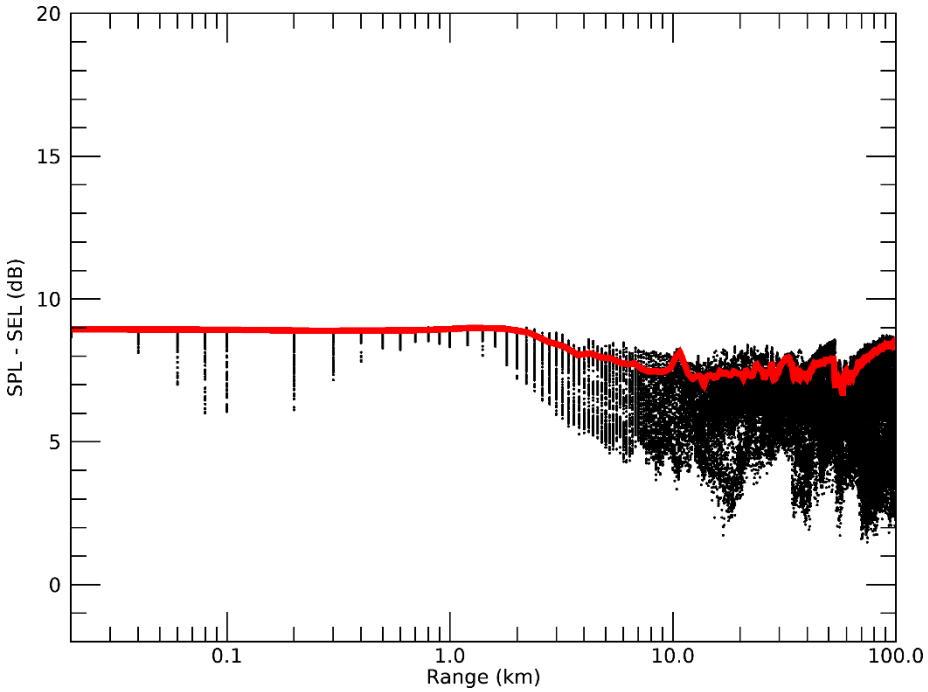

Figure D-6. *Site 10 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

D.3. Environmental Parameters

D.3.1. Bathymetry

Water depths throughout the modelled area were extracted from Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data was extracted and re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 200 × 200 m to generate the bathymetry in Figure D-7.

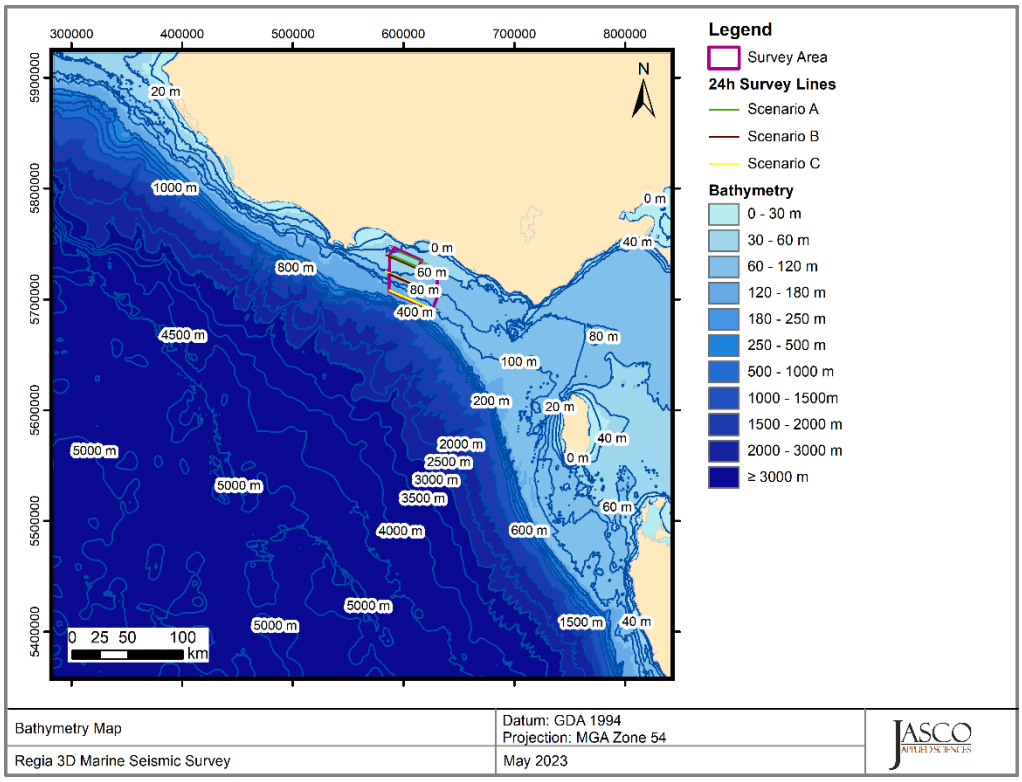

Figure D-7. Bathymetry map of the modelling area for the Regia Marine Seismic Survey.

D.3.2. Sound Speed Profile

The sound speed profiles for the modelled sites were derived from temperature and salinity profiles from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the US Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles within a 100 km box radius encompassing all modelled sites. The December sound speed profile is expected to be most favourable to longer-range sound propagation during the proposed survey time frame due its upward refracting profile. As such, December was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure D-8 shows the resulting profile used as input to the sound propagation modelling.

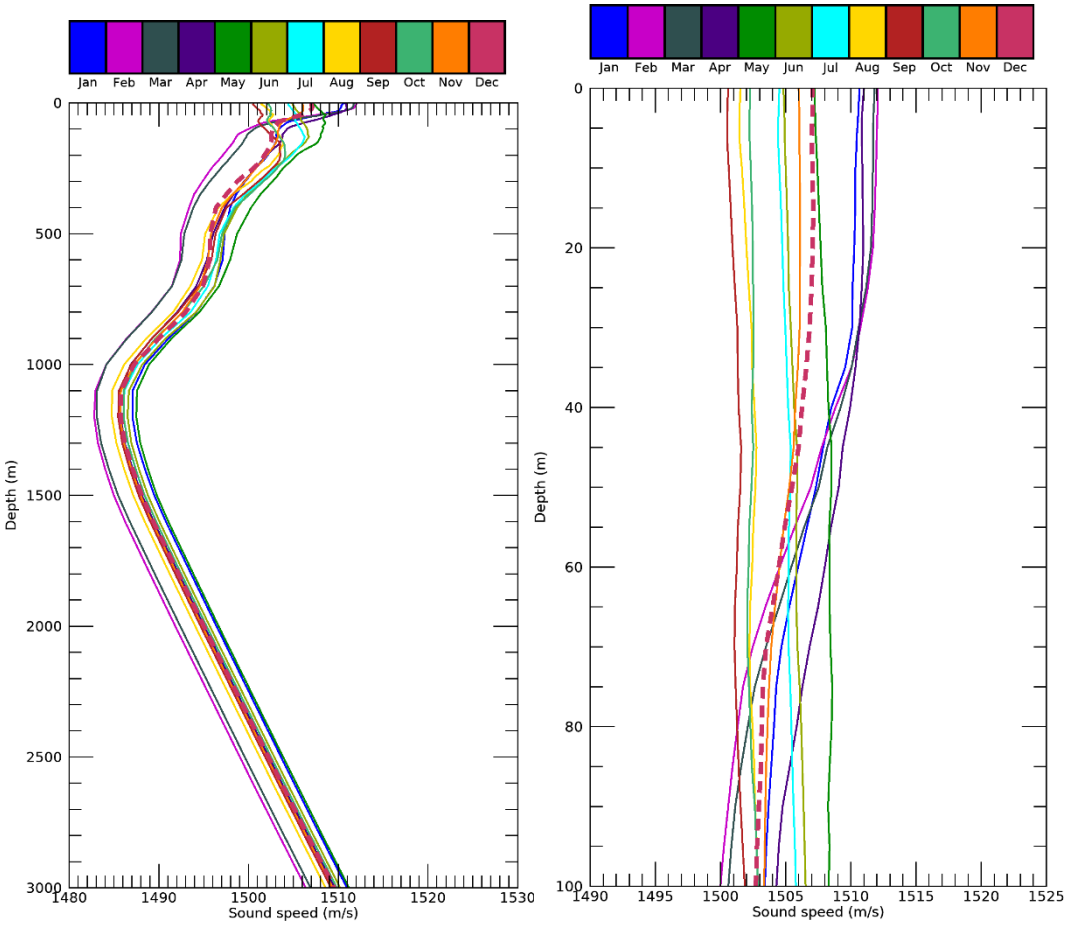

Figure D-8. The sound speed profile (December) used for all modelling, showing the entire water column (left) and the top 100 m within the profile (right). Profiles are calculated from temperature and salinity profiles from GDEM V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

D.3.3. Geoacoustics

The geoacoustic parameters used for modelling have been sourced from previous public reports completed by Jasco for modelling projects in the surrounding area. Similar to previous modelling studies in the region (Wood and McPherson 2018, Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), several seabed types were considered for modelling. These seabed profiles are indicative of a benthic environment located on the continental shelf and upper slope and are consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010) within the Otway region.

For the sites modelled in shallow water (less than 50 m depth) the seabed was modelled as a sand layer underlain by variably cemented calcarenite. Literature and public reports suggest that this layer likely begins to thin as water depths increase in an offshore direction (Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), and for water depths greater than 50 m it was considered absent with only the variably calcarenite present at the seafloor interface. These two seabed profiles are consistent with profiles described in association with measurement data (McCauley et al. 2016), and other modelling studies in the region (AIMS 2018).

Sites located above the calcarenite seabed generally displayed higher rates of loss (Duncan et al. 2009) at distance away from the source as compared to sites where a layer of sand overlies calcarenite and as such additional modelling was conducted to account for the propagation loss associated with a limestone seabed and additional modelled was conducted to account for the loss

associated with exposed calcarenite (see Appendix C.3.2). For sites located in water along the shelf, geoacoustic parameters considered for modelling are provided in Tables D-1 and D-2

Table D-1. Geoacoustic profile used in the acoustic propagation models less than 50 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm³)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-5	Fine Carbonate Sand	2.1	1634-1803	0.09-0.73	315	3.65
5-25	Increasingly cemented calcarenite	2.2	2000-2120	0.30-0.34		
25-45		2.3	2120-2240	0.34-0.38		
45-65		2.4	2240-2360	0.38-0.42		
65-85		2.5	2360-2480	0.42-0.46		
85-105		2.6	2480-2600	0.46-0.50		
>105	Well-cemented calcarenite	2.7	2600	0.50		

Table D-2. Geoacoustic profile used in the acoustic propagation models for between 50 m and 150 m water depth.Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm³)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-1	Well-cemented carbonate caprock	2.7	2600	0.5	500	0.4
1-20	Increasingly cemented calcarenite	2.2	2000-2120	0.30-0.34		
20-40		2.3	2120-2240	0.34-0.38		
40-60		2.4	2240-2360	0.38-0.42		
60-80		2.5	2360-2480	0.42-0.46		
80-10		2.6	2480-2600	0.46-0.50		
>100	Well-cemented calcarenite	2.7	2600	0.50		

For sites located along the shelf break/upper continental slope, the geoacoustic parameters used for modelling was derived from sedimentary grain size measurements from the Australian Government's Marine Sediments (MARS) database (Heap 2009). On average, the surficial grain size indicates silty carbonate sand is present. Information on the deeper geological structure was sparse, as such the seabed was assumed to consist of a thick package of unconsolidated sediments. However, this is consistent with the "shaved shelf" model of the discussed in James and Bone 2010, where sediments are transported and deposited from the shelf onto the slope. Representative grain sizes and porosity

were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models. Table D-3 lists the geoacoustic parameters used for modelling for sites in water depths greater than 150 m.

Table D-3. Geoacoustic profile used in the acoustic propagation models for all modelled sites greater than 150 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–10	Silty carbonate sand to semi-cemented carbonate	1.88	1605–1700	0.35–0.70	255	3.65
10–20		1.88–1.89	1700–1755	0.70–0.85		
20–50		1.89–1.90	1755–1850	0.85–1.15		
50–100		1.90–1.92	1850–1950	1.15–1.35		
100–200		1.92–1.96	1950–2100	1.35–1.60		
200–500		1.96–2.05	2100–2355	1.60–1.95		
>500		2.05	2355	1.95		

D.4. Animal Movement and Exposure Modelling

Animal movement and exposure modelling considers the movement of both sound sources and animals over time. Acoustic source and propagation modelling are used to generate 3-D sound fields that vary as a function of distance to source, depth, and azimuth. Sound sources are modelled at representative sites and the resulting sound fields are assigned to source locations using the minimum Euclidean distance. The sound received by an animal at any given time depends on its location relative to the source. Because the true locations of the animals within the sound fields are unknown, realistic animal movements are simulated using repeated random sampling of various behavioural parameters. The Monte Carlo method of simulating many animals within the operations area is used to estimate the sound exposure history of the population of simulated animals (animats).

Monte Carlo methods provide a heuristic approach for determining the probability distribution function (PDF) of complex situations, such as animals moving in a sound field. The probability of an events occurrence is determined by the frequency with which it occurs in the simulation. The greater the number of random samples, in this case the more simulated animats, the better the approximation of the PDF. Animats are randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2). Higher densities provide a finer PDF estimate resolution but require more computational resources. To ensure good representation of the PDF, the animat density is set as high as practical allowing for computation time. The animat density is much higher than the real-world density to ensure good representation of the PDF. The resulting PDF is scaled using the real-world density.

Several models for marine mammal movement have been developed (Ellison et al. 1987, Frankel et al. 2002, Houser 2006). These models use an underlying Markov chain to transition from one state to another based on probabilities determined from measured swimming behaviour. The parameters may represent simple states, such as the speed or heading of the animal, or complex states, such as likelihood of participating in foraging, play, rest, or travel. Attractions and aversions to variables like anthropogenic sounds and different depth ranges can be included in the models.

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was based on the open-source marine mammal movement and behaviour model (3MB, Houser 2006) and used to predict the exposure of animats to sound arising from the anthropogenic activities. Animats are programmed to behave like the species likely to be present in the survey area. The parameters used for forecasting realistic behaviours (e.g., diving, foraging, aversion, surface times, etc.) are determined and interpreted from marine species studies (e.g., tagging studies) where available, or reasonably extrapolated from related species. An individual animats modelled sound exposure levels are summed over the total simulation duration to determine its total received energy, and then compared to the assumed threshold criteria.

JASMINE uses the same animal movement algorithms as 3MB (Houser, 2006), but has been extended to be directly compatible with JASCO's Marine Operations Noise Model (MONM) and Full Waveform Range-dependent Acoustic Model (FRAWM) acoustic field predictions, for inclusion of source tracks, and importantly for animats to change behavioural states based on time and space dependent modelled variables such as received levels for aversion behaviour, although aversion was not considered in this study.

D.4.1. Animal Movement Parameters

JASMINE uses previously measured behaviour to forecast behaviour in new situations and locations. The parameters used for forecasting realistic behaviour are determined (and interpreted) from marine species studies (e.g., tagging studies). Each parameter in the model is described as a probability distribution. When limited or no information is available for a species parameter, a Gaussian or uniform distribution may be chosen for that parameter. For the Gaussian distribution, the user determines the mean and standard deviation of the distribution from which parameter values are drawn. For the uniform distribution, the user determines the maximum and minimum distribution from which parameter values are drawn. When detailed information about the movement and behaviour of a species are available, a user-created distribution vector, including cumulative transition probabilities, may be used (referred to here as a vector model; Houser 2006). Different sets of parameters can be defined for different behaviour states. The probability of an animat starting out in or transitioning into a given behaviour state can in turn be defined in terms of the animats current behavioural state, depth, and the time of day. In addition, each travel parameter and behavioural state has a termination function that governs how long the parameter value or overall behavioural state persists in simulation.

The parameters used in JASMINE describe animal movement in both the vertical and horizontal planes. The parameters relating to travel in these two planes are briefly described below.

Travel sub-models

- **Direction**– determines an animats choice of direction in the horizontal plane. Sub-models are available for determining the heading of animats, allowing for movement to range from strongly biased to undirected. A random walk model can be used for behaviours with no directional preference, such as feeding and playing. In a random walk, all bearings are equally likely at each parameter transition time step. A correlated random walk can be used to smooth the changes in bearing by using the current heading as the mean of the distribution from which to draw the next heading. An additional variant of the correlated random walk is available that includes a directional bias for use in situations where animals have a preferred absolute direction, such as migration. A user-defined vector of directional probabilities can also be input to control animat heading. For more detailed discussion of these parameters, see Houser (2006) and Houser and Cross (1999).
- **Travel rate**–defines an animats rate of travel in the horizontal plane. When combined with vertical speed and dive depth, the dive profile of the animat is produced.

Dive sub-models

- **Ascent rate**–defines an animats rate of travel in the vertical plane during the ascent portion of a dive.
- **Descent rate**–defines an animats rate of travel in the vertical plane during the descent portion of a dive.
- **Depth**–defines an animats maximum dive depth.
- **Reversals**–determines whether multiple vertical excursions occur once an animat reaches the maximum dive depth. This behaviour is used to emulate the foraging behaviour of some marine mammal species at depth. Reversal-specific ascent and descent rates may be specified.
- **Surface interval**–determines the duration an animat spends at, or near, the surface before diving again.

D.4.2. Exposure Integration Time

The interval over which acoustic exposure (L_E) should be integrated and maximal exposure (L_p) determined is not well defined. Both Southall et al. (2007) and the NMFS (2018) recommend a 24 h baseline accumulation period, but state that there may be situations where this is not appropriate (e.g., a high-level source and confined population). Resetting the integration after 24 h can lead to overestimating the number of individual animals exposed because individuals can be counted multiple times during an operation. The type of animal movement engine used in this study simulates realistic movement using swimming behaviour collected over relatively short periods (hours to days) and does not include large-scale movement such as migratory circulation patterns. For this study, a representative 24-hour period was simulated.

Ideally, a simulation area is large enough to encompass the entire range of a population so that any animal that could approach the source during an operation is included. However, there are limits to the simulation area, and computational overhead increases with area. For practical reasons, the simulation area is limited. In the simulation, every animat that reaches a border is replaced by another animat entering at the opposing border—e.g., an animat crossing the northern border of the simulation is replaced by one entering the southern border at the same longitude. When this action places the animat in an inappropriate water depth, the animat is randomly placed on the map at a depth suited to its species definition. The exposures of all animats (including those leaving the simulation and those entering) are kept for analysis. This approach maintains a consistent animat density and allows for longer integration periods with finite simulation areas.

D.4.3. Seeding Density and Scaling

Seeding density refers to the spatial sample rate, in units of animats/km^2, used in the simulation. It is not related to the real-world animal density, but rather is a model parameter that controls how samples are drawn from the model space. The minimum required seeding density for any given project depends on several factors such as bathymetry, source characteristics, and the behavioural profile of the animats, with the main constraint being computation time and resources. Seeding density is adjusted as needed based on model conditions specific to a project or project area.

In the present study, the exposure criteria for impulsive sounds were used to determine the number of animats exceeding exposure thresholds. To generate statistically reliable probability density functions, all simulations were seeded with an animat density of 4 animat/km^2 over the entire simulation area. The modelling results are not related to real-world animal densities and the number of real-world animals potentially exposed was not calculated.

Appendix E. Model Validation Information

Predictions from JASCO's Airgun Array Source Model (AASM) and propagation models (MONM, FWRAM and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Artic, Canadian and southern United States waters, Greenland, Russia and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities which have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016).

Appendix F. Supplemental Results

Histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenarios B and C are shown in Figures 1 to 24.

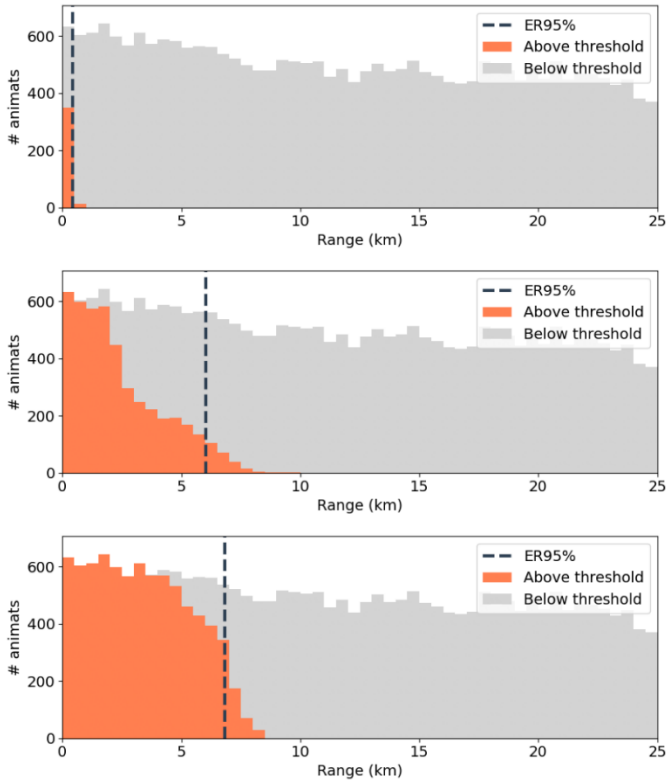

Figure F-1. *Scenario B, female pygmy blue whale animats, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

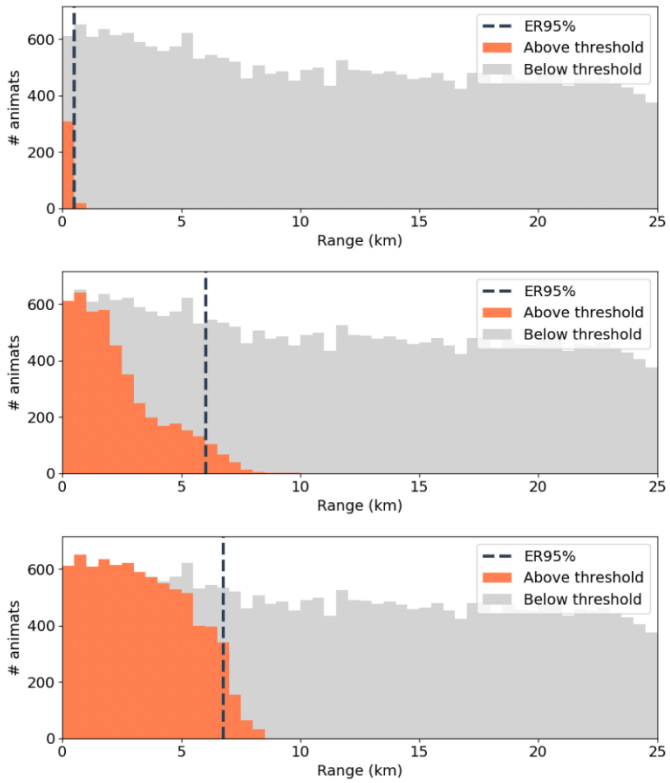

Figure F-2. *Scenario B, male pygmy blue whale animats, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

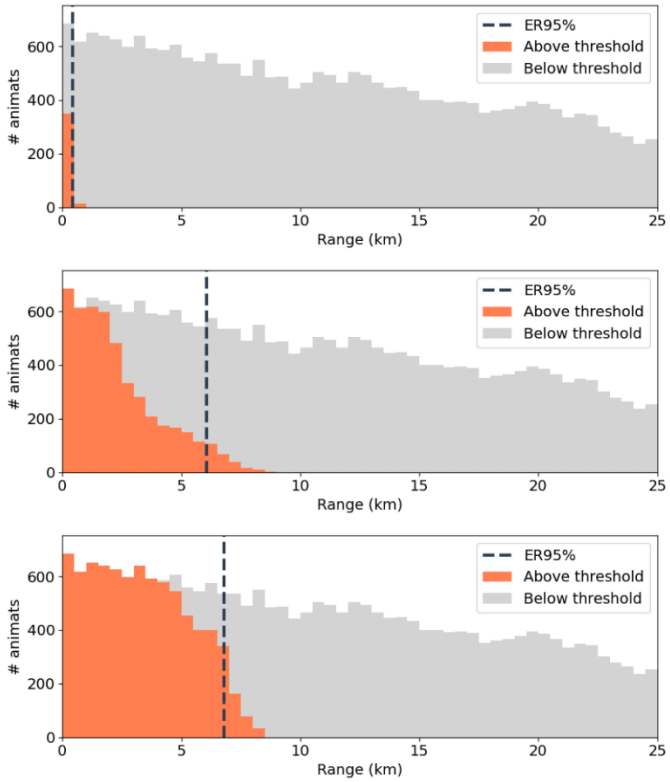

Figure F-3. *Scenario B, female pygmy blue whale animats, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

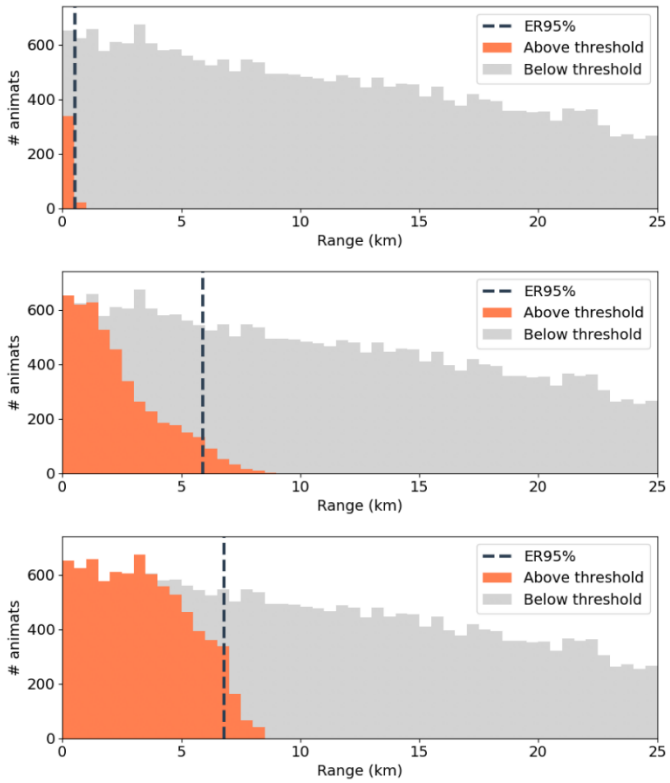

Figure F-4. *Scenario B, male pygmy blue whale animats, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

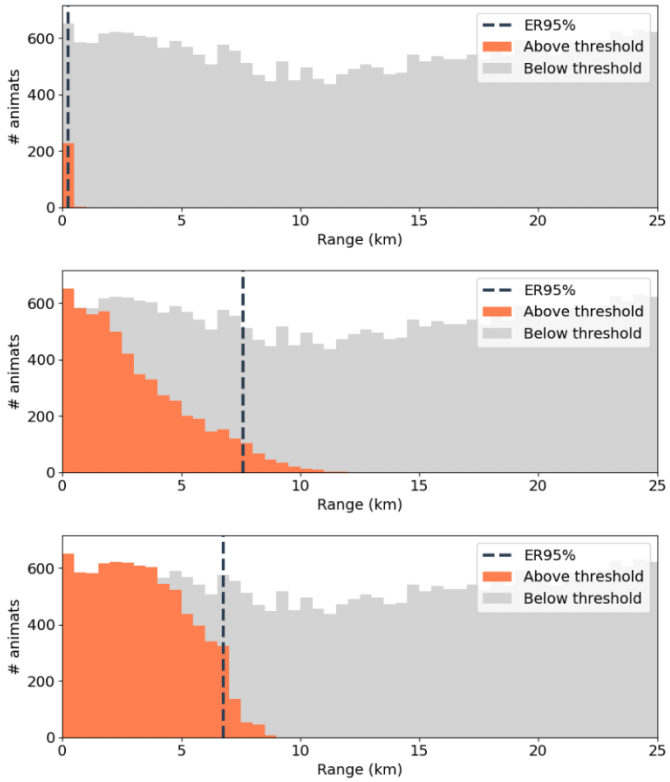

Figure F-5. *Scenario C, female pygmy blue whale animats, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

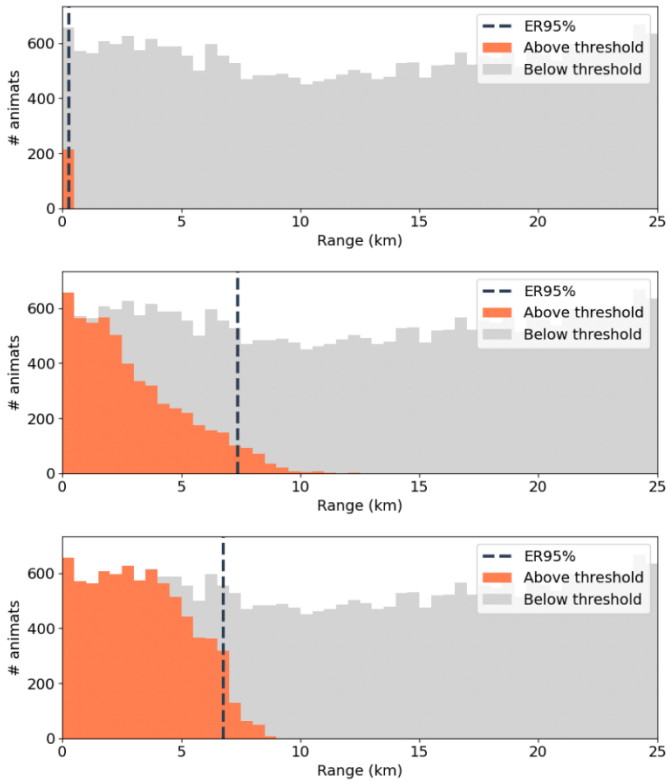

Figure F-6. *Scenario C, male pygmy blue whale animats, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

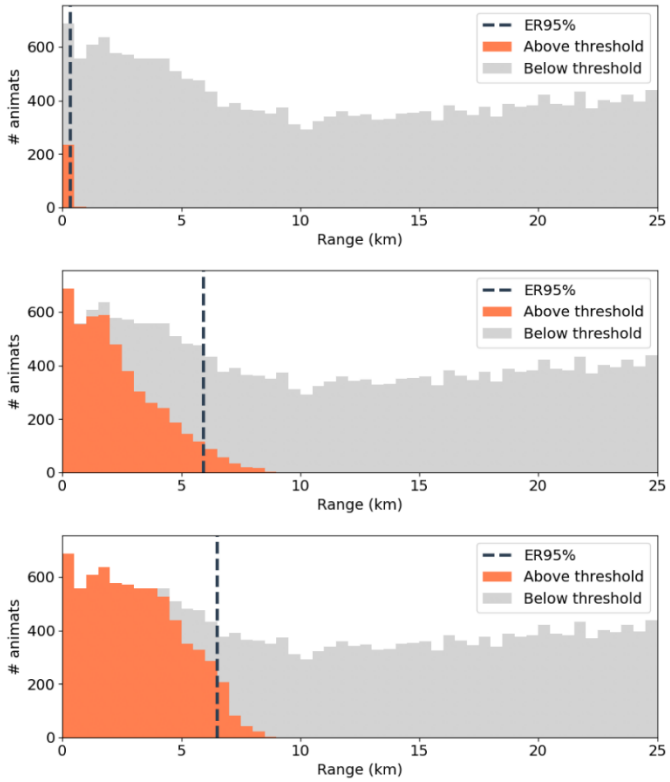

Figure F-7. *Scenario C, female pygmy blue whale animats, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

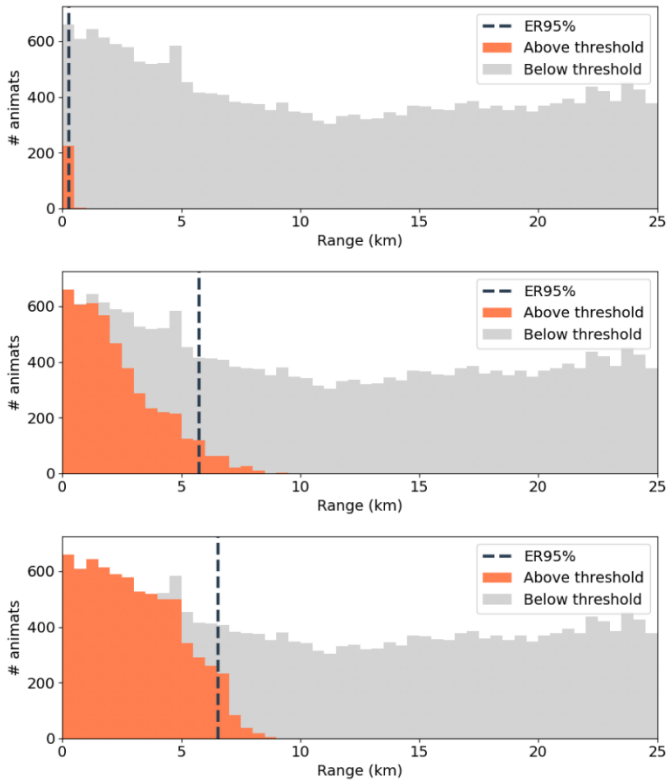

Figure F-8. *Scenario C, male pygmy blue whale animats, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

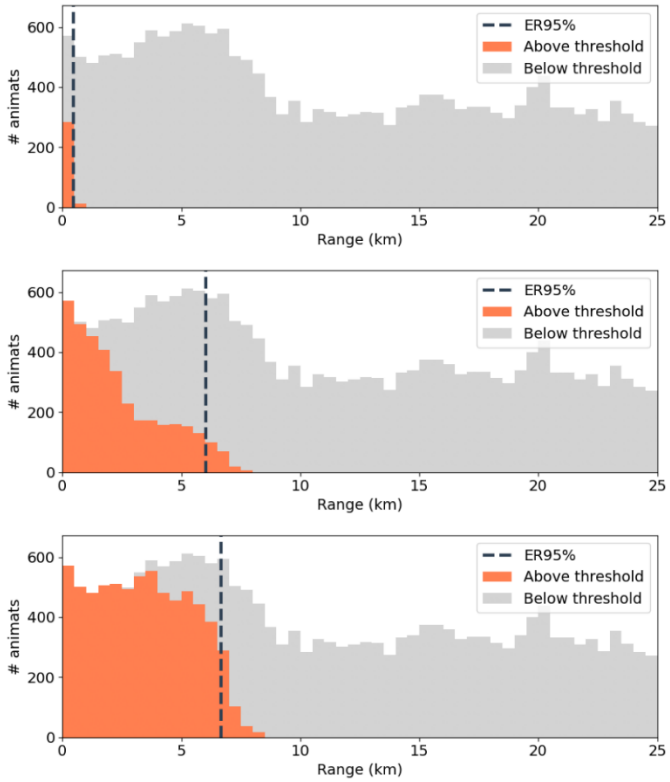

Figure F-9. *Scenario B, migrating southern right whales, mother & calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

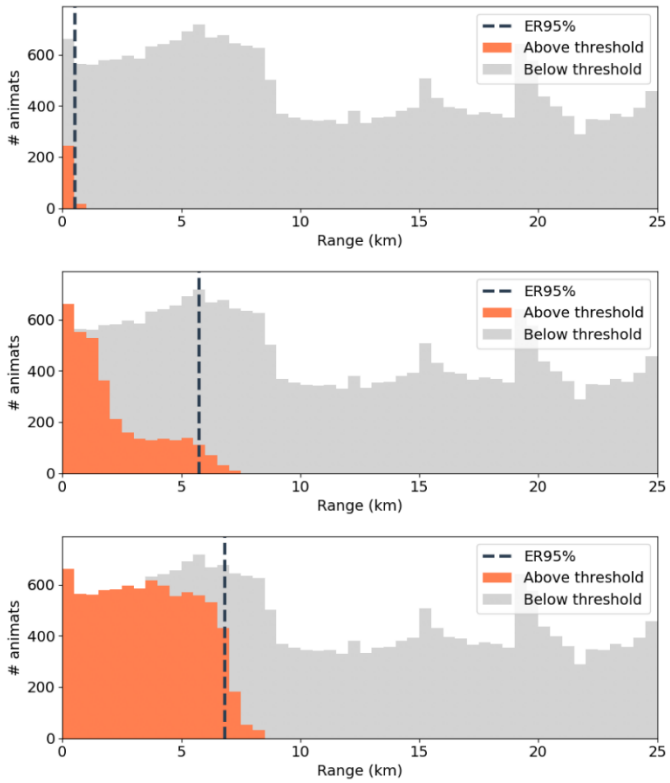

Figure F-10. *Scenario B, migrating southern right whales, no calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

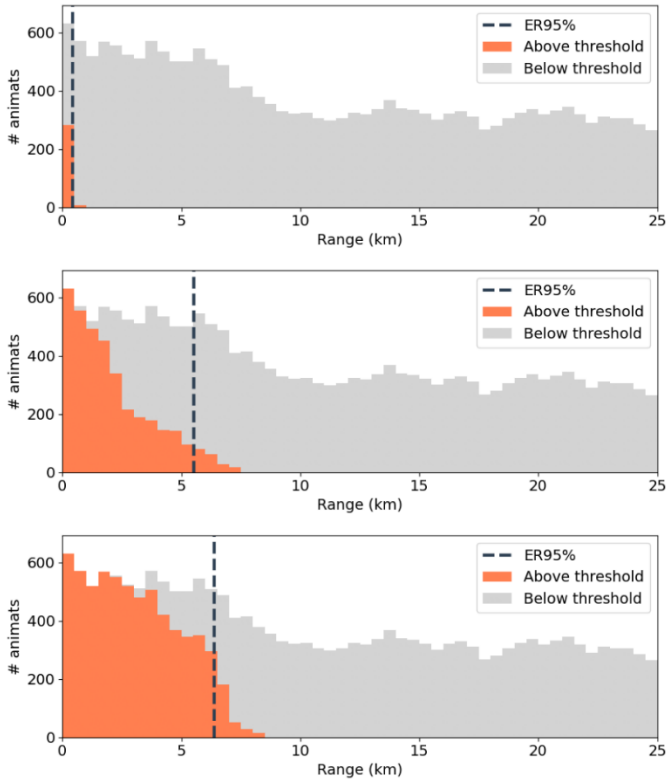

Figure F-11. *Scenario B, aggregating southern right whales, mother & calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

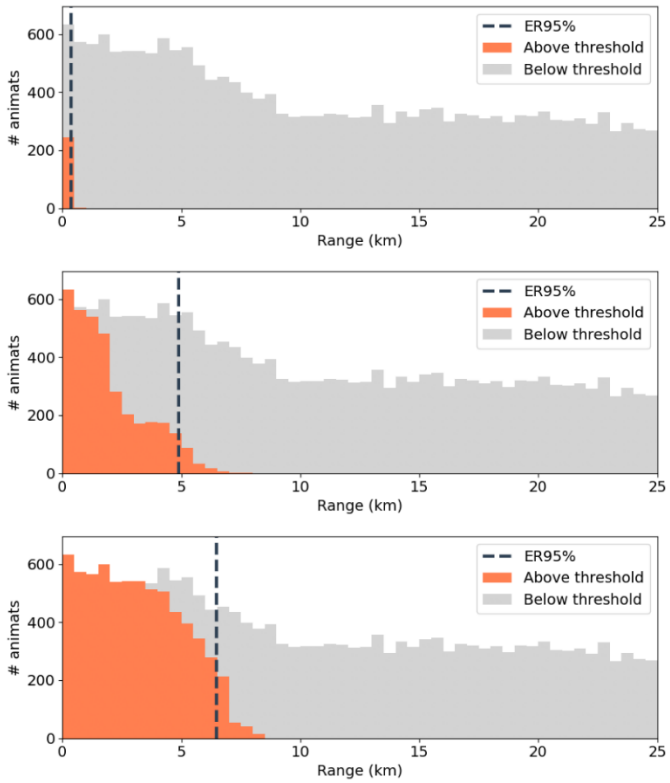

Figure F-12. *Scenario B, aggregating southern right whales, no calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

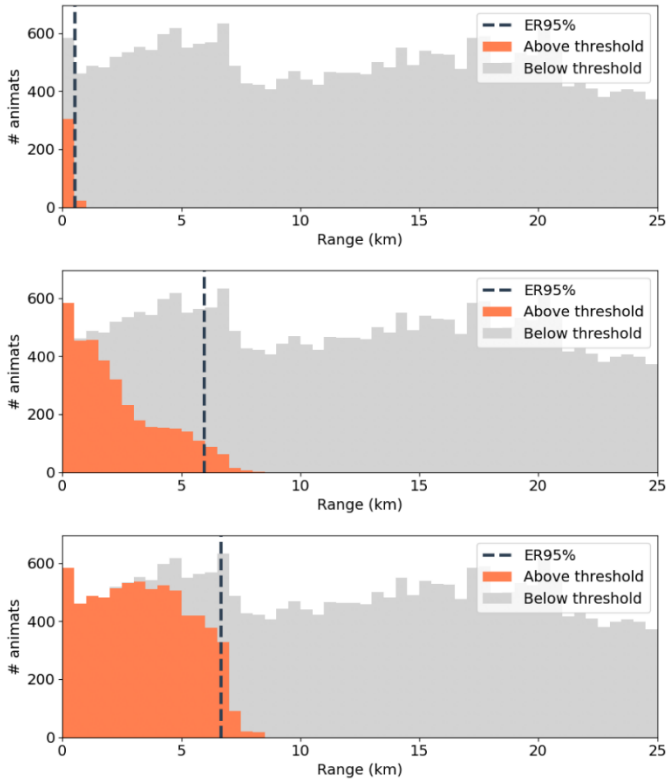

Figure F-13. *Scenario B, migrating southern right whales, mother & calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

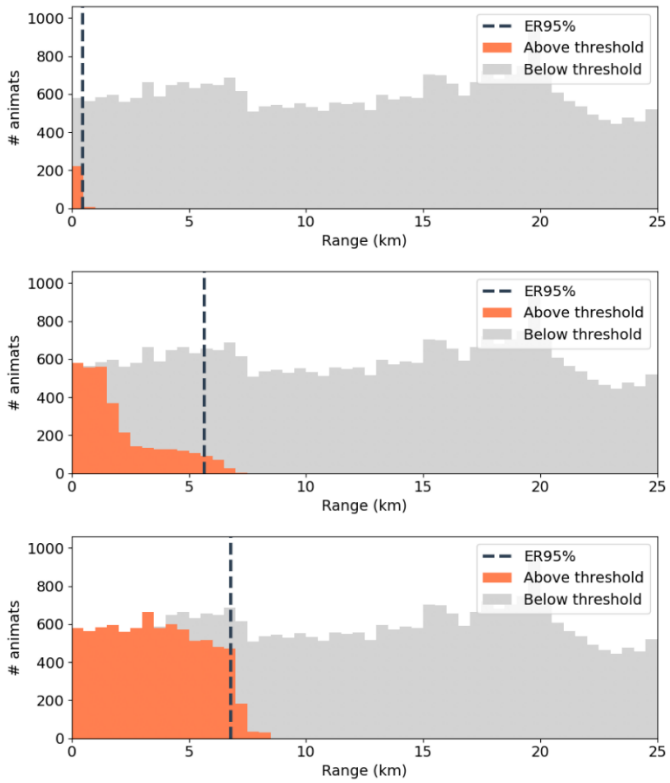

Figure F-14. *Scenario B, migrating southern right whales, no calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

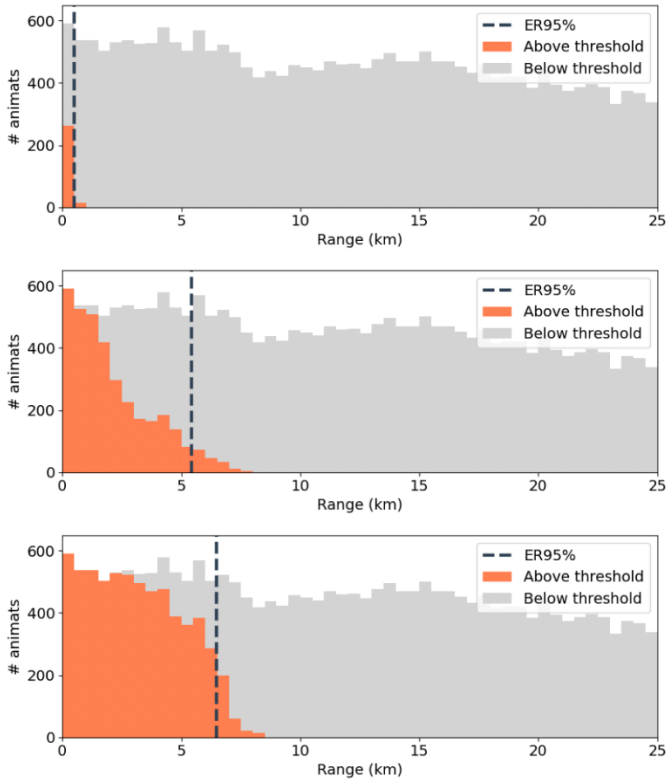

Figure F-15. *Scenario B, aggregating southern right whales, mother & calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

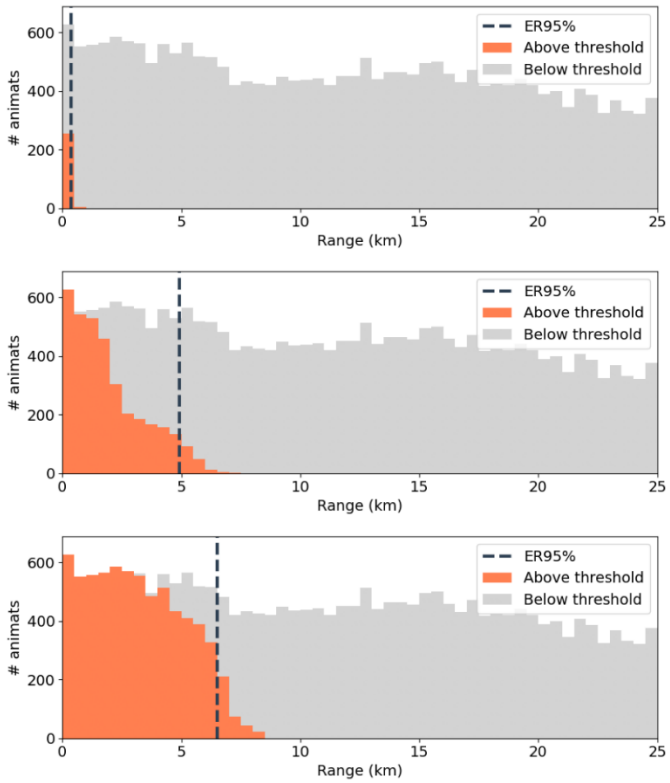

Figure F-16. *Scenario B, aggregating southern right whales, no calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

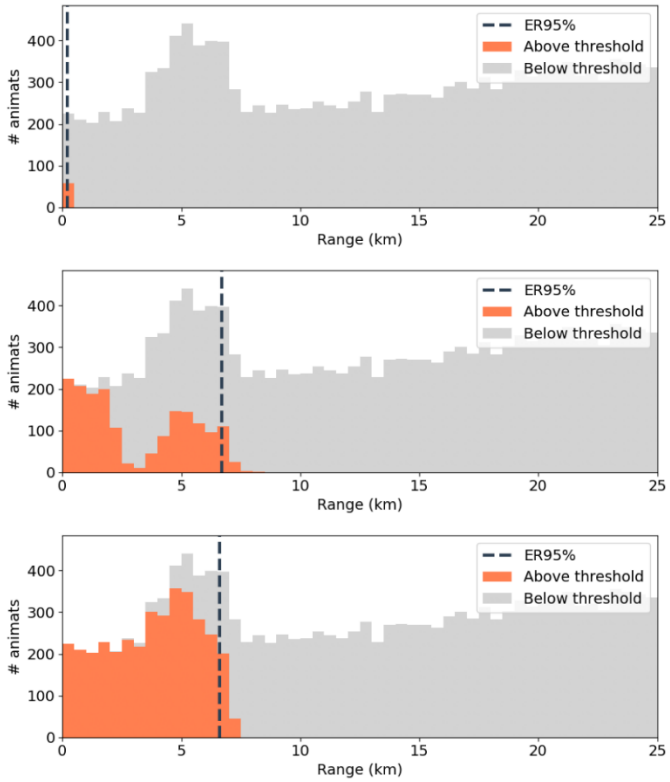

Figure F-17. *Scenario C, migrating southern right whales, mother & calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

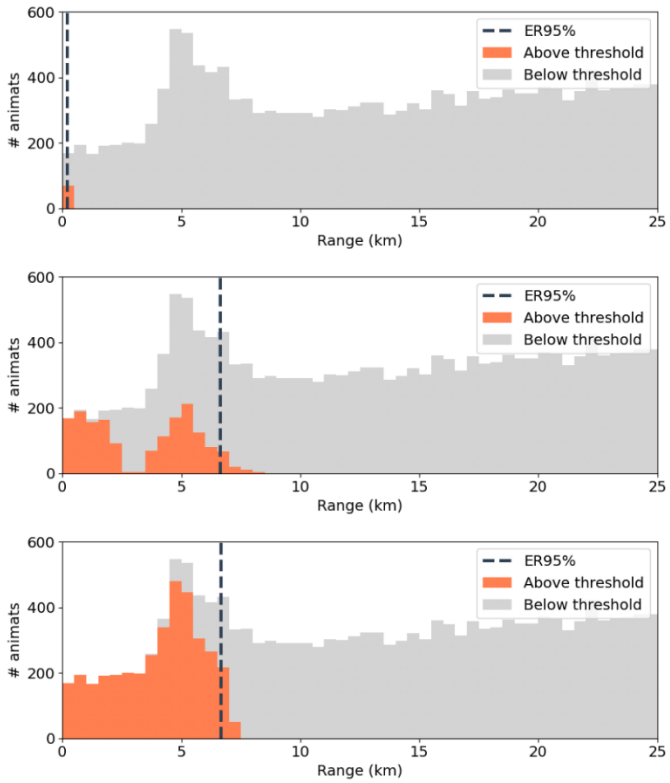

Figure F-18. *Scenario C, migrating southern right whales, no calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

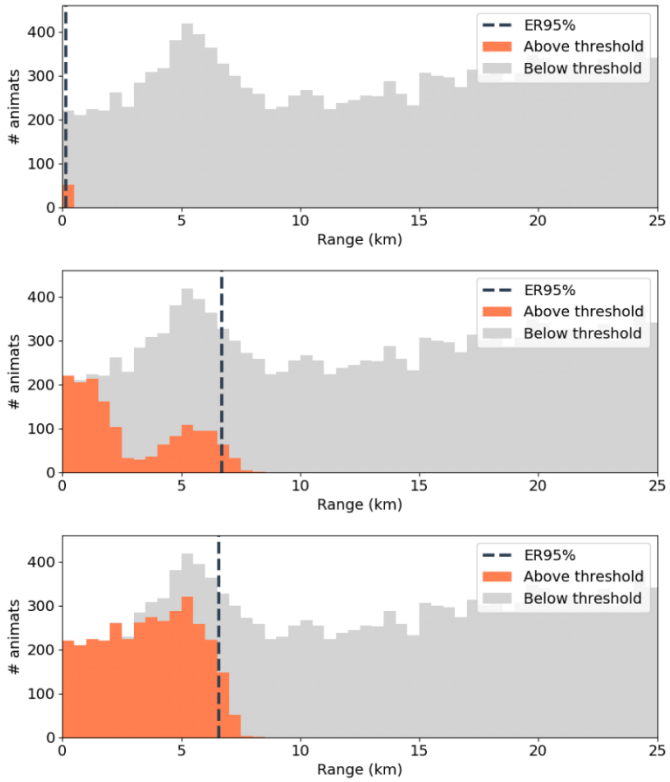

Figure F-19. *Scenario C, aggregating southern right whales, mother & calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

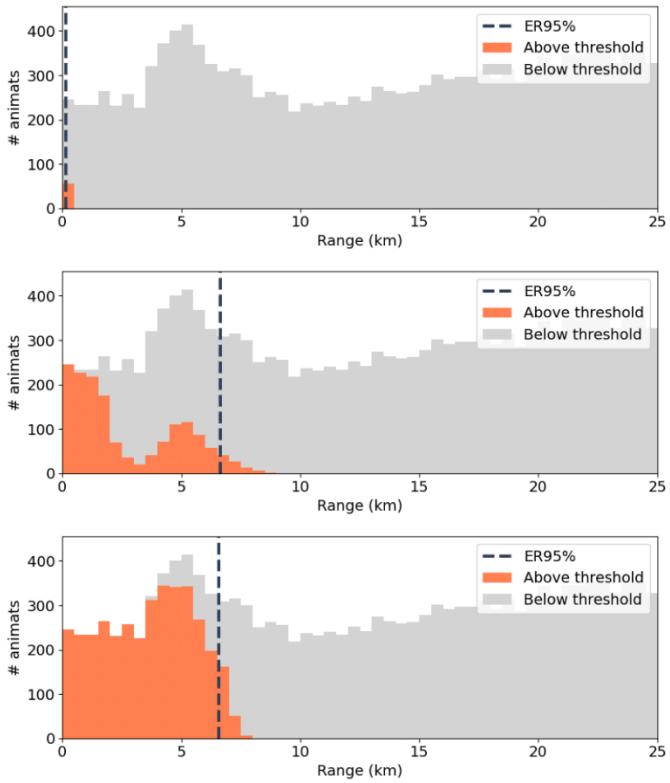

Figure F-20. *Scenario C, aggregating southern right whales, no calf, seeding A*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

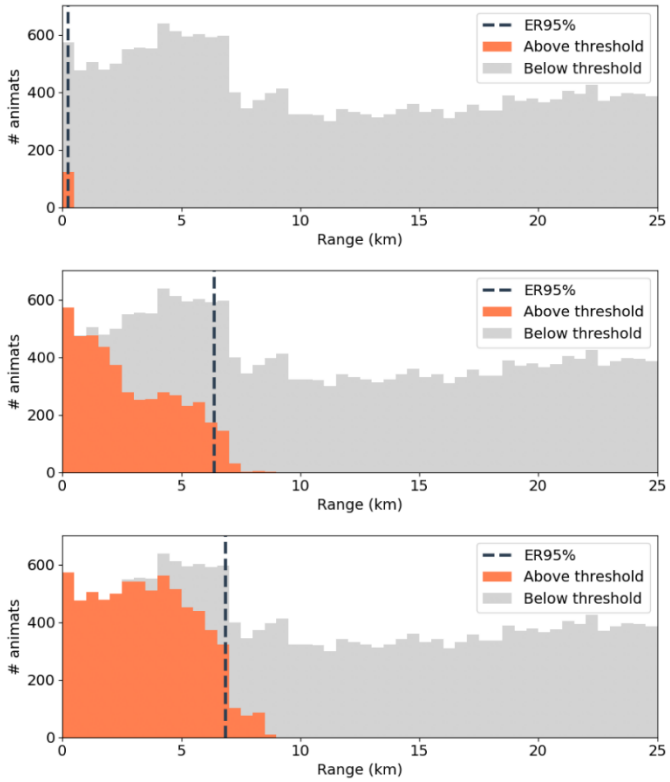

Figure F-21. *Scenario C, migrating southern right whales, mother & calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

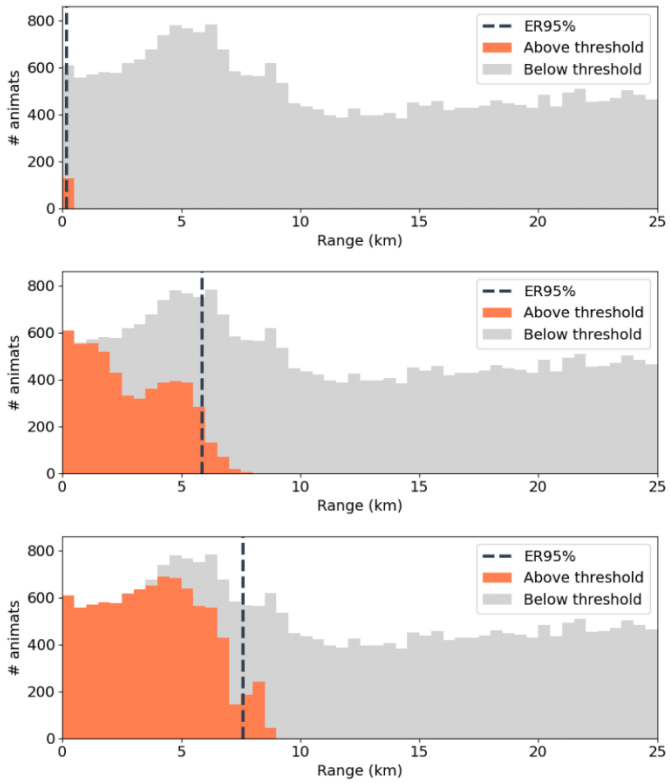

Figure F-22. *Scenario C, migrating southern right whales, no calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

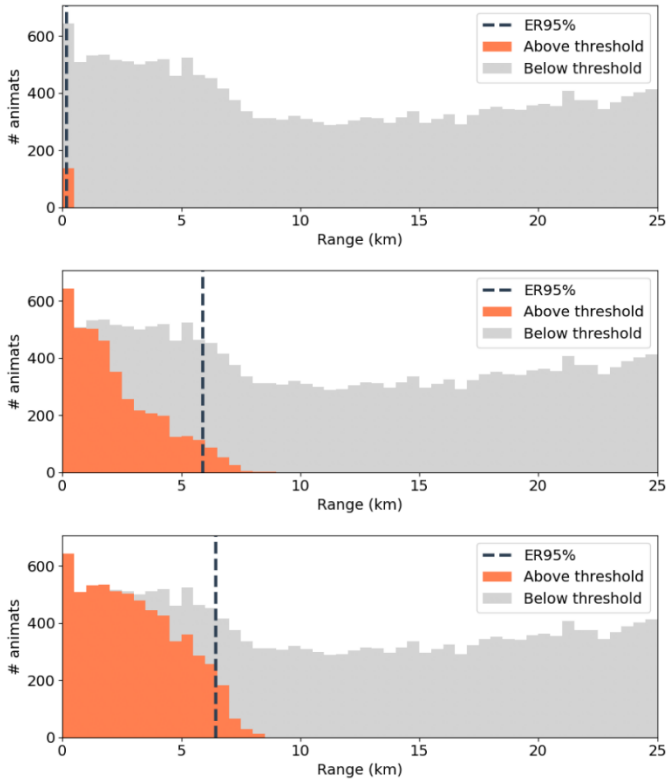

Figure F-23. *Scenario C, aggregating southern right whales, mother & calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

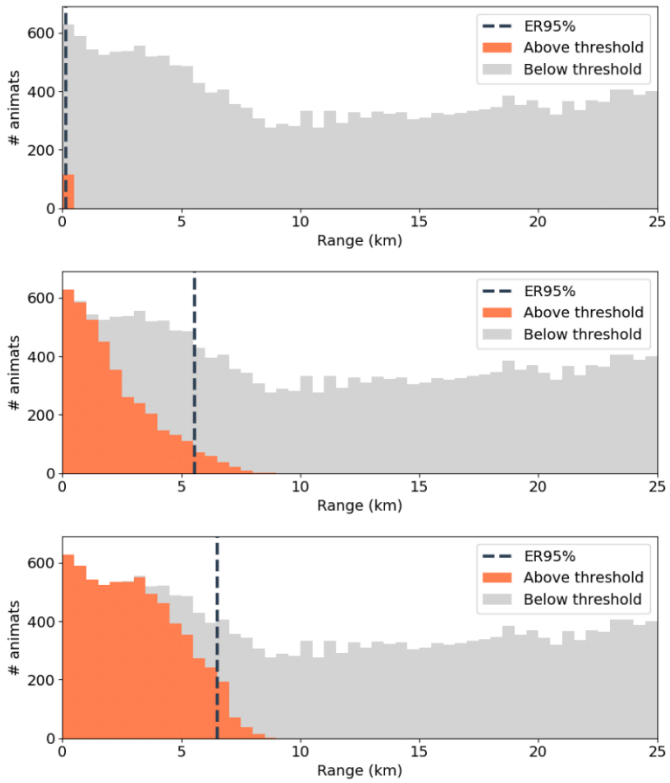

Figure F-24. *Scenario C, aggregating southern right whales, no calf, seeding B*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

Regia Marine Seismic Survey

Acoustic Modelling for Assessing Sound Exposures

JASCO Applied Sciences (Australia) Pty Ltd

5 June 2024

Submitted to:

Klarite

Executive Summary 1
1. Introduction 6
1.1. Iterative Approach 6
1.2. Modelling Scenarios 7
1.3. Sensitive receivers 9
2. Noise Effect Criteria 12
2.1. Marine Mammals 13
2.2. Fish, Fish Eggs, and Fish Larvae 14
2.3. Sea Turtles 15
2.4. Diving Birds 16
2.5. Invertebrates 16
2.5.1. Benthic Invertebrates 16
2.5.2. Plankton 17
2.6. Human Health Assessment Threshold 18
3. Methods 19
3.1. Parameter Overview 19
3.2. Acoustic Source Model 19
3.3. Sound Propagation Models 19
3.4. Geometry and Modelled Regions 20
3.5. Accumulated SEL 20
3.6. Per-pulse Levels at Receivers 21
3.7. Animal Movement and Exposure Modelling 22
3.7.1. Methodology 22
3.7.2. Exposure–based Radial Distance Estimation 24
3.7.3. Species Specific Behaviour Profile Parameterisation 25
4. Results 27
4.1. Acoustic Source Levels and Directivity 27
4.2. Per-pulse Sound Fields 27
4.2.1. Tabulated Results 29
4.2.2. Sound Field Maps and Graphs 35
4.3. Multiple Source Fields 54
4.3.1. Tabulated Results 55
4.3.2. Sound Level Contour Maps 56
4.4. Animal Movement Exposure Ranges 58
4.4.1. Exposure Range Histograms: Pygmy Blue Whales 60
4.4.2. Exposure Range Histograms: Southern Right Whales 64
5. Discussion and Summary 67
5.1. Per-Pulse Sound Fields 67

5.2. Multiple Pulse Sound Fields 68
5.3. Acoustic Results Summary 68
5.4. Animal Movement Modelling 72
5.4.1. PTS and TTS 73
5.4.2. Behavioural Effects 74

Executive Summary

JASCO Applied Sciences (JASCO) performed a numerical modelling study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic impacts on key regional receptors including marine mammals, fish, turtles, benthic invertebrates, plankton and recreational divers and swimmers. The modelling considered a seismic source in triple configuration with a 2820 in^3 total volume, towed at a 7 m depth behind a single vessel, with a 12.5 m impulse interval (inter-pulse interval) and a 37.5 m crossline array separation.

JASCO's specialised airgun array source model was used to predict the acoustic signature of the seismic source and complementary underwater acoustic propagation models were used in conjunction with the modelled array signatures to estimate sound levels over a large area around the sources. Single-impulse sound fields were predicted at 15 sites over the proposed survey line plans. Accumulated sound exposure fields for a 24-hour period were predicted for four representative survey operation scenarios. Four animal movement modelling scenarios, to address the four different survey operations, were also modelled.

The modelling methodology considered source directivity and range-dependent environmental properties likely to be encountered within the proposed survey area. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria. A conservative sound speed profile that would be most supportive of sound propagation conditions for the period of the survey was defined and applied to all modelled sites.

SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels over 24 hours, based on the assumption that a receiver (e.g., an animal) is consistently exposed to such noise levels at a fixed position. More realistically, marine animals would not stay in the same location for 24 hours (especially in the absence of location-specific habitat) but rather a shorter period, depending on the animal's behaviour and the source's proximity and movements. Therefore, a reported radius for the SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS)) if it remained at that location for 24 hours.

A more realistic representation of the potential exposures for pygmy blue whales and southern right whales within the modelling area was undertaken using animal movement modelling ('animat modelling'). While acoustic modelling inherently assumes static animals, the JASCO Animal Simulation Model Including Noise Exposure (JASMINE) combines modelled sound fields with realistic animal movements to predict how animals might be impacted through sound exposure. Calculated exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters.

The distribution of distances of animats predicted to be exposed to sound levels above relevant thresholds was used to calculate 95th percentile exposure ranges ($ER_{95\%}$). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed the threshold criterion. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which the animats are exposed to the sound field over time, both vertically and horizontally. The probability that an animat within the $ER_{95\%}$ was exposed above the threshold criterion was also computed (P_{exp}) to provide additional context.

The acoustic analysis considered the distances away from the seismic source at which several effects criteria or relevant sound levels were reached. The results are summarised below considering all the representative single-impulse modelling sites and all accumulated SEL scenarios for both acoustic

modelling results and pygmy blue whale and southern right whale animat $ER_{95\%}$ results and probabilities.

Marine Mammals – Acoustic Results

- The maximum distance where the NOAA marine mammal behavioural response criterion of 160 dB re 1 µPa^2 (SPL) for impulsive noise could be exceeded varied between 2.91 and 11.8 km from the 2820 in^3 seismic source, depending on modelled site.
- The results for marine mammal injury considered the criteria from Southall et al. (2019). These criteria contain two metrics (PK and SEL_{24h}), both required for the assessment of marine mammal PTS and TTS. The longest distance associated with either metric is required to be applied for assessment; Table 1 summarises the maximum distances, along with the relevant metric.

Table 1. Summary of maximum (R_{max}) horizontal distances (in km) from all modelled sites and scenarios to behavioural response thresholds, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals showing the relevant metric.

Hearing group	Maximum modelled distance to effect threshold (R_{max})								
	Behavioural response[1]	Scenario A		Scenario B		Scenario C		Scenario D	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	11.8 (SPL)	41.9 (SEL_{24h})	5.07 (SEL_{24h})	35.4 (SEL_{24h})	4.55 (SEL_{24h})	20.5 (SEL_{24h})	2.43 (SEL_{24h})	28.6 (SEL_{24h})	1.00 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.03 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.82 (PK)	0.41 (PK)	0.82 (PK)	0.41 (PK)	0.79 (PK)	0.39 (PK)	0.71 (PK)	0.37 (PK)
Otariid Pinnipeds		0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.05 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Animal Movement Modelling

The exposure ranges predicted using animat modelling are more realistic, due to the incorporation of species-specific realistic movements, rather than a conservative approach of calculating ranges using the maximum-over-depth sound fields and receivers which are stationary for 24 hours. In particular, the exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving and movement parameters.

Animal movement modelling ('animat modelling') focussed on feeding pygmy blue whales, migrating southern right whales, and reproducing southern right whales. Animat simulations were run with unrestricted animat seeding, and, if applicable, with seeding restricted to relevant BIAs (southern right whales were restricted to their reproduction BIA and pygmy blue whales were restricted to their foraging BIA). Southern right whales were not additionally restricted to the southern right whale migration BIA as this BIA completely encompassed the modelling area. Pygmy blue whales were additionally restricted to be on the shelf.

- Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criterion, are typically comparable to the predicted acoustic ranges. Apart from reproducing

southern right whales restricted to their reproduction BIA, all scenarios resulted in exposures above the behavioural response threshold (NOAA (2019)). Of these, the maximum $ER_{95\%}$ to the marine mammal behavioural response threshold was 9.83 km, with an associated probability of exposure of 76%. These results are summarised in Table 2.

- Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because the moving animats have a shorter time ('dwell time') to accumulate sound energy. There were exposures above PTS and TTS threshold for all considered scenarios and species, except for southern right whales when they were restricted to their respective reproductive BIA. The maximum $ER_{95\%}$ to PTS and TTS thresholds (Southall et al. 2019) were 1.98 and 22.5 km, respectively, with probabilities of exposure of 58% and 56%.

Table 2. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales. Maximum exposure ranges show $ER_{95\%}$ (km) first and associated probability of exposure of animats travelling within the maximum $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL_{24h})[3]	PTS (SEL_{24h})[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	9.83 (76%)	22.5 (56%)	1.98 (58%)
	B	9.54 (77%)	18.9 (57%)	1.73 (50%)
	C	8.38 (45%)	10.8 (35%)	0.83 (36%)
	D	6.69 (63%)	8.85 (59%)	0.37 (59%)
Southern right whale	A	9.51 (83%)	14.2 (1%)	1.40 (52%)
	B	8.97 (73%)	11.3 (64%)	1.22 (44%)
	C	7.39 (47%)	7.10 (35%)	0.69 (26%)
	D	6.84 (63%)	6.23 (58%)	0.24 (51%)

[1] LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 $\mu Pa^2 \cdot s$)
[2] SPL (L_p; dB re 1 μPa^2)
[3] Southall et al. (2019) criteria for marine fauna.
[4] NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

Sea Turtles

- The PK sea turtle injury criteria of 232 dB re 1 µPa for PTS and 226 dB re 1 µPa for TTS from Finneran et al. (2017) were exceeded at a distance up to 40 m and 80 m from the acoustic centre of the source, respectively.
- The maximum distance to the SEL_{24h} metrics of 204 dB re 1 $\mu Pa^2 s$ for PTS and 189 dB re 1 $\mu Pa^2 s$ for TTS (summarised in Table 3) for all scenarios was 0.07 km for PTS onset and 3.35 km for TTS onset for the 2820 in^3 seismic source (Finneran et al. 2017). As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that sea turtles travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- Table 3 summarises the distances to where the criterion for behavioural response of turtles to 166 dB re 1 μPa^2 (SPL) and the 175 dB re 1 μPa^2 (SPL) threshold for behavioural disturbance (McCauley et al. 2000) could be exceeded.

Table 3. Summary of maximum horizontal distances (in km) from the sound source within which the turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS), are exceeded.

Hearing group	Maximum modelled distance to effect threshold (R_{max})									
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C		Scenario D	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	6.30 (SPL)	2.62 (SPL)	3.35 (SEL_{24h})	0.07 (SEL_{24h})	3.20 (SEL_{24h})	0.07 (SEL_{24h})	1.67 (SEL_{24h})	0.07 (SEL_{24h})	0.60 (SEL_{24h})	0.07 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance within which the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 µPa^{2}s was reached was 0.06 km for all scenarios. PTS and PK thresholds were not resolved within the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.
- The maximum distance within which the OCW-weighted penguin behavioural response threshold of 120 dB re 1 µPa^2 (SPL) for impulsive noise could be exceeded varied between 10.4 and 77.0 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 4 summarises maximum distances within which effect criteria for fish, fish eggs, and fish larvae were exceeded along with the relevant metric. Received sound levels at the seafloor were assessed at a set of representative depths related to the planned acquisition lines ranging from 40 to 170 m.

Table 4. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single-impulse and 24 hour sound exposure level (SEL_{24h}) criteria.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Mortality and Potential Mortal Injury	PK	0.11
	Recoverable injury	PK	0.11
	TTS	SEL_{24h}	8.35
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Mortality and Potential Mortal Injury	PK	0.21
	Recoverable injury	PK	0.23
	TTS	SEL_{24h}	8.35
Fish eggs, and larvae (relevant to plankton)	Mortality and Potential Mortal Injury	PK	0.23

Benthic invertebrates

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 µPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 322 and 715 m for the 2820 in^3 source.
- Bivalves: For comparison to relevant criteria in Day et al. (2016a), the distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was calculated. This particle acceleration was reached at a range of 4 m for a water depth of 50 m, and was not reached at any greater water depth.
- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for sponges and corals (Heyward et al. 2018); the threshold was not reached in water depths greater than 50 m.

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 μPa^2 (SPL; L_P) derived from (Parvin 2005) was considered for recreational swimmers and divers. This criterion was considered for all single-impulse modelled sites and cumulative scenarios, and specifically at 14 coastal sensitive receiver locations. The human health assessment threshold was predicted to be exceeded at Deen Maar (Lady Julia Percy Island), Middle Island, Port Fairy Lighthouse, Killarney Beach and Merri Sanctuary. Maximum received sound levels varied between154.8–150.6 dB re 1 μPa^2 (SPL; L_P) at predicted at Deen Maar and Killarney Beach respectively.

1. Introduction

JASCO Applied Sciences (JASCO) performed a numerical estimation study of underwater sound levels associated with the planned Regia Marine Seismic Survey (MSS) to assist in understanding the potential acoustic effect on receptors including marine mammals, fish, sea turtles, benthic invertebrates, plankton, and divers.

This study considered a 2820 in^3 seismic source array. JASCO's specialised Airgun Array Source Model (AASM) was used to predict acoustic signatures and spectra (see Section 3.2). AASM accounts for individual airgun volumes, airgun bubble interactions, and array geometry to yield accurate source predictions.

Complementary underwater acoustic propagation models were used in conjunction with the array signature and spectra to estimate sound levels considering site-specific environmental influences. Single-impulse sound fields were predicted at 15 unique geographic locations linked to the considered survey line plans and four representative scenarios for accumulated SEL modelling were considered. Accumulated sound exposure fields were predicted for each representative scenario for likely survey operations over 24 hours (see Section 0).

The modelling methodology considered source directivity and range-dependent environmental properties. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), zero-to-peak pressure levels (PK, L_{pk}), peak-to-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria.

The planned seismic acquisition area overlaps the pygmy blue whale (*Balaenoptera musculus brevicauda*) foraging BIA and the migration BIA for southern right whales (*Eubalaena australis*). The southern right whale reproduction BIA lies inshore of the proposed survey lines. The acoustic modelling results were used in conjunction with animal movement modelling ('animat modelling') simulations to predict the distance at which feeding pygmy blue whales, migrating and reproducing southern right whales are expected to be exposed above threshold criteria for PTS, TTS, and behavioural response. Estimates of sound exposure distribution were determined by moving large numbers of simulated animals (animats) through a modelled time-evolving sound field, computed using acoustic models. This approach provides the most realistic prediction of the maximum expected SPL and SEL_{24h} for comparison against the relevant thresholds.

Section 2 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 3 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the seismic source and all environmental parameters the propagation models require. Section 3 also describes the methodology used in the animal movement and exposure modelling simulations. Section 4 presents the results, which are then discussed and summarised in Section 5.

1.1. Iterative Approach

This report, labelled version 2.0, presents a second iteration of modelling undertaken to assess the risks and impacts of underwater noise for the proposed Regia MSS. This second iteration incorporates additional modelled sites and updated survey line plans. The updated survey line plans focused on moving the survey to deeper water depths and increasing the separation from Deen Maar. The acoustic modelling considers an increased number of single-impulse modelling sites to enhance the resolution of predictions at sensitive receiver locations. The labelling of sites and scenarios are similar to the original version 1.0 report. However, identically labelled sites and scenarios are not necessarily equivalent, any comparisons should be done with the careful consideration and attention to detail.

1.2. Modelling Scenarios

Four nominal 24-hour acquisition scenarios were considered for both acoustic modelling and animal movement modelling. Acoustic modelling consisted of both source and propagation modelling and was conducted at 15 individual single-impulse sites for SEL and SPL while water column PK was assessed at eight sites. The locations of the modelled sites are provided in Table 6 and the acquisition lines for the scenarios are shown in Figure 1. The current iteration of the proposed line plan for the survey has included a provision to not survey over bathymetry less than 50 m. The modelling conducted herein was based on a line plan which had some lines extending over bathymetry that was marginally less than 50 m. For the purposes of acoustic and animal movement modelling very little difference is expected if the modelled lines were terminated at the 50 m bathymetric contour. The sites in Table 6 are representative of the geographic and bathymetric extents of the survey.

This study considered a 2820 in^3 seismic source towed in a triple array configuration at a speed of 4.5 knots with an impulse interval (inter-pulse interval) of 12.5 m and a crossline array separation of 37.5 m. The acoustic propagation modelling utilised the sound speed profile for June, as this month is likely to be the most supportive of sound propagation conditions across all months.

The single-impulse sites and the accumulated SEL scenarios were determined based on proposed survey line plans with lines orientated at 113/293°. The single-impulse sites and accumulated SEL scenarios were chosen to be representative of the range of water depths and the potential sound propagation characteristics of the considered line plans. Near-field sea-floor PK and PK-PK sound levels were assessed considering 10 water depths chosen to represent the depth range encompassed by the considered line plans (50 – 170 m). Particle motion modelling was also performed for these representative water depths.

Table 5 summarises the total number of impulses and the period of acquisition within each of the four 24-hour scenarios. The total assessment period for accumulated sound exposure level was 24 h and during line turns, the seismic source was not operating for modelling purposes. The time surveying and time on turns combine to a total 24 h period.

Table 5. Key parameters of the four accumulated sound exposure level (SEL) scenarios.

Scenario	Array	Impulse interval (m)	Tow direction (°)	Total impulses	Acquisition period (h)
A	Triple 2820 in^3 seismic source	12.5	113/293	8000	11.9
B				8116	12.46
C				13508	20.26
D				13248	20.16

Table 6. Location details for the single-impulse modelled sites. Each site was modelled for both tow directions applicable to the modelling of the scenarios of 24 hour operation.

Site	Scenario(s)	Tow directions (°)	Latitude (°S)	Longitude (°E)	MGA[1] Zone 54		Water depth (m)
					X (m)	Y (m)

[1] Map grid of Australia (MGA)

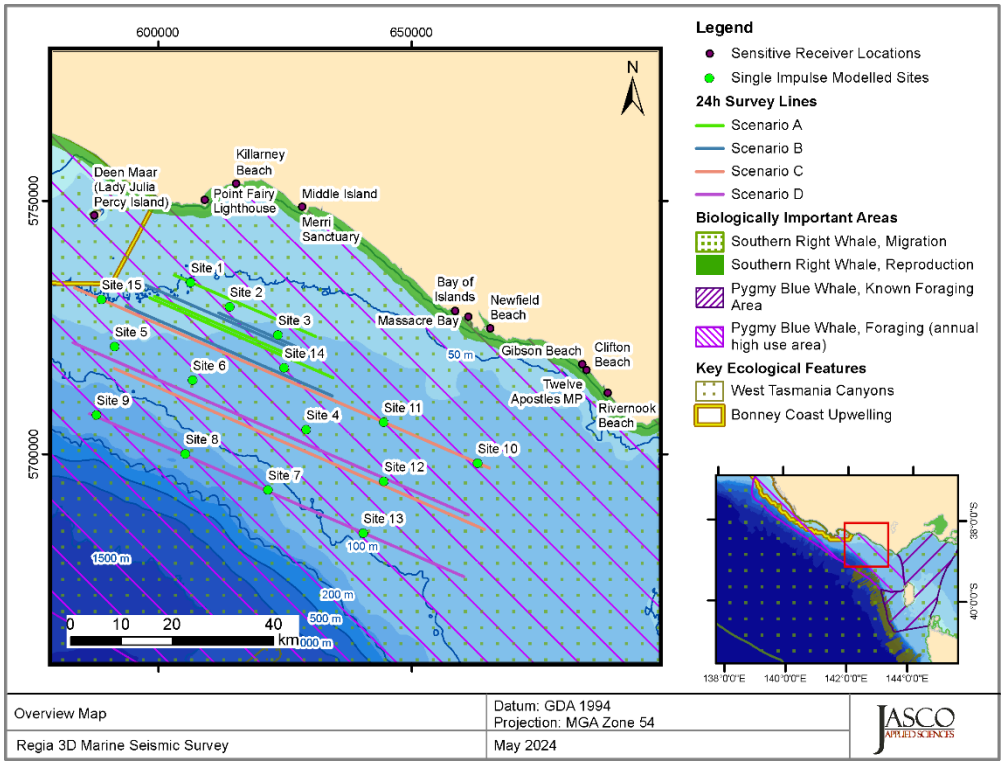

Figure 1. Overview of the single-impulse modelled sites, acquisition lines in the modelled scenarios, and features relevant to the Regia Marine Seismic Survey.

Animal movement modelling ('animat modelling') was undertaken considering the four nominal 24-hour nominal acquisition scenarios and focussed on feeding pygmy blue whales, migrating southern right whales, and reproducing southern right whales.

In unrestricted scenarios, animats were randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2) within the species preferred depth range. During the simulation, if an animat's movement takes it outside of its preferred depth range, it will begin to make movements (while still following the parameters within its species behaviour file) back towards its preferred depth range.

Animat simulations were also run with seeding restricted to relevant BIAs (southern right whales were restricted to their reproduction BIA and pygmy blue whales were restricted to their foraging BIA). Southern right whales were not additionally restricted to the southern right whale migration BIA as this BIA completely encompassed the modelling area. Pygmy blue whales were additionally restricted to be on the shelf.

Animats were seeded at a nominal horizontal sampling density of 4 animats/km^2 for all simulations, except those in which southern right whale animats were restricted to their reproduction BIA, in which case the density was increased to 6 animats/km^2 to account for the relatively small area. Each of the animat simulations were run for a representative 24 h duration.

Figure 2 shows the spatial extent of animat seeding for the four modelled scenarios.

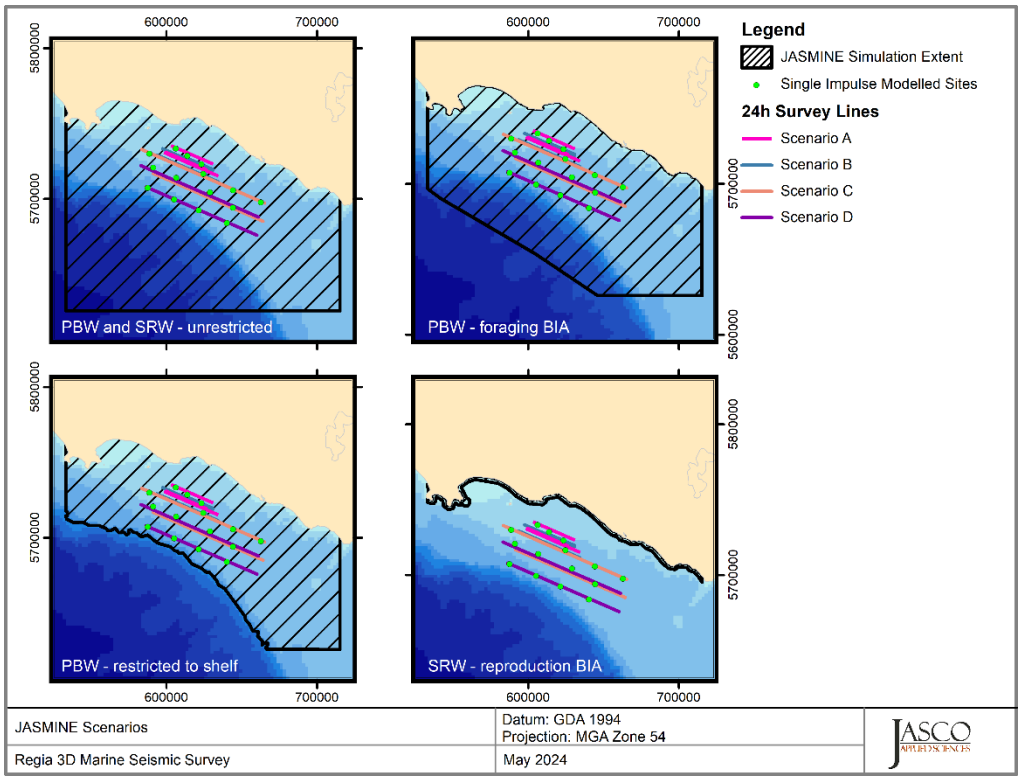

Figure 2. Overview maps of the seeding areas and restrictions for animal movement modelling.

1.3. Sensitive receivers

The Regia MSS lies within a foraging BIA for pygmy blue whales and the migration BIA for southern right whales. In addition, there are several swimming, diving and surfing beaches that are within proximity of the survey area. Deen Maar (Lady Julia Percy Island) is also an important sensitive location. The modelled received sound levels at 14 specific receiver locations have been calculated and are presented in Section 4.2.1.4. The sensitive receiver locations have been labelled 1–14 and are summarised in Table 7 along with the nature of the receptor(s) present at each location.

Table 7. Location details for the sensitive receiver sites.

Receiver ID	Sensitive receiver location	Receptors	Latitude (S)	Longitude (E)	MGA[1] Zone 54	
					X (m)	Y (m)
1	Deen Maar (Lady Julia Percy Island)	No Specific Receptors	38° 25' 37.22"	142° 00' 20.52"	587784	5746327

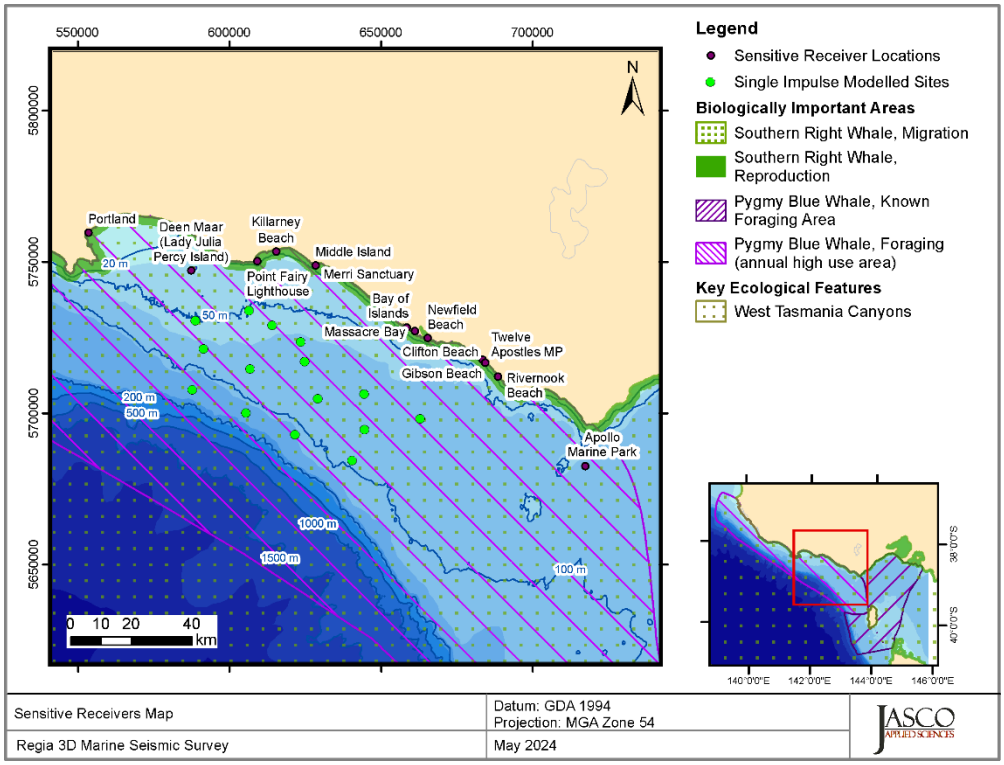

Figure 3. Sensitive receiver locations and single-impulse modelled sites

2. Noise Effect Criteria

The perceived loudness of sound, especially impulsive sound such as that from seismic airguns, is not generally proportional to the instantaneous acoustic pressure. Rather, perceived loudness depends on the pulse rise-time and duration, and the frequency content. Several sound level metrics, such as PK, SPL, and SEL, are commonly used to evaluate sound and its effects on marine life (Appendix A). The period of accumulation associated with SEL is defined, with this report referencing either a "per pulse" assessment or over 24 h. The acoustic metrics in this report reflect the updated ISO standard for acoustic terminology, ISO/DIS 18405:2017 (2017).

Whether acoustic exposure levels might injure or disturb marine mammals is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that have investigated the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

The following noise criteria and sound levels for this study were chosen because they include standard thresholds, thresholds suggested by the best available science, and sound levels presented in literature for species with no suggested thresholds (Sections 2.1–2.5 and Appendix A):

1. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from (Southall et al. 2019) for the onset of Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) in marine mammals.
2. Marine mammal behavioural threshold based on the current US National Oceanic and Atmospheric Administration (NOAA 2019) criterion for marine mammals of 160 dB re 1 µPa^2 (SPL; L_p) for impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs and larvae (including plankton) (Popper et al. 2014).
4. Peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in turtles.
5. Sea turtle behavioural response threshold of 166 dB re 1 µPa^2 (SPL; L_p), (McCauley et al. 2000) as cited in the Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017), along with a sound level associated with behavioural disturbance 175 dB re 1 µPa^2 (SPL; L_p) (McCauley et al. 2000)
6. Diving birds (penguins):
    - Thresholds for otariid pinnipeds are used as a proxy (Section 2.4): Peak pressure levels (PK; L_{pk}) and frequency–weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Southall et al. (2019) for the onset of PTS and TTS in otariids.
    - Behavioural response to impulsive sound of 120 dB re 1 µPa^2 (SPL; L_p) for diving birds based on information from Sørensen et al. (2020).
7. Peak-peak pressure levels (PK-PK; $L_{pk\text{-}pk}$) and particle acceleration (ms^{-2}) at the seafloor to help assess effects of noise on crustaceans through comparing to results in Day et al. (2016a), Day et al. (2019), Day et al. (2016b), Day et al. (2017) and Payne et al. (2008).
8. A sound level of 226 dB re 1 µPa (PK; L_{pk}) for comparison to Heyward et al. (2018) for sponges and corals.
9. An SPL human health assessment threshold of 145 dB re 1 µPa^2 (SPL; L_p) for sound exposure to people swimming and diving derived from Parvin (2005), and considering Ainslie (2008).

Additionally, to assess the size of the low-power zone required under the Australian Environment Protection and Biodiversity Conservation (EPBC) Act Policy Statement 2.1, Department of the

Environment, Water, Heritage and the Arts (DEWHA 2008), the distance to an unweighted per-pulse SEL of 160 dB re 1 µPa^2·s (L_E) is reported.

The following subsections (Sections 2.1–2.5, along with Appendix A.4 and A.5), expand on the thresholds, guidelines and sound levels for marine mammals, fish, fish eggs, fish larvae, sea turtles, and benthic invertebrates.

2.1. Marine Mammals

There are two categories of auditory threshold shifts or hearing loss: permanent threshold shift (PTS), a physical injury to an animal's hearing organs; and Temporary Threshold Shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued.

To help assess the potential for the possible injury and hearing sensitivity changes in marine mammals, this report applies the criteria recommended by Southall et al. (2019), considering both PTS and TTS. These criteria, along with the applied behavioural criterion (NOAA 2019), are summarised in Table 8, with descriptions included in Appendix A.4.1 (auditory impairment) and Appendix A.4.2 (behavioural response), with frequency weighting explained in Appendix A.5. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

Table 8. Unweighted sound pressure level (SPL), 24-hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds for acoustic effects on marine mammals.

Hearing group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS onset thresholds[1] (received level)		TTS onset thresholds[1] (received level)	
	SPL (L_p; dB re 1 µPa^2)	Weighted SEL (L_E; dB re 1 µPa^2 s)	PK (L_{pk}; dB re 1 µPa)	Weighted SEL (L_E; dB re 1 µPa^2 s)	PK (L_{pk}; dB re 1 µPa)
Low-frequency cetaceans (baleen whales)	160	183	219	168	213
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)		185	230	170	224
Very-high-frequency cetaceans (*Kogia*, cephalorhynchid, and *L. australis*)		155	202	140	196
Pinnipeds[2] (Australian sea lion, Australian fur seal, New Zealand fur seal)		203	232	188	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

[2] Listed as pinnipeds but equivalent to other marine carnivores in water in the Southall et al. (2019) criteria. Also equivalent to Otariid pindipeds listed in NMFS (2018).

L_p denotes sound pressure level and has a reference value of 1 µPa^2.

$L_{pk,\,flat}$ peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.

L_E denotes cumulative sound exposure over a 24-hour period and has a reference value of 1 µPa^{2}s.

2.2. Fish, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and turtles, work begun by a panel convened by NOAA two years earlier. The resulting guidelines included specific thresholds for different levels of effects and for different groups of species (Popper et al. 2014). These guidelines defined quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death.
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma.
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges, these effects are not addressed in this report and are included in Table 9 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Turtles, fish eggs, and fish larvae are considered separately. Table 9 lists relevant effects thresholds from Popper et al. (2014).

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long-lasting exposures, it is required to define a time. Popper et al. (2014) recommend applying a standard period, where this is either defined as a justified fixed period or the duration of the activity; however, Popper et al. (2014) also included caveats about how long the fish will be exposed because they can move (or remain in location) and so can the source. Popper et al. (2014) summarises that in all TTS studies considered, fish that showed TTS recovered to normal hearing levels within 18–24 hours. Due to this, a period of accumulation of 24 hours has been applied in this study for SEL, which is similar to that applied for marine mammals in NMFS (2016, 2018).

In the discussion of the criteria, Popper et al. (2014) discuss the complications in determining a relevant period of mobile seismic surveys, as the received levels at the fish change between impulses because the source is moving, and that in reality a revised guideline based on the closest PK or the per-pulse SEL might be more useful than one based on accumulated SEL. This is because exposures at the closest point of approach (CPA) are the primary exposures contributing to a receiver's accumulated level (Gedamke et al. 2011). Additionally, several important factors determine the likelihood and duration a receiver is expected to be in close proximity to a sound source (i.e., overlap in space and time between the source and receiver). For example, accumulation time for fast moving (relative to the receiver) mobile sources is driven primarily by the characteristics of the source (i.e., speed, duty cycle; NMFS 2016, 2018).

As discussed in Popper (2018), many fish species move around, some over large distances. The author suggests that it is reasonable to think that if the sound of a seismic source becomes too loud, the fish will move away from the source because they are able to determine the direction of a sound source. If the fish moves away, the amount of energy to which it is exposed is likely to be one or a few seismic pulses, and these would not likely be loud enough to result in any effect because the fish would move away at a much lower level signal than could cause harm. Data on TTS for fish are very limited, with the only study that examined recovery from seismic impulses being Popper et al. (2005). Popper (2018) states that if this study had been conducted on wild, free-swimming fish instead of caged ones, there would have been no effect whatsoever because they were likely to have moved

away from the source as it approached them, as would happen with normally free-moving demersal and pelagic fish species associated with a 3-D seismic survey in northern Australian waters, extrapolating from the Bethany 3-D assessed in Popper (2018).

Therefore, the time over which energy should be accumulated in each individual fish in the survey area should be limited to the time over which fish receives the maximum exposure, and 24 h is likely too long a period for calculating the accumulation of energy in determining potential harm (e.g., damage or TTS) (Popper 2018). Even if fish do show some TTS, recovery will start as soon as the most intense sounds end, and recovery is likely to even occur, to a limited degree, between seismic pulses. Based on very limited data, recovery within 24 h (or less) is very likely. If TTS does occur, the duration of exposure to the most intense sounds that could result in TTS will be over just a few hours. Thus, energy accumulating over longer periods than a few hours is probably inappropriate (Popper 2018).

Table 9. Criteria for seismic noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	>219 dB SEL_{24h} or >213 dB PK	>216 dB SEL_{24h} or >213 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	>>186 dB SEL_{24h}	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or >207 dB PK	203 dB SEL_{24h} or >207 dB PK	186 dB SEL_{24h}	(N) Low (I) Low (F) Moderate	(N) High (I) High (F) Moderate
Fish eggs and fish larvae (relevant to plankton)	>210 dB SEL_{24h} or >207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low

Peak sound level (PK) dB re 1 µPa; SEL_{24h} dB re 1µPa^2·s. All criteria are presented as sound pressure, even for fish Without swim bladders, since no data for particle motion exist. Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

2.3. Sea Turtles

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles).

Finneran et al. (2017) presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

McCauley et al. (2000) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 μPa^2 (SPL), the sea turtles increased their swimming activity, and above 175 dB re 1 μPa^2 they began to behave erratically, which was interpreted as an agitated state. The

Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017) acknowledges the 166 dB re 1 µPa^2 SPL reported (McCauley et al. 2000) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1 µPa^2 level from McCauley et al. (2000) is recommended as a criterion for behavioural disturbance. These thresholds are shown in Table 10.

Table 10. Acoustic effects of impulsive noise on sea turtles: Unweighted sound pressure level (SPL), 24 hour sound exposure level (SEL_{24h}), and peak pressure (PK) thresholds

Effect type	Criterion	SPL (L_p; dB re 1 µPa^2)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^2·s)	PK (L_{pk}; dB re 1 µPa)
Behavioural response	McCauley et al. (2000)	166	NA	
Behavioural disturbance		175		
PTS onset thresholds[1] (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds[1] (received level)			189	226

[1] Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

L_p denotes sound pressure level and has a reference value of 1 µPa^2.

$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted and has a reference value of 1 µPa.

L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa^{2}s.

2.4. Diving Birds

There are no regulatory thresholds with regard to onset of hearing impairment for penguins, any other bird species, or phylogenetically or anatomically related species. The only scientifically robust thresholds in this context exist for marine mammals. To allow for assessing the noise–induced impact risk of impulsive airgun signals on penguins, the least sensitive marine mammal hearing group, other carnivores in water (OCW), from Southall et al. (2019), is recommended as a proxy. This hearing group has been selected due to similar hearing sensitivity in the frequency band of underwater hearing for diving birds and otariid pinnipeds, which are included in the group. This provides a conservative approach, as otariids are considered more sensitive to underwater sound at higher frequencies than penguins.

There are also no regulatory thresholds or criteria established to assess potential behavioural responses by penguins or flying seabirds to underwater noise. To allow for assessing the potential for such impacts, an onset criterion for behavioural responses of penguins and flying seabirds of 120 dB re 1 µPa^2 (SPL) for impulsive sources was chosen based on information from Sørensen et al. (2020). They exposed gentoo penguins (*Pygoscelis papua*) in a controlled exposure experiment to underwater noise bursts (impulsive signals) and demonstrated that the animals show a graded reaction depending on received sound levels. For consistency with the approach to assess PTS and TTS, the behavioural response threshold is applied as OCW weighted.

2.5. Invertebrates

2.5.1. Benthic Invertebrates

Research is ongoing into the relationship between sound and its effects on crustaceans, including the relevant metrics for both effect and impact. Available literature suggests particle motion, rather than sound pressure, is a more important factor for crustacean and bivalve hearing. Water depth and

seismic source size are related to the particle motion levels at the seafloor, with larger arrays and shallower water being related to higher particle motion levels, more likely relevant to effects on crustaceans and bivalves.

At the seafloor interface, crustaceans and bivalves are subject to particle motion stimuli from several acoustic or acoustically induced waves. These include the particle motion associated with an impinging sound pressure wave in the water column (the incident, reflected, and transmitted portions), substrate acoustic waves, and interface waves of the Scholte type. However, it is unclear which aspect(s) of these waves is/are most relevant to the animals, either when they normally sense the environment or their physiological responses to loud sounds so there is not enough information to establish similar criteria and thresholds as done for marine mammals and fish. Including recent research, such as Day et al. (2016b), current literature does not clearly define an appropriate metric or identify relevant levels (pressure or particle motion) for an assessment. This includes the consideration of what particle motion levels lead to a behavioural response, or mortality. Therefore, at this stage, we cannot propose authoritative thresholds to inform the impact assessment. However, levels can be determined for pressure metrics presented in literature to assist the assessment.

The pressure and acceleration examples provided in Day et al. (2016a) (Figures 11 and 12) indicate that the acceleration and pressure signals occurred simultaneously, which was interpreted as an indication that the waterborne sounds were responsible for the accelerations measured by the geophones. For clarity, it is important to distinguish that the acceleration from waterborne sound energy is *not* ground roll, which Day et al. (2016a) correctly define as the sound that propagates along the interface at a speed lower than the shear wave speed of the sediment. However, the report subsequently uses ground roll for all further discussions of particle acceleration. While Day et al. (2016a) discuss that they chose the simplest measure of ground roll, it should have been referring to as ‘the acceleration from waterborne sound energy’, or ‘waterborne acceleration’ for short.

For crustaceans, a PK-PK sound level of 202 dB re 1 µPa (Payne et al. 2008) is considered to be associated with no effect, and therefore applied in the assessment. Additionally for context related to different levels of potential impairment, the PK-PK sound levels determined for crustaceans in Day et al. (2016b), 209–212 dB re 1 µPa and 213 dB re 1 µPa from Day et al. (2019), are also included.

For bivalves, PK-PK sound levels of 212 and 213 dB re 1 µPa are presented to allow comparison to the maximum sound levels measured in Day et al. (2016a) and Day et al. (2017) for scallops and pearl shell oyster.

A sound level of 226 dB re 1 µPa (PK; L_{pk}) has been considered for comparison to Heyward et al. (2018) for sponges and corals.

Particle acceleration from the seismic source has been presented to allow for comparison with the results in Table 7 of Day et al. (2016a). The maximum particle acceleration assessed by Day et al. (2016a) for scallops was 37.57 ms^{-2}.

2.5.2. Plankton

To assess effects on plankton, there are only a few studies to base threshold criteria on. Popper et al. (2014) cites many of the references and studies on potential impacts of noise emissions on fish eggs and larvae prior to 2014. Results presented in Day et al. (2016b) for embryonic lobsters and Fields et al. (2019) for copepods align with those presented in Popper et al. (2014), which is that mortality and sub-lethal injury are limited to within tens of metres of seismic sources. Additionally, the Popper et al. (2014) criteria (Table 9), are extrapolated from simulated pile driving signals which have a more rapid rise time and greater potential for trauma than pulses from a seismic source.

Other research, such as McCauley et al. (2017), has indicated the potential for effects at longer range and at levels of 178 dB PK-PK, however, Fields et al. (2019) noted that it was difficult to reconcile the

high mortality reported by McCauley et al. (2017) with the low mortalities reported in the greater previous body of earlier research and their experiment. They recommended further research into whether it is the sound pulse itself (i.e., the energy, peak pressures, or particle acceleration), the (turbulent) fluid flow occurring more slowly (i.e., not related to the sound pulse), or other effects such as the bubble cloud that which might cause higher mortality near the seismic source.

2.6. Human Health Assessment Threshold

Underwater, the human ear is about 20 dB less sensitive than it is in air at low frequencies (20 Hz), increasing to 40 dB at mid–frequencies (less than 1 kHz), and increasing to 70–80 dB less sensitive at higher frequencies (Parvin 1998). Divers who wear neoprene hoods have even higher hearing thresholds (lower sensitivity) above 500 Hz because the hood material absorbs high–frequency sounds (Sims et al. 1999). Exposure studies related to divers have typically focused on military sonar exposure, with little information on seismic surveys, and as such care is required when considering thresholds for recreational divers and swimmers, particularly for impulsive sounds such as seismic surveys (Ainslie 2008).

The auditory threshold of hearing under water was lowest at 1 kHz (70 dB re 1 µPa SPL) and increased for lower and higher frequencies to around 120 dB re 1 µPa at 20 Hz and at 20 kHz (Parvin 1998). Fothergill et al. (2000) and Fothergill et al. (2001) conducted controlled acoustic exposure experiments on military divers under fully controlled conditions at a US Ocean Simulation Facility and an US Open water test facility; in all tests, the diver were covered with soft or hard shell dive suits and their position and distance relative to sound source, signal characteristics and received levels were controlled and documented (Pestorius et al. 2009). A total of 89 male Navy divers were exposed to pure tone signals and sweeps between 160–320 Hz at SPLs up to 160 dB re 1 µPa. The divers were exposed to these sounds over 100 seconds at depths from 10 to 40 metres. The divers rated the sounds on a severity scale. For frequencies between 100 and 500 Hz, at a received SPL of 130 dB re 1 µPa, divers and swimmers detected body vibration. None of the divers tested rated levels of 140 dB re 1 µPa as “very severe”; however, at 157 dB re 1 µPa, sound was rated as “very severe” 19 per cent of the time. No physiological damage was observed at the highest levels tested: 160 dB re 1 µPa (Fothergill et al. 2001). In a subsequent study, recreational divers were exposed to tonal signals or 30 Hz–sweeps at frequencies between 100 and 500 Hz at received levels of 130–157 dB re 1 µPa (Pestorius et al. 2009). Each exposure lasted for seven seconds. Nine female and 17 male scuba divers were tested, all wearing full body neoprene wetsuits. Diver aversion and perception of body vibration were used as test parameters. The results showed no sex–specific differences. The results differed as a function of frequency – while test results showed a strong overall variation between subjects, signals at 100 Hz elicited the strongest aversion in all tests and even at 148 dB a few diver ratings indicated extreme aversion. Due to this and the strong variation between test subjects, the following exposure limit for both military and recreational divers was suggested as a conservative measure: For frequencies between 100 and 500 Hz, the maximum SPL should be 145 dB re 1 µPa over a maximum continuous exposure of 100 seconds or with a maximum duty cycle of 20 per cent and a maximum daily cumulative total of three hours. The trading relation between the maximum SPL and duration was 4 dB per doubling of duration (e.g. 141 dB SPL for a 200 second exposure) (Pestorius et al. 2009).

Considering only frequencies between 100 and 500 Hz, Parvin (2005) suggested 145 dB re 1 µPa as a safety criterion for recreational divers and swimmers. Piling impulses are broadband sources, and therefore, to be precautionary, the 145 dB re 1 µPa SPL suggested by Fothergill et al. (2001) and Parvin (2005) has been applied in this study as a broadband SPL and as a human health assessment threshold for recreational divers and swimmers. This does not imply that this level is associated with the onset of injury.

3. Methods

3.1. Parameter Overview

The specifications of the seismic sources and the environmental parameters used in the propagation models are described in additional detail in Appendix D. A single sound speed profile for June was considered in this modelling study (Appendix D.3.2). This was identified as the month that would likely provide the farthest propagation by comparing the sound speed profile across all months.

The modelled single-impulse sites spanned water depths of 49–174 m. Three geological profiles were defined to represent the different geo-acoustic properties across the area encompassed by the considered line plans, and are representative of the different zones within the entire Survey Area (Appendix D.3.3). In water depths less than 120 m, the seabed geological profile was characterised as layered limestone, variably cemented. In the shallowest modelled water depths, less than 65 m and within 20 km of the coast, the geological profile also included a thin layer of overlying sand. For sites in deeper water, greater than 120 m, the seabed geologic profile was characterised as a thick package of unconsolidated sediments.

3.2. Acoustic Source Model

The pressure signature of the individual airguns and the composite decidecade-band point-source equivalent directional levels (i.e., source levels) of the 2820 in^3 seismic source were modelled with JASCO's Airgun Array Source Model (AASM). Although AASM accounts for notional pressure signatures of each seismic source with respect to the effects of surface-reflected signals on bubble oscillations and inter-bubble interactions, the surface-reflected signal (known as surface ghost) is not included in the far-field source signatures. The acoustic propagation models account for those surface reflections, which are a property of the propagating medium rather than the source.

AASM considers:

- Array layout.
- Volume, tow depth, and firing pressure of each airgun.
- Interactions between different airguns in the array.

All seismic sources considered were modelled over AASMs full frequency range, up to 25 kHz. Appendix B.1 details this model.

3.3. Sound Propagation Models

Three sound propagation models were used to predict the acoustic field around the seismic source:

- Combined range-dependent parabolic equation and Gaussian beam acoustic ray-trace model (MONM-BELLHOP, 10 Hz to 25 kHz).
- Full Waveform Range-dependent Acoustic Model (FWRAM, 10 to 1024 Hz).
- Wavenumber integration model (VSTACK, 10 to 1024 Hz).

The models were used in combination to characterise the acoustic fields at short and long ranges in terms of SEL, SPL, PK, and PK-PK. Appendix C details each model. MONM-BELLHOP was used to calculate SEL of a 360° area around each source location. FWRAM was used to model synthetic seismic pulses and to generate a generalised range-dependent SEL to SPL conversion function for a

sub-set of the considered modelled sites. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM-BELLHOP to estimate SPL values. FWRAM was also used to calculate water column PK and PK-PK levels.

VSTACK was used to calculate near field PK and PK-PK levels along 4 transects at the seafloor along the endfire and broadside directions considering a set of 11 unique water depths at 40, 50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m. This model was also used to model the peak particle acceleration magnitude considering the same 11 unique water depths. For modelled sites where the seabed is likely to be composed of outcropping limestone (Appendix D.3.3), an additional correction factor was applied to predictions to better estimate loss characteristics of the seabed (see Appendix C.3.2).

3.4. Geometry and Modelled Regions

To predict sound levels with MONM-BELLHOP was used to calculate propagation losses up to distances of 100 km from the source, with a horizontal separation of 20 m between receiver points along all modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta = 2.5°$ for a total of $N = 144$ radial planes. Receiver depths were chosen to span the entire water column over the modelled area, from 2 m to a maximum of 2700 m, with step sizes that increased with depth. To supplement the MONM results, high-frequency results for propagation loss were modelled using BELLHOP for frequencies from 1.25 to 25 kHz. The MONM and Bellhop results were combined to produce results for the full frequency range of interest.

FWRAM was run to 100 km along four radials (fore and aft endfire, and port and starboard broadside) for computational efficiency. This was done to compute SEL-to-SPL conversions (Appendix D.2) and also to quantify water column PK and PK-PK. The horizontal range step begins at 20 m and increases with range from the source.

The maximum modelled range for VSTACK was 1000 m, and a variable receiver range increment that increased away from the source was used, which increased from 10 to 25 m. The final tabulated distances were obtained through interpolating predicted received levels. Received levels were computed for receivers at 5 and 50 cm above the seafloor to assist in the assessment on invertebrates and fish respectively.

3.5. Accumulated SEL

New sound energy is introduced into an environment with each pulse from the seismic source. While some impact criteria are based on the per-pulse energy released, others, such as the marine mammal and fish SEL criteria (Section 2), account for the total acoustic energy marine fauna is subjected to over a specified duration, defined in this report as 24 h. An accurate assessment of the accumulated sound energy depends not only on the parameters of each seismic impulse but also on the number of impulses delivered in a duration and the relative positions of the impulses.

When there are many seismic impulses, it becomes computationally prohibitive to perform sound propagation modelling for every single event. The distance between the consecutive seismic impulses is small enough, such that the environmental parameters that influence sound propagation are virtually the same for many impulse points. The acoustic fields can, therefore, be modelled for a subset of seismic pulses and estimated at several adjacent ones. After sound fields from representative impulse locations are calculated, they are adjusted to account for the source position for nearby impulses.

Although estimating the cumulative sound field with the described approach is not as precise as modelling sound propagation at every impulse location, small-scale, site-specific sound propagation features tend to blur and become less relevant when sound fields from adjacent impulses are

summed. Larger scale sound propagation features, primarily dependent on water depth, dominate the cumulative field. The accuracy of the present method acceptably reflects those large-scale features, thus providing a meaningful estimate of a wide area SEL field in a computationally feasible framework.

To produce the map of accumulated received sound level distributions and calculate distances to specified sound level thresholds, the maximum-over-depth were calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth sound levels for each impulse were then resampled (by linear triangulation) to produce a regular Cartesian grid. The sound field grids from all impulses were summed (see Equation A-5) to produce the cumulative sound field grid with cell sizes of 20 m. The contours and threshold ranges were calculated from these flat Cartesian projections of the modelled acoustic fields.

The unweighted (fish) and frequency-weighted SEL_{24h} results were rendered as contour maps, including contours that focus on the relevant criteria-based thresholds. Only contours at ranges larger than the nearfield of the seismic source were rendered.

3.6. Per-pulse Levels at Receivers

The received acoustic levels at 14 sensitive receiver locations have been calculated; sensitive receiver locations are summarised in Table 7. To determine whether per-pulse levels at these receivers exceed relevant thresholds, modelling was undertaken to estimate the sound level at a given receiver from any shot within the survey.

The method utilised to calculate per-pulse levels at receivers is similar to the method described in Section 3.5 to calculate accumulated received levels. The per-pulse sound fields modelled for the fifteen single-impulse modelled sites were translated to each impulse location on the survey lines based on the closest, most appropriate single-impulse modelled site. For computational efficiency purposes, every 50^{th} impulse was considered in this method. Modelling every shot on the survey lines would be computationally prohibitive.

After translation the maximum-over-depth received level at a given location was extracted. In such a fashion, a sequence of received levels at a given location can be tabulated for impulses in the survey. In order to obtain per-pulse received levels, the received levels were not summed for this analysis, unlike the calculation for accumulated received levels (Section 3.5).

3.7. Animal Movement and Exposure Modelling

3.7.1. Methodology

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was used to predict the exposure of animats to sound arising from the seismic activity. JASMINE integrates the predicted sound field with biologically meaningful movement rules for each marine mammal species (pygmy blue whales and southern right whales for the current analysis) that results in an exposure history for each animat in the model. An overview of the exposure modelling process using JASMINE is shown in Figure 4.

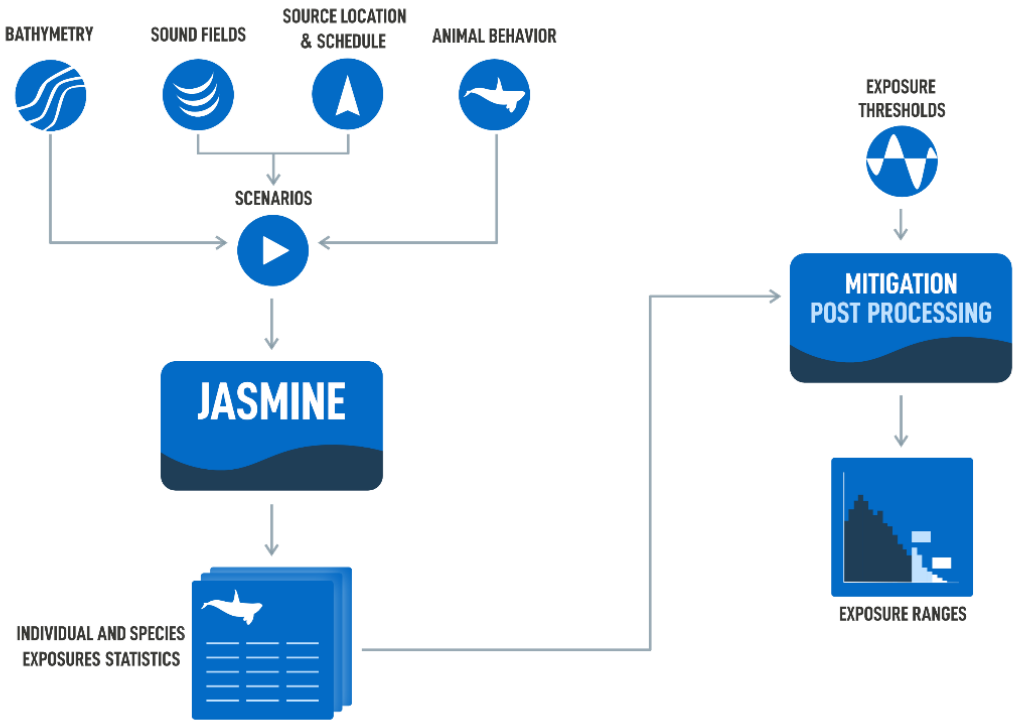

Figure 4. Exposure modelling process overview.

In JASMINE, the sound received by the animats is determined by the proposed seismic operations. As illustrated in Figure 5, animats are programmed to behave like the marine animals that may be present in the modelling area. The parameters used for forecasting realistic behaviours (e.g., diving and foraging depth, swim speed, surface times) are determined and interpreted from marine mammal studies (e.g., tagging studies) where available, or reasonably extrapolated from related or comparable species. For the assessment of cumulative criteria, an individual animats sound exposure levels are summed over a 24 h duration to determine its total received energy, and then compared to the relevant threshold criteria. For single-exposure metrics, the maximum exposure is evaluated against threshold criteria for each 24 h period. For additional information on JASMINE, see Appendix D.4.

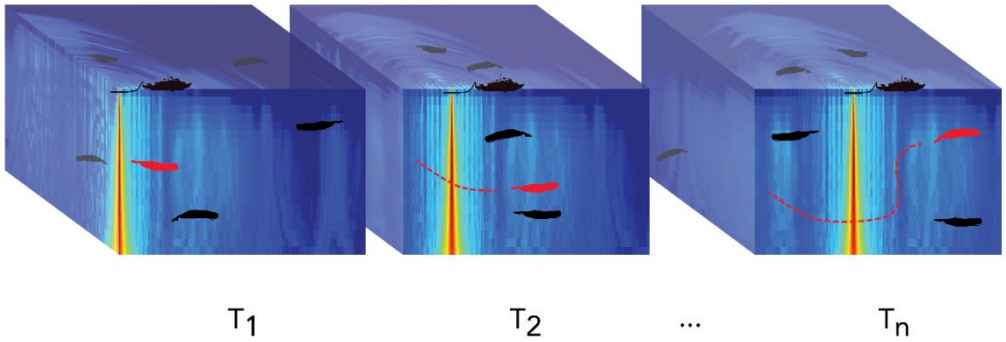

Figure 5. Depiction of animats in a moving sound field. Example animat (red) shown moving with each time step (T_n). The acoustic exposure of each animat is determined by where it is in the sound field, and its exposure history is accumulated as the simulation steps through time.

The exposure criteria for impulsive sounds (described in Section 2) were used to determine the number of animats that exceeded thresholds. To generate statistically reliable probability density functions, model simulations were run with animat sampling densities of 4 animats/km^2, except those in which southern right whale animats were restricted to their reproduction BIA, in which case the density was increased to 6 animats/km^2 to account for the relatively small area. The modelling results are not related to real-world density estimates for pygmy blue whales and southern right whales within BIAs or the wider area, as animal density in the area is unknown. To evaluate PTS, TTS and behavioural response, exposure results were obtained using detailed behavioural information for pygmy blue whales and southern right whales (described in Sections 3.7.3.1 and 3.7.3.2).

The seismic source was modelled as a vessel towing an airgun array at a speed of 4.5 knots, with an impulse interval of 12.5 m. The simulated source tracks followed a racetrack configuration with acquisition not occurring on turns. At the time and location of each seismic pulse, the modelled source location with the closest distance was selected for exposure modelling. The track lines along with the acoustic modelling locations are shown in Figure 1.

Figure 6 shows an example animat track (generated for information purposes only and not related to the results presented in this report) with associated received levels from a stationary point source. The top panel displays the animat track relative to the point source, and the bottom panel displays the accumulation of SEL_{24h} for TTS and PTS criteria. At approximately 50 seconds, the animat is exposed so that the TTS threshold is exceeded, and at approximately 700 seconds the animat is exposed so that the PTS threshold is exceeded.

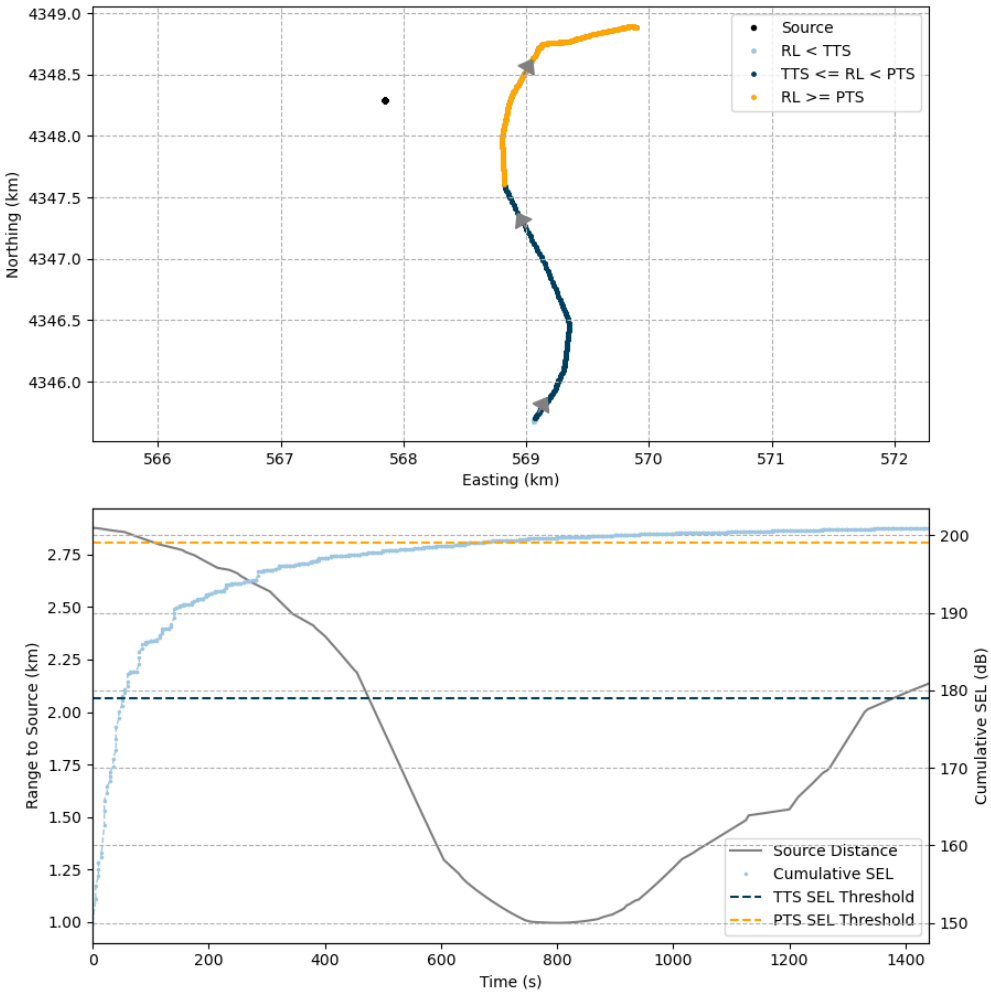

Figure 6. Animat track from an example simulation showing northward movement over a 1400 s duration. The upper panel shows a plan view of both a stationary point source and a foraging animat. Animat steps are coloured to indicate whether the accumulated sound energy at that point has exceeded either TTS or PTS threshold criteria. The lower panel shows horizontal distance in kilometres to the source (grey line; left y-axis) and cumulative 24-h SEL ($L_{E,24h}$, dB re 1 µPa²·s; right y-axis) as a function of time. Note that this example does not use data from the current study.

3.7.2. Exposure–based Radial Distance Estimation

The results from the animal movement and exposure modelling provided a way to estimate radial distances to effect thresholds. The distance to the closest point of approach (CPA) for each of the animats was recorded. The $ER_{95\%}$ (95% Exposure Range) is the horizontal distance that includes 95% of the animat CPAs that exceeded a given effect threshold (see Section 2). Within the $ER_{95\%}$, there is generally some proportion of animats that do not exceed threshold criteria. This occurs for several reasons, including the spatial and temporal characteristics of the sound field and the way in which animats sample the sound field over time, both vertically and horizontally. The sound field varies as a function of range, depth, and azimuth based on a variety of factors such as bathymetry, sound speed profile, and geoacoustic parameters. The way the animats sample the sound field depends upon species-typical swimming and diving characteristics (e.g., swim speed, dive depth, surface intervals, and reversals). Furthermore, even within a particular species definition, these characteristics vary with behavioral state (e.g., feeding, migrating). As this results in some animats not exceeding threshold criteria even within the $ER_{95\%}$, the probability that an animat within that distance was exposed above threshold within the $ER_{95\%}$ was also computed (P_{exp}) to provide additional context.

Acoustic ranges are reported for both $R_{95\%}$ and R_{max}, however, exposure ranges are reported for $ER_{95\%}$ only since, statistically, ER_{max} is not defined. JASMINE is a Monte Carlo simulation, and the results are probabilistic in nature. This is in contrast with acoustic modelling, where there is a specific maximum isopleth range for a given source/environment setup.

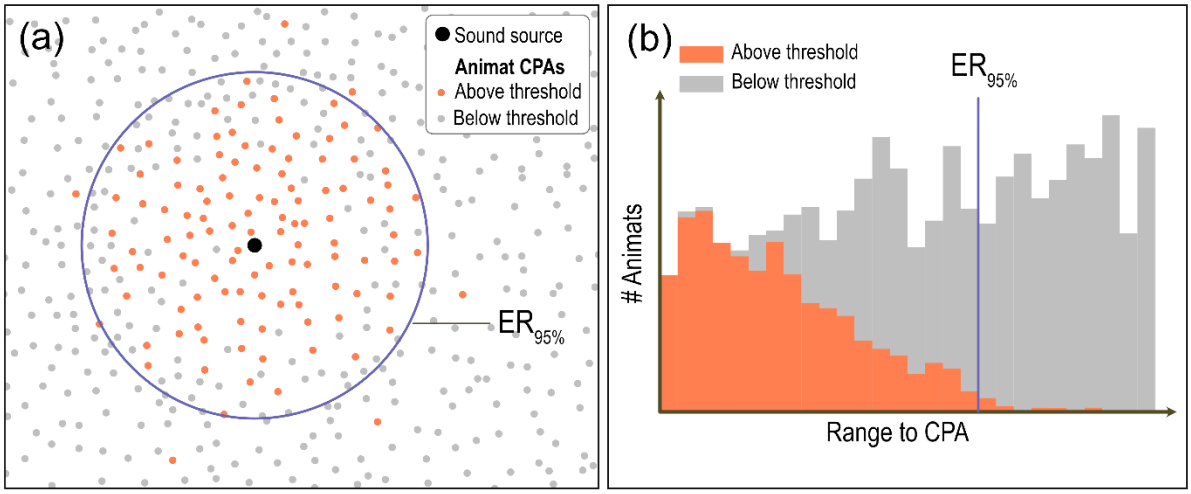

Figure 7. Example distribution of animat closest points of approach (CPAs). Panel (a) shows the horizontal distribution of animats near a sound source. Panel (b) shows the distribution of distances to animat CPAs. The 95% exposure range ($ER_{95\%}$) is indicated in both panels.

3.7.3. Species Specific Behaviour Profile Parameterisation

3.7.3.1. Pygmy Blue Whale Behaviour Profile

The project area overlaps with a known foraging BIA for pygmy blue whales (DoE (AU) 2015-2025). Therefore, only foraging behaviours were considered in the species profile.

Data on fine-scale foraging behaviour are not currently available for pygmy blue whales. Therefore, data from multi-sensor tags deployed on blue whales from the North Pacific were used to inform the feeding behaviours. Irvine et al. (2019) used intermediate-duration archival tags (SPLASH MK10) attached to eight blue whales off the coast of California and was able to determine two feeding modes based on depth: shallow and deep. These two feeding behaviours differed further between males and females, with females generally diving deeper than males during both shallow and deep feeding. In order to account for these differences, female and male pygmy blue whales were modelled separately, with values derived from Irvine et al. (2019). Most remaining parameters for feeding behaviour were sourced from Goldbogen et al. (2011), who deployed 25 multi-sensor suction cup tags (DTAGs) on blue whales off the coast of California. Finally, travel speed was derived from satellite tags deployed on pygmy blue whales off southern Australia (Möller et al. 2020), and surface interval was derived from a satellite tag deployed on a pygmy blue whale off western Australia (Davenport et al. 2022).

3.7.3.2. Southern Right Whale Behaviour Profile

The project area is located in the migration BIA for southern right whales, and the reproduction BIA for this species lies inshore of the proposed survey lines. Animals of all demographics use these areas, including mothers with new calves. The behaviour of southern right whale mother/calf pairs can be dramatically different from other demographics, particularly in regards to the amount of time spent resting at the surface (Cusano et al. 2019, Nielsen et al. 2019). Therefore, separate behavioural

profiles were modelled for mother/calf pairs and for all other demographics. Accordingly, a total of four behavioural profiles were considered for southern right whales: migrating mother with calf, migrating adult with no calf, reproducing adult with calf, reproducing adult with no calf. Migration profiles are applicable to the migration BIA, and reproducing profiles are applicable to the reproduction BIA.

The behaviour of migrating southern right whales was modelled to reflect animats transiting through the migration BIA on a 293º track to correspond with the tow direction. This reflects the animals migrating along the southern coast of Australia in a westerly or counter-clockwise direction (Burnell et al. 2001). Fine-scale behavioural data on southern right whales are limited, however migrating travel speed was derived from satellite-tagged southern right whales (Mackay et al. 2020). The remaining parameters used for the migrating species profiles were primarily sourced from multi-sensor tags (DTAGs and/or TDRs) deployed on North Atlantic right whales (Baumgartner and Mate 2003) (Dombroski et al. 2021).

Reproductive BIAs for southern right whales act as aggregation areas for mothers with new calves and for other demographics. For the reproducing behavioural profiles, behaviours reflect those observed in North Atlantic right whales on calving grounds due to limited data availability for southern right whales. Behavioural states comprise resting, travelling, and surface active. Additionally, the mother/calf profile includes nursing behaviour. The parameters used for the reproducing species profiles were again primarily sourced from North Atlantic right whales with the exception of behavioural probabilities, which were available from studies of southern right whales in South America (Thomas et al. 1984 and Lundquist et al. 2008).

4. Results

4.1. Acoustic Source Levels and Directivity

AASM (Section 3.2) was used to predict the horizontal and vertical overpressure signatures and corresponding power spectrum levels for the seismic sources, with results provided in Appendix B.3 along with the horizontal directivity plots for the selected source.

Table 11 shows the PK and per-pulse SEL source levels in the horizontal-plane broadside (perpendicular to the tow direction), endfire (along the tow direction), and vertical directions for the modelled array signature (2820 in^3 source). The vertical source level that accounts for the "surface ghost" (the out of phase reflected pulse from the water surface) is also presented to make it easier to compare the output of other seismic source models.

Figure B-2 in Appendix B.3 shows the broadside, endfire, and vertical overpressure signature and corresponding power spectrum levels for the source. The signature consists of a strong primary peak, related to the initial release of high-pressure air, followed by a series of pulses associated with bubble oscillations. Most energy was produced at frequencies below 500 Hz. Frequency-dependent peaks and nulls in the spectrum result from interference among airguns in the source and correspond with the volumes and relative locations of the airguns to each other.

Table 11. Far-field source level specifications for 2820 in^3 source, for 7 m tow depth. Source levels are for a point-like acoustic source with equivalent far-field acoustic output in the specified direction. Sound level metrics are per-pulse and unweighted.

Direction	Peak source pressure level ($L_{S,pk}$; dB re 1 µPa m)	Per-pulse source SEL ($L_{S,E}$; dB 1 μPa^2m^2s)	
		10–2000 Hz	2000–25000 Hz
Broadside	249.0	224.3	185.8
Endfire	244.9	222.6	186.4
Vertical	255.1	228.0	194.0
Vertical (surface affected source level)	255.1	230.8	197.0

4.2. Per-pulse Sound Fields

This section presents the per-pulse sound fields in terms of maximum-over-depth SPL, SEL, PK, and seafloor PK and PK-PK. The different metrics are presented for the following reasons:

- SPL sound fields were used to determine the distances to marine mammal and turtle behavioural thresholds (see Sections 2.1 and 2.3).
- Received per-pulse SPL at the considered receiver locations are presented in Table 19, as well as maps showing which impulses result in levels above the human health assessment threshold (Figure 38).
- Per-pulse SEL sound fields are used as inputs into the 24 h SEL scenario and to provide context for the range to 160 dB re 1 $\mu Pa^2 \cdot s$, relevant for the EPBC Act Policy Statement 2.1 (DEWHA 2008).
- PK metrics within the water column are relevant to thresholds and guidelines for marine mammals, sea turtles, fish, fish eggs and larvae (as well as plankton; Sections 2.1–2.3).

- PK metrics at the seafloor are relevant to guidelines for fish, fish eggs and larvae (Section 2.3) and the sound level for no effect on corals and sponges.
- PK-PK metrics at the seafloor are relevant to sound levels used in the assessment of effect on benthic invertebrates (Section 2.5.1).

The maximum and 95% distances to per-pulse SEL and SPL metrics are presented in Tables 12–13. The SPL sound fields, and distances to relevant isopleths can be visualised on the contour maps presented in Figures 8–22. Where indicated in the table captions, distances to maximum and 95% distance were calculated considering both survey directions (tow directions); the largest resultant distances were reported. The SPL sound fields are also presented as vertical slices for selected azimuths along the endfire and broadside directions out to 50 km, with the airgun array in the centre (Figures 23–27).

Maximum horizontal distances to maximum-over-depth water column PK thresholds were calculated for eight modelled single-impulse sites, Sites 1, 2, 5, 8, 10, 12, 14 and 15. This metric was calculated for the sites where FWRAM was applied to enable the SEL to SPL conversion (Appendix C.2 and D.2). PK results are presented in Table 15.

Seafloor sound levels were assessed considering ten different representative water depths (50, 60, 70, 80, 90, 100, 120, 140, 160 and 170 m). Tables 16 and 17 present the PK and PK-PK results. Particle motion was also calculated considering these water depths, results are presented in Table 18.

Table 19 provides a summary of whether or not the 145 dB re 1 µPa SPL human health assessment threshold was exceeded at each of the 14 sensitive receiver sites identified in Section 1.3 from any impulse location on the survey lines. Figures 38 to 43 indicate which modelled impulses on the seismic survey lines result in these exceedances.

4.2.1. Tabulated Results

4.2.1.1. Entire Water Column

Table 12. *Sites 1-15, 2820 in³ source*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to modelled maximum-over-depth unweighted per-pulse sound exposure level (SEL) isopleths from the modelled single-impulse sites. Water depth at each site is indicated. The results presented are the maxima considering either of the two tow directions modelled for each site.

Per-pulse SEL (L_E; dB re 1 µPa²·s)	Site 1 (49.1 m)		Site 2 (54.8 m)		Site 3 (63.9 m)		Site 4 (81.0 m)		Site 5 (61.9 m)		Site 6 (71.1 m)		Site 7 (124.9 m)		Site 8 (173.6 m)		Site 9 (166.5 m)		Site 10 (67.4 m)		Site 11 (72.0 m)		Site 12 (84.0 m)		Site 13 (99.0 m)		Site 14 (69.2 m)		Site 15 (51.6 m)

[2] Mortality and potential mortal injury threshold
A dash indicates the threshold is not reached within the limits of the modelling resolution (20 m).

4.2.1.2. Seafloor

Ranges presented for seafloor receptors are provided in Tables 16 and 17 for receiver depths of 50 and 5 cm above the seafloor. The seafloor PK results in Table 16 differ from the maximum-over-depth modelled results presented in Table 15. This is because the model used for the water column results, calculated using FWRAM do not represent the maximum sound levels at the seafloor close to the array. FWRAM is based on a wide-angle parabolic equation (PE) algorithm which is valid to only approximately 70° down angle from the horizontal, and while it provides accurate predictions in the horizontal direction, it cannot predict sound levels directly under the array. VSTACK was used to

determine the levels at the seafloor directly under the array and is valid in the very nearfield directly under the source.

Table 16. *2820 in³ source*: Maximum (R_{max}) horizontal distances (in m) from the seismic source to modelled seafloor (receiver located 50 cm above seafloor) peak pressure level thresholds (PK) at ten representative water depths.

Hearing group/animal type	PK threshold (L_{pk}; dB re 1 µPa)	Water Depth									
		50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)

4.2.1.3. Particle Motion Metrics

Particle motion was modelled at a depth of 5 cm above the seafloor for an associated assessment for invertebrates. The maximum distances in metres to a peak particle acceleration magnitude of 37.57 ms^{-2} are presented in Table 18 for ten considered water depths. This particle acceleration threshold was assessed for invertebrates by Day et al. (2016a).

Table 18. 2820 *in^3 source*: Maximum (R_{max}) horizontal distances (in m) from the 2820 in^3 to particle motion level: Peak acceleration magnitude level (m/s^2), 5 cm above the seafloor. Results included in relation to benthic invertebrates (Section 2.5.1).

Hearing group/animal type	Peak Acceleration Magnitude (m/s^2)	Water Depth									
		50 m	60 m	70 m	80 m	90 m	100 m	120 m	140 m	160 m	170 m
		Distance R_{max} (m)									
Benthic invertebrates	37.57	4	*	*	*	*	*	*	*	*	*

An asterisk indicates that the particle motion level was not reached.

4.2.1.4. Sound Levels at Sensitive Receiver Locations

Table 19 provides a summary of whether or not the 145 dB re 1 µPa SPL human health assessment threshold was exceeded at each of the 14 sensitive receiver sites identified in Section 1.3 from any impulse location on the survey lines.

Table 19. Exceedances of the human health assessment threshold (145 dB re 1 µPa) at each the sensitive receivers outlined in Section 1.3.

Receiver ID	Sensitive receiver	Exceedance of 145 dB re 1 µPa SPL human health assessment threshold?	Minimum Received Level (dB re 1 µPa)†	Maximum Received Level (dB re 1 µPa
1	Deen Maar (Lady Julia Percy Island)	Yes	145.0	154.8
2	Middle Island	Yes	145.0	151.8
3	Apollo Marine Park	No	*	*
4	Portland	No	*	*
5	Port Fairy Lighthouse	Yes	145.6	154.6
6	Killarney Beach	Yes	145.0	150.6
7	Merri Sanctuary	Yes	145.0	151.8
8	Rivernook Beach	No	*	*
9	Clifton Beach	No	*	*
10	Gibson Beach	No	*	*
11	Newfield Beach	No	*	*
12	Bay of Islands	No	*	*
13	Massacre Bay	No	*	*
14	Twelve Apostles MP	No	*	*

†Minimum received level above the stated threshold or criteria.
An asterisk indicates that the level did not exceed the stated threshold or criteria.

4.2.2. Sound Field Maps and Graphs

The SPL sound fields, and distances to relevant isopleths can be visualised for the 113° tow direction on the contour maps presented in Figures 8–22. Equivalent maps for the 293° tow direction are included in Appendix F.

The SPL sound fields are also presented as vertical slices for selected azimuths along the endfire and broadside directions out to 50 km, with the airgun array in the centre (Figures 23–27).

Section 4.2.2.3 includes maps showing which modelled impulses on the seismic survey lines result in exceedances of the human health assessment threshold for the sensitive receptor locations outlined in Section 1.3.

4.2.2.1. Sound Level Contour Maps

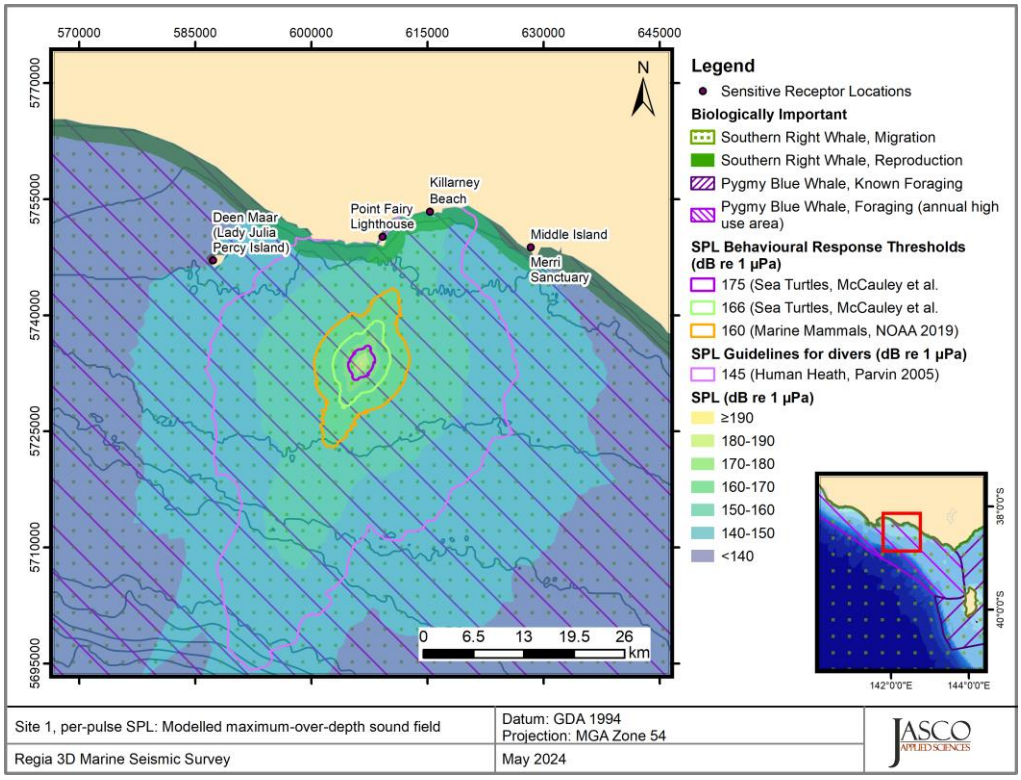

Figure 8. *Site 1, SPL, 2820 in³ source, tow direction 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

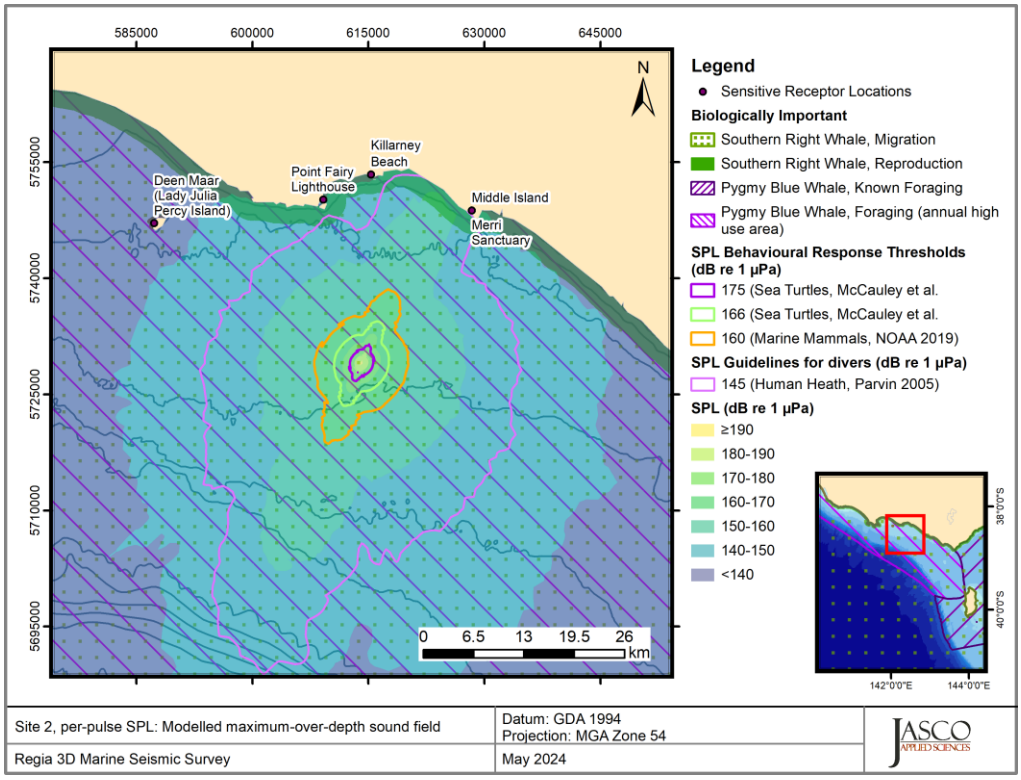

Figure 9. *Site 2, SPL, 2820 in³ source, tow direction 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

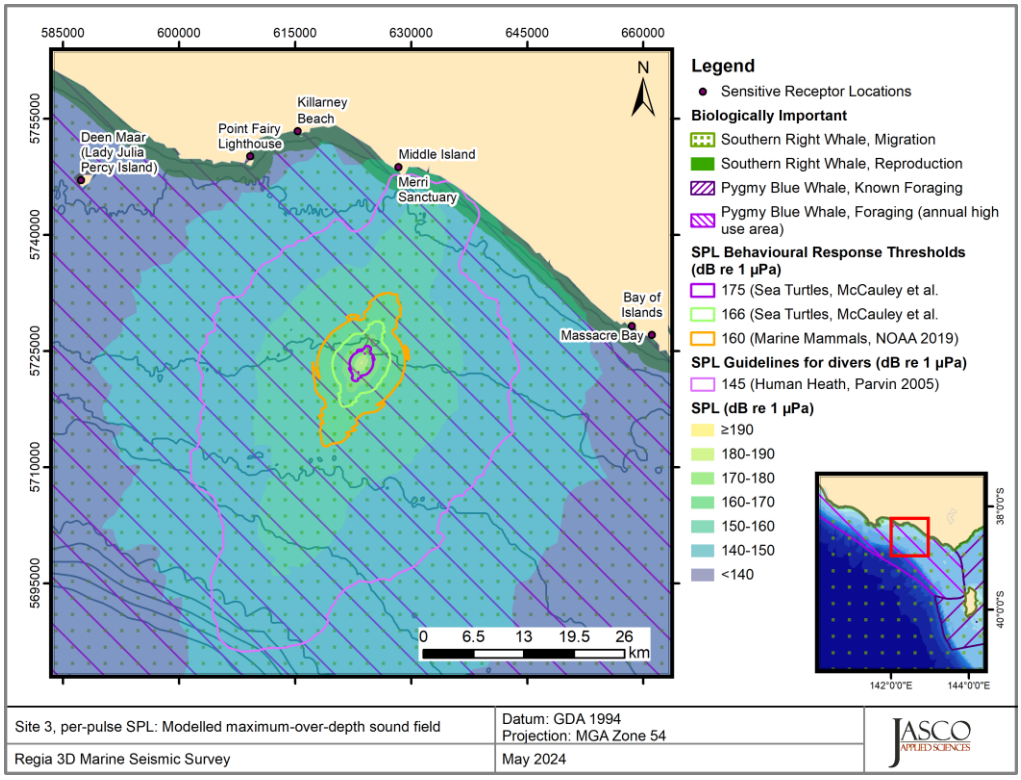

Figure 10. *Site 3, SPL, 2820 in³ source, tow direction 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

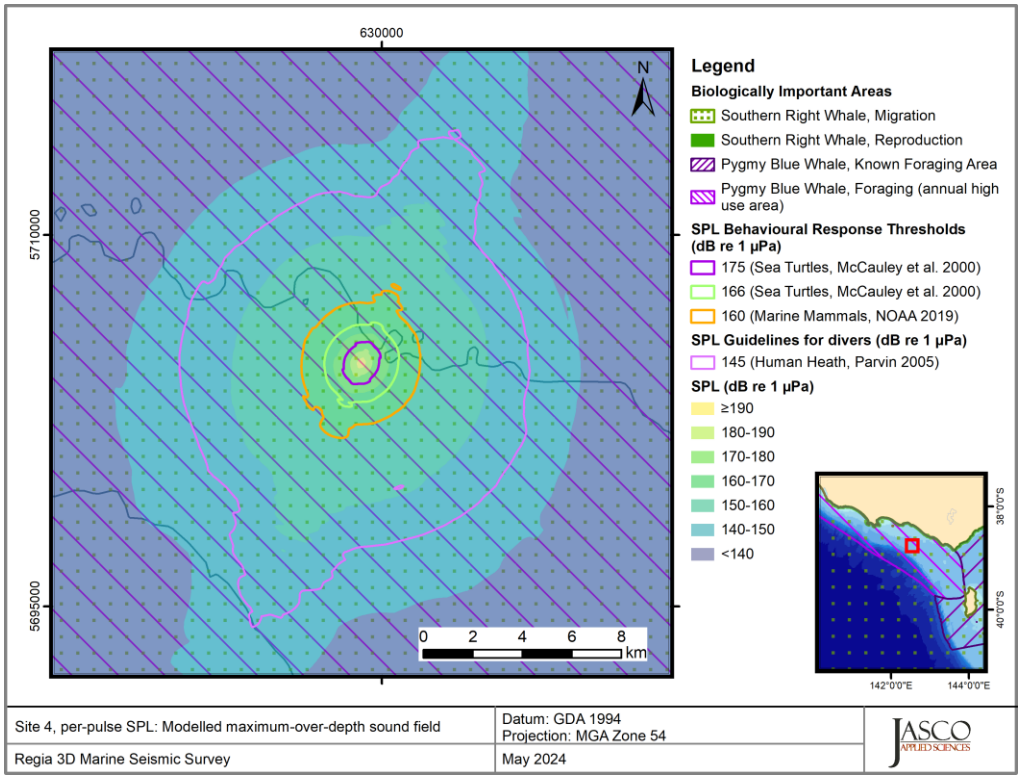

Figure 11. *Site 4, SPL, 2820 in³ source, tow direction 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

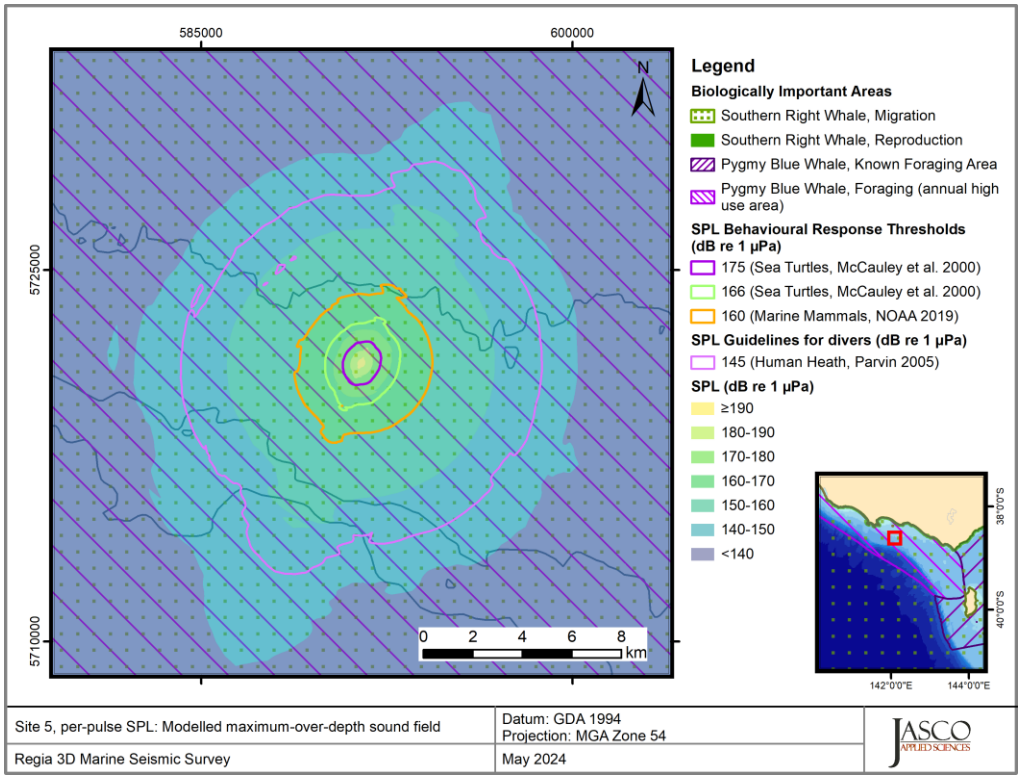

Figure 12. *Site 5, SPL, 2820 in³ source, tow direction 113°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

4.2.2.3. Sensitive Receiver Maps

Figure 38 indicates which modelled impulses on the seismic survey lines result in an exceedance in the human health assessment threshold for any of the 14 sensitive receiver locations outlined in Section 1.3.

Figures 39 – 43 indicate which modelled impulses result in an exceedance in the human health assessment threshold for specific sensitive receiver locations. Maps for all other specific sensitive receiver locations where exceedances did not occur are included in Appendix G.

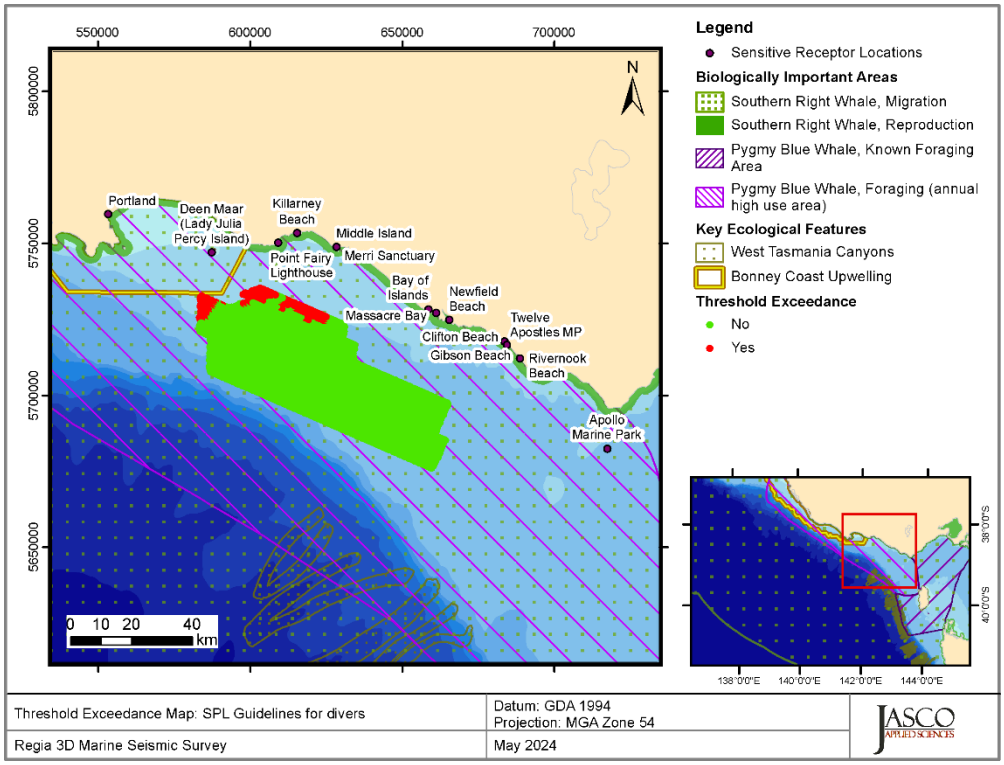

Figure 38. *SPL, 2820 in³ source,* seismic single-impulse locations where the human health assessment threshold at any sensitive receivers is exceeded.

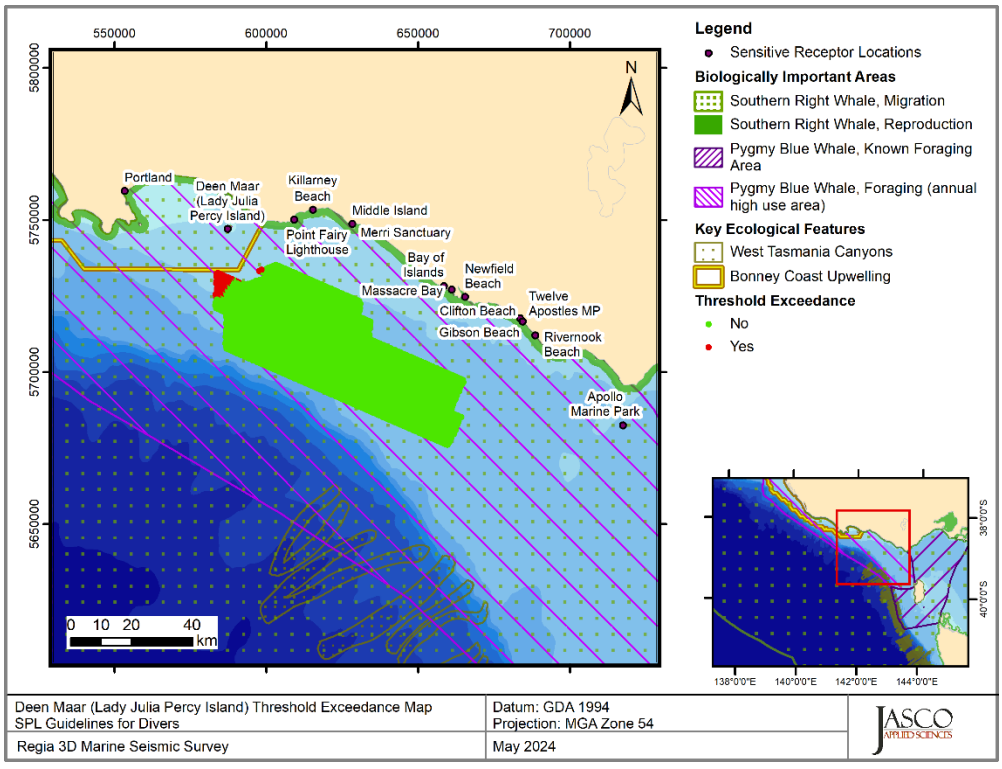

Figure 39. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Deen Maar (Lady Julia Percy Island) is exceeded.

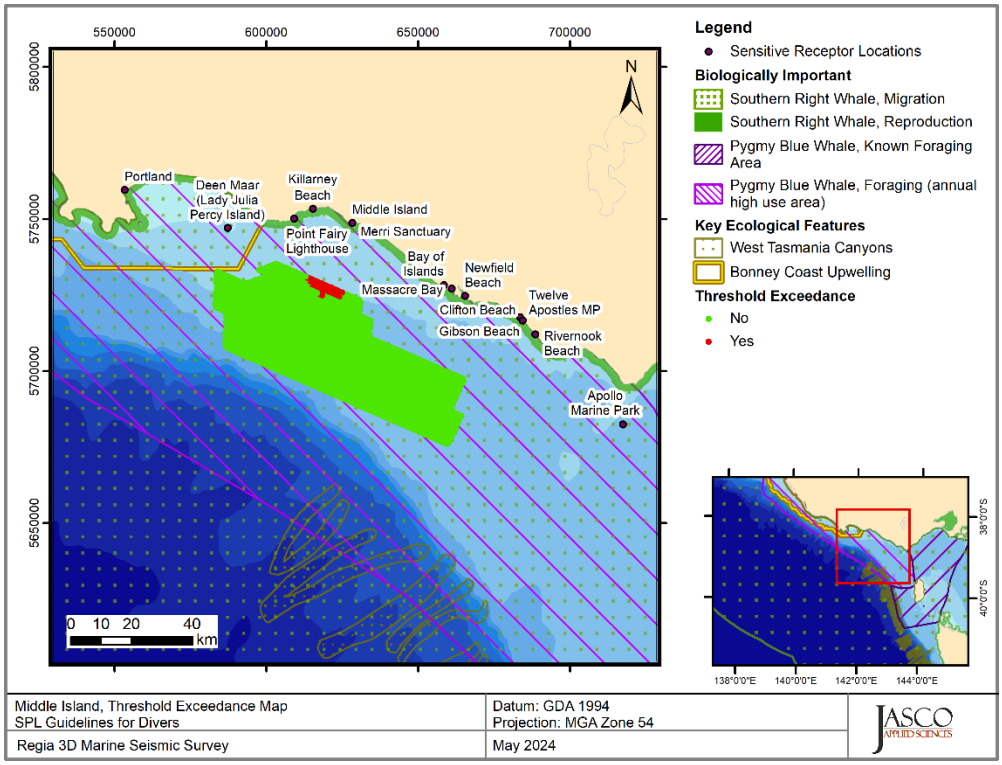

Figure 40. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Middle Island is exceeded.

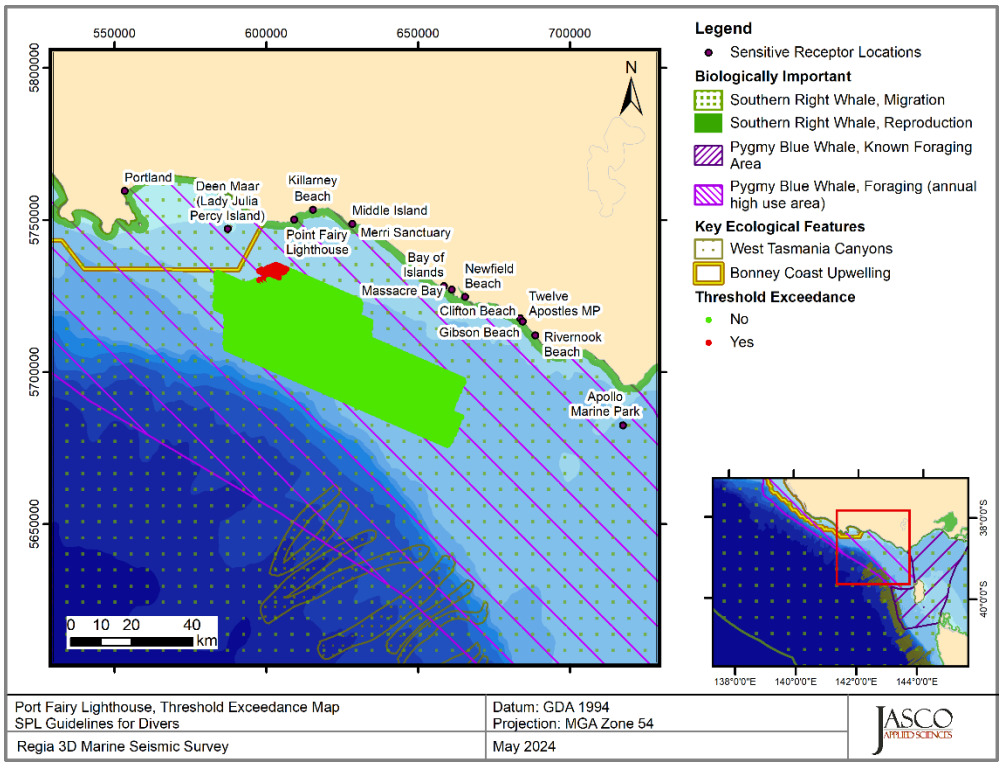

Figure 41. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Port Fairy Lighthouse is exceeded.

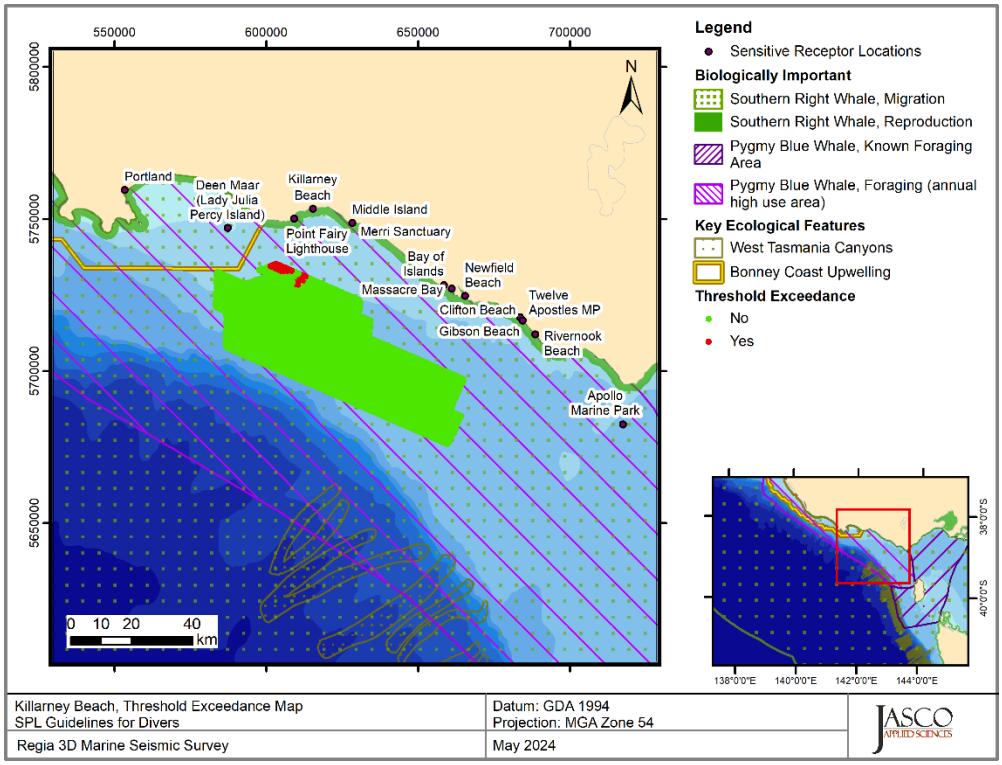

Figure 42. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Killarney Beach is exceeded.

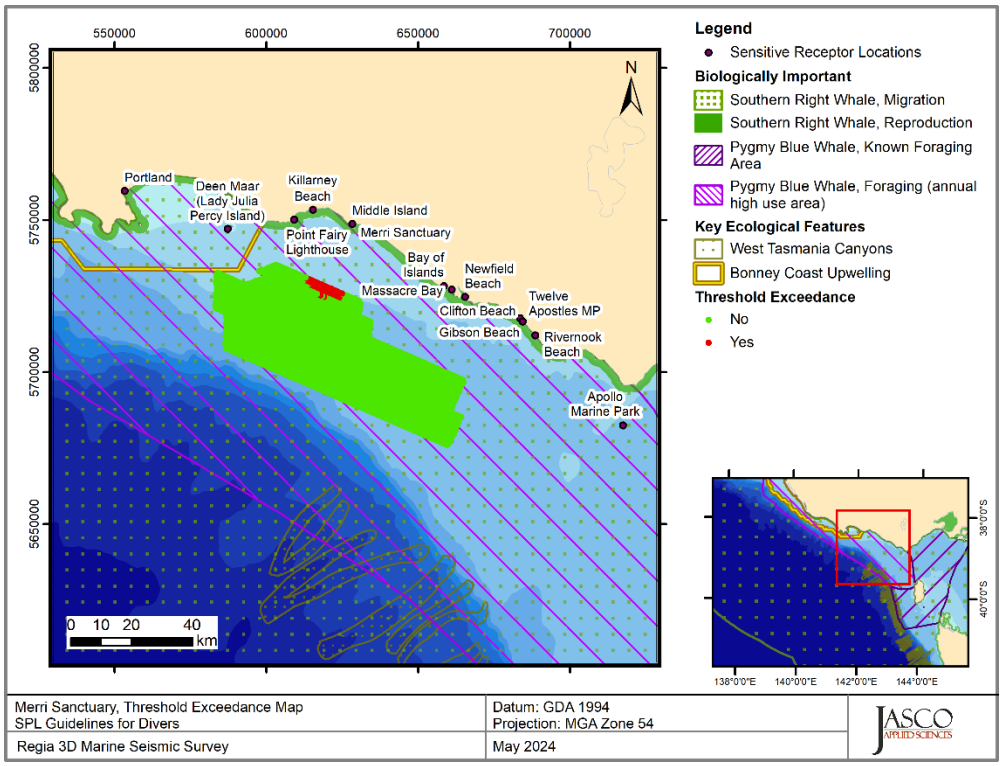

Figure 43. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Merri Sanctuary is exceeded.

4.3. Multiple Source Fields

This section presents the sound fields in terms of SEL accumulated over 24 h for the modelled scenarios (Section 0). Frequency-weighted SEL_{24h} sound fields were used to estimate the maximum horizontal distances (R_{max}) to marine mammal and sea turtle PTS and TTS thresholds (listed in Table 20), and to estimate maximum distance and the area for injury and TTS guidelines for fish (Table 21).

The SEL_{24h} sound fields are presented as contour maps in Figures 44–46. These figures present the unweighted SEL_{24h} in 10 dB steps, as well as the isopleths corresponding to thresholds or guidelines that are large enough to be resolved on a map.

4.3.1. Tabulated Results

Table 20. Maximum-over-depth horizontal distances (R_{max}, in km) to frequency-weighted 24 h sound exposure level (SEL_{24h}) marine mammal and turtle thresholds, and the corresponding area ensonified above the respective threshold (in km^2). Thresholds provided are based on permanent threshold shift (PTS) and temporary threshold shift (TTS) for marine mammals (Southall et al. 2019) and sea turtles (Finneran et al. 2017).

Hearing group	Threshold for SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	Scenario A		Scenario B		Scenario C		Scenario D

4.3.2. Sound Level Contour Maps

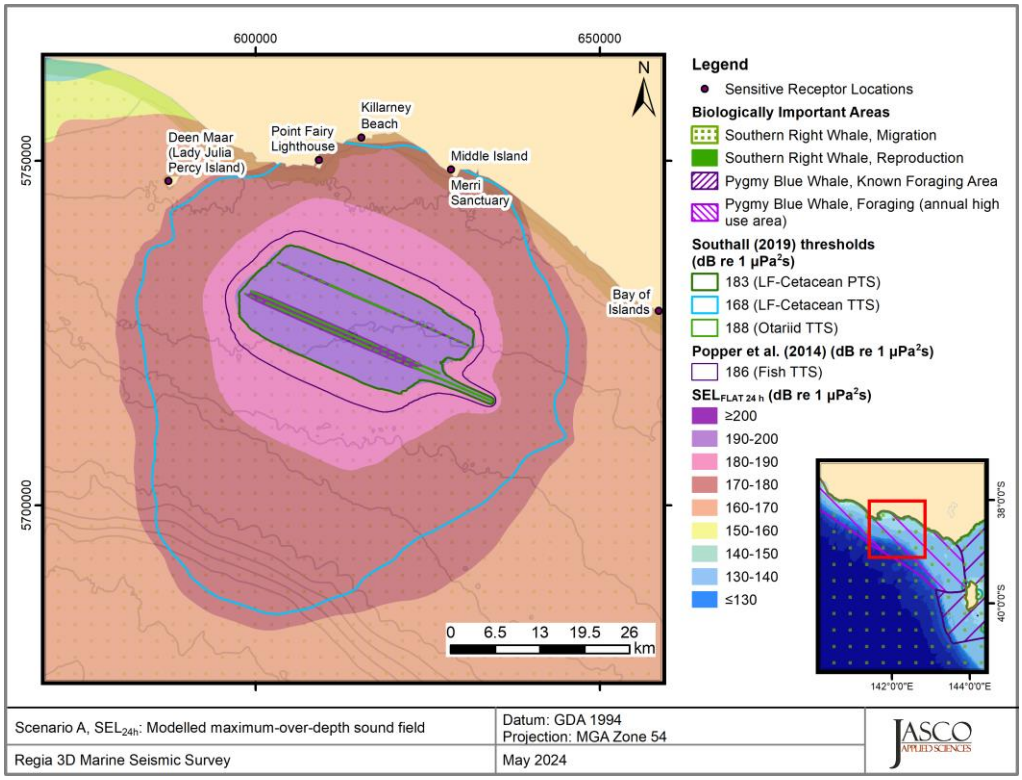

Figure 44. *Scenario A*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

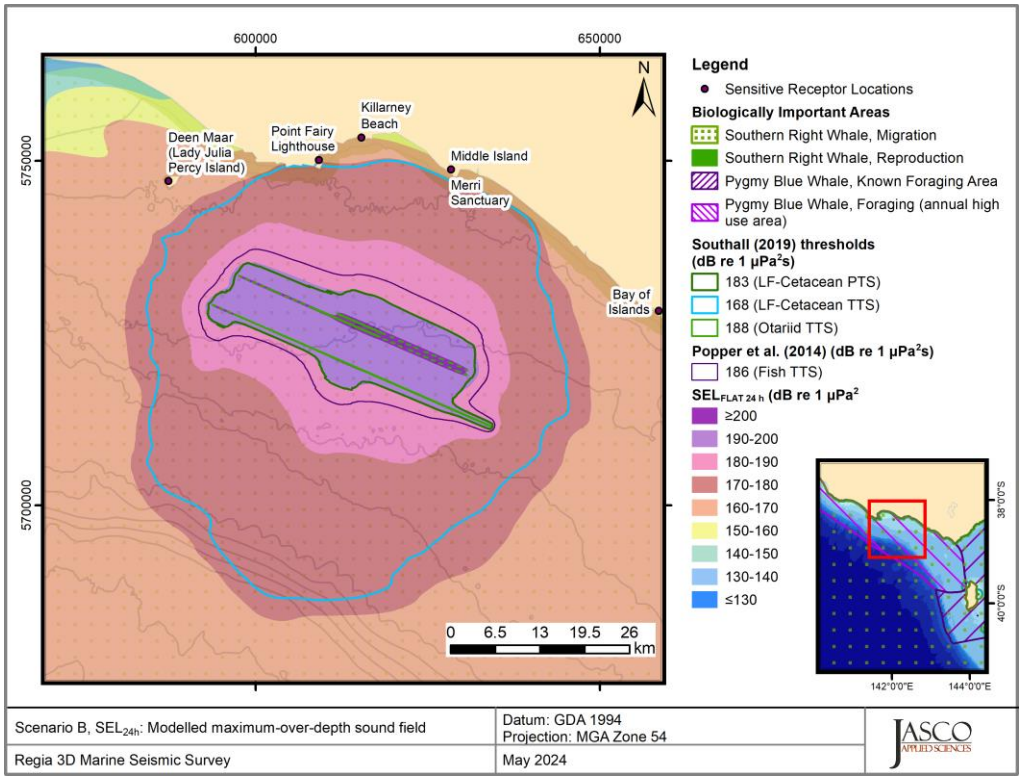

Figure 45. *Scenario B*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

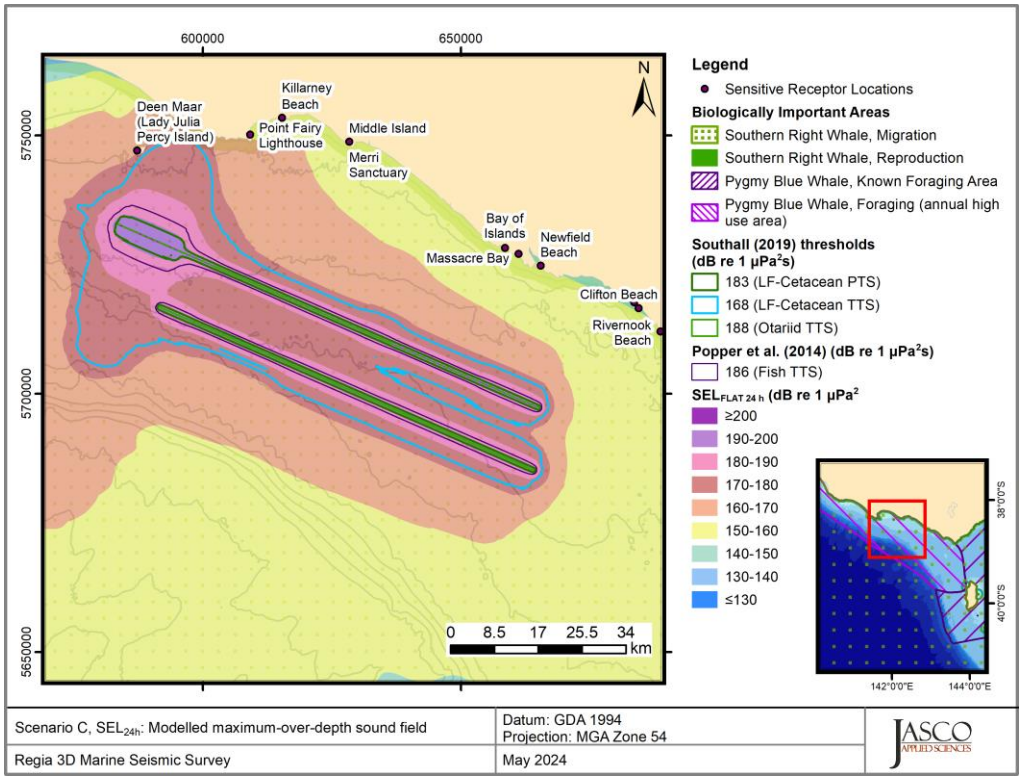

Figure 46. *Scenario C*, sound level contour map of unweighted maximum-over-depth SEL_{24h} results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

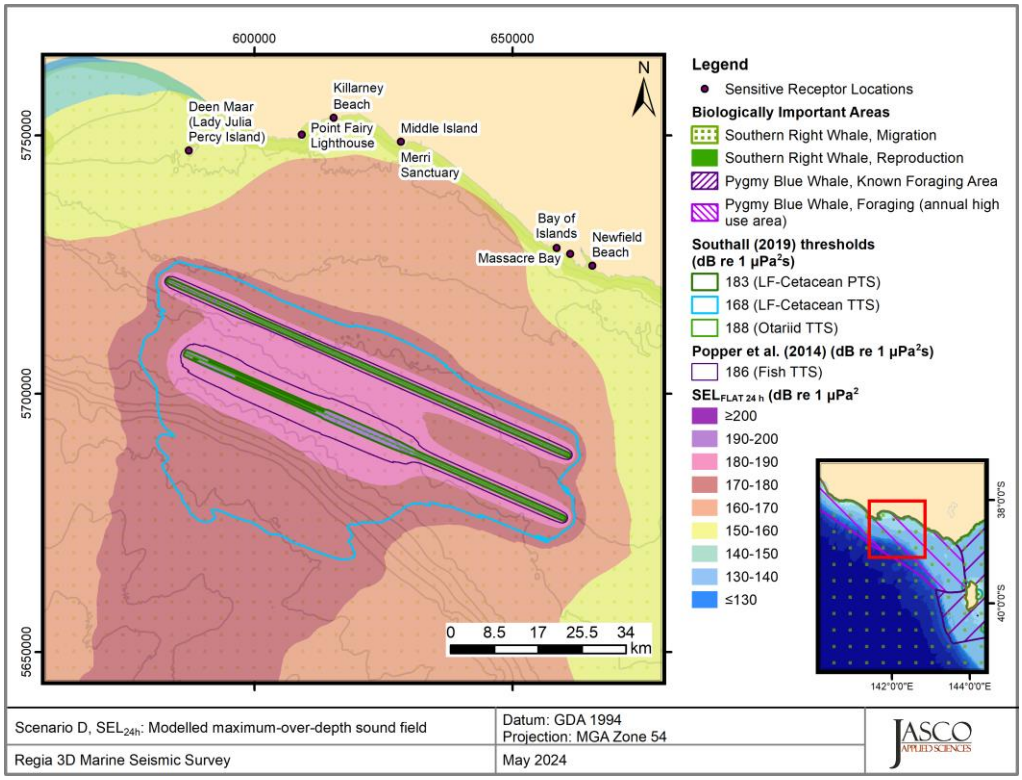

Figure 47. *Scenario D*, sound level contour map of unweighted maximum-over-depth SEL24h results, along with isopleths for marine mammals and fish. Thresholds omitted here were not reached or not large enough to display graphically. Refer to Tables 20 and 21 for threshold distances.

4.4. Animal Movement Exposure Ranges

A summary of radial distances to exposure thresholds for pygmy blue whales and southern right whales, along with probability of exposure for each modelled scenario (Section 0), are included below. Table 22 shows results for scenarios with pygmy blue whale animats with unrestricted seeding, seeding restricted to their foraging BIA, and seeding restricted to the shelf. Tables 23 and 24 show results for scenarios with southern right whale animats within their migration BIA (which is equivalent to unrestricted seeding) and within their reproduction BIA (both unrestricted and restricted seeding), respectively. Reproducing southern right whales restricted to the reproduction BIA were not exposed above any of the three thresholds (PTS, TTS or behavioural response), except in scenario A where SRWs (without a calf) restricted to the reproduction BIA were exposed within 14.2 km with a probability of exposure of 1%. Results include $ER_{95\%}$ exposure ranges calculated for the 160 dB behavioural response threshold and SEL_{24h} thresholds for both TTS and PTS, and the probability of an animat being exposed above the threshold within the $ER_{95\%}$.

Exposure ranges for TTS and PTS PK thresholds were not included in the exposure analysis since acoustic modelling predicted the PK exceedance distances are small and close to the source (see Table 15) such that only minor differences are expected between acoustic and animat exposure predictions.

Sections 4.4.1 and 4.4.2 include histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenario A. Additional histograms for the remaining scenarios can be found in Appendix F.

Table 22. Summary of animat simulation results for pygmy blue whales. The 95th percentile exposures ranges ($ER_{95\%}$) in km and probability of animats being exposed above threshold within the $ER_{95\%}$ (P_{exp} (%)) are provided.

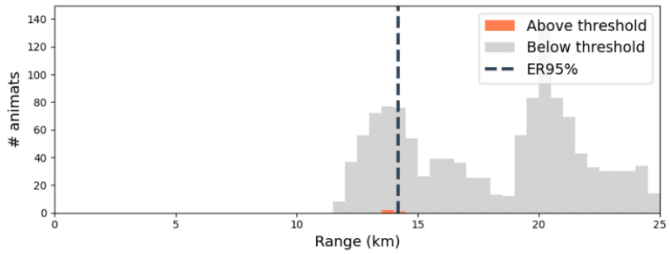

Figure 58. *Scenario A, reproducing southern right whale animats, no calf, restricted to reproduction BIA*: CPA range histogram for animats, SEL_{24h} TTS threshold. Bar colours indicate whether the animats exceeded the threshold.

5. Discussion and Summary

The modelling study predicted underwater sound levels associated with the planned Regia MSS. The underwater sound field from a 2820 in^3 seismic source was modelled (Appendix B.2). An analysis of seasonal sound speed profiles and associated sensitivity comparison indicated that June was likely to be the month most conductive to sound propagation, and hence was selected to ensure a conservative estimation of distances to received sound level (Appendix D.3.2). Modelling also accounted for site-specific bathymetric variations (Appendix D.3.1) and local geoacoustic properties (Appendix D.3.3).

Most acoustic energy from a seismic source is output at lower frequencies, in the tens to hundreds of hertz. The modelled array had a pronounced broadside directivity for decidecade bands between ~100 to 400 Hz (Appendix B.3), which caused a noticeable axial bulge in the modelled acoustic footprints. The overall broadband (10–25000 Hz) unweighted per-pulse SEL and peak pressure source levels of the seismic source operating at 7 m depth are detailed in Table 11.

5.1. Per-Pulse Sound Fields

The single-impulse modelled sites span water depths of 49–174 m across three different geological regions. The bathymetry within the vicinity of the survey varied between approximately 20–150 m; however, along a south-westward transect the environment generally transitions from shallower water of the Otway Shelf to the significantly deeper waters of the continental slope and abyssal plane (>1000 m). The frequency content of the seismic sources coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters. The maximum-over-depth sound footprint maps and vertical slice plots (Sections 4.2.2.1 and 4.2.2.2) assist in demonstrating the influence of the bathymetry and seabed composition on the sound field.

The geological profile for single-impulse modelled sites in water depths less than 65 m, consisted of a sand layer underlain by variably cemented limestone (calcarenite). Literature suggests that the sand layer likely begins to thin as water depths increase in an offshore direction, and for water depths greater than 65 m it was considered absent with only the variably cemented calcarenite present at the seafloor interface. Modelled sites located in environments where the seabed was modelled as bare calcarenite generally displayed higher rates of loss with distance away from the source as compared to sites where a layer of sand overlies calcarenite.

The presence of unconsolidated coarse sand overlying semi-cemented calcarenite led to a more reflective seabed which is associated with large isopleths for low level thresholds. This is most evident for the marine mammal behavioural threshold of 160 dB re 1 μPa^2 (SPL) for impulsive sound sources. However, the distribution of a sand layer is not well known and if the thickness of the sand layer is not as uniform as modelled then this variability could potentially lead to smaller radii. It is possible to model a transitioning seabed type, where the sand layer mentioned above thins with distance; however, sufficient information was not available to make that discrimination to develop reliable model inputs.

The array directionality and frequency content coupled with the bathymetry had a considerable effect on propagation at longer distances, with larger lobes of sound energy extending into the deeper waters for all modelled sites. This is particularly evident for modelled Sites 8 and 9 which are situated along the continental shelf break and continental slope. For source locations close to the continental shelf break modelling indicates that significant amounts of energy reflected from the seabed slope can be trapped in the deep sound channel and propagate for large distances within the ocean interior. This phenomenon is evident in the slice plots showing the sound field in the broadside direction, where greater ranges to all isopleths are predicted to occur in the downward sloping offshore

direction. The vertical slice plots in Section 4.2.2.2 assist in demonstrating the influence of the sloping bathymetry on the sound field.

5.2. Multiple Pulse Sound Fields

The accumulated SEL over 24 hours of survey operation was modelled considering four acoustic scenarios and four animal movement modelling scenarios, each with a realistic acquisition pattern based on provided survey designs. The modelling predicted the accumulation of sound energy, considering the change in location and the tow direction of the source at each pulse point, which was used to assess possible injury in marine mammals and the SEL_{24h} based fish criteria. The results were presented as maps of the accumulated exposure levels and tabulated values of ranges to threshold levels and exposure areas for the given effects criteria (Section 2).

The footprints and range maxima for all accumulated SEL thresholds are influenced by the seabed compositions along acquisition lines. The discussion above regarding ranges to isopleths also applies to the accumulated SEL calculations. The farthest ranges to thresholds for PTS and TTS were driven by the source orientation and bathymetry, particularly in the broadside and offshore directions.

5.3. Acoustic Results Summary

This section presents a summary of the distances to the noise effect criteria applied in this study (Section 2) as relevant to the impact assessment. The effect criteria for impairment of marine mammals, fish and sea turtles use dual metrics (PK and SEL_{24h}), and the longest distance associated with either metric is required to be applied, and thus is presented in this summary.

The SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 h based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. Where the corresponding SEL_{24h} radii are larger than those for peak pressure criteria, they often represent an unlikely worst-case scenario. More realistically, marine mammals, fish, and sea turtles would not remain in the same location for 24 hours, but rather a shorter period, depending upon their behaviour, the proximity and movements of the source. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (either PTS or TTS) if it remained in that location for 24 h. A more realistic representation of the potential exposures was undertaken using animal movement modelling (‘animat modelling’), with the results summarised separately below.

A summary of predicted distances to criteria from acoustic modelling are presented below.

Marine Mammals

Table 25 summarises the distances to where effect criteria for marine mammals are no longer exceeded. Full results for PK levels were presented in Table 15, while SEL_{24h} results were presented in Table 20.

Table 25. Summary of maximum (R_{max}) horizontal distances (in km) from modelled sites or scenarios to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. Maximum extents are in the broadside direction of the 2820 in^3 seismic source.

Hearing group	Maximum modelled distance to effect threshold (R_{max})								
	Behavioural response[1]	Scenario A		Scenario B		Scenario C		Scenario D	
		TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)	TTS[2] (km)	PTS[2] (km)
Low-frequency cetaceans	11.8 (SPL)	41.9 (SEL_{24h})	5.07 (SEL_{24h})	35.4 (SEL_{24h})	4.55 (SEL_{24h})	20.5 (SEL_{24h})	2.43 (SEL_{24h})	28.6 (SEL_{24h})	1.00 (SEL_{24h})
High-frequency cetaceans		0.05 (SEL_{24h})	–	0.05 (SEL_{24h})	–	0.03 (SEL_{24h})	–	0.04 (SEL_{24h})	–
Very high-frequency cetaceans		0.82 (PK)	0.41 (PK)	0.82 (PK)	0.41 (PK)	0.79 (PK)	0.39 (PK)	0.71 (PK)	0.37 (PK)
Otariid Pinnipeds		0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.06 (SEL_{24h})	–	0.05 (SEL_{24h})	–

Noise exposure criteria: [1] NOAA (2019) and [2] Southall et al. (2019).
A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

Sea Turtles

Table 26 summarises the distances to where effect criteria for sea turtles are no longer exceeded, with the results for behavioural thresholds presented in Table 3 while SEL_{24h} results are in Table 20.

Table 26. Summary of horizontal distances (in km) to turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group	Maximum modelled distance to effect threshold (R_{max})									
	Behavioural response[1]	Behavioural disturbance[1]	Scenario A		Scenario B		Scenario C		Scenario D	
			TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]	TTS[2]	PTS[2]
Sea Turtles	6.30 (SPL)	2.62 (SPL)	3.35 (SEL_{24h})	0.07 (SEL_{24h})	3.20 (SEL_{24h})	0.07 (SEL_{24h})	1.67 (SEL_{24h})	0.07 (SEL_{24h})	0.60 (SEL_{24h})	0.07 (SEL_{24h})

Noise exposure criteria: [1] McCauley et al. (2000), and [2] Finneran et al. (2017)

Penguins

- The maximum distance to where the OCW-weighted penguin TTS SEL_{24h} threshold of 188 dB re 1 μPa^2s was no longer exceeded was 0.06 km for scenarios A–C and 0.05 km for scenario D. PTS and PK thresholds were not resolved within the modelled resolution of 20 m. As is the case with marine mammals, a reported radius for SEL_{24h} criteria does not mean that a penguin underwater travelling within this radius of the source will be injured, but rather that an animal

could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.

- The maximum distance where the OCW-weighted penguin behavioural response threshold of 120 dB re 1 μPa^2 (SPL) for impulsive noise could be exceeded varied between 10.4 and 77.0 km for the 2820 in^3 seismic source, depending on modelled site.

Fish, fish eggs, and fish larvae

- This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK (seafloor and water column) and SEL_{24h} metrics associated with mortality and potential mortal injury as well as impairment in the following groups:
  - Fish without a swim bladder (also appropriate for sharks in the absence of other information),
  - Fish with a swim bladder that do not use it for hearing,
  - Fish that use their swim bladders for hearing,
  - Fish eggs and fish larvae.
- Table 27 summarises distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric. Results for PK are presented in Tables 15 whilst SEL_{24h} results are in Tables 21.

Table 27. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for single impulse and 24 hr sound exposure level (SEL_{24h}) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R_{max} (km)
Fish: No swim bladder	Mortality and Potential Mortal Injury	PK	0.11
	Recoverable injury	PK	0.11
	TTS	SEL_{24h}	8.35
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Mortality and Potential Mortal Injury	PK	0.21
	Recoverable injury	PK	0.23
	TTS	SEL_{24h}	8.35
Fish eggs, and larvae (relevant to plankton)	Mortality and Potential Mortal Injury	PK	0.23

Benthic invertebrates

To assist with assessing the potential effects on these receptors, the following results were determined:

- Crustaceans: The sound level of 202 dB re 1 µPa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at ranges between 322 and 715 m for the 2820 in^3 source.
- Bivalves: The distance where a particle acceleration of 37.57 ms^{-2} at the seafloor could occur was determined for comparing to results presented in Day et al. (2016a). This particle acceleration was

reached at a range of 4 m for a water depth of 50 m, and was not reached at any greater water depth.

- Sponges and coral: The PK sound level at the seafloor directly underneath the seismic source was estimated at all modelled sites and compared to the sound level of 226 dB re 1 µPa PK for sponges and corals (Heyward et al. 2018); the threshold was not reached in water depths greater than 50

Divers and Swimmers

An SPL human health assessment of 145 dB re 1 µPa^2 (SPL; L_P) derived from (Parvin 2005) was considered for recreational swimmers and divers. This criterion was considered for all single-impulse modelled sites and cumulative scenarios, and specifically at 14 coastal sensitive receiver locations. The human health assessment threshold was predicted to be exceeded at Deen Maar (Lady Julia Percy Island), Middle Island, Port Fairy Lighthouse, Killarney Beach and Merri Sanctuary. It is important to review the provided contour maps (Section 4.2.2.1) and sensitive receiver maps (Section 4.2.2.3, Appendix G) to contextualise levels at coastal areas and understand which portions of the survey may result in the human health assessment level being exceeded.

5.4. Animal Movement Modelling

The estimated sound fields produced by source and propagation models for the planned Regia MSS were incorporated into animat sound exposure models for pygmy blue whales and southern right whales to estimate the radial distances within which 95% of exposure exceedances occur ($ER_{95\%}$), along with the probability that an animat with the closest point of approach within that distance would be exposed above the relevant threshold (P_{exp}).

For the exposure analysis, all four acquisition scenarios were run with multiple animat seeding approaches (see Figure 2). Survey lines from all nominal acquisition scenarios overlap with the foraging BIA for pygmy blue whales and migrating BIA for southern right whales. The reproduction BIA for southern right whales lies inshore of the nominal acquisition scenarios.

Sections 5.4.1 and 5.4.2 summarise the PTS, TTS, and behavioural exposure range results, with all tabulated results presented in Tables 22 to 24. Table 28 summarises the maximum exposure range results for pygmy blue whales and southern right whales across the different species profiles and seeding regimes considered. Figure 59 summarises results for each modelled scenario, species profile and seeding regime. Reproducing southern right whales restricted to the reproduction BIA were not exposed above any of the three considered thresholds (PTS, TTS or behavioural response).

Table 28. Summary of animat simulation results for PTS, TTS and SPL behavioural response criteria for pygmy blue whales and southern right whales Maximum exposure ranges show $ER_{95\%}$ (km) first and associated probability of exposure of animats travelling within maximum $ER_{95\%}$ (P_{exp} (%)) in parentheses.

Species	Scenario	Behavioural response (SPL)[4]	TTS (SEL_{24h})[3]	PTS (SEL_{24h})[3]
		160[2]	168[1]	183[1]
Pygmy blue whale	A	9.83 (76%)	22.5 (56%)	1.98 (58%)
	B	9.54 (77%)	18.9 (57%)	1.73 (50%)
	C	8.38 (45%)	10.8 (35%)	0.83 (36%)
	D	6.69 (63%)	8.85 (59%)	0.37 (59%)
Southern right whale	A	9.51 (83%)	14.2 (1%)	1.40 (52%)
	B	8.97 (73%)	11.3 (64%)	1.22 (44%)
	C	7.39 (47%)	7.10 (35%)	0.69 (26%)
	D	6.84 (63%)	6.23 (58%)	0.24 (51%)

1 LF-weighted SEL_{24h} ($L_{E,24h}$; dB re 1 $\mu Pa^2 \cdot s$)
2 SPL (L_p; dB re 1 μPa^2)
3 Southall et al. (2019) criteria for marine fauna.
4 NOAA (2019) recommended unweighted behavioural threshold for marine mammals.

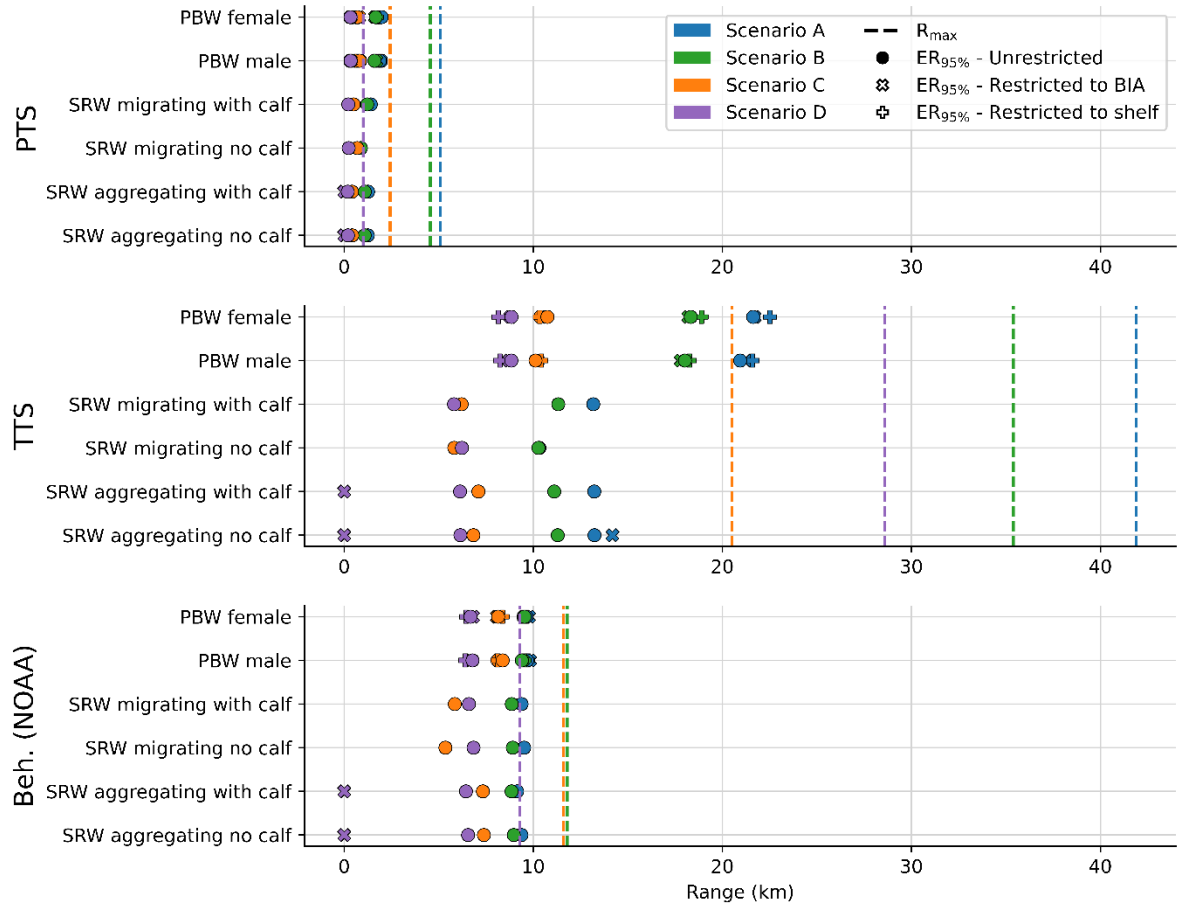

Figure 59. Acoustic (R_{max}) and exposure ranges ($ER_{95\%}$) for PTS, TTS and the behavioural thresholds, shown for each species. Colour represents the acoustic modelled scenario. The "restricted to BIA" sub-set refers to the pygmy blue whale foraging BIA and southern right whale reproduction BIA for pygmy blue whales and southern right whales respectively, presented in Figure 2. The "restricted to shelf" sub-set refers to pygmy blue whales, presented in Figure 2.

5.4.1. PTS and TTS

Exposure ranges from animal movement modelling for PTS and TTS criteria are typically shorter than those predicted using acoustic propagation modelling because of the generally shorter time ('dwell time') for moving animats to accumulate sound energy. In this study, PTS and TTS exposure ranges were substantially shorter than acoustic ranges to threshold, as shown in Figure 59.

All considered scenarios resulted in exposures above the PTS and TTS thresholds with the exception of scenarios B, C and D for reproducing southern right whales restricted to the reproduction BIA.

The maximum $ER_{95\%}$ for pygmy blue whale scenarios was 22.5 and 1.98 km for TTS and PTS, respectively. The associated probability of exposure above threshold within these $ER_{95\%}$ was 56% and 58%, respectively. For southern right whales, the maximum $ER_{95\%}$ for TTS and PTS were 14.2 and 1.40 km, respectively, with associated probabilities of exposure above threshold of 1% and 52%. The fact that some, but not all, animats that travelled within the 95th percentile range were exposed above threshold is because animats alter their horizontal position in the modelling area as well as their vertical position in the water column, thus potentially limiting the length of time they are within ensonified areas. For example, an animat might travel within the predicted exposure range but if they

are traveling more quickly on average than other animats, they may not accumulate as much exposure, or they may be spending more time at depths with quieter sound levels.

Female pygmy blue whale scenarios did not result in significantly or consistently different exposure ranges than the corresponding male pygmy blue whale scenarios. Based on the vertical distribution of the sound field (see Section 4.2.2.2), the sound fields are relatively constant with depth, and hence female pygmy blue whale animats accumulated similar exposure as the males even though females generally dive deeper than males (Section 3.7.3.1).

Exposure ranges are not significantly affected by seeding restrictions for pygmy blue whales. This is due to the survey being located within the boundaries of the restricted scenarios (pygmy blue whales foraging BIA and restricted to the shelf). Exposure ranges from the seismic survey were generally comparable or less than the distance to the edge of the restrictions, therefore restricted scenarios resulted in similar exposure ranges as unrestricted scenarios.

No southern right whales restricted to the reproduction BIA were exposed above PTS, TTS or behavioural threshold, except for limited exposures above TTS in scenario A. The SRW reproduction BIA is both narrow and close to shore, and in comparison with the modelled acoustic ranges, relatively little sound energy reaches the BIA. Sufficient sound energy from scenario A reaches the SRW reproduction BIA to result in TTS exposures, however, very few animats were exposed above this threshold (1% probability of exposure above the TTS criterion, Table 24).

The animat modelling was included in the scope of work to provide context to possible exposures to pygmy blue and southern right whales over an entire day. The distances to isopleths associated with the effect thresholds for PTS and TTS are more realistic than those from the static sound fields as they consider potential animal movements passing through the operational region.

5.4.2. Behavioural Effects

Exposure ranges ($ER_{95\%}$) for single exposure metrics, such as the SPL behavioural response criteria, are typically comparable to the predicted acoustic ranges. Maximum acoustic ranges (e.g., R_{max}) are conservatively calculated using the maximum-over-depth sound fields and assuming static receivers, while exposure ranges account for animats sampling the sound field vertically and horizontally based on species-specific diving parameters, so exposure ranges are generally slightly lower than the R_{max} acoustic ranges. In this case, exposure ranges were slightly shorter than acoustic ranges to threshold for most modelled scenarios (Figure 59).

Overall, ranges were longest for Scenario A. For all considered pygmy blue whale scenarios, the $ER_{95\%}$ to behavioural threshold ranged from 6.40 to 9.83 km for pygmy blue whales, with associated P_{exp} of 66 and 76%. For southern right whales, the $ER_{95\%}$ to behavioural threshold ranged from 5.35 to 9.51 km, with associated P_{exp} of 57 and 83%, notwithstanding reproducing southern right whales restricted to the reproduction BIA which were not exposed above the behavioural response threshold.

Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 80000-3 (2017).

1/3-octave

One third of an octave. *Note*: A one-third octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

1/3-octave-band

Frequency band whose bandwidth is one one-third octave. *Note*: The bandwidth of a one-third octave-band increases with increasing centre frequency.

A-weighting

Frequency-selective weighting for human hearing in air that is derived from the inverse of the idealized 40-phon equal loudness hearing function across frequencies.

absorption

The reduction of acoustic pressure amplitude due to acoustic particle motion energy converting to heat in the propagation medium.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

auditory frequency weighting

The process of applying an auditory frequency weighting function. In human audiometry, C-weighting is the most commonly used function, an example for marine mammals are the auditory frequency weighting functions published by Southall et al. (2007).

auditory frequency weighting function

Frequency weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity. Example hearing groups are low-, mid-, and high-frequency cetaceans, phocid and otariid pinnipeds.

azimuth

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also called bearing.

bandwidth

The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI S1.13-2005 (R2010)).

bar

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to 10^5 Pa or 10^{11} µPa.

boxcar averaging

A signal smoothing technique that returns the averages of consecutive segments of a specified width.

broadband level

The total level measured over a specified frequency range.

broadside direction

Perpendicular to the travel direction of a source. Compare with endfire direction.

cetacean

Any animal in the order Cetacea. These are aquatic species and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called primary wave or P-wave.

conductivity-temperature-depth (CTD)

Measurement data of the ocean's conductivity, temperature, and depth; used to compute sound speed and salinity.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006).

decidecade

One tenth of a decade. *Note*: An alternative name for decidecade (symbol ddec) is "one-tenth decade". A decidecade is approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct) and for this reason is sometimes referred to as a "one-third octave".

decidecade band

Frequency band whose bandwidth is one decidecade. *Note*: The bandwidth of a decidecade band increases with increasing centre frequency.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Unit: dB.

duty cycle

The time when sound is periodically recorded by an acoustic recording system.

endfire direction

Parallel to the travel direction of a source. Also see **broadside direction**.

energy source level

A property of a sound source obtained by adding to the sound exposure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2m^2s.

energy spectral density source level

A property of a sound source obtained by adding to the energy spectral density level of the sound pressure measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2m^2s/Hz$.

ensonified

Exposed to sound.

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

Fourier transform (or Fourier synthesis)

A mathematical technique which, although it has varied applications, is referenced in the context of this report as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as fast Fourier transform (FFT).

flat weighting

Term indicating that no frequency weighting function is applied. Synonymous with unweighted.

frequency

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol: *f*. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function. For sound of a given frequency, the frequency weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency weighting function*: compensatory frequency weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency weighting function*: frequency weighting function describing the sensitivity of an acoustic acquisition system, typically consisting of a hydrophone, one or more amplifiers, and an analogue to digital converter.

geoacoustic

Relating to the acoustic properties of the seabed.

harmonic

A sinusoidal sound component that has a frequency that is an integer multiple of the frequency of a sound to which it is related. For example, the second harmonic of a sound has a frequency that is double the fundamental frequency of the sound.

hearing group

Category of animal species when classified according to their hearing sensitivity and to the susceptibility to sound. Examples for marine mammals include very low-frequency (VLF) cetaceans, low-frequency (LF) cetaceans, mid-frequency (MF) cetaceans, high-frequency (HF) cetaceans, very high-frequency (VHF) cetaceans, otariid pinnipeds in water (OPW), phocid pinnipeds in water (PPW), sirenians (SI), other marine carnivores in air (OCA), and other marine carnivores in water (OCW) (NMFS 2018, Southall et al. 2019). See **auditory frequency weighting functions**, which are often applied to these groups. Examples for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual for specified background noise during a specific percentage of experimental trials.

hertz (Hz)

A unit of frequency defined as one cycle per second.

high-frequency (HF) cetacean

See **hearing group**.

intermittent sound

A sound whose level abruptly drops below the background noise level several times during an observation period.

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 second), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Examples of impulsive sound sources include explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some quantity.

knot

One nautical mile per hour. Symbol: kn.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. Examples include sound pressure level, sound exposure level, and peak sound pressure level. For example, a value of sound exposure level with reference to 1 μPa^2 s can be written in the form *x* dB re 1 μPa^2 s.

low-frequency (LF) cetacean

See **hearing group**.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetacean

See **hearing group**.

M-weighting

See **auditory frequency weighting function** (as proposed by Southall et al. 2007).

mysticete

A suborder of cetaceans that use baleen plates to filter food from water. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. A non-impulsive sound is not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

otariid

A common term used to describe members of the Otariidae, eared seals, commonly called sea lions and fur seals. Otariids are adapted to a semi-aquatic life; they use their large fore flippers for propulsion. Their ears distinguish them from phocids. Otariids are one of the three main groups in the superfamily Pinnipedia; the other two groups are phocids and walrus.

otariid pinnipeds in water (OPW)

See **hearing group**.

other marine carnivores in air (OCA)

See **hearing group**.

other marine carnivores in water (OCW)

See **hearing group**.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of back-scattered sound, simplifying the computation of propagation loss. The effect of back-scattered sound is negligible for most ocean-acoustic propagation problems.

particle acceleration, particle displacement, particle motion, particle velocity

See sound particle acceleration, sound particle displacement, sound particle motion, and sound particle velocity.

peak sound pressure level (zero-to-peak sound pressure level)

The level ($L_{p,pk}$ or L_{pk}) of the squared maximum magnitude of the sound pressure (p_{pk}^2).
Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa^2.

$$L_{p,\mathrm{pk}} := 10\log_{10}\left(p_{\mathrm{pk}}^2/p_0^2\right)\,\mathrm{dB} = 20\log_{10}\left(p_{\mathrm{pk}}/p_0\right)\,\mathrm{dB}$$

The frequency band and time window should be specified. Abbreviation: PK or L_{pk}.

peak-to-peak sound pressure

The difference between the maximum and minimum sound pressure over a specified frequency band and time window. Unit: pascal (Pa).

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

phocid

A common term used to describe all members of the family Phocidae. These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves. Phocids are one of the three main groups in the superfamily Pinnipedia; the other two groups are otariids and walrus.

phocid pinnipeds in water (PPW)

See **hearing group**.

pinniped

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source

A source that radiates sound as if from a single point.

pressure, acoustic

The deviation from the ambient pressure caused by a sound wave. Also called sound pressure. Unit: pascal (Pa).

pressure, hydrostatic

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, PL(x) = SL − L(x). Also see **transmission loss**.

received level

The level measured (or that would be measured) at a defined location. The type of level should be specified.

reference values

standard underwater references values used for calculating sound **levels**, e.g., the reference value for expressing sound pressure level in decibels is 1 µPa.

Quantity	Reference value
Sound pressure	1 µPa
Sound exposure	1 μPa^2 s
Sound particle displacement	1 pm
Sound particle velocity	1 nm/s
Sound particle acceleration	1 $\mu m/s^2$

rms

abbreviation for root-mean-square.

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium.

sound exposure

Time integral of squared sound pressure over a stated time interval. The time interval can be a specified time duration (e.g., 24 hours) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: Pa^2 s.

sound exposure level

The level (L_E) of the sound exposure (E). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 μPa^2 s.

$$L_E := 10 \log_{10}(E/E_0)\,\mathrm{dB} = 20 \log_{10}\left(E^{1/2}/E_0^{1/2}\right)\,\mathrm{dB}$$

The frequency band and integration time should be specified. Abbreviation: SEL.

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum. Unit: Pa^2 s/Hz.

sound field

Region containing sound waves.

sound intensity

Product of the sound pressure and the sound particle velocity. The magnitude of the sound intensity is the sound energy flowing through a unit area perpendicular to the direction of propagation per unit time.

sound particle acceleration

The rate of change of sound particle velocity. Unit: metre per second squared (m/s^2). Symbol: *a*.

sound particle motion

smallest volume of a medium that represents its mean physical properties.

sound particle displacement

Displacement of a material element caused by the action of sound, where a material element is the smallest element of the medium that represents the medium's mean density.

sound particle velocity

The velocity of a particle in a material moving back and forth in the direction of the pressure wave. Unit: metre per second (m/s). Symbol: *v*.

sound pressure

The contribution to total pressure caused by the action of sound.

sound pressure level (rms sound pressure level)

The level ($L_{p,\mathrm{rms}}$) of the time-mean-square sound pressure (p^2_{rms}). Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa^2.

$$L_{p,\mathrm{rms}} := 10\log_{10}(p^2_{\mathrm{rms}}/p_0^2)\ \mathrm{dB} = 20\log_{10}(p_{\mathrm{rms}}/p_0)\ \mathrm{dB}$$

The frequency band and averaging time should be specified. Abbreviation: SPL or Lrms.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

soundscape

The characterization of the ambient sound in terms of its spatial, temporal, and frequency attributes, and the types of sources contributing to the sound field.

source level (SL)

A property of a sound source obtained by adding to the sound pressure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^{2}m^2.

spectrum

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

surface duct

The upper portion of a water column within which the sound speed profile gradient causes sound to refract upward and therefore reflect off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity. TTS can be caused by noise exposure.

thermocline

The depth interval near the ocean surface that experiences temperature gradients due to warming or cooling by heat conduction from the atmosphere and by warming from solar heating.

transmission loss (TL)

The difference between a specified level at one location and that at a different location, TL(x1,x2) = L(x1) − L(x2). Also see **propagation loss**.

unweighted

Term indicating that no frequency weighting function is applied. Synonymous with flat weighting.

very high-frequency (VHF) cetacean

See **hearing group**.

very low-frequency (VLF) cetacean

See **hearing group**.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol: λ.

Appendix A. Acoustic Metrics

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow the American National Standard Institute and International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI R2013), but these standards are not always consistent.

The zero-to-peak sound pressure, or peak sound pressure (PK or $L_{p,pk}$; dB re 1 µPa), is the decibel level of the maximum instantaneous acoustic pressure in a stated frequency band attained by an acoustic pressure signal, $p(t)$:

$$L_{p,\mathrm{pk}} = 10\log_{10}\frac{\max|p^2(t)|}{p_0^2} = 20\log_{10}\frac{\max|p(t)|}{p_0} \tag{A-1}$$

PK is often included as a criterion for assessing whether a sound is potentially injurious; however, because it does not account for the duration of an acoustic event, it is generally a poor indicator of perceived loudness.

The peak-to-peak sound pressure (PK-PK or $L_{p,pk\text{-}pk}$; dB re 1 µPa) is the difference between the maximum and minimum instantaneous sound pressure, possibly filtered in a stated frequency band, attained by an impulsive sound, $p(t)$:

$$L_{p,\mathrm{pk\text{-}pk}} = 10\log_{10}\frac{[\max(p(t)) - \min(p(t))]^2}{p_0^2} \tag{A-2}$$

The sound pressure level (SPL or L_p; dB re 1 µPa^2) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10\log_{10}\left(\frac{1}{T}\int_T g(t)\,p^2(t)\,dt \Big/ p_0^2\right) \tag{A-3}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function. For short acoustic events, such as sonar pulses and marine mammal vocalizations, it is important to choose an appropriate time window that matches the duration of the signal. For in-air studies, when evaluating the perceived loudness of sounds with rapid amplitude variations in time, the time weighting function $g(t)$ is often set to a decaying exponential function that emphasizes more recent pressure signals. This function mimics the leaky integration nature of mammalian hearing. For example, human-based fast time-weighted SPL ($L_{p,fast}$) applies an exponential function with time constant 125 ms. A related simpler approach used in underwater acoustics sets $g(t)$ to a boxcar (unity amplitude) function of width 125 ms; the results can be referred to as $L_{p,boxcar\ 125ms}$. Another approach, historically used to evaluate SPL of impulsive signals underwater, defines $g(t)$ as a boxcar function with edges set to the times corresponding to 5% and 95% of the cumulative square pressure function encompassing the duration of an impulsive acoustic event. This calculation is applied individually to each impulse signal, and the results are referred to as 90% SPL ($L_{p,90\%}$).

The sound exposure level (SEL or L_E; dB re 1 µPa²·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10 \log_{10} \left(\int_T p^2(t)\, dt \Big/ T_0 p_0^2 \right) \quad \text{(A-4)}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10 \log_{10} \sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \quad \text{(A-5)}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LF,24h}$; see Appendix A.5) or auditory-weighted SPL ($L_{p,ht}$). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Particle Acceleration and Velocity Metrics

Since sound is a mechanical wave, it can also be measured in terms of the vibratory motion of fluid particles. Particle motion can be measured in terms of three different (but related) quantities: displacement, velocity, or acceleration. Acoustic particle velocity is the time derivative of particle displacement, and likewise acceleration is the time derivative of velocity. For the present study, acoustic particle motion has been reported in terms of acceleration and velocity.

The particle velocity (v) is the physical speed of a particle in a material moving back and forth in the direction of the pressure wave. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium:

$$v = -\int \nabla p(t) dt / \rho_0 \quad \text{(A-6)}$$

The particle acceleration (a) is the rate of change of the velocity with respect to time, and it can be obtained from equation A-6 as:

$$a = \frac{dv}{dt} = -\frac{\nabla p(t)}{\rho_0} \quad \text{(A-7)}$$

Unlike sound pressure, particle motion is a vector quantity, meaning that it has both magnitude and direction: at any given point in space, acoustic particle motion has three different time-varying components (x, y, and z). Given the particle velocity in the x, y, and z, directions, v_x, v_y, and v_z, the particle velocity magnitude $|v|$ is computed per the Pythagorean equation:

$$|v| = \sqrt{v_x + v_y + v_z} \quad \text{(A-8)}$$

The magnitude of particle acceleration is calculated similarly from the particle acceleration in the *x*, *y*, and *z* directions.

A.3. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. They are approximately one third of an octave (base 2) wide and are therefore often referred to as 1/3-octave-bands. Each octave represents a doubling in sound frequency. The centre frequency of the ith band, $f_c(i)$, is defined as:

$$f_c(i) = 10^{\frac{i}{10}} \text{ kHz} \tag{A-9}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i) \tag{A-10}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 7 (f_c (7) = 5 Hz) to band 44 ($f_c(44)$ = 25 kHz).

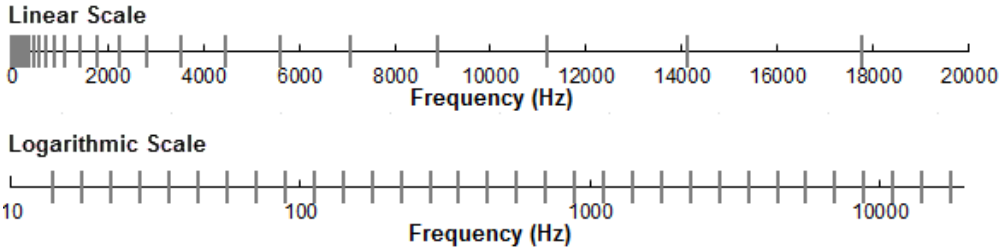

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{lo,i}$ and $f_{hi,i}$:

$$L_{p,i} = 10 \log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f)\, df \tag{A-11}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_{i} 10^{\frac{L_{p,i}}{10}} \tag{A-12}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

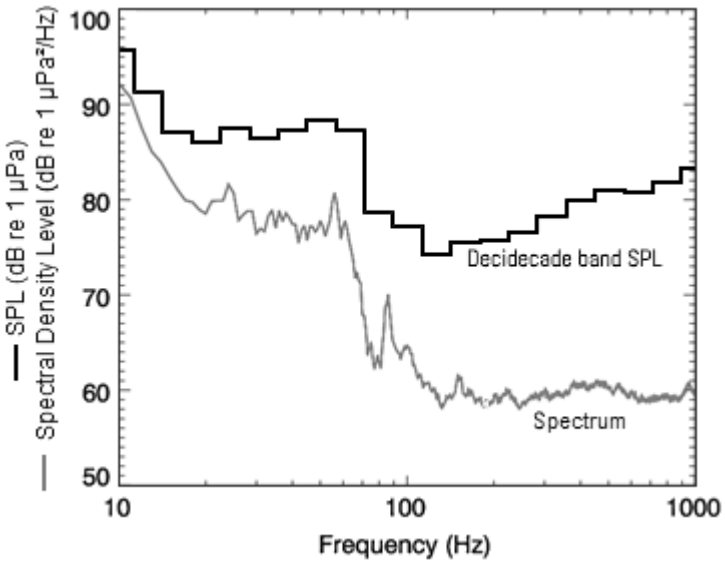

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.

A.4. Marine Mammal Impact Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggested that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for both injury and disturbance. The following sections summarize the recent development of thresholds; however, this field remains an active research topic.

A.4.1. Injury

In recognition of shortcomings of the SPL-only based injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual acoustic injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas the SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for human; Appendix A.5). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower injury values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 $\mu Pa^2 \cdot s$. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 $\mu Pa^2 \cdot s$.

As of present, an optimal approach is not apparent. There is consensus in the research community that an SEL-based method is preferable either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018; with the criteria defined in NMFS (2018). The latest criteria are from Southall et al. (2019) which is applied in this report.

A.4.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1 μPa^2 SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). The HESS team recognised that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above a SPL of 140 dB re 1 μPa^2. Southall et al. (2007) found varying responses for most marine mammals between a SPL of 140 and 180 dB re 1 μPa^2, consistent with the HESS (1999) report, but lack of convergence in the data prevented them from suggesting explicit step functions.

A.5. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.5.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^{2}\right]^{a}\left[1+(f/f_{hi})^{2}\right]^{b}}\right)\right] \quad \text{(A-13)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values. Table A-1 lists the frequency-weighting parameters for each hearing group. Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	f_{lo} (Hz)	f_{hi} (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very-high-frequency cetaceans (true porpoises, *Kogia*, river dolphins, cephalorhynchid, *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Other marine carnivores in water (Australian sea lion, Australian fur seal, New Zealand fur seal, Penguins)	2.0	2	940	25,000	0.64

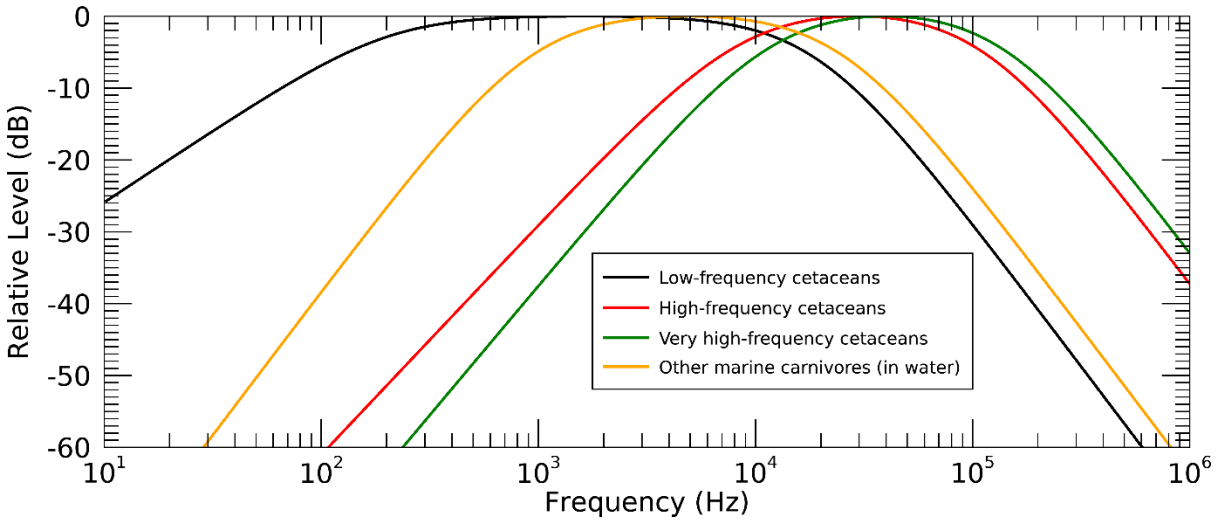

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

Appendix B. Acoustic Source Model

B.1. Airgun Array Source Model

The source levels and directivity of the seismic source were predicted with JASCO's Airgun Array Source Model (AASM). AASM includes low- and high-frequency modules for predicting different components of the seismic source spectrum. The low-frequency module is based on the physics of oscillation and radiation of airgun bubbles, as originally described by Ziolkowski (1970), that solves the set of parallel differential equations that govern bubble oscillations. Physical effects accounted for in the simulation include pressure interactions between airguns, port throttling, bubble damping, and generator-injector (GI) gun behaviour discussed by Dragoset (1984), Laws et al. (1990), and Landrø (1992). A global optimisation algorithm tunes free parameters in the model to a large library of airgun source signatures.

While airgun signatures are highly repeatable at the low frequencies, which are used for seismic imaging, their sound emissions have a large random component at higher frequencies that cannot be predicted using a deterministic model. Therefore, AASM uses a stochastic simulation to predict the high-frequency (800−25,000 Hz) sound emissions of individual airguns, using a data-driven multiple-regression model. The multiple-regression model is based on a statistical analysis of a large collection of high quality seismic source signature data recently obtained from the Joint Industry Program (JIP) on Sound and Marine Life (Mattsson and Jenkerson 2008). The stochastic model uses a Monte-Carlo simulation to simulate the random component of the high-frequency spectrum of each airgun in an array. The mean high-frequency spectra from the stochastic model augment the low-frequency signatures from the physical model, allowing AASM to predict airgun source levels at frequencies up to 25,000 Hz.

AASM produces a set of "notional" signatures for each array element based on:

- Array layout
- Volume, tow depth, and firing pressure of each airgun
- Interactions between different airguns in the array

These notional signatures are the pressure waveforms of the individual airguns at a standard reference distance of 1 m; they account for the interactions with the other airguns in the array. The signatures are summed with the appropriate phase delays to obtain the far-field source signature of the entire array in all directions. This far-field array signature is filtered into decidecade-bands to compute the source levels of the array as a function of frequency band and azimuthal angle in the horizontal plane (at the source depth), after which it is considered a directional point source in the far field.

A seismic array consists of many sources and the point source assumption is invalid in the near field where the array elements add incoherently. The maximum extent of the near field of an array (R_{nf}) is:

$$R_{\mathrm{nf}} < \frac{l^2}{4\lambda} \tag{B-1}$$

where λ is the sound wavelength and l is the longest dimension of the array (Lurton 2002, §5.2.4). For example, a seismic source length of l = 21 m yields a near-field range of 147 m at 2 kHz and 7 m at 100 Hz. Beyond this R_{nf} range, the array is assumed to radiate like a directional point source and is treated as such for propagation modelling.

The interactions between individual elements of the array create directionality in the overall acoustic emission. Generally, this directionality is prominent mainly at frequencies in the mid-range between

tens of hertz to several hundred hertz. At lower frequencies, with acoustic wavelengths much larger than the inter-airgun separation distances, the directionality is small. At higher frequencies, the pattern of lobes is too finely spaced to be resolved and the effective directivity is less.

B.2. Seismic Source

The layout of the 2820 in^3 seismic sources used for modelling in this study is provided in Figure B-1. Details of the airgun parameters are provided in Table B-1.

For the modelled array, the layout is presented in a nominal cartesian coordinate system. In this coordinate system the direction of vessel travel determines the relative position of the array elements as plotted and tabulated. The layout used for acoustic modelling was produced by transforming the coordinates of client supplied layouts such that the resultant layouts correspond to a vessel travel direction along the positive X-axis and the array is centred on the X-Y origin. When used with an acoustic model the positive X-axis in this nominal coordinate system aligns with the vessel tow direction or survey line azimuth.

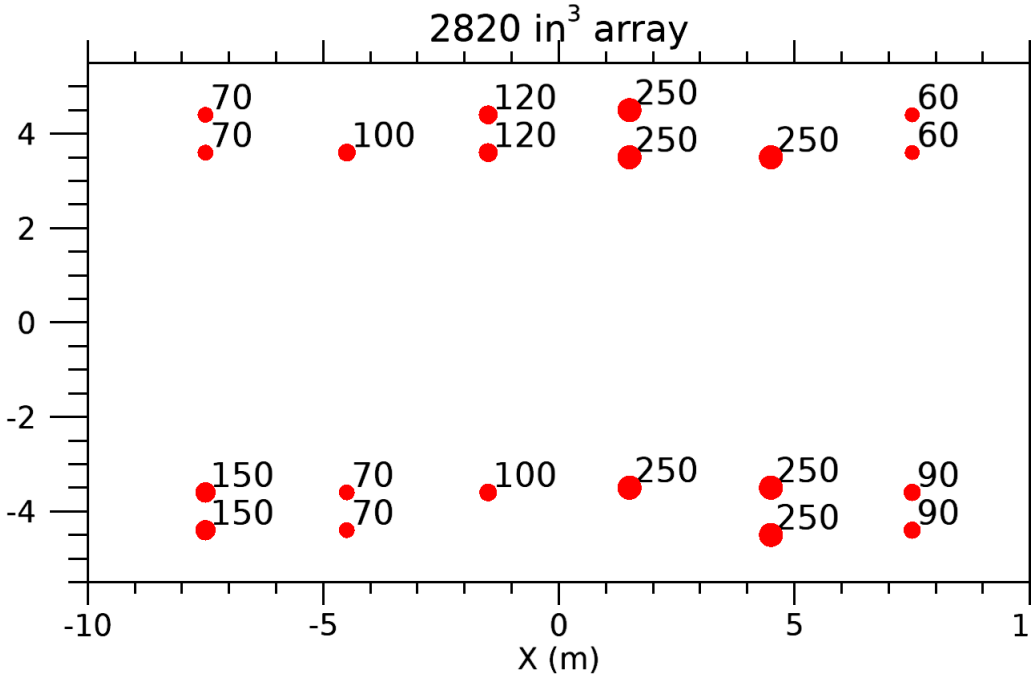

Figure B-1. Layout of the modelled 2820 in^3 seismic source where the plotted layout is such that the array is centred on the origin and vessel travel direction is in the positive x-direction. Tow depth was 7 m. The labels indicate the firing volume (in cubic inches) for each airgun. Also see Table B-1.

Table B-1. Layout of the modelled 2820 in^3 seismic source. Tow depth was 7 m. Firing pressure for all guns was 2000 psi. Greyed out values indicate spares. Also see Figure B-1.

String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)	String	Gun	*x* (m)	*y* (m)	*z* (m)	Vol (in^3)
1	1	7.5	-4.4	7	90	2	13	7.5	3.6	7	60
	2	7.5	-3.6	7	90		14	7.5	4.4	7	60
	3	4.5	-4.5	7	250		15	4.5	3.5	7	250
	4	4.5	-3.5	7	250		16	4.5	4.5	7	220
	5	1.5	-4.5	7	250		17	1.5	3.5	7	250
	6	1.5	-3.5	7	250		18	1.5	4.5	7	250
	7	-1.5	-4.4	7	100		19	-1.5	3.6	7	120
	8	-1.5	-3.6	7	100		20	-1.5	4.4	7	120
	9	-4.5	-4.4	7	70		21	-4.5	3.6	7	100
	10	-4.5	-3.6	7	70		22	-4.5	4.4	7	100
	11	-7.5	-4.4	7	150		23	-7.5	3.6	7	70
	12	-7.5	-3.6	7	150		24	-7.5	4.4	7	70

B.3. Array Source Levels and Directivity

Figure B-2 shows the broadside (perpendicular to the tow direction), endfire (parallel to the tow direction) and vertical overpressure signature and corresponding power spectrum levels for the 2820 in^3 seismic source (Appendix B.2). Horizontal decidecade-band source levels are shown as a function of band centre frequency and azimuth in Figure B-3.

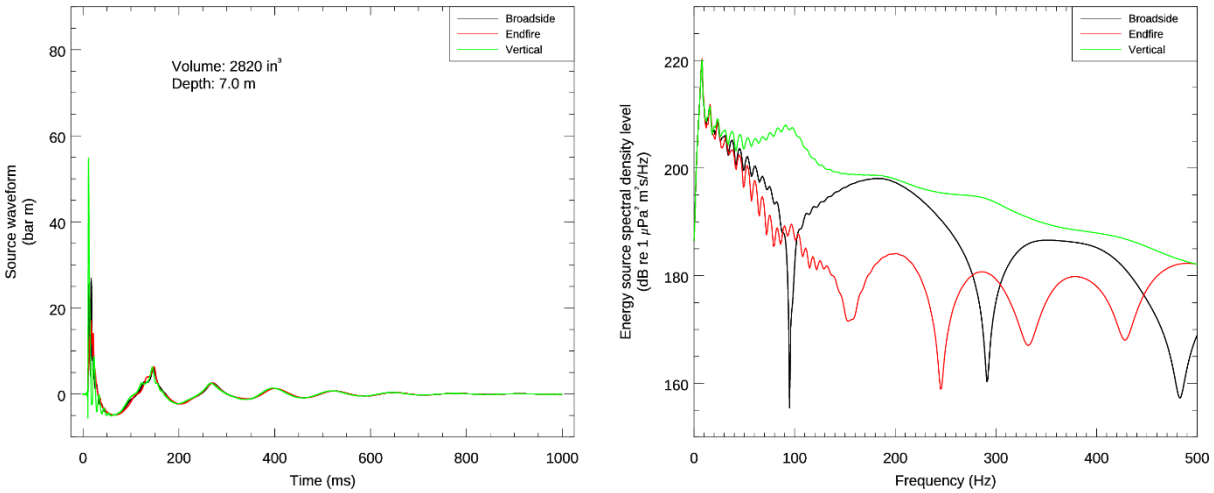

Figure B-2. Predicted source level details for the 2820 in^3 seismic source with a 7 m tow depth. (Left) the overpressure signature and (right) the power spectrum for in-plane horizontal (broadside), perpendicular (endfire), and vertical directions (no surface ghost).

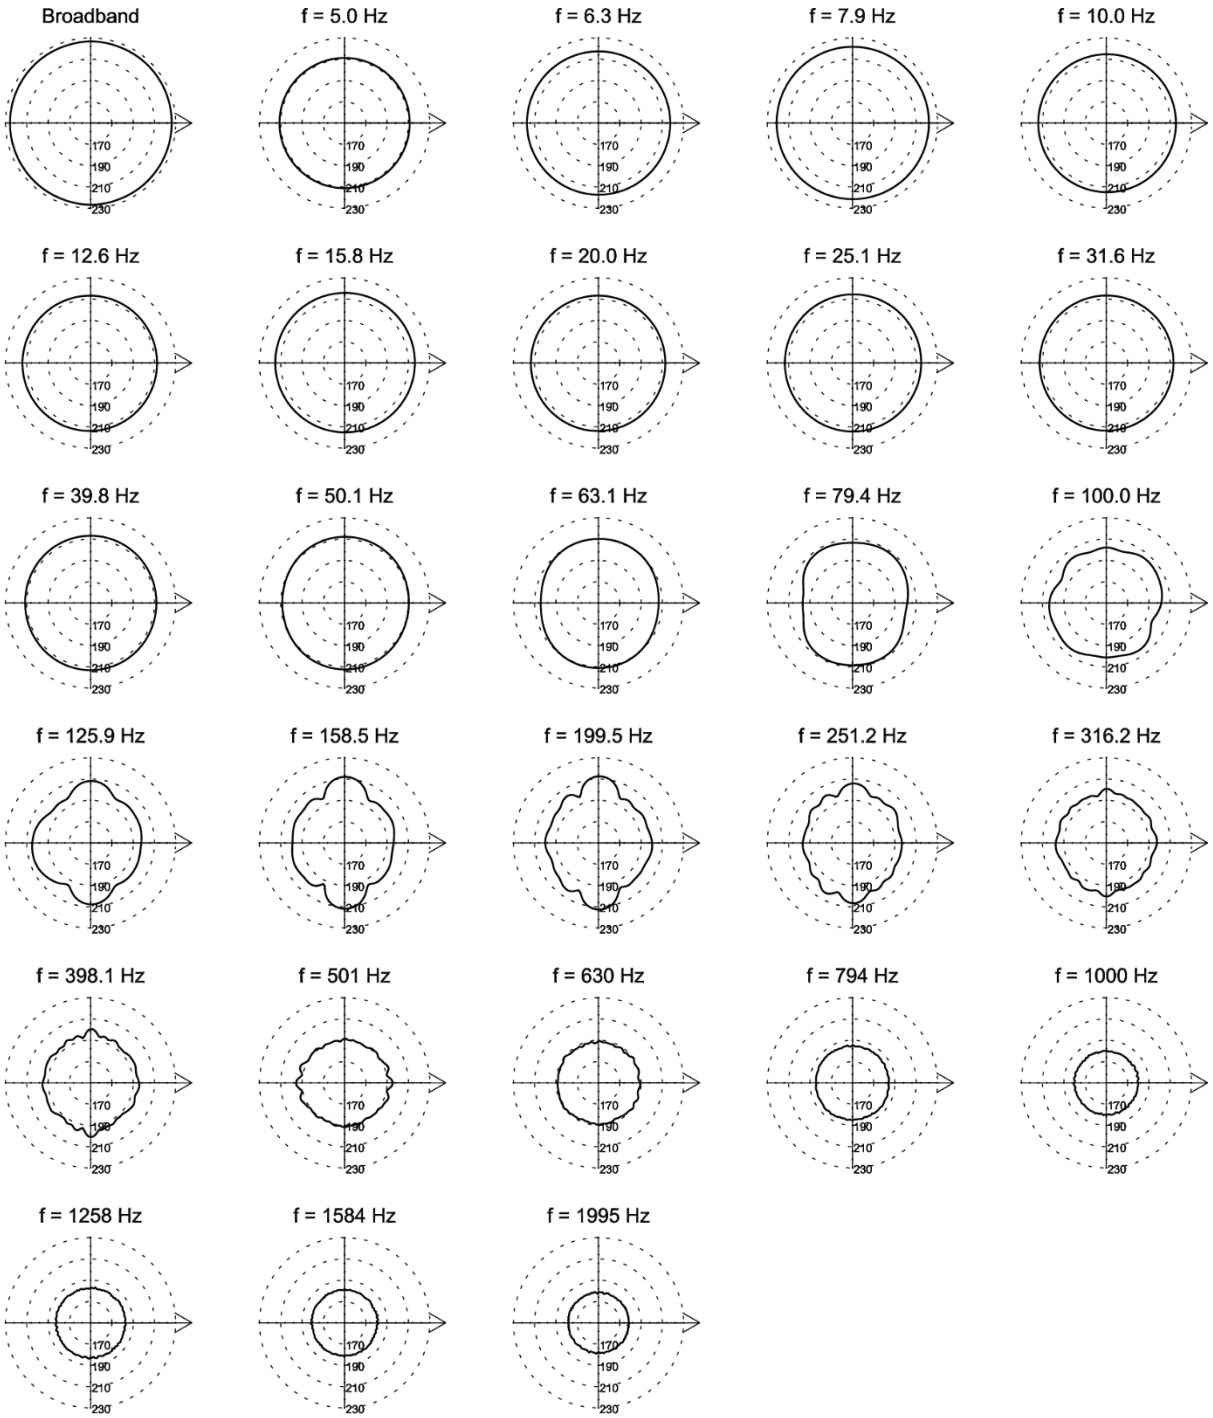

Figure B-3. Directionality of the predicted horizontal source levels for the 2820 in^3 seismic source, 5 Hz to 2 kHz. Source levels (in dB re 1 $\mu Pa^2 \cdot s\ m^2$) are shown as a function of azimuth for the centre frequencies of the decidecade bands modelled; frequencies are shown above the plots. The perpendicular direction to the frame is to the right. Tow depth was 7 m (see Table B-1).

Appendix C. Sound Propagation Models

C.1. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). Compared to VSTACK, MONM less accurately predicts steep-angle propagation for environments with higher shear speed but is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 5 Hz to 1 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies >1 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

This version of MONM accounts for sound attenuation due to energy absorption through ion relaxation and viscosity of water in addition to acoustic attenuation due to reflection at the medium boundaries and internal layers (Fisher and Simmons 1977). The former type of sound attenuation is significant for frequencies higher than 5 kHz and cannot be neglected without noticeably affecting the model results.

MONM computes acoustic fields in three dimensions by modelling transmission loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure C-1).

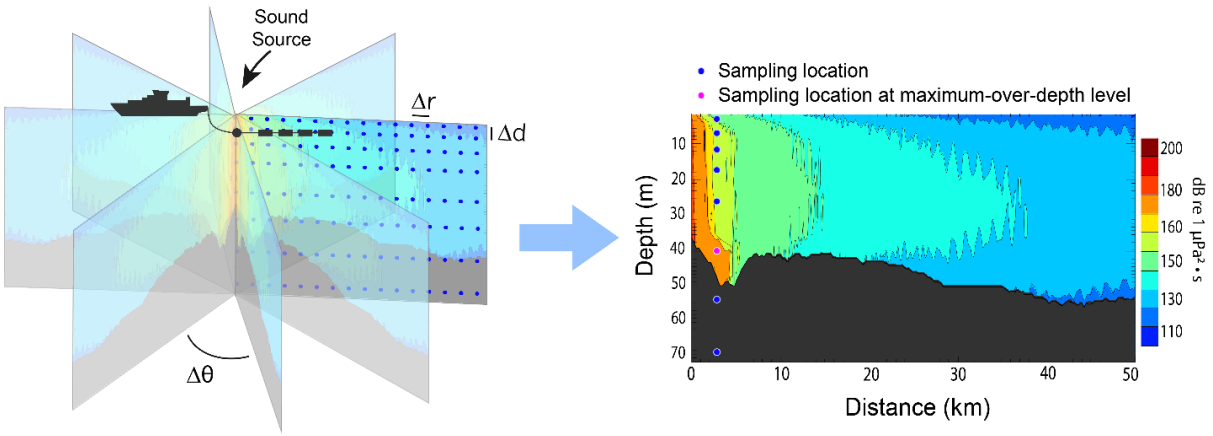

Figure C-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic transmission loss at the centre frequencies of decidecade bands. Sufficiently many decidecade bands, starting at 5 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the transmission loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade band received per-pulse SEL are computed by subtracting the band transmission loss values from the directional source level in that frequency band. Composite

broadband received per-pulse SEL are then computed by summing the received decidecade band levels.

The received per-pulse SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. The maximum received per-pulse SEL at many sampling depths are taken over all samples within the water column, i.e., the maximum-over-depth received per-pulse SEL. These maximum-over-depth per-pulse SEL are presented as contours around the source.

C.2. Full Waveform Range-dependent Acoustic Model: FWRAM

For impulsive sounds from the seismic source, time-domain representations of the pressure waves generated in the water are required to calculate SPL and PK. Furthermore, the seismic source must be represented as a distributed source to accurately characterise vertical directivity effects in the near-field zone. For this study, synthetic pressure waveforms were computed using FWRAM, which is a time-domain acoustic model based on the same wide-angle parabolic equation (PE) algorithm as MONM. FWRAM computes synthetic pressure waveforms versus range and depth for range-varying marine acoustic environments, and it takes the same environmental inputs as MONM (bathymetry, water sound speed profile, and seafloor geoacoustic profile). Unlike MONM, FWRAM computes pressure waveforms via Fourier synthesis of the modelled acoustic transfer function in closely spaced frequency bands. FWRAM employs the array starter method to accurately model sound propagation from a spatially distributed source (MacGillivray and Chapman 2012).

Besides providing direct calculations of the PK and SPL, the synthetic waveforms from FWRAM can also be used to convert the SEL values from MONM to SPL.

C.3. Wavenumber Integration Model

Sound pressure levels near the seismic source were modelled using JASCO's VSTACK wavenumber integration model. VSTACK computes synthetic pressure waveforms versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. The output of the model can be post-processed to yield estimates of the SEL, SPL, and PK.

VSTACK accurately predicts steep-angle propagation in the proximity of the source, but it is computationally slow at predicting sound pressures at large distances due to the need for smaller wavenumber steps with increasing distance. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. VSTACK is thus best suited to modelling the sound field near the source.

C.3.1. Particle Motion

VSTACK was also used to compute estimates of particle acceleration and velocity at four sites for the 2820 in^3 seismic source. Particle motion waveforms were modelled, and pulse metrics were computed from the time-domain traces. VSTACK uses the wavenumber integration approach to solve the exact acoustic wave equation for arbitrarily layered range-independent acoustic environments.

The VSTACK model setup for the particle velocity scenarios was identical to that for the peak pressure scenarios (Section 4.2.1.2) in terms of source treatment, frequency range and environmental model. The particle acceleration and velocity waveforms were computed to a maximum distance of 1000 m in the broadside and endfire directions from the centre of the airgun array for a receiver 5 cm above the seafloor.

As discussed above in Appendix A.2, particle velocity (v) is the physical speed of a particle in a material. It can be derived from the pressure gradient and Euler's linearised momentum equation where ρ_0 is the density of the medium. Since the wavenumber integration kernel is a product of analytic expressions in terms of range and depth, VSTACK computes particle velocity by computing the spatial gradient of the pressure field analytically in the frequency domain. Fourier synthesis is applied to compute time series synthetic pressure and/or velocity waveforms at depth and range receivers by convolving the source waveforms with the impulse response of the waveguide. Particle velocity metrics at each receiver location were calculated from the modelled particle motion along three perpendicular axes (horizontal and along the source-receiver path, horizontal and perpendicular to the source-receiver path, and vertical).

The particle velocity results were converted to acceleration by time differentiation. The peak particle acceleration and velocity were calculated from the maximum of the predicted acceleration and velocity magnitude, defined as "peak magnitude".

C.3.2. Limestone Seabed Propagation Loss

For all modelled sites, an additional broadband correction was applied to the propagation loss results from MONM to better account for the additional propagation loss associated with a calcarenite/limestone seabed. The differences between the broadband per-pulse SEL from MONM and VSTACK were extracted at the same modelled ranges and depths for corresponded range independent environments. The 90th percentile of the resultant dB differences in range bins were selected to generate a correction function for representative sites to be modelled. The conversion functions were applied after to the summed decidecade band levels from MONM, but before gridding, and radii calculations for each modelled site in each modelled scenario considered.

Appendix D. Methods and Parameters

D.1. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure D-1).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure D-1(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure D-1(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

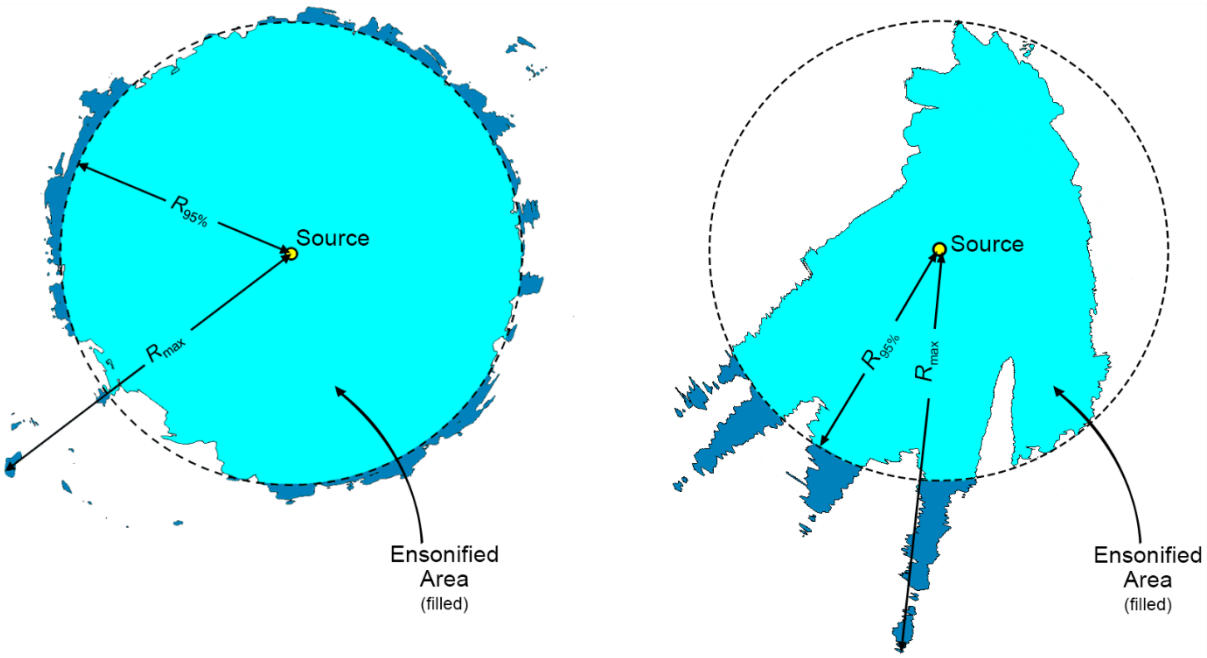

Figure D-1. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

D.2. Estimating SPL from Modelled SEL Results

The per-pulse SEL of sound pulses is an energy-like metric related to the dose of sound received over a pulse's entire duration. The pulse SPL on the other hand, is related to its intensity over a specified time interval. Seismic pulses typically lengthen in duration as they propagate away from their source, due to seafloor and surface reflections, and other waveguide dispersion effects. The changes in pulse length, and therefore the time window considered, affect the numeric relationship between SPL and SEL. This study has applied a fixed window duration to calculate SPL (T_{fix} = 125 ms; see Appendix A.1), as implemented in Martin et al. (2017b). Full-waveform modelling was used to estimate SPL, but this type of modelling is computationally intensive, and can be prohibitively time consuming when run at high spatial resolution over large areas.

For the current study, FWRAM (Appendix C.2) was used to model synthetic seismic pulses over the frequency range 5–1024 Hz. This was performed along all broadside and endfire radials at five sites. FWRAM uses Fourier synthesis to recreate the signal in the time domain so that both the SEL and SPL from the source can be calculated. The differences between the SEL and SPL were extracted for all ranges and depths that corresponded to those generated from the high spatial-resolution results from MONM. A 125 ms fixed time window positioned to maximize the SPL over the pulse duration was applied. The resulting SEL-to-SPL offsets were averaged in 0.02 km range bins along each modelled radial and depth, and the 90th percentile was selected at each range to generate a generalised range-dependent conversion function for each site. The range-dependent conversion function was applied to predicted per-pulse SEL results from MONM to model SPL values. Figures D-2 to D-6 show the conversion offsets for Sites 2, 3, 5, 8, and 10 with the 2820 in^3 array; the spatial variation is caused by changes in the received airgun pulse as it propagates from the source. The conversion to SPL from SEL was conducted considering the water depth and seabed geology at a given modelled site.

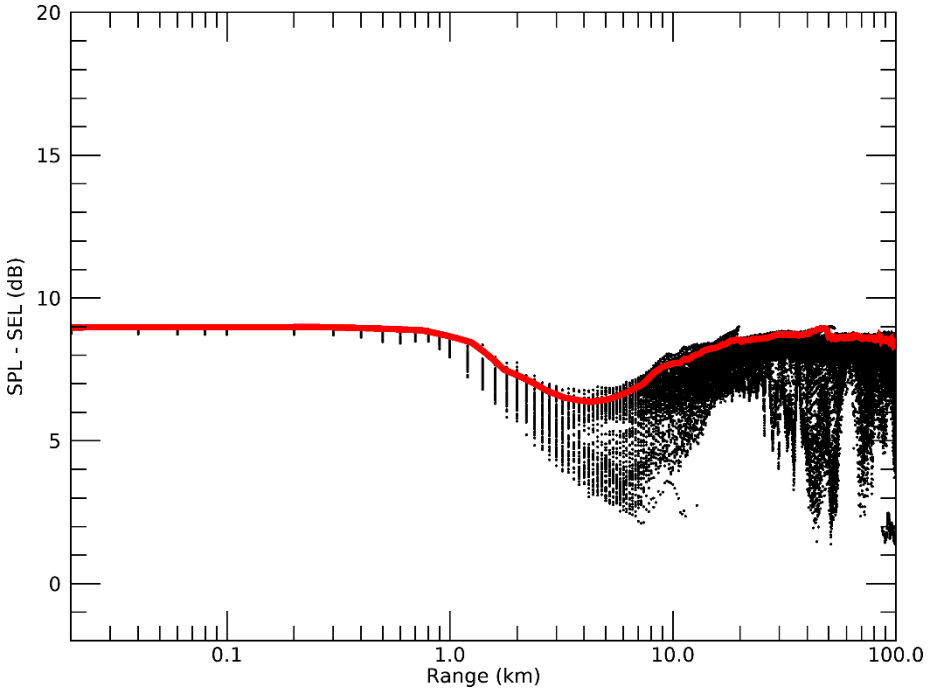

Figure D-2. *Site 2 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

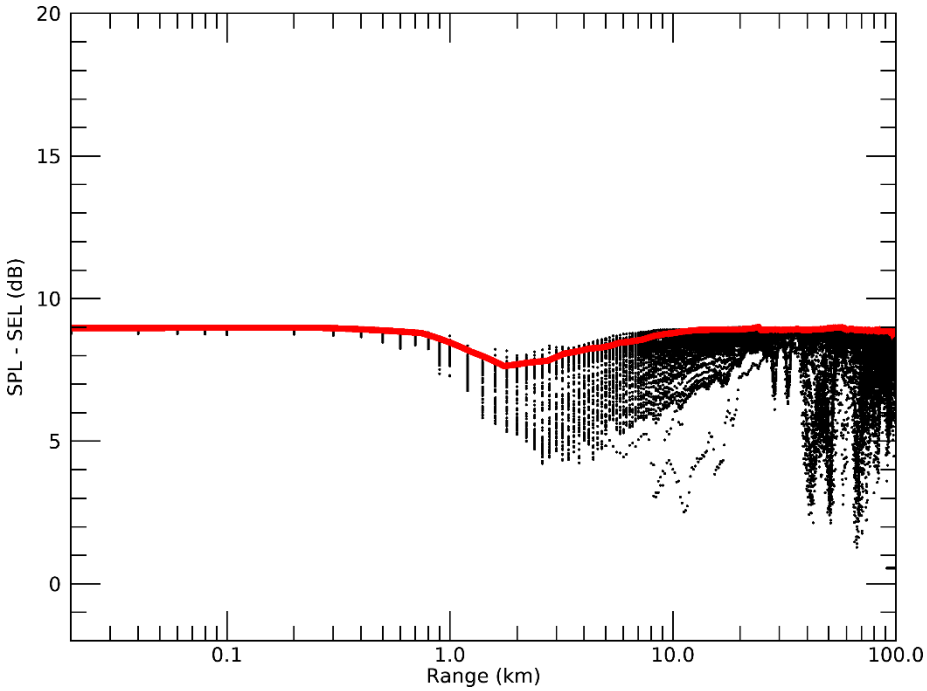

Figure D-3. *Site 3 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

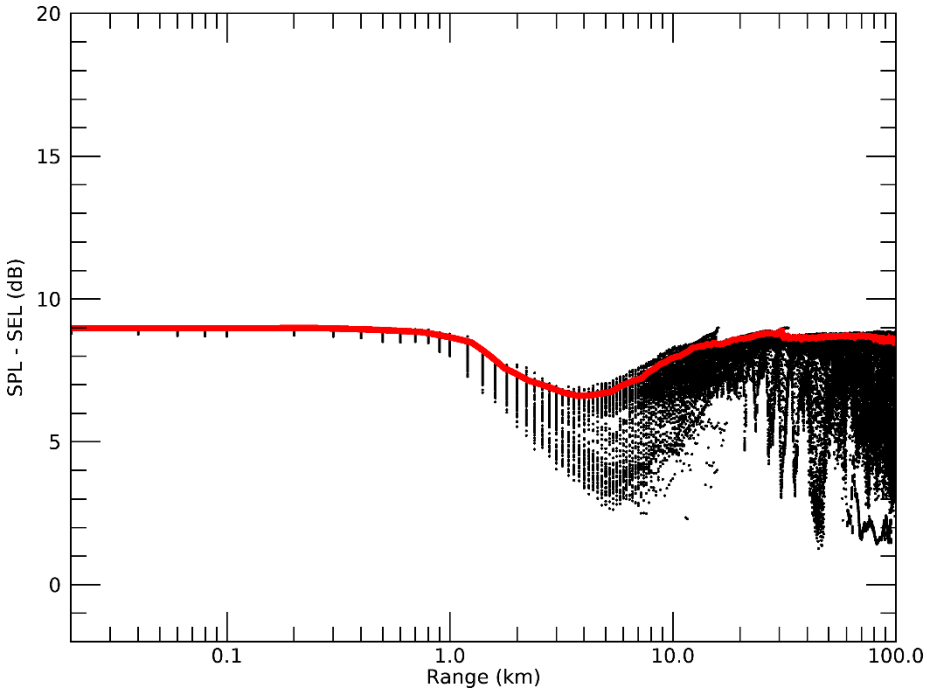

Figure D-4. *Site 5 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

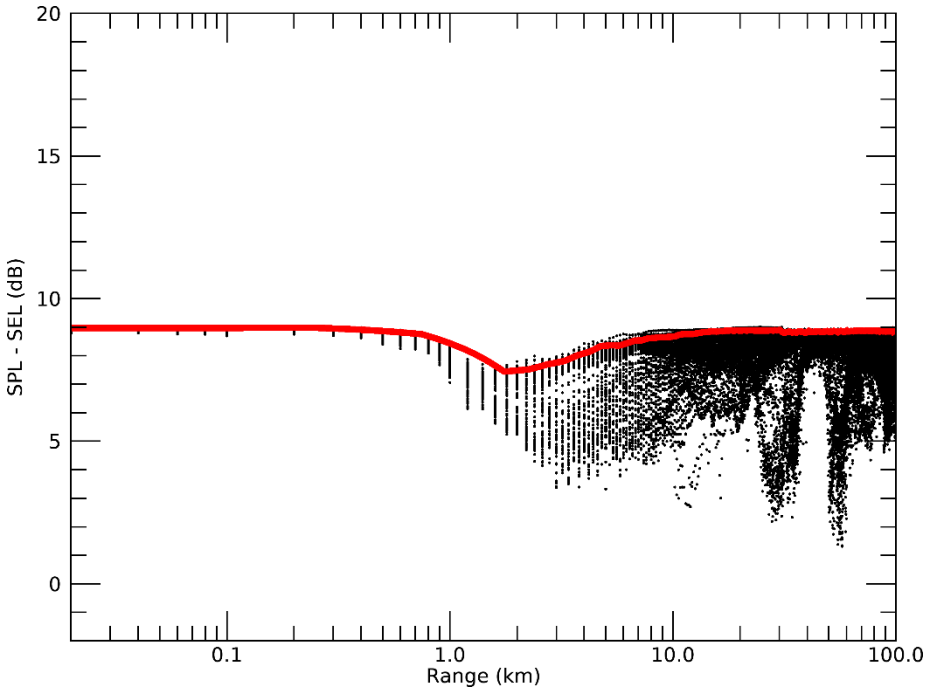

Figure D-5. *Site 8 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

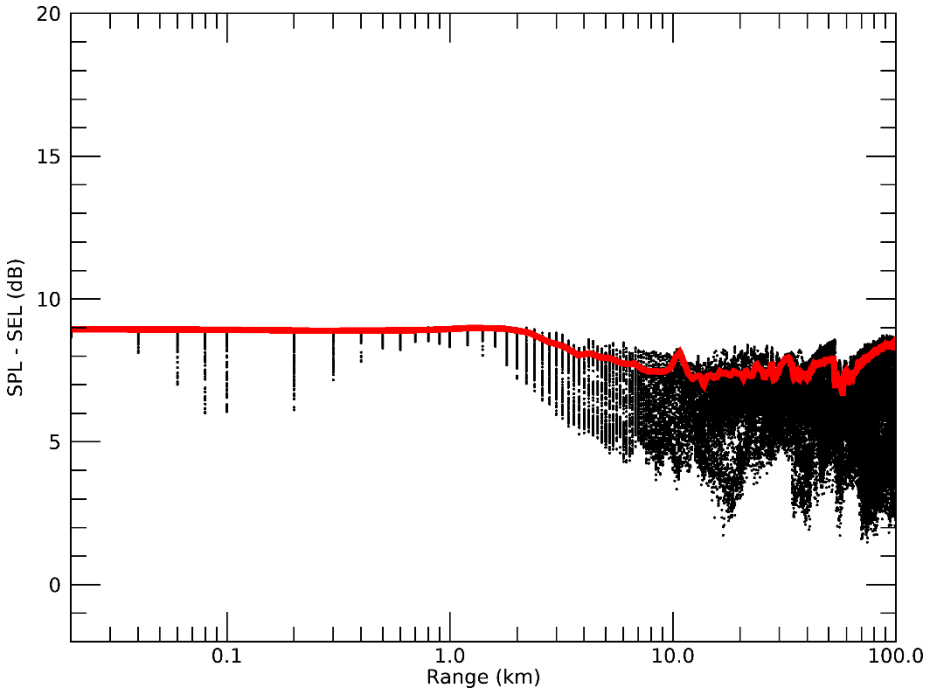

Figure D-6. *Site 10 tow direction 113°*: Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for seismic pulses. Slices are shown for the 2820 in^3 seismic source. Black lines are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

D.3. Environmental Parameters

D.3.1. Bathymetry

Water depths throughout the modelled area were extracted from Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data was extracted and re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 200 × 200 m to generate the bathymetry in Figure D-7.

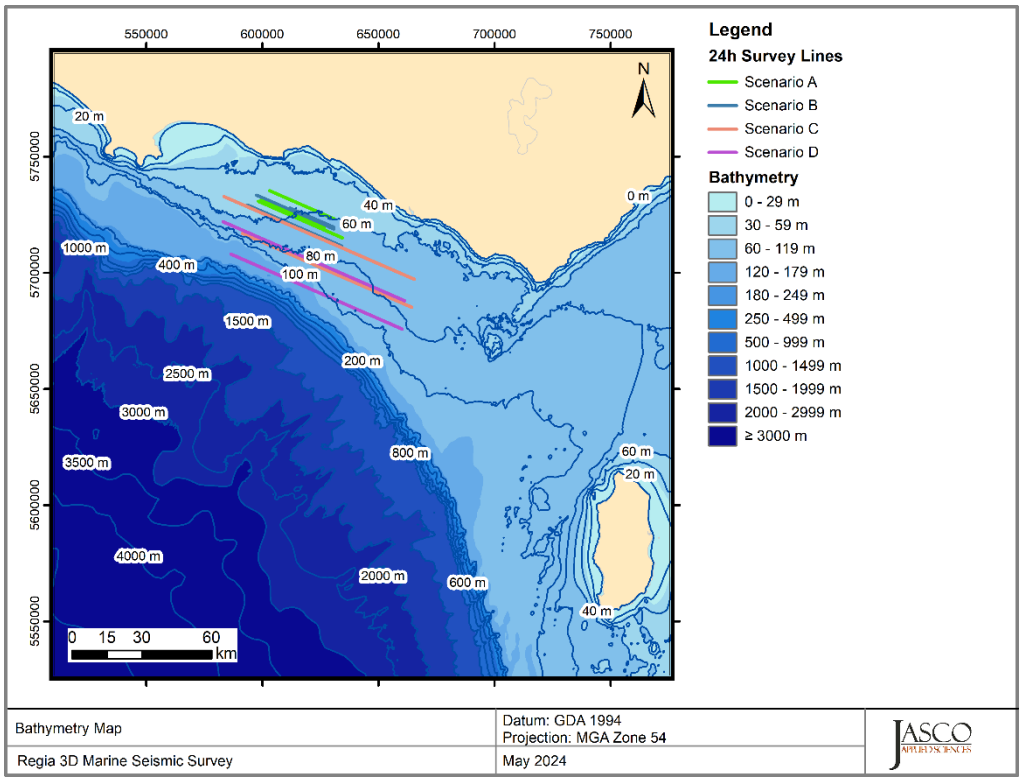

Figure D-7. Bathymetry map of the modelling area for the Regia Marine Seismic Survey.

D.3.2. Sound Speed Profile

The sound speed profiles for the modelled sites were derived from temperature and salinity profiles from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the US Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles within a 100 km box radius encompassing all modelled sites. The June sound speed profile is expected to be most favourable to longer-range sound propagation due its upward refracting profile. As such, June was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure D-8 shows the resulting profile used as input to the sound propagation modelling.

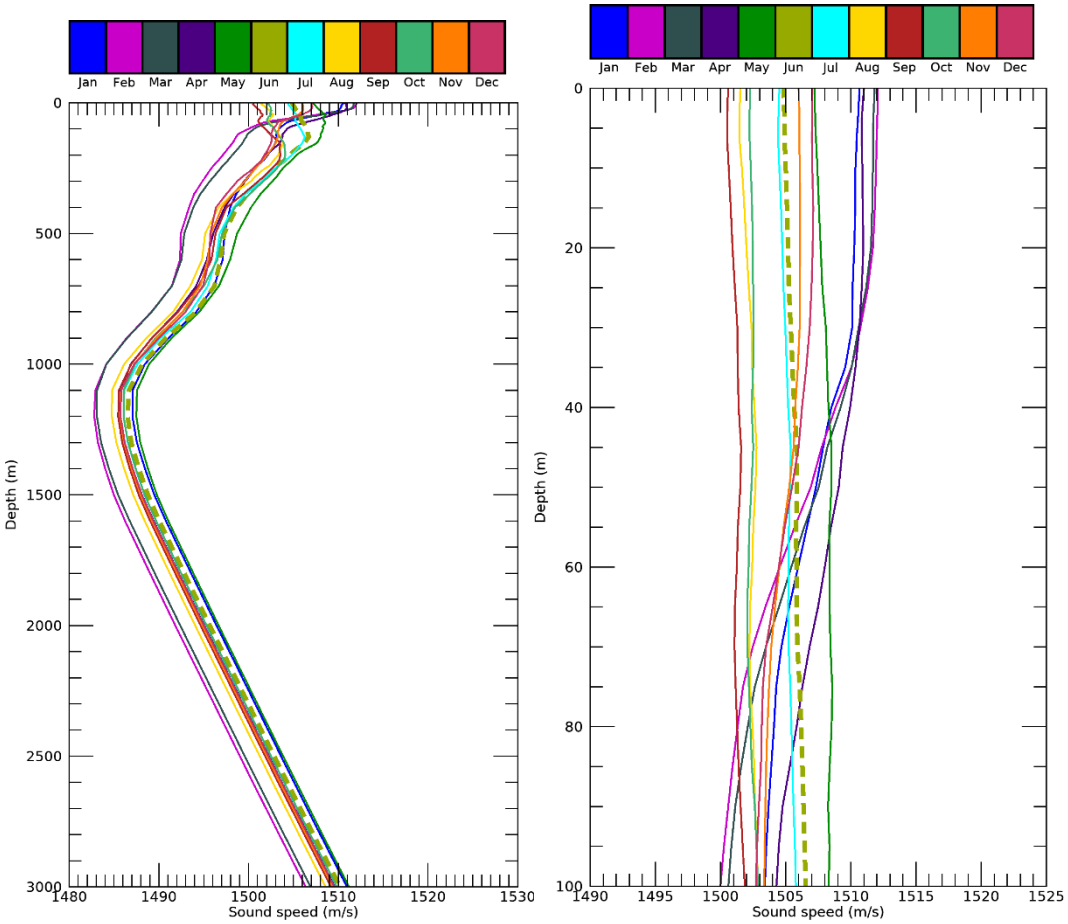

Figure D-8. The sound speed profile (June) used for all modelling, showing the entire water column (left) and the top 100 m within the profile (right). Profiles are calculated from temperature and salinity profiles from GDEM V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

D.3.3. Geoacoustics

The geoacoustic parameters used for modelling have been sourced from previous public reports completed by JASCO for modelling projects in the surrounding area. Similar to previous modelling studies in the region (Wood and McPherson 2018, Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), several seabed types were considered for modelling. These seabed profiles are indicative of a benthic environment located on the continental shelf and upper slope and are consistent with larger scale geological data and interpretations of the Australian continental shelf environment (James and Bone 2010) within the Otway region.

For the sites modelled in shallow water (less than 65 m depth) the seabed was modelled as a sand layer underlain by variably cemented calcarenite. Literature and public reports suggest that this layer likely begins to thin as water depths increase in an offshore direction (Koessler et al. 2020, Matthews et al. 2020, McPherson et al. 2021), and for water depths greater than 65 m it was considered absent with only the variably cemented calcarenite present at the seafloor interface. These two seabed profiles are consistent with profiles described in association with measurement data (McCauley et al. 2016), and other modelling studies in the region (AIMS 2018).

Sites located above the calcarenite seabed generally displayed higher rates of loss at distance away from the source as compared to sites where a layer of sand overlies calcarenite (Duncan et al. 2009) and as such precises modelled was conducted to account for the loss associated with exposed calcarenite (see Appendix C.3.2). For sites located in water along the shelf, geoacoustic parameters considered for modelling are provided in Tables D-1 and D-2

Table D-1. Geoacoustic profile used in the acoustic propagation models for sites in less than 65 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-5	Fine Carbonate Sand	2.1	1634-1803	0.09-0.73	315	3.65
5-25	Increasingly cemented calcarenite	2.2	2000-2120	0.30-0.34		
25-45		2.3	2120-2240	0.34-0.38		
45-65		2.4	2240-2360	0.38-0.42		
65-85		2.5	2360-2480	0.42-0.46		
85-105		2.6	2480-2600	0.46-0.50		
>105	Well-cemented calcarenite	2.7	2600	0.50		

Table D-2. Geoacoustic profile used in the acoustic propagation models for between 65 m and 120 m water depth.Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Material	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	S-wave speed (m/s)	S-wave attenuation (dB/λ)
0-1	Well-cemented carbonate caprock	2.7	2600	0.5	500	0.4
1-20	Increasingly cemented calcarenite	2.2	2000-2120	0.30-0.34

For sites located along the shelf break/upper continental slope, the geoacoustic parameters used for modelling was derived from sedimentary grain size measurements from the Australian Government's Marine Sediments (MARS) database (Heap 2009). On average, the surficial grain size indicates silty carbonate sand is present. Information on the deeper geological structure was sparse, as such the seabed was assumed to consist of a thick package of unconsolidated sediments. However, this is consistent with the "shaved shelf" model of the discussed in James and Bone 2010, where sediments are transported and deposited from the shelf onto the slope. Representative grain sizes and porosity were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models. Table D-3 lists the geoacoustic parameters used for modelling for sites in water depths greater than 120 m.

Table D-3. Geoacoustic profile used in the acoustic propagation models for all modelled sites greater than 120 m water depth. Within each depth range, each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm^3)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–10	Silty carbonate sand to semi-cemented carbonate	1.88	1605–1700	0.35–0.70	255	3.65
10–20		1.88–1.89	1700–1755	0.70–0.85		
20–50		1.89–1.90	1755–1850	0.85–1.15		
50–100		1.90–1.92	1850–1950	1.15–1.35		
100–200		1.92–1.96	1950–2100	1.35–1.60		
200–500		1.96–2.05	2100–2355	1.60–1.95		
>500		2.05	2355	1.95		

D.4. Animal Movement and Exposure Modelling

Animal movement and exposure modelling considers the movement of both sound sources and animals over time. Acoustic source and propagation modelling are used to generate 3-D sound fields that vary as a function of distance to source, depth, and azimuth. Sound sources are modelled at representative sites and the resulting sound fields are assigned to source locations using the minimum Euclidean distance. The sound received by an animal at any given time depends on its location relative to the source. Because the true locations of the animals within the sound fields are unknown, realistic animal movements are simulated using repeated random sampling of various behavioural parameters. The Monte Carlo method of simulating many animals within the operations area is used to estimate the sound exposure history of the population of simulated animals (animats).

Monte Carlo methods provide a heuristic approach for determining the probability distribution function (PDF) of complex situations, such as animals moving in a sound field. The probability of an events occurrence is determined by the frequency with which it occurs in the simulation. The greater the number of random samples, in this case the more simulated animats, the better the approximation of the PDF. Animats are randomly placed, or seeded, within the simulation boundary at a specified density (animats/km^2). Higher densities provide a finer PDF estimate resolution but require more computational resources. To ensure good representation of the PDF, the animat density is set as high as practical allowing for computation time. The animat density is typically much higher than the real-world density to ensure good representation of the PDF. The resulting PDF can be scaled using real-world animal density when this information is available.

Several models for marine mammal movement have been developed (Ellison et al. 1987, Frankel et al. 2002, Houser 2006). These models use an underlying Markov chain to transition from one state to another based on probabilities determined from measured swimming behaviour. The parameters may represent simple states, such as the speed or heading of the animal, or complex states, such as likelihood of participating in foraging, play, rest, or travel. Attractions and aversions to variables like anthropogenic sounds and different depth ranges can be included in the models.

The JASCO Animal Simulation Model Including Noise Exposure (JASMINE) was based on the open-source marine mammal movement and behaviour model (3MB, Houser 2006) and used to predict the exposure of animats to sound arising from the anthropogenic activities. Animats are programmed to behave like the species likely to be present in the survey area. The parameters used for forecasting realistic behaviours (e.g., diving, foraging, aversion, surface times, etc.) are determined and interpreted from marine species studies (e.g., tagging studies) where available, or reasonably extrapolated from related species. An individual animats modelled sound exposure levels are summed over the total simulation duration to determine its total received energy, and then compared to the assumed threshold criteria.

JASMINE uses the same animal movement algorithms as 3MB (Houser, 2006), but has been extended to be directly compatible with JASCO's Marine Operations Noise Model (MONM) and Full Waveform Range-dependent Acoustic Model (FRAWM) acoustic field predictions, for inclusion of source tracks, and importantly for animats to change behavioural states based on time and space dependent modelled variables such as received levels for aversion behaviour, although aversion was not considered in this study.

D.4.1. Animal Movement Parameters

JASMINE uses previously measured behaviour to forecast behaviour in new situations and locations. The parameters used for forecasting realistic behaviour are determined (and interpreted) from marine species studies (e.g., tagging studies). Each parameter in the model is described as a probability distribution. When limited or no information is available for a species parameter, a Gaussian or uniform distribution may be chosen for that parameter. For the Gaussian distribution, the user determines the mean and standard deviation of the distribution from which parameter values are drawn. For the uniform distribution, the user determines the maximum and minimum distribution from which parameter values are drawn. When detailed information about the movement and behaviour of a species are available, a user-created distribution vector, including cumulative transition probabilities, may be used (referred to here as a vector model; Houser 2006). Different sets of parameters can be defined for different behaviour states. The probability of an animat starting out in or transitioning into a given behaviour state can in turn be defined in terms of the animats current behavioural state, depth, and the time of day. In addition, each travel parameter and behavioural state has a termination function that governs how long the parameter value or overall behavioural state persists in simulation.

The parameters used in JASMINE describe animal movement in both the vertical and horizontal planes. The parameters relating to travel in these two planes are briefly described below.

Travel sub-models

- **Direction**– determines an animats choice of direction in the horizontal plane. Sub-models are available for determining the heading of animats, allowing for movement to range from strongly biased to undirected. A random walk model can be used for behaviours with no directional preference, such as feeding and playing. In a random walk, all bearings are equally likely at each parameter transition time step. A correlated random walk can be used to smooth the changes in bearing by using the current heading as the mean of the distribution from which to draw the next heading. An additional variant of the correlated random walk is available that includes a directional bias for use in situations where animals have a preferred absolute direction, such as migration. A user-defined vector of directional probabilities can also be input to control animat heading. For more detailed discussion of these parameters, see Houser (2006) and Houser and Cross (1999).
- **Travel rate**–defines an animats rate of travel in the horizontal plane. When combined with vertical speed and dive depth, the dive profile of the animat is produced.

Dive sub-models

- **Ascent rate**–defines an animats rate of travel in the vertical plane during the ascent portion of a dive.
- **Descent rate**–defines an animats rate of travel in the vertical plane during the descent portion of a dive.
- **Depth**–defines an animats maximum dive depth.
- **Reversals**–determines whether multiple vertical excursions occur once an animat reaches the maximum dive depth. This behaviour is used to emulate the foraging behaviour of some marine mammal species at depth. Reversal-specific ascent and descent rates may be specified.
- **Surface interval**–determines the duration an animat spends at, or near, the surface before diving again.

D.4.2. Exposure Integration Time

The interval over which acoustic exposure (L_E) should be integrated and maximal exposure (L_p) determined is not well defined. Both Southall et al. (2007) and the NMFS (2018) recommend a 24 h baseline accumulation period, but state that there may be situations where this is not appropriate (e.g., a high-level source and confined population). Resetting the integration after 24 h can lead to overestimating the number of individual animals exposed because individuals can be counted multiple times during an operation. The type of animal movement engine used in this study simulates realistic movement using swimming behaviour collected over relatively short periods (hours to days) and does not include large-scale movement such as migratory circulation patterns. For this study, a representative 24-hour period was simulated.

Ideally, a simulation area is large enough to encompass the entire range of a population so that any animal that could approach the source during an operation is included. However, there are limits to the simulation area, and computational overhead increases with area. For practical reasons, the simulation area is limited. In the simulation, every animat that reaches a border is replaced by another animat entering at the opposing border—e.g., an animat crossing the northern border of the simulation is replaced by one entering the southern border at the same longitude. When this action places the animat in an inappropriate water depth, the animat is randomly placed on the map at a depth suited to its species definition. The exposures of all animats (including those leaving the simulation and those entering) are kept for analysis. This approach maintains a consistent animat density and allows for longer integration periods with finite simulation areas.

D.4.3. Seeding Density and Scaling

Seeding density refers to the spatial sample rate, in units of animats/km^2, used in the simulation. It is not related to the real-world animal density, but rather is a model parameter that controls how samples are drawn from the model space. The minimum required seeding density for any given project depends on several factors such as bathymetry, source characteristics, and the behavioural profile of the animats, with the main constraint being computation time and resources. Seeding density is adjusted as needed based on model conditions specific to a project or project area.

In the present study, the exposure criteria for impulsive sounds were used to determine the number of animats exceeding exposure thresholds. To generate statistically reliable probability density functions, all simulations were seeded with an animat density of 4 animat/km^2 over the entire simulation area, except those in which southern right whale animats were restricted to their reproduction BIA, in which case the density was increased to 6 animats/km^2 to account for the relatively small area. The modelling results are not related to real-world animal densities as animal density in the area is unknown.

Appendix E. Model Validation Information

Predictions from JASCO's Airgun Array Source Model (AASM) and propagation models (MONM, FWRAM and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Artic, Canadian and southern United States waters, Greenland, Russia and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities which have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016).

Appendix F. Supplemental Modelling Results

The SPL sound fields, and distances to relevant isopleths, can be visualised for the 293° tow direction on the contour maps presented below. Equivalent maps for the 113° tow direction are included in Section 4.2.2.1.

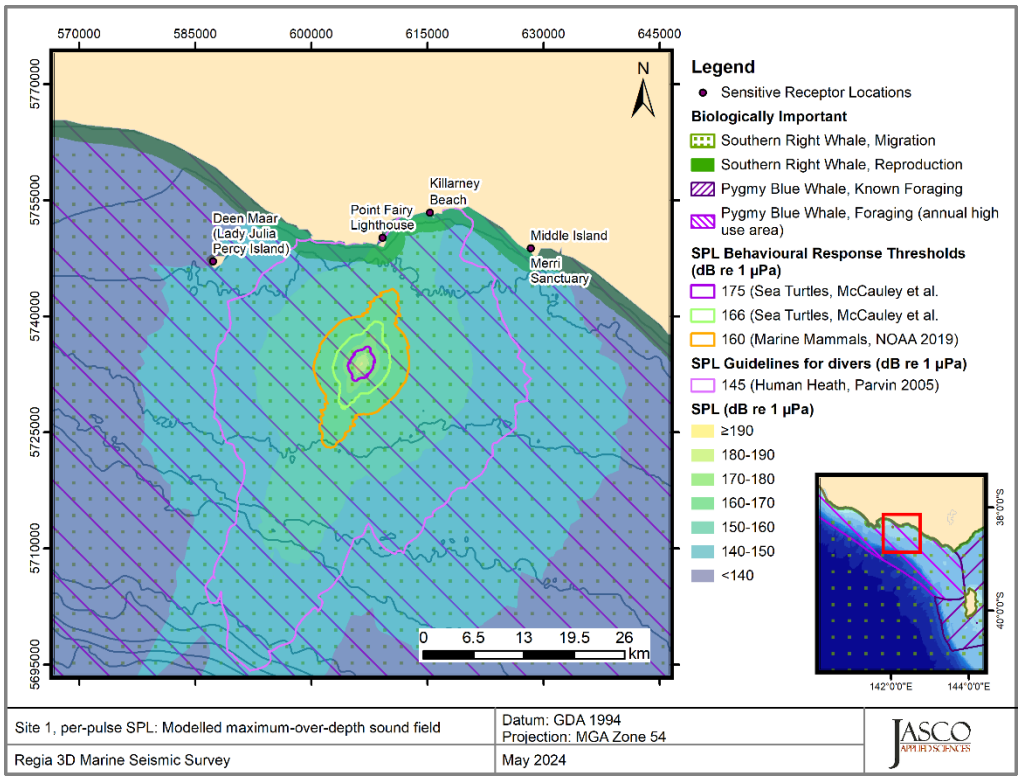

Figure F-1. *Site 1, SPL, 2820 in^3 source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

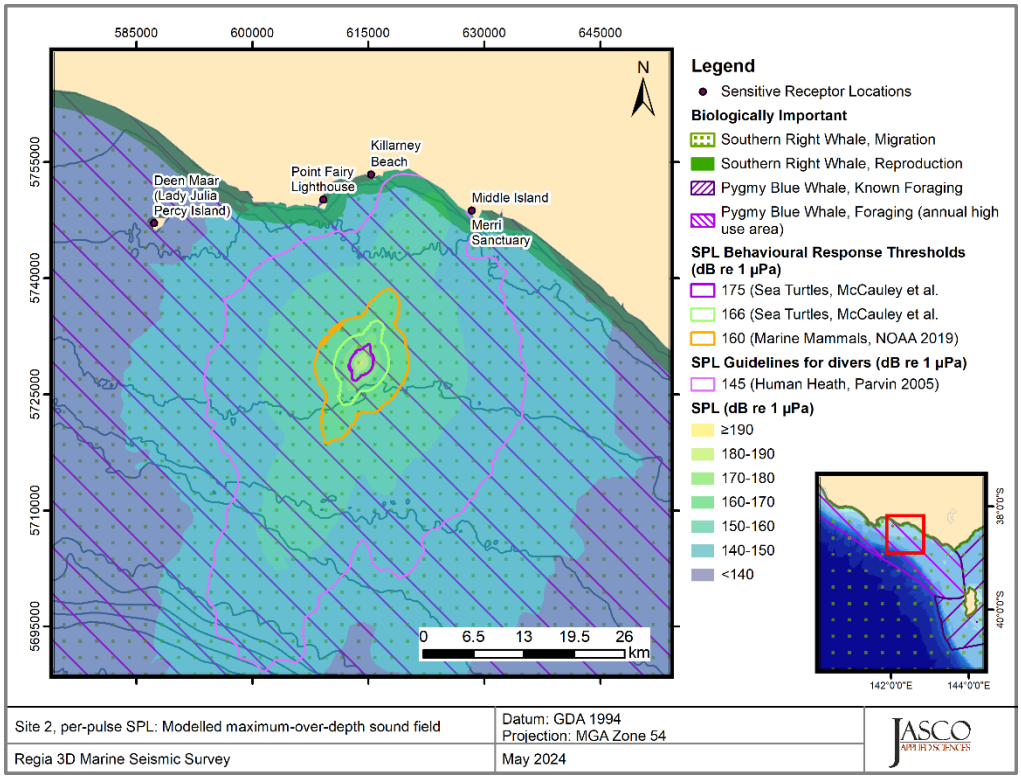

Figure F-2. *Site 2, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

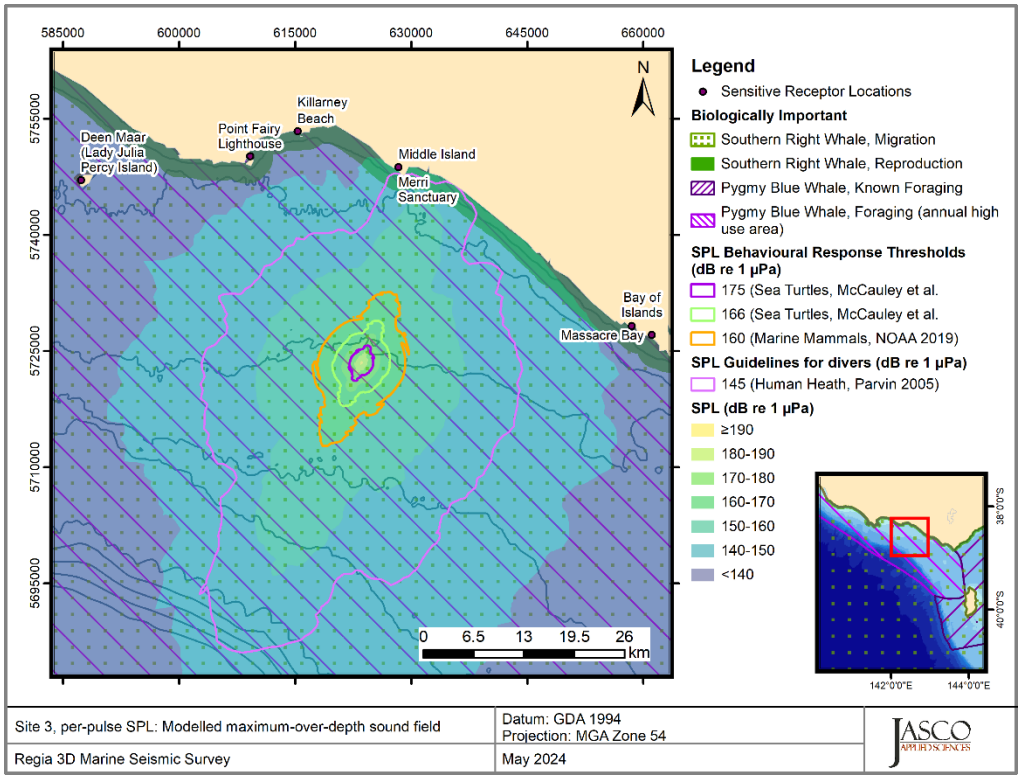

Figure F-3. *Site 3, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

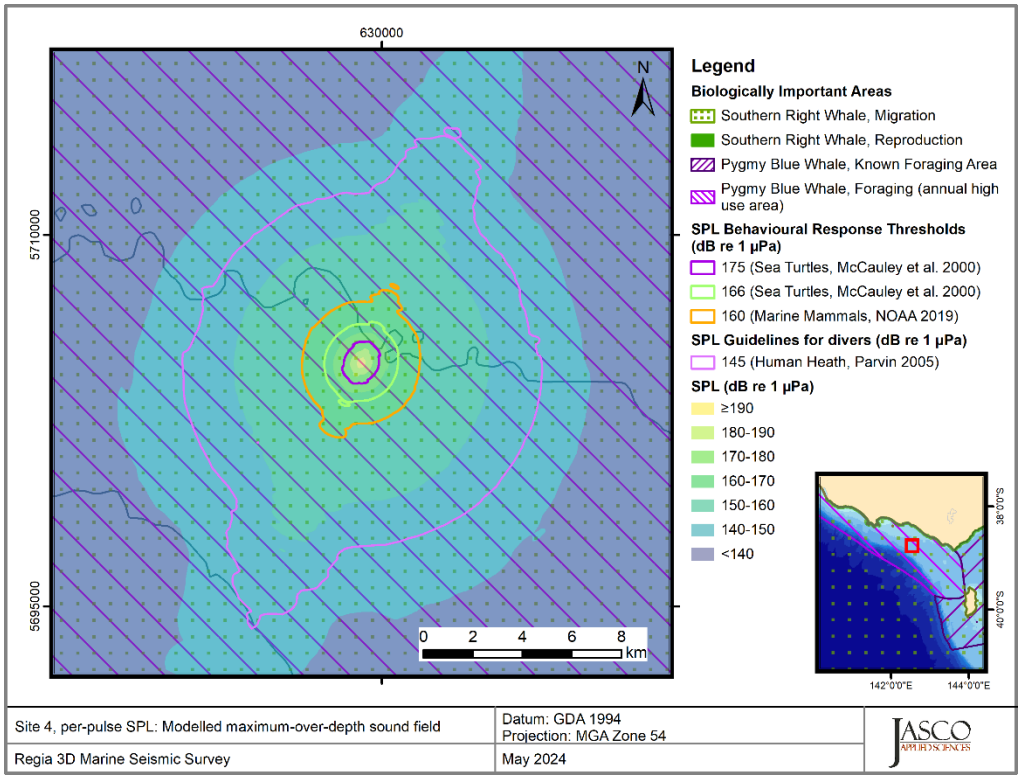

Figure F-4. *Site 4, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

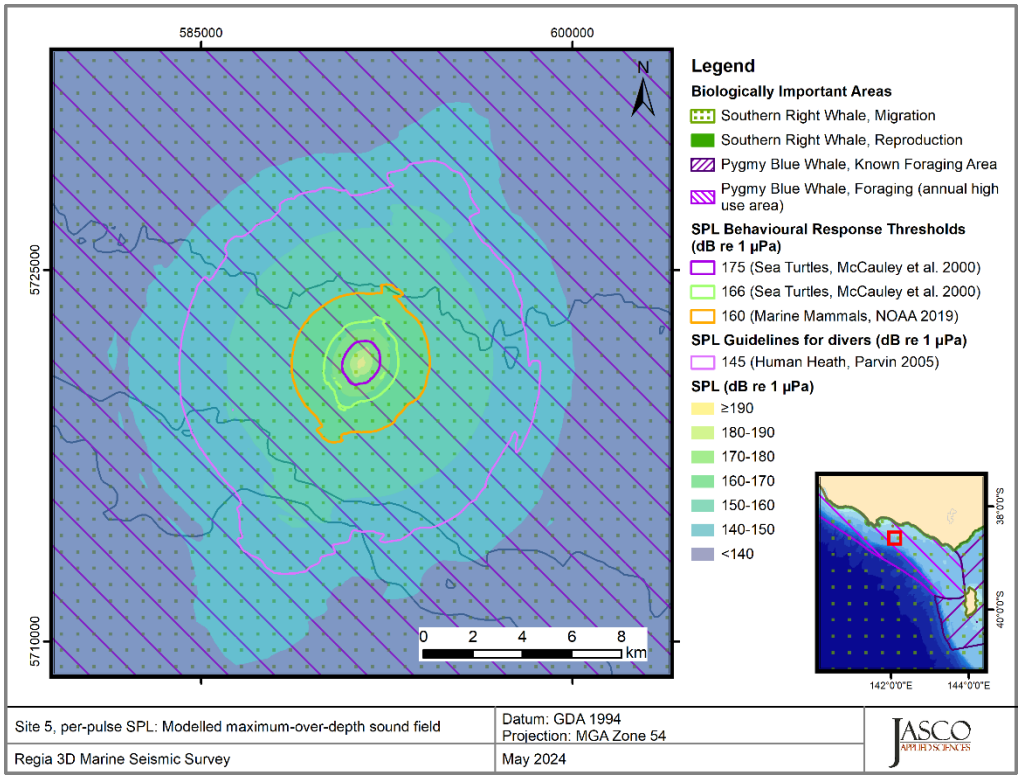

Figure F-5. *Site 5, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

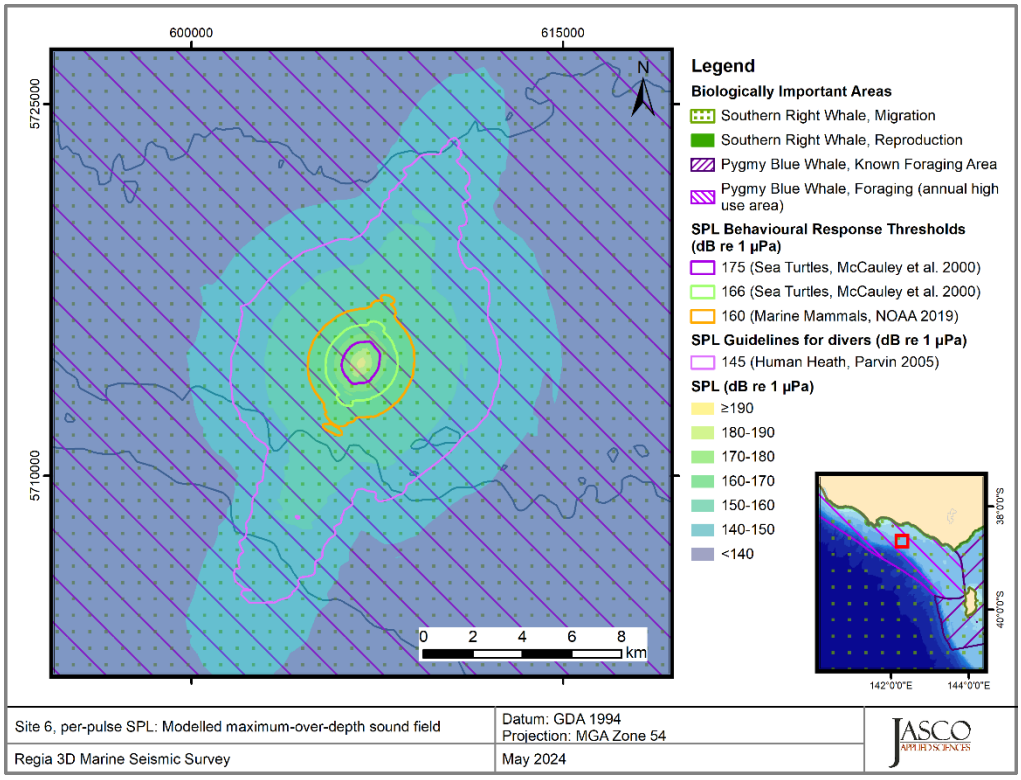

Figure F-6. *Site 6, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

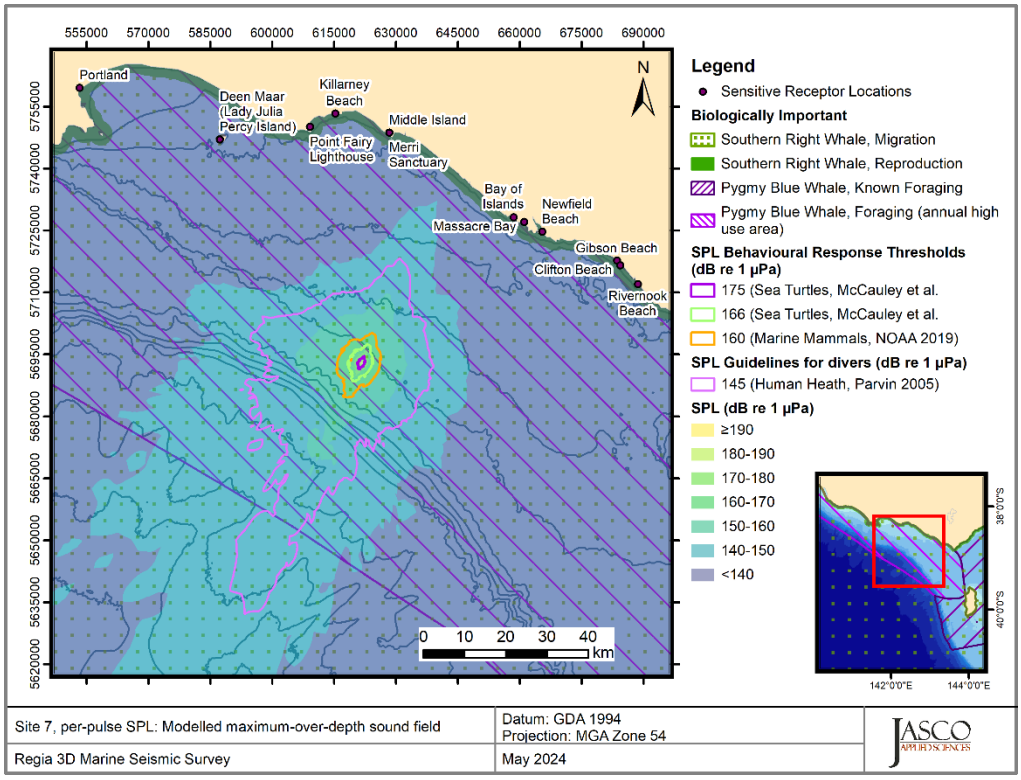

Figure F-7. *Site 7, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

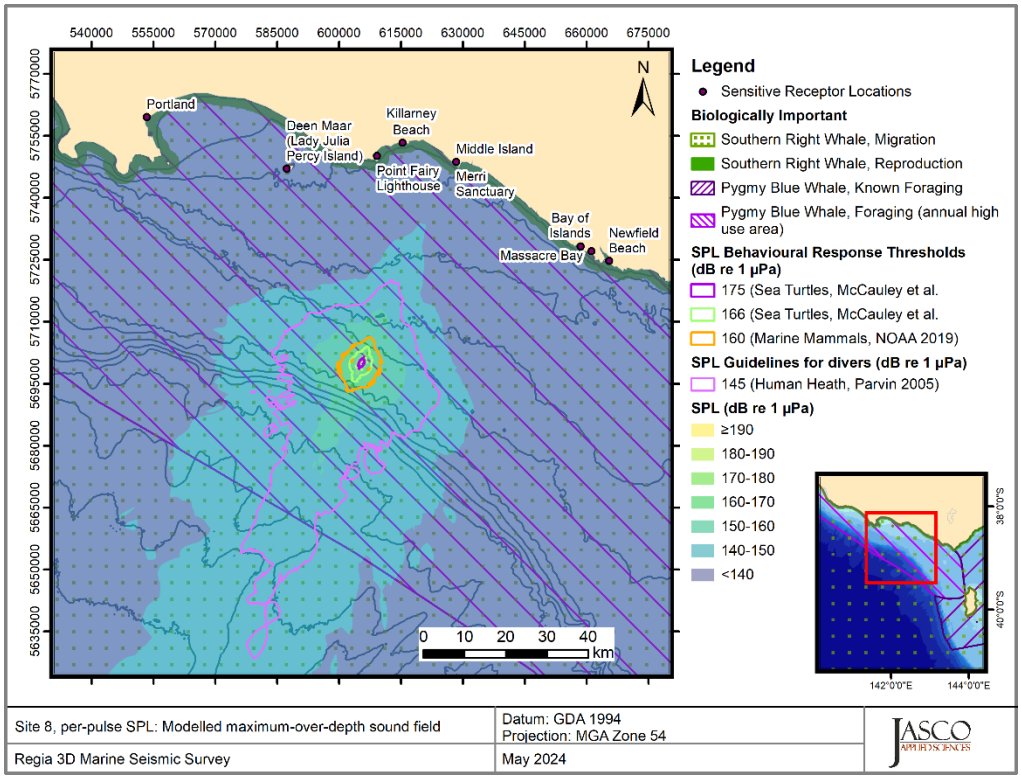

Figure F-8. *Site 8, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

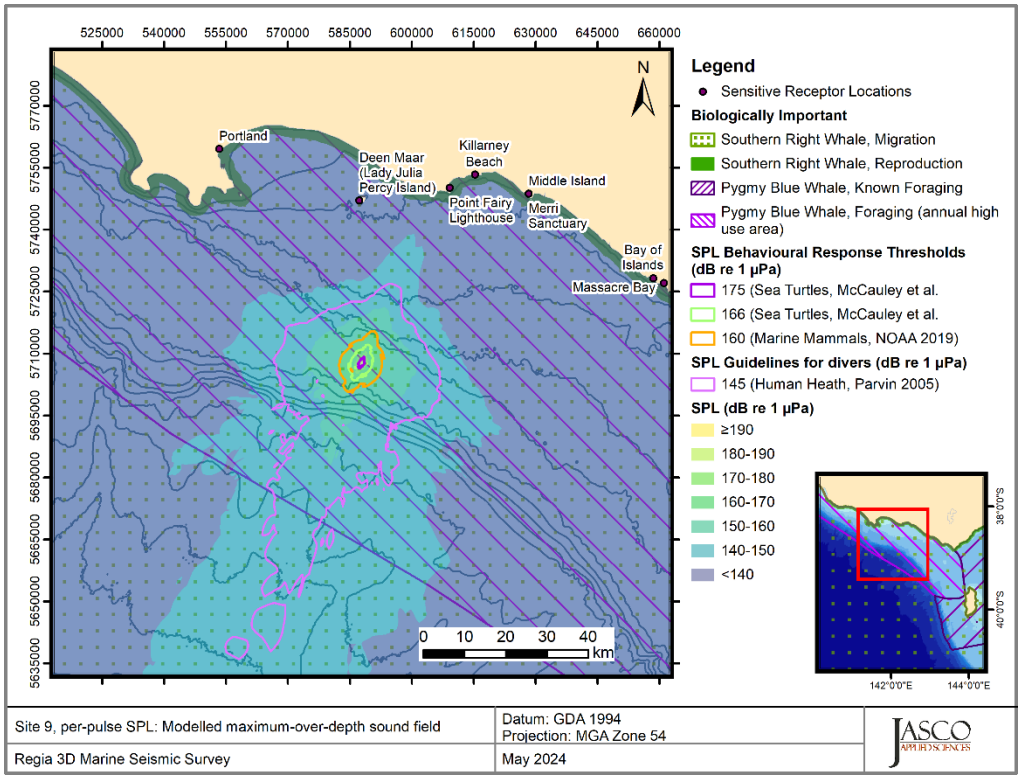

Figure F-9. *Site 9, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

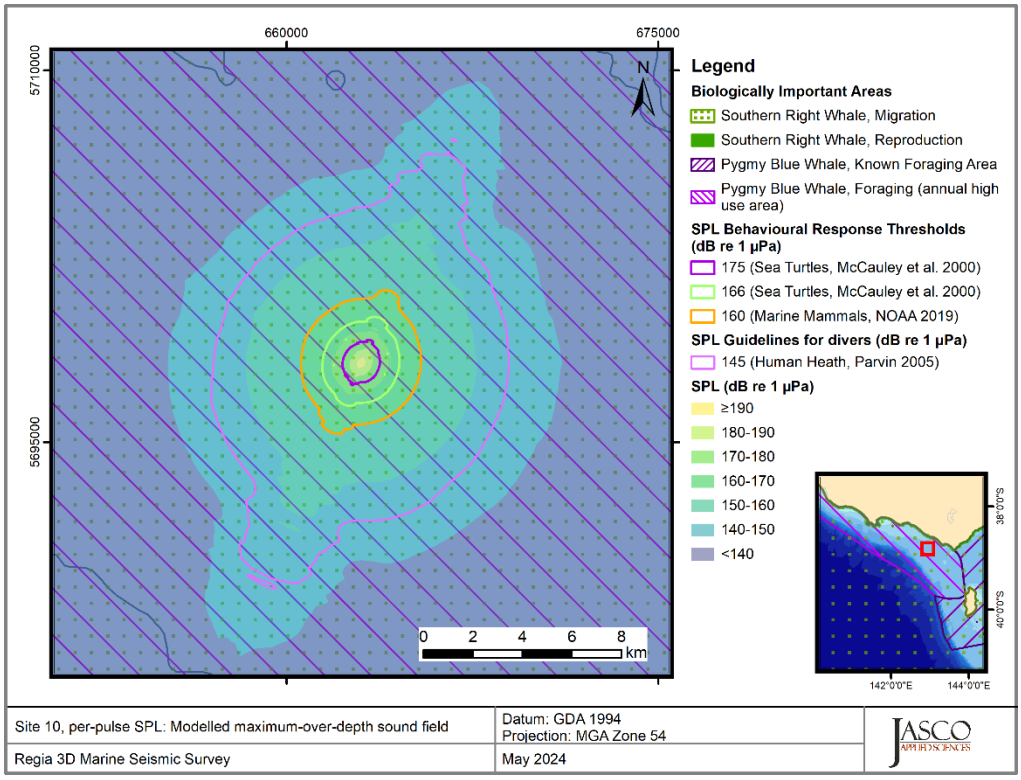

Figure F-10. *Site 10, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

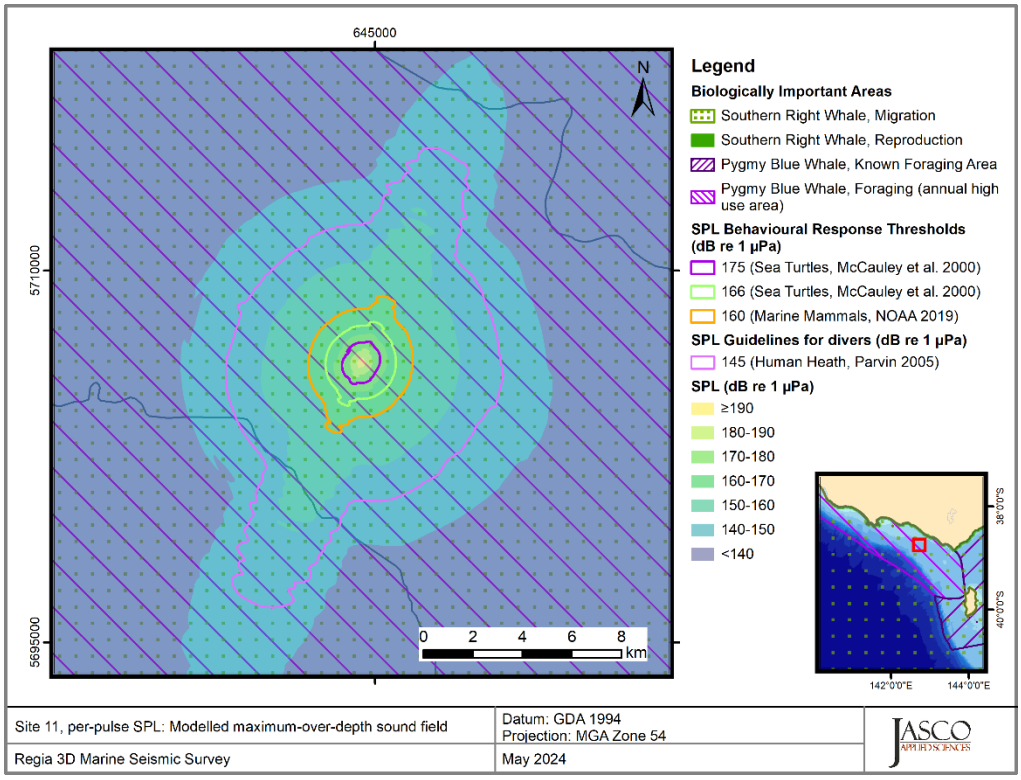

Figure F-11. *Site 11, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

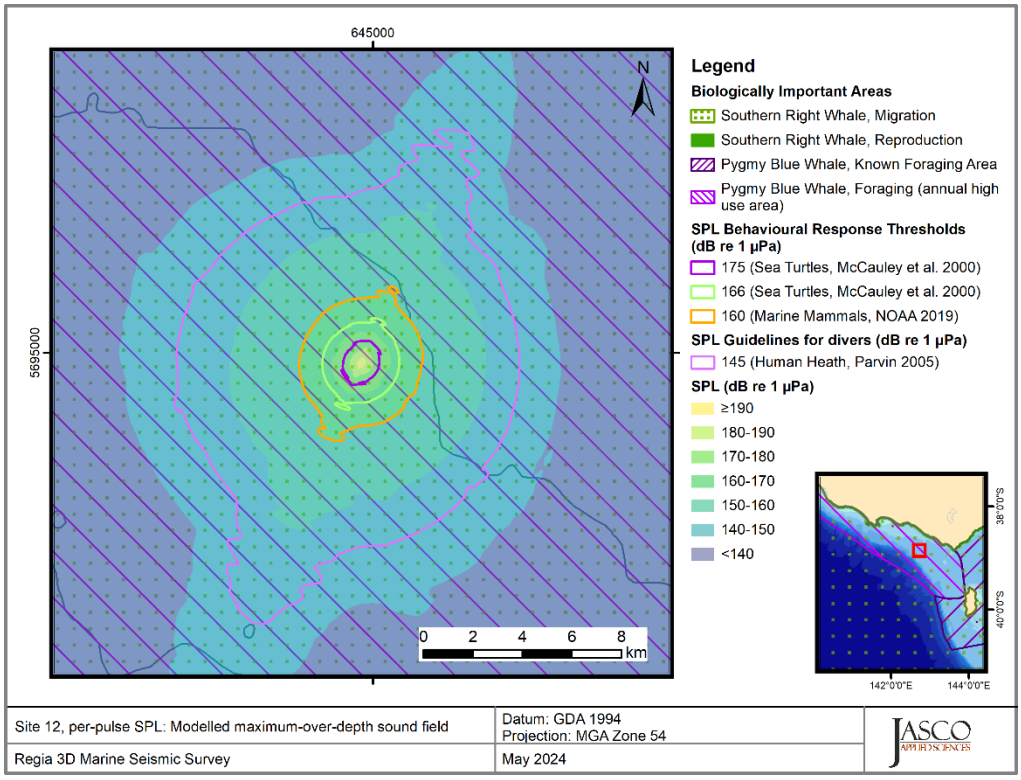

Figure F-12. *Site 12, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

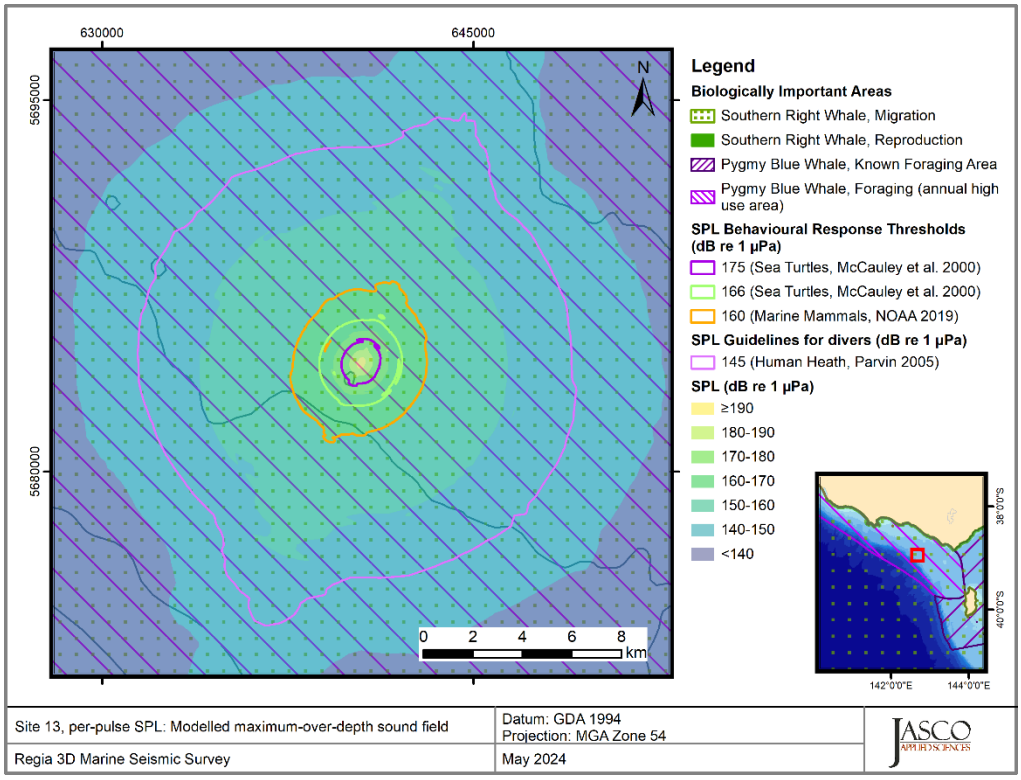

Figure F-13. *Site 13, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

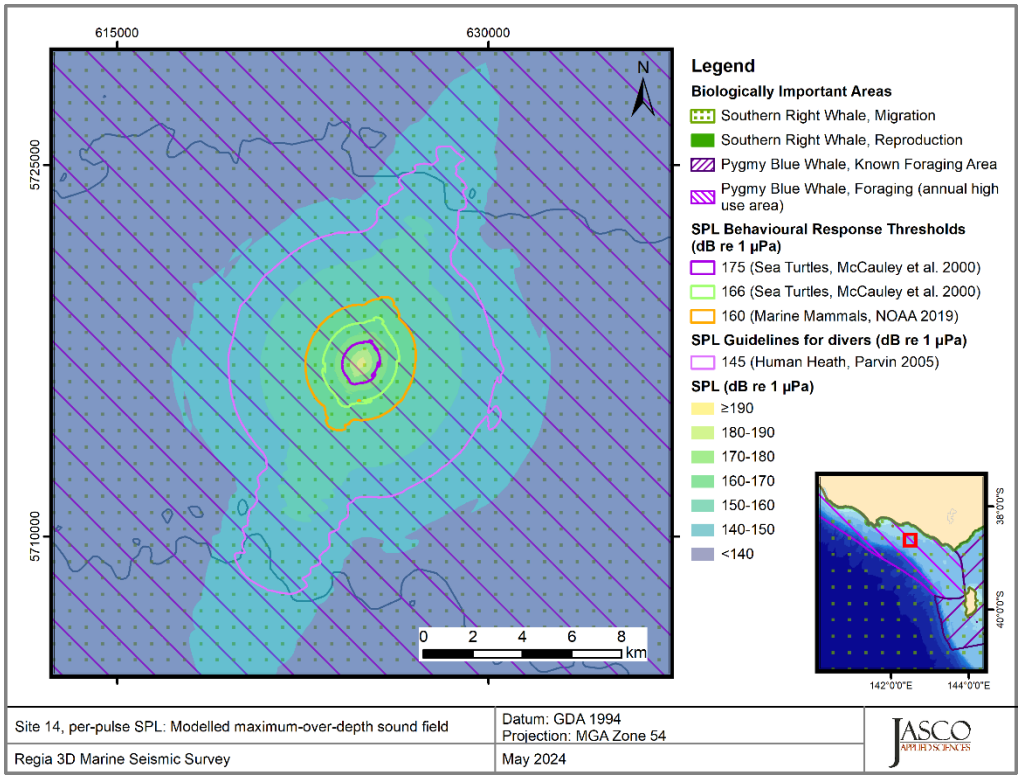

Figure F-14. *Site 14, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

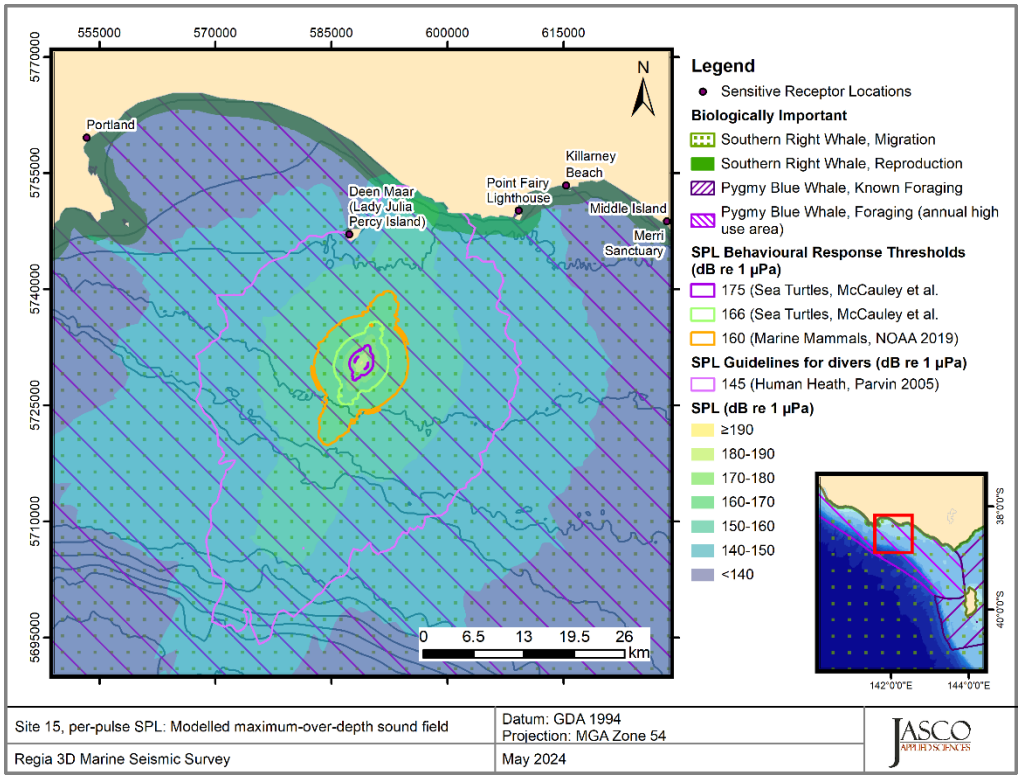

Figure F-15. *Site 15, SPL, 2820 in³ source, tow direction 293°*: Sound level contour map of unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response thresholds for marine mammals, sea turtles and the human health assessment threshold.

Appendix G. Sensitive Receiver Maps

Maps showing which impulses result in levels above the human health assessment threshold. Each map shows which impulse if any result in an exceedance in the human health assessment threshold at the location listed in the figure caption.

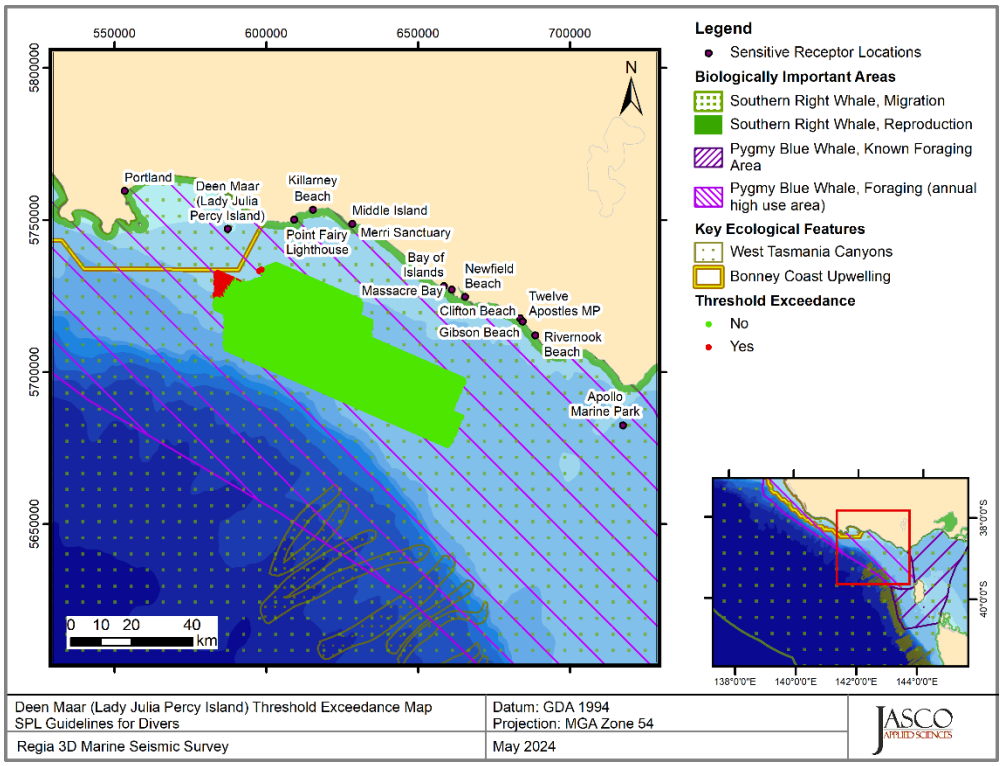

Figure G-1. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Deen Maar (Lady Julia Percy Island) is exceeded.

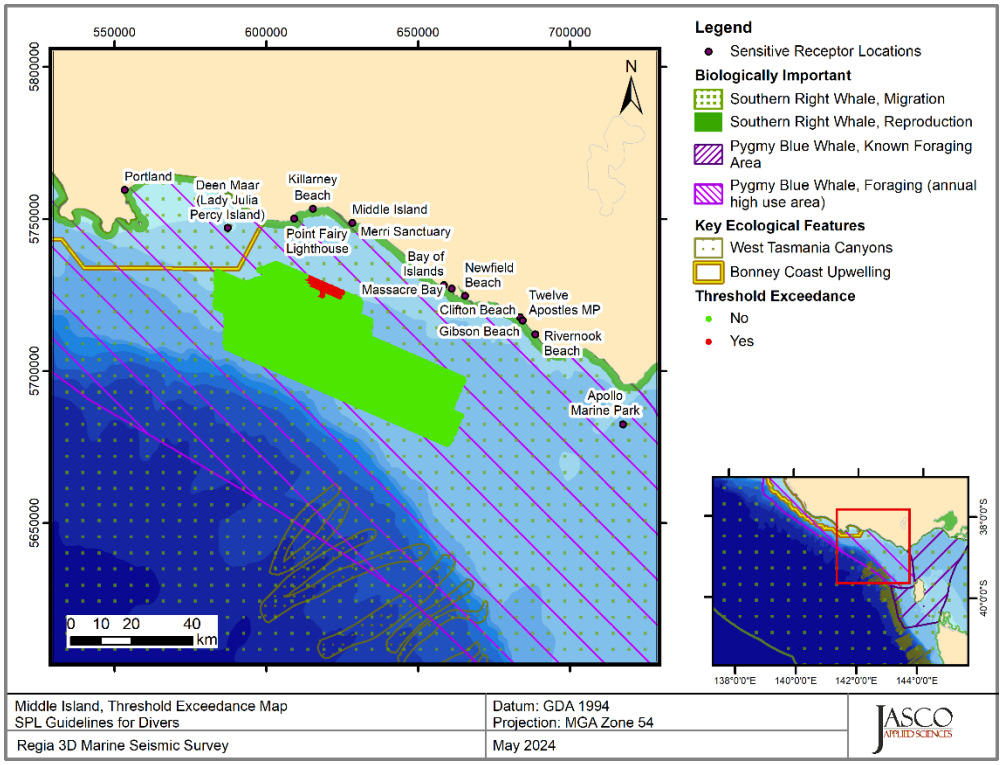

Figure G-2. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Middle Island is exceeded.

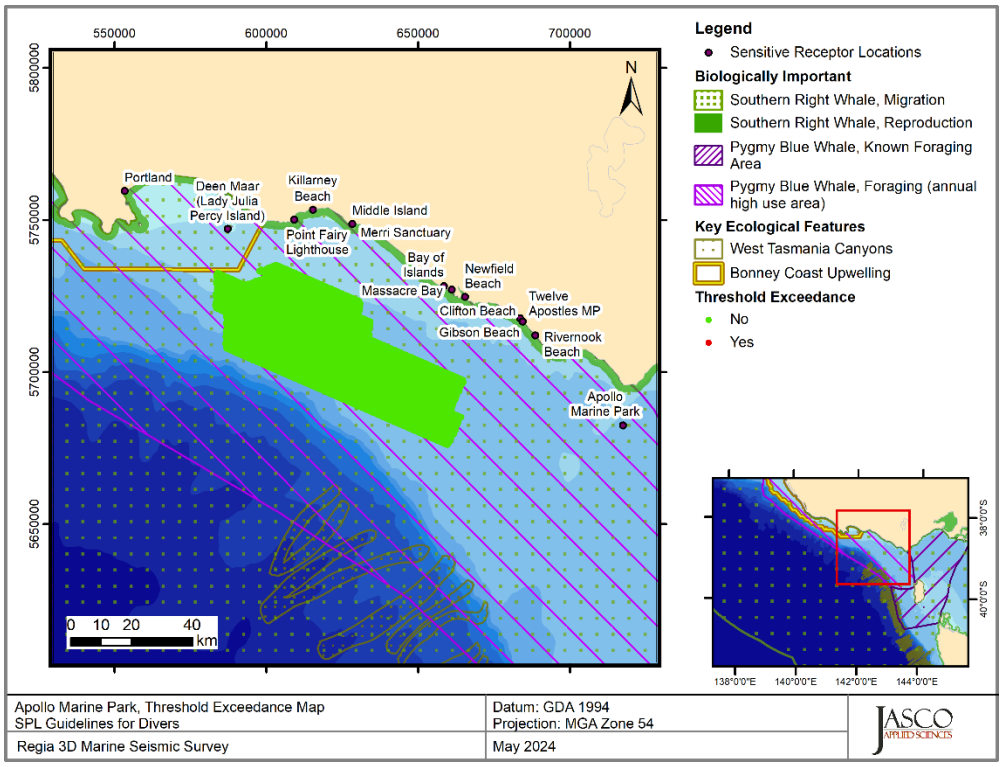

Figure G-3. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Apollo Marine Park is exceeded.

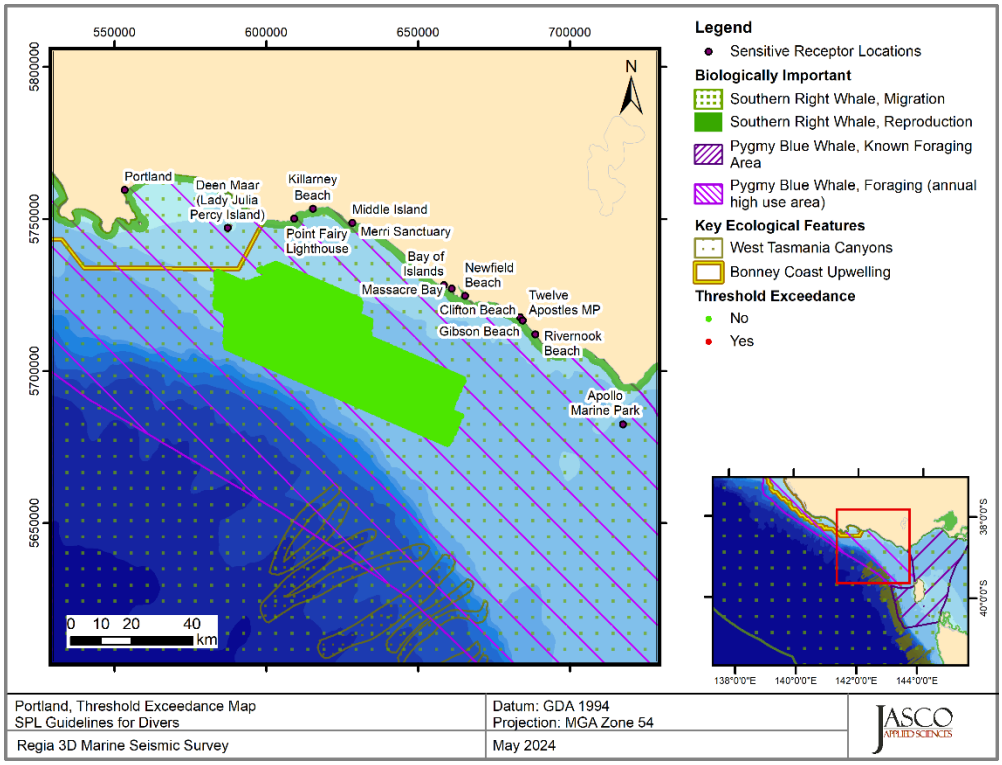

Figure G-4. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Portland is exceeded.

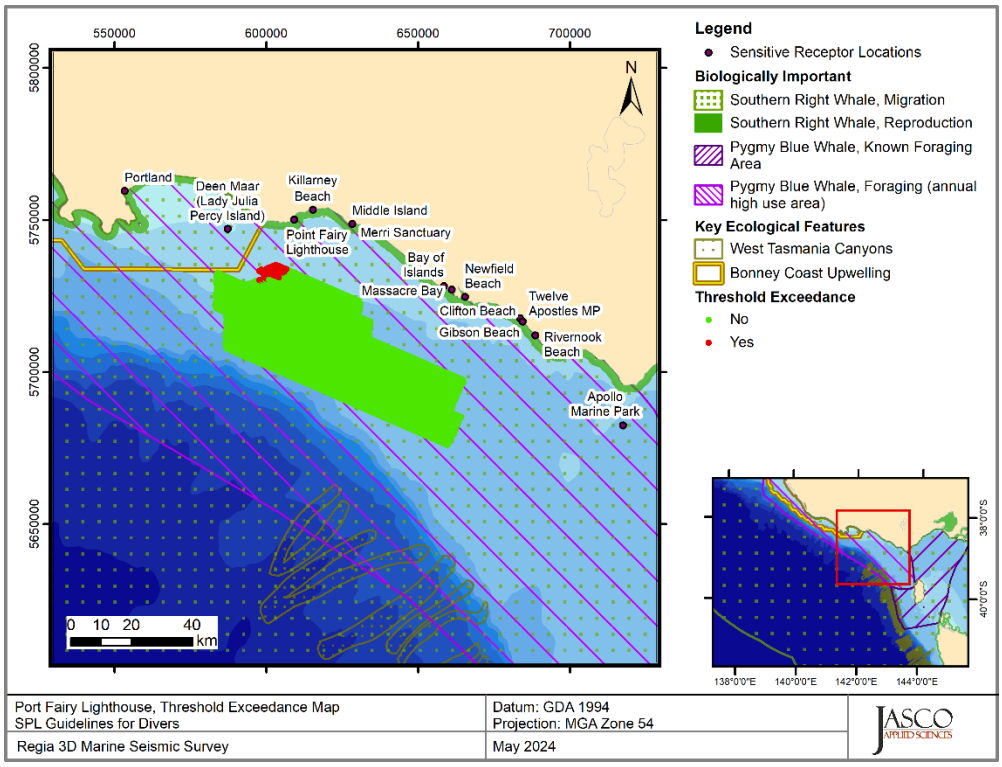

Figure G-5. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Port Fairy Lighthouse is exceeded.

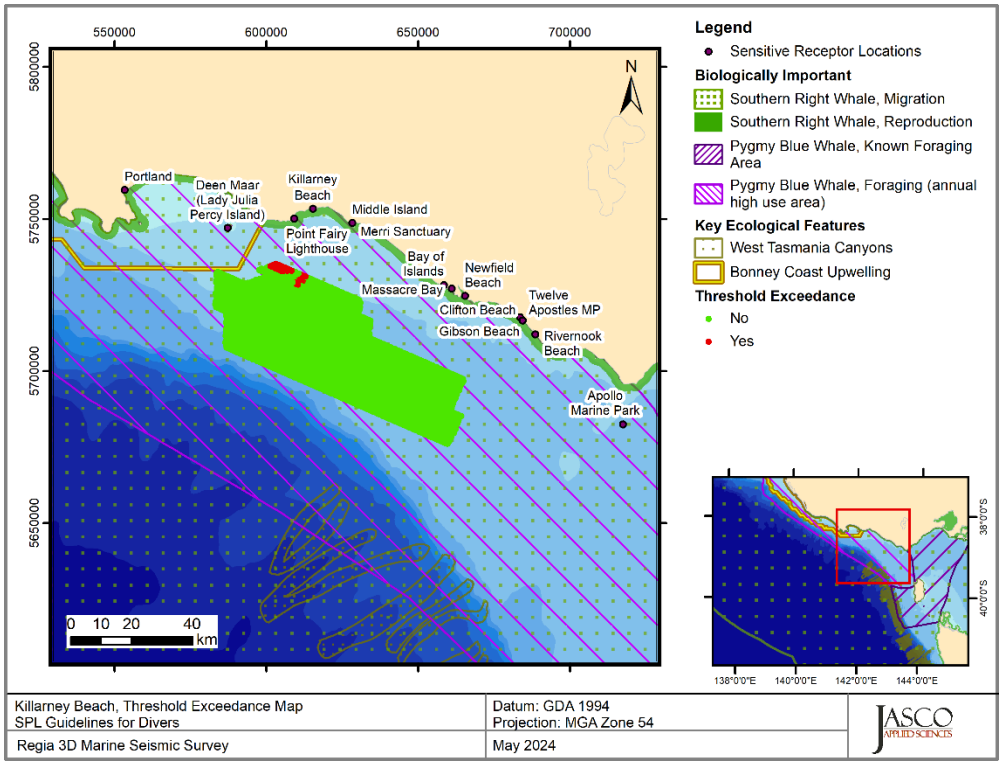

Figure G-6. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Killarney Beach is exceeded.

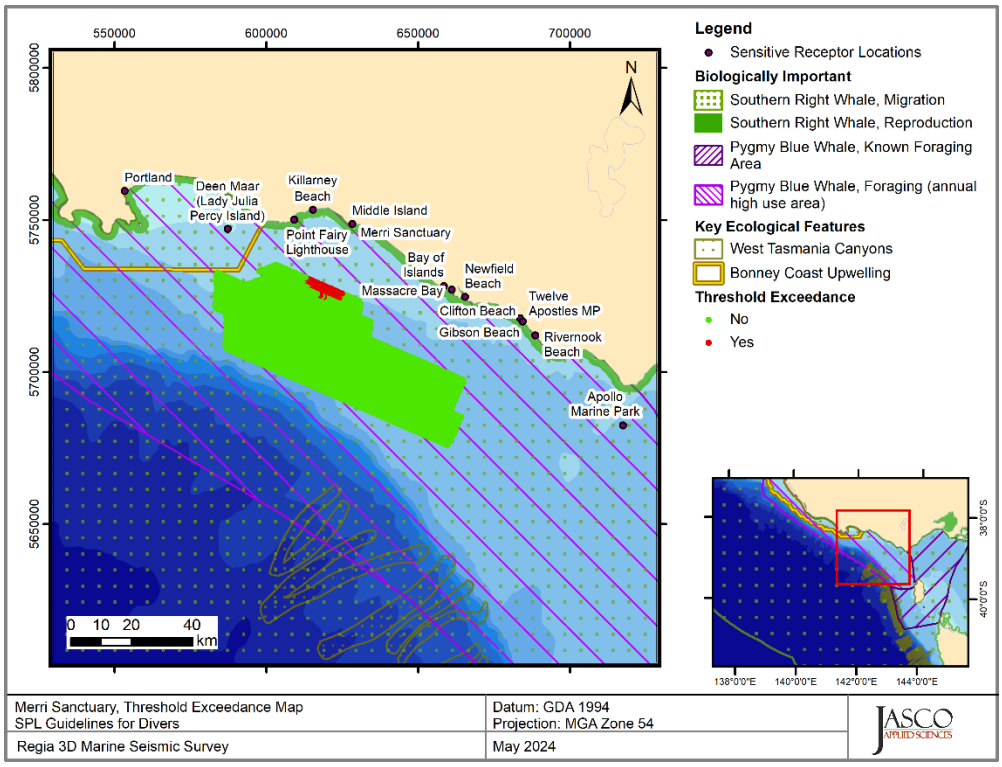

Figure G-7. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Merri Sanctuary is exceeded.

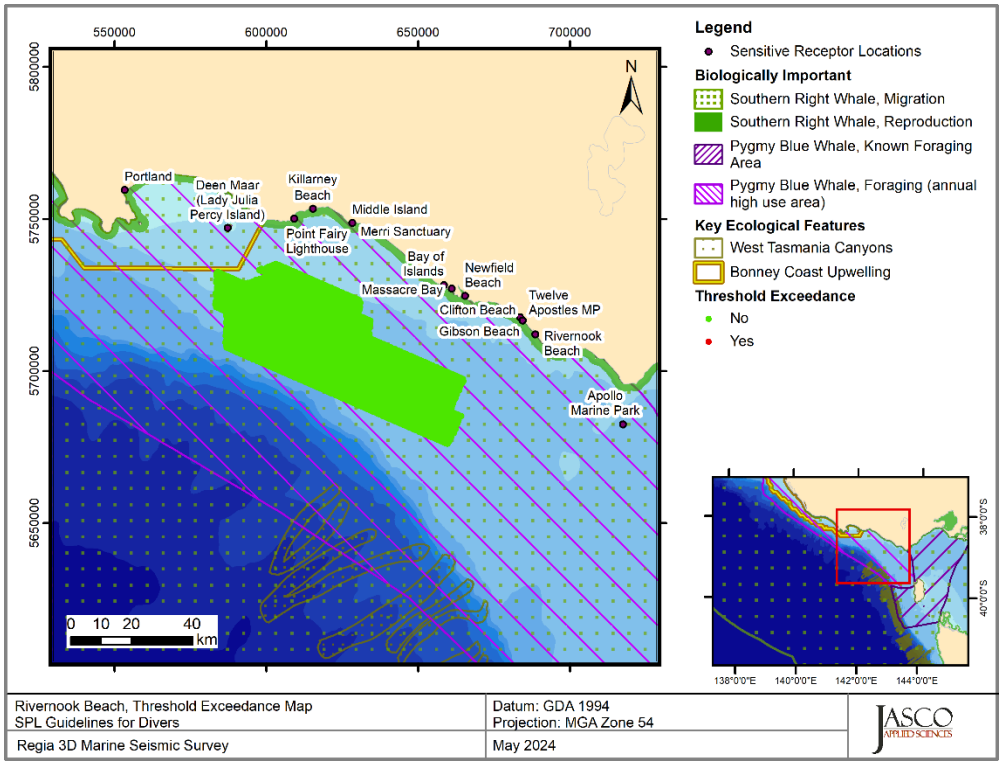

Figure G-8. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Rivernook Beach is exceeded.

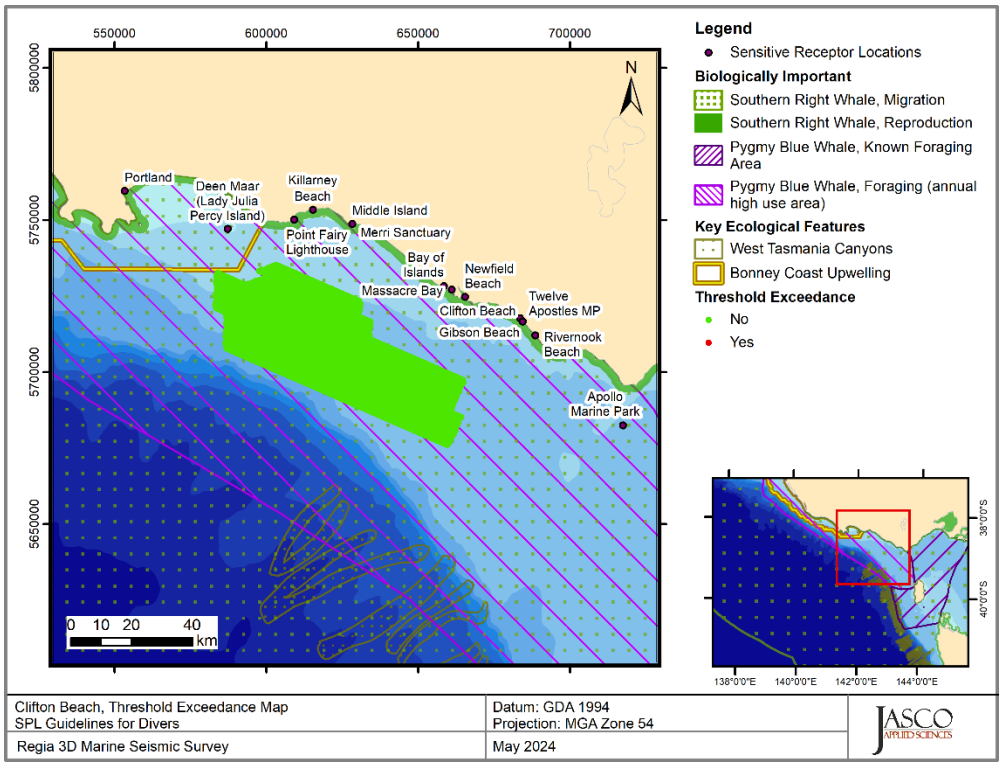

Figure G-9. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Clifton Beach is exceeded.

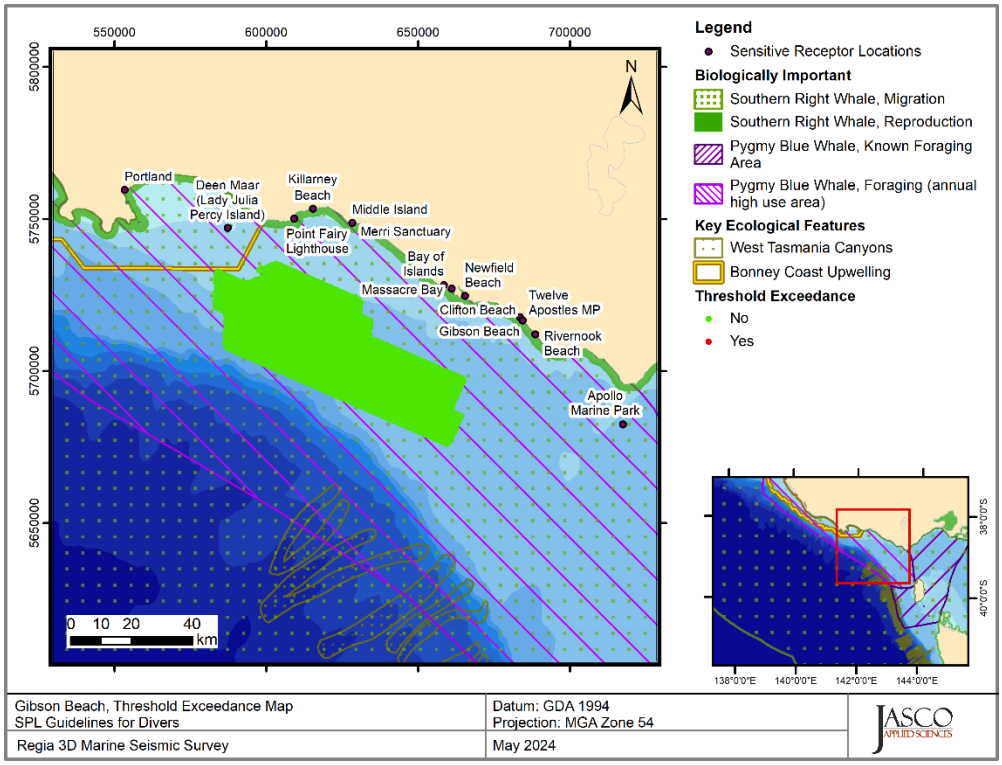

Figure G-10. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Gibson Beach is exceeded.

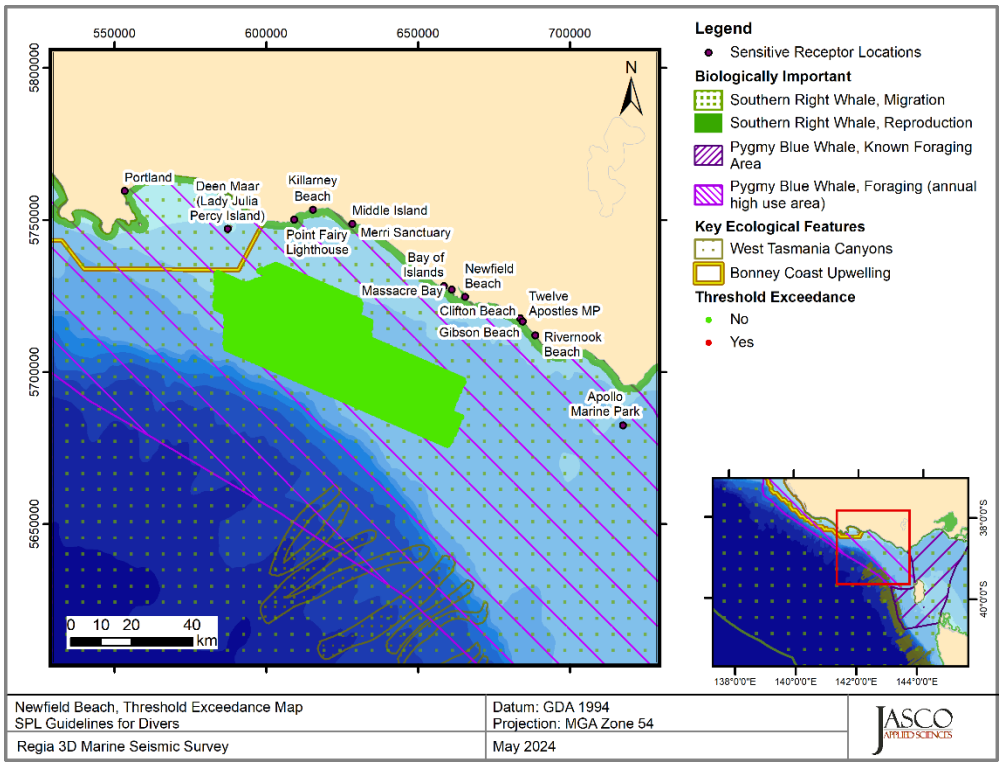

Figure G-11. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Newfield Beach is exceeded.

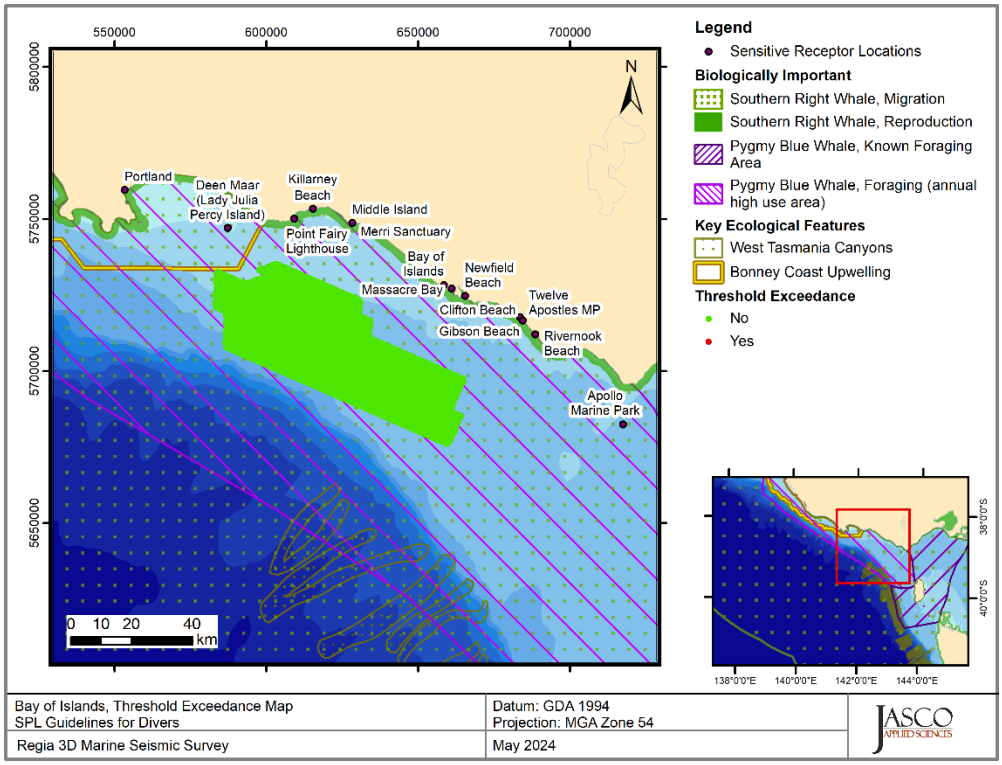

Figure G-12. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Bay of Islands is exceeded.

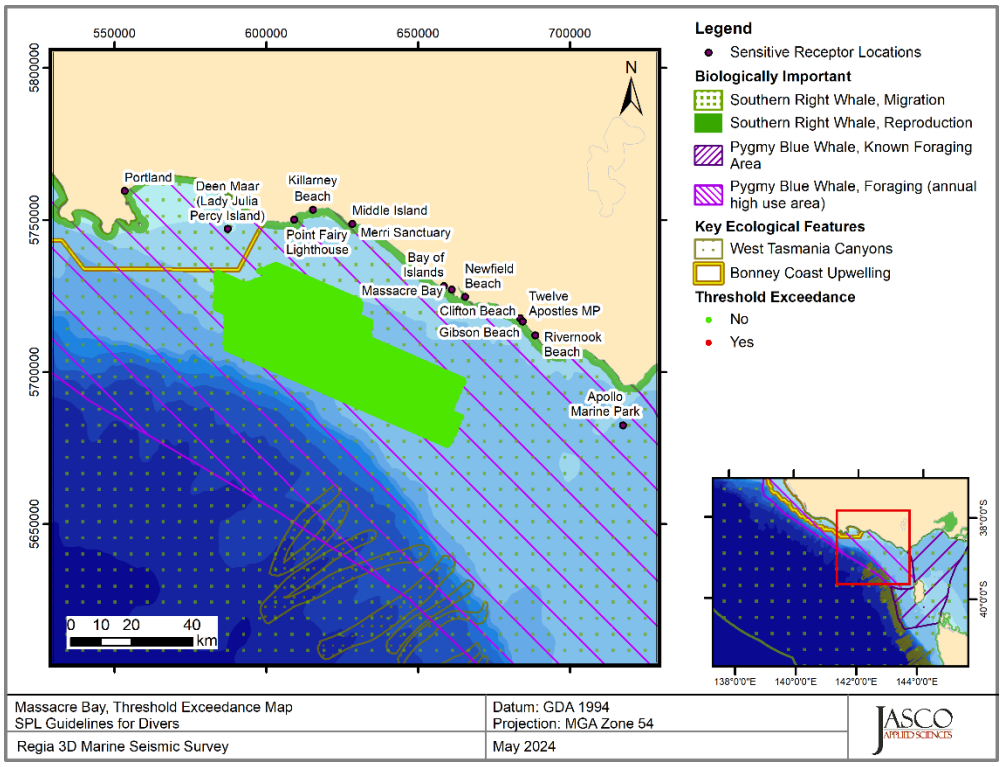

Figure G-13. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Massacre Bay is exceeded.

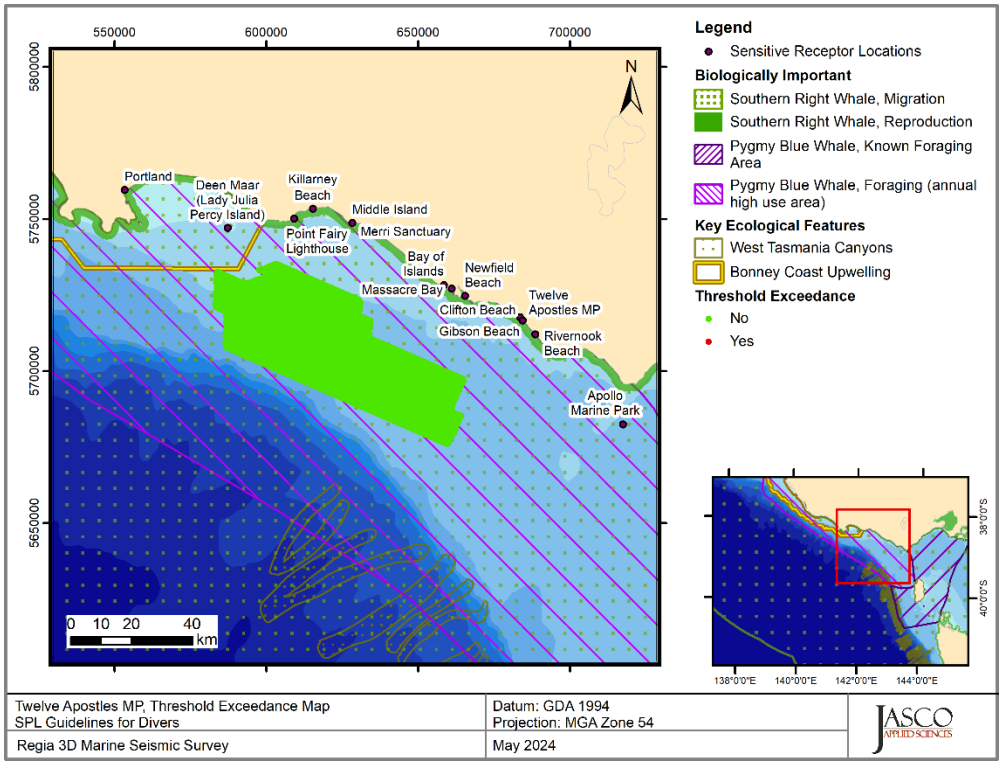

Figure G-14. *SPL, 2820 in³ source,* seismic impulse locations where the human health assessment threshold at Twelve Apostles MP is exceeded.

Appendix H. Supplemental Animal Movement Modelling Results

Histograms of CPA ranges to SEL_{24h} PTS, TTS, and the behavioural response threshold for Scenarios B, C and D are shown in Figures F-1 to F-30.

H.1. Scenario B

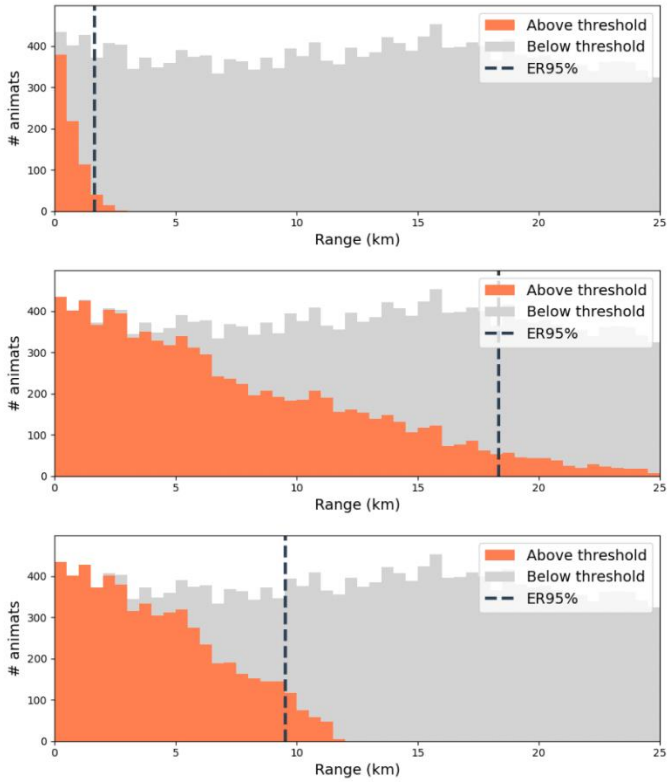

Figure H-1. *Scenario B, female pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

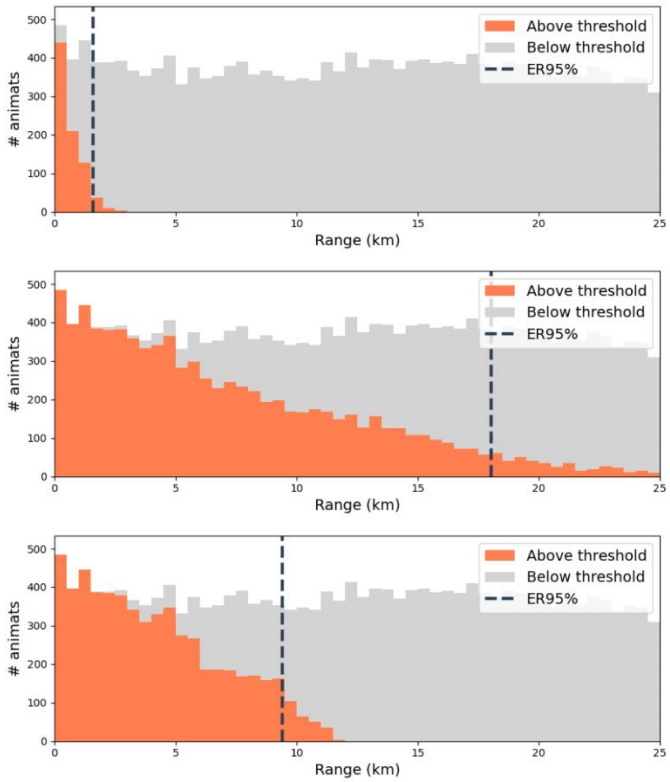

Figure H-2. *Scenario B, male pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

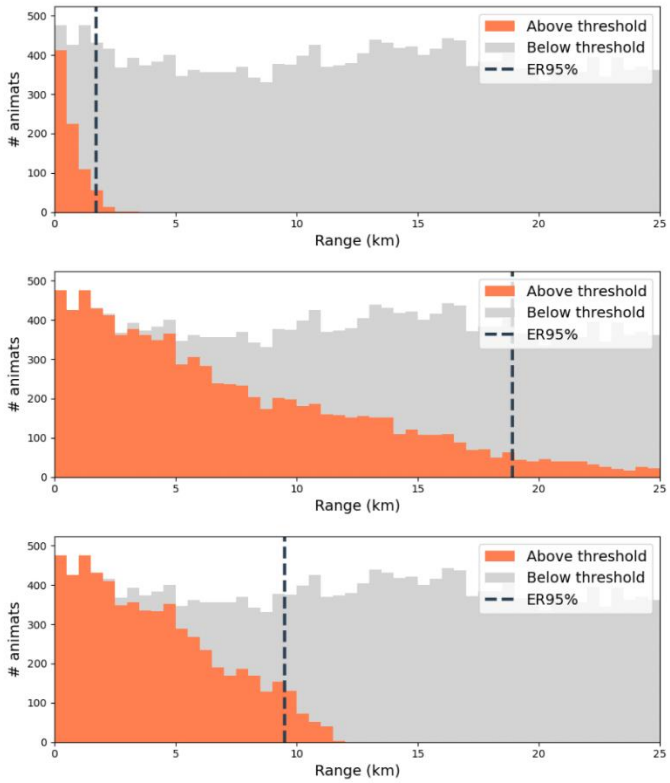

Figure H-3. *Scenario B, female pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

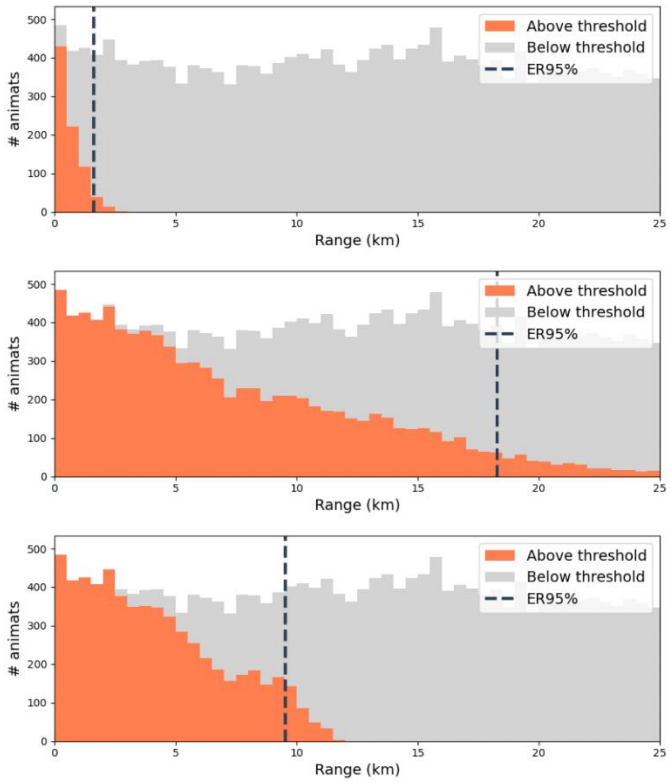

Figure H-4. *Scenario B, male pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

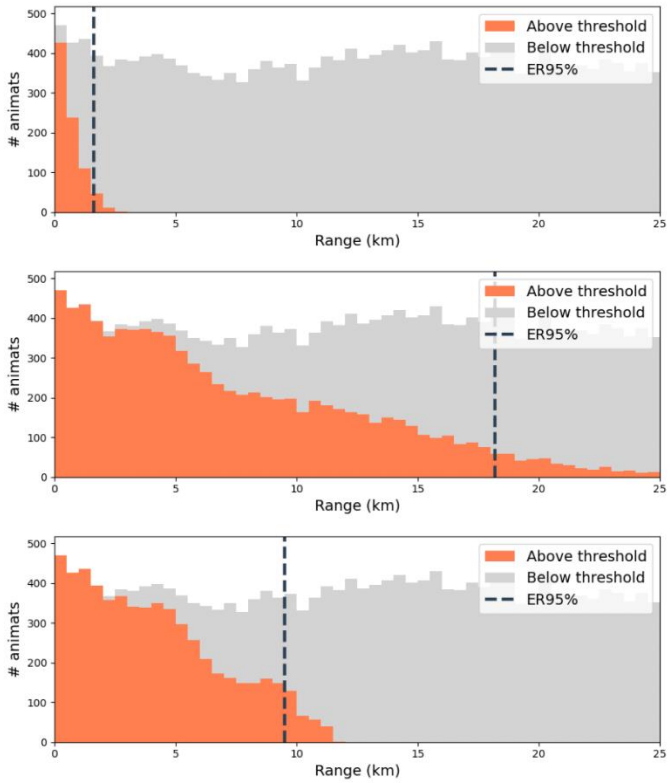

Figure H-5. *Scenario B, female pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

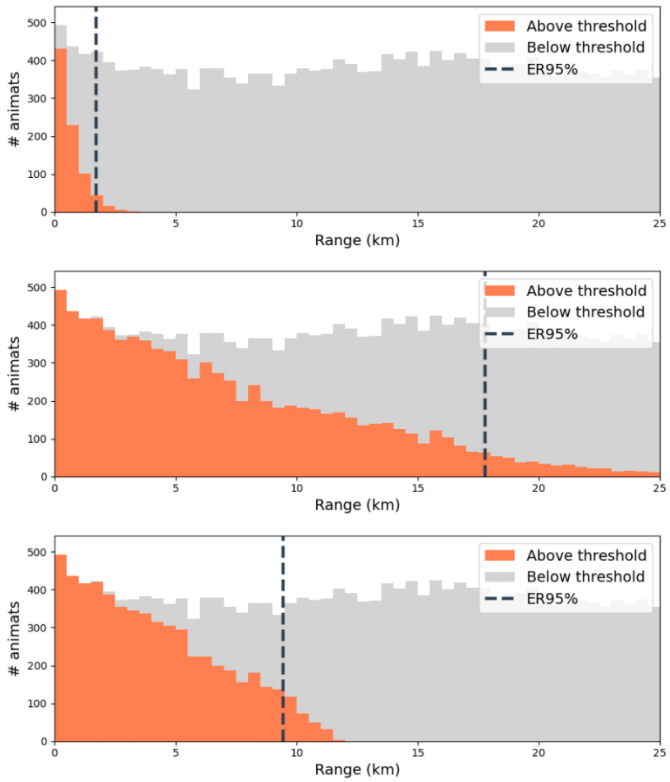

Figure H-6. *Scenario B, male pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

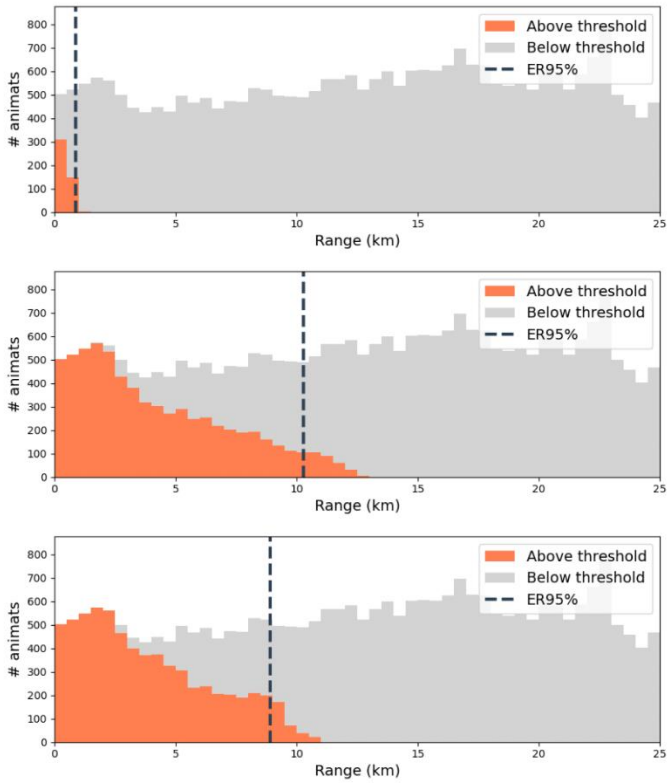

Figure H-7. *Scenario B, migrating southern right whale animats, no calf, unrestricted:* CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

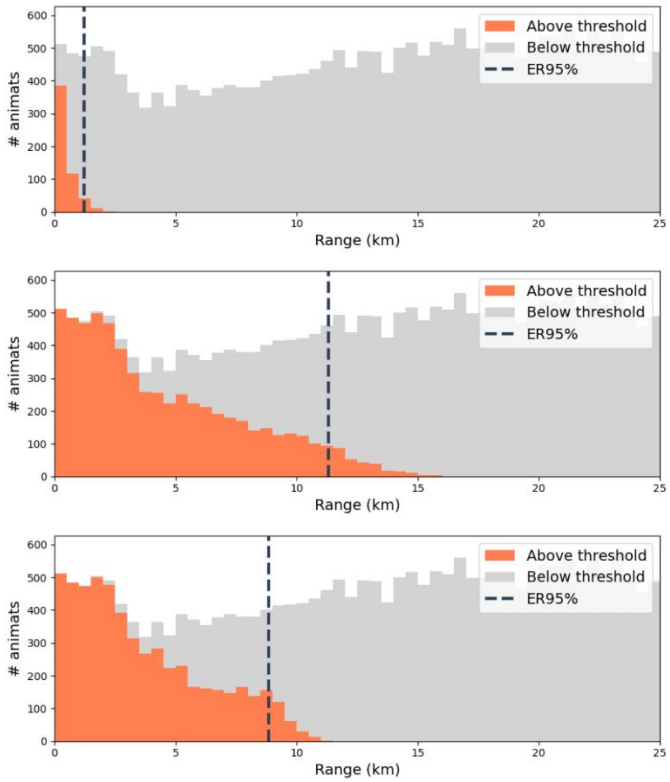

Figure H-8. *Scenario B, migrating southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

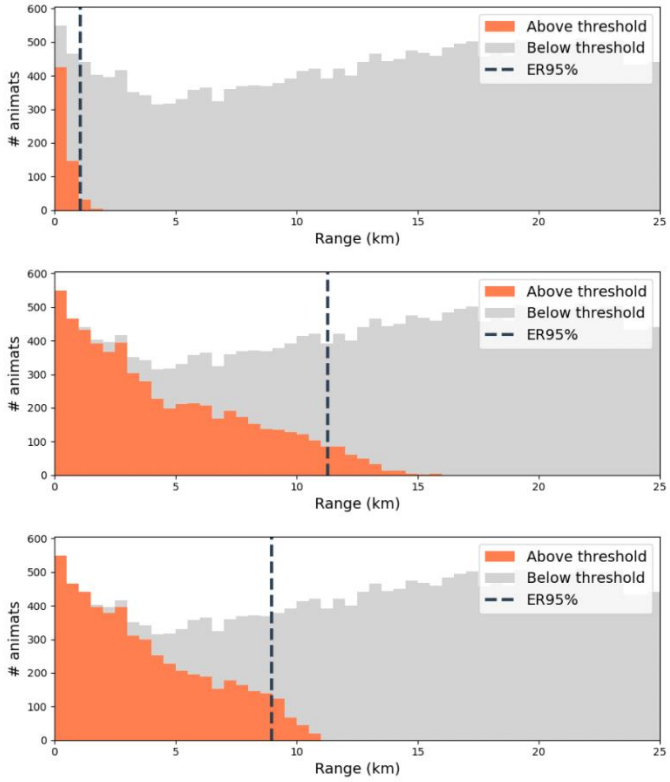

Figure H-9. *Scenario B, reproducing southern right whale animats, no calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

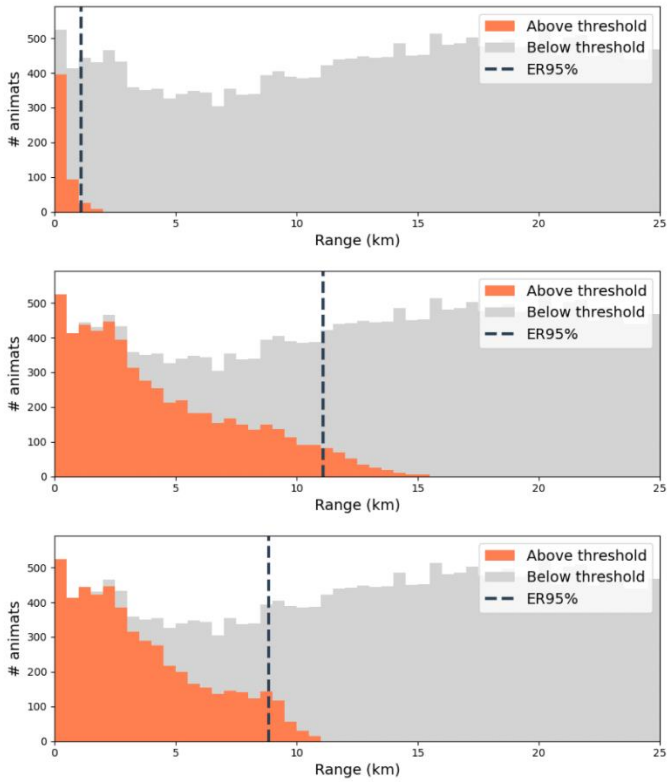

Figure H-10. *Scenario B, reproducing southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

H.2. Scenario C

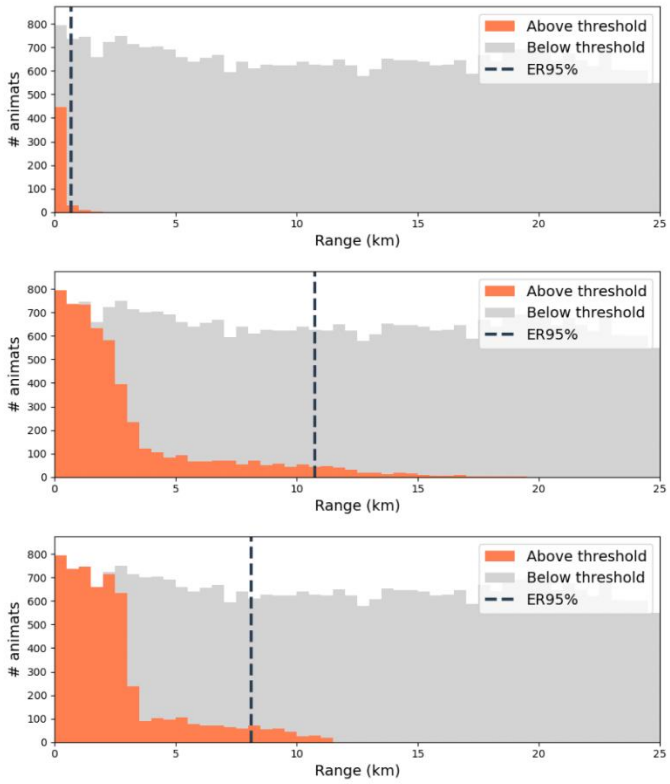

Figure H-11. *Scenario C, female pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

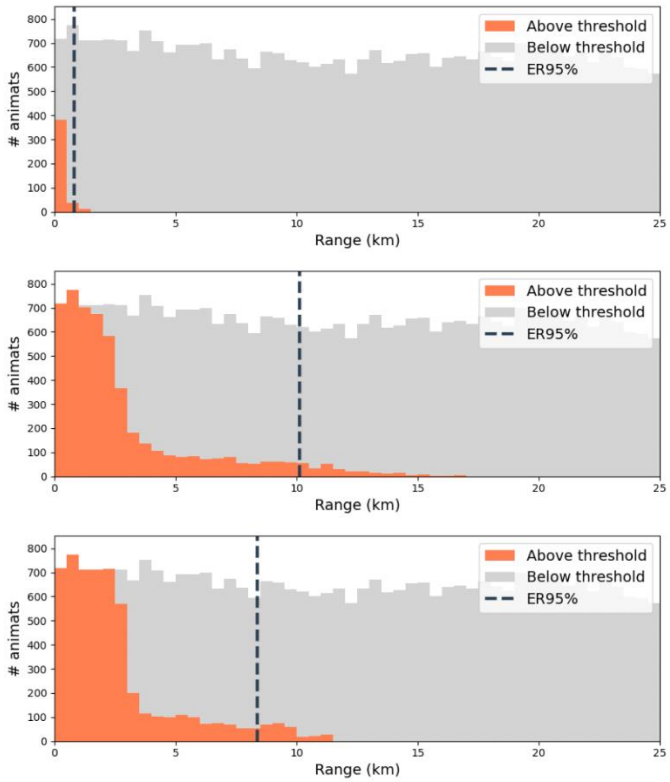

Figure H-12. *Scenario C, male pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

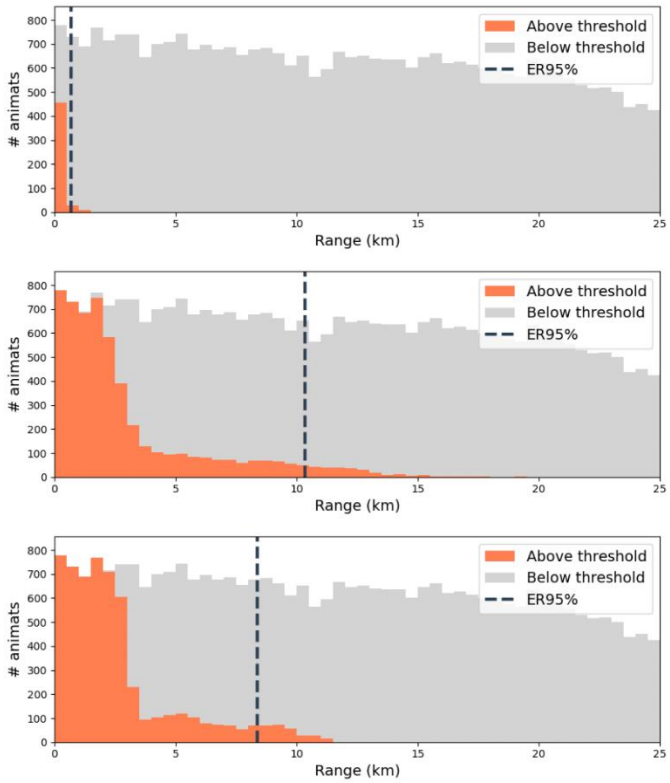

Figure H-13. *Scenario C, female pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

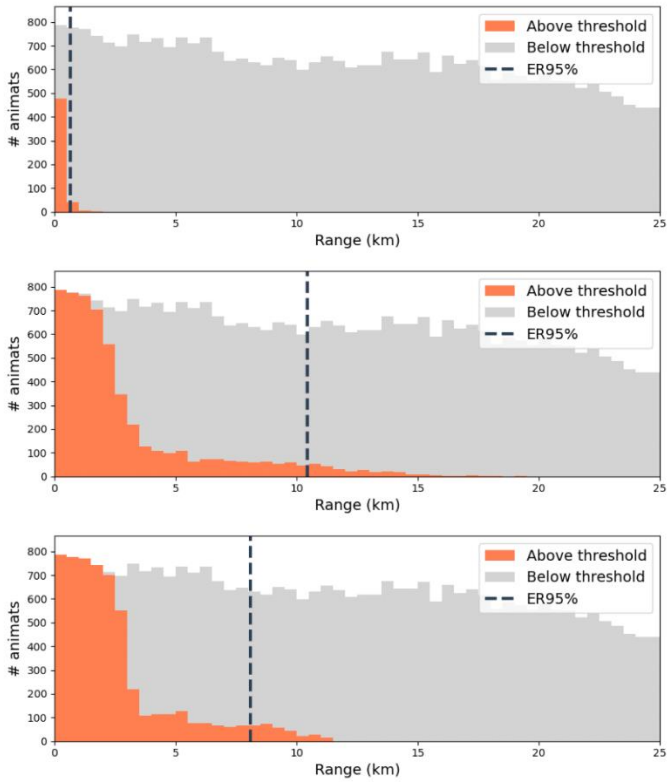

Figure H-14. *Scenario C, male pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

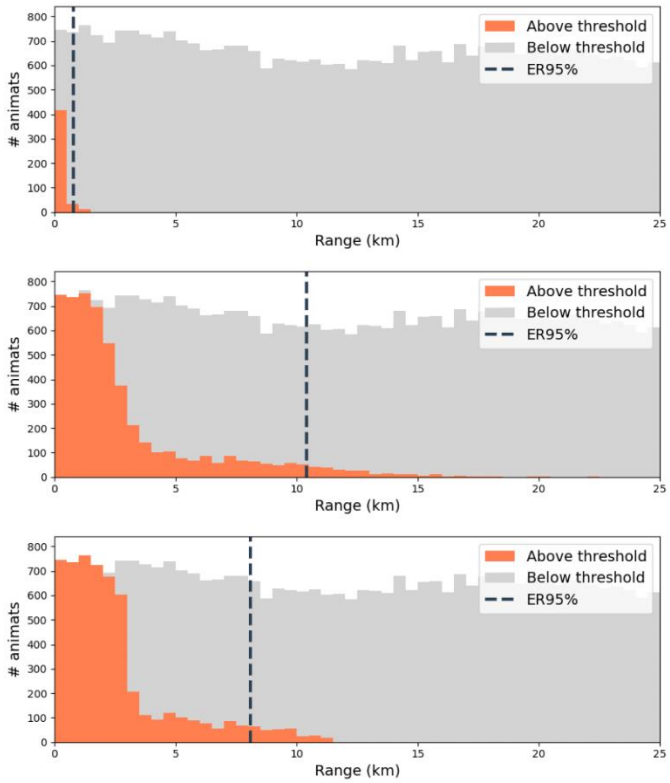

Figure H-15. *Scenario C, female pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

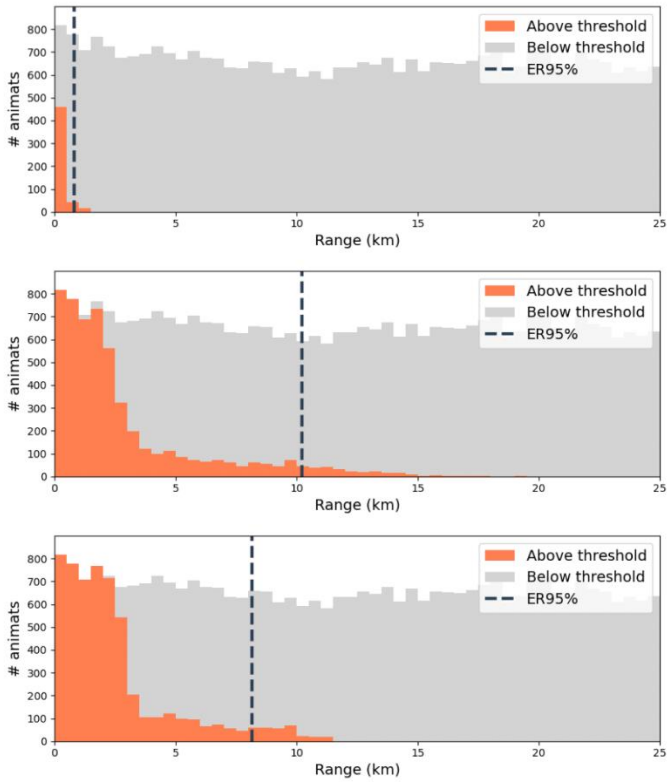

Figure H-16. *Scenario C, male pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

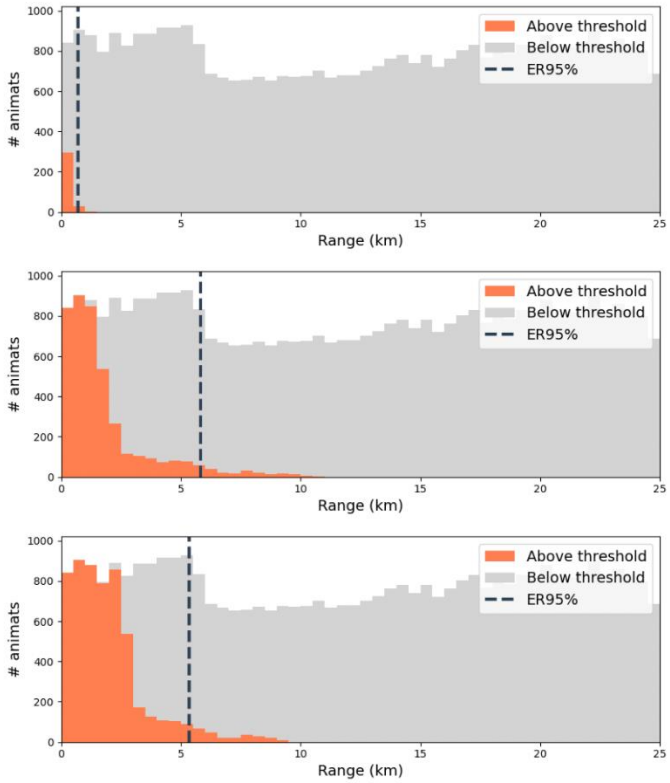

Figure H-17. *Scenario C, migrating southern right whale animats, no calf, unrestricted:* CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

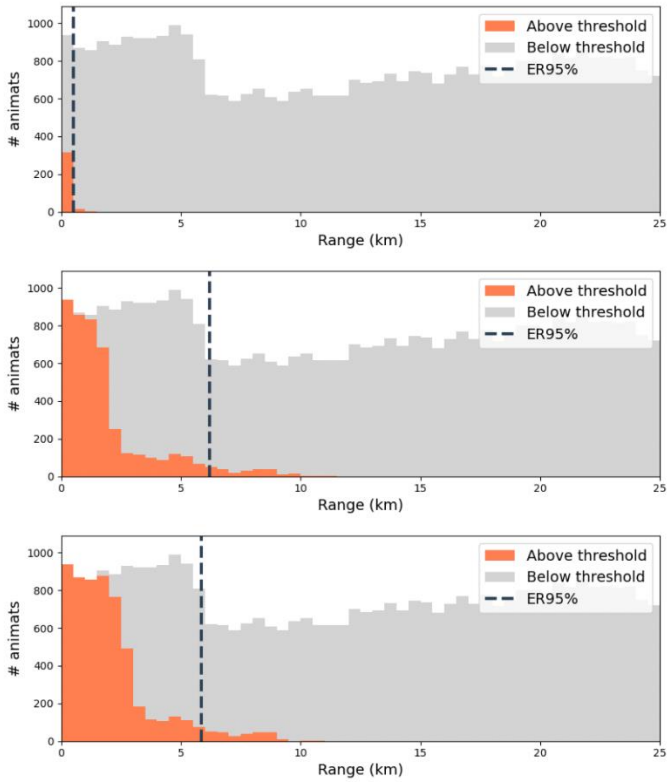

Figure H-18. *Scenario C, migrating southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

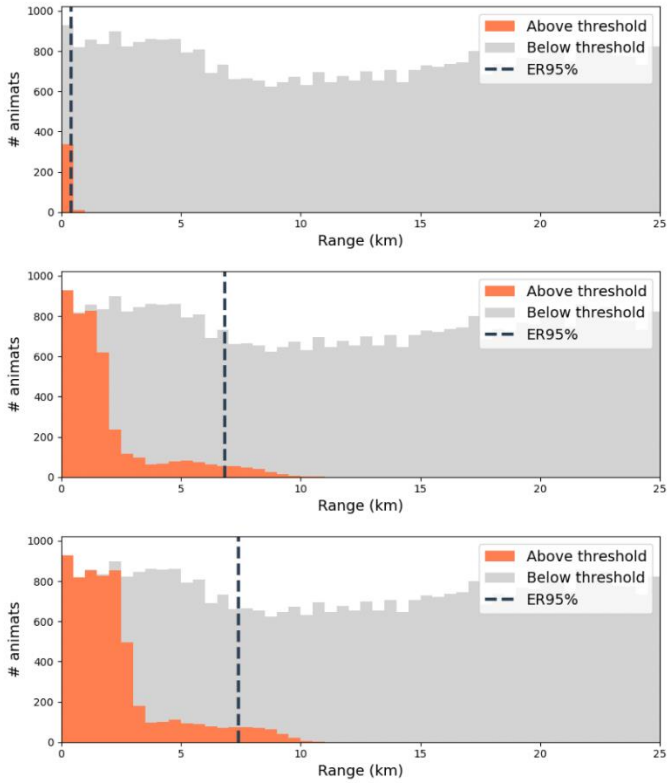

Figure H-19. *Scenario C, reproducing southern right whale animats, no calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

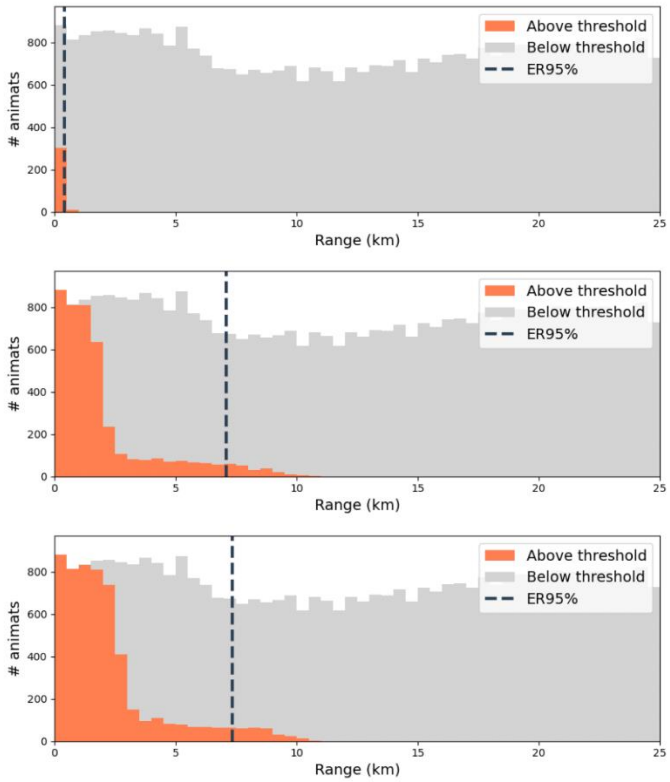

Figure H-20. *Scenario C, reproducing southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

H.3. Scenario D

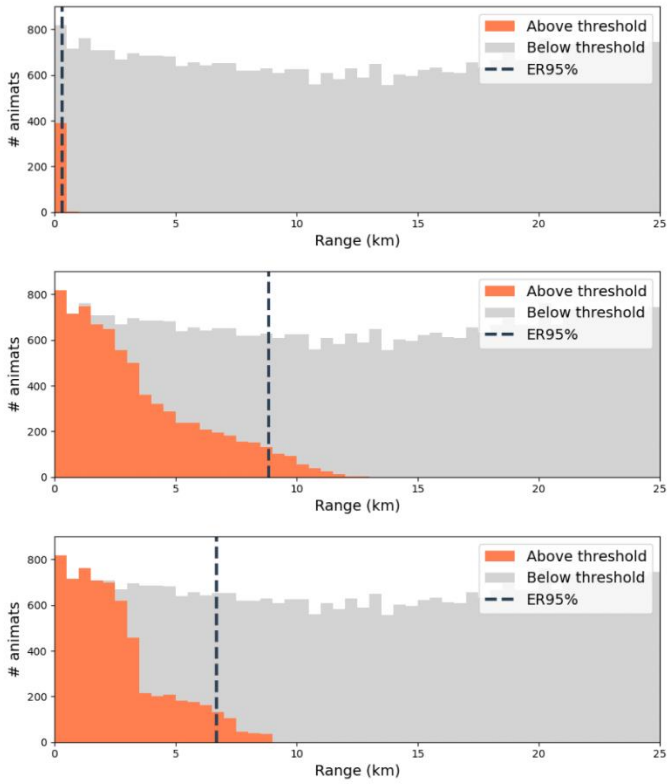

Figure H-21. *Scenario D, female pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

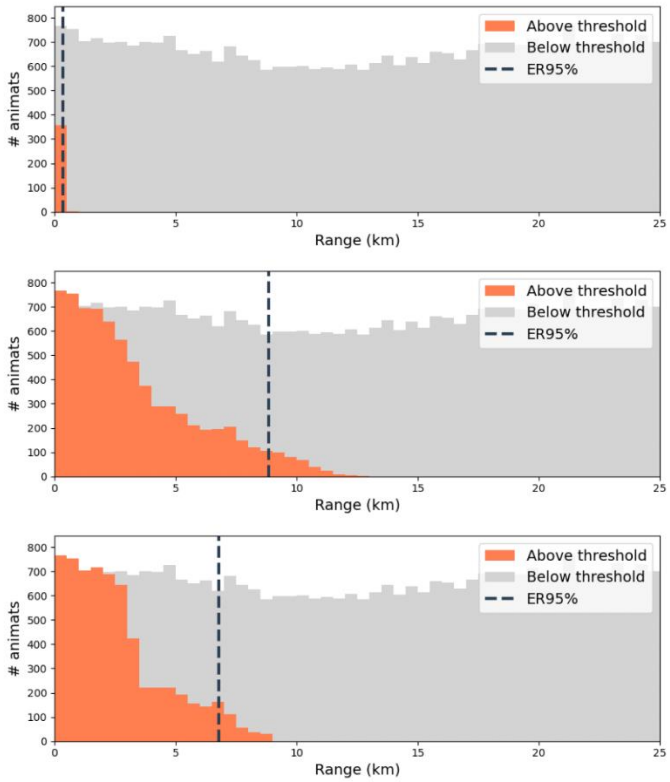

Figure H-22. *Scenario D, male pygmy blue whale animats, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

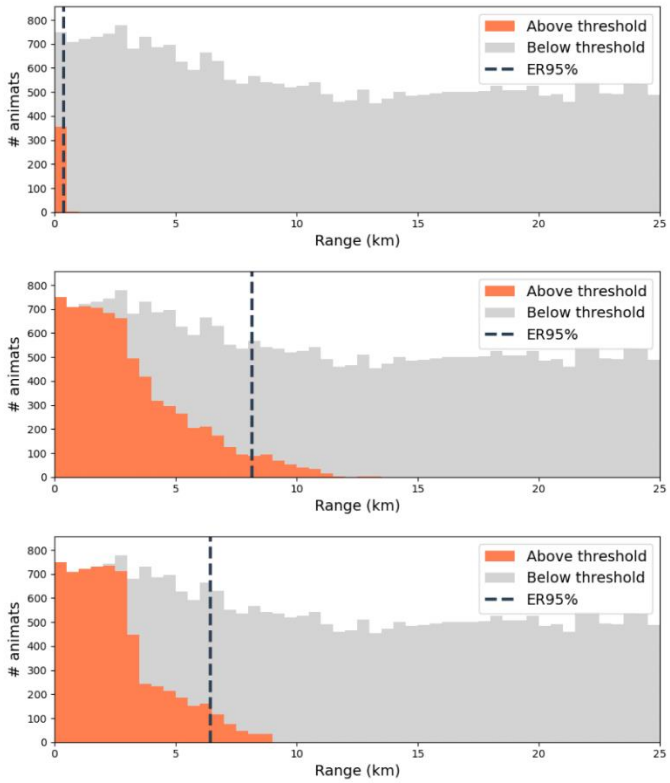

Figure H-23. *Scenario D, female pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

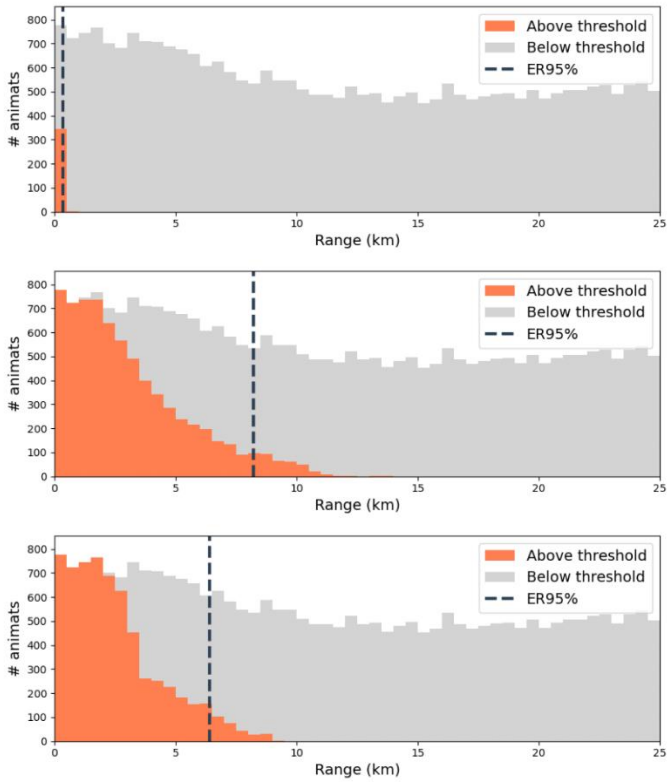

Figure H-24. *Scenario D, male pygmy blue whale animats, restricted to shelf*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

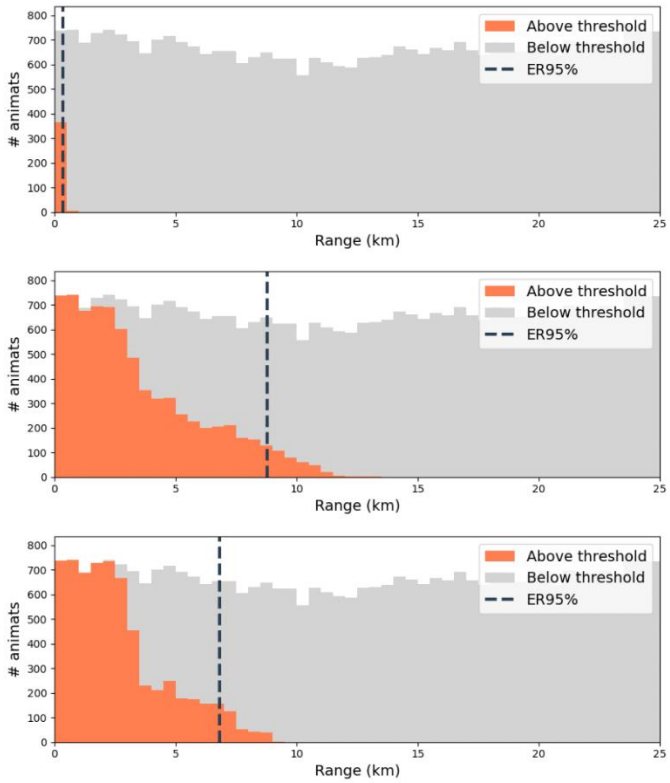

Figure H-25. *Scenario D, female pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

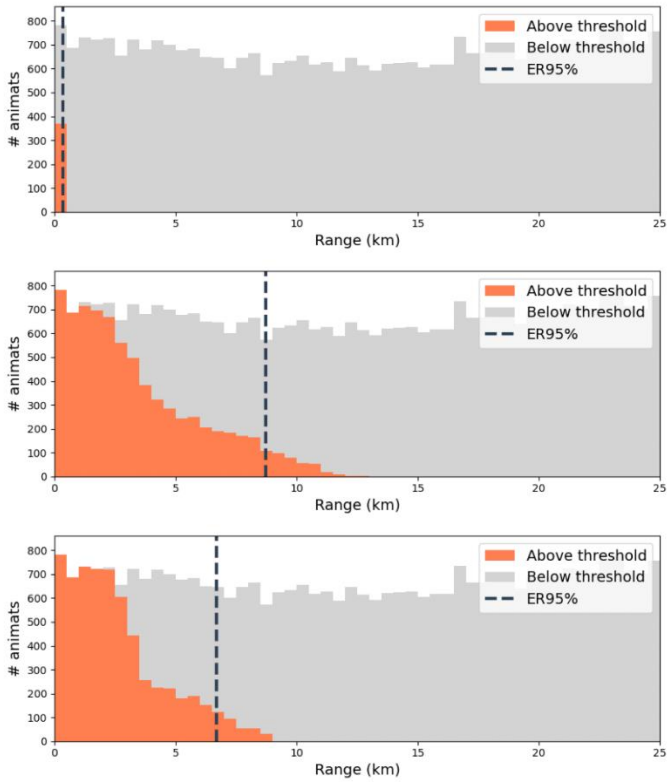

Figure H-26. *Scenario D, male pygmy blue whale animats, restricted to foraging BIA*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

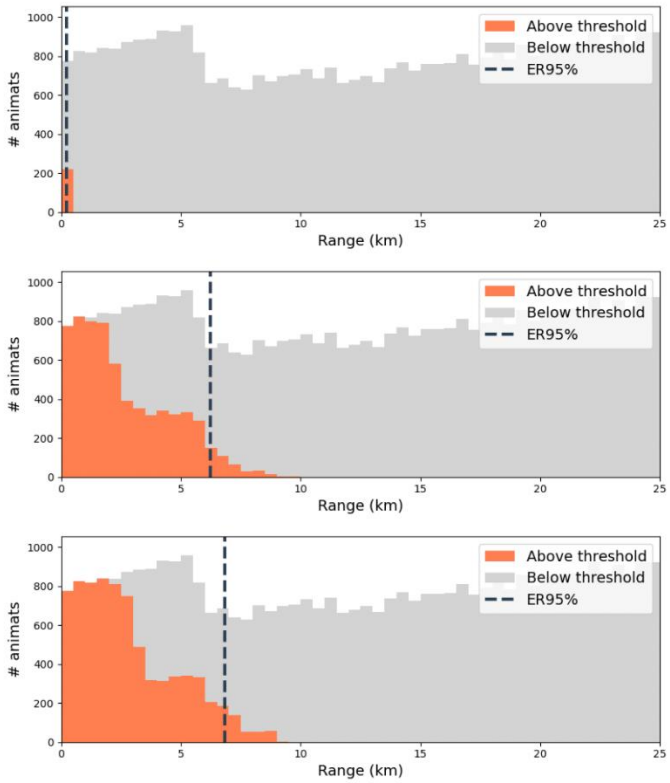

Figure H-27. *Scenario D, migrating southern right whale animats, no calf, unrestricted:* CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

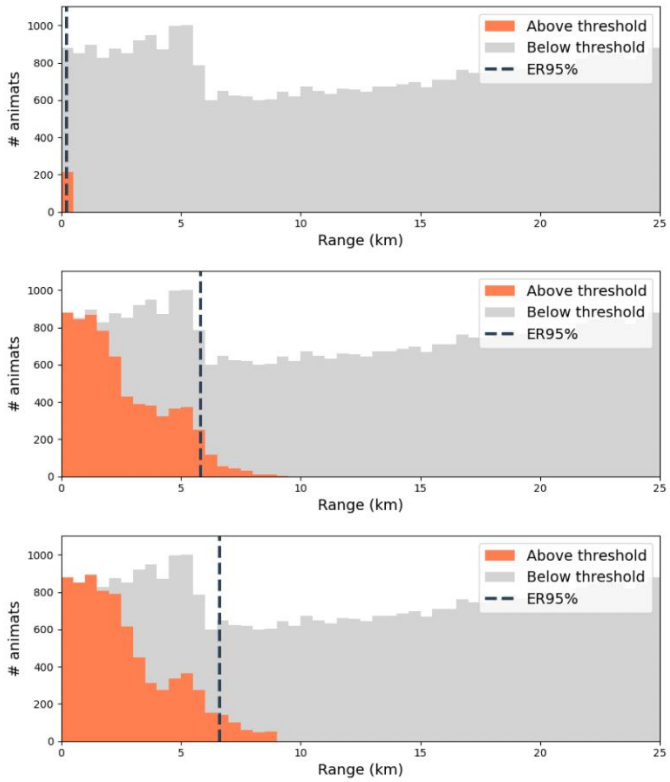

Figure H-28. *Scenario D, migrating southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

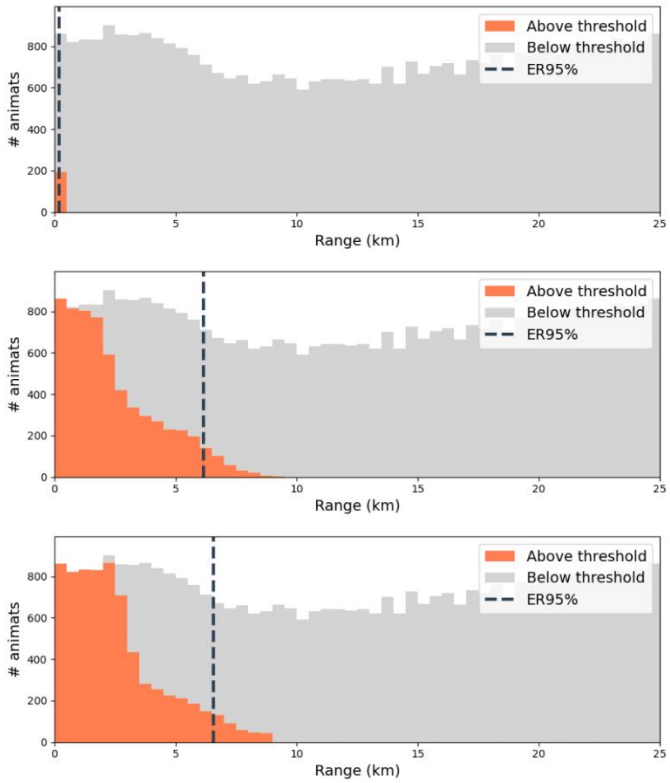

Figure H-29. *Scenario D, reproducing southern right whale animats, no calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

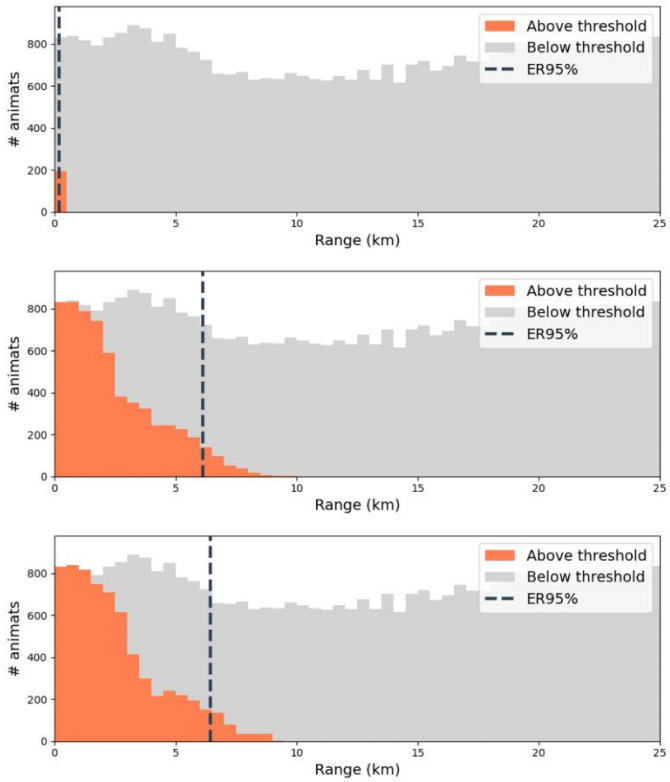

Figure H-30. *Scenario D, reproducing southern right whale animats, with calf, unrestricted*: CPA range histogram for animats, SEL_{24h} PTS threshold (top panel), SEL_{24h} TTS threshold (middle panel), SPL behavioural threshold (bottom panel). Bar colours indicate whether the animats exceeded the threshold.

Statement of Limitations

This report has been prepared by SLR Consulting Australia Pty Ltd (SLR) in conjunction with SLR Consulting Canada Ltd. (SLR Canada) for Klarite Pty Ltd (Client) in accordance with the scope of work and all other terms and conditions of the agreement between such parties. SLR acknowledges and agrees that the Client may provide this report to government agencies, interest holders, and/or Indigenous communities as part of project planning or regulatory approval processes. Copying or distribution of this report, in whole or in part, for any other purpose other than as aforementioned is not permitted without the prior written consent of SLR.

Any findings, conclusions, recommendations, or designs provided in this report are based on conditions and criteria that existed at the time work was completed and the assumptions and qualifications set forth herein.

This report may contain data or information provided by third party sources on which SLR is entitled to rely without verification and SLR does not warranty the accuracy of any such data or information.

Nothing in this report constitutes a legal opinion nor does SLR make any representation as to compliance with any laws, rules, regulations, or policies established by federal, provincial territorial, or local government bodies, other than as specifically set forth in this report. Revisions to legislative or regulatory standards referred to in this report may be expected over time and, as a result, modifications to the findings, conclusions, or recommendations may be necessary.

Executive Summary

The report provides a comprehensive underwater noise impact assessment for the proposed Regia Marine Seismic Survey in the Otway Basin, southwest of Victoria, Australia. The study evaluates acoustic emissions from two seismic source array technologies (Conventional G-Gun II and Bluepulse) using advanced Sound Transmission Loss Modelling (STLM) and Animat Modelling. The modelling incorporates updated NMFS 2024 noise exposure criteria, site-specific bathymetry, geoacoustic profiles, and seasonal sound speed profiles to predict zones of impact for marine fauna, including marine mammals, turtles, fish, diving seabirds, invertebrates, and human divers.

The modelling demonstrates that conventional arrays produce higher peak and root-mean-square sound pressure levels (SPL), while Bluepulse significantly reduces unnecessary high-frequency emissions (> 200 Hz), thereby lowering ecological risk. Immediate physiological impacts such as auditory injury (AUD INJ) and temporary threshold shift (TTS) are confined to tens of meters from the source, whereas behavioural disturbance can extend to tens or even hundreds of kilometres, particularly for low-frequency cetaceans. Cumulative exposure modelling under worst-case assumptions predicts larger impact zones, though these are precautionary and likely overestimate real-world exposure. Bluepulse consistently reduces impact ranges across all scenarios, with shallow-water sites showing greater near-field amplification compared to deep-water sites.

For low-frequency (LF) cetaceans, immediate exposure zones for AUD INJ range from approximately 73 m for conventional arrays to 62 m for Bluepulse, while behavioural disturbance may extend up to 160 km and 130 km respectively; cumulative exposure zones for TTS can reach 28 km for conventional arrays versus 10 km for Bluepulse.

Turtles exhibit immediate AUD INJ zones of 51 m versus 39 m and behavioural disturbance up to 1.6 km versus 1.3 km, while fish mortality zones range from 210 m to 104 m and behavioural disturbance up to 13.8 km versus 12.7 km.

Diving seabirds show AUD INJ zones of 55 m versus 44 m and behavioural disturbance up to 10.6 km versus 2.3 km, whereas invertebrates such as lobsters and squid may experience behavioural disturbance at distances of 397 m versus 220 m and 2.7 km versus 2.4 km respectively.

Human divers could experience slight aversion at distances of 24 km versus 23.5 km, with cumulative tolerance limits extending beyond 160 km.

Additionally, Appendix F include the Animat modelling of pygmy blue whales and southern right whales using the modelled sound fields conducted by Marine Acoustics, Inc. (MAI) to assess potential acoustic exposure of pygmy blue whales and southern right whales during a proposed seismic survey in the Otway Basin, off southern Australia. Using the Acoustic Integration Model (AIM), simulations integrated realistic animal movement patterns with predicted sound fields from two seismic source types—conventional airguns and the Bluepulse system—across two representative track lines. The analysis evaluated exposure against regulatory thresholds for AUD INJ, TTS, and behavioural SPLs (120, 140, 160 dB). Species-specific behaviour profiles, including foraging and migrating states and mother-calf dynamics, were incorporated to ensure ecological relevance.

Results show that conventional sources produce significantly larger exposure ranges for physiological thresholds compared to Bluepulse. Transect scenario C (Site 15) consistently yielded greater exposure ranges than transect scenario D (Site 7), reflecting spatial variability in

acoustic propagation. Animat predictions for behavioural disturbance also show lower ranges when comparing to Bluepulse.

Overall, findings highlight the effectiveness of Bluepulse in reducing high-level acoustic impacts and underscore the importance of site-specific planning and alternative technologies to mitigate risks to vulnerable cetacean populations during seismic operations. While seismic surveys inherently generate high-intensity impulsive noise, the integration of updated criteria, advanced modelling, and alternative source technologies provides a robust framework for impact prediction and mitigation.

These findings support environmentally responsible planning and regulatory compliance for seismic activities in the Otway Basin and underscore the importance of adopting Bluepulse technology, prioritizing deep-water survey lines, implementing exclusion zones based on updated NMFS criteria, scheduling operations outside critical migration and calving periods, and deploying real-time acoustic monitoring and marine fauna observers.

1.0 Introduction

1.1 Project Background

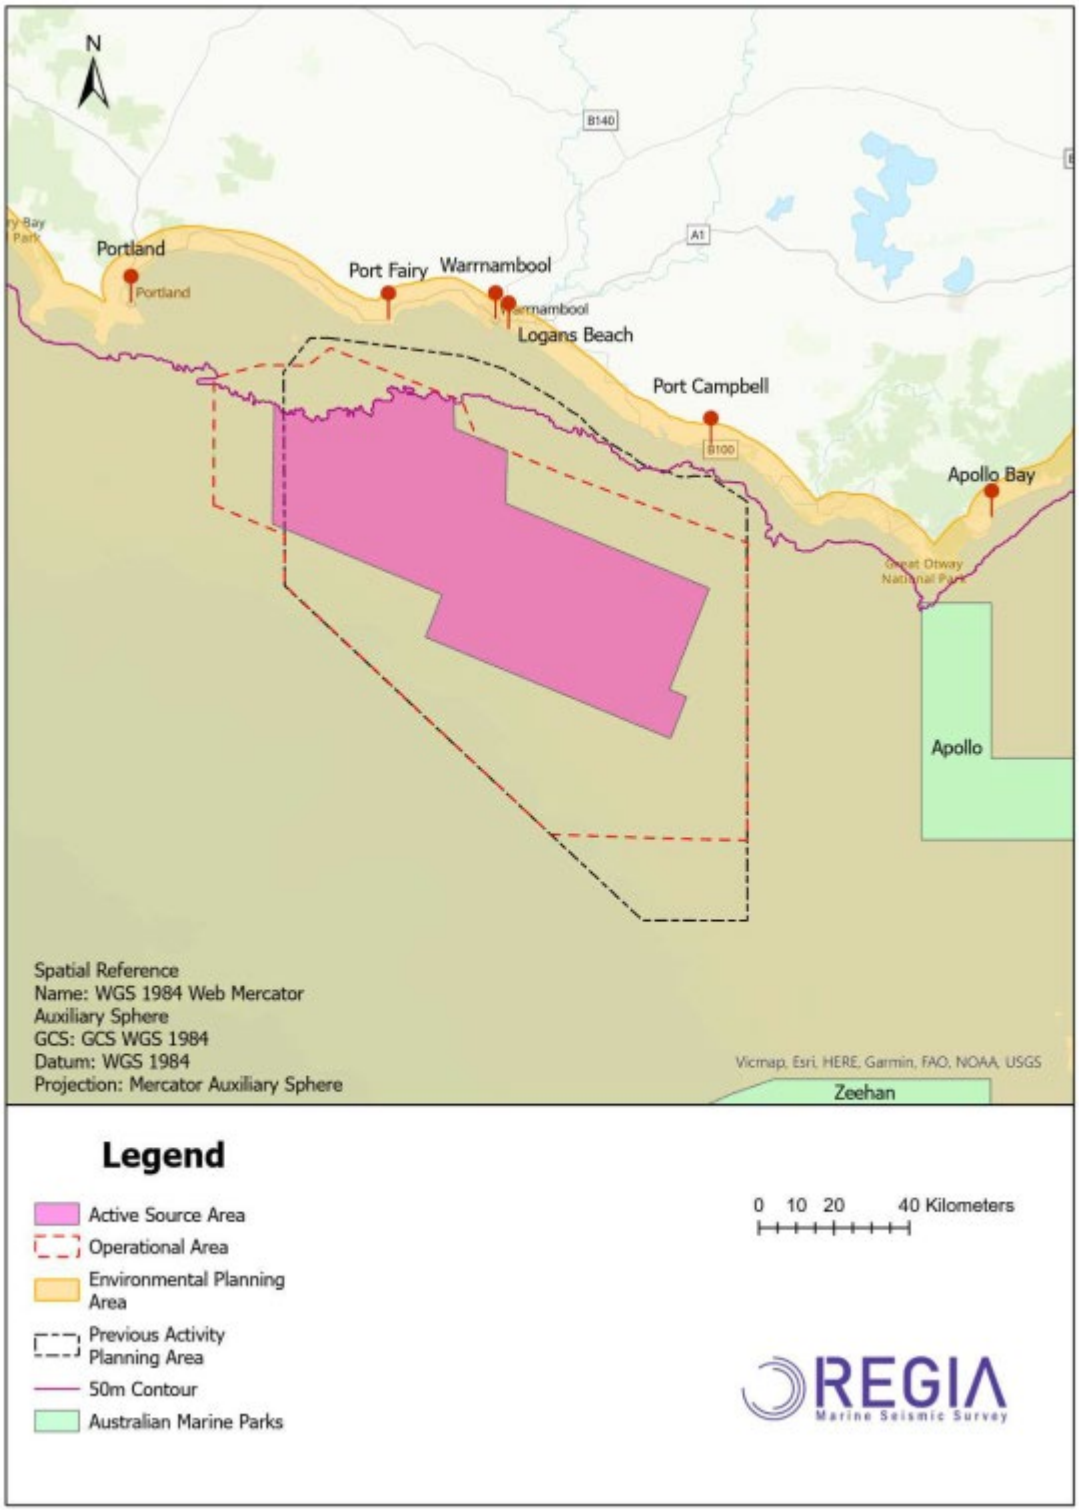
CGG Services Australia Pty Ltd is proposing a Regia Marine Seismic Survey (Regia MSS), a large-scale offshore geophysical exploration initiative in the Otway Basin, located off the southwest coast of Victoria. The project aims to collect high-resolution seismic data to better understand subsurface geological formations and assess potential oil and gas resources. Spanning approximately 2,750 square kilometres in Commonwealth waters, the survey will involve advanced acoustic technologies deployed from a single vessel, operating over a period of up to 90 days (Figure 1).

An initial modelling study requested by CGG provided detailed predictions of the expected sound emissions from the Regia MSS. It included modelling results, sound level contour maps, and comprehensive assessments of potential exposure to marine wildlife, including behavioural and physiological impacts. A subsequent modelling study accounted for increased depth and additional areas of geophysical interest, as well as sound exposure at popular recreational and commercial dive sites. It also accounted for changes in activity design up to the point of its commission. Both reports were based on the marine mammal noise exposure criteria published by the National Oceanic and Atmospheric Administration (NOAA) in 2019.

In October 2024, the United States National Marine Fisheries Service (NMFS) published a peer-reviewed update to its Technical Guidance for Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing. The updates include new information and changes to sound impact threshold, which are likely to alter the ranges for predicted effects on marine mammals detailed in previous studies. In April 2025, SLR Consulting (SLR) carried out a high-level assessment of the latest acoustic modelling study using the latest NMFS technical guidance (2024), and the results were summarized in a technical letter. This new modelling study considers several other elements not taken into account in previous acoustic modelling studies carried out on the proposed activity, namely updated noise criteria for marine mammals published recently (NMFS 2024), the application of a slightly different airgun source array (lower volume) and application of a new source array from Sercel technology (i.e., Bluepulse) to limit emissions of higher frequencies from the source.

In order to assess the potential noise impacts on marine fauna when considering the other elements as described above, SLR Consulting (Canada) Limited (SLR Canada) has been commissioned by Klarite Proprietary Limited (Klarite) to undertake a standalone Sound Transmission Loss Modelling (STLM) and Animat Modelling study to determine the zones of impact for different marine faunal groups of concern for the major noise sources associated with the proposed offshore seismic survey activities on the Otway Basin area.

Figure 1: Location of the active survey and operational areas within the Otway Basin, located off the southwest coast of Victoria, Australia



1.2 Content and Structure of the Report

This modelling study includes the following components:

- Source modelling, i.e., modelling of sound energy emissions from the source arrays proposed to be used in the seismic surveys, including the far-field signature and its power spectral density (PSD), as well as the beam pattern of the source array.
- Short-range modelling, i.e., prediction of the received noise levels over a range of up to four kilometres from the selected array source location of various depths, in order to investigate sound field variations due to the water depth changes, as well as to assess the potential high-risk immediate noise impact to marine fauna species of interest.
- Long-range modelling, i.e., prediction of the received noise levels over a range of up to two hundred kilometres from the selected array source locations, in order to assess the potential noise impact from the surveys on relevant far-field marine sensitive areas.
- Cumulative noise exposure modelling, i.e., prediction of the cumulative sound exposure levels over a 24-hour period for selected representative survey scenarios adjacent to sensitive marine areas, to assess the potential cumulative noise impact on marine fauna species of interest.
- Zones of impact, i.e., prediction for immediate exposure from single pulses and cumulative exposure from multiple pulses in order to assess noise impact on local marine receptor groups.
- Comparative analysis between the two source arrays modelled results.

The report content is summarised below:

- Section 2.0 of the report provides a summary of underwater noise concepts and noise metrics used in this study, including shipping traffic in the project area.
- Section 3.0 details relevant noise impact assessment for marine animals, including the noise criteria for different marine fauna groups and human divers.
- Section 4.0 outlines the methodologies and procedures for the seismic survey acoustic modelling components, including the input parameters and modelling scenarios.
- Section 5.0 presents the STLM modelling results for the source array, the short-range, long-range, and cumulative modelling.
- Section 6.0 includes the estimated impact zones for different marine faunal groups and human divers.
- Section 7.0 provides a discussion of the key findings of the STLM and Animat study.
- Section 9.0 provides references cited in the report.

Additional technical information is provided in Appendices:

- Appendix A – Acoustic Terminology
- Appendix B – Auditory Weighting Functions
- Appendix C – Marine Fauna Classification
- Appendix D – Noise Modelling Table Results
- Appendix E – Noise Modelling Figure Results and Exclusion Zone Maps
- Appendix F – MAI Otway Basin Animat Modelling Report

2.0 Underwater Noise Environment

2.1 Introduction to Underwater Noise Concepts

Sound is a form of energy made by vibrations. When an object vibrates, it causes the fluid particles around it to move. These particles collide with nearby particles, and this continues until they run out of energy.

In underwater acoustics, the word sound is used to describe all the pressure waves that are generated in an underwater medium. Sound waves propagate as alternate phases of compression and rarefaction. Compression occurs when molecules are pressed together. Rarefaction is just the opposite; molecules are allowed to expand.

There are two types of sound waves: transversal and longitudinal. In physics, a transverse wave is a wave that oscillates perpendicularly to the direction of the wave's advance. In contrast, a longitudinal wave travels in the direction of its oscillations. Sound propagates from a source as a longitudinal wave. Wavelength is the spatial distance between two successive peaks in a propagation wave; sound frequency is the number of waves passing through a fixed point per second.

Sound levels are typically reported in units of decibels (dB[1]). The decibel is defined as a ratio of measured acoustic intensity and a reference intensity level and is expressed in a logarithmic scale. However, the sound in air and underwater is often measured as pressure rather than directly as intensity.

2.2 Underwater Noise Metrics

Where possible, recent updates to the ANSI and ISO standards for acoustic terminology and metrics (ANSI S1.13-2013; ISO 18405:2017; ISO 80000-3:2019) have been incorporated into this modelling study.

The Sound Pressure Level (SPL) indicates the amplitude level of sound at a specific location in space and is a scalar quantity. The level is dependent on the location and distance at which the sound is observed relative to a sound source. Sound pressure is measured in Pascals but can be computed in decibels. A standard reference pressure is used to compare sound levels given in decibels to one another. In underwater acoustics, the traditional standard reference pressure (p_o) is 1 micro-Pascal (µPa), leading to the use of the unit dB re 1 µPa, which represents a decibel referenced to a pressure of 1 µPa.

The most common types of acoustic metrics that refer to how pressure was measured are:

- source level, SL (L_S, dB re 1 µPa^{2}m^2) is the acoustic source level referenced to a distance of 1 m from a point source.
- zero-to-peak sound pressure level, PK ($L_{p,pk}$, dB re 1 µPa) simply measures the maximum instantaneous signal's amplitude without considering time in a stated frequency band. It is used to assess a potential permanent and temporary injury in the hearing of marine mammals and mortality and injury in fish and sea turtles exposed to impulsive sound.
- root-mean-square sound pressure level, SPL ($L_{p,rms}$, dB re 1 µPa), is essentially an average intensity over a given amount of time and, therefore, not an instantaneous

[1] dB differs from the common reference dB(A) used for airborne acoustics.

pressure. This type of metric can be used to assess potential behavioural disturbance in marine mammals from impulsive and non-impulsive sound exposure. It is also used to assess the mortality or injury in fish and sea turtles exposed to non-impulsive sound.

- sound exposure level, SEL (L_E, dB re 1 µPa^2·s), is related to the acoustic energy contained in one or more acoustic events over a given period (i.e., 24 hours) and is often used to assess cumulative exposure to noise.
    - For a single event, it is the integration of sound energy produced from a source, over the full event duration. For impulsive or non-impulsive intermittent sounds, this is the SEL for a single hammer strike for pile driving, a single air gun shot for a seismic survey or a single ping for sonar.
    - For multiple acoustic events, the cumulative SEL is commonly referred to as a 24-hour event or alternatively can be calculated by summing the SEL of a single event plus the logarithm of the N individual events multiplied by 10 and will be indicated by an appropriate subscript (i.e., $L_{E,N}$). If a period is used, the integration time shall be specified (e.g., $L_{E,24h}$). This type of acoustic metric is used to assess potential permanent and temporary injury in the hearing of marine mammals and turtles when exposed to impulsive or non-impulsive sounds and the mortality or injury of fish exposed to impulsive sounds.
- weighted sound exposure level, SEL_W ($L_{E,w}$, dB re 1 µPa^2·s), is the cumulative SEL weighted with a specific frequency range of sound pressure levels. If a period is used, the integration time shall be specified. If a specific frequency weighting is applied, appropriate subscripts should also indicate this. For example, auditory weighting functions that have been proposed for specific auditory groups of marine mammals over a 24-hour period can be expressed using the weighted SEL metric plus an abbreviation for the respective auditory group (e.g., $L_{E,LF,24h}$ see Section 3.3.1).
- Spectrum or spectra is the visual display of the frequency content of a sound signal. It shows how sound level varies when the frequency is given. The spectra are presented in third-octave bands (1/3-octave), which measure the sound level in frequency bands that widen exponentially with increasing frequency and are evenly spaced on a logarithmic frequency axis. In underwater acoustics, this is used to approximate the bandwidths of the marine mammals' fish' and turtles' auditory systems.

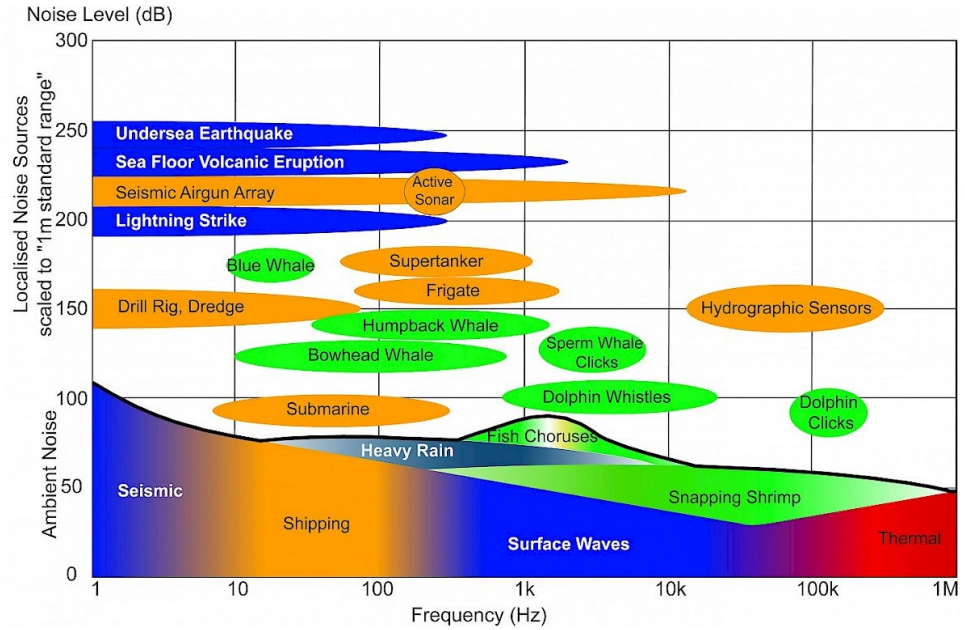
2.3 Ocean Ambient Noise

Acoustic cues are thought to be important to marine fauna in the perception of their environment as well as for navigation purposes, predator avoidance, and in mediating social and reproductive behaviour. Noise is generally an unwanted sound, a sound that clutters and masks other sounds of interest, such as those generated by marine fauna. Ocean ambient noise poses a baseline limitation on the use of sound by marine animals, as signals of interest must be detected against background noise. The level and frequency characteristics of the ambient noise environment are the two major factors that control how far away a given sound signal can be detected (Richardson et al. 2013).

Ocean ambient noise is comprised of a variety of sounds of different origins at different frequency ranges, with temporal and spatial variations. It primarily consists of noise from natural physical events, marine biological species, and anthropogenic sources.

An overview of the indicative noise spectral levels produced by various natural and anthropogenic sources relative to typical background or ambient noise levels in the ocean is shown in Figure 2.

Figure 2: Levels and Frequencies of Sound Sources in the Marine Environment



Source: from https://www.ospar.org/work-areas/eiha/noise. Notes: Natural physical noise sources are represented in blue; marine fauna noise sources are shown in green; human noise sources are shown in orange.

Background noise at higher frequencies tends to be dominated by natural physical or bioacoustics sources such as rainfall, surface waves and spray, as well as fish choruses and snapping shrimp for coastal waters. Human contributions to ambient noise are often significant at low frequencies, between about 20 Hz and 500 Hz, predominantly from distant shipping (Hildebrand 2009).

- **Geophony:** the major natural physical events contributing to ocean ambient noise include, but are not limited to, wave/turbulence interactions, wind, precipitation (rain and hail), breaking waves and seismic events (e.g., earthquakes/tremors):
  - The interactions between waves/turbulence can cause very low-frequency noise in the infrasonic range (below 20 hertz [Hz]). Seismic events such as earthquakes/tremors and underwater volcanos also generate noise predominantly at low frequencies from a few Hz to a few hundred Hz;
  - Wind and breaking waves, as the prevailing noise sources in much of the world's oceans, generate noise across a very wide frequency range, typically dominating the ambient environment from 100 Hz to 20 kilohertz [kHz] in the absence of biological noise sources. The wind-dependent noise spectral levels also strongly depend on sea states, which are essentially correlated with wind force; and
  - Precipitation, particularly heavy rainfall, can produce much higher noise levels over a wider frequency range of approximately 500 Hz to 20 kHz.
- **Biophony:** some marine animals produce various sounds (e.g., whistles, clicks) for different purposes (e.g., communication, navigation, reproductive displays, territorial defence, or detection and feeding):

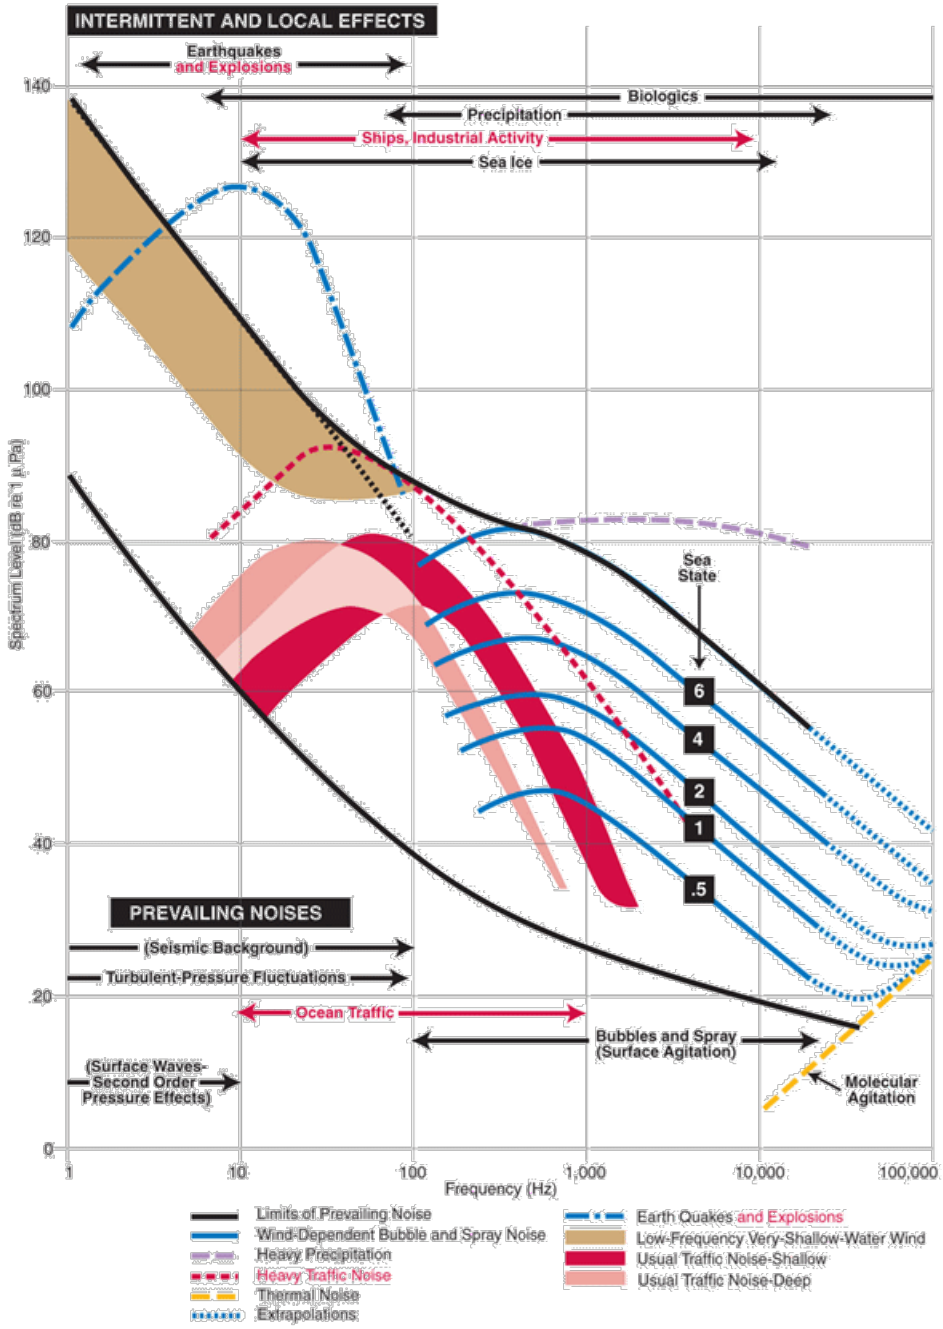
  - Baleen whales (e.g., great whales like humpback whales) regularly produce intense low-frequency sounds (whale songs) that can be detected at long ranges in open water. Odontocete whales, including dolphins, can produce rapid bursts of high-frequency clicks (up to 150 kHz) that are primarily for echolocation purposes;
  - Some fish species produce sounds individually, and some species also make noise in choruses. Typically, fish chorusing sounds depend on species, time of day and time of the season; and

- **Anthrophony:** anthropogenic noise primarily consists of noise from shipping activities, offshore seismic and drilling explorations, marine industrial developments, and operations, as well as equipment such as sonar and echo sounders:
  - Shipping traffic from various sizes of ships is the prevailing man-made noise source around nearshore port areas. Shipping noise is typically due to cavitation from propellers and thrusters (operating using dynamic positioning systems or DPS), with energy predominantly below 1 kHz;
  - Pile driving and offshore seismic exploration generate repetitive pulse signals with intense energy at relatively low frequencies (hundreds of Hz) that can potentially cause physical injuries to marine species close to the noise source. The full frequency range for these impulsive signals could be up to 10 kHz; and
  - Dredging activities and other marine industry operations are additional man-made sources which generate broadband noise over relatively long durations.

A summary of the spectra of various ambient noise sources, based on a review study undertaken by Wenz (1962), is shown in Figure 3. Although the spectral curves in the figure are based on average levels from reviewed references primarily for the North Atlantic Ocean, they are regarded as representative (in general) of the ocean ambient noise spectral components in the project region. Ambient noise levels typically range:

- From as low as 80 dB re 1 µPa for the 10-10 kHz frequency range for areas with few shipping movements and calm sea surface conditions to; and
- Up to 120 dB re 1 µPa for the 10-10 kHz frequency range for areas with moderate to heavy remote shipping traffic and medium to high wind conditions.

Figure 3: Spectra and Frequency Distribution of Ocean Sound Sources



Source: Miksis-Olds et al. 2013, adapted from Wenz (1962)

2.3.1 Otway Basin Ambient Noise

A recent assessment of ambient noise in the Otway Basin (RMSS, 2025) reported median broadband ambient noise levels of 104.5 dB re 1 µPa, with a mean of 118.3 dB re 1 µPa. Noise levels ranged between 86.6 to 153.6 dB re 1 µPa.

2.3.2 Shipping Traffic in the Project Area

Shipping traffic is an important component of ocean ambient noise in the project area. As can be seen in Figure 4, shipping traffic density overpasses the seismic and operational areas. Thus, the shipping noise component of the ambient noise environment is expected to be present throughout deeper zones.

Figure 4: Shipping traffic density at Otway Basin, around the seismic and operational area (green)

3.0 Underwater Noise Impact Assessment Criteria

3.1 Marine Fauna Hearing Sensitivity

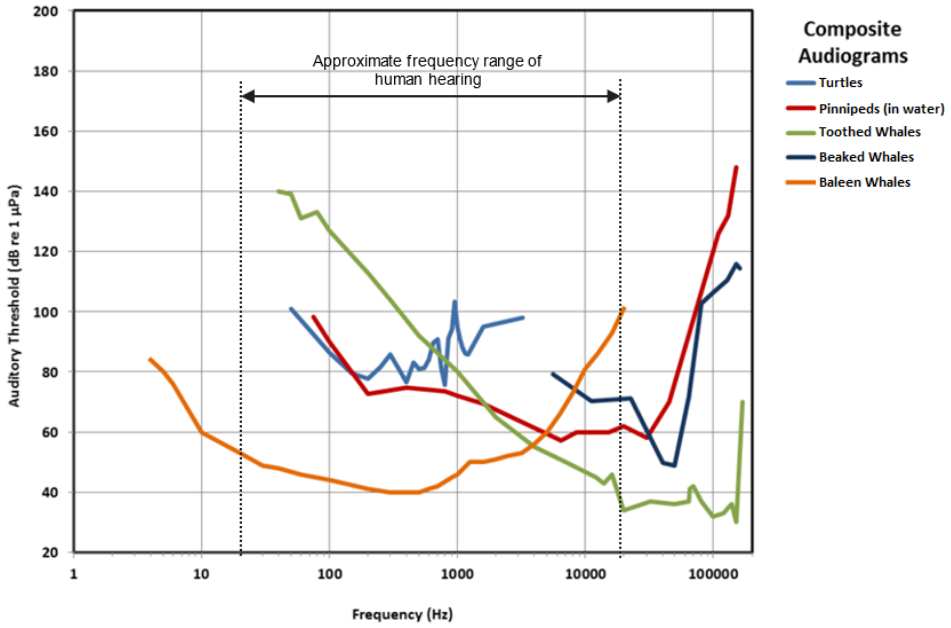
A sound is audible when the receiver is able to perceive it over background noise. The audibility is also determined by the individual's threshold of hearing, which varies with frequency. Hearing ability is typically described using audiograms, which display hearing threshold (the sound level at which sound is just detectable) as a function of sound wave frequency. A low sound pressure level on an audiogram indicates a low hearing threshold at a given frequency, which means that even a very weak sound is still audible and indicates a higher auditory sensitivity.

Hearing capabilities differ between different groups of species, with some being more sensitive to low-frequency sounds while others hear better in the high-frequency range. Hipsey and Booth (2012) considered several marine mammals (and turtle) species and compiled composite audiograms for different groups (see Figure 5). Table 1 summarises the information on which the composite audiograms are based.

Marine mammals and fish species usually have U-shaped audiograms, meaning that within their respective hearing ranges, they are more sensitive to the sound energy component in the mid-frequency range and less sensitive to the energy components in the lower and upper-frequency ranges (Finneran 2016, Southall et al. 2019; Popper et al. 2019).

For sirenians (manatees and dugongs), Southall et al. (2019) suggested that species would be sensitive to sounds less than 20 kHz, with peak sensitivity around 8 kHz. The hearing capability in sirenians ranges from 20 Hz to 60 kHz.

Figure 5: Composite Audiograms of Marine Fauna Based on Various Studies



Source: adapted from Hipsey & Booth 2012

Table 1: Hearing Capabilities of Marina Fauna Groups Based on Composite Audiograms

Marine Species Group	Hearing Capability (Hz)		Peak Hearing Sensitivity (Hz)	
	Minimum	Maximum	Minimum	Maximum
Toothed whales (odontocetes)[1]	150	160,000	20,000	120,000
Beaked whales (ziphiids)[2]	5,600	160,000	40,000	50,000
Baleen whales (mysticetes)[3]	7	35,000	100	200
Pinnipeds (seals; under water)	70	> 100,000	7,000	30,000
Sirenians (manatees, dugongs)	20	60,000	8,000	<20,000
Fish	10	4,000	100	800
Turtles	50	3,000	100	800

[1]Some odontocete species can hear well below this range.
[2]Based on two studies in which single individuals were tested.
[3]Based on theoretical evidence only (no empirical data).
Sources: Hipsey & Booth 2012, DoN 2017, Popper and Hawkins 2019, Southall et al. 2019

For fish species, sound detection is based on the response of the auditory portion of their ears (i.e., the otolithic organs) to the particle motion of the surrounding fluid (Popper and Hawkins 2018). Some fish species also detect sound pressure via gas-filled structures near the ear and/or extensions of the swim bladder that functionally affect the ear, in addition to purely the fluid particle motion, resulting in higher hearing sensitivity and broader hearing bandwidth (Nedelec et al. 2016; Popper and Hawkins 2018). Fishes that can detect sound pressure hear sounds from <50 Hz (even as low as 10–30 Hz) to perhaps 1000 Hz, and a much smaller number of species can detect sounds of 3–4000 Hz (Popper and Hawkins 2019).

For turtles, the Department of the U.S. Navy (DoN 2017) agreed that these animals have low sensitivity to impulsive noise, with audiograms more similar to those of fish but without specialized high-frequency hearing adaptations poor auditory sensitivity.

3.2 Possible Noise Impacts on Marine Fauna

The potential impacts of noise on marine fauna species include masking of communication and other biologically important sounds, behavioural responses, and physiological impacts (including discomfort, hearing impairment, and physical injury or mortality in extreme cases) (Richardson et al. 2013; Hawkins and Popper 2017; Erbe et al. 2018; Popper and Hawkins 2019).

The type and distance of noise impacts on marine fauna depend on the acoustic characteristics of the noise (e.g., source level, spectral content, temporal characteristics, directionality, etc.), the sound propagation environment, as well as the hearing ability and physical reaction of an individual to detect sound. The individual types of impacts are discussed below.

3.2.1 Masking

Masking occurs when the introduced noise is loud enough to impair the detection of biologically relevant sound signals, such as communication signals, echolocation clicks and passive detection cues that are used for navigation and finding prey (Clark et al. 2009). The extent of the masking area depends on the differences in the animal's hearing frequency range, received sound levels, and the introduced anthropogenic and background ambient noise (Richardson et al. 2013). The masking effect can be partly compensated by an animal’s frequency and temporal discrimination ability, directional hearing, co-modulation masking

release (if noise is amplitude modulated over several frequency bands) and multiple looks (if the noise has gaps or the signal is repetitive), as well as anti-masking strategies (increasing call level, shifting frequency, repetition, etc.) (Erbe et al. 2016).

3.2.2 Behavioural Response and Disturbance

Sound that is significantly above ambient noise levels and the animal's audiogram range can trigger behavioural responses that can include changes in vocalisation, resting, diving, and breathing patterns, and in most cases, avoidance of the noise source (Wartzok et al. 2003). Behavioural response effects can be challenging to measure and depend on a wide variety of factors such as the physical characteristics of the signal, the behavioural and motivational state of the receiver, its age, sex and social status and many other aspects. In summary, behaviour response refers to any observable change in behaviour of an animal due to a sound stimulus. Importantly, a behavioural response does not necessarily imply harm or disruption to the animal's normal functioning. In contrast, behaviour disturbance is a subset of behavioural responses that are considered disruptive to normal biological functions such as feeding, mating and migration. The type and magnitude of behavioural disturbance for any given signal can vary both within a population and for the same individual over time and can vary significantly, from very subtle changes in behaviour to strong avoidance reactions (Ellison et al. 2012; Richardson et al. 2013).

3.2.3 Hearing Impairment

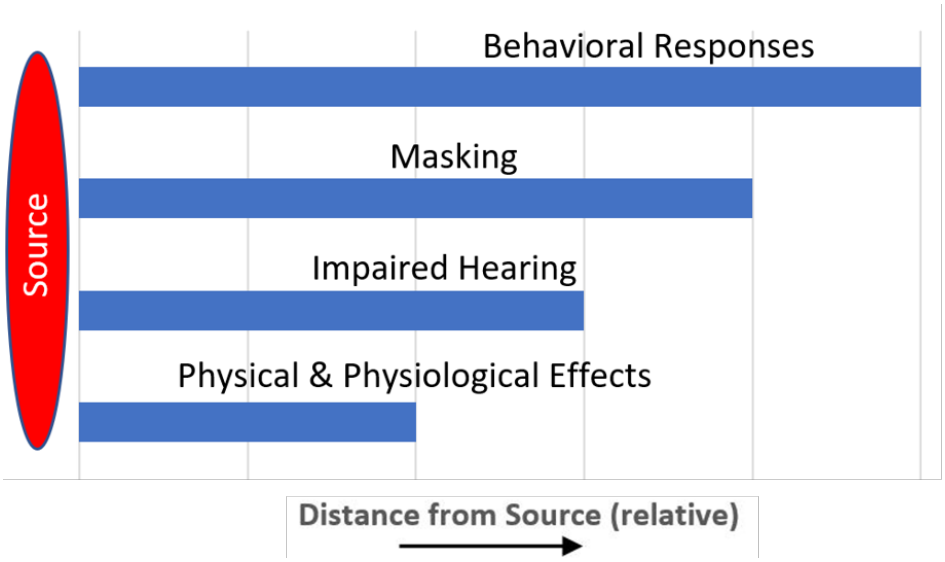
The physiological effects of underwater noise are primarily associated with the auditory system, which is likely to be most sensitive to noise. Exposure to noise sources can cause a loss of sensitivity to sound. If noise exposure is below a critical level of sound energy or for a certain duration, hearing loss is usually temporary, and the animal recovers; this effect is called Temporary Threshold Shift (TTS). If damage occurs to the inner ear that can lead to tissue destruction, the effect is called auditory injury (AUD INJ) and may or may not result in permanent hearing loss or permanent threshold shift (PTS) (NMFS 2024). Noise exposure can cause a reduction in the animal's hearing sensitivity or increase the hearing threshold (i.e., the sound level that is just audible to the animal) (Finneran 2016; Popper and Hawkins 2019; Southall et al. 2019).

3.2.4 Physical Injury

Noise at very high sound pressure levels may cause concussive effects and physical damage to tissues, organs, and cavitation or result in the rapid formation of bubbles in the blood system due to massive pressure oscillations (Groton 1998). The physiological systems of marine animals that are potentially affected include the vestibular system, reproductive system, nervous system, liver, or organs with high concentrations of dissolved gas and gas-filled spaces (swim-bladders).

The severity of these impacts decreases with increasing distance from the noise source, as illustrated by the potential zones of noise impact shown in Figure 6.

Figure 6: Potential zones of noise impact on marine fauna



Source: Adapted from Hawkins and Popper 2017.

3.3 Criteria for Determining Adverse Noise Effects

This section outlines the impact assessment criteria for noise impacts on marine mammals, fish, and sea turtles, diving seabirds and some invertebrate species, as well as human divers.

Extensive scientific studies and research have been conducted to determine quantitative links between marine noise and its impacts on marine fauna. For example, Southall et al. (2019) have proposed noise exposure criteria associated with various sound types, including impulsive and non-impulsive noise for marine mammal species, based on a review of expanding literature on marine mammal hearing and physiological and behavioural responses to anthropogenic sounds.

Popper and Hawkins (2019) reviewed sound exposure guidelines for fish, considering the diversity of fish, the different ways they detect sound, various sound sources, and their acoustic characteristics. The Department of the U.S. Navy (DoN 2017) presented a revision of the thresholds for sea turtle injury and hearing impairment (TTS and PTS).

The noise exposure levels presented in the following sections, are based on the most recent available data and published literature (i.e., the state of current knowledge, also see Appendix B and Appendix C).

This research is considered applicable to the marine fauna of the study area and appropriate as a basis of assessment since the species present there share the same physiological characteristics as the species that were subject to the cited research.

3.3.1 Marine Mammals

The newly updated scientific recommendations in marine mammal noise exposure criteria (NMFS 2024) propose auditory injury (AUD INJ[2]) onset and temporary threshold shift (TTS) onset criteria for both impulsive noise and non-impulsive noise events.

As different mammals hear at different frequencies (see Section 3.1), they are grouped into different hearing groups and, hence, different threshold levels:

- Low-frequency cetaceans (LF) include baleen whales;
- High-frequency cetaceans (HF) are dolphins, toothed whales, beaked whales, bottlenose whales;
- Very-high-frequency cetaceans (VHF) include true porpoises and river dolphins,
- Phocid pinnipeds in water (PW) include true seals;
- Otariid pinnipeds in water (OW), such as sea lions and fur seals; and
- Sirenians (SI), e.g., manatees and dugongs;

A summary of marine species classified by auditory group is presented in Appendix C. Not all animals listed are expected to be found in the vicinity of the project area; however, is known that reproduction, foraging, and migration areas overlap the operational area for the following marine fauna species:

- LF – Pygmy Blue Whale (PBW)
- LF – Southern Right Whale (SRW)

Therefore, while these hearing groups are considered relevant in this STLM reporting study, the "other" hearing groups (HF, VHF, PW, OW and SI) are still assessed and reported here.

The AUD INJ-onset and TTS-onset criteria for impulsive noise are outlined in Table 2, which incorporates a dual-criteria approach based on both $L_{p,pk}$ (immediate exposure) and $L_{E,w}$ (cumulative weighted exposure over a 24-hour period).

The widely used threshold level for the onset of possible behavioural disturbance in all marine mammals is the SPL of 160 dB re 1 µPa from a single pulse. However, thresholds of 140/120 dB re 1 µPa are also considered in this study as shown in Table 2 and explained below.

While progress has been made in many areas, it is important to recognize that hearing measurements are lacking in most marine mammal species, especially in LF cetaceans. For example, hearing studies for SRW and PBW are scarce and must almost certainly rely on comparative anatomical models of other LF cetacean species, given the difficulties in obtaining direct hearing measurements.

Although a compilation of different studies is presented by Southall et. al (2021); most of these studies refer to stimulus to other impulsive sources (i.e., pile driving and intermittent sonar). Only four studies refer to a stimulus with seismic airguns and its response in LF cetaceans (particularly Humpback and Gray Whale). From those, only one study (Malme et al., 1986) refers to experimental seismic airgun noise to migrating Gray Whales with an associated response of SPL values ranged 149 and 174 dB re 1µPa.

[2] AUD INJ refers to damage to the inner ear that can result in tissue destruction, such as loss of cochlear neuron synapses or auditory neuropathy (NMFS 2024). AUD INJ may or may not result in permanent damage.

Table 2: Noise criteria for marine mammals exposed to impulsive noise sources

Marine mammal hearing group	AUD INJ onset		TTS onset		Behavioural response
	Single pulse	Multiple pulses	Single pulse	Multiple pulses	Single pulse
	$L_{p,pk}$ dB re 1µPa	$L_{E,w,24h}$ dB re 1µPa^2·S	$L_{p,pk}$ dB re 1µPa	$L_{E,w,24h}$ dB re 1µPa^2·S	$L_{p,rms}$ dB re 1µPa
LF	222	183	216	168	160/140/120
HF	230	193	224	178	
VHF	202	159	196	144	
PW	223	183	217	168	
OW	230	185	224	170	
SI	226[1]	190[1]	220	175	

$L_{p,pk}$ = zero to peak sound pressure level; $L_{E,w,24h}$ = weighted sound exposure level over a 24h period; $L_{p,rms}$ = root-mean-square sound pressure level; AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift. [1]The sirenian group uses the noise criteria for PTS = permanent hearing threshold shift. Green shaded areas highlight the groups likely to be present within the operational area.

Sources: NMFS 2024, NMFS 2024a, Southall et al. 2019

While according to Southall 2024 the concepts of all-or-nothing response thresholds are clearly and unequivocally incompatible with the best available information; Southall (2024) also recommends the need to develop novel approaches and evaluate and apply existing and new experimental and observational findings on the behavioural disturbance of marine mammals to understand and mitigate the effects of anthropogenic noise on protected species.

A scientific understanding of the effects of noise on behavioural disturbances must also be combined with the (sometimes extensive) variability among individuals, species, sources, situational contexts, and temporal and spatial scales of exposure for long-term, broad-scale, and population-level impact assessments.

Therefore, for this modelling study, three different noise thresholds (160/140/120 dB re 1µPa) are applied for the behavioural disturbance to impulsive sound sources, such as seismic air guns.

3.3.2 Turtles

Popper et al. (2014) suggested threshold levels for potential PTS of turtles, extrapolated from other animal groups, such as fish, on the basis that the hearing range of turtles is relatively close to that of certain fish. More recently, the Department of the U.S. Navy (DoN 2017) revised thresholds based on a review of references from at least five different species of turtles to construct their composite audiograms and provide thresholds for the onset of PTS and TTS (see Appendix C). They agreed that turtles' audiograms have low sensitivity, which is more similar to those of fish without specialized hearing adaptations for high frequencies.

Data on the behavioural responses of sea turtles to sound sources is limited. Currently, there is not enough data to derive separate thresholds for different source types. However, behavioural disturbance (immediate exposure) from impulsive and non-impulsive noise generally occurs around 175 dB re 1 µPa SPL (O'Hara and Wilcox 1990; Moein et al. 1994; Lenhardt 2002; McCauley et al. 2000),), which has also been adopted by NMFS (NMFS 2024b).

The revised thresholds for turtles (impulsive noise) are presented in Table 3.

Table 3: Noise criteria for turtles exposed to impulsive noise

Type of animal	PTS onset		TTS onset		Behaviour disturbance
	Single pulse	Multiple pulses	Single pulse	Multiple pulses	Single pulse
	$L_{p,pk}$ dB re 1µPa	$L_{E,TU,24h}$ dB re 1µPa^2·S	$L_{p,pk}$ dB re 1µPa	$L_{E,TU,24h}$ dB re 1µPa^2·S	$L_{p,rms}$ dB re 1µPa
Turtles	232	204	226	189	175

$L_{p,pk}$ = zero to peak sound pressure level; $L_{E,TU,24h}$ = weighted sound exposure level for turtles over a 24h period; $L_{p,rms}$ = root-mean-square sound pressure level; PTS = permanent hearing threshold shift; TTS = temporary hearing threshold shift.

3.3.3 Fish Groups

In general, limited scientific data is available regarding the effects of sound on fish. As such, Federal agencies from some countries often follow assessment procedures and best practices implemented by other anthropogenic activities in offshore waters. The U.S. National Oceanic and Atmospheric Administration (NOAA) convened an international panel of experts in 2004 to develop noise exposure criteria for fish and turtles, primarily based on published scientific data in the peer-reviewed literature. The panel was organized as a Working Group (WG) under the ANSI-Accredited Standards Committee S3/SC 1, Animal Bioacoustics, which the Acoustical Society of America sponsors.

The outcomes of the WG are broadly applicable to sound exposure guidelines for fish, fish eggs and larvae (Popper et al. 2014, Popper and Hawkins 2019), considering the diversity of fish and the different ways they detect sound, as well as various sound sources and their acoustic characteristics. Acoustic thresholds, which represent the minimal sound level at which the onset of a particular effect may occur, are also available for fish grouped either by size (less than 2 grams and greater than or equal to 2 grams) as recommended by the Fisheries Hydroacoustic Working Group (FHWG 2008) or by physiology (with/without swim bladder involved/not involved in hearing) as recommended by Popper et al. (2014).

The derivation and origin of the informal 150 dB threshold is not as well-defined as other thresholds. However, recent publications do not refute that behavioural disturbance for fish can occur around this level (Hawkins et al. 2014).

The exposure criteria for sound sources relevant to the Project, notably impulsive noise from seismic sources, are presented in Table 4 noting the following:

- When data exist to infer thresholds such as PK (single pulse), SEL (multiple pulses over 24 hours) and, SPL (single pulse or second) threshold levels are reported; and
- When insufficient data exists to be able to infer thresholds, a dash is highlighted.

Table 4: Noise criteria for fish hearing groups exposed to impulsive noise

Fish Group	Mortality and Non-Recoverable Injury		Recoverable Injury		TTS	Behaviour disturbance
	Single pulse	Multiple pulses	Single pulse	Multiple pulses	Multiple pulses	Single pulse
	$L_{p,pk}$ dB re 1µPa	$L_{E,24h}$ dB re 1µPa^2·S	$L_{p,pk}$ dB re 1µPa	$L_{E,24h}$ dB re 1µPa^2·S	$L_{E,24h}$ dB re 1µPa^2·S	$L_{p,rms}$ dB re 1µPa
[a] Fish without swim bladder	>213	>219	>213	>216	>>186	150
[a] Fish: with swim bladder not involved in hearing	>207	210	>207	203	>186	150
[a] Fish: with swim bladder involved in hearing	>207	207	>207	203	186	150
[a] Eggs and larvae	>207	>210	-	-	-	150
[b] Fish ≥ 2g	-	-	206	187	-	150
[b] Fish < 2g			206	183		

$L_{p,pk}$ = zero to peak sound pressure level; $L_{E,24h}$ = unweighted sound exposure level over a 24h period; $L_{p,rms}$ = root-mean-square sound pressure level; TTS = temporary hearing threshold shift; a dash indicates the threshold is not available for the fish category.

3.3.4 Diving Seabirds

Currently, there is no data to derive thresholds for TTS and PTS caused during diving seabird activities. However, to assess the noise-induced impact risk of airgun impulse signals on diving seabirds, the least sensitive group of marine mammals Otariid pinnipeds in water (OW), is recommended as a proxy indicator (Southall et al., 2019). This group has been selected due to the similar hearing sensitivity in the underwater frequency band of diving seabirds, thus providing a conservative approach.

For the case of behaviour response on penguins, underwater playback exercises (non-impulsive noise) conducted in a pool in the penguin enclosure at Odense Zoo, Denmark, suggested that gentoo penguins (*Pygoscelis papua*) respond to exposure to noise levels starting at 100 dB re 1 µPa SPL RMS (Sørensen et al. 2020). However, clear behaviour responses (45-90˚ change of swim direction and change of speed) were captured at playback intensities between 110 and 120 dB re 1 µPa, with the majority of responses (>75%) recorded at the 120 dB re 1 µPa threshold (see Table 5). The stimulus contained frequencies between 0.2 and 6 kHz with noise bursts of 500 milliseconds.

Revised and approximate thresholds for diving seabirds, including penguins, are presented in Table 5. To maintain consistency with the approach to assessing AUD INJ and TTS, the behavioural disturbance threshold weighted by OW was applied on diving seabirds.

Table 5: Noise criteria for diving seabirds exposed to impulsive noise

Type of animal	AUD INJ onset		TTS onset		Behaviour disturbance
	Single pulse	Multiple pulses	Single pulse	Multiple pulses	One-second exposure
	$L_{p,pk}$ dB re 1µPa	$L_{E,TU,24h}$ dB re 1µPa²·S	$L_{p,pk}$ dB re 1µPa	$L_{E,TU,24h}$ dB re 1µPa²·S	$L_{p,rms}$ dB re 1µPa
Diving Seabirds (e.g. penguins)	230[1]	185[1]	224[1]	170[1]	120[2]

$L_{p,pk}$ = zero to peak sound pressure level; $L_{E,TU,24h}$ = weighted sound exposure level for turtles over a 24h period; $L_{p,rms}$ = root-mean-square sound pressure level; AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift.

[1]Proxy threshold (similar to otariid pinnipeds in water, OW). [2]Threshold weighted as OW

Sources: Southall et al. 2019, Sørensen et al. 2020

3.3.5 Invertebrates

The acoustic signals emitted by crustaceans span a broad range of frequencies. Low-frequency rumblings (20–60 Hz) are produced by stomatopod mantis shrimp (*Hemisquilla californiensis*) and American lobsters (*Homarus americanus*), while ultrasonic signals (20–55 kHz) are emitted by European spiny lobsters (*Palinurus elephas*) (Edmonds, et al. 2016). In a report by Christian et al. (2003), no significant difference was found between the acute effects of seismic airgun exposure upon adult snow crabs (*Chionoecetes opilio*) in comparison with control crabs (broadband received levels 197–220 dB re 1 µPa).

No comprehensive analyses have yet been carried out for anthropogenic sound. One of the few studies to explore the issue found no statistically significant correlation between seismic surveys and changes in commercial rock lobster (*Panulirus cygnus*) catch rates (Parry and Gason, 2006). Therefore, in the absence of specific sound pressure levels received, reliable conclusions cannot be drawn.

However, a monitoring study conducted in aquariums by Payne et al. (2007) found no effect of airgun exposure (202–227 dB re 1 µPa at 1 m) on delayed mortality in American lobsters (*H. americanus*). Therefore, for crustaceans, a PK threshold of 202 dB re 1 µPa, respectively, is considered conservative and consequently applied in the assessment. Additionally for context related to different levels of potential impairment, the PK sound levels determined for scallops in Day et al. (2017), 212 dB re 1 µPa are also included.

Fewtrell and McCauley (2012) used a captive squid species (*Sepioteuthis australis*) and exposed it to the noise of an air gun. Six trials were conducted off the coast of Western Australia, each with a different noise exposure regime. The noise levels perceived by the animals ranged from 120 to 184 dB re 1 µPa²·s. When the air gun signal intensity exceeded 162 dB re 1 µPa²·s, ink ejection was observed, and the squid retreated and moved away from the gun. While this result is preliminary, the behavioural observations in this study indicate that air gun noise does alter squid behaviour

A sound level of 226 dB re 1 µPa has also been considered for comparison to Heyward et al. (2018) for sponges and corals. Revised and approximate thresholds for invertebrates are presented in Table 6.

Table 6: Noise criteria for invertebrates exposed to impulsive noise

Type of animal	Behaviour disturbance	
	Single pulse	
	$L_{p,pk}$ dB re 1µPa	L_E dB re 1µPa²·s
Crustaceans (e.g. Lobsters)	202[1]	-
Scallops	212[2]	-
Sponges and corals	226[3]	-
Squid	-	162[4]

$L_{p,pk}$ = zero to peak sound pressure level; L_E = sound exposure level (not weighted); a dash means a threshold has not been reported or there is limited data.

Sources: 2006; [1]Payne et al. 2007; [2]Day et al. (2017); [3]Heyward et al. 2018; [4]Fewtrell and McCauley 2012

3.3.6 Human Divers

3.3.7 Hearing sensitivity of human divers

Although sound intensity in water is much lower than in air (because of the higher impedance of water), loud underwater noise in human divers is believed to still produce hearing damage to bare-headed human divers with ‘wet’ ears. The mechanism for hearing damage is that the external ear canal is filled with water, and water is in direct contact with the tympanic membrane (Anthony et al., 2009).

In air, the human auditory system can perceive pressure changes at levels as low as 20 µPa, but in water, hearing ability, including the ability to perceive sound at certain frequencies, is lost. Based on the audiograms (see Figure 7), bare-headed human divers will be more sensitive to low-frequency components when underwater than in the air (Nedwell et al., 2007).

The physical effects in human divers exposed to high levels of underwater sound include dizziness, hearing damage, and extreme cases injuries to other sensitive organs, depending on the frequency and intensity of the sound. Indirect effects can include distraction of attention, irritability, anxiety and a potentially threatening panic reaction (Ainslie 2008).

3.3.8 Maximum exposure thresholds

The North Atlantic Treaty Organization (NATO) published safety guidelines for divers and recommended that a threshold of 154 dB re 1µPa (600 Hz to 2500 Hz) should not be exceeded for recreational divers (NATO 2006). The latter guideline is consistent with the recommendation of Parvin and Nedwell (1995) of a maximum short-term ‘exposure level’ for human divers of 155 dB re 1µPa (500 Hz to 2500 Hz).

Pestorius et al. 2009 and Parvin 2005 reported the results of a series of diver tests that included recreational divers placed in an acoustically transparent box at a depth of one meter and exposed to a seven-second pure tone swept signal at frequencies from 100 to 500 Hz and levels of 130 to 157 dB re 1µPa. Based on the resulting observations, a maximum SPL exposure of 145 dB re 1µPa was recommended for a duration of 100 seconds (s), and

141 dB re 1µPa for double the duration (200 s). Revised thresholds for human divers, are presented in Table 7 and Table 8.

Figure 7: Human audiograms in air and water (Parvin and Nedwell 1995)

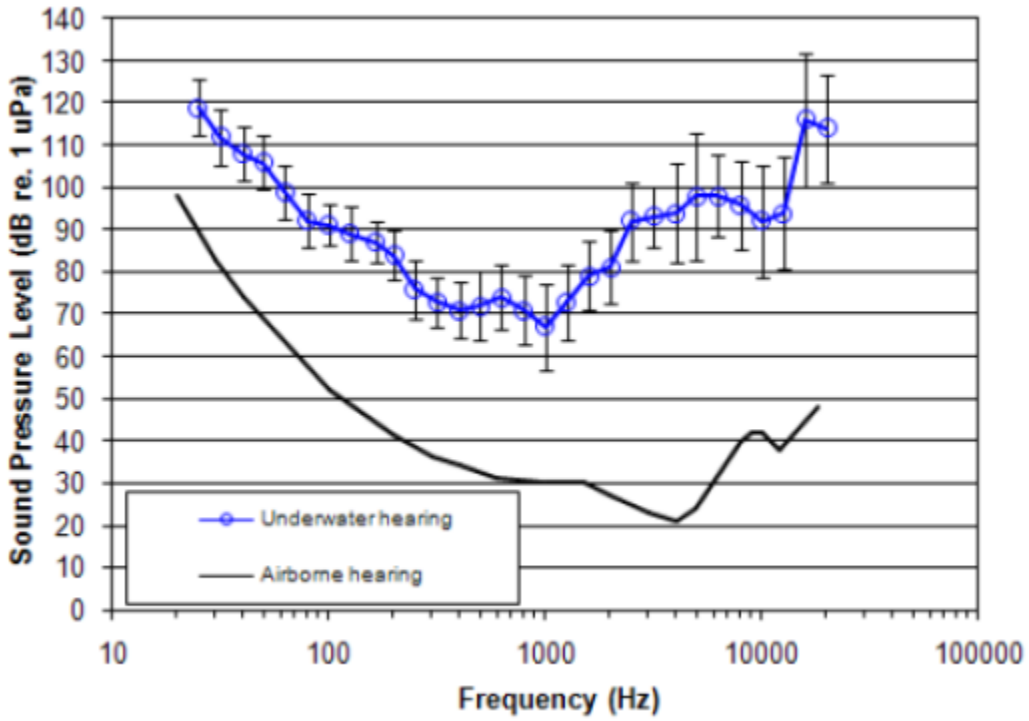

Table 7: Noise criteria for human divers exposed to a single seismic pulse

Human Diver	**Physiological Effects**
	Single exposure
	$L_{p,rms}$ dB re 1µPa
I. Slight aversion	140[1]
II. Very severe	148[1]
III. Increasingly aversive	154[1,2]

3.4 Impacts Zones on Marine Fauna

The distances from the sound source within which various types of impacts on marine fauna can be expected (”impact zones”) are determined by modelling the transmission loss of sound in water (i.e., the decrease in noise levels when moving away from the noise source) and determining the distance at which predicted noise levels fall below the various threshold levels described in Section 3.3.

Impact zones thus identify the maximum horizontal distance from an area within which the anthropogenic noise from impulsive or non-impulsive sources may have certain types of adverse impacts on certain marine fauna species. This report defines the impact zones as follows:

- immediate impact from a single pulse or one-second signal – this is applicable if animals move out of or avoid entering the impact zone and are thus exposed at most for a short period (i.e., one-second); and
- cumulative impact from exposure over an entire event to impulsive and continuous noise – this would be applicable if an animal remains with the noise source over an entire period and thus remains within the impact zone over a 24-hour period. It is highly likely that animals will not remain in proximity of the noise source and that their exposure to sound levels above the various thresholds is much shorter. The distances identified for cumulative thresholds are thus very conservative (worst-case) and are likely to overstate the extent of the typical impact area.

This information can be used to assess the potential risk (likelihood) and impact of potential adverse noise impacts by combining the acoustic impact zones with ecological information, such as habitat significance and migratory routes, in the affected area.

4.0 Sound Transmission Loss Modelling

4.1 Modelling Input Parameters

The noise levels generated by the seismic operations will be significantly higher than ambient noise levels in the project area (86.6 to 153.6 dB re 1 µPa as described in Section 2.3.2). In simple words, ambient noise does not contribute to the cumulative noise levels with the noise of seismic operations. Therefore, ambient noise is not considered in (or material for) the determination of zones of impact.

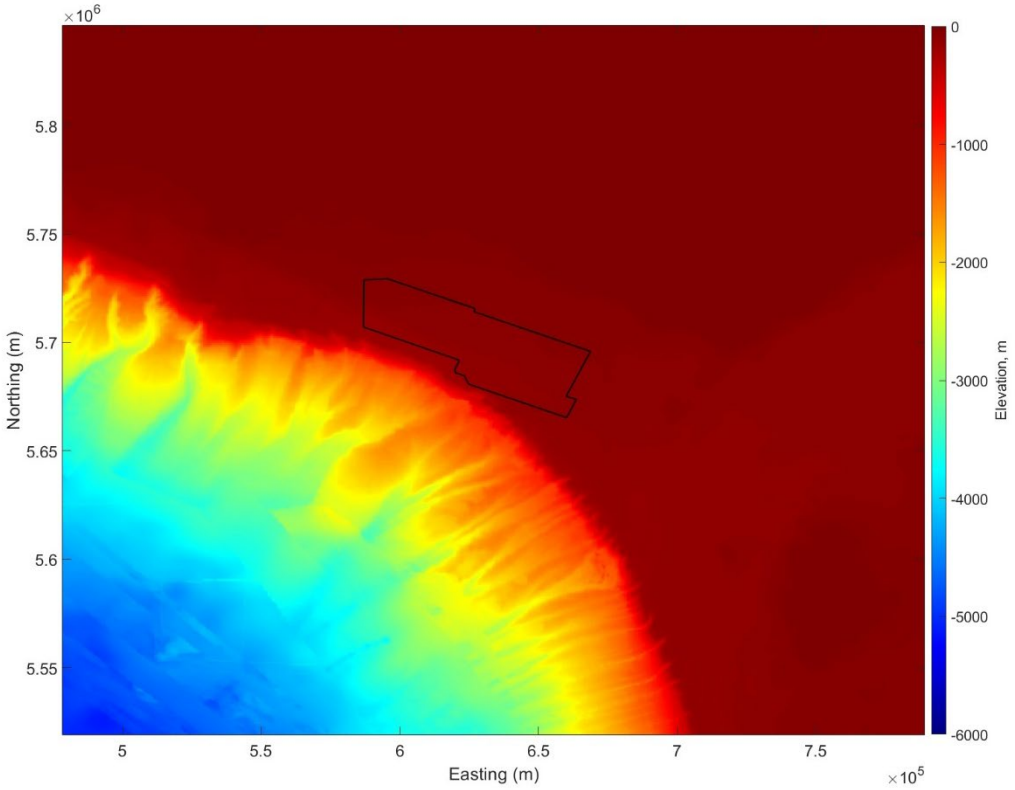
The propagation of sound is determined by how fast a sound wave travels in a medium and is slowest in gases (~343 m/s in air), faster in liquids (~1 481 m/s in water), and fastest in solids (~5 120 m/s in iron). For any one medium, sound speed is further determined by aspects that cause smaller changes in density, e.g., temperature, depth/height and (in water) salinity.

This model thus takes into account the water depth (see Section 4.1.1), salinity and water temperature (see Section 4.1.2) and seabed composition (see Section 4.1.3) in the block area. The ocean currents within the survey area are not expected to have significant effects on sound propagation due to limited current heights compared with overall water depths and low current speed compared with the sound speed within typical seawater.

4.1.1 Bathymetry

The bathymetry data used for the sound propagation modelling were obtained from the General Bathymetric Chart of the Oceans (GEBCO) dataset grid (GEBCO 2022). This is the fourth GEBCO grid developed through the Nippon Foundation-GEBCO ‘Seabed 2030 Project’ (https://seabed2030.org). Water depths throughout the modelled area were extracted from the Australian Bathymetry and Topography Grid, a 4 arc-second grid rendered for Australian waters. The bathymetric imagery within and surrounding the project area is presented in Figure 8.

Figure 8: Bathymetric imagery within and around the seismic operational area (black)



Map details: WGS 84 / UTM Zone 54H

4.1.2 Sound Speed Profiles

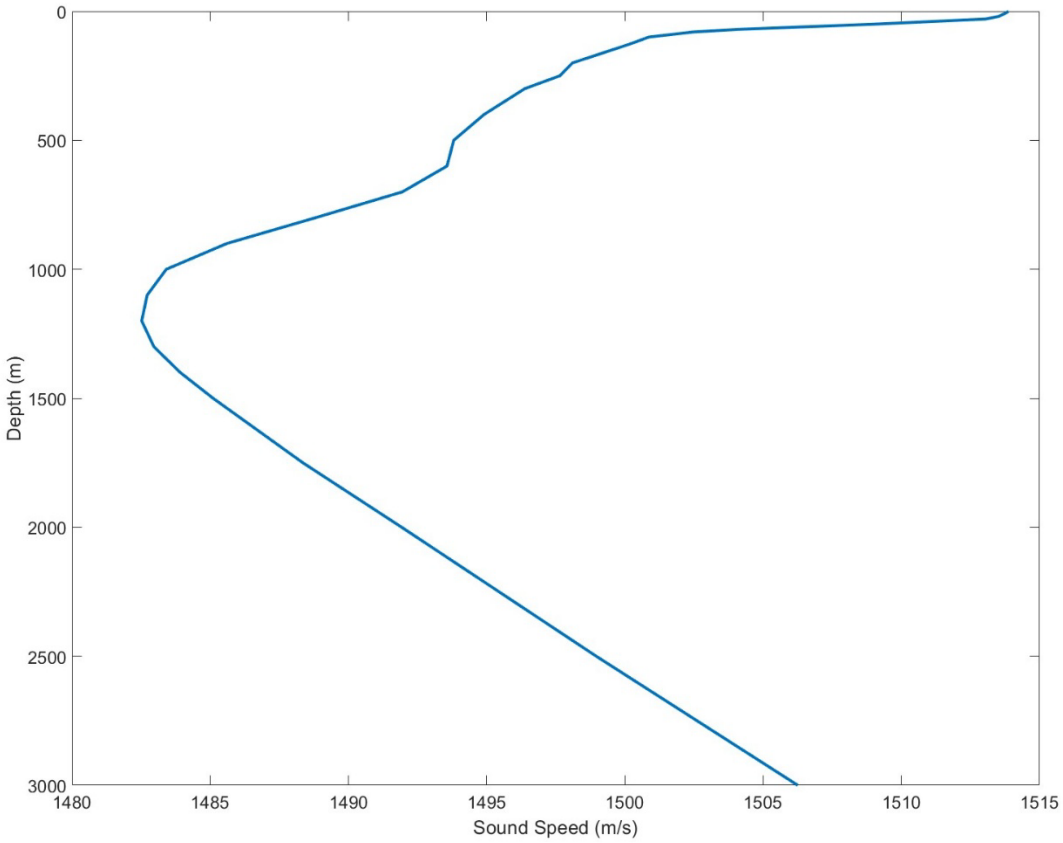
Temperature and salinity data required to derive the sound speed profiles were obtained from the World Ocean Atlas 2009 (WOA09) (Locarnini et al. 2010; Antonov et al. 2010). The hydrostatic pressure needed for the calculation of the sound speed based on the depth and latitude of each particular sample was obtained using Sanders and Fofonoff's formula (Sanders and Fofonoff 1976). The sound speed profiles were derived based on Del Grosso's equation (Del Grosso 1974).

Figure 9 presents the typical sound speed profiles for four seasons in the area of interest. The figure demonstrates that the most significant distinctions for the profiles of the four seasons occur within the mixed layer near the surface (to a depth of approximately 200 m), in which the speed of sound is susceptible to daily and local changes of heating, cooling, and wind action.

The seasonal thermocline is characterized by a negative sound speed gradient that varies with the seasons. Due to the more substantial gradient variation, the winter season is expected to favour the propagation of sound from a near-surface acoustic source array.

The winter sound speed profile was thus selected as the most conservative modelling input, i.e., the worst-case scenario. As the overall sound speed profiles of different seasons across the water column are quite similar, the differences in sound fields between different seasons are not expected to be significant.

Figure 9: Typical sound speed profile within the survey area during the winter season



4.1.3 Seafloor Geo-acoustic Model

The geoacoustics parameters used for this modelling study are similar to those reported in the Appendix B7b of the Regia MSS Acoustic and Animat Modelling for Assessing Marine Fauna Sound Exposures (Document 03301, Version 2.0) (Stephen T.J. et al. 2024).

For sites 10 and 15 (less than 68 m depth), the seabed was modelled as fine carbonate sand for the first 5 meters, followed by increasingly cemented calcarenite for the next 100 meters and then well-cemented calcarenite for the deepest layer, as detailed in Table 9. This seabed profile is consistent with measurement profiles data (McCauley et al. 2016).

For Site 7 (over 120 m depth), the seabed was modelled as silty carbonate sand to semi-silty carbonate, as detailed in Table 10. These geoacoustic parameters are derived from grain size measurements from the Australian Government's Marien Sediment Survey (MARS) database (Heap 2009).

Table 9: Geo-acoustic parameters for the proposed seabed model of sites 10 and 15

Depth below seafloor (m)	Material	Density (g/cm3)	Attenuation (dB/λ)	Shear wave attenuation (dB/λ)
0-5	Fine Carbonate Sand	2.1	0.73	3.65
5-25	Increasingly cemented calcarenite	2.2	0.34	
25-45		2.3	0.38	
45-65		2.4	0.42	
65-85		2.5	0.46	
85-105		2.6	0.50	
>105	Well-cemented calcarenite	2.7	0.50	

Table 10: Geo-acoustic parameters for the proposed seabed model of site 7

Depth below seafloor (m)	Material	Density (g/cm3)	Attenuation (dB/λ)	Shear wave attenuation (dB/λ)
0-10	Silty carbonate sand to semi-cemented carbonate	1.9	0.70	3.65
10-20		1.9	0.85	
20-50		1.9	1.15	
50-100		1.9	1.35	
100-200		2.0	1.60	
200-500		2.1	1.95	
>500		2.1	1.95	

The inclusion of shear wave attenuation in the modelling study improves the realism and accuracy of subsurface simulations by accounting for energy loss in the seabed. This improves the modelling of seismic wave reflections, refractions, and conversions, allowing for better interpretation of subsurface properties and material characterization. It also impacts source design and signal processing by influencing the amplitude and frequency content of the waveform. While increasing computational complexity, the inclusion of shear attenuation is crucial for high-fidelity modelling.

The seabed acoustic reflection is also dominated by the top sediment layer across the frequency range, with high reflection at low grazing angles and low reflection (high refraction) at higher grazing angles.

4.2 Modelling Source Scenarios

4.2.1 Source Array Configuration

The noise emissions from the conventional source array, including the source spectral levels and directivities, are modelled based on the Gundalf Designer software package (version 8.3, 2024). A conventional G-Gun II array of 2,630 CUI supplied by compressed air quads is proposed to be used for the seismic survey. The array consists of 18 active G-Gun II units (6 pairs) with two strings (1 x 1160 CUI + 1 x 1470 CUI), an average towing depth of 6 m, and an operating pressure of 2000 PSI. The operating pressure is consistent for the CUI volumes of the source array in this study (see Figure 10 and Table 11).

In general, array size and configuration are determined by the seismic survey's project-specific acquisition goals. Due to the interaction of array elements in multi-gun arrays (and the complexity of combining multiple impulsive acoustic sources), each configuration must be independently modelled to determine precise source levels.

The sound produced by a compressed air source is a function of the volume (CUI), size, and geometry of the ducts through which the air escapes. Considering a single airgun unit, the amplitude of the sound increases proportionally to the volume in CUI, so instead of a smaller number of larger source arrays to achieve appropriate source levels, multiple sources can be combined in an array, as is the case in this project.

The vessel will activate source 1, source 2, and source 3 in standard flip-flap-flop mode at 12.5 m intervals. Then the vessel will activate its three sources following the same pattern.

Sercel Bluepulse technology has the exact same array design as the conventional source array, with the sole exception that its acoustic signature is slightly different due to the airgun chambers used the bluepulse upgrade (see Figure 10 and Table 11). This technology intentionally suppresses the higher frequencies (above 200 Hz) emitted by the source that are not useful for the geophysical objectives of the survey. To differentiate between the two arrays of sources referred to in this report, the following terminology is used: Conventional and Bluepulse (BP200).

Figure 10: Schematic of seismic source array configuration (Conventional and Bluepulse 2630 CUI)

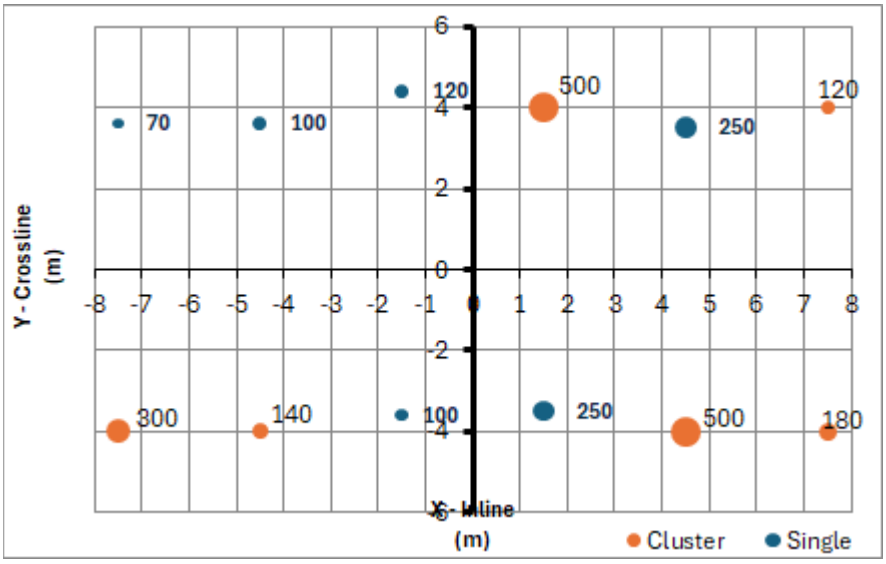


Table 11: Source array configuration (Conventional and Bluepulse 2630 CUI)

Gun	X(m)	Y(m)	Z(m)	Source element	Volume CUI
1	7.5	-4.0	6.0	Cluster	180
2	4.5	-4.0	6.0	Cluster	500
3	1.5	-3.5	6.0	Single	250
4	-1.5	-3.6	6.0	Single	100
5	-4.5	-4.0	6.0	Cluster	140
6	-7.5	-4.0	6.0	Cluster	300
7	7.5	4.0	6.0	Cluster	120
8	4.5	4.0	6.0	Cluster	250
9	1.5	4.0	6.0	Cluster	500
10	-1.5	4.0	6.0	Single	120
11	-4.5	4.0	6.0	Single	100
12	-7.5	4.0	6.0	Single	70

4.2.2 Source Locations

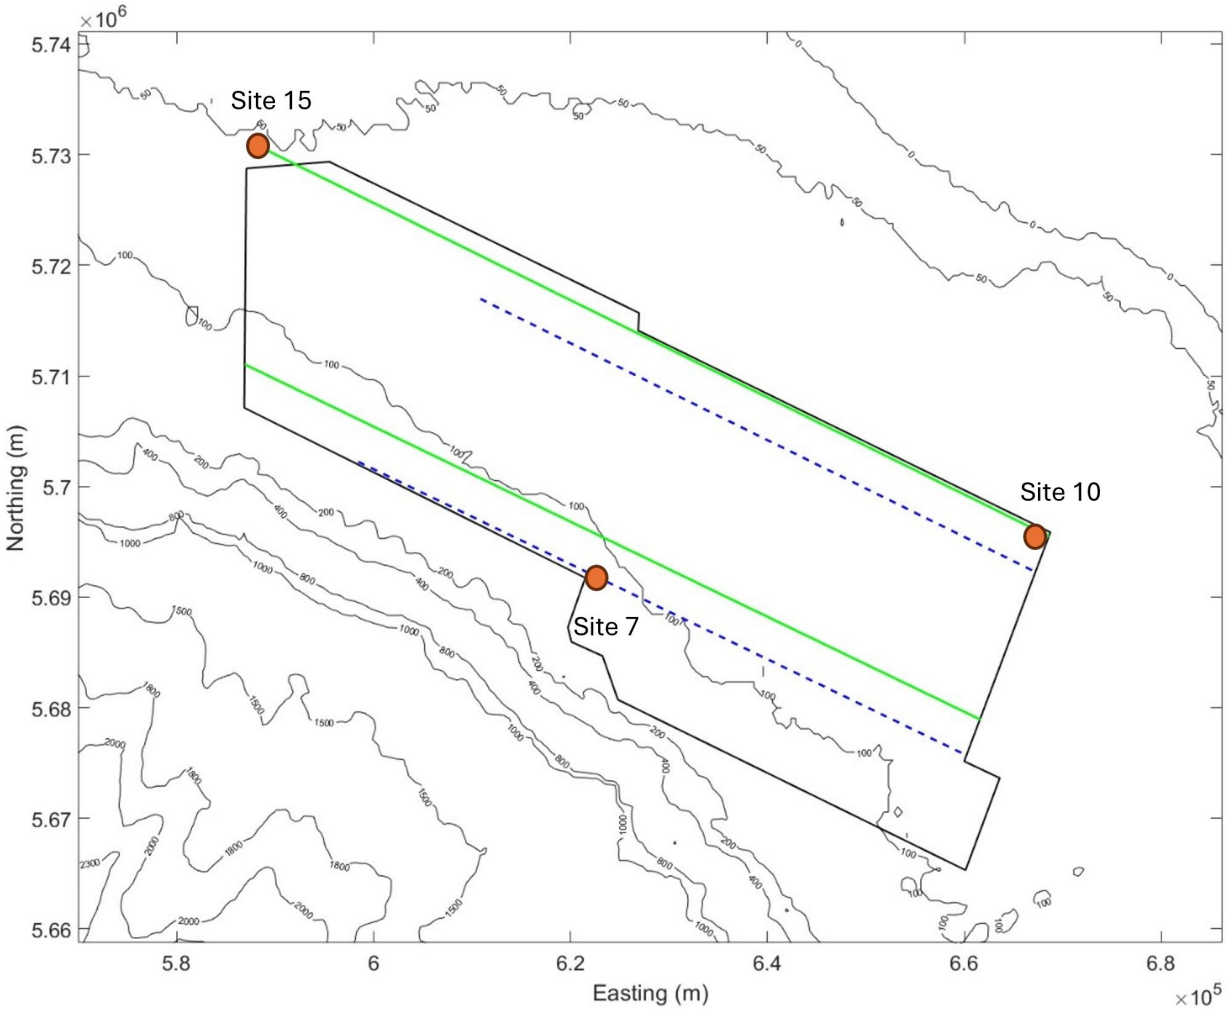
Three long-range modelling source locations are proposed for the seismic survey, as detailed in Table 12 and shown in Figure 11. The modelling is representative of the noise propagation within the seismic survey area.

Source location at site 15 represents the shallow-water environment of the northwest survey area, site 10 represents the eastern portion of the survey area; and site 7 represents the deep-water area furthest from the coast.

Table 12: Details of the three selected source locations for the long-range modelling

Source Location	Water Depth, m	UTM Coordinates Zone 54H (m)	Locality
Site 15	51.6	588878 E 5730493 S	Northwest extent of the survey area towards shallow water environments and near Biologically Important Areas (BIAs).
Site 10	67.4	663020 E 5698199 S	Eastern extent of the survey area near Biologically Important Areas (BIAs).
Site 7	124.9	621664 E 5692971 S	Southern extent of the survey area towards deep-water and further from the coast.

Figure 11: Representation of the selected source locations (orange) over the survey area



Map details: WGS 84 / UTM Zone 54 H

4.2.3 Survey Lines

Assuming a relatively fast vessel speed of 4.5knots, a single survey line takes on average, 10.15 hours and the average line change is 3.62 hours. As the survey polygon is not rectangular, these numbers vary as the length of the line changes across the survey lines. On average, the periods of seismic pulses within 24 hours would be 74.33% of 24 hours or 17.84 hours. Therefore, the approximate 18 hours is related to the maximum possible amount of shooting possible in 24 hours given the duration of the line changes at end of line and a 4.5knot speed.

The transect survey line details for the modelling scenarios A and B are detailed in Table 13 and Table 14 and indicated in Figure 12. The modelling is representative of the noise propagation within the proposed seismic areas and sites 15, 10 and 7.

Table 13: Details of the selected transect survey lines for the cumulative SEL modelling for scenario C

Scenario C Survey Lines	UTM Coordinates Zone 54H		Distance (m)	Time (hours)	Estimated number of pulses
	Start (m)	End (m)			
1 (sites 15 and 10)	588879 E 5730494 S	668617 E 5695483 S	87,086	10.45	6,967
2	667270 E 5692245 S	610840 E 5716943 S	61,598	7.39	4,928
		Total	148,684	17.84	11,895

Table 14: Details of the selected transect survey lines for the cumulative SEL modelling for scenario D

Scenario D Survey Lines	UTM Coordinates Zone 54H		Distance (m)	Time (hours)	Estimated number of pulses
	Start (m)	End (m)			
3 (site 7)	586898 E 5711026 S	661636 E 5678916 S	81,340	9.76	6,507

4.3 Methodology and Procedure

The sub-sections below describe the modelling methodology and procedures for predicting received noise levels of relevant metrics associated with seismic survey activities.

4.3.1 Notional signature

The notional signatures are the pressure waveforms of individual source elements at a standard reference distance of 1 m. Notional signatures are modelled using the Gundalf Designer software package (version 8.3r, 2025). The Gundalf source model is developed based on the well-understood fundamental physics of source bubble oscillation and radiation as described by Ziolkowski (1970) and for an array source case, taking into account non-linear pressure interactions between source elements (Ziolkowski et al. 1982; Laws et al. 1988, 1990). Based on the preceding references, the related fundamental physics of bubble oscillation has been robustly understood for several decades.

The model solves a complex set of differential equations combining heat transfer and dynamics and has been calibrated against multiple measurements of non-interacting source elements and interacting clusters for all common source types at a wide range of deployment depths.

4.3.1.1 Far-field signatures

The notional signatures from all sources in the array are combined using appropriate phase delays in three dimensions to obtain the far-field source signature of the array. This procedure to combine the notional signatures to generate the far-field source signature is summarised as follows:

- The distances from each individual acoustic source to the nominal far-field receiving location are calculated. A 3 km & 9 km receiver set is used to verify the characteristics of the far-field signature (such as the power spectral density). Multiple ranges are considered for quality control purposes;
- The time delays between the individual acoustic sources and the receiving locations are calculated from these distances with reference to the speed of sound in water;
- The signal at each receiver location from each individual acoustic source is calculated with the appropriate time delay. These received signals are summed to obtain the array's overall far-field signature for the direction of interest, and
- The far-field signature also accounts for ocean surface reflection effects by the inclusion of the "surface ghost". Following the default settings in Gundalf Designer, a sea surface reflection coefficient of -1 is added as an additional ghost source for each acoustic source element. Alternative coefficients can be used in cases where regional sea surface information is available (typically in-situ measurements).

4.3.1.2 Beam patterns

The beam patterns of the acoustic source array are obtained as follows:

- The far-field signatures are calculated for all directions from the source using azimuthal and dip angle increments of 1-degree;
- The PSD (dB re 1 $\mu Pa^2s/Hz$ @ 1 m) for each pressure signature waveform is calculated using a Fourier transform technique, and
- The PSDs of all resulting signature waveforms are combined to form the frequency-dependent beam pattern for the array.

4.3.2 Conversion Factors

For received individual signals emitted from impulsive sources such as seismic sources, the differences between the SEL and other sound parameters, such as the PK and SPL, are expected to be greatest at the source location and then gradually decrease with receiving locations further away from the source location. This is due to the following effects:

- Theoretically, the source pulse goes through increasing waveguide distortion effects (e.g., dispersion, interference effects, seafloor and surface reflections, differences of time arrivals, etc.) with an increasing range from the source, which predominantly impact the characteristics of the pulse and the energy-based metric levels (e.g., lower peak level, extended pulse duration, etc.).

- Numerous theoretical and empirical research studies reliably support the above statement, e.g., the relevant seismic survey signal modelling and measurement studies (e.g., Austin et al. 2013; Matthews and MacGillivray 2013; Galindo-Romero et al. 2015; McCauley et al. 2000, 2016) show that the differences between the three temporal parameters (PK, SPL and SEL) are increasingly higher at the receiver closer to the source location.

4.3.2.1 SEL and PK

The difference between the PK and SEL of the far-field signature of the source array (at a reference distance of 1 m from the centre of the array) is 28 dB. This value is used as the conversion factor applied to the SEL to calculate the received peak sound pressure over the receiving range near the source location. This approach is regarded as conservative for estimating relevant near-field acoustic parameters based on SEL predictions.

4.3.2.2 SEL and SPL

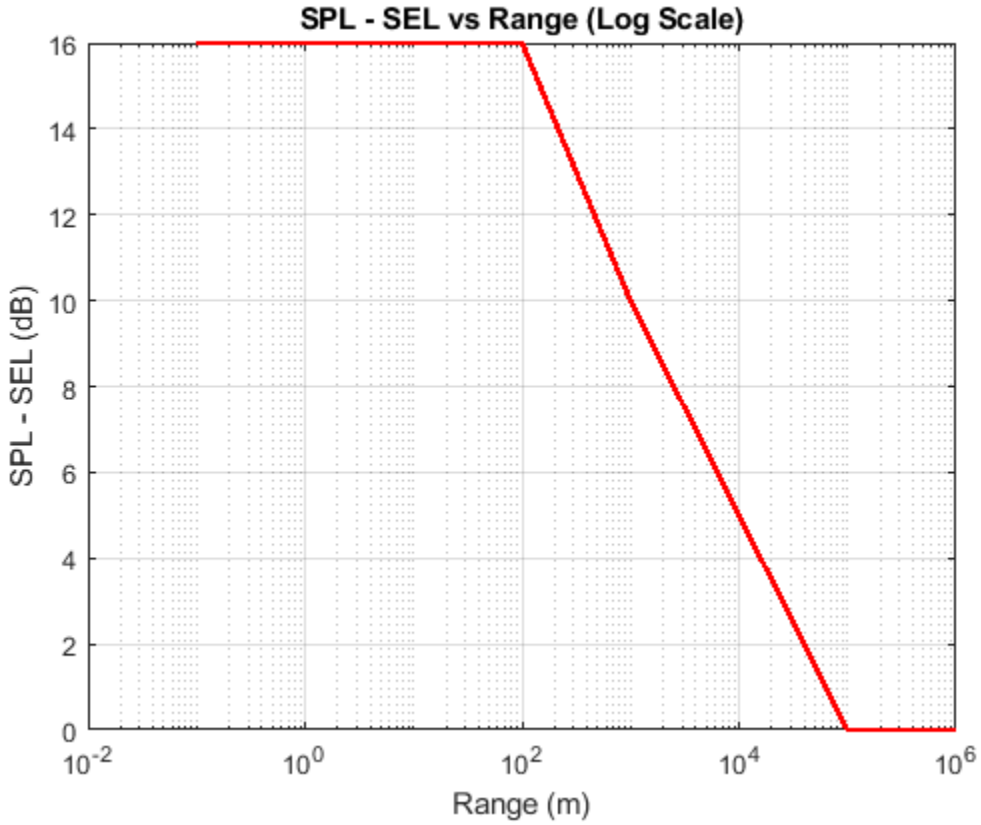
Previous empirical studies demonstrate that at relatively close distances from the noise sources (within 1.0 km), the difference between SEL and SPL could be between 10 dB and 15 dB (Austin et al. 2013; McCauley et al. 2000). The differences could drop to under 5 dB when the distances are close to 10 km (Austin et al. 2013). The differences are expected to drop further with increasing distances beyond 10 km (Simon et al. 2018).

For this project, the SPL was estimated using the following conversion factors to be applied to the modelled SEL within different distance ranges. These conversion factors are conservatively estimated based on the source array modelling results:

- 0 – 100 m, a conversion factor of 16 dB (Conventional) and 13 dB (Bluepulse);
- 100 – 1 000 m, conversion factors of 16 dB (Conventional) and 13 dB (Bluepulse) to 10 dB, following a logarithmic trend with distance;
- 1 000 – 10 000 m, conversion factors 10 dB to 5 dB, following a logarithmic trend with distance;
- 10 000 – 100 000 m, conversion factors 5 dB to 0 dB, following a logarithmic trend with distance; and
- > 100 000 m, a conversion factor of 0 dB.

The SEL to SPL conversion factors, as a function of horizontal distance from the source array, are illustrated in Figure 13.

Figure 13: SEL to SPL conversion factor as a function of horizontal range from the conventional and Bluepulse source array 2630 CUI



4.3.3 Short Range Modelling

Short-range modelling has been used to model received SELs in relative proximity to the sound source, considering the sound field's near-field effect. As such, the short-range case predictions are modelled by reconstructing the received signal waveforms from individual airgun source units within the array.

The wavenumber integration modelling algorithm SCOOTER (Porter 2001, 2020) is used to calculate the transfer functions (both amplitudes and phases) between sources and receivers. SCOOTER is a finite element code for computing acoustic fields in range-independent environments. The method is based on the direct computation of the spectral integral and is capable of dealing with an arbitrary layered seabed with both fluid and elastic characteristics.

The following procedures have been followed to calculate received SELs for short-range cases:

1 The modelling algorithm SCOOTER is executed for frequencies from 1 Hz to 1 kHz, in 1 Hz increments. The source depth is taken to be the array depth of 6.0 m. A receiver grid of 1 m in range (maximum range 4.0 km) and 1 m in depth is applied for the selected receivers. For each gridded receiver, the received SEL is calculated by following steps 2) – 5) below;

2 The range from the source to each receiver is calculated, and the transfer function between the source and the receiver is obtained by interpolating the results produced by the modelling algorithm SCOOTER in Step 1). This interpolation involves both the amplitude and phase of the signal waveform in the frequency domain;

3 The complex frequency domain signal of the notional signature waveform for each source element is calculated via the Fourier Transform and multiplied by the corresponding transfer function from Step 2) to obtain the frequency domain representation of the received signal from the source element;

4 The waveform of the received signal from the array source is reconstructed via the Inverse Fourier Transform. The received signal waveforms from all airgun sources in the array are summed to obtain the overall received signal waveform and

5 The signal waveform is squared and integrated over time to obtain the received SEL value. Alternatively, the SEL value can also be calculated via integrating the PSD over frequency in Step 3).

The modelling inputs for the short-range modelling case, such as sound speed profile and seabed geoacoustic models, have been detailed in Section 4.1. To analyse the received SEL variations with water depth changes, modelling has been undertaken for two water depths such as 60 and 120 m.

4.3.4 Long Range Modelling

Long-range modelling generally involves complex and variable environmental factors (such as sound speed profiles and bathymetric variations) along an extended range of sound propagation environments. It requires an efficient modelling prediction algorithm with reasonable accuracy. Therefore, the modelling prediction for the long-range case is carried out using the far-field source levels of octave frequency bands and their corresponding transmission loss calculations.

The fluid parabolic equation modelling algorithm RAMGeo (Collins 1993) is used to calculate the transmission loss between the source and the receiver. RAMGeo is an efficient and reliable PE algorithm for solving range-dependent acoustic problems with fluid seabed geo-acoustic properties.

The received sound exposure levels are calculated following the procedure below:

1 One-third octave source levels for each azimuth to be considered are obtained by integrating the horizontal plane source spectrum over each frequency band; these levels are then corrected to SELs;

2 Transmission loss is calculated using RAMGeo at one-third octave band central frequencies from 8 Hz to 1 kHz, with a maximum range of 200 km and at 5-degree azimuth increments. The bathymetry variation along each modelling track is obtained via interpolation from the bathymetry dataset;

3 The one-third octave source SEL levels and transmission loss are combined to obtain the received SEL levels as a function of range, depth, and frequency; and

4 The overall received SEL levels are calculated by summing all frequency band SEL levels.

4.3.5 Cumulative SEL Modelling

The cumulative SEL accounts for the total acoustic energy received from all seismic impulses within a full period of 24 hours[3]. A typical survey will generate thousands of sound pressure

[3] As the survey vessel moves continuously, the area affected by noise also changes, and no one area will be exposed to the same noise levels for 24 hours continuously. This scenario therefore rather assumes that a receptor, i.e., marine animal, remains in proximity to (moves with) the survey vessel for a 24-hour period.

releases (“pulses”) within a 24-hour period. This model assumes that the propagation environment for a set of consecutive pulses is similar, and therefore, one propagation model is to be representative of the total number of sound pressure releases.

The cumulative SELs (frequency unweighted and weighted) are modelled as follows:

1 The received SELs at individual grid locations (a 100-m grid size for this study) from individual representative survey shots considered (one in every ten shots for this study) is modelled based on the long-range modelling methodology and procedure as detailed in Section 4.3.4, and then the results are adjusted for the rest of the survey shots based on their shot locations;

2 The SEL at individual receiving grid locations is obtained by summing SEL contribution from all survey shots within a 24-hour period for the survey operation scenario considered;

3 For weighted SEL for individual marine mammal hearing groups, the source spectra are adjusted, accounting for the frequency weighting functions for individual hearing groups (as in Appendix B), and the weighted SEL for individual hearing groups to be obtained by repeating the first two steps as above; and

4 For the high-frequency energy component, which is important for marine mammals with high-frequency hearing range, the source spectra and propagation modelling are extended up to 10 kHz, with the source spectra being close to $1/f$ attenuation for frequencies above 1 kHz (LandrØ et al. 2011), so that the high-frequency energy component to be included for the weighted SEL predictions.

It should be noted that the source level inputs for long-range modelling, as detailed in Section 5.3, are based on the array source noise emissions in the horizontal plane, and this approach may underestimate the actual sound field close to the array source (< 4 km). As such, the sound fields close to the array source predicted by the long-range modelling described in Step (1) above are adjusted by benchmarking them against short-range modelling results, accounting for the near-field effects and providing a realistic model result.

4.3.6 Model Validation

The accuracy of source array sound field modelling depends on the suitability and accuracy of the array source model and the transmission loss model, as well as the realism of the parameters defining the sound propagation environment, including the bathymetry, seafloor geo-acoustics and sound speed profiles.

The following model validation exercises have been undertaken previously in regard to the array source model, short-range model and long-range model that have been used in this modelling study:

- The source modelling software Gundalf has been calibrated against various datasets of near-field recorded signatures and has been verified against other source array sound signature models (Ainslie et al. 2016); and
- The short-range and long-range models have been validated against various underwater acoustic measurement programs undertaken by independent third parties, with good agreements between modelled and measured results being reported (e.g., Simon et al. 2018; Li et al. 2021).

4.4 Impact Zones on Marine Fauna

The distances from the sound source within which various types of impacts on marine fauna can be expected (”impact zones”) are determined by modelling the transmission loss of sound in water (i.e., the decrease in noise levels when moving away from the noise source) and determining the distance at which predicted noise levels fall below the various threshold levels described in Section 3.3.

Impact zones thus identify the maximum horizontal distance from an area within which the anthropogenic noise from impulsive or non-impulsive sources may have certain types of adverse impacts on certain marine fauna species. This report defines the impact zones as follows:

- immediate impact from a single pulse – this is applicable if animals move out of or avoid entering the impact zone and are thus exposed at most for a short period (i.e., one-second); and
- cumulative impact from exposure over an entire event to impulsive noise – this would be applicable if an animal remains or moves with the noise source over an entire period and thus remains within the impact zone over an extended period of time. It is highly likely that animals will not remain in proximity of the noise source and that their exposure to sound levels above the various thresholds is much shorter. The distances identified for cumulative thresholds are thus very conservative (worst case) and very likely to overstate the extent of the typical impact area.

This information can be used to assess the risk (likelihood) of potential adverse noise impacts by combining the acoustic impact zones with ecological information such as habitat significance and migratory routes in the affected area.

5.0 Modelling Results

This section presents the modelling results for the seismic surveys, including the notional signature, far-field signature, and beam patterns of the source array configuration, as well as the short-range, long-range, and cumulative noise exposure modelling.

5.1 Seismic Source

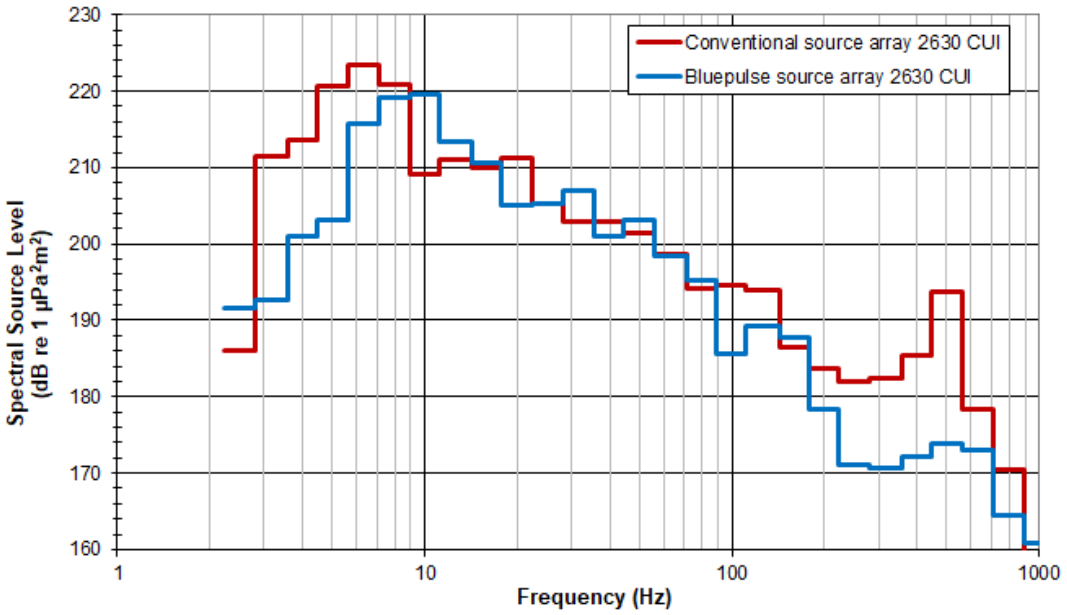
Received noise levels can be predicted by modelling the sound propagation transmission loss of known source levels as sound travels away from the source. As a first step, the noise emitted from the seismic array must be modelled before sound transmission loss is modelled.
The parameters and source levels of the modelled seismic source arrays are presented in Table 15.

Table 15: Noise source levels (Conventional and Bluepulse 2630 CUI)

Acoustic Metric	Conventional	Bluepulse
zero-to-peak sound pressure level, PK ($L_{p,pk}$, dB re 1 µPa @ 1 m)	256	249
root-mean-square sound pressure level, SPL ($L_{p,rms}$, dB re 1 µPa @ 1 m) with a 90%-energy pulse duration	243	237
Unweighted sound exposure level SEL (L_E, dB re µPa^2·s @ 1 m)	228	224

The one-third octave band spectral SL to be used as sound transmission modelling input for both source arrays are presented in Figure 14.

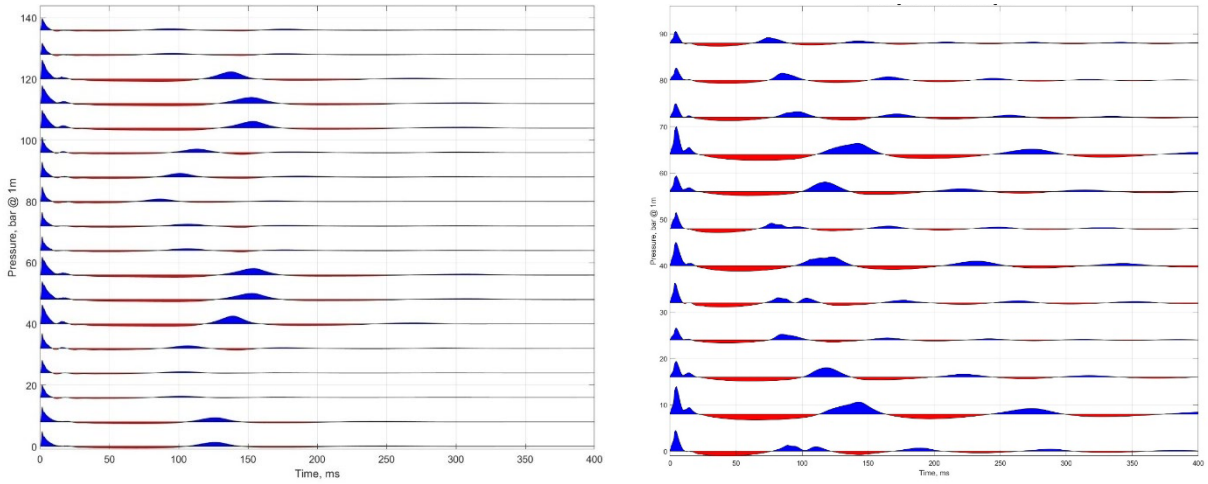
Figure 14: One-third-octave band spectral SL (Conventional and Bluepulse 2630 CUI)



5.1.1 Notional Signature

Figure 15 shows the notional source signatures for the individual/cluster active source elements in the conventional and Bluepulse source array as details in Section 4.2.1 (see Figure 10 and Table 11). Noticeable pressure variations last between 150 and 400 milliseconds (ms). In the Bluepulse array, certain airgun pairs (two guns of the same volume separated by 0.75 m) have been combined into a cluster of equivalent total volume. There is no meaningful variation between the conventional separation scheme and clustering in this particular scenario. The output shows positive (blue) and negative (red) pressure produced by each source element as a sound is produced.

Figure 15: Notional source signatures for the source elements in the source array 2630 CUI - Conventional (left) and Bluepulse (right)



5.1.2 Far-field Signatures

Figure 16 shows the far-field signature waveform and power spectral density of the conventional and Bluepulse proposed airgun arrays (simulated by the Gundalf Designer software 2024). The signatures are for the vertically downward direction with surface ghost included.

Figure 16: Waveform of the far-field signature in the vertically downward direction for the Conventional and Bluepulse (BP200) source array 2630 CUI

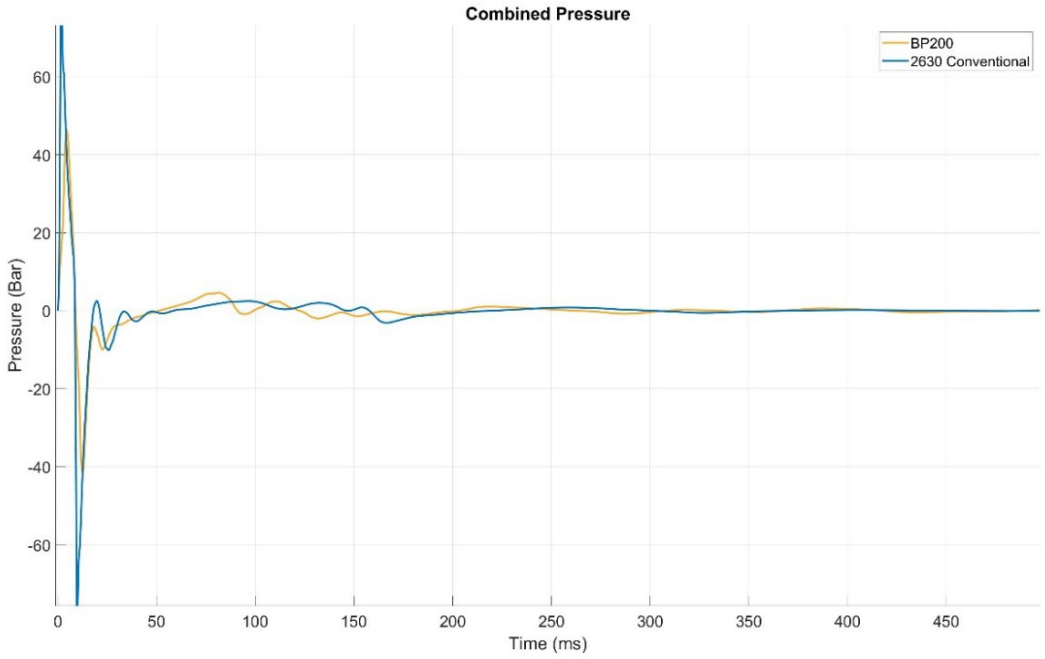


Figure 17: Power spectral density of the far-field signature for the Conventional and Bluepulse (BP200) source array 2630 CUI

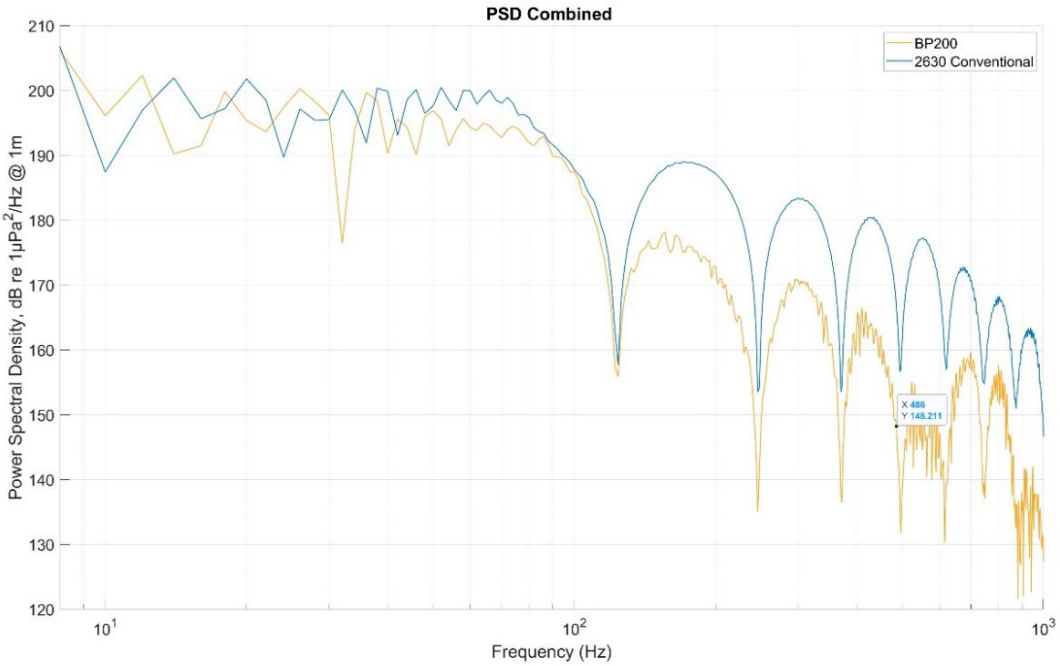


5.1.3 Beam Patterns

The beam patterns in Figure 18 illustrate the strong angle and frequency dependence of the energy radiation from each array. The array far-field beam patterns of the following three cross sections are presented:

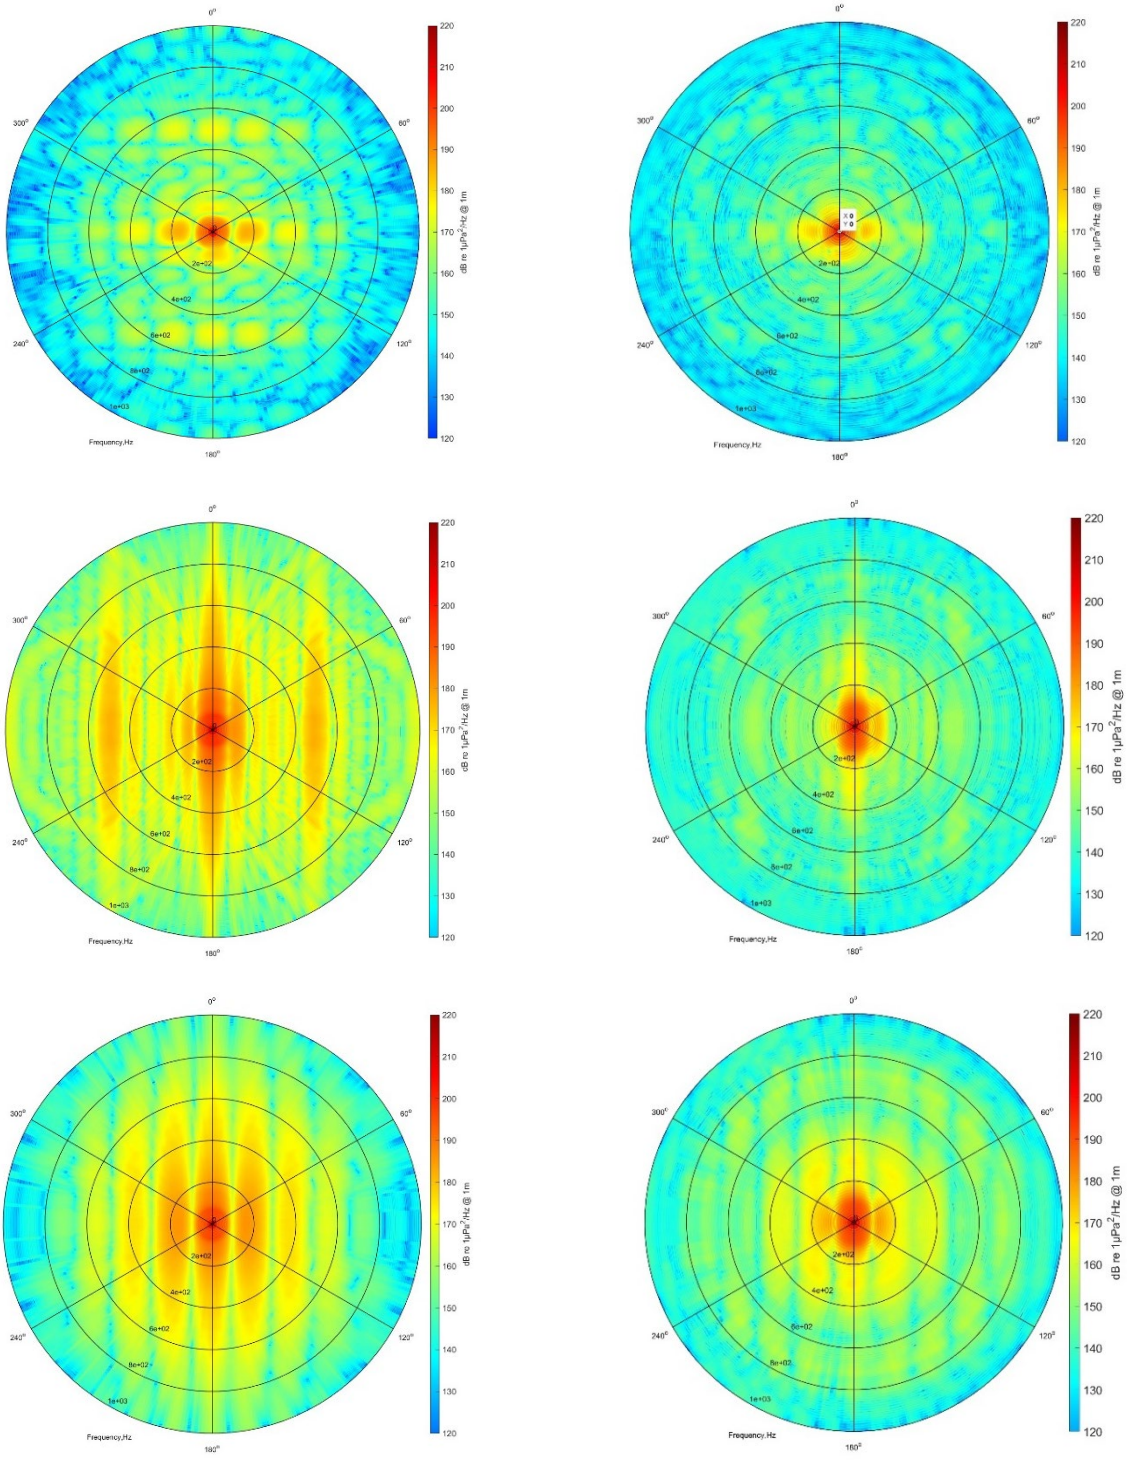
- The horizontal plane (i.e., dip angle of 90 degrees) with an azimuthal angle of 0 degrees corresponding to the in-line direction;
- The vertical plane for the in-line direction (i.e., azimuthal angle of 0 degrees) with dip angle of 0 degrees corresponding to the vertically downward direction; and
- The vertical plane for the crossline direction (i.e., azimuthal angle of 90 degrees) with a dip angle of 0 degrees corresponding to the vertically downward direction.

The beam pattern in the horizontal plane shows relatively stronger energy radiation in the crossline direction (perpendicular to the direction of vessel travel) than in the in-line direction (directly ahead of the surveying vessel). The beam patterns of the in-line and crossline vertical planes have the strongest radiation in the vertical direction (vertically downward from the horizontal plane of the surveying vessel and highly directional).

Source-level values in the horizontal plane are extracted at a dip angle of 90 degrees to conservatively estimate the distance to thresholds and determine exclusion zones appropriate for monitoring and mitigation.

An overall comparison of both source arrays (Conventional vs Bluepulse) shows a higher concentration of energy at the vertical plane for both the inline and crossline directions.

Figure 18: Array far-field beam patterns for Conventional (left) and Bluepulse (right) array 2630 CUI as a function of orientation and frequency.



Top: The horizontal plane with 0 degrees corresponding to the in-line direction (Dip: 90^0 Azim: 0 – 360^0). Middle: The vertical plane for the in-line direction (Dip: 0^0– 360^0 Azm: 0). Bottom: The vertical plane for the crossline direction (Dip: 0 – 360^0 Azim: 90^0). The 0-degree dip angle corresponds to the vertically downward direction.

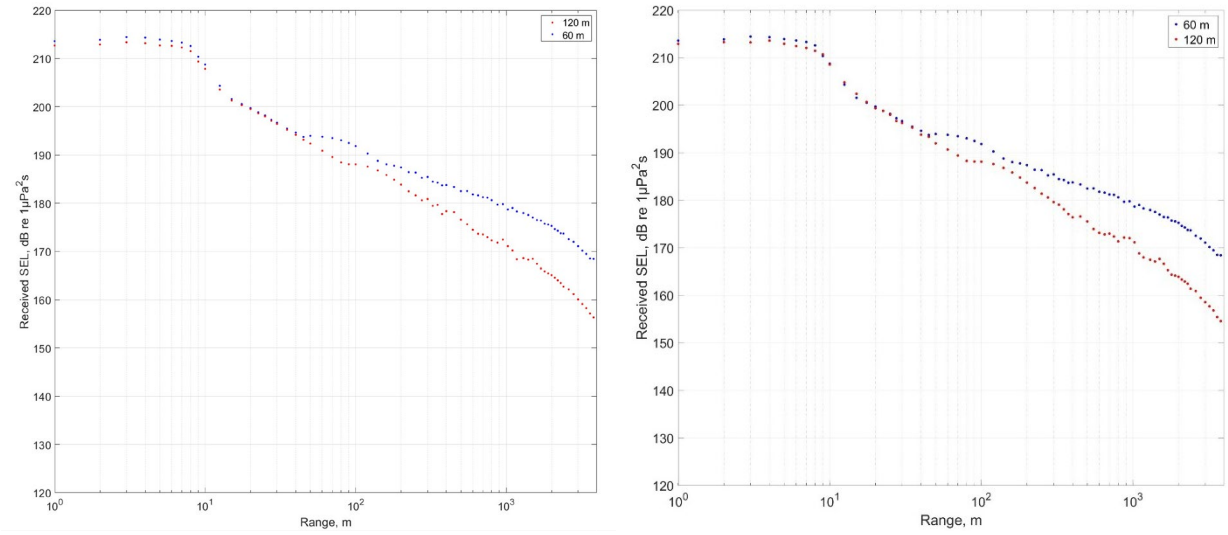
5.2 Short Range Modelling

SELs were modelled for two water depths (i.e., 60 and 120 m) for verification purposes against the long-range RAMGeo model.

The scatter plots of the predicted maximum SELs across the water column for all azimuths as a function of the horizontal range (0 – 4 km) from the source array are displayed in Figure 19 for the two water depths modelled (60 and 120 m). It is noted that:

- For the proposed seismic surveys, the maximum SELs are nearly identical for the first 40 m at the horizontal range; therefore, the maximum SELs will be dominated by acoustic energy directly arriving from the array source.
- At a horizontal distance of more than 40 m from the noise source, the maximum SELs are predicted to be higher in shallow water depth of 60 m than for deeper areas (120 m). This is because more acoustic energy is reflected from the seabed in shallower depths from the unique geo-acoustic profile of the sediments, which amplifies the resulting SEL.
- The two source arrays (Conventional and Bluepulse) have many similarities in the way sound propagates over short range (0 – 4 km).

Figure 19: Modelled maximum SELs across the water column for all azimuths as a function of range (0 – 4 km) from the source locations for the Conventional (left) and Bluepulse (right) array 2630 CUI



5.3 Long Range Modelling

Long range modelling results are presented in Appendix E. The noise contour images show the horizontal distances (in increments of 50 km) of the maximum SELs predicted from a single seismic pulse emitted at sites 15, 10 and 7. SEL is unweighted, and the maximum level across the water column is shown.

Figures E-1 to E-6 indicate that noise after a seismic pulse would be brief (see Section 5.1) above the ambient noise (>100 dB) before attenuating with the distance. Underwater noise is propagated at greater distances towards the southwest, where the depths are greater, while it attenuates more rapidly towards the coast, where the sea is shallower.

Figures E-7 to E-12 show the vertical contour images (depth and extent) of predicted maximum SELs across the water column towards the four cardinal directions from a single seismic pulse emitted at sites 15, 10 and 07. The horizontal axis shows distances from the noise source (seismic array at 0 m on the left) in increments of 20 km.

As evidenced in the horizontal contour images, the vertical contours show that sound travels further towards the west and south, where depths are greater compared to areas to the north and east, which are shallower.

The strong attenuation of the sound at site 10 is due to the shallow areas and the strong interaction between the sound signal and the seabed across the continental shelf. Site 7 (with west and south directions) shows a good example of how sound waves travel through the deep-water Sound Fixing and Ranging (SOFAR) channel. For these directions, the seabed depth variations are insignificant along the propagation paths within the deep-water region; and the directivity of received noise is dominated by the directionality of the source array.

5.4 Cumulative SEL Modelling

Cumulative modelling results are presented in Appendix E. The sound exposure contributions from consecutive survey shots vary with the distances from the receiving locations to the survey line. Cumulative modelling is carried out for a modelling radius of 200 km from the selected sites, with a 100-metre grid size, ensuring the modelling area is sufficiently large to encompass all potential zones of impact for assessed marine fauna species.

The cumulative SEL modelling has been carried out for an entire period of continuous exposure as described in Sections 4.2.3 and 4.3.5[4], based on the modelling methodology and procedure as laid out for the unweighted SEL scenario and weighted SEL_W scenario with frequency weighting functions of different marine mammal hearing groups applied (see Appendix B).

The modelled cumulative unweighted SEL contour map for the survey scenarios C and D of the seismic surveys for the two source arrays (Conventional and Bluepulse) is presented in Figures E-13 and E-16. For visualization purposes, the radius covered is approximately 60 km from each point along the survey line.

The results indicate that while noise levels attenuate rapidly in shallow waters, they attenuate at larger distances in deep waters. Also, sound exposure contributions from multiple adjacent pulses along the survey lines become more proportionally significant compared with the survey pulses closer to the survey lines.

6.0 Impact Zones

The modelled noise levels of all scenarios were compared against the latest noise exposure criteria for potential fauna impacts listed in Section 3.3. The resulting extent of impact zones (i.e., modelled horizontal distance for maximum range) for different noise exposure scenarios is presented below.

For immediate exposure to single pulse (i.e., impulsive noise), the additional two relevant SPL metrics (i.e., $L_{p,pk}$ and $L_{p,rms}$) are derived based on conservative conversion factors applied to the

[4] As the survey vessel moves continuously, the area affected by noise also changes, and no one area will be exposed to the same noise levels for 24 hours continuously. This scenario therefore rather assumes that a receptor, i.e., marine animal, remains in proximity to (moves with) the survey vessel for a 24-hour period.

predicted unweighted SEL values for the various receiving distances from the source location. These conversion factors are detailed in Section 4.3.2.

For cumulative exposure to multiple pulses (i.e., impulsive noise), the unweighted SEL metric (i.e., L_E) is applied for the fish groups, and the weighted SEL metric (i.e., $L_{E,w}$) is applied for turtles and marine mammal hearing groups based on the auditory weighting functions for each group (see Appendix B).

6.1 Immediate Exposure from Single Pulses

This section considers noise emissions during full operation of the conventional and BP200 source arrays 2360 CUI from a single pulse at the different locations detailed in Table 12.

The following subsections outline the resulting extent of impact zones for the AUD INJ, TTS, and behavioural disturbance based on immediate noise exposure metrics such as zero-to-peak sound pressure level, PK ($L_{p,pk}$, dB re 1 µPa), root-mean-square sound pressure level, SPL ($L_{p,rms}$, dB re 1 µPa), sound exposure level, SEL (L_E, dB re 1 µPa^2·s) for different marine fauna groups i.e., marine mammals, turtles, fish, diving seabirds and invertebrates (for detailed species classification, see Appendix C).

Behaviour disturbance modelling results are presented in Appendix E (Figures E-17 to E-22).

6.1.1 Marine Mammals and Turtles

The impact zones for AUD INJ and TTS due to immediate single-pulse seismic exposure of marine mammals and turtles are presented in Appendix D. All marine mammal hearing groups may experience AUD INJ, PTS or TTS from the noise produced by a single pulse from the Conventional and Bluepulse source arrays 2630 CUI. The following are maximum distances from the source within which LF cetaceans and turtles may experience impact or behavioural disturbance:

- LF cetaceans
  - AUD INJ: 73 m (sites 15 and 10) – Conventional source array
  - AUD INJ: 62 m (sites 15 and 10) – Bluepulse source array
  - TTS: 86 m (sites 15 and 10) – Conventional source array
  - TTS: 76 m (site 15) – Bluepulse source array
  - Behaviour disturbance: 160.6 km (site 07) – Conventional source array
  - Behaviour disturbance: 129.7 km (site 07) – Bluepulse source array
- Turtles
  - AUD INJ: 51 m (site 15) – conventional source array
  - AUD INJ: 39 m (site 15) – Bluepulse source array
  - TTS: 64 m (sites 15 and 10) – Conventional source array
  - TTS: 53 m (sites 15) – Bluepulse source array
  - Behaviour disturbance: 1.6 km (site 10) – Conventional source array
  - Behaviour disturbance: 1.3 km (site 10) – Bluepulse source array

6.1.2 Fish

The impact zones for AUD INJ and TTS due to immediate single-pulse seismic exposure of fish are presented in Appendix D. The zones of potential injuries for fish grouped by size are predicted to be the ones with the larger zones, followed up by the fish species with a swim bladder. Fish species without a swim bladder are less sensitive and have slightly smaller zones of impact. The following are maximum distances from the source within which fish with swim bladder, eggs, and larvae may experience impact or behavioural disturbance:

- Fish with swim bladder, eggs, and larvae:
  - Mortality and recoverable injury: 210 m (site 15) – Conventional source array
  - Mortality and recoverable injury: 104 m (site 15) – Bluepulse source array
  - Behaviour disturbance: 13.8 km (site 10) – Conventional source array
  - Behaviour disturbance: 12.7 km (site 10) – Bluepulse source array

6.1.3 Diving Seabirds

The impact zones for AUD INJ and TTS due to immediate single-pulse seismic exposure of diving seabirds are presented in in Appendix D. The following are maximum distances from the source within which diving seabirds (e.g. penguins) may experience impact or behavioural disturbance:

- Penguins:
  - AUD INJ: 55 m (sites 15 and 10) – Conventional source array
  - AUD INJ: 44 m (site 15) – Bluepulse source array
  - TTS: 68 m (sites 15 and 10) – Conventional source array
  - TTS: 58 m (site 15) – Bluepulse source array
  - Behaviour disturbance: 10.6 km (site 10) – Conventional source array
  - Behaviour disturbance: 2.3 km (site 10) – Bluepulse source array

6.1.4 Invertebrates

The impact zones for behaviour disturbance due to immediate single-pulse seismic exposure of invertebrates are presented in in Appendix D. Sponges and Coral may not respond at such threshold. The following are maximum distances from the source within which scallops, lobster and squid may experience a change on behaviour:

- Scallops:
  - Behaviour disturbance: 90 m (sites 15 and 10) – Conventional source array
  - Behaviour disturbance: 80 m (sites 15 and 10 – Bluepulse source array
- Lobster:
  - Behaviour disturbance: 397 m (site 15) – Conventional source array
  - Behaviour disturbance: 220 m (site 15) – Bluepulse source array
- Squid:
  - Behaviour disturbance: 2.7 km (site 15) – Conventional source array
  - Behaviour disturbance: 2.4 km (site 15) – Bluepulse source array

6.1.5 Human Divers

The impact zones for physiological effects due to immediate single-pulse seismic exposure of human divers are presented in in Appendix D. The following are maximum distances from the source within which human divers may experience slight aversion:

- Humna divers:
  - Slight aversion: 24.1 km (site 15) – Conventional source array
  - Slight aversion: 23.5 km (site 15) – Bluepulse source array

6.2 Cumulative Exposure from Multiple Pulses

This section considers the impact zones arising from theoretical continuous full-time exposure to a seismic survey. As noted earlier in Section 4.3.5, this scenario assumes thousands pulses from the seismic source and that a receptor, i.e., marine animal, remains in proximity to (continuously moves with) the moving survey vessel for a 24-hour period and thus remains within the impact zone, which is unlikely but presents a very conservative worst-case scenario. Most likely, exposure of animals will lie somewhere between the very short-term exposure assumed in Section 6.1 and the 24-hour exposure assumed in Section 6.2 as the animal moves in the ocean and changes its position relative to the seismic survey vessel, either in response to the vessel or in response to other environmental triggers.

The following subsections outline the resulting extent of impact zones for AUD INJ, and TTS based on cumulative noise metrics such as sound exposure level, SEL (L_E, dB re 1 μPa^2·s) for fish and SEL_W ($L_{E,w}$, dB re 1 μPa^2·s) for marine mammals and turtles (for detailed species classification, see Appendix C).

6.2.1 Marine Mammals and Turtles

The impact zones of AUD INJ and TTS due to cumulative multi-pulse seismic exposure of marine mammals and turtles are presented in Appendix D. All marine mammal hearing groups may experience AUD INJ, or TTS from the noise produced by multiple pulses from the Conventional and Bluepulse source arrays 2630 CUI.

The following are maximum distances from the source within which LF cetaceans and turtles may experience impact during survey scenarios C and D.

- LF cetaceans:
  - AUD INJ: 8.5 km (scenario D) – Conventional source array
  - AUD INJ: 1.4 km (scenario D) – Bluepulse source array
  - TTS: 27.9 km (scenario D) – Conventional source array
  - TTS: 10.1 km (scenario D) – Bluepulse source array
- Turtles
  - AUD INJ: 1.0 km (scenario C) – Conventional source array
  - AUD INJ: 0.3 km (scenario C) – Bluepulse source array
  - TTS: 6.2 km (scenario C) – Conventional source array
  - TTS: 3.4 km (scenario C) – Bluepulse source array

6.2.2 Fish

The impact zones of AUD INJ and TTS due to cumulative multi-pulse seismic exposure of fish groups are presented in Appendix D. All hearing fish groups may be susceptible to mortality and non-recoverable injury, with small fish (< 2 g) being the most vulnerable to TTS from exposure to survey scenario A. Fish with swim bladders involved in hearing being are the most susceptible to AUD INJ, followed up by fish eggs and larvae.

Existing experimental data regarding recoverable injury and TTS impacts on fish eggs and larvae are sparse, and no guideline recommendations have been provided. However, based on peer-reviewed literature (Popper et al. 2014), noise impacts related to recoverable injury and TTS on fish eggs and larvae are expected to be moderate in the near field (tens of meters) from the source location and low for intermediate and far-field distances from the source location.

The following are maximum distances from the source within which fish with swim bladder, involved in hearing may experience impact:

- Fish with swim bladder, involved in hearing:
  - Mortality: 1.2 km (scenario C) – Conventional source array
  - Mortality: 0.8 km (scenario C) – Bluepulse source array
  - TTS: 10.9 km (scenario C) – Conventional source array
  - TTS: 9.2 km (scenario C) – Bluepulse source array

6.2.3 Diving Seabirds

The impact zones for AUD INJ and TTS due to cumulative multi-pulse seismic exposure of diving seabirds are presented in Appendix D. The following are maximum distances from the source within which diving seabirds (e.g. penguins) may experience impact:

- Penguins:
  - AUD INJ: 55 m (scenario C) – Conventional source array
  - AUD INJ: 50 m (scenario C) – Bluepulse source array
  - TTS: 1.0 km (scenario C) – Conventional source array
  - TTS: 0.1 km (scenario C) – Bluepulse source array

6.2.4 Invertebrates

Comprehensive analyses of cumulative exposure to anthropogenic noise in invertebrates have not yet been carried out (see Section 3.3.5).

6.2.5 Human Divers

The impact zones for recommended tolerance due to multi-pulse seismic exposure of human divers are presented in Appendix D. The following are maximum distances from the source within which human divers may tolerate seismic noise:

- Humna divers:
  - Max Time (200s): 165.6 km (scenario D) – Conventional source array
  - Max Time (200s): 162.5 km (scenario D) – Bluepulse source array

7.0 Discussion

The modelling study shows how site-specific geoacoustic profiles, validated acoustic propagation models, and updated biological criteria can produce realistic and precautionary estimates of underwater noise impact. At Site 15 and Site 10, the seabed was modelled as fine carbonate sand overlying increasingly cemented calcarenite, transitioning to well-cemented calcarenite at depth. This profile yields strong seabed reflections, particularly in shallow water, which amplifies received sound levels and increases the extent of near-field impact zones. In contrast, Site 7, located in deeper water, was modelled with silty carbonate sand transitioning to semi-cemented carbonate, which absorbs more acoustic energy and reduces reflection, resulting in lower near-field SELs and more directional propagation. These geoacoustic differences significantly influence both short-range and long-range modelling outcomes.

The modelling results per immediate exposure from single pulses show that physiological impacts such as AUD INJ and TTS are limited to relatively small zones around the source, particularly for regional marine mammals. For example, LF cetaceans such as the pygmy blue whale and the southern right whale can suffer hearing loss (AUD INJ and TTS) within 100 m of a conventional emission source. Similarly, fish in general are expected to suffer mortality or recoverable injuries within 250 m. In contrast, the impact zones are slightly reduced for all animal groups when the Bluepulse source array is used. An overall reduction in distances of 10 m for marine mammals and 100 m for fish is anticipated.

Behavioural disturbance covers much larger areas. Marine mammals can exhibit behavioural disturbance up to 160 km from the source when conventional arrays are used offshore and at greater depths (>100 m). Bluepulse technology can reduce this distance by 30 km. Other animal groups are affected behaviourally at shorter distances, and for all species, the use of Bluepulse reduces the impact zone. These distances highlight the broad ecological impact of seismic noise, especially for species that rely on acoustic cues for navigation, communication, and foraging. The model uses the lowest root-mean-square SPL thresholds for immediate exposure of a species to a single pulse, which better reflects behavioural alteration than injury.

In the cumulative exposure analysis, the model assumes that animals follow the vessel and are exposed to the total number of seismic pulses over a 24-hour period. However, this is a conservative scenario representing the worst-case scenario. In reality, marine fauna, such as marine mammals, sea turtles, fish, and diving seabirds, are unlikely to remain near survey vessels unless they are tied to specific feeding or breeding grounds or are unable to move (e.g., plankton, fish eggs, and larvae). Therefore, the projected cumulative impact zones likely overestimate actual exposure and should be considered precautionary limits.

The cumulative results demonstrate the extent of impact zones for various hearing groups. For LF cetaceans, AUD INJ is predicted within 6.2 km (Scenario C) and 8.5 km (Scenario D), while TTS may occur up to approximately 24 km and 28 km, respectively when a conventional source array is used. However, a considerable difference is visible when a Bluepulse source array is applied. For LF cetaceans, AUD INJ is reduced to 3.5 km (Scenario C) and 1.4 km (Scenario D), while TTS may also decrease up to approximately 13 km and 10 km, respectively. These distances reflect the influence of the acoustic signature for each active element of the source array used as well as lower energy at higher frequencies (>200 Hz).

Other hearing groups, such as HF and very-high-frequency VHF cetaceans, exhibit significantly smaller zones of impact because of their different auditory weighting functions and decreased sensitivity to low-frequency seismic pulses. A summary of the maximum impact zones modelled by the STLM analysis for all the marine fauna and human divers is detailed in Table 16.

Table 16: Summary of maximum impact zones modelled by the STLM study

Group	Noise Impact	Immediate Exposure (Single Pulse)		Cumulative Exposure (24 hrs)	
		Conventional	Bluepulse	Conventional	Bluepulse
Low-Frequency Cetaceans (e.g., pygmy blue whale, southern right whale	AUD INJ	73 m	62 m	8.5 km	3.5 km
	TTS	86 m	76 m	28 km	10 km
	Behavioural	160 km	130 km	-	
Turtles	AUD INJ	51 m	39 m	1.0 km	0.4 km
	TTS	64 m	53 m	6.2 km	3.4 km
	Behavioural	1.6 km	1.3 km	-	
Fish	Mortality	210 m	104 m	1.2 km	0.8 km
	TTS	-	-	10.9 km	9.2 km
	Behavioural	13.8 km	12.7 km	-	
Diving Seabirds (e.g., penguins)	AUD INJ	55 m	44 m	55 m	50 m
	TTS	68 m	58 m	1.0 km	0.1 km
	Behavioural	10.6 km	2.3 km	-	
Invertebrates	Behavioural (Lobster)	397 m	220 m	-	
	Behavioural (squid)	2.7 km	2.4 km		
Human Divers	Slight Aversion	24 km	23.5	-	
	Tolerance limit	-		165 km	162 km

AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift; a dash means threshold is not available or there is limited data.

The results of the Animat modelling indicate that exposure ranges to physiological thresholds (PTS and TTS) and behavioural thresholds for SPL vary significantly depending on the source type and scenario. Conventional source array consistently produced higher exposure ranges compared to Bluepulse, suggesting that Bluepulse offers a substantial advantage in mitigating high-level acoustic impacts. Scenario C (Site 15) yielded higher exposure ranges than Scenario D (Site 7), reflecting the spatial variability in sound propagation and animal distribution.

Modelling with Animat of pygmy blue whales and southern right whales with specific behavioural profiles further underscores the importance of considering the ecological context, such as feeding versus migration states and mother-calf dynamics, in exposure assessments.

8.0 Closure

Thank you for retaining SLR to provide this service.

A.1 Acoustic Terminology

Term	Definition
1/3 Octave Band Levels	The energy of a sound is split into a series of adjacent frequency bands, each being one-third of an octave wide.
Impulsive noise	Noise that is typically very short (in seconds), broadband and has high peak pressure with rapid time and decay back to ambient levels (e.g., noise from pile driving, seismic surveys and explosives).
Non-Impulsive noise	It is typically continuous and produces sounds that can be narrowband, or tonal, and brief or prolonged. It does not have the high peak sound pressure with rapid rise time typical of impulsive sounds (e.g., drilling and vibratory pile driving).
Continuous noise	Noise with a sound pressure level that remains above ambient sound during the entire observation period (e.g., vessel noise, drilling and vibratory pile driving).
Power Spectral Density (PSD)	PSD describes how the power of a signal is distributed with frequency.
Sound Pressure (p)	A deviation from the ambient hydrostatic pressure caused by a sound wave.
Source Level (SL)	The acoustic source level is the level referenced to a distance of 1 m from a point source.
Peak Sound Pressure Level (PK)	The peak sound pressure level is the logarithmic ratio of the peak pressure over the impulsive signal event to the reference pressure.
root-mean-square Sound Pressure Level (SPL)	The mean-square sound pressure is the average of the squared pressure over the pulse duration. The root-mean-square sound pressure level is the logarithmic ratio of the root of the mean-square pressure to the reference pressure. Pulse duration is taken as the duration between the 5% and the 95% points on the cumulative energy curve.
Sound Exposure Level (SEL)	SEL is a measure of energy. Specifically, it is the decibel level of the cumulative sum of squared sound pressures for 1-s equivalent duration referenced to 1 µPa for water. The time duration and frequency range shall be specified.
Sound Exposure Level, Weighted (SEL_w)	Weighted sound exposure level is the level of the power quantity weighted time-integrated squared sound pressure. The integration time and frequency range shall be specified.
Permanent Threshold Shift (PTS)	A permanent, irreversible increase in the threshold of audibility at a specified frequency or portion of an individual's hearing above a previously established level.
Auditory Injury (AUD INJ)	Damage to the inner ear that can result in destruction of tissue, such as the loss of cochlear neuron synapses or auditory neuropathy. Auditory injury may or may not result in a permanent threshold shift (PTS).
Temporary hearing Threshold Shift (TTS)	TTS is defined as a temporary, reversible increase in the threshold of audibility at a specified frequency or portion of an individual's hearing range above a previously established reference level.

Appendix B Auditory Weighting Functions

SLR Project No.: 675.073227.00001

December 1, 2025

B.1 Auditory Weighting Functions

This appendix provides the recommended frequency-weighting functions for use in assessing the effects of relatively intense sounds on hearing. This information is derived based on all available relevant data and published literature (i.e., the state of current knowledge).

Marine animals do not hear equally well at all frequencies within their functional hearing range. Based on the hearing range and sensitivities, NMFS (2024) have categorised marine mammal species (i.e., cetaceans and pinnipeds) into five underwater hearing groups: low-frequency (LF), high-frequency (HF), very high-frequency (VHF) cetaceans, Phocid pinnipeds in water (PW) and Otariid pinnipeds in water (OW). For each specific marine mammal species, refer to Appendix C within the reference document for their corresponding hearing groups.

The potential noise effects on animals depend on how well the animals can hear the noise. Frequency weighting is a method of quantitatively compensating for the differential frequency response of sensory systems (Southall et al. 2019).

When developing updated scientific recommendations in marine mammal noise exposure criteria, Southall et al. (2019) adopted the auditory weighting functions as expressed in the equation below, which are based on the quantitative method by Finneran (2016) and are consistent with the U.S. National Oceanic and Atmospheric Administration (NOAA) technical guidance (NMFS 2024).

The department of the U.S. Navy (DoN 2017) revised the auditory-weighting functions for sea turtle (TU). Audiogram slopes were calculated across a frequency range of one octave for five species (refer to Appendix C with composite audiograms based on experimental data.

$$W(f) = C + 10log10\left\{\frac{(f/f_1)^{2a}}{[1+(f/f_1)^2]^a[1+(f/f_2)^2]^b}\right\} \quad \text{(b.1)}$$

Where:

W(f) is the weighting function amplitude (in dB) at frequency f (in kHz).

f_1 represents LF transition value (in kHz), i.e., the lower frequency at which the function amplitude begins to change from the flat, central portion of the curve.

f_2 represents HF transition value (in kHz), i.e., the upper frequency at which the function amplitude begins to change from the flat, central portion of the curve.

a represents the LF exponent value (dimensionless) which defines the rate of decline of the weighting function amplitude at low frequencies. The change in weighting function amplitude with frequency at low frequencies (the LF slope) is 20a dB/decade.

b represents the HF exponent value (dimensionless) which defines the rate of decline of weighting function amplitude at high frequencies, becoming linear with the logarithm of frequency. The change in weighting function amplitude with frequency at high frequencies (the HF slope) is -20b dB/decade.

C is the constant that defines the vertical position of the curve. It is defined so that the maximum amplitude of the weighting function equals 0 dB (with all other values being negative).

Table B-1 lists the auditory weighting parameters as defined above for the seven hearing groups. The corresponding auditory weighting functions for all hearing groups are presented in Figure B-1.

Table B-1: Auditory weighting functions – revised parameters
(NMFS 2024; DoN 2017)

Marine mammal hearing group	a	b	f1 (kHz)	f2 (kHz)	C (dB)
Low-frequency cetaceans (LF)	0.99	5	0.163	26.6	0.12
High-frequency cetaceans (HF)	1.55	5	1.73	129	0.32
Very-high-frequency cetaceans (VHF)	2.23	5	5.93	186	0.91
Phocid pinnipeds in water (PW)	1.63	5	0.81	68.3	0.29
Otariid pinnipeds in water (OW)	1.58	5	2.53	43.8	1.37
Sea turtles (TU)	1.4	2	0.077	0.44	2.35

Appendix C Marine Fauna Classification

Regia Marine Seismic Survey in the Otway Basin

Underwater Sound Transmission Loss Modelling Study

Klarite Pty Ltd

SLR Project No.: 675.073227.00001

December 1, 2025

C.1 Marine Fauna Classification

The following appendix gives a summary of marine fauna hearing group classification. Not all animals listed in the Table C-1 are expected to be found in the vicinity of the project area, however, special attention is paid to those highlighted in green, as they are listed as endangered species in Australia and are considered vitally important due to biologically important behaviours and critical life stages that are known to occur in the region.

Table C-1: Summary of marine mammal classification

Classification	Common Name	Scientific Name
Low frequency cetaceans (adapted from Appendix 1 Southall et al. 2019)	Bowhead whale	*Balaena mysticetus*
	Blue whale	*Balaenoptera musculus*
	Pygmy blue whale	*Balaenoptera musculus brevicauda*
	Southern right whale	*Eubalaena australias*
	North Atlantic right whale	*Eubalaena glacialis*
	North Pacific right whale	*Eubalaena japonica*
	Common minke whale	*Balaenoptera acutorostrata*
	Antarctic minke whale	*Balaenoptera bonaerensis*
	Sei whale	*Balaenoptera borealis*
	Bryde's whale	*Balaenoptera edeni*
	Omura's whale	*Balaenoptera omurai*
	Fin whale	*Balaenoptera physalus*
	Humpback whale	*Megaptera novaeangliae*
	Pygmy right whale	*Caperea marginata*
	Gray whale	*Eschrichtius robustus*
High frequency cetaceans (adapted from Appendix 2 Southall et al. 2019)	Sperm whale	*Physeter macrocephalus*
	Arnoux' beaked whale	*Berardius arnuxii*
	Baird's beaked whale	*Berardius bairdii*
	Northern bottlenose whale	*Hyperoodon ampullatus*
	Southern bottlenose whale	*Hyperoodon planifrons*
	Tropical bottlenose whale	*Indopacetus pacificus*
	Sowerby's beaked whale	*Mesoplodon bidens*
	Andrews' beaked whale	*Mesoplodon bowdoini*
	Hubb's beaked whale	*Mesoplodon carlbubbsi*
	Blainville's beaked whale	*Mesoplodon densirostris*
	Gervais' beaked whale	*Mesoplodon europaeus*

Classification	Common Name	Scientific Name
High frequency cetaceans (extracted from Appendix 2 Southall et al. 2019)	Ginkgo-toothed beaked whale	*Mesoplodon ginkgodens*
	Gray's beaked whale	*Mesoplodon grayi*
	Hector's beaked whale	*Mesoplodon hectori*
	Deraniyagala's beaked whale	*Mesoplodon hotaula*
	Layard's beaked whale	*Mesoplodon layardii*
	True's beaked whale	*Mesoplodon mirus*
	Perrin's beaked whale	*Mesoplodon perrini*
	Pygmy beaked whale	*Mesoplodon peruvianus*
	Stejneger's beaked whale	*Mesoplodon stejnegeri*
	Spade-toothed whale	*Mesoplodon traversii*
	Tasman beaked whale	*Tasmacetus shepherdi*
	Cuvier's beaked whale	*Ziphius cavirostris*
	Killer whale	*Orcinus orca*
	Beluga	*Delphinapterus leucas*
	Narwhal	*Monodon monoceros*
	Common dolphin	*Delphinus delphis*
	Pygmy killer whale	*Feresa attenuata*
	Short-finned pilot whale	*Globicephala macrorhynchus*
	Long-finned pilot whale	*Globicephala melas*
	Risso's dolphin	*Grampus griseus*
	Fraser's dolphin	*Lagenodelphis hosei*
	Atlantic white-sided dolphin	*Lagenorhynchus acutus*
	White-beaked dolphin	*Lagenorhynchus albirostris*
	Pacific white-sided dolphin	*Lagenorhynchus obliquidens*
	Dusky dolphin	*Lagenorhynchus obscurus*
	Northern right whale dolphin	*Lissodelphis borealis*
	Southern right whale dolphin	*Lissodelphis peronii*
	Irrawaddy dolphin	*Orcaella brevirostris*
	Australian snubfin dolphin	*Orcaella heinsohni*
	Melon-headed whale	*Peponocephala electra*
	False killer whale	*Pseudorca crassidens*
	Indo-Pacific humpback dolphin	*Sousa chinensis*
	Indian Ocean humpback dolphin	*Sousa plumbea*
	Australian humpback dolphin	*Sousa sahulensis*
	Atlantic humpback dolphin	*Sousa teuszii*
	Tucuxi	*Sotalia fluviatilis*

Classification	Common Name	Scientific Name
High frequency cetaceans (extracted from Appendix 2 Southall et al. 2019)	Guiana dolphin	*Sotalia guianensis*
	Pantropical spotted dolphin	*Stenella attenuata*
	Clymene dolphin	*Stenella clymene*
	Striped dolphin	*Stenella coeruleoalba*
	Atlantic spotted dolphin	*Stenella frontalis*
	Spinner dolphin	*Stenella longirostris*
	Rough-toothed dolphin	*Steno bredanensis*
	Indo-Pacific bottlenose dolphin	*Tursiops aduncus*
	Bottlenose dolphin	*Tursiops truncatus*
	South Asian river dolphin	*Platanista gangetica*
Very high frequency cetaceans (extracted from Appendix 3 Southall et al. 2019)	Peale's dolphin	*Lagenorhynchus australis*
	Hourglass dolphin	*Lagenorhynchus cruciger*
	Commerson's dolphin	*Cephalorhynchus commersonii*
	Chilean dolphin	*Cephalorhynchus eutropia*
	Heaviside's dolphin	*Cephalorhynchus heavisidii*
	Hector's dolphin	*Cephalorhynchus hectori*
	Narrow-ridged finless porpoise	*Neophocaena asiaeorientalis*
	Indo-Pacific finless porpoise	*Neophocaena phocaenoides*
	Spectacled porpoise	*Phocoena dioptrica*
	Harbor porpoise	*Phocoena phocoena*
	Vaquita	*Phocoena sinus*
	Burmeister's porpoise	*Phocoena spinipinnis*
	Dall's porpoise	*Phocoenoides dalli*
	Amazon river dolphin	*Inia geoffrensis*
	Yangtze river dolphin	*Lipotes vexillifer*
	La Plata dolphin	*Pontoporia blainvillei*
	Pygmy sperm whale	*Kogia breviceps*
	Dwarf sperm whale	*Kogia sima*

Classification	Common Name	Scientific Name
Phocid pinnipeds in water (extracted from Appendix 5 Southall et al. 2019)	Hooded seal	*Cystophora cristata*
	Bearded seal	*Erignathus barbatus*
	Gray seal	*Halichoerus grypus*
	Ribbon seal	*Histriophoca fasciata*
	Leopard seal	*Hydrurga leptonyx*
	Weddell seal	*Leptonychotes weddellii*
	Crabeater seal	*Lobodon carcinophaga*
	Northern elephant seal	*Mirounga angustirostris*
	Southern elephant seal	*Mirounga leonina*
	Mediterranean monk seal	*Monachus monachus*
	Hawaiian monk seal	*Neomonachus schauinslandi*
	Ross seal	*Ommatophoca rossii*
	Harp seal	*Pagophilus groenlandicus*
	Spotted seal	*Phoca largha*
	Harbor seal	*Phoca vitulina*
	Caspian seal	*Pusa caspica*
	Ringed seal	*Pusa hispida*
	Baikal seal	*Pusa sibirica*
Otariid pinnipeds in water (extracted from Appendix 6 Southall et al. 2019)	Walrus	*Odobenus rosmarus*
	South American fur seal	*Arctocephalus australis*
	New Zealand fur seal	*Arctocephalus forsteri*
	Galapagos fur seal	*Arctocephalus galapagoensis*
	Antarctic fur seal	*Arctocephalus gazella*
	Juan Fernandez fur seal	*Arctocephalus philippii*
	Cape fur seal/Australian fur seal	*Arctocephalus pusillus*
	Subantarctic fur seal	*Arctocephalus tropicalis*
	Northern fur seal	*Callorhinus ursinus*
	Steller sea lion	*Eumetopias jubatus*
	Australian sea lion	*Neophoca cinerea*
	South American sea lion	*Otaria byronia*

Classification	Common Name	Scientific Name
Otariid pinnipeds in water (extracted from Appendix 6 Southall et al. 2019)	Hooker's sea lion	*Phocarctos hookeri*
	California sea lion	*Zalophus californianus*
	Galapagos sea lion	*Zalophus wollebaeki*
	Polar bear	*Ursus maritimus*
	Sea otter	*Enhydra lutris*
	Marine otter	*Lontra feline*
Sea Turtles (extracted from DoN 2017)	Green sea turtle	*Chelonia mydas*
	Kemp's ridley sea turtle	*Lepidochelys kempii*
	Loggerhead sea turtle	*Caretta*
	Leatherback sea turtle	*Dermochelys coriacea*
	Hawksbill sea turtle	*Eretmochelys imbricata*
Penguins (extracted from https://birdwatchinghq.com/penguins-of-australia/)	Little Penguin	*Eudyptula minor*
	Gentoo Penguin	*Pygoscelis papua*
	King Penguin	*Aptenodytes patagonicus*
	Chinstrap Penguin	*Pygoscelis antarcticus*
	Southern Rockhopper Penguin	*Eudyptes chrysocome*
	Fiordland Penguin	*Eudyptes pachyrhynchus*

Appendix D Noise Modelling Table Results

Regia Marine Seismic Survey in the Otway Basin

II. Very severe	148[1]	15,680	12,710	10,220	14,590	10,730	8,060
III. Increasingly aversive	154[1,2]	11,000	8,630	5,620	10,200	7,210	5,100
IV. Tolerance limit	170[1]	2,720	2,300	1,140	2430	1,780	940
V. Physiological damage	184[1]	520	480	300	440	380	270
$L_{p,rms}$ = root-mean-square sound pressure level Sources: [1]Parvin 2005 [2]NATO 2006							

D.1.6 Behaviour Disturbance

Table D-9: Immediate exposure impact zones (behavioural disturbance) from a single seismic pulse (Conventional source arrays 2630 CUI) for all marine fauna

Marine Fauna	Behavioural disturbance			
	$L_{p,rms}$ dB re 1µPa	Maximum horizontal distance (m)		
		Site 15	Site 10	Site 07
Marine Mammals	120	71,250	69,166	160,620
	140	20,020	24,180	17,010
	160	5,460	6,960	3,120
Fish	150	11,930	13,810	7,940
Turtles	175	1,300	1,640	590
Diving Seabirds	120[1]	7,400	10,620	5,660

$L_{p,rms}$ = root-mean-square sound pressure level
[1] Behaviour disturbance threshold weighted as OW

Table D-10: Immediate exposure impact zones (behavioural response) from a single seismic pulse (Bluepulse source arrays 2630 CUI) for all marine fauna

Marine Fauna	Behavioural disturbance			
	$L_{p,rms}$ dB re 1µPa	Maximum horizontal distance (m)		
		Site 15	Site 10	Site 07
Marine Mammals	120	63,330	62,420	129,740
	140	16,710	23,340	14,610
	160	4,400	6,230	2820
Fish	150	9,260	12,710	6,950
Turtles	175	1,020	1,330	390
Diving Seabirds	120[1]	2,200	2,300	1,400

$L_{p,rms}$ = root-mean-square sound pressure level
[1]Behaviour disturbance threshold weighted as OW

D.2 Cumulative Exposure from Multiple Pulses

D.2.1 Marine Mammals and Turtles

Table D-11: Cumulative exposure impact zones (AUD INJ and TTS) to multiple seismic pulses (Conventional source array 2630 CUI) for marine mammals and turtles

Animal hearing group	AUD INJ onset			TTS onset		
	$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)		$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)	
		C	D		C	D
LF	183	6,250	8,530	168	23,630	27,920
HF	193	80	80	178	600	280
VHF	159	90	90	144	840	380
PW	183	1,060	620	168	7,410	5,500
OW	185	55	50	170	1,020	660
SI	190[1]	40	40	175	90	90
TU	204[1]	1,060	500	189	6,250	4,160

$L_{E,w,24h}$ = weighted sound exposure level over a 24h period; AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift. [1]The sirenian and TU animal groups use the noise criteria for PTS = permanent hearing threshold shift. Green shaded areas highlight the groups likely to be present within the operational area.

Table D-12: Cumulative exposure impact zones (AUD INJ and TTS) to multiple seismic pulses (Bluepulse source array 2630 CUI) for marine mammals and turtles

Animal hearing group	AUD INJ onset			TTS onset		
	$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)		$L_{E,w}$ dB re 1µPa²·sS	Maximum horizontal distance (m)	
		C	D		C	D
LF	183	3,520	1,450	168	12,860	10,120
HF	193	40	35	178	80	75
VHF	159	50	40	144	100	85
PW	183	115	90	168	1,450	840
OW	185	50	45	170	120	85
SI	190[1]	-	-	175	50	40
TU	204[1]	360	220	189	3,400	1,300

$L_{E,w,24h}$ = weighted sound exposure level over a 24h period; AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift. Green shaded areas highlight the groups likely to be present within the operational area. [1]The sirenian and TU animal groups use the noise criteria for PTS = permanent hearing threshold shift.

D.2.2 Fish Groups

Table D-13: Cumulative exposure impact zones (mortality, recovery injury and TTS) to multiple seismic pulses (Conventional source array 2630 CUI) for fish

Fish Group	Mortality and Non-Recoverable Injury			Recoverable Injury			TTS onset		
	L_E dB re 1µPa²·s	Maximum horizontal distance (m)		L_E dB re 1µPa²·s	Maximum horizontal distance (m)		L_E dB re 1µPa²·s	Maximum horizontal distance (m)	
		C	D		C	D		C	D
Fish without swim bladder	219	230	110	216	310	200	186	10,950	7,570
Fish: with swim bladder not involved in hearing	210	740	380	203	2,010	930	186	10,950	7,570
Fish: with swim bladder involved in hearing	207	1,230	540	203	2,010	930	186	10,950	7,570
Eggs and larvae	210	740	380	-	-		-	-	
Fish ≥ 2g	-	-		187	10,670	7,100	-	-	
Fish < 2g				183	14,280	10,030			

L_E = unweighted sound exposure level over multiple pulses; TTS = temporary hearing threshold shift; a dash indicates the threshold is not available for the fish category.

Table D-14: Cumulative exposure impact zones (mortality, recovery injury and TTS) to multiple seismic pulses (Bluepulse source array 2630 CUI) for fish

Fish Group	Mortality and Non-Recoverable Injury			Recoverable Injury			TTS onset		
	L_E dB re 1µPa²·s	Maximum horizontal distance (m)		L_E dB re 1µPa²·S	Maximum horizontal distance (m)		L_E dB re 1µPa²·s	Maximum horizontal distance (m)	
		C	D		C	D		C	D
Fish without swim bladder	219	205	105	216	275	160	186	9,210	6,090
Fish: with swim bladder not involved in hearing	210	540	300	203	1540	580	186	9,210	6,090
Fish: with swim bladder involved in hearing	207	820	385	203	1540	580	186	9,210	6,090
Eggs and larvae	210	540	300	-	-		-	-	
Fish ≥ 2g	-	-		187	8,570	5410	-	-	
Fish < 2g				183	13,150	8240			

L_E = unweighted sound exposure level over multiple pulses; TTS = temporary hearing threshold shift; a dash indicates the threshold is not available for the fish category.

D.2.3 Diving Seabirds

Table D-15: Cumulative exposure impact zones (AUD INJ and TTS) to multiple seismic pulses (Conventional source array 2630 CUI) for diving seabirds

Animal hearing group	AUD INJ onset			TTS onset		
	$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)		$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)	
		C	D		C	D
Diving Seabirds (e.g., penguins)	185	55	50	170	1,020	660

$L_{E,w,24h}$ = weighted sound exposure level over a 24h period; AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift. [1]The sirenian and TU animal groups use the noise criteria for PTS = permanent hearing threshold shift.

Table D-16: Cumulative exposure impact zones (AUD INJ and TTS) to multiple seismic pulses (Bluepulse source array 2630 CUI) for diving seabirds

Animal hearing group	AUD INJ onset			TTS onset		
	$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)		$L_{E,w}$ dB re 1µPa²·s	Maximum horizontal distance (m)	
		C	D		C	D
Diving Seabirds (e.g., penguins)	185	50	45	170	120	85

$L_{E,w,24h}$ = weighted sound exposure level over a 24h period; AUD INJ = auditory injury onset; TTS = temporary hearing threshold shift. [1]The sirenian and TU animal groups use the noise criteria for PTS = permanent hearing threshold shift.

D.2.4 Human Divers

Table D-17: Zones of impact for cumulative exposure (100 and 200s) to multiple seismic pulses for– human divers

Human Diver	Recommended tolerance				
	$L_{E,w}$ dB re 1µPa²·s	Conventional		Bluepulse	
		Maximum horizontal distance (m)		Maximum horizontal distance (m)	
		C	D	C	D
200s	141[1]	165,600	59,700	162,500	59,210
100s	145[1,2]	39,090	42,350	38,920	41,130

$L_{E,w}$ = weighted sound exposure level over 100s and 200s period.

LIST OF TABLES

Table 1. Modeling scenarios used in animat modeling to estimate exposure ranges of marine mammal species of interest. 7

Table 2. Marine mammal physiological (AUD INJ, TTS; NMFS, 2024) thresholds for the low frequency (LF) hearing group for impulsive sounds. SEL thresholds are weighted using the LF auditory weighting function and peak thresholds are unweighted. 9

Table 3. Summary of 95th percentile exposure ranges (km) estimated for pygymy blue whales due to the operation of Conventional and Bluepulse airguns. SEL thresholds have units of dB re 1µPa^{2}s and peak (PK) and SPL thresholds have units of dB re 1µPa. 14

Table 4. Summary of 95th percentile exposure ranges (km) estimated for migrating and foraging southern right whales due to the operation of Conventional and Bluepulse airguns. SEL thresholds have units of dB re 1µPa^{2}s and peak (PK) and SPL thresholds have units of dB re 1µPa. 15

LIST OF FIGURES

Figure 1. Model scenarios, acoustic propagation modeling sites, and modeling box used in the animat modeling of the seismic surveys in Otway Basin. 8

Figure 2. Histograms showing the distribution of ranges (km) of the modeled female pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species. 16

Figure 3. Histograms showing the distribution of ranges (km) of the modeled female pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species. 17

Figure 4. Histograms showing the distribution of ranges (km) of the modeled male pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species. 18

Figure 5. Histograms showing the distribution of ranges (km) of the modeled male pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the

Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species..... 19

Figure 6. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale mother with calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species..... 20

Figure 7. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale mother with calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species. 21

Figure 8. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale adult without calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species..... 22

1 INTRODUCTION

Marine Acoustics, Inc (MAI) was contracted by SLR Consulting Ltd. (SLR) to perform animat modeling of pygmy blue whales and southern right whales for a seismic survey within Otway Basin, located off the southern coast of Australia. The scope of work included animat modeling of two seismic airgun sources (Conventional [2630 cubic inches] and Bluepulse) along two representative track lines. SLR provided the modeled sound fields and MAI performed animat modeling using the provided inputs.

Tasks in this scope included:

1. Translation of SLR provided sound fields and track lines into usable format for ingestion into MAI animat model
    - SLR provided track lines for each representative track
    - SLR provided sound fields (low-frequency (LF) weighted single pulse sound exposure level (SEL) field, unweighted sound pressure level (SPL) field, unweighted peak SPL field) from a single model site along each track line (Site 15 and Site 7) for both seismic source types
    - While SLR modeled three sites (Site 7, Site 10, and Site 15), only two sites were chosen for the animat modeling effort (Site 7 and Site 15). Site 10 and Site 15 are along the same representative track and both correspond to Scenario C. Only one model site was chosen to represent each Scenario in the animat modeling. Further explanation of why Site 15 was chosen over Site 10 to represent Scenario C in the animat modeling study is provided in the *Underwater Sound Transmission Loss Modelling Study* report.
2. Animat modeling of two seismic source types (Conventional and Bluepulse) traversing two separate track lines
    - Include animats representative of pygmy blue whales (female and male) and southern right whales (migrating and foraging animats representing mother & calf pair and an adult with no calf)
3. Provide exposure ranges to auditory injury (AUD INJ) SEL and Peak (PK), temporary threshold shift (TTS) SEL and PK, and SPL (120, 140, 160 dB) thresholds as tables for each modeled marine mammal animat to the two seismic source types along each track line
4. Provide histogram plots showing exposure ranges of modeled animats which experienced a received level above AUD INJ SEL, TTS SEL and SPL (120, 140, 160 dB) thresholds

2 ANIMAT MODELING SCENARIOS

The modeling scenarios run by MAI are outlined in Table 1. Animat modeling was conducted within a model area that extended from 39.774°S to 38.209°S and 141.073°E to 143.870°E (Figure 1). This model area encompassed the area where received SPL sound levels were above 120 dB per the sound fields provided by SLR. The scenarios and representative sites are indicated in Figure 1, overlaid with the area used in the animat modeling.

In all scenarios, 24-hours of track line was modeled assuming the vessel transits at 2.315 m/s. There is a 12.5 m (or 5.4 second) impulse interval for a total of 11,895 shots in Scenario C and 11,891 in Scenario D. In both scenarios, transmissions will occur for 17.84 hours a day, with the turn in the track line taking 6.16 hours to complete. No transmissions occur on the turn.

Table 1. Modeling scenarios used in animat modeling to estimate exposure ranges of marine mammal species of interest.

Scenario	Representative Acoustic Propagation Model Site Used	Airgun Type	Total # of Shots Modeled	Duration of First Transect (hrs)	Turn Time (hrs)	Duration of Second Transect (hrs)
Scenario C	Site 15	Conventional	11,895	10.45	6.16	7.39
		Bluepulse				
Scenario D	Site 7	Conventional	11,891	9.76	6.16	8.08
		Bluepulse				

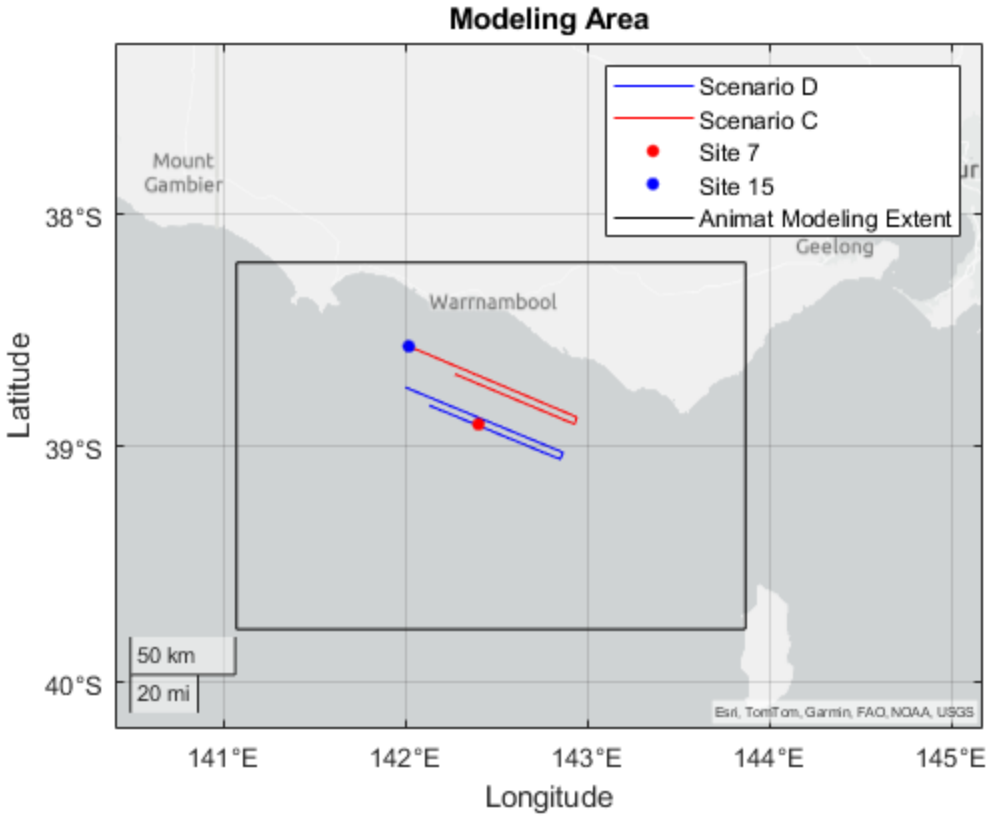

Figure 1. Model scenarios, acoustic propagation modeling sites, and modeling box used in the animat modeling of the seismic surveys in Otway Basin.

3 ACOUSTIC CRITERIA

The National Marine Fisheries Service (NMFS) has provided guidance for assessing the physiological impacts of anthropogenic sound on marine mammals under their regulatory jurisdiction, which includes whales, dolphins, seals, and sea lions (NMFS, 2024).The guidance specifically defines hearing groups, develops auditory weighting functions, and identifies the received levels or acoustic threshold levels, above which individual marine mammals are predicted to experience changes in their hearing sensitivity (permanent threshold shift [PTS] or temporary threshold shift [TTS]) for acute, incidental exposure to underwater sound. The guidance defines thresholds for onset of TTS and auditory injury (AUD INJ), which includes, but is not limited to, PTS. The marine mammals of interest to this study (pygmy blue whales and southern right whales) are part of the low-frequency (LF) cetacean hearing group, which is defined as the mysticetes (baleen whales) with a collective generalized hearing range of 7 Hz to 36 kilohertz (kHz).

Airguns are considered impulsive sources and utilize the acoustic thresholds defined in Table 2. The cumulative SEL metric considers both received level and duration of exposure over the

duration of the activity within a 24-hr period. This threshold is weighted using the LF auditory weighting functions. Peak thresholds are unweighted.

Table 2. Marine mammal physiological (AUD INJ, TTS; NMFS, 2024) thresholds for the low frequency (LF) hearing group for impulsive sounds. SEL thresholds are weighted using the LF auditory weighting function and peak thresholds are unweighted.

Hearing Group	AUD INJ Onset		TTS Onset	
	SEL (dB re 1 μPa^2s)	Peak (dB re 1 µPa)	SEL (dB re 1 μPa^2s)	Peak (dB re 1 µPa)
Low-frequency (LF) cetaceans	183 dB	222 dB	168 dB	216 dB

The behavioral threshold for marine mammals is defined by NMFS to be 160 dB re 1 µPa for impulsive sources, such as airguns (NOAA, 2005). To assess potential for behavioral reactions, sound pressure level thresholds of 120 dB, 140 dB in addition to the 160 dB threshold will be used.

4 EXPOSURE MODELING

4.1.1 METHODOLOGY

MAI conducted animat modeling of the marine mammal species of interest in the Otway Basin to determine their potential level of exposure to the underwater sounds generated during the proposed seismic activity. The animat modeling integrated the predicted received level sound fields of the seismic activity with four-dimensional (4D) movements of marine mammals (pygmy blue whales and southern right whales) to estimate their potential acoustic exposure at which physiological effects, specifically, AUD INJ, TTS and behavioral effects are experienced. The modeling was conducted using the Acoustic Integration Model© (AIM) (Frankel et al., 2002), which is a Monte Carlo based statistical model in which multiple iterations of realistic predictions of acoustic source use as well as animal distribution and movement patterns are conducted to provide statistical predictions of estimated effects from exposure to underwater sound.

In AIM, each acoustic source and sound receiver is modeled via the animat concept. Animats are computationally simulated animals or objects. When an animat represents a marine animal, movement is defined by specifying behavioral variables, such as dive parameters, swimming speed, and course/direction changes. This results in a realistic representation of animal movements that mimic the real-world diving patterns and swimming abilities of marine species. The movements of an animat can also be programmed to respond to environmental factors (e.g., water depth) so that a marine species that normally inhabits a specific environment (e.g., shallow, coastal waters) can be constrained to stay within a specified marine habitat.
AIM simulated the four-dimensional (range, depth, bearing, and time) movements of the marine mammals of interest (pygmy blue whale and southern right whale) during the seismic

survey. Animats were distributed throughout the modeling area (Figure 1) and were constrained within the modeling area by the coastline and the expected occurrence depth relative to each species. These simulated marine mammal movements were integrated with the broadband acoustic received level fields produced by SLR to predict the exposure range for each simulated animal.

Separate AIM simulations were created and run for each marine mammal species and modeling scenario. During each of these modeling iterations or runs, animats were randomly distributed over the modeling area (Figure 1), and the predicted sound received level was estimated every 30 seconds (sec) for each animat, which resulted in a sound exposure history over the modeled duration of the seismic activity. The animat model area was chosen to be the area that encompassed received levels of 120 dB SPL and above in the acoustic propagation modeling, with an additional nominal buffer added to each side of the modeling area. This ensured that the animats were distributed throughout the modeled sound field and would receive sound levels below the lowest acoustic threshold being assessed, which was 120 dB SPL. At each 30-sec time step, every animat was moved according to the programmed rules describing each marine mammal species' behavior, and the received sound level for each animat is recorded (in the same units that were used to specify the source level, e.g., dB rms, SEL or peak). At the end of each time step, the environment of each animat was evaluated, including its three-dimensional (3D) location. If an environmental variable exceeded the user-specified boundary value (e.g., the animat moved into water that is too deep), then the animat altered its course to respond to the environment. There are many ways in which animats can be programmed to depict realistic behavioral reactions to such elements of their physical environment, including bathymetry or geographic boundaries. These programmed behaviors may lead to some animats "reflecting" off the simulation area boundary as no animals are allowed to diffuse outside the model simulation area. Thus, the appropriate density of animats is maintained throughout the simulation.

Marine mammal animats populated the model area with nominal densities. The modeled animat density was higher than the real-world density estimated for a given species. This "over population" ensures that the result of the animat model simulation was not unduly influenced by the initial animat placement and provides statistical robustness. A density of 2 animats/square km was used in the modeling.

4.1.2 ANIMAT MODEL OUTPUT

AIM simulates realistic 4D animal movements (3D space and time) and records each animats received level at each time step to create the animats' exposure history. The output of an AIM simulation is the time history of acoustic exposure for each animat. For this modeling effort, the exposure history provides the received level for each modeled animat every 30 sec for the duration of the seismic survey. Animat exposure histories for metrics of maximum sound pressure level, maximum peak sound pressure level, and sound exposure level were generated and used to estimate the exposure ranges of each species for each modeled scenario.

4.1.3 EXPOSURE RANGE ESTIMATION

Exposure ranges to acoustic thresholds are calculated using the results of the animat movement modeling. As each animat moves through the acoustic sound field during an AIM simulation, the predicted received sound level is recorded, along with the distance of the animat from the sound source. The cumulative SEL, maximum peak SPL and maximum SPL for each animat is calculated over the duration of the seismic survey. The modeled animats that have predicted sound levels that exceed the regulatory thresholds for the modeled taxa are identified, and the range to those animats' closest point of approach (CPA) (i.e., minimum distance between each animat and the acoustic source) is determined, producing a distribution of ranges. The 95th percentile of these distances is defined as the exposure range.

5 SPECIES SPECIFIC BEHAVIOR PROFILES

As explained in Section 4.1.1, animats are based on real-world animal behavior. Therefore, it is necessary to research the swim and dive behavior for all species included in a project. Animats are programmed using maximum and minimum dive depth and duration, surface time, dive angle (ascent and descent), swim speed, water depth preferences, and heading variance and turn time. This section provides swim and dive behavior profiles for the two species of interest in this study—pygmy blue whales and southern right whales.

5.1.1 PYGMY BLUE WHALE BEHAVIOR PROFILES

Pygmy blue whales (*Balaenoptera musculus brevicauda*), a subspecies of blue whales living in the Southern Hemisphere, are listed as Data Deficient (Not Evaluated) on the International Union for Conservation of Nature (IUCN) Red List and Endangered under the Commonwealth Environmental Protection and Biodiversity Conservation Act 1999 (EPBC Act) (Australian Government, 2015; International Whaling Commission, 2025). Pygmy blue whales are found in the Indian Ocean, along the east coast of southern Africa, and around Australia, New Zealand, and Indonesia (McCauley et al., 2018).

Blue whales are the largest animal on Earth, and their diet mainly consists of krill (NOAA, 2025). Like most baleen whales, pygmy blue whales feed during the austral summer and autumn and spend their winters at higher latitudes in warmer waters for breeding (NOAA, 2025). Because the study area overlaps with a known foraging area for pygmy blue whales, only foraging behaviors were considered in this species' profile (Australian Government, 2015).

Foraging behavior data on pygmy blue whales is scarce, so animat behavior is derived from blue (*Balaenoptera musculus*) and pygmy blue whales. A single, tagged migrating pygmy blue whale off the western coast of Australia had a mean maximum feeding depth of 129±183 m (range 13-505 m) and mean dive duration was 7.6 min; however, the individual had deep and shallow feeding bouts and mean dive times were 11.4 min and 5.2 min, respectively (Owen et al., 2016). Bimodal dive times were also recorded in tagged pygmy blue whales in the eastern Indian Ocean—dive times were between 0.2 and 16.8 min, but most were 3 to 5 min or 10 to 12 min (Davenport et al., 2022). Tagged blue whales off southern California's, USA coast had similar

mean maximum nighttime dive depths (between 90 and 130 m) compared to the induvial pygmy blue whale in Owen et al. (2016); however, when separated by sex, female blue whales routinely dove deeper than males (Irvine et al., 2019). Consequently, two animats were created for pygmy blue whales: Male and Female. Mean surface time between dives is approximately 2.5 min (range: 10 s to 6.7 min) (Davenport et al., 2022; de Vos et al., 2013; Goldbogen et al., 2011). Blue whales generally have the same mean body angle during ascent (42°) and descent (-38°) (Goldbogen et al., 2011). Lastly, lunge speeds can reach 18 km/h, but swim speeds are most commonly between 1 and 10 km/h (Goldbogen et al., 2011; Möller et al., 2020; Owen et al., 2016).

Blue whales and pygmy blue whales produce infrasonic signals between 10 and 20 Hz, and up to 200 Hz, and these signals can be heard across ocean basins (Cummings and Thompson, 1972; Ketten, 2000). Consequently, they are sensitive to low-frequency sounds (< 1 kHz) (Goldbogen et al., 2013; Melcon et al., 2012; Southall et al., 2019).

5.1.2 SOUTHERN RIGHT WHALE BEHAVIOR PROFILES

In the U.S., Southern right whales are listed as endangered under the Endangered Species Act and depleted under the Marine Mammal Protection Act; and they are listed as Endangered in Australia under the EPBC Act (WWF-Australia, 2018) and as Least Concern on the IUCN Red List (Cooke and Zerbini, 2018).

Southern right whales are found throughout the Southern Hemisphere and like many baleen whales, they feed during the austral summer in high-latitude feeding grounds in the Southern Ocean and spend their winters in low-latitude breeding grounds (NOAA, 2024). The survey area of this project overlaps with a reproductive Biologically Important Area (BIA) for southern right whales (DCCEEW, 2022; Austin, 2021). Sightings of mother/calf pairs have been documented in the survey area (Stamation et al., 2020) to rest and briefly forage mid-migration. The behavior of mother/calf pairs can be different from solo adults—inhabiting shallower waters, spending more time resting and/or at the surface, slower swim speeds (Payne, 1986; Hain et al., 2013; Cusano et al., 2019; Nielsen et al., 2019a). Consequently, four behavioral profiles were included for this species—foraging adult without calf, foraging adult with calf, migrating adult without calf, and migrating adult with calf.

The four southern right whale animats were created using data from tagged North Atlantic (NARW) and Southern right whales (SRW) due to the plethora of information on NARW and less abundant data on SRW. Baumgartner and Mate (2003) did not observe significant dive depth differences between NARW adults with and without calves in feeding grounds, but Dombroski et al. (2021) observed significant dive depth differences on calving grounds (12.1 vs 7.3m). Feeding dives for NARW were between 80-175m, with the majority (90%) between 113 and 130m (Baumgartner and Mate, 2003) and feeding SRW off Argentina dove to a maximum of 115 m (to the seafloor) and calves were observed with their mothers at depth too (D'Agostino et al., 2024); however, in a breeding ground, feeding dives did not exceed 20 m due to the shallower waters of those areas (Dombroski et al., 2021). Traveling speeds also do not differ

much between a mother/calf pair and solo adult; average travel speed for both is between 2.5 and 3.5 km/h with maximum swim speeds up to 8 km/h (Baumgartner and Mate, 2003; Barendse and Best, 2014; Nielsen et al., 2019b; Mackay et al., 2020). Aggregating and feeding speeds are slightly slower than travel speeds (Dombroski et al., 2021). Though not always significant, adults with calves spend more time at the surface than adults without calves (Baumgartner and Mate, 2003; Dombroski et al., 2021). Surface intervals for foraging calves and females with calves averaged ~5.5 min whereas surface intervals for all other individuals excluding the pregnant female averaged ~3 min (Baumgartner and Mate, 2003), and for 0m,.lactating (adults with calf) versus non-lactating (adults with no calf) adults on a breeding ground, average surface times were 2.5 and 3.5 min, respectively (Dombroski et al., 2021). Lastly, feeding dive times range from 2 to 16 min, but on average last 7 to 12 min (Baumgartner and Mate, 2003; D'Agostino et al., 2024) and no difference in dive times was observed between females with and females without calves (Baumgartner and Mate, 2003).

There is no audiogram for southern right whale hearing; however, like other baleen whales, southern right whales are considered low-frequency hearing specialists (Sprogis et al., 2023). SRW produce a variety of different sounds (e.g. upcalls, downcalls, constant calls, high calls, hybrid calls and pulsive calls), most of which are between 10 and 500 Hz (Cummings et al., 1971; Clark 1982; Ward et al., 2014).

6 ANIMAT EXPOSURE RANGES

The results of the animat movement modeling in the form of exposure ranges to each of acoustic metrics for the two source types for pygmy blue whales (Table 3) and the southern right whales (Table 4) are provided. The results generally show longer ranges to the AUD INJ and TTS SEL and SPL thresholds for Scenario C compared to Scenario D for both species, except for a few cases where the ranges are the same between Scenario C and D. The ranges to the AUD INJ, TTS, and SPL thresholds due to the use of the Conventional source are larger compared to the use of the Bluepulse source.

Table 3. Summary of 95th percentile exposure ranges (km) estimated for pygymy blue whales due to the operation of Conventional and Bluepulse airguns. SEL thresholds have units of dB re 1µPa^{2}s and peak (PK) and SPL thresholds have units of dB re 1µPa.

Modeling Scenario	Airgun Type	Pygmy Blue Whale Animat Type	AUD INJ		TTS		SPL		
			183 dB SEL	222 dB PK	168 dB SEL	216 dB PK	120 dB	140 dB	160 dB
Scenario C	Conventional	Female	0.079	0.071	4.195	0.078	51.773	18.227	4.669
		Male	0.127	0.070	4.322	0.077	51.579	18.224	4.640
	Bluepulse	Female	0.069	0.058	2.124	0.073	48.746	17.391	4.270
		Male	0.069	0.055	2.182	0.073	48.161	17.391	4.255
Scenario D	Conventional	Female	0.071	0.060	2.334	0.071	37.935	11.259	2.463
		Male	0.073	0.059	2.054	0.071	36.406	11.294	2.424
	Bluepulse	Female	0.061	0.046	0.657	0.059	33.326	10.529	2.197
		Male	0.064	0.044	0.815	0.058	30.704	10.446	2.151

Table 4. Summary of 95th percentile exposure ranges (km) estimated for migrating and foraging southern right whales due to the operation of Conventional and Bluepulse airguns. SEL thresholds have units of dB re 1µPa²s and peak (PK) and SPL thresholds have units of dB re 1µPa.

Modeling Scenario	Airgun Type	Southern Right Whale Animat Type	AUD INJ		TTS		SPL		
			183 dB SEL	222 dB PK	168 dB SEL	216 dB PK	120 dB	140 dB	160 dB
Scenario C	Conventional	migrating - mother w/calf	0.077	0.068	3.484	0.077	49.670	18.421	4.606
		migrating - adult w/o calf	0.072	0.069	3.642	0.072	50.027	18.434	4.547
		foraging - mother w/calf	0.059	0.050	2.900	0.054	30.969	12.425	3.149
		foraging – adult w/o calf	0.069	0.057	3.754	0.059	32.364	12.838	3.355
	Bluepulse	migrating - mother w/calf	0.068	0.058	1.770	0.068	46.090	17.758	4.338

7 EXPOSURE RANGE HISTOGRAMS

The figures in this section show the distribution of ranges of the modeled animats to the source. Each subsection will contain histograms for each species showing the animats above AUD INJ and TTS SEL and SPL thresholds. The closest point of approach of all modeled animats to the source is shown by the grey bars. The red bars show the animats that were above the indicated threshold and the black dashed line indicates the 95th percentile exposure range that was reported for the species.

7.1 SCENARIO C (SITE 15)

7.1.1 PYGMY BLUE WHALES FEMALE

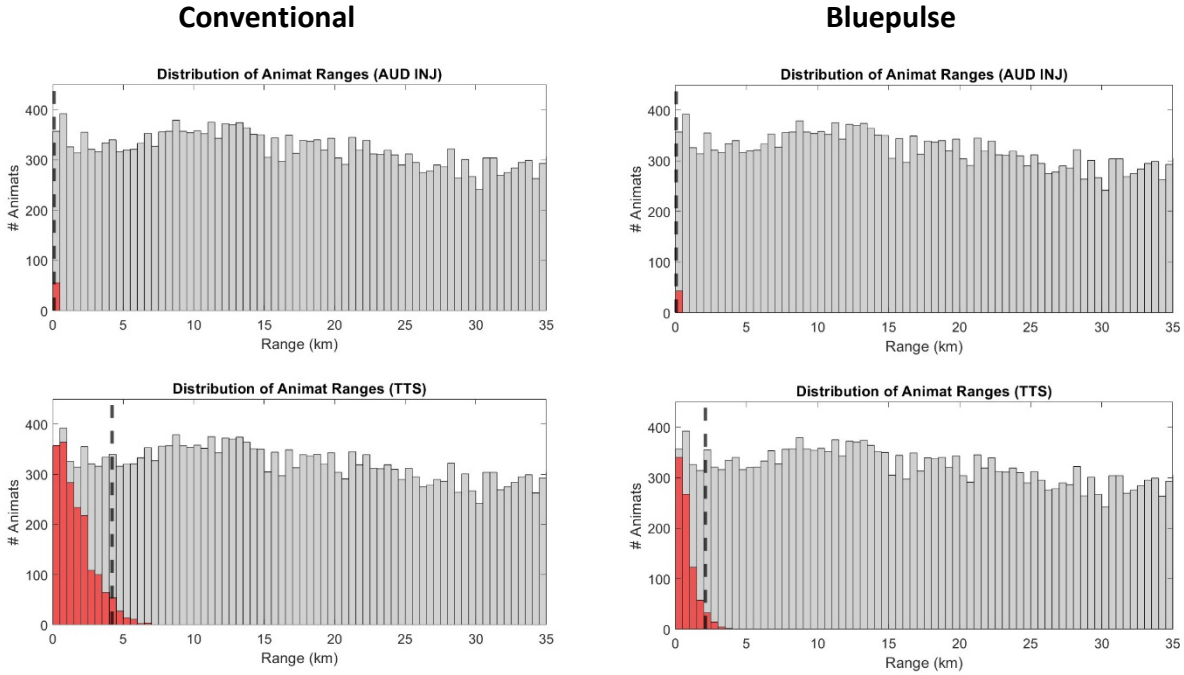

Figure 2. Histograms showing the distribution of ranges (km) of the modeled female pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

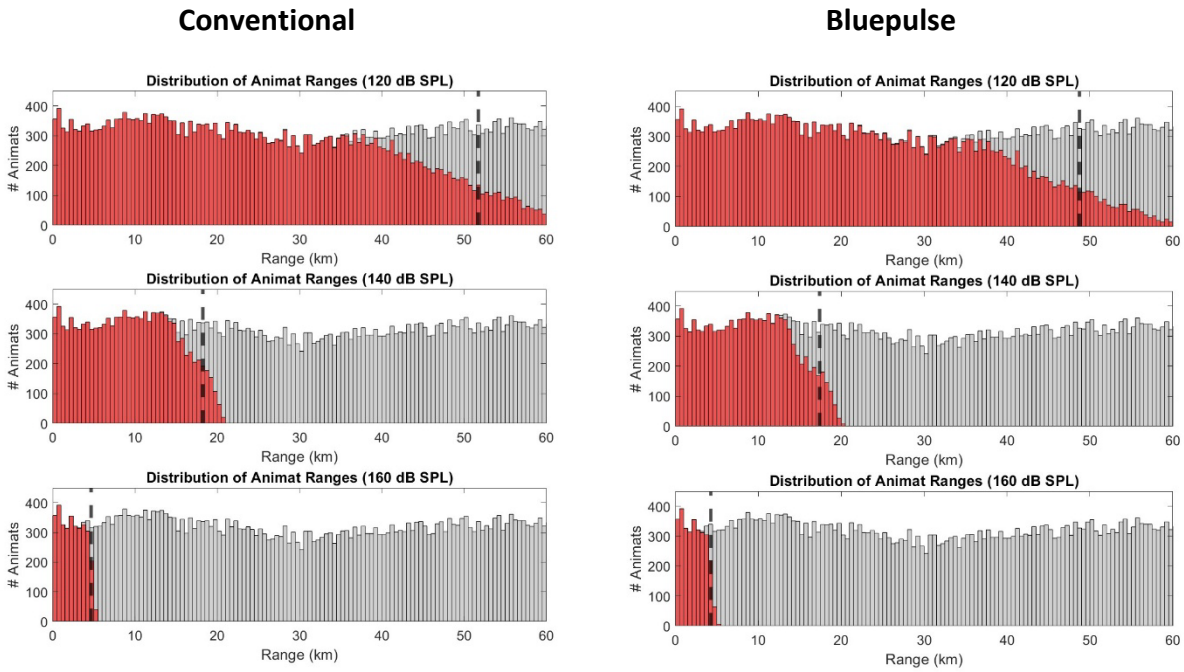

Figure 3. Histograms showing the distribution of ranges (km) of the modeled female pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.1.2 PYGMY BLUE WHALES MALE

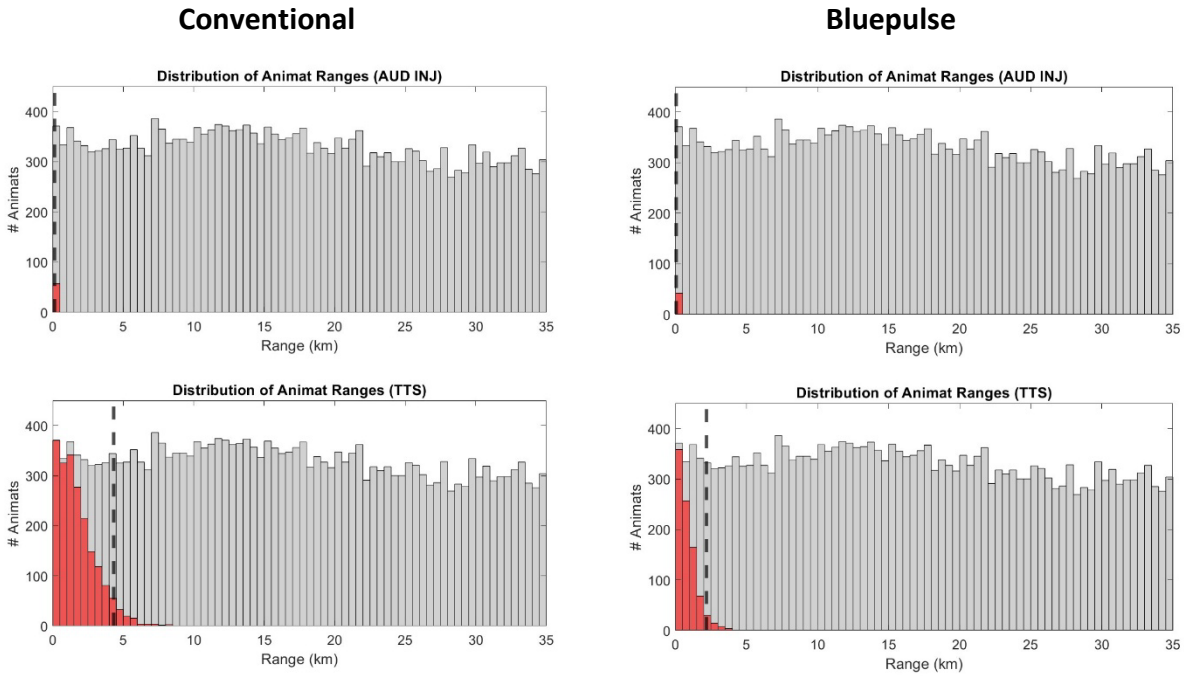

Figure 4. Histograms showing the distribution of ranges (km) of the modeled male pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

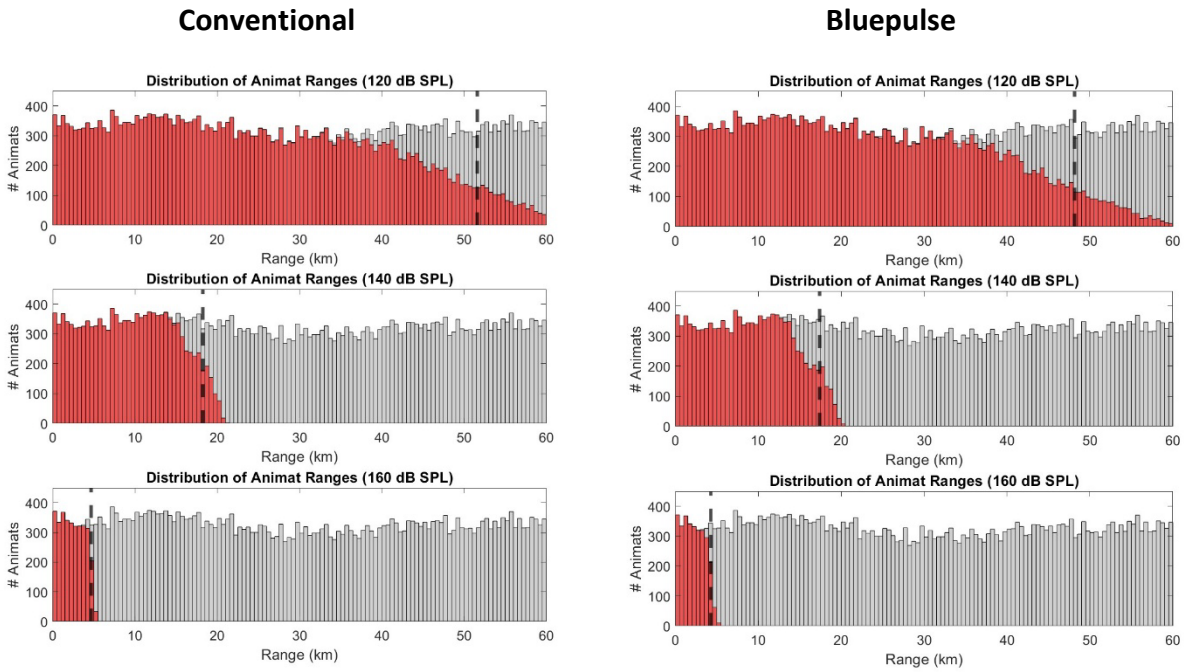

Figure 5. Histograms showing the distribution of ranges (km) of the modeled male pygmy blue whale animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.1.3 SOUTHERN RIGHT WHALES – MIGRATING WITH CALF

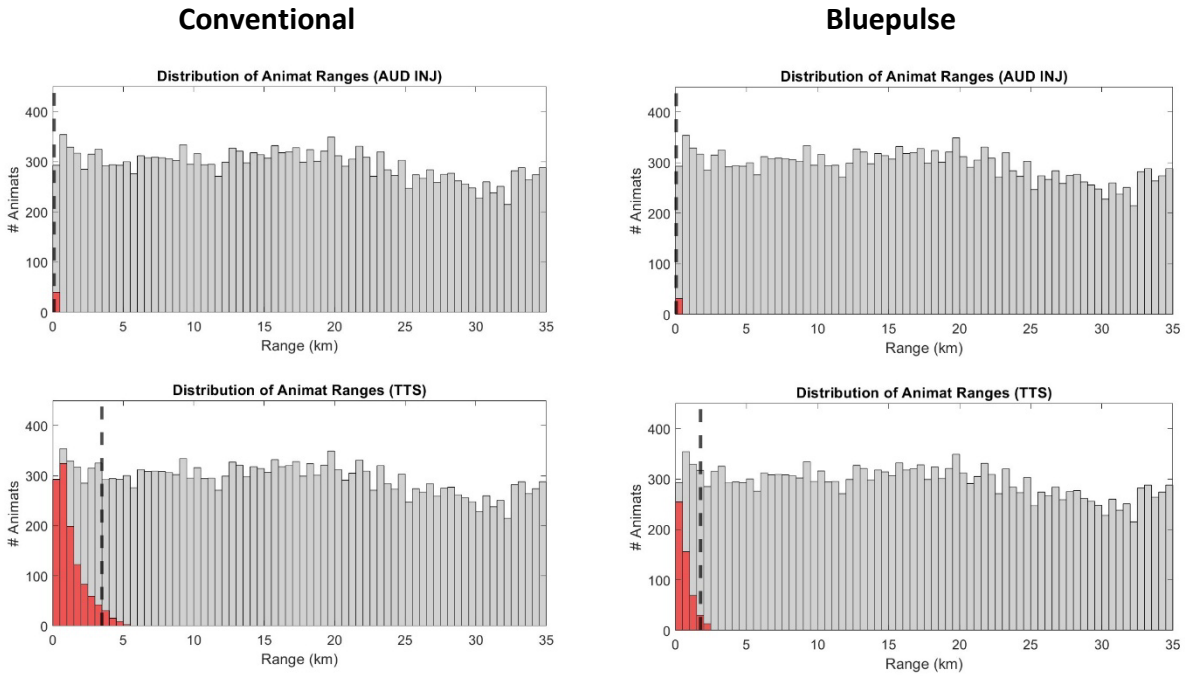

Figure 6. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale mother with calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

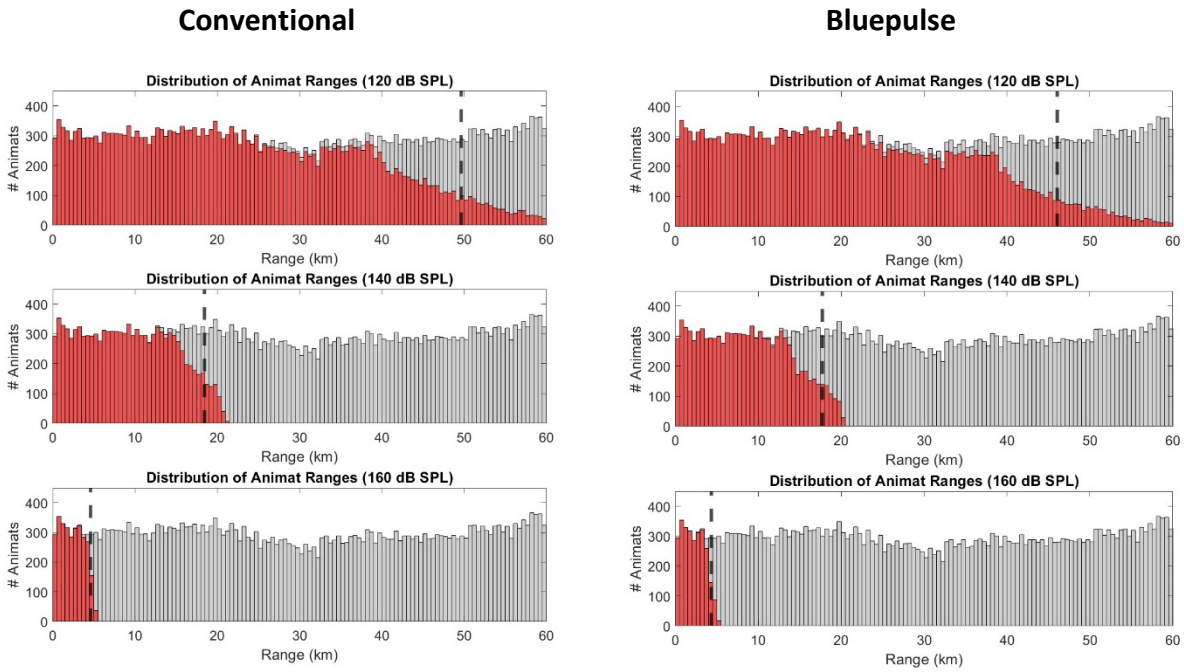

Figure 7. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale mother with calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.1.4 SOUTHERN RIGHT WHALES – MIGRATING WITHOUT CALF

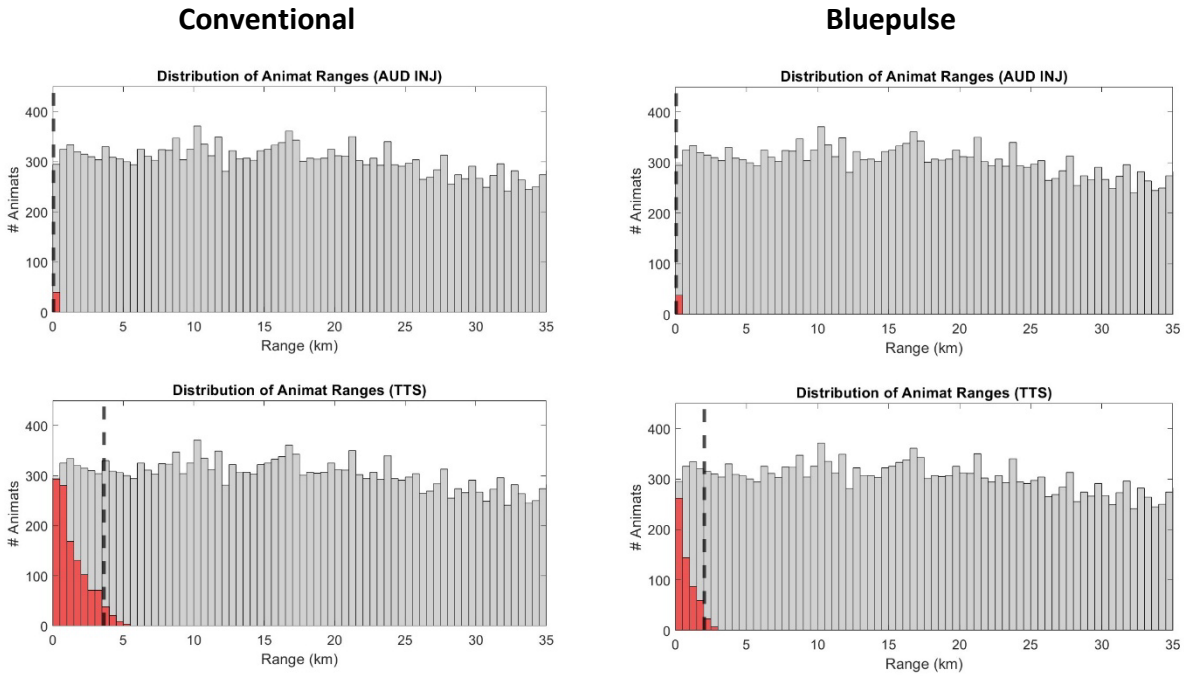

Figure 8. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale adult without calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

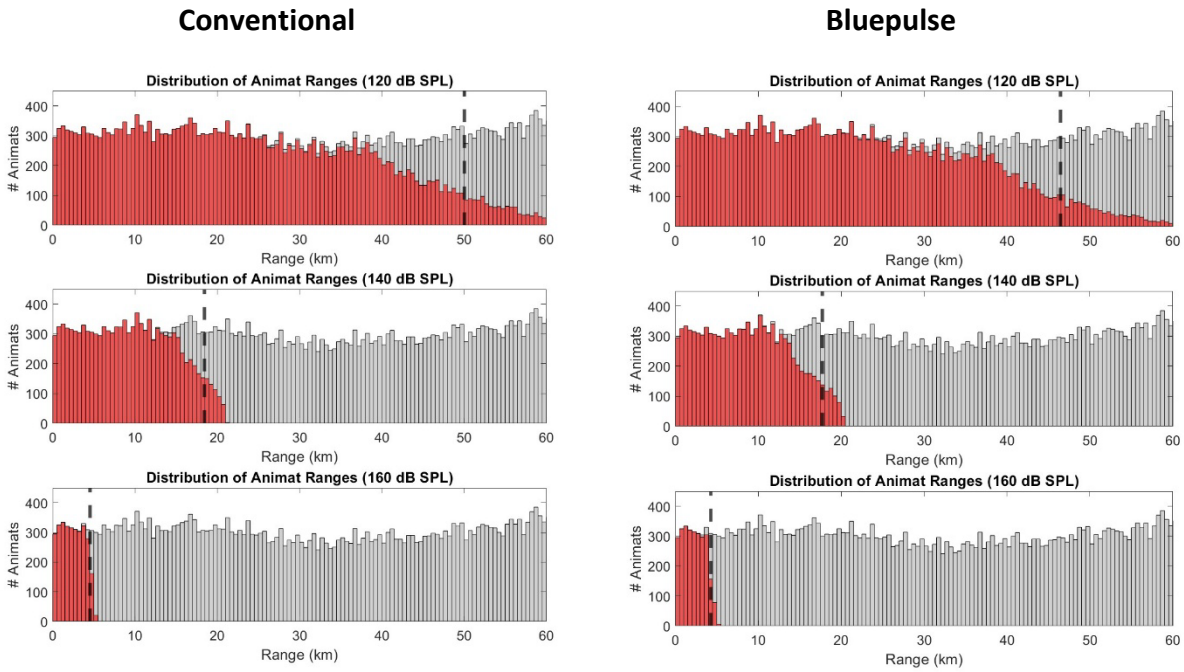

Figure 9. Histograms showing the distribution of ranges (km) of the modeled migrating southern right whale adult without calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.1.5 SOUTHERN RIGHT WHALES – FORAGING WITH CALF

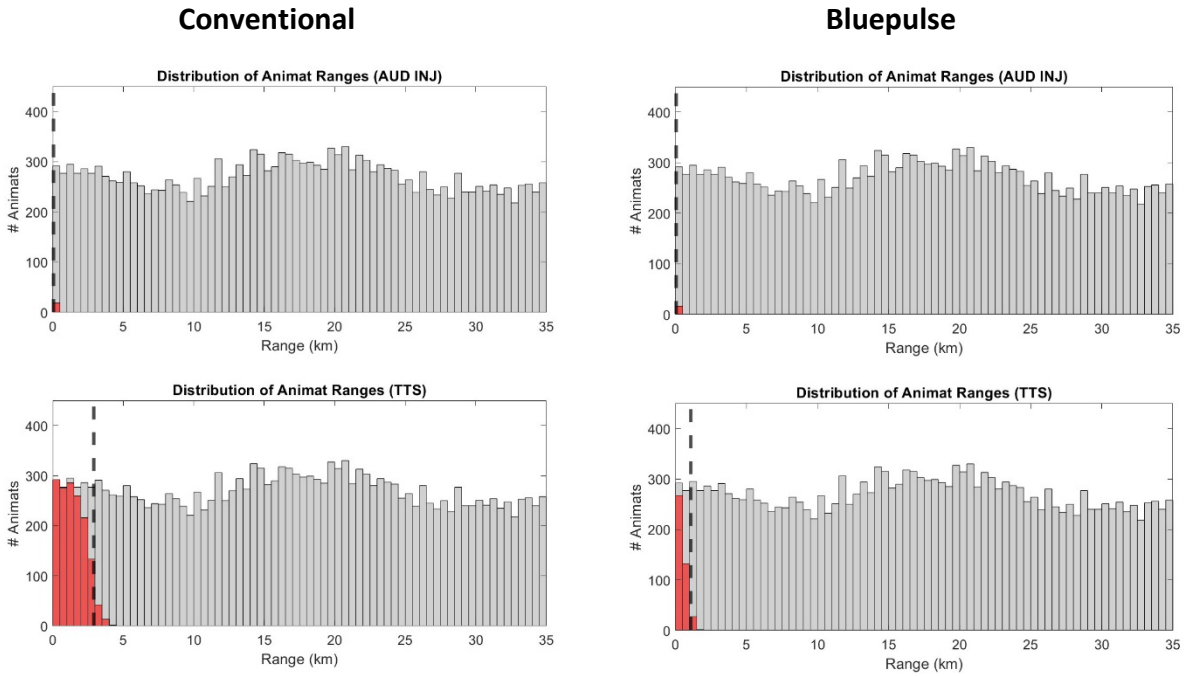

Figure 10.Histograms showing the distribution of ranges (km) of the modeled foraging southern right whale mother with calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

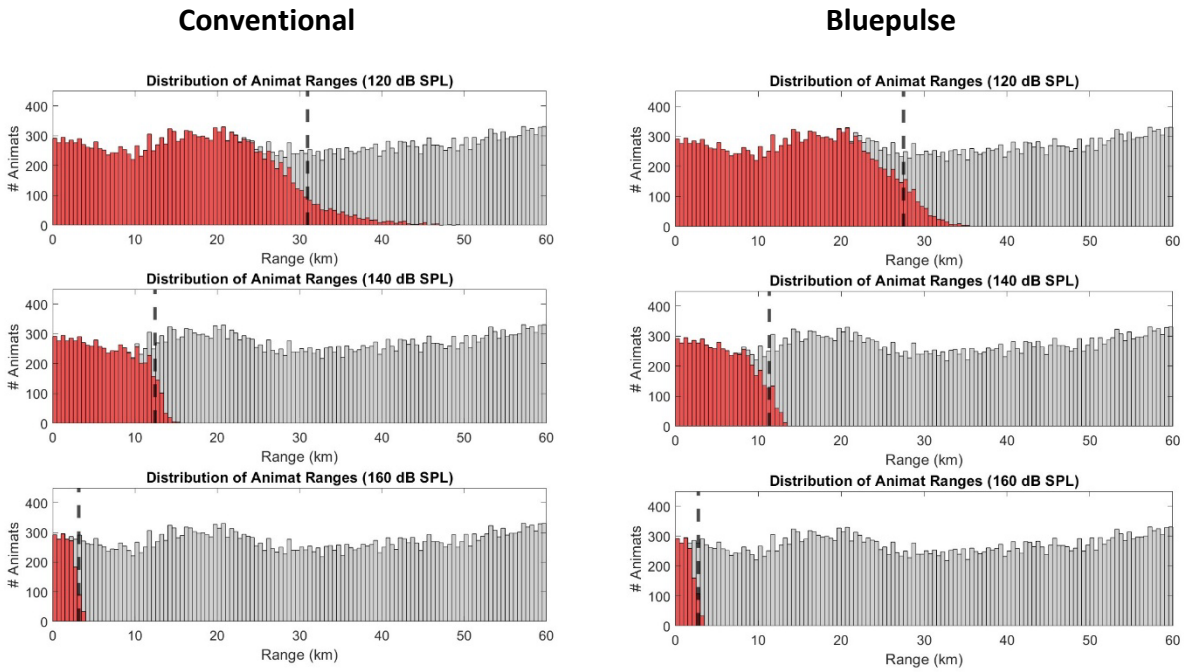

Figure 11. Histograms showing the distribution of ranges (km) of the modeled foraging southern right whale mother with calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.1.6 SOUTHERN RIGHT WHALES – FORAGING WITHOUT CALF

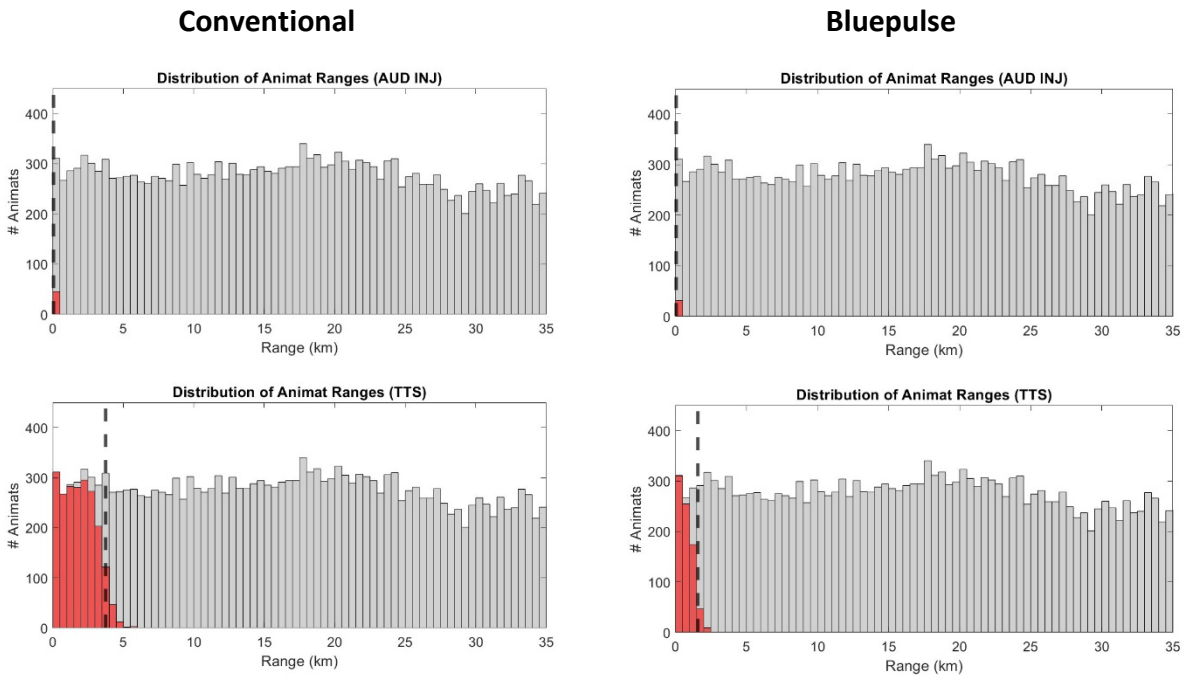

Figure 12. Histograms showing the distribution of ranges (km) of the modeled foraging southern right whale adult without calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

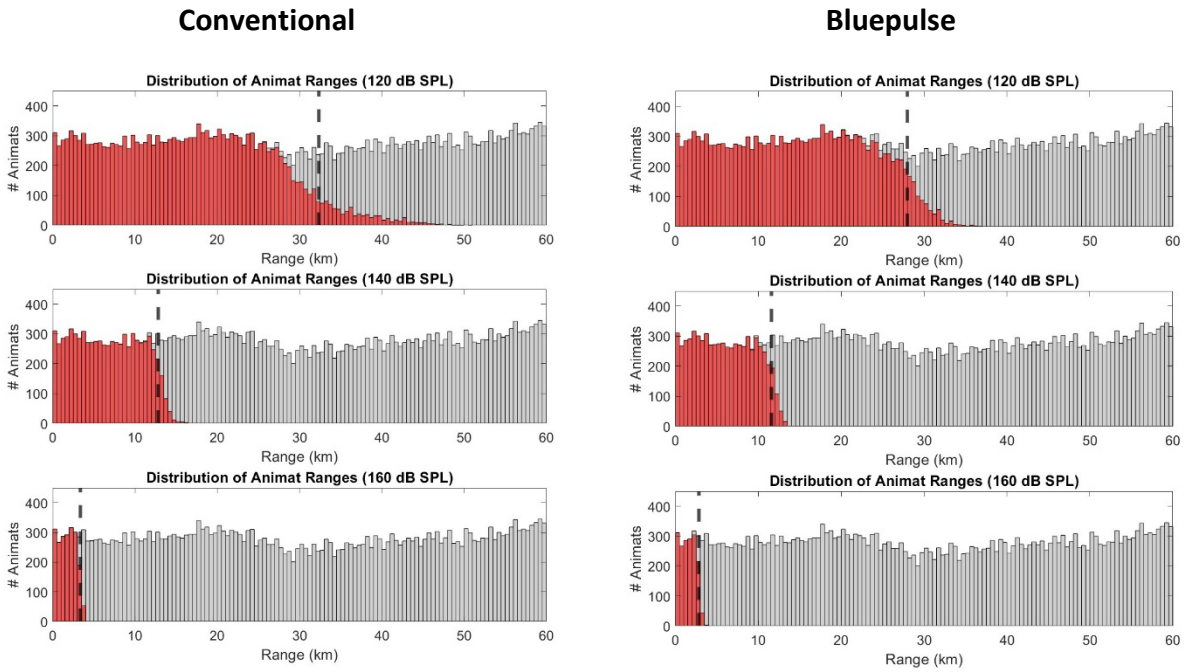

Figure 13. Histograms showing the distribution of ranges (km) of the modeled foraging southern right whale adult without calf animats from the source during Scenario C. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.2 SCENARIO D (SITE 7)

7.2.1 PYGMY BLUE WHALES FEMALE

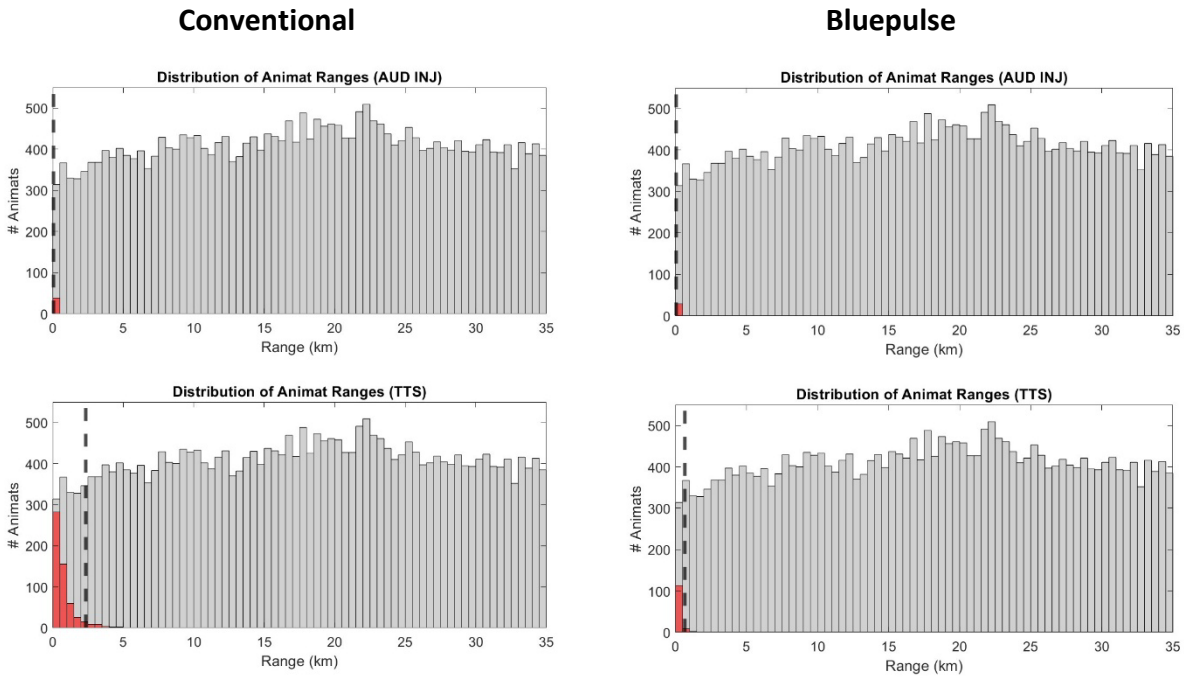

Figure 14. Histograms showing the distribution of ranges (km) of the modeled female pygmy blue whale animats from the source during Scenario D. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

7.2.6 SOUTHERN RIGHT WHALES – FORAGING WITHOUT CALF

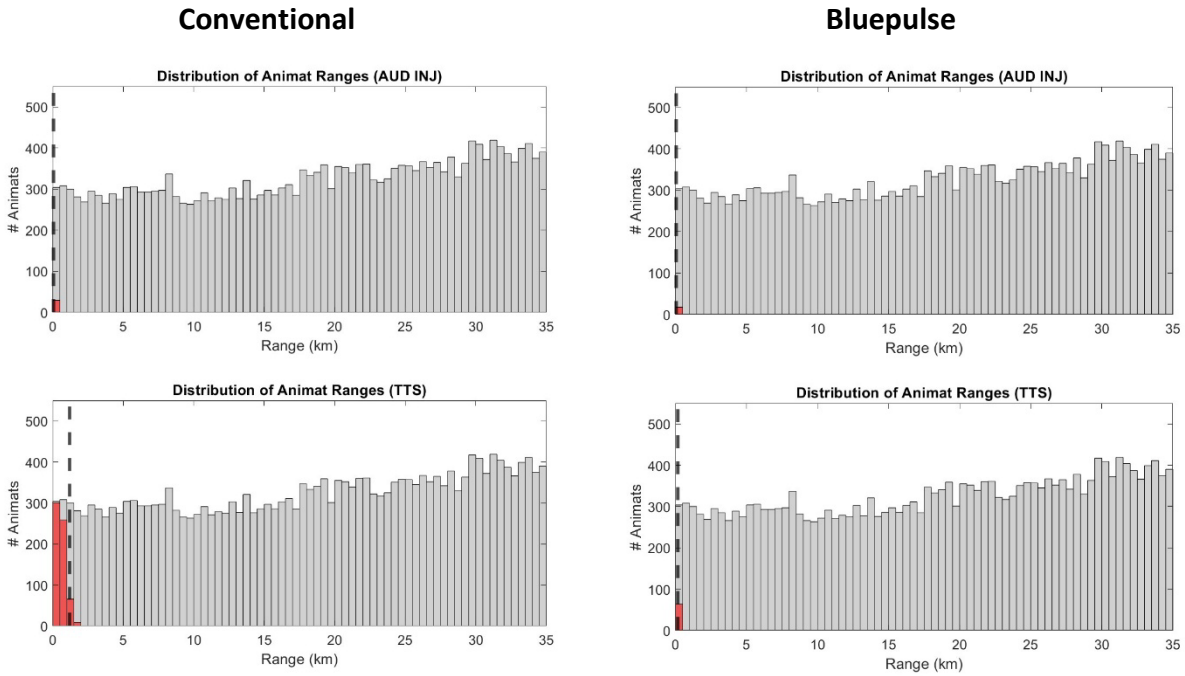

Figure 24. Histograms showing the distribution of ranges (km) of the modeled foraging southern right whale adult without calf animats from the source during Scenario D. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above AUD INJ (top) and TTS (bottom) SEL thresholds for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

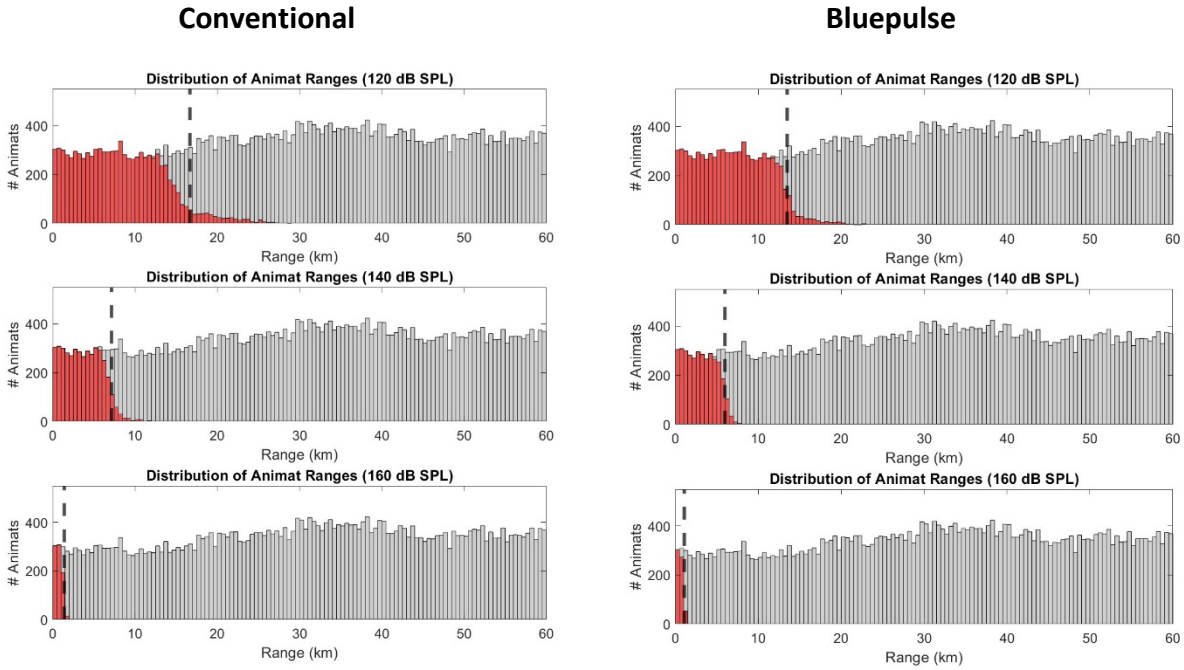

Figure 25. Histograms showing the distribution of ranges (km) of the modeled foraging southern right whale adult without calf animats from the source during Scenario D. Grey bars indicate the closest points of approach of all animats to the source and the red bars indicate the ranges at which the animats were above SPL thresholds of 120 dB (top), 140 dB (middle), and 160 dB (bottom) for the Conventional (left) and Bluepulse (right) airguns. Dotted black line indicates the 95th percentile range reported for this species.

8 DISCUSSION

This study modeled the acoustic impacts of two seismic airgun sources—Conventional and Bluepulse—on two endangered marine mammal species off southeast Australia—pygmy blue and southern right whale—at two different locations (Site 15/ Scenario C and Site 7/ Scenario D). Exposure ranges to AUD INJ SEL and PK, TTS SEL and PK, and SPL (120, 140, 160 dB) thresholds were modeled for each species' animats and for both seismic sources for both scenarios.

For pygmy blue whales, the 95th percentile exposure ranges for AUD INJ SEL and PK, TTS SEL and PK, and the three SPL thresholds were greater when the Conventional airgun was operating than when the Bluepulse airgun was operating for both Scenario C and D. Additionally, as expected, TTS SEL exposure ranges for both scenarios were larger than AUD INJ SEL, AUD INJ PK, and TTS PK ranges (Scenario C: at least 30x greater for Conventional, at least 29x greater for Bluepulse; Scenario D: at least 28x greater for Conventional, at least 10x greater for Bluepulse). The largest TTS SEL exposure ranges for female and male pygmy blue whales were 4.195 km and 4.322 km, respectively, when the Conventional airgun was used for Scenario C. AUD INJ PK and TTS PK exposure ranges were relatively similar (within 20 m of each other) between airgun sources for both Scenarios and for male and female pygmy blue whales. For both Scenarios and

airgun type, the exposure ranges were similar between the male and female pygmy blue whale animats (< 600 m difference), except for the SPL 120 dB exposure ranges for Scenario D (> 1.5 km difference for Conventional; > 2.5 km difference for Bluepulse). Lastly, AUD INJ and TTS PK and SEL exposure ranges for male and female pygmy blue whales exposed to either airgun type for both Scenarios were substantially smaller than the exposure ranges to SPL 120 and 140 dB thresholds (120 dB threshold range: 30.704 to 51.773 km; 140 dB threshold range: 10.446 to 18.227 km) and usually smaller than the SPL 160 dB threshold (range: 2.151 to 4.669 km).

Similar 95th percentile exposure range patterns were observed in southern right whales. AUD INJ SEL and PK, TTS SEL and PK, and the three SPL threshold exposure ranges were larger when animats were exposed to the Conventional airgun than the Bluepulse airgun for Scenario C and D. AUD INJ SEL, AUD INJ PK, and TTS PK exposure ranges were similar for all scenarios regardless of southern right whale animat type, airgun type, or Scenario (i.e. site) (ranges were 46 to 77 m for AUD INJ SEL, 23 to 69 m for AUD INJ PK, and 38 to 77 m for TTS PK). Unsurprisingly, AUD INJ SEL and TTS SEL exposure ranges were larger than AUD INJ PK and TTS PK exposure ranges for all animat types; however, AUD INJ SEL exposure ranges were only slightly larger than AUD INJ PK exposure ranges (< 25 m difference). The largest exposure ranges were TTS SEL exposure ranges for Scenario C, which ranged from 1.087 to 3.754 km. Additionally, AUD INJ SEL, TTS SEL, and all three SPL threshold exposure ranges were larger for migrators than foragers likely because they're spending more time at depth than the foragers. Lastly, the SPL 120 dB threshold exposure ranges were at least 10x greater than the SPL 160 dB exposure ranges for each animat scenario.

APPENDIX A: ANIMAT MODELING PARAMETERS

A-1. Parameters that Define Animat Movement in AIM

Animals move through four dimensions: three-dimensional space and time. Several parameters are used in AIM to produce simulated movements that accurately represent expected real animal movement patterns. This section provides short descriptions of the various parameters, with nominal values as examples of how the parameters are implemented in AIM. When scientific papers or reports contain numeric descriptions of movement behaviors (e.g., dive times), these numeric values are added to the MAI Animat Movement Library. This compendium of movement values for each marine mammal species is then interpreted by a MAI subject matter expert to derive a set of summary values that represent each species/modeling group/behavioral state.

A-2. Marine Mammal Diving Patterns

Diving parameters, such as time limits, depth limits, heading variance, and speed, are specified for each animat in the AIM model (Figure A-1). As an example, a dive pattern is presented that consists of a shallow, respiratory sequence (Figure A-1) followed by a deeper, longer dive (bottom row of Figure A-1). The horizontal component of the dive is handled with the "heading variance" term, which allows the animal to change course up to a certain number of degrees at each movement step. For this example, the animal can change course 20° during a shallow dive and 10° during a deep dive (Figure A-1). Using the defined diving parameters, AIM generates realistic dive patterns (Figure A-2).

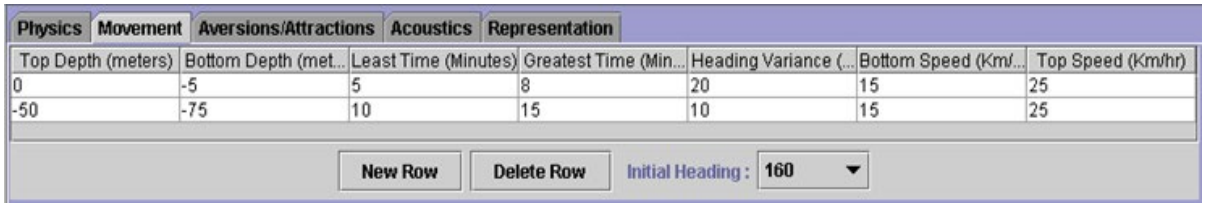

Figure A-1. Example of AIM marine mammal movement parameters, with the top row showing the parameters of a shallow, respiratory dive (diving from surface to 5 m for 5 to 8 min) and the bottom row showing a deeper, longer dive (diving between 50 and 75 m for 10 to 15 min).

A-3. Aversions

In addition to movement patterns, animats can be programmed to avoid certain environmental characteristics (Figure A-3). For example, aversions can be used to constrain an animal to a particular depth regime. (e.g., an animat can be constrained to waters between 2,000 and 5,000 m deep). An animat will continue to turn until the aversion is satisfied. In this example,

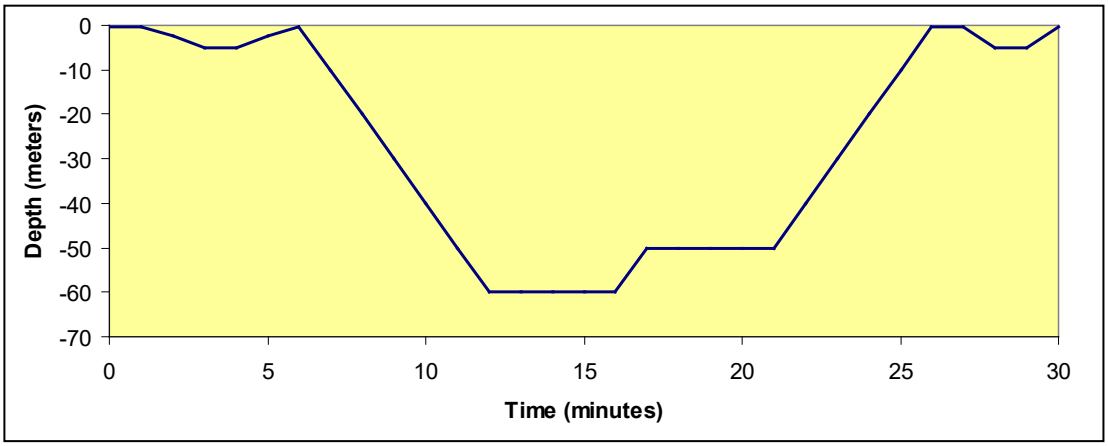

Figure A-2. Marine mammal dive pattern based on animat data in Figure A-1. The animat makes a shallow dive from the surface to 5 m for approximately 6 min, surfaces, and then makes a deep dive to 60 m for about 5 min, changes depth to 50 m for another 5 min, and then surfaces.

animat makes 20° turns in water depths shallower than 2,000 m or deeper than 5,000 m to remain within that depth range.

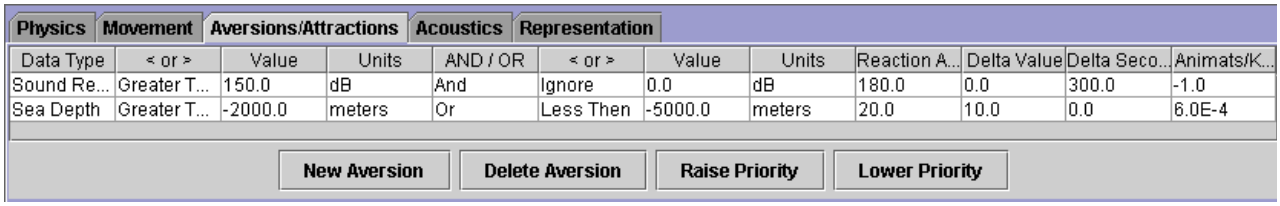

Figure A-3. Example of depth aversion parameters for modeling of marine mammal movements.

A-4. Heading Variance

There is little data that summarizes movement in terms of heading variance, or the amount the course of the animal changes per unit time. Therefore, the default value used in the modeling is 30 degrees. Exceptions are made for migratory animals, which tend to have more linear travel; therefore, these animals typically are assigned a value of 10 degrees. Foraging animals tend to have less linear travel, as they may be trying to remain within a food patch. Therefore, foraging animals are assigned a higher heading variance value, typically 45 to 60 degrees.

These types of data have been reported in the literature as “linearity”, “tortuosity” and “meander” (Soule and Wilcock, 2013). “Meander” is defined as the ratio of the total distance along the smoothed path to the net distance traveled; a value of 1 would indicate a straight path.

A-5. Residency

The amount of time that an animal spends in an area can have a tremendous influence on how the animal samples an acoustic field. For example, individuals displaying high residency in the area of a localized noise source will experience higher exposures than animals that transit once

through that area. However, since the animat exposure models are run for a 24-hour period, in accordance with the NMFS 24-hour reset rule, the effect of residency in animat modeling is minimized.

A-6. Parameters of Marine Mammal Movement Behaviors Used in Impact Analysis

Dive and swim speed information for each marine mammal or marine mammal group is a critical component of accurately and realistically modeling marine mammal movements when assessing potential exposure to underwater acoustic sound. All parameters except speed use a uniform distribution between the minimum and maximum values. Speed parameters include the minimum and maximum as well as the statistical distribution used to select speed values. Options include a normal distribution and a gamma distribution. When gamma distributions are specified, they are typically the result of fitting to an existing dataset. The mean of the normal distribution is also the mean of the minimum and maximum speed. The minimum and maximum values are four standard deviations below or above the distribution mean.

1 Introduction

Marine fauna use sound in a variety of functions, including social interactions, foraging, orientation, and responding to predators. The type and scale of effect of seismic sound emissions on receptors depends on several factors including the level of exposure, the physical environment, the location of the receptor in relation to the seismic source, how long the receptor is exposed to the sound, the exposure history, how often the sound repeats (repetition period) and the ambient sound level.

This document provides a summary of the available information that will be used to inform the acoustic impact assessment for the Regia Marine Seismic Survey (Regia MSS).

1.1 Baseline Soundscape in the Otway

Ambient noise in the ocean is the background sound that incorporates the broad range of individual sources, some identified and others not. There are three frequency bands under which different noise sources are generally categorised: low (10 to 500 Hz), medium (500 Hz to 25 kHz) and high (>25 kHz). The low-frequency band is dominated by manmade (anthropogenic) noise sources, with the primary source of low-frequency anthropogenic noise coming from commercial shipping. Seismic exploration also falls under this low-frequency band. Both commercial shipping and seismic sources contribute to ambient noise across ocean basins, as low-frequency sound experiences little attenuation, allowing for long-range propagation. The highest levels of ocean ambient noise within the band of interest (10 Hz to 100 kHz) are seen at low frequencies (Hildebrand 2009) For context and visualisation, Figure B8-1 below provides a general comparison of various sound sources as per their frequency and sound-type (natural, impulsive or continuous).

Because of greater attenuation, medium frequency sound cannot propagate over long distances, and only regional (10s of km distant) sound sources contribute to the ambient soundscape. Breaking waves, sea-surface agitation, spray, bubble formation and collapse, and rainfall are some of the main natural factors contributing to the makeup of ambient noise in the mid-frequency band. Other sources such as military sonars and small vessels also contribute anthropogenic noise at mid-frequencies. At high frequencies, acoustic attenuation becomes extreme so that all noise sources are confined to a localised region in close proximity to a receiver. Thermal noise is the dominant noise source above about 60 kHz (Hildebrand 2009). Other sources that significantly contribute to the natural marine ambient soundscape across all frequency bands include cetaceans, fish, and snapping shrimp.

Ambient sound sources and levels in the Otway Basin have been studied and measured as part of previous impact assessment activities for the petroleum industry. We describe these assessments below.

In a desktop review conducted by McCauley and Duncan (2001) to investigate the underwater sound sources likely to be prevalent in the Otway Basin, they concluded that natural noise sources are dominated by wind, rain, biological sources, and sporadic noise from earthquakes. Anthropogenic noise was found to be mainly derived from vessel traffic, both commercial and small, petroleum production, exploration drilling activities, and sporadic seismic surveys.

Erbe et al. (2016) present some key detections by the Integrated Marine Observing System (IMOS), where underwater sound was recorded in a region south of Portland, Victoria. Leading sound sources identified in these recordings included Antarctic and pygmy blue whales, fin whales, ship noise (at 20-200 Hz), and fish noise (at 1-2 kHz).

A sound monitoring study in the Gippsland Basin, Bass Strait indicated that the primary sources of background noise were wind, rain, and current and wave-associated sound. Considerable variation in background sound was observed at these study locations, but low frequencies reportedly dominated (Przeslawski et al. 2016a).

As part of a study to gain an understanding of the soundscape in the marine environment for a petroleum development project in the Otway, Woodside Petroleum Limited placed a noise logger in a shipping lane approximately 60 km south of Port Fairy, Victoria (Woodside 2003 cited in Beach 2024). This part of the study was conducted between November 2001 and March 2002 with the following results observed:

- Regular transiting of boats.
- Regular fish choruses throughout the dawn, day, and evening.
- Persistent blue whale calling that spanned several hours.
- Whale-calls from at least three other whale species.
- Baseline broadband underwater noise for the duration of the test was between 93 and 97 dB 1 µPa. Shipping increased the average noise level to above 105 dB re 1 µPa for 6% of the duration during which the logger was deployed.

JASCO Applied Sciences (Australia) recently conducted a study for Beach Energy Ltd with the aim of providing an acoustic characterisation of the offshore petroleum activity (drilling) and associated vessel activity within the Otway Basin. Results from a recorder stationed farthest from the rig (25 km) indicated median broadband ambient noise was 104.5 dB re 1 μ Pa, with a mean of 118.3 dB re 1 μ Pa, Noise levels ranged between 86.6 dB re 1 μ Pa, and 153.6 dB re 1 μ Pa (Beach 2024).

1.1.1 Regia MSS Operational Area Soundscape

In addition to natural sources of ambient sound as described previously, there are also anthropogenic activities that are expected to emit sound in the Regia MSS Operational Area. Sources of anthropogenic sound known to occur in this region of the Otway Basin include both permanent and temporary activities such as shipping traffic, commercial fishing and recreational activities, petroleum development/production and exploration-drilling activities and sporadic petroleum seismic surveys.

The nearest point sources of industrial noise are associated with existing offshore gas fields. These include the Beach Energy Otway Development which comprises subsea infrastructure and the Thylacine-A unmanned platform. and also, the Cooper Energy Casino Henry Netherby Development consisting of subsea infrastructure (Appendix B12 MAP-REG-EPM-082). Across an entire gas exploration program of which the Regia MSS is one component, there is the potential for sound-emitting exploration and development activities such as infrastructure maintenance and repairs, seabed surveys, seismic surveys, drilling, and installation of infrastructure using vessels and drill rigs, all in support of ongoing energy supply of gas and potentially renewables within the Otway Basin.

The main shore-based sources of industrial noise are at Portland (Victoria), where the Alcoa Aluminium Smelter operates, and the Port of Portland which handles the import and export of bulk commodities.

Noise will be generated from two primary sources during the Regia MSS: the survey vessel, and the active sound source. The active sound source typically generates much higher noise levels than the survey vessels and is predicted to dominate overall underwater sound emissions at times when data acquisition is occurring. The frequency of the sound produced from each seismic pulse is primarily less than 2 kHz, with the highest levels at frequencies in the range of 10-500 Hz (McCauley 1994). This frequency band is notably comparable with that described by Erbe et al. (2016) to have been related to ship noise at the IMOS site at Portland, Victoria.

While the soundscape will be altered during the Regia MSS, this effect is transient and will cease once the MSS is completed. Sound levels will return to natural levels with no expected lasting or long-term changes. While the change to ambient sound has been assessed as minor and, temporary, a change to the ambient soundscape nevertheless has the potential to impact several biological receptors. Impacts to these biological receptors from underwater sound have been assessed independently in appendices E2-E7.

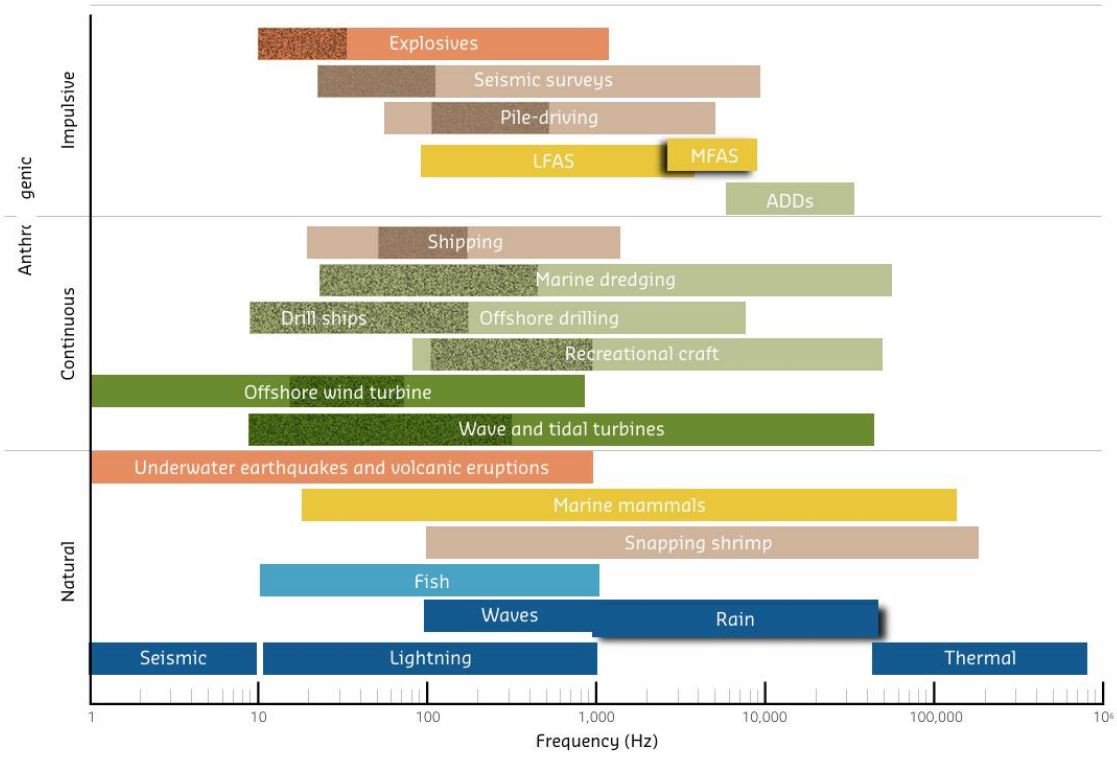

Figure B8-1: Comparison of sound sources, where the order shows the relative sound pressure levels (dB) of the noise sources and the colour code allows comparison of the levels between categories: orange (represents the highest dB level) to dark blue (represents lowest dB level). The areas with hatching indicate the frequency range with most energy. MFAS = medium frequency active sonar, LFAS = low frequency active sonar, ADD = acoustic deterrent device (Thomsen et al. 2021).

1.2 Overview of Seismic Acoustic Emissions

When underwater objects vibrate, they create sound-pressure waves that alternately compress and decompress the water molecules as the sound wave travels through the sea. Sound waves radiate in all directions away from the source like ripples on the surface of a pond. The compressions and decompressions associated with sound waves are detected as changes in pressure by the receiver.

Sound moves at a faster speed in water than in air because the mechanical properties of water differ from air. The reference level used in air (20µPa @ 1m) was selected to match human hearing sensitivity. A different reference level is used for underwater sound (1µPa @ 1m). Because of these differences in reference standards, noise levels cited in air do not equal underwater levels.

The energy, or intensity (loudness) of a sound is measured on the decibel (dB) scale. It takes about 61.5 times more energy to transmit a sound through air than through water. Because of this energy difference, there is a 61.5 dB difference between sounds transmitted through air and water, such that a sound intensity of 120 dB in water would be equivalent to an intensity of about 60 dB in air (Webb 2023).

Impulsive underwater acoustic emissions will result from the seismic source releasing compressed air (seismic pulse) that creates a sound wave that is directed downwards into the seabed.

Underwater acoustic emissions from a seismic source are characterised by high energy pulses of low frequency sound. The frequency of the sound produced from each seismic pulse is primarily less than 2 kHz, with the highest levels at frequencies in the range of 10-500 Hz (McCauley 1994).

The rate of sound attenuation from the seismic source is dependent on local sound propagation characteristics, including seawater temperature and salinity profiles, water depth, bathymetry and the geoacoustic properties of the seabed (McCauley 1994). While the seismic pulses are directed downwards, horizontal propagation may be detected over long distances due to the high intensity and low frequency properties of the sound.

Sound travels as a wave with the amplitude of the wave related to the amount of acoustic energy it carries. Figure B8-2 shows a representative sound wave and the sound metrics used in this studies summary. Table B8-1 provides definitions of the sound metrics and other sound related terms used in this studies summary.

The particle motion component of sound is also relevant to the assessment of potential impacts to marine fauna. Acoustic particle motion refers to the physical motion caused by a sound wave within the water, seafloor or other medium. Unlike pressure, particle motion is directional in nature, although the actual to-and-fro particle displacements that constitute sound are extremely small, in the order of nanometres (Popper & Hawkins 2018). Particle motion can be described in terms of particle displacement (m), velocity (m/s), or acceleration (m/s-2) (Popper et al. 2014; Carroll et al. 2017). Alternatively, it is sometimes expressed in dB with respect to a reference value of displacement (dB re 1 pm), velocity (dB re 1 nm/s) or acceleration (dB re 1 $\mu m/s^2$) (Nedelec et al. 2016).

Particle motion is important because marine invertebrates and most fishes are primarily sensitive to particle motion rather than sound pressure and, therefore, particle motion is the most relevant metric for perceiving underwater sound by invertebrates and most fish species (Popper & Hawkins 2019). It is of less importance to marine mammals as evolution of the mammalian ear operating in air has led to a greater dependence on pressure for hearing sound (Finneran et al. 2002). There is currently limited information available to quantify the particle motion sensitivity of fishes and invertebrates. It is complex and challenging to directly measure particle motion compared to sound pressure, hence most research is presented in the context of sound pressure or exposure levels instead of particle motion (Carroll et al. 2017; Popper & Hawkins 2018).

It should be noted that particle motion is most relevant close to the source where it is the dominant component of a sound wave (i.e., in the near field), while pressure will dominate a sound wave propagating over distance (i.e., in the far field) (Radford et al. 2012; Morley et al. 2014; Nedelec et al. 2016; Popper & Hawkins 2018). Sound pressure levels received at increasing distance from a source do not, therefore, provide a reliable representation of particle motion. Organisms that are sensitive only to particle motion have typically been found to be sensitive only at close range where these particle motions are greatest (Popper et al. 2014; Edmonds et al. 2016; Popper & Hawkins 2018).

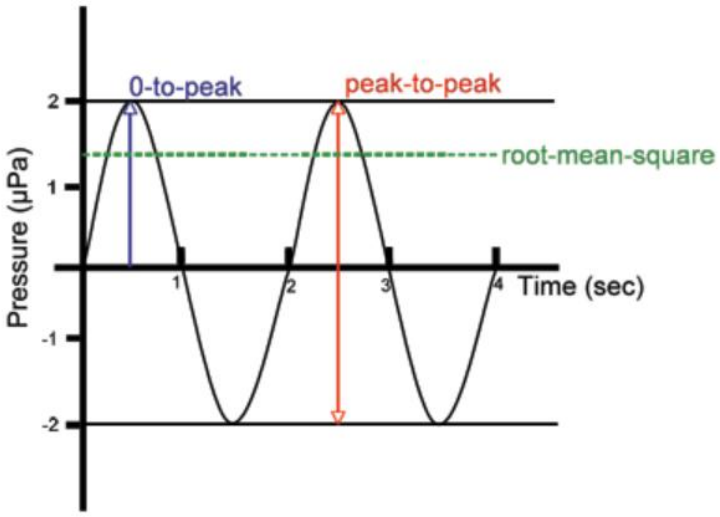

Figure B8-2 - Simplified Sound Wave and Sound Pressure Metrics (DOSITS 2023)

Table B8-1 - Underwater Sound Terminology

Term	Definition
0-to-peak or Peak sound pressure level (PK)	The peak pressure, also called the 0-to-peak pressure, is the range in pressure between zero and the greatest pressure of the signal. It is represented by PK and the unit dB re 1 µPa and summarised as dB PK.
Peak-to-peak sound pressure level (PK-PK)	The peak-to-peak pressure is the range in pressure between the most negative pressure and the most positive pressure of the signal. It is represented by PK-PK and the unit dB re 1 µPa or dB re 1 µPa2m2 and summarised as dB PK-PK.
Permanent threshold shift (PTS)	Permanent loss of hearing sensitivity at certain frequencies caused by excessive sound exposure.
Received sound level	The sound level measured at a receiver.
Root mean square sound pressure level (RMS)	The root-mean-square pressure is the square root of the average of the square of the pressure of the sound signal over a given duration. It is represented by sound pressure level (SPL) and the unit dB re 1 µPa and summarised as dB SPL.
Sound exposure level (SEL)	A measure of the sound energy that considers both received level and duration of exposure. SEL is specified in terms of either single pulse (SEL) or a defined accumulation period (SEL_{cum}). For this assessment 24 hrs is used for the accumulation period and is shown as SEL24h. Units are dB re 1 µPa2 s or dB re 1 µPa2m2s.
Source sound level	The sound pressure level or sound exposure level measured 1 metre from a theoretical point source that radiates the same total sound power as the actual source.
Temporary threshold shift (TTS)	Temporary loss of hearing sensitivity at certain frequencies caused by excessive sound exposure.

2 Assessment Input

2.1 Public Comment

The completed EP was published for public comment on the NOPSEMA website on 25 Jan 2024 for a 30-day period, closing 26 February 2024. Table B8-2 shows how this feedback has been incorporated into the environmental assessments.

Table B8-2 - Public comment input into the preparation of the EP

Matter	Matter ID	Changes made arising from public comment
Matter: Research on impacts of anthropogenic noise on marine mammals.	M11	CGG has considered these claims and has updated the EP Seismic Studies Report (Appendix B8) Section 8.

3 Zooplankton (including Fish and Invertebrate Eggs and Larvae)

This section summarises the published studies in relation to seismic acoustic emission studies on plankton and fish and invertebrate eggs and larvae. Plankton is a collective term for all marine organisms that are unable to swim against a current. This group is diverse and includes phytoplankton (plants) and zooplankton (animals), as well as fish and invertebrate eggs and larvae.

Some zooplankton can sense pressure changes to some degree. Swim bladders may also develop during the larval stages of some fish species, rendering larvae susceptible to pressure-related injuries such as barotrauma (Popper et al. 2014). Data on the effects of sound upon eggs and larvae containing gas bubbles is, therefore, largely focused on barotrauma rather than actual hearing. Very few publications have considered the effects of particle motion or vibration on plankton (Popper et al. 2014).

Few studies have found significant negative impacts on zooplankton, fish eggs, larvae, or fry, and most have reported that impacts occur within a few metres or tens of metres from the source (Kostyuchenko 1973; Dalen & Knutsen 1987; Holliday et al. 1987; Kosheleva 1992; as cited in Parry et al. 2002; Pearson et al. 1994; Turnpenny & Nedwell 1994; Booman et al. 1996; Payne et al. 2004; Payne et al. 2009). These studies included exposures to sound pressures up to approximately 242 dB SPL. Larval stages of fish are often perceived to be more sensitive to stressors than adult stages, but exposure to seismic sound does not appear to result in any differences in larval mortality or abundance for fishes, crabs, or scallops (Carroll et al. 2017).

Kostyuchenko (1973) found up to a 17% increase in mortality of fish eggs of various species exposed to a seismic source, but no effect beyond 10 m. Kosheleva (1992; as cited in Turnpenny & Nedwell 1994) also reported that eggs and larvae died within 1 m of a seismic source producing sound pressures of 220-240 dB SPL, but no injuries were reported at greater distances. Dalen and Knutsen (1987) exposed eggs, larvae and post-larval stages of cod exposed to seismic source elements with source levels of 222 – 231 dB SPL at 1 m. At ranges of 1 – 10 m from the source, some specimens indicated temporarily impaired balance following exposure but with rapid recovery. Mortality was only observed in just one of the three exposure experiments, with 90% mortality when exposed at 2 m from the seismic source, but no significant impacts at 6 m from the seismic source. Overall, there was no significant change in the survival of eggs.

Holliday et al. (1987) obtained mixed results during studies undertaken over a two-year period, with eggs and larvae exposed to sound pressures of 221 – 235 dB SPL at 1.5 m from a seismic source. Either no significant impact was observed or a 9% reduction in the survival of eggs. Pearson et al. (1994)

reported no effects to crab larvae exposed to sound pressures up to 231 dB SPL at 1 m from a seismic source. Booman et al. (1996) exposed fish eggs and larvae to sound pressures of 220 – 242 dB SPL. High rates of mortality were observed at distances of 1.4 m from the seismic source, but low or no mortality rates at distances of 5 m.

In a review of the above studies, Payne et al. (2004) noted that injury and mortality to eggs and larvae is likely to be limited to within 5 m of the seismic source. Payne et al. (2009) found no statistical differences between controls and exposed larvae following exposure to mean sound pressure levels of 205 dB PK-PK, positioned 0.5 m from the seismic source element.

Parry et al. (2002) undertook studies on the effects of a marine seismic survey on scallop fisheries in Bass Strait, including on larvae. This study was undertaken in December 2001 and February 2002 during a 3D marine seismic survey undertaken by Esso Australia in the Gippsland Basin, which used a 3,542 m^3 source towed 6 m below the sea surface. Plankton samples (impact and duplicate) were collected from five sites located 500 m apart in water depths of 55 m in a Before-After-Control-Impact (BACI) experimental study. The study results found few bivalve larvae in the live plankton samples and there was no significant difference in the number of bivalve larvae found in samples collected before and after passage of the seismic vessel (the same was true for all planktonic taxa). Parry et al. (2002) postulated that invertebrates that do not contain gas spaces (like swim bladders in fish) appear to be very resilient to seismic pulses. The research also notes that while the study does not exclude the possibility that some changes to planktonic communities resulted from the seismic survey, the failure to detect any impacts occurred because impacts were small. Parry et al. (2002) also indicated there is no evidence of mortality-associated population effects such as reduced abundance in plankton a few hours after exposure.

Pearson et al. (1994) exposed crab larvae to single pulses from a seismic source array (840 m^3) with a measured sound pressure level of 231 PK-PK at 1 m. For immediate and long-term survival and time to moult, this study did not reveal any statistically significant differences between the exposed and unexposed larvae, even those exposed within 1 m of the seismic source.

Impacts to scallop larvae have been identified following intense and lengthy periods of exposure to low-frequency sound. Tank experiments by Aguilar de Soto et al. ((2013)) showed evidence of morphological abnormalities in early-stage scallop larvae from simulated seismic signals for a 6,920 in^3 seismic source. However, the lengthy exposure period of 3 second pulse intervals for an exposure duration of 90 hours and at 1 m distance from sound source is not realistic of an actual survey. Christian et al. (2003) found major developmental differences between control and treatment groups of snow crab eggs exposed to a peak pressure level of 216 dB SPL every 10 seconds for 33 minutes. Again, the exposure to a constant peak pressure level for a prolonged period is not realistic of an actual survey where the source is moving and so does not remain in one place.

Hawkins (2014) used continuous sonar to record zooplankton layers, comprising copepods, cladocerans, decapod larvae, gastropod larvae, and bivalve larvae, exposed to playback of pile driving sound (pile driving sound typically has a more rapid rise time, more frequent strike rates and therefore a greater sound exposure regime than a seismic survey). Zooplankton layers responded to sound by showing a 'dent' in the top of the layer at the onset of the sound sequence, although the change in depth often did not persist for the whole duration of the sound exposure and zooplankton distribution quickly returned to normal.

Day et al. (2016a) found no effects on the mortality, abnormality, competency, or energy content of lobster larvae after exposure of early embryonic stages to seismic exposure. In this study, egg-bearing female southern rock lobsters (*Jasus edwardsii*) were exposed to signals from three air gun configurations, all of which exceeded sound exposure levels (SEL) of 185 dB re 1 $\mu Pa^2 \cdot s$ (209-212 dB PK-PK). Lobsters were maintained until their eggs hatched and the larvae were then counted for fecundity, assessed for abnormal morphology using measurements of larval length and width, tested for larval competency using an established activity test and measured for energy content. Overall, there were no differences in the quantity or quality of hatched larvae, indicating that the

condition and development of spiny lobster embryos were not adversely affected by air gun exposure. Day et al. (2016a) detailed that the results suggest that embryonic spiny lobster are resilient to air gun signals and highlight the caution necessary in extrapolating results from the laboratory to real world scenarios or across life history stages.

Based on the studies discussed above, physical impacts to planktonic organisms have typically been found to be limited to within approximately 10 m of the seismic source. Using this 10 m impact range, a study by McCauley (1994) calculated the impact in a seismic survey area, assuming plankton mortality of 100% within 10 m of a seismic source. This suggested that the total mortality due to seismic testing would impact less than 1% of plankton in the survey area. DNV Energy (2007) and Hawkins & Popper (2012) conducted comprehensive reviews of a number of scientific studies, including those by Kostyuchenko (1973), Dalen & Knutsen (1987), Booman et al. (1996) and Saetre & Ona (1996); the effects of seismic activities on eggs and larvae were predicted to result in average and worst-case mortality rates of 0.0012% and 0.45% per day respectively, which were not deemed significant when compared to a natural mortality rate of 5-15% per day, as applicable to most species during early life stages. Natural mortality rates in larvae can be much higher than this—exceeding 50% per day in some species and commonly exceeding 10% per day (Tang et al. 2014). For example, in a review of mortality estimates (Houde & Zastrow 1993), the mean mortality rate for marine fish larvae was M = 0.24, a rate equivalent to a loss of 21.3% per day.

In 2014, noise effect criteria for fish eggs and larvae were established by the American National Standards Institute (ANSI) accredited report of sound exposure guidelines for fishes and sea turtles (Popper et al. 2014). The criteria from Popper et al. (2014) are from an offshore pile driving study by Bolle et al. (2012) that indicated no damage was caused by simulated repeated pile driving (100 strikes at 100 m) of 210 dB SEL_{cum}. Popper et al. (2014) also detailed that other studies suggest that eggs and larvae in proximity (<5 m) to a seismic source are likely to suffer mortality and tissue damage (Kostyuchenko 1973; Booman et al. 1996). Sætre and Ona (1996) concluded that mortality rates caused by exposure to seismic source sounds are so low compared to natural mortality that the impact from seismic surveys must be regarded as insignificant.

However, a study by McCauley et al. (2017) received notable attention for suggesting the potential for zooplankton mortality to increase two- to three-fold out to 1.2 km from a single seismic source element, with an estimated decline in zooplankton abundance of up to 64% and a “hole” in the zooplankton backscatter observed via acoustic detection methods. The 1.2 km range corresponded with pressure levels of 178 dB PK-PK (McCauley et al. 2017). However, the extent of such impacts is inconsistent with previously and subsequently documented effects to plankton.

The findings of this study have been questioned by several reviews (Richardson et al. 2017; IAGC 2017; Fields et al. 2019) particularly in relation to:

- There was no evidence of attenuation of impacts with distance from the source with no consistent decline in the proportion of zooplankton that were killed with increasing distance from the source.
- Sonar backscatter data indicated an immediate decline in zooplankton abundance (the “hole” in the data). However, if the zooplankton had been killed, they would not have sunk from the surface layers of the water column immediately, suggesting that some zooplankton may have moved, or they may have simply reorientated themselves to the sonar in response to the seismic pulses, which raises questions over the occurrence, magnitude, and extent of mortal impacts.
- The study was based on a relatively small number of tow samples on two separate days. On the second day, even before the use of the seismic source element, the zooplankton net tow abundance counts were significantly lower than the first day and, therefore, it is difficult to draw reliable conclusions from these data. On the second day almost all values at 80 m range presented greater plankton abundance from exposed samples and lower

abundance of control samples, indicative of a potential flaw in the sampling scheme and analysis protocol.

The McCauley et al. (2017) study was undertaken in early March 2015, using two replicated experiments in Storm Bay in southeast Tasmania. It involved the deployment of acoustic noise loggers to measure air gun signals and used an acoustic source volume of 150 in^3 and operating pressure of 2,000 psi. The study measured zooplankton abundance and the proportion of the population that was dead at three distances from the acoustic source - 0, 200 and 800 m. The experiment estimated the proportion of the zooplankton that was dead, both before and after exposure to acoustic source sound, using net samples to measure zooplankton abundance, and bioacoustics to identify the distribution of zooplankton. In this study, copepods dominated the mesozooplankton (0.2-20 mm), and impacts were not assessed on microzooplankton (0.02-0.2 mm) or macrozooplankton (>20 mm). There was movement of water through the experimental area, which made interpreting their results more difficult (Richardson et al. 2017).

The results of the experiment found that zooplankton exposure to acoustic sources increased the mortality rate from a natural level of 19% per day to 45% per day (on the day of exposure), with this mortality rate observed out to 1.2 km. This is more than two orders of magnitude greater than the 10 m previously assumed (McCauley et al. 2017). These results escalated the concerns that some stakeholders had about the effects of marine seismic surveys on plankton, particularly fishers and conservation groups.

This study postulates that the external sensory hairs that zooplankton possess may be extremely sensitive and in response to seismic sound, may 'shake' to the point where damage could accrue to sensory hairs or tissue. Importantly, the study notes that for anthropogenic sources to have significant impacts to plankton at an ecological scale, the spatial or temporal scale of the impact (i.e., the seismic survey) must also be large when compared to the impacted ecosystem.

In response to this research, the Australian Petroleum Production and Exploration Association (APPEA) commissioned the Commonwealth Scientific and Industrial Research Organisation (CSIRO) to assess the potential local and regional impacts on zooplankton of a typical marine seismic survey. A large-scale marine seismic survey conducted on the North West Shelf of Australia was modelled in a hydrodynamic model using the McCauley et al. (2017) results, as reported in Richardson et al. (2017). The modelled survey parameters include a survey area of 2,900 km^2, 60 survey lines, waters 300 - 800 m deep, an acoustic source of 3,000-3,200 m^3 and operating pressure of 2,000 psi. This paper reports that impact is recorded within the survey area and within 15 km of it, but that these impacts are not discernible at the bioregional scale and barely discernible within 150 km of the survey area. Zooplankton populations recovered quickly after seismic exposure due to their fast growth rates and due to the dispersal and mixing of zooplankton from both inside and outside of the impacted region. The modelling undertaken by Richardson et al. (2017) found that while there was a maximum decline of 22% in zooplankton populations in the survey and a 14% decline within 15 km of the survey area, it took only three days following the completion of the survey for zooplankton biomass to recover to pre-seismic survey levels within the survey area and within an area of 15 km around the survey area. The study notes that because zooplankton growth rates are slower in colder regions (e.g., Bass Strait), the recovery rate of zooplankton populations following exposure to a seismic survey is likely to be slower in colder waters. It is important to note that Fields et al. (2019) and IAGC (2017) noted that the findings of McCauley et al. (2017) (which were used in Richardson et al. 2017) may provide an overly conservative estimate of the potential effects of seismic pulses to zooplankton.

Independently of the APPEA/CSIRO study, the International Association of Geophysical Contractors (IAGC) conducted its own review of the McCauley et al. (2017) study. This review came to the following conclusion: "*While we found the study interesting, we are also troubled by the small sample sizes, the large day-to-day variability in both the baseline and experimental data, and the large number of speculative conclusions that appear inconsistent with the data collected over a two-day period.*

Both statistically and methodologically, this project falls short of what would be needed to provide a convincing case for adverse effects from geophysical survey operations." (IAGC 2017).

An assessment of zooplankton was undertaken to determine pre- and post-seismic survey abundance of zooplankton at sites within CarbonNet's Pelican Marine Seismic Survey area in the Gippsland Basin and at reference sites during January and February 2018. Pre-seismic survey plankton samples collected were dominated by copepods, cladocerans and salps while post-seismic survey plankton samples were dominated by the dinoflagellate *Noctiluca scintillans*. Other groups present included siphonophores, fish larvae, fish eggs, polychaetes, ghost shrimps and cnidarians. There was variance between and within assessments, with samples exhibiting levels of diversity and abundance typical of healthy temperate coastal waters. Neither lobster nor scallop larvae were present in any of the samples assessed (CarbonNet 2018).

A study by Fields et al. (2019) exposed the copepod (*Calanus finmarchicus*) to seismic pulses at various distances up to 25 m from a seismic source. The source levels produced were estimated to be 221 dB SEL comparable to the far-field source levels associated with some commercial scale seismic surveys. The study observed an increase in immediate mortality rates of up to 30% of copepods in samples compared to controls at distances of 5 m or less from the seismic source. Mortality one week after exposure was significantly higher by 9% relative to controls in the copepods placed 10 m from the seismic source. Fields et al. (2019) also reported that no sublethal effects occurred at any distance greater than 5 m from the seismic source. The findings of the study are consistent with numerous other field studies, as referenced previously, indicating that the potential effects of seismic pulses to zooplankton are limited to within approximately 10 m from the seismic source. Fields et al. (2019) detailed that it is difficult to reconcile the high mortality reported by McCauley et al. (2017) with the low mortalities reported in the body of earlier studies and in the experiment they undertook. Fields et al. (2019) details that it is possible that their results can be attributed to *C. finmarchicus* having a high tolerance to air gun impulses and that other species would be more sensitive. Other possible causes for the high mortality observed by McCauley et al. (2017) could be bubbles because of cavitation or small-scale shear produced by the sampling boat, unrelated to the air gun impulses.

Day et al. (2021, 2022) undertook a study to determine whether early development and recruitment of southern rock lobsters puerulus and juveniles might be affected by exposure to seismic sound by assessing mortality rates following exposure; impairment of the righting reflex, and development through assessment of progression through the moult cycle. This study also undertook to respond to the finding by McCauley et al. (2017) of increased mortality in zooplankton following exposure to air gun signals that suggests that planktonic, early life stages of marine invertebrates may be more vulnerable than adults or developing embryos. Outcomes of this study are detailed in the section below on crustaceans.

Vereide et al. (2023) conducted a field experiment to assess mortality and naupliar body length of the calanoid copepod (*Acartia tonsa*) when exposed to an air gun array discharge. The air gun array treatment consisted of two 40 in^3 air guns fired at a pressure of 110 bar every 10 seconds for three hours. The air gun array was towed at 2 knots at a depth of 3–4 m along an oval transect (3 nm in total) by the research vessel *H.U. Sverdrup II*. The vessel sailed between 50 m and 1,220 m from the line holding the bags. During the boat control treatment, *H.U. Sverdrup II* followed the same transect without discharging the air guns. The boat control treatment was included to control for the sound generated by the vessel itself.

The sound exposure level (SEL) was 152 dB re 1 μPa^2 s furthest away and 183 dB re 1 μPa^2 s at the closest distance. Nauplii were placed in plastic bags and attached to a line at a depth of 6 m. For each treatment, three bags of nauplii were exposed to one of three treatments for 2.5-hours: Air gun array discharge, a boat control, or a silent control. After exposure, nauplii were kept in filtered seawater in the laboratory without food. The immediate mortality was significantly higher in the air gun array treatment than in the silent and boat control treatments. On average, 13.5 ± 3.8% of the nauplii in the air gun array exposed treatment died immediately after exposure, compared to 3.4 ±

1.3% in the silent control and 2.6 ± 1.7% (mean ± SD) in the boat control. There was a significant difference in delayed mortality between the treatments. On days 1 and 2 after exposure, nearly all of the nauplii from the control groups were alive, while 27.0 ± 14.2% and 14.8 ± 14.2% of the air gun array exposed nauplii had died in the aliquots from day 1 and day 2, respectively. Mortality started occurring from day 3 (5.7 ± 10.1%, boat control) and 4 (9.4 ± 14.4%, silent control) in the control treatments but with lower mortality than in the air gun array exposed treatment (day 3, 47.5 ± 19.2% dead nauplii). In the aliquots from days 5 and 6 after the treatments, almost all of the air gun array exposed nauplii were dead, in contrast to the control groups, in which the proportion of dead nauplii was 49.2 ± 12.0% on day 5, and 72.6 ± 21.8% day 6 in the silent control and 4.0 ± 10.1% on day 5 and 48.4 ± 17.9% on day 6 in the boat control.

There was a significant interaction between treatment and time (days) on the body length (µm) of the nauplii, with lower growth from day 1–4 in the air gun array exposed treatment than in the control treatments. On day 1 after treatment, the average body length was 125 ± 10 µm. After four days, the average body length in the air gun array exposed nauplii was 128 ± 7 µm, which differed from the silent control (144 ± 8 µm) and the boat control (146 ± 7 µm). Over the first four days after exposure, the growth rates were 1.7 (4.1% in total), 5.4 (12.5%), and 6.1 per day (18.7%) in the air gun array exposed, silent control, and boat control, respectively. Naupliar development stages (NI–NIV) were positively correlated with body length (µm). In all treatments, >50% of the nauplii reached stage NII one day after exposure. By day 4, 43 ± 26.9% of the air gun array exposed nauplii were still in NI, compared with 11 ± 12.7% in the silent control and 1 ± 3.6% in the boat control. Only four individuals reached stage NIV: 3 in the silent control and 1 in the boat control.

Immediate mortality in the air gun array exposed nauplii was approximately 14% compared to less than 4% in the silent and boat control. Similarly, there was higher mortality in the air gun array exposed nauplii up to six days after exposure compared to the control treatments. Nearly all of the air gun exposed nauplii were dead after four days, while >50% of the nauplii in the control treatments were alive at six days post-exposure. There was an interaction between treatment and time on naupliar body length, indicating lower growth in the nauplii exposed to the air gun discharge. These experiments indicate that the output of two small air guns affected mortality and growth of the naupliar stages of *Acartia tonsa* in close vicinity to the array.

Vereide et al. (2023) concluded:

- The results of this study suggest that air gun array discharges affected the growth and mortality of *Acartia tonsa* in early naupliar stages. However, the degree of impact is likely to be stage- and species-specific and may be difficult to separate from background mortality.
- The results observed are consistent with many previous studies that show small effects of air gun discharges on zooplankton mortality. For example, no effects were detected in bivalve larvae sampled 2 km away from the source after exposure to air gun discharges (Parry et al. 2002) or in adult scallops sampled up to 1 km from the source shortly after exposure (Harrington et al. 2010). Similarly, Fields et al. (2019) reported that the mortality of the copepod *Calanus finmarchicus* adults to a two air gun array discharge increased (<5%) compared to that of the control groups, but only at <10 m from the air guns and no effects at distances from 10 to 50 m.
- There were notable differences in these results from previous studies. For example, in contrast to Fields et al. (2019), this study found significantly higher mortality in the exposed animals compared to the controls at distances of 50–~1,200 m. Although the sound exposure levels were higher in Fields et al. (2019) than those in this study, the animals in this study were exposed to multiple air gun discharges that resulted in a cumulative exposure that lasted much longer. The cumulative exposure of multiple blasts coupled with the younger stage used in this study may help to explain the higher mortality.

- Despite the higher mortality, the immediate mortality observed in this study is much lower than the 50% mortality in zooplankton at >1 km from the source (McCauley et al. 2017). Even though the absolute immediate mortality was lower than that reported by McCauley et al. (2017), the relative increase in mortality compared to the controls was somewhat greater in this study (greater than three-fold increase) than in McCauley et al. (2017) (two-to three-fold increase). However, in McCauley et al. (2017), the mortality in the controls was ~20% compared to less than 4% in this study.
- In this study, the mortality rate in nauplii directly after exposure was lower than the natural mortality rates observed in *Acartia* nauplii (up to 0.35 per day), although this is dependent on temperature, season, and region (Elliott & Tang 2011). This indicates that the population-level effect of air gun exposure might not be detectable from the background mortality.
- The air gun array exposed nauplii grew less and developed slower over four days than the boat and silent control groups. The slower development in the air gun array treatment nauplii was correlated with decreased growth. The progression through developmental stages and increase in body length observed in the control groups in our study is more similar to the development of naturally observed in *Acartia tonsa* nauplii cultured in 10–15° C water than is the development in the air gun array exposed nauplii. Slowed or arrested development at naupliar stages can reduce fitness or cause death. Thus, mortality could be affected long after seismic exposure. The population-level effects that this might have are uncertain.

4 Invertebrates

Research is ongoing into the relationship between sound and potential effects on benthic invertebrates, including the relevant metrics for both effect and impact. Marine invertebrates lack a gas-filled bladder and are unable to detect the pressure component of sound waves (Parry & Gason 2006; Carroll et al. 2017) or "hear" sound in the way that mammals and fish can. Instead, invertebrates detect sound by sensing the particle motion component of sound in water and seabed sediments through physiological structures such as sensory hairs, statocysts and muscles, and therefore detect sound at close range (McCauley 1994; Parry & Gason 2006; André et al. 2016: Roberts et al. 2016: Edmonds et al. 2016: Carroll et al. 2017: Popper & Hawkins 2018). Statocysts, found in a wide range of invertebrates, are utilised by animals to maintain their orientation, direct their movements through the water and may play a key role in controlling the behaviour responses of invertebrates to a wide range of stimuli. Although directly sensitive to particle motion and not to sound pressure, most available research on seismic impacts to invertebrates characterises received sound levels in terms of the sound pressure. Therefore, available literature suggests particle motion, rather than sound pressure, is a more important factor for benthic invertebrates such as crustacean and molluscs.

A range of physiological responses have been identified in some studies; however, the received sound levels are typically at levels that would be received within tens or a few hundred metres from the sound source or have been from repeated exposure at the same sound levels, which is not typical of an actual seismic survey (Carroll et al. 2017; Edmonds et al. 2016; Salgado Kent et al. 2016; Webster et al. 2018).

The most recent critical review of the potential impacts of marine seismic surveys on fish and invertebrates by Carroll et al. (2017) summarised the impacts of seismic sound emissions on marine invertebrates based on a literature review of 70 studies, which comprised a total of 68 species of fish and 35 species of invertebrates, including several studies that were not differentiated. Carroll et al. (2017) concluded that:

> *"Our review has identified scientific evidence for high-intensity and low-frequency sound-induced physical trauma and other negative effects on some fish and invertebrates; however, the sound exposure scenarios in some cases are not realistic to those encountered by marine organisms during routine seismic operations. Indeed, there has been no evidence of reduced catch or abundance following seismic activities for invertebrates, and there is conflicting evidence for fish with catch observed to increase, decrease or remain the same."*

4.1 Crustaceans

Specific studies examining the effect of seismic survey signals on crustaceans, including larval stages, are relatively rare, though recent Australian studies (e.g., Day et al. 2016b; Przeslawski et al. 2016b; Carroll et al. 2017; Day et al. 2019; Day et al. 2021, 2022), have aimed to narrow the knowledge gap. A recent study was undertaken to specifically investigate seismic survey impacts on Western Rock Lobster off the central WA coast (de Lestang et al 2024). These are being supplemented by global research, including ongoing projects such as Canadian Healthy Oceans Network Project 2.1.4 (Anthropogenic Noise in The Ocean Soundscape: Effects on Fishes and Invertebrates).

To understand interactions between marine seismic surveys and marine invertebrates, the Commonwealth Government's Fisheries Research Development Corporation (FRDC), Origin Energy Ltd and the CarbonNet Project contributed funding to a research program assessing the impact of marine seismic surveys on southern rock lobsters and commercial scallops. This program study was undertaken by researchers from the Institute for Marine and Antarctic Studies (IMAS) at the University of Tasmania (Day et al. 2016b).

The research program involved exposure of cohorts of southern rock lobsters to multiple seismic acoustic source pulses at two sites (sandy substrate and limestone rock platform), both in 10–12 m water depths off the southern Tasmanian coast. The exposed lobsters were captive and control

lobsters (no exposure) were also examined during subsequent analyses undertaken at 0-, 14-, and 120 -days post-exposure. Exposure experiments were undertaken in July 2013 (45 in^3 acoustic source, 2,000 psi), July 2014 (150 in^3 acoustic source, 1,300 psi and 2,000 psi) and February 2015 (150 in^3 acoustic source, 2,000 psi). The acoustic source was towed at approximately 5 m depth from 1 km away and at a speed of approximately 5.5–7.4 km/hr with a shot interval of 11.6 seconds. The seismic source circled near the lobster pots. The maximum calculated exposures were 212 dB re 1 µPa PK-PK, a per-pulse SEL of 190 dB re 1 μPa^2.s, an accumulated SEL of 199 dB re 1 μPa^2.s and maximum peak magnitude of ground acceleration of 68 ms^{-2}, though Day et al. (2016b) note this was an outlier.

Conclusions from the study are:

- Exposure to seismic sound did not result in any mortality from any of the experiments comprising this study.
- There was no difference in fecundity between control and exposed lobsters.
- The ability of exposed lobsters, and one cohort of control lobsters, to right themselves, a complex reflex, was compromised in the long-term (120 days post-exposure) in three of the four experiments. This response was linked to damage to sensory hairs of the statocyst, the primary mechano-sensory and balance organ in lobsters.
- Tail extension, a simple behavioural reflex response, showed reduction in exposed lobsters in one of the four experiments. The authors noted it is unclear how significant this finding is, as the warm summer water conditions during this experiment may have been a contributing factor.
- Haemolymph (blood) biochemistry showed little effects on metabolic and respiratory stress, or vitality following exposure.
- Haemocyte count (indicative of immune response function) in exposed lobsters showed a long-term decline to 120 days post-exposure. However, haemocyte counts subsequently recovered to double the number of haemocytes in control lobsters at 365 days post-exposure, which may indicate a possible immune response to pathogens.
- Seismic exposure did not cause any mass mortality. Not considering when both the control and exposed groups suffered mass mortality, the experimental mortality rates at 120 days' post-seismic acoustic source exposure were between 9.4% and 20%. These fall towards the low end of what might be expected from natural mortality rates. Even the highest levels of mortality recorded, 17.5% and 20% suffered by 4-pass treatments from the 2014 and 2015 experiments, were assessed by the authors to be modest compared to naturally occurring mortality rates.

Overall, no direct lethal effects to adult lobsters were observed and impacts were limited to statocyst condition, behavioural reflexes, and immune response functions in adult lobsters. Day et al. (2016b) note that these could have some effect on longer-term survivability.

Subsequent to the Day et al. (2016b) study, Day et al. (2020) undertook additional work to determine whether southern rock lobsters with pre-existing damage to their mechanosensory statocyst organs as a result of exposure to anthropogenic sound, incur further damage from exposure to marine seismic surveys. For this study, southern rock lobsters collected from a site subject to high levels of anthropogenic noise (a high shipping traffic lane used by cargo vessels and cruise ships, as well as pumping stations) were exposed to an equivalent seismic air gun signal regime as the Day et al. (2016b) study of lobsters, which was from an area of minimal anthropogenic sound ('noise-naïve' lobsters). Following exposure, both control and exposed treatments were found to have damage to the statocyst equivalent to that of noise-naïve lobsters following seismic exposure, leading to the conclusion that the damage was both pre-existing and not exacerbated by seismic exposure. Additional to the lack of further damage following marine seismic survey exposure, no disruption to

the righting reflex was observed, demonstrating the lobster's ability to cope with or adapt to the mechanosensory damage (Day et al. 2020).

The lobsters from the high shipping site showed a pre-existing level of statocyst damage equivalent to that of lobsters exposed to the seismic signals. These lobsters also demonstrated a resilience to further damage, with exposure to seismic sound not increasing the level of cell loss in the statocyst hairs (Day et al. 2020). There were also no significant differences in the time taken to right themselves (from 'belly up' to 'belly down') between the control and exposed lobsters from the shipping site, though righting time was slower and more variable than the lobsters at the control site.

Day et al. (2021, 2022) undertook a study to determine whether early development and recruitment of southern rock lobsters puerulus and juveniles might be affected by exposure to seismic sound by assessing mortality rates following exposure; impairment of the righting reflex, and development through assessment of progression through the moult cycle. This study also undertook to respond to the finding by McCauley et al. (2017) of increased mortality in zooplankton following exposure to air gun signals that suggests that planktonic, early life stages of marine invertebrates may be more vulnerable than adults or developing embryos.

The Day et al. (2021, 2022) study involved exposing puerulus and juvenile southern rock lobsters within oyster baskets on the seabed to a full-scale array (three 2,820 in^3 seismic sources at 2,000 psi at a depth of 8 m) during a commercial seismic survey in 51-58 m of water. Day et al. (2021, 2022) identified that:

- Exposure did not result in any elevated mortality for puerulus or juveniles and thus, seismic surveys are unlikely to produce significantly increased mortality in puerulus and juvenile southern rock lobsters.
- An impact to righting reflex occurred in the immediate vicinity (directly below the sound source) for puerulus and out to at least 500 m for juvenile southern rock lobsters. However, juveniles exposed at 500 m recovered after the first moult, indicating that the impact range extended to at least 500 m from the source, the maximum range tested in the study. The results from the combined puerulus and juvenile treatments indicated that puerulus and juveniles below the sound source did not show the capacity for recovery whereas juvenile lobsters at 500 m from the source recovered from impairment after the first moult, providing evidence of a range threshold for recovery.
- The intermoult period was significantly increased in juvenile lobsters directly below the sound source and appeared to be increased in puerulus, though the latter could not be statistically analysed.
- Juveniles at 500 m showed a moderate, non-significant increase in moult duration.
- Increased intermoult duration suggested impacted development and potentially slowed growth, though the proximate cause was not identified.

In another study focusing on southern rock lobster, Fitzgibbon et al. (2017) examined the impact of seismic acoustic exposure on the haemolymph physiology and nutritional condition of this species and found no effect of seismic exposure on 24 haemolymph biochemical parameters, hepatopancreas index or survival. However, this study did report evidence of:

- A chronic negative impact on immune competency for up to 120 days post-exposure.
- A potential immune response to infection after 365 days post-exposure.
- Chronic impairment of nutritional condition 120 days post-exposure.

These authors concluded that the biochemical hematological homeostasis of rock lobster is reasonably resilient to seismic acoustic signals; however, exposure may negatively influence the rock lobster's nutritional condition and immunological capacity. The impact of these results at an ecological level is not known.

The recently published study by de Lestang et al (2024) used cages to assess seismic effects on Western Rock Lobster (*Panulirus cygnus*) in shallow reef habitat adjacent to Dongera on the central WA coast. Juvenile lobsters were confined to cages and subject to seismic pulses from very close quarters (2-5m metres) after which they were released. A recapture program was followed to determine what effects seismic might have on catches. Results indicated a short-term reduction in catchability for the first month of the recapture program which subsequently disappeared. The recapture rates after the first month were very low (e.g. max of 1-3 animals per treatment) and not appropriate to draw any further conclusions from, as highlighted by the breadth of the 95% CI's associated with the analysis (6-68%). Treatment was not reflective of normal seismic activity nor were lobsters exposed while in their typical habitat such as a ledge or hole on the reef. It was not possible to draw any firm conclusions beyond a temporary reduction in catch levels.

Payne et al. (2007) conducted a pilot study of the effects of exposure to seismic sound on various health endpoints of the American lobster *(Homarus americanus*). Adult lobsters were exposed either 20 to 200 times to 202 dB re 1µPa PK-PK or 50 times to 227 dB re 1µPa PK-PK, and then monitored for changes to survival, food consumption, turnover rate, serum protein, enzyme and calcium levels. Lobsters were exposed to seismic pulses at very close range to the source (~2 m). The SEL that the lobsters were exposed to was not described in the report but can be estimated to be up to 207 dB re 1 μPa^2.s. Observations were made over a period of a few days to several months and found that:

- Results indicated no effects on delayed mortality or damage to the mechanosensory systems associated with animal equilibrium and posture (as assessed by turnover rate).
- There was a decrease in the levels of serum protein, enzymes, and calcium in the haemolymph of animals exposed to seismic sound. Statistically significant differences were noted in serum protein at 12 days post-exposure, serum enzymes at five days post-exposure, and serum calcium at 12 days post-exposure. Serum enzymes are valuable in detecting major organ damage whereby enzymes leak into the blood upon cellular rupture. Within this study two enzymes, aspartate transaminase and creatine kinase, were not elevated in seismic-exposed animals, reflecting the absence of major cellular rupture or necrosis being affected by seismic sound, including high exposure conditions. Similar results were obtained in studies with snow crabs (Christian et al. 2003). However, there was evidence of decreased serum enzymes in some trials, indicating the possibility of haemodilution or uptake of excess water by the animals. A similar decrease in serum protein and calcium was noted in some trials indicating a potential for disturbance to osmoregulation (i.e., the process by which the body regulates the osmotic pressure of any organisms' fluids to keep the homeostasis of the organisms' water level constant). Altogether, the results suggest a potential for osmo-regulatory disturbance in lobsters exposed to seismic sound. This study did not provide evidence for delayed mortality in lobsters several months after exposure, with some observations extending to nine months.
- During the histological analysis conducted four months post-exposure, no structural differences in hepatopancreatic tissues were noted, which would denote cell or tissue rupture, necrosis, or inflammation. There was also no evidence of tissue necrosis or inflammation in the ovaries. However, histology identified elevated deposits of carbohydrates, thought to be glycogen, in the hepatopancreas of seismic-exposed animals. Such abnormal accumulations are believed to be due to disturbance in cellular processes connected with synthesis and secretion; however, the report concludes that further research is required to assess whether this observation is due to organ stress. These

studies are noted as being exploratory in nature, with the authors cautioning against over-interpretation.

In 2018, the CarbonNet Project undertook the Pelican 3D marine seismic survey in waters 15 m to 35 m deep located between 1 km and 13 km from the Gippsland shoreline in Victoria. Underwater sound and its potential impact on the marine environment was a key issue raised by stakeholders, particularly the commercial fishing industry. In response, and among other actions, CarbonNet undertook southern rock lobster surveys before and after the marine seismic survey to ascertain whether any differences in abundance could be attributed to the marine seismic survey. The design of the survey was overseen by an independent advisory panel to provide advice on the survey methodology and interpretation of the survey results and its implications.

Ten sites (in areas of reef) were monitored, including six sites within the survey acquisition area and four reference sites located more than 15 km to the northeast. At all sites, more southern rock lobsters were retrieved during the post-survey assessment (four months after the survey), with 81 individuals trapped during the pre-survey assessment compared to 122 trapped post-survey. This increase in numbers post-survey was most likely due to seasonal effects rather than any impact of the survey (CarbonNet 2018). These results indicate no effect of the marine seismic survey on lobster abundance.

Morris et al. (2018) and Cote et al. (2020) undertook field studies in from 2015 – 2017 into the effects of marine seismic surveys on the behaviour of the snow crab (*Chionoecetes opilio*) on the shelf and slope habitats of Atlantic Canada using a BACI study design to assess the behavioural responses of snow crab to seismic exposure. A 4,880 in^3 seismic source operated at 2,000 psi, 9 m depth and fired at a frequency of 10 seconds (approximately 25 m apart). Animal movements were tracked using an acoustic positioning array consisting of 50 acoustic receivers. The study concluded that while effects of seismic exposure on snow crab movement could not be ruled out completely, effects were at most quite small relative to natural variation. In contrast, snow crab exhibited much clearer responses to handling, temperature, and time of day. Overall, the results suggested that seismic effects, specific to the behaviour of adult male snow crab, were at most subtle and are not likely to be a prominent threat to the fishery.

A pilot study on snow crabs (*C. opilio*) (Christian et al. 2003, 2004) exposed captive adult males, egg-carrying females, and fertilised eggs to variable SPLs (191–221 dB re 1 µPa PK) and SELs (<130–187 dB re 1 $\mu Pa^2.s$) under controlled field experimental conditions. The crabs were exposed to 200 discharges over 33 minutes and found that:

- Neither acute nor chronic (12 weeks post-exposure) mortality was observed for the adult crabs.
- There was a significant difference in the development rate noted between the exposed and unexposed fertilised eggs/embryos in this study with the egg mass exposed to seismic energy demonstrating a higher proportion of less-developed eggs than the unexposed mass. However, this experiment was performed on eggs stripped from a single berried female and cultured in a laboratory for six weeks prior to exposure and 18 weeks following exposure.
- Stress indicators in the haemolymph of adult males were monitored immediately after exposure of the animals to seismic survey sound (Christian et al. 2003, 2004) and at various intervals after exposure. No significant acute or chronic differences between exposed and unexposed animals in terms of the stress indicators (e.g., proteins, enzymes, cell type count) were observed.

Christian et al. (2003) also investigated the behavioural effects of exposure to seismic survey sound on snow crabs. Caged animals on the ocean bottom at a depth of 50 m were monitored with a remote video camera during exposure to seismic sound and did not exhibit any overt startle response during the exposure period. Eight animals were equipped with ultrasonic tags, released,

and monitored for multiple days prior to exposure and after exposure. None of the tagged animals left the immediate area after exposure to the seismic survey sound. Five animals were captured in the snow crab commercial fishery the following year, one at the release location, one 35 km from the release location, and three at intermediate distances from the release location.

In 2003, a collaborative study was conducted in the southern Gulf of St. Lawrence, Canada, to investigate the effects of exposure to sound from a commercial seismic survey on egg-bearing female snow crabs (DFO 2004). Caged animals were placed on the ocean bottom at a location within the survey area and at a location outside of the survey area. The maximum received SPL was ~195 dB re 1 µPa PK. The crabs were exposed for 132 hours of the survey, equivalent to thousands of seismic shots of varying received SPLs. The animals were retrieved and transferred to laboratories for analyses. Neither acute nor chronic lethal or sub-lethal injury to the female crabs or crab embryos was indicated. DFO (2004) reported that some exposed individuals had short-term soiling of gills, antennules and statocysts, bruising of the hepatopancreas and ovary, and detached outer membranes of oocytes. However, they were found to be completely cleaned of sediment when sampled five months later and any differences could not be conclusively linked to exposure to seismic survey sound.

In a field study, Pearson et al. (1994) exposed Stage II larvae of the Dungeness crab (*Cancer magister*) to single discharges from a seven-source air gun array and compared their mortality and development rates with those of unexposed larvae. For immediate and long-term survival and time to moult, this study did not reveal any statistically significant differences between the exposed and unexposed larvae, even those exposed within 1 m of the seismic source (with a mean peak pressure as high as 231 dB re 1 µPa).

4.2 Molluscs

Molluscs include benthic invertebrates such as marine bivalves (e.g., scallops, oysters, mussels and clams), gastropods (e.g. sea snails/trochus, sea slugs and nudibranchs) and cephalopods (e.g. octopi and squid). Like crustaceans, the mechanism of impacts for molluscs are unlikely to be from sound pressure, but rather from particle motion. The physiology and sensory structures of different marine bivalves and gastropods is similar and so results of studies on the effects of seismic sound are broadly representative for species other than those studied.

Wardle et al. (2001) monitored molluscs and echinoderms on a shallow water reef exposed to seismic sound with peak SPLs of 218, 210 and 195 dB re 1 µPa at distances of 5 m, 16 m and 109 m respectively. Video observations made over two weeks indicated that the sound did not result in invertebrates moving away from the reef and there was little effect on their day-to-day behaviour.

Kosheleva (1992; as cited in Parry & Gason 2006) identified no detectable effects to marine bivalves and gastropods (mussels and periwinkles) after exposure to a single seismic source element of source level 233 dB re 1µPa at 0.5 m or greater from the source. Conversely, Matishov (1992; as cited in Parry & Gason 2006) reported a single scallop shell splitting in a sample of three scallops, but this was located 2 m beneath a seismic source and therefore exposed to maximum sources levels.

Recent Australian studies (Harrington et al. 2010; Przeslawski et al. 2016a, 2016b, 2018; Day et al. 2016b, 2017) have focussed on commercial scallops (*Pecten fumatus*).

Harrington et al. (2010) conducted a BACI study of the short-term effects of seismic surveying on adult commercial scallops within the Bass Strait Central Zone Scallop Fishery between February and June 2010. The study aimed to determine the survival and health of adult scallops within impacted (directly below seismic survey transects), semi-impacted (within the seismic survey transect grid) and control (outside of the seismic survey transect grid) strata two months after seismic surveying. A before-seismic impact scallop dredge survey was conducted in February 2010 at both impact and control sites. In total, 45 sample dredge tows were conducted, with 15 sample tows being completed within each survey stratum. Between February 2010 and April 2010, the seismic survey vessel *M/V Aquila Explorer* completed 8,000 line kilometres of 2D seismic transects within eastern Bass Strait,

including areas within the Bass Strait Central Zone Scallop Fishery with high densities of adult scallops. The seismic source, 4,130 in^3 with an operating pressure of 2,000 psi was towed at a depth of ~6 m, with seismic discharges occurring at intervals of approximately every five seconds. The after seismic impact scallop dredge survey was conducted on the 2nd and 3rd June 2010, approximately eight weeks after the seismic survey had been completed within the vicinity of the dredge survey location.
Data on the abundance of live and dead scallops within the impacted and control sites were examined to assess whether any changes were evident and whether they may be attributable to effects of the seismic survey. Animals collected in surveys were separated into one of four shell categories; live scallops, clappers (very new dead scallops with two shell halves still joined together), new dead shell and old dead shell. Sub-lethal impacts were investigated by examining changes in roe and meat condition within each of the areas sampled.

No change in the abundance of live scallops (or related change in dead scallop categories) or macroscopic gonad and meat condition was detected after seismic surveying within either the control, impacted or semi-impacted strata. There was also no observable change in the size frequency distribution of scallops in the impacted and semi-impacted strata following seismic surveying. The conclusion was that no short-term (<2 months) impacts on the survival or health of adult commercial scallops (*Pecten fumatus*) were detected following the seismic survey.

Przeslawski et al. (2016a, 2016b, 2018) examined the short-term impacts on scallops and other marine invertebrates from a 2,530 in^3 seismic array and found no evidence of mortality or change in condition following exposure to a seismic survey. Analysis of images and samples revealed some site-specific differences in scallop abundance, size, condition, and assemblages, but these were not related to seismic operations.

From 2013-2015, a long-term study evaluated the acoustic impacts from seismic exposure on scallops in Australia (Day et al. 2016b, 2017). The experimental field research maintained the scallops in mesh enclosures while a vessel with the acoustic source passed close to the animals. Day et al. (2016b, 2017) exposed scallops to maximum received sound exposures of up to 213 dB re 1µPa PK-PK, 181 to 188 dB re 1 $\mu Pa^2.s$ per-pulse SEL, and SEL_{cum} of 188 to 198 dB re 1$\mu Pa^2.s$. The study also predicted ground acceleration of up to 37.57 m/s^2.

Day et al. (2016b, 2017) concluded that exposures did not result in any immediate mass mortalities; however, repeated exposures, not representative of typical survey conditions, resulted in a chronic increase in mortality over timeframes of approximately four months post-exposure, though not beyond naturally occurring rates of mortality. Separate experiments undertaken in 2013 and 2014 yielded mortalities of 3.6-3.8% in control scallops (no seismic exposure), 9.4-11.3% mortality in scallops exposed to a single pass of the seismic source, 11.3-16.1% mortality in scallops exposed to two passes of the seismic source, and 14.8-17.5% mortality in scallops exposed to four passes of the seismic source. The mortality rates were at the low end of the range of naturally occurring mortality rates documented in the wild, which range from 11-51% with a six year mean of 38% (Day et al. 2017). A third experiment in 2015 resulted in 100% mortality to both control scallops and exposed scallops, and accordingly was attributed to other causes and not to seismic exposure (Day et al. 2016b, 2017).

Sub-lethal effects to exposed scallops were also observed by Day et al. (2016b, 2017) indicating a compromised capacity for homeostasis and potential immunodeficiency over acute (hours to days) and chronic (months) timescales post exposure. Exposures did not elicit energetically expensive behaviours (i.e., extensive swimming or long periods of valve closure), but scallops showed significant changes in behavioural patterns during exposure, through a reduction in classic behaviours and demonstration of a non-classic “flinch” response to seismic signals. Furthermore, following exposure scallops showed an increase in recessing into sediment following exposure (Day et al. 2017).

Though Day et al. (2016b) recorded increased mortality with repeated exposure to a seismic source, it has not been established as to whether this was due to exposure to the seismic source or other mechanism related to the study design (Przeslawski et al. 2016). Using a precautionary approach, if

the increased mortality was due to exposure to the seismic source, then the increased mortality identified translates to an annual increase of between 9.4% and 20%. These fall towards the low end of what might be expected when compared with natural mortality rates in wild scallop populations, which range from 11-51% with a six year mean of 38% (Day et al. 2016b).

Scallops exposed to repeated seismic sound suffered physiological damage with no signs of recovery over the four month period, suggesting potentially reduced tolerance to subsequent stressors. In addition, changes in behaviour and reflexes during and following seismic exposure were observed. However, Day et al. (2016a, 2016b) cautioned that it was unclear from the study whether the observed physiological (and behavioural) impairments would result in mortality beyond the timeframes considered in their study.

Przeslawski et al. (2018) concluded that there was no evidence of increased scallop mortality, or effects on scallop shell size, adductor muscle diameter, gonad size, or gonad stage due to the seismic sound from an actual seismic survey. The authors concluded that the study provided no clear evidence of adverse effects on scallops, fish, or commercial catch rates due to the 2015 seismic survey undertaken in the Gippsland Basin. Przeslawski et al. (2018) further concluded that the study provided a robust and evidence-based assessment of the potential effects of a seismic survey on some fish and scallops.

Studies by Mooney et al. (2010) showed squid use their statocysts to detect low frequency, particle motion stimuli with a frequency response similar to the accelerometer ears of most elasmobranch and teleost fishes. Evoked potential response characteristics also parallel those found in many fish species that lack auditory specializations.

Laboratory studies that exposed two species of squid to seismic sound showed that *Alloteuthis sublata* was tolerant to a sound level up to 260 dB re 1 µPa (SPL) and *Loglio vulgaris* was fatally injured at levels of 246 – 252 dB re 1 µPa (SPL) within 3 – 11 minutes of exposure (Norris & Mohl 1983). However, received sound levels from a typical seismic survey do not reach these levels.

Fewtrell & McCauley (2012) assessed the effects of air gun noise on caged squid (*Sepioteuthis australis*). No sub-lethal injury or mortality as a result of exposures in this study was observed. Several squid showed alarm responses to the start-up of an air gun by firing their ink sacs and/or jetting away from the source, but this was not observed for similar or greater levels if the signal was ramped up. General habituation was observed with a decrease in alarm responses with subsequent exposures. During the trial the squid showed avoidance to the air gun by keeping close to the water surface at the end of the cage furthest from the air gun (within the sound shadow). Fewtrell & McCauley (2012) suggested a threshold of 166 dB re 1 µPa (SPL) would give an indication of the extent of disruption of a seismic survey by significant alteration in swimming patterns. They found that in one trial, where the received level of the first airgun impulse was 162 dB re 1 $\mu Pa^2 \cdot s$, the squid inked. This response was not observed again within this trial; however, the authors stated that it was unknown if this was due to depleted ink reserves or habituation. In two other trials, the initial received levels were lower (132 and 146 dB re 1 $\mu Pa^2 \cdot s$ per–pulse SEL), and although the cumulative received levels did exceed 162 dB re 1 µPa2 s, no inking behaviour was observed. The authors hypothesised that the results also suggest that a gradual increase in received levels and prior exposure to air gun impulses decreases the severity of the alarm responses in this species. This aligns with findings of general habituation in response to predators in squid (Long et al. 1989). Recent work (Jones et al. 2020) supports these findings as well, indicating potential rapid, short–term habituation by squid to impulsive noise, however, similar response rates were seen 24-hours later, which indicated that squid might re–sensitise to the noise.

The results presented in by Fewtrell and McCauley (2012) were stated by the authors to be preliminary, and while they stated that while it is possible that noise levels greater than 147 dB re 1 $\mu Pa^2 \cdot s$ are required to induce avoidance behaviour, the level associated with inking, of 162 dB re 1 $\mu Pa^2 \cdot s$ per–pulse SEL, has been considered as a startle response level for squid. In the absence of

additional studies and thresholds this level may be considered for other cephalopods; however, it may be limited when applied to other species.

André et al. (2011) exposed cephalopods (squid, cuttlefish, and octopus) to low-frequency sounds, 50–400 Hz sinusoidal wave sweeps with 100% duty cycle and one second sweep period for two hours in either a 2 L fiberglass reinforced plastic tank or a 200 L glass-walled tank, filled with natural seawater. The sweep was produced and amplified through an in-air loudspeaker, with measured received SPL of 157 ± 5 dB 1 µPa, with peak levels at 175 dB re 1 µPa. Following exposure, the individuals were decapitated at different intervals, ranging from immediately afterward to 12, 24, 48, 72, and 96 hours after exposure, respectively. All exposed individuals from presented the same lesions and the same incremental effects over time. The most pronounced lesions were visible in specimens observed 96 hours after sound exposure. In these individuals, the sensory epithelium was severely damaged, with very few hair cells remaining; most of the hair cells had been extruded. The epithelium only presented supporting cells, creating a holed mosaic, where residual hair cells showed either very few bent, flaccid, or fused kinocilia, or none at all. André et al. (2011) detailed that the lesions described in the study were new to cephalopod pathology and that their presence in all the noise-exposed individuals (versus their absence in controls) and their clear progression over time are consistent with the effects observed in other species that have been exposed to much higher intensities of sound.

Mooney et al. (2016) detailed that squid responded to sounds from 80 to 1,000 Hz, with response rates diminishing at the higher and lower ends of this frequency range. Animals responded to the lowest sound levels in the 200-400 Hz range. These results demonstrate that squid can exhibit a range of behavioural responses to sound include fleeing, startle, and protean behaviours, all of which are associated with predator evasion. Response types were frequency and sound level dependent, reflecting a relative loudness concept to sound perception in squid.

Solé et al. (2017) conducted offshore noise controlled exposure experiments on common cuttlefish (*Sepia officinalis*), at three different depths and distances from the source and particle motion and sound pressure measurements were performed at each location. Scanning electron microscopy revealed injuries in statocysts, which severity was quantified and found to be proportional to the distance to the transducer. These findings are the first evidence of cephalopods sensitivity to anthropogenic noise sources in their natural habitat. From the measured received power spectrum of the sweep, it was possible to determine that the animals were exposed at levels ranging from 139 to 142dB re 1µPa^2 and from 139 to 141 dB re 1µPa^2, at 1/3 octave bands centred at 315 Hz and 400 Hz, respectively. These results could therefore be considered a coherent threshold estimation of noise levels that can trigger acoustic trauma in cephalopods.

Dead beached squids have been documented in the vicinity of seismic surveys (Guerra et al. 2004) and from a seismic survey vessel (Leite et al. 2016).

Guerra et al. (2004) detailed that five giant squids were stranded between the end of September and the middle of October and four giant squid were found floating or stranded along the Asturian coast during a single week in September 2003. Guerra et al. (2004) examined seven of the nine animals, and did not find an obvious cause of death in any of these giant squid; however, internal examinations showed that two of the squids suffered extensive damage to internal muscle fibres, stomachs and digestive tracts were mangled. Some of the squids had also suffered severe damage to their statocysts that would have effectively disorientated them. Coincidentally, at the time of both mass strandings, vessels had been conducting seismic geophysical surveys in the vicinity, using ten compressed air guns that produced sound waves of low frequency (below 100 Hz) and high intensity (source level of 240 dB re 1 µPa at 1m per air gun) (Guerra et al. 2011).

Leite et al. (2016) reported that a squid, ~2 m long and identified as *Architeuthis dux,* was sighted as dead from a seismic survey vessel that had been operating in the area using a 5,085 in^3 seismic source with an operating pressure of 2,000 psi. Leite et al. (2016) detailed that while there is no

definite proof to link the death of this specimen to the seismic activity, its occurrence in an area of active surveys is suggestive of a possible link.

Given the similarities in physiology between squid and octopus, octopus are not thought to be at risk of physical injury even if individuals are exposed to several passes as noted by Fewtrell and McCauley (2012). There is limited information on the hearing sensitivity of octopus to sound stimuli. Kaifu (2008) studied *Octopus ocellatus* and concluded that the statocyst was responsible for the observed responses kinetic sound energy (particle motion). It is unknown how octopuses will respond behaviourally, but since they are benthic and territorial it is thought more likely that they will retreat into their lair as they normally do to perceived threats. They may also freeze and camouflage themselves if out in the open. Octopus are not expected to move very far from their territory and therefore will not be exposed to repeat close passes in short period of time since subsequent survey lines are about 4 km apart. If they remain in the same area, they may be exposed to sounds shown to elicit strong responses two to three times throughout the survey period and these events will be several days apart allowing the individual animals to recover.

4.3 Corals

A literature review by Dr Mardi Hastings stated that the primary mechanisms for injury of hermatypic corals from seismic sound emissions are: (1) breaking of the external coral skeleton which could also damage the polyp tissue, and (2) rupture or tearing of polyp tissues inside the corallites (Hastings 2008).

Although injury to corals is theoretically possible as described by Hastings (2008), studies on the actual impacts were limited prior to the Maxima 3D and Gigas 2D studies at Scott Reef (see below). A survey of coral reefs in Brunei that were subjected to seismic noise did not detect any damage to hard or soft corals, sponges, or other sessile benthic organisms (IEC 2003).

The most relevant data currently available are results from exposure studies that Woodside conducted during the Maxima 3D and Gigas 2D Pilot Ocean Bottom Cable (OBC) marine seismic surveys at Scott Reef offshore northern Western Australia.

In the Maxima 3D experiments corals in and around the lagoon were exposed to seismic signals (both experimental seismic lines and a full seismic survey) using a 2,055 in^3 source over a 59-day period. The experimental lines passed directly over the coral communities (source at 7 m depth, corals at ~60 m depth) whereas the full seismic survey passed within tens to hundreds of metres (horizontal offset). The maximum estimated received seismic signal levels at coral impact sites were 226–232 dB PK-PK, 214–220 dB SPL, 197–203 dB SEL, and a maximum cumulative SEL of 197–203 dB (Salgado Kent et al. 2016).

For plate corals, *Lobophytum* spp., and various soft corals including *Sarcophytum* spp., the proportion of dead and bare coral cover and the percent cover of red algae were documented, and no detectable effect was found from one or multiple passes of the seismic source (Battershill et al. 2008). Further, there was no evidence of coral breakage, no signs of physiological impairment in the corals (polyp withdrawal or reduction in soft coral rigidity) and no long-term change in coral community structure related to the experimental or full seismic survey activities (Battershill et al. 2008).

The Gigas 2D Pilot OBC coral monitoring study (SKM 2008) examined the potential for physical damage to a range of shallow water corals in North Scott Reef lagoon from seismic source emissions. This study used several sub-lethal indicators of stress and mortality (partial and whole colony mortality) to determine the effects of seismic source emissions on corals. The conclusion from this study was that emissions from the seismic source did not cause significant injury, tissue damage, sublethal stress or mortality to coral colonies, even when colonies were within a few metres of the seismic source (SKM 2008). This survey had a measured at source SEL of 206 dB (McCauley 2008).

Heyward et al. (2018) reviewed the research undertaken at Scott Reef and the analyses detected no effect of seismic activity measured as coral mortality, skeletal damage, or visible signs of stress immediately after and up to four months following the 3D marine seismic survey. Maximum received levels were 226 dB PK.

5 Fishes

Although hearing ranges and sensitivities vary substantially between species (e.g., Ladich & Fay 2013), all fish species tested to date can detect sound and vibration to some degree (Dale et al. 2015). Fish produce sounds in a wide range of context such as feeding, mating or fighting, and as a result anything that inhibits the detection of these sounds can have a negative effect on their fitness and survival (Popper & Hawkins 2019). The majority of fish species detect sounds from <50 Hz up to 500-1500 Hz (Popper & Hawkins 2019). A smaller number of species can detect sounds over 3 kHz, while very few species can detect ultrasound over 100 kHz (Ladich & Fay 2013). The critical issue for understanding whether an anthropogenic sound will affect the hearing of a fish is whether it is within the hearing frequency range of the fish and loud enough to be detectable above background ambient noise.

The hearing sensitivity of fish varies depending upon the auditory structures in the inner ear (otoliths surrounded by an epithelium of hair cells) and, if present, the swim bladder (Finneran & Hastings 2000; Nedwell et al. 2004). Otoliths are sensitive only to particle motion, while the swim bladder may provide an indirect route for sound pressure to reach the inner ear. The other main mechano-reception system in fish is the lateral line system, which runs along the side of the body and is more pronounced in some groups of fish than others. The lateral line system responds to particle motion produced in the near-field of a sound source, as well as to tiny water currents set up by the motions of the fish (Nedwell et al. 2004); therefore, all fish are sensitive to the particle motion component of sound at close range from a sound source. Particle motion is the most relevant metric for perceiving underwater sound for most species, but with the exception of a few species (Popper & Fay 2011; Popper et al. 2014), there is an almost complete lack of relevant data on particle motion sensitivity in fish (Popper & Hawkins 2018). Some more specialised fish with a swim bladder that they use for hearing are sensitive to sound pressure and are capable of detecting less intense noise and a wider range of frequencies, compared to less-specialised groups of fish (Popper et al. 2014; Carroll et al. 2017; Hawkins & Popper 2017). The susceptibility of fish to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Inter-specific variations in hearing range and sensitivity result from the different adaptations in these systems for perceiving sound pressure and particle motion information (Popper & Fay 2011).

Based on their morphology, Popper et al. (2014) classified fishes into three categories comprising:

- Fishes with swim bladders whose hearing does not directly involve the swim bladder or other gas volumes.
- Fishes whose hearing does directly involve a swim bladder or other gas volume.
- Fishes without a swim bladder that can sink and settle on the substrate when inactive.

The Popper et al. (2014) classifications can be assigned to the following families or species of commercial fish species, common in Australian waters:

- Fishes with swim bladders or other gas volumes, but whose hearing does not directly involve the swim bladder, e.g., snappers, emperors, groupers and rock cods (lutjanids and lethrinids such as *Pristipomoides* spp., *Lethrinus* spp., *Lutjanus* spp., and Family Serranidae), and some species of tuna (*Thunnus* sp.) (Tavolga & Wodinsky 1963; Higgs et al. 2006; Braun & Grande 2008; Engineering-Environmental Management, Inc. 2008; United States Department of the Navy 2008; Caiger et al. 2012; Bertrand & Josse 2000; Song et al. 2006).
- Fishes whose hearing does directly involve a swim bladder or other gas volume e.g., Family Clupeidae (herrings, sardines, pilchards, and shads) and some Haemulidae (grunters and sweetlips) (Nedwell et al. 2004; Braun & Grande 2008; Popper et al. 2014).

- Fishes without a swim bladder (e.g., mackerel, *Scomberomorus* spp., some species of tuna, *Thunnus* sp. and sharks) (Casper et al. 2012; Popper et al. 2014; Carroll et al. 2017).

Underwater noise levels significantly higher than ambient levels can have a negative impact on fishes, ranging from physical injury or mortality to temporary effects on hearing and behavioural disturbance effects.

The effects of underwater sound on fishes within the vicinity of a seismic sound source array will vary depending on the size, age, sex, and condition of the receptor among other physiological aspects, and the topography of the benthos, water depth, sound intensity and sound duration. The effect of noise on a receptor may be either physiological (e.g., injury or mortality) or behavioural, as described in the following sub-sections.

Mortality/Potential Mortal Injury

It is noted that while thresholds for fish mortality have been included for consideration in this assessment based on the Popper et al. (2014) guidelines, no studies to date have demonstrated direct mortality of free-swimming adult fish in response to seismic source emissions, even when at close proximity (within 1–7 m) (DFO 2004; Boeger et al. 2006; Popper et al. 2016; Carroll et al. 2017). Although some fish deaths have been reported during cage experiments, these were more likely caused by experimental artefacts of handling fish or confinement stress (Hassel et al. 2004). For free swimming fishes that can move away from seismic sources as they approach, the potential for lethal physical damage from air gun emissions is even further nullified. However, reef or bottom-dwelling fishes that show greater site attachment may be less inclined to flee from a seismic sound source and experience greater effects.

Despite mortality being a theoretical possibility for fish exposed to seismic source emissions, Popper et al. (2014) did not reference an actual occurrence of this effect. At the time of developing the guidelines, no quantified data on injury and mortality from seismic sources on fishes had been reviewed by the Working Group. Therefore, the Popper et al. (2014) exposure guidelines for mortality/potential mortal injury and recoverable injury for fishes exposed to seismic source emissions are based solely on data from pile driving conducted on predominantly temperate, freshwater fish species. Although seismic surveys and pile driving both produce impulsive sound, their sound characteristics are markedly different; pile driving impulses result in a more rapid rise time in sound pressure than seismic pulses and it is this rapid rise time that has the greatest potential for trauma (Caltrans 2001, 2004; Hastings & Popper 2005; Popper et al. 2006). Also, pile driving sound effects are usually more significant due to the fact that they usually involve a static source and static receivers (e.g., site-attached fishes).

Environmental Resources Management Australia (ERM) undertook a detailed literature review of potential fish mortality and physical injury because of exposure to seismic sources (ERM 2017). Of the 28 studies reviewed, only three observed direct mortality and in each case, mortalities occurred to fish that were caged at very close proximity to the seismic source (<2 m). This is clearly not representative of real-life exposures from seismic surveys given fish are free-swimming and therefore capable of moving away from a sound source if needed. The received sound levels that resulted in mortality ranged from 220 to 241 dB re 1 µPa PK; however, other studies reported no mortality or injury at levels as high as 246 dB re 1 µPa PK. Therefore, the sound exposure criteria proposed by Popper et al. (2014) for mortality and mortal injury are considered to be highly conservative.

Other than physiological stress responses or hearing loss, no other physical damage to adult fish or invertebrates have been directly attributed to exposure to seismic source emissions, even at close proximity (NSW DPI 2014). It should be noted that some reports of physical damage arise from studies undertaken using explosions and other high-pressure sound waves, and not from seismic source emissions that generate lower maximum pressures and pressure change (Popper & Hastings 2009).

There is some evidence that bony fishes can regenerate the sensory cells in their hearing system to a fully functional state within weeks after a detrimental exposure. The processes involved in the recovery are not fully understood, and there is conflicting evidence from sound exposure studies, such as McCauley et al. (2003). These findings could also suggest that the process of sensory hair cell death and regeneration is species-specific.

Recovery processes take a few days to a few weeks (Scholik & Yan 2001; Mackenzie & Raible 2012), and the time course for recovering from hearing loss likely depends on the species, its normal hearing sensitivity, the sound exposure intensity and duration, and the amount of sensory epithelial damage (Smith & Monroe 2016). Noise-induced PTS has not been reported for fishes yet, which may be explained by their apparent ability to regenerate hair cells.

Injurious effects caused by rapid pressure changes within the body are called 'barotrauma' (Stephenson et al. 2010; Halvorsen et al. 2011, 2012b). The range of barotrauma effects in fishes mostly depends on the temporal pattern of the pressure changes and the physiological state of the exposed fishes (Stephenson et al. 2010; Halvorsen et al. 2012a, 2012b); they range in severity from damage with full recovery to lethal injury (McKinstry et al. 2007).

Casper et al. (2012) showed that fishes can recover from less severe injuries under laboratory conditions, suggesting that minor injuries do not inevitably lead to mortality. Nevertheless, in open waters, they have the potential to reduce the animal's fitness to the extent that its ability to find food decreases and its risk of being predated increases (Halvorsen et al. 2011, 2012b).

Mortality is either a direct effect of barotrauma (in the case of severe injury) or indirect if an animal is moderately injured. Data on sound-induced mortality in fishes are scarce and mainly related to underwater explosions (see review by Popper & Hastings 2009). Caltrans (2001) documented fish mortality near underwater pile driving. There is no evidence for fish mortality caused by exposure to other sound sources such seismic source emissions, dredging, or vessel noise (Normandeau Associates, Inc. 2012).

Temporary Threshold Shift

The following is sourced from Popper et al. (2014):

> *"Temporary threshold shift (TTS) is a temporary reduction in hearing sensitivity caused by exposure to intense sound. TTS has been demonstrated in some fishes, and its extent is of variable duration and magnitude. TTS results from temporary changes in sensory hair cells of the inner ear and/or damage to auditory nerves innervating the ear (Smith et al. 2006; Liberman 2015). However, sensory hair cells are constantly added in fishes (e.g., Corwin 1981, 1983; Popper and Hoxter 1984; Lombarte and Popper 1994) and also replaced when damaged (Lombarte et al. 1993; Smith et al. 2006; Schuck and Smith 2009), unlike in the auditory receptors of mammals. When sound-induced hair cell death occurs in fishes, its effects may be mitigated over time by the addition of new hair cells (Smith et al. 2006, 2011; Smith 2012, 2015).*
>
> *After termination of a sound that causes TTS, normal hearing ability returns over a period that is variable, depending on many factors, including the intensity and duration of sound exposure (e.g., Popper and Clarke 1976; Scholik and Yan 2001, 2002a, b; Amoser and Ladich 2003; Smith et al. 2004a, b, 2006, 2011; Popper et al. 2005, 2007). While experiencing TTS, fishes may have a decrease in fitness in terms of communication, detecting predators or prey, and/or assessing their environment."*

McCauley et al. (2003) demonstrated that exposure to repeated emissions of a single air gun (source level of 222.6 dB re 1µPa PK-PK) from 5 to 15 m at the closest approach caused extensive damage to the sensory hair cells in the inner ear of caged pink snapper (*Pagrus auratus*). Although no mortality was observed, the damage was severe with no evidence of repair or replacement of damaged sensory cells up to 58 days post-exposure. However, the study did not investigate the effects on fish hearing. The study acknowledged that the fish were caged and therefore not able to swim away from sound source, and that the monitoring video suggested the fish would have fled the sound

source if possible. The authors of the study also acknowledged that the impact of exposure on ultimate survival of the fish was not clear.

As part of Woodside's Maxima 3D marine seismic survey, an extensive field study was undertaken at Scott Reef. A component of this study investigated the potential physical, physiological, and behavioural noise-induced effects on fish assemblages. The results showed statistically more damage to the hearing in blue-stripe sea perch (*Lutjanus kasmira*) exposed to the seismic impulses than in control fishes. However, the damage found in these fishes was marginal, and—assuming a direct relationship between hair cell density and hearing capability—a negligible effect on the fishes' hearing capability. The damage was monitored through time out to 58 days post seismic exposure and did not increase significantly through time, with almost zero damage detected by 58 days (McCauley 2008).

A study of auditory sensitivity in four species of tropical reef fishes following exposure to emissions from the 2,055 in^3 array showed that none of the four species, including the pinecone soldierfish (a species with expected to have good hearing sensitivity) experienced any hearing sensitivity loss (i.e. TTS) following exposure to SEL_{cum} up to 190 dB re 1 $\mu Pa^2 \cdot s$ (Hastings et al. 2008; Hastings & Miksis-Olds 2012). No detectable gross physiological damage was found in individuals from any of the seven species (McCauley & Kent 2012). The results of the hearing tests are consistent with the sound exposure guidelines proposed in Popper et al. (2014), which indicated that TTS may occur at SEL_{cum} levels >186 dB re 1 $\mu Pa^2 \cdot s$ while other studies (Popper & Hastings 2009; Song et al. 2008) indicate that TTS may occur at levels as high as SPL 205-210 dB re 1µPa (PK).

Behavioural Effects

The sound-related factors influencing behavioural reactions in fishes can include its frequency content, intensity above background noise and temporal sound characteristics. If exposed to the same stimulus over a prolonged period, an initial behavioural reaction might fade as the fishes habituate to the sound. Behavioural reactions that are usually observed in fishes in response to sound are dispersion, directed movements away from the sound source (leaving the area of the noise source, aggregation and descending closer to the bottom), startle response (fast start escapes, C-start response) at sound onset (Wardle et al. 2001; Slotte et al. 2004). Effects can be acute (such as acoustic masking), or chronic (including altered distribution), lasting from the immediate duration of sound exposure to several days or weeks if fishes are displaced from their preferred areas during a survey (Engås et al. 1996; Slotte et al. 2004; Løkkeborg et al. 2012; Streever et al. 2016).

The onset level of behavioural responses in fishes varies greatly between and within species, including between fishes of different ages and sizes, the behavioural and social context, and the motivation of the fishes. Existing data on behavioural responses do not provide a clear dose-response relationship and, consequently, it is currently impossible to determine single value thresholds for the onset of behavioural reactions. Instead, broad response and effect categories such as those proposed by Popper et al. (2014) seem most reasonable and may guide regulatory decisions in this context.

Strong 'startle' responses have been observed in some fish species at received sound levels of 200-205 dB re 1 µPa, indicating that sounds at or above this level may cause more severe behavioural reaction such as avoidance. Sound levels of this intensity are likely to occur 100 to 300 m from an acoustic array. Based on this, an approximate range of 200 m was estimated as the minimum distance at which fishes may start avoiding the approaching seismic source (McCauley 1994). Wardle et al. (2001) documented that schooling reef fishes swam past a seismic source array at received levels that would be received at about 20 m below a survey array consisting of 30 air guns.

Pearson et al. (1992) showed that exposure to air gun sound can cause changes in schooling patterns and distribution. Løkkeborg et al. (2012) found changes in catch rates of fish species in Norwegian waters, indicating that these species all responded to seismic sound emissions. However, they also showed that gillnet catches were doubled for some fish species during seismic surveying and only longline catch rates fell slightly. Except for one species, they did not find any changes in abundance

or displacement from fishing grounds. Hawkins et al. (2014) used synthetic impulsive signals in a behavioural response study; they documented that sprat and mackerel reacted to the impulsive sound exposure generally by dispersal and depth changes (which would make it difficult to detect the true scope of effects in a study relying on fisheries technology).

Other studies looking at the behavioural response of sound pressure-sensitive Gadidae and Clupeidae species, such as whiting, Atlantic cod and herring, have reported changes in vertical position in the water column, potential avoidance responses and short-term changes in distribution. Chapman & Hawkins (1969) observed that the depth distribution of free-ranging whiting changed in response to an intermittently discharging stationary seismic source, which resulted in fish being exposed to an estimated SPL of 178 dB re 1 µPa. The fish school responded to the sound by shifting downward, forming a more compact layer at greater depth although temporary habituation was observed after one hour of continual sound exposure (Chapman & Hawkins, 1969).

Hawkins et al. (2014) exposed free-swimming sprat (a sound pressure-sensitive Clupeidae species with a swim bladder connected to the inner ear) and Atlantic mackerel (a particle motion detecting species without a swim bladder) to playback of impulsive sound. Sprat schools were more likely to disperse laterally in response to received sound levels of approximately 135 dB re 1 μPa^2.s SEL. Mackerel schools were more likely to alter their depth in the water column in response to approximately 142 dB re 1 μPa^2.s SEL. Hawkins et al. (2014) note how the two different species seemed to respond to the sound playback at similar sound levels despite the differences in sound sensitivity of the two species, but suggested that mackerel were simply more “flighty” than sprat and therefore more likely to react. The tests were also undertaken using low sound level playback in very close proximity to the schools of fish and it is not clear how relevant the sound pressure and sound exposure levels are in relation to mackerel given that their response was likely driven by particle motion. The study location, a very small, enclosed, quiet, coastal sea lough, where fish were not accustomed to heavy disturbance from shipping and other intense sound sources is also very different from an open ocean location.

Slotte et al. (2004) monitored the effects of a 3,090 in^3 seismic array on migrating herring (Clupeidae) and whiting (Gadidae), mapping their distribution and abundance in relation to the seismic survey lines. There was no significant evidence of immediate, near-field scaring reactions on the horizontal scale in response to acquiring survey lines, but there was some evidence that fish changed position in the water column, moving closer to the seabed. Some short-term changes in distribution were observed but weren’t statistically significant; fish consistently remained within the immediate vicinity of the survey area, but in a limited number of measurements there was an indication that fish abundance was lower near to the survey area and increased with distance out to a maximum range of 37 km. However, results were inconsistent, and clear trends were not observed in all cases. Slotte et al. (2004) concluded that it was not possible to determine how much abundance and distribution were attributed to the seismic survey or to the natural migration patterns and food availability of the fish, or other natural factors. Herring and whiting were found to be abundant in the survey area again after a pause in seismic acquisition and monitoring of fishes for three to four days, indicating that if any displacement did occur as a result of seismic sound exposure, the displacement was temporary (i.e. less than 3-4 days) (Slotte et al. 2004).

In similar studies, Engås et al. (1996) and Engås & Løkkeborg (2002) reported on the effects of seismic surveys on Atlantic cod and haddock (Gadidae) and found that the abundance of fish were lower in the survey area compared with areas outside of the survey area, which the authors hypothesize may be the result of an avoidance response. Some differences in abundance were still detectable within the survey area five days after the survey was completed (Engås et al. 1996; Engås & Løkkeborg 2002).

Santulli et al. (1999) exposed caged European sea bass (a demersal species) to a 2,500 in^3 seismic source. Limited response was observed at 2.5 km distance, a startle response was observed when the array was at a distance of approximately 800 m, but after passing within 180 m, fish behaviour appeared to return to normal within one hour. Increased biochemical stress levels were measured in some fish following exposure, returning to normal levels within 72 hours of exposure. It is noted

that exposures of fish in the wild would likely result in avoidance of high sound levels prior to the seismic source approaching to as close a range and to as high sound levels as the captive fish in the experiment were exposed to.

The behavioural observations of free-swimming fishes in Woodside's Maxima 3D survey at Scott Reef (Miller & Cripps 2013) show that seismic source emissions did not cause lethal or sub-lethal effects on fish near the operating array. At close range, the vessel approach caused fishes to cease their behaviours and move towards the seabed, but the effect was short-lived, and fishes began to feed and behave normally again within 20 minutes after the passage of the seismic survey vessel. Caged fishes displayed startle responses too infrequently to analyse. However, agitation levels increased with increasing received sound exposure level for the three holocentrid species (squirrelfishes and soldierfishes, suborder Holocentroidei) but were not detectable for the blue-stripe sea perch. Sonar observations of free-swimming fishes indicated that individual animals tended to move towards the seabed on approach of the operating seismic source, consistently out to 400 m either side of the survey test line. Schools of fishes moved towards the seabed within 200 m of the survey test line in response to the passage of the operating seismic source and stayed significantly closer to the seabed up to 63 minutes post-exposure. The vocal behaviour of fishes was unaffected from the seismic activity; fish choruses remained unchanged with regards to timing and chorus level (at daily, lunar and seasonal scales); these findings suggest that in the long-term the survey had little effect on the fish that produced the choruses. Underwater visual censuses (UVC) revealed that diversity and abundance of both Pomacentridae (damselfishes and clownfishes) and non-Pomacentridae fish species (inhabtiting shallow-slope regions) showed no significant changes after the seismic survey compared to the long-term temporal trend before the survey. Analysis of recordings from baited remote underwater video stations showed no detectable effects of the seismic survey on the diversity and abundance of deeper water fish communities at the spatial and temporal scales examined. Also, there were no signs of loss of individuals or of systematic re-distribution of individuals and species at any of the time scales examined.

The findings from the research at Scott Reef support those by Wardle et al. (2001), who exposed free ranging fishes inhabiting an inshore reef to sounds from a seismic source (maximum received levels of 195-218 dB re 1 µPa PK). The study found that fishes exhibited a startle response to all received levels, but no avoidance behaviours were observed, they showed no signs of moving away from the reef and exposure to the seismic noise did not interrupt a diurnal rhythm of fishes gathering at dusk. Slight changes were recorded to the long-term day-to-night movements of two tagged pollack (*Pollachius sp.*), particularly when positioned within 10 m of their normal living positions. However, the seismic sound had little effect on the day-to-day behaviour of the resident fishes and invertebrates.

Behavioural observations of two tropical snapper species and another coral reef fish species, spadefish, in field enclosures before, during and after exposure to seismic sound showed that repeated exposure resulted in increasingly less obvious startle responses (Boeger et al. 2006). This is consistent with the potential habituation suggested by McCauley et al. (2000) and by Fewtrell and McCauley (2012).

McCauley & Salgado Kent (2007) observed the behaviour of goldband snapper in fish traps in the Timor Sea using cameras placed inside the fish traps. A seismic vessel towed two 3,090 in^3 seismic sources. Maximum signals reached at the closest trap to each seismic pass-by were 200, 202 and 212 dB re 1 µPa PK-PK (equivalent to approximately 194, 196 and 206 dB re 1 µPa PK). No dramatic behavioural responses of fish to the passing seismic source were observed. Fish generally displayed increased activity immediately after entering a trap presumably as they searched for a way out, with this activity reducing with time. Fish that had been in a trap for some time showed increased activity levels as the operating seismic source approached but were 'quiet' when the array passed at the point of closest approach.

Fewtrell & McCauley (2012) showed that fishes tended to remain lower in the water column and/or swim faster and form tighter schools during periods of close air-gun emissions. Fish populations can

be potentially impacted if behavioural responses result in deflection from migration paths, feeding grounds or disturbance of spawning, thereby affecting recruitment of fish stocks.

Paxton et al. (2017) observed temperate reef fishes, including snapper and grouper species, in 33 m water depths located 7.9 km from a seismic survey line using video recordings. The authors observed fish abundance and habitat use during the evening hours for three days prior to a seismic survey and then during the evening of the day when seismic activity occurred. The authors attempted to measure sound at two other reefs in closer proximity to the survey, but the hydrophones malfunctioned. No video recordings were made at the other reefs where hydrophone measurements were attempted. No hydrophone measurements were made at the reef where video recordings took place, but maximum sound levels were estimated to be more than 170 dB re 1 µPa SPL. Despite no clear visual evidence of behavioural responses in fishes during the seismic survey, the authors noted a 78% decline in abundance in the evening following the survey. No further recordings were made to assess when fish abundance returned to pre-exposure levels or how far they may have moved. Therefore, with limited data, it is not clear from this study if reduced abundance is attributed to the seismic sound or other natural factors such as tidal influence or food availability. However, the study may indicate a possible avoidance response and temporary change in local abundance and distribution.

Bruce et al. (2018) tagged tiger flathead, which were monitored during a seismic survey undertaken in Australian waters. Minor behavioural effects were observed in exposed tiger flathead, which increased their swimming speed during the seismic survey and changed daily movement patterns after the survey but showed no significant displacement. Overall, there was little evidence for consistent behavioural responses (Bruce et al. 2018).

Davidsen et al. (2019) investigated the effects of seismic sound exposure on the physiology and behaviour of captive Atlantic cod (*Gadus morhua*) and saithe (*Pollachius virens*), both species from the Family Gadidae with a swim bladder directly involved in sound detection. Experimental sound exposures were 18-60 dB above ambient. The cod exhibited reduced heart rate in response to the particle motion component of the sound from the air gun, indicative of an initial flight response. No behavioural startle response to the air gun was observed despite some observed changes in swimming depth and position, and the fish seemed to habituate both physiologically and behaviourally with repeated exposure. The authors concluded that sound exposures induced over the three day study period appear unlikely to be associated with long-term alterations in physiology or behaviour.

Hubert et al. (2020) also exposed captive Atlantic cod to one hour of playback of seismic air gun sound pulses with a 10 second shot point interval. Results indicated no strong overall pattern of change in swimming patterns or immediate, short-term behaviours during the exposure, compared to baseline periods without playback. However, several individuals changed their time spent in several behavioural states during the one-hour sound exposure, which may be indicative of changes in energy expenditure.

van der Knaap (2021) investigated the effect of a 3.5-day, full-scale, seismic survey exposure on the movement behaviour of free-swimming Atlantic cod, using acoustic telemetry. The closest point of approach to the tagging location was 2.25 km. The study found that during the experimental survey, cod did not leave the detection area more than expected from baseline data. However, cod left more quickly than expected, from two days to two weeks after the seismic survey. Furthermore, behavioural analyses indicated that during the exposure cod decreased their activity, with time spent being locally active (moving over small distances, showing high body acceleration) becoming shorter, and time spent being inactive (moving over small distances, having low body acceleration) becoming longer. Additionally, diurnal activity cycles were disrupted with lower locally active peaks at dusk and dawn–periods when cod is known to actively feed.

Meekan et al. (2021) undertook a large-scale experiment that quantified the impacts of exposure of an assemblage of tropical demersal emperors (Family Lutjanidae), snappers (Family Lethrinidae)

and groupers (Family Epinephelidae) targeted by commercial fisheries to a commercial-scale seismic source on the North West Shelf off Western Australia. Dominant species included spangled emperor (*Lethrinus punctulatus*), red emperor (*Lutjanus sebae*), and brownstripe snapper (*L. vitta*). A combination of Baited Remote Underwater Video Systems (BRUVS) and acoustic tagging methods were used to measure the behaviours and movements of fishes at high, medium, and low exposure sites, as well as at control sites. The high, medium, and low exposure sites were located at horizontal distances from the path of the seismic source of approximately 0 – 300 m, 2 – 10 km and 11 km respectively. The maximum modelled SEL values received at the high, medium, and low exposure sites were in the order of 180 – 200 dB re 1 $\mu Pa^2 \cdot s$, 130 – 160 dB re 1 $\mu Pa^2 \cdot s$ and 115 – 125 dB re 1 $\mu Pa^2 \cdot s$ respectively. There were no short-term (days) or long-term (months) effects of exposure on the composition, abundance, size structure, behaviour, or movement of fishes at any exposure sites. The authors suggest that it is a reasonable assumption that the behavioural responses of demersal fishes to the bait cue provided by the BRUVS are a realistic proxy of the likely response of the same species to baited hooks or traps used by the commercial fisheries that target them. The acoustic tags and telemetry found little evidence that fish were displaced by the exposure to the seismic source. Movements of tagged fish occurred over a limited area focused on two or three acoustic receivers, and there was no evidence for the departure of tagged fish after exposure. These multiple lines of evidence suggest that seismic surveys have little impact on the behaviours of demersal fishes in this environment.

A recent study examined behavioural responses in spawning Atlantic cod in Norway (McQueen et al. 2022, 2023). Atlantic cod (*Gadus morhua*) may be especially vulnerable to sound disturbance during spawning, as it is a soniferous fish species, with acoustic communication playing an important role in the cod mating system, and a low frequency hearing range (10 – 650 Hz). During the spawning period, male cod produce low frequency grunts (~50 Hz) that have been associated with aggressive and courtship behaviours. Low frequency noise associated with ship traffic has been found to reduce the effective communication range of spawning cod (Stanley et al. 2017; as cited in McQueen et al. 2023), and low frequency anthropogenic noise can elicit stress responses in cod resulting in reduced egg production and fertilization rates (Sierra-Flores et al. 2015). Additionally, cod tend to demonstrate high site fidelity to spawning areas. There have been reports that free-ranging cod move away from an area in immediate or delayed response to seismic surveys (Engås et al. 1996; van der Knaap et al. 2021).

To investigate whether airgun sound causes cod to leave their spawning grounds, McQueen et al. (2022, 2023) deployed acoustic telemetry arrays were on two cod spawning grounds: a test and a reference site. From 2019 to 2021, 136 mature cod from the test site and 45 from the reference site were tagged with acoustic transmitters. Intermittent seismic shooting of two 40 cui airguns for one week during the spawning periods of 2020–2021 resulted in fluctuating SELs at the test site, comparable to a full-scale industrial survey 5–>40 km away. Residency and survival of tagged cod were analysed with capture–mark–recapture models fitted to the detection and recapture data. Departure rate of the mature cod varied between spawning seasons but was similar between the test and reference sites. Cod demonstrated only weak responses to the disturbance from repeated three hour treatment periods over five days, swimming on average slightly deeper during seismic exposure compared to silent control periods. This response varied between individuals. Longer-term effects of seismic exposure on swimming depth were not detected. No changes in swimming acceleration, displacement, or area use occurred. Neither survival nor departure significantly differed between seismic exposure and baseline periods. The results indicated that exposure to airguns at received SEL of up to ~145 dB re 1 μPa^2 s, comparable to a seismic survey occurring several kilometres away, did not displace tagged cod from spawning grounds. These results suggest that relatively distant seismic surveys do not substantially alter cod behaviour during the spawning period at received sound exposure levels varying between 115 and 145 dB re 1 μPa^2 s over a five day period (McQueen et al., 2022, 2023).

The following conclusions are made regarding behavioural effects to fish from seismic airguns, based on the literature above:

- Different fish may exhibit different behavioural responses when exposed to seismic survey noise, depending on their activities, motivation and the context in which they receive sound.
- Fish may change position in the water column (i.e., move closer to the seabed) as a response to becoming aware of approaching seismic sound (e.g., Pearson et al. 1992; McCauley et al. 2000, 2003; Slotte et al. 2004; Fewtrell & McCauley 2012; Miller & Cripps 2013; Davidsen et al. 2019).
- Exposure to higher sound levels at close range to a seismic source may begin to result in more noticeable startle or alarm responses, such as changes in school structure, increased swimming speed and avoidance of the sound source (e.g., Simmonds & MacLennan 2005; McCauley et al. 2000, 2003; Fewtrell & McCauley 2012; Popper et al. 2014; Carroll et al. 2017).
- Many exposure experiments are undertaken using a single airgun and it is not clear how transferrable the behaviours and received SPL/SEL levels are to a full commercial-sized seismic array, particularly if observed behaviours are in response to particle motion close to the sound source rather than to sound pressure.
- There is some evidence that fish may also tolerate gradual increases in sound levels and habituate to repeated sound exposures (Chapman & Hawkins 1969; McCauley et al. 2000; Boeger et al. 2006; Fewtrell & McCauley 2012; Peña et al. 2013; Davidsen et al. 2019).
- Many studies indicate that fishes resume normal behaviour shortly after cessation of the acoustic disturbance (within minutes / less than an hour), with no evidence of long-term changes (e.g., Wardle et al. 2001; Pearson et al. 1992; Santulli et al. 1999; McCauley et al. 2000, 2003; Fewtrell & McCauley 2012; Miller & Cripps 2013; Davidsen et al. 2019).
- Meekan et al. (2021) found no short-term (days) or longer-term (months) effects of seismic sound exposure on the behaviour and movement of tropical demersal snapper, emperor and grouper species on the North West Shelf.
- There is some evidence that changes in distribution may persist for longer than the initial change in behaviour, i.e. position in the water column, schooling behaviours and swim speeds may return to normal relatively quickly (within minutes or hours), but their distribution may not return to normal for hours or days. Potential changes in distribution of fish has been observed in some studies for approximately five days following sound exposure, although such changes are limited to studies that focused primarily on migrating sound pressure-sensitive types of fish with a swim bladder-ear connection (e.g. Clupeidae, Gadidae). These studies also acknowledge that it is difficult to attribute these changes in distribution directly to the seismic survey or to natural migration patterns, food availability or other natural factors (Slotte et al. 2004; Engås et al. 1996; Engås & Løkkeborg 2002). However, it is possible that changes to the behaviour and distribution of some sound-sensitive prey species (e.g. herring, sardines) may have some indirect influence on the distribution of larger predatory fishes during the days following exposure and disturbance.
- Small changes in behaviour or disruption to diurnal activities of pressure-sensitive species of fish (Gadidae) with a swim bladder-ear connection may indicate that activities such as feeding and energy expenditure can be affected if exposed long-term (Davidsen et al. 2019; Hubert et al. 2020; van der Knaap 2021), although these species of fish may also habituate to the sound with repeated exposure (Davidsen et al. 2019).

Given the limited convergence in results from the available studies, the subjective nature of many assessments and the context under which fish received sound, the Popper et al. (2014) ANSI-Accredited Standards Committee Sound Exposure Guidelines for Fishes and Turtles determined

that it is not possible to define exact sound level thresholds for changes in fish behaviours. Instead, Popper et al. (2014) applies relative risk criteria. The criteria reflect the potential for substantial changes in behaviour for a large proportion of the animals exposed to a sound, which may alter distribution, and moving from preferred sites for feeding and reproduction. The criteria do not include effects on single animals or small changes in behaviour such as a startle response or minor movements. As such, Popper et al. (2014) indicate that fish without a swim bladder or with no connection between the swim bladder and the inner ear may experience substantial changes in behaviour within tens or hundreds of metres of a seismic source. These peer-reviewed and accredited sound exposure criteria are reflected in this risk assessment. It is acknowledged that some fishes with swim bladders may show varying levels of awareness of sound pressure at greater distances from the seismic source, but it is important to recognise changes in behaviour that may be of ecological significance from those that aren't.

Sand et al (2000) noted avoidance behaviour of glass eels when exposed to infrasound at a frequency of 11.8Hz and found during the periods with infrasound exposure, the proportion of silver eels entering the section closest to the sound source was reduced to 43% in the control. It should be noted this experiment was a caged study and not representative of a full-scale seismic survey.

Acoustic Masking

Masking impairs an animal's hearing impairment with respect to the relevant biological sounds normally detected within the environment and can have long lasting effects on survival, reproduction, and population dynamics of fishes. The consequences of masking for fishes; however, have not been sufficiently examined to allow a thorough assessment of effects caused in the context of this survey. Popper et al. (2014) surmised that "*It is likely that increments in background sound within the hearing bandwidth of fishes and sea turtles may render the weakest sounds undetectable, render some sounds less detectable, and reduce the distance at which sound sources can be detected. Energetic and informational masking may increase as sound levels increase, so that the higher the sound level of the masker, the greater the masking*." If impulsive sounds are generated repeatedly by many sources over a wide geographic area there is a possibility that the separate sounds might merge and that the overall background noise be raised (Nieukirk et al. 2004). However, acoustic masking only occurs while the interfering sound is present, and therefore, masking resulting from a single pulse of sound (such as seismic source impulses) or widely separated pulses would be infrequent and not likely affect an individual's overall fitness and survival.

5.1 Sharks

Myrberg (2001) stated that sharks differ from bony fishes in that they have no accessory organs of hearing such as a swim bladder and therefore are unlikely to respond to acoustical pressure. The study also suggested that the lateral line system does not respond to normal acoustical stimuli and is unable to detect sound-induced water displacements beyond a few body lengths, even with large sound intensities (Myrberg 2001).

Chapuis et al. (2019) detailed that the auditory apparatus of sharks comprises the paired inner ears that, as in all fishes, detect the particle motion component of a sound. However, unlike most bony fishes, cartilaginous fishes do not possess a swim bladder, which responds to the pressure component of a sound, and therefore are thought to only be sensitive to particle motion. Though Lobel (2009) noted that at very loud levels, an elasmobranch is able to discriminate between sounds based upon the phased difference between particle motion and acoustic pressure (Lobel 2009).

Two sensory maculae, the sacculus and the macula neglecta, have been shown to be responsive to particle motion detection in the inner ear of cartilaginous fishes which are known to be sensitive to low frequency sounds up to 1.5 kHz, peaking between 200 and 600 Hz, depending on the species (Chapuis et al. 2019). This range overlaps with seismic pulses which are primarily less than 2 kHz, with the highest levels at frequencies in the range of 10-500 Hz (McCauley 1994).

There is some indication that a sudden onset of sound can also cause a startle response in sharks (Myrberg et al. 1978). Klimley and Myrberg (1979) established that an individual shark will suddenly turn and withdraw from a sound source of high intensity (more than 20 dB re 1 µPa above broadband ambient SPL) when approaching within 10 m of the sound source.

Research by Bruce et al. (2018), which tagged two shark species and monitored their movements in response to a seismic survey in Australian waters noted that both control sharks and exposed sharks moved freely in and out of the study area which did not indicate any changes in behaviour or distribution as a result of seismic sound exposure.

A study by Chapuis et al. (2019) used a baited underwater camera rig to record the behavioural responses of eight species of sharks (seven reef and coastal shark species and the white shark) to the playback of two distinct sound stimuli in the wild: an orca call sequence and an artificially generated sound. The aim of the study was to look at sound-induced behavioural changes in sharks to potentially identify acoustic repellent devices. When sounds were playing, reef and coastal sharks were less numerous in the area, were responsible for fewer interactions with the baited test rigs, and displayed less 'inquisitive' behaviour, compared to during silent control trials. White sharks spent less time around the baited camera rig when the artificial sound was presented but showed no significant difference in behaviour in response to orca calls.

It is noted that there has been reported cased of sharks biting the seismic streamers, such as during seismic surveys conducted by the survey vessel *Pacific Titan* in New Zealand waters.

6 Marine Turtles

Morphological studies of green turtles (*Chelonia mydas*) and loggerhead turtles (*Caretta caretta*) (Ridgway et al. 1969; Wever 1978; Lenhardt et al. 1985) found that the turtle ear is similar to other reptile ears but has adaptations for underwater listening. In-air electrophysiological and behavioural studies on green and loggerhead turtles found their hearing frequency range is approximately 50-2,000 Hz, with highest sensitivity to sounds between 200 and 400 Hz (Ridgway et al. 1969; Bartol et al. 1999; Ketten & Bartol 2005; Bartol & Ketten 2006; Yudhana et al. 2010; Piniak et al. 2011; Lavender et al. 2012, 2014).

Underwater audiograms are only available for three species, all of whom have poor hearing sensitivity. Two of these species, the red-eared slider (*Trachemys scripta elegans*, freshwater, semi-aquatic) (Christensen-Dalsgaard et al. 2012) and the loggerhead turtle (Martin et al. 2012), demonstrated highest sensitivity at around 500 Hz (Willis 2016). Piniak et al. (2016) found that green turtles have maximum underwater sensitivity between 200 and 400 Hz. Very little research has been performed on the hearing capabilities of hawksbill turtles (*Eretmochelys imbricata*). Yudhana et al. (2010) measured auditory brainstem responses from two hawksbill turtles in Malaysia and found that peak frequency sensitivity occurred at 457 Hz in one turtle and at 508 Hz in the other.

There is no robust information on the susceptibility of marine turtles to noise-induced effects. Most studies researching the effect of seismic noise on marine turtles focused on behavioural responses, as physiological impacts are more difficult to observe in living animals. Turtles avoid low-frequency sounds (Lenhardt 1994) and sounds from an air gun (O'Hara & Wilcox 1990), but these reports did not note received sound levels. Moein et al. (1995) found that penned loggerhead turtles initially reacted to an air gun but then showed little or no response to the sound (i.e., habituated to it). Caged green and loggerhead turtles increased their swimming activity in response to an approaching air gun when the received SPL was above 166 dB re 1 µPa, and they behaved erratically when the received SPL was approximately 175 dB re 1 µPa (McCauley et al. 2000).

The 166 dB re 1 µPa level has been used as the threshold level for a behavioural response to marine turtles by NMFS and applied in the Arctic Programmatic Environmental Impact Statement (PEIS) (NSF 2011) and the Recovery Plan for Marine Turtles in Australia (DoEE 2017). The 175 dB re 1 µPa level from McCauley et al. (2000) is recommended as the threshold for behavioural disturbance. Sound levels defined by Popper et al. (2014) show that animals are very likely to exhibit a behavioural response when they are near an air gun (tens of metres), a moderate response if they encounter the source at intermediate ranges (hundreds of metres), and a low response if they are far (thousands of metres) from the air gun.

Mortality and potential mortality injury (PMI) impacts have not been reported to have occurred in turtles as a result of noise emissions during seismic surveys. Popper et al. (2014) suggested injury to turtles could occur for sound exposures above 207 dB re 1 µPa (PK) or above 210 dB re 1 $uPa^2 \cdot s$ (SEL_{24h}). However, (Finneran et al. 2017, updated by Accomando et al 2025) presented revised thresholds for turtle injury and hearing impairment from impulsive noise, considering both PK and frequency weighted SEL, suggesting that PTS may occur in response to received levels of 204 dB re 1 $uPa^2 \cdot s$ (SEL_{24h}) or 232 dB re 1 µPa (PK) and TTS may occur in response to received levels of 189 dB re 1 $uPa^2 \cdot s$ (SEL_{24h}) or 226 dB re 1 µPa (PK).

7 Birds

There is very little known about the effects of intense underwater sound (i.e. seismic surveys) on marine birds. However, impacts have not been observed during previous seismic surveys (Turnpenny and Nedwell, 1994), and it is generally thought that noise produced from activities associated with seismic surveys may impact only those species of birds that spend large quantities of time underwater, either swimming or plunge diving while foraging for food, for example penguins.

Pichegru et al. (2017) investigated the behavioural response of endangered African penguins (*Spheniscus demersus*) before, during and after a seismic survey conducted within 100 km of their breeding colony in South Africa, using a multi-year GPS tracking dataset.

Penguins foraging within 100 km of the active seismic operations showed a change of foraging direction during seismic periods, increasing their distance between their feeding area and the location of the seismic vessel. The avoidance behaviour by penguins observed in this study may be explained by either a direct disturbance from the noise generated by the operation or a change in fish distribution during that period (possibly as a result of seismic activities). Small-scale acoustic fish surveys assessing distribution and abundance of small pelagic fish in Algoa Bay around both penguin colonies did not show a significant change in distribution and/or abundance of small pelagic fish in the region in March 2013 compared to a few months prior to or after the seismic operations. Therefore, African penguins likely relocated away from their traditional feeding zone to avoid the disturbance generated by the noise of the seismic vessels, rather than to follow their prey.

The African penguins quickly reverted to normal foraging behaviour after cessation of seismic activities during this study, which suggest a relatively short-term influence of seismic activity on these birds' behaviour and/or that of their prey. Most bird and many fish species have the capacity to regenerate lost or damaged sensory cells of the ear, although the researchers could not rule out potential longer-terms impacts on the penguins hearing ability.

Stemp (1985; as cited in LGL 2012) conducted observations on the effects of seismic exploration on seabirds and did not observe any negative effects.

Lacroix et al. (2003) assessed the effect of near shore seismic surveys on the foraging behaviour of moulting long-tailed ducks in the Beaufort Sea, Alaska. Long-tailed ducks are not capable of flying during the moult and to compensate for the nutritionally costly moult process they increase their foraging. Lacroix et al. (2003) found that the abundance and distribution of ducks, in both the seismic and control areas, changed similarly following the start of the seismic operations suggesting other influencing factors such as wind were more important for duck distribution than seismic activities, and that seismic activities did not significantly change the diving intensity of ducks. Overall Lacroix et al. (2003) concluded that there was no evidence to suggest any displacement away from seismic operations.

In a controlled exposure experiment, Sørensen et al. (2020) exposed captive Gentoo Penguins (*Pygoscelis papua*) to impulsive signals, and most animals showed strong aversive reactions at received levels above 120 dB re 1µPa (SPL). While the experiment made efforts to reduce some of the limitations of captive experiments, the study is still difficult to reconcile exposures to sudden sound stimuli at close range (metres) in the absence of natural ocean background noise with a real-life exposure.

8 Marine Mammals

The potential impacts of anthropogenic noise on marine mammals have been the subject of considerable research (see reviews by Nowacek et al. 2007; Southall et al. 2007; Weilgart 2007; Wright et al. 2007; Southall et al. 2019; Southall et al. 2021).

Kavanagh et al. (2019) modelled over 8,000 hours of cetacean survey data across diverse offshore region of the Northeast Atlantic to investigate the effect of seismic surveys on baleen and toothed whales. They found a significant effect of seismic activity across multiple species and habitats, with an 88% (82–92%) decrease in sightings of baleen whales, and a 53% (41–63%) decrease in sightings of toothed whales during active seismic surveys when compared to control surveys. Significantly fewer sightings of toothed whales also occurred during active versus inactive air gun periods of seismic surveys, although some species-specific response to noise was observed.

Southall et al. (2007), Finneran & Jenkins (2012), Wood et al. (2012), Finneran (2015) and more recently NMFS (2018) and Southall et al. (2019, 2021) and most recently updated by Accomando et al 2025), reviewed available literature to determine noise exposure criteria, based on the onset levels of non-recoverable PTS and TTS in cetaceans. The NMFS (2018) criteria incorporate the best available science to inform assessment of PTS and TTS. However, a lack of a quality low-frequency (LF) cetacean audiograms has made it difficult to precisely determine hearing sensitivity, and the criteria for LF cetaceans are likely precautionary.

Hearing Sensitivity

Current data and predictions show that marine mammal species differ in their hearing capabilities, absolute hearing sensitivity and frequency band of hearing (Richardson et al. 1995; Wartzok & Ketten 1999; Southall et al. 2007). While hearing measurements are available for a small number of species based on captive animal studies, direct measurements of many odontocetes and all mysticetes do not exist. As a result, hearing ranges for many odontocetes are grouped with similar species, and predictions for mysticetes are based on other methods, such as anatomical studies and modelling (Houser et al. 2001; Parks et al. 2007; Tubelli et al. 2012; Cranford & Krysl 2015), vocalizations (see reviews in Richardson et al. 1995; Wartzok & Ketten 1999; Au & Hastings 2008), taxonomy, and behavioural responses to sound (Dahlheim & Ljungblad 1990)

To better reflect the auditory similarities between phylogenetically closely related species, but also significant differences between species groups among the marine mammals, Southall et al. (2007) defined five groups of marine mammals, based on phylogenetic relationships and a combination of auditory, physiological, and behavioural characteristics, where known. A revised set of marine mammal hearing groups and associated frequency-weighting functions were proposed by Finneran (2016) and these groups were adopted in technical guidance (NMFS 2018) as a useful approach in developing auditory weighting functions and deriving noise exposure criteria for marine mammals. In 2019, Southall et al. reviewed these marine mammal hearing groups and modified them based on phylogenetic relationships and a comprehensive review of studies on hearing, auditory anatomy, and sound production (Southall et al. 2019). This review resulted in eight discrete hearing groups as detailed in Table B8-3.

Frequency weighting

Different animals are sensitive to different sound frequencies, which are measured in Hertz (Hz) and kiloHertz (kHz). Therefore, if an animal is sensitive to a particular frequency range, a sound in that frequency range will seem louder to that animal than to a different animal that is less sensitive to those frequencies. For example, some large baleen whales are sensitive to very low frequency sounds (7 Hz to 35 kHz), while toothed whales and dolphin species are considered more sensitive to mid-high frequency sounds (150 Hz to 160 kHz) with their peak hearing frequency somewhere between these frequency ranges (NMFS 2018). Therefore, how loud a sound will be perceived will differ between species.

As the hearing of different species of marine fauna is frequency dependent, rather than express received sound pressures in terms of their levels over a broad bandwidth, levels can be weighted by the frequency response of hearing for the animal. This approach has been widely used for examining exposure of humans to sound (Popper et al. 2014). Southall et al. (2007) developed M frequency weighting functions (M-weightings) for five functional hearing groups of marine mammals, with this method designed specifically to represent the broader bandwidth at which auditory effects (TTS and/or PTS) might occur for higher exposures. Southall et al. (2019) expanded on this approach to provide M-weighting functions for eight marine mammal hearing groups, including LF cetaceans, HF cetaceans, VHF cetaceans, sirenians, phocid carnivores and other marine carnivores (refer to Table B8-3).

Table B8-3 - Marine Mammal Hearing Groups

Group	Genera or species included
Low-frequency (LF) cetaceans	The LF cetacean group contains all of the mysticetes: Balaenidae (*Balaena* spp. and *Eubalaena*, Neobalenidae (*Caperea*), Eschrichtiidae (*Eschrichtius*), and Balaenopteridae (*Balaenoptera* spp. and *Megaptera*).
High frequency (HF) cetaceans	The HF cetacean group contains most delphinid species (e.g., bottlenose dolphin, common dolphin, and pilot whale), beaked whales, sperm whales and killer whales.
Very high frequency (VHF) cetaceans	The VHF cetacean group comprises the true porpoises, most river dolphin species, pygmy/dwarf sperm whales, as well as number of oceanic dolphins (Commerson's, Chilean, Heaviside's, Hector's, Hourglass, and Peale's dolphins).
Sirenian (SI)	The SI group includes the manatees and dugongs.
Phocid Carnivores in Air (PCA) and Water (PCW)	This group contains all the true seals, including harbour, grey, and freshwater seals; elephant and monk seals; and both Antarctic and Arctic ice seals.
Other Marine Carnivores in Air (OCA) and Water (OCW)	This group contains all non-phocid marine carnivores, including the otariid seals (sea lions and fur seals), walruses, sea otters, and polar bears.

Behavioural Effects

Differences between species, individuals, exposure situational context, the temporal and spatial scales over which they occur, and the potential interacting effects of multiple stressors can lead to inherent variability in the behavioural response of marine mammals to sound exposure (Southall et al. 2021).

Southall et al. (2007) presented a severity-index ranking the intensity of behavioural responses that was later amended by Ellison et al. (2012), Miller et al. (2012), and Sivle et al. (2015) and has recently been updated by Southall et al. (2021) based primarily on studies of free-ranging mammals.

The NMFS currently uses a step function with a 50% probability of inducing behavioural responses at an SPL of 160 dB re 1 µPa to assess behavioural impact. This threshold value was derived from the HESS (1999) report, which, in turn, was based on the responses of migrating mysticete whales to seismic sounds (Malme et al. 1983, 1984). The HESS team recognized that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above an SPL of 140 dB re 1 µPa. An extensive review of behavioural responses to sound was undertaken by Southall et al. (2007), which found varying responses for most marine mammals between an SPL of 140 and 180 dB re 1 µPa, consistent with the HESS (1999) report.

In 2012, Wood et al. (2012) proposed a graded probability of response for impulsive sounds using a frequency weighted SPL metric (see Table B8-4). They designated behavioural response categories

for sensitive species (such as harbour porpoises, *Phocoena phocoena*, and beaked whales) and for migrating mysticetes.

Table B8-4 - Graded Probability of Response for Impulsive Sounds

Marine Mammal Group	Probability of response to frequency -weighted SPL (dB re 1 µPa)			
	120	140	160	180
Sensitive species	50%	90%		
Other species		10%	50%	90%

McCauley et al. (2000) monitored the effects of seismic survey sounds on humpback whales in the Exmouth Gulf region of Western Australia. They documented rapid swimming on the surface, breaching and localised avoidance behaviour by migrating whales during the seismic operation, indicating that the 'risk factor' associated with the marine seismic survey was confined to a comparatively short period and small range displacement. During their migration and breeding season, humpback whales rarely display deep dives. This tendency to stay close to the surface has been interpreted as actively utilising the 'sound shadow' (Lloyd's Mirror effect) near the surface; irrespective of the motivation for this behaviour, it reduces the risk for noise-induced effects unless at very short range from a large seismic source array.

A comparison of behavioural observations of humpback whale behaviour during seismic surveys shows the variability and context dependence of these responses (Richardson et al. 1995). McCauley et al. 2000) estimated that humpback whales would avoid seismic surveys in key habitat (such as breeding, resting, or feeding areas) at distances between 7 and 12 km, whereas migrating individuals generally showed an avoidance range of around 3 km. Some males have even been recorded approaching seismic survey vessels to within 1 to 2 km (McCauley et al. 2000). It is considered that avoidance behaviour represents a temporary and minor effect, unless avoidance results in displacement of whales from breeding, resting, or feeding areas.

The BRAHSS (Behavioural Response of Australian Humpback whales to Seismic Surveys) project conducted studies at Peregian Beach in Queensland, and off Dongara in Western Australia, to better understand the behavioural responses of humpback whales to noise from the operation of seismic air gun arrays (20 in^3 and 140 in^3 arrays) (Cato et al. 2013). Results from the experiments are published in Dunlop et al. (2015, 2016, 2017a, b). The BRAHSS Project found:

- Humpback whale groups responded by decreasing both dive time and speed of southwards movement though the response magnitude was not found to be related to the proximity of the source vessel, the received level of the air gun, the tow path direction, or the exposure time within the during phase. There was no evidence of orientation of the groups towards, or away from, the source vessel in the during phase. Interestingly, this behavioural response was found in the control trials as well as the active trials suggesting a response to the source vessel.
- No abnormal behaviours were recorded during the trials. However, in response to the active seismic array and the controls, the whales displayed changes in behaviour. Changes in respiration rate were of a similar magnitude to changes in baseline groups being joined by other animals suggesting any change group energetics was within their behavioural repertoire. However, the reduced progression southwards in response to the active treatments, for some cohorts, was below typical migratory speeds. This response was more likely to occur within 4 km from the array at received levels over 135 dB re 1 μPa^2.s
- Humpback whales were more likely to avoid the air gun arrays (but not the controls) within 3 km of the source at levels over 140 re. 1 μPa^2 s, meaning that both the proximity and the

received level were important factors and the relationship between dose (received level) and response is not a simple one.

The results of the BRAHSS study are consistent with previous studies with humpback whales in different behavioural contexts. Feeding humpback whales, for example, responded at ranges up to 3 km from the source, at levels of 150-169 dB re 1 µPa (Malme et al. 1985). Resting female humpback whales with calves displayed avoidance reactions at 140 dB re 1 µPa, though other cohorts reacted at higher levels (157-164 dB re 1 µPa - McCauley et al. 2000).

Recent research has found that male humpback whales switch to singing in the presence of seismic airguns (Dunlop and Noad 2024). They found that during periods of active air guns, the number of male singing whales increased, and singers were more likely to be observed joining females, while conversely, non-singing males were less likely to engage in joining interactions suggesting that active air guns caused a switch in male breeding tactics.

Blackwell et al. (2015) found evidence for two behavioural thresholds in migrating bowhead whales responding to seismic operations in the Beaufort Sea. A moderate cessation or modification of vocal behaviour (interpreted as compensation behaviour) was found at received SEL over a 10 minute period of 94 dB re 1µPa²·s (increase of calling rates) and 127 dB re 1µPa²·s (decrease in calling rates). At received levels of >160 dB re 1µPa²·s; however, whales were completely silent. Robertson et al. (2013) detected changes in surfacing, respiration, and diving behaviour of bowhead whales in response to seismic survey activity but did not provide any qualitative information on the received levels. Castellote et al. (2010) documented avoidance behaviour in fin whales in response to seismic survey activity in the Mediterranean Sea lasting over 10 days.

Observations of sperm whale behaviour during seismic surveys provided conflicting results: Stone (2003) identified that while sperm whales were frequently (visually) detected during seismic surveys, these animals did not show any observable behavioural reactions. Jochens et al. (2008) found sperm whales tolerant of seismic activity; however, a decrease in foraging activity was observed for a small number of animals but no horizontal avoidance was measured. In a tagging study, Jochens and Biggs (2003) found that sperm whales did not show any behavioural reaction (horizontal avoidance of the seismic vessel, change in feeding rates) at maximum received levels of 148 dB re 1µPa.

In the Gulf of Mexico, sperm whales were equipped with multisensory tags to investigate their behaviour in response to seismic surveys. The animals did not show any statistically significant changes in horizontal movement, diving and echolocation behaviour at received levels of approximately 118–131 dB re 1µPa²·s ($SEL_{M\text{-}weighted}$) (Miller et al. 2009).

The hearing of dolphins (HF cetaceans) is less sensitive in the low frequency range of air gun impulses (<500 Hz) and seismic operators sometimes report dolphins and other small toothed whales near operating seismic source arrays. However, there is a component of seismic pulses in the higher spectrum and in general most toothed whales do show some limited avoidance of operating seismic vessels. Goold (1996) studied the effects of seismic surveys common dolphins (*Delphinus delphis*) in the Irish Sea. The results indicated that there was a local displacement of dolphins around the seismic operation. This observation is consistent with visual data compiled by Stone (2003) from marine mammal surveys in the North Sea that shows small toothed whale species tend to move away from operating compressed air seismic sources. In a review of behavioural effects of seismic surveys on marine mammals in UK waters, Stone and Tasker (2006) reported that small odontocetes (dolphins, HF cetaceans and porpoises, VHF cetaceans) showed the strongest avoidance response to the seismic survey activity, were seen less often during periods of seismic acquisition, remaining further from the air guns and showing altered behaviour (e.g., less bow-riding, orienting away from the survey vessel, faster swimming). The same study documented that killer whales also showed some localised avoidance to seismic surveys.

A reduction in feeding activity in response to seismic survey activity has been documented for harbour porpoises at estimated received SEL of 150 – 165 dB re 1µPa²·s (Pirotta et al. 2014). Due to the

permanently high energy demands of harbour porpoises (Wisniewska et al. 2016) a prolonged cessation of feeding can have significant effects on the fitness of affected animals.

Gotz et al. (2009) reported that controlled exposure experiments with small acoustic sources (215 - 224 dB re 1µPa) were carried out over one hour to individual harbour seals (*Phoca vitulina*) and grey seals (*Halichoerus grypus*), and in seven out of eight trials with harbour seals, the animals exhibited strong avoidance reactions.

Two harbour seals equipped with heart rate tags showed immediate, but short-term, startle responses to the initial acoustic source pulses. The behaviour of all harbour seals seemed to return to normal soon after the end of each trial, even in areas where disturbance occurred on several consecutive days. Only one harbour seal showed no detectable response to the acoustic sources and approached the acoustic source to within 300 m, and seals remaining in the water returned to pre-trial behaviours within two hours of the end of the experiment (Gotz et al. 2009). General avoidance behaviour of other Northern Hemisphere seal species was exhibited at exposure levels above 170 dB re 1µPa.

Monitoring studies (Harris et al. 2001) undertaken on the behaviour of phocid seals (more sensitive to sound than otariid pinnipeds) during a nearshore seismic program in Alaska observed that:

- During daylight hours seals were seen at nearly identical rates during periods where there were no air guns firing, one air gun firing and the full array operational.
- Seals tended to be further away during full array seismic. Swimming away was more common during full array operation than no air gun periods, but relative behaviours (looked, approached, swam parallel to boat's track, dive or swam away when full array was firing) did not differ significantly among the distance categories.
- Approximately 79% of seal sightings were within 250 m of the seismic vessel. There was partial avoidance of the zone less than 150 m from the vessel during full array seismic, but seals did not move much beyond 250 m at any time.
- Received levels of noise pulses from the full array were ≥180 dB SPL out to a radius of 1 km. Despite this, many seals showed little or no obvious avoidance and no obvious tendency to avoid diving.

Darias-O'Hara et al. (2025) presents research conducted by a team of experts attempting to determine thresholds for Antarctic marine mammal species. The work conducted on LF cetaceans relied heavily on the extensive body of research on humpback whale responses to seismic airguns, using these studies as the primary evidence base. These results were then adjusted to infer how other low-frequency species may respond, drawing on comparative studies across marine mammals. This approach produced a median behavioural response threshold of 139 dB, driven predominantly by humpback whale data and supported by broader cross-species insights.

Darias-O'Hara et al. note the lack of consensus globally on the most appropriate behavioural thresholds for marine mammals, emphasising that different permitting agencies apply different metrics and, as a result, harmonising to a single universal threshold is not currently feasible. The study also recognises that the elicitation process revealed "*significant uncertainty – driven by a lack of data – on how marine mammal species respond to these sound sources*," particularly when attempting to apply results from different species, sound sources, or regions to Antarctic EIAs. The authors reinforce this point, stating that "*the distributions clearly highlight the uncertainty associated with these thresholds. Critically, these behavioural response thresholds are restricted to the scenarios and assumptions in this elicitation. Specifically, these thresholds are appropriate for use in applications in Antarctic waters where the definition of response is the same as applied here*."

The behavioural thresholds presented represent the average levels at which responses with potential fitness consequences may begin to occur, offering a reasonably conservative basis for delineating areas where significant behavioural changes could arise. However, whether these responses result in meaningful biological impacts depends on several external factors, including activity duration, individual health, prey availability, and recovery capacity. While the thresholds reflect expert judgement certainty, the accompanying dose–response functions capture variability and uncertainty within and between species. As Darias-O'Hara et al. acknowledge, this work represents a necessary early step toward refining impact assessment, but substantial knowledge gaps remain. Further research is essential for regulators to more confidently assess and mitigate the effects of anthropogenic noise on Antarctic marine mammals as research activity in the region continues to expand.

Physiological Effects

A study on the physiological response of Arctic Narwhals to anthropogenic noise found individuals had marked cardiovascular, respiratory and locomotor reactions in response to seismic pulses. Noise exposed Narwhals experienced a 2-2.2-fold increase in the energetic cost of diving, whilst paradoxically heart rate reduced (bradycardia). Williams et. al. 2022 compared these results to studies on trained harbour porpoises (Phocoena phocoena, Elmegaard et al., 2021) and a closely related species, the Beluga Whale (Delphinapterus leucas, Lyamin et al., 2011). In the harbour porpoise study, the cetaceans initially had intensified levels of bradycardia, however this response diminished as they habituated to the noise. In the Beluga Whale study, the continued noise exposure resulted in eventual bradycardia. These studies are impacted by variation in environmental conditions and type of fear stimuli (Williams et. al. 2022). [Paragraph has been added in response to Matter M11].

Acoustic Masking

Masking is the process by which the threshold of hearing for one sound is raised by the presence of another (masking) sound (Erbe & Farmer 1998; Erbe 2008; Erbe et al. 2016). This describes the reduction in audibility for one sound (termed 'signal') caused by the simultaneous presence of another sound (termed 'noise'). For this to occur, the sound must be loud enough, have similar frequency content to the signal, and must happen at the same time. Masking depends on the spectral and temporal characteristics of signal and noise and is reduced if the signal and noise are separated in time, frequency, or direction (space); it can occur if the noise happens shortly before or after the signal (forward and backward masking). The zone of masking can maximally be as large as the zone of audibility, as a faint noise might mask a faint signal. The masking effect can be reduced or remedied by various active or passive mechanisms for masking-release, such as spatial or temporal release from masking, the Lombard effect, or co-modulation masking release.

Auditory masking can lead to disruption of a behaviour, lack of appropriate behavioural reactions, increased vulnerability to predators, reduced access to prey, reduced communication, changes in vocal behaviour, disruption of spawning activities, and stress. The biological significance of acoustic masking is directly linked to the duration of the masking sound. While masking can be detrimental to the fitness, reproduction, and survival of individuals, it ends immediately after the masking sound ceases. Both anthropogenic and natural marine sound can affect hearing and partially or completely reduce an individual's ability to effectively communicate; detect important predator, prey, and/or conspecific signals; and detect important environmental features associated with spatial orientation (Clark et al. 2009). This is true for all marine fauna; however, masking is most frequently associated with marine mammals. Masking in fishes has not been studied in detail.

Masking reduces the communication space of marine mammals (Clark et al. 2009; Hatch et al. 2012). A calculation of reductions in communication range can be a useful proxy for impact. So far, a direct

assessment and quantification of masking effects in wild animals has proven impossible (Tougaard et al. 2015). It depends on the positions of the signalling and the receiving animal relative to the sound source and to each other. In humpback whales (*Megaptera novaeangliae*), tonal and grunting sounds acting as contact calls between a mother and its calf were recorded at comparatively low levels (Videsen et al. 2017). While there is controversy about the validity of conclusions, such low levels would create a small communication space (<100 m) which, in turn, would be sensitive to increases in ambient noise.

Most studies related to masking effects in marine mammals have investigated the auditory parameters that are most relevant in this context, such as auditory sensitivity, frequency-tuning (critical bandwidth and critical ratio), auditory integration time, and critical interval. Erbe et al. (2016) reviewed the current knowledge on masking in marine mammals, summarising data on marine mammal hearing as they relate to masking and discussing masking release processes of receivers. The variability seen in auditory sensitivity (see Hearing sensitivity) indicates the variability seen with respect to auditory masking.

Temporary Threshold Shift and Permanent Threshold Shift

In marine mammals, the onset level and growth of TTS is frequency specific, depends on the temporal pattern, duty cycle, and the hearing test frequency of the fatiguing stimuli. Exposure to intense impulse noise might be more hazardous to hearing than non-impulsive noise, and there is a positive relationship between exposure duration and the amount of TTS induced. TTS can accumulate across multiple exposures, but the resulting TTS will be less than the TTS from a single, continuous exposure with the same total sound exposure level. Sounds generated by seismic sources, pile driving and mid-frequency sonars have directly been tested and proven to cause noise-induced threshold shifts in marine mammals at high received levels. Finneran (2015) reviewed the current state of knowledge on TTS and PTS. TTS typically decreases in marine mammals relative to the logarithm of the increasing recovery time. However, there is considerable individual difference in all TTS-related parameters between subjects and species tested so far.

PTS is considered injurious in marine mammals, but there are no published data on the sound levels that cause PTS in marine mammals. Hence, PTS effects in marine mammals should be viewed as theoretical, as they have never actually been demonstrated in either captive or wild animals. Regeneration of sensory cells, as known to occur in fishes, has not been documented for any marine or terrestrial mammal. Onset levels of PTS onset are typically extrapolated from TTS onset levels and assumed growth functions (Southall et al. 2007). The NMFS (2018) criteria incorporate the best available science to estimate PTS onset in marine mammals from sound energy (SEL_{24h}), or very loud, instantaneous peak sound pressure levels. Criteria are given separately for each cetacean functional hearing group and discriminate between impulsive and non-impulsive sounds. Southall et al. (2019) undertook a comprehensive review of all available data on direct measures of hearing auditory anatomy, and emitted sound characteristics for all marine mammal species. The quantitative process undertaken resulted in exposure criteria, in many respects identical to those derived by Finneran (2016) and adopted by the NMFS (2016, 2018); however, the Southall et al. (2019) exposure criteria (Table B8-5) appear in a peer-reviewed publication and include marine mammal species for all noise exposures, both under water and in air for amphibious species.

Table B8-5 - TTS- and PTS-onset Thresholds for Marine Mammals Exposed to Impulsive Noise

Marine mammal hearing group	TTS onset: SEL (weighted)	TTS onset: Peak SPL (unweighted)	PTS onset: SEL (weighted)	PTS onset: Peak SPL (unweighted)
LF	168	213	183	219
HF	170	224	185	230
VHF	140	196	155	202
SI	175	220	190	226
PCW	170	212	185	218
OCW	188	226	203	232
PCA	123	138	138	144
OCA	146	161	161	167

The role of the temporal pattern of sound on TTS in marine mammals has been studied in MF and HF cetaceans (Mooney et al. 2009; Finneran et al. 2010; Kastelein et al. 2014; Kastelein et al. 2015). The results of these studies show that TTS can accumulate across multiple exposures, but the resulting TTS will be less than the TTS from a single, continuous exposure with the same total SEL.

Only a few studies have investigated TTS in marine mammals in response to exposure to impulsive sounds such as seismic impulses. Lucke et al. (2009) tested the effect of a single seismic source on a male harbour porpoise. They documented onset of TTS at received (unweighted) SEL of 164 dB re 1 $\mu Pa^2 \cdot s$. This equates to a (HF) weighted SEL_{24h} of 140 dB re 1 $\mu Pa^2 \cdot s$ (NOAA 2016). The main energy of the fatiguing stimulus (seismic pulse) was centred below 500 Hz, but a substantial amount of energy was also present at higher frequencies. Kastelein et al. (1997) tested the auditory tolerance of a harbour porpoise to playbacks of broadband pile driving sounds. After one hour of exposure an unweighted SEL 146 dB re 1 $\mu Pa^2 \cdot s$ and a SEL_{24h} of 180 dB re 1 $\mu Pa^2 \cdot s$, a TTS of 2.3 dB and 3.6 dB occurred at 4 kHz and 8 kHz, respectively. The average weighted SEL_{24h} from these exposures was 144 dB re 1 $\mu Pa^2 \cdot s$.

In a study using playbacks of pile driving sounds, Kastelein et al. (2013) exposed harbour porpoises to a maximum single-strike unweighted broadband SEL of 145 dB re 1 $\mu Pa^2 s$ and a cumulative SEL_{24h} of up to 187 dB re 1 $\mu Pa^2 \cdot s$. TTS increased from 0 dB after 15 minutes exposure to 5 dB after 360 minutes exposure. Based on their results, they calculated an onset of TTS for this type of sound at a SEL_{24h} of approximately 175 dB re 1 $\mu Pa^2 \cdot s$. Kastelein et al. (2017) exposed a harbour porpoise to 10 and 20 consecutive seismic impulses at received SEL_{24h} of 188-191 dB re 1 $\mu Pa^2 \cdot s$ with a mean shot intervals of around 17 seconds. TTS of ~4.4 dB was measured at 4 kHz.

Finneran et al. (2015) tested the exposed three bottlenose dolphins to 10 impulses produced by a seismic source. The highest exposures were conducted at peak sound pressure levels (PK) of 210 dB re 1 µPa, peak-peak sound pressure levels (PK-PK) of 212 dB re 1 µPa, and cumulative (unweighted) SEL_{24h} of 195 dB re 1 $\mu Pa^2 \cdot s$. This exposure induced 9 dB TTS in one animal at 8 kHz.

9 Commercial Fishing Catch and Abundance Effect Studies

Some effort to relate fishing catch data to marine seismic survey effects has been undertaken, but to date none of the Australian efforts to relate catch data with marine seismic surveys have yielded significant results. Elsewhere, the potential effects of seismic operations on fish distribution, local abundance or catch have been examined for some teleost species with varying results (Carroll et al. 2017).

A range of behavioural responses have been observed in wild fish in the presence of anthropogenic sound. Studies suggest that fish will generally move away from a loud sound source to minimise their exposure, but this response may depend upon the animal's motivational state. Anthropogenic sound (including marine seismic surveys) has been shown to cause changes in schooling patterns and distribution (Engås et al. 1996; Engås and Lokkeborg 2002; Slotte et al. 2004; Lokkeborg et al. 2012; Popper at al. 2014; Streever et al. 2016) potentially altering the catchability of commercially valuable species or recreationally targeted species.

The following studies have relevance to commercial fish and invertebrate species with respect to their catchability:

- The effects of a marine seismic survey on demersal long-line and trawl catch rates of Atlantic cod (*Gadus morhua*) and haddock (*Melanogrammus aeglefinus*) in Norway after a marine seismic survey were shown to fall by 45% and 70% respectively five days after survey completion (Engås et al., 1996). Based upon this decline Engås et al. (1996) hypothesised a reduction in catch rates due to fish avoidance behaviour, but this was not quantified. Similar reductions in catch rates (52% decrease in catch per unit effort (CPUE)) relative to controls) has been observed in the hook-and-line fishery for rockfish during controlled discharges of a single air gun (Skalaski et al. 1992). The authors suggest that the CPUE decline may not be dispersal but a decreased responsiveness to baited hooks from alarm response behaviour. A companion behavioural study showed the alarm and startle responses were not sustained following the removal of the sound source (Pearson et al. 1992; Skalski et al. 1992) suggested fishing effects may be transitory, primarily occurring during the sound exposure.
- Lokkeborg et al. (2012) observed, following air gun exposure, gillnet catches increased substantially for redfish (*Sebates norvegicus*) and Greenland halibut (*Reinharditius hippoglossoides*) by 86% and 132% respectively compared with pre-shooting levels, while longline catches of Greenland halibut and haddock decreased by 16% and 25% respectively compared with pre-survey catch. These contradictory results were explained by greater swimming activity versus lowered food search behaviour in fish when exposed to air-gun emissions. Changes in catch rates of all species studied, including saithe and ling, found all species responded to air-gun sounds. Except for saithe (a pelagic hearing sensitive fish), acoustic mapping of fish abundance did not suggest displacement from fishing grounds.
- Sonar observations by Peña et al. (2013) observing real-time behaviours of Atlantic herring (*Clupea harengus* - a clupeid species with good hearing capability) schools exposed to an acoustic source approaching from 27 km to 2 km over a two hour period found no changes in school size, swimming speed or direction. The lack of response was interpreted as a combination of a strong motivation for feeding, a lack of suddenness of the air gun stimulus and an increased tolerance to seismic shooting.
- Catch studies undertaken as part of a marine seismic survey in the Gippsland Basin found no clear evidence of adverse effects on scallops, fish or commercial catch rates (Przeslawski et al. 2016a; Bruce et al. 2018) The study followed 15 species caught by Danish

seine and demersal gillnet and identified in the six months which followed the survey, six species showed increased catch. For Danish seine this included tiger flathead, goatfish and elephantfish. For demersal gillnet this included boarfish, broadnose shark and school shark. Three species showed decreased catch caught via Danish seine – gummy shark, red gurnard, sawshark. No change was observed in the remainder of species. No change to gummy shark catch was observed for demersal gillnet capture techniques. These results support previous studies in which the effects of seismic surveys on catch seem transitory and vary among species and gear types.

In October 2020, the FRDC released preliminary results of a Multiple BACI experiment that they funded to investigate the effects of a 3D marine seismic survey in eastern Bass Strait on Danish Seine catch rates (Fishwell Consulting 2020). The key targets for the Danish Seine fishery in the areas of the marine seismic survey are flathead (*Platycephalus* sp.) and whiting (*Sillago* sp.). The October 2020 report (Fishwell Consulting 2020) provided preliminary results of three phases of the four phase study and found that overall, the BACI analyses provide robust evidence for a negative impact of seismic acquisition on whiting catch rates in the Danish Seine Fishery up to ~100 days following the survey and on flathead rates up to ~200 days. Relative catch indices for both species in the years preceding the marine seismic survey were highly variable (temporally and spatially), and that relative catch index is a measure of catch per effort, not an absolute measure of abundance. As the relative catch indices for both species in the years preceding the marine seismic survey were highly variable it is difficult to determine the effect of the survey.

Specific studies examining the effect of seismic survey signals on invertebrate catch data are rare but include:

- Carroll et al. (2017) undertook a critical review of the potential impacts of marine seismic surveys on fishes and invertebrates. Carroll et al (2017) found no significant differences in any of the studies reviewed in catch rates from the potential effects of seismic signals (Christian et al. 2003; Parry & Gason 2006; Przeslawski et al. 2016a).

- Christian et al. (2003) investigated the behavioural effects of exposure to seismic survey sound on snow crabs. Caged animals on the ocean bottom at a depth of 50 m were monitored with a remote video camera during exposure to seismic sound and did not exhibit any overt startle response during the exposure period. Eight animals were equipped with ultrasonic tags, released, and monitored for multiple days prior to exposure and after exposure. None of the tagged animals left the immediate area after exposure to the seismic survey sound. Five animals were captured in the snow crab commercial fishery the following year, one at the release location, one 35 km from the release location, and three at intermediate distances from the release location.

- Parry & Gason (2006) undertook a statistical analysis of CPUE data collected over nearly 30 years in the Victorian southern rock lobster (SRL) fishery (in southwest Victoria) that showed no influence of historical 2D and 3D marine seismic survey activity. Analyses looked at short-term (weekly) and long-term variations (up to seven years) in CPUE to determine whether changes were correlated with the marine seismic survey. The surveys occurred in water depths ranging from 10 m to 150 m. The study included surveys occurring during the SRL spawning period as well as during the lobster fishing. This study found no evidence that catch rates were affected in the weeks or years following the surveys; however, Day et al. (2016a) suggest that catch rates would have had to decrease by around 50% for this study to detect a result.

- A study undertaken by the CSIRO and Geoscience Australia (Thomson et al. 2014) examined fisheries catches (10 species of interest) and catch rates for potential effects from 183 seismic surveys undertaken in the Gippsland Basin (Bass Strait). The authors found that there were no clear or consistent relationships between seismic surveys and subsequent

fisheries catch rates in their study. However, they cautioned that the results did not imply that such impacts do not exist, but that data was lacking. In terms of duration since a seismic survey occurred, significant positive and negative effects were found but could not be distinguished from inter-annual changes in stock size or availability to fishing gear resulting from other dynamics (Thomson et al., 2014).

- Przeslawski et al. (2016a) monitored scallop populations and fish behaviour before, during, and/or after an April 2015 seismic survey in the Gippsland Basin, commercial scallops (*Pecten fumatus*) and doughboy scallops (*Mimachlamys asperrima*) were assessed using dredged samples and underwater imagery from an Autonomous Underwater Vehicle (AUV) before and two and ten months after completion of the seismic survey. The study provided no clear evidence of adverse effects on scallops or commercial catch rates due to the 2015 seismic survey undertaken in the Gippsland Basin. It was noted that there were limitations with some of the analyses (e.g., large variance in scallop catch).
- Haddon (2017) further investigated the effect of the 2015 seismic survey in the Gippsland Basin on deepwater flathead catches and concluded that the significant drop in CPUE was very likely negatively influenced by the seismic survey. However, Haddon (2017) went on to add that the seismic survey did not appear to have had a lasting impact on deepwater flathead CPUE, which returned to typical values in the first month following the seismic survey.
- Morris et al. (2018) investigated the effects of 2D seismic acquisition on the snow crab fishery along the continental slope in Canada in a BACI study over a period of two years. Crabs were exposed to received levels of 187 dB re 1µPa^2 s (single shot) and 200 dB re 1µPa^2 s (cumulative over 24-hours). There was no negative effects on the catch rates in the shorter term (days) or longer term (weeks), and the authors concluded that seismic effects on snow crab harvest (if they do exist) would be smaller than changes related to natural spatial and temporal variation.
- In a further study, Morris et al. (2020) conducted a field experiment applying a series of comparisons conducted within a BACI study design to investigate the effect of prolonged industrial 3D seismic exposure on the catch rates of snow crab over nine weeks in 2017 and five weeks in 2018. Changes in catch rates at 3D seismic surveying sites were inconsistent across years, with reduced catches in 2017 and increased catches in 2018. Catch rates were similar at experimental and control sites within two weeks after exposure, and the potential effect of seismic surveying was not measured at a distance of 30 km. The large variation in catch rates across small temporal and spatial scales coupled with the absence of notable mechanistic responses of snow crab in past studies to seismic in associated snow crab movement behaviour, gene expression and physiology, the authors concluded that the observed differences owing to seismic surveying in this study design are likely a result of stochastic processes external to their manipulation.

10 Scuba Divers and Snorkelers

Scuba divers and snorkelers exposed to high levels of underwater sound can suffer from dizziness, hearing damage or other injuries to other sensitive (mainly air-filled) organs, depending on the frequency and intensity of the sound. The human auditory system is significantly less sensitive underwater than in air and is further degraded if diving equipment obstructs the ears or face (e.g., diving with a hood or full facemask).

Underwater, the human ear is about 20 dB less sensitive than it is in air at low frequencies (20 Hz), increasing to 40 dB at mid-frequencies (less than 1 kHz), and increasing to 70–80 dB less sensitive at higher frequencies (Parvin 1998). Divers who wear neoprene hoods have even higher hearing thresholds (lower sensitivity) above 500 Hz because the hood material absorbs high-frequency sounds (Sims et al. 1999). Exposure studies related to divers have typically focused on military sonar exposure, with little information on seismic survey operations, and as such care is required when considering thresholds for non-military divers, particularly for impulsive sounds such as seismic source impulses (Ainslie 2008).

Underwater auditory threshold curves indicate that the human auditory system is most sensitive to waterborne sound at frequencies between 400 Hz to 1 kHz (Parvin et al. 1994) and these frequencies have the greatest potential for damage. The auditory threshold of hearing under-water was lowest at 1 kHz (70 dB re 1 µPa SPL) and increased for lower and higher frequencies to around 120 dB re 1 µPa at 20 Hz (Parvin 1998).

Within the literature there is some variation in acceptable SPLs for divers (Ainslie 2008).

Fothergill et al. (2000) and Fothergill et al. (2001) conducted controlled acoustic exposure experiments on military divers under fully controlled conditions at a US Ocean Simulation Facility and an US Open water test facility. In all tests, the divers were covered with soft or hard shell dive suits and their position and distance relative to sound source, signal characteristics and received levels were controlled and documented (Pestorius et al. 2009). A total of 89 male Navy divers were exposed to pure tone signals and sweeps between 160-320 Hz at SPLs up to 160 dB re 1 µPa. The divers were exposed to these sounds over 100 seconds at depths from 10 to 40 m. The divers rated the sounds on a severity scale. For frequencies between 100 and 500 Hz, at a received SPL of 130 dB re 1 µPa, divers and swimmers detected body vibration. None of the divers tested rated levels of 140 dB re 1 µPa as “very severe”; however, at 157 dB re 1 µPa, sound was rated as “very severe” 19% of the time. No physiological damage was observed at the highest levels tested: 160 dB re 1 µPa (Fothergill et al. 2001).

In a subsequent study, recreational divers were exposed to tonal signals or 30 Hz sweeps at frequencies between 100 and 500 Hz at received levels of 130-157 dB re 1 µPa (Pestorius et al. 2009). Each exposure lasted for seven seconds. Nine female and 17 male scuba divers were tested, all wearing full body neoprene wetsuits. Diver aversion and perception of body vibration were used as test parameters. The results showed no sex-specific differences. The results differed as a function of frequency – while test results showed a strong overall variation between subjects, signals at 100 Hz elicited the strongest aversion in all tests and even at 148 dB a few diver ratings indicated extreme aversion. Due to this and the strong variation between test subjects, the following exposure limit for both military and recreational divers was suggested as a conservative measure: For frequencies between 100 and 500 Hz, the maximum SPL should be 145 dB re 1 µPa over a maximum continuous exposure of 100 seconds or with a maximum duty cycle of 20% and a maximum daily cumulative total of three hours. The trading relation between the maximum SPL and duration was 4 dB per doubling of duration (e.g., 141 dB SPL for a 200 second exposure) (Pestorius et al. 2009).

In alignment with these studies, and considering only frequencies between 100 and 500 Hz, Parvin (2005) suggested 145 dB re 1 µPa as a safety criterion for recreational divers and swimmers. This does not imply that this level is associated with the onset of injury not been established due to ethical

research protocols. Parvin (2005) reported vibration in forearms and thighs at 180 dB re 1 µPa but no physical injury.

Guidance issued by the Diving Medical Advisory Committee (DMAC 2020) suggests that adverse effects to divers may be experienced at distances of up to 27 km from the seismic source, which is a considerably greater distance than has previously been recognised. However, the basis for this conclusion is not provided.

11 Acronyms and Abbreviations

BRUVS	Baited remote underwater video stations
dB	Decibels
FRDC	Fisheries Research Development Corporation
HF cetaceans	High-frequency cetaceans
hr	Hour
Hz	Hertz
IMAS	Institute for Marine and Antarctic Studies
In3	Cubic inch
kHz	KiloHertz
km	Kilometre
LF cetaceans	Low-frequency cetaceans
m	Metre
m3	Cubic metre
MSS	Marine Seismic Survey
nm	Nautical mile
OCA	Other Marine Carnivores in Air
OCW	Other Marine Carnivores in Water
PCA	Phocid Carnivores in Air
PCW	Phocid Carnivores in Water
PK	Peak sound pressure level
PK-PK	Peak-to-peak sound pressure level
PSI	Pound per square in
PTS	Permanent threshold shift
RMS	Root mean square
sec	Second
SEL	Sound exposure level
SPL	Sound pressure level
µPa	Micropascal
TTS	Temporary threshold shift
VHF cetaceans	Very-high-frequency cetaceans

Annex 1

Objections and Claims Raised from Consultation

During the consultation process relevant persons were invited to raise objections and claims about the adverse effects of the activity. An assessment of merit of each objection or claim has been made by CGG which can be found in the consultation report using the Feedback ID number shown in Table B8-6 If an objection or claim had merit and was relevant to this assessment it has been included in the table below.

Table B8-6 - Objections and Claims raised from consultation.

Feedback ID	Objection or Claim Summary	Titleholder Response	Event ID
4504	GMTOAC objects to the weakening and inconsistency of shutdown measures between the November 2024 and April 2025 versions of CGG's EP. The earlier EP committed to shutting down the sound source if any whale was within 2 km (with larger buffers for Southern Right and Blue Whales), but the April 2025 EP introduces a much smaller 500 m shutdown zone for most whales, which GMTOAC argues increases the risk of exposure to harmful sound levels. GMTOAC notes that the April 2025 EP creates confusion by implying that CGG's "shutdown zone" is actually a 2 km low-power zone, despite providing no explanation of what "low-power" means, what sound levels it produces, or how continuous low-power operation affects Karntubul, other cetaceans, or cumulative noise exposure. This contradicts Appendix G2, which states CGG will use a shutdown zone rather than a low-power zone, consistent with EPBC Policy Statement 2.1. GMTOAC warns that such internal contradictions undermine the reliability and enforceability of mitigation measures. GMTOAC questions CGG's assumption that a 10 km behavioural shutdown zone will protect Blue Whales, given scientific uncertainty about behavioural impact distances. They highlight evidence that seismic noise can mask baleen whale calls across thousands of kilometres, that ambient noise levels can be elevated by 25 dB over 40 km from air-gun operations, and that reverberated pulses can create	All relevant details of the sound source, including low-power mode, is in Appendix A2. We have also committed to a full shutdown if any whale enters the 2 km shutdown zone, far more precautionary than the EPBC Policy 2.1 requirement of a 2 km low-power zone and a 500 m shutdown zone. This approach exceeds industry standards and legislative requirements for mitigating potential impacts from seismic sound sources. Our EP applies a suite of measures designed to ensure impacts to Blue Whales and Southern Right Whales remain at acceptable levels. We will shut down the sound source immediately upon detection of any SRW, including cow–calf pairs, and we will manage to ambient sound levels in the SRW reproduction BIA to ensure those levels are never exceeded. The Regia MSS is a short, temporary activity, 90 days in total, including 60 days of acquisition, so any increase in ambient noise will be brief and localised. No exceedance of ambient sound levels will occur in the SRW reproduction BIA during the reproductive season, ensuring cow–calf pairs are not exposed to elevated noise or displaced from critical habitat. Our shutdown zones include highly conservative buffers well beyond standard requirements, further reducing potential impacts. Collectively, these measures ensure any short-term noise increases are managed to acceptable levels, consistent with the precautionary intent of relevant recovery plans. Appendix B8 addresses acoustic masking using recent scientific literature, not the older references cited by GMTOAC. For example, Nieukirk et al.	EVT352

	near-continuous noise for months. GMTOAC argues that such persistent elevated noise levels could impair communication, migration, and calf–mother cohesion, posing cultural and ecological harm, and that CGG's 10 km buffer is therefore not precautionary. GMTOAC is also concerned about ambiguity over whether shutdown means turning the source off or merely reducing power, noting that this ambiguity is not precautionary and risks behavioural impacts for Blue Whales.	(2012) showed that airgun signals detected thousands of kilometres from fin whales were unlikely to have direct effects, with the most probable impact being reduced communication range. Even then, the study had major limitations, including uncertainty about the actual distance between vocalising whales and receivers. Key context from Estabrook et al. (2016) is omitted, which analysed multiple seismic surveys over multiple years. That study does not represent received levels for animals closer to the sound source and therefore is not applicable to the Regia MSS. No other seismic surveys are currently planned in the Otway region, further limiting the relevance of that study's conclusions.

Executive summary

Biosis Pty Ltd was commissioned by Conoco Phillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait.

The purpose of this report is to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area in order to provide the project a grounding in Aboriginal cultural heritage. This short report will describe the known cultural environment, include a brief ethnohistory and history, and detail results of register searches.
The study area includes the proposed permit areas (the location of the exploration zone(s)), where seabed surveys and drilling exploration may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island.

The study area consists of a large geographical area noted as the 'Investigation Area for the Identification of Values and Sensitivities' which is based on stochastic modelling of oil spills, generating a statistical area where impacts may occur under many eventualities. This modelling predicts potential oil spill outcomes over many different variables to generate an investigation area for potential impacts.

Due to the significant size of the study area, it is broken into three areas for discussion in parts of this report and for the Communication Plan (CP), this includes:

1. Primary Stakeholder area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines
2. Secondary Stakeholder area – the wider area affected by the modelling of oil spills
3. Primary Stakeholder area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and LDADs. Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

In light of a review of Aboriginal places within the study area, there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

Within Tasmania and the Bass Strait Islands, there are no recent published figures of sites located on the coastal margins. Access to this data is restricted, and permission will need to be sought by the Aboriginal Heritage Council to access the Aboriginal Heritage Register via Aboriginal Heritage Tasmania. However, from the assessment of available regional data, Aboriginal heritage should be expected in any area of low-lying coastal areas, shelter sites, and sources of food, water and raw materials. These coastal margins contain all Tasmanian Aboriginal site types. It is also known on the West Coast of Tasmania, that a number of rock art sites are located on the coast, many either close or in tidal margins (Dix pers. obs.). Large midden sites are also located very close to the waters edge, as well as some stone quarry sites within tidal margins (Dix pers .obs.).

1 Introduction

1.1 Acknowledgement

Biosis acknowledges that the authors of this assessment identify as non-Aboriginal Australians living on Bunurong and Wurundjeri Countries. We acknowledge that they interpret, present and understand the past through their own cultural lens. In writing this report about Aboriginal living culture including their cultural heritage and the events following the commencement of colonisation, we pay our respects to Elders past, present and emerging and recognise that Country is unceded.

The authors acknowledge the inherent racism, cultural ignorance and political agendas imbedded within ethnographic sources at the time of, and following, colonisation.

Traditional Owners are the owners of all Traditional knowledge. Traditional knowledge and cultural values remain the intellectual property of the Traditional Owners and the interpretation and understanding of cultural values must be undertaken in genuine consultation with Aboriginal people.

1.2 Scope of works

Biosis Pty Ltd was commissioned by Conoco Phillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait.

It must be emphasised, that this report is not intended to meet the requirements of a formal assessment under First Peoples – State Relations, Heritage Victoria, Aboriginal Heritage Tasmania or Heritage Tasmania guidelines.

The purpose of this report is to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area in order to provide the project a grounding in Aboriginal cultural heritage. This short report will describe the known cultural environment, include a brief ethnohistory and history, and detail results of register searches.

1.3 Study area

The extent of the study area is shown in Figure 1.

The study area includes the proposed permit areas (the location of the exploration zone(s)), where seabed surveys and drilling exploration may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island.

The study area consists of a large geographical area noted as the 'Investigation Area for the Identification of Values and Sensitivities' which is based on stochastic modelling of oil spills, generating a statistical area where impacts may occur under many eventualities. This modelling predicts potential oil spill outcomes over many different variables to generate an investigation area for potential impacts.

Due to the significant size of the study area, it is broken into three areas for discussion in parts of this report and for the Communication Plan (CP), this includes:

4. Primary Stakeholder area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines
5. Secondary Stakeholder area – the wider area affected by the modelling of oil spills

6. Primary Stakeholder area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands

1.4 Heritage Advisor/Authorship

Emily Ward BArch

Emily has recently started her career in the Heritage Industry by initially interning at Biosis from August 2022 to September 2022, to her current role as a Graduate Heritage Consultant. Within her internship, Emily learnt and completed many techniques and processes such as aiding in background research to Cultural Heritage Management Plans, illustrating stratigraphic contexts and subsurface field testing. Emily also gained experience in field photography, rock art and heritage building surveys. Emily has been a part of several projects since she was an intern, gaining knowledge of several systems, such as HERMES and ACHRIS.

Emily completed her Bachelor of Archaeology at LaTrobe University at the end of 2022 and will start further study in 2024.

Erica Walther BArch(Hons)

Erica (B Arch Hons (2007)) is an Archaeologist and Heritage Advisor, with over 15 years' experience as a heritage consultant. Erica is the Technical Director for heritage in Victoria and specialises in project management, community liaison and the resolution of complex cultural heritage issues in varying situations. Erica provides specialist cultural heritage legislative advice and completes technical reports to meet the requirements of heritage legislation. Erica has broad experience completing various heritage assessments, including over 60 Cultural Heritage Management Plans (CHMPs). Erica carries out cultural heritage inductions, salvages, and other compliance requirements for completed CHMPs. Erica has also completed Due Diligence Assessments, Heritage Impact Assessments, "Consents to Disturb" and other permit applications, conservation management plans, and heritage reports. Erica has also assisted on a wide variety of other heritage projects, including as an expert witness and with planning and overlay applications, strategic advice, and continues to work towards completing projects to best practice standards.

Erica is a full member of the Australian Association of Consulting Archaeologists and is a listed heritage advisor under the *Aboriginal Heritage Act 2006*.

Dr Samuel Dix BA(Hons), PhD, MCIfA

Samuel has worked in archaeology and heritage management since 2007. Samuel has undertaken numerous archaeological projects around Australia and has worked in consulting, government, teaching and museums in Victoria, Tasmania, Northern Territory, Western Australia, the United Kindom, Middle East, and South Africa. Samuel completed his Bacheor of Arts with First Class Honours where his thesis focussed on hand stencil rock art. After a break from university to undertake consulting, government and teaching based archaeological work, Samuel returned to complete his PhD at Griffith University where he was the recipient of the Australian Research Council Laureate Scholarship in 2016. His thesis explored contact archaeology in Arnhem Land, and how people reacted to change through what was depicted in rock art.

Samuel is a registered heritage advisor under the Victorian *Aboriginal Heritage Act 2006.*

1.5 Stakeholders

It is not within the remit of this report to undertake consultation with Traditional Owner groups, industry bodies or other stakeholders. No consultation was undertaken. Stakeholder engagement is considered in the Communication Plan (CP). In Victoria, Traditional Owner groups are represented by the relevant Registered Aboriginal Party (RAP). There are five RAPs registered in the study area, including the Gunditjmara, Eastern Maar, Wadawurrung, Bunurong, and Gunaikurnai.

In Tasmania, the Traditional Owner group is referred to collectively as the Palawa, and are not represented by a representative or governing body.

2 Background review

2.1 Geology and geomorphology

The Bass Strait is the stretch between the south of the Australian mainland and north of the Tasmanian state. The Bass Strait formed during the last glacial period, also known as the Last Ice Age, which occurred between 110,000 and 12,000 years ago (Williams et al. 2018, p. 149). During this time, the Earth's climate was much cooler and global sea levels were much lower due to the large amount of water that was locked up in glaciers and ice sheets.

As the climate began to warm and the glaciers began to melt, sea levels began to rise. This process caused the land bridge that connected Tasmania to mainland Australia to be gradually flooded eventually forming the Bass Strait as we know it today.

This gradual flooding is therefore known to have occurred within the period of human occupation in southeastern Australia – the diaspora of people from Victoria to Tasmania occurred prior to the total flooding of the strait, across a land bridge for which archaeological evidence may be buried deep below the ocean (Lourandos 1997, p. 244). Evidence for this indicates people crossed the land bridge from Victoria to Tasmania at 35,000 years ago (Lourandos 1997, p. 254). In addition, dreaming stories of both Victorian and Tasmanian Aboriginal communities further reinforce the memories and songlines relating to the flooding and connection to Sea Country of coastal communities (Nunn & Reid 2016).

2.1.1 Bass Strait, Islands and the land bridge

The Bass Strait is bordered on the west by King Island and the King Island Rise and on the east by Flinders Island and the Bassian Rise, with an approximated depth of between 60 and 80 metres (Harris & Heap 2009, Robinson 1974). The predominant deposits within the Bass Strait consist of Tertiary sediments overlaid on early Cretaceous deposits. The sediments in the early Cretaceous period contained combinations of shale, siltstone, sandstone, while a variety of marl, mudstone, limestone and shale can be seen in the later deposits (Robinson 1974).

Phillip Island's geomorphology is centred around Quaternary limestone dunes with higher-level shore platforms that were formed by Quaternary sea levels (Birch 2003). French Island is boarded by sandy sheets, similar to Western Port Sunkland. Port Phillip Bay is the lowest part of the Sunklands and is currently flooded due to Quaternary sea-level fluctuations in the Last Glacial Maximum (Birch 2003, p. 556). Also during this period the Yarra River water levels had risen and spilled over the coastal plain, forming what is now known as the Bass Strait (Birch 2003, p. 556).

2.1.2 The Victorian Coast

The coastal plains of southwest Victoria are made up of both Tertiary and Quaternary marine and nonmarine sediments, formed on calcareous sands and sandy limestones, overlaid with dune ridges and beaches that were formed during the last 800 000 years. The dune ridges closer to the coast are younger than those further inland and are comprised of calcareous sands. Caves are common in ridges of the limestone sands (Birch 2003, p. 545).

The coastline of western Victoria is seen to have several layers of sedimentary deposits, as evident in the cliffs often found, containing stratigraphic sections of basalt, limestone and clay (Birch 2003, p. 555).

The geomorphic evolution of southeast coastal plains of Victoria is varied, with Tertiary overlaying early Cretaceous sediments on the Otway coast as well as Quaternary sand and limestone dunes in Mornington

Peninsula and Phillip Island (Birch 2003, pp. 547,556). The coast of East Gippsland is covered extensively in coastal dunes, with intermittent pockets of Pleistocene deposits. Parabolic dunes formed from Pleistocene and Holocene age deposits are also located in this area (Birch 2003, p. 557).

2.1.3 The Tasmanian Coast

The Tasmanian coast consists of varying deposits making up its rugged nature. Geological formations include Dolerite, Sandstone, Mudstone, Granite, Limestone, and other Volcanic rocks. These varying geologies are reflected in high cliffs and outcrops, dune-backed beaches, sea stacks and arches. The Tasmanian geological makeup is complex and varies. Along the coastal regions detailed in the study area, these consist of Devonian granites, Tertiary Basalt, Neoproterozoic dolomite, Cambrian bonitite, Cambrian Sediment, and Mesoproterozoic quartzite (MRT: 2022).

Tasmania is known to have been one of the few areas in the southern hemisphere that was glaciated during the Pleistocene (MRT 2002). This generally occurred in higher regions of the state and influenced many of the earlier Pleistocene sites recorded in Tasmania (MRT 2022).

2.1.4 Archaeology of the Sea Floor

Archaeology of the sea floor is an emerging aspect of archaeological science. Throughout the world, archaeological investigations have shown that there is evidence for human occupation to be recovered below current sea levels. Investigations in the Sunda Shelf, Southeast Asia demonstrates the impact of sea level rise at approximately 12,000 years ago, with the investigation of settlements, fish traps, and other structures. Other investigations have occurred in India (Kumar et al. 2021), and the Black Sea (Ryan et al. 1996), investigating more recent sea level change, around 7,500 years ago. In the UK and US, the offshore wind industry is required to complete offshore archaeological investigations including desk-based studies and field survey.

In comparison, Bass Strait is comparable to the vanished landscape of Doggerland that was submerged similarly in rising sea levels during the Mesolithic Period. Like the Bassian Plain, Doggerland formed a land bridge between the United Kingdom and Europe. Works by marine archaeologists have found that many artefacts and environmental sediments still remain form this now vanished ancient landscape (Gaffney et al. 2007). It is even suggested by Weninger et al (2008) that this was caused by a catastrophic flood. However, such ideas are not believed in the example of Bass Strait, and that this was a more gradual separation (see Davidson and Roberts 2008:20)

In Victoria, limited investigations have been completed, however the use of LiDAR and shoreline mapping has occurred. In particular, Gunditjmara have worked with Extent Heritage in partnership with Wessex University in determining the location of prior shorelines with the use of remote sensing. Should archaeological evidence survive, it is likely that the previous shorelines would provide the most likely locations for this. Physical investigations are likely to be difficult, complex, and costly.

Following deposition, archaeological evidence of human occupation along the Bass Strait has flooded. Since flooding, sedimentation has also occurred, capping any archaeological evidence deep below the current sea floor. The depth of sedimentation varies throughout the strait, however combined with deep waters (400 to 5,500 metres) and harsh conditions, exploration of sea floor archaeology utilising physical methods in this area is currently unlikely.

2.2 Land use history

Permanent European colonisation of Victoria and Tasmania occurred first in Tasmania, in 1803, and Victoria in 1835. Earlier exploration and transitory, temporary or failed settlements occurred in the two states. Early settlements in Tasmania were penal, with free settlement commencing following. The Gold Rush in Victoria in the 1850s resulted in the rapid expansion of population and the establishment of towns throughout the state. Agriculture and Industry heavily influenced the growth of the population of Tasmania.

Settlement, population growth and utilisation of land for agricultural purposes has resulted in the spread of disease, displacement, and violence to Indigenous communities, leading to a significant decline in population and disruption to traditional cultural practice. Aboriginal people were subject to forced displacement and assimilation, including the forced removal of Aboriginal children, from the 1800s up until the 1970s. Overall the impact of colonisation on Aboriginal people has been devastating.

In regard to the remains of physical cultural heritage (such as sites and places), the practice of archaeology has increased the knowledge of Aboriginal occupation of the land in the past. The potential for archaeology to shed light on Aboriginal connections to Country has been realised with increasing frequency due to relatively recent legislative requirements.. Archaeology is, however, a finite resource which has also been impacted by the effects of population growth, construction, land clearance, resource extraction, and climate change. Self-determination for Aboriginal people in regard to ownership of cultural heritage and knowledge has resulted in increased investigations led by Aboriginal people supported by technical experts, following research pathways set by the communities themselves.

Archaeological sites are located throughout the land and adjacent seascape and consist of the physical remains of the way people used the land in the past. Places may reflect resource extraction (such as scarred trees, stone quarries); be evidence of settlement (such as stone huts), manufacture (stone artefact scatters) and cultural practices (such as painting, etchings, and stone arrangements); food consumption (shell middens, earth mounds and hearths); and ritual practice (such as burials). Other cultural values can take the form of intangible places or be recorded in historic (ethnographic) references.

Whilst long-lasting, archaeological sites are heavily affected, and frequently destroyed, by the effects of modern, and past, impacts. Land clearance and increasingly intense bushfires result in the removal of old growth trees, including those showing cultural scarring, and also increases the effects of erosion. Ploughing for agricultural practices displace artefact scatters and deflate earth mounds. Coastal erosion, coastal change and increased storm surges destroys shell middens and artefact scatters located in coastal and offshore landforms. The practice of archaeology itself is destructive and results in the loss of archaeological places. Alteration of the natural environment also affects intangible values, affecting connections between the Dreamtime and the landscape, for example, by interrupting songlines. As Aboriginal people have strong connections to Country, effects on the natural environment, the land, sea, and animals, also have strong effects on Aboriginal people.

2.3 Aboriginal heritage – registered archaeological places in the study area

A search of the Victorian Aboriginal Heritage Register (VAHR) was undertaken by Emily Ward, Biosis Pty Ltd on the 21 of December 2022 utilising access number 11456. The search area was set by the study area and consists of the entire Victorian coastline.

The search identified 5636 recorded Aboriginal places within the study area (Table 1).

The dominant Aboriginal place types in the study area are shell middens (n=2639, 46.82%), artefact scatters (n=2210, 39.21%) and low density artefact distribution also known as LDADs (n=321, 5.70%). Other place types include earth features (n=181, 3.21%), object collections (n=160, 2.84%), Aboriginal Ancestral Remains (Burial) (n=51, 0.90%), scarred trees (n=42, 0.75%), stone features (n-12, 0.21%), quarries (n=9, 0.16%), Aboriginal historical places (n=8, 0.14%), Aboriginal Ancestral Remains Reinterments (n=2, 0.04%) and rock art (n=1, 0.012%).

Object Collections represent places that have been removed from the context in which they were originally recorded. More specifically, they represent the location of stored artefacts (i.e. heritage consultancies, museums, private collections) or places where artefacts have been repatriated; therefore, Object Collections are not necessarily representative of the archaeological character of the region

Due to most of the search area being coastal, the dominance of shell middens in the study area is not surprising. Middens represent the repeated consumption of coastal resources (predominantly shells of rocky or sandy shore types, such as mussel, pipi, oyster, turban) and consist of the discarded shell. Other objects may be discarded within the midden, such as bones (seal and bird are common), and artefacts. The shells and other items were discarded in discrete areas over time, some middens are small consisting of a smaller number of meals or individuals, others are larger, indicating multiple meals, some revisited over many hundreds, or thousands, of years (Frankel 2017, p.38).

> *'Archaeological evidence from Victoria indicates that occupation of coastal areas is as old as the present coastline – about 6000 years. Most coastal occupation sites in Victoria, however, are 4000 years old or younger' (National Oceans Office, 2002:80)*

Within the study area the Traditional Owner group with the most registered Aboriginal places is Bunurong with 1486 place registrations, with 26.37% of the total registered sites in the study area. This is then followed by Gunditjmara with 853 registered sites (15.77%), then Eastern Maar with 853 registered sites (15.13%), Wadawurrung with 798 registered sites (14.16%), Gunaikurnai with 700 registered sites (12.42%) and the area of overlap of Gunditjmara and Eastern Maar has 88 registered sites (1.56). The area within the study area that has no registered RAP group has a total of 822 registered sites (14.16%). The specifics of each group are discussed below.

The areas of Bellarine Peninsula, Mornington Peninsula and French Island and Wilson's Promontory have been searched specifically on the Victorian Aboriginal Heritage Register (VAHR) as they are distinctive landforms on the coastline of Victoria and hold distinct cultural patterning, regarding both tangible and intangible cultural heritage values. These three areas contribute 1775 of the registered sites (31.5%), out of the 5636 total registered sites in the study area; The Bellarine Peninsula has 578 registered sites, Mornington Peninsula and French Island have 813 registered sites and Wilson's Promontory has 384 registered sites.

Table 1 – Aboriginal places within the study area (Victoria)

Aboriginal Place Type	Total number of sites	Percentage of sites
Aboriginal Ancestral Remains (Burial)	51	0.90%
Aboriginal Ancestral Remains (Reinternment)	2	0.04%
Aboriginal Historical Place	8	0.14%
Artefact Scatter	2210	39.21%
Earth Feature	181	3.21%
LDAD	321	5.70%
Object Collection	160	2.84%
Quarry	9	0.16%
Rock Art	1	0.012%
Scarred Tree	42	0.75%
Shell Midden	2639	46.82%
Stone Feature	12	0.21%
Total	5636	100%

2.3.1 Primary Stakeholder Area - Gunditjmara Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 889 recorded Aboriginal places within the Gunditjmara RAP area. The dominant Aboriginal place types in the study area are artefact scatters (47.36%), shell middens (38.81%) and LDADs (6.3%).

Artefact scatters have been registered throughout the search area, with notable clusters of artefact scatters south of Portland, around Point Danger. Low Density Artefact Distributions (LDADs) consisting of fewer artefacts less densely present than artefact scatters, are most often found further inland, compared to artefact scatters and shell middens which are located close to the shoreline. This suggests concentration of activity close to the coast, and increased transitory movement to and from the coast, as material is being discarded when people are moving across the landscape.

Other registered place types include earth features (6.3%), object collection (0.56%), Aboriginal historic places (0.34%), Aboriginal Ancestral Remains Burial (0.11%), quarry (0.11%) and scarred trees (0.11%) There are no registered sites in the western most area of the Gunditj Mara RAP group, within the study area. This area is along the southern most point of the Fitzroy River and west of Narrawong.

2.3.2 Primary Stakeholder Area - Eastern Maar Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 853 recorded Aboriginal places within the Eastern Maar RAP area. The dominant Aboriginal place types in the study area are shell middens (53.81%), artefact scatters (34.11%) and earth features (5.39%)

Shell midden sites on in coastal landforms have been frequently registered. The artefact scatters with the study area tend to follow natural paths inland. This suggests movement to and from the coast, with people utilising land resources. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016).

Other registered place types include LDADs (3.99%), object collection (1.52%), Aboriginal Ancestral Remains Burial (0.94%), quarry (0.12%) and stone features (0.12%)

2.3.3 Primary Stakeholder Area – Shared Gunditjmara and Eastern Maar Aboriginal places

In this area, the two RAP groups overlap. The search of the Victorian Aboriginal Heritage Register (VAHR) identified 88 recorded Aboriginal places within the shared Gunditjmara and Eastern Maar RAP area. The dominant Aboriginal place types in the study area are shell middens (52.27%) artefact scatters (34.09%) and stone features (7.95%).

Majority of the artefact scatters and shell midden sites with the study area are located between the coast and Eumerella River. This suggests the use of both fresh and sea water sources for material and resources. Shell midden sites can be found along the coastline while the artefact scatters tend to be closer to fresh water sources. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016).

Other registered place types include earth features (4.55%) and Aboriginal historic places (1.14%).

2.3.4 Secondary Stakeholder Area - Wadawurrung Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 798 recorded Aboriginal places within the Wadawurrung RAP area. The predominate Aboriginal place types in the study area are artefact scatters (46.12%), shell middens (33.83%) and LDADs (9.27%).

Within the study area, artefact scatters tend to follow freshwater sources inland and cluster around headlands (such as the Queenscliff and the Indented Heads area). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea. LDADs are most often found further inland, compared to shell middens which are located closer to the shoreline. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape

Other registered place types include object collection (5.64%), earth features (2.88%), scarred trees (0.88%), Aboriginal Ancestral Remains Burial (0.75%) Aboriginal historic places (0.25%), stone features (0.25%) and quarry (0.13%)

Bellarine Aboriginal Places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 578 recorded Aboriginal places within the Bellarine Peninsula. The predominate Aboriginal place types found on the Bellarine Peninsula are artefacts scatters (48.44%), shell middens (29.41%) and LDADs (10.03%).

Within the study area, artefact scatters tend to follow freshwater sources inland and cluster around headlands (such as Queenscliff and Barwon Heads). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea. LDADs are most often found further inland, compared to shell middens which are located closer to the shoreline. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape

Other site types include object collection (6.75%), earth features (3.29%), Aboriginal Ancestral Remains Burial (0.87%), scarred trees (0.69%), Aboriginal historical places (0.35%) and stone features (0.17%).

2.3.5 Secondary Stakeholder Area - Bunurong Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 1486 recorded Aboriginal places within the Bunurong RAP area. The predominate Aboriginal place types in the study area are shell middens (45.56%), artefact scatters (38.36%) and LDADs (8.28%).

Within the study area, artefact scatters on French Island and Phillip Island are found further inland, compared to shell middens. Some of the shell middens within the study area can be found in clusters around headlands (such as the Portsea and Sorrento area). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea.

Other registered place types include object collection (5.79%), earth features (1.28%), scarred trees (0.20%), Aboriginal Ancestral Remains Burial (0.20%), quarry (0.13%). Aboriginal historic place (0.07%), rock art (0.07%) and stone features (0.07%)

Mornington Peninsula and French Island Aboriginal Places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 813 recorded Aboriginal places within the Mornington Peninsula and French Island area. The dominant Aboriginal place types in the study area are shell middens (50.43%), artefact scatters (31.12%) and LDADs (11.69%).

Along the coast of the Mornington Peninsula there is a significant increase in shell midden sites from Sorrento to Cape Schanck. This could indicate targeted gathering of resources specific to this area and purposeful occupation of the coastline. From Cape Schanck, moving east, there is a noticeable decrease in the number of registered sites along the coast. Shell middens can be found along the coast, either along the shore or along creeks close to the coast (such as Merricks Creek). Artefact scatters can be found intermittently along the coast but can also be seen following water sources inland. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources and coastal sites as occupation sites and opportunities for variety in resource gathering. LDADs are an inland site type within the locality. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape.

There are 50 registered sites on French Island. Only 9 of these sites are located along its coast, the other 41 are inland sites, with the majority of the sites being artefact scatters. The inland artefact scatters are located along paths of water, suggesting targeted use of the landscape (land use patterning).

Other registered place types include object collection (4.31%), earth features (1.72%), scarred trees (0.37%), Aboriginal historic places (0.12%), quarry (0.12%) and rock art (0.12%).

2.3.6 Secondary Stakeholder Area - Gunaikurnai Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 700 recorded Aboriginal places within the Gunaikurnai RAP area. The predominate Aboriginal place types in the study area are shell middens (46.29%), artefact scatters (43.14%) and scarred trees (4.29%).

Clusters of artefact scatter sites can be found on the eastern coast of the Corner Inlet Marine and Coastal Park. These artefact scatters ten to follow sources of freshwater inland. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea.

Other registered place types include LDADs (2.14%), Aboriginal Ancestral Remains Burial (2.14%), earth features (1%), object collection (0.57%), Aboriginal Ancestral Remains Reinternment (0.14%), Aboriginal historic places (0.14%) and stone features (0.14%).

Wilson's Promontory Aboriginal Places

The Traditional Owners of Wilson's Promontory come from two recognised RAP groups: Bunurong and Gunaikurnai.

The search of the Victorian Aboriginal Heritage Register (VAHR) identified recorded 384 Aboriginal places within the Wilson's Promontory area. The predominate Aboriginal place types in the study area are shell middens (72.40%), artefact scatters (21.61%) and earth features (2.08%)

Clusters of shell midden sites can be found both inland and around the coast of Wilson's Promontory. A large shell midden cluster can be found along the western coast of the Promontory with a total of 163 shell midden registered sites. Another two clusters have been recorded around the opening of Wilson's Promontory, with a total of 18 registered sites between them. All 18 shell midden sites are in close proximity to either the coast or moving water. Majority of the artefact scatter register sites recorded at Wilson's Promontory follow water sources inland. The strategic locations of both shell midden and artefact scatter sites demonstrate land use patterning.

Other registered place types include LDADs (1.56%), Aboriginal Ancestral Remains Burial (1.3%), object collection (0.52%), Aboriginal Ancestral Remains Reinternment (0.26%) and scarred trees (0.26%)

2.4 Aboriginal heritage – archaeological places in Tasmania

2.4.1 Primary Stakeholder Area – Bass Strait Island Aboriginal places

Mackay (1946) was the first to identify archaeological evidence of past Aboriginal use of the Bass Strait Islands in the 1930s (see also Sim 1991:6). Earlier thoughts were that these were stone artefacts left behind when the Tasmanians were moved to Flinders Island by George Augustus Robinson in the 1830s. It was not until Rhys Jones' work in the 1960s that attention to the Bass Strait islands was made. Sandra Bowdler (1979) excavated at Cave Bay Cave on Hunter Island that provided the first evidence of Pleistocene occupation, dating from 23,000 years. At this time, this was the oldest recorded date of Aboriginal occupation in Tasmania. This was also archaeological proof of the Bassian Land Bridge that once connected Tasmania to Mainland Australia (Sim 1991).

Further work was carried out on Flinders Island and several other smaller islands in Bass Strait showed signs of earlier occupation, including stone artefacts, middens and burials. It was believed at the time that the absence of middens on some islands, but the presence of stone artefacts meant that the midden sites were once closer to the original pre-Ice Age coast, which is now under water (Orchiston and Glenie 1978). The first middens excavated in Bass Strait was by Orchistone (Orchiston and Glenie 1978, Orchiston 1979a, 1979b, 1984), however, the full details of the report have not been published. Sim (1991:12) recorded a number of middens on Flinders Island in 1989 and noted that many of the remaining midden sites were found where the sea floor drops away abruptly, further suggesting that many of the midden sites were possibly found on ground level now under water due to rising waters after the Ice Age. Sim (1991) argued that the Bass Strait islands were abandoned before the last remnants of the Bassian Plain land bridge between Mainland Australia and Tasmania disappeared. Davidson and Roberts (2008:20) state:

> *For a while, perhaps, it was possible to use watercraft to maintain contact with families and friends on the other side but eventually this became more difficult. Boats sank sometimes, or storms and rough seas would have made the crossing perilous. When the sea barrier became too wide, those left on the Tasmanian side turned their backs and never saw their friends and families again. It proved to be a monumental turning point, leading to an independent evolution in their technology, economy, society and culture. They were alone for five hundred generations, knowing no other people in the world, living with the knowledge and beliefs derived from those they had known before the sea surrounded them. They remained isolated from the rest of*

humanity until that same sea brought the first Europeans in the late seventeenth and early eighteenth centuries

Brown (1990) conducted excavations on Flinders Island that again proved the antiquity of the Bass Strait Islands, where sporadic occupation from 20,000 years to 8,500 years was found at Mannalargenna Cave on Prime Seal Island. Again, it was hypothesised that the islands were abandoned after 8,500 years due to the rising sea levels (see Sim 1991:11). Early thoughts at the time state that water craft between the islands would have been possible, and the sea level rise was gradual and would have been shallower. However, with the rise of waters, also meant that the distance between land masses increased, therefore making travel much harder and dangerous. It is thus why many believe that the islands were abandoned around 6,000 years ago when the seas reached their current levels (Sim 1991:12).

The flooding of the Bassian Plain meant that the people who chose to remain in Tasmania would soon be Isolated for generations. Jones (1977) states '… no other human society, which survived until modern times, had been isolated so completely and for so long'.

2.4.2 Secondary Area – Tasmanian coastal Aboriginal places

Archaeological evidence of occupation in Tasmania range between 34,000 – 40,000 BP. The most accurate date for occupation is from the Parmerpar Rockshelter close to Cradle Mountain that was excavated by archaeologist Richard Cosgrove (Mulvaney and Kamminga 1999:189). This was a time when Tasmania was still a part of the landmass of Australia before it was disconnected with the flooding of the Bassian Plain after the last Ice Age. Further excavations of Kutukina Cave (formally Frasier Cave) in southwest Tasmania established Pleistocene settlement of Tasmania with radio carbon dates ranging from 15,000 to 20,000 years BP (Kiernan 1983; Mulvaney and Kamminga 1999:182).

By the end of the last Ice Age (12,000 BP) the rising temperatures and subsequent rising sea levels flooded the Bassian Plain and separated Tasmania from the mainland of Australia (Kee 1987:12; Taylor 2003). The formation of what is now known at the Bass Strait ultimately led to the isolation of the Tasmanians from their groups on the mainland of Australia. The resulting 10,000 years of isolation crafted a unique culture and economy that was independent from any mainland Australia influence (Mulvaney and Kamminga 1999:339). A series of environmental and climatic changes started to occur in Tasmania as a result of this separation with a reduction in rainfall, lower than normal temperatures, some reduction in the seeding of vegetation, as well as the formation of sand dune systems that were to become a prime area for the discovery of Aboriginal remains. Kee (1987:14) stated that these dunes formulated a new abundance of resources available to the Tasmanian's, which is reflected in much of the early archaeology of this period. These climatic changes started to stabilise around 6,000 years ago. This has been noted by radiocarbon dating at Carlton Bluff, where dates ranged from 8,000 to 6,000 BP (Dix 2015:147-148; Key 1987:12 Neil 1981; Reber1965), and therefore the range of sites found on the coast are more than likely representative of this 6,000 year figure.

Regionally, sites vary in Tasmania. As such, the state has been divided into three geographic regions. Various studies were conducted in the 1980s and 1990s to understand these regional differences in sites, and to understand more broadly Tasmanian Aboriginal archaeology (Brown 1991; Cane 1980; Cosgrove 1985; 1990; Gaughwin 1985: 52; Jones 1965; 1966; 1967; Key 1991; Lourandos 1968; 1970; 1977; MacFarlane 1993; Stockton 1977a, 1977b; 1982). Many of these were published as part of the Parks and Wildlife section of the Tasmanian government. More recent and accurate data is available at Aboriginal Heritage Tasmania, however prior approval from the Aboriginal Heritage Council will be required to access this data.

- East/South East Tasmania
  - Middens formulate 90% of all site types on the east coat with a range of shell from turbo, oyster, limpet, abalone and mussel. Brown (1991:46) determined that turbo middens dominated areas behind rock platforms where oysters were mostly predominant behind sandy beaches, where shell fish consumption generally took place within the immediate proximity of where it was procured from;
  - 50m within the coastline appears to be the limit of the majority of the larger sites in the area;
  - Sites are generally situated on well drained more inland areas;
  - That 81% of sites recorded contained some level of stone artefacts, and generally consist of hornfels, cert, quartzite and chalcedony flakes.
  - Stone artefact scatters were generally located on flat or gently inclined landscapes where they were close to a water source;
  - The underlying geology of the inland area suggests that areas where the underlying rock was sandstone was more favourable over those areas that contain dolerite;
  - Sandstone rock shelters located close to water often contain signs of occupation.
  - Rock art can occasionally be found on sandstone rock shelters, and is generally executed in ochre.
- Archaeological Sites – North/ North East Tasmania
  - Sites generally occur on high energy coastlines;
  - Approximately 78% of sites occur within 50m from a water source;
  - Sand dune areas most commonly have sites located on them;
  - The main stone typology noted in these assemblages include hornfels, chert, and quartz.
  - Rock art can be found pecked in stone on coastal margins
- Archaeological sites North West/ West/ South West
  - Majority of sites can be found on sand dunes close to rock platforms;
  - Middens are generally smaller and lower on sandy shores.
  - Middens are generally absent along rocky granite shorelines.
  - Site types include artefact scatters, isolated artefacts, stone and ochre quarry sites and rock shelters.

- The main stone types used in the area include spongolite, quartzite, quartz, silcrete and hornfels.
- Artefact scatters and isolated artefacts are generally located on the forest plain.
- Stone artefacts will be varies in material type, which reflects the opportunistic nature of collecting material.
- Areas within 500m of major water courses and creeks will generally contain Aboriginal sites.
- Sites that contain stone artefacts made from spongolite artefacts will no predate 2,500BP.
- Generally, sites are 70 to 100 artefacts per km^2. Densities are approximately 1.7 artefacts per site in places away from major rivers and quarry sites, whereas there will be approximately 6.5 artefacts per site in areas close to these resources.
- Sites will generally be located near the transition of inland heath plains and forest margins.
- Large artefact scatters will be located close to major creeks or rivers especially where flat grounds are associated with the area;
- Hut depression occur on coastal margins, generally close to food sources
- Rock art is found on coastal margins, and is generally pecked or engraved on large sandstone faces, or where creeks exit to the sea.

2.5 Archaeological summary

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and LDADs. Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

In light of a review of Aboriginal places within the study area, there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

Within Tasmania and the Bass Strait Islands, there are no recent published figures of sites located on the coastal margins. Access to this data is restricted, and permission will need to be sought by the Aboriginal Heritage Council to access the Aboriginal Heritage Register via Aboriginal Heritage Tasmania. However, from the assessment of available regional data, Aboriginal heritage should be expected in any area of low-lying coastal areas, shelter sites, and sources of food, water and raw materials. These coastal margins contain all Tasmanian Aboriginal site types. It is also known on the West Coast of Tasmania, that a number of rock art sites are located on the coast, many either close or in tidal margins (Dix pers. obs.). Large midden sites are also located very close to the waters edge, as well as some stone quarry sites within tidal margins (Dix pers .obs.).

2.6 Traditional Owner groups and ethnohistory

For the purposes of this assessment, information about Aboriginal Victorian pre and post contact history has been sourced from nineteenth and twentieth century primary and secondary ethnographic/historical records.

2.6.1 Primary Stakeholder Area - Gunditjmara

The Gunditjmara RAP group covers the area boarding the South Australia border with Victoria and the Southern Grampians. This area includes Harrow and Horsham, south to Dunkeld and MacArthur, and southwest to Portland and Cape Nelson. The Gunditjmara RAP area also includes many state and national parks such as Discovery Coastal Park, Mount Richmond National Park, Cape Nelson State Park and the Grampians National Park.

The area between the Shaw and Eumerella Rivers in the south-west to Lake Linlithgow in the north and Yambuk in the south, are shared by both the Gunditjmara RAP and the Eastern Maar RAP groups.

There are many landscapes within Gunditjmara Country – Nyamat Mirring (Sea Country), Tungatt Mirring (Stone Country), Bocara Mirring (River Country) and Woorrowarook Mirring (Forest Country) (Glenelg-Hopkins Regional Catchment Strategy 2023).

It can be noted that the Gunditj Mara view water as part of their traditional lands and should be recognised and protected as such (Clark 1990, RNTBC 2023)

Evidence of Gunditj Mara knowledge of water is found in the eel trapping and the redirecting of waterways at Lake Condah and in the larger Budj Bim National Heritage Landscape. The Budj Bim National Heritage Landscape had been managed by Traditional Owners to form waterways and channels to bring eels down from Darlots Creek into Lake Condah for fishing and resource gathering (Department of Climate Change, Energy, the Environment and Water 2021). This practice can be dated to approximately 6600 years old, with one of five of the eel trap systems around the lake's edge being carbon dated. The relocating and breeding of eels became a sustainable husbandry practice that sustained the Gunditj Mara through every season, providing food stuffs and sources of trade. There are plans currently being made with VicWater and Wannon Water to reestablish traditional eel farming in the Budj Bim area (VicWater 2022)Another plan devised to aid in the management of Indigenous water landscapes is the Sea Country IPA Program. The Sea Country IPA (Indigenous Protected Areas) Program was developed at the beginning of 2021 to aid in the conservation and protection of Indigenous marine and coastal environments. The IPA program covers the Gunditj Mara area from the Convincing Ground to the Yambuk Lakes and provides further protection of the Budj Bim landscape as well as opportunities for Indigenous employment, documentation of traditional knowledge and sea management (DCCEEW n.d.)

The Lake Condah mission was opened in 1867 in response to the displaced Gunditj Mara after the Eumerella wars (Budj Bim Cultural Landscape 2023). The Eumerella wars lasted over 20 years, beginning in the mid 1830's to the 1860's, starting over disagreements in ownership of land in southwest Victoria. The Dhauwurd wurrung people (apart of Eastern Maar country) refused to settle at the mission in Framlingham, so the Lake Condah mission was established, where they farmed and learnt to read and write English. The mission was strategically position to both house eel trapping facilities and have a view of the Budj Bim Reserve. In 1918, the mission was formally closed, and some of the Gunditj Mara were moved to other missions, such as the Lake Tyers Mission, while others refused to leave country. In 1987, the land on which the mission was situated on was given back to the Gunditj Mara (Budj Bim Cultural Landscape 2023).

Gunditj Mara hold strong cultural connections to sea country (Nyamat Mirring), and Nyamat Mirring features heavily in the Dreaming and creation stories of the Gunditj Mara. The Gunditj Mara believe that after the initial eruption of the creator spirit, Budj Bim, out of a volcano, the spirits movement throughout the landscape created the surrounding landscapes and their features. The lava

flow from this eruption caused the creation of the wetlands found within the Gunditj Mara landscape. In the traditional funeral rites of the Gunditj Mara people, bodies are bundled in grass and laid into the ground with their heads pointing towards Deen Maar (Lady Julia Percy Island). This is due to Deen Maar having a cave called Tarn Wirrung, which is thought to be the beginning of the passage towards the afterlife. Once the bodies were buried, if grass grew at the mouth of the cave, it was thought that the spirit had made it to the island, and into the realm of the clouds

Deen Maar (Lady Julia Percy Island) is the point where two creator deities, Punjil and Pallian left this earth. Pallian was the creator deity of the sea and fish and the governor of the oceans (after William Thomas, Letters from Victorian Pioneers, in National Oceans Office 2003:12). This island holds and creation story holds significance for both the Gunditj Mara and Eastern Maar.

Significant locations of conflict are also located on the coast, including the massacre of Gunditj Mara at Convincing Ground, east of Portland. The Convincing Ground Massacre occurred at Allestree, approximately 10km from Portland, where Kilcarer Gundidj, Gundtij Mara people were killed by whalers over a disagreement about the ownership of a beached whale(VHR n.d.). The suggested dates for this massacre are between 1833 and 1834, with an unknown number of Indigenous peoples being killed(VHR n.d.).

2.6.2 Primary Stakeholder Area - Eastern Maar

The Eastern Maar RAP group covers the area including Port Fairy and Warrnambool, down to Apollo Bay, east to Lorne and northwest towards Ararat. The RAP area of Eastern Maar also extends 100 meters off the coast and therefore encompasses the Twelve Apostles.

Eastern Maar is an umbrella term, used to describe a large area of land containing many, smaller traditional owner groups, such as Maar, Eastern Gunditgimara, Tjap Wurrung, Peek Whurrong, Kirraw Whurrung, Kuurn Kopan Noot. Yarro waetch and many others.(Eastern Maar Aboriginal Corporation 2020)

In 1865 the first Aboriginal mission was formed in the Western District at Framlingham in Girai wurrung country, north-east of Warrnambool. Aside from the Dhauwurd wurrung clans who moved to the Lake Condah mission in the 1860s, other Indigenous people were removed to the Framlingham Aboriginal Mission, which was gazetted as a "temporary reservation for the use of Aborigines" (Barwick 1979: 4).In this mission the Eastern Maar people continued both cultural and spiritual traditional practices. In 1867 and 1899 the mission was meant to close down, and the Eastern Maar people were expected to move into the Lake Condah mission. Again, in 1916, the Eastern Maar people were expected to move into missions within Gippsland Victoria. All three times, the people refused to move and were successful in staying on country. During the 1970's, Eastern Maar were granted ownership of the land, including 586 acres of the original mission(Lawler, Oataway, & Berelov 2016).

Eastern Maar's connection to water relies heavily in the marine resources, abundant around the area. Fishing practices are still used today with the fishing and collection of eels, perch, blackfish, yabbies, abalone, cockles and crayfish (Eastern Maar Aboriginal Corporation 2015, pp. 9). The techniques used in eeling have been passed down for generations, meaning the practices used today are techniques and skills traditional owners were using to eat and to trade (Eastern Maar Aboriginal Corporation 2015, pp. 9). Shell middens are an important archaeological site to the Eastern Maar, where they take time to teach others about the importance of culture and preservation and management of sea resources (Eastern Maar Aboriginal Corporation 2015, pp. 9).

> *When Maar citizens visit places with archaeological sites, we take time to teach our young ones about what they mean in terms of our history and culture. For example, our ancestors left many ancient middens along the coast which continue to tell a story about our Country - how the coastline and estuaries fluctuated, how and when our ancestors used the resources along the coast, what was harvested from out in the open ocean, how climatic conditions changed over time, where the meeting places were and ceremonies took place. This type of cultural*

learning helps develop empathy for Country; a deeper understanding on a societal scale of what Country means to us as a nation. We always pay our respects…(Eastern Maar Aboriginal Corporation 2015, pp. 9)

Through Country, Eastern Maar People connect with their ancestors who are associated with different water systems within the landscape (Eastern Maar Aboriginal Corporation 2015, pp. 9):

> *We believe that the spirits of our dead reside in our waterways and water bodies, and that they use animate and inanimate objects to move through Country. The signs they reveal to us are an important part of the interaction with our Ancestors – engaging, guiding, informing and warning us. When our citizens die, they are often buried with their bodies facing towards Deen Maar (Island). A story associated with Deen Maar Island is that the spirits go first to Deen Maar and then up to the stars, as Bunjil had done. A star falling or lights flying through the sky is a sign that the spirit is going over.*
>
> *Sea Country Maar citizens have always had a close connection with the sea and its resources, which were central to our culture, economy and survival. The ocean nourished our Ancestors and we still rely on it for our survival. Abundant middens along the coastline tell a rich story of our past. The coastline is home to sites that are important for our Dreaming - Three Sisters Rocks and Deen Maar (Lady Julia Percy Island) where our Ancestors leave the earth. Our connection with our Sea Country extends well beyond the current shoreline to the edge of the continental shelf. While this area is under the sea today, we occupied it for thousands of years and rising sea levels have not washed away the history, physical evidence or our connection.*(Eastern Maar Aboriginal Corporation 2015, pp. 13)

2.6.3 Secondary Stakeholder Area - Wadawurrung

Aboriginal groups mapped natural features as boundaries for their ranges, estates and economic territories. The Wadawurrung held land along the coast from Painkalac Creek at Aireys Inlet, east into Port Phillip Bay and to the Werribee River and to the north as far as Mt Emu and Fiery Creeks (Clark 1990).

Little is known about the Wadawurrung and their social organisation as they were one of the first Aboriginal groups within the region to be affected by European settlement in the area (Clark 1990). However, the Wadawurrung RAP organisation has traced its people's lineage to that of the seven families of John Robinson who was born in 1846 and passed in 1919 (WTOAC 2019).

During the summertime months, Wadawurrung along with Djab wurrung, Dhauwurd wurrung and girai wurrung language groups gathered at Mirraewuae swamp for ceremony and hunting. In early autumn the *Wada wurrung* would meet with Girai wurrung at Lake Bolac with local Djab wurrung named groups to take advantage of the migratory eels. The Wadawurrung participated in trade meetings at Terang, trading axe's and adhesive gum.

The coastal Wadawurrung first came into contact with settlers around the early 1800s when John Murray and William Flinders surveyed part of Indented Head. By the end of 1836 sheep runs were endemic around Geelong for an approximate 40.2 kilometre radius. The following year, settlers began to spread westward towards the Colac district.

An important figure in the history of Wadawurrung country was an escaped convict named William Buckley. The Wadawurrung balug first encountered Europeans in 1832 when William Buckley, escaped from the failed Sorrento settlement in 1803. Buckley was adopted by the Wadawurrung balug and spent the next 32 years with them; taking part in their customs, learning the language as well as hunting gathering techniques (Clark 1990). Buckley's story was recorded by John Morgan in 1852. From Buckley's accounts it was recorded that the Wadawurrung balug would catch eels at Lake Modewarre and would spend time on the hunting ground of the neighbouring Bengalat bulluck. According to Buckley the clan was at odds with the Bun wurrung, Woi wurrung and Daung wurrung clans (Clark 1990).

2.6.4 Secondary Stakeholder Area - Bunurong

The land encompassing the eastern side of the study area, as mapped by Clark (Clark 1990), is held by the Boon Wurrung language group, commonly associated with the Bunurong people. Boon Wurrung land occupied the coastal area from the Werribee River to Anderson Inlet, Phillip Island and probably beyond to Wilsons Promontory(Horton & Morris 1983, pp. 44). The Bunurong RAP group covers the Mornington Peninsula (such as Rosebud and Frankston), Western Port (French Island, Phillip Island and San Remo) and the eastern most part of South Gippsland (Warragul down to Leongatha)(BLCAC 2023).

The Bunurong group is loosely divided into smaller clan or family groups, named for the area they associated with (Gaughwin & Sullivan 1984, pp. 85). Barwick (1984, pp. 117–118) identified six clans: the *Burinyung-balluk* from Point Nepean and Cape Schanck, the *Mayone-bulluk* associated with the Carrum swamp, Cranbourne and the northern part of the Mornington Peninsula, the *Ngaruk-willam* associated with the Brighton area and Mordialloc, the *Yallock-bulluk* (most relevant to the study area) associated with the eastern side of Bass River and Tooradin, the *Yallukit-willam* associated with the area now called St Kilda and a broader region from the Werribee River to Mordialloc, the *Yowengherra* occupying the Tarwin River area. Thomas distinguished between the Bunurong people from Port Phillip and those of Western Port, though he rarely had contact with the Bunurong people on the eastern side of Western Port Bay (Sullivan 1981, pp. 16–19, Clark 1990). The Yallock-Bulluk Bunurong group are the most likely to have lived and associated with San Remo and Phillip Island area. The moiety of the Yallock-Bulluk named group is Bunjil, commonly associated with the Phillip Island area.

People were likely to have moved between the interior in winter and the coast in the summer. Movement was made up of many small distances (c. 10 km per day) punctuated by camps of one to three nights and occasionally longer stays of eight to ten days (Sullivan 1981). Social activity involving neighbouring named or socio-dialectical groups was usually held in warmer periods, held at the intersection of group boundary's and arranged by a person assigned of the responsibility of travelling between groups to organise the time, place, and events of the meeting.

An important figure in the history of Bunuroung country was an Indigenous man named Derrimut. Derrimut was the *arweet* the *Yalukit Willam* group at the time of European settlement of the region (Clark 1990, pp. 368–369). His name, Derrimut (derrimart/derremot), is believed to mean 'to hunt' or 'to pursue' in the language of the *Yalukit Willam* (Clark 2005, p. 1), Derrimut was a prominent figure in both the Indigenous and European histories of early Melbourne, and historical and contemporary views of his status vary. William Buckley, an escaped convict who lived with the Wadawurrung people of the Geelong region, considered him a 'traitor' who should be speared for divulging impending attacks to European colonists (Clark 2005, pp. 109). Clark (2005) considers Derrimut a "culture-broker" who sought to navigate the newly imposed political context of colonial Victoria by forging relationships with prominent early European Melbournians including John Pascoe Fawkner and William Thomas, who held Derrimut in high regard (Clark 2005, pp. 111). In 1849, Derrimut and other members of the *Yalukit-Willam* agitated for the establishment of the Mordialloc Reserve, and when it was later divided for sale in 1863, Derrimut used his European connections to angrily protest its sale (Clark 2005, pp. 116).

Bunurongs use of water-based resources is evident in the quantity of shell midden sites found along the coastline. Within the study area and the bounds of the Bunurong RAP group, there are a total of 677 registered shell midden sites, within two hundred meters of the shoreline. This suggests knowledgeable exploitation of marine resources as practiced techniques and an understanding of the ocean would be needed to accumulate the amount of shell middens listed on Bunurong country.

2.6.5 Secondary Stakeholder Area - Gunaikurnai

The Gunaikurnai RAP group covers most of the Gippsland Area, spanning from Warragul and Noojee, down to Port Albert and Port Welshpool, eastward towards Bairnsdale, Lakes Entrance and Marlo, and north towards Omeo and Hotham Heights

The Gunaikurnai believe in strong connections between land (Wurruk), water (Yarnda) and air (Watpootjan) and how these connections support living things. The Gunaikurnai see no separation of land and water, combining the two to represent whole country and therefore, demonstrate the same levels of importance to both land and sea. Due to this definition of country, both land and ocean receive the same amount of protection and management(GLWAC 2023a).

Throughout Gunaikurnai country, there are multiple sites that detail indigenous relation to country and resource exploitation. One site that displays local resource exploitation is the recently excavated cave near Mitchell River, Raymond Creek 2 Rock Shelter, that provides evidence of using mussel shell tools and localised resource gathered through fishing(Monash University & GLWAC 2019).

The Buchan Caves Reserve is an example of the spiritual and physical relation to country that the Gunaikurnai people share. At this site in Eastern Victoria there are registered indigenous burials located in and around the cave system, creating a spiritual space within the landscape. In conjunction to the sacred burials, the site was already known to be a great place of connection as it played an integral role in the migrating patterns of the Gunaikurnai travelling through the mountains(GLWAC 2023b).

The area surrounding Buchan Caves Reserve is also considered special to country, with several other caves being recognized as having cultural meaning One such cave is Cloggs Cave, located southeast of Buchan Caves Reserve, having an undisturbed cultural sequence, that could prove indigenous settlement in the Late Holocene and holds evidence of megafauna that challenge the idea of megafaunal extinction being caused by the LGM(GLWAC 2023a, David et al. 2021, GLWAC 2023b)

2.6.6 Primary Stakeholder Area – Palawa (Tasmania)

According to Jones (1974), Tasmanian Aboriginal society consisted of three social units: hearth group, the band and the Tribe. The hearth group was described as being the family unit, and consisted of a man, woman, their children, aged relatives, and ranged from 2-8 people (Jones 1974: Plomley 1983).

> *There were nine individuals in this family, and clearly they represented a hearth group, because Peron visited their campsite with its single hut. The group comprised an older man and wife, a younger man and wife, and five children, one a daughter (Oure-Oure) of the older man and wife, and the other four the children of the younger man and wife. (Plomley 1983:168).*

The band was more similar to a social unit, comprising of a number of hearth groups, and this was defined by land owned and the boundaries within this territory being lined with defined geographic boundaries (Jones 1974:324-325). Brown (1986:21) further notes that the band was generally led by an older man who had a reputation as a successful hunter and fighter. Brown (1986:21) also believes that the band was exogamous, with the wife generally moving to her husband's band and hearth group. Each of these bands were then further associated with a 'political' unit, as termed by Jones (1974:328-329) as a tribe. Jones (1974:328-329) describes:

> *...that agglomeration of bands which lived in contiguous regions, spoke the same language or dialect, shared the same cultural traits, usually intermarried, had a similar pattern of seasonal movement, habitually met together for economic and other reasons, the pattern of whose peaceful relations were within the agglomeration and of whose enmities and military adventures were directed outside it. Such a tribe had a territory, consisting of the sum of the land owned by its constituent bands ... The borders of a territory ranged from a sharp well defined line associated with a prominent geographic feature to a broad transition zone.*

Ryan (2012:14) hypothesises that the population of Tasmania was associated with a broad network of nine Tribes, each consisting of six to 15 bands. Ryan (2012:14) estimates that at by the time of European colonisation, the population of each tribe was around 350 and 800 people, where the overall population of Tasmania is estimated at being 3000-8000 people.

Coastal sites generally consist of midden sites, however, significant stone quarries, rock art, and former hut depressions and camp site can still be located. These sites show a seasonal exploitation of the coastal areas (Brown 1991; Jones 1977). The recording of bark canoes by early explorers shows that the Tasmanians did have a rich maritime tradition, however, many of these were used to access smaller off shore islands, not the larger islands of Bass Strait, or to the main land of Australia (Jones 1977).

With the removal of the Tasmanians to Flinders Island, population decreases, and associations with different geographical areas of Tasmania were lost. When the Tasmanian's returned to the mainland to Oyster Cove, many of these survivors were not allowed back into their traditional areas where they were born, or where their family had resided for generations.

2.7 Conclusion

Aboriginal communities in Victoria and Tasmania continue to be present and vibrant, and maintain strong connections to their traditional lands, waters, and their cultures. Each group is distinct and hold different systems of belief, connection, ceremony, language and lore and cultural practice. Each group hold traditional ecological knowledge of plants, animals and land management passed down through generations.

Aboriginal communities continue to practice traditional hunting, fishing, and gathering, and have a deep understanding of the environment around them. They also have a spiritual connection to the land and sea. Aboriginal people and representative bodies in Victoria and Tasmania have become more active in conservation, land and heritage management, working to protect and restore their traditional lands and waters, and to ensure that their cultural heritage is respected and protected.

> *Coastal environments in south-eastern Australia are rich in cultural sites. These include archaeological sites, such as shell middens and stone quarries, as well as "natural" sites, such as headlands, river mouths, reefs and islands. These sites have continuing cultural meaning because of their connection with Creation Stories, Dreaming Tracks, ceremonial places, camping places and massacre sites. Many of these places are listed on the Register of the National Estate, others are recorded in State-based heritage registers, while many others are known only to Indigenous people themselves and are not formally recorded...*
>
> *Protecting this cultural heritage is a major concern for Indigenous people. (National Oceans Office 2002:4).*

This Cultural Heritage Desktop Assessment explores the cultural heritage background for the region, provides a summary of available information in order to provide the project with a grounding in the cultural heritage of Aboriginal people in the study area.

4 Glossary of Terms

The glossary provides definitions of various archaeological and heritage related terms.

Heritage place: A place that has aesthetic, historic, scientific or social values for past, present or future generations – ' ...this definition encompasses all cultural places with any potential present or future value as defined above' (Pearson & Sullivan, 1995, p. 7).

Aboriginal place: Aboriginal place is defined under Section 5 of the *Aboriginal Heritage Act* 2006 as follows:

5 What is an Aboriginal place?

(1) For the purposes of this Act, an Aboriginal place is an area in Victoria or the coastal waters of Victoria that is of cultural heritage significance to the Aboriginal people of Victoria.

(2) For the purposes of subsection (1), *area* includes any one or more of the following—

(a) an area of land;

(b) an expanse of water;

(c) a natural feature, formation or landscape;

(d) an archaeological place, feature or deposit;

(e) the area immediately surrounding anything referred to in paragraphs (c) and (d), to the extent that it cannot be separated from the thing without diminishing or destroying the cultural heritage significance attached to the thing by Aboriginal people;

(f) land set aside for the purpose of enabling Aboriginal human remains to be re-interred or otherwise deposited on a permanent basis;

(g) a building or structure.

Alluvial terrace: a platform created from deposits of alluvial material along river banks.

Angular fragment: a piece of stone that is blocky or angular, not flake-like.

Archaeology: the study of the remains of past human activity.

Artefact scatter: a surface scatter of cultural material. Aboriginal artefact scatters are defined as being the occurrence of five or more items of cultural material within an area of about 100 square metres. Artefact scatters are often the only physical remains of places where people have lived camped, prepared and eaten meals and worked.

Backed piece: a flake or blade that has been abruptly retouched along one or more margins opposite an acute (sharp) edge. Backed pieces include backed blades and geometric microliths. They are thought to have been hafted onto wooden handles to produce composite cutting tools. Backed pieces are a feature of the 'Australian small tool tradition', dating from between 5,000 and 1,000 BP in southern Australia (Holdaway & Stern, 2004).

Blade: a flake at least twice as long as it is wide.

Burial place: usually a sub-surface pit containing human remains and sometimes associated artefacts.

Contact place: see 'Aboriginal historical archaeological place'.

Core: an artefact from which flakes have been detached using a hammerstone. Core types include single platform, multi-platform and bipolar forms.

Cortex: original or natural (unflaked) surface of a stone.

Cortical: refers to the cortex.

Flake: a stone piece removed from a core by percussion (striking it) or pressure. It is identified by the presence of a striking platform and bulb of percussion, not usually found on a naturally shattered stone.

Flaked piece: a piece of stone with definite flake surfaces, which cannot be classified as a flake or core.

Formal tool: an artefact that has been shaped by flaking, including retouch, or grinding to a predetermined form for use as a tool. Formal tools include scrapers, backed pieces and axes.

Geocentric Datum of Australia 1994 (GDA94): a system of latitudes and longitudes, or east and north coordinates, centred at the centre of the earth's mass. GDA94 is compatible with modern positioning techniques such as the Global Positioning System (GPS). It supersedes older coordinate systems (AGD66, AGD84). GDA94 is based on a global framework, the IERS Terrestrial Reference Frame (ITRF), but is fixed to a number of reference points in Australia. GDA94 is the Victorian Government Standard and spatial coordinates for excavations, transects and places in CHMP documents.

Geometric microlith: a small tool that has been fashioned from breaking apart a microblade. The piece is then retouched or backed and a small tool formed.

Grindstones: upper (handstone) and lower (basal) stones used to grind plants for food and medicine and/or ochre for painting. A handstone sometimes doubles as a hammerstone and/or anvil.

Hearth: usually a sub-surface feature found eroding from a river or creek bank or a sand dune - it indicates a place where Aboriginal people cooked food. The remains of a hearth are usually identifiable by the presence of charcoal and sometimes clay balls (like brick fragments) and hearth stones. Remains of burnt bone or shell are sometimes preserved within a hearth.

Isolated artefact: the occurrence of less than five items of cultural material within an area of about 100 square metres. It/they can be evidence of a short-lived (or one-off) activity location, the result of an artefact being lost or discarded during travel, or evidence of an artefact scatter that is otherwise obscured by poor ground visibility.

Manuport: foreign fragment**,** chunk or lump of stone that shows no clear signs of flaking but is out of geological context and must have been transported to the place by people.

Map Grid of Australia (MGA): The official coordinate projection for use with the Geocentric Datum of Australia 1994 (GDA94).

Mound: these places, often appearing as raised areas of darker soil, are found most commonly in the volcanic plains of western Victoria or on higher ground near bodies of water. The majority were probably formed by a slow build-up of debris resulting from earth-oven cooking; although some may have been formed by the collapse of sod or turf structures.

Percussion: the act of hitting a core with a hammerstone to strike off flakes.

Platform preparation: removal of small flake scars on the dorsal edge of a flake, opposite the bulb of percussion. These overhang removal scars are produced to prevent a platform from shattering.

Pre-contact: before contact with non-Aboriginal people.

Post-contact: after contact with non-Aboriginal people.

Quarry (stone/ochre source): a place where stone or ochre is exposed and has been extracted by Aboriginal people. The rock types most commonly quarried for artefact manufacture in Victoria include silcrete, quartz, quartzite, chert and fine-grained volcanics such as greenstone.

Rejuvenation flake: a flake that has been knapped from a core solely for the purpose of preparing a new platform and making it easier to get flakes off a core, as it reduces the angle between platform and core surface.

Retouch: a flake, flaked piece or core with intentional secondary flaking along one or more edges.

Rock art: 'paintings, engravings and shallow relief work on natural rock surfaces' (Rosenfeld, 1988, p. 1). Paintings were often produced by mineral pigments, such as ochre, combined with clay and usually mixed with water to form a paste or liquid that was applied to an unprepared rock surface. Rock engravings were made by incising, pounding, pecking or chiselling a design into a rock surface. Rare examples of carved trees occasionally survive.

Rock shelter: may contain the physical remains of camping places where people prepared meals, flaked stone, etc. They are often classed as a different type of place due to their fixed boundaries and greater likelihood of containing sub-surface deposits. Rock shelters may also contain rock art.

Scarred tree: scars on trees may be the result of removal of strips of bark by Aboriginal people e.g. for the manufacture of utensils, canoes or for shelter; or resulting from small notches chopped into the bark to provide hand and toe holds for hunting possums and koalas. Some scars may be the result of non-Aboriginal activity, such as surveyors' marks.

Scraper: a flake, flaked piece or core with systematic retouch on one or more margins.

Shell midden: a surface scatter and/or deposit comprised mainly of shell, sometimes containing stone artefacts, charcoal, bone and manuports. These place types are normally found in association with coastlines, rivers, creeks and swamps – wherever coastal, riverine or estuarine shellfish resources were accessed and exploited.

Significance: the importance of a heritage place or place for aesthetic, historic, scientific or social values for past, present or future generations.

Striking platform: the surface of a core, which is struck by a hammerstone to remove flakes.

Structures (Aboriginal): can refer to a number of different place types, grouped here only because of their relative rarity and their status as built structures. Most structures tend to be made of locally available rock, such as rock arrangements (ceremonial and domestic), fishtraps, dams and cairns, or of earth, such as mounds or some fishtraps.

Stratified deposit: material that has been laid down, over time, in distinguishable layers.

Transect: A fixed path along which one records archaeological remains.

Utilised artefact: a flake, flaked piece or core that has irregular small flake scarring along one or more margins that does not represent platform preparation.

This Report is to be made public and distribution is uncontrolled.

1. Introduction

This technical review of oil spill modelling has been prepared to support CGG Services (Australia) Pty Ltd (CGG) in its impact and risk assessment process for the for the Regia Marine Seismic Survey (Regia MSS).

The Regia MSS Preliminary Environmental Impact and Risk Assessment (PIERA) used an Environmental Planning Area set at 155 km around the Activity Planning Area. This distance was selected using professional judgement and a review of previous impact and risk assessments for similar activities in the region. Further justifying the distance, the NERA Reference Case: Consequences analysis of an accidental release of diesel (NERA 2018) found that diesel spills under 700m^3 were reliably predicted to disperse within 150 km. An additional 5 km was added to this range to ensure that coastal sensitivities were included in the search ranges for environmental values and sensitivities to inform the description of environment.

The PIERA recommended that following be undertaken: Review the NERA Reference Case 2018:1003 Consequence analysis of an accidental release of diesel and regionally relevant spill models from similar worst-case events to determine the applicability of the NERA Reference Case and, subsequently, the need for activity specific spill modelling. This report actions this recommendation to determine if the Environmental Planning Area is appropriate to approximate the spatial extent and variability of the receiving environment's contact with oil and subsequently inform risk evaluation and planning for oil spill response and monitoring, for the oil spill risk associated with the Regia MSS.

The initial spill modelling review was undertaken in April 2023 and updated in December 2023 prior to submission of the Regia MSS EP to NOPSEMA to consider any new oil spill modelling undertaken within the Otway Basin relevant to the review.

2. Review Recommendations

The following recommendations are made to CGG from this review:

- Basing the spill volume on the vessel's largest fuel tank is appropriate for the risk assessment.
- The NERA Reference Case distance of 150 km is appropriate for defining the furthest an oil spill could reach for spills up to 250 m^3 diesel spill that may occur within the Regia MSS Activity Planning Area.
- The Environmental Planning Area is appropriate for:
    - Estimating the spatial extent of oil exposure at the low thresholds (NOPSEMA 2019) for a 250 m^3 diesel spill within the Regia MSS Activity Planning Area.
    - Predicting oil exposure at King Island from a 250 m^3 diesel spill within the Regia MSS Activity Planning Area.
    - Predicting no oil exposure at the Tasmanian coast from a 250 m^3 diesel spill within the Regia MSS Activity Planning Area.
- CGG should keep the largest tank volume for vessels below 250 m^3.
- Once the seismic survey vessel and type of support vessels are contracted, undertake a review of the largest fuel tank volume. If the largest fuel tank volume is greater than 250 m^3 this oil spill modelling review should be redone to determine if the Environmental Planning Area is still

appropriate. If it is not a management of change should be undertaken as per CGG's Implementation Strategy for the Regia MSS.

- If the Regia MSS Activity Planning Area changes, this oil spill modelling review should be redone to determine if the Environmental Planning Area is still appropriate. If it is not a management of change should be undertaken as per CGG's Implementation Strategy for the Regia MSS.

3. Regia MSS Spill Risk

The Regia MSS PIERA identified that whilst undertaking the activity, unplanned events may occur which result in a discharge of marine diesel. The Regia MSS Description of the Activity details that the worse-case credible oil spill risk of a vessel collision could result in the loss of diesel fuel from the vessels largest fuel tank. This assumption aligns with AMSA's National Plan Technical Guidelines for Preparing Contingency Plans for Marine and Coastal Facilities (AMSA 2015) that recommend that the indicative maximum credible spill volume for a vessel collision is the volume of the largest fuel tank.

The Regia MSS Description of the Activity details that the survey will be conducted using a purpose-built seismic survey vessel supported by up to three support vessels. CGG provided information on the proposed seismic survey vessel and type of support vessels that are likely to be used for the Regia MSS and it was identified that the largest fuel tank was 257.4 m^3.

4. Review Process

The review process focussed on oil spill modelling that is publicly available that met the following requirements:

- Surface release of marine diesel oil.
- Modelling thresholds align with those in the NOPSEMA Oil Spill Modelling Environment Bulletin April 2019.
- Modelling was used in an environment plan available on the NOSPEMA website.
- Modelled location is within the Regia MSS Activity Planning Area or > 20 km of the Regia MSS Activity Planning Area where the metocean conditions would be similar.

5. Review

The oil spill modelling that met the criteria in Section B11-4 are detailed in Table B11-51-. Marine diesel oil spill volumes ranged from 200 m^3 to 375 m^3 with all models using a release rate over 6 hours.

Distances to the modelling thresholds ranged considerable with the furthest distances typically to the east of the spill release location. This aligns with the major ocean currents in South-eastern Australia where the Leeuwin current from Western Australia flows south-east across the Great Australian Bight and reaches the west coast of Tasmania as the Zeehan Current (CoA 2015a).

Larger volumes modelled typically resulted in greater distances with entrained hydrocarbons travelling the furthest.

The NERA Reference Case (NERA 2018) detailed that, except for one outlier, there was no surface impact above thresholds beyond 150 km from the source of the spill for spills up to 700 m^3. This does not align with the modelling reviewed for which surface oil travelled between 10 to 300 km for spill volumes up to 373 m^3. Though it is noted that the moderate threshold for surface oil (NOPSEMA 2019) was used in the NERA Reference Case which would result in a smaller distance.

The NERA Reference Case (NERA 2018) also used 500 ppb for water column consequences of hydrocarbon release which does not align with NOPSEMA (2019) for which the low thresholds of 10 ppb for dissolved and entrained hydrocarbons are recommended for determining the spatial extent that may be exposed to a measurable level of hydrocarbons.

Only one spill volume of 250 m^3 was modelled (RPS 2019a) at the Annie-1 well location in 70 m water depth and 15 km from the Victorian coastline. The outputs from this modelling are relevant to the Regia MSS Activity Planning Area nearshore component and would be valid to estimate the distance to surface, dissolved and entrained low thresholds and oil contact to the mainland coast. The distances to these thresholds are within the Environmental Planning Area except for:

- The surface oil distance to the east of the oil spill modelling location was 193 km which is greater than the 150 km used for the Environmental Planning Area. However, the modelling used a threshold value of 0.1 g/m^2 which is lower than the current modelling threshold of 1 g/m^2 (NOSPEMA 2019) Based on a lower threshold was used and that the modelling at Minerva for Woodside (~ 10 km east of the Annie location) in a similar water depth (60 m) and distance to the Victorian coast (9 km) had a furthest distance of 75 km to the east for the low threshold surface oil, the 150 km used for the Environmental Planning Area in the nearshore Regia MSS Activity Planning Area would be appropriate.
- The moderate threshold for entrained oil was used for the modelling. This threshold is appropriate for informing the risk evaluation, but NOPSEMA (2019) recommend that the low threshold be used to define the area that may be exposed to oil above background levels. The moderate threshold was reached at a maximum distance of 60 km so even if this distance was double it would still be within the 150 km used for the Environmental Planning Area.

However, as the Regia MSS Activity Planning Area extends out ~ 120 km from the Victorian mainland and ~100 km from King Island the Annie-1 location may not accurately predict oil exposure to King Island or Tasmania.

Based on the following modelling that was undertaken closer to King Island and the Tasmanian mainland than the Regia MSS Activity Planning Area, the Regia MSS Activity Planning Area is appropriate for predicting low shoreline exposure to King Island and no shoreline exposure to the Tasmanian mainland from a 250 m^3 diesel spill over 6 hours:

- The ConocoPhillips Australia SH1 Pty Ltd modelling at Permit T/49P, 70 km west of King Island and 50 km south of Cape Otway, for a 350 m^3 diesel spill over 6 hours predicted no shoreline oil exposure for the Tasmanian mainland and a maximum probability of shoreline accumulation at the low threshold of 3%.

- The Beach Energy (Operations) Limited modelling at the Thylacine field located 70 km south of Port Campbell and 90 km northwest of King Island, for a 200 m^3 diesel spill over 6 hours predicted no shoreline oil exposure for the Tasmanian mainland and a maximum probability of shoreline accumulation at the low threshold of 2%.
- The Beach Energy (Operations) Limited modelling at the Thylacine field located 70 km south of Port Campbell and 90 km northwest of King Island, for a 300 m^3 diesel spill over 6 hours predicted no shoreline oil exposure for the Tasmanian mainland and a maximum probability of shoreline accumulation at the low threshold of 4%.

Table B11-5-1: Oil Spill Modelling Outcomes

Company	EP	EP Status	Modelling Site	Approximate Modelling Location	Diesel Spill Volume	Water depth	Approximate Distance to Low Threshold			
							Surface Low - 1 g/m2	Shoreline Low - 10 g/m2	Dissolved Low- 10 ppb	Entrained Low - 10 ppb

2 Public Comment

The following feedback was received during the public comment period starting 25 January 2024 which ran for 30-days. Table B12-1 shows how this feedback has been incorporated into the environmental assessments.

Table B12-1 - Public comment input into the preparation of the EP

Matter	Matter ID	Changes made arising from public comment
Matter: Unacceptable impacts and risks to Marine Parks and protected areas	E01	CGG has considered these claims and has updated figures in Appendix B12 to include distances from operational and activity action zone areas to marine parks, reserves, and KEFs thereby providing further context of separation distances; and has calculated the percentage overlap of the Regia Operational Area with Bonney Coast Upwelling KEF.
Matter: Acknowledgement of breeding colonies	B02	The noise EMBA has been added to Figure MAP-REG-EPM-064 to show that the declared little penguin BIAs occur outside of the noise EMBA.
Matter: Surveying previously surveyed areas is unnecessary	I24	CGG has considered these claims and is satisfied that the concerns raised have been adequately addressed in the EP, for the reasons outlined above but has undertaken to update EP Appendix B12 (Regia MSS Maps), namely Figures MAP-REG-EPM-052 (2D NOPIMS) and MAP-REG-EPM-053 (3D Surveys) to show the overlap of the operational and activity action zone and previous survey data in response to these claims.

1 Introduction

Pursuant to Part 4 Division 3 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (**the Regulations**) and considering recent case law, CGG Geophysical Services Pty Ltd (**CGG**) has performed consultations as required. This appendix aims to document how CGG undertook the consultation process, managed risks to as low as reasonably practicable and an acceptable level, and appropriately responded to, incorporated, and adopted measures based on relevant persons objections, claims, and other feedback.

By capturing sufficiently broad people and information through desktop research, community outreach events, and various targeted media and advertising techniques, CGG were able to identify relevant persons, provide them with sufficient information on the possible consequences of the activity on their functions, interests, or activities, allow a reasonable period for consultation, time to respond appropriately, and document details of such a process.

This chapter will outline the guidelines set out by NOPSEMA, legislation and case law and demonstrate how CGG has satisfied these requirements. The following appendices should be read in conjunction with the consultation chapter.

Appendix C2: Consultation Report

Section 24(b) requires an environment plan that includes a report on all consultations under Section 25 of any relevant person by the titleholder. This report must include the following:

- A summary of each response; and
- An assessment of the merits of objections and claims regarding adverse impacts of activities proposed; and
- A statement of CGG's response as titleholder where they were given.
- This appendix is sorted separately by organisations and persons, so each specific case by case response by the titleholder and the relevant person can be assessed on their merits and easily referred to.

Appendix C3: Sensitive Information Part (16(b)(iv))

To comply with sub-section 26(8) of the Regulations, the full text of all responses by relevant individuals engaged under Section 25 and any other sensitive information (if applicable) must be included in a sensitive information report.

This report satisfies the remainder of section 24 and sub-section 26(8) by containing full text responses by relevant persons and any additional sensitive information. This report will not be published.

Appendix C4: Full Text copies

Full text copies of consultations with relevant persons. This information will not be publicly available.

Appendix C5: Consultation Materials

CGG have a further appendix which highlights extra efforts and methods used to find every possible relevant person in the community and raise awareness of the ability to self-identify through several mediums, such as the Regia website.

Appendix C6: Public Comment Report

CGG received nearly 15,000 submissions through public comment which we believe is in the top 3 of total submissions submitted to NOPSEMA as part of an EP application This document provides a summary of the process used to ensure all submissions have been considered in the EP.

2 Background

CGG are required by legislation to prepare an Environment Plan (**EP**) to carry out the Regia Marine Seismic Survey (**Regia MSS**). This EP must then be accepted by the National Offshore Petroleum Safety and Environmental Management Authority (**NOPSEMA**). A key part of this EP is the consultation and co-design process, that must be carried out in preparation for the EP. CGG adhered to an iterative consultation process that was developed with consideration and in accordance with legislation, case law and NOPSEMA guidelines.

The foundations of this consultation process included:

- Maximising the broad capture of relevant persons through appropriate, targeted and subject-specific advertisements; and
- Allowing multiple channels for relevant persons to self-identify; and
- Encouraging relevant persons to share activity details with others; and
- Gathering knowledge about specific environmental, cultural, and societal values; and
- Providing concise yet sufficient information allowing relevant persons to make informed decisions; and
- Communicating with relevant persons through their preferred medium and in appropriate language through established information channels; and
- Allowing appropriate timeframes and encouraging feedback and queries; and
- Incorporating relevant persons input into the EP where appropriate; and
- Ensuring all relevant persons are aware of the consultation period and process, and affording the opportunity to participate in preparation and co-design of the EP.

The following principles outlined in Table C1-1 from the former Ministerial Council on Mineral and Petroleum Resources were also pillars of CGG's communication and consultation procedures.

Table C1-1 - Principles of Consultation

Principle	CGG's approach
Communication	Undertook effective two-way engagement to encourage feedback on relevant, accurate information provided.
Transparency	Transparency was fundamental in the consultation process and continues to be so. All feedback was addressed, and comments posted on the Regia website were responded to, and EP documents uploaded into the public document library hosted on the activity website.
Collaboration	Relevant persons were heard and collaborated with, which helped to adapt approaches and outcomes based on merit. The collaborative approach resulted in outcomes beneficial to both relevant persons and the titleholder.
Inclusiveness	All identified relevant persons were involved in the consultation process. This will last throughout the life of the Regia MSS through CGG's implementation and ongoing consultation strategies.
Integrity	The process fostered respect through freedom of information on the Regia website and trust through tailored two-way communication.

2.1 Legislation and Requirements

The following legislation was strictly adhered to during the consultation process:

- *Offshore Petroleum and Greenhouse Gas Storage Act 2006*
- *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009/2023*

- *Environmental Protection and Biodiversity Conservation Act 1999*

The following NOPSEMA guidelines were also considered and complied with:

- NOPSEMA Guideline GL2086 – Consultation in the course of preparing an environment plan – May 2023
- NOPSEMA Guidance Note GN1847 – Responding to public comment on environment plans – July 2022
- NOPSEMA Guidance Note GN1344 – Environment plan content requirements – December 2022
- NOPSEMA Guideline GL1721 – Environment Plan Decision Making Guideline – December 2022
- NOPSEMA Guidance Note GN1488 – Oil pollution risk management – July 2021
- NOPSEMA Guidance Note GN1785 – Petroleum activities and Australian Marine Parks – June 2020
- NOPSEMA Guideline GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023
- NOPSEMA Brochure – Consultation on offshore petroleum environmental plans – May 2023
- NOPSEMA Policy PL2098 – Engaging gender-restricted information Draft Policy – May 2023
- NOPSEMA Policy PL1347 – Environment Plan Assessment Policy – December 2022
- Recent case law developments also moulded CGG's consultation process:
- *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193
- *Cooper v National Offshore Petroleum Safety and Environmental Management Authority* (No 2) [2023] FCA 1158

Other resources and guidelines used:

- *NOPSEMA* Guidance framework: Supporting cooperative coexistence of seismic surveys and commercial fisheries in Australia's Commonwealth marine area.
- Victorian Aboriginal Heritage Council: Registered Aboriginal Parties (RAPs) - Fact Sheet.
- Victorian Aboriginal Heritage Council: Victorian Aboriginal Heritage Council - Fact Sheet.

2.2 CGG Consultation Principles

During the consultation process there was significant clarification about the consultation requirements that apply to preparing an EP arising from case law. As this clarification was delivered over time, CGG decided to create consultation principles that supported communicating the purpose of consultation with relevant persons. These principles were:

1. **Co-design:** Incorporating a co-design principle into the consultation process emphasises collaboration and mutual agreement on how consultations are conducted. This principle is essential when relevant persons may have their preferred engagement processes that may or may not align with the regulatory requirements of the Regulations. By adopting a co-design approach, CGG aimed to ensure that all parties had a say in shaping the consultation methodology, fostering a sense of ownership and acceptance among all relevant persons.
2. **Voluntary Participation:** Ensuring that participation in the consultation process is voluntary respects the autonomy of all relevant persons. This principle recognises that while input and engagement are highly valued, mandating participation could lead to procedural compliance rather than genuine dialogue. Voluntary participation encourages more meaningful and constructive contributions from those who choose to engage, ensuring that

any feedback is driven by a genuine interest in the outcomes of the project rather than compulsion.

3. **Not Seeking Consent:** By not seeking explicit consent through the consultation process, CGG acknowledges that the purpose of consultation is to inform, discuss, and consider the perspectives and feedback of relevant persons, not to obtain approval. This approach aligns with the regulatory framework under which CGG operates, where the final decision-making authority rests with regulatory bodies like NOPSEMA, not with the relevant persons, nor the public. This distinction helps maintain clarity in the roles and responsibilities within the consultation process.
4. **Regulatory Permission for Impacts:** The principle that regulations allow NOPSEMA to permit impacts underscores the structured regulatory environment within which environmental impacts are assessed and managed. It highlights that while relevant person input is crucial and valued, there are established legal and scientific frameworks in place to evaluate and mitigate environmental impacts. This ensures that decisions are made based on comprehensive environmental assessments and best practice standards, balancing economic, cultural, and social factors. CGG often encountered a misconception that 'no impact' was the requisite standard that had to be met.
5. **Absence of Requirement for Universal Participation:** Acknowledging that not every relevant person must participate in the consultation process recognises the practical limitations of engagement and avoids the logistical and procedural complexities that attempting to achieve full participation would entail. It ensures that the process remains efficient and manageable while still being inclusive and comprehensive. This principle also respects the diversity of interest and the varying degrees of impact on different relevant persons, allowing for a focus on those most affected or most knowledgeable without diluting the quality of engagement with mandatory universal participation.
6. **Multidimensional Nature of Relevant Persons:** CGG decided it was important to acknowledge the multidimensional nature of relevant persons and not to assume the primary reason for contacting a relevant person was the exclusive reason they were a relevant person. For instance, a commercial fisher may also be a recreational diver and have different pathways to being affected. This approach ensures a comprehensive understanding of how the Regia MSS affects all aspects of relevant persons lives, fostering more meaningful engagement and building trust. This holistic view not only enhances stakeholder participation but also ensures that strategic decisions are informed by a broad spectrum of perspectives, leading to more equitable and sustainable outcomes.

These principles were frequently referred to during the community consultation forums and subsequent consultations with relevant persons.

3 Consultation Methodology

CGG proposed a process that allowed relevant persons to co-design both the development of the consultation process and the preparation of the EP. This process was designed with the context of the objects of the Regulations.

As stated by Justice Lee in *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 at [141], these objects are "best achieved by a consulting process that is practicable but is sufficiently broad so as to collect available input into the possible risks and environmental impacts of the activity and ways of reducing those risks and impacts and managing them to an acceptable level." CGG adapted this statement to include the following:

1. Broad capture of all relevant persons.
2. Develop knowledge of and describe relevant values and sensitivities of the environment that may be affected.
3. Provide sufficient information.
4. Create two-way channels for communication from relevant persons.
5. Allow a reasonable period for relevant persons assessment and feedback.
6. Respond to each claim or objection where appropriate.
7. Continue ongoing consultation throughout the life of the project.

This approach was underpinned by and upholds the principles of the International Association for Public Participation spectrum (IAP2 spectrum), which helped to achieve the goals set out by the NOPSEMA guidelines and legislation. The project-specific Regia website not only helped with community engagement and co-design of consultation but further aligned goals and outcomes between CGG's consultation methodology and the IAP2 spectrum.

The decision-making criteria was captured in a document (Decision Making Criteria in the Environmental Assessment Process – March 2023). This document was uploaded in to the 'Establishing Context' section of the activity webpages' document library. It was also featured on the landing page, with a feedback function that facilitated public discourse regarding the decision-making criteria.

The Environmental Planning Area (EPA) was established to frame the initial studies and community consultation effort. Set at 155 km around the Activity Planning Area, this distance was selected using professional judgement and a review of previous impact and risk assessments for similar activities in the region. Further justification for this distance can be found in Appendix B11.

CGG identified several subject-centred groups in its planning process and the consultation methodology was tailored to the cultural, social, and economic features of these people and communities. The discussion in the subsequent sections of this document apply to all subject-centred groups. Through the consultation process two, subject-centred groups (Commercial Fishers and First Nations Australians) warranted elevated tailoring of the consultation method. Demonstrations of compliant consultation with these groups have therefore been provided in Annex 1 – Commercial Fishers and Annex 2 – First Nations Australians.

The streams of relevant persons consultation and public engagement are shown in Figure C1-1. Further details are available from the Community Consultation Hub on the Regia website (regiamss.com.au).

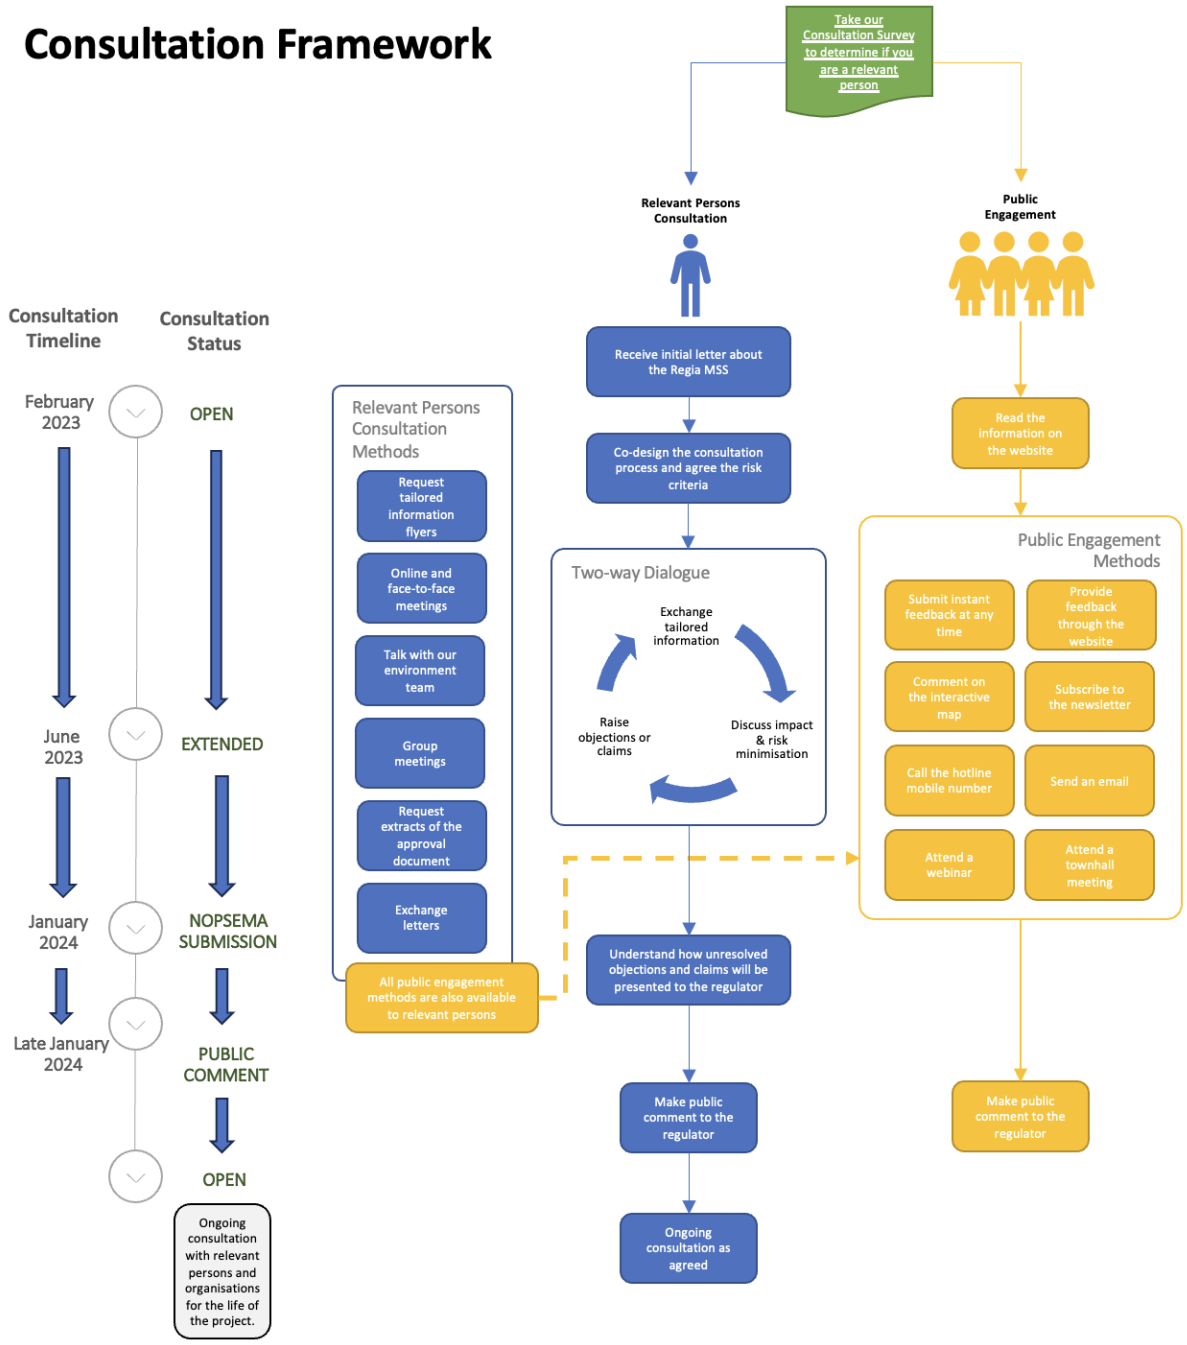

Figure C1-1 - Regia MSS Consultation Activities

3.1 Relevant Person Identification

Titleholders are required to identify and consult with each authority, person or organisation who fits the definition of a relevant persons pursuant to Section 25 of the Regulations. This section clearly demonstrates who is a relevant person, and the rationale used to determine that status. Key factors considered by CGG in this process included the nature of the activity, the environment in which it is being undertaken and the impacts and risks associated with it.

3.1.1 Broad Capture of People and Information

Identifying relevant persons is essential in designing a consultation method that is inclusive, effective, and legally compliant. It promotes fairness, transparency, and accountability in decision-making processes and can lead to more successful outcomes and reduced risks for all parties involved. CGG's process for relevant persons identification provided for the broad capture of relevant persons such that each relevant person who can be identified, was identified (GN1344: Section 12.3; GL2086: Section 6). CGG also understands that despite our best endeavours, there may still be some unidentified relevant persons. Despite this, the methodology used by CGG was capable of identifying each relevant person.

The search for persons or organisations who are relevant persons starts as a global public search because the definitions of functions, interests and activities are not geographically constrained. However, certain groups, such as other marine users, are likely to be proximate to the activity.

By categorising people within the community, engagement was tailored to specific subject-centred groups. The legislation provides guidelines to this effect using four categories: the public, authorities, organisations, and persons. For the purposes of Part 4 Division 3, there is a clear, explicit difference between the public and *relevant persons* (organisations, authorities, and persons) who unlike the public, are mandatory consultees in preparation of the EP.

CGG has identified and evaluated all potential environmental impacts and risks based on the information and relevant persons identified. If new information or relevant persons are identified, CGG has appropriate change management procedures in place, which are outlined in our ongoing consultation strategy (See Appendix B3).

3.1.1.1 Method(s) used for the identification of relevant persons

CGG used the following methods to identify authorities, organisations and persons who may be affected by its activities. Table C1-2 also provides further details on the strategies employed by CGG to identify relevant persons and engage with them using tailored, subject-centred consultation approaches. These strategies were designed to address the specific cultural, social, and economic needs of each group effectively. Annex 3 Table C1-9 shows CGG's record of engagements.

- **Contacted government agencies and organisations:** Relevant government agencies provided information about individuals and organisations potentially affected by the activity.
- **Consulted with local community groups:** CGG reached out to local community groups, such as those focused on environmental conservation or fishing, as they may have had members with interests or activities impacted by the activity.
- **Engaged with local Indigenous groups:** Indigenous groups, with specific cultural or spiritual interests, were consulted to ensure their rights and beliefs were respected. See Annex 2 Consultation with First Nations Australians for further information.
- **Conducted online research:** CGG searched for news articles or press releases about similar activities in the area to identify individuals or organisations mentioned.
- **Advertised in local newspapers and on local radio stations:** Local media outlets were used to inform the public about the planned activity and encourage individuals with specific interests to come forward.
- **Reached out to industry associations:** Industry associations related to fishing, shipping, and oil and gas exploration in the area were contacted, as their members' interests could have been impacted.
- **Contacted local businesses:** Local businesses, such as tour operators were approached since their customers' interests or activities could have been affected.

- **Engaged with local educational institutions:** CGG reached out to universities and research centres, as they might have had researchers or students whose interests or activities were impacted.
- **Used social media:** Social media platforms were used to identify relevant persons by searching hashtags or keywords related to the activity, following local groups, and reaching out to those who engaged with posts on similar topics.
- **Conducted surveys:** Surveys were distributed widely to gather information from people whose interests or activities could be affected.
- **Attended local community events:** CGG identified and participated in local community events, where it engaged with groups and individuals potentially affected by the activity.

In addition to the above methods, CGG had an online survey available for anyone to determine if they are entitled to consultation as a relevant person, or if they should engage as a member of the public. The survey remained live in the preparation of the EP, the public comment period, and throughout NOPSEMA's assessment period.

The streams of relevant persons consultation and public engagement are shown in Figure C1-1 above.

3.1.2 Opportunity to Self-Identify

To combat the challenges faced by a requirement to identify every relevant person, CGG launched the Regia website (regiamss.com.au), which created two channels of communication with the public and with relevant persons. This website, advertised at community events, and via print (both link and QR code), social, radio and television media, helped reach and locate interested members of the public and provided a simple survey to determine if a person was relevant for Section 25. This survey helped self-identification as it enabled individuals to provide their functions, interests, and activities, or request more information to determine if they were relevant. In total, the website reached over 3700 unique users, with over 12,200 total visits, 852 document downloads, and the consultation survey was taken 121 times, identifying 108 relevant persons.

To facilitate use of the Regia MSS website, 13 social media boosted adverts were run, the audience being 18-65+ within the Environment Planning Area (**EPA**) and matching potentially affected interests. The adverts encouraged people to visit the Regia MSS website to self-identify, access or request information and submit comments. These advertisements were through Facebook (META), LinkedIn and Instagram, with an estimated target audience of 270,300-318,000. A full report detailing Thruplay, Reach and Impressions is available in Appendix C5. A total of 10 advertisements were run through traditional media, with a QR code and written website link, and 13 through social media, which were also used to publicise community information sessions.

The streams of relevant persons consultation and public engagement are shown in Figure C1-1 above.

3.1.3 Raising Awareness

CGG published a total of 299 notices in local and national print media, social media, and local radio and television interviews to:

- Provide sufficient information to allow individuals to make informed decisions on potential impacts on their functions, interests, or activities.
- Facilitate information and consultation requests.
- Promote self-identification through the Regia website.
- Notify the public of commencement of the EP and consultation process.
- Advertise information sessions.
- Access recordings of previous webinars.

- Allow individuals to sign up for newsletters and webinars.
- List 'Frequently asked questions' and, as engagement progressed, thematic 'What we've heard so far' feedback, with assessment of merit and measures adopted.
- Publish summaries, implementation strategies and risk assessments.
- Allow individuals to make both public (interactive map) and private instant feedback.

The notices were placed in media where the audience were potentially relevant to the activity, such as located in the EPA and a First Nations newspaper. In addition, the initial community sessions were run jointly with another titleholder who also had a proposal in the Otway, they placed 4 print adverts and 142 radio spots within the EPA to advertise these sessions.

All identified relevant persons were contacted via email and/or phone or post and informed of their rights and the role they play as a relevant person. Each person was also asked what their preferred line of communication was and how they would like to co-design the consultation in a way which best suits their interests, availability, and needs. A full record of these communications can be found in Appendix C2 and C3, but some of the techniques employed by CGG included:

- 11 Community information sessions.
- 6 online webinars, which were recorded and uploaded to the activity website.
- 10 Campaign email project newsletters.
- 23 Letters via postal service.
- 121 Consultation surveys.
- Feedback surveys.
- 7 Instant feedback.
- 11 Commercial fisher engagement surveys.
- 17 Webinar series registrations.
- 38 Newsletter registrations.
- 78 Interactive map comments.
- 13 Boosted social media targeted adverts.
- 25 Face-to-face meetings.
- 19 Virtual meetings.
- 10 print advertisements.
- 272 radio adverts over 6 local stations and their websites.
- 9 Tailored information summaries.
- Commercial fisher group meetings.
- 1 ENGO group meeting.
- Local radio and television interviews/comments.

In addition to this, the project-specific website, which can be accessed at www.regiamss.com.au, was designed to create an open-book space where people can publicly or privately raise concerns, share and/or access information and stay informed. On the website, the consultation survey empowered CGG and the public to determine the best way for them to engage with the Regia project and decide if they are a relevant person for the purposes of Section 25 of the Regulations. The Regia website goes beyond industry standards for consultations, and assisted CGG in locating a further 118 relevant persons through self-identification on the website.

In a bid to mitigate consultation fatigue, initial community information events were held in conjunction with another proponent who was also promoting an offshore activity in the Otway. Following these events, CGG received feedback from some attendees that this was confusing and requested Regia MSS only events (Event ID806 & ID919). CGG worked with these groups and held the standalone events (Event ID's 4112, 1731), working with them to ensure the location and date was suitable, and advertising via email notice (ID987 & ID1020) and in the local newsletter a community member suggested during the first community event (ID762 & ID1199).

During these information events, individuals were informed of the ways they could participate and the classification of a Relevant Person. They were encouraged to self-identify by contacting the Regia team via one of the points of communication, and to forward information to any potentially relevant person they may know.

In three of the community events (Event ID1481, ID1731 & ID4112) an attendee requested that a vote be taken on who opposes the project, at all events the majority were against the activity. The Regia Environment Manager informed each event that a 'for and against' vote is not part of the community or relevant person engagement but would nevertheless be recorded in the consultation record. This was reiterated to individuals who were unable to attend the event and subsequently emailed in a 'no vote'.

In total there were 37 in-person engagements with the Regia Environmental Manager in the south-west region, this included visiting wharfs and local fishing businesses to raise awareness of the activity.

The streams of relevant persons consultation and public engagement are shown in Figure C1-1 above.

3.1.4 Tailored Engagement Methods

CGG employed a range of communication techniques which were tailored based on different audiences, preferred mediums, and technological availability. Consultation consisted of two-way dialogue, where relevant persons were given sufficient information through a medium of their choice, allowing them to make an informed decision on the potential consequences of the Regia MSS on their functions, activities, or interests. These mediums included emails, phone calls, face-to-face meetings, tailored presentations, webinars, and website interactions. An outline of the engagement methods used by CGG is in Annex 3. This approach was underpinned by the principles of the International Association for Public Participation spectrum (IAP2 spectrum). The assessment of effectiveness of a communication channel included consideration of the following:

- Accessibility to the channel.
- Accessibility of information.
- Depth and quality of information able to be communicated.
- Least burden on the person.
- Opportunity to respond to the information.
- Ability to show genuine consideration of the views prior to a decision.

Table C1-2 – Consultation goals

IAP2 Spectrum Element	Consultation goal
Inform	Provide balanced and objective information to assist persons in understanding the problems, alternatives and/or solutions. To seek and further understand the environmental values and sensitivities in the EMBA.
Consult	Obtain specific feedback on analysis, alternatives and/or decisions from potentially relevant persons.
Involve	Work directly with relevant persons throughout the process to ensure that their functions, interests and activities are consistently understood, considered and addressed.
Collaborate	Partner with the public in each aspect of CGG's decision making including the development of alternatives and the identification of the preferred solutions.
Empower	Provide the opportunity to co-design the consultation process and directly influence the final design of the activity.

3.1.5 Reasonable Period of Raising Awareness

To promote best practice, CGG took a broad interpretation of the reasonable period required in sub-section 25(3) to mean not only a reasonable period with sufficient information but a reasonable period of raising awareness as well. CGG commenced consultation on 03 February 2023, over 330 days before first submission to NOPSEMA.

3.1.6 Statutory categories

Section 25(1) stipulates the categories titleholders must search for relevant persons. How CGG covered these categories is discussed below.

3.1.6.1 Section 25(1)(a), (b) and (c)

Identifying relevant persons under these categories is simple as they are all government agencies and statutory authorities that have functions, interests, or activities within the EPA. The exhaustive list of these relevant persons and a summary of communications can be found in Appendix C2.

3.1.6.2 Section 25(1)(e)

Nobody was identified under this section as all identified relevant persons fit into 25(1)(a)-(d). This is because CGG has treated everyone engaged as a relevant person and only people who positively opted out of consultation have not been subject to the full methodology.

3.1.6.3 Section 25(1)(d)

The factors in Section 3.1 helped determine which individuals, authorities and persons had functions, interests or activities that may be affected. The definition of the terms "functions", "activities" and "interest" were used as per the recent Federal Court judgements and NOPSEMA guidelines. CGG contacted persons whose functions, interests or activities could not be easily ascertained and validated any assumptions about whether they may be affected by the Regia MSS.

Contrary to section 25(1)(a), (b) and c, the list of relevant persons here was and is non-exhaustive, as it can change as the project developed, but the Regulations and NOPSEMA understand and cater for this. A total of 688 people and organisations were identified as relevant persons for the purposes of this regulation. For each of these the consultation process was applied, with an aim to engage in two-way dialogue, inviting co-design of consultation, including engagement via their preferred medium, whether it be email or a meeting. See Appendix C2 for a summary of these consultations and Appendix C4 for full text responses.

3.1.7 Identification of Subject Centred Groups and Relevant Persons

CGG used subject-centred groups and tailored consultation strategies to identify relevant persons and subsequently engage with them in a way that was appropriate to their cultural, social, and economic needs. Table C1-2 outlines the strategies used. The search for persons or organisations who are relevant persons starts as a global public search because the definitions of functions, interests and activities are not geographically constrained, for example, national environmental non-governmental organisations. However, certain groups, such as other marine users, are likely to be proximate to the activity and as such the Activity Planning Area (APA) and the Environmental Planning Area (EPA) were used. This is captured in the table below.

For a complete list of relevant persons identified, see Appendix C2.

Table C1-2 - Subject-centered groups

Subject-centred group	Tailored identification strategies	Relevant persons identified
Commerce	Contacted Chamber of Commerce offices adjacent to the EPA to identify relevant marine based businesses. Online searches for news articles or press releases about marine-based businesses in the area.	7
Commercial Fishers	Annex 1, Consultation with Commercial Fisher describes in detail how CGG undertook a tailored approach to identify this group. In summary, studies were performed to identify state and commonwealth fisheries that overlap the EPA. This information was then used to obtain relevant commonwealth fisher's details and to support identification of relevant state fishers via engagement with peak associations and in-community.	290
Conservation Groups	Reviewed EP's previously submitted on the NOPSEMA website, identifying conservation groups listed in similar offshore activities. Conducted online searches for conservation groups with interests in similar activities, and using keywords like "marine conservation" and "environmental advocacy". Looked for conservation groups with a history of engagement in offshore energy discussions or campaigns, ensuring relevancy to the current activity. Including online searches for news articles.	42
Educational Bodies	Contacted Persons/institutions with research programs related to the EPA (such as Blue Whale) from previous activity database and desktop research.	3
Fishing Associations	Annex 1, Consultation with Commercial Fisher describes in detail how CGG undertook a tailored approach to identify this group. In summary, details of relevant fishing associations were provided in engagement with AFMA and VFA, in addition to desktop research for associations related to the identified species.	23
State Government **Commonwealth Government**	Previous databases and desktop research undertaken for government agencies and statutory authorities that have functions, interests, or activities within the EPA. Accessed the Australasian Underwater Cultural Heritage Database.	33
Interested member of the public	List compiled through project awareness raising, including local adverts (print, social, media, TV adverts), and community information sessions.	172
Local councils	Searched the Victorian Electoral Commission database and targeted local government entities (councils, shires and cities) proximate to the EPA.	16
Traditional Owner Group	See Annex 2 – Consultation with First Nations Australians, describes in detail how CGG undertook a tailored approach to identify this group. In summary, an approach including desktop research, databases of registered native title claims, Indigenous government agencies, and lists of local land councils in and around the EPA was undertaken.	16

Subject-centred group	Tailored identification strategies	Relevant persons identified
Petroleum title holders	Utilised the NEATS database to find titles and titleholders within the EPA. Used the NOPSEMA EP database to find other titleholders with activities in the EPA area. Subscribed to NOPSEMA EP submission pages for all activities in the Otway region to track ongoing and relevant developments.	2
Other Marine Users	Harbourmasters adjacent to the EPA contacted to enquire about frequent users. Online searches conducted for businesses located at wharves in ports adjacent to the EPA. Performed online searches for groups who use or have a connection to the marine environment within the EPA.	48
Recreational fishers	Desktop research was undertaken to identify recreational fishing associations and recreational fishing clubs and business, located in areas within and adjacent to the EPA.	17
Tourism operators	Conducted online searches for marine tourism services, and recreational experiences within the EPA, such as marine mammal observations, and diving. Specific keywords such as “marine tours”, “diving”, “scuba diving”, and “fishing charters”were used.	20

3.1.8 Non-responsive Relevant Persons

Where the identified, or self-identified, Relevant Person was non-responsive a follow up attempt to make contact, and confirm receipt, was undertaken using an alternative method of communication, where CGG could access this. For example, Commonwealth Fisher's contacted via email and SMS. Where an additional contact method was not able to be obtained, even following additional desktop research, a follow-up was made using the initial method. If a response was still not obtained, CGG continued to provide project updates, encouraging engagement and continuing to keep the Relevant Person informed of developments and changes.

Where CGG learnt from desktop research, or other Relevant Persons that a non-responsive Relevant Person did want to discuss the activity and their functions, interests and activities, CGG deemed it appropriate to modify this approach and make further attempts at direct requests for engagement. This is evidenced in the Relevant Person Summary in Appendix C2.

3.2 Give Sufficient Information

Under sub section 25(2) of the OPGGE(S)R, titleholders must give relevant persons sufficient information to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, activities, and interests.

As a minimum, all relevant persons were given initial information including:

- An activity description summary.
- A map indicating the activity planning area and environmental planning area.
- An overview of the consultation process proposed by CGG.

The initial information pack was specifically designed to provide sufficient information for readers to understand if they may be affected, and if they wanted to participate in the consultation process. In giving this information CGG informed each relevant person of their rights in the consultation process and that they could request information provided, be kept confidential.

Once it became available the Preliminary Environmental Impact and Risk Assessment (**PEIRA**) was used to provide further information in a digestible shortened format. CGG were able to empower relevant persons to make informed decisions and engage in the construction of positive outcomes by:

- Tailoring information, responses, and communication mediums to relevant persons; and
- Providing further information when requested to ensure relevant persons understanding and comprehension; and
- Published Decision Making Criteria: and
- Offering summaries or further explanation if required; and
- Producing receptor and industry specific reports and summaries; and
- Directed relevant persons to the NOPSEMA guidelines; and
- Published all relevant information on the Regia MSS website document library; and
- Community information sessions; and
- Webinars; and
- Group and individual meetings.

A detailed list of information requests and how they were addressed is captured in Annex 6 of this document, Appendix C2 and Appendix C4.

Project newsletters were utilised as a tool to capture important information, within a single correspondence to limit consultation fatigue, and to provide information on changes made throughout the consultation process. The newsletters provided information such as when the team would be in the area and inviting meeting requests, how to refer a potentially relevant person, changes to timings, how to request information is kept sensitive, distribute the NOPSEMA community consultation brochure, and to inform of, and request feedback on, measures implemented through the engagement process. Project newsletters were sent to all organisations and people in the database (both relevant and non-relevant) and uploaded to the project website. Located on the project website was also a link to provide details to sign up for the newsletter.

3.2.1 Information Formatting

The original provision of information was broad, simplistic, and easily accessible to the public to engage and capture the maximum possible number of relevant persons. Once these groups and individuals had been identified, they were consulted regarding which communication channel they preferred and the detail of information they required; helping build the framework for ongoing consultation with CGG.

Rather than using a one-size-fits-all approach, CGG understands that different people digest and respond to information differently. Information was therefore uniquely tailored to different requirements through multiple techniques, some of these include:

- **Changing the format of information flow depending on the person's needs:** For example, some First Nations groups (Event ID 1891) required in person, face-to-face meetings, whereas some groups preferred online (Event ID 2937).
- **Changing the content and complexity of the information based on a person's needs:** Rather than overwhelming people with information, CGG provided concise information and evidence surrounding the function, interest or activity that was being affected by the Regia MSS. Information was broken down into themes, topics and receptors, to mitigate concerns of information being inaccessible. For example, the environmental impact and risk assessments were both published online, in chapters, relating to their specific receptors. This allowed information relating to a specific concern to be easily accessed and reviewed. These

chapters were also released with cover letters requesting feedback, directing the reader to context documents, relevant studies, and offering a summary and/or to discuss further with a member of the Regia team.

- **Subject-specific information summaries:** Flyers were produced to complement the consultation process and assist in capturing a broad group of relevant persons. These flyers were unique to the subject-centred groups previously discussed, to facilitate the understanding of risks and response from interested persons.
- **Regia website:** The project-specific Regia website allowed all members of the public and persons with interest to access every piece of information they would need to make informed decisions and objections, or request information in a form and delivery method appropriate to their needs. There are multiple industry-exceeding features of this website which include:
- **An interactive map for the Regia MSS:** This map included a boundary of the EPA and invited members of the public to place a 'marker' and share feedback for the activity. There were also instructions indicating that leaving a marker is a contribution as a member of the public and not as a relevant person pursuant to the Regulations. These instructions also provided an email, phone number, and a link to the consultation survey should someone believe they were a relevant person and mandatory consultee. Where questions were asked, they were responded to in a thread, so answers were available for public viewing.
- **Consultation survey:** This key feature provided members of the public a non-confrontational, simplistic way to check if they were a relevant person under the Regulations.

Through the design and nature of this publicly available information, interested parties were able to access the exact information they required to make informed decisions, without needing to request it, however, they were also afforded the opportunity to request the information in a format suitable to their specific needs.

A total of 40 relevant documents are published and publicly available for review and comment on the Regia website. The full list of documents available on the website prior to Public Comment can be found in Annex 7 along with the original publication dates. This transparency employed by CGG promoted trust within the community and far exceeds the level of sufficient information required to make an informed decision.

3.2.2 Further Information

In addition to the efforts put into tailoring the delivery and content of information to the relevant persons requirements, CGG invited relevant persons to request further information, in their preferred form, and engage in two-way consultation. Where requested, further relevant information was provided and relevant persons were referred to the Regia website, if necessary, which is supported in the full text responses annexed in Appendix C3 and listed in Annex 6 of this document, and in the 'Information Requested' tables in the Relevant Perso Summaries in Appendix C2.

3.2.3 Iterative Process for Reaching Sufficient Information

CGG has adopted an iterative and collaborative approach to provide relevant persons with sufficient information to allow an informed assessment of any possible effects of the activity on their functions, interests, or activities. When a relevant person requested further information, CGG promptly provided it. The iterative nature of the consultation process is best demonstrated where there were multiple occasions of information, questions, and feedback exchange between CGG and relevant persons.

3.2.4 Community sessions

The community sessions were incredibly valuable in identifying relevant persons. A total of 11 community sessions were held at strategic locations based on their proximity to the EPA. Information exchange at, and following, these events allowed engagement to be co-designed. Initially, in a bid to mitigate consultation fatigue, events were held with another titleholder who had a proposal in the

area. When requests were made to hold standalone events, in requested areas, these were organised (Event ID's 1005, 806).

The sessions were advertised in 9 local print newspapers, 3 targeted social media adverts and 272 radio adverts over 6 local stations and their websites. In addition, the collaborating titleholder placed 4 print adverts and 142 radio spots within the EPA to advertise these sessions.

3.3 Reasonable Period with Sufficient Information

Pursuant to sub-section 25(3) of the Regulations, relevant persons must be afforded a reasonable period for consultation. NOPSEMA guidelines reiterate that for consultation to be genuine and meaningful, relevant persons must be given a reasonable period with sufficient information to allow them to make an informed assessment of the possible consequences of the activity on their functions, interests, or activities (GL2086: Section 9).

CGG understood that a reasonable period is contextually different for different groups and subsequently applied different interpretations of the term 'reasonable period' to different subject-centred groups and relevant persons. The provision of a reasonable period is therefore closely linked to the iterative nature of consultation and can change on a case-by-case basis. It is also inappropriate to assimilate the term reasonable period with a strict time frame as both relevant persons and a titleholder could misuse this interpretation against the spirit of consultation and the regulations. Subsequently and as an example, CGG considered multiple attempts to engage and the provision of subsequent information and project updates as a reasonable period.

CGG also considered the subjective context affecting a relevant person's communication important to determining what a reasonable period might be. For example, due to the professional nature of a government agency, an initial email and a 30-day minimum period may constitute a reasonable period. By comparison, a First Nations organisation may have technological or cultural barriers preventing the application of an email and 30-day minimum being appropriate. Full details of these communications, efforts and timeframes can be found in Appendix C2 and C4.

When stakeholders expressed concern and burden, due to other proposed activities with similar engagement timelines and internal resourcing (Event ID 3413 & 3384), the decision was made to cancel the consultation pause, moving intended Public Comment period to 2024, and keeping engagement open (Event ID 3331).

All identified potentially relevant persons were contacted on a minimum of two separate occasions, and timeframes were extended on a case-by-case basis. Consultation time frames and response times were highly variable between different relevant persons, and as such a standard period is difficult to conclude. What can be said is that as an absolute minimum, all relevant persons were afforded a 30-day minimum for consultation, and where no response was received after 30 days, project updates continued to be provided, inviting engagement as the project design evolved. Further, phone calls were made to confirm receipt where details were available, and a final written or SMS follow-up was made.

3.4 Relevant Person Feedback

Another expectation of the titleholder is to utilise consultation and feedback to improve the predictive outcomes for the environment. CGG used multiple approaches to engage relevant persons and seek feedback on how the activity conducted would affect their interests, activities, or functions. These approaches were tailored to different subject-centred groups and individuals to ensure that feedback was encouraged and facilitated in an appropriate manner. There were multiple feedback channels available to relevant stakeholders, which included face-to-face meetings, phone calls, emails, and the Regia website to name a few.

3.4.1 Types of Feedback

Feedback was received via various communication methods, including in writing in emails and verbally during meetings. In all cases, feedback from relevant persons was assessed to determine its type so that it could be processed properly. The feedback types were determined to be either an:

- An assertion or concern
- Objection or claim
- A request for information

All feedback was assigned a type, assessed, and addressed. The full record of each feedback made by a relevant person, and how it was addressed, has been provided in Appendix C2.

3.4.1.1 Assertions and Concerns

During the consultation in preparation of the EP, CGG received numerous assertions and concerns that were not about the adverse effects of the activity:

- **Objection to Gas Development:** 80 feedbacks (11.59%)
- **General Seismic Activity in the Otway:** 6 feedbacks (0.87%)
- **Titleholder Consultation:** 53 feedbacks (7.68%)
- **First Nations Consultation:** 17 feedbacks (2.46%)
- **Regulator Consultation:** 7 feedbacks (1.01%)
- **Positive Consultation:** 1 feedbacks (0.14%)
- **Research and Data Specific:** 12 feedbacks (1.74%)
- **General Environmental Concerns:** 8 feedbacks (1.16%)
- **Local Community Concerns:** 7 feedbacks (1.01%)
- **No Assertions and Concerns:** 499 events (72.32%)

The assertions and concerns received from relevant persons, and how they were addressed by CGG, are shown in Annex 4.

3.4.1.2 Objections or Claims

During the consultation in preparation of the EP, CGG invited relevant persons to raise objections or claims about the adverse effects of the activity on their functions, interests, or activities. Each objection or claim was assessed for merit in accordance with the process outlined below and can be found in the relevant persons consultation report (Appendix C2). They were assigned to each of the environmental assessment chapters and are not repeated in this appendix.

3.4.1.3 Information Received

CGG also invited relevant persons to share information that may be relevant to the activity or about the adverse effects of the activity on their functions, interests or activities. There were 385 pieces of information shared and considered in the activity design. The information received is shown in full in Annex 5.

3.4.1.4 Information Requests

During the consultation process, relevant persons made requests for more information that may be relevant in their assessment of the adverse effects of the activity on their functions, interests or activities. There were 293 feedback(s) shared, which are shown with the titleholder response in Annex 6.

3.4.1.5 Third-party Correspondence Provided By NOPSEMA

In some instances, relevant persons may choose to send information relevant to the Regia MSS environment plan directly to NOPSEMA, without providing the correspondence to CGG. This correspondence is then provided to CGG, as part of procedural fairness as it may contain information that may be relevant to the EP. This feedback is then assessed for relevancy and when required the process described in sections 3.4.2 and 3.4.3 is undertaken.

Information was received in this manner on the 17th of March 2025 from Surfrider Foundation, an organisation who has previously engaged in the consultation process (Org ID's 117 and 245). The submission was items taken from the previous RFWI, as such the information provided within was found at the time of assessment to be outdated, incorrect, or beyond the purview of CGG or Surfrider Foundation. Examples of this were statements that clear demonstrations of mitigations were not, and cannot, be made. The appropriate authority to determine this is NOPSEMA, as regulator. There were incorrect statements made, such as assumptions on the size of a survey vessels fuel tank, claims of the absence of shut down consideration for marine fauna (Appendix G2), and the misunderstanding of MDO/MGO Group 2 non-persistent oils. Other examples include claims of missing appendices on the project website, when the RFWI response (also published) states *'Appendix B9 has been removed from the submission and the relevant parts of the environmental assessment have been included in Appendix B3'*. It should also be noted that there is no requirement for CGG to publish its EP or the NOPSEMA decision letters on the project website, however this has been committed to, to maintain transparency and build trust.
Therefore, as the information was not new or relevant, no updates to the EP were required.

3.4.2 Tailored and Appropriate Feedback

CGG recognised that relevant persons have varying information requirements and preferred channels of communication. To avoid overloading relevant persons with irrelevant content, information was customised to provide the necessary material for informed decision-making in a manner that best suited each RP. For instance, Government agencies were primarily contacted via email with periodic project updates, while some First Nations organisations requested face-to-face meetings on Country, which CGG accommodated as a sign of respect for cultural values. Appendix C2 contains a list of all events undertaken by CGG in consultation with relevant persons. Where feedback was revealed from any event, Appendix C2 also provides a summary of the feedback(s) arising from that event.

Occasionally CGG has extensive engagement with relevant persons (e.g. Org ID 98/195 and Person ID 1715) which elicited multiple instances of similar, potentially repetitive, feedback. It can be easy to dismiss feedback that appears repetitive at first glance and miss nuance and deeper substantive issues. CGG was careful not to make this mistake and always engaged further with the relevant person to reveal underlying objections and claims.

3.4.3 Assessment of Merit

The merit of all feedback received from relevant persons during consultation was assessed. A record of all feedback received, the assessment of merit, and the response provided is included in Appendix C2. A relevant person's feedback was deemed to have merit when one or more of the following criteria was met:

- About the adverse effects of the activity.
- About the provision of sufficient information and a reasonable period.
- An information request that supports the management of environmental impacts and risks.
- Relevant to the persons functions, interests, and activities.
- Can be resolved through the adoption of additional control measures, an activity design variation/limitation, or through changes to the implementation strategy for the EP.

Where feedback had merit CGG considered what measures could be adopted and separately recorded what measures were adopted because of the consultation. Mostly, the measures adopted because of the consultations were an activity limitation, a legislative requirement, a control measure (or part thereof), a performance standard, or implementation strategy commitments that had already

been adopted through the environmental assessment process. Those that were new measures were often characterised as an activity limitation, a control measure, a performance standard, or implementation strategy commitment for ease of compliance monitoring. Requests were usually related to further information required by the relevant person and this information was subsequently provided. Where feedback did not have merit CGG did not progress through the process beyond the assessment of merit.

CGG has informed, or has a planned response, to every relevant person who raised feedback about the outcome of this process. The information provided includes whether the feedback was substantiated, how it was assessed, and what measures, if any, were put in place to manage the impact or risk.

4 Record Keeping

CGG created and maintained a confidential database of relevant persons using a bespoke consultation management system, an ISO27001/9001 compliant product, to ensure accurate record-keeping. Viewing access is only granted to authorized persons by CGG's authorised Administrator.

5 Ongoing Consultation

It is a requirement that ongoing consultation is part of the titleholder's implementation strategy, as stipulated by section 14(9) of the Regulations. External communications with relevant persons will occur on an ongoing basis, with the intent to understand and cater for how relevant persons functions, interests and activities are being affected. CGG's implementation strategy includes ongoing consultation processes that are in place to manage and fulfil this requirement (see Appendix B3).

6 Document Control

Table C1-3 - Revision History

Version	Date of Revision	Author/Reviewer	Summary of Changes
0.0	20 December 2023	MS	Initial preparation for CGG review.
0.1	5 January 2024	LB/SR	Review and update.
1	9 January 2024	MS	Review and update for submission.
2	11 May 2024	MS	Updated following public comment.
3	11 November 2024	MS/SR/DS/MG	Updated following NOPSEMA assessment.
4	16 April 2025	MS/SR/SS	Updated following NOPSEMA OMR 1 Letter
5	8 December 2025	SR/MG/MS	Updated following NOPSEMA OMR #2 Letter

Annex 1 – Consultation with Commercial Fishers and Commercial Fishing Associations

Introduction

In the planning and execution of the Regia MSS, CGG recognised the critical importance of engaging with commercial fishers, a key subject-centred group directly affected by maritime activities. Understanding the unique challenges and operational realities of commercial fishing, CGG committed to a tailored and co-designed consultation approach. This strategy was developed to ensure that the consultation process was not only compliant with the Regulations, but also respectful and responsive to the specific needs of the commercial fishing community and drew from NOPSEMA's 'Supporting cooperative coexistence of seismic surveys and commercial fisheries in Australia's Commonwealth marine area' guidance framework.

Consultation Methodology

A tailored and co-designed consultation approach was applied to allow for a broad capture of commercial fishers who operate in the activity area, and for sufficient information to be provided to allow for assessment of the potential impacts of Regia MSS on their functions, interests, and activities. Underpinned by CGG's consultation methodology (Appendix A3) engagement was adapted and co-designed to remain fit-for-purpose (Table C1-4), understanding that due to the nature of the industry some methods may be more suitable than others. For example, for a government fishing agency an email with information attached would be appropriate, however for a commercial fisher, an SMS with a link to the information is likely easier to access.

Table C1-4 outlines the methods and outcomes of communication that were used to facilitate two-way information share with commercial fishers and their associations, allowing for co-design of both the engagement and activity, minimising any potential impacts.

Table C1-4 - Commercial fisheries communications

Method	Description	Outcome
Email	Emails sent to/from dedicated activity inbox.	Fishers able to send and receive information, can also be accessed by others involved in running the fishing operation
Phone	Calls to landline or mobile.	Used to confirm receipt of information and on request
SMS	SMS to mobile.	Links to relevant information were sent to mitigate accessibility when undertaking fishing operations, and confirm receipt of data
Online consultation surveys	In addition to the general consultation survey hosted on activity website, identified commercial fishers through AFMA were provided with a link to a tailored survey.	Allows for self-identification, to request information, and preferred contact method. The commercial fishers specific survey allowed fishers to indicate if they wanted to be contacted directly, through their association or opt-out, and state if functions, interests, or activities outside of commercial fishing
Online instant feedback	Instant feedback posted on activity website.	Offers opportunity to make instant private comment, feedback or requests

Method	Description	Outcome
Registered letter	Printed letter to fishers (Event ID 4098), with commercial fishers' information sheet.	Registered letters were sent to fishers where an email or SMS second form of contact was not available
Fee-for-service arrangements	Associations engage on behalf of their members, providing two-way information exchange in the appropriate manner for their members.	Fee-for-service arrangements were undertaken with four fishing associations, allowing for co-design of consultation and EP.
Commercial Fishing Information sheet	Comprehensive information sheet with activity overview, timing, map, coordinates, identified fisheries, potential impacts and measures in place, schematic of vessel and streamers, photo of tail buoy, links to website, fisheries report and contact details.	Provided to all identified commercial fishing associations, commercial fishers, and fishing industry organisations, providing a further opportunity for informed assessment of relevancy. Also available on the activity website and promoted on activity social media
Commercial Fisheries Analysis Report (Appendix B6)	Commercial Fisheries Analysis Report produced using Australia Fisheries Management Authority (AFMA) and Victorian Fisheries Authority (VFA) data to identify Commonwealth and State fisheries that have the authority to fish within the activity and/or environmental planning area	Available on the project website and supplied to individuals upon request/when appropriate to engagement.
Local presence	In person visit to commercial fishing related locations by Environment Manager	The Environment Manager made multiple visits to local areas, including drop in's to fishing industry related businesses and wharf's
Individual meetings	In person or online one on one meetings offered	In person and online meetings with activity Environment Manager were held with fishers and their associations
Group meetings	In person or online group meetings offered	Where requested group meetings for commercial fishers and their associations were held
Social media	Instagram, Facebook and LinkedIn activity dedicated pages	Project announcements and updates, including promotion of fishing specific items (information sheet and NERA feedback). Information shared to association Facebook under fee-for-service arrangement
Website	Dedicated activity website	Allowed for easy access of up-to-date activity information, comprehensive document library, alternative contact methods, and hosted tools such as interactive map and consultation surveys (Appendix C5).
Interactive Map	Hosted on the activity website	The map being interactive allowed fishers to focus on their area of interest, facilitated public comments and questions as well.

Method	Description	Outcome
NERA protocol document link and instant feedback	Located on the landing page of the website, the NERA protocol document was made available with an instant feedback comment box	This allowed for easy access to the document and a convenient way to submit feedback. Commercial fishers and associations were notified when this became available

Identification and Initial Contact

A Commercial Fisheries Review (Appendix B6) was commissioned by CGG, to identify which fisheries may be affected by the activity. This allowed identification of Relevant Persons and how they may be affected.

Contact information for individual fishers within the identified Commonwealth commercial fisheries were obtained through a data request to AFMA, who also provided the contact details for the fisheries peak associations. Contact information for individual State licensed commercial fishers is not made available to titleholders, as stated on the Victorian Fisheries Authority (VFA) website (Org ID 13). CGG followed VFA's directive to engage with VFA directly, VRFish (Org ID 18) and Seafood Industry Victoria (Org ID 9), to assist in identifying Victorian state fishers. Desktop research was also undertaken, with the parameters being commercial fishing organisations and associations within the Environmental Planning Area.

Consultation through peak associations is an approach that is recognised and recommended by government and industry bodies, including VFA[1], FRDC[2], and NOPSEMA[3]. Three fishing associations (Org ID 9, 196 & 98/195), detailed below, were identified as having members within fisheries relevant to the activity. In order to facilitate the provision of information to their members and allow for fishers to nominate the associations to consult on their behalf, engagement agreements were arranged (Event ID's 3901, 3898, 3899).

- Org ID 9, Seafood Industry Victoria (SIV): '*SIV is the representative peak body for the Victorian seafood industry with a membership encompassing a broad range of stakeholders from across the seafood supply chain.'* With its members being defined as '*a person or entity who holds a commercial fishing Access Licence, Aquaculture Licence, Fish Receiver's Licence, quota entitlement or permit under the Fisheries Act (1995) Victoria in respect of which a peak body levy is paid for the funding of SIV, or - at the relevant time is a voting member or voluntary member of SIV*'
- Org ID 98/195, Southeast Trawl Fishing Association (SETFIA) & Southern Shark Industry Alliance (SSIA): '*The South East Trawl Fishing Industry Association (SETFIA) is an association representing the interests of trawl fishermen, quota owners, wholesalers and others with a stake-holding in the Commonwealth Trawl Sector. Around 80% of this fishery's quota owners and fishers are members of SETFIA.' 'The Southern Shark Industry Alliance (SSIA) represents stakeholders with an interest in the Gillnet, Hook and Trap (GHaT) fishery.'*
- Org ID 196, Tuna Australia: '*Tuna Australia is the industry association representing statutory fishing right holders, fishing companies, fish processors and sellers, and associate members*

[1] 2017). Available at: https://vfa.vic.gov.au/about/publications-and-resources/undertaking-seismic-surveys-in-victorian-managed-waters (Accessed: 10 October 2024).

[3] https://www.agriculture.gov.au/sites/default/files/documents/guidance-framework-supporting-cooperative-coexistence-seismic-surveys-commercial-fisheries.pdf

of the Eastern and Western Tuna and Billfish fisheries of Australia. Tuna Australia is considered the peak body for the longline fishing sector by the Australian government. Tuna Australia's members hold more than 90% of the Statutory Fishing Rights (SFRs) issued in the Eastern Tuna and Billfish Fishery, and more than 70% of SFR holdings in the Western Tuna and Billfish Fishery.'

The outcomes of engagement with both individual fishers and fishing associations was the contribution to identification of Relevant Persons and facilitating co-design of engagement through the fisher being able to elect to consult directly with CGG, or through their association.

Using the individual Commonwealth fishers contact details, Commonwealth fishers were contacted via two points of contact, with information, including the comprehensive Commercial Fishing Information sheet, allowing an informed assessment to be made. It was also highlighted in the communications that they may have functions, activities, or interests, that may be affected by the activity, in addition to their commercial fishing activities (respecting the multidimensional nature of relevant persons).

Twenty-three fishing associations were provided with information and invited to engage. These were both national and state associations. In addition to Victorian state associations, Tasmanian and South Australian peak bodies were also contacted. Although not in the Activity Planning Area, and as such not impacted by planned activities, some blocks do have overlap with the Environmental Planning Area.

Commercial fishers, as community members, were also able to self-identify and refer others, through the broad capture undertaken by CGG, including public information sessions and group commercial fisher in-person meetings. A representative of CGG's also visited wharfs and dropped into related businesses in the local areas, to inform of the proposed activity and upcoming community events (Event ID 1280, 1500).

Industry related organisations and local industry related businesses, such as co-ops and government agencies, were also contacted, provided with initial information, and invited to engage on a co-design design basis, with project updates being provided as planning progressed.

Giving Sufficient Information

Once contact details for a commercial fisher were obtained, for fishers' convenience, a link to a survey was provided, where the individual was able to state if they were a relevant person, choose their form and method of engagement, including through their association, and indicate other functions, interests, and activities. They were also able to opt-out of receiving any communications.

A Commercial Fisheries Analysis Report (Appendix B6) was produced, using Australia Fisheries Management Authority (**AFMA**) and Victorian Fisheries Authority (**VFA**) data to identify Commonwealth and State fisheries that have the authority to fish within the activity and/or environmental planning area. This allowed for initial identification of relevant fisheries and the relative fishing intensity. A commercial fishers information brochure to support the consultation efforts with commercial fishers was provided to fishers, directly and via the fishing associations, as well as being made available publicly on the activity website, with this availability highlighted on social media. This brochure drew on the information in the analysis report (Appendix B6), listing identified fisheries, but also providing activity, timing and location information, maps, potential impacts and measures in place, and how to make contact. In addition, fishers were encouraged to state any other functions, interests, or activities they may have, and share the information with anyone they know who may be relevant.

The report was made available publicly, through the Consultation Hub Document Library, and contained detailed effort maps to assist with determining how functions, activities, and interests may be impacted. This report and the maps within, were printed and shared during in person meetings and provided electronically to fishing associations. Fishing associations were also employed to provide information about the Regia MSS and their nominated engagement process followed, with

three fee-for-service arrangements being undertaken. These services include providing their members directly with supplied information, social media posts, and engaging on members behalf to provide a two-way information exchange and feedback on engagement, the activity, and proposed measures.

For full transparency, the environmental assessments, including those about the predicted impacts on fish and invertebrates, were made publicly available on the website, with feedback encouraged, and commercial fishers informed when they were available (e.g. Event ID 1182 & 2561). Detailed analysis was shared with relevant fishers during the group meetings held on location.

Where individual requests for information were made, this can be seen, along with the titleholder response, in the Relevant Person Summary (Appendix C2), in the Information Request table.

Reasonable Period with Sufficient Information

To discharge the commercial fishers and commercial fishing associations consultation obligation, CGG understood that they must demonstrate that these groups have been afforded a reasonable opportunity to be consulted with. Further, all group members should be afforded a reasonable opportunity to participate in consultation with clear, simple, and directly expressed terms. The fulfillment of this duty is evidenced in the consultation records (Appendix C).

Recognising the seasonal and often prolonged nature of fishing trips, CGG extended the typical consultation period, allowing a minimum of 45 days. This adjustment accounted for long hours and/or days commercial fishers often spend away from home, ensuring they had ample opportunity to carefully review and respond to consultation materials upon their return. The FRDC funded paper '*Oil and Gas: National coordination - seismic and other issues*'[4] describes the consultation challenges between commercial fishers and the offshore oil and gas sector as arising from ongoing consultation fatigue and cumulative pressures. Therefore, it is CGG's view that the consideration of an extended reasonable period allowed for sufficient opportunity to participate and was crucial for inclusivity, ensuring that commercial fishers were not disadvantaged, unfairly burdened or excluded from the consultation process.

Relevant Person Feedback

Throughout the consultation process, CGG made a concerted effort to ensure that all feedback received was carefully considered and, where appropriate, integrated into the project planning and execution. This feedback significantly influenced several aspects of the project, including the mitigation strategies employed to protect commercially productive areas. Information received from an individual, along with Objections and Claims, Assertions and Concerns, and Request for Information, can be found in the relevant table in their Relevant Person Summary (Appendix C2).

Nearly every fisher and fishing association consulted with, identified the long-term effects on fishery recruitment from the known mortal effects on zooplankton arising from seismic surveys as a concern. CGG performed numerous additional studies on key target species, plankton communities, and upwelling events to look for scientific corroboration of anecdotal feedback. In all cases, CGG has not found any statistically significant or measurable effect to fish populations. Notwithstanding this effort CGG remains willing to complete further analysis, however fishing data from individual fishers will be required to provide the level of detail necessary. To date, no fisher has agreed to provide permission for CGG to access such data.

CGG committed to ongoing engagement with the commercial fishers and commercial fishing associations, ensuring that consultation did not end with the initial regulatory approval but continued throughout the lifecycle of the Regia MSS.

[4] Telfer, C. (2022) Oil and Gas: National coordination - seismic and other issues, Fisheries Research and Development Corporation. Available at: https://www.frdc.com.au/sites/default/files/products/2017-186-DLD.pdf (Accessed: 10 October 2024).

Appropriate Measures Adopted

There are several measures adopted through feedback received during the consultation process with commercial fishers and commercial fishing associations. These include measures to avoid interference between the Regia MSS and historical commercial fishing efforts such as:

- Depth limitations on the active source area.
- Spatial restrictions around productive fishing grounds.
- Seasonal avoidance of the most productive summer months.
- Notification procedures to avoid interference.

CGG recognised that the Regia MSS may not be able to avoid all interference with commercial fishers and other commercial marine users. Hence a commitment to an evidence-based adjustment protocol for reasonable compensation claims was adopted early. CGG recognises that the details of the protocol need to be refined through ongoing consultation and is collaborating with other titleholders in the region, and fishing associations, to institute a fit-for-purpose compensation protocol.

Industry Appropriate Engagement and Tailored Consultation Strategies

To engage effectively with commercial fishers in an industry appropriate manner, CGG adopted a nuanced and tailored approach that recognized the unique aspects of their work life and community dynamics. The strategies employed aimed to provide a conducive environment for meaningful dialogue and ensure that all information pertaining to the Regia MSS was accessible and comprehensible to this subject-centred group.

1. **Small Group Meetings:** Recognising the close-knit nature of the fishing community, CGG organized small group meetings which provided a comfortable and secure setting for fishers to voice their concerns and opinions. These smaller and less formal settings encouraged participation by offering an atmosphere where individuals could express themselves without feeling isolated or spotlighted. This approach facilitated more open exchange of ideas and the adoption of measures to protect their interests.
2. **Individual Meetings:** CGG recognised that due to commercial confidentiality concerns, some fishers may require one-on-one meetings to divulge sensitive information.
3. **Facilitation Through Respected Representatives:** To further enhance the engagement process, CGG worked through respected representatives from sub-communities within the fishers' communities, categorised by target species or fishing methods. These representatives, who were well-regarded and trusted within their groups, played a crucial role in mediating discussions and gathering collective input. By leveraging these established relationships, CGG ensured that the consultations were respectful of community hierarchies and communication norms, leading to more effective and representative feedback.
4. **Progressive Information Sessions:** Over several months, CGG conducted multiple in-person group sessions, each providing progressively more detailed information about the project. This gradual dissemination allowed fishers to digest complex information over time and develop informed questions and feedback in subsequent sessions. Such a structured yet less formal approach ensured that fishers could engage with the consultation process at a deeper level, building their understanding and involvement as the project details became more comprehensive.
5. **Extended Timeframes for Engagement:** As previously discussed.
6. **Multiple Forms of Correspondence:** Given the transient lifestyle, lack of digital literacy of some fishers and the importance of ensuring that every individual received and acknowledged the receipt of consultation documents, CGG utilised multiple communication channels (see Table C1-7, above), respecting the fishers' need for tangible, accessible

information best suited to their needs. These culturally appropriate engagement strategies were carefully designed to respect the unique characteristics and preferences of the commercial fishing community, ensuring that the consultation process was not only effective but also respectful of the fishers' working conditions and community norms.

Challenges in Consulting with Commercial Fishers and Commercial Fishing Associations

In general, CGG has been able to develop strong relationships with individual commercial fishers in the region. CGG notes most engagements were positive and respectful of each other's rights and activities. Unfortunately, there were some engagements that were less productive with circular arguments about the anecdotal impacts from seismic activities (particularly related to long-term productivity) and what the scientific evidence produced by CGG indicated.

During consultation with some commercial fishing associations, it was strongly preferred that we only engage with fishers through their peak associations. CGG noted this preference and agreed to the fee-for-service arrangements for engagement with fishers through the associations but informed the associations that we would also be consulting with individual fishers directly. This decision was made to mitigate several challenges identified in using the fishing associations solely as consultative bodies on behalf of their members, these challenges included:

- Some associations were not willing to provide a written record of the consultation they intended to carry out.
- Some associations agreed to provide general feedback and information on behalf of their members but could not produce evidence of the individual member providing authority to their association to act on their behalf.
- Most of the associations were not able to represent all the diverse functions, interests, and activities for their members beyond their status as commercial fishers, which is an issue considering the principle of the multidimensional nature of relevant persons.
- Some associations did not engage further once the fee-for-service agreements had been signed. CGG recognises that fishing associations have other priorities than supporting consultation for petroleum titleholders.
- Engagement with many individual fishers occurred where CGG was instructed to consult only with the fisher and explicitly asked not to consult thorough the fishing associations.

There was no instance where a fishing industry association was able to entirely satisfy CGG that using them exclusively to consult with their members was an appropriate and sufficient method of consultation, or one that could be appropriately evidenced as such. CGG recognises that this diminished role of fishing associations in the consultation process, could lead to duplicative consultation with some individuals, risked overloading fishers with too much information, and not be viewed positively by some associations. However, given the nature and scale of potential effect on commercial fishers, these drawbacks were insufficient to warrant reliance on fishing associations to perform the consultations.

SETFIA/SSIA/Atlantis Consulting

Our consultation process has faced significant challenges, particularly with the Southeast Trawl Fishing Industry Association (SETFIA, Org ID 98), the Southern Shark Industry Alliance (SSIA, Org ID 195), and Atlantis Consulting (Org ID 127). The primary concerns raised by SETFIA/SSIA have centred around the perceived inadequacy of the data provided by CGG, which they argue is crucial for accurately assessing the impacts of our survey operations on trawl fishing activities.

Throughout the consultation, SETFIA/SSIA has consistently requested more detailed economic information on the overlap of our survey activities with fishing zones, emphasizing the importance of this data in understanding, and managing impacts on trawl fishing, but without providing an

explanation as to how this information could be of benefit. This is despite CGG providing the information in its own form (from another reputable consultancy using the same ABARES data obtained via AFMA that SETFIA use) and explaining that the information being requested had no utility in managing impacts on commercial fishers. As requested, the overlap, including tonnage, was calculated and provided to SETFIA multiple times, alongside other relevant information such as assessments on receptors and details of adopted measures put in place to manage impacts on fishers (Event IDs 4803 & 4805). The fishery overlap data is available in Appendix E1, Annex 3.

Desktop research discovered multiple SETFIA reports for other planned petroleum activities in the Otway. As part of our preparation of the Regia MSS Environment Plan, we reviewed these EP's and found that SEFTIA/SSIA has previously and regularly reported that the CTS and all other Commonwealth fishing generally occurs been 400m and 1,000m. This information differed to the information received from CTS fishers during consultation who stated that they do occasionally fish down to 200m. The fishers' claims were supported by the ABARES data. Ultimately, the fishing effort is assessed as relatively low, as demonstrated by the ABARES data, previous SETFIA/SSIA/Atlantis reports, and the prevalence of confidentiality limitations on the data (i.e. less than 5 fishers). CGG noted the sensitivities around conflicts of interest present in the information request and this is crucial in understanding our engagement with SETFIA/SSIA. Throughout the consultation process, concerns were raised regarding data accuracy and the perceived impartiality of the analysis provided. This scepticism was partly due to historical instances where SETFIA/SSIA believed that data might have been selectively presented or interpreted to minimise impacts on fishing activities. CGG consulted with AFMA to validate use of the ABARES data to ensure its accuracy and reliability (Event ID 3672). In this feedback (Feedback ID 1237), AFMA confirmed the reliability of the ABARES data, stating it uses logbook and other AFMA collected data. They did note that industry associations have previously been critical of the economic aspects of the ABARES data, however this data is based on in field surveying of fishing industry operators.

In response to these initial challenges, CGG adopted several strategic measures aimed at addressing the concerns raised by SETFIA/SSIA. One of the earliest measures was the adoption of a compensation protocol, which aimed to provide financial redress for any displacement of fishing activities. This protocol was designed with other Titleholders in the region, in consultation with the fishing communities, to ensure it adequately compensates for any economic disruptions, whilst reducing burden on stakeholders. To further our efforts in fostering a productive relationship, we implemented several operational adjustments based on direct feedback from the fishing communities. This included modifying our survey timelines and exclusion zones to minimize overlap with peak fishing periods and critical depths, as detailed in Feedback ID 4276 and 1280, Appendix E1, section 8 and Appendix A2, section 4. On request from SETFIA, CGG also committed to the activity limitation of no sound source discharges within the Orange Roughy research program sites (Feedback IDs 4124 & 4125).

CGG's attempts to provide more localised and specific data were met with continued requests for even more detailed analysis, particularly concerning the tonnage and economic value of the catch in the Activity Planning Area, with SETFIA stating this was required in order for CGG to know how much they may need to pay via a compensation plan (Event ID 3382). This was deemed to have no utility for minimising impacts as the reports obtained by CGG allowed for consultation with commercial fishers to identify potential high impact areas and manage these, as described above. For a previous activity, the data report had been purchased from SETFIA/Atlantis and was not accurate to the compensation paid. Therefore, the advantage of purchasing another report, which also uses the same ABARES data, cannot be deduced by CGG nor offered by SETFIA when asked. The data would not improve or add to the minimisation of interactions with SETFIA's members, all concessions possible have already been made, as documented in Appendix E1, section 8 and Appendix A2, section 4.

The concessions made by CGG in co-designing the activity to minimise interference with commercial fishers were communicated through a series of email updates and consultations, where CGG provided revised maps and operational plans to demonstrate our commitment to reducing the impact on local fisheries.

Despite these efforts, challenges persisted, particularly in maintaining consistent and productive communication. As noted in several emails, there were moments of frustration, which underscored the need for even more robust and considered communication strategies. In response, CGG provided a comprehensive summary of the consultations that included not only regular updates but also proactive outreach to ensure that all parties were informed and engaged throughout the process. Recent communications have included repeated requests for the tonnage and economic value of the catch. As our response and position has been clearly stated many times, and our repeated request for the explanation of how this information can inform mitigation measures is yet to be fulfilled, we have refrained from continuing to address this, due to the risk of causing an incendiary reaction, deteriorating communication further.

SETFIA had also stated that they would be unable to assist with on-water communication SMSs to their members, without the obtainment of the tonnage report. Further consultation with individual commercial fishers has identified that due to 3G shutdown in the area, they no longer have mobile coverage on their vessels (Event ID 6876). Therefore, internet and VHF are more reliable, though CGG managed SMS's will also be offered to fishers.

In conclusion, our consultation process has been a complex interplay of addressing detailed data requests, adapting operational plans, and enhancing communication strategies to foster a cooperative and mutually beneficial relationship with the fishing communities affected by our survey operations. Through a combination of compensation measures, operational adjustments, validated data sharing, and comprehensive stakeholder engagement, the activity's level of interference is no greater than is necessary to exercise the right to carry out exploration by the titles granted.

We have strived to maintain a productive relationship despite the significant challenges encountered. These efforts are ongoing, and we remain committed to continuous improvement and adaptation in response to feedback and environmental considerations.

Annex 2 – Consultation with First Nations Australians

Introduction

In accordance with the requirements outlined in the Regulations, CGG undertook extensive consultations with First Nations Australians to ensure their deep cultural connections, values, and environmental concerns were identified and comprehensively addressed in the planning of the Regia MSS. Recognising the unique consultation needs of First Nations groups, CGG adopted a multi-faceted approach to engage in a culturally appropriate way.

Consultation Methodology

As part of the Regia MSS consultation, this method was developed to ensure that the consultations were not only compliant with regulatory requirements but also respectful and inclusive of the cultural protocols of the First Nations communities involved.

Identification and Initial Contact

For clarity, the broad capture process (section 3.1.1), the opportunity to self-identify (section 3.1.2), and the awareness raising activities (section 3.1.3) all apply to First Nations Australians.

The tailored consultation process for First Nations Australians began in parallel to the previously referenced activities with comprehensive desktop research aimed at identifying First Nations groups who might be impacted by the Regia MSS. CGG undertook to identify and contact First Nations organisations in and around the Environment Planning Area. Understanding that First Nations interests may be direct and/or indirect, such as a spiritual connection to Sea Country, this was undertaken with a broad capture approach, identifying not-for-profit and First Nations groups and organisations, in addition to those with functions related to native title and Country management.

This research was crucial in ensuring that all potentially relevant groups were included from the outset. CGG employed a variety of sources, including databases of registered native title claims, Indigenous government agencies, and lists of local land councils, to compile a comprehensive list of contacts.

Following this identification phase, CGG initiated contact through a series of initial outreach efforts, including sending detailed letters and making follow-up phone calls. These communications were designed to explain the scope of the Regia MSS, the nature of potential impacts, and the reasons these groups were being contacted. The letters invited recipients to engage in the consultation process and offered various forms of follow-up, including face-to-face meetings, to discuss the project in further detail. The opportunity to co-design the consultation process was explicitly offered at the commencement of consultation.

The other methods of raising awareness about the proposed activity and the opportunity to consult with CGG apply equally to all Australians and they should be considered when deciding whether the broad approach taken to finding all relevant persons has suitably contributed to finding each First Nations group and individual.

Table C1-5 lists the organisations identified through the dedicated First Nations Australians searches and initial contact. First Nations individuals also had the opportunity to engage as relevant persons. In addition to outreach advertising covered in (3.1.3), an additional First Nations focused placement was made in the Koori Mail (Appendix C5), a National First Nations newspaper. This was a further step taken to help raise awareness, and allow self-identification of, relevant First Nations people inside and outside of Victoria. The list of First Nations persons is available in the Sensitive Information Report (Appendix C3).

Table C1-5 - First Nations organisations identified and consulted

ID	Name of organisation	Functions, Interests, Activities
12	National Native Title Tribunal	Providing for the recognition and protection of native title
26	Gunaikurnai Land and Waters Aboriginal Corporation	Represent the Gunaikurnai people
27	Barengi Gadjin Land Council	Trustee for the Native Title rights and interest of the Wotjobaluk, Jaadwa, Jadawadjali, Wergai and Japagulk peoples
28	Gunditj Mirring Traditional Owners Aboriginals Corporation	Works to progress rights and interests in cultural identity, social justice, native title, cultural heritage, and land justice
29	Eastern Maar Aboriginal Corporation	Traditional Owners of South-Western Victoria
30	Federation of Victorian Traditional Owner Corporations	Advocates for the rights and interests of Traditional Owners
31	First Nations Legal & Research services	Work with groups who wish to pursue land justice outcomes in Victoria
33	Right People for Country program	Supporting Traditional Owners to make agreements between and within groups.
34	The Koling wada-ngal Aboriginal Corporation (Wyndham City)	Engage in an equal partnership with the Wyndham Aboriginal community and key stakeholders to work towards providing a culturally safe Aboriginal Community Centre.
35	Department of Justice & Community Safety Koori Justice Unit)	Native title is the recognition in Australian law that some Aboriginal and Torres Strait Islander people continue to hold rights and interests in land and water.
36	National Indigenous Australians Agency	Native title recognises the traditional rights and interests to land and waters of First Nations people.
143	Boon Wurrung Foundation	Represents the traditional people and custodians of the lands from the Werribee River to Wilson Promontory,
144	Bunurong Land Council Aboriginal Corporation	Registered Aboriginal Party for an on behalf of the Bunurong People, with lands and waters across greater Melbourne, Mornington Peninsula, and the Bass Coast.
145	Flinders Island Aboriginal Association Inc. (FIAAI)	An Aboriginal Community Controlled Organisation. Established in 1971 by a local Aboriginal group, FIAAI is governed by an Aboriginal Board of Management, elected by the local community.
146	Tasmania Aboriginal Centre	Represents the political and community development aspirations of the Tasmanian Aboriginal community
32	Victorian Aboriginal Heritage Council	Helping the community respect and understand Aboriginal Cultural Heritage and Traditional Owner responsibilities.
316	Southern Ocean Protection Embassy Collective	Southern Ocean Protection Embassy Collective in their fight to protect Southern Sea Country from seismic blasting

These organisations were contacted with an initial letter and supporting information, and phone calls were placed to confirm receipt. This initial letter described the activity, why they are being contacted, offering further information, and requesting co-design of the consultation process and activity. Non-respondents were followed up with periodically, restating the reason for contact, confirming if there is an alternative preferred contact, and were provided with project updates including measures put in place around Deen Maar, after consultation feedback and research that the island and area between the island and mainland is culturally significant (Event ID 1891 & Desktop Research: Org ID 316 & Person ID 1163 in Appendix C3), and the Sea Country Protection Plan. .

If contact continued to be unsuccessful, further attempts were made to find alternate contact details at the organisations, these included government (Org ID 32, Event ID's 2331, 2332, 3008), and online resources. It was understood that many of the land councils and traditional owners' corporations were under resourced for engagement with offshore proponents, so collaborative meetings with other titleholders were offered when appropriate (Event ID: 1891, 2608 & 2386). Where organizations had preferred booking processes, these were adhered to, for example via booking forms (Event ID 2791 & 3894).

Pursuing a co-design of consultation, organisations were offered and encouraged to request information specific to their group, for example, a map was produced to assist in understanding impacts (Event ID 2386) and a requested summary explaining the differences between our activity and that of another titleholder (Event ID 3887). This helped ease burden on the groups when determining potential impacts. During engagement, groups were also asked to provide input and feedback on best practice for information sharing, including use of appropriate language and method (e.g. Event ID 1891, 3678, 3674).

Giving Sufficient Information

Throughout the planning and execution of the consultation process for the Regia MSS EP, CGG has demonstrated a commitment to providing comprehensive and understandable information to all relevant persons. The processes and information in section 3.2 apply to First Nations Australians as much as they do all other relevant persons.

During consultations with First Nations organisations there were requests made for more information either in writing or during meetings. In each case listed below CGG gave the additional information to the relevant person.

1. The Eastern Maar Aboriginal Corporation (EMAC) requested information on the differences between the Regia MSS and the proposed TGS Otway MSS. This included a map request.
2. The GMTOAC requested a presentation on the activity, the assessment process, and the protection measures adopted for Sea Country values and sensitivities.
3. The GMTOAC requested a detailed assessment of how the Outstanding Universal Values of the Budj Bim World Heritage Area had been assessed.

Reasonable Period with Sufficient Information

To discharge the First Nations consultation obligation, CGG understood that they must demonstrate that First Nation groups have been afforded a reasonable opportunity to be consulted with. Further, all group members should be afforded a reasonable opportunity to participate in consultation with clear, simple, and directly expressed terms. The fulfillment of this duty is evidenced in the consultation records (Appendix C).

In determining whether CGG had provided a reasonable period for consultation with First Nations groups (Registered Aboriginal Parties, Prescribed Bodies Corporate, and Native Title groups) and peoples, we acknowledge the following benchmarks used in other relevant legislative processes, for example:

- Regulation 30 of the OPGGS(E)R, which sets out a public consultation period of 30 days
- While repealed, guidance taken from the Aboriginal Cultural Heritage Act 2021—Consultation Guidelines (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period to allow identification, contact, and response, from First Nations peoples
- Recent DCCEEW consultation on offshore wind zone (Southern Ocean) in the same general offshore region as this project allowed for 2 months.

Drawing on these examples, a minimum period of 60 days was deemed appropriate to meet the obligations discussed above. However, it should be noted that whilst 60 days was a minimum, the actual period with sufficient information was well beyond this.

Relevant Person Feedback

Throughout the consultation process, CGG made a concerted effort to ensure that all feedback received was carefully considered and, where appropriate, integrated into the project planning and execution. This feedback significantly influenced several aspects of the project, including the mitigation strategies employed to protect culturally sensitive areas and the environmental

management plans developed to minimize impacts on natural resources important to First Nations communities.

CGG committed to ongoing engagement with the First Nations groups involved, ensuring that consultation did not end with the initial regulatory approval but continued throughout the lifecycle of the Regia MSS. This ongoing dialogue is aimed at maintaining trust and transparency and allows CGG to promptly address any new concerns or issues that arise as the project progresses.

Appropriate Measures Adopted

All interactions, feedback, and the measures adopted were meticulously documented, with CGG ensuring that each concern raised by GMTOAC was met with a detailed and considered response. This thorough documentation was critical in showcasing CGG's commitment to a transparent and responsive consultation process.

Through engagement and this research, the Sea Country Protection Plan was devised (Appendix B3). An outline of a possible program was provided to identified First Nations organisations and persons, and they were offered the opportunity to co-design, co-implement, and provide feedback on the program. The opportunity to make public comment or to join the consultation process at any time was also reiterated.

Culturally Appropriate Engagement and Tailored Consultation Strategies

Recognising the diverse needs and preferences within First Nations communities, CGG offered multiple engagement formats. These included traditional meetings, community gatherings on Country, and virtual meetings to accommodate remote participants. Each meeting was designed to facilitate open dialogue and ensure that community members could express their views and concerns in a culturally appropriate setting.

CGG recognised that in the vastly diverse culture of Indigenous Australians, there is often different cultural and consultation requirements that exist in the different jurisdictions, Indigenous communities, and representative bodies. These differences create potential challenges in processing and responding to information through traditional methods such as email or phone. In response to this, CGG sought input and feedback from the First Nations groups, on how they require consultation to be undertaken, including considerations to reduce burden and consultation fatigue. All available methods of communication were offered, including meetings on Country and in groups, and bespoke information was encouraged to be requested.

First Nations groups and organisations, such as land councils, traditional owners' corporations, local environmental groups, and individuals, may have a function, interest or activity that may be affected by the Regia MSS. Further, these groups may provide advice in relation to which other First Nations groups or individuals may need to be consulted with. This connection of traditional owners is represented in the Native Title Act 1993 (**NT Act**), that demonstrates consultation with First Nations people is workable through the communal interest they hold with their respective groups. Through this communal interest, the authorities require reasonable notice to group members but not an exhaustive communication with every person.

CGG provided opportunities for all relevant persons to co-design the consultation process. This approach ensured that the methods employed were not only respectful but also effective in capturing the full range of feedback from the communities. The consultation sessions were structured to be interactive, with CGG representatives providing information on the environmental planning process and listening to the concerns and suggestions from the community members.

CGG recognised through the consultation process that the consultation materials could be improved to use of First Nations language and as a result edits were made to support the preservation of language. In addition, CGG consistently invited further questions or requests for First Nations organisations to provide the opportunity to further tailor the consultation, or the information given.

Challenges in Consulting with First Nations Australians

The consultation process with First Nations Australians, while structured to be inclusive and respectful, presented several significant challenges, particularly when engaging with registered corporations. Despite CGG's commitment to a culturally appropriate consultation method, the response from many First Nations groups was less than optimal, impacting the overall timeline and effectiveness of the engagement efforts.

One of the primary challenges faced was the unresponsiveness of several registered First Nations corporations. Despite multiple attempts at contact through letters, emails, and phone calls, responses were infrequent and tardy. When responses were received, internal resource constraints were highlighted as a barrier to further consultation. Therefore, CGG assumed this lack of engagement was not due to a lack of interest but rather a reflection of the limited resources available to many First Nations corporations, which are often stretched thin across numerous obligations. CGG was willing to provide resourcing support to facilitate consultations provided there was a clear schedule of fees for such services. When such fees were required/requested they were paid by CGG.

Additionally, when First Nations groups did engage, there were some requests for CGG to "wait for instruction" before proceeding. While these requests were made to ensure that the engagement process was aligned with the cultural protocols and timelines of the communities, they introduced significant delays into the consultation timeline. The consultation period was extended on three separate occasions to attempt to accommodate First Nations Australians requests. CGG was prepared to accommodate these requests within reasonable limits, but these delays posed challenges, especially given the timelines associated with regulatory and environmental planning processes.

CGG is required to consult in a manner that is culturally appropriate and respectful of the traditions and practices of First Nations Australians. However, CGG experienced a complex set of circumstances when trying to balance the discharge of its legislative duties in a reasonable timeframe when First Nations groups were unresponsive or when we were requested to wait for consultation preferences. While CGG remained committed to respecting cultural protocols, the company also needs to adhere to regulatory timelines, its consultation principles, and project schedules.

In instances where prolonged unresponsiveness occurred, CGG had to make difficult decisions about how to proceed, always striving to keep open channels for late engagement and to document all efforts and communications thoroughly. In particular, the voluntary participation principle and the absence of universal participation principle were thoroughly considered during engagement with First Nations Australians.

Southern Ocean Protection Embassy Collective

CGG became aware of the Southern Ocean Protection Embassy Collective (Org ID 316), founded by Person ID 1163, through social media posts in opposition of the activity. A direct phone number or email could not be found, so social media was utilised to send a direct message (Event ID 2807), stating the purpose of contact and engagement, and confirming that participation on the engagement process would not be seen as consent and objections would be recorded. Information exchange was offered to be in the individuals preferred method, including the suggestion of a group meeting with their network. Public responses to social media posts concerning the activity and consultation process (Event ID's 2804, 3327) were also made, to reinforce the aim of engaging to protect and preserve Country and culture and reconfirming that consultation would not be seen as consent.

Contact networks were also requested to facilitate contact information exchange (Event ID's 2813, 2723, 2975, 3416, 3890, 4016). The project email was not removed from a reply all sent by person ID61, so received emails in error (Event ID 4057, 4058), but these included Person ID 1163 and confirmed receipt and no intention to respond (Event ID 4061). CGG responded to these by reinforcing how the individuals' concerns had been considered, what measures had been put in place, and restating how participation in the activity can be undertaken if they do wish to engage in future.

Whilst direct engagement was not undertaken by the organisation or individual, desktop research and learning was used to inform management and mitigation measures to minimise potential consequences of the activity on the persons' functions, interests, and activities. Relevant organisations and individuals' publicly published writing, websites, public social medias, and interviews, on First Nations matters, their functions, interests and activities, Sea Country and the reason for their objection to the activity, were valuable resources in both understanding appropriate consultation and activity design approaches (see Appendix C3, Desktop Research: Org ID 316 & Person ID 1163).

Gunditj Mirring Traditional Owners Aboriginal Corporation

CGG's consultation efforts with the Gunditji Mirring Traditional Owners Aboriginal Corporation (GMTOAC), organisation ID 28, highlighted several key interactions that underscored both the proactive outreach efforts and the engagement responses from GMTOAC. These consultations were fundamental in addressing specific concerns related to the impact of the project on sensitive ecological and cultural areas.

The consultation process was initiated with a structured approach, leveraging multiple communication platforms to ensure thorough engagement. Early interactions included emails (Event IDs 46, 672) and phone calls (Event ID s 439, 3031), setting a precedent for open and continuous dialogue. CGG's team was proactive, seeking to establish a foundational understanding of GMTOAC's perspectives and concerns from the outset.

An initial meeting was held (alongside ConocoPhillips Australia, who also have a proposal in the Otway, to ease burden) on 30 May 2023 (Event ID 1891) to discuss the activity and plan the consultation process for Gunditjmara people represented by GMTOAC. GMTOAC representatives provided information to CGG on the cultural values of Budj Bim (both onshore and offshore) and highlighted the significance of Deen Maar. When further inquiries about the characteristics of the cultural values were made, CGG were informed that it is not appropriate to ask for this information and only to recognise the significance of the island.

CGG were asked to wait for further instruction on a GMTOAC facilitated consultation day where all petroleum titleholders would be invited to consult with a broader audience of Gunditjmara people and GMTOAC staff. CGG respectfully awaited information about the consultation day. When no invitation was forthcoming CGG attempted to reestablish a communication channel through email, phone calls, and offering meetings whilst staff were on Country.

CGG received an invite to a consultation day on 7 December 2023, over 6 months after the initial meeting. CGG had progressed with its preparation of the EP, as described in project update emails received by GMTOAC, and discovered more information about the cultural values and sensitivities of Sea Country from other sources.

CGG attended the GMTOAC open day which we understand was a properly notified meeting under the Native Title Act. However, the GMTOAC did specify that the event was an information sharing meeting only and, in their view, did not represent consultation. CGG presented information previously provided to GMTOAC staff to attendees at the consultation day. This included information about the activity, the impact and risks of the activity, and detailed assessments of the predicted effects and management measures for totemic species and significant areas of Sea Country (such as the World Heritage Values of Budj Bim, the short-finned eel and the Southern Right Whale).

During the consultation day, GMTOAC representatives requested specific information, challenging CGG to demonstrate that there would be no measurable effects on the World Heritage values of Budj Bim. In response, CGG provided comprehensive documents and factsheets (Event ID 4794), ensuring that all data was transparent and accessible to GMTOAC representatives. This demonstrated CGG's commitment to not only meet regulatory requirements but also to respect the cultural and environmental concerns of the Traditional Owners.

Shortly after the consultation day, CGG received formal correspondence from Environmental Justice Australia, acting on behalf of GMTOAC. This communication was significant as it outlined specific consultation concerns that GMTOAC felt were not adequately addressed during the consultation. The intention to design a consultation plan was also stated. In response CGG offered its assistance in co-designing the plan, as well as reiterating their commitment to ongoing consultation and protection of Sea Country (Event ID 4797). This offer was also made in later correspondence (Event ID 4970), Following further correspondence, CGG wrote to GMTOAC addressing the assertions and concerns raised regarding the consultation process (Event ID 4973). These, as well as other assertions and concerns received throughout the process, are featured in the Assertions and Concerns table in GMTOAC's Relevant Person Summary, along with CGG's response. The summaries also contain an Information Received table that clearly describes the information exchange between the organisation and CGG, how it was addressed, and where relevant, how it informed the EP. Requests for Information, and how this was addressed, is also tabled in the summary.

On November 11th 2024, EJA provided CGG with the Gunditjmara Consultation & Negotiation Protocol – Final Version 11.11.24 (hereinafter referred to as the 'the protocol'), it should be noted that this was originally expected to be received by the end of August 2023.

The protocol describes the standards and expectations for consultation and negotiation concerning activities on Gunditjmara land (Mirring), including offshore and onshore energy projects, Gunditjmara Mirring (Country), cultural values, objectives and powers of GMTOAC and Native Title determinations, noting that the provided maps define certain areas of Gunditjmara Mirring and Nyamat Mirring, but do not fully capture the interconnected nature of the landscape. The GMTOAC Consultation and Negotiation Protocols apply to the entire Gunditjmara Mirring, including Nyamat Mirring, ensuring that all lands and waters under Gunditjmara stewardship are managed according to their traditions and legal rights. The document goes on to describe the principles by which consultation/negotiation must be conducted: Free, Prior, and Informed Consent (FPIC), mutual respect, equal relationship building, and accommodation of Gunditjmara Mirring and culture. And the protocols which include consultation/negotiation with Gunditjmara, early engagement and timing, decision-making, information requirements, confidentiality and IP, resourcing and a statement that Gunditjmara judge the completeness of the consultation/negotiation process. CGG thanked EJA for providing the protocol, acknowledging agreement with the sections concerning respect and cultural appropriateness (Event ID 6430), but expressed a lack of clarity concerning alignment between the protocol and the legislative requirements (section 2.1), and how the protocol can be adapted to be suitable specific projects, considering it covers a wide variety of activities. CGG provided feedback, summarised below, without prejudice, reinforcing that CGG encourages further dialogue however they were expecting a consultation, rather than a negotiation, plan and as such require further clarity.

Consultation or negotiation	Negotiation and consultation serve distinct purposes, follow different processes, and lead to different outcomes. Consultation is centered on gathering perspectives and providing information to inform decisions without requiring consensus. In contrast, negotiation seeks to establish a binding agreement through mutual concessions and collaboration. The protocol merges the distinct concepts of consultation and negotiation, creating significant ambiguity in how CGG should engage with GMTOAC. This lack of clarity makes it challenging to build respectful relationships based on aligned expectations while adhering to legislative requirements. For example, the protocol mandates the application of Free, Prior, and Informed Consent (FPIC) to both consultation and negotiation. However, seeking consent is inherent to negotiation and agreement-making, whereas it contradicts the fundamental purpose of consultation. If CGG approaches discussions as a consultation process while GMTOAC treats them as a negotiation, neither party's expectations will be met,

	making it difficult to foster mutual respect. CGG is concerned that there is not a clear or mutual understanding between consultation and negotiation within the Protocol. To avoid misunderstandings that could hinder future discussions clarity around this, and which parts of the protocol apply to each, is required. CGG typically reserves negotiation for contracts or dispute resolution and does not currently see the need for a negotiation process.
Decision-making	The protocol states that Gunditjmara determine when consultation/negotiation is meaningful and complete. CGG requests clarity regarding this, as consultation concludes at the discretion of the party seeking input, while negotiation should end when all parties reach an agreement. Additionally, the protocol calls for an early decision-making process between GMTOAC and the Proponent, which CGG contends is unnecessary in a consultation, where one party simply invites contributions to their decision-making.
Scope – Native Title and Protocol Map area	There is a lack of clarity in the protocol regarding how different areas, such as Native Title areas, joint Native Title areas, and non-Native Title areas, have been considered. Since CGG's proposed Regia MSS activity does not overlap with a Native Title area, nor with the map contained in the protocol that shows the areas to which the protocol applies, CGG seeks clarification on how GMTOAC has accounted for activities outside of the stated protocol areas, as they do not appear to be addressed in the current draft.
Scope – shared Sea Country	CGG seeks clarity on how Free, Prior, and Informed Consent (FPIC) applies in the context of shared Sea Country, where multiple Traditional Owner groups have overlapping cultural and legal interests. The protocol does not clearly outline how FPIC would function in such cases. Specifically, clarification is required on: • Scope of Consent – What matters would require consent? • Authority and Representation – Who grants consent, and do they represent all groups with shared cultural values? • Consent Process and Dispute Resolution – What procedures govern consent, how are disputes resolved, and under what authority? • Involvement of Other Marine Users – How would commercial fishers and other affected marine users be included in the process, particularly if their interests' conflict with GMTOAC's consent requirements? CGG seeks further information on how GMTOAC envisions managing these complexities in the consent process.
Scope – application to activities	The protocol appears to apply the same protocols to all projects, regardless of their scale or impact. This approach may not differentiate between long-term, high-impact projects, such as a 25-year onshore mining proposal, and shorter, lower-impact activities, such as a 90-day offshore seismic survey.

In response (Event ID 6340), GMTOAC confirmed that discussion on the protocol was included in the proposed agenda items for the February 2025 consultation day (Event ID 6880), but provided the following items as likely to involve negotiation: the Co-design Process and Consultation Framework, which covers agreed milestones and timeframes, CGG's proposed Consultation Framework with "agreed risk criteria," the proposed Sea Country Protection Plan, strategic regional environmental and cultural assessment, and any additional technical advice related to the EP.

CGG has continued to attend, and provide funding, for group meetings when invited by GMTOAC, provide information when and how requested, despite lack of clarity on the technical level of the individual stakeholder of some of the more detailed and specific information requests, and respond to feedback. CGG has diligently endeavoured to discharge its consultation duties with the GMTOAC by seeking to use culturally appropriate methods and adapting to the specific needs and protocols of the community. Recognizing the challenges of timely and constructive engagement due to various constraints on the part of GMTOAC, CGG proactively informed itself about the cultural values and sensitivities relevant to the affected environment. This was achieved through extensive desktop research, Cultural heritage desktop assessment report (Appendix B10) and public documentation to ensure a thorough understanding of the cultural landscape (Appendix F3, section 3.16). Additionally, CGG implemented measures to facilitate ongoing dialogue, offering multiple avenues for continued engagement and feedback. These efforts reflect CGG's commitment to respecting and integrating First Nations perspectives and concerns throughout the activity, reinforcing its dedication to fulfilling its ongoing consultation obligations responsibly and respectfully.

CGG recognise that the GMTOAC does not agree that consultation with them or their members is complete. CGG acknowledges GMTOAC's desire to progress with further consultation and affirms its desire to participate in any ongoing reasonable consultation process.

CGG acknowledges the role that GMTOAC play in preserving the communal interests of the Gunditjmara people. However, CGG has taken extensive further actions to reach all relevant persons (including First Nations individuals) and consult with them, reducing the reliance on GMTOAC facilitating access to individuals and knowledge (cognisant of the absence of a universal participation mandate). Further, the information likely to be revealed through the GMTOAC consultation process has already been found in sufficient detail to identify and protect cultural values of the existing environment. These were identified through considering the Biosis Cultural Heritage Report (Appendix B10), studying the Nyamat Mirring Plan 2023 – 2033, mining social media representations of First Nations individuals, reviewing information and documents available on First Nations groups websites, review of management plans which include Sea Country values (Twelve Apostles Marine National Park The Arches Marine Sanctuary), and in the meetings held with GMTOAC, government organisations and other First Nations organisations. Notwithstanding, CGG acknowledges the importance of providing ongoing engagement throughout the life cycle of the activity to allow GMTOAC and Gunditjmara people to continue to share information and make decisions about cultural heritage protection, as captured above in section 5. Ongoing Consultation and through the Sea Country Protection Plan, as per Appendix B3, section 5.4.5.

On 30 September 2025, GMTOAC, via counsel, provided CGG with a proposal for a Gunditjmara Nyamat Mirring Cultural Values Assessment (CVA) (Event ID EVT267). GMTOAC advised that a CVA was required for Gunditjmara to meaningfully continue participating in consultation for the Environment Plan (EP) and expressed the expectation that the EP should not be resubmitted until the CVA had been completed. GMTOAC further indicated that a CVA is likely to take an extended period to complete, estimating a period of around 12 months. The proposal described a comprehensive cultural assessment process that would involve a participatory model co-designed with GMTOAC, the engagement of an external consultant to undertake this work, cultural mapping, workshops with Gunditjmara knowledge-holders, and the documentation of both tangible and intangible cultural values associated with Nyamat Mirring and the broader Gunditjmara cultural landscape. GMTOAC indicated that the CVA would form the basis for consultation and would provide identification of, and information on, their cultural values and sensitivities.

CGG formally responded to this proposal (Event ID EVT337), reaffirming its respect for the cultural significance of Nyamat Mirring and welcoming the opportunity to continue dialogue with GMTOAC. CGG explained that, while it is open to undertaking cultural values work with GMTOAC, it did not consider it necessary to delay the resubmission of the EP, as CGG had already met the consultation requirements under the Regulations. CGG noted that the proposal provided by GMTOAC did not include sufficient detail to allow immediate progression and that, in its present form, the scope of the proposed CVA was limited to pre-survey activities and did not include the collaboration CGG

considered important during and after the survey. To support meaningful ongoing engagement, CGG developed and provided GMTOAC with an Alternative Scope of Work. This alternative proposal broadens the CVA concept into a partnership model that centres Gunditjmara people in the protection and management of cultural values throughout the period before, during and after the survey. The Alternative Scope of Work aligns with the Nyamat Mirring Plan 2023–2033 and offers a practical and adaptive management framework that strengthens cultural protection measures through a longer-term collaborative approach. It includes opportunities for full-group workshops, ongoing progress meetings, co-developed methodologies, cultural leadership in decision-making processes, and structured reporting designed to incorporate new cultural information throughout the lifecycle of the activity. CGG presented this alternative on a without-prejudice basis and invited GMTOAC to co-design the methodology to ensure it aligns with Gunditjmara governance and cultural frameworks.

On 7 November 2025 (Event ID EVT352), GMTOAC provided correspondence recording its objection to the resubmission of the EP. GMTOAC stated that it had not been provided with the opportunity to meaningfully participate in consultation and reiterated its position that a Nyamat Mirring Cultural Values Assessment (CVA) must be completed before further consultation can occur. GMTOAC asserted that consultation to date does not meet the standards required under the Environment Regulations and requested that NOPSEMA note its objections in considering the EP. Attachments accompanying the letter outlined GMTOAC's regulatory interpretation and detailed cultural matters it considers outstanding. As per CGG's documented process, these feedbacks have been assessed for merit and proposed responses compiled.

CGG provided a further response on 12 November 2025 (Event ID EVT367), reaffirming that CGG's position on the requirement of a CVA pre-submission remains that the Regulations do not require a CVA to be undertaken as part of the consultation process or as a prerequisite to preparing or resubmitting an EP. CGG outlined that the consultation obligations had been lawfully fulfilled and provided a detailed chronology demonstrating how this had been reached at each submission (see below).

CGG stated that its initial February 2023 correspondence met the legal standard in Tipakalippa and Regulation 25 by providing specific, sufficient information for GMTOAC to understand the Regia MSS and respond meaningfully. CGG notes that consultation began early, continued for many months, and allowed ample time for response before the EP's initial submission in January 2024. CGG rejects the claim that a Gunditjmara Nyamat Mirring Cultural Values Assessment (CVA) is required before submission, stating that no such obligation exists in the Regulations or guidelines and that cultural values had already been clearly conveyed through GMTOAC's meetings, correspondence, and published documents. CGG further noted that the relevant timeframe for ongoing consultation is the multi-year validity of the EP, not the 90-day activity window, and that its proposed Alternative Scope of Work and Sea Country Protection Plan provides a pathway for adaptive management and environmental protection.

CGG also noted that the cultural values central to the proposed CVA had already been articulated by GMTOAC and Gunditjmara through published materials, including the Nyamat Mirring Plan 2023–2033 and the Consultation and Negotiation Protocol, as well as through meetings, full-group sessions and written correspondence. These sources had informed CGG's description of the environment, impact and risk assessments, and cultural protection measures, including the Sea Country Protection Plan. CGG considered that this material provided sufficient information to assess the cultural values that may be affected and to integrate those values into the EP in accordance with the Regulations.

CGG confirmed that it would not delay the resubmission of the EP to undertake the CVA proposed by GMTOAC, as doing so would be inconsistent with the statutory consultation framework and disproportionate to the nature and scale of the survey. CGG reiterated its willingness to undertake cultural values work with GMTOAC as part of ongoing consultation embedded within the EP's Implementation Strategy and reaffirmed its commitment to collaboration through the Alternative Scope of Work. CGG acknowledged GMTOAC's position that it would not continue in-person

consultation until a CVA is completed, noting that this reflects a voluntary decision by GMTOAC and does not limit CGG's willingness to consult in good faith throughout the life of the EP.

Reasonable Period of Time and Sufficient Information

CGG's consultation process for both the initial and subsequent submissions of the Regia MSS EP accords with the First Nations methodology (Appendix C1, Annex 2), and the legal benchmarks for "sufficient information" and "reasonable period" as articulated in Regulation 11A, Regulation 10A(g), Regulation 34, NOPSEMA's Consultation in the course of preparing an Environment Plan Guideline (GL2086), and the Federal Court's decision in Santos v Tipakalippa. These instruments make clear that the duty to consult is discharged where the titleholder: (i) identifies relevant persons whose functions, interests or activities may be affected; (ii) provides each with enough information to make an informed assessment of the possible consequences of the activity; (iii) allows a reasonable period for them to respond; and (iv) demonstrates in the EP that the consultation process, and any measures adopted as a result, are appropriate and supported by an "evident and intelligible" justification. In this context, NOPSEMA's guideline stresses that "sufficient information" and "reasonable period" are assessed case by case, that information can properly be provided iteratively as more detail is developed, and that consultation must be appropriate and adapted to the nature of the interests affected, particularly where First Nations interests in Sea Country are held communally. CGG considers that consultation with GMTOAC commenced on 15 February 2023 and that GMTOAC was provided with sufficient information to make an informed assessment of the possible effects of the proposed Regia MSS on its functions, interests and activities for 242 days prior to the EP's initial submission, with ongoing consultation meeting this requirement at each subsequent submission.

CGG first contacted GMTOAC on 15 February 2023, providing an introductory letter that outlined the proposed Regia Marine Seismic Survey (Regia MSS), included an Activity Overview flyer and maps of the planning areas, and attached the Consultation Framework. This correspondence also described the purpose of the survey, potential consequences for GMTOAC's functions, interests and activities, and the environmental measures already adopted to reduce impacts, such as sound management, exclusion zones and protections for key species and habitats. CGG further included information on the regulatory framework and offered GMTOAC the opportunity to co-design the consultation process to suit their needs. On 23 March 2023, CGG confirmed by phone that the correspondence had been received, followed by additional emails on 20 April and 1 May 2023 resending the information and proposing an in-person meeting. During the period from 17 April to 16 June 2023, GMTOAC members also had the opportunity to attend 13 open community information sessions about the Regia MSS.

On 26 May 2023, CGG issued a newsletter drawing attention to the Regia MSS consultation hub, which at that time included a direct feedback submission tool, interactive map, the Community Consultation and Engagement Plan, a Preliminary Environmental Impact and Risk Assessment (PEIRA), information on the proposed environmental assessment process, decision-making criteria, and CGG's intention to place an exclusion zone around the culturally significant Deen Maar. CGG then met with GMTOAC on Country on 30 May 2023, reiterating information already provided, discussing consultation preferences, advising that most draft environmental assessments were available online, and explaining that any sensitive information supplied by GMTOAC could be kept confidential. On 3 July 2023, CGG issued another update outlining progress in activity design and confirming that exclusion zones were being carefully considered. Further information was distributed on 14 September 2023, when CGG provided detailed design updates, links to all published environmental assessments, and specialist reports including seismic sound studies, commercial fisheries analysis, vessel presence assessments, oil spill risk modelling, and impact assessments across a range of biological receptors. All communications, including letters and the consultation hub, invited and encouraged requests for information, providing multiple avenues in which these could be requested.

On 22 September 2023, CGG again provided GMTOAC with direct links to draft impact assessments. CGG followed this with a project update email, containing a webinar invitation and information about the upcoming public comment period, and when the EP was scheduled to be submitted to NOPSEMA.

After receiving feedback from First Nations organisations about consultation fatigue and resource limitations, CGG notified GMTOAC on 20 October 2023 that the EP submission would be postponed by three months. On 30 November 2023, CGG invited relevant persons to provide feedback on the consultation process and shared a link to a consultation survey and draft impact assessments. On 12 December 2023, CGG reiterated its view that sufficient information and reasonable opportunity for consultation had been provided and proposed a meeting to discuss the Sea Country Protection Program.

Following submission of the EP in January 2024, CGG notified the start of the public comment period on 26 January 2024, and on 31 January a webinar invitation to support participation. On 17 February 2024, CGG delivered a group presentation attended by GMTOAC and Gunditjmara providing further explanation of the activity, its potential impacts and risks, cultural features of environmental values and sensitivities, and key management measures. On 8 March 2024, CGG supplied additional information requested by GMTOAC members, including fact sheets on glass eels and Southern Right Whales, and a summary of the assessment of World Heritage Values for the Budj Bim Cultural Landscape. CGG also responded on 23 April 2024 to GMTOAC's notification of its consultation plan, seeking the opportunity to engage in co-designing the plan.

On 7 June 2024, CGG emailed in response to prior correspondence from GMTOAC's representatives, again emphasising that CGG sought involvement in the design of any future consultation plan and confirming its willingness to engage collaboratively. On 28 June 2024, CGG sent a detailed letter which set out CGG's position on the sufficiency of consultation already undertaken and explained how CGG had concluded that it had provided GMTOAC with sufficient information and a reasonable opportunity to comment during the preparation of the Regia MSS EP. The letter also summarised the history of consultation with GMTOAC, enclosing a table of all communications before and after the EP submission and attaching copies of correspondence, to provide transparency regarding the consultation process.

On 3 July 2024, CGG issued a campaign update advising relevant persons of the number of public comments received, providing a link to a summary information sheet, and sharing details of an upcoming webinar, sound reports (including a second commissioned report), and the titleholder report available on both the project and NOPSEMA websites. A further campaign email on 12 September 2024 directed GMTOAC to NOPSEMA's Request for Further Written Information (RFWI), explained refinements to the activity design that reduced the acquisition area, linked to a "Safeguarding Southern Right Whale" information sheet, and confirmed that CGG was addressing the matters raised in the RFWI and updating the EP accordingly. On 21 November 2024, CGG issued a project update confirming resubmission of the EP following the RFWI, providing a link to the revised EP, highlighting additional assessments for key values (including little penguins and plankton) and summarising these in Appendix F3, and inviting registration for a further webinar.

In December 2024, CGG responded to GMTOAC's correspondence on the Gunditjmara Consultation and Negotiation Protocol, acknowledging its significance but raising concerns about the blending of consultation and negotiation, as covered in this annex above. On the same day, CGG sent follow-up emails checking that GMTOAC had received the 21 November project update and providing links to requested project shapefiles while noting that marine park datasets were better sourced directly from the data owners; these were supplemented on 13 December 2024 with further shapefile links and a reminder that CGG did not own or maintain the marine park datasets. On 19 December 2024, CGG informed relevant persons that NOPSEMA had extended the EP assessment period to 7 February 2025 and that the survey was unlikely to commence in April 2025, with the next possible start date being September 2025. On 16 January 2025, compiled and shared requested materials for an upcoming group Gunditjmara meeting, reiterating its willingness to tailor communications.

On 6 February 2025, CGG provided information sheets to meet requests for simplified material. On 27 February 2025, CGG issued a campaign email confirming that NOPSEMA had issued an Opportunity to Modify and Resubmit (OMR), publishing the redacted decision letter on the project website and outlining next steps, including addressing the OMR and updating the EP. On 5 May 2025, CGG informed relevant persons that a modified EP had been resubmitted to NOPSEMA, summarising key

changes, including enhanced protection measures for little penguins and Southern Right Whales, reduced acquisition and active source areas, revised sound thresholds, use of updated fishing data, and expanded cultural heritage information. On 22 May 2025 consultation materials for the June group meeting were provided, including a presentation addressing agenda items, simplified information sheets, and a technical Q&A resource. On 11 June 2025, CGG shared a link to the consolidated EP, outlined key amendments since the last submission, and stated that a NOPSEMA decision was anticipated by 20 June. On 26 June 2025, CGG confirmed two next steps: CGG would fund a Cultural Values Assessment subject to an acceptable proposal by 25 July 2025 and would postpone the Regia MSS until at least 1 April 2026. On 27 June 2025, a campaign update advised that NOPSEMA had issued an OMR, that the decision letter had been published.

In the following months, CGG's outgoing information continued to focus on EP refinements and the proposed cultural values work. On 1 August 2025, CGG sent a consolidated update confirming that the EP had been revised to include clearer impact assessments for key marine species, confirming agreement in principle to fund a cultural values assessment and to postpone the survey until at least 1 April 2026, and recirculating key EP updates. Finally, on 28 October 2025, CGG responded to GMTOAC's CVA proposal of 30 September 2025, advising that the proposal lacked sufficient detail and appeared too limited in scope, and attaching an Alternative Scope of Work (Annex A) on a without-prejudice basis that proposed a broader partnership framework for Gunditjmara involvement before, during and after the survey. CGG confirmed that, while EP resubmission would not be delayed, the survey itself would not occur before September 2026.

Collectively, this chronology demonstrates CGG's continued provision of sufficient information, before first submission and before each resubmission, to GMTOAC, Gunditjmara peoples, and a reasonable period at each of these stages. This information was also provided to GMTOAC counsel once they became involved.

Annex 3 – Record of Engagements

Table C1-6 - Record of Engagements

Method	Summary	Total engagement
Community/Information sessions	Located in local towns along the activity area. Presented during these events: project description, engagement process, definition of Relevant Person, functions, interests and activities, the process and requirements for an EP. Discussion and information share with attendees. Attendees encouraged to register their details for updates and to self-identify as relevant persons.	176 attendees (please note not all attendees registered).
Project Outreach	Potentially relevant persons and organisations who appear to have functions, interests or activities that may be affected, found through desktop research and referral. Initial letters, sent via email or post, contained information on why recipient was being contacted, the applicable regulations, summary of the activity, link to the activity website, description of intent of an EP, invitation to co-design their consultation, commitment to provide sufficient information in appropriate manner, opt-out information, explaining sensitive information can be kept confidential on request, ongoing updates, request that they forward information to contacts that may have interested in the activity. Attachments to initial letter: • Activity Overview • Map of planning areas • Consultation Framework If no response phone calls and/or follow up emails were undertaken to attempt to confirm receipt. For organisations found through desktop research, or suggested referral, whose relevancy was uncertain, an email was sent with an activity description, link to the comprehensive website to determine if potentially affected. Follow up communications were sent to non-responders.	Over 260 individuals and organisations initially contacted through the project outreach.
Government agencies	Relevant government departments and agencies were identified under Section 25(1) using a combination of guidance documents and desktop research.	32 agencies identified and contacted.
Titleholder search	National Electronic Approvals Tracking System (NEATS) perused for other titleholders.	2 other titleholders found and contacted.
Conservation groups	Reached out to local community groups, such as those focused on environmental conservation or fishing, to identify members whose interests or activities could be affected by the activity.	40 conservation groups contacted.
First Nations groups	The activity may have an impact on the cultural or spiritual functions, interests and activities of First Nations groups. Therefore, it was considered important to conduct meaningful and effective consultation to establish genuine, ongoing, and effective relationships. The methods used for consultation are elaborated below.	14 First Nations groups contacted.

Method	Summary	Total engagement
Local (within EPA) newspaper and radio	The public was notified about the planned activity and asked to come forward if they had any specific functions, interests or activities that may be affected by the activity through advertisements in local newspapers and on local radio stations.	23 advertisements placed across social and traditional media. 272 radio spots over 6 stations. 4 radio and TV interviews/comments given (with direction to activity website).
Other marine users	These include petroleum titleholders, Ports, Coastguards, surf clubs, diving associations, subsea communications, and yacht clubs.	58 Other marine users.
Commercial fishing license holders	Through engagement with AFMA, in-community and Peak Associations found during the commercial fisheries review, fishers' details were obtained, and they were contacted via two points of contact.	377 commercial fishers contacted.
Fishing Industry Associations	Industry associations were contacted and engaged with, both on behalf of their members and as relevant organisations. Fee for service arrangements were undertaken where appropriate.	23 fishing industry associations.
Local Businesses & Tourism operators	We contacted local businesses and umbrella organisations, including Chambers of Commerce and tour operators, to engage members and customers through business networks whose interests or activities could be impacted by the activity.	25 businesses and operators contacted.
Educational Institutions & Research bodies	We reached out to local educational institutions, such as universities or research centres, to engage with researchers or students whose interests or activities could be affected by the activity.	8 educational institutes, researchers & Research bodies contacted.
Engagement Feedback Survey	Released in the November project update, the survey requested feedback on the engagement process, including timing and information received (ID:3811).	Sent to 413 individuals, 2 surveys completed.
Social media	An activity Instagram, Facebook (META), and LinkedIn were established, providing activity information, and updates, available to be shared. 13 posts were boosted as adverts to targeted local relevant audience, advertising community sessions and important updates. Social media was also used to privately message and comment to potentially relevant persons who were unable to be reached via traditional communication methods.	Estimated audience size of 270,300-318,000, with over 600 link clicks to the activity website.
Webinars	Live as well as recorded and uploaded onto the website and YouTube channel.	8 webinars.
Consultation Hub/project specific website	The project-specific Regia website allowed all members of the public and persons with interest to access every piece of information they would need to make informed decisions and objections. There are multiple industry-exceeding features of this website which are expanded on in section 1.4.1.	6361 visits, 2765 unique users, interacted on the website over 280 times, and over 860 document downloads.
Hosted industry-specific group meetings	Accommodating a co-design engagement process, when requested, commercial fishers group meetings were held in their locality and an online meeting for multiple NGO representatives.	5 group meetings.

Method	Summary	Total engagement
Presence in locality	The activity Environment Manager spent 44 days visiting the local areas to raise awareness and identify potentially relevant persons. Local businesses, such as those involved in recreational diving and commercial fishing, were visited. They also attended a locally held climate event, where they identified themselves, responded to an audience question regarding seismic and invited the member, who stated they were with a local conservation group, to meet at the events conclusion (Event ID 3778).	21 local in person meetings. 11 community information sessions. 4 wharf visits. 4 local in person group meetings. 2 door knocks/business visits. 1 attendance at relevant local event.

Annex 4 – Assertions or Concerns

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3000	4446	Stakeholder mentioned another company had open and respectful interaction and requested more of that approach from titleholder.	Responded in Event 4454, thanking the stakeholder for the meeting the previous week. Regia team member reassures the stakeholder that they are taking the claim seriously and that their Principal Research Scientist, who specialises in fish spawning and has 25 years of experience in the fishing and research industry, is currently reviewing the provided paper along with other related studies. This thorough approach aims to clearly establish potential impacts and identify any necessary mitigations. They appreciate the patience shown while awaiting a response, emphasising the importance of a careful and informed evaluation.
3001	872	Stakeholder refuted the need for the project as misdirected for a sustainable future.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3002	3413	Advised that simultaneous public comment periods for both Environmental Plans from ConocoPhillips Australia and CGG was not a good idea.	The Titleholder followed up confirming submission delayed until after Christmas (Event ID 3414)
3003	3152	Advocacy for more urgent climate action across all levels of government.	The titleholder noted the stakeholders position and requested further engagement to discuss (Event ID 606).
3004	2900	AMCS expresses concern about the meaningfulness of the consultation process without the requested map showing previous seismic in the area over the previous 15 years.	Provided these maps in Event ID 2802, explaining the delay was due to active source area only just been confirmed. Explained the latest email (Event ID 2900) had been overlooked as it was not sent to the project email, requested that project email is kept in copy for future correspondence.
3005	2901	AMCS is requesting another consultation meeting after receiving information that would enable them to give feedback on the seismic proposals and the contents of the Environmental Plan (EP) as Regia added to meeting at last minute.	Regia team attempted to arrange a meeting (Event 1056, 1356, 2802). Regia was included in the meeting (Event ID 2038) at AMCS's request (as clarified in Event ID 1025)
3006	2901	AMCS requested information about operational shutdowns related to marine life sightings. It was indicated that providing this information would require significant time and effort, and advised AMCS to consult the Australian Antarctic Division instead, which contradicts the goal of meaningful consultation, as directing AMCS to another agency for information on company practices is inadequate.	The Regia teams reflection on the meeting differs from AMCS's understanding. The Regia team member believes AMCS sought information on operational shutdowns across the entire industry, which CGG does not possess. While CGG could ask the other companies for this data, it would be more appropriate for AMCS to request it from the Australian Antarctic Division (AAD), which standardizes sighting data. This would ensure proper data collection without additional burden. Clarification on how AMCS's functions or interests might be impacted by the Regia MSS and the relevance of historical whale sightings in other parts of the country to environmental management in the survey, is requested. Event ID 1231

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3007	3415	Appreciates mitigations made regarding area and timing, but doesn't believe any mitigations would be enough.	We agree that refining the operating area and timing are not enough alone to mitigate impacts. This is why we have several other measures in place, to bring any impacts to an acceptable level (that being short-term, temporary, and recoverable). Examples being reducing sound source to the lowest settings, reducing the number of times the sound source is activated, and implementing exclusion zones around marine mammals.
3008	3021	Assertion about the narrowness of consultation requirements.	The stakeholder was concerned that they would not be able to be involved in consultation as there connection to the area was through familial connections and consideration of relocating. The Regia team responded, explain that the definition of functions, interests and activities can be read broadly, provided information on the consultation process, environmental processes, and inviting them to engage (Event ID 1384).
3009	2997	Assertion that offshore drilling in other locations is a better alternative.	The stakeholder responded to a project updates with a number of complaints regarding another Titleholders public comment period. When the Regia team informed the stakeholder of this, they rejected the explanation and continued to state petitions related to a different proposed activity. The Regia team previously assured the Stakeholder that all their comments would be received and provided to the industry regulator (Event ID 2630)
3010	5195	Asserts that throughout their communications with CGG, they have consistently advocated for the use of catch and effort data alongside spatial overlap data. The stakeholder expresses frustration over claim that the data provided was not in the correct format, labelling this suggestion as flippant.	This assertion has been raised multiple times, with the titleholder requesting the stakeholder explain how this data can assist where the currently supplied data can not. At the risk of damaging relationships further, this has not been responded to this time. Please refer to Appendix C1, where consultation with this stakeholder, including this assertion, is described in detail.
3011	5114	Burning more fossil fuels is criticised	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3012	3373	Categoric rejection of the proposal altogether.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3013	4075	CGG has the responsibility to facilitate community consultation.	CGG ran an extensive community consultation process, details of which may be found in EP Appendix C1. CGG had not at any time requested AMCS do any consultation on their behalf. The request was to encourage any potentially relevant persons who came forward to AMCS but had not yet identified themselves, to make contact with the Regia team in order for consultation to occur.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3014	3384	CGG have published significant amounts of information (draft EP chapters), which AMCS does not have in house capacity to fully review and assess. As such AMCS requests an extension of at least 4 weeks, before the EP is provided to NOPSEMA	As advised via email on Event ID 3331, consultation will not be paused, granting time extension well beyond the 4 weeks requested. We will submit the Regia MSS EP for public comment once we believe we have met the Reg 10A(g) acceptance criteria
3015	4788	Claims that without a comprehensive data report, it's impossible to accurately assess the materiality of the proposed actions.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.
3016	2274	Climate crisis being fuelled by new fossil fuel projects.	Objections to oil and gas activities are not about the adverse effects of the activity. These are not assessed further.
3017	2085	Comment highlights that the regulatory body lacks true independence and emphasises the need for credible, peer-reviewed scientific evidence before conducting activities with potentially severe environmental impacts.	We look forward to providing you our environmental assessments that are thoroughly referenced with peer reviewed literature and scientific evidence (Event ID 2085).
3018	2179	Community opposition to seismic testing and drilling for gas.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3019	3092	Concern about how the findings of the testing may impact the coastline and the town.	The titleholder requested further information (Event ID 869) on the coastline activities and confirmed contact with their sailing club (Event ID 960)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3020	4407	Concern about passing on the sea country protection program to others in the organisation due to lack of expertise in cultural values.	Titleholder expressed their appreciation if the stakeholder could provide any contacts that may be able to provide feedback on the Sea Country plan. (Event ID: 4456)
3021	3237	Concern about the need for the 83rd survey in a well-surveyed area.	The titleholder responded formally to submitted concerns in Event ID 3886, stating that new surveys allow for new technologies to better understand the geophysics of an area. Also there are areas where 3D seismic is yet to be acquired.
3022	2901	Concerns about a tick box approach to public consultation.	Prior to email Event ID 2901, AMCS was contacted via letter (Event ID 41) and phone (Event ID 433) at the start of the consultation process. The letter provides background information on the project, including an invitation to consultation and how to engage. Attached to the letter was an activity overview, with timing an map, a description of the consultation framework, illustrating how consultation can be co-designed, various methods of contact and direction to the Regia webpage with further information. AMCS then submitted an online survey with specific questions (Event ID 529), these were responded to via the supplied email (Event ID 633). AMCS was encouraged to continue engagement and request further clarification on their questions. Further engagement in a manner that best suited them was offered, including a webinar for their members. They were also notified of upcoming community sessions their members may be interested in.
3023	3373	Concerns about consultation process and fatigue	The titleholder holder acknowledged consultation fatigue as an issue for a range of stakeholders at the commencement of consultation and outlined how Regia MSS has attempted to reduce consultation fatigue. (Event ID: 916)
3024	722	Concerns about inadequate consultation with communities living on the coastline.	The assertion that consultation is inadequate has been based on the individuals interaction with the early stages of a much more thorough consultation process whereby they have taken an isolated community event and inferred inadequate consultation. The titleholder responded to the individual by providing information on the consultation process (Event ID: 2819)
3025	917	Concerns about the community's opposition to seismic testing and drilling for gas.	Titleholder met with stakeholder to discuss their concerns (Event ID 2011)
3026	164	Concerns about the consultation process providing sufficient information and a reasonable period for consultation were mentioned.	Titleholder has responded advising of their engagement with additional local council stakeholders (Event ID: 556).
3027	3152	Concerns about the economic profile of the region being reliant on a healthy natural environment and tourism.	The titleholder noted this concern and requested further engagement to discuss (Event ID 606)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3028	2766	Concerns about the ethical implications and role modelling of the seismic surveying business.	Titleholder responded acknowledging community views about the ongoing need for gas in Australia and provided CGG perspective based on AEMO modelled demand and Australian Energy Policy. (Event ID: 1862)
3029	2940	Concerns about the organization's dismissal of public submissions, social media, and other channels, indicating a lack of acknowledgment and transparency in the consultation process.	Titleholder responded querying if they had confused Regia MSS with a different project as the public comment period had not started. (Event ID: 2938)
3030	3917	Concerns about the registration process on the website due to unclear terms and conditions.	Titleholder responded confirming registration. (Event ID: 4464)
3031	2773	Concerns about the validity of the consultation process and submissions on the plan.	Titleholder responded outlining on of the purposes of consultation is to be able to receive and share information that improves the assessment of potential impacts and reiterated request for further information on previous assertions. (Event ID: 2414)
3032	3678	Concerns regarding the expansion of gas exploration activities, particularly in the context of climate change.	Outlined the ongoing need for gas identified by AEMO and the ongoing need beyond 2050 (Event ID 3678).
3033	579	Constituents voiced concerns about the wind farm, indicating they may also have concerns about the MSS.	During the phone call the Titleholder confirmed the project is not related to the wind farm proposal, provided background information on activity and seismic/multi-client. Discussed consultation formats available, offered to arrange workshop.
3034	3383	Consultation conducted through Tuna Australia can lead to better environmental outcomes.	Titleholder responded confirming fee-for-service arrangement to support consultation with Tuna Fishers (Event ID: 3796)
3035	3800	Consultation conducted through Tuna Australia can lead to better environmental outcomes.	Titleholder responded committing to fee-for-service arrangement. (Event ID: 3796)
3036	3746	Consultation services to be paid on a fee-for-service basis	Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers participation in the consultation process. (Events 2930, 3350, 3856, 4039)
3037	2830	Consultation will demonstrate opposition to further oil or gas projects in the waters.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3038	886	Continued use, search, and retrieval of fossil fuels (gas) is outrageous due to the declared "Climate Emergency" by the local Warrnambool City Council.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3039	3152	Council's position opposing seismic testing and oil and gas development in the Otway Basin.	The titleholder responded with an aknowledgement of the correspondence and an offer to organise a meeting for further discussion (Event ID 606).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3040	2072	Criticises the lack of social license for offshore gas exploration and expansion in the Otway Basin. It emphasises that while attempts to assess impacts on commercial fish stocks are noted, the ongoing investment in fossil fuels will worsen climate change and increase ocean temperatures, leading to consequences for communities.	The titleholder responded to this interactive map comment: We understand your concern. There may not be commercially viable gas deposits in this area so we cannot assess the contribution of future developments to human made climate impacts. Further investment in gas development is needed in Australia to meet local gas demand and is a key part of the Labour governments energy transition plan.
3041	3237	Disappointment in the Federal Government for allowing the project to proceed.	Titleholder responded acknowledging information presented and that the team will review and respond. Offerred to meet with group (Event ID: 2754)
3042	4794	EJA, on behalf of GMTOAC, describes regulations for consultation; providing meaningful opportunity and resonable period to engage in consultations regarding activities affecting their Sea Country.	Responded in Event ID 4973, stating agreeance to provisions of regulations and providing the regulations.
3043	881	Emphasises that the issue extends beyond a single oil rig, pointing to a broader problem with Australia's reliance on oil and gas. It calls for retraining efforts and a shift toward renewable energy as a solution.	Objections to oil and gas activities are not about the advserse affects of the activity and were not assessed further.
3044	3674	Engagement with the Traditional Owner (TO) community has been challenging due to a severe lack of resources, with those available being stretched thin. Community members have expressed frustration over numerous requests for engagement with petroleum titleholders concerning events that are considered very unlikely.	Discussion in meeting was held around possible avenues to reduce consutlation fatigue on TO community. (Event ID: 3674.
3045	3654	Engagment should be formalised in an agreement.	Accepted and entered into engagement agreement.
3046	993	Expressed concerns regarding the absence of environmental and economic accounting, questioned what tangible benefits would accrue to the Eastern Maar Traditional Owners and EMAC from the data gathered, especially since CGG commercially profits from selling this information.	Described that without knowing what would be valuable to these groups it's hard for us to know. Noted that CGG suspect but don't know that there is anything of value in the data they'll gather. Benefits could include Traditional Owner's knowing what may be of value in Sea Country. Sharing of bathymetry data that might reveal culturally significant sites. CGG requesting EMAC support in translating information into appropriate language. CGG supporting EMAC in strengthening culture in other ways. Developing plans that align the objectives of EMAC and CGG through a Sea Country Protection Plan (working title). Agreed to share the draft Sea Country Protection Plan for discussion (Event ID 3678).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3047	2110	Expresses a clear stance against the proposed activity, indicating disapproval and concern regarding its impacts.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3048	1022	Expresses strong concern about the project's ability to conduct an environmental impact survey, emphasising that our limited knowledge of ocean ecosystems makes it impossible to predict the potential damage the activities may cause.	We have set decision making criteria that align with your comment in that we must not have long-lasting effects on ecological or cultural sensitivities. Our impact assessments will be thoroughly scrutinised by an independent regulator with the necessary expertise to hold us accountable if our work is not accurate. The Regia activity is a marine seismic survey. There has never been an oil spill from a seismic survey in Australia and we take every precaution to ensure this will remain the case. Even in the unlikely event of a spill the consequences would be undetectable 7 days after the event. The risk is lower than the 1000's of vessels that transit through the marine park every year without accident (Event ID 1022).
3049	880	Feedback states that ecosystems are collapsing and calls for a collective transition away from oil dependence.	Objections to oil and gas activities are not about the advserse affects of the activity and were not assessed further.
3050	2677	Further consultation and research are required.	The titleholder provided the NOPSEMA guidelines regarding environmental information and how research and data from applicable regions can be used to inform environment and impact assessments.
3051	4794	GMTOAC emphasises that effective consultation goes beyond sending emails or information sheets to staff without decision-making authority, as they view all offshore petroleum activities as potentially significant to their interests.	Responded in Event ID 4973, recognising that EJA only recently began acting on behalf of GMTOAC and as such provided the history of consultation carried out since 15 February 2023. Highlighted that EJA did not suggest any meaningful alternatives for engaging with GMTOAC, aside from stating that our efforts were insufficient. CGG would like to clarify that our efforts have been more extensive than the limited examples provided, as shown in our Community Consultation and Engagement Plan, which has been available on the Regia MSS Consultation Hub since February 2023.
3052	4794	GMTOAC emphasises the need for independent technical advice to assess the impacts of proposed offshore petroleum activities on Gunditjmara Sea Country, given the complexity of the EPs and states advice is crucial for understanding the potential effects of seismic surveying and to provide meaningful information to GMTOAC and its members.	Responded in Event ID 4973, stating GMTOAC had access to sufficient information and a resonable period, including an invitation to comment on each draft environmental assessment, which contained detailed information about how the activity may affect their functions, interests, or activities of relevant persons, 127 days before submission.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3053	4948	GMTOAC expresses concern that CGG's decision to submit the Regia MSS Environment Plan before receiving the Consultation Plan undermines the potential for meaningful dialogue and is frustrating.	On December 7, 2024, GMTOAC contacted CGG, inviting them to present for 45 minutes at an information day for GMTOAC members after 295 days without a response. Although CGG considered delaying the submission of the Regia MSS Environment Plan (EP) at that time, they ultimately decided to proceed with the submission for several reasons: the reasonable and accommodating consultation efforts already made, to which GMTOAC had previously been unresponsive; the extended consultation periods that had been provided; the absence of the promised consultation plan from GMTOAC; the fact that the information day invitation would not occur until February 17, 2024—an additional 73 days away; and the characterization of the meeting with the GMTOAC community as merely an information session, rather than part of the future and unspecified consultation plan that CGG had been awaiting since May 30, 2023, which was 197 days prior to receiving this invitation. (Event ID 4973)
3054	5228	GMTOAC requests that CGG commit to conducting proper, lawful, and respectful consultation, including withdrawing the current EP from submission to NOPSEMA and providing GMTOAC with the latest version of the proposed EP for effective participation in the consultation process.	CGG has clearly requested consultation with GMTOAC and its members on multiple occasions and explicitly invited co-design of the consultation process several times. They provided sufficient information both before and on May 30, 2023, and made additional information available after that date. CGG also offered to enter fee-for-service arrangements for consultation and waited months for any response. They attempted to identify relevant Gunditjmara persons and consult with the Gunditjmara community in various other ways. They supplied full copies of the environmental assessment to address uncertainties about sufficient information and shared their understanding of the cultural features relevant to environmental values and sensitivities. Furthermore, they communicated proposed protections for these cultural features and extended the consultation period multiple times to accommodate GMTOAC's needs. Despite these efforts, CGG had not received the consultation plan by the end of August, as promised in the May 30 meeting. Should no consultation plan be forthcoming by 30 June 2024, CGG will have been waiting 398 days for a consultation plan from GMTOAC. CGG remains committed to achieving mutually beneficial outcomes for GMTOAC members and CGG throughout this process, but that will not be possible without open two-way communication within a reasonable time frame The letter includes a summary table of correspondence and a copy of correspondence. (Event ID 4973). As of 1 November 2024, CGG has not received the consultation plan.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3055	4948 & 5228	GMTOAC restates their position that requirements for consultation have not been met, higlighting two-way dialogue, sufficient information and a resonable period.	CGG has clearly requested consultation with GMTOAC and its members on multiple occasions and explicitly invited co-design of the consultation process several times. They provided sufficient information both before and on May 30, 2023, and made additional information available after that date. CGG also offered to enter fee-for-service arrangements for consultation and waited months for any response. They attempted to identify relevant Gunditjmara persons and consult with the Gunditjmara community in various other ways. They supplied full copies of the environmental assessment to address uncertainties about sufficient information and shared their understanding of the cultural features relevant to environmental values and sensitivities. Furthermore, they communicated proposed protections for these cultural features and extended the consultation period multiple times to accommodate GMTOAC's needs. Despite these efforts, CGG had not received the consultation plan by the end of August, as promised in the May 30 meeting. Should no consultation plan be forthcoming by 30 June 2024, CGG will have been waiting 398 days for a consultation plan from GMTOAC. CGG remains committed to achieving mutually beneficial outcomes for GMTOAC members and CGG throughout this process, but that will not be possible without open two-way communication within a reasonable time frame The letter includes a summary table of correspondance and a copy of correspondance. (Event ID 4973). As of 1 November 2024, CGG has not receieved the consultation plan.
3056	4794	GMTOAC states the information session held on February 17, 2024, was deemed insufficient, serving only as a preliminary introduction rather than a comprehensive consultation.	Responded in Event ID 4973, stating the offer for a meeting with GMTOAC community was characterised as an information session and not part of the (future and unspecified) consultation plan that CGG had been waiting for since 30 May 2023, some 197 days at the time of receiving this invitation.
3057	1317	I have already stated my position to oppose seismic testing in the Otway Basin. Period.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3058	3373	Indivdual provided a general objection to oil and gas acitivities that including advising the titleholder that 11 local governments has opposed seismic activities and that the fishing and tourism industires also opposed it.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3059	4637	Inferred titleholder's ALARP assessments are the product of assumptions	Event ID 4635 explains that the methods of assessment, conclusions and assumptions have been outlined. The Regia MSS team have also shared impact assessments, citing over 120 references. Titleholder invites a detailed critique of their assumptions, encouraging the provision of validated sources to further inform their analysis.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3060	1389	It is clearly irresponsible to continue exploring for more fossil fuels as CO2 levels are high and continue to rise.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3061	4808	Lack of consultation with First Nations people on the cultural significance of Deen Maar.	Titleholder responded noting assertions and claims and outlining ongoing consultation approach with First Nations stakeholders (Event ID: 2630)
3062	2773	Lack of independent Australian University research before the seismic survey.	Titleholder responded clarifying scientific findings on mortality rates in lobsters and requesting further information on assertions regarding impacts to rock lobsters as a result of MSS in the Otway Basin. (Event ID: 2414)
3063	2901	Lack of information provided by Regia failed to meet AMCS expectations of consultation.	Prior to email Event ID 2901, AMCS was contacted via letter (Event ID 41) and phone (Event ID 433) at the start of the consultation process. The letter provides backgaround information on the project, including an invitation to consultation and how to engage. Attached to the letter was an activity overview, with timing an map, a description of the consultation framework, illustrating how consultation can be co-designed, various methods of contact and direction to the Regia webpage with further information. AMCS then submitted an online survey with specific questions (Event ID 529), these were responded to via the supplied email (Event ID 633). AMCS was encouraged to continue engagament and request further clarification on their questions. Further engagament in a manner that best suited them was offered, including a webinar for their members. They were also notified of upcoming community sessions their members may be interested in.
3064	4190	Lack of response to meeting request to understand the proposal better	Explained that unfortunately the email his colleague sent him, regiamss@cgg.com, does not exist. Stated the correct email was provided to his group in prior correspondance. Event ID 1739
3065	1022	Lack of trust in the environmental impact and risk assessments conducted. Claims if the assessments were done properly, the project would not proceed.	We have set decision making criteria that align with your comment in that we must not have long-lasting effects on ecological or cultural sensitivities. Our impact assessments will be thoroughly scrutinised by an independent regulator with the necessary expertise to hold us accountable if our work is not accurate. The Regia activity is a marine seismic survey. There has never been an oil spill from a seismic survey in Australia and we take every precaution to ensure this will remain the case. Even in the unlikely event of a spill the consequences would be undetectable 7 days after the event. The risk is lower than the 1000's of vessels that transit through the marine park every year without accident (Event ID 1022).
3066	4036	Late awareness of consultation period or contact with Blue Whale Study Organisation	Titleholder reponded to individual outline previous attempts to make contact and commence consultation. Provided NOPSEMA brochure and previously provided letter requesting consultation. (Event ID: 1933)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3067	4808	Local fishing and tourism industries passed motions against the project.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3068	1655	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3069	1659	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3070	1661	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3071	1662	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3072	1663	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3073	1665	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3074	1666	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3075	1668	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3076	1669	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3077	1670	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3078	1672	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3079	2586	Member lodging vote against the survey, seeks a receipt and asks for a transcript. States objection to proposed activity is on the grounds of unnecessary gas exploration and there is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan, although comments have been recorded and will be reported(Appendix C1). Provided consultation plans, NOPSEMA brochure and link to consultation hub. Requested more information on FIAs.
3080	3237	Mention of other ongoing projects and activities adding pressure to the marine environment.	The titleholder responded formally to submitted concerns in Event ID 3886, explaining that cumulative impacts are considered when assessments are made.
3081	4808	Moyne Shire and other local councils are unified against the project.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3082	3747	MSS Proponents are encouraged to complete a data project and then to use this to guide their consultation. (SETFIA's involvement is not critical but the Association can complete this work under contract and clients report finding it invaluable.)	A fisheries consultant was engaged to analyse the publicly available ABARES data and produced a comprehensive report which demonstrated the overlap of each fishery. See Appendix B6.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3083	4049	Need to know normal annual catch ($) in area to establish if co-existance is possible.	As detailed in Event ID's 4129 & 3989, knowing a value or tonnes of historical fishing averages in an area does not add to the solutions already in place for this proposed activity. Event ID 4805 notes that SETFIA, SSIA, and Atlantis stated they have previously submitted at least 11 reports to titleholders in the Otway, which are publicly available in other Environment Plans. In preparing the Regia MSS Environment Plan, CGG reviewed these reports and found that SETFIA/SSIA regularly indicated that Commonwealth Trawl Sector (CTS) fishing typically occurs between 400m and 1,000m, although some CTS fishers mentioned occasionally fishing down to 200m, a claim supported by ABARES data. Overall, CGG concluded that fishing effort in the area is relatively low, as evidenced by the ABARES data, past reports, and confidentiality limitations indicating fewer than five active fishers.
3084	1899	No seismic testing. Leave our amazing ocean alone.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3085	1668	Objection to proposed activity on the grounds of unnecessary gas exploration. There is no acceptable level of environmental impact or risk.	Confirmed no official vote and a vote is not part of community or relevant person engagement plan. Provided link to plan on website. Confirmed recorded in system and requested information on FIAs.
3086	2278	Opposition to seismic testing, exploratory drilling for gas, and future drilling for commercial quantities of gas due to potential climate damage.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3087	1669	Our oceans are already under extreme stress from drilling, plastic, shipping, pollution and global warming - they cannot bear this further, unnecessary pressure.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3088	4190	Poor communication and lack of serious handling of consultation	Explained that unfortunately the email his colleague sent him, regiamss@cgg.com, does not exist. Stated the correct email was provided to his group in prior correspondance. Event ID 1739
3089	3674	Preference for petroleum titleholders to collaborate in reducing the consultation burden. A proposal was made for quarterly meetings among all titleholders to engage with the TOs. This approach could provide mutual benefits, allowing titleholders to share updates on their activities and any changes, while TOs would have the opportunity to share cultural stories, strengthen their community ties, and contribute to the management of environmental impacts associated with the petroleum activities.	Discussion in meeting was held around possible avenues to reduce consutlation fatigue on TO community. (Event ID: 3674.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3090	2024	Raised an objection by questioning the overall necessity of the survey, focusing on whether it should be conducted at all, rather than just discussing the "how" and "when".	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3091	2940	Reference to the overwhelming public opinion against the plans to proceed with the project.	Titleholder responded quering if they had confused Regia MSS with a different project as the public comment period had not started. (Event ID: 2938)
3092	5121	Relevant Persons have not been informed of content of letter from NOPSEMA to CGG	As publishing private correspondance is not a usual part of the process, but a choice made by CGG to demonstrate transparency and build trust, CGG requested permission from NOPSEMA to publish the letter. Once this approval was given the letter was uploaded to the consultation hub, and notice sent to relevant persons (Event ID 5134). AMCS was informed of this process in Event ID 5124.
3093	886	Request for a real contact person's name to deal with.	Titleholder advised the individual that the project email was a shared inbox and provided an overview of the administrative function and use for consultation and advised with whom they were corresponding in this instance. (Event ID 3187)
3094	4481	Request for the company to abandon exploration and seek more sustainable energy sources.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3095	2003	Request that the issue of compensation be dealt with through the associations only.	Discussion and input with associations only - rejected, fishers have requested this doesn't occur. Discussion and input with fishers only - rejected, excludes fishers who are happy to be represented by their asssociations. Discussion and input through a CGG process - adopted, noting the benefits of a collaborative approach. Discussion and input through a collaborative process (similar to the one NERA ran) - adopted.
3096	3746	Request to engage their data consultant to review and present data on shark and trawl fishery catches and values over the past 20 years in the proposed survey area, anticipating similar requests from other fisheries	A fisheries consultant was engaged to analyse the publicly available ABARES data and produced a comprehensive report which demonstrated the overlap of each fishery. See Appendix B6
3097	3705	Restatement that the consultation should consider IF the survey should go ahead, not just how and when the survey should be undertaken.	Acknowleged restatement of previous feedback (Feedback ID 275) and repeated response (Event ID 4280)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3098	5231	SETFIA indicates that there is likely little more they can contribute moving forward, stating their willingness to share information about compensation with members. However, they express reluctance to engage in separating vessels from the survey due to CGG's perceived failure to act in good faith to minimise impacts.	This assertion has been raised multiple times, with the titleholder requesting the stakeholder explain how this data can assist where the currently supplied data can not. At the risk of damaging relationships further, this has not been responded to this time. Please refer to Apendix C1, where consultation with this stakeholder, including this assertion, is described in detail.
3099	2003	SSIA and SETFIA request a review of 20 years of AFMA data, reporting back on the extent of average annual overlap with each fishery. This can be done under contract with SETFIA or by an alternative company.	A fisheries consultant was engaged to analyse the publicly available ABARES data and produced a comprehensive report which demonstrated the overlap of each fishery. See Appendix B6
3100	4554	Stakeholder accused titleholder of showing a lack of integrity and stated they would blockade boats if titleholder attempted activity. Requested to know where a BACI designed study is and asked 'what happened at lakes entrance'.	Responded in Event 4555, stating that they are consulting with the stakeholder in good faith and adhering to legal requirements. They invite credible sources of information and relevant studies for review, committing to implement measures to avoid impacts or provide compensation if warranted. However, they currently conclude that the Regia MSS will not measurably affect King George Whiting populations, and thus no compensation is necessary. They reject the idea of negotiations being contingent on threats to block legal operations as unacceptable. Regarding the request for a Before-After-Control-Impact (BACI) study, they state there is no basis for further research on seismic effects on King George Whiting from the Regia MSS, asserting there are no significant evidence gaps. They also clarify that while the FRDC study they assume is referenced is ongoing, they cannot draw conclusions until a peer-reviewed report is available.
3101	2963	Stakeholder advocated for declaring coastlines off-limits to drilling and other destructive practices.	The titleholder has noted, recorded and reported the objection to oil and gas activities.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3102	3209	Stakeholder asserted that consultation was token.	We can confirm that our correspondence with you is recorded in our consultation records. The classification of relevant person and public comment are not defined by us, but rather the authorising body NOPSEMA, in order to simplify engagement for all parties. This does not mean that if you are not in the category of relevant person that you are unable to be informed or make comment. Rather there is a distinction in how we engage. For example, if someone has a general objection to all oil and gas activities, whilst we will record this and it can be presented during public comment, we are working within the bounds of current legalisation that allows oil and gas activities to occur (once the specific permits are in place). However, if an individual or group raise a specific concern that they may be affected by our activities, then we are required to evaluate it and place mitigations in place as required. An example with this project would be considerations around Deen Maar. Through engagement we learnt that there is a spiritual significance to the area, so we impended an exclusion zone around the island and put a measure in place to ensure the vessel does not pass between the coast and Deen Maar. I have attached a brochure from NOPSEMA that explains the process in further detail.
3103	3209	Stakeholder asserted that despite consultation, views were not valued.	We take engagement very seriously and stand firmly behind our environmental scientists' work. Through the "engagement process we have been able to identify potential impacts and put measures in place, and so respectfully engagement process we have been able to identify potential impacts and put measures in place, and so respectfully disagree with your final statement that we aren't truly listening. Thank you for your time in sharing your concerns and engaging with us, it is an important part of the process and much appreciated. If you would like any clarification of the above, or to request further information and engagement, please don't hesitate to contact us."

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3104	3209	Stakeholder asserted the need to stop new gas/oil projects and reduce fossil fuel reliance.	The 'no new oil or gas' statement comes from the International Energy Association (IEA) World Energy Outlook (WEO) 2021, Net Zero Scenario which is a global analysis predicated on a demand driven decrease in fossil fuel use. It does not consider that at an Australia level, the AEMO predicts shortfalls of gas as early as 2027 in its Victorian Gas Planning We understand community views about the ongoing need for gas in Australia (or lack thereof) as the country navigates the energy transition. The current government policy is that more gas is needed, and petroleum exploration titles continue to authorise the exploration process, including seismic surveys. Matters of national energy policy are not within the purview of CGG or the Regia MSS. We will register claims related to the ongoing need for gas and provide those to NOPSEMA. We also advise that these concerns are better directed to your State or Federal members of parliament and/or the State or Federal Resources Ministers.
3105	2632	Stakeholder asserts a range of general objections and opposition to oil and gas acitivites and the Regia MSS including: Labeling the sender as the last bastion of outdated fossil technology, sharing his preference for receiving gas from existing suppliers over new supply and a proliferation of frontier gas exploration in the southern ocean, and advocating for the use of renewable energy sources once exisiting gas supply is exhausted.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3106	5236	Stakeholder emailed another organisation with the Regia project team cc'd into correspondence. Stakeholder states that in a recent SETFIA general meeting, CGG expressed their stance regarding the BACI study they co-funded in eastern Bass Strait, asserting that without publication, they do not acknowledge impact on catch rates from marine seismic surveys. They raised several concerns: the report's significant delay, issues with the FRDC board's acceptance of the report, and CGG's ongoing requests to the FRDC for the report over the past few years. Stakeholder followed up in the email.	The titleholder responded to all, correcteing the content of stakeholder's email to FRDC regarding BACI data. (Event ID: 5239).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3107	3148	Stakeholder enquired why there is no community session in their region and made an official request for this to occur.	The titleholder responded offering a meeting and provided additional survey information that may interest the club members. (Event ID: 4567)
3108	549	Stakeholder expressed concerns that NOPTA was the sole government body overseeing the award of SPA's, without needing joint authority approval, and argued that this process was undemocratic.	Titleholder advised that objections and claims needed to be about the advserse affects of the activity and explained that this concern was a matter for NOPTA, the Minister for Resources or the local member for parliament (Event ID: 549).
3109	3386	Stakeholder expresses concern that CGG has not recognised them as a relevant person, despite their representation of AMCS, a recognized entity.	Regia team contacted the individual (Event ID 3143) two days after they had completed an online survey. They had sent an email a day later with a number of information requests. Event ID 3143 confirmed they were recorded, but also requested information regarding if they were also seeking to be a relevant person as an individual, in addition to as a representative of AMCS, or both. This was requested as previous consultation with AMCS had been with another individual, and also due to the multiple correspondance methods stakeholder (Person ID 1203) had used in a two day period. The individual was informed that a person may hold multiple FIA's, including as an individual and as part of an organisation (Event ID 3368)
3110	5192	Stakeholder listed statements they said were made by the Regia MSS team member asking if they were being withdrawn, which would align the views of CGG and SETFIA goals.	Titleholder responded clarifying statements and views including the preference to use final results, the importance of the peer review process in BACI results and methodology (Event ID: 5239).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3111	5195	Stakeholder outlines their understanding of responsibilities under the Act. Stating that the proponent must identify relevant stakeholders (such as SETFIA) and provide them with necessary information, specifically requesting data on catch and effort rather than just gross spatial overlap. Additionally, the stakeholder emphasises that the proponent should present the impacts of their project, recognising that while fishing grounds are important, the primary concerns for fishing businesses are catch and revenue. The feedback asserts that the proponent must also take reasonable steps to reduce impacts to an acceptable level, referencing the ALARP (As Low As Reasonably Practicable) principle, and notes that SETFIA believes CGG has not adequately mitigated impacts, relying instead on compensation offers.	This assertion has been raised multiple times, with the titleholder requesting the stakeholder explain how this data can assist where the currently supplied data can not. At the risk of damaging relationships further, this has not been responded to this time. Please refer to Apendix C1, where consultation with this stakeholder, including this assertion, is described in detail.
3112	4057	Stakeholder questioned the validity and genuine nature of Regia MSS' efforts to include the stakeholder in the environmental assessment process.	The titleholder responded by offering to discuss the points made further with the stakeholder, and highlighted the stakeholders option to inform NOPSEMA of any dissatisfaction they may have relating to the consultation process (Event ID 4063).
3113	4032	Stakeholder questioned why the Regia MSS would not respect the past history, honour their present moment in time and protect their future.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3114	4057	Stakeholder refused to communicate with Regia MSS further and called for an outright ban on all seismic blasting for fossil fuel projects.	The titleholder responded by offering to discuss the points made further with the stakeholder, and highlighted the stakeholders option to inform NOPSEMA of any dissatisfaction they may have relating to the consultation process (Event ID 4063).
3115	2586	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3116	1653	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3117	1655	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3118	1659	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3119	1661	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3120	1662	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3121	1663	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3122	1665	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3123	1668	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3124	1667	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3125	1670	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3126	1672	Stakeholder strongly objected to the proposal for seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3127	2254	Standing in solidarity with first nations custodians of the Gunditjmara land who say no to this!	Objections to oil and gas activities are not about the adverse effects of the activity. These are not assessed further.
3128	842	Stated that the oceans are incredibly important to the safety and health of our futures and noted that a project like this is absolutely not in line with moving towards safer futures.	Titleholder responded providing information on marine mitgation plans, confirming individual as an interested community member and inviting further engagement, noting connection with First Nations community (Event ID: 843)
3129	3382	States CGG needs to undertake the financial overlap report to ensure it has sufficient funds	In CGGs past experience such information provided no basis for protection measure or a reasonable estimation of the compensation that was actually due. Event ID 2894 explains that this is a concern for CGG and is not relevant to the purpose of consultation with SETFIA/SSIA. However, CGG remains open to any other reasons that we might need to generate and share this information. However, at present CGG cannot see any improvement to the predictive accuracy of our impact assessment work from obtaining or sharing this information.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3130	4236	States financial catch information is needed by CGG to prepare their funds. The data project spoken about early on in the consultation process is from ABARES reports and doesn't provide the information CGG would need for this.	In CGGs past experience such information provided no basis for protection measure or a reasonable estimation of the compensation that was actually due. Event ID 2894 explains that this is a concern for CGG and is not relevant to the purpose of consultation with SETFIA/SSIA. However, CGG remains open to any other reasons that we might need to generate and share this information. However, at present CGG cannot see any improvement to the predictive accuracy of our impact assessment work from obtaining or sharing this information. As detailed in Event ID's 4129 & 3989, knowing a value or tonnes of historical fishing averages in an area does not add to the solutions already in place for this proposed activity. Event ID 4805 notes that SETFIA, SSIA, and Atlantis stated they have previously submitted at least 11 reports to titleholders in the Otway, which are publicly available in other Environment Plans. In preparing the Regia MSS Environment Plan, CGG reviewed these reports and found that SETFIA/SSIA regularly indicated that Commonwealth Trawl Sector (CTS) fishing typically occurs between 400m and 1,000m, although some CTS fishers mentioned occasionally fishing down to 200m, a claim supported by ABARES data. Overall, CGG concluded that fishing effort in the area is relatively low, as evidenced by the ABARES data, past reports, and confidentiality limitations indicating fewer than five active fishers. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3131	4948	States GMTOAC and its members are concerned about the potential impacts of CGG's proposed seismic survey activities on Gunditjmara Sea Country and its environmental and cultural features. They feel that CGG has not sufficiently addressed the cultural, marine, and cumulative impacts related to the various activities proposed in the Otway Basin. CGG expressed interest in collaborating with GMTOAC on the co-design of its Consultation Plan and engaging further on its Sea Country Protection Program. However, GMTOAC has instructed that they will only meet with CGG regarding the Regia MSS Environment Plan (EP) after the Consultation Plan is finalised. GMTOAC emphasises that, given CGG's submission of the EP without prior consultation, it is inappropriate to discuss other matters, including the Sea Country Protection Program. They also assert that any such program must be entirely designed and led by Gunditjmara Traditional Owners, as mere consultation is not acceptable to them.	Despite the challenges faced in consultation, CGG remains committed to ongoing engagement with GMTOAC and its members. On February 17, 2024, CGG discussed the proposed activity, its impacts, risks, and protective measures for cultural features with the Gunditjmara community. This information refined earlier communications from before and on May 30, 2023, reflecting feedback from relevant persons. On March 8, 2024, CGG provided fact sheets addressing impacts on glass eels and Southern Right Whales, as well as clarifications about the absence of impacts to the Outstanding Universal Values of the Budj Bim Cultural Landscape, in response to GMTOAC community requests. While delays in the consultation plan have been frustrating, CGG emphasises that these challenges do not equate to a failure of consultation, engagement which will continue throughout the project's lifecycle. CGG believes the best path forward involves input from GMTOAC into their Sea Country Protection Program and other ongoing consultation protocols, including a future GMTOAC consultation plan, ensuring that cultural features and environmental sensitivities are adequately considered and managed for mutually beneficial outcomes. (Event ID 4973)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3132	4788	States SETFIA cannot provide assistance without further information, so they will wait to see the outcomes, stating the activity is now potentially dangerous, commenting that the operator may 'be lucky' or may encounter a critical interaction with a trawl vessel.	Responded in Event ID 4804, explaining CGG's experience with the Gippsland survey has enabled them to identify the necessary information to minimize vessel overlap. They obtained and validated data from ABARES, and through discussions with trawl fishers, established measures to reduce disruption in shared areas. Their analysis and maps are conservative, as the operational area has been reduced and will continue to be updated. CGG reiterated they would like to engage in a fee-for-service arrangement to provide information to SETFIA's members, including on-water communications, noting that overlap reports may not effectively account for changing fishing areas Event ID 4788 challenges the comment regarding the survey now being dangerous and impactful, and the chance of a negative interaction at sea, stating that given there has only been a reduction in the nature and scale of the survey over the last 12 months the statement is mischievous, incendiary and not in accordance with the Commonwealth Government guidance framework. The stakeholder is asked to refrain from making such statements as that outcome would only be true with a complete lack of cooperation leading to fishers acting illegally.
3133	2274	STOP the destruction NOW	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3134	1669	Strong objection to the proposal by Regia to 3D seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3135	1673	Strongly object to the proposal being made by Regia to 3D seismic blast in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3136	1021	That has not been funded by the fossil fuels industry.	Objections to oil and gas activities are not about the advserse affects of the activity and were not assessed further.
3137	2038	The Australian Marine Conservation Society (AMCS) expressed serious concerns about the impacts of certain processes on the community and marine life. They advocate for the cessation of these processes, viewing the industry as polluting and incompatible with Paris climate targets. AMCS strongly advocates for the protection of oceans and marine life and the end of offshore oil and gas operations.	The titleholder has noted, recorded and reported the objection to oil and gas activities. Regarding concerns on marine life and the community, the consultation process has been followed, with subsequent engagment with the relevant organisation.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3138	2082	The commenter questions the true independence of NOPSEMA, the supposed independent regulator, citing its sole funding from the petroleum industry as a conflict of interest.	A Productivity Commission study into Resources Sector Regulation (Nov 2020) stated that other regulators should "investigate opportunities for enhancing regulators' cost recovery processes (like those adopted by NOPSEMA)". Our claim of NOPSEMA's independence is repeating the claim they themselves make. It is regulatory best practice to cost recover from proponents and typical in many sectors (Event ID 2082).
3139	2997	The community and elected officials have spoken against the project.	The stakeholder responded to a project updates with a number of complaints regarding another Titleholders public comment period. When the Regia team informed the stakeholder of this, they rejected the explanation and continued to state petitions related to a different proposed activity. The Regia teampreviously assured the Stakeholder that all their comments would be received and provided to the industry regulator (Event ID 2630)
3140	2632	The community, local governments, and signatories are against seismic blasting in the southern ocean.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3141	2901	The consultation process was not clear, transparent, or accessible.	Prior to email Event ID 2901, AMCS was contacted via letter (Event ID 41) and phone (Event ID 433) at the start of the consultation process. The letter provides background information on the project, including an invitation to consultation and how to engage. Attached to the letter was an activity overview, with timing an map, a description of the consultation framework, illustrating how consultation can be co-designed, various methods of contact and direction to the Regia webpage with further information. AMCS then submitted an online survey with specific questions (Event ID 529), these were responded to via the supplied email (Event ID 633). AMCS was encouraged to continue engagament and request further clarification on their questions. Further engagament in a manner that best suited them was offered, including a webinar for their members. They were also notified of upcoming community sessions their members may be interested in.
3142	4942	The Council's request to NOPSEMA, the Victorian State Government, and the Commonwealth Government for the moratorium.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3143	653	The DNP should be made aware of oil/gas pollution incidences which occur within a marine park or are likely to impact on a marine park as soon as possible.	The titleholder responded with a link to the Implementation Strategy document that details the procedure relevent to the claim. (Event ID: 1751)
3144	3373	The entire community, including First Nations and non-Indigenous people, will not back down against seismic activities.	The titleholder has noted, recorded and reported the objection to oil and gas activities.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3145	880	The feedback expresses strong concern about the environmental risks associated with potential spills, emphasising the need to prioritise ecosystem protection.	We understand this is a risk people are concerned about. Seismic surveying has occurred in Australia extensively for 60 years and there has never been an oil spill from a seismic activity, this is due to the prevention measures we implement to protect the environment. Further, in case the worst happens, we have plans in place to response quickly and effectively. These will be published shortly. Our oil spill risk is far less than the thousands of ships that pass through these waterways every year, without incident, delivering essential goods and services to local communities. The fuel we use is similar to diesel you'd put in your car. Our vessels are designed to the highest standard and have redundancies in place if unforeseen circumstances arise (Event ID 880).
3146	880	The feedback expresses that oil spills are inevitable and argues that protecting waterways is more important than pursuing profit.	We understand this is a risk people are concerned about. Seismic surveying has occurred in Australia extensively for 60 years and there has never been an oil spill from a seismic activity, this is due to the prevention measures we implement to protect the environment. Further, in case the worst happens, we have plans in place to response quickly and effectively. These will be published shortly. Our oil spill risk is far less than the thousands of ships that pass through these waterways every year, without incident, delivering essential goods and services to local communities. The fuel we use is similar to the diesel you'd put in your car. Our vessels are designed to the highest standard and have redundancies in place if unforeseen circumstances arise (Event ID 880).
3147	881	The feedback highlights concern over the cumulative damage to reefs caused by diesel-powered ships and oil industries. It stresses that diesel is harmful and not to be taken lightly, noting its long-term impact on the environment.	We understand your concern which is why we'll publish our risk prevention measures as well as our emergency plans for you to comment on (Event ID 881).
3148	2080	The feedback questions why corporate interests, under the guise of human necessity, are allowed to continue practices that may irreparably harm marine ecosystems.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3149	878	The feedback stresses the importance of transparency regarding the seismic blasting license being sought and calls for a clear explanation of the Seismic Program Application (SPA) to ensure the community is well-informed.	Titleholder responded to online feedback outlining process required prior to applying for the SPA and/or an AA and acknowledged inidividuals calls for transparency about titles. (Event ID: 878)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3150	2080	The feedback urges a shift in investment from gas to alternative energy sources, suggesting that funds should support innovative, sustainable energy solutions instead of further gas development.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3151	2074	The latest AEMO report indicates that Australia's gas demand for electricity generation is expected to decrease by a third by 2030. However, gas companies are forecasted to maintain their current export levels, suggesting that the focus is more on profit than on addressing supply needs.	Electricity generation is only one source of gas usage. The latest AEMO Victorian Gas Planning Report stated "Unless new Victorian supply is developed, Victoria is forecast to become a net importer of gas from winter 2027, as Victorian annual consumption exceeds Victorian production (Event ID 2074).
3152	4049	The list of fishers provided by AFMA includes holders of SESSF vessel permits, many of whom do not actively fish and lease their rights elsewhere. Most permit holders do not operate in the Otway region. It's noted that the primary value of rights in the SESSF comes from quotas rather than vessel permits. While NOPSEMA is urging this process, it is viewed as misdirected and potentially irritating to rights holders who are not impacted.	Event ID 3879 explains that commonwealth fishers have been contacted via the AFMA details we have obtained, to ensure we have reached everyone and to establish if the fishers have functions, interests, or activities outside of commercial fishing.
3153	2073	The March 2023 IPCC report emphasises the need to halt new fossil fuel exploration to keep global warming below 1.5 to 2 degrees Celsius. It calls for an immediate stop to licensing and funding new oil and gas projects, halting the expansion of existing reserves, and achieving net-zero electricity generation by 2035 for developed nations and 2040 for others. Ignoring these recommendations is deemed grossly irresponsible, highlighting the critical nature of addressing climate change.	In most world energy outlooks gas still has a role to play in a net-zero world, particularly in hard to abate sectors. The most recent IRENA report suggested that even if we can scale up renewables three times faster than current projections, renewables will only meet 90% of the world's energy demand. Gas, particularly with carbon capture technologies, is necessary for a net-zero emissions world (Event ID 2073).
3154	4091	The possible risks of the proposed activity far outweigh any value that may be derived from hydrocarbon exploitation.	The titleholder responded: The legislation allows NOPSEMA to permission environmental impacts provided we comply with the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations (Event ID 4092).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3155	3746	The Regia consultation process has thus far failed to meet NOPSEMA's principles of effective consultation, including communication, transparency, collaboration, inclusiveness, and integrity.	In Event ID's 4597 & 4805, CGG reiterated that they have addressed all matters raised in previous correspondence with SETFIA, SSIA, and Atlantis. They note the absence of some correspondence from SETFIA's records and attach their full communication history with these parties for transparency. CGG has also confirmed their discussions with AFMA regarding the accuracy of ABARES data. They remain committed to finding ways to minimize impacts on individual commercial fishers and will communicate updates to the associations. Additionally, CGG has provided a purchase order for invoicing, requesting that SETFIA include the PO number on their invoice when convenient.
3156	4942	The resolution adopted by the Glenelg Shire Council to support the moratorium on seismic testing in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3157	806	The sender mentions confusion among community members after a joint presentation with Conoco Phillips Australia, and and seeks consultation in Apollo Bay.	Explained joint sessions were held in an attempt to mitigate consultation fatigue, offered and held standalone Regia session in Apollo Bay. Requested preferred dates and times. Event ID's 817, 813.
3158	3384	The staged approach of release of draft EP chapters means relevant persons were not able to initially review as a whole.	As advised via email on Event ID 3331, consulation will not be paused, granting time extension well beyond the 4 weeks requested. We will submit the Regia MSS EP for public comment once we believe we have met the Reg 10A(g) acceptance criteria
3159	2014	The stakeholder advised against petroleum development and seismic surveys.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3160	1891	The stakeholder advised that they were organising an offshore wind symposium aimed at fostering collaboration among wind proponents. Asserted that a new appraoch was necessary.	Titleholder requested an invitation to the offshore wind symposium so that we can listen and learn (no response was provided) (Event ID 1891). Titleholder also asked if there was a preferred way we should consult. If there were preferred consultants that we could use. Stakeholder advised nobody preferred. And that we need to be aware about the Sea Country IPA that they are working on and will publish shortly.
3161	2109	The stakeholder argues that the urgent need to transition away from fossil fuels limits the profitability of any gas found before a ban. They emphasise that the risks to marine life from seismic exploration and gas extraction are significant, advocating for prioritising ecological health over economic gain.	We are working hard to design our survey so that we limit our impacts to acceptable levels. Our activity is no more than 90 days so we'll find an appropriate window to operate in. We will not destroy any wildlife habitat as a result of our activity (Event ID 2109).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3162	1891	The stakeholder asserted that effective consultation hinges on recognising the sovereign rights of Traditional Owners and ensuring collaboration on an equal footing. They sought a partnership model, as any superficial, tick-box appraoch is quickly identified and not trusted. Stakeholder mentioned that it is crucial to align on goals and the methods to achieve them.	Agreed that we are aligned on protecting cultural heritage and respecting the sovereign rights of TO's in everything we do.
3163	2103	The stakeholder asserts that the IPCC has called for no new fossil fuel development, emphasising that greenhouse gas emissions from existing fossil fuel infrastructure are already sufficient to exceed the 1.5°C global temperature increase. They argue that any additional fossil fuel projects would contradict climate goals and commitments.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3164	2097	The stakeholder asserts that the project will significantly exacerbate the climate crisis, emphasising the belief that this impact is undeniable.	CGG acknowledges claims regarding global warming and has reviewed Environment Plan (EP) Appendix B4 (Regia MSS Preliminary Environmental Impact and Risk Assessment (PEIRA)), which provided preliminary information on the potential impacts and risks to support consultations with relevant persons and provided the context to the subsequent impact and risk assessments. An assessment of atmospheric emissions was conducted as part of the PEIRA which concluded that, while emissions from the use of fuel to power vessel engines, generators and mobile and fixed plant add to the GHG load in the atmosphere which adds to global warming potential, they are relatively small on a state, national and global scale, representing an insignificant contribution to overall GHG emissions. Emissions will be small in quantity and short-term. The emissions from up to three vessels for 90 days will not significantly contribute to climate change. Therefore, impacts to ecological components of the environment from atmospheric emissions from the Regia MSS are not predicted and have not been evaluated further. CGG acknowledges claims regarding the concerns about the future potential for natural gas extraction; however, CGG is not proposing the commercial extraction of natural gas as part of the Regia MSS. The activity presented in the Environment Plan is for a short-term, temporary marine seismic survey. Consequently, this claim is not relevant to the adverse effects of the proposed Regia MSS to which the EP relates and is beyond the scope of this assessment.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3165	2757	The Stakeholder claimed it disturbed greatly that this could go ahead without consent from people in this area despite consultation.	As per the previously provided NOPSEMA document (reattached for convenience), whilst the law doesn't require agreement or consent, it does require us to demonstrate in our EP (Environment Plan) that we have considered and addressed concerns, objections, or claims. This helps ensure that any associated impacts are as low as reasonably practicable and are acceptable. An example of this with Regia would be mitigations around Deen Maar. Through engagement we learnt that there is a spiritual significance to the area, so we implemented an exclusion zone around the island and put a measure in place to ensure the vessel does not pass between the coast and Deen Maar.
3166	3450	The stakeholder considered the consultation update to be inaccurate and failed to respond to many issues.	Titleholder responded outlinging thepurpose of project updates and response on previous questions. (Event ID: 3455)
3167	879	The stakeholder emphasised the need for honesty in the consultation process regarding the seismic project. They stated that the area in question is not a designated title released by the Australian Government but rather a frontier exploration zone.	Titleholder responded publically to this interactive map comment: The title/titles we end up applying for has no bearing on how we protect the beautiful and important creatures in your photo. The title you reference expires after 183 days so it is quite normal to apply for these when we submit our Environment Plan and not before. Questions about the purpose and use of titles are best answered by the National Offshore Petroleum Titles Administrator (NOPTA).
3168	1891	The stakeholder explained that they function solely as the administrative body, and would need to present a position to the Traditional Owners at the next meeting to determine the next steps after the initial letter. Advised that once they receive guidance from the Traditional Owners, they can develop an effective consultation process.	Titleholder responded providing information on the assesments completed to-date and the SCPP, inviting further involvement in the co-design and co-implementation of the program (Event ID: 256) and requested in-person meeting when team were next in the region after draft environmental impact assessments were made available (Event ID: 2669, 3031)
3169	1891	The stakeholder expressed diappointment over the lack of communication from NOPSEMA regarding the regulations.	TItleholder offered to relay that message to NOPSEMA (Event ID 1891).
3170	4048	The stakeholder expressed disatisfaction with activity design changes being made via direct consultation with relevant persons (Trawl Fishers), who the Regia team did not name and as such may be state or unlicenced.	The consultation process allows relevant persons to co-design the consultation process. This means some fishers may choose to engage directly with the Titleholder, whilst others may nominate an organisation to consult on their behalf.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3171	2708	The stakeholder expressed dissatisfaction with the lack of information provided during the online consultation	The titleholder responded by thanking the stakeholder for their engagement, offered to arrange a meeting once relevant documents had been finalised, and offered to arrange a webinar tailored to the stakeholder groups needs. The titleholder also provided information on the topics covered in a recent webinar hosted by the titleholder (Event 1889).
3172	2105	The stakeholder expresses agreement with previous comments from the online Interactive Map, urging that the area should remain untouched to preserve it for future generations. They emphasise the desire for their descendants to enjoy the environment as their father did, voicing a preference for leaving the area natural and undisturbed.	The titleholder responded publically to the interactive map commment: We respect your views and encourage you to consult with us through the relevant persons process so that your views can be documented and shared with the independent regulatory decision makers at NOPSEMA. We understand your opinion and encourage you to consult with us through the prescribed regulatory process. However, our there is overwhelming evidence that the area is not untouched and is impacted daily by transient shipping, defence activities, port activities, commercial and recreational fishing and the natural fluctuations of a functioning ecosystem. It would be unacceptable to have long-term or perminent/unrecoverable impacts that threaten the environmental enjoyment future generations. Fortunately, impacts from marine seismic surveys are short-term, temporary, and recoverable. We acknowledge your opinion and encourage you to engage in the prescribed regulatory process so that NOPSEMA can take this into account. There is evidence that the Otway area is a highly productive industrialised waterway with defence, shipping, fishing, and petroleum activities coexisting within the environment in the region for many years.
3173	2107	The stakeholder expresses strong disapproval of profit-driven activities that harm the planet and marine life, advocating for a shift toward sustainable energy investments. They emphasise the responsibility to protect the environment for future generations.	The legislative framework in Australia permits some impact from offshore petroleum if it is managed and of an acceptable level. We believe that responsible development of gas is essential for maintaining the current quality of life we all enjoy and ensuring we pass that quality of life on to future generations. Gas is part of the Labour governments energy transition plan (Event ID 2107).
3174	2255	The stakeholder expresses the need for a move away from fossil fuels.	The titleholder responded, noting the concerns, providing information and offering further enagagement (Event ID 674)
3175	3697	The stakeholder has a standing objection to seismic surveys and will continue to campaign for an end to these activities.	Acknowledged objection to seismic surveys. (Event ID: 3701)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3176	2708	The stakeholder highlighted the importance of having a consultation meeting that allows for sufficient time to consider all project plans.	The titleholder responded by thanking the stakeholder for their engagement, offered to arrange a meeting once relevant documents had been finalised, and offered to arrange a webinar tailored to the stakeholder groups needs. The titleholder also provided information on the topics covered in a recent webinar hosted by the titleholder (Event 1889).
3177	579	The stakeholder mentioned of an organisation opposing offshore activities, suggesting potential objections to the project.	Titleholder acknowledged assertion and provided date Team memeber would be in the region for a workshop with council. (Event ID: 579,)
3178	5192	The stakeholder mentioned that it would be left to the FRDC (Fisheries Research and Development Corporation) to decide on a response, highlighting that a group of 15 contributors to FRDC funding had heard the same remarks.	Titleholder responded acknowledging preliminary report and outling that they were unwilling to rely on them in isolation as the currently didn't mee standards of other studies taken into account in the EP. (Event ID: 5239)
3179	3697	The stakeholder noted that the titleholder's commitment to transparency and consultation had been industry leading.	Noted in meeting minutes (Event ID 3697).
3180	2389	The stakeholder objected to the activity on the basis that it is opposed to Australian Government Senate Enquiry.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3181	4189	the stakeholder objects to the gas exploration proposal in the Otway Basin.	The titleholder has noted, recorded and reported the objection to oil and gas activities.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3182	2034	The stakeholder raised concerns about climate change increasing sea water temperatures.	CGG acknowledges claims regarding global warming and has reviewed Environment Plan (EP) Appendix B4 (Regia MSS Preliminary Environmental Impact and Risk Assessment (PEIRA)), which provided preliminary information on the potential impacts and risks to support consultations with relevant persons and provided the context to the subsequent impact and risk assessments. An assessment of atmospheric emissions was conducted as part of the PEIRA which concluded that, while emissions from the use of fuel to power vessel engines, generators and mobile and fixed plant add to the GHG load in the atmosphere which adds to global warming potential, they are relatively small on a state, national and global scale, representing an insignificant contribution to overall GHG emissions. Emissions will be small in quantity and short-term. The emissions from up to three vessels for 90 days will not significantly contribute to climate change. Therefore, impacts to ecological components of the environment from atmospheric emissions from the Regia MSS are not predicted and have not been evaluated further. CGG acknowledges claims regarding the concerns about the future potential for natural gas extraction; however, CGG is not proposing the commercial extraction of natural gas as part of the Regia MSS. The activity presented in the Environment Plan is for a short-term, temporary marine seismic survey. Consequently, this claim is not relevant to the adverse effects of the proposed Regia MSS to which the EP relates and is beyond the scope of this assessment.
3183	3697	The stakeholder raised concerns about titleholders surveying at the same time.	Outlined that a minimum buffer of 40km would be applied between the two activities in the unlikely event they were acquired simultaneously. (Event ID 3697)
3184	1891	The stakeholder requested that the industry come back to the stakeholder with an improved consultation approach.	Titleholder responded providing information on the assesments completed to-date and the SCPP, inviting further involvement in the co-design and co-implementation of the program (Event ID: 256) and requested in-person meeting when team were next in the region after draft environmental impact assessments were made available (Event ID: 2669, 3031)
3185	2831	The stakeholder stated that although the Regia team is working to reduce environmental impacts, and is listening to the community, it is not enough.	The titleholder responded in Event ID 2382, responding to concerns raised and offering ongoing engagement.
3186	1890	The stakeholder stated that there were no benefits of the seismic activity to the community.	This was discussed during the online meeting with the stakeholder, noted, recorded and reported.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3187	1890	The stakeholder stated that they were concerned about climate change and that there is no longer a need for gas.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3188	3697	The stakeholder stated they oppose seismic surveys and will continue to campaign against them.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3189	4234	The stakeholder suggests if CGG and TGS have X overlap in the west, then there will be entire quotas that can't be caught and will need to be compensated for. The stakeholder states the data provided by the titleholder does not provide adequate information for this.	CGG responded in Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information.
3190	2255	The stakeholder supports moving away from fossil fuels and expresses concerns about seismic blasting leading to drilling for oil and gas.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3191	2074	The statement asserts that transitioning to net zero does not necessitate new fossil fuel infrastructure or investments, as there is already sufficient gas supply in Australia. It emphasises that the issue lies not in the availability of gas but in the fact that most of it is exported rather than used domestically.	Electricity generation is only one source of gas usage. The latest AEMO Victorian Gas Planning Report stated "Unless new Victorian supply is developed, Victoria is forecast to become a net importer of gas from winter 2027, as Victorian annual consumption exceeds Victorian production (Event ID 2074).
3192	1389	The sufficiency of Australia's gas reserves for the gas as transition phase.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3193	5195	The use of fine-scale fishing data can aid in minimising mutual risks and impacts on fishing activities when shared marine spaces are proposed. It emphasises that the effectiveness of this approach hinges on CGG's willingness to make reasonable efforts to act.	This assertion has been raised multiple times, with the titleholder requesting the stakeholder explain how this data can assist where the currently supplied data can not. At the risk of damaging relationships further, this has not been responded to this time. Please refer to Apendix C1, where consultation with this stakeholder, including this assertion, is described in detail.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3194	2886	There is no "gas shortage," just a shortage of ethics and integrity from the gas cartel offering data in declining gas usage and querying the AEMO conclusion that more supply is needed for domestic demand. LINK provided.	Titleholder acknowledged individual and communities views on the ongoing need for gas in Australia and provided CGG perspective based on current AEMO expected demand and Australian Government Policy drivers. Titleholder advised that matters of national energy policy were not within the purview of the Regia MSS and suggested the individual direct their concerns to their State or Federal members of parliament and the State and Federal Resources minister. (Event ID: 2634)
3195	1673	There is no acceptable level of environmental impact or risk	Petroleum activities do not operate to a no-impact standard. Instead, the Regia MSS is required to define the acceptable levels of impact and risk, and work below those levels. Acceptable levels of impact are established based on relevant up-to-date technical and scientific studies, government advice, and are considerate of the information gathered through the consultation process. This information is used to make predictions of the levels of impact we expect to occur and compares those to the previously defined acceptable levels and is presented in the Environment Plan.
3196	3386	They have not received feedback on their submission or any indication of intended consultation. After CGG's request for clarification on October 12, the writer confirmed their representation of AMCS in a response on October 13, summarising their concerns. However, they have not received any further communication from CGG about a consultation meeting	Response Event ID 3368 explains that we carefully consider and review each submission, calling on specialists where required, to ensure each point has been understood thoroughly, researched, and any action or measure required put in place. This can be a longer process, and to avoid consultation fatigue, we endeavour to respond when we have all the requested information in place to provide to you.
3197	4794	They state that law mandates that these consultations should be appropriate to their communal interests	Responded in Event ID 4973: CGG's approach to consultation during the preparation of an Environment Plan is fundamentally rooted in legislation, case law and previously accepted approaches by other titleholders. We agree with paragraph 7 of your letter dated 13 June 2024, which addresses s25(2) of the Regulations quoting Santos NA Barossa Pty Ltd v Tipakalippa (Santos) and stating that consultation needs to be "appropriate and adapted to the nature of the interests.
3198	2094	This feedback asserts that the timeline for project approval is 183 days from the date of approval, not from the registration of the project with NOPTA, indicating a potential misunderstanding or miscommunication about the regulatory process.	It appears you may be conflating the roles of our two petroleum regulators, NOPTA and NOPSEMA. Once again, the title instruments required have no bearing on how we manage environmental impacts and risks. Therefore, questions about titles are best directed to NOPTA (Event ID 124).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3199	2100	This statement argues against the proposed drilling by highlighting the shift away from fossil fuels. It emphasises the destruction of the environment and local ecosystems, asserting that this stance is self-evident and does not require further justification.	Gas has successfully been developed in the Otway for 25 years, including the successful co-existence of seismic surveying with the fishing, shipping, port infrastructure, and other marine users. If. you have particular places you'd like to see protected please let us know on this map so that we can acknowledge them and consider how best to protect them (Event ID 2100).
3200	2101	This statement expresses solidarity with Cetaceans (such as whales), emphasising a personal connection and a sense of kinship with these marine animals. It reflects a commitment to their protection, underscoring a belief in the intrinsic value of these species and concern over potential harm to their wellbeing.	Thank you for your comment. We will not carry out our survey whilst Southern Right Whales are present in their reproductive biologically important area. We have meetings with the local traditional owners soon and look forward to hearing their stories, learning about their culture, and protecting sea country (Event ID 2101).
3201	4808	Thousands of signatories against the project.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3202	2275	Total opposition to seismic blasting and oil and gas exploration	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3203	1265	We don't need more oil and gas exploration.	The titleholder has noted, recorded and reported the objection to oil and gas activities.
3204	3746	Will only engage with the titleholder if commercially engaged to do so.	Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers participation in the consultation process. (Events 2930, 3350, 3856, 4039)
3205	4191	You couldn't care less about the environment, global warming or anything else.	The titleholder has noted, recorded and reported the objection to oil and gas activities.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
4377	6412	Stakeholder claims that the lack of consultation with local experts and scientists could lead to adverse effects on the Fairy Penguin colonies and other species.	Event ID 6882 (Doc ID 9096) - CGG consulted with Parks Victoria (PV) during the planning of the proposed survey, meeting on 11/08/2023. The consultation records are available in the EP (Appendix C2). PV raised concerns about the survey's proximity to the Twelve Apostles Marine Park, leading to a refinement of the survey area. Fairy Penguins were not mentioned in this meeting. CGG also consulted with the Warrnambool Coastcare Landcare Network and their Middle Island Penguin Project. A referenced expert in scientific literature was consulted about penguin foraging ecology and at-sea movements. They advised against relying on outdated population estimates for penguins due to rapid ecosystem changes and predation pressures. CGG has sent the F3 assessment from the Regia EP to the Professor for feedback and is awaiting a response. CGG also reached out to DECCA but has not received any information. Regarding the other individuals mentioned, they were consulted, with records available on the public website. The Regia MSS EP includes extensive references to studies by blue whale (EP E7 and F3) and Southern Right Whale experts. Additionally, a professor's work on Fairy Penguins is referenced, along with the Middle Island Penguin Project. CGG based its impact assessment on peer-reviewed literature, including studies by the scientists mentioned, and disagrees with any suggestion that knowledge was bypassed or cherry-picked. The process has been fully transparent, and CGG has actively sought additional relevant literature. CGG also met with Warrnambool City Council to discuss the Middle Island Penguin Project and is looking to support efforts to gather data on penguin populations.
3206	6313	Request for all future correspondence from CGG to be sent to EJA on behalf of GMTOAC.	Responded in Event ID 6429 stating that the project update had been sent to EJA, requesting stakeholder advise the Regia team if this hadn't been received. Explained that relevant persons and individuals who receive the update may have interest in the project separate to their role in an organisation, and in this case it is appropriate for individuals to follow the advice in the project updates and unsubscribe if they so wished.
3207	6315	Concerned about the timing of the decision-making process due to the holiday period and has requested an extension for the decision-making period to a date after 15 January 2025	This assertion was made to NOPSEMA
3208	6324	Concerns that points in submission from relevant person have been misunderstood or being obscured	In Event ID 6318, Regia team provided credentials of experts who made the assessment and asked the stakeholder to specificy the points they feel have not been understood.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3209	6325	Relevant person asserts that the Regia team do not care for their business	This assertion is rejected by the Titleholder. As shown in the consultation records and the EP a large amount of additional research and assessment has been undertaken on the stakeholders request.
3210	6326	The relevant person was concerned that they had not been notified of status updates of the EP re submission.	Event ID 6314 - The Regia team responded that the Regia MSS EP remains under assessment and that CGG would issue an update to all relevant persons on the status of the submission in due course.
3211	6327	Stakeholder was not satisfied with some aspects of the recipient's response to her Fairy Penguin report.	Event ID 6320 - The Regia team encouraged them to provide feedback.
3212	6341	The relevant organisation asserted that consultation has not occurred according to the standard required and therefore is not complete.	Event ID 6430 - The Regia team member clarified their duty under Section 25 of the Regulations, and restated CGG's position on historicial consultation efforts, including CGG's initial contact and request to co-design a consultation process, 660 days previous to the date of the letter.
3213	6341	Acknowledges it has taken time to develop an appropriate protocol for consultation and that they are open to suggestions on how consultation may best occur.	Event ID 6430 - The Regia team member provides feedback on the consultation and negociation protocol, highlighting lack of clarity with how the protocol can be applied to CGG's legislative requirements, the negotiation process, the activity area not being included in the scope, and questions how the protocol can be adapted to the activity (short duration), and how FPIC can be applied in a situation where other traditional owner groups have shared interests. It is stated that the feedback is made without prejudice and should not be taken as an unwillingness for dialogue and understanding of the need for a negotiation process, but rather that a consultation plan was expected.
3214	6341	Claims that the meeting held on 17 February 2024 could not properly and meaningfully progress consultations due to various reasons, including the limited time for each session, the complexity of the information presented, and the lack of specific tailoring to the risks of the proponents' activities in respect of GMTOAC and Gunditjmara functions, interests, and activities.	Event ID 6430 - The Regia team member responds stating that CGG has previously put forward their position regarding previous consultation effects as they relate to Section 25 of the regulations and so repeating them would be redundant. However the dates of initial communication (15 Feb 2023) and passage of time before receiving the promised consultation plan, (532 days) are described.
3215	6341	Objects to the fact that a single 45-minute meeting with only some members of a Traditional Owner group is not sufficient for representative decision-making or to be informed about technical petroleum activities that may have decades of implications for the environment.	Event ID 6430 - The Regia team member responds stating that CGG has previously put forward their position regarding previous consultation effects as they relate to Section 25 of the regulations and so repeating them would be redundant. However the dates of initial communication (15 Feb 2023) and passage of time before receiving the promised consultation plan, (532 days) are described.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3216	6341	Objects to the fact that the recipient has not provided updated versions of the EPs despite previous requests.	Event ID 6430 - CGG refute this claim. Each updated document of the EP has been updated on the Regia consultation hub, despite this not being mandated, and notification of this sent to all relevant persons. CGG have records that show GMTOAC and EJA staff both received and opended these notifications.
3217	6341	Requested information on whether the CGG agree to fund the costs of consultation, obtaining independent technical advice, and a strategic regional environmental and cultural assessment.	Event ID 6430 - The Regia team responded that CGG had no objection to payment of sitting fees, requested to be made aware of any fees the organisation, or any other party, sought to charge before any engagement. CGG requested that discussions about the cost of ongoing consultation should be tabled.CGG was open to discussion about what information the organisation may need to comission, but could not agree to the clause of their consultation and negotiation protocol that was tantamount to providing a blank cheque.The Regia team also stated that CGG was open to discussion about relevant strategic regional environmental and cultural assessment but that it was premature to offer a view on their agreeement to such a scope of work without initiating the co-design of the consultation process.
3218	6341	The relevant organisation requested CGG's views and comments on their Consultation Plan by 6 December 2024, including whether CGG was open to negotiation in respect of agreement-making with the organisation to discuss its activities in the Otway Basin.	Event ID 6430 - Titleholder responded clarifying between Negotiation and Consultation and outlined their believe that the provided Consultation and Negotiation Protocol blends the differences between consultation and negotiation creating a lack of clarity in how CGG is best to progress engagement whilst building respectful relationships. The titleholder stated that the feedback was made without prejudice and should not been seen as unwillingness to continue dialogue and understand the need for a negotiation process.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3219	6410	The sender asserts that the information provided by CGG is inconsistent and confusing and does not provide comprehensive or comprehensible information to relevant persons and the community.	In Event 6529, Regia team member states that the claims of inconsistency, between the EP and the consultation hub, are evidence of genuine consultation, with effective consultation and management processes, undertaken over an extended period of time. The comment that the stakeholder pointed to, was made when the previous Southern Right Whale (SRW) Conservation Management Plan was in effect, with survey timing scheduled for January, February, and March. Since then, the SRW National Recovery Plan was updated, changing the area listed as critical to the species' survival, particularly regarding the proposed Regia MSS area. As a result, the survey design was modified to increase separation from the reproductive BIA and the timing adjusted to align with transition periods between SRW and Blue Whale usage in the Otway region. To ensure transparency, CGG has published each version of the Environment Plan and consultation materials over the past 20 months.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3220	6412	Asserts that the consultation process for the Regia MSS project has not included scientific experts with local knowledge on Fairy Penguins	Event ID 6882 (Doc ID 9096) - CGG consulted with Parks Victoria (PV) (Event ID 2282)during the planning of the proposed survey, meeting on 11/08/2023. The consultation records are available in the EP (Appendix C2). PV raised concerns about the survey's proximity to the Twelve Apostles Marine Park, leading to a refinement of the survey area. Fairy Penguins were not mentioned in this meeting. CGG also consulted with the Warrnambool Coastcare Landcare Network and their Middle Island Penguin Project. A referenced expert in scientific literature was consulted about penguin foraging ecology and at-sea movements. They advised against relying on outdated population estimates for penguins due to rapid ecosystem changes and predation pressures. CGG has sent the F3 assessment from the Regia EP to the Professor for feedback and is awaiting a response. CGG also reached out to DECCA but has not received any information. Regarding the other individuals mentioned, they were consulted, with records available on the public website. The Regia MSS EP includes extensive references to studies by blue whale (EP E7 and F3) and Southern Right Whale experts. Additionally, a Professor's work on Fairy Penguins is referenced, along with the Middle Island Penguin Project. CGG based its impact assessment on peer-reviewed literature, including studies by the scientists mentioned, and disagrees with any suggestion that knowledge was bypassed or cherry-picked. The process has been fully transparent, and CGG has actively sought additional relevant literature. CGG also met with Warrnambool City Council to discuss the Middle Island Penguin Project and is looking to support efforts to gather data on penguin populations.
3221	6412	Asserts that the decision-making process regarding the project should not be left solely to CGG and needs to be closely overseen by NOPSEMA.	Throughout the consultation process, including Event ID's 1481, 1731 and 1499, the relevant person has been informed of the consultation and assessment process, including NOPSEMA's role as regulator.
3222	6420	Stakeholder suggested they may need information explained to them, regarding their concern around potential regional population impacts of seismically induced krill mortality within the ASA.	In Event ID 6414, Regia Team member agreed with stakeholder to hold meeting with the Regia marine science team to discuss matters further. This meeting is Event ID 6890
3223	6432	Asserts that CGG was never intending to blast the initial, larger ASA and always intended to reduce it based on public feedback.	In Event ID 6815, The Regia team stated the reductions made during consultation, planning, and environmental assessment processes, are significant and pertain to areas that might be surveyed in the future. These reductions clearly contribute to minimizing impacts and risks, which is a requirement of the activity design.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3224	6432	Asserts that CGG has been insincere, minimising accountability rather than engaging in meaningful environmental stewardship.	Regia has dedicated over 3,000 pages to understanding and developing a comprehensive environmental management program for the area where the Regia MSS will take place. The program includes an extensive and detailed discussion of the ecosystem, with a particular emphasis on the "complexity of population and ecosystem dynamics in the region." This work is supported by hundreds of citations. Additionally, Regia has conducted two years of community consultation, which is still ongoing. (Event ID 6815)
3225	6505	The sender questions the recipient's understanding of the agreed action items from their meeting.	The Regia team noted in Event ID 6518 that they did not agree that the stakeholders action item (as per Event ID 6513) was the one agreed upon, however still committed to providing the full review of the submission (Event ID 6815)
3226	6507	The sender questions how the NOPSEMA assessment process integrates public submissions and maintains transparency at this stage	Ongoing consultation processes was discussed with the relevant person via phone call (Event ID 6874). In addition, the following is included in project updates: Ongoing consultation will continue with relevant persons, organisations and authorities, and updates provided of any changes or new information as it becomes available. Relevant Persons are invited to contact us at any time with any new information they have concerning the project.
3227	6512	The relevant person expressed concern about the lack of interest in his model and its supporting material.	Event ID 6517 - The Regia team responded that they would like discuss the relevant person's calculations, which occurred in the online meeting (Event ID 6890) later that day.

3228	6512	The relevant person asserted that the Regia team's explanation of the precautionary principle needs clarification as there were many uncertainties.	Event ID 6517 - The Regia team discussed the precautionary principle. They responded that the quote the relevant person had pulled is from the NOPSEMA Safety Case Guidance and has not come from Environment Plan guidance. It also encourages a precautionary approach and does not apply the precautionary principle as defined in Section 391(2) of the EPBC Act. To be clear, taking precaution in impact/risk management and legally complying with the EPBC Act are two related and different things. The Regia team stated that they had routinely applied the former and assessed the latter in the EP, which I will provide you some reading on below. NOPSEMA Environment Plan Guidance focuses on implementing the legal definition. s391(2): The precautionary principle is that lack of full scientific certainty should not be used as a reason for postponing a measure to prevent degradation of the environment where there are threats of serious or irreversible environmental damage. The Regia team provided a link to an article which the relevant person may find helpful in understanding this and the two conditions precedent for its application: Federal Court confirms interpretation of the precautionary principle | Lindsay Taylor Lawyers Federal Court confirms interpretation of the precautionary principle Posted on October 28, 2022 by Liam Mulligan 11. Federal Court confirms interpretation of the precautionary principle. The Federal Court of Australia in Bob Brown Foundation Inc v Minister for the Environment (No 2) [2022] FCA 873 has confirmed how the precautionary principle is to be interpreted and applied under the Environment Protection and Biodiversity Conservation Act 1999 (Cth) ('EPBC ... www.lindsaytaylorlawyers.com.au They also stated that there is a distinction drawn between "uncertainty" and "scientific uncertainty" that is relevant to consider here. The word "uncertainty" itself has slightly different meanings when used in everyday speech versus a scientific context. In scientific discourse, it conveys the degree to which something is known. In the vernacular, the word conveys rather the sense of not knowing. The difference is subtle, but important. Regardless, there are two preconditions to satisfy when considering whether 'to postpone a measure to prevent degradation' and the case we have put forward in the Regia EP is that, with the measures put in place, there is no threat of serious or irreversible environmental

Feedback ID	Event ID	Feedback Summary	Titleholder Response
			damage from the Regia MSS. This renders any discussion about the scale of uncertainty moot in relation to application of the legally defined precautionary principle.
3229	6513	The relevant person asserted that CGG's logic around regional scale impacts of Regia MSS on larval krill within the CGG EP has some critical flaws, where their model did not attempt to quantify such effects and indicted the multiplier effect of currents (between 0 and 1 knot) on krill larvae mortality through the ASA is about 5x.	Event ID 6518 - The Regia team responded that they did not agree with the relevant person's written conclusion. They stated that they had considered the relevant person's paper and model and committed to providing them with more detailed feedback to understand its utility in an impact assessment. The Regia team requested more information on the model, all the references and underlying data used in the model including the code and calculations, and the numbers used for what appared to be mortality and reproduction estimates with references.
3230	6520	The relevant organisation asserted they did not have enough time to discuss the requested material from the Regia team prior to the meeting on 15 February 2025.	Event ID 6521 - The Regia team provided the material requested by the relevant organisation and stated that most of the information had been previously given to them or had been available online since September 2023. They stated that any changes are as result of: - The passage of time. - Incorporating new science and literature (such as the Gunditjmara Nyamat Mirring Plan). - Activity design reductions and/or improvements to management measures. - Responses to public comment and ongoing consultation. - Feedback from NOPSEMA's assessment.
3231	6520	The relevant organisation asserted that 'appropriate and adapted' consultation for them included consultation at duly convened meetings, with information in the format requested being received in advance of such meetings.	Event ID 6521 - The Regia team responded to the assertion made concerning the presentation and accessibility of information with a reiteration that throughout the consultation process, CGG had repeatedly offered tailored and bespoke communications, including numerous requests to meet with the relevant organisation to discuss their needs. In the absence of requests or feedback being received, CGG had endeavoured to provide information in multiple formats, including summarised information sheets and recorded webinars, and also made these publicly available, along with multiple forms of contact to request alternative communications. They provided an example of their compliance to the provision of information when a request was made: CGG was asked at the meeting in February 2024 to supply their assessment of impacts to the OUV of the Budj Bim Cultural Landscape, and fact sheets on Glass Eel and Southern Right Whale, which was promptly produced and given.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3232	6520	The relevant organisation asserted that the information requested is necessary to be reasonably informed about the proposed activities under the EP and its potential consequences on organisations functions, activities, and interests. They also assert that it is the duty of the titleholder to present this information to relevant persons in an appropriate, adapted, and meaningful way to give effect to the objects of consultation.	Event ID 6521 - The Regia team responded to the assertion made concerning the presentation and accessibility of information with a reiteration that throughout the consultation process, CGG had repeatedly offered tailored and bespoke communications, including numerous requests to meet with the relevant organisation to discuss their needs. In the absence of requests or feedback being received, CGG had endeavoured to provide information in multiple formats, including summarised information sheets and recorded webinars, and also made these publicly available, along with multiple forms of contact to request alternative communications. They provided an example of their compliance to the provision of information when a request was made: CGG was asked at the meeting in February 2024 to supply their assessment of impacts to the OUV of the Budj Bim Cultural Landscape, and fact sheets on Glass Eel and Southern Right Whale, which was promptly produced and given.
3233	6526	Concerns about the consultation process, including milestones and timeframes, consultation costs, confidentiality and intellectual property requirements	Event 6528 - The Regia team responded to the relevant person's request for information regarding the Regia Marine Seismic Survey (Regia MSS) consultation. They acknowledged the additions to the meeting agenda for 15 February 2025 and reiterated the need for written feedback on specific points from previous correspondence to prepare adequately.
3234	6526	Need for further technical advice in respect of the EP	Event 6288 - Titleholder recognised relevant persons perception of inequity in consultation process and outline regulatory requirements of the titleholder in the consultation process.
3235	6526	Expressed concerns about the ability of their client to navigate the volume of material without support.	Event 6528 - Titleholder responsed querying relevant persons intent around large request for information whilst raising concern about the requirement to navigate large volumes of information.
3236	6526	The sender raises concerns about whether the consultation process has provided sufficient information and a reasonable period for consultation.	Event 6528 - Titleholder responded advising that both sufficient information and a reasonable period for consultation had been provided, as evidenced in the consultation records.
3237	6880	The relevant person did not consider what had happened prior to their meeting with the Regia team on 14/02/25 consultation.	Event ID 6880 - The Regia team responded in-meeting and discussed co-design for the ongoing consultation process and stated they were happy to be guided on the relevant person's preferred method of consultation.
3238	6880	The relevant person was concerned that the Regia team were trivialising what was happening on Country.	Event 6880 - The Regia team responded in-meeting and provided overview of what CGG had undertaken to reduce impacts and risks of activity, specifically impacts to whales.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3239	6880	The relevant person was concerned that the EP only focused on 'big-ticket' items like whales and ignored the effects of seismic on other species.	Event ID 6880 - The Regia team responded in-meeting that the first half of the EP is associated with assessment work undertaken prior to commencing the activity. First and foremost, because there are so many different species, they explained that they had grouped species together from a physiological perspective. Secondly, the Regia team explained that their focus is on the mega-fauna and species which have protection under the EPBC act.
3240	6880	The relevant person said there was a genocidal hierarchy in picking and choosing which species live and dies.	Event ID 6880 - The Regia team responded in-meeting that the first half of the EP is associated with assessment work undertaken prior to commencing the activity. First and foremost, because there are so many different species, they explained that they had grouped species together from a physiological perspective. Secondly, the Regia team explained that their focus is on the mega-fauna and species which have protection under the EPBC act. The hierarchy is something in place by the Australian government. In terms of the effects of seismic, they stated that there are no mortal effects predicted to these species. A large majority are affected in a behavioural sense or not affected at all.
3241	6880	The relevant person wanted to ensure that the Gunditjmara people were protected environmentally.	Event ID 6880 - The Regia team responded in-meeting and discussed risk pathways on Sea Country. Discussed accidental oil spills, release of waste, invasive marine species and fauna interactions. Discussed impact pathways i.e. atmospheric emissions, light emissions, physical presence. Discussed planned discharges. In relation to underwater sound, there are 2 categories – continuous noise and impulsive sound. Explained data can take 12-18 months to process before they could get an image of rock layers.
3242	6880	The relevant person asserted that the finances of the project need to be spoken about in true context.	Event ID 6880 - The Regia team responded in-meeting and discussed confidentiality and intellectual property requirements. Explained sensitive information requirement and our obligation to make it private. Explained we have to submit it to regulator but it will fall under the SIR. We do not know what is sensitive until we are told. Explained the EP is published and made publicly available. If the information is reasonably publicly known, that information would be made public.
3243	6880	The relevant person asserted that the Otway region and Sea Country was unhealthy.	Event ID 6880 - The Regia team responded in-meeting with an overview of the Otway region and explained that it is a productive and dynamic environment holding a variety of species.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3244	6880	The relevant person was concerned that, in relation to the SCPP, their contribution would be part of the design rather than having it be something brought to the table to trigger consultation.	Event ID 6880 - The Regia team responded that they had put forward their case with the regulator and are continuing to engage with the organisation as there was a particular process they had to follow. Explained that they had engaged with Traditional Owners across the Otway Region and that the Regia team respect the relevant person's values and that it would be beneficial to exchange information on those values. Explained the SCPP could be a vehicle to discuss shared values.
3245	6880	The relevant person was concerned that an email sent to them was regarded as consultation.	Event ID 6880 - The Regia team responded in-meeting with an explanation of consultation efforts made with the organisation since 15th February 2023 and that they had an obligation to provide copy correspondence to NOSPEMA.
3246	6880	The relevant person was concerned that CGG would profit from the information they provide through consultation.	Event ID 6880 - The Regia team explained in-meeting that if the relevant person tells them the information they provide is sensitive, CGG and NOPSEMA are not allowed to publish it. The Regia team stated that the data licensed by CGG is only sub-surface data/scientific data from the survey.
3247	6880	The relevant person was concerned about impact of mother nature on the 90 day activity limit.	Event ID 6880 - The Regia team responded in-meeting that there may be times when operation would cease due to conditions.
3248	6880	The relevant person asserted that information provided by the Regia team needs to be simple, easy to understand and brought to the broader group so that everyone in the organisation has the same information.	Event ID 6880 - The Regia team responded in-meeting that some questions that have been previously raised by the organisation are difficult to respond to without providing a scientific response and using technical language. Provided the example of decibel thresholds. The Regia team explained that if someone had a scientific question, they would respond to that person and discuss the easiest way to share the information with the organisation. The Regia team also stated that every document had been made publicly available and they want to ensure everyone has access to the information. Offered a workshop to provide information on how to work the EP and locate information.
3249	6880	The relevant person asserted that future meetings with their organisation should be held on a weekend.	Event ID 6880 - The Regia team responded in-meeting that meeting over a weekend would be suitable with prior notice.
3250	6880	The relevant person asserted that they have a preference for face-to-face meetings/hybrid meetings.	Event ID 6880 - The Regia team responded in-meeting that during the next meeting they would allow more time to go into a deep Q&A regarding the organisation's concerns.
3251	6623	Asserted that they had not been able to identify answers to questions raised in the consultation materials provided by CGG.	Event ID 6859 - The Regia team responded by providing responses to questions raised with a letter annexure. Noted unease in attempting to answer detailed technical and scientific questions in the requested “plain non-technical language”, but stated that had done their best to ensure that answers are in a form that is appropriate and adapted to the audience.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3252	6702	Asserted that the Sea Country Protection program must be co-designed and led by Gunditjmara and/or with Traditional Owners of another adjacent Country.	Event 6880 - Regia team responded by acknowledging past consultation and advised that the Regia team have engaged with TO's across the Otway region as a whole. Titleholder shared that they acknowledge and respect your values and therefore need to exchange information on those values. Titleholder suggested that if relevant person did not think the SCPP was not the best vehicle to protect Sea Country they were invited to make alternative suggestions
3253	6690	Asserted that it would be beneficial for all parties to be fully informed on the proposed activity and its progress.	Event ID 6794 - The Regia team responded that at the start of consultation on the Regia MSS, CGG recognised the need for transparency in order to build trust with relevant persons. One aspect of this has been to publish the NOPSEMA assessment letters, which they had done on the web site and notified relevant persons via a project update. They stated that as this is not something that other titleholders do, and as the letter is essentially private correspondence meant for the addressee (CGG) only, there is a process that has to be undertaken before we publish the correspondence.Once the correspondence was ready to be published, the Regia team would notify relevant persons via a project update, as they had done previously.
3254	6879	Asserted general opposition to seismic activities.	Event ID 6879 - The Regia team responded in-meeting and provided project updates by way of information.
3255	6878	Asserted that the organisation is saturated by consultation requests and that engagement with the Regia team was about listening and understanding.	Event ID 6878 - The Regia team responded in-meeting with an overview of the SCPP and initiatives that could be run through the SCPP.
3256	6878	Asserted that their organisation requires a lot of lead time and need to be involved at the beginning of the process.	Event ID 6878 - The Regia team responded in-meeting and discussed the consultation position put forward to the regulator. Stated that they hoped the Eastern Maar people would understand the process and stated that they would be kept informed.
3279	6748	Relevant person stated that they had followed up seeking a response to questions made on compensation a number of times and were seeking a response	Event 6722 - Responded to relevant person clarifying the commitment to investigate the matter and advised the work on this was still ongoing a nd requested patience. Provided brief update on search for additional research that supports the FRDC findings and requested if the relevant person was able to access/ provide any other peer reviewed literature to support the claim

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3281	6749	If OMICC is correct and there are no impacts, providing compensation after the survey has no cost and should be agreed to in the scheme.	Event 6724 - OMICC announces that the latest version of the OMICC Otway Adjustment Protocol has been published, along with a video briefing for fishers, which can be accessed through a provided link. In the briefing, OMICC confirms that, following the relevant persons feedback, a "claim period" and a "lodgment period" have been incorporated into the definitions of the protocol. The claim period is set to 30 days after the end of any activity, while the lodgment period extends up to 6 months after the end date of any activity. OMICC further informs the relevant person that the OMICC Founders reviewed the request for claims up to 6 months after an activity. However, the decision was made to adopt a 30-day claim period, as this duration resulted in a positive compensation outcome for fishers affected by the Gippsland survey in 2019.
3282	6749	Small coastal towns rely on the fishing industry.	Noted, compensation protocol put in place.
3283	6759	The relevant person requests a response, emphasizing the need for an in-person meeting at the offices in Brighton. They also note that this is the third request for a meeting.	Event 6704 - OMICC acknowledges receipt of an email, which appears to be the first message received from the relevant person in the OMICC project inbox. They are seeking confirmation about whether the email was intended for the Otway Marine Industries Co-Existence Cooperative (OMICC) or one of the founding titleholders, CGG (Regia MSS) or ConocoPhillips Australia (Otway Exploration Drilling Program). If the email was meant for a specific titleholder or project, OMICC requests clarification so they can forward the message to the appropriate team.
3285	6594	Relevant person criticised VFA management of fishery and consultation	Event - 6595 Titleholder responded to relevant person outlining approach to assessment of fisheries and SRL, including assessment of mitigiations in place and advised the would not comment on VFA matters.
3286	6592	Relevant person replied to campaign sms - noted that seismic companies had not been honest with rock lobster fishermen.	Event ID 6595 - The titleholder responded that they could not comment on VFA matters and that they had undertaken a thorough assessment of potential impacts on SRL, including a further assessment on the effectiveness of the mitigations in place.
3287	6875	Asserted that they had experienced a fishing decline and suspected that seismic blasting was the reason.	Event ID 6875 - The Regia team responded in-meeting. Discussed that they had completed some analysis and presented data on long-term catchability and went through the analysis with the stakeholder.
3288	6875	Asserted that a lot of commercial fishers have had to 'sell-out' as a result of historic activities.	Event ID 6875 - The Regia team responded in-meeting. Explained that the Regia survey area had been reduced and provided an update on timeframes and duration.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3289	6875	Concerned about loss of fishing quota and questioned why it is commercial fishers that are wearing the impact.	Event ID 6875 - The Regia team responded in-meeting and explained that there is an impact of the seismic activity on lobster associated with their righting reflex. Discussed that they needed to look at what the resource tolerates. Discussed research boat in Tasmania and directed relevant person to recent research paper "Boom, Shake the Room."
3290	6876	Relevant person was concerned about how the protocol had been amended without fisher consultation.	Event ID 6876 - The Regia team responded in-meeting and explained that the protocol was open for comment to commercial fishers. Outlined the feedback received and the amendments made to the adjustment protocol as a result of consultation.
3291	6876	Raised concern about quota reduction.	Event ID 6876 - The Regia team responded in-meeting with discussion regarding egg rate production in the western fishery.
3292	6876	Asserted that they were dissatisfied the Regia team were not acknowledging their request for retirement of quota.	Event ID 6786 - The Regia team responded in-meeting and stated they had spoken with SIV and explained why retirement of quota is not the right way to pay compensation. Explained that the quota holder is not always the fisher and that it was the Regia team's position that the person on the water should be compensated. The Regia team also discussed anti-rivalry laws.
3293	6876	Concerned that tests showing effects on puerulus and soft shell requested by the relevant person had not been completed.	Event ID 6786 - The Regia team responded in-meeting and discussed UTAS study which looked into effects of seismic during different stages of juvenile development. Explained that the sample size was very small. Study showed that there is a repairing period.
3294	6988	Asserted the test claim button on the online form was not working.	Event ID 6990- Titleholder responded with a copy adjustment protocol which had hard copy claim forms attached. The Titleholder also provided the stakeholder with login details to access the online test claim form and supplied a step-by-step screenshot guide for how to log in.
3295	6966	Asserted that they remained committed to consulting with CGG about the proposed activity in line with their consultation and negotiation protocol.	In Event ID 7022, CGG responded acknowledging this and confirming that they also remained committed to consultation, as per Section 25 of the Regulations.
3296	6966	Asserted that the SCPP and strategic regional environmental cultural assessment, including any funding required to pursue these initiatives in a culturally competent way, would be the subjects of substantive consultation moving forward.	In Event ID 7022, CGG confirms it will seek to follow the Gunditjmara Consultation and Negotiation Protocol, while also meeting its legal obligations under Section 25 of the Regulations.
3297	6966	Asserted that CGG had previously represented that it would not commence certain activities without its SCPP in place.	In Event ID 7022 CGG encouraged GMTOAC and Gunditjmara to take part in the Sea Country Protection Program, which supports the identification and management of new, activity-relevant information through collaboration with participating First Nations people.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3298	6966	Asserted that though all information prepared by CGG was provided to Gunditjmara ahead of time using their Cultural Information Management System, there was not enough time to discuss the information sheets and other requested materials prior to the 14 February 2025 meeting.	Noted
3299	6966	Asserted they were grateful for the efforts made by CGG to prepare consultation materials.	Noted
3300	6966	Asserted that receiving the finalised PowerPoint presentation one week before the native title meeting did not allow the relevant person enough time to consider materials and the structure of the 14 February 2025 session did not afford the time to discuss agenda items in full.	In Event ID 7022, the titleholder expresses their support for in-person, full group meetings with Gunditjmara, which include open-ended Q&A sessions.
3301	6966	Concern that if the documents provided by CGG remain unchanged, it will pose challenges for the relevant person to effectively participate in consultation.	CGG reaffirmed their willingness to make changes to the documents but requested further clarity regarding the format and expectations for future documents, particularly when technical questions are involved. CGG also noted its efforts to balance brevity and substance in the information sheets, aiming to be respectful while avoiding oversimplification that could appear dismissive (Event ID 7022)
3302	6966	Asserted that consultation be conducted via dedicated, Gunditjmara-specific, full group meetings.	In Event ID 7022, the titleholder expresses their support for in-person, full group meetings with Gunditjmara, which include open-ended Q&A sessions.
3303	6966	Asserted that their client was disappointed by the tone and insinuations made by CGG and would write to CGG separately.	Titleholder recieved separate correspondance from GMTOAC (Event ID 7004) and responded in Event ID 7023.
3304	7004	Asserted that they felt the meeting with CGG on 14 February 2025 had gone well and was a positive first step towards meaningful consultation with Gunditjmara.	In Event ID 7023, Titleholder extended their gratitude for the meeting.
3305	7004	Asserted that they were disappointed with CGG's letter of 4th March 2025 as they felt it questioned their right to be consulted in the manner that is appropriate and adapted to their interests and their right to independent advice.	CGG expressed regret that its correspondence was perceived as questioning the approach to receiving independent advice, clarifying that this was not its intention and reaffirming a commitment to respectful and collaborative engagement. CGG also reiterated the need for clarity regarding correspondence involving EJA as an intermediary, emphasising that its request for transparency aligns with legal obligations to report consultation details to NOPSEMA (Event ID 7023)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3306	7004	Asserted that CGG's questioning of their right to ask detailed questions is not appropriate and not appreciated in the light of efforts to build a relationship through consultation.	CGG emphasised that their request for clarification should not be seen as a refusal to provide the requested information, but rather a need to ensure they meet GMTOAC's expectations. CGG reiterated their previous offer to provide information through various formats such as webinars, videos, or one-on-one meetings. CGG also highlighted their commitment to transparency by publishing all iterations of their Environment Plan, including external assessments and correspondence with NOPSEMA, in order to build trust, and expressed disappointment at being assumed to withhold independent advice. CGG expressed disappointment that GMTOAC has chosen not to share the preliminary technical advice referenced in the EJA letter of 6 February 2025, which is now considered confidential. CGG noted that sharing this advice would support mutual understanding and help achieve better environmental outcomes, particularly given the alignment with GMTOAC's own Consultation and Negotiation Protocol. CGG also highlighted a disconnect between written requests from representatives and the questions raised during direct engagement, with some Gunditjmara attendees appearing unfamiliar with the proposed activity (Event ID 7023).
3307	7004	Concern that if the documents provided by CGG remain unchanged, it will pose challenges for the relevant person to effectively participate in consultation.	CGG clarified that they had not changed their position on consultation with GMTOAC and Gunditjmara and were not making the insinuations claimed. However, they emphasised their legal obligation to provide NOPSEMA with a consultation report detailing the consultations undertaken, and therefore, it was reasonable for them to request transparency and clarity about the specific individuals they had consulted with (Event ID 7023).
3308	7007	Relevant person asserted there had been misunderstandings with information and communication between CGG and another stakeholder which led to unfortunate assumptions by CGG.	CGG clarified that while they cannot discuss specific private correspondence, they wanted to provide insights into their consultation process and scientific practices. They explained that during consultation, all stakeholders are invited to share information, but any received information must be validated for relevance and accuracy, similar to the peer review process in scientific research. Peer review ensures quality, credibility, and error detection. CGG acknowledged that feedback can be challenging to receive but is crucial for transparency and improving future work. They concluded by expressing appreciation for the stakeholder's participation and emphasized their commitment to protecting the environment while managing the proposed activity (Event ID 7024)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
3309	7007	Asserted that there were a number of concerns about Fairy Penguins that require attention, and they will write to us with these in due time.	In Event ID 7024, CGG responded to comments about Fairy Penguins by encouraging the provision of new relevant information for their marine science team's assessment.

Annex 5 – Information Received

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1000	168	Stakeholder noted attached information doesn't provide details of survey effort, locations or proximity to Australian Marine Parks.	Appendix E1 Section 4 and 8.	The titleholder responded with the relevant documents and shape files for both the proposed activity and environmental planning. The titleholder confirmed that they were refining the project they engaged with stakeholders therefore changes/refinements to the areas or plans may occur. (Event ID: 559, Document ID: 333)
1001	405	Provided secondary email contact. Advised email to resend initial letter. Could not confirm receipt of initial letter, advised the original email is a business and email could have been deleted.		Correspondence was sent to the revised email address provided; receipt confirmed via phone call (Event ID 3914).
1002	428	Highlights the ecological importance of the area as a significant birthing and migration site for endangered southern right whales, which visit annually.	E7 Section 4.3.6, F3 Section 4.1	We are about to start our environmental assessments and will include details about how we plan to protect southern right whales and minimise our interference with local fishers. Keep informed of updates by registering for our newsletter and our webinars (Event ID 428).
1003	529	FIA's are marine conservation, advocacy and community support in subject areas, including being residents in affected communities.		Information used to inform consultation process
1004	537	Highlights that numerous scientific studies have investigated the impacts of seismic surveys, specifically noting that several studies have been conducted in the region of Tasmania and King Island.		The information was noted. No further action required.
1005	560	Recommendation to continue to engage with relevant councils as key stakeholders		Advised that we have engaged with local councils adjacent to the proposed activity area. No further action required.
1006	626	Regia MSS's brief flyer only mentions the presence of Pygmy Blue Whales	E7 Section 4.3.5, F3 Section 4.2	The titleholder informed the stakeholder that a full environmental assessment utilising information sources provided by the stakeholder was being conducted, and provided a link to the project website where the documents could be found (Event ID 724).
1007	626	In 2019 and 2023 at least this region was a birthing and nursery area for Pygmy Blues and Sperm Whales (the data is not formally published in journals at this stage, but is on the biological database of the Department of Environment).	Appendix E7 Section 4 and 8, F3 Section 4.2	Advised that no validated scientific data exists to confirm presence of sperm whale birthing and nursery areas in the area where the Regia MSS will occur. All relevant data on Pygmy Blues has however been assessed.
1008	648	Advised of email address for staff member that could be contacted in their place.		The information was noted. No further action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1009	653	The stakeholder requests , the EP must: identify and manage all impacts and risks on Australian marine park values (including ecosystem values) to an acceptable level and has considered all options to avoid or reduce them to as low as reasonably practicable.	D4, E1	CGG has assessed risks and impacts to Marine Parks in Appendices D4 and E1 of the EP. The closest marine protected area is the 12 Apostles State Marine Park. CGG will implement anactivity limitation with no operational activity within 5 km of this Park
1010	653	The proposed operational area intersects the West Tasmania Canyons and the Bonney Coast Upwelling. Both features are areas of high productivity and aggregations of marine life	A2, F3 Section 4.13	The active source area does not overlap with the West Tasmania Canyons and the Regia MSS will not be operating during the summer months of high productivity in the Bonney Upwelling.
1011	653	The operational area is adjacent to, and appears to overlap, recent seismic activities undertaken by ConocoPhillips and is near another proposed seismic activity.	A2, F1	CGG undertook a cumulative impact assessment to ensure other projects in the Otway (see Appendix F1). There will be no overlap with drilling activities and the Regia MSS. The overall cumulative impact is considered low.
1012	653	The operational area is adjacent to and overlaps the following biologically important areas:Presence of Southern Rock Lobster and Giant Crab within the proposed acquisition area, including previously excised areas in the recent ConocoPhillips acquisition.	E1, E4 Sections 4 & 8, F3 Sections 4.5 & 4.6	CGG has acknowledged the presence and assessed the impacts of seismic sound to Southern Rock Lobster, and Giant Crab in relation to the acquisition area across the EP including Appendices to E1, E4, and F3.
1013	653	The operational area is adjacent to and overlaps the following biologically important areas: Pygmy Blue Whales' seasonal feeding aggregations are supported by upwelling systems located at the Bonney Upwelling system and adjacent waters off South Australia and Victoria. Whales predominantly occur in these regions from November to May. Research to date has found that Pygmy blue whales occupy the western are of the Bonney Upwelling system in the Eastern Great Australia Bight and adjacent to the Kangaroo Island canyons from November to December – with high variability of abundance between and within seasons – 'Conservation Management Plan for the Blue Whale'.	E7 Section 4.3.5, F3 Section 4.2	CGG has acknowledged the presence and assessed the impacts of seismic sound to Pygmy Blue Whales in relation to the acquisition area across the EP including Appendices E7 and F3.
1014	653	The operational area is adjacent to and overlaps the following biologically important areas: Foraging areas for numerous protected seabirds.	E5 Section 8	CGG carried out a full impact assessment on seabirds (see Appendix E5) that may be undertaking biologically important areas in the vicinity of the operational area, and the predicted levels of impact were below acceptable levels of impact.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1015	653	The operational area is adjacent to and overlaps the following biologically important areas: Core use and range area for the Southern Right Whale ('Draft National Recovery Plan for the Southern Right Whale'). Impacts within the species' range is an identified risk in the plan emphasising the need to ensure injury and, or, disturbance is minimised, including from the impacts from anthropogenic underwater noise – particularly as whales demonstrate site fidelity.	E7 Section 4.3.6, F3 Section 4.1	CGG has acknowledged the presence and assessed the impacts of seismic sound to Southern Right Whales, in relation to the acquisition area across the EP including Appendices E7 and F3.
1016	653	The EP must clearly demonstrate that the activity will not be inconsistent with the South-east Commonwealth Marine Reserves Network Management Plan 2013-2023	B2	CGG as part of its obligations ensures that its EP complies with all relevant legislation that applies to offshore activities. These are designed to ensure the protection and preservation of the marine environment and the sustainability of its resources. This is consistent with the SECMRN management plan which was proclaimed for the purpose of protecting and maintaining marine biodiversity, while allowing for the sustainable use of natural resources in some areas, and contributing to the NRSMPA.
1017	653	Spatial avoidance of fishing grounds or temporal avoidance of fishing seasons is recommended.	A2	The titleholder responded with an explanation that the Regia MSS team are consulting with fishers to identify appropriate controls to manage impacts to fishers and stock. Based on feedback to date, the following exclusion zone will be implemented: No acquisition in water depths of less than 50m as this is protective for abalone divers, abalone, and other recreational marine users. (Event ID: 1751)
1018	653	Noted the acquisition area is 37 km from Nelson Marine Park and 33 km from Zeehan Marine Park which form part of the South-east Marine Parks Network. If activity is not effectively managed, it could affect the parks' natural, social and economic values.	A2, E1	There is no overlap with the acquisition area and Nelson Marine Park and Zeehan Park
1019	653	Noted planned activity does not overlap an Australian Marine Park. As such, there are no licencing requirements from the Director of National Parks.		The information was noted. No further action required.
1020	653	Information on the values for the marine parks can be located on the Australian Marine Parks Science Atlas.	E1 Section 8	CGG has considered this information in its Physical Presence Impact Assessment in E1.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1021	653	Further information for Zeehan and Apollo Marine parks can be found in the South-east Commonwealth Marine Reserves Network Management Plan 2013-2023.		The information was noted. No further action required.
1022	653	Asked Regia MSS to take note of the guidance note created by the stakeholder and NOPSEMA outlining what titleholders need to consider and evaluate.	E1	CGG has consulted with the Director of National Parks.
1023	781	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1024	788	***Redacted***	E8	***Redacted***
1025	792	Stakeholder is now retired so provided contact details for the person acting in the role.		The information was noted. No further action required.
1026	820	***Redacted***	E8	***Redacted***
1027	823	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1028	823	Stakeholder provided details of functions, interests and activities: family run a local business that relies on tourism.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1029	832	The stakeholder informed the titleholder of their role which is the collection of Marine Debris (plastics) along our ocean beaches. They want to be assured that the activities out at sea will not result in increased rubbish washing up.	D1	CGG has considered this information and has included a risk assessment in the EP (Appendix D1) to ensure the accidental release of materials from the vessel is minimised. CGG will have a Garbage Management Plan, Streamer Recovery Units, Garbage Record Books, and OVID style inspections to ensure compliance and to ensure no waste from the activity washes up on any local beaches.
1030	835	As a member of Portland Field Naturalists Club, the stakeholder watches whales and seals and also pelagic and shorebirds along the southwest coast of Victoria	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1031	840	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1032	852	***Redacted***	E8	***Redacted***
1033	886	Stakeholder mentioned the Southern Right Whales that migrate to Warrnambool every year to give birth.	E7 Sections 4.3.6 and 8, F3 Section 4.1	CGG acknowledges this information and has condsidered impacts to SRW's that migrate to the waters off the coast of Victoria in EP Appendices E7 and F3.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1034	918	The Regia MSS is proposed within Eastern Maar unceded territory	A2	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. There is a buffer of 17km around Deen Maar.
1035	918	Confirming Eastern Maar Aboriginal Corporation (EMAC) represents the rights of the Eastern Maar.		Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1036	948	The stakeholder stated that abalone typically do not inhabit depths greater than 30 meters.	A2 Section 4	CGG has adopted a minimum survey depth of 50m.
1037	948	The stakeholder recognised the disease outbreak that affected the abalone in Portland in 2019, and highlighted the importance of giving areas time to recover.	A2	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. CGG has adopted a minimum survey depth of 50m.
1038	948	The stakeholder recognised other fishers who may be impacted and consented to share their details.		The information was noted. No further action required.
1039	948	Fishers explained that abalone divers have a high degree of self-regulation, attributed to the smaller number of divers, which enables easier consensus on areas to leave fallow.		The information was noted. No further action required.
1040	956	Given the location, the the stakeholder believed there weren't any risk of interaction with the Saturday races since they don't venture that far offshore. However, he mentioned a large yacht race from Queenscliff to Port Fairy, where participants take the fastest route but may need to tack out depending on wind conditions, sometimes reaching 3 to 4 nautical miles offshore.		The information was noted. No further action required.
1041	989	The stakeholder suggested that the recipient should advertise the event in the AB community news sheet	C2	I can confirm that we have contacted the editor to request placing an advert in the newsletter.
1042	1040	Stakeholder took part in an online survey and advised they would like to be deemed a relevant person for the purpose of consultation and has requested a meeting.		Undertook consultation process with Relevant Person. No further action required.
1043	1180	The proposed activity area is important for Eastern Tuna and Billfish Fishery concession holders.	E1 Section 4.1	Information was noted but fishery activity in the Operational Area was assessed as low with less than 5 fishers during 2010 to 2020. See Table E1-5 1: Fishery effort is typically concentrated along the NSW coast and southern Queensland coast

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1044	1181	Tuna Australia represents members of the Eastern and Western Tuna and Billfish fisheries of Australia which includes the operational area of Regia MSS. Members target tuna and associated baitfish stocks such as Yellowfin Tuna (Thunnus albacares), Bigeye Tuna (T. obesus), Albacore Tuna (T. alalunga), Broadbill Swordfish (Xiphias gladius) and Striped Marlin (Tetrapturus audax) and some target Southern Bluefin Tuna (T. maccoyii). Target fish species are from internationally shared highly migratory fish stocks. Fishing effort is variable, and is related to but not entirely, ocean pelagic habitat. Due to climate change and increased fish abundance, we have observed significant changes to fishing grounds, with some fishing effort moving 1500kms.	E1 Section 4.1	Information was noted but fishery activity in the Operational Area was assessed as low with less than 5 fishers during 2010 to 2020. See Table E1-5 1: Fishery effort is typically concentrated along the NSW coast and southern Queensland coast
1045	1244	***Redacted***	E1, E8	***Redacted***
1046	1251	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1047	1317	Stakeholders ancestry includes connections with the ocean through livelihoods.		Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1048	1317	Stakeholder is the curator of Portland Bay Beacon, facilitating community discussions.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1049	1325	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1050	1333	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1051	1335	The stakeholder mentions being a regular visitor to the coastline for recreational purposes, indicating potential knowledge of fishing locations.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1052	1389	The stakeholder identified themselves as a relevant person because they are passionate about climate change and conservation.		Regia MSS Environment Team responded to each assertion and provided thorough feedback and information, including providing links to research on seismic studies, humpback whale studies, impact surveys on marine life.
1053	1432	Commenter mentions that they dive along the coastline from Port Campbell to Portland throughout the year.	E8 Section 8.2	We understand that divers may be affected by the activity which is why we'd like to know where and when you're diving so that we can implement a SIMOPS plan in accordance with DMAC guidelines. One of the team will be in touch with you to discuss your activities (Event ID 1432).
1054	1432	A scuba diving instructor, notes witnessing significant changes in the local ocean environment over the past 40 years.		The information was noted. No further action required.
1055	1438	The maximum area fished applies the five boat rule and expands reporting to 1-degree squares, shading the entire square to indicate any fishing activity. This means there could be just one fishing event within a shaded 1-degree square.		Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1056	1438	The effort/intensity data (red/pink) indicates catch intensity at a square kilometre scale, excluding areas where data is reported by fewer than five boats.		Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1057	1438	ABARES maps reflect the catch and effort restraint of AFMA's information disclosure policy		Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1058	1529	There is a strong objection to the idea of peak bodies receiving compensation, suggesting that such payments should not be directed to these organisations but rather to individual fishers or affected parties.	Refer to Otway Adjustment Protocol	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1059	1529	There is a clear objection to compensation being directed solely to license holders, emphasising that payments should instead be made to boat owners and those actively engaged in fishing.	Refer to Otway Adjustment Protocol	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1060	1529	Shark/ gillnet and trawl fishers provided information about the potential displacement from northern fishing areas within Victoria/P79 due to seismic activities. They highlighted that fishing plans can be affected by weather conditions.	Refer to Otway Adjustment Protocol	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1061	1529	Participants referenced a historic protocol by Origin Energy, where the seasonal quota for SRL was retired as a compensation measure.	Refer to Otway Adjustment Protocol	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1062	1529	Fishers indicated that SETFIA (South East Trawl Fishing Industry Association) represents members of the trawl sector in Portland and emphasised the importance of ongoing consultation with this organisation.		Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1063	1529	Discussion around the fishing areas/ targeted areas and Regia MSS current exclusions commitments. Information received confirmed zones as Trawl fishing from 200m out, Sharknet and some Trawl within 200m, SRL targeted in 20-70m depths.	Refer to Otway Adjustment Protocol	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1064	1529	Discussion around critical lifecycle stages, feedback that February to April better time for SRL, and that Shark flagged that Gummies are spawning during May.	B8 Sections 4 & 9, E3 Section 4, E4 Sections 4 & 8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1065	1649	Individual identified as running two relevant not-for-profit fishing associations		CGG identified and contacted the stakeholders associations in February 2023, at the start of the consultation process, requesting engagement (Event IDs 4202, 4203 & 3210)
1066	1655	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1067	1659	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1068	1661	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1069	1662	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1070	1663	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1071	1665	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1072	1666	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1073	1668	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1074	1669	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1075	1669	Registered their vote AGAINST Regia's proposal.		Information noted but no further action required.
1076	1670	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process
1077	1672	Stating they are a member of OCEAN, Org ID 190		Information used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1078	1686	Stakeholder sent a brief email to advise they were the CEO for SETFIA and SSIA, explaining Atlantis Fisheries Consulting Group is a company engaged by the aforementioned associations.		Information used to inform consultation process
1079	1737	A map was provided of the Tasmanian jurisdiction for rock lobster and giant crab	A2	There is no overlap of the active source area with the Tasmanian fishing sector.
1080	1738	Stakeholder emailed detailed documents of dive sites as attachments and advised other divers use these and other sites up to 2 km out from shore.	E8	Multiple measures undertaken to manage interaction with divers
1081	1740	Recreational fishing activities		Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1082	1740	Involvement in fishing charters		Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1083	1742	The stakeholder stated the environmental planning area extends into Tasmanian jurisdiction for rock lobster and giant crab, and in addition, abalone and octopus fishing.	A2, E4	There is no overlap of the active source area with the Tasmanian fishing sector. No impacts predicted within Tasmanian jurisdictions.
1084	1760	Provided information on previous scientific work undertaken in area: Investigator p190 - modelling and possibly measurements done, Crowes Foot - modelling for impact on lobster and suggested mitgations, no measurements and unsure if mitigations were accepted and undertaken, Enterprise - modelling for biological impacts and safe diving distance, no measurements. Other measurements of seismic in area: west coast Tassie T48P, Aargon west side King Island, Essential and Kerr McGee Robe.		Information noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1085	1780	Stakeholder informed us that 'The Arches" is a popular dive site and located inside a Marine Park and therefore protected.	E1	The information was noted. No further action required as Regia MSS is 25km away and does not impinge on any marine parks.
1086	1783	Research findings on the effects of seismic testing on penguins, showed avoidance of preferred foraging areas during seismic testing.	B8 Section 7, E5 Section 8, F3 Section 4.4	CGG has considered this research and it has been included in the EP-Appendix B8 Seismic Studies and Appendix E 5 Section 8

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1087	1783	Middle Island is home to seabirds such as the Short-tailed Shearwater, the Black-faced Cormorant, and the Little Penguin.	E5, F3 Section 4.4	The Regia EP has conducted a thorough assessment of the literature and found there will be minimal seismic impacts to birds on Middle Island. The MSS will not pose any threat to the long-term health and sustainability of the bird populations on Middle Island. Foxes remain the greatest threat to long term survival of resident birds. See E5, F3
1088	1783	Background on the Middle Island Penguin Project and the use of Maremma Guardian Dogs to protect Little Penguins from foxes.		The information was noted. No further action required.
1089	1784	Research findings on the effects of seismic testing on penguins, showed avoidance of preferred foraging areas during seismic testing.	B8 Section 7, E5 Section 8, F3 Section 4.4	CGG has included this research in the EP- Appendix B8 Seismic Studies and Appendix E 5 Section 8
1090	1784	Potential decrease in the penguin population due to the adverse effects on foraging behaviour.	B8 Section 7, E5 Section 8, F3 Section 4.4	CGG acknowledges this information and has addressed poytential impacts to penguin foraging behaviour in EP Appendices E5- Section 8 and F3 Section 4.4.
1091	1784	Penguins began foraging significantly further from the seismic survey vessel when in operation.	B8 Section 7, E5 Section 8, F3 Section 4.4	CGG acknowledges this information and has addressed the impacts of seismic on penguin foraging in EP Appendices E5- Section 8 and F3 Section 4.4.
1092	1784	Increased stress and fatigue on birds due to having to travel further for food.	B8 Section 7, E5 Section 8, F3 Section 4.4	CGG acknowledges this information and has addressed the impacts of seismic seabirds in EP Appendix E5- Section 8
1093	1784	Decreased chances of penguins returning to their chicks and survival.	B8 Section 7, E5 Section 8, F3 Section 4.4	CGG acknowledges this information and has addressed potential decreases in penguins and chick survival in EP Appendices E5- Section 8 and F3 Section 4.4.
1094	1785	***Redacted***		***Redacted***
1095	1815	The stakeholder stated that they would not be in a position to address objections and claims raised by members and that their scope of work would need to be clear.		Stakeholder interests were noted. No further action required.
1096	1815	The stakeholder stated an expectation to receive a fee for service arrangement.		Stakeholder interests were noted. No further action required.
1097	1815	The stakeholder provided information that their policy position and fee for service arrangement would be available in a month and would be for the provision of information only.		Stakeholder interests were noted. No further action required.
1098	1890	The stakeholder provided the locations of surf priority sites both along the coast and 1km from the coast.	A2	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. CGG has implemented a minimum depth threshold of 50m.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1099	1890	Provided details of their functions, interests and activities as a surf group representing over 100 members from Apollo Bay to Warrnambool/Port Fairy with a function to preserve and protect the marine environment.		Stakeholder interests were noted. No further action required.
1100	1891	The stakeholder stated that they function solely as the administrative body and do not act as representatives until they have received direction from Traditional Owners.		Information was noted and used to inform consultation.
1101	1891	The stakeholder recommended that titleholder's review the process used for listing Budi Bim as a UNESCO World Heritage site, and emphasised the cultural significance of the areas surrounding and connected to Budi Bim.	F3 Section 4.15	Advised that we're here to learn about country and what was significant in the region. Mentioned that we'd heard that Deen Maar was culturally significant (Event ID 1891).
1102	1891	The stakeholder mentioned that creating a sea country plan was on the agenda to help raise community awareness about the culturally significant sites in the region.		Information was noted. No further action required.
1103	1891	The stakeholder confirmed that Dean Maar holds cultural significance and recommended leaving it alone.	A2	Confirmed that a buffer of 17km has been put in place around Deen Maar (Event ID 1891).
1104	1891	The stakeholder advised they needed to speak to someone at the organisation who might be able to assist. Stakeholder provided contact name.		Information was noted and contact given.
1105	1891	The stakeholder advised not a native title holder, and that should consult with specific groups as well as well as Gunditjmirring and Eastern Maar.		Information was noted and used to inform consultation process
1106	1891	Stakeholder expressed that they prefer a collective request for information on (cultural values and sensitivities). Example of eight offshore wind proponents all wanting the same thing.		Information was noted and used to inform consultation process
1107	1891	Provided information that recent studies have revealed ancient cave dwellings and culturally significant sites located on the seafloor and within geological formations in other areas and hence should be aware of this during this process.		Information was noted and used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1108	1891	Advised that the Iluka silica/sand mine underwent a thorough assessment process lasting between 12 to 24 months, encountering some challenges but ultimately experiencing fewer consultation issues compared to other similar projects.		Information noted but no further action required.
1109	1892	There was a discussion regarding lighter-coloured lobster found along the 100m contour, which has not been fished due to current market dynamics.	Refer to compensation protocol	Intention to fish there if the market changes could be accounted for in a compensation approach (Event ID 1892).
1110	1892	The Victorian SRL is actively working towards achieving MSC qualifications.		Information was noted. No further action required.
1111	1892	Participants requested that the engagement and consultation process be transparent and consistent.		Information was noted and used to inform consultation process
1112	1892	Fishers reported that the Victorian Fisheries Authority (VFA) has revised its models for calculating fishing quotas. They noted that the community decided not to increase the quota this year, opting instead to maintain the current quota levels despite having the option to raise them.		Information was noted. No further action required.
1113	1892	Fishers expressed concerns about port facilities in Warrnambool, particularly noting previous damage that industry support vessels have caused.		Information was noted. No further action required.
1114	1892	Fishers discussed the current state of Giant Crab fishing, noting that the fishery is small and characterised by low quota levels.	E4 Section 4.2 & 8, F3 Section 4.6	Information was noted. No further action required.
1115	1893	Recommendation to consult with the Victorian Department of Energy Environment and Climate Action (DEECA) and the Victorian Fisheries Authority (VFA) for the consultation process.		Consultation was undertaken with these organisations, Org ID 330 and 13 respectively
1116	1924	Provided the fisheries present in the area		Information was noted. No further action required.
1117	1924	Provided information on process to obtain individual fishers contact details		Information used for identification of relevant persons
1118	1924	Provided contact details for additional associations AFMA suggest are contacted		Information used for identification of relevant persons
1119	2003	Use the Atlantis email address for communications with SETFIA and SSIA		Information used to inform consultation process
1120	2003	The trawl fishery is now 85% closed.		Information was noted. No further action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1121	2003	The hourly charges for contact with proponent and costs for SMS's sent to members.		Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers participation in the consultation process. (Events 2930, 3350, 3856, 4039)
1122	2003	SSIA is concerned about the impacts on the shark fishery (displacement). The shark fishery is 90% closed.	E3 Section 4.2	Stakeholder concerns were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1123	2003	SETFIA is concerned about the impacts on the fishery (displacement) and on the exploratory roughy fishery.	C2	Information used to inform consultation process
1124	2003	SETFIA (trawl) and SSIA (shark) are relevant association for which Atlantis holds the management contract	C2	Information used to inform consultation process
1125	2003	Members names and details are not released, however all members are potentially impacted as fishers in the west may be displaced to the east.	C2	Information used to inform consultation process
1126	2003	This exploratory roughy fishery is run by SETFIA, not SSIA.	C2	Information used to inform consultation process
1127	2006	Light pollution poses a challenge for shearwaters during their northern migration, as the birds are often attracted to artificial lights in towns. In response, a program has been initiated in Warrnambool to turn off lights when the shearwaters depart for their migration to Alaska at the end of summer.	Appendix E9 Section 4 and 8.	Information is noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1128	2006	Advised there are currently three cameras installed on Middle Island to monitor bird activity.		Information was noted. No further action required.
1129	2006	Advised shearwater breeding, which also occurs on Griffith Island, and black-faced cormorants are both present on Middle island.		Information is noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1130	2006	Advised penguins in the area are equipped with microchips but do not have GPS tags or trackers.		Information was noted. No further action required.
1131	2006	Advised penguins are observed year-round, with breeding activity typically beginning in August and September when they lay eggs. Population counts are generally conducted in September to monitor breeding trends and numbers.	Appendix E5 Section 4 and 8, F3 Section 4.	Information is noted and used to inform the analysis and assessment of impacts arising from the Regia MSS

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1132	2006	Advised in 1999, the penguin population on the island was approximately 90 birds, but recent counts have dwindled to just 6, primarily due to the threat posed by foxes. The project's objective is to protect the remaining penguins and increase their numbers.	Appendix E5 Section 4 and 8, F3 Section 4.	Information is noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1133	2007	The Southern Right Whale Study off GAB is a long-term research program designed to monitor the recovery of the Southern Right whale population.		Information was noted. No further action required.
1134	2007	The most recent population estimate for the species is derived from the acoustic monitoring conducted by McCauley as part of the Integrated Marine Observing System (IMOS) project.		Information was noted. No further action required.
1135	2007	Options for monitoring blue whales in the Otway region were discussed, highlighting the importance of both acoustic monitoring and aerial surveillance. Acoustic methods, such as those implemented by IMOS or fixed loggers positioned off the Thylacine platform, can effectively track the location and timing of whale presence. However, to gain a comprehensive understanding of the whales' behaviors and activities, aerial surveillance is also necessary to provide contextual information about their movements and interactions within the area.	Appendix E7 Section 4 and 8, F3 Section 4, G1 and G2	Information is noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1136	2007	The Blue Whale Study is not currently collaborating with any oil and gas companies in its research efforts.		Information noted but no further action required.
1137	2009	The stakeholder confirmed the accuracy of ABARES data.		Information was noted. No further action required.
1138	2026	The fisher confirmed specific fishing areas he operates in, detailing that he regularly fishes in blocks G12, G13, and H14, with occasional activity in block H13.		Information was noted. No further action required.
1139	2028	Stakeholder offered to assist with communications with recreational divers through their network, indicating a willingness to facilitate dialogue and information sharing between stakeholders.	Appendix E8 Section 4 and 8, and C2	Welcomed this and confirmed that we'd like to take up this offer near to the survey timing, once the final dates were known (Event ID 2028).

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1140	2028	Shared details about diving experience, noting they regularly use several dive sites and complete over 300 dives each year, both during the day and at night.	Appendix E8 Section 4 and 8	Acknowledge that it might be easier to coordinate SIMOPS if a commitment to only survey close to the coast at night was made. The other alternative was to distance the survey away from those sites. Noted that CGG would be completing more modelling in the future once the activity has been further refined. Committed to share this modelling with stakeholder when received (Event ID 2028).
1141	2029	The stakeholder confirmed availability to provide data for aggregated areas over previous surveys.		Information was noted. No further action required.
1142	2032	the stakeholder stated the effects on individual rock lobsters were well established but population level effects were not so well understood.	Appendix E1 Section 4 and 8, E5 Section 4 and 8, and F3 Section 4.	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1143	2032	The stakeholder confirmed that there were no research activities planning that may be affected by the activity but were open to undertaking research if needed with vessel time.		Information was noted. No further action required.
1144	2037	Stakeholder requested to be included on project updates.		Request was noted and actioned.
1145	2038	Stakeholder stated that the impacts of seismic blasts, which can travel hundreds of kilometers, especially on cetaceans, need to be better studied.	C2	At a joint briefing by Regia MSS and ConocoPhillips Australia, the representative of Regia MSS attempted to answer the question that followed this statement of information about seismic blasts but was cut off. (13/6/2023; Event ID 1655). There is no seismic testing scheduled for this project and that point has been reiterated in project information materials as it is clearly a matter of community interest.
1146	2038	Stakeholder questioned about the measures being taken to avoid operations during migration times of federally listed species, including endangered ones, in areas with high migratory species traffic like the Otway Basin.	A2	The Regia Mss team responded to information shared and a subsequent question about measures to ensure the project would not be operational during migration times for Federally listed species. The response affirmed that there would be both activity limitations and control measures.
1147	2073	Logans Beach is the only established nursery for southern right whales in south-eastern Australia, serving as a vital habitat for mothers and calves during the calving season.	Appendix E7 Section 4 and 8 and F3 Section 4.	We agree, it would be unacceptable to acquire seismic in a known Southern Right Whale calving area while they are present. So CGG commits to not undertaking seismic activities while Southern Right Whales are in the critical habitat defined in their conservation management plan. That plan identifies that the Southern Right Whales are likely to be present between May and November (Event ID 2073).

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1148	2097	The Bonney Upwelling is identified as essential for the survival of local marine species, underscoring its ecological importance.	E2 Section 4.3, F3 Section 4.13	Information was noted. A thorough analysis of the upwelling has been conducted and used to inform the analysis and assessment of impacts arising from the Regia MSS.
1149	2113	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	Appendix E8 Section 8.	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1150	2117	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	Appendix E8 Section 8.	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1151	2120	Stakeholder emailed as an attachment a paper published in 2023 regarding leatherback turtle foraging grounds in the Southern Ocean.	E6 Section 4, E7 Sections 4.3.6 and 8, F3 Section 4.1	CGG acknowledges this information and added the source into the EP Appendix E6 Section 4.
1152	2135	Stakeholder provided information regarding the potential effect to blue whale reproduction from displacement.	E7 Section 4 and 8, F3 Section 4.2	CGG acknowledges this information and it was considered as part of all material assessed for the EP.
1153	2135	Stakeholder provided information regarding sightings of skinny blue whales in the Bonney Upwelling and Otway suggesting they may be nutritionally stressed.	E7 Sections 4.3.5 and 8, F3 Section 4.2	CGG acknowledges this information and it was considered as part of all material assessed for the EP.
1154	2135	Stakeholder provided information regarding La Nina and climate pattern appears reducing prey availability for blue whales in Indonesia and sightings of skinny blue whales off NW Australia.	E7 Section 4 and 8, F3 Section 4.2	CGG acknowledges this information and it was considered as part of all material assessed for the EP.
1155	2135	Stakeholder provided information regarding energy trade offs in blue whale foraging techniques	E7 Section 4 and 8, F3 Section 4.2	CGG acknowledges this information and it was considered as part of all material assessed for the EP.
1156	2135	Stakeholder provided information on the differences between energy storage techniques in blue whales, southern right whales and humpback whales	E7 Section 4 and 8, F3 Section 4.2	CGG acknowledges this information and it was considered as part of all material assessed for the EP.
1157	2135	Challenges and feasibility of tagging studies regarding Blue Whales in the Otway region.		Information noted but no further action required.
1158	2135	Blue whales' feeding habits and reliance on prey-rich areas such as GAB, and the WA coast.	E7 Section 4 and 8, F3 Section 4.2	CGG acknowledges this information and it was considered as part of all material assessed for the EP.
1159	2255	The stakeholder emphasizes their role as a local member of the community and the planet, indicating a broader perspective beyond personal interests.		

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1160	2255	The stakeholder mentions their appreciation of the environment and awareness of the detrimental effects of the blasting activity on marine ecosystems.	Appendices E1 to E9 and F3	Information noted but no further action required.
1161	2255	The stakeholder highlights their activities in the southern ocean, indicating a personal connection to the marine environment.	E8	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1162	2256	***Redacted***	Appendices E1 to E9 and F3	***Redacted***
1163	2275	Reference to accurate information obtained from the Australian Marine Conservation Society		Information noted but no further action required.
1164	2275	Mention of suitably qualified scientists from the Australian Marine Conservation Society		Information noted but no further action required.
1165	2275	Circulation of social communications and videos related to the topic		Information noted but no further action required.
1166	2278	***Redacted***	Appendix E7 Section 4 and 8 and F3 Section 4.1.	***Redacted***
1167	2278	***Redacted***	Appendix E1 Section 4 and 8, E4 Section 4 and 8, and F3 Section 4	***Redacted***
1168	2282	The stakeholder outlined several dive sites that they used and that they completed >300 divers per year, both a day and night.	C2	Information was noted and used to inform the consultation process.
1169	2282	The stakeholder offered to assist with communications with recreational divers through her network.	C2	Welcomed this and confirmed that we'd like to take up this offer near to the survey timing, once the final dates were known. (Event ID 2282)
1170	2371	Mention of the high cultural significance of the Mornington Peninsula and Point Nepean to Bunurong People.	C2	The titleholder requested stakeholder availability for a meeting (Event ID 2917).
1171	2383	Vulnerable Plant and Animal Life: Reference to the need to protect marine life and the whale birthing nursery in Warrnambool.	E7 Section 4 and 8, F3 Section 4.1	Information noted but no further action required.
1172	2383	Indigenous Relationship with Land and Sea: Mention of the importance of indigenous culture and the significance of the Otway Basin Sea Country.	E1 Section 4.6 and F3 Section 4.16	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1173	2389	The stakeholder provided an information link to a protest in Port Fairy and to websites of other opposition groups.		Information noted but no further action required.
1174	2586	Stating they are a member of OCEAN, Org ID 190	C2	Information used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1175	2629	SRL key findings and implications from report (Document ID 1875) were as follows: There was no increased mortality in either lobster group, righting reflex was significantly impaired immediately after exposure for those in E0 and E500 treatments, recovery was observed after the first moult in juvenile E500 lobsters, while E0 juveniles showed persistent impairment after the second moult, ntermoult periods were significantly longer for E0 juveniles, suggesting potential slowed development and growth. Implications: Seismic exposure levels matched previous studies, validating the experimental approach, righting impairment extended to at least 500 m from the seismic source, persistent impairment in lobsters exposed at close range suggests a threshold beyond which recovery occurs, highlighting the need for careful management of seismic activities to minimize impacts on fisheries.	Appendix E1 Section 4 and 8, E4 Section 4 and 8, and F3 Section 4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. Reports are in database.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1176	2629	Adult pale octopus key findings and implications from report (Document ID 1875): Key Findings: The BACI analysis showed no impact on octopus CPUE at the fishing block level, though localized short-term declines were noted independently. No mortality occurred in either sex due to seismic exposure, but behavioural changes were observed: Males exhibited reduced adventurousness and feeding rates, females showed decreased maternal care as eggs approached hatching. Egg counts in exposed females suggested potential issues, though not conclusively linked to exposure. Physiological assessments indicated lower initial pH levels in males, with significant changes following exposure, elevated immune responses (phagocytosis) in exposed octopuses, alongside variable results for oxidative stress indicators, some evidence of neurotransmitter activity changes, potentially linked to behavioural impacts, no significant DNA damage or long-term impairments were detected. Implications: The study concluded no evidence of mortality or severe long-term effects from seismic exposure. Behavioural changes raised concerns about neuromuscular coordination and environmental interactions. Overall, the impacts were negligible at 500 m and almost non-existent at 1000 m, establishing a threshold for minimizing seismic survey impacts.	Appendix E1 Section 4 and 8, E4 Section 4 and 8, and F3 Section 4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. Reports are in database.
1177	2631	Stakeholder was thankful for being kept updated and advised weather had prevented a lot of diving activity recently and advised that from then on they would be highly active in the region.		Information noted but no further action required.
1178	2640	Stakeholder was thankful for being kept updated and advised weather had prevented a lot of diving activity recently and advised that from then on they would be highly active in the region.		Information noted but no further action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1179	2687	Proposed activity is in close proximity to 2 fisher communities, the King Island and north-west communities.	A2	Responded with information about how Regia EP identifies impacts and risks and subsequent mitigation plans. Acquisition area is ~100km away.
1180	2745	Provided information, contact details and links to 5 Registered Aboriginal Parties, for further engagement, and has extended help in engaging if no response is received.		Information noted but no further action required.
1181	2766	Species presence: Mention of the Southern Right Whale choosing the area for birthing their calves.	E7 Section 4 and 8, F3 Section 4.1	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1182	2766	Local environmental knowledge: Insights into the cultural heritage and significance of the Otway Basin Sea Country.	B3, E1 Section 4.6,F3 Section 4.1	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1183	2766	Fishing locations: Reference to the significance of the Otway Basin Sea Country and the importance of local elders in protecting the whale birthing nursery.	E1 Section 4.6, E7 Section 4 and 8 and F3 Section 4.1	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1184	2886	Stakeholder provided information as part of the objections and claims in the form of links to articles supporting the objection.		Information noted but no further action required.

1185	2886	Stakeholder cited a study showing reduced cetacean sightings (baleen and toothed whales) across large spatial scales across effects in seismic testing and control sites, with evidence of multi-species impacts from seismic survey noise on cetaceans. The stakeholder also cited studies to show that airguns can damage whales' hearing if they're fired within a kilometre or so of an animal, and can also be disturbingly loud at great distances. because they are both loud and ow-frequency creating a range of behavioural impacts dozens of kilometres away from airgun arrays. LINK provided.		CCG is committed to ensuring that marine mammals can continue to undertake biologically important behaviours within the Otway Basin. Several species of marine mammals (whales, dolphins, and seals) are typically found within the area where the Regia survey is proposed. Where underwater noise has the potential to affect marine mammals, mitigation and management measures will need to be in place. We are currently reviewing all mitigations to identify those that will be effective in managing impacts to whales, particularly southern right whale and blue whale which have been identified as undertaking biologically important behaviour within or close to the Regia survey area. As southern right whales have been identified as calving and resting within coastal areas adjacent to the survey area, we have committed to no acquisition to be undertaken when they are in these coastal areas. To determine when southern right whales are present or absent from these coastal areas, we will work with southern right whale researchers to develop appropriate survey methods. We have also altered our timing, following relevant person consultation, from a 6- month window (November – May), to two separate 3-month windows of April – June, or September – November. The activity will occur once in these windows between 2024 and 2028. The decision to alter timing reflects an additional priority for protection and the implementation of an additional impact management buffer for Southern Right Whales (SRW). SRW's remain our priority for protection, and we are now increasing the level of protection afforded to the biodiversity associated with the summer upwelling events. Finding ways to reduce impacts to these sensitivities has led to the implementation of: - an additional impact management area for SRW's (which extends 11.3km beyond the proposed reproductive biologically important area), and - the change in timing to avoid the expected increase in blue whales associated with the summer upwelling. In addition, we will not be acquiring in water shallower than 50m,

				increasing the survey's distance from shore and offering additional biodiversity protection. For other whale species, industry standard controls for seismic surveys that will be implemented as per EPBC Act Policy Statement 2.1: Interaction between Offshore Seismic Exploration and Whales are: - Two marine mammal observers will be present on the survey vessel with a minimum of one on watch at all times during day light hours to implement controls including shut down zones. - The acoustic source is ramped up over a period of 30 minutes with acoustic source components gradually added in sequence until operating level is achieved. - The seismic source ramp up (called a soft start) can only commence if no whales have been observed (minimum observation zone will be 3 km) in the previous 30 minutes. - If a whale is sighted during the soft start the acoustic source should is to be powered down to the lowest possible setting and the soft start cannot commence until the whale is no longer observed or 30 minutes has passed since the whale has been observed. - Shutdown and low power zones implemented for whales. - For line turns acoustic source will be at low power to deter whales form entering the survey area. When observations cannot be undertaken (night-time and low visibility) start-up may commence after a soft start: - Provided that there have not been 3 or more whale instigated power-down or shutdown events during the preceding 24-hour period; or If operations were not previously underway during the preceding 24 hours, the vessel (and/or a spotter vessel or aircraft) has been in the vicinity (approximately 10km) of the proposed start up position for at least 2 hours (under good visibility conditions) within the preceding 24-hour period, and no whales have been sighted. Operations may proceed provided that there have not been 3 or more whale instigated power-down or shut-down situations during the preceding 24-hour period. When observations cannot be undertaken (night-time and low visibility) operations may proceed provided that there have not been 3 or more whale instigated power-down or shut-down situations

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
				during the preceding 24-hour period. Other controls being evaluated with expert opinion from acoustic specialists and whale researchers: - Use of acoustic monitoring for detection of whales. - Use of vessel and aerial surveys and shoreline observations to detect presence/absence of southern right whales in coastal areas and presence/absence of blue and other whales in offshore areas. Our full draft impact assessment is available here.
1186	2886	Stakeholder quoted seafood industry calls for more research on seismic testing under 'real-world conditions' in response to research into seismic impacts on demersal fish species which have shown profound negative impacts to the fish stocks. Including a Fisheries Research and Development Corporation report which showed a 80-99 per cent decline in the catch rates of flathead and school whiting following seismic testing in the Danish seine commercial fishery off Lakes Entrance. Stakeholder also referred to a study showing that seismic surveying reduces whiting catch rate by 99.5 per cent. The research found catch rates for whiting were down by 99.5 per cent during a six-month-long survey at Lakes Entrance in eastern Victoria, compared to before the survey. Flathead catch was also reduced by 71 per cent, according to the research. LINK provided.		The paper you cite here is yet to be finalised and released, therefore assessment is undertaken. on current scientifically accepted research. The survey has the potential to temporarily displace fish and other marine life from the survey area, which may temporarily impact the local fishing industry. However, measures will be taken to minimize the impact, such as conducting surveys during the time of year when fish are less likely to be in the area and implementing exclusion zones around fishing grounds. If exclusions zones cannot be accommodated, we will work with individual fishers to ensure they are no worse off because of the survey.
1187	2901	VP-79 has 43 referenced migratory species known to use this area for foraging and habitat including blue whale, pygmy blue whale and northern royal albatross.	Appendix E7 Section 4 and 8, E5 Section 4 and 8 and Appendix F3 Section 4	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1188	2901	Lease V79 lease abounds with the Apollo marine protected areas of which AMCS has long running Marine Park and Threatened Species campaign activity in.	Appendix E1 Section 4 and 8.	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1189	2924	Requested to be removed from email correspondence list.		Information noted but no further action required.
1190	2926	Mention of phasing the activity to consider Southern Right Whales and Blue Whales at different times of the year.	B3, E7 Section 4 and Section 8, F3 Sections 4.1 and 4.2	Stakeholder interests were noted and used to inform the analysis and assessment of impacts arising from the Regia MSS

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1191	2926	Interest in studying the cumulative impacts of 2D and 3D seismic surveying.	F1	
1192	2970	Stakeholder provided fishing locations in Portland.		Information noted but no further action required.
1193	2997	Mention of the area being a blue whale migratory location and southern right whale breeding ground.	Appendix E7 Section 4 and F3 Section 4.1 and 4.2	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1194	3021	Mention of the rich sea life in the ocean off Portland.		Information noted but no further action required.
1195	3068	The AHO will promulgate the appropriate Notice to Mariners (NTM), which will ensure other vessels receive information of activities.		Information noted but no further action required.
1196	3068	Advised to provide updates to both the Australian Hydrographic Office and the JRCC on progress and, importantly, any changes to the intended operations.	C2	Information used to inform consultation process
1197	3068	Advised to notify AMSA's Joint Rescue Coordination Centre (JRCC) by email or phone for promulgation of radio-navigation warnings at least 24-48 hours before operations commence. AMSA's JRCC will require the vessel details (including name, callsign and Maritime Mobile Service Identity (MMSI)), satellite communications details (including INMARSAT-C and satellite telephone numbers), area of operation, requested clearance from other vessels and any other information that may contribute to safety at sea. JRCC will also need to be advised when operations start and end.	C2	Information used to inform consultation process
1198	3068	Advised to exhibit appropriate lights and shapes to reflect the nature of operations.	B2	All vessels engaged in the Regia MSS will be compliant with the International Rules for Preventing Collisions at Sea
1199	3068	Advised to contact the Australian Hydrographic Office no less than four weeks before operations, with details relevant to the operations.	C2	Information used to inform consultation process
1200	3068	Advised how to obtain a vessel traffic plot showing Automatic Identification System (AIS) traffic data for area of interest through AMSA's spatial data gateway and Spatial@AMSA portal to download digital data sets and maps.	C2	Information used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1201	3080	Stakeholder responded to a meeting offer accepting and discussing method of meeting. Advised that 2 colleagues have been added to email and would be happy to all meet at the same time.		Information noted but no further action required.
1202	3092	Mention of a yacht race each Saturday off the coastline of Port Fairy.		Information noted but no further action required.
1203	3182	The paper "McCauley et al. 'Widely used marine seismic survey air gun operations negatively impact zooplankton' 2017" raises concerns about the negative impact of marine seismic survey air gun operations on zooplankton.	Appendix E 2 Section 8 and F3 Section 4.13 and 4.14.	The titleholder provided a response in the form of an attached document. This response included information around why the paper in question is considered an outlier in evidence, and explained that NOPSEMA has accepted the petroleum industry's position on the paper in multiple other seismic survey EP's. The titleholder also explains the absence of a "no impact" requirement in Australia and the relevance of defined acceptable levels (Event ID 2356).
1204	3209	Stakeholder referred to the Precautionary Principle; the IPCC Report on Climate Change; and the Sonic Sea movie.		Information noted but no further action required.
1205	3212	Stakeholder stating they are CEO for two associations.	C2	Information used to inform consultation process
1206	3215	Contact details for SETFIA and SSIA are the Atlantis contact details.	C2	Information used to inform consultation process
1207	3217	Provided SETFIA SSIA Policy on MSS Proponent Engagement 2_0 20 June 2023	C2	Information used to inform consultation process
1208	3224	Provided information regarding consulting with the Commonwealth Fishing industry	C2	Information used to inform consultation process
1209	3228	This feedback provides information about the fishing practices for RL, indicating that most activities occurred in shallower waters closer to ports.	A1	Confirmed that the data agreed with this and why the 50 m activity limitation was adopted (Event IDs 3228 and 4107).
1210	3228	One participant expressed a preference for compensation payments to be directed to quota owners, indicating that this approach would be more beneficial for him as a quota owner.	Adjustment protocol	Stakeholder interests were noted. Refer to compensation protocol document.
1211	3228	No agreement was reached from stakeholders that compensation should be paid on a boat-by-boat basis.	C2	The Regia MSS team pointed out feedback from Portland fishers who preferred that each fisher should be the claimant. Agreed that all evidence-based claims would be put through the NERA adjustment protocol (Event ID 3228).

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1212	3228	Expression of interest from the fishers about putting their boats forward for a spotter vessel if required.		Information noted but no further action required.
1213	3229	Identification of any seabed anomalies that may be potential heritage sites (shipwrecks, crashed aircraft, etc), Regis MSS must notify Heritage Victoria in accordance with the requirements of s 80 of the Heritage Act 2017 (Vic) and/or s 40 of the Underwater Cultural Heritage Act 2018 (Cth). The stakeholder also noted 40 of the UCH Act also requires notification to the Minister.		Information noted but no further action required.
1214	3237	Impacts on whales and dolphins due to seismic air-gun surveys.	B8 Section 8, E7, F3 Section 4	Regia EP has conducted a thorough assessment of the literature and found seismic impacts to cetaceans can be mitigated and managed through appropriate timing of the survey and a comprehensive fauna management plan
1215	3237	Impact on seals from seismic testing.	B8 Section 8, E7, F3 Section 4.3	Regia EP has conducted a thorough assessment of the literature and found potential seismic impacts to seals do not pose any threat to the long-term health and sustainability of any populations of these taxa found within the operational area. Any interactions with seismic are mitigated and managed through spatial boundaries and a comprehensive fauna management plan.
1216	3237	Impact on Molluscs and Crustaceans from seismic testing.	B8 Section 4, E4, F3 Sections 4.5, 4.6, 4.8, 4.9, 4.10	Regia EP has conducted a thorough assessment of the literature and found seismic impacts to fish, molluscs and crustaceans do not pose any threat to the long-term health and sustainability of any populations of these taxa found within the operational area.
1217	3237	Impact on Fish from seismic testing.	B8 Section 5, E3, F3 Sections 4.11, 4.12, 4.14	Regia EP has conducted a thorough assessment of the literature and found seismic impacts to fish, molluscs and crustaceans do not pose any threat to the long-term health and sustainability of any populations of these taxa found within the operational area.
1218	3237	Impact on zooplankton from seismic testing.	B8 Section 8, E7, F3 Section 4.13	Regia EP has conducted a thorough assessment of the literature and found potential seismic impacts to zooplankton do not pose any threat to the long-term health and sustainability of any populations of these taxa found within the operational area.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1219	3328	The stakeholder stated fishers will look to them for advice and that they would support their members.	C2	Information used to inform consultation process
1220	3350	The stakeholder stated that Gillnet fishers don't go deeper than 100f, 183m.	Appendix E1 Section 4 and 8	Stakeholder information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1221	3350	The stakeholder stated that trawlers operate mostly in deeper waters and only go as shallow as 150m.	Appendix E1 Section 4 and 8	Stakeholder information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1222	3350	The stakeholder provided information regarding their consultation services and stated they could provide on-water comms including SMS, Facebook posts and emails by fishing zone.		Information noted but no further action required.
1223	3355	SETFIA clarifies that it undertakes work specifically for marine seismic survey (MSS) proponents and not Atlantis. As a not-for-profit organization, SETFIA, along with the SSIA, engages Atlantis to manage their associations, but Atlantis does not receive payment from either association for MSS project work.	C2	Information used to inform consultation process
1224	3356	Stakeholder shared concern about the start time for meeting in Portland.		
1225	3373	Mention of the protest rally in Warrnambool		
1226	3383	Tuna concession owners wish for all environmental plan consultation to be directed through Tuna Australia.	C2	Information used to inform consultation process
1227	3383	Mention of Tuna Australia's internal database being up to date, accurate, actively managed, and reviewed after each consultation.	C2	Information used to inform consultation process
1228	3383	Advice from the Australian Fisheries Management Authority (AFMA) on the preferred method for energy companies to conduct environmental plan consultation through fishing industry associations.	C2	Information used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1229	3384	Stating AMCS's functions, interests and activities as relating to the protection and preservation of the health, biodiversity and function of marine ecosystems in Commonwealth and states waters. Also the management of state and Commonwealth marine parks, threatened species and fisheries in the proposed operational area (OA) and environment that may be affected (EMBA) zones.	C2	Information used to inform consultation process
1230	3384	Stating AMCS is Australia's peak marine conservation organisation and Australia's leading national charity dedicated solely to protecting our precious oceans and wildlife. Representing people from all around the country, we work to protect our oceans and coastal environments for the benefit of all marine life, and current and future generations	C2	Information used to inform consultation process
1231	3398	Stakeholder advised they believed they were a person that may be affected, stated why they thought that and requested a catch up to acquire more information.	C2	The Regia MSS team undertook consultation process with Relevant Person.
1232	3415	Person ID 1163/Org ID 316 is busy but keep trying as they do want to be heard.	C2	The Regia MSS team continued to attempt to make contact to arrange meeting. See Appendix C1, Annex 2, 'Southern Ocean Protection Embassy Collective'
1233	3415	Limited social license for seismic blasting along the affected coastline.		Information noted but no further action required.
1234	3417	The Southern Bluefin Tuna fishery also overlaps the proposed activity.	E3, Section 4.1	Southern Bluefin Tuna is not commercially caught in the Operational Area. It is sometimes caught recreationally off Victoria.
1235	3654	***Redacted***	C2	***Redacted***
1236	3672	In-field survey of operators is undertaken to collect the data the economic ABARES information is based on.	C2	Information used to inform consultation process
1237	3672	ABARES data uses logbook and other data collected in fisheries status report assessments, and is reliable.	C2	Information used to inform consultation process
1238	3674	WTOAC has a dedicated Caring for Country Team that, despite being busy, should be involved in any initiatives related to Caring for Country.	C2	Information used to inform consultation process
1239	3674	To make a booking with another relevant person for input.	C2	Information used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1240	3674	The WTOAC is involved in aquaculture projects focused on seaweed and kelp, specifically located in Corio Bay.		Information noted but no further action required.
1241	3674	The WTOAC Healthy Country Plan includes coastal values.		Information noted but no further action required.
1242	3674	The suggestion was made for the Regia MSS to engage with the Federation of Victorian Traditional Owner Corporations.	C2	Information used to inform consultation process
1243	3674	The stakeholder expressed skepticism regarding the substantial efforts being dedicated by titleholders to the project, citing a low likelihood of the event occurring.		Information noted but no further action required.
1244	3674	Discussed engagement being difficult with a TO community severely affected by a lack of resources and those available are stretched; lot's of requests for engagement with petroleum titleholders on very unlikely events.	C2	Information used to inform consultation process
1245	3674	Discussed a preference for petroleum titleholders to get together and reduce consultation burden on WTOAC.	C2	Information used to inform consultation process
1246	3674	Briefing to the regional TO Corporation Caucus possible - held monthly online and quarterly in person. In relation to input into the sea country protection program (working title).	C2	Information used to inform consultation process
1247	3674	***Redacted***	C2	***Redacted***
1248	3678	Advised that this meeting did not constitute consultation with Eastern Maar Traditional Owners.	C2	Discussed consultation process for offshore petroleum activities. Outlined that EMAC can request information from the Regia team to help reduce burden on EMAC. Outlined that EMAC can request information on a particular form. Outlined that the public comment period should not be confused with the parallel 'relevant persons' consultation process (Event ID 3678).
1249	3697	Identified Southern Right Whales, Blue Whales, Eels, and Zooplankton as potentially important receptors to be covered.	E2, E3, E7, F3	The Regia EP has conducted a thorough assessment of the literature which is both aspect-focussed and also receptor-focussed for those taxa of increased public concerns. Southern Right Whales, Blue Whales, Eels, and Zooplankton (focus on Bonney Upwelling) have all been subject to increased levels of assessment which have been used to decide outcomes.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1250	3697	Criticised the aspect-by-aspect approach currently published and suggested that key matters reports for matters of national environmental significance would be a preferred way to review information.		
1251	3745	***Redacted***	C2	***Redacted***
1252	3800	Tuna concession owners wish for all environmental plan consultation to be directed through Tuna Australia.	C2	Information used to inform consultation process
1253	3800	Advice informing that the the preferred method for energy companies to conduct environmental plan consultation according to Australian Fisheries Management Authority (AFMA), is through fishing industry associations.	C2	Information used to inform consultation process
1254	3803	The stakeholder identified their FIA's as a local resident and local business owner.	C2	Information used to inform consultation process
1255	3803	Stakeholder relevance as a local resident, ocean lover, surfer, business owner, and sustainability professional.		
1256	3853	***Redacted***	C2	***Redacted***
1257	3891	Stakeholder requested to be consulted with through their fishing association and not directly with Regia Team		
1258	3892	Stakeholder requested to be consulted with through their fishing association and not directly with Regia Team		
1259	3917	The largest jig fishery for squid in Bass Strait in operates in 70 to 130 metres between Portland and the Thylacine platform in Western Bass Strait.	B8 Section 4, E4 Section 4.2, F3 Section 4.8	Extensive assessment done on the jig fishery and no significant impacts are expected from MSS.
1260	3954	Stakeholder requested to be consulted with through their fishing association and not directly with Regia Team		
1261	3955	Stakeholder requested to be consulted with through their fishing association and not directly with Regia Team		
1262	4026	Stakeholder requested to be consulted with through their fishing association and not directly with Regia Team		
1263	4036	Reference to the Blue Whale Study as a regional stakeholder for blue whales.	E7 Section 4 and 8, F3 Section 4.2	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1264	4036	Mention of the survey taking place in a Biologically Important Area for pygmy blue whales.	E7 Sections 4 and 8, F3 Section 4.2	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1265	4043	Provided costs for communication protocols and services	C2	Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers participation in the consultation process. (Events 2930, 3350, 3856, 4039)
1266	4048	Stakeholder provided information on trawling depths: between 100 and 1,100m (mostly <700m).	Appendix E 1 Section 4 and 8, and F3 Section 4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1267	4062	The titleholder requested the stakeholder connect with another person and relay the titleholders messages to date, and encourage the person to engage with the titleholder.	C2	The Regia MSS team want the person to do whatever they believe is best for them with regards to how they engage, however, there is only a short window left to consult prior to submission (Event ID 4062).
1268	4069	GMTOAC invitation to a consultation day.	C2	Information used to inform consultation process
1269	4091	Fauna records identify nearly 200 species within the Belfast Coastal Reserve, over 50 of these are listed as threatened and of conservation significance. Four of these are bird species listed for recovery plans under the Australian Government's Threatened Species Strategy are found in BCS : Orange-bellied parrot, Hooded Plover, Australasian Bittern and Eastern Curlew.	A2, E5, E9	The active source area is located over 30km from the BCR, there is no overlap with the acquisition area.
1270	4091	BCS is culturally significant area for indigenous peoples for ceremony and includes burial sites and shell middens.	A2	The active source area is located over 30km from the BCR, there is no overlap with the acquisition area.
1271	4091	BCS contains habitat of international significance for migratory birds Sanderling and Sharp-tailed Sandpiper.	A2, E5, E9	The active source area is located over 30km from the BCR, there is no overlap with the acquisition area.
1272	4106	The individual shared that he only holds the minimum leased quota and is unlikely to venture far from Port Fairy, suggesting he does not anticipate any overlap with the upcoming survey.		Information noted but no further action required.
1273	4106	The individual indicated that he possesses an 'ocean general' license and expressed interest in possibly making a claim related to the activities.	See Compensation Protocol for fishers	Encouraged him to do so if he were to be displaced from his fishing activities.
1274	4106	Stated he'll fish for squid occasionally in the summer.		Information noted but no further action required.
1275	4106	Stated he only has the minimum quota for southern rock lobster which he leases. Unlikely to go too far from Port Fairy and that he didn't think they'd be any overlap with the survey.		Information noted but no further action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1276	4106	Has an 'ocean general' license and that he may want to make a claim for these activities.	E1	Fisher informed of the compensation protocol in place and all submissions accepted with suitable evidence to support claims.
1277	4107	This feedback provides information about the fishing practices for RL, indicating that most activities occurred in shallower waters closer to ports.	Appendix A2, E 1 Section 4 and 8, E4 Section 4 and 8 and F3 Section 4	Confirmed that the data agreed with this and why the 50 m activity limitation was adopted (Event ID 4107).
1278	4107	This feedback notes that fishing activities, particularly for sharks, often occur close to or even within the area, suggesting potential concerns about the impact of seismic activities on local fishing practices.	See Compensation Protocol for fishers	Reaffirmed the methods of claiming compensation if displaced from fishing grounds (Event ID 4107).
1279	4107	This feedback expresses concern that if the market for reds opens up again, fishers may be incentivised to venture deeper into active source areas.	See Compensation Protocol for fishers	Reiterated that catch history in an area is required to be able to have a successful claim. (Event ID 4107).
1280	4107	Stakeholders expressed concerns regarding the reliability of ABARES data for trawl fishing, asserting that it does not accurately reflect fishing effort or productivity in the trawl sector. They indicated that the data does not provide a true representation of their fishing locations or the effectiveness of trawl fishing activities.	Appendix E 1 Section 4 and 8, E4 Section 4 and 8 and F3 Section 4	Asked where the trawl sector fished if not shown in the maps. Sought clarification from stakeholder that almost all trawl fishing is undertaken between 200 m and 400 m depth contour. Agreed to consider a 200 m activity limitation on the active source area and see if CGG could also minimise the time the vessel spent in the operational area in waters deeper than 200 m (Event ID 4107).
1281	4107	Fishers reported that squid fishing is concentrated in a specific area and occurs primarily during a limited season, with February being the main month for fishing. They did not raise concerns regarding the overlap of ABARES data collected in April/May/June or September/October/November, indicating a consensus on fishing patterns without noted conflicts.	B8 Section 4, E4 Section 4.2, F3 Section 4.8	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. Assessments were done on squid fishing.
1282	4107	Expression of interest from the fishers about putting their boats forward for a spotter vessel if required.		Information noted but no further action required.
1283	4133	Tuna Australia's role as the peak body for the longline fishing sector in Australia.		Information noted but no further action required.
1284	4133	Changes in tuna fishing grounds due to climate change and increased fish abundance.	E3	Information was noted. Assessments of fisheries impacts from RSS are inclusive of relevant climate change science. Tuna fisheries are not operating in the activity area.
1285	4152	***Redacted***	C2	***Redacted***

1288	4184	The Stakeholder advised that his main interest was in being across the science underpinning mitigations of the seismic testing.		
1289	4185	Stakeholder provided details of their functions, interests and activities: swim and/or surf and/or dive and/or fish and/or kayak and/or sail and/or watch wildlife in the local area.	E1 Section 8	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1290	4218	Stakeholder advised inability to provide fishing data by area and fishery and explained reasons for this.	E1 Section 4 , F3 Sections 4.5 to 4.14	Information noted but no further action required.
1291	4218	Offered to have a virtual meeting if preferred.		Information noted but no further action required.
1292	4218	Offer to provide CPUE fishery data from 2010	E1 Section 4, F3 Sections 4.5 to 4.14	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1293	4219	***Redacted***	E1 Section 4, F3 Sections 4.5 to 4.14	***Redacted***
1294	4221	Stakeholder requested to be consulted with through their fishing association and not directly with Regia Team		
1295	4233	Stakeholder confirmed Facebook post and email was shared a few weeks ago to all members.	C2	Information used to inform consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1296	4235	Brief email from stakeholder to Regia stating another proponent has looked at the catch and revenue data three times and reduced their proposed area and potential impacts.	C2	Responses in Event ID 2655, Regia team seeks to understand why SETFIA/SSIA are focused on the aggregate tonnes of fish potentially affected by the survey, especially since higher-resolution catch data may not be relevant for a whole fishery analysis. Following this, Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information.
1297	4355	Self-identified as relevant person, stated their FIA's as a commercial fisher.	C2	Information used to inform consultation process
1298	4367	Provided scheduling information and states there will be arrangements for individuals to join online. Explained that companies will have a designated timeslot and be pre-informed of questions to assist them in their presentations.	C2	Information used to prepare for consultation day presentation.
1299	4370	The measures and approach proposed in the planning and design of the survey are seen as approaching 'As Low As Reasonably Practicable' (ALARP) for the operations of the SBT fishery in the Great Australian Bight.		Information was noted as supportive of the Regia MSS EP and its approach. No action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1300	4370	Preference for the survey to occur within a specific time period after main fishing operations.		
1301	4370	Preference for the survey to start in the shallower portion of the operational area and progress towards deeper areas.		
1302	4378	The presence and location of the temperature logger mooring in the Otway.		Information noted but no further action required.
1303	4405	Time allocated to CGG to present at consultation day		Information noted but no further action required.
1304	4405	Stated each session will be closed to only Gunditjmara, GMTOAC program staff, National Indigenous Australians Agency Vic region representatives, NOPSEMA representatives and the proponent.	C2	Information used to inform consultation process
1305	4406	Then sender would like to maintain the logger in its current position for the foreseeable future.		Information noted but no further action required.
1306	4407	Stakeholder advised the Titleholder that cultural values are not in their remit and they would have to look into any contacts within their organisation that could assist with the sea country protection program, if required.	C2	Titleholder has confirmed that they would appreciate any further contacts the Stakeholder can provide. (Event ID 4456)
1307	4410	***Redacted***		***Redacted***
1308	4410	Stakeholder emailed to clarify their feedback or information provided can be treated as outlined in the terms of agreement as of the new year.	C2	Information noted but no further action required.
1309	4411	***Redacted***	C2	***Redacted***
1310	4433	The stakeholder provided information regarding their functions, interests and activities as a commercial fisher.	C2	Information used to inform consultation process
1311	4478	Stakeholder confirmed King George Whiting is their principal concern.	C2	Information used to inform consultation process
1312	4492	Stakeholder states 80% of their stock comes from or through the proposed acquisition area	F3 Section 4.12	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS. A comprehensive Assessment has been made of the potential impacts of seismic to the King George Whiting Fishery with no risk to population stability found.
1313	4516	Stakeholder provided fishing locations in Portland and Port Fairy.	OMICC Otway Adjustment Protocol	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1314	4546	Relevant Person resends submission as unsure if it had previously been received.		Information noted but no further action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1315	4551	Seismic Effects on marine mammals like whales	B8 Section 8, E7, F3 Sections 4.1, 4.2	Regia EP has conducted a thorough assessment of the literature and found seismic impacts to cetaceans can be mitigated and managed through appropriate timing of the survey and a comprehensive fauna management plan.
1316	4627	The stakeholder stated that their organisation's input is not required for correspondence with commercial fishers.	C2	Information used to inform consultation process
1317	4627	The stakeholder noted that while collaboration with the petroleum industry is welcome, the fishers and their organisation's board would determine the policy regarding the specifics for fishers. If negotiating individually offers a better deal, they will pursue that option. Ultimately, fishers will seek what is best for them.		Information noted but no further action required.
1318	4637	Noted King George Whiting have long larval duration that makes the species more susceptible to impacts	E1 Section 4 and 8, E 3 Section 4 and 8 and F3 Section 4.	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1319	4669	The stakeholder responded to the team member's query about the data request and suggested that Regia send a separate data request to the mentioned organisation to clarify its purpose.		Information noted but no further action required.
1320	4669	The stakeholder acknowledged and supported the concept of OMICC and appreciated the advance notice. The organisation would consider their involvement once the letter was received. Stakeholder recommended including another specific organisation in Regia awareness-raising activities.		Information noted but no further action required.
1321	4788	Stakeholder states the distribution of trawl fishing is uneven, with over 90% of the trawl fishery closed due to marine parks, fishery closures, and oil and gas exclusions.	C2	Information noted but no further action required.
1322	4788	Agrees that avoiding depths greater than 200 meters may be beneficial.	A2	CGG will implement an activity limitation of no acquisition beyond 200 m depth contour.
1323	4794	Their primary concerns focus on projects with significant impacts, such as seismic surveys and drilling, along with cumulative effects on Gunditjmara Sea Country.	C2	Given that CGG's project involves a seismic survey, the consultation should have been prioritized. It is therefore puzzling that, to our knowledge, GMTOAC and its members have not met to discuss this matter since February 17, 2024.(Event ID 4973)

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1324	4794	GMTOAC plans to deliver a consultation plan to CGG by late May 2024	C2	Information noted but no further action required. The Regia MSS team have has not been received.
1325	4794	GMTOAC is the corporate representative of the Gunditjmara people.	C2	Information used to inform consultation process
1326	4794	GMTOAC are relevant persons	C2	The Regia MSS confirmed this and GMTOAC were identified as such and contacted at the start of the consultation process on 15th February 2023, inviting consultation and co-design, of both the activity and consultation process. Receipt of the letter was confirmed via phone on 23rd March 2023. (Event ID's 46 & 439)
1327	4794	EJA acts for GMTOAC regarding the Regia MSS.	C2	The Regia team noted this information and it was used to inform the consultation process
1328	4934	Explained shark fishing occurs at depths of 50-183 meters, line fishing from 183 meters to about 600 meters, and trawling from 30 to 1,000 meters, all approximate ranges	Appendix E1 Section 4.5 and 8.	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1329	4938	Stating that the consultation plan will not be finalised before late May 2024.	C2	Information noted but no further action required.
1330	4938	GMTOAC advising that the consultation plan will be provided no earlier than GMTOAC's next Board meeting on 28 June 2024.	C2	Information noted but no further action required.
1331	4938	EJA acts for GMTOAC regarding the Regia MSS.	C2	Information noted but no further action required.
1332	4948	GMTOAC is currently working towards getting technical advice to assist them in developing a consultation plan, the plan will contain minimum standards, preferences and parameters for consultation, and that the plan will not be provided earlier than 28 June 2024.	C2	Information noted but no further action required.
1333	4948	EJA acts for GMTOAC regarding the Regia MSS.	C2	The Regia team noted this information and it was used to inform the consultation process
1334	4953	Informing CGG that the Consultation Plan will be shared with proponents no earlier than the next Board meeting, which has been rescheduled from June 28, 2024, to July 5, 2024, due to Sorry Business in the Gunditjmara community.	C2	Information noted but no further action required.
1335	4953	EJA acts for GMTOAC regarding the Regia MSS.	C2	The Regia team noted this information and it was used to inform the consultation process

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1336	5115	The stakeholder mistakenly reported the maximum foraging range for Fairy Penguins as 37.4 km instead of the correct 30.7 km.	E4 Section 4.5, F3 Section 4.4	Information noted but no further action required.
1337	5117	There are at least 5 main Fairy Penguin breeding colonies along the coastline of Western Victoria: Deen Maar (Lady Julia Percy Island), Middle Island, London Bridge, Gibson Steps, and Lawrence Rocks	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1338	5117	Penguins gather ashore at these colonies (Deen Maar, Middle Island, London Bridge, Gibson Steps, and Lawrence Rocks) to breed from as early as June through to February the following year.	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1339	5117	Fairy Penguins: Their main food sources are small schooling fish like anchovies and pilchards, as well as squid and sometimes krill	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1340	5117	Fairy Penguins: Eggs are laid between June and November, taking 35 days to hatch. Young chicks are guarded for 10-15 days, and parents take turns foraging	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1341	5117	Fairy Penguins, also known as Little Penguins, are the smallest species of penguin in the world, measuring about 30-35cm high and weighing approximately 1-1.5kg	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1342	5117	Fairy Penguins are protected under Australian federal law by the Environment Protection and Biodiversity Conservation Act 1999 and under state law by the Wildlife Act 1975	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1343	5117	During the breeding season, adult penguins take turns every second day to forage for food, leaving before dawn and returning within the first one or two hours after dusk	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1344	5117	Fairy Penguins: After the chicks are 8-10 weeks old, they begin to fledge, and adults can take longer foraging trips out to sea for multiple days	E4 Section 4.5, F3 Section 4.4	Information was noted and used to inform the analysis and assessment of impacts arising from the Regia MSS
1345	5185	The stakeholder suggested distributing information through their general member updates, a weekly newsletter that typically goes out on Fridays. This approach would effectively reach SIV members and license holders with relevant project updates.	C2	Regia Team confirmed with stakeholder that they would be distributing OMICC and project update information shortly.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1346	5185	Stakeholder asked if project team would like to distribute an Information Sheet to SIV members and license holders per the Engagement Agreement, indicating an opportunity for the project to reach a broader audience.	C2	Regia Team confirmed with stakeholder that they would be distributing OMICC and project update information shortly.
1347	5189	Stakeholder mentions having catch history and data that could be relevant to the management of environmental impacts.	C2	The Regia team responded to the stakeholder, noting that they commercially fish and requesting further information on their activities to enable a full assessment of potential impacts to be completed. They were asked for their preference of communication form and provided with a link to the consultation hub, with project information and interactive map. A record of this correspondence can be viewed in Appendix C2, under Org ID 805
1348	5189	Stakeholder expresses frustration about the amount of seismic tubes, electrical wire, and debris left behind from previous seismic surveys	C2	The Regia team responded to the stakeholder, noting that they commercially fish and requesting further information on their activities to enable a full assessment of potential impacts to be completed. They were asked for their preference of communication form and provided with a link to the consultation hub, with project information and interactive map. A record of this correspondence can be viewed in Appendix C2, under Org ID 805
1349	5190	Fishing locations: Portland, Victoria	C2	The Regia team responded to the stakeholder, noting that they commercially fish and requesting further information on their activities to enable a full assessment of potential impacts to be completed. They were asked for their preference of communication form and provided with a link to the consultation hub, with project information and interactive map. A record of this correspondence can be viewed in Appendix C2, under Org ID 805
1350	5190	Financial impact: provided details on annual turnover	C2	The Regia team responded to the stakeholder, noting that they commercially fish and requesting further information on their activities to enable a full assessment of potential impacts to be completed. They were asked for their preference of communication form and provided with a link to the consultation hub, with project information and interactive map. A record of this correspondence can be viewed in Appendix C2, under Org ID 805

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1351	5194	Advised a mapping consultant would be able to complete the work suggested and provided contact information of a suggested consultant, who was cc'd into the email.		
1352	5195	The stakeholder references the efforts of TGS, who ran their spatial overlap analysis three times, reducing their overlap with commercial fishing by 95% from their initial plan, resulting in nearly a $10 million reduction in potential impact. Similar analysis' by DCCEEW and other wind proponents have also reduced trawling impacts, achieving reductions of up to 99% and 90% in various regions. The stakeholder cites extensive experience in this field over the past 15 years.		Information noted but no further action required.
1353	5227	Stakeholder stating he was citing the Greg Jenkins paper.		Information noted but no further action required.
1354	5228	GMTOAC is developing a Consultation Plan, which will guide its consultation approach with proponents of offshore petroleum Environment Plans. This plan is set to be finalized after GMTOAC's next Board meeting, rescheduled to July 5, 2024, due to Sorry Business within the Gunditjmara community. As the prescribed body corporate under the Native Title Act 2003 and the Registered Aboriginal Party under the Aboriginal Heritage Act 2006, GMTOAC must follow specific decision-making protocols that include deliberative processes. The Consultation Plan is essential for GMTOAC's participation in statutory consultations regarding offshore petroleum activities.		Information noted but no further action required.
1355	5228	EJA acts for GMTOAC regarding the Regia MSS.		Information noted but no further action required.
1356	5228	A full meeting of Gunditjmara native title holders is planned for late October 2024 to discuss and potentially adopt the Consultation Plan.		Information noted but no further action required.
1357	5232	Stakeholder advised required format for documents so they can distribute and stated that once the document is received along with request to distribute, they will action the information sharing.		Information noted but no further action required.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1358	5235	The Operational Area for the Regia MSS overlaps with three foraging BIA's of the Little Penguin. These areas are Deen Maar, London Bridge and Gibson Steps.	Appendix E5, Section 4 and 8, F3 Section 4.4.	CGG has acknowledged the presence and assessed the impacts of seismic sound to Little Penguins in relation to the acquisition area.
1359	5259	Stakeholder provided website detailing their completed activities		Information noted but no further action required.
1360	5261	Stakeholder sharing update of their 2023 activities and those beyond, as well as continuation of existing operations.		Information noted but no further action required.
1361	4409, 4411	Confidential information request for all past and future correspondence, whether verbal or electronic, to be treated as privileged and confidential.		Event ID 4457 email sent to clarify the request, responded in Event ID 4413 that all correspondence and information is to be considered sensitive.
1362	2038	Relevant person expressed the need to ensure statutory notifications are made within a two-hour timeframe to relevant authorities and control agencies, and showed interest in following up on this matter.		We will provide periodic updates to relevant persons in line with a consultation and communication plan for the activity, for example, notifications prior to , during and on completion of the activity. ConocoPhillips Australia noted the request for the provision of information on incidents and spills during the activity and requested information on why this information was being requested and how it would support the relevant persons assessment of the possible consequences on their functions, interests and activities.
1363	5117	Specialist in Fairy Penguins should be consulted with, also Warrnambool Coastcare Landcare Network, Warrnambool Field Naturalists Club, Deakin University, Parks Victoria, DEECA, Warrnambool Council. Also other organisations or members of the community with an interest in Fairy Penguins.		Appendix C1 documents how CGG undertook the consultation process, managed risks to as low as reasonably practicable and an acceptable level, and appropriately responded to, incorporated, and adopted measures based on relevant persons objections, claims, and other feedback. This included a broad capture approach to people and information, including specialists on Fairy Penguins, such as the Middle Island Penguin Project. A record of consultation with these groups, including feedbacks, can be found in Appendix C2.
1364	3873	AFMA notifying Regia team of spelling mistake on commercial fishers information sheet, Troll Fishery should be Trawl Fishery		Corrected the spelling mistake in the information sheet and resent to recipients.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1365	4794 & 4948	GMTOAC asserts that prior interactions with CGG do not constitute proper consultation regarding the Environment Plan (EP) and that formal consultation has yet to begin.		Responded in Event ID 4973: GMTOAC and GMTOAC members had many opportunities over a long period of time to voluntarily participate in the consultation process with CGG. Having extended our consultation timeframe on three separate occasions, for a total of five months longer than originally planned, GMTOAC and GMTOAC members have clearly had a reasonable period to instruct CGG on their preferred consultation plan, provide input into the preparation of the EP, review the measures adopted to protect Sea Country, and meaningfully engage with CGG. To further illustrate their efforts, CGG enclosed a summary table of all communications with GMTOAC during the consultation process for the EP, both before and after the submission of the Regia MSS EP, along with copies of additional correspondence not previously referenced. Hoping that this will demonstrate the breadth of the consultation process and potentially shift their perspective. CGG firmly aligns with the interpretations made in Cooper v NOPSEMA (No 2), and believes our pre-submission consultation efforts were not only lawful and sufficient but also exceeded industry norms. (Event ID 4973).
1366	3355	There is disatisfaction expressed made about the titleholders' use of the word 'claim' regarding feedbacks received.		
1367	3746	The stakeholder provides a summary of their record of correspondence with Regia team, then describes Regulation 11A (1)(d), following which stakeholder states their associations to be Relevant Persons.		CGG identified and contacted the stakeholders associations in February 2023, at the start of the consultation process, requesting engagement (Event IDs 4202, 4203 & 3210).

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1368	3415	The use of 'how' not 'if' language does not allow for Traditional Owners consent.		Advised person that the consultation would not be genuine had CGG included consultation on if the activity should proceed. The Australian government has provided permission for development of this region by awarding titles and CGG is clearly of the position that whether these activities can go ahead has already been asked and answered in the affirmative by the government. Provided advice to lobby the government to change decisions if still dissatisfied. Noted that Sea Country protection was a priority and we'd be seeking engagement from Traditional Owner to establish how Sea Country is best protected.
1369	3639	Preferred communication format is written, may request a video call following this.		CGG offered video calls on stakeholders request (Event ID 3637, 3368)
1370	4384	18 other commercial licence holders (around 10 businesses) in the area and an in-person meeting may be worth the trip.		Responded in Event 4452, requesting to have initial online meetings in order to assess if there were potential impacts.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1371	874	Stakeholder referred to well-documented effects of seismic testing which meant their support could not be given to the project.		Thank you for your interest in the planned Regia marine seismic survey. I can confirm you've been added to our records as an interested community member. Regarding your environmental concerns, we recognise the potential to harm marine life and address this by identifying potential impacts and risks and putting mitigation plans in place. Examples of these include: - Conducting the survey during a time of year marine mammals and fish are less likely to be in the area. - Reducing the sound source to the lowest settings and reducing the number of times the sound source is activated. - Implementing marine mammal and fish monitoring programs during the survey. - Implementing exclusion zones around marine mammals and fish to minimize the potential for injury or harm. - In-field monitoring of the ocean for the presence of marine life. - Following strict guidelines as set by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA). Our Preliminary Environmental Impact and Risk Assessment document has been published on the project website and is available here. We will also be publishing environmental assessment documents, and the environmental impact and risk treatments, expected in May, in the document library. The Australian Government requires petroleum and greenhouse gas (GHG) companies to conduct their activities in a manner that meets a high standard of environmental protection. The seismic industry's environmental record in Australia, particularly in offshore areas, has been exemplary. No offshore seismic survey proposal would be approved unless the highest environmental standards had been met. If we can clarify any of the information above, or if you have any questions or comments, please don't hesitate to contact us.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1372	653	Introduction of spatial and temporal buffers to any other seismic activities is advised.		The titleholder responded with an explanation that the industry standard control of 40 km separation distance between operating seismic sources will be applied. The cumulative impact assessment will identify if further spatial and temporal buffers are required to manage impacts to an acceptable level. (Event ID: 1751)
1373	653	Set a limit to the number of days for acquisition at full power and, or, the total distance of sail lines for acquisition at full power.		Titleholder responded by clarifying that there are set limits for the seismic survey with the Maximum days of Operation set to 90 continuous days in a single phase. Maximum days of actual acquisition set to 60 days and Maximum sail line distance set to 1700 km.
1374	918	EMAC representatives at the meeting will communicate the information received back to the Eastern Maar community.		Confirmed consultation process with EMAC was as a representative body
1375	3121	EMAC representative confirming the newsletter sign up was for their role within EMAC, not as an interested individual.		Recorded and consulted as EMAC representative
1376	2413	Recipient agrees to a discussion on activity, confirming direct family member operates SOPEC and they can facilitate contact.		Continued to attempt to make contact to arrange meeting. See Appendix C1, Annex 2, 'Southern Ocean Protection Embassy Collective'
1377	4061	Regia team received this email in error, which states stakeholders intention to not acknowledge receipt of email sent to them, on advice from Org ID 249.		Responded in Event ID 4063, stating disappointed that Regia Teams effort to provide opportunity to engage has been seen as a box ticking exercise. Reconfirming points raised in original email. Offering again opportunity to speak to Regia team regarding project, via email, phone, meeting. Again noting that views can be put forward during public comment.
1522	920	Advised that unexploded ordnance (UXO) may be present on and in the sea floor.		Information noted.
1523	920	The titleholder undertakes exploration activities at their own risk		Information noted.
1524	920	Advised that the DoD doesn't take responsibility for reporting the location or type of UXO that may be in area		Information noted.
1525	920	Advised that the DoD doesn't take responsibility for reporting the location or type of UXO that may be in area		Information noted.
1526	920	Advised the DoD doesn't take responsibility for any loss or damage incurred by Regia MSS or third parties as a result of UXO's in the area.		Information noted.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1383	2774	Individual sent link to article: *The impact of seismic survey exposure on the righting reflex and moult cycle of Southern Rock Lobster (Jasus edwardsii) puerulus larvae and juveniles.*	Appendix B8	Information noted. No action taken as already considered in EP
1384	6410	The eastern SRW population is recognised as being genetically distinct from the western population and is estimated to be around 300 individuals.	Appendix E7 - section 4.3.6	This is described in the EP
1385	6410	The rate of increase of the eastern population is estimated to be 4.7% pa.	Appendix E7 - section 4.3.6	This is described in the EP
1386	6410	SRW females have high site fidelity to reproduction areas, meaning that they return to the same calving grounds each calving year.	Appendix E7 - section 4.3.6	Calving SRW area fidelity is described in the EP: Calving females are known to have high site fidelity and a 3 to 4-year calving interval.
1387	6410	There has been no change over three decades in the annual abundance of cow-calf pairs at Logans Beach in Warrnambool, Victoria, the only established calving ground in south-east Australia.		Evidence shows a broader distribution of SRW, including a broader distribution of cow calve pairs, such that isolating metrics to those beaches near the Regia MSS is a narrow and selective approach to the consideration of impacts to SRW and the SRW population.Watson et al. 2021 is referenced to accurately describe SRW use of Logans Beach.
1388	6410	It is estimated that there are probably less than 12 females regularly using the Logans Beach nursery.		CGG notes that this statement is unreferenced and contradictory to Stamation et al. 2020 which confirms the actual number at Logan's Beach in 2018 as 14.
1389	6411	If Southern Rock Lobster larvae are going to be encountered in the region in which the proposed survey will be conducted, it is likely that they will be the planktonic phyllosoma stage, not pre- and post-settlement stages or eggs	Appendix E4 - Section 9.1.2	This is described in the EP
1390	6411	Octopus populations rely on a small number of well-developed offspring.		The Octopus single reproductive episode is described in Appendix E4, section 4.2.2
1391	6411	Cephalopods demonstrate a high level of intelligence and are reliant on neuromuscular coordination.		Cephalopods are described and assessed in Appendix E4.
1392	6412	Stakeholder states that they have learned that the colony they believed was located at Gibson Steps is actually located at The 12 Apostles.	Appendix E5 - section 4.5	This is described in the EP
1393	6412	Stakeholder states that the correct normal breeding season commencement time is June/July for the Fairy Penguins of Western Victoria.	Appendix E5 - section 4.5	Information was noted and the EP updated

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1394	6415	Provided draft update being distributed to members in organisation newsletter under the engagement arrangement.		Noted for consultation.
1395	6421	The relevant organisation plan to create a map incorporating all Otway Basin Eps that is fit for purpose so native title holders can visualise the extent of various projects and their effects.		Noted for consultation.
1396	6432	information on krill	Appendix E2 - Section 4.1	This is described in the EP
1397	6505	The sender mentions a Python file containing most of the constants and data used to run his experimental simulations.		Noted for consultation.
1398	6507	The sender mentions that N. Australis is the primary food source for Blue Whales feeding in and around the ASA from November onwards.	Appendix E7 - Section 4.3.5	This is described in the EP
1399	6509	Historical monitoring of these penguins has been by the local council.		Noted for consultation.
1400	6509	Professor at Deakin University has been involved in past monitoring activities		Noted for consultation.
1401	6511	The sender mentions the proposed operational windows and suggests excluding November and December.		Titleholder responded to relevant person in Event ID 6432
1402	6512	The relevant person provided cumulative calculations for their model and its key assumptions.		Noted for consultation.
1403	6512	The relevant person provided their interpretation of the Regia team's material, specifically the impact of seismic blasting on zooplankton and krill in the Regia Active Source Area and the Otway bioregion.		Noted for consultation. Titleholder responded to interpretation and modelling in Event ID 6815.
1404	6513	The multiplier effect of currents (between 0 and 1 knot) on krill larvae mortality through the ASA is about 5x.		Noted for consultation. Titleholder responded to interpretation and modelling in Event ID 6815.
1405	6525	The relevant person mentioned a paper that suggests the bounce in zooplankton populations due to decreased phytoplankton grazing is a possibility.		Noted for consultation. Titleholder responded to interpretation and modelling in Event ID 6815.
1406	6525	The relevant person informed that the bioregion provided looks reasons and no triggers relating to krill and relevant stressors exist, with chlorophyll-a not a specific enough proxy for krill distribution.		Noted for consultation. Titleholder responded to interpretation and modelling in Event ID 6815.
1407	6526	Mentions the Gunditjmara Nyamat Mirring and Mirring as potentially affected by the project.	Appendix C1 Annex 2 Appendix F3 - Section 3.16	This is described in the EP

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1408	6526	mentions the Budj Bim Cultural Landscape and its integral outstanding values, such as the endangered Kooyang.	Appendix E1 Appendix F3	This is described in the EP
1409	6526	mentions the endangered Pygmy Blue Whale and Southern Right Whale as potentially affected by the project.	Appendix E7 - Sections 4.3.5 & 4.3.6	This is described in the EP
1410	6526	mentions the Kooyang's lifecycle, its migration through the EMBA and/or Operational Area of the EP, and any associated impacts on the Budj Bim Cultural Landscape.	Appendix E7 - section 4.3.6	This is described in the EP
1411	6526	Mention of key feeding, breeding/ calving and transits to and from biologically important areas for key whale species.	Appendix E7 - section 4.3.6	This is described in the EP
1412	6526	Mention of the lifecycle of the Kooyang and its migration through the EMBA and/or Operational Area for the proposed activities.	Appendix E7 - section 4.3.6	This is described in the EP
1413	6526	The relevant person mentioned that under traditional law and custom, Gunditjmara are compelled and have a cultural duty to protect Mirring and Nyamat Mirring. Under traditional law/lore, this is not optional, but mandatory.	Appendix E1 - Section 4.6.2.1	This is described in the EP
1414	6532	Individual questioned the reliability of older estimates of little penguin populations due to rapidly changing ecosystems and increasing predation pressure from recolonising New Zealand fur seals.		Little Penguin are assessed in Appendix E5, with a further assessment in Appendix F3, section 3.4, that discusses population numbers and predation.
1415	6541	Individual stated no monitoring of little penguins had been possible on Middle Island for the last two breeding seasons due to rough sea conditions.		This is described in EP Appendix F3, section 3.4
1416	6541	Individual stated that maremma dogs have returned to Middle Island.		Noted.
1417	6541	Individual stated that penguin tracks had been observed on Middle Island, though it did not help with population estimates.		Noted.
1418	6541	Individual attached graphs depicting the number of arrivals and estimated population sizes during their involvement in the Middle Island project.		Little Penguin are assessed in Appendix E5, with a further assessment in Appendix F3, section 3.4, that discusses population numbers.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1419	6562	Individual stated that they did not consider themselves eligible for compensation as they dive close to shore and therefore had not been personally affected.		Noted.
1421	6654	Individual stated that due to extreme weather conditions over the last couple of seasons, an accurate penguin count had not been able to be completed for the Middle Island Colony.		Little Penguin are assessed in Appendix E5, with a further assessment in Appendix F3, section 3.4, that discusses population numbers.
1422	6654	Individual informed that an estimation of the population of the Middle Island penguin colony had not been able to occur since 2020/21 due to insufficient data.		Little Penguin are assessed in Appendix E5, with a further assessment in Appendix F3, section 3.4, that discusses population numbers.
1423	6654	Individual suggested reaching out to Parks VIC for more recent data on the Little Penguin colony at the 12 Apostles site.		Noted for consultation.
1424	6654	Provided key penguin statistics for 2020/21, 2021/22, 2022/23 and 2023/24 reports.		Noted for consultation.
1425	6691	Relevant person provided updated office address for meeting.		Noted for consultation.
1426	6630	Provided location and time for the 14 February 2025 meeting with the Regia team.		Noted for consultation.
1427	6630	Provided a cost estimate and fee schedule for meeting with the Regia team.		Noted for consultation.
1428	6630	Gunditjmara's obligations to Mirring (including Nyamat Mirring) are dictated by traditional lore, law and custom and apply irrespective of whether Mirring is subject to a determination under the Native Title Act 1993 (Cth) or not.	Appendix E1 - Section 4.6.2.1	This is described in the EP
1429	6870	Provided a link to the Offshore Petroleum: Special Prospecting Authority, Access Authority and Scientific Investigation Consents Guideline		Noted.
1430	6702	The relevant organisation provided their draft position on the agenda items for meeting with the Regia team.		Noted for consultation.
1431	6816	The relevant person had extended their model to attempt to quantify the impact of Nyctiphanes australis depletion by Regia MSS on the food source of Blue Whales in the region.		Noted for consultation. Titleholder responded to interpretation and modelling in Event ID 6815.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1432	6676	GMTOAC and Gunditjmara consult and negotiate by way of a full group meeting, including because their rights and interests are held communally.		Noted for consultation.
1433	6879	Informed that Middle Island Penguin Project had not been able to get onto the island and it had been difficult to complete a population count.		Little Penguin are assessed in Appendix E5, with a further assessment in Appendix F3, section 3.4, that discusses population numbers.
1434	6879	Informed that Middle Island Project is funded by donations, council and dog tours.		Noted.
1435	6878	Provided information that 2024 whale season was poor.		Noted. Whale are assessed in Appendix E7 and Appendix F3.
1436	6878	Provided information that there is a small SRW population in the east and that they are highly variable with their calving cycles stretching out.	Appendix E7 - Section 4.3.6	This is described in the EP
1437	6878	Informed of a SRW migratory corridor as well as a separate breeding population.	Appendix E7 - Section 4.3.6	This is described in the EP
1438	6878	Informed that more research needed to be done about the difference in SRW calls during migration.		Noted. Whale are assessed in Appendix E7 and Appendix F3.
1439	6878	Informed that Eastern Maar people were a prescribed body corporate comprised of 13 families.		Noted for consultation.
1440	6878	Informed that the September project window was preferable due to SRW presence in the local area.		Noted.
1441	6878	Relevant person informed that they were interested in tagging whales but that it had ethical complications.		Noted.
1442	6966	Relevant person provided NatureKit link to 2022 and 2023 SRW data	Appendix E7 - Section 4.3.6	This is described in the EP
1443	6966	Relevant person informed that the best way to keep track of SRW sightings during the season is via the sightings map in WhaleFace.		Noted. Used for sighting information in Appendix E7, section 4.3.6 (SWIFFT)
1444	6893	Relevant person provided details of their responsibility as part of the Middle Island Project Committee for annual population counts of the Little Penguins on Middle Island over the summer period.		Noted for consultation.
1445	6893	Relevant person informed that they had been unable to safely cross to Middle Island for a Little Penguin population count the past 2 summers due to deep channels forming in the Merri River.		Little Penguin are assessed in Appendix E5, with a further assessment in Appendix F3, section 3.4, that discusses population numbers.

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1446	6894	Relevant person provided information that arrival counts and breeding monitoring of Little Penguins is undertaken by volunteers from Warrnambool Coastcare Landcare Network.		Noted for consultation.
1447	6894	Relevant person provided contact information for Warrnambool Coastcare Landcare Network.		Noted for consultation.
1448	6886	Relevant person informed that sightings from SRW monitoring program WhaleFace are submitted to the Victorian Biodiversity Atlas (VBA) where it is publicly available.	Appendix E7 - Section 4.3.6	This is described in the EP
1449	6886	Relevant person provided information on how to extract SRW sighting data up to 2021 via NatureKit.	Appendix E7 - Section 4.3.7	This is described in the EP
1450	6886	Relevant person informed that 2024 SRW sighting data was being processed and not yet submitted to the VBA but 2024 sightings could be viewed via Sightings Map in WhaleFace portal	Appendix E7 - Section 4.3.8	This is described in the EP
1451	6887	Relevant person confirmed that in an emergency situation to ensure safety of life at sea, while trying to minimise environmental impact, the Regia team were allowed to transit through a marine park to reach a safe location, noting that acquisition gear would be turned off and not discharging any sound source.		Noted.
1493	6752	The relevant person confirms that the text in the attachment can be included in the next e-news update to members, scheduled for February 7th, in accordance with the terms of the Engagement Agreement.		Noted for consultation
1494	6753	The relevant person expresses gratitude for the advice provided and confirms that they are the key contact for the Association moving forward.		Noted for consultation
1496	6755	The relevant person attached a slightly updated version of update which they feel is clearer.		Noted for consultation
1516	6876	Informed that catch rates were falling because fishers were not getting the recruitment.		Catch rates are shown and described in Appendix F3 section 3.5
1517	6876	Informed that fishers are targeting red crays because of markets.		Noted. Red cray or the Murray spiny freshwater crayfish is not present in the operational area.
1518	6876	Informed that fishers can hear seismic activity on their vessels.		Noted

Feedback ID	Event ID	Feedback Summary	EP Reference	Titleholder Response
1520	6876	Fisher provided information that it would be good to have a website with lookaheads including telephone numbers and email addresses for the vessel.	Appendix B3 - Section 8.1	This is included in the implementation strategy.

Annex 6 – Information Requests

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2000	2686	Request for information on how the proposed activity may impact the community, marine environment, and marine species.	The titleholder responded with an explanation of how the Regia MSS team addressed potential harm to marine life by identifying potential impacts and risks and putting mitigation plans in place. They also provided detailed examples of these mitigation plans in their response, and provided information on where to find relevant documents within the EP (Event ID 1912).
2001	2686	Request for stated commitments on reducing impacts to the marine environment and species.	The titleholder responded with examples of mitigation plans and industry standard controls for seismic surveys that will be implemented to reduce potential impacts to marine life. The titleholder also provided information on where to find relevant documents within the EP (Event ID 1912).
2002	2687	Request for a map of the EMBA	The titleholder responded by providing the stakeholder with the latest map showing the current activity area and exclusion zones implemented during the stakeholder engagement process, and requested that the stakeholder share the map with communities/areas the stakeholder is active in (Event ID 1912).
2003	2687	Request for information on in-person community consultations within Tasmania.	The titleholder provided information about the upcoming presence of a Regia MSS team member's presence on King Island, and offered for the stakeholder to meet with them. The titleholder also offered to hold an online information session for the stakeholder organisation (Event ID 1918).
2004	1831	Request for approximate dates for seismic blasting.	The titleholder responded with an explanation around how the Regia MSS team were still gathering information through engagement and consultation, therefore no acquisition dates had been decided at the time of the correspondence from the stakeholder (Event ID 2910). Project updates will continue through out the activity.
2005	2708	In-person meeting to discuss publications concerning the scope and impacts of the offshore project proposed for the Victorian coastline.	The titleholder responded by thanking the stakeholder for their engagement, offered to arrange a meeting once relevant documents had been finalised, and offered to arrange a webinar tailored to the stakeholder groups needs. The titleholder also provided information on the topics covered in a recent webinar hosted by the titleholder (Event 1889).
2006	4091	Requested details on how risks of the proposed activity will be reduced and how the effects of seismic testing will be monitored.	The titleholder responded with an explanation of the information sources used to inform the Regia MSS impact and risk assessments, and explained how these information sources and resulting measures are specific to the potential impact. The titleholder also made reference to documents relevant to this claim within the environment plan (Event ID 4092).
2007	4091	Question about the compatibility of the proposed activity with international emissions goals.	The titleholder responded with information on The International Energy Association (IEA) World Energy Outlook (WEO) 2021, Net Zero Scenario, the AEMO prediction of shortfalls of gas, and the current government policy. It was also noted that matters of national energy policy are not within the purview of CGG or the Regia MSS. (Event ID 4092).
2008	4091	Question about whether NOPSEMAs decisions will be consistent with the federal governments Threatened Species Recovery Plan.	The titleholder confirmed consistency with the Threatened Species Recovery Plan and provided a relevant extraction from NOPSEMAs Environment Plan decision making guideline document. (Event ID 4092)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2009	4091	Question about consultation with BirdLife Australia.	The titleholder responded with a statement that they will contact the mentioned stakeholder (Org 333), and included the email address they would use to make this contact (Event ID 4092)
2010	2953	Requested notes from missed event.	The titleholder provided a document containing the requested meeting notes (Event ID 1441).
2011	1281	Requested the minutes from the Warrnambool meeting.	The titleholder provided a document containing the requested meeting notes (Event ID 1441).
2012	4571	Enquired about the next opportunity for in-person small group consultations and there was a plan for more open community sessions in Warrnambool	The titleholder responded with details about the next occurrence of a Regia MSS team member being in the relevant area. The titleholder also offered the option of arranging alternative forms of communication prior to this in-person meeting (Event ID 1729).
2013	2956	Requested the minutes from the Warrnambool Session held at the Surf Club.	The titleholder provided a document containing the requested meeting notes (Event ID 2392).
2014	2958	Enquired about the next date in August for in-person small group consultations in Warrnambool.	The titleholder responded with the relevant dates that a Regia MSS team member would be at the mentioned location for in-person consultation (Event ID 1970 & 2392).
2015	1327	Requested in person meeting to understand more about Regia MSS' processes, environmental considerations and legislative requirements.	The titleholder responded with a proposed date and time to meet the stakeholder (Event ID 1353).
2016	4208	A rationale for choosing the 5 km buffer zone was requested.	The titleholder responded stating that the Regia MSS team undertook a series of risk and impact assessments for the activity. The titleholder then explained how they considered the Twelve Apostles Marine National Park and the Arches Marine Sanctuary Management plan, with relevant highlights shown in a table, providing the rationale for the 5 km buffer. (Event ID 4220).
2017	1893	EPA Victoria would like to be kept informed of activities and progress with the Regia EP.	EPA were placed on the campaign email list, to receive project updates.
2018	2192	Stakeholder requested a meeting between available dates and times outlined within the email.	Titleholder contacted Stakeholder to confirm alternate date and time for the requested meeting. (Event ID 2243)
2019	2244	Stakeholder requested alternate meeting date and time.	Titleholder contacted Stakeholder to confirm alternate date and time for the requested meeting. (Event ID 2243)
2020	3697	Requested single map of the TGS survey and the Regia MSS.	Map provided (Event ID: 3890, Document ID 3086)
2021	4106	Asked whether he'd be eligible for compensation.	Stated that the protocol would allow for commercial fishers to make a CPUE claim if they had a catch history in the area. (Event ID 4106)
2022	740	Why seismic again, there has been a lot in the region before?	Clarified that we're surveying mostly where there has been no seismic before. Clarified where the activity planning area is (Event ID 740).
2023	740	Stated the time of year we survey is important to know.	Explained that this isn't set yet as we'd like input from fishers and the community about when the best time to survey might be (Event ID 740).
2024	917	Details about the timing, duration, and exclusion zones of seismic testing.	Responded (Event ID 1018) with information and requesting a meeting to discuss further (Event ID 2011)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2025	2179	Details about the timing, duration, and exclusion zones of seismic testing.	Responded (Event ID 1018) with information and requesting a meeting to discuss further (Event ID 2011)
2026	2179	Information on the impact of seismic testing on marine species.	Responded (Event ID 1018) with information and requesting a meeting to discuss further (Event ID 2011)
2027	2259	The stakeholder requested further information regarding the impact of the proposed activity on the Warrmambool community and marine environment.	The titleholder responded identifying potential impacts and risks and putting mitigations in place, such as conducting survey during time of year marine mammals are less likely to be in area, reducing sound source to lowest setting and reducing number of times activated, implementing marine mammal and fish monitoring programs, exclusion zones, and following strict NOPSEMA guidelines. Also provided information on how activity should not affect recreational activities. Provided link to PEIRA. (Event ID 783)
2028	834	Request for information on the activity, environmental considerations, consultation process and regulations.	The titleholder responded with the requested information. (Event ID 833)
2029	839	Request for information on the activity, environmental considerations, consultation process and regulations.	The titleholder responded with the requested information. (Event ID 838)
2030	1258	Request for information on the activity, environmental considerations, consultation process and regulations.	The titleholder responded with the requested information. (Event ID 1257)
2031	1747	Asking who the Federal Minister is who has given permission for this activity	The titleholder responded with information on the regulations and authorisation process (Event ID 2787)
2032	3450	The stakeholder requested information regarding how the safety of the marine ecosystem would be ensured in the Bonney Upwelling zone.	The titleholder responded with information on assessment of, and mitigations for, the ecosystem and the Bonney Upwelling Key Ecological Feature. (Event ID 3450)
2033	3450	The stakeholder asked if any cultural heritage sites had been identified across the operational area.	The titleholder responded with information on assessment of, and mitigations for, cultural heritage. (Event ID 3450)
2034	3450	the stakeholder asked if there was traditional owner consent to impact their whale songline and sea country.	The titleholder explained that consultation with relevant persons which is not a consent seeking activity, rather a mechanism designed to be able to information share, allowing titleholders to consider, and put appropriate measures in place to address, potential impacts on functions, interests, or activities. (Event ID 3450)
2035	168	Further information required includes proposed activity location/s, proximity to Australian Marine Parks, Impacts to marine park values, and risk mitigations.	The titleholder responded with the relevant documents and shape files for both the proposed activity and environmental planning. The titleholder confirmed that they were refining the project they engaged with stakeholders therefore changes/refinements to the areas or plans may occur. (Event ID: 559, Document ID: 333)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2036	1446	Stakeholder requested an attached data request form be completed and advised approx. 6 week data request timeframes.	The titleholder responded with a completed form and a request for data on a number of fisheries. (Event ID: 1728, Document ID: 924)
2037	3400	Stakeholder responded to meeting information request to advise the points of interest they wanted clarified and gave options for convenient meeting times. Points for clarity were regarding research done on impact to marine life, mitigation measures, and impacts on state marine national parks.	The Titleholder provided the information requested (Event ID 3411) for discussion in meeting (Event ID 3783)
2038	3752	Stakeholder responded to correspondence to advise they weren't able to locate a specific document and request it be sent to them via email.	Titleholder responded explaning the information they are looking for in within the provided documents (Event ID 3753)
2039	421	Stakeholder took part in an online survey and advised they would like to receive further information regarding the project risks, impacts and processes.	The titleholder responded with the requested information. (Event ID 690)
2040	4381	Stakeholder queried the duration of the comment period for the EP as they couldn't find it on NOPSEMA website.	The titleholder responded with the requested information. (Event ID 4448)
2041	1655	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2806)
2042	1659	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2688)
2043	1661	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2817)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2044	1662	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2780)
2045	1663	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2785)
2046	1665	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2809)
2047	1668	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2771)
2048	1672	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2772)
2049	1670	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 3190)
2050	2586	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2812)
2054	4476	Stakeholder requested a timeline update regarding the EP and dates required for feedback.	The titleholder responded with the requested information. (Event ID 4499)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2055	4483	Stakeholder Enquired if there is an anticipated date for EP submission and noted they haven't received feedback on the information sheet.	The titleholder responded with the requested information. (Event ID 4499)
2056	4552	Stakeholder requested information on whether previously discussed survey research and analysis has taken place and if so, requested the findings to be shared.	The titleholder responded with the requested findings. (Event ID 4542)
2057	4600	Stakeholder queried if a similar analysis to those previously reported could also be done for King George Whiting catch in Corner Inlet also to address more queries they are receiving.	Titleholder responded confirming this is something they were exploring, if it is possible to gain access to data. (Event ID 4599)
2058	1653	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2936)
2059	2702	Why does the operational area include a large area in waters less than 50m deep off the Warrnambool - Portland area when you advise that you will no longer to acquire data in these areas.	The Titleholder responded explaining that the operational area is where the vessel may be present, the active source area (in pink) is where the sound source may be discharged at full-power and data acquired. Data won't be acquired in water shallower than 50m. (Event ID 2558)
2060	3209	The Stakeholder requested to know the qualifications of the Regia Team.	The Titleholder responded explaining that the team is comprised of specialists in several areas, including Environmental Science, along with contracted companies and scientists to complete project reports. Examples provided. (Event ID 2410)
2061	4184	Stakeholder requested information on mitigation methodology	Titleholder responded explaining the assessment and mitigation process. Provided links to PEIRA documents (Event ID 1764)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2062	4389	The Stakeholder quoted from project information on the NOPSEMA website, namely “The Regia 3D MSS will take a maximum of 90 days to acquire, and may be undertaken in any month except January, February, and March. The precise timing of the survey is subject to vessel availability, weather conditions and other operational considerations, and will consider the seasonality of environmental sensitivities, where practicable.” Stakeholder then asked "Does this mean CGG is willing to conduct seismic surveying over southern right whale calving grounds, including the Logan’s beach exclusion zone, during calving season?"	The Titleholder responded by email confirming that there will not be seismic surveying over the Southern Right Whale (SRW) calving grounds, during calving season. (Event ID 4390)
2063	4450	Stakeholder thanked representative for helping her understand CGG’s proposed Regia 3D Marine Seismic Survey and asked a couple of clarifying questions. "Looking at the map... link: Industry environment plans (nopsema.gov.au) it looks like the active source area and the operational area run parallel to Logan’s Beach Whale Nursery. Would it be correct to say that the active source area runs parallel to Logan’s Beach Whale Nursery, but does not overlap it? And what about the operational area?	The Titleholder responded in an email exchange, confirming parallel to the coast, but more than 16 km offshore at the closest point to Warrnambool. (Event ID 4451)
2064	3356	Stakeholder requested confirmation of the meeting start time and location.	Titleholder provided this information in Event ID 3073
2065	1259	Stakeholder queried the Environmental impact of the process on the community.	Titleholder responded confirming individual had been added to Regia MSS records as an interested community member and requested the individual outline their functions, interests and activities in the area and any specific concerns they may have regarding the activity. Titleholder provided links to the PEIRA and consultation website and attached the NOPSEMA brochure. (Event ID 1260)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2066	3035	The sender requests to remain informed about the proposed Otway Seismic Survey.	Titleholder responded requesting the individuals outline their functions, interests and activities in the area and any specific concerns they may have regarding the activity. Titleholder provided links to the activity description and consultation website and attached the NOPSEMA brochure.
2067	722	Request for independent research results on the harm caused by seismic blasting and asked for a document defining "adequate community consultation".	Titleholder responded providing a link to the PEIRA and advised that individual would be able to view the reference list of research used. Titleholder provided context on the difference between relevant person consultation and community consultation and went on to provide outline what information has been available for members of the community and approaches used for engagement. (Event ID 2819)
2068	2926	Clarification on phasing the activity.	Titleholder responded providing clarity on the phasing of the activity, specifically the protection of whales by providing the Protection of Marine Mammals document (Event ID 387) and shared that the full Marine Mammal Adaptive Management Plan would be available via the consultation website one completed.
2069	2926	Process for sending out pre-survey notifications and community awareness.	Titleholder responded providing general approach for communicating with relevant persons and interested members of the public for the project. Titleholder advised that SMS notifications would be used when the activity occurred to provide vessel location information to ocean users that may be affected and queried if the individual had a preferred notification method or any additional recommendations for notifications (Event ID 387)
2070	2926	Request for a detailed map with a legend including the permit zone.	Titleholder responded providing map that included a legend and an outline of the permit. (Event ID 387)
2071	2926	Request for a list of stakeholders/contracted and subcontracted companies involved, specifically marine fauna observations.	Titleholder advised that MFOs had not been contracted as yet and provided the name of two companies that frequently provided these services. (Event ID 387)
2072	2926	Inquiry about MFO training procedures.	Titleholder responded advising that the companies providing the service provide training materials for MFOs and that CGG did not have access to this training material and that it was not publicly available. Titleholder sought to clarify if the individual had a specific concern or wish to know what was included in the training and key documentation. Titleholder went on to provide and overview on how contracted MFOs met the requirements under the EPBC Act Policy Statement 2.1 and that the EP would detail competency requirements for MFOs and ongoing awareness. Also provided a link to the Regia MSS Implementation Strategy (Event ID 387)
2073	2926	Question about testing Modular Buoys for PAM and the study schedule.	Titleholder responded outlining plans to test tethered buoys with passive acoustic monitoring technology and committed to providing results of test when complete. (Event ID 387)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2074	1395	Stakeholder requested clarification on being classified as a 'relevant person'.	Titleholder responded outlying requirements of titleholders to respond to concerns raised about the Regia MSS, including evaluation, mitigation and response requirements. Titleholder advised the individual that they had a duty to consult but that the consultee was not obligated to participate in consultation. Titleholder provided the Consultation Framework flyer and Engagement Plan (Event ID 3022).
2075	2089	Request for clarification on the exploration part that people are most worried about.	Titleholder responded to online comment via email asking if the individual would like to opt-in to ongoing correspondence on the Regia MSS. The titleholder also requested more information from the individual including interest/activities in the area and any specific concerns they might have about the proposed activity.(Event ID 1338)
2076	2089	Inquiry about the impact of seismic blasting on the Bonney upwelling and marine mammals.	Titleholder responded to online comment via email asking if the individual would like to opt-in to ongoing correspondence on the Regia MSS. The titleholder also requested more information from the individual including interest/activities in the area and any specific concerns they might have about the proposed activity.(Event ID 1338)
2077	2089	Inquiry about whether comments are still allowed on the map.	Titleholder responded to online comment via email asking if the individual would like to opt-in to ongoing correspondence on the Regia MSS. The titleholder also requested more information from the individual including interest/activities in the area and any specific concerns they might have about the proposed activity.(Event ID 1338)
2078	1452	Request for information on whether the beaches will be shut off during testing.	Titleholder responded via email confirming the individual had been added to Regia MSS records as an interested community member. The titleholder also requested more information from the individual including interest/activities in the area and any specific concerns they might have about the proposed activity and provided the NOPSEMA brochure. Titleholder advised that the summaries on sound and marine mammals would be provided when finalised. (Event ID 1492, 1745)
2079	1453	Request for information on how the activity will affect the community and environment	Titleholder responded via email confirming the individual had been added to Regia MSS records as an interested community member. The titleholder also requested more information from the individual including interest/activities in the area and any specific concerns they might have about the proposed activity and provided the NOPSEMA brochure and consultation framework flyer. Titleholder provided overview of the activity, the environmental assessment process, the consultation process, and regulations and regulatory process. Links to the PEIRA, Community Consultation and Engagement Plan, and document library were also provided (Event 1454)
2080	3229	Stakeholder advising that any anomalies found that may be a potential heritage site must be reported to Heritage Victoria and noted that the Minister is also to be notified.	Titleholder responded acknowledging information provided regarding reports and enquired as to whether individual would like to receive updates about the proposed activity (Event ID 558)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2081	1455	Requested more information and consultation on the effects of this activity on Warrnambool, Port Fairy and its surrounds.	Titleholder responded via email confirming the individual had been added to Regia MSS records as an interested community member. The titleholder also requested more information from the individual including interest/activities in the area and any specific concerns they might have about the proposed activity and provided the NOPSEMA brochure and Activity Description flyer. (Event 1456)
2082	1656	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement.
2083	1669	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement.
2084	1673	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement.
2085	2766	Request for clarification on how concerns about environmental risks will be mitigated.	Titleholder responded providing overview on environmental risk management that included scientific data on marine surveys, protection of the marine environment and links to five large scale studies on MSS in Australia. (Event ID 1862)
2086	2766	Request for information on how the seismic testing proposal aligns with the push for renewable resources and consideration of marine environment vulnerability.	Titleholder responded providing a perspective on the role of gas in the Australian and global energy mix. (Event ID 1862)
2087	2677	Request for further information on direct primary research into the safety of activities in the Port Fairy area.	Titleholder responded outlining how environmental information not specifically related to the location of the activity can be used to inform the description of the existing environment in an EP. Titleholder also provided insight that research and data from the Otway and other applicable regions had been used to inform the Regia MSS assessments and measures and provided a link to an example. (Event ID 1907)
2088	2773	Request for the recipient to listen to a recording regarding concerns raised by the community and scientists prior to the seismic survey.	Titleholder responded clarifying the Regia MSS activity and sharing link to consultation opportunities for other drilling activity the individual referred to. Titleholder provided information on the marine environment including links to the PEIRA, environmental impact and risk treatments and links to five large scale studies on MSS in Australia. (Event ID 2281)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2089	2773	Request for comparison of the damage done to one species with the potential impact of the recipient's activities.	Titleholder responded providing outlines on rock lobster, whales, oil spill and the marine environment. (Event ID 2281)
2090	2383	Role-Modelling: Request for Regia MSS to reflect on their ethical responsibilities and consider the positive qualities they demonstrate to society.	Titleholder responded providing CGG perspective on need for gas in Australian energy mix and role in energy transition. Provided clarification on range of terms and names and advised that the claims related to the ongoing need for gas whilst not relevant to the adverse effects of the activity, would be provided to NOPSEMA. (Event ID 2815)
2091	2383	Request for clarification on how concerns regarding environmental risks and indigenous heritage will be mitigated.	Titleholder responded providing outline on current activity limitations put in place because of consultation around First Nations considerations. Provided outlying on approach to marine mammal protection, requirements of titleholders under EPBC Act Policy Statement 2.1 and other controls being considered for the activity. (Event ID 2815)
2092	2383	Request for an explanation on the rationale behind taking significant risks with the marine environment amidst the push for renewable resources.	Titleholder responded providing overview on environmental risk, specifically scientific data on marine seismic surveys. This included the assessment that impacts to displaced marine fauna are typically short term with no impact to ecosystem function, providing an overview on the legislations and providing links to five large scale studies undertaken in Australia on MSS. (Event ID 2915)
2093	115	Request for details of the proposed seismic activity in the Otway Basin. Request for more information or previous environmental plans related to the seismic blasting.	Titleholder responded by sending newsletter (Event ID 1182), a summary document for a SIMOPS plan for comment and review (Event ID 1752) and providing the Activity Overview and Consultation Framework information sheets and the NOPSEMA brochure (Event ID 1757)
2094	3203	The stakeholder requests clarification on the purpose of the documents and outlines for discussion with the Managing Director.	Titleholder responded clarifying that intent of contact was to establish if the organisation was a stakeholder or interested party for the Regia MSS, provided additional links on how to engage and where to find more information about the activity. (Event ID 621)
2095	353	The activity	Titleholder responded providing Activity Overview Flyer and NOPSEMA Brochure (Event ID 1755)
2096	353	The environmental assessment process	Titleholder responded providing link to the PEIRA (Event ID 1755)
2097	353	Environmental aspects (i.e. the ways the activity interacts with the marine environment)	Titleholder responded providing link to the PEIRA (Event ID 1755)
2098	353	Predicted levels of environmental impact	Titleholder responded providing link to the PEIRA (Event ID 1755)
2099	353	Predicted levels of environmental risk	Titleholder responded providing link to the PEIRA (Event ID 1755)
2100	353	The environmental management of the activity	Titleholder responded providing link to the PEIRA (Event ID 1755)
2101	353	The consultation processes	Titleholder responded providing Consultation Framework Flyer (Event ID 1755)
2102	353	The regulations or the regulatory processes	Titleholder responded providing overview of regulatory process, including NOPSEMA's role in assessment. (Event ID 1755)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2103	649	The stakeholder requests information on the estimated size of the Environmental Planning Area and the Activity Planning Area.	Titleholder provided the estimated size of the Environmental Planning Area and the Activity Planning Area in Event ID 3154.
2104	3173	Request for a briefing with a focus on what is proposed, approval process and timelines along with any impact assessment/environmental assessment that you able to share.	Titleholder provided in person briefing, presenting the requested information and responding to questions (Event ID 2322)
2105	3178	A request for Matt's surname is made by the stakeholder.	Titleholder provided this information in Event ID 899.
2106	3182	The stakeholder requests a written response to the paper "McCauley et al. 'Widely used marine seismic survey air gun operations negatively impact zooplankton' 2017."	Titleholder provided written response to the paper (Event ID 2356)
2107	626	Request for the coordinates of the EP boundary in Excel format.	Titleholder provided the requested coordinates (Event ID 724)
2108	4370	Forward reports for baseline surveys, plankton, fish, and whales, and observations/sightings from ongoing aerial surveillance for marine mammals.	Titleholder will provide all information post-survey.
2109	4370	Reports of sound source verification, particularly at a distance seaward of the survey area.	Titleholder will provide all information post-survey.
2110	4370	Updates on survey progress and daily/weekly look-ahead.	Titleholder will provide look ahead and project updates
2111	2762	The stakeholder requests information on the survey's location to assess if potential impacts on fishing operations.	Titleholder provided latest map in Event ID 1788, offered stakeholder co-ords if they would prefer. Event ID 2642 followed up following area refinement with updated map.
2112	2742	The stakeholder requested the recipient to send through any specific information about the potential impacts of their work on Bunurong Country.	Titleholder responded in Event ID 2386, with information on how Regia may have potential impact. Providing map showing overlap, stating potential impact oil spill, explaining that concerns can be outside of RAP area.
2113	832	Request for waste management plan.	Titleholder provided information on garbage management plan and commitments. Offered to share the specific garbage management plan once vessel has been contracted. (Event ID 831)
2114	832	Request for any plan for disposal of crude oil balls.	Titleholder clarified to stakeholder that the vessels only carry marine diesel, which does not result in oil balls. (Event ID 831)
2115	1831	The stakeholder requests the approximate dates of the seismic blasting.	We are currently still gathering information through engagement and consultation, so as yet we don't have acquisition dates.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2116	4133	Tuna Australia requests a map from proponents to determine potential impacts on member interests.	Map provided
2117	1181	Tuna Australia wishes to be contacted when any proposed activity has the potential to impact vessel navigation, fishing activities, and/or the conservation of fish resources consistent with the Offshore Petroleum and Greenhouse Gas Storage Act 2006.	Titleholder responded acknowledging Tuna Australia's position on consultation on offshore activities and requested the services agreement be provided for consideration. Titleholder requested how under a services agreement, Tuna Australia could provide evidence that they had authority to represent Tuna Fishers in consultation with titleholders and requested a full list of members they represented to ensure Regia MSS did not duplicate consultation efforts. (Event ID 1177)
2118	3383	Consultation not conducted through Tuna Australia's fee for service is likely to be incomplete.	Titleholder responded advising they would like to engage Tuna Australia per the provided proposal and noted that they would also need to contact fishers per the AFMA data base and outlined reasons for this. (Event ID 3796)
2119	604	The stakeholder requests an email from March 10th to be resent.	The email in question is resent to the stakeholder. Event 605.
2120	969	The stakeholder requested a phone number to discuss a meeting.	Phone number provided, Event 3166.
2121	3167	The stakeholder requested maps of the proposed Regia seismic area.	Map provided, Event 1176.
2122	5261	Request to be kept informed on any timing of offshore works.	Replied to stakeholder informing them that their details had been forwarded to Regia Environment Manager who would keep them updated as part of the ongoing consultation process
2123	3917	Request for proposals to mitigate the impact on the squid fishery during the survey period and on squid reproduction in the long term.	Titleholder responded requesting confirmation that the individual was referring to the Regia MSS and confirmed previous registration and historic communications and information provision, including a map. Titleholder advised of reduced activity and operational areas and active source areas. Titleholder confirmed the Southern Squid Jig Fishery had been identified and assess in impact assessments and provided outline on current proposed mitigations and effectiveness. Provided overview on adjustment protocol and outlined future consultation. (Event ID 4464)
2124	5189	There was not any information requested within this event.	Titleholder responded providing overview of OMICC, the adjustment protocol
2125	5190	Request for details on how compensation will be provided	Titleholder responded providing overview of OMICC, principles of compensation approach and basic application process. (Event ID 5241)
2126	1051	Information needs related to the activity, environmental assessment process, environmental aspects, predicted levels of environmental impact and risk, environmental management, consultation processes, and regulations or regulatory processes.	Titleholder responded confirming individual had been added to records as an interested community member and provided overview of activity, the legislative framework, and the consultation process. Titleholder also provided links to the consultation website and PEIRA. (Event ID 1052)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2127	2830	Enquired about the investigation into underwater noise capture methods.	Titleholder responded confirming approach to consultation and consultation requirements. Titleholder provided clarification on the use and attributes of an acoustic blanket in an MSS and provided anecdotal information received through consultation regarding the marine environment in the operational area. Titleholder provided links to five large scale studies on MSS in Australia and advised that no causal links had been found between whale strandings and MSS. (Event ID 2381)
2128	1653	Stakeholder requested confirmation of receipt of the email and recording of their vote and strong objection to Regia MSS's proposal. Requested a transcript of the Apollo Bay information session.	Titleholder responded in explaining no official vote, the purpose of the information session and consultation plans and NOPSEMA brochure. Requesting information for engagement. (Event ID 2936). Stakeholder had previously been contacted and invited to engage (Event ID 2936) following their attendance at an information session (Event ID 762).
2129	3043	Stakeholder requested to register as a Relevant Person and requested a meeting to discuss their questions regarding damage caused by seismic blasting, awareness of future litigation for environmental harm and what the ESG is in regard to continuing prospecting for fossil fuels?	Titleholder responded in Event ID 1820, providing information regarding their enquiry, and offering engagement in a format of their choosing.
2130	1832	Stakeholder thanked the team for the response to their questions and raised a concern that the team was signing off correspondence and not a real full name.	The Titleholder responded explaining that the dedicated activity email was a shared inbox, and why a team's/activities details not individuals are in the signature. Provided full names and roles of individuals involved in the project, and how enquiries are managed by the team. (Event ID 3044)
2131	1181	Tuna Australia requests a map from proponents of the proposed activity to determine if member interests may be affected on a case-by-case basis. Where potential effects exist, there is a need for a service agreement.	The titleholder requested Tuna Australia provide evidence of the Board resolution and evidence that all members agree to the position statement (Event ID 1177)
2132	879	Enquired whether the seismic blasting project falls under the category of a Special Prospectors Authority (SPA).	The titleholder responded that the title referenced by the stakeholder expires after 183 days so it is quite normal to apply for these after the Environment Plan is submitted and not before. Questions about the purpose and use of titles are best answered by the National Offshore Petroleum Titles Administrator (NOPTA) (Event ID 879).
2133	879	Stakeholder asked why the Regia MSS project was not on the NOPTA application tracking system.	The titleholder responded that questions about the purpose and use of titles are best answered by the National Offshore Petroleum Titles Administrator (NOPTA) (Event ID 879).
2134	923	Cray fisherman's concern about the proximity of seismic activities to Port Fairy and inquiries about when these activities will take place throughout the year.	The titleholder responded that they were in the process of refining the survey area and timing as consultation with stakeholders continued (Event ID 922).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2135	1038	Raises concerns about the potential impacts of proposed activities on endangered species, specifically asking if the effects on hooded plovers and shearwaters, which nest in the area, have been considered.	The titleholder responded that these species will be considered in the impact and risk assessments. The effect to birds is from artificial light from our survey during nighttime and made a commitment to using the minimum lighting needed for navigation and safe operations. The titleholder also stated they will have a porthole shroud to minimise light impacts to all birds (Event ID 1038).
2136	1529	A request was made to clarify whether the studies being used are from the Fisheries Research and Development Corporation (FRDC) and if the fishing industry can submit their studies.	In the in-person meeting the Titleholder discussed the review of the EP chapter and scientific papers supporting it (Event ID 1529) and forwarded the papers (Event ID 2996).
2137	1529	A participant inquired whether fishing data is obtained from the Victorian Fisheries Authority (VFA), seeking clarity on the sources of fishing data used.	In the in-person meeting the Titleholder responded and described how commercial fishing and underwater sound is assessed in the EP (Event ID 1529)
2138	1529	A stakeholder enquired whether new research is required or if there is a commitment to research as part of the Regia MSS.	In the in-person meeting the Titleholder described how the EP has assessed potential impacts on commercial fishing and fish species (Event ID 1529)
2139	1782	Asking for clarification about the vessel's allocated zone on the map, noting it has not been extended due to the exclusion around Deen Maar. They want the map updated to show this change accurately.	The titleholder provided the requested map (Event ID 2387).
2140	1782	Questioning why the vessel could not turn within the originally proposed zone. They wonder if this decision is intended to maximise the area covered during the surveying process.	The titleholder responded that the extended area is for vessel turning only and not acquisition. (Event ID 2387)
2141	1782	Asking for confirmation that the extension being discussed is still within the boundaries of the licensed zone.	The titleholder responded that the extended area is included in the Environmental Planning Area (Event ID 2387).
2142	1782	Inquiring whether the proposed operational zone is not considered final until the Environmental Plan (EP) is submitted.	The titleholder responded that the extended area is included in the Environmental Planning Area (Event ID 2387).
2143	1846	The feedback requests a link to the reference document used for determining safe distances for seismic in relation to different life forms.	The titleholder responded that the Sound Modelling report could be located on the Regia website and that they could not provide a link directly to it via an interactive map comment (Event ID 1846).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2144	1891	The stakeholder requested for clarification on the specific activities and provided a titleholder's map.	The titleholder responded with which titleholder activities were which and clarified activity areas. Also explained why they were hosting a joint meeting - to collaborate in consultation and reduce fatigue (Event ID 1891).
2145	1892	Fishers asked if there could be opportunities for local vessels to be contracted as support vessels for project-related activities.	In the in-person meeting the titleholder discussed that support vessels would be used and opportunity to offer that service (Event ID 1892)
2146	2010	The stakeholder requested to be kept informed of the consultation activities.	VFA were placed on the campaign email list, to receive project updates.
2147	2075	The statement expresses a request for clarification on what the organisation considers unacceptable impacts on marine life, acknowledging that NOPSEMA holds the final authority on such matters. The person seeks to understand the organisations stance on environmental concerns related to their operations.	The titleholder responded that they believe it would be unacceptable to have long-term, regional scale, or irreversible effects on the marine environment. This would also be inconsistent with the principles of ecologically sustainable development that the Regia MSS must be consistent with. You can comment on our Decision-Making Criteria recently published on the Regia website (Event ID 2075).
2148	2084	The stakeholder requested details on how the current seismic survey efforts differ from previous ones that resulted in significant mortality among molluscs, indicating a concern about the potential environmental impacts of seismic activities on marine life.	The titleholder responded that through our extensive research, they had not found any evidence of causation between seismic survey and mortal effects on molluscs. In fact, the evidence found (which would be published), suggested seismic and fishing can happily co-exist. The titleholder requested references, evidence, or testimonials for the stakeholder's claims so that they could be taken into consideration in the proper process (Event ID 2084).
2149	2091	The comment seeks clarification on how seismic blasting will be managed to prevent impacts on the Bonney Upwelling, emphasising the unpredictable nature of its location and the need for assurances that blasting will not occur nearby.	The titleholder responded that they were still working through the impact assessment and would publish the predictions of impact on the Bonney Upwelling as soon as possible (Event ID 2091).
2150	2091	The comment questions how the organisation can ensure that seismic blasting will not affect whales and larger marine creatures, given that the impact zone extends thousands of kilometres. It expresses concern over the potential for significant adverse effects on these species.	The titleholder responded that the preliminary results for the impact zone for marine mammals is 10.3 kilometres (single pulse) and 13.2 km (over time). There will be effects to whales, and it is only acceptable if those effects are behavioural i.e. not injurious (Event ID 2091).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2151	2093	This feedback seeks clarification on whether the organisation is responsible for past ecological damage to the scallop industry and what measures are being implemented to prevent a similar disaster in the future. It emphasises the importance of accountability and the need for transparency regarding the company's environmental practices.	The titleholder responded that it would be unacceptable to have mortal effects on any marine species from our or any marine seismic survey and that they do not predict mortal effects to molluscs (including scallops, abalone, oysters, clams, mussels, limpets, squids, octopus, and cuttlefish etc.). The titleholder stated that their full assessment of predicted impacts on molluscs would be made publicly available as soon as it is completed (Event ID 2093).
2152	2099	The stakeholder sought clarification on the decision-making process regarding acceptable risks to whales associated with seismic activities, indicating the need for more information about regulatory bodies and their criteria.	The titleholder responded that the Federal Department of Environment, through the EBPC Act, protect matters of national environmental significance. Whale species have specific levels of protected enacted through legal instruments such as Conservation Management Plans. These plans often contain information about the levels of impact that is unacceptable, and we must adopt them to comply with the law (Event ID 2099).
2153	2102	The stakeholder seeks clarification on the adequacy of a 52-meter depth exclusion zone for protecting abalone in regions where they might be impacted by seismic activities within the REGIA MSS area.	The titleholder responded that sound propagation is considered in both the vertical and horizontal directions. The 52m referenced here is the horizontal distance. Even with the 40m depth exclusion zone there may be abalone exposed above threshold levels, and we will contend that the residual impacts will be of an acceptable level at a population/ecosystem level (Event ID 2102).
2154	2322	The stakeholder attended a briefing with a conservation group earlier in the month, in relation to the impact of MSS on zooplankton. The stakeholder requested the titleholder create a submission in response to this.	The titleholder requested a written response to the paper McCauley et al. 'Widely used marine seismic survey air gun operations negatively impact zooplankton' 2017 (Event ID 3182) and provided formal written response to the paper with supporting documentation (Event ID 2356).
2155	3228	Request on information about the types of compensation that would be paid via NERA protocol.	Discussions are underway with fishing associations to provide an opportunity for all commercial fishers in the region to review and input into the final content of the adjustment protocol. Outlined that fishers would also be able to nominate suitably qualified competent assessors for compensation claims (Event ID 3228).
2156	3228	Request from fishers to get the active source area and the operational area data for themselves.	The titleholder agreed to provide the lat/longs of the areas in WGS84 format prior to the survey and as soon as they are finalised (Event IDs 3228; 4107).
2157	3350	The stakeholder requested that consultation services be paid on a fee for service basis.	Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers' participation in the consultation process. (Events 2930, 3350, 3856, 4039)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2158	3367	It was recommended to reach out to the Victorian Scuba Divers Federation to facilitate contact with recreational divers who may be impacted.	The titleholder responded that they had contacted Victorian Scuba Divers Federation and that notice on popular boat ramps would be place prior to the survey starting to notify recreational divers of the risks and the SIMOPS plan (Event ID 3367).
2159	3697	The stakeholder requested a single map of the respective titleholder survey area maps.	The titleholder provided a map of the TGS survey and Regia MSS areas (Event ID 3890).
2160	3678	Requested for a summary to be put together of the differences between the TGS seismic survey and the Regia MSS.	The titleholder provided a document with a summary of the summary of the differences between the TGS Seismic Survey and the Regia Seismic Survey (Event ID 3887).
2161	3678	Request for a map to be provided of the TGS activity area and the Regia MSS area.	The titleholder provided a map of the TGS survey area and the relevant Regia MSS areas (Event ID 3887).
2162	3678	Request for the draft Sea Country Protection Plan.	The titleholder provided the draft Sea Country Protection Plan (Event ID 3887).
2163	4076	The stakeholder requested coordinates of the acquisition area.	The titleholder provided a document with the requested coordinates of the active source area (Event ID 4101).
2164	4106	Expressed interest in eligibility for compensation.	The titleholder responded that the NERA protocol did allow for any fisher to make a CPUE claim if they had a catch history in the area (Event ID 4106)
2165	4106	Advised occasionally fish for squid in the summer.	The titleholder advised that the activity had no overlap with summer months (Event ID 4106).
2166	4108	The operator of a growing fresh fish market at the port expressed a desire to ensure that their business would be included in the compensation protocols established by CGG for the seismic survey.	The titleholder responded that the NERA protocol did not explicitly cater for a calculation method for fishing co-ops or markets. However, agreed that the co-op could be commercially affected and that a claim put forward to CGG would be considered for compensation. Outlined that evidence would be required to support such a claim. (Event ID 4108)
2167	4433	the stakeholder requested a 12-month monitoring program of recruitment prior to the survey commencing to determine the effects that should be compensated.	The titleholder replied that work had been completed to determine effects on spawning of commercial fish species and promised to provide information on assessment. Stated that effects from seismic on recruitment to fisheries were not found (Event ID 4433).
2168	5051	The stakeholder asked how the changes to the National Recovery Plan for the Southern Right Whale would be considered within the EP.	The titleholder replied that they had considered and referred to the draft recovery plan and now the final had been published, they would follow the processes in place to handle changes such as these. The titleholder stated they plan to send out a project update to relevant persons to notify them of changes (Event ID 5051).
2169	5051	The stakeholder asked how the changes to the Cultural Heritage Act would be considered within the EP.	The titleholder responded that Regia MSS is proposed to be undertaken in Commonwealth waters and therefore there is no obligation to comply. However, state heritage had been considered and this is reflected in cultural heritage notifications and reporting implementations (Event ID 5051).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2170	5051	The stakeholder asked for information regarding the timeframe on the project's start date and decisions on the EP.	The titleholder responded that NOPSEMA had extended their assessment timeline and that they have made a commitment to publish every decision letter we receive, for full transparency. The titleholder stated that the re-submission timeline will depend on the decision made by NOPSEMA, and that the overall timeline is tied to this. However, during consultation with community and their concerns over increased summer biodiversity, it was agreed that they would not acquire in the summer months, January to March and that the earliest start time would be 1 April 2025 (Event ID 5051).
2171	5051	The stakeholder asked what the titleholder did with data collected.	The titleholder responded that multi-client data is acquired, processed by CGG and can then be sold to multiple clients. (Event ID 5051)
2172	5051	The stakeholder asked if there would be another public comment period.	The titleholder responded that there would not be a further Public Comment process, but there would be ongoing consultation with relevant persons (Event ID 5051).
2173	5051	The stakeholder asked if track lines are part of the EP and if there were any plans to do further work on them.	The titleholder responded that more work is being done and that a map with the latest refinement of lines would be published in due course (Event ID 5051).
2174	5211	This feedback seeks clarification on the measures that will be implemented to protect whales during nighttime operations, expressing concern for their safety in low-visibility conditions.	The titleholder responded that they are assessing a range of measures to detect whales at night, or during poor visibility. These include the measures outlined in Policy Statement 2.1 (Part B), which is the standard set by the Federal Government for management of interactions between whales and seismic surveys. The titleholder stated they would publish our marine mammal adaptive management plan as soon as it is complete (Event ID 5211).
2175	4107	This feedback raises a concern about how intangible losses related to relocation will be addressed, such as time spent away from family and the need to fish in Gippsland instead of the preferred Otway region.	The titleholder responded that the NERA protocol did not have such provisions, and they would be difficult to calculate. Reiterated that this type of feedback could be provided and CGG would consider it (Event ID 4107).
2176	4107	Feedback requesting more information on what compensation would be paid to fishers.	The titleholder outlined that discussions are underway with fishing associations to provide an opportunity for all commercial fishers in the region to review and input into the final content of the adjustment protocol. Outlined that fishers would be able to nominate suitably qualified competent assessors for compensation claims (Event ID 4107).
2177	4107	Request from fishers to get the active source area and the operational area data for themselves.	The titleholder agreed to provide the lat/longs of the areas in WGS84 format prior to the survey and as soon as they are finalised (Event ID 4107).
2178	5203	The stakeholder inquired about the timeline for the Environment Plan (EP) resubmission to NOPSEMA, specifically seeking information on when the next version of the EP will be available for assessment.	The titleholder provided details about the timeline for resubmission of the Regia MSS EP to NOPSEMA and stated that CGG would update relevant persons when there is information to share (Event ID 5204).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2179	5181	The stakeholder requested clarification regarding CGG's recent name change and why it was changed.	The titleholder responded to confirm CGG's recent rebrand and explained that the CGG business name was being retained for consultation. The titleholder provided a link to a press release about the name change (Event ID 5187).
2180	5183	The stakeholder requested a link to the latest Environment Plan (EP) as they were uncertain where to find it.	The titleholder responded that the latest EP is the version submitted to NOPSEMA following Public Comment and provided a link to its location on the NOPSEMA webpage and Regia consultation hub (Event ID 5182).
2181	5183	The stakeholder asked whether the Environment Plan includes the newly updated, reduced Active Source Area map, indicating a desire to review this specific aspect carefully.	The titleholder responded that the EP was being updated to ensure it is updated with relevant new information, such as the latest active source area (Event ID 5182).
2182	5186	Seeks clarity on when the survey will take place including the time of year.	The titleholder provided an update that the Regia MSS survey timings would be between April-June or September-November, with the survey occurring once for 90 days and that the precise timing is subject to EP approval, vessel availability, weather approval and other operational considerations (Event ID 5191).
2183	5230	Stakeholder re-forwarded previous correspondence regarding OMICC adjustment protocol. Requested confirmation that Regia team had received their correspondence.	OMICC team responded confirming receipt of email.
2184	740	Stakeholder queried why there was seismic activity again as the region has already experience numerous events in the past.	The titleholder clarified that the survey is primarily being conducted in areas with no prior seismic activity and provided details about the activity planning area (Event ID 740)
2185	1183	Stakeholder asked what measures would Regia implement to minimise the impact on their ocean activities.	The titleholder responded requesting a description of the stakeholder's interests and activities in the area to supply information specific to them (Event ID(s) 1186; 3090).
2186	2967	Stakeholder requested for updates regarding the proposed activity.	The titleholder responded that the Environmental Impact Assessments were available (Event ID 2967) and re-forwarded link to the documents (Event ID 2960).
2187	3883	Stakeholder reiterated their request to be notified about the surveys to ensure they can provide the necessary safety information.	The titleholder noted the request and continued to provide the organisation with relevant project update correspondence regarding Regia MSS (Event ID(s) 4403; 4404; 4897; 5134).
2188	4359	Stakeholder requested an update on the status of the Regia MSS EP.	The titleholder responded that submission had been made to NOPSEMA and that they were waiting for confirmation that the EP was ready for public comment (Event ID 4359).
2189	4359	Stakeholder enquired if the changes made to the EP would be shared to assist their organisation in their content assessment.	The titleholder responded that each EP document contains a section which reflects feedback received on the topic and actions made in response to the feedback that are referenced in the document (Event ID 4359).

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2190	4365	The stakeholder mentioned that their organisation wished to submit to the titleholder and asked about the best way to proceed.	The titleholder explained the consultation process and advised that as a relevant person, ASBTIA could make representations to CGG at any time and submit public comment (Event ID 4365).
2191	4468	Stakeholder queried how ALARP decisions can be made without knowing the profitability of the company.	The titleholder explained the origins of ALARP from safety and that the cost of implementing a measure is to be compared against the risk reduction it achieves. If the measure is reasonably practicable the company must adopt it, and if it can't afford to do so then it shouldn't undertake the activity (Event ID 4468).
2192	4468	Stakeholder inquired about the role of ALARP under the EPBC Act.	The titleholder clarified that the ALARP construct is from OPGGSA and that it is only linked to the EPBC Act through a Part 10 approval of NOPSEMA's authorisation process (Event ID 4468).
2193	4468	Stakeholder questioned whether ALARP was linked under the principles of ESD.	The titleholder clarified that ESD have a valuation principle that is more about the value of development or pricing principles and does not reflect the ALARP principle (Event ID 4468).
2194	817	Stakeholder requested to see a project map with more features and clarity on SPA's.	The titleholder responded with an overview to the names involved in the project: Regia; CGG; EP and Klarite and attached a project overview sheet for reference. The titleholder also provided a link to the interactive map and noted that the activity area was in the process of being refined (Event ID 813).
2195	4627	The stakeholder requested that Regia avoid explicitly mentioning consultation with their organisation and instead use general terms in their letters.	The titleholder acknowledged the request and noted that consultation with the entity would have to be reported but that the content would remain confidential. The titleholder also agreed to remove the entity name from future correspondence. (Event ID 4627)
2196	4669	AFMA representative queried if consultation with a fishing organisation was proceeding.	A Regia team member outlined a request for data regarding tonnage of catch in the Regia area. CGG's experience was that this data is inaccurate and not required for previous surveys and is yet to receive information from organisation on how it can help in the management of impact and risks, so for now CGG is not inclined to undertake this work. (Event ID 4669)
2197	2331	Stakeholder requested a descriptive outline of what Regia/seismic is and what they are seeking from the organisation.	The titleholder responded with a description of Regia MSS and directed the stakeholder to the activity webpage. The titleholder explained how permitting works and how they had been contacting traditional owner groups in the region (Event ID 2331) and re-sent email correspondence stating who had been contacted as part of consultation (Event ID 2332).
2198	3224	Request for an online meeting to better understand the project and consultation process.	Held online meeting, Event ID 2009
2199	918	Requesting a visit on Country in Warrnambool to discuss the proposed activity	Met on Country, Event ID 3678
2200	930	Requested name of Regia representative to address correspondence to.	Responded in Event ID 4225 with Regia team names and roles, also clarified other names (survey name, company names) related to the activity.
2201	1517	Stakeholder requesting to discuss survey before consultation period ends.	Online meeting held, Event ID 2032

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2202	1027	Stakeholder requesting clarification that the advertised community session will be CGG only information.	Confirmed session was CGG standalone, Event ID 4183
2203	3908	Enquiry if full financial position of companies project would need to be known in order to consider if something is ALARP.	Called stakeholder, Event ID 4062, to discuss concept of ALARP in detail. Agreed to prepare dedicated report on ALARP assessment (Appendix F2)
2204	4292	Clarifying understanding of PTS/TTS distances for effects to Blue Whales from webinar.	Responded in Event ID 4292 following questioning in Event ID 4280, confirming PTS and TTS may have been confused.
2205	4292	Seeking information on submission timing.	Event ID 4292 provided update on submission process and timing.
2206	4600	Run analysis on King George Whiting catch in Corner Inlet	Completed the analysis of historical seismic data and the investigation of correlation with KGW recruitment.
2207	4483	Requesting anticipated submission date of EP	Event ID 4503 provided information on submission process and timing.
2208	4152	The sender requests assistance in scheduling a Teams meeting in June with the new SIV CEO.	Online meeting held, Event ID 1815
2209	4161	Requesting signed agreement is resent.	Resent, Event ID 4163
2210	4476	Enquiring as to timeline update for Regia EP and if there is a timeline for feedback from SIV.	Information provided in Event ID 4499
2211	4552	The inquiry seeks confirmation on whether analysis discussed at meeting was completed and requests access to the relevant findings. The case study discussed was to analyse trends in fishery data related to large-scale seismic surveys along the Victorian coastline. The analysis would examine data from two years prior, one year during, and seven years after these surveys to identify any correlations with recruitment and productivity in key fisheries. The specific surveys mentioned included the Enterprise and Crowes Foot projects.	Responded in Event ID 4542, forwarded full write up of work in cumulative impact assessment re query on fishing data. Monthly data (2006-2023) was conclusive that there are no detectable long-term effects to catch rates.
2212	4607	Stakeholder explaining they received a bounceback from their email and confirming if previous email had been received.	Confirmed email received (Event ID 2532)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2213	4180	The VRLC requests to hear back on how the points raised in their letter will be considered in determining an appropriate way forward.	As the feedback concerned the Otway adjustment protocol, these points were addressed in a response to SIV from the Otway Marine Industries Co-Existence Cooperative on 13/9/24.
2214	5234	Stakeholder requests summary of how the following receptors are addressed in the EP: Southern Rock Lobster, Octopus, and Giant Crab	Provided the relevant person with the requested information summaries on SRL, Octopus and Giant Crab assessments. (Event ID 5298)
2215	2898	Request for clarification on seismic information sharing with permit holders	Responded in Event ID 633, explaining multi-client data
2216	2898	Inquiry about times for surveys in the area and correlation to other seismic plans in the Otway's Basin.	Provided information on survey timing and cumulative effects Event ID 633
2217	2901	Provide information regarding exclusion zones and modelling informing the work in progress.	Informed stakeholder that initial sound propagation modelling was published on the Regia website that day. Explained it was initial modelling undertaken based on feedback from relevant person consultation that the areas of most concern were near to Deen Maar/Lady Julia Percy Island. Stated likely to commission further modelling (which will be published) once settled on an activity design. Stated that we have implemented three exclusions zones as a result of relevant persons objections: - No survey activities in the SRW reproductive BIA whilst they are present in the area (May-November) - No acquisition (i.e. full power discharge of the sound source) within 10.3km of Deen Maar as this is the behavioural response threshold for marine mammals. - No acquisition in water depths of less than 40m as this is protective for abalone divers, abalone, and other recreational marine users. Event ID 1231
2218	2901	Regia will include AMCS to the distribution list of data information provided to Antarctic Division and other organisations.	Regia team committed to preparing a Communications Plan for the activity and confirmed that AMCS will be added to the distribution list of data provided to AAD. Agreed to add AMCS to the distribution list of shut-down notifications for sightings of marine mammals. Stated if they would like other information during the survey, to let us know and they can be added to those distribution lists also. Event ID 1231
2219	2901	AMCS to be provided information on shutdown occurrences due to sightings of marine mammals.	Regia team committed to preparing a Communications Plan for the activity and confirmed that AMCS will be added to the distribution list of data provided to AAD. Agreed to add AMCS to the distribution list of shut-down notifications for sightings of marine mammals. Stated if they would like other information during the survey, to let us know and they can be added to those distribution lists also. Event ID 1231
2220	2901	Stakeholder asking if daily survey reports of marine life spotted in the areas will be shared.	Explained CGG are happy to share our reports of marine life spotted from our survey, but they will not be from within or near the Apollo Reserve, as the Vic-P70 title is approx. 100km from the reserve. Event 1231

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2221	2901	Stakeholder asking to be provided with biodiversity and critical habitat BIA data being used for the EP	Stated we use data from primary research of peer reviewed literature and data from the DEECCW websites (SPRAT Database, PMST reports, conservation advice, management plans etc.), information published by State agencies, and information received during consultation. Asked if AMCS have any biodiversity data or critical habitat BIA data, as we would welcome the opportunity to input that into our impact assessments. We are aware of the draft conservation management plan for Southern Right Whales and have taken this latest information into account in our activity plan, despite it not being the legal instrument yet. Explained we are also aware that the South-east Commonwealth Marine Reserves Network Management Plan is due to expire in June 2023, and we are not aware of any published draft or updated plan. Asked if AMCS have any information on the update to either of these plans, as we would happily take that information into consideration in our EP. Event ID 1231
2222	2901	Stakeholder asking for identified impacts of seismic operations on the values of the Apollo marine park	Explained the Vic-P79 title is approximately 100km from the Apollo Commonwealth Marine Reserve. As such, the Regia MSS will come no closer than approximately 35km from the Reserve. Regarding the impact of seismic operations, given the distances of the Regia MSS to the Apollo Commonwealth Marine Reserve, no predicted change to the conservation values or conservation pressures within the Reserve. Event 1231
2223	2901	Requesting specific measures being taken to ensure operations are not ongoing during migration times for federally listed species in VP79	Explained the Regia MSS is not just limited to the Vic-P79 title. Seismic surveys are allowed to be conducted during migration times provided that appropriate control measures are in place to mitigate effects. We will adopt Policy Statement 2.1 management measures to protect whales, and we will increase shutdown distances for all whales to 2000m from the vessel. Event ID 1231
2224	2901	Which species are their measures to monitor and mitigate for	Stated additional assessment of mitigation measures for Southern Right Whales and Blue Whales had been undertaken and have implemented an exclusion for SRWs in their new reproductive BIA. For Blue Whales we are investigating new technologies that will help us detect whales beyond our visual capabilities including running tethered passive acoustic monitoring buoys deployed before, and during the survey with real-time reporting of SRW/BW presence in the area. We are also looking into the feasibility of Autonomous Underwater Vehicles to assist in marine mammal detections. Event ID 1231
2225	2901	The inquiry is about how the seismic plans are being modified in light of ongoing criminal investigations related to Schlumberger's breaches during seismic operations that affected the Bonney Upwelling.	Requested AMCS to provide a reference to the proceedings they'd like us to consider, so we can properly respond. Event ID 1231
2226	2901	Requested history of seismic over the proposed area in the last 15 years	Agreed to produce this, with underlying titles also shown. This was provided in Event ID 2802

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2227	2901	Request for information on cumulative impact of operations on marine values and threatened species	Agreed to produce the cumulative impact assessment. This was provided in Event ID 1830
2228	2901	Asked how data from CGG's noted citizen science projects on the Victorian coast has shaped our operations	Explained CGG haven't surveyed in this area before but are looking into how we can utilise the citizen science projects as they relate to marine mammal observations. Explained we are consulting with the relevant State agencies to access their data on citizen science observations Event ID 1231
2229	2901	Where will vessels be brought in from, and what biosecurity risks and mitigation measures are involved?	Explained that do not have a vessel specified for the survey yet. It may be a vessel already operating in Australia or a vessel coming from international waters. Stated we have just published our risk assessment of introducing invasive marine species which is available on our website. Event ID 1231
2230	2901	How is the Regia data different to already available seismic in the area?	Explained the Regia MSS is targeting areas of geology that have not been previously surveyed although there will be some overlaps with previous surveys to tie the data together. We will provide the map previously mentioned that will show where previous surveys have taken place. Event ID 1231
2231	2901	Was the title obtained through an SPA	Explained that due to being a multi-client project, an SPA would be applied for over areas of open acreage and access authorities over award petroleum titles. Event ID 1231
2232	2680	AMCS seeking clarification on the title under which the seismic exploration is being conducted, following feedback from community consultation sessions.	Event ID 2799 reiterates that combination of SPA and AA will be applied for. Supplied map of recently confirmed active source area and the overlap with existing titles.
2233	2680	Information on timeframes	Event ID 2799 provides the latest timelines, including the intention to pause consultation on October 20th.
2234	2535	Sought clarification on the submission dates and the start of the Public Comment phase.	Provides expected dates and timelines in response Event ID 2536
2235	2798	Stakeholder asking if AA and SPA permits will still be used for the activity.	Event ID 2799, reiterates that combination of SPA and AA will be applied for. Supplied map of recently confirmed active source area and the overlap with existing titles.
2236	2798	Requesting clarification on consultation and public comment timelines, stating community groups are confused.	Event ID 2799 provides the latest timelines, including the intention to pause consultation on October 20th.
2237	4380	AMCS representative requesting clarification on timeframes. Latest project update sent out by CGG is different to what they've heard from relevant person community members.	Event ID 4447 explains that we currently do not have date for public comment yet. When the date is known a project update will be sent out, with updates on website and social media. As per regulations also print media advertisements will be produced.
2238	4357	AMCS representative (different representative to Event ID 4380) requesting clarification on timeframes. Latest project update sent out by CGG is different to what they've heard from relevant person community members.	Event 4358 explained communications with their colleague and confirmed, as per Event ID 4403, that the EP was available for Public Comment.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2239	5040	AMCS requests information on the steps being taken to update the EP and the public consultation processes for the necessary revision.	Confirmed that the Environment plan adhered to the draft National Recovery Plan for Southern Right Whales and noted that now the final recovery plan has been released, the team is working to identify changes and additions and will make necessary updates to the Regia MSS Environment Plan after the next decision. Provided information that the Regia MSS EP outlines how CGG have committed to handling new information. This is provided in Section 4 of Appendix B3 - Implementation Strategy. Noted that an information sheet will be compiled for distribution to inform on the update to conservation plan and how it relates to the Regia MSS EP. Event ID 5034
2240	5076	AMCS requests to know when relevant persons will be given opportunity to consult on the changes to EP, what this means for expected approval timelines from NOPSEMA.	Event ID 5125 reaffirms there are no changes to management measures affecting relevant persons, and if changes occur, feedback will be requested.
2241	5076	AMCS requests information on how First nations and community groups along coast of Victoria with interest in southern right whale are being consulted.	Event ID 5125 provides direction to specific sections of the EP for details on First Nations consultation.
2242	5076	Requesting information on how recent GHG permit announcements by federal government may impact the EP currently with NOPSEMA and what GHG/CCS exploration utility this seismic project may have.	Event ID 5125 clarifies that greenhouse gas release is not relevant due to uncertainty about hydrocarbons in the area.
2243	5121	Requests clarification on why the Environmental Plan (EP) was sent back to the titleholder, CGG, and asks whether NOPSEMA issued a Request for Further Written Information or an Opportunity to Modify and Resubmit	Event ID 5124 informs stakeholder that the RFWI letter has been published on the consultation hub.
2244	5121	AMCS requests a copy of the letter NOPSEMA provided to CGG stating the reasons for returning the EP	Event ID 5124 informs stakeholder that the RFWI letter has been published on the consultation hub.
2245	5203	Inquired when the Environmental Plan (EP) for the CGG Regia MSS project will be resubmitted to NOPSEMA, expressing an understanding that it is imminent and seeking insights on when the next version can be expected for assessment.	Stakeholder informed that CGG has 90 days from August 29 to resubmit the Regia MSS EP, with a deadline of November 27, though the submission may occur earlier or potentially be delayed. Clarified that the resubmission is not imminent, and CGG will keep relevant persons updated. Event ID 5124

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2246	2713	Confirming they would like a meeting when Regia team is in the area, flexible on times, query on whether it would be a one-on-one meeting or venue?	Event ID 2723 offers meeting size of their choosing, requested feedback from stakeholder on preference. Followed up with phone call, Event ID 2967. Offered online options if in person was not convenient for stakeholder.
2247	2713	Query on if project is an SPA or AA?	Event ID 2723 confirmed that as per previous meetings, it remains the case that the Regia MSS is likely to be acquired under AAs and SPAs.
2248	1246	Requested phone call to discuss information session	Attempted to call multiple times (Event ID's 4569, 1288, 1290, 1291). Managed to make contact via phone Event ID1309
2249	5039	Requested information on how Regia had adjusted the EP since the implementation of the new Southern Right Whale Recovery Plan and details on how the changes came into effect.	Replied to stakeholder's query regarding the implementation of the new Southern Right Whale Recovery Plan, stating Regia team are identifying changes and additions to EP and will make the necessary updates. Explained the EP outlined how CGG committed to handling new information in section 4 of Appendix B3. Stated Regia Team were compiling an information sheet. Event ID 5046. Provided follow up email to confirm the information sheet (Event ID 5134) had been received. Event ID 5238
2250	5235	Stakeholder asks for details on how to revise the environment plan and the project to prevent any negative effects on Little penguins. It seeks specific strategies or measures that will be implemented to protect this species.	The titleholder responded in Event ID 5299, defining what a BIA is and how they are identified. Also described is the assessment of Little Penguins in the Regia EP. Appendix F3, 'Further Assessment of Key Environmental Values and Sensitivities', was provided, directing the stakeholder to Section 4.4 that summarises the work undertaken on Little Penguins, including the mitigation effectiveness summary.
2251	5235	The request asks for clarification on why there are no specific receivers identified at Deen Maar, despite it being a sensitive location and falling within the foraging Biologically Important Area (BIA) for Little penguins. It seeks an explanation of the reasoning or criteria used to determine that no specific receivers were deemed necessary in this context.	The titleholder responded in Event ID 5299, defining what a BIA is and how they are identified. Also described is the assessment of Little Penguins in the Regia EP. Appendix F3, 'Further Assessment of Key Environmental Values and Sensitivities', was provided, directing the stakeholder to Section 4.4 that summarises the work undertaken on Little Penguins, including the mitigation effectiveness summary.
2252	5235	The inquiry seeks clarification on how the declared Little penguin Biologically Important Areas (BIAs) are considered to be outside of the noise Emission Management Buffer Area (EMBA), given that the project area overlaps with three BIAs. It highlights concerns about the potential for vessels to come close to foraging Little penguins, and asks for an explanation of the criteria or assessments that led to this determination.	The titleholder responded in Event ID 5299, defining what a BIA is and how they are identified. Also described is the assessment of Little Penguins in the Regia EP. Appendix F3, 'Further Assessment of Key Environmental Values and Sensitivities', was provided, directing the stakeholder to Section 4.4 that summarises the work undertaken on Little Penguins, including the mitigation effectiveness summary.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2253	4543	Requesting details for invoicing	Provided in Event ID 4538
2254	4368	Stakeholder asking for Regia presenters' name	Provided in Event ID 4498
2255	4405	Requested CGG's presentation at the consultation day covers the following: What your project(s) are, what stage it/they are up to, are there likely to be and/or is Gunditjmara Sea country being impact by the project(s)? If so, how? What plans are in place to protect the Gunditjmara cultural values? What do you see as good consultation/engagement with Gunditjmara?	These topics were covered in the presentation given, Event 4469.
2256	4936	Requesting to know the revenue overlap	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2257	4787	Requesting CTS tonnage of the catch taken in proposed survey area.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.
2258	4553	Stakeholder queried what Titleholder's position on understanding the materiality of trawl fishing in the MSS area.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2259	4128	Stakeholder questioned if there was any work being done on trying to understand the volume of fishing occurring in the proposed area.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.
2260	4046	Stakeholder emailed with regards to understanding how much fishing overlaps the proposed area, and expressed it remains critical for them.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.
2261	3857	Brief email from stakeholder to Regia, requesting additional items to be added to purchase order. Request for materiality of trawl impacts as per letter previously supplied (Event ID 3747).	Responded and agreed (Event ID 4039)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2262	3746	Fishing associations request the need to understand the financial overlap of the survey with historical fishing activities.	Challenged the utility of such information that fails to consider behavioural movements for target species, cooperative measures the fishing industry could take, and the adoption of a compensation protocol for affected fishers. In CGGs experience such information provided no basis for protection measure nor a reasonable estimation of the compensation that was due.
2263	3746	Request review of AFMA data and report back to us on the extent of average annual overlap with each fishery in terms of tonnes or monetary value.	Provided information that we have confirmed the accuracy of ABARES data with AFMA and that we have provided information on the worst-case overlap with associations fisheries, just not to the fidelity requested. CGG sees no utility in gaining more accurate figures on the overlap between the survey and the fishery for reasons shared in response to Feedback ID 172.
2264	3382	Fishing associations request the need to understand the financial overlap of the survey with historical fishing activities.	Challenged the utility of such information that fails to consider behavioural movements for target species, cooperative measures the fishing industry could take, and the adoption of a compensation protocol for affected fishers. In CGGs experience such information provided no basis for protection measure nor a reasonable estimation of the compensation that was due.
2265	3351	Titleholder stating, they need to know the tonnage/financial displacement totals.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information. Event ID 4969 requested from the stakeholder the reasoning behind purchasing this report, and how it would help avoid interference, and provide information for mitigations.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2266	4237	Requesting data relating to the catch (tonnes) and materiality in each fishery, specifically trawl and shark. The titleholder stated catches in the area are not deemed to be confidential when 5 or more fishers are present in the survey area and requested the titleholder to go back to the data team for updated information.	Initially responded in Event ID 2655, Regia team seeks to understand why SETFIA/SSIA are focused on the aggregate tonnes of fish potentially affected by the survey, especially since higher-resolution catch data may not be relevant for a whole fishery analysis. Following this, Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information.
2267	2557	The titleholder stated the report lacks comprehensive data and has asked for further clarification around volume and value of the catch (trawl and shark gillnet) in the area for compensation purposes.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information.
2268	2002	Stakeholder requests to know how they can provide input into compensation protocol	Event ID 4700 provides information on, and invitation to engage with, the Otway Marine Industries Co-Existence Cooperative (OMICC) on the Otway Adjustment Protocol
2269	2002	Request for fisheries and survey overlap data	This Commercial Fisheries review was compiled via a fisheries consultant who was engaged to analyse the publicly available ABARES data and produced a comprehensive report which demonstrated the overlap of each fishery. See Appendix B6
2270	2003	Requests single point of contact	This was provided (Event ID 1974) and a meeting held (Event ID 3350)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2271	4601	Stakeholder requested the months of the active seismic surveys conducted previously and to be shown that they do not align with the downturns in recruitment.	Event ID 4635 describes the assessment process and provides a linear regression graph, that tests for any correlations between the past 22 years of annual recruitment of KGW to PPB and the annual count of seismic surveys across Victorian waters, which was then lagged by 1,2 and 3 years. The figure shows there is no significant relationship between frequency of seismic events in the region and the levels of recruitment.
2272	4637	Stakeholder requested copies of the references	Copies of the 44 papers referenced were provided in Event ID 4636
2273	4637	Required further information on assessment of potential impacts on KGW recruitment.	In Event ID 4635, the Regia team outlines their investigation into potential effects of marine seismic surveys on King George Whiting (KGW) and their recruitment. They reference extensive scientific citations in their impact assessments, including a specific evaluation of literature provided by the other party, and encourage feedback supported by validated sources. To assess any correlation between seismic activities and KGW recruitment, they analysed long-term datasets from Port Philip Bay (PPB) and the National Offshore Petroleum Information Management System (NOPIMS). They noted that if seismic testing significantly impacted fish populations, increased seismic frequency should correlate with declines in recruitment. However, their analysis revealed no significant relationship between the frequency of seismic events and KGW recruitment levels over the past 22 years, indicating that recruitment can vary independently of seismic activity. They emphasized that while proving direct cause and effect is challenging due to various confounding factors, their data did not support the claims of adverse effects on KGW stocks. They conclude that extensive research shows no measurable impact from seismic surveys and assert that the concerns raised are not substantiated by evidence
2274	4048	Stakeholder requested overlap in value or at least tonnes to provide meaningful feedback from the stakeholder, expressed that this was the first time a proponent has refused to consider the provided fishing data.	CGG responded to this request many times, including Event ID 2894, explaining that after further discussion, it was concluded that information about the value of previous catch is not necessary or useful for several reasons. First, historical catch data does not help understand how individual commercial fishers or fishing associations may be affected in the future. Second, this information is irrelevant to assessing the impact of underwater sound on fish and fishing activities, as monetary values do not contribute to the cause-effect pathways in impact assessments. Additionally, aggregated data does not provide the appropriate level of analysis needed for individual fishers, nor is it needed for an effective compensation protocol. The data would likely overestimate the economic impact, as fishers must fish to qualify for compensation and would still receive remuneration regardless. Lastly, historical data only indicates that some unspecified fishers may have been affected in the past under hypothetical scenarios that could not have coincided with actual surveys. Overall, no improvements to predictive accuracy in impact assessments are expected from obtaining or sharing this information.
2275	2020	Look into how compensation could apply to a co-op market retailer.	In the in-person meeting the Titleholder agreed to table this with OMICC (Event ID 2020)

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2276	917	Questions about the benefits for Port Fairy and local employment opportunities.	Individual attended community information session where title holder addresses this issues (event ID 1501)
2277	2092	Feedback seeks clarification the organisations view on what people are concerned about regarding the activity. Suggests organisation is implying that seismic surveys are not the primary element people are concerned about.	Titleholder responded clarifying that they have received many concerns about varying aspects of the activity and the underlying merits of proceeding. Stated they are openly consulting to learn about the environment from the local community to protect their values and sensitivities. Stated they will register objection to gas developments. (Event ID 2092).
2278	2179	Questions about benefits for Port Fairy, local employment opportunities, and visibility of rigs from shore.	Individual attended community information session where titleholder addresses these issues (event ID 1501)
2279	2830	Questioned the coordination between public consultation activities and the Environment Plan preparation, and the relevance of public concerns.	Titleholder responded addressing the questions in Event ID 2381.
2280	2821	The stakeholder requested video footage showing the impact at the sea floor, and other potentially impacted areas.	The titleholder provided video footage as requested (Event ID 1077).
2281	4208	The stakeholder requested the rationale for the 5 km buffer limit and any environmental risk assessment or other methods that were used to determine that the 5km buffer zone provides significant protection from the seismic surveys.	The titleholder provided the link to the Regia MSS website and directed the stakeholder to the risk and impact assessments within the Document Library (Event ID 4220).
2282	4966	Are the documents provided in this email the sum total of new information Regia will be providing to NOPSEMA in their updated EP?	The titleholder responded in Event ID 4931, stating the new information in the EP.
2283	3783	The stakeholder also made a specific request for the EP to have regard to the marine and coastal policy and act for Victoria	The titleholder agreed and the policy is referenced in the EP (Event ID 3783)
2284	806	The sender requests contact via phone number provided.	Called stakeholder, Event ID 817.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2285	3855	The stakeholder requested confirmation on acceptance of price and invoicing. Nominated a fee structure for all work ongoing related to the MSS and will cover all businesses involved.	Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers' participation in the consultation process. (Events 2930, 3350, 3856, 4039)
2286	3355	Requested the titleholder provide additional financial data on survey/fisher activity overlap to allow reduction of impact from activities in the area.	As detailed in Event ID's 4129 & 3989, knowing a value or tonnes of historical fishing averages in an area does not add to the solutions already in place for this proposed activity.
2287	3746	Request for confirmation of ongoing engagement by responding to their October 4 email regarding a proposed commercial arrangement.	Agreed to engage SETFIA/SSIA for fee-for-service consultation with members to raise awareness about the activity and encourage individual fishers' participation in the consultation process. (Events 2930, 3350, 3856, 4039)
2288	994	Stakeholder requests in-person consultation to address concerns outlined in the relevant person survey submission.	In-person meetings held: Event ID's 2024, 3413, 4062
2289	5242	Request from EMAC employee to be added to the project list for Regia MSS.	Added their details to project list.
2290	994	Stakeholder requests separate public information sessions for projects presented by ConocoPhillips and CGG.	Separate community information sessions held, Event ID's 4112, 1731
2520	4469	Query about the assessment of 'no measurable effect' on the world heritage values of Budj Bim	Outlined the reasons for the statement and noted that the information of our assessment had been available to GMTOAC since Sept 2023. Produced and provided an information sheet on the Regia assessment of the Outstanding Universal Values of Budj Bim (Event ID 4634).
2521	4469	Request for information on the impact assessment on Kooyang (short-finned eels) and on Kontapool (SRW).	Agreed to provide the detailed assessments. Produced and provided information sheets on Kooyang and Kontapool (Event ID 4634).
2522	4469	Query about whether seismic surveys were the same as 'fracking'.	Outlined the differences between fracking and seismic mapping.
2523	4469	Query about the timing of the activities being limited to exclude January, February and March and whether any other months are excluded	Explained that the July and August weather made surveying impossible and unlikely to occur in those months. Also outlined the current position to carry two separate windows through the assessment at this time. Notified that the survey area and the timing may narrow as the assessment and our planning progress.

Feedback ID	Event ID	Feedback Summary	Titleholder Response
2524	5220	Request for names and qualifications for members of the Whale Expert Panel to be publicly available, along will all meeting minutes and discussions between the panel and CGG.	Acknowledged their interest in the composition and activities of the Whale Expert Panel, which plays a critical role in advising on the implementation of the Fauna Management Plan (FMP). Explained that whilst unable to share individual panel members' names or qualifications publicly, nor make meeting minutes available, this information will be accessible to NOPSEMA, the regulatory body responsible for overseeing compliance with the EP. NOPSEMA's oversight provides the necessary accountability for the commitments made in the EP. Explained that in this instance, public involvement, particularly from organisations with clear objectives to end oil and gas activities, is not appropriate in the operations of the Whale Expert Panel. This independent panel is designed to function objectively within the regulated framework, aligning with best practices to ensure marine environmental protection of sensitive marine fauna. Event ID 5302
2291	6323	request for confirmation on distribution of information sheet	Responded in Event ID 6322, providing PDF for distribution to members
2292	6324	Requested information on next steps in the process and if any further concerns should be sent straight to NOPSEMA	Event ID 6318 - Titleholder informed relevant person that it would be best to send straight through to project however anything sent to NOPSEMA would be given to CGG to have an opportunity to provide a response
2293	6326	The relevant person requested confirmation of the date of the resubmission of the Regia MSS project.	Event ID 6314 - The Regia team responded that the Regia MSS EP remained under assessment and that CGG would issue an update to all relevant persons on the status of the submission in due course.
2294	6326	The relevant person requested the most recent version of the EP that has been resubmitted to NOPSEMA for assessment.	Event ID 6314 - The Regia team responded that there was no requirement for the titleholder to publish the updated EP throughout the assessment. However, they had proactively and voluntarily decided to do so on the Regia Consultation Hub. They confirmed that when it is available, the relevant person would be notified in the same manner as everyone else.
2295	6327	The relevant person asked for confirmation about the intended timing of the seismic blasting project	Event ID 6320 - stated the window of April/May/June had been chosen as offers most minimal impacts, following assessment and identification of cause-effect pathways
2296	6327	The relevant person sought clarification about what the recipient means by avoiding the "prime" egg laying or chick raising time.	Event ID 6320 - Explained that the timing of lifecycle events like nesting and chick rearing can vary due to numerous factors and differs between colonies and years. Long-term studies and their averages are the best way to understand reproductive timing. Scheduling the MSS in April/May/June avoids the core egg-laying and chick-rearing periods, making it the most effective mitigation strategy tool.
2297	6327	The relevant person asked if the Regia team would consider starting the seismic free time in May to be on the safe side, or if they would communicate with various organizations and researchers to find out when the penguins' egg laying season begins.	Event ID 6320 - Team highlighted their assessment of the minimal predicted overlap with the outer limits of the core foraging area, which was based on a review of all available literature.

2298	6328	The relevant person requested information about when the public will have access to CGG's EP Rev 3 and if there are any obligations regarding this and the 30 day assessment period.	Event ID 6319 - The Regia team responded that there is no obligation for CGG (nor NOPSEMA) to publish the latest version of the EP. However, they stated they had made commitment to publish the resubmitted EP as soon as possible on the Regia MSS website. The relevant person would receive notice of the EP being published along with everyone else as part of the project update.
2299	6329	The relevant person requested a discussion on how the Regia EP deals with potential impacts to plankton.	Event ID 6321 - The Regia team provided a summary of their assessment of zooplankton and measures adopted to assuage concerns of stakeholders. They extended an offer to discuss their work with the relevant person further if required.
2300	6329	The relevant person asked if the Regia Marine Seismic Survey presents an opportunity for the organisation to further their undersanding on the potential impacts of seismic on plankton.	Event ID 6321 - The Regia team responded that whilst further research is something they had considered, the already significant analysis of the effect of sound on krill, additional assessment work completed by Regia marine scientists on the significance of the Bonney Upwelling, and the measures put into place, means that the Regia team did not see the case for any additional research on this topic.
2301	6330	The relevant person asked if Regia team would like to provide a summary document to be distributed as part of Engagement Agreement.	Event ID 6322 - The Regia team provided the information sheet in PDF for distribution to members.
2302	6333	The relevant person requested confirmation about the assessment period.	Event ID 6626 - The Regia team responded that they were yet to receive a decision from NOPSEMA.
2303	6334	The relevant person requested a meeting with the Regia MSS team.	Event ID 6321 - The Regia team provided a summary of their assessment of zooplankton and measures adopted to assuage concerns of stakeholders. They extended an offer to discuss their work with the relevant person further if required.
2306	6338	The relevant person asked for the date the status of the EP changed from Under assessment (with Titleholder), to Under assessment (with NOPSEMA).	Event ID 6316 - The Regia team responded that CGG resubmitted the EP on Tuesday 12th November 2024 and that they did not know when NOPSEMA updated their website.
2307	6338	The relevant person was seeking clarification if the EP has been resubmitted to NOPSEMA for assessment and when.	Event ID 6316 - The Regia team responded that CGG resubmitted the EP on Tuesday 12th November 2024.
2308	6338	The relevant person requested a timeline on when the updated EP will be available.	Event ID 6316 - The Regia team responded that they were working on the Regia Consultation Hub updates and the associated project update for all relevant persons. They stated that they would provide the information as soon as possible with a webinar to follow.
2309	6341	Requested information on whether the recipient can meet with GMTOAC and Gunditjmara native title holders to discuss the Consultation Plan.	Event ID 6430 - The Regia team confirmed that CGG would make themselves available to meet with the organisation in February 2025 and requested the exact dates for meeting.

2310	6341	Requested information of impacts and risks associated with greenhouse has emissions and climate change impacts, sensitive ecosystems, protected areas, sites of national envrionmental significance, culturally important animal and plant species, noise and light pollution, unplanned activity events and cumulative impacts of the activities.	Event ID 6430 - The Regia team responded that CGG had already provided this information to GMTOAC as outlined in previous correspondence to the organisation. They stated that the information remained available in the Document Library on the Consultation Hub at www.regiamss.com.au. This included the presentation provided at the February 2024 Information Session, summarised information about impacts and risks of the activity, detail assessments of impacts and risks, the proposed management and mitigation measures to protect the environment, and other relevant information.
2311	6410	The sender is looking forward to receiving clarification on what the proposed timeframes for surveys are	Event ID 6529 - Following the stakeholders statement that timelines were inconsistent, referring to comments on the interactive map, the Regia team confirmed that the proposed timelines can be found in Appendix A2.
2312	6411	Request for response to the concerns raised about the potential impacts of the proposed survey on Southern Rock Lobster, Pale Octopus, and Giant Crab.	Event ID 6820 - The Regia team provided the requested information: For Southern Rock Lobster, the Regia team stated that while larvae may be present in the survey area, the species is highly resilient due to its well-connected, genetically homogenous stock. They asserted that any impacts on individual larvae would be negligible relative to natural mortality rates and broader population dynamics. Regarding Pale Octopus, the Regia team acknowledged findings from the Day et al. (2023) study indicating potential neurological impacts from seismic activity but emphasized that the study found no significant long-term damage or impairment at the population level. They maintained that while some effects were observed in individual octopuses, they were not of a scale likely to influence population health. For Giant Crab, the Regia team referred to their environmental assessment, which concluded that seismic effects on crustaceans, particularly adults, are minimal and that any mortality observed in studies occurred only at very close proximity to the sound source. They reiterated that climate change and fishing pressure remain the primary threats to Giant Crab populations, not seismic activity.
2313	6416	The relevant person requested for KMZ files instead of shapefiles.	Event ID 6423 - The Regia team responded that the requested format is now in the file location to which they provided a link.
2314	6416	The relevant person requested for all data sets from the project	Event ID 6423 - The Regia team responded that they had included the Marine Park files but they are not property of, created, or maintained by the Regia team and therefore they could not take responsibility. They stated that it is the Federal Governmnets responsibility to maintain the datasets and they may change from time to time.
2315	6419	The relevant person requested an information sheet to include in their organisation member update communication.	Event ID 6425 - The Regia team attached correspondence for distribution to the organisation members as requested.

2316	6420	The relevant person requested to look at specific assumptions around both theirs the Regia team's position on krill.	Event ID 6414 - Regia Team member agreed with stakeholder to hold meeting (Event ID 6890) with the Regia marine science team to discuss matters further. Also attached: Skartaesterhagen et al 2024 Ecosystem effects of underwater noise in the Nordic seas, and provided a link: https://www.waterquality.gov.au/anz-guidelines/your-location/australia-marine-IMCRA.
2317	6421	Request for GIS data related to CGG's Otway Basin, environments that might be affected, and regulated areas.	Event ID 6428 - The Regia team provided link to the requested shapefiles for CGG's petrolem title areas, project areas, operational areas, environments that might be affected, including all biologically important areas for threatened and endangered species. The Regia team outlined that information relating to IPA's, Commonwealth and/or State marine parks, and any other regulated areas are better accessed directly from the owners/creators' websites.
2318	6432	requests that active current monitoring be independently evaluated for reasonableness and implemented if the benefit outweighs the costs or efforts involved.	Event ID 6874 - Regia team discussed relevant persons existing concerns on zooplankton and agreed to follow up with email and meeting with experts. Event ID 6414 - The Regia team thanked the relevant person for their time on a recent call and suggested that a meeting with their marine research scientists would be the best way to further discuss concerns. They noted that since the Regia MSS Environmental Plan (EP) would remain under assessment well into the New Year, there was no urgency to schedule the discussion before Christmas. Event ID 6890 - Online meeting to discuss stakeholders submission; a model of the effect of ocean currents on impacts to krill from seismic. The meeting focused on discussing the stakeholders modelling work regarding the potential impacts of seismic surveys on krill and how this would impact the blue whale's food source. The discussion involved reviewing figures in the EP Appendix E2, and the scientific literature where the stakeholder argued that the current evidence was insufficient to rule out potential impacts on the whale's food source. Regia's marine scientists challenged the assumptions, stating that the natural variation in the ecosystem was much larger than the potential impacts their model suggested. They also pointed out that the literature did not support the stakeholder's model and that there was no evidence of a population collapse or catastrophic effects on krill from seismic activity. The stakeholder was encouraged to refine his work, particularly regarding the historical effects of seismic surveys, and consider the scale and natural variability of the ecosystem. The Regia team agreed to review their figures in Appendix E2 and provide comprehensive written feedback on the stakeholder's work.

2319	6432	requests that the recipient consider the references included in this response as evidence that relevant peer-reviewed papers have been considered when developing the current model and this response.	Event ID 6874 - Regia team discussed relevant persons existing concerns on zooplankton and agreed to follow up with email and meeting with experts. Event ID 6414 - The Regia team thanked the relevant person for their time on a recent call and suggested that a meeting with their marine research scientists would be the best way to further discuss concerns. They noted that since the Regia MSS Environmental Plan (EP) would remain under assessment well into the New Year, there was no urgency to schedule the discussion before Christmas. Event ID 6890 - Online meeting to discuss stakeholders submission; a model of the effect of ocean currents on impacts to krill from seismic. The meeting focused on discussing the stakeholders modelling work regarding the potential impacts of seismic surveys on krill and how this would impact the blue whale's food source. The discussion involved reviewing figures in the EP Appendix E2, and the scientific literature where the stakeholder argued that the current evidence was insufficient to rule out potential impacts on the whale's food source. Regia's marine scientists challenged the assumptions, stating that the natural variation in the ecosystem was much larger than the potential impacts their model suggested. They also pointed out that the literature did not support the stakeholder's model and that there was no evidence of a population collapse or catastrophic effects on krill from seismic activity. The stakeholder was encouraged to refine his work, particularly regarding the historical effects of seismic surveys, and consider the scale and natural variability of the ecosystem. The Regia team agreed to review their figures in Appendix E2 and provide comprehensive written feedback on the stakeholder's work.

2320	6432	requests that CGG should also attempt to detect and avoid concentrations of adult krill and develop strategies around achieving this.	Event ID 6874 - Regia team discussed relevant persons existing concerns on zooplankton and agreed to follow up with email and meeting with experts. Event ID 6414 - The Regia team thanked the relevant person for their time on a recent call and suggested that a meeting with their marine research scientists would be the best way to further discuss concerns. They noted that since the Regia MSS Environmental Plan (EP) would remain under assessment well into the New Year, there was no urgency to schedule the discussion before Christmas. Event ID 6890 - Online meeting to discuss stakeholders submission; a model of the effect of ocean currents on impacts to krill from seismic. The meeting focused on discussing the stakeholders modelling work regarding the potential impacts of seismic surveys on krill and how this would impact the blue whale's food source. The discussion involved reviewing figures in the EP Appendix E2, and the scientific literature where the stakeholder argued that the current evidence was insufficient to rule out potential impacts on the whale's food source. Regia's marine scientists challenged the assumptions, stating that the natural variation in the ecosystem was much larger than the potential impacts their model suggested. They also pointed out that the literature did not support the stakeholder's model and that there was no evidence of a population collapse or catastrophic effects on krill from seismic activity. The stakeholder was encouraged to refine his work, particularly regarding the historical effects of seismic surveys, and consider the scale and natural variability of the ecosystem. The Regia team agreed to review their figures in Appendix E2 and provide comprehensive written feedback on the stakeholder's work.

2321	6432	requests that the months of November to April should be excluded from consideration by CGG to conduct seismic acquisition.	Event ID 6874 - Regia team discussed relevant persons existing concerns on zooplankton and agreed to follow up with email and meeting with experts. Event ID 6414 - The Regia team thanked the relevant person for their time on a recent call and suggested that a meeting with their marine research scientists would be the best way to further discuss concerns. They noted that since the Regia MSS Environmental Plan (EP) would remain under assessment well into the New Year, there was no urgency to schedule the discussion before Christmas. Event ID 6890 - Online meeting to discuss stakeholders submission; a model of the effect of ocean currents on impacts to krill from seismic. The meeting focused on discussing the stakeholders modelling work regarding the potential impacts of seismic surveys on krill and how this would impact the blue whale's food source. The discussion involved reviewing figures in the EP Appendix E2, and the scientific literature where the stakeholder argued that the current evidence was insufficient to rule out potential impacts on the whale's food source. Regia's marine scientists challenged the assumptions, stating that the natural variation in the ecosystem was much larger than the potential impacts their model suggested. They also pointed out that the literature did not support the stakeholder's model and that there was no evidence of a population collapse or catastrophic effects on krill from seismic activity. The stakeholder was encouraged to refine his work, particularly regarding the historical effects of seismic surveys, and consider the scale and natural variability of the ecosystem. The Regia team agreed to review their figures in Appendix E2 and provide comprehensive written feedback on the stakeholder's work.

2322	6432	requests that krill swarm detection mechanisms should be assessed by the proponent.	Event ID 6874 - Regia team discussed relevant persons existing concerns on zooplankton and agreed to follow up with email and meeting with experts. Event ID 6414 - The Regia team thanked the relevant person for their time on a recent call and suggested that a meeting with their marine research scientists would be the best way to further discuss concerns. They noted that since the Regia MSS Environmental Plan (EP) would remain under assessment well into the New Year, there was no urgency to schedule the discussion before Christmas. Event ID 6890 - Online meeting to discuss stakeholders submission; a model of the effect of ocean currents on impacts to krill from seismic. The meeting focused on discussing the stakeholders modelling work regarding the potential impacts of seismic surveys on krill and how this would impact the blue whale's food source. The discussion involved reviewing figures in the EP Appendix E2, and the scientific literature where the stakeholder argued that the current evidence was insufficient to rule out potential impacts on the whale's food source. Regia's marine scientists challenged the assumptions, stating that the natural variation in the ecosystem was much larger than the potential impacts their model suggested. They also pointed out that the literature did not support the stakeholder's model and that there was no evidence of a population collapse or catastrophic effects on krill from seismic activity. The stakeholder was encouraged to refine his work, particularly regarding the historical effects of seismic surveys, and consider the scale and natural variability of the ecosystem. The Regia team agreed to review their figures in Appendix E2 and provide comprehensive written feedback on the stakeholder's work.
2323	6505	The relevant person asked what the action items were following their meeting with the Regia team.	Event ID 6815 - The Regia team responding to a document submitted regarding the potential impact of the Regia Marine Seismic Survey (MSS) on the Bonney Upwelling system and its marine ecosystem. The document in question claimed that the MSS would cause significant krill mortality and critiqued the Regia Environmental Plan (EP) as scientifically flawed. They strongly rejects these claims, asserting that the EP is a robust scientific assessment, developed with peer-reviewed literature and extensive expert experience. In contrast, the submitted model is criticized for lacking transparency, validation, and alignment with real-world conditions.

2324	6505	The relevant person asked the Regia team to explain their reasoning about why any level of krill mortality as a consequence of Regia MSS will have no serious impact on Blue Whale food source	Event ID 6815 - The Regia team responding to a document submitted regarding the potential impact of the Regia Marine Seismic Survey (MSS) on the Bonney Upwelling system and its marine ecosystem. The document in question claimed that the MSS would cause significant krill mortality and critiqued the Regia Environmental Plan (EP) as scientifically flawed. They strongly rejects these claims, asserting that the EP is a robust scientific assessment, developed with peer-reviewed literature and extensive expert experience. In contrast, the submitted model is criticized for lacking transparency, validation, and alignment with real-world conditions.
2325	6505	The relevant person asked the Regia team to let them know if they are wrong about not referencing Teng et al (2014).	Event ID 6815 - The Regia team responding to a document submitted regarding the potential impact of the Regia Marine Seismic Survey (MSS) on the Bonney Upwelling system and its marine ecosystem. The document in question claimed that the MSS would cause significant krill mortality and critiqued the Regia Environmental Plan (EP) as scientifically flawed. They strongly rejects these claims, asserting that the EP is a robust scientific assessment, developed with peer-reviewed literature and extensive expert experience. In contrast, the submitted model is criticized for lacking transparency, validation, and alignment with real-world conditions.
2326	6506	The relevant organisation asked for confirmation by close of business Monday 20 January whether the proposed date change suits CGG.	Event ID 6522 - The Regia team responded that CGG welcomed the change in meeting date and confirmed that it is a suitable date and time.
2327	6506	The relevant organisation requested notification if there were any issues with providing a response to the proposed meeting change by Monday.	Event ID 6522 - The Regia team responded that CGG welcomed the change in meeting date and confirmed that it is a suitable date and time.
2328	6507	The relevant person requested confirmation on their interpretation: that no level of harm to krill within the ASA warrants mitigation, as the EP concludes that regional impacts are insufficient to trigger mitigation measures.	Event ID 6414 - In the email following a phone call (Event ID 6874) the Regia Team member states the best spatial scale for considering the impacts on krill larvae populations, as discussed on the call, and the IMRCA bioregions have been chosen as the appropriate scale for assessing such impacts on plankton populations, including krill. The Regia team member agreed to hold a meeting with the Regia marine science team to discuss matters further and provided a relevant paper and link to the IMCRA: Skartaesterhagen et al 2024 Ecosystem effects of underwater noise in the Nordic seas.
2329	6507	The relevant person requested a short monthly Zoom meeting with their core group of NGOs.	This was a request directed at NOPSEMA
2330	6508	The relevant organisation requested dedicated slides for the agreed agenda items, including: previous information provided about consultation, the Sea	Event ID 6618 - The Regia team responded that as agenda items, they had assumed these were topics for discussion and not things they would be expected to present on. The Regia team requested further instruction on this matter.

		Country Protection Program and views on the other agenda items.	
2331	6508	The relevant organisation requested that the Regia team reduce the amount of text per slide.	Event ID 6618 - The Regia team responded that they understoof the request to reduce the text on the slides and would undertake this task.
2332	6511	The relevant person requested clarification on how they are wrong if the Regia team did not agree with their suggestions regarding plankton/krill.	Event ID 6516 - The Regia team responded that the relevant person had not understood CGG's position correctly. They provided an outline of their reasoning that the relevant person's modelling is insufficient to understand its utility and plausibility due to its failure to consider a borad basis of literature to support the model, failure to provide assumptions or the method used to generate the modelled result, and a failure to provide the underlying data for the model.
2333	6519	The relevant organisation made a request for information about the missing documents in the folder that was supposed to be sent.	Event ID 6522 - The Regia team apologised and confirmed that they had re-uploaded the documents. The Regia team provided a screenshot of the uploaded files and requested to know if the relevant person had any issues accessing the files.
2334	6524	Requests core logic as discussed - the cumulative % impacts that lead t othe negligible conclusion with regard to krill impacts.	Event ID 6514 - The Regia team responded that they were trying to demonstrate that even if they were to use the logic from the relevant person's paper i.e. that there were 100% mortality to all exposed plankton (which is not supported by the literature), the effects would be immeasurably small. The Regia team confirmed that they had not used this logic in their demonstration of why there are acceptable levels of impact from their sound emissions. The Regia team outlined their case for acceptability: that it is not based on calculated levels of mortality and recoverability. The case is that given the enormity of the ecosystem and the dynamics at play, that the effects are such that they are totally subsumed by natural variation and dynamics and as such are immeasurable (i.e. that there is no calculation that could even be made). This case is supported in the context that the survey avoids peak upwelling times which are when population levels are expected to be at their most productive. This is also the justification when considering cumulative impacts, i.e. that despite any additional mortality suffered, the natural variation and ecosystem dynamics in this region are such that the effects are completely subsumed, likely within days after the survey.

2335	6525	The relevant person requested an outline of the chain of % calculation which results in no measurable impact of seismic activity on N. australis.	Event ID 6514 - The Regia team responded that they were trying to demonstrate that even if they were to use the logic from the relevant person's paper i.e. that there were 100% mortality to all exposed plankton (which is not supported by the literature), the effects would be immeasurably small. The Regia team confirmed that they had not used this logic in their demonstration of why there are acceptable levels of impact from their sound emissions. The Regia team outlined their case for acceptability: that it is not based on calculated levels of mortality and recoverability. The case is that given the enormity of the ecosystem and the dynamics at play, that the effects are such that they are totally subsumed by natural variation and dynamics and as such are immeasurable (i.e. that there is no calculation that could even be made). This case is supported in the context that the survey avoids peak upwelling times which are when population levels are expected to be at their most productive. This is also the justification when considering cumulative impacts, i.e. that despite any additional mortality suffered, the natural variation and ecosystem dynamics in this region are such that the effects are completely subsumed, likely within days after the survey.
2336	6526	Request for PowerPoint presentation covering previously identified topics to include images and visual aids that clearly convey information requested alongside limited text per slide.	Event ID 6521 - The Regia team confirmed that they had provided the requested material via a share folder link. They clarified that this information had been previously provided to the organisation or had been available online since September 2023. They also stated that CGG had repeatedly offered tailored and bespoke communications, including numerous requests to meet with the organisation to discuss their needs. The requested material was re-uploaded in Event 6522.
2337	6526	Requested plain English information sheets on various matters related to the project.	Event ID 6521 - The Regia team confirmed that they had provided the requested material via a share folder link. They clarified that this information had been previously provided to the organisation or had been available online since September 2023. They also stated that CGG had repeatedly offered tailored and bespoke communications, including numerous requests to meet with the organisation to discuss their needs. The requested material was re-uploaded in Event 6522.
2338	6526	Requested amendments to the proposed meeting agenda for 15 February 2024.	Event ID 6528 - The Regia team responded that they accept the proposed additions to the agenda for the meeting to be held on 15 February 2024.
2339	6526	Requested the recently updated EP including identification of changes made in response to NOPSEMA's RFWI's and copy correspondence from NOPSEMA to CGG.	Event ID 6521 - The Regia team provided the requested EP via a share folder link. The material was re-uploaded in Event 6522.
2340	6526	Asked how is the Regia MSS EP consistent with r 4 of the Regulations, that is, to ensure that any petroleum activity or greenhouse gas	Event ID 6521 - The Regia team provided a tailored information sheet to the relevant person about greenhouse gas emissions and climate change impacts.

		activity carried out in an offshore area is carried out in a manner consistent with the principles of ecologically sustainable development set out in section 3A of the EPBC Act.	
2341	6526	Asked how is the Regia MSS EP consistent with r 4 of the Regulations, that is, to ensure that any petroleum activity or greenhouse gas activity carried out in an offshore area is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable.	Event ID 6859 - The Regia team provided Annexure A in addition to correspondence and outlined the three stages of the Environmental Assessment Process as well as clarifying the difference between potential and predicted impacts.
2342	6526	Asked how is the Regia MSS EP consistent with r 4 of the Regulations, that is, to ensure that any petroleum activity or greenhouse gas activity carried out in an offshore area is carried out in a manner by which the environmental impacts and risks of the activity will be of an acceptable level.	Event ID 6859 - The Regia team provided Annexure A in addition to correspondence and advised that assessments were undertaken in three stages to identify cause-effect pathways and ensure these were appropriately managed, stepping through the process and providing examples held within the EP.
2343	6526	Asked in what ways and by what measures does the Regia MSS EP respond to and address the principles of ecologically sustainable development under section 3A of the Environment Protection and Biodiversity Conservation Act 1999 (Cth), including that decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations.	Event ID 6521 - The Regia team provided a tailored information sheet to the relevant person about greenhouse gas emissions and climate change impacts.
2344	6526	Asked in what ways and by what measures does the Regia MSS EP respond to and address the principles of ecologically sustainable development under section 3A of the Environment Protection and Biodiversity Conservation Act 1999 (Cth)	The ways in which the titleholder adheres to the principles of ESD were discussed in the in-person meeting (Event ID 6880). Materials were provided prior to the meeting, and again post meeting in Event 6859.
2345	6526	Asked further to s 3A of the EPBC Act and the Gunditjmara Nyamat Mirring Plan 2023-2033, how are the proposed activities within the Regia MSS EP (and the consequences of same) consistent with the best available scientific data and internationally agreed goal of a safe climate by	Event ID 6521 - The Regia team provided a tailored information sheet to the relevant person about greenhouse gas emissions and climate change impacts.

		reducing greenhouse gas emissions?	
2346	6526	Asked how and in what manner have the threats identified in the Gunditjmara Nyamat Mirring Plan, including but not limited to Table 1, page 22 "Existing or future threats to Nyamat Mirring – Climate Change" been addressed and mitigated?	As per the presentation for the in person meeting (Event ID 6880), this is also addressed in Information Sheet 1, provided in Event ID 6521 and confimed received in Event ID 6508
2347	6526	Asked how and in what manner has the Regia MSS EP accounted for and described Gunditjmara rights, functions, interests and values in relation to the "environment" (as broadly defined under r 5 of the Regulations) in relation to ecosystems, natural and physical resources, qualities and characteristics of locations, heritage value of places.	Event ID 6521 - the Regia team provided a tailored information sheet to the relevant person about cultural features.
2348	6526	Asked how does CGG consider the social, economic and cultural features of ecosystems, natural and physical resources, qualities and characteristics of locations, heritage value of places, including Gunditjmara law/lore, custom and knowledge?	Event ID 6859 - The Regia team responded that assessment of species and places of cultural significance could be located in Appendix F3, Section 3.16 Cultural Features of the Environment Plan. Additionally, in event ID 6521, the Regia team provided a tailored information sheet to the relevant person about cultural features.
2349	6526	Asked what, if anything, does CGG require from the relevant person in order to more accurately describe the "environment" as defined under the Regulations?	As per the presentation for the in person meeting (Event ID 6880), this was provided in the powerpoint send in Event ID 6521 and confimed received in Event ID 6508
2350	6526	Asked how and in what manner do the proposed activities within the Regia MSS EP, including associated risks and impacts to the environment, ensure that no adverse action, interference, and/or inconsistency (to the extent permitted) arises in connection with Gunditjmara people, communities, heritage, and/or social, economic and cultural interests?	Event ID 6859 - The Regia team respodned that following consultation with relevant persons, and completion of the environmental assessments, activity limitations have been adopted (see following slide). These activity limitations have been referred to throughout the environmental assessment, consultation, and public comment processes.

2351	6526	Asked where impacts are identified, on what basis does CGG justify that these impacts are of an acceptable level? Similarly, on what basis does CGG conclude that these impacts are mitigated to as low as reasonably practicable?	Event ID 6859 - The Regia team responded an outline of the framework for defining acceptable levels for the Regia MSS can be found in Appendix F4.The acceptable levels defined by CGG for all relevant receptors including marine mammals were assembled using scientific rigor, which included the analysis of peer-reviewed and unbiased literature to predict impacts to relevant species, while also ensuring their consistency with species' recovery and conservation management plans. CGG has also engaged in extensive consultation efforts to learn and gain as much knowledge as possible around the cultural significance of marine species during this process and continues to welcome additional relevant information and knowledge that could further benefit the protection of the marine environment, including culturally significant species. Also noted : CGG's first draft of defined acceptable levels were published in May 2023 on the Consultation Hub alongside our environmental assessment process to provide an opportunity to the community and relevant persons to understand the assessment process and influence the criteria used in the assessment process. The opportunity to comment was open for 60 days.
2352	6526	Asked how has CGG demonstrated to NOPSEMA, being a relevant Commonwealth agency, that its proposed activities are not inconsistent with and/or do not contravene any recovery plans under the EPBC Act, per s 268 of that Act, including but not limited to the recovery plans for the Southern Right Whale and the Blue Whale?	Event ID 6859 - The Regia team responded that as per EP Appendix E7, CGG will ensure there are no behavioural impacts to Blue Whales, as the seismic source will be shut down within 10km of a blue whale. This is based on the underwater sound modelling commissioned by CGG where behavorial impacts to blue whales was predicted to occur within 9.83km of the sound source.
2353	6526	Asked how and in what manner do the proposed activities within the Regia MSS EP, including associated risks and impacts of same, ensure that no adverse action, interference, and/or inconsistency arises in connection with recovery actions and/or implementations of the above-mentioned SRW recovery plans?	Event ID 6859 - The Regia team responded that as per E7 Appendix 7, There are only 3 BIAs associated with whales that are relevant to the Regia MSS, the Southern Right Whales Reproductive and Migration BIA, and the Blue Whale Foraging BIA. The sound source will be operated within the Southern Right Whale Reproductive BIA at any time. CGG will ensure the seismic source will only not be operated within the pygmy blue whale foraging BIA if there are low numbers of blue whales present. CGG will use a whale expert panel to help define 'low numbers' CGG will also shut down if a blue whale is detected within 10km of the seismic source. This 10km will ensure there are no behavioural impacts which may displace whales from their foraging BIASs. CGG will shut down the sound source if a blue whale remains resident in the 23 km ensonified area for more than 12 hours, this will ensure blue whales will not experience TTS (temporary auditory injury).

2354	6526	Asked how does the Regia MSS EP propose to avoid key feeding, breeding/ calving and transits to and from biologically important areas for key whale species?	As per the presentation for the in person meeting (Event ID 6880), this was provided in the powerpoint send in Event ID 6521 and confimed received in Event ID 6508. Further information was also provided in Event ID 6859.
2355	6526	Asked what mitigation measures are proposed to avoid impacts and how are any impacts justified and on what basis are any such impacts mitigated to the legal standard required?	Event ID 6859 - The Regia team provided Annexure A in addition to correspondence and advised that assessments were undertaken in three stages to identify cause-effect pathways and ensure these were appropriately managed, stepping through the process and providing examples held within the EP.
2356	6526	Asked how has CGG considered the impact on Kooyang?	Event ID 6859 - The Regia team responded that the noise modelling conducted by CGG assessed the impacts from sound to fish under three subcategories. These include fish with a swim bladder, fish without a swim bladder, and fish eggs and larvae. Fish susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder, fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. The latter two categories representing a further level of complexity applied to the modelling categories for fish. For context, CGG has grouped kooyang with fish containing swim bladders when assessing seismic effect studies. Therefore, CGG does not agree that the results from the noise modelling were necessarily a “broad evaluation”, but an appropriately categorised one. Standard modelling methodology models for receptors based on hearing group, not species. As this relates to fish, the presence/absence of a swim bladder remains the most suitable parameter for grouping fish in modelling for impacts from sound, therefore justifying CGGs reasoning behind not conducting species-specific modelling for kooyang, nor any other fish, bird, marine mammal, or turtle species.
2357	6526	Asked to what extent has the Regia MSS EP considered potential impacts to the Outstanding International Values of the Budj Bim Cultural Landscape, including the integrity of threatened Kooyang populations (and Kooyang husbandry and associated native title rights and interests concerning aquaculture)?	Event ID 6859 - The Regia team provided Annexure A in additiona to correspondence that outlined that Biosis Pty Ltd (Biosis) was commissioned by ConocoPhillips to undertake a cultural heritage desktop assessment (Appendix B10) for proposed resource exploration in Bass Strait. ConocoPhillips and Biosis gave permission for CGG to utilise this report given the overlap of the study area with the Regia MSS. The report supported the foundation of knowledge for the cultural heritage parts of the overall assessment. Cultural values are included in the impact assessments, for example, in Appendix E3 Impact Assessment Underwater Sound: Fish, Section 4.1.6 Eels, there is a section entitled ‘First Nations Connection to Eels’. Appendix F3 Further Assessment of Key Values and Sensitivities, Section 3.16 further assesses environmental values and sensitivities that were identified as culturally important features of the environment that may be affected by the Regia MSS. Included in this are Karntubul, Kooyang, and the Bonney Upwelling.

2358	6526	Asked how will any identified impacts to Kooyang be mitigated to the legal standard required?	Event ID 6859 - The Regia team responded that the modelling methodology (explained and justified above) is an industry-standard practise that applies the most appropriate and up-to-date scientific and peer-reviewed literature to best-assess the potential impacts from sound to fish, including kooyang.
2359	6526	Asked what is CGG's response to relevant actions, including in respect of Kooyang, within the Budj Bim Indigenous Protected Area Plan of Management 2022-2027 (for example only, see sections 5.5.2-5.5.7, Actions 29-31, 43)?	Event ID 6859 - The regia team provided Annexure A in addition to correspondence and advised that the noise modelling conducted by CGG assessed the impacts from sound to fish under three subcategories. These include fish with a swim bladder, fish without a swim bladder, and fish eggs and larvae. Fish susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder, fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. The latter two categories representing a further level of complexity applied to the modelling categories for fish. For context, CGG has grouped kooyang with fish containing swim bladders when assessing seismic effect studies. Therefore, CGG does not agree that the results from the noise modelling were necessarily a "broad evaluation", but an appropriately categorised one. Standard modelling methodology models for receptors based on hearing group, not species. As this relates to fish, the presence/absence of a swim bladder remains the most suitable parameter for grouping fish in modelling for impacts from sound, therefore justifying CGGs reasoning behind not conducting species-specific modelling for kooyang, nor any other fish, bird, marine mammal, or turtle species.
2360	6526	Asked what research has been commissioned or conducted in relation to the lifecycle of the Kooyang and its migration through the EMBA and/or Operational Area for the proposed activities?	Event ID 6859 - The Regia team provided Annexure A in addition to correspondence and advised that no life-cycle stages of kooyang that occur in the Budj Bim Cultural Landscape are predicted to be impacted from the Regia MSS, nor are any population-level impacts predicted for kooyang that would potentially impact the landscape. As a World Heritage Listed environmental value it was important for CGG to thoroughly assess the Outstanding Universal Value of the Budj Bim site. The assessment of the Budj Bim Cultural Landscape (available to view in Appendix F3) has found no threat to the values of the site from the proposed activity.

2361	6526	Asked what steps has CGG taken to avoid impacts from the proposed activities on the Bonney Coast Upwelling and to address key receptors, including the critical cultural heritage values associated with this Upwelling?	Event ID 6859 - The Regia team provided Annexure A in addition to correspondence and advised that the Precautionary Principle is utilised when there is uncertainty. Further assessment of Plankton Communities and the Bonney Upwelling System, in Section 3.13 in Appendix F3 Further Assessment of Key Values and Sensitivities, assesses potential impacts on plankton in further detail. Multiple studies on the effects of seismic activity on plankton, especially fish larvae, show harmful impacts, but the extent of these effects varies by species and proximity to seismic sources. Impacts to zooplankton and the Bonney Coast Upwelling and the role they both play in ecosystem function and productivity, are not predicted as: • Impacts to phytoplankton are not predicted. • Mortality or injury effects to zooplankton will be well within natural mortality rates. Upwelling systems in the region are highly dynamic with large variations in biomass a normal process. Zooplankton communities demonstrate high rates of turnover and will be constantly replenishing even as the seismic survey occurs. • Mortality or mortal injury effects to zooplankton, including krill, do not impact on marine fauna being able to feed on them as they will still be available within the water column.
2362	6526	Asked how and in what ways do measures within the Regia MSS EP address and respond to cumulative risks and impacts (both direct and indirect) reasonably associated with the proposed activities, in light of the other activities, be that past, current (both temporally and spatially) or anticipated, in the Otway Basin.	Event ID 6859 - The Regia team responded that as summarised in EP Section 10.1, Cumulative impacts were inherently considered in Stage 2 of the environmental assessments by virtue of considering the existing environment as a dynamic place inclusive of other natural and anthropogenic pressures. Specifically, the effects of past projects and activities, and currently operating projects, are captured when describing the existing condition of environmental values and sensitivities, inclusive of any pressure or threats affecting that value or sensitivity. Reasonably foreseeable further projects and activities within the spatial and temporal extent of the assessment includes the proposed Calico seismic survey. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about cumulative impacts.
2363	6526	Asked how and in what ways do measures within the Regia MSS EP address and respond to cumulative risks and impacts (both direct and indirect) reasonably associated with the proposed activities, in light of the best available scientific literature and practice in the design of cumulative impact assessments?	Event ID 6859 - The Regia team responded that as summarised in EP Section 10.1, Cumulative impacts were inherently considered in Stage 2 of the environmental assessments by virtue of considering the existing environment as a dynamic place inclusive of other natural and anthropogenic pressures. Specifically, the effects of past projects and activities, and currently operating projects, are captured when describing the existing condition of environmental values and sensitivities, inclusive of any pressure or threats affecting that value or sensitivity. Reasonably foreseeable further projects and activities within the spatial and temporal extent of the assessment includes the proposed Calico seismic survey. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about cumulative impacts.

2364	6526	Asked has CGG considered the risk of hydrocarbon or other vessel spills and/or collisions in their proposed activities, including from routine vessel traffic and/or rig operations, particularly in the overlapping areas with ConocoPhillips proposed activities? If so, how have any such environmental impacts been assessed and mitigated?	Event ID 6521 - The Regia team provided a tailored information sheet to the relevant person on unplanned events, including the accidental release of fuel, introduction of marine pests, accidental release of materials or waste overboard and collisions with marine fauna.
2365	6526	Asked how and in what manner have all environmental factors within the environment (as defined under r 5) been considered in cumulative impact assessments?	Event ID 6859 - The Regia team responded that as summarised in EP Section 10.1, Cumulative impacts were inherently considered in Stage 2 of the environmental assessments by virtue of considering the existing environment as a dynamic place inclusive of other natural and anthropogenic pressures. Specifically, the effects of past projects and activities, and currently operating projects, are captured when describing the existing condition of environmental values and sensitivities, inclusive of any pressure or threats affecting that value or sensitivity. Reasonably foreseeable further projects and activities within the spatial and temporal extent of the assessment includes the proposed Calico seismic survey. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about cumulative impacts.
2366	6526	Asked how and to what extent have acoustic impacts (including, for example, potential fatalaties to zooplankton and other fish species; injury and/or serious harm to mammal species; and other impacts to the broader ecosystem) considered in cumulative impact assessments, including cumulative impact assessments of the cultural environment?	Event ID 6859 - The Regia team responded that as summarised in EP Section 10.1, Cumulative impacts were inherently considered in Stage 2 of the environmental assessments by virtue of considering the existing environment as a dynamic place inclusive of other natural and anthropogenic pressures. Specifically, the effects of past projects and activities, and currently operating projects, are captured when describing the existing condition of environmental values and sensitivities, inclusive of any pressure or threats affecting that value or sensitivity. Reasonably foreseeable further projects and activities within the spatial and temporal extent of the assessment includes the proposed Calico seismic survey. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about cumulative impacts.

2367	6526	Asked on what basis does CGG determine, conclude or justify that any impacts or harms from seismic activity, surveys and/or blasting have been reduced to an acceptable level and/or to as low as reasonably practicable?	Event ID 6859 - The Regian team provided Annexure A that outlined that as per EP Section 2 Environmental Assessment Process, the EP undertook the environment assessment process in three stages:Stage 1: Preliminary Environmental Impact and Risk Assessment. This first stage of the assessment focused on the activity as a whole. Information was collated on the proposed activity, including setting an initial geographical area of investigation, and gathering environmental knowledge of the area. The preliminary assessment established the cause-effect pathways between the proposed activity and the environment to determine the environmental aspects of the activity to be managed.Stage 2: Detailed Environmental Assessments. The second assessment was undertaken at the aspect level. This approach was taken because the conclusion of this stage of the assessment process was to set Environmental Performance Outcomes (EPO), which are about the management of environmental aspects of the activity. The assessments primarily focus on demonstrating that the impacts and risks of the activity are of an acceptable level. This is because CGG applies this criterion before it attempts to further reduce impacts and risks through the ALARP assessment process. This assessment built on the content and context of the first assessment and included consideration of additional content (gathered from literature reviews, modelling reports, and other expert reports etc.) before then undertaking each impact and risk assessment in respect of the environmental aspects arising from the proposed activity.Stage 3: Further Assessment and Acceptance Criteria. The third assessment was undertaken at the impact/risk level. This is because the acceptance criteria focus on the demonstration that environmental impacts and risks will be of an acceptable level and reduced to as low as reasonably practicable (ALARP).
2368	6623	Requested that CGG respond to questions provided in 28 days.	Event ID 6859 - The Regia team responded to questions provided by the organisation as requested.

2369	6623	Requested information on how procedures requiring observation of karntubul for 12 hours prior to shutdown of CGG's proposed activities practically provide protection for karntubul? For example, how do these procedures specifically protect karntubul, where marine mammal observation is complicated by the following non-exhaustive list of factors such as low-light, poor visibility, high seas and variable weather, the need for karntubul to be close to the water's surface to be readily detected by marine mammal observers and the impact of backgrounf noise and karntubil that are not vocalising on passive acousic monitoring.	Event ID 6859 - The Regia team responded that as per their tailored information sheet, EP Appendix E7, and G2, CGG will use multiples lines of evidence when detecting whales. The Regia MSS will utilise a range of whale detections methods such as Marine Mammal Observers (MMOs) (and an additional MMO on board the support vessel), Aerial surveys, and Passive Acoustic Monitoring (PAM) technology. CGG has also committed to trialling an additional PAM system and if successful 3 more PAM detection buoys will be added to the suite of detection methods. During low-light and poor visibility/weather PAM technology will be the main method used for whale detection, CGG will use two different types of PAM technology to monitor whales. If whales are close to the waters surface, MMOs and aerial surveys will have the ability to monitor them. Ambient noise levels will be taken into account prior to the survey. It should be noted, it is only low frequency cetaceans (baleen whales) that if detected, need to be monitored for 12 hours. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about Karntubul species.
2370	6623	Asked how will CGG reasonably determine that an individual karntubul has been present within the ensonified area for more than 12 hours?	Event ID 6859 - The Regia team responded that as per their tailored information sheet, EP Appendix E7, and G2, CGG will use multiples lines of evidence when detecting whales. The Regia MSS will utilise a range of whale detections methods such as MMOs (and an additional MMO on board the support vessel), Aerial surveys, and PAM technology. CGG has also committed to trialling an additional PAM system and if successful 3 more PAM detection buoys will be added to the suite of detection methods. CGG will be relying on a suite of detection methods to enhance detections of whales. These techniques along with input and advice from a whale expert panel, will be used to monitor detections of whales for 12 hours. It should be noted, it is only low frequency cetaceans (baleen whales) that if detected, need to be monitored for 12 hours. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about Karntubul species.
2371	6623	Asked what training, skills and experience will the "CGG Site Representative" have in ensuring mammal observation duties are conducted to an acceptable level (when the marine mammal observer is unavailable)?	Event ID 6859 - The Regia team responded that as per EP Appendix G2, the CGG Site Representative is responsible for the implementation of the Fauna Management Plan and provides training and activity specific inductions to the Survey Environment Advisor. The CGG Site Representative does not make any decisions regarding marine mammal observations. Additionally, in Event ID 6521, the Regia team provided a tailored information sheet to the relevant person about Karntubul species and measures in place to protect marine mammals.

2372	6623	Asked if CGG could explain the conflicting shut-down measures that it proposes in the EP? For example, how does CGG conclude that a 500 m shutdown measure is sufficiently protective of low-frequency cetaceans, when a 2 km shutdown zone was considered in the impact analysis in the EP? Also, is the "moderate" conclusion reached therein still accurate in the absence of a 2 km shutdown shut down within 500measure.	Event ID 6859 - The Regia team responded that it is not conflicting. The 2km refers to a previous version of the EP, prior to our latest submission (a version prior to November 2024). The EP is a live document, it is important to always ensure you are reading the most up to date version. The most up to date control measures whales can be found in EP Appendix E7 and G1. These include: - Shut down within 500m of sound source to ensure thresholds from PTS per pulse are not reached for any low-frequency (LF) cetacean. - Shut down the sound source for any LF cetacean observed within 5 km of the sound source for more than 12 hours to ensure PTS cumulative 24h is not reached. - Shut down the sound source if a blue whale remains resident in the 23 km ensonified area for more than 12 hours, or move away from the area, to ensure TTS cumulative 24h is not reached. - Shut down the sound source if a blue whale is observed within 10 km from the sound source or move away from the area to ensure behavioural thresholds per pulse are not reached. - Shut down the sound source if a SRW remains resident in the 15 km ensonified area for more than 12 hours or move away from the area to ensure TTS cumulative 24h is not reached. - Shut down the sound source if a SRW cow and calf pair are observed within 10 km from the sound source or move away from the area to ensure TTS cumulative 24h for SRW calf cow pair is not reached.
2373	6623	Asked how does CGG conclude that seismic activity within the foraging BIA of the karntubul species Pygmy Blue Whale is consistent with the recovery plan under the EPBC Act for that species?	Event ID 6859 - The Regia team responded that as per EP Appendix E7, CGG will ensure there are no behavioural impacts to Blue Whales, as the seismic source will be shut down within 10km of a blue whale. This is based on the underwater sound modelling commissioned by CGG where behavorial impacts to blue whales was predicted to occur within 9.83km of the sound source.
2374	6623	Asked on what basis has CGG concluded that a Pygmy Blue Whale will not be injured, disrupted from foraging, or displaced?	Event ID 6859 - The Regia team responded that as per EP Appendix E7, CGG has ensured the Regia MSS will not be taking place during the peak upwelling months associated with the Bonney . The most likely window now will be September. Along with shut downs for blue whales mentioned previously, CGG will ensure the seismic source will only not be operated within the pygmy blue whale foraging BIA if there are low numbers of blue whales present. CGG will use a whale expert panel to help define 'low numbers' CGG will also shut down if a blue whale is detected within 10km of the seismic source. This 10km will ensure there are no behavioural impacts which may displace whales from their foraging BIASs. CGG will shut down the sound source if a blue whale remains resident in the 23 km ensonified area for more than 12 hours, this will ensure blue whales will not experience TTS (temporary auditory injury).

2375	6623	Asked what are the predicted impacts when seismic survey blasting takes place inside of a BIA with karntubul present?	Event ID 6859 - The Regia team responded that as per E7 Appendix 7, There are only 3 BIAs associated with whales that are relevant to the Regia MSS, the Southern Right Whales Reproductive and Migration BIA, and the Blue Whale Foraging BIA. The sound source will be operated within the Southern Right Whale Reproductive BIA at any time. CGG will ensure the seismic source will only not be operated within the pygmy blue whale foraging BIA if there are low numbers of blue whales present. CGG will use a whale expert panel to help define 'low numbers' CGG will also shut down if a blue whale is detected within 10km of the seismic source. This 10km will ensure there are no behavioural impacts which may displace whales from their foraging BIASs. CGG will shut down the sound source if a blue whale remains resident in the 23 km ensonified area for more than 12 hours, this will ensure blue whales will not experience TTS (temporary auditory injury).
2376	6623	Asked how has CGG concluded that impacts to culturally significant marine mammals like karntubul and sea lions are “individual”, “temporary”, “recoverable” or “small scale” without meaningful engagement with Gunditjmara to determine what, if any, harms and impacts are acceptable for culturally significant species?	Event ID 6859 - The Regia team responded that an outline of the framework for defining acceptable levels for the Regia MSS can be found in Appendix F4.The acceptable levels defined by CGG for all relevant receptors including marine mammals were assembled using scientific rigor, which included the analysis of peer-reviewed and unbiased literature to predict impacts to relevant species, while also ensuring their consistency with species’ recovery and conservation management plans. CGG has also engaged in extensive consultation efforts to learn and gain as much knowledge as possible around the cultural significance of marine species during this process and continues to welcome additional relevant information and knowledge that could further benefit the protection of the marine environment, including culturally significant species. Also to noted: CGG’s first draft of defined acceptable levels were published in May 2023 on the Consultation Hub alongside our environmental assessment process to provide an opportunity to the community and relevant persons to understand the assessment process and influence the criteria used in the assessment process. The opportunity to comment was open for 60 days.
2377	6623	Asked how has CGG concluded that the Regia MSS will not result in population-level impacts given that studies have suggested impacts on individual marine mammals can aggregate into population-level disturbances?	Event ID 6859 - The Regia team sought clarification if this question related to whales or marine mammals as a whole? As per E7 Appendix 7, CGG has assessed underwater sound impacts to marine mammals. The reference provided discussed impacts to beaked whales which are not baleen whales. Impacts to whales have been categorised into hearing groups. CGG considered numerous scientific studies, conservation management plans, recovery plans, and conservation advice when assessing impacts to marine mammals. CGG will be implementing shut-downs for whales to ensure impacts are minimised, therefore impacts at a population level are not expected.

2378	6623	Asked how has CGG ensured compliance with the Objects of the Regulations (and section 3A of the EPBC Act) in employing the precautionary principle in concluding the matters identified relating to Karntubul.	Event ID 6859 - The Regia team responded that application of the precautionary principle is required when there are threats of serious or irreversible environmental damage and a lack of full scientific certainty. There are examples in CGGs analysis where a lack of full scientific uncertainty was identified, however, there were no instances where threats to environmental values and sensitivities were serious or irreversible. Despite this CGG routinely applied precaution in its assessment; selecting conservative effect thresholds for sound, adjusting the activity design to avoid sound discharge during particularly sensitive periods, to avoid overlap with sensitive species protected areas (e.g. KEFs), and implementing buffers around marine protected areas.
2379	6623	Asked if CGG could explain why it adopted a 160 dB threshold for behavioural impacts to marine mammals when a 140 dB or 120 dB threshold would appear to better reflect both scientific uncertainty and the findings presented in Appendix B8 of the EP?	Event ID 6859 - The Regia team responded that the noise criteria for the acoustic modelling study were chosen because they include standard thresholds and thresholds suggested by the best available science. The chosen marine mammal behavioural threshold is based on the current US National Oceanic and Atmospheric Administration (NOAA 2019) criterion for marine mammals of 160 dB re 1 µPa (SPL; Lp) for impulsive sound sources. Changing this industry standard methodology to include a lower threshold (140 dB or 120 dB) would require substantial new scientific evidence to justify it that is not currently available, nor is it currently believed to be relevant based on the justifications for using the 160dB threshold.
2380	6623	Asked if CGG could explain and justify why this higher dB threshold is also being applied to endangered, vulnerable, and culturally significant species?	Event ID 6859 - The Regia team responded that the noise criteria for the acoustic modelling study were chosen because they include standard thresholds and thresholds suggested by the best available science. The chosen marine mammal behavioural threshold is based on the current US National Oceanic and Atmospheric Administration (NOAA 2019) criterion for marine mammals of 160 dB re 1 µPa (SPL; Lp) for impulsive sound sources. Changing this industry standard methodology to include a lower threshold (140 dB or 120 dB) would require substantial new scientific evidence to justify it that is not currently available, nor is it currently believed to be relevant based on the justifications for using the 160dB threshold.
2381	6623	Asked why CGG had two different buffer zones (18km and 17km) for Deen Maar?	Event ID 6859 - The Regia team responded that the EP states 17 km. The draft presentation slides provided prior to the February 14th 2025, meeting incorrectly stated 18 km, this had been corrected prior to presentation.
2382	6623	Asked how will the Deen Maar buffer zone be enforced and why has this area not been excised from the title area?	Event ID 6859 - The Regia team responded that a petroleum title area is the geographical boundary of a petroleum title, which is defined by the government. The survey design has been updated, acquisition lines will adhere to this.

2383	6623	Asked why is the buffer zone around Deen Maar less than the area for which CGG has found elevated noise levels (20km)?	Event ID 6859 - The Regia team responded that 11.8 km is the furthest distance to sound effect criteria for pinnipeds (seals and sea lions). The increased protections afforded through the 17 km buffer are considered highly conservative to minimise disturbance of breeding seals in recognition that this is the largest Australian Fur Seal breeding colony in Australia.
2384	6623	Asked given the significant uncertainty characterising the issue of plankton mortality caused by seismic activity, particularly in the context of the culturally and biologically significant Bonney Upwelling, why has CGG not employed the precautionary principle in its assessment of impacts on plankton and other culturally significant species?	Event ID 6859 - The Regia team responded that the Precautionary Principle is utilised when there is uncertainty. Further assessment of Plankton Communities and the Bonney Upwelling System, in Section 3.13 in Appendix F3 Further Assessment of Key Values and Sensitivities, assesses potential impacts on plankton in further detail. Multiple studies on the effects of seismic activity on plankton, especially fish larvae, show harmful impacts, but the extent of these effects varies by species and proximity to seismic sources. In general, the closer the plankton are to seismic sources, the greater the impact, though some studies, like McCauley et al. (2017), challenge this distance-effect relationship. Richardson et al. (2017) called for more research into McCauley's findings, particularly regarding the lack of attenuation with distance. Experimental methods have varied widely, often not replicating real-life conditions, highlighting the need for further focused studies. McCauley's work has spurred additional research, including Norway's ZoopSeis project, which investigates seismic effects on zooplankton under realistic conditions. This work is designed to investigate effects under realistic seismic survey conditions and finished at the end of 2023. Peer-reviewed papers of the research are being completed, with the first publication now available. Mortality rates and reduced growth of copepod larvae of Acartia spp were found to be high in the vicinity of the airgun discharges however the actual rates were significantly lower than normal population mortality rates and hence would likely not be detected (Vereide et al. 2023). They did not test for the effects of distance-from-seismic in this work, but their results remain consistent with most of the other research already published in this area. A second publication from the ZoopSeis research (Vereide et al., 2024a) found that while seismic discharges caused significant damage close to the sources, mortality did not extend extensively beyond 1 km, as suggested by McCauley et al. (2017). The mortality rates were lower than natural mortality and thus difficult to distinguish from background mortality. A review (Vereide et al., 2024b) highlighted the challenge of applying experimental results to real-life scenarios. While seismic surveys can cover vast areas and last for weeks, the plankton's exposure is not continuous and typically lasts only 3-4 days in studies, which may not accurately reflect real-world conditions due to migration and advection. Zooplankton will experience varying exposure to seismic discharges depending on factors like time, sound levels, and seasonal or species-specific distribution changes. Studies like Dongen-Vogels et al. (2011) show significant local variations in plankton abundance due to physical events like upwelling or water column stratification. Additionally, a study off Florida (Robinson et al., 2021) showed that planktonic

			assemblages exhibit multi-scale patchiness. While effects of seismic will be felt by plankton assemblages at localised scales the highly dynamic nature of populations in space and time will ensure there are no population level effects hence the magnitude of any effects will be minor. Impacts to zooplankton and the Bonney Coast Upwelling and the role they both play in ecosystem function and productivity, are not predicted as: • Impacts to phytoplankton are not predicted. • Mortality or injury effects to zooplankton will be well within natural mortality rates. Upwelling systems in the region are highly dynamic with large variations in biomass a normal process. Zooplankton communities demonstrate high rates of turnover and will be constantly replenishing even as the seismic survey occurs. • Mortality or mortal injury effects to zooplankton, including krill, do not impact on marine fauna being able to feed on them as they will still be available within the water column.
2385	6623	Asked for more information on how the EP discusses modern cultural values associated with particular species or environmental features.	Event ID 6859 - The Regia team responded that Biosis Pty Ltd (Biosis) was commissioned by ConocoPhillips to undertake a cultural heritage desktop assessment (Appendix B10) for proposed resource exploration in Bass Strait. ConocoPhillips and Biosis gave permission for CGG to utilise this report given the overlap of the study area with the Regia MSS. The report supported the foundation of knowledge for the cultural heritage parts of the overall assessment. Cultural values are included in the impact assessments, for example, in Appendix E3 Impact Assessment Underwater Sound: Fish, Section 4.1.6 Eels, there is a section entitled 'First Nations Connection to Eels'. Appendix F3 Further Assessment of Key Values and Sensitivities, Section 3.16 further assesses environmental values and sensitivities that were identified as culturally important features of the environment that may be affected by the Regia MSS. Included in this are Karntubul, Kooyang, and the Bonney Upwelling.

2386	6623	Asked how was the Biosis desktop review used to inform CGG's analysis of impacts?	Event ID 6859 - The Regia team responded that Appendix B10, the Cultural Heritage Review, is a report that supported the foundation of knowledge for the cultural heritage parts of the overall assessment. It informed the description of the environment that may be affected, which could be found in the relevant impact/risk assessment.
2387	6623	Asked if CGG considered or conducted an analysis of modern cultural values and if so, where has it gathered information on those modern cultural values?	Event ID 6859 - The Regia team responded that they used information provided through consultation, relevant literature, case law and desktop research.
2388	6623	Asked how does CGG ensure that the harms are fully considered and mitigated for culturally significant features?	Event ID 6859 - The Regia team responded that following consultation with relevant persons, and completion of the environmental assessments, activity limitations had been adopted. The Regia team provided a list of the activity limitations relevant to protecting environmental values and sensitivities, relevant to protected area, relevant to cultural sensitivities, relevant to compliance and relevant to protecting other marine users. They explained that these activity limitations had been referred to throughout the environmental assessment, consultation, and public comment processes.
2389	6623	Asked how and where does the November EP assess species and places of cultural significance holistically?	Event ID 6859 - The Regia team responded that assessment of species and places of cultural significance could be located in Appendix F3, Section 3.16 Cultural Features of the Environment Plan.

2390	6623	The Acceptable Levels Assessment (Appendix F4) concludes that "impacts to cultural features are not predicted" for invertebrates, turtles, and marine mammals, and birds. However, the November EP describes numerous impacts to these animal groups, many of which hold cultural importance to Gunditjmara. Notwithstanding this, the EP reaches the conclusion, culturally, that the species will not be impacted by underwater noise. What is CGG's response?	Event ID 6859 - The Regia team responded that there seems to have been a misreading of the EP, with confusion around 'potential' (cause-effect pathways) and 'predicted' (impacts given the measures in place). As per EP Section 2 Environmental Assessment Process, the EP undertook the environment assessment process in three stages: Stage 1: Preliminary Environmental Impact and Risk Assessment. This first stage of the assessment focused on the activity as a whole. Information was collated on the proposed activity, including setting an initial geographical area of investigation, and gathering environmental knowledge of the area. The preliminary assessment established the cause-effect pathways between the proposed activity and the environment to determine the environmental aspects of the activity to be managed. Stage 2: Detailed Environmental Assessments. The second assessment was undertaken at the aspect level. This approach was taken because the conclusion of this stage of the assessment process was to set Environmental Performance Outcomes (EPO), which are about the management of environmental aspects of the activity. The assessments primarily focus on demonstrating that the impacts and risks of the activity are of an acceptable level. This is because CGG applies this criterion before it attempts to further reduce impacts and risks through the ALARP assessment process. This assessment built on the content and context of the first assessment and included consideration of additional content (gathered from literature reviews, modelling reports, and other expert reports etc.) before then undertaking each impact and risk assessment in respect of the environmental aspects arising from the proposed activity. Stage 3: Further Assessment and Acceptance Criteria. The third assessment was undertaken at the impact/risk level. This is because the acceptance criteria focus on the demonstration that environmental impacts and risks will be of an acceptable level and reduced to as low as reasonably practicable (ALARP).
2391	6623	Asked why does the November EP evaluate cultural impacts differently?	Event ID 6859 - The Regia team responded that following feedback from NOPSEMA, the presentation and organisation of the EP and Appendices were changed, rather than underlying methodology. Appendix A3, B1, B9, F1, and G5 were removed from the November submission, with relevant content moved into other parts of the EP. The original Appendix F1 has been replaced with an EP Summary document. The Cumulative Impact Assessment (previously Appendix E10 has been updated and renamed F1 to better reflect its place in the assessment process.
2392	6623	How and where does CGG assess impacts on species and places of cultural significance holistically, at	Event ID 6859 - The Regia team responded that both direct and indirect cause-effect pathways were identified and assessed. Appendix F3, Section 3.16 Cultural Features of the Environment

		the individual, population and ecosystem level?	
2393	6623	Asked how is CGG able to confidently conclude that there are no long term, serious or irreversible threats from the Regia MSS?	Event ID 6859 - The Regia team responded that in Appendix F4, CGG has put forward its case that the environmental impacts and risks of the activity are of an acceptable level because: 1. All environmental impacts and risks have been identified and assessed. 2. Lower order impacts and risks have been screened and eliminated or managed. 3. Higher order impacts and risks have been assessed by: a. Gathering knowledge about relevant environmental values and sensitivities, including through extensive consultation. b. Defining acceptable levels for the activity and, more specifically, for environmental values and sensitivities. c. Predicting the levels of impact and risk. d. Evaluating the effectiveness of measures that protect the environment. 4. Predicted impacts and risks of the activity have been compared to acceptable levels of impact. 5. The titleholder has considered predictive uncertainty in the environmental assessments. 6. The environmental assessments are appropriate to the nature and scale of the activity. 7. Once managed, no pathways to unacceptable impacts were identified. 8. The proposed activity will comply with the requirements of the EPBC Act. 9. The proposed activity is consistent with the principles of ecologically sustainable development. Each of these reasons is explained, in detail, in Appendix F4. They demonstrate that environmental impacts and risks arising from the activity are of an acceptable level.
2394	6623	Asked if CGG could clarify whether it plans to acquire the seismic survey in a single phase or in multiple phases over the estimated four-year duration of the activity?	Event ID 6859 - The Regia team responded that the activity is a single phase of a maximum of 90 days of operations, with a maximum of 60 of those days being acquisition, during which the sound is emitted.
2395	6623	Asked if the 60 days of survey activity be spread out over the 5-year acquisition period or will CGG be surveying 60 days per year? Is a different proposed phase of acquisition contemplated by CGG?	Event ID 6859 - The Regia team responded that if the EP gains acceptance, the activity would occur once, anytime (excluding January, February or March) between acceptance and 2028.
2396	6623	Asked what is the maximum number of days that seismic surveying	Event ID 6859 - The Regia team responded that there would be 90 days of operations, with 60 of those days being acquisition.

		could occur over the project's duration?	
2397	6623	Asked if CGG could confirm that the sound source will not be active (even at low levels or for testing) outside of the active source area?	Event ID 6859 - The Regia team responded that the survey is designed with progressively smaller areas within the activity planning area, these areas have designated activities assigned to them: Operation Area (OA): an area within the Activity Planning Area in which survey vessel activities occur including equipment maintenance and deployment/recovery, crew change and resupply. The sound source cannot be active in the operational area, outside of the active source area. Active Source Area (ASA): an area within the Operational Area in which the sound source can be active. Line runouts and run-ins occur within this area and outside of the survey acquisition area. The sound source cannot be discharged at full power within the activity source area and outside of the survey acquisition area. Survey Acquisition Area (SAA): the primary target area for the survey and the area in which seismic data will be recorded, and the sound source can be discharged at full power.
2398	6623	Asked if CGG could confirm whether underwater acoustic modelling limited itself to the active source area or source acquisition area?	Event ID 6859 - The Regia team responded that Two sound modelling reports were undertaken: - Appendix B7a - Modelling Report on Sound Emissions: Regia Marine Seismic Survey by JASCO Applied Sciences - Appendix B7b - Regia Marine Seismic Survey: Acoustic and Animat Modelling for Assessing Marine Fauna Sound Exposures (Document 03301, Version 2.0) CGG commissioned the initial underwater sound modelling prior to the decision regarding the location of the operational area and active source area. This was to ensure CGG could make an informed decision regarding sound levels within the area of interest. This is why the modelling does not include an Operational Area and an Active Source Area. Provided sound modelling map images and clarified that they were produced to demonstrate the relevance of the modelling in relation to the proposed survey acquisition area. They stated that a further description of the Appendices can be found in the EP, Section 7.3.1.
2399	6623	Can CGG provide a single map including the boundaries of all three areas of the operational	Event ID 6859 - The Regia team provided the requested map.

		area, the active source area, and acquisition area?	
2400	6623	Asked why are vessel activities outside the operational area not included as "petroleum activities" within the scope of the EP? How would they contribute to noise emissions, ship strikes, and other impacts and risks (including cumulative impacts) if they were included?	Event ID 6859 - The Regia team responded that the scope of the EP does not include the periods when the seismic vessel or support vessels are not within the OA, such as during maintenance activities outside of the OA, port calls, crew changes, inclement weather avoidance, or vessel mobilisation/demobilisation to/from the OA. During these periods the project vessels are deemed to be operating under the Commonwealth Navigation Act 2012 and are not managed within this EP.
2401	6623	Asked how has CGG ensured that the best available information was incorporated into the EP's assessment of environmental impacts, given it seems underlying searches and reports have not been updated since May 2024?	Event ID 6859 - The Regia team responded that multiple searches and reports, such as the Protected Matters Search Tool (PMST), were undertaken in the preparation of the EP, including in May 2024 prior to submission to ensure any changes to species or listings were identified to cater for the passage of time. These searches will be re-run prior to the activity commencing to help determine any changes to environmental knowledge underpinning this EP.
2402	6623	Asked how did CGG ensure that the November EP did not ignore or downplay environmental harms, as it focused its analysis on why the project is acceptable?	Event ID 6859 - The Regia team responded that assessments were undertaken in three stages to identify cause-effect pathways and ensure these were appropriately managed. Within these documents potential direct and indirect cause-effect pathways, impacts and risks, along with the predicted level of risk are identified and comprehensively described. The stage two assessments primarily focus on demonstrating that the impacts and risks of the activity are of an acceptable level. This is because CGG applies this criterion before it attempts to further reduce impacts and risks through the ALARP assessment process. This assessment built on the content and context of the first assessment and included consideration of additional content (gathered from literature reviews, modelling reports, and other expert reports etc.) before then undertaking each impact and risk assessment in respect of the environmental aspects arising from the proposed activity.
2403	6623	Asked why did CGG choose not to revise its underwater noise models despite the flaws found by NOPSEMA in its Request for Further Information, dated 28 August 2024?	Event ID 6859 - The Regia team responded that the issue raised by NOPSEMA in the Request for Further Written Information (RFFWI) were concerning how CGG had demonstrated that the sound modelling reports are commensurate with the nature and scale of the activity and the severity of individual impacts and risks. CGG addressed this by updating the EP to provide clarification to the queries raised. This included new maps, explanation of the two modelling reports and their utility in the impact assessments. Further description of the Appendices can be found in the EP, Section 7.3.1, and Appendix B7a and B7b.

2404	6623	Asked how can CGG ensure that the oil spill model, based on a literature review, is realistic and relatable to this project?	Event ID 6859 - The Regia team responded that CGG commissioned a detail analysis of all the oil spill models completed in the Otway region since the integration of environmental functions into NOPSEMA. For a spill model to be considered relevant to the activity it had to meet the following requirements: • Surface release of marine diesel oil. • Modelling thresholds align with those in the NOPSEMA Oil Spill Modelling Environment Bulletin April 2019. • Modelling was used in an environment plan available on the NOSPEMA website. • Modelled location is within the Regia MSS Activity Planning Area or > 20 km of the Regia MSS Activity Planning Area where the metocean conditions would be similar. Twelve suitable models were analysed with all but one having a greater spill volume than is applicable to the proposed Regia MSS. The review found that the EPA set for the activity was suitable for the consideration of the extent of the risk (consequence) that may arise from the activity. The full report has been included in the EP as Appendix B11.
2405	6623	Asked is it contemplated by CGG that multiple seismic surveys may proceed in the Otway Basin at the same time or in near succession? If this is the case, how has impact for concurrent and consecutive seismic surveys on species and ecosystems been accounted for in the EP?	Event ID 6859 - The Regia team responded that as summarised in EP Section 10.1, Cumulative impacts were inherently considered in Stage 2 of the environmental assessments by virtue of considering the existing environment as a dynamic place inclusive of other natural and anthropogenic pressures. Specifically, the effects of past projects and activities, and currently operating projects, are captured when describing the existing condition of environmental values and sensitivities, inclusive of any pressure or threats affecting that value or sensitivity. Reasonably foreseeable further projects and activities within the spatial and temporal extent of the assessment includes the proposed Calico seismic survey.
2406	6623	Asked how will CGG address cumulative impacts from anthropogenic noise generally and specifically from consecutive and concurrent seismic surveys?	Event ID 6859 - The Regia team responded that cumulative impacts were considered in the environmental assessments.

2407	6623	Asked why CGG's EP does not consider how elevated noise levels over long durations and distances can affect marine mammal behaviour and physiology, particularly beyond a 24 hour period.	Event ID 6859 - The Regia team responded that information provided in this statement is unweighted and lacking scientific evidence to support this claim about how sound will propagate through the water in the region of the proposed Regia MSS. The 24-hour duration applied to the cumulative noise exposure is an industry-standard method based on the unlikelihood that a highly mobile animal such as a marine mammal would remain static in an area for long enough to be exposed to cumulative noise exposure. Particularly due to the behavioural response threshold criteria being below those associated with TTS and PTS. Therefore a 24 hour duration is likely a conservative approach when being applied to cumulative noise exposure relating to marine mammals. CGG acknowledges that an assessment of the ambient noise in the proposed region of the Regia MSS may be required to provide sufficient context that informs the impact assessment of underwater sound on relevant receptors. CGG will be providing additional information in the EP on ambient noise in the Otway region.
2408	6623	Asked why CGG does not appear to evaluate the impacts of noise on kooyang specifically, instead relying on a broad evaluation of noise impacts to fish, generally.	Event ID 6859 - The Regia team responded that noise modelling conducted by CGG assessed the impacts from sound to fish under three subcategories. These include fish with a swim bladder, fish without a swim bladder, and fish eggs and larvae. Fish susceptibility to injury from noise exposure varies depending on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder, fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. The latter two categories representing a further level of complexity applied to the modelling categories for fish. For context, CGG has grouped kooyang with fish containing swim bladders when assessing seismic effect studies. Therefore, CGG does not agree that the results from the noise modelling were necessarily a “broad evaluation”, but an appropriately categorised one. Standard modelling methodology models for receptors based on hearing group, not species. As this relates to fish, the presence/absence of a swim bladder remains the most suitable parameter for grouping fish in modelling for impacts from sound, therefore justifying CGGs reasoning behind not conducting species-specific modelling for kooyang, nor any other fish, bird, marine mammal, or turtle species.
2409	6623	Asked if CGG did not model noise impacts on kooyang specifically, how can it then make conclusions required under the Regulations (including those in relation to reducing impacts to ALARP and an acceptable level) about the impact of the seismic survey on this species?	Event ID 6859 - The Regia team responded that the modelling methodology (explained and justified above) is an industry-standard practise that applies the most appropriate and up-to-date scientific and peer-reviewed literature to best-assess the potential impacts from sound to fish, including kooyang

2410	6623	Asked how were conclusions drawn that prospective effects on kooyang would not effect the Budj Bim Cultural Landscape, which depends on the life cycle of kooyang for its Outstanding Universal Value and World Heritage Property listing?	Event ID 6859 - The Regia team responded that no life-cycle stages of kooyang that occur in the Budj Bim Cultural Landscape are predicted to be impacted from the Regia MSS, nor are any population-level impacts predicted for kooyang that would potentially impact the landscape. As a World Heritage Listed environmental value it was important for CGG to thoroughly assess the Outstanding Universal Value of the Budj Bim site. The assessment of the Budj Bim Cultural Landscape (available to view in Appendix F3) has found no threat to the values of the site from the proposed activity.
2411	6623	Asked how has CGG specifically considered the relevant cultural environment, including: Gunditjmara views, concerns, and objections in relation to potential harm to kooyang, and Potential impacts from the proposed activities on Gunditjmara's native title rights and interests in relation to the aquaculture systems of the Budj Bim Cultural Landscape?	Event ID 6859 - The Regia team responded that CGG acknowledges Gunditjmara views, concerns, and objections in relation to potential harm of kooyang, and believes that the information provided by CGG can assist in the understanding of CGG's predicted impacts on these species, which have been rigorously and thoroughly assessed to the best of their ability using industry-standard practices, and robust scientific methods. CGG acknowledges that the integrity and authenticity of the site are maintained through the intact and operational nature of the aquaculture systems, the ongoing connection of the Gunditjmara to their land, and the continuation of cultural practices. The landscape is managed to respect the rights and obligations of the Gunditjmara Traditional Owners, ensuring the preservation of its cultural and natural values, by the Ngootyoong Gunditj Ngootyoong Mara South West Management Plan (2015). Whilst there are no direct effects, and immeasurable indirect effects, from the Regia MSS on the World Heritage Values of Budj Bim, CGG recognises that there may be other indirect effects to spiritual values held by the Gunditjmara people and that this information may be sensitive such that it cannot be shared. In acknowledgement of the ongoing sovereignty of the Gunditjmara people, and CGG's willingness to find ways to protect cultural heritage, a Sea Country Protection Program will be implemented that aims to facilitate the co-design and co-implementation of initiatives to mitigate indirect effects from the Regia MSS if they are evident.
